Rev.1.40 Jun, 2025

# Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

(Rev.5.0-1 October 2020)

## Trademarks (continued)

For the “Cortex” notation, it is used as follows;
— Arm® Cortex®-A55
— Arm® Cortex®-M33
Note that after this page, they may be noted as Cortex-A55 and Cortex-M33 respectively.

Examples of trademark or registered trademark used in the RZ/G series, 2nd Generation User’s Manual: Hardware;

AMBA®: AMBA is a registered trademark of Arm Limited.
CoreLink™: CoreLink is a trademark of Arm Limited.
CoreSight™: CoreSight is a trademark of Arm Limited.
Mali™: Mali is a trademark of Arm Limited.
TrustZone ®: TrustZone is a registered trademark of Arm Limited.
HyperFlash™: HyperFlash is a trademark of Cypress Semiconductor Corporation.
MIPI®: MIPI is a registered trademark of MIPI Alliance, Inc.
Neon™: Neon is a trademark of Arm Limited.
OpenGL ES™: OpenGL ES is a trademark of Khronos Group, Inc.
DynamIQ™: DynamIQ is a trademark of Arm Limited.
OctaFlash™: OctaFlash is a trademark of Macronix International Co., Ltd.
eMMC™: eMMC is a trademark of MultiMediaCard Association.

Note that in each section of the Manual, trademark notation of ® and TM may be omitted.
All other trademarks and registered trademarks are the property of their respective owners.

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

# Table of Contents

1. Overview ..... 63
1.1 Introduction ..... 63
1.2 List of Specifications ..... 64
1.2.1 CPU Core ..... 64
1.2.2 CPU Peripheral ..... 65
1.2.3 Internal Memory ..... 65
1.2.4 External Memory Interface ..... 66
1.2.5 Video Processing Unit ..... 66
1.2.6 Camera Interfaces ..... 67
1.2.7 Display Interface ..... 68
1.2.8 Sound Interface ..... 68
1.2.9 Storage and Network ..... 69
1.2.10 Timer ..... 70
1.2.11 Peripheral Module ..... 71
1.2.12 Security ..... 71
1.2.13 Analog ..... 72
1.2.14 Others ..... 72
1.2.15 Power Supply Voltage ..... 72
1.2.16 Temperature Range ..... 72
1.2.17 Quality level ..... 73
1.2.18 Package ..... 73
1.3 Product Lineup ..... 74
1.4 Pin ..... 75
1.4.1 Pin Assignment ..... 75
1.4.2 External Pins and Multiplexed Functional Pins ..... 75
2. System CPU Cortex-A55 ..... 76
2.1 Features ..... 76
2.2 Resets ..... 77
2.2.1 Cold Reset ..... 78
2.2.2 Core Warm Reset ..... 80
2.2.3 Cluster Warm Reset ..... 83
2.2.4 Debug Reset ..... 85
2.3 Low Power Consumption Mode ..... 86
2.3.1 Cortex-A55 Sleep Mode ..... 86
2.4 Function Reference ..... 87
3. System CPU Cortex-M33 ..... 88
3.1 Features ..... 88
3.2 Address Space ..... 89

3.2.1 IDAU Setting ..... 89
3.3 Register Descriptions ..... 90
3.4 Description of Functions ..... 91
3.4.1 Startup Sequence ..... 91
3.4.2 Control by the SYSC ..... 92
3.4.3 Warm Reset ..... 93
3.4.4 Cortex-M33 Sleep Mode ..... 94
3.4.5 SysTick Timers ..... 96
3.4.6 Restrictions of Functions ..... 97
4. Boot Mode ..... 98
4.1 Overview ..... 98
4.2 Operation ..... 99
4.2.1 Boot Mode 0 (eSD) ..... 99
4.2.1.1 External Connections ..... 100
4.2.1.2 Overview of Operation ..... 101
4.2.1.3 Operation of Booting from eSD ..... 101
4.2.1.4 Allocation of the Loader Programs in the eSD Device ..... 102
4.2.1.5 Note ..... 106
4.2.2 Boot Mode 1 (1.8-V eMMC) ..... 107
4.2.2.1 External Connections ..... 108
4.2.2.2 Overview of Operation ..... 109
4.2.2.3 Operation of Booting from 1.8-V eMMC ..... 109
4.2.2.4 Allocation of the Loader Program in the eMMC Device ..... 110
4.2.2.5 Alternative Boot Operation ..... 112
4.2.2.6 Notes ..... 113
4.2.3 Boot Mode 2 (3.3-V eMMC) ..... 114
4.2.3.1 External Connections ..... 115
4.2.3.2 Overview of Operation ..... 116
4.2.3.3 Operation of Booting from 3.3-V eMMC ..... 116
4.2.3.4 Notes ..... 116
4.2.4 Boot Mode 3 (1.8-V Single or Quad Serial Flash Memory) ..... 117
4.2.4.1 External Connections ..... 118
4.2.4.2 Overview of Operation ..... 120
4.2.4.3 Operation of Booting from 1.8-V Serial Flash Memory ..... 120
4.2.4.4 Allocation of the Loader Program in the Serial Flash Memory ..... 121
4.2.5 Boot Mode 4 (3.3-V Single or Quad Serial Flash Memory) ..... 123
4.2.5.1 External Connections ..... 124
4.2.5.2 Overview of Operation ..... 126
4.2.5.3 Operation of Booting from 3.3-V Serial Flash Memory ..... 126
4.2.5.4 Note ..... 126
4.2.6 Boot Mode 5 (SCIF Downloading) ..... 127
4.2.6.1 External Connections ..... 127
4.2.6.2 Overview of Operation ..... 128
4.2.6.3 Operation of Booting through SCIF Downloading ..... 129
4.2.6.4 Allocation of the Loader Program for SCIF Downloading ..... 130
4.2.6.5 Note ..... 131

5. LSI Internal Bus ..... 132
5.1 Overview ..... 132
5.1.1 Features ..... 132
5.1.2 Block Diagram of LSI Internal Bus ..... 132
5.2 Area Maps ..... 134
5.2.1 Overall Address Space ..... 134
5.2.2 Cortex-M33 Address Space ..... 138
5.3 Accessible Areas ..... 145
5.4 Bus System Control ..... 147
5.4.1 Security Control ..... 147
5.4.1.1 Re-Setting the Security Attribute Output from Bus Masters ..... 147
5.4.1.2 Determining the Security Levels of Bus Slaves ..... 149
5.4.2 Address Translation ..... 153
5.4.2.1 34-Bit Address Space Access ..... 153
5.4.3 Bus Error Interrupt Generation ..... 155
6. System Controller (SYSC) ..... 156
6.1 Overview ..... 156
6.1.1 Features ..... 156
6.1.2 Block Diagram of SYSC ..... 157
6.2 Register Configuration ..... 158
6.3 Register Descriptions ..... 160
6.3.1 Master Access Control Register 0 (SYS_MSTACCCTL0) ..... 160
6.3.2 Master Access Control Register 1 (SYS_MSTACCCTL1) ..... 162
6.3.3 Master Access Control Register 2 (SYS_MSTACCCTL2) ..... 165
6.3.4 Master Access Control Register 3 (SYS_MSTACCCTL3) ..... 167
6.3.5 Master Access Control Register 4 (SYS_MSTACCCTL4) ..... 169
6.3.6 Slave Access Control Register 0 (SYS_SLVACCCTL0) ..... 171
6.3.7 Slave Access Control Register 1 (SYS_SLVACCCTL1) ..... 172
6.3.8 Slave Access Control Register 2 (SYS_SLVACCCTL2) ..... 174
6.3.9 Slave Access Control Register 3 (SYS_SLVACCCTL3) ..... 175
6.3.10 Slave Access Control Register 4 (SYS_SLVACCCTL4) ..... 176
6.3.11 Slave Access Control Register 5 (SYS_SLVACCCTL5) ..... 177
6.3.12 Slave Access Control Register 6 (SYS_SLVACCCTL6) ..... 178
6.3.13 Slave Access Control Register 7 (SYS_SLVACCCTL7) ..... 178
6.3.14 Slave Access Control Register 8 (SYS_SLVACCCTL8) ..... 179
6.3.15 Slave Access Control Register 10 (SYS_SLVACCCTL10) ..... 179
6.3.16 Slave Access Control Register 12 (SYS_SLVACCCTL12) ..... 180
6.3.17 Slave Access Control Register 13 (SYS_SLVACCCTL13) ..... 180
6.3.18 Slave Access Control Register 14 (SYS_SLVACCCTL14) ..... 181
6.3.19 Slave Access Control Register 16 (SYS_SLVACCCTL16) ..... 181
6.3.20 ECCRAM0 ECC Setting Register (SYS_RAM0_ECC) ..... 182

6.3.21 ECCRAM0 Access Control Register (SYS_RAM0_EN) ..... 182
6.3.22 ECCRAM1 ECC Setting Register (SYS_RAM1_ECC) ..... 183
6.3.23 ECCRAM1 Access Control Register (SYS_RAM1_EN) ..... 183
6.3.24 WDT0 Control Register (SYS_WDT0_CTRL) ..... 184
6.3.25 WDT2 Control Register (SYS_WDT2_CTRL) ..... 185
6.3.26 GEther0 Config Register (SYS_GETH0_CFG) ..... 186
6.3.27 GEther1 Config Register (SYS_GETH1_CFG) ..... 187
6.3.28 I2C0 Config Register (SYS_I2C0_CFG) ..... 187
6.3.29 I2C1 Config Register (SYS_I2C1_CFG) ..... 188
6.3.30 I2C2 Config Register (SYS_I2C2_CFG) ..... 188
6.3.31 I2C3 Config Register (SYS_I2C3_CFG) ..... 189
6.3.32 CM33 Config Register0 (SYS_CM33_CFG0) ..... 189
6.3.33 CM33 Config Register1 (SYS_CM33_CFG1) ..... 190
6.3.34 CM33 Config Register2 (SYS_CM33_CFG2) ..... 190
6.3.35 CM33 Config Register3 (SYS_CM33_CFG3) ..... 191
6.3.36 CM33 Lock Register (SYS_CM33_LOCK) ..... 191
6.3.37 CA55 Core0 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL0) ..... 192
6.3.38 CA55 Core0 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH0) ..... 192
6.3.39 LSI Mode Signal Register (SYS_LSI_MODE) ..... 193
6.3.40 LSI Device ID Register (SYS_LSI_DEVID) ..... 194
6.3.41 LSI Product Register (SYS_LSI_PRR) ..... 195
6.3.42 Address Offset Register0 (SYS_AOF0) ..... 196
6.3.43 Address Offset Register1 (SYS_AOF1) ..... 197
6.3.44 Address Offset Register2 (SYS_AOF2) ..... 198

7.2.4.4 PLLn (SSCG) Monitor Register (CPG_SAMPLLn_MON) (n = 1, 4, or 6)....238
7.2.4.5 PLL1_SEL_SETTING Register (CPG_PLL1_SETTING)....239
7.2.4.6 CPG_OTPPLL0_MON Register (CPG_OTPPLL0_MON)....240
7.2.4.7 CPG_OTPPLL1_MON Register (CPG_OTPPLL1_MON)....241
7.2.4.8 CPG_OTPPLL2_MON Register (CPG_OTPPLL2_MON)....242
7.2.4.9 PLL5 (SSCG) Standby Control Register (CPG_SIPLL5_STBY)....243
7.2.4.10 PLL5 (SSCG) Output Clock Setting Register 1 (CPG_SIPLL5_CLK1)....245
7.2.4.11 PLL5 (SSCG) Output Clock Setting Register 2 (CPG_SIPLL5_CLK2)....246
7.2.4.12 PLL5 (SSCG) Output Clock Setting Register 3 (CPG_SIPLL5_CLK3)....248
7.2.4.13 PLL5 (SSCG) Output Clock Setting Register 4 (CPG_SIPLL5_CLK4)....249
7.2.4.14 PLL5 (SSCG) Output Clock Setting Register 5 (CPG_SIPLL5_CLK5)....250
7.2.4.15 PLLn (SSCG) Monitor Register (CPG_SIPLLn_MON) (n = 2, 3, or 5)....252
7.2.4.16 Division Ratio Setting (PLL1) Register (CPG_PL1_DDIV)....253
7.2.4.17 Division Ratio Setting (PLL2) Register (CPG_PL2_DDIV)....254
7.2.4.18 Division Ratio Setting (PLL3A) Register (CPG_PL3A_DDIV)....256
7.2.4.19 Division Ratio Setting (PLL3B) Register (CPG_PL3B_DDIV)....258
7.2.4.20 Source Clock Setting (SDHI) Register (CPG_PL2SDHI_DSEL)....259
7.2.4.21 Source Clock Setting (DDR) Register (CPG_PL4_DSEL)....260
7.2.4.22 Clock Status Monitor Register (CPG_CLKSTATUS)....261
7.2.4.23 Source Clock Setting Register (CPG_PL3_SSEL)....263
7.2.4.24 Source Clock Setting Register (CPG_PL6_ETH_SSEL)....264
7.2.4.25 Division Ratio Setting (PLL5) Register (CPG_PL5_SDIV)....265
7.2.4.26 Clock Control Register Cortex-A55 (CPG_CLKON_CA55)....267
7.2.4.27 Clock Control Register Cortex-M33 (CPG_CLKON_CM33)....269
7.2.4.28 Clock Control Register ACPU (CPG_CLKON_SRAM_ACPU)....270
7.2.4.29 Clock Control Register MCPU (CPG_CLKON_SRAM_MCPU)....271

7.2.4.30 Clock Control Register GIC600 (CPG_CLKON_GIC600) ..... 272
7.2.4.31 Clock Control Register IA55 (CPG_CLKON_IA55) ..... 273
7.2.4.32 Clock Control Register IM33 (CPG_CLKON_IM33) ..... 274
7.2.4.33 Clock Control Register MHU (CPG_CLKON_MHU) ..... 275
7.2.4.34 Clock Control Register CST (CPG_CLKON_CST) ..... 276
7.2.4.35 Clock Control Register SYC (CPG_CLKON_SYC) ..... 278
7.2.4.36 Clock Control Register DMAC_REG (CPG_CLKON_DMAC_REG) ..... 279
7.2.4.37 Clock Control Register GTM (CPG_CLKON_GTM) ..... 280

7.3.1 Clock Control....446
7.3.1.1 PLL Control, Setting, and Monitoring Functions....446
7.3.1.2 Clock Frequency Dividers and Selectors ....448
7.3.1.3 Fixed Frequency Dividers....448
7.3.1.4 PLL Clock Monitoring ....449

7.3.2 Clock Generation and Control Functions ....450
7.3.2.1 Range of Reset Application ....450
7.3.2.2 System Reset (External Pin) ....451
7.3.2.3 WDT System Reset ....451
7.3.2.4 Cortex-A55 Reset ....456
7.3.2.5 Cortex-M33 Reset ....462
7.3.2.6 Module Reset Application Control ....464
7.4 Operating Procedures ....465
7.4.1 Procedures for Supplying and Stopping Module Clocks ....465
7.4.2 Procedures for Supplying and Stopping Reset Signals ....466
7.4.3 Procedure for Activating Modules ....467
7.4.4 Procedure for Activating the Modules Related to PLL5 ....467
7.4.5 Procedures for PLL Setup ....469
7.4.5.1 Procedure for Setting PLL Normal Mode (Changing the Output Clock and SSCG Mode) ....469
7.4.5.2 Procedure for Setting PLL Standby Mode ....471
7.4.5.3 PLLs with Restrictions ....471
7.4.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers ....472
7.4.7 Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors ....473
7.4.8 Procedure for Switching Clocks by the Static Switching Frequency Dividers and Selectors (Procedure for Switching Source Clocks) ....474
7.4.9 Boot Sequence (Normal Operation) ....474
7.4.10 Boot Sequence (Debug Mode) ....475
7.4.11 General Operating Procedures ....475
7.4.11.1 Procedure for Writing to Registers ....475
8. Interrupt Controller ....476
8.1 Features ....476
8.1.1 External Signal Pins ....477
8.1.2 Block Diagram ....478
8.2 Interrupt Mapping ....480
8.3 GIC-600 and NVIC Register Configuration ....493
8.4 GIC-600 and NVIC Register Descriptions ....493
8.5 IA55 and IM33 Register Configuration ....494
8.6 IA55 and IM33 Register Descriptions ....495
8.6.1 NMI Status Control Register (NSCR) ....495
8.6.2 NMI Interrupt Type Selection Register (NITSR) ....496
8.6.3 IRQ Status Control Register (ISCR) ....497
8.6.4 IRQ Interrupt Type Selection Register (IITSR) ....498
8.6.5 TINT Status Control Register (TSCR) ....499
8.6.6 TINT Interrupt Type Selection Register0 (TITSR0) ....500
8.6.7 TINT Interrupt Type Selection Register1 (TITSR1) ....500
8.6.8 TINT Source Selection Register0 (TSSR0) ....501

