| 20 | SAD | 0 | R/W | Source Address Direction<br>This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1 (fixed) to this bit.<br>0: Incrementing (default)<br>1: Fixed<br>When the transfer source uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 19 to 16 | DDS[3:0] | All 0 | R/W | Destination Data Size<br>These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode.<br>Use bit 3 to switch between the normal and skip modes.<br>0: Normal mode (default)<br>1: Skip mode<br>Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 32B.21**.)<br>000: 8 bits (default)<br>001: 16 bits<br>010: 32 bits<br>011: 64 bits<br>100: 128 bits<br>101: 256 bits<br>110: 512 bits<br>111: Setting prohibited |
| 15 to 12 | SDS[3:0] | All 0 | R/W | Source Data Size<br>These bits specify the size of DMA transfer data.<br>Use bit 3 to switch between the normal and skip modes.<br>0: Normal mode (default)<br>1: Skip mode<br>Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 32B.21**.)<br>000: 8 bits (default)<br>001: 16 bits<br>010: 32 bits<br>011: 64 bits<br>100: 128 bits<br>101: 256 bits<br>110: 512 bits<br>111: Setting prohibited |
| 11 | DRRP | 0 | R/W | Descriptor Read Repeat<br>This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0. (See **section 32B.9.12.1(2)(a), Operation flow of link mode**.)<br>• 0: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default)<br>• 1: This module keeps reading the same descriptor until the LV value changes to 1, and, when the LV value becomes 1, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register. |
| 10 to 7 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 6, 5 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 1. |
| 4 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 3 | REQD | 0 | R/W | Request Direction<br>This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side.<br>0: The USB control is on the transfer source side. (Default)<br>1: The USB control is on the transfer destination side. |
| 2, 1 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 0 | SEL | 0 | R/W | Terminal Select<br>This bit selects the FIFO channel to be used on the USB control side.<br>0: D0FIFO<br>1: D1FIFO |

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 32B.21 Range of Sizes That Can Be Specified in SDS and DDS Bits

| Transfer Address | REQD | SDS[2:0] | DDS[2:0] |
|---|---|---|---|
| Beat aligned | 0 | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. | 8 to 32 bits (000 to 010)<br>128 to 512 bits (100 to 110) |
| | 1 | 8 to 32 bits (000 to 010)<br>128 to 512 bits (100 to 110) | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. |
| Beat unaligned | 0 | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. | 8 to 32 bits (000 to 010)<br>128 to 256 bits (100 to 101) |
| | 1 | 8 to 32 bits (000 to 010)<br>128 to 256 bits (100 to 101) | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. |

**Note:** When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits.
Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned.
If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

## 32B.5.4 Channel Interval Register n

For details, see **Section 32B.9.13.6, Interval Count Function**.

### 32B.5.4.1 Channel Interval Register ch0 [CHITVL_0] <Address: H'430>
### Channel Interval Register ch1 [CHITVL_1] <Address: H'470>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ITVL | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 15 to 0 | ITVL | All 0 | R/W | Interval<br>These bits specify the DMA transfer interval. |

## 32B.5.5 Channel Extension Register n

### 32B.5.5.1 Channel Extension Register ch0 [CHEXT_0] <Address: H'434>
### Channel Extension Register ch1 [CHEXT_1] <Address: H'474>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R | — R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | DPR | | | | — | — | — | — | SPR | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | — R | — R | — R | — R | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 11 to 8 | DPR | All 0 | R/W | Destination PROT<br>These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer.<br>The initial value of these bits is H'0. |
| 7 to 4 | — | All 0 | R/W | Nothing is assigned to these bits. Fix these bits to 0. |
| 3 to 0 | SPR | All 0 | R/W | Source PROT<br>These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer.<br>The initial value of these bits is H'0. |

## 32B.6 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

### 32B.6.1 Next Link Address Register n (NXLA_n)

#### 32B.6.1.1 Next Link Address Register ch0 [NXLA_0] <Address: H'438>
#### Next Link Address Register ch1 [NXLA_1] <Address: H'478>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NXLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NXLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | NXLA | All 0 | R/W | Next Link Address |
| 1, 0 | | All 0 | R | These bits specify the link-destination address. Upper two bits are fixed to 0, and only the address aligned with a word boundary can be set. |

## 32B.6.2 Current Link Address Register n (CRLA_n)

### 32B.6.2.1 Current Link Address Register ch0 [CRLA_0] <Address: H'43C>
### Current Link Address Register ch1 [CRLA_1] <Address: H'47C>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

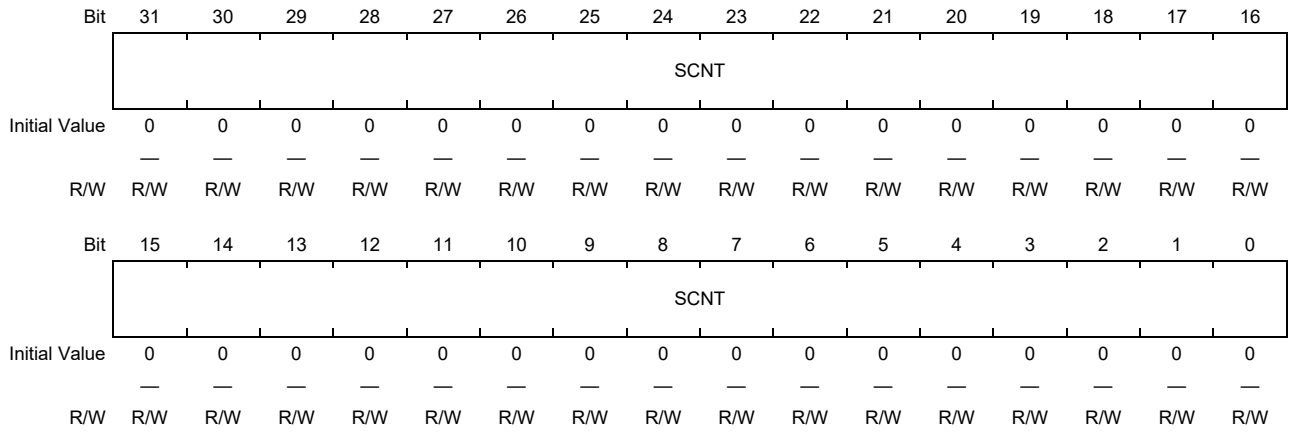
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRLA | All 0 | R | Current Link Address<br>These bits indicate the address of the descriptor being used for current transaction. |

## 32B.7 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

### 32B.7.1 Source Continuous Register n

#### 32B.7.1.1 Source Continuous Register ch0 [SCNT_0] <Address: H'600>
#### Source Continuous Register ch1 [SCNT_1] <Address: H'620>

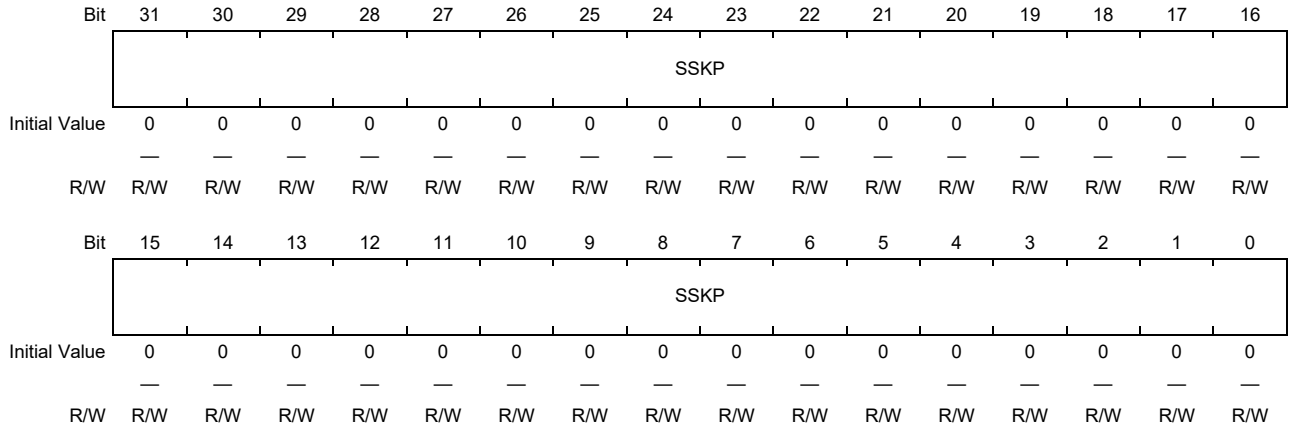


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SCNT | All 0 | R/W | Source Continuous<br>These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte) |

**Note:** This register is used in pair with the SSKP_n register (see **Figure 32B.3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the SCNT bits set to 0.

## 32B.7.2 Source Skip Register n

### 32B.7.2.1 Source Skip Register ch0 [SSKP_0] <Address: H'604>
### Source Skip Register ch1 [SSKP_1] <Address: H'624>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SSKP | All 0 | R/W | Source Skip<br>These bits specify the size of area to be skipped in a source address access. (Unit: byte) |

**Note:** This register is used in pair with the SCNT_n register (see **Figure 32B.3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1 (Fixed).

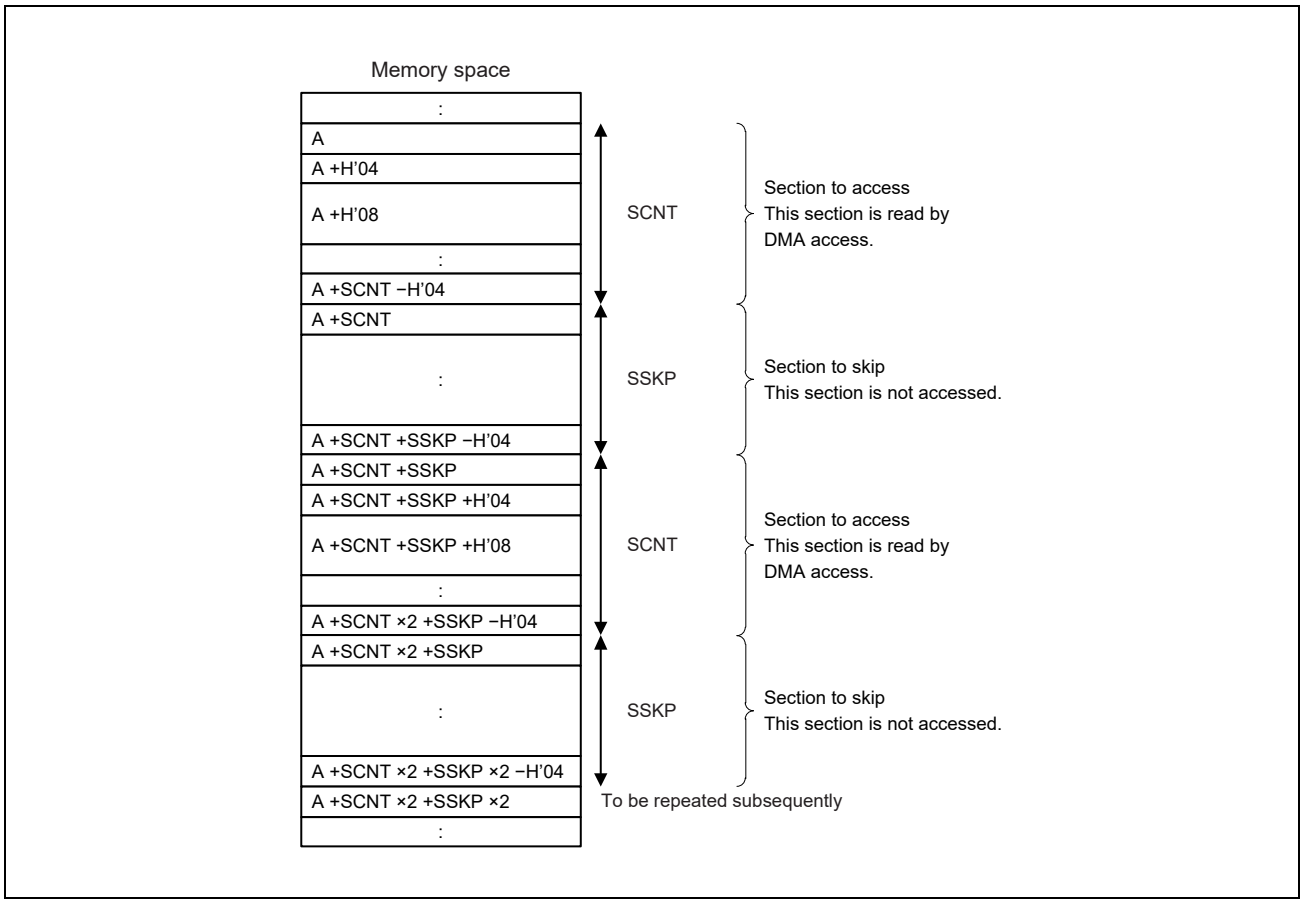


Figure 32B.3 Relationship between SSKP and SCNT

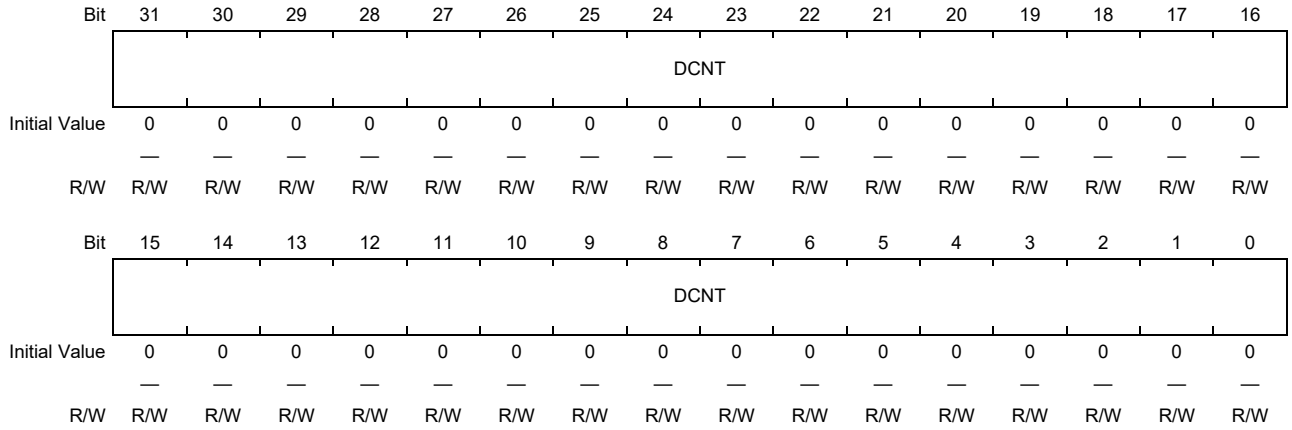
You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see **Section 32B.9.14.1(1), Read access**).

## 32B.7.3 Destination Continuous Register n

### 32B.7.3.1 Destination Continuous Register ch0 [DCNT_0] <Address: H'608>
### Destination Continuous Register ch1 [DCNT_1] <Address: H'628>

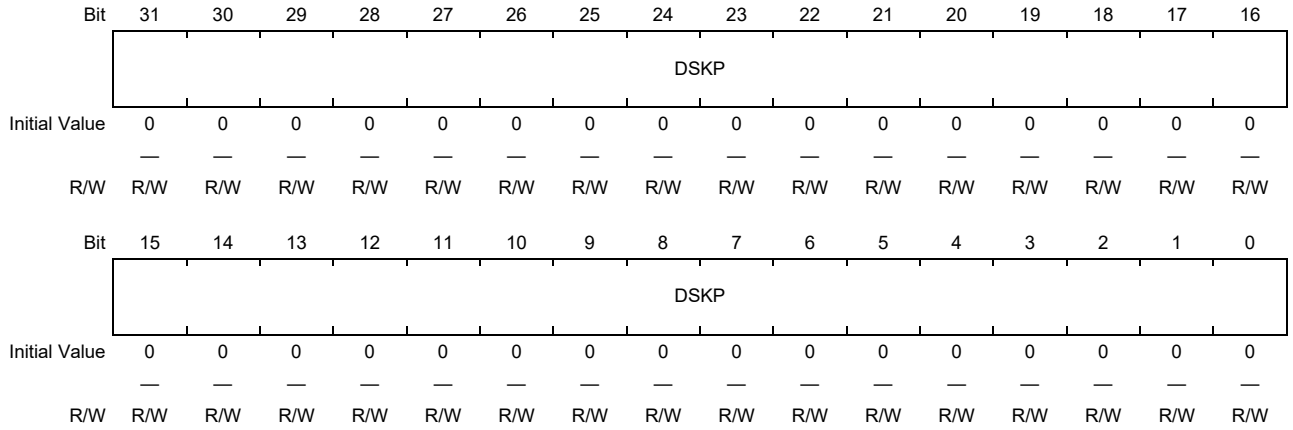


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DCNT | All 0 | R/W | Destination Continuous<br>These bits specify the size of the space to be accessed continuously by destination address access.<br>(Unit: byte) |

**Note:** This register is used in pair with the DSKP_n register (see **Figure 32B.4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the DCNT bits set to 0.

## 32B.7.4 Destination Skip Register n

### 32B.7.4.1 Destination Skip Register ch0 [DSKP_0] <Address: H'60C>
### Destination Skip Register ch1 [DSKP_1] <Address: H'62C>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DSKP | All 0 | R/W | Destination Skip<br>These bits specify the size of area to be skipped in a destination address access.<br>(Unit: byte) |

**Note:** This register is used in pair with the DCNT_n register (see **Figure 32B.4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed).

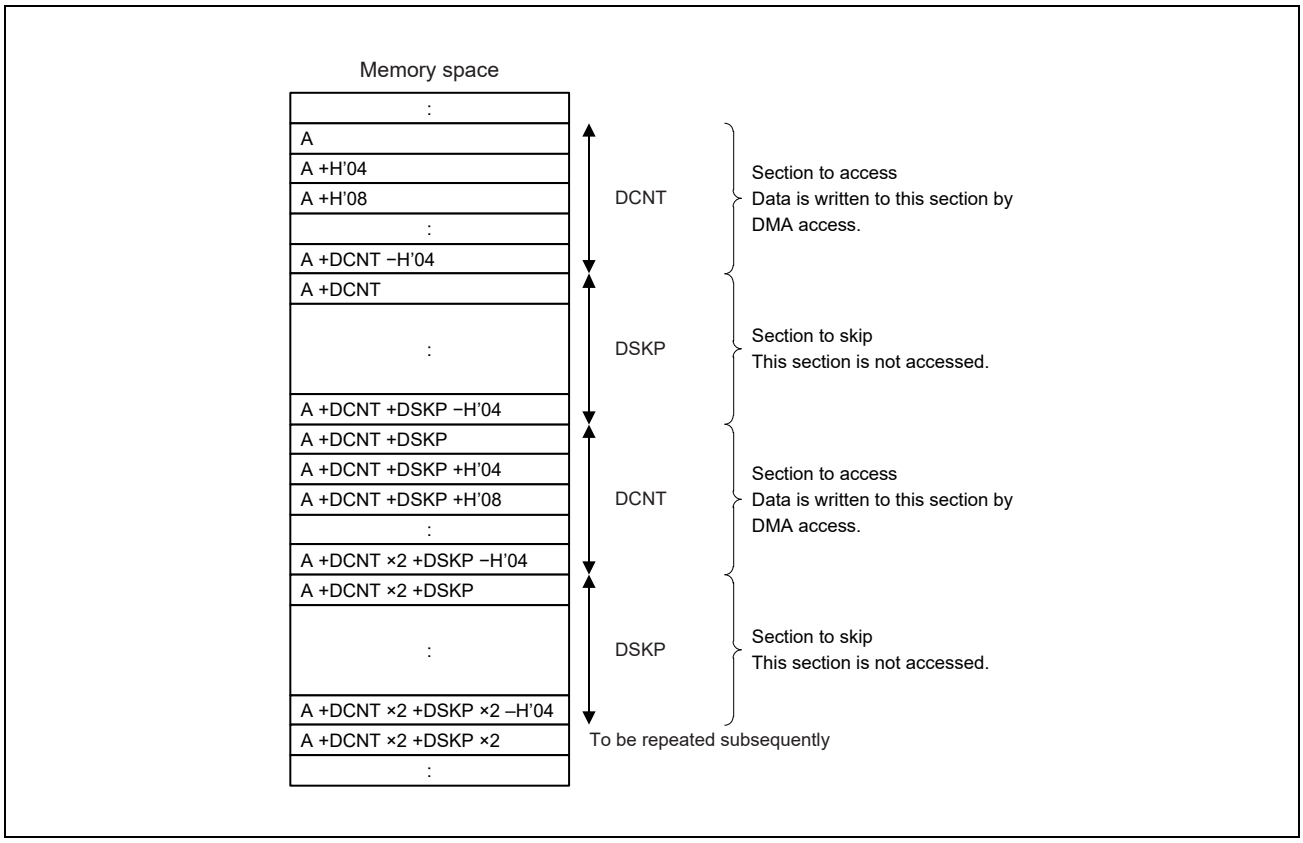


Figure 32B.4 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see **Section 32B.9.14.1(1), Read access**).

# 32B.8 DMA Register Set

The registers described below are shared by all channels.

## 32B.8.1 DMA Control Register

### 32B.8.1.1 DMA Control Register [DCTRL] <Address: H'700>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | LWPR | | | | — | — | — | — | LDPR | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LVINT | PR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 27 to 24 | LWPR | All 0 | R/W | Link WriteBack PROT<br>These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode. |
| 23 to 20 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 19 to 16 | LDPR | All 0 | R/W | Link Descriptor PROT<br>These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode. |
| 15 to 2 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 1 | LVINT | 0 | R/W | Level Interrupt<br>To use this module, be sure to set this bit to 1. |
| 0 | PR | 0 | R/W | Priority<br>This bit specifies the transfer priority control mode (see **Section 32B.9.13.2, DMA channel priority control**).<br>0: Fixed priority mode<br>1: Round-robin mode |

## 32B.8.2 Descriptor Interval Register n

### 32B.8.2.1 Descriptor Interval Register [DSCITVL] <Address: H'704>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DITVL | | | | | | | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 15 to 8 | DITVL | All 0 | R/W | Descriptor Interval<br>These bits specify the interval of descriptor read operation. The descriptor will be re-read at intervals of "value of DITVL x 256." |
| 7 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

## 32B.8.3 DMA Control Register

### 32B.8.3.1 DMA Status EN Register [DSTAT_EN] <Address: H'710>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | EN1 | EN0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 1 | EN1 | 0 | R | This bit indicates the state of the EN bit for DMA channel 1. |
| 0 | EN0 | 0 | R | This bit indicates the state of the EN bit for DMA channel 0. |

## 32B.8.4 DMA Status ER Register

### 32B.8.4.1 DMA Status ER Register [DSTAT_ER] <Address: H'714>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ER1 | ER0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

# 32B.9 Functions

## 32B.9.1 System Control and Oscillation Control

This chapter describes register manipulations required to perform initial setup of this module. This chapter also describes the registers required to control power consumption.

For the parts of the sequence that are required in both host and peripheral modes, see **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.

### 32B.9.1.1 USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USBPHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.

Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

## 32B.9.2 Interrupt Function

### 32B.9.2.1 Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as U2P_IXL_INT. Check the status register to identify the interrupt factor. The interrupt from this module is not asserted when the supply of the internal bus clock (P1ϕ) is stopped.

Table 32B.22 List of Interrupt functions

| Bit | Interrupt name | Interrupt factor | Related status |
|---|---|---|---|
| VBINT | VBUS interrupt | The status change of the VBUS input pin is detected.<br>(Changes from L to H and from H to L are detected.) | VBSTS |
| RESM | Resume interrupt | In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0). | — |
| SOFR | Frame number update interrupt | If SOFRM is 0: An SOF packet with a different frame number is received.<br>If SOFRM is 1: An SOF with µframe number 0 cannot be received due to a problem such as packet corruption. | — |
| DVST | Device state transition interrupt | A transition of a device state is detected.<br>USB bus reset detected<br>Suspended state detected Set Address request received<br>Set Configuration request received | DVSQ |
| CTRT | Control transfer stage transition interrupt | A transition of a control transfer stage is detected.<br>Setup stage completed<br>ControlWrite transfer status stage transition<br>ControlRead transfer status stage transition<br>Control transfer completed<br>Control transfer sequence error | CTSQ |
| BEMP | Buffer empty interrupt | All data in the buffer memory is sent and the buffer becomes empty.<br>A packet exceeding the maximum packet size is received. | PIPEBEMP |
| NRDY | Buffer not ready interrupt | A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data.<br>A CRC error or bit stuff error occurs when data is received in isochronous transfer.<br>An interval error occurs when data is received in isochronous transfer. | PIPENRDY |
| BRDY | Buffer ready interrupt | The buffer becomes ready (available for reading or writing data). | PIPEBRDY |

The following shows the relationship between interrupts of this module.

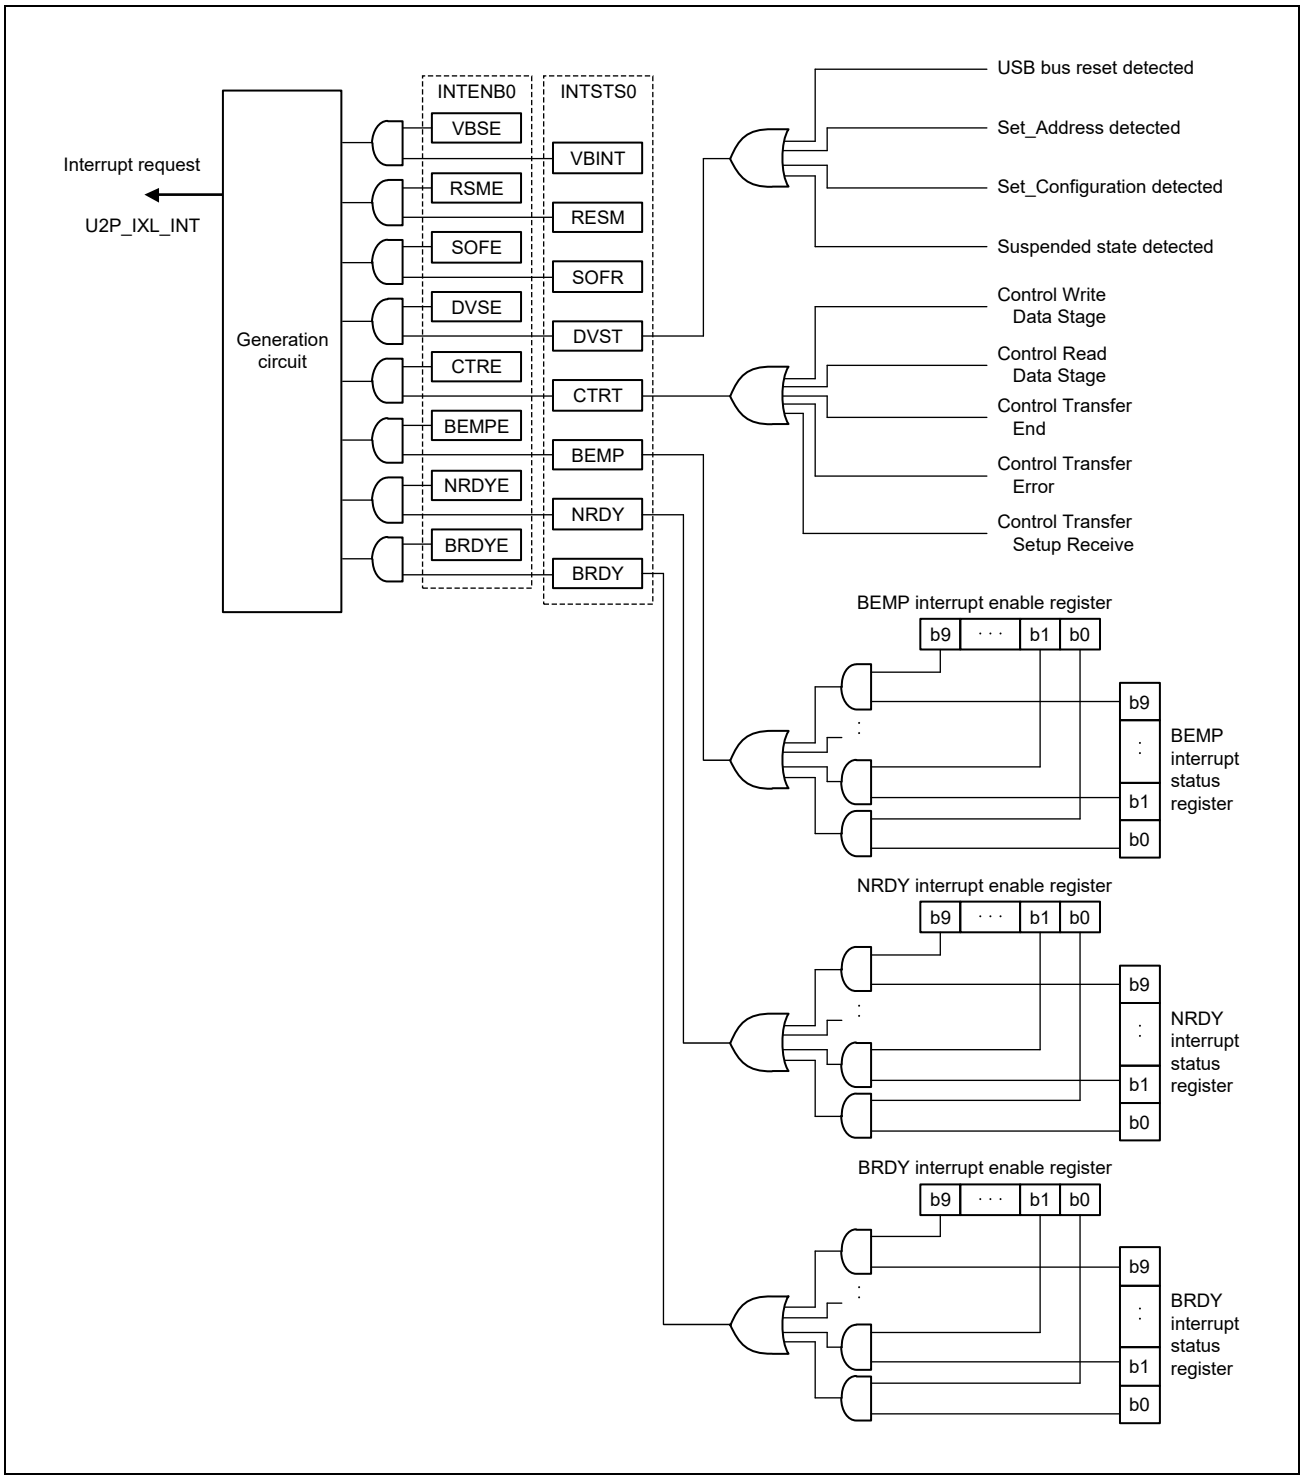

Figure 32B.5 Interrupt Association Diagram

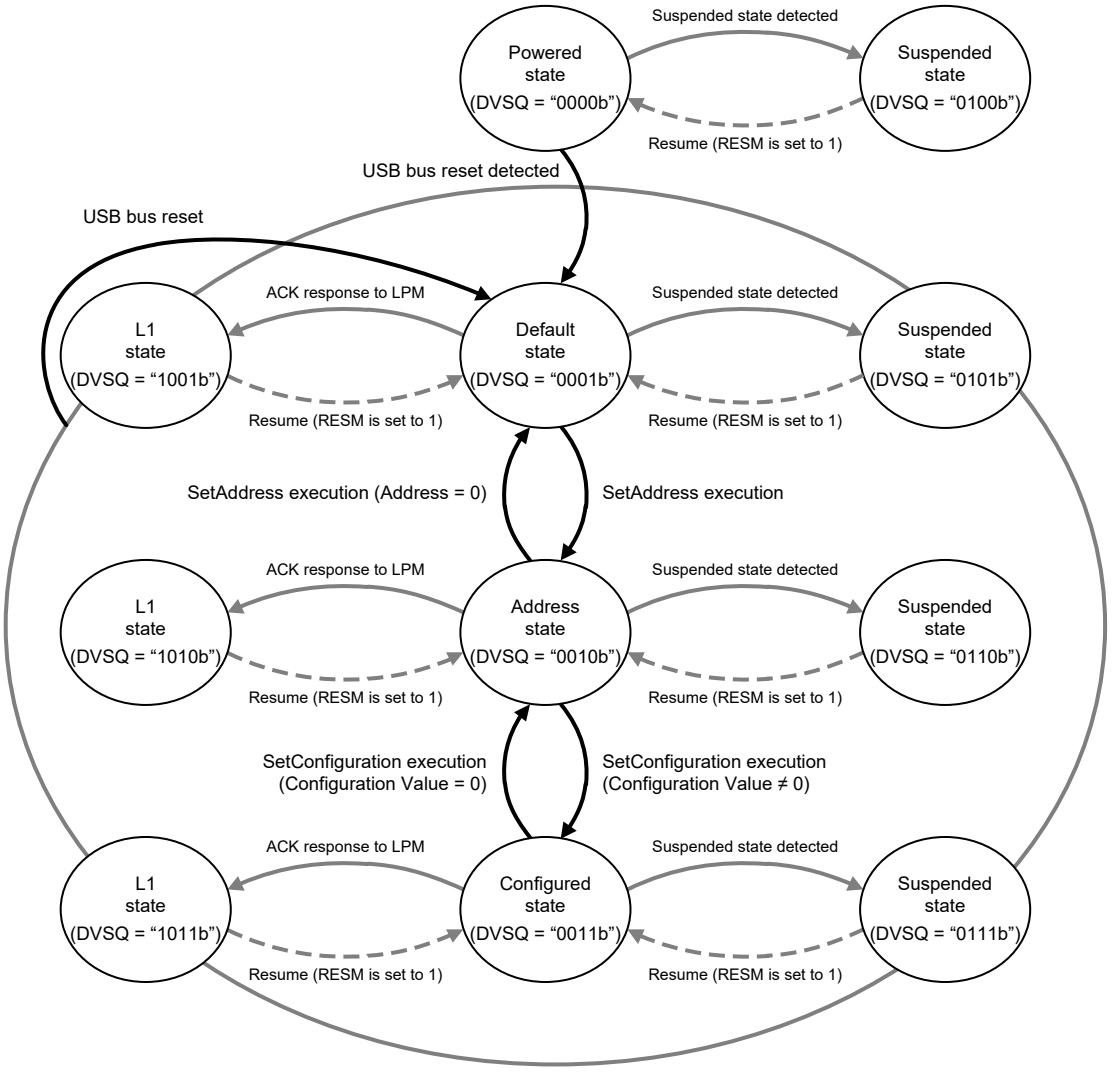
### 32B.9.2.2 Device State Transition Interrupts

**Figure 32B.6** shows the device state transition diagram of this module.

This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.

To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.



**Note:** When a transition indicated by a solid line occurs, the DVST bits are set to 1.
When a transition indicated by a broken line occurs, the RESM bit is set to 1.

Figure 32B.6 Device State Transition Diagram

#### 32B.9.2.3 Control Transfer Stage Transition Interrupts

**Figure 32B.7** shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer. If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

**(1) For Control Read transfer**

(a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.

(b) An IN token is received in the status stage.

(c) A data packet "DATAPID = DATA0" is received in the status stage.

**(2) For Control Write transfer**

(a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.

(b) The first data packet ”DATAPID = DATA0” is received in the data stage.

(c) An OUT or PING token is received in the status stage.

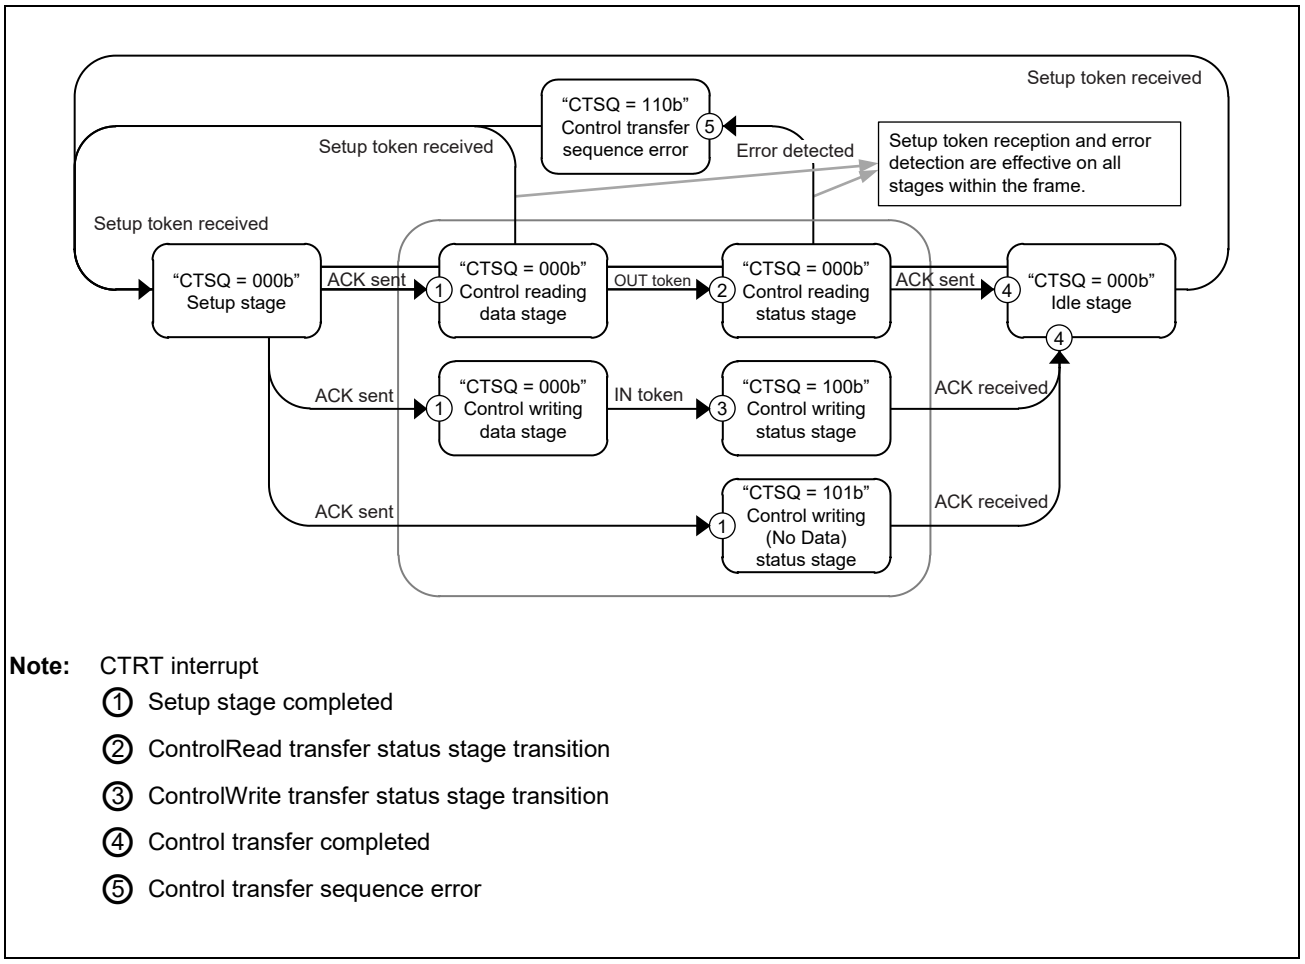
**(3) For Nodata Control transfer**

(a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.

Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)



**Note:** CTRT interrupt

① Setup stage completed

② ControlRead transfer status stage transition

③ ControlWrite transfer status stage transition

④ Control transfer completed

⑤ Control transfer sequence error

Figure 32B.7 Control Transfer Stage Transition Diagram

#### 32B.9.2.4 Interrupts Relating to DMA Master

Table 32B.23 List of Interrupts

| Interrupt Name | Interrupt Type |
|---|---|
| USBFDMAmn (m, n = 0, 1) | A DMA transaction ends. |
| | An invalid descriptor is read in link mode. |
| USBFDMAERRm (m = 0, 1) | An error response is returned for a transfer issued by the master interface. |

This module has two types of DMA interrupts USBFDMAmn and USBFDMAERRm.

(1) USBFDMAmn interrupt (m, n = 0, 1)
This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.
An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

(2) USBFDMAERRm interrupt
This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAmn interrupt output can be temporarily masked by setting a register.

Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.

On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

### 32B.9.3 Pipe Control

**Table 32B.24** lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 32B.24 PIPE Settings

| Register Name | Bit Name | Setting | Comment |
|---|---|---|---|
| DCPCFG | TYPE | Specifies the transfer type. | Pipes 1 to 9: Settable |
| PIPECFG | BFRE | Selects BRDY interrupt mode. | Pipes 1 to 5: Settable |
| | DBLB | Selects double-buffer configuration. | Pipes 1 to 5: Settable |
| | CNTMD | Selects continuous transfer or non-continuous transfer. | DCP: Settable<br>Pipes 1, 2: Settable only in bulk transfers<br>Pipes 3 to 5: Settable |
| | DIR | Selects transfer direction. | Settable to IN or OUT |
| | EPNUM | Endpoint number | Pipes 1 to 9: Settable<br>Set to a value other than “0000” when a pipe is in use. |
| | SHTNAK | Disables pipes when transfer is completed. | DCP: Settable<br>Pipes 1, 2: Settable only in bulk transfers<br>Pipes 3 to 5 Settable |
| PIPEBUF | BUFSIZE | Buffer memory size | DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes)<br>Pipes 1 to 5: Settable (up to 2 Kbytes specifiable)<br>Pipes 6 to 9: Unsettable (fixed to 64 bytes) |
| | BUFNMB | Buffer memory number | DCP: Unsettable (fixed to area 0 to 3 hex)<br>Pipes 1 to 5 Settable (area 8 to 87 hex specifiable)<br>Pipes 6 to 9: Unsettable (fixed to area 4 to 7 hex) |
| DCPMAXP<br>PIPEMAXP | MXPS | Maximum packet size | Setting conforming to the USB specification. |
| PIPEPERI | IFIS | Buffer flush | Pipes 1, 2: Settable only in isochronous transfers<br>Pipes 3 to 5: Unsettable<br>Pipes 6 to 9: Unsettable |
| | IITV | Interval counter | Pipes 1, 2: Settable only in isochronous transfers<br>Pipes 3 to 5: Unsettable<br>Pipes 6 to 9: Unsettable |
| DCPCTR<br>PIPExCTR | BSTS | Buffer status | DCP state switched between receive and transmit buffer by ISEL bit |
| | INBUFM | IN buffer monitor | Available only for pipes 3 to 5 |
| | ACLRM | Auto buffer clear | Pipes 1 to 9: Settable |
| | SQCLR | Sequence clear | Clears data toggle bit. |
| | SQSET | Sequence set | Sets data toggle bit. |
| | SQMON | Sequence monitor | Monitors data toggle bit. |
| | PBUSY | Pipe busy monitor | |
| | PID | Response PID | |
| DCPCTR<br>PIPExCTR | ATREPM | Auto response mode | Pipes 1 to 5: Settable |
| PIPExTRE | TRENB | Transaction count enable | Pipes 1 to 5: Settable |
| | TRCLR | Current transaction counter clear | Pipes 1 to 5: Settable |
| PIPExTRN | TRNCNT | Transaction counter | Pipes 1 to 5: Settable |

#### 32B.9.3.1 Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting “PID = BUF”).

DCP: Set 64 for high-speed operation.

DCP: Set 8, 16, 32, or 64 for full-speed operation. Pipes 1 to 5: Set 512 for high-speed bulk transfer.

Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.

Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.

Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.

Pipes 6 to 9: Set 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

#### 32B.9.3.2 Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPExCTR registers.

(1) Response PID setting
The response PID specifies the response to a transaction from the host.

a) NAK: Always sends a NAK response to a generated transaction.

b) BUF: Responds to a transaction in accordance with the buffer memory state.

c) STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result. This module writes data to the PID bits in the following cases:

a) NAK:

(A) The SETUP token is received normally (for the DCP only).

(B) If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.

(C) If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.

b) BUF:

This module does not write "BUF".

c) STALL:

(A) When a maximum packet size over error is detected in a received data packet

(B) When a control transfer sequence error is detected

#### 32B.9.3.3 Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK).

**Figure 32B.8** shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registered that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:

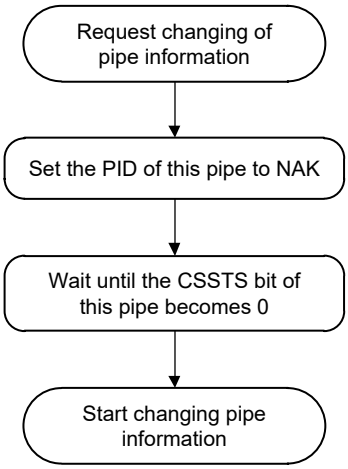
(1) All bits in the DCPCFG and DCPMAXP registers

(2) SQCLR and SQSET bits in the DCPCTR register

(3) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(4) ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register

(5) All bits in the PIPExTRE and PIPExTRN registers



**Note:** If the pipe is detached during a USB transaction, the PBUSY bit might remain 1.

Figure 32B.8 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

(6) All bits in the DCPCFG and DCPMAXP registers

(7) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(8) ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

#### 32B.9.3.4 Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with “PID = DATA1” without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

### 32B.9.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.

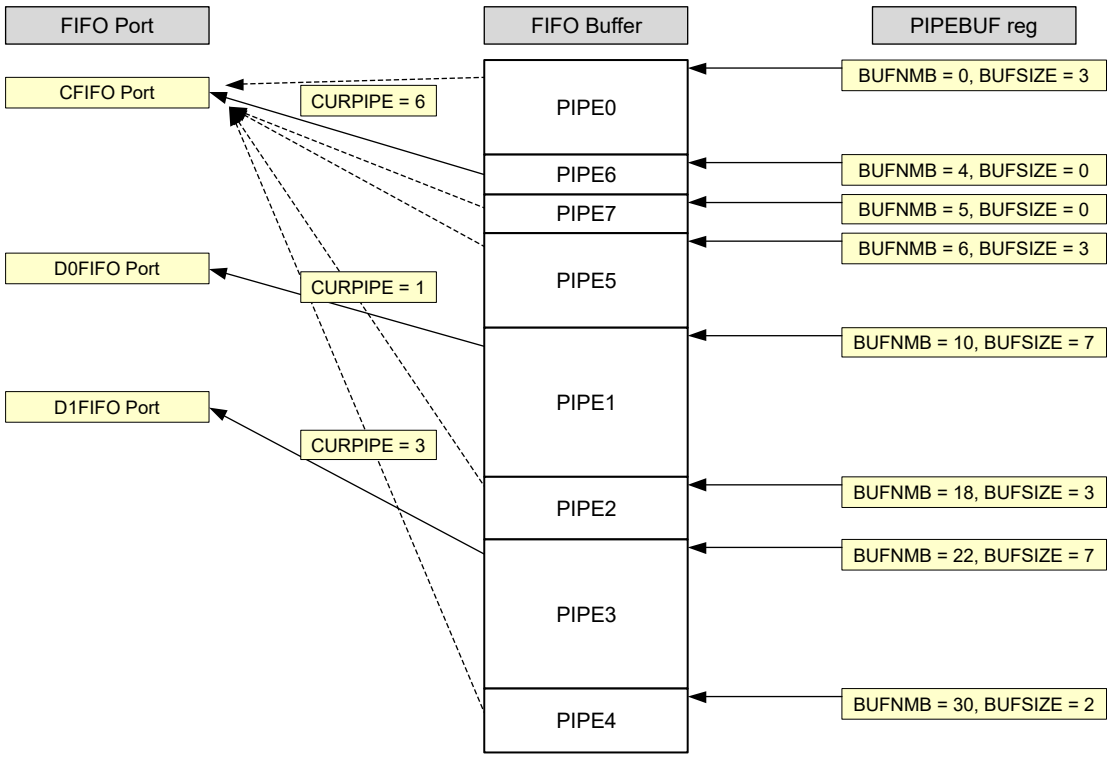
#### 32B.9.4.1 FIFO buffer allocation

**Figure 32B.9** shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPExCFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPExCFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPExCTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/ DxFIFOCTR register.



**Note:** If pipes 8 and 9 are not in use: Settings such as BUFSIZE are unspecified.

Figure 32B.9 Example of FIFO Buffer Memory Mapping

### 32B.9.4.2 Clearing FIFO buffers

**Table 32B.25** lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 32B.25 List of FIFO Buffer Clearing Modes

| Bit Name | BCLR | DCLRM | ACLRM |
|---|---|---|---|
| Register | CFIFOCTR register<br>DxFIFOCTR register | DxFIFOSEL register | PIPExCTR register |
| Function | The FIFO buffer on the CPU side is cleared. | The FIFO buffer is automatically cleared after the data is read from the specified pipe. | The buffer is automatically cleared to discard all the received packets. |
| Clearing method | Write “1” to clear. | 1: Mode enabled<br>0: Mode disabled | 1: Mode enabled<br>0: Mode disabled |

### 32B.9.5 FIFO Port Functions

This section describes FIFO port functions. **Table 32B.26** shows the FIFO port function settings for this module.

If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/DxFIFOCTR register must be used to set write end.

To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.

When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.

The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 32B.26 FIFO Port Function Settings

| Register Name | Bit Name | Function | Note |
|---|---|---|---|
| C/DxFIFOSEL | RCNT | Selects DTLN read mode | |
| | REW | Rewinds buffer memory (re-read, re-write) | |
| | DCLRM | Reads received data of the specified pipe, and then automatically clears the received data | DxFIFO only |
| | DREQE | Asserts DREQ signal | DxFIFO only |
| | MBW | Specifies FIFO port access bit width | |
| | BIGEND | Selects FIFO port endian | CFIFO only |
| | ISEL | Specifies FIFO port access direction | DCP only |
| | CURPIPE | Selects current pipe | |
| C/DxFIFOCTR | BVAL | Finishes buffer memory write | |
| | BCLR | Clears CPU-side buffer memory | |
| | FRDY | Monitors FIFO port ready | |
| | DTLN | Confirms received data length | |

#### 32B.9.5.1 FIFO port selection

**Table 32B.27** lists pipes that can be selected for each FIFO port.

Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

**Figure 32B.10** shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pile (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPExCFG register determines the buffer memory access direction.

Table 32B.27 FIFO Port Access for Each Pipe

| Pipe | Access Method | Usable Port |
|---|---|---|
| DCP | CPU access | CFIFO port register |
| Pipes 1 to 9 | CPU access | CFIFO port register |
| | DMA access | DxFIFO port register |

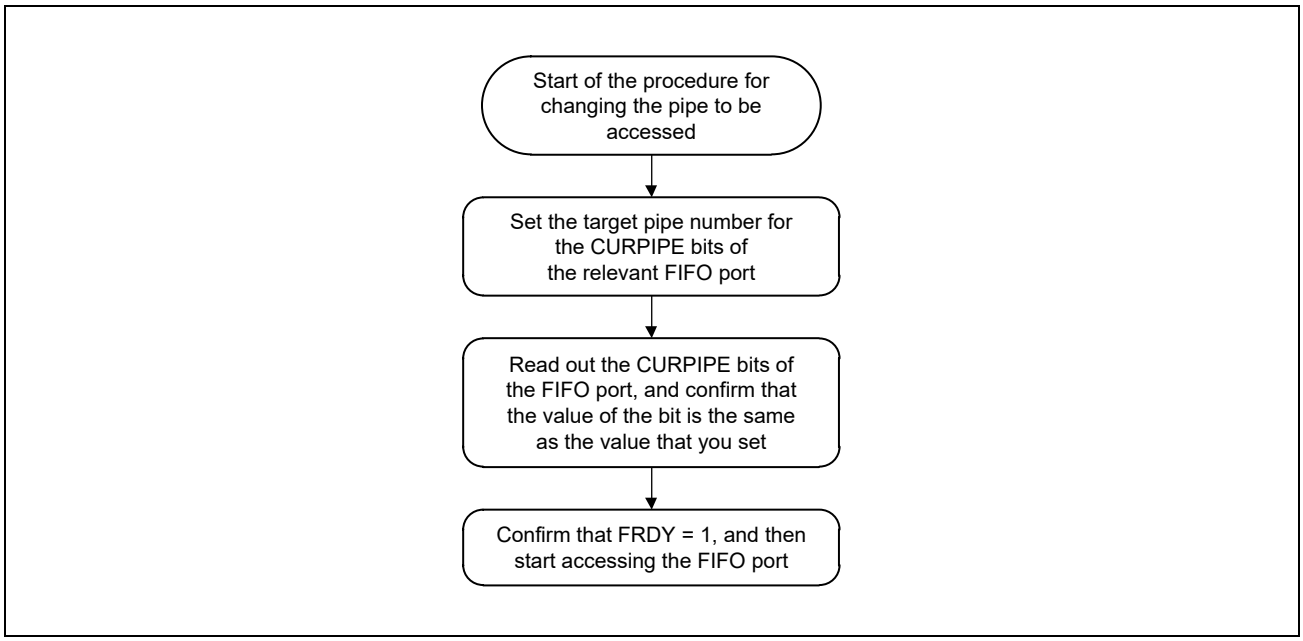


Figure 32B.10 Pipe Switching Procedure for FIFO Port Access

#### 32B.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

**Table 32B.28** shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.

As shown in **Table 32B.28**, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 32B.28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

| | Register Setting | | | |
|---|---|---|---|---|
| | DCLRM = 0 | | DCLRM = 1 | |
| Buffer State during Packet Reception | BFRE = 0 | BFRE = 1 | BFRE = 0 | BFRE = 1 |
| Buffer full | Clearing unnecessary | | Clearing unnecessary | |
| Zero-length packet received | Clearing necessary | | | |
| Normal short packet received | Clearing unnecessary | Clearing necessary | | |
| Transaction count end | | | | |

#### 32B.9.5.3 BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The “last data” here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

**Table 32B.29** shows when this module generates a BRDY interrupt.

Table 32B.29 BRDY Interrupt Generation Timing

| | Register Setting | |
|---|---|---|
| Buffer State during Packet Reception | BFRE = 0 | BFRE = 1 |
| Buffer full (normal packet received) | When packet is received | No interrupt generated |
| Zero-length packet received | When packet is received | When packet is received |
| Normal short packet received | When packet is received | When received data has been read from the buffer memory |
| Transaction count end | When packet is received | When received data has been read from the buffer memory |

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

### 32B.9.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

#### 32B.9.6.1 Control transfer

##### (1) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
   (a) VALID bit in the INTSTS0 register: 1
   (b) PID bit in the DCPCTR register: NAK
   (c) CCPL bit in the DCPCTR register: 0

2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.

By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (ControlRead, ControlWrite, or NodataControl) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see **Figure 32B.7**.

##### (2) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.

A transaction is executed by setting the PID bit in the DCPCTR register to BUF.

The end of data transfer is detected with a BRDY or BEMP interrupt. For ControlWrite transfer, use a BRDY interrupt. For ControlRead transfer, use a BEMP interrupt.

For ControlWrite transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

### (3) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.

After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

#### (a) For ControlRead transfer

Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

#### (b) For ControlWrite or NodataControl transfer

This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

### (4) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

(a) bmRequestType ≠ “H’00”

(b) wIndex ≠ “H’00”

(c) wLength ≠ “H’00”

(d) wValue > “H’7F”

(e) DVSQ = “011 (Configured) ”

Software must respond to all requests other than SET_ADDRESS.

### 32B.9.7 Bulk Transfer (Pipes 1 to 5)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

#### 32B.9.7.1 NYET handshake control

**Table 32B.30** lists responses to tokens received in a bulk or control transfer.

When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 32B.30 List of Responses to Received Tokens

| PID bit value | Buffer memory state*1 | Received token | Response | Note |
|---|---|---|---|---|
| NAK/STALL | — | SETUP | ACK | — |
| | — | IN/OUT/PING | NAK/STALL | — |
| BUF | — | SETUP | ACK | — |
| | RCV-BRDY | OUT/PING | ACK | Receives data packet when OUT token is received*1 |
| | RCV-BRDY | OUT | NYET | Receives data packet*2 |
| | RCV-BRDY | OUT (Short) | ACK | Receives data packet*2 |
| | RCV-BRDY | PING | ACK | *2 |
| | RCV-NRDY | OUT/PING | NAK | |
| | TRN-BRDY | IN | DATA0/1 | Sends data packet |
| | TRN-NRDY | IN | NAK | |

**Note:** Details are described below.
RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.
RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.
RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.
TRN-BRDY: Buffer memory has sent data when an IN token is received.
TRN-NRDY: Buffer memory has no send data when an IN token is received.

### 32B.9.8 Interrupt Transfer (Pipes 6 to 9)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.

Note that this module does not support high-bandwidth interrupt transfers.

### 32B.9.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

1. Notification of error information about isochronous transfers
2. Interval counter (IITV bit)
3. Data setup control for isochronous IN transfers (IDLY function)
4. Buffer flush function for isochronous IN transfers (IFIS bit)
5. SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

#### 32B.9.9.1 Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.

**Table 32B.31** and **Table 32B.32** describe the error checking procedure and interrupts that are generated.

1. PID error
   The PID of the received packet is invalid.
2. CRC error and bit stuffing error
   The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
   The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
   (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
   (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
   An interval error occurs in the following cases:
   (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
   (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 32B.31 Error Detection during Transmission/Reception of Token

| Error Detection Priority | Error Type | Interrupt Generated at Error Detection and Status |
|---|---|---|
| 1 | PID error | No interrupt is generated (ignored as a corrupted packet). |
| 2 | CRC error, bit stuffing error | No interrupt is generated (ignored as a corrupted packet). |
| 3 | Overrun error, underrun error | An NRDY interrupt is generated and the OVRN bit is set.<br>A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token. |
| 4 | Interval error | An NRDY interrupt is not generated. |

Table 32B.32 Error Detection during Reception of Data Packet

| Error Detection Priority | Error Type | Interrupt Generated at Error Detection and Status |
|---|---|---|
| 1 | PID error | No interrupt is generated (ignored as a corrupted packet). |
| 2 | CRC error, bit stuffing error | An NRDY interrupt is generated and the CRCE bit is set. |
| 3 | Packet size error (too large packet) | A BEMP interrupt is generated and the PID bit is set to STALL. |

#### 32B.9.9.2 DATA-PID

This module does not support high-bandwidth transfers.

The following shows actions that can be taken in response to a received PID.

1. IN direction:

(a) DATA0: Used to send packets.

(b) DATA1: Not used to send packets.

(c) DATA2: Not used to send packets.

(d) mDATA: Not used to send packets.

2. OUT direction (in full-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are ignored.

(d) mDATA: Packets are ignored.

3. OUT direction (in high-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are received normally.

(d) mDATA: Packets are received normally.

### 32B.9.9.3 Interval counter

#### (1) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer. The interval counter enables the functions listed in **Table 32B.33**.

Table 32B.33 Functions of the Interval Counter

| Transfer Direction | Function | Detecting Condition |
|---|---|---|
| IN | Transmit buffer flush function | An IN token cannot successfully be received within the interval frame during isochronous IN transfer. |
| OUT | Notification of unreceived token | An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer. |

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2n (micro) frames, where n is the value of the IITV bit.

#### (2) Interval counter initialization

This module initializes the interval counter under the following conditions:

(a) Power on reset
The IITV bit is initialized.

(b) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.

(c) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:

1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.

2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

(a) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.

(b) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

#### 32B.9.9.4 Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called “send data setup for isochronous transfer”.

This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

**Figure 32B.11** shows examples of sending using the send data setup function for isochronous transfer by setting “IITV = 0” (each frame) in this module.

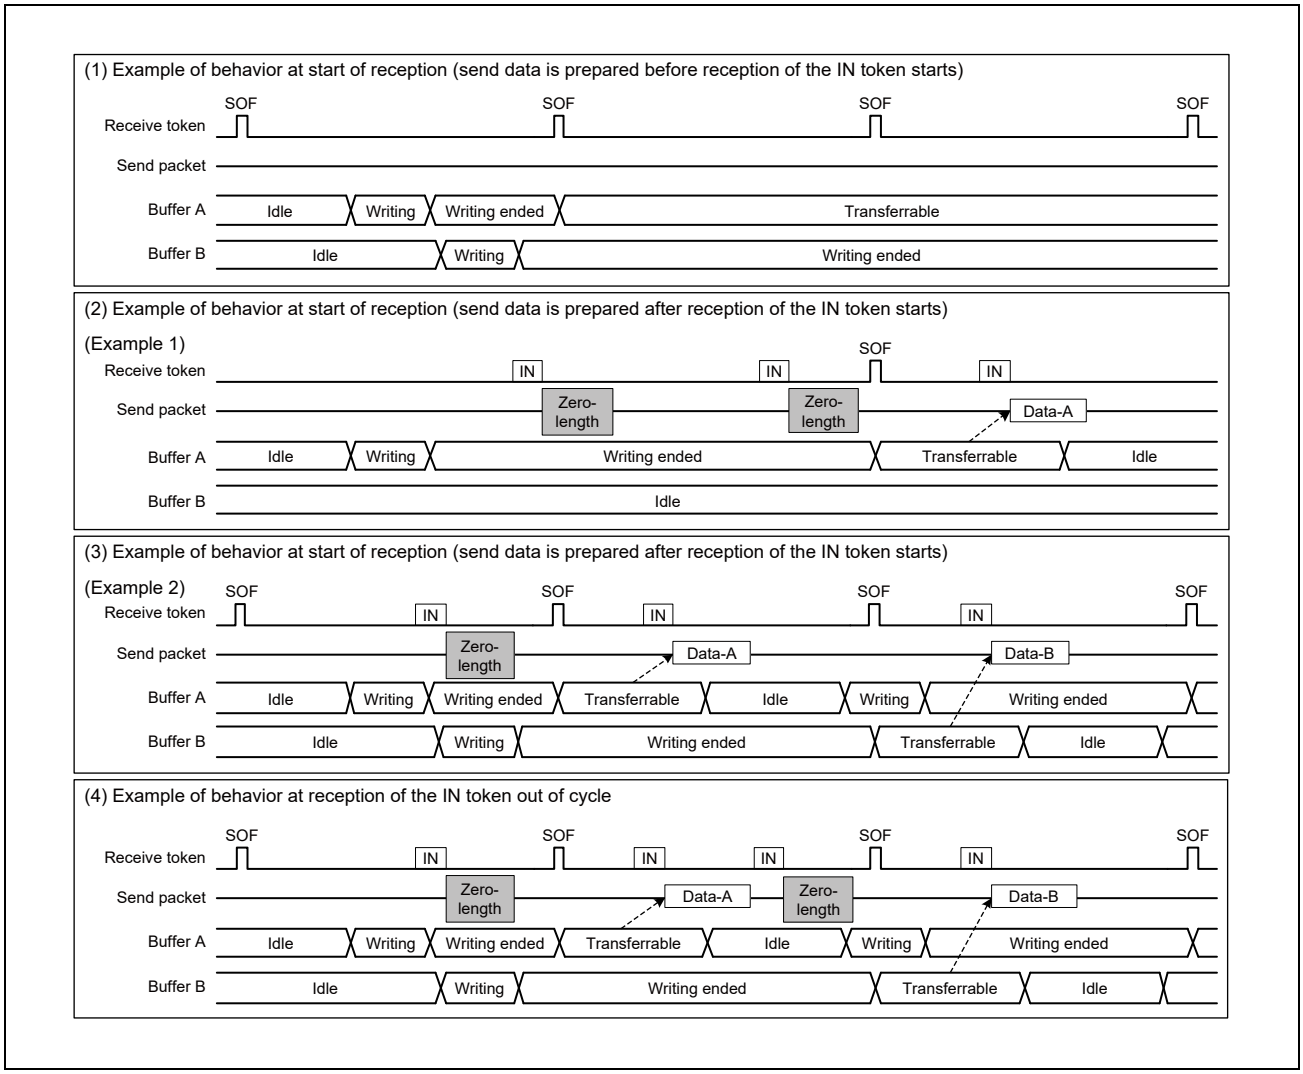

Figure 32B.11 Examples of Data Setup Function Behavior

#### 32B.9.9.5 Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.

At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

1. If IITV is 0
   Buffer flush operation is performed from the first frame after the pipe is enabled.
2. If IITV is not 0
   Buffer flush operation is performed after the first successful transaction.

**Figure 32B.12** shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

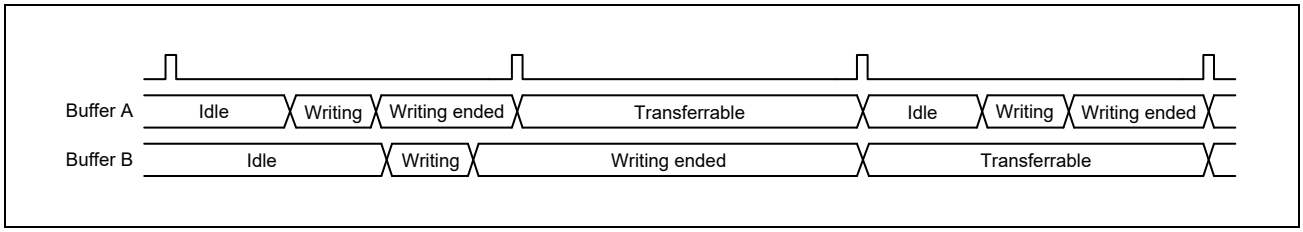

Figure 32B.12 Example of Buffer Flush Function Behavior

**Figure 32B.13** shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.

If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.

Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.

In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

1. IN direction:

(a) If the buffer is ready to transfer data, data is transferred and a normal response is returned.

(b) If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.

2. OUT direction:

(a) If the buffer is ready to receive data, data is received and a normal response is returned.

(b) If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

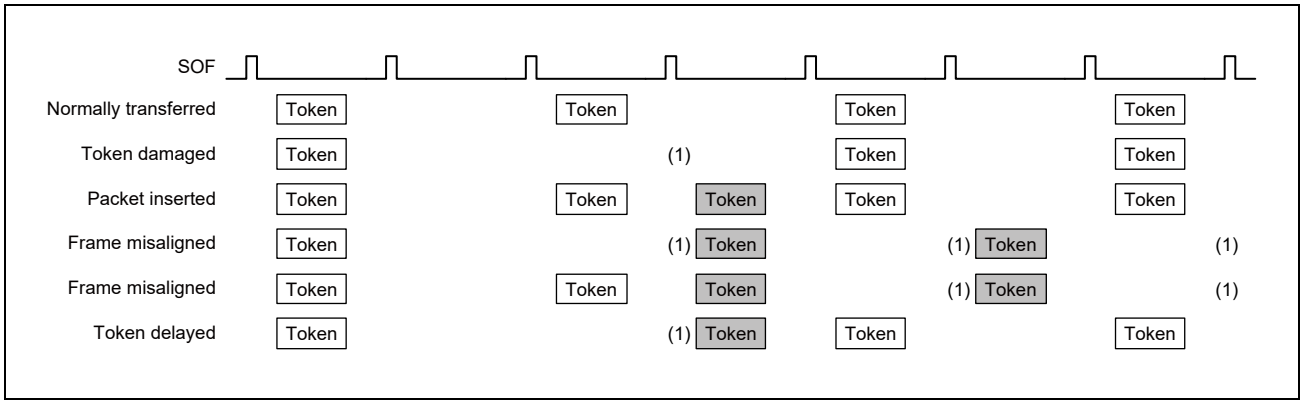

Figure 32B.13 Example of Occurrence of Interval Error (when IITV is 1)

### 32B.9.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 µs (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:

(1) Power on reset

(2) USB bus reset

(3) Suspended state detected

The SOF interpolation operates according to the following specifications:

(1) Frame interval (125 µs or 1 ms) is based on the results of the reset handshake protocol.

(2) The interpolation function does not operate until an SOF packet is received.

(3) After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 µs or 1 ms.

(4) After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.

(5) Interpolation is not performed in the suspended state or while a USB bus reset is being received.
(If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:

(1) Updating of frame number or micro-frame number

(2) SOFR interrupt and micro SOF lock

(3) SOF pulse output

(4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.

If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.

However, if a micro SOF packet for which “micro-FRNM = 000” is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which “micro-FRNM = 000” is not set are successfully received.

### 32B.9.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.

The table below compares the features of the L2 (suspend) state and L1 state.

Table 32B.34 Comparison Between Suspend (L2) State and L1 State

| Item | L1 | Suspend (L2) |
|---|---|---|
| Transition | LPM Transaction | 3-ms idle period |
| Host-activated resumption | (Host)<br>Minimum drive period specifiable by the host. Specified between 75 µs to 1.175 ms<br>(Device)<br>10-µs K drive | (Host)<br>Min. 20-ms K drive<br><br>(Device)<br>10-ms K drive |
| Device-activated resumption | (Device)<br>50-µs K drive<br>(Host)<br>60- to 990-µs K drive<br>(Device)<br>10-µs K drive | (Device)<br>1-ms to 15-ms K drive<br>(Host)<br>Min. 20-ms K drive<br>(Device)<br>10-ms K drive |
| Signaling | Low and Full Speed Idle | Low and Full Speed Idle |

The following describes the processing for transition to and resumption from the L1 state.

#### 32B.9.11.1 Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.

Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 32B.35 Relationship between LPM Response and Descriptor

| LPM Response | bcdUSB | Presence of USB 2.0 Ex.Desc | USB 2.0 Ex.Desc LPM | Response When LPM Is Received | Remarks |
|---|---|---|---|---|---|
| Not respond | 0200 | Not present | — | Not Respond | Standard action in the case where this module does not respond to LPM |
| | 0201 | Present | LPM = 0 | STALL | This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response. |
| Respond | 0201 | Present | LPM = 1 | ACK or NYET | Standard action in the case where this module responds to LPM |

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.

When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.

When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.

When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

#### 32B.9.11.2 Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with “No response”, “ACK”, “NYET”, or “STALL” according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 µs after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.

For 2, both retransmission control and transition to the L1 state are processed by the hardware. Transition to the L1 state can be identified through a DVST interrupt.

For 3, a RESM interrupt occurs on detection of host K in the L1 state.

For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software. The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

#### 32B.9.11.3 HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

NOTE

This HIRD value negotiation function must also be supported on the host side.

## 32B.9.12 DMA Mode

### 32B.9.12.1 Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 32B.36 DMA mode settings

| DMS (CHCFG) | Mode | Description |
|---|---|---|
| 0 | Register mode | Performs DMA transfer based on the values set by Next Register Set. |
| 1 | Link mode | Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing. |

### (1) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.

Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

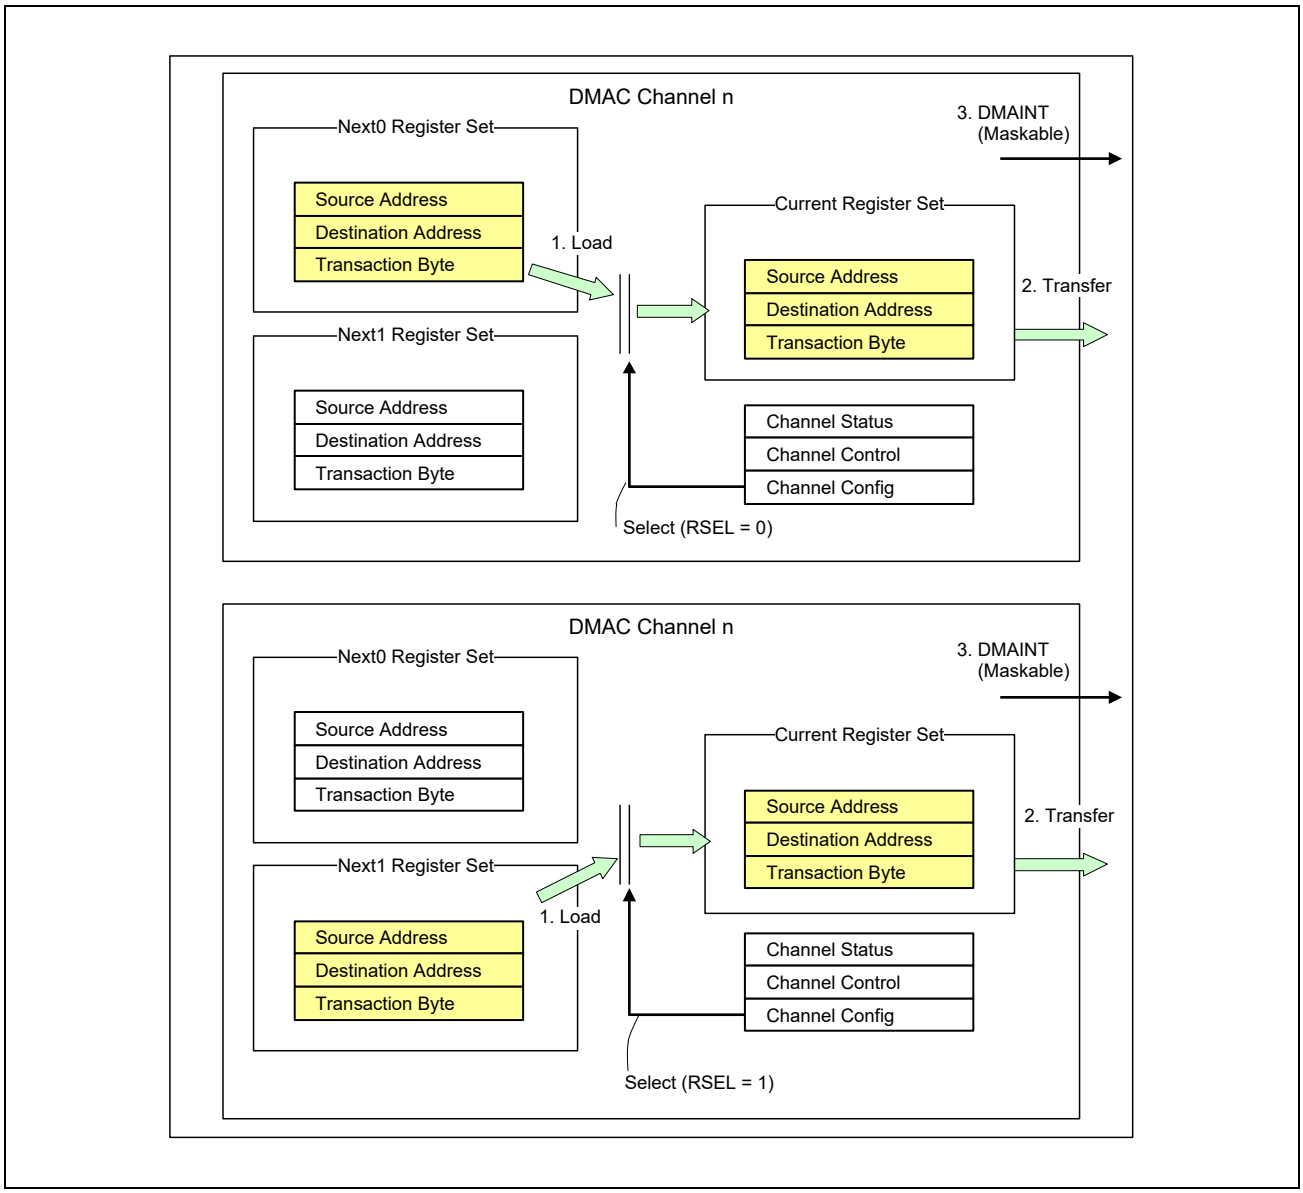

Figure 32B.14 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

### (a) Operation flow of register mode

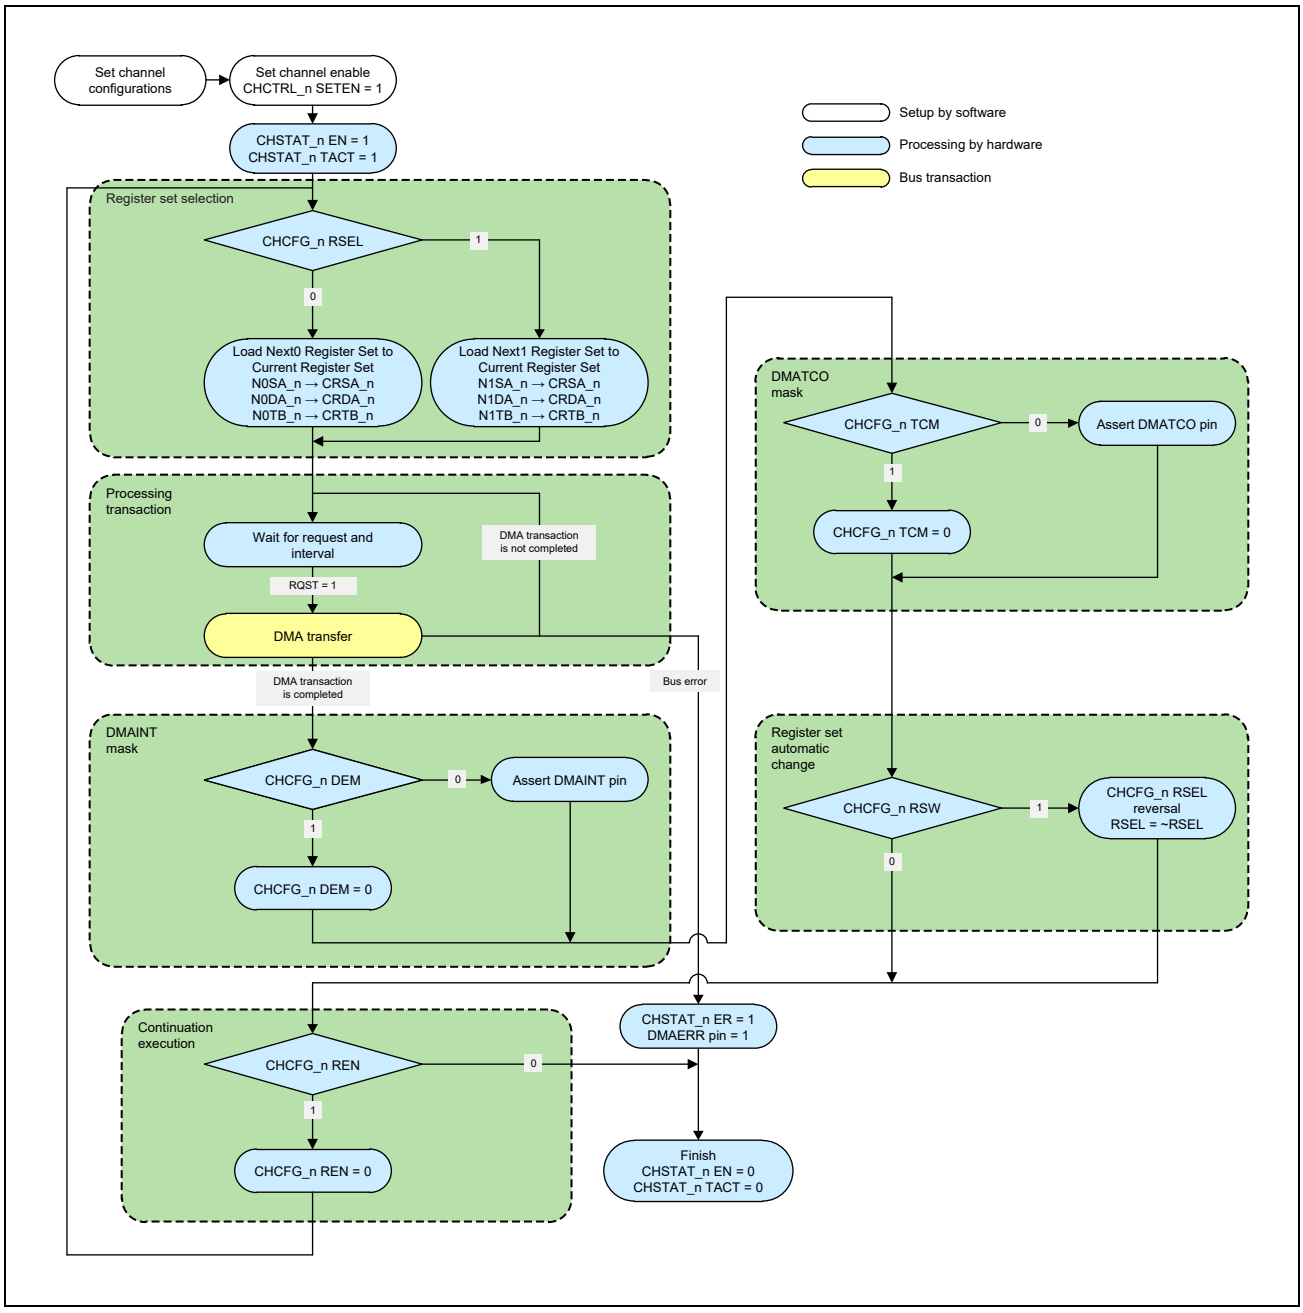

Figure 32B.15 Register Mode Operation Flow

**Description of the register mode operation flow:**

1. Channel setting
   The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.
   No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.
   (see **Section 32B.9.13, DMA Transfer**).

2. Register set selection
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.

3. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, **Section 32B.9.13, DMA Transfer**.

4. The USBFDMAmn masking
   The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.

5. DMATC masking
   DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.

6. Automatic register set switchover
   Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.

7. Continuation of execution
   Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

### (b) Register mode setting

- Register mode setting

  The register set to be processed is selected.

Table 32B.37 Register Mode Setting

| DMS (CHCFG_n) | RSEL (CHCFG_n) | Description |
|---|---|---|
| 0 | 0 | Processes Next0 Register Set. |
| | 1 | Processes Next1 Register Set. |

- USBFDMAmn masking

  The USBFDMAmn interrupt can be masked.

Table 32B.38 USBFDMAmn Mask Setting

| DEM (CHCFG_n) | Description |
|---|---|
| 0 | Asserts the USBFDMAmn interrupt when the DMA transaction is completed. |
| 1 | Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed.<br>After the DMA transaction is completed, the DEM bit is cleared to 0. |

- DMATC mask setting

  DMATC from DMAC control to USB control can be masked.

Table 32B.39 DMATC Mask Setting

| DEM (CHCFG_n) | Description |
|---|---|
| 0 | Asserts DMATC when the DMA transaction is completed. |
| 1 | Does not assert DMATC even when the DMA transaction is completed.<br>After the DMA transaction is completed, the TCM bit is cleared to 0. |

- Automatic transaction execution for a register set

  After a DMA transaction finishes, another DMA transaction can be executed.

Table 32B.40 Automatic Execution Setting for a Register Set

| REN (CHCFG_n) | Behavior | Remarks |
|---|---|---|
| 0 | The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes. | Use this setting to execute a DMA transaction only once. |
| 1 | After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful. | Use this setting to continue processing of register set contents. |

- Automatic register set switchover setting

  After a DMA transaction finishes, the next register set to be processed can be switched.

Table 32B.41 Automatic Execution Setting for a Register Set

| RSW (CHCFG_n) | Behavior | Remarks |
|---|---|---|
| 0 | The register set is not switched when a DMA transaction finishes. | Use this setting to use only one register set. |
| 1 | When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set. | Use this setting to switch the register set. |

### (c) Example of setting the register mode

- Example of setting the register mode when using only the Next0 register set

Table 32B.42 Register Mode Setting Example

| DMS (CHCFG_n) | RSEL (CHCFG_n) | DEM (CHCFG_n) | TCM (CHCFG_n) | RSW (CHCFG_n) | REN (CHCFG_n) |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | 0 |
| (register mode) | (Next0) | (not masked) | (not masked) | (not switched) | (continuous execution disabled) |

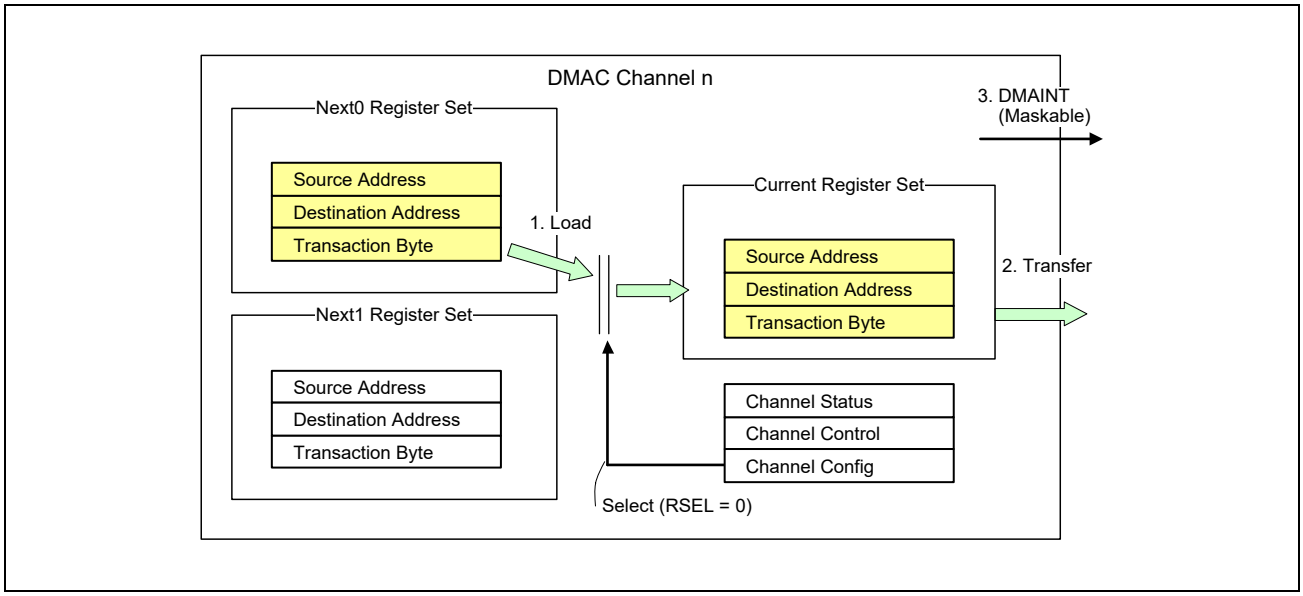

Figure 32B.16 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Example of setting the register mode when using two register sets continuously

Table 32B.43 Automatic Register Set processing Setting

| DMS (CHCFG_n) | RSEL (CHCFG_n) | DEM (CHCFG_n) | TCM (CHCFG_n) | RSW (CHCFG_n) | REN (CHCFG_n) |
|---|---|---|---|---|---|
| 0 | 0 | 1 | 0 | 1 | 1 |
| (register mode) | (Next0) | (masked) | (not masked) | (switched) | (continuous execution enabled) |

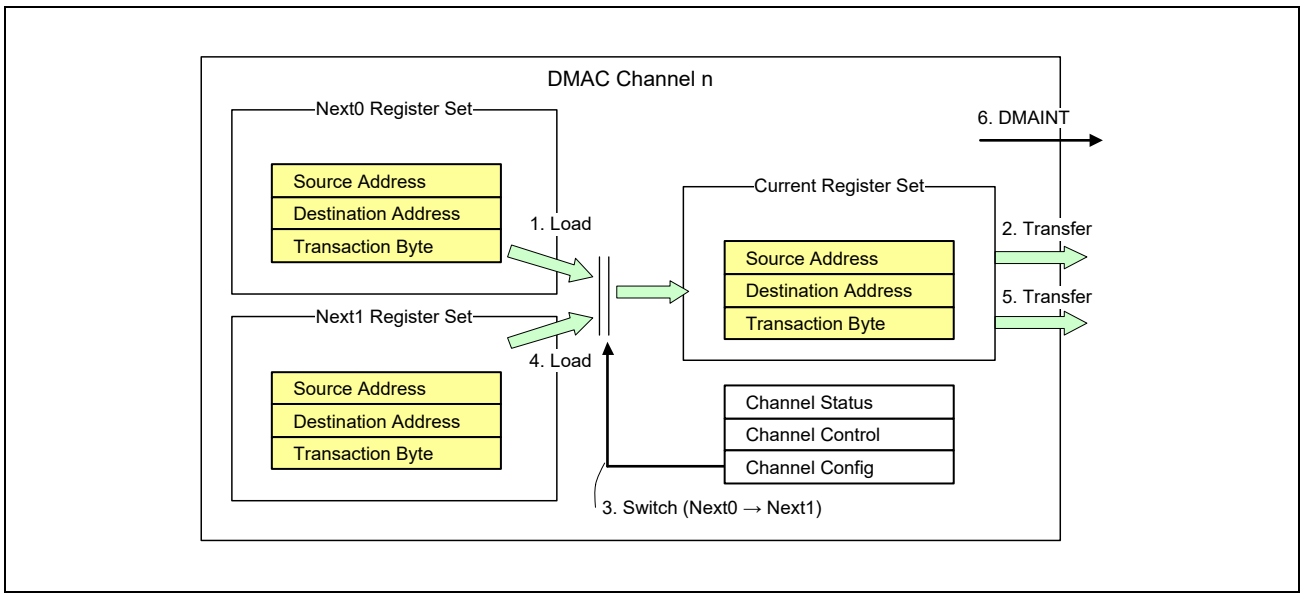

Figure 32B.17 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAmn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

### (2) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

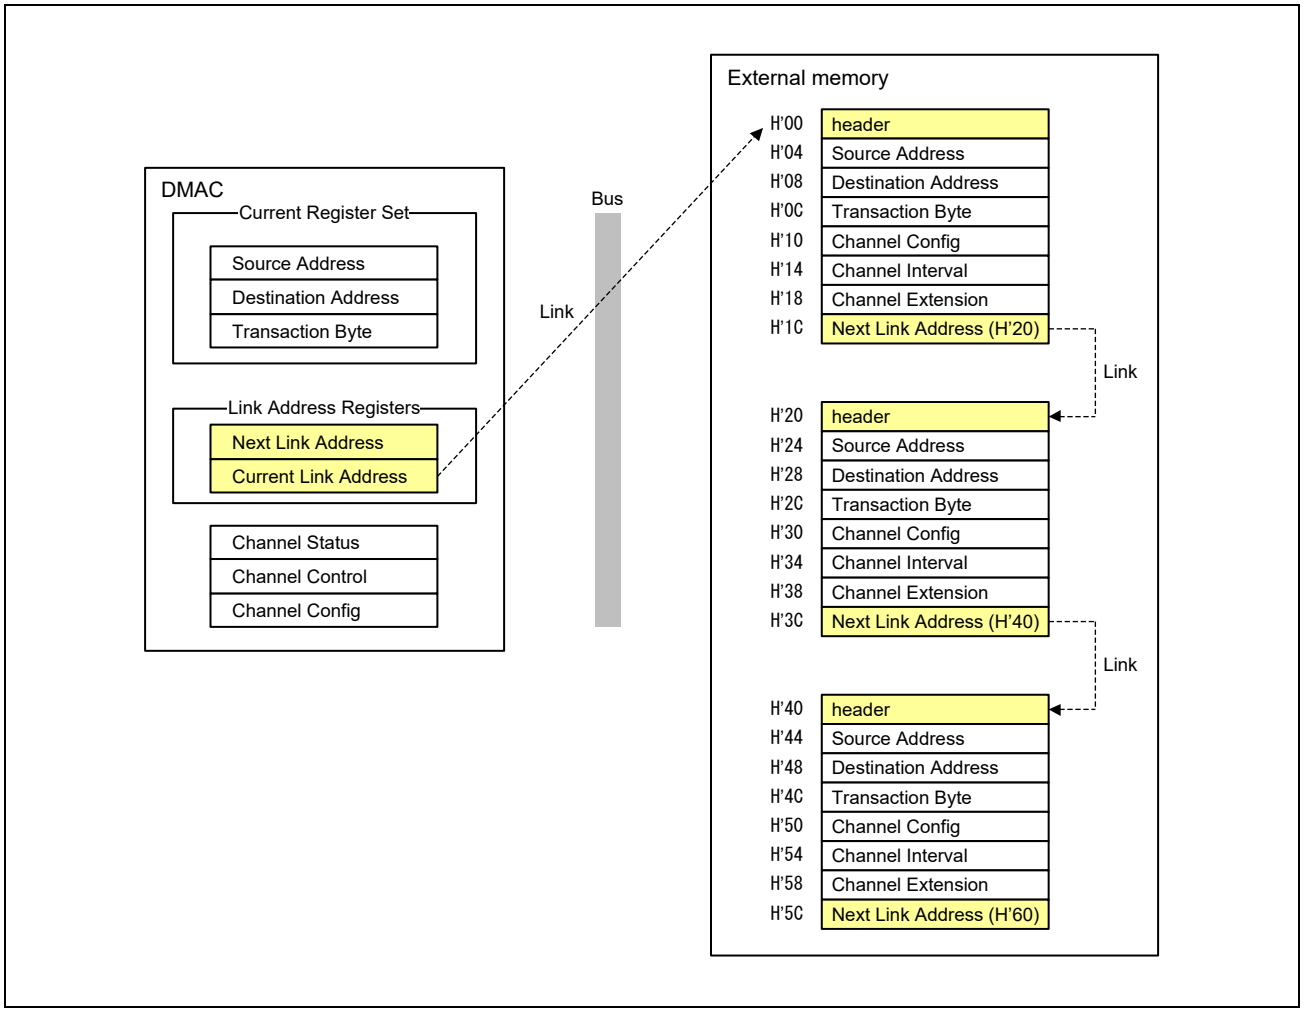

Figure 32B.18 Overview of Link Mode

### (a) Operation flow of link mode

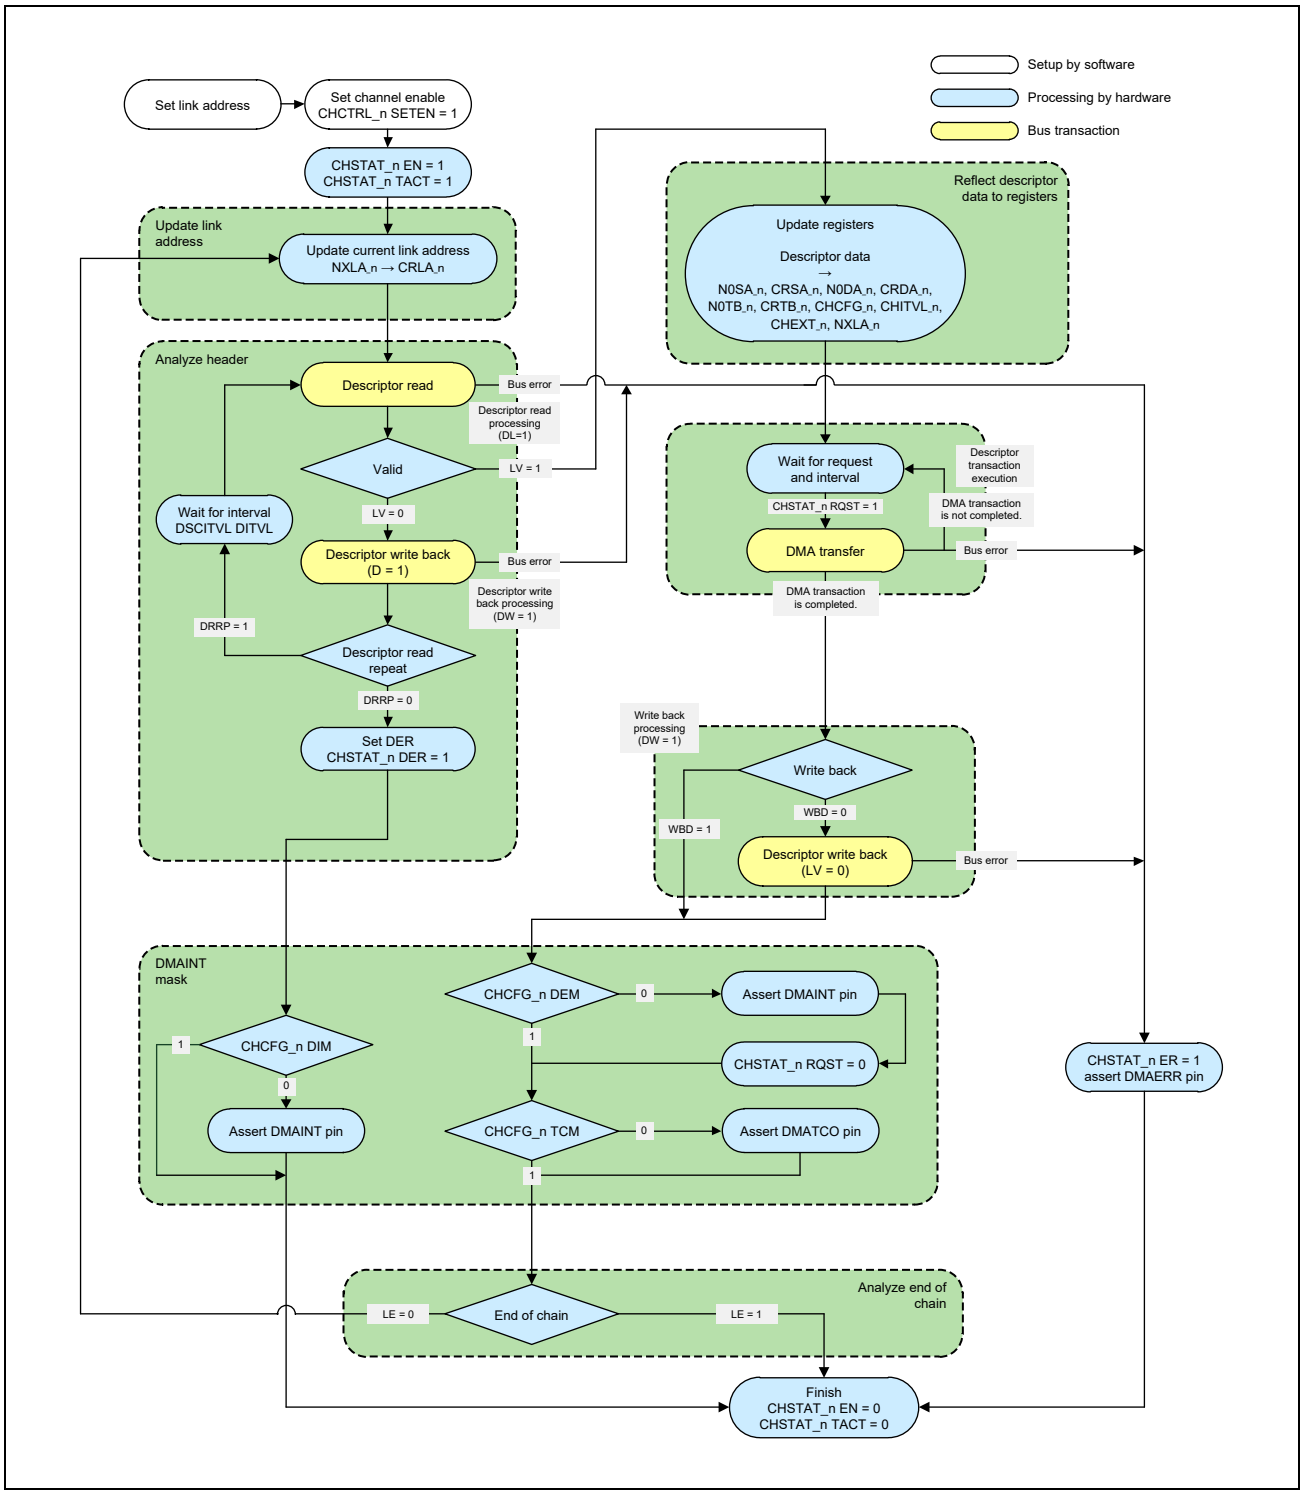

Figure 32B.19 Link Mode Operation Flow

**Description of the link mode operation flow:**

1. Channel setting
   The beginning address of the link destination is set in the NXLA_n register.

2. Link address updating
   If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.

3. Descriptor reading and header judgment
   A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

4. Descriptor setting
   If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.

5. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, see **Section 32B.9.13, DMA Transfer**.

6. Header write-back
   If WBD of header is 0, DMAC writes LV = 0 to the header area.

7. USBFDMAmn masking
   If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

8. DMATC masking
   If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.

9. Link end judgment
   If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

### (b) Register setting

- Link mode setting

  To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 32B.44 Link Mode Setting

| DMS (CHCFG_n) | Description |
|---|---|
| 1 | This module operates in link mode. The setting of this bit cannot be changed by using a descriptor. |

- Link address setting

  The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target. Before starting link mode, set the link target in the NXLA_n register.
  After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 32B.45 Link Address Register Set

| Register | Description |
|---|---|
| Next Link Address Register (NXLA_n) | This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register. |
| Current Link Address Register (CRLA_n) | This register is used to display the link target that is being executed. This is a read-only register. |

### (c) Descriptor setting

DMAC supports multiple descriptor formats.

A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.

The following table shows the relationship between DSCFM values and descriptor formats.

Table 32B.46 Descriptor Formats

| DSCFM | Descriptor Size | Next Link Address | Channel Extension | Channel Interval | Channel Config | Transaction Size | Destination Address | Source Address | header |
|---|---|---|---|---|---|---|---|---|---|
| 3 | 4 words | ✓ | — (reload) | — (reload) | — (reload) | — (header) | ✓ | ✓ | ✓ (with STS) |
| 1 | 8 words | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ (no STS) |
| Other than the above | If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3. | | | | | | | | |

Table 32B.47 Explanation of the Marks in **Table 32B.46**

| Field | Mark | Description | Remarks |
|---|---|---|---|
| Header | ✓ (with STS) | The STS field of bits [15:0] in the header is valid.<br>The value set in the STS field is used as the total number of transfer bytes (Transaction Size). | — |
| | ✓ (no STS) | The STS field of bits [15:0] in the header is invalid.<br>The value of "Transaction Size" in the descriptor is used as the total number of bytes. | |
| Source Address | ✓ | Specify the source address. | — |
| Destination Address | ✓ | Specify the destination address. | — |
| Transaction Size | ✓ | Specify the transaction size. | — |
| | — (header) | Omit the transaction size.<br>The value set in the STS field is used as the total number of transfer bytes (Transaction Size) | Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set. |
| Channel Config<br>Channel Interval<br>Channel Extension | ✓ | Specify Channel Config, Channel Interval, and Channel Extension. | — |
| | — (reload) | Omit Channel Config, Channel Interval, and Channel Extension.<br>The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited. | — |
| Next Link Address | ✓ | Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor. | — |

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by "✓" in **Table 32B.46** on memory.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 32B.48 Example of Placing Descriptors

| DSCFM | Address | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Link Address + H'1C | Link Address + H'18 | Link Address + H'14 | Link Address + H'10 | Link Address + H'0C | Link Address + H'08 | Link Address + H'04 | Link Address + H'00 |
| H'3 | — | — | — | — | Next Link Address | Destination Address | Source Address | header |
| H'1 | Next Link Address | Extension | Interval | Config | Transaction Byte | Destination Address | Source Address | header |

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

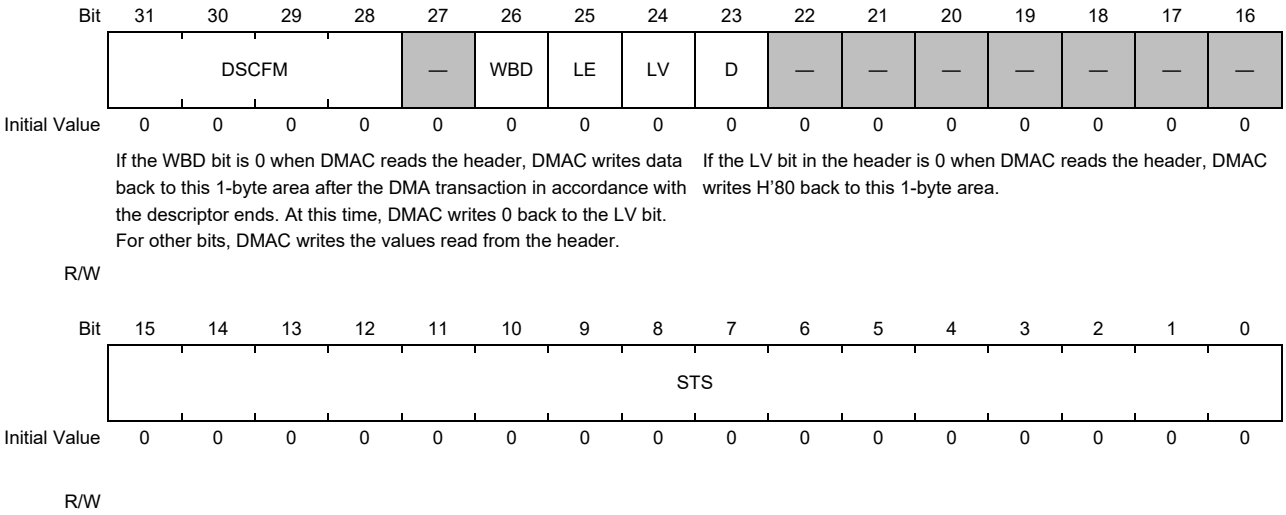

Figure 32B.20 Header Area

Table 32B.49 Header Area (1/2)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | DSCFM | | | Descriptor Format<br>Specifies the descriptor format (length and combination of descriptors).<br>For details see **Table 32B.46**. |
| 27 | — | | | Reserved area. Set 0. |
| 26 | WBD | | | Wrazite Back Disable<br>Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation.<br>0: Writes 0 back to the LV bit.<br>1: Does not perform a write-back operation for the LV bit. |
| 25 | LE | | | Link End<br>Indicates that the link will end with the DMA transaction for this descriptor.<br>Set this bit to 1 to indicate the end of link.<br>0: The link continues.<br>1: The link ends. |

Table 32B.49 Header Area (2/2)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 24 | LV | | | Link Valid<br>Indicates that this descriptor is valid.<br>If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit.<br>0: This descriptor is invalid.<br>1: This descriptor is enable. |
| 23 | D | | | Descriptor Error<br>Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit.<br>0: A descriptor error has not occurred.<br>1: LV was 0 when the descriptor was read. |
| 22 to 16 | — | | | Reserved area. Set 0. |
| 15 to 0 | STS | | | Short Transaction Size<br>If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535.<br>If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed. |

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

  The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

  The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

  The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

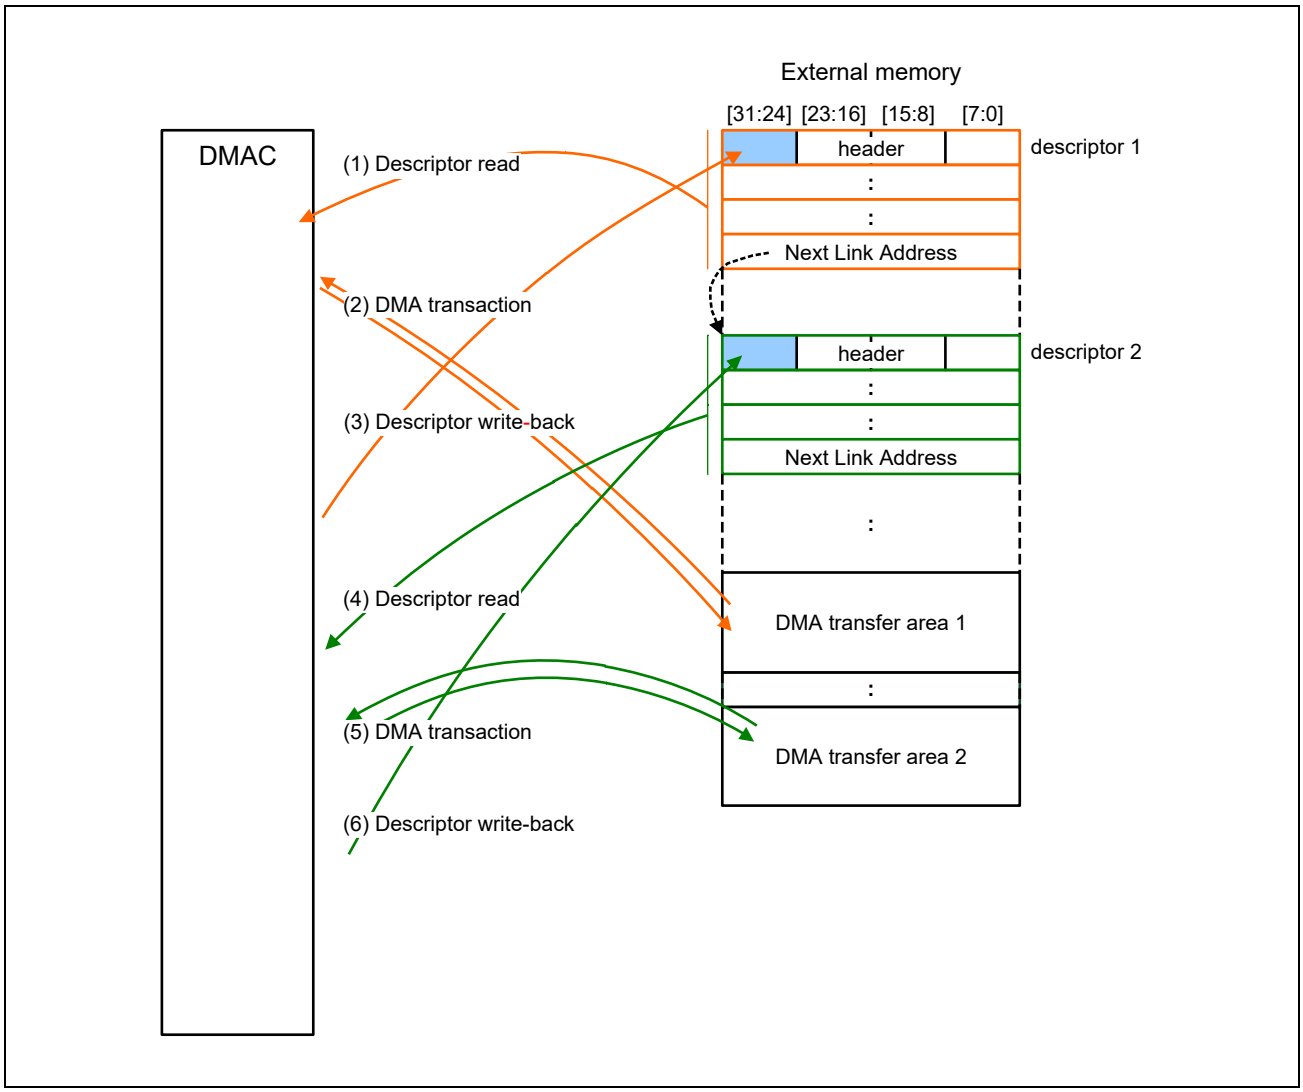

Figure 32B.21 Overview of Descriptor Areas and DMA Transfer Areas

(1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).

(2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte-size basis.

(4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.

(5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte-size basis.

(Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.

If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).

If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors
  - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
  - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
  - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
  - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
  - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

### (d) Link configuration example

In link mode, descriptors can be configured as shown below.

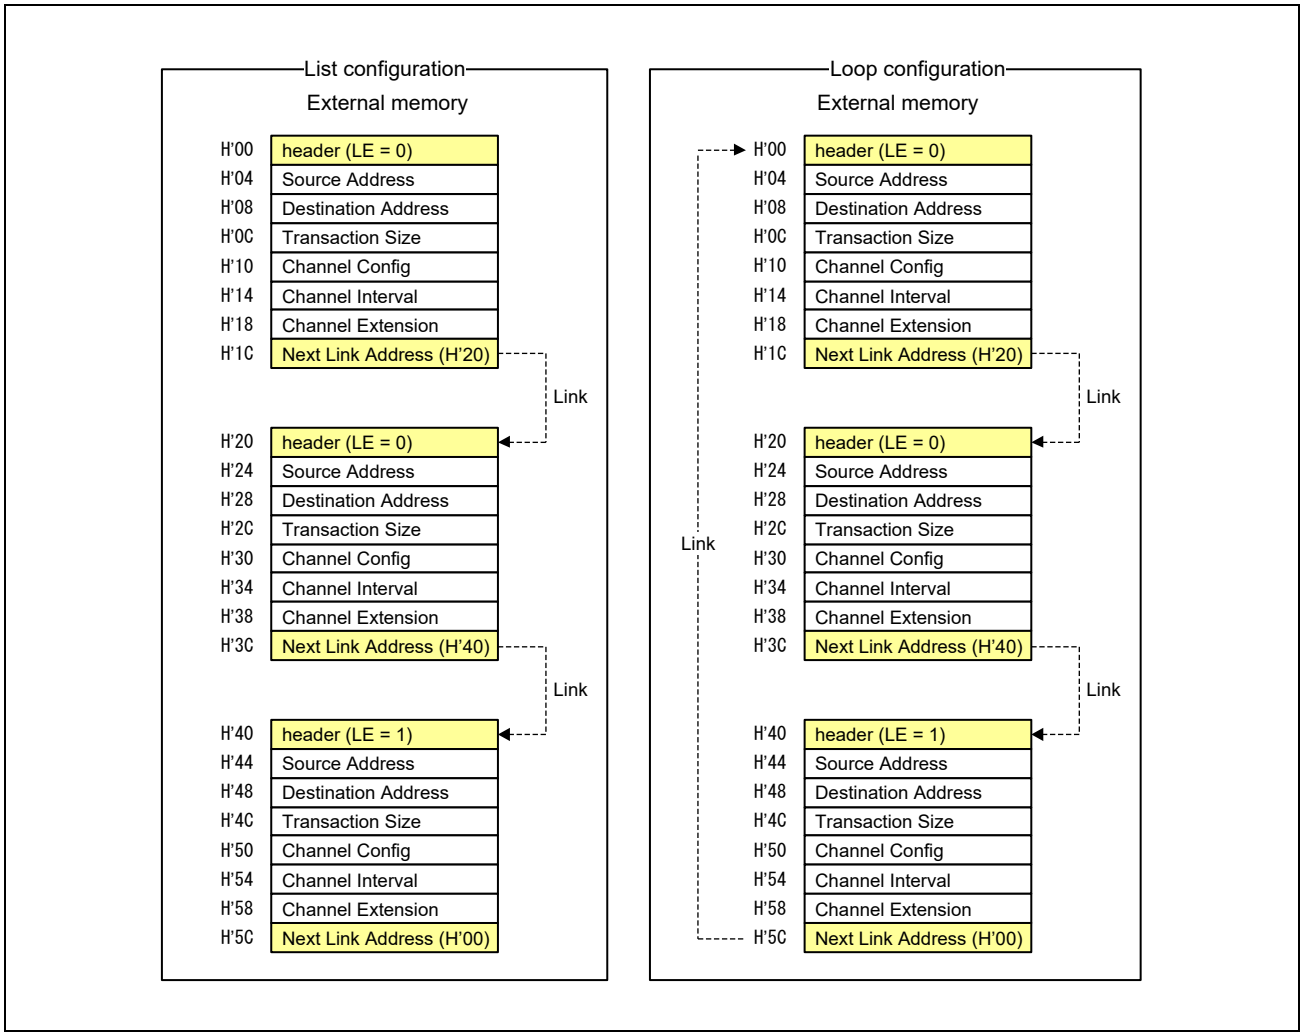

Figure 32B.22 Link Mode Configuration Example

- List configuration

  The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

  A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

#### 32B.9.12.2 Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 32B.50 Write-Only Mode Setting

| WONLY (CHCFG) | Mode | Description |
|---|---|---|
| 0 | Normal mode | A DMA transfer is performed using the values set in Next Register Set. |
| 1 | Write-only mode | A DMA write transfer is performed without performing a DMA read transfer. |

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.

Use this mode to, for example, initialize the memory area.

## 32B.9.13 DMA Transfer

This chapter describes the basic operation of DMA transfer.

### 32B.9.13.1 Transfer modes

DMAC supports only single transfer mode.

Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).

The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see **Section 32B.9.13.7, Operational difference depending on the transfer size**.

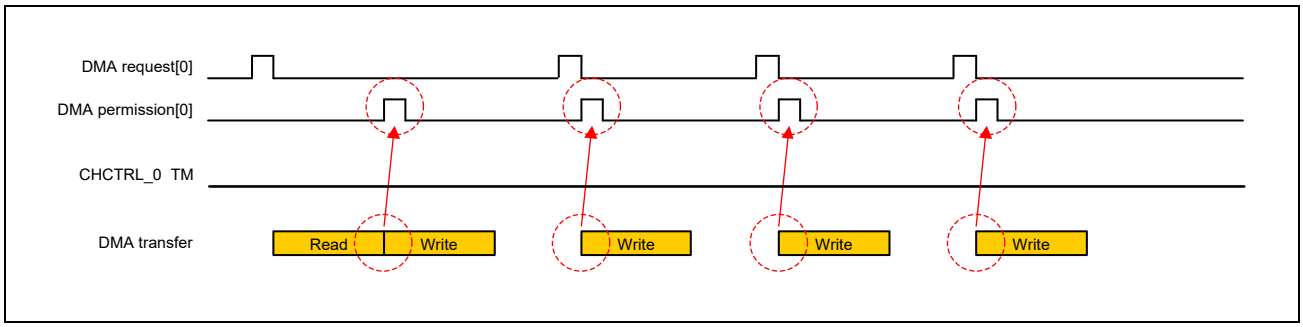

Figure 32B.23 Single Transfer Mode (REQD = 1, SDS > DDS)

### 32B.9.13.2 DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 32B.51 Priority Control Setting

| Mode | PR (DCTRL) | Description | Remarks |
|---|---|---|---|
| Fixed-priority | 0 | Controls requests based on fixed priority (CH0 > CH1 > ...). | Use this mode if channels have priority. |
| Round-robin | 1 | Controls requests in a round-robin manner. | Use this mode to execute requests equally. |

#### (1) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

### (2) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.

In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

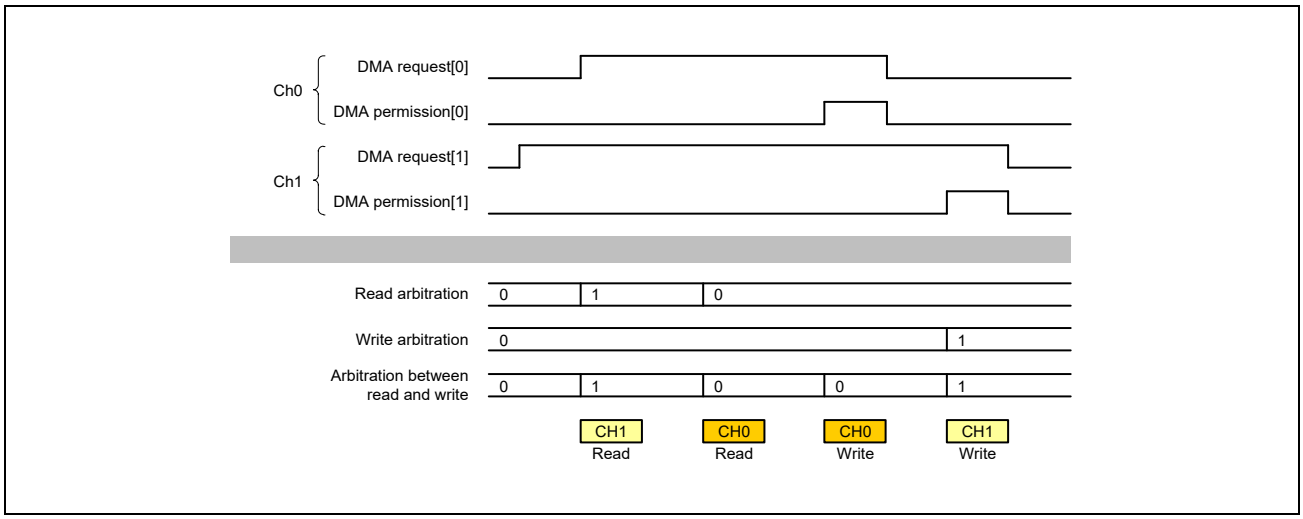

Figure 32B.24 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

### 32B.9.13.3 Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

(1) If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.

(2) If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.

(3) The difference from ordinary sweeping mode described in **Section 32B.9.13.8(3)(b), Transfer suspension (buffer sweeping enabled: SBE = 1)** (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

#### (1) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

#### 32B.9.13.4 DMA transfer completion interrupt (USBFDMAmn)

USBFDMAmn (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn (m, n = 0, 1) interrupt.
(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 32B.52 USBFDMAmn Assertion Conditions

| Cause | Condition | INT_DMA[n] mask signal |
|---|---|---|
| DMA transaction ended | A transfer of data by the number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes) | DEM bit in the CHCFG_n register |
| Descriptor was invalid | LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG_n register are both 0 in link mode | DIM bit in the CHCFG_n register |

#### 32B.9.13.5 DMA error interrupt (USBFDMAERRm)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERRm interrupt is asserted.

The USBFDMAERRm signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

### 32B.9.13.6 Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.

The following shows an operation example.

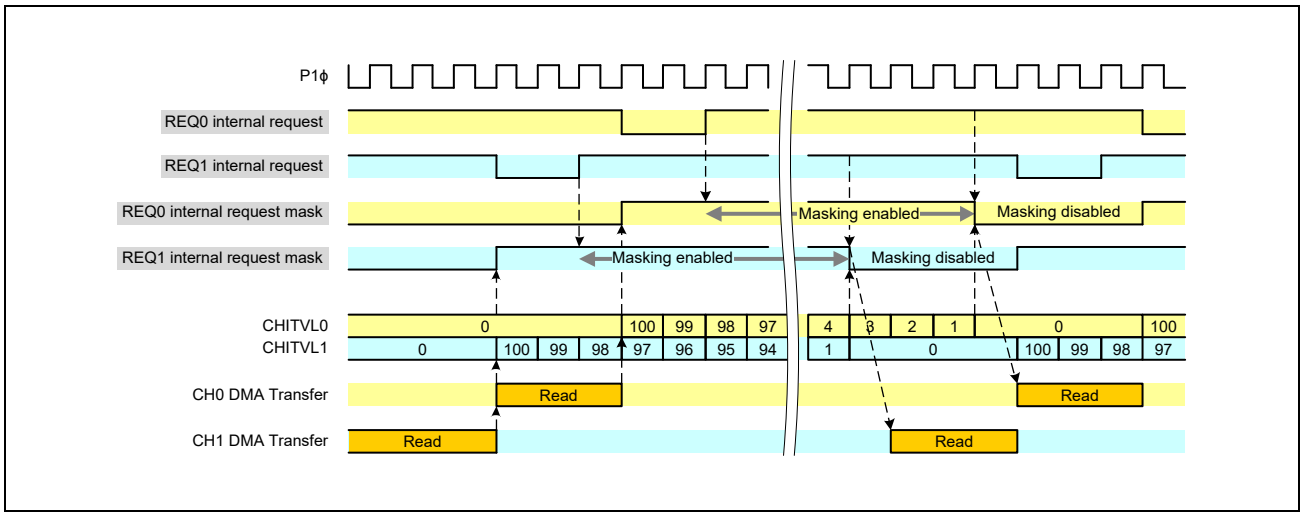

Figure 32B.25 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

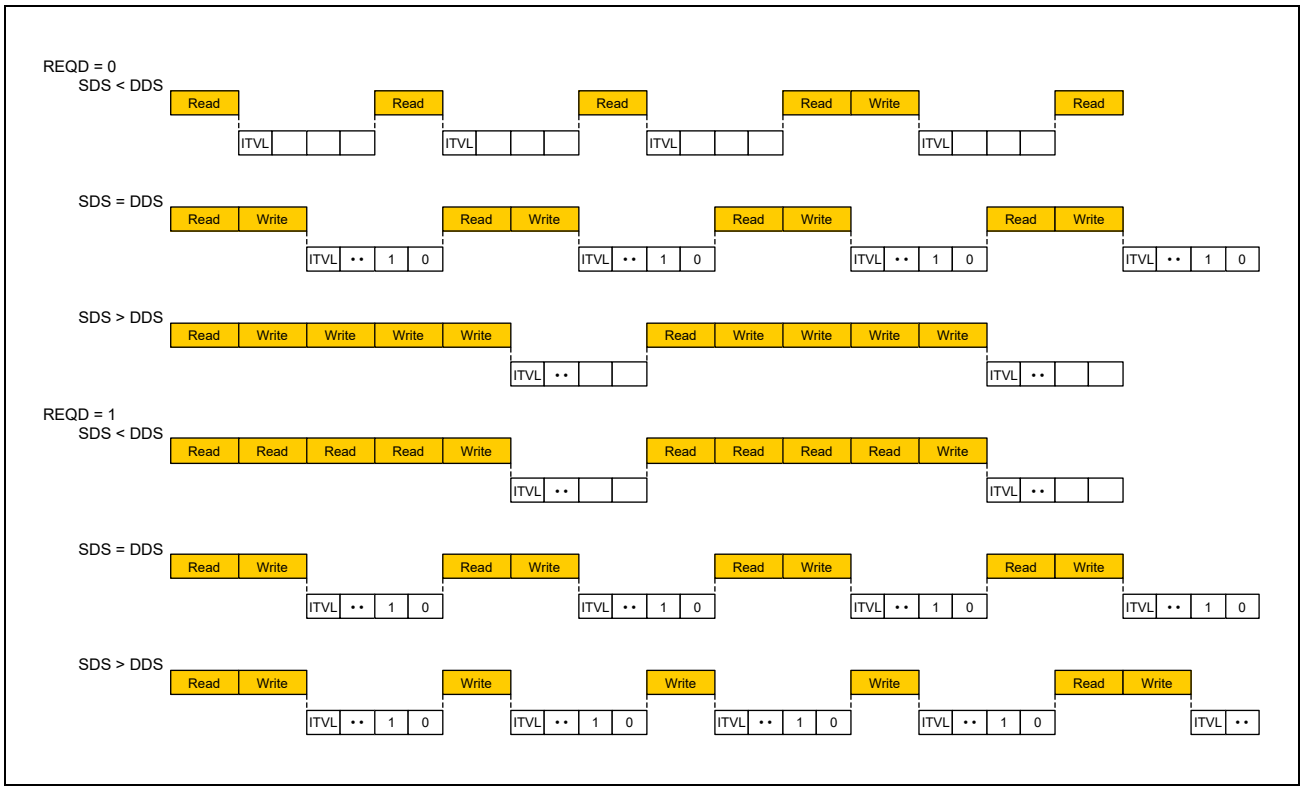

Figure 32B.26 DMA Transfer Settings and Interval Count

### 32B.9.13.7 Operational difference depending on the transfer size

#### (1) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.

The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

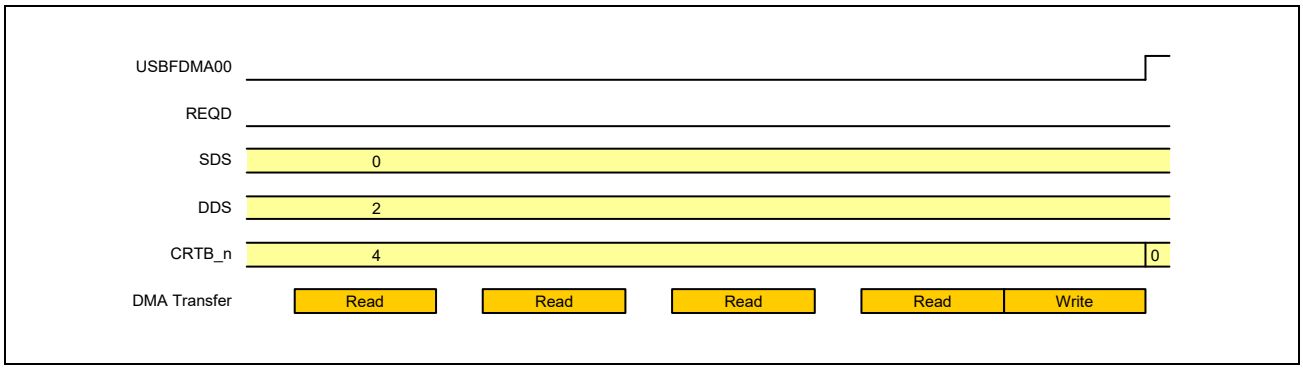

Figure 32B.27 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

#### (2) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

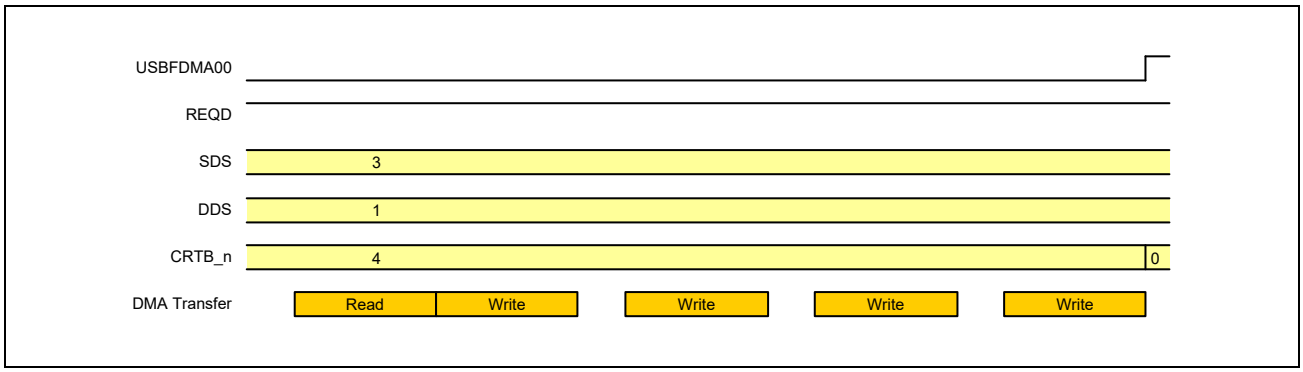

Figure 32B.28 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

### (3) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.

The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

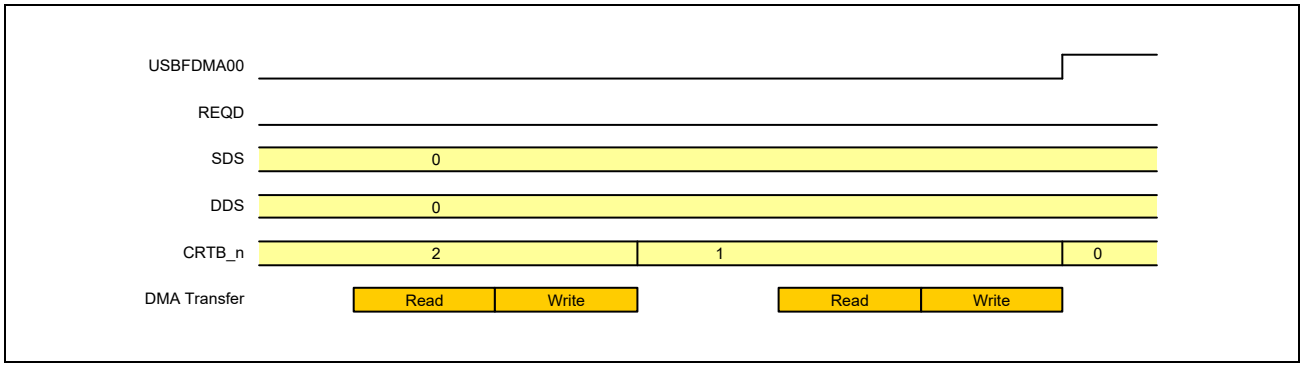

Figure 32B.29 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

### 32B.9.13.8 Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

#### (1) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see **Section 32B.4.1, Current Source Address Register**) and the DMA transfer ends.

If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

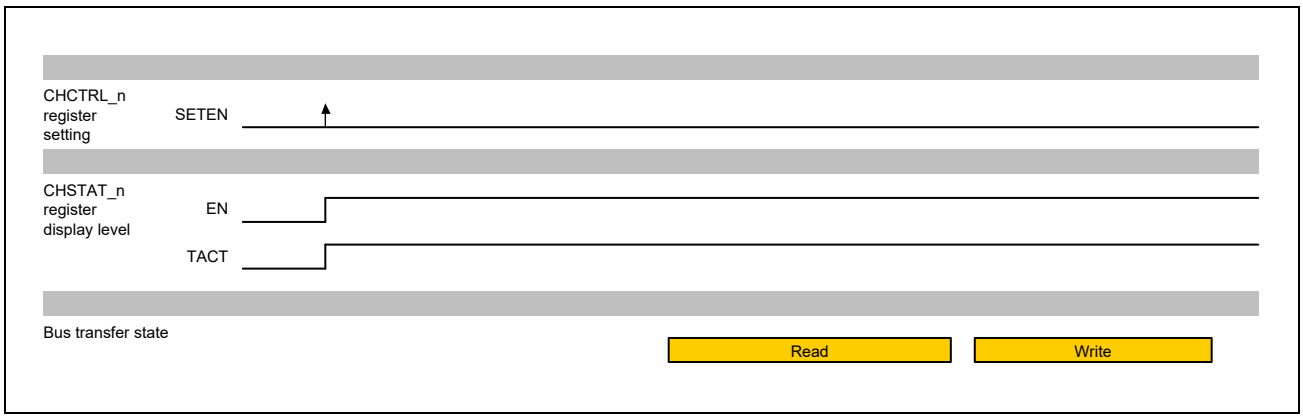

Figure 32B.30 DMAC State Example 1 (Hardware Request)

#### (2) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

### (3) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).

If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

#### (a) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.

If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.

If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

#### (b) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.

After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

#### (c) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

### (d) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

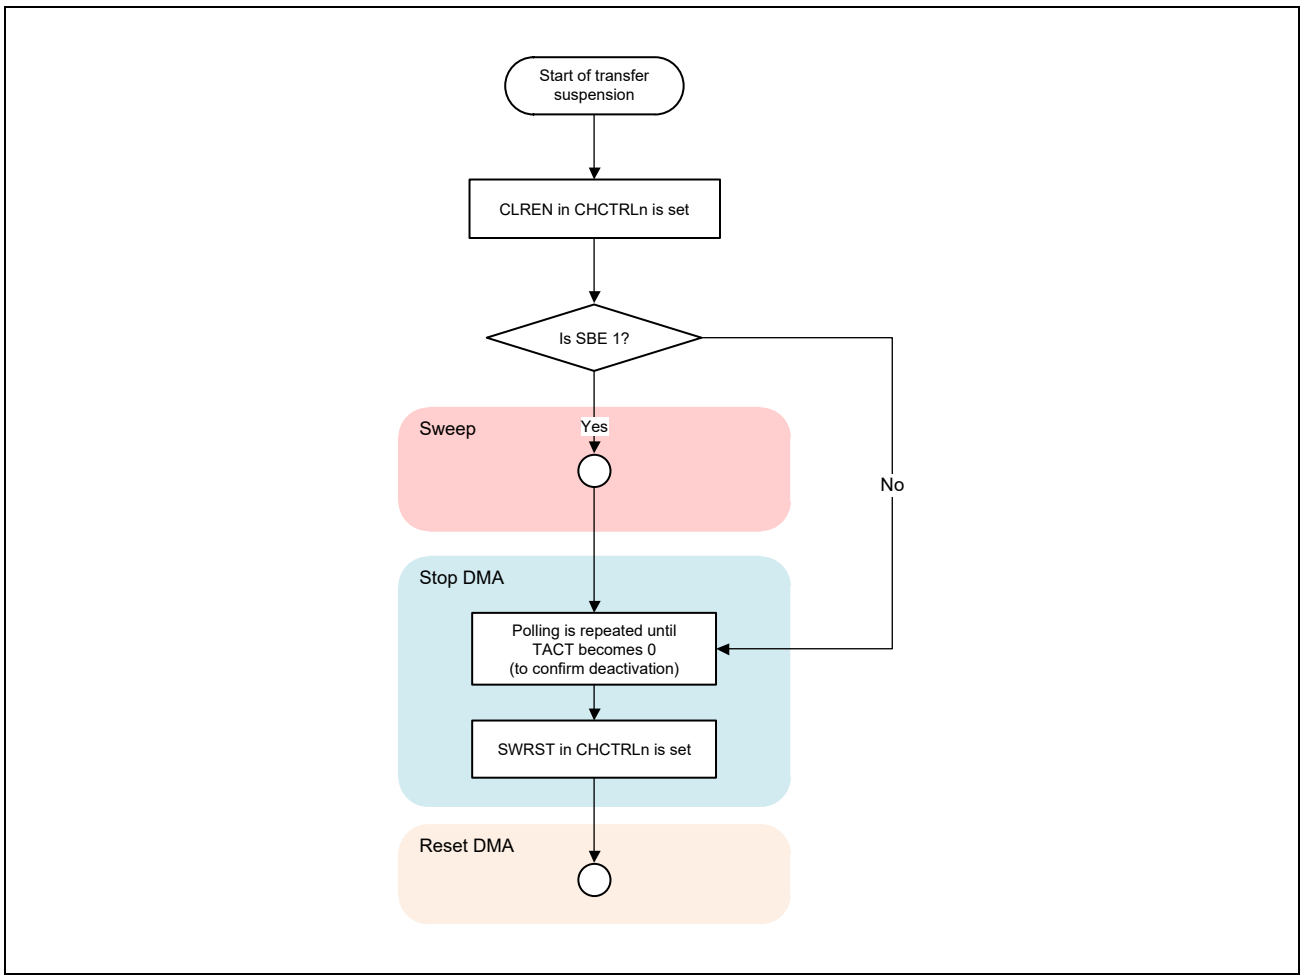

Figure 32B.31 Transfer Suspension Flowchart

## 32B.9.14 Access Type

### 32B.9.14.1 DMA master transfer combination list

#### (1) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.
- The size and burst length are determined based on the value set in the SDS[2:0] field.
  If the value set in the SDS[2:0] field is equal to or less than the bus width
  Size: Value set in SDS[2:0]
  Burst type: SINGLE
  If the value set in the SDS[2:0] field is larger than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 32B.53 DMA Read Transfer Combination List

| SDS | Source Address | AHB transfer | | | | | |
|---|---|---|---|---|---|---|---|
| | | First transfer | | | Second transfer | | |
| | | Address | Data Size | Burst Type | Address | Data Size | Burst Type |
| 0 (8 bits) | - | addr | 8 | SINGLE | | | |
| 1 (16 bits) | 2 byte align | {addr[31:1], 0b} | 16 | SINGLE | | | |
| | 2 byte unalign | | | | {addr[31:1], 0b} + H'2 | 16 | SINGLE |
| 2 (32 bits) | 4 byte align | {addr[31:2], 00b} | 32 | SINGLE | | | |
| | 4 byte unalign | | | | {addr[31:2], 00b} + H'4 | 32 | SINGLE |
| 4 (128 bits) | 16 byte align | {addr[31:4], H'0} | 32 | INCR4 | | | |
| | 16 byte unalign | | | | {addr[31:4], H'0} + H'10 | 32 | INCR4 |
| 5 (256 bits) | 32 byte align | {addr[31:5], H'00} | 32 | INCR8 | | | |
| | 32 byte unalign | | | | {addr[31:5], H'00} + H'20 | 32 | INCR8 |
| 6 (512 bits) | 64 byte align | {addr[31:6], H'00} | 32 | INCR16 | | | |
| | 64 byte unalign | | | | {addr[31:6], H'00} + H'40 | 32 | INCR16 |

**Note:** If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

### (2) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.
- The size and burst length are determined based on the value set in the DDS[2:0] field.
  If the value set in the DDS[2:0] field is equal to or less than the bus width
  Size: Value set in DDS[2:0]
  Burst type: SINGLE
  If the value set in the DDS[2:0] field is greater than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)
- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.
  - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
  - An access specified in the DDS field will be across the SKIP boundary.
  - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

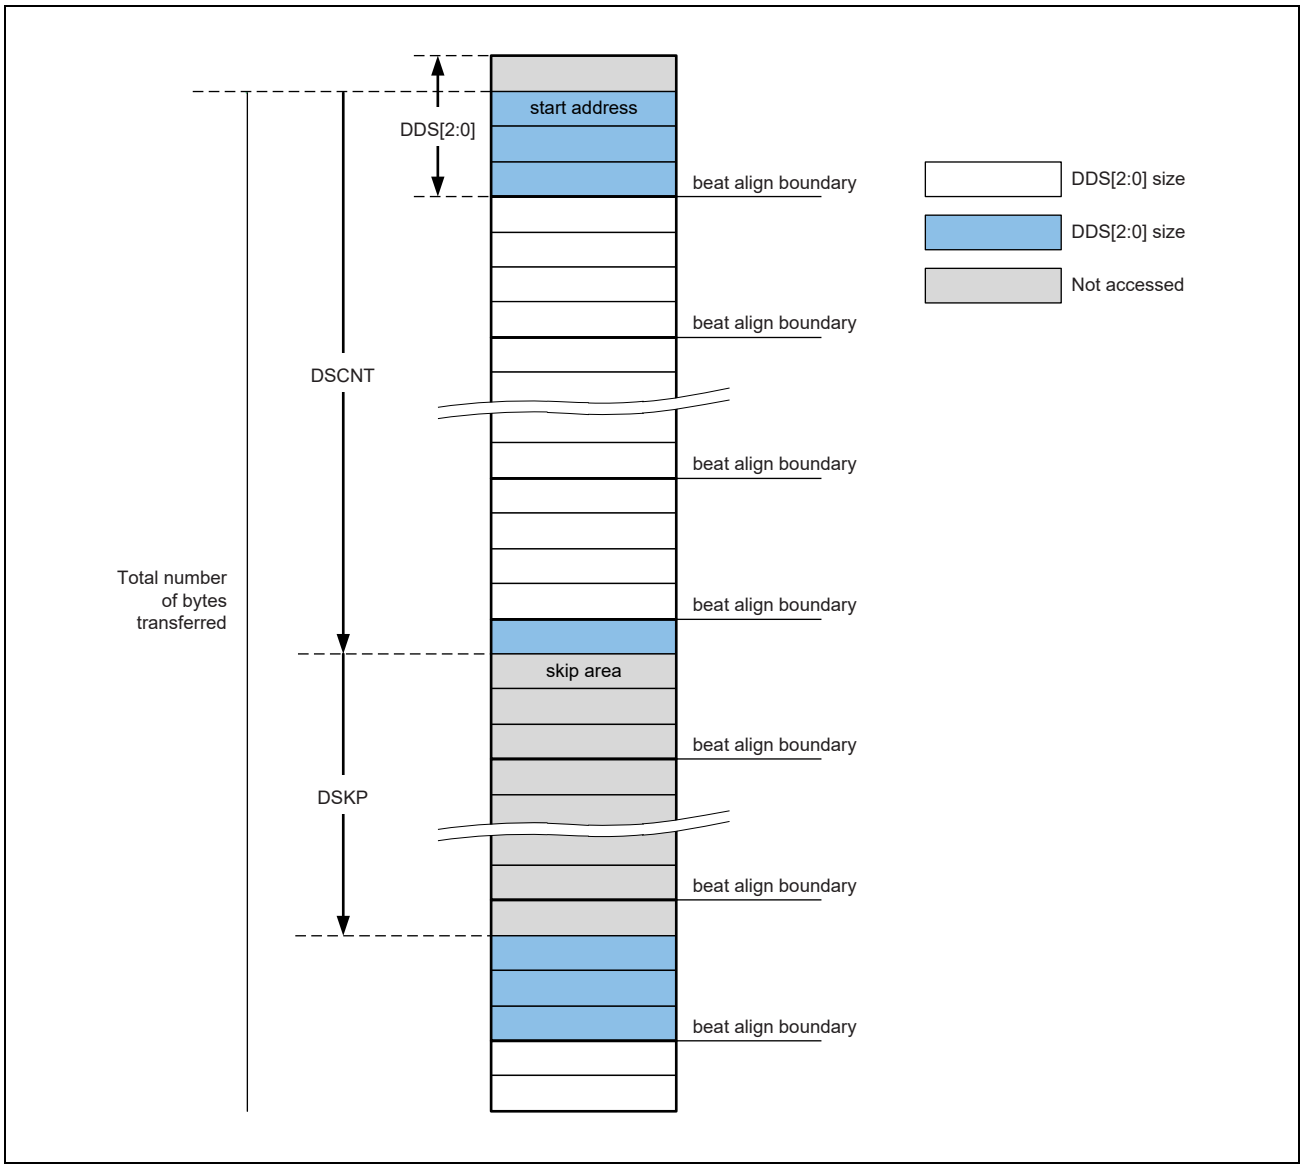

Figure 32B.32 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 32B.54 DMA Write Transfer Combination List

| | AHB transfer | | |
|---|---|---|---|
| | First transfer | | |
| DDS[2:0] | Address | Data Size | Burst Type |
| 0 (8 bits) | addr | 8 | SINGLE |
| 1 (16 bits) | {addr[31:1], 0b} | 16 | SINGLE |
| 2 (32 bits) | {addr[31:2], 00b} | 32 | SINGLE |
| 4 (128 bits) | {addr[31:4], H'0} | 32 | INCR4 |
| 5 (256 bits) | {addr[31:5], H'00} | 32 | INCR8 |
| 6 (512 bits) | {addr[31:6], H'00} | 32 | INCR16 |

### 32B.9.14.2 DMA master descriptor combination list

#### (1) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 32B.55 Descriptor Read Transfer Combination List

| Descriptor Format | Address | AHB Transfer | | | | | |
|---|---|---|---|---|---|---|---|
| | | First Transfer | | | Second Transfer | | |
| | addr[4:0] | Address | Size | Burst | Address | Size | Burst |
| 4 words | H'00 | {addr[31:4], 0000b} | 32 | INCR8 | | | |
| | H'04 | | | | | | |
| | H'08 | | | | | | |
| | H'0C | | | | | | |
| | H'10 | | | | | | |
| | H'14 | | | | {addr[31:4], 0000b} + H'20 | 32 | INCR8 |
| | H'18 | | | | | | |
| | H'1C | | | | | | |
| 8 words | H'00 | | | | | | |
| | H'04 | | | | {addr[31:4], 0000b} + H'20 | 32 | INCR8 |
| | H'08 | | | | | | |
| | H'0C | | | | | | |
| | H'10 | | | | | | |
| | H'14 | | | | | | |
| | H'18 | | | | | | |
| | H'1C | | | | | | |

**Note:** If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

#### (2) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 32B.56 Descriptor Write Transfer Combination List

| Type | AHB transfer | | |
|---|---|---|---|
| | Address | Size | Burst |
| Write-back in normal mode | {addr[31:2], 00b} + H'3 | 8 | SINGLE |
| Write-back in the case of an error | {addr[31:2], 00b} + H'2 | 8 | SINGLE |

### 32B.9.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.

In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 32B.57 Priority of a transfer request for DMACs that are performing transfer

| | Next DMAC | |
|---|---|---|
| Current DMAC | DMAC0 | DMAC1 |
| DMAC0 | 2 | 1 |
| DMAC1 | 1 | 2 |

**Note:** Priority: 1 (high), 2 (low)

## 32B.9.16 Notes

### 32B.9.16.1 Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is H'0000_1038 and SDS is 5 (256-bit), read starts from area H'0000_1020, not from address H'0000_1038. At this time, if the area from H'0000_1020 to H'0000_1037 contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

### 32B.9.16.2 Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAmn (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.

To use peripheral module interrupt USBFDMAmn or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

# 33. LCDC

## 33.1 Overview

This chapter describes the features of the LCDC unit of this LSI.

This unit is LCD controller, it is composed of Frame Compression Processor (FCPVD), Video Signal Processor (VSPD), and Display Unit (DU)

### 33.1.1 Features

The following is key features of this unit.

- FCPVD
  - Support out-of-order for the whole outstanding transactions
  - Read linear addressing image data
  - Read display list data
  - Write image data
- VSPD
  - Supports various data formats and conversion
    - Supports YCbCr444/422/420, RGB, α RGB, α plane
    - Color space conversion and changes to the number of colors by dithering
    - Color keying
    - Supports combination between pixel alpha and global alpha
    - Supports generating pre multiplied alpha
  - Video processing
    - Blending of two picture layers and raster operations (ROPs)
    - Clipping
    - 1D look up table
    - Vertical flipping in case of output to memory
  - Direct connection to display module
    - Supporting 1920 pixels in horizontal direction
    - Writing back image data which is transferred to Display Unit (DU) to memory
- DU
  - Supporting Display Parallel Interface (DPI)
  - Display timing master
    - Generating video timings (Front porch, Back porch, Sync active, Active video area)
    - Selecting the polarity of output DCLK, HSYNC, VSYNC, and DE
  - Supporting Progressive (Non-interlace)
  - Not supports Interlace

- Input data format (from VSPD): RGB888, RGB666 (not supports dithering of RGB565)
- Output data format: same as Input data format
- Supporting WXGA (1280 pixels × 800 lines) for Parallel Output

### 33.1.2 Block Diagram

**Figure 33.1** shows a block diagram.

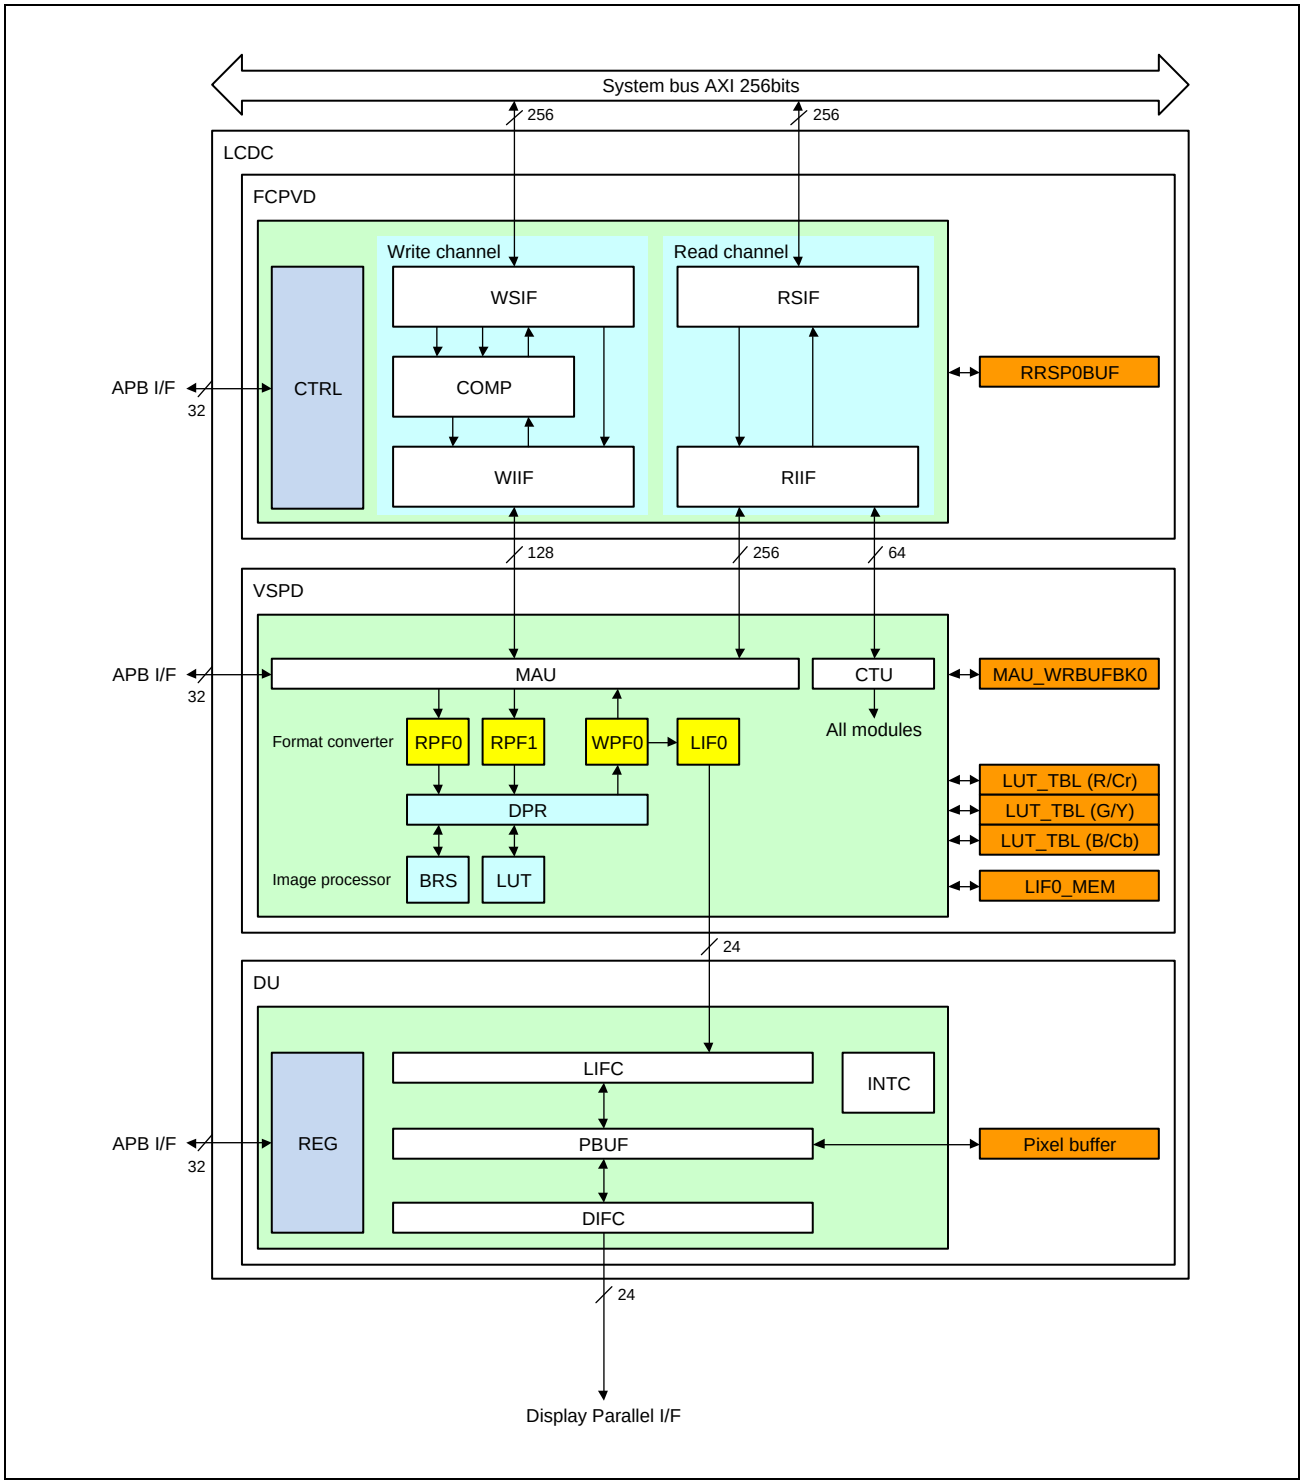

Figure 33.1 Block Diagram

#### 33.1.2.1 FCPVD

FCPVD has the following sub modules.

Table 33.1 Sub modules in FCPVD

| Abbreviation | Description |
|---|---|
| CTRL | FCPVD controller |
| WIIF | VSPD write channel interface |
| WSIF | System AXI write channel interface |
| RIIF | VSPD read channel interface |
| RSIF | System AXI read channel interface |
| COMP | Compression module (This is a dummy module) |

#### 33.1.2.2 VSPD

VSPD has the following sub modules.

##### (1) Memory Access Unit (MAU)

The VSPD applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSPD necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSPD.

##### (2) Command Transfer Unit (CTU)

The VSPD can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

### (3) Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, a color space converter and multiply-alpha. **Figure 33.2** show the processing flow in the RPF.

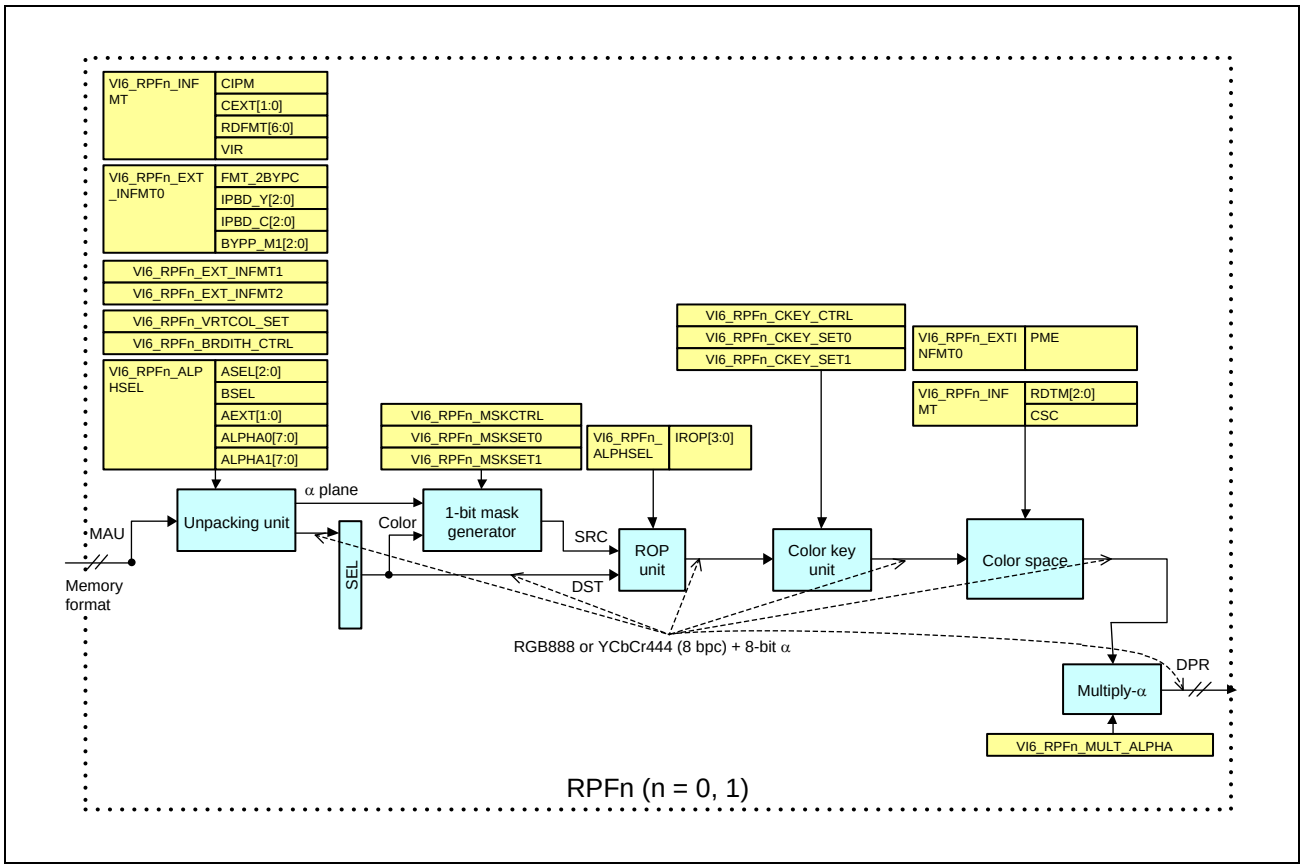

Figure 33.2 RPF Processing Flow

The input format unpacking unit expand the image data input from the MAU into the image format for internal processing (YCbCr444 8bpc or RGB888 8bpc), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The VSPD provides maximum two RPF modules (RPF0 to RPF1).

### (4) Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRS or LUT), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

### (5) Look Up Table (LUT)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

The LUT supports local area processing for Y component. The LUT can apply 1D look up table for Y component per area where an image is divided into multiple area specified by registers and command list.

### (6) Blend ROP Sub Unit (BRS)

The BRS is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRS has two blend/ROP operation units (blend/ROP unit m, m = A to B), a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

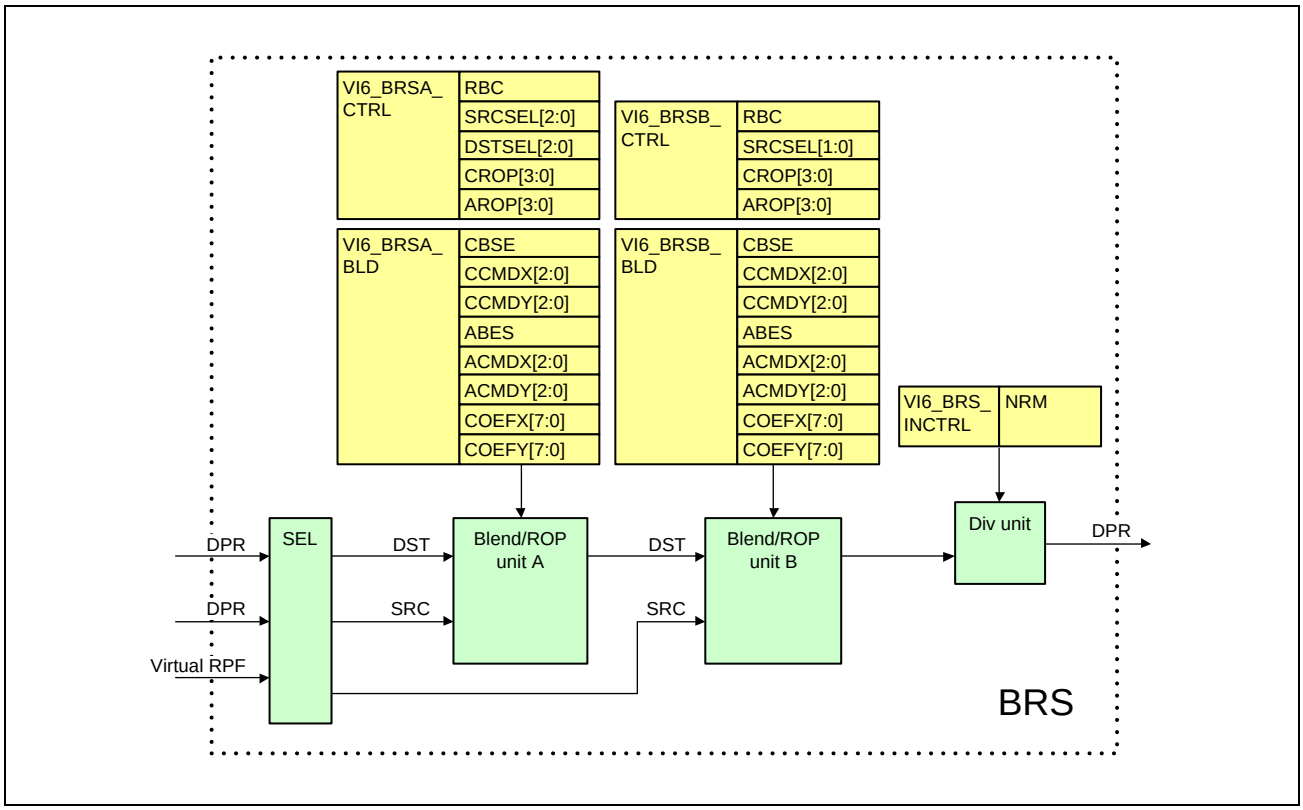

Figure 33.3 BRS Processing Flow

Each of the two blend-ROP operation units (blend/ROP unit m) receives the output from the SEL or blend/ROP Unit m, and executes blending or raster operation (ROP) of images.

The divider for normalization (div unit) divides the pixel value by the α value.

### (7) Write Pixel Formatter (WPF)

The WPF is an output module that receives 32bits image data (YCbCr444 or RGB888 + 8-bitα) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSPD image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

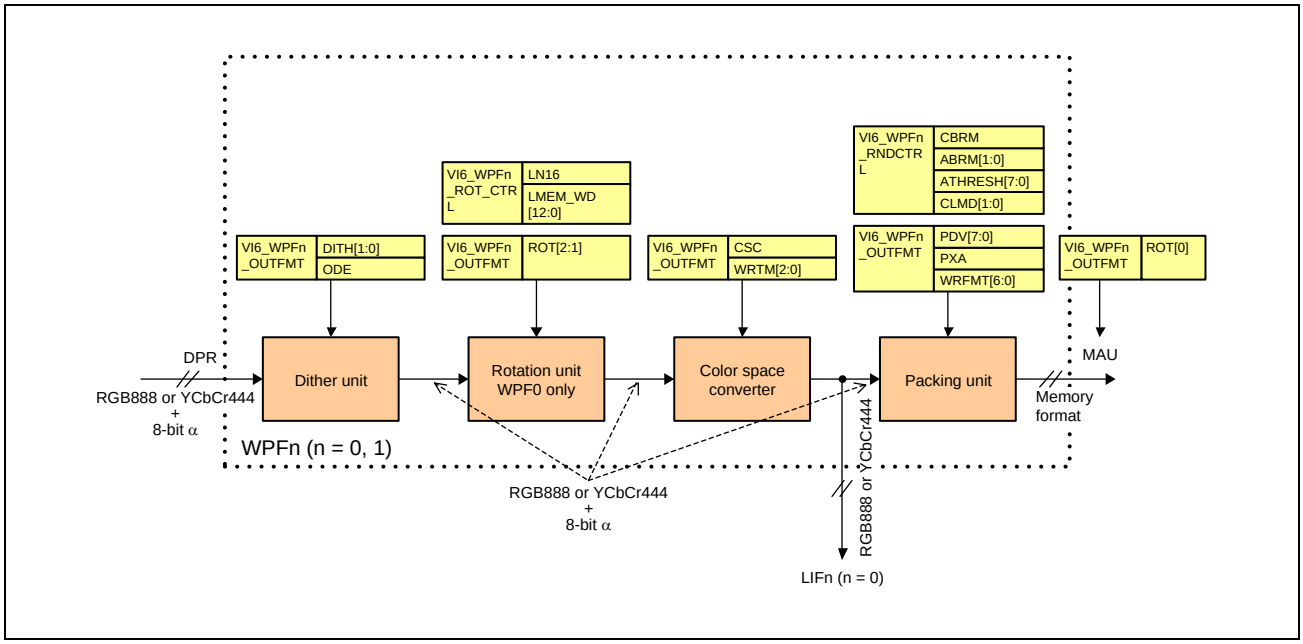

Figure 33.4 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSPD provides one WPF (WPF0). The WPF has the output to LIF module after the color space conversion for transferring the video data to the display module. Image data to LIF is 24bits (YCbCr444 or RGB888) format, and its' color space is after color space conversion.

### (8) Display Unit InterFace (LIF)

The LIF module is used for transferring image data to the display module. The input port of the LIFn (n = 0) module is connected to WPFn (n = 0), and the output port of the LIF module is connected to DU (Display Unit). Data flow in LIF is shown in **Figure 33.30**.

### (9) Detail Function

Table 33.2 Detail Function of VSPD (1/5)

| | | | |
|---|---|---|---|
| • Image Data Transfer Function | | | |
| Bus interface | Protocol | | AXI 256 bits through FCPVD |
| | Data alignment | Conversion method | Byte, Word, LW, or LLW data swapping |
| | | Channel | Data alignment can be specified separately for each input/output channel |
| Image memory | Input | Address setting | 1-byte units |
| | Output | Address setting | 1-byte units |
| | | Memory area | Images can be written to the same memory area where the master layer is stored.<br>Note the restrictions shown in **Table 33.38** |
| Tile transfer mode | | | Supported by RPF0 to RPF1 |
| YCbCr memory storage format | | | Interleaved, planar, or semi-planar |
| • Display list/Extended Display List Transfer Function | | | |
| Bus interface | Protocol | | AXI 256 bits through FCPVD |
| | Data alignment | Conversion method | Byte, Word, LW data swapping |
| | | | Data alignment can be specified separately for display list and each entry of extended display list |
| Data memory | Load | Address setting | 8-byte units |
| | Store | — | Not available |

Table 33.2 Detail Function of VSPD (2/5)

| | | | |
|---|---|---|---|
| • Read Pixel Formatter (RPF) | | | |
| Number of channels | | | Two channels (RPF0 to RPF1) |
| Input color bit-depth | | Color | 2 to 8bit |
| | | Alpha | 1/2/4/8 bit |
| Operation bit-depth | | Color | 8bit |
| | | Alpha | 8bit |
| Image format | Input | RGB | RGB888, RGB565, RGB666,<br>αRGB8888, αRGB4444, αRGB1555<br>α plane (8 bpp, 1 bpp) |
| | | YCbCr | YCbCr4:4:4 (8 bpc) Planar/Semi planar/Interleaved<br>YCbCr4:2:2 (8 bpc) Planar/Semi planar/Interleaved<br>YCbCr4:2:0 (8 bpc) Planar/Semi planar/Interleaved<br>α plane (8 bpp, 1 bpp) |
| | | Maximum size | 1920 × 1080 pixels<br>The internal data path modules have separate restrictions on the maximum image size. For details, refer to **Section 33.5.3**. |
| | | Minimum size | 1 × 1 pixel<br>The internal data path modules have separate restrictions on the minimum image size. For details, refer to **Section 33.5.3**. |
| | | Size setting unit | YCbCr420: 2-pixel units both horizontally and vertically.<br>YCbCr422: 2-pixel units horizontally and 1-pixel units vertically.<br>In other formats, the size can be set in 1-pixel units. |
| Color keying | Color replacement | Compared data | RGB or Y (8 bpc) |
| | | Replaced data | αRGB or αYCbCr (8 bpc for R, G, B, Y, Cb, Cr, α) |
| | | Comparison Mode | Matched color mode |
| | | Input source | RPF0 to RPF1 |
| | Transparent color | Compared data | RGB or Y (8 bpc) |
| | | Replaced data | α 8bpp |
| | | Comparison Mode | Matched color mode, Luma threshold mode |
| | | Input source | RPF0 to RPF1 |
| Raster operation | ROP2 (within input channels) | Operator | 16 types (OpenGL2.0 is supported) |
| | | Sources of operation | ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF1.<br>Note that 1-bpp α is converted to αRGB or αYCbCr4:4:4. (8 bpc) |
| Color space conversion | RGB to YCbCr | Conversion expression | RGB (0, $2^n$-1) to BT601 ($2^{n-4}$, 235*$2^{n-8}$/240*$2^{n-8}$)<br>RGB (0, $2^n$-1) to BT709 ($2^{n-4}$, 235*$2^{n-8}$/240*$2^{n-8}$)<br>RGB (0, $2^n$-1) to BT601 (0, $2^n$-1)<br>RGB ($2^{n-4}$, 235*$2^{n-8}$) to BT709 ($2^{n-4}$, 235*$2^{n-8}$/240*$2^{n-8}$)<br>(n = 8) |

| Changing number of colors | Output | Reducing RGB color depth | Dithering, lower-order bit truncation, or rounding |
| | | YCbCr422/420 | CbCr skipping or CbCr vertical skipping and horizontal skipping |
| α bit count conversion | Output | Bit reduction | Truncation, rounding, or comparison with threshold (for 1 bpp) |

Table 33.2 Detail Function of VSPD (5/5)

| | | | |
|---|---|---|---|
| • Image Compositing | | | |
| α blending | Input α value selection | RGB | Pixel α, fixed α value, α plane, or<br>1-bit α converted from the color specified for pixels |
| | | YCbCr | α plane, fixed α value, or<br>1-bit α converted from the color specified for pixels |
| | α blending expression | Layer A: Upper layer<br>Layer B: Lower layer | xA + yB, xA - yB<br>Coefficients x and y should be selected from the following.<br>Fixed α value,<br>(α for layer A), (1 - α for layer A),<br>(α for layer B), (1 - α for layer B) |
| | Output α value selection | RGB | Fixed α value,<br>x (α for layer A) + y (α for layer B),<br>x (α for layer A) – y (α for layer B)<br>Coefficients x and y should be selected from the following.<br>Fixed α value,<br>(α for layer A), (1 - α for layer A),<br>(α for layer B), (1 - α for layer B) |
| | Blending layers | Number of layers | Two layers selected from RPF0 to RPF1 and video processing function output, and virtual RPF; three layers in total |
| | | Order of layers | The order of three layers selected from RPF0 to RPF1, virtual RPF, and video processing function output can be changed as desired. |
| | α plane | Format | 8 bpp or 1 bpp (α value can be specified through register) |
| | | Input source | RPF0 to RPF1 |
| | Fixed α value | Format | 8 bpp |
| | | Input source | RPF0 to RPF1, virtual RPF, or video processing function output |
| Raster operation | ROP2 (between input channels) | Operator | 16 types (OpenGL2.0 is supported) |
| | | Sources of operation | RPF0 to RPF1, virtual RPF, and video processing function output |
| | | Operation control | RGB/YCbCr and α are operated separately. |
| | ROP3 (between input channels) | Operator | 256-type ROP3 is available by combining ROP2 operations |
| | | Sources of operation | RPF0 to RPF1, virtual RPF, and video processing function output |
| | | Operation control | RGB/YCbCr and α are operated separately. |
| • Color Adjustment Function | | | |
| 1D-LUT | LUT configuration | Independent R/Y, G/Cb, and B/Cr. 256 entries each | |
| Direct connection to Display module | | | |
| Display I/F | Destination | | DU |
| | Direct connection | | Can transfer data without going through external memory to DU |
| Line padding | Padding cycles | | 1 to 32 cycles |
| | Padding pattern | | Arbitrarily setting up to 32 cycles |

#### 33.1.2.3 DU

DU has the following sub modules.

##### (1) REG

The REG controls registers for DU. The DU has APB4 interface, its transaction is transfer with no wait states.

##### (2) LIFC

The LIFC is the interface block from/to VSPD. The LIFC receives image data from VSPD, sends to PBUF in a pixel unit. The LIFC continues to receive the image data from VSPD unless FIFO will be full.

##### (3) PBUF

The PBUF is the asynchronous FIFO which convert clock domain of image data from System Bus Clock to Video Clock. The PBUF watches over FIFO underflow.

##### (4) DIFC

The DIFC is the display timing master. The DIFC controls the polarity and the timing of the control signals (DISP_CLK, DISP_HSYNC, DISP_VSYNC, and DISP_DE). Controllable timings are the followings.

- Hfront: Horizontal front porch (pixels)
- Hback: Horizontal back porch (pixels)
- Hsync: Horizontal sync active (pixels)
- Hactive: Horizontal active area (pixels)
- Vfront: Vertical front porch (lines)
- Vback: Vertical back porch (lines)
- Vsync: Vertical sync active (lines)
- Vactive: Vertical active area (lines)

##### (5) INTC

The INTC generates the interrupt when PBUF will detect FIFO underflow. The interrupt is level signal.

### 33.1.3 External Pins

**Table 33.3** shows the pin configuration.

Table 33.3 LCDC Display Parallel Interface (DPI) External Pins

| Pin Name | Input/Output | Function |
|---|---|---|
| DISP_CLK | Output | Display Parallel Interface pixel clock |
| DISP_HSYNC | Output | Display Parallel Interface Horizontal sync pulse |
| DISP_VSYNC | Output | Display Parallel Interface Vertical sync pulse |
| DISP_DE | Output | Display Parallel Interface data enable |
| DISP_DATA0 | Output | Display Parallel Interface pixel data output Red0 |

### 33.1.4 Clock and Interrupt signal

The following clocks are supplied to the LCDC.

Table 33.4 Clock List

| Clock Name | Clock Symbol | Description | Frequency (MHz) |
|---|---|---|---|
| LCDC_CLK_A | M0ϕ | AXI clock.<br>This clock should be a synchronous clock of LCDC_CLK_P | 200 |
| LCDC_CLK_P | ZTϕ | APB clock.<br>This clock should be a synchronous clock of LCDC_CLK_A | 100 |
| LCDC_CLK_D | M3ϕ | Video clock.<br>The duty of this clock is 50% when the display parallel interface | up to 83.5 |

The LCDC transmits the following interrupt signals to the interrupt controller.

Table 33.5 Interrupt List

| Signal Name | Interrupt Condition | Interrupt Source Register |
|---|---|---|
| VSPD_INT | Frame End | VI6_WPF0_IRQ_STA.FRE |
| | Display List Frame End | VI6_WPF0_IRQ_STA.DFE |
| | DU Connection UnderRun Error | VI6_WPF0_IRQ_STA.UND |
| DU_INT | RBUF FIFO Underflow | DU_MSR0.ST_PB_RUF |

**Note:** Refer to **Section 33.3.2.4(13)**. WPFn Interrupt Status Registers and **Section 33.3.3.1**. DU Module Control Register 0 for details.

## 33.2 Register Configuration

### 33.2.1 FCPVD Register Configuration

The FCPVD contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32bits register.

Never access the registers when the FCPVD is in the module standby mode (with the operation clock placed in hold status).

Base Address: H'0_1088_0000 (Cortex-A55 Address Space)
H'4088_0000 (Cortex-M33 Address Space Non-Secure)
H'5088_0000 (Cortex-M33 Address Space Secure)

Table 33.6 FCPVD Register Configuration

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| FCPVD version control register | FCP_VCR | R | H'0000 0109 | H'0000 | 32 |

### 33.2.2 VSPD Register Configuration

Base Address: H'0_1087_0000 (Cortex-A55 Address Space)
H'4087_0000 (Cortex-M33 Address Space Non-Secure)
H'5087_0000 (Cortex-M33 Address Space Secure)

Lowercase "n" in a register name or a offset address indicates an integer and the range of value n is defined when necessary. For RPFn, and WPFn, when the range of value n is not defined, RPFn (n = 0, 1), WPFn (n = 0) are assumed.

Table 33.7 VSPD Register Configuration (1/3)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| VSPD Start Registers 0 | VI6_CMD0 | R/W*1 | H'0000 0000 | H'0000 | 32 |
| Clock Control Register 0 | VI6_CLK_CTRL0 | R/W | H'0000 0000 | H'0010 | 32 |
| Clock Control Register 1 | VI6_CLK_CTRL1 | R/W | H'0000 0000 | H'0014 | 32 |

Note 1. Read only bits or write only bits or read/write bits are mixed in the registers.

### 33.2.3 DU Register Configuration

The DU contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits), word (16 bits), and byte (8 bits) in the registers. Therefore, read-modify-write is needed to change partial bits not more than 8 bits in 32 bits register.

Never access the registers when the DU is in the module standby mode (with the operation clock placed in hold status).

Base Address: H'0_1089_0000 (Cortex-A55 Address Space)
H'4089_0000 (Cortex-M33 Address Space Non-Secure)
H'5089_0000 (Cortex-M33 Address Space Secure)

Table 33.8 DU Register Configuration

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| DU Module Control Register 0 | DU_MCR0 | R/W | H'00000000 | H'00 | 32/16/8 |

| 7 to 0 | REVISION | H'09 | R | Version of LSI product<br>H'09: FCP revision is this LSI. |

## 33.3.2 VSPD Registers

### 33.3.2.1 Notational Conventions for Registers and Bit Fields

This section uses the following notational conventions for the VSPD registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase “n” in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For RPFn, and WPFn, when the range of value n is not defined, RPFn (n = 0, 1), WPFn (n = 0) are assumed.
4. In each subsection for register description in **Section 33.3.2**, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

### 33.3.2.2 Register Classification

The VSPD registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSPD, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from **Section 33.3.2.4**.