8.6.9 TINT Source Selection Register1 (TSSR1) ..... 502
8.6.10 TINT Source Selection Register2 (TSSR2) ..... 503
8.6.11 TINT Source Selection Register3 (TSSR3) ..... 504
8.6.12 TINT Source Selection Register4 (TSSR4) ..... 505
8.6.13 TINT Source Selection Register5 (TSSR5) ..... 506
8.6.14 TINT Source Selection Register6 (TSSR6) ..... 507
8.6.15 TINT Source Selection Register7 (TSSR7) ..... 508
8.6.16 Bus Error Interrupt Status Control Register0 (BEISR0) ..... 509
8.6.17 Bus Error Interrupt Status Control Register1 (BEISR1) ..... 510
8.6.18 ECCRAM Error Interrupt Status Control Register0 (EREISR0) ..... 511
8.6.19 ECCRAM Error Interrupt Status Control Register1 (EREISR1) ..... 513
8.7 Operation ..... 515
8.7.1 NMI Interrupt ..... 515
8.7.2 IRQ Interrupt ..... 515
8.7.3 GPIO Interrupt (TINT) ..... 516
8.7.4 Internal Interrupt ..... 518
8.7.4.1 Bus Error Interrupt ..... 518
8.7.4.2 ECCRAM Error Interrupt ..... 520
8.8 Usage Note ..... 522
8.8.1 Precaution when use the peripheral modules which can initiate DMA Controller. ..... 522
8.8.2 Clear Timing of Interrupt Cause ..... 522
8.8.3 Precaution when Changing Interrupt Settings ..... 522
9. DDR3L/DDR4 SDRAM Memory Controller (MEMC) ..... 523
9.1 Features ..... 523
9.2 Interface ..... 525
9.2.1 Power, Ground ..... 525
9.2.2 External Pins ..... 525
9.3 Usage Note ..... 526
9.3.1 Power On ..... 526
10. On-chip RAM ..... 527
10.1 Features ..... 527
11. Error Correcting Code (ECC) for On-Chip RAM ..... 528
11.1 Overview ..... 528
11.1.1 Features ..... 528
11.2 Register Configuration ..... 529
11.3 Register Descriptions ..... 532
11.3.1 ECC Control Registers_n (<REG_base>CTL_n) (n = 0 to 7) ..... 532
11.3.2 ECC Error Address Registers m_n (<REG_base>EADm_n) (m = 0 to 7) (n = 0 to 7) ..... 535
11.4 Initializing the ECC Function ..... 536
11.5 Initializing the Detection-Usage Areas of the On-Chip RAM ..... 536

11.6 Usage Notes....537
11.6.1 Notes on Setting the Registers of This Module....537
11.6.2 8- or 16-Bit Access....537
11.6.3 Numbers of Cycles for Reading from or Writing to a RAM Area with the ECC Function Enabled....537
11.6.4 ECC Error Address Register Overwrite Conditions....538
12. Message Handling Unit (MHU)....539
12.1 Features....539
12.2 Interrupt....542
12.3 Register Configuration....543
12.4 Register Descriptions....546
12.4.1 Non secure message transmission interrupt Status register (CA55 Core0 -> CM33)....546
12.4.2 Non secure message transmission interrupt Status register (CM33 -> CA55 Core0)....546
12.4.3 Non secure message transmission interrupt Set register (CA55 Core0 -> CM33)....547
12.4.4 Non secure message transmission interrupt Set register (CM33 -> CA55 Core0)....547
12.4.5 Non secure message transmission interrupt Clear register (CA55 Core0 -> CM33)....548
12.4.6 Non secure message transmission interrupt Clear register (CM33 -> CA55 Core0)....548
12.4.7 Non secure response transmission interrupt Status register (CM33 -> CA55 Core0)....549
12.4.8 Non secure response transmission interrupt Status register (CA55 Core0 -> CM33)....549
12.4.9 Non secure response transmission interrupt Set register (CM33 -> CA55 Core0....550
12.4.10 Non secure response transmission interrupt Set register (CA55 Core0 -> CM33)....550
12.4.11 Non secure response transmission interrupt Clear register (CM33 -> CA55 Core0)....551
12.4.12 Non secure response transmission interrupt Clear register (CA55 Core0 -> CM33)....551
12.4.13 Non secure software interrupt Status register (ch0)....552
12.4.14 Non secure software interrupt Status register (ch2)....552
12.4.15 Non secure software interrupt Set register (ch0)....553
12.4.16 Non secure software interrupt Set register (ch2)....553
12.4.17 Non secure software interrupt Clear register (ch0)....554
12.4.18 Non secure software interrupt Clear register (ch2)....554
12.4.19 Secure message transmission interrupt Status register (CA55 Core0 -> CM33)....555
12.4.20 Secure message transmission interrupt Status register (CM33 -> CA55 Core0)....555
12.4.21 Secure message transmission interrupt Set register (CA55 Core0 -> CM33)....556
12.4.22 Secure message transmission interrupt Set register (CM33 -> CA55 Core0)....556
12.4.23 Secure message transmission interrupt Clear register (CA55 Core0 -> CM33)....557
12.4.24 Secure message transmission interrupt Clear register (CM33 -> CA55 Core0)....557
12.4.25 Secure response transmission interrupt Status register (CM33 -> CA55 Core0)....558
12.4.26 Secure response transmission interrupt Status register (CA55 Core0 -> CM33)....558
12.4.27 Secure response transmission interrupt Set register (CM33 -> CA55 Core0)....559
12.4.28 Secure response transmission interrupt Set register (CA55 Core0 -> CM33)....559
12.4.29 Secure response transmission interrupt Clear register (CM33 -> CA55 Core0)....560
12.4.30 Secure response transmission interrupt Clear register (CA55 Core0 -> CM33)....560

12.5 Function description ..... 561
12.5.1 Inter CPU communication ..... 561
12.6 Operation sequence ..... 563
12.6.1 Message transmit sequence ..... 563
12.6.2 Response transmit sequence ..... 564
13. TrustZone Address Space Controller (TZC) ..... 565
13.1 Overview ..... 565
13.1.1 Features ..... 565
13.1.2 Block Diagram ..... 566
13.1.3 External Pins ..... 567
13.2 Register Configuration ..... 568
13.3 Register Descriptions ..... 569
13.4 Operation ..... 569
13.5 Usage Note ..... 569
14. Direct Memory Access Controller ..... 570
14.1 Features ..... 570
14.2 Input/Output Pins ..... 570
14.3 Register Configuration ..... 571
14.4 Register Descriptions ..... 573
14.4.1 Next Source Address Register n/nS (N0SA_n/nS, N1SA_n/nS) ..... 586
14.4.2 Next Destination Address Register n/nS (N0DA_n/nS, N1DA_n/nS) ..... 586
14.4.3 Next Transaction Byte Register n/nS (N0TB_n/nS, N1TB_n/nS) ..... 587
14.4.4 Current Source Address Register n/nS (CRSA_n/nS) ..... 588
14.4.5 Current Destination Address Register n/nS (CRDA_n/nS) ..... 589
14.4.6 Current Transaction Byte Register n/nS (CRTB_n/nS) ..... 590
14.4.7 Channel Status Register n/nS (CHSTAT_n/nS) ..... 591
14.4.8 Channel Control Register n/nS (CHCTRL_n/nS) ..... 595
14.4.9 Channel Configuration Register n/nS (CHCFG_n/nS) ..... 597
14.4.10 Channel Interval Register n/nS (CHITVL_n/nS) ..... 600
14.4.11 Channel Extension Register n/nS (CHEXT_n/nS) ..... 601
14.4.12 Next Link Address Register n/nS (NXLA_n/nS) ..... 602
14.4.13 Current Link Address Register n/nS (CRLA_n/nS) ..... 602
14.4.14 DMA Control Register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S) ..... 603
14.4.15 DMA Status EN Register (DSTAT_EN_0_7/0_7S) ..... 604
14.4.16 DMA Status EN Register (DSTAT_EN_8_15/8_15S) ..... 605
14.4.17 DMA Status ER Register (DSTAT_ER_0_7/0_7S) ..... 606
14.4.18 DMA Status ER Register (DSTAT_ER_8_15/8_15S) ..... 607
14.4.19 DMA Status END Register (DSTAT_END_0_7/0_7S) ..... 608
14.4.20 DMA Status END Register (DSTAT_END_8_15/8_15S) ..... 609
14.4.21 DMA Status TC Register (DSTAT_TC_0_7/0_7S) ..... 610

14.4.22 DMA Status TC Register (DSTAT_TC_8_15/8_15S) ....611
14.4.23 DMA Status SUS Register (DSTAT_SUS_0_7/0_7S) ....612
14.4.24 DMA Status SUS Register (DSTAT_SUS_8_15/8_15S) ....613
14.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S) ....614
14.5 Operation ....617
14.5.1 Transfer Flow ....617
14.5.2 DMA Transfer Requests ....618
14.6 DMA Mode ....624
14.6.1 Mode Setting ....624
14.6.2 Register Mode ....625
14.6.3 Link Mode ....631
14.7 DMA Transfer ....640
14.7.1 Transfer Mode ....640
14.7.2 Priority Control for DMA Channels ....641
14.7.3 DMA Transfer Request ....644
14.7.4 DMA Transfer End Interrupt ....644
14.7.5 DMA Error Interrupt ....645
14.7.6 Interval Count Function ....645
14.7.7 Difference in Operation Due to the Transfer Size ....646
14.7.8 Transfer Status ....648
14.8 DMA Setting Examples ....652
14.8.1 Setting Example 1 (Register Mode/Hardware Request) ....652
14.8.2 Setting Example 2 (Register Mode/Software Request) ....654
14.8.3 Setting Example 3 (Register Mode/Continuous Execution) ....656
14.8.4 Setting Example 4 (Link Mode) ....658
14.8.5 Next Register Set Continuous Execution Setting ....661
14.9 Points for Caution ....664
14.9.1 Problem of the Interrupt Signal Overtaking DMA Transfer ....664
14.9.1.1 Overview ....664
14.9.1.2 Workaround ....664
15. System Counter (SYC) ....665
15.1 Overview ....665
15.1.1 Features ....665
15.1.2 Block Diagram of SYC ....666
15.2 Address Space ....667
15.3 Register Descriptions ....667
15.4 Operation ....668
15.4.1 System Bus Access Control ....668
15.4.2 Halt on Debug Function ....668

16. Multi-Function Timer Pulse Unit 3 (MTU3a) ..... 669
16.1 Overview ..... 669
16.2 Register Descriptions ..... 675
16.2.1 Timer Control Register (TCR) ..... 680
16.2.2 Timer Control Register 2 (TCR2) ..... 682
16.2.3 Timer Mode Register 1 (TMDR1) ..... 687
16.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B) ..... 690
16.2.5 Timer Mode Register 3 (TMDR3) ..... 691
16.2.6 Timer I/O Control Register (TIOR) ..... 693
16.2.7 Timer Compare Match Clear Register (TCNTCMPCLR) ..... 712
16.2.8 Timer Interrupt Enable Register (TIER) ..... 713
16.2.9 Timer Status Register (TSR) ..... 717
16.2.10 Timer Buffer Operation Transfer Mode Register (TBTM) ..... 718
16.2.11 Timer Input Capture Control Register (TICCR) ..... 720
16.2.12 Timer Synchronous Clear Register (TSYCR) ..... 721
16.2.13 Timer Counter (TCNT) ..... 722
16.2.14 Timer Longword Counter (TCNTLW) ..... 723
16.2.15 Timer General Register (TGR) ..... 724
16.2.16 Timer Longword General Registers (TGRALW and TGRBLW) ..... 726
16.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR) ..... 727
16.2.18 Timer Synchronous Registers (TSYRA and TSYRB) ..... 730
16.2.19 Timer Counter Synchronous Start Register (TCSYSTR) ..... 732
16.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB) ..... 734
16.2.21 Timer Output Master Enable Registers (TOERA and TOERB) ..... 735
16.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B) ..... 737
16.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B) ..... 739
16.2.24 Timer Output Level Buffer Registers (TOLBRA and TOLBRB) ..... 742
16.2.25 Timer Gate Control Register A (TGCRA) ..... 743
16.2.26 Timer Subcounters (TCNTSA and TCNTSB) ..... 745
16.2.27 Timer Cycle Data Registers (TCDRA and TCDRB) ..... 745
16.2.28 Timer Cycle Buffer Registers (TCBRA and TCBRB) ..... 746
16.2.29 Timer Dead Time Data Registers (TDDRA and TDDRB) ..... 746
16.2.30 Timer Dead Time Enable Registers (TDERA and TDERB) ..... 747
16.2.31 Timer Buffer Transfer Set Registers (TBTERA and TBTERB) ..... 748
16.2.32 Timer Waveform Control Registers (TWCRA and TWCRB) ..... 749
16.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C) ..... 751
16.2.34 Noise Filter Control Register 5 (NFCR5) ..... 755
16.2.35 Timer A/D Converter Start Request Control Register (TADCR) ..... 756
16.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB) ..... 760
16.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA and TADCOBRB) ..... 761

16.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB) ....761
16.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B)....762
16.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B) ....765
16.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B)....767
16.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B) ....769
16.2.43 Bus Master Interface ....771
16.3 Operation....772
16.3.1 Basic Functions ....772
16.3.2 Synchronous Operation....778
16.3.3 Buffer Operation ....780
16.3.4 Cascaded Operation ....785
16.3.5 PWM Modes ....790
16.3.6 Phase Counting Mode....795
16.3.6.1 16-Bit Phase Counting Mode....796
16.3.6.2 Cascade Connection 32-Bit Phase Counting Mode....807
16.3.7 Reset-Synchronized PWM Mode ....810
16.3.8 Complementary PWM Mode ....813
16.3.9 A/D Converter Start Request Delaying Function....861
16.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7 ....869
16.3.11 External Pulse Width Measurement....873
16.3.12 Dead Time Compensation....874
16.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode....876
16.3.14 Noise Filter Function ....877
16.4 Interrupt Sources....878
16.4.1 Interrupt Sources and Priorities....878
16.4.2 DMAC Activation ....879
16.4.3 A/D Converter Activation ....880
16.5 Operation Timing....882
16.5.1 Input/Output Timing....882
16.5.2 Interrupt Signal Timing ....888
16.6 Usage Note ....891
16.6.1 Count Clock Restrictions ....891
16.6.2 Note on Cycle Setting....891
16.6.3 Contention between TCNT Write and Clear Operations....892
16.6.4 Contention between TCNT Write and Increment Operations ....892
16.6.5 Contention between TGR Write Operation and Compare Match....893
16.6.6 Contention between Buffer Register Write Operation and Compare Match ....893
16.6.7 Contention between Buffer Register Write and TCNT Clear Operations....894
16.6.8 Contention between TGR Read Operation and Input Capture ....894
16.6.9 Contention between TGR Write Operation and Input Capture ....895
16.6.10 Contention between Buffer Register Write Operation and Input Capture ....896

16.6.11 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation ..... 897
16.6.12 Counter Value When Count Operation is Stopped in Complementary PWM Mode ..... 898
16.6.13 Buffer Operation Setting in Complementary PWM Mode ..... 898
16.6.14 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode ..... 899
16.6.15 Overflow in Reset-Synchronized PWM Mode ..... 900
16.6.16 Contention between Overflow/Underflow and Counter Clearing ..... 901
16.6.17 Contention between TCNT Write Operation and Overflow/Underflow ..... 902
16.6.18 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode ..... 902
16.6.19 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode ..... 902
16.6.20 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection ..... 903
16.6.21 Interrupt-Skipping Function 2 ..... 903
16.6.22 Notes When Complementary PWM Mode Output Protection Function is Not Used ..... 903
16.6.23 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR) ..... 904
16.6.24 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode ..... 905
16.6.25 Continuous Output of Interrupt Signal in Response to a Compare Match ..... 907
16.6.26 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode ..... 908
16.7 MTU Output Pin Initialization ..... 910
16.7.1 Operating Modes ..... 910
16.7.2 Operation in Case of Re-Setting Due to Error during Operation ..... 910
16.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation ..... 911
17. Port Output Enable 3 (POE3) ..... 941
17.1 Overview ..... 941
17.2 Register Descriptions ..... 944
17.2.1 Input Level Control/Status Register 1 (ICSR1) ..... 945
17.2.2 Input Level Control/Status Register 2 (ICSR2) ..... 946
17.2.3 Input Level Control/Status Register 3 (ICSR3) ..... 947
17.2.4 Input Level Control/Status Register 4 (ICSR4) ..... 949
17.2.5 Output Level Control/Status Register 1 (OCSR1) ..... 951
17.2.6 Output Level Control/Status Register 2 (OCSR2) ..... 952
17.2.7 Software Port Output Enable Register (SPOER) ..... 953
17.2.8 Port Output Enable Control Register 1 (POECR1) ..... 955
17.2.9 Port Output Enable Control Register 2 (POECR2) ..... 956
17.2.10 Port Output Enable Control Register 4 (POECR4) ..... 958
17.2.11 Port Output Enable Control Register 5 (POECR5) ..... 960

17.3 Operation....961
17.3.1 MTU Pin Selection....964
17.3.2 Input Level Detection Operation....966
17.3.3 Output Level Compare Operation....968
17.3.4 High-Impedance Control Using Registers....968
17.3.5 Additional Functions for Controlling High-Impedance States....968
17.3.6 Release from High-Impedance State....969
17.4 POE3 Setting Procedure....970
17.5 Interrupts....971
17.6 Usage Notes....972
17.6.1 High-Impedance Control when MTU6 and MTU7 are not Used....972
20. General Timer (GTM)....973
20.1 Functional Overview....973
20.1.1 Features of GTM....973
20.2 Registers....975
20.2.1 Registers Overview....975
20.2.2 Details of OSTM Registers....976
20.2.2.1 OSTMnCMP — OSTM Compare Register....976
20.2.2.2 OSTMnCNT — OSTM Counter Register....977
20.2.2.3 OSTMnTE — OSTM Count Enable Status Register....978
20.2.2.4 OSTMnTS — OSTM Count Start Trigger Register....979
20.2.2.5 OSTMnTT — OSTM Count Stop Trigger Register....979
20.2.2.6 OSTMnCTL — OSTM Control Register....980
20.3 Functional Description....981
20.3.1 Block Diagram....981
20.3.2 Count Clock....982
20.3.3 Generation of Interrupt Request....982
20.3.4 Starting and Stopping the Timer....983
20.3.5 Interval Timer Mode....984
20.3.5.1 Basic Operation in Interval Timer Mode....984
20.3.5.2 Operation when OSTMnCMP = H’0000 0000....986
20.3.6 Free-Running Comparison Mode....987
20.3.6.1 Basic Operation in Free-Running Comparison Mode....987
20.3.6.2 Operation when OSTMnCMP = H’0000 0000....989
21. Watchdog Timer (WDT)....990
21.1 Features....991
21.1.1 Normal Watchdog Timer Function....991
21.1.2 Reset Request Function due to CPU Parity Error....991
21.1.3 Internal Block Diagram....992
21.1.4 Input/Output Pin....993
21.2 Register Configuration....994

21.3 Register Descriptions ....996
21.3.1 WDT Control Register_n (WDTCNT_n) (n = 0, 2) ....996
21.3.2 WDT Period Setting Register_n (WDTSET_n) (n = 0, 2) ....997
21.3.3 WDT Elapsed Time Register_n (WDTTIM_n (n = 0, 2)) ....998
21.3.4 WDT Interrupt Control Register_n (WDTINT_n (n = 0, 2)) ....999
21.3.5 Parity Error Control Register_n (PECR_n (n = 0, 2)) ....1000
21.3.6 Parity Error Forced Enable Register_n (PEEN_n (n = 0, 2)) ....1001
21.3.7 Parity Error Status Register_n (PESR_n (n = 0, 2)) ....1002
21.3.8 Parity Error Enable Register_n (PEER_n (n = 0, 2)) ....1003
21.3.9 Parity Error Polarity Setting Register_n (PEPO_n (n = 0, 2)) ....1004
21.3.10 Register Setting Order for Each WDT Channel ....1005
21.4 Operation ....1006
21.4.1 WDT_CORE Operaton Timing ....1006
21.4.2 WDT Interrupt Control Register (WDTINT) Specification for Write Access Interval ....1007
21.4.3 Watchdog Timer Operation Reflection Timing of Register Setting Value ....1008
21.4.4 Timing of Reflecting WDT Counter Value to WDTTIM Register ....1010
21.4.5 Conditions Under which WDTRSTB and PERROUT Operate ....1011
21.5 Reset Control ....1015
21.5.1 WDTRST Control of Each WDT Channels ....1015
21.6 Usage Note ....1016
22. Serial Communications Interface with FIFO (SCIFA) ....1017
22.1 Overview ....1017
22.2 Register Descriptions ....1019
22.2.1 Receive Shift Register (RSR) ....1020
22.2.2 Receive FIFO Data Register (FRDR) ....1020
22.2.3 Transmit Shift Register (TSR) ....1020
22.2.4 Transmit FIFO Data Register (FTDR) ....1021
22.2.5 Serial Mode Register (SMR) ....1022
22.2.6 Serial Control Register (SCR) ....1024
22.2.7 Serial Status Register (FSR) ....1026
22.2.8 Bit Rate Register (BRR) ....1030
22.2.9 Modulation Duty Register (MDDR) ....1035
22.2.10 FIFO Control Register (FCR) ....1038
22.2.11 FIFO Data Count Register (FDR) ....1040
22.2.12 Serial Port Register (SPTR) ....1041
22.2.13 Line Status Register (LSR) ....1044
22.2.14 Serial Extended Mode Register (SEMR) ....1045
22.2.15 FIFO Trigger Control Register (FTCR) ....1047
22.3 Operation ....1048
22.3.1 Overview ....1048
22.3.2 Operation in Asynchronous Mode ....1050

22.3.3 Operation in Clock Synchronous Mode ..... 1061
22.4 Bit Rate Modulation ..... 1070
22.5 Interrupt Sources ..... 1071
22.6 Serial Port Register (SPTR) and SCIFA-Related Pins ..... 1072
22.7 Noise Cancellation ..... 1074
22.8 Usage Notes ..... 1075
22.8.1 FTDR Register Writing and TDFE Flag ..... 1075
22.8.2 FRDR Register Reading and RDF Flag ..... 1075
22.8.3 Break Detection and Processing ..... 1075
22.8.4 Writing to the SPTR Register ..... 1075
22.8.5 Break Signal Transmission ..... 1076
22.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode ..... 1077
22.8.7 Note on FER Flag and PER Flag in Serial Status Register (FSR) ..... 1078
22.8.8 Notes on External Clock Input in Clock Synchronous Mode ..... 1078
22.8.9 Module Standby Mode Setting ..... 1078
22.8.10 Notes on Operation for Reception when an Internal Clock is Selected in Clock Synchronous Mode ..... 1078
23. Serial Communications Interface (SCIg) ..... 1079
23.1 Overview ..... 1079
23.2 Register Descriptions ..... 1082
23.2.1 Receive Shift Register (RSR) ..... 1083
23.2.2 Receive Data Register (RDR) ..... 1083
23.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL) ..... 1084
23.2.4 Transmit Data Register (TDR) ..... 1085
23.2.5 Transmit Data Register H, L, HL (TDRH, TDRL, TDRHL) ..... 1086
23.2.6 Transmit Shift Register (TSR) ..... 1086
23.2.7 Serial Mode Register (SMR) ..... 1087
23.2.8 Serial Control Register (SCR) ..... 1091
23.2.9 Serial Status Register (SSR) ..... 1096
23.2.10 Smart Card Mode Register (SCMR) ..... 1102
23.2.11 Bit Rate Register (BRR) ..... 1104
23.2.12 Modulation Duty Register (MDDR) ..... 1108
23.2.13 Serial Extended Mode Register (SEMR) ..... 1109
23.2.14 Noise Filter Setting Register (SNFR) ..... 1111
23.2.15 Extended function control register (SECR) ..... 1112
23.3 Operation in Asynchronous Mode ..... 1113
23.3.1 Serial Data Transfer Format ..... 1114
23.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode ..... 1115
23.3.3 Clock ..... 1116
23.3.4 Double-Speed Mode ..... 1116
23.3.5 CTS and RTS Functions ..... 1117

23.3.6 SCI Initialization (Asynchronous Mode) ....1118
23.3.7 Serial Data Transmission (Asynchronous Mode) ....1119
23.3.8 Serial Data Reception (Asynchronous Mode) ....1123
23.4 Multi-Processor Communications Function ....1127
23.4.1 Multi-Processor Serial Data Transmission ....1128
23.4.2 Multi-Processor Serial Data Reception ....1129
23.5 Operation in Clock Synchronous Mode ....1132
23.5.1 Clock ....1133
23.5.2 CTS and RTS Functions ....1133
23.5.3 SCI Initialization (Clock Synchronous Mode) ....1134
23.5.4 Serial Data Transmission (Clock Synchronous Mode) ....1135
23.5.5 Serial Data Reception (Clock Synchronous Mode) ....1140
23.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode) ....1143
23.6 Operation in Smart Card Interface Mode ....1145
23.6.1 Sample Connection ....1145
23.6.2 Data Format (Except in Block Transfer Mode) ....1146
23.6.3 Block Transfer Mode ....1148
23.6.4 Receive Data Sampling Timing and Reception Margin ....1149
23.6.5 SCI Initialization (Smart Card Interface Mode) ....1150
23.6.6 Serial Data Transmission (Except in Block Transfer Mode) ....1151
23.6.7 Serial Data Reception (Except in Block Transfer Mode) ....1154
23.6.8 Clock Output Control ....1156
23.7 Noise Cancellation Function ....1157
23.8 Interrupt Sources ....1158
23.8.1 Buffer Operations for TXI and RXI Interrupts ....1158
23.8.2 Interrupts in Asynchronous Mode and Clock Synchronous Mode ....1158
23.8.3 Interrupts in Smart Card Interface Mode ....1159
23.9 Usage Notes ....1160
23.9.1 Break Detection and Processing ....1160
23.9.2 Mark State and Production of Breaks ....1160
23.9.3 Receive Error Flags and Transmit Operations (Clock Synchronous Mode) ....1160
23.9.4 Writing Data to TDR ....1160
23.9.5 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode) ....1161
23.9.6 Restrictions on Using DMAC ....1163
23.9.7 Notes on Starting Transfer ....1163
23.9.8 External Clock Input in Clock Synchronous Mode ....1163
23.9.9 Note on Transmit Enable Bit (TE bit) ....1163
23.10 IrDA Communications ....1164
23.11 Description of the IrDA Register ....1165
23.11.1 IrDA Control Register (IRCR) ....1166

23.12 IrDA Operation ....1167
23.12.1 Flow of Settings for IrDA Operation....1167
23.12.2 Transmission ....1167
23.12.3 Reception ....1168
23.12.4 Relationship between Bit Rate and High-Level Pulse Width ....1168
23.13 Note on IrDA Usage ....1169
23.13.1 Minimum Pulse Width in Reception....1169
23.13.2 Base Clock in Asynchronous Mode for the Serial Communications Interface....1169
24. Renesas Serial Peripheral Interface....1170
24.1.1 Features ....1170
24.2 Input/Output Pins ....1173
24.3 Register Descriptions ....1174
24.3.1 Control Register (SPCR) ....1176
24.3.2 Slave Select Polarity Register (SSLP) ....1177
24.3.3 Pin Control Register (SPPCR) ....1178
24.3.4 Status Register (SPSR)....1179
24.3.5 Data Register (SPDR) ....1181
24.3.6 Sequence Control Register (SPSCR) ....1182
24.3.7 Sequence Status Register (SPSSR)....1183
24.3.8 Bit Rate Register (SPBR) ....1184
24.3.9 Data Control Register (SPDCR)....1185
24.3.10 Clock Delay Register (SPCKD) ....1186
24.3.11 Slave Select Negation Delay Register (SSLND)....1187
24.3.12 Next-Access Delay Register (SPND) ....1188
24.3.13 Command Register (SPCMD) ....1189
24.3.14 Buffer Control Register (SPBFCR)....1191
24.3.15 Buffer Data Count Setting Register (SPBFDR)....1193
24.4 Operation....1194
24.4.1 Overview of Operations ....1194
24.4.2 Pin Control....1195
24.4.3 System Configuration Example ....1196
24.4.4 Transfer Format....1198
24.4.5 Data Format....1200
24.4.6 Error Detection ....1206
24.4.7 Initialization....1209
24.4.8 SPI Operation ....1210
24.4.9 Error Handling ....1220
24.4.10 Loopback Mode ....1221
24.4.11 Interrupt Sources ....1221

25. SPI Multi I/O Bus Controller ..... 1222
25.1 Features ..... 1222
25.1.1 Serial Flash Memory Interface ..... 1222
25.1.2 External Address Space Read Mode ..... 1222
25.1.3 Manual Mode ..... 1222
25.2 Block Diagram ..... 1223
25.3 Input/Output Pins ..... 1224
25.4 Register Descriptions ..... 1225
25.4.1 Common Control Register (CMNCR) ..... 1226
25.4.2 SSL Delay Register (SSLDR) ..... 1228
25.4.3 Data Read Control Register (DRCR) ..... 1230
25.4.4 Data Read Command Setting Register (DRCMR) ..... 1232
25.4.5 Data Read Extended Address Setting Register (DREAR) ..... 1233
25.4.6 Data Read Option Setting Register (DROPR) ..... 1234
25.4.7 Data Read Enable Setting Register (DRENR) ..... 1235
25.4.8 Manual Mode Control Register (SMCR) ..... 1237
25.4.9 Manual Mode Command Setting Register (SMCMR) ..... 1238
25.4.10 Manual Mode Address Setting Register (SMADR) ..... 1239
25.4.11 Manual Mode Option Setting Register (SMOPR) ..... 1240
25.4.12 Manual Mode Enable Setting Register (SMENR) ..... 1241
25.4.13 Manual Mode Read Data Register 0 (SMRDR0) ..... 1243
25.4.14 Manual Mode Write Data Register 0 (SMWDR0) ..... 1244
25.4.15 Common Status Register (CMNSR) ..... 1245
25.4.16 Data Read Dummy Cycle Setting Register (DRDMCR) ..... 1246
25.4.17 Data Read DDR Enable Register (DRDRENR) ..... 1247
25.4.18 Manual Mode Dummy Cycle Setting Register (SMDMCR) ..... 1248
25.4.19 Manual Mode DDR Enable Register (SMDRENR) ..... 1249
25.4.20 PHY Control Register (PHYCNT) ..... 1250
25.4.21 PHY Offset Register 1 (PHYOFFSET1) ..... 1252
25.4.22 PHY Offset Register 2 (PHYOFFSET2) ..... 1254
25.4.23 PHY Interrupt Register (PHYINT) ..... 1255
25.4.24 PHY Adjustment Register 1 (PHYADJ1) ..... 1256
25.4.25 PHY Adjustment Register 2 (PHYADJ2) ..... 1257
25.5 Operation ..... 1258
25.5.1 System Configuration ..... 1258
25.5.2 Address Map ..... 1259
25.5.3 32-bit Serial Flash Addresses ..... 1260
25.5.4 Operating Modes ..... 1261
25.5.5 External Address Space Read Mode ..... 1261
25.5.6 Read Cache ..... 1266
25.5.7 Manual mode ..... 1267

25.5.8 Command Sequence ..... 1271
25.5.9 Data Pin Control ..... 1275
25.5.10 QSPIn_SSL Pin Control ..... 1276
25.5.11 Flags ..... 1277
25.5.12 Write Buffer Operation ..... 1278
25.5.13 Supported Protocol for Serial Flash Memory ..... 1280
25.5.14 Timing Adjustment ..... 1281
25.5.15 Data Alignment ..... 1284
25.6 Usage Notes ..... 1285
25.6.1 Transfer to read data while the signal on the QSPIn_SSL pin is de-asserted ..... 1285
25.6.2 Transfer to read data while the signal on the QSPIn_SSL pin is asserted ..... 1285
25.6.3 Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode ..... 1285
25.6.4 Handling of QSPI_RESET# ..... 1285
25.6.5 Software Reset after Release from the Module Stop State ..... 1285
26. I²C Bus Interface ..... 1286
26.1 Features ..... 1286
26.1.1 Channels ..... 1286
26.1.2 Register Base Addresses ..... 1286
26.1.3 External I/O Signals ..... 1287
26.2 Overview ..... 1288
26.2.1 Functional Overview ..... 1288
26.2.2 Block Diagram ..... 1290
26.3 Registers ..... 1292
26.3.1 RIICnCR1 — I²C Bus Control Register 1 ..... 1293
26.3.2 RIICnCR2 — I²C Bus Control Register 2 ..... 1296
26.3.3 RIICnMR1 — I²C Bus Mode Register 1 ..... 1300
26.3.4 RIICnMR2 — I²C Bus Mode Register 2 ..... 1302
26.3.5 RIICnMR3 — I²C Bus Mode Register 3 ..... 1304
26.3.6 RIICnFER — I²C Bus Function Enable Register ..... 1307
26.3.7 RIICnSER — I²C Bus Status Enable Register ..... 1310
26.3.8 RIICnIER — I²C Bus Interrupt Enable Register ..... 1312
26.3.9 RIICnSR1 — I²C Bus Status Register 1 ..... 1314
26.3.10 RIICnSR2 — I²C Bus Status Register 2 ..... 1317
26.3.11 RIICnSARy — I²C Slave Address Register y (y = 0 to 2) ..... 1322
26.3.12 RIICnBRL — I²C Bus Bit Rate Low-Level Register ..... 1324
26.3.13 RIICnBRH — I²C Bus Bit Rate High-Level Register ..... 1325
26.3.14 RIICnDRT — I²C Bus Transmit Data Register ..... 1328
26.3.15 RIICnDRR — I²C Bus Receive Data Register ..... 1329
26.3.16 RIICnDRS — I²C Bus Shift Register ..... 1330
26.4 Interrupt Sources ..... 1331

26.5 Operation....1332
26.5.1 Communication Data Format....1332
26.5.2 Initial Settings....1334
26.5.3 Master Transmit Operation....1335
26.5.4 Master Receive Operation....1339
26.5.5 Slave Transmit Operation....1345
26.5.6 Slave Receive Operation....1348
26.6 SCL Synchronization Circuit....1351
26.7 Facility for Delaying SDA Output....1352
26.8 Digital Noise-Filter Circuits....1353
26.9 Address Match Detection....1354
26.9.1 Slave-Address Match Detection....1354
26.9.2 Detection of the General Call Address....1357
26.9.3 Device-ID Address Detection....1358
26.9.4 Host Address Detection....1360
26.10 Automatically Low-Hold Function for SCL....1361
26.10.1 Function to Prevent Wrong Transmission of Transmit Data....1361
26.10.2 NACK Reception Transfer Suspension Function....1362
26.10.3 Function to Prevent Failure to Receive Data....1363
26.11 Arbitration-Lost Detection Functions....1365
26.11.1 Master Arbitration-Lost Detection (MALE Bit)....1365
26.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)....1368
26.11.3 Slave Arbitration-Lost Detection (SALE Bit)....1369
26.12 Start Condition/Restart Condition/Stop Condition Issuing Function....1370
26.12.1 Issuing a Start Condition....1370
26.12.2 Issuing a Restart Condition....1371
26.12.3 Issuing a Stop Condition....1372
26.13 Bus Hanging....1373
26.13.1 Timeout Function....1373
26.13.2 Extra SCL Clock Cycle Output Function....1375
26.13.3 RIIC Reset and Internal Reset....1376
26.14 SMBus Operation....1377
26.14.1 SMBus Timeout Measurement....1377
26.14.2 SMBus Host Notification Protocol/Notify ARP Master....1378
26.15 Reset Function of RIIC....1379
27. Serial Sound Interface (SSIF-2)....1381
27.1 Overview....1381
27.1.1 Features....1381
27.1.2 Block Diagram....1383