1. General control registers (VI6_CMDn (n = 0, 1), VI6_SRESET, VI6_STATUS, VI6_WPFn_IRQ_* (n = 0))
2. Display list control registers (VI6_DL_*)
3. RPF control registers (VI6_RPFn_* (n = 0, 1))
4. WPF control registers (VI6_WPFn_* (n = 0))
5. DPR control registers (VI6_DPR_*)
6. LUT control register (VI6_LUT_CTRL)
7. BRS control registers (VI6_BRS_*)
8. LIFn control registers (VI6_LIFn_* (n = 0))

The VSPD has two RPF channels and the register configuration is the same for all of RPFn (n = 0, 1). However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all WPFn (n = 0), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to **Table 33.7**.

#### 33.3.2.3 Restrictions on Access to Registers and Lookup Tables

The VSPD has control registers and lookup tables. All VSPD registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSPD will not operate correctly.

1. For the read-only bits and reserved bits in all VSPD registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in **Table 33.7** are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMDn, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDRn, VI6_DL_BODY_SIZE0, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to **Section 33.4.4**.
4. There are three types about General control registers (**Section 33.3.2.4**) and Display List Control Registers (**Section 33.3.2.5**) as below.
   - Controlling WPF0 (ex. VI6_CMD0, VI6_SRESET.SRST0)
   - Common setting of WPF0 (ex. VI6_DL_CTRL.AR_WAIT [15:0])

Table 33.9 Correspondence between Modules and Register Names

| Module Name | Register Name |
|---|---|
| RPFn (n = 0, 1) | VI6_RPFn_* |
| WPFn (n = 0) | VI6_WPFn_* |
| DPR | VI6_DPR_* |
| LUT | VI6_LUT_CTRL |
| BRS | VI6_BRS_* |
| LIFn (n = 0) | VI6_LIFn_* |

### 33.3.2.4 General Control Registers

#### (1) VSPD Start Registers n (VI6_CMDn: n = 0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | UPDHDR | — | — | — | STRCMD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | UPDHDR | 0 | R/W | Reserved state of updating Display List Header (DLH) address.<br>UPDHDR can be negated by software reset (VI6_SRESET.SRSTn).<br>[Write]<br>0: NOP<br>1: Don't set 1 to this bit<br>[Read]<br>0: Not reserved to update DLH address.<br>1: Reserved to update DLH address.<br>Set 0 to this bit when STRCMD bit is set to 1. |
| 3 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | STRCMD | 0 | R/W | Start reservation of WPF<br>VI6_CMDn.STRCMD controls WPFn. Writing 1 to this bit starts WPFn in VSPD. Set this bit for activation only after all register settings in each output channel have been completed.<br>If WPFn is idle, WPFn starts right after this bit is set to 1.<br>If WPFn is active, writing 1 to this bit reserves starting WPFn operation. Wait to set 1 to VI6_CMDn.STRCMD until this bit is read as 0.<br>VI6_CMDn.STRCMD can be negated by software reset (VI6_SRESET.SRSTn).<br>[Write]<br>0: Start reservation of WPFn is canceled.<br>1: Start reservation of WPFn is set.<br>[Read]<br>0: Starting VSPD is not reserved.<br>1: Starting VSPD is reserved. |

The basic concept of image processing operation started by activating the VSPD is shown in **Figure 33.5**. The actual data input/output is executed by the MAU, which is the bus interface module, as described in **Section 33.1.2**, but conceptually the RPF works as the data entry point to the VSPD and the WPF works as the data exit point. To process images through the VSPD, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6_WPFn_SRCRPF, which is a register for WPFn (refer to **Section 33.3.2.7(1)**). This setting determines that RPFn will be started when WPFn is started through VI6_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSPD between RPF and WPF. This function is provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to **Section 33.3.2.8**).

After a data path is formed (RPFn → WPFn) as described above, starting output module WPFn in the VSPD through VI6_CMDn starts all function modules connected to WPFn and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSPD.

There are two types of data path configuration in the VSPD; one is “a single input module to a single output module” as shown in **Figure 33.5 (A)**, and the other is “multiple input modules to a single output module” as shown in **Figure 33.5 (B)**.

**Figure 33.5 (A)** shows an example of a configuration where modules with single input and single output are implemented through the DPR.

**Figure 33.5 (B)** shows another configuration example where the module with multiple input and single output is implemented through the DPR.

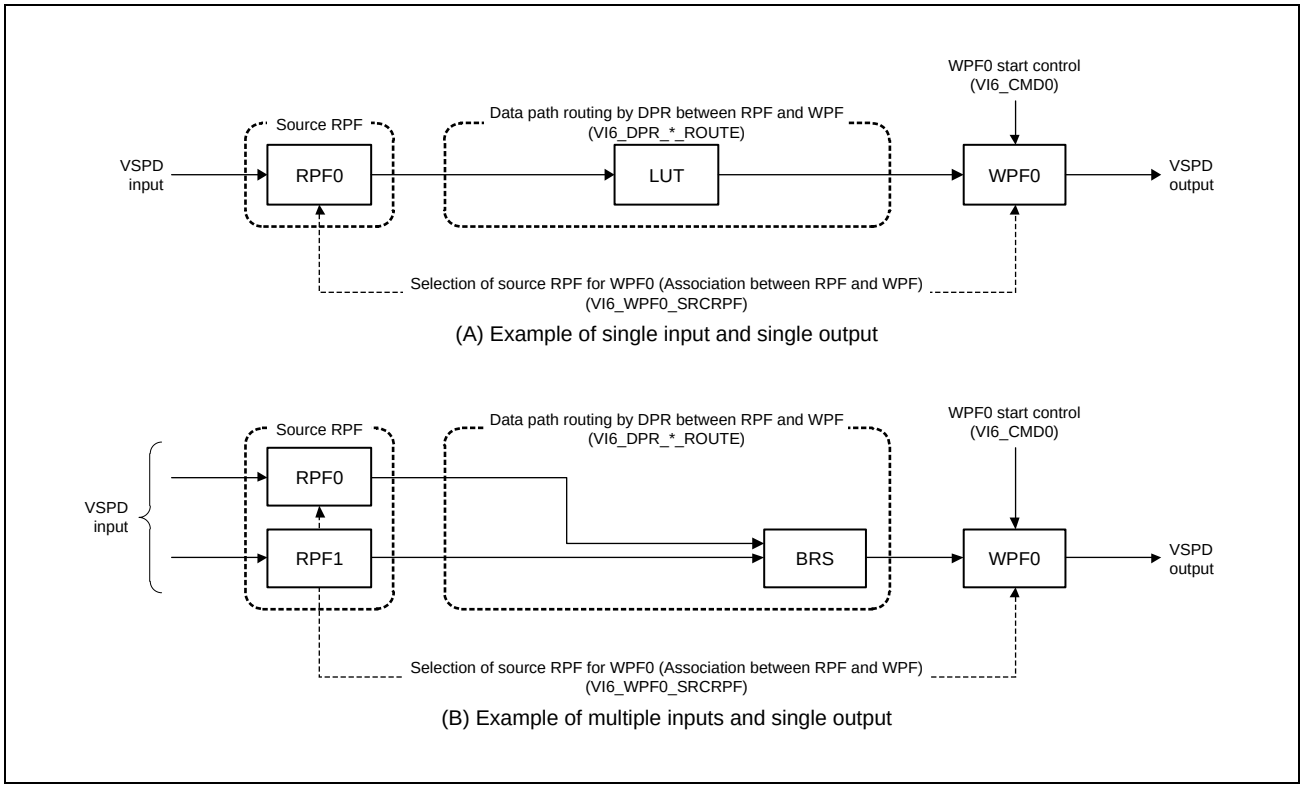

Figure 33.5 Basic Concept of VSPD Startup

### (2) Clock Control Register 0 (VI6_CLK_CTRL0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | GCS0 | — | — | — | — | — | — | — | — | — | — | — | GCS1 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | GCS2 | | | | — | — | — | GCS3 | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | GCS0 | 0 | R/W | Clock Control Setting0 |
| 27 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | GCS1 | 0 | R/W | Clock Control Setting1 |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 8 | GCS2 | 0 | R/W | Clock Control Setting2 |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 to 0 | GCS3 | 0 | R/W | Clock Control Setting3 |

VSPD can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’0000 0000
- VI6_CLK_CTRL1 = H’0000 0000
- VI6_CLK_DCSWT = H’0000 0808
- VI6_CLK_DCSM0 = H’0000 0000
- VI6_CLK_DCSM1 = H’0000 0000

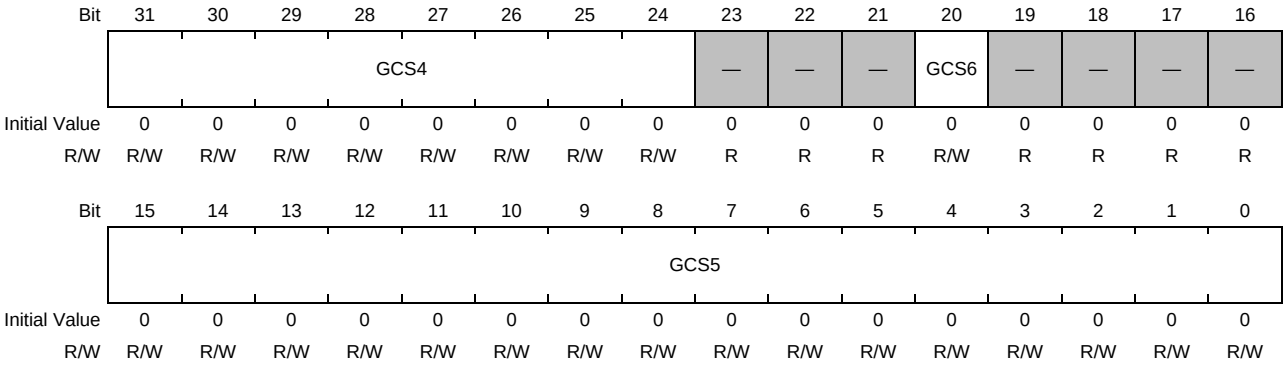
To disable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’1001 0F1F
- VI6_CLK_CTRL1 = H’FF10 FFFF
- VI6_CLK_DCSWT = H’0033 0808
- VI6_CLK_DCSM0 = H’1FFF 0F1F
- VI6_CLK_DCSM1 = H’FF10 FFFF

When the clock gating is enabled, the supply of the clock signal is stopped for the module which is not operated. If the bit field of this register is changed from 0 to 1, the supply of the clock signal for the module is immediately started. If

the bit field of the register is changed from 1 to 0, the clock supply is immediately stopped. Therefore, please do not change this register field from 1 to 0 in operation because the VSPD may be stalled.

### (3) Clock Control Register 1 (VI6_CLK_CTRL1)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | GCS4 | 0 | R/W | Clock Control Setting4 |
| 23 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | GCS6 | 0 | R/W | Clock Control Setting6 |
| 19 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | GCS5 | 0 | R/W | Clock Control Setting5 |

See **Section 33.3.2.4(2)** for detail.

### (4) Dynamic Clock Stop Control Register (VI6_CLK_DCSWT)

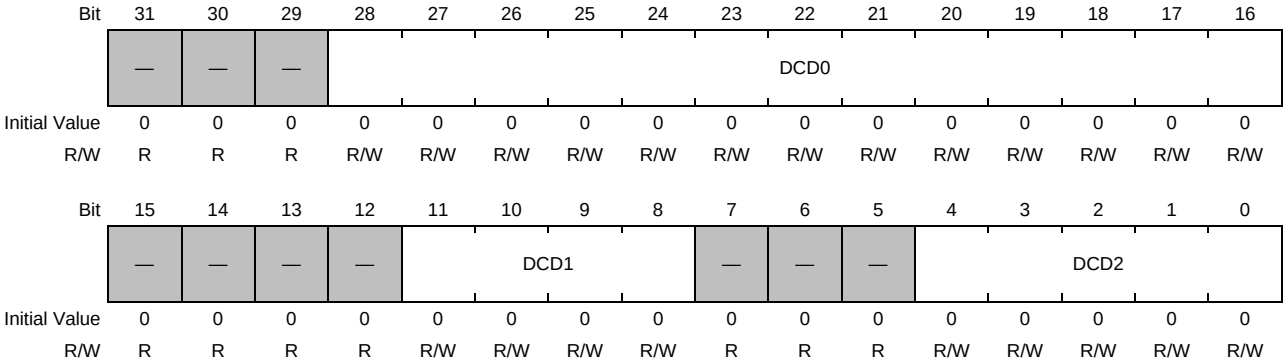
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | DCC0 | | — | — | DCC1 | DCC2 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R | R | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CSTPW[7:0] | | | | | | | | CSTRW[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21, 20 | DCC0 | 0 | R/W | Dynamic Clock Control Setting0 |
| 19, 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | DCC1 | 0 | R/W | Dynamic Clock Control Setting1 |
| 16 | DCC2 | 0 | R/W | Dynamic Clock Control Setting2 |
| 15 to 8 | CSTPW[7:0] | 0 | R/W | Dynamic Clock Stop Control 1<br>Always specify 8. |
| 7 to 0 | CSTRW[7:0] | 0 | R/W | Dynamic Clock Stop Control 2<br>Always specify 8. |

See **Section 33.3.2.4(2)** for detail.

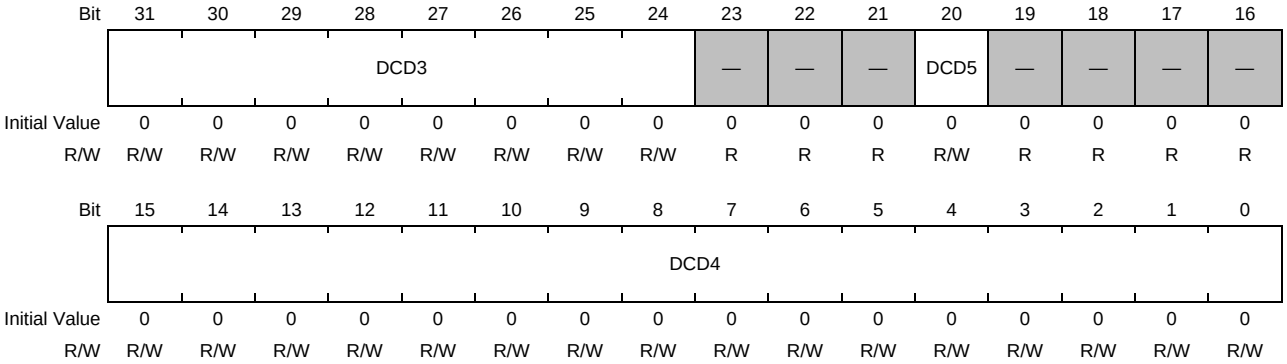
### (5) Dynamic Clock Stop Disable Register 0 (VI6_CLK_DCSM0)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | DCD0 | 0 | R/W | Dynamic Clock Stop Disable Setting0 |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 8 | DCD1 | 0 | R/W | Dynamic Clock Stop Disable Setting1 |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 to 0 | DCD2 | 0 | R/W | Dynamic Clock Stop Disable Setting2 |

See **Section 33.3.2.4(2)** for detail.

### (6) Dynamic Clock Stop Disable Register 1 (VI6_CLK_DCSM1)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | DCD3 | 0 | R/W | Dynamic Clock Stop Disable Setting3 |
| 23 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | DCD5 | 0 | R/W | Dynamic Clock Stop Disable Setting5 |
| 19 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | DCD4 | 0 | R/W | Dynamic Clock Stop Disable Setting4 |

See **Section 33.3.2.4(2)** for detail.

### (7) Software Reset Register (VI6_SRESET)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SRST0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | SRST0 | 0 | R/W | WPFn Software Reset (SRSTn, n = 0)<br>Writing 1 to this bit aborts the current processing in WPFn (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state.<br>When this reset processing is completed, the VI6_WPFn_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing.<br>This bit is always read as 0.<br>0: NOP<br>1: WPFn software reset*1 |

Note 1. Applying a software reset to each WPF has the following restrictions.

1. A software reset can be applied to only one of WPF0 through single write access to VI6_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. The end of software reset processing is notified through the FRE bit in VI6_WPFn_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSPD may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSPD completes operation.
4. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.

### (8) Module Reset Enable Register 0 (VI6_MRESET_ENB0)

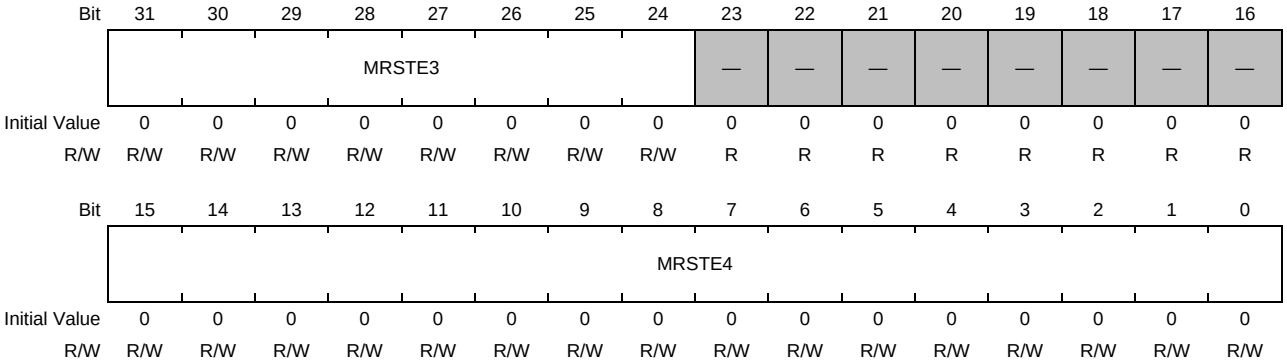
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | MRSTE0 | | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MRSTE1 | | | | — | — | — | MRSTE2 | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 29, 28 | MRSTE0 | 0 | R/W | Module Reset Enable 0 |
| 27 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 8 | MRSTE1 | 0 | R/W | Module Reset Enable 1 |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 to 0 | MRSTE2 | 0 | R/W | Module Reset Enable 2 |

This register is for purpose of h/w debugging.

### (9) Module Reset Enable Register 1 (VI6_MRESET_ENB1)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | MRSTE3 | 0 | R/W | Module Reset Enable 3 |
| 23 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | MRSTE4 | 0 | R/W | Module Reset Enable 4 |

This register is for purpose of h/w debugging.

### (10) Module Reset Issuing Register (VI6_MRESET)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MRST |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | MRST | 0 | R/W | Module Reset Assertion |

This register is for purpose of h/w debugging.

### (11) Operating Status Register (VI6_STATUS)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | FLDST0 | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SYS0_ACT | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | FLDST0 | 0 | R | Field status of previous frame of WPF0.<br>0: Previous finished frame is TOP field.<br>1: Previous finished frame is BOT field.<br><br>This bit can be referred in case of AUTO-FLD or AUTO-DISP.<br>This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE. |
| 27 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | SYS0_ACT | 0 | R | WPFn Operating Status (SYSn_ACT, n=0)<br>Each bit indicates the operating or stopped state of control channel n (WPFn).<br>0: WPFn is stopped.<br>1: WPFn is operating. |
| 7 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### (12) WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNDE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DFEE | FREE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNDE | 0 | R/W | Interrupt Enable for WPFn (n = 0) Underrun in case of DU connection. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | DFEE | 0 | R/W | Interrupt Enable for WPFn (n = 0) Display List Frame End |
| 0 | FREE | 0 | R/W | Interrupt Enable for WPFn (n = 0) Frame End |

Each bit in VI6_WPFn_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPFn_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1.

### (13) WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UND |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DFE | FRE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UND | 0 | R/W | Interrupt Status and Clear for WPFn (n = 0) Underrun in case of DU connection.<br>This interrupt source bit is set to 1 when data underrun occurs in case of DU connection.<br>Timing that this bit is set to 1 is at end of 1 frame. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | DFE | 0 | R/W | Interrupt Status and Clear for WPFn (n = 0) Display List Frame End<br>This interrupt source bit is set to 1 when VSPD completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to **Section 33.4.4**).<br>When display lists are not used, this bit is not used. In this case, clear VI6_WPFn_IRQ_ENB.DFEE to 0 to mask the interrupt generation by this interrupt source.<br><br>This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | FRE | 0 | R/W | Interrupt Status and Clear for WPFn (n = 0) Frame End<br>This interrupt source bit is set to 1 when VSPD completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed.<br>The interrupt status is set to 1 by any of the following conditions.<br>a) Processing one frame is finished normally<br>b) Software reset is issued during VSPD is processing.<br>c) One frame's data from DU is displayed while VSPD couldn't transfer one frame data to DU. (in case of Linked with DU)<br><br>This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared. |

VI6_WPFn_IRQ_STA indicates the state of the interrupt sources generated in the VSPD. Whether to output a VSPD interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPFn_IRQ_ENB. While an interrupt is disabled in VI6_WPFn_IRQ_ENB, the VSPD does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

### (14) Display-n Interrupt Enable Register (VI6_DISPn_IRQ_ENB: n = 0)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R/W | R | R | R/W | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | DSTE | 0 | R/W | Interrupt Enable for Display Start |
| 7 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 | MAEE | 0 | R/W | Interrupt Enable for Display Read Data End |
| 4 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### (15) Display-n Interrupt Status Register (VI6_DISPn_IRQ_STA: n = 0)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 8 | DST | 0 | R/W | Interrupt Enable for Display Start |
| 7, 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 | MAE | 0 | R/W | Interrupt Enable for Display Read Data End |
| 4 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 33.3.2.5 Display List Control Registers

#### (1) Display List Control Register (VI6_DL_CTRL)

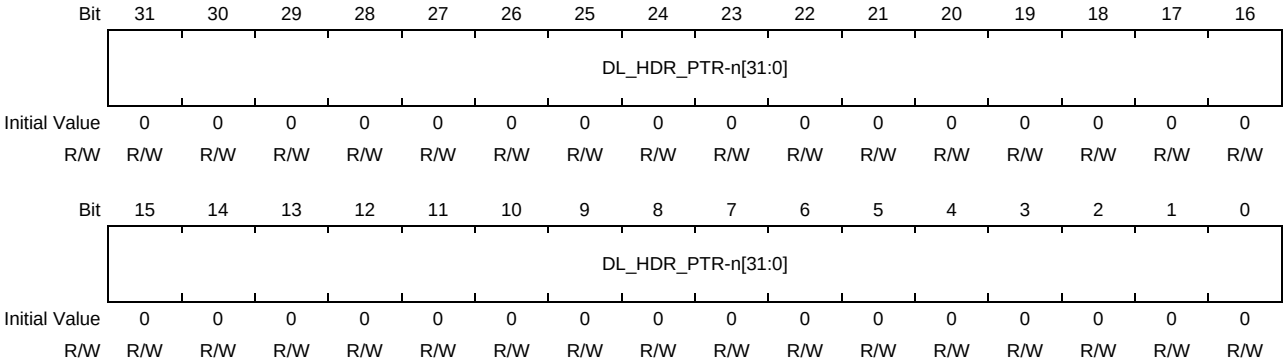
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | AR_WAIT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | DC2 | — | — | — | DC1 | — | — | — | DLE1 | RLM0 | CFM0 | NH0 | DLE0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | AR_WAIT [15:0] | All 0 | R/W | Display List Control Setting<br>Always specify 256. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | DC2 | 0 | R/W | This bit doesn't affect anything to VSPD (NOP) |
| 11 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | DC1 | 0 | R/W | This bit doesn't affect anything to VSPD (NOP) |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | DLE1 | 0 | R/W | This bit doesn't affect anything to VSPD (NOP) |
| 3 | RLM0 | 0 | R/W | Loading two plane Registers Mode for WPF0.<br>0: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also.<br>1: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also. |
| 2 | CFM0 | 0 | R/W | Continuous Frame Mode for Header-less Display List for WPF0<br>This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred.<br>0: Stopped at the end of every frame<br>1: The next frame is automatically started |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | NH0 | 0 | R/W | Header-less Display List Mode<br>This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register.<br>When this bit is changed, make sure that VSPD is stopped. And also make sure the following before starting VSPD.<br>– Header Address (VI6_DL_HDR_ADDR0)<br>– Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode<br>0: Use Display List Header (Normal DL Mode)<br>1: Don't use Display List Header (Header-less Mode)<br>*Note 1.* Only WPF0 supports header-less display list. WPF1 work as the normal display list mode even if the WPF0 is set to header-less display list mode.<br>*Note 2.* When DLE0 bit is 0, set 0 to NH0 bit. |
| 0 | DLE0 | 0 | R/W | Display List Enable/Disable for WPF0<br>Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode.<br>When using display lists, note the restrictions in **Section 33.3.2.3**.<br>0: The display list function is disabled<br>1: The display list function is enabled |

### (2) Display List-n Header Address Register (VI6_DL_HDR_ADDRn: n = 0)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DL_HDR_PTR-n[31:0] | All 0 | R/W | Display List-n Header Address<br>These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPFn is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated.<br><br>A value from H'0000 0000 to H'FFFF FFF0 can be specified. |

### (3) Display List-n Data Swapping Register (VI6_DL_SWAPn: n = 0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | IND | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | LWS | WDS | BTS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | IND | 0 | R/W | Enabling independent swap setting per WPF.<br>This bit is available only for VI6_DL_SWAP1.<br>This bit is reserved for VI6_DL_SWAP0.<br>0: Display list swap for WPF1 is specified by LWS, WDS and BTS in VI6_DL_SWAP0.<br>1: Display list swap for WPF1 is specified by LWS, WDS and BTS in VI6_DL_SWAP1 |
| 30 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | LWS | 0 | R/W | Display List Data Swapping in long word Units<br>The effect of this bit setting is defined in **Table 33.10**.<br>0: Data swapping in long word (32-bit) units is disabled<br>1: Data swapping in long word (32-bit) units is enabled |
| 1 | WDS | 0 | R/W | Display List Data Swapping in Word Units<br>The effect of this bit setting is defined in **Table 33.10**.<br>0: Data swapping in word (16-bit) units is disabled<br>1: Data swapping in word (16-bit) units is enabled |
| 0 | BTS | 0 | R/W | Display List Data Swapping in Byte Units<br>The effect of this bit setting is defined in **Table 33.10**.<br>0: Data swapping in byte (8-bit) units is disabled<br>1: Data swapping in byte (8-bit) units is enabled |

**Table 33.10** shows the data order before and after swapping according to the long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 33.34**, set 111b to {LWS, WDS, BTS}. If data order is different from the definition, change data order within 8byte unit by these bits as shown in **Table 33.10**.

Table 33.10 Changing data order according to display list swap register

| Data order in memory | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Byte address | 8n+0 | 8n+1 | 8n+2 | 8n+3 | 8n+4 | 8n+5 | 8n+6 | 8n+7 | *_LWS | *_WDS | *_BTS |
| Data | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 1 | 1 | 1 |
| | 1 | 0 | 3 | 2 | 5 | 4 | 7 | 6 | 1 | 1 | 0 |
| | 2 | 3 | 0 | 1 | 6 | 7 | 4 | 5 | 1 | 0 | 1 |
| | 3 | 2 | 1 | 0 | 7 | 6 | 5 | 4 | 1 | 0 | 0 |
| | 4 | 5 | 6 | 7 | 0 | 1 | 2 | 3 | 0 | 1 | 1 |
| | 5 | 4 | 7 | 6 | 1 | 0 | 3 | 2 | 0 | 1 | 0 |
| | 6 | 7 | 4 | 5 | 2 | 3 | 0 | 1 | 0 | 0 | 1 |
| | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 0 | 0 | 0 |

| Data order defined in **Table 33.34** | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Byte address | 8n+0 | 8n+1 | 8n+2 | 8n+3 | 8n+4 | 8n+5 | 8n+6 | 8n+7 |
| Data | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

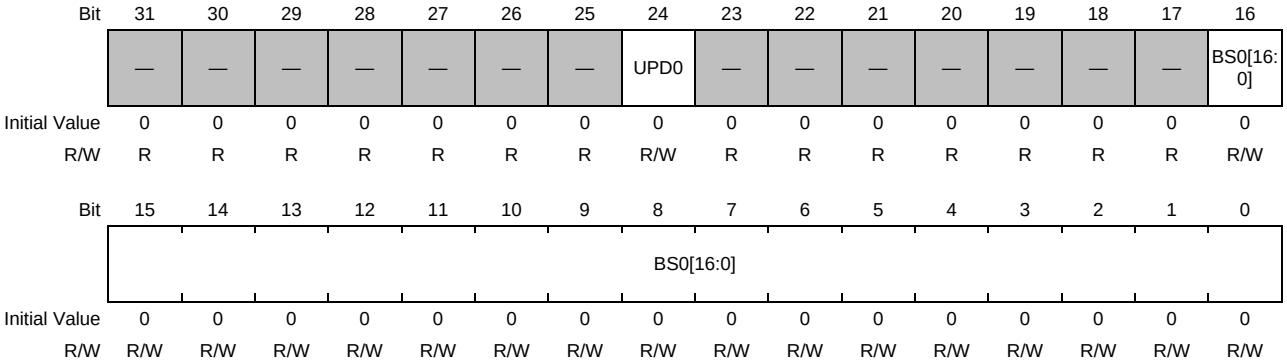
### (4) Extended Display List-n Control Register (VI6_DL_EXT_CTRLn: n = 0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NWE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | POLINT | | | | | | — | — | DLPRI | EXPRI | — | — | — | EXT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | NWE | 0 | R/W | No Wait for Polling<br>When this bit is set to 1, the polling condition for extended display lists is always assumed to be true. |
| 15, 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 8 | POLINT | All 0 | R/W | Extended Display List Command Control<br>Always specify 2. |
| 7, 6 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 | DLPRI | 0 | R/W | Display List Control 0<br>Always specify 1. |
| 4 | EXPRI | 0 | R/W | Display List Control 1<br>Always specify 0. |
| 3 to 1 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | EXT | 0 | R/W | Extended Display List for WPFn<br>Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes.<br>0: No extended display lists are used<br>1: Extended display lists are used<br>[Note]<br>When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLEn); executing only extended display lists is not possible.<br>When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode.<br>Extended Display List is available only for VSPD/LIF0 or VSPDL/LIFn (n = 0, 1) to realized AUTO-FLD or AUTO-DISP. |

### (5) Display List Body Size Register n (VI6_DL_BODY_SIZEn: n = 0)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 24 | UPD0 | 0 | R/W | Update Flag<br>This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. Set 1 to this bit when display list need to be downloaded for next frame. This bit is automatically cleared to 0 after VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) is downloaded in H/W side. When this bit is set to 1, the value of VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) should not be changed.<br>0: Updating display list for the next frame is not reserved<br>1: Updating display list for the next frame is reserved |
| 23 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 to 0 | BS0[16:0] | 0 | R/W | Header-less Display List Body Size (WPFn, n = 0)<br>These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8. |

See **Section 33.4.8.2** for detail.

### (6) Display List-n Header Reference Address Register (VI6_DL_HDR_REF_ADDRn: n = 0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DL_HDR_REF_PTR-n [31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DL_HDR_REF_PTR-n [31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DL_HDR_REF_PTR-n [31:0] | All 0 | R | Display List-n reference Header Address<br>Following value is read out from the VI6_DL_HDR_REF_ADDRn for each period.<br>(1) When H/W is reading display list from external memory, header address of the display list referred by VSPD -H/W is read out.<br>(2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDRn is read out. |

### (7) Display List-0 Wake Up Counter Register (VI6_DL_WUPCNT0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 33.3.2.6 RPF Control Registers

#### (1) RPFn Basic Read Size Registers (VI6_RPFn_SRC_BSIZE)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | BHSIZE[12:0] | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | BHSIZE[12:0] | All 0 | R/W | Horizontal Size of RPF Basic Read Area<br>These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 1920 can be specified.<br>Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE). |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | BVSIZE[12:0] | All 0 | R/W | Vertical Size of RPF Basic Read Area<br>These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 1080 can be specified.<br>Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE). |

**Figure 33.6** shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSPD.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

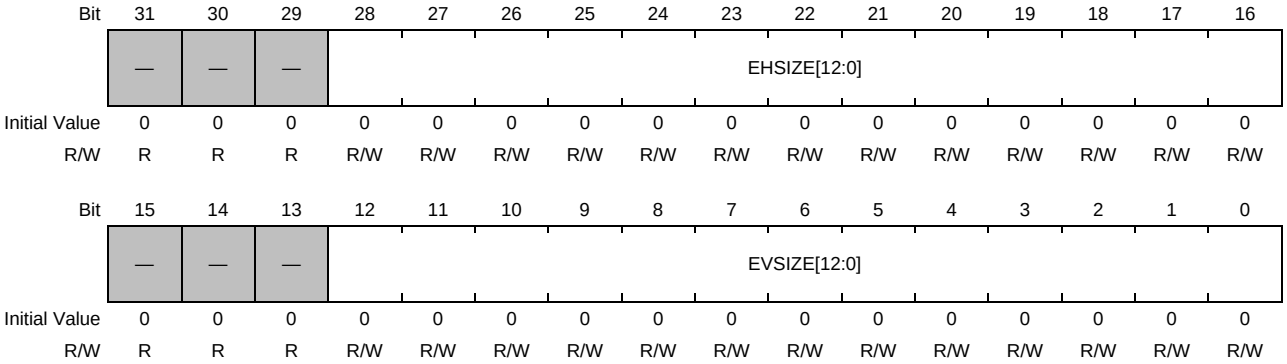
### (2) RPFn Extended Read Size Registers (VI6_RPFn_SRC_ESIZE)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | BHSIZE[12:0] | All 0 | R/W | RPF Extended Horizontal Read Size<br>These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 33.6**, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value).<br>A value from 1 to 1920 can be specified. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | EVSIZE[12:0] | All 0 | R/W | RPF Extended Vertical Read Size<br>These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 33.6**, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value).<br>A value from 1 to 1080 can be specified. |

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in **Section 33.3.2.8** and later sections are all applied to the image in the extended read size shown on the right side in **Figure 33.6**.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | VIR | 0 | R/W | Virtual Input Enable<br>Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSPD. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn.<br>While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in **Section 33.3.2.6(11)** can be used.<br>0: RPFn uses general input.<br>1: RPFn uses virtual input. |
| 27 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CIPM | 0 | R/W | Horizontal Chrominance Interpolation Method Setting<br>Image data is processed in the YCbCr444 format inside VSPD in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in **Figure 33.7** for internal processing. This bit specifies the method of up-sampling for this purpose.<br>0: The nearest-neighbor method is used for horizontal chrominance interpolation.<br>1: The bilinear method is used for horizontal chrominance interpolation. |
| 15 | SPYCS | 0 | R/W | RPF Input Mode Setting 1<br>When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47).<br>When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (H'47).<br>In other cases, set this bit to 0. |
| 14 | SPUVS | 0 | R/W | RPF Input Mode Setting 2<br>When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H'41).<br>When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H'42).<br>When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (H'47).<br>In other cases, set this bit to 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 13, 12 | CEXT[1:0] | All 0 | R/W | Lower-Bit Color Data Extension Method Setting<br>When an RGB input format where each color component is expressed in less than 8 bits are selected from **Table 33.12** through the RDFMT bits, VSPD internally extends each color component to 8 bits before using the data. These bits select this extension method.<br>00b: Lower-order bits of color data are extended with 0.<br>01b: Upper-order bits of color data are copied to the lower -order bits.<br>10b: Lower-order bits of color data are extended with 0. The maximum value is limited to H'FF.<br>11b: Setting prohibited |
| 11 to 9 | RDTM[2:0] | All 0 | R/W | CSC Conversion Expression Setting<br>These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected.<br>0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255]<br>1: BT.601 YCbCr [0,255] ↔ RGB [0,255]<br>2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255]<br>3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235]<br>4 to 7: Setting prohibited |
| 8 | CSC | 0 | R/W | Color Space Conversion Enable<br>Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting.*1<br>When using the virtual input (VIR = 1), specify 0.<br>0: Color space conversion is disabled.<br>1: Color space conversion is enabled. |
| 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 to 0 | RDFMT[6:0] | All 0 | R/W | RPF Input Image Format Setting<br>These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in **Table 33.12** and **Table 33.13**.<br>When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64.<br><br>[Note 1] Number of input pixels<br>When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE. |

Note 1. Note on color space settings

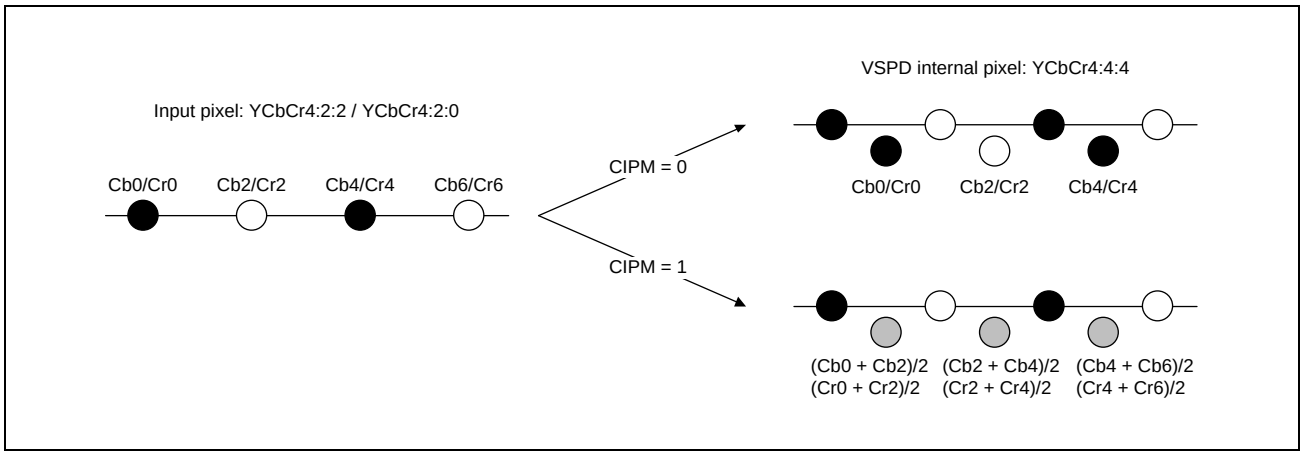

Figure 33.7 Chrominance Interpolation Methods Selectable through CIPM Setting

The color space for the image output from the RPF to VSPD internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (**Table 33.11**). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSPD internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSPD internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 33.11 RPFn Input Color Space and Output Color Space

| RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT) | | Color Space Conversion Setting (VI6_RPFn_INFMT.CSC) | | RPFn Output Color Space |
|---|---|---|---|---|
| RGB | (H'00 to H'3F)*1 | Disabled | (0) *1 | RGB |
| | | Enabled | (1) *1 | YCbCr |
| YCbCr | (H'40 to H'7F)*1 | Disabled | (0) *1 | YCbCr |
| | | Enabled | (1) *1 | RGB |

Note 1. Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in **Table 33.11**, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPFn_OUTFMT.WRFMT.

**Figure 33.8** shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSPD internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in **Table 33.11** and **Figure 33.8**. The user should first determine whether the image processing in the VSPD is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of

VSPD depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in **Figure 33.8.** The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPFn_OUTFMT.WRFMT). For example, in the flow shown in **Figure 33.8.**, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

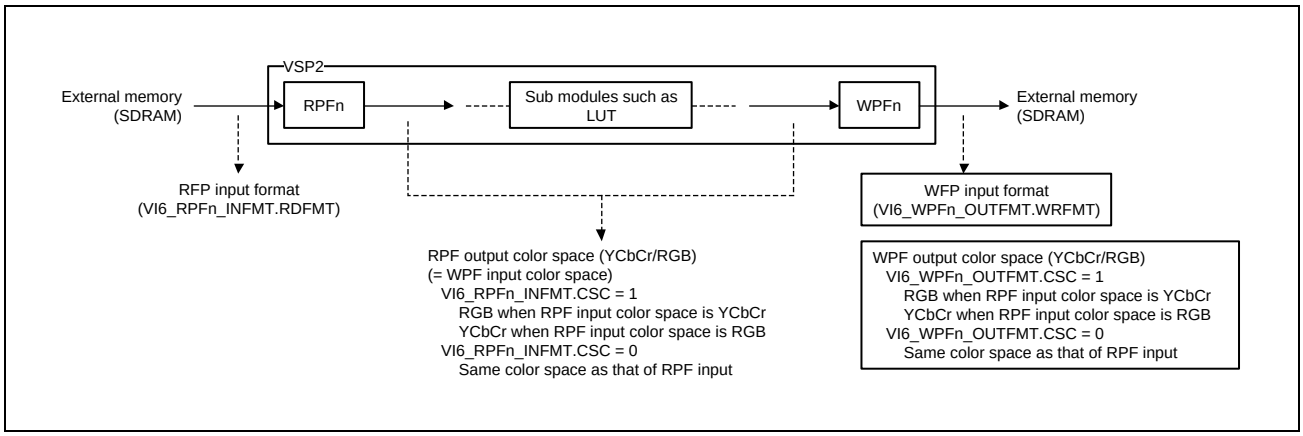

Figure 33.8 Relationship between Input/output Format and Color Space

| H'7f | Reserved | — |

Note 1. When the input format is NV61 or NV21, set the SPUVS bit to 1.

Note 2. When the input format is YUY2, set the SPYCS bit to 1.

Note 3. When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.

Note 4. **Figure 33.12** shows the definition of memory address for each pixel in **Figure 33.9** to **Figure 33.11**.

Note 5. Each line of C plane is read twice, so byte/pixel of YCbCr420 is 2 byte/pixel (same as YCbCr422).

Note 6. Each line of plane is read twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

| 7 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | P_LLS | 0 | R/W | Picture Plane Data Swapping in LONG LWORD Units<br>The effect of this bit setting is defined in **Table 33.14**.<br>0: Data swapping in LONG LWORD (64-bit) units is disabled<br>1: Data swapping in LONG LWORD (64-bit) units is enabled<br>This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases. |
| 2 | P_LWS | 0 | R/W | Picture Plane Data Swapping in long word Units<br>The effect of this bit setting is defined in **Table 33.14**.<br>0: Data swapping in long word (32-bit) units is disabled<br>1: Data swapping in long word (32-bit) units is enabled<br>This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | P_WDS | 0 | R/W | Picture Plane Data Swapping in Word Units<br>The effect of this bit setting is defined in **Table 33.14**.<br>0: Data swapping in Word (16-bit) units is disabled<br>1: Data swapping in Word (16-bit) units is enabled<br>This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases. |
| 0 | P_BTS | 0 | R/W | Picture Plane Data Swapping in Byte Units<br>The effect of this bit setting is defined in **Table 33.14**.<br>0: Data swapping in Byte (8-bit) units is disabled<br>1: Data swapping in Byte (8-bit) units is enabled<br>This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases. |

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

**Table 33.14** shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 33.12** for RGB format and **Figure 33.9** to **Figure 33.12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is different from the definition, change data order within 16byte unit by these bits as shown in **Table 33.14**.

Table 33.14 Changing data order according to swap register

| Data order in memory | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

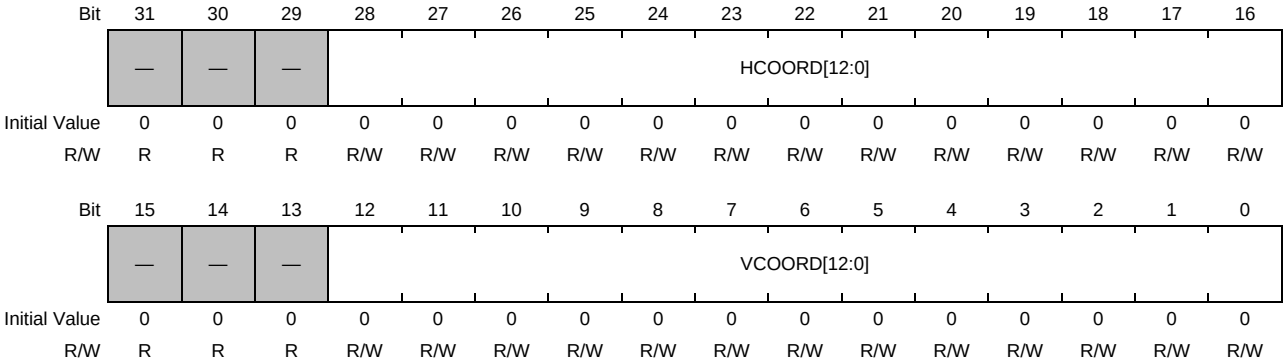
### (5) RPFn Display Location Registers (VI6_RPFn_LOC)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | HCOORD [12:0] | All 0 | R/W | Horizontal Coordinate of Sublayer Display Location on Master Layer<br>These bits specify the left-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0.<br>If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer.<br>A value from 0 to 1919 can be specified. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | VCOORD [12:0] | All 0 | R/W | Vertical Coordinate of Sublayer Display Location on Master Layer<br>These bits specify the top-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0.<br>If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer.<br>A value from 0 to 1079 can be specified. |

**Figure 33.13** shows an example of RPF1 offsets with respect to master layer RPF0. Although this figure only shows sublayers RPF1, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sublayer is determined through the selection of the source RPF for WPFn (the VI6_WPFn_SRCRPF setting). For details, refer to **Section 33.3.2.7(1)**.

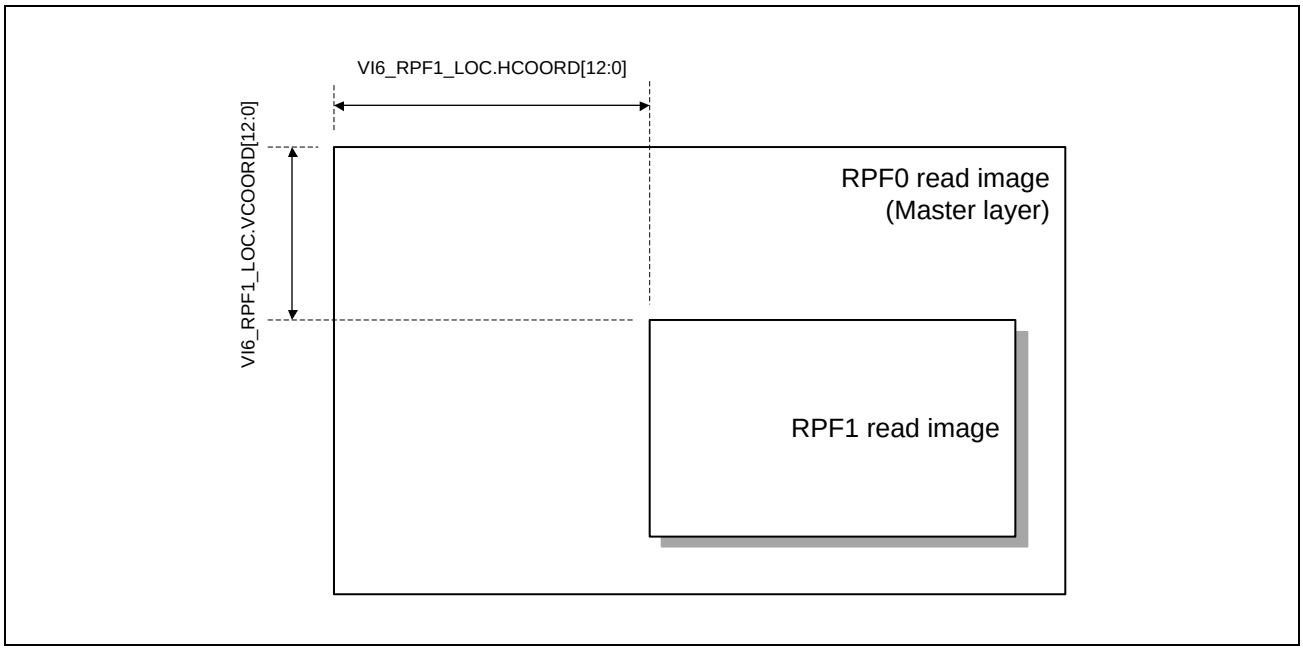


Figure 33.13 RPF1 Offsets from Master Layer

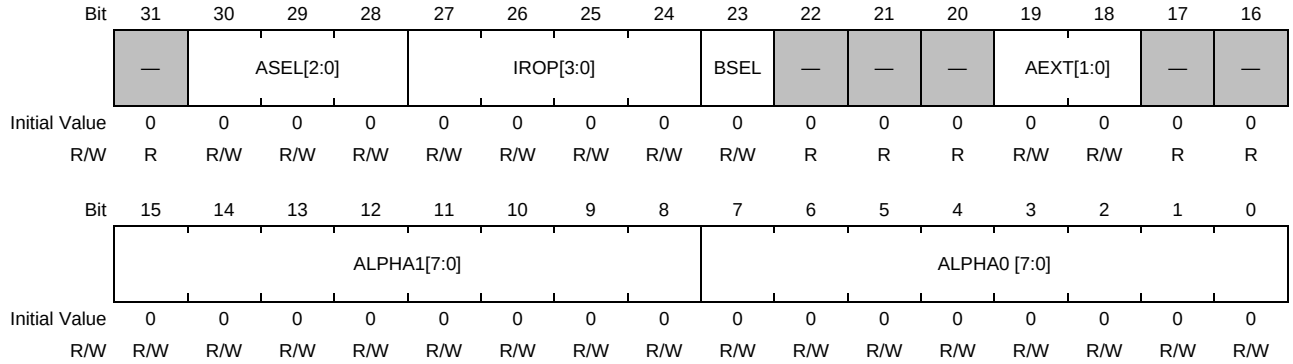
### (6) RPFn α Plane Selection Control Registers (VI6_RPFn_ALPH_SEL)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 30 to 28 | ASEL[2:0] | All 0 | R/W | α Format and Processing Method Select<br>These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSPD assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian).<br>The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in **Figure 33.14** and then output to the subsequent modules. The output α value is used, for example, for blending in the BRS.<br>The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in **Figure 33.14**.<br>Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting.<br>When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), specify 4.<br>0: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15)<br>The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT.<br>When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read.<br>1: 8-bit plane α<br>The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in **Figure 33.14** without change.<br>When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed.<br>2: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15)<br>The 1-bit packed α input is converted by the 8-bit transparent α generator shown in **Figure 33.14** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field.<br>When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read.<br>3: 1-bit plane α<br>The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in **Figure 33.14** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified.<br>When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed.<br>4: Fixed α<br>The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case.<br>5 to 7: Setting prohibited. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 27 to 24 | IROP [3:0] | All 0 | R/W | IROP Operation Setting<br>These bits specify the operator to be executed in the IROP operation unit shown in **Figure 33.14**. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data.<br>If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A).<br>When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1), IROP operation is not available; set these bits to 0000b.<br>0000b: NOP(D)<br>0001b: AND(S & D)<br>0010b: AND_REVERSE(S & ~D)<br>0011b: COPY(S)<br>0100b: AND_INVERTED(~S & D)<br>0101b: CLEAR(0)<br>0110b: XOR(S ^ D)<br>0111b: OR(S \| D)<br>1000b: NOR(~(S \| D))<br>1001b: EQUIV(~(S ^ D))<br>1010b: INVERT(~D)<br>1011b: OR_REVERSE(S \| ~D)<br>1100b: COPY_INVERTED(~S)<br>1101b: OR_INVERTED(~S \| D)<br>1110b: NAND(~(S & D))<br>1111b: SET(all 1) |
| 23 | BSEL | 0 | R/W | α Bit Count Conversion Selection for 1-Bit Mask Generator<br>Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in **Figure 33.14**.<br>Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect.<br>0: 8-bit α is converted to 1-bit α through the 1-bit mask generator.<br>When the 8-bit α value input to the RPF is not 0, it is converted to 1b; when the value is 0, it is converted to 0b.<br>1: α value goes through the 1-bit mask generator.<br>The 1-bit α value input to the RPF is output through the 1-bit mask generator without change. |
| 22 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 to 18 | AEXT[1:0] | All 0 | R/W | Lower-Bit α Value Extension Method Set<br>These bits specify the method for extending the input α data to 8 bits through the unpack processing.<br>00b: The lower-order bits of α value are extended with 0.<br>01b: The upper-order bits of α value are copied to the lower-order bits.<br>10b: The lower-order bits of α value are extended with 0. The maximum value is limited to H'FF.<br>11b: Setting prohibited |
| 17, 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | ALPHA1[7:0] | All 0 | R/W | 8-Bit α Value Output when 1-Bit α Value is 1<br>These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 33.14** is 1b. This setting is valid when the ASEL bits are set to 010b or 011b.<br>A value from 0 to 255 can be specified. |
| 7 to 0 | ALPHA0 [7:0] | All 0 | R/W | 8-Bit α Value Output when 1-Bit α Value is 0<br>These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 33.14** is 0b. This setting is valid when the ASEL bits are set to 010b or 011b.<br>A value from 0 to 255 can be specified. |

**Figure 33.14** shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

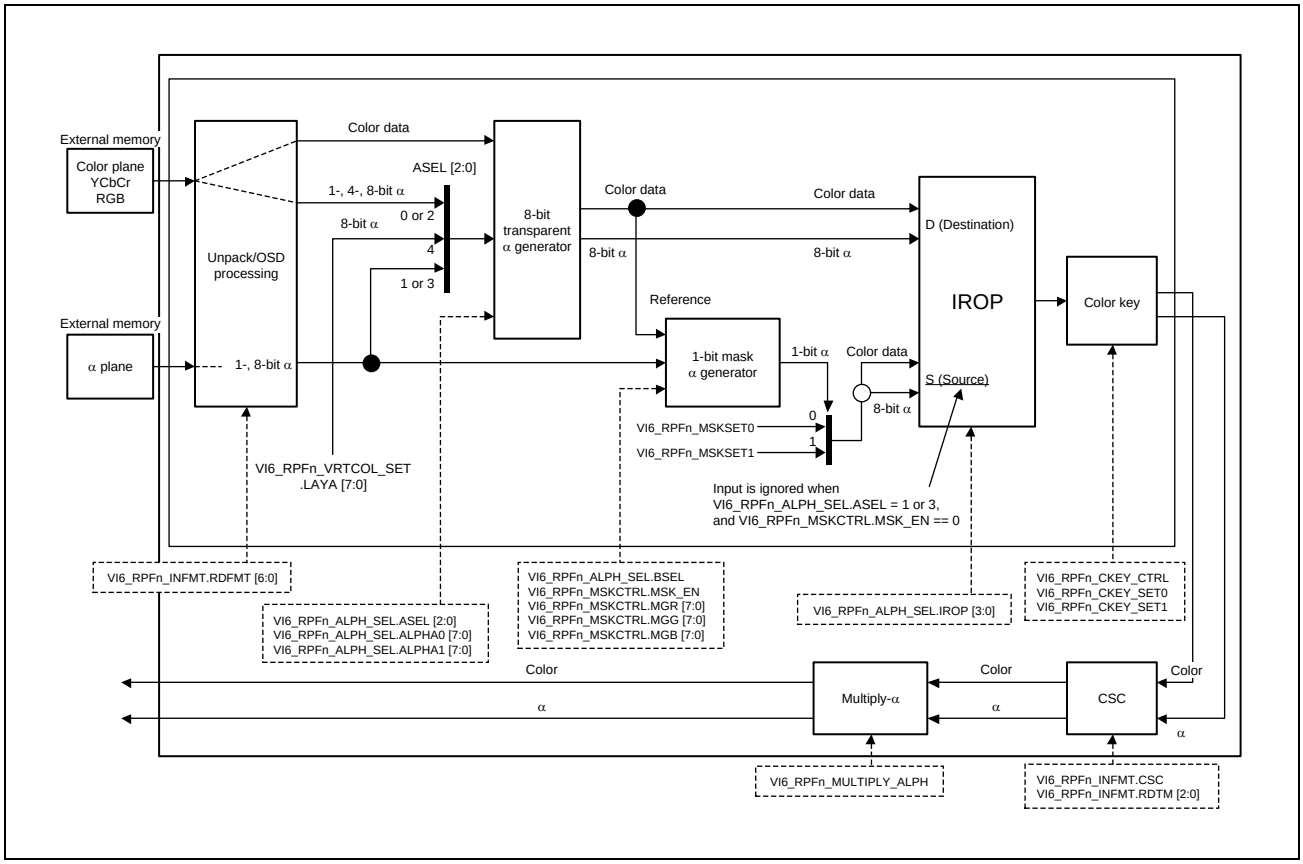


Figure 33.14 Configuration of alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in **Figure 33.14**. Read the following while referring to the figure as necessary.

**Unpack/OSD processor:**

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

**8-bit transparent α generator:**

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

**1-bit mask α generator:**

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of 0b is generated; if the value is not 0, a 1-bit α value of 1b is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is 0b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is 1b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in **Figure 33.14**, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to **Section 33.3.2.6(8)**), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

**IROP operation unit:**

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in **Table 33.15**. Where the source input state is indicated as “Valid” in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 33.15 Source Input State in IROP Operation Unit

| VI6_RPFn_ALPH_SEL.ASEL[2:0] | | VI6_RPFn_MSKCTRL.MSK_EN | | |
|---|---|---|---|---|
| | | 0 (Source data is generated according to input α plane) | | 1 (Source data is generated according to the destination-side pixel data) |
| 000b | (1-, 4-, or 8-bit packed α + plane α) | Valid | (α plane input) | Valid |
| 001b | (8-bit α plane) | Invalid | (IROP operation is not available; α plane is output to the subsequent modules behind RPF) | Valid |
| 010b | (8-bit α generated from 1-bit packed α + plane α) | Valid | (α plane input) | Valid |
| 011b | (8-bit α generated from 1-bit plane α) | Invalid | (IROP operation is not available; α plane is output to the subsequent modules behind RPF) | Valid |
| 100b | (Fixed α) | Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF) | | |

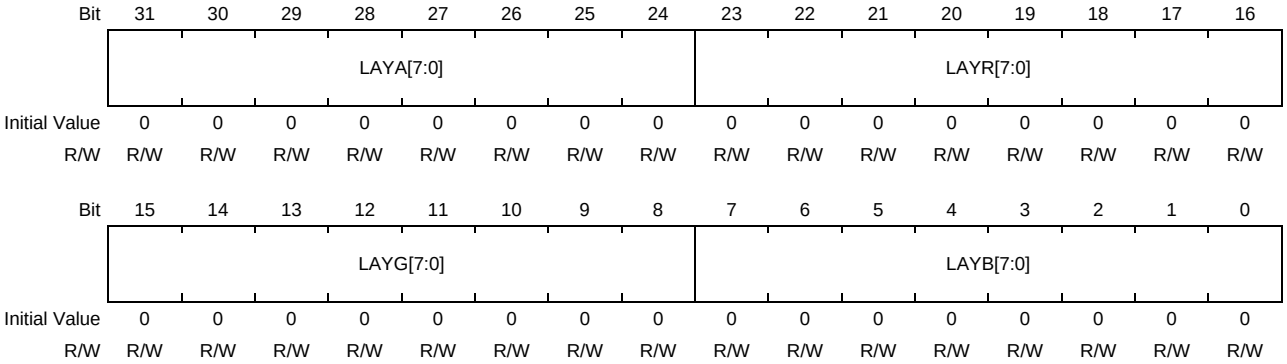
For the handling of the α values shown in **Figure 33.14** and **Table 33.15**, the relationship between the RPF input format and RPF output α value is shown in **Table 33.16**. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

Table 33.16 α Value Selected and Output according to ASEL Bits in Each Input Format

| ASEL Setting | | α Value Output for Each Input Format | |
|---|---|---|---|
| | | RGB | YCbCr |
| 000b | (8-, 4-, or 1-bit packed α is input) | 1- ,4-, or 8-bit pixel α | H’FF*1 |
| 001b | (8-bit plane α is input) | 8-bit α plane | 8-bit α plane |
| 010b | (8-bit α is generated from the 1-bit packed α input) | ALPHA0 or ALPHA1 setting | H’FF*1 |
| 011b | (8-bit α is generated from the 1-bit plane α input) | ALPHA0 or ALPHA1 setting | ALPHA0 or ALPHA1 setting |
| 100b | (Fixed α is output) | VI6_RPFn_VRTCOL_SET.LAYA setting | |

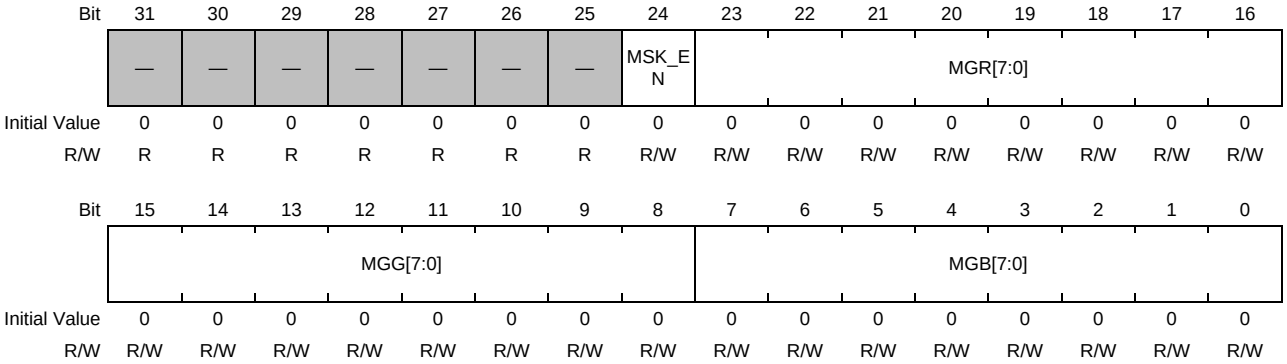
Note 1. Fixed value H’FF is output because packed α is not included in YCbCr.

### (7) RPFn Virtual Plane Color Information Registers (VI6_RPFn_VRTCOL_SET)



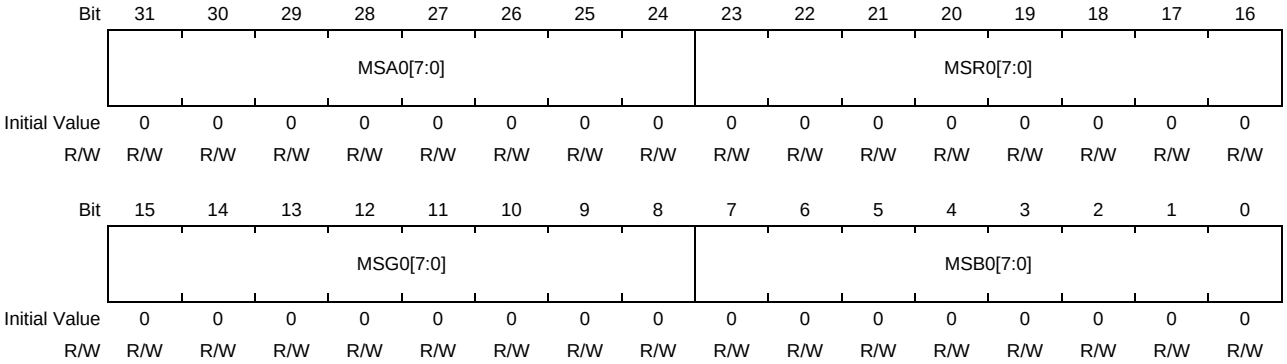
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | LAYA[7:0] | All 0 | R/W | Virtual-Input Fixed α Value<br>These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting.<br>When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified. |
| 23 to 16 | LAYR[7:0] | All 0 | R/W | Virtual-Input Fixed R/Cr Component Value<br>These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified. |
| 15 to 8 | LAYG[7:0] | All 0 | R/W | Virtual-Input Fixed G/Y Component Value<br>These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified. |
| 7 to 0 | LAYB[7:0] | All 0 | R/W | Virtual-Input Fixed B/Cb Component Value<br>These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified. |

### (8) RPFn Mask Control Registers (VI6_RPFn_MSKCTRL)



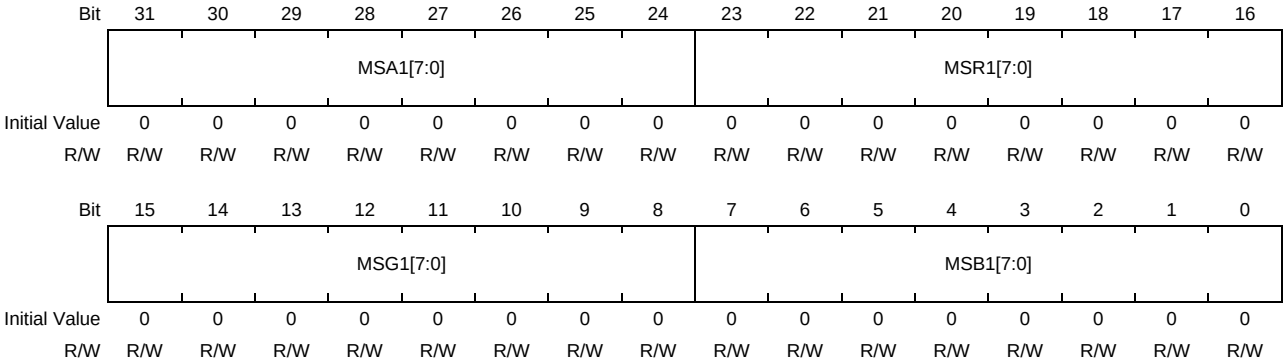
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 24 | MSK_EN | 0 | R/W | Mask Generation Specification<br>Specifies the method of α value generation in the 1-bit mask α generator shown in **Figure 33.14**.<br>0: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the α value is H'00; otherwise, the 1-bit mask value is 1.<br>1: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0. |
| 23 to 16 | MGR[7:0] | All 0 | R/W | R/Cr Comparison Value for 1-Bit α Generation<br>These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison.<br>This setting is ignored when the MSK_EN bit is set 0.<br>A value from 0 to 255 can be specified. |
| 15 to 8 | MGG[7:0] | All 0 | R/W | G/Y Comparison Value for 1-Bit α Generation<br>These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison.<br>This setting is ignored when MSK_EN is set to 0.<br>A value from 0 to 255 can be specified. |
| 7 to 0 | MGB[7:0] | All 0 | R/W | B/Cb Comparison Value for 1-Bit α Generation<br>These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison.<br>This setting is ignored when MSK_EN is set to 0.<br>A value from 0 to 255 can be specified. |

### (9) RPFn IROP-SRC Input Value Registers 0 (VI6_RPFn_MSKSET0)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | MSA0[7:0] | All 0 | R/W | IROP-Source Input α Value when 1-Bit α is 0<br>These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**). A value from 0 to 255 can be specified. |
| 23 to 16 | MSR0[7:0] | All 0 | R/W | IROP-Source Input R/Cr Value when 1-Bit α is 0<br>These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**).<br>When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified. |
| 15 to 8 | MSG0[7:0] | All 0 | R/W | IROP-Source Input G/Y Value when 1-Bit α is 0<br>These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**).<br>When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified. |
| 7 to 0 | MSB0[7:0] | All 0 | R/W | IROP-Source Input B/Cb Value when 1-Bit α is 0<br>These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**).<br>When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified. |

### (10) RPFn IROP-SRC Input Value Registers 1 (VI6_RPFn_MSKSET1)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | MSA1[7:0] | All 0 | R/W | IROP-Source Input α Value when 1-Bit α is 1<br>These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (**Figure 33.14**). |
| 23 to 16 | MSR1[7:0] | All 0 | R/W | IROP-Source Input R/Cr Value when 1-Bit α is 1<br>These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**).<br>When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified. |
| 15 to 8 | MSG1[7:0] | All 0 | R/W | IROP-Source Input G/Y Value when 1-Bit α is 1<br>These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**).<br>When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified. |
| 7 to 0 | MSB1[7:0] | All 0 | R/W | IROP-Source Input B/Cb Value when 1-Bit α is 1<br>These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**).<br>When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified. |

### (11) RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)

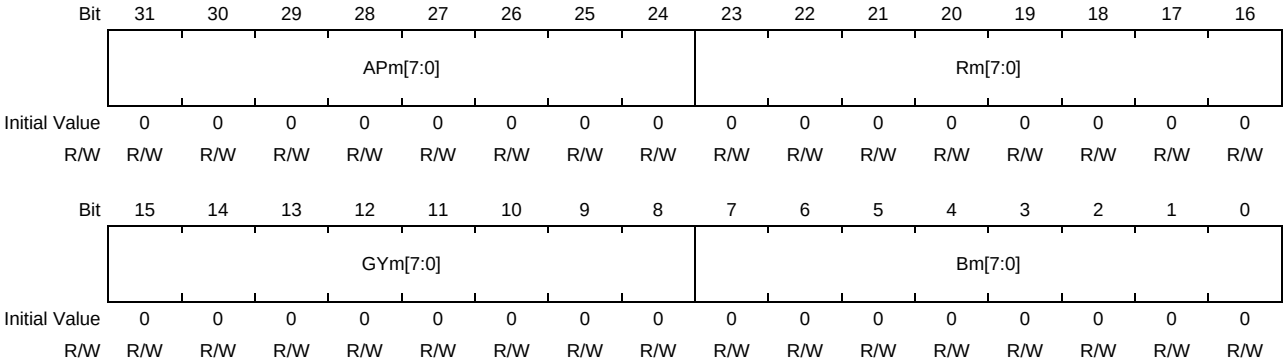
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | LTH | — | — | — | CV | — | — | SAPE1 | SAPE0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | LTH | 0 | R/W | Transparent color-luma Threshold Mode Enable/Disable<br>This bit enables or disables transparent color-luma threshold mode for the color keying module.<br>In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values.<br>When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0.<br>This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0.<br>0: Luma threshold mode is disabled (Matched color mode)<br>1: Luma threshold mode is enabled |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | CV | 0 | R/W | Color Replacement Control<br>This bit controls the color replacement function in the color keying module shown in **Figure 33.2**. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1.<br>When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0.<br>0: Color replacement function is disabled (transparent color mode).<br>1: Color replacement function is enabled. |
| 3, 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | SAPE1 | 0 | R/W | Comparison Color Data Setting 1 Enable/Disable<br>This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1.<br>In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared.<br>When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0.<br>0: Comparison color data setting 1 is disabled.<br>1: Comparison color data setting 1 is enabled. |
| 0 | SAPE0 | 0 | R/W | Comparison Color Data Setting 0 Enable/Disable<br>This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1.<br>In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared.<br>When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), clear this bit to 0.<br>0: Comparison color data setting 0 is disabled.<br>1: Comparison color data setting 0 is enabled. |

### (12) RPFn Color Keying Color Setting Registers m (VI6_RPFn_CKEY_SETm : m = 0, 1)

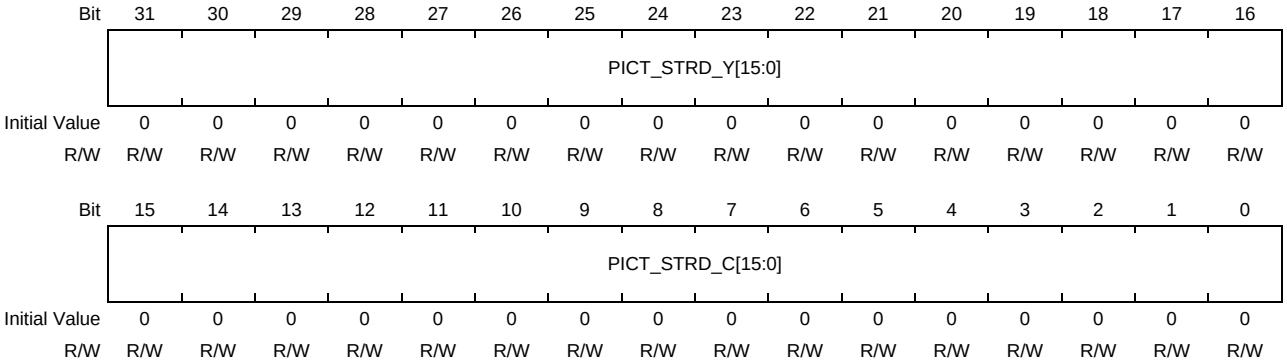


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | APm[7:0] | All 0 | R/W | α Data in Color Keying Color Information-m<br>● In transparent color-matched color mode for color keying<br>When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value.<br>● In transparent color-luma threshold mode for color keying<br>When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0).<br>Specify the α value in this bit field (AP0) to replace the input value.<br>AP1 is not used in this mode. Set AP1 to 0 value.<br>● In color replacement mode for color keying<br>These bits are not used in this mode. Clear them to 0.<br>α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting.<br>A value from 0 to 255 can be specified. |
| 23 to 16 | Rm[7:0] | All 0 | R/W | R*1/Cr Component Data in Color Keying Color Information-m<br>● In transparent color-matched color mode for color keying<br>Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored.<br>● In transparent color-luma threshold mode for color keying<br>The color keying module does not refer this bit field, and the setting of these bits is ignored.<br>● In color replacement mode for color keying<br>Specify the R component value to be compared with the input data in the color replacement function of the color keying module.<br>A value from 0 to 255 can be specified. |
| 15 to 8 | GYm[7:0] | All 0 | R/W | G*1/Y Component Data in Color Keying Color Information-m<br>● In transparent color-matched color mode for color keying<br>Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting.<br>● In transparent color-luma threshold mode for color keying<br>Specify the Y component value in the GY0 to be compared.<br>● In color replacement mode for color keying<br>Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module.<br>A value from 0 to 255 can be specified. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 0 | Bm[7:0] | All 0 | R/W | B*1/Cb Component Data in Color Keying Color Information-m<br>• In transparent color-matched color mode for color keying<br>Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored.<br>• In transparent color-luma threshold mode for color keying<br>The color keying module does not refer this bit field, and the setting of these bits is ignored.<br>• In color replacement mode for color keying<br>Specify the B component value to be compared with the input data in the color replacement function of the color keying module.<br>A value from 0 to 255 can be specified. |

Note 1. When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

### (13) RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | PICT_STRD_Y[15:0] | All 0 | R/W | Memory Stride of Source Picture Y/RGB Plane<br>These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn.<br>A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings. |
| 15 to 0 | PICT_STRD_C[15:0] | All 0 | R/W | Memory Stride of Source Picture C Plane<br>These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set.<br>A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings.<br>In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes. |

This register specifies the memory stride of the picture planes in the source area as shown in **Figure 33.15**. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in **Figure 33.15**. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to **Section 33.3.2.6(6)**.

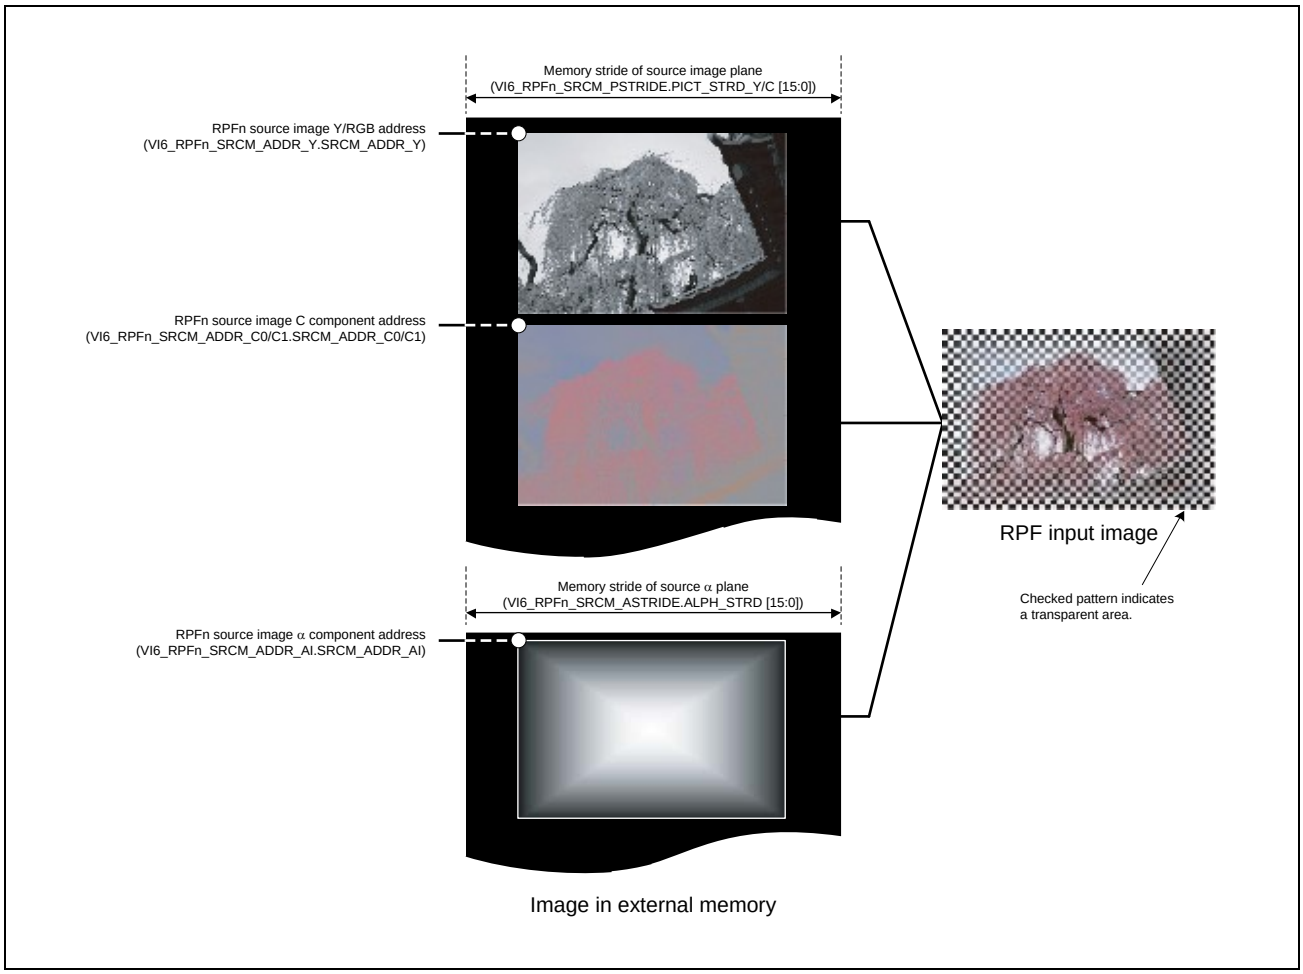


Figure 33.15 Reading an Image from RPFn Source Area

### (14) RPFn Source α Memory Stride Setting Registers (VI6_RPFn_SRCM_ASTRIDE)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ALPH_STRD[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | ALPH_STRD [15:0] | All 0 | R/W | Memory Stride of Source α Plane<br>These bits specify in 1-byte units the memory stride of the source α plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings. |

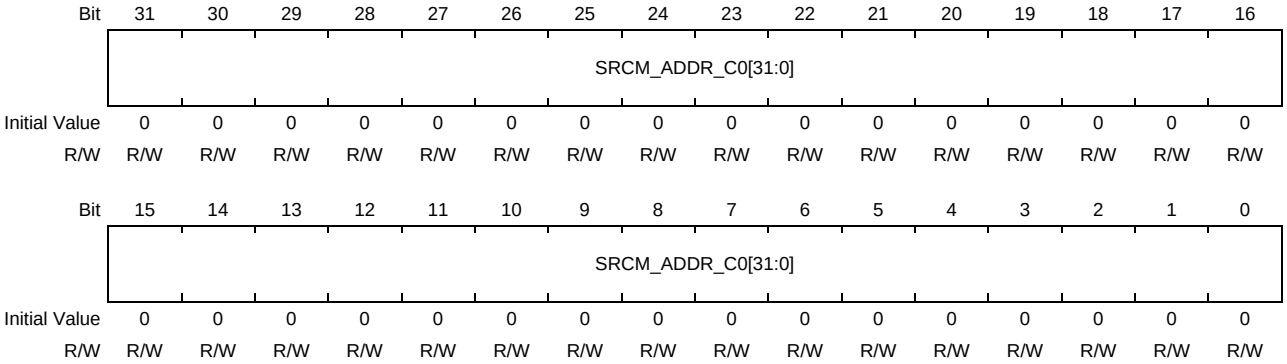
### (15) RPFn Source Y/RGB Address Registers (VI6_RPFn_SRCM_ADDR_Y)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SRCM_ADDR_Y[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SRCM_ADDR_Y[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

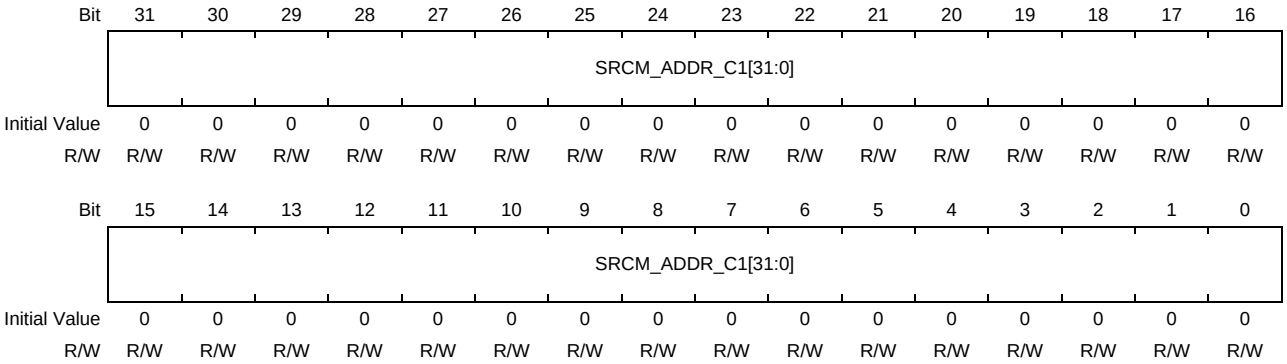
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SRCM_ADDR _Y[31:0] | All 0 | R/W | Source Image Y/RGB Plane Storing Address<br>These bits specify in 1-byte units the start address of the source image Y plane and packed RGB plane read by the RPFn.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings. |

### (16) RPFn Source Chroma Address Registers 0 (VI6_RPFn_SRCM_ADDR_C0)



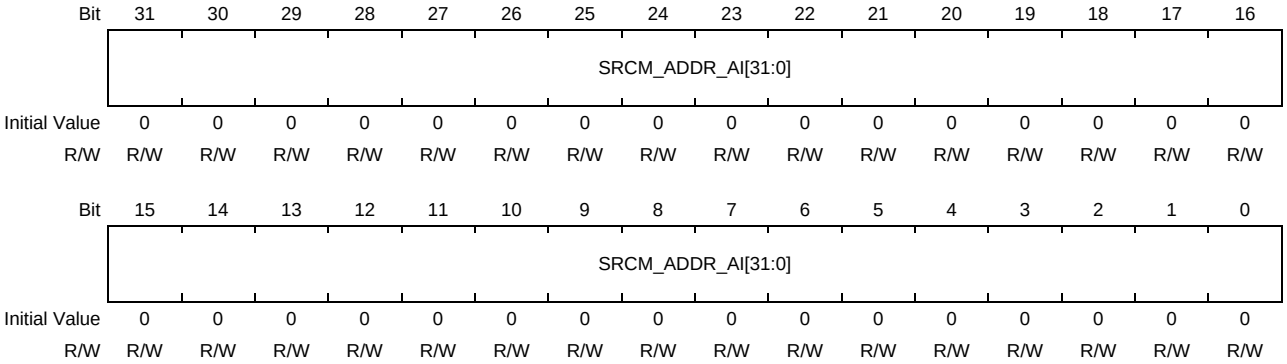
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SRCM_ADDR_C0[31:0] | All 0 | R/W | Source Image C Plane Storing Address 0<br>These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Figure 33.15** or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings. |

### (17) RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1)



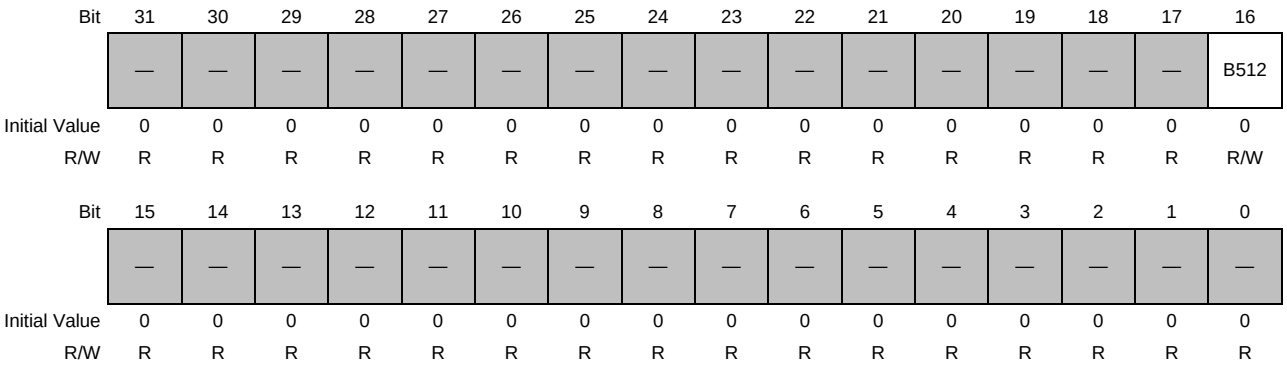
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SRCM_ADDR_C1[31:0] | All 0 | R/W | Source Image C Plane Storing Address 1<br>These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in **Figure 33.15** is read by the RPFn.<br>This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings. |

### (18) RPFn Source α Address Registers (VI6_RPFn_SRCM_ADDR_AI)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SRCM_ADDR_AI[31:0] | All 0 | R/W | Source Image α Plane Storing Address<br>These bits specify in 1-byte units the start address of the α plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the α plane is not read from the source area, these bits do not need to be set.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings. |

### (19) RPFn Bus Access Control Registers (VI6_RPFn_BAC)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | B512 | 0 | R/W | Burst access in 512 pixels' enable<br>0: burst access in 256 pixels<br>1: burst access in 512 pixels<br>Always set 0 to this bit |
| 15 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### (20) RPFn Multiple Alpha Control Registers (VI6_RPFn_MULT_ALPH)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | A_MMD | — | — | P_MMD[1:0] | | ALPHA_RATIO[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | A_MMD | 0 | R/W | 0: Alpha data go through multiply-alpha unit.<br>1: Multiply-alpha unit multiplies alpha data by specified alpha (ALPHA_RATIO[7:0]).<br>When output format from CSC unit is YCbCr, set 0 to this bit. |
| 11, 10 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9, 8 | P_MMD[1:0] | All 0 | R/W | 0: Image data go through multiply-alpha unit.<br>1: Multiply-alpha unit multiplies image data by specified alpha (ALPHA_RATIO[7:0]).<br>2: Multiply-alpha unit multiplies image data by alpha data.<br>3: Multiply-alpha unit multiplies image data by alpha data and specified alpha (ALPHA_RATIO[7:0]).<br>When output format from CSC unit is YCbCr, set 0 to this bit. |
| 7 to 0 | ALPHA_RATIO[7:0] | All 0 | R/W | Multiply alpha value |

ALPin: Input Alpha data to Multiply-alpha unit

PIXin(R): Input R data to Multiply-alpha unit

PIXin(G): Input G data to Multiply-alpha unit

PIXin(B): Input B data to Multiply-alpha unit

ALPout: Output Alpha data from Multiply-alpha unit

PIXout(R): Output R data from Multiply-alpha

PIXout(G): Output G data from Multiply-alpha

PIXout(B): Output B data from Multiply-alpha

Table 33.17 Expression of output alpha data from Multiply-alpha unit

| A_MMD | ALPHA_RATIO[7:0] | Expression |
|---|---|---|
| 0 | Don't care | ALPout = ALPin |
| 1 | Not 255 | ALPout = ALPin * ALPHA_RATIO / 256 |
| | 255 | ALPout = ALPin |

Table 33.18 Expression of output pixel data from Multiply-alpha unit

| P_MMD[1:0] | ALPHA_RATIO[7:0] | ALPin | Expression |

### 33.3.2.7 WPF Control Registers

#### (1) WPFn-Source-RPF Registers (VI6_WPFn_SRCRPF)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | VIR_ACT2[1:0] | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | RPF1_ACT[1:0] | | RPF0_ACT[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25, 24 | VIR_ACT2 [1:0] | All 0 | R/W | Virtual RPF Start Enable in BRS<br>These bits enable start of the virtual RPF in the BRS as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following.<br>**Section 33.3.2.10(1) BRS Input Control Register (VI6_BRS_INCTRL)**<br>**Section 33.3.2.10(2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)**<br>**Section 33.3.2.10(3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)**<br>**Section 33.3.2.10(4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)**<br>Note that the virtual RPF is in the BRS as shown in **Figure 33.28** and there are no register bits for DPR setting related to the virtual RPF.<br>0: The virtual RPF in the BRS is not started.<br>1: The virtual RPF in the BRS is started as a sublayer source RPF for the WPFn.<br>2: The virtual RPF in the BRS is started as the master-layer source RPF for the WPFn.<br>3: Setting prohibited |
| 23 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3, 2 | RPF1_ACT [1:0] | All 0 | R/W | RPFn Start Enable (RPFn_ACT, n = 0 to 1)<br>These bits enable start of RPFn as the source RPF for the WPFn when the WPFn is started. When RPFn is not started by any of the WPFn (n = 0), set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to D'63.<br>0: RPFn is not started.<br>1: RPFn is started as a sublayer source RPF for the WPFn.<br>2: RPFn is started as the master-layer source RPF for the WPFn.<br>3: Setting prohibited |
| 1, 0 | RPF0_ACT [1:0] | All 0 | R/W | |

When the WPFn is started through the VSPD start register n (VI6_CMDn: n = 0), the RPF and virtual RPF in the BRS specified as the source RPF in this register are also started to supply data to the VSPD internal modules.

Note the following when specifying the source RPF.

(1) When blending or ROP operation is applied to multiple images through the BRS, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs.

Do not assign all RPFs as sublayer source RPFs (VI6_WPF1_SRCRPF = H'00000015) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = H'0000025A) (such settings are prohibited).

(2) When the BRS is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

### (2) WPFn Horizontal Input Size Clipping Registers (VI6_WPFn_HSZCLIP)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | HCEN | — | — | — | — | HCL_OFST[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | HCL_SIZE[12:0] | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | HCEN | 0 | R/W | Horizontal Size Clipping Enable/Disable<br>Enables or disables clipping of the horizontal size of the WPFn input image.<br>0: Horizontal size clipping is disabled<br>1: Horizontal size clipping is enabled |
| 27 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 to 16 | HCL_OFST [7:0] | All 0 | R/W | Horizontal Size Clipping Offset Value Setting<br>These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (**Figure 33.16**). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored.<br>A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | HCL_SIZE [12:0] | All 0 | R/W | Horizontal Clipping Size Setting<br>When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPFn input image are discarded. When the HCEN bit is 0, this setting is ignored.<br>A value from 1 to 1920 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly.<br>(Note)<br>When the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits. |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SPYCS | SPUVS | DITH[1:0] | | WRTM[2:0] | | | CSC | — | WRFMT[6:0] | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | PDV [7:0] | All 0 | R/W | PAD Value in Output Packed Data<br>These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 33.19**. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified. |
| 23 | PXA | 0 | R/W | PAD Data Select<br>Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in **Table 33.20**. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in **Table 33.19** are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPFn_RNDCTRL.ABRM setting. For bit count reduction, refer to **Figure 33.17** and the description of VI6_WPFn_RNDCTRL.ABRM.<br>0: The value specified in the PDV bits is stored in the PAD shown in **Table 33.19**.<br>1: The α value output from DPR in pixel units is stored in the PAD shown in **Table 33.19**. |
| 22 | ODE | 0 | R/W | Ordered Dither (mode A) Enable/Disable<br>0: Ordered dither (mode A) is disabled.<br>1: Ordered dither (mode A) is enabled.<br>When the output format specified through the WRFMT bits is YCbCr, specify 0 in this bit. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in this bit even in the case that the output format specified through the WRFMT bits is RGB.<br>Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1, set WRFMT at 18bpp format.<br>When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register<br>Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp. |
| 21 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 to 16 | ROT[2:0] | All 0 | R/W | Rotation Processing Select<br>These bits select the flipping processing to be applied to the WPFn output image. **Figure 33.18** shows the correspondence between the original image and the flipping result according to each setting.<br>0: No flipping<br>1: Vertical flipping<br>Note that the destination address setting should be changed according to the setting of these bits. For details, refer to **Section 33.3.2.7(9)**.<br>When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to ROT[2:0]. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | SPYCS | 0 | R/W | WPF Output Mode Setting 1<br>When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47).<br>When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (H'47).<br>In other cases, set this bit to 0. |
| 14 | SPUVS | 0 | R/W | WPF Output Mode Setting 2<br>When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41).<br>When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42).<br>When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (H'47).<br>In other cases, set this bit to 0. |
| 13, 12 | DITH[1:0] | All 0 | R/W | Ordered Dither (mode B) Enable/Disable<br>When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction.<br>When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits.<br>And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in these<br>bits even in the case that the output format specified through the<br>WRFMT bits is RGB.<br>0: Dithering (mode B) is disabled<br>3: Dithering (mode B) is enabled<br>1, 2: Setting prohibited<br>When ODE bit in the register is 1, set this bit to 0. |
| 11 to 9 | WRTM[2:0] | All 0 | R/W | CSC Conversion Expression Setting<br>These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr.<br>0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255]<br>1: BT.601 YCbCr [0,255] ↔ RGB [0,255]<br>2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255]<br>3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235]<br>4 to 7: Setting prohibited |
| 8 | CSC | 0 | R/W | Color Space Conversion Setting<br>Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPFn. The characteristics of color space conversion are determined by the WRTM setting.<br>There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in **Section 33.3.2.6(3)**, RPFn Input Format Registers (VI6_RPFn_INFMT).<br>0: Color space is not converted.<br>1: Color space is converted. |
| 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 6 to 0 | WRFMT[6:0] | All 0 | R/W | WPF Output Image Format Setting<br>These bits select the format of the image output from the WPFn to the external memory from among those listed in **Table 33.19** and **Table 33.20**.<br>[Note 1] Number of output pixels<br>When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF -> DPR -> target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings.<br>[Note 2] Output lines in YCbCr4:2:0<br>In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in **Figure 33.19**).<br>[Note 3] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2<br>In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels. |

Table 33.20 Packed YCbCr Formats for WPF Output

| WRFMT[6:0] | Packed YCbCr Output Format | Reference |
|---|---|---|
| H'40 | YCbCr4:4:4 semi-planar | **Figure 33.9***4 |
| H'41 | YCbCr4:2:2 semi-planar (NV16, NV61*1) | |
| H'42 | YCbCr4:2:0 semi-planar (NV12, NV21*1) | |
| H'43 to H'45 | Reserved | — |
| H'46 | YCbCr4:4:4 interleaved | **Figure 33.10***4 |
| H'47 | YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3) | |
| H'48 | YCbCr4:2:2 interleaved type 1 | |
| H'49 | YCbCr4:2:0 interleaved *5 | |
| H'4A | YCbCr4:4:4 planar | **Figure 33.11***4 |
| H'4B | YCbCr4:2:2 planar (YV16) | |
| H'4C | YCbCr4:2:0 planar (YV12, I420) | |
| H'4D to H'7F | Reserved | — |

Note 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

Note 2. When the output format is YUY2, set SPYCS (bit 15) to 1.

Note 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

Note 4. **Figure 33.12** shows the definition of memory address for each pixel in **Figure 33.9** to **Figure 33.11**.

Note 5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to **Figure 33.9**, **Figure 33.10**, **Figure 33.11**, **Figure 33.12**. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

| (RPF registers in the figures) | → | (Corresponding WPF registers) |
|---|---|---|
| VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y | → | VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y |
| VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0 | → | VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0 |
| VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1 | → | VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1 |

### (5) WPFn Data Swapping Registers (VI6_WPFn_DSWAP)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | P_LLS | P_LWS | P_WDS | P_BTS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | P_LLS | 0 | R/W | WPF Output Data Swapping in LONG LWORD Units<br>The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.14**.<br>0: Data swapping in LONG LWORD (64-bit) units is disabled<br>1: Data swapping in LONG LWORD (64-bit) units is enabled |
| 2 | P_LWS | 0 | R/W | WPF Output Data Swapping in long word Units<br>The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.14**.<br>0: Data swapping in long word (32-bit) units is disabled<br>1: Data swapping in long word (32-bit) units is enabled |
| 1 | P_WDS | 0 | R/W | WPF Output Data Swapping in Word Units<br>The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.14**.<br>0: Data swapping in word (16-bit) units is disabled<br>1: Data swapping in word (16-bit) units is enabled |
| 0 | P_BTS | 0 | R/W | WPF Output Data Swapping in Byte Units<br>The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.14**.<br>0: Data swapping in byte (8-bit) units is disabled<br>1: Data swapping in byte (8-bit) units is enabled |

**Table 33.14** shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in **Table 33.19** for RGB format and **Figure 33.9** to **Figure 33.12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 33.14**.

### (6) WPFn Rounding Control Registers (VI6_WPFn_RNDCTRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | CBRM | — | — | ABRM[1:0] | | ATHRESH[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | CLMD[1:0] | | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | CBRM | 0 | R/W | Bit Count Reduction Method Selection for Data Storage in Packed RGB<br>This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 33.19** and the target bit fields are not 8 bits.<br>0: Bit count conversion: The lower-order bits are truncated<br>1: Bit count conversion: Rounding (rounding off) |
| 27, 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25, 24 | ABRM[1:0] | All 0 | R/W | Bit Count Reduction Method Selection for Data Storage in PAD<br>These bits specify the method for reducing the number of bits when the data selected through VI6_WPFn_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in **Table 33.19** and the target bit field is four bits or one bit.<br>A value of 10b can be specified only when the packed RGB format specified through VI6_WPFn_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPFn_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored.<br>00b: Bit count conversion: The lower-order bits are truncated<br>01b: Bit count conversion: Rounding (rounding off)<br>10b: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit)<br>11b: Setting prohibited |
| 23 to 16 | ATHRESH [7:0] | All 0 | R/W | Threshold for Conversion to 1-Bit α Data<br>These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to 10b. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data.<br>A value from 0 to 255 can be specified. |
| 15, 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13, 12 | CLMD[1:0] | All 0 | R/W | Color Data Clipping<br>These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits.<br>00b: Output value is not clipped (0-255)<br>01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr))<br>10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254)<br>11b: Setting prohibited |
| 11 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### (7) WPFn Destination Y Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_Y)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PICT_STRD_Y[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | PICT_STRD_Y[15:0] | All 0 | R/W | Memory Stride of Destination Picture Y/RGB Plane<br>These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 33.20**.<br>A value from H'0000 to H'FFFF can be specified. |

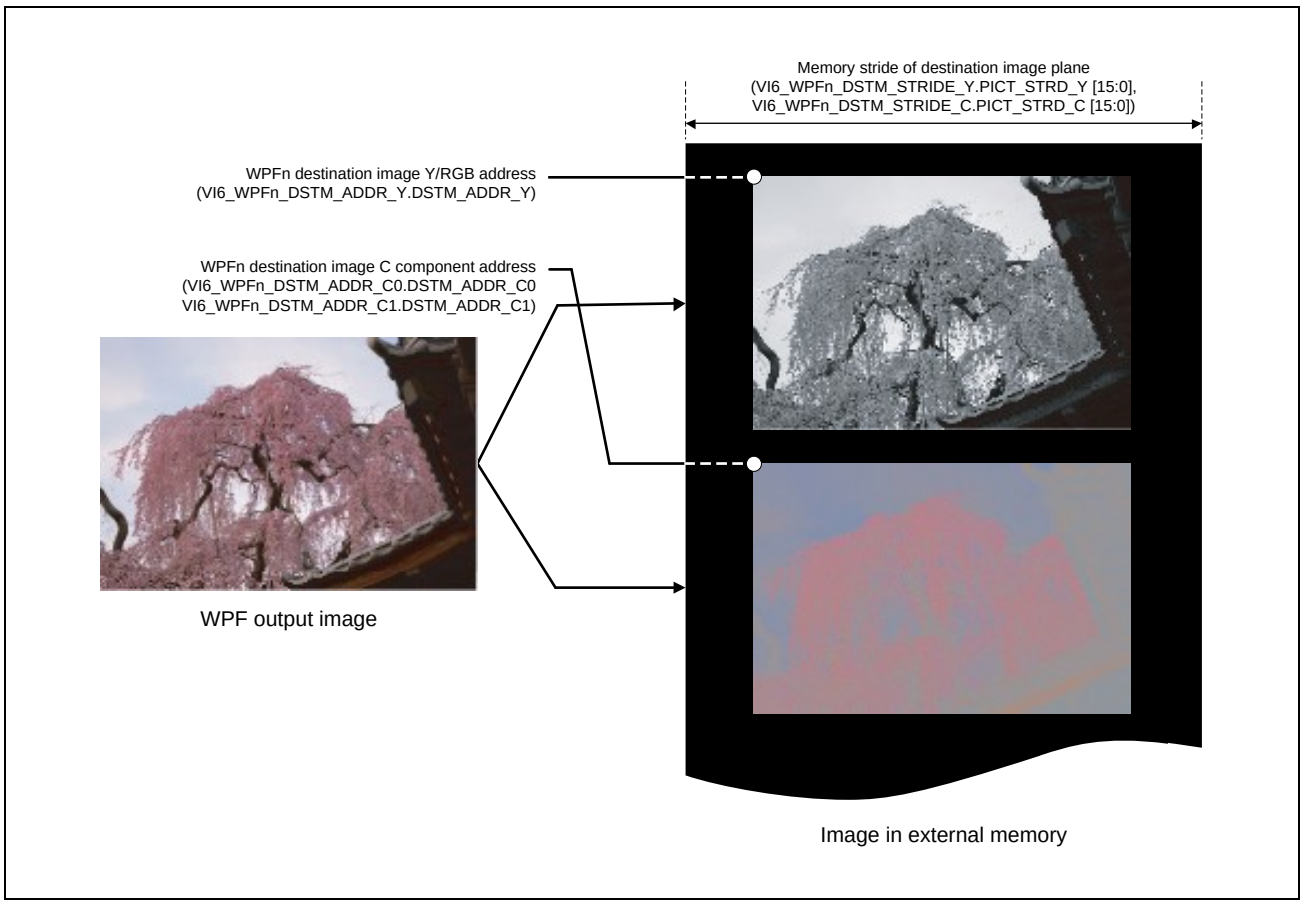

Figure 33.20 Writing Image Data to Destination Area in WPFn

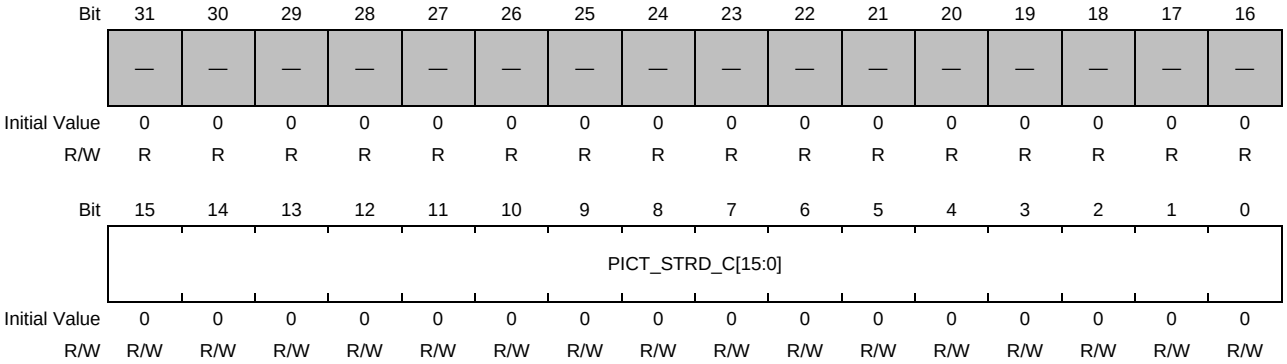
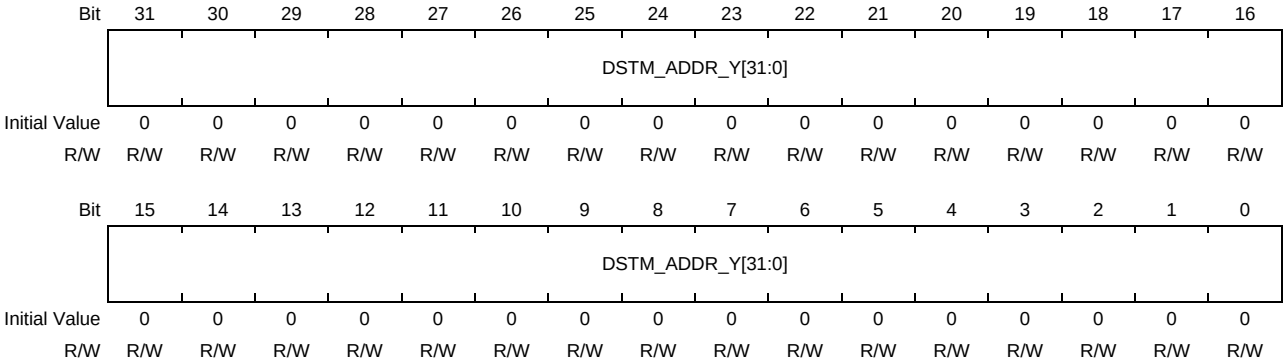
### (8) WPFn Destination C Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_C)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | PICT_STRD_Y[15:0] | All 0 | R/W | Memory Stride of Destination Picture C Plane<br>These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 33.20**. When the WPFn outputs images in an RGB format, this setting is not used. When the WPFn outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes.<br>A value from H'0000 to H'FFFF can be specified. |

### (9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DSTM_ADDR_Y[31:0] | All 0 | R/W | Destination Image Y/RGB Plane Storing Address<br>These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPFn in the method described later.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. |

#### [Destination Address Specification Method]

When flipping is not used, the start address of a frame (address FHA shown in **Figure 33.21**) should be specified as the destination address. When flipping is used, the destination address is not the frame start address (FHA); one of addresses A0 and A2 shown in **Figure 33.21** should be selected according to the combination of desired flipping (VI6_WPFn_OUTFMT.ROT setting).

To strictly define locations A0 and A2, let the horizontal size of the output image be H, the vertical size of the output image be V, and the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in **Figure 33.21**. Calculate the destination address (one of A0 and A2) using the formula shown in **Table 33.21** and specify it in the destination address storing register.

The values of variables L in **Table 33.21** depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to **Table 33.22** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_Y, or **Table 33.23** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_C0 or VI6_WPFn_DSTM_ADDR_C1.

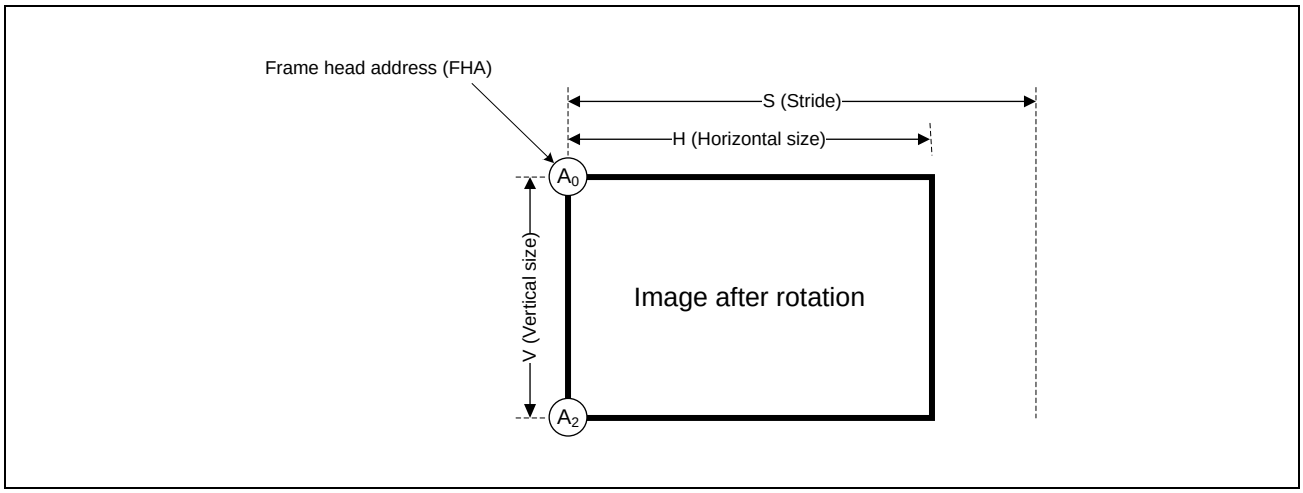


Figure 33.21 Location of Destination Address to be Specified for Flipping

Table 33.21 Destination Address $A_0$, $A_1$, $A_2$, and A3 Calculation Formulas

| VI6_WPFn_OUTFMT.ROT Setting | Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1 |
|---|---|
| 0 | $A_0$ = FHA |
| 1 | $A_2$ = FHA + (V×L – 1) × S |

Table 33.22 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for RGB and Luminance Y Address Calculation)

| VI6_WPFn_OUTFMT.WRFMT | L |
|---|---|
| 73 | 0.5 |
| 0 to 2, 4 to 35, 64 to 66, 70 to 72, or 74 to 76 | 1 |

Table 33.23 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for Chrominance C0 and C1 Address Calculation)

| VI6_WPFn_OUTFMT.WRFMT | L |
|---|---|
| 70 to 73 | Not defined |
| 66, 76 | 0.5 |
| 64 to 65, 74 to 75 | 1 |

### (10) WPFn Destination Chroma Address Registers 0 (VI6_WPFn_DSTM_ADDR_C0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DSTM_ADDR_C0[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DSTM_ADDR_C0[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DSTM_ADDR_C0[31:0] | All 0 | R/W | Destination Image C Plane Storing Address 0<br>These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPFn. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings.<br>Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 33.20** or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.21** in **Section 33.3.2.7(10)** for settings. |

### (11) WPFn Destination Chroma Address Registers 1 (VI6_WPFn_DSTM_ADDR_C1)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DSTM_ADDR_C1[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DSTM_ADDR_C1[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DSTM_ADDR_C1[31:0] | All 0 | R/W | Destination Image C Plane Storing Address 1<br>These bits specify in 1-byte units the address for storing the Cr plane when the WPFn outputs images to the external memory in YCbCr planar format shown in **Table 33.20**. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings.<br>This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format.<br>A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.21** in **Section 33.3.2.7(10)** for settings. |

### (12) WPFn LIF Write Back Control Registers (VI6_WPFn_WRBCK_CTRL: n = 0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 33.3.2.8 DPR Control Registers

#### (1) Concept of DPR Settings

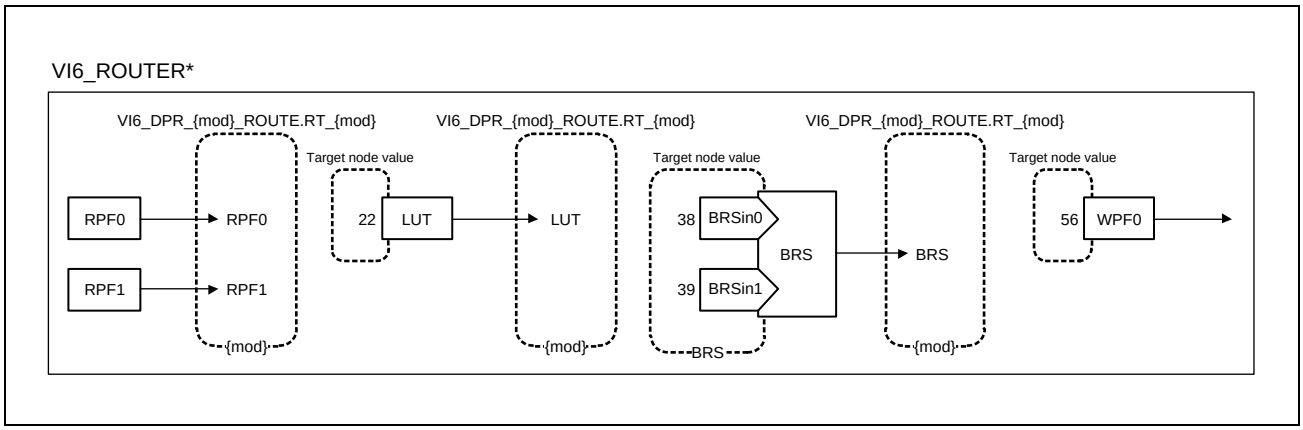

Figure 33.22 Node Register Names and Target Node Values on Data Path Router

In the VSPD internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in **Figure 33.22** to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed.

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value. Note: VI6_DPR_{mod}_ROUTE.RT are not implemented in VSPD which doesn't have {mod}. See **Figure 33.1** whether VSPD has {mod} or not.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF1 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Desired modules can be connected between each RPF and BRS input port, but all RPFs specified as the sources for a BRS input port should have the same target WPF.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRS input ports are the same.
6. Do not connect the output of any module as the input to the same module (in the BRS case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
7. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in **Figure 33.22** is assigned in one RPF to WPF path, it cannot be used in another RPF to WPF path.
8. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.
9. Be careful to do the following setting when BRS is used.
   VI6_DPR_ILV_BRS_ROUTE.BRSSEL = 1

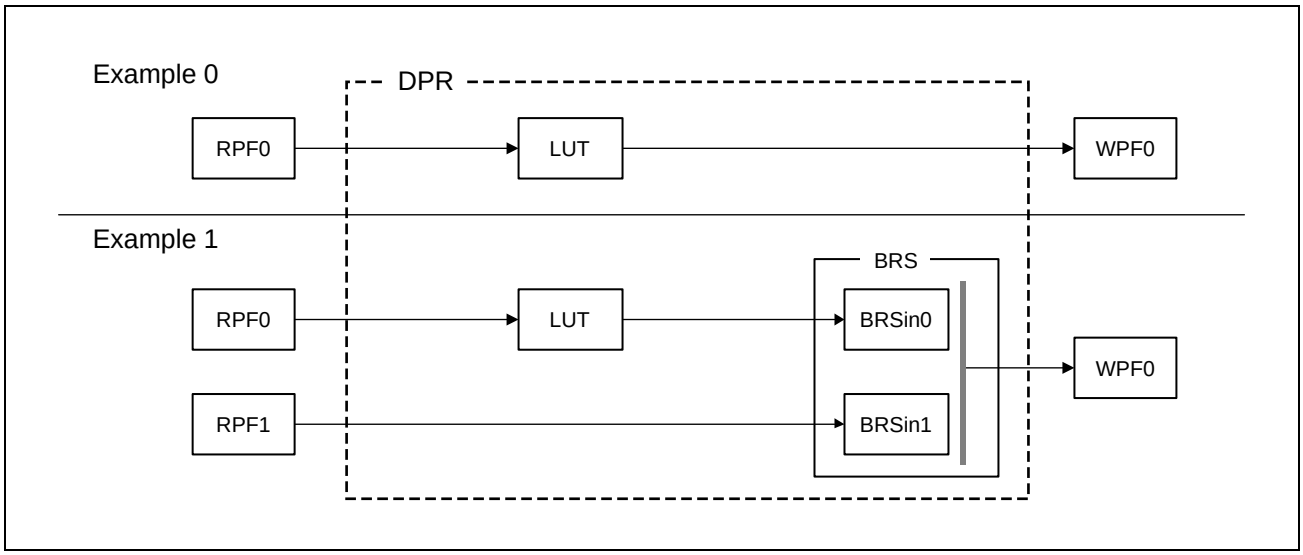

Figure 33.23 Examples of Internal Data Path Routing

**Figure 33.23** shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0 to RPF1 are the source RPFs). Each example has the configuration shown in **Figure 33.23**. Example 0 performs LUT (e.g. γ correction) processing. Example 1 performs LUT processing (e.g. γ correction), for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 (RPF1). The VI6_ DPR_*_ROUTE settings for these examples are shown in **Table 33.24**. The bit fields for the modules that are not used in the examples should be set to 63.

**Table 33.24** VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in **Figure 33.23**. Although both examples show in **Figure 33.23** include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

Table 33.24 Examples of Internal Data Path Routing

| | Register Name | Setting | |
|---|---|---|---|
| Example 0 | VI6_DPR_RPF0_ROUTE.RT_RPF0 | 22 | (To LUT) |
| | VI6_DPR_RPF1_ROUTE.RT_RPF1 | 63 | (UNUSED) |
| | VI6_DPR_LUT_ROUTE.RT | 56 | (To WPF0) |
| | VI6_DPR_ILV_BRS_ROUTE.RT | 63 | (UNUSED) |
| Example 1 | VI6_DPR_RPF0_ROUTE.RT_RPF0 | 22 | (To LUT) |
| | VI6_DPR_RPF1_ROUTE.RT_RPF1 | 39 | (To BRSin1) |
| | VI6_DPR_LUT_ROUTE.RT | 38 | (To BRSin0) |
| | VI6_DPR_ILV_BRS_ROUTE.RT | 56 | (To WPF0) |

### (2) RPFn Routing Register (VI6_DPR_RPFn_ROUTE : n = 0, 1)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | RT_RPFn[5:0] | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | RT_RPFn [5:0] | All 0 | R/W | RPFn Target Node Value<br>These bits specify the target node value for RPFn. When using RPFn, refer to **Figure 33.22** for settings.<br>When RPFn is not started through the VI6_WPFn_SRCRPF setting, specify 63. |

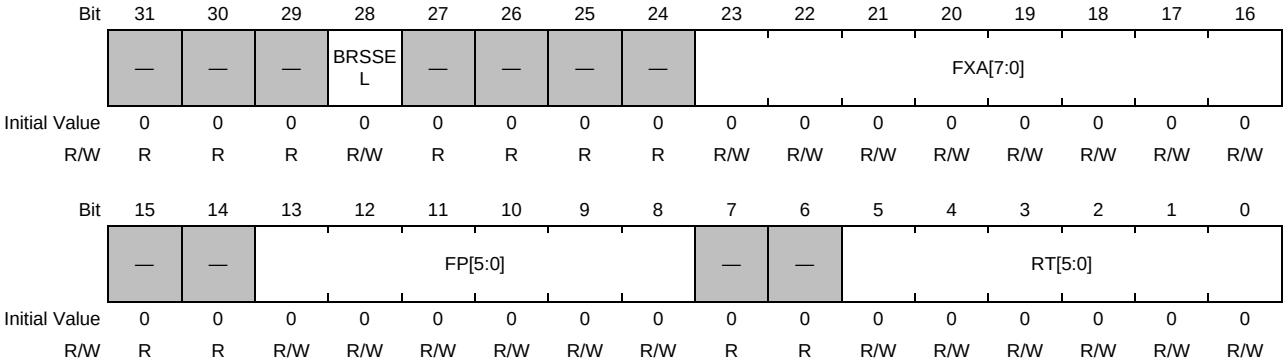
### (3) WPFn Timing Control Register (VI6_DPR_WPFn_FPORCH : n = 0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | FP_WPFn[5:0] | | | | | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 8 | FP_WPFn [5:0] | All 0 | R/W | WPFn Internal Operation Timing Setting<br>Specify 5. |
| 7 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### (4) {mod} Routing Register (VI6_DPR_{mod}_ROUTE : {mod}=ILV_BRS, LUT)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | BRSSEL | 0 | R/W | This bit is valid only for VI6_DPR_ILV_BRS_ROUTE.<br>Always specify 1. |
| 27 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 to 16 | FXA[7:0] | All 0 | R/W | Fixed α Output Value for {mod}<br>The {mod} does not support input/output of the α value. The α value input to the {LUT} is discarded, and the fixed α value specified in these bits is always output from the {LUT}.<br>A value from 0 to 255 can be specified.<br>These bits are valid for LUT module. For BRS module, these bits are reserved. |
| 15, 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 8 | FP[5:0] | All 0 | R/W | {mod} Internal Operation Timing Setting<br>Specify 0. |
| 7, 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | RT[5:0] | All 0 | R/W | {mod}Target Node Value<br>These bits specify the target node value for the {mod}. When using the {mod}, refer to **Figure 33.22** for settings. When not using the {mod}, specify 63. |

### 33.3.2.9 LUT Control Register

#### (1) LUT Control Register (VI6_LUT_CTRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LUT_EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | LUT_EN | 0 | R/W | 1D-LUT Enable/Disable<br>Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to **Section 33.4.7.1**.<br>0: 1D-LUT function is disabled<br>1: 1D-LUT function is enabled |

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in **Figure 33.24**, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in **Figure 33.25**, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. **Figure 33.25** shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in **Figure 33.26**, the input bits are reversed. This has the effect of negative-positive flipping. In **Figure 33.27**, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

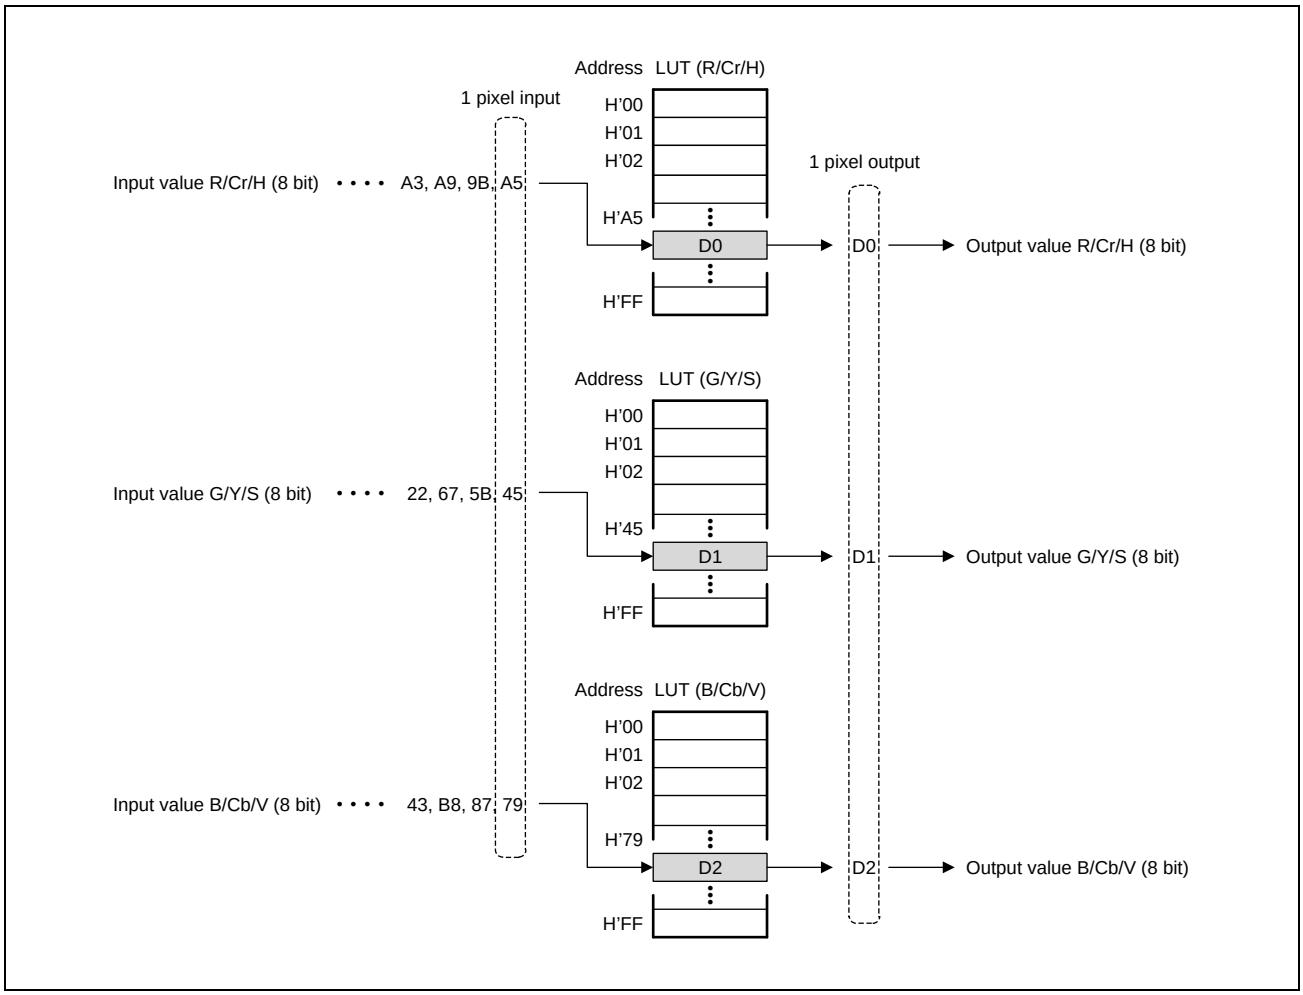


Figure 33.24 Relationship between Input and Output for 1D-LUT Table

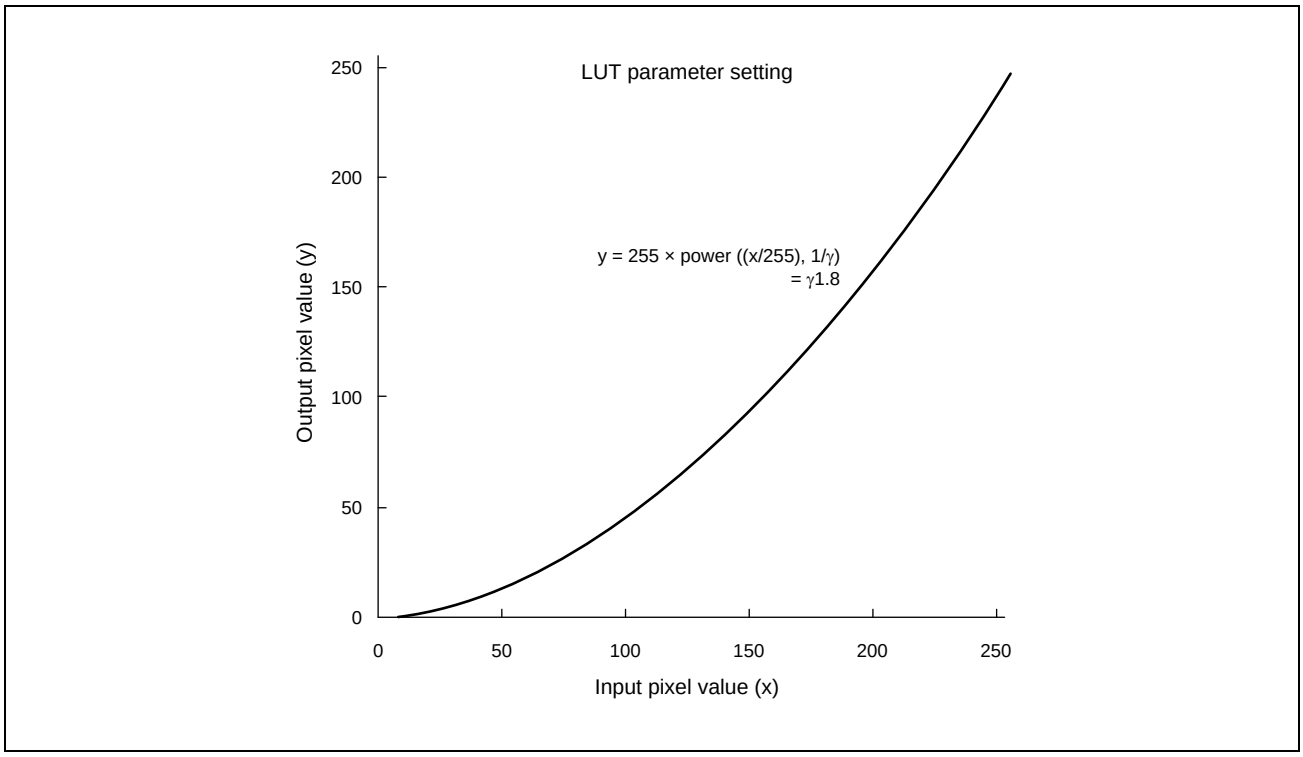

Figure 33.27 Setting Example of γ Correction

### 33.3.2.10 BRS Control Registers

#### (1) BRS Input Control Register (VI6_BRS_INCTRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | NRM | — | — | — | — | — | — | — | — | — | — | D1ON | D0ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ODE1 | DITH1[2:0] | | | ODE0 | DITH0 [2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | NRM | 0 | R/W | Color Data Normalization<br>Enables or disables division by the α value of the color data in BRS blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format.<br>0: Divider (DIV unit in **Figure 33.28**) does not divide the color value by α<br>1: Divider (DIV unit in **Figure 33.28**) divides the color value by α |
| 27 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | D1ON | 0 | R/W | Ordered dither (mode B) Enable of BRS Input 1<br>Enables or disables dithering (color reduction) of BRS input 1 (BRSin1 in **Figure 33.28**).<br>0: Dithering (mode B) of BRSin1 is disabled<br>1: Dithering (mode B) of BRSin1 is enabled<br>When ODE1 in this bit is set to 1, set 0 to this bit. |
| 16 | D0ON | 0 | R/W | Ordered dither (mode B) Enable of BRS Input 0<br>Enables or disables dithering (color reduction) of BRS input 0 (BRSin0 in **Figure 33.28**).<br>0: Dithering (mode B) of BRSin0 is disabled<br>1: Dithering (mode B) of BRSin0 is enabled<br>When ODE0 in this bit is set to 1, set 0 to this bit. |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | ODE1 | 0 | R/W | Ordered Dither (mode A) of CH1 Input to BRS Enable/Disable<br>0: Ordered dither (mode A) of BRSin1 is disabled.<br>1: Ordered dither (mode A) of BRSin1 is enabled.<br>Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1.<br>When ODE1 bit is equal to 0, BRSin1 dither method is specified by D1ON in the register<br>Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 6 to 4 | DITH1[2:0] | All 0 | R/W | Dithering of CH1 Input to BRS<br>These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D1ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits.<br>0: Dithering of BRSin1 input image is disabled<br>1: Dithering of BRSin1 input image at 18 bpp (RGB666: 260000 colors)<br>2: Dithering of BRSin1 input image at 16 bpp (RGB565: 65535 colors)<br>3: Dithering of BRSin1 input image at 15 bpp (RGB555: 32768 colors)<br>4: Dithering of BRSin1 input image at 12 bpp (RGB444: 4096 colors)<br>5: Dithering of BRSin1 input image at 8 bpp (RGB332: 256 colors)<br>6, 7: Setting prohibited |
| 3 | ODE0 | 0 | R/W | Ordered Dither (mode A) of CH0 Input to BRS Enable/Disable<br>0: Ordered dither (mode A) of BRSin0 is disabled.<br>1: Ordered dither (mode A) of BRSin0 is enabled.<br>Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1, set DITH0 = 1.<br>When ODE0 bit is equal to 0, BRSin0 dither method is specified by D0ON in the register<br>Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp. |
| 2 to 0 | DITH0 [2:0] | All 0 | R/W | Dithering of CH0 Input to BRS<br>These bits specify how to perform dithering of the CH0 input to the BRS. The setting method is the same as that for the DITH1 bits. Read the description of the DITH1 bits with BRSin0 and D0ON replacing BRSin1 and D1ON, respectively. |

**Figure 33.28** shows the configuration of the BRS. For the BRS inputs, there are two inputs from the DPR and one internal input as a virtual RPF. BRSin0 to BRSin1 are input ports that have the target node values shown in **Figure 33.22**, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the two inputs from the DPR to the BRS.

The virtual RPF inside the BRS is an input unit not connected to the DPR. It is called the “virtual RPF” because it outputs images internally created by the BRS. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT2, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRSin0 to BRSin1. The color space for the single color to be set for the virtual RPF needs to match the color space of the two inputs from the DPR to the BRS. For this setting method, see **Section 33.3.2.10(4)**.

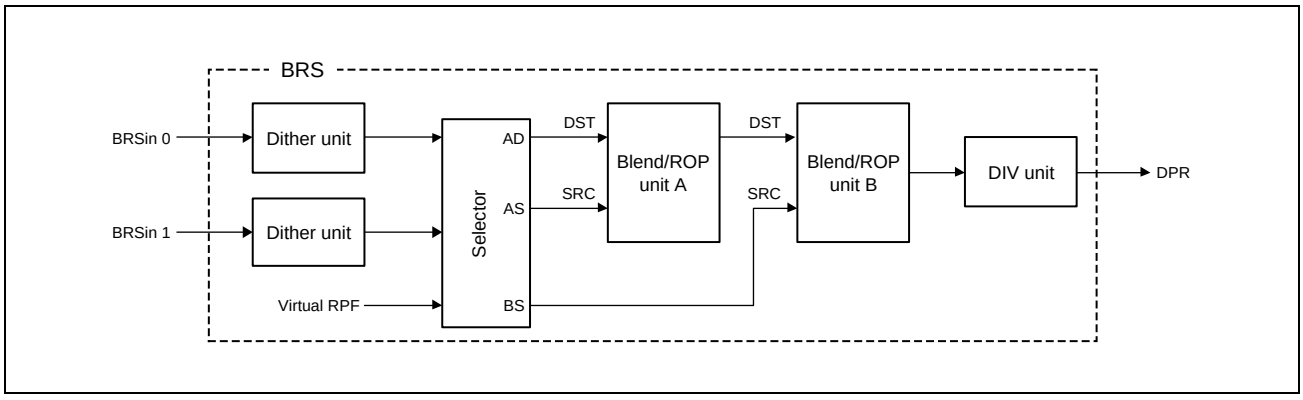

Figure 33.28 BRS Configuration

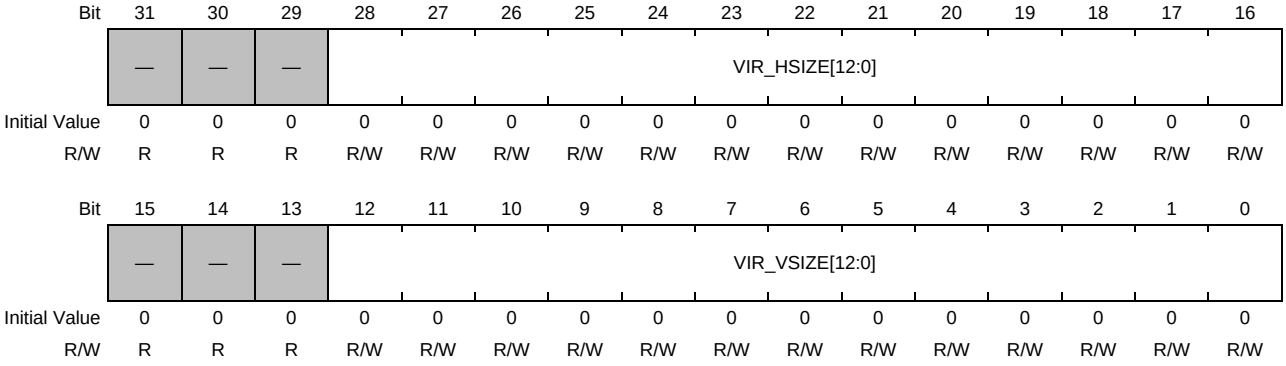
The selector in **Figure 33.28** is used to select the SRC and DST inputs to blending/ROP units A to B from BRSin0 to BRSin1 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to B are either uniquely determined based on the configuration shown in **Figure 33.28** or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS and BS, which correspond to the registers shown in **Table 33.25**.

Table 33.25 Correspondence between Selector Output Destinations and Register Bits for BRS

| Selector Output | Output Destination | Register Bits |
|---|---|---|
| AD | Blending/ROP unit A - DST | VI6_BRSA_CTRL.DSTSEL |
| AS | Blending/ROP unit A - SRC | VI6_BRSA_CTRL.SRCSEL |
| BS | Blending/ROP unit B - SRC | VI6_BRSB_CTRL.SRCSEL |

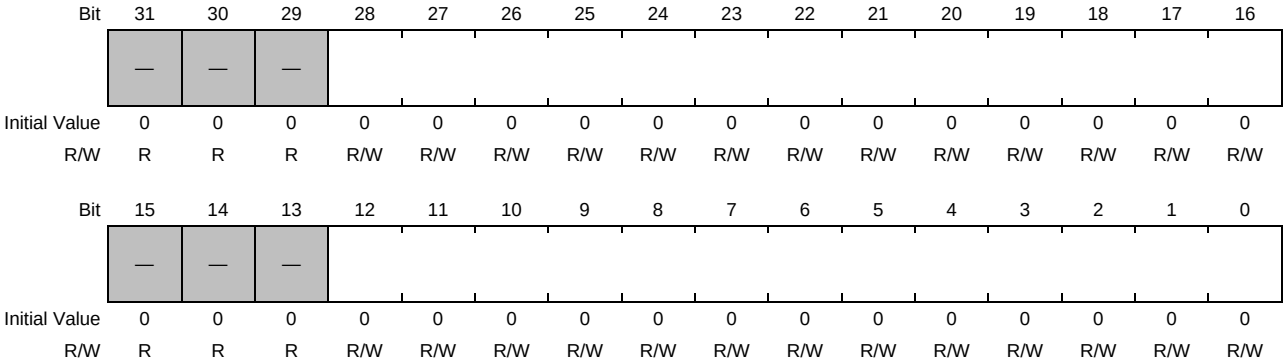
### (2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | VIR_HSIZE [12:0] | All 0 | R/W | Virtual RPF Horizontal Size<br>These bits set the horizontal size of an image from the virtual RPF shown in **Figure 33.28**. A value from 1 to 1920 can be specified. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | VIR_VSIZE [12:0] | All 0 | R/W | Virtual RPF Vertical Size<br>These bits set the vertical size of an image from the virtual RPF shown in **Figure 33.28**. A value from 1 to 1080 can be specified. |

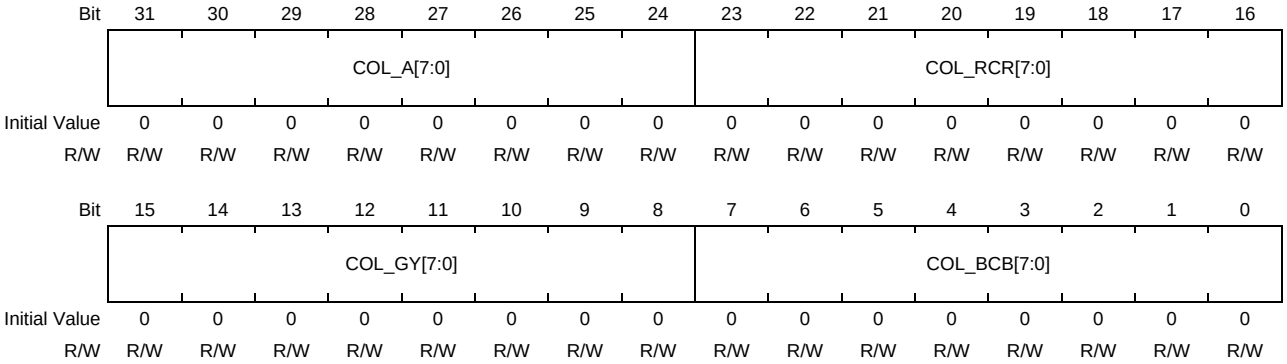
The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRS input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

### (3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | HCOORD [12:0] | All 0 | R/W | Horizontal Coordinate of Virtual RPF Location on Master Layer<br>These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1919 can be specified.<br>When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | VCOORD [12:0] | All 0 | R/W | Vertical Coordinate of Virtual RPF Location on Master Layer<br>These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1079 can be specified.<br>When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0. |

### (4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | COL_A[7:0] | All 0 | R/W | Fixed α of Virtual RPF<br>These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified. |
| 23 to 16 | COL_RCR [7:0] | All 0 | R/W | Fixed R/Cr of Virtual RPF<br>These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified. |
| 15 to 8 | COL_GY[7:0] | All 0 | R/W | Fixed G/Y of Virtual RPF<br>These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified. |
| 7 to 0 | COL_BCB [7:0] | All 0 | R/W | Fixed B/Cb of Virtual RPF<br>These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified. |

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRS is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

#### [Case 1: When an input other than the virtual RPF is used]

When the source RPF is connected to any one of the BRS input ports (BRSin0 to BRSin1) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRS inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of “all BRS inputs must have the same color space”, as described in **Section 33.3.2.8(1)** or **Section 33.3.2.10(1)**.

#### [Case 2: When only the virtual RPF is used]

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRS, as shown in **Figure 33.29**. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRS is determined by the WPF setting.

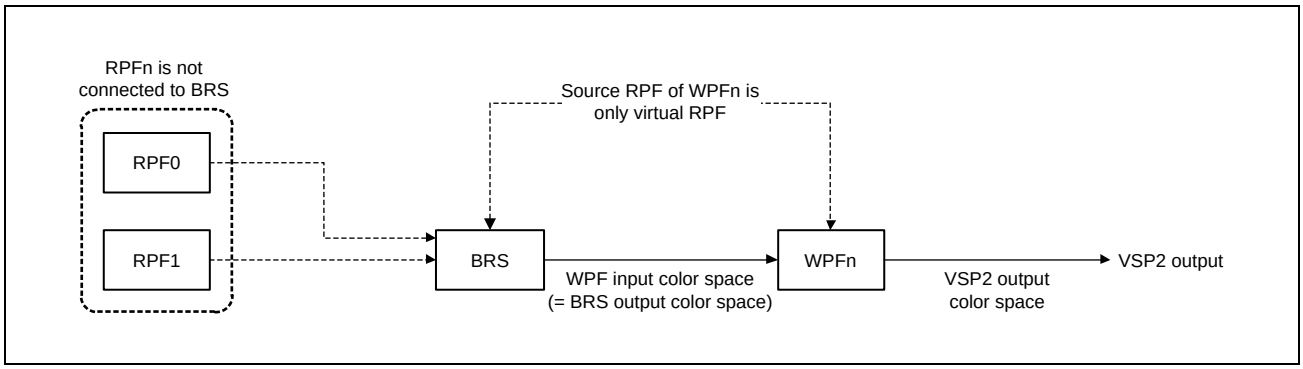


Figure 33.29 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

**Figure 33.29**, the output color space of the VSPD (= output color space of WPFn) is determined by VI6_WPFn_OUTFMT.WRFMT. When bit 6 in VI6_WPFn_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRS output color space) is determined by the relationship between the WPF output color space and VI6_WPFn_OUTFMT.CSC. When VI6_WPFn_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRS output color space) are the same. When VI6_WPFn_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRS output color space) are the opposite. This relationship is summarized in **Table 33.26**.

The color space for the virtual RPF's color information should be set in this register according to the “BRS output color space” shown in **Table 33.26**.

Table 33.26 Relationship between WPF Output Color Space and BRS Output Color Space

| VI6_WPFn_OUTFMT Register Bit Settings | | | | BRS Output Color Space (= WPF Input Color Space) |
|---|---|---|---|---|
| Bit 6 in WRFMT | | CSC | | |
| 0 | (WPF output is RGB) | 0 | (YCbCr to RGB conversion is disabled) | RGB |
| 0 | (WPF output is RGB) | 1 | (YCbCr to RGB conversion is enabled) | YCbCr |
| 1 | (WPF output is YCbCr) | 0 | (RGB to YCbCr conversion is disabled) | YCbCr |
| 1 | (WPF output is YCbCr) | 1 | (RGB to YCbCr conversion is enabled) | RGB |

### (5) BRS Control Registers (VI6_BRSm_CTRL: m = A, B)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RBC | — | — | — | — | — | — | — | — | DSTSEL[2:0] | | | — | SRCSEL[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | LBA2[11:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

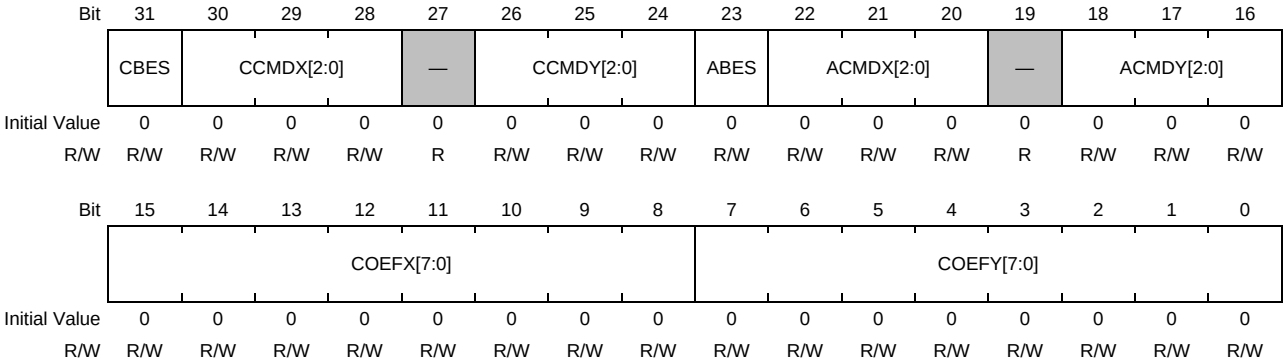
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RBC | 0 | R/W | Operation Type of Blending/ROP Unit m (m = A, B)<br>Specifies the operation type for blending/ROP unit m (m = A, B) shown in **Figure 33.28**.<br>0: ROP (raster operation)<br>1: Blending operation |
| 30 to 23 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 22 to 20 | DSTSEL[2:0] | All 0 | R/W | Input Selection for DST Side of Blending/ROP Unit A<br>These bits select the input for the DST side of blending/ROP unit A shown in **Figure 33.28**. These bits specify the connection between the BRS input port and the DST separately from the setting of connections between other modules and the BRS input port through the DPR.<br>000b: BRS input 0 (BRSin0) is input to DST<br>001b: BRS input 1 (BRSin1) is input to DST<br>100b: Virtual RPF is input to DST<br>010b, 011b, 101b to 111b: Setting prohibited<br>[Note]<br>The DSTSEL bits for blending/ROP unit B is reserved. The write value should always be 0. |
| 19 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 to 16 | SRCSEL[2:0] | All 0 | R/W | Input Selection for SRC Side of Blending/ROP Unit m (m = A, B)<br>These bits select the input for the SRC side of blending/ROP unit m (m = A, B) shown in **Figure 33.28**.These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR.<br>000b: BRS input 0 (BRSin0) is input to SRC<br>001b: BRS input 1 (BRSin1) is input to SRC<br>100b: Virtual RPF is input to SRC<br>010b, 011b, 101b to 111b: Setting prohibited<br>[Note]<br>The SRCSEL bits for blending/ROP unit B are reserved. The write value should always be 0. |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 4 | CROP[3:0] | All 0 | R/W | Color Data ROP Operator<br>These bits select the ROP operator of the color data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from **Table 33.27**. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 to 0 | AROP[3:0] | All 0 | R/W | α Data ROP Operator<br>These bits select the ROP operator of the α data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from **Table 33.27**. |

Table 33.27 ROP Operator of Blending/ROP Unit m (m = A, B)

| Opcode | Operator |
|---|---|
| 0000b | NOP(D) |
| 0001b | AND(S & D) |
| 0010b | AND_REVERSE(S & ~D) |
| 0011b | COPY(S) |
| 0100b | AND_INVERTED(~S & D) |
| 0101b | CLEAR(0) |
| 0110b | XOR(S ^ D) |
| 0111b | OR(S \| D) |
| 1000b | NOR(~(S \| D)) |
| 1001b | EQUIV(~(S ^ D)) |
| 1010b | INVERT(~D) |
| 1011b | OR_REVERSE(S \| ~D) |
| 1100b | COPY_INVERTED(~S) |
| 1101b | OR_INVERTED(~S \| D) |
| 1110b | NAND(~(S & D)) |
| 1111b | SET(all1) |

### (6) BRS Blend Control Registers (VI6_BRSm_BLD: m = A, B)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | CBES | 0 | R/W | Blending Expression Selection<br>Selects the blending expression of the color data in the BRS (VI6_BRSm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits.<br>0: CCMDX * (DST color data) + CCMDY * (SRC color data)<br>1: CCMDX * (DST color data) - CCMDY * (SRC color data) |
| 30 to 28 | CCMDX[2:0] | All 0 | R/W | Blending Coefficient X Selection<br>These bits specify coefficient X used in the blending expression determined by the CBES bit.<br>000b: DST α data is used as blending coefficient X<br>001b: 255 - (DST α data) is used as blending coefficient X<br>010b: SRC α data is used as blending coefficient X<br>011b: 255 - (SRC α data) is used as blending coefficient X<br>100b: Fixed α value 0 (COEFX setting) |
| 27 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 26 to 24 | CCMDY[2:0] | All 0 | R/W | Blending Coefficient Y Selection<br>These bits specify coefficient Y used in the blending expression determined by the CBES bit.<br>000b: DST α data is used as blending coefficient Y<br>001b: 255 - (DST α data) is used as blending coefficient Y<br>010b: SRC α data is used as blending coefficient Y<br>011b: 255 - (SRC α data) is used as blending coefficient Y<br>100b: Fixed α value 1 (COEFY setting) When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0. |
| 23 | ABES | 0 | R/W | Blending α Creation Expression<br>Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B). α creation coefficients are specified by the ACMDX and ACMDY bits.<br>0: ACMDX * (DST α data) + ACMDY * (SRC α data)<br>1: ACMDX * (DST α data) - ACMDY * (SRC α data) |
| 22 to 20 | ACMDX[2:0] | All 0 | R/W | α Creation Coefficient X<br>These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit.<br>000b: (α creation coefficient X) = (DST α data)<br>001b: (α creation coefficient X) = 255 - (DST α data)<br>010b: (α creation coefficient X) = (SRC α data)<br>011b: (α creation coefficient X) = 255 - (SRC α data)<br>100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting)<br>101b to 111b: Setting prohibited |
| 19 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 18 to 16 | ACMDY[2:0] | All 0 | R/W | α Creation Coefficient Y<br>These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit.<br>000b: (α creation coefficient Y) = (DST α data)<br>001b: (α creation coefficient Y) = 255 - (DST α data)<br>010b: (α creation coefficient Y) = (SRC α data)<br>011b: (α creation coefficient Y) = 255 - (SRC α data)<br>100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting)<br>101b to 111b: Setting prohibited |
| 15 to 8 | COEFX[7:0] | All 0 | R/W | Fixed α Value 0<br>These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from H'00 to H'FF can be specified. |
| 7 to 0 | COEFY[7:0] | All 0 | R/W | Fixed α Value 1<br>These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from H'00 to H'FF can be specified. |

### 33.3.2.11 LIF Control Registers

#### (1) LIF0 Control Register (VI6_LIF0_CTRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | OBTH [11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | PADL | — | — | — | CFMT | — | — | REQSEL | LIF_EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | OBTH [11:0] | 0 | R/W | Buffer Threshold for Start Ready Notification to Display Module<br>Always specify 1500, when LIF_EN is set to 1. |
| 15 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | PADL | 0 | R/W | Enable/Disable of padding with dummy lines to output-image to the DU. [LIF0 only]<br>Enables or disables of padding with dummy lines to output-image to the DU.<br>0: Padding with dummy lines to output image to DU is disabled.<br>1: Padding with dummy lines to output image to DU is enabled. |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | CFMT | 0 | R/W | Chroma Format<br>This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0.<br>0: YCbCr444 or RGB Format<br>1: YCbCr422 Format<br>[Note] The DU cannot receive YCbCr422 format. Therefore, when CFMT is 1, YCbCr444 data which information contents is equal to YCbCr422 is output to DU as shown in **Figure 33.30**. |
| 3, 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | REQSEL | 0 | R/W | External Display Module Selection<br>0: This value is setting prohibited when 1 is set to LIF_EN<br>1: DU is selected as the destination external display module. |
| 0 | LIF_EN | 0 | R/W | Enable/Disable of Data Output to External Display Module<br>Enables or disables data output from the LIF to the external display module (DU).<br>0: Data output to the external display module is disabled.<br>1: Data output to the external display module is enabled. |

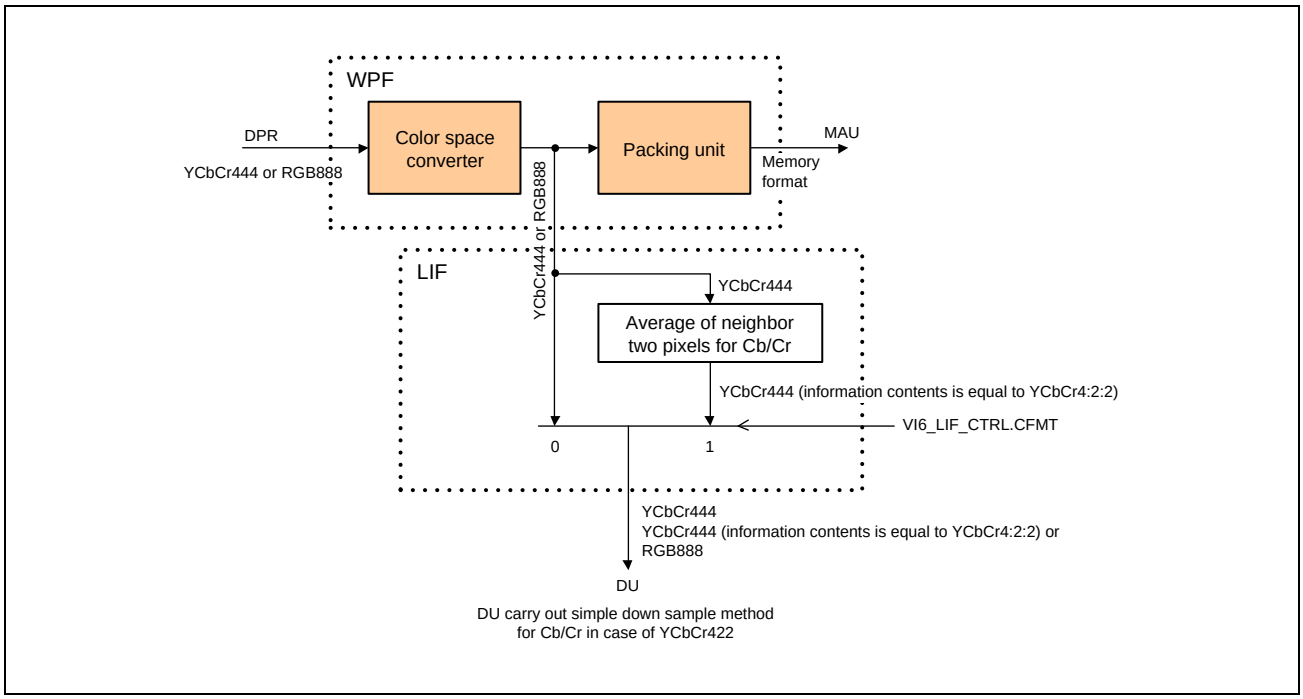


Figure 33.30 Data flow between LIF and DU

### (2) LIF0 Clock Stop Buffer Control Register (VI6_LIF0_CSBTH)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | HBTH[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | LBTH[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | HBTH[11:0] | 0 | R/W | Buffer Threshold for Start Ready Notification to Display Module<br>Always specify 1500, when LIF_EN is set to 1. |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | LBTH[11:0] | 0 | R/W | Buffer Threshold for Clock Start in Dynamic Clock Control<br>Set LBTH[11:0] = 0 (fixed value) |

### (3) LIF0 Buffer Attribute Register (VI6_LIF0_LBA)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LBA0 | — | — | — | LBA1[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | LBA2[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | LBA0 | 0 | R/W | LIF Buffer Attribute Register0<br>Always specify 1, when LIF_EN is set to 1 |
| 30 to 28 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | LBA1[11:0] | 0 | R/W | LIF Buffer Attribute Register1<br>Always specify 1536, when LIF_EN is set to 1 |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | LBA2[11:0] | 0 | R | LIF Buffer Attribute Register2<br>These bits are internal status for purpose of h/w debugging. |

### (4) LIF0 Padding Line Cycle Register (VI6_LIF0_PADLN_CYC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | PADLN_CYC[5:0] | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | PADLN_CYC [5:0] | 0 | R/W | Cycle of padding pattern.<br>These bits specify the minimum number of cycles of the padding pattern of valid lines and dummy lines. For example, if PADLN_CYC[5:0] is 4, lower 4 bits of PADLN_PATTERN[3:0] indicates padding pattern. A value from 1 to 32 can be specified. |

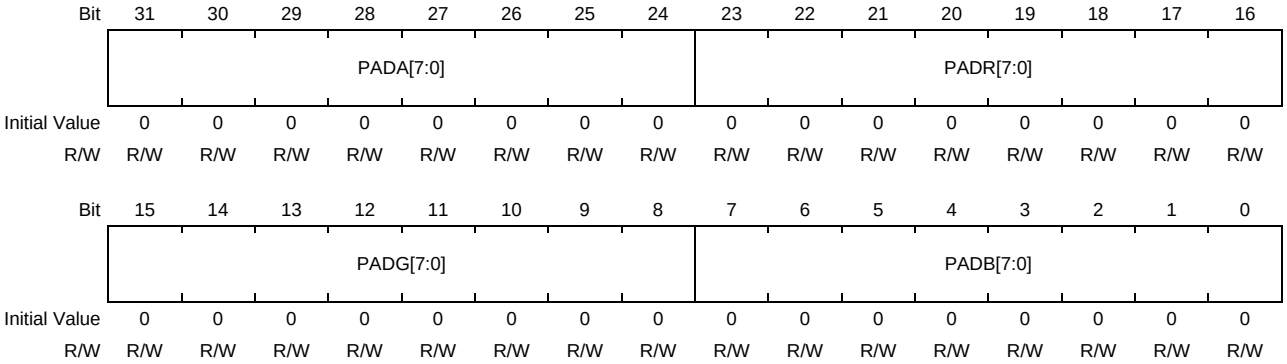
### (5) LIF0 Padding Line Pattern Register (VI6_LIF0_PADLN_PT)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PADLN_PATTERN[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PADLN_PATTERN[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | PADLN_PAT TERN[31:0] | 0 | R/W | Pattern of padding with dummy lines<br>These bits specify the padding pattern of valid lines and dummy lines. In each bit, 0b indicates an active line, 1b indicates a dummy line. It starts from the lower bit (Bit 0).<br>First line should be valid line (Always set 0 to PADLN_PATTERN[0]). |

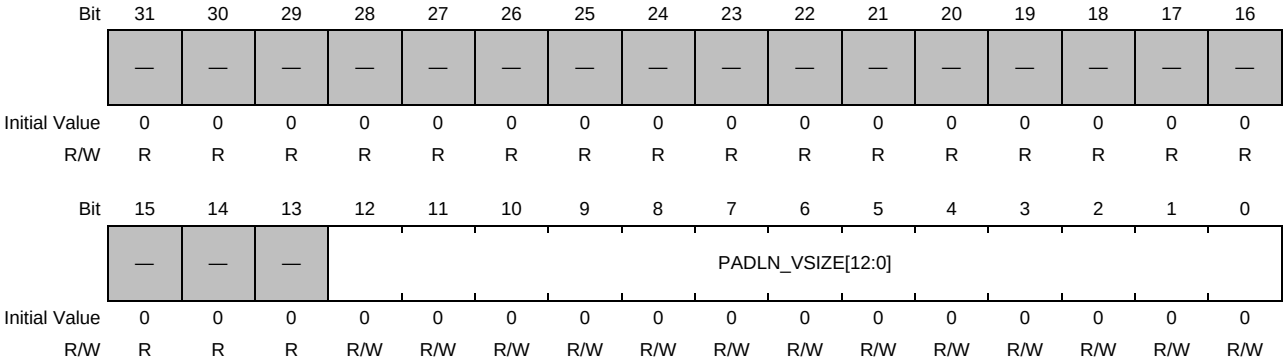
### (6) LIF0 Padding Line Value Register (VI6_LIF0_PADLN_VAL)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | PADA[7:0] | 0 | R/W | Padding data of EDC code for dummy line. |
| 23 to 16 | PADR[7:0] | 0 | R/W | Padding data of R/Cr for dummy line. |
| 15 to 8 | PADG[7:0] | 0 | R/W | Padding data of G/Y for dummy line. |
| 7 to 0 | PADB[7:0] | 0 | R/W | Padding data of B/Cb for dummy line. |

**Note:** Set H'24FFFFFF to the register, when output format is YUV422. Set H'2EFFFFFF to the register in other case.

### (7) LIF0 Padding Line Size Register (VI6_LIF0_PADLN_SIZE)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | PADLN_VSIZE[12:0] | 0 | R/W | Vertical Size of LIF output in case of enabling Padding line<br>When VI6_LIF0_CTRL.PADL is 1, dummy lines are included in the output data from LIF, so set the LIF output VSIZE including dummy lines to these bits. If the number of output lines does not reach the value of PADLN_VSIZE [12:0] even if all valid lines are output according to padding pattern, dummy lines are inserted until the number of output lines reaches PADLN_VSIZE [12:0].<br>• Output vsize of LIF is same with input vsize to LIF when VI6_LIF0_CTRL.PADL is 0<br>• Output vsize of LIF is PADLN_VSIZE [12:0] when VI6_LIF0_CTRL.PADL is 1 |

## 33.3.3 DU Registers

### 33.3.3.1 DU Module Control Register 0 (DU_MCR0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PB_CLR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
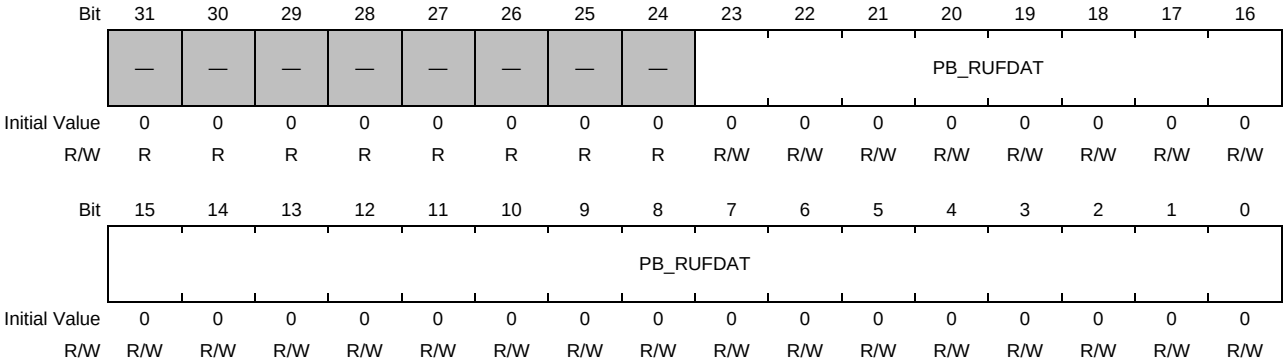
| 31 to 1 | — | H'0000_0000 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 0 | PB_RUFOP | 0 | R/W | Specify behavior when the PBUF underflow occurs.<br>0: Continue outputting invalid data<br>1: Output DU_PBCR2.PB_RUFDAT |

### 33.3.3.13 DU PBUF Control Register 2 (DU_PBCR2)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | H'00 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 23 to 0 | PB_RUFDAT | H'00_0000 | R/W | Read data when the PBUF underflow occurs. |

# 33.4 Operation

## 33.4.1 Operation Control Setting

### (a) To start image process

FCPVD registers do not need to be set when starting an image process. Therefore, refer the **Section 33.4.4** for the guidance of starting an image process.

## 33.4.2 Reset Operation

FCPVD reset can be conducted by power on reset. Power on reset initializes the whole FCPVD logic immediately.

### 33.4.2.1 Power-on Reset, Hardware reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of LCDC.

## 33.4.3 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set H’0000 0808 to VI6_CLK_DCSWT

[2] Always set D’256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set D’2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPFn.

[4] Always set D’1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPFn.

[5] Always set D’0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPFn.

[6] Always set H’0000 0500 toVI6_DPR_WPFn_FPORCH (n = 0, 1) in case of using WPFn.

[7] Always set D’1500 to VI6_LIF0_CTRL.OBTH [11:0] in case of using LIF (VI6_LIF0_CTRL.LIF_EN = 1).

[8] Always set H’8600 0000 to VI6_LIF0_LBA in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[9] Always set D’1 to VI6_LIFn_CTRL.REQSEL in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[10] Always set D’0 to VI6_LIFn_CSBTH in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[11] Always set H'1F to DU_PBCR0 in case of using DU (DU_MCR0.DI_EN = 1).

### 33.4.4 Concept of VSPD Operation Starting and Stopping

The VSPD provides one channel of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0, which are output modules of the VSPD. Use the start registers shown in **Table 33.28** to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in **Table 33.28**; clearing a source register cancels the corresponding interrupt signal. Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. **Figure 33.32** shows these operation timings.

Table 33.28 Target Module and Corresponding Registers for Starting and Stopping Operation

| Target Module | Start Register | End Interrupt Source Register | Operating Status Register |
|---|---|---|---|
| WPF0 | VI6_CMD0.STRCMD | VI6_WPF0_IRQ_STA. FRE | VI6_STATUS.SYS0_ACT |

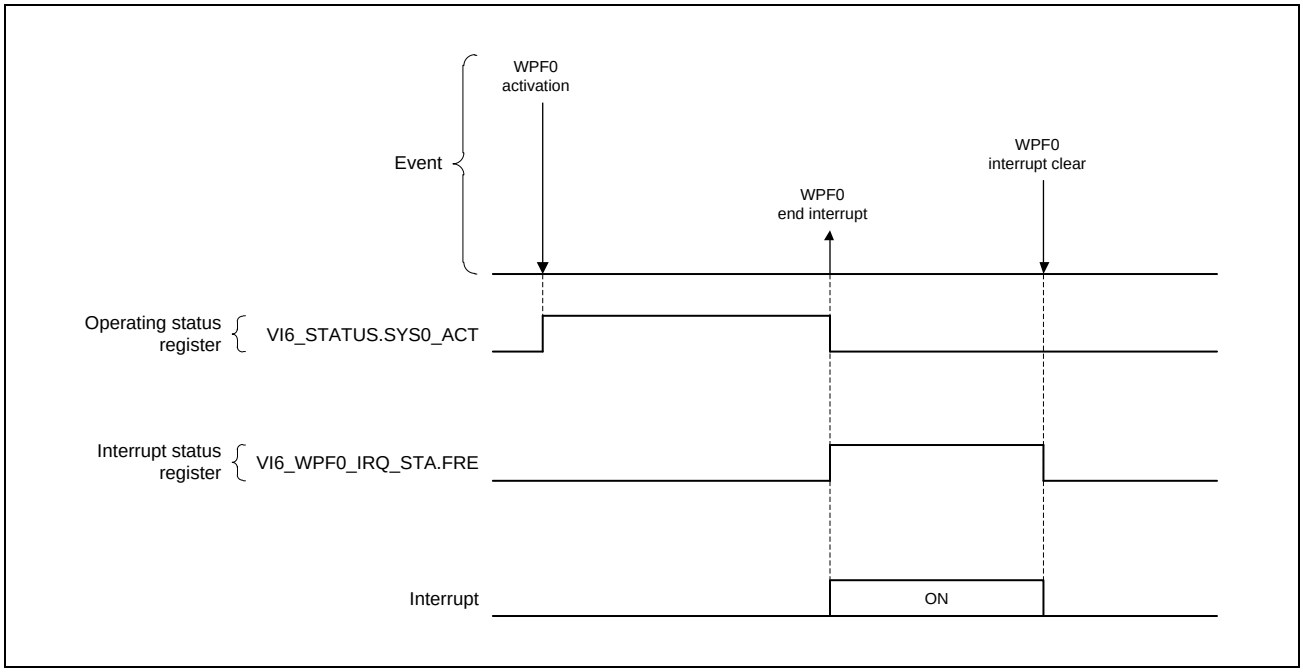


Figure 33.32 VSPD Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSPD internal modules. As described in **Section 33.3.2**, the VSPD has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the BRS is WPF0, the BRS operating state is the same as that of WPF0; that is, the BRS operating state is indicated by the VI6_STATUS.SYS0_ACT as shown in **Table 33.28** and the status change timing is shown as VI6_STATUS. SYS0_ACT in **Figure 33.32**. Likewise, the operating states of all modules connected to WPF0 is indicated by VI6_STATUS. SYS0_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSPD will hang.

**Figure 33.33** shows relation between start reservation and operating status. When start is reserved while VSPD is operating, the reservation is accepted after VSPD status is moved from “operating” into “idle” as shown in **Figure 33.33**.

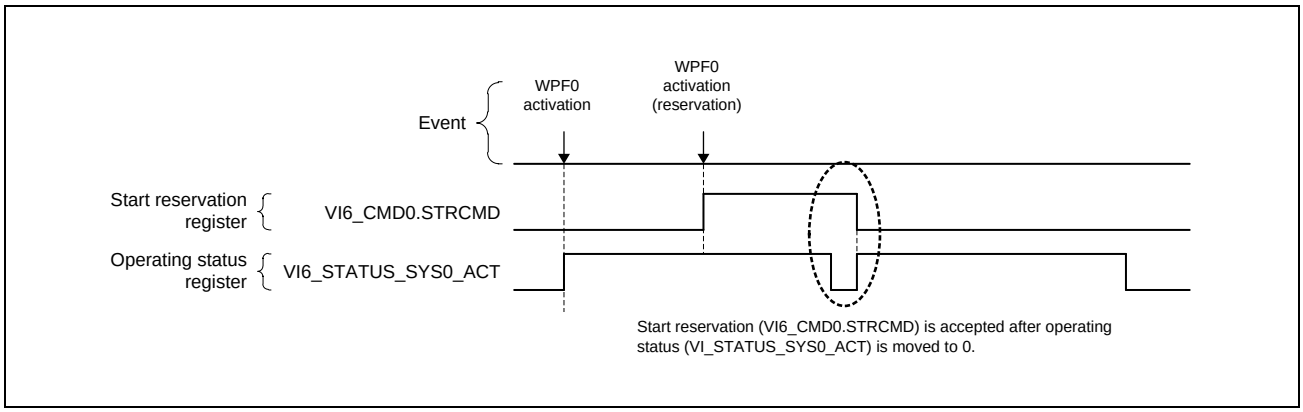

Figure 33.33 VSPD Start reservation and Operating status

## 33.4.5 Display List

### 33.4.5.1 Functional Description

The VSPD provides the display list function. As a display list, the VSPD automatically downloads the register settings except for the control registers (**Sections 33.3.2.4** and **Section 33.3.2.5**) from external memory and stores the settings in the VSPD registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSPD processing are prepared in advance in external memory such as SDRAM.

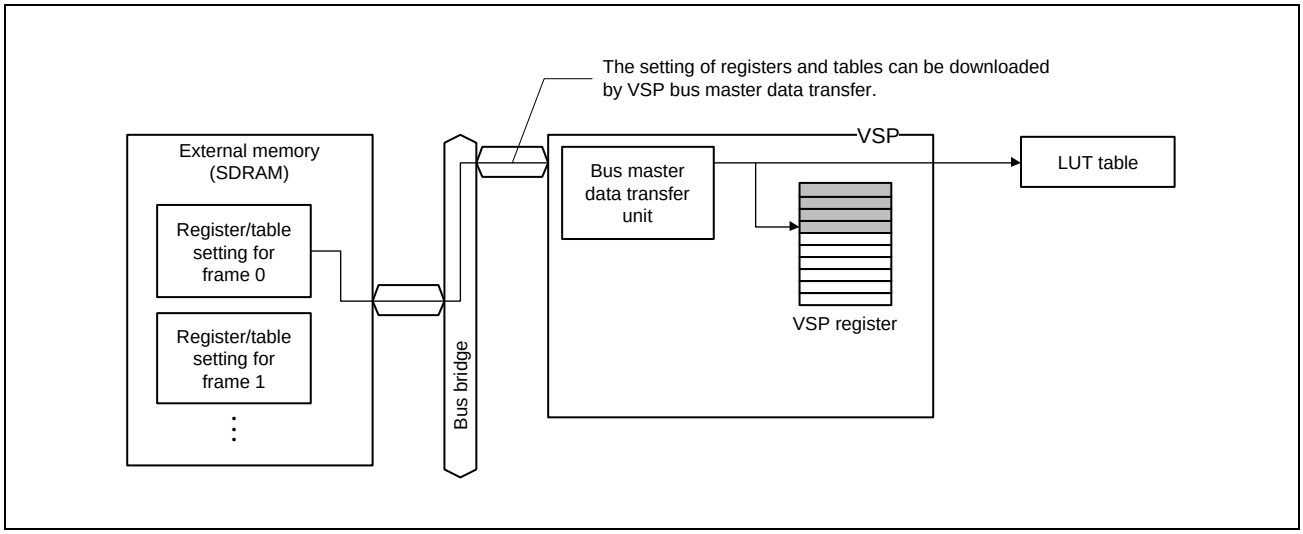

Figure 33.34 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in **Section 33.3.2.5**. The register settings or various types of information should be stored in external memory in the format described in **Section 33.4.5.2**. **Figure 33.35** shows the difference between VSPD operation through normal register settings and through display lists.

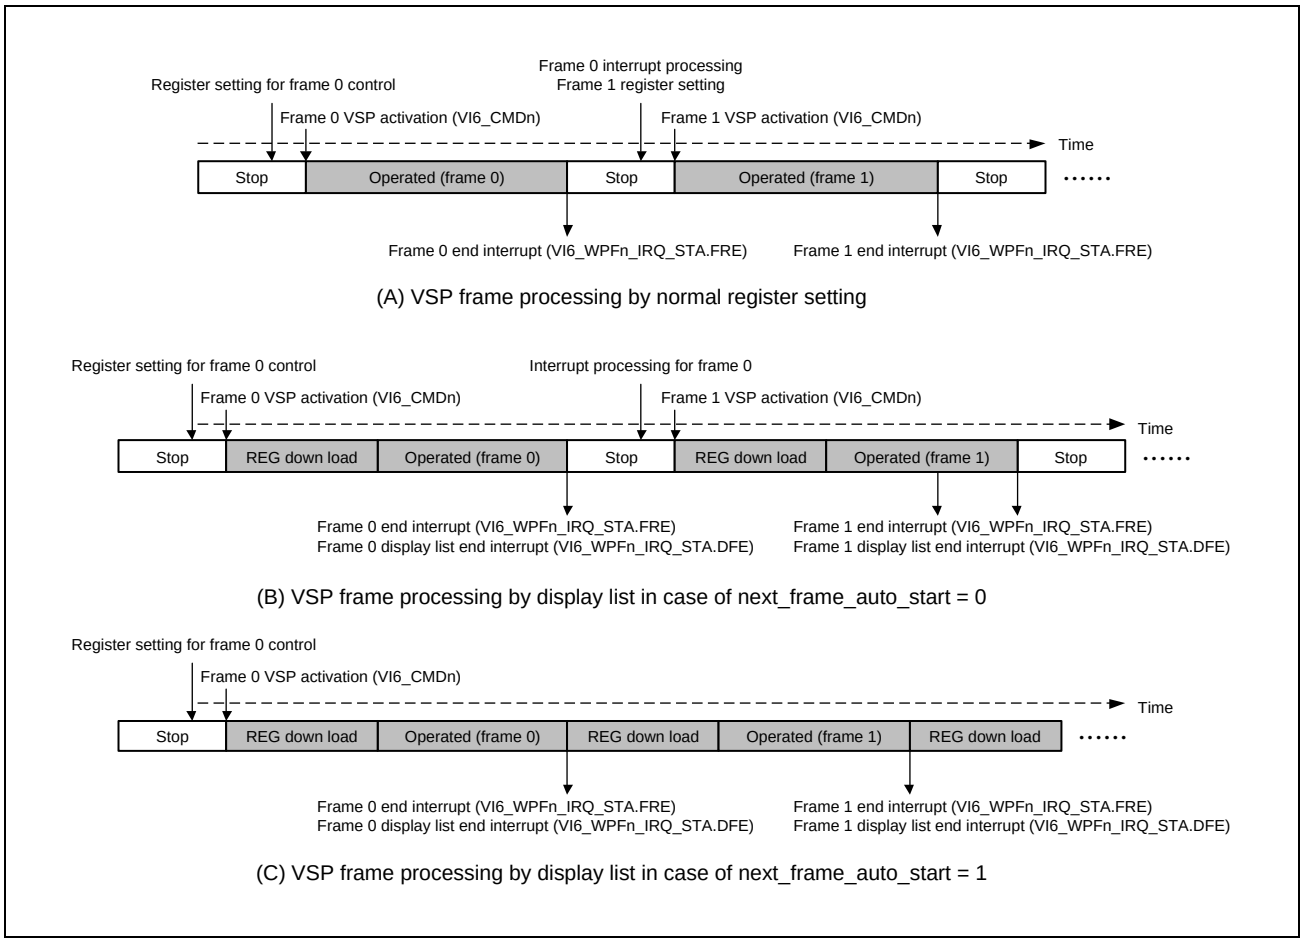

Figure 33.35 Comparison of VSPD Operation between Normal Register Settings and Display Lists

As shown in **Figure 33.35** (A), in the VSPD processing through normal register settings, all registers should be set up before the VSPD is started for each frame. After the VSPD processing is completed, the VSPD outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSPD automatically downloads register settings from external memory as shown in **Figure 33.35** (B) and (C), which reduces the load on the CPU between frames.

**Figure 33.35** (B) shows the display list usage where the VSPD stops at the end of every frame; only the VSPD start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSPD is large. In the case shown in **Figure 33.35** (C), as soon as the frame processing ends, the VSPD automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

**Table 33.29** shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 33.29 Display list mode and supported functions

| Mode | Extended Display List | Continuous Frames |
|---|---|---|
| Normal Display List Mode | Supported | Controlled by “next frame auto start” in the header of the display list. |
| Header-less Display List Mode | Not Supported | Controlled by VI6_DL_CTRL.CFM0 bit. |

### 33.4.5.2 Normal Display List Mode

The VSPD display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. **Figure 33.36** shows the display list structure.