27.2 Input/Output Pins ..... 1385
27.3 List of Registers ..... 1386
27.4 Function Details ..... 1388
27.4.1 Register Descriptions ..... 1388
27.4.1.1 Control Register (SSICR) ..... 1388
27.4.1.2 Status Register (SSISR) ..... 1401
27.4.1.3 FIFO Control Register (SSIFCR) ..... 1414
27.4.1.4 FIFO Status Register (SSIFSR) ..... 1423
27.4.1.5 Transmit FIFO Data Register (SSIFTDR) ..... 1427
27.4.1.6 Receive FIFO Data Register (SSIFRDR) ..... 1430
27.4.1.7 Audio Format Register (SSIOFR) ..... 1432
27.4.1.8 Status Control Register (SSISCR) ..... 1436
27.4.2 Communication Formats ..... 1437
27.4.2.1 $I^2S$ Format ..... 1438
27.4.2.2 Monaural Format ..... 1439
27.4.2.3 TDM Format ..... 1441
27.4.3 Communication Modes ..... 1442
27.4.3.1 Slave-mode Communication ..... 1443
27.4.3.2 Master-mode Communication ..... 1443
27.4.3.3 Transmission ..... 1443
27.4.3.4 Reception ..... 1443
27.4.3.5 Transmission and Reception ..... 1443
27.5 Operation ..... 1444
27.5.1 Operational State ..... 1444
27.5.1.1 Idle State ..... 1444
27.5.1.2 Communication States ..... 1447
27.5.2 Communication Operation ..... 1451
27.5.2.1 Start Communication ..... 1452
27.5.2.2 Transmission ..... 1453
27.5.2.3 Reception ..... 1455
27.5.2.4 Transmission and Reception ..... 1456
27.5.2.5 Halt Communication ..... 1457
27.5.2.6 Error Handling ..... 1458
27.5.2.7 Resume Communication ..... 1460
27.5.3 Interrupt Sources ..... 1461
27.5.3.1 INT_ssif_int_req Interrupt ..... 1461
27.5.3.2 INT_ssif_dma_tx Interrupt [full-duplex communication] ..... 1463
27.5.3.3 INT_ssif_dma_rx Interrupt [full-duplex communication] ..... 1463
27.5.3.4 INT_ssif_dma_rt Interrupt [half-duplex communication] ..... 1464
27.5.4 Software Resets ..... 1465
27.5.4.1 Software Reset Procedure ..... 1465
27.6 Notes ..... 1467
27.6.1 Notes ..... 1467
27.6.1.1 Attention by communication using DMA ..... 1467
27.6.1.2 Notes for Slave-mode Communication ..... 1467
27.6.1.3 Notes for Master-mode Communication ..... 1468
27.6.1.4 Notes for Communication Flow ..... 1468
27.6.1.5 Write Access Restriction ..... 1470

28. CANFD Interface (RS-CANFD) ..... 1472
28.1 Features of RS-CANFD ..... 1472
28.1.1 Number of Units and Channels ..... 1472
28.1.2 Register Base Address ..... 1474
28.1.3 Clock Supply ..... 1474
28.1.4 Interrupt Request ..... 1475
28.1.5 External Input/Output Signals ..... 1475
28.2 Overview ..... 1476
28.2.1 Functional Overview ..... 1476
28.2.2 Interface Modes ..... 1479
28.2.3 Block Diagram ..... 1479
28.3 Registers (Classical CAN Mode) ..... 1480
28.3.1 List of Registers ..... 1480
28.3.2 Details of Interface Mode-related Registers ..... 1484
28.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register ..... 1484
28.3.3 Details of Channel-related Registers ..... 1485
28.3.3.1 RSCANnCmCFG — Channel Configuration Register (m = 0, 1) ..... 1485
28.3.3.2 RSCANnCmCTR — Channel Control Register (m = 0, 1) ..... 1487
28.3.3.3 RSCANnCmSTS — Channel Status Register (m = 0, 1) ..... 1492
28.3.3.4 RSCANnCmERFL — Channel Error Flag Register (m = 0, 1) ..... 1495
28.3.4 Details of Global-related Registers ..... 1499
28.3.4.1 RSCANnGCFG — Global Configuration Register ..... 1499
28.3.4.2 RSCANnGCTR — Global Control Register ..... 1502
28.3.4.3 RSCANnGSTS — Global Status Register ..... 1504
28.3.4.4 RSCANnGERFL — Global Error Flag Register ..... 1506
28.3.4.5 RSCANnGTSC — Global Timestamp Counter Register ..... 1508
28.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0 ..... 1509
28.3.4.7 RSCANnGFDCFG — Global FD configuration register ..... 1511
28.3.5 Details of Receive Rule-related Registers ..... 1512
28.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register ..... 1512
28.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0 ..... 1513
28.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15) ..... 1514
28.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15) ..... 1516
28.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15) ..... 1518
28.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 0 Register (j = 0 to 15) ..... 1520
28.3.6 Details of Receive Buffer-related Registers ..... 1521
28.3.6.1 RSCANnRMNB — Receive Buffer Number Register ..... 1521
28.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0) ..... 1522
28.3.6.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 31) ..... 1523
28.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 31) ..... 1524
28.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 31) ..... 1526
28.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register (q = 0 to 31) ..... 1527
28.3.7 Details of Receive FIFO Buffer-related Registers ..... 1528
28.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ..... 1528
28.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ..... 1530

28.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ....1532
28.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ....1533
28.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)1534
28.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)....1535
28.3.7.7 RSCANnRFDF1_x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7)....1536
28.3.8 Details of Transmit/Receive FIFO Buffer-related Registers ....1537
28.3.8.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5) ....1537
28.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5) 1541
28.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)....1544
28.3.8.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5) ....1546
28.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)....1548
28.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 5) ....1550
28.3.8.7 RSCANnCFDF1_k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 5) ....1551
28.3.9 Details of FIFO Status-related Registers ....1552
28.3.9.1 RSCANnFESTS — FIFO Empty Status Register....1552
28.3.9.2 RSCANnFFSTS — FIFO Full Status Register ....1554
28.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register....1556
28.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ....1558
28.3.9.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ....1559
28.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ....1560
28.3.10 Details of Transmit Buffer-related Registers ....1561
28.3.10.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 31) ....1561
28.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 31) ....1563
28.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 31) ....1565
28.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)....1567
28.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 31) ....1569
28.3.10.6 RSCANnTMDF1_p — Transmit Buffer Data Field 1 Register (p = 0 to 31) ....1570
28.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0)....1571
28.3.11 Details of Transmit Buffer Status-related Registers ....1573
28.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)....1573
28.3.11.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0)....1575
28.3.11.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0)....1577
28.3.11.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0)....1579
28.3.12 Details of Transmit Queue-related Registers ....1581
28.3.12.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0, 1)....1581

28.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0, 1)....1583
28.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)..1585
28.3.13 Details of Transmit history-related Registers....1586
28.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)....1586
28.3.13.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0, 1)....1588
28.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)..1590
28.3.13.4 RSCANnTHLACCm — Transmit History Access Register (m = 0, 1)....1591
28.3.14 Details of Test-related Registers....1593
28.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register....1593
28.3.14.2 RSCANnGTSTCTR — Global Test Control Register....1595
28.3.14.3 RSCANnGLOCKK — Global Lock Key Register....1596
28.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)....1597
28.4 Registers (CANFD Mode)....1598
28.4.1 List of Registers....1598
28.4.2 Details of Interface Mode-related Registers....1602
28.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register....1602
28.4.3 Details of Channel-related Registers....1603
28.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0, 1)....1603
28.4.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0, 1)....1605
28.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0, 1)....1611
28.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0, 1)....1614
28.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0, 1)....1618
28.4.3.6 RSCFDnCFDCmFDCFG — Channel CANFD Configuration Register (m = 0, 1)....1621
28.4.3.7 RSCFDnCFDCmFDCTR — Channel CANFD Control Register (m = 0, 1)....1625
28.4.3.8 RSCFDnCFDCmFDSTS — Channel CANFD Status Register (m = 0, 1)....1626
28.4.3.9 RSCFDnCFDCmFDCRC — Channel CANFD CRC Register (m = 0, 1)....1628
28.4.4 Details of Global-related Registers....1630
28.4.4.1 SCFDnCFDGCFG — Global Configuration Register....1630
28.4.4.2 RSCFDnCFDGCTR — Global Control Register....1634
28.4.4.3 RSCFDnCFDGSTS — Global Status Register....1636
28.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register....1638
28.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register....1640
28.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0....1641
28.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register....1643
28.4.5 Details of Receive Rule-related Registers....1644
28.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register....1644
28.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0....1645
28.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)....1646
28.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)....1648
28.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)....1650
28.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)....1652
28.4.6 Details of Receive Buffer-related Registers....1653
28.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register....1653
28.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0)....1654
28.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 31)....1655
28.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)....1657

28.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CANFD Status Register (q = 0 to 31) ....1659
28.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 31)....1660
28.4.7 Details of Receive FIFO Buffer-related Registers ....1661
28.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ....1661
28.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ....1664
28.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)....1666
28.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)....1667
28.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) ....1669
28.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CANFD Status Register (x = 0 to 7) ....1671
28.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)....1672
28.4.8 Transmit/Receive FIFO Buffer-related Registers ....1673
28.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5) ....1673
28.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5) ....1677
28.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5) ....1680
28.4.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)....1682
28.4.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5) ....1684
28.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CANFD Configuration/ Status Register (k = 0 to 5)....1686
28.4.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 5)....1688
28.4.9 Details of FIFO Status-related Registers ....1689
28.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register ....1689
28.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register ....1691
28.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register ....1693
28.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ....1695
28.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ....1696
28.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ....1697
28.4.10 Details of FIFO DMA-related Registers....1698
28.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register ....1698
28.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register ....1700
28.4.11 Details of Transmit Buffer-related Registers ....1702
28.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 31)....1702
28.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 31)....1704
28.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 31)....1706
28.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31) ....1708
28.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CANFD Configuration Register (p = 0 to 31)....1710

28.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 31) ..... 1712
28.4.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0) ..... 1713
28.4.12 Details of Transmit Buffer Status-related Registers ..... 1715
28.4.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0) ..... 1715
28.4.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0) ..... 1717
28.4.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0) ..... 1719
28.4.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0) ..... 1721
28.4.13 Details of Transmit Queue-related Registers ..... 1723
28.4.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0, 1) ..... 1723
28.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0, 1) ..... 1725
28.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1) ..... 1727
28.4.14 Details of Transmit History-related Registers ..... 1728
28.4.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0, 1) ..... 1728
28.4.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0, 1) ..... 1730
28.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1) ..... 1732
28.4.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0, 1) ..... 1733
28.4.15 Details of Test-related Registers ..... 1735
28.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register ..... 1735
28.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register ..... 1737
28.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register ..... 1739
28.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63) ..... 1740
28.5 Interrupt Sources and DMA Trigger ..... 1741
28.5.1 Interrupt Sources ..... 1741
28.5.2 DMA Trigger (Only in CANFD Mode) ..... 1746
28.6 CAN Modes ..... 1747
28.6.1 Global Modes ..... 1748
28.6.1.1 Global Stop Mode ..... 1749
28.6.1.2 Global Reset Mode ..... 1749
28.6.1.3 Global Test Mode ..... 1749
28.6.1.4 Global Operating Mode ..... 1750
28.6.2 Channel Modes ..... 1751
28.6.2.1 Channel Stop Mode ..... 1752
28.6.2.2 Channel Reset Mode ..... 1752
28.6.2.3 Channel Halt Mode ..... 1753
28.6.2.4 Channel Communication Mode ..... 1753
28.6.2.5 Bus Off State ..... 1754
28.6.3 Initializing Registers by Transition to CAN Mode ..... 1755
28.7 Reception Function ..... 1757
28.7.1 Data Processing Using the Receive Rule Table ..... 1757

28.7.1.1 Acceptance Filter Processing ..... 1758
28.7.1.2 DLC Filter Processing ..... 1759
28.7.1.3 Routing Processing ..... 1759
28.7.1.4 Label Addition Processing ..... 1759
28.7.1.5 Mirror Function Processing ..... 1759
28.7.1.6 Timestamp ..... 1760
28.8 Transmission Functions ..... 1761
28.8.1 Transmit Priority Determination ..... 1762
28.8.2 Transmission Using Transmit Buffers ..... 1763
28.8.2.1 Transmit Abort Function ..... 1763
28.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function) ..... 1763
28.8.2.3 Transmit Buffer Merge Mode (Only in CANFD Mode) ..... 1763
28.8.3 Transmission Using FIFO Buffers ..... 1764
28.8.3.1 Interval Transmission Function ..... 1764
28.8.4 Transmission Using Transmit Queues ..... 1767
28.8.5 Transmit Data Padding (Only in CANFD Mode) ..... 1767
28.8.6 Transmit History Function ..... 1768
28.9 Gateway Function ..... 1770
28.9.1 CAN-CANFD Gateway (Only in CANFD Mode) ..... 1770
28.10 Test Function ..... 1771
28.10.1 Standard Test Mode ..... 1771
28.10.2 Listen-Only Mode ..... 1772
28.10.3 Self-Test Mode (Loopback Mode) ..... 1772
28.10.3.1 Self-Test Mode 0 (External Loopback Mode) ..... 1773
28.10.3.2 Self-Test Mode 1 (Internal Loopback Mode) ..... 1773
28.10.4 Restricted Operation Mode (Only in CANFD Mode) ..... 1774
28.10.5 RAM Test ..... 1774
28.10.6 Inter-Channel Communication Test ..... 1774
28.10.6.1 CRC Error Test ..... 1775
28.11 RS-CANFD Setting Procedure ..... 1776
28.11.1 Initial Settings ..... 1776
28.11.1.1 Clock Setting ..... 1778
28.11.1.2 Bit Timing Setting ..... 1778
28.11.1.3 Communication Speed Setting ..... 1780
28.11.1.4 Receive Rule Setting ..... 1782
28.11.1.5 Buffer Setting ..... 1783
28.11.1.6 Transmitter Delay Compensation (Only in CANFD Mode) ..... 1785
28.11.2 Reception Procedure ..... 1786
28.11.2.1 Receive Buffer Reading Procedure ..... 1786
28.11.2.2 FIFO Buffer Reading Procedure ..... 1788
28.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer ..... 1792
28.11.3 Transmission Procedure ..... 1793
28.11.3.1 Procedure for Transmission from Transmit Buffers ..... 1793
28.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers ..... 1798
28.11.3.3 Procedure for Transmission from the Transmit Queue ..... 1802
28.11.3.4 Transmit History Buffer Reading Procedure ..... 1803
28.11.4 Test Settings ..... 1804

28.11.4.1 Self-Test Mode Setting Procedure ....1804
28.11.4.2 Procedure for Releasing the Protection ....1805
28.11.4.3 RAM Test Setting Procedure ....1806
28.11.4.4 Inter-Channel Communication Test Setting Procedure ....1807
28.12 Notes on the RS-CANFD Module ....1809
30. Gigabit Ethernet Interface ....1811
30.1 Features ....1811
30.1.1 Specification ....1811
30.1.2 Block Diagram ....1812
30.2 External Signal Pins ....1813
30.3 Register Configuration ....1814
30.3.1 Register Base Address ....1814
30.3.2 IO Mode Registers ....1814
30.3.3 DMAC Registers ....1814
30.3.4 E-MAC Registers ....1815
30.3.5 TOE Registers ....1817
30.4 Register Descriptions ....1819
30.4.1 DMAC Registers ....1819
30.4.1.1 DMAC Mode Register (CCC) ....1819
30.4.1.2 Descriptor Base Address Table Register (DBAT) ....1821
30.4.1.3 Descriptor Base Address Load Request Register (DLR) ....1822
30.4.1.4 DMAC Status Register (CSR) ....1823
30.4.1.5 Current Descriptor Address Register q (CDARq) (q = 0,4) ....1825
30.4.1.6 Error Status Register (ESR) ....1826
30.4.1.7 Receive Configuration Register (RCR) ....1828
30.4.1.8 Reception Truncation Configuration Register I (RTC) ....1829
30.4.1.9 Transmit Configuration Register (TGC) ....1830
30.4.1.10 Transmit Configuration Control Register (TCCR) ....1831
30.4.1.11 Transmit Status Register (TSR) ....1833
30.4.1.12 MAC status FIFO Access Register (MFA) ....1834
30.4.1.13 MAC status FIFO Access 2 Register (MFA2) ....1835
30.4.1.14 Descriptor Interrupt Status Register (DIS) ....1836
30.4.1.15 Descriptor Interrupt Control Register (DIC) ....1837
30.4.1.16 Descriptor Interrupt Enable Register (DIE) ....1838
30.4.1.17 Descriptor Interrupt Disable Register (DID) ....1839
30.4.1.18 Error Interrupt Status Register (EIS) ....1840
30.4.1.19 Error Interrupt Control Register (EIC) ....1842
30.4.1.20 Error Interrupt Enable Register (EIE) ....1844
30.4.1.21 Error Interrupt Disable Register (EID) ....1845
30.4.1.22 Receive Interrupt Status Register 0 (RIS0) ....1846
30.4.1.23 Receive Interrupt Control Register 0 (RIC0) ....1847
30.4.1.24 Receive Interrupt Enable Register 0 (RIE0) ....1848
30.4.1.25 Receive Interrupt Disable Register 0 (RID0) ....1848
30.4.1.26 Receive Interrupt Status Register 1 (RIS1) ....1849
30.4.1.27 Receive Interrupt Control Register 1 (RIC1) ....1850
30.4.1.28 Receive Interrupt Enable Register 1 (RIE1) ....1851
30.4.1.29 Receive Interrupt Disable Register 1 (RID1) ....1851
30.4.1.30 Receive Interrupt Status Register 2 (RIS2) ....1852

30.4.1.31 Receive Interrupt Control Register 2 (RIC2) ..... 1853
30.4.1.32 Receive Interrupt Enable Register 2 (RIE2) ..... 1854
30.4.1.33 Receive Interrupt Disable Register 2 (RID2) ..... 1855
30.4.1.34 Receive Interrupt Status Register 3 (RIS3) ..... 1856
30.4.1.35 Receive Interrupt Control Register 3 (RIC3) ..... 1857
30.4.1.36 Receive Interrupt Enable Register 3 (RIE3) ..... 1858
30.4.1.37 Receive Interrupt Disable Register 3 (RID3) ..... 1858
30.4.1.38 Transmit Interrupt Status Register (TIS) ..... 1859
30.4.1.39 Transmit Interrupt Control Register (TIC) ..... 1862
30.4.1.40 Transmit Interrupt Enable Register (TIE) ..... 1864
30.4.1.41 Transmit Interrupt Disable Register (TID) ..... 1866
30.4.1.42 Common Interrupt Enable register (CIE) ..... 1868
30.4.1.43 Interrupt Summary Status Register (ISS) ..... 1869
30.4.2 E-MAC Registers ..... 1871
30.4.2.1 E-MAC operating mode register 1 (CXR20) ..... 1871
30.4.2.2 Maximum receive frame length register (CXR2A) ..... 1874
30.4.2.3 Interrupt status register (CXR21) ..... 1875
30.4.2.4 Enables/disables interrupts register (CXR22) ..... 1876
30.4.2.5 PHY register access register (CXR23) ..... 1877
30.4.2.6 Link status register (CXR2B) ..... 1878
30.4.2.7 Polarity set register (CXR2C) ..... 1879
30.4.2.8 In-Band Status set register (CXR31) ..... 1880
30.4.2.9 In-Band Status indicate register (CXR32) ..... 1882
30.4.2.10 Mode indicate register (CXR33) ..... 1883
30.4.2.11 PHY interface select register (CXR35) ..... 1884
30.4.2.12 PHY interface indicate register (CXR36) ..... 1886
30.4.2.13 PAUSE frame register 1 (CXR71) ..... 1887
30.4.2.14 PAUSE frame register 2 (CXR72) ..... 1888
30.4.2.15 PAUSE frame register 3 (CXR8A) ..... 1889
30.4.2.16 PAUSE frame register 4 (CXR80) ..... 1889
30.4.2.17 PAUSE frame register 5 (CXR81) ..... 1890
30.4.2.18 PAUSE frame register 6 (CXR82) ..... 1891
30.4.2.19 E-MAC operating mode register 2 (CXR2D) ..... 1892
30.4.2.20 Software LINK status register (CXR2G) ..... 1893
30.4.2.21 Mac Address register 1 (CXR24) ..... 1894
30.4.2.22 Mac Address register 2 (CXR25) ..... 1894
30.4.2.23 TINT1 counter register (CXR40) ..... 1895
30.4.2.24 TINT2 counter register (CXR41) ..... 1895
30.4.2.25 TINT3 counter register (CXR42) ..... 1896
30.4.2.26 RINT1 counter register (CXR50) ..... 1897
30.4.2.27 RINT2 counter register (CXR51) ..... 1897
30.4.2.28 RINT3 counter register (CXR52) ..... 1898
30.4.2.29 RINT4 counter register (CXR53) ..... 1899
30.4.2.30 RINT5 counter register (CXR54) ..... 1900
30.4.2.31 RINT6 counter register (CXR55) ..... 1900
30.4.2.32 RINT7 counter register (CXR56) ..... 1901
30.4.2.33 RINT8 counter register (CXR57) ..... 1901
30.4.2.34 MDIO status register (MDIOSTS) ..... 1902
30.4.2.35 MDIO command register (MDIOCMD) ..... 1903
30.4.2.36 MDIO address register (MDIOADR) ..... 1903
30.4.2.37 MDIO data register (MDIODAT) ..... 1904
30.4.2.38 MDIO mode register (MDIOMOD) ..... 1905
30.4.2.39 Low Power Mode register 1 (LPTXMOD1) ..... 1906

30.4.2.40 Low Power Mode register 2 (LPTXMOD2) ..... 1907
30.4.2.41 RGMII Low Power parameter register 1 (LPTXGTH1) ..... 1908
30.4.2.42 RGMII Low Power parameter register 2 (LPTXGTH2) ..... 1909
30.4.2.43 RGMII Low Power parameter register 3 (LPTXGTH3) ..... 1910
30.4.2.44 RGMII Low Power parameter register 4 (LPTXGTH4) ..... 1912
30.4.2.45 MII Low Power parameter register 1 (LPTXMTH1) ..... 1913
30.4.2.46 MII Low Power parameter register 2 (LPTXMTH2) ..... 1914
30.4.2.47 MII Low Power parameter register 3 (LPTXMTH3) ..... 1915
30.4.2.48 MII Low Power parameter register 4 (LPTXMTH4) ..... 1916
30.4.3 TOE Registers ..... 1917
30.4.3.1 Checksum operating mode register (CSR0) ..... 1917
30.4.3.2 Tx Frame Checksum Enable register (CSR1) ..... 1919
30.4.3.3 Rx Frame Checksum Enable register (CSR2) ..... 1921
30.4.3.4 Tx Extended Header Number register (CSR3) ..... 1923
30.4.3.5 Rx Extended Header Number register (CSR4) ..... 1924
30.4.3.6 Unsupported Tx Frame Counter register (CSR20) ..... 1925
30.4.3.7 Unsupported Rx Frame Counter register (CSR30) ..... 1926
30.4.3.8 Rx IPv4 Header checksum Error Counter register (CSR31) ..... 1927
30.4.3.9 Rx TCP/UDP/ICMP checksum Error Counter register (CSR32) ..... 1927
30.4.3.10 Filter Operation/Auto Response Enable register (CSFR00) ..... 1928
30.4.3.11 Local IPv4 address register (CSFR01) ..... 1931
30.4.3.12 Local IPv6 address register i (i = 0 to 3) (CSFR02_i) ..... 1931
30.4.3.13 Upper Local MAC address register (CSFR03_U) ..... 1932
30.4.3.14 Lower Local MAC address register (CSFR03_L) ..... 1932
30.4.3.15 IPv6 no_next_header Protocol Number register (CSFR04) ..... 1933
30.4.3.16 Ethernet Type Condition register i (i = 0 to 3) (CSFR10_i) ..... 1933
30.4.3.17 Ethernet Type Condition Enable register (CSFR10) ..... 1934
30.4.3.18 Protocol Condition register i (i = 0 to 3) (CSFR11_i) ..... 1935
30.4.3.19 Protocol Condition Enable register (CSFR11) ..... 1936
30.4.3.20 UDP Por Condition register i (i = 0 to 11) (CSFR12_i) ..... 1938
30.4.3.21 UDP Port Condition Enable register (CSFR12) ..... 1939
30.4.3.22 Upper MAC DA unicast address Condition register (CSFR13_U) ..... 1942
30.4.3.23 Lower MAC DA unicast address Condition register (CSFR13_L) ..... 1942
30.4.3.24 Upper MAC DA broadcast address Condition register (CSFR14_U) ..... 1943
30.4.3.25 Lower MAC DA broadcast address Condition register (CSFR14_L) ..... 1943
30.4.3.26 Upper MAC DA multicast address Condition register i (i = 0 to 19) (CSFR15_U_i) ..... 1944
30.4.3.27 Lower MAC DA multicast address Condition register i (i = 0 to 19) (CSFR15_L_i) ..... 1944
30.4.3.28 MAC DA Condition Enable register (CSFR15) ..... 1945
30.4.3.29 IPv6 analysis Protocol Condition register 0 (CSFR16_0) ..... 1948
30.4.3.30 IPv6 analysis Protocol Condition register 1 (CSFR16_1) ..... 1949
30.4.3.31 IPv6 analysis Protocol Condition register 2 (CSFR16_2) ..... 1950
30.4.3.32 IPv6 analysis Protocol Condition Enable register (CSFR16) ..... 1951
30.4.3.33 Wake Up Interrupt Status register (CSFR20) ..... 1952
30.4.3.34 Wake Up Interrupt Mask register (CSFR21) ..... 1955
30.4.3.35 Auto Response Configuration register1 (CSFR30) ..... 1958
30.4.3.36 Auto Response Configuration register2 (CSFR31) ..... 1960
30.4.3.37 ARPREQ/Neighbor Solicitations Receive Interrupt Status register (CSFR40) ..... 1961
30.4.3.38 ARPREQ/Neighbor Solicitations Receive Interrupt Mask register (CSFR41) ..... 1962
30.4.3.39 Rx ARPREQ/Neighbor Solicitation Upper MAC SA register (CSFR42_U) ..... 1963
30.4.3.40 Rx ARPREQ/Neighbor Solicitation Lower MAC SA register (CSFR42_L) ..... 1964
30.4.3.41 Rx ARPREQ/Neighbor Solicitation IP SA register i (i = 0 to 3) (CSFR43_i) ..... 1965

30.5 Operation....1966
30.5.1 DMAC Operating Modes....1967
30.5.1.1 Operating Modes....1967

31.3.3 A/D Converter Mode Register 2 (ADM2) ....2057
31.3.4 A/D Converter Mode Register 3 (ADM3) ....2058
31.3.5 A/D Converter Interrupt Control Register (ADINT) ....2059
31.3.6 A/D Converter Status Register (ADSTS) ....2060
31.3.7 A/D Converter Clock Division Setting Register (ADIVC) ....2061
31.3.8 A/D Converter External Trigger Pin Filter Control Register (ADFIL) ....2062
31.3.9 A/D Conversion Result Registers 3 to 0 (ADCR3 to ADCR0) ....2063
31.4 Operation ....2065
31.4.1 Types of A/D Conversion Modes ....2065
31.4.1.1 Trigger Modes ....2066
31.4.1.2 Operating mode ....2067
31.4.1.3 Conversion Mode ....2069
31.4.2 Interrupt Functions ....2070
31.4.3 Procedures of A/D Conversion ....2071
31.4.3.1 Procedure for Starting A/D Conversion ....2072
31.4.3.2 Procedure for Stopping A/D Conversion ....2073
31.4.3.3 Procedure for Stopping and Restarting A/D Conversion ....2074
31.4.3.4 Procedure for Entering Power-saving Mode ....2074
31.4.3.5 Procedure for Releasing from Power-saving Mode ....2075
31.4.3.6 Procedure for a Software Reset ....2076
31.4.3.7 Procedure for Restarting A/D Conversion after a Software Reset ....2077
31.4.3.8 Procedure for Interrupt Processing ....2078
31.4.4 Examples of A/D Conversion ....2079
31.4.4.1 Example of A/D Conversion in Select Mode with Single Mode Selected ....2080
31.4.4.2 Example of A/D Conversion in Select Mode with Repeat Mode Selected ....2082
31.4.4.3 Example of A/D Conversion in 4-Buffer Mode ....2084

31.4.4.4 Example of A/D Conversion in Scan Mode with Single Mode Selected.....2086
31.4.4.5 Example of A/D Conversion in Scan Mode with Repeat Mode Selected.....2087
31.4.4.6 Example of A/D Conversion in Auto Mode.....2088
31.4.4.7 Example of A/D Conversion in Step Mode.....2090
31.5 Notes.....2092
31.5.1 Interval of Hardware Trigger.....2092
31.5.2 Timing Restrictions.....2092
31.5.3 Restrictions on ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) Cycles.....2092
31.5.4 Operation when Stopping or Restarting A/D Conversion.....2092
32. USB2.0.....2094
32.1 Features.....2094
32.1.1 Ch0: USB2.0 OTG/DRD(Host/Function) interface.....2094
32.1.2 Ch1: USB2.0 HOST interface.....2095
32.1.3 Block Diagram.....2095
32.1.4 External signal pins.....2096
32.1.5 Power and GND pins.....2096
32.1.6 Interrupt.....2097
32.2 Register Configuration.....2098
32.2.1 Host controller Register.....2098
32.2.2 Function controller Register.....2098
32.2.3 USBPHY Control Register.....2098
32.3 Register Descriptions.....2099
32.3.1 Reset register (RESET).....2099
32.3.2 Clock control register (UCLKCTL).....2100
32.3.3 Direct power down setting register (UDIRPD).....2101
32.3.4 VBUSEN control register (VBENCTL).....2102
32.3.5 Connection control register (CON_CTRL).....2103
32.3.6 Clock status register (CLK_STAT).....2104
32.4 Operation.....2105
32.4.1 USB/PHY Initialization.....2105
32.4.2 Handling of permanently unused pin.....2106
32.4.2.1 USB/PHY related pins.....2106
32.4.2.2 Handling of USB controller related pins.....2107
32.4.3 Direct power down (DIRPD).....2107
32.4.3.1 Enter to Direct power down mode.....2107
32.4.3.2 Resume from Direct power down mode.....2108
32.5 Usage Notes.....2109
32.5.1 Precautions in power down mode.....2109
32A. USB 2.0 Host Module.....2110
32A.1 Overview.....2110
32A.1.1 Overview.....2110
32A.1.2 Features.....2110

32A.1.2.1 EHCI v1.1 functions ..... 2111
32A.1.2.2 Link Power Management (LPM) function ..... 2112
32A.1.2.3 OTG function ..... 2113
32A.1.2.4 Battery-charging function ..... 2113
32A.1.2.5 Suspend extension function ..... 2113
32A.1.3 Support of USB-Related Specifications ..... 2114
32A.2 Register Descriptions ..... 2115
32A.2.1 Register Attributes ..... 2115
32A.2.2 Base Address ..... 2115
32A.2.3 Register Overview ..... 2116
32A.2.4 Description of Registers ..... 2118
32A.2.4.1 OHCI Operational Register ..... 2118
32A.2.4.2 EHCI Controller Capability Register ..... 2150
32A.2.4.3 HCI Operational Register ..... 2155
32A.2.4.4 AHB Bridge Register ..... 2172
32A.2.4.5 UCOM Register ..... 2185
32A.3 Clock Signals ..... 2192
32A.3.1 Clock Gating Specifications ..... 2192
32A.3.1.1 Overview of clock gating ..... 2192
32A.3.1.2 Specifications of NONUSE_CLK_MSK operation ..... 2192
32A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations ..... 2193
32A.4 Interrupt Sources ..... 2194
32A.4.1 Interrupt Signals ..... 2194
32A.4.2 Interrupt Sources and Control ..... 2195
32A.4.2.1 U2H_INT assertion source and control ..... 2195
32A.4.2.2 U2H_OHCI_INT assertion source and control ..... 2196
32A.4.2.3 U2H_EHCI_INT assertion source and control ..... 2197
32A.4.2.4 U2H_WAKEON_INT assertion source and control ..... 2198
32A.4.2.5 U2H_OBINT assertion source and control ..... 2199
32A.4.3 Timing of De-asserting Interrupt Signals ..... 2200
32A.5 Power-Saving Function ..... 2201
32A.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY ..... 2201
32A.5.2 Controlling the Clock-Gating Function ..... 2201
32A.6 Battery Charging ..... 2202
32A.6.1 Support of charging port ..... 2202
32A.6.2 Support of portable device ..... 2202
32A.7 Bus Master ..... 2203
32A.7.1 Functional specifications of the bus master ..... 2203
32A.7.1.1 Supported bus master functions ..... 2203
32A.7.1.2 Issuing requests for different types of bus transfer ..... 2203
32A.7.1.3 Supported responses ..... 2203
32A.7.1.4 Protection control information ..... 2203
32A.7.1.5 Maximum burst length ..... 2204
32A.7.1.6 Boundary of transfer data ..... 2204
32A.7.1.7 Start address of fixed-length INCR burst transfer ..... 2205