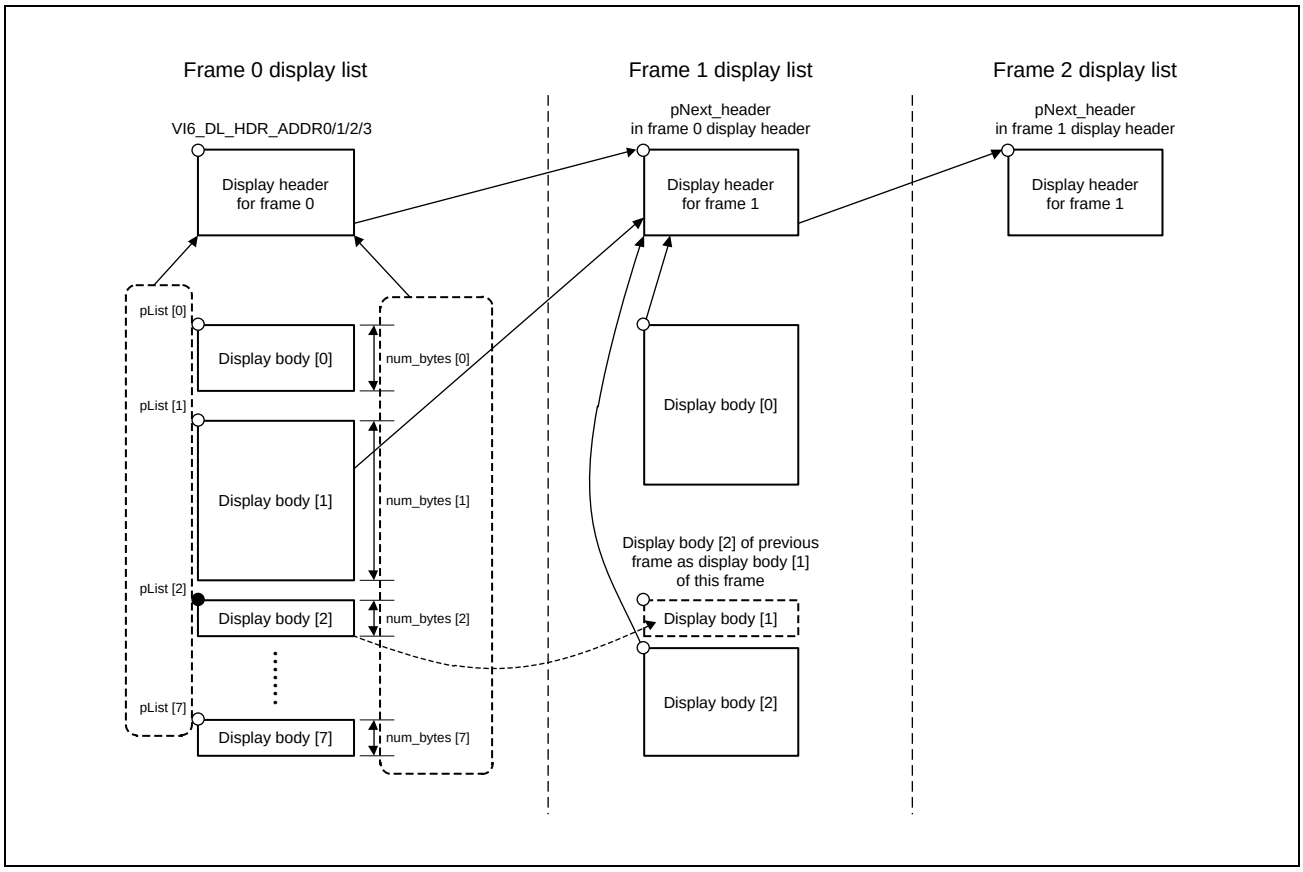

Figure 33.36 Structure and Concept of VSPD Display List

A VSPD display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSPD analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSPD registers described in **Section 33.3.2.5**. When activated in a mode that uses display lists, the VSPD downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0 (number 0 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSPD becomes ready for frame image processing; the VSPD then starts the actual frame processing.

After processing of a frame ends, the VSPD proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in **Figure 33.35**. In one mode, the VSPD stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for

downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSPD is stopped. When the VSPD is started after a correct value is specified, the VSPD starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSPD after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSPD downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSPD starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSPD continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, **Table 33.30** defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, **Table 33.31** defines the header section format of a display list and **Table 33.32** defines the body section format and **Table 33.33** defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. **Table 33.34** shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (see the **Section 33.3.2.5(3)**).

Table 33.30 Definition of a Function for Simple Description

| Syntax | Bit Count |
|---|---|
| zero_bits (num_bits) | |
| { | |
| for (i = 0; i<num_bits; i++) { | |
| **zero_bit** | 1 |
| } | |
| } | |

| Bit String | Contents |
|---|---|
| zero_bit | zero_bit indicates a 1-bit integer having a value of 0. |

Table 33.31 Format of Display List Header Section

| Syntax | Bit Count |
|---|---|
| display_header () /* Fixed length */ | |
| { | |
| zero_bits (29) | |
| **num_list_minus1** | 3 |
| | |
| for (i=0; i<8; i++) | |
| zero_bits (15) | |
| **num_bytes [i]** | 17 |
| **pList [i]** | 32 |
| } | |
| **pNext_header** | 32 |
| zero_bits (23) | |
| **wait_wup** | 1 |
| zero_bits (3) | |
| **ignore_upd_dl** | 1 |
| zero_bits (2) | |
| **current_frame_int_enable** | 1 |
| **next_frame_auto_start** /* 76 bytes from the beginning of this header*/ | 1 |
| | |
| if (VI6_DL_EXT_CTRL.EXT) { | |
| zero_bits (32) /* padding zero 4 bytes for alignment */ | |
| zero_bits (6) | |
| **pre_ext_dl_exec** | 1 |
| **post_ext_dl_exec** | 1 |
| zero_bits (8) | |
| **pre_ext_dl_num_cmd** | 16 |
| **pre_ext_dl_pList** | 32 |
| zero_bits (16) | |
| **post_ext_dl_num_cmd** | 16 |
| **post_ext_dl_pList** /* 96 bytes from the beginning of this header*/ | 32 |
| } | |
| } | |

| Bit String | Contents |
|---|---|
| num_list_minus1 | Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body. |
| num_bytes [i] | Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0. |
| pList [i] | Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0. |
| pNext_header | Specifies the address of the display list header for the next frame. After display list downloading ends, the VSPD keeps its value in the internal memory and uses it in the next display list header downloading.<br>Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). |
| wait_wup | When this bit is 1, VSPD starts reading image data from external memory after WUP (Wake Up) signal from any channel of VIN asserts. This bit is available for WPF0. |
| ignore_upd_dl | If this bit is set to 1, new display list pointed by VI6_DL_HDR_ADDR0 is not downloaded in VSPD H/W for the next frame, even if S/W sets VI6_DL_HDR_ADDR0 during the frame. New display list is downloaded in VSPD H/W at next frame of the processing which this bit is 0. This bit is available for WPF0. |
| current_frame_int_enable | This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated.<br>If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSPD generates an interrupt. |
| Next_frame_auto_start | Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSPD starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSPD stops operation when one-frame processing by this display header ends. In this case, start the VSPD through VI6_CMDn to process the next frame. |
| pre_ext_dl_exec | Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSPD executes the extended display list for frame preprocessing. The VSPD does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0. |
| post_ext_dl_exec | Set 0 to this bit. |
| pre_ext_dl_num_cmd | Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes.<br>When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0. |
| pre_ext_dl_pList | Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0. |
| post_ext_dl_num_cmd | Set 0 to this bit. |
| post_ext_dl_pList | Set 0 to this bit. |

Table 33.32 Format of Display List Body Section

| Syntax | Bit Count |
|---|---|
| display_list (num_bytes) /* Variable length (num_bytes) */ | |
| { | |
| for (i =0; i<num_bytes; i+=8) { | |
| **set_address** | 32 |
| **set_data** | 32 |
| } | |
| } | |

| Bit String | Contents |
|---|---|
| set_address | Specifies the address where the value specified by set_data is to be stored. Specify a register address.<br>Note :<br>Register space of VSPD is 32Kbyte (H'0000 - H'7FFC). So, set 0 to upper 17bit of set_address in Display List Body Section. |
| set_data | Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register. |

Table 33.33 Format of Extended Display List Body Section

| Syntax | Bit Count |
|---|---|
| ext_dl_display_list (num_llw) /* Variable length (pre/post_ext_dl_num_bytes) */ | |
| { | |

| pList + 11 | set_address [1] (bit7-0) |
| pList + 12 | set_data [1] (bit31-24) |
| pList + 13 | set_data [1] (bit23-16) |
| pList + 14 | set_data [1] (bit15-8) |
| pList + 15 | set_data [1] (bit7-0) |
| ~~~ | ~~~ |

#### 33.4.5.3 Header-less Display List Mode

The header-less display list does not have the display header listed in **Table 33.31**, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see the **Section 33.3.2.5(1)**) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

#### 33.4.5.4 Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed.
2. Do not execute write access to the same LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 33.35**.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 33.35**.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in **Section 33.3.2.3**.

6. Manipulation and setting of the registers described in **Section 33.3.2.4** and **Section 33.3.2.5** through a display list is prohibited.
7. The extended display list function enabled by VI6_DL_EXT_CTRL.EXT is to control the registers of the ICB connected with the VSPD. Do not use extended display lists for any other purpose.

### 33.4.6 Interrupt Processing

When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in WPF independently, the VSPD has the following registers to control interrupts in WPF.

WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0) (refer to **Section 33.3.2.4(12)**)

WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0) (refer to **Section 33.3.2.4(13)**)

CAUTION

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSPD.

## 33.4.7 Lookup Table Settings

### 33.4.7.1 LUT

For a single entry to the LUT space (see **Table 33.35**) of the VSPD, the LUT data is set by a write access in the format shown in **Figure 33.37**.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + H'7000 + 7 × 4 = (offset address) + H'701C.

**Table 33.35** shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in **Table 33.35** is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 33.35 LUT Space Addresses

| Space Name | Space Addresses | Entry Count | Module that References the Space in the Left Column |
|---|---|---|---|
| VI6_LUT_TBL | (offset address) + H'7000 to (offset address) + H'73FC | 256 | LUT |

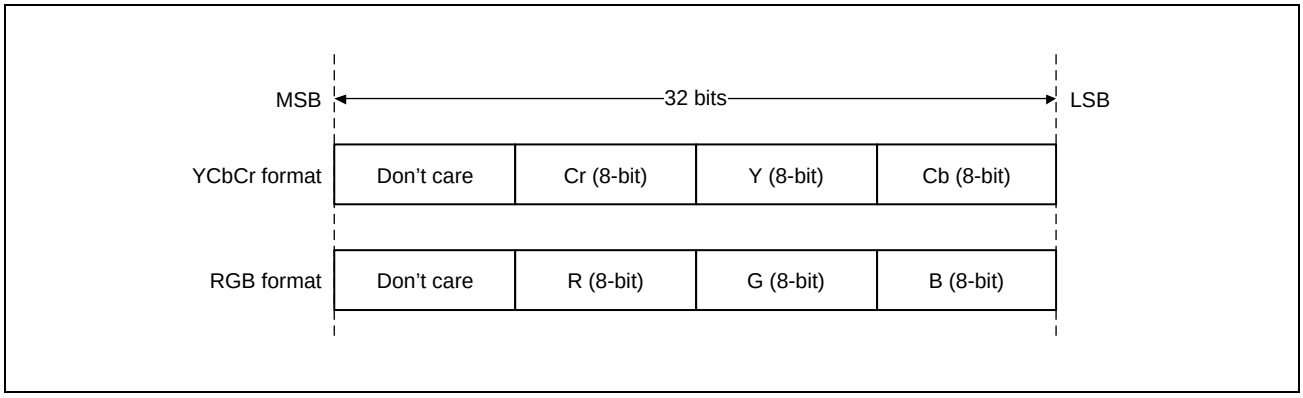

Figure 33.37 VI6_LUT_TBL Formats

## 33.4.8 Linked with DU

### 33.4.8.1 Operation flow of VSPD and DU

This section shows operation flow of VSPD by using Normal Display List Mode. For details of Normal Display List Mode, refer to **Section 33.4.5.2**.

**Figure 33.38** and **Figure 33.39** shows a procedure (register setting flow) to display image data to display panel.

**Figure 33.38** shows setting flow to start VSPD/LIF0 linked with DU. **Figure 33.39** shows setting flow to update display image.

Using display list with enabling next_frame_auto_start shown in **Section 33.4.5** is required to take the flow from **Figure 33.38** and **Figure 33.39**.

NOTE

If display sync operation ([1-8] step in **Figure 33.38**) is set before activating the VSPD, invalid data is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

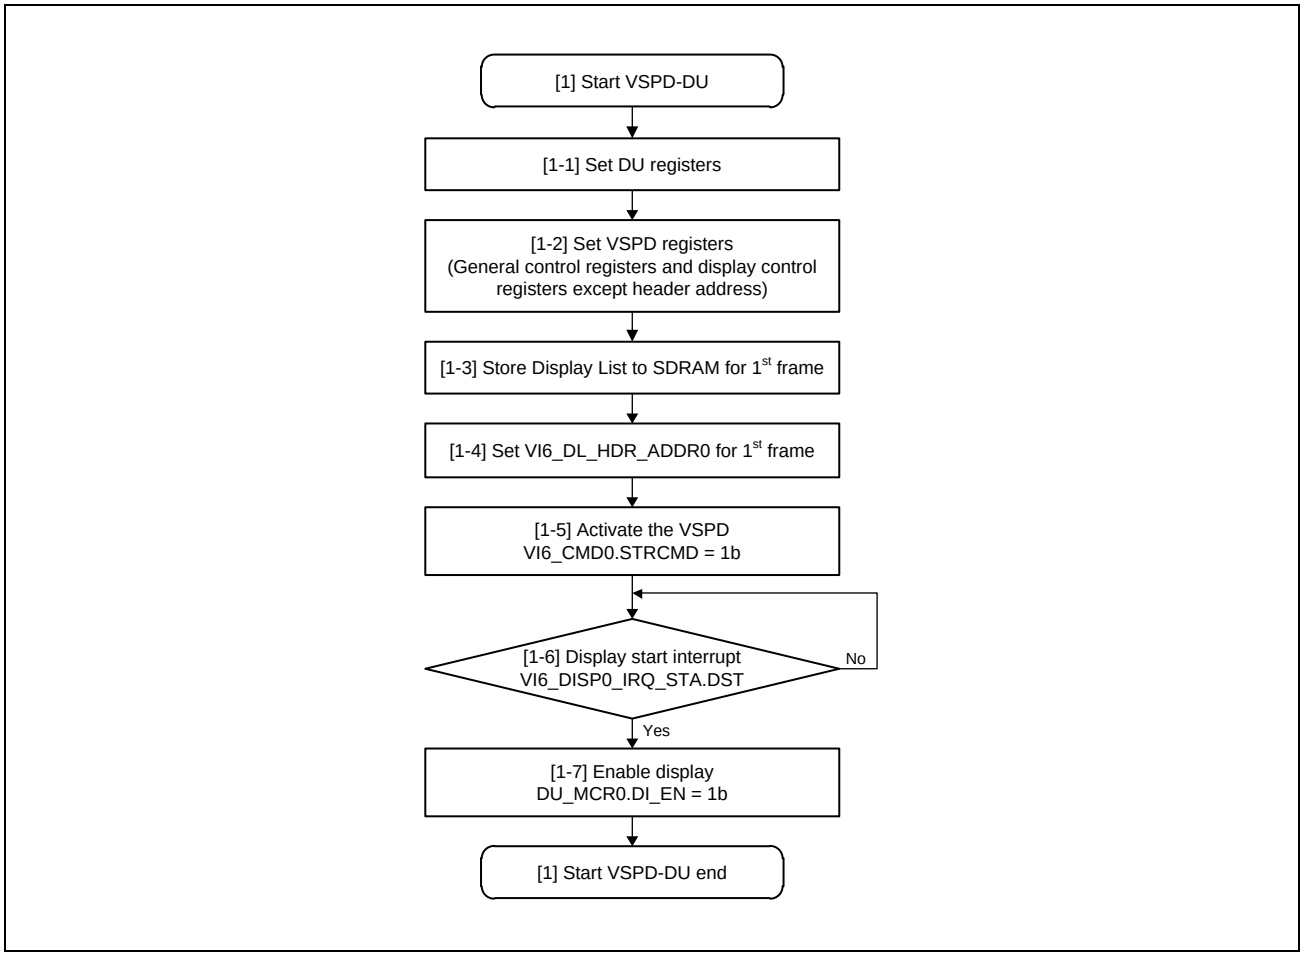

Figure 33.38 Setting flow to start VSPD linked with DU

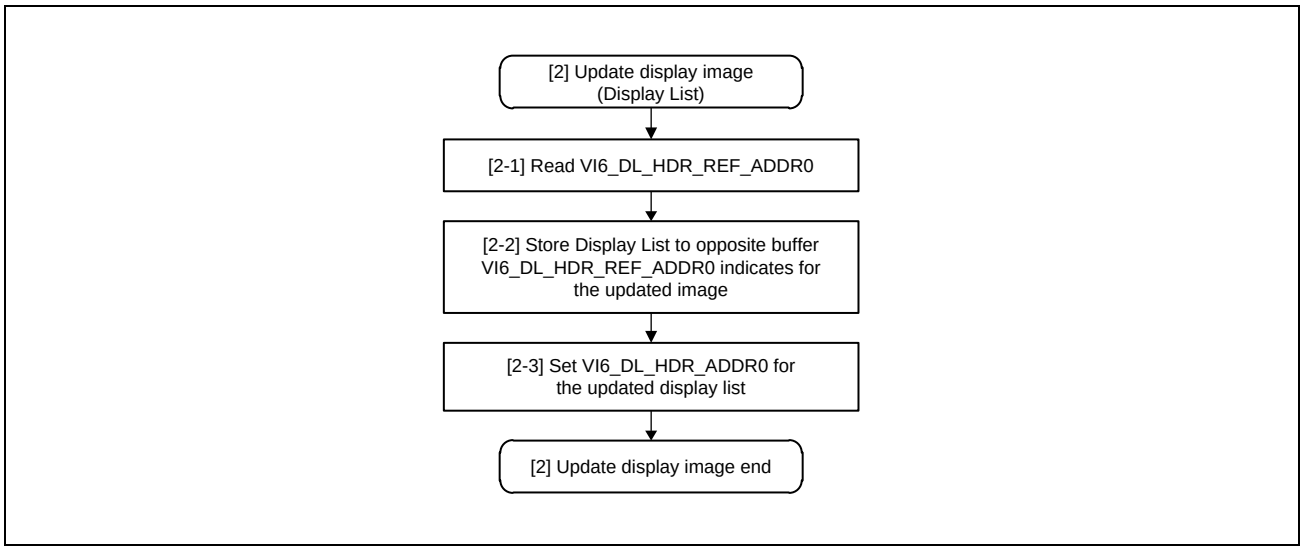

Figure 33.39 Setting flow to update display image

It is possible to update display list at any time (arbitrary timing) as shown in **Figure 33.39**. Don't overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSPD is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in **Section 33.3.2.5(6)**, when VSPD is reading display list from external memory (Period [A] in **Figure 33.40**), VI6_DL_HDR_REF_ADDRn indicates header address of the display list referred by VSPD. When VSPD is not reading display list from external memory (Period [B] in **Figure 33.40**), VI6_DL_HDR_REF_ADDRn indicates the value of VI6_DL_HDR_ADDRn, and there is possibility that the display list is being read soon by VSPD at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSPD -H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSPD.

[2] Set header address of new display list into VI6_DL_HDR_ADDRn.

[3] VSPD reads display list from the external memory area pointed by VI6_DL_HDR_ADDRn at frame start timing.

Refer also to **Section 33.3.2.5(2)** and **Section 33.3.2.5(6)**.

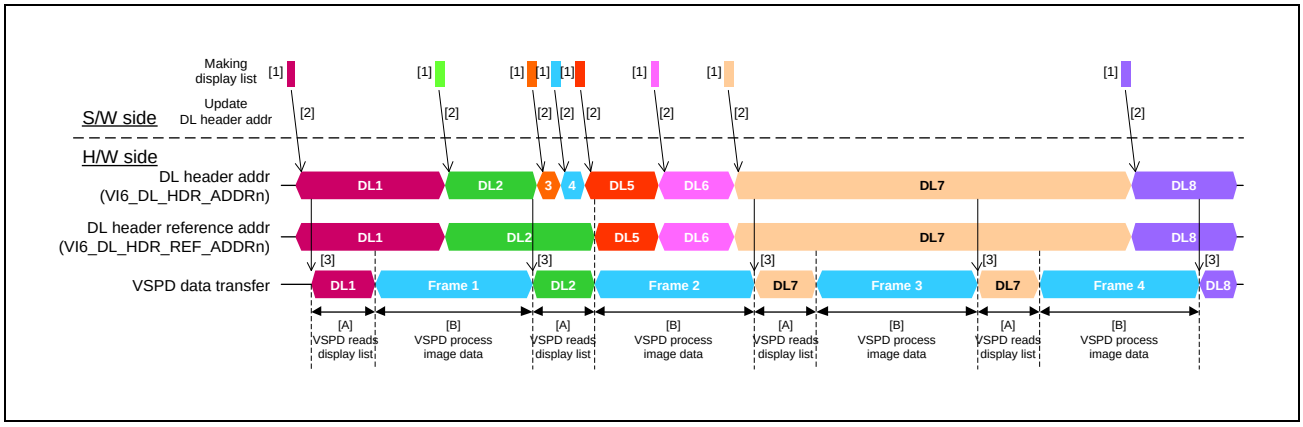

Figure 33.40 Updating display list at arbitrary timing

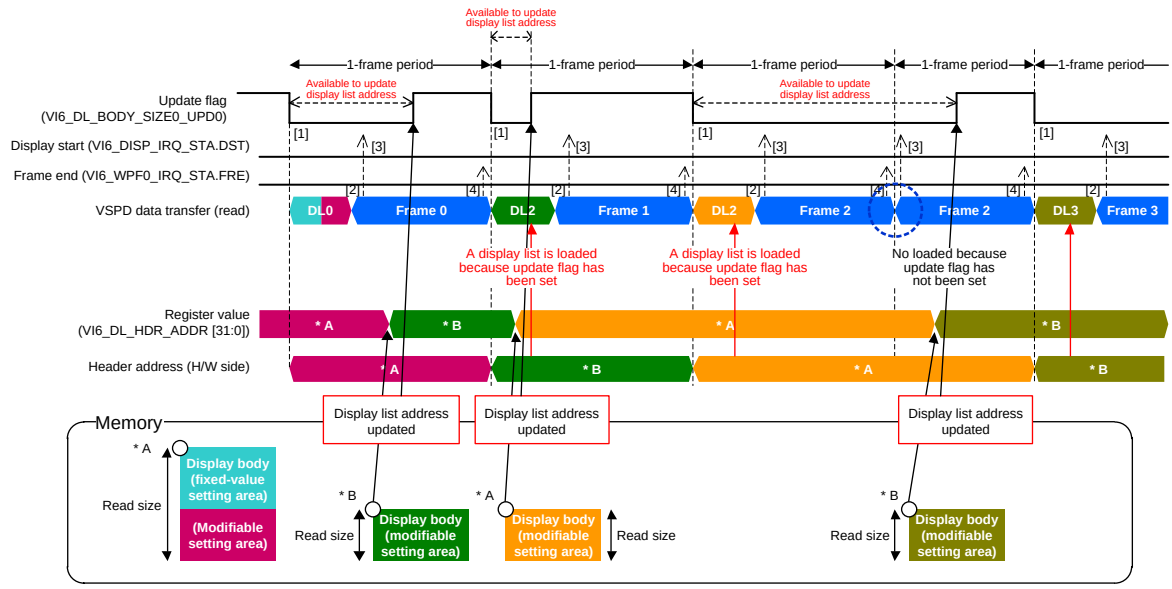
### 33.4.8.2 Controlling Two Register Planes Using Display Lists

This section shows operation flow of VSPD by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in **Section 33.4.8.1** except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in **Figure 33.38**. The procedure to update display list is different with Normal Display List Mode, and is described later. **Figure 33.41** shows the control of two register planes using header-less display lists (see **Section 33.4.5.3**) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.



Display list plane A: “Fixed-value settings” and “modifiable settings” are stored as a set in contiguous area A.
Display list plane B: Only the “modifiable settings” are stored in area B, which is separate from display list A.

To switch settings for every frame, modify two display list planes alternately. After every modification, update the display list address register (VI6_DL_HDR_ADDR0 [31:0]) and writing 1 to update flag (VI6_DL_BODY_SIZE0.UPD0) in the VSPD.
Update flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically after header address is loaded into H/W side.

Figure 33.41 Controlling Two Register Planes Using a Display List

The VSPD downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSPD downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSPD -H/W Events mentioned as [1], [2], [3] and [4] in **Figure 33.41** are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSPD -H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from “[4] VI6_WPF0_IRQ_STA.FRE” to next “[3] VI6_DISP_IRQ_STA.DST”, because VSPD is reading the display list for the period.

## 33.5 Usage Note

### 33.5.1 Assignment in Memory Space

Make sure that VSPD memory space shall be mapped to Non-Cache region.

### 33.5.2 Limitations on Software Reset and Module Standby

Stop LCDC with the software reset sequence following to the guidance in the **Section 33.4.1**.

### 33.5.3 Input Image Size

**Table 33.36** is a list of input size specifications.

Table 33.36 List of Input Size Specifications

| Module | Min. Input Size | Max. Input Size | Restriction on Setting Unit |
|---|---|---|---|
| RPF | 1 (horizontal)<br>x 1 (vertical) pixel | 1920 (horizontal)<br>x 1080 (vertical) pixels | YCbCr422: 2-pixel units horizontally and 1-pixel units vertically.<br>YCbCr420: 2-pixel units both horizontally and vertically.<br>Other formats: 1-pixel units both horizontally and vertically.<br>*Note 1.* When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format.<br>*Note 2.* These restrictions including note 1 are applied to the following.<br>VI6_RPFn_SRC_BSIZE<br>VI6_RPFn_SRC_ESIZE |
| LUT | 1 (horizontal)<br>x 1 (vertical) pixel | 1920 (horizontal)<br>x 1080 (vertical) pixels | 1-pixel units both horizontally and vertically. |
| BRS | 1 (horizontal)<br>x 1 (vertical) pixel | 1920 (horizontal)<br>x 1080 (vertical) pixels | 1-pixel units both horizontally and vertically. |
| LIF | 1 (horizontal)<br>x 1 (vertical) pixel | 1920 (horizontal)<br>x 1080 (vertical) pixels | 1-pixel units both horizontally and vertically. |
| WPF | 1 (horizontal)<br>x 1 (vertical) pixel | 1920 (horizontal)<br>x 1080 (vertical) pixels | YCbCr422: 2-pixel units horizontally and 1-pixel units vertically.<br>YCbCr420: 2-pixel units both horizontally and vertically.<br>Other formats: 1-pixel units both horizontally and vertically.<br>*Note 1.* This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units. |

Note 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 011b.

The most important restriction shown in **Table 33.36** is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in **Table 33.36**.

### 33.5.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in **Figure 33.1**, the data input to the VSPD is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. **Table 33.37** is a list of the processing that changes image size.

Table 33.37 Image Processing that changes image size

| Module | Function*1 | Related Register | Size of Output from Module |
|---|---|---|---|
| WPF | Input size clipping | VI6_WPFn_HSZCLIP<br>VI6_WPFn_VSZCLIP | When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size.<br>Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE x 2 setting<br>Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE x 2 setting |
| LIF | Padding line | VI6_LIFn_CTRL | When padding with dummy lines is disabled, output size is same with Input size.<br>When padding with dummy lines is enabled:<br>Horizontal output size: input size<br>Vertical output size: VI6_LIF0_PADLN_SIZE setting |

Note 1. For details of each function, refer to the descriptions of the related registers.

Note 2. Refer to **Section 33.3.2.1** for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in **Table 33.37**. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSPD output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in **Table 33.37**, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in **Table 33.37**, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSPD output size for that WPFn path.

**Figure 33.42** shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

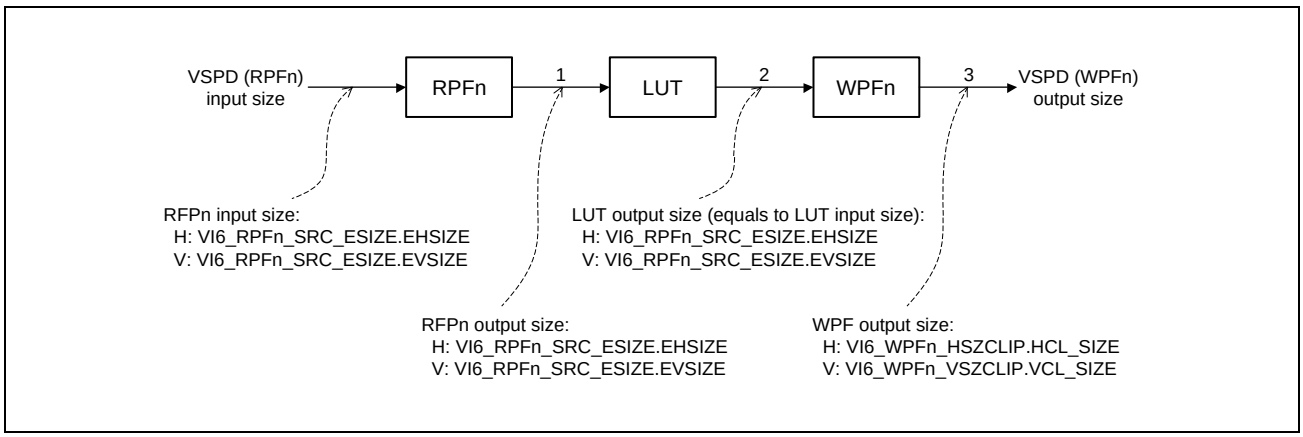


Figure 33.42 Input/output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSPD output image size determined as shown in the figure does not violate the restrictions shown in **Table 33.37**.

### 33.5.5 Restriction

When the data output from this unit is written back to the same memory area where the input data for this unit has been read, this unit has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically, horizontally, or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in. Refer to the descriptions of the registers related to each restriction. In the table, RPFm indicates the RPFn that inputs the master layer, and WPFwb indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 33.38 Restrictions on Use when Output Data is Written Back to Input Data Area

| No. | Restriction | Related Registers |
|---|---|---|
| Restriction 1 | The RPFm input format and the WPFwb output format should be the same. | VI6_RPFn_INFMT.RDFMT<br>VI6_RPFn_INFMT.VIR |
| | The RPFm source image storing address and the WPFwb destination address should be the same. | VI6_RPFn_SRCM_ADDR_* |
| | The RPFm source picture memory stride and the WPFwb destination memory stride should be the same. | VI6_RPFn_SRCM_PSTRIDE<br>VI6_RPFn_SRCM_ASTRIDE |
| | The RPFm and WPFwb data swapping settings should be the same. | VI6_WPFn_DSWAP |
| Restriction 2 | The RPFm basic read size and extended read size should be the same. | VI6_RPFn_SRC_BSIZE<br>VI6_RPFn_SRC_ESIZE |
| | Color space conversion is prohibited in RPFm and WPFwb. | VI6_RPFn_INFMT.CSC<br>VI6_WPFn_OUTFMT.CSC |
| Restriction 3*1 | NOP should be specified for IROP operation. | VI6_RPFn_ALPH_SEL.IROP |
| | Color keying is prohibited. | VI6_RPFn_CKEY_CTRL.CV |

Note 1. Note: When the input format is not YCbCr4:2:0, restriction 3 in not applied.

# 35. Camera Data Receiving Unit (CRU)

The CRU consists of a MIPI CSI-2 block and an Image Processing block.

### (1) MIPI CSI-2

This block can receive signals conforming to the MIPI CSI-2 standard, extracts video signal from various packets, and sends them to Image Processing block in the subsequent stage.

### (2) Image Processing

This block can receive video data received from MIPI CSI-2 block, and perform appropriate image processing for each. The image-processed data is temporarily stored in the FIFO and transferred to an external memory.

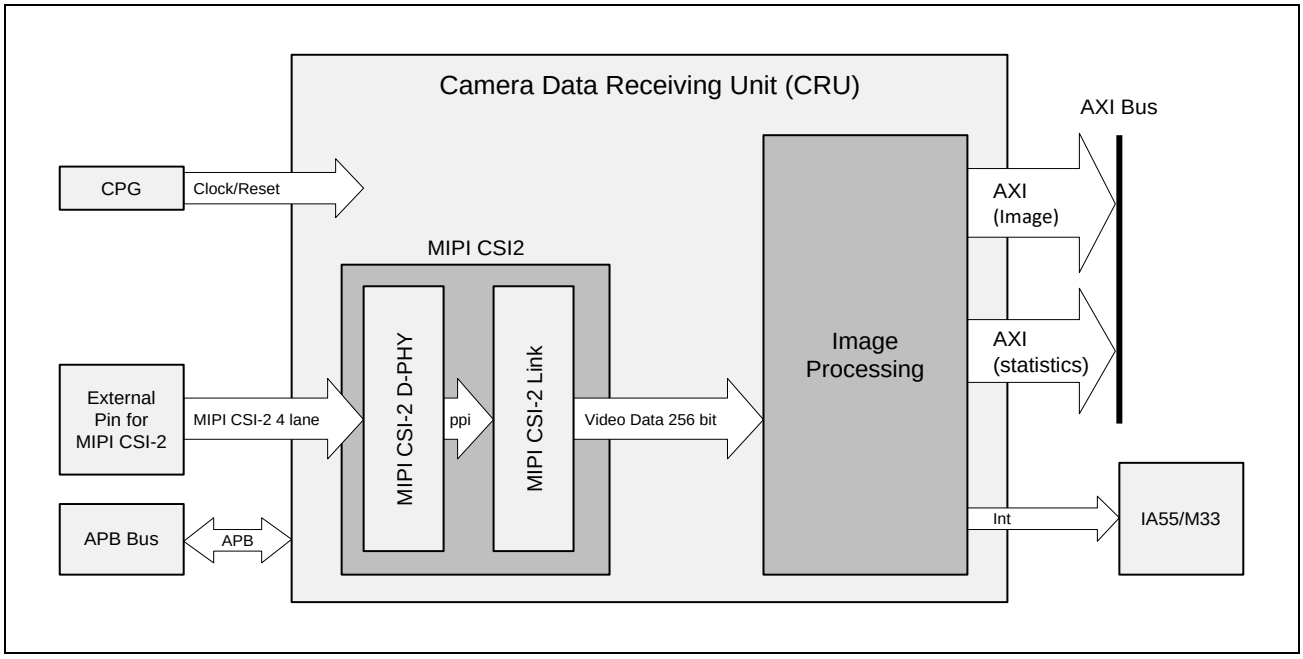

Figure 35.1 Block Diagram of CRU

# 35.1 MIPI CSI-2

## 35.1.1 Overview

The MIPI CSI-2 is an MIPI Camera Serial Interface 2 receiver module.

This module supports MIPI CSI-2 V2.1 and MIPI D-PHY V2.1 (80 Mbps ~ 1500 Mbps).

The image signal received by the MIPI-CSI2 is output to the image processing module.

## 35.1.2 Features

This module supports the following functions.

1) Input Image Size

- Maximum image size: 5 M pixels
- Minimum image size: QVGA (320 × 240) ＝ 76.8 K pixels
- Maximum number of valid pixels in the horizontal direction: 2800 pixels
- Maximum number of valid pixels in the vertical direction: 4095 lines

2) Compliant with Specification for Camera Serial Interface 2 (CSI-2)$^{SM}$

3) Support 1/2/4 lanes

4) Supported Input Data Format is described in **Table 35.10**.

5) Support Data De-Scrambling

6) Generic Short Packet FIFO with the depth of 16

7) Support Latency Reduction and Transport Efficiency (LRTE)

8) ECC 1bit error correction and 2bit error detection in packet header

9) CRC check for payload data

10) Support 4 Virtual Channel

11) Support Data Interleaving

- Data Type Interleaving
  - Packet Level Interleaved Data Transmission
  - Frame Level Interleaved Data Transmission
- Virtual Channel Identifier Interleaving

12) Receiver Error Detection and Report

- D-PHY Level Errors
- Packed Level Errors
- Protocol Decoding Level Errors

13) Skew Adjustment for D-PHY

14) MIPI CSI-2 Input Bandwidth Limitation

- CRU can receive signals which satisfied both of **Table 35.1** and **Table 35.2**.

15) Blanking period

- Minimum invalid period between horizontal lines: 412ns.

Table 35.1 Supported Image Format and Maximum Transfer Rate

| | Transfer Data Rate per Lane [M bps / Lane] | | Total Transfer Data Rate [M bps] | |
|---|---|---|---|---|
| Number of Lanes | MIN | MAX | MIN | MAX |
| 1 lane | 80 | 1500 | 80 | 1500 |
| 2 Lanes | 80 | 1500 | 160 | 3000 |
| 4 Lanes | 80 | 1500 | 320 | 6000 |

Table 35.2 Supported Image Format and Maximum Transfer Rate

| No. | Input Image Format | MIPI CSI-2 Maximum Transfer Ratio [Mbps] |
|---|---|---|
| 1 | YCbCr/YUV422 8-bit | 4256 |
| 2 | YCbCr/YUV422 10-bit | 5238 |
| 3 | RGB565 | 4256 |
| 4 | RGB666 | 4540 |
| 5 | RGB888 | 6000 |
| 6 | RAW8 | 2128 |
| 7 | RAW10 | 2619 |
| 8 | RAW12 | 3095 |
| 9 | RAW14 | 3584 |
| 10 | RAW16 | 4000 |
| 11 | Others | 2128 |

### 35.1.3 Block Diagram

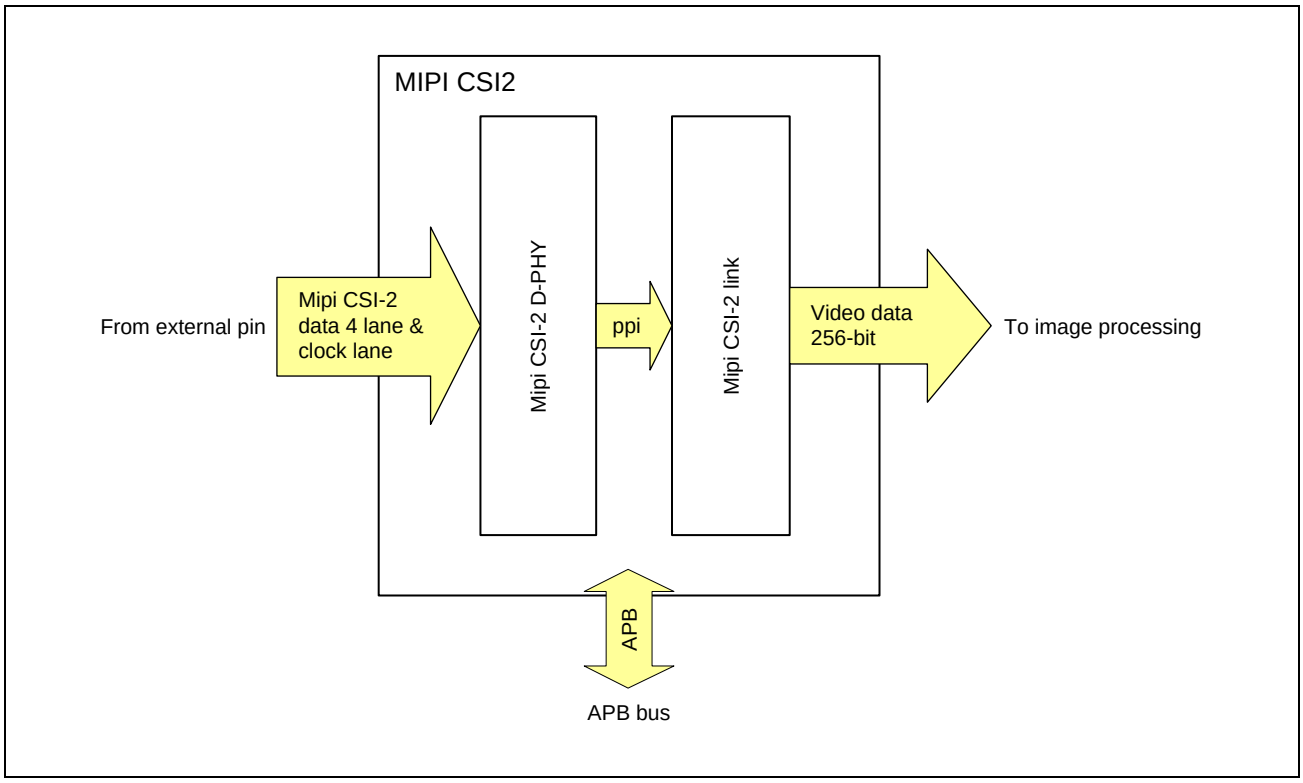

Figure 35.2 Block Diagram of MIPI CSI-2

### 35.1.4 External Pins

**Table 35.3** shows the pin configuration.

Table 35.3 External Pins

| Pin Name | Input/Output | Function |
|---|---|---|
| CSI_CLKP | Input | MIPI CSI-2 Rx clock input (positive) |
| CSI_CLKN | Input | MIPI CSI-2 Rx clock input (negative) |
| CSI_DATA0_P | Input | MIPI CSI-2 Rx serial data inputs lane0 (positive) |
| CSI_DATA0_N | Input | MIPI CSI-2 Rx serial data inputs lane0 (negative) |
| CSI_DATA1_P | Input | MIPI CSI-2 Rx serial data inputs lane1 (positive) |
| CSI_DATA1_N | Input | MIPI CSI-2 Rx serial data inputs lane1 (negative) |
| CSI_DATA2_P | Input | MIPI CSI-2 Rx serial data inputs lane2 (positive) |
| CSI_DATA2_N | Input | MIPI CSI-2 Rx serial data inputs lane2 (negative) |
| CSI_DATA3_P | Input | MIPI CSI-2 Rx serial data inputs lane3 (positive) |
| CSI_DATA3_N | Input | MIPI CSI-2 Rx serial data inputs lane3 (negative) |

### 35.1.5 Register Configuration

Module and base address are shown below.

| Module Name | Address |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | VSRSTS | 0b | R | Indicates the execution status of the software reset generated by CSI2nRTCT.VSRST.<br>0b: Not during a reset<br>1b: During a reset |

### 35.1.6.7 EPD Option Control Register (CSI2nEPCT)

This register supports the TX_REG_CSI_EPD_EN_SSP register and the TX_REG_CSI_EPD_OP_SLP register that are defined in *Section 9.11.1.2.3, D-PHY EPD Specifications (for EPD Options 1 and 2)* in *the MIPI CSI-2 V2.1 Specification*.

Set the same value as the one set in this register in the CSI-2 transmitter.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | EPDEN | SSP | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | EPDOP | SLP | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | EPDEN | 0b | RW | Enables the EPD.<br>0b: Disables the EPD.<br>1b: Enables the EPD. |
| 30 to 16 | SSP | All 0 | RW | Specify the number of spacers inserted after a short packet.<br>This field is valid when EPDEN = 1.<br>The following shows the specifiable minimum number of spacers when EPDEN = 1.<br>Setting a value less than the minimum value is prohibited. |
| 15 | EPDOP | 0b | RW | Selects an EPD option. Set this bit to 1b.<br>0b: D-PHY EPD Option 1 (0 cannot be set when EPDEN = 1)<br>1b: D-PHY EPD Option 2 |
| 14 to 0 | SLP | All 0 | RW | Specify the number of spacers inserted after a long packet.<br>This field is valid when EPDEN = 1.<br>When EPDEN = 1, the minimum number of spacers is the value described in the SSP field.<br>Setting a value less than the minimum value is prohibited. |

| EPDOP | Minimum number of spacers |
|---|---|
| 1b | The larger value of the following two values:<br>• Minimum number of spacers due to the D-PHY setting<br>• Minimum number of spacers due to the number of used lanes<br>Minimum number of spacers due to the D-PHY setting:<br>The minimum value can be found by using the ROUNDUP function that rounds up the decimal places.<br>ROUNDUP(( 105/UI[ns] + 20 ) / 8 ), 0 )<br>Minimum number of spacers due to the number of used lanes:<br>Number of used lanes: Minimum number of spacers<br>One lane: 64<br>Two lanes: 32<br>Four lanes: 32 |

### 35.1.6.8 Module Interrupt Status Register (CSI2nMIST)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
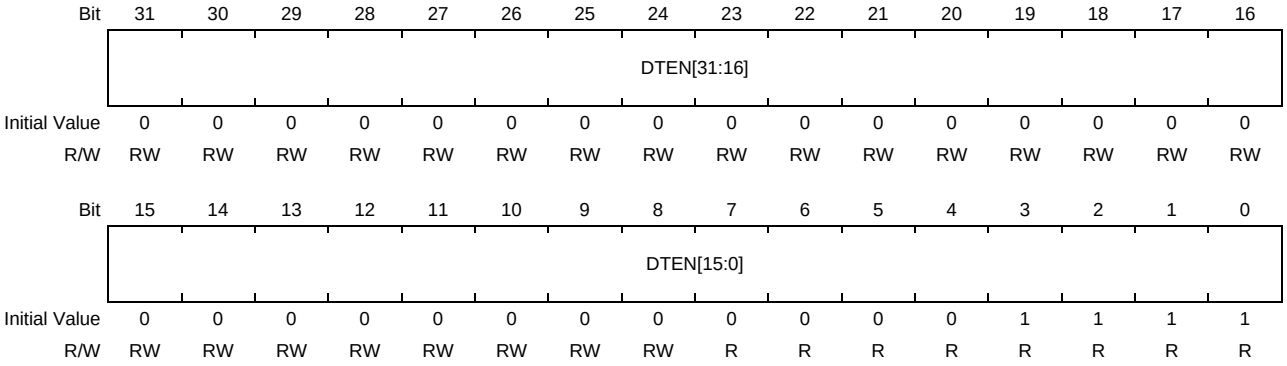
| | — | — | — | — | — | RXS | GSTS | PMS | — | — | — | — | DL3S | DL2S | DL1S | DL0S |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | VC3S | 0b | R | When this bit is set to 1, there is an interrupt source regarding virtual channel 3.<br>Check the CSI2nVCST3 register for the details of the interrupt source. |
| 18 | VC2S | 0b | R | When this bit is set to 1, there is an interrupt source regarding virtual channel 2.<br>Check the CSI2nVCST2 register for the details of the interrupt source. |
| 17 | VC1S | 0b | R | When this bit is set to 1, there is an interrupt source regarding virtual channel 1.<br>Check the CSI2nVCST1 register for the details of the interrupt source. |
| 16 | VC0S | 0b | R | When this bit is set to 1, there is an interrupt source regarding virtual channel 0.<br>Check the CSI2nVCST0 register for the details of the interrupt source. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 10 | RXS | 0b | R | When this bit is set to 1, there is an interrupt source regarding the reception in general.<br>Check the CSI2nRXST register for the details of the interrupt source. |
| 9 | GSTS | 0b | R | When this bit is set to 1, there is an interrupt source regarding reception of generic short packets.<br>Check the CSI2nGSST register for the details of the interrupt source. |
| 8 | PMS | 0b | R | When this bit is set to 1, there is an interrupt source regarding the power management.<br>Check the CSI2nPMST register for the details of the interrupt source. |
| 7 to 4 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | DL3S | 0b | R | When this bit is set to 1, there is an interrupt source regarding data lane 3.<br>Check the CSI2nDLST3 register for the details of the interrupt source. |
| 2 | DL2S | 0b | R | When this bit is set to 1, there is an interrupt source regarding data lane 2.<br>Check the CSI2nDLST2 register for the details of the interrupt source. |
| 1 | DL1S | 0b | R | When this bit is set to 1, there is an interrupt source regarding data lane 1.<br>Check the CSI2nDLST1 register for the details of the interrupt source. |
| 0 | DL0S | 0b | R | When this bit is set to 1, there is an interrupt source regarding data lane 0.<br>Check the CSI2nDLST0 register for the details of the interrupt source. |

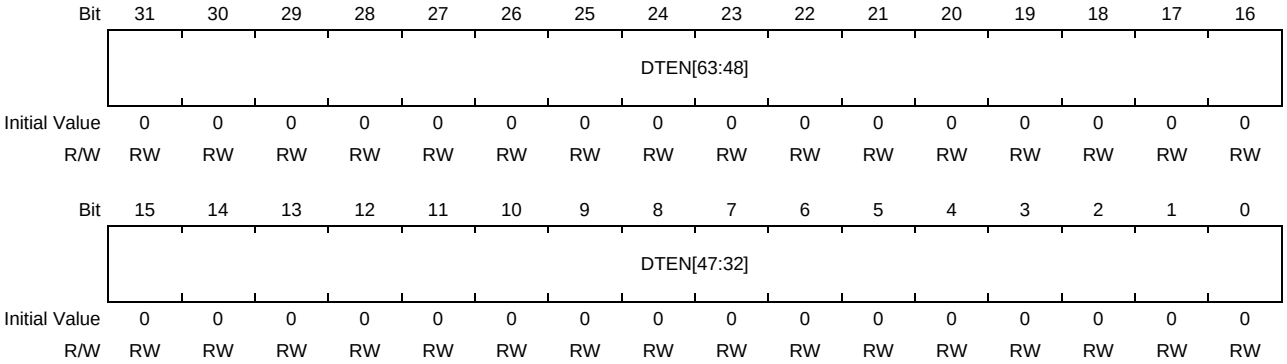
### 35.1.6.9 Receive Data Type Enable Low Register (CSI2nDTEL)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DTEN[31:0] | H'0000_000F | RW/R | Receive data of a packet whose data type is one of the following.<br>0b: Does not receive data.<br>1b: Receives data.<br>*Note*: After multiple data types are selected here, only one data type is selected by the INF[5:0] bits in the ICnMC register in the image processing module. |

| Bit | Data Type | Attribute | Comment |
|---|---|---|---|
| 31 | YUV422 10-bit | RW | When this bit is set to 1b, data is output to the image processing module. |
| 30 | YUV422 8-bit | RW | |
| 29 | YUV420 10-bit (Chroma Shifted Pixel Sampling) | RW | |
| 28 | YUV420 8-bit (Chroma Shifted Pixel Sampling) | RW | |
| 27 | Reserved | RW | |
| 26 | Legacy YUV420 8-bit | RW | |
| 25 | YUV420 10-bit | RW | |
| 24 | YUV420 8-bit | RW | |
| 23 | Reserved | RW | |
| 22 | Generic Long Packet Data Type 4 | RW | |
| 21 | Generic Long Packet Data Type 3 | RW | |
| 20 | Generic Long Packet Data Type 2 | RW | |
| 19 | Generic Long Packet Data Type 1 | RW | |
| 18-16 | Reserved (Embedded 8-bit non Image Data, etc.) | RW | Fixed to 0 since this function is not support. |
| 15 | Generic Short Packet Code 8 | RW | Fixed to 1 for each bits. |
| 14 | Generic Short Packet Code 7 | RW | When each bits are set to 1b and CSI2nGSCT.GFIF = 1, data is output to the generic short packet FIFO. |
| 13 | Generic Short Packet Code 6 | RW | |
| 12 | Generic Short Packet Code 5 | RW | |
| 11 | Generic Short Packet Code 4 | RW | |
| 10 | Generic Short Packet Code 3 | RW | |
| 9 | Generic Short Packet Code 2 | RW | |
| 8 | Generic Short Packet Code 1 | RW | |
| 7-4 | Reserved | R | Fixed to 0. |
| 3-0 | Reserved | R | Fixed to 1. |

### 35.1.6.10 Receive Data Type Enable High Register (CSI2nDTEH)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DTEN[63:32] | H'0000_0000 | RW | Receive data of a packet whose data type is one of the following.<br>0b: Does not receive data.<br>1b: Receives data. |

| Bit | Data Type | Attribute | Comment |
|---|---|---|---|
| 31 | Reserved | RW | Changing the reserved bit from the initial value is prohibited. |
| 30-24 | Reserved | RW | When this bit is set to 1b and CSI2nMCT0.RVMD = 1, data is output to the image processing module. |
| 23 | User Defined 8-bit Data Type 8 | RW | When this bit is set to 1b, data is output to the image processing module. |
| 22 | User Defined 8-bit Data Type 7 | RW | |
| 21 | User Defined 8-bit Data Type 6 | RW | |
| 20 | User Defined 8-bit Data Type 5 | RW | |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W | R0W | R0W | R0W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | RULC(N) | 0b | R0W | Write 1 to this bit to clear CSI2nDLST(N).RUL(N).<br>This bit cannot be modified to 0. |
| 16 | EULC(N) | 0b | R0W | Write 1 to this bit to clear CSI2nDLST(N).EUL(N).<br>This bit cannot be modified to 0. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 8 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 4 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | EESC(N) | 0b | R0W | Write 1 to this bit to clear CSI2nDLST(N).EES(N).<br>This bit cannot be modified to 0. |
| 2 | ECTC(N) | 0b | R0W | Write 1 to this bit to clear CSI2nDLST(N).ECT(N).<br>This bit cannot be modified to 0. |
| 1 | ESSC(N) | 0b | R0W | Write 1 to this bit to clear CSI2nDLST(N).ESS(N).<br>This bit cannot be modified to 0. |
| 0 | ESHC(N) | 0b | R0W | Write 1 to this bit to clear CSI2nDLST(N).ESH(N).<br>This bit cannot be modified to 0. |

### 35.1.6.16 Data Lane (N) Interrupt Enable Register (CSI2nDLIE(N))

(N) indicates a logical data lane number.

(N) = 0, 1, 2, or 3

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RULE(N) | EULE(N) |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | EESE(N) | ECTE(N) | ESSE(N) | ESHE(N) |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 18 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 17 | RULE(N) | 0b | RW | Enables interrupts generated by CSI2nDLST(N).RUL(N).<br>0b: Does not assert csi2_int_dl when CSI2nDLST(N).RUL(N) = 1.<br>1b: Asserts csi2_int_dl when CSI2nDLST(N).RUL(N) = 1. |
| 16 | EULE(N) | 0b | RW | Enables interrupts generated by CSI2nDLST(N).EUL(N).<br>0b: Does not assert csi2_int_dl when CSI2nDLST(N).EUL(N) = 1.<br>1b: Asserts csi2_int_dl when CSI2nDLST(N).EUL(N) = 1. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 8 | — | H'0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 7 to 4 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | EESE(N) | 0b | RW | Enables interrupts generated by CSI2nDLST(N).EES(N).<br>0b: Does not assert csi2_int_dl when CSI2nDLST(N).EES(N) = 1.<br>1b: Asserts csi2_int_dl when CSI2nDLST(N).EES(N) = 1. |
| 2 | ECTE(N) | 0b | RW | Enables interrupts generated by CSI2nDLST(N).ECT(N).<br>0b: Does not assert csi2_int_dl when CSI2nDLST(N).ECT(N) = 1.<br>1b: Asserts csi2_int_dl when CSI2nDLST(N).ECT(N) = 1. |
| 1 | ESSE(N) | 0b | RW | Enables interrupts generated by CSI2nDLST(N).ESS(N).<br>0b: Does not assert csi2_int_dl when CSI2nDLST(N).ESS(N) = 1.<br>1b: Asserts csi2_int_dl when CSI2nDLST(N).ESS(N) = 1. |
| 0 | ESHE(N) | 0b | RW | Enables interrupts generated by CSI2nDLST(N).ESH(N).<br>0b: Does not assert csi2_int_dl when CSI2nDLST(N).ESH(N) = 1.<br>1b: Asserts csi2_int_dl when CSI2nDLST(N).ESH(N) = 1. |

### 35.1.6.17 Virtual Channel (M) Status Register (CSI2nVCST(M))

(M) indicates a virtual channel number.

(M) = 0, 1, 2, or 3

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | LER(M) | LSR(M) | FER(M) | FSR(M) | — | — | — | — | — | — | — | OVF(M) |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | FRD(M) | FRS(M) | — | ECN(M) | ECC(M) | WCE(M) | IDE(M) | CRC(M) | ECD(M) | MLF(M) |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 | LER(M) | 0b | R | When this bit is set to 1, a packet whose data type is "Line End Code" has been received.<br>Write 1 to CSI2nVCSC(M).LERC(M) to clear this bit. |
| 26 | LSR(M) | 0b | R | When this bit is set to 1, a packet whose data type is "Line Start Code" has been received.<br>Write 1 to CSI2nVCSC(M).LSRC(M) to clear this bit. |
| 25 | FER(M) | 0b | R | When this bit is set to 1, a packet whose data type is "Frame End Code" has been received.<br>Write 1 to CSI2nVCSC(M).FERC(M) to clear this bit. |
| 24 | FSR(M) | 0b | R | When this bit is set to 1, a packet whose data type is "Frame Start Code" has been received.<br>Write 1 to CSI2nVCSC(M).FSRC(M) to clear this bit. |
| 23 to 17 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | OVF(M) | 0b | R | When this bit is set to 1, the generic short packets on virtual channel M has been discarded due to an overflow of the generic short packet FIFO.<br>Write 1 to CSI2nVCSC(M).OVFC(M) to clear this bit. |
| 15 to 10 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 | FRD(M) | 0b | R | When this bit is set to 1, ErrFrameData has been detected.<br>This bit is set to 1 if any of the following errors occurs between FS and FE:<br>• ErrCRC<br>• ErrWC<br>• ECC 2-bit error (when CSI2nMCT0.EDMD = 1)<br>• Reception of a packet of less than four bytes (when CSI2nMCT0.EDMD = 1)<br>Note that this bit is set to 1 if Virtual Channel = M is between FS and FE because the virtual channel of a packet with an ECC 2-bit error or the virtual channel which received a packet of less than four bytes cannot be determined.<br>Write 1 to CSI2nVCSC(M).FRDC(M) to clear this bit. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | FRS(M) | 0b | R | When this bit is set to 1, ErrFrameSync has been detected.<br>This bit is set to 1 if any of the following conditions occurs:<br>• After an FS is received, another FS has been received on the same virtual channel without receiving an FE.<br>• Although an FE is received, an FS has not been received on the same virtual channel.<br>Write 1 to CSI2nVCSC(M).FRSC(M) to clear this bit. |
| 7 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 | ECN(M) | 0b | R | When this bit is set to 1, no error was found in the ECC check on the received packets.<br>Write 1 to CSI2nVCSC(M).ECNC(M) to clear this bit. |
| 5 | ECC(M) | 0b | R | When this bit is set to 1, a 1-bit error was found in the ECC check on the received packets and the error was corrected.<br>Write 1 to CSI2nVCSC(M).ECCC(M) to clear this bit. |
| 4 | WCE(M) | 0b | R | When this bit is set to 1, it was detected that the data payload length of the packet is shorter than the value indicated by WC.<br>Write 1 to CSI2nVCSC(M).WCEC(M) to clear this bit. |
| 3 | IDE(M) | 0b | R | When this bit is set to 1, an ErrID was detected and the packet was discarded.<br>This bit is set to 1 if any of the following conditions occurs:<br>• A packet which is defined as "Reserved" in chapter 9, Low Level Protocol in the CSI-2 Specification has been received.<br>– A packet whose Data Type is H’04 to H’07 has been received.<br>– A packet whose Data Type is H’38 to H’3F has been received when CSI2nMCT0.RVMD = 0.<br>• A generic short packet (Data Type = H’08 to H’0F) for which the corresponding bit in CSI2nDTEL.DTEN is 0 has been received.<br>• A long packet (Data Type = H’10 to H’3F) for which the corresponding bit in CSI2nDTEL(H).DTEN is 0 has been received.<br>Write 1 to CSI2nVCSC(M).IDEC(M) to clear this bit.<br>Note that this bit may be set to 1 if more spacers than the count specified in CSI2nEPCT.SSP/SLP are received when using EPD option 2. |
| 2 | CRC(M) | 0b | R | When this bit is set to 1, a CRC error was detected in the received packet.<br>Write 1 to CSI2nVCSC(M).CRCC(M) to clear this bit. |
| 1 | ECD(M) | 0b | R | When this bit is set to 1, a 2-bit error was found in the ECC check on the received packets.<br>Because the virtual channel of the packet with an error cannot be determined, the ECD(M) field is set to 1 for all virtual channels.<br>To clear the ECD(M) field for all virtual channels, write 1 to CSI2nVCSC(M).AECDC(M) for any virtual channel.<br>To clear the ECD(M) field of virtual channel M, write 1 to CSI2nVCSC(M).ECDC(M). |
| 0 | MLF(M) | 0b | R | When this bit is set to 1, a packet of less than 4 bytes has been received.<br>Because the virtual channel of the packet with an error cannot be determined, the MLF(M) field is set to 1 for all virtual channels.<br>To clear the MLF(M) field for all virtual channels, write 1 to CSI2nVCSC(M).AMLFC(M) for any virtual channel.<br>To clear the MLF(M) field of virtual channel M, write 1 to CSI2nVCSC(M).MLFC(M). |

### 35.1.6.18 Virtual Channel (M) Status Clear Register (CSI2nVCSC(M))

(M) indicates a virtual channel number.

(M) = 0, 1, 2, or 3

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CUNE | CUXE | DUNE | DUXE | CSNE | CSXE | DSNE | DSXE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | CUNE | 0b | RW | Enables interrupts generated by CSI2nPMST.CUN.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.CUN = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.CUN = 1. |
| 6 | CUXE | 0b | RW | Enables interrupts generated by CSI2nPMST.CUX.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.CUX = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.CUX = 1. |
| 5 | DUNE | 0b | RW | Enables interrupts generated by CSI2nPMST.DUN.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.DUN = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.DUN = 1. |
| 4 | DUXE | 0b | RW | Enables interrupts generated by CSI2nPMST.DUX.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.DUX = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.DUX = 1. |
| 3 | CSNE | 0b | RW | Enables interrupts generated by CSI2nPMST.CSN.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.CSN = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.CSN = 1. |
| 2 | CSXE | 0b | RW | Enables interrupts generated by CSI2nPMST.CSX.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.CSX = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.CSX = 1. |
| 1 | DSNE | 0b | RW | Enables interrupts generated by CSI2nPMST.DSN.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.DSN = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.DSN = 1. |
| 0 | DSXE | 0b | RW | Enables interrupts generated by CSI2nPMST.DSX.<br>0b: Does not assert csi2_int_pm when CSI2nPMST.DSX = 1.<br>1b: Asserts csi2_int_pm when CSI2nPMST.DSX = 1. |

### 35.1.6.23 Generic Short Packet Control Register (CSI2nGSCT)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GFIF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | SHTH | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 16 | GFIF | 1b | RW | When this bit is set to 1, the received generic short packet is stored in the generic short packet FIFO (GS FIFO). |
| 15 to 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 to 0 | SHTH | H'00 | RW | Asserts CSI2nGSST.GTH while the number of packets stored in the generic short packet FIFO equals or exceeds the value of this field + 1.<br>Set this field to 15 or less when using CSI2nGSST.GTH.<br>Set the default value when not using CSI2nGSST.GTH. |

### 35.1.6.24 Generic Short Packet Status Register (CSI2nGSST)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STRDS | GCD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PNUM | | | | | | | | — | — | — | GOV | — | — | GTH | GNE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | STRDS | 0b | R | Indicates whether the received generic short packets can be stored in the generic short packet FIFO.<br>0b: Can be stored in the generic short packet FIFO.<br>1b: Cannot be stored in the generic short packet FIFO.<br>This field indicates an inverted value of the store_en signal described in **Section 35.1.7.1** with a delay of internal latency. It may indicate the previous value depending on the signal change timing. |
| 16 | GCD | 0b | R | When this bit is set to 1, the GS FIFO is being cleared by CSI2nGSCT.GFCLR. |
| 15 to 8 | PNUM | H'00 | R | Indicate the number of packets stored in the generic short packet FIFO. |
| 7 to 5 | — | 000b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | GOV | 0b | R | When this bit is set to 1, the generic short packet FIFO has overflowed.<br>Write 1 to CSI2nGSSC.GOVC to clear this bit. |
| 3, 2 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | GTH | 0b | R | When this bit is set to 1, the number of packets stored in the generic short packet FIFO equals or exceeds "CSI2nGSCT.SHTH + 1". |
| 0 | GNE | 0b | R | When this bit is set to 1, the generic short packet FIFO is not empty. |

### 35.1.6.25 Generic Short Packet Status Clear Register (CSI2nGSSC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | GOVC | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | GOVC | 0b | R0W | Write 1 to this bit to clear CSI2nGSST.GOV.<br>This bit cannot be modified to 0. |
| 3 to 0 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

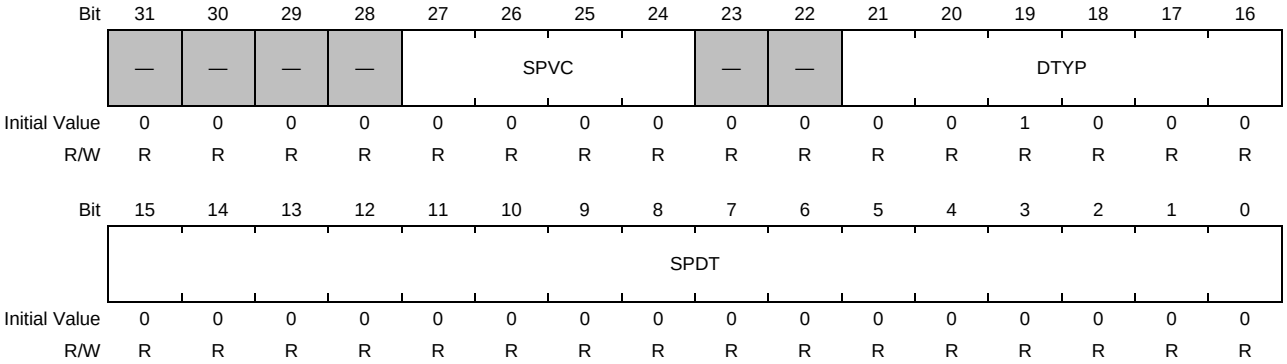
### 35.1.6.26 Generic Short Packet Interrupt Enable Register (CSI2nGSIE)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | GOVE | — | — | GTHE | GNEE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | GOVE | 0b | RW | Enables interrupts generated by CSI2nGSST.GOV.<br>0b: Does not assert csi2_int_gst when CSI2nGSST.GOV = 1.<br>1b: Asserts csi2_int_gst when CSI2nGSST.GOV = 1. |
| 3, 2 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | GTHE | 0b | RW | Enables interrupts generated by CSI2nGSST.GTH.<br>0b: Does not assert csi2_int_gst when CSI2nGSST.GTH = 1.<br>1b: Asserts csi2_int_gst when CSI2nGSST.GTH = 1. |
| 0 | GNEE | 0b | RW | Enables interrupts generated by CSI2nGSST.GNE.<br>0b: Does not assert csi2_int_gst when CSI2nGSST.GNE = 1.<br>1b: Asserts csi2_int_gst when CSI2nGSST.GNE = 1. |

### 35.1.6.27 Generic Short Packet Register (CSI2nGSHT)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

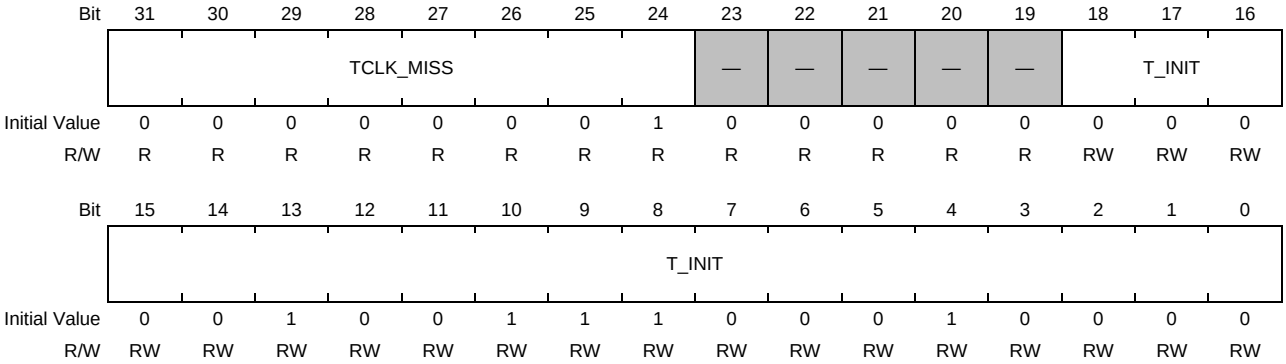
### 35.1.6.30 D-PHY Timing Register 0 (CSIDPHYTIM0)



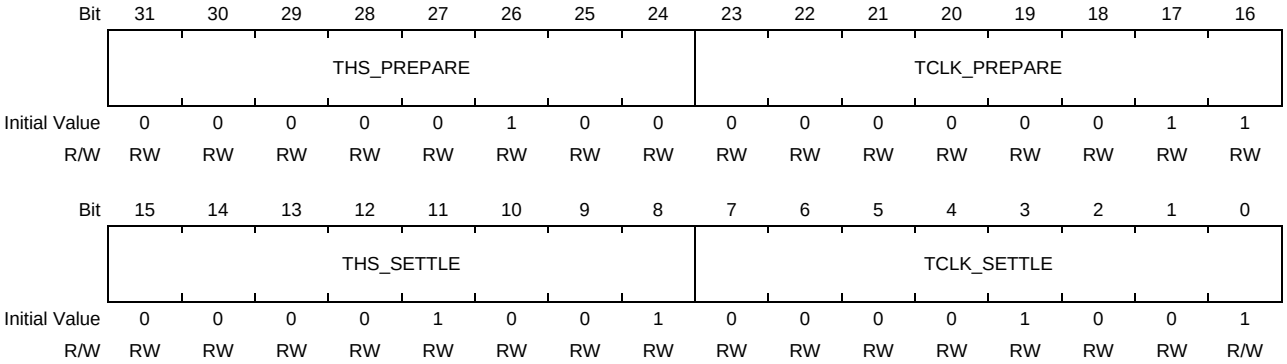
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | TCLK_MISS | H'01 | RW | Timing parameter*1 |
| 23 to 19 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 to 0 | T_INIT | H'0_2710 | RW | Timing parameter*1 |

Note 1. The table below lists the recommended setting values.

Table 35.7 Recommended Setting Values of the D-PHY Timing Register

| No. | Pin Name | Transmission Rate | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | 80Mbps ≤ ≤ 100Mbps | 100Mbps < ≤ 130Mbps | 130Mbps < ≤ 200Mbps | 200Mbps < ≤ 300Mbps | 300Mbps < ≤ 400Mbps | 400Mbps < ≤ 700Mbps | 700Mbps < ≤ 1100Mbps | 1100Mbps < ≤ 1500Mbps |
| 1 | T_INIT[18:0] | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) | 19'd79801 (H'137B9) |
| 2 | TCLK_MISS[7:0] | 8'd4 (H'4) | 8'd4 (H'4) | 8'd4 (H'4) | 8'd4 (H'4) | 8'd4 (H'4) | 8'd4 (H'4) | 8'd4 (H'4) | 8'd4 (H'4) |
| 3 | TCLK_SETTLE[7:0] | 8'd18 (H'12) | 8'd18 (H'12) | 8'd18 (H'12) | 8'd18 (H'12) | 8'd18 (H'12) | 8'd18 (H'12) | 8'd18 (H'12) | 8'd18 (H'12) |
| 4 | THS_SETTLE[7:0] | 8'd19 (H'13) | 8'd17 (H'11) | 8'd16 (H'10) | 8'd15 (H'F) | 8'd14 (H'E) | 8'd14 (H'E) | 8'd13 (H'D) | 8'd12 (H'C) |
| 5 | TCLK_PREPARE[7:0] | 8'd14 (H'E) | 8'd14 (H'E) | 8'd14 (H'E) | 8'd14 (H'E) | 8'd14 (H'E) | 8'd14 (H'E) | 8'd14 (H'E) | 8'd14 (H'E) |
| 6 | THS_PREPARE[7:0] | 8'd18 (H'12) | 8'd16 (H'10) | 8'd14 (H'E) | 8'd12 (H'C) | 8'd11 (H'B) | 8'd10 (H'A) | 8'd9 (H'9) | 8'd9 (H'9) |

### 35.1.6.31 D-PHY Timing Register 1 (CSIDPHYTIM1)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | THS_PREPARE | H'04 | RW | Timing parameter*1 |
| 23 to 16 | TCLK_PREPARE | H'03 | RW | Timing parameter*1 |
| 15 to 8 | THS_SETTLE | H'09 | RW | Timing parameter*1 |
| 7 to 0 | TCLK_SETTLE | H'09 | RW | Timing parameter*1 |

Note 1. **Table 35.7** lists the recommended setting values.

### 35.1.6.32 D-PHY Skew Adjustment Function (CSIDPHYSKW0)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | UTIL_DL3_SKW_ADJ | | | — | UTIL_DL2_SKW_ADJ | | | — | UTIL_DL1_SKW_ADJ | | | — | UTIL_DL0_SKW_ADJ | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | RW | RW | RW | R | RW | RW | RW | R | RW | RW | RW | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 to 16 | — | 000b | RW | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 15 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 to 12 | UTIL_DL3_SKW_ADJ | 000b | RW | Data lane 3 skew adjustment function<br>Set the recommended value 001b. If required, change the value referring to **Figure 35.3**. |
| 11 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 10 to 8 | UTIL_DL2_SKW_ADJ | 000b | RW | Data lane 2 skew adjustment function<br>Set the recommended value 001b. If required, change the value referring to **Figure 35.3**. |
| 7 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 to 4 | UTIL_DL1_SKW_ADJ | 000b | RW | Data lane 1 skew adjustment function<br>Set the recommended value 001b. If required, change the value referring to **Figure 35.3**. |
| 3 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 to 0 | UTIL_DL0_SKW_ADJ | 000b | RW | Data lane 0 skew adjustment function<br>Set the recommended value 001b. If required, change the value referring to **Figure 35.3**. |

The skew adjustment function adjusts the skew by using the circuit shown in **Figure 35.3**.

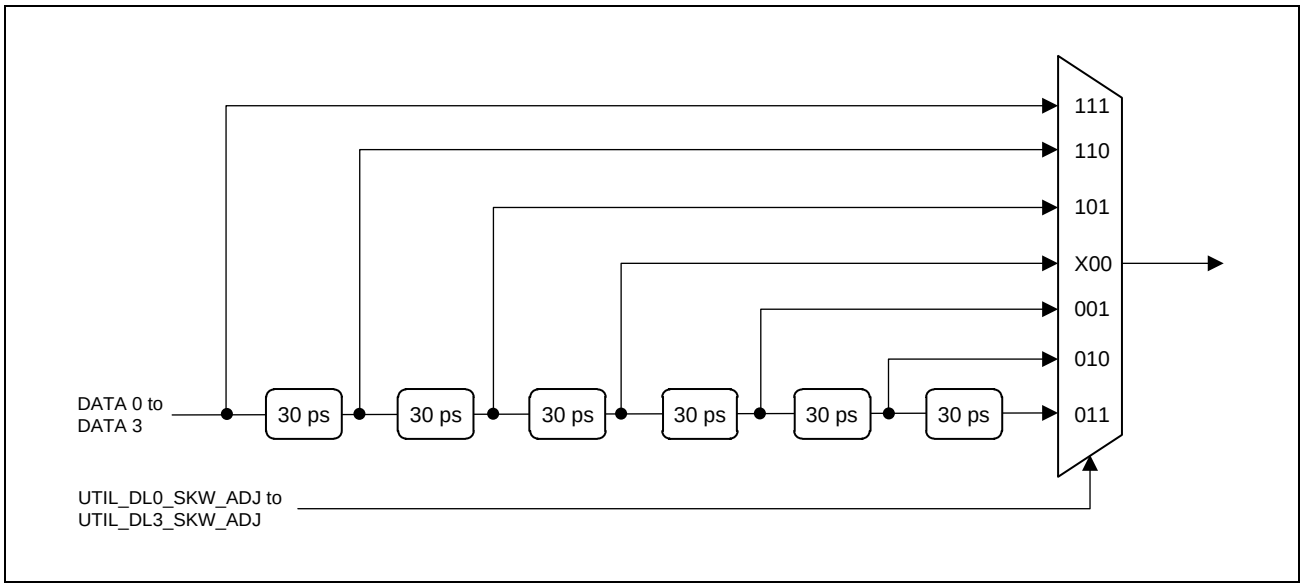


Figure 35.3 Skew Adjustment Circuit

## 35.1.7 Operation

### 35.1.7.1 Data Reception

#### (1) Common Between Short Packets and Long Packets

**Figure 35.4** shows the flow when receiving a packet whose data type is A and virtual channel is M.

This flow is common between short packets and long packets.

Upon receiving a packet, the CRU checks the length of the received packet.

If the length of the received packet is less than the packet header length (4 bytes), a virtual channel cannot be determined, resulting in setting CSI2nVCST(M).MLF(M) to 1 for all virtual channels. In addition, this packet is discarded because it is invalid.

When the length of the received packet is 4 bytes or more, ECC checking is performed. The check results are indicated in the CSI2nVCST(M) register.

- 2-bit error: Because the virtual channel of the packet with an error cannot be determined, CSI2nVCST(M).ECD(M) is set to 1 for all virtual channels.
  In addition, the packet is discarded because error correction cannot be performed.
- 1-bit error: CSI2nVCST(M).ECC(M) is set to 1 for the relevant virtual channel.
  Error correction is performed because it is possible.
  No error: CSI2nVCST(M).ECN(M) is set to 1 for the relevant virtual channel.

If the ECC check results are “1-bit error” or “no error”, the Data Type field of the packet header is analyzed.

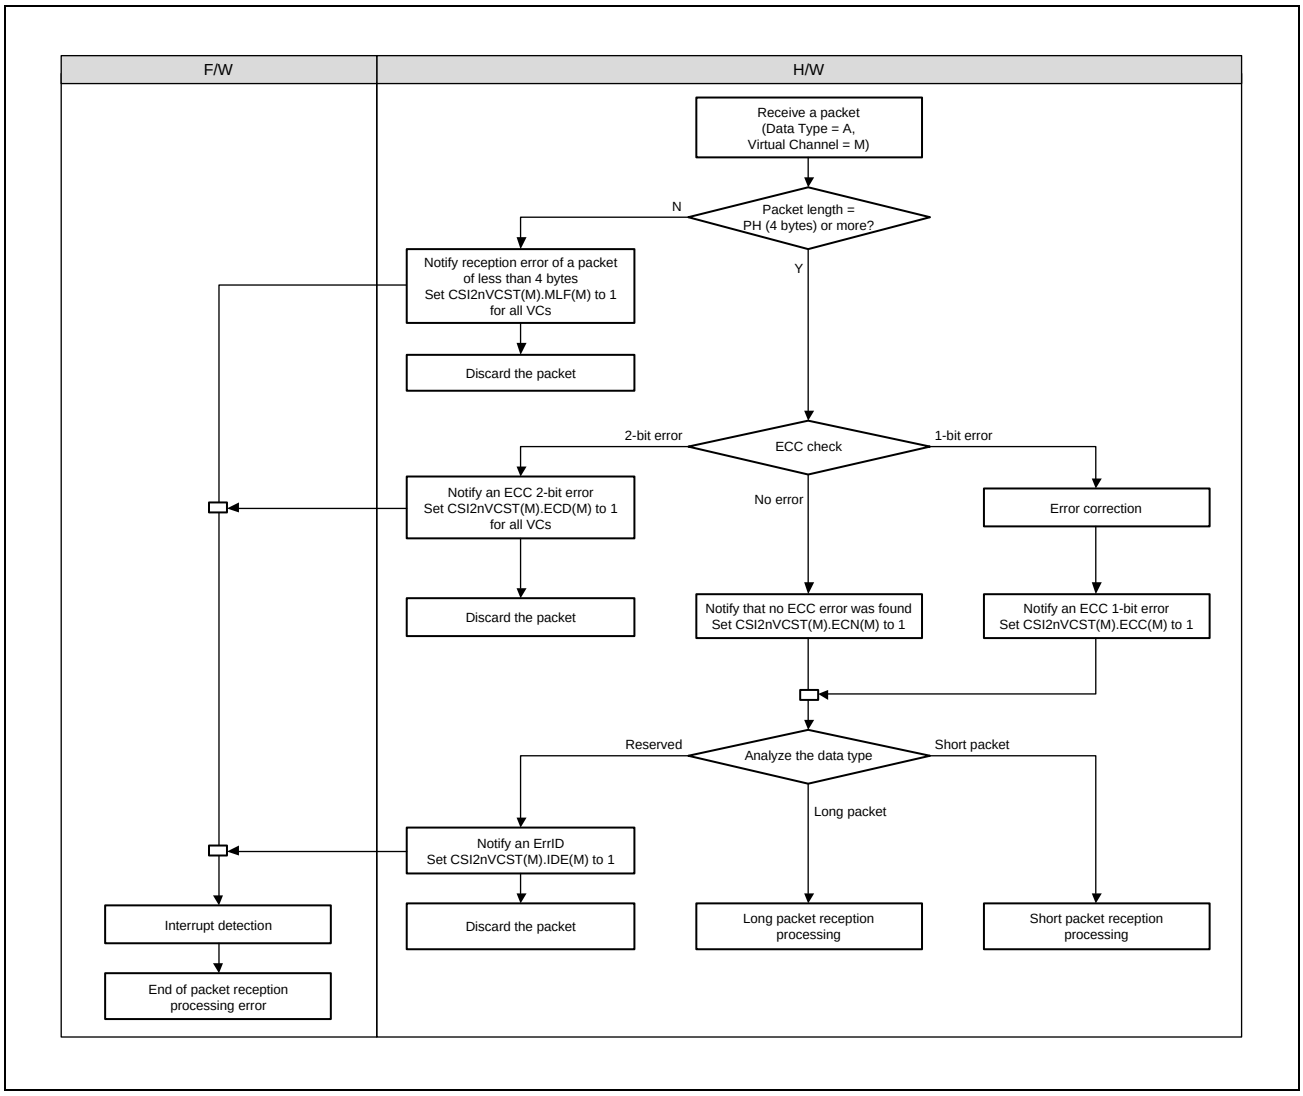

Figure 35.4 Packet Reception Processing

### (2) Generic Short Packet Data Type Code

**Figure 35.5** shows the flow when receiving a packet whose data type is generic short packet code 1 to 8 and virtual channel is M.

When the corresponding bit in CSI2nDTEL.DTEN is set to 0, CSI2nVCST(M).IDE(M)) is asserted and the packet is discarded.

When the corresponding bit in CSI2nDTEL.DTEN is set to 1 and CSI2nGSCT.GFIF is set to 1, the generic short packet is output to the generic short packet FIFO. For details on the operation when using the generic short packet FIFO, see the flow in **Figure 35.5**.

The initial value of internal signal store_en which is described in the flow is 1. When store_en is set to 1, packets can be stored in the generic short packet FIFO. When it is set to 0, packets cannot be stored in the generic short packet FIFO.

- store_en is set to 0 when the generic short packet FIFO has overflowed.
- store_en is set to 1 when 1 is written to CSI2nGSIU.GFEN.

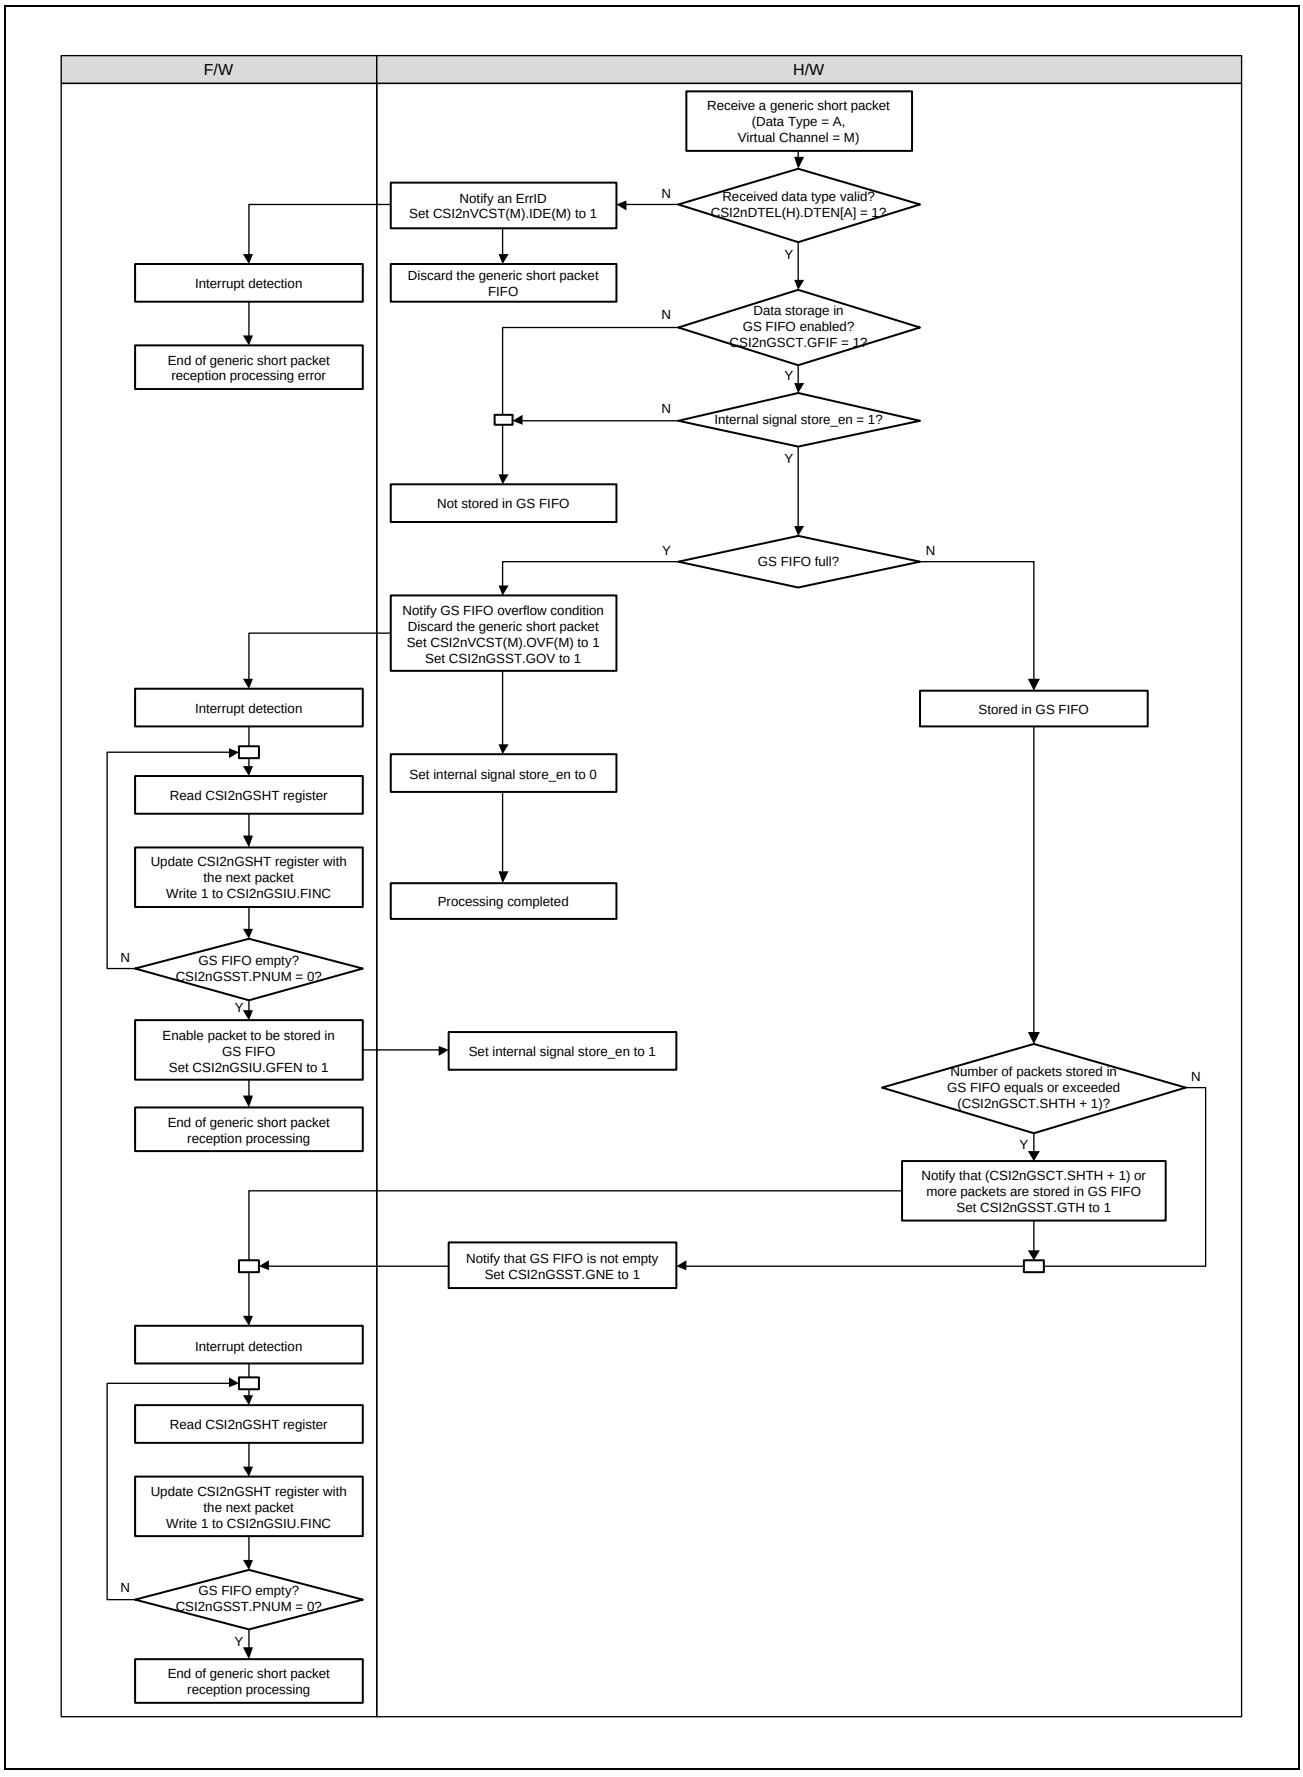

Figure 35.5 Generic Short Packet Receive Processing

### (3) Clearing the Generic Short Packet FIFO

**Figure 35.6** shows how the generic short packet FIFO is cleared.

Writing 1 to CSI2nGSIU.GFCLR starts clearing the generic short packet FIFO.

After requesting to clear the generic short packet FIFO, check if CSI2nGSST.GCD is set to 1 to make sure that the FIFO is cleared. Then, writing 0 to CSI2nGSIU.GFCLR cancels the request for clearing the generic short packet FIFO. Check if CSI2nGSST.GCD is set to 0 to make sure that the request for clearing the generic short packet FIFO is canceled.

When CSI2nMCG.GSNM is set to 0d, it is prohibited to clear the generic short packet FIFO.

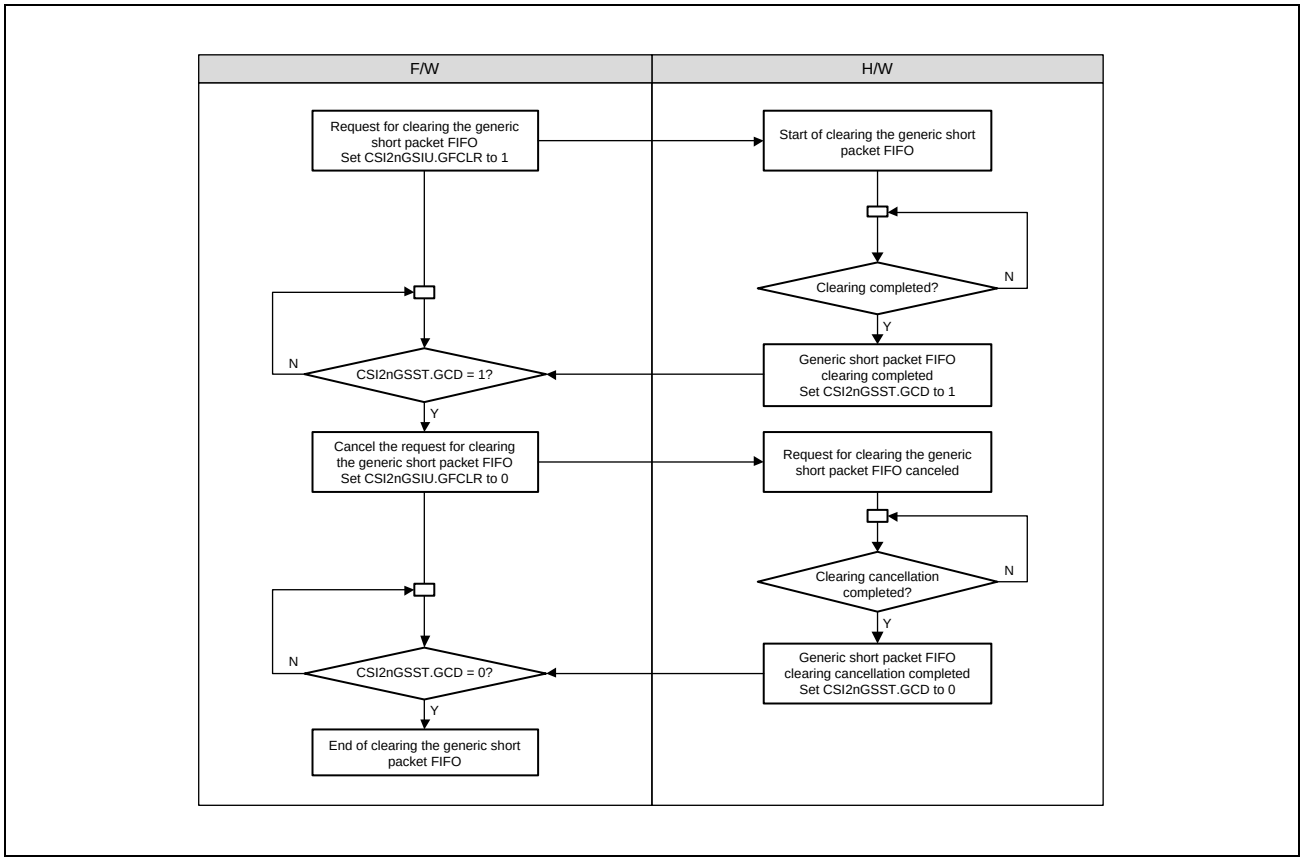

Figure 35.6 Clearing the Generic Short Packet FIFO

### 35.1.8 Interrupt

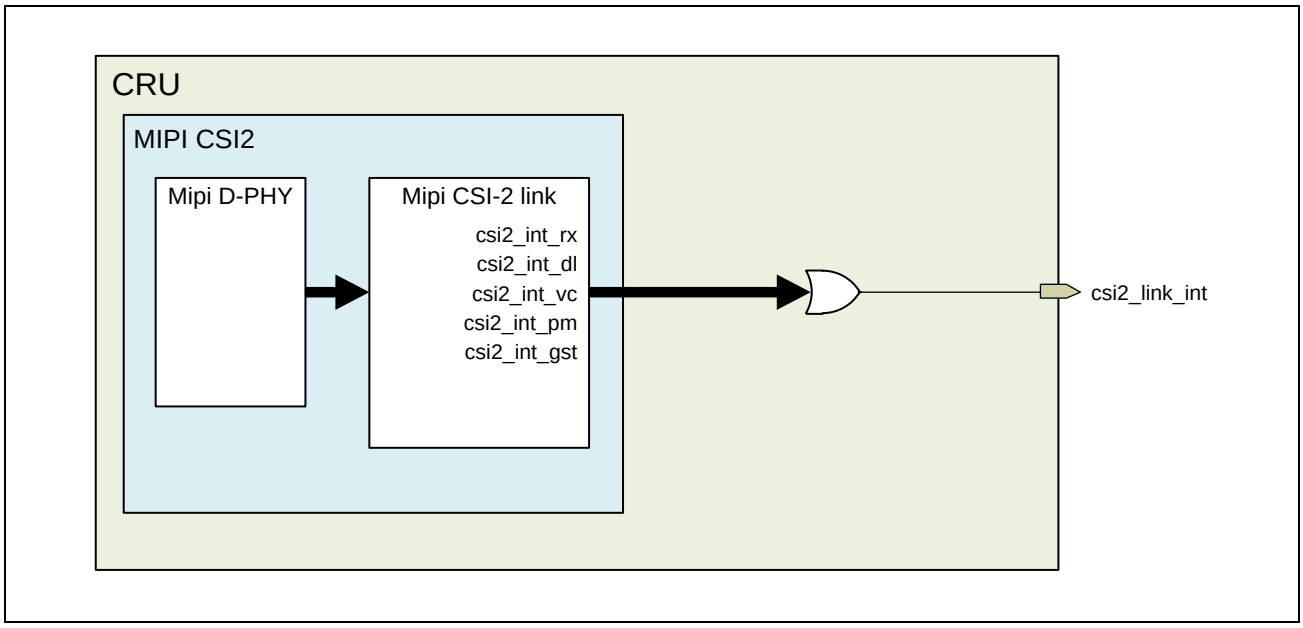

Figure 35.7 Interrupt Structure

Table 35.8 Interruption Status and Generation Condition (1/3)

| Interrupt Status | Interrupt Source Register Field | Interrupt Enable Register Field | Generation Condition |
|---|---|---|---|
| CSI2nMIST.RXS | CSI2nRXST.RACTDET | CSI2nRXIE.RACTDETE | This IP received a packet. |
| CSI2nMIST.DLS0 | CSI2nDLST0.ESH0 | CSI2nDLIE0.ESHE0 | ErrSotHS occurred on DL0. |
| | CSI2nDLST0.ESS0 | CSI2nDLIE0.ESSE0 | ErrSotSyncHS occurred on DL0. |
| | CSI2nDLST0.ECT0 | CSI2nDLIE0.ECTE0 | ErrControl occurred on DL0. |
| | CSI2nDLST0.EES0 | CSI2nDLIE0.EESE0 | ErrESC occurred on DL0. |
| | CSI2nDLST0.EUL0 | CSI2nDLIE0.EULE0 | DL0 exited from the ULPS. |
| | CSI2nDLST0.RUL0 | CSI2nDLIE0.RULE0 | DL0 transitioned to the ULPS. |
| CSI2nMIST.DLS1 | CSI2nDLST1.ESH1 | CSI2nDLIE1.ESHE1 | ErrSotHS occurred on DL1. |
| | CSI2nDLST1.ESS1 | CSI2nDLIE1.ESSE1 | ErrSotSyncHS occurred on DL1. |
| | CSI2nDLST1.ECT1 | CSI2nDLIE1.ECTE1 | ErrControl occurred on DL1. |
| | CSI2nDLST1.EES1 | CSI2nDLIE1.EESE1 | ErrESC occurred on DL1. |
| | CSI2nDLST1.EUL1 | CSI2nDLIE1.EULE1 | DL1 exited from the ULPS. |
| | CSI2nDLST1.RUL1 | CSI2nDLIE1.RULE1 | DL1 transitioned to the ULPS. |
| … | … | … | … |
| CSI2nMIST.DLS3 | CSI2nDLST3.ESH3 | CSI2nDLIE3.ESHE3 | ErrSotHS occurred on DL3. |
| | CSI2nDLST3.ESS3 | CSI2nDLIE3.ESSE3 | ErrSotSyncHS occurred on DL3. |
| | CSI2nDLST3.ECT3 | CSI2nDLIE3.ECTE3 | ErrControl occurred on DL3. |
| | CSI2nDLST3.EES3 | CSI2nDLIE3.EESE3 | ErrESC occurred on DL3. |
| | CSI2nDLST3.EUL3 | CSI2nDLIE3.EULE3 | DL3 exited from the ULPS. |
| | CSI2nDLST3.RUL3 | CSI2nDLIE3.RULE3 | DL3 transitioned to the ULPS. |

Table 35.8 Interruption Status and Generation Condition (2/3)

| Interrupt Status | Interrupt Source Register Field | Interrupt Enable Register Field | Generation Condition |
|---|---|---|---|
| CSI2nMIST.VCS0 | CSI2nVCST0.MLF0 | CSI2nVCIE0.MLFE0 | Malformed packet was received on VC0. |
| | CSI2nVCST0.ECD0 | CSI2nVCIE0.ECDE0 | ErrEccDouble occurred on VC0. |
| | CSI2nVCST0.CRC0 | CSI2nVCIE0.CRCE0 | ErrCrc occurred on VC0. |
| | CSI2nVCST0.IDE0 | CSI2nVCIE0.IDEE0 | ErrID occurred on VC0. |
| | CSI2nVCST0.WCE0 | CSI2nVCIE0.WCEE0 | ErrWC occurred on VC0. |
| | CSI2nVCST0.ECC0 | CSI2nVCIE0.ECCE0 | ErrEccCorrected occurred on VC0. |
| | CSI2nVCST0.ECN0 | CSI2nVCIE0.ECNE0 | ErrEccNoError occurred on VC0. |
| | CSI2nVCST0.FRS0 | CSI2nVCIE0.FRSE0 | ErrFrameSync occurred on VC0. |
| | CSI2nVCST0.FRD0 | CSI2nVCIE0.FRDE0 | ErrFrameData occurred on VC0. |
| | CSI2nVCST0.OVF0 | CSI2nVCIE0.OVFE0 | Generic short packets on VC0 were discarded because GS FIFO overflowed. |
| | CSI2nVCST0.FSR0 | CSI2nVCIE0.FSRE0 | Frame Start was received on VC0. |
| | CSI2nVCST0.FER0 | CSI2nVCIE0.FERE0 | Frame End was received on VC0. |
| | CSI2nVCST0.LSR0 | CSI2nVCIE0.LSRE0 | Line Start was received on VC0. |
| | CSI2nVCST0.LER0 | CSI2nVCIE0.LERE0 | Line End was received on VC0. |
| CSI2nMIST.VCS1 | CSI2nVCST1.MLF1 | CSI2nVCIE1.MLFE1 | Malformed packet was received on VC1. |
| | CSI2nVCST1.ECD1 | CSI2nVCIE1.ECDE1 | ErrEccDouble occurred on VC1. |
| | CSI2nVCST1.CRC1 | CSI2nVCIE1.CRCE1 | ErrCrc occurred on VC1. |
| | CSI2nVCST1.IDE1 | CSI2nVCIE1.IDEE1 | ErrID occurred on VC1. |
| | CSI2nVCST1.WCE1 | CSI2nVCIE1.WCEE1 | ErrWC occurred on VC1. |
| | CSI2nVCST1.ECC1 | CSI2nVCIE1.ECCE1 | ErrEccCorrected occurred on VC1. |
| | CSI2nVCST1.ECN1 | CSI2nVCIE1.ECNE1 | ErrEccNoError occurred on VC1. |
| | CSI2nVCST1.FRS1 | CSI2nVCIE1.FRSE1 | ErrFrameSync occurred on VC1. |
| | CSI2nVCST1.FRD1 | CSI2nVCIE1.FRDE1 | ErrFrameData occurred on VC1. |
| | CSI2nVCST1.OVF1 | CSI2nVCIE1.OVFE1 | Generic short packets on VC1 were discarded because GS FIFO overflowed. |

| | CSI2nVCST3.FRD3 | CSI2nVCIE3.FRDE3 | ErrFrameData occurred on VC3. |
| | CSI2nVCST3OVF3 | CSI2nVCIE3.OVFE3 | Generic short packets on VC3 were discarded because GS FIFO overflowed. |
| | CSI2nVCST3.FSR3 | CSI2nVCIE3.FSRE3 | Frame Start was received on VC3. |
| | CSI2nVCST3.FER3 | CSI2nVCIE3.FERE3 | Frame End was received on VC3. |
| | CSI2nVCST3.LSR3 | CSI2nVCIE3.LSRE3 | Line Start was received on VC3. |
| | CSI2nVCST3.LER3 | CSI2nVCIE3.LERE3 | Line End was received on VC3. |
| CSI2nMIST.PMS | CSI2nPMST.DSX | CSI2nPMIE.DSXE | All data lanes exited from the stop state. |
| | CSI2nPMST.DSN | CSI2nPMIE.DSNE | All data lanes transitioned to the stop state. |
| | CSI2nPMST.CSX | CSI2nPMIE.CSXE | The clock lane exited from the stop state. |
| | CSI2nPMST.CSN | CSI2nPMIE.CSNE | The clock lane transitioned to the stop state. |
| | CSI2nPMST.DUX | CSI2nPMIE.DUXE | All data lanes exited from the ULPS. |
| | CSI2nPMST.DUN | CSI2nPMIE.DUNE | All data lanes transitioned to the ULPS. |
| | CSI2nPMST.CUX | CSI2nPMIE.CUXE | The clock lane exited from the ULPS. |
| | CSI2nPMST.CUN | CSI2nPMIE.CUNE | The clock lane transitioned to the ULPS. |
| CSI2nMIST.GSTS | CSI2nGSST.GNE | CSI2nGSIE.GNEE | GS FIFO is not empty. |
| | CSI2nGSST.GTH | CSI2nGSIE.GTHE | Data stored in GS FIFO equals or exceeds the threshold. |
| | CSI2nGSST.GOV | CSI2nGSIE.GOVE | GS FIFO overflowed. |

## 35.2 Image Processing

### 35.2.1 Overview

The image processing module is a data conversion module equipped with pixel color space conversion, LUT, pixel format conversion, image clipping, frame subsampling, demosaicing, linear matrix, statistics, etc. An MIPI CSI-2 (**Section 35.1**) input is provided as the image sensor interface. Either of the two inputs is selected and stored in the internal FIFO (RAM), and then the data is transferred to the external memory by using the internal AXI bus. The MIPI CSI-2 input processes only a single data type on one channel from virtual channels CH0 to CH3. Some parameters allow changes on a per-frame basis. If multiple virtual channels (with the same image size) are to be processed, channels are switched at the frame boundary by changing register settings.

#### 35.2.1.1 Features

- The operating ranges are as follows:
  - Maximum number of valid pixels: QVGA (320 × 240) to 5 Mpixels
  - Range of valid pixels in the horizontal direction: 320 to 2800 pixels
  - Range of valid pixels in the vertical direction: 240 to 4095 lines
  - The maximum transfer rate depends on the input format, see **Section 35.1.2** for details.
- Input data format (type): See **Table 35.10**.
  - MIPI CSI-2 input: YUV, RGB, RAW, etc.
- Output data format (type): Only little endian is supported.
  - YCbCr422/YCbCr420, 8-bit multiplexed (Y, U/V order swapping supported)
  - YC separation from YCbCr422 (separated into Y and CbCr components)
  - Y component extraction from YCbCr422
  - U/V of the YUV422/YCbCr420 output is expressed in offset binary or two’s complement notation.
  - RGB-888 (24 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)
  - RAW8,10,12,14,16
  - MIPI CSI-2 Recommended Memory Storage Format
- Color space conversion
  - YCbCr422 to RGB888
  - RGB888 to YCbCr422
- Image format conversion
  - YCbCr422 → YC separation (separated into Y and CbCr components)
  - YCbCr422 → Y component extraction
  - YCbCr422 → YCbCr420
  - RGB-888 → RGB-888 (32 bits/pixel)
  - RGB-888 → ARGB-8888 (32 bits/pixel): B First A Last format

  - RGB-888 → ARGB-8888 (32 bits/pixel): A First B Last format
  - RGB-565 → RGB-888 conversion (intermediate processing)
  - RGB-666 → RGB-888 conversion (intermediate processing)
- Conversion 10-bit to 8-bit by using a lookup table (LUT)
- Data clipping (See **Section 35.2.4.11**)
- Image clipping
- Frame subsampling
- Bypassing each function (function bypassed)
- Pattern generator (for debugging)
  - Output Y, U, V register values.
- Demosaicing
  - RAW8, 10, 12, 14, and 16 to RGB888
- Statistics (statistical processing operations: horizontal detection area: 320 to 2048 pixels; vertical detection area: 240 to 4080)
  - Accumulation in the (16×16, 32×32, 64×64, and 128×128) areas for each of R, G, and B from RAW8, 10, 12, 14, and 16 data
  - Summation of absolute values for differences from adjacent pixel values of G from RAW8, 10, 12, 14, and 16 data
- Linear Matrix (Color correction by linear matrix operations)
  - Offset calculation included
- FIFO:
  - For image data: 8 K bytes
  - For statistics data: 512 bytes
- AXI master: Two channels (image processing, statistics system)
- APB slave: Only 32-bit access is supported.

### 35.2.1.2 Block Diagram

Below figure shows a block diagram of the image processing module.

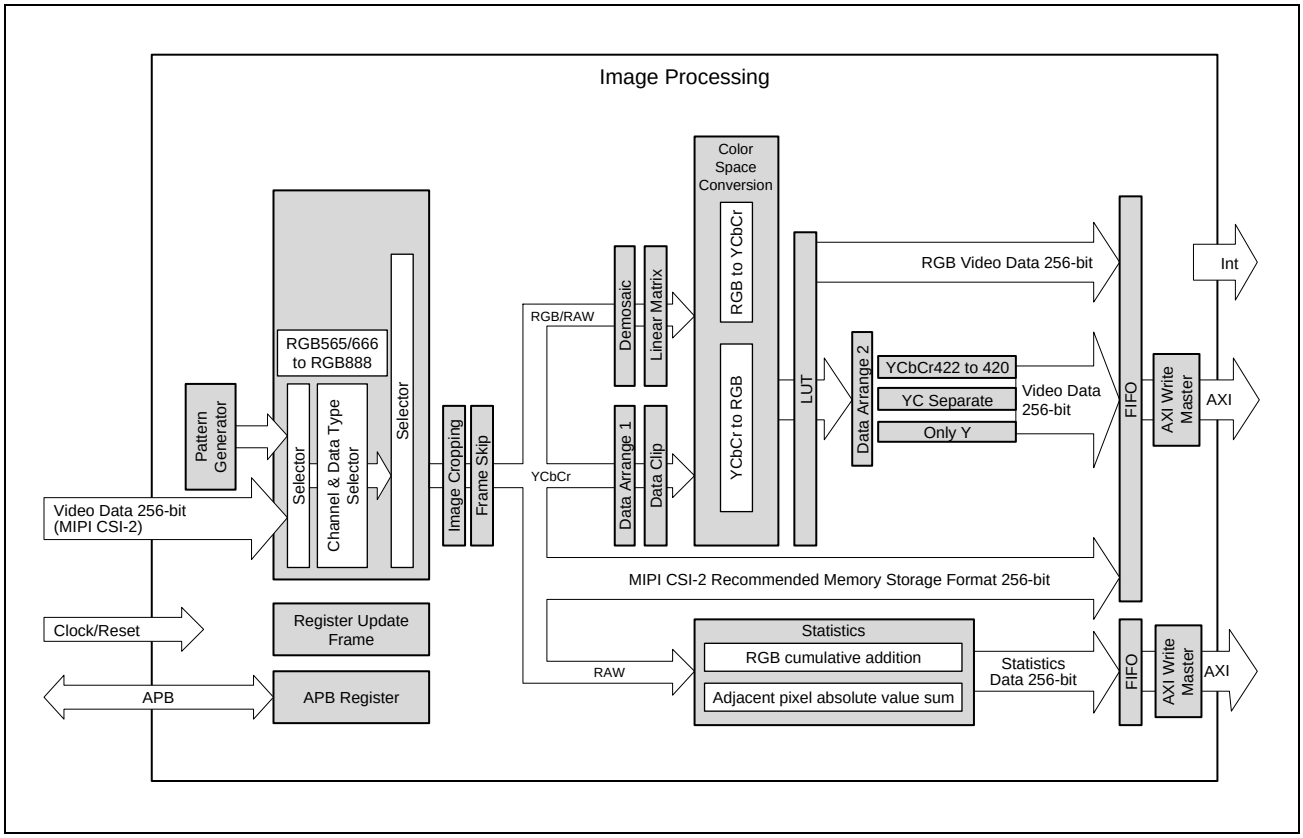

Figure 35.8 Block Diagram of the Image Processing Module

### 35.2.2 Register Configuration

The following shows the base address of this module.

| Module Name | Address |
|---|---|
| Image Processing | H'0_1083_0000 (Cortex-A55 Address Space)<br>H'4083_0000 (Cortex-M33 Address Space Non-Secure)<br>H'5083_0000 (Cortex-M33 Address Space Secure) |

The register values at addresses H'1083_0208 to H'1083_0244 can be changed through frame synchronization. For the changing flows, see **Section 35.3.3.1** and **Section 35.3.3.2**.

Table 35.9 Register Configuration of the Image Processing Module (1/4)

| Register Name | Register Symbol Name | Address | R/W | Initial Value |
|---|---|---|---|---|
| Common | | | | |
| CRU Control Register | CRUnCTRL | H'0000 | R/W | H'0000_0000 |
| CRU Interrupt Enable Register | CRUnIE | H'0004 | R/W | H'0000_0000 |
| CRU Interrupt Status Register | CRUnINTS | H'0008 | R/W | H'0000_0000 |

## 35.2.3 Register Descriptions

Access the following registers only in units of 32 bits.

### 35.2.3.1 CRU Control Register (CRUnCTRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | VINSEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | VINSEL | 0b | RW | Video data input switch setting<br>0b: MIPI I/F<br>1b: Setting Prohibited |

### 35.2.3.2 CRU Interrupt Enable Register (CRUnIE)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | WIE | SIE | EFE | SFE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | SDFEOVWE | SDDECEE | SDSLVEE | SDFOE | — | — | — | — | FEOVWE | DECEE | SLVEE | FOE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | RW | RW | RW | RW | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | 000b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 28 to 21 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 19 | WIE | 0b | RW | Work count value error interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 18 | SIE | 0b | RW | Scan line interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 17 | EFE | 0b | RW | Frame end interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 16 | SFE | 0b | RW | Frame start interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | SDFEOVWE | 0b | RW | Frame End Overwrite (Statistics data-related) interrupt enable control<br>0b: No interrupts are generated<br>1b: Interrupts are generated |
| 10 | SDDECEE | 0b | RW | AXI DECERR Error (Statistics data-related) interrupt enable control<br>0b: No interrupts are generated<br>1b: Interrupts are generated |
| 9 | SDSLVEE | 0b | RW | AXI SLVERR Error (Statistics data-related) interrupt enable control<br>0b: No interrupts are generated<br>1b: Interrupts are generated |
| 8 | SDFOE | 0b | RW | FIFO overflow (Statistics data-related) interrupt enable control<br>0b: No interrupts are generated<br>1b: Interrupts are generated |
| 7 to 4 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | FEOVWE | 0b | RW | Frame End Overwrite (image-related) interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 2 | DECEE | 0b | RW | DECERR (image-related) interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 1 | SLVEE | 0b | RW | SLVERR (image-related) interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |
| 0 | FOE | 0b | RW | FIFO overflow (image-related) interrupt control<br>0b: No interrupts are generated.<br>1b: Interrupts are generated. |

### 35.2.3.3 CRU Interrupt Status Register (CRUnINTS)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | WIS | SIS | EFS | SFS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | SDFEOVWS | SDDECES | SDSLVES | SDFOS | — | — | — | — | FEOVWS | DECES | SLVES | FOS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | RW | RW | RW | RW | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | 000b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 28 to 21 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 19 | WIS | 0b | RW | Word count value error interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 18 | SIS | 0b | RW | Scan line interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 17 | EFS | 0b | RW | Frame end interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 16 | SFS | 0b | RW | Frame start interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | SDFEOVWS | 0b | RW | Frame End Overwrite (Statistics data-related) interrupt status<br>An error occurs if the end of the next frame is received while processing a frame end.<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 10 | SDDECES | 0b | RW | AXI DECERR Error (Statistics data-related) interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 9 | SDSLVES | 0b | RW | AXI SLVERR Error (Statistics data-related) interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 8 | SDFOS | 0b | RW | FIFO overflow (Statistics data-related) interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 7 to 4 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | FEOVWS | 0b | RW | Frame End Overwrite (image-related) interrupt status<br>An error occurs if the end of the next frame is received while processing a frame end.<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 2 | DECES | 0b | RW | DECERR (image-related) interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 1 | SLVES | 0b | RW | SLVERR (image-related) interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |
| 0 | FOS | 0b | RW | FIFO overflow (image-related) interrupt status<br>Write 0: Invalid, 1: Clears the interrupt & status<br>Read 0: No interrupts generated, 1: Interrupts generated |

### 35.2.3.4 CRU Reset Register (CRUnRST)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | VRESETN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | VRESETN | 0b | RW | 0b: Resets the image processing module.<br>1b: Releases the image processing module from the reset state. |

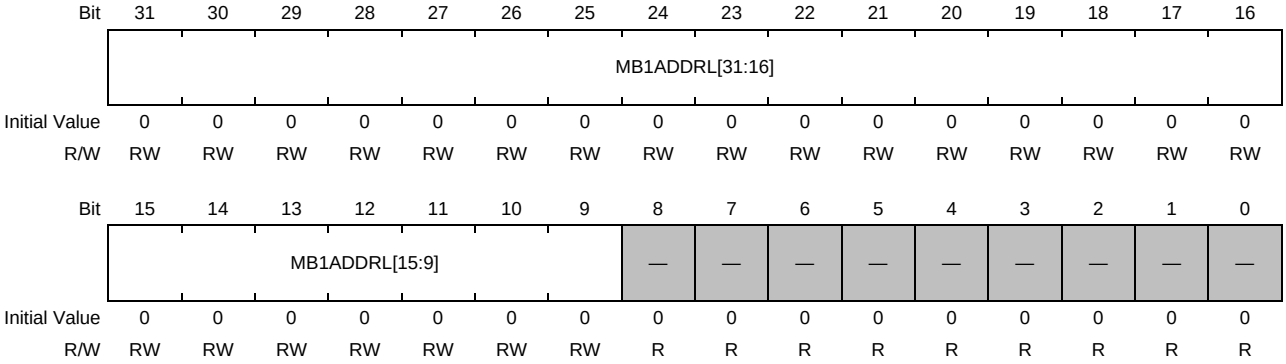
### 35.2.3.5 CRU General Read/Write Register (CRUnCOM)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | COMMON[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | COMMON[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

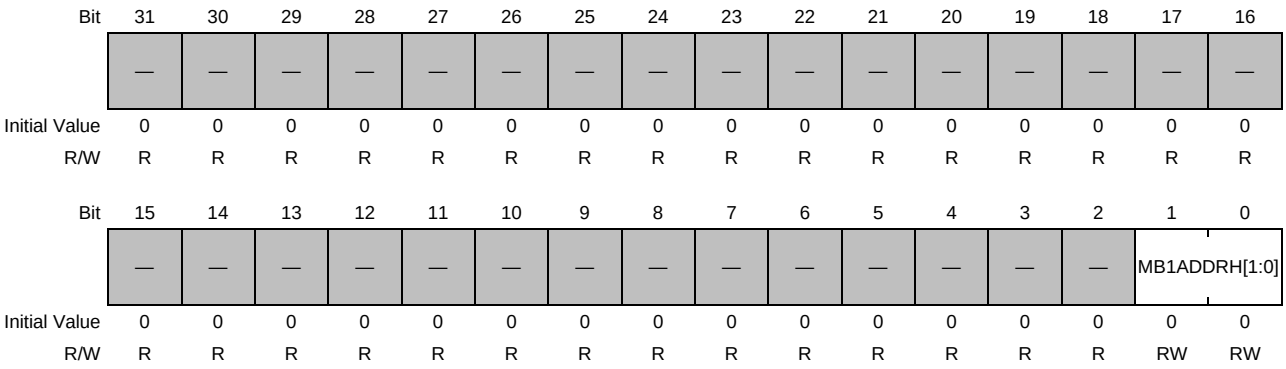
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | COMMON [31:0] | All 0 | RW | General register |

### 35.2.3.6 Memory Bank 1 Base Address (Lower) Register for CRU Image Data (AMnMB1ADDRL)



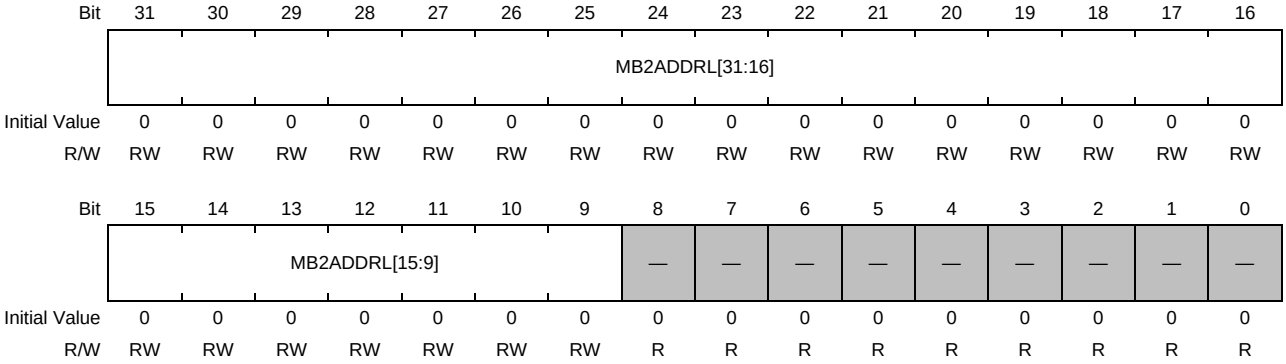
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB1ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 1 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.7 Memory Bank 1 Base Address (Higher) Register for CRU Image Data (AMnMB1ADDRH)



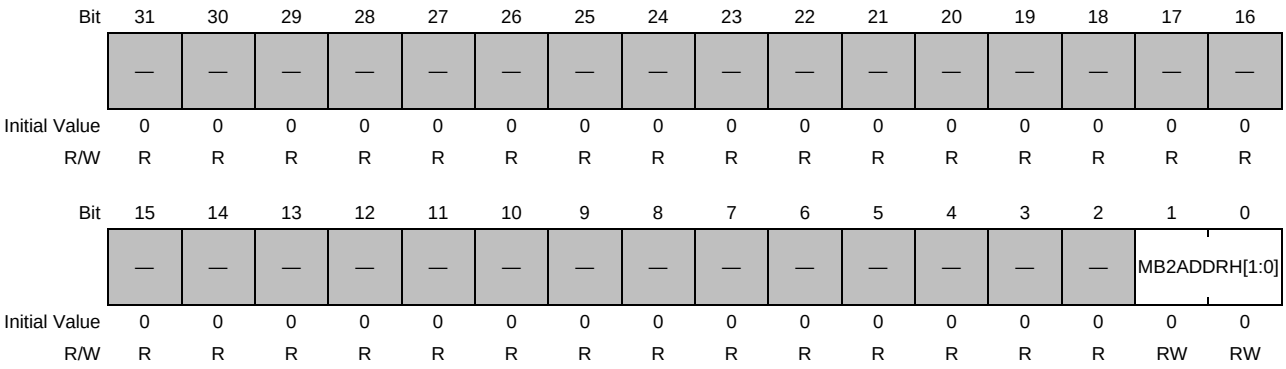
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB1ADDRH [1:0] | 00b | RW | Image data transfer destination base address 1 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.8 Memory Bank 2 Base Address (Lower) Register for CRU Image Data (AMnMB2ADDRL)



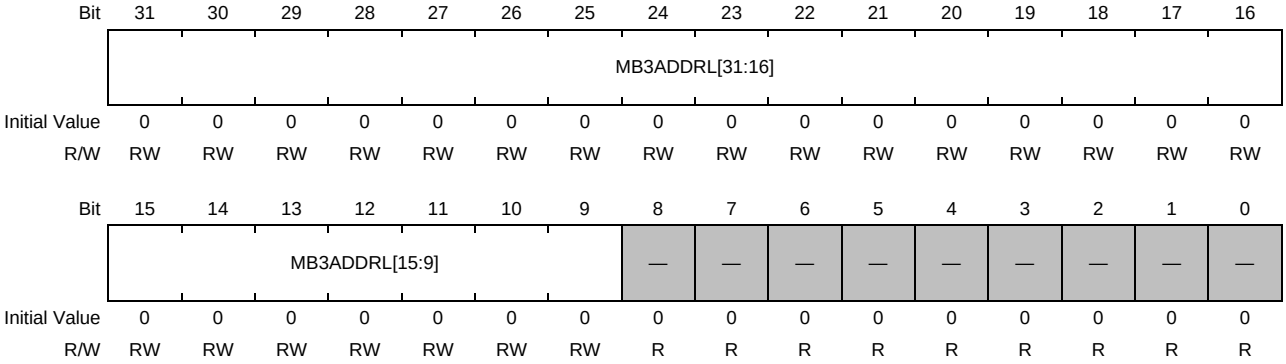
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB2ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 2 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.9 Memory Bank 2 Base Address (Higher) Register for CRU Image Data (AMnMB2ADDRH)



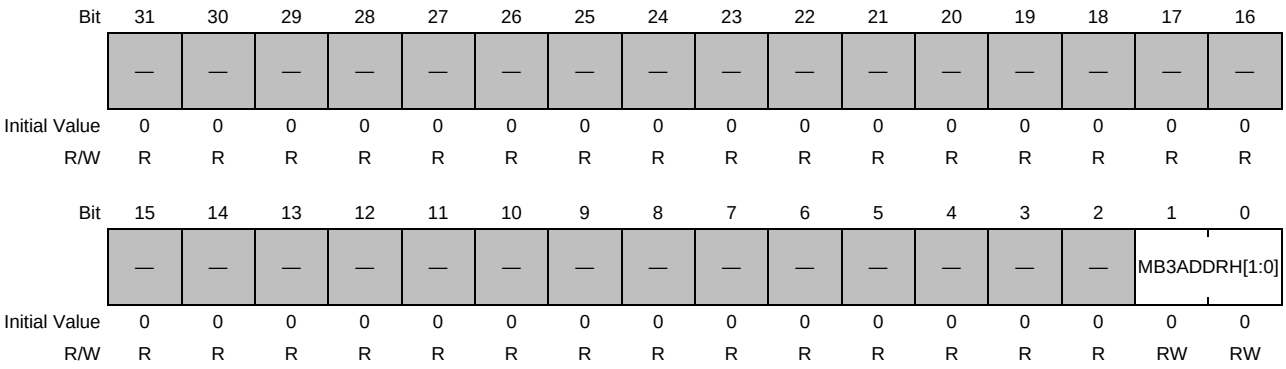
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB2ADDRH [1:0] | 00b | RW | Image data transfer destination base address 2 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.10 Memory Bank 3 Base Address (Lower) Register for CRU Image Data (AMnMB3ADDRL)



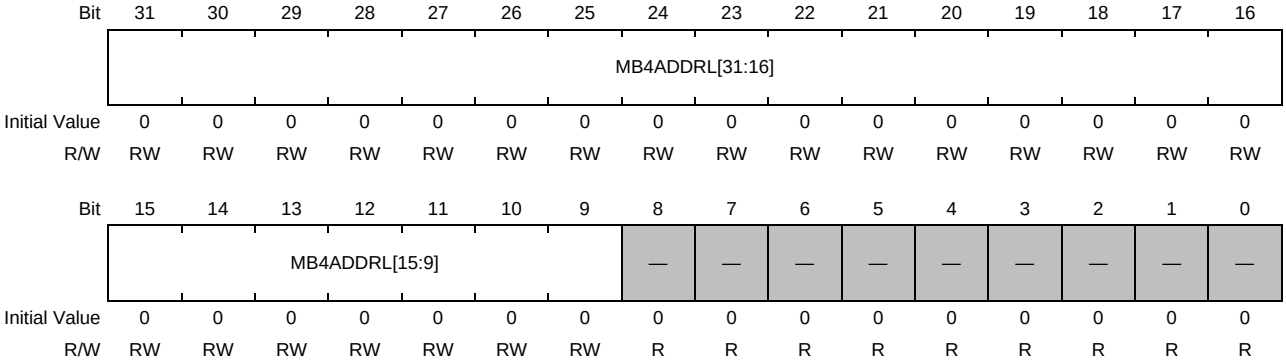
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB3ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 3 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.11 Memory Bank 3 Base Address (Higher) Register for CRU Image Data (AMnMB3ADDRH)



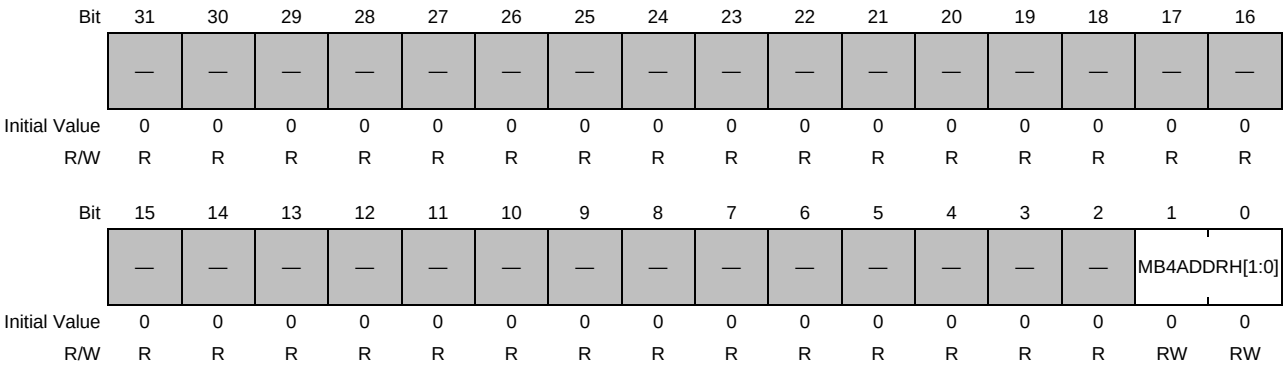
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB3ADDRH [1:0] | 00b | RW | Image data transfer destination base address 3 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.12 Memory Bank 4 Base Address (Lower) Register for CRU Image Data (AMnMB4ADDRL)



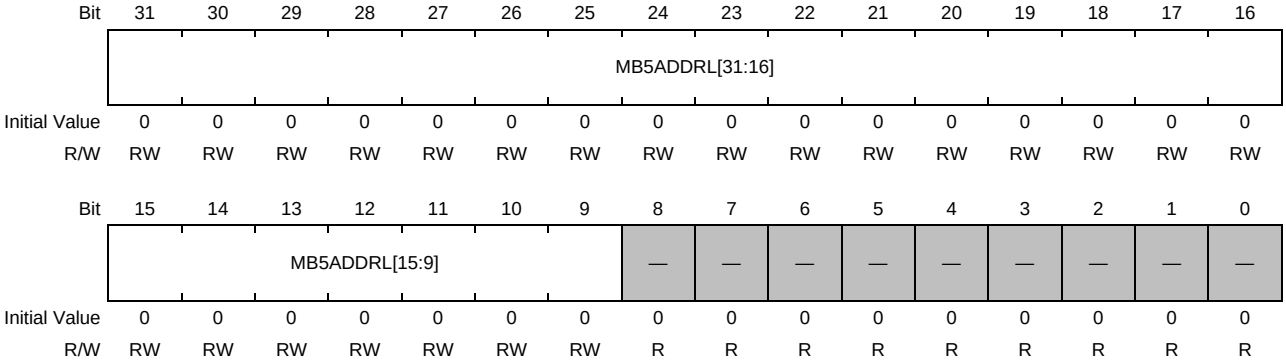
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB4ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 4 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.13 Memory Bank 4 Base Address (Higher) Register for CRU Image Data (AMnMB4ADDRH)



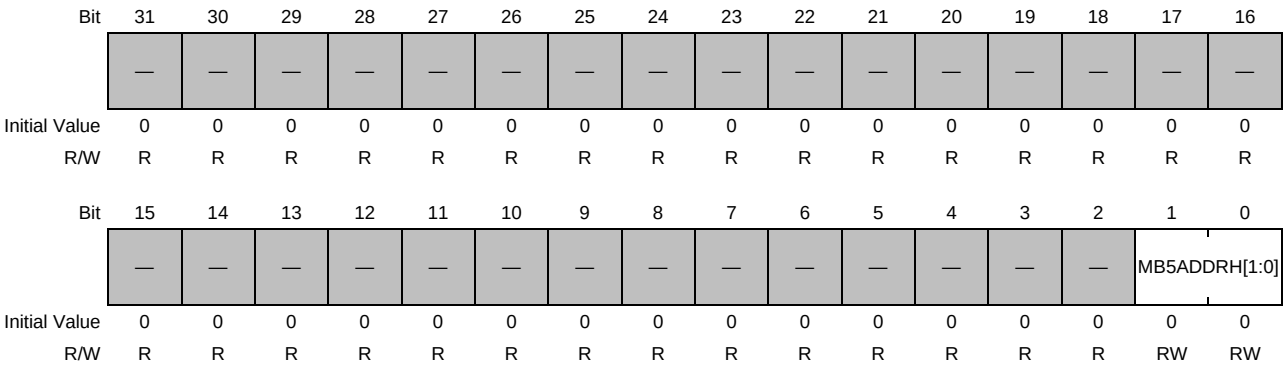
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB4ADDRH [1:0] | 00b | RW | Image data transfer destination base address 4 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.14 Memory Bank 5 Base Address (Lower) Register for CRU Image Data (AMnMB5ADDRL)



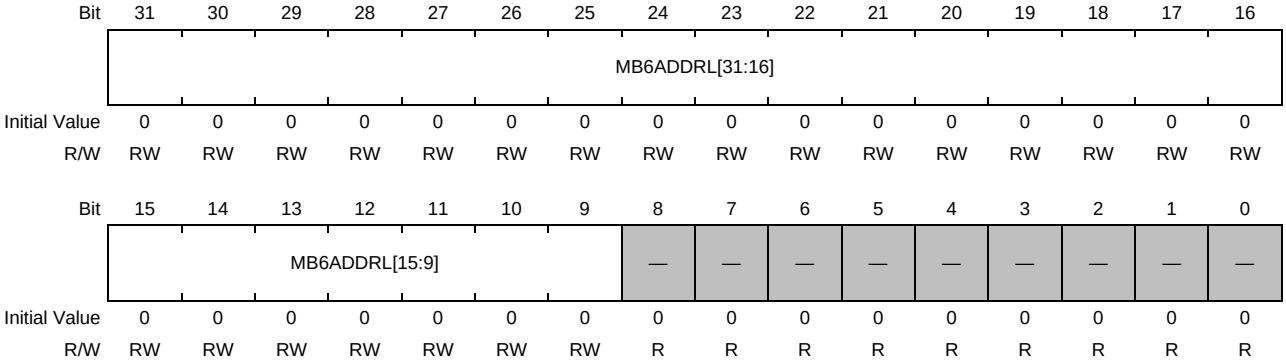
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB5ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 5 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.15 Memory Bank 5 Base Address (Higher) Register for CRU Image Data (AMnMB5ADDRH)



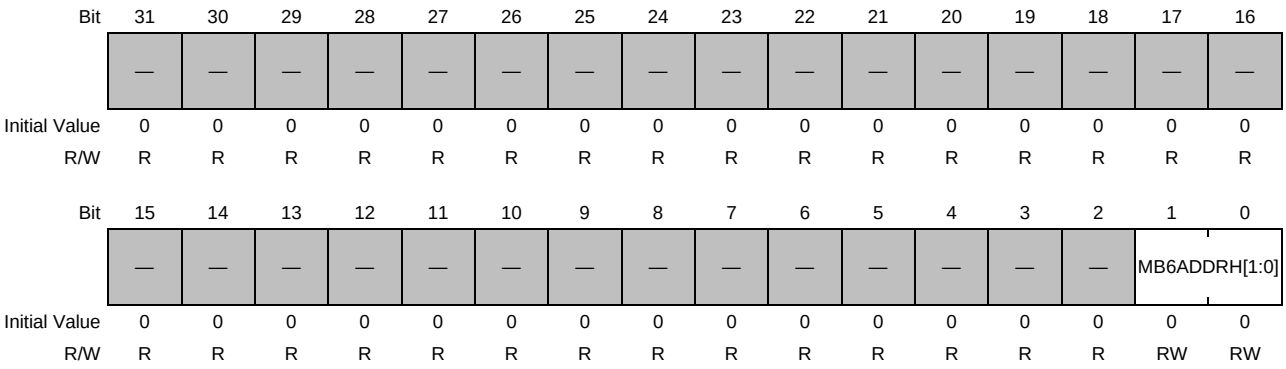
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB5ADDRH [1:0] | 00b | RW | Image data transfer destination base address 5 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.16 Memory Bank 6 Base Address (Lower) Register for CRU Image Data (AMnMB6ADDRL)



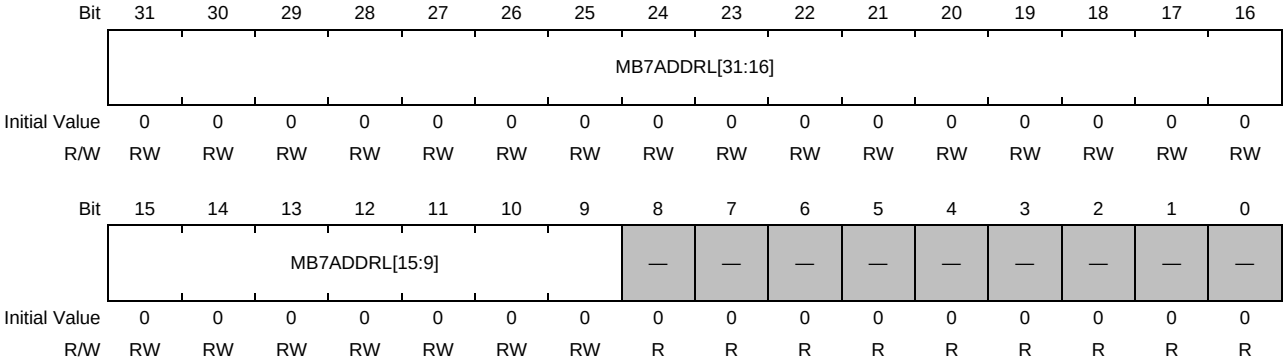
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB6ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 6 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.17 Memory Bank 6 Base Address (Higher) Register for CRU Image Data (AMnMB6ADDRH)



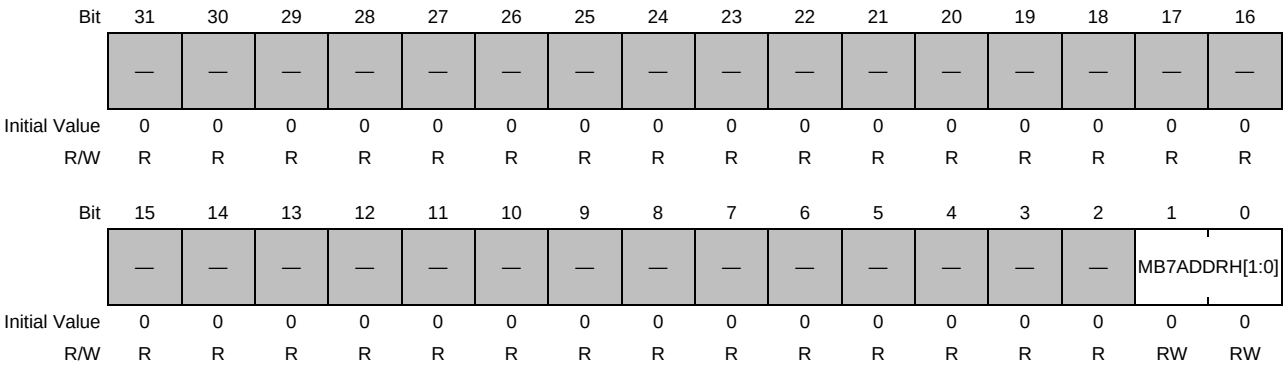
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB6ADDRH [1:0] | 00b | RW | Image data transfer destination base address 6 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.18 Memory Bank 7 Base Address (Lower) Register for CRU Image Data (AMnMB7ADDRL)



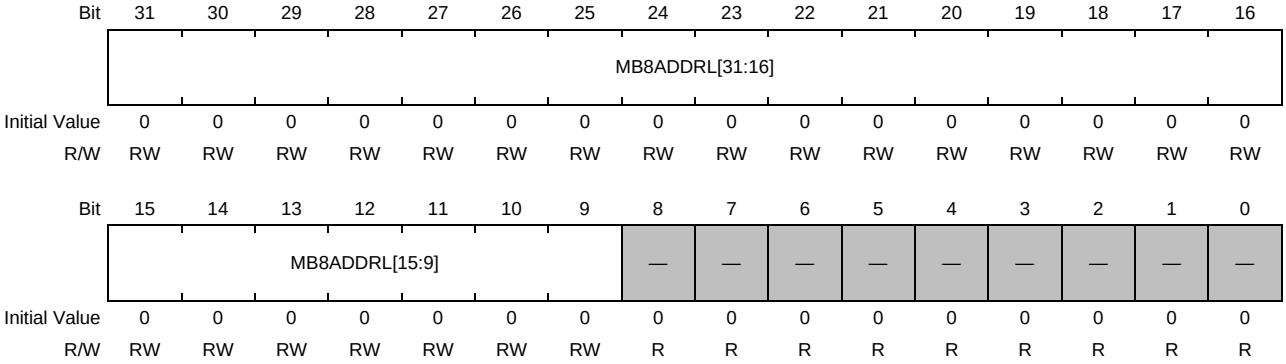
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB7ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 7 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.19 Memory Bank 7 Base Address (Higher) Register for CRU Image Data (AMnMB7ADDRH)



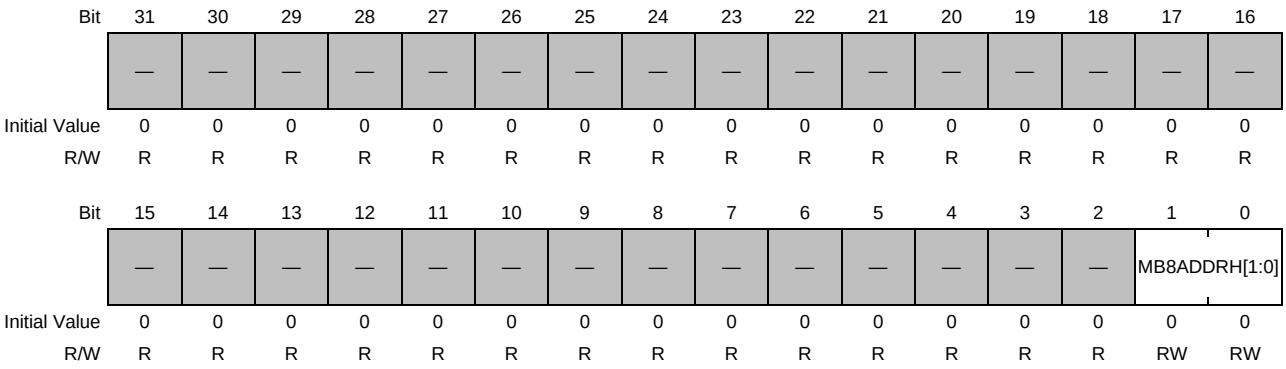
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB7ADDRH [1:0] | 00b | RW | Image data transfer destination base address 7 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.20 Memory Bank 8 Base Address (Lower) Register for CRU Image Data (AMnMB8ADDRL)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | MB8ADDRL [31:9] | All 0 | RW | Image data transfer destination base address 8 (valid bits: [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.21 Memory Bank 8 Base Address (Higher) Register for CRU Image Data (AMnMB8ADDRH)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | MB8ADDRH [1:0] | 00b | RW | Image data transfer destination base address 8 (valid bits: [33:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.22 UV Data Address Offset (Lower) Register for CRU Image Data (AMnUVAOFL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | UVAOFL[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | UVAOFL[15:9] | | | | | | | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | UVAOFL [31:9] | All 0 | RW | UV data address offset when outputting image data YUV (valid bits: [31:9])<br>Set it in the base address in units of 512 bytes.<br>*Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating). |
| 8 to 0 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.23 UV Data Address Offset (Higher) Register for CRU Image Data (AMnUVAOFH)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UVAOFH[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 to 0 | UVAOFH[2:0] | 000b | RW | UV data address offset when outputting image data YUV (valid bits: [34:32])<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.24 Memory Bank Enable Register for CRU Image Data (AMnMBVALID)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | MBVALID[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 0 | MBVALID[7:0] | H'01 | RW | Image data transfer destination valid address (Details is written in **Section 35.2.4.3**.)<br>[0]: 0: MB1 invalid, 1: MB1 valid<br>[1]: 0: MB2 invalid, 1: MB2 valid<br>[2]: 0: MB3 invalid, 1: MB3 valid<br>[3]: 0: MB4 invalid, 1: MB4 valid<br>[4]: 0: MB5 invalid, 1: MB5 valid<br>[5]: 0: MB6 invalid, 1: MB6 valid<br>[6]: 0: MB7 invalid, 1: MB7 valid<br>[7]: 0: MB8 invalid, 1: MB8 valid<br>*Note*: Set the valid destination address from the LSB continuously. Data transferred from the LSB is written sequentially only in valid banks, and the process is repeated from the start (LSB) when the last address is reached.<br>(These bits cannot be modified while the AXI is operating.) |

### 35.2.3.25 Memory Bank Status Register for CRU Image Data (AMnMBS)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | MBSTS[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 to 0 | MBSTS[2:0] | 000b | R | Indicates which memory bank the image data is being transferred to, MB1 to MB8.<br>(H'0: MB1, H'1: MB2 … H'6: MB7, H'7: MB8) |

### 35.2.3.26 AXI Master Transfer Setting Register for CRU Image Data (AMnAXIATTR)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | AXILEN[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 24 | — | H'0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 23 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 22 to 16 | — | H'00 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

| 6 to 4 | — | 101b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 to 0 | AXILEN[3:0] | H'0 | RW | AXI burst max length setting for image data (these bits cannot be modified while the AXI is operating.)<br>For YC separation mode (ICnDMR.YCMODE[2:0] = 010b or 110b):<br>H'0: up to 1-beat burst<br>H'1: up to 1-beat burst<br>H'3: up to 2-beat burst<br>H'7: up to 4-beat burst<br>H'F: up to 8-beat burst<br>Others: Setting prohibited.<br>Except for YC separation mode (ICnDMR.YCMODE[2:0] ≠ 010b or 110b):<br>H'0: up to 1-beat burst<br>H'1: up to 2-beat burst<br>H'3: up to 4-beat burst<br>H'7: up to 8-beat burst<br>H'F: up to 16-beat burst<br>Others: Setting prohibited.<br><br>To improve the transfer performance of this unit, it is recommended to use it in H'F. |

### 35.2.3.27 AXI Master FIFO Setting Register for CRU Image Data (AMnFIFO)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FIFOOVFREC |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | FIFOOVFREC | 1b | RW | Recovery mode when image data FIFO overflowed<br>The image-related AXI master stops when the image data FIFO overflowed. The operation after an overflow can be selected:<br>0b: Auto recovery: The CRU recovers automatically in the next frame after the image-related AXI master stopped and the FIFO was cleared. After recovery, transfer resumes to the start address of the MB to which data was being transferred to.<br>1b: Stop: The image-related AXI master stops and the FIFO is cleared. The status can be verified by the reg_axi_mst_err_int interrupt. The CRU recovers in the next frame after AXI_TRANS_START bit in the AMnFIFOTRST register is set to 1.<br>The image data being processed at the time of the FIFO overflow will be corrupted. The FIFO overflow may have been caused by bus congestion. Take actions for bus congestion. |

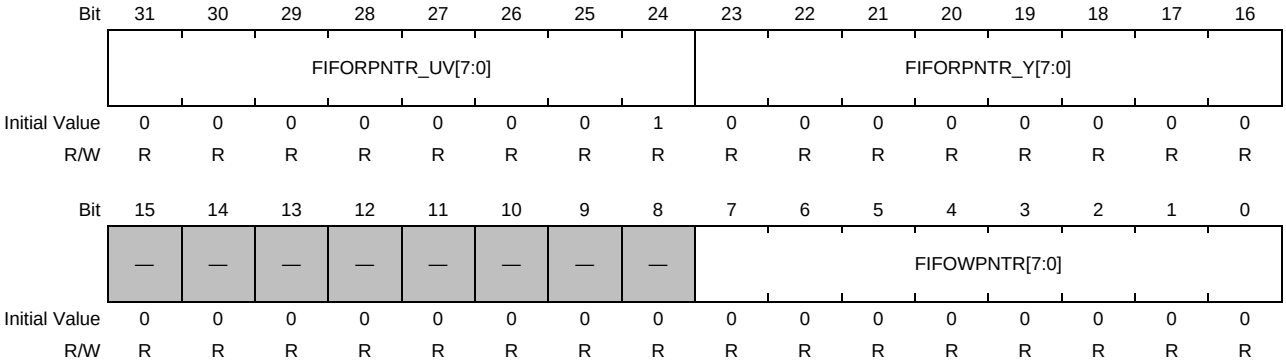
### 35.2.3.28 AXI Master Transfer Resume Register for CRU Image Data (AMnFIFOTRST)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AXI_TRANS_START |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | AXI_TRANS_START | 0b | RW | AXI transfer control for image data (valid when AMnFIFO.FIFOOVFREC = 1). See **Section 35.2.3.27**.<br>0b: Writing prohibited.<br>Write 1 to this bit to recover the image-related AXI (transfer resume) (This bit returns to 0 when transfer is resumed.) |

### 35.2.3.29 AXI Master FIFO Pointer Register for CRU Image Data (AMnFIFOPNTR)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | FIFORPNTR_UV[7:0] | H'01 | R | FIFO read pointer for image data (for UV)<br>Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): Unused<br>During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): FIFO read pointer for UV data<br>[7:1] RAM read pointer value for UV data FIFO<br>[0] Fixed to 1 |
| 23 to 16 | FIFORPNTR_Y[7:0] | H'00 | R | FIFO read pointer for image data<br>Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): All FIFO read pointer<br>[7:0] RAM read pointer value for FIFO<br>During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): Y data FIFO read pointer<br>[7:1] RAM read pointer value for Y data FIFO<br>[0] Fixed to 0 |
| 15 to 8 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 0 | FIFOWPNTR[7:0] | H'00 | R | FIFO write pointer for image data<br>Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b):<br>[7:0] RAM write pointer value for FIFO<br>*Note*: The amount of data stored in the FIFO can be found by FIFOWPNTR[7:0] - FIFORPNTR_Y[7:0].<br>During YC separation mode (ICnDMR.YCMODE[2:0] = 010b):<br>[7:1] RAM write pointer value for FIFO<br>[0] Fixed to 0<br>*Note*: The amount of data stored in the FIFO can be found by FIFOWPNTR[7:1] - FIFORPNTR_Y[7:1], FIFOWPNTR[7:1] - FIFORPNTR_UV[7:1]. |

### 35.2.3.30 AXI Master Transfer Stop Register for CRU Image Data (AMnAXISTP)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AXI_STOP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | AXI_STOP | 0b | RW | Image data AXI transfer stop (used to stop the CRU from receiving data. Perform the reception stop procedure described in **Section 35.3.2**.)<br>0b: Does not stop the AXI master from transferring data.<br>1b: Stops the AXI master from transferring data. |

### 35.2.3.31 AXI Master Transfer Stop Status Register for CRU Image Data (AMnAXISTPACK)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AXI_STOP_ACK |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | AXI_STOP_ACK | 0b | R | Image data AXI transfer stop response (used to stop the CRU from receiving data. Perform the reception stop procedure described in **Section 35.3.2**.)<br>0b: The AXI master is transferring data.<br>1b: The AXI master has finished transferring data (valid when AXI_STOP = 1) |

### 35.2.3.32 Memory Bank 1 Base Address Lower Register for CRU Statistics Data (AMnSDMB1ADDRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SDMB1ADDRL[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SDMB1ADDRL[15:9] | | | | | | | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | SDMB1ADDRL[31:9] | All 0 | RW | Statistics data transfer destination base address 1 (valid bits are [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.) |
| 8 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.33 Memory Bank 1 Base Address Higher Register for CRU Statistics Data (AMnSDMB1ADDRH)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SDMB1ADDRH[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | SDMB1ADDRH[1:0] | 00b | RW | Statics data transfer destination base address 1 (valid bits are [33:32])<br>*Note*: These bits cannot be modified while the AXI-SD is operating. |

### 35.2.3.34 Memory Bank 2 Base Address Lower Register for CRU Statistics Data (AMnSDMB2ADDRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SDMB2ADDRL[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SDMB2ADDRL[15:9] | | | | | | | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | SDMB2ADDRL[31:9] | All 0 | RW | Statistics data transfer destination base address 2 (valid bits are [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.) |
| 8 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

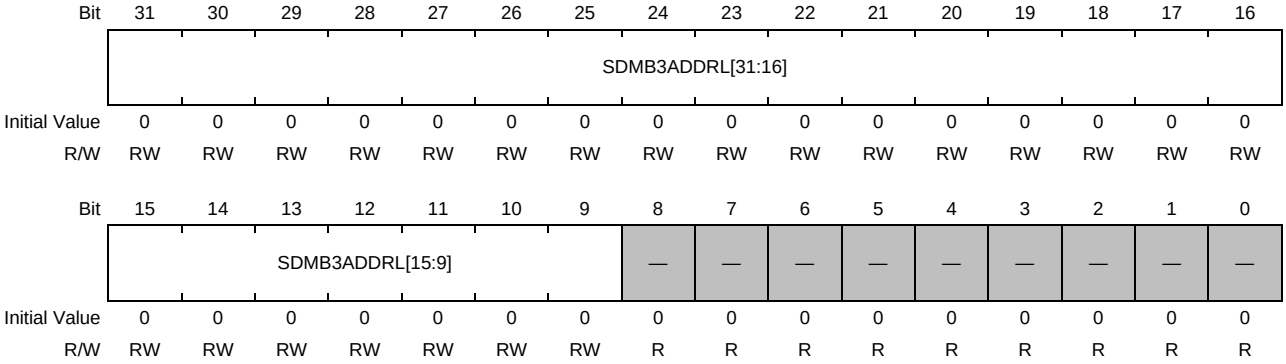
### 35.2.3.35 Memory Bank 2 Base Address Higher Register for CRU Statistics Data (AMnSDMB2ADDRH)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SDMB2ADDRH[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

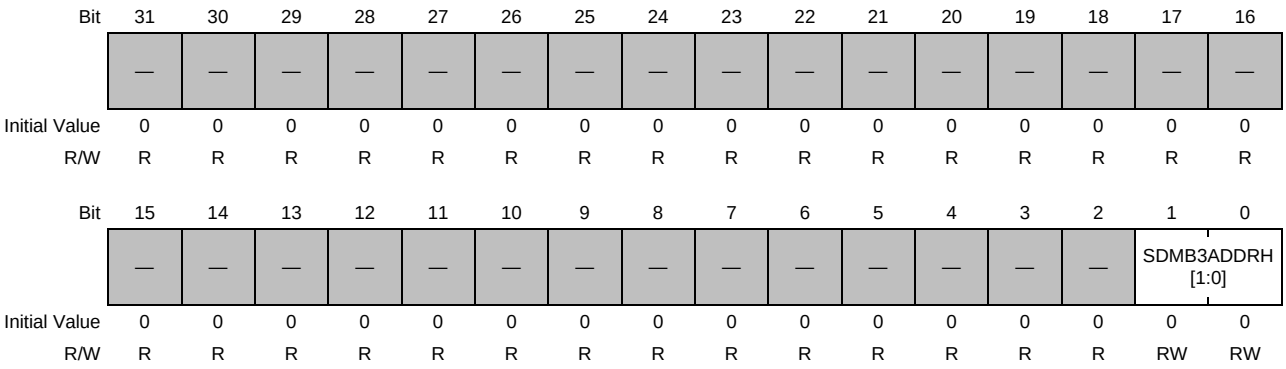
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | SDMB2ADDRH[1:0] | 00b | RW | Statics data transfer destination base address 2 (valid bits are [33:32])<br>*Note*: These bits cannot be modified while the AXI-SD is operating. |

### 35.2.3.36 Memory Bank 3 Base Address Lower Register for CRU Statistics Data (AMnSDMB3ADDRL)



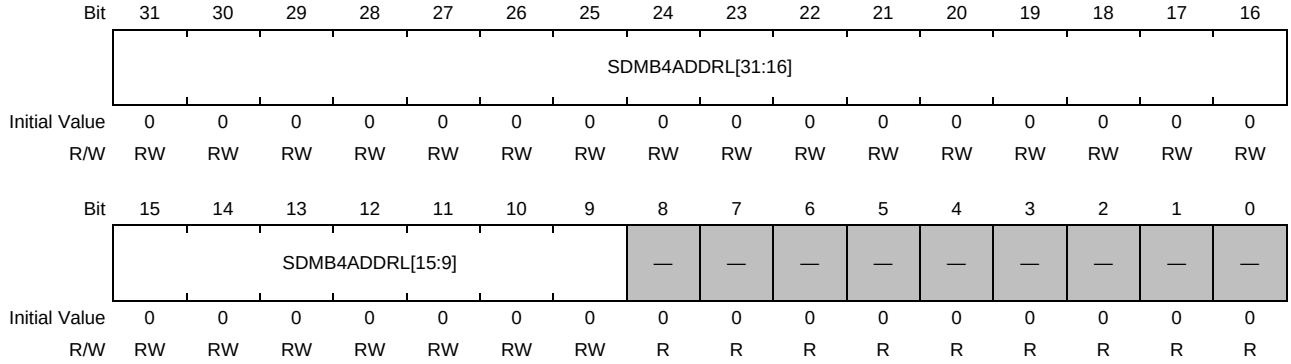
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | SDMB3ADDRL[31:9] | All 0 | RW | Statistics data transfer destination base address 3 (valid bits are [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.) |
| 8 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.37 Memory Bank 3 Base Address Higher Register for CRU Statistics Data (AMnSDMB3ADDRH)



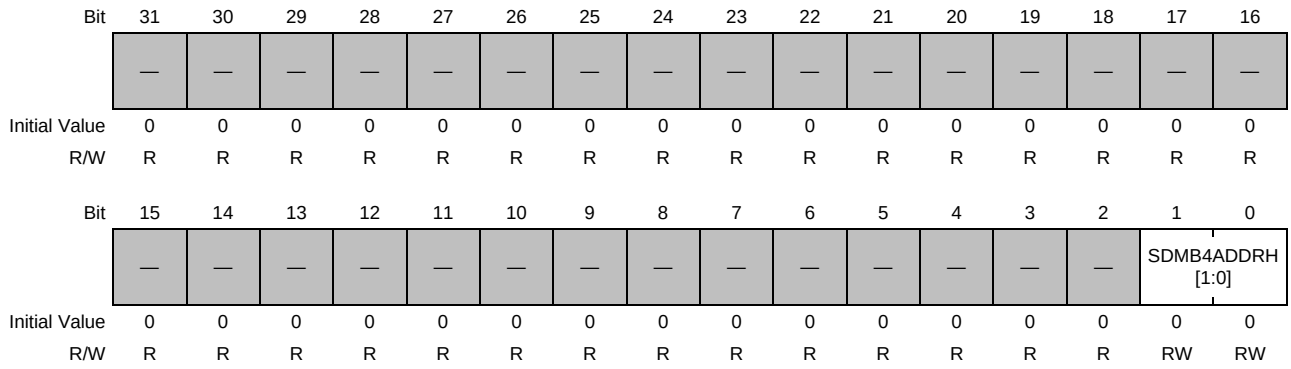
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | SDMB3ADDRH[1:0] | 00b | RW | Statics data transfer destination base address 3 (valid bits are [33:32])<br>*Note*: These bits cannot be modified while the AXI-SD is operating. |

### 35.2.3.38 Memory Bank 4 Base Address Lower Register for CRU Statistics Data (AMnSDMB4ADDRL)



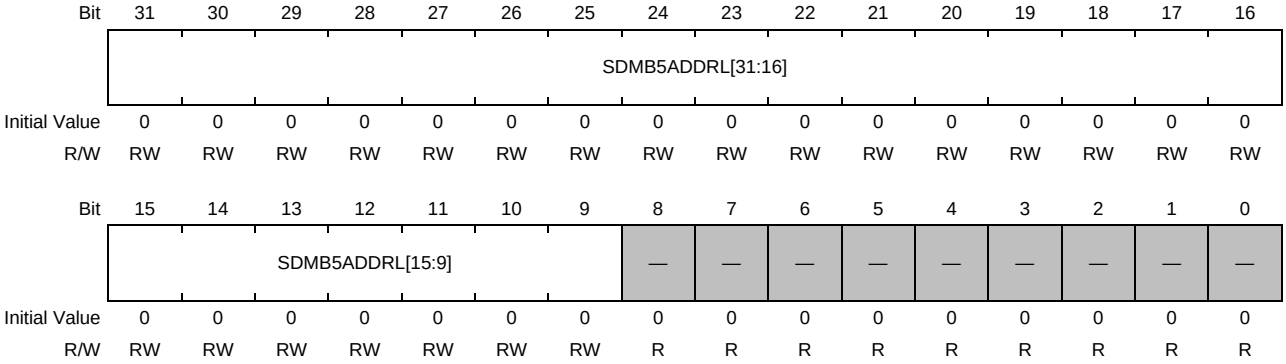
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | SDMB4ADDRL[31:9] | All 0 | RW | Statistics data transfer destination base address 4 (valid bits are [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.) |
| 8 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.39 Memory Bank 4 Base Address Higher Register for CRU Statistics Data (AMnSDMB4ADDRH)



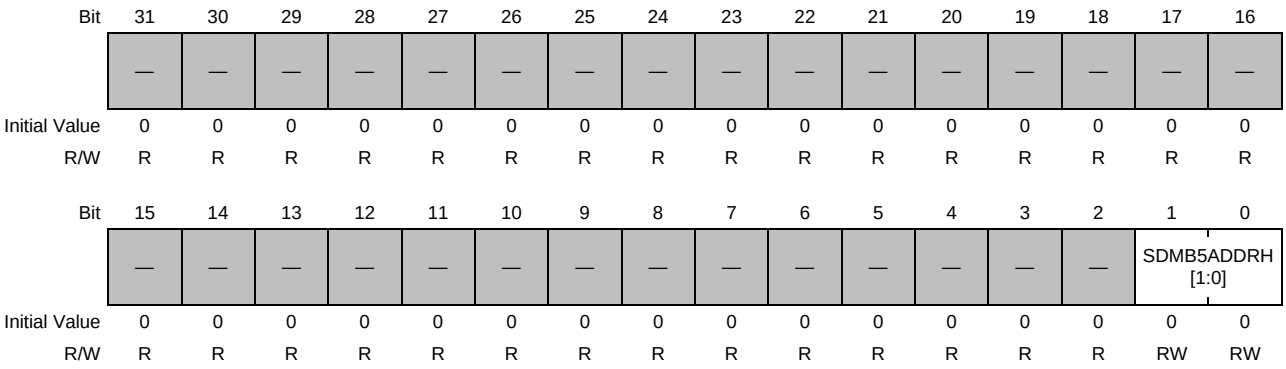
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | SDMB4ADDRH[1:0] | 00b | RW | Statics data transfer destination base address 4 (valid bits are [33:32])<br>*Note*: These bits cannot be modified while the AXI-SD is operating. |

### 35.2.3.40 Memory Bank 5 Base Address Lower Register for CRU Statistics Data (AMnSDMB5ADDRL)



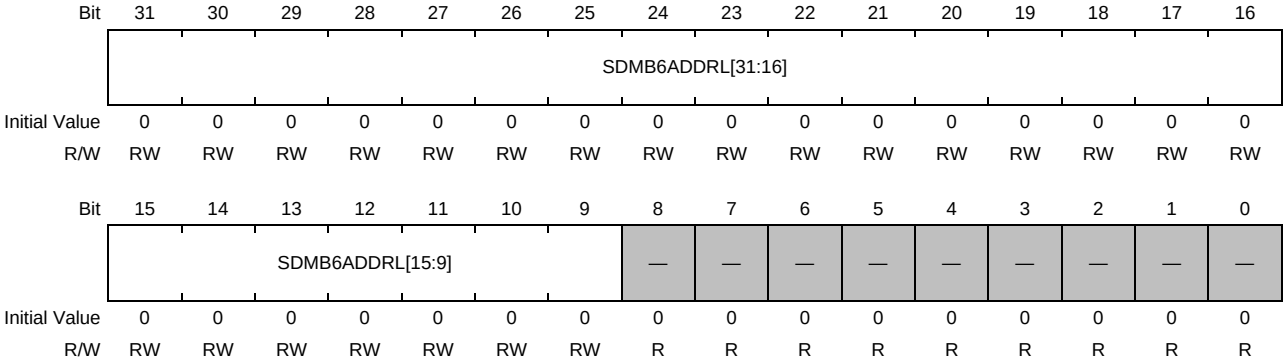
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | SDMB5ADDRL[31:9] | All 0 | RW | Statistics data transfer destination base address 5 (valid bits are [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.) |
| 8 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.41 Memory Bank 5 Base Address Higher Register for CRU Statistics Data (AMnSDMB5ADDRH)



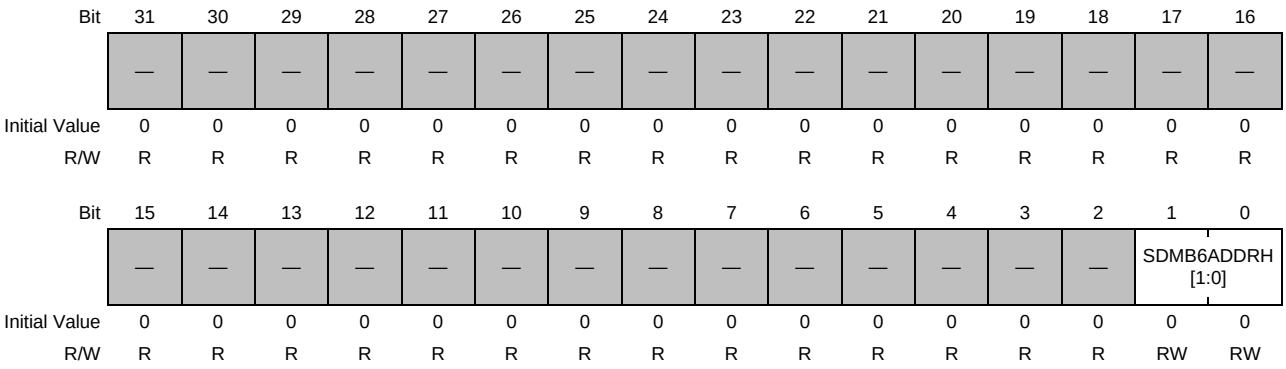
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | SDMB5ADDRH[1:0] | 00b | RW | Statics data transfer destination base address 5 (valid bits are [33:32])<br>*Note*: These bits cannot be modified while the AXI-SD is operating. |

### 35.2.3.42 Memory Bank 6 Base Address Lower Register for CRU Statistics Data (AMnSDMB6ADDRL)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | SDMB6ADDRL[31:9] | All 0 | RW | Statistics data transfer destination base address 6 (valid bits are [31:9])<br>Set it as the base address in units of 512 bytes.<br>*Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.) |
| 8 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 35.2.3.43 Memory Bank 6 Base Address Higher Register for CRU Statistics Data (AMnSDMB6ADDRH)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | SDMB6ADDRH[1:0] | 00b | RW | Statics data transfer destination base address 6 (valid bits are [33:32])<br>*Note*: These bits cannot be modified while the AXI-SD is operating. |

### 35.2.3.44 Memory Bank 7 Base Address Lower Register for CRU Statistics Data (AMnSDMB7ADDRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ICEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | ICEN | 0b | RW | Enables the operation of the image processing module. (Enable or disable the operation according to **Section 35.3.1** and **Section 35.3.2**.)<br>0b: Disables the image processing module.<br>1b: Enables the image processing module.<br>*Note*: If this bit is set to 0, a frame start is not detected. If this bit is changed from 1 to 0 while a frame is being processed, the data at that time is processed as the frame end and then the next frames are not processed. |

### 35.2.3.57 CRU Image Processing Register Setting Change Control Register (ICnREGC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | REFEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | REFEN | 0b | RW | Allows register setting changes to be reflected.<br>By using this register for an MIPI CSI-2 input, the registers at addresses H'1083_0208 to H'1083_0244 can be changed through frame synchronization during operation. (Allow or disallow this according to **Section 35.3.3.1**, **Section 35.3.3.2**.)<br>0b: Does not allow register setting changes to be reflected.<br>1b: Allows register setting changes to be reflected.<br>*Note 1.* If this bit is set to 1 while the image processing module is operating (ICnEN.ICEN = 1), the register setting values (at addresses H'1083_0208 to H'1083_0244) are reflected at a frame start, and then the bit is cleared to 0 automatically.<br>*Note 2.* If the image processing module is stopped (ICnEN.ICEN = 0), the register setting values can be reflected irrespective of this register. Note that registers other than the above cannot be changed during operation. |

### 35.2.3.58 CRU Image Processing Main Control Register (ICnMC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RAWSTTYP[1:0] | | VCSEL[1:0] | | INF[5:0] | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 |
| R/W | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | IBINSEL | CLP[1:0] | | — | — | — | — | STITHR | LUTTHR | CSCTHR | LMXTHR | DEMTHR | CLPTHR | DECTHR | — |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| R/W | R | RW | RW | RW | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored.. |
| 25, 24 | RAWSTTYP [1:0] | 00b | RW | Specify the type of the 1st pixel of the 1st line of the RAW data<br>This setting is for recognizing the components of RAW data when demosaicing.<br>00b: R (RGRG…)<br>01b: Gr (GRGR…)<br>10b: Gb (GBGB…)<br>11b: B (BGBG…) |
| 23, 22 | VCSEL[1:0] | 00b | RW | Specify a virtual channel to be processed by the image processing module.<br>A single channel specified by the register is selected from virtual channels 0 to 3. |
| 21 to 16 | INF[5:0] | H'1E | RW | Specify the MIPI input image formats to be processed in the image processing module.<br>For details about the formats, see Data Type Codes in the MIPI CSI-2 V2.1 Specification. From the formats specified here, only one format is processed.<br>*Note 1.* Initial value: YUV422 8-bit<br>*Note 2.* The following values can be set. Other settings are prohibited.<br>H'13 to H'16: Generic Long Packet Data Type<br>H'18 to H'1A, H'1C to H'1F: YUV Data<br>H'20 to H'24: RGB Data<br>H'28 to H'2F: RAW Data<br>H'30 to H'37: User-Defined Byte-based Data<br>The data types specified here must have been set in CSI2nDTEL.DTEN and CSI2DTEH.DTEN of MIPI CSI2. |
| 15 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 14 | IBINSEL | 0b | RW | Binary selection for UV of input image format YUV422<br>0b: Offset binary (straight binary)<br>1b: Two's complement binary |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 13, 12 | CLP[1:0] | 11b | RW | Data clipping setting for the YCbCr (YUV) format<br>To make the input data to be RGB-converted comply with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240 (when YCbCr is 8-bit).<br>00b: No clipping for Y<br>When CbCr is 8-bit: Values below 16 and above 240 are clipped for CbCr<br>When CbCr is 10-bit: Values below 64 and above 960 are clipped for CbCr<br>01b:<br>When YCbCr is 8-bit: Values below 16 and above 240 are clipped for Y<br>Values below 16 and above 240 are clipped for CbCr<br>When YCbCr is 10-bit: Values below 64 and above 960 are clipped for Y<br>Values below 64 and above 960 are clipped for CbCr<br>10b: No clipping for Y<br>When CbCr is 8-bit: Values below 16 are increased to 128 and values above 240 are clipped to 128 for CbCr<br>When CbCr is 10-bit: Values below 64 are increased to 512 and values above 960 are clipped to 512 for CbCr<br>11b: No clipping for Y and CbCr (initial value) |
| 11 to 8 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | STITHR | 1b | RW | Bypassing Statistics processing for RAW data<br>0: Statistics processing is performed<br>1: Statistics processing is not performed (bypassed)<br>*Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.10**. |
| 6 | LUTTHR | 1b | RW | Bypassing LUT-based image color conversion<br>Regardless of whether this setting is 0b or 1b, the output of the LUT is 8 bits for 10 bits of input.<br>0b: Image color conversion is performed.<br>1b: Image color conversion is not performed (bypassed).<br>*Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.10**. |
| 5 | CSCTHR | 1b | RW | Bypassing color space conversion (YCbCr(YUV) → RGB, RGB → YCbCr(YUV)) and data clipping.<br>0b: Color space conversion and data clipping are performed.<br>1b: Color space conversion and data clipping are not performed (bypassed).<br>*Note 1.* This setting of 0b applies only for the corresponding format shown in **Table 35.10**. For other image formats, color space conversion is not performed regardless of the settings (RAW is subject to RGB conversion after demosaic processing).<br>*Note 2.* Even when this bit is 1, the data is expanded from 8-bit to 10-bit. |
| 4 | LMXTHR | 1b | RW | Bypassing Linear Matrix processing for RAW data<br>0: Linear Matrix processing is performed<br>1: Linear Matrix processing is not performed (bypassed)<br>*Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.10**. For other image formats, Linear Matrix processing is not performed regardless of the settings (RAW is subject to RGB conversion after demosaic processing). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | DEMTHR | 1b | RW | Bypassing Demosaicing processing for RAW data<br>0: Demosaicing processing is performed<br>1: Demosaicing processing is not performed (bypassed)<br>*Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.10**. For other image formats, Demosaicing processing is not performed regardless of the settings (RAW is subject to RGB conversion after demosaic processing). |
| 2 | CLPTHR | 1b | RW | Bypassing image clipping (Details is described in **Section 35.2.4.6**.)<br>0b: Image clipping is performed.<br>1b: Image clipping is not performed (bypassed).<br>*Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.10**. |
| 1 | DECTHR | 1b | RW | Bypassing frame skip (Details is described in **Section 35.2.4.7**.)<br>0b: Frame subsampling is performed.<br>1b: Frame subsampling is not performed (bypassed).<br>*Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.10**. |
| 0 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |

### (1) Bypass Setting for Each Function

**Figure 35.9** shows where the bypass settings by the DECTHR, CLPTHR, DEMTHR, LMXTHR, CSCTHR, LUTTHR, and STITHR bits of the ICnMC register work.

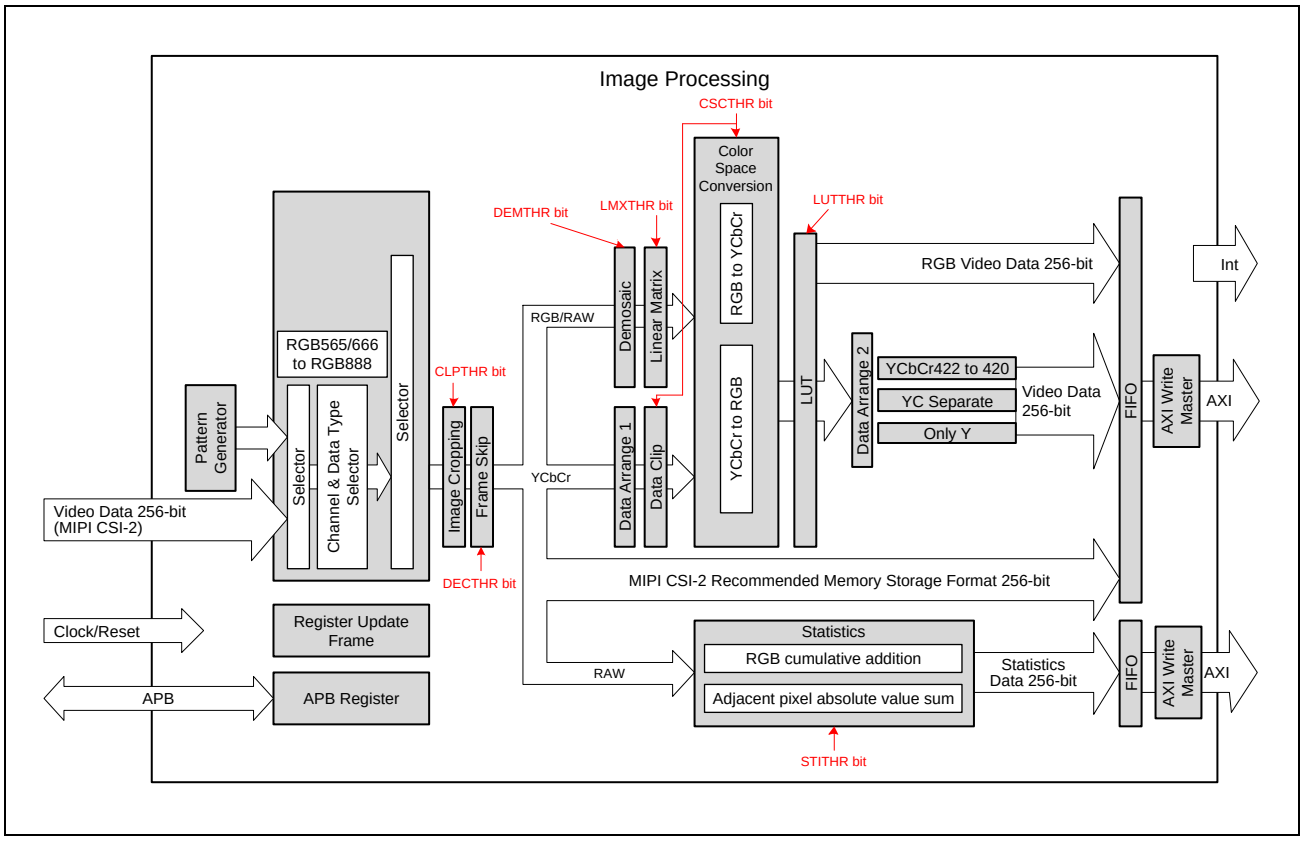

Figure 35.9 Bypass Setting of Each Function

### 35.2.3.59 CRU Image Clipping Start Line Register (ICnSLPrC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
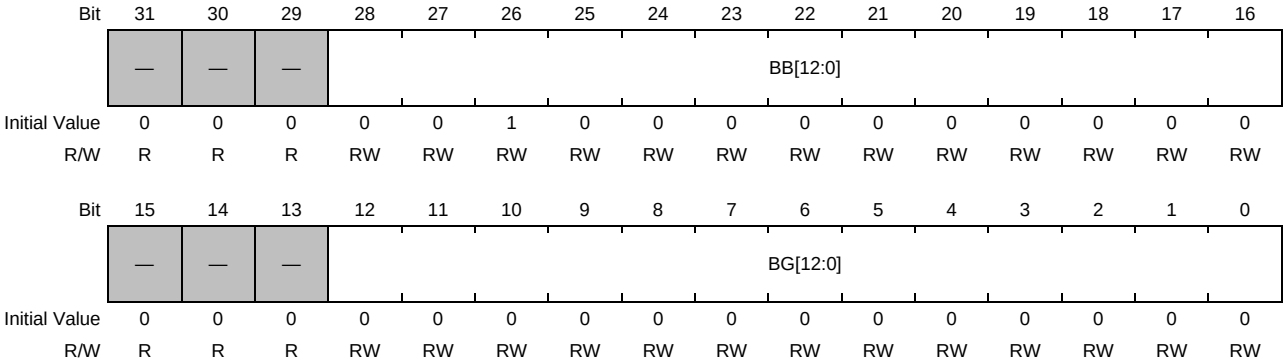
| 12 to 0 | RR[12:0] | All 0 | RW | Coefficient R of B data for linear matrix calculation (bit 12: sign)<br>*Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024.<br>Setting range: −4096 (H'1000) to 4095 (H'0FFF) |

### 35.2.3.70 CRU Linear Matrix B Coefficient 2 Register (ICnLMXBC2)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | 000b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 to 16 | BB[12:0] | H'0400 | RW | Coefficient B of B data for linear matrix calculation (bit 12: sign)<br>*Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024.<br>Setting range: −4096 (H'1000) to 4095 (H'0FFF) |
| 15 to 13 | — | 000b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 to 0 | BG[12:0] | All 0 | RW | Coefficient G of B data for linear matrix calculation (bit 12: sign)<br>*Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024.<br>Setting range: −4096 (H'1000) to 4095 (H'0FFF) |

### 35.2.3.71 CRU Statistics Control 1 Register (ICnSTIC1)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | STSADPOS[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STUNIT[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 to 16 | STSADPOS [3:0] | H'0 | RW | Input data bit position selection (0 – 8) for the sum of absolute values for adjacent pixels for statistics processing.<br>Use the 8 lower-order bits from the MSB-"n" bit for each type of RAW.<br>*Note*: Comply with the restrictions described in ICnSTIC1.STUNIT. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | STUNIT[1:0] | 00b | RW | Setting an arithmetic processing unit for statistics processing (blocks).<br>00b: 16 × 16 pixels<br>01b: 32 × 32 pixels<br>10b: 64 × 64 pixels<br>11b: 128 × 128 pixels<br>Example) In case of QVGA, STUNIT should be only 0. In case of VGA, STUNIT should be lesser than 1. In case of Full-HD, STUNIT should be lesser than 2.<br>*Note*: Set the STUNIT and the STHPOS parameters, complying the following formula.<br>((HSIZE – STHPOS) >> (4 + STUNIT)) × (VSIZE >> (4 + STUNIT)) × 4 > 512<br>HIZE: horizontal pixels / VSIZE: vertical lines |

### 35.2.3.72 CRU Statistics Control 2 Register (ICnSTIC2)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | STHPOS[8:0] | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 to 0 | STHPOS[8:0] | H'000 | RW | Horizontal starting position for statistics processing (0 – 376 (H'178)).<br>*Note 1.* Set the value of STUNIT and STHPOS so that there are 9 blocks or more per screen.<br>*Note 2.* Normally 0 is used, and if the horizontal size of the pixel is 2800, it is assumed to be set to 376 (H'178). |

### 35.2.3.73 CRU Module Status Register (ICnMS)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | IA | AV | CA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | IA | 0b | R | Indicates whether the image converter block (module covering the video data input up to the pre-FIFO stage) is processing.<br>0b: Image data has not been received yet.<br>1b: Image data is being converted. |
| 1 | AV | 0b | R | Indicates whether processing is performed within the image-clipped area.<br>(For details, see **Section 35.2.4.6**.)<br>0b: Processing is performed outside the image-clipped area.<br>1b: Processing is performed within the image-clipped area. |
| 0 | CA | 0b | R | Indicates whether the frame is subsampled.<br>(For details, see **Section 35.2.4.7**.)<br>0b: A subsampled frame is being processed.<br>1b: A frame which is not subsampled is being processed.<br>*Note*: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN is changed from 0 to 1. |

### 35.2.3.74 CRU Frame Subsampling Control Register (ICnDEC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | FRMDEC[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 to 0 | FRMDEC[3:0] | H'0 | RW | Subsampling interval in frame subsampling<br>(For details, see **Section 35.2.4.7**.)<br>H'0: All images are passed.<br>H'1: One pass every two frames<br>H'2: One pass every three frames<br>Omitted<br>H'14: One pass every 15 frames<br>H'15: One pass every 16 frames |

### 35.2.3.75 CRU Line Count Register (ICnLC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | LC[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | LC[11:0] | H'000 | R | Indicate the line counter value before image clipping and subsampling in the image processing module. |

### 35.2.3.76 CRU Word Count Register (ICnWC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WC[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | WCLC[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | WC[15:0] | H'0000 | R | Indicate the current word count from LINK for the MIPI CSI-2 input.<br>*Note 1.* These bits are cleared to 0 at a frame start.<br>*Note 2.* If the word count value does not match the value set in ICnEWC.EWC[15:0], the unmatched value is retained until the next frame start. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | WCLC[11:0] | H'000 | R | Indicate the count of continuous lines for which the word count value from LINK for the MIPI CSI-2 input matches the value set in ICnEWC.EWC[15:0].<br>*Note 1.* This value is cleared by a frame start.<br>*Note 2.* If the word count value does not match the value set in ICnEWC.EWC[15:0], the unmatched value is retained until the next frame start. |

### 35.2.3.77 CRU Word Count Check Control Register (ICnEWC)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | EWC[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | H'0000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | EWC[15:0] | H'0000 | RW | Specify an expected word count value that is output from LINK for the MIPI CSI-2 input.<br>If this setting value does not match the word count value that is output from LINK for the MIPI CSI-2 input, the image_conv_err_int interrupt can be output. These bits are used for debugging when the operation for the MIPI CSI-2 input is abnormal. |

### 35.2.3.78 CRU Frame Subsampling Interrupt Control Register (ICnINTCTRL)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DECINTE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | DECINTE | 0b | RW | Specifies whether an interrupt (CRUnINTS.SFS, CRUnINTS.EFS, or CRUnINTS.SI) is generated for a subsampled frame.<br>0b: No interrupt is generated for a subsampled frame. (Initial value)<br>1b: An interrupt is generated for a subsampled frame. |

### 35.2.3.79 CRU Output Image Format Register (ICnDMR)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | A8BIT[7:0] | | | | | | | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OBINSEL | — | YCMODE[2:0] | | | — | — | RGBMODE[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | RW | R | RW | RW | RW | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | A8BIT[7:0] | H'00 | RW | Alpha bit<br>Alpha value in the ARGB8888 format output |
| 23 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | OBINSEL | 0b | RW | Output binary selection for YCbCr data<br>0b: Offset binary (straight binary)<br>1b: Two's complement binary<br>*Note*: Valid when the output is YUV422/420. |
| 7 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LUTWR | LUTSEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | LUTWR | 0b | RW | Enables APB read/write access to the lookup table (LUT).<br>0b: Disables APB access (set this bit to 0 in operation with the normal path).<br>1b: Enables APB access (normal access is unavailable in this case).<br>*Note*: **Figure 35.43, Storing LUT Data (Both)** for the LUT setting procedure. |
| 0 | LUTSEL | 0b | RW | Specifies the access path of the lookup table (LUT).<br>0b: Normal path (image conversion by using the LUT)<br>1b: APB I/F (read/write from registers)<br>Used to write (and confirm) data to the LUT in initial setting.<br>Set this bit to 0 after finishing writing and reading data.<br>Note that the LUT data is retained even after a reset.<br>*Note*: **Figure 35.43, Storing LUT Data (Both)** for the LUT setting procedure. |

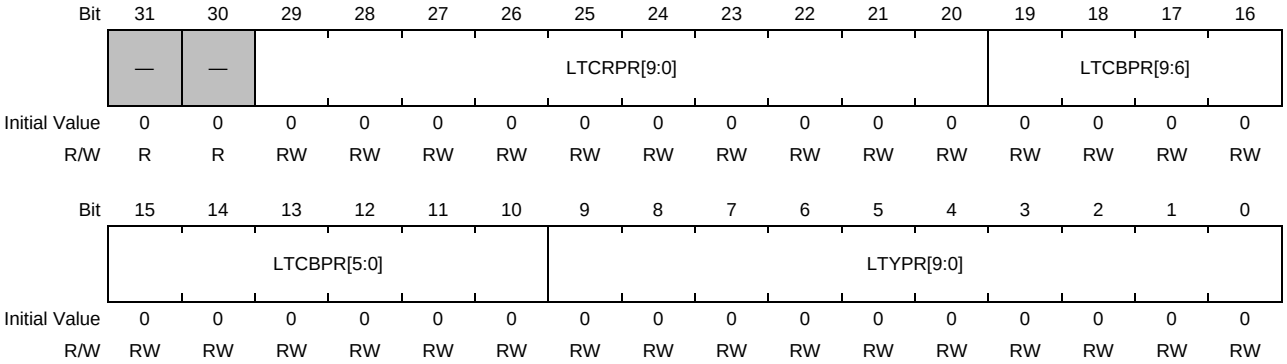
### 35.2.3.94 CRU Lookup Table Status Register (ICnLUTS)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LUTREGSEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

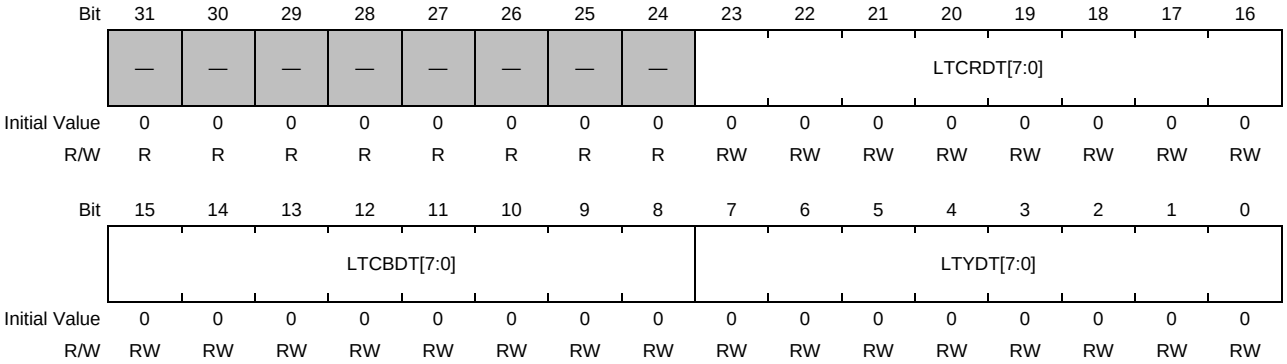
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | LUTREGSEL | 0b | R | Indicates that the lookup table (LUT) can be accessed for a read and write from the APB.<br>The LUTWR register value is reflected in this register after a while. Access the lookup table after confirming this bit.<br>0b: Both read access and write access are unavailable.<br>1b: Both read access and write access are available.<br>*Note*: **Figure 35.43, Storing LUT Data (Both)** for the LUT setting procedure. |

### 35.2.3.95 CRU Lookup Table Pointer Register (ICnLUTP)



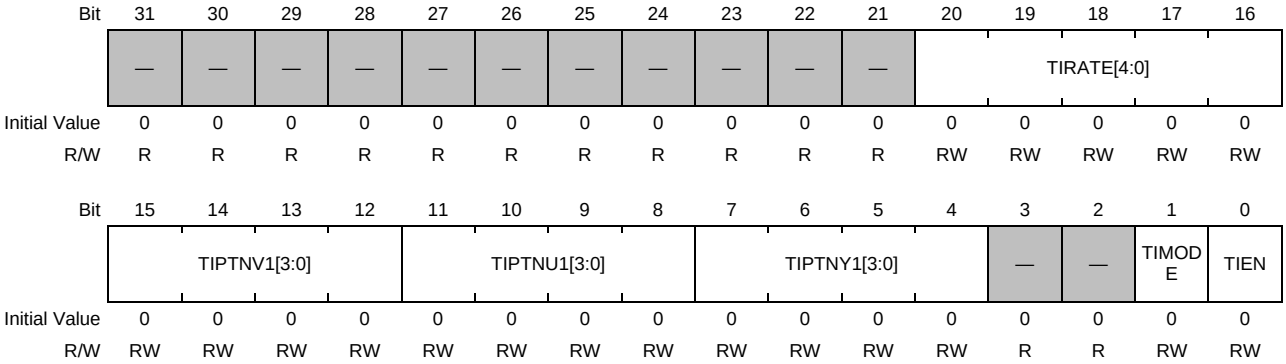
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 29 to 20 | LTCRPR[9:0] | H'000 | RW | Lookup table (LUT) Cr/B pointer<br>Specify the current pointer (access point) to lookup table Cr/B in APB access. The pointer is incremented automatically when ICnLUTD.LTCRDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits.<br>*Note*: **Figure 35.43, Storing LUT Data (Both)** for the LUT setting procedure. |
| 19 to 10 | LTCBPR[9:0] | H'000 | RW | Lookup table (LUT) Cb/G pointer<br>Specify the current pointer (access point) to lookup table Cb/G in APB access. The pointer is incremented automatically when ICnLUTD.LTCBDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits.<br>*Note*: **Figure 35.43, Storing LUT Data (Both)** for the LUT setting procedure. |
| 9 to 0 | LTYPR[9:0] | H'000 | RW | Lookup table (LUT) Y/R pointer<br>Specify the current pointer (access point) to the lookup table Y/R in APB access. The pointer is incremented automatically when ICnLUTD.LUTYDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits.<br>*Note*: **Figure 35.43, Storing LUT Data (Both)** for the LUT setting procedure. |

### 35.2.3.96 CRU Lookup Table Data Register (ICnLUTD)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 to 16 | LTCRDT[7:0] | H'00 | RW | Lookup table (LUT) Cr/B data<br>Read and write data to the location indicated by the ICnLUTP.LTCRPR[9:0] pointer in lookup table Cr/B through the APB interface. |
| 15 to 8 | LTCBDT[7:0] | H'00 | RW | Lookup table (LUT) Cb/G data<br>Read and write data to the location indicated by the ICnLUTP.LTCBPR[9:0] pointer in lookup table Cb/G through the APB interface. |
| 7 to 0 | LTYDT[7:0] | H'00 | RW | Lookup table (LUT) Y/R data<br>Read and write data to the location indicated by the ICnLUTP.LTYPR[9:0] pointer in lookup table Y/R through the APB interface. |

### 35.2.3.97 CRU Test Image Generation Control 1 Register (ICnTICTRL1)



| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | TIRATE[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIPTNV1[3:0] | | | | TIPTNU1[3:0] | | | | TIPTNY1[3:0] | | | | — | — | TIMODE | TIEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | H'000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 to 16 | TIRATE[4:0] | H'00 | RW | Specify the test image generation rate.<br>16 pixels / (18 + TIRATE) cycles |
| 15 to 12 | TIPTNV1[3:0] | H'0 | RW | Specify the pixel (V) counter bits for the test image pattern.<br>0000b: Selects bits [3:0].<br>0001b: Selects bits [4:1].<br>0010b: Selects bits [5:2].<br>Omitted<br>1100b: Selects bits [15:12].<br>1101b to 1111b: Setting prohibited |
| 11 to 8 | TIPTNU1[3:0] | H'0 | RW | Specify the pixel (U) counter bits for the test image pattern.<br>0000b: Selects bits [3:0].<br>0001b: Selects bits [4:1].<br>0010b: Selects bits [5:2].<br>Omitted<br>1100b: Selects bits [15:12].<br>1101b to 1111b: Setting prohibited |
| 7 to 4 | TIPTNY1[3:0] | H'0 | RW | Specify the pixel (Y) counter bits for the test image pattern.<br>0000b: Selects bits [3:0].<br>0001b: Selects bits [4:1].<br>0010b: Selects bits [5:2].<br>Omitted<br>1100b: Selects bits [15:12].<br>1101b to 1111b: Setting prohibited |
| 3, 2 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | TIMODE | 0b | RW | Specifies a test image generation pattern.<br>0b: Selects a counter value for YUV output.<br>1b: Same-color YUV output for the entire screen |
| 0 | TIEN | 0b | RW | Enables generation of a test image pattern.<br>0b: Does not generate a test image pattern (processes image data from LINK).<br>1b: Generates a test image pattern. |

### 35.2.3.98 CRU Test Image Generation Control 2 Register (ICnTICTRL2)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TIPTNV2[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIPTNU2[7:0] | | | | | | | | TIPTNY2[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | H'00 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 to 16 | TIPTNV2[7:0] | H'00 | RW | Specify V for the entire-screen same-color test image pattern. |
| 15 to 8 | TIPTNU2[7:0] | H'00 | RW | Specify U for the entire-screen same-color test image pattern. |
| 7 to 0 | TIPTNY2[7:0] | H'00 | RW | Specify Y for the entire-screen same-color test image pattern. |

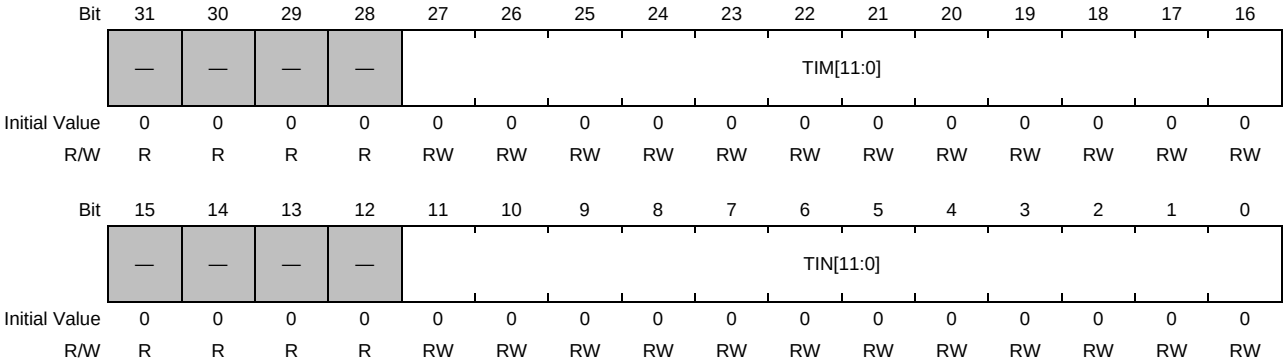
### 35.2.3.99 CRU Test Image Size Setting 1 Register (ICnTISIZE1)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TIPPL[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to12 | — | H'0_0000 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | TIPPL[11:0] | H'000 | RW | Number of valid pixels per line in the test image pattern<br>*Note 1.* If a value from 0 to 15 is specified, it is assumed that 16 is specified.<br>*Note 2.* The lower four bits are invalid. |

### 35.2.3.100 CRU Test Image Size Setting 2 Register (ICnTISIZE2)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | TIM[11:0] | H'000 | RW | Invalid period (number of lines) per frame in the test image pattern<br>*Note*: If 0 is specified, it is assumed that 1 is specified. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | TIN[11:0] | H'000 | RW | Valid period (number of lines) per frame in the test image pattern<br>*Note*: If 0 is specified, it is assumed that 1 is specified. |

## 35.2.4 Operation

### 35.2.4.1 Input Formats and Image Processing

**Table 35.10** lists the input image formats that can be processed by this module, and corresponding image processing. Output format will be limited depending on this setting.

Table 35.10 Input Format and Image Processing (1/2)

| Input Format | | | Image Processing | | | | | | | | | | | Interrupt | | | | | | | Output format | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Data Type | Data Type Classes | Data Type Name | SAV/EAV Decode | Frame Subsampling | Image Clipping | Demosaicing | Data Arrange (Input) | Data Clipping | Linear Matrix | YCbCr to RGB | RGB to YCbCr | LUT | Data Arrange (Output) | YCbCr422 to 420 | Frame Start | Frame End | Scan Line | Abnormal Word Count Value | ITU656 DECERR | Statistics | YCbCr422 | YCbCr420 | RGB | RAW | MIPI CSI-2 Recommended Memory Storage Format |
| MIPI CSI2 (INF[5:0] Bits of ICnMC Register) | | | | | | | | | | | | | | | | | | | | | | | | | |
| H'00 | Synchronization Short Packet Data Types | Frame Start Code | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

Note 1. Output format
YCbCr422 output format supports YCbCr multiplexed 8bit,YC Separation and Only Y.
YCbCr420 output format supports YCbCr multiplexed 8bit.
RGB output format supports RGB888 (24 bits), RGB888 (32 bits) and ARGB8888 (32 bits).
RAW output format only supports the same width as the input RAW.

Note 2. YUV422 input format
This format is converted from 10 bits to 8 bits by the LUT when ICnMC.LUTTHR = 0, and the upper 8 bits out of 10 bits are converted when ICnMC.LUTTHR = 1.

Note 3. RGB565 and RGB666 input format
This format is once expanded to RGB888 and processed internally. (See **Section 35.2.4.4**)

### 35.2.4.2 Output Formats

**Table 35.11** lists the image output formats.

Table 35.11 Image Output Formats (1/2)

| Format | | | Register | Image Data[255:0] | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | byte31 | byte30 | byte29 | byte28 | byte27 | byte26 | byte25 | byte24 | byte23 | byte22 | byte21 | byte20 | byte19 | byte18 | byte17 | byte16 |
| YUV (YCbCr) 422 | Cb 1st | | ICnDMR.YCMODE = 001b | Y15 [7:0] | Cr14 [7:0] | Y14 [7:0] | Cb14 [7:0] | Y13 [7:0] | Cr12 [7:0] | Y12 [7:0] | Cb12 [7:0] | Y11 [7:0] | Cr10 [7:0] | Y10 [7:0] | Cb10 [7:0] | Y9 [7:0] | Cr8 [7:0] | Y8 [7:0] | Cb8 [7:0] |

### 35.2.4.3 Transfer to DRAM

#### (1) Image Data Transfer Destination Address (Image Storage Destination)

- The transfer destination address (image data storage destination) is determined by the AMnMB1ADDRL to AMnMB8ADDRL, and AMnMB1ADDRH to AMnMB8ADDRH registers (MB1ADDR, MB2ADDR, …).
- Up to eight transfer destination addresses (image data storage destinations) are supported.
- A valid register (MB1ADDR, MB2ADDR, …) is switched by AMnMBVALID.
- UV data address offset UVAOF when outputting YUV image data is determined by the AMnUVAOFL and AMnUVAOFH registers.

##### (a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Transfer sequence: MB1 → MB2 → … → MB8 → MB1 → MB2 → …

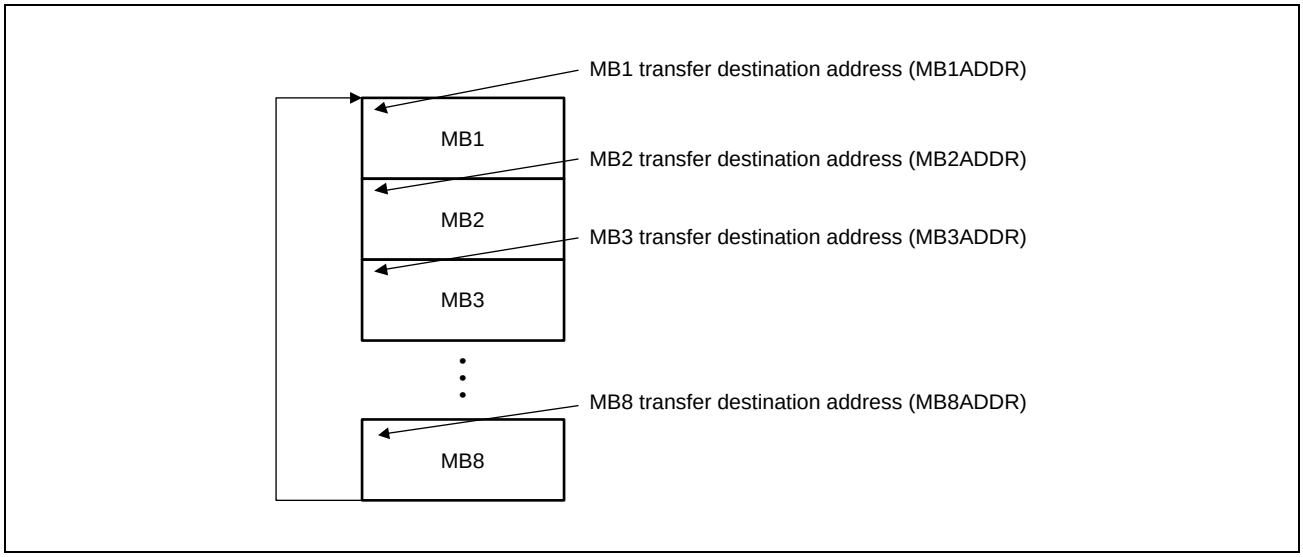

Figure 35.10 Memory Banks (Eight Transfer Destinations)

**(b) AMnMBVALID[7:0] = 0000_1111b (four transfer destinations)**

MB1 → MB2 → MB3 → MB4 → MB1 → MB2 → …

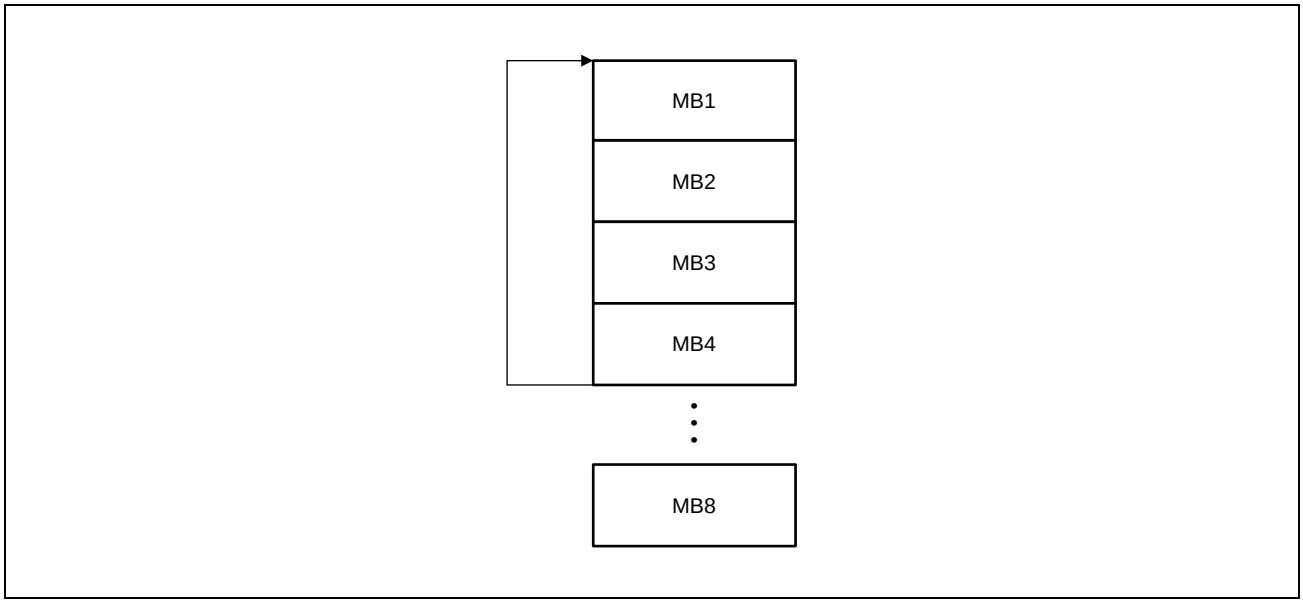

Figure 35.11 Memory Banks (Four Transfer Destinations)

**(c) AMnMBVALID[7:0] = 0000_0001b (one transfer destination)**

MB1 → MB1 → MB1 → …

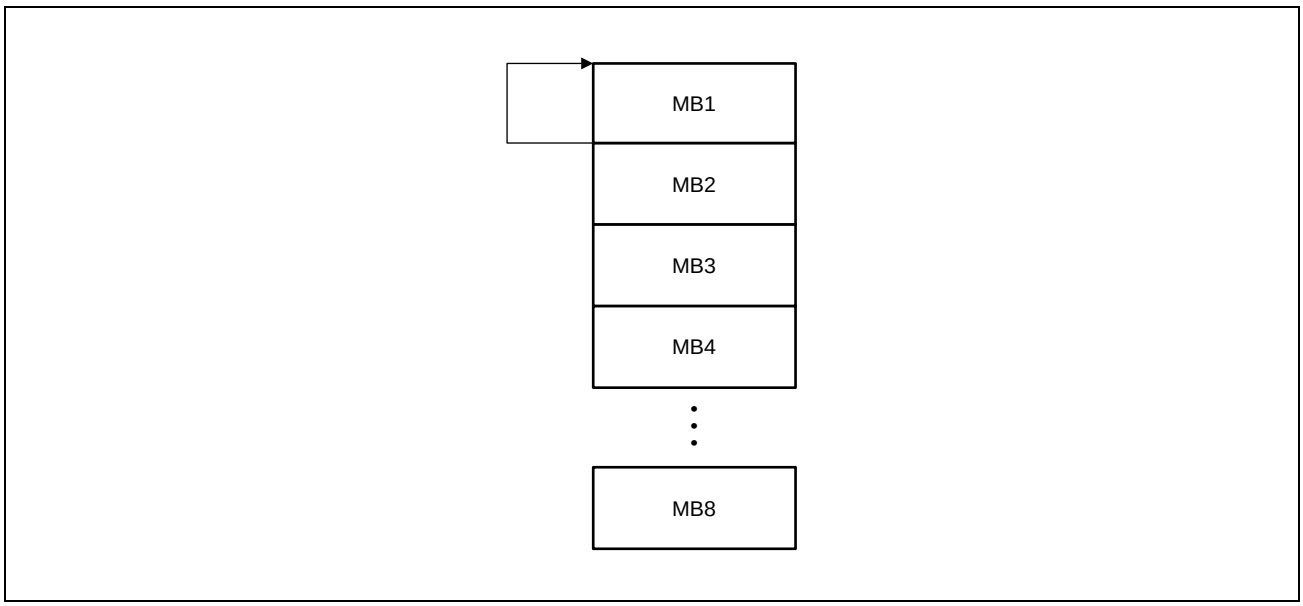

Figure 35.12 Memory Banks (One Transfer Destinations)

### (2) Image Data Transfer Destination Address (Storage in Y/UV Separation)

The following shows the sequence of data storage in the MB1 transfer destination address (MB1ADDR) in the case of Y First (YUYV...).

#### (a) When YUV is Not Separated (ICnDMR.YCMODE[2:0] = 000b to 001b, 100b to 101b):

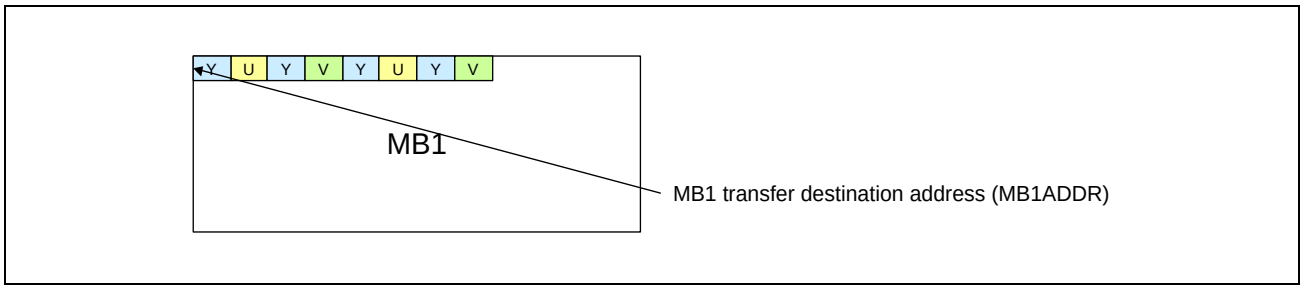

Figure 35.13 Data Storage (YUV is Not Separated)

#### (b) When YUV is Separated (ICnDMR.YCMODE[2:0] = 010b):

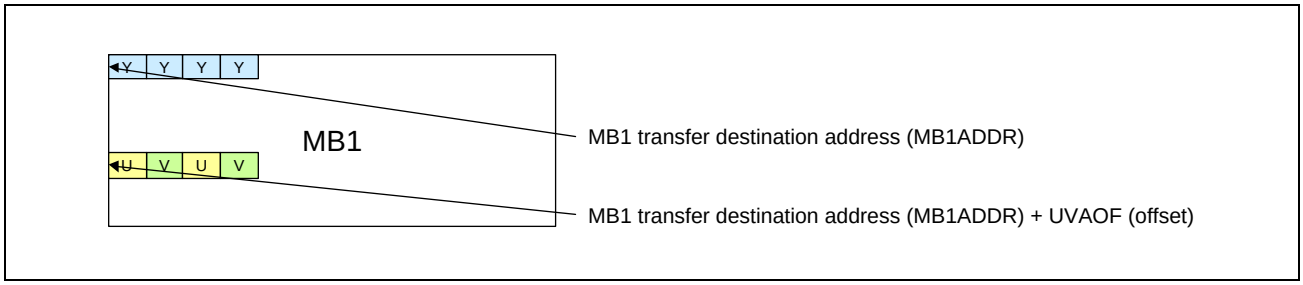

Figure 35.14 Data Storage (YUV is Separated)

#### (c) When Only Y is Separated (ICnDMR.YCMODE[2:0] = 011b)

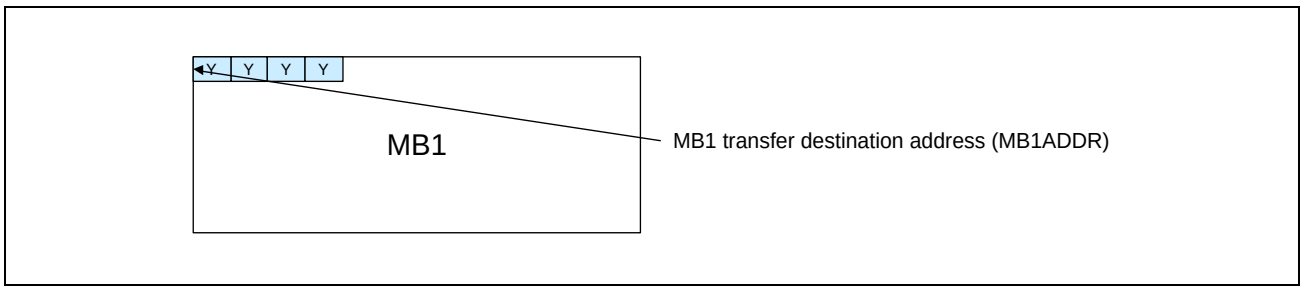

Figure 35.15 Data Storage (Only Y is Separated)

### (3) Statistics Data Transfer Destination Address (Statistics Data Storage Destination)

The results of statistics processing are transferred from the statistics data bus to external memory. The external transfer destination start address is determined by AMnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH.

The number of planes of the memory bank is determined by AMnSDMBVALID. The transfer start address (statistics data storage destination) is determined by the MnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH registers.

The valid AMnSDMB1ADDR, AMnSDMB2ADDR, …registers are switched by AMnSDMBVALID.

#### (a) AMnSDMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Order of transfer destinations: SDMB1 → SDMB2 → … → SDMB8 → SDMB1 → SDMB2 → …

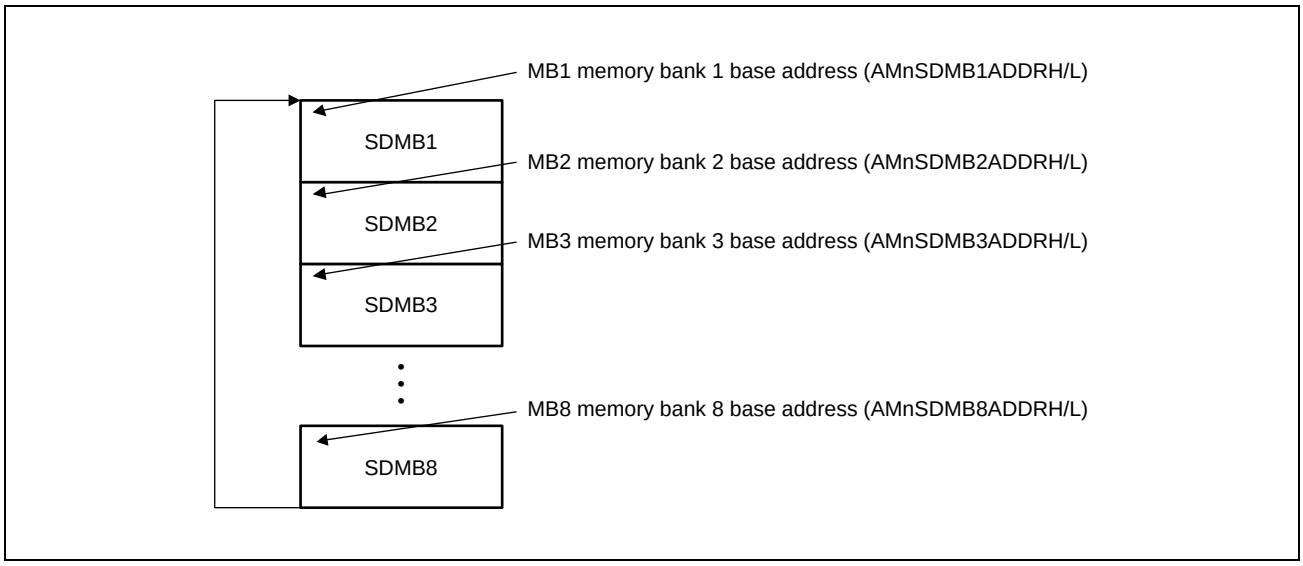

Figure 35.16 Image of Memory Bank (Eight Transfer Destinations)

### (4) Processing of the Last Line in a Frame

Note that data is written to the end of the frame (32 bytes × number of AXI bursts specified by the AXILEN[3:0] bits in the AMnAXIATTR register). Because overrun data is written for a frame, ignore it. Set the start address taking this into consideration.

The figure below shows the case of full HD YUV422.

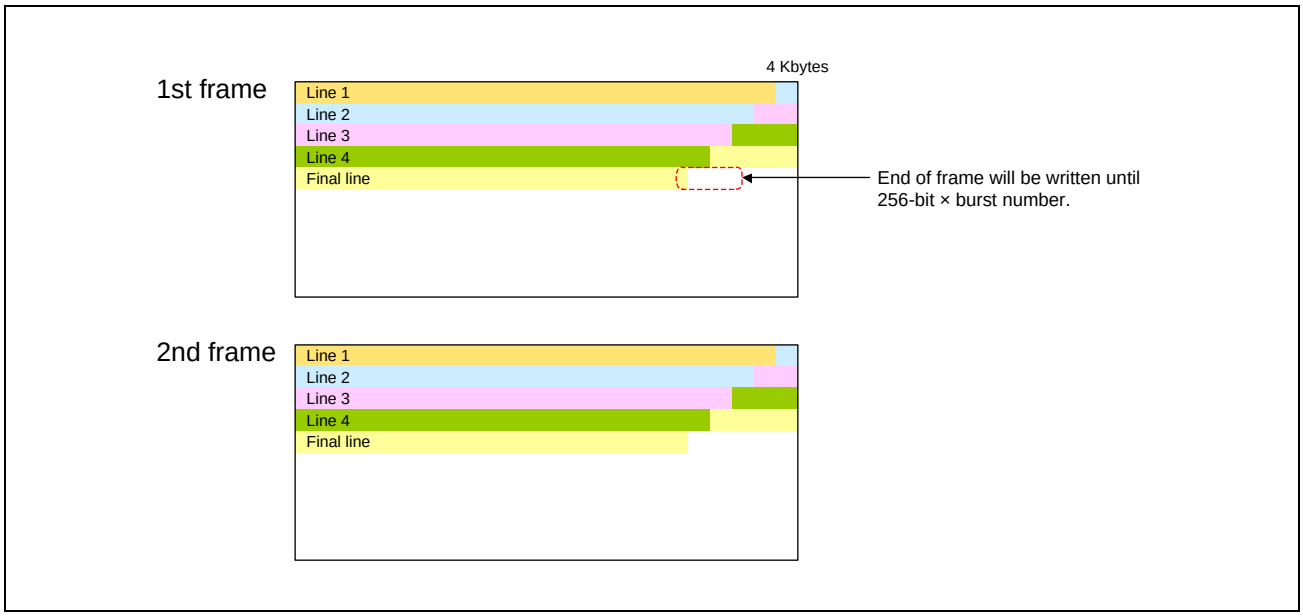

Figure 35.17 Data Storage

#### 35.2.4.4 RGB565/RGB666 to RGB888

RGB565 and RGB666 inputs are converted to RGB888 as shown in **Table 35.13**.

Table 35.13 Conversion Table from RGB565/RGB666 to RGB888

| RGB565 | RGB888 |
|---|---|
| R[4:0] | {R[4:0], R[4:2]} |
| G[5:0] | {G[5:0], G[5:4]} |
| B[4:0] | {B[4:0], B[4:2]} |

| RGB666 | RGB888 |
|---|---|
| R[5:0] | {R[5:0], R[5:4]} |
| G[5:0] | {G[5:0], G[5:4]} |
| B[5:0] | {B[5:0], B[5:4]} |

#### 35.2.4.5 MIPI CSI-2 Recommended Storage Format

In the output format, there are data types that can be output in MIPI CSI-2 Recommended Memory Storage Format.

This format packs the received data in byte units and outputs them.

The data is packed according to the method specified for each Data Type in the MIPI CSI-2 standard, so please refer to the standard for details such as bit positions.

(1) Mode Setting

This mode can be supported by setting the ICnMC register as follows.
ICnMC.LUTTHR = 1
ICnMC.DEMTHR = 1
ICnMC.LMXTHR = 1
ICnMC.CSCTHR = 1
ICnMC.CLPTHR = 1

(2) Supported Data Types

See to **Table 35.10** for supported datatypes.

#### 35.2.4.6 Image Clipping

This function clips the input image to the range specified by registers. Specify the clipping range by setting the following registers.

(Horizontal direction)

- Image clipping start pixel register: ICnSPPrC.SPPrC[11:0]
- Image clipping end pixel register: ICnEPPrC.EPPrC[11:0]

(Vertical direction)

- Image clipping start line register: ICnSLPrC.SLPrC[11:0]
- Image clipping end line register: ICnELPrC.ELPrC[11:0]

While the image clipped to the size which is indicated in grey is being processed, the AV bit of the ICnMS register is set to 1. If any other part of the image is being processed, the AV bit of the ICnMS register is set to 0. An image is clipped in the same way even if the image is subsampled.

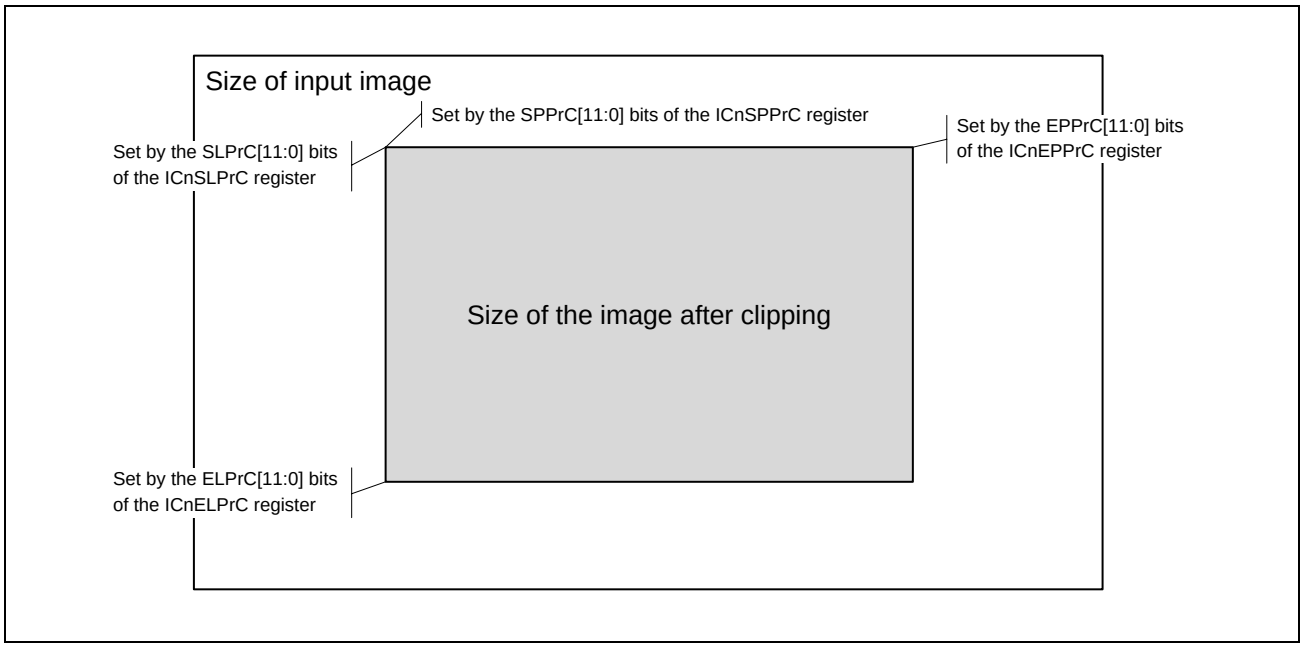

Figure 35.18 Image Clipping

### 35.2.4.7 Frame Subsampling

This function subsamples the input image by setting a register. Set the following register to specify the reduced frequency of transmission (once every × frames).

- Frame subsampling control register: ICnDEC.FRMDEC[3:0]

The following shows the operation when ICnDEC.FRMDEC[3:0] is set to 2.

The image is sampled every (register value + 1) frames. ICnMS.CA is set to 1 when a non-subsampled image is being processed.

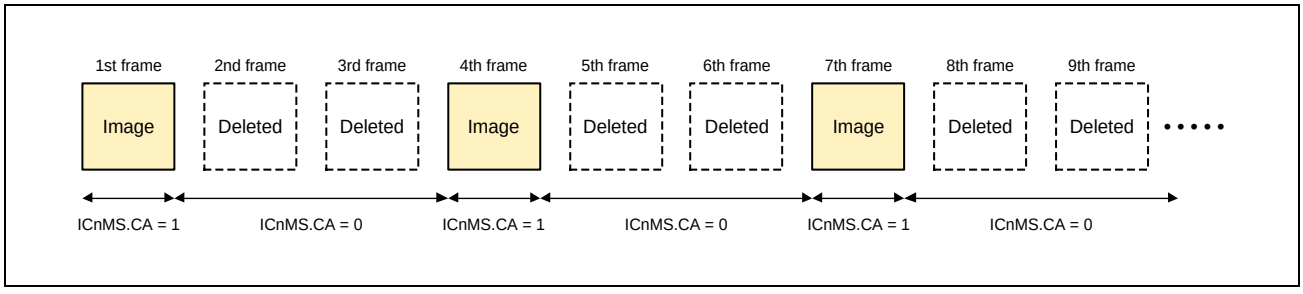

Figure 35.19 Frame Subsampling When ICnDEC.FRMDEC[3:0] is Set to 2 (Progressive)

### 35.2.4.8 Demosaicing

This function is only valid on input data of the RAW type. Its operation is on the assumption that the RAW data input from MIPI-CSI-2 are Bayer data and generates pixel data that are interpolated from the RAW data.

The demosaicing function uses a bilinear method. The 2×2 pixels surrounding the calculation target position are used to linearly interpolate the luminance. The interpolation formula is shown below. The edges of the image are processed by mirroring as follows.

The following describes the method of calculating the RGB components (R22, Gb22/Gr22, B22) of the pixels at the center position.

In the case of RAW10/12, the eight higher-order bits are used for the calculation.

#### (1) Calculating the Gb22 data portion

**Figure 35.20** shows the method of interpolation calculation for pixel data (R/G/B) of Gb22.

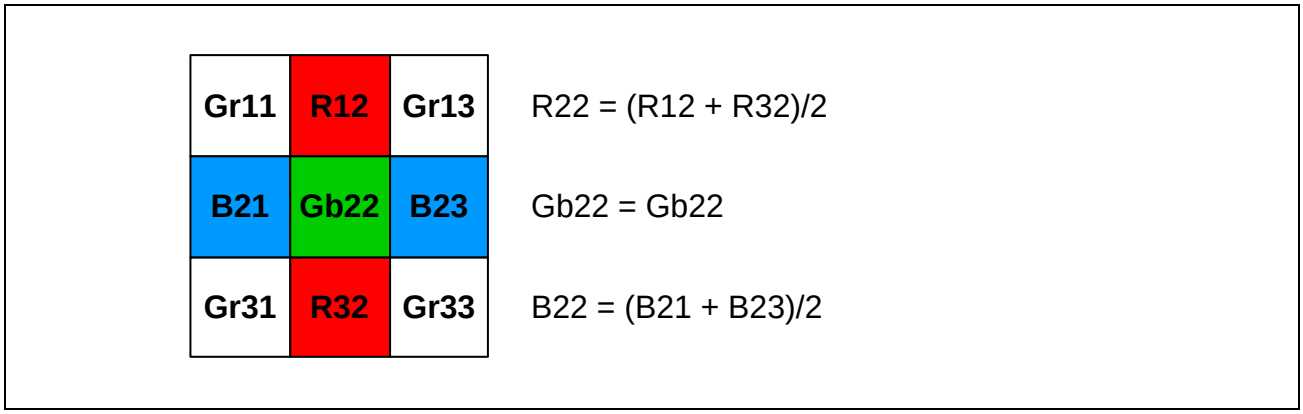

Figure 35.20 Calculation of the Gb22 Data

#### (2) Calculating the B22 data portion

**Figure 35.21** shows the method of interpolation calculation for pixel data (R/G/B) of B22.

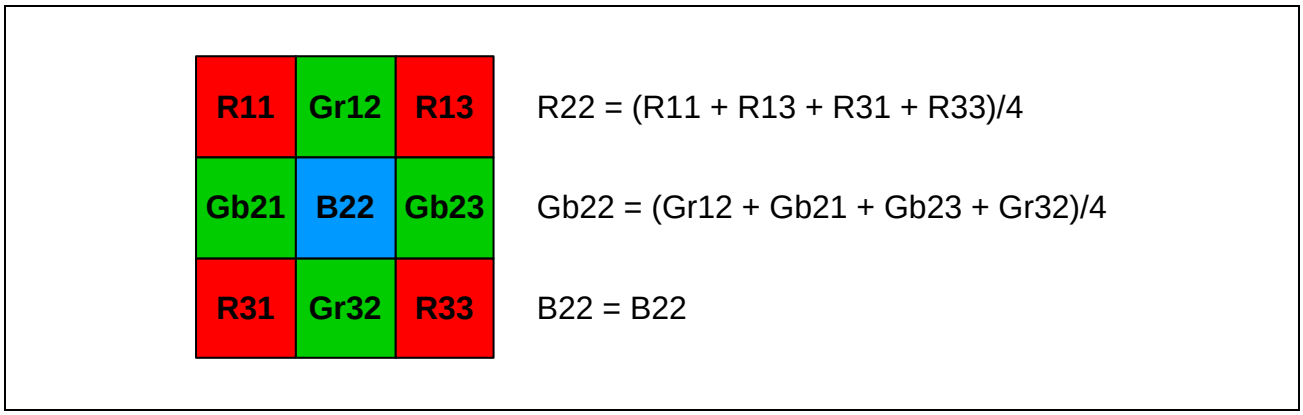

Figure 35.21 Calculation of the B22 Data Portion

### (3) Calculating the R22 data portion

**Figure 35.22** shows the method of interpolation calculation for pixel data (R/G/B) of R22.

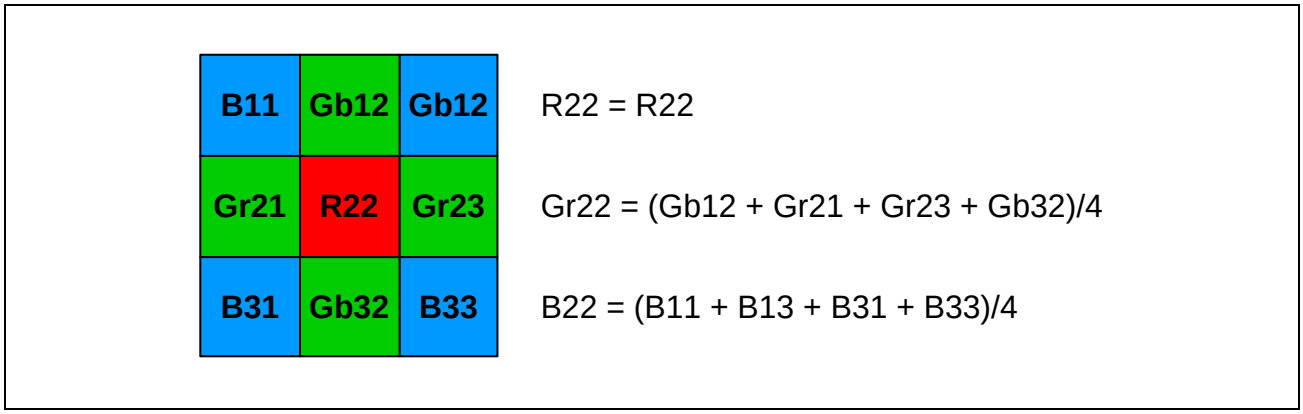

Figure 35.22 Calculation of the R22 Data Portion

### (4) Calculating the Gr22 data portion

**Figure 35.23** shows the method of interpolation calculation for pixel data (R/G/B) of G22.

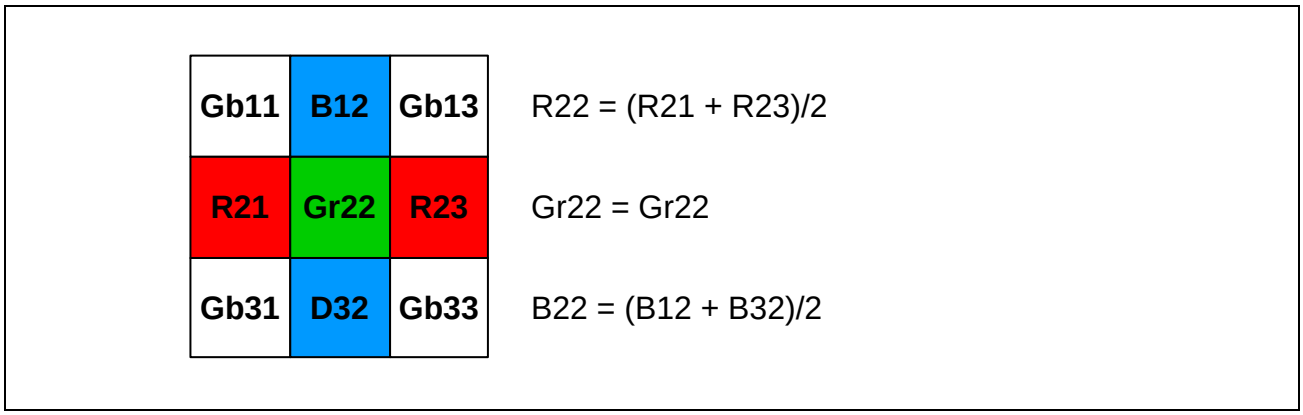

Figure 35.23 Calculation of the Gr22 Data Portion

### 35.2.4.9 Linear Matrix

Linear matrix processing involves calculation of the matrix of R', G', and B' (8 bits per color) by using the registers listed below to set the following coefficients for R, G, and B (8 bits per color) after demosaicing as the previous stage.

Gof = Register ICnLMXOF.GOF[7:0]
Rof = Register ICnLMXOF.ROF[7:0]
Bof = Register ICnLMXOF.BOF[7:0]

Rr = Register ICnLMXRC1.RR[12:0]
Rb = Register ICnLMXRC2.RB[12:0]
Rg = Register ICnLMXRC2.RG[12:0]

Gr = Register ICnLMXGC1.GR[12:0]
Gb = Register ICnLMXGC2.GB[12:0]
Gg = Register ICnLMXGC2.GG[12:0]

Br = Register ICnLMXBC1.BR[12:0]
Bb = Register ICnLMXBC2.BB[12:0]
Bg = Register ICnLMXBC2.BG[12:0]

$$R' = \frac{Rr \cdot (R + Rof)^{*1} + Rg \cdot (G + Gof)^{*1} + Rb \cdot (B + Bof)^{*1}}{1024}$$

$$G' = \frac{Gr \cdot (R + Rof)^{*1} + Gg \cdot (G + Gof)^{*1} + Gb \cdot (B + Bof)^{*1}}{1024}$$

$$B' = \frac{Br \cdot (R + Rof)^{*1} + Bg \cdot (G + Gof)^{*1} + Bb \cdot (B + Bof)^{*1}}{1024}$$

**Note 1.** When the result of addition is a negative value, it is converted to 0.

### 35.2.4.10 Data Arrange

This function converts the negative expression of UV in the YUV (YCbC) data when inputting and outputting image data. The Data Arrange1 input side is set by the IBINSEL bit of the ICnMC register, and the Data Arrange2 output side is set by the OBINSEL bit of the ICnDMR register.

Set Data Arrange1 according to the sensor specifications. Data Arrange1 supports 8 or 10 bits depending on the number of bits of input data. Set Data Arrange2 according to the specifications used by the output destination. Data Arrange2 supports 8 bits depending on the output data. YUV of the MIPI CSI-2 module is usually used in offset binary. It may be output in two's complement depending on the sensor used.

**Table 35.14** shows an example of processing when the input is 8 bits.

Data Arrange1 also has 10-bit input, and when 10-bit input is used, it can be converted to 10-bit offset binary/2's complement as well as 8-bit.

Table 35.14 Input Format and Image Processing

| UV Value (Hex) | Offset Binary (Dec)<br>Register Settings:<br>DataArrange1: ICnMC.IBINSEL = 0<br>DataArrange2: ICnDMR. OBINSEL = 0 | Two's Complement (Dec)<br>Register Settings:<br>DataArrange1: ICnMC.IBINSEL = 1<br>DataArrange2: ICnDMR. OBINSEL = 1 |
|---|---|---|
| H'FF | 127 | −1 |
| H'FE | 126 | −2 |
| . . . | . . . | ... |
| H'81 | 1 | −127 |
| H'80 | 0 | −128 |
| H'7F | −1 | 127 |
| . . . | ... | ... |
| H'01 | −127 | 1 |
| H'00 | −128 | 0 |

### 35.2.4.11 Data Clipping

Data in the YCbCr (YUV) format is clipped. To make the input data to be RGB-converted comply with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240 for YCbCr-8bit and below 64 and above 960 for YCbCr-10bit. Data clipping can be set by the CLP[1:0] bits in the ICnMC register. (See **Section 35.2.3.58**.)

### 35.2.4.12 Color Space Conversion

#### (1) RGB to YCbCr

The RGB data (8 or 10 bits) which is image-clipped, frame-subsampled, or demosaiced is extended to 12 bits, and then is converted into YCbCr (10 bits). By setting coefficients in registers, perform calculations equivalent to ITU-R BT.601 and ITU-R BT.709.

Perform calculations according to the coefficients and formulas specified by the following registers:

YCLRP = ICnYCCR1.YCLRP[12:0]
YCLBP = ICnYCCR2.YCLBP[12:0]
YCLGP = ICnYCCR2.YCLGP[12:0]
YCLSFT = ICnYCCR3.YCLSFT[4:0]
YCLAP = ICnYCCR3.YCLAP[11:0]

CBCLRP = ICnCBCCR1.CBCLRP[12:0]
CBCLBP = ICnCBCCR2.CBCLBP[12:0]
CBCLGP = ICnCBCCR2.CBCLGP[12:0]
CBCLSFT = ICnCBCCR3.CBCLSFT[4:0]
CBCLAP = ICnCBCCR3.CBCLAP[11:0]

CRCLRP = ICnCRCCR1.CRCLRP[12:0]
CRCLBP = ICnCRCCR2.CRCLBP[12:0]
CRCLGP = ICnCRCCR2.CRCLGP[12:0]
CRCLSFT = ICnCRCCR3.CRCLSFT[4:0]
CRCLAP = ICnCRCCR3.CRCLAP[11:0]

$Y = ((YCLRP \times R + YCLGP \times G + YCLBP \times B) / 2^{YCLSFT}) + YCLAP$
$Cb = ((CBCLRP \times R + CBCLGP \times G + CBCLBP \times B) / 2^{CBCLSFT}) + CBCLAP$
$Cr = ((CRCLRP \times R + CRCLGP \times G + CRCLBP \times B) / 2^{CRCLSFT}) + CRCLAP$

In the case of ITU-R BT.601 (8 bits) (same as defaults):

$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$
$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$
$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$

Register Settings:

YCLRP = H’0107
YCLBP = H’0064
YCLGP = H’0204
YCLSFT = H’0A
YCLAP = H’100

CBCLRP = H’1F68
CBCLBP = H’01C2
CBCLGP = H’1ED6
CBCLSFT = H’0A
CBCLAP = H’800

CRCLRP = H’01C2
CRCLBP = H’1FB7
CRCLGP = H’1E87
CRCLSFT = H’0A
CRCLAP = H’800

### (2) YCbCr to RGB

The YCbCr data (8 or 10 bits) which is data-arranged and data-clipped is extended to 12 bits (the extension method: 0 added to lower bits), and then is converted into RGB (10 bits). By setting coefficients in registers, perform calculations equivalent to ITU-R BT.601 and ITU-R BT.709. Perform calculations according to the coefficients and formulas specified by the following registers:

YMUL = ICnCSCC1.YMUL[13:0]
YSUB = ICnCSCC2.YSUB[11:0]
RCRMUL = ICnCSCC2.CSUB[11:0]
GCRMUL = ICnCSCC3.RCRMUL[13:0]
GCBMUL = ICnCSCC3.GCRMUL[13:0]
BCBMUL = ICnCSCC4.GCBMUL[13:0]
CSUB = ICnCSCC4.BCBMUL[13:0]

$$R = \frac{YMUL \times (Y - YSUB)^{*1} + RCRMUL \times (Cr - CSUB)}{4096}$$

$$G = \frac{YMUL \times (Y - YSUB)^{*1} - GCRMUL \times (Cr - CSUB) - GCBMUL \times (Cb - CSUB)}{4096}$$

$$B = \frac{YMUL \times (Y - YSUB)^{*1} + BCBMUL \times (Cb - CSUB)}{4096}$$

**Note 1.** A negative value is rounded to 0.

In the case of ITU-R BT.601 (8 bits) (same as defaults):

R = 1.164 × (Y − 16) + 1.596 × (Cr − 128)
G = 1.164 × (Y − 16) − 0.813 × (Cr − 128) − 0.392 × (Cb − 128)
B = 1.164 × (Y − 16) + 2.017 × (Cb −128)

Register Settings:

YMUL = H’129F
YSUB = H’100
RCRMUL = H’1989
GCRMUL = H’0D02
GCBMUL = H’0645
BCBMUL = H’2045
CSUB = H’800

### 35.2.4.13 LUT (Lookup Table)

Used to convert 10-bit data after color space conversion (YCbCr to RGB or RGB to YCbCr) into 8-bit data.

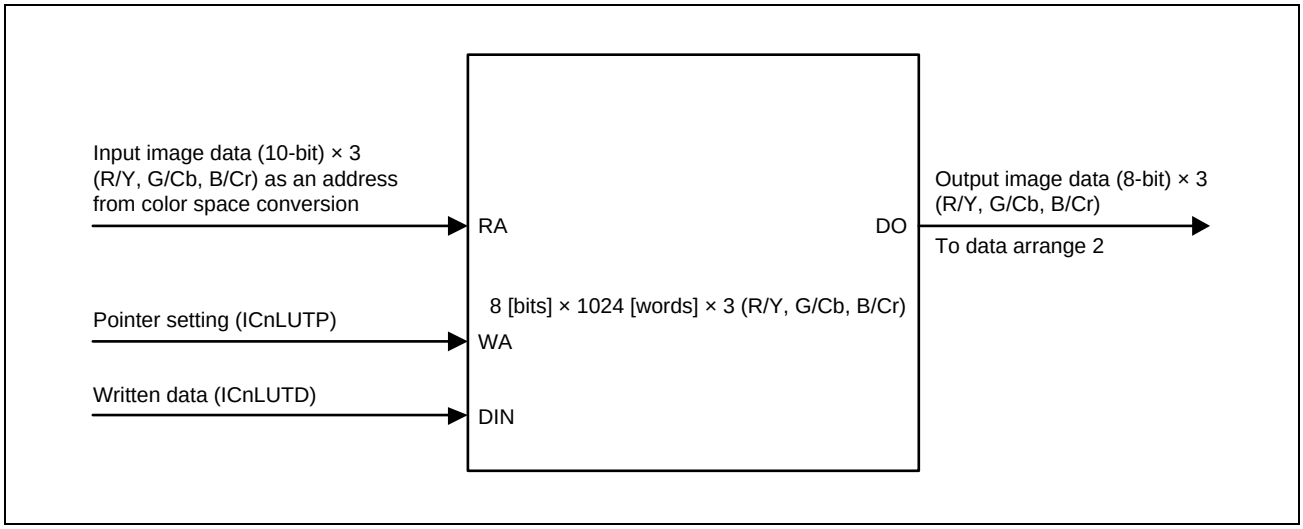

Figure 35.24 Lookup Table (LUT)

#### (1) Pointer Access

The pointer is incremented every time the ICnLUTD register is written.

The incremented value can be read from the ICnLUTP register. When the ICnLUTD register is read, the pointer is not incremented. The pointer must be set immediately before the register is read.

Follow the procedure below to access the lookup table. See **Section 35.3.1**.

The lookup table cannot be accessed from the CPU in normal mode.

#### (2) Lookup Table Usage Notes

1. Set the lookup table only after the CRU has stopped its operation.
2. Rewrite the entire lookup table before use because the initial values are not guaranteed after the power is turned on.
3. Data to be set in the lookup table must be restricted to the range that is compatible with the input bit width.

#### 35.2.4.14 YCbCr422 to 420

Data is skipped from YCbCR422 to produce YCbCr420. Averaging or any other calculations are not performed. This conversion can be set by the YCMODE[2:0] bits in the ICnDMR register. (See **Section 35.2.3.79**.)

#### 35.2.4.15 Y/C Separation / Only Y

Only Y can be separated or extracted from Y/C, and then can be stored in memory. For details, see **Section 35.2.4.3(2)**.

#### 35.2.4.16 Statistics

This function is limited to a RAW data input through SVC0 of CRU0/1. This module divides one image vertically and horizontally into blocks (see **Figure 35.25**). The statistical information within this block is transferred to memory and the image is adjusted by weighting the information of every block by the CPU and providing feedback to the external video state.

##### 1) In-block accumulation

Accumulation of each color component, R, G, and B, is performed within each block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for exposure control, etc. from the next frame.

The weighting could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the subject is judged to be dark, exposure control is applied to widen the aperture, and if the subject is judged to be bright, the aperture is made narrower.

Additionally, each color component among the R, G, and B components is adjusted and the latter stage performs operations in such a way that the B component is reduced, for example, in video which appears bluish in white regions.

This adjustment of each color includes changing the coefficients of the sensor or the linear matrix as the latter stage.

##### 2) In-block sum of absolute difference values

Focusing on the G component within the block, the overall value for the differences from the adjacent parts of the image is extracted and accumulation is performed within the block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for focus adjustment, etc. from the next frame.

The weighing could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the obtained evaluation value is compared with the previous frame and if the amount continues to be reduced, the evaluation value is increased to adjust the focus, for example, by adjusting the distance between the lens and the sensor toward the opposite direction.

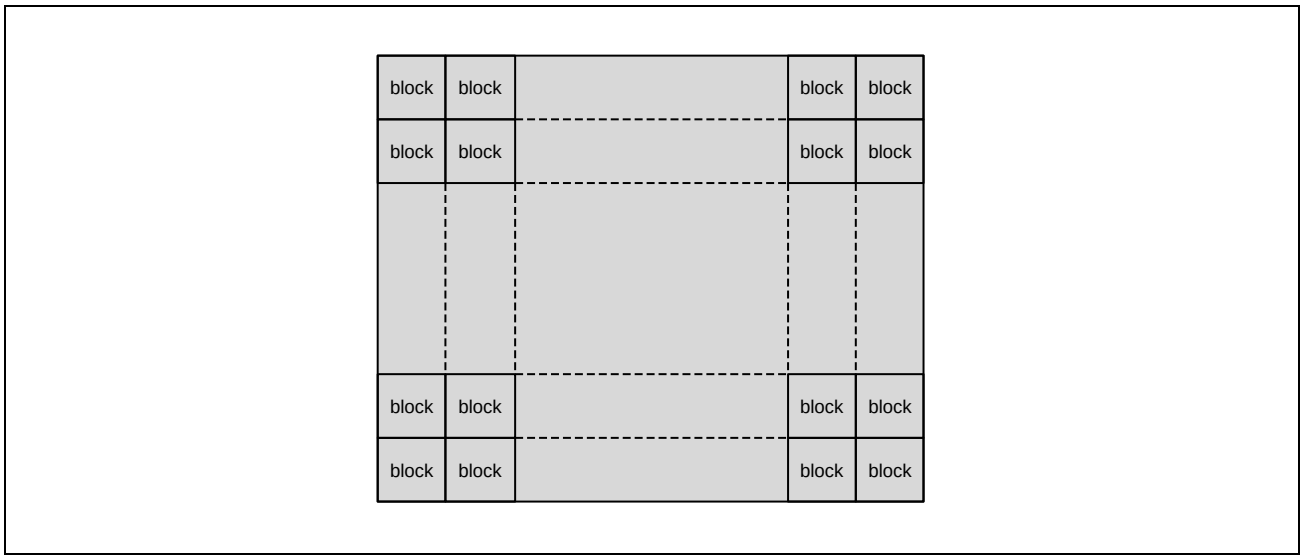

Figure 35.25 Image of Dividing an Image into Blocks Vertically and Horizontally

**Figure 35.26** is a block diagram of statistics. The result of AE/AWB statistical calculations for per block is 8 bits × 3 = 3 bytes, respectively, and that of the AF statistical calculations is 1 byte for G only, so a total of 4 bytes of data are output.

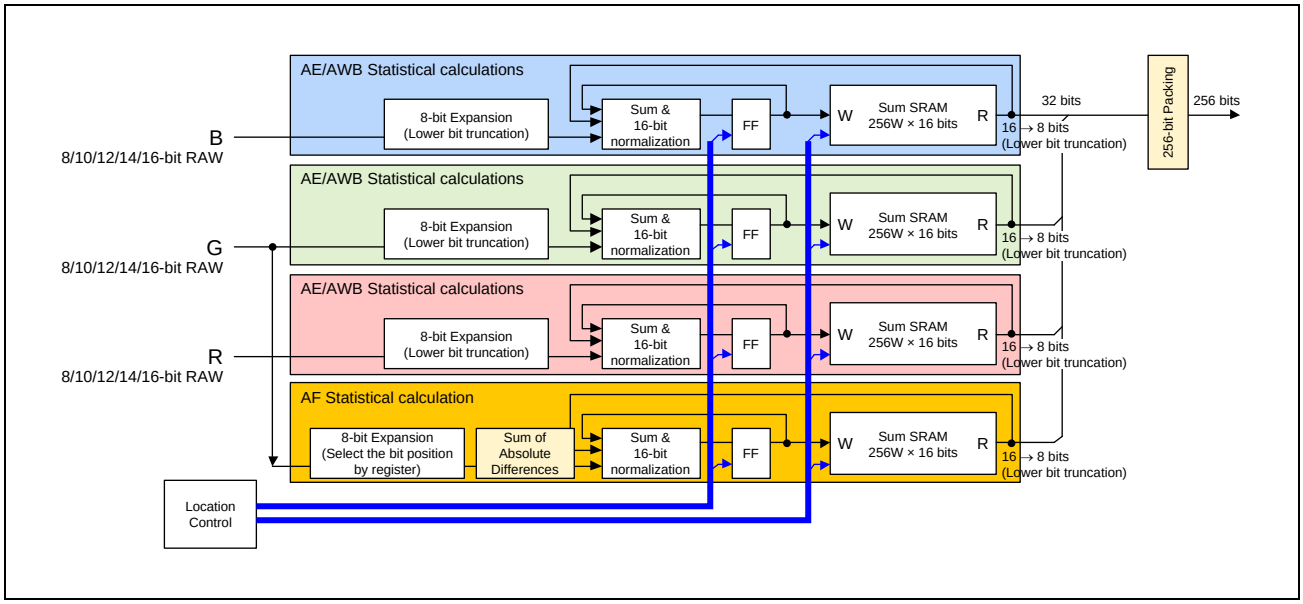

Figure 35.26 Statistics Block Diagram

### (1) RGB cumulative addition

The STUNIT[1:0] bit fields in each of the ICnSTIC1 registers are used to select the pixel (block) sizes for statistical calculations from among four values, 16×16, 32×32, 64×64, and 128×128. The target pixels when the setting is 16×16 are described in **(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)** and the methods of calculation for each block-size setting are described in **(b) Methods of calculation for each block-size setting**.

#### (a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)

G component: 128 pixels are present in the area of 16×16

R and B components: 32 pixels are present in the area of 16×16

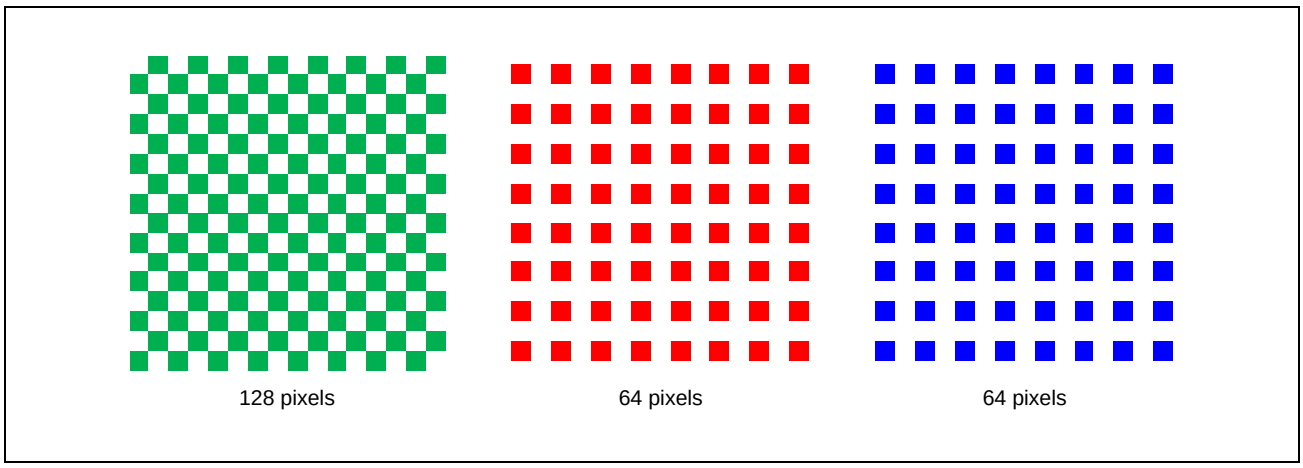

Figure 35.27 Target Pixels when the Block Size is Selected as 16×16

#### (b) Methods of calculation for each block-size setting

**[G component]**

- When the block size is 16×16: 8 bits × 128 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 512 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 2048 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: 8 bits × 8192 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

**[R and B components]**

- When the block size is 16×16: 8 bits × 64 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 256 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 1024 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

- When the block size is 128×128: 8 bits × 4096 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

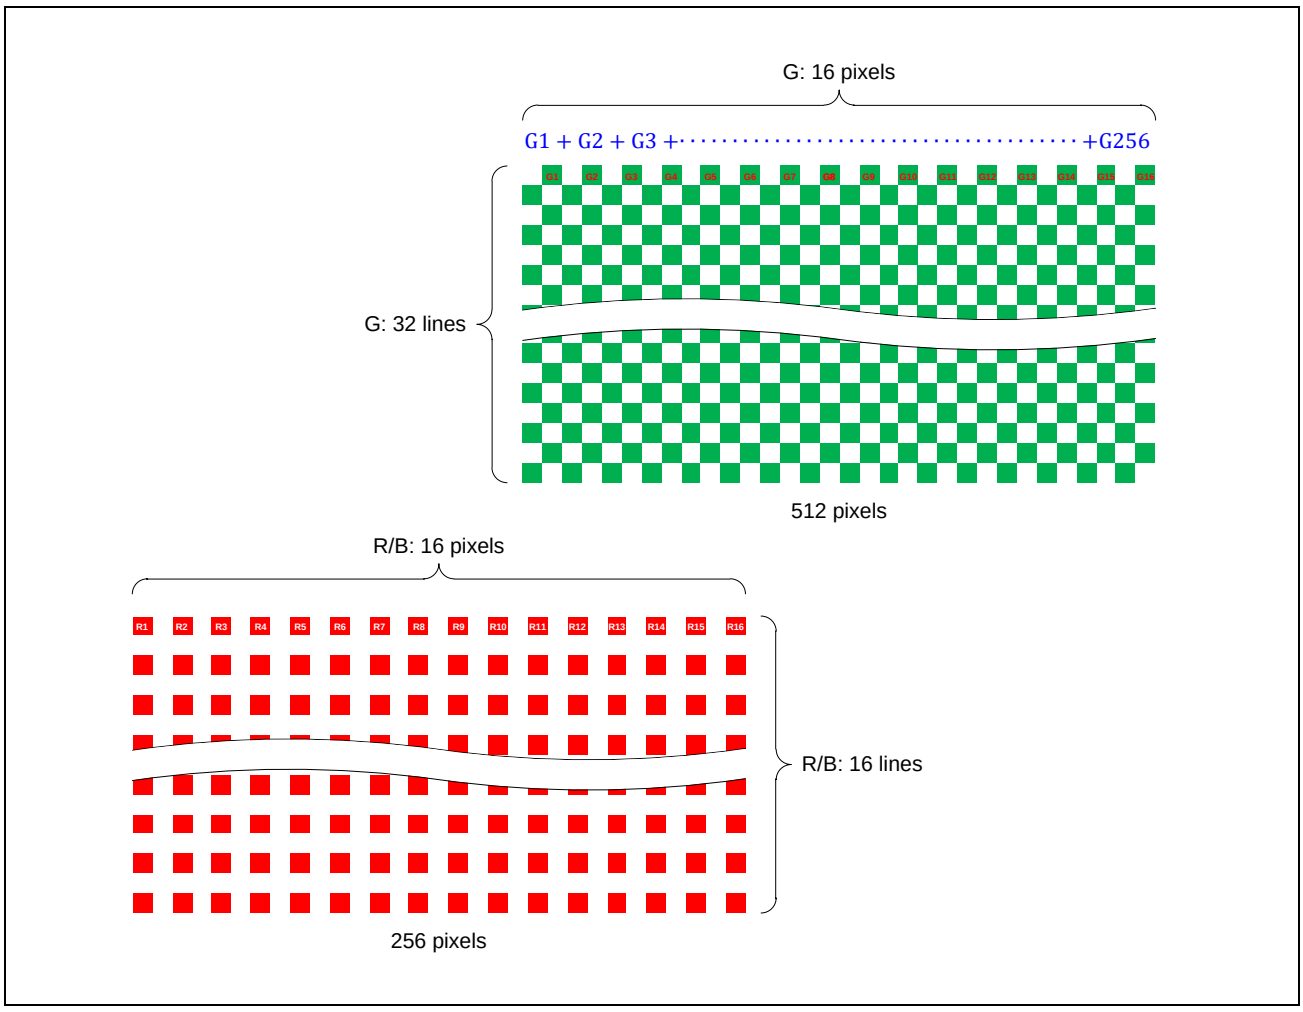

Figure 35.28 Illustration Diagram of Accumulation within the Block when the Block Size is 32×32

### (2) Sum of absolute values for adjacent pixels

Set the area for which the sum of absolute values for adjacent pixels is taken with the use of register ICnSTIC1.STUNIT[1:0] to make the calculations in the following ways.

- **In the case of 16×16 pixel unit operations (ICnSTIC1.STUNIT[1:0] = 0b):**
  - For 8-bit data: Up to 16 bits
  - For 10- to 16-bit data: A sum-of-absolute-differences (SAD) operation is performed with the eight higher-order bits (default).
  - Addition can also be performed with the eight lower-order bits by shifting the bits by setting register ICnSTIC1.STSADPOS[3:0].

- **Methods of calculation for the setting area:**

[G component calculation]

  - When the block size is 16×16: Adjacent differences × 112 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
  - When the block size is 32×32: Adjacent differences × 480 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
  - When the block size is 64×64: Adjacent differences × 1984 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
  - When the block size is 128×128: Adjacent differences × 8064 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

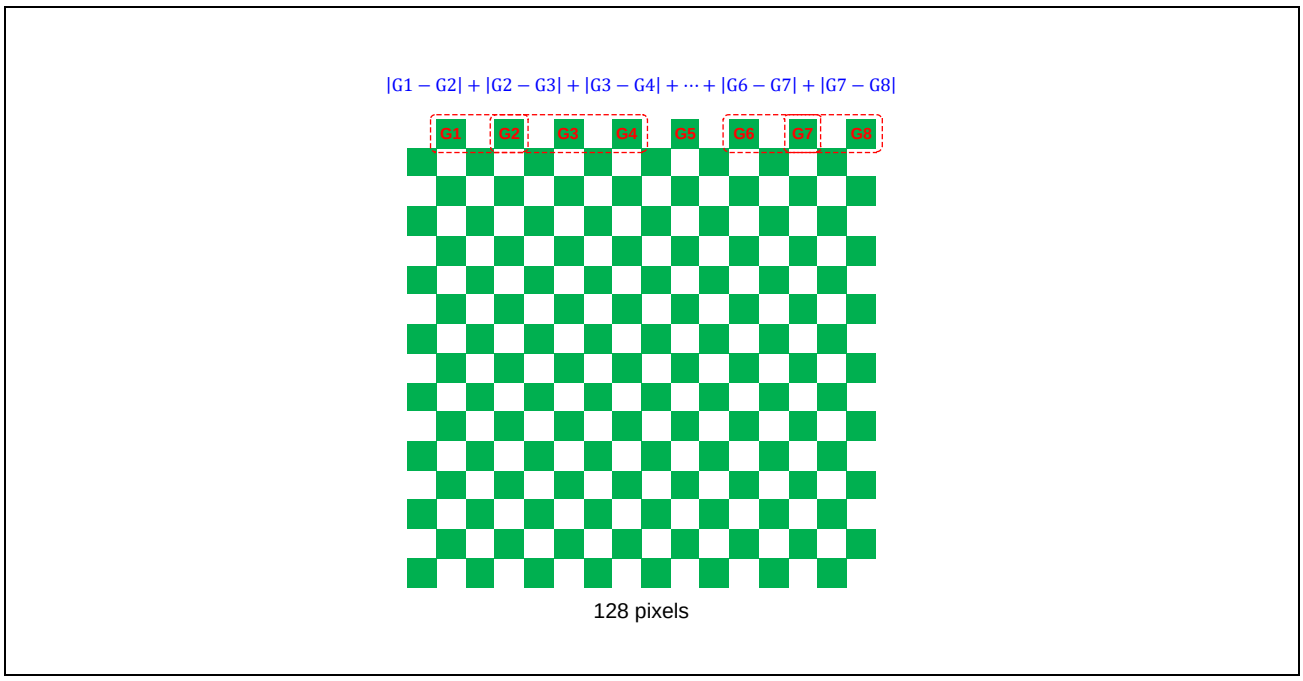

Figure 35.29 Illustration Diagram of Sum of Absolute Values for Adjacent Pixels when the Block Size is 16×16

### (3) Statistics data generated image

The following describes the amounts of data in the operations when a 1920×1080 pixel area is set as 16×16 blocks and as 128×128 blocks for the statistics function. The numerals in the figures below represent the block numbers. In processing of the right end or bottom of the image, if the input image size is greater than the size specified as the number of blocks in the horizontal direction, that difference does not fall within the target range for arithmetic processing. This also applies in the vertical direction.

● **In the case of operations for a 1920×1080 pixel area as 16×16 blocks:**

As shown in **Figure 35.30**, the calculated values for each of the blocks are transferred sequentially. A total of 31 Kbytes of data are transferred for one frame. For the format of data for transmission, see **Table 35.12**.

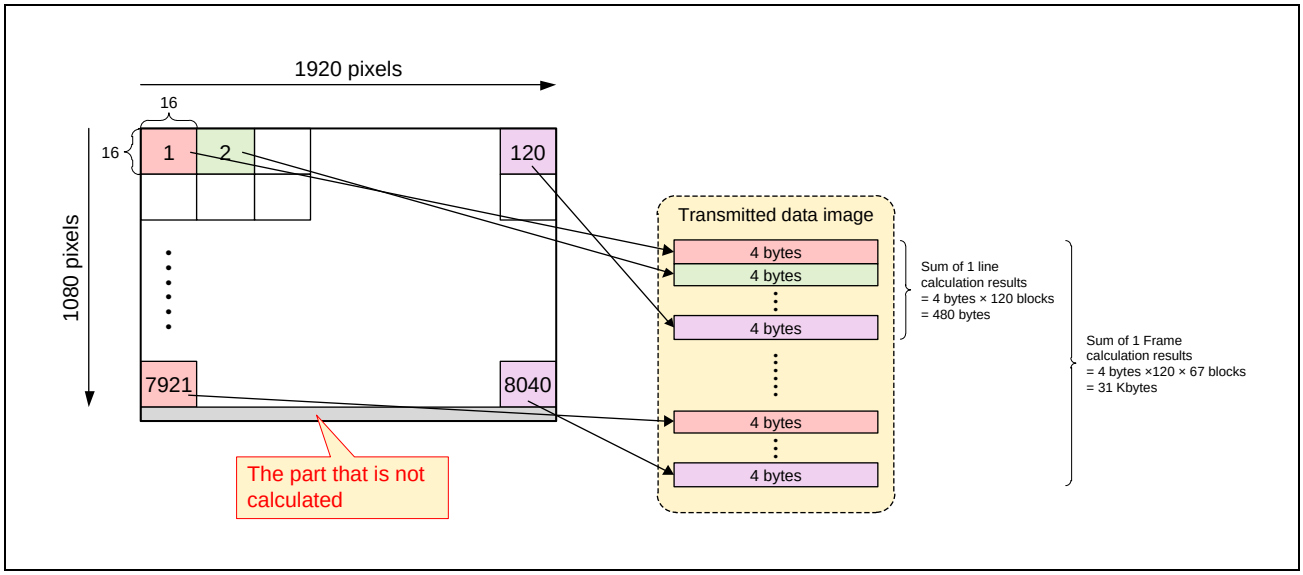

Figure 35.30 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

● **In the case of operations for a 1920×1080 pixel area as 128×128 blocks:**

The calculated values for the corresponding blocks are sequentially transferred. A total of 480 bytes of data are transferred for one frame.

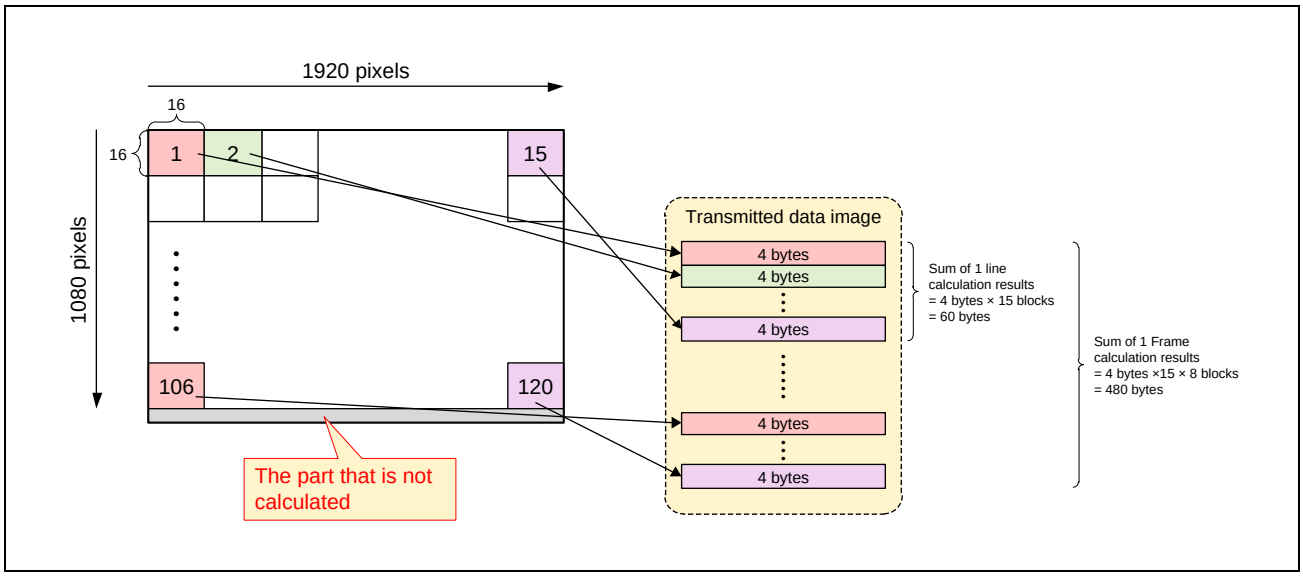

Figure 35.31 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

### (4) Horizontal pixels exceed 2048

Statistics can only detect up to 2048 pixels horizontally. If horizontal pixel exceeds 2048 pixels, the offset setting (ICnSTIC2.STHPOS[8:0]) can be used to detect the center pixel and calculate Statistics.

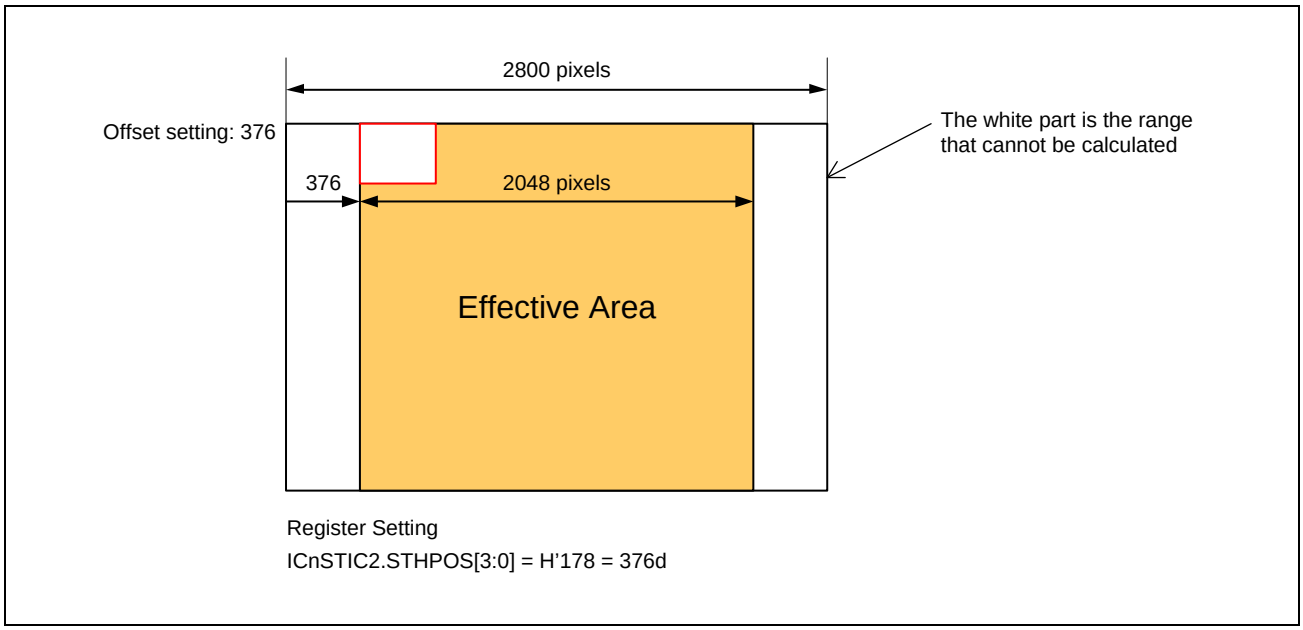

Figure 35.32 Statistics Calculation Example at 2800 Pixels Width

### 35.2.4.17 Pattern Generator (for Debugging)

A test image (YUV422 only) can be generated for use as an MIPI CSI-2 input by setting the following registers. This function is used for debugging to identify where the problem is originated (in the sensor or in the internal settings). Two modes are implemented for this pattern (monochrome or pattern). See **Section 35.3** for the setting procedure.

TIEN = ICnTICTRL1.TIEN: Enables generation of a test image pattern.
TIMODE = ICnTICTRL1.TIMODE: Selects a test image generation pattern (monochrome or pattern).

TIPTNY1[3:0] = ICnTICTRL1.TIPTNY1[3:0]: Bit settings for the pixel (Y) counter.
TIPTNU1[3:0] = ICnTICTRL1.TIPTNU1[3:0]: Bit settings for the pixel (U) counter.
TIPTNV1[3:0] = ICnTICTRL1.TIPTNV1[3:0]: Bit settings for the pixel (V) counter.

TIRATE[4:0] = ICnTICTRL1.TIRATE[4:0]: Specify a test image generation rate.

TIPTNY2[7:0] = ICnTICTRL2.TIPTNY2[7:0]: Specify Y for the entire-screen same-color test image pattern.
TIPTNU2[7:0] = ICnTICTRL2.TIPTNU2[7:0]: Specify U for the entire-screen same-color test image pattern.
TIPTNV2[7:0] = ICnTICTRL2.TIPTNV2[7:0]: Specify V for the entire-screen same-color test image pattern.

TIPPL[11:0] = ICnTISIZE1.TIPPL[11:0]: Number of valid pixels per line in the test image pattern.
TIN[11:0] = ICnTISIZE2.TIN[11:0]: Valid period (number of lines) per frame in the test image pattern.
TIM[11:0] = ICnTISIZE2.TIM[11:0]: Invalid period (number of lines) per frame in the test image pattern.

#### (1) Image and Settings (Common to Monochrome and Pattern Generation)

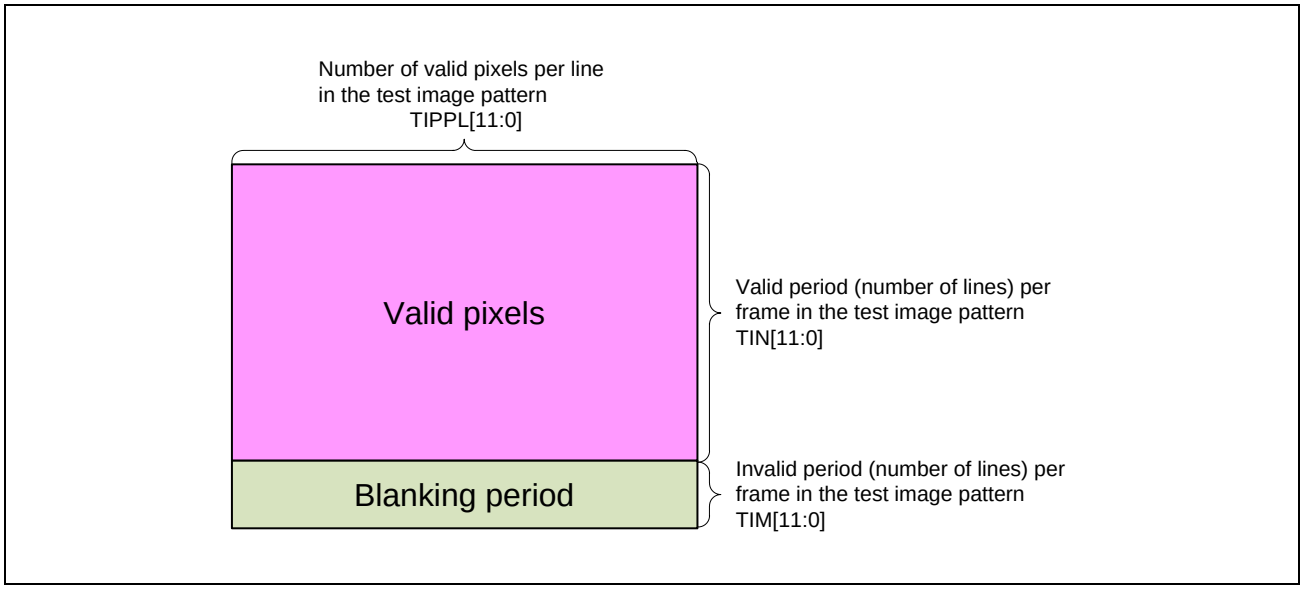

Figure 35.33 Image and Settings

### (2) Timing Generation and Settings (Common to Monochrome and Pattern Generation)

(Bits TIRATE[4:0] allow the test image generation rate to be set in the range between 3.783 Gbps and 1.390 Gbps.)

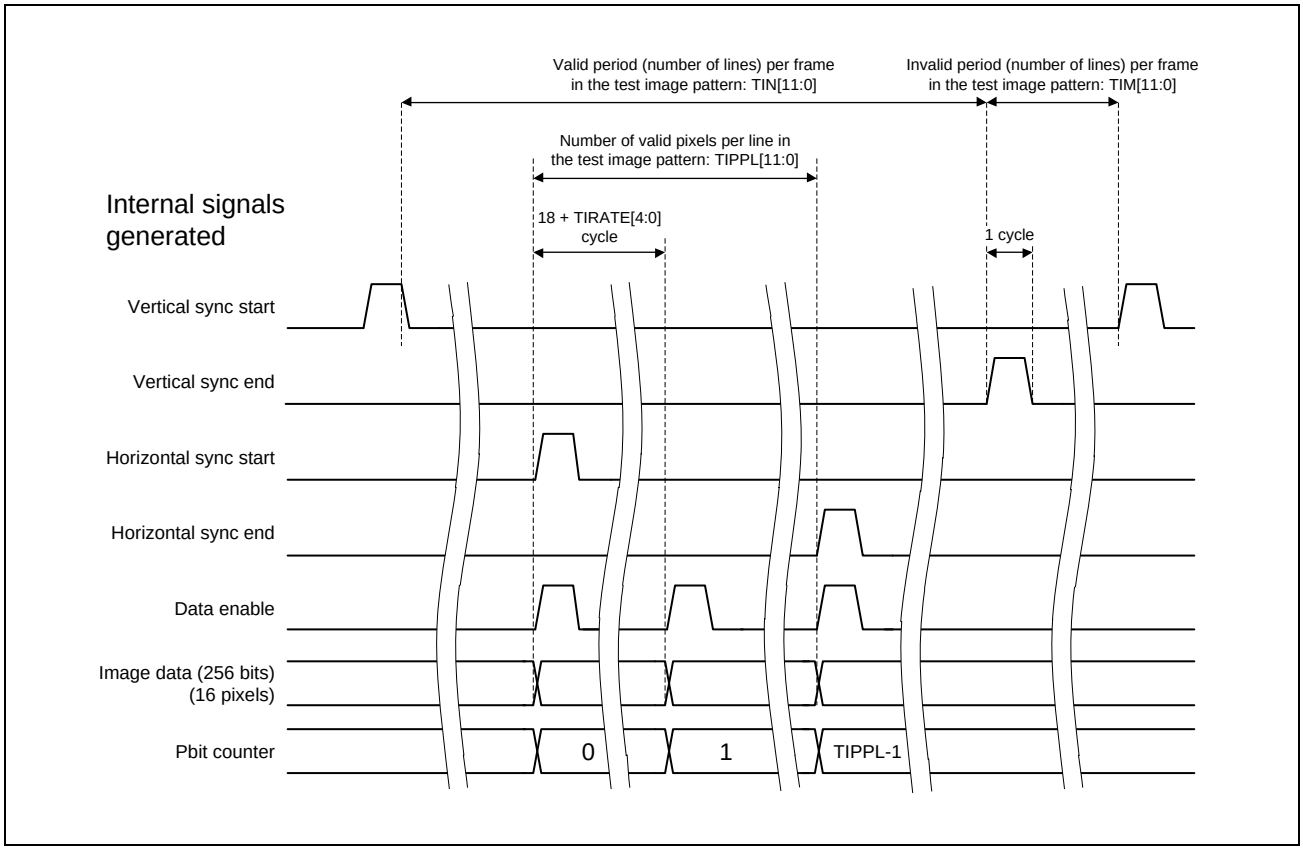

Figure 35.34 Timing Generation and Settings

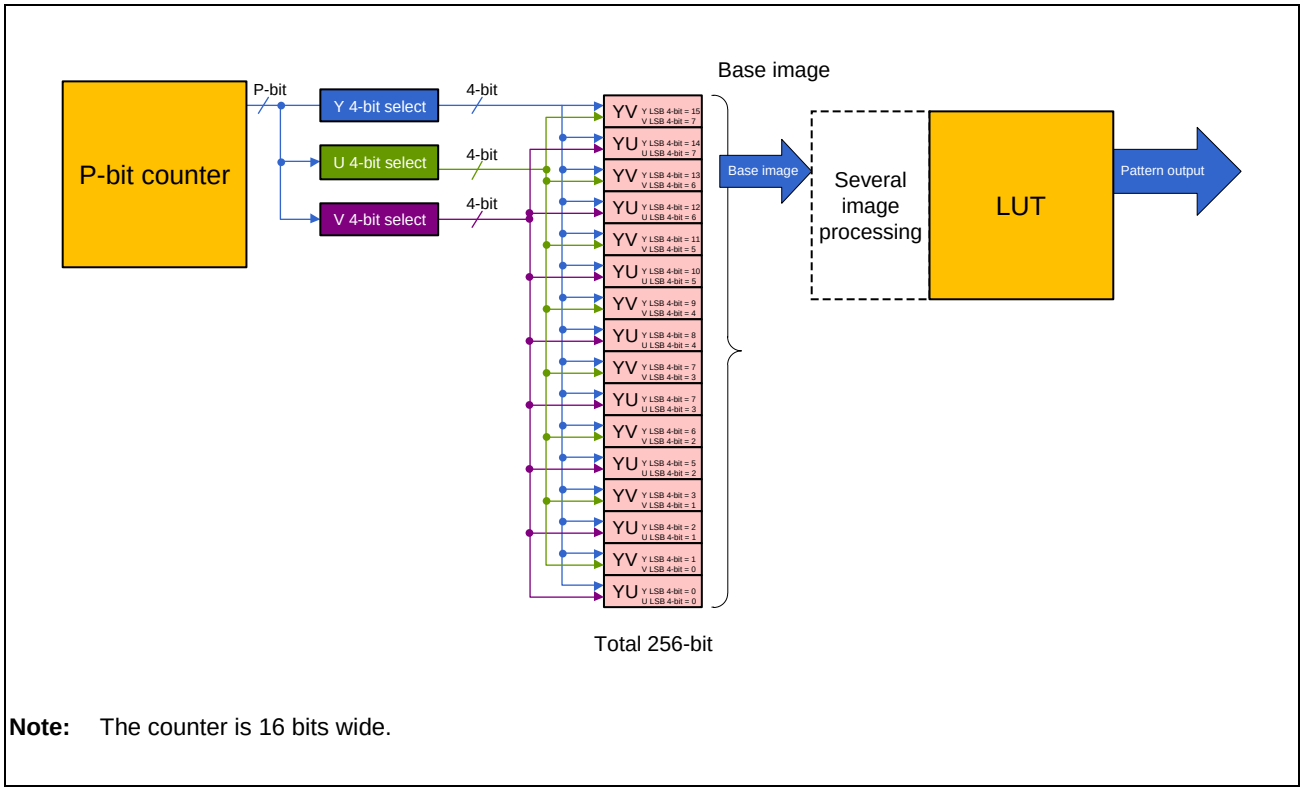
### (3) Data Generation Circuit (in the Case of Pattern Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated as follows (other formats cannot be generated). The 16-bit Pbit counter is incremented in 18 + TIRATE[4:0] (cycles at 266 MHz). The bits of this Pbit counter are selected by the TIPTNV1[3:0], TIPTNU1[3:0], and TIPTNY1[3:0] bits, and then they are packed and sent as follows:



**Note:** The counter is 16 bits wide.

Figure 35.35 Data Generation Circuit (in the Case of Pattern Generation)

### (4) Data Generation Circuit (in the Case of Monochrome Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated in monochrome as follows (other formats cannot be generated). The values set by the TIPTNV2[7:0], TIPTNU2[7:0], and TIPTNY2[7:0] bits are packed and sent as follows:

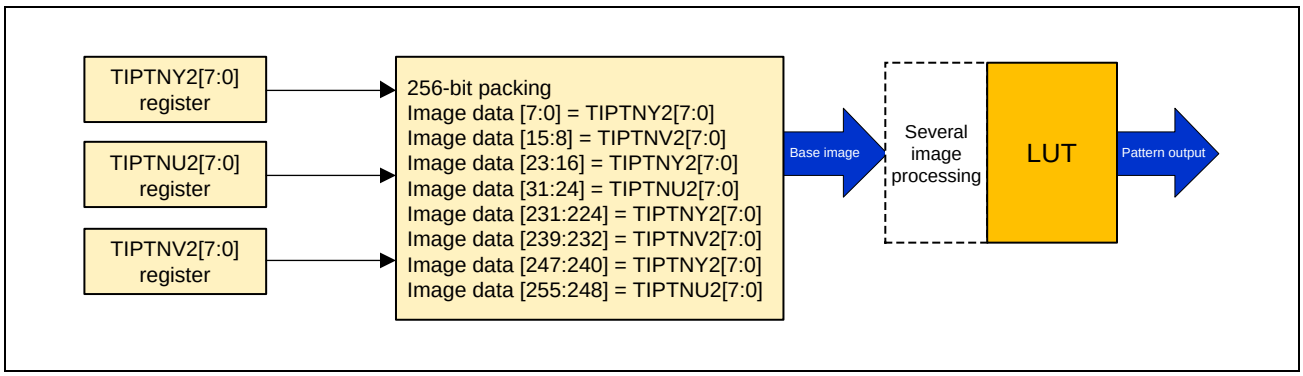


Figure 35.36 Data Generation Circuit (in the Case of Monochrome Generation)

### (5) Generated Image Data Example (in the Case of Pattern Generation)

VGA (640x480): TIEN = 1b, TIMODE = 0b, TIPTNY1[3:0] = 0000b, TIPTNU1[3:0] = 0100b, TIPTNV1[3:0] = 1000b (Offset binary: ICnMC.IBINSEL = 0, ICnDMR.OBINSEL = 0)

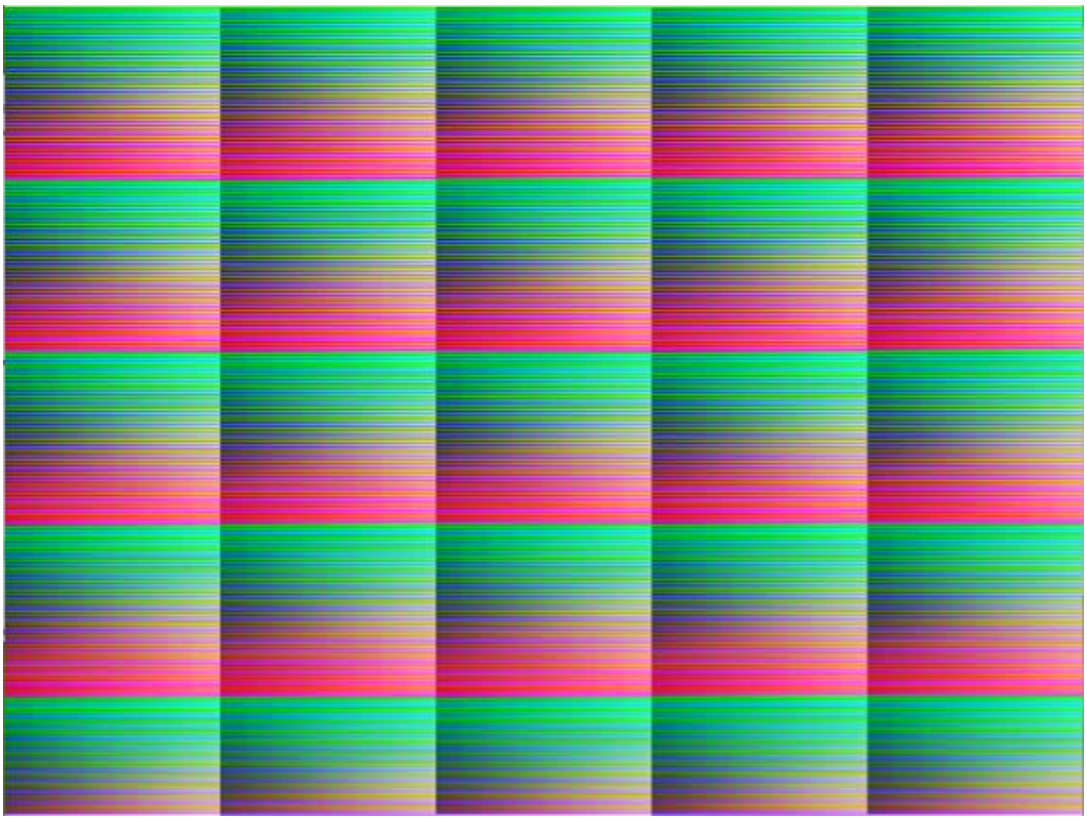

Figure 35.37 Generated Image Data Example (in the Case of Pattern Generation)

### (6) Generated Image Data Example (in the Case of Monochrome Generation)

VGA (640x480): TIEN = 1b, TIMODE = 1b, TIPTNY2[7:0] = H’52, TIPTNU2[7:0] = H’5A, TIPTNV2[3:0] = H’F0
(Offset binary: ICnMC.IBINSEL = 0, ICnDMR.OBINSEL = 0)

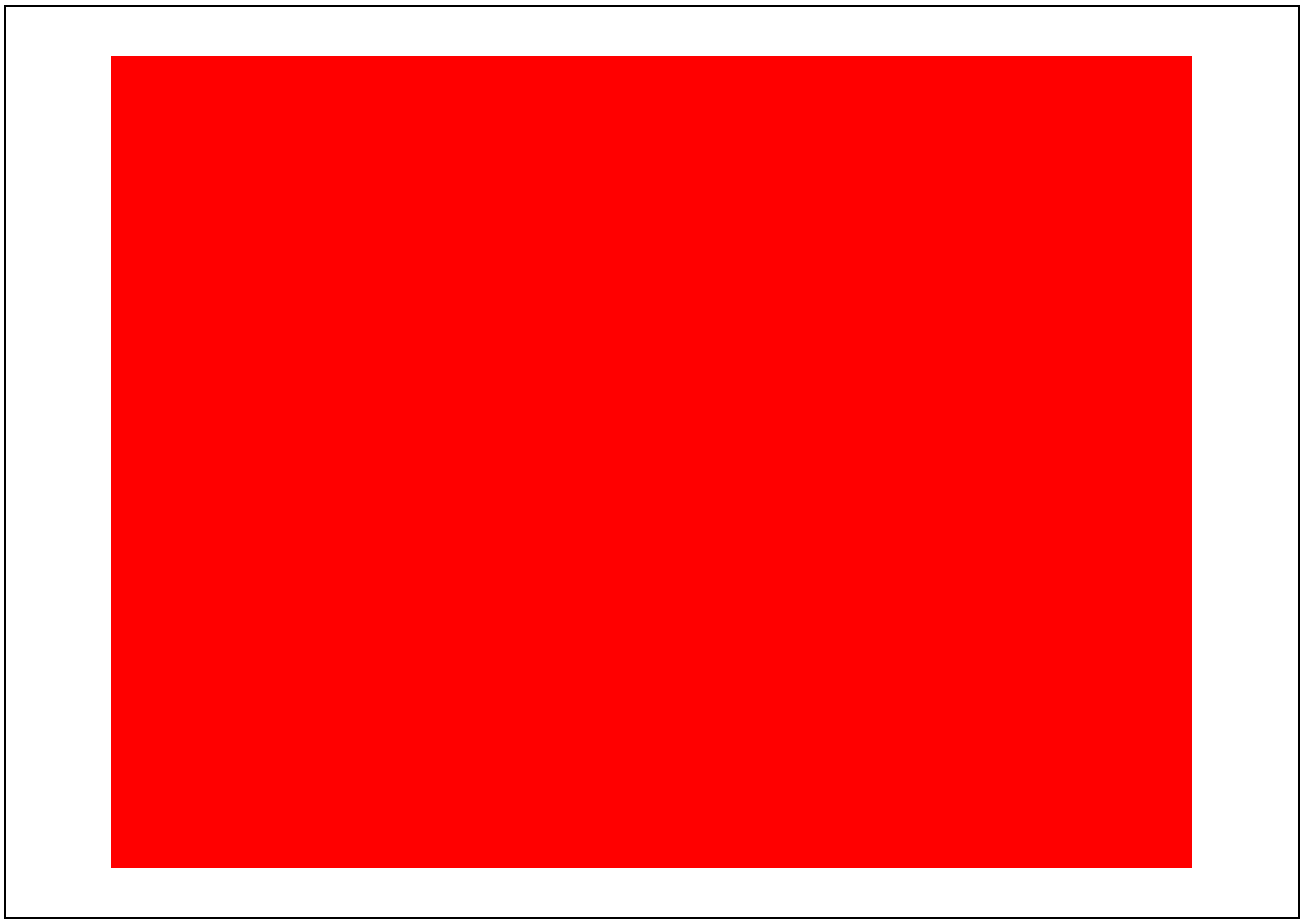

Figure 35.38 Generated Image Data Example (in the Case of Monochrome Generation)

### 35.2.5 Interrupts

**Table 35.15** lists the interrupt sources, registers, and interrupt signals to the interrupt controller.

Table 35.15 Interrupt Sources, Registers, and Interrupt Signals to the Interrupt Controller

| Internal Signal Name | Item | Interrupt Source Status/Clear | Interrupt Enable Register Field | Generation Condition |
|---|---|---|---|---|
| axi_mst_err_int | FIFO overflow (image-related) | CRUnINTS.FOS | CRUnIE.FOE | When the image-related FIFO overflowed |
| | SLVERR error (image-related) | CRUnINTS.SLVES | CRUnIE.SLVEE | When an SLVERR error occurred in the image-related AXI |
| | DECERR error (image-related) | CRUnINTS.DECES | CRUnIE.DECEE | When a DECERR error occurred in the image-related AXI |
| | Frame End Overwrite (image-related) | CRUnINTS.FEOVWS | CRUnIE.FEOVWE | When the Frame End is overwritten in the image-related FIFO |
| | FIFO-SD overflow (statistics data) (for debugging) | CRUnINTS.SDFOS | CRUnIE1.SDFOE | When Statistics Data FIFO-SD overflows |
| | SLVERR error (statistics data) | CRUnINTS.SDSLVES | CRUnIE1.SDSLVEE | When the SLVERR error of Statistics Data AXI-SD occurs |
| | DECERR error (statistics data) | CRUnINTS.SDDECES | CRUnIE1.SDDECEE | When the Statistics Data AXI-SD DECERR error |
| | Frame End Overwrite (Statistics-related) | CRUnINTS.SDFEOVWS | CRUnIE.SDFEOVWE | When the Frame End is overwritten in the Statistics Data FIFO-SD |
| image_conv_int | Frame Start | CRUnINTS.SFS | CRUnIE.SFE | When a frame starts<br>*Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified. |
| | Frame End | CRUnINTS.EFS | CRUnIE.EFE | When a frame ends<br>*Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified. |
| | Scan Line | CRUnINTS.SIS | CRUnIE.SIE | When there is a match with the line number specified in the register (ICnSI.SI[11:0])<br>*Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified. |
| image_conv_err_int | Abnormal word count Value | CRUnINTS.WIS | CRUnIE.WIE | When the word count value set in the register (ICnEWC.EWC[15:0]) did not match the word count value of MIPI |
| | ITU656 DECERR | CRUnINTS.CES | CRUnIE.CEE | When an ITU656 error was detected |

### 35.2.6 Usage Notes

There are no special usage notes currently.

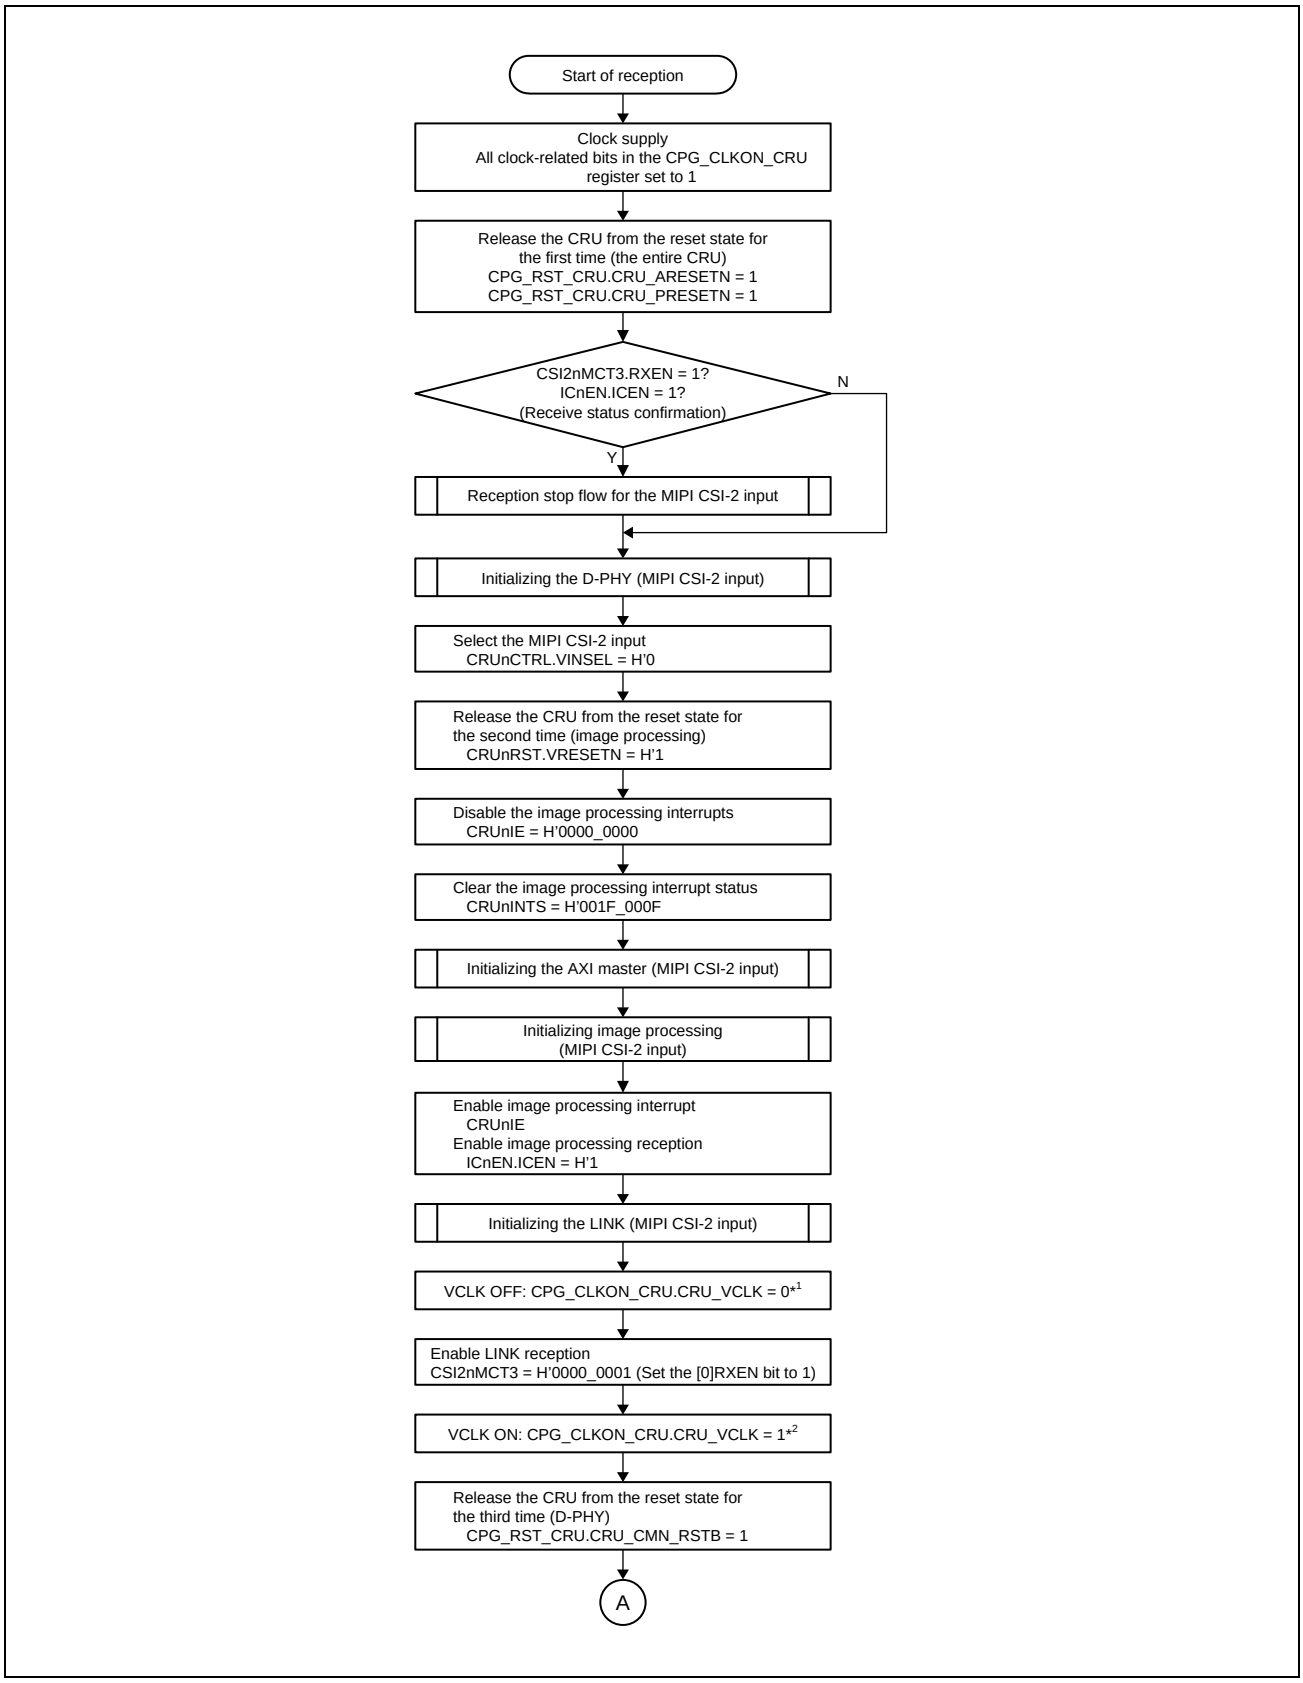
## 35.3 Operation

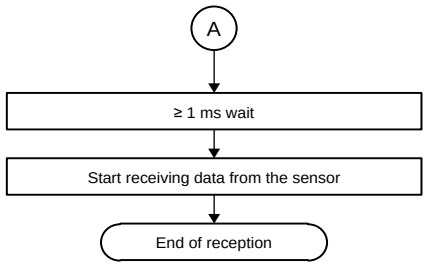
**Table 35.16** lists the operations that this section deals with. Follow the procedures described below. If the procedure is not followed, an unexpected behavior may result. The subsections that follow describe each operation.

Table 35.16 List of Operations

| Item | | Description |
|---|---|---|
| Starting reception for the MIPI CSI-2 input | | Describes the procedure to start reception for the MIPI CSI-2 input (including the pattern generator). |
| Initializing the D-PHY (MIPI CSI-2 input) | | Describes the procedure to initialize the D-PHY for the MIPI CSI-2 input. |
| Initializing the AXI master (MIPI CSI-2 input) | | Describes the procedure to initialize the AXI master for the MIPI CSI-2 input. |
| Initializing image processing (MIPI CSI-2 input) | | Describes the procedure to initialize image processing for the MIPI CSI-2 input. |
| Storing LUT data (both) | | Describes the procedure to store LUT data for both the MIPI CSI-2 input. |
| Initializing the LINK (MIPI CSI-2 input) | | Describes the procedure to initialize the LINK for the MIPI CSI-2 input. |
| Stopping reception for the MIPI CSI-2 input | | Describes the procedure to stop reception for the MIPI CSI-2 input (not including the pattern generator). |
| Determining LINK packet stop (MIPI CSI-2 input) | | Describes the procedure to determine LINK packet stop for the MIPI CSI-2 input. |
| Stopping the D-PHY (MIPI CSI-2 input) | | Describes the procedure to stop the D-PHY for the MIPI CSI-2 input. |
| Stopping image processing reception (MIPI CSI-2 input) | | Describes the procedure to stop image processing reception for the MIPI CSI-2 input. |
| Changing frame synchronization settings | By setting registers | Describes the procedure to change the frame synchronization settings by setting registers from the CPU for the MIPI CSI-2 input. |
| | By using the DMAC | Describes the procedure to change the frame synchronization settings by using the DMAC for the MIPI CSI-2 input. |
| Stopping the pattern generator | | Describes the stop procedure using the pattern generator. |

### 35.3.1 Starting Reception for the MIPI CSI-2 Input





Note 1. After VCLK OFF setting, confirm whether VCLK is off by reading CPG_CLKMON_CRU.CLK1_ON = 0.

Note 2. After VCLK ON setting, confirm whether VCLK is on by reading CPG_CLKMON_CRU.CLK1_ON = 1.

Figure 35.39 Reception Start Flow for the MIPI CSI-2 Input

### 35.3.2 Stopping Reception for the MIPI CSI-2 Input

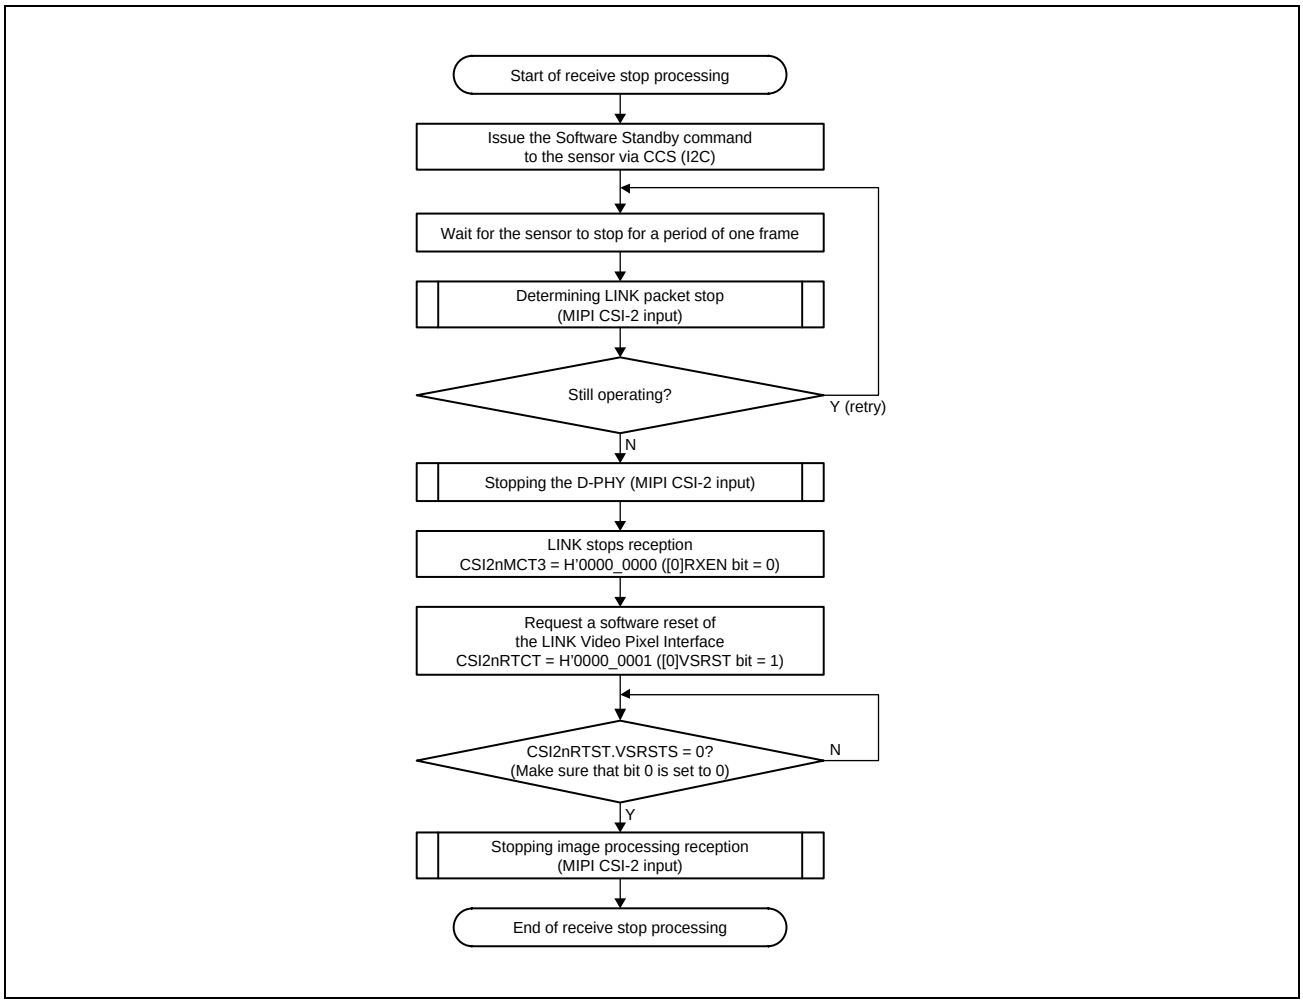

Figure 35.45 Reception Stop Flow for the MIPI CSI-2 Input

### 35.3.2.1 Determining LINK Packet Stop (MIPI CSI-2 Input)

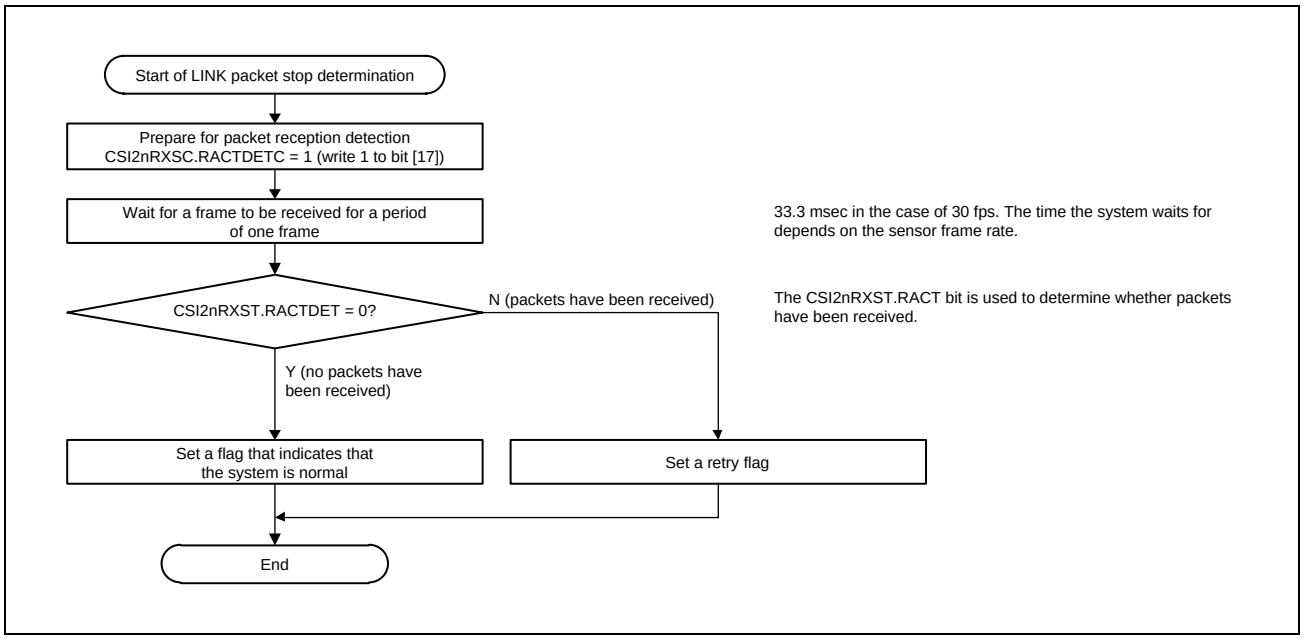

Figure 35.46 Determining LINK Packet Stop (MIPI CSI-2 Input)

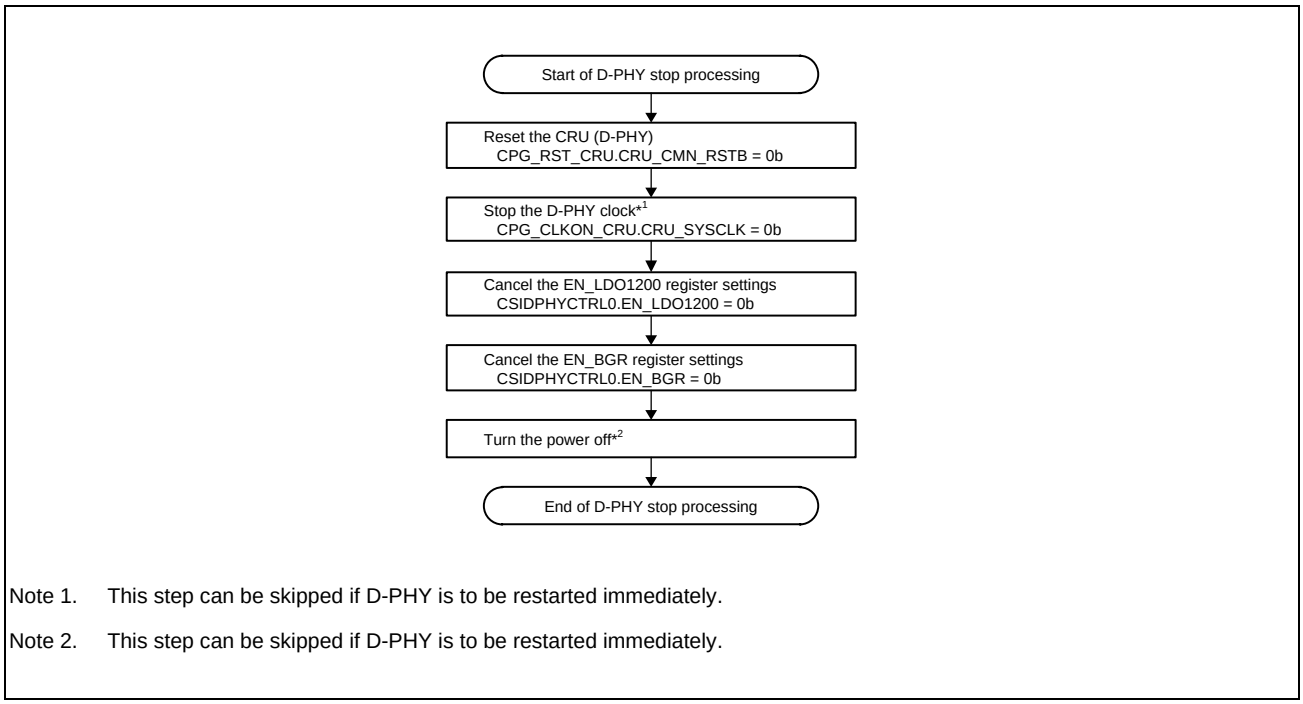
### 35.3.2.2 Stopping the D-PHY (MIPI CSI-2 Input)

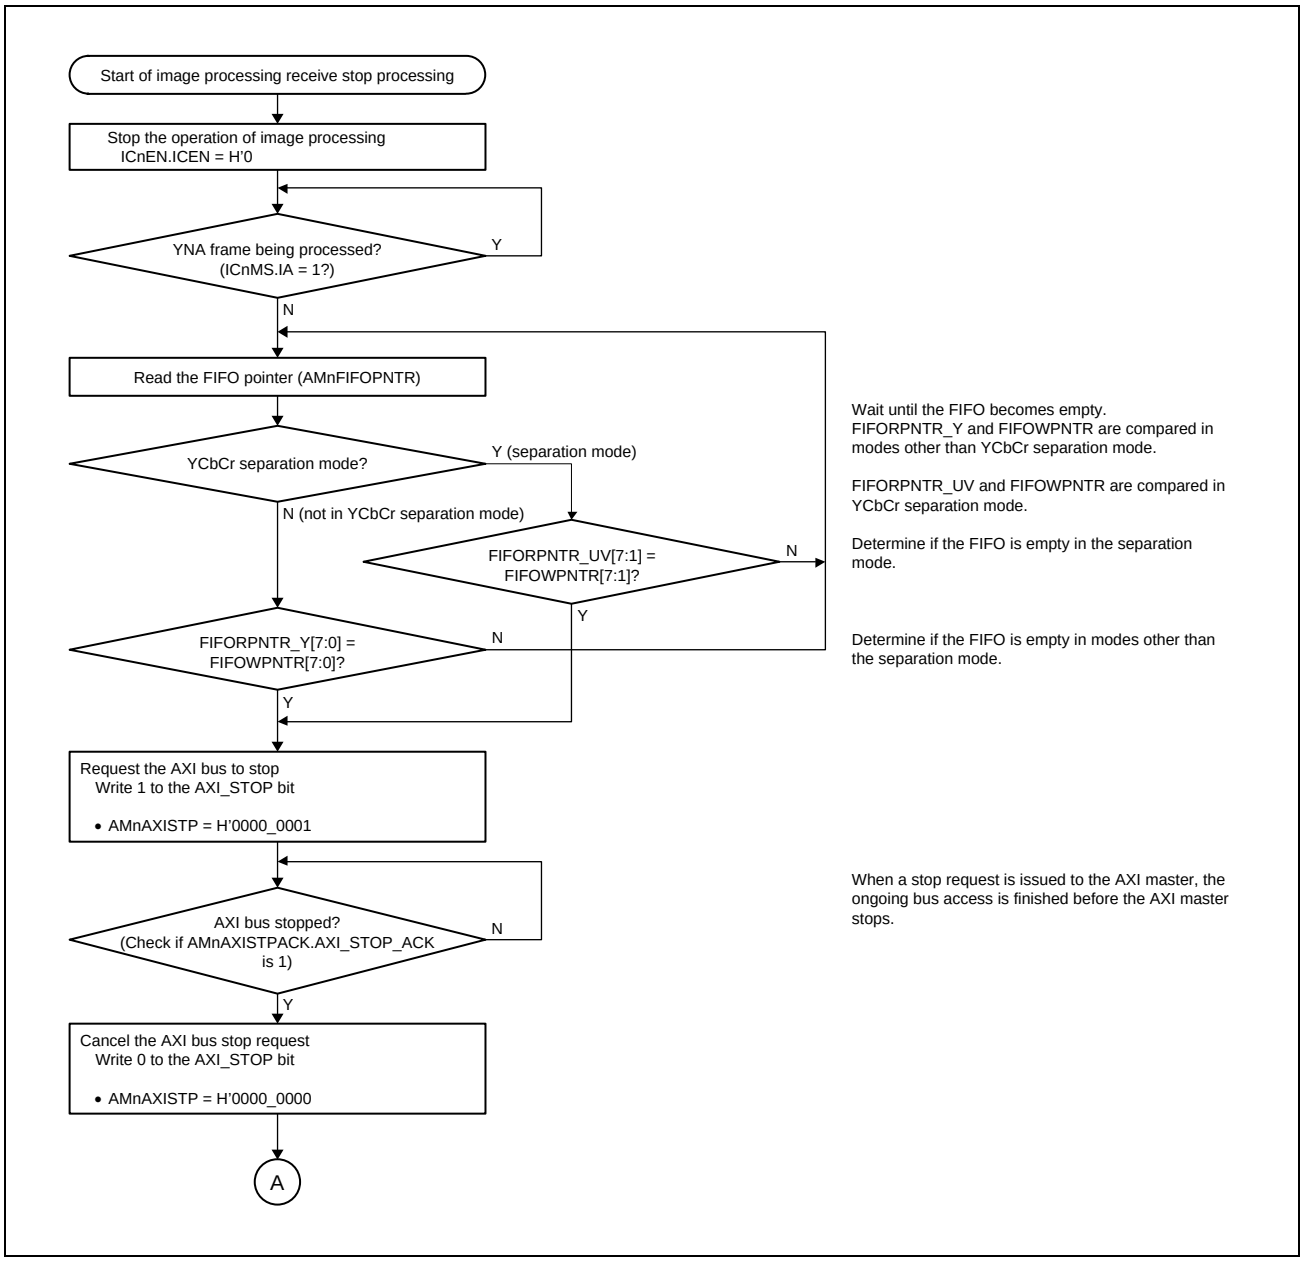


Note 1. This step can be skipped if D-PHY is to be restarted immediately.

Note 2. This step can be skipped if D-PHY is to be restarted immediately.

Figure 35.47 Stopping the D-PHY (MIPI CSI-2 Input)

### 35.3.2.3 Stopping Image Processing Reception (MIPI CSI-2 Input)



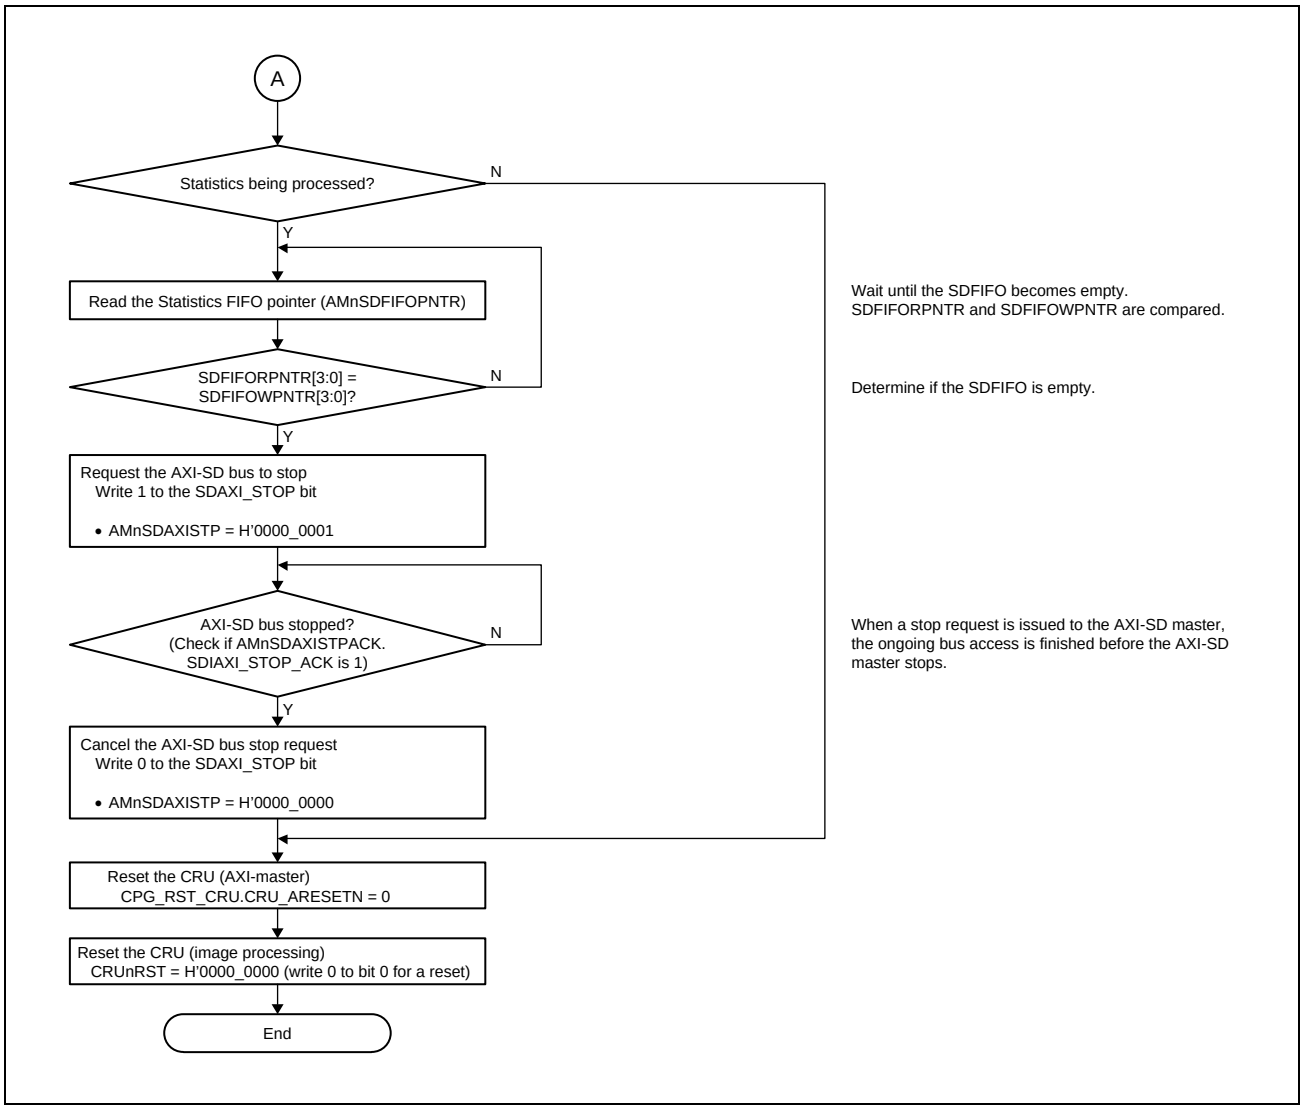


Figure 35.48 Stopping Image Processing Reception (MIPI CSI-2 Input)

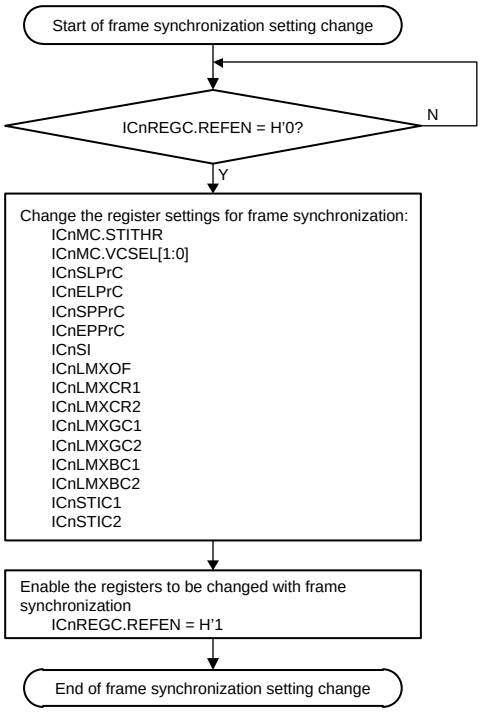
### 35.3.3 Frame Synchronization Settings

During the CRU is receiving data via the MIPI CSI-2 input, the following registers can only be changed with frame synchronization:

- ICnMC.STITHR
- ICnMC.VCSEL[1:0]
- ICnSLPrC, ICnSPPrC, ICnELPrC, ICnEPPrC
- ICnSI, ICnLMXOF
- ICnLMXRC1, ICnLMXRC2
- ICnLMXGC1, ICnLMXGC2
- ICnLMXBC1, ICnLMXBC2
- ICnSTIC1, ICnSTIC2

This section shows the flows for changing the frame synchronization settings both by setting registers from the CPU and by using the DMAC.

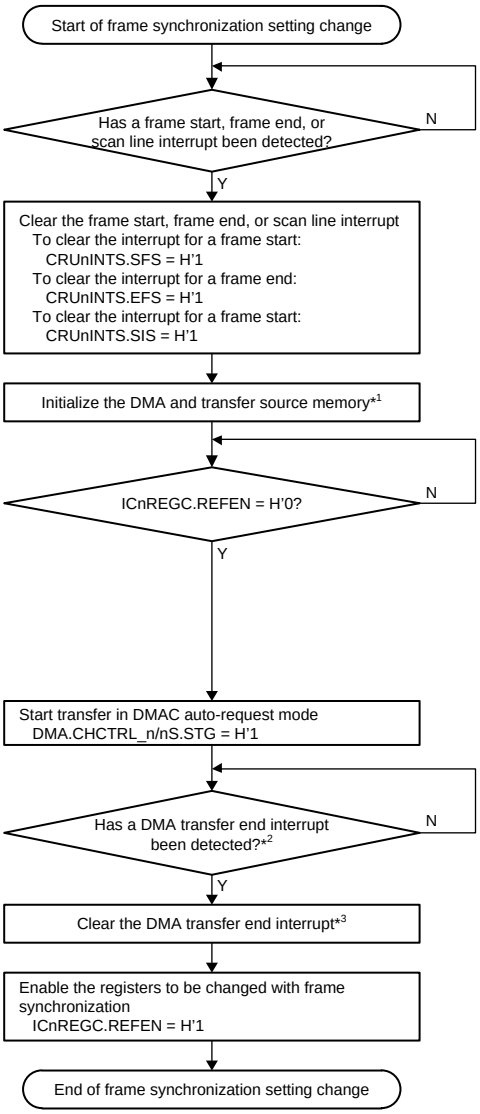
#### 35.3.3.1 Changing Frame Synchronization Settings (by Setting Registers)



**Note:** This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input.

Figure 35.49 Flow for Changing the Frame Synchronization Settings (by Setting Registers)

### 35.3.3.2 Changing Frame Synchronization Settings (by Using the DMAC)



**NOTES:**

1. This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input. It cannot be used for the parallel input.
2. In the initial settings when the CRU starts, interrupts for a frame start, frame end and scan line must be set.

   To set an interrupt for a frame start:
   CRUnIE.SFE = H'1

   To set an interrupt for a frame end:
   CRUnIE.EFE = H'1

   To set an interrupt for a frame start:
   CRUnIE.SIE = H'1

   In addition, CRU and DMA interrupts must be enabled by seeing the section about the interrupt controller.

Note 1. Perform initialization by seeing the section about DMA.

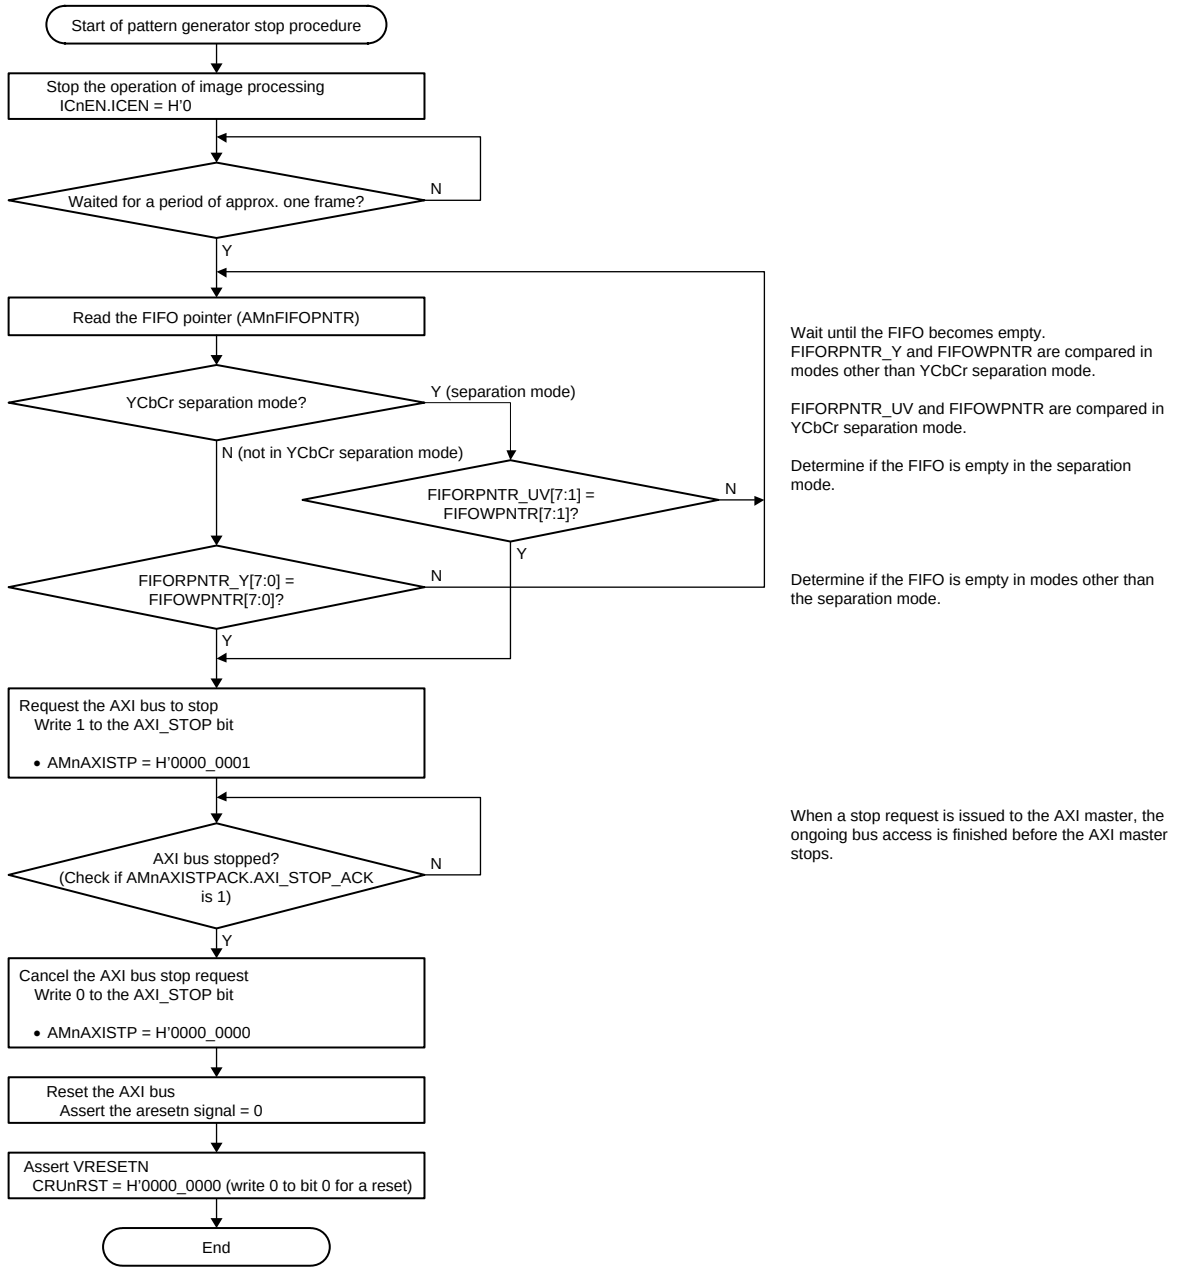
- Note that the following register settings are required:
  DMA.CHCFG_n/nS.DAD = H'0: Increment
  DMA.CHCFG_n/nS.SAD = H'0: Increment
  DMA.CHCFG_n/nS.DDS = H'3: 32 bits
- Set the DMA transfer size to 32 bits for both transfer destination and transfer source
- In transfer source memory initialization, store the values that set the following register: (Start address: Up to 64 bytes in ICnMC)
  ICnMC.STITHR, ICnMC.VCSEL[1:0],
  ICnSLPrC, ICnSPPrC, ICnELPrC, ICnEPPrC,
  ICnSI, ICnLMXOF,
  ICnLMXRC1, ICnLMXRC2, ICnLMXGC1, ICnLMXGC2,
  ICnLMXBC1, ICnLMXBC2,
  ICnSTIC1

Note 2. A setting is required in advance (see the sections about DMA and interrupt controller).

Note 3. Clear the interrupt by seeing the section about DMA and interrupt controller.

Figure 35.50 Flow for Changing the Frame Synchronization Settings (by Using the DMAC)

### 35.3.4 Stopping the Pattern Generator



**Note:** The waiting time is determined by the pattern generator setting values.

Figure 35.51 Flow for Stopping the Pattern Generator

# 36. Image Scaling Unit (ISU)

The ISU is a module that reads out the image stored in the external DRAM, scales down image size, and outputs the reduced image into the DRAM. The ISU also support a color format conversion and cropping image.

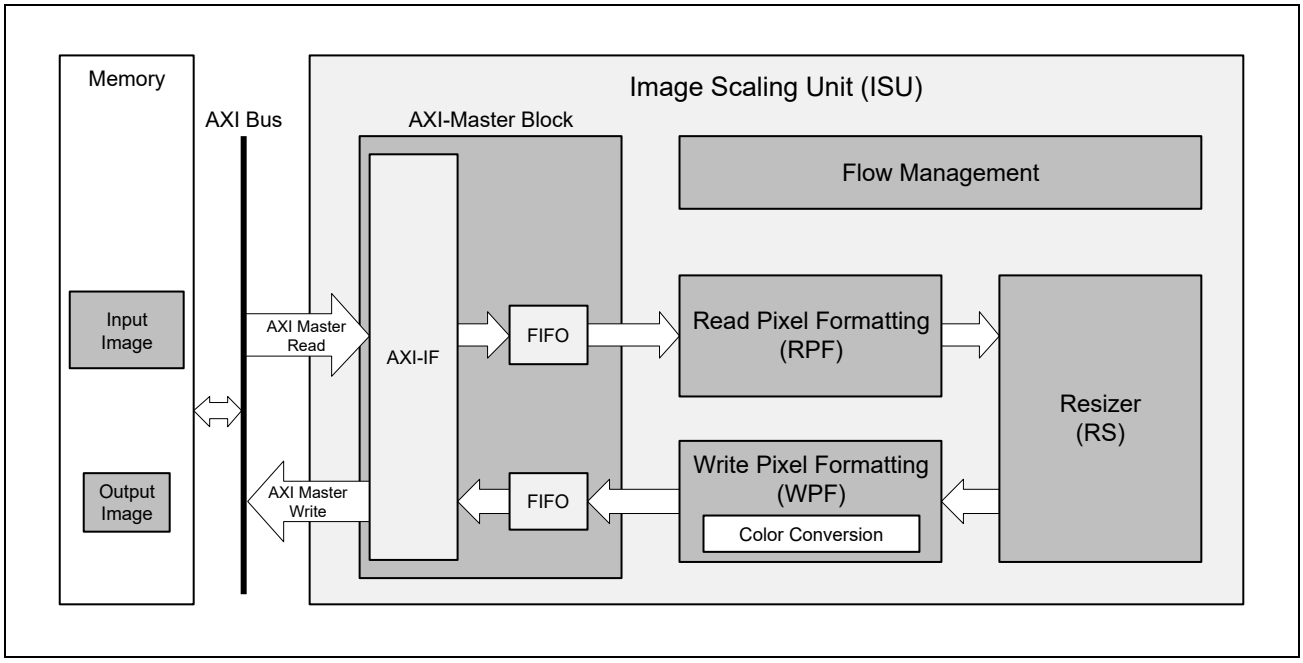


Figure 36.1 ISU Block Diagram

## 36.1 Features

The ISU functionality consists of “Resizer” and “Color Format Conversion”. “Color Format Conversion” can convert color space and color format (RGB/ARGB, YCbCr/YUV, RAW).

- Resizer
  - Scaling ratio: ×1/1 to 1/15 (Scale down)
  - Scaling algorithm: Bilinear
  - Horizontal and Vertical image scaling ratio are adjustable individually.
  - Cropping image

- Color Space and Color Format Conversion
  - Supported color format: RGB/ARGB, YCbCr/YUV, RAW (Grayscale)
    A (Alpha) of ARGB format is transparency. Zero is transparent (colorless).
  - Color space conversion by using 3 × 3 matrix which coefficients can be set arbitrary.
  - Convert color space and color format each other.
  - Endian correction.

Table 36.1 Supported Image Format

| Item | Description |
|---|---|
| Input | • Color Format<br>– RGB/ARGB: 8 formats<br>RGB565, RGB888,<br>BGR888, BGR666,<br>ARGB8888, ARGB1555,<br>RGBA8888,<br>ABGR8888<br>– YCbCr/YUV: 4 formats<br>YCbCr422 (Interleave) = UYVY<br>YCbCr422 (Interleave) = YUY2 (YUYV)<br>YCbCr422 (Semi-Planar) = NV16<br>YCbCr420 (Semi-Planar) = NV12<br>– RAW: 3 formats<br>RAW8, RAW10, RAW12 (Grayscale)*1<br>• Maximum Size<br>2800 × 2047 |
| Output | • Color Format<br>– RGB/ARGB: 8 formats<br>RGB565, RGB888,<br>BGR888, BGR666,<br>ARGB8888, ARGB1555,<br>RGBA8888,<br>ABGR8888<br>– YCbCr/YUV: 4 formats<br>YCbCr422 (Interleave) = UYVY<br>YCbCr422 (Interleave) = YUY2 (YUYV)<br>YCbCr422 (Semi-Planar) = NV16<br>YCbCr420 (Semi-Planar) = NV12<br>– RAW: 3 formats<br>RAW8, RAW10, RAW12 (Grayscale)*1<br>• Maximum Size<br>1920 × 1080 |

Note 1. RAW10 and RAW12 are rounded to 8-bit internally.

### 36.1.1 Flow Management (FM)

Controls the processing of the entire ISU. The frame processing is controlled by receiving the frame processing start instruction from the register. There are three types of frame processing:

1. Register Mode
2. Descriptor Mode (without automatic start of next frame)
3. Descriptor Mode (with automatic start of next frame)

#### 36.1.1.1 Frame Processing Mode

There are the following three types of frame processing methods depending on the register settings.

- Register Setting Mode (1) is one-time processing operation according to the register setting at once.
- Descriptor Mode without Auto-start (2) is also one-time processing operation according to the descriptor, not the register setting. Descriptor Mode with Auto-start (3) automatically reads out the descriptor and continues its operation until all descriptors have been processed.

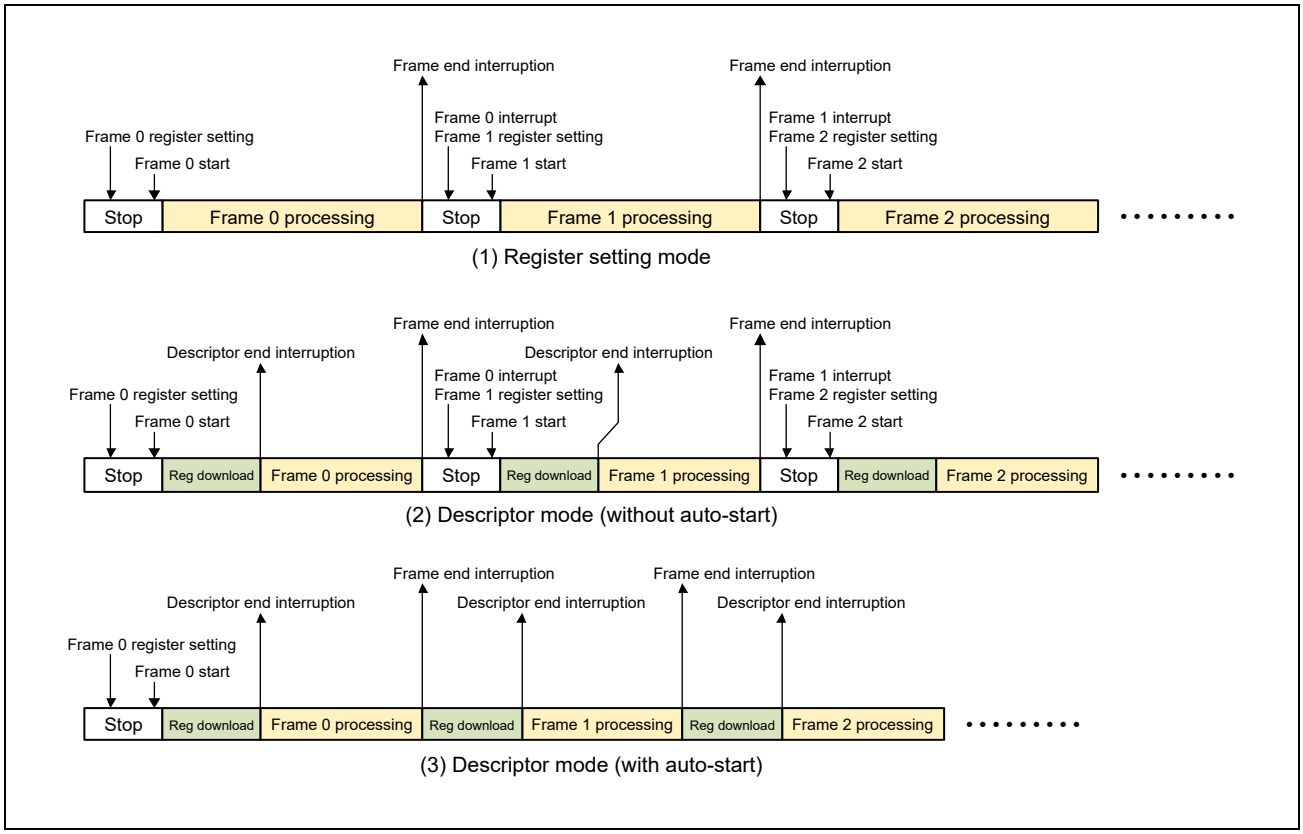

Figure 36.2 Frame Processing Mode

### 36.1.1.2 Descriptor

Descriptor Mode is the processing which reads out the descriptor format data stored in the memory and sets the registers automatically. It also includes the Auto-start setting for the next frame.

Flow Management (FM) reads this descriptor setting data while not frame processing.

#### (1) Descriptor Format

The descriptor format is shown below.

Table 36.2 Descriptor Format

| No. | Category | Item | Byte | Setting Range | Description |
|---|---|---|---|---|---|
| 1 | Header*1,*2 | Descriptor Table Byte Count Setting | 4 bytes | H'0000_0000 to H'0000_2000 | Up to 8 Kbytes. The total number of bytes of register address and register setting data. |
| 2 | Register Setting Main body*3,*4,*5 | Register Address 1 | 4 bytes | H'0000_0100 to H'0000_01F0 | 1st Register Setting Address |
| | | Register Setting Data 1 | 4 bytes | H'0000_0000 to H'FFFF_FFFF | 1st Register Setting Data |
| | | Register Address 2 | 4 bytes | H'0000_0100 to H'0000_01F0 | 2nd Register Setting Address |
| | | Register Setting Data 2 | 4 bytes | H'0000_0000 to H'FFFF_FFFF | 2nd Register Setting Data |
| | | Register Address 3 | 4 bytes | H'0000_0100 to H'0000_01F0 | 3rd Register Setting Address |
| | | Register Setting Data 3 | 4 bytes | H'0000_0000 to H'FFFF_FFFF | 3rd Register Setting Data |
| | | Register Address 4 | 4 bytes | H'0000_0100 to H'0000_01F0 | 4th Register Setting Address |
| | | Register Setting Data 4 | 4 bytes | H'0000_0000 to H'FFFF_FFFF | 4th Register Setting Data |
| | | • | • | • | • |
| | | • | • | • | • |
| | | • | • | • | • |
| 3 | Footer*2 | Next Descriptor Table Address | 8 bytes | H'0000_0000_0000_0000 to H'0000_0002_3FFF_FFFF | The next address is a multiple of 32 bytes.<br>The setting range will be changed according to the product specifications. |
| | | Control identifier register | 4 bytes | H'0000_0000 to H'0000_0003 | b31 to 2: All-0 |
| | | | | | b1: Select bit to generate a frame end interruption.<br>0: Does not generate a Frame end interruption.<br>1: Generate a Frame end interruption. |
| | | | | | b0: Select bit for auto-start of next frame or end at this frame.<br>0: Disable next frame auto-start.<br>(Exit without next frame operation.)<br>1: Enable next frame auto-start. |

Note 1. The location of the Descriptor List is a 32-byte boundary. (Address that is a multiple of 32-byte) 0,32,64 ...

Note 2. The number of bytes is fixed for the header and footer. The register body is 8 bytes per set (address 4 bytes, data 4 bytes)

Note 3. The registers that can be set in the descriptor are limited to the Common register.

Note 4. Operation when the same register address is described in multiple addresses is not guaranteed.

Note 5. Specify in the offset address to be added to the Base Address (H'1084_0000). Specifically, the lower 10 bits [9: 0] should be the address of the register map, and the higher 22 bits [31:10] should be the address of All '0'. If the higher 22 bits are other than All '0', it will be out of the register area and a list error will occur.

### (2) Descriptor Error

An error flag is issued in the following cases.

#### (a) When the number of bytes in the header exceeds the limit, or when the value is not in units of 8 bytes

An error interrupt is generated, and subsequent frame processing is not executed.

Normal operation and recovery are not guaranteed unless the system is reset.

#### (b) When the register address is outside the specified address

A decoding error will occur if decoding is performed for items outside the register area.

Ignore the write to the register where the error occurred and continue the process itself.

### 36.1.2 AXI-Master

In response to a descriptor read request or input image read request from Flow Management (FM), the descriptor or input image is read from the DRAM. It also writes a reduced image to DRAM in response to a reduced image write request from the WPF.

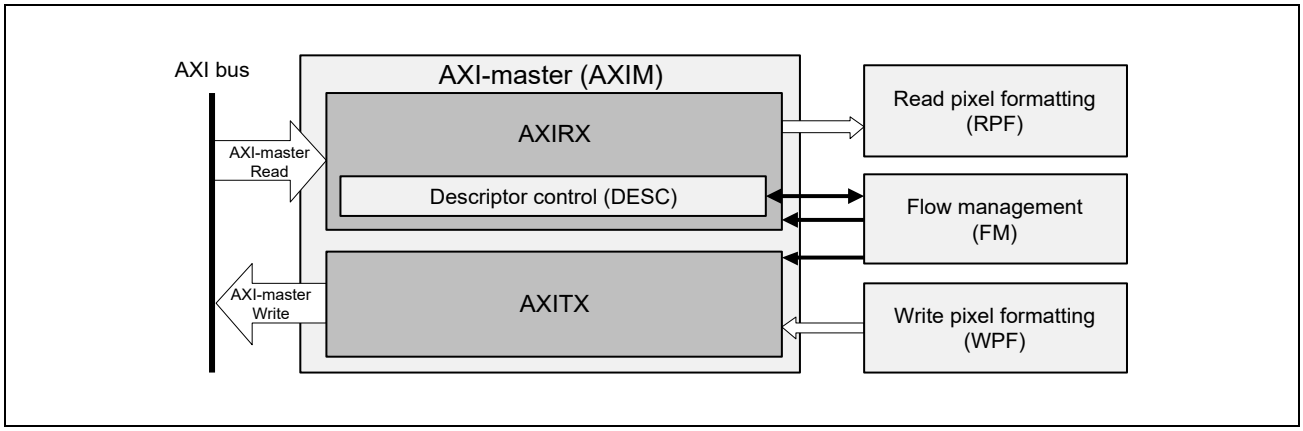

Figure 36.3 AXI-Master Block Diagram

#### 36.1.2.1 Read Input Image (AXIRX)

In response to the descriptor read request from FM or the frame transfer start request, the descriptor or input image data is read from DRAM by AXI.

##### (1) Image Input Format

AXIRX support to read following formats from memory.

Table 36.3 Input Image Format

| Read Method | Image Format | Variation |
|---|---|---|
| Interleave (Plane Number = 1) | ARGB (8 types) | • The order of colors is different / the number of color bits is different.<br>• There may or may not be A. |
| | YCbCr422 8-bit (2 types) | The two types differ only in the order of the colors of Cb and Cr. |
| | RAW (3 types) | Grayscale 8-/10-/12-bit. |
| Semi-Planner (Plane Number = 2) | YCbCr422 8-bit (1 type) | |
| | YCbCr420 8-bit (1 type) | |

- Interleave

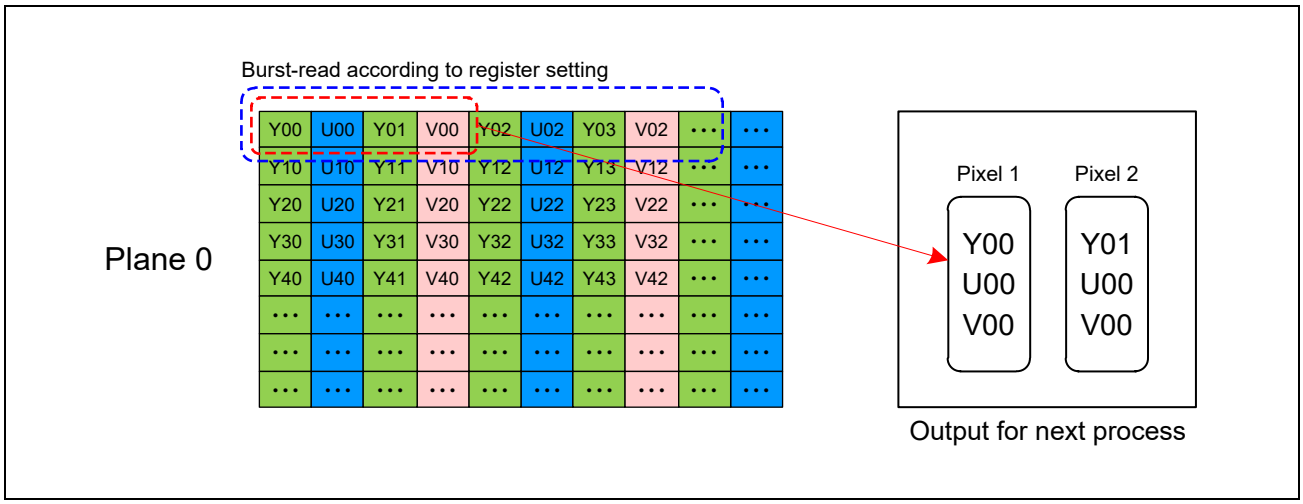

Figure 36.4 Example of Interleave Format for YCbCr422 (YUV422)

- Semi-planar

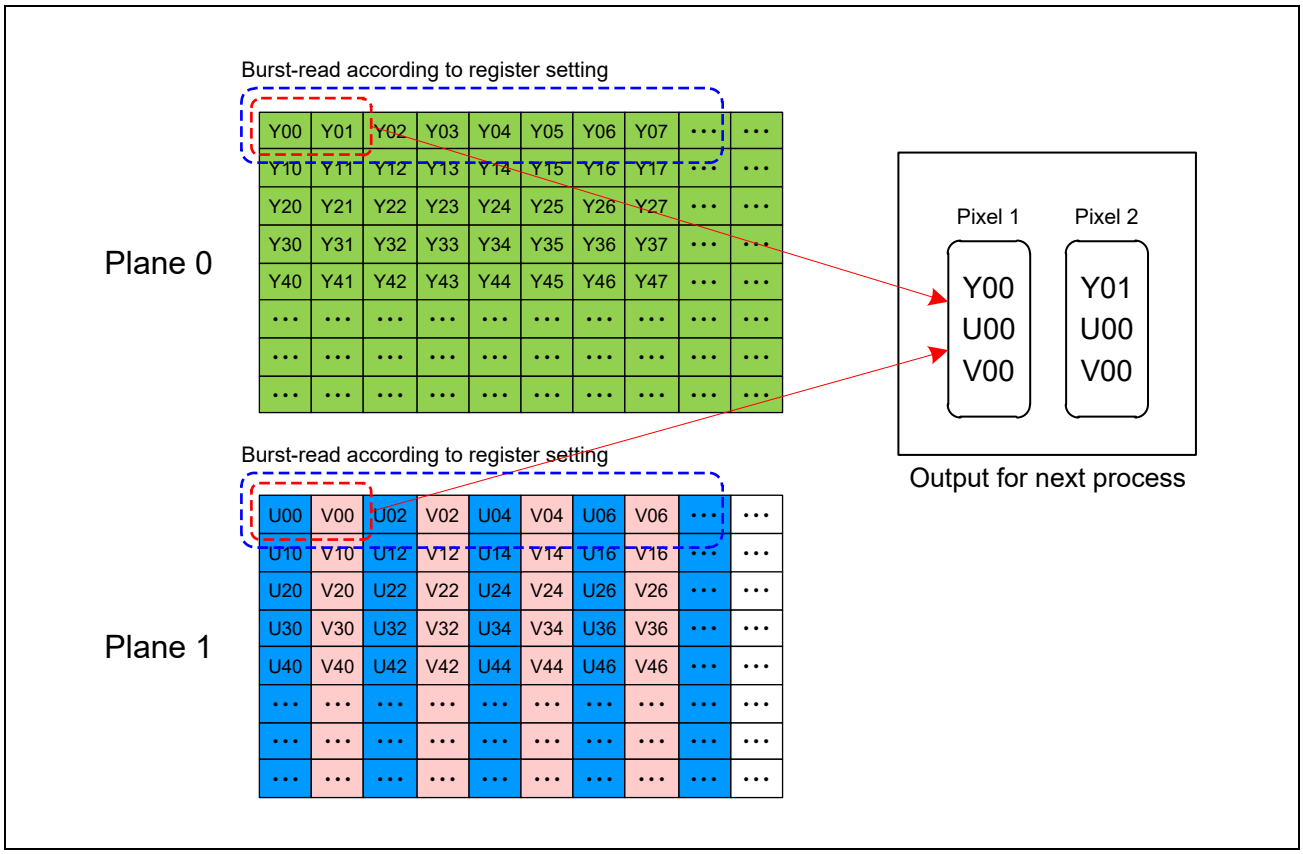

Figure 36.5 Example of Semi-planar Format for YCbCr422 (YUV422)

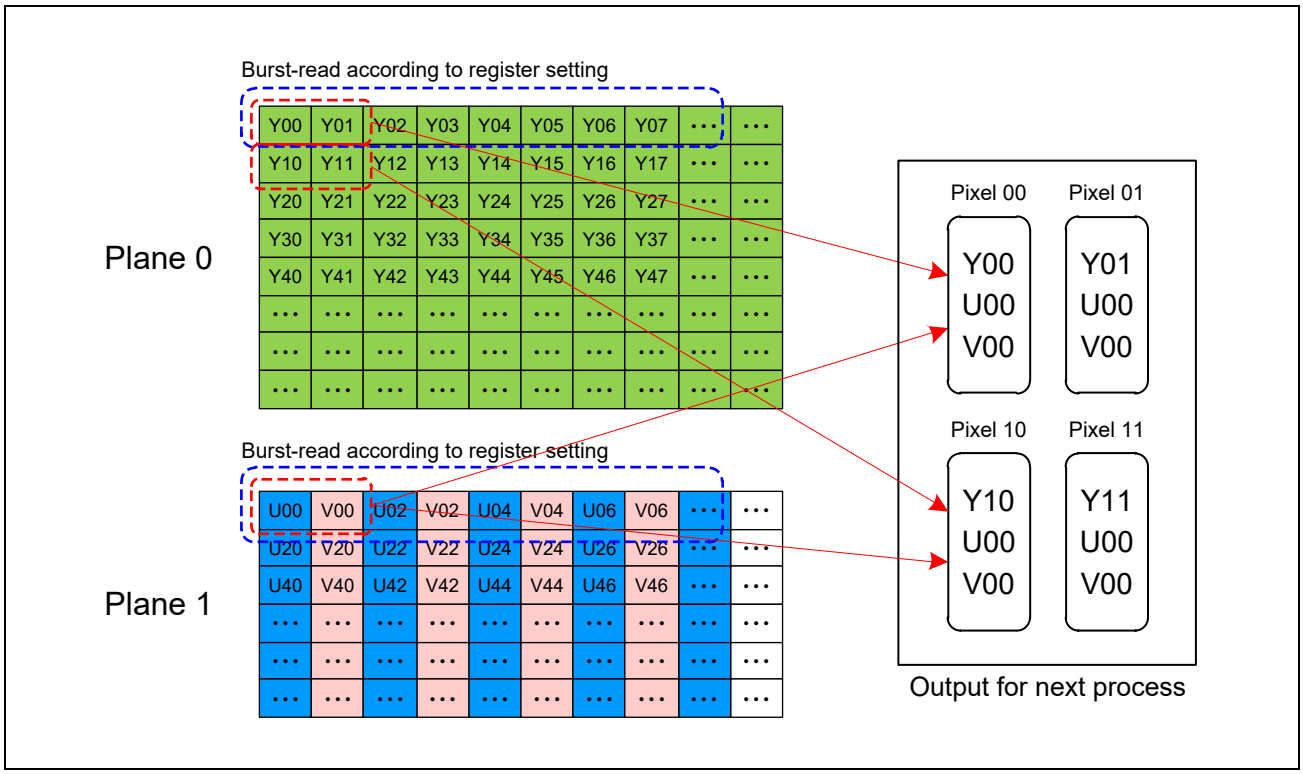

Figure 36.6 Example of Semi-planar format for YCbCr420 (YUV420)

### (2) Input Setting

Data is read from each plane according to following register setting. Registers are required to set for each plane (Max 2 Plane).