32A.8 Overcurrent Control and VBUS Control ..... 2206
32A.8.1 OVRCUR/VBUSEN pin ..... 2206
32A.8.2 Overcurrent detection timer setting ..... 2206
32A.8.3 Port Power (VBUS) control specifications ..... 2207
32A.8.4 Timing Chart for Overcurrent Detection and Recovery ..... 2208
32A.9 Procedure for Setting this Module ..... 2209
32A.9.1 Host/Peripheral Common Setting Sequence ..... 2209
32A.9.2 Initialization Sequence ..... 2210
32A.9.3 Flow of Error Handling ..... 2211
32B. USB 2.0 Function Module ..... 2212
32B.1 Overview ..... 2212
32B.1.1 Overview ..... 2212
32B.1.2 Features ..... 2212
32B.1.2.1 Peripheral controller supporting high-speed USB ..... 2212
32B.1.2.2 Support of all types of USB transfer ..... 2212
32B.1.2.3 Bus interface ..... 2212
32B.1.2.4 Pipe configuration ..... 2213
32B.1.2.5 Features of peripheral functions ..... 2213
32B.1.2.6 Features of DMA transfer ..... 2213
32B.1.2.7 Other functions ..... 2214
32B.1.3 Overview of Functions ..... 2215
32B.1.3.1 Automatic recognition of USB transfer speed ..... 2215
32B.1.3.2 USB event ..... 2215
32B.1.3.3 USB data transfer ..... 2215
32B.1.3.4 SOF pulse output function ..... 2215
32B.1.4 Restriction matter and Notes ..... 2216
32B.1.4.1 Restriction matter ..... 2216
32B.1.4.2 Notes ..... 2216
32B.2 Registers ..... 2217
32B.2.1 Base Address ..... 2218
32B.2.2 List of Registers ..... 2218
32B.2.3 System Configuration Control Registers ..... 2221
32B.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: H’000> ..... 2221
32B.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: H’002> ..... 2224
32B.2.4 System Configuration Status ..... 2225
32B.2.4.1 System Configuration Status Register (SYSSTS0) <Address: H’004> ..... 2225
32B.2.5 USB Signal Control Registers ..... 2226
32B.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: H’008> ..... 2226
32B.2.6 Test Mode Register ..... 2228
32B.2.6.1 USB Test Mode Register [TESTMODE] <Address: H’00C> ..... 2228
32B.2.7 FIFO Port Registers ..... 2229
32B.2.7.1 CFIFO Port Register [CFIFO] <Address: H’014> ..... 2229
32B.2.7.2 CFIFO Port Register [CFIFO] <Address: H’016> ..... 2229
32B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H’020> ..... 2231
32B.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address:H’028>
D1FIFO Port Select Register [D1FIFOSEL] <Address:H’02C> ..... 2234

32B.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: H'022>
D0FIFO Port Control Register [D0FIFOCTR] <Address: H'02A>
D1FIFO Port Control Register [D1FIFOCTR] <Address: H'02E> ....2236
32B.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB) ....2238
32B.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: H'030> ....2238
32B.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: H'036> ....2239
32B.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: H'038> ....2240
32B.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: H'03A> ....2241
32B.2.9 SOF Control Register ....2242
32B.2.9.1 SOF Pin Configuration Register [SOFCFG] <Address: H'03C> ....2242
32B.2.10 Interrupt Status ....2243
32B.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: H'040> ....2243
32B.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: H'046> ....2246
32B.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: H'048> ....2249
32B.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: H'04A> ....2251
32B.2.11 Frame Number Registers (FRMNUM, UFRMNUM) ....2252
32B.2.11.1 Frame Number Register [FRMNUM] <Address: H'04C> ....2252
32B.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: H'04E> ....2254
32B.2.12 USB Address ....2255
32B.2.12.1 USB Address Register [USBADDR] <Address: H'050> ....2255
32B.2.13 USB Request Registers ....2256
32B.2.13.1 USB Request Type Register [USBREQ] <Address: H'054> ....2256
32B.2.13.2 USB Request Value Register [USBVAL] <Address: H'056> ....2257
32B.2.13.3 USB Request Index Register [USBINDX] <Address: H'058> ....2257
32B.2.13.4 USB Request Length Register [USBLENG] <Address: H'05A> ....2258
32B.2.14 DCP Configuration ....2259
32B.2.14.1 DCP Configuration Register [DCPCFG] <Address: H'05C> ....2259
32B.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: H'05E> ....2260
32B.2.14.3 DCP Control Register [DCPCTR] <Address: H'060> ....2261
32B.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI) ....2264
32B.2.15.1 Pipe Window Select Register [PIPESEL] <Address: H'064> ....2264
32B.2.15.2 Pipe Configuration Register [PIPECFG] <Address: H'068> ....2265
32B.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: H'06A> ....2271
32B.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: H'06C> ....2273
32B.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: H'06E> ....2274
32B.2.16 Pipe Control Registers (PIPExCTR) ....2277
32B.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: H'070>
PIPE2 Control Register [PIPE2CTR] <Address: H'072>
PIPE3 Control Register [PIPE3CTR] <Address: H'074>
PIPE4 Control Register [PIPE4CTR] <Address: H'076>
PIPE5 Control Register [PIPE5CTR] <Address: H'078> ....2277
32B.2.16.2 PIPE6 Control Register [PIPE6CTR] <Address: H'07A>
PIPE7 Control Register [PIPE7CTR] <Address: H'07C>
PIPE8 Control Register [PIPE8CTR] <Address: H'07E>
PIPE9 Control Register [PIPE9CTR] <Address: H'080> ....2283
32B.2.17 Transaction Counters (PIPExTRE) ....2285

32B.2.17.1 PIPE1 Transaction Counter Enable Register [PIPE1TRE] <Address: H'090>
PIPE2 Transaction Counter Enable Register [PIPE2TRE] <Address: H'094>
PIPE3 Transaction Counter Enable Register [PIPE3TRE] <Address: H'098>
PIPE4 Transaction Counter Enable Register [PIPE4TRE] <Address: H'09C>
PIPE5 Transaction Counter Enable Register [PIPE5TRE] <Address: H'0A0> ...2285
32B.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: H'092>
PIPE2 Transaction Counter Register [PIPE2TRN] <Address: H'096>
PIPE3 Transaction Counter Register [PIPE3TRN] <Address: H'09A>
PIPE4 Transaction Counter Register [PIPE4TRN] <Address: H'09E>
PIPE5 Transaction Counter Register [PIPE5TRN] <Address: H'0A2> .....2287
32B.2.18 Low Power Control Register.....2289
32B.2.18.1 Low Power Control Register [LPCTRL] <Address: H'100>.....2289
32B.2.19 Low Power Status Register.....2290
32B.2.19.1 Low Power Status Register [LPSTS] <Address: H'102>.....2290
32B.2.20 PHY Function Control Register.....2291
32B.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: H'104>.....2291
32B.2.21 PHY_OTG Control Register (PHYOTGCTR).....2292
32B.2.21.1 PHY_OTG Control Register [PHYOTGCTR] <Address: H'10A>.....2292
32B.2.22 Peripheral L1 Control Register 1 (PL1CTRL).....2293
32B.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: H'144>.....2293
32B.2.23 Peripheral L1 Control Register 2.....2296
32B.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: H'146>.....2296
32B.3 Next Register Set.....2297
32B.3.1 Next Source Address Register n.....2297
32B.3.1.1 Next0 Source Address Register ch0 [N0SA_0] <Address: H'400>
Next1 Source Address Register ch0 [N1SA_0] <Address: H'40C>
Next0 Source Address Register ch1 [N0SA_1] <Address: H'440>
Next1 Source Address Register ch1 [N1SA_1] <Address: H'44C>.....2297
32B.3.2 Next Destination Address Register n.....2298
32B.3.2.1 Next0 Destination Address Register ch0 [N0DA_0] <Address: H'404>
Next1 Destination Address Register ch0 [N1DA_0] <Address: H'410>
Next0 Destination Address Register ch1 [N0DA_1] <Address: H'444>
Next1 Destination Address Register ch1 [N1DA_1] <Address: H'450>.....2298
32B.3.3 Next Transaction Byte Register n.....2299
32B.3.3.1 Next0 Transaction Byte Register ch0 [N0TB_0] <Address: H'408>
Next1 Transaction Byte Register ch0 [N1TB_0] <Address: H'414>
Next0 Transaction Byte Register ch1 [N0TB_1] <Address: H'448>
Next1 Transaction Byte Register ch1 [N1TB_1] <Address: H'454>.....2299
32B.4 Current Register Set.....2300
32B.4.1 Current Source Address Register.....2300
32B.4.1.1 Current Source Address Register ch0 [CRSA_0] <Address: H'418>
Current Source Address Register ch1 [CRSA_1] <Address: H'458>.....2300
32B.4.2 Current Destination Address Register.....2301
32B.4.2.1 Current Destination Address Register ch0 [CRDA_0] <Address: H'41C>
Current Destination Address Register ch1 [CRDA_1] <Address: H'45C>.....2301
32B.4.3 Current Transaction Byte Register.....2302
32B.4.3.1 Current Transaction Byte Register ch0 [CRTB_0] <Address: H'420>
Current Transaction Byte Register ch1 [CRTB_1] <Address: H'460>.....2302

32B.5 Channel Register Set ..... 2303
32B.5.1 Channel Status Register n ..... 2303
32B.5.1.1 Channel Status Register ch0 [CHSTAT_0] <Address: H'424>
Channel Status Register ch1 [CHSTAT_1] <Address: H'464> ..... 2303
32B.5.2 Channel Control Register n ..... 2308
32B.5.2.1 Channel Control Register ch0 [CHCTRL_0] <Address: H'428>
Channel Control Register ch1 [CHCTRL_1] <Address: H'468> ..... 2308
32B.5.3 Channel Configuration Register ..... 2311
32B.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: H'42C>
Channel Configuration Register ch1 [CHCFG_1] <Address: H'46C> ..... 2311
32B.5.4 Channel Interval Register n ..... 2315
32B.5.4.1 Channel Interval Register ch0 [CHITVL_0] <Address: H'430>
Channel Interval Register ch1 [CHITVL_1] <Address: H'470> ..... 2315
32B.5.5 Channel Extension Register n ..... 2316
32B.5.5.1 Channel Extension Register ch0 [CHEXT_0] <Address: H'434>
Channel Extension Register ch1 [CHEXT_1] <Address: H'474> ..... 2316
32B.6 Link Register Set ..... 2317
32B.6.1 Next Link Address Register n (NXLA_n) ..... 2317
32B.6.1.1 Next Link Address Register ch0 [NXLA_0] <Address: H'438>
Next Link Address Register ch1 [NXLA_1] <Address: H'478> ..... 2317
32B.6.2 Current Link Address Register n (CRLA_n) ..... 2318
32B.6.2.1 Current Link Address Register ch0 [CRLA_0] <Address: H'43C>
Current Link Address Register ch1 [CRLA_1] <Address: H'47C> ..... 2318
32B.7 Skip Register Set ..... 2319
32B.7.1 Source Continuous Register n ..... 2319
32B.7.1.1 Source Continuous Register ch0 [SCNT_0] <Address: H'600>
Source Continuous Register ch1 [SCNT_1] <Address: H'620> ..... 2319
32B.7.2 Source Skip Register n ..... 2320
32B.7.2.1 Source Skip Register ch0 [SSKP_0] <Address: H'604>
Source Skip Register ch1 [SSKP_1] <Address: H'624> ..... 2320
32B.7.3 Destination Continuous Register n ..... 2322
32B.7.3.1 Destination Continuous Register ch0 [DCNT_0] <Address: H'608>
Destination Continuous Register ch1 [DCNT_1] <Address: H'628> ..... 2322
32B.7.4 Destination Skip Register n ..... 2323
32B.7.4.1 Destination Skip Register ch0 [DSKP_0] <Address: H'60C>
Destination Skip Register ch1 [DSKP_1] <Address: H'62C> ..... 2323
32B.8 DMA Register Set ..... 2325
32B.8.1 DMA Control Register ..... 2325
32B.8.1.1 DMA Control Register [DCTRL] <Address: H'700> ..... 2325
32B.8.2 Descriptor Interval Register n ..... 2326
32B.8.2.1 Descriptor Interval Register [DSCITVL] <Address: H'704> ..... 2326
32B.8.3 DMA Control Register ..... 2326
32B.8.3.1 DMA Status EN Register [DSTAT_EN] <Address: H'710> ..... 2326
32B.8.4 DMA Status ER Register ..... 2327
32B.8.4.1 DMA Status ER Register [DSTAT_ER] <Address: H'714> ..... 2327
32B.8.5 DMA Status END Register ..... 2327
32B.8.5.1 DMA Status END Register [DSTAT_END] <Address: H'718> ..... 2327

32B.8.6 DMA Status TC Register ..... 2328
32B.8.6.1 DMA Status TC Register [DSTAT_TC] <Address: H'71C> ..... 2328
32B.8.7 DMA Status SUS Register ..... 2328
32B.8.7.1 DMA Status SUS Register [DSTAT_SUS] <Address: H'720> ..... 2328
32B.9 Functions ..... 2329
32B.9.1 System Control and Oscillation Control ..... 2329
32B.9.1.1 USB data bus resistor control ..... 2329
32B.9.2 Interrupt Function ..... 2330
32B.9.2.1 Overview of Interrupt Function (other than DMA Master) ..... 2330
32B.9.2.2 Device State Transition Interrupts ..... 2332
32B.9.2.3 Control Transfer Stage Transition Interrupts ..... 2333
32B.9.2.4 Interrupts Relating to DMA Master ..... 2335
32B.9.3 Pipe Control ..... 2336
32B.9.3.1 Maximum packet size setting ..... 2337
32B.9.3.2 Response PID ..... 2337
32B.9.3.3 Pipe control register switching procedure ..... 2338
32B.9.3.4 Data PID sequence bit ..... 2339
32B.9.4 FIFO Buffer ..... 2340
32B.9.4.1 FIFO buffer allocation ..... 2340
32B.9.4.2 Clearing FIFO buffers ..... 2341
32B.9.5 FIFO Port Functions ..... 2342
32B.9.5.1 FIFO port selection ..... 2343
32B.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction) ..... 2344
32B.9.5.3 BRDY interrupt timing selection function ..... 2344
32B.9.6 Control Transfer (DCP) ..... 2345
32B.9.6.1 Control transfer ..... 2345
32B.9.7 Bulk Transfer (Pipes 1 to 5) ..... 2347
32B.9.7.1 NYET handshake control ..... 2347
32B.9.8 Interrupt Transfer (Pipes 6 to 9) ..... 2348
32B.9.9 Isochronous Transfer (Pipes 1 and 2) ..... 2349
32B.9.9.1 Isochronous transfer error detection ..... 2349
32B.9.9.2 DATA-PID ..... 2350
32B.9.9.3 Interval counter ..... 2351
32B.9.9.4 Send data setup for isochronous transfer ..... 2352
32B.9.9.5 Transmit buffer flush for isochronous transfer ..... 2353
32B.9.10 SOF Interpolation Function ..... 2355
32B.9.11 Link Power Management Processing ..... 2356
32B.9.11.1 Descriptor ..... 2356
32B.9.11.2 Basic processing ..... 2357
32B.9.11.3 HIRD value negotiation ..... 2357
32B.9.12 DMA Mode ..... 2358
32B.9.12.1 Register mode/link mode ..... 2358
32B.9.12.2 Write only mode ..... 2375
32B.9.13 DMA Transfer ..... 2376
32B.9.13.1 Transfer modes ..... 2376
32B.9.13.2 DMA channel priority control ..... 2377
32B.9.13.3 Forced sweeping request ..... 2379
32B.9.13.4 DMA transfer completion interrupt (USBFDMAmn) ..... 2380
32B.9.13.5 DMA error interrupt (USBFDMAERRm) ..... 2380

32B.9.13.6 Interval Count Function ....2381
32B.9.13.7 Operational difference depending on the transfer size ....2382
32B.9.13.8 Transfer state....2384
32B.9.14 Access Type ....2387
32B.9.14.1 DMA master transfer combination list ....2387
32B.9.14.2 DMA master descriptor combination list....2390
32B.9.15 Arbitration between DMACs ....2391
32B.9.16 Notes ....2392
32B.9.16.1 Access ....2392
32B.9.16.2 Level Interrupt bit....2392
33. LCDC ....2393
33.1 Overview ....2393
33.1.1 Features ....2393
33.1.2 Block Diagram ....2395
33.1.2.1 FCPVD....2396
33.1.2.2 VSPD ....2396
33.1.2.3 DU....2405
33.1.3 External Pins ....2406
33.1.4 Clock and Interrupt signal....2407
33.2 Register Configuration ....2408
33.2.1 FCPVD Register Configuration ....2408
33.2.2 VSPD Register Configuration....2409
33.2.3 DU Register Configuration ....2412
33.3 Register Descriptions ....2413
33.3.1 FCPVD Registers ....2413
33.3.1.1 FCPVD version Control Register (FCP_VCR) ....2413
33.3.2 VSPD Registers....2414
33.3.2.1 Notational Conventions for Registers and Bit Fields....2414
33.3.2.2 Register Classification ....2414
33.3.2.3 Restrictions on Access to Registers and Lookup Tables ....2415
33.3.2.4 General Control Registers ....2416
33.3.2.5 Display List Control Registers ....2433
33.3.2.6 RPF Control Registers....2441
33.3.2.7 WPF Control Registers....2479
33.3.2.8 DPR Control Registers ....2497
33.3.2.9 LUT Control Register....2501
33.3.2.10 BRS Control Registers ....2505
33.3.2.11 LIF Control Registers....2515
33.3.3 DU Registers ....2520
33.3.3.1 DU Module Control Register 0 (DU_MCR0)....2520
33.3.3.2 DU Module Status Register 0 (DU_MSR0) ....2521
33.3.3.3 DU Module Status Register 1 (DU_MSR1) ....2522
33.3.3.4 DU Interrupt Mask Register 0 (DU_IMR0)....2522
33.3.3.5 DU Display I/F Timing Register 0 (DU_DITR0) ....2523
33.3.3.6 DU Display I/F Timing Register 1 (DU_DITR1) ....2524
33.3.3.7 DU Display I/F Timing Register 2 (DU_DITR2) ....2526
33.3.3.8 DU Display I/F Timing Register 3 (DU_DITR3) ....2526
33.3.3.9 DU Display I/F Timing Register 4 (DU_DITR4) ....2527