Table 36.4 Input Image Setting

| No. | Category | Register | Variation |
|---|---|---|---|
| (1) | Start Address | ISU_RPF_SRC_ADDH_PL0.SADD_PL0[1:0]<br>ISU_RPF_SRC_ADDL_PL0.SADD_PL0[31:0] | • Start address for Plane 0 of input image. |
| | | ISU_RPF_SRC_ADDH_PL0.SADD_PL1[1:0]<br>ISU_RPF_SRC_ADDL_PL0.SADD_PL1[31:0] | • Start address for Plane 1 of input image. |
| (2) | Image Stride | ISU_RPF_SRC_STRD.SSTRPL0[15:0] | • Image stride of Plane 0 [Byte] |
| | | ISU_RPF_SRC_STRD.SSTRPL1[15:0] | • Image stride of Plane 1 [Byte] |
| (3) | Input Area | ISU_RPF_SRC_SIZE.S_HSIZE[11:0] | • Horizontal size of processing area [Pixel]<br>• Max 2800 pixels |
| (4) | | ISU_RPF_SRC_SIZE.S_VSIZE[10:0] | • Vertical size of processing area [Pixel]<br>• Max 2047 pixels |

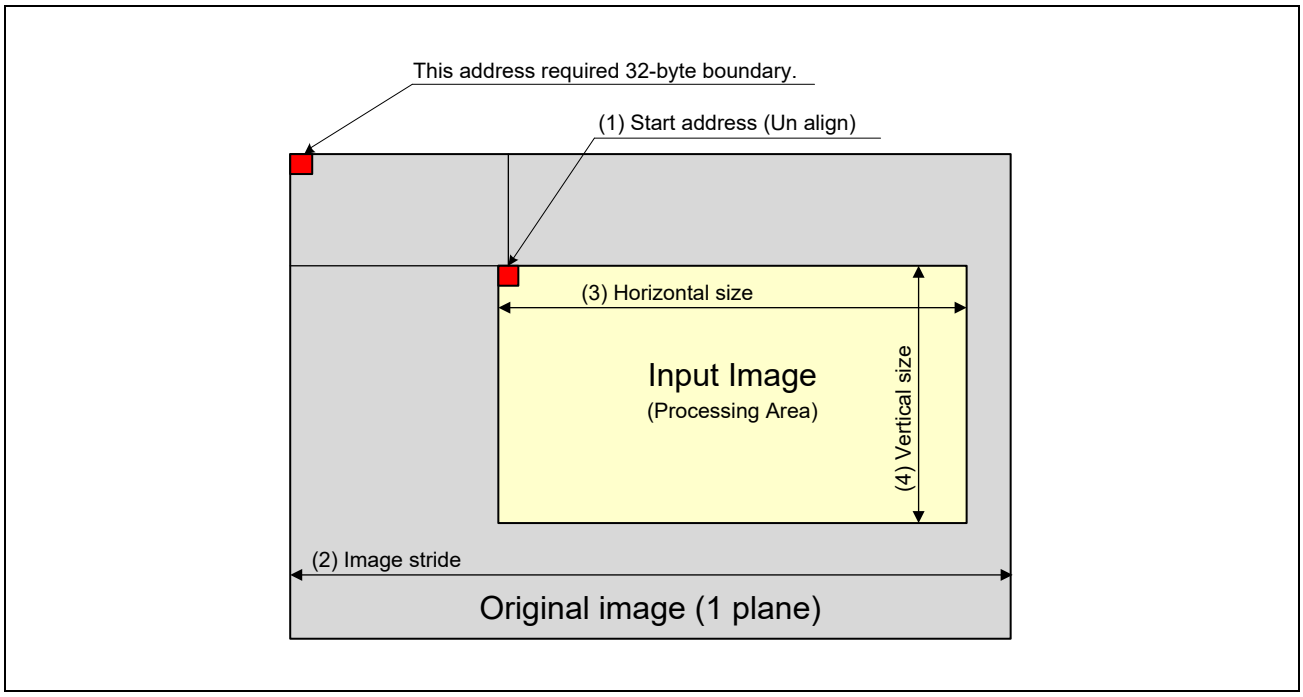

Figure 36.7 Input Area (Processing Area) Setting

### (3) Write Output Image (AXITX)

This function write the resized (reduced) image data to DRAM.

### (4) Support Format

AXITX support the same format as AXIRX.

### (5) Output Setting

Data is written out for each plane according to the following setting. Registers are required to set for each plane (Max plane number is 2).

Table 36.5 Output Image Setting

| No. | Category | Register | Variation |
|---|---|---|---|
| (1) | Start Address | ISU_WPF_DST_ADDH_PL0.DADD_PL0[1:0]<br>ISU_WPF_DST_ADDL_PL0.DADD_PL0[31:0] | • Start address of Plane 0 for output image. |
| | | ISU_WPF_DST_ADDH_PL1.DADD_PL1[1:0]<br>ISU_WPF_DST_ADDL_PL1.DADD_PL1[31:0] | • Start address of Plane 1 for output image. |
| (2) | Image Stride | ISU_WPF_DST_STRD.DSTRPL0[15:0] | • Image stride of Plane 0 [Byte] |
| | | ISU_WPF_DST_STRD.DSTRPL1[15:0] | • Image stride of Plane 1 [Byte] |
| (3) | Processing Area | ISU_RS_OS_CROP.O_HSIZE[10:0] | • Horizontal crop size [Pixel]<br>• Max 1920 pixels |
| (4) | | ISU_RS_OS_CROP.O_VSIZE[10:0] | • Vertical crop size [Pixel]<br>• Max 1080 pixels |

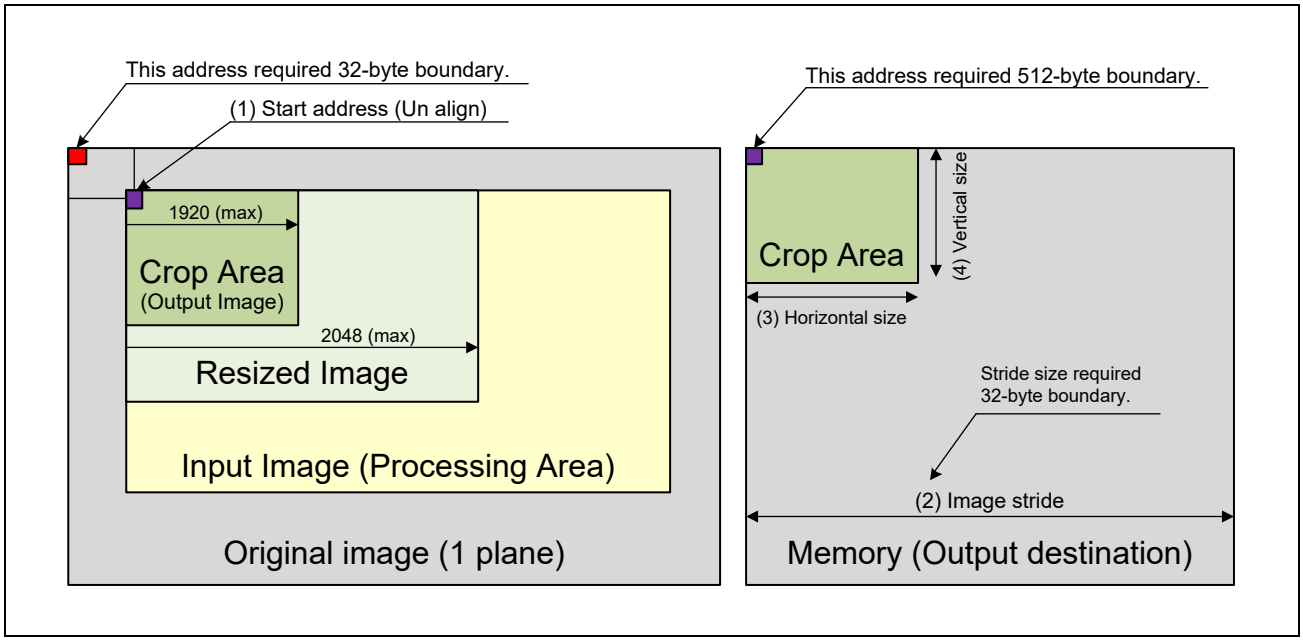

Figure 36.8 Output Setting

### 36.1.3 Read Pixel Formatting (RPF)

This function converts the input image data from the AXI-Master and outputs it to the resizer. There are four types of conversion: Data swap, Data extraction, Offset binary conversion (YCbCr only), and pixel normalization. RPF also includes a test pattern generation function.

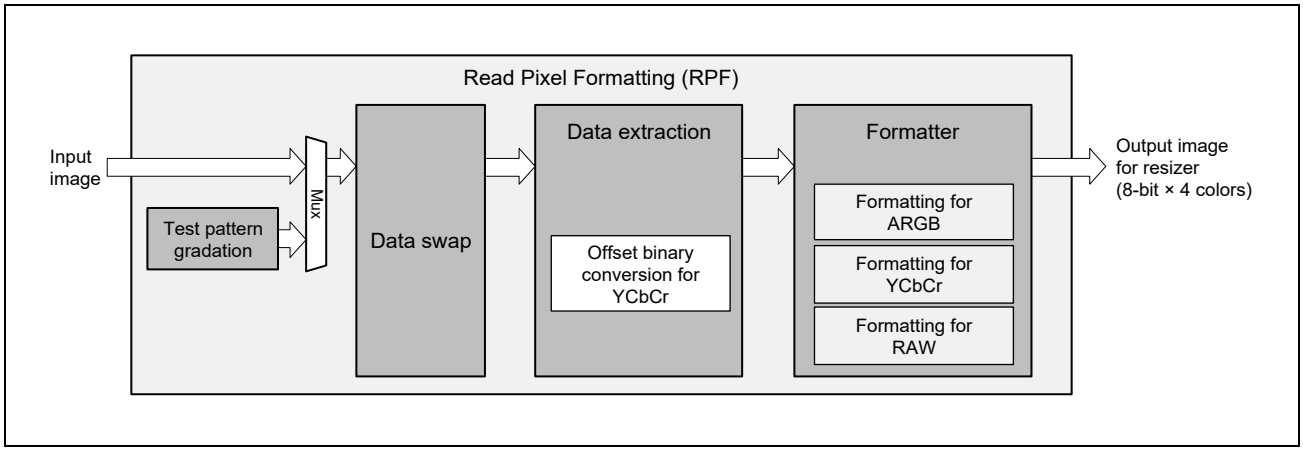

Figure 36.9 RPF Block Diagram

#### 36.1.3.1 Data Swap (Endian Correction)

This function corrects byte order so that image data can be handled by ISU. Each bytes can be arranged any order according to the register setting of ISU_RPF_SRC_DSWAP.RD_SWAP[2:0].

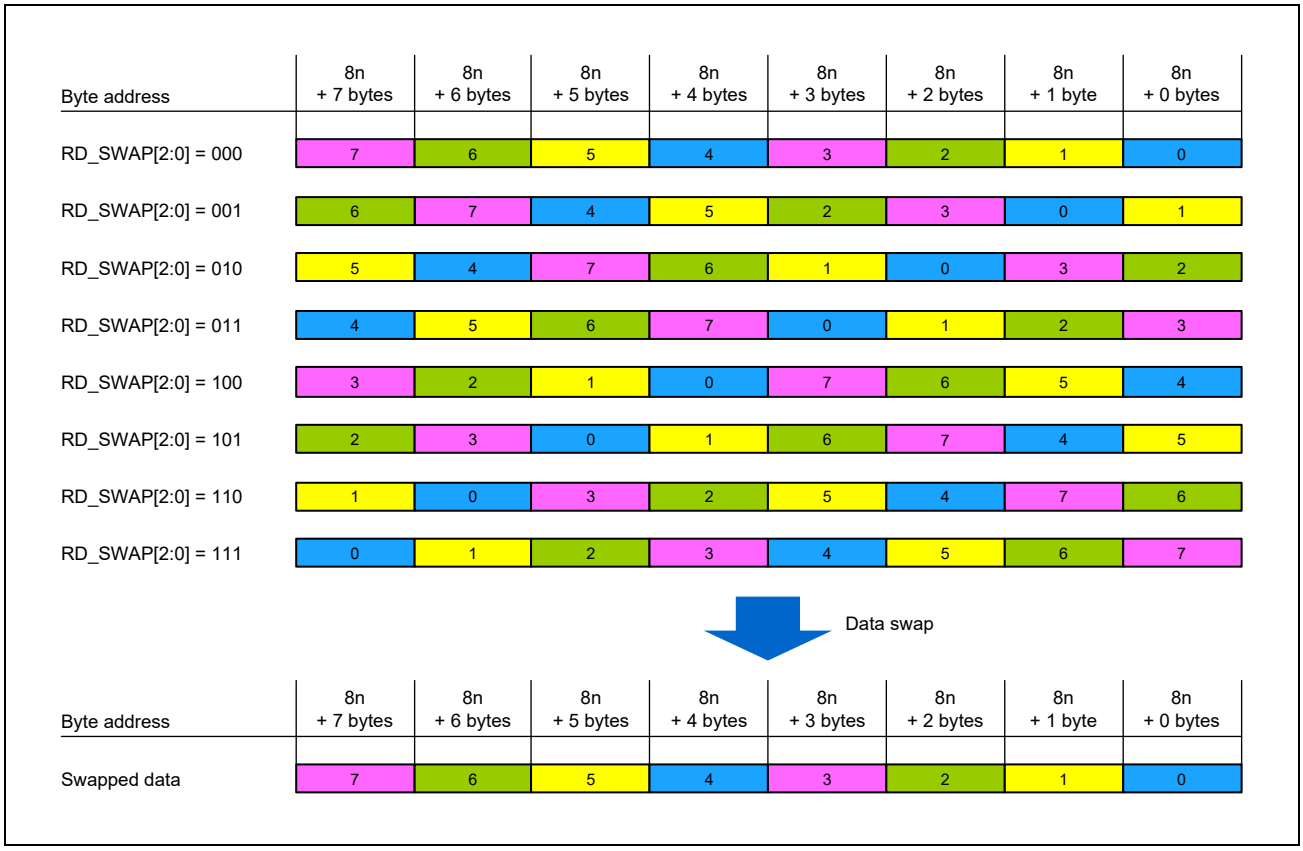

Figure 36.10 Data Swap Correction

### 36.1.3.2 RPF Formatter

These functions extract each color components (ex. R, G, B) and normalized as 8-bit for each so that image data can be handled by Resizer. Appropriate processing is performed for each input color format (RGB/ARGB, YCbCr/YUV, RAW) by setting of ISU_RPF_FMT.RDFMT[5:0].

#### ■ RGB/ARGB

This function supports 8 ARGB/RGB formats as shown below. All formats are “Number of planes = 1”.

Table 36.6 ARGB Support Format

| | Format | | | | n | | | | | | | | n + 1 | | | | | | | | n + 2 | | | | | | | | n + 3 | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RDFMT [5:0] | Color Format | Padding | bit/pixel | phase | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

## ■ YCbCr/YUV

This function supports 4 YCrCb/YUV formats as shown below.

Table 36.7 YCbCr/YUV Support Format

| Data Format | RDFMT[5:0] | Color Format | Alias | Figure Index |
|---|---|---|---|---|
| Interleave (Number of Planes = 1) | H'20 | YCbCr422 8-bit | UYVY | (1) |
| | H'21 | YCbCr422 8-bit | YUY2 | (2) |
| Semi-Planar (Number of Planes = 2) | H'22 | YCbCr422 8-bit | NV16 | (3) |
| | H'23 | YCbCr420 8-bit | NV12 | (4) |

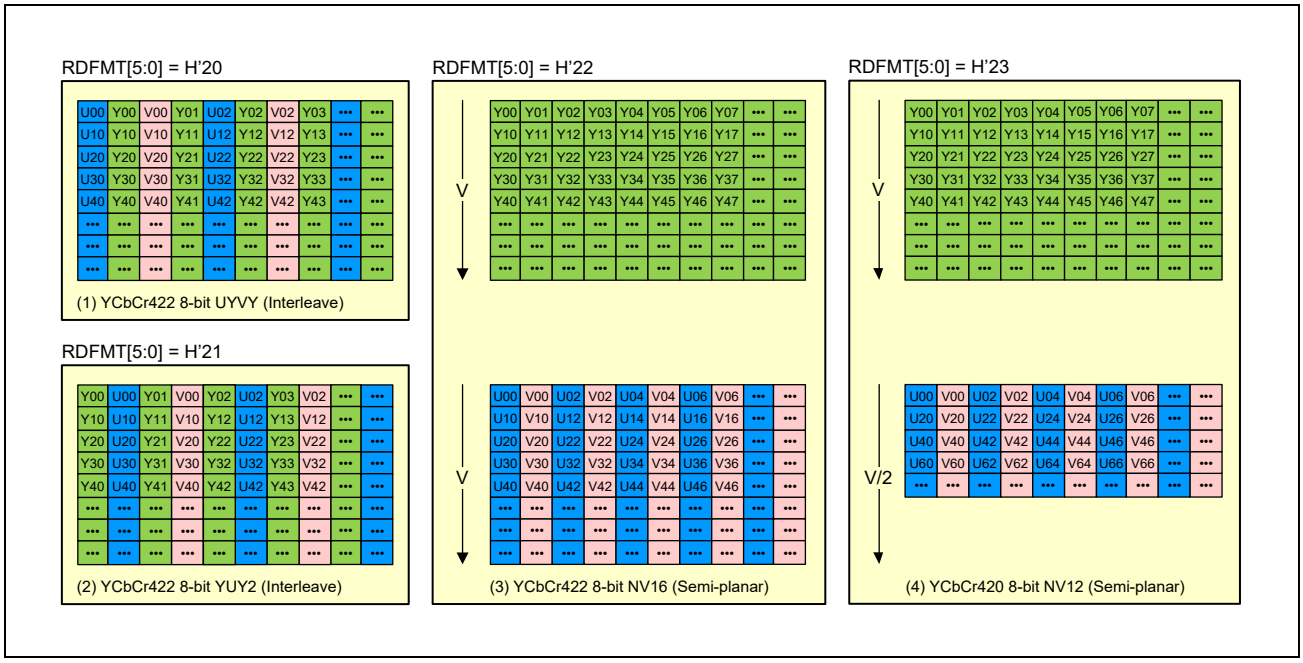

Figure 36.11 YCbCr/YUV Support Format

ISU can handle only Offset Binary as the chroma data format (CbCr/UV). Therefore, it is necessary to convert from Two's Complement Binary to Offset Binary.

### ■ ISU_RPF_UVBIN.UVCHG = 0 (Default)

ISU uses original data on DRAM as chroma value when RDFMT = H'20 to H'23.
(CrCb/UV is Offset Binary.)

### ■ ISU_RPF_UVBIN.UVCHG = 1

ISU convert chroma data (CrCb/UV) from Two's Complement Binary to Offset Binary.

| Decimal Number | Offset Binary | Decimal Number | Two's Compliment Binary |
|---|---|---|---|
| 127 | 1111 1111 | 127 | 0111 1111 |
| 126 | 1111 1110 | 126 | 0111 1110 |
| 1 | 1000 0001 | 1 | 0000 0001 |
| 0 | 1000 0000 | 0 | 0000 0000 |
| –1 | 0111 1111 | –1 | 1111 1111 |
| –128 | 0000 0000 | –128 | 1000 0000 |

Figure 36.12 Types of Binary Expression

### ■ RAW

This function supports 3 RAW formats as shown below. All formats are "Number of planes = 1".

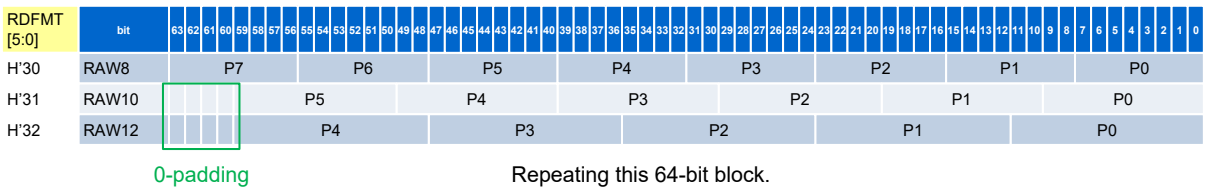

Figure 36.13 RAW Support Format

### 36.1.3.3 Data Extraction

The 8-bit normalization is required for ARGB/RGB and RAW formats since Resizer can handle the 8-bit format only.

On the other hand, although YCbCr/YUV does not need the 8-bit normalization since its components are already 8-bit, it is necessary to exchange into the YCbCr/YUV444 format.

#### ■ RGB/ARGB

For the RGB/ARGB format normalization, higher bits are copied to lower bits.

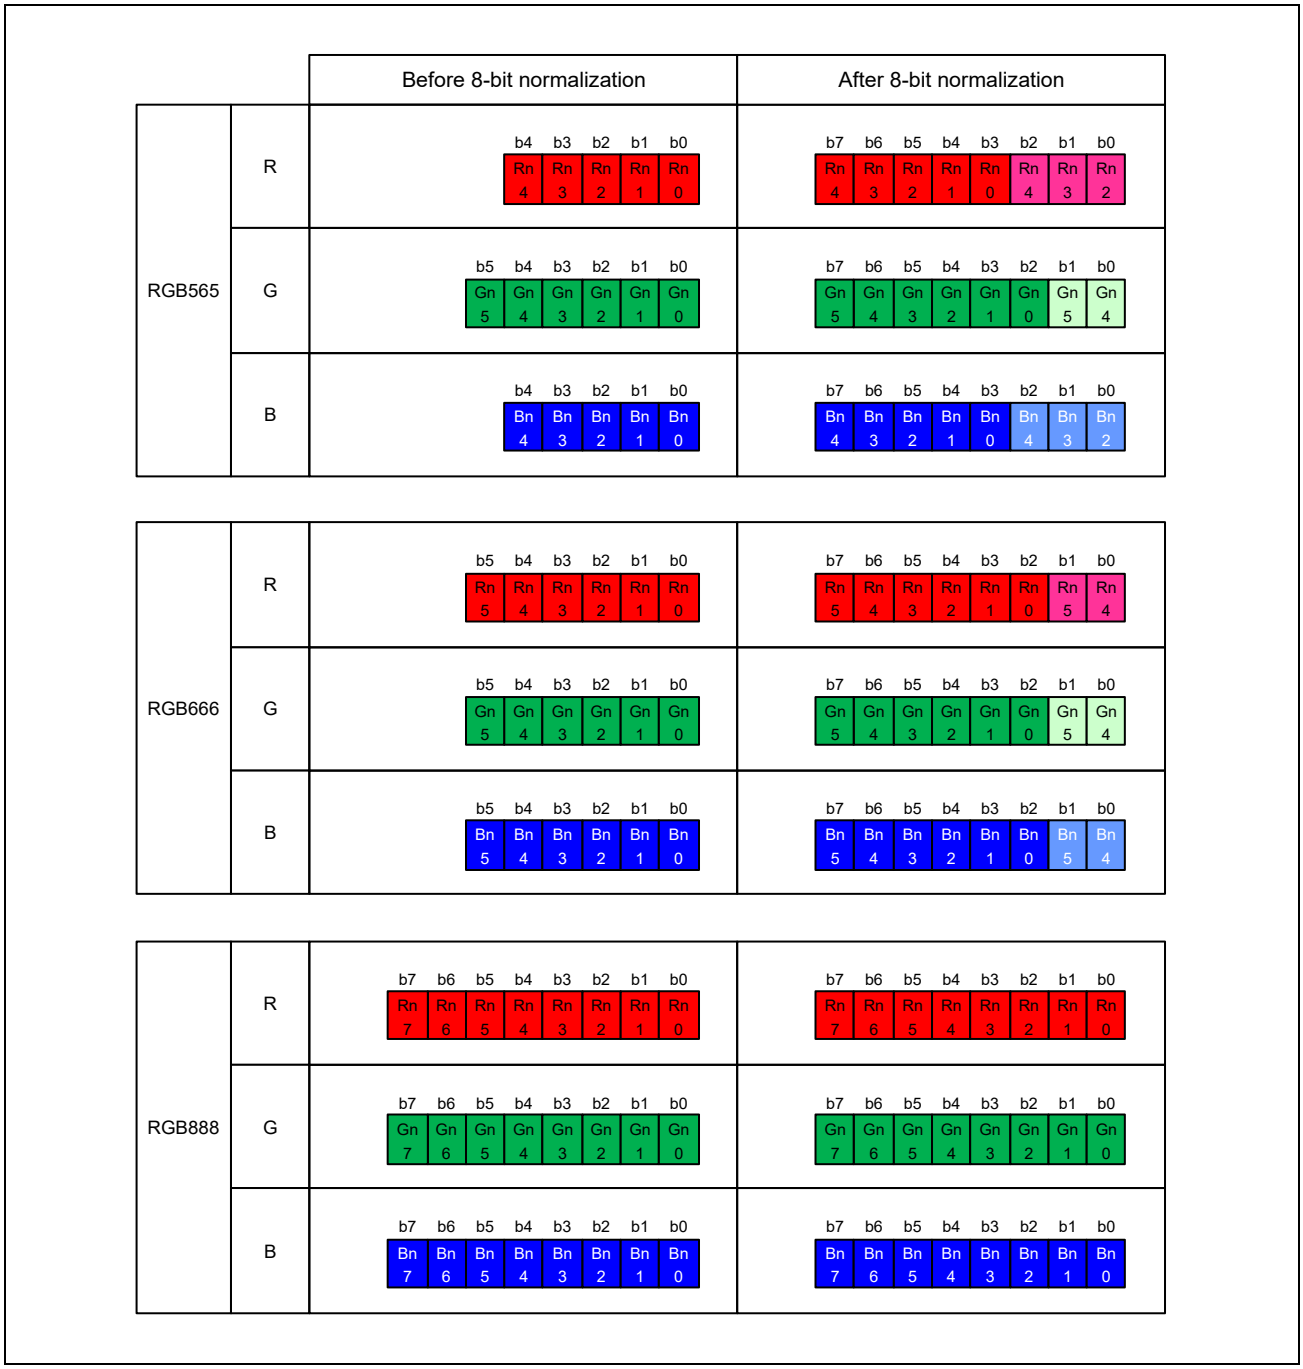

Figure 36.14 8-bit Normalization for RGB Format

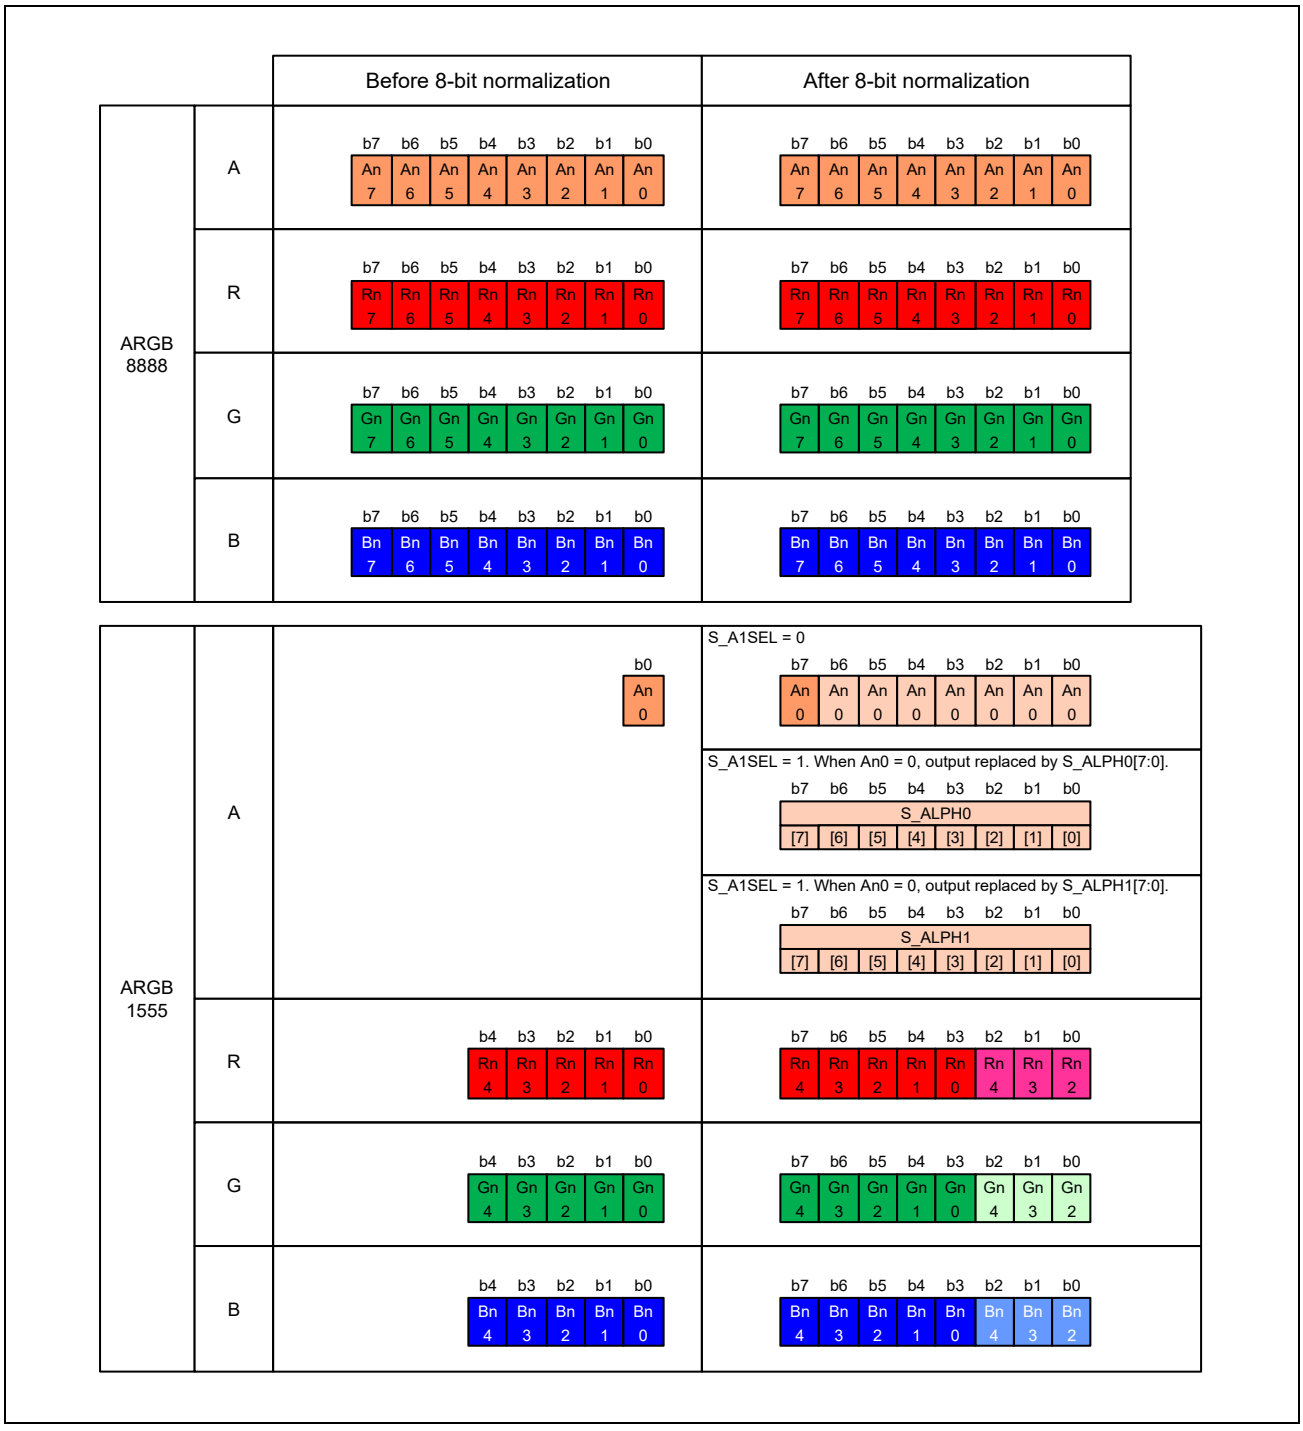

Figure 36.15 8-bit Normalization for ARGB Format

## ■ YCbCr/YUV

For YCbCr/YUV420 Semi-Planar format, even line re-use previous odd line's chroma information.

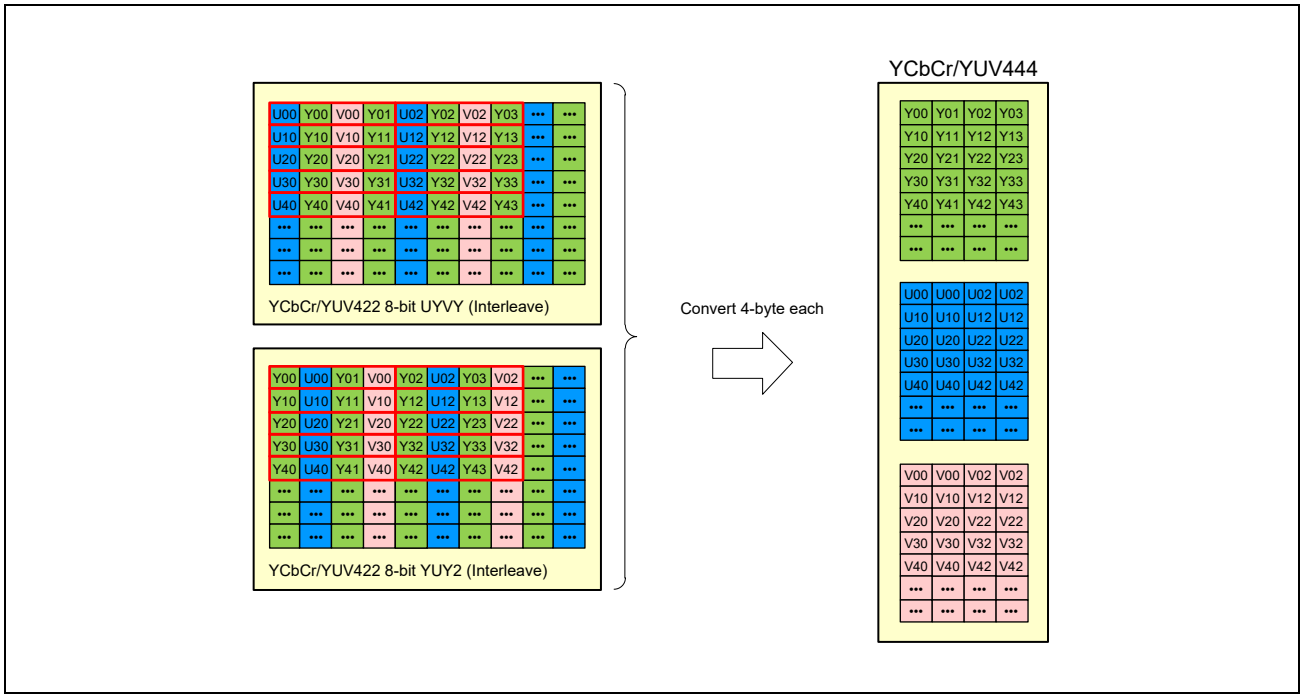

Figure 36.16 YCbCr/YUV444 Conversion from YCbCr/YUV422 Format

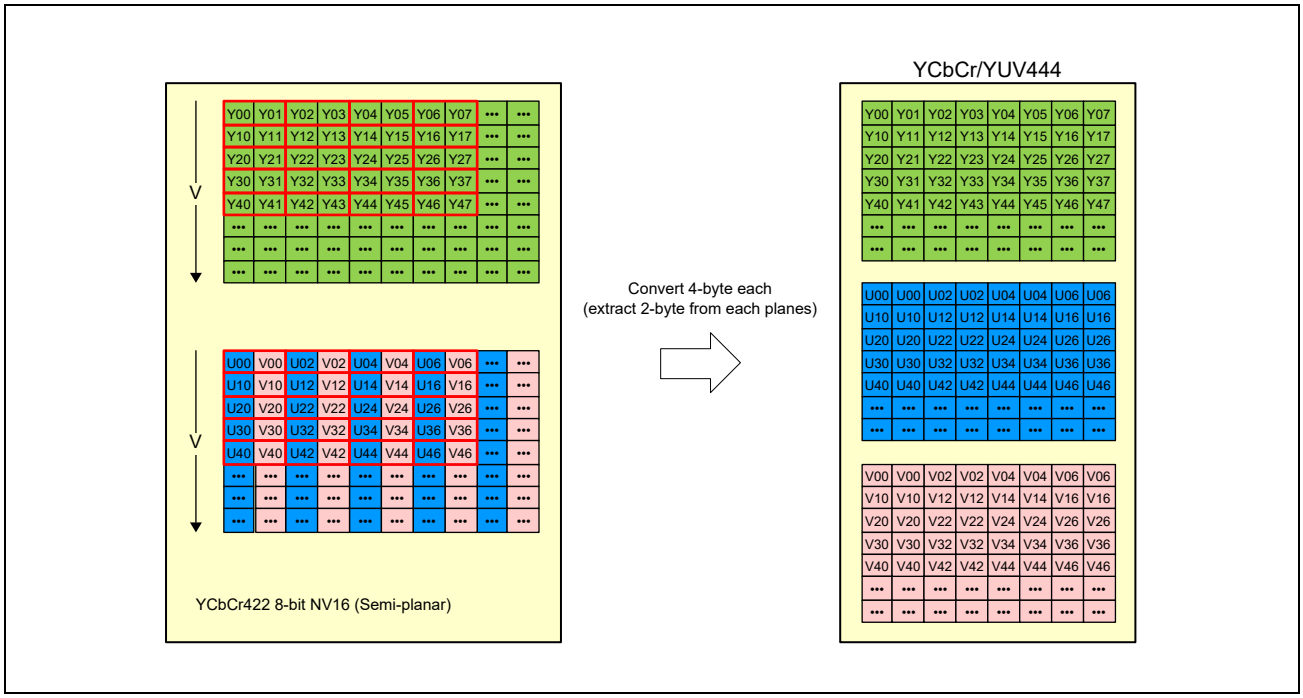

Figure 36.17 YCbCr/YUV444 Conversion from YCbCr/YUV422 Semi-Planar Format

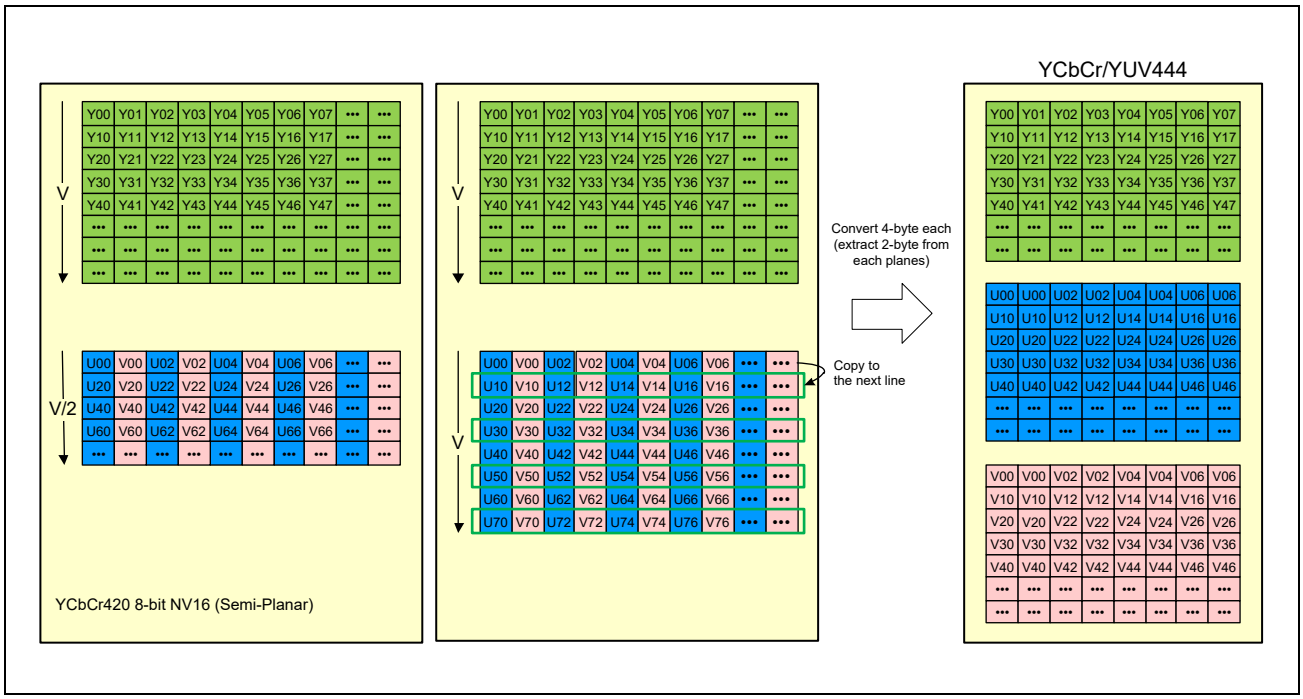

Figure 36.18 YCbCr/YUV444 Conversion from YCbCr/YUV420 Semi-Planar Format

## ■ RAW

RAW is converted to 8-bit by using higher 8 bits of RAW8-/10-/12-bit.

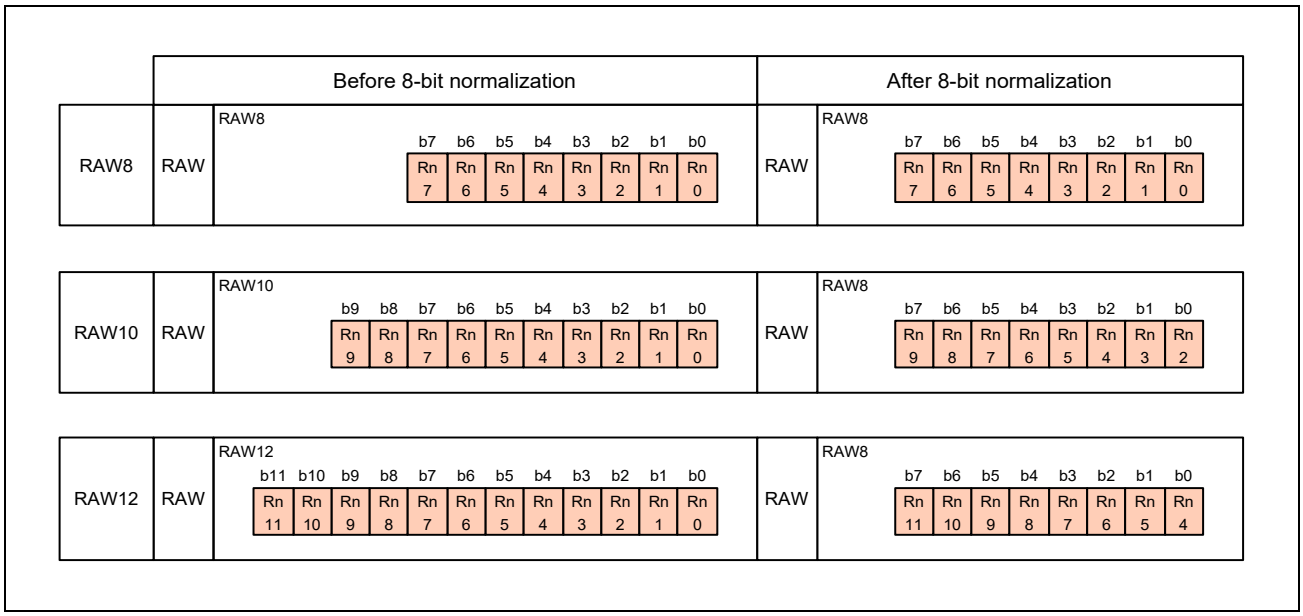

Figure 36.19 8-bit Normalization for RAW Format

### 36.1.3.4 Test Pattern Generation

Instead of the input image data from the AXI-Master, RPF can generates a test pattern and outputs it to the Resizer.

The test pattern is an 8-bit gradation image from the upper left to the lower right in the ARGB8888 format according to the register setting.

Please switch between the test pattern and the input image data from the AXI-Master according below procedure.

1. Enable the test pattern. (ISU_RPF_SRC_TD1.TMODE_EN = 1b)
2. Start the resizing process. (ISU_FM_FRCON.START = 1b)

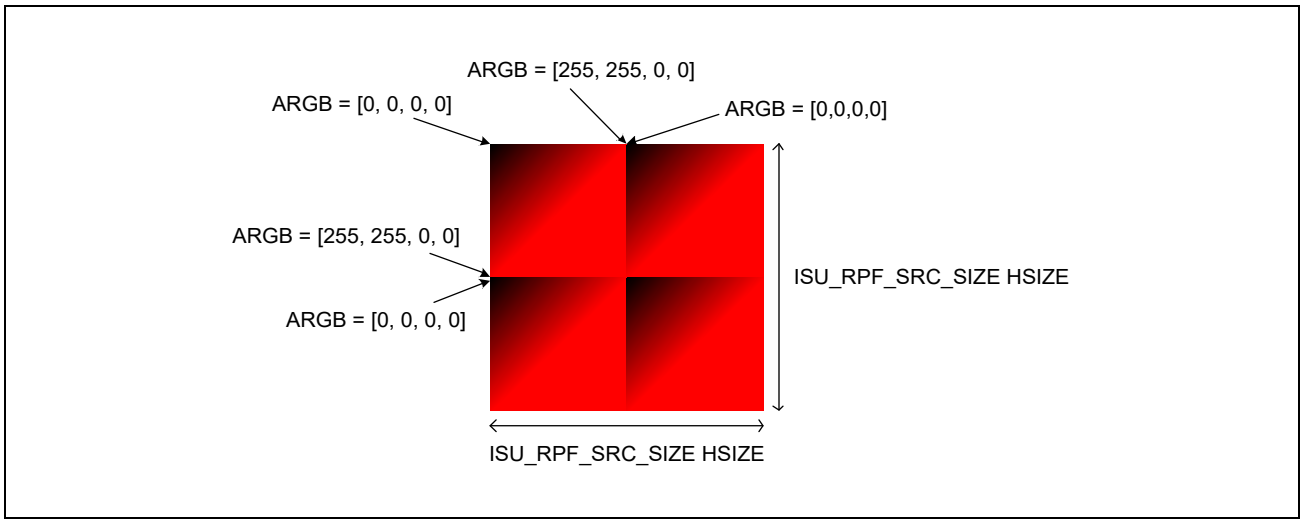

Figure 36.20 Test Pattern of R Gradation

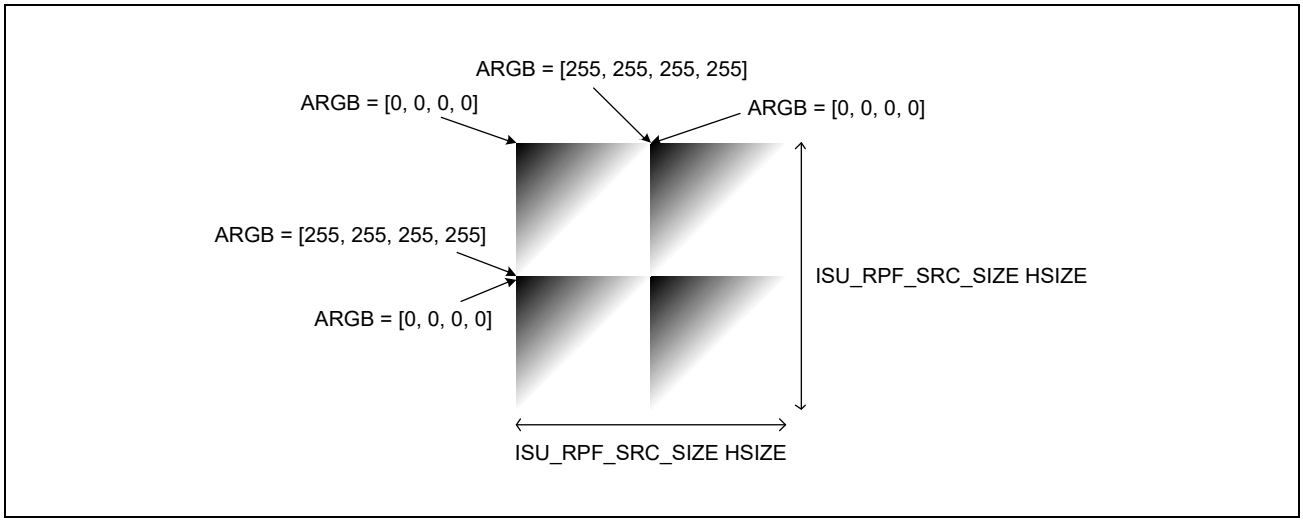

Figure 36.21 Pattern of R,G,B Gradation

### 36.1.4 Resizer (RS)

Resizer (RS) reduces the image size by using bi-linear algorithm (4-point linear interpolation) according to register setting of horizontal / vertical resize ratio.

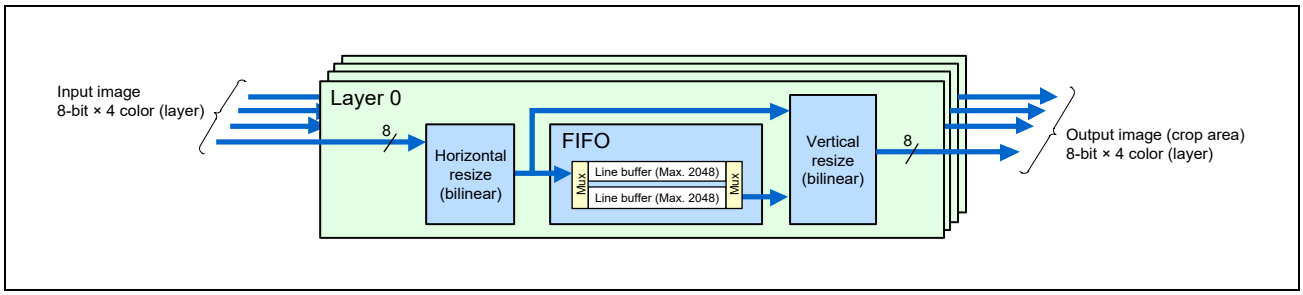

Figure 36.22 Resizer Block Diagram

The resize processing is different whether the Resized image size is smaller or larger than the Crop area.

If the Resized image size is smaller than the Crop area, fill in the missing edge pixels according to the register settings below.

When ISU_RS_PADDMODE.PADDSEL = 0, fill in the padding area by copying the right / bottom edge pixels after the reduction.

When ISU_RS_PADDMODE.PADDSEL = 1, fill in the padding area with the value specified by the register.

If the Resized image size is larger than the Crop area, it will be cut off by the Crop area.

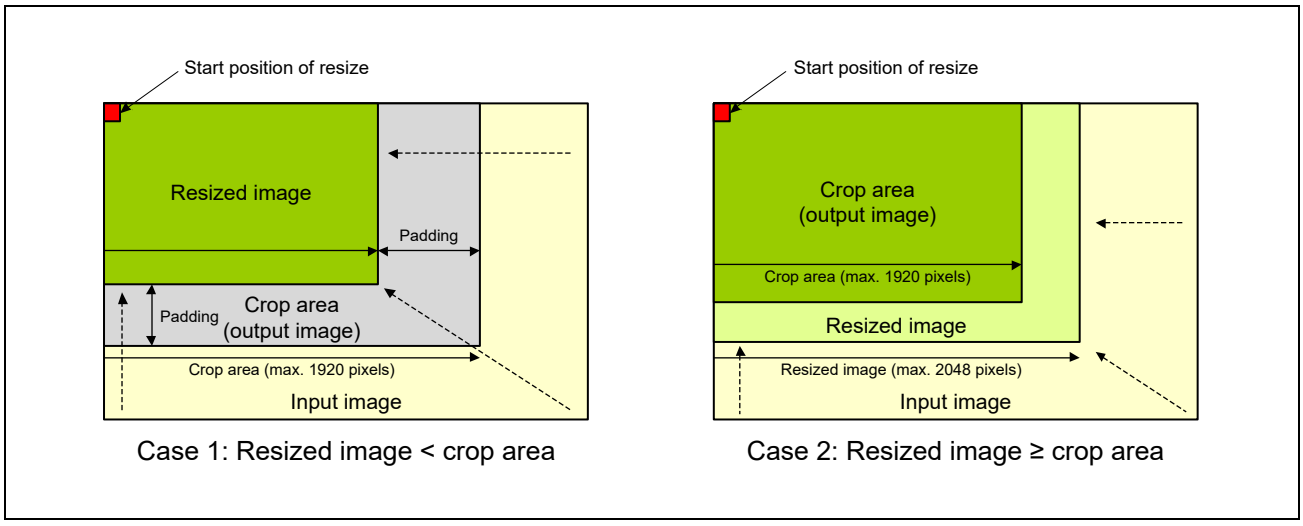

Figure 36.23 Relationship of Resized Image and Crop Area

### 36.1.4.1 Resize Start Position

The resize processing start from Resize Start Position (ISU_RS_STPOS) on the input image in according to the register setting. This position setting is specified in pixel coordinates from the top left of the image. If 0 is specified, the input image will be the Resizer (RS) target image as it is.

Padding area will be filled based on the setting of ISU_RS_PADDMODE.PADDSEL.

- Register ISU_RS_STPOS.HSTART = Resize Start H position
- Register ISU_RS_STPOS.VSTART = Resize Start V position

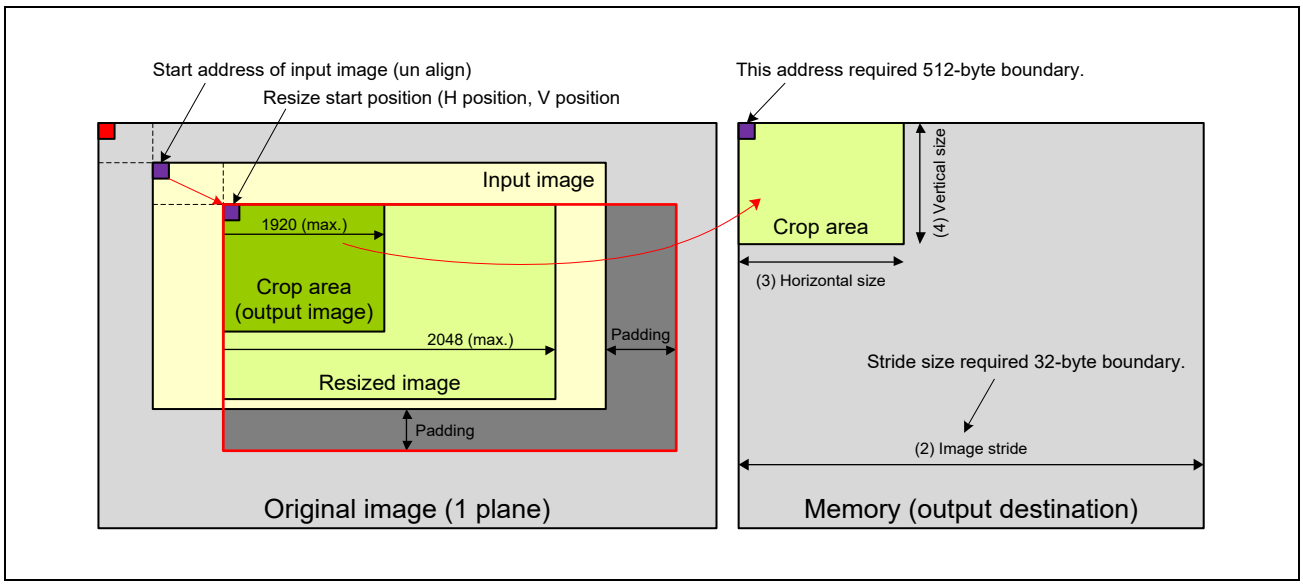

Figure 36.24 Resize Start Position

### 36.1.4.2 Sub Pixel Offset

The Resize Start Position Tuning (ISU_RS_POS_TUNE) can be used to adjust the start position by sub pixel level to reduce moiré.

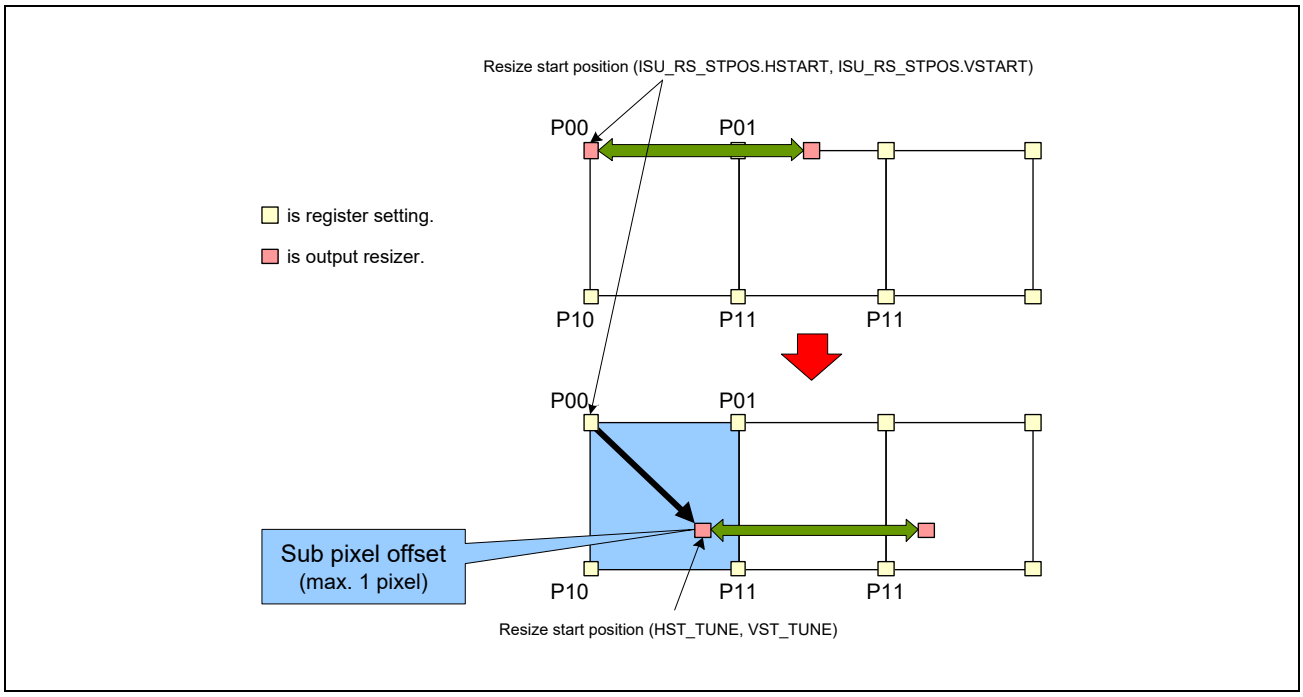

Figure 36.25 Sub Pixel Position Adjustment

### 36.1.4.3 Scaling Calculation

The coefficients are defined in **Table 36.8**.

Table 36.8 Scaling Coefficient Setting

| No. | Category | Register | Variation |
|---|---|---|---|
| (1) | Horizontal Scaling Ratio | ISU_RS_HSCALE.HMANT[3:0] | • $m_h$: Integer part of Horizontal scaling coefficient. |
| | | ISU_RS_HSCALE.HFRAC[11:0] | • $f_h$: Fraction part of Horizontal scaling coefficient. |
| (2) | Vertical Scaling Ratio | ISU_RS_VSCALE.VMANT[3:0] | • $m_v$: Integer part of Vertical scaling coefficient. |
| | | ISU_RS_VSCALE.VFRAC[11:0] | • $f_v$: Fraction part of Vertical scaling coefficient. |

Follow the procedure below to set the coefficients.

**Step 1:** Estimation of scaling factor

The resizer can be handled resizing magnification independently for horizontally and vertically. The image size of this processing result can be calculated approximately by using “Input image horizontal size × hscale” and “Input image vertical size × vscale”.

$$\text{hascale} = \frac{4096}{4096 \times m_h + f_h} \qquad \text{vscale} = \frac{4096}{4096 \times m_v + f_v}$$

**Step 2:** Conversion of set values

Convert the set values according to **Table 36.9**.

Table 36.9 $m_h$' or $m_v$' Settings

| ISU_RS_HSCALE.HMANTsetting (ISU_RS_VSCALE.VMANTsetting) | $m_h$' ($m_v$') |
|---|---|
| 1 to 3 | 1 |
| 4 to 7 | 2 |
| 8 to 15 | 4 |

**Step 3:** Fine-tuning of size calculations

- Definitions

  $hsize_{org}$: Input horizontal image size
  $vsize_{org}$: Input vertical image size
  $hsize_{down_scaled}$: Horizontal image size after scale down
  $vsize_{down_scaled}$ : Vertical image size after scale down
  < >: Rounding down to the decimal point

- Formula

$$hsize_{down_scaled} = \langle 1 + \left[ \left[ \langle 1 + \frac{hsize_{org} - 1}{m_{\acute{h}}} \rangle - 1 \right] \times m_{\acute{h}} \times 4096 \right] / (4096 \times m_h + f_h) \rangle$$

$$vsize_{down_scaled} = \langle 1 + \left[ \left[ \langle 1 + \frac{vsize_{org} - 1}{m_{\acute{v}}} \rangle - 1 \right] \times m_{\acute{v}} \times 4096 \right] / (4096 \times m_v + f_v) \rangle$$

**Step 4:** Adjustment

If the down scaled image size does not match the intended size, the values of $f_h$ and $f_v$ are fine-tuned and recalculated to find $f_h$ and $f_v$ that result in the desired output down scaled size.

The values thus obtained are set to the corresponding register values RS_HSCALE and RS_VSCALE.

### 36.1.4.4 Resize Processing

The following figure shows the processing image of bi-linear algorithm (4-point interpolation).

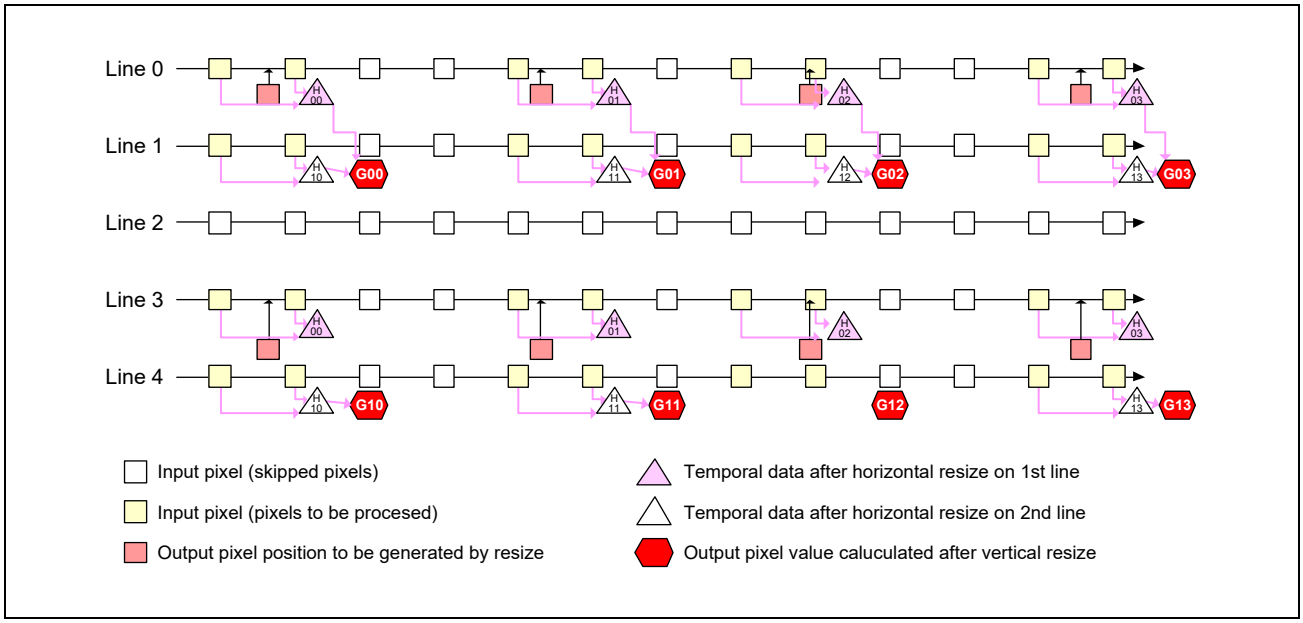

Figure 36.26 Points Bi-Linear Resize

The outline of the calculation procedure of 4-point linear interpolation is shown below.

Although dH and dV are not exist actually, it is used to help understanding for this algorithm. The pixel value of the target pixel position G00 will be calculated from the nearest 4 input pixels, and dH and dV indicate sub pixel position of G00 calculated from Horizontal/Vertical scaling ratio.

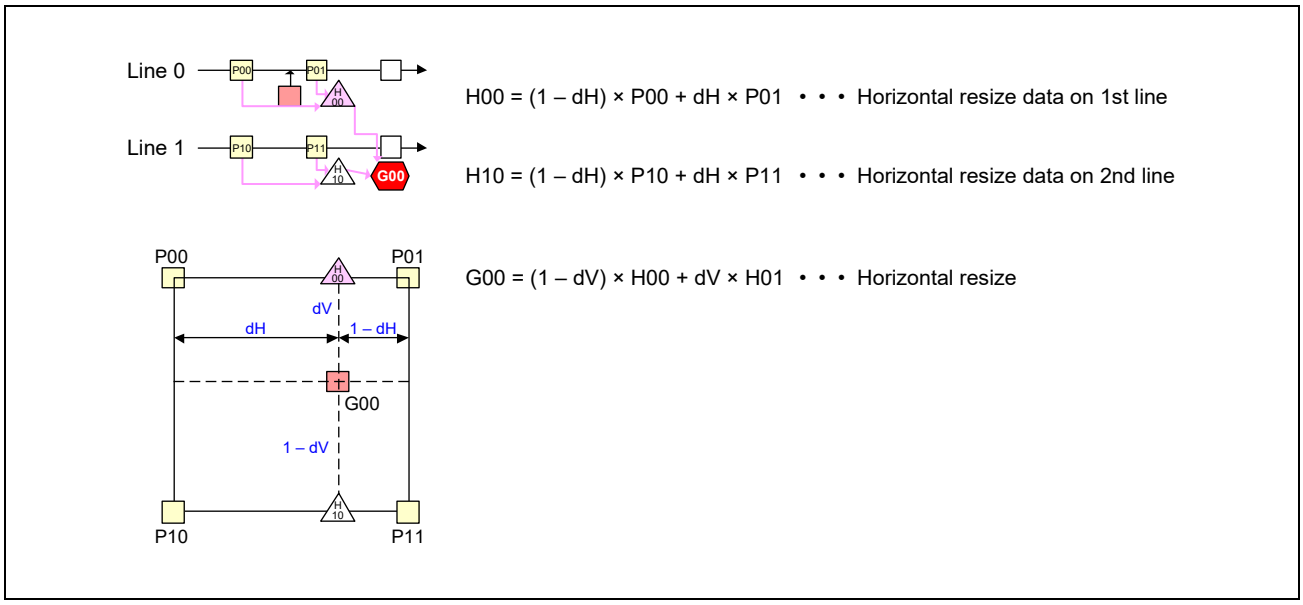

Figure 36.27 Calculation for 4 Points Bi-linear Resize

### 36.1.5 Write Pixel Formatting (WPF)

WPF converts the resized image data from RS and outputs it to AXI-Master.

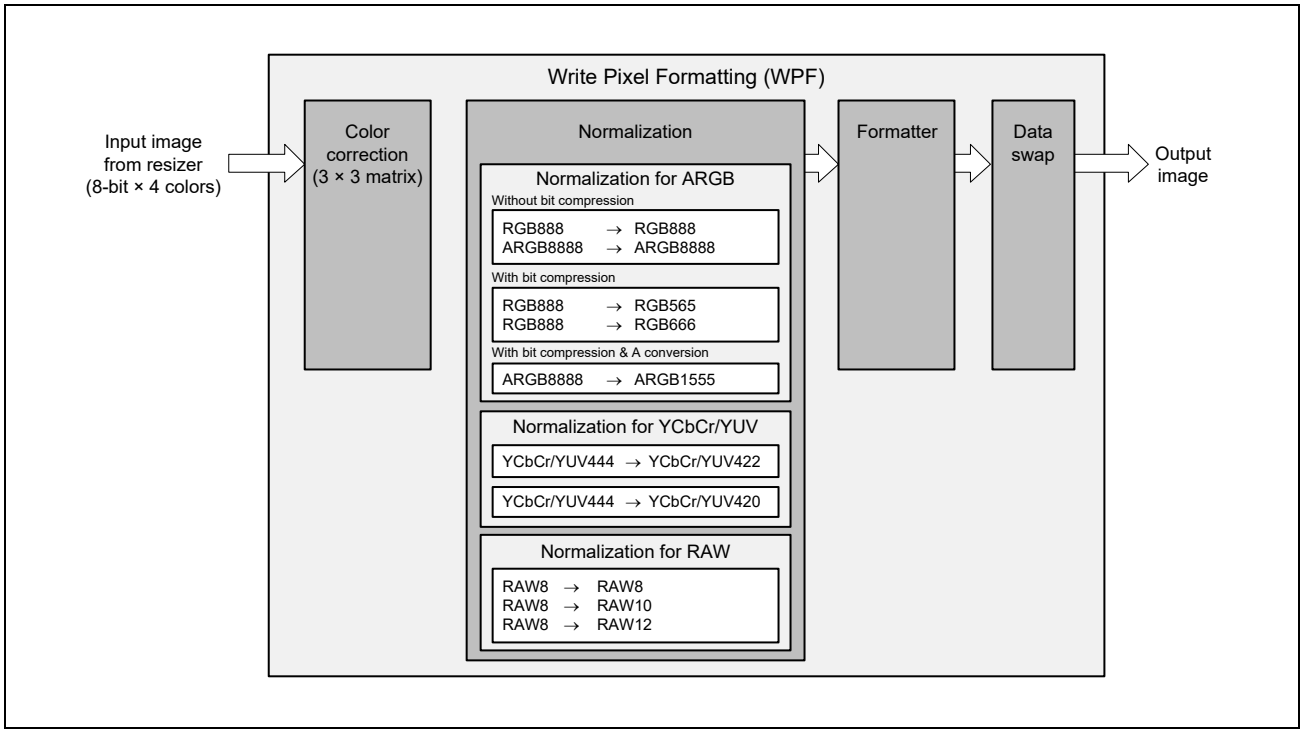

Figure 36.28 WPF Block Diagram

### 36.1.5.1 Color Correction

This function is for the color space conversion among RGB, YCbCr, and YUV by using 3 × 3 color matrix. Matrix coefficients can be set by registers. The matrix calculation formula and circuit block diagram are shown below.

3 × 3 Matrix

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFST_A1 \\ B - OFST_B1 \\ C - OFST_C1 \end{bmatrix} + \begin{bmatrix} OFST_A2 \\ OFST_B2 \\ OFST_C2 \end{bmatrix}$$

Level clipping

$$C1'' = MAX\ (CLPMIN_A, MIN\ (CLPMAX_A, C1'))$$
$$C2'' = MAX\ (CLPMIN_B, MIN\ (CLPMAX_B, C2'))$$
$$C3'' = MAX\ (CLPMIN_C, MIN\ (CLPMAX_C, C3'))$$

Figure 36.29 Color Correction Equation

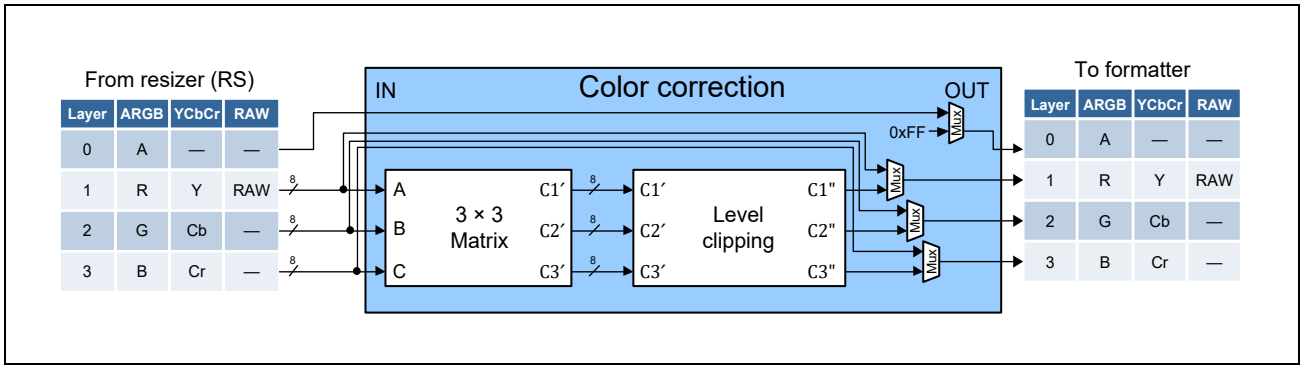

Figure 36.30 Color Correction Block Diagram

Sample setting of color matrix are shown below.

Conversion between RGB and YUV (PAL, SECAM)

$$\begin{bmatrix} Y_{OUT} \\ U_{OUT} \\ V_{OUT} \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.147 & -0.289 & 0.436 \\ 0.615 & -0.515 & -0.100 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.140 \\ 1.000 & -0.395 & -0.580 \\ 1.000 & 2.032 & -0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (U_{in} - 128) \\ (V_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion between RGB and YCbCr ITU-R BT.601 / BT.709 (1250/50/2:1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.169 & -0.331 & 0.500 \\ 0.500 & -0.419 & -0.081 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.402 \\ 1.000 & -0.344 & -0.714 \\ 1.000 & 1.772 & -0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (Cb_{in} - 128) \\ (Cr_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion between RGB and YCbCr ITU-R BT.709 (1125/60/2:1)

$$\begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \begin{bmatrix} 0.213 & 0.715 & 0.072 \\ -0.115 & -0.385 & 0.500 \\ 0.500 & -0.454 & -0.046 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.575 \\ 1.000 & -0.187 & -0.468 \\ 1.000 & 1.856 & -0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (Cb_{in} - 128) \\ (Cr_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion from RAW to RGB or YCbCr/YUV (Grayscale)

$$\begin{bmatrix} R_{OUT} \\ G_{OUT} \\ B_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 0.000 \\ 1.000 & 0.000 & 0.000 \\ 1.000 & 0.000 & 0.000 \end{bmatrix} \begin{bmatrix} RAW_{in} \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \qquad \begin{bmatrix} Y_{OUT} \\ Cb_{OUT} \\ Cr_{OUT} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 0.000 \\ 0.000 & 0.000 & 0.000 \\ 0.000 & 0.000 & 0.000 \end{bmatrix} \begin{bmatrix} RAW_{in} \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

### 36.1.5.2 Normalization

This function converts each color data into appropriate bit depth.

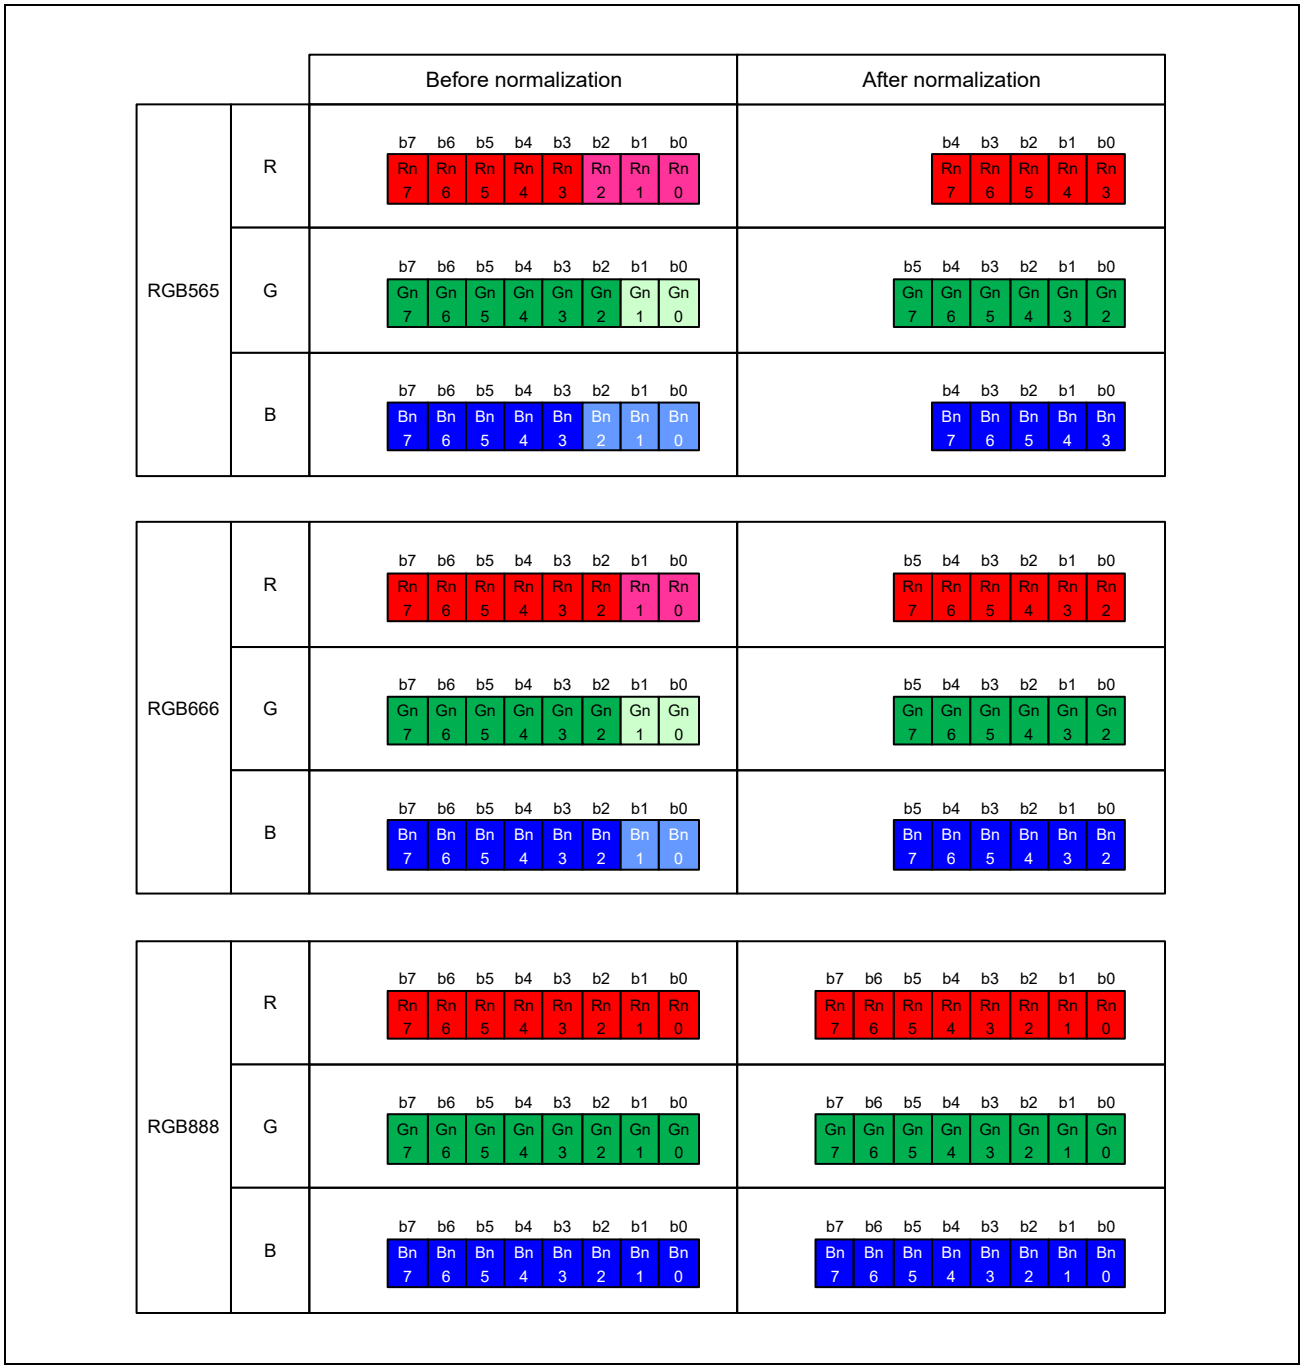

Figure 36.31 Normalization for RGB Format

■ **ARGB**

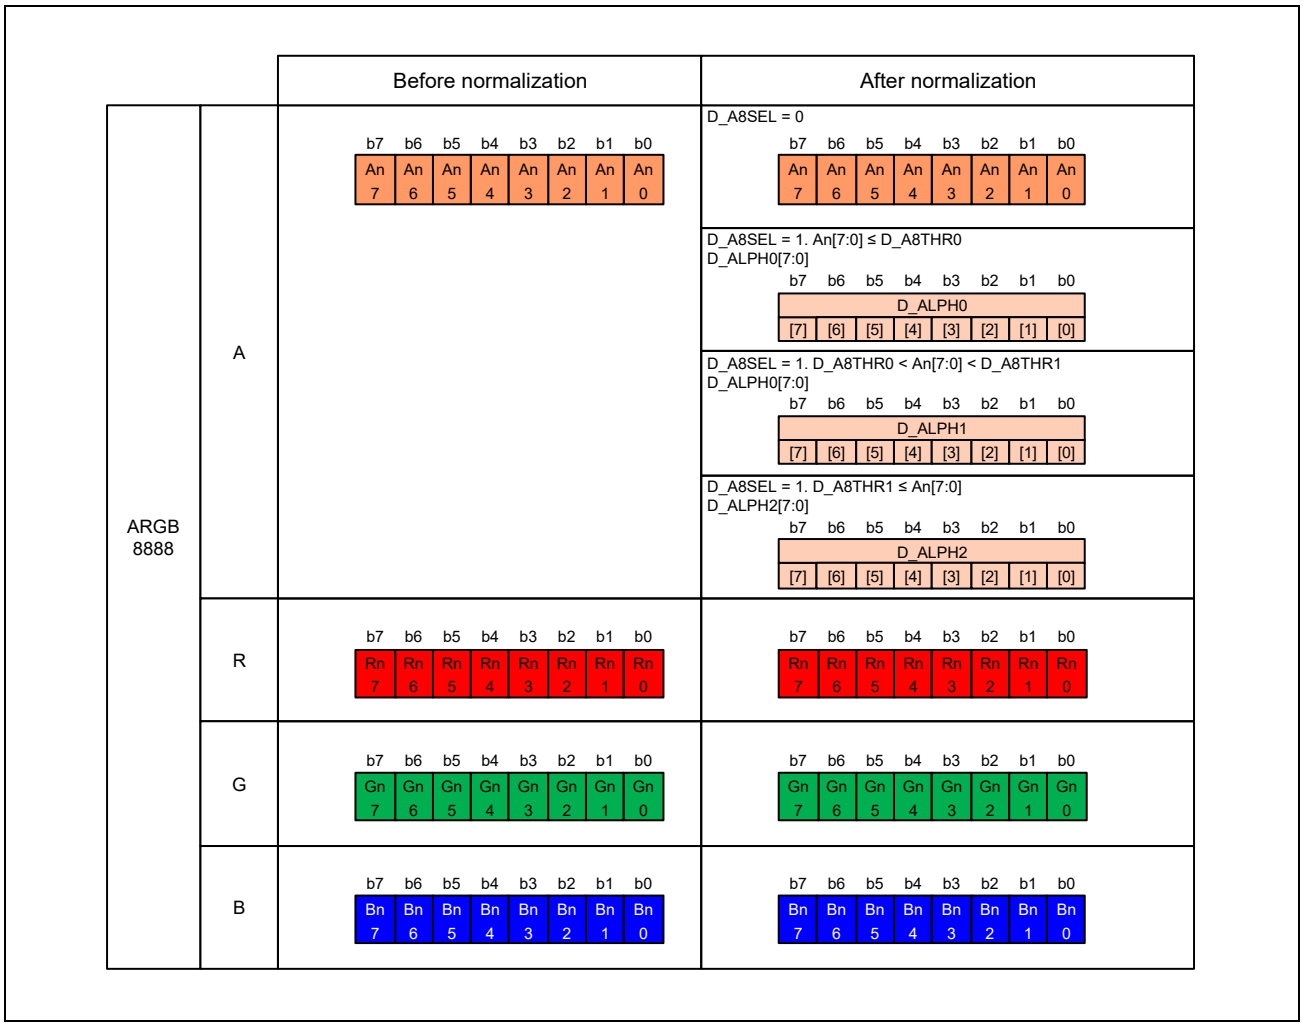

Figure 36.32 Normalization for ARGB8888 Format

"A(An)" of ARGB8888 is normalized according to the following logic.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 0, An is output as it is.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 1, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL2.D_A8THR0 to 1 and An.

If An ≤ D_A8THR0, replace it with ISU_WPF_ALPH_VAL.D_ALPH0.

If D_A8THR0 < An <D_A8THR1, replace it with ISU_WPF_ALPH_VAL.D_ALPH1.

If D_A8THR1 ≤ An, replace it with ISU_WPF_ALPH_VAL.D_ALPH2.

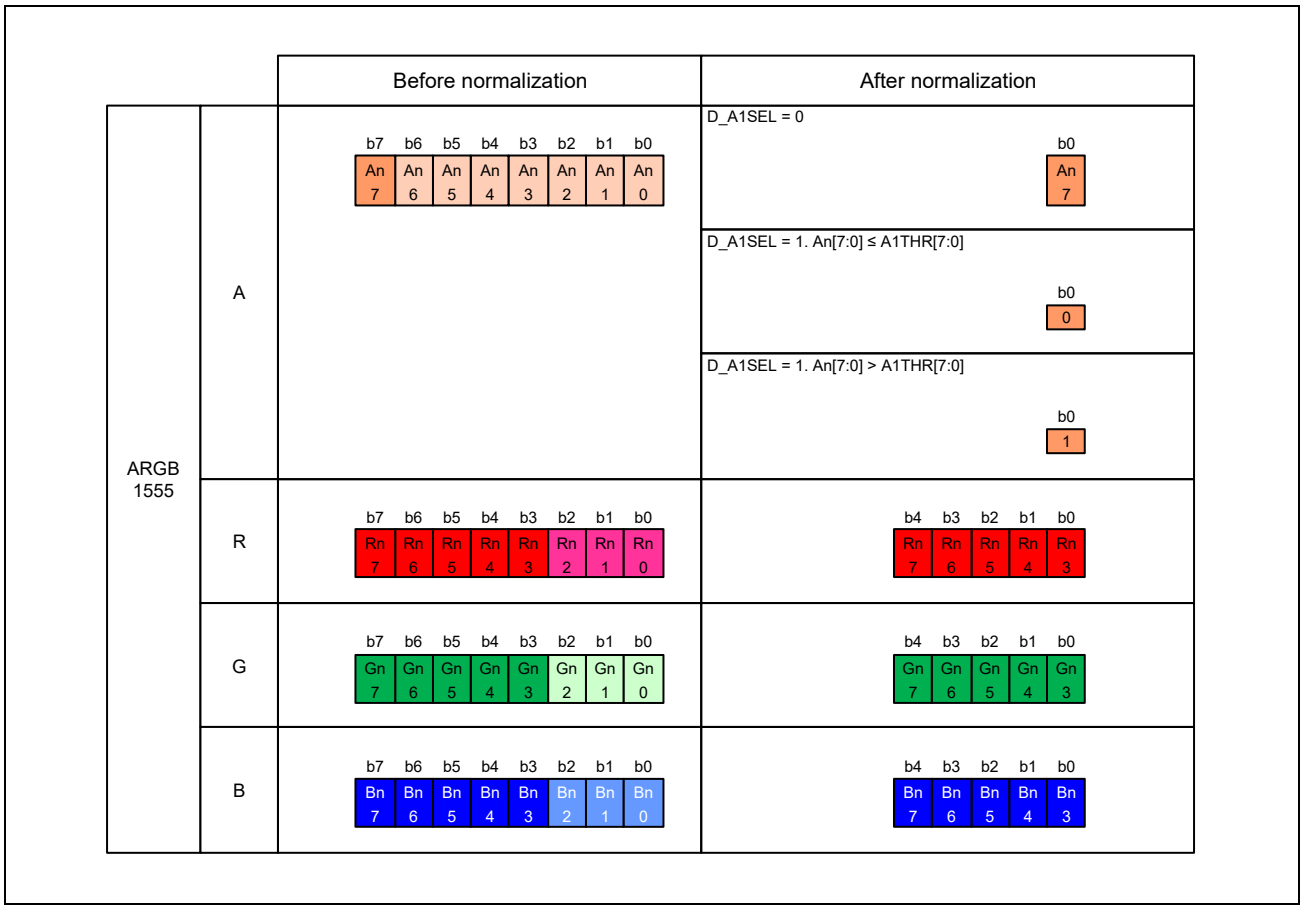

Figure 36.33 Normalization for ARGB1555 Format

“A(An)” of ARGB1555 A is compressed according to the following.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 0, An7 is output.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 1, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL1.D_A1THR and An.

If An ≤ D_A1THR, 0 is output.

If D_A1THR < An, 1 is output.

■ **YCbCr/YUV**

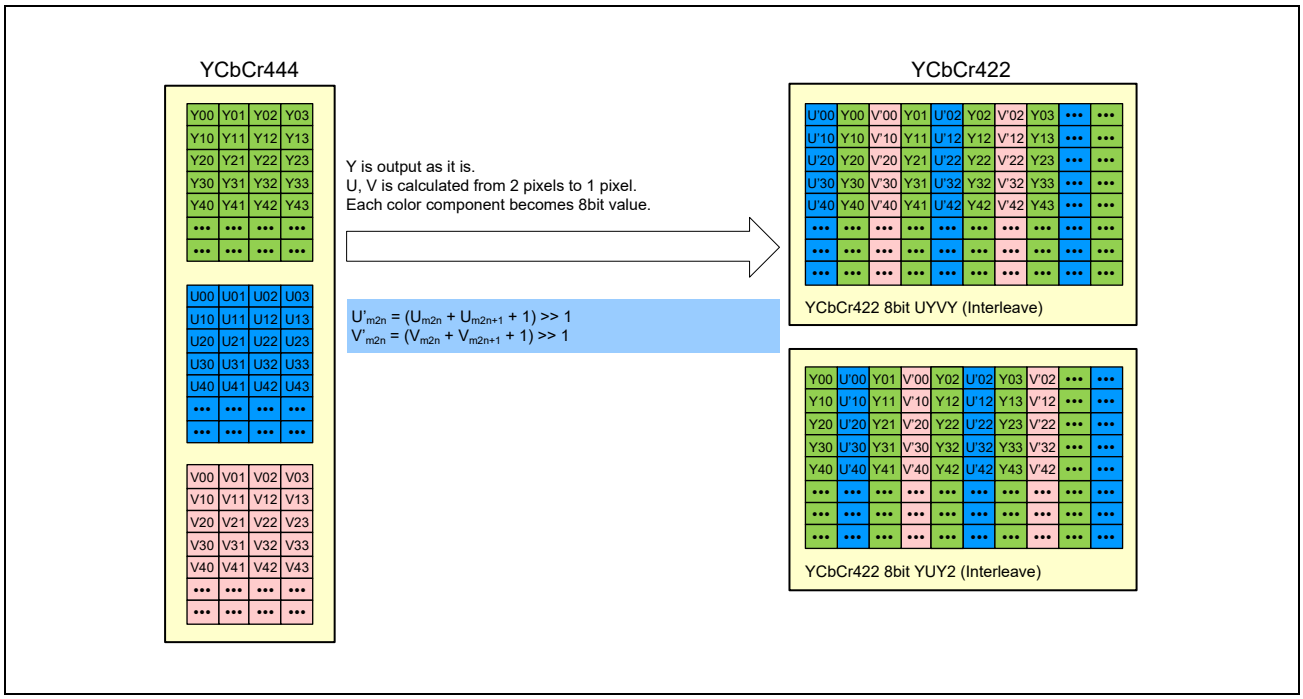

Figure 36.34 Normalization for YCbCr/YUV422 (Interleave) Format

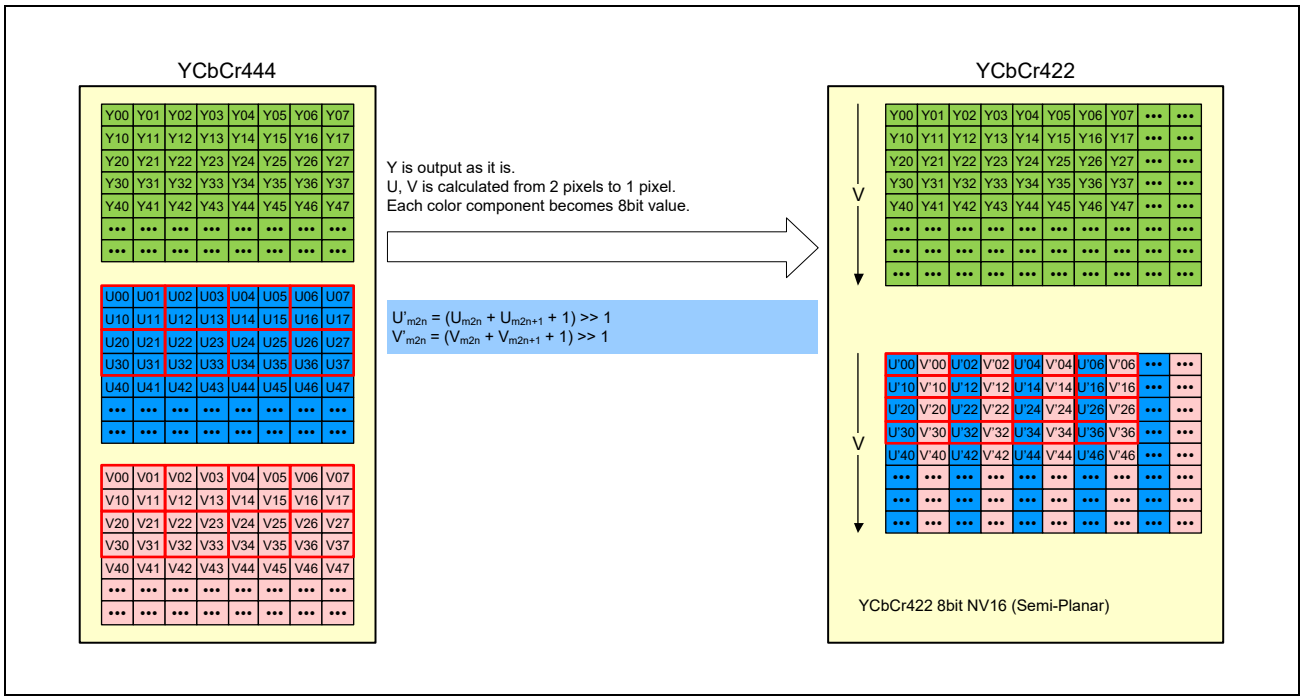

Figure 36.35 Normalization for YCbCr/YUV422 (Semi-Planar) Format

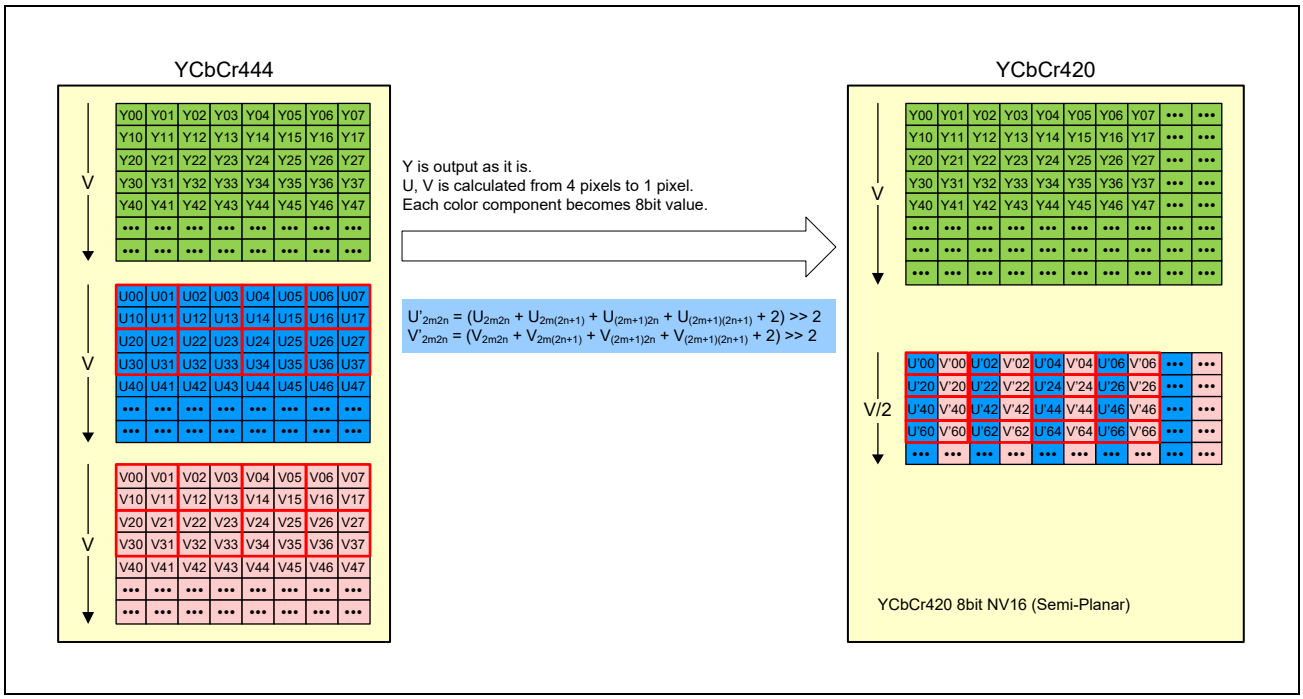

Figure 36.36 Normalization for YCbCr/YUV420 Format

## ■ RAW

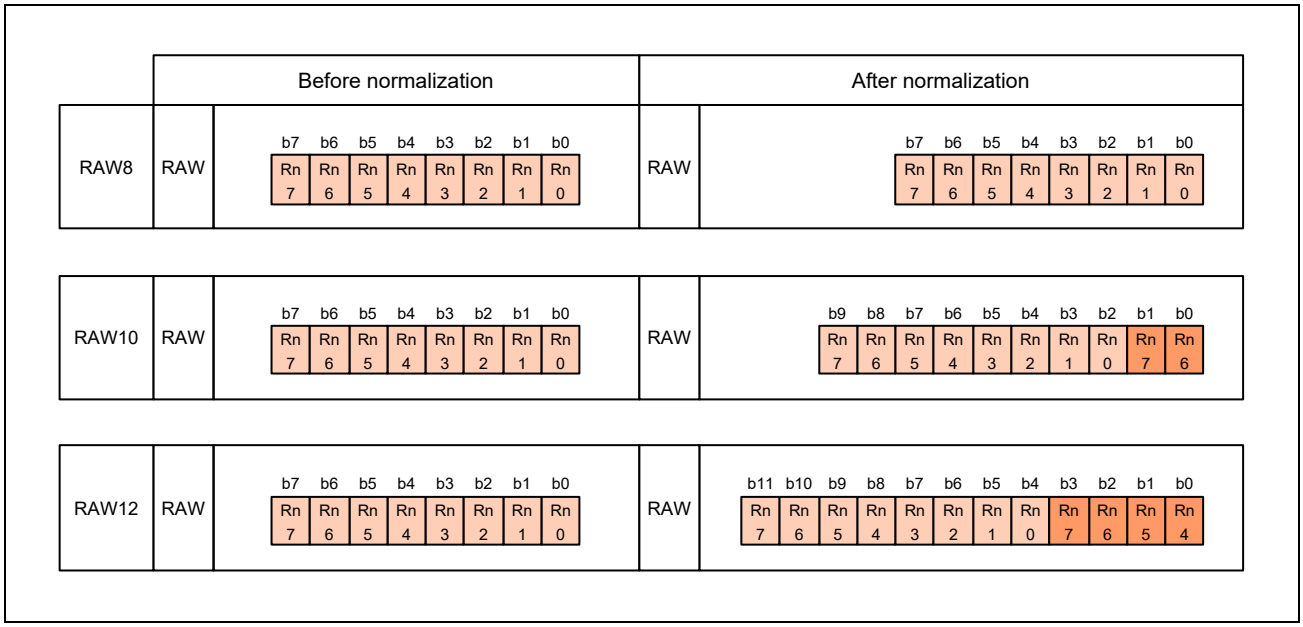

Figure 36.37 Normalization for RAW Format

### 36.1.5.3 WPF Formatter

The following data formats are described as 2-/3-/4-/8-byte per unit. Eventually, these data unit are packed in 32-byte (256-bit) each so that it can be handled in next process. Image format setting is indicated by ISU_WPF_FMT.WDFMT[5:0].

#### ■ RGB/ARGB

This function supports 8 ARGB/RGB formats as shown below. All formats are “Number of planes = 1”.

Table 36.10 ARGB Support Format

| Format | | | | | n | | | | | | | | n + 1 | | | | | | | | n + 2 | | | | | | | | n + 3 | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## ■ YCbCr/YUV

This function supports 4 YCrCb/YUV formats as shown below.

Table 36.11 YCbCr/YUV Support Format

| Data Format | RDFMT[5:0] | Color Format | Alias | Figure Index |
|---|---|---|---|---|
| Interleave (Number of Planes = 1) | H'20 | YCbCr422 8-bit | UYVY | (1) |
| | H'21 | YCbCr422 8-bit | YUY2 | (2) |
| Semi-Planar (Number of Planes = 2) | H'22 | YCbCr422 8-bit | NV16 | (3) |
| | H'23 | YCbCr420 8-bit | NV12 | (4) |

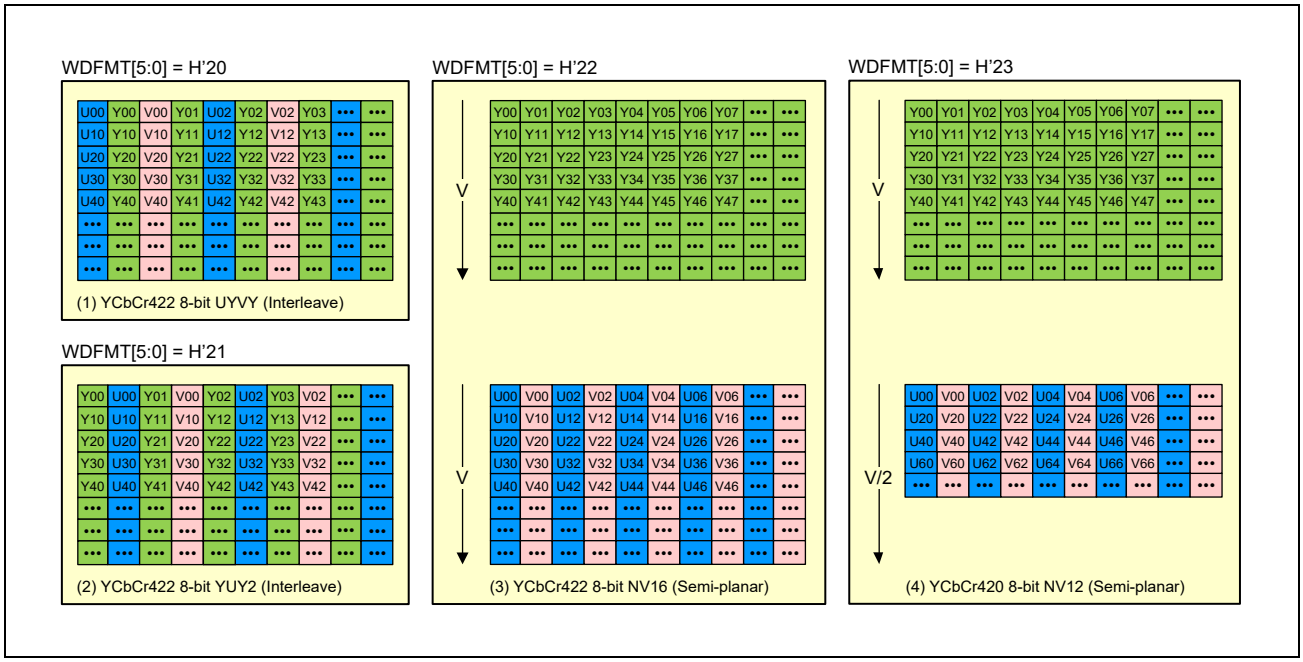

Figure 36.38 YCbCr/YUV Support Format

## ■ RAW

This function supports 3 RAW formats as shown below. All formats are “Number of planes = 1”.

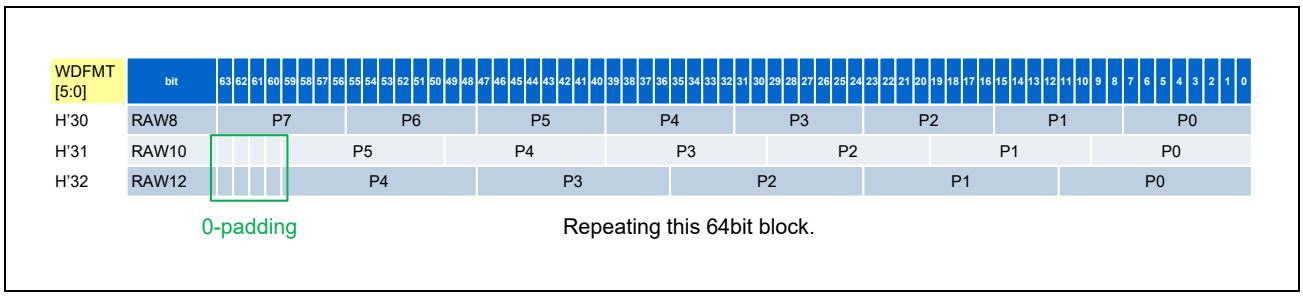

Figure 36.39 RAW Support Format

### 36.1.5.4 Data Swap (Endian Correction)

This function corrects the byte order so that modify endian of data on memory. Each bytes can be arranged any order according to the register setting.

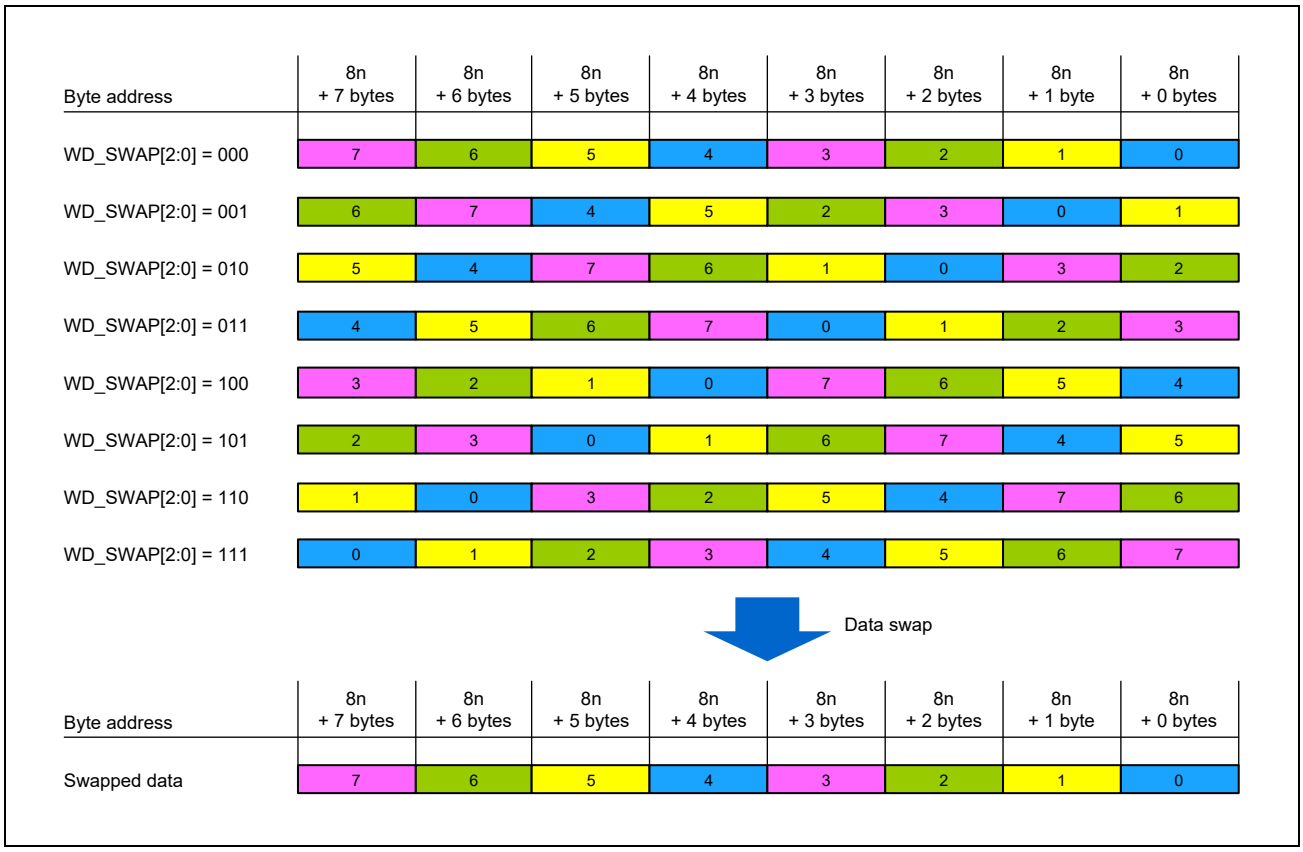

Figure 36.40 Data Swap Correction

## 36.2 Register Configuration

The address of the ISU register is represented by the offset address from the base address. ISU base address is as follows:

Base Address: H'0_1084_0000 (Cortex-A55 Address Space)
Base Address: H'4084_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'5084_0000 (Cortex-M33 Address Space Secure)

### 36.2.1 System Management Register

"System Management Register" sets descriptor processing and interrupts control.

The descriptor cannot access these registers.

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| FM Descriptor List Address Registers 0 | ISU_FM_DL_STADDH | R/W | H'0000_0000 | H'000 | 32 |
| FM Descriptor List Address Registers 1 | ISU_FM_DL_STADDL | R/W | H'0000_0000 | H'004 | 32 |
| FM Frame Control Registers | ISU_FM_FRCON | R/W | H'0000_0000 | H'008 | 32 |
| FM Module Stop Registers | ISU_FM_STOP | R/W | H'0000_0000 | H'00C | 32 |
| FM Interrupt Enable Registers | ISU_FM_INT_EN | R/W | H'0000_0000 | H'010 | 32 |
| FM Interrupt Status Registers | ISU_FM_INT_STA | R/W | H'0000_0000 | H'014 | 32 |
| AXI Error Action Registers | ISU_AXI_ERACT | R/W | H'0000_0000 | H'020 | 32 |
| AXI FIFO Capability Registers | ISU_AXI_FIFO_CAP | R | H'4000_4000 | H'02C | 32 |

### 36.2.2 Common Register

“Common Register” sets input/output, reduction ratio and color conversion coefficient.

Prohibits write to these registers during frame processing.

The descriptor can access these registers.

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| RPF Source Image Size Registers | ISU_RPF_SRC_SIZE | R/W | H’0000_0000 | H’100 | 32 |
| RPF Source Stride Registers | ISU_RPF_SRC_STRD | R/W | H’0000_0000 | H’104 | 32 |
| RPF Source Plane0 Address Registers 0 | ISU_RPF_SRC_ADDH_PL0 | R/W | H’0000_0000 | H’108 | 32 |
| RPF Source Plane0 Address Registers 1 | ISU_RPF_SRC_ADDL_PL0 | R/W | H’0000_0000 | H’10C | 32 |
| RPF Source Plane1 Address Registers 0 | ISU_RPF_SRC_ADDH_PL1 | R/W | H’0000_0000 | H’110 | 32 |
| RPF Source Plane1 Address Registers 1 | ISU_RPF_SRC_ADDL_PL1 | R/W | H’0000_0000 | H’114 | 32 |
| RPF Source Image Format Registers | ISU_RPF_FMT | R/W | H’0000_0000 | H’118 | 32 |
| RPF Source Image UV Format Register | ISU_RPF_UVBIN | R/W | H’0000_0000 | H’11C | 32 |
| RPF Source Image Data Swap Registers | ISU_RPF_SRC_DSWAP | R/W | H’0000_0000 | H’120 | 32 |
| RPF Source ALPHA Data Selection Registers | ISU_RPF_ALPH_SEL | R/W | H’0000_0000 | H’124 | 32 |
| RPF Source TEST Data Register 1 | ISU_RPF_SRC_TD1 | R/W | H’0000_0000 | H’128 | 32 |
| RPF Source TEST Data Register 2 | ISU_RPF_SRC_TD2 | R/W | H’0000_0000 | H’12C | 32 |
| RS Scaling Factor Registers 0 | ISU_RS_HSCALE | R/W | H’0000_0000 | H’140 | 32 |
| RS Scaling Factor Registers 1 | ISU_RS_VSCALE | R/W | H’0000_0000 | H’144 | 32 |
| RS Output Image Start Position Registers | ISU_RS_STPOS | R/W | H’0000_0000 | H’148 | 32 |
| RS Output Image Start Position Tuning Registers | ISU_RS_POS_TUNE | R/W | H’0000_0000 | H’14C | 32 |
| RS Output Size Crop Registers | ISU_RS_OS_CROP | R/W | H’0000_0000 | H’150 | 32 |
| RS CROP Padding Mode Registers | ISU_RS_PADDMODE | R/W | H’0000_0000 | H’154 | 32 |
| RS CROP Padding Value Registers | ISU_RS_PADDVAL | R/W | H’0000_0000 | H’158 | 32 |
| WPF Destination Plane0 Address Registers 0 | ISU_WPF_DST_ADDH_PL0 | R/W | H’0000_0000 | H’180 | 32 |
| WPF Destination Plane0 Address Registers 1 | ISU_WPF_DST_ADDL_PL0 | R/W | H’0000_0000 | H’184 | 32 |
| WPF Destination Plane1 Address Registers 0 | ISU_WPF_DST_ADDH_PL1 | R/W | H’0000_0000 | H’188 | 32 |
| WPF Destination Plane1 Address Registers 1 | ISU_WPF_DST_ADDL_PL1 | R/W | H’0000_0000 | H’18C | 32 |
| WPF Destination Stride Registers | ISU_WPF_DST_STRD | R/W | H’0000_0000 | H’190 | 32 |

# 36.3 Register Descriptions

## 36.3.1 FM Descriptor List Address Registers 0 (ISU_FM_DL_STADDH)

This register sets the start address [33:32] of the “Descriptor List”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DLADD[33:32] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 to 0 | DLADD [33:32] | All 0 | R/W | Set the start address [33:32] of the “Descriptor-List”. |

## 36.3.2 FM Descriptor List Address Registers 1 (ISU_FM_DL_STADDL)

This register sets the start address [31:0] of the “Descriptor List”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DLADD[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DLADD[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DLADD [31:0] | All 0 | R/W | Set the start address [31:0] of the “Descriptor List”.<br>*Note*: Set an address that is a multiple of 32-byte. |

### 36.3.3 FM Frame Control Registers (ISU_FM_FRCON)

This register controls the frame processing method selection and processing start.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DESON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | START |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | DESON | All 0 | R/W | Processing method selection<br>Select “Register Mode” or “Descriptor Mode”.<br>0: Register Mode<br>When executing in this mode, set the register before starting frame processing.<br>1: Descriptor Mode<br>When executing in this mode, write a “Descriptor List” before starting frame processing. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | START | All 0 | R/W | Frame processing start instruction<br>[Write]<br>0: NOP<br>1: Start frame processing<br>[Read]<br>This bit is always read as 0.<br>*Note*: If 1 is written during frame processing, it will be ignored.<br>*Note*: Also, when 1 is written, the frame end interrupt (ISU_FM_INT_STA.FREND) and descriptor footer read completion interrupt (ISU_FM_INT_STA.DESEND) are automatically cleared. |

### 36.3.4 FM Module Stop Registers (ISU_FM_STOP)

This register controls an emergency stop.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STOP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | STOP | All 0 | R/W | Emergency stop instruction<br>[Write]<br>0: NOP<br>1: Start emergency stop<br>[Read]<br>This bit is always read as 0.<br>*Note*: It will be cleared automatically after the emergency stop is completed. If 1 is written during the emergency stop process, it will be ignored.<br>*Note*: If you want to stop frame synchronously, you can stop it by setting the footer of the “Descriptor List” not to process the next frame. |

### 36.3.5 FM Interrupt Enable Registers (ISU_FM_INT_EN)

This register controls the interrupt factor.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | AXIRXERRE | — | — | — | AXITXERRE | — | — | — | — | — | — | — | LISTERRE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SRSTENDE | — | — | — | — | — | — | DESENDE | FRENDE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | AXIRXERRE | All 0 | R/W | Control of AXI bus read error interrupt (ISU_INT_ERR)<br>Controls interrupt by “ISU_FM_INT_STA.RRESPERR”.<br>0: Do not output interrupt factors<br>1: Output interrupt factor |
| 27 to 25 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 24 | AXITXERRE | All 0 | R/W | Control of AXI bus write error interrupt (ISU_INT_ERR)<br>Controls interrupt by “ISU_FM_INT_STA.BRESPERR”.<br>0: Do not output interrupt factors<br>1: Output interrupt factor |
| 23 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | LISTERRE | All 0 | R/W | Control of “Descriptor List” format violation interrupt (ISU_INT_ERR)<br>Controls interrupt by the number of bytes set in the header exceeding the limit or not being in 8-byte units.<br>0: Do not output interrupt factors<br>1: Output interrupt factor |
| 15 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | SRSTENDE | All 0 | R/W | Control of emergency stop completion interrupt (ISU_INT_STOPE)<br>Controls interrupt by the completion of emergency stop.<br>0: Do not output interrupt factors<br>1: Output interrupt factor |
| 7 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | DESENDE | All 0 | R/W | Control of descriptor footer read completion interrupt (ISU_INT_DESE)<br>Controls interrupt by the completion of descriptor footer read.<br>0: Do not output interrupt factors<br>1: Output interrupt factor<br>*Note*: When an error occurs due to a format violation of “Descriptor List”, the ISU_INT_DESE interrupt does not occur even if this bit is set to 1. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | FRENDE | All 0 | R/W | Control of frame processing end interrupt (ISU_INT_FRE)<br>Controls interrupt by the frame processing end.<br>0: Not output interrupt factor<br>1: Output interrupt factor<br>*Note*: This bit is updated according to the setting of the footer if the descriptor mode is set. |

### 36.3.6 FM Interrupt Status Registers (ISU_FM_INT_STA)

This register displays the status of the interrupt factors.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | RRESPERR[2:0] | | | — | BRESPERR[2:0] | | | — | — | — | — | — | — | LISTER R |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/WC0 | R/WC0 | R/WC0 | R | R/WC0 | R/WC0 | R/WC0 | R | R | R | R | R | R | R/WC0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SRSTEND | — | — | — | — | — | — | DESEND | FREND |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/WC0 | R | R | R | R | R | R | R/WC0 | R/WC0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 30 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 29 to 27 | RRESPERR [2:0] | All 0 | R/WC0 | Displays the status of the AXI read response.<br><br>Each bit means the following factors.<br>[0] EXOKAY<br>0: EXOKAY no response<br>1: EXOKAY response<br>[1] SLVERR<br>0: SLVERR no response<br>1: SLVERR response<br>[2] DECERR<br>0: DECERR no response<br>1: DECERR response<br><br>*Note*: If you want to clear it, please clear 3-bit at the same time. |
| 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25 to 23 | BRESPERR [2:0] | All 0 | R | Displays the status of the AXI write response.<br><br>Each bit means the following factors.<br>[0] EXOKAY<br>0: EXOKAY no response<br>1: EXOKAY response<br>[1] SLVERR<br>0: SLVERR no response<br>1: SLVERR response<br>[2] DECERR<br>0: DECERR no response<br>1: DECERR response<br><br>*Note*: If you want to clear it, please clear 3-bit at the same time. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 22 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | LISTERR | All 0 | R/WC0 | Displays the status of “Descriptor List” format violations (ISU_INT_ERR).<br>0: Descriptor list does not violate format<br>1: Descriptor list does violate format |
| 15 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | SRSTEND | All 0 | R/WC0 | Displays the status of the emergency stop completion (ISU_INT_STOPE).<br>0: Emergency stop not completed<br>1: Emergency stop completed |
| 7 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | DESEND | All 0 | R/WC0 | Displays the status of the descriptor footer read completion (ISU_INT_DESE).<br>0: Descriptor footer read incomplete<br>1: Descriptor footer read completed |
| 0 | FREND | All 0 | R/WC0 | Displays the status of the frame processing end (ISU_INT_FRE).<br>0: Frame processing incomplete<br>1: Frame processing completed |

### 36.3.7 AXI Error Action Registers (ISU_AXI_ERACT)

This register sets the operation of AXI-Master after an AXI error occurs.

For each AXI error condition, choose whether to ignore and continue or stop subsequent transactions.

Transaction continuation settings are used for debugging purposes.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | RRESPEXO_ACT | RRESPSLV_ACT | RRESPDEC_ACT | — | BRESPEXO_ACT | BRESPSLV_ACT | BRESPDEC_ACT | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 30 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 29 | RRESPEXO_ACT | All 0 | R/W | Operation settings after AXI read response EXOKAY occurs<br>0: Transaction stop<br>1: Transaction continuation (For debugging) |
| 28 | RRESPSLV_ACT | All 0 | R/W | Operation settings after AXI read response SLVERR occurs<br>0: Transaction stop<br>1: Transaction continuation (For debugging) |
| 27 | RRESPDEC_ACT | All 0 | R/W | Operation settings after AXI read response DECERR occurs<br>0: Transaction stop<br>1: Transaction continuation (For debugging) |
| 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25 | BRESPEXO_ACT | All 0 | R/W | Operation settings after AXI write response EXOKAY occurs<br>0: Transaction stop<br>1: Transaction continuation (For debugging) |
| 24 | BRESPSLV_ACT | All 0 | R/W | Operation settings after AXI write response SLVERR occurs<br>0: Transaction stop<br>1: Transaction continuation (For debugging) |
| 23 | BRESPDEC_ACT | All 0 | R/W | Operation settings after AXI write response DECERR occurs<br>0: Transaction stop<br>1: Transaction continuation (For debugging) |
| 22 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 36.3.8 AXI FIFO Capability Registers (ISU_AXI_FIFO_CAP)

This register is a register that displays the free space of the FIFO in AXI-Master.

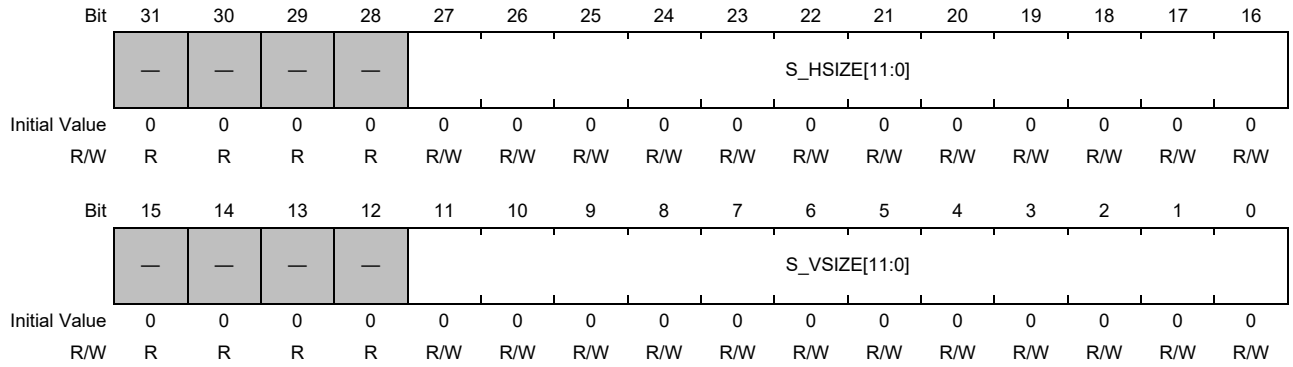
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | SCAP_PL0[6:0] | | | | | | | — | — | SCAP_PL1[5:0] | | | | | |
| Initial Value | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | DCAP_PL0[6:0] | | | | | | | — | — | DCAP_PL1[5:0] | | | | | |
| Initial Value | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 30 to 24 | SCAP_PL0 [6:0] | H'40 | R | Free space in FIFO of the input image "Plane0"<br>0 to 32 in Semi-Planar mode. 0 to 64 in other modes. |
| 23 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21 to 16 | SCAP_PL1 [5:0] | All 0 | R | Free space in FIFO of the input image "Plane1"<br>0 to 32 in Semi-Planar mode. 0 in other modes. |
| 15 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 to 8 | DCAP_PL0 [6:0] | H'40 | R | Free space in FIFO of the output image "Plane0"<br>0 to 32 in Semi-Planar mode. 0 to 64 in other modes. |
| 7 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | DCAP_PL1 [5:0] | All 0 | R | Free space in FIFO of the output image "Plane1"<br>0 to 32 in Semi-Planar mode. 0 in other modes. |

### 36.3.9 RPF Source Image Size Registers (ISU_RPF_SRC_SIZE)

This register sets the size of the input image.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | S_HSIZE [11:0] | All 0 | R/W | Horizontal size of the input image<br>Set the horizontal size of the input image in pixels.<br>Set the size from 1 to 2800.<br>0: Setting prohibited<br>2801 to: Setting prohibited<br>*Note*: For YCbCr type, set it to an even number. |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | S_VSIZE [11:0] | All 0 | R/W | Vertical size of the input image<br>Set the vertical size of the input image in pixels.<br>Set the size from 1 to 2047.<br>0: Setting prohibited<br>2048 to: Setting prohibited<br>*Note*: For YCbCr420, set it to an even number. |

## 36.3.10 RPF Source Stride Registers (ISU_RPF_SRC_STRD)

This register sets the stride of the input image.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SSTRPL0[15:0] | | | | | | | | | | | | | | | |

|---|---|---|---|---|
| 31 to 16 | SSTRPL0 [15:0] | All 0 | R/W | Set the “Plane0 (Y/RGB/RAW)” stride<br>Set the “Plane0 (Y/RGB/RAW)” stride in bytes.<br>*Note*: Set it as a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE). |
| 15 to 0 | SSTRPL1 [15:0] | All 0 | R/W | Set the “Plane1 (C(Cb/Cr))” stride<br>Set the “Plane1 (C(Cb/Cr))” stride in bytes.<br>*Note*: Set it as a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE). |

## 36.3.11 RPF Source Plane0 Address Registers 0 (ISU_RPF_SRC_ADDH_PL0)

This register sets the start address [33:32] of the input image of “Plane0”.

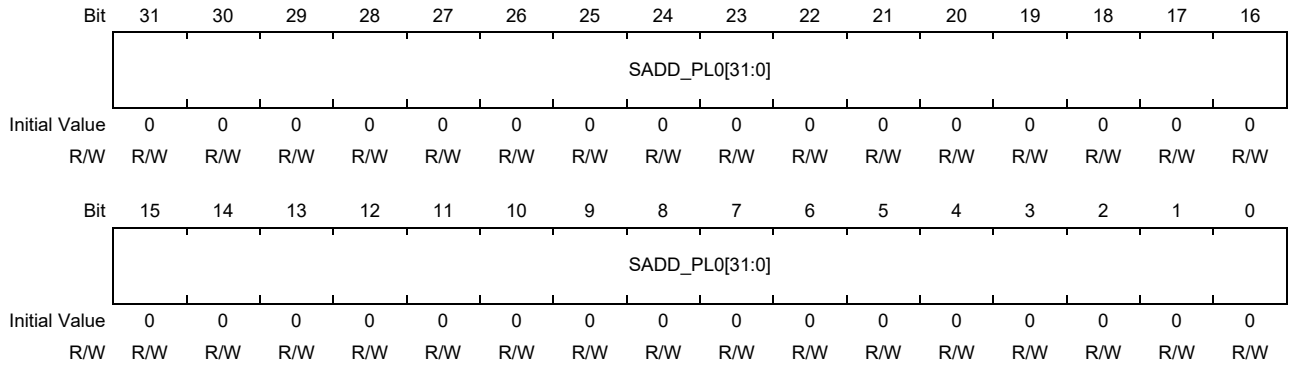
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SADD_PL0 [33:32] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 to 0 | SADD_PL0 [33:32] | All 0 | R/W | Set the start address [33:32] for “Plane0 (Y/RGB/RAW)”. |

## 36.3.12 RPF Source Plane0 Address Registers 1 (ISU_RPF_SRC_ADDL_PL0)

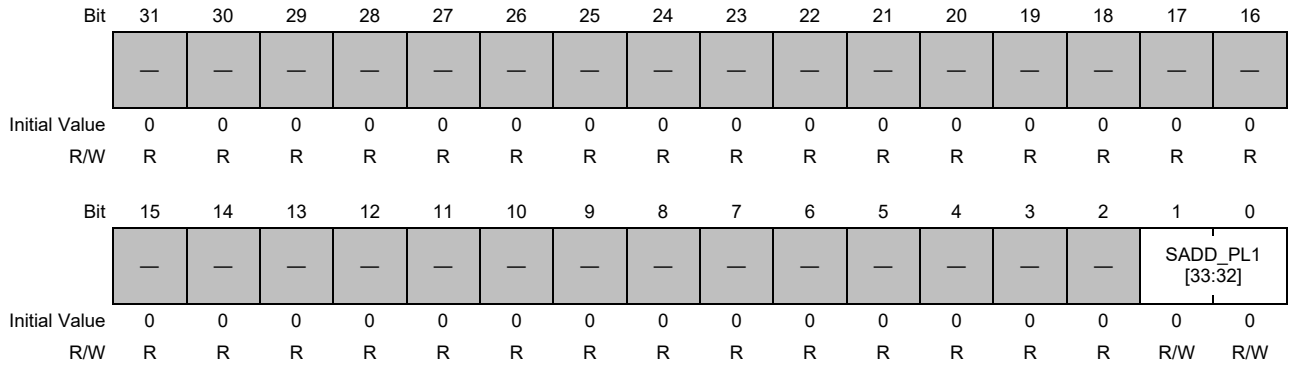
This register sets the start address [31:0] of the input image of “Plane0”.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SADD_PL0 [31:0] | All 0 | R/W | Set the start address [31:0] of “Plane0 (Y/RGB/RAW)”.<br>*Note*: Set an address that is a multiple of 32-byte. |

## 36.3.13 RPF Source Plane1 Address Registers 0 (ISU_RPF_SRC_ADDH_PL1)

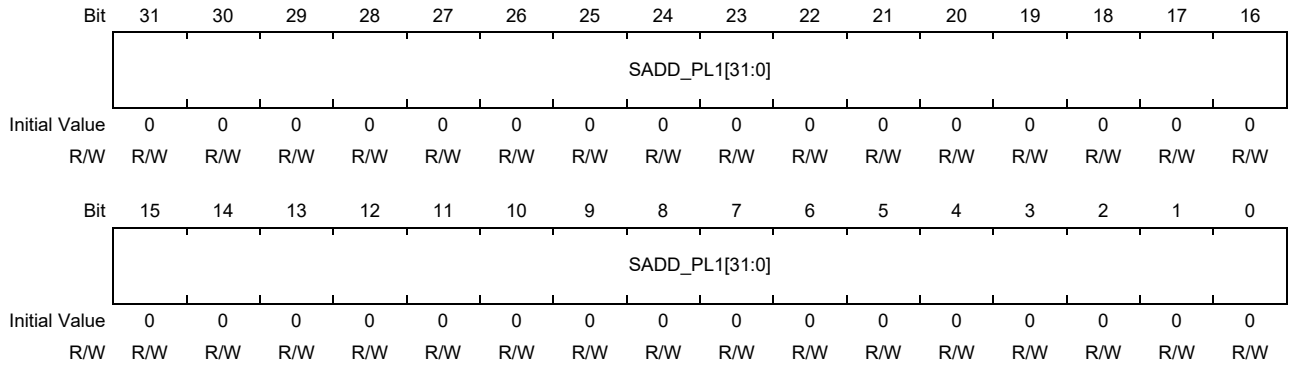
This register sets the start address [33:32] of the input image of “Plane1”.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R/W | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 to 0 | SADD_PL1 [33:32] | All 0 | R/W | Set the start address [33:32] of “Plane1 (C(Cb/Cr))”. |

### 36.3.14 RPF Source Plane1 Address Registers 1 (ISU_RPF_SRC_ADDL_PL1)

This register sets the start address [31:0] of the input image of “Plane1”.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SADD_PL1 [31:0] | All 0 | R/W | Set the start address [31:0] for “Plane1 (C(Cb/Cr))”.<br>*Note*: Set an address that is a multiple of 32-byte. |

### 36.3.15 RPF Source Image Format Registers (ISU_RPF_FMT)

This register sets the color format of the input image.

For details, refer to **Section 36.1.3.2, RPF** Formatter.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | RDFMT[5:0] | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R/W | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | RDFMT[5:0] | All 0 | R/W | Color format of input image<br>The following formats can be configured.<br>H'00: ARGB1555<br>H'01: RGB565<br>H'02: BGR666<br>H'03: RGB888<br>H'04: BGR888<br>H'05: ARGB8888<br>H'06: RGBA8888<br>H'07: ABGR8888<br>H'20: YCbCr422 8-bit UYVY<br>H'21: YCbCr422 8-bit YUY2<br>H'22: YCbCr422 8-bit NV16<br>H'23: YCbCr420 8-bit NV12<br>H'30: RAW8<br>H'31: RAW10<br>H'32: RAW12<br>Others: Setting prohibited |

## 36.3.16 RPF Source Image UV Format Registers (ISU_RPF_UVBIN)

This register sets whether to convert CbCr / UV to offset binary.

For details, refer to **Section 36.1.3.2, RPF** Formatter.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UVCHG |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UVCHG | All 0 | R/W | Offset binary conversion selection for CbCr / UV data<br>0: No conversion<br>1: Conversion |

## 36.3.17 RPF Source Image Data Swap Registers (ISU_RPF_SRC_DSWAP)

This register sets the data swap of the input image.

For details, refer to **Section 36.1.3.1, Data Swap (Endian Correction)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

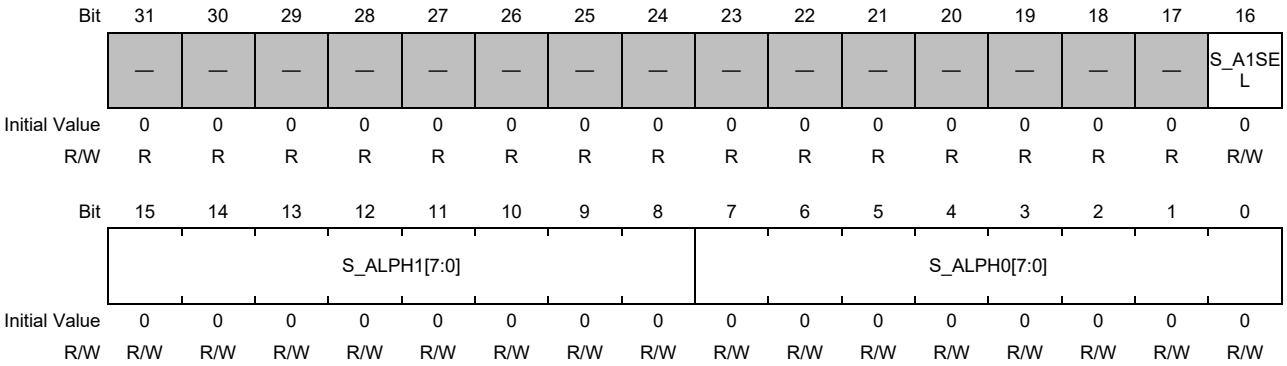
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RD_SWAP[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 to 0 | RD_SWAP [2:0] | All 0 | R/W | Data swap for input images |

### 36.3.18 RPF Source ALPHA Data Selection Registers (ISU_RPF_ALPH_SEL)

This register sets the extension method from A (Alpha) 1-bit to 8-bit at the time of ARGB1555 input.

For details, refer to **Section 36.1.3.3, Data Extraction**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | S_A1SEL | All 0 | R/W | Setting of how to extend A(Alpha) from 1-bit to 8-bit<br>0: Copy input Alpha value 1-bit to all 8-bit<br>1: Select the register value according to the input Alpha value 1 bit<br><br>S_ALPH0 when Alpha = 0<br>S_ALPH1 when Alpha = 1 |
| 15 to 8 | S_ALPH1 [7:0] | All 0 | R/W | Extended Alpha value when S_A1SEL = 1 and input Alpha value is 1. |
| 7 to 0 | S_ALPH0 [7:0] | All 0 | R/W | Extended Alpha value when S_A1SEL = 1 and input Alpha value is 0. |

### 36.3.19 RPF Source TEST Data Registers 1 (ISU_RPF_SRC_TD1)

This register controls the test pattern generation.

For details, refer to **Section 36.1.3.4, Test Pattern Generation**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMODE_EN | — | — | — | — | — | — | — | — | — | — | — | GRADA_A | GRADA_R | GRADA_G | GRADA_B |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

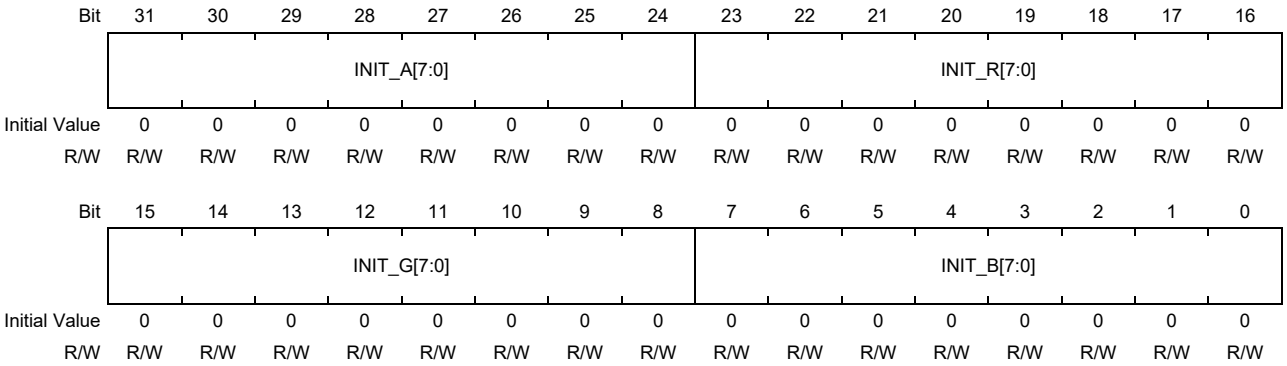
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | GRAD_TYPE | GRADA_STEP[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | TMODE_EN | All 0 | R/W | Control of test pattern generation<br>0: Normal operation<br>1: Test pattern generation<br>After one frame of the test pattern is generated, it is automatically cleared to 0.<br>*Note*: Setting in descriptor mode is prohibited. |
| 30 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | GRADA_A | All 0 | R/W | A color when generating a test pattern<br>0: 0 fixed<br>1: Gradation |
| 18 | GRADA_R | All 0 | R/W | R color when generating a test pattern<br>0: 0 fixed<br>1: Gradation |
| 17 | GRADA_G | All 0 | R/W | G color when generating a test pattern<br>0: 0 fixed<br>1: Gradation |
| 16 | GRADA_B | All 0 | R/W | B color when generating a test pattern<br>0: 0 fixed<br>1: Gradation |
| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | GRADA_TYPE | All 0 | R/W | Gradient type<br>0: Gradation from 0 to 255<br>1: Gradation from 255 to 0 |
| 3 to 0 | GRADA_STEP[3:0] | All 0 | R/W | Gradient step<br>*Note*: If the setting is 0, the initial value (ISU_RPF_SRC_TD2.INIT_*) is entered. |

## 36.3.20 RPF Source TEST Data Registers 2 (ISU_RPF_SRC_TD2)

This register sets the initial value of each color of ARGB for test pattern generation.

For details, refer to **Section 36.1.3.4, Test Pattern Generation**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | INIT_A[7:0] | All 0 | R/W | Initial value of A color |
| 23 to 16 | INIT_R[7:0] | All 0 | R/W | Initial value of R color |
| 15 to 8 | INIT_G[7:0] | All 0 | R/W | Initial value of G color |
| 7 to 0 | INIT_B[7:0] | All 0 | R/W | Initial value of B color |

## 36.3.21 RS Scaling Factor Registers 0 (ISU_RS_HSCALE)

This register sets the reduction factor of the input image in the horizontal direction.

For details, refer to **Section 36.1.4.3, Scaling Calculation**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | HMANT[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

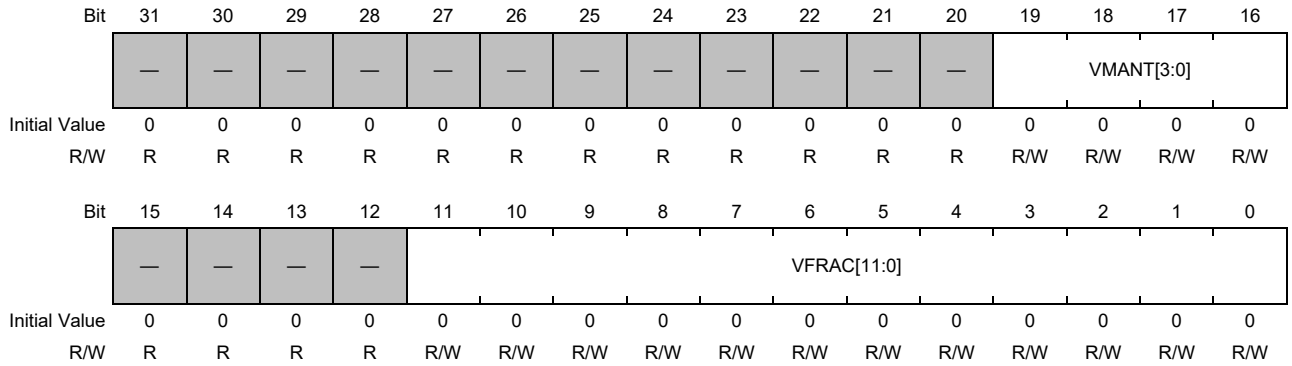
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | HFRAC[11:0] | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 to 16 | HMANT[3:0] | All 0 | R/W | Horizontal reduction factor (integer part)<br>0: Setting prohibited |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | HFRAC[11:0] | All 0 | R/W | Horizontal multiplication factor (decimal part) |

## 36.3.22 RS Scaling Factor Registers 1 (ISU_RS_VSCALE)

This register sets the reduction factor of the input image in the vertical direction.

For details, refer to **Section 36.1.4.3, Scaling Calculation**.

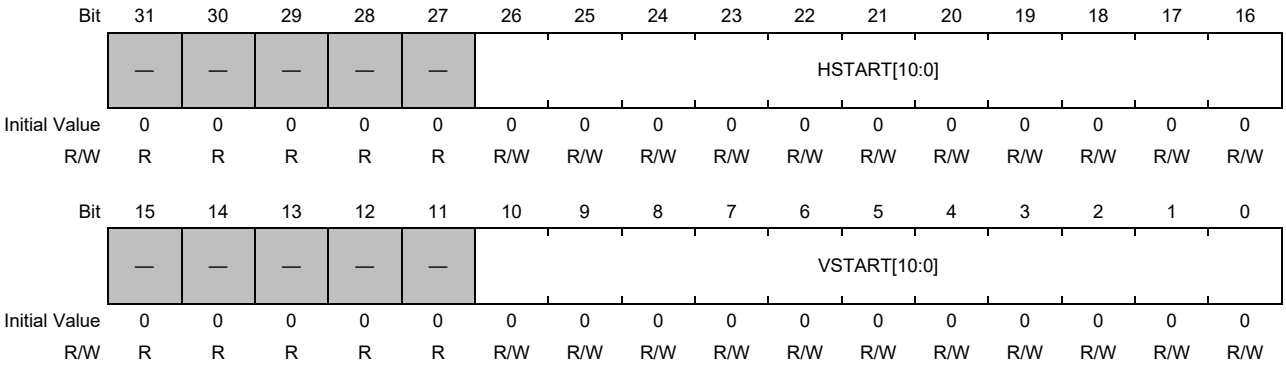


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 to 16 | VMANT[3:0] | All 0 | R/W | Vertical reduction factor (integer part)<br>0: Setting prohibited |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | VFRAC[11:0] | All 0 | R/W | Vertical reduction factor (decimal part) |

## 36.3.23 RS Output Image Start Position Registers (ISU_RS_STPOS)

This register sets the resize start position.

For details, refer to **Section 36.1.4.1, Resize Start Position**.

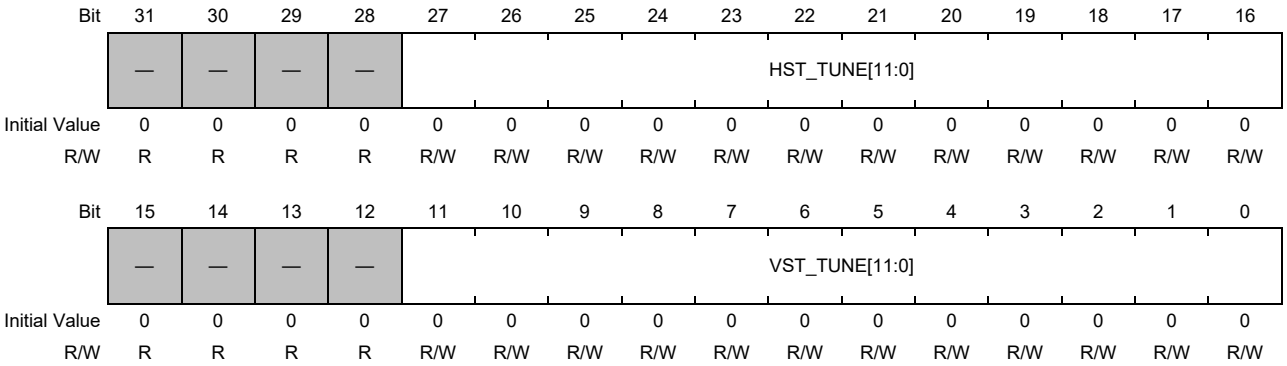


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 27 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 26 to 16 | HSTART [10:0] | All 0 | R/W | Resize start horizontal position<br>Set the resizing start horizontal position by the number of pixels with the upper left of the input image as the origin.<br>Set it with less than the number of input horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE). |
| 15 to 11 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 10 to 0 | VSTART [10:0] | All 0 | R/W | Resize start vertical position<br>Set the resizing start vertical position by the number of pixels with the upper left of the input image as the origin.<br>Set it with less than the number of input vertical pixels (ISU_RPF_SRC_SIZE.S_VSIZE). |

### 36.3.24 RS Output Image Start Position Tuning Registers (ISU_RS_POS_TUNE)

This register sets the offset for fine adjustment of the reduction start position.

For details, refer to **Section 36.1.4.2, Sub Pixel Offset**.

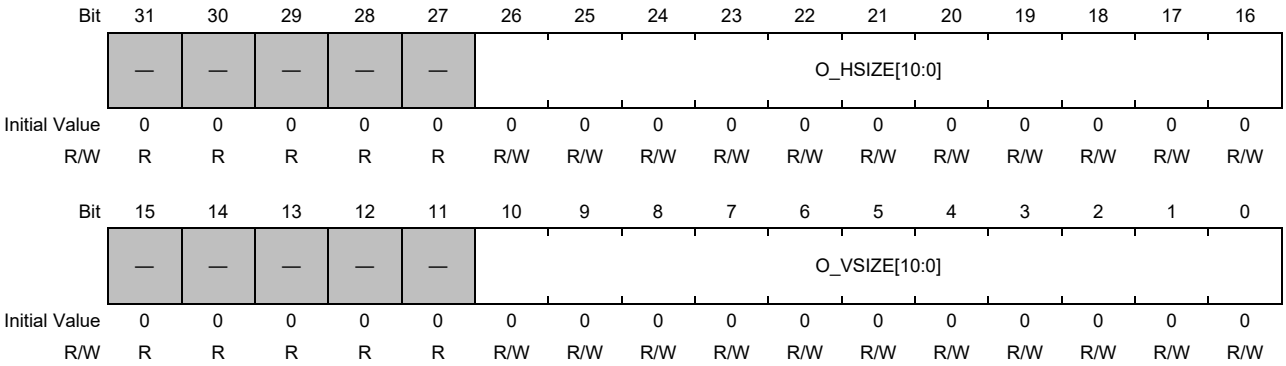


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | HST_TUNE [11:0] | All 0 | R/W | Offset from the resize-starting horizontal position (ISU_RS_STPOS.HSTART)<br>Set the offset to be added to the horizontal position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image). |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | VST_TUNE [11:0] | All 0 | R/W | Offset from the resize-starting vertical position (ISU_RS_STPOS.VSTART)<br>Set the offset to be added to the vertical position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image). |

## 36.3.25 RS Output Size Crop Registers (ISU_RS_OS_CROP)

This register sets the crop size of the reduced image.

For details, refer to **Section 36.1.4, Resizer (RS)**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 27 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 26 to 16 | O_HSIZE [10:0] | All 0 | R/W | Horizontal crop size<br>Set the horizontal crop size in pixels.<br>Set it in the range of 1 to 1920.<br>0: Setting prohibited<br>1921 to: Setting prohibited<br>*Note*: For YCbCr type, set it to an even number. |
| 15 to 11 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 10 to 0 | O_VSIZE [10:0] | All 0 | R/W | Vertical crop size<br>Set the vertical crop size in pixels.<br>Set it in the range of 1 to 1080.<br>0: Setting prohibited<br>1081 to: Setting prohibited<br>*Note*: For YCbCr420, set it to an even number. |

### 36.3.26 RS CROP Padding Mode Registers (ISU_RS_PADDMODE)

This register sets the padding method when the reduced image is smaller than the set crop size.

For details, refer to **Section 36.1.4, Resizer (RS)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

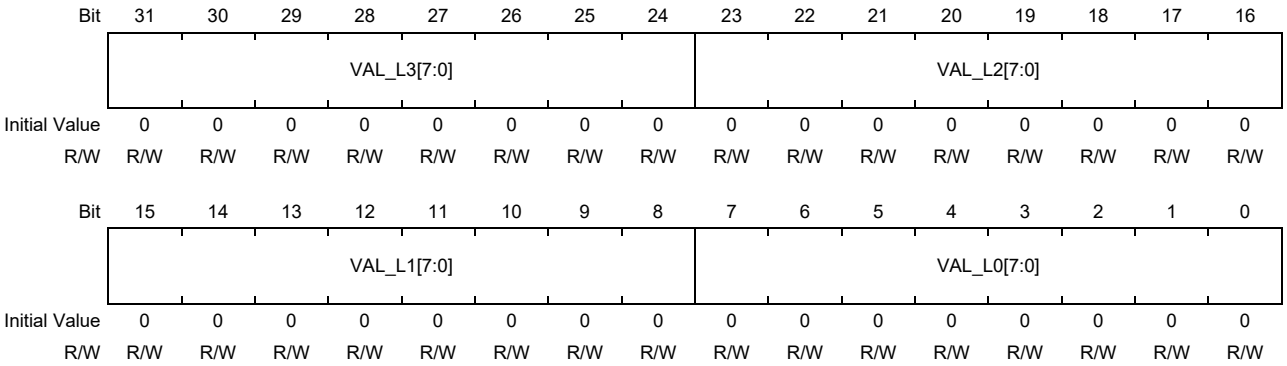
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PADDSEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | PADDSEL | All 0 | R/W | Selecting a padding method<br>Set the padding method when the reduced image is smaller than the set crop size.<br>0: Fill in the padding area by copying the edge pixels after the reduction.<br>1: Fill in the padding area with the color specified by the register (ISU_RS_PADDVAL.VAL_*). |

### 36.3.27 RS CROP Padding Value Registers (ISU_RS_PADDVAL)

This register sets the color that fills the edges with padding.

For details, refer to **Section 36.1.4, Resizer (RS)**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | VAL_L3[7:0] | All 0 | R/W | The value to fill Layer 3 if the reduced image is smaller than the set crop size. |
| 23 to 16 | VAL_L2[7:0] | All 0 | R/W | The value to fill Layer 2 if the reduced image is smaller than the set crop size. |
| 15 to 8 | VAL_L1[7:0] | All 0 | R/W | The value to fill Layer 1 if the reduced image is smaller than the set crop size. |
| 7 to 0 | VAL_L0[7:0] | All 0 | R/W | The value to fill Layer 0 if the reduced image is smaller than the set crop size. |

## 36.3.28 WPF Destination Plane0 Address Registers 0 (ISU_WPF_DST_ADDH_PL0)

This register sets the start address [33:32] of the output image of “Plane0”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DADD_PL0 [33:32] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 to 0 | DADD_PL0 [33:32] | All 0 | R/W | Set the write start address [33:32] for “Plane0 (Y/RGB/RAW)”. |

## 36.3.29 WPF Destination Plane0 Address Registers 1 (ISU_WPF_DST_ADDL_PL0)

This register sets the start address [33:32] of the output image of “Plane0”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DADD_PL0[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DADD_PL0[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DADD_PL0 [31:0] | All 0 | R/W | Set the write start address [31:0] for “Plane0 (Y/RGB/RAW)”.<br>*Note*: Set an address that is a multiple of 512-byte. |

## 36.3.30 WPF Destination Plane1 Address Registers 0 (ISU_WPF_DST_ADDH_PL1)

This register sets the start address [33:32] of the output image of “Plane1”.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DADD_PL1 [33:32] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 to 0 | DADD_PL1 [33:32] | All 0 | R/W | Set the write start address [33:32] for “Plane1 (C(Cb/Cr))”. |

## 36.3.31 WPF Destination Plane1 Address Registers 1 (ISU_WPF_DST_ADDL_PL1)

This register sets the start address [31:0] of the output image of “Plane1”.

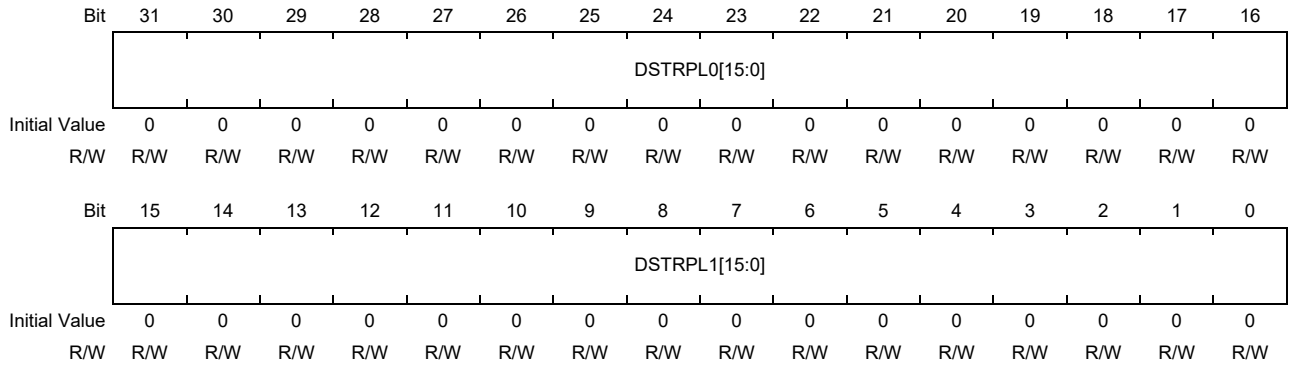
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DADD_PL1[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DADD_PL1[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DADD_PL1 [31:0] | All 0 | R/W | Set the write start address [31:0] for “Plane1 (C(Cb/Cr))”.<br>*Note*: Set an address that is a multiple of 512-byte. |

### 36.3.32 WPF Destination Stride Registers (ISU_WPF_DST_STRD)

This register sets the stride of the output image.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | DSTRPL0 [15:0] | All 0 | R/W | Set the “Plane0 (Y/RGB/RAW)” stride<br>Set the “Plane0 (Y/RGB/RAW)” stride in bytes.<br>*Note*: Set it as a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE). |
| 15 to 0 | DSTRPL1 [15:0] | All 0 | R/W | Set the “Plane1 (C(Cb/Cr))” stride<br>Set the “Plane1 (C(Cb/Cr))” stride in bytes.<br>*Note*: Set it as a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE). |

### 36.3.33 WPF Destination Image Format Registers (ISU_WPF_FMT)

This register sets the color format of the output image.

For details, refer to **Section 36.1.5.3, WPF** Formatter.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | WDFMT[5:0] | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | WDFMT[5:0] | All 0 | R/W | Color format of output image<br>The following formats can be configured.<br>H'00: ARGB1555<br>H'01: RGB565<br>H'02: BGR666<br>H'03: RGB888<br>H'04: BGR888<br>H'05: ARGB8888<br>H'06: RGBA8888<br>H'07: ABGR8888<br>H'20: YCbCr422 8-bit UYVY<br>H'21: YCbCr422 8-bit YUY2<br>H'22: YCbCr422 8-bit NV16<br>H'23: YCbCr420 8-bit NV12<br>H'30: RAW8<br>H'31: RAW10<br>H'32: RAW12<br>Others: Setting prohibited |

### 36.3.34 WPF Color Correction Control Registers (ISU_WPF_CCOL)

This register sets the color conversion correction control.

For details, refer to **Section 36.1.5.1, Color Correction**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CMAT_SEL | CMAT_ASEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CMAT_SEL | 0 | R/W | Color conversion correction control<br>0: No conversion<br>1: Conversion |
| 0 | CMAT_ASEL | 0 | R/W | A (Alpha) color conversion correction control<br>0: No conversion<br>1: Conversion |

### 36.3.35 WPF Color Correction MUL Coefficient Registers1 (ISU_WPF_MUL1)

This register sets the matrix value K11 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | K11[13:0] | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 0 | K11[13:0] | All 0 | R/W | Color Correction Coefficient K11<br>Signed fixed point: 4-bit integer part, 10-bit decimal part |

### 36.3.36 WPF Color Correction MUL Coefficient Registers2 (ISU_WPF_MUL2)

This register sets the matrix value K12 and K13 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | K12[13:0] | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | K13[13:0] | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 30 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 29 to 16 | K12[13:0] | All 0 | R/W | Color Correction Coefficient K12<br>Signed fixed point: 4-bit integer part, 10-bit decimal part |
| 15 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 0 | K13[13:0] | All 0 | R/W | Color Correction Coefficient K13<br>Signed fixed point: 4-bit integer part, 10-bit decimal part |

## 36.3.37 WPF Color Correction MUL Coefficient Registers3 (ISU_WPF_MUL3)

This register sets the matrix value K21 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | K21[13:0] | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 0 | K21[13:0] | All 0 | R/W | Color Correction Coefficient K21<br>Signed fixed point: 4-bit integer part, 10-bit decimal part |

## 36.3.38 WPF Color Correction MUL Coefficient Registers4 (ISU_WPF_MUL4)

This register sets the matrix value K22 and K23 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | K22[13:0] | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|
| 31 to 30 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 29 to 16 | K22[13:0] | All 0 | R/W | Color Correction Coefficient K22<br>Signed fixed point: 4-bit integer part, 10-bit decimal part |
| 15 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 0 | K23[13:0] | All 0 | R/W | Color Correction Coefficient K23<br>Signed fixed point: 4-bit integer part, 10-bit decimal part |

## 36.3.39 WPF Color Correction MUL Coefficient Registers5 (ISU_WPF_MUL5)

This register sets the matrix value K31 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

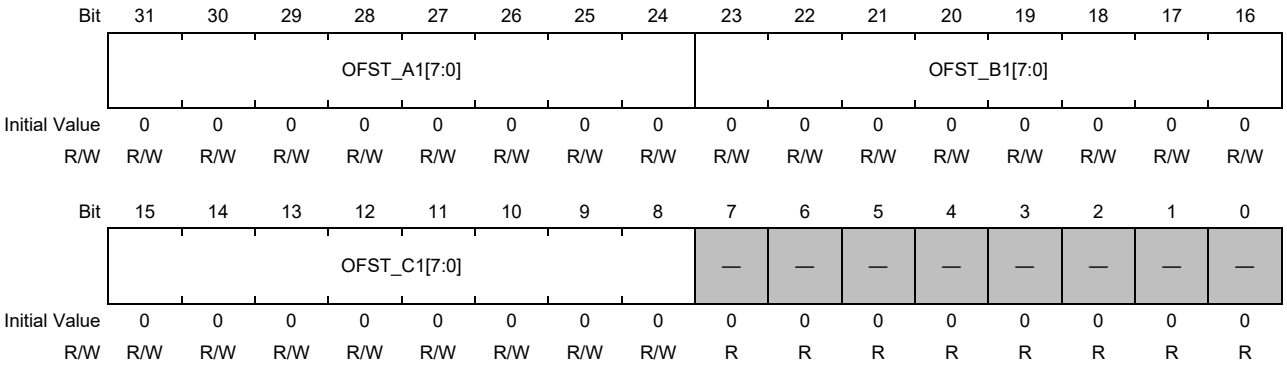
### 36.3.41 WPF Color Correction Offset Coefficient Registers1 (ISU_WPF_OFST1)

This register sets the offset 1 of the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

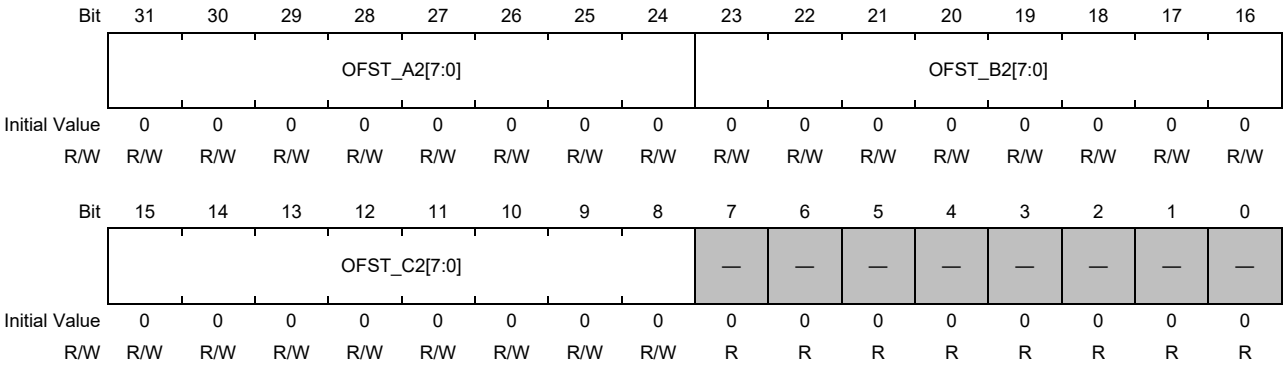


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | OFST_A1 [7:0] | All 0 | R/W | Color Correction Offset value A1<br>Unsigned integer 8-bit |
| 23 to 16 | OFST_B1 [7:0] | All 0 | R/W | Color Correction Offset value B1<br>Unsigned integer 8-bit |
| 15 to 8 | OFST_C1 [7:0] | All 0 | R/W | Color Correction Offset value C1<br>Unsigned integer 8-bit |
| 7 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 36.3.42 WPF Color Correction Offset Coefficient Registers2 (ISU_WPF_OFST2)

This register sets the offset 2 of the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

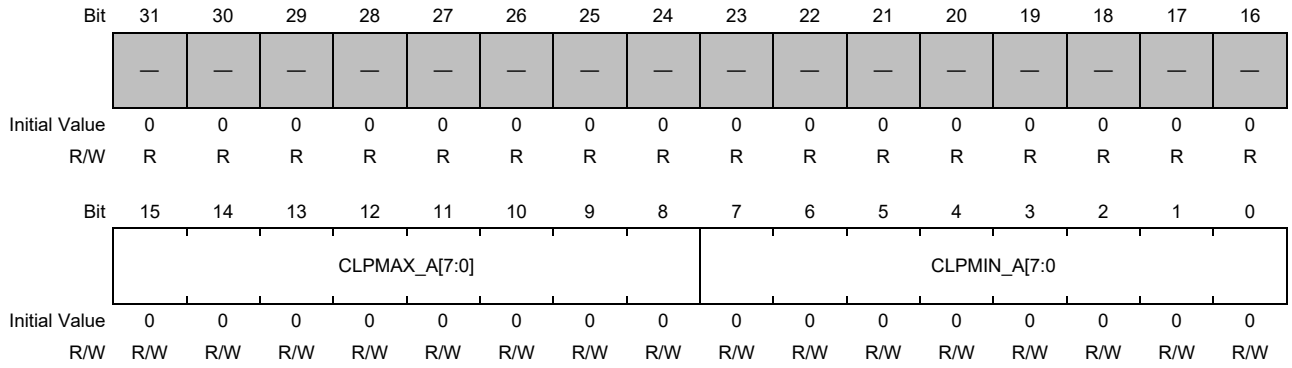


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | OFST_A2 [7:0] | All 0 | R/W | Color Correction Offset value A2<br>Unsigned integer 8-bit |
| 23 to 16 | OFST_B2 [7:0] | All 0 | R/W | Color Correction Offset value B2<br>Unsigned integer 8-bit |
| 15 to 8 | OFST_C2 [7:0] | All 0 | R/W | Color Correction Offset value C2<br>Unsigned integer 8-bit |
| 7 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 36.3.43 WPF Color Correction Clip Registers1 (ISU_WPF_CLP1)

This register sets the maximum and minimum value of the color conversion correction for Layer 1.

For details, refer to **Section 36.1.5.1, Color Correction**.

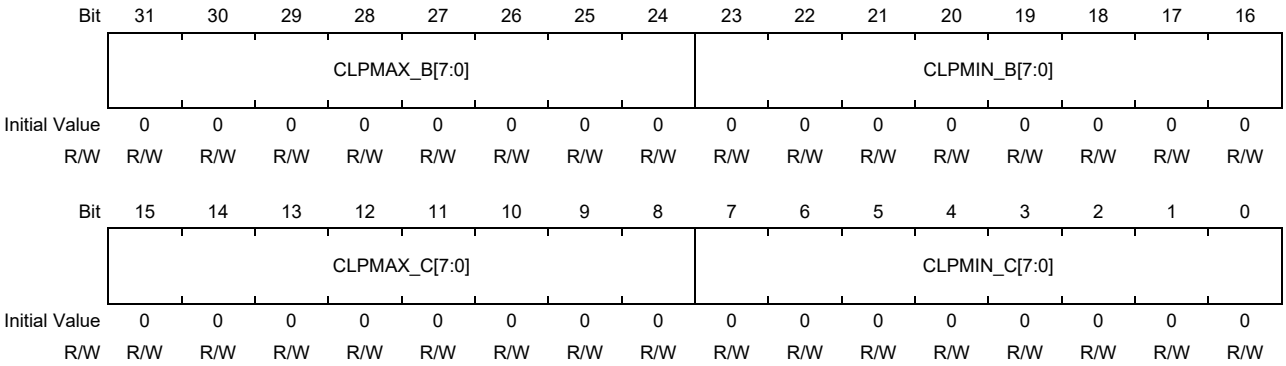


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 8 | CLPMAX_A [7:0] | All 0 | R/W | Color correction maximum clip level value A<br>Set the value to CLPMAX_A ≥ CLPMIN_A |
| 7 to 0 | CLPMIN_A [7:0] | All 0 | R/W | Color correction minimum clip level value A<br>Set the value to CLPMAX_A ≥ CLPMIN_A |

### 36.3.44 WPF Color Correction Clip Registers2 (ISU_WPF_CLP2)

This register sets the maximum and minimum value of the color conversion correction for Layer 2 and Layer 3.

For details, refer to **Section 36.1.5.1, Color Correction**.

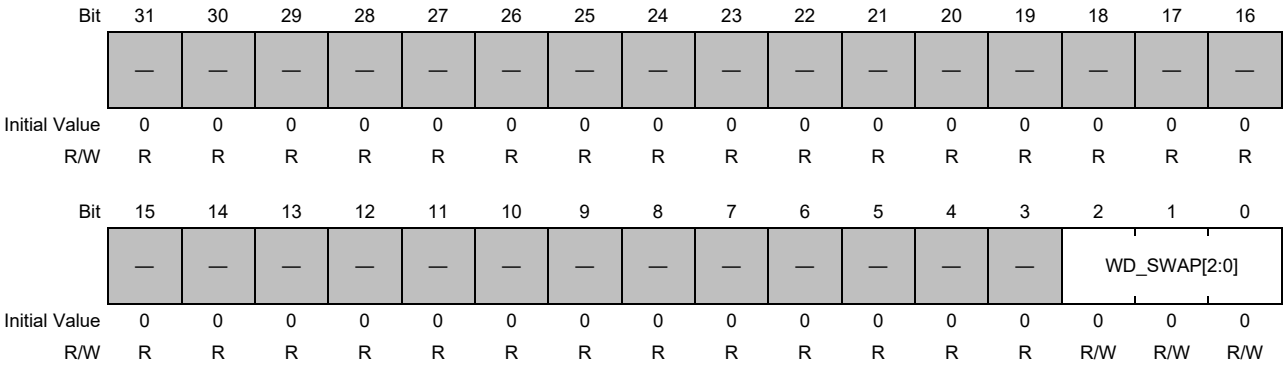


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | CLPMAX_B [7:0] | All 0 | R/W | Color correction maximum clip level value B<br>Set the value to CLPMAX_B ≥ CLPMIN_B |
| 23 to 16 | CLPMIN_B [7:0] | All 0 | R/W | Color correction minimum clip level value B<br>Set the value to CLPMAX_B ≥ CLPMIN_B |
| 15 to 8 | CLPMAX_C [7:0] | All 0 | R/W | Color correction maximum clip level value C<br>Set the value to CLPMAX_C ≥ CLPMIN_C |
| 7 to 0 | CLPMIN_C [7:0] | All 0 | R/W | Color correction minimum clip level value C<br>Set the value to CLPMAX_C ≥ CLPMIN_C |

### 36.3.45 WPF Destination Image Data Swap Registers (ISU_WPF_DST_DSWAP)

This register sets the data swap of the output image data.

For details, refer to **Section 36.1.5.4, Data Swap (Endian Correction)**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 to 0 | WD_SWAP [2:0] | All 0 | R/W | Data swap for output images |

### 36.3.46 WPF Destination ALPHA Selection Registers1 (ISU_WPF_ALPH_SEL1)

This register sets the method of compressing the A (Alpha) value at the ARGB1555 output from 8-bit to 1-bit.

For details, refer to **Section36.1.5.2, Normalization**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | D_A1SEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

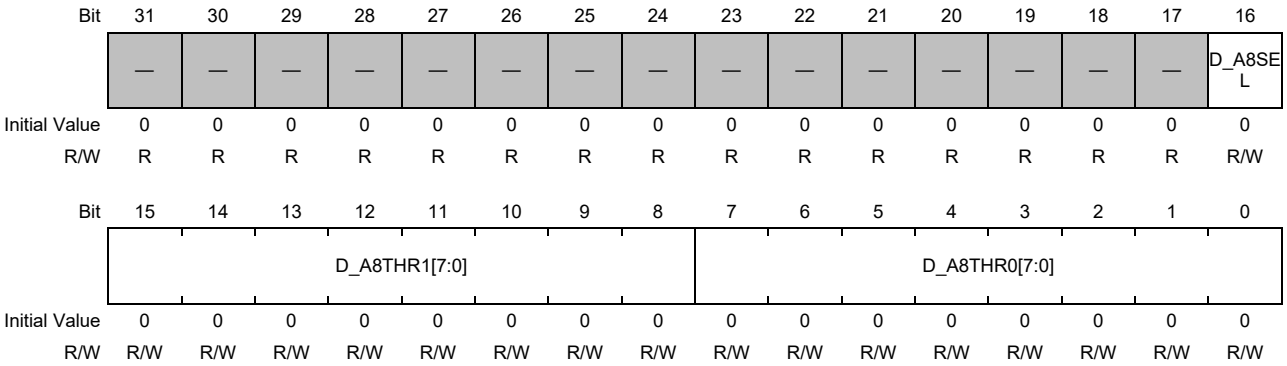
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | D_A1THR[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | D_A1SEL | All 0 | R/W | Setting of how to compress A (Alpha) from 8-bit to 1-bit<br>0: Outputs the MSB of alpha value<br>1: Selects the output according to the alpha value and threshold level<br>Outputs 0b when Alpha ≤ D_A1THR<br>Outputs 1b when Alpha > D_A1THR |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 0 | D_A1THR [7:0] | All 0 | R/W | Threshold level value<br>Value used to determine when D_A1SEL = 1. |

## 36.3.47 WPF Destination ALPHA Selection Registers2 (ISU_WPF_ALPH_SEL2)

This register sets the 8-bit A (Alpha) value at the time of ARGB8888 output.

For details, refer to **Section36.1.5.2, Normalization**.

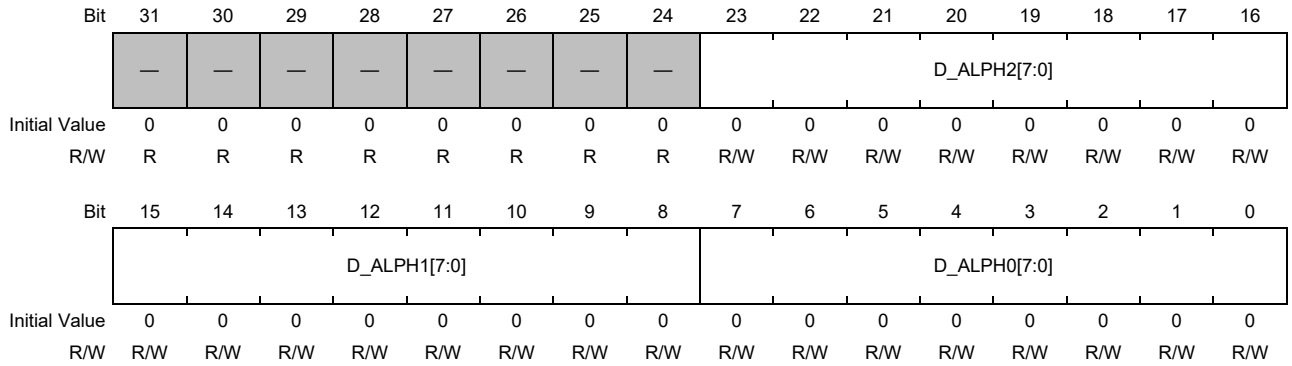


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | D_A8SEL | All 0 | R/W | A (Alpha) 8-bit output selection<br>0 Output Alpha value as it is<br>1: Outputs the register value according to the alpha value and the threshold level (D_A8THR0 and D_A8THR1)<br>Outputs D_ALPH2 when D_A8THR1≤ Alpha<br>Outputs D_ALPH1 when D_A8THR0 < Alpha < D_A8THR1<br>Outputs D_ALPH0 when Alpha ≤ D_A8THR0 |
| 15 to 8 | D_A8THR1 [7:0] | All 0 | R/W | Threshold level value 1<br>Value used to determine which register value is output as Alpha when D_A8SEL = 1.<br>Set the value to D_A8THR0 < D_A8THR1. |
| 7 to 0 | D_A8THR0 [7:0] | All 0 | R/W | Threshold level value 0<br>Value used to determine which register value is output as Alpha when D_A8SEL = 1.<br>Set the value to D_A8THR0 < D_A8THR1. |

### 36.3.48 WPF Destination ALPHA Value Registers (ISU_WPF_ALPH_VAL)

This register sets the A (Alpha) value to be output when ARGB8888 and D_A8SEL = 1.

For details, refer to **Section36.1.5.2, Normalization**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 to 16 | D_ALPH2 [7:0] | All 0 | R/W | Conversion Alpha value 2<br>The value to be output when D_A8THR1 ≤ Alpha. |
| 15 to 8 | D_ALPH1 [7:0] | All 0 | R/W | Conversion Alpha value 1<br>The value to be output when D_A8THR0 < Alpha < D_A8THR1. |
| 7 to 0 | D_ALPH0 [7:0] | All 0 | R/W | Conversion Alpha value 0<br>The value to be output when Alpha ≤ D_A8THR0. |

### 36.3.49 AXI Max Burst Length Registers (ISU_AXI_BLEN)

This register sets the upper limit to the burst length of the AXI-Master.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | ARLEN_MAX[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | AWLEN_MAX[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 to 16 | ARLEN_ MAX[3:0] | H'F | R/W | Upper limit of read data burst length<br>H'3: Up to 4-beat burst<br>H'7: Up to 8-beat burst<br>H'F: Up to 16-beat burst<br>Others: Setting prohibited |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 to 0 | AWLEN_ MAX[3:0] | H'F | R/W | Upper limit of write data burst length<br>H'3: Up to 4-beat burst<br>H'7: Up to 8-beat burst<br>H'F: Up to 16-beat burst<br>Others: Setting prohibited |

# 36.4 Operation

## 36.4.1 Start Processing

After setting various registers, write 1 to the start instruction bit to start.

At that time, start it together with the setting of whether to execute by the descriptor method.

Table 36.12 Explanation for ISU FM Frame Control Registers (ISU_FM_FRCON)

| ICU_FM_FRCON | | Description |
|---|---|---|
| Bit 16 | DESON | 0: Execute with Descriptor read OFF.<br>1: Execute with Descriptor read ON. |
| Bit 0 | START | When the frame processing start is executed, the frame completion interrupt and descriptor capture completion interrupt are automatically cleared.<br>[Write]<br>0: NOP<br>1: Start Frame Processing<br>[Read]<br>Always Zero is read. |

### 36.4.1.1 Descriptor List Address

In the case of the descriptor method (DESON = 1 and START is set to 1), the access to acquire the descriptor list is performed first. The access destination is set in advance in the following register.

- FM Descriptor List Address Register 0 (ISU_FM_DL_STADDH [2: 0])
- FM Descriptor List Address Register 1 (ISU_FM_DL_STADDL [31: 0])

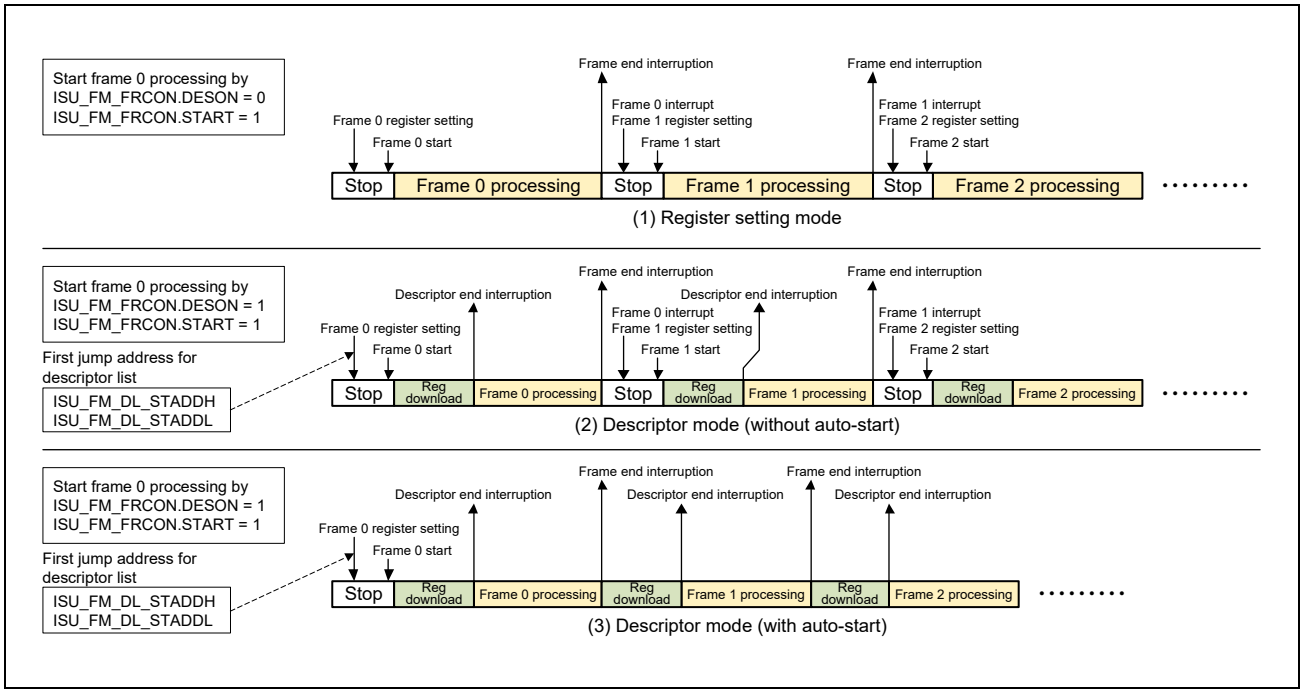


Figure 36.41 Relationship Between Register ISU_FM_FRCON Setting and Frame Processing Mode

#### 36.4.1.2 Frame End Interruption

- When started with ISU_FM_FRCON.DESON = 0
  - An interrupt is generated when one frame processing is completed inside the ISU.
  - Completion of 1-frame processing shall meet the following conditions.
    1) Write the reduced data from the AXI bus and receive the response of the response channel.
    2) The FIFO pointer of the input image is in the initial state (empty state), and the FIFO pointer of the output image is also in the initial state (empty state).
    3) You have not accidentally started capturing the image of the next frame.
  - When the descriptor is not used, only one interrupt is held instead of two interrupts.

- When started with ISU_FM_FRCON.DESON = 1
  - One frame processing by the descriptor is completed, and an interrupt is issued in the descriptor list. An interrupt is generated when it is enabled (see the corresponding bit in the footer).
  - In the descriptor method, it advances to the next frame without doing anything after the interrupt occurs. In this case, the interrupt remains on.
  - If an interrupt is issued in the next frame, it means that two interrupts have occurred. In this case, the interrupt is cleared by clearing the interrupt twice (clearing from the oldest one).
  - ISU retains the latest two interrupt information.

### 36.4.2 Stop Processing

There are two ways to stop it.

- Normal stop
  - When started with ISU_FM_FRCON.DESON = 0
    It will end automatically when the processing of one frame is completed. After completion, the read and write FIFOs on the AXI-Master side will also be empty.
  - When started with ISU_FM_FRCON.DESON = 1
    If there is no instruction to execute the next frame in the footer of the descriptor, it will automatically end after executing one frame. After completion, the read and write FIFOs on the AXI-Master side will also be empty.

- Emergency stop

  Emergency stop will be stopped by register setting from APB.

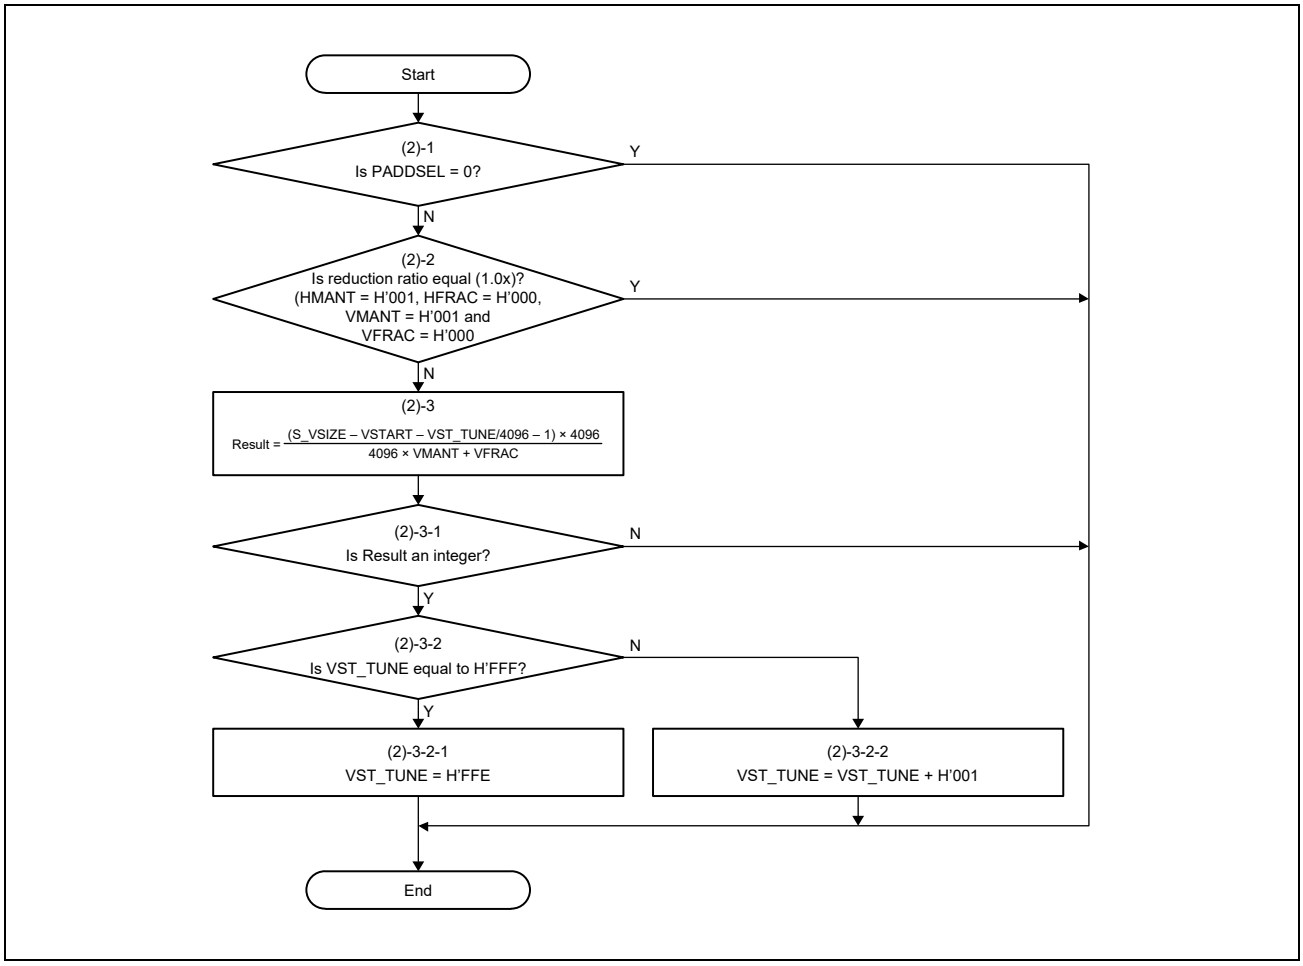
  In response to the instruction from APB, the transfer to the bus in process of the AXI-Master is executed until a correct response is made, and after it is completed, an interrupt signal is issued. After that, when restarting from the system side, ISU system reset is always applied from the outside and executed from initialization.

  If the APB instructs the emergency stop again during the emergency stop process, only the first emergency stop instruction will be valid.

### 36.4.3 Setting the vertical size, start position and reduction factor

Set the input image size, start position, and reduction ratio before calculating the reduction by Resizer (RS).

Before setting the parameters, please check and adjust the following settings for the vertical direction.



(1) List of related registers

ISU_RPF_SRC_SIZE. S_VSIZE[11:0]
ISU_RS_STPOS.VSTART[10:0]
ISU_RS_POS_TUNE.VST_TUNE[11:0]
ISU_RS_VSCALE.VMANT[3:0]
ISU_RS_VSCALE.VFRAC[11:0]
ISU_RS_HSCALE.HMANT[3:0]
ISU_RS_HSCALE.HFRAC[11:0]
ISU_RS_PADDMODE.PADDSEL

(2) Confirmation and determination of setting values

(2)-1 When PADDSEL = 0
There is no need to change those register parameters.

(2)-2 When the reduction ratio is equal (1.0x)
In other words, when HMANT = H’1, HFRAC = H’000, VMANT = H’1 and VFRAC = H’000
There is no need to change those register parameters.

(2)-3 When the setting value is other than the above (other than equal)
Perform the following calculations.

$$\text{Result} = \frac{(\text{S_VSIZE} - \text{VSTART} - \text{VST_TUNE}/4096 - 1) \times 4096}{4096 \times \text{VMANT} + \text{VFRAC}}$$

(2)-3-1 If the calculation result (Result) is not an integer
There is no need to change those register parameters.

(2)-3-2 If the calculation result (Result) is an integer

(2)-3-2-1 If VST_TUNE is equal to H'FFF
VST_TUNE = H'FFE

(2)-3-2-2 If VST_TUNE is not equal to H'FFF
VST_TUNE = VST_TUNE + H'001 (Add 1 to correct the start position)

## 36.5 Usage Notes

This section shows examples of converting image size and color format using the image scaling unit (ISU).

### 36.5.1 Image Size Conversion

#### 36.5.1.1 2800 × 2047 (ARGB8888) → 1920 × 1080 (ARGB8888) with Automatic start of the next frame

Set as follows to handle image size conversion.

Table 36.13 Image Size Conversion Example 1

| Item | Description |
|---|---|
| Assuming that the following image is in the DDR | |
| Input size | 2800 × 2047 |
| Input format | ARGB8888 |
| Input start address | 1st frame: H'0_1000_0000<br>2nd frame: H'0_3000_0000 |
| Input stride | 11,200 (H'2BC0) //2800*4byte/pixel |
| ISU setting | |
| Output (CROP) size | 1920 × 1080 |
| Output format | ARGB8888 |
| Output start address | 1st frame: H'0_2000_0000<br>2nd frame: H'0_4000_0000 |
| Output stride | 7,680 (H'1E00) //1920*4byte/pixel |
| Reduction ratio | 1st frame: H = 1/1.5, V = 1/1.5<br>2nd frame: H = 1/1.8984375, V = 1/1.8984375 |
| Processing method | Descriptor method with automatic start of the next frame |
| Color format conversion | None |
| Descriptor address | Table 1: H'8000_0000<br>Table 2: H'8000_0100 |

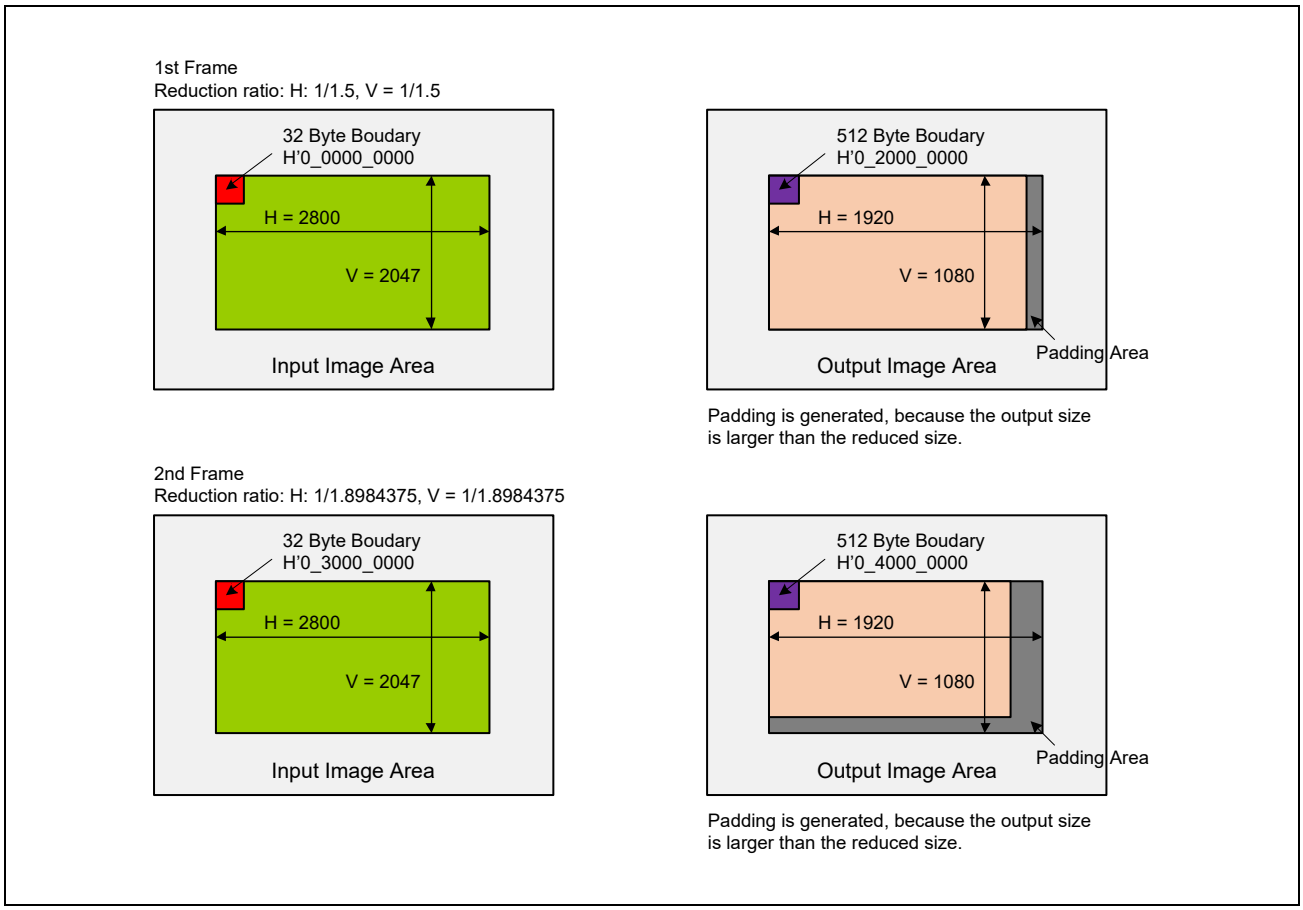


Figure 36.42 Image Size Conversion Example 1

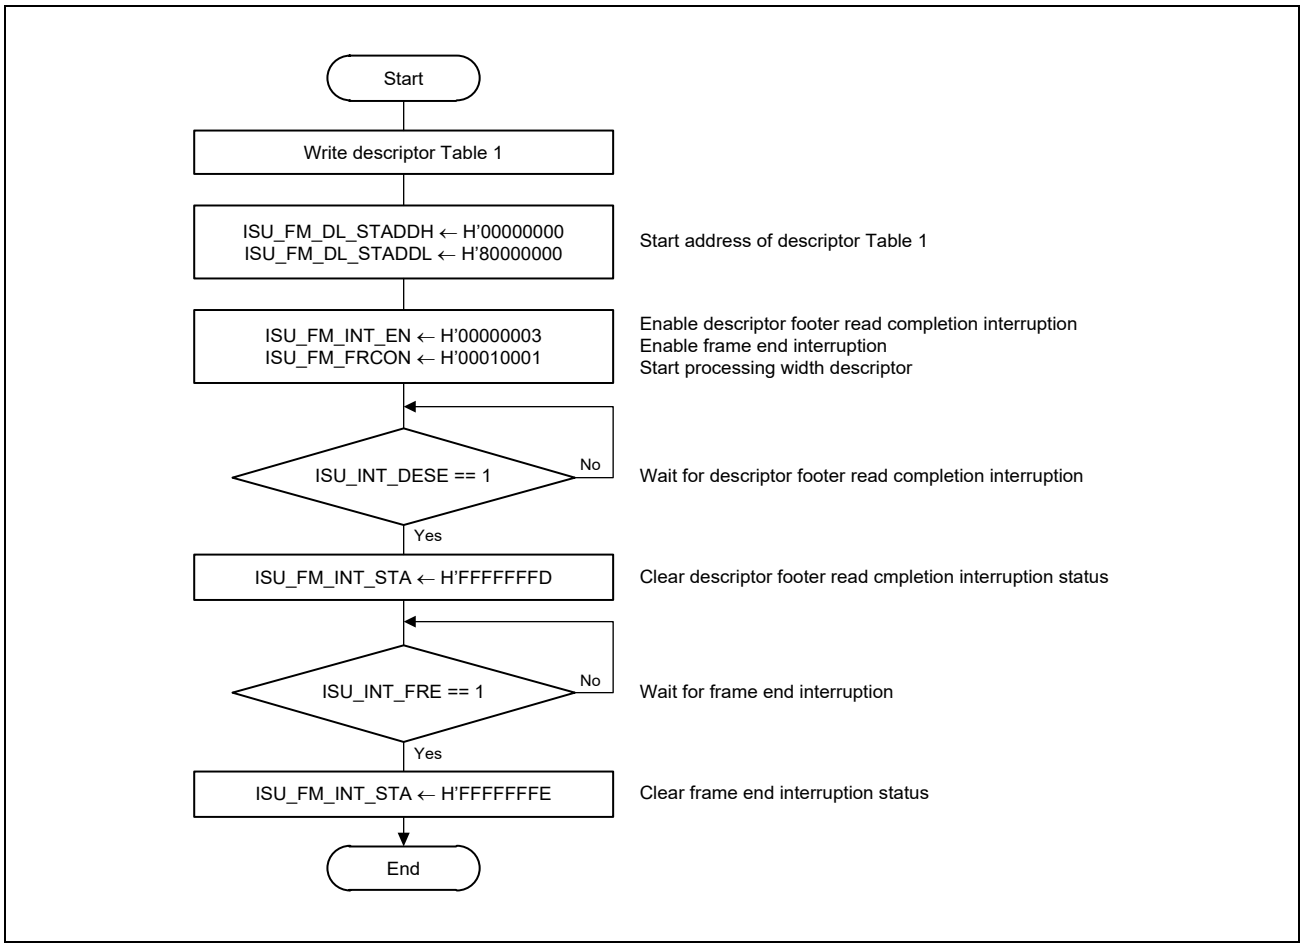

Figure 36.45 Flowchart of Image Size Conversion Example 2

### 36.5.1.3 5M (2800 × 2047) → FullHD (1920 × 1080)

Set as follows to handle image size conversion.

Table 36.19 Image Size Conversion Example 4

| Item | Description |
|---|---|
| Assuming that the following image is input from the CRU | |
| Input size | 2800 × 2047 |
| Input format | ARGB8888<br>* (The ISU swaps data because of the BGRA format.) |
| Input start address | H'0_5000_0000 |
| Input stride | Plane 0 = H'2BC0 |
| ISU setting | |
| Output (CROP) size | 1920 × 1080 |
| Output format | ARGB8888 |
| Output start address | Plane 0 = H'0_6000_000 |
| Output stride | Plane 0 = H'1E00 |
| Processing method | Register |
| Color format conversion | None |

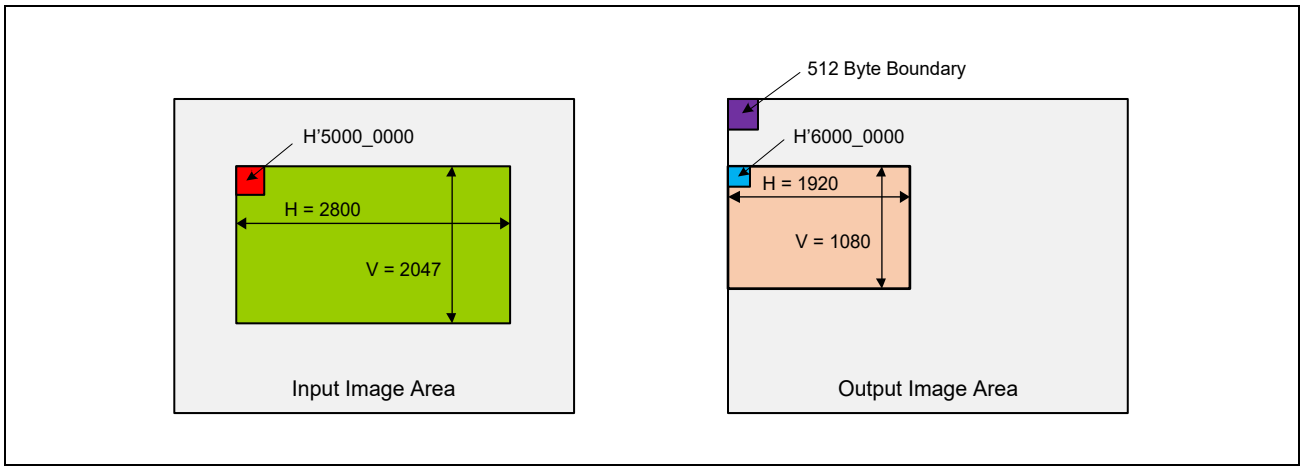

Figure 36.46 Image Size Conversion Example 4

Obtain the multiplication coefficient in the horizontal direction/

2800 / 1920 = 1.458333...
HMANT (integer part) = 1 = H'1
HFRAC (decimal part) = 0.458333 × 4096 (Q12) = 1877.3320 ... = H'755

Obtain the multiplication coefficient in the vertical direction.

2047 / 1080 = 1.895370...
VMANT (integer part) = 1 = H'1
VFRAC (decimal part) = 0.895370 × 4096 (Q12) = 3667.43552... = H'E53

*Note*: HFRAC and VFRAC are set by unsigned fixed point Q12 and are truncated after the decimal point.

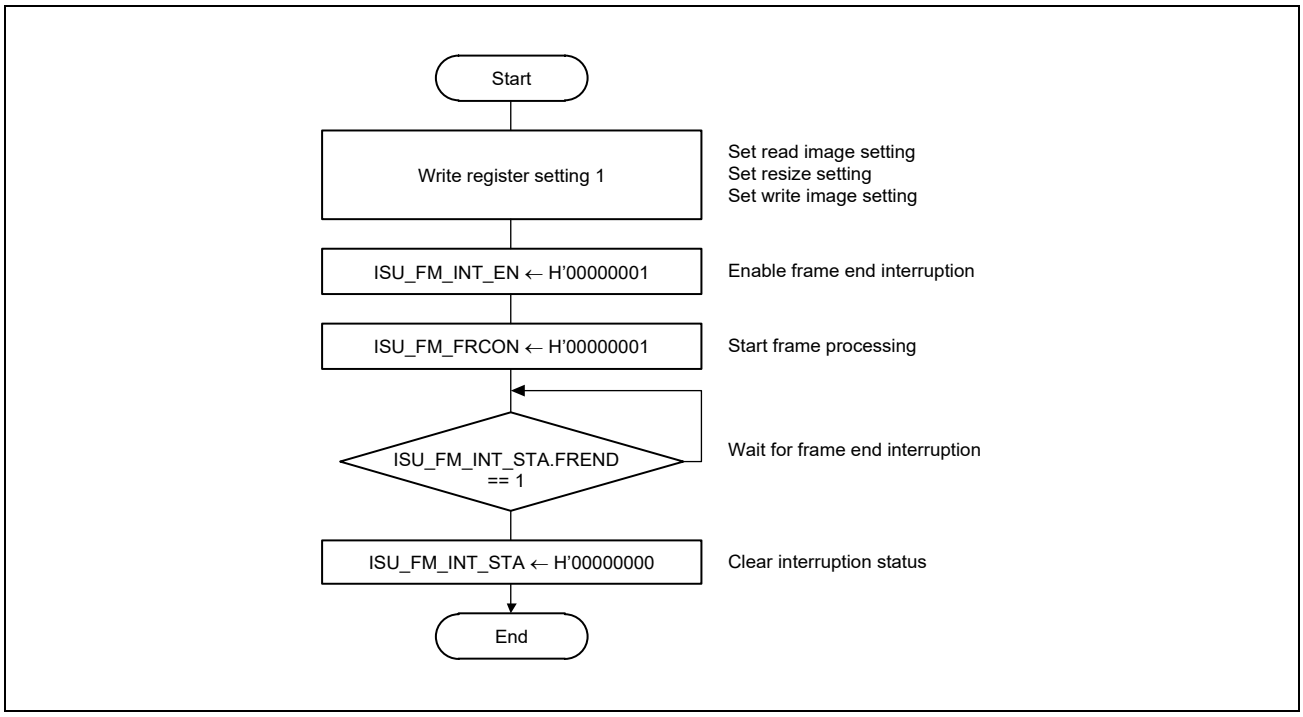

Figure 36.48 Flowchart of Color Format Conversion 1

### 36.5.2.2 YCbCr422 → ARGB8888

Set as follows to handle color format conversion.

Table 36.23 Color Format Conversion Example 2

| Item | Description |
|---|---|
| Assuming that the following image is input from the CRU | |
| Input size | 320 × 240 |
| Input format | YCbCr422 8-bit UYVY (Interleave) |
| Input start address | H'0_5000_0000 |
| Input stride | Plane 0 = H'280 |
| ISU setting | |
| Output (CROP) size | 320 × 240 |
| Output format | ARGB8888 |
| Output start address | Plane 0 = H'0_6000_000 |
| Output stride | Plane 0 = H'500 |
| Processing method | Register |
| Color format conversion | YCbCr → RGB (BT.601 SDTV) |

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11\ K12\ K13 \\ K21\ K22\ K23 \\ K31\ K32\ K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS_A1 \\ B - OFS_B1 \\ C - OFS_C1 \end{bmatrix} + \begin{bmatrix} OFST_A2 \\ OFST_B2 \\ OFST_C2 \end{bmatrix}$$

$$C1'' = MAX\ (clip_a_min, Min\ (clip_a_max, C1'))$$
$$C2'' = MAX\ (clip_b_min, Min\ (clip_b_max, C2'))$$
$$C3'' = MAX\ (clip_c_min, Min\ (clip_c_max, C3'))$$

Figure 36.49 Matrix Operation Formula for Conversion and Color Correction

The following shows the YCbCr422-to-RGB conversion formula (BT.601 SDTV).

$$R = 1.164\ (Y - 16) + 1.596\ (Cr - 128)$$
$$G = 1.164\ (Y - 16) - 0.391\ (Cb - 128) - 0.813\ (Cr - 128)$$
$$B = 1.164\ (Y - 16) + 2.018\ (Cb - 128)$$

*Note*: R/G/B: 0 to 255

Perform YCbCr-to-RGB conversion with the following allocation.

$$R = K11\ (Y - OFST_A1) + K12\ (Cb - OFST_B1) + K13\ (Cr - OFST_C1) + OFST_A2$$
$$G = K21\ (Y - OFST_A1) + K22\ (Cb - OFST_B1) + K23\ (Cr - OFST_C1) + OFST_B2$$
$$B = K31\ (Y - OFST_A1) + K32\ (Cb - OFST_B1) + K33\ (Cr - OFST_C1) + OFST_C2$$

*Note*: K** is set by signed fixed point Q10.
Example: K11 = 1.164 × 1024 = 1191.936 = H'4A8
Rounded to the nearest whole number.

| ISU_WPF_MUL6 | H'08120000 | K32 = H'0812, K33 = H'0000 |
| ISU_WPF_OFST1 | H'10808000 | OFST_A1 = H'10, B1 = H'80, C1 = H'80 |
| ISU_WPF_OFST2 | H'00000000 | OFST_A2 = H'00, B2 = H'00, C2 = H'00 |
| ISU_WPF_CLP1 | H'0000FF00 | CLP (MAX/MIN)_A = H'FF, H'00 |
| ISU_WPF_CLP2 | H'FF00FF00 | CLP (MAX/MIN)_B = H'FF, H'00, C = H'FF, H'00 |

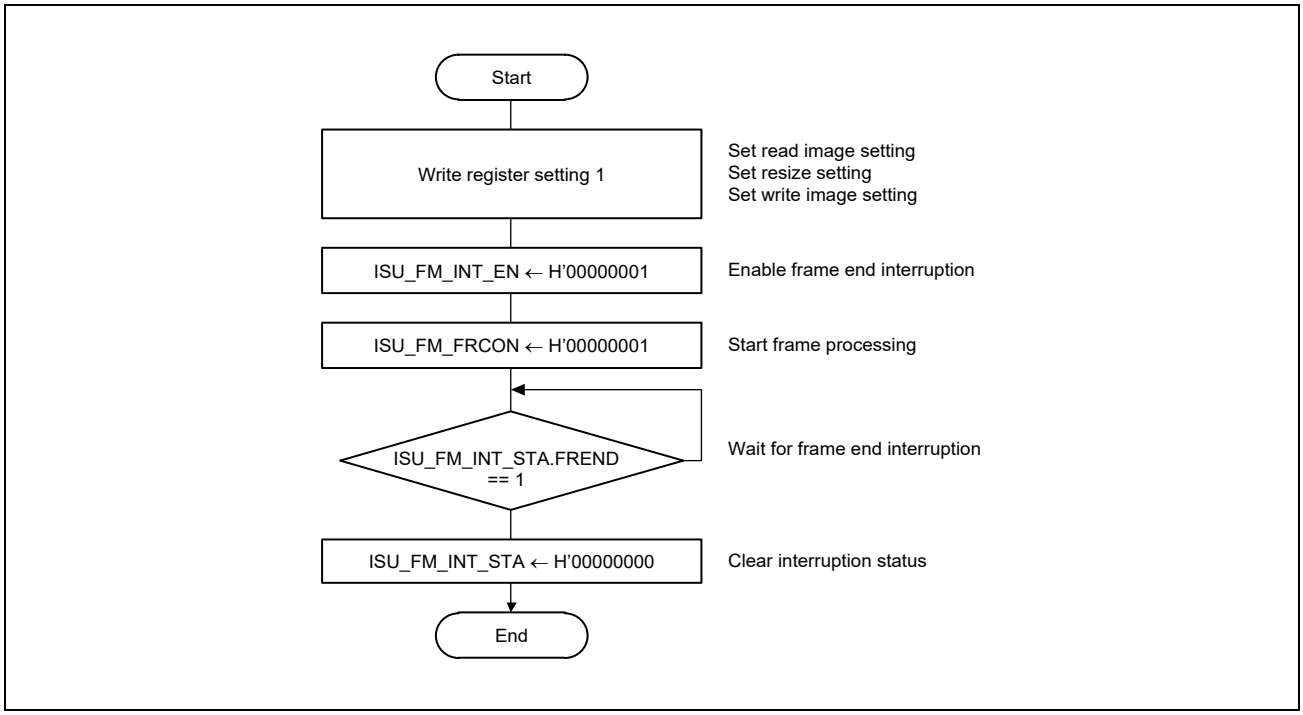

Figure 36.50 Flowchart of Color Format Conversion 2

### 36.5.2.3 BGR888 → YCbCr422

Set as follows to handle color format conversion.

Table 36.25 Color Format Conversion Example 3

| Item | Description |
|---|---|
| Assuming that the following image is input from the CRU | |
| Input size | 320 × 240 |
| Input format | BGR888 |
| Input start address | H'0_5000_0000 |
| Input stride | Plane 0 = H'03C0 |
| ISU setting | |
| Output (CROP) size | 320 × 240 |
| Output format | YCbCr422 8-bit UYVY (Interleave) |
| Output start address | Plane 0 = H'0_6000_000 |
| Output stride | Plane 0 = H'0280 |
| Processing method | Register |
| Reduction setting | No reduction |
| Color format conversion | RGB → YCbCr (BT.601 SDTV) |

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11\ K12\ K13 \\ K21\ K22\ K23 \\ K31\ K32\ K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS_A1 \\ B - OFS_B1 \\ C - OFS_C1 \end{bmatrix} + \begin{bmatrix} OFST_A2 \\ OFST_B2 \\ OFST_C2 \end{bmatrix}$$

$$C1'' = MAX\ (clip_a_min, Min\ (clip_a_max, C1'))$$
$$C2'' = MAX\ (clip_b_min, Min\ (clip_b_max, C2'))$$
$$C3'' = MAX\ (clip_c_min, Min\ (clip_c_max, C3'))$$

Figure 36.51 Matrix Operation Formula for Conversion and Color Correction

The following shows the RGB-to-YCbCr422 conversion formula (BT.601 SDTV).

$$Y = 0.257R + 0.504G + 0.098B + 16$$
$$Cb = -0.148R - 0.291G + 0.439B + 128$$
$$Cr = 0.439R - 0.368G - 0.071B + 128$$

*Note*: Brightness: 16 to 235
Color difference: 16 to 240

Perform RGB-to-YCbCr conversion with the following allocation.

$$Y = K11\ (R - OFST_A1) + K12\ (G - OFST_B1) + K13\ (B - OFST_C1) + OFST_A2$$
$$Cb = K21\ (R - OFST_A1) + K22\ (G - OFST_B1) + K23\ (B - OFST_C1) + OFST_B2$$
$$Cr = K31\ (R - OFST_A1) + K32\ (G - OFST_B1) + K33\ (B - OFST_C1) + OFST_C2$$

*Note*: K** is set by signed fixed point Q10.
Example: K11 = 0.257 × 1024 = 263.168 = H'107
Rounded to the nearest whole number.

# 40. SD/MMC Host Interface

NOTE

Development of the SD host--related products needs the conclusion of the following agreement. SD Host/Ancillary Product License Agreement (SD HALA)

## 40.1 Overview

### 40.1.1 Features

- 2 channels
- Channel 0 supports SDHI / e-MMC
- Channel 1 supports SDHI
- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, and SDR104 transfer modes supported
- SD clock (SD_CLK) frequency = SDxϕ/4 frequency/$2^n$ (n = 0 to 9) (x = 0, 1)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 2
- Card detect function
- Write protect supported
- MMC interface (1-/4-/8-bit MMC bus)
- e-MMC device access supported
- Backward-compatible, high-speed, HS200 transfer modes supported
- High-priority interrupt (HPI) supported

### Block Diagram

**Figure 40.1** shows a block diagram of the SD/MMC host interfaces.

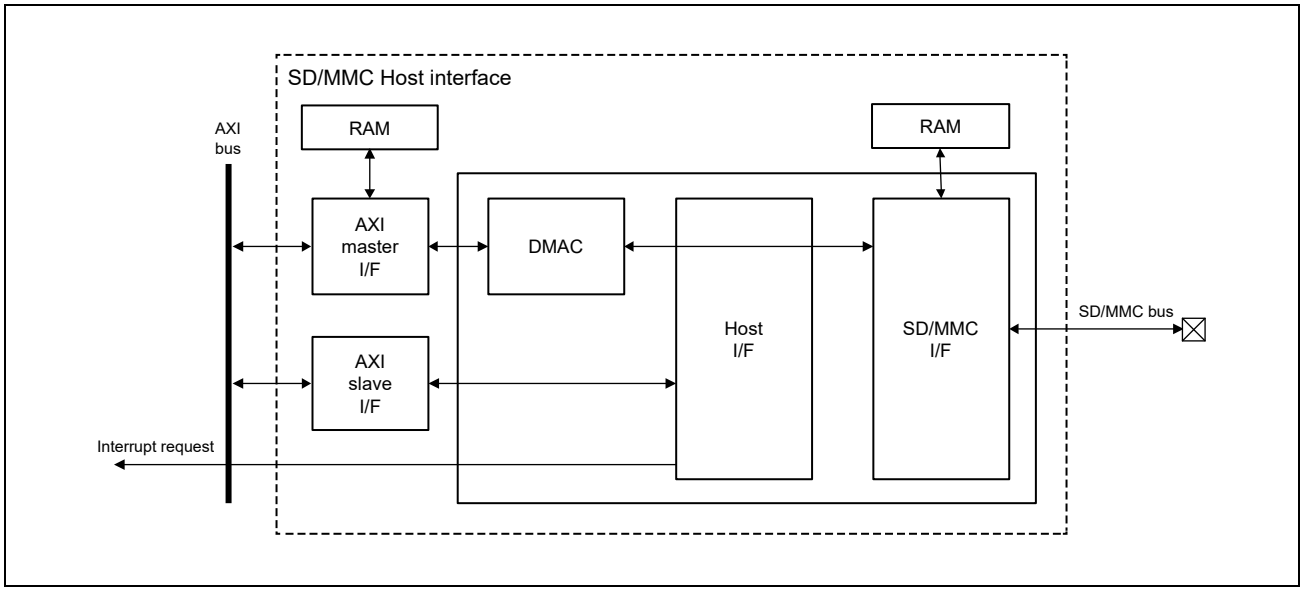

Figure 40.1 Block Diagram of SD/MMC Host Interface

### 40.1.2 External Pins

**Table 40.1** lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V. Channels 0 and 1 can operate with different voltages. Before using the pins of the SD/MMC host interface, be sure to set the SD ch0/1 IO Voltage Mode Control Register (SD_ch0 and SD_ch1) and Driving Ability Control Register (IOLH).

For details, see the following sections:

**Section 41.3.7, Driving Ability Control Register**,
**Section 41.3.17, SD ch0 IO Voltage Mode Control Register**,
**Section 41.3.18, SD ch1 IO Voltage Mode Control Register**.

Table 40.1 Pin Configuration

| PIN Name | I/O | Function |
|---|---|---|
| SDx_CLK*1 | O | SD/MMC clock output |
| SDx_CMD*1 | I/O | SD/MMC command output, response input |
| SDx_DATA0*1 | I/O | SD/MMC Data 0 [bit 0] |
| SDx_DATA1*1 | I/O | SD/MMC Data 1 [bit 1], SDIO interrupt |
| SDx_DATA2*1 | I/O | SD/MMC Data 2 [bit 2], read wait |
| SDx_DATA3*1 | I/O | SD/MMC Data 3 [bit 3], Card detection |
| SD0_DATA4*1 | I/O | SD/MMC Data 4 [bit 4] |
| SD0_DATA5*1 | I/O | SD/MMC Data 5 [bit 5] |
| SD0_DATA6*1 | I/O | SD/MMC Data 5 [bit 6] |
| SD0_DATA7*1 | I/O | SD/MMC Data 7 [bit 7] |
| SDx_CD*1 | I | SD/MMC card detection*2 |
| SDx_WP*1 | I | SD/MMC write protection*2 |
| SD0_RST# | O | SD/MMC reset |

Note 1. x (= 0, 1) is the channel number of the SD/MMC host interface. In this manual, those pins are referred as SDDAT0, SDDAT1, …, SDDAT7.

Note 2. Fix to 1 when not in use.

### 40.1.3 Register Configuration

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SD_CMD).

Channel 0:
H'0_11C0_0000 (Cortex-A55 Address Space)
H'41C0_0000 (Cortex-M33 Address Space Non-Secure)
H'51C0_0000 (Cortex-M33 Address Space Secure)

Channel 1:
H'0_11C1_0000 (Cortex-A55 Address Space)
H'41C1_0000 (Cortex-M33 Address Space Non-Secure)
H'51C1_0000 (Cortex-M33 Address Space Secure)

Table 40.2 Register Configurations (1/2)

| Name | Abbreviation | Address | Access Width | Mirror |
|---|---|---|---|---|
| Command type register | SD_CMD | H'0000 | 16/32/64 | |
| Command argument registers | SD_ARG | H'0010 | 16/32/64 | |

| DMAC address register | DM_DTRAN_ADDR | H'0880 | 16/32/64 | |
| SCC register area*2 | — | — | — | — |

Note 1. Only for channel 0.

Note 2. Refer to **Section 40.7, SCC Register Descriptions**.

## 40.2 Register Description

### 40.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to **Section 40.4.14, Example of SD_CMD Register Setting**.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | MD7 | 00 | R/W | Multiple Block Transfer Mode (enabled at multiple block transfer) |
| 14 | MD6 | | | 00: CMD12 is automatically issued at multiple block transfer.<br>01: CMD12 is not automatically issued at multiple block transfer.<br>10: Setting prohibited<br>11: Setting prohibited |
| 13 | MD5 | 0 | R/W | Single/Multiple Block Transfer (enabled when the command with data is handled)<br>0: Single block transfer<br>1: Multi block transfer |
| 12 | MD4 | 0 | R/W | Write/Read Mode (enabled when the command with data is handled)<br>0: Write (SD/MMC host interfaces -> SD card)<br>1: Read (SD/MMC host interfaces <- SD card) |
| 11 | MD3 | 0 | R/W | Data Mode (Command Type)<br>0: Command without data transfer (bc, bcr, ac)<br>1: Command with data transfer (adtc) |
| 10 | MD2 | 000 | R/W | Mode/Response Type |
| 9 | MD1 | | | 000: Normal mode |
| 8 | MD0 | | | The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled.<br>001: Setting prohibited<br>010: Setting prohibited<br>011: Extended mode/No response<br>100: Extended mode/R1, R5, R6, or R7 response from the SD card<br>101: Extended mode/R1b response from the SD card<br>110: Extended mode/R2 response from the SD card<br>111: Extended mode/R3 or R4 response from the SD card<br>Some commands cannot be used in normal mode. For details, see **Section 40.4.14, Example of SD_CMD Register Setting** to select mode/response type. |
| 7 | C1 | 00 | R/W | 00: CMD |
| 6 | C0 | | | 01: ACMD<br>10: Setting prohibited<br>11: Setting prohibited |
| 5 | CF45 | 000000 | R/W | Command Index<br>These bits specify Command Format[45:40] (command index).<br>[Examples]<br>CMD6: SD_CMD[7:0] = 0000 0110b<br>CMD18: SD_CMD[7:0] = 0001 0010b<br>ACMD13: SD_CMD[7:0] = 0100 1101b |
| 4 | CF44 | | | |
| 3 | CF43 | | | |
| 2 | CF42 | | | |
| 1 | CF41 | | | |
| 0 | CF40 | | | |

**Note:** SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

### 40.2.2 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is H'0000 0000 regardless of the setting of SD_ARG.

SD_ARG

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 0 | CF39 to CF8 | All 0 | R/W | Set command format[39:8] (argument). |

SD_ARG1 (Mirror of SD_ARG[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | CF39 to CF24 | All 0 | R/W | Set command format[39:24] (argument). |

### 40.2.3 Data Stop Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 19 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 18 | — | 0*1 | R/W | Reserved<br>The write value should always be 0. |
| 17 | HPIMODE | 0*1 | R/W | HPI Mode Enable<br>0: Disables HPI mode.<br>1: Enables HPI mode. |
| 16 | HPICMD | 0*1 | R/W*3 | HPI Command Issue<br>When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed.<br>The timing with which this bit is set to 1 is as follows.<br>• After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence.<br>• After reception of the response to CMD24/CMD25 has been completed<br>After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0. |
| 15 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | SEC | 0*1 | R/W | Block Count Enable*2<br>0: Disables SD_SECCNT setting value.<br>1: Enables SD_SECCNT setting value.<br>Set SEC to 1 at multiple block transfer.<br>When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT.<br>1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000)<br>2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer)<br>When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued. |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | STP | 0*1 | R/W | Stop<br>● When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly.<br>● When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued.<br>● When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued.<br>● When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued.<br>● When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set.<br>● Set STP to 1 after the response end flag has been set.<br>● Set STP to 0 after the response end flag has been set. |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. It is effective only if 1 is written.

### 40.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 0 | CNT31 to CNT0 | All 0 | R/W | Number of Transfer Blocks*1<br>When H'0000 0001 is set, the number of transfer blocks is 1.<br>:<br>When H'0000 FFFF is set, the number of transfer blocks is 65535.<br>:<br>When H'FFFF FFFF is set, the number of transfer blocks is 4294967295.<br>Do not set this register to H'0000 0000 if multiple blocks are to be transferred. |

Note 1. Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

### 40.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

SD_RSP10

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 0 | R71 to R8 | All 0 | R | Hold the response from the SD card |

SD_RSP1 (Mirror of SD_RSP10[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | R39 to R24 | All 0 | R | Hold the response from the SD card |

SD_RSP32 (Mirror of SD_RSP10[63:32])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 0 | R71 to R40 | All 0 | R | Hold the response from the SD card |

SD_RSP3 (Mirror of SD_RSP32[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | R71 to R56 | All 0 | R | Hold the response from the SD card |

SD_RSP54

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 56 | — | All 0 | R | These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 55 to 0 | R127 to R72 | All 0 | R | Hold the response from the SD card |

SD_RSP5 (Mirror of SD_RSP54[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | R103 to R88 | All 0 | R | Hold the response from the SD card |

SD_RSP76 (Mirror of SD_RSP54[63:32])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 23 to 0 | R127 to R104 | All 0 | R | Hold the response from the SD card |

SD_RSP7 (Mirror of SD_RSP76[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 to 0 | R127 to R120 | All 0 | R | Hold the response from the SD card |

**Table 40.3** lists the response types and corresponding SD_RSP registers.

Table 40.3 Response Types and Corresponding SD_RSP Registers

| Response Types | SD_RSP Registers |
|---|---|
| R1, R1b[39:8] | SD_RSP10<br>SD_RSP54*1 |
| R2[127:8] | SD_RSP54 and SD_RSP10 |
| R3[39:8] | SD_RSP10 |
| R4[39:8] | SD_RSP10 |
| R5[39:8] | SD_RSP10 |
| R6[39:8] | SD_RSP10 |
| R7[39:8] | SD_RSP10 |

Note 1. The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

### 40.2.6 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | HPIRES | 0*2 | R/W*1 | Response Reception Completion<br>[Setting condition]<br>When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode.<br>[Clearing condition]<br>When 0 is written to HPIRES |
| 15 to 11 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 10 | INFO10 | Unknown | R | Indicates the SDDAT3 state.<br>0: SDDAT3 is set to 0.<br>1: SDDAT3 is set to 1. |
| 9 | INFO9 | 0 | R/W*1 | SDDAT3 Card Insertion<br>[Setting condition]<br>After change in SDDAT3 from 0 to 1, two cycles of 2 P1ϕ have elapsed with SDDAT3 held 1.<br>[Clearing condition]<br>When 0 is written to INFO9 |
| 8 | INFO8 | 0 | R/W*1 | SDDAT3 Card Removal<br>[Setting condition]<br>After change in SDDAT3 from 1 to 0, two cycles of 2 P1ϕ have elapsed with SDDAT3 held 0.<br>[Clearing condition]<br>When 0 is written to INFO8 |
| 7 | INFO7 | Unknown | R | Write Protect<br>Indicates the ISDWP state.<br>0: ISDWP is set to 1.<br>1: ISDWP is set to 0. |
| 6 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 5 | INFO5 | Unknown | R | Indicates the ISDCD state.<br>0: Indicates that Mcycle has elapsed with ISDCD held 1.<br>1: Indicates that Mcycle has elapsed with ISDCD held 0.<br>Mcycle is set by bits 3 to 0 in SD_OPTION. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 4 | INFO4 | 0 | R/W*1 | ISDCD Card Insertion<br>[Setting condition]<br>After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0.<br>[Clearing condition]<br>When 0 is written to INFO4<br>Mcycle is set by bits 3 to 0 in SD_OPTION. |
| 3 | INFO3 | 0 | R/W*1 | ISDCD Card Removal<br>[Setting condition]<br>After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1.<br>[Clearing condition]<br>When 0 is written to INFO3<br>Mcycle is set by bits 3 to 0 in SD_OPTION. |
| 2 | INFO2 | 0*2 | R/W*1 | Access End<br>[Setting conditions]<br>1. When read access to the buffer is completed in the case of transfer for single block read<br>2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read<br>3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12<br>4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write<br>5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write<br>6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12<br>7. When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read<br>8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write<br>9. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read<br>10. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write<br>In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout.<br>[Clearing condition]<br>When 0 is written to INFO2<br>When the access end bit is set to 1, the command sequence is terminated. |
| 1 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | INFO0 | 0*2 | R/W*1 | Response End<br>[Setting conditions]<br>1. When the reception of the response is completed<br>2. When the transmission of the command not requiring a response is completed,<br>3. When receiving busy reception after R1b response<br>4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read<br>5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write,<br>In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout.<br>[Clearing condition]<br>When 0 is written to INFO0<br>When issuing a command without data, the command sequence ends when the response end is set to 1. |

Note 1. It is effective only if 0 is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

### 40.2.7 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | ILA | 0*2 | R/W*1 | Illegal Access Error<br>[Setting conditions]<br>1. Writing of data to SD_CMD within a command sequence (CBSY=1)<br>2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD<br>[Clearing condition]<br>When 0 is written to ILA |
| 14 | CBSY | 0*2 | R | Command Type Register Busy<br>0: A command sequence has been completed.<br>1: A command sequence is being executed. |
| 13 | SCLKDIVEN | 1*2 | R | 0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register.<br>1: The SD bus (CMD, DAT) is not busy.<br>When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence. |
| 12 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 11 | — | 0 | R/W | Reserved<br>The write value should always be 1. |
| 10 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 9 | BWE | 0*2 | R/W*1 | SD_BUF Write Enable<br>0: Data cannot be written in SD_BUF0.<br>1: Data can be written in SD_BUF0.<br>[Setting conditions]<br>1. When SD_BUF is empty at single block transfer<br>2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer<br>[Clearing conditions]<br>1. When 0 is written to BWE<br>2. Writing of a block of data to SD_BUF by DMA transfer<br>When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | BRE | 0*2 | R/W*1 | SD_BUF Read Enable<br>0: Data cannot be read from SD_BUF0.<br>1: Data can be read from SD_BUF0.<br>[Setting conditions]<br>1. When data set in SD_SIZE is stored in SD_BUF at single block transfer<br>2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer<br>[Clearing conditions]<br>1. When 0 is written to BRE<br>2. Reading of a block of data from SD_BUF by DMA transfer<br>When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3.<br>Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set. |
| 7 | DAT0 | Unknown | R | SDDAT0<br>Indicates the SDDAT0 state.<br>0: SDDAT0 is set to 0.<br>1: SDDAT0 is set to 1.<br>If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0.<br>If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0.<br>While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped. |
| 6 | ERR6 | 0*2 | R/W*1 | Response Timeout<br>[Setting condition]<br>When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5)<br>[Clearing condition]<br>When 0 is written to ERR6<br>The command sequence is halted by a response timeout.*4 |
| 5 | ERR5 | 0*2 | R/W*1 | SD_BUF Illegal Read Access<br>[Setting conditions]<br>1. When SD_BUF is empty while SD_BUF0 is read<br>2. When data with a CRC error or END error is read from SD_BUF0<br>[Clearing condition]<br>When 0 is written to ERR5 |
| 4 | ERR4 | 0*2 | R/W*1 | SD_BUF Illegal Write Access<br>[Setting conditions]<br>1. When data is written to SD_BUF0 while it is not in the data read/write command state<br>2. When data is written to SD_BUF0 while SD_BUF is full<br>3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length<br>4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status<br>[Clearing condition]<br>When 0 is written to ERR4<br>Ncycle is set by bits 7 to 4 in SD_OPTION. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | ERR3 | 0*2 | R/W*1 | Data Timeout (except response timeout)<br>[Setting conditions]<br>1. After R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle.<br>2. After CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle.<br>3. After write data, the CRC status is not received even after Ncycle has elapsed.<br>4. After read command, read data is not received even after Ncycle has elapsed.<br>5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle.<br>6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed.<br>7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed.<br>[Clearing condition]<br>When 0 is written to ERR3<br>Ncycle is set by bits 7 to 4 in SD_OPTION.<br>The command sequence is halted by the data timeout. |
| 2 | ERR2 | 0*2 | R/W*1 | END Error<br>[Setting conditions]<br>1. When an error occurs in the response length (and the end bit has not been detected)<br>2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits)<br>3. When an error occurs in the CRC status length (and the end bit has not been detected)<br>4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected)<br>[Clearing condition]<br>When 0 is written to ERR2<br>The command sequence is halted by the End error.*4 |
| 1 | ERR1 | 0*2 | R/W*1 | CRC Error<br>[Setting conditions]<br>1. When an error occurs in the CRC status (i.e. the received CRC status was not 010')<br>2. When a CRC error occurs in the read data<br>3. When a CRC error occurs in the response<br>4. A CRC error in the response to a command issued within a command sequence*5<br>[Clearing condition]<br>When 0 is written to ERR1<br>The command sequence is halted by the CRC error.*4 |
| 0 | ERR0 | 0*2 | R/W*1 | CMD Error<br>[Setting conditions]<br>1. The command index of the transmitted command differing from the command index of the received response<br>2. The command index of a command issued within a command sequence*5 differing from the command index of the received response<br>[Clearing condition]<br>When 0 is written to ERR0<br>The command sequence is halted by the CMD error.*4 |

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes

setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in **Figure 40.16** under **Section 40.4.8, IO_RW_EXTENDED (CMD53/Multiple Block Read)** or in **Figure 40.19** under **Section 40.4.9, IO_RW_EXTENDED (CMD53/Multiple Block Write)**.

Note 5. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

### 40.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt.

When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | IMASK16 | 1 | R/W | HPIRES interrupt masked |
| 15 to 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | IMASK9 | 1 | R/W | INFO9 interrupt masked |
| 8 | IMASK8 | 1 | R/W | INFO8 interrupt masked |
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 4 | IMASK4 | 1 | R/W | INFO4 interrupt masked |
| 3 | IMASK3 | 1 | R/W | INFO3 interrupt masked |
| 2 | IMASK2 | 1 | R/W | INFO2 interrupt masked |
| 1 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 0 | IMASK0 | 1 | R/W | INFO0 interrupt masked |

### 40.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt.

When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | IMASK | 1 | R/W | ILA interrupt masked |
| 14 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11 | — | 1 | R/W | Reserved<br>The write value should always be 1. |
| 10 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 9 | BMASK1 | 1 | R/W | BWE interrupt masked |
| 8 | BMASK0 | 1 | R/W | BRE interrupt masked |
| 7 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 6 | EMASK6 | 1 | R/W | ERR6 interrupt masked |
| 5 | EMASK5 | 1 | R/W | ERR5 interrupt masked |
| 4 | EMASK4 | 1 | R/W | ERR4 interrupt masked |
| 3 | EMASK3 | 1 | R/W | ERR3 interrupt masked |
| 2 | EMASK2 | 1 | R/W | ERR2 interrupt masked |
| 1 | EMASK1 | 1 | R/W | ERR1 interrupt masked |
| 0 | EMASK0 | 1 | R/W | ERR0 interrupt masked |

### 40.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | — | 0 | R/W | Reserved<br>The write value should always be 0. |
| 15 to 11 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 10 | — | 0*1 | R/W | Reserved<br>The write value should always be 0. |
| 9 | SDCLKOFFEN | 0 | R/W | SD Clock (SDCLK) Output Automatic Control Enable<br>0: Automatic control for SD clock (SDCLK) output is disabled.<br>1: Automatic control for SD clock (SDCLK) output is enabled.<br>This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence.<br>The timing with which SDCLK output starts and stops is as follows.<br>SDCLK output starts after writing to SD_CMD.<br>SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence.<br>In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit. |
| 8 | SCLKEN | 0*1 | R/W*2 | SD Clock (SDCLK) Output Control Enable<br>0: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0.<br>1: SD clock (SDCLK) output is enabled. |
| 7 | DIV7 | 0 | R/W*2 | SD Clock (SDCLK)<br>1000 0000b: (SDxϕ/4)/512<br>0100 0000b: (SDxϕ/4)/256<br>0010 0000b: (SDxϕ/4)/128<br>0001 0000b: (SDxϕ/4)/64<br>0000 1000b: (SDxϕ/4)/32<br>0000 0100b: (SDxϕ/4)/16<br>0000 0010b: (SDxϕ/4)/8<br>0000 0001b: (SDxϕ/4)/4<br>0000 0000b: (SDxϕ/4)/2<br>1111 1111b: SDxϕ/4 (x = 0, 1)<br>Other settings are prohibited. |
| 6 | DIV6 | 0 | R/W*2 | |
| 5 | DIV5 | 1 | R/W*2 | |
| 4 | DIV4 | 0 | R/W*2 | |
| 3 | DIV3 | 0 | R/W*2 | |
| 2 | DIV2 | 0 | R/W*2 | |
| 1 | DIV1 | 0 | R/W*2 | |
| 0 | DIV0 | 0 | R/W*2 | |

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

**Notes on when setting the SD clock (SDCLK) to P1ϕ (DIV[7:0] = 1111 1111b)**

When changing the setting of bits DIV[7:0] to 1111 1111b, or from 1111 1111b to other setting, perform the following processing before writing to SD_CMD.

(1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

(2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)

(3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to 1111 1111b after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

### 40.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 12 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11, 10 | — | All 0 | R | Reserved |
| 9 to 0 | LEN9 to LEN0 | 1000000000 | R/W | Transfer Data Size*1<br>These bits specify a size between 1 and 512 bytes for single block transfer.<br>In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes.<br>Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53.<br>Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes. |

Note 1. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

### 40.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | WIDTH | 0*1 | R/W | Bus width*2<br>{WIDTH,WIDTH8} = 01: 8 bits width<br>{WIDTH,WIDTH8} = 00: 4 bits width<br>{WIDTH,WIDTH8} = 10,11: 1 bit width<br>In the case of writing of one-byte block, 8 bits width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block. |
| 14 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit. |
| 13 | WIDTH8 | 0*1 | R/W | Bus width*2<br>See the description of the WIDTH bit. |
| 12 to 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | EXTOP | 0*1 | R/W | Timeout Mode Select<br>0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*$2^{13}$ to SDCLK*$2^{27}$.<br>1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*$2^{14}$ to SDCLK*$2^{28}$. |
| 8 | TOUTMASK | 0*1 | R/W | Timeout Mask<br>0: Enables timeout.<br>1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.)<br>If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence. |
| 7 | TOP27 | 1*1 | R/W | Timeout Counter*2<br>0000: SDCLK*$2^{13}$<br>0001: SDCLK*$2^{14}$<br>:<br>1101: SDCLK*$2^{26}$<br>1110: SDCLK*$2^{27}$<br>1111: Setting prohibited |
| 6 | TOP26 | 1*1 | R/W | |
| 5 | TOP25 | 1*1 | R/W | |
| 4 | TOP24 | 0*1 | R/W | |
| 3 | CTOP24 | 1*1 | R/W | Card Detect Time Counter<br>0000: SDCLK*$2^{10}$<br>0001: SDCLK*$2^{11}$<br>:<br>1101: SDCLK*$2^{23}$<br>1110: SDCLK*$2^{24}$<br>1111: Setting prohibited |
| 2 | CTOP23 | 1*1 | R/W | |
| 1 | CTOP22 | 1*1 | R/W | |
| 0 | CTOP21 | 0*1 | R/W | |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

### 40.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 15 | — | Unknown | R | Reserved<br>These bits are always read as unknown. The write value should always be 0. |
| 14 | E14 | 0*1 | R | These bits hold the CRC status. (normal: 010) |
| 13 | E13 | 1*1 | | |
| 12 | E12 | 0*1 | | |
| 11 | E11 | 0*1 | R | Set to 1 when an error occurs in the CRC status. |
| 10 | E10 | 0*1 | R | Set to 1 when a CRC error occurs in the read data. |
| 9 | E9 | 0*1 | R | Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8. |
| 8 | E8 | 0*1 | R | Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2). |
| 7, 6 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 | E5 | 0*1 | R | Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected). |
| 4 | E4 | 0*1 | R | Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits). |
| 3 | E3 | 0*1 | R | Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2. |
| 2 | E2 | 0*1 | R | Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2). |
| 1 | E1 | 0*1 | R | Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0. |
| 0 | E0 | 0*1 | R | Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2). |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

### 40.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 7 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 6 | E6 | 0*1 | R | Set to 1 when the interface remains in a busy state for at least Ncycle after the CRC status. |
| 5 | E5 | 0*1 | R | Set to 1 when the CRC status is not received even after Ncycle has elapsed after data writing. |
| 4 | E4 | 0*1 | R | Set to 1 when read data is not received even after Ncycle has elapsed after the command has been read.<br>Set to 1 when read data for the next block are not received even after Ncycle has elapsed after the reception of read data.<br>Set to 1 when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state. |
| 3 | E3 | 0*1 | R | Set to 1 when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2. |
| 2 | E2 | 0*1 | R | Set to 1 when the interface remains in a busy state for at least Ncycle after R1b response. |
| 1 | E1 | 0*1 | R | Set to 1 when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0. |
| 0 | E0 | 0*1 | R | Set to 1 when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed. |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

### 40.2.15 SD Buffer Read/Write Register (SD_BUF0)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 0 | BUF63 to BUF0 | Unknown | R/W | When writing to the SD card, the write data is written to this register.<br>When reading from the SD card, the read data is read from this register.<br>This register is internally connected to two 512-byte buffers (SD_BUF).<br>When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock. |

**Note:** When using the DMAC, the bus width should be fixed at 64 bits.

### 40.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | C52PUB | 0 | R/W | SDIO None Abort<br>• When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1.<br>• When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1.<br>• If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB.<br>• Set SD_ARG before setting C52PUB to 1.<br>• Set C52PUB to 1 after the response end flag has been set. |
| 8 | IOABT | 0 | R/W | SDIO Abort<br>• When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued.<br>However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued.<br>Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1.<br>• When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued.<br>• When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued.<br>• When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued.<br>• When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set.<br>• Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set. |
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | RWREQ | 0 | R/W | Read Wait Request<br>When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks.<br>[Read wait state releasing]<br>(1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state.<br>(2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released.<br>(3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.)<br>When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end.<br>Set RWREQ to 1 after the response end flag has been set. |
| 1 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 0 | IOMOD | 0 | R/W | SDIO Mode*1<br>0: Disables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card<br>1: Enables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card |

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

### 40.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | EXWT | 0*2 | R/W*1 | [Setting condition]<br>While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1.<br>[Clearing condition]<br>When 0 is written to EXWT |
| 14 | EXPUB52 | 0*2 | R/W*1 | [Setting conditions]<br>1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1.<br>2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred.<br>[Clearing condition]<br>When 0 is written to EXPUB52 |
| 13 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2, 1 | — | All 0*2 | R/W | Reserved<br>The write value should always be 1. The value may change during operation. |
| 0 | IOIRQ | 0*2 | R/W*1 | [Setting condition]<br>When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1.<br>[Clearing condition]<br>When 0 is written to IOIRQ*3 |

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

### 40.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | MEXWT | 1 | R/W | EXWT interrupt masked |
| 14 | MEXPUB52 | 1 | R/W | EXPUB52 interrupt masked |
| 13 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 | — | 1 | R/W | Reserved<br>The write value should always be 1. |
| 1 | — | 1 | R/W | Reserved<br>The write value should always be 1. |
| 0 | IOMSK | 1 | R/W | IOIRQ interrupt masked |

### 40.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 13 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 12 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit. |
| 11, 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9, 8 | — | All 0 | R/W | Reserved<br>The write value should always be 0. |
| 7, 6 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 | — | 0 | R/W | Reserved<br>The write value should always be 0. |
| 4 | — | 1 | R | Reserved<br>This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit. |
| 3, 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | DMASDRW | 0 | R/W | SD_BUF Read/Write DMA Transfer*1<br>0: The SD_BUF read/write DMA transfer is disabled.<br>1: The SD_BUF read/write DMA transfer is enabled. |
| 0 | — | 0 | R/W | Reserved<br>The write value should always be 0. |

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

### 40.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD/MMC host interfaces and before attempting access to the other registers.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2, 1 | — | 11 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 0 | SDRST | 1 | R/W | Software Reset of SD Interface Unit<br>0: Reset<br>1: Reset released |

### 40.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD/MMC host interfaces.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15, 14 | UR7, UR6 | 11 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 13, 12 | UR5, UR4 | 00 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11 to 8 | UR3 to UR0 | H'C | R | Version of Renesas' IP |
| 7 to 0 | IP7 to IP0 | H'10 | R | Version of introductory IP |

### 40.2.22 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | BUSWIDTH | 0 | R/W | Width for Access to SD_BUF*1*2<br>Read or write access to SD_BUF0 can be performed with the specified width for access.<br>0: 16-bit access<br>1: 32-bit access<br>This bit is enabled while the WMODE bit is set to 1. |
| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | ENDIAN | 0 | R/W | SD_BUF0 data swap |
| 0 | WMODE | 0 | R/W | Width for Access to SD_BUF*1*2<br>Read or write access to SD_BUF0 can be performed with the specified width for access.<br>0: 64-bit access<br>1: 16-bit or 32-bit access |

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

### 40.2.23 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register specifies transfer mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | — | 0*1 | R/W | Reserved<br>The write value should always be 0. |
| 8 | NOCHKCR | 0*1 | R/W | CRC Check Mask (test command for MMC supported)<br>Enables or disables checking of the CRC16 and CRC status.<br>0: Enables the CRC check.<br>1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write) |
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

### 40.2.24 SD Status Register (SD_STATUS)

The effective bit of the SD status register controls the output value on the SD0_RST# pin.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | SD_RST | 0 | R/W | Controls the output value on the SD0_RST# pin.<br>0: The output value on the SD0_RST# pin is 0.<br>1: The output value on the SD0_RST# pin is 1. |
| 0 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |

### 40.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

The DMAC Transfer Mode Register (DM_CM_DTRAN_MODE) sets the operation mode of the module built-in DMAC.

High 32 bits (bit 63 to 32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 18 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 17, 16 | CH_NUM | 00 | R/W | DMAC channel selector<br>00 : SD down stream<br>01 : SD up stream<br>Other settings are prohibited. |
| 15 to 6 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5, 4 | BUS_WIDTH [1:0] | 11 | R/W | Bus width selector<br>11: 64-bit<br>Other settings are prohibited. |
| 3 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

### 40.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

The DMAC Transfer Control Register (DM_CM_DTRAN_CTRL) controls the module built-in DMAC operation. High 32 bits (bit 63-32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | — | 0 | R/W | Reserved<br>The write value should always be 0. |
| 7 to 1 | — | All 0 | R | Reserved |
| 0 | DM_START | 0 | R/W | DMAC Start<br>Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started. |

### 40.2.27 DMAC Reset Register (DM_CM_RST)

High 32 bits (bit 63 to 32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 10 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. |
| 9 | DTRANRST1 | 1 | R/W | Soft resets of the module built-in DMAC channel 1<br>0: Reset<br>1: Reset released |
| 8 | DTRANRST0 | 1 | R/W | Soft resets of the module built-in DMAC channel 0<br>0: Reset<br>1: Reset released |
| 7 to 1 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. |
| 0 | SEQRST | 1 | R/W | Soft resets of the sequencer<br>0: Reset<br>1: Reset released |

NOTE

Make sure there is no communication to the SD/MMC device before applying a software reset using this register.

### 40.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 21 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 20 | DTRANEND1 | 0*1 | R/W | Module built-in DMAC Channel 1 Transfer End<br>[Setting conditions]<br>1. When transfer of DMAC channel 1 is completed<br>2. When an error occurs on DMAC channel 1<br>[Clearing condition]<br>When 0 is written to DTRANEND1 |
| 19 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | DTRANEND0 | 0*2 | R/W | Module built-in DMAC Channel 0 Transfer End<br>[Setting conditions]<br>1. When transfer of DMAC channel 0 is completed<br>2. When an error occurs on DMAC channel 0<br>[Clearing condition]<br>When 0 is written to DTRANEND0 |
| 15 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | SEQEND | 0*3 | R/W | Sequencer Operation End<br>[Setting conditions]<br>1. When operation of a sequencer is completed<br>2. When a sequencer error occurs<br>[Clearing condition]<br>When 0 is written to SEQEND |

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

### 40.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 21 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 20 | DTRANEND1_MASK | 1 | R/W | DTRANEND1 interrupt masked |
| 19 to 17 | — | All 1 | R/W | Reserved<br>The write value should always be 1. |
| 16 | DTRANEND0_MASK | 1 | R/W | DTRANEND0 interrupt masked |
| 15 to 1 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 0 | SEQEND_MASK | 1 | R/W | SEQEND interrupt masked |

### 40.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 20 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 19, 18 | — | 00 | R | Reserved<br>The write value should always be 0. |
| 17 | DTRANERR1 | 0*1 | R/W | Module built-in DMAC Channel 1 Error<br>[Setting condition]<br>When an error occurs on DMAC channel 1<br>[Clearing condition]<br>When 0 is written to DTRANERR1 |
| 16 | DTRANERR0 | 0*2 | R/W | Module built-in DMAC Channel 0 Error<br>[Setting condition]<br>When an error occurs on the DMAC channel 0<br>[Clearing condition]<br>When 0 is written to DTRANERR0 |
| 15 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | SEQERR | 0*3 | R/W | Sequencer error<br>[Setting condition]<br>When a sequencer error occurs<br>[Clearing condition]<br>When 0 is written to SEQERR |

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

### 40.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 20 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 19, 18 | — | 11 | R | Reserved<br>The write value should always be 1. |
| 17 | DTRANERR1_MASK | 1 | R/W | DTRANERR1 interrupt masked |
| 16 | DTRANERR0_MASK | 1 | R/W | DTRANERR0 interrupt masked |
| 15 to 1 | — | All 1 | R | Reserved<br>These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 0 | SEQERR_MASK | 1 | R/W | SEQERR interrupt masked |

### 40.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR)

The DMAC Transfer Address Register (DM_DTRAN_ADDR) sets the transfer destination and source address of the module built-in DMAC.

Higher-order 32 bits (bit 63 to 32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 32 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 3 | DADDR | All 0 | R/W | Destination address / Source address (8 byte unit)<br>Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to $2^{32}$. |
| 2 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

# 40.3 Operation

## 40.3.1 SD Interface

### (1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see **Figure 40.2**, **Figure 40.3** and **Figure 40.4**.)
2. The receive data is stored in SD_BUF of the SD/MMC host interfaces. (SD_BUF store data: see **Figure 40.5**)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see **Table 40.4**)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See **Figure 40.5**)

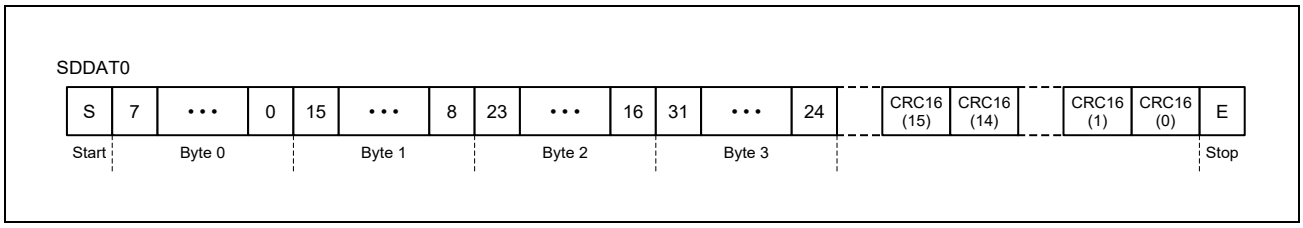

Figure 40.2 SDDAT in 1-Bit Width Mode

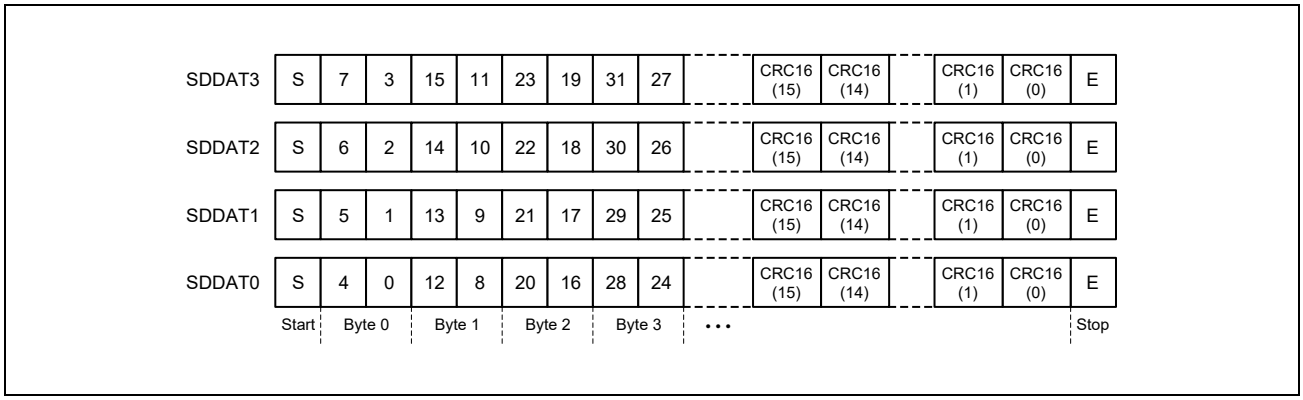

Figure 40.3 SDDAT in 4-Bit Width Mode

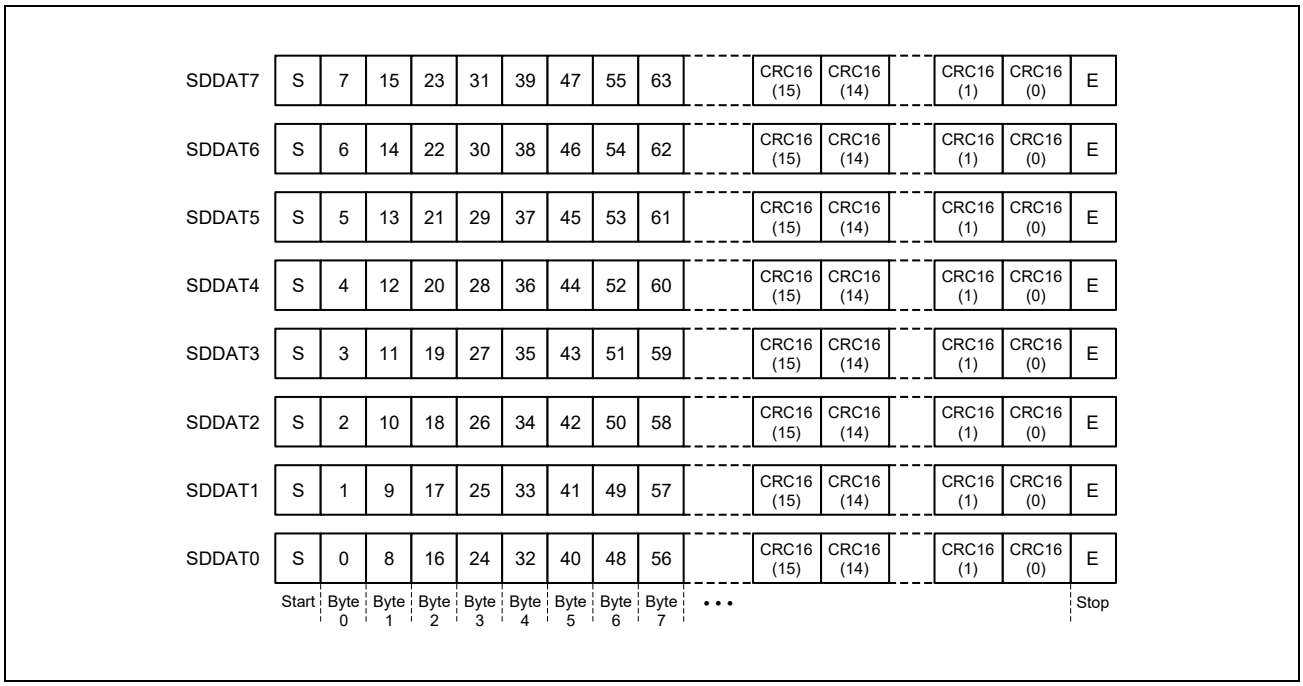

Figure 40.4 SDDAT in 8-Bit Width Mode

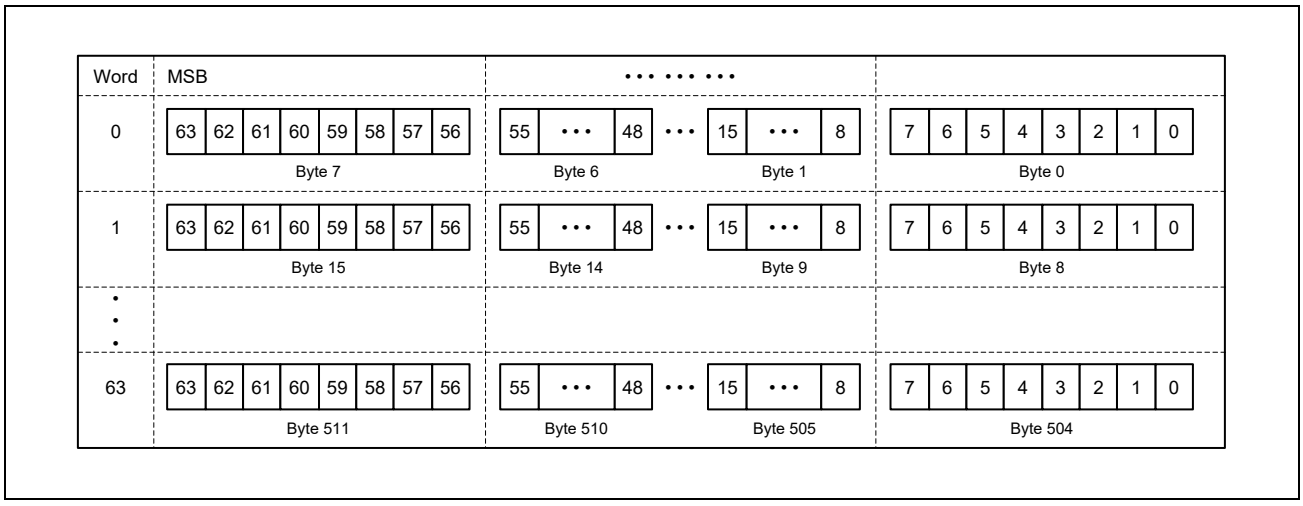

Figure 40.5 SD_BUF Store Data

Table 40.4 Reading from SD_BUF0

| WMODE*1 | BUSWIDTH*1 | ENDIAN*1 | Read Data*2 |
|---|---|---|---|
| 0 | 0 | 0 | H'0123456789ABCDEF |
| 0 | 0 | 1 | H'EFCDAB8967452301 |
| 1 | 1 | 0 | H'89ABCDEF (1st)<br>H'01234567 (2nd) |
| 1 | 1 | 1 | H'EFCDAB89 (1st)<br>H'67452301 (2nd) |
| 1 | 0 | 0 | H'CDEF (1st)<br>H'89AB (2nd)<br>H'4567 (3rd)<br>H'0123 (4th) |
| 1 | 0 | 1 | H'EFCD (1st)<br>H'AB89 (2nd)<br>H'6745 (3rd)<br>H'2301 (4th) |

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is H'0123456789ABCDEF

### (2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(1) Issuing CMD11
Perform command sequence processing of CMD11.

(2) Stopping the SD clock (a)
Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop*[1] the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.

**Note 1.** When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(3) Checking the value of SDDAT
Check that the DAT0 bit in the SD_INFO2 register is 0.

(4) Changing the supply voltage of the host device
Change the voltage which is supplied through the power supply pin of the given channel (SD0_PVDD for channel 0 or SD1_PVDD for channel 1) from 3.3 V to 1.8 V.

For details, see the following sections:

**Section 41.3.4, Port Function Control Register**,
**Section 41.3.7, Driving Ability Control Register**,
**Section 41.3.17, SD ch0 IO Voltage Mode Control Register**,
**Section 41.3.18, SD ch1 IO Voltage Mode Control Register**.

(5) Starting supply of the SD clock (b)
After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(6) Checking the value of SDDAT
After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

## 40.3.2 Card Detect/Write Protect

### (1) Card Detect

The SD/MMC host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

  **Figure 40.6** shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

  [Card insertion]

  ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

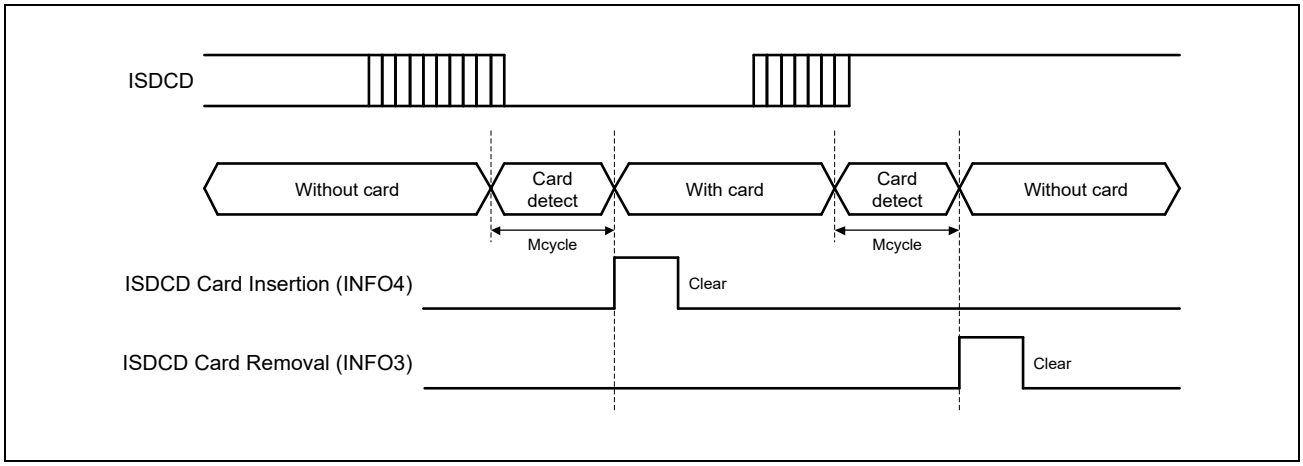

Figure 40.6 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

  **Figure 40.7** shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

  [Card insertion]

  When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

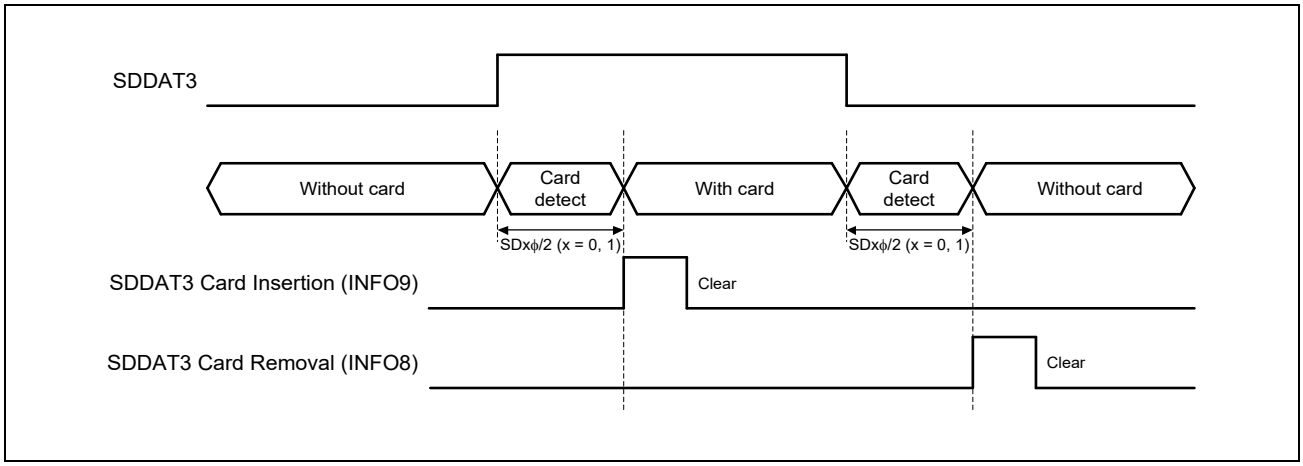

Figure 40.7 SD Card Detect with SDDAT3

### (2) Write Protect

The SD/MMC host interface has two types of write protect functions.

- Write protect with ISDWP

  ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

  The card's internal write protection and the card lock/unlock operation are realized by the command.

## 40.3.3 Interrupt Request

### (1) Interrupt Request

The SD/MMC host interface has the interrupt requests shown in **Table 40.5** shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 40.5 Interrupt Request

| | Interrupt Flag Register | | Interrupt Mask Register | |
|---|---|---|---|---|
| Interrupt Request | Register Name | Bit Name | Register Name | Bit Name |
| Card access interrupt*1 | SD_INFO1 | INFO2 | SD_INFO1_MASK | IMASK2 |
| | | INFO0 | | IMASK0 |
| | SD_INFO2 | ILA | SD_INFO2_MASK | IMASK |
| | | BWE | | BMASK1 |
| | | BRE | | BMASK0 |
| | | ERR6 | | EMASK6 |
| | | ERR5 | | EMASK5 |
| | | ERR4 | | EMASK4 |
| | | ERR3 | | EMASK3 |
| | | ERR2 | | EMASK2 |
| | | ERR1 | | EMASK1 |
| | | ERR0 | | EMASK0 |
| SDIO access interrupt*2 | SDIO_INFO1 | EXWT | SDIO_INFO1_MASK | MEXWT |
| | | EXPUB52 | | MEXPUB52 |
| | | IOIRQ | | IOMSK |
| Card detect interrupt*1 | SD_INFO1 | INFO9 | SD_INFO1_MASK | IMASK9 |
| | | INFO8 | | IMASK8 |
| | | INFO4 | | IMASK4 |
| | | INFO3 | | IMASK3 |
| DMAC interrupt*1 | DM_CM_INFO1 | DTRANEND1 | DM_CM_INFO1_MASK | DTRANEND1_MASK |
| | | DTRANEND0 | | DTRANEND0_MASK |
| | | SEQEND | | SEQEND_MASK |
| | DM_CM_INFO2 | DTRANERR1 | DM_CM_INFO2_MASK | DTARERR1_MASK |
| | | DTRANERR0 | | DTARERR0_MASK |
| | | SEQERR | | SEQERR_MASK |

Note 1. Interrupt signal “OXMNIRQ” is asserted.

Note 2. Interrupt signal both “OXMNIRQ” and “OXASIOIRQ” are asserted.

### 40.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

**Table 40.6** and **Table 40.7** show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 40.6 Communications Errors

| Communication Error | SD Interrupt Flag Register | | SD Error Status Register | | Description |
|---|---|---|---|---|---|
| | Register Name | Bit Name | Register Name | Bit Name | |
| END error | SD_INFO2 | ERR2 | SD_ERR_STS1 | E5 | When an error occurs in the CRC status length |
| | | | | E4 | When an error occurs in read data length |
| | | | | E3 | When an error occurs in the response length to a command issued within a command sequence |
| | | | | E2 | When an error occurs in the response length (other than a response to a command issued within a command sequence) |
| CRC error | | ERR1 | | E11 | When an error occurs in the CRC status |
| | | | | E10 | When a CRC error occurs in the read data |
| | | | | E9 | When a CRC error occurs in the response to a command issued within a command sequence |
| | | | | E8 | When a CRC error occurs in the response (other than a response to a command issued within a command sequence) |
| CMD error | | ERR0 | | E1 | The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence) |
| | | | | E0 | The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence) |

Table 40.7 Timeouts

| Timeout | SD Interrupt Flag Register | | SD Error Status Register | | Description |
|---|---|---|---|---|---|
| | Register Name | Bit Name | Register Name | Bit Name | |
| Response timeout | SD_INFO2 | ERR6 | SD_ERR_STS2 | E1 | When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed |
| | | | | E0 | When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed |
| Data timeout (other than response timeout) | | ERR3 | | E6 | When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after the CRC status |
| | | | | E5 | When the CRC status is not received t even after Ncycle*1 has elapsed after data writing |
| | | | | E4 | When read data is not received even after Ncycle*1 has elapsed after read command |
| | | | | | When read data for the next block are not received even after Ncycle*1 has elapsed after the reception of read data |
| | | | | | When read data for the next block are not received even after Ncycle*1 has elapsed after release of the read wait state |
| | | | | E3 | When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after CMD12 has been issued within a command sequence |
| | | | | E2 | When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after R1b response |

Note 1. Ncycle is set by bit 7 to bit 4 in SD_OPTION.

# 40.4 Usage Example

## 40.4.1 Command without Data Transfer

### (1) Flowchart

**Figure 40.8** and **Figure 40.9** show flowchart examples.

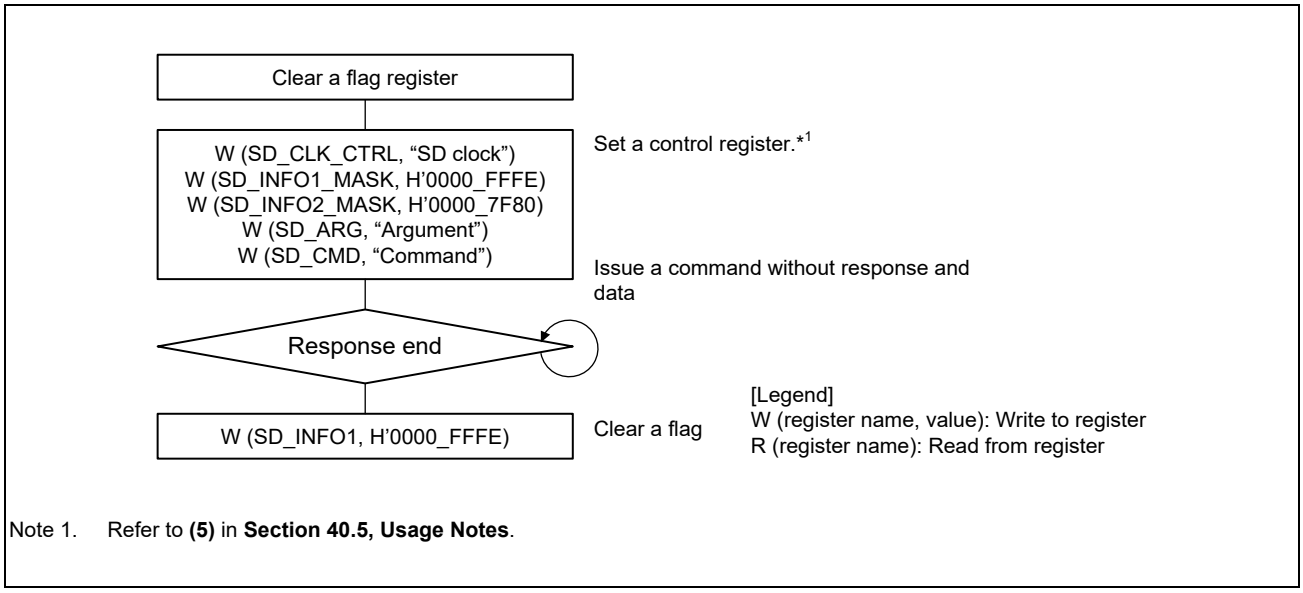

Figure 40.8 Flow Example of Command without Response and Data

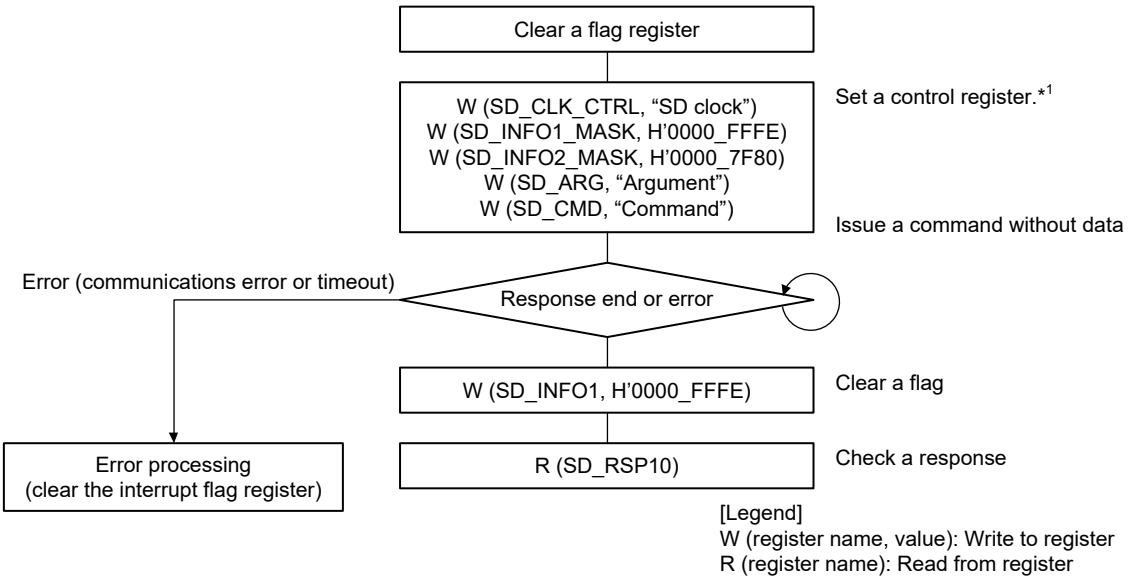


Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.9 Flow Example of Command without Data

### (2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value):Write to register

R (register name):Read from register

The operation is described as below.

#### (a) Command without response and data

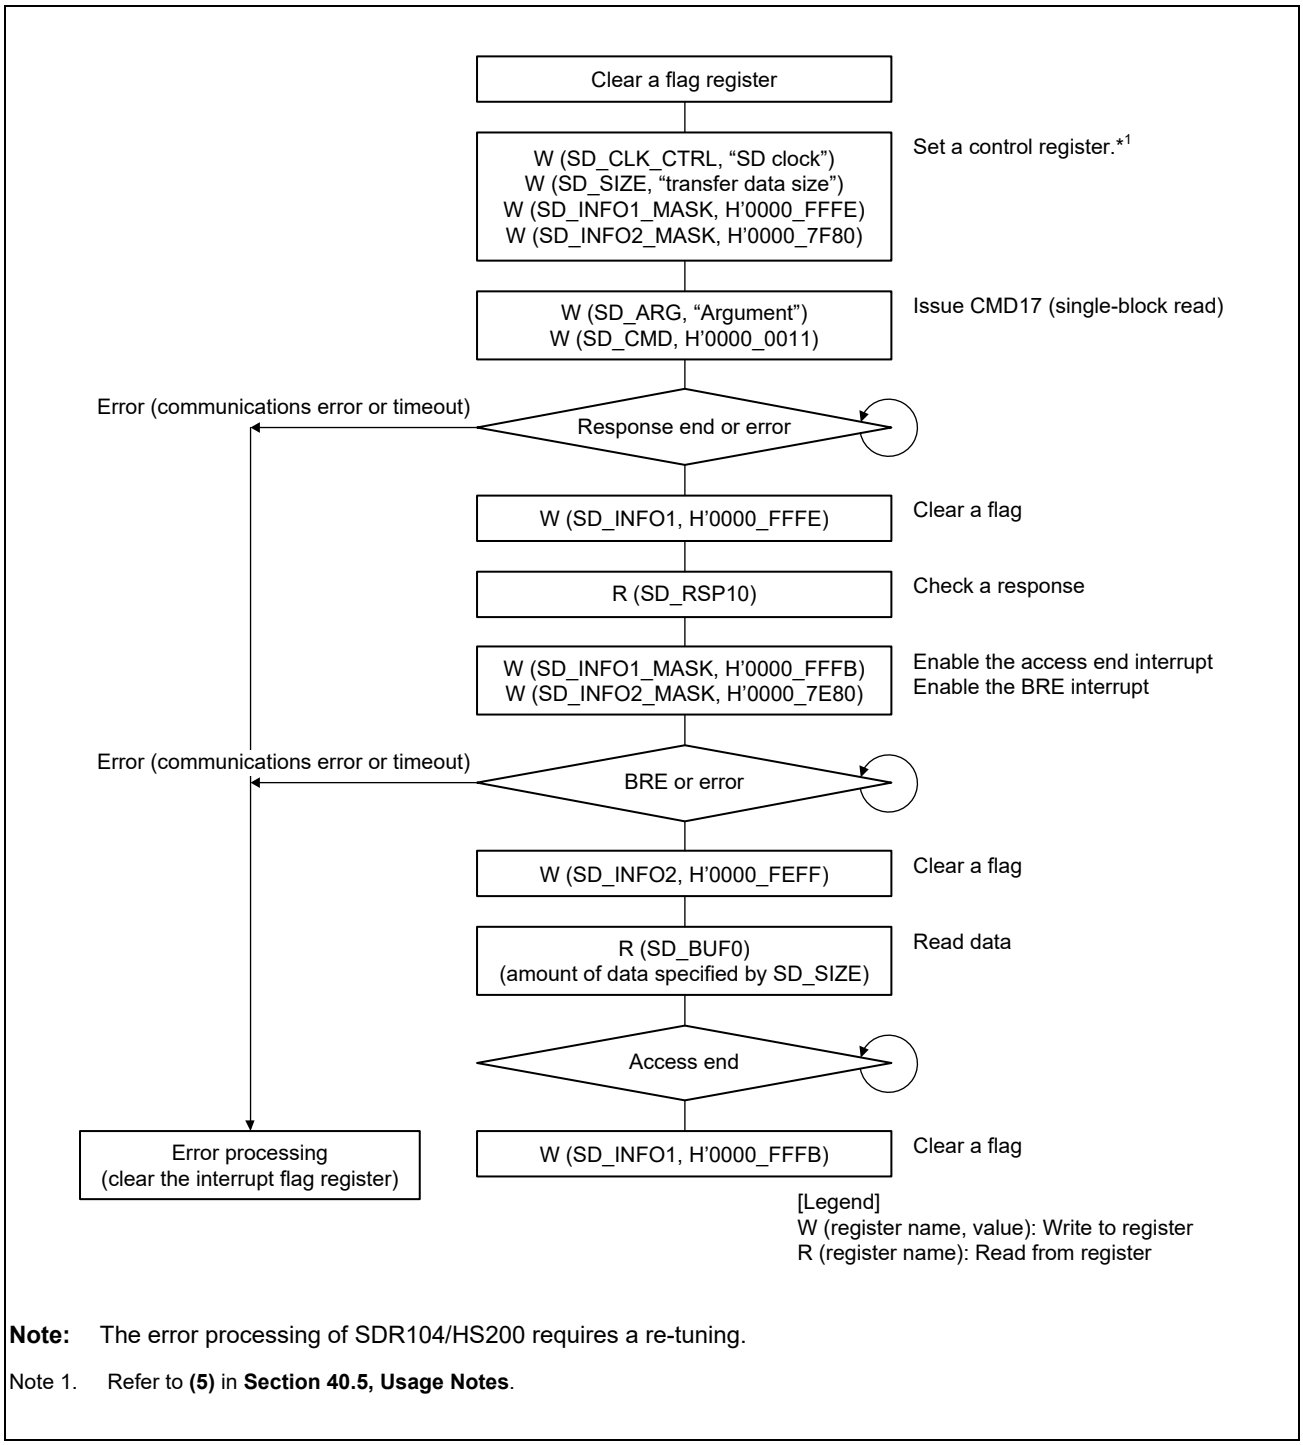
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

#### (b) Command without data

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

## 40.4.2 Single Block Read

### (1) Flowchart



**Note:** The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.10 Single Block Read Flowchart Example

### (2) Operation for Single Block Read

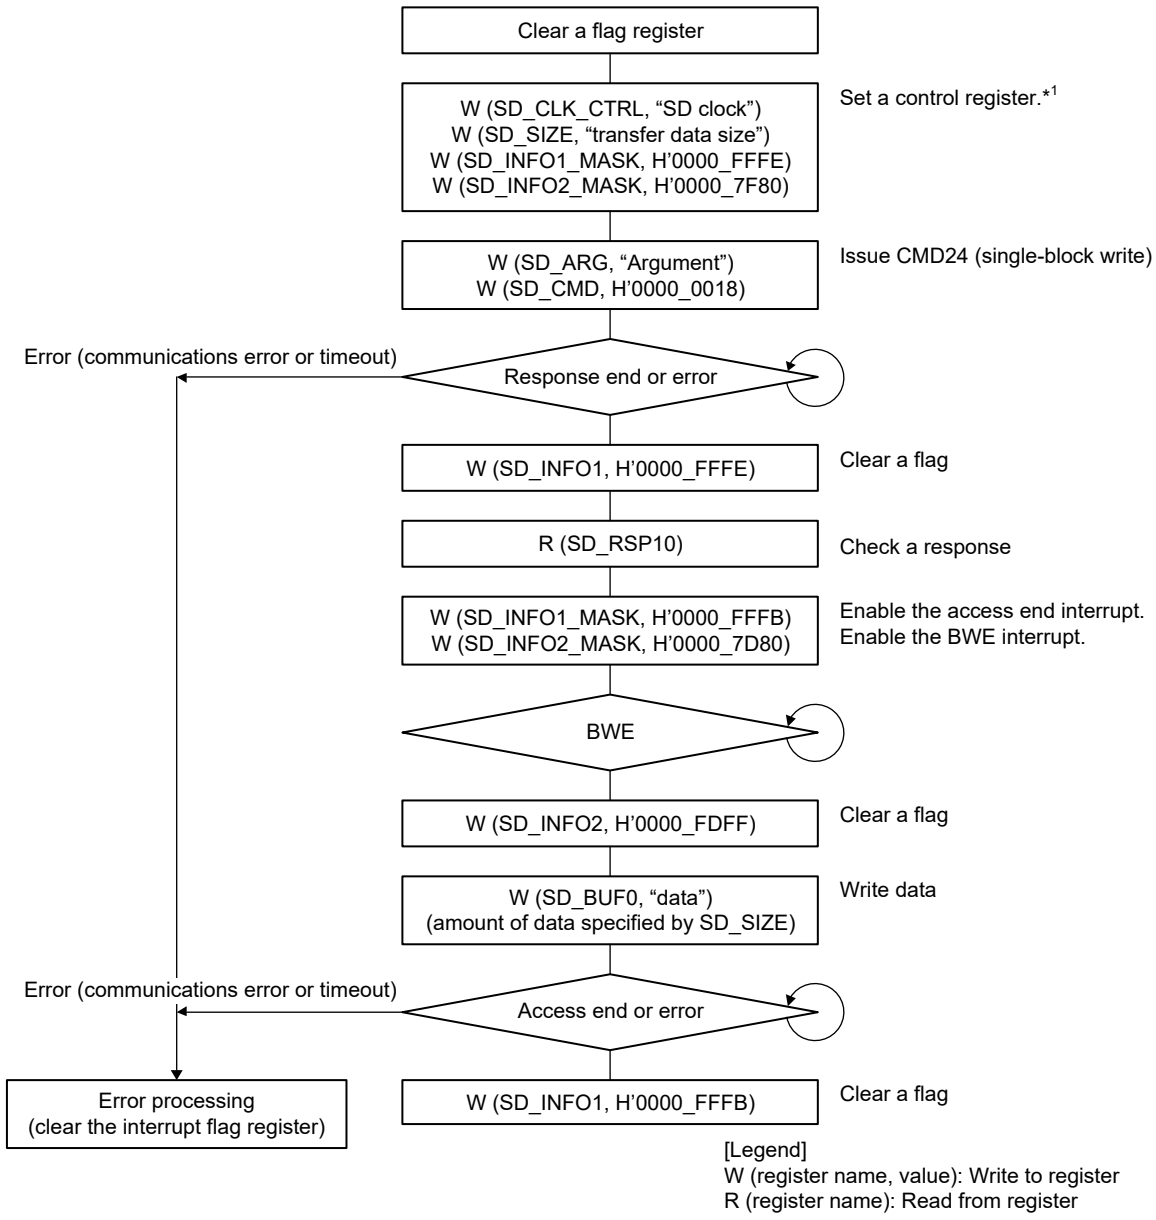
The operation of the single block read is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write H'0000 0011 to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

### 40.4.3 Single Block Write

#### (1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.11 Single Block Write Flowchart Example

### (2) Operation for Single Block Write

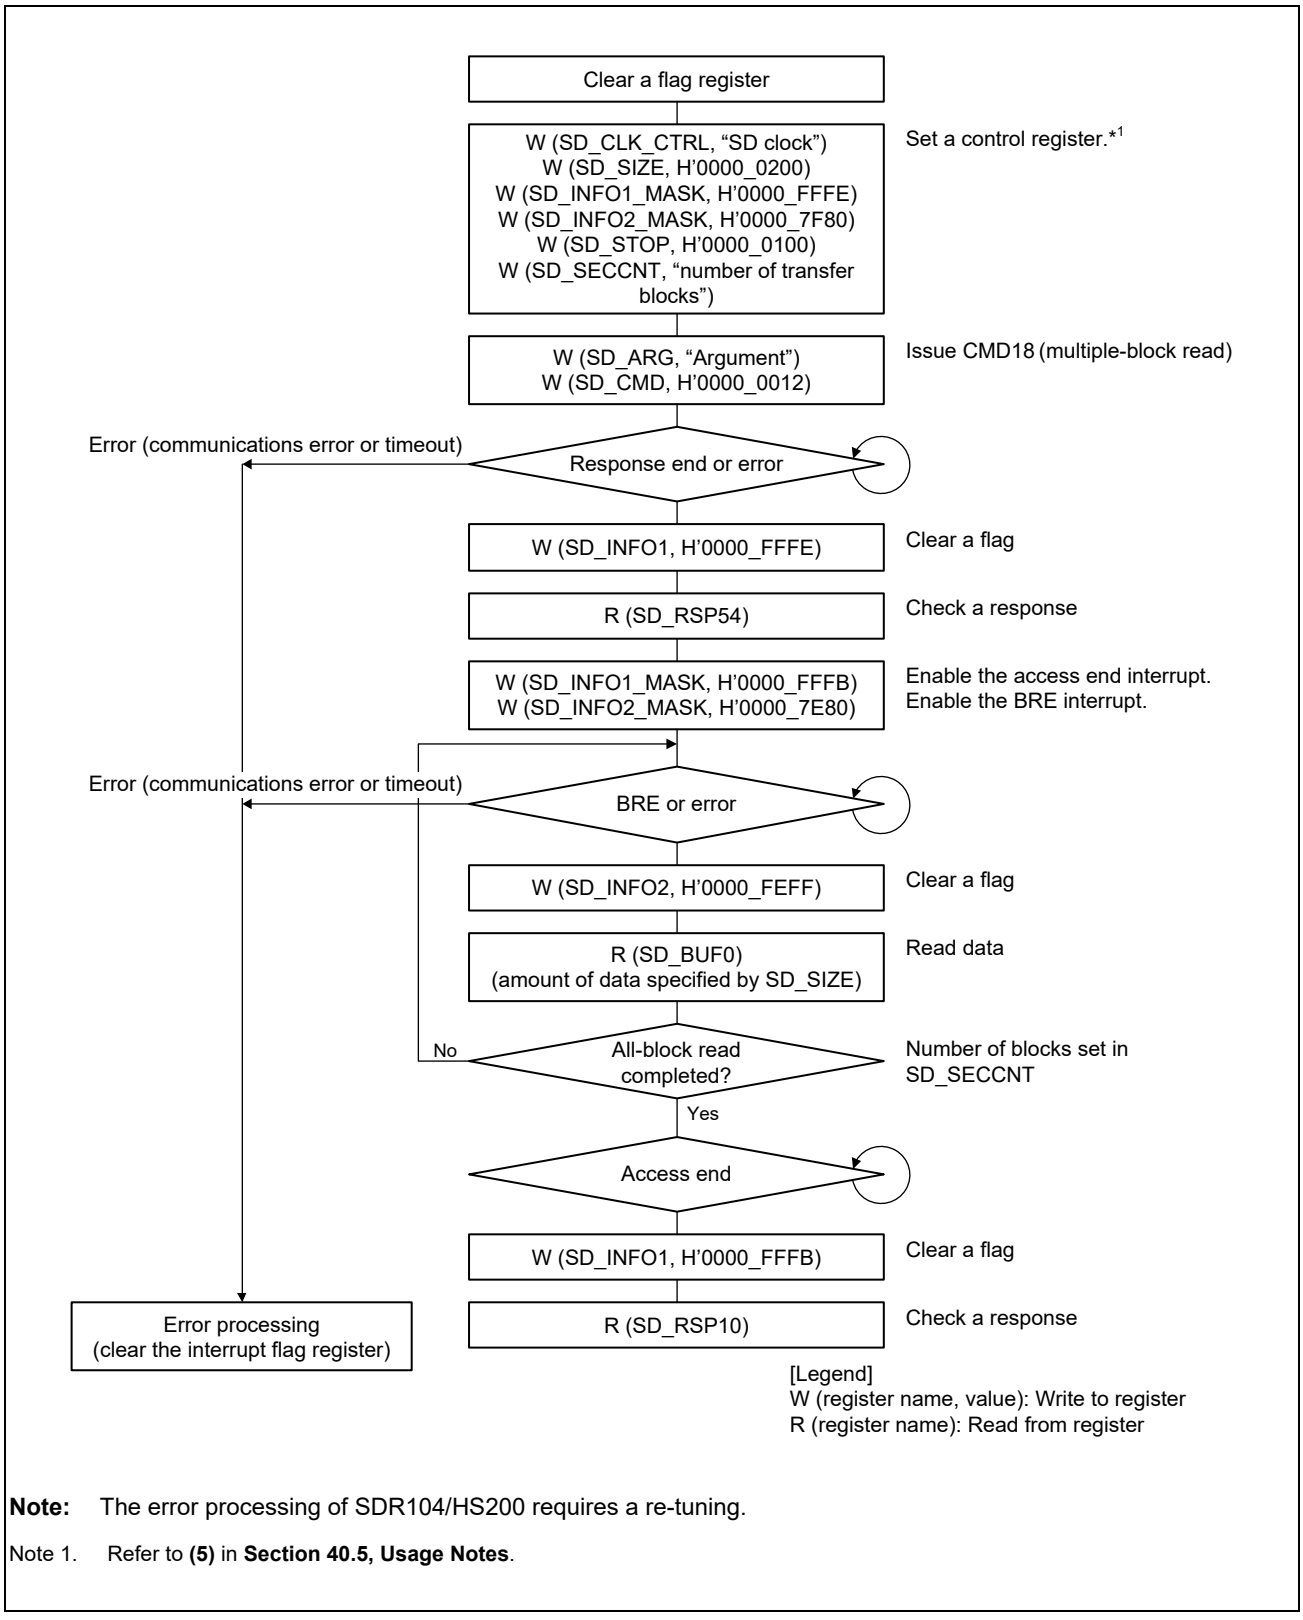
The operation of the single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

### 40.4.4 Multiple Block Read

#### (1) Flowchart



**Note:** The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.12 Multiple Block Read Flowchart Example

### (2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

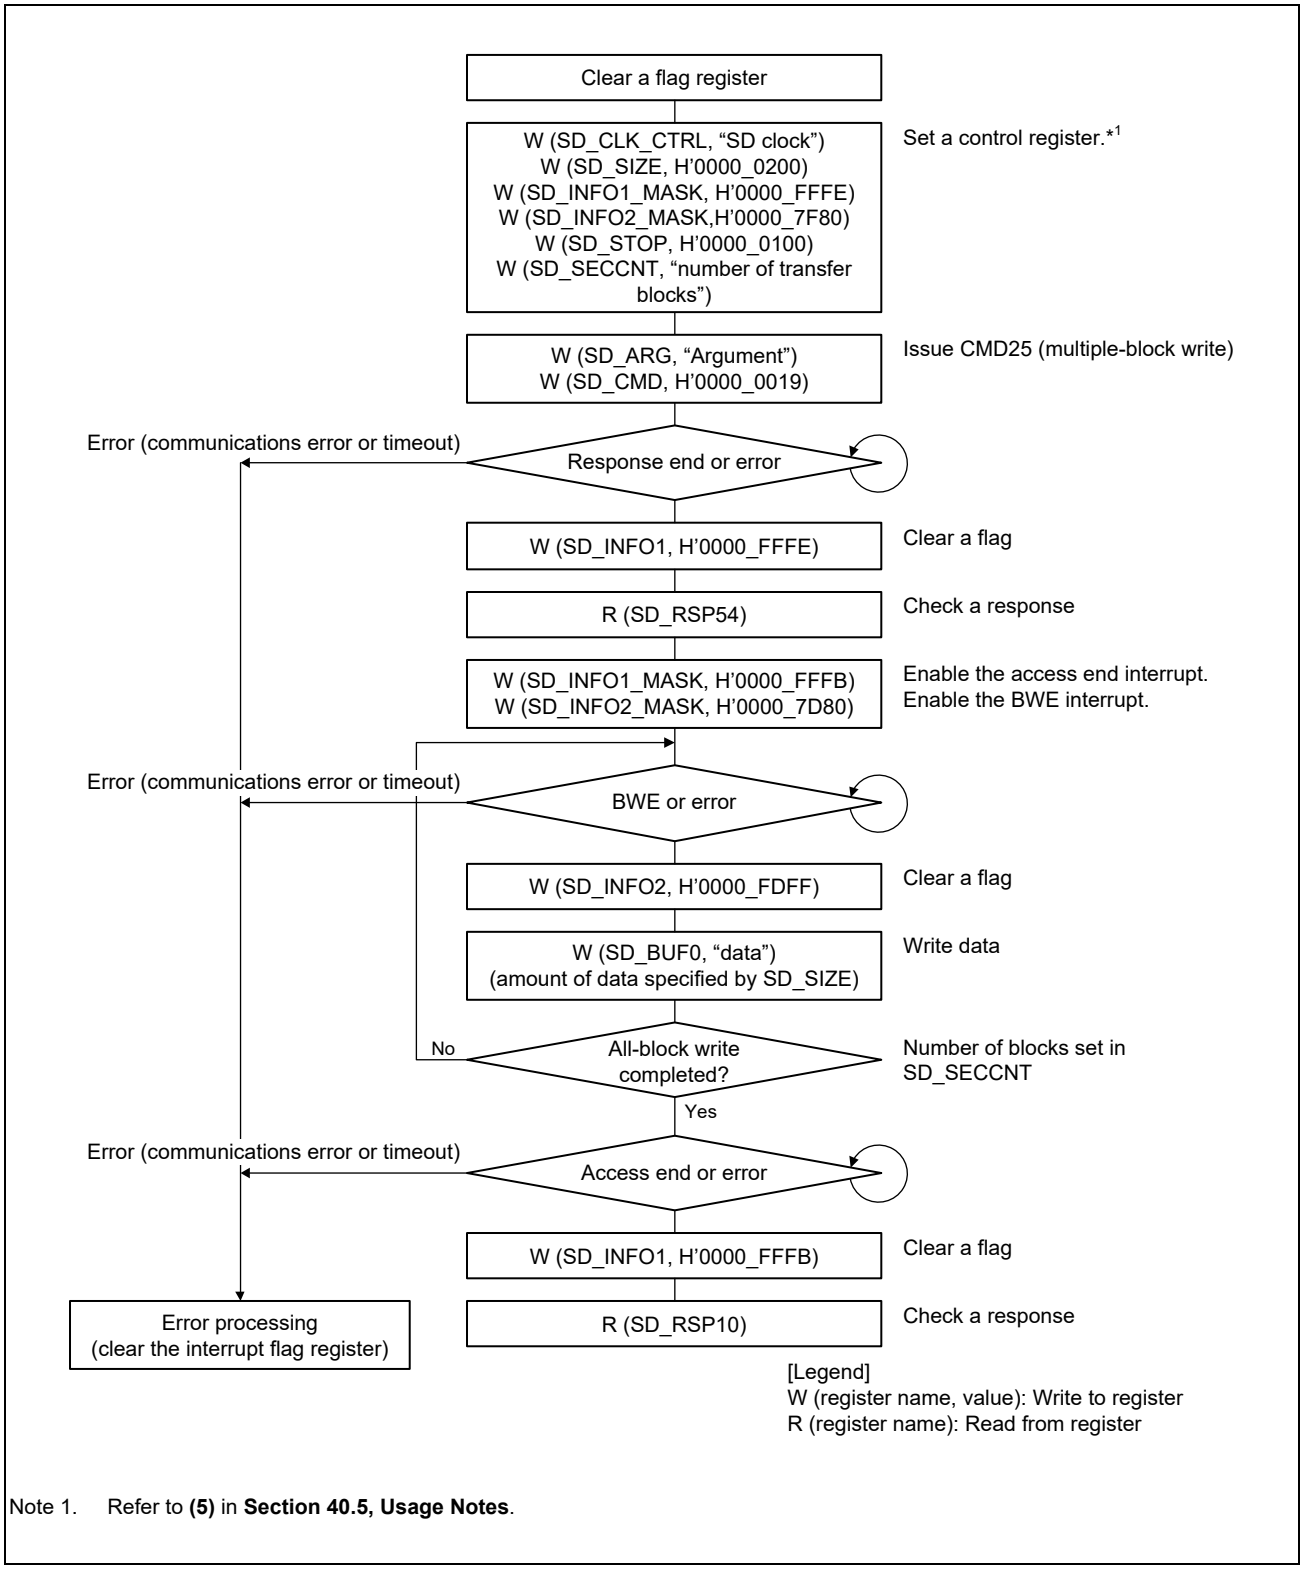
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write H'0000 0012 to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 000.
6. Operation complete
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

### 40.4.5 Multiple Block Write (when Using Internal Timer)

#### (1) Flowchart

**Figure 40.13** shows the flowchart when using an internal timer.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.13 Multiple Block Write Flowchart Example (when Using Internal Timer)

### (2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

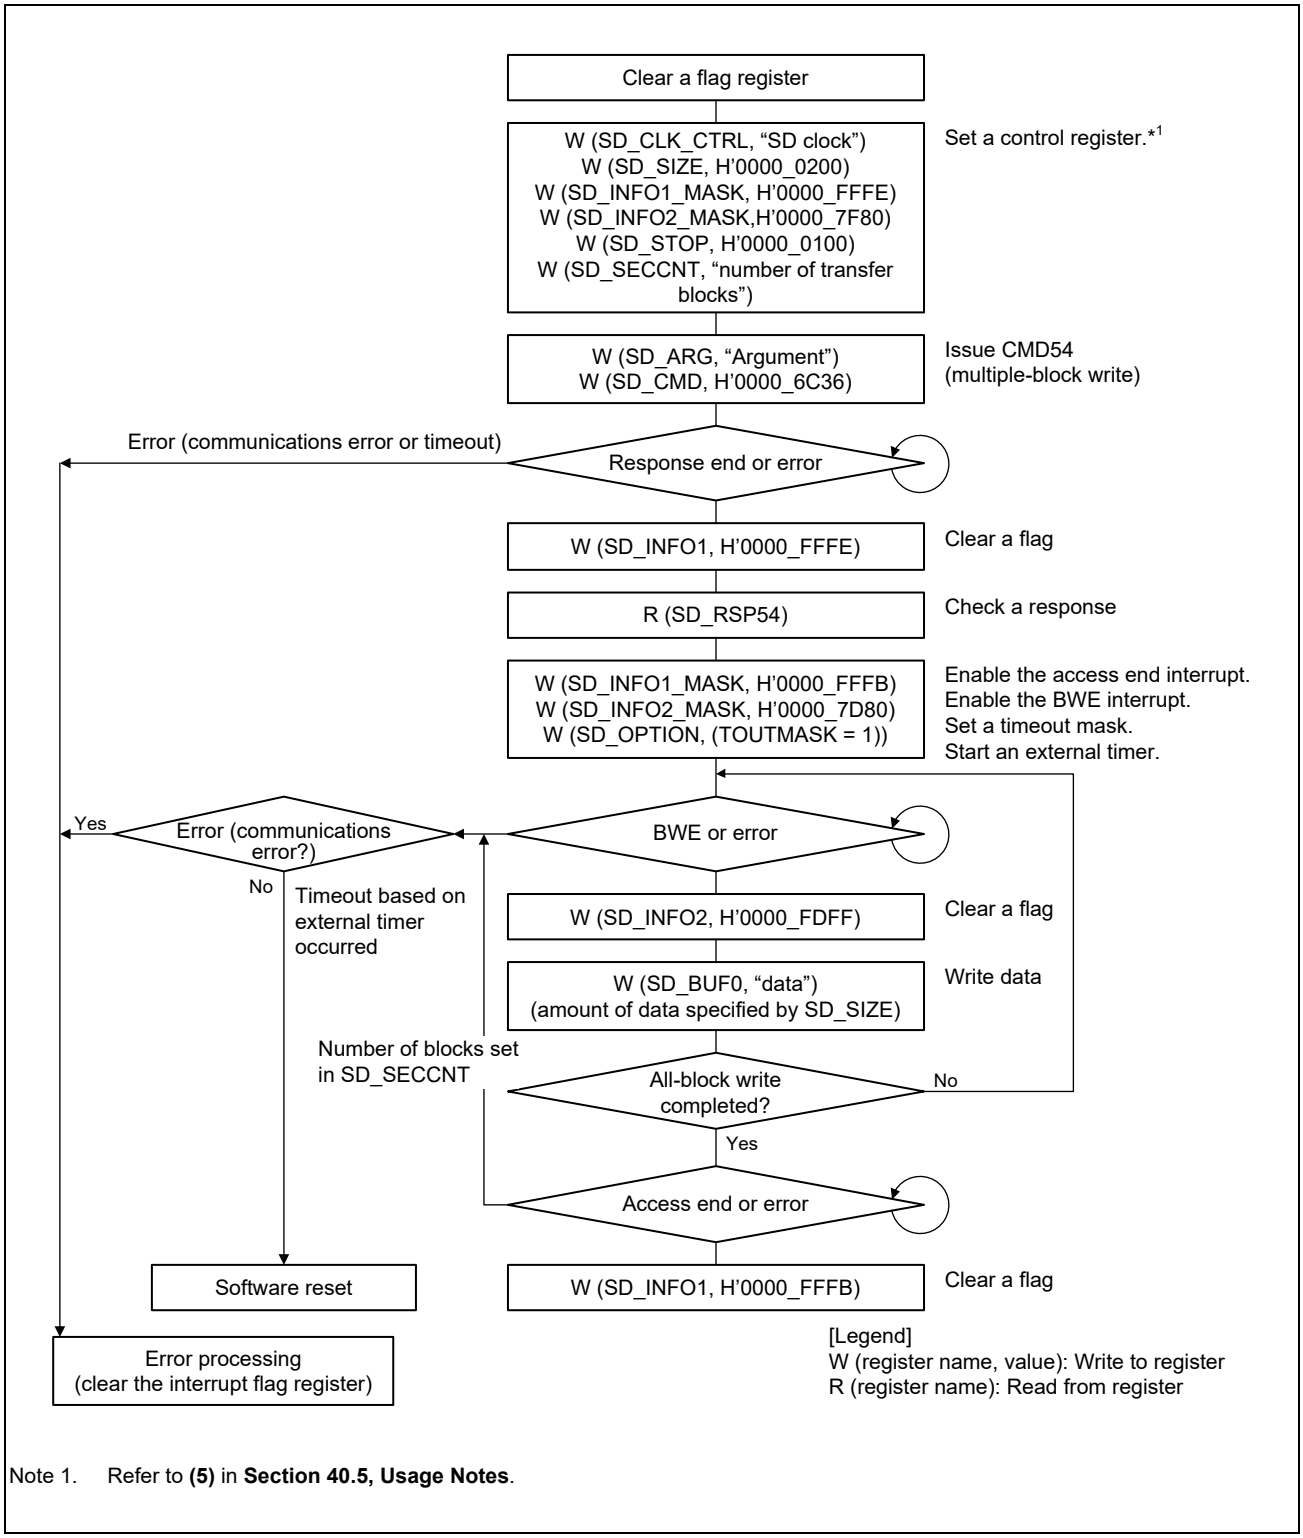
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 0000.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

## 40.4.6 Multiple Block Write (when Using External Timer)

### (1) Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.14 Multiple Block Write Flowchart Example (when Using External Timer)

### (2) Operation for Multiple Block Write

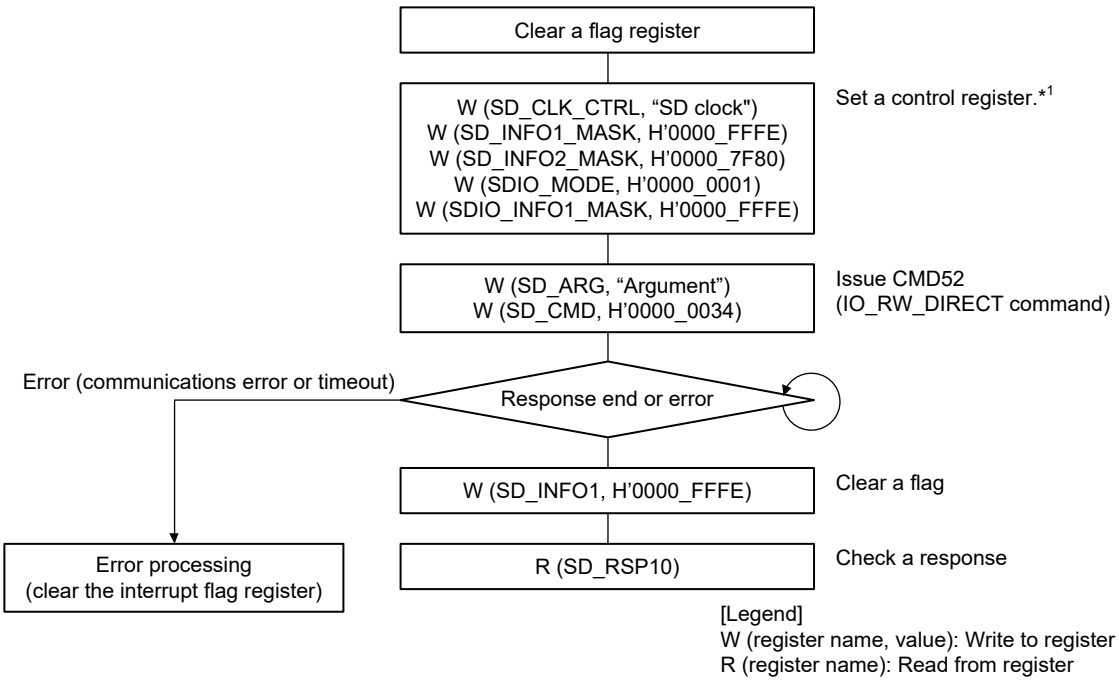
The operation of the multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write H'0000 6C36 to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

## 40.4.7 IO_RW_DIRECT Commend (CMD52)

### (1) Flowchart



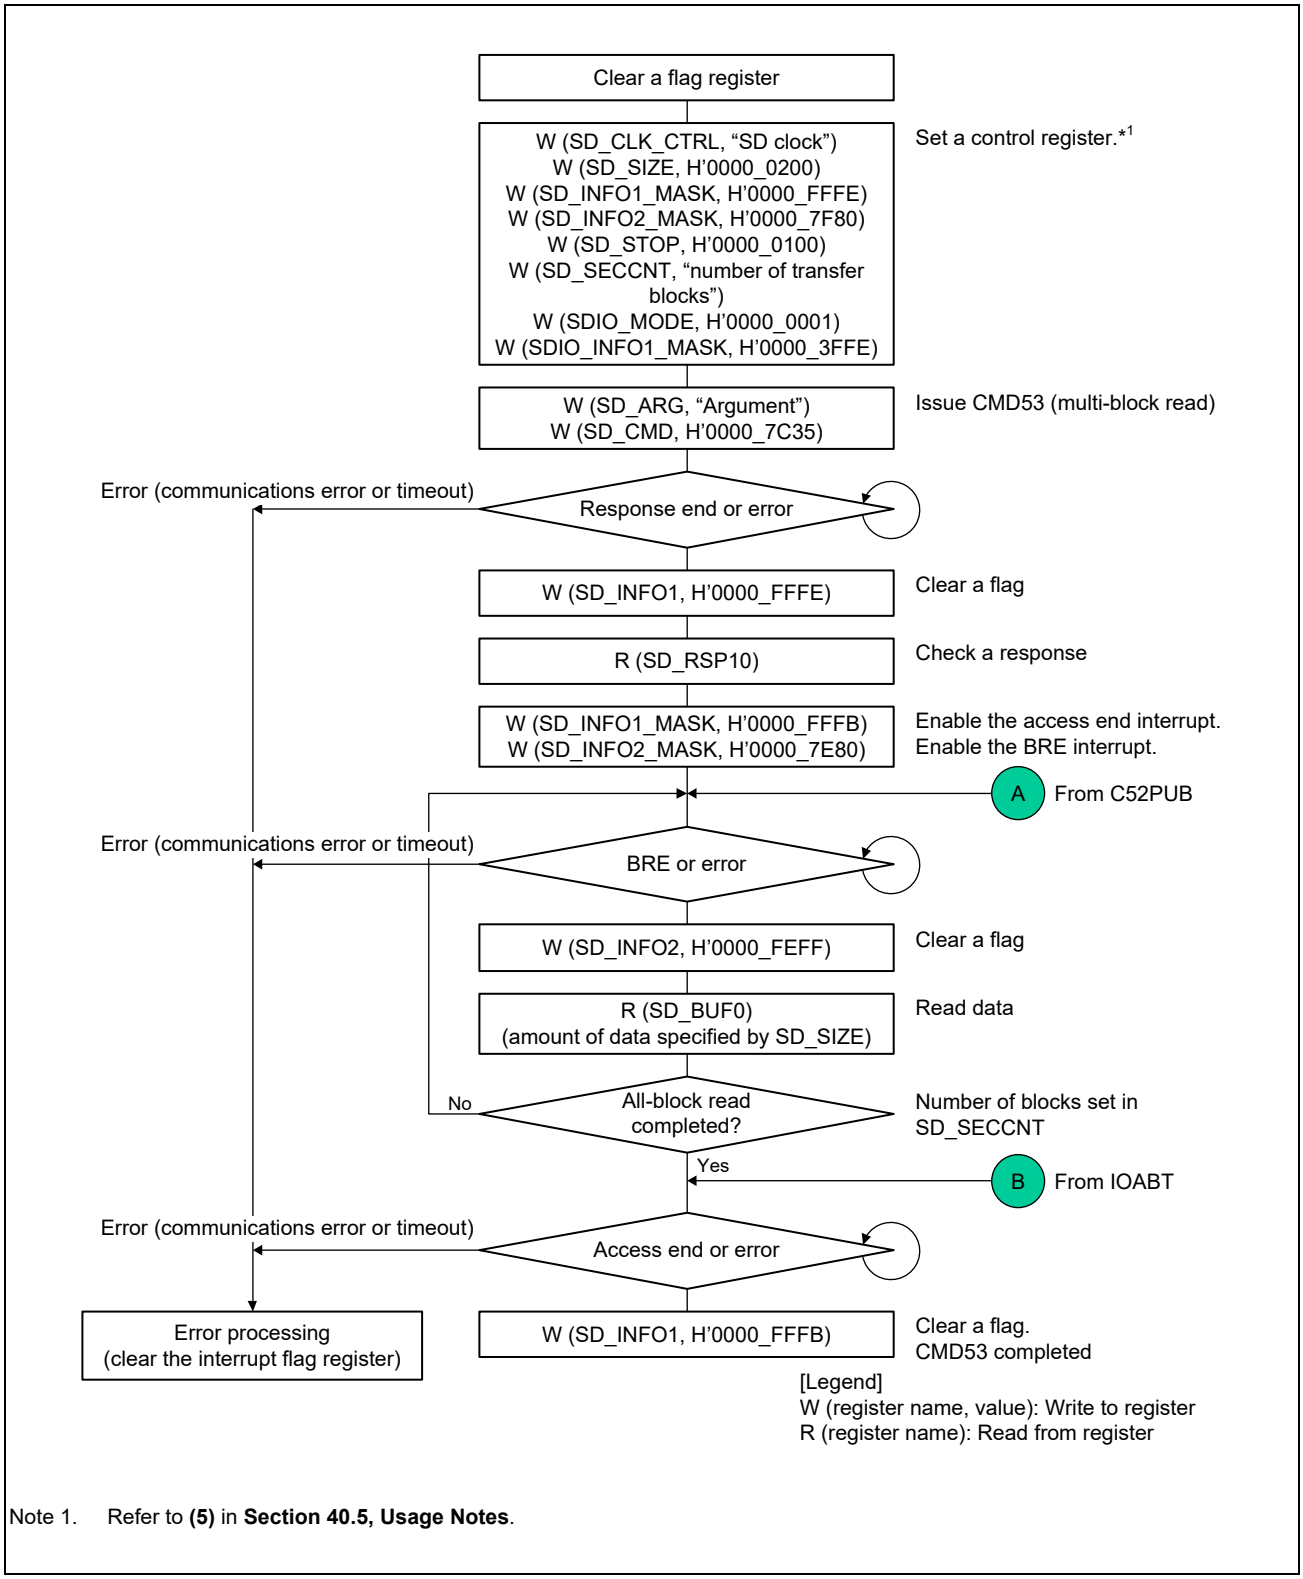
Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.15 IO_RW_DIRECT Command (CMD52) Flowchart Example

## 40.4.8 IO_RW_EXTENDED (CMD53/Multiple Block Read)

### (1) Flowchart

**Figure 40.16** shows a flowchart example for CMD53 (multiple block read).



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.16 CMD53 (Multiple Block Read) Flowchart Example

**Figure 40.17** shows a flowchart example when CMD52 (SDIO abort) is issued at CMD53 (multiple block read).

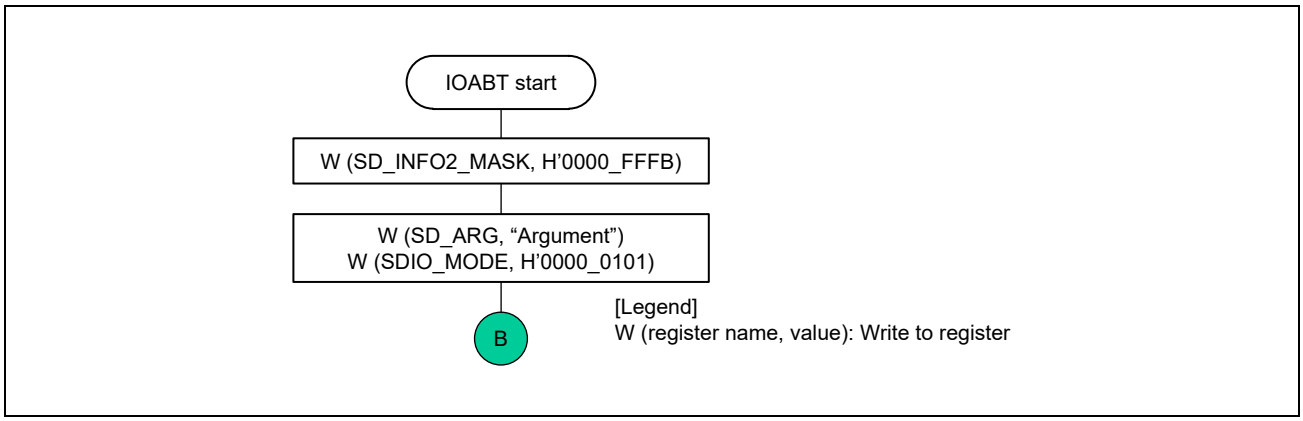


Figure 40.17 Flowchart Example when CMD52 (SDIO Abort) is Issued at CMD53 (Multiple Block Read)

**Figure 40.18** shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block read) while the SD/MMC host interface is in the read wait state.

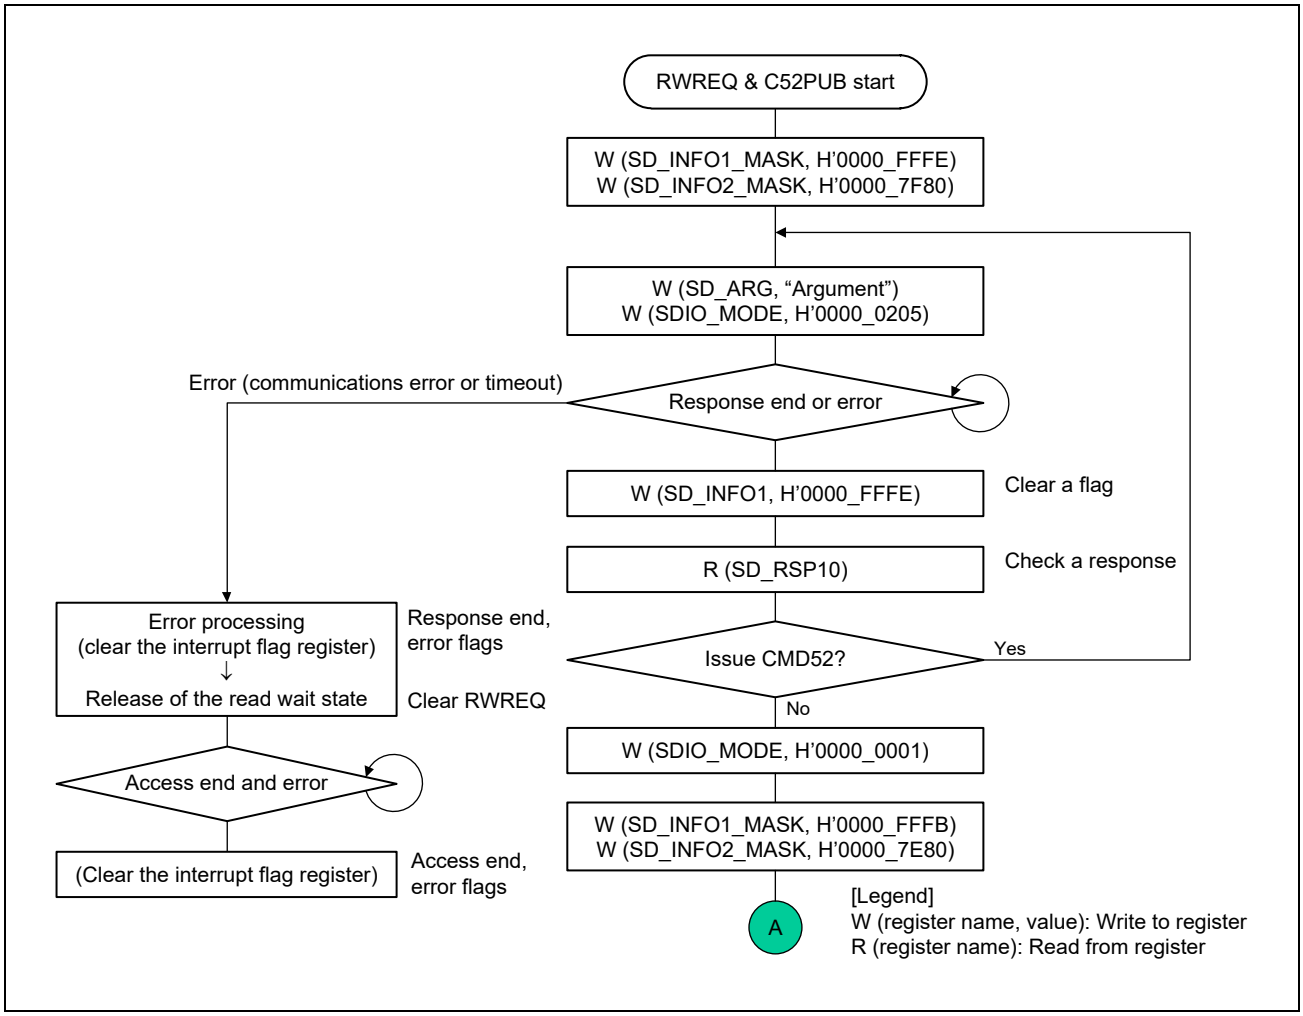

Figure 40.18 Flowchart Example when CMD52 (SDIO None Abort) is Issued after Read Wait State is Entered at CMD53 (Multi Block Read)

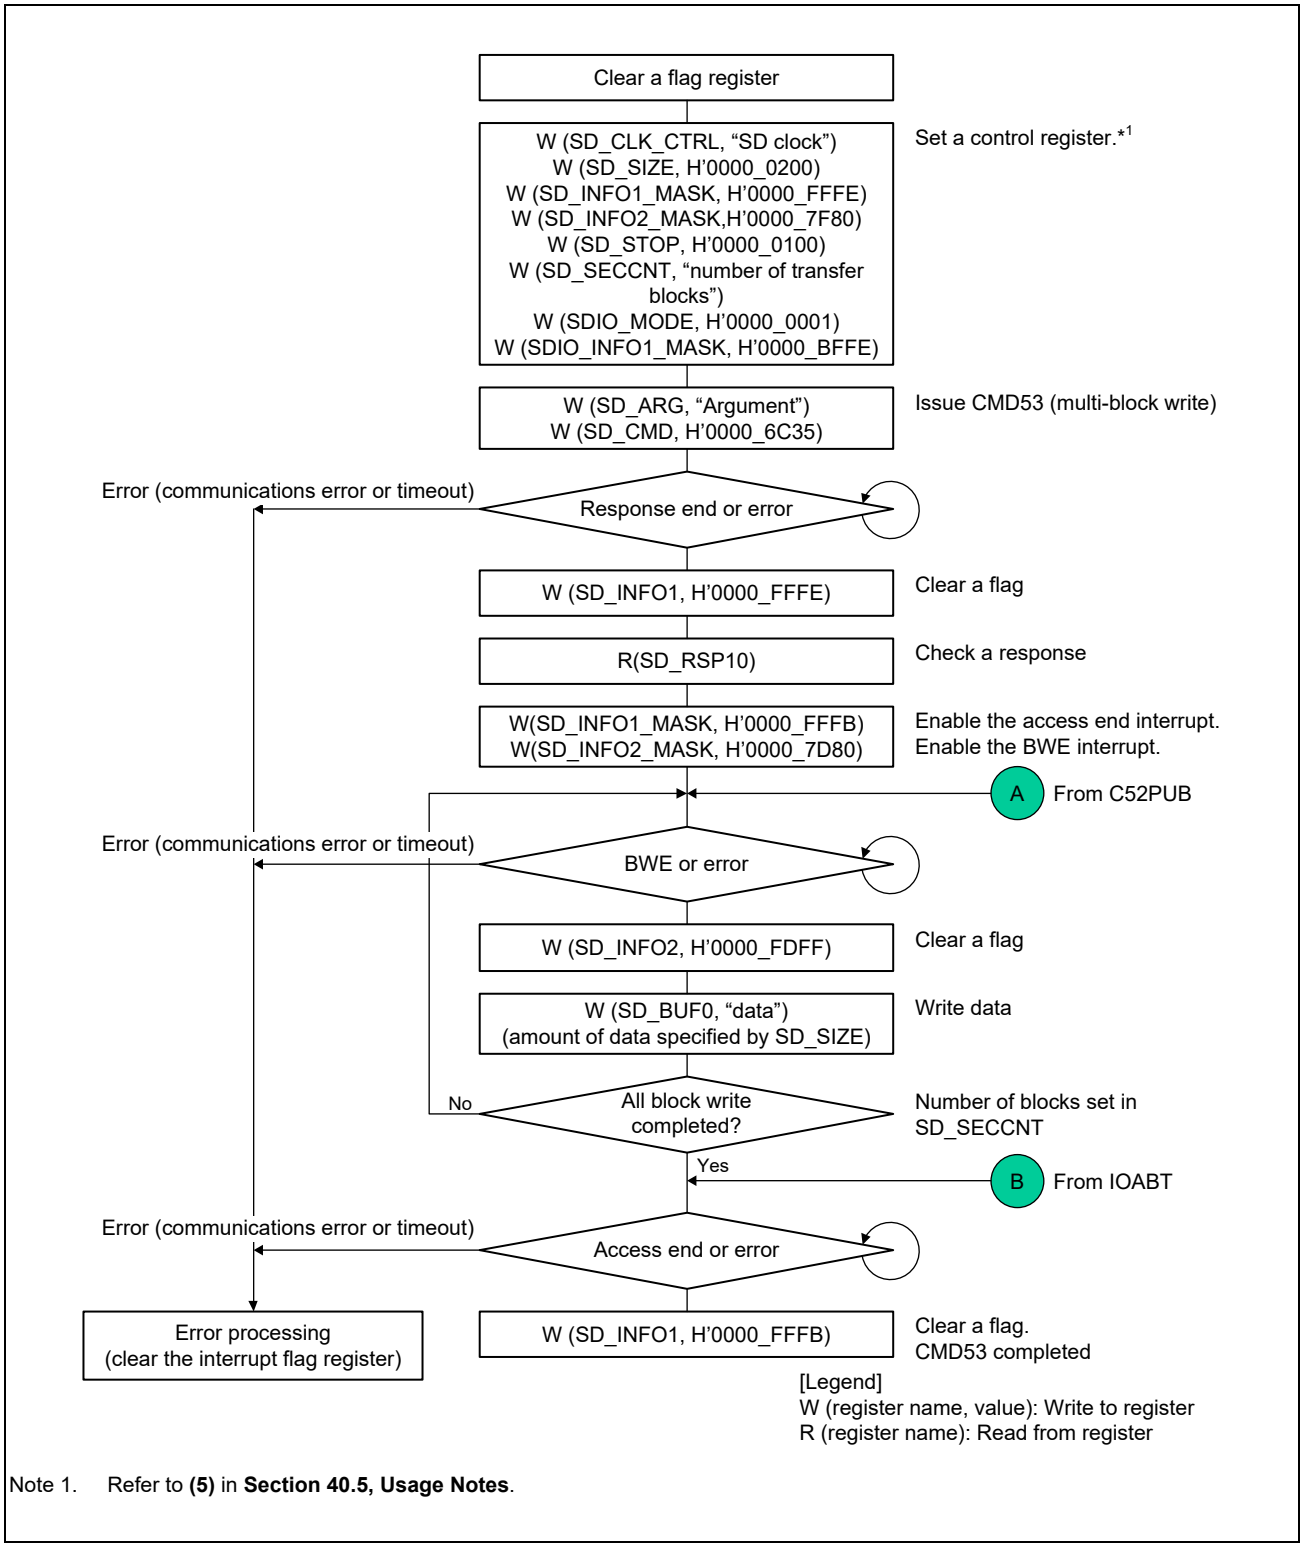
## 40.4.9 IO_RW_EXTENDED (CMD53/Multiple Block Write)

### (1) Flowchart

**Figure 40.19** shows a flowchart example for CMD53 (multiple block write).



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.19 CMD53 (Multiple Block Write) Flowchart Example

**Figure 40.20** shows a flowchart example when CMD52 (SDIO abort) is issued at CMD53 (multiple block write).

**Figure 40.21** shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block write).

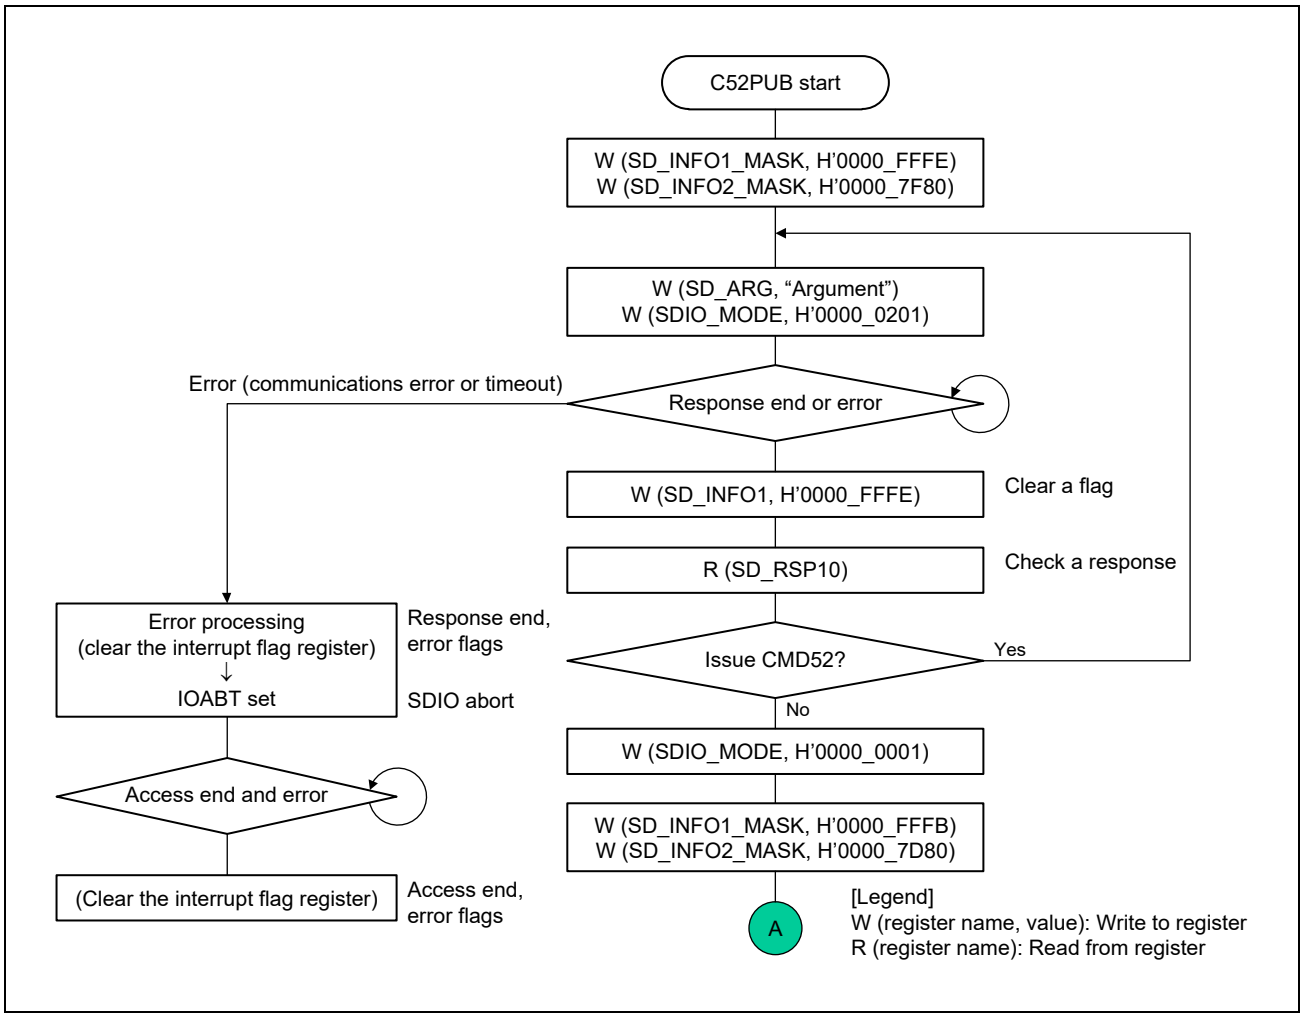

Figure 40.21 Flowchart Example when CMD52 (SDIO None Abort) is Issued at CMD53 (Multiple Block Write)

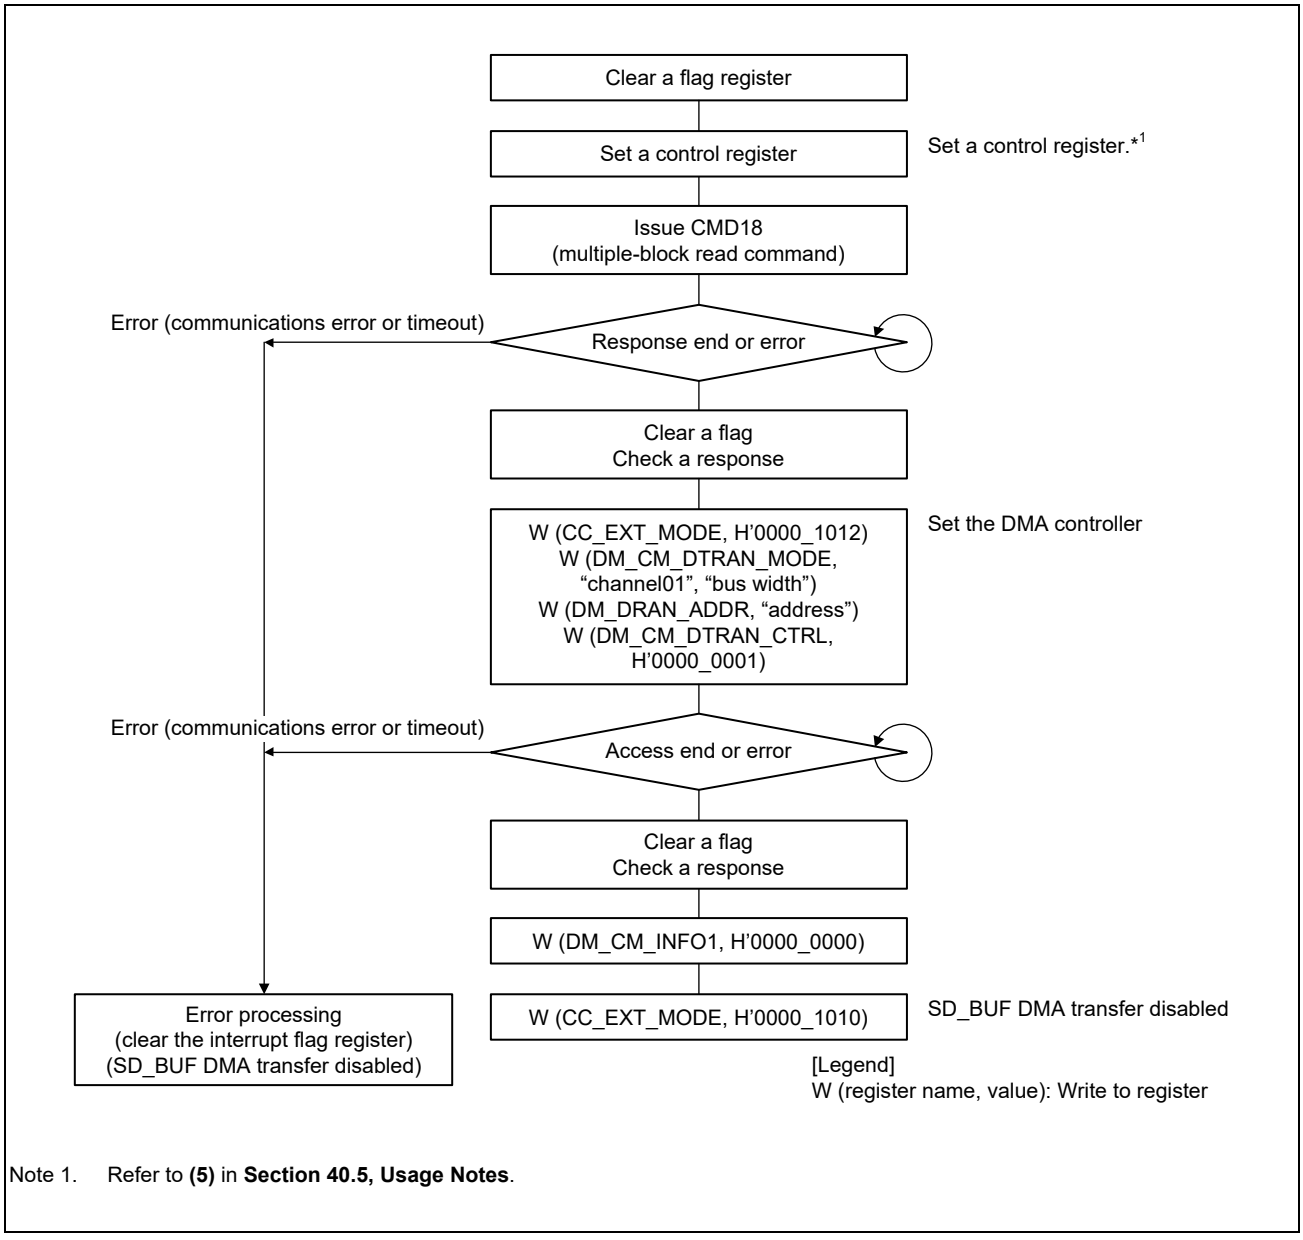
## 40.4.10 DMA Transfer

### (1) SD_BUF DMA Transfer

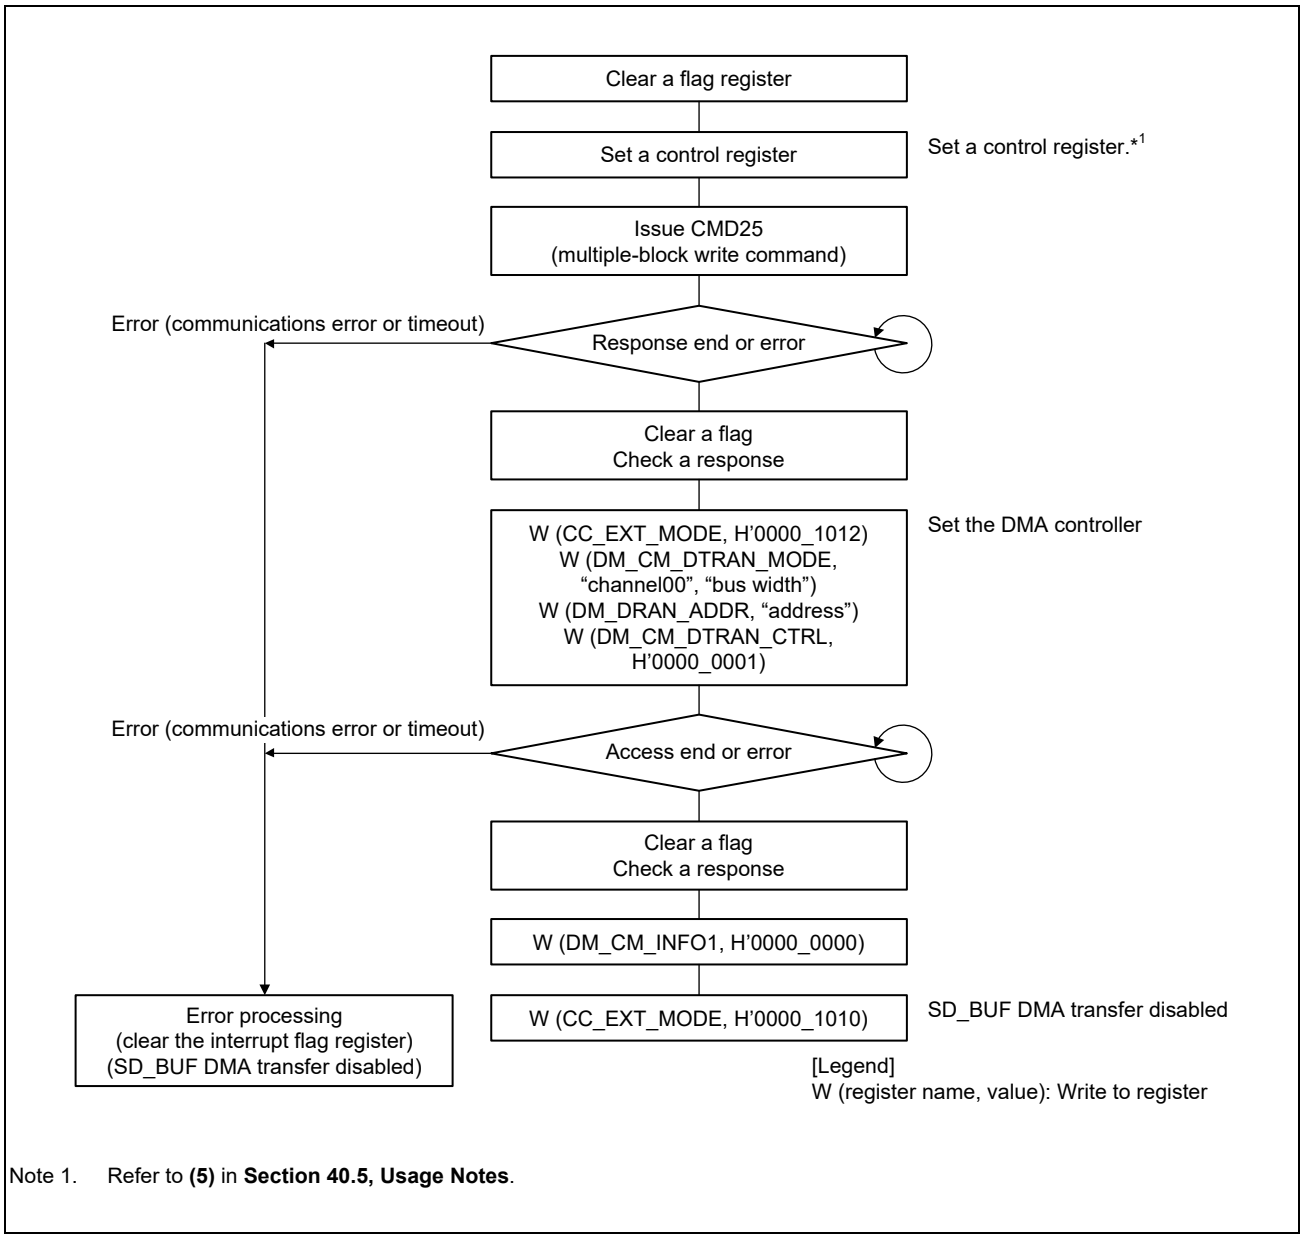
**Figure 40.22** shows a flowchart example for SD_BUF DMA read when CMD18 (multiple block read) is issued.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.22 SD_BUF DMA Read Flowchart Example

**Figure 40.23** shows a flowchart example for SD_BUF DMA write when CMD25 (multiple block write) is issued.

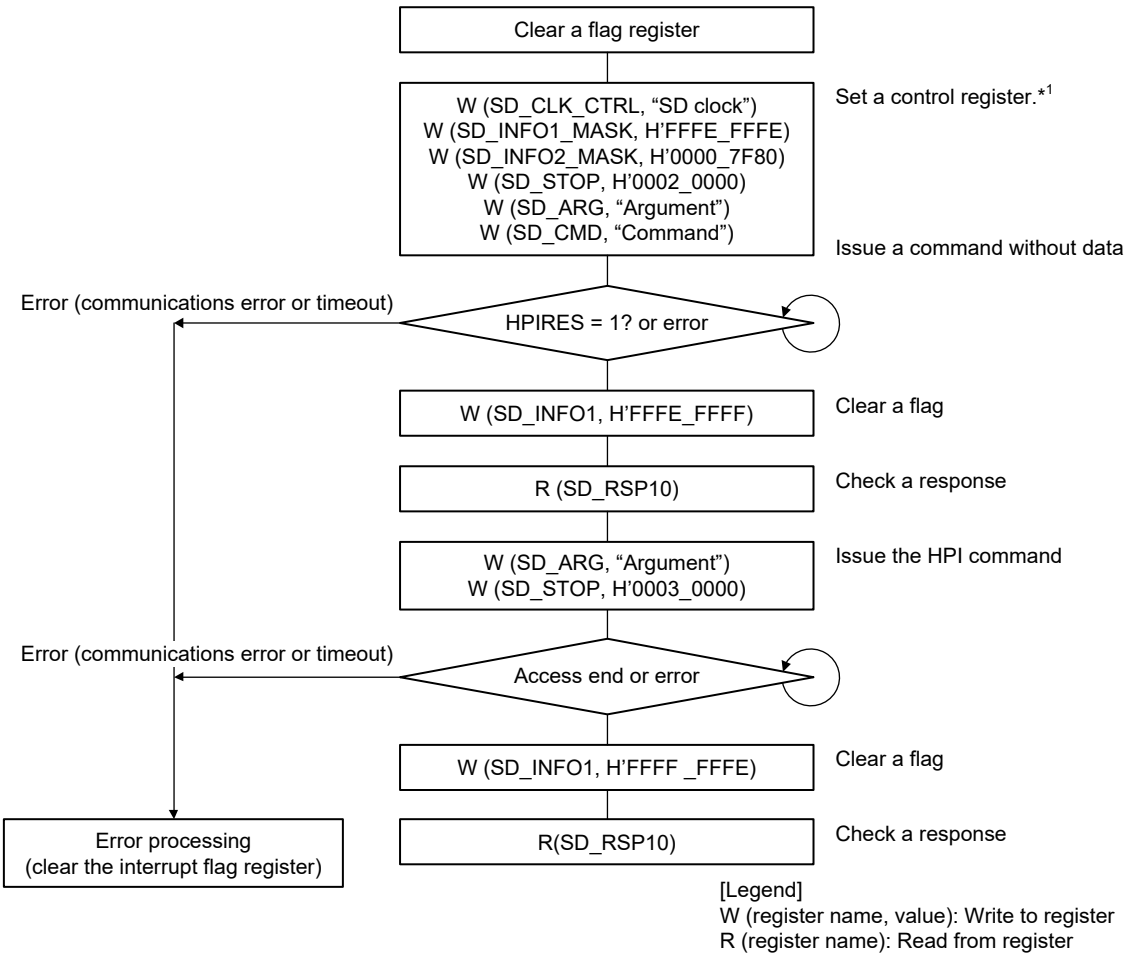


Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.23 SD_BUF DMA Write Flowchart Example

## 40.4.11 High-Priority Interrupt (without Data Transfer)

### (1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.24 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

### (2) Operation for High-Priority Interrupt without Data Transfer

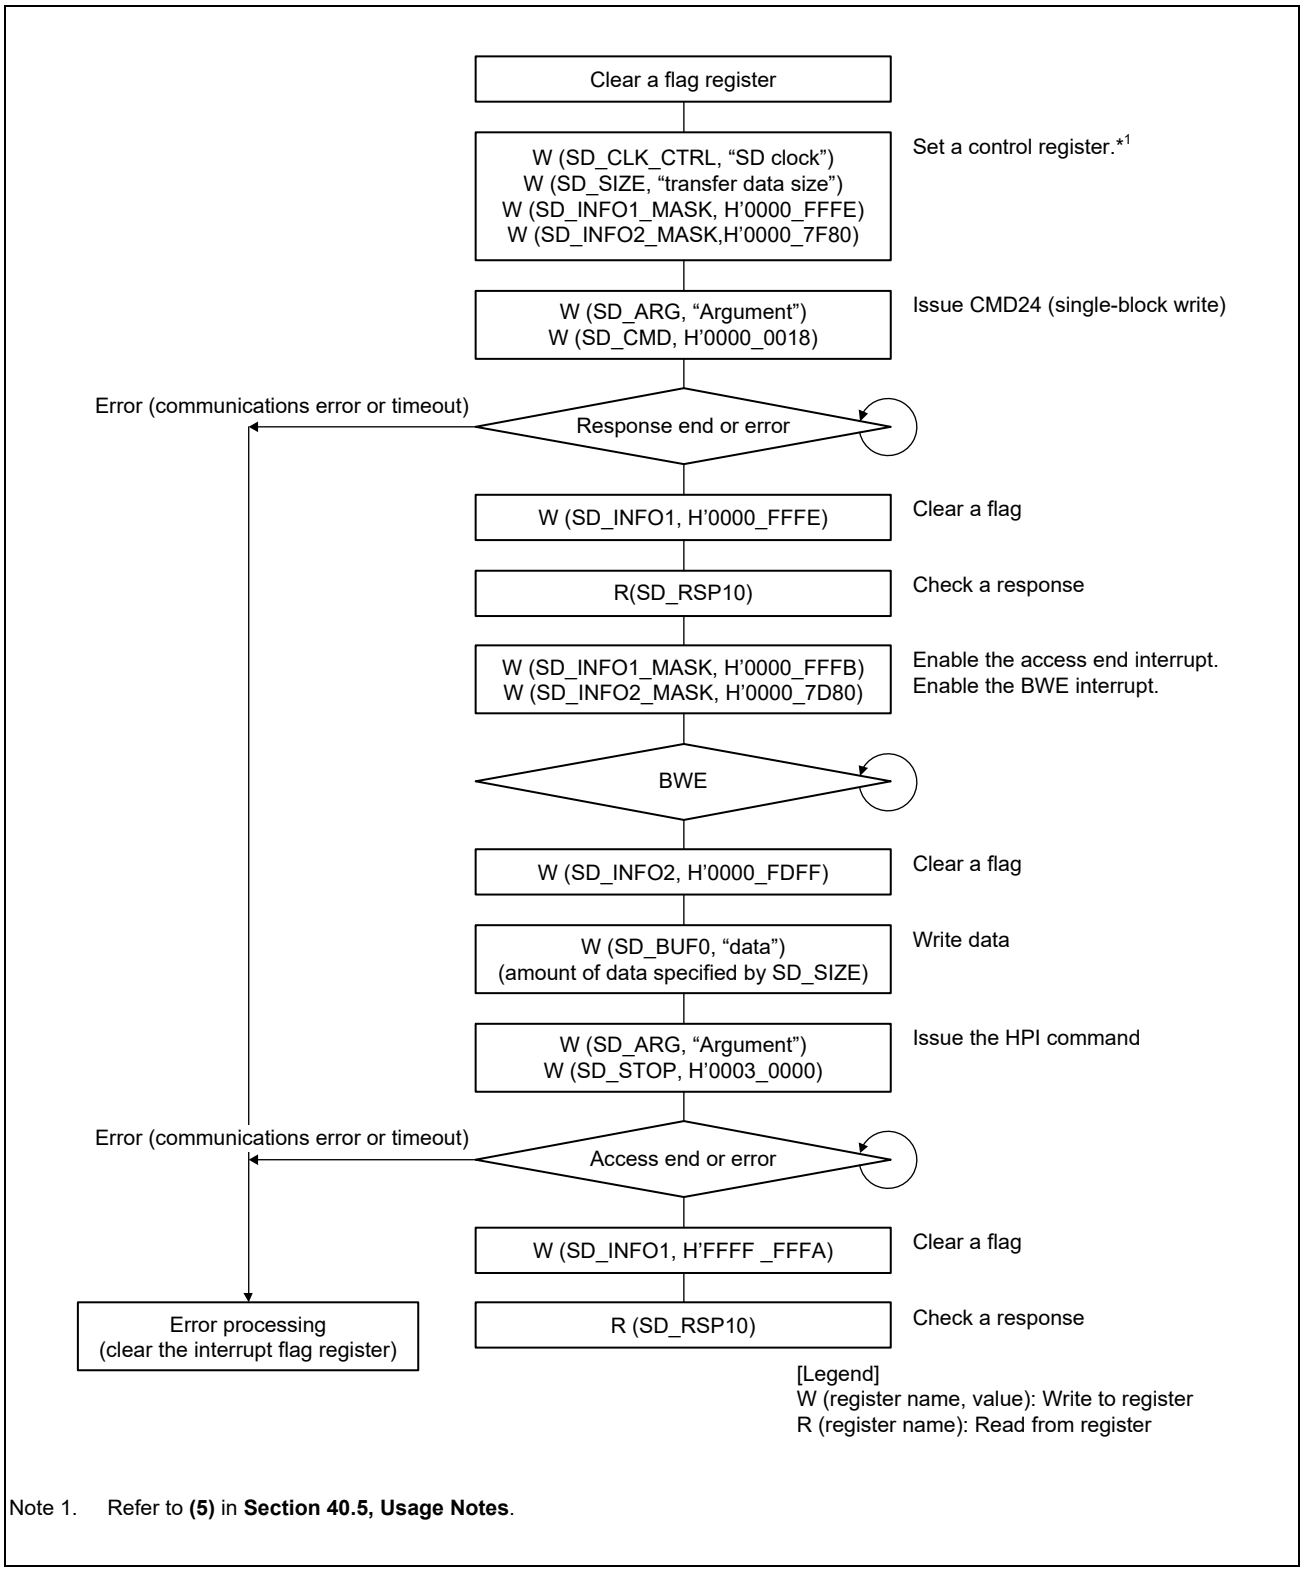
The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10.
   This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

## 40.4.12 High-Priority Interrupt (at Single Block Write)

### (1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.25 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

### (2) Operation for HPI at Single Block Write

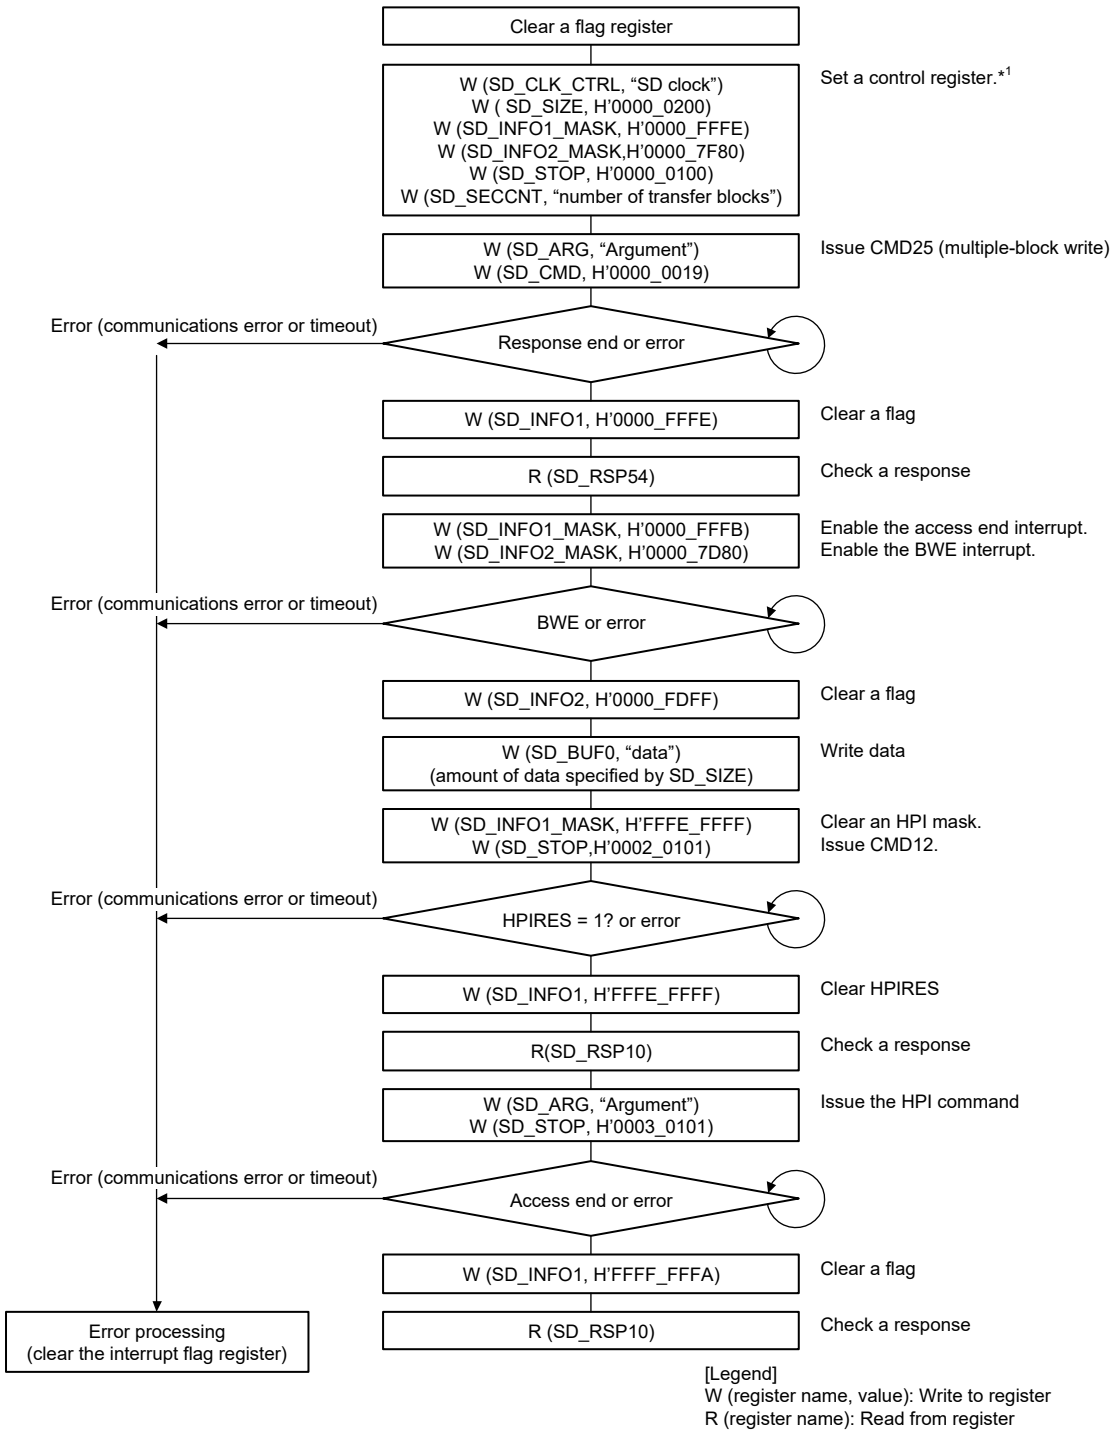
The operation of HPI at single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

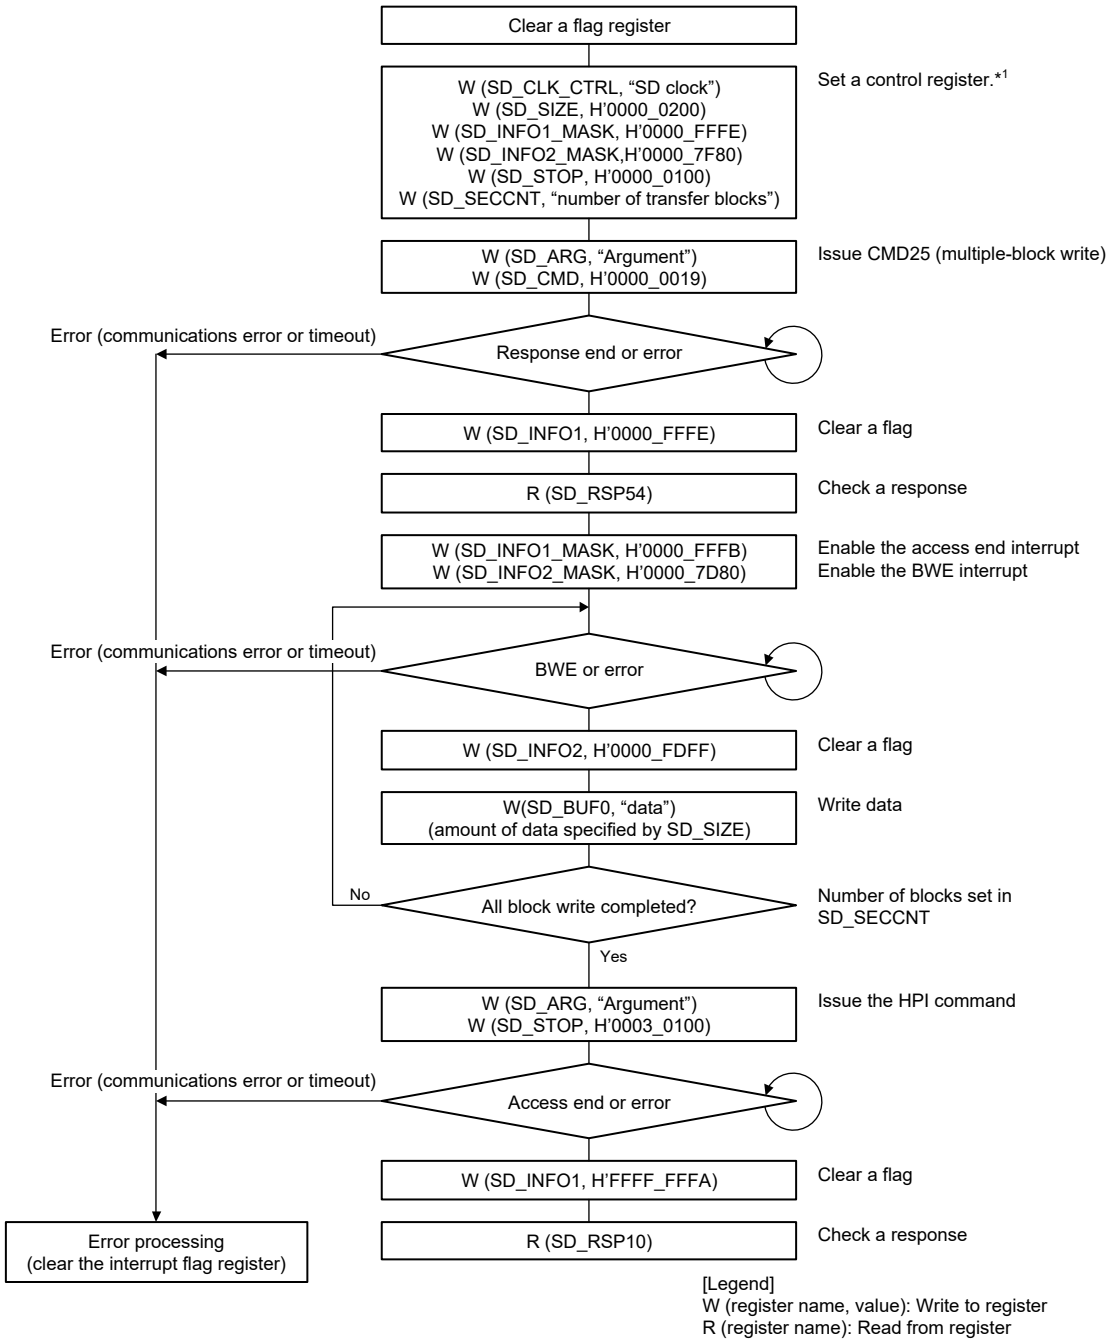
## 40.4.13 High-Priority Interrupt (at Multiple Block Write)

### (1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.26 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.27 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

### (2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

#### (a) When not all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
   Write H'FFFE FFFF to SD_INFO1_MASK to enable the HPIRES interrupt. Write H'0002 0101 to SD_STOP, which causes CMD12 to be issued.
7. Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

**(b) When all the data has been written to SD_BUF**

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

### 40.4.14 Example of SD_CMD Register Setting

**Table 40.8** lists the example of SD_CMD (SD interface) register setting.

Table 40.8 Example of SD_CMD Register Setting (SD) (1/2)

| Type | Command | Example of SD_CMD Register Setting | Remark |
|---|---|---|---|
| CMD | CMD0 | H'0000 0000 | |
| | CMD2 | H'0000 0002 | |
| | CMD3 | H'0000 0003 | |

## 40.5 Usage Notes

### (1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

### (2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

#### <Mechanism of incorrect reading>

**Figure 40.28** shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of **Figure 40.28**, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

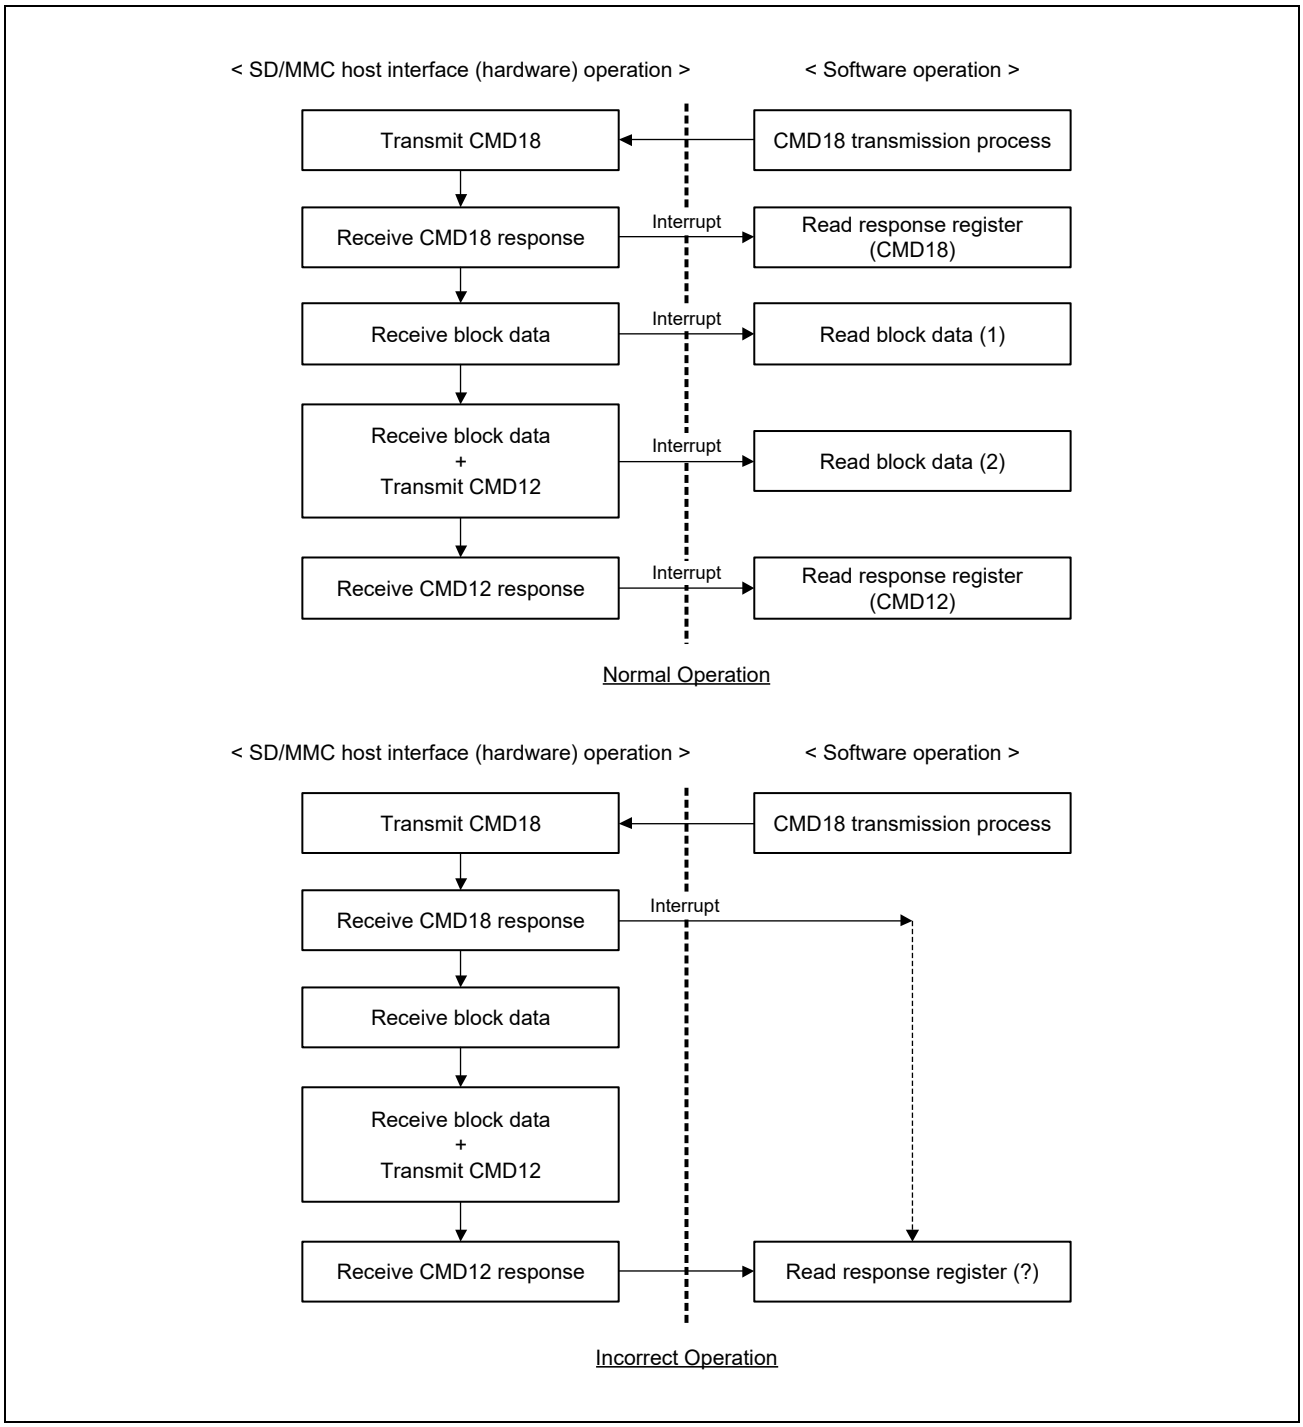

Figure 40.28 Flowcharts for Multiple Block Read Operation (Two Blocks)

### (3) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

### (4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

### (5) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

### (6) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.

### (7) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

## 40.6 Sampling Clock Controller (SCC)

### 40.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/ SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

### 40.6.2 SCC Block Diagram

**Figure 40.29** shows a block diagram of the sampling clock controller.

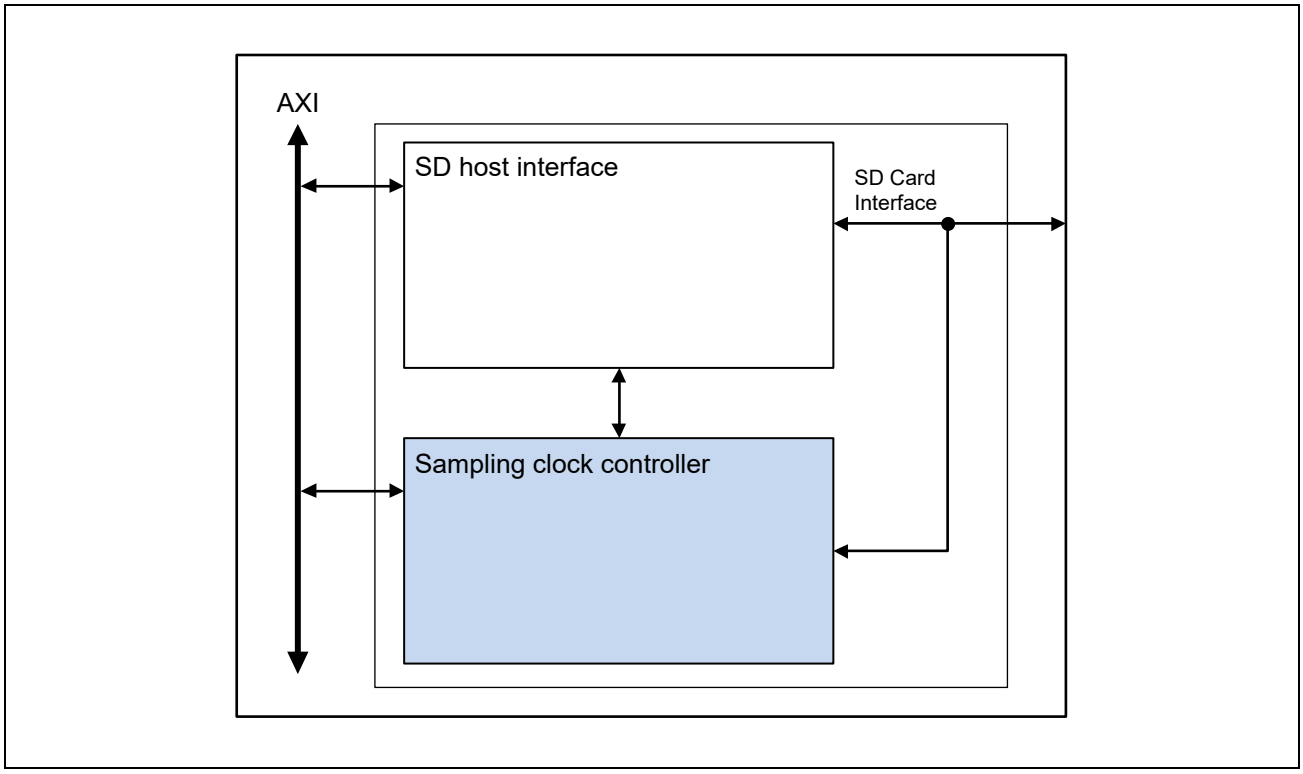

Figure 40.29 Block Diagram of the Sampling Clock Controller

### 40.6.3 SCC Register Configuration

**Table 40.10** shows the SCC registers. Regarding the base address of registers as follows, refter to **Section 40.1.3**.