33.3.3.10 DU Module Control Register 1 (DU_MCR1) ..... 2528
33.3.3.11 DU PBUF Control Register 0 (DU_PBCR0) ..... 2529
33.3.3.12 DU PBUF Control Register 1 (DU_PBCR1) ..... 2530
33.3.3.13 DU PBUF Control Register 2 (DU_PBCR2) ..... 2531
33.4 Operation ..... 2532
33.4.1 Operation Control Setting ..... 2532
33.4.2 Reset Operation ..... 2532
33.4.2.1 Power-on Reset, Hardware reset ..... 2532
33.4.3 Registers to set fixed value ..... 2532
33.4.4 Concept of VSPD Operation Starting and Stopping ..... 2533
33.4.5 Display List ..... 2534
33.4.5.1 Functional Description ..... 2534
33.4.5.2 Normal Display List Mode ..... 2536
33.4.5.3 Header-less Display List Mode ..... 2541
33.4.5.4 Restrictions on Display List Usage ..... 2541
33.4.6 Interrupt Processing ..... 2542
33.4.7 Lookup Table Settings ..... 2543
33.4.7.1 LUT ..... 2543
33.4.8 Linked with DU ..... 2544
33.4.8.1 Operation flow of VSPD and DU ..... 2544
33.4.8.2 Controlling Two Register Planes Using Display Lists ..... 2546
33.5 Usage Note ..... 2548
33.5.1 Assignment in Memory Space ..... 2548
33.5.2 Limitations on Software Reset and Module Standby ..... 2548
33.5.3 Input Image Size ..... 2548
33.5.4 Output Image Size ..... 2549
33.5.5 Restriction ..... 2551
35. Camera Data Receiving Unit (CRU) ..... 2552
35.1 MIPI CSI-2 ..... 2553
35.1.1 Overview ..... 2553
35.1.2 Features ..... 2553
35.1.3 Block Diagram ..... 2555
35.1.4 External Pins ..... 2555
35.1.5 Register Configuration ..... 2556
35.1.6 Register Descriptions ..... 2558
35.1.6.1 Module Configuration Register (CSI2nMCG) ..... 2558
35.1.6.2 Module Control Register 0 (CSI2nMCT0) ..... 2559
35.1.6.3 Module Control Register 2 (CSI2nMCT2) ..... 2560
35.1.6.4 Module Control Register 3 (CSI2nMCT3) ..... 2561
35.1.6.5 Reset Control Register (CSI2nRTCT) ..... 2561
35.1.6.6 Reset Status Register (CSI2nRTST) ..... 2562
35.1.6.7 EPD Option Control Register (CSI2nEPCT) ..... 2563
35.1.6.8 Module Interrupt Status Register (CSI2nMIST) ..... 2564
35.1.6.9 Receive Data Type Enable Low Register (CSI2nDTEL) ..... 2565
35.1.6.10 Receive Data Type Enable High Register (CSI2nDTEH) ..... 2566
35.1.6.11 Receive Status Register (CSI2nRXST) ..... 2567

35.1.6.12 Receive Status Clear Register (CSI2nRXSC) ..... 2568
35.1.6.13 Receive Interrupt Enable Register (CSI2nRXIE) ..... 2569
35.1.6.14 Data Lane (N) Status Register (CSI2nDLST(N)) ..... 2570
35.1.6.15 Data Lane (N) Status Clear Register (CSI2nDLSC(N)) ..... 2572
35.1.6.16 Data Lane (N) Interrupt Enable Register (CSI2nDLIE(N)) ..... 2573
35.1.6.17 Virtual Channel (M) Status Register (CSI2nVCST(M)) ..... 2574
35.1.6.18 Virtual Channel (M) Status Clear Register (CSI2nVCSC(M)) ..... 2576
35.1.6.19 Virtual Channel (M) Interrupt Enable Register (CSI2nVCIE(M)) ..... 2578
35.1.6.20 Power Management Status Register (CSI2nPMST) ..... 2580
35.1.6.21 Power Management Status Clear Register (CSI2nPMSC) ..... 2582
35.1.6.22 Power Management Interrupt Enable Register (CSI2nPMIE) ..... 2583
35.1.6.23 Generic Short Packet Control Register (CSI2nGSCT) ..... 2584
35.1.6.24 Generic Short Packet Status Register (CSI2nGSST) ..... 2585
35.1.6.25 Generic Short Packet Status Clear Register (CSI2nGSSC) ..... 2586
35.1.6.26 Generic Short Packet Interrupt Enable Register (CSI2nGSIE) ..... 2586
35.1.6.27 Generic Short Packet Register (CSI2nGSHT) ..... 2587
35.1.6.28 Generic Short Packet Information Update Register (CSI2nGSIU) ..... 2588
35.1.6.29 D-PHY Control Register 0 (CSIDPHYCTRL0) ..... 2589
35.1.6.30 D-PHY Timing Register 0 (CSIDPHYTIM0) ..... 2590
35.1.6.31 D-PHY Timing Register 1 (CSIDPHYTIM1) ..... 2591
35.1.6.32 D-PHY Skew Adjustment Function (CSIDPHYSKW0) ..... 2592
35.1.7 Operation ..... 2594
35.1.7.1 Data Reception ..... 2594
35.1.8 Interrupt ..... 2598
35.2 Image Processing ..... 2601
35.2.1 Overview ..... 2601
35.2.1.1 Features ..... 2601
35.2.1.2 Block Diagram ..... 2603
35.2.2 Register Configuration ..... 2604
35.2.3 Register Descriptions ..... 2608
35.2.3.1 CRU Control Register (CRUnCTRL) ..... 2608
35.2.3.2 CRU Interrupt Enable Register (CRUnIE) ..... 2609
35.2.3.3 CRU Interrupt Status Register (CRUnINTS) ..... 2611
35.2.3.4 CRU Reset Register (CRUnRST) ..... 2613
35.2.3.5 CRU General Read/Write Register (CRUnCOM) ..... 2613
35.2.3.6 Memory Bank 1 Base Address (Lower) Register for CRU Image Data (AMnMB1ADDRL) ..... 2614
35.2.3.7 Memory Bank 1 Base Address (Higher) Register for CRU Image Data (AMnMB1ADDRH) ..... 2614
35.2.3.8 Memory Bank 2 Base Address (Lower) Register for CRU Image Data (AMnMB2ADDRL) ..... 2615
35.2.3.9 Memory Bank 2 Base Address (Higher) Register for CRU Image Data (AMnMB2ADDRH) ..... 2615
35.2.3.10 Memory Bank 3 Base Address (Lower) Register for CRU Image Data (AMnMB3ADDRL) ..... 2616
35.2.3.11 Memory Bank 3 Base Address (Higher) Register for CRU Image Data (AMnMB3ADDRH) ..... 2616
35.2.3.12 Memory Bank 4 Base Address (Lower) Register for CRU Image Data (AMnMB4ADDRL) ..... 2617
35.2.3.13 Memory Bank 4 Base Address (Higher) Register for CRU Image Data (AMnMB4ADDRH) ..... 2617

35.2.3.14 Memory Bank 5 Base Address (Lower) Register for CRU Image Data (AMnMB5ADDRL) ....2618
35.2.3.15 Memory Bank 5 Base Address (Higher) Register for CRU Image Data (AMnMB5ADDRH)....2618
35.2.3.16 Memory Bank 6 Base Address (Lower) Register for CRU Image Data (AMnMB6ADDRL) ....2619
35.2.3.17 Memory Bank 6 Base Address (Higher) Register for CRU Image Data (AMnMB6ADDRH)....2619
35.2.3.18 Memory Bank 7 Base Address (Lower) Register for CRU Image Data (AMnMB7ADDRL) ....2620
35.2.3.19 Memory Bank 7 Base Address (Higher) Register for CRU Image Data (AMnMB7ADDRH)....2620
35.2.3.20 Memory Bank 8 Base Address (Lower) Register for CRU Image Data (AMnMB8ADDRL) ....2621
35.2.3.21 Memory Bank 8 Base Address (Higher) Register for CRU Image Data (AMnMB8ADDRH)....2621
35.2.3.22 UV Data Address Offset (Lower) Register for CRU Image Data (AMnUVAOFL)....2622
35.2.3.23 UV Data Address Offset (Higher) Register for CRU Image Data (AMnUVAOFH)....2622
35.2.3.24 Memory Bank Enable Register for CRU Image Data (AMnMBVALID)....2623
35.2.3.25 Memory Bank Status Register for CRU Image Data (AMnMBS)....2623
35.2.3.26 AXI Master Transfer Setting Register for CRU Image Data (AMnAXIATTR)....2624
35.2.3.27 AXI Master FIFO Setting Register for CRU Image Data (AMnFIFO)....2626
35.2.3.28 AXI Master Transfer Resume Register for CRU Image Data (AMnFIFOTRST)....2627
35.2.3.29 AXI Master FIFO Pointer Register for CRU Image Data (AMnFIFOPNTR)....2628
35.2.3.30 AXI Master Transfer Stop Register for CRU Image Data (AMnAXISTP)....2629
35.2.3.31 AXI Master Transfer Stop Status Register for CRU Image Data (AMnAXISTPACK)....2629
35.2.3.32 Memory Bank 1 Base Address Lower Register for CRU Statistics Data (AMnSDMB1ADDRL) ....2630
35.2.3.33 Memory Bank 1 Base Address Higher Register for CRU Statistics Data (AMnSDMB1ADDRH)....2630
35.2.3.34 Memory Bank 2 Base Address Lower Register for CRU Statistics Data (AMnSDMB2ADDRL) ....2631
35.2.3.35 Memory Bank 2 Base Address Higher Register for CRU Statistics Data (AMnSDMB2ADDRH)....2631
35.2.3.36 Memory Bank 3 Base Address Lower Register for CRU Statistics Data (AMnSDMB3ADDRL) ....2632
35.2.3.37 Memory Bank 3 Base Address Higher Register for CRU Statistics Data (AMnSDMB3ADDRH)....2632
35.2.3.38 Memory Bank 4 Base Address Lower Register for CRU Statistics Data (AMnSDMB4ADDRL) ....2633
35.2.3.39 Memory Bank 4 Base Address Higher Register for CRU Statistics Data (AMnSDMB4ADDRH)....2633
35.2.3.40 Memory Bank 5 Base Address Lower Register for CRU Statistics Data (AMnSDMB5ADDRL) ....2634
35.2.3.41 Memory Bank 5 Base Address Higher Register for CRU Statistics Data (AMnSDMB5ADDRH)....2634
35.2.3.42 Memory Bank 6 Base Address Lower Register for CRU Statistics Data (AMnSDMB6ADDRL) ....2635
35.2.3.43 Memory Bank 6 Base Address Higher Register for CRU Statistics Data (AMnSDMB6ADDRH)....2635

35.2.3.44 Memory Bank 7 Base Address Lower Register for CRU Statistics Data (AMnSDMB7ADDRL) ....2636
35.2.3.45 Memory Bank 7 Base Address Higher Register for CRU Statistics Data (AMnSDMB7ADDRH) ....2636
35.2.3.46 Memory Bank 8 Base Address Lower Register for CRU Statistics Data (AMnSDMB8ADDRL) ....2637
35.2.3.47 Memory Bank 8 Base Address Higher Register for CRU Statistics Data (AMnSDMB8ADDRH) ....2637
35.2.3.48 Memory Bank Enable Register for CRU Statistics Data (AMnSDMBVALID) ....2638
35.2.3.49 Memory Bank Status Register for CRU Statistics Data (AMnSDMBS) ....2639
35.2.3.50 AXI-SD Master Transfer Setting Register (AMnSDAXIATTR) ....2640
35.2.3.51 AXI-SD Master FIFO Setting Register (AMnSDFIFO) ....2641
35.2.3.52 AXI-SD Master Transfer Re-Start (AMnSDFIFOTRST) ....2641
35.2.3.53 AXI-SD Master FIFO Pointer Register (AMnSDFIFOPNTR) ....2642
35.2.3.54 AXI-SD Master Transfer Stop Register (AMnSDAXISTP) ....2643
35.2.3.55 AXI-SD Master Transfer Stop Status Register (AMnSDAXISTPACK) ....2643
35.2.3.56 CRU Image Processing Enable Register (ICnEN) ....2644
35.2.3.57 CRU Image Processing Register Setting Change Control Register (ICnREGC) 2645
35.2.3.58 CRU Image Processing Main Control Register (ICnMC) ....2646
35.2.3.59 CRU Image Clipping Start Line Register (ICnSLPrC) ....2650
35.2.3.60 CRU Image Clipping End Line Register (ICnELPrC) ....2650
35.2.3.61 CRU Image Clipping Start Pixel Register (ICnSPPrC) ....2651
35.2.3.62 CRU Image Clipping End Pixel Register (ICnEPPrC) ....2652
35.2.3.63 CRU Scan Line Interrupt Register (ICnSI) ....2653
35.2.3.64 CRU Linear Matrix Offset Register (ICnLMXOF) ....2653
35.2.3.65 CRU Linear Matrix R Coefficient 1 Register (ICnLMXRC1) ....2654
35.2.3.66 CRU Linear Matrix R Coefficient 2 Register (ICnLMXRC2) ....2655
35.2.3.67 CRU Linear Matrix G Coefficient 1 Register (ICnLMXGC1) ....2656
35.2.3.68 CRU Linear Matrix G Coefficient 2 Register (ICnLMXGC2) ....2657
35.2.3.69 CRU Linear Matrix B Coefficient 1 Register (ICnLMXBC1) ....2658
35.2.3.70 CRU Linear Matrix B Coefficient 2 Register (ICnLMXBC2) ....2659
35.2.3.71 CRU Statistics Control 1 Register (ICnSTIC1) ....2660
35.2.3.72 CRU Statistics Control 2 Register (ICnSTIC2) ....2661
35.2.3.73 CRU Module Status Register (ICnMS) ....2662
35.2.3.74 CRU Frame Subsampling Control Register (ICnDEC) ....2663
35.2.3.75 CRU Line Count Register (ICnLC) ....2664
35.2.3.76 CRU Word Count Register (ICnWC) ....2664
35.2.3.77 CRU Word Count Check Control Register (ICnEWC) ....2665
35.2.3.78 CRU Frame Subsampling Interrupt Control Register (ICnINTCTRL) ....2665
35.2.3.79 CRU Output Image Format Register (ICnDMR) ....2666
35.2.3.80 CRU YCbCr → RGB Color Space Conversion Coefficient 1 Register (ICnCSCC1) ....2667
35.2.3.81 CRU YCbCr → RGB Color Space Conversion Coefficient 2 Register (ICnCSCC2) ....2668
35.2.3.82 CRU YCbCr → RGB Color Space Conversion Coefficient 3 Register (ICnCSCC3) ....2669
35.2.3.83 CRU YCbCr → RGB Color Space Conversion Coefficient 4 Register (ICnCSCC4) ....2670
35.2.3.84 CRU RGB → YCbCr Color Space Conversion Y Coefficient 1 Register (ICnYCCR1) ....2671
35.2.3.85 CRU RGB → YCbCr Color Space Conversion Y Coefficient 2 Register (ICnYCCR2) ....2671

35.2.3.86 CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (ICnYCCR3)....2672
35.2.3.87 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 1 Register (ICnCBCCR1)....2673
35.2.3.88 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 2 Register (ICnCBCCR2)....2673
35.2.3.89 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 3 Register (ICnCBCCR3)....2674
35.2.3.90 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 1 Register (ICnCRCCR1)....2675
35.2.3.91 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 2 Register (ICnCRCCR2)....2675
35.2.3.92 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 3 Register (ICnCRCCR3)....2676
35.2.3.93 CRU Lookup Table Control Register (ICnLUT)....2677
35.2.3.94 CRU Lookup Table Status Register (ICnLUTS)....2678
35.2.3.95 CRU Lookup Table Pointer Register (ICnLUTP)....2679
35.2.3.96 CRU Lookup Table Data Register (ICnLUTD)....2680
35.2.3.97 CRU Test Image Generation Control 1 Register (ICnTICTRL1)....2681
35.2.3.98 CRU Test Image Generation Control 2 Register (ICnTICTRL2)....2682
35.2.3.99 CRU Test Image Size Setting 1 Register (ICnTISIZE1)....2682
35.2.3.100 CRU Test Image Size Setting 2 Register (ICnTISIZE2)....2683
35.2.4 Operation....2684
35.2.4.1 Input Formats and Image Processing....2684
35.2.4.2 Output Formats....2686
35.2.4.3 Transfer to DRAM....2689
35.2.4.4 RGB565/RGB666 to RGB888....2694
35.2.4.5 MIPI CSI-2 Recommended Storage Format....2694
35.2.4.6 Image Clipping....2694
35.2.4.7 Frame Subsampling....2695
35.2.4.8 Demosaicing....2696
35.2.4.9 Linear Matrix....2698
35.2.4.10 Data Arrange....2699
35.2.4.11 Data Clipping....2699
35.2.4.12 Color Space Conversion....2700
35.2.4.13 LUT (Lookup Table)....2702
35.2.4.14 YCbCr422 to 420....2703
35.2.4.15 Y/C Separation / Only Y....2703
35.2.4.16 Statistics....2703
35.2.4.17 Pattern Generator (for Debugging)....2711
35.2.5 Interrupts....2716
35.2.6 Usage Notes....2717
35.3 Operation....2718
35.3.1 Starting Reception for the MIPI CSI-2 Input....2719
35.3.1.1 Initializing the D-PHY (MIPI CSI-2 Input)....2721
35.3.1.2 Initializing the AXI Master (MIPI CSI-2 Input)....2722
35.3.1.3 Initializing Image Processing (MIPI CSI-2 Input)....2723
35.3.1.4 Storing LUT Data (Both)....2725
35.3.1.5 Initializing the LINK (MIPI CSI-2 Input)....2726
35.3.2 Stopping Reception for the MIPI CSI-2 Input....2727
35.3.2.1 Determining LINK Packet Stop (MIPI CSI-2 Input)....2728