Channel 0: H'0_11C0_1000 (Cortex-A55)

Channel 0: H'41C0_1000 (Cortex-M33 Non-Secure)
H'51C0_1000 (Cortex-M33 Secure)

Channel 1: H'0_11C1_1000 (Cortex-A55)

Channel 1: H'41C1_1000 (Cortex-M33 Non-Secure)
H'51C1_1000 (Cortex-M33 Secure)

Table 40.10 Register Configuration

| Name | Abbreviation | Address [9:0] | Access Size |
|---|---|---|---|
| Initial setting register | SCC_DTCNTL | H'1000 | 32/64 |
| Sampling clock position setting register | SCC_TAPSET | H'1008 | 32/64 |
| Hardware adjustment register 1 | SCC_DT2FF | H'1010 | 32/64 |
| Sampling clock selection register | SCC_CKSEL | H'1018 | 32/64 |
| Sampling clock position correction register | SCC_RVSCNTL | H'1020 | 32/64 |
| Sampling clock position correction request register | SCC_RVSREQ | H'1028 | 32/64 |
| Sampling data comparison register | SCC_SMPCMP | H'1030 | 32/64 |
| Hardware adjustment register 2 | SCC_TMPPORT | H'1038 | 32/64 |

## 40.7 SCC Register Descriptions

### 40.7.1 Initial Setting Register (SCC_DTCNTL)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 23 to 16 | TAPNUM7 to TAPNUM0 | H'08 | R/W | When bits DIV7 to DIV0 in the SD_CLK_CTRL register are H'FF (1: 1 mode), set these bits to H'08. |
| 15 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | TAPEN | 0 | R/W | SCC Sampling Clock Operation Enable<br>0: SCC sampling clock operation is disabled.<br>1: SCC sampling clock operation is enabled. |

### 40.7.2 Sampling Clock Position Setting Register (SCC_TAPSET)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 to 0 | TAPSET7 to TAPSET0 | H'00 | R/W | SCC Sampling Clock Position<br>• Set the tuning result in the range from 0 to TAPNUM-1. |

### 40.7.3 Sampling Clock Selection Register (SCC_CKSEL)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | DTSEL | 0 | R/W | Sampling Clock Selection<br>0: An SCC sampling clock is not used (for other than SDR104 and HS200).<br>1: An SCC sampling clock is used (for SDR104 or HS200).<br>• For SDR104 or HS200, set DTSEL to 1.<br>DIV[7:0] in the SD_CLK_CTRL register to H'FF (1:1 mode).<br>• When this bit is switched, stop the SD clock output from the SD/MMC host interface (set SCLKEN in SD_CLK_CTRL to 0). |

### 40.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 8 | TAPSEL7 to TAPSEL0 | H'00 | R | SCC Sampling Clock Position Display<br>• Displays the SCC sampling clock position selected by hardware.<br>• After RVSEN has been set to 1, the value may differ from that of TAPSET. |
| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | RVSW | 0 | R/W | This bit is read as 0. The write value should be 1. |
| 0 | RVSEN | 0 | R/W | SCC Sampling Clock Position Correction Enable<br>0: SCC sampling clock position correction is disabled.<br>1: SCC sampling clock position correction is enabled.<br>• When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface.<br>• However, when RVSERR is 1, this module does not correct the SCC sampling clock position.<br>• While tuning is being performed, set RVSEN to 0. |

### 40.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 | RVSERR | 0 | R/W | SCC Sampling Clock Position Correction Error<br>0: There is no correction error.<br>1: There is a correction error.<br>• If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again.<br>• Ignore this bit while tuning is being performed.<br>• Writing 1 to this bit is disabled and writing 0 to this bit is only enabled. |
| 1 | REQTAPUP | 0 | R/W | SCC Sampling Clock Position Positive Direction Correction Request<br>0: There is no correction request.<br>1: There is a correction request.<br>• If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET).<br>• When RVSEN is 1, this bit is disabled (this bit is not set to 1).<br>• Writing 1 to this bit is disabled and writing 0 to this bit is only enabled. |
| 0 | REQTAPDWN | 0 | R/W | SCC Sampling Clock Position Negative Direction Correction Request<br>0: There is no correction request.<br>1: There is a correction request.<br>• If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET).<br>• When RVSEN is 1, this bit is disabled (this bit is not set to 1).<br>• Writing 1 to this bit is disabled and writing 0 to this bit is only enabled. |

### 40.7.6 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 8 | DT2NE | H'03 | R/W | Hardware Adjustment 2<br>This is a setting register for adjusting the timing inside the IP when using Tuning.<br>When using Tuning, set H'02 to this bit, make the setting before setting 1 in SCC_CKSEL [0] .DTSEL. |
| 7 to 0 | DT2NS | H'00 | R/W | Hardware Adjustment 1<br>This is a setting register for adjusting the timing inside the IP when using Tuning.<br>When using Tuning, set H'07 to this bit., make the setting before setting 1 in SCC_CKSEL [0] .DTSEL. |

### 40.7.7 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 24 to 16 | CMPNGU | All 0 | R/W | Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit 24 is the comparison result of CMD.<br>0: Match<br>1: Mismatch<br>< Clear conditions.><br>The start of the command sequence<br>Write to SCC_TAPSET register |
| 15 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 to 0 | CMPNGD | All 0 | R/W | Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit 8 is the comparison result of CMD.<br>0: Match<br>1: Mismatch<br>< Clear conditions.><br>The start of the command sequence<br>Write to SCC_TAPSET register |

### 40.7.8 Hardware adjustment register 2 (SCC_TMPPORT)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 63 to16 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0.<br>Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | TMPOUT | H’0000 | R/W | Hardware adjustment 3<br>When using the delay tuning mechanism, set the following values.<br>When TAPNUM = 8, set H’0000 to these bits.<br>When operating with other than SDR104 / HS200, this register adjusts the clock delay of the Flip Flop that latches the received data from the outside of the chip.<br>For this product, set H’0000 when transferring at 3.3V, and set H’0001 when transferring at 1.8V. |

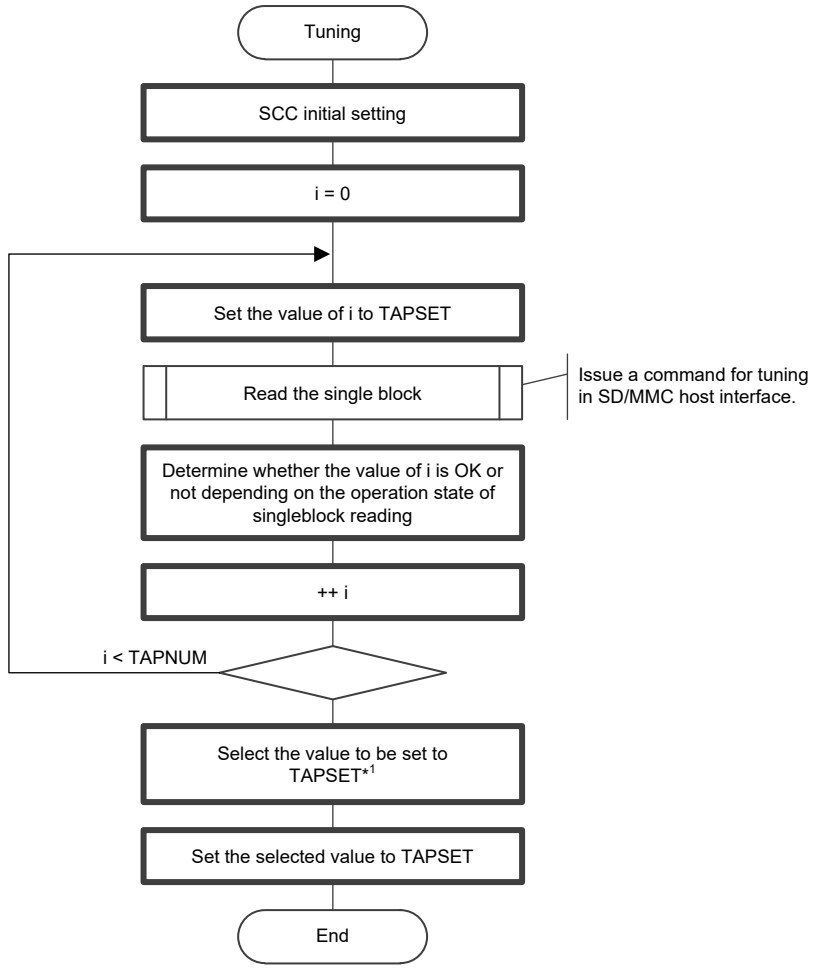
# 40.8 Usage Example of SCC

## 40.8.1 Tuning

SCC is tuned by using operation of single-block reading.

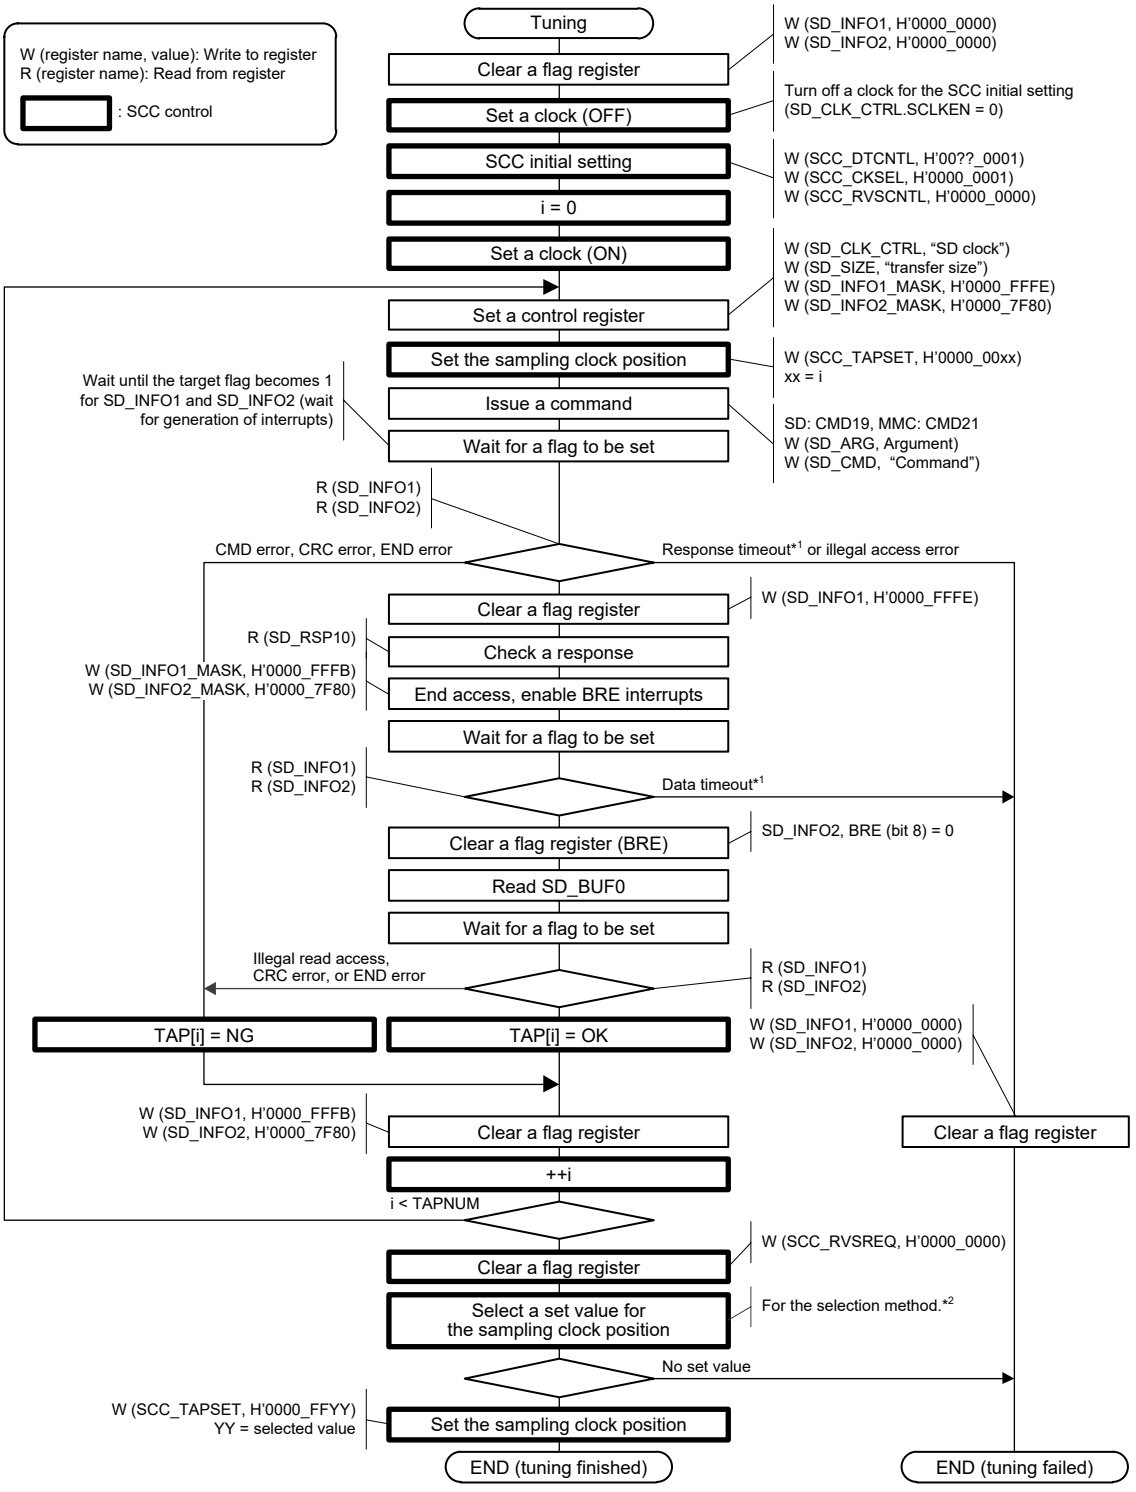
As shown in **Figure 40.30**, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

**Figure 40.31** and **Table 40.11** show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).



Note 1. See the example shown in **Table 40.11**.

Figure 40.30 Example of Tuning Flow (Outline)



Note 1. If all of the TAP[i] has become "NG".

Note 2. See **Table 40.11**.

Figure 40.31 Example of Tuning Flow (Detailed)

Table 40.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

| Item | i | Case 1 | Case 2 | Case 3 | Case 4 | Case 5*1 |
|---|---|---|---|---|---|---|
| TAP[i] | 0 | NG | OK | NG | OK | OK |
| | 1 | OK | OK | NG | NG | OK |
| | 2 | OK | NG | OK | NG | OK |
| | 3 | OK(←) | NG | OK | NG | OK |
| | 4 | OK | NG | NG | NG | OK |
| | 5 | OK | OK | NG | OK | OK |
| | 6 | NG | OK | NG | OK(←) | OK |
| Max. value→ | 7 | NG | OK(←) | NG | OK | OK |
| | (0) | NG | OK | NG | OK | OK |
| | (1) | OK | OK | NG | NG | OK |
| | (2) | OK | NG | OK | NG | OK |
| | (3) | OK | NG | OK | NG | OK |
| | (4) | OK | NG | NG | NG | OK |
| | (5) | OK | OK | NG | OK | OK |
| | (6) | NG | OK | NG | OK | OK |
| | (7) | NG | OK | NG | OK | OK |
| Selected value | | i = 3 | i = 7 | Fail | i = 6 or 7 | i = 0 to 7 |

**Remarks:** (←): Example of selection, (x): repeated display of index x of TAP[x]

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

Note 1. If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data. Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is **Section 40.8.3, Change point of the input data**.

## 40.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

### (1) Manual correction of the sampling clock position

**Figure 40.32** shows the flow of manual correction of the sampling clock position. **Table 40.12** shows set values determined when correction is required (when TAPNUM = 8).

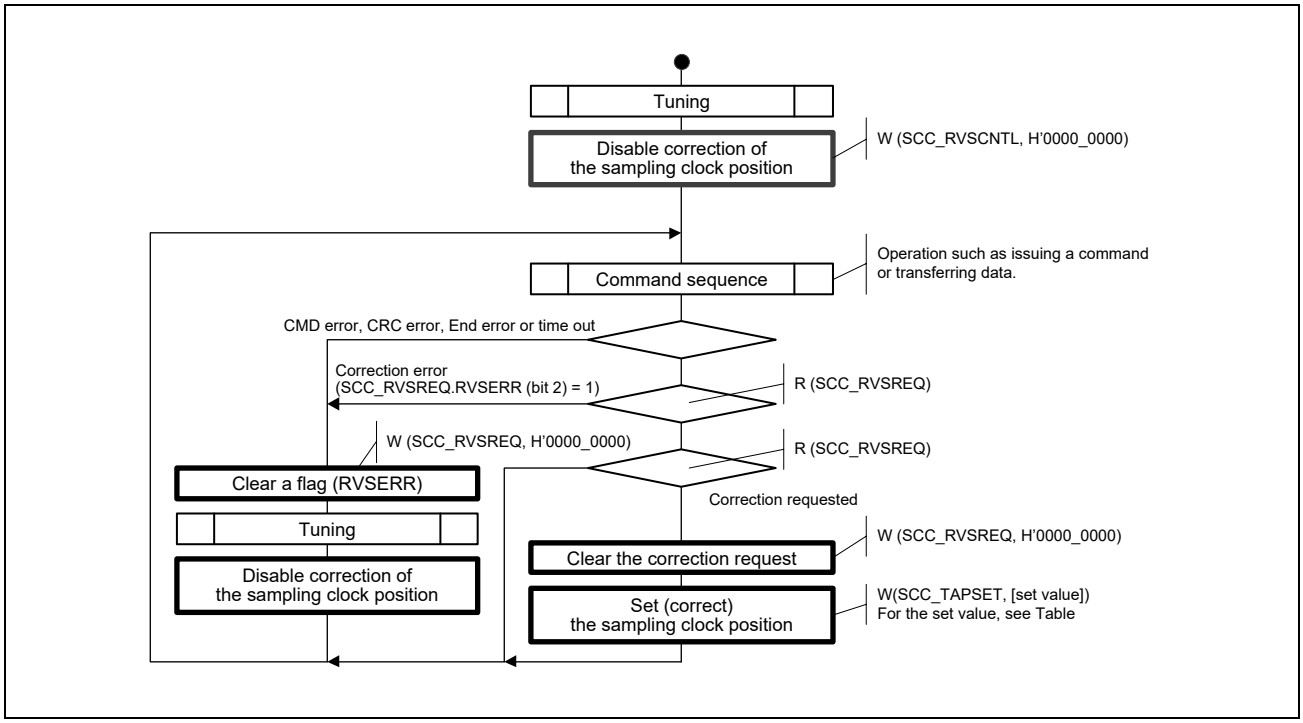


Figure 40.32 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 40.12 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

| No. | Current value of TAPSET | Value set to TAPSET when REQTAPUP = 1 | Value set to TAPSET when REQTAPDWN = 1 |
|---|---|---|---|
| 1 | 0 | 1 | 7 |
| 2 | 1 | 2 | 0 |
| 3 | 2 | 3 | 1 |
| 4 | 3 | 4 | 2 |
| 5 | 4 | 5 | 3 |
| 6 | 5 | 6 | 4 |
| 7 | 6 | 7 | 5 |
| 8 | 7 | 0 | 6 |

**Note:** As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

### (2) Automatic correction of the sampling clock position

**Figure 40.33** shows the flow of automatic correction of the sampling clock position.

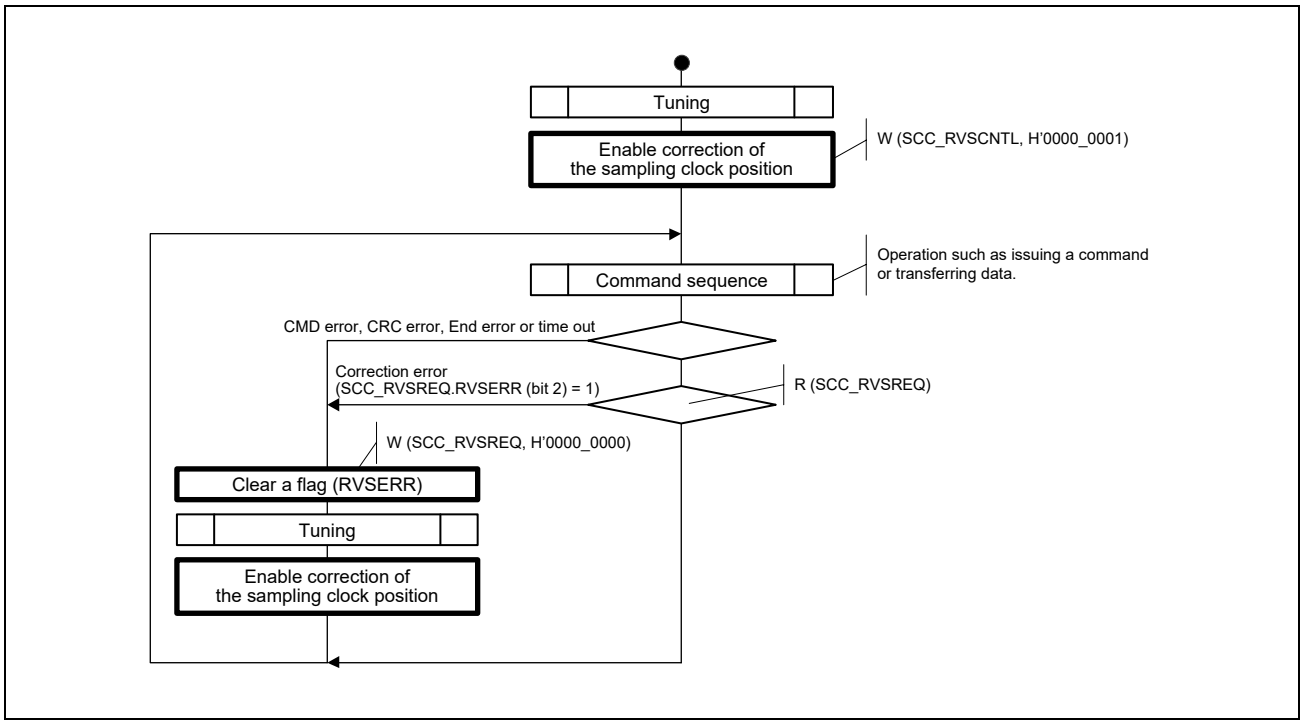

Figure 40.33 Flow of Automatic Correction of the Sampling Clock Position (Example)

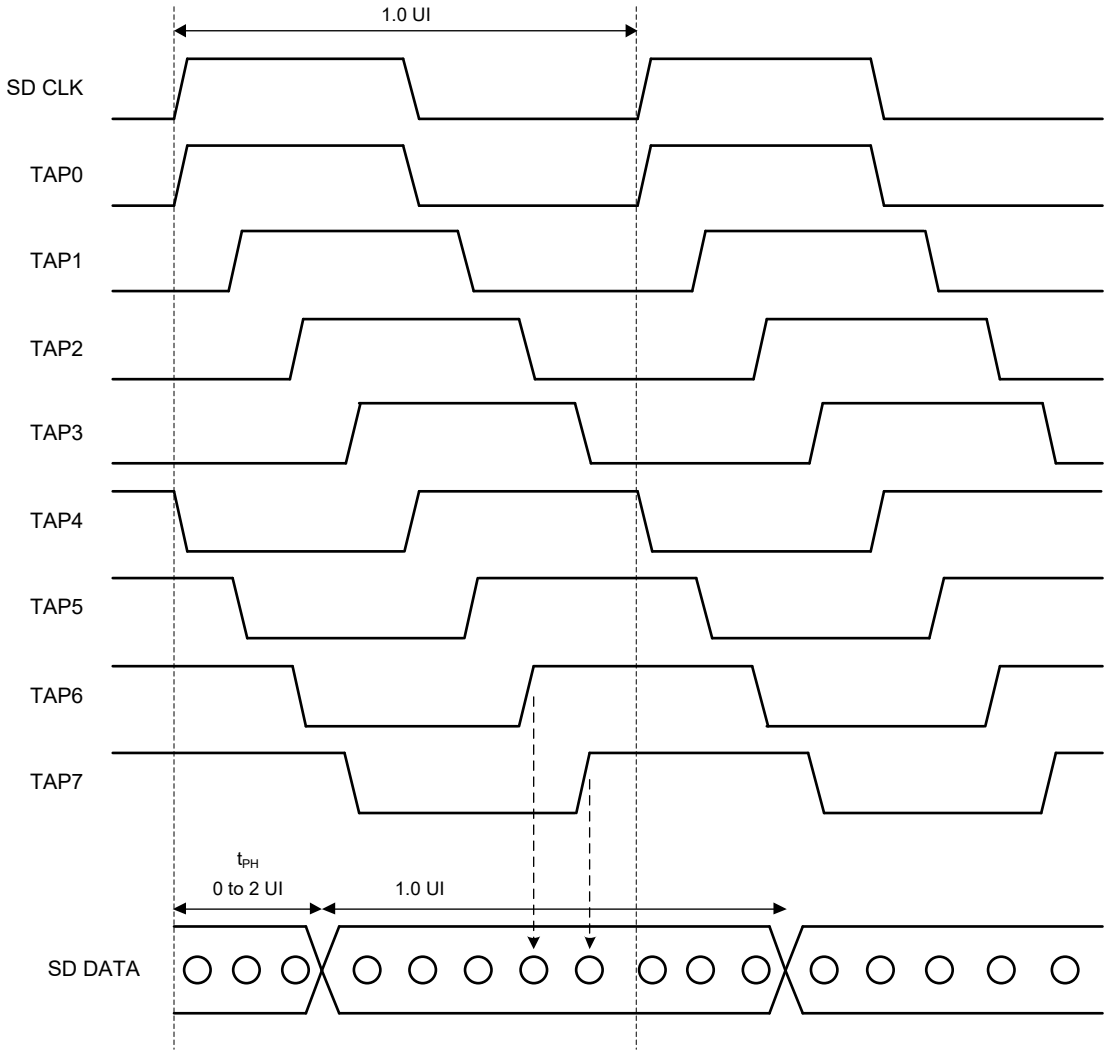
### 40.8.3 Change point of the input data

Tuning captures the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the behind the TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set as TAP6 or TAP7.



**Note:** After recognizing the changing point of the input data, need to set the TAP clock.

Figure 40.34 Example, All taps is OK.

**Figure 40.34** shows change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). When the tuning of TAP2 or TAP3, CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

# 41. General Purpose Input Output Port (GPIO)

This LSI can use up to 82 general-purpose I/O ports.

Each port of the general-purpose I/O port is multiplexed with the terminal of the peripheral function, and either the general-purpose I/O port function or the peripheral function can be selected by setting the register.

## 41.1 Features

### 41.1.1 General Purpose Input Output Port (GPIO)

General-purpose input/output ports (GPIOs) provide general-purpose ports that can be configured as inputs or outputs.

When set as an output, it can be written to an internal register to control the state driven by the output pin. When set as an input, you can read the state of the input by reading the state of the internal registers. You can also generate interrupts using the GPIO input pin.

- GPIO Output Control (Port Register [Pn])
- GPIO Input, Output Enable (Port Mode Register [PMn])
- GPIO Input Monitor (Port Input Register [PINn])
- Interrupt used the GPIO input (Interrupt Enable Control Register[ISEL])

Also, it able to control the following on some ports

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Slew Rate Switching for each port
- Pull Up / Pull down Switching for each port
- Digital noise filter control for each port

### 41.1.2 Port Function Control

Switching of each port function can be controlled by the following register settings.

- GPIO function and peripheral function selection (Port Mode Control Register[PMCn])
- Selection of each peripheral function (Port Function Control Register[PFCm]) [Function0 to 7]

NOTE

Please refer to another file for the pin function for the peripheral functions that can be selected.
Please refer to above excel file for the“Pin function list” described in each chapter.

Do not select the same peripheral function for multiple different external terminals.

### 41.1.3 Special Purpose Port Function Control

The settings of the following specific ports can be controlled by registers.

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Slew Rate Switching for each port
- Digital noise filter control for each port
- Ether MII / RGMII mode control

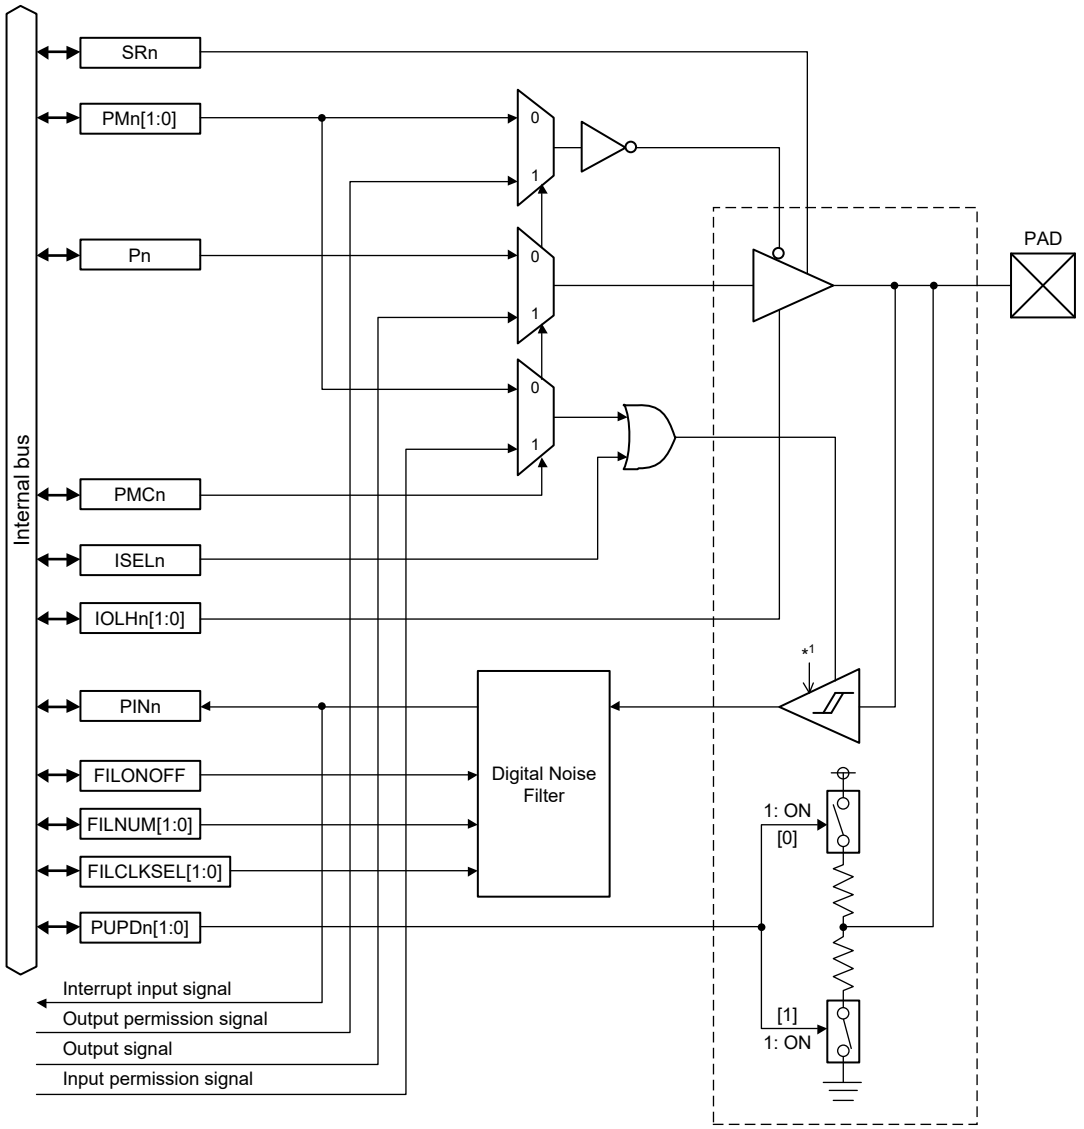
The specific ports shown below are targeted.

- Target Functions: Ether ch0/ch1, SDHI ch0/ch1, QSPI、RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2

### 41.1.4 General Purpose Input Output Port Configuration

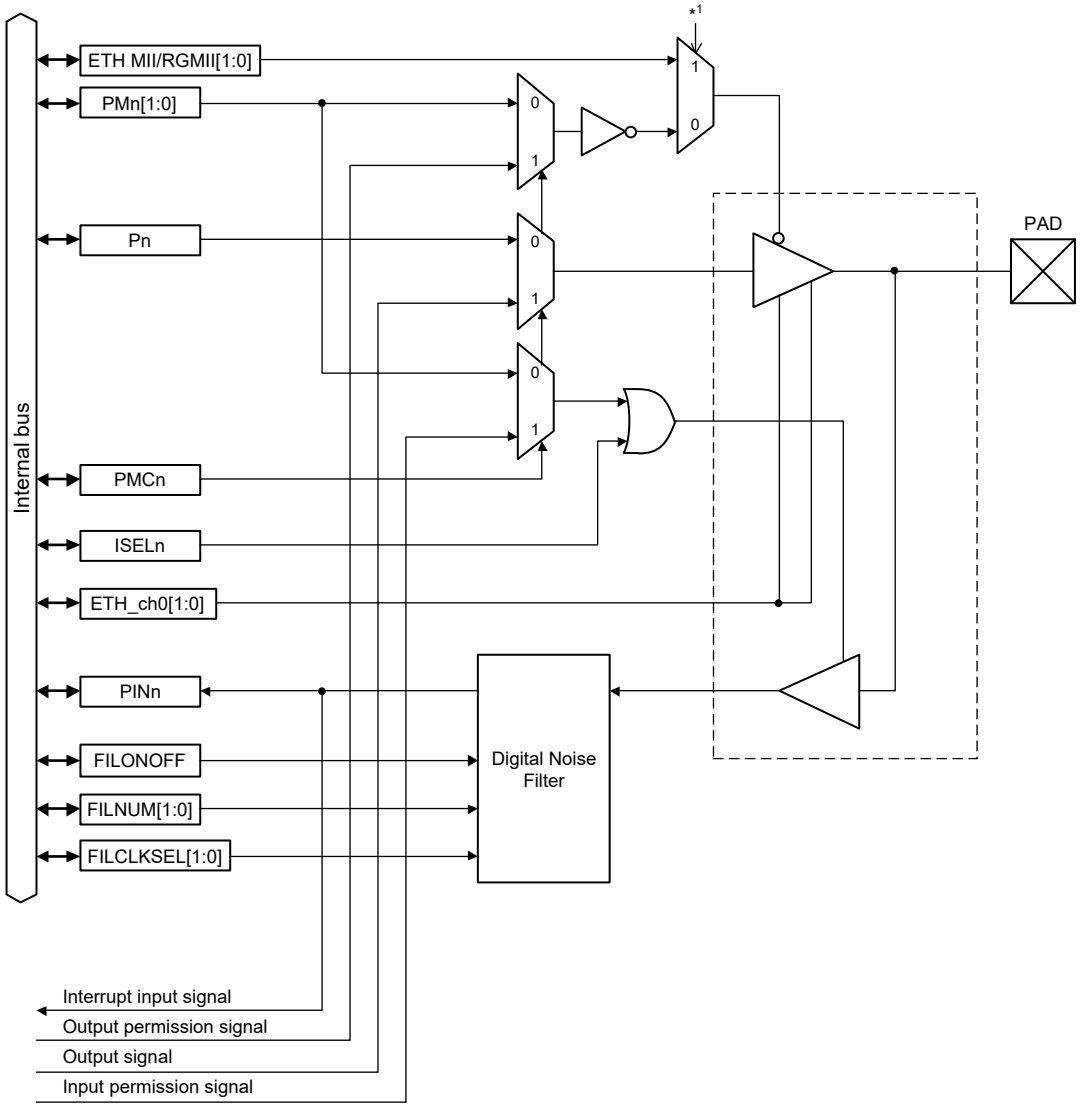
The configuration of the general-purpose I/O port is shown in **Figure 41.1** to **Figure 41.5**.

In addition, the configuration of the multiplexed Ether ch0 / ch1 is also included in the configuration diagram of the general-purpose I/O port.



Note 1. When RIIC * is selected as the peripheral module, the Schmitt trigger circuit is enabled.

Figure 41.1 P0_0 to P0_3, P5_0 to P6_4, P11_0 to P18_5 (Multiplexed peripheral functions)



Note 1. When ETH0 is selected as the peripheral module, the ETH MII / RGMII register output is selected.

Figure 41.2 P1_0 (Multiplexed Ether ch0)

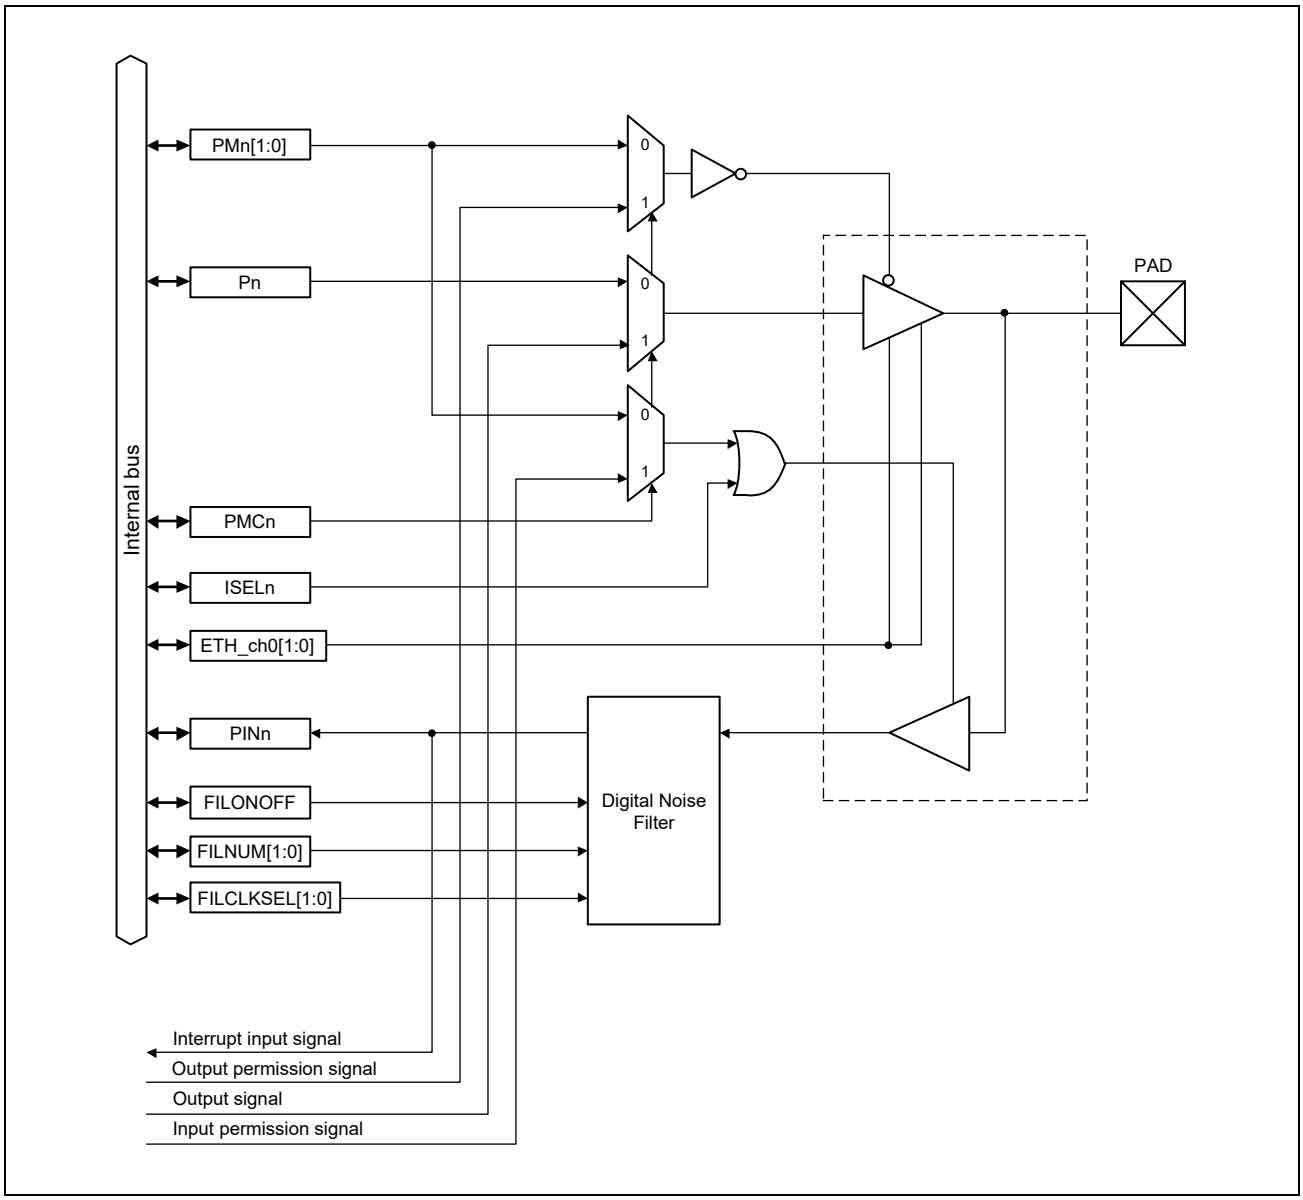


Figure 41.3 P1_1 to P4_5 (Multiplexed Ether ch0)

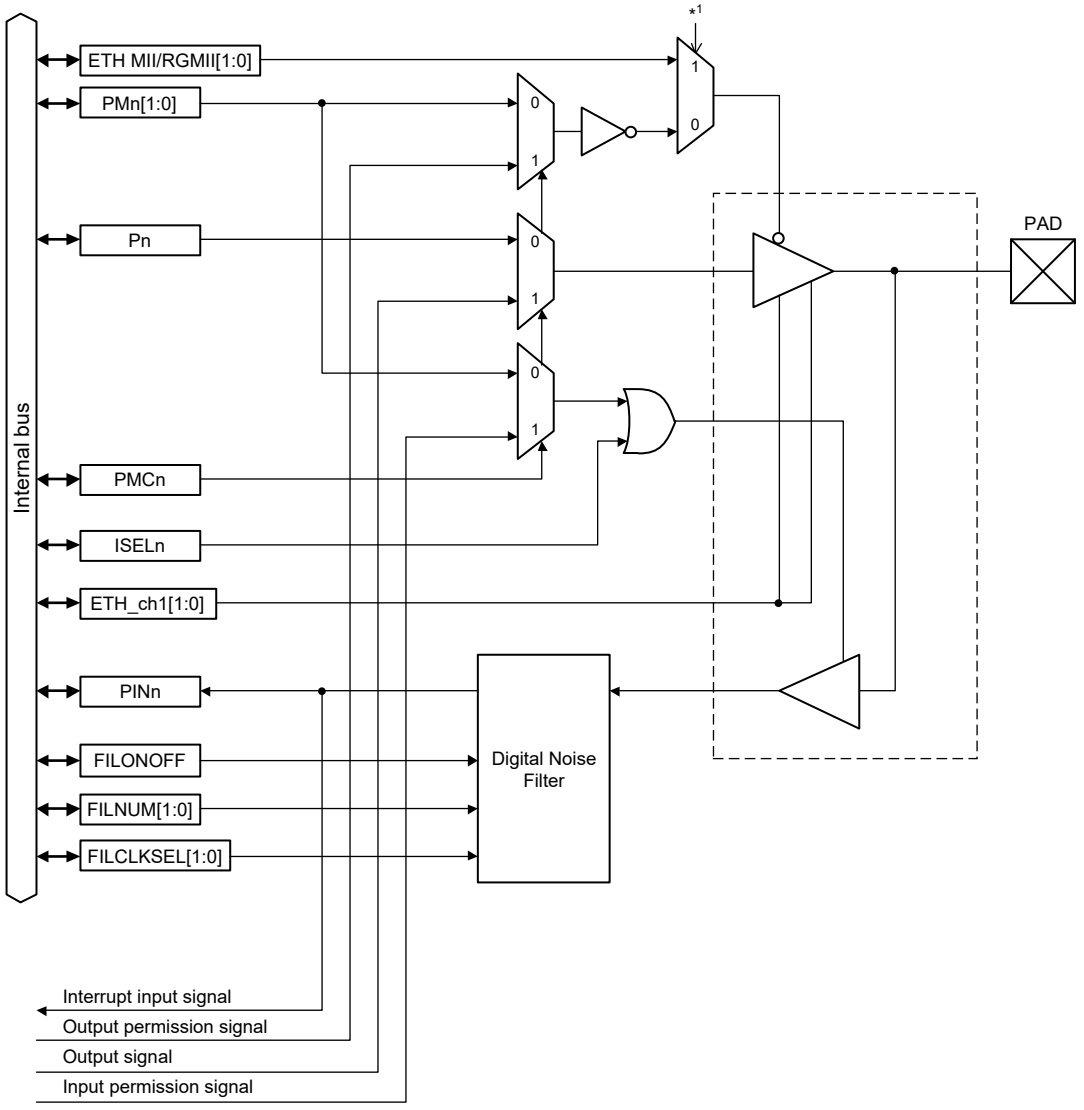

Note 1. When ETH1 is selected as the peripheral module, the ETH MII / RGMII register output is selected.

Figure 41.4 P7_0 (Multiplexed Ether ch1)

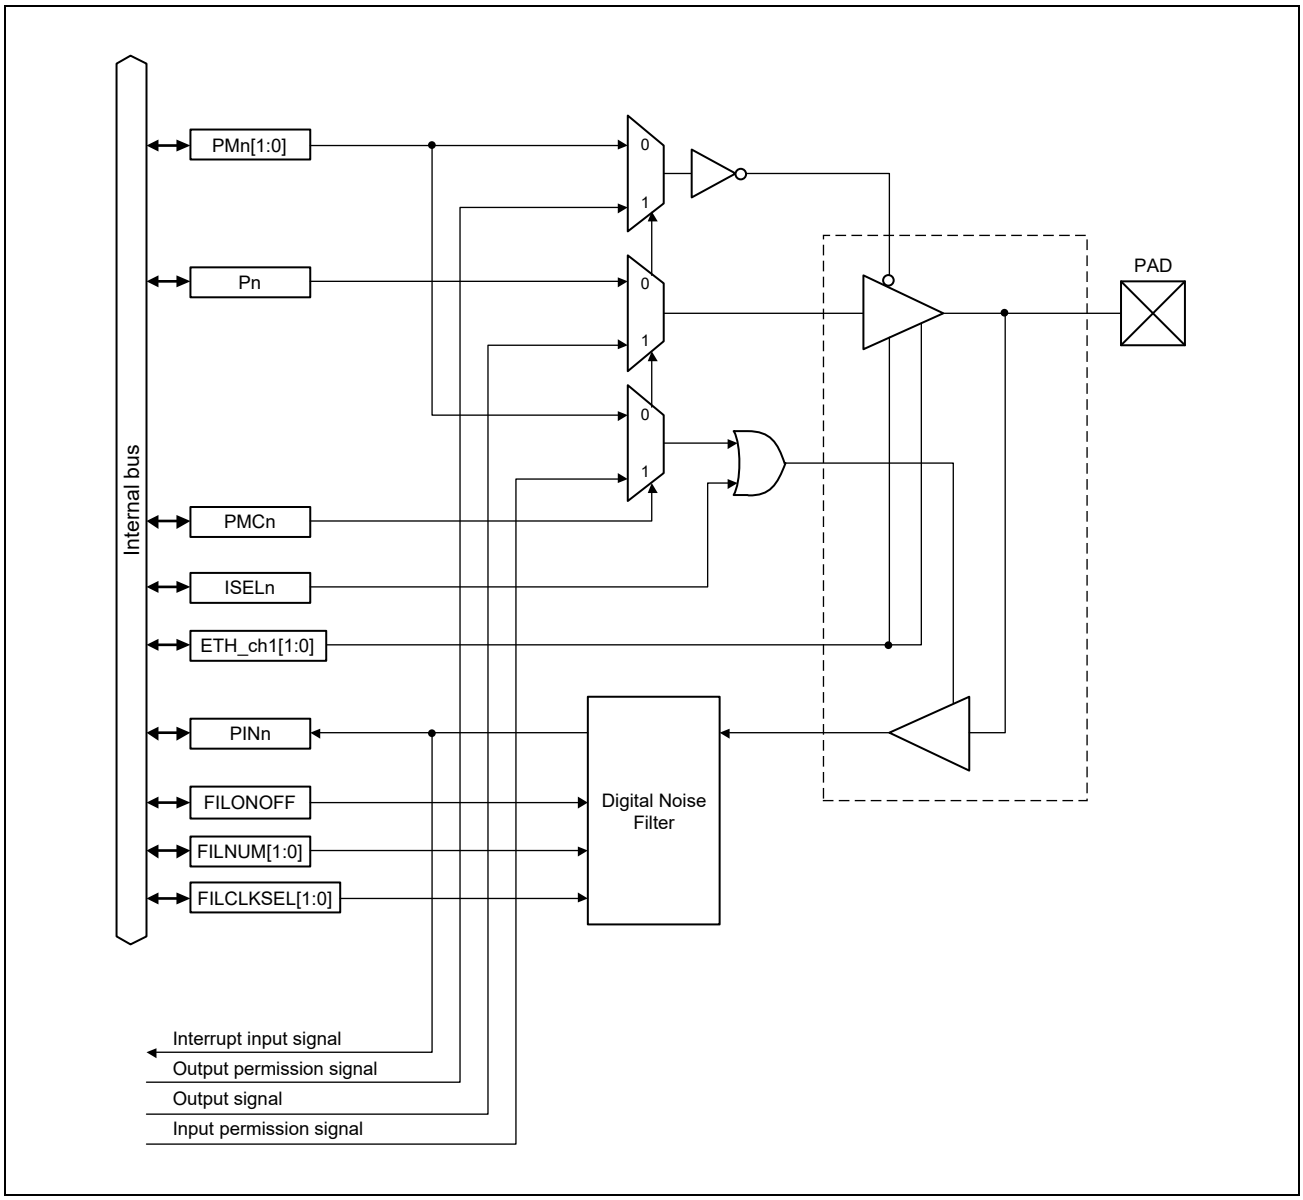

Figure 41.5 P7_1 to P10_4 (Multiplexed Ether ch1)

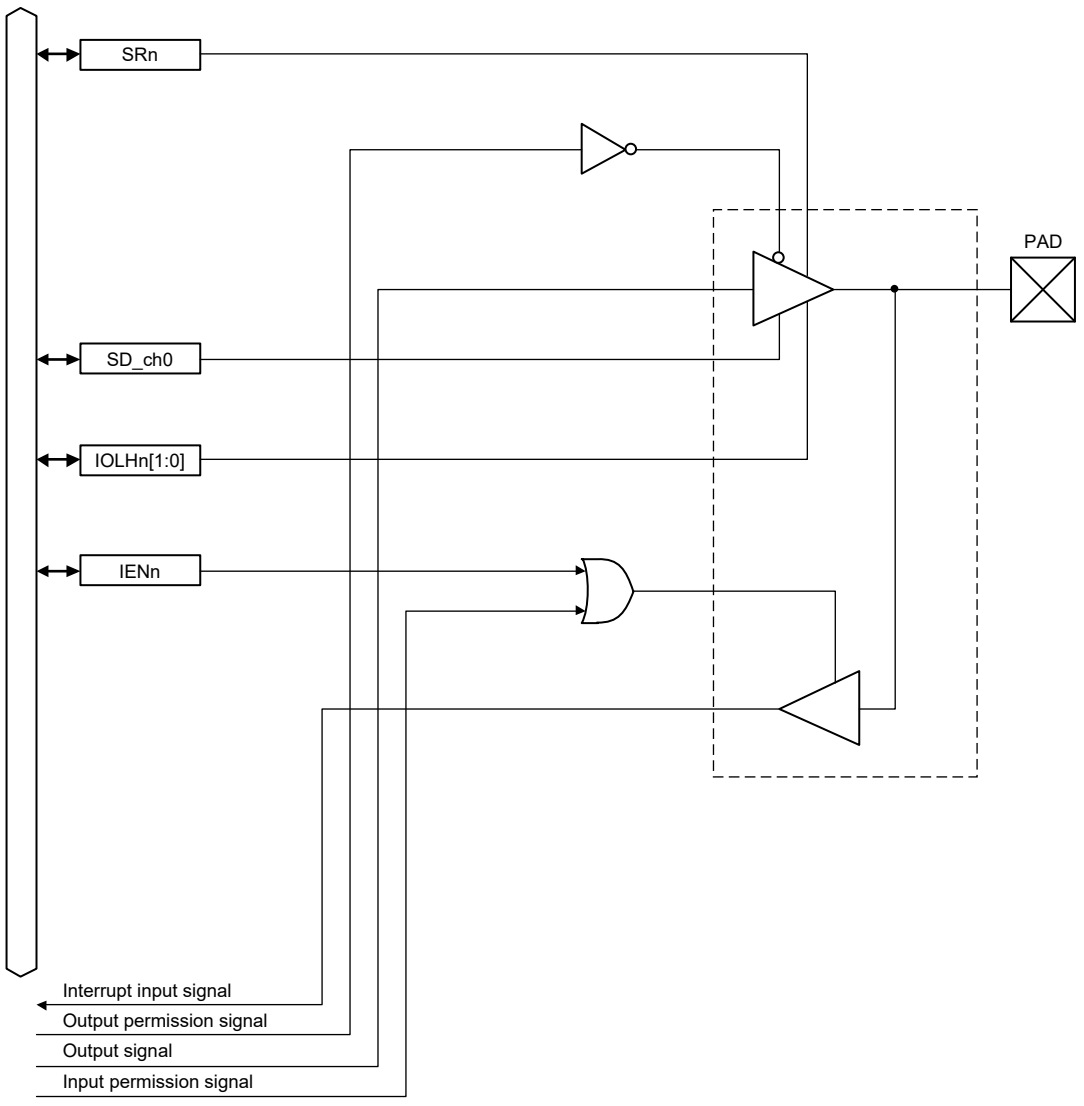
### 41.1.5 Special purpose port Configuration

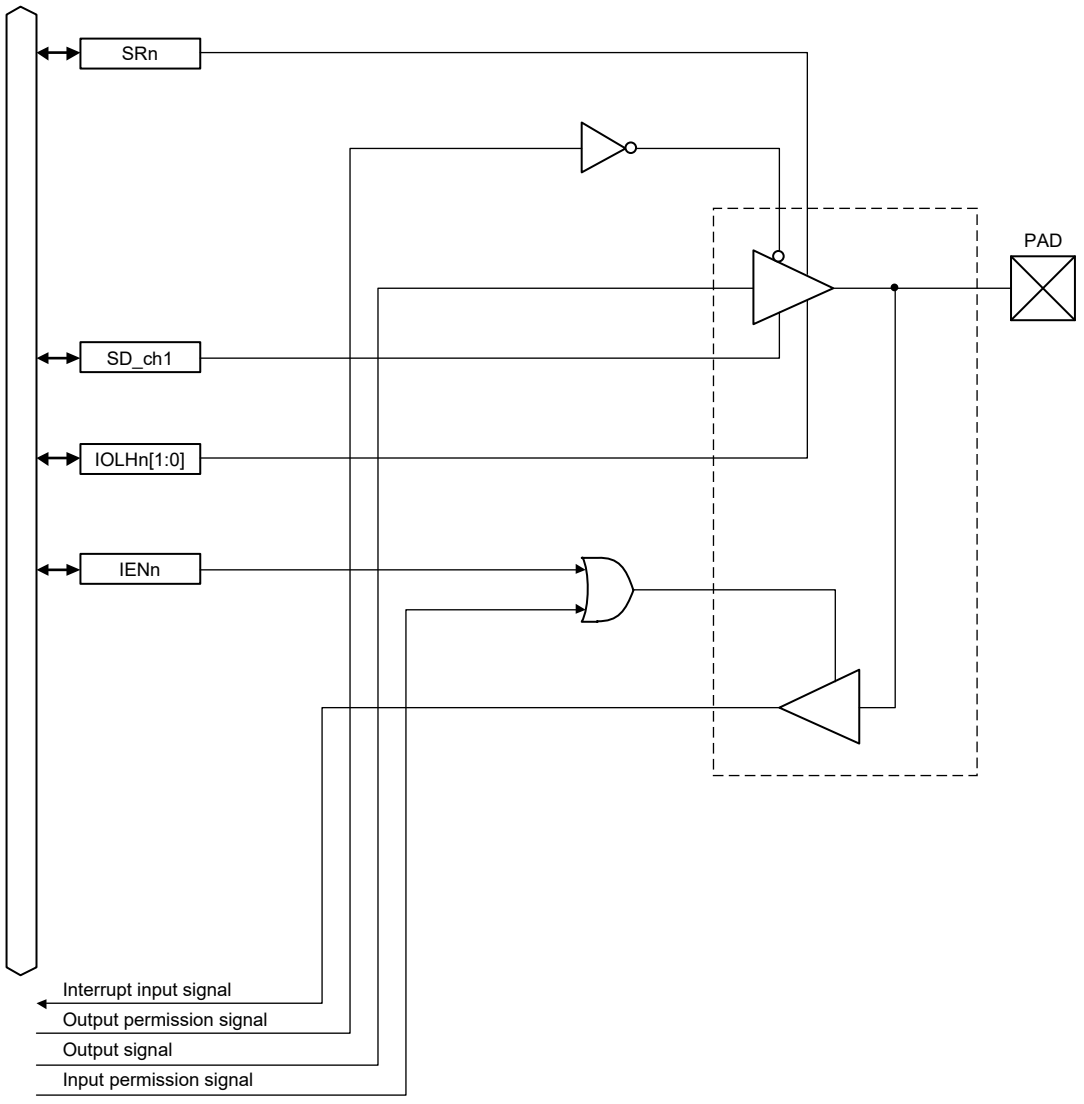
The functions and the signal of configurations shown below are shown in **Figure 41.6** to **Figure 41.13**.

- Target Functions: SDHI ch0, SDHI ch1, QSPI, RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2



**Note:** The IENn registers do not exist at the SD0_CLK and SD0_RST# pins.

Figure 41.6 SDHI ch0 (SD0_CLK, SD0_CMD, SD0_RST#, SD0_DATA[7:0])



**Note:** The IENn registers do not exist at the SD1_CLK pin.

## 41.2 Register Configuration

The base address is shown below.

Base address: H'0_1103_0000 (Cortex-A55 Address Space)
Base address: H'4103_0000 (Cortex-M33 Address Space Non-Secure)
Base address: H'5103_0000 (Cortex-M33 Address Space Secure)

The register addresses shown in the following chapters will be offset addresses from the above base address.

NOTE

Access to areas for which Offset address is not defined in the register map is prohibited.

Please align the addresses according to the access size.

### 41.2.1 Port Register (Pn)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| PORT REGISTER10 | P10 | R/W | H'00 | H'0010 | 8 |
| PORT REGISTER11 | P11 | R/W | H'00 | H'0011 | 8 |
| PORT REGISTER12 | P12 | R/W | H'00 | H'0012 | 8 |
| PORT REGISTER13 | P13 | R/W | H'00 | H'0013 | 8 |
| PORT REGISTER14 | P14 | R/W | H'00 | H'0014 | 8 |
| PORT REGISTER15 | P15 | R/W | H'00 | H'0015 | 8 |

### 41.2.3 Port Mode Control Register (PMCn)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| PORT MODE CONTROL REGISTER10 | PMC10 | R/W | H'00 | H'0210 | 8 |
| PORT MODE CONTROL REGISTER11 | PMC11 | R/W | H'00 | H'0211 | 8 |
| PORT MODE CONTROL REGISTER12 | PMC12 | R/W | H'00 | H'0212 | 8 |
| PORT MODE CONTROL REGISTER13 | PMC13 | R/W | H'00 | H'0213 | 8 |
| PORT MODE CONTROL REGISTER14 | PMC14 | R/W | H'00 | H'0214 | 8 |
| PORT MODE CONTROL REGISTER15 | PMC15 | R/W | H'00 | H'0215 | 8 |
| PORT MODE CONTROL REGISTER16 | PMC16 | R/W | H'00 | H'0216 | 8 |
| PORT MODE CONTROL REGISTER17 | PMC17 | R/W | H'00 | H'0217 | 8 |
| PORT MODE CONTROL REGISTER18 | PMC18 | R/W | H'00 | H'0218 | 8 |
| PORT MODE CONTROL REGISTER19 | PMC19 | R/W | H'00 | H'0219 | 8 |
| PORT MODE CONTROL REGISTER1A | PMC1A | R/W | H'00 | H'021A | 8 |
| PORT MODE CONTROL REGISTER1B | PMC1B | R/W | H'00 | H'021B | 8 |
| PORT MODE CONTROL REGISTER1C | PMC1C | R/W | H'00 | H'021C | 8 |
| PORT MODE CONTROL REGISTER1D | PMC1D | R/W | H'00 | H'021D | 8 |
| PORT MODE CONTROL REGISTER1E | PMC1E | R/W | H'00 | H'021E | 8 |
| PORT MODE CONTROL REGISTER1F | PMC1F | R/W | H'00 | H'021F | 8 |
| PORT MODE CONTROL REGISTER20 | PMC20 | R/W | H'00 | H'0220 | 8 |
| PORT MODE CONTROL REGISTER21 | PMC21 | R/W | H'00 | H'0221 | 8 |
| PORT MODE CONTROL REGISTER22 | PMC22 | R/W | H'00 | H'0222 | 8 |

### 41.2.4 Port Function Control Register (PFCm)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| PORT FUNCTION CONTROL REGISTER10 | PFC10 | R/W | H'0000 0000 | H'0440 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER11 | PFC11 | R/W | H'0000 0000 | H'0444 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER12 | PFC12 | R/W | H'0000 0000 | H'0448 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER13 | PFC13 | R/W | H'0000 0000 | H'044C | 8/16/32 |

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| PORT FUNCTION CONTROL REGISTER14 | PFC14 | R/W | H'0000 0000 | H'0450 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER15 | PFC15 | R/W | H'0000 0000 | H'0454 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER16 | PFC16 | R/W | H'0000 0000 | H'0458 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER17 | PFC17 | R/W | H'0000 0000 | H'045C | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER18 | PFC18 | R/W | H'0000 0000 | H'0460 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER19 | PFC19 | R/W | H'0000 0000 | H'0464 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER1A | PFC1A | R/W | H'0000 0000 | H'0468 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER1B | PFC1B | R/W | H'0000 0000 | H'046C | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER1C | PFC1C | R/W | H'0000 0000 | H'0470 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER1D | PFC1D | R/W | H'0000 0000 | H'0474 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER1E | PFC1E | R/W | H'0000 0000 | H'0478 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER1F | PFC1F | R/W | H'0000 0000 | H'047C | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER20 | PFC20 | R/W | H'0000 0000 | H'0480 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER21 | PFC21 | R/W | H'0000 0000 | H'0484 | 8/16/32 |
| PORT FUNCTION CONTROL REGISTER22 | PFC22 | R/W | H'0000 0000 | H'0488 | 8/16/32 |

### 41.2.5 Port Input Register (PINn)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| PORT INPUT REGISTER10 | PIN10 | R | H'00 | H'0810 | 8 |
| PORT INPUT REGISTER11 | PIN11 | R | H'00 | H'0811 | 8 |
| PORT INPUT REGISTER12 | PIN12 | R | H'00 | H'0812 | 8 |
| PORT INPUT REGISTER13 | PIN13 | R | H'00 | H'0813 | 8 |
| PORT INPUT REGISTER14 | PIN14 | R | H'00 | H'0814 | 8 |
| PORT INPUT REGISTER15 | PIN15 | R | H'00 | H'0815 | 8 |
| PORT INPUT REGISTER16 | PIN16 | R | H'00 | H'0816 | 8 |
| PORT INPUT REGISTER17 | PIN17 | R | H'00 | H'0817 | 8 |
| PORT INPUT REGISTER18 | PIN18 | R | H'00 | H'0818 | 8 |
| PORT INPUT REGISTER19 | PIN19 | R | H'00 | H'0819 | 8 |
| PORT INPUT REGISTER1A | PIN1A | R | H'00 | H'081A | 8 |
| PORT INPUT REGISTER1B | PIN1B | R | H'00 | H'081B | 8 |
| PORT INPUT REGISTER1C | PIN1C | R | H'00 | H'081C | 8 |
| PORT INPUT REGISTER1D | PIN1D | R | H'00 | H'081D | 8 |
| PORT INPUT REGISTER1E | PIN1E | R | H'00 | H'081E | 8 |
| PORT INPUT REGISTER1F | PIN1F | R | H'00 | H'081F | 8 |
| PORT INPUT REGISTER20 | PIN20 | R | H'00 | H'0820 | 8 |
| PORT INPUT REGISTER21 | PIN21 | R | H'00 | H'0821 | 8 |
| PORT INPUT REGISTER22 | PIN22 | R | H'00 | H'0822 | 8 |

### 41.2.6 Interrupt Enable Control Register (ISEL)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| INTERRUPT ENABLE CONTROL REGISTER10 | ISEL10 | R/W | H'0000 0000 | H'2C80 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER11_L | ISEL11_L | R/W | H'0000 0000 | H'2C88 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER11_H | ISEL11_H | R/W | H'0000 0000 | H'2C8C | 8/16/32 |

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| INTERRUPT ENABLE CONTROL REGISTER12 | ISEL12 | R/W | H'0000 0000 | H'2C90 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER13 | ISEL13 | R/W | H'0000 0000 | H'2C98 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER14_L | ISEL14_L | R/W | H'0000 0000 | H'2CA0 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER14_H | ISEL14_H | R/W | H'0000 0000 | H'2CA4 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER15_L | ISEL15_L | R/W | H'0000 0000 | H'2CA8 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER15_H | ISEL15_H | R/W | H'0000 0000 | H'2CAC | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER16_L | ISEL16_L | R/W | H'0000 0000 | H'2CB0 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER16_H | ISEL16_H | R/W | H'0000 0000 | H'2CB4 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER17_L | ISEL17_L | R/W | H'0000 0000 | H'2CB8 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER17_H | ISEL17_H | R/W | H'0000 0000 | H'2CBC | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER18_L | ISEL18_L | R/W | H'0000 0000 | H'2CC0 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER18_H | ISEL18_H | R/W | H'0000 0000 | H'2CC4 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER19 | ISEL19 | R/W | H'0000 0000 | H'2CC8 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1A_L | ISEL1A_L | R/W | H'0000 0000 | H'2CD0 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1A_H | ISEL1A_H | R/W | H'0000 0000 | H'2CD4 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1B | ISEL1B | R/W | H'0000 0000 | H'2CD8 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1C | ISEL1C | R/W | H'0000 0000 | H'2CE0 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1D_L | ISEL1D_L | R/W | H'0000 0000 | H'2CE8 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1D_H | ISEL1D_H | R/W | H'0000 0000 | H'2CEC | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1E | ISEL1E | R/W | H'0000 0000 | H'2CF0 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER1F | ISEL1F | R/W | H'0000 0000 | H'2CF8 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER20 | ISEL20 | R/W | H'0000 0000 | H'2D00 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER21 | ISEL21 | R/W | H'0000 0000 | H'2D08 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER22_L | ISEL22_L | R/W | H'0000 0000 | H'2D10 | 8/16/32 |
| INTERRUPT ENABLE CONTROL REGISTER22_H | ISEL22_H | R/W | H'0000 0000 | H'2D14 | 8/16/32 |

### 41.2.7 Driving Ability Control Register (IOLH)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| DRIVING ABILITY CONTROL REGISTER02 | IOLH02 | R/W | *1 | H'1010 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER03 | IOLH03 | R/W | *1 | H'1018 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER06 | IOLH06 | R/W | *1 | H'1030 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER07_L | IOLH07_L | R/W | *1 | H'1038 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER07_H | IOLH07_H | R/W | *1 | H'103C | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER08 | IOLH08 | R/W | *1 | H'1040 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER09 | IOLH09 | R/W | *1 | H'1048 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER0A_L | IOLH0A_L | R/W | *1 | H'1050 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER0A_H | IOLH0A_H | R/W | *1 | H'1054 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER0C | IOLH0C | R/W | *1 | H'1060 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER0D | IOLH0D | R/W | *1 | H'1068 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER10 | IOLH10 | R/W | *1 | H'1080 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER15_L | IOLH15_L | R/W | *1 | H'10A8 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER15_H | IOLH15_H | R/W | *1 | H'10AC | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER16_L | IOLH16_L | R/W | *1 | H'10B0 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER16_H | IOLH16_H | R/W | *1 | H'10B4 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER1B | IOLH1B | R/W | *1 | H'10D8 | 8/16/32 |

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| DRIVING ABILITY CONTROL REGISTER1C | IOLH1C | R/W | *1 | H'10E0 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER1D_L | IOLH1D_L | R/W | *1 | H'10E8 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER1D_H | IOLH1D_H | R/W | *1 | H'10EC | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER1E | IOLH1E | R/W | *1 | H'10F0 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER1F | IOLH1F | R/W | *1 | H'10F8 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER20 | IOLH20 | R/W | *1 | H'1100 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER21 | IOLH21 | R/W | *1 | H'1108 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER22_L | IOLH22_L | R/W | *1 | H'1110 | 8/16/32 |
| DRIVING ABILITY CONTROL REGISTER22_H | IOLH22_H | R/W | *1 | H'1114 | 8/16/32 |

Note 1. For the initial value, refer to **Section 41.3.7, Driving Ability Control Register (IOLH)**.

## 41.2.8 Slew Rate Switching Register (SR)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| SLEW RATE SWITCHING REGISTER02 | SR02 | R/W | *1 | H'1410 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER03 | SR03 | R/W | *1 | H'1418 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER06 | SR06 | R/W | *1 | H'1430 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER07_L | SR07_L | R/W | *1 | H'1438 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER07_H | SR07_H | R/W | *1 | H'143C | 8/16/32 |
| SLEW RATE SWITCHING REGISTER08 | SR08 | R/W | *1 | H'1440 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER09 | SR09 | R/W | *1 | H'1448 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER0A_L | SR0A_L | R/W | *1 | H'1450 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER0A_H | SR0A_H | R/W | *1 | H'1454 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER0C | SR0C | R/W | *1 | H'1460 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER0D | SR0D | R/W | *1 | H'1468 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER10 | SR10 | R/W | *1 | H'1480 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER15_L | SR15_L | R/W | *1 | H'14A8 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER15_H | SR15_H | R/W | *1 | H'14AC | 8/16/32 |
| SLEW RATE SWITCHING REGISTER16_L | SR16_L | R/W | *1 | H'14B0 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER16_H | SR16_H | R/W | *1 | H'14B4 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER1B | SR1B | R/W | *1 | H'14D8 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER1C | SR1C | R/W | *1 | H'14E0 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER1D_L | SR1D_L | R/W | *1 | H'14E8 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER1D_H | SR1D_H | R/W | *1 | H'14EC | 8/16/32 |
| SLEW RATE SWITCHING REGISTER1E | SR1E | R/W | *1 | H'14F0 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER1F | SR1F | R/W | *1 | H'14F8 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER20 | SR20 | R/W | *1 | H'1500 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER21 | SR21 | R/W | *1 | H'1508 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER22_L | SR22_L | R/W | *1 | H'1510 | 8/16/32 |
| SLEW RATE SWITCHING REGISTER22_H | SR22_H | R/W | *1 | H'1514 | 8/16/32 |

Note 1. For the initial value, refer to **Section 41.3.8, Slew Rate Switching Register (SR)**.

### 41.2.9 Pull Up/Pull down Switching Register (PUPD)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| PULL UP/PULL DOWN SWITCHING REGISTER10 | PUPD10 | R/W | H'0000 0000 | H'1C80 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER15_L | PUPD15_L | R/W | H'0000 0000 | H'1CA8 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER15_H | PUPD15_H | R/W | H'0000 0000 | H'1CAC | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER16_L | PUPD16_L | R/W | H'0000 0000 | H'1CB0 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER16_H | PUPD16_H | R/W | H'0000 0000 | H'1CB4 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER1B | PUPD1B | R/W | H'0000 0000 | H'1CD8 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER1C | PUPD1C | R/W | H'0000 0000 | H'1CE0 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER1D_L | PUPD1D_L | R/W | H'0000 0000 | H'1CE8 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER1D_H | PUPD1D_H | R/W | H'0000 0000 | H'1CEC | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER1E | PUPD1E | R/W | H'0000 0000 | H'1CF0 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER1F | PUPD1F | R/W | H'0000 0000 | H'1CF8 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER20 | PUPD20 | R/W | H'0000 0000 | H'1D00 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER21 | PUPD21 | R/W | H'0000 0000 | H'1D08 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER22_L | PUPD22_L | R/W | H'0000 0000 | H'1D10 | 8/16/32 |
| PULL UP/PULL DOWN SWITCHING REGISTER22_H | PUPD22_H | R/W | H'0000 0000 | H'1D14 | 8/16/32 |

### 41.2.10 Write protected register (PWPR)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| WRITE PROTECTED REGISTER | PWPR | R/W | H'80 | H'3014 | 8 |

### 41.2.11 Digital Noise Filter Switching Register (FILONOFF)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| DIGITAL NOISE FILTER SWITCHING REGISTER 01 | FILONOFF01 | R/W | H'0000 0000 | H'2008 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER 10 | FILONOFF10 | R/W | H'0000 0000 | H'2080 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER11_L | FILONOFF11_L | R/W | H'0000 0000 | H'2088 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER11_H | FILONOFF11_H | R/W | H'0000 0000 | H'208C | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER12 | FILONOFF12 | R/W | H'0000 0000 | H'2090 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER13 | FILONOFF13 | R/W | H'0000 0000 | H'2098 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER14_L | FILONOFF14_L | R/W | H'0000 0000 | H'20A0 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER14_H | FILONOFF14_H | R/W | H'0000 0000 | H'20A4 | 8/16/32 |
| DIGITAL NOISE FILTER SWITCHING REGISTER15_L | FILONOFF15_L | R/W | H'0000 0000 | H'20A8 | 8/16/32 |

| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER1C | FILCLKSEL1C | R/W | H'0000 0000 | H'28E0 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER1D_L | FILCLKSEL1D_L | R/W | H'0000 0000 | H'28E8 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER1D_H | FILCLKSEL1D_H | R/W | H'0000 0000 | H'28EC | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER1E | FILCLKSEL1E | R/W | H'0000 0000 | H'28F0 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER1F | FILCLKSEL1F | R/W | H'0000 0000 | H'28F8 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER20 | FILCLKSEL20 | R/W | H'0000 0000 | H'2900 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER21 | FILCLKSEL21 | R/W | H'0000 0000 | H'2908 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER22_L | FILCLKSEL22_L | R/W | H'0000 0000 | H'2910 | 8/16/32 |
| DIGITAL NOISE FILTER CLOCK SELECTION REGISTER22_H | FILCLKSEL22_H | R/W | H'0000 0000 | H'2914 | 8/16/32 |

### 41.2.14 Ether ch0 IO Voltage Mode Control Register (ETH_ch0)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| ETHER CH0 IO VOLTAGE MODE CONTROL REGISTER | ETH_ch0 | R/W | H'00 | H'300C | 8 |

### 41.2.15 Ether ch1 IO Voltage Mode Control Register (ETH_ch1)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| ETHER CH1 IO VOLTAGE MODE CONTROL REGISTER | ETH_ch1 | R/W | H'00 | H'3010 | 8 |

### 41.2.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| ETHER MII/RGMII MODE CONTROL REGISTER | ETH MII/RGMII | R/W | H'03 | H'3018 | 8 |

### 41.2.17 SD ch0 IO Voltage Mode Control Register (SD_ch0)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| SD CH0 IO VOLTAGE MODE CONTROL REGISTER | SD_ch0 | R/W | *1 | H'3000 | 8 |

Note 1. For the initial value, refer to **Section 41.3.17, SD ch0 IO Voltage Mode Control Register (SD_ch0)**.

### 41.2.18 SD ch1 IO Voltage Mode Control Register (SD_ch1)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| SD CH1 IO VOLTAGE MODE CONTROL REGISTER | SD_ch1 | R/W | H'00 | H'3004 | 8 |

### 41.2.19 QSPI IO Voltage Mode Control Register (QSPI)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| QSPI IO VOLTAGE MODE CONTROL REGISTER | QSPI | R/W | *1 | H'3008 | 8 |

Note 1. For the initial value, refer to **Section 41.3.19, QSPI IO Voltage Mode Control Register (QSPI)**.

### 41.2.20 Input Enable Control Register (IEN)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| INPUT ENABLE CONTROL REGISTER02 | IEN02 | R/W | H'0000 0000 | H1810 | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER04 | IEN04 | R/W | H'0000 0000 | H1820 | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER06 | IEN06 | R/W | H'0000 0000 | H1830 | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER07_L | IEN07_L | R/W | H'0000 0000 | H1838 | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER07_H | IEN07_H | R/W | H'0000 0000 | H183C | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER08 | IEN08 | R/W | H'0000 0000 | H1840 | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER09 | IEN09 | R/W | H'0000 0000 | H1848 | 8/16/32 |
| INPUT ENABLE CONTROL REGISTER0E | IEN0E | R/W | H'0000 0000 | H1870 | 8/16/32 |

# 41.3 Register Descriptions

## 41.3.1 Port Register (Pn)

The Pn register sets the GPIO output value.

For the offset address, refer to **Section 41.2.1, Port Register (Pn)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | P7 | 0b | R/W | These bits set the value of the GPIO pin. (P7 to P0)<br>0b: Low is output.<br>1b: High is output.<br>Please refer to the table below for the correspondence of each terminal. |
| 6 | P6 | 0b | R/W | |
| 5 | P5 | 0b | R/W | |
| 4 | P4 | 0b | R/W | |
| 3 | P3 | 0b | R/W | |
| 2 | P2 | 0b | R/W | |
| 1 | P1 | 0b | R/W | |
| 0 | P0 | 0b | R/W | |

Table 41.1 Correspondence between register and each terminal

| Bit Name | bit5 | bit4 | bit3 | bit2 | bit1 | bit0 |
|---|---|---|---|---|---|---|
| P10 | — | — | P0_3 | P0_2 | P0_1 | P0_0 |
| P11 | — | P1_4 | P1_3 | P1_2 | P1_1 | P1_0 |
| P12 | — | — | P2_3 | P2_2 | P2_1 | P2_0 |

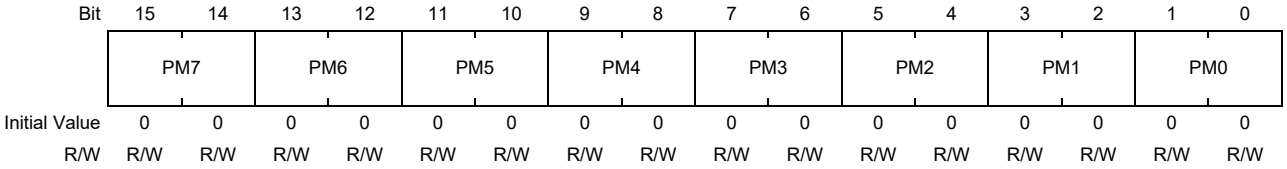
| P14 | P4_5 | P4_4 | P4_3 | P4_2 | P4_1 | P4_0 |
| P15 | — | P5_4 | P5_3 | P5_2 | P5_1 | P5_0 |
| P16 | — | P6_4 | P6_3 | P6_2 | P6_1 | P6_0 |
| P17 | — | P7_4 | P7_3 | P7_2 | P7_1 | P7_0 |
| P18 | — | P8_4 | P8_3 | P8_2 | P8_1 | P8_0 |
| P19 | — | — | P9_3 | P9_2 | P9_1 | P9_0 |
| P1A | — | P10_4 | P10_3 | P10_2 | P10_1 | P10_0 |
| P1B | — | — | P11_3 | P11_2 | P11_1 | P11_0 |
| P1C | — | — | — | — | P12_1 | P12_0 |
| P1D | — | P13_4 | P13_3 | P13_2 | P13_1 | P13_0 |
| P1E | — | — | — | P14_2 | P14_1 | P14_0 |
| P1F | — | — | P15_3 | P15_2 | P15_1 | P15_0 |
| P20 | — | — | — | — | P16_1 | P16_0 |
| P21 | — | — | P17_3 | P17_2 | P17_1 | P17_0 |
| P22 | P18_5 | P18_4 | P18_3 | P18_2 | P18_1 | P18_0 |

### 41.3.2 Port Mode Register (PMn)

The PMn register sets input/output of GPIO.

For the offset address, refer to **Section 41.2.2, Port Mode Register (PMn)**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15, 14 | PM7 | 00b | R/W | These bits set input/output of the GPIO pin. (PM7 to PM0)<br>00b: Hi-Z (Initial Value)<br>01b: Input Mode<br>10b: Output Mode (Input Disable)<br>11b: Output Mode (Input Enable)<br>Please refer to the table below for the correspondence of each terminal. |
| 13, 12 | PM6 | 00b | R/W | |
| 11, 10 | PM5 | 00b | R/W | |
| 9, 8 | PM4 | 00b | R/W | |
| 7, 6 | PM3 | 00b | R/W | |
| 5, 4 | PM2 | 00b | R/W | |
| 3, 2 | PM1 | 00b | R/W | |
| 1, 0 | PM0 | 00b | R/W | |

Table 41.2 Correspondence between register and each terminal

| Bit Name | bit11-10 | bit9-8 | bit7-6 | bit5-4 | bit3-2 | bit1-0 |
|---|---|---|---|---|---|---|
| PM10 | — | — | P0_3 | P0_2 | P0_1 | P0_0 |
| PM11 | — | P1_4 | P1_3 | P1_2 | P1_1 | P1_0 |
| PM12 | — | — | P2_3 | P2_2 | P2_1 | P2_0 |
| PM13 | — | — | P3_3 | P3_2 | P3_1 | P3_0 |
| PM14 | P4_5 | P4_4 | P4_3 | P4_2 | P4_1 | P4_0 |

| PM20 | — | — | — | — | P16_1 | P16_0 |
| PM21 | — | — | P17_3 | P17_2 | P17_1 | P17_0 |
| PM22 | P18_5 | P18_4 | P18_3 | P18_2 | P18_1 | P18_0 |

### 41.3.3 Port Mode Control Register (PMCn)

The PMCn register switches the mode for the multiplexed pins of GPIO.

For the offset address, refer to **Section 41.2.3, Port Mode Control Register (PMCn)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PMC7 | PMC6 | PMC5 | PMC4 | PMC3 | PMC2 | PMC1 | PMC0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | PMC7 | 0b | R/W | These bits switch the mode for the multiplexed pin of the GPIO pin. (PMC7 to PMC0)<br>0b: Port Mode (GPIO)<br>1b: Peripheral Function Mode (Peripheral Function)<br>Please refer to the table below for the correspondence of each terminal. |
| 6 | PMC6 | 0b | R/W | |
| 5 | PMC5 | 0b | R/W | |
| 4 | PMC4 | 0b | R/W | |
| 3 | PMC3 | 0b | R/W | |
| 2 | PMC2 | 0b | R/W | |
| 1 | PMC1 | 0b | R/W | |
| 0 | PMC0 | 0b | R/W | |

Table 41.3 Correspondence between register and each terminal

| Bit Name | bit5 | bit4 | bit3 | bit2 | bit1 | bit0 |
|---|---|---|---|---|---|---|
| PMC10 | — | — | P0_3 | P0_2 | P0_1 | P0_0 |

### 41.3.4 Port Function Control Register (PFCm)

The PFCm register sets multiplexed functions.

This register can be write-protected by the PWPR register.

For the offset address, refer to **Section 41.2.4, Port Function Control Register (PFCm)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | PFC7 | | | — | PFC6 | | | — | PFC5 | | | — | PFC4 | | |

### 41.3.5 Port Input Register (PINn)

The PINn register is a read-only register to monitor input values of input pins.

For the offset address, refer to **Section 41.2.5, Port Input Register (PINn)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | PIN7 | PIN6 | PIN5 | PIN4 | PIN3 | PIN2 | PIN1 | PIN0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 41.3.6 Interrupt Enable Control Register (ISEL)

The ISEL register controls whether to enable or disable interrupts.

The pin set as the GPIO input port can be used as an external interrupt input. Controls whether this feature is enabled or disabled. When enabled, this pin can be used as an interrupt by setting the interrupt controller.

For the offset address, refer to **Section 41.2.6, Interrupt Enable Control Register (ISEL)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ISEL3 | — | — | — | — | — | — | — | ISEL2 |
| Initial Value | — | — | — | — | — | — | — | 0 | — | — | — | — | — | — | — | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### 41.3.8 Slew Rate Switching Register (SR)

The SR register sets the slew rate of the GPIO pins and Special purpose pins.

For the offset address, refer to **Section 41.2.8, Slew Rate Switching Register (SR)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 41.3.9 Pull Up/Pull down Switching Register (PUPD)

The PUPD register sets pull-up and pull-down of the GPIO pins and the special purpose pins.

For the offset address, refer to **Section 41.2.9, Pull Up/Pull down Switching Register (PUPD)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PUPD3 | | — | — | — | — | — | — | PUPD2 | |

### 41.3.10 Write protected register (PWPR)

The PWPR register sets write permission / prohibition for the PFC register and the PFCWE bit of this register.

For the offset address, refer to **Section 41.2.10, Write protected register (PWPR)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | BOWI | PFCWE | — | — | — | — | — | — |
| Initial Value | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | BOWI | 1b | R/W | 1b: Writing a value to the PFCWE bit disabled<br>0b: Writing a value to the PFCWE bit enabled |
| 6 | PFCWE | 0b | R/W | 1b: Writing a value to the PFC register enabled<br>0b: Writing a value to the PFC register disabled |
| 5 to 0 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |

### 41.3.11 Digital Noise Filter Switching Register (FILONOFF)

This register controls whether the digital noise filter is enabled / disabled for GPIO input pin and NMI pin.

For the offset address, refer to **Section 41.2.11, Digital Noise Filter Switching Register (FILONOFF)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 41.3.12 Digital Noise Filter Number Register (FILNUM)

This register sets the number of FF stages of digital noise filter for GPIO pin and NMI pin.

For the offset address, refer to **Section 41.2.12, Digital Noise Filter Number Register (FILNUM)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|
| FILCLKSEL19 | P9_3 | P9_2 | P9_1 | P9_0 |
| FILCLKSEL1A_L | P10_3 | P10_2 | P10_1 | P10_0 |
| FILCLKSEL1A_H | — | — | — | P10_4 |
| FILCLKSEL1B | P11_3 | P11_2 | P11_1 | P11_0 |
| FILCLKSEL1C | — | — | P12_1 | P12_0 |
| FILCLKSEL1D_L | P13_3 | P13_2 | P13_1 | P13_0 |
| FILCLKSEL1D_H | — | — | — | P13_4 |
| FILCLKSEL1E | — | P14_2 | P14_1 | P14_0 |
| FILCLKSEL1F | P15_3 | P15_2 | P15_1 | P15_0 |
| FILCLKSEL20 | — | — | P16_1 | P16_0 |
| FILCLKSEL21 | P17_3 | P17_2 | P17_1 | P17_0 |
| FILCLKSEL22_L | P18_3 | P18_2 | P18_1 | P18_0 |
| FILCLKSEL22_H | — | — | P18_5 | P18_4 |

The operation of the digital noise filter will be explained using a timing chart using the external terminal P0_0 as an example.

### (1) When the digital noise filter is disabled (FILONOFF = 0)

The timing chart of FILONOFF = 0 (OFF), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

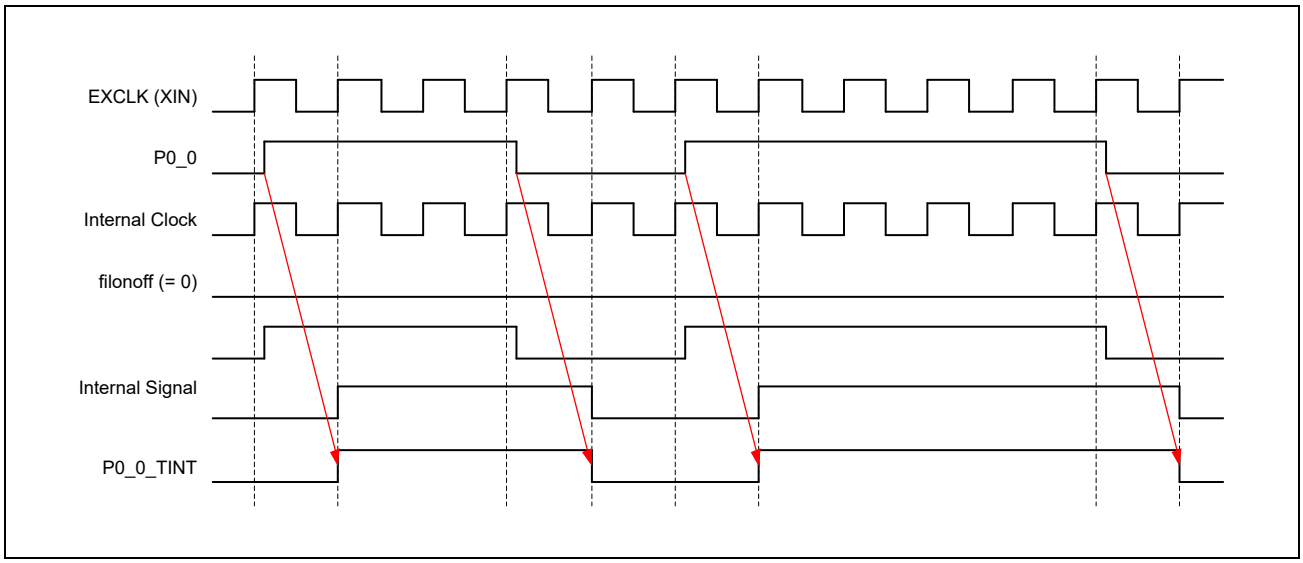

Figure 41.14 Digital noise filter (FILONOFF = 0) timing chart

The signal at the external terminal (P0_0) is not filtered regardless of the number of stages set in the FILNUM register.

The digital noise filter circuit inserts one stage of FF in the output of a digital noise filter.

Therefore, the external terminal (P0_0) signal is propagated internally with a delay of one cycle. (EXCLK (XIN)).

### (2) When the digital noise filter is enabled (FILONOFF = 1)

The timing chart of FILONOFF = 1 (ON), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

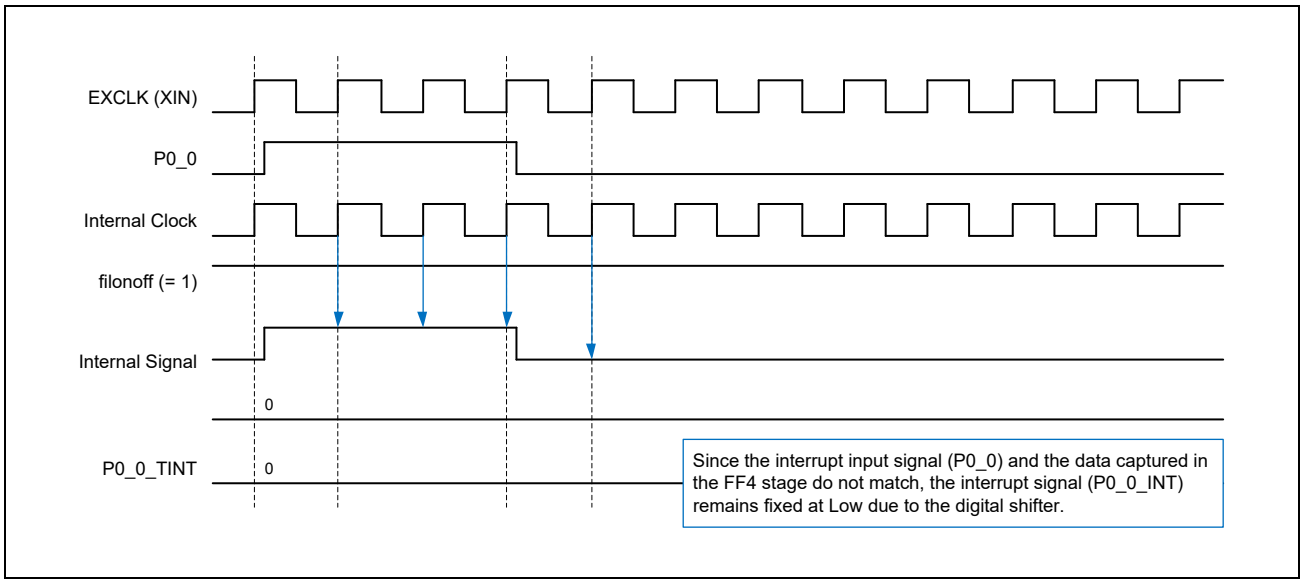

Figure 41.15 Digital noise filter (FILONOFF = 1) Timing chart (1)

The signal of the external terminal (P0_0) is filtered, if even one signal captured by each FF for the number of FF stages set in the FILNUM register does not match.

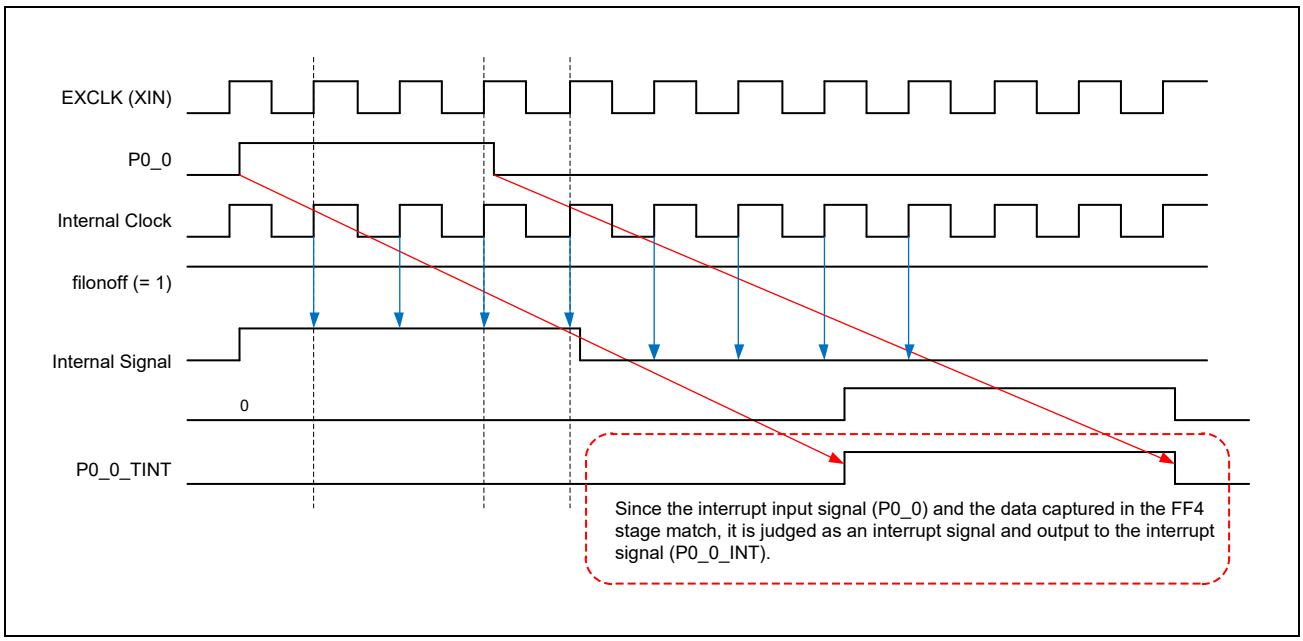

Figure 41.16 Digital noise filter (FILONOFF = 1) Timing chart (2)

The external terminal (P0_0) signal is the signal captured by each FF for the number of FF stages set in the FILNUM register. If they all match, no filtering is done.

The digital noise filter circuit outputs to the interrupt signal with a delay of FILTER_CYCLE.

[FILTER_CYCLE Calculation]

FILTER_CYCLE = FILNUM_FF + $FILTER_FF

FILNUM_FF: Number of FF stages set in the FILNUM register @EXCLK(XIN)
FILTER_FF: FF 2 stage in digital noise filter @EXCLK(XIN) + Digital noise filter output FF 1 stage @EXCLK(XIN)

**Note:** One stage of FF is inserted in the final stage of the digital noise filter circuit. Therefore, interrupt signals less than 1CLK @ EXCLK (XIN) may be removed regardless of whether the digital noise filter is enabled or disabled.

### 41.3.14 Ether ch0 Voltage Mode Control Register (ETH_ch0)

This register is sets the IO voltage mode control of Ether ch0.

For the offset address, refer to **Section 41.2.14, Ether ch0 IO Voltage Mode Control Register (ETH_ch0)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | ETH0_2.5V_PVDD | ETH0_1.8V_PVDD |
| Initial Value | — | — | — | — | — | — | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 1 | ETH0_2.5V_PVDD | 0b | R/W | These bits set the IO voltage mode. |
| 0 | ETH0_1.8V_PVDD | 0b | R/W | |

| Bit 1 | Bit 0 | IO Voltage |
|---|---|---|
| 0 | 0 | 3.3V (Initial value) |
| 0 | 1 | 1.8V |
| 1 | 0 | 2.5V |
| 1 | 1 | Setting prohibited |

- For the IO voltage mode of P1_0 to P4_5, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch0 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_0) to be used.

  When Function2 to Function7, a function other than Ether ch0 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function0 to Function7 in the Pin function List.

  For Function2 to Function7, only 3.3V can be set.

**Note:** When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

### 41.3.15 Ether ch1 Voltage Mode Control Register (ETH_ch1)

This register sets the IO voltage mode control for Etherch1.

For the offset address, refer to **Section 41.2.15, Ether ch1 IO Voltage Mode Control Register (ETH_ch1)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | ETH1_2.5V_PVDD | ETH1_1.8V_PVDD |
| Initial Value | — | — | — | — | — | — | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 1 | ETH1_2.5V_PVDD | 0b | R/W | These bits set the IO voltage mode. |
| 0 | ETH1_1.8V_PVDD | 0b | R/W | |

| Bit 1 | Bit 0 | IO Voltage |
|---|---|---|
| 0 | 0 | 3.3V (Initial value) |
| 0 | 1 | 1.8V |
| 1 | 0 | 2.5V |
| 1 | 1 | Setting prohibited |

- For the IO voltage mode of P7_0 to P10_4, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch1 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_1) to be used.

  When Function2 to Function7, a function other than Ether ch1 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function0 to Function7 in the Pin function List.

  For Function2 to Function7, only 3.3V can be set.

**Note:** When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

### 41.3.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII)

This register can be selected “MII” or “RGMII” of Ether.

This register is valid only for Function1

For the offset address, refer to **Section 41.2.16, Ether MII/RGMII Mode Control Register (ETH MII/RGMII)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | ETH1_mode | ETH0_mode |
| Initial Value | — | — | — | — | — | — | 1 | 1 |
| R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 1 | ETH1_mode | 1b | R/W | Ether MII or RGMII can be selected by setting this register.<br>0b = RGMII<br>The Direction of the ET1_TXC/TX_CLK is Output.<br>1b = MII (Initial value)<br>The Direction of the ET1_TXC/TX_CLK is Input. |
| 0 | ETH0_mode | 1b | R/W | Ether MII or RGMII can be selected by setting this register.<br>0b = RGMII<br>The Direction of the ET0_TXC/TX_CLK is Output.<br>1b = MII (Initial value)<br>The Direction of the ET0_TXC/TX_CLK is Input. |

**Note:** By setting this register, the direction of some pins when using Ether’s MII or RGMII can be selected.
Refer to **Section 30, Gigabit Ethernet Interface** chapter for switching between MII and RGMII of Ether.

**Note:** In RGMII mode, set the external terminals shown below to port mode (PMCn = 0) and I/O disabled (PMn = 00b).

| Ether ch0 | | Ether ch1 | |
|---|---|---|---|
| Terminal name Function0 | Terminal name Function1 | Terminal name Function0 | Terminal name Function1 |
| P2_2 | ET0_TX_COL | P8_2 | ET1_TX_COL |
| P2_3 | ET0_TX_CRS | P8_3 | ET1_TX_CRS |
| P4_2 | ET0_RX_ERR | P10_1 | ET1_RX_ERR |

### 41.3.17 SD ch0 IO Voltage Mode Control Register (SD_ch0)

This register sets the IO voltage mode control of SD ch0.

For the offset address, refer to **Section 41.2.17, SD ch0 IO Voltage Mode Control Register (SD_ch0)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SD0_PVDD |
| Initial Value | — | — | — | — | — | — | — | 0*1 |
| R/W | R | R | R | R | R | R | R | R/W*1 |

Note 1. In Boot Mode1 and Boot Mode2, R/W is R (Read Only).

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 0 | SD0_PVDD | 0b*1 | R/W | This bit sets the IO voltage mode.<br>1b: I/O domain voltage ≤ 1.8V<br>0b: I/O domain voltage ≥ 3.3V (Initial value)*1 |

Note 1. The initial value of this register

- The IO voltage mode of SD0_CLK, SD0_CMD, SD0_DATA [7-0], SD0_RST# is set by selecting each mode of this register and MD_BOOT [2: 0].
  - When Boot Modes 1 and 2 are not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 1 and 2 are selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

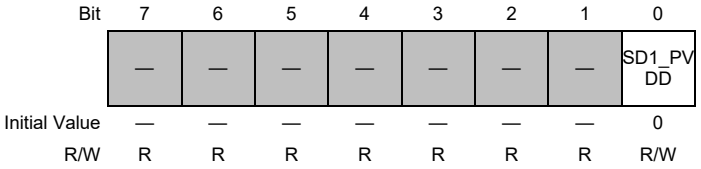
| MD_BOOT[2:0] | | | Mode | Selection function | Selection Device | Control method |
|---|---|---|---|---|---|---|
| 0 | 0 | 1 | Boot Mode 1 | SDHI0 | eMMC(1.8V) | By Hardware |
| 0 | 1 | 0 | Boot Mode 2 | SDHI0 | eMMC(3.3V) | By Hardware |
| Other | | | SD_ch0 Control by Register | | | |

**Note:** When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

### 41.3.18 SD ch1 IO Voltage Mode Control Register (SD_ch1)

This register sets the IO voltage mode control of SD ch1.

For the offset address, refer to **Section 41.2.18, SD ch1 IO Voltage Mode Control Register (SD_ch1)**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 0 | SD1_PVDD | 0b | R/W | This bit sets the IO voltage mode.<br>1b: I/O domain voltage ≤ 1.8V<br>0b: I/O domain voltage ≥ 3.3V (Initial value) |

**Note:** The IO voltage mode of SD1_CLK, SD1_CMD, SD1_DATA [3-0] is set by this register.

**Note:** When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

### 41.3.19 QSPI IO Voltage Mode Control Register (QSPI)

This register sets the IO voltage mode control of QSPI.

For the offset address, refer to **Section 41.2.19, QSPI IO Voltage Mode Control Register (QSPI)**.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | QSPI_PVDD |
| Initial Value | — | — | — | — | — | — | — | 0*1 |
| R/W | R | R | R | R | R | R | R | R/W*1 |

Note 1. In Boot Mode3 and Boot Mode4, R/W is R (Read Only).

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 0 | QSPI_PVDD | 0b*1 | R/W | This bit sets the IO voltage mode.<br>1b: I/O domain voltage ≤ 1.8V<br>0b: I/O domain voltage ≥ 3.3V (Initial value)*1 |

Note 1. The initial value of this register

- The IO voltage of QSPI0_SPCLK, QSPI0_IO[3-0], QSPI0_SSL, QSPI_RESET#, QSPI_WP# is set by each mode of this register and MD_BOOT[2: 0].
  - When Boot Modes 3 and 4 are not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 3 and 4 are selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

| MD_BOOT[2:0] | | | Mode | Selection Function | Selection Device | Control method |
|---|---|---|---|---|---|---|
| 0 | 1 | 1 | Boot Mode 3 | SPI Multi I/O Bus Controller | Single/Quad(1.8V) | By Hardware |
| 1 | 0 | 0 | Boot Mode 4 | | Single/Quad(3.3V) | By Hardware |
| Other | | | QSPI Control by register | | | |

**Note:** When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 1.8V and the register is set to 3.3V, the reliability of this LSI will be affected.

## 41.3.20 Input Enable Control Register (IEN)

This register is a register that controls the input of the special purpose port.

For the offset address, refer to **Section 41.2.20, Input Enable Control Register (IEN)**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | IEN3 | — | — | — | — | — | — | — | IEN2 |
| Initial Value | — | — | — | — | — | — | — | 0 | — | — | — | — | — | — | — | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | IEN1 | — | — | — | — | — | — | — | IEN0 |

## 41.4 Operation

The operating procedure for the general-purpose I/O port function and the operating procedure for peripheral functions are shown below.

### 41.4.1 Operation for GPIO Function

(1) Set the PMCn register to “0” (initial value = 0).

(2) Set the GPIO input / output with the PMn register.

(3) Set the GPIO output value in the Pn register.

(4) The input value of the input terminal can be detected by the PINn register.

(5) When setting the interrupt input using the GPIO input pin, set the ISEL register to “1”.

- Set the FILONOFF, IOLH, SR, and PUPD registers between (1) and (2) as necessary.
- Set the FILONOFF register when using GPIO to set a digital noise filter for interrupt input and GPIO input.
- Set the FILNUM and FILCLKSEL registers according to the purpose of use.

### 41.4.2 Operation for Peripheral Function

(1) Set the PMCn register to “1” (initial value = 0).

(2) Set the PWPR register to allow writing to the PFCm register.

After setting the PWPR.B0WI bit to “0” (initial value = 1), set the PWPR.PFCWE bit to “1” (initial value = 0).

Select the required function from Functions 1-7. (Hereafter, Function1 setting example)

(3) Set PFCm = 001b and switch to Function1.

(4) Set the PFCm register to write-protected. After setting the PWPR.PFCWE bit to “0”, set the PWPR.B0WI bit to “1”.

- Set the FILONOFF, IOLH, SR, and PUPD registers between (1) and (2) as necessary.
- Set the FILONOFF register when using GPIO to set a digital noise filter for the IRQ[0-7].
- Set the FILNUM and FILCLKSEL registers according to the purpose of use. And also, the NMI input can set the noise filter by the same registers.

# 42. Low Power Mode

This chapter describes the lower mode of this LSI.

## 42.1 Overview

This LSI has three modes of low power consumption shown in the following table.

These three modes work independently.

Table 42.1 Low Power Mode

| Low Power Mode | Description | Return factor |
|---|---|---|
| Module Standby Mode | Stop the clock of specific peripheral module by setting the CPG register.<br>Refer to **Section 42.2, Module Standby Mode** for detail. | CPG register setting |
| Cortex-M33 Sleep Mode | Put Cortex-M33 into a low power state by issuing a WFI instruction.<br>The SLEEPDEEP bit of SCR register should be set to 1.<br>Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** and **Section 42.3, Cortex-M33 Sleep Mode** for detail. | Interrupt<br>SysTick Timer |
| Cortex-A55 Sleep Mode | Put Cortex-A55 into a low power state by issuing a WFI instruction.<br>Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** and **Section 42.4, Cortex-A55 Sleep Mode** for detail. | Interrupt |

**Note:** When a system reset is applied, the LSI is released from the low power mode and initialized.

## 42.2 Module Standby Mode

### 42.2.1 Overview

The Module Standby Mode is a mode that requests the clock stop of the module specified by the master.

The purpose of this mode is to reduce power consumption by stopping unnecessary functions.

The master which can request the clock stop is Cortex-A55 and Cortex-M33. So, Cortex-A55 and Cortex-M33 cannot be placed in the Module Standby Mode. To reduce the power consumption in the CPUs, use the CPU sleep modes to be described later.

This mode is implemented by stopping the clock supply by the CPG register and switching the MSTOP signal of the bus through CPG register settings.

If the master accesses a module that has the clock stopped and the MSTOP bit set, a bus error will occur.

The following registers are used in the Module Standby Mode.

Table 42.2 Module Standby Mode related registers

| Register name | Abbreviation | Description |
|---|---|---|
| Clock Control Register | CPG_CLKON_*** | The detail information of each register is described in **Section 6, System Controller (SYSC)** and **Section 7, Clock Pulse Generator (CPG)**.<br>The usage of these registers is described in **Section 42.2.2, Operation**. |
| MSTOP Register | CPG_BUS_***_MSTOP<br>CPG_MHU_STOP | |

The following figure shows the block connection overview related Module Standby Mode.

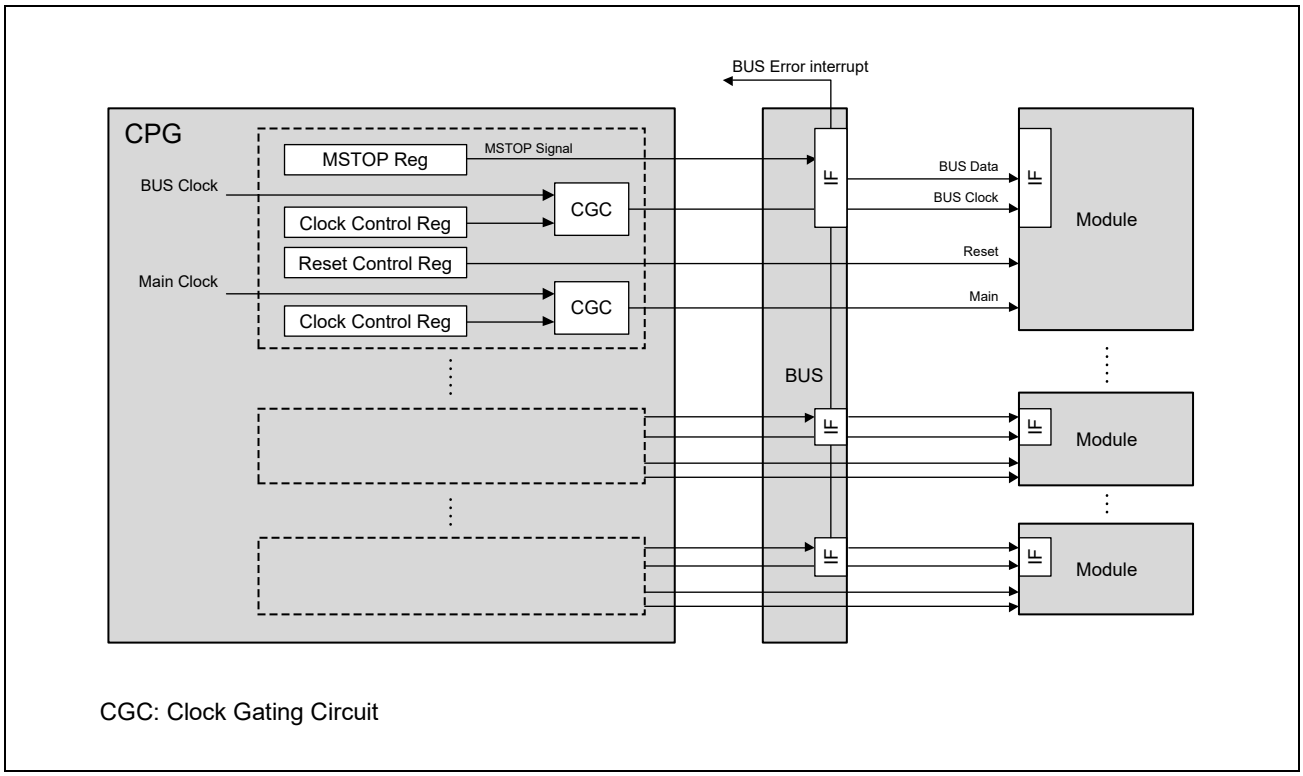

Figure 42.1 Block connection overview for Module Standby Mode

### 42.2.2 Operation

The following chart shows the procedure to enter and return from the Module Standby Mode.

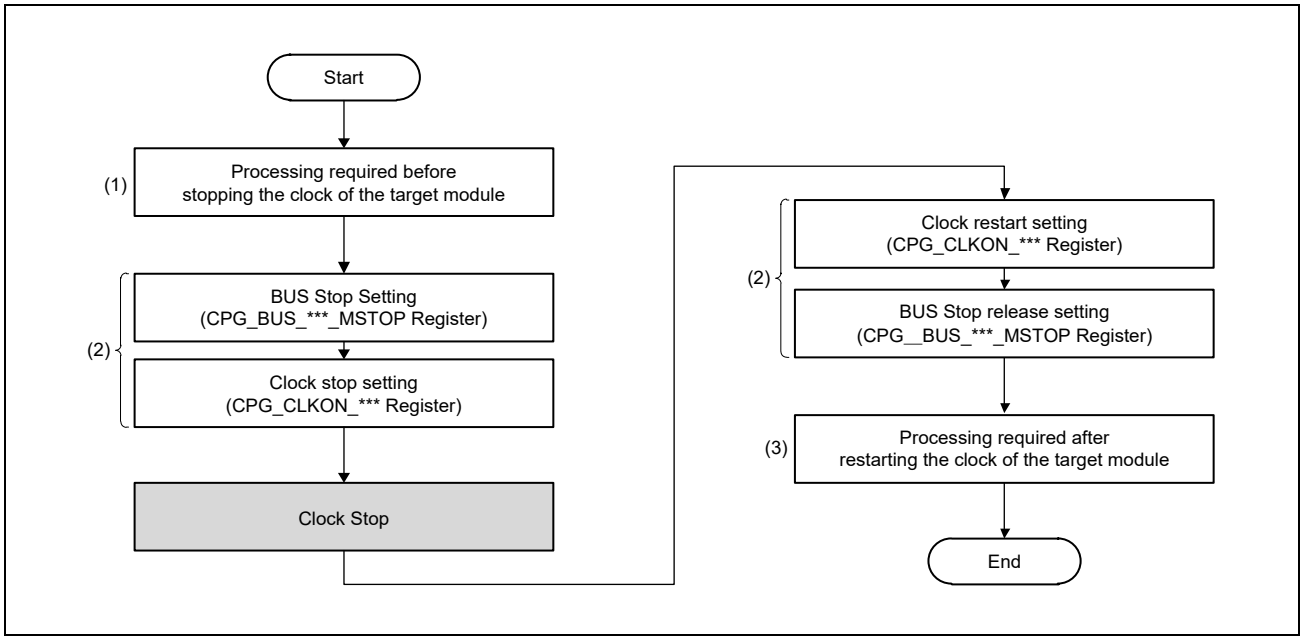

Figure 42.2 Module Standby Mode procedure

(1) Depend on the module, there may be a request to stop during communication, image processing, and various processing. In this case, if the managed CPU can be stopped unilaterally for each module, a stop request is immediately issued to the CPG. For those that cannot be stopped until a certain process is completed, after confirming that the managed CPU has stopped for each module, a stop request is made to the CPG.

(2) Refer to **Section 42.2.2.1, Setting of Clock control and MSTOP register** regarding to the setting of Clock Control Register and MSTOP Register.

(3) Whether the reset control is required depends on the module; check the specifications of the target module. Set the reset control register to 0 to enter the reset state. Set 1 for the release from the reset state.

#### 42.2.2.1 Setting of Clock control and MSTOP register

The following table shows the combination of the Clock Control register and the MSTOP register to stop the clock of the target module.

The Module Standby Mode can be applied only to the modules shown in the table below.

- When entering the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 1.
  Set the Clock Control Register bit of the target module to 0.

- When exiting the Module Standby Mode:

  Set the Clock Control Register bit of the target module to 1.
  Set the MSTOP Register bit of the target module to 0.

Table 42.3 Registers for Module Standby Mode (1/2)

| Target module for Module Standby Mode | Clock Control Register | | MSTOP Register | |
|---|---|---|---|---|
| | Register Name (CPG_CLKON_***) | bit | Register Name (CPG_BUS_***_MSTOP) | bit |
| GIC | GIC600 | [0] | REG1 | [7] |
| IA55 | IA55 | [1:0] | PERI_CPU | [13] |
| IM33 | IM33 | [1:0] | PERI_CPU | [14] |
| MHU | MHU | [0] | CPG_MHU_STOP*1 | [0] |
| CoreSight | CST | [10:0] | PERI_CPU | [2] |
| SYC | SYC | [1] | PERI_CPU | [3] |
| DMAC | DMAC_REG | [1:0] | REG1 | [3:0] |
| GTM ch0 | GTM | [0] | REG0 | [4] |

| USB2.0 PHY*2 | | [3] | | [4] |
| ETHER ch0 | ETH | [0] | PERI_COM | [2] |
| ETHER ch1 | | [1] | | [3] |

Table 42.3 Registers for Module Standby Mode (2/2)

| Target module for Module Standby Mode | Clock Control Register | | MSTOP Register | |
|---|---|---|---|---|
| | Register Name (CPG_CLKON_***) | bit | Register Name (CPG_BUS_***_MSTOP) | bit |
| I2C ch0 | I2C | [0] | MCPU2 | [10] |
| I2C ch1 | | [1] | | [11] |
| I2C ch2 | | [2] | | [12] |
| I2C ch3 | | [3] | | [13] |
| SCIF ch0 | SCIF | [0] | MCPU2 | [1] |
| SCIF ch1 | | [1] | | [2] |
| SCIF ch2 | | [2] | | [3] |
| SCIF ch3 | | [3] | | [4] |
| SCIF ch4 | | [4] | | [5] |
| SCI ch0 | SCI | [0] | MCPU2 | [7] |
| SCI ch1 | | [1] | | [8] |
| IRDA | IRDA | [0] | MCPU2 | [6] |
| RSPI ch0 | RSPI | [0] | MCPU1 | [14] |
| RSPI ch1 | | [1] | | [15] |
| RSPI ch2 | | [2] | MCPU2 | [0] |
| CANFD | CANFD | [0] | MCPU2 | [9] |
| ADC | ADC | [1:0] | MCPU2 | [14] |
| TSU | TSU | [0] | MCPU2 | [15] |

Note 1. CPG_MHU_STOP itself is the register name.

Note 2. The clock for USB2.0 PHY can only be stopped when the clock for USB2.0 ch0 and ch1 are stopped.

## 42.3 Cortex-M33 Sleep Mode

### 42.3.1 Overview

Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** for detail.

The following table shows the registers related to the Cortex-M33 Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 42.4 Cotrex-M33 Sleep Mode related registers

| Register name | Abbreviation | Bit name |
|---|---|---|
| Lowpower Sequence Control Register1 | SYS_LP_CTL1 | bit[28]: CM33SLEEP_ACK<br>bit[12]: CM33SLEEP_REQ |
| Lowpower Sequence Control Register5 | SYS_LP_CTL5 | bit[10]: CM33SLEEP_F |
| Lowpower Sequence Control Register6 | SYS_LP_CTL6 | bit[10]: CM33SLEEP_E |
| Lowpower Sequence Control Register7 | SYS_LP_CTL7 | bit[0]: IM33_MASK |

### 42.3.2 Operation

This section shows an example procedure.

The following figure is one exmple how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-M33 with Cotrex-A55. Refering to these registers, Cortex-A55 can peform processing if need when Cortex-M33 enters and exits the Cortex-M33 Sleep Mode.

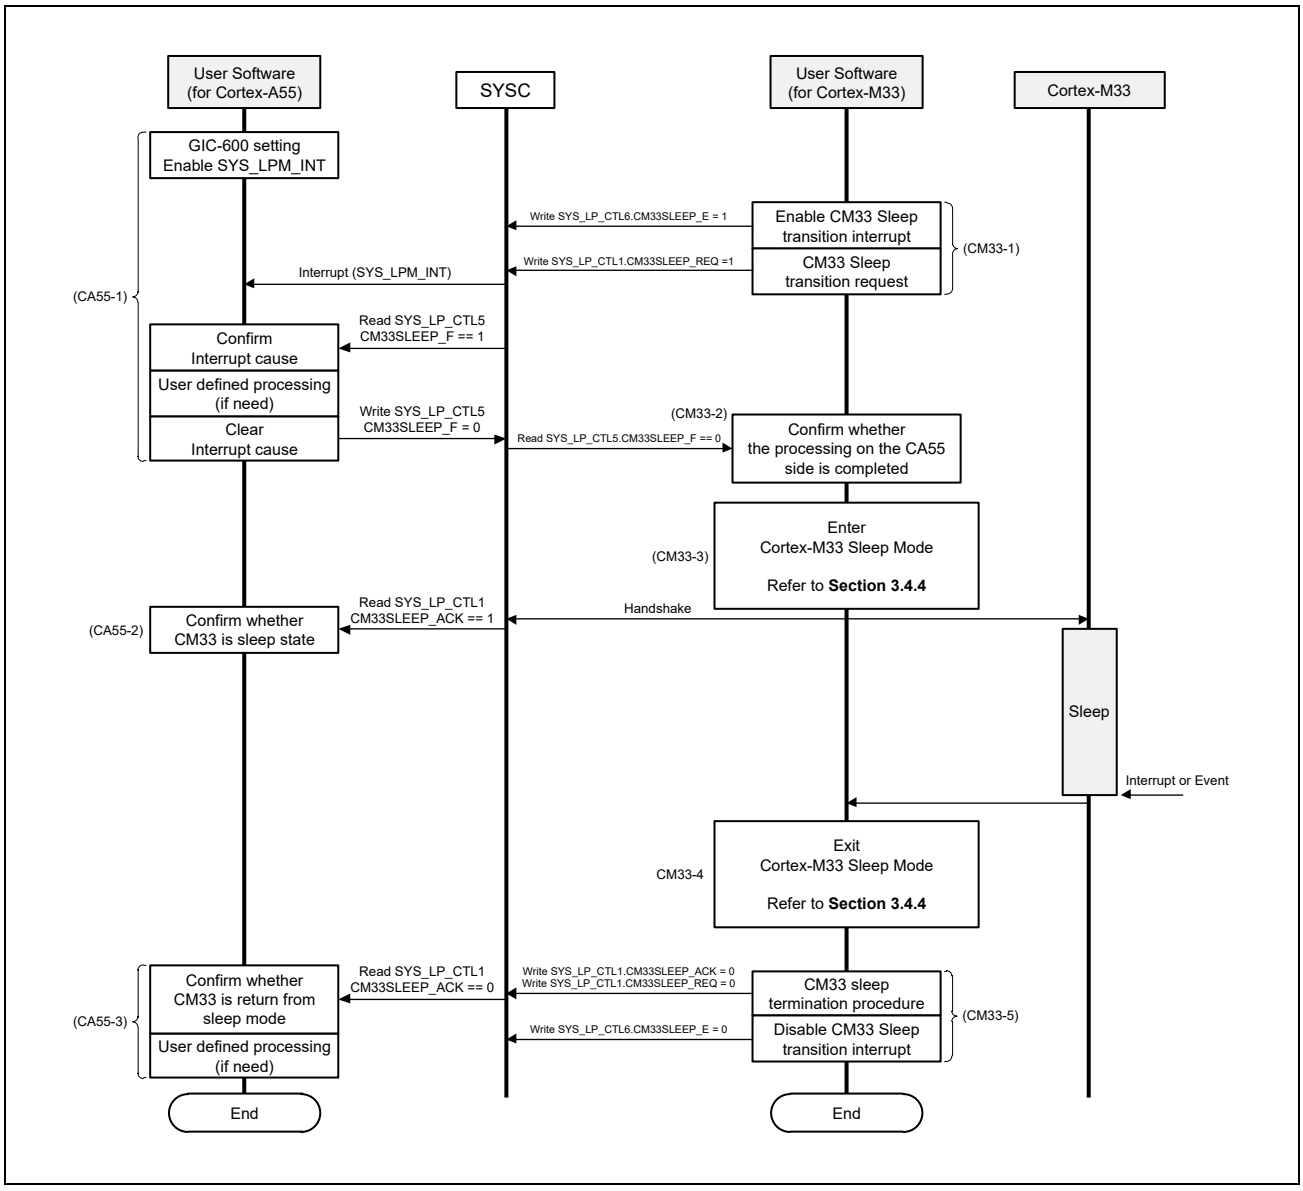

Figure 42.3 The example procedure how to use the SYSC registers (Cortex-M33 Sleep Mode)

(CM33-1) Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-M33 Sleep Mode.
Setting the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to 1 causes a SYS_LPM_INT interrupt.
The CM33SLEEP_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CA55-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the GIC in advance.)
By confirming that the CM33SLEEP_F bit is 1, the software on Cortex-A55 can know that Cortex-M33 is about to transition to Sleep Mode.
Perform the process required when Cotrex-M33 is the sleep mode. (if need)
And then clear the CM33SLEEP_F bit of the SYS_LP_CTL5 register.

(CM33-2) Read the SYS_LP_CTL5 register.
By confirming that the CM33SLEEP_F is cleared, the software on Cortex-M33 can confirm that the processing on Cortex-A55 side is completed.

(CM33-3) Enter the Cortex-M33 Sleep Mode.
Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** procedure (1) to (7).

(CA55-2) Read SYS_LP_CTL1 register.
By confirming that the CM33SLEEP_ACK bit is 1, the software on Cortex-A55 can confirm that Cortex-M33 completed transiting to the sleep mode.

(CM33-4) Exit the Cortex-M33 Sleep Mode.
Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** procedure (8) to (12).

(CM33-5) Clear the CM33SLEEP_ACK bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to release the Cortex-M33 sleep mode transition request.
Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-M33 Sleep Mode.

(CA55-3) Read SYS_LP_CTL1 register.
By confirming that the CM33SLEEP_ACK bit is cleared, the software on Cortex-A55 can confirm that Cortex-M33 completed returning from the sleep mode.
Perform the process required when Cotrex-M33 returned from the sleep mode. (if need)

## 42.4 Cortex-A55 Sleep Mode

### 42.4.1 Overview

Refer to **Section 2.3.1, Cotrex-A55 Sleep Mode** for detail.

The following table shows the registers related to the Cortex-A55 Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 42.5 Cotrex-A55 Sleep Mode related registers

| Register name | Abbreviation | Bit name |
|---|---|---|
| Lowpower Sequence Control Register1 | SYS_LP_CTL1 | bit[24]: CA55SLEEP_ACK<br>bit[8]: CA55SLEEP_REQ |
| Lowpower Sequence Control Register2 | SYS_LP_CTL2 | bit[0]: CA55_STBYCTL |
| Lowpower Sequence Control Register5 | SYS_LP_CTL5 | bit[8]: CA55SLEEP0_F |
| Lowpower Sequence Control Register6 | SYS_LP_CTL6 | bit[8]: CA55SLEEP0_E |

### 42.4.2 Operation

This section shows an example procedure.

The following figure is one exmple how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-A55 with Cotrex-M33. Refering to these registers, Cortex-M33 can peform processing if need when Cortex-A55 enters and exits the Cortex-A55 Sleep Mode.

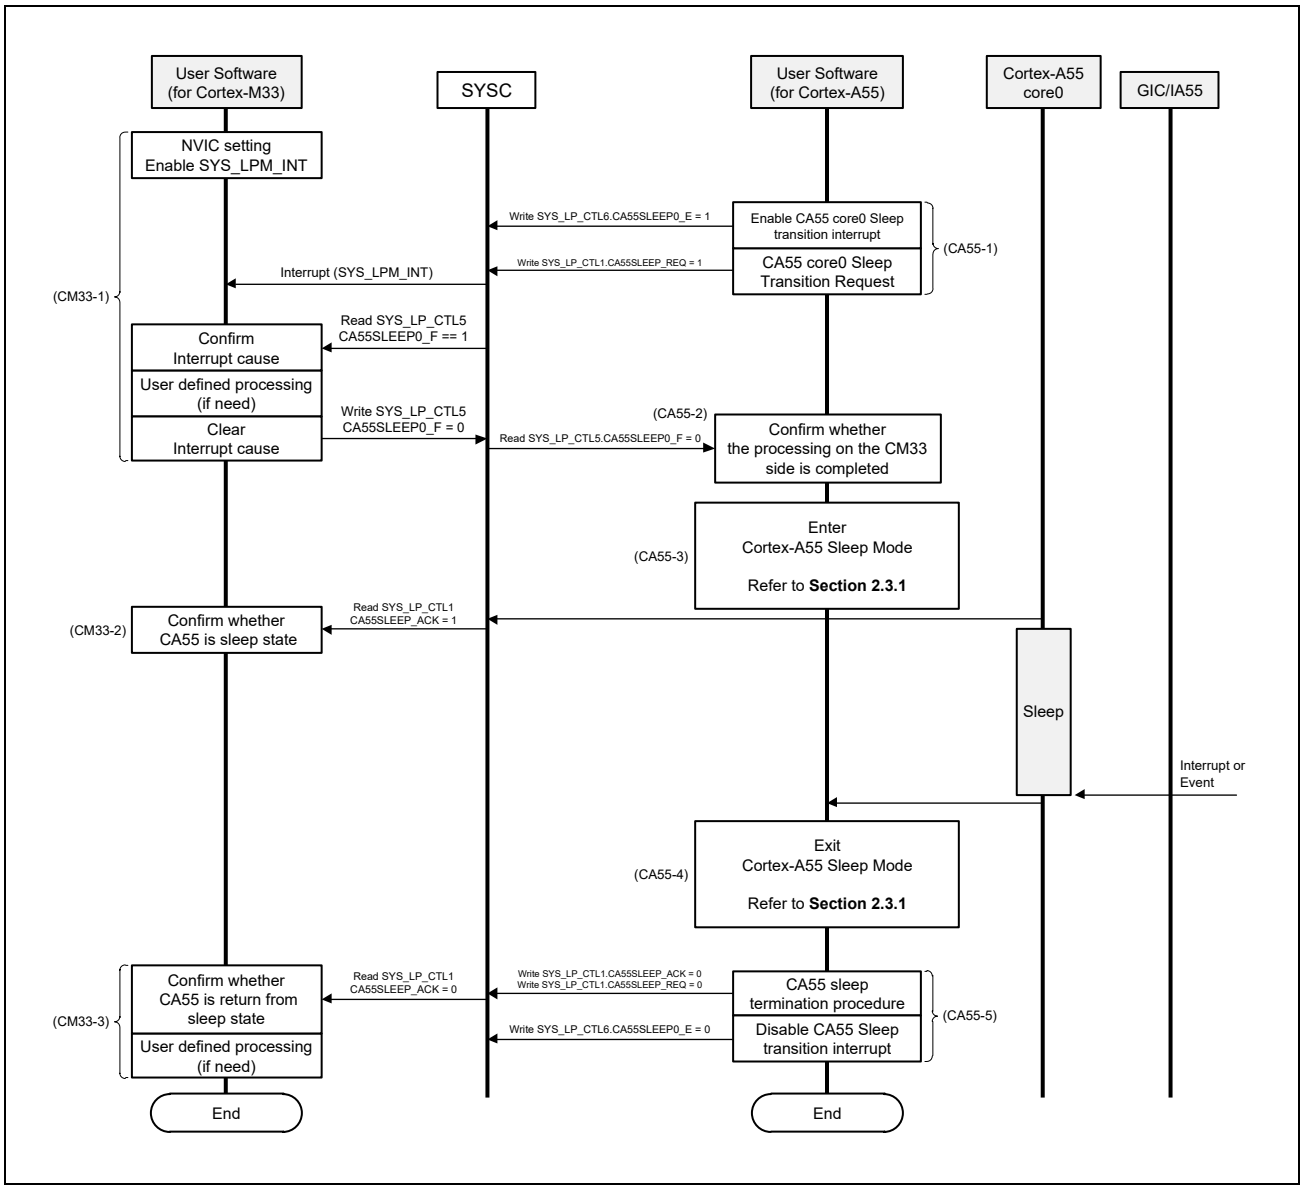

Figure 42.4 The example procedure how to use the SYSC registers (Cortex-A55 Sleep Mode)

(CA55-1) Set the CA55SLEEP0_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-A55 Sleep Mode (core0).
Setting the CA55SLEEP_REQ bit of the SYS_LP_CTL1 register to 1b causes a SYS_LPM_INT interrupt.
The CA55SLEEP0_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CM33-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the NVIC in advance.)
By confirming that the CA55SLEEP0_F bit is 1, the software on Cortex-M33 can know that Cortex-A55 core0 is about to transition to Sleep Mode.
Perform the process required when Cotrex-A55 is the sleep mode. (if need)
And then clear the CA55SLEEP0_F bit of the SYS_LP_CTL5 register.

(CA55-2) Read the SYS_LP_CTL5 register.
By confirming that the CA55SLEEP0_F is cleared, the software on Cortex-A55 can confirm that the processing on the Cortex-M33 side is completed.

(CA55-3) Enter the Cortex-A55 Sleep Mode.
Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** procedure (1) to (3).

(CM33-2) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK bit is 1b, the software on Cortex-M33 can confirm that Cortex-A55 core0 completed transiting to the sleep mode.

(CA55-4) Exit the Cortex-A55 Sleep Mode.
Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** procedure (4) to (6).

(CA55-5) Clear the CA55SLEEP_ACK bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CA55SLEEP_REQ bit of the SYS_LP_CTL1 register to release the Cortex-A55 sleep mode transition request.
Set the CA55SLEEP0_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-CA55 Sleep Mode.

(CM33-3) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK bit is cleared, the software on Cortex-M33 can confirm that Cortex-A55 completed returning from the sleep mode.
Perform the process required when Cotrex-A55 returned from the sleep mode. (if need)

# 43. Debug Interface

## 43.1 Overview

This LSI has a debug interface for boundary scan function and debug support for Cortex-A55 and Cortex-M33.

### 43.1.1 Features

The functions of the debug interface of this LSI are shown below.

- Debug Interface
  - Support JTAG and SWD

- Debugger control function (DAP function)
  - Direct control of IP without going through CPU by switching Access Port (AP)

- Trace data support
  - Cortex-A55 trace output
  - Cortex-M33 trace output
  - Buffer function of trace data by ETF
  - Trace data output to system bus by using ETR

- Boundary Scan
  - Connection test between this LSI and other LSIs on the user board

- Other functions
  - Interlocking operation of Cortex-A55, Cortex-M33, system counter (SYC), watchdog timer, general timer (GTM), and debug component by cross trigger
  - Support WDT counter stop control function
  - Add time information to trace data by Time Stamp (24MHz operation)

### 43.1.2 Block Diagram

**Figure 43.1** shows the block diagram of the debug interface, and **Figure 43.2** shows the block diagram of the Core Sight System (CST).

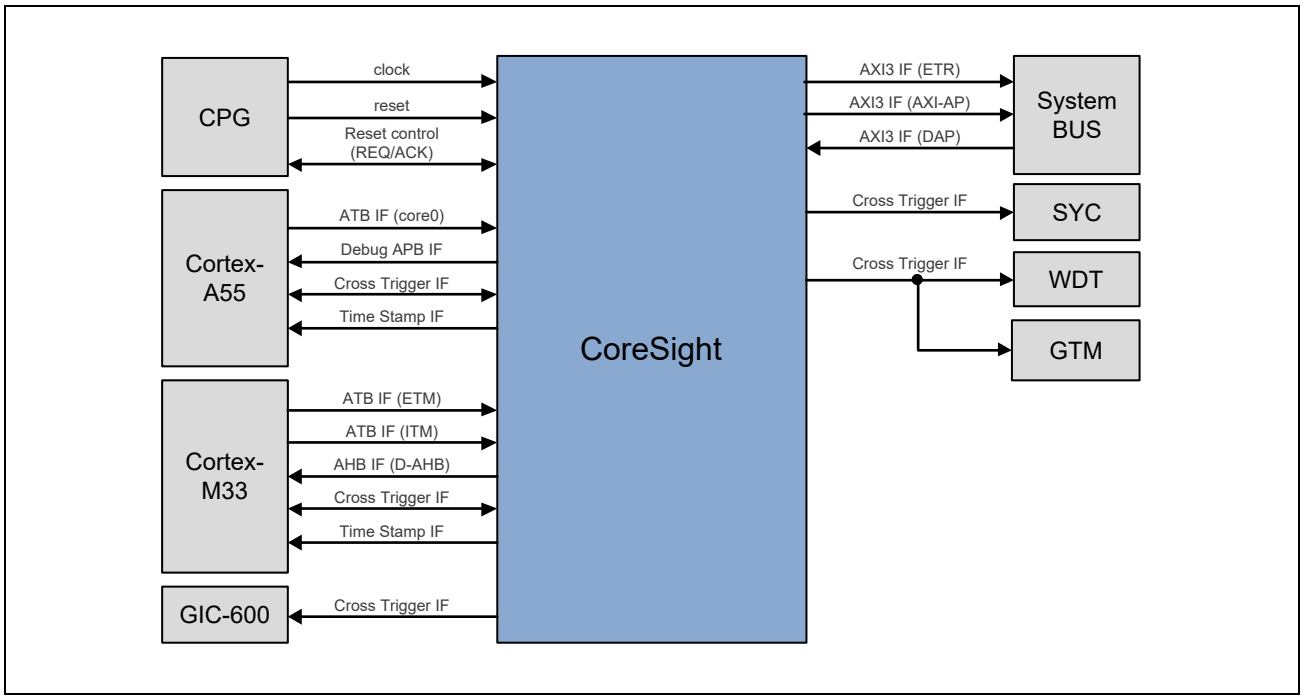

Figure 43.1 Debug System Block Diagram

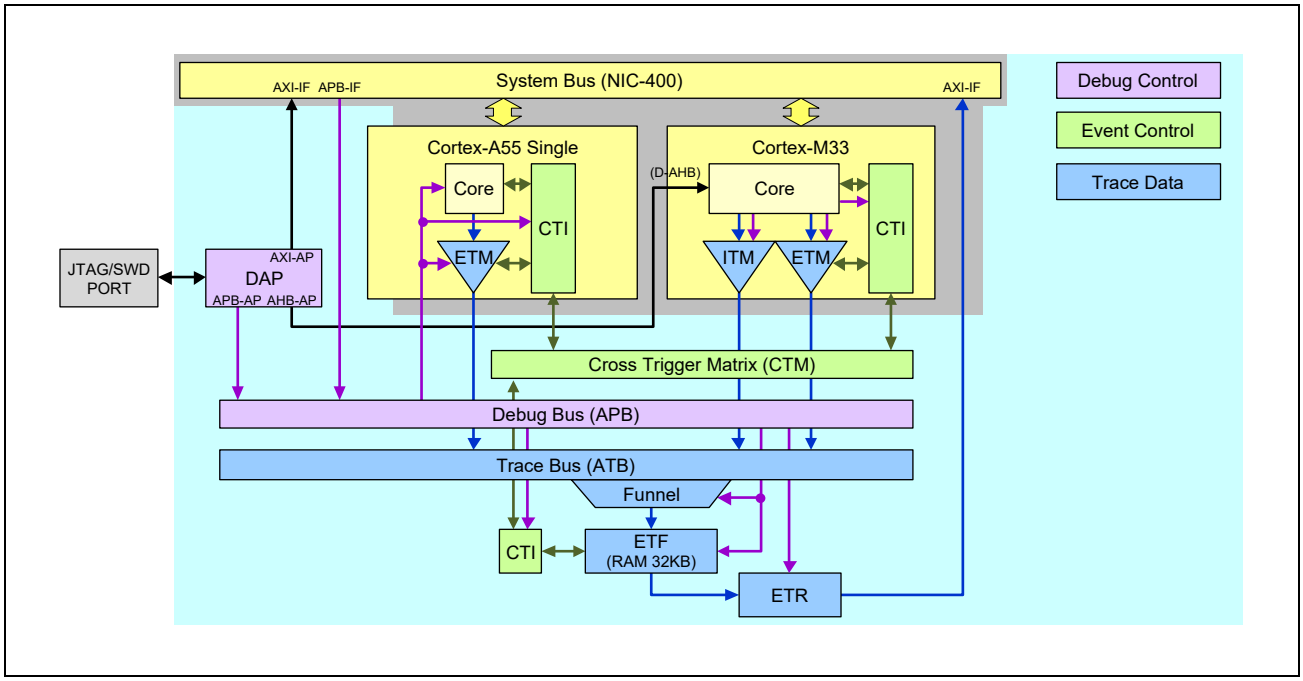

Figure 43.2 Core Sight System Block Diagram

- Debug Bus (APB)

  Bus used for controlling debug functions and acquiring debug data (register values and trace data in On-Chip Buffer)

  - DAP: Debug Access Port

- Cross Trigger Matrix (CTM)

  Functions required for co-debugging triggered by mutual events between CPU and Component

  - CTI: Cross Trigger Interface

- Trace Bus (ATB)

  A data bus which the trace data output by ETM flows

  - ETM: Embedder Trace Macrocell
  - ETR: Embedder Trace Router
  - ETF: Embedder Trace FIFO
  - Funnel: Trace data merge function

For details on ETM, ETR, and ETF, refer to “CoreSight Trace Memory Controller Technical Reference Manual”.

### 43.1.3 External Pins

- JTAG pins

The debug interface supports JTAG IF and SWD IF. **Table 43.1** shows the JTAG pins and their functions.

Table 43.1 JTAG Pins

| Pin Name | I/O | Function | | Name |
|---|---|---|---|---|
| | | JTAG IF | SWD IF | |
| TCK/SWDCLK | Input | TCK | SWCLK | Test clock,<br>Serial wire clock |
| TMS/SWDIO | Input,<br>Input/Output | TMS | SWDIO | Test mode select,<br>Serial wire data input/output |
| TDI | Input | TDI | — | Test data input |
| TDO | Output | TDO | — | Test data output |
| TRST# | Input | TRST | — | Test reset |

- DEBUGEN pins

**Table 43.2** shows the functions of the DEBUGEN pin.

Table 43.2 DEBUGEN Pins

| Pin Name | I/O | Function |
|---|---|---|
| DEBUGEN | Input | Switches between normal operation and debug operation.<br>0: Normal operation<br>1: Debug operation |

The DEBUGEN value must be fixed before releasing the power-on reset (PRST#). **Table 43.3** shows the difference in operation between normal operation and debug operation.

Table 43.3 Difference in Operation by DEBUGEN

| | Normal Operation (DEBUGEN=0) | Debug Operation (DEBUGEN=1) | Related Module |
|---|---|---|---|
| Debug function module<br>(CoreSight (other than DAP)) | Boot impossible<br>(Reset state) | Boot<br>(Refer **Section 43.6.1** for reset condition and range) | CPG<br>(Reset control) |

- BSCANP pins

**Table 43.4** shows the functions of the BSCANP pin.

Table 43.4 BSCANP Pins

| Pin Name | I/O | Function |
|---|---|---|
| BSCANP | Input | Switches between normal operation and boundary scan test mode.<br>0: Normal operation<br>1: Boundary scan test mode |

Boundary scan test mode is a mode in which a connection test is performed between the terminals of this LSI and other ICs connected on the customer's board and is performed when BSCANP = 1.

The actual access is controlled by the 5 terminals of JTAG when BSCANP = 1.

**Table 43.5** shows the operation modes of this LSI according to the values of the DEBUGEN pin and BSCANP pin.

Table 43.5 Operating Mode

| Pin Name | | |
|---|---|---|
| BSCANP | DEBUGEN | Operating Mode |
| 0 | 0 | Normal operation |
| 0 | 1 | Debug operation |
| 1 | * | Boundary scan test mode |

### 43.1.4 Treatment of Unused Pins

When the external terminal of the debug interface is not used, handle it as shown in **Table 43.6**.

Table 43.6 Handling of Unused Pins

| Pin Name | Handle*1 |
|---|---|
| TCK/SWDCLK | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) |
| TMS/SWDIO | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) |
| TDI | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) |
| TDO | Open-circuit |
| TRST#*2 | Fix this pin at a low level (pull down or connect to the ground level) |
| DEBUGEN | Fix this pin at a low level (pull down or connect to the ground level) |
| BSCANP | Fix this pin at a low level (pull down or connect to the ground level) |

Note 1. Mount the pull-up/pull-down resistors on the board side

Note 2. TRST# should be fixed at low level in non-debug mode, and TRST# should be changed from low level to high level in debug mode.

## 43.2 Address Space

The CoreSight of this LSI has a 4 MB debug system address space. The address space of the debug system is shown in **Table 43.7**.

Table 43.7 Address Space of the Debug System

| Address | Component*1 |
|---|---|
| CoreSight Debug Components (Overall Address Space of this LSI) | |
| H'0_10C0_0000 ~ H'0_10C0_FFFF | CoreSight: ROM table |
| H'0_10C1_0000 ~ H'0_10C1_FFFF | CoreSight: Timestamp generator |
| H'0_10C2_0000 ~ H'0_10C2_FFFF | CoreSight: ETF |
| H'0_10C3_0000 ~ H'0_10C3_FFFF | CoreSight: ETR |
| H'0_10C4_0000 ~ H'0_10C4_FFFF | CoreSight: Trace Funnel |
| H'0_10C5_0000 ~ H'0_10C5_FFFF | CoreSight: CTI0 |
| H'0_10C6_0000 ~ H'0_10C6_FFFF | CoreSight: CTI1 |
| H'0_10C7_0000 ~ H'0_10CE_FFFF | CoreSight: Reserved |
| H'0_10CF_0000 ~ H'0_10CF_FFFF | CoreSight: Reserved |
| Reserved | |
| H'0_10D0_0000 ~ H'0_10DF_FFFF | Reserved |
| Cortex-A55 Debug Components (Overall Address Space of this LSI) | |
| H'0_10E0_0000 ~ H'0_10E0_FFFF | Cortex-A55: ROM table |
| H'0_10E1_0000 ~ H'0_10E1_FFFF | Cortex-A55: Core0 Debug |
| H'0_10E2_0000 ~ H'0_10E2_FFFF | Cortex-A55: Core0 CTI |
| H'0_10E3_0000 ~ H'0_10E3_FFFF | Cortex-A55: Core0 PMU |
| H'0_10E4_0000 ~ H'0_10E4_FFFF | Cortex-A55: Core0 ETM |
| H'0_10E5_0000 ~ H'0_10ED_FFFF | Reserved |
| H'0_10EE_0000 ~ H'0_10EE_FFFF | Reserved |
| H'0_10EF_0000 ~ H'0_10F0_FFFF | Reserved |
| H'0_10F1_0000 ~ H'0_10F1_FFFF | Reserved |
| H'0_10F2_0000 ~ H'0_10F2_FFFF | Reserved |
| H'0_10F3_0000 ~ H'0_10F3_FFFF | Reserved |
| H'0_10F4_0000 ~ H'0_10F4_FFFF | Reserved |
| H'0_10F5_0000 ~ H'0_10FF_FFFF | Cortex-A55: Reserved |
| Cortex-M33 Debug Components (Cortex-M33 Address Space) | |
| H'E000_0000 ~ H'E000_0FFF | Cortex-M33: ITM |
| H'E000_1000 ~ H'E000_1FFF | Cortex-M33: DWT |
| H'E000_2000 ~ H'E000_2FFF | Cortex-M33: FPB |
| H'E000_3000 ~ H'E000_DFFF | Cortex-M33: Reserved |
| H'E000_E000 ~ H'E000_EFFF | Cortex-M33: Secure SCS |
| H'E000_F000 ~ H'E002_DFFF | Cortex-M33: Reserved |
| H'E002_E000 ~ H'E002_EFFF | Cortex-M33: Non-Secure SCS |
| H'E002_F000 ~ H'E004_0FFF | Cortex-M33: Reserved |
| H'E004_1000 ~ H'E004_1FFF | Cortex-M33: ETM |
| H'E004_2000 ~ H'E004_2FFF | Cortex-M33: CTI |
| H'E004_3000 ~ H'E00F_EFFF | Cortex-M33: Reserved |
| H'E00F_F000 ~ H'E00F_FFFF | Cortex-M33: ROM Table |

Note 1. Access to the Reserved area is prohibited. Operation is not guaranteed when accessed.

NOTE

- The CoreSight Debug Components area and Cortex-A55 Debug Components area can be accessed via the system bus and APB-AP.
  APB-AP is connected to port-0 of DAP. For the port configuration of DAP, refer to **Section 43.6.2, DAP**.
- The Cortex-M33 Debug Components area is accessible via AHB-AP.
  The AHB-AP for the area access is connected to port-2 of the DAP. For the port configuration of DAP, refer to **Section 43.6.2, DAP**.
- Each component is placed on a 64KB address boundary according to the ARMv8 Debug memory map. As an entity, the first 4 KB is valid.

## 43.3 Register Descriptions

### 43.3.1 ID Register (BSID)

The BSID register is a 32-bit register that cannot be accessed from the CPU. When the BSCANP pin is 1, it can be read from the TDO pin by setting the IDCODE command on the TAP controller. It cannot be written.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BSID[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BSID[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | BSID[31:0] | H'0845_0447 | — | This is the ID register specified in JTAG.<br>The upper 4 bits (bit31-28) may change depending on the chip version. |

### 43.3.2 Other Registers

For details on each register other than the BSID register, refer to “ARM CoreSight SoC-400 Technical Reference Manual” and “CoreSight Trace Memory Controller Technical Reference Manual”.

## 43.4 Debug Connection

### 43.4.1 Debug Connection Mode

There are the following four modes for the debug connection method of this LSI.

| Authentication Mode | Method |
|---|---|
| No authentication | Allow access from the debugger without authentication (initial setting) |
| SEC authentication*1 | Allow access from the debugger after authentication is OK.<br>(authentication method is security authentication by security IP) |
| Authentication refusal*1 | Block access from the debugger |

Note 1. SEC authentication and Authentication refusal can only be authenticated with secure products.

For SEC authentication modes, enter the authentication code from the debugger is needed.

For information on the authentication function of secure products, please contact our sales.

## 43.5 Debug Access Range

The debug access range by CoreSight is for all slaves as well as Cortex-A55. For details, refer to **Section 5.3, Accessible Areas**.

## 43.6 Operation

### 43.6.1 Debug Related Reset

Please refer to **Section 7.3.2.1, Range of Reset Application** for debug-related reset and reset range.

### 43.6.2 DAP

DAP is equipped with SWJ-DP as Debug Port (DP) and APB-AP, AXI-AP, AHB-AP as Access Port (AP).

The DAP port numbers are shown in **Table 43.8**. Indicates the correspondence between the port number specified in the DP SELECT register and the AP, and its usage.

Table 43.8 DAP Port Number

| Port number | AP | Usage |
|---|---|---|
| Port-0 | APB-AP | Debug Component recognition and settings |
| Port-1 | AXI-AP | System IP control (access to system bus) |
| Port-2 | AHB-AP | Cortex-M33 settings |

### 43.6.3 Trace

#### 43.6.3.1 Data Flow

In CoreSight, all trace data is aggregated once by Trace Funnel, and stored in ETF, or output to the system bus via ETR in the subsequent stage. Setting this port number to the Trace Funnel according to the route of the trace data is needed. The Trace Funnel port numbers are shown in **Table 43.9**.

Table 43.9 Trace Funnel Port Number

| Port Number | Source Components |
|---|---|
| Port-0 | CA55: Core0 ETM |
| Port-1 | Reserved |
| Port-2 | CM33: ITM |
| Port-3 | CM33: ETM |

#### 43.6.3.2 Timestamp

If time information want to be included in the trace data, the Timestamp Generator can be used. The timestamp replicator port numbers are shown in **Table 43.10**. The Timestamp Generator runs on a 24-MHz clock.

Table 43.10 Timestamp Replicator Port Number

| Port Number | Target Components |
|---|---|
| Port-0 | CA55: Core0 ETM |
| Port-1 | CM33 |

### 43.6.4 Cross Trigger

The CTI (Cross Trigger Interface) implemented in CoreSight, Cortex-A55, and Cortex-M33 is used to communicate debug events.

#### 43.6.4.1 CoreSight Cross Trigger Connectiion

CoreSight has two CTIs. The connection specifications are shown in **Table 43.11** to **Table 43.14**.

Table 43.11 CoreSight CTI0 Trigger Input

| Trigger Input Bit | Source Components | Description |
|---|---|---|
| [7] | (Unused) | — |
| [6] | (Unused) | — |
| [5] | (Unused) | — |
| [4] | (Unused) | — |
| [3] | ETR | ETR Event Output 1 (FULL) |
| [2] | ETR | ETR Event Output 0 (ACQCOMP) |
| [1] | ETF | ETF Event Output 1 (FULL) |
| [0] | ETF | ETF Event Output 0 (ACQCOMP) |

Table 43.12 CoreSight CTI0 Trigger Output

| Trigger Output Bit | Destination Components | Description |
|---|---|---|
| [7] | SYC | SYC Event input1 (RESTART REQ/ACK) |
| [6] | SYC | SYC Event input0 (HALT REQ) |
| [5] | WDT/OSTM | WDT/OSTM Event input1 (RESTART REQ/ACK) |
| [4] | WDT/OSTM | WDT/OSTM Event input0 (HALT REQ) |
| [3] | ETR | ETR Event Input 1 (TRIGIN) |
| [2] | ETR | ETR Event Input 0 (FLUSHIN) |
| [1] | ETF | ETF Event Input 1 (TRIGIN) |
| [0] | ETF | ETF Event Input 0 (FLUSHIN) |

Table 43.13 CoreSight CTI1 Trigger Input

| Trigger Input Bit | Source Components | Description |

| [0] | GIC-600 | GIC-600 Event Input (sample_req/sample_ack) |

### 43.6.4.2 Cortex-A55 Cross Trigger Connectiion

The Cortex-A55 has one CTI (Cortex-A55 Core0 CTI). The connection specifications for each are shown in **Table 43.15** and **Table 43.16**.

Table 43.15 Cortex-A55 CTI0 trigger input

| Trigger Input Bit | Source Components | Description |
|---|---|---|
| [7] | Cortex-A55: Core0 ETM | ETM Trace Output 3 trigger event |
| [6] | Cortex-A55: Core0 ETM | ETM Trace Output 2 trigger event |
| [5] | Cortex-A55: Core0 ETM | ETM Trace Output 1 trigger event |
| [4] | Cortex-A55: Core0 ETM | ETM Trace Output 0 trigger event |
| [3] | (Unused) | — |
| [2] | Cortex-A55: Core0 PE | Profiling sample trigger event |
| [1] | Cortex-A55: Core0 PE | Performance Monitors Overflow trigger event |
| [0] | Cortex-A55: Core0 PE | Cross-halt trigger event |

Table 43.16 Cortex-A55 CTI0 Trigger Output

| Trigger Output Bit | Destination Components | Description |
|---|---|---|
| [7] | Cortex-A55: Core0 ETM | Generic Trace External Input 3 trigger event |
| [6] | Cortex-A55: Core0 ETM | Generic Trace External Input 2 trigger event |
| [5] | Cortex-A55: Core0 ETM | Generic Trace External Input 1 trigger event |
| [4] | Cortex-A55: Core0 ETM | Generic Trace External Input 0 trigger event |
| [3] | (Unused) | — |
| [2] | External (GIC-600) | Generic CTI Interrupt trigger event |
| [1] | Cortex-A55: Core0 PE | Restart Request trigger event |
| [0] | Cortex-A55: Core0 PE | Debug Request trigger event |

#### 43.6.4.3 Cortex-M335 Cross Trigger Connectiion

The Cortex-M33 has one CTI (Cortex-M33 CTI). The connection specifications are shown in **Table 43.17** and **Table 43.18**.

Table 43.17 Cortex-M33 CTI Trigger Input

| Trigger Input Bit | Source Components | Description |
|---|---|---|
| [7] | (Unused) | — |
| [6] | (Unused) | — |
| [5] | Cortex-M33: ETM | ETM Event Output 1 |
| [4] | Cortex-M33: ETM/Processor | ETM Event Output 0 or Comparator Output 3 |
| [3] | Cortex-M33: Processor | DWT Comparator Output 2 |
| [2] | Cortex-M33: Processor | DWT Comparator Output 1 |
| [1] | Cortex-M33: Processor | DWT Comparator Output 0 |
| [0] | Cortex-M33: Processor | Processor Halted |

Table 43.18 Cortex-M33 CTI Trigger Output

| Trigger Output Bit | Destination Components | Description |
|---|---|---|
| [7] | Cortex-M33: ETM | ETM Event Input 3 |
| [6] | Cortex-M33: ETM | ETM Event Input 2 |
| [5] | Cortex-M33: ETM | ETM Event Input 1 |
| [4] | Cortex-M33: ETM | ETM Event Input 0 |
| [3] | Cortex-M33: System | Interrupt request 1 |
| [2] | Cortex-M33: System | Interrupt request 0 |
| [1] | Cortex-M33: Processor | Processor Restart |
| [0] | Cortex-M33: Processor | Processor debug request |

### 43.6.5 WDT Counter Stop Control

This LSI has a WDT counter stop control function linked with a debug event to prevent an unintended reset by WDT during debug operation. When a debug event occurs, CoreSight asserts the WDT counter stop request signal, controls the WDT counter stop signal (CNTSTOP), and stops counting. The target WDT is all WDT. For details on the WDT count stop function, refer to **Section 6.4.2, WDT Stop control function**.

### 43.6.6 GTM Counter Stop Control

This LSI has a GTM counter stop control function linked with debug events to prevent unintended GTM counts during debug operation. When a debug event occurs, CoreSight asserts a GTM counter stop request signal to stop the GTM count.

### 43.6.7 SYC Counter Stop Control

This LSI has a SYC counter stop control function linked with debug events to prevent unintended SYC counts during debug operation. When a debug event occurs, CoreSight asserts a SYC counter stop request signal to stop the SYC count.

# 44. Thermal Sensor Unit (TSU)

This LSI chip incorporates a thermal sensor unit (TSU) that measures the temperature inside the LSI.

## 44.1 Overview

### 44.1.1 Features

- This LSI has a single TSU.
- The thermal sensor in this unit measures temperatures in the range from −40°C to 125°C with an accuracy of ±3°C.
- The TSU repeats measurement at 20-µs intervals, and automatically updates the results of measurement.

### 44.1.2 Block Diagram

**Figure 44.1** is a block diagram of the TSU.

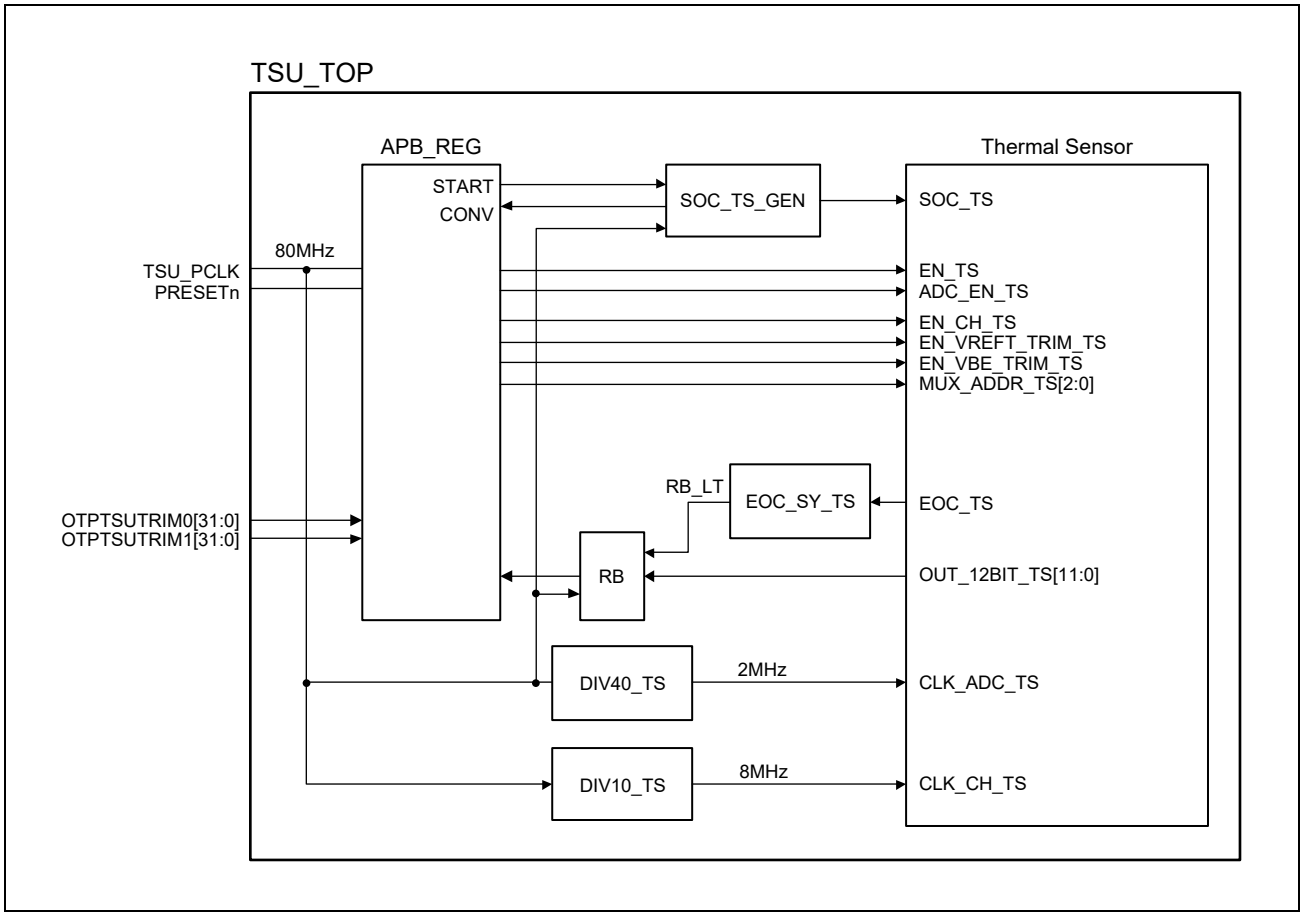

Figure 44.1 Block Diagram of the TSU

The TSU consists of the following blocks.

- APB_REG
- Thermal Sensor
- DIV40_TS and DIV10_TS
- SOC_TS_GEN
- EOC_SY_TS
- Read Buffer (RB)

#### 44.1.2.1 APB_REG

- The APB_REG block provides an external interface for the TSU.
- This block contains control and status registers for the thermal sensor.

#### 44.1.2.2 Thermal Sensor

- The thermal sensor block includes the internal probe, A/D converter and other items.
- The thermal sensor generates 12-bit digital values corresponding to the temperature and outputs them through the OUT_12BIT_TS[11:0] port.

#### 44.1.2.3 DIV40_TS and DIV10_TS

- The TSU operates with the TSU_PCLK clock (80 MHz).
- The DIV40_TS block is a divide-by-40 divider which divides TSU_PCLK to generate a 2-MHz clock frequency to be supplied to the A/D converter in the thermal sensor as CLK_ADC_TS.
- The DIV10_TS block is a divide-by-10 divider which divides TSU_PCLK to generate an 8-MHz clock frequency to be supplied to the thermal sensor core as CLK_CH_TS.

#### 44.1.2.4 SOC_TS_GEN

- The SOC_TS_GEN block generates the SOC_TS signal to be supplied to the thermal sensor for control over the timing of its operations.
- The SOC_TS_GEN block generates the SOC_TS signal every 20 µs. This is triggered by the START signal from the APB_REG block.
- The SOC_TS_GEN block generates the CONV signal that indicates the operating state of the thermal sensor. The value of the CONV signal can be read through the APB_REG block.

#### 44.1.2.5 EOC_SY_TS

- The EOC_SY_TS block detects the EOC_TS signal from the thermal sensor and generates the RB_LT signal in synchronization with TSU_PCLK.
- The EOC_TS signal indicates the end of A/D conversion of the voltage for the temperature measured by the thermal sensor.

#### 44.1.2.6 Read Buffer (RB)

- The RB block captures the 12-bit digital value from the OUT_12BIT_TS[11:0] port terminals of the thermal sensor in a register. This is triggered by the RB_LT signal from the EOC_SY_TS block. This value corresponds to the measured temperature.
- The value captured in the RB block can be read from the TSU through the APB_REG block.

### 44.1.3 External Pins

The TSU has no external pins.

### 44.1.4 Interrupts

The TSU has no interrupts.

## 44.2 Register Configuration

This section describes the registers for use in controlling the TSU.

Base Address: H'0_1005_9400 (Cortex-A55 Address Space)
Base Address: H'4005_9400 (Cortex-M33 Address Space Non-Secure)
Base Address: H'5005_9400 (Cortex-M33 Address Space Secure)

### 44.2.1 List of Register

**Table 46 1** lists the TSU registers. All registers are accessible in 32-bit units.

Table 44.1 List of the TSU Registers

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| Sensor Mode Register | TSU_SM | R/W | H'0000_0000 | H'00 | 32 |
| Sensor Trigger Register | TSU_ST | R/W | H'0000_0000 | H'04 | 32 |
| Sensor ADC Data Register | TSU_SAD | R | H'0000_0000 | H'0C | 32 |
| Sensor Status Register | TSU_SS | R | H'0000_0000 | H'10 | 32 |
| TSU OTP Calibration Register 0 | OTPTSUTRIM0_REG | R | — | H'18 | 32 |
| TSU OTP Calibration Register 1 | OTPTSUTRIM1_REG | R | — | H'1C | 32 |

# 44.3 Register Descriptions

## 44.3.1 Sensor Mode Register (TSU_SM)

This register is used to specify the operating mode of the thermal sensor.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ADC_EN_TS | ADC_EN_TS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | ADC_EN_TS | 0b | R/W | These bits specify the operating mode of the thermal sensor. |
| 0 | EN_TS | 0b | R/W | |

| ADC_EN_TS | EN_TS | Operating mode of the thermal sensor |
|---|---|---|
| 0b | 0b | Power-saving mode |
| 0b | 1b | ADC power-saving mode |
| 1b | 0b | Power-saving mode |
| 1b | 1b | Normal operating mode |

### 44.3.2 Sensor Trigger Register (TSU_ST)

This register is used to start and stop the cycles of A/D conversion by the thermal sensor. The A/D conversion is repeated at 20-µs intervals once the conversion is started.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RSV | START |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RSV | 0b | R/W | The software may use this bit as a note.<br>The written value is read. |
| 0 | START | 0b | R/W | This bit starts and stops the cycles of A/D conversion by the thermal sensor.<br>0b: Stops the A/D conversion*2<br>1b: Starts the A/D conversion*1 |

Note 1. Before setting the START bit to 1b, be sure to set the TSU_SM register. Specifically, set the TSU_SM register, wait for 60 µs, and then set the START bit to 1b.

Note 2. When the START bit is to be set to 0b, be sure to read the A/D-converted value before making the setting.

### 44.3.3 Sensor ADC Data Register (TSU_SAD)

This register holds the digital value after A/D conversion of the voltage from the thermal sensor.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | OUT_12BIT_TS | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | OUT_12BIT_TS | H'000 | R | These bits hold the digital value after A/D conversion of the voltage from the thermal sensor. The value is 12-bit unsigned. |

### 44.3.4 Sensor Status Register (TSU_SS)

This register indicates the state of A/D conversion in the thermal sensor.

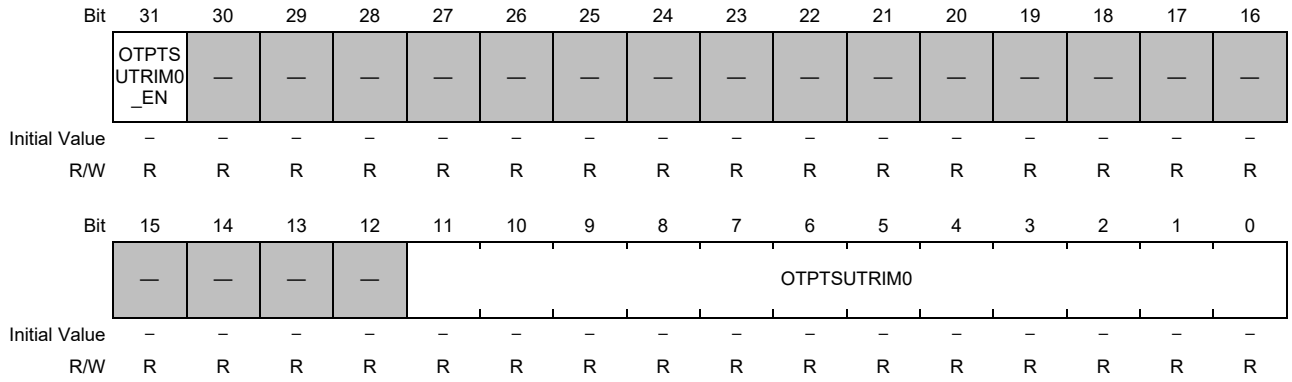
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CONV |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CONV | 0b | R | These bits indicate the state of A/D conversion in the thermal sensor.<br>0b: A/D conversion is stopped.<br>1b: A/D conversion is ongoing. |

### 44.3.5 TSU OTP Calibration Register 0 (OTPTSUTRIM0_REG)

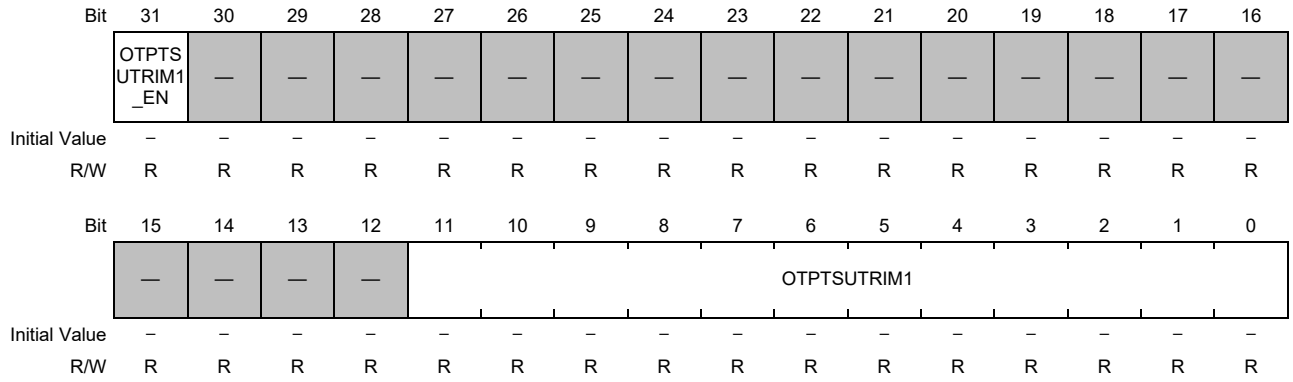
This register holds the correction value for calibration to be used in calculating the temperature



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | OTPTSUTRIM0_EN | — | R | This bit indicates whether [11:0] OTPTSUTRIM0 is valid or invalid.<br>0b: [11:0] OTPTSUTRIM0 is invalid.<br>1b: [11:0] OTPTSUTRIM0 is valid. |
| 30 to 12 | — | — | R | Reserved<br>When read, the value is indefinite value. The written value will be ignored. |
| 11 to 0 | OTPTSUTRIM0 | — | R | These bits hold the correction value for calibration to be used in calculating the temperature. |

### 44.3.6 TSU OTP Calibration Register 1 (OTPTSUTRIM1_REG)

This register holds the correction value for calibration to be used in calculating the temperature.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | OTPTSUTRIM1_EN | — | R | This bit indicates whether [11:0] OTPTSUTRIM1 is valid or invalid.<br>0b: [11:0] OTPTSUTRIM1 is invalid.<br>1b: [11:0] OTPTSUTRIM1 is valid. |
| 30 to 12 | — | — | R | Reserved<br>When read, the value is indefinite value. The written value will be ignored. |
| 11 to 0 | OTPTSUTRIM1 | — | R | These bits hold the correction value for calibration to be used in calculating the temperature. |

## 44.4 Operation

### 44.4.1 Procedure for Starting the A/D Conversion

This section describes the procedure for starting the A/D conversion. Follow this procedure to acquire the A/D converted values for the measured temperatures.

1. Start supplying the clock to the TSU.
2. Release the TSU from the reset state.
3. Set the EN_TS and ADC_EN_TS bits in the TSU_SM register to 1b to place the thermal sensor in the normal operating mode.
4. Wait for 60 µs, leaving the value of the START bit as 0b.
5. Set the START bit in the TSU_ST register to 1b. The thermal sensor then starts the cycles of A/D conversion and the CONV bit in the TSU_SS register indicates 1b.
6. Once 20 µs have passed, the first A/D converted value from the thermal sensor is automatically stored in the TSU_SAD register. The value in that register is then updated every 20 µs. Reading the TSU_SAD register returns the latest A/D converted value.

**CAUTION**

Ensure that the setting of START is 1b when reading an A/D converted value from the TSU_SAD register.

### 44.4.2 Procedure for Stopping the A/D Conversion

This section describes the procedure for stopping the A/D conversion.

1. Set the START bit in the TSU_ST register to 0.
2. Poll the CONV bit in the TSU_SS register until it indicates 0b (A/D conversion has stopped).
3. Once you have confirmed that conversion has stopped, set the EN_TS and ADC_EN_TS bits in the TSU_SM register to 0b to place the thermal sensor in the power-saving mode.

**CAUTION**

If you intend to restart the A/D conversion after having stopped it, start from step 3 in **Section 44.4.1, Procedure for Starting the A/D Conversion**.

### 44.4.3 Confirming the State of the A/D Conversion by Monitoring the CONV Bit

The A/D conversion by the TSU can be started and stopped by the START bit in the TSU_ST register. However, the timing of stopping the A/D conversion by the thermal sensor is not synchronous with the START bit being set to 0 (stopping the A/D conversion). Monitor the CONV bit in the TSU_SS register to confirm that the A/D conversion by the thermal sensor has stopped.

### 44.4.4 Procedure for Measuring the Temperature

To calculate the temperature Tj, read registers TSU_SAD, OTPTSUTRIM0_REG, and OTPTSUTRIM1_REG, and follow the procedure below.

1. Read the value of the TSU_SAD register eight times every at least 20 µs. The read values are defined as TSCode[0] to TSCode[7].

2. Calculate the average of the values read, TSCodeAVE, by using the following formula.

$$\mathrm{TSCodeAVE} = \frac{(\mathrm{TSCode}[0] + \cdots + \mathrm{TSCode}[7])}{8}$$

3. Apply curvature correction and calculate DSENSOR by using the following formula.

$$\mathrm{DSENSOR} = \frac{\mathrm{TSCodeAVE}}{(1 + \mathrm{TSCodeAVE} \times 0.000013)}$$

4. Read the correction values for use in calibration from registers OTPTSUTRIM0_REG and OTPTSUTRIM1_REG and use the following formula to calculate Tj.

$$\mathrm{Tj} = (\mathrm{DSENSOR} - \mathrm{OTPTSUTRIM1}) \times \left(\frac{165}{(\mathrm{OTPTSUTRIM0} - \mathrm{OTPTSUTRIM1})}\right) - 40$$

## 44.5 Usage Note

When the START bit in the TSU_ST register is to be set to 0b, be sure to read the A/D-converted value in the TSU_SAD register before making the setting.

# 45. Trusted Secure IP

This LSI incorporates a Trusted Secure IP module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator. In combination with the Trusted Secure IP driver, the Trusted Secure IP can prevent eavesdropping (confidentiality), falsification of information (integrity), and impersonation (authenticity).

Key information to be used in encrypting and decrypting data is only stored within the Trusted Secure IP, and any external access can be shut out to obtain a system with strong security.

## 45.1 Overview

**Table 45.1** summarizes the specifications of the Trusted Secure IP. **Figure 45.1** shows a block diagram of the Trusted Secure IP.

Table 45.1 Specifications of Trusted Secure IP (1/2)

| Item | Description |
|---|---|
| Access control | Access management circuit<br>• In case of irregular access to the Trusted Secure IP due to a falsified program or runaway execution of a program, this circuit blocks all subsequent access and stops the output of data from the Trusted Secure IP. |
| Encryption engine | AES: Compliant with NIST FIPS PUB 197 algorithm<br>• Key sizes: 128, 192, or 256 bits<br>• Block sizes: 128 bits<br>• Block cipher mode of operation<br>– ECB, CBC, CTR: Compliant with NIST SP 800-38A<br>– CMAC: Compliant with NIST SP 800-38B<br>– CCM: Compliant with NIST SP 800-38C<br>– GCM: Compliant with NIST SP 800-38D<br>– XTS: Compliant with NIST SP 800-38E<br>– GCTR<br>• Number of cycles for execution*1<br>– ECB, CBC, CTR, CMAC, GCTR, XTS: 11 cycles of P1ϕ for 128-bit keys, 13 cycles of P1ϕ for 192-bit keys, 15 cycles of P1ϕ for 256-bit keys<br>– CCM: 22 cycles of P1ϕ for 128-bit keys, 26 cycles of P1ϕ for 192-bit keys, 30 cycles of P1ϕ for 256-bit keys AES-GCM<br>AES-GCM is realized by combining AES-GCTR and GHASH. |

Table 45.1 Specifications of Trusted Secure IP (2/2)

| Item | Description |
|---|---|
| Encryption engine | RSA<br>• Key sizes: Up to 4096 bits<br>• Block sizes: Up to 4096 bits<br>• Number of cycles for execution*1<br>– Approximately 64,000 cycles (Encryption) / 13,000,000 cycles (Decryption) of P1ϕ.<br><br>HASH<br>• Support for SHA1, SHA224/SHA256, GHASH<br>• Block sizes: 512 bits<br>• Number of cycles for execution*1<br>– SHA1: 80 cycles of P1ϕ<br>– SHA224/SHA256: 64 cycles of P1ϕ<br>– GHASH: 9 cycles of P1ϕ<br><br>ECC<br>• Compatible with ECDSA and ECDH<br>• Data block length: 256 bits |
| Encryption engine | Key management<br>• Keys are only valid within the Trusted Secure IP.<br>• Only key generation information is output from the Trusted Secure IP.<br>• Keys can be regenerated by the input of key generation information to the Trusted Secure IP.<br><br>Endian<br>• Big or little |
| Generation of random numbers | 32-bit true random number generator<br>• The Trusted Secure IP driver can assemble 32-bit true random numbers to generate 128- or 256-bit true random numbers.<br>• The generated 128-bit and 256-bit true random numbers are used as keys in encrypting and decrypting data. |
| Unique ID | • An ID unique to the LSI (unique ID) is accessible from the access management circuit through the dedicated bus.<br>• Combining the unique ID with the key generation information prevents the illicit copying of data to another LSI. |
| Interrupt sources | 10 |
| Low power consumption | Setting of the module stop state is possible. |

Note 1. This does not include the overhead for calling functions of the Trusted Secure IP driver.

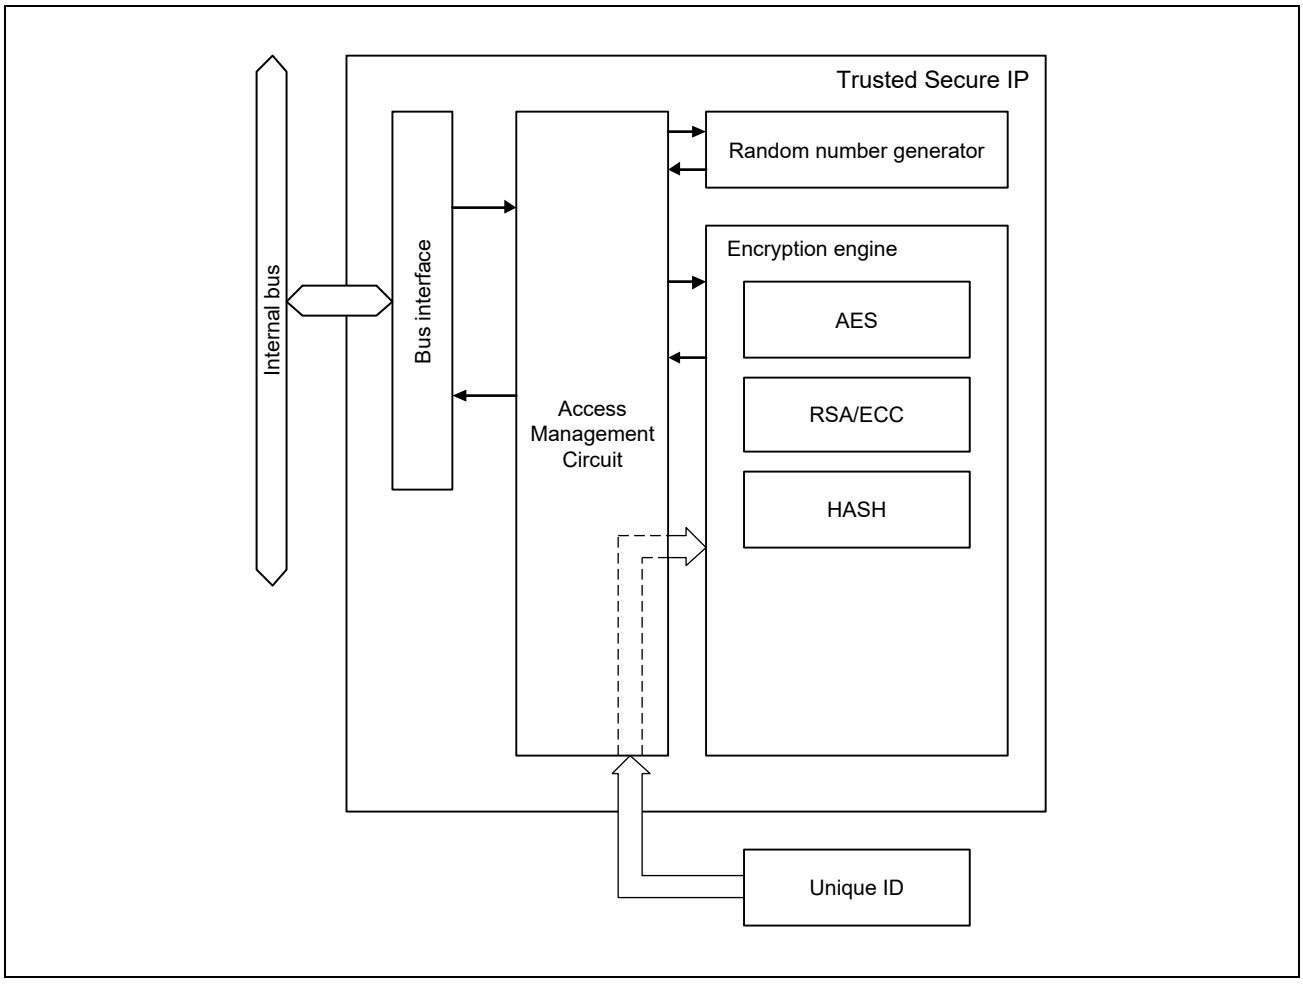


Figure 45.1 Trusted Secure IP Block Diagram

## 45.2 Operation

### 45.2.1 Operating Modes and State Transitions

**Figure 45.2** shows the state transitions of the Trusted Secure IP.

Use of the Trusted Secure IP security functions is only possible through use of the Trusted Secure IP driver provided by Renesas Electronics, in accordance with the state transitions as shown in the figure below.

When irregular access to the Trusted Secure IP (access that violates the defined procedure) due to a falsified program or a program entering runaway execution, etc. is attempted, the access management circuit does not accept any subsequent access and stops the output of any data from the Trusted Secure IP.

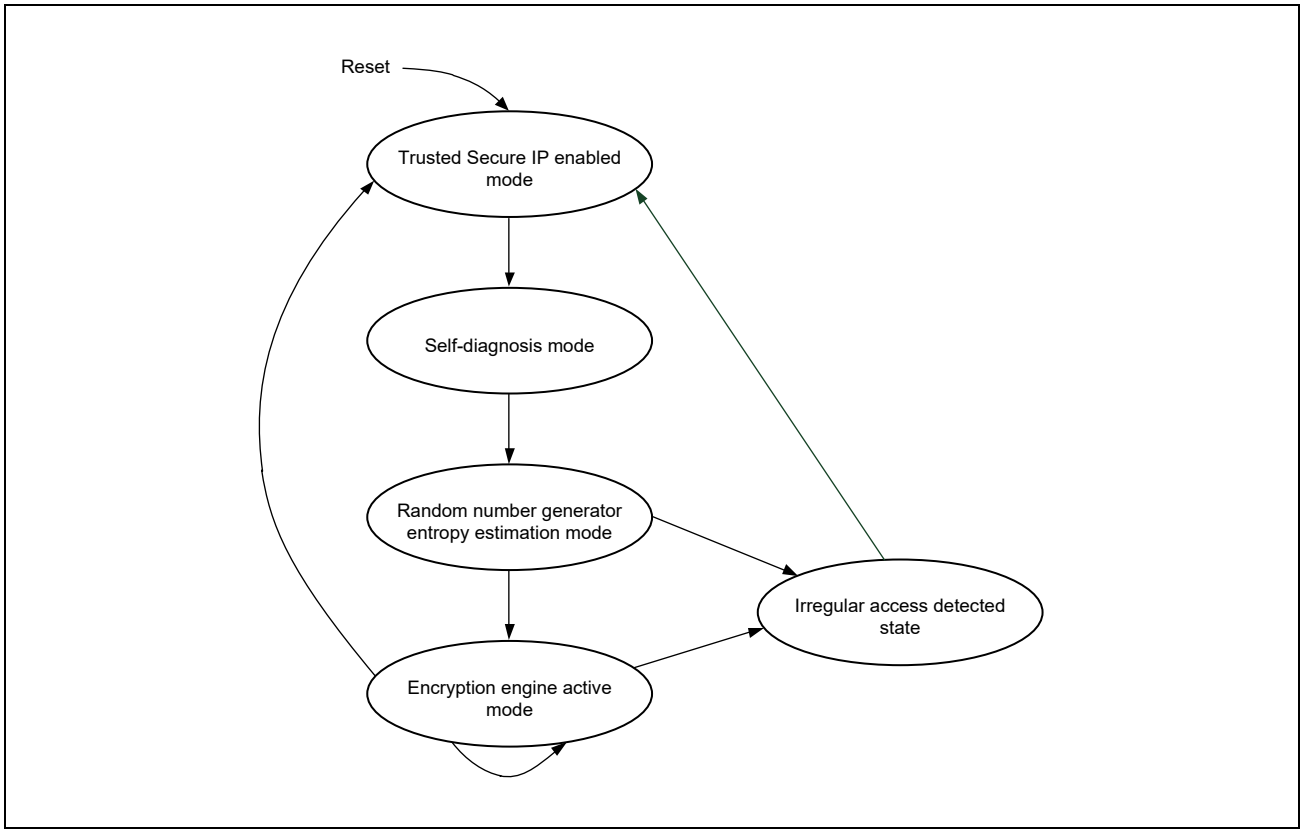

Figure 45.2 Trusted Secure IP Operating Modes and State Transitions

Many of the security functions that the Trusted Secure IP offers are applicable only in the encryption engine active mode. The operations that can be performed in this mode are given below.

(1) Key Installation

(2) Encryption and decryption

(3) Key generation

(4) Random number generation

### 45.2.2 Encryption Engine

**Figure 45.3** shows processes of the encryption engine integrated in the Trusted Secure IP.

The encryption engine, using the key generation information, performs plaintext to ciphertext encryption and ciphertext to plaintext decryption by hardware.

In no part of the encryption or decryption process, is key data or intermediate data ever exposed outside of the Trusted Secure IP.

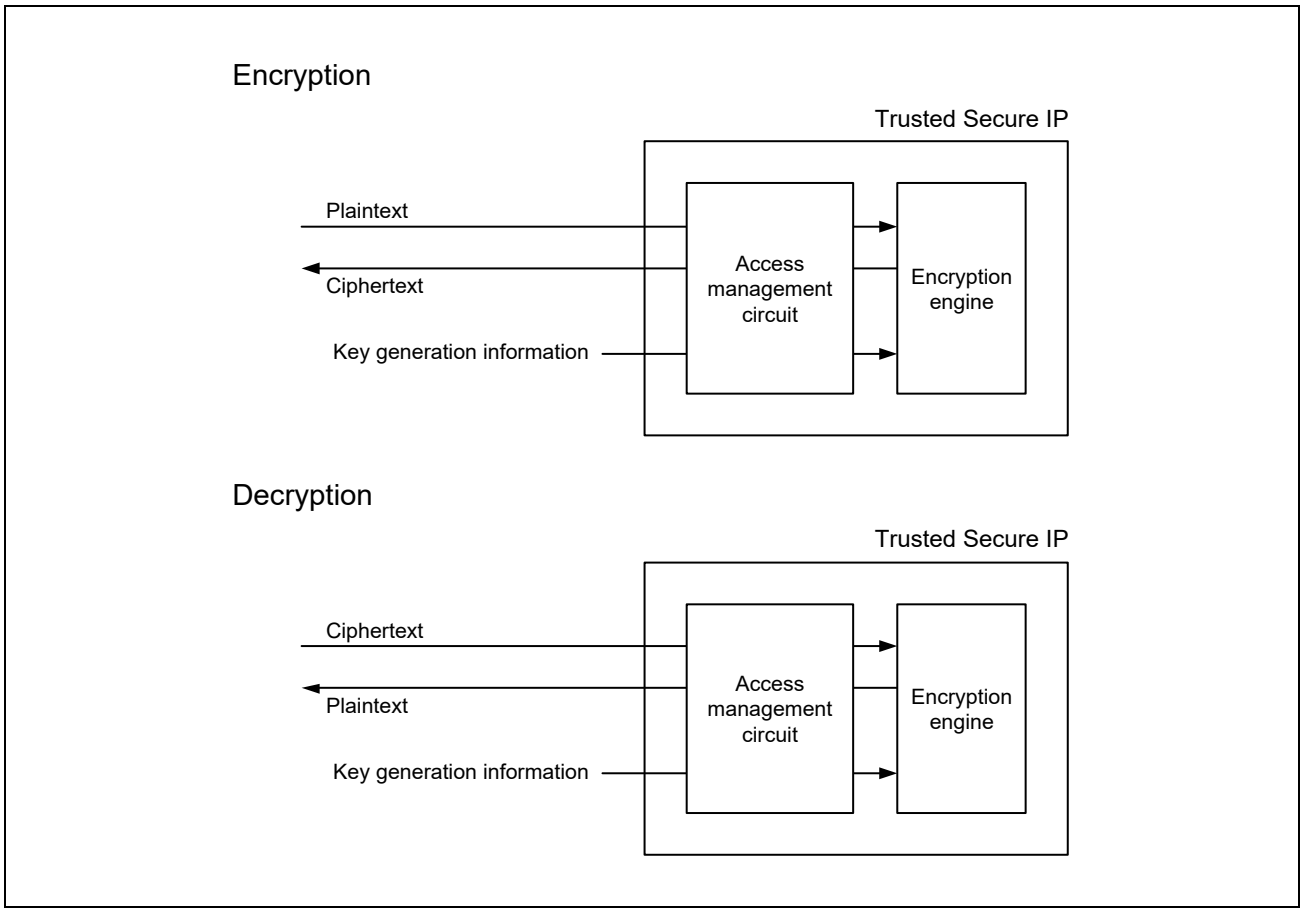

Figure 45.3 Encryption and Decryption processes by Encryption Engine

### 45.2.3 Key Installation

The key installation is the operation that safely converts the user key to the key generation information and stores it in flash memory. The procedure for installing the key data is given below.

(1) The user uses the key (Key-2) used for encrypting the user key to encrypt the user key (Key-1) producing eKey-1.

(2) The user sends the encrypted user key (eKey-1) to the Trusted Secure IP.

(3) The key generation information of the Key-2 (Index-2) contained in the Trusted Secure IP driver is used to recover the Key-2, which is then used to decrypt the user key.

(4) The user key is converted to user key generation information (Index-1) using the unique ID and a random number, and stored in flash memory.

The installation process and flow chart are given in **Figure 45.4** and **Figure 45.5**, respectively.

Once the key data is installed, the user key generation information (Index-1) can then be used to perform encryption or decryption.

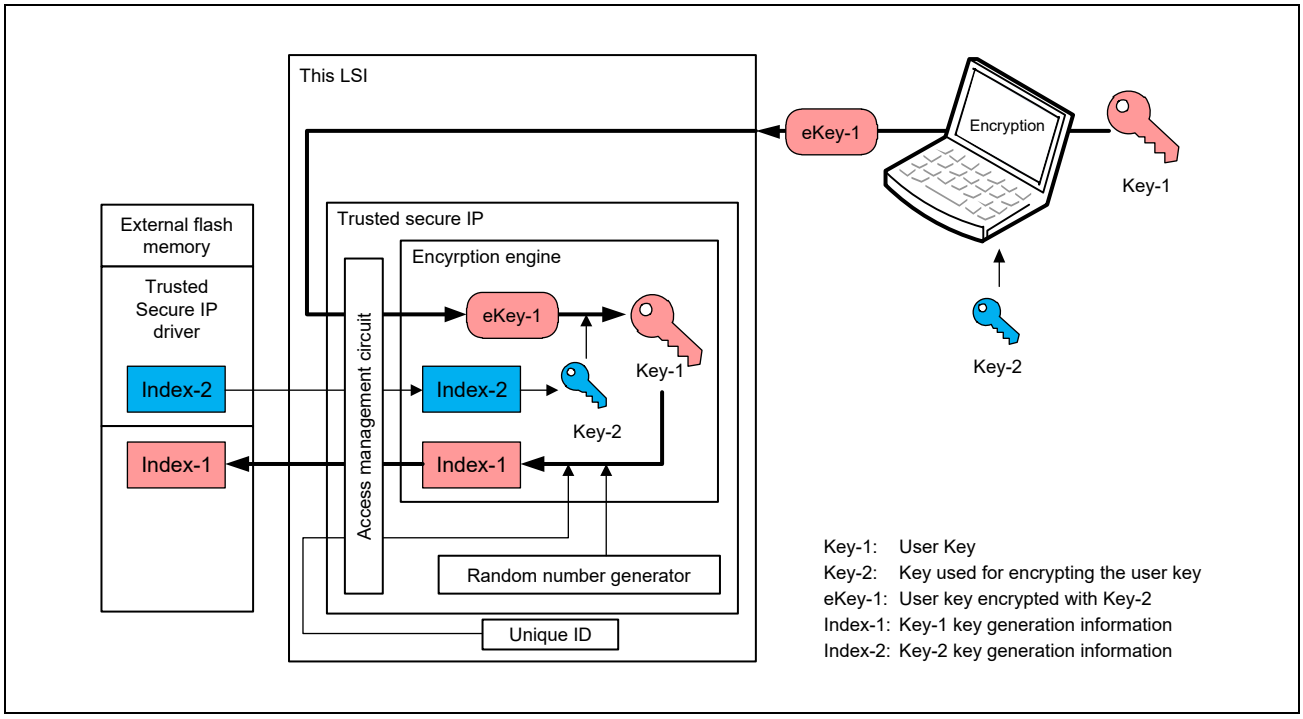

Figure 45.4 Key Installation Process

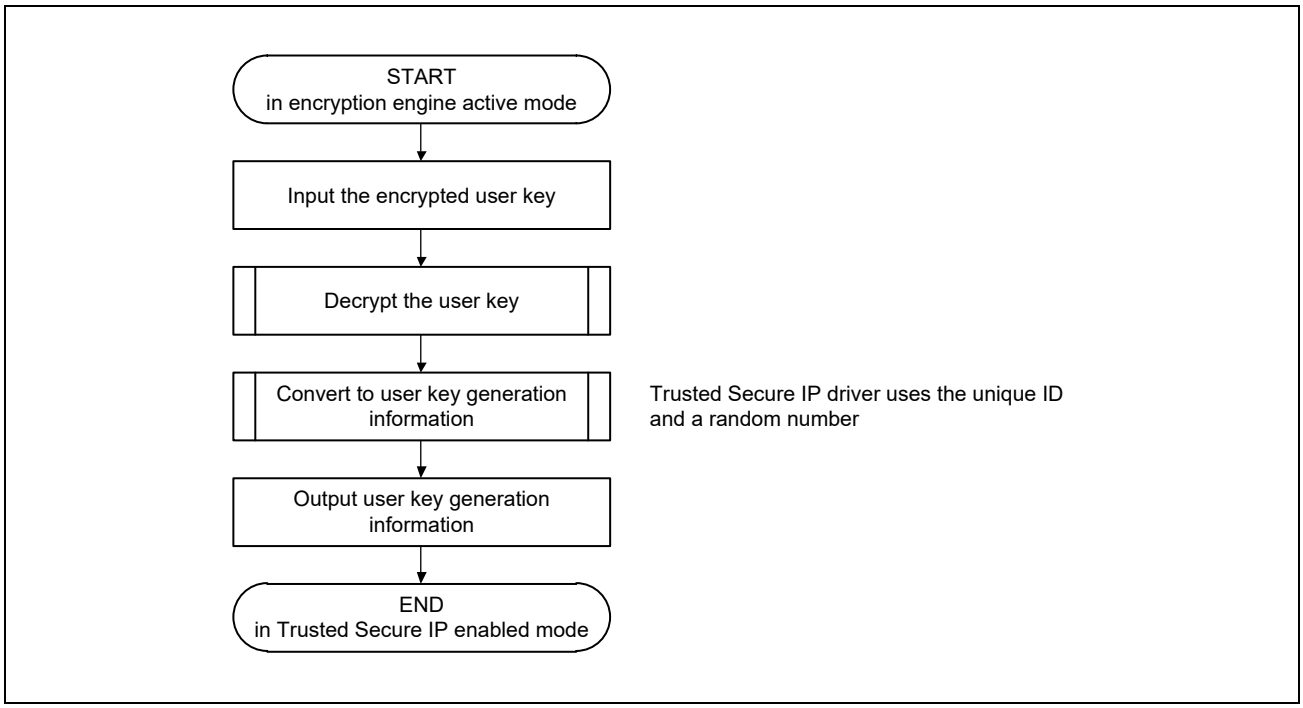

Figure 45.5 Key Installation Flow Chart

### 45.2.4 Encryption and Decryption

The procedures for encrypting and decrypting data are given below.

(1) Input the key generation information into the Trusted Secure IP, and recover the key data.

(2) Input the data to encrypt or decrypt into the Trusted Secure IP. This converts plaintext into ciphertext, and ciphertext into plaintext.

(3) Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output.

**Figure 45.6**, **Figure 45.7**, and **Figure 45.8** show the timing diagram, encryption flow, and decryption flow, respectively.

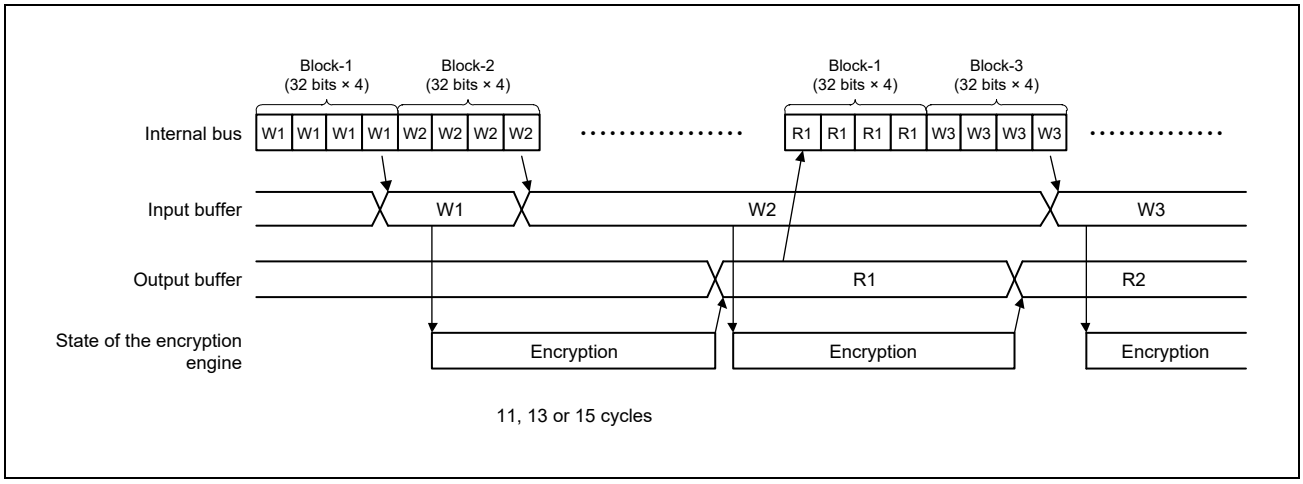

Figure 45.6 Encryption and Decryption Timing Diagram

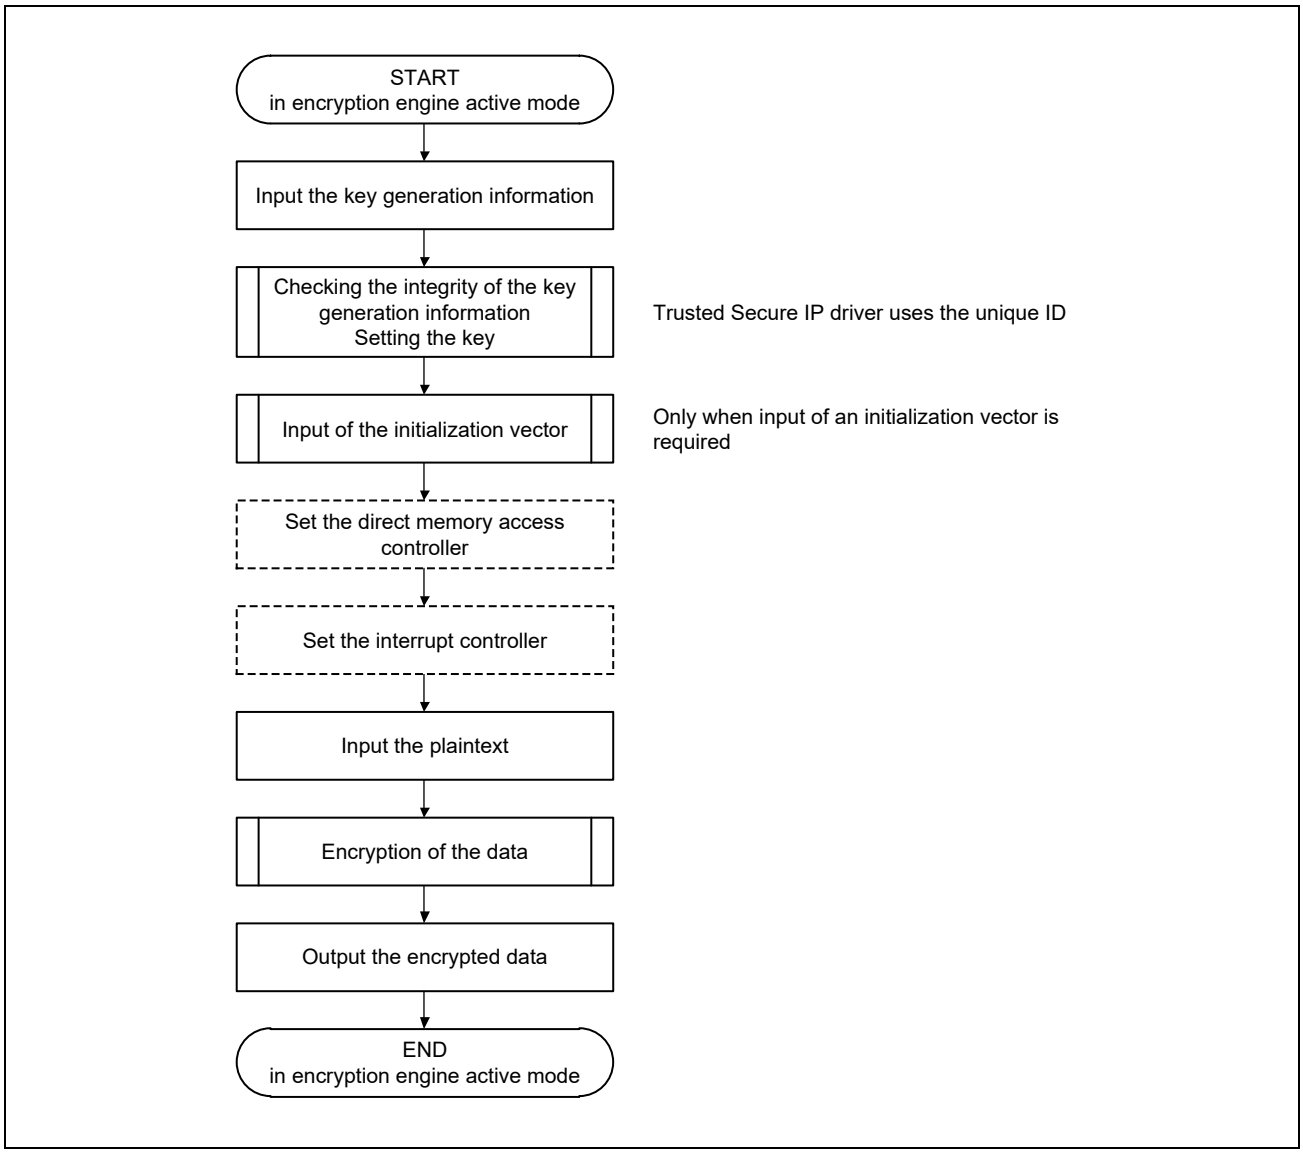

Figure 45.7 Encryption Flow Chart

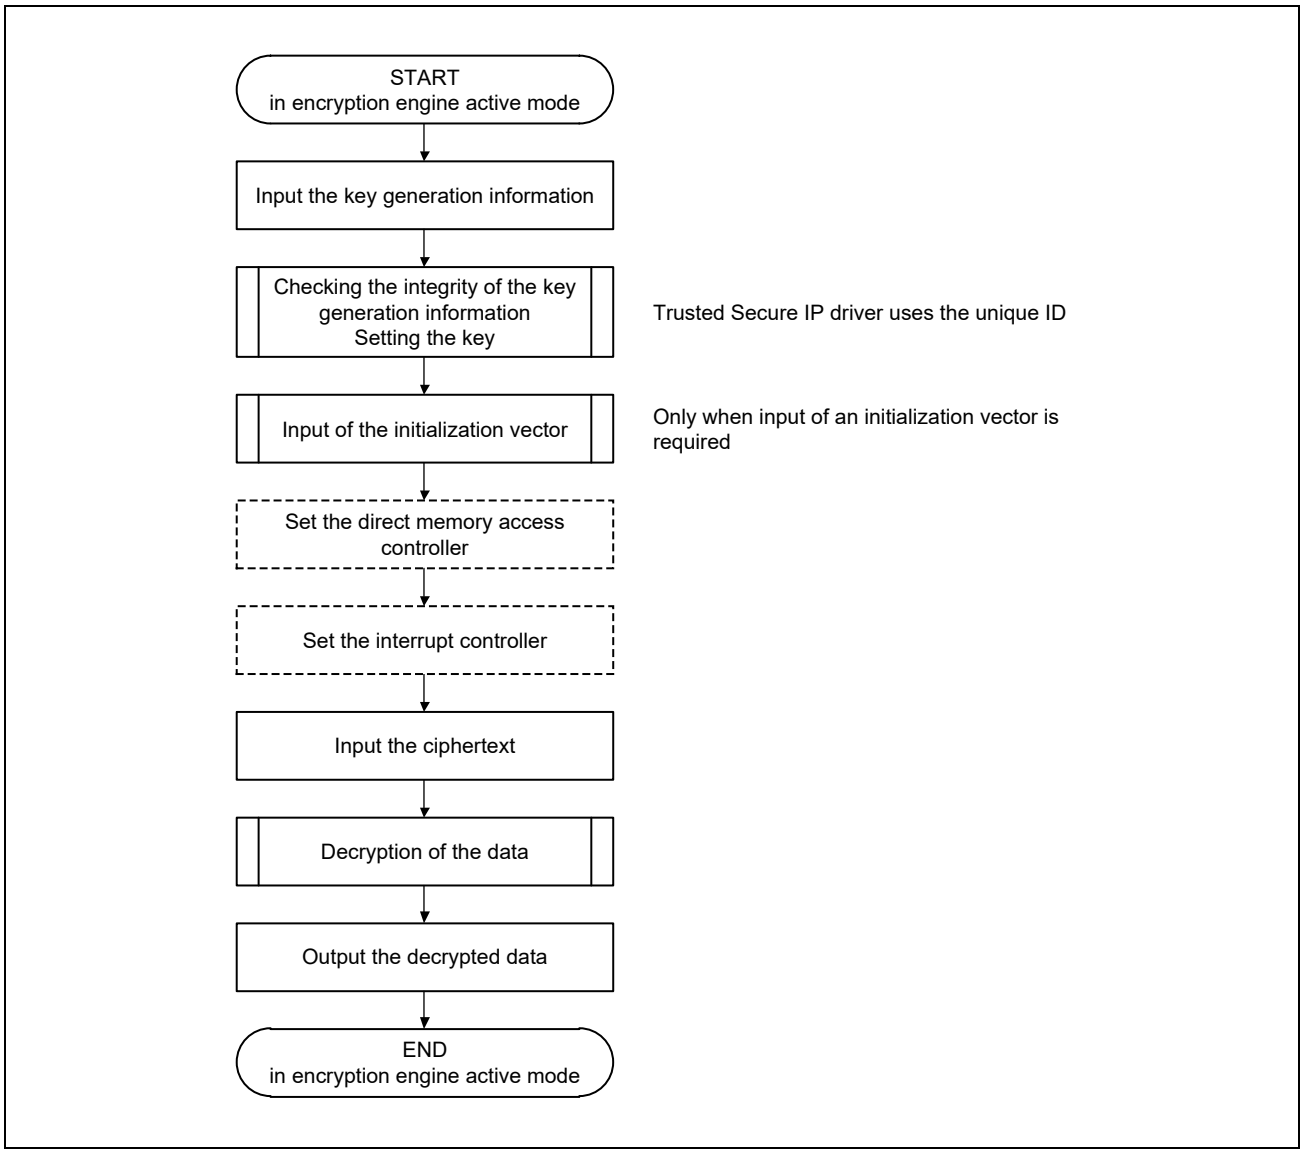

Figure 45.8 Decryption Flow Chart

### 45.2.5 Generating Key Generation Information (by Using Random Numbers)

**Figure 45.9** shows the generating flow for the key generation information by using random numbers.

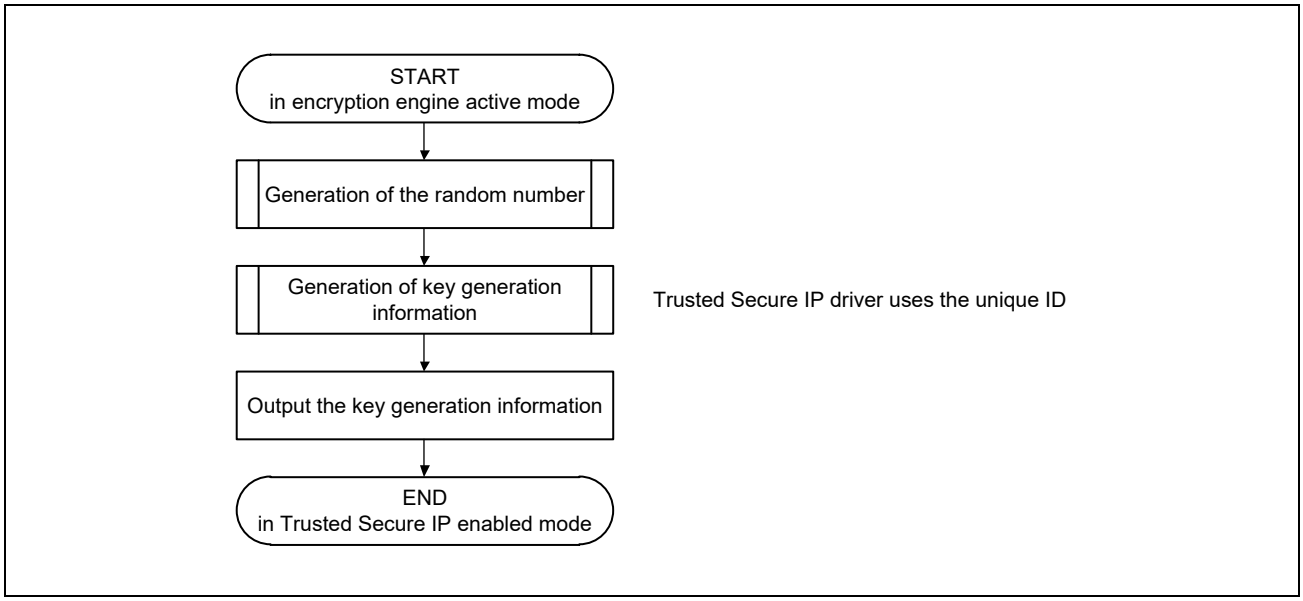

Figure 45.9 Key Generation Information Generating Flow Chart (Using Random Numbers)

### 45.2.6 Random Number Generation

**Figure 45.10** shows the random number generation flow.

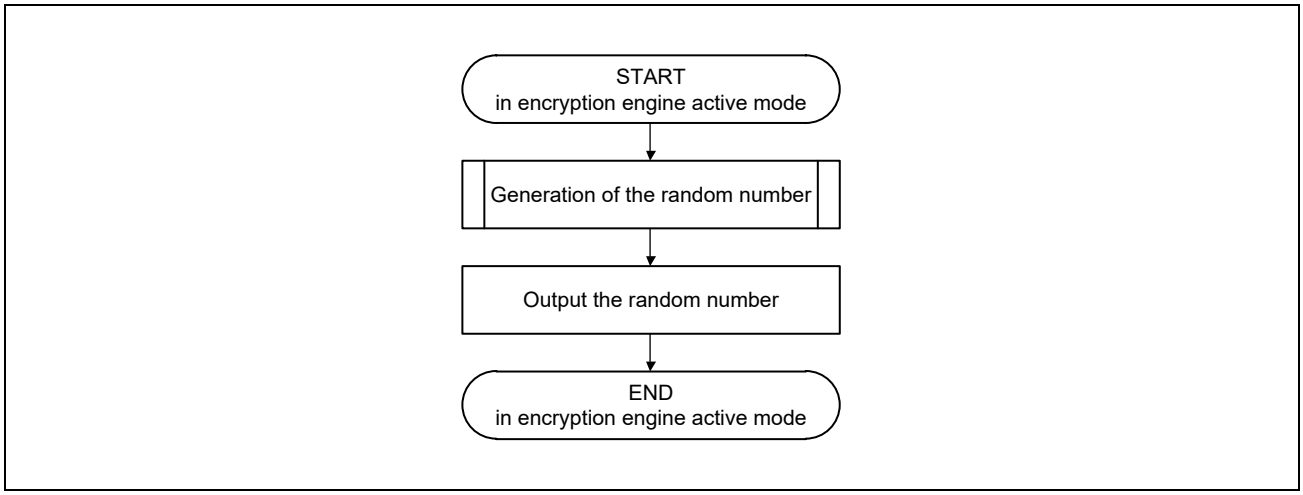

Figure 45.10 Random Number Generation Flow Chart

## 45.3 Interrupt

**Table 45.2** lists the interrupt sources.

Trusted Secure IP driver uses interrupts caused by these interrupt sources. Do not change the setting of the interrupt controller corresponding to these interrupt sources.

Table 45.2 Trusted Secure IP Interrupt Sources

| Name | Interrupt Source |
|---|---|
| PROC_BUSY | Procedure completion interrupt |
| ROMOK | Falsification detection interrupt |
| LONG_PLG | Calculation completion interrupt |
| WRRDY0 | Write ready 0 |
| WRRDY1 | Write ready 1 |
| WRRDY4 | Write ready 4 |
| RDRDY0 | Read ready 0 |
| RDRDY1 | Read ready 1 |
| IWRRDY | Integration write ready |
| IRDRDY | Integration read ready |

## 45.4 Usage Notes

### 45.4.1 Trusted Secure IP Driver

Use of the Trusted Secure IP requires the Trusted Secure IP driver provided by Renesas Electronics. Please contact our sales office for information regarding the Trusted Secure IP driver.

# 48. Electrical Characteristics

## 48.1 Absolute Maximum Ratings

Table 48.1 Absolute Maximum Ratings

| Item | | Symbol | Value | Unit |
|---|---|---|---|---|
| Power supply voltage (3.3 V) | | $PV_{DD}$ | −0.5 to +3.8 | V |
| | | $USB_V_{DD33}$ | | |
| Power supply voltage (1.8-V/3.3-V switchable) | | $SD0_PV_{DD}$ | −0.5 to +3.8 | V |
| | | $SD1_PV_{DD}$ | | |
| | | $SPI_PV_{DD}$ | | |
| Power supply voltage (1.8-V/ 2.5-V/ 3.3-V switchable) | | $PV_{DD182533_0/1}$ | −0.5 to +3.8 | V |
| Power supply voltage (1.8 V) | | $V_{DD18}$ | −0.5 to +2.5 | V |
| | | $PLL1_AV_{DD18}$ | | |
| | | $PLL23_AV_{DD18}$ | | |
| | | $PLL4_AV_{DD18}$ | | |
| | | $PLL5_AV_{DD18}$ | | |
| | | $PLL6_AV_{DD18}$ | | |
| | | $CSI_V_{DD18}$ | | |
| | | $USB_V_{DD18}$ | | |
| | | $ADC_AV_{DD18}$ | | |
| | | $OTP_V_{DD18}$ | | |
| DDR power supply voltage (DDR4/ DDR3L switchable) | | $DDR_V_{DDQ}$ | −0.5 to +2.5 | V |
| Power supply voltage (1.1-V) | | $V_{DD}$ | −0.5 to +1.5 | V |
| | | $PLL23_DV_{DD11}$ | | |
| | | $PLL5_DV_{DD11}$ | | |
| Input voltage | 3.3-V I/O input pins | — | −0.3 to 3.3-V power supply ($PV_{DD}$, $USB_V_{DD33}$) + 0.3 | V |
| | 1.8-V/3.3-V switchable I/O input pins | — | −0.3 to 1.8-V/3.3-V switchable power supply ($SD0_PV_{DD}$, $SD1_PV_{DD}$, $SPI_PV_{DD}$) + 0.3 | V |
| | 1.8-V/2.5-V/3.3-V switchable I/O input pins | — | −0.3 to 1.8-V/2.5-V/3.3-V switchable power supply ($PV_{DD182533_0.1}$) + 0.3 | V |
| | 1.8-V I/O input pins | — | −0.3 to 1.8-V power supply ($V_{DD18}$, $CSI_V_{DD18}$, $USB_V_{DD18}$) + 0.3 | V |
| Operating temperature | Ambient temperature | $T_a$ | −40°C to +85°C*1 | °C |
| | Junction temperature | $T_j$ | −40°C to +125°C | °C |
| Storage temperature | Ambient temperature | $T_{stg}$ | −40°C to +150°C | °C |

Note 1. If wider temp is required than this range, use case has to be investigated.

## 48.2 Power Supply

Table 48.2 Power Supply

| Item | Symbol | Min. | Typ. | Max. | Unit | Remarks |
|---|---|---|---|---|---|---|
| Power supply voltage (3.3 V) | $PV_{DD}$ | 2.97 | 3.30 | 3.63 | V | — |
| Power supply voltage (1.8 V) | $V_{DD18}$, $ADC_AV_{DD18}$ | 1.62 | 1.80 | 1.98 | V | — |
| | $OTP_V_{DD18}$ | 1.65 | 1.80 | 1.95 | V | — |
| Power supply voltage (1.1 V) | $V_{DD}$ | 1.05 | 1.10 | 1.15 | V | — |
| Power supply voltage (USB) | $USB_V_{DD33}$ | 3.00 | 3.30 | 3.60 | V | — |
| | $USB_V_{DD18}$ | 1.65 | 1.80 | 1.95 | V | — |
| Power supply voltage (SD) | $SD0_PV_{DD}$, $SD1_PV_{DD}$ | 2.97 | 3.30 | 3.63 | V | When 3.3 V is supplied |
| | | 1.70 | 1.80 | 1.95 | V | When 1.8 V is supplied |
| Power supply voltage (SPI) | $SPI_PV_{DD}$ | 2.97 | 3.30 | 3.63 | V | When 3.3 V is supplied |
| | | 1.70 | 1.80 | 1.95 | V | When 1.8 V is supplied |
| Power supply voltage (Ether) | $PV_{DD182533_0/1}$ | 2.97 | 3.30 | 3.63 | V | When 3.3 V is supplied |
| | | 2.25 | 2.50 | 2.75 | V | When 2.5 V is supplied |
| | | 1.62 | 1.80 | 1.98 | V | When 1.8 V is supplied |
| Power supply voltage (CSI) | $CSI_V_{DD18}$ | 1.65 | 1.80 | 1.95 | V | — |
| Power supply voltage (DDR) | $DDR_V_{DDQ}$ | 1.14 | 1.20 | 1.26 | V | When using DDR4 |
| | | 1.283 | 1.35 | 1.45 | V | When using DDR3L |
| Power supply voltage (PLL) | $PLL1_AV_{DD18}$, $PLL23_AV_{DD18}$, $PLL4_AV_{DD18}$, $PLL5_AV_{DD18}$, $PLL6_AV_{DD18}$ | 1.62 | 1.80 | 1.98 | V | — |
| | $PLL23_DV_{DD11}$, $PLL5_DV_{DD11}$ | 1.05 | 1.10 | 1.15 | V | — |

## 48.3 Power-On/Power-Off Sequence

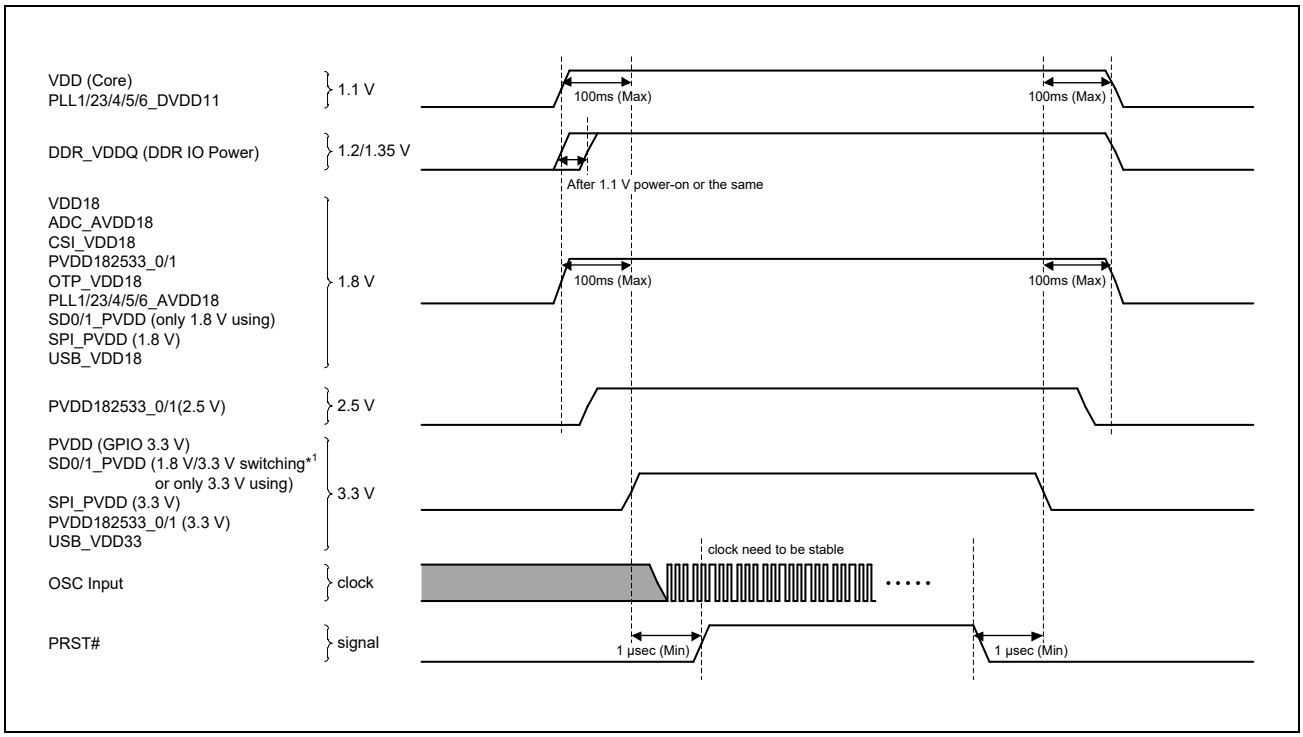

Figure 48.1 Power-On/Power-Off Sequence

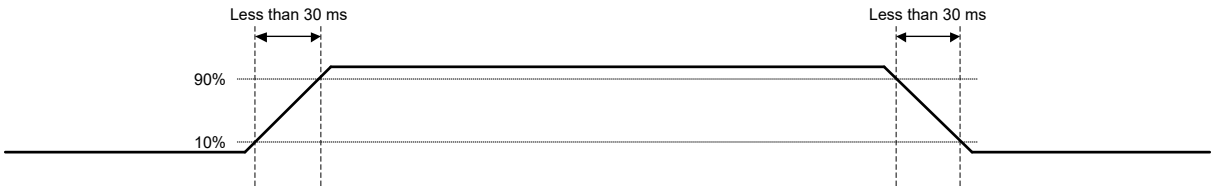
NOTES

1. Turn on 3.3 V after 1.1 V/1.8 V.

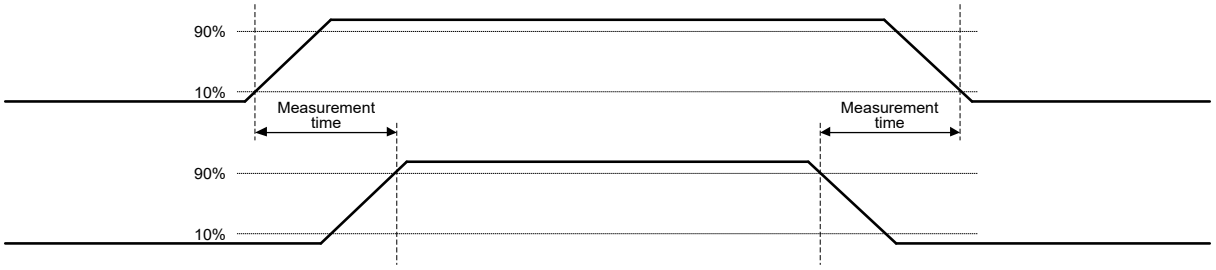
   *Note 1.* About SD0/1_$PV_{DD}$, especially in the case of switching between 1.8 V and 3.3 V at same power rail, 1.8-V power-on/off timing can also follow 3.3-V power rail sequence as shown in the **Figure 48.1**.

2. Turn on the DDR IO power supply at the same time as or after the 1.1-V power supply.
3. From first power rising start to last power rising end must be within 100 ms.
4. The power-off sequence is the reverse of the power-on sequence
   (PRST# → Low ⇨ 3.3 V = OFF ⇨ Other = OFF)
5. PRST# should be changed from Low to High after the 3.3-V power supply is turned on, after 1 µsec, and after the input clock from the oscillator stabilizes.
6. Refer to SD0/1_$PV_{DD}$ when connecting eMMC.



**Note:** The rise/fall time of each power supply should be within 30 msec.
Start point / end point of rising / falling time of each power supply should be 10% or 90% level of each power supply.

Figure 48.2 Power Up Time/Power Down Time (1)



**Note:** In case of there is restriction of sequence between different power supply, measurement time is starting point that is 10% of earlier rising power voltage level to end point that is 90% of later rising power voltage level, and starting point that is 90% of earlier falling power voltage level to end point that is 10% of later falling power voltage level.

Figure 48.3 Power Up Time/Power Down Time (2)

## 48.4 DC Characteristics

Table 48.3 DC Characteristics (1) [3.3-V I/O]

| Item | | Symbol | Min. | Typ. | Max. | Unit | Remarks |
|---|---|---|---|---|---|---|---|
| High-level input voltage | | $V_{IH}$ | 2 | — | $PV_{DD}$ + 0.3 | V | |
| Low-level input voltage | | $V_{IL}$ | −0.3 | — | 0.8 | V | |
| Hysteresis threshold ↑ | | $V_T$+ | 0.9 | — | 2.1 | V | |
| Hysteresis threshold ↓ | | $V_T$− | 0.7 | — | 1.9 | V | |
| Input hysteresis voltage | | $V_{HYS}$ | 0.306 | — | 0.420 | V | |
| Output logic high voltage | ($I_{OH}$ = –2mA) | $V_{OH}$ | $PV_{DD}$ – 0.4 | — | $PV_{DD}$ | V | |
| | ($I_{OH}$ = –4mA) | | | | | | |
| | ($I_{OH}$ = –8mA) | | | | | | |
| | ($I_{OH}$ = –12mA) | | | | | | |
| Output logic low voltage | ($I_{OL}$ = 2mA) | $V_{OL}$ | 0 | — | 0.4 | V | |
| | ($I_{OL}$ = 4mA) | | | | | | |
| | ($I_{OL}$ = 8mA) | | | | | | |
| | ($I_{OL}$ = 12mA) | | | | | | |
| Weak pull-up resistor (input mode) | | $R_{UP}$ | 7K | — | 100K | Ω | |
| Weak pull-down resistor (input mode) | | $R_{DN}$ | 7K | — | 100K | Ω | |
| Input leakage current | | $I_{LI}$ | — | — | 5 | μA | 0V ≤ $V_{in}$ ≤ $PV_{DD}$<br>In case of 3state buffer, the leak current when output mode OFF |

**Note:** $V_{in}$ means input voltage of external input pin.

**Note:** Schmitt can be used at only RIIC mode.

Table 48.4 DC Characteristics (2) [1.8-V I/O]

| Item | | Symbol | Min. | Typ. | Max. | Unit | Remarks |
|---|---|---|---|---|---|---|---|
| High-level input voltage | | $V_{IH}$ | 0.65 × $V_{DD18}$ | — | $V_{DD18}$ + 0.3 | V | |
| Low-level input voltage | | $V_{IL}$ | −0.3 | — | 0.35 × $V_{DD18}$ | V | |
| Output logic high voltage | ($I_{OH}$ = –2mA) | $V_{OH}$ | $V_{DD18}$ – 0.4 | — | $V_{DD18}$ | V | |
| | ($I_{OH}$= –4mA) | | | | | | |
| | ($I_{OH}$ = –8mA) | | | | | | |
| | ($I_{OH}$ = –12mA) | | | | | | |
| Output logic low voltage | ($I_{OL}$ = 2mA) | $V_{OL}$ | 0 | — | 0.4 | V | |
| | ($I_{OL}$ = 4mA) | | | | | | |
| | ($I_{OL}$ = 8mA) | | | | | | |
| | ($I_{OL}$ = 12mA) | | | | | | |

Table 48.5 DC Characteristics (3) [3.3-V Input]

| Item | Symbol | Min. | Typ. | Max. | Unit | Remarks |

Table 48.17 DC Characteristics (15) [USB 2.0]

| Item | Symbol | Min. | Typ. | Max. | Unit | Remarks |
|---|---|---|---|---|---|---|
| Input levels for low/full speed | | | | | | |
| High (driven) | $V_{IH}$ | 2.0 | — | — | V | |
| Low | $V_{IL}$ | — | — | 0.8 | V | |
| Differential input sensitivity | $V_{DI}$ | 0.2 | — | — | V | |
| Differential common mode range | $V_{CM}$ | 0.8 | — | 2.5 | V | |
| Input levels for high speed | | | | | | |
| High-speed squelch detection threshold (differential signal amplitude) | $V_{HSSQ}$ | 100 | — | 150 | mV | |
| High-speed data signaling common mode voltage range (guideline for receiver) | $V_{HSCM}$ | −50 | — | 500 | mV | |
| Output levels for low/full speed | | | | | | |
| Low | $V_{OL}$ | 0.0 | — | 0.3 | V | |
| High (driven) | $V_{OH}$ | 2.8 | — | 3.6 | V | |
| Output signal crossover voltage | $V_{CRS}$ | 1.3 | — | 2.0 | V | |
| Output levels for high-speed | | | | | | |
| High-speed idle level | $V_{HSOI}$ | −10.0 | — | 10.0 | mV | |
| High-speed data signaling high | $V_{HSOH}$ | 360 | — | 440 | mV | |
| High-speed data signaling low | $V_{HSOL}$ | −10.0 | — | 10.0 | mV | |
| Chirp J level (differential voltage) | $V_{CHIRPJ}$ | 700 | — | 1100 | mV | |
| Chirp K level (differential voltage) | $V_{CHIRPK}$ | −900 | — | −500 | mV | |

Table 48.18 DC Characteristics (16) [ADC]

| Item | Symbol | Min. | Typ. | Max. | Unit | Remarks |
|---|---|---|---|---|---|---|
| Resolution | — | — | 12 | — | Bit | |
| Analog input channel | — | — | — | 2 | Channel | |
| Analog input range | AIN | $V_{SS}$ | — | ADC_$AV_{DD18}$ | V | |
| Differential non-linearity | DNL | — | — | ±3.0 | LSB | |
| Integral non-linearity | INL | — | — | ±6.0 | LSB | |
| Full-scale error | — | — | ±10 | ±20 | LSB | |
| Offset error | — | — | ±10 | ±20 | LSB | |
| Analog input capacitance | $C_{IN}$ | — | — | 12.6 | pF | |
| Analog input resistance | $R_{IN}$ | — | — | 1780 | Ω | |
| External capacitance | $C_{EXT}$ | — | — | (*1) | pf | |
| External resistance | $R_{EXT}$ | — | — | (*1) | Ω | |

Note 1. Refer to **Figure 48.4** for Cext and Rext.
The Cext and Rext need to satisfy the sampling time.
A/D conversion time = sampling time (6T to 2800T) + 14T.
T stands for the cycle of ADIVCLK (20 MHz).
If A/D conversion is performed with the minimum conversion time, the sampling time must be 6T.
(Minimum conversion time per channel is 1 µs when A/D conversion clock ADIVCLK is 20 MHz.)

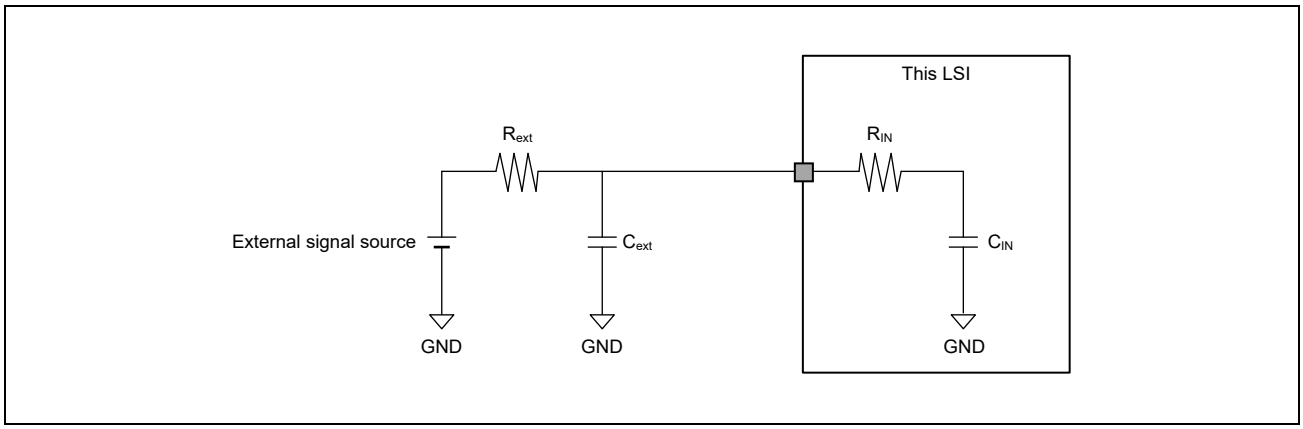

Figure 48.4 Analog Input Equivalent Circuit

Table 48.19 DC Characteristics (17) [Current Consumption]

| Item | Power rail symbol | Max Current | Unit | Remarks |

## 48.5.3 eMMC Access Timing

### 48.5.3.1 eMMC Host Interface Timing (Default)

Table 48.22 eMMC Host Interface Timing (MMC Default 3.3-V Power Supply)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| SD0_CLK clock cycle | $t_{MMCPP}$ | 40.00 | — | ns | **Figure 48.9** |
| SD0_CLK clock high level width | $t_{MMCWH}$ | 18.50 | — | ns | |
| SD0_CLK clock low level width | $t_{MMCWL}$ | 18.50 | — | ns | |
| SD0_CLK clock rise time | $t_{MMCLH}$ | — | 3 | ns | |
| SD0_CLK clock fall time | $t_{MMCHL}$ | — | 3 | ns | |
| SD0_CMD/SDDAT output delay | $t_{MMCODLY}$ | −4.50 | 4.0 | ns | |
| SD0_CMD/SDDAT input set up time | $t_{MMCISU}$ | 5.5 | — | ns | |
| SD0_CMD/SDDAT input hold time | $t_{MMCIH}$ | 2.0 | — | ns | |
| SD0_CMD/SDDAT input data width | $t_{MMCIDW}$ | — | — | ns | |

Table 48.23 eMMC Host Interface Timing (MMC Default 1.8-V Power Supply)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| SD0_CLK clock cycle | $t_{MMCPP}$ | 40.00 | — | ns | **Figure 48.9** |
| SD0_CLK clock high level width | $t_{MMCWH}$ | 19.25 | — | ns | |
| SD0_CLK clock low level width | $t_{MMCWL}$ | 19.25 | — | ns | |
| SD0_CLK clock rise time | $t_{MMCLH}$ | — | 2.45 | ns | |
| SD0_CLK clock fall time | $t_{MMCHL}$ | — | 2.45 | ns | |
| SD0_CMD/SDDAT output delay | $t_{MMCODLY}$ | −2.00 | 2.50 | ns | |
| SD0_CMD/SDDAT input set up time | $t_{MMCISU}$ | 4.00 | — | ns | |
| SD0_CMD/SDDAT input hold time | $t_{MMCIH}$ | 1.40 | — | ns | |
| SD0_CMD/SDDAT input data width | $t_{MMCIDW}$ | — | — | ns | |

### 48.5.3.2 eMMC host interface timing (HS-SDR)

Table 48.24 eMMC Host Interface Timing (MMC HS-SDR 3.3-V Power Supply)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| SD0_CLK clock cycle | $t_{MMCPP}$ | 30.00 | — | ns | **Figure 48.9** |
| SD0_CLK clock high level width | $t_{MMCWH}$ | 13.50 | — | ns | |
| SD0_CLK clock low level width | $t_{MMCWL}$ | 13.50 | — | ns | |
| SD0_CLK clock rise time | $t_{MMCLH}$ | — | 3 | ns | |
| SD0_CLK clock fall time | $t_{MMCHL}$ | — | 3 | ns | |
| SD0_CMD/SDDAT output delay | $t_{MMCODLY}$ | −4.50 | 4.0 | ns | |
| SD0_CMD/SDDAT input set up time | $t_{MMCISU}$ | 5.5 | — | ns | |
| SD0_CMD/SDDAT input hold time | $t_{MMCIH}$ | 2.0 | — | ns | |
| SD0_CMD/SDDAT input data width | $t_{MMCIDW}$ | — | — | ns | |

Table 48.25 eMMC Host Interface Timing (MMC HS-SDR 1.8-V Power Supply)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| SD0_CLK clock cycle | $t_{MMCPP}$ | 20.00 | — | ns | **Figure 48.9** |
| SD0_CLK clock high level width | $t_{MMCWH}$ | 9.25 | — | ns | |
| SD0_CLK clock low level width | $t_{MMCWL}$ | 9.25 | — | ns | |
| SD0_CLK clock rise time | $t_{MMCLH}$ | — | 2.45 | ns | |
| SD0_CLK clock fall time | $t_{MMCHL}$ | — | 2.45 | ns | |
| SD0_CMD/SDDAT output delay | $t_{MMCODLY}$ | −2.00 | 2.50 | ns | |
| SD0_CMD/SDDAT input set up time | $t_{MMCISU}$ | 4.00 | — | ns | |
| SD0_CMD/SDDAT input hold time | $t_{MMCIH}$ | 1.40 | — | ns | |
| SD0_CMD/SDDAT input data width | $t_{MMCIDW}$ | — | — | ns | |

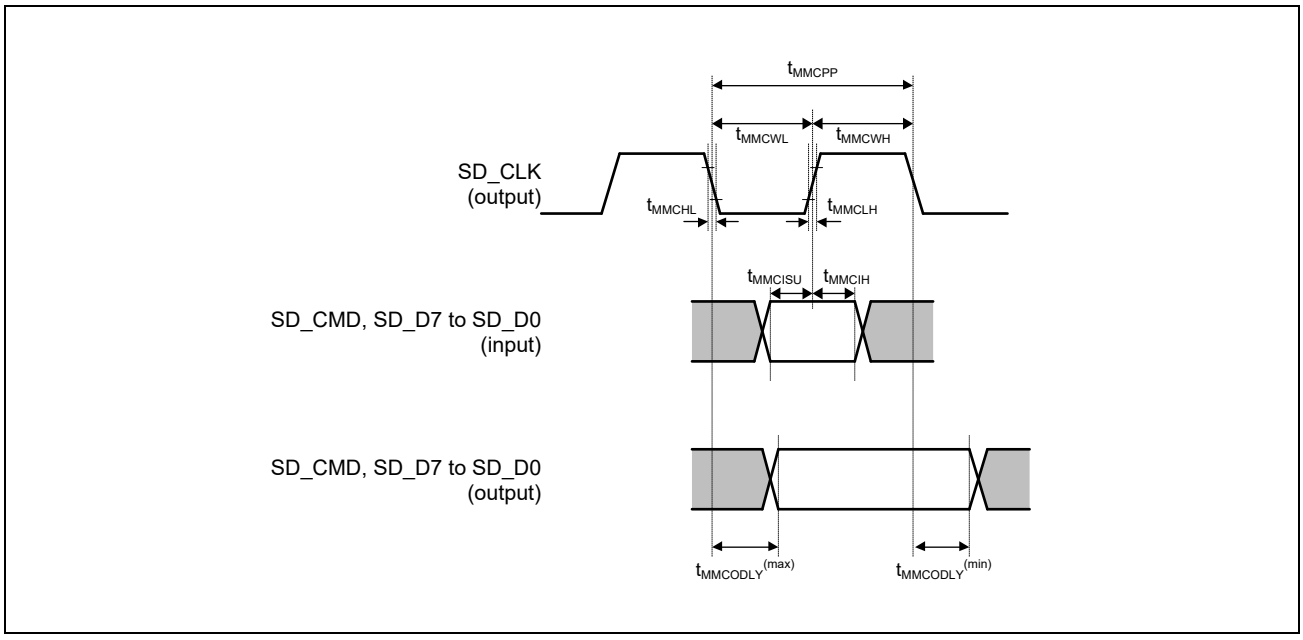

Figure 48.9 eMMC Host Interface Timing (MMC Default/HS-SDR 1.8-V/3.3-V Power Supply)

### 48.5.3.3 eMMC host interface timing (HS200)

Table 48.26 eMMC Host Interface Timing (HS200 1.8-V Power Supply Operation, Output Load 15 pF)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| SD0_CLK clock cycle | $t_{MMCPP}$ | 7.50 | 15.0 | ns | **Figure 48.10** |
| SD0_CLK clock high level width | $t_{MMCWH}$ | 3.20 | — | ns | |
| SD0_CLK clock low level width | $t_{MMCWL}$ | 3.20 | — | ns | |
| SD0_CLK clock rise time | $t_{MMCLH}$ | — | 1.22 | ns | |
| SD0_CLK clock fall time | $t_{MMCHL}$ | — | 1.22 | ns | |
| SD0_CMD/SDDAT output delay | $t_{MMCODLY}$ | −1.50 | 1.75 | ns | |
| SD0_CMD/SDDAT input set up time | $t_{MMCISU}$ | — | — | ns | |
| SD0_CMD/SDDAT input hold time | $t_{MMCIH}$ | — | — | ns | |
| SD0_CMD/SDDAT input data width | $t_{MMCIDW}$ | 4.31 | — | ns | |

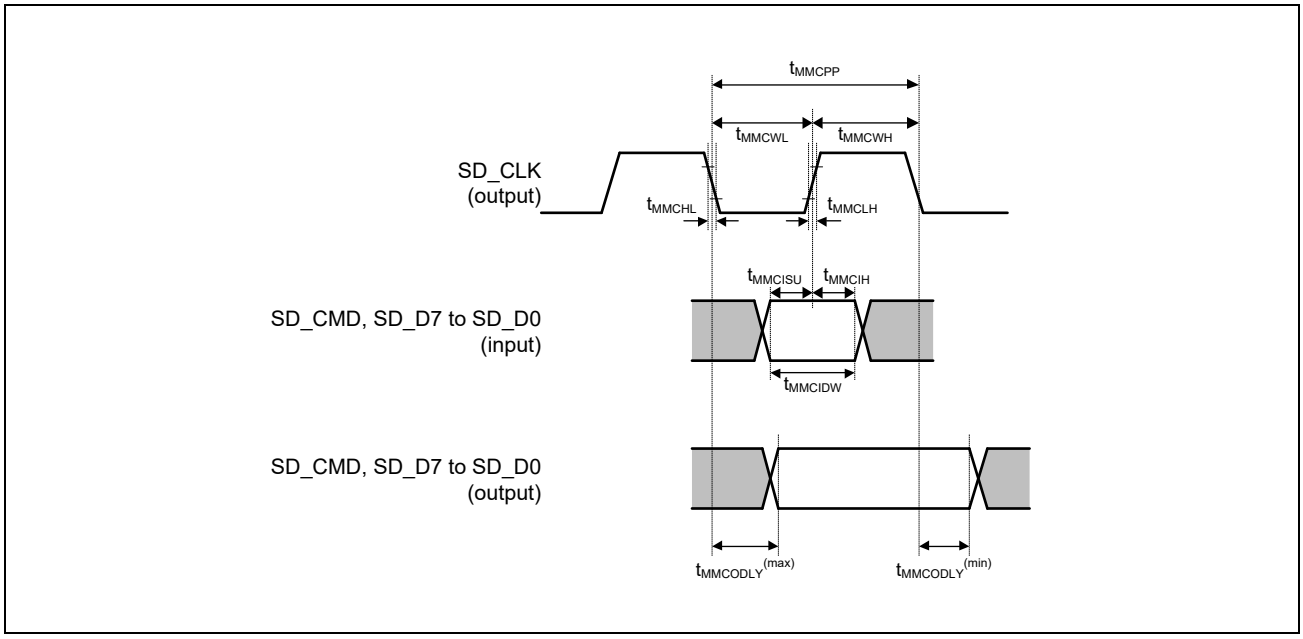

Figure 48.10 eMMC Host Interface (MMC Interface HS200 Mode 1.8-V Power Supply Selection)

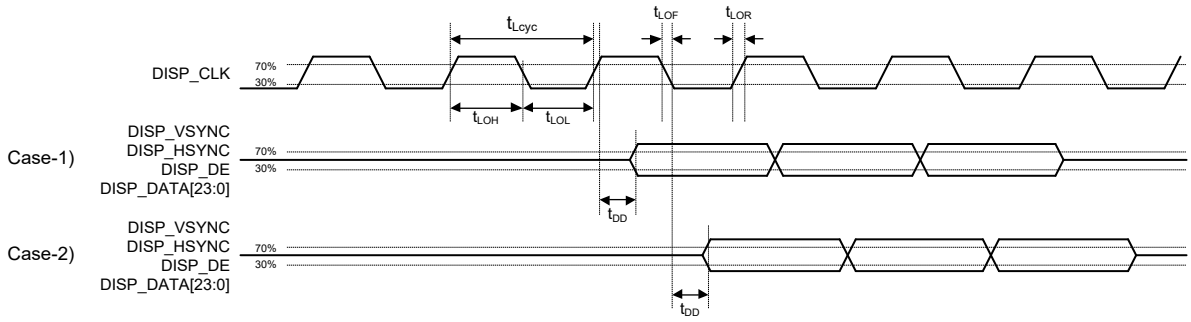
### 48.5.4 LCDC Access Timing

Table 48.27 LCDC AC Access Timing

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| DCLK period | $t_{Lcyc}$ | 11.5 | 172.33 | ns | **Figure 48.11** |
| DCLK low pulse width | $t_{LOL}$ | $t_{Lcyc}/2 - 1.06$ | $t_{Lcyc}/2 + 1.06$ | ns | |
| DCLK high pulse width | $t_{LOH}$ | $t_{Lcyc}/2 - 1.06$ | $t_{Lcyc}/2 + 1.06$ | ns | |
| DCLK rise time | $t_{LOR}$ | — | 3 | ns | |
| DCLK fall time | $t_{LOF}$ | — | 3 | ns | |
| Data output dealy | $t_{DD}$ | −1.5 | 1.5 | ns | |

**Note:** AC access timing condition: SR = 1 (fast) / Drive capacity setting 12 mA / Load capacity 30 pF.



**Note:** *Case-1*) DISP_CLK forward rotation output mode
When DPI_CLKMD bit in DU_DITR0 register is 0.

*Case-2*) DISP_CLK inverted output mode
When DPI_CLKMD bit in DU_DITR0 register is 1.

Figure 48.11 LCDC AC Access Timing

## 48.5.5 USB 2.0 Host/Function Module Access Timing

### 48.5.5.1 USB 2.0 Low-Speed Access Timing

Table 48.28 USB Transceiver Timing (Low-Speed)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| Rise time | $t_{LR}$ | 75 | 300 | ns | **Figure 48.12** |
| Fall time | $t_{LF}$ | 75 | 300 | ns | |
| Rise/fall time lag | $t_{LR}/t_{LF}$ | 80 | 125 | % | |

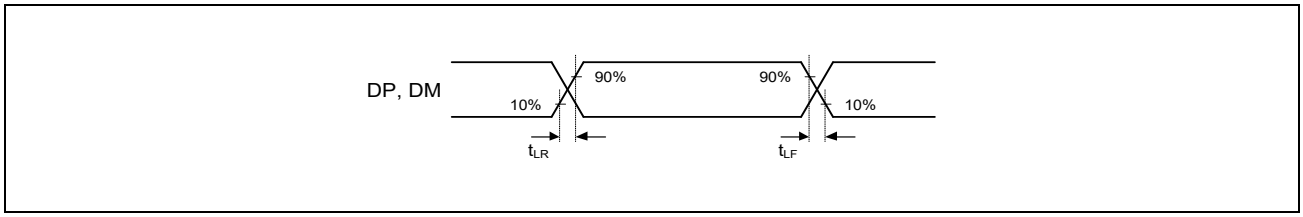


Figure 48.12 USB0_DP, USB1_DP, USB0_DM, and USB1_DM Output Timing (Low-Speed)

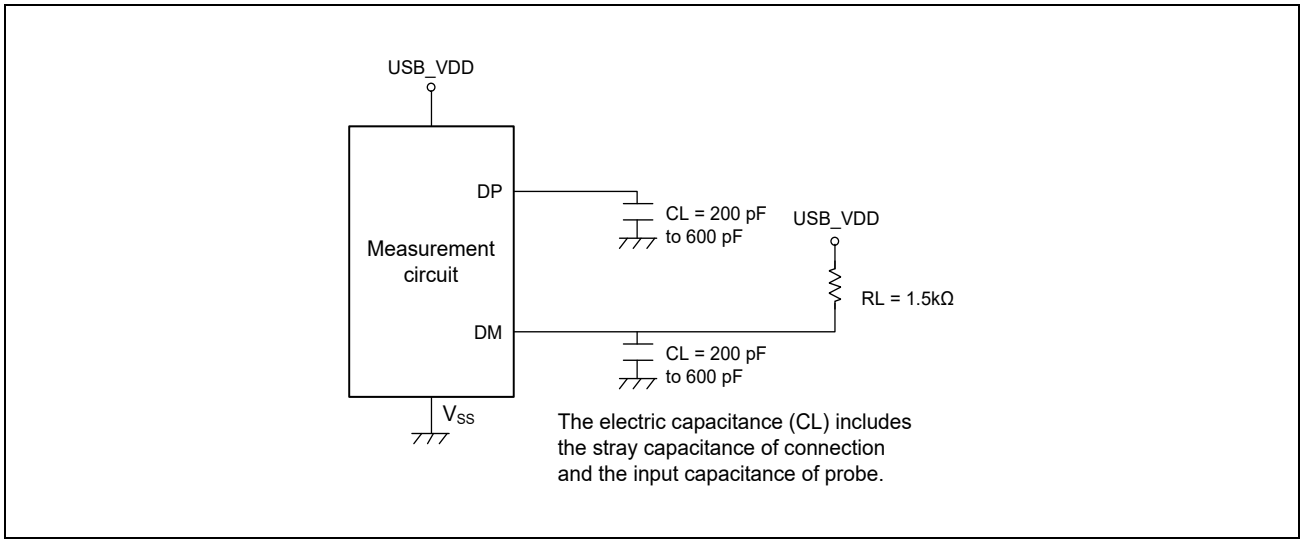

Figure 48.13 Measurement Circuit (Low-Speed)

### 48.5.5.2 USB 2.0Full-Speed Access Timing

Table 48.29 USB Transceiver Timing (Full-Speed)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| Rise time | $t_{FR}$ | 4 | 20 | ns | **Figure 48.14** |
| Fall time | $t_{FF}$ | 4 | 20 | ns | |
| Rise/fall time lag | $t_{FR}/t_{FF}$ | 90 | 111.11 | % | |

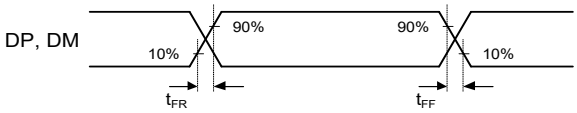

Figure 48.14 USB0_DP, USB1_DP, USB0_DM, and USB1_DM Output Timing (Full-Speed)

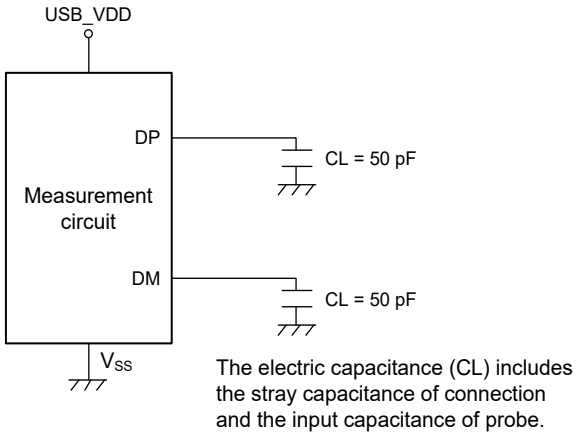

Figure 48.15 Measurement Circuit (Full-Speed)

### 48.5.5.3 USB 2.0 Hi-Speed Access Timing

Table 48.30 USB Transceiver Timing (Hi-Speed)

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| Rise edge rate | $t_{HSR}$ | — | 2133 | V/µs | **Figure 48.16** |
| Fall edge rate | $t_{HSF}$ | — | 2133 | V/µs | |
| Output driver resistance | $Z_{HSDRV}$ | 40.5 | 49.5 | Ω | |

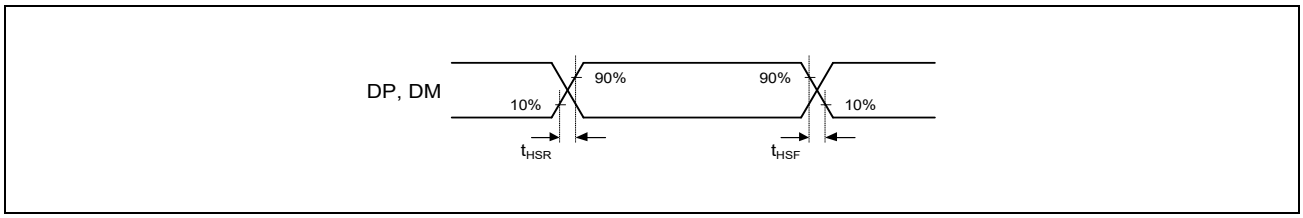

Figure 48.16 USB0_DP, USB1_DP, USB0_DM, and USB1_DM Output Timing (Hi-Speed)

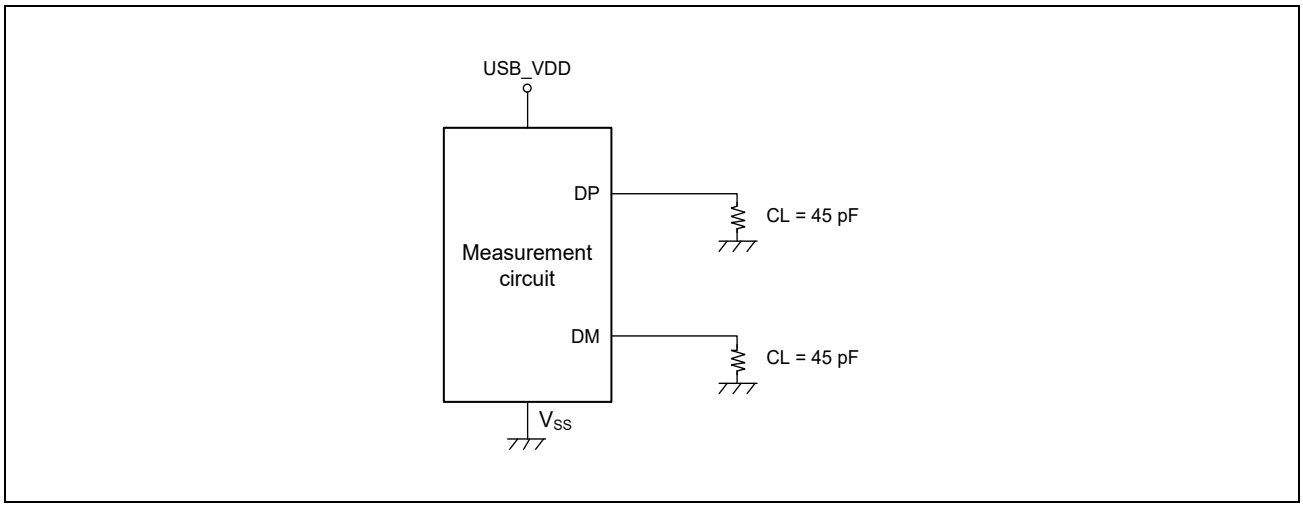

Figure 48.17 Measurement Circuit (Hi-Speed)

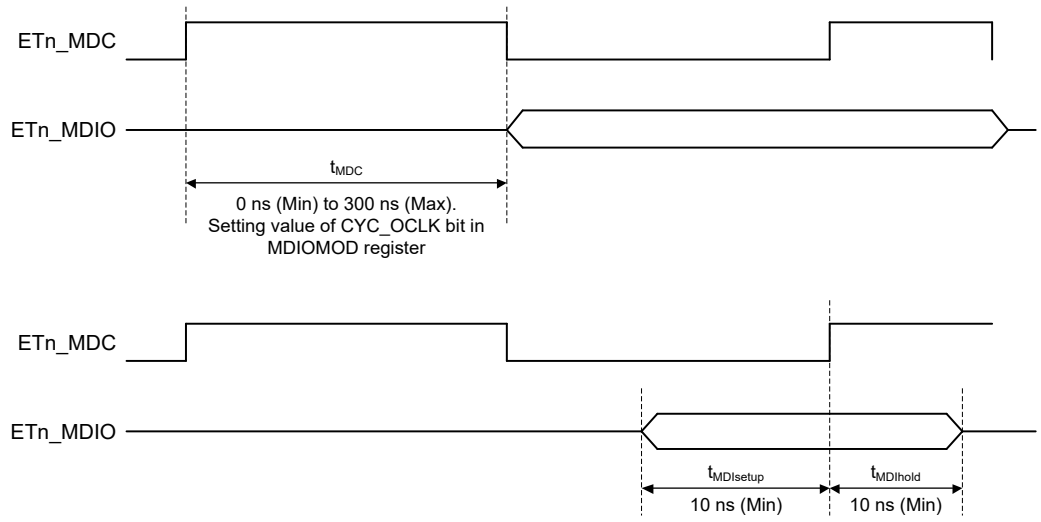
### 48.5.6 Ethernet Interface Access Timing

Table 48.31 Ethernet Interface Access Timing

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| MDC half cycle | $t_{MDC}$ | 0 | 300 | ns | **Figure 48.18** |
| MDI setup time | $t_{MDIsetup}$ | 10 | — | ns | |
| MDI hold time | $t_{MDIhold}$ | 10 | — | ns | |



**Note:** (n = 0, 1)

Figure 48.18 Management Interface

### 48.5.6.1 Ethernet-IF (Ether MII)

Table 48.32 Ethernet-IF Access Timing (Ether MII)

| Item | | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|---|
| Ether MII | ETH_GTXTXC_TXC period | $t_{Tcyc}$ | 40 | — | ns | **Figure 48.19** |
| | ETH_TXCTL output delay | $t_{TENd}$ | 0 | 25 | ns | |
| | ETH_TXD3-0 output delay | $t_{MTDd}$ | 0 | 25 | ns | |
| | ETH_RXC period | $t_{Rcyc}$ | 40 | — | ns | |
| | ETH_RXDV setup time | $t_{RDVs}$ | 10 | — | ns | |
| | ETH_RXDV hold time | $t_{RDVh}$ | 10 | — | ns | |
| | ETH_RXD3-0 setup time | $t_{MRDs}$ | 10 | — | ns | |
| | ETH_RXD3-0 hold time | $t_{MRDh}$ | 10 | — | ns | |
| | ETH_RXER setup time | $t_{RERs}$ | 10 | — | ns | |
| | ETH_RXER hold time | $t_{RERh}$ | 10 | — | ns | |

**Note:** I/O driving ability: 8 mA
CL = 8 pF

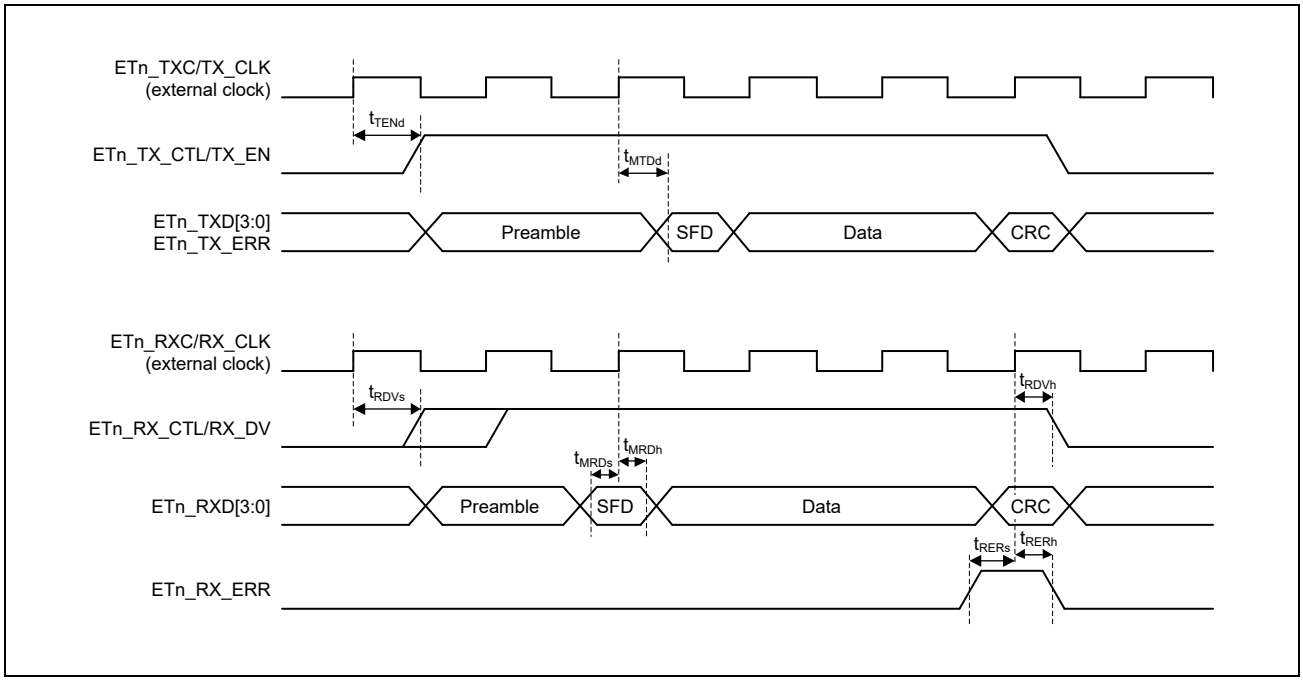


Figure 48.19 MII Transmission Timing

Validated with IEEE802.3 regulation.

The propagation delay for each twisted pair, measured from the MII connector to the PHY, shall not exceed 2.5 ns.

The variation in the propagation delay of the twisted pairs in a given cable bundle, measured from the MII connector to the PHY, shall not exceed 0.1 ns.

### 48.5.6.2 Ethernet-IF (Ether RGMII)

Table 48.33 Ethernet-IF Access Timing (Ether RGMII)

| Item | | Symbol | Min. | Typ. | Max. | Unit | capaci-tance | Remarks | Figures |
|---|---|---|---|---|---|---|---|---|---|
| Ether RGMII | Data to clock output skew @ transmitter | $T_{skewT}$ | −500 | 0 | 500 | ps | 8 pF | Tx RGMII | **Figure 48.20** |
| | Data to clock input skew @ receiver | $T_{skewR}$ | 1 | 1.8 | 2.6 | ns | 8 pF | | |
| | Data to clock output setup @ transmitter integrated delay | $T_{setupT}$ | 1.2 | 2.0 | — | ns | 8 pF | Rx RGMII-ID | **Figure 48.21** |
| | Clock to data output hold @ transmitter integrated delay | $T_{holdT}$ | 1.2 | 2.0 | — | ns | 8 pF | | |
| | Data to clock input setup setup @ receiver integrated delay | $T_{setupR}$ | 1.0 | 2.0 | — | ns | 8 pF | Rx RGMII-ID | **Figure 48.21** |
| | Data to clock input setup hold @ receiver integrated delay | $T_{holdR}$ | 1.0 | 2.0 | — | ns | 8 pF | | |
| | Clock cycle duration*1 | $T_{cyc}$ | 7.2 | 8 | 8.8 | ns | 8 pF | — | — |
| | Duty cycle for gigabit | Duty_G | 45 | 50 | 55 | % | 8 pF | | |
| | Duty cycle for 10/100T | Duty_T | 40 | 50 | 60 | % | 8 pF | | |
| | Rise/fall time (20-80%) | $T_r/T_f$ | — | — | 0.75 | ns | 8 pF | | |

Note 1. For 10 Mbps and 100 Mbps, $T_{cyc}$ will scale to 400ns ±40ns and 40ns ±4ns respectively.

### 48.5.9 Control Signal Access Timing

Table 48.36 Control Signal Timing

| Item | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|
| PRST# pulse width | $t_{RESW}$ | 20 | — | $t_{cyc}$*1 | **Figure 48.29** |
| TRST# pulse width | $t_{TRSW}$ | 20 | — | $t_{cyc}$*1 | |
| NMI pulse width | $t_{NMIW}$ | 20 | — | $t_{cyc}$*1 | **Figure 48.31** |
| IRQ pulse width | $t_{IRQW}$ | 20 | — | $t_{cyc}$*1 | |
| TINT pulse width | $t_{TINTW}$ | 20 | — | $t_{cyc}$*1 | |
| PRST# input rise time | $t_{RSr}$ | — | 500 | µs | **Figure 48.30** |

Note 1. $t_{cyc}$ = 41.666 ns (24 MHz)

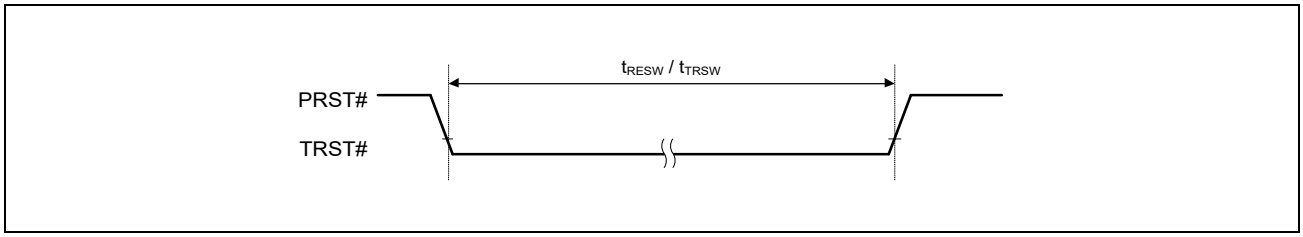

Figure 48.29 Reset Input Timing 1

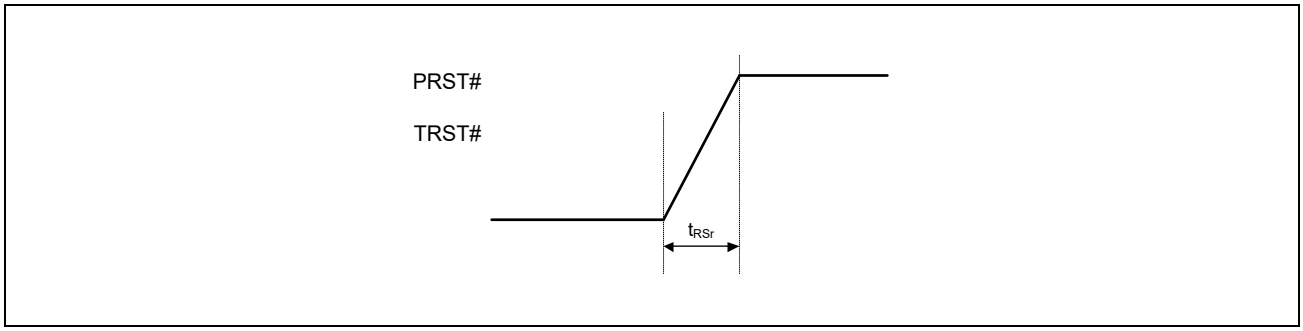

Figure 48.30 Reset Input Timing 2

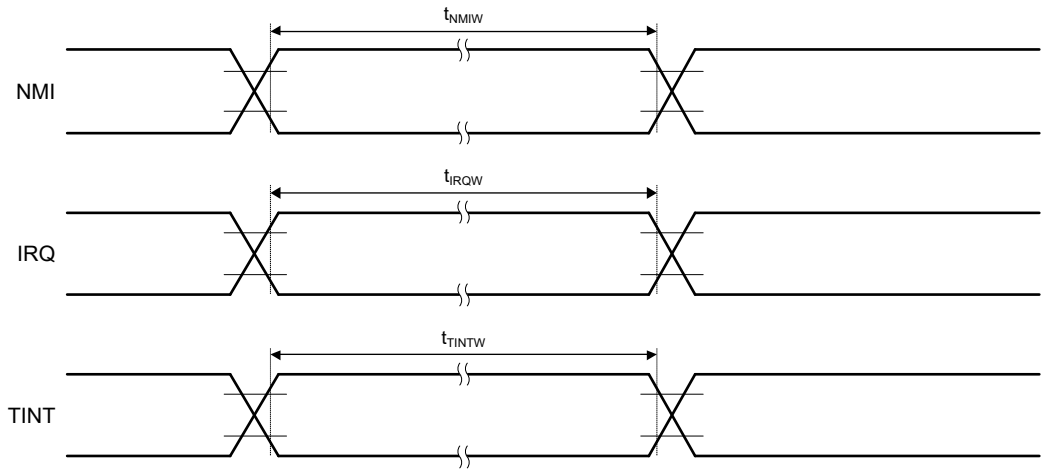

**Note:** This specification “(Min. 20 $t_{cycle}$)” is the min. pulse width the case that the digital noise filter is off. Refer to **Section 41, General Purpose Input Output Port (GPIO)** for Digital Noise Filter Settings in detail.

Figure 48.31 Interrupt Signal Input Timing

### 48.5.10 Serial Sound Interface (SSIF-2) Access Timing

Table 48.37 SSIF-2 Timing

| Item | I/O | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|---|
| Output clock cycle | Output | $t_O$ | 80 | 64000 | ns | **Figure 48.32** |
| Input clock cycle | Input | $t_I$ | 80 | — | ns | |
| Clock high | Bidirectional | $t_{HC}$ | 32 | — | ns | |
| Clock low | | $t_{LC}$ | 32 | — | ns | |
| Clock rise time/clock fall time | Output | $t_{RC}/t_{FC}$ | — | 25 | ns | |
| Setup time | Input | $t_{SR}$ | 25 | — | ns | **Figure 48.33**, **Figure 48.34**, **Figure 48.35** |
| Hold time | | $t_{HR}$ | 5 | — | ns | |
| SILRCK output delay time | Output | $t_{DTR}$ | −5 | 25 | ns | |
| Data output delay time (Noise canceler not in use) | | $t_{DTR}$ | −5 | 25 | ns | |
| Data output delay time (Noise canceler in use) | | $t_{DTR}$ | 10 | 50 | ns | |

**Note:** AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

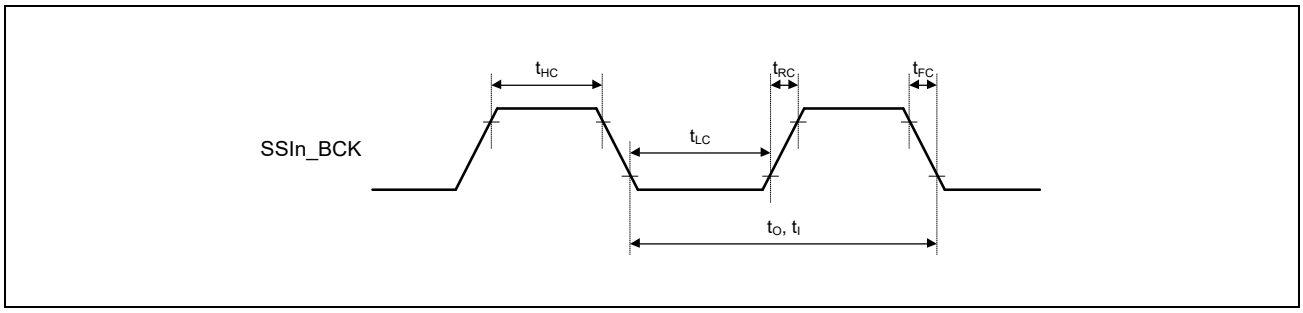

Figure 48.32 Bit Clock Input/Output Timing

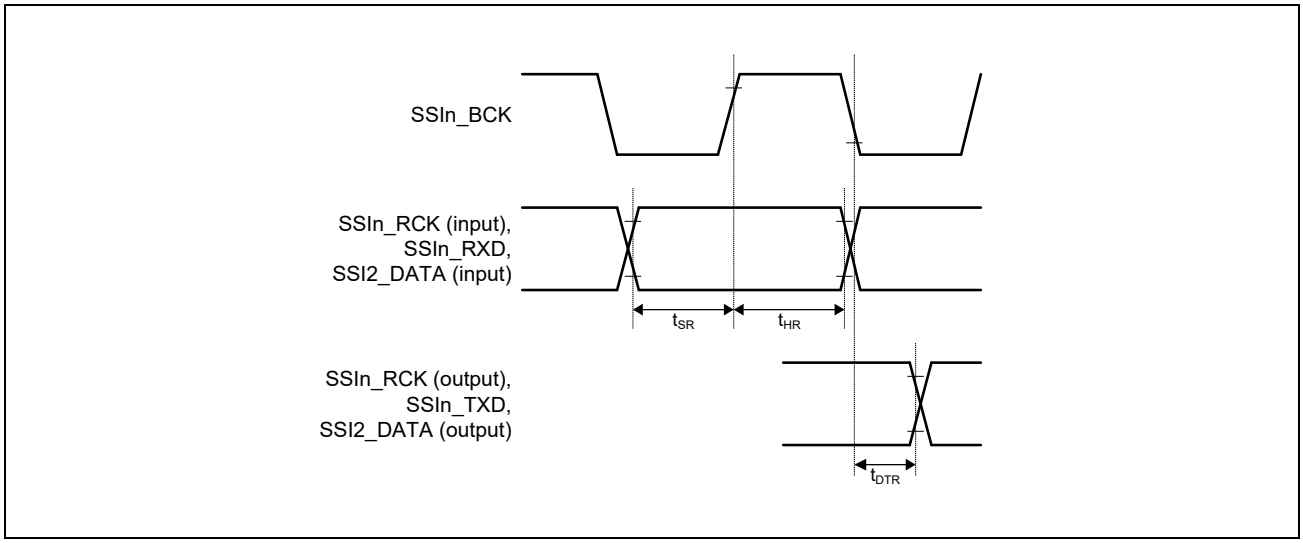

Figure 48.33 Transmission and Reception Timing (SSIBCK Falling Output)

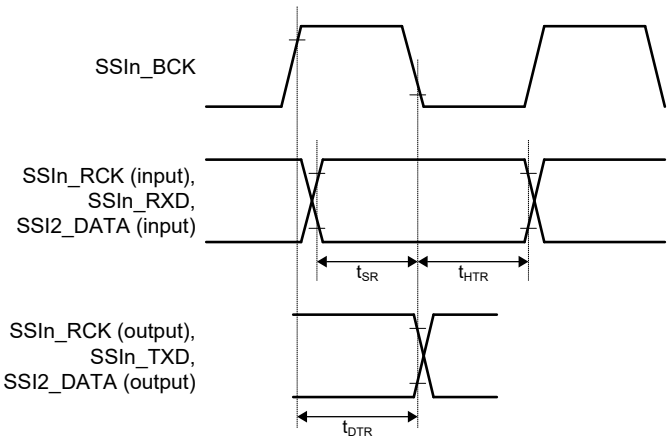

Figure 48.34 Transmission and Reception Timing (SSIBCK Rising Output)

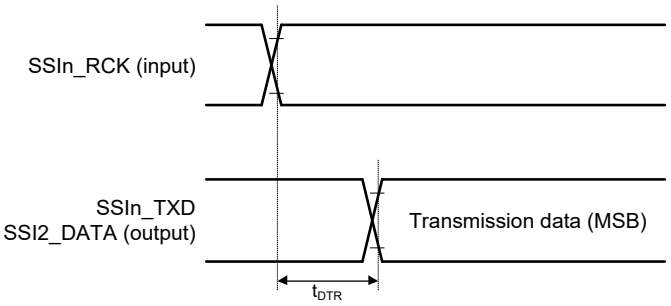

**Note:** Output timing of the MSB when slave transmission satisfies the following condition a) or b)
a) SSICR.DEL = 1, SSICR.SDTA = 0
b) SSICR.DEL = 1, SSICR.SDTA = 1, without padding

Figure 48.35 Transmission Timing (Slave, in Synchronization with SSILRCK)

### 48.5.11 CAN-FD Interface Access Timing

Table 48.38 CAN-FD Interface Timing

| Item | Symbol | CAN | | CAN-FD | | Unit | Figures |
|---|---|---|---|---|---|---|---|
| | | Min. | Max. | Min. | Max. | | |
| Internal delay time | $t_{node}$*1 | — | 100 | — | 75 | ns | **Figure 48.36** |
| Transmission rate | — | — | 1 | — | 4 | Mbps | |

**Note:** AC access timing condition: drive ability 12mA, output load 15pF, slew rate = fast

Note 1. Internal delay time ($t_{node}$) = Internal transfer delay time ($t_{output}$) + Internal receive delay time ($t_{input}$)

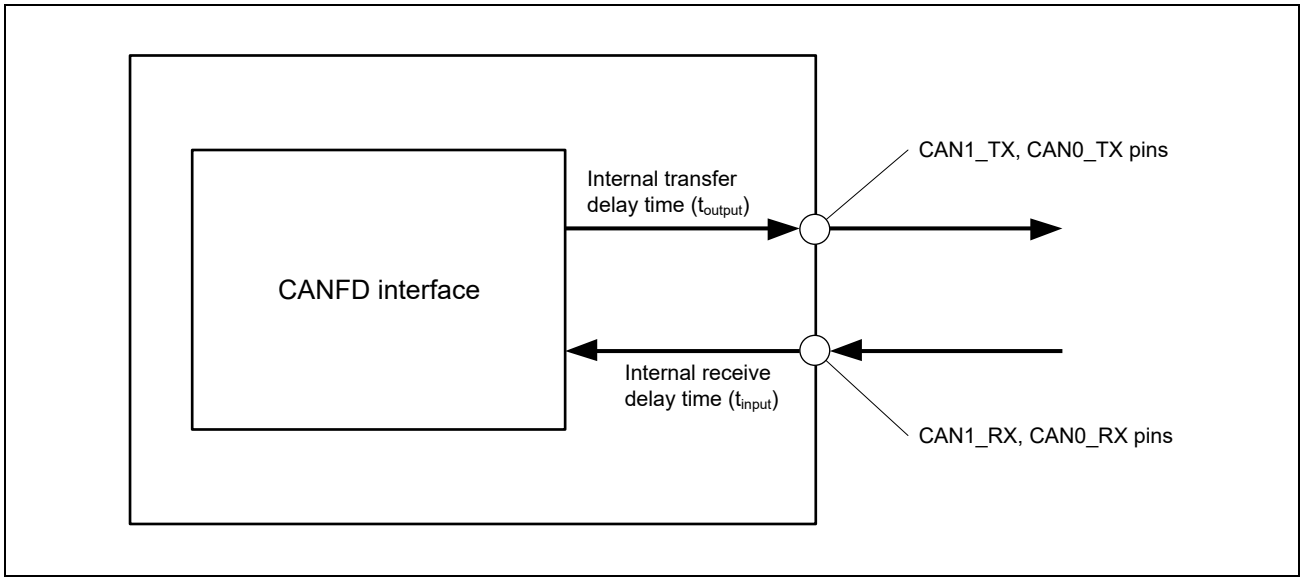

Figure 48.36 CAN-FD Interface Condition

## 48.5.12 Multi-Function Timer Pulse Unit 3 (MTU3a) Access Timing

Table 48.39 MTU3a Timing

| Item | | | Symbol | Min. | Max. | Unit*1 | Figures |
|---|---|---|---|---|---|---|---|
| MTU3a | Input capture input pulse width | Single-edge setting | $t_{MTICW}$ | 1.5 | — | $t_{p1cyc}$*1 | **Figure 48.37** |
| | | Both-edge setting | | 2.5 | — | | |
| | Timer clock pulse width | Single-edge setting | $t_{MTCKWH}$, $t_{MTCKWL}$ | 1.5 | — | $t_{p1cyc}$*1 | **Figure 48.38** |
| | | Both-edge setting | | 2.5 | — | | |
| | | Phase counting mode | | 2.5 | — | | |

**Note:** AC access timing condition: drive ability 4mA, output load 30pF, slew rate = fast

Note 1. $t_{p1cyc}$ indicates peripheral clock means MTU_X_MCLK_MTU3 (P0ϕ).

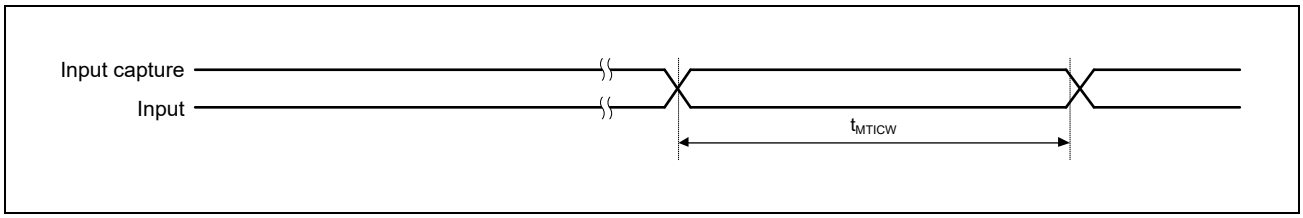

Figure 48.37 MTU3a Input Capture Input Timing

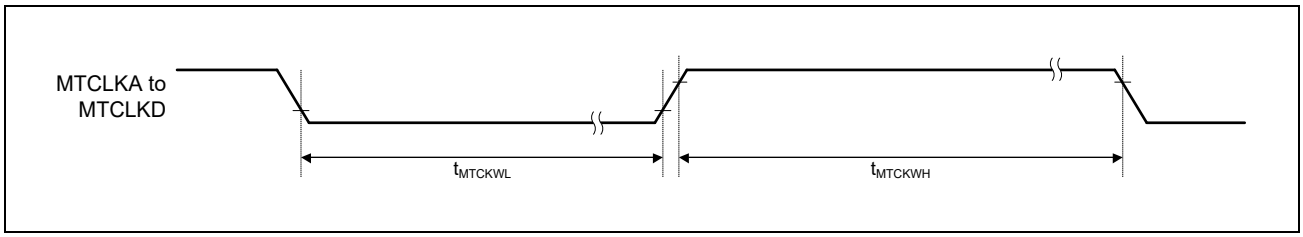

Figure 48.38 MTU3a Clock Input Timing

### 48.5.13 Port Output Enable 3 (POE3) Access Timing

Table 48.40 POE3 Timing

| Item | | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|---|
| POE3 | POEn# input pulse width | $t_{POE3W}$ | 1.5 | — | $t_{p1cy}$*1 | **Figure 48.39** |

Note 1. $t_{p1cyc}$ indicates peripheral clock means POE3_CLKM_POE (P0ϕ).

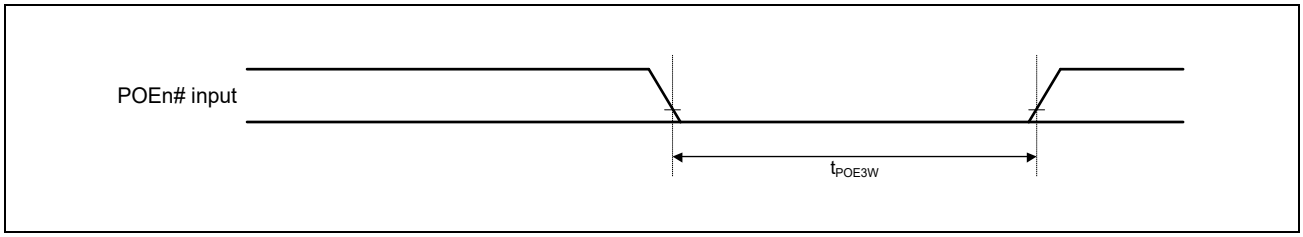

Figure 48.39 POEn# Input Pulse Timing

## 48.5.14 I²C Bus Interface Access Timing

Table 48.41 I²C Bus Interface Timing

| Item | Symbol | I/O | Standard Mode (Sm) | | Fast Mode (Fm) | | Fast Mode Plus (Fm+) | | Unit |
|---|---|---|---|---|---|---|---|---|---|
| | | | Min. | Max. | Min. | Max. | Min. | Max. | |
| SCL clock frequency | $f_{CLK}$ | I/O | 0 | 100 | 0 | 400 | 0 | 1000 | kHz |
| Bus free time (between stop and start condition) | $t_{BUF}$ | I/O | 4.7 | — | 1.3 | — | 0.5 | — | µs |
| Hold time*1 | $t_{HD:STA}$ | I/O | 4.0 | — | 0.6 | — | 0.26 | — | µs |
| Low period of SCL clock | $t_{LOW}$ | I/O | 4.7 | — | 1.3 | — | 0.5 | — | µs |
| High period of SCL clock | $t_{HIGH}$ | I/O | 4.0 | — | 0.6 | — | 0.26 | — | µs |
| Setup time for start / restart condition | $t_{SU:STA}$ | I/O | 4.7 | — | 0.6 | — | 0.26 | — | µs |
| Data hold time (I²C bus device) | $t_{HD:DAT}$ | I/O | 0*2 | — | 0*2 | — | 0 | — | µs |
| Data setup time | $t_{SU:DAT}$ | I/O | 250 | — | 100*3 | — | 50 | — | ns |
| SDA and SCL signal rise time | $t_R$ | Input | — | 1000 | 20 | 300 | — | 120 | ns |
| SDA and SCL signal fall time*3 | $t_F$ | Input | — | 300 | 20 × ($PV_{DD}$/ 5.5 V) | 300 | 20 × ($PV_{DD}$/ 5.5 V) | 120 | ns |
| | | Output | — | 300 | 20 × ($PV_{DD}$/ 5.5 V)*6 | 300*6 | 20 × ($PV_{DD}$/ 5.5 V)*7 | 120*7 | ns |
| Setup time for STOP condition | $t_{SU:STO}$ | I/O | 4.0 | — | 0.6 | — | 0.26 | — | µs |
| Capacitive load for each bus line | $C_b$ | — | — | 400*4 | — | 400*4 | — | 550*4 | pF |
| Pulse width of spikes that must be suppressed by the input filter | $t_{SP}$ | Input | — | — | 0 | 50*5 | 0 | 50*5 | ns |

**Note:** In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

**Note:** AC access timing condition: drive ability 4mA, output load 400pF, slew rate = slow

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches $V_{IL}$ (max.) from $V_{IH}$ (min.)).

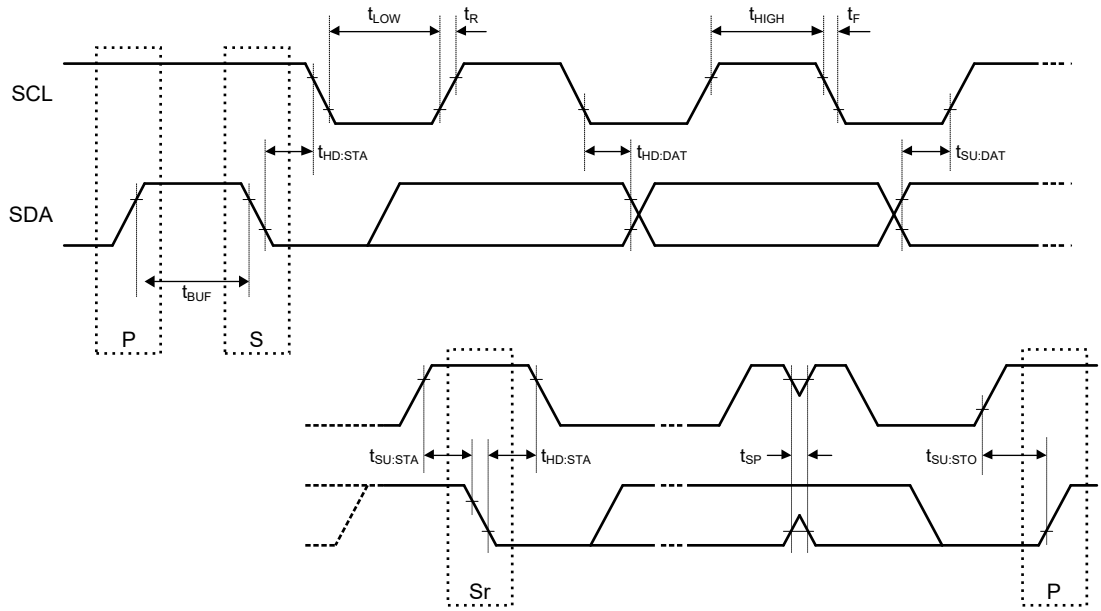
Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time ($t_{SU:\,DAT}$ (min.) 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock ($t_{LOW}$), this condition is automatically satisfied. If the system extends the low period of SCL clock ($t_{LOW}$), transmit the subsequent data bit to the SDA line before the SCL line is released ($t_R$ (max.) + $t_{SU:\,DAT}$ (min.) = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICϕ) and the NF[1:0] bits in RIICnMR3. For details, refer to **Section 26, I²C Bus Interface**.

Note 6. External pull-up resistor is required 1077Ω to 1770Ω when using RIIC ch2 or RIIC ch3.

Note 7. External pull-up resistor is required 240Ω to 257Ω when using RIIC ch2 or RIIC ch3.



**Note:** P: Stop condition
S: Start condition
Sr: Start condition for retransmission

Figure 48.40 Input/Output Timing

## 48.5.15 Serial Communications Interface with FIFO (SCIFA) Access Timing

Table 48.42 SCIFA Timing

| Item | | | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|---|---|
| SCIFA | Input clock cycle | Asynchronous | $t_{Scyc}$ | 4 | — | $t_{p1cyc}$*1 | **Figure 48.41** |
| | | Clocked synchronous | | 12 | — | | |
| | Input clock pulse width | | $t_{SCKW}$ | 0.4 | 0.6 | $t_{p1cyc}$*1 | |
| | Input clock rise time | | $t_{SCKr}$ | — | 5 | ns | |
| | Input clock fall time | | $t_{SCKf}$ | — | 5 | ns | |
| | Output clock cycle | Asynchronous*2 | $t_{Scyc}$ | 8 | — | $t_{p1cyc}$*1 | |
| | | Clocked synchronous | | 4 | — | | |
| | Output clock pulse width | | $t_{SCKW}$ | 0.4 | 0.6 | $t_{p1cyc}$*1 | |
| | Output clock rise time | | $t_{SCKr}$ | — | 9 | ns | |
| | Output clock fall time | | $t_{SCKf}$ | — | 9 | ns | |
| | Transmit data delay time | Internal clock | $t_{TXD}$ | −10 | 10 | ns | **Figure 48.42** |
| | | External clock | | 3 × $t_{p1cyc}$*1 | 4 × $t_{p1cyc}$*1 + 20 | | |
| | Receive data setup time | Internal clock | $t_{RXS}$ | 3 × $t_{p1cyc}$*1 + 20 | — | ns | |
| | | External clock | | $t_{p1cyc}$*1 + 10 | — | | |
| | Receive data hold time | Internal clock | $t_{RXH}$ | −3 × $t_{p1cyc}$*1 | — | ns | |
| | | External clock | | 2 × $t_{p1cyc}$*1 + 10 | — | | |

**Note:** AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

Note 1. $t_{p1cyc}$ indicates peripheral clock means SCIFn_CLK_PCK (P0ϕ) (n = 0 to 4).

Note 2. When the SEMR.ABCS0 and SEMR.BGDM bits are set to 1.

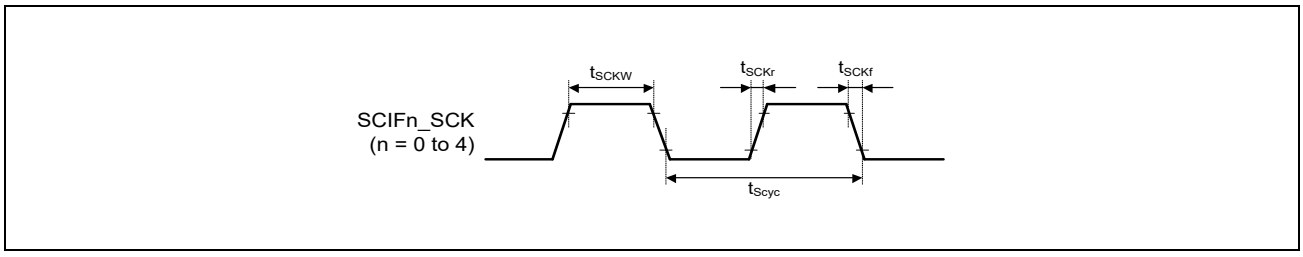


Figure 48.41 SCK Input Clock Timing

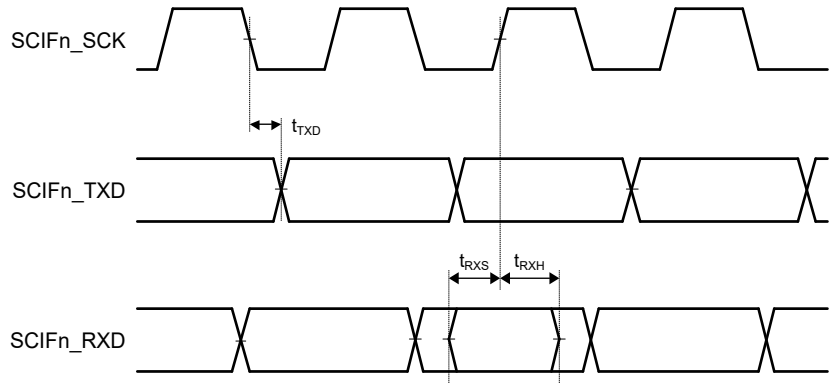

**Note:** n = 0 to 4

Figure 48.42 SCIFA Input/Output Timing in Clocked Synchronous Mode

## 48.5.16 Serial Communications Interface (SCIg) Access Timing

Table 48.43 SCIg Timing

| Item | | | Symbol | Min. | Max. | Unit | Figures |
|---|---|---|---|---|---|---|---|
| SCIg | Input clock cycle | Asynchronous | $t_{Scyc}$ | 4 | — | $t_{p1cyc}$*1 | **Figure 48.43** |
| | | Clocked synchronous | | 6 | — | | |
| | Input clock pulse width | | $t_{SCKW}$ | 0.4 | 0.6 | $t_{p1cyc}$*1 | |
| | Input clock rise time | | $t_{SCKr}$ | — | 5 | ns | |
| | Input clock fall time | | $t_{SCKf}$ | — | 5 | ns | |
| | Output clock cycle | Asynchronous*2 | $t_{Scyc}$ | 8 | — | $t_{p1cyc}$*1 | |
| | | Clocked synchronous | | 4 | — | | |
| | Output clock pulse width | | $t_{SCKW}$ | 0.4 | 0.6 | $t_{p1cyc}$*1 | |
| | Output clock rise time | | $t_{SCKr}$ | — | 5 | ns | |
| | Output clock fall time | | $t_{SCKf}$ | — | 5 | ns | |
| | Transmit data delay time | Clocked synchronous | $t_{TXD}$ | — | 28 | ns | **Figure 48.44** |
| | Receive data setup time | Clocked synchronous | $t_{RXS}$ | 15 | — | ns | |
| | Receive data hold time | Clocked synchronous | $t_{RXH}$ | 5 | — | ns | |

**Note:** AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

Note 1. $t_{p1cyc}$ indicates peripheral clock means SCIn_CLKP (P0ϕ) (n = 0 to 1).

Note 2. When the SEMR.ABCS0 and SEMR.BGDM bits are set to 1.

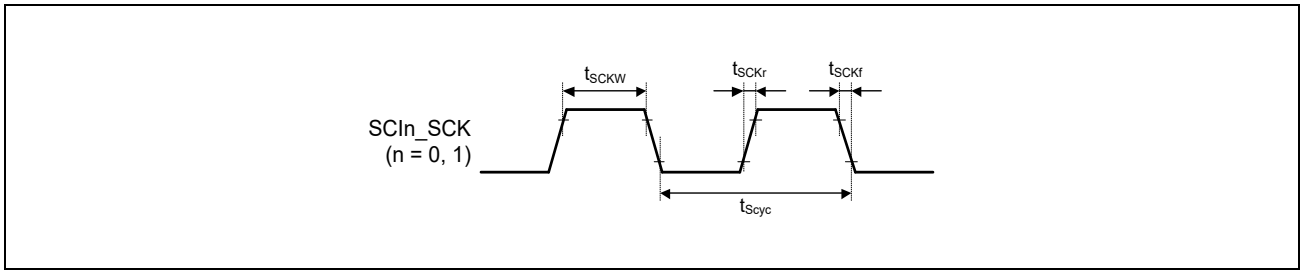

Figure 48.43 SCK Input Clock Timing

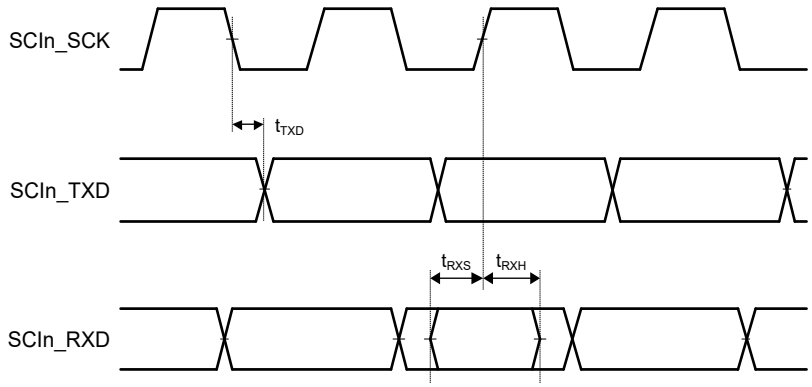


**Note:** n = 0, 1

Figure 48.44 SCIFA Input/Output Timing in Clocked Synchronous Mode

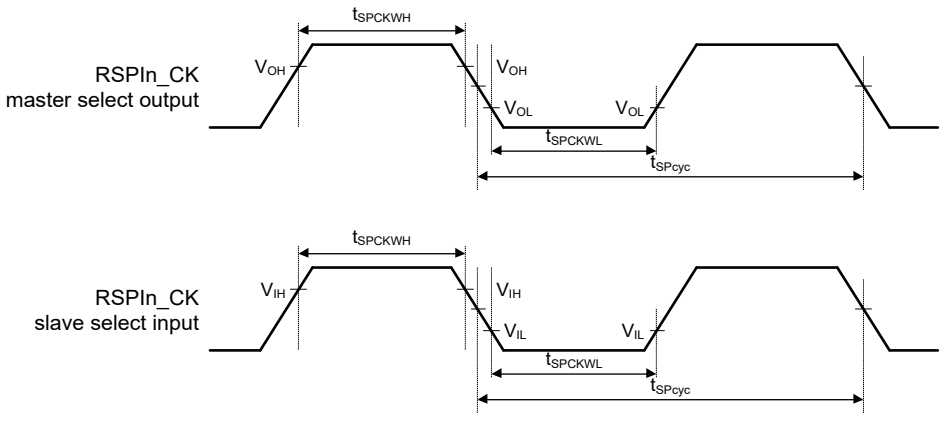
## 48.5.17 Renesas Serial Peripheral Interface (RSPI) Access Timing

Table 48.44 Renesas Serial Peripheral Interface Timing

| Item | | Symbol | Min. | Max. | Unit | Figure |
|---|---|---|---|---|---|---|
| RSPCK clock cycle | Master | $t_{SPcyc}$ | 2 | 4096 | $t_{p1cyc}$*1 | **Figure 48.45** |
| | Slave | | 8 | 4096 | | |
| RSPCK clock high pulse width | Master | $t_{SPCKWH}$ | 0.4 | — | $t_{SPcyc}$*1 | |
| | Slave | | 0.4 | — | | |
| RSPCK clock low pulse width | Master | $t_{SPCKWL}$ | 0.4 | — | $t_{SPcyc}$*1 | |
| | Slave | | 0.4 | — | | |
| Data input setup time | Master | $t_{SU}$ | 10 | — | ns | **Figure 48.46** to **Figure 48.49** |
| | Slave | | 0 | — | $t_{p1cyc}$*1 | |
| Data input hold time | Master | $t_H$ | 0 | — | ns | |
| | Slave | | 4 | — | $t_{p1cyc}$*1 | |
| SSL setup time | Master | $t_{LEAD}$ | 1 × $t_{SPcyc}$ − 20 | 8 × $t_{SPcyc}$ | ns | |
| | Slave | | 4 | — | $t_{p1cyc}$*1 | |
| SSL hold time | Master | $t_{LAG}$ | 1 × $t_{SPcyc}$ | 8 × $t_{SPcyc}$ + 20 | ns | |
| | Slave | | 4 | — | $t_{p1cyc}$*1 | |
| Data output delay time | Master | $t_{OD}$ | — | 19 | ns | |
| | Slave | | — | 4 | $t_{p1cyc}$*1 | |
| Data output hold time | Master | $t_{OH}$ | 5 | — | ns | |
| | Slave | | 2 | — | $t_{p1cyc}$*1 | |
| Continuous transmission delay time | Master | $t_{TD}$ | 1 × $t_{SPcyc}$ + 2 × $t_{cyc}$ | 8 × $t_{SPcyc}$ + 2 × $t_{cyc}$ | ns | |
| | Slave | | 4 × $t_{cyc}$ | — | | |
| Slave access time | | $t_{SA}$ | — | 4 | $t_{p1cyc}$*1 | **Figure 48.48**, **Figure 48.49** |
| Slave out release time | | $t_{REL}$ | — | 3 | $t_{p1cyc}$*1 | |

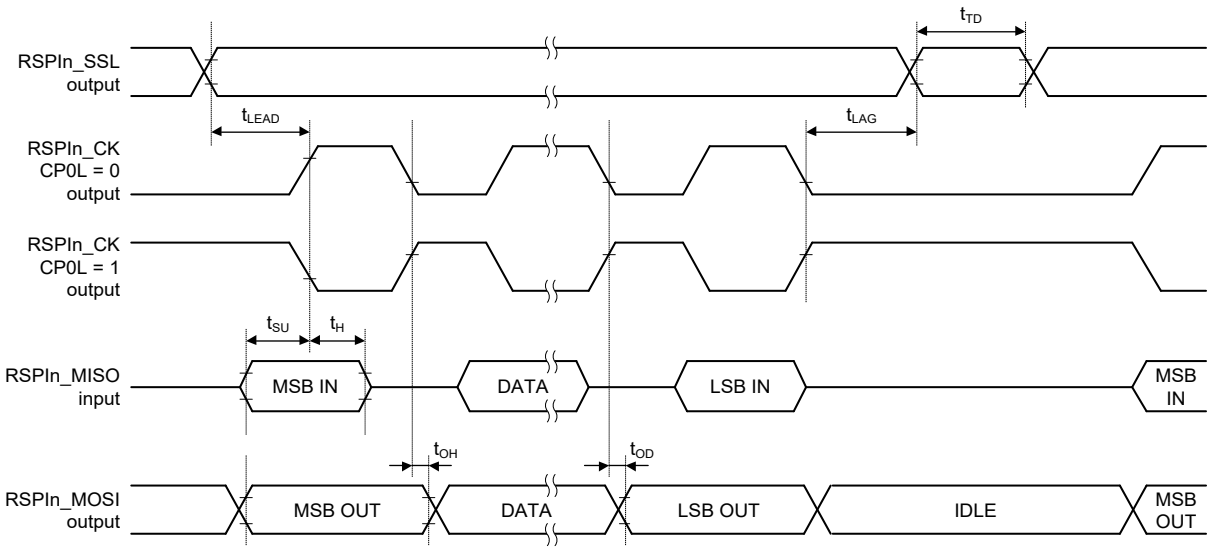
**Note:** AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

Note 1. $t_{p1cyc}$ indicates peripheral clock means RSPIn_CLKB (P0ϕ) (0 to 2).



**Note:** n = 0 to 2

Figure 48.45 Clock Timing



**Note:** n = 0 to 2

| REVISION HISTORY | RZ/G2UL Group User's Manual: Hardware |
|---|---|

| Rev. | Date | Description | |
|---|---|---|---|
| | | Page | Summary |
| 1.00 | Apr 28, 2022 | — | First edition issued |
| 1.10 | Sep 26, 2022 | 4. Boot Mode | |
| | | 94 | 4.1 Overview: Note added for starting the user program |
| | | 7. Clock Pulse Generator (CPG) | |
| | | 471 | 7.4.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers: The description "Division ratio setting (PLL1) register (CPG_PL1_DDIV)", added |
| | | 35. Camera Data Receiving Unit (CRU) | |
| | | 2578 | Table 35.2 Supported Image Format and Maximum Transfer Rate: No.12, ICnMC.ICTHR (the column), deleted |
| | | 2583 | 35.1.6.2 Module Control Register 0 (CSI2nMCT0): The R/W attribute and description on bit 20, modified |
| | | 2592 | 35.1.6.12 Receive Status Clear Register (CSI2nRXSC): The R/W attribute on bit 24, modified |
| | | 2593 | 35.1.6.13 Receive Interrupt Enable Register (CSI2nRXIE): The R/W attribute on bit 24, modified |
| | | 2596 | 35.1.6.15 Data Lane (N) Status Clear Register (CSI2nDLSC(N)): The R/W attribute on bits 19, 18, 11, 10, 9, and 8, modified |
| | | 2597 | 35.1.6.16 Data Lane (N) Interrupt Enable Register (CSI2nDLIE(N)): The R/W attribute and description on bits 19, 18, 11, 10, 9, and 8, modified |
| | | 2609 | 35.1.6.23 Generic Short Packet Control Register (CSI2nGSCT): The R/W attribute and description on bit 17, modified |
| | | 2614 | 35.1.6.29 D-PHY Control Register 0 (CSIDPHYCTRL0): The R/W attribute on bit 16, 8, and 2, modified |
| | | 2615 | Table 35.7 Recommended Setting Values of the D-PHY Timing Register: The transmission rate for No. 3 to 6, modified |
| | | 2626, 2627 | 35.2.1.1 Features: The description on the operating ranges, output data format (type), image format conversion, and conversion by using a lookup table (LUT), modified |
| | | 2628 | Figure 35.8 Block Diagram of the Image Processing Module, modified |
| | | 2633 | 35.2.3.1 CRU Control Register (CRUnCTRL): The R/W attribute and description on bit 1, modified |
| | | 2634 | 35.2.3.2 CRU Interrupt Enable Register (CRUnIE): The R/W attribute and description on bits 31 to 29, and 11 to 8, modified |
| | | 2635 | 35.2.3.3 CRU Interrupt Status Register (CRUnINTS): The R/W attribute and description on bits 31 to 29, and 11 to 8, modified |
| | | 2647 | 35.2.3.24 Memory Bank Enable Register for CRU Image Data (AMnMBVALID): The description on bits 7 to 0 (MBVALID[7:0]), modified |
| | | 2648 | 35.2.3.26 AXI Master Transfer Setting Register for CRU Image Data (AMnAXIATTR): The R/W attribute and description on bits 27 to 24, 22 to 16, 13 to 12, 9 to 8, and 6 to 4, modified. The description on bits 3 to 0 (AXILEN[3:0]), modified. |
| | | 2656, 2657 | 35.2.3.34 CRU Image Processing Main Control Register (ICnMC): The R/W attribute and description on bits 25 to 24, and 15, modified. The description on bits 13 to 12 (CLP[1:0]), modified. The R/W attribute and description on bit 7, modified. The description and note on bit 6 (LUTTHR), modified. The note on bit 5 (CSCTHR), modified. The R/W attribute and description on bits 4 to 3, modified. The note on bit 2 (CLPTHR), modified. The note on bit 1 (DECTHR), modified. The bit name (ICTHR → Reserved) and description on bit 0, modified. |
| | | 2658 | Figure 35.9 Bypass Setting of Each Function, modified |
| | | 2673 | 35.2.3.53 CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (ICnYCCR3): The R/W attribute and description on bits 31 and 16, modified |
| | | 2675 | 35.2.3.56 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 3 Register (ICnCBCCR3): The R/W attribute and description on bits 31 and 16, modified |

| Rev. | Date | Description | |
|---|---|---|---|
| | | Page | Summary |
| 1.10 | Sep 26, 2022 | 2677 | 35.2.3.59 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 3 Register (ICnCRCCR3): The R/W attribute and description on bits 31 and 16, modified |
| | | 2685 | Table 35.10 Input Format and Image Processing (1/2), modified: All Bypassed (ICnMC.ICTHR = 1) (the column), deleted. MIPI CSI-2 Recommended Memory Storage Format (the column), added. |
| | | 2686 | Table 35.10 Input Format and Image Processing (2/2), modified: All Bypassed (ICnMC.ICTHR = 1) (the column), deleted. MIPI CSI-2 Recommended Memory Storage Format (the column), added. Note 2 and Note 3, added. |
| | | 2687 | Table 35.11 Image Output Formats (1/2), modified: MIPI CSI-2 Recommended Memory Storage Format, added |
| | | 2688 | Table 35.11 Image Output Formats (2/2), modified: MIPI CSI-2 Recommended Memory Storage Format, added |
| | | 2693 | 35.2.4.4 RGB565/RGB666 to RGB888, added |
| | | 2693 | 35.2.4.5 MIPI CSI-2 Recommended Storage format, added |
| | | 2695 | 35.2.4.9 Data Clipping: The description for YCbCr-10bit, added |
| | | 2709 | Figure 35.29 Initializing Image Processing (MIPI CSI-2 Input): “ICnMC.ICTHR” in “Set modes”, deleted |
| 1.20 | Jun 15, 2023 | All | Hexadecimal notation, unified to H'xx |
| | | 1. Overview | |
| | | 69 | 1.2.11 Peripheral Module: Renesas Serial Peripheral Interface (RSPI): The description on the maximum transfer rate, deleted |
| | | 72 | 1.3 Product Lineup, added |
| | | 2. System CPU Cortex-A55 | |
| | | 73 | Table2.2 Core Configuration: AArch32, deleted |
| | | 4. Boot Mode | |

| | | Page | Summary |
| 1.20 | Jun 15, 2023 | 26. $I^2C$ Bus Interface | |
| | | 1293 | 26.3.1 RIICnCR1 — $I^2C$ Bus Control Register 1: The description of bit 3 (SCLO), modified (SDA Output Control → SCL Output Control) |
| | | 1346 | Figure 26.15 Example of Slave Transmission Flowchart: The judgement, modified (ansmitted? → All data transmitted?) |
| | | 30. Gigabit Ethernet Interface | |
| | | 1865 | 30.4.1.21 Error Interrupt Disable Register (EID): The description (register name), modified |
| | | 2027 | Figure 30.31 Supported Frame of IPv4: Modified (ICMP/TCP/UDPTCP Data → ICMP/TCP/UDP Data) |
| | | 31. A/D Converter | |
| | | 2068 | 31.1 Features: The input channels and the data registers, modified |
| | | 2083 | 31.3.9 A/D Conversion Result Registers 3 to 0 (ADCR3 to ADCR0): The register, modified |
| | | 2084 | Figure 31.3 Relationship between Analog Input Voltage and A/D Conversion Result: A/D conversion result registers, modified |
| | | 32. USB2.0 | |
| | | 2118 | Table 32.6 USBPHY Control Register List: VBUSEN control register, added |
| | | 2122 | 32.3.4 VBUSEN control register (VBENCTL), added |
| | | 32A. USB 2.0 Host Module | |
| | | 2133 | 32A.1.2.3 OTG function: The description of the OTG_PERI bit, modified |
| | | 2180 | 32A.2.4.3, (3) USBINTR Register: The section title, modified |
| | | 2205 | 32A.2.4.5, (1) Common Control Register: The description of bit 31 (OTG_PERI), modified |
| | | 2206 | 32A.2.4.5, (2) OTG-BC Interrupt Status Register: Bit 3 (VBSTAINT_STA) and bit 2 (VBSTACHG_STA), changed to reserved bits |
| | | 2207 | 32A.2.4.5, (3) OTG-BC Interrupt Enable Register: Bit 3 (VBSTAINT_EN) and bit 2 (VBSTACHG_EN ), changed to reserved bits |
| | | 2208 | 32A.2.4.5, (4) VBUS Control Register: Bit 0: changed (Reserved → the VBOUT bit) |
| | | 2209 | 32A.2.4.5, (5) Line Control Port 1 Register: Bits 25 and 24 (VDPMLLVL[1:0]), changed to reserved bits |
| | | 2217 | 32A.4.2.3 U2H_EHCI_INT assertion source and control: [Interrupt enable control by register]: The description (bit), modified. [Interrupt source]: The row of bit [17], deleted. The description of bit[16] and bit[2], modified. |
| | | 2219 | 32A.4.2.5 U2H_OBINT assertion source and control: [Interrupt enable control by register]: The description (bits), modified; [Interrupt source]: The rows of bit [3], bit [2], deleted; The description of the VBUSIN pin for Interrupt Source (1, 2), deleted; [Clearing the interrupt]: The description (bits), modified |
| | | 2227 | 32A.8.3 Port Power (VBUS) control specifications: The description, modified |
| | | 33. LCDC | |
| | | 2416 | Table 33.1 Sub modules in FCPVD: The description of COMP, modified |
| | | 2427 | Table 33.4 Clock List: The frequency for LCDC_CLK_D, modified |
| | | 2428 | Table 33.6 FCPVD Register Configuration: FCPVD configuration register 0, FCP reset register, and FCP status register, deleted |
| | | 2432 | Table 33.8 DU Register Configuration: DU Display I/F Timing Register 5, deleted |
| | | — | 33.3.1.2 FCPVD Configuration Register 0 (FCP_CFG0), deleted |
| | | — | 33.3.1.3 FCP Reset Register (FCP_RST), deleted |
| | | — | 33.3.1.4 FCP Status Register (FCP_STA), deleted |
| | | 2443 | 33.3.2.4, (7) Software Reset Register (VI6_SRESET): Note 5, deleted |
| | | 2466 | Figure 33.7 Chrominance Interpolation Methods Selectable through CIPM Setting: VSP → VSPD |
| | | 2529 | 33.3.2.10, (4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL): The description (unit), modified |

| | | Page | Summary |
| 1.20 | Jun 15, 2023 | 2546 | 33.3.3.8 DU Display I/F Timing Register 3 (DU_DITR3): The description of bits 11 to 0 (HSA), modified |
| | | 2547 | 33.3.3.9 DU Display I/F Timing Register 4 (DU_DITR4): The description of bits 28 to 16 (HFP), and bits 12 to 0 (HBP), modified |
| | | — | 33.3.3.10 DU Display I/F Timing Register 5 (DU_DITR5), deleted |
| | | 2548 | 33.3.3.10 DU Module Control Register 1 (DU_MCR1), Bit 8 (UPD_SZ), changed to a reserved bit |
| | | 2552 | 33.4.1 (a) FCPVD initialization, deleted |
| | | 2552 | 33.4.1 (c) To stop image process immediately, deleted |
| | | 2552 | 33.4.2 Reset Operation: The description, modified |
| | | — | 33.4.2.1 Software Reset, deleted |
| | | 2552 | 33.4.3 Registers to set fixed value: The description of [11], added |
| | | 2557 | Table 33.31 Definition of a Function for Simple Description: Syntax; I = 0; i<num_bits; i++) → i = 0; i<num_bits; i++) |
| | | 2564 | 33.4.8.1 Operation flow of VSPD and DU: The description, modified (VSP2 → VSPD) |
| | | — | Figure 33.41 Setting flow to stop VSPD linked with DU, deleted |
| | | 2565 | Figure 33.40 Updating display list at arbitrary timing: VSP2 → VSPD |
| | | 2566 | Figure 33.41 Controlling Two Register Planes Using a Display List: The description, added; VSP1 → VSPD, VSP → VSPD |
| | | 2570 | Figure 33.42 Input/output Size for Each Module in a Sample DPR Connection: VSP → VSPD |
| | | 35. Camera Data Receiving Unit (CRU) | |
| | | 2576, 2577 | Table 35.4 Register Configuration of MIPI CSI-2 LINK: The table header, modified (Address → Offset Address) |
| | | 2676 | 35.2.3.62 CRU Lookup Table Pointer Register (ICnLUTP): Bits 29 to 20: Bit Name: LTYPR[9:0] → LTCRPR[9:0]; The description, modified. Bits 9 to 0: Bit Name: LTCRPR[9:0] → LTYPR[9:0]; The description, modified. |
| | | 2677 | 35.2.3.63 CRU Lookup Table Data Register (ICnLUTD): Bits 23 to 16: Bit Name: LTYDT[7:0] → LTCRDT[7:0]; The description, modified. Bits 7 to 0: Bit Name: LTCRDT[7:0] → LTYDT[7:0]; The description, modified. |
| | | 2691 | 35.2.4.8 Data Arrange: The description, modified |
| | | 2692 | 35.2.4.10, (1) RGB to YCbCr: Register Settings: The register settings, modified |
| | | 2698 | 35.2.4.14, (5) Generated Image Data Example (in the Case of Pattern Generation): The description (the setting values for TIPTNV1[3:0]), modified |
| | | 36. Image Scaling Unit (ISU) | |
| | | — | All: collection → correction |
| | | 2718 | Table 36.2 Descriptor Format: Item: Setting Range of Register Address 2, 3, 4, modified |
| | | 2724 | Table 36.5 Output Image Setting: The register of No. (1), (2), modified. The variation for No. (4), modified. |
| | | 2726 | 36.1.3.2 Formatter: The section title, modified (Data Extraction → Formatter ). The description, modified. |
| | | 2729 | 36.1.3.3 Data Extraction: The section title, modified (Formatter → Data Extraction ). The description, modified. |
| | | 2741 | Figure 36.32 Color Correction Equation, modified |
| | | 2749 | Figure 36.43 Data Swap Correction: The byte address, modified (RD_SWAP_*** → WD_SWAP_***) |
| | | 2761 | 36.3.8 AXI FIFO Capability Registers (ISU_AXI_FIFO_CAP): The initial values of bits 30 to 24 (SCAP_PL0[6:0]), and bits 14 to 8 (DCAP_PL0[6:0]), modified |
| | | 2766 | 36.3.15 RPF Source Image Format Registers (ISU_RPF_FMT): The reference, modified; Bit 5 to 0 in the table of bits, modified |

| Rev. | Date | Description | |
|---|---|---|---|
| | | Page | Summary |
| 1.20 | Jun 15, 2023 | 2767 | 36.3.16 RPF Source Image UV Format Registers (ISU_RPF_UVBIN): The reference, modified |
| | | 2768 | 36.3.18 RPF Source ALPHA Data Selection Registers (ISU_RPF_ALPH_SEL): The reference, modified |
| | | 2781 | 36.3.33 WPF Destination Image Format Registers (ISU_WPF_FMT): The reference, modified |
| | | 2793 | 36.3.49 AXI Max Burst Length Registers (ISU_AXI_BLEN): Bit 19 to 16(ARLEN_MAX[3:0]): The initial value of bits 3 to 0 (AWLEN_MAX[3:0]), modified |
| | | 2794 | Table 36.11 Explanation for ISU FM Frame Control Registers (ISU_FM_FRCON): The table title, modified |
| | | 2794 | Figure 36.44 Relationship Between Register ISU_FM_FRCON Setting and Frame Processing Mode: The figure title, modified |
| | | 2800 | Table 36.13 Image Size Conversion Example 1 (Descriptor Table 1, 1st frame) (1/2): The comment for Header, modified |
| | | 2801 | Table 36.14 Image Size Conversion Example 1 (Descriptor Table 2, 2nd frame): The comment for Header, modified |
| | | 2812 | 36.5.2.2 YCbCr422 → ARGB8888: The conversion formula from YCbCr422 to RGB, modified |
| | | 2814 | 36.5.2.3 BGR888 → YCbCr422: The section title, modified |
| | | 2814 | Table 36.24 Color Format Conversion Example 3: The description of Input stride, modified |
| | | 40. SD/MMC Host Interface | |
| | | 2816 | 40.1.1 Features: The channels, added. NOTE, deleted. |
| | | 2822 | 40.2.2 Command Argument Register (SD_ARG): SD_ARG: Bits 63 to 32 (Reserved), added. SD_ARG1: Bits 63 to 16 (Reserved), added. |
| | | 2826 | 40.2.5 SD Card Response Registers (SD_RSP): SD_RSP5, modified (31 to 16 (Reserved) → 63 to 16 (Reserved)) |
| | | 2837 | 40.2.10 SD Clock Control Register (SD_CLK_CTRL): The description of bits 7 to 0 (DIV7 to DIV0), modified |
| | | 2840 | 40.2.12 SD Card Access Control Option Register (SD_OPTION): The description of bit 15 (WIDTH), modified |
| | | 2849 | 40.2.23 SD Interface Mode Setting Register (SDIF_MODE): The description (mode), modified. Bit 0 (DDR), changed to a reserved bit. |
| | | — | Figure 40.4 SDDAT in 4-Bit Width DDR Mode, deleted |
| | | — | Figure 40.6 SDDAT in 8-Bit Width DDR Mode, deleted |
| | | 2859 | 40.3.1, (2) Bus Signal Voltage Switch: The description of (4), modified |
| | | 2861 | Figure 40.7 SD Card Detect with SDDAT3: The card detect, modified (2P1ϕ → SDxϕ/2 (x = 0, 1)) |
| | | 2895 | Table 40.9 Example of SD_CMD Register Setting (MMC): The remark of CMD21, deleted |
| | | 2900 | 40.6.3 SCC Register Configuration: Base Address of Cortex-M33, added |
| | | 41. General Purpose Input Output Port (GPIO) | |
| | | 2965 | 41.4.2 Operation for Peripheral Function: (2), The number of the functions, modified |
| | | 42. Low Power Mode | |
| | | 2970 | Table 42.3 Registers for Module Standby Mode: The register name, modified (OSTM → GTM) |
| | | 45. Trusted Secure IP | |
| | | 3007 | Table 45.1 Specifications of Trusted Secure IP: RSA for Encryption engine: Number of cycles for execution, added |
| | | 48. Electrical Characteristics | |
| | | 3021 | Figure 48.1 Power-On/Power-Off Sequence, modified (PVDD182533 → PVDD182533_0/1, PLL1/2/3/4/5/6_AVDD18 → PLL1/23/4/5/6_AVDD18) |

| | | Page | Summary |
| 1.30 | Oct 31, 2023 | 1398 | Figure 27.9 Alignment Setting of Placement Data in Reception, modified (010 to 100 → 010 to 101) |
| | | 1403, 1406, 1408, 1410 | 27.4.1.2 Status Register (SSISR): TUIRQ Bit, TOIRQ Bit, RUIRQ Bit, and ROIRQ Bit: [Clearing condition], modified (When either the following → When either of the following) |
| | | 1411 | Figure 27.18 ROIRQ Setting Timing: The waveform of SSIn_RCK, modified |
| | | 1417 | Figure 27.22 Timing chart when it begins to communicate master from system reset: The place of the description of “BCK output enable”, modified |
| | | 1437 | 27.4.1.8 Status Control Register (SSISCR): Hexadecimal notation, unified |
| | | 1461 | Figure 27.57 Procedure to Resume Communication (CPU Procedure): The place of the description of processing “Writing transmit data to FIFO”, modified |
| | | 30. Gigabit Ethernet Interface | |
| | | 1889 | 30.4.1.42 Common Interrupt Enable register (CIE): The table of bits: The descriptions of bit 8 and bit 0, modified |
| | | 1940 | 30.4.3.2 Tx Frame Checksum Enable register (CSR1): The table of bits: The initial value of bit 23, modified |
| | | 1942 | 30.4.3.3 Rx Frame Checksum Enable register (CSR2): The table of bits: The initial Value of bit 23, modified |
| | | 1982 | 30.4.3.37 ARPREQ/Neighbor Solicitations Receive Interrupt Status register (CSFR40): The table of bits, modified (31 to 13 → 31 to 3) |
| | | 2018 | 30.5.6.1, (1) Reception Handling: The description, modified |
| | | 2033 | Figure 30.36 Received Frame Filtering Flow (Part3), modified (v4_udp_pt_flg → v6_udp_pt_flg) |
| | | 2034 | Figure 30.37 Received Frame Filtering Flow (Part4), modified (v4_udp_pt_flg → v6_udp_pt_flg) |
| | | 2039 | Figure 30.41 Overview of Filtering and Interrupt, modified (xxx_flg → yyy_flg) |
| | | 2052 | Table 30.20 Interrupt of DMAC: The internal trigger of the interrupt flag bit RIS2.RFFF, modified |
| | | 2054 | 30.5.13.1 Set Up Procedure: The description of action “E-MAC.CXR35”, modified (registor → register) |
| | | 32. USB2.0 | |
| | | 2124 | 32.3.5 Connection control register (CON_CTRL): The table of bits: The description of bit 4, modified |
| | | 2127 | 32.4.2.1 USB/PHY related pins: The sections for reference, modified |
| | | 2129 | 32.4.3.2 Resume from Direct power down mode: Notation unified (us → µs) |
| | | 32A. USB 2.0 Host Module | |
| | | 2137 | 32A.2.3 Register Overview: The initial value of register HcRhDescriptorB, modified |
| | | 2140 | 32A.2.4.1, (2) HcControl Register: The table of bits: The description of bit 9, modified |
| | | 2154 | 32A.2.4.1, (11) HcBulkHeadED Register: The table of bits: The description of bits 31 to 4, modified (Bulk Head ED → BulkHead ED) |
| | | 2163 | 32A.2.4.1, (19) HcRhDescriptorA Register: The table of bits: The description of bits 7 to 0, modified (Down stream → Downstream) |
| | | 2164 | 32A.2.4.1, (20) HcRhDescriptorB Register: The table of bits: The initial value of bit 17, modified (0 → 1) |
| | | 2199, 2200 | 32A.2.4.4, (6) Suspend Control Register: The bit chart: R/W of bit 22, modified. The table of bits: The description of bit 0, modified (Disable status → disabled status) |
| | | 2212 | 32A.2.4.5, (6) BC Control Port 1 Register: The table of bits: R/W of bit 5 (DCPMODE), modified (R → R/W) |
| | | 32B. USB 2.0 Function Module | |
| | | 2241 | Table 32B.3 List of Registers (3/3): The register name of the symbol “DSCITVL”, modified (Descriptor Interval → Descriptor Interval Register) |
| | | 2252 | 32B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H’020>: The table of bits: The initial value of bit 11 and bit 10 (MBW), modified (0 → All 0) |

| Rev. | Date | Description | |
|---|---|---|---|
| | | Page | Summary |
| 1.30 | Oct 31, 2023 | 2314 | 32B.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: H'144>: The bit chart: R/W of bit 14 (L1EXTMD), added. |
| | | 2349 | 32B.8.7.1 DMA Status SUS Register [DSTAT_SUS] <Address: H'720>: The bit chart: The bit names of bit 1 and bit 0, modified (TC1 → SUS1, TC0 → SUS0) |
| | | 35. Camera Data Receiving Unit (CRU) | |
| | | All | Hexadecimal notation of initial values in the table of bits, modified |
| | | 2573 | (1) MIPI CSI-2: The description, modified (data → signal) |
| | | 2573 | Figure 35.1 Block Diagram of CRU, modified |
| | | 2622 | 35.2.1 Overview: The description, modified |
| | | 2623 | 35.2.1.1 Features: The descriptions of Demosaicing, Statistics, and Linear Matrix, added; The descriptions of FIFO and AXI master, changed |
| | | 2624 | Figure 35.8 Block Diagram of the Image Processing Module, modified |
| | | 2626, 2627 | Table 35.9 Register Configuration of the Image Processing Module: Registers related to CRU Statistics, AXI-SD Master, and CRU Linear Matrix, added |
| | | 2630 | 35.2.3.2 CRU Interrupt Enable Register (CRUnIE): Bit 11, changed: (Reserved → SDFEOVWE); Bit 10, changed (Reserved → SDDECEE); Bit 9, changed (Reserved → SDSLVEE); Bit 8, changed (Reserved → SDFOE). The R/W attribute and description on bits 11 to 8, changed |
| | | 2632 | 35.2.3.3 CRU Interrupt Status Register (CRUnINTS): Bit 11, changed (Reserved → SDFEOVWS); Bit 10, changed (Reserved → SDDECES); Bit 9, changed (Reserved → SDSLVES); Bit 8, changed (Reserved → SDFOS). The R/W attribute and description on bits 11 to 8, changed |
| | | 2635 | 35.2.3.7 Memory Bank 1 Base Address (Higher) Register for CRU Image Data (AMnMB1ADDRH): The description of bit 2 (reserved), modified |
| | | 2636 | 35.2.3.9 Memory Bank 2 Base Address (Higher) Register for CRU Image Data (AMnMB2ADDRH): The description of bit 2 (reserved), modified |
| | | 2637 | 35.2.3.11 Memory Bank 3 Base Address (Higher) Register for CRU Image Data (AMnMB3ADDRH): The description of bit 2 (reserved), modified |
| | | 2638 | 35.2.3.13 Memory Bank 4 Base Address (Higher) Register for CRU Image Data (AMnMB4ADDRH): The description of bit 2 (reserved), modified |
| | | 2639 | 35.2.3.15 Memory Bank 5 Base Address (Higher) Register for CRU Image Data (AMnMB5ADDRH): The description of bit 2 (reserved), modified |
| | | 2640 | 35.2.3.17 Memory Bank 6 Base Address (Higher) Register for CRU Image Data (AMnMB6ADDRH): The description of bit 2 (reserved), modified |
| | | 2641 | 35.2.3.19 Memory Bank 7 Base Address (Higher) Register for CRU Image Data (AMnMB7ADDRH): The description of bit 2 (reserved), modified |
| | | 2642 | 35.2.3.21 Memory Bank 8 Base Address (Higher) Register for CRU Image Data (AMnMB8ADDRH): The description of bit 2 (reserved), modified |
| | | 2651 | 35.2.3.32 Memory Bank 1 Base Address Lower Register for CRU Statistics Data (AMnSDMB1ADDRL), added |
| | | 2651 | 35.2.3.33 Memory Bank 1 Base Address Higher Register for CRU Statistics Data (AMnSDMB1ADDRH), added |
| | | 2652 | 35.2.3.34 Memory Bank 2 Base Address Lower Register for CRU Statistics Data (AMnSDMB2ADDRL), added |
| | | 2652 | 35.2.3.35 Memory Bank 2 Base Address Higher Register for CRU Statistics Data (AMnSDMB2ADDRH), added |
| | | 2653 | 35.2.3.36 Memory Bank 3 Base Address Lower Register for CRU Statistics Data (AMnSDMB3ADDRL), added |
| | | 2653 | 35.2.3.37 Memory Bank 3 Base Address Higher Register for CRU Statistics Data (AMnSDMB3ADDRH), added |
| | | 2654 | 35.2.3.38 Memory Bank 4 Base Address Lower Register for CRU Statistics Data (AMnSDMB4ADDRL), added |

| Rev. | Date | Description | |
|---|---|---|---|
| | | Page | Summary |
| 1.30 | Oct 31, 2023 | 2654 | 35.2.3.39 Memory Bank 4 Base Address Higher Register for CRU Statistics Data (AMnSDMB4ADDRH), added |
| | | 2655 | 35.2.3.40 Memory Bank 5 Base Address Lower Register for CRU Statistics Data (AMnSDMB5ADDRL), added |
| | | 2655 | 35.2.3.41 Memory Bank 5 Base Address Higher Register for CRU Statistics Data (AMnSDMB5ADDRH), added |
| | | 2656 | 35.2.3.42 Memory Bank 6 Base Address Lower Register for CRU Statistics Data (AMnSDMB6ADDRL), added |
| | | 2656 | 35.2.3.43 Memory Bank 6 Base Address Higher Register for CRU Statistics Data (AMnSDMB6ADDRH), added |
| | | 2657 | 35.2.3.44 Memory Bank 7 Base Address Lower Register for CRU Statistics Data (AMnSDMB7ADDRL), added |
| | | 2657 | 35.2.3.45 Memory Bank 7 Base Address Higher Register for CRU Statistics Data (AMnSDMB7ADDRH), added |
| | | 2658 | 35.2.3.46 Memory Bank 8 Base Address Lower Register for CRU Statistics Data (AMnSDMB8ADDRL), added |
| | | 2658 | 35.2.3.47 Memory Bank 8 Base Address Higher Register for CRU Statistics Data (AMnSDMB8ADDRH), added |
| | | 2659 | 35.2.3.48 Memory Bank Enable Register for CRU Statistics Data (AMnSDMBVALID), added |
| | | 2660 | 35.2.3.49 Memory Bank Status Register for CRU Statistics Data (AMnSDMBS), added |
| | | 2661 | 35.2.3.50 AXI-SD Master Transfer Setting Register (AMnSDAXIATTR), added |
| | | 2662 | 35.2.3.51 AXI-SD Master FIFO Setting Register (AMnSDFIFO), added |
| | | 2662 | 35.2.3.52 AXI-SD Master Transfer Re-Start (AMnSDFIFOTRST), added |
| | | 2663 | 35.2.3.53 AXI-SD Master FIFO Pointer Register (AMnSDFIFOPNTR), added |
| | | 2664 | 35.2.3.54 AXI-SD Master Transfer Stop Register (AMnSDAXISTP), added |
| | | 2664 | 35.2.3.55 AXI-SD Master Transfer Stop Status Register (AMnSDAXISTPACK), added |
| | | 2667 to 2669 | 35.2.3.58 CRU Image Processing Main Control Register (ICnMC): Bits 25 and 24, changed (Reserved → RAWSTTYP[1:0]); The R/W attribute and description, changed. Bit 7, changed (Reserved → STITHR); The R/W attribute and description, changed. Bit 4, changed (Reserved → LMXTHR); The R/W attribute and description, changed. Bit 3, changed (Reserved → DEMTHR); The R/W attribute and description, changed. Bit 5 (CSCTHR): The description, modified. |
| | | 2670 | 35.2.3.58, (1) Bypass Setting for Each Function: The description, modified |
| | | 2670 | Figure 35.9 Bypass Setting of Each Function, modified |
| | | 2674 | 35.2.3.64 CRU Linear Matrix Offset Register (ICnLMXOF), added |
| | | 2675 | 35.2.3.65 CRU Linear Matrix R Coefficient 1 Register (ICnLMXRC1), added |
| | | 2676 | 35.2.3.66 CRU Linear Matrix R Coefficient 2 Register (ICnLMXRC2), added |
| | | 2677 | 35.2.3.67 CRU Linear Matrix G Coefficient 1 Register (ICnLMXGC1), added |
| | | 2678 | 35.2.3.68 CRU Linear Matrix G Coefficient 2 Register (ICnLMXGC2), added |
| | | 2679 | 35.2.3.69 CRU Linear Matrix B Coefficient 1 Register (ICnLMXBC1), added |
| | | 2680 | 35.2.3.70 CRU Linear Matrix B Coefficient 2 Register (ICnLMXBC2), added |
| | | 2681 | 35.2.3.71 CRU Statistics Control 1 Register (ICnSTIC1), added |
| | | 2682 | 35.2.3.72 CRU Statistics Control 2 Register (ICnSTIC2), added |
| | | 2693 | 35.2.3.86 CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (ICnYCCR3): Bit 16, changed (Reserved → YCLCEN); The R/W attribute and description, changed |
| | | 2695 | 35.2.3.89 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 3 Register (ICnCBCCR3): Bit 16, changed (Reserved → CBCLCEN); The R/W attribute and description, changed |

| Rev. | Date | Description | |
|---|---|---|---|
| | | Page | Summary |
| 1.30 | Oct 31, 2023 | 2697 | 35.2.3.92 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 3 Register (ICnCRCCR3): Bit 16, changed (Reserved → CRCLCEN); The R/W attribute and description, changed |
| | | 2705, 2706 | Table 35.10 Input Format and Image Processing: The rows of functions Demosaicing, Linear Matrix, and Statistics, added |
| | | 2707, 2708 | Table 35.11 Image Output Formats: The register settings of “RAW” and “MIPI CSI-2 Recommended Memory Storage Format”, modified |
| | | 2709 | Table 35.12 Statistics Output Formats, added |
| | | 2713 | 35.2.4.3, (3) Statistics Data Transfer Destination Address (Statistics Data Storage Destination), added |
| | | 2715 | 35.2.4.5, (1) Mode Setting, modified |
| | | 2717 | 35.2.4.8 Demosaicing, added |
| | | 2719 | 35.2.4.9 Linear Matrix, added |
| | | 2721 | 35.2.4.12, (1) RGB to YCbCr: The description, modified |
| | | 2724 | 35.2.4.16 Statistics, added |
| | | 2737 | Table 35.15 Interrupt Sources, Registers, and Interrupt Signals to the Interrupt Controller: Statistics-related interrupts and errors for axi_mst_err_int, added |
| | | 2743 | Figure 35.41 Initializing the AXI Master (MIPI CSI-2 Input), modified |
| | | 2744, 2745 | Figure 35.42 Initializing Image Processing (MIPI CSI-2 Input), modified |
| | | 2750, 2751 | Figure 35.48 Stopping Image Processing Reception (MIPI CSI-2 Input), modified |
| | | 2752 | 35.3.3 Frame Synchronization Settings: The description, modified |
| | | 2752 | Figure 35.49 Flow for Changing the Frame Synchronization Settings (by Setting Registers), modified |
| | | 2753 | Figure 35.50 Flow for Changing the Frame Synchronization Settings (by Using the DMAC), modified |
| 1.40 | Jun 16, 2025 | 1. Overview | |
| | | 68 | 1.2.8 Sound Interface<br>Sampling Rate Converter, deleted |