35.3.2.2 Stopping the D-PHY (MIPI CSI-2 Input) ..... 2728
35.3.2.3 Stopping Image Processing Reception (MIPI CSI-2 Input) ..... 2729
35.3.3 Frame Synchronization Settings ..... 2731
35.3.3.1 Changing Frame Synchronization Settings (by Setting Registers) ..... 2731
35.3.3.2 Changing Frame Synchronization Settings (by Using the DMAC) ..... 2732
35.3.4 Stopping the Pattern Generator ..... 2733
36. Image Scaling Unit (ISU) ..... 2734
36.1 Features ..... 2735
36.1.1 Flow Management (FM) ..... 2737
36.1.1.1 Frame Processing Mode ..... 2737
36.1.1.2 Descriptor ..... 2738
36.1.2 AXI-Master ..... 2740
36.1.2.1 Read Input Image (AXIRX) ..... 2740
36.1.3 Read Pixel Formatting (RPF) ..... 2745
36.1.3.1 Data Swap (Endian Correction) ..... 2745
36.1.3.2 RPF Formatter ..... 2746
36.1.3.3 Data Extraction ..... 2749
36.1.3.4 Test Pattern Generation ..... 2753
36.1.4 Resizer (RS) ..... 2754
36.1.4.1 Resize Start Position ..... 2755
36.1.4.2 Sub Pixel Offset ..... 2756
36.1.4.3 Scaling Calculation ..... 2757
36.1.4.4 Resize Processing ..... 2759
36.1.5 Write Pixel Formatting (WPF) ..... 2760
36.1.5.1 Color Correction ..... 2761
36.1.5.2 Normalization ..... 2762
36.1.5.3 WPF Formatter ..... 2767
36.1.5.4 Data Swap (Endian Correction) ..... 2769

36.3.7 AXI Error Action Registers (ISU_AXI_ERACT) ..... 2780
36.3.8 AXI FIFO Capability Registers (ISU_AXI_FIFO_CAP) ..... 2781
36.3.9 RPF Source Image Size Registers (ISU_RPF_SRC_SIZE) ..... 2782
36.3.10 RPF Source Stride Registers (ISU_RPF_SRC_STRD) ..... 2783
36.3.11 RPF Source Plane0 Address Registers 0 (ISU_RPF_SRC_ADDH_PL0) ..... 2783
36.3.12 RPF Source Plane0 Address Registers 1 (ISU_RPF_SRC_ADDL_PL0) ..... 2784
36.3.13 RPF Source Plane1 Address Registers 0 (ISU_RPF_SRC_ADDH_PL1) ..... 2784

36.3.14 RPF Source Plane1 Address Registers 1 (ISU_RPF_SRC_ADDL_PL1)....2785
36.3.15 RPF Source Image Format Registers (ISU_RPF_FMT)....2786
36.3.16 RPF Source Image UV Format Registers (ISU_RPF_UVBIN)....2787
36.3.17 RPF Source Image Data Swap Registers (ISU_RPF_SRC_DSWAP)....2787
36.3.18 RPF Source ALPHA Data Selection Registers (ISU_RPF_ALPH_SEL)....2788
36.3.19 RPF Source TEST Data Registers 1 (ISU_RPF_SRC_TD1)....2789
36.3.20 RPF Source TEST Data Registers 2 (ISU_RPF_SRC_TD2)....2790
36.3.21 RS Scaling Factor Registers 0 (ISU_RS_HSCALE)....2791
36.3.22 RS Scaling Factor Registers 1 (ISU_RS_VSCALE)....2792
36.3.23 RS Output Image Start Position Registers (ISU_RS_STPOS)....2793
36.3.24 RS Output Image Start Position Tuning Registers (ISU_RS_POS_TUNE)....2794
36.3.25 RS Output Size Crop Registers (ISU_RS_OS_CROP)....2795
36.3.26 RS CROP Padding Mode Registers (ISU_RS_PADDMODE)....2796
36.3.27 RS CROP Padding Value Registers (ISU_RS_PADDVAL)....2797
36.3.28 WPF Destination Plane0 Address Registers 0 (ISU_WPF_DST_ADDH_PL0)....2798
36.3.29 WPF Destination Plane0 Address Registers 1 (ISU_WPF_DST_ADDL_PL0)....2798
36.3.30 WPF Destination Plane1 Address Registers 0 (ISU_WPF_DST_ADDH_PL1)....2799
36.3.31 WPF Destination Plane1 Address Registers 1 (ISU_WPF_DST_ADDL_PL1)....2799
36.3.32 WPF Destination Stride Registers (ISU_WPF_DST_STRD)....2800
36.3.33 WPF Destination Image Format Registers (ISU_WPF_FMT)....2801
36.3.34 WPF Color Correction Control Registers (ISU_WPF_CCOL)....2802
36.3.35 WPF Color Correction MUL Coefficient Registers1 (ISU_WPF_MUL1)....2802
36.3.36 WPF Color Correction MUL Coefficient Registers2 (ISU_WPF_MUL2)....2803
36.3.37 WPF Color Correction MUL Coefficient Registers3 (ISU_WPF_MUL3)....2804
36.3.38 WPF Color Correction MUL Coefficient Registers4 (ISU_WPF_MUL4)....2804
36.3.39 WPF Color Correction MUL Coefficient Registers5 (ISU_WPF_MUL5)....2805
36.3.40 WPF Color Correction MUL Coefficient Registers6 (ISU_WPF_MUL6)....2805
36.3.41 WPF Color Correction Offset Coefficient Registers1 (ISU_WPF_OFST1)....2806
36.3.42 WPF Color Correction Offset Coefficient Registers2 (ISU_WPF_OFST2)....2807
36.3.43 WPF Color Correction Clip Registers1 (ISU_WPF_CLP1)....2808
36.3.44 WPF Color Correction Clip Registers2 (ISU_WPF_CLP2)....2809
36.3.45 WPF Destination Image Data Swap Registers (ISU_WPF_DST_DSWAP)....2809
36.3.46 WPF Destination ALPHA Selection Registers1 (ISU_WPF_ALPH_SEL1)....2810
36.3.47 WPF Destination ALPHA Selection Registers2 (ISU_WPF_ALPH_SEL2)....2811
36.3.48 WPF Destination ALPHA Value Registers (ISU_WPF_ALPH_VAL)....2812
36.3.49 AXI Max Burst Length Registers (ISU_AXI_BLEN)....2813
36.4 Operation....2814
36.4.1 Start Processing....2814
36.4.1.1 Descriptor List Address....2814
36.4.1.2 Frame End Interruption....2815
36.4.2 Stop Processing....2815
36.4.3 Setting the vertical size, start position and reduction factor....2816

36.5 Usage Notes....2818
36.5.1 Image Size Conversion....2818
36.5.1.1 2800 × 2047 (ARGB8888) → 1920 × 1080 (ARGB8888) with Automatic start of the next frame....2818
36.5.1.2 1920 × 1080 (ARGB8888) → 960 × 540 (ARGB8888) without Automatic start of the next frame....2823
36.5.1.3 5M (2800 × 2047) → FullHD (1920 × 1080)....2828
36.5.2 Color Format Conversion....2830
36.5.2.1 YCbCr422 → YCbCr420....2830
36.5.2.2 YCbCr422 → ARGB8888....2832
36.5.2.3 BGR888 → YCbCr422....2834
40. SD/MMC Host Interface....2836
40.1 Overview....2836
40.1.1 Features....2836
40.1.2 External Pins....2838
40.1.3 Register Configuration....2839
40.2 Register Description....2841
40.2.1 Command Type Register (SD_CMD)....2841
40.2.2 Command Argument Register (SD_ARG)....2842
40.2.3 Data Stop Register (SD_STOP)....2843
40.2.4 Block Count Register (SD_SECCNT)....2845
40.2.5 SD Card Response Registers (SD_RSP)....2846
40.2.6 SD Card Interrupt Flag Register (SD_INFO1)....2848
40.2.7 SD Card Interrupt Flag Register (SD_INFO2)....2851
40.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)....2855
40.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)....2856
40.2.10 SD Clock Control Register (SD_CLK_CTRL)....2857
40.2.11 Transfer Data Length Register (SD_SIZE)....2859
40.2.12 SD Card Access Control Option Register (SD_OPTION)....2860
40.2.13 SD Error Status Register 1 (SD_ERR_STS1)....2861
40.2.14 SD Error Status Register 2 (SD_ERR_STS2)....2862
40.2.15 SD Buffer Read/Write Register (SD_BUF0)....2862
40.2.16 SDIO Mode Control Register (SDIO_MODE)....2863
40.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)....2865
40.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)....2866
40.2.19 DMA Mode Enable Register (CC_EXT_MODE)....2867
40.2.20 Software Reset Register (SOFT_RST)....2867
40.2.21 Version Register (VERSION)....2868
40.2.22 Host Interface Mode Setting Register (HOST_MODE)....2868
40.2.23 SD Interface Mode Setting Register (SDIF_MODE)....2869
40.2.24 SD Status Register (SD_STATUS)....2869
40.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)....2870
40.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)....2870

40.2.27 DMAC Reset Register (DM_CM_RST) ..... 2871
40.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1) ..... 2872
40.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK) ..... 2873
40.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2) ..... 2874
40.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK) ..... 2875
40.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR) ..... 2875
40.3 Operation ..... 2876
40.3.1 SD Interface ..... 2876
40.3.2 Card Detect/Write Protect ..... 2880
40.3.3 Interrupt Request ..... 2882
40.3.4 Communications Errors and Timeouts ..... 2883
40.4 Usage Example ..... 2885
40.4.1 Command without Data Transfer ..... 2885
40.4.2 Single Block Read ..... 2888
40.4.3 Single Block Write ..... 2890
40.4.4 Multiple Block Read ..... 2892
40.4.5 Multiple Block Write (when Using Internal Timer) ..... 2894
40.4.6 Multiple Block Write (when Using External Timer) ..... 2896
40.4.7 IO_RW_DIRECT Commend (CMD52) ..... 2898
40.4.8 IO_RW_EXTENDED (CMD53/Multiple Block Read) ..... 2899
40.4.9 IO_RW_EXTENDED (CMD53/Multiple Block Write) ..... 2901
40.4.10 DMA Transfer ..... 2903
40.4.11 High-Priority Interrupt (without Data Transfer) ..... 2905
40.4.12 High-Priority Interrupt (at Single Block Write) ..... 2907
40.4.13 High-Priority Interrupt (at Multiple Block Write) ..... 2909
40.4.14 Example of SD_CMD Register Setting ..... 2913
40.5 Usage Notes ..... 2916
40.6 Sampling Clock Controller (SCC) ..... 2919
40.6.1 Features ..... 2919
40.6.2 SCC Block Diagram ..... 2919
40.6.3 SCC Register Configuration ..... 2920
40.7 SCC Register Descriptions ..... 2921
40.7.1 Initial Setting Register (SCC_DTCNTL) ..... 2921
40.7.2 Sampling Clock Position Setting Register (SCC_TAPSET) ..... 2921
40.7.3 Sampling Clock Selection Register (SCC_CKSEL) ..... 2921
40.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL) ..... 2922
40.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ) ..... 2922
40.7.6 Hardware Adjustment Register 1 (SCC_DT2FF) ..... 2923
40.7.7 Sampling data comparison register (SCC_SMPCMP) ..... 2923
40.7.8 Hardware adjustment register 2 (SCC_TMPPORT) ..... 2924

40.8 Usage Example of SCC ....2925
40.8.1 Tuning ....2925
40.8.2 Sampling Clock Position Correction after Tuning ....2928
40.8.3 Change point of the input data ....2930
41. General Purpose Input Output Port (GPIO) ....2931
41.1 Features ....2931
41.1.1 General Purpose Input Output Port (GPIO) ....2931
41.1.2 Port Function Control ....2931
41.1.3 Special Purpose Port Function Control ....2932
41.1.4 General Purpose Input Output Port Configuration ....2933
41.1.5 Special purpose port Configuration ....2938
41.2 Register Configuration ....2945
41.2.1 Port Register (Pn) ....2945
41.2.2 Port Mode Register (PMn) ....2945
41.2.3 Port Mode Control Register (PMCn) ....2946
41.2.4 Port Function Control Register (PFCm) ....2946
41.2.5 Port Input Register (PINn) ....2947
41.2.6 Interrupt Enable Control Register (ISEL) ....2947
41.2.7 Driving Ability Control Register (IOLH) ....2948
41.2.8 Slew Rate Switching Register (SR) ....2949
41.2.9 Pull Up/Pull down Switching Register (PUPD) ....2950
41.2.10 Write protected register (PWPR) ....2950
41.2.11 Digital Noise Filter Switching Register (FILONOFF) ....2950
41.2.12 Digital Noise Filter Number Register (FILNUM) ....2951
41.2.13 Digital Noise Filter Clock Selection Register (FILCLKSEL) ....2952
41.2.14 Ether ch0 IO Voltage Mode Control Register (ETH_ch0) ....2953
41.2.15 Ether ch1 IO Voltage Mode Control Register (ETH_ch1) ....2953
41.2.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII) ....2953
41.2.17 SD ch0 IO Voltage Mode Control Register (SD_ch0) ....2954
41.2.18 SD ch1 IO Voltage Mode Control Register (SD_ch1) ....2954
41.2.19 QSPI IO Voltage Mode Control Register (QSPI) ....2954
41.2.20 Input Enable Control Register (IEN) ....2954
41.3 Register Descriptions ....2955
41.3.1 Port Register (Pn) ....2955
41.3.2 Port Mode Register (PMn) ....2956
41.3.3 Port Mode Control Register (PMCn) ....2957
41.3.4 Port Function Control Register (PFCm) ....2958
41.3.5 Port Input Register (PINn) ....2960
41.3.6 Interrupt Enable Control Register (ISEL) ....2961
41.3.7 Driving Ability Control Register (IOLH) ....2963
41.3.8 Slew Rate Switching Register (SR) ....2965

41.3.9 Pull Up/Pull down Switching Register (PUPD) ..... 2967
41.3.10 Write protected register (PWPR) ..... 2968
41.3.11 Digital Noise Filter Switching Register (FILONOFF) ..... 2969
41.3.12 Digital Noise Filter Number Register (FILNUM) ..... 2971
41.3.13 Digital Noise Filter Clock Selection Register (FILCLKSEL) ..... 2973
41.3.14 Ether ch0 Voltage Mode Control Register (ETH_ch0) ..... 2978
41.3.15 Ether ch1 Voltage Mode Control Register (ETH_ch1) ..... 2979
41.3.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII) ..... 2980
41.3.17 SD ch0 IO Voltage Mode Control Register (SD_ch0) ..... 2981
41.3.18 SD ch1 IO Voltage Mode Control Register (SD_ch1) ..... 2982
41.3.19 QSPI IO Voltage Mode Control Register (QSPI) ..... 2983
41.3.20 Input Enable Control Register (IEN) ..... 2984
41.4 Operation ..... 2985
41.4.1 Operation for GPIO Function ..... 2985
41.4.2 Operation for Peripheral Function ..... 2985
42. Low Power Mode ..... 2986
42.1 Overview ..... 2986
42.2 Module Standby Mode ..... 2987
42.2.1 Overview ..... 2987
42.2.2 Operation ..... 2989
42.2.2.1 Setting of Clock control and MSTOP register ..... 2990
42.3 Cortex-M33 Sleep Mode ..... 2992
42.3.1 Overview ..... 2992
42.3.2 Operation ..... 2993
42.4 Cortex-A55 Sleep Mode ..... 2995
42.4.1 Overview ..... 2995
42.4.2 Operation ..... 2996
43. Debug Interface ..... 2998
43.1 Overview ..... 2998
43.1.1 Features ..... 2998
43.1.2 Block Diagram ..... 2999
43.1.3 External Pins ..... 3001
43.1.4 Treatment of Unused Pins ..... 3003
43.2 Address Space ..... 3004
43.3 Register Descriptions ..... 3006
43.3.1 ID Register (BSID) ..... 3006
43.3.2 Other Registers ..... 3006
43.4 Debug Connection ..... 3007
43.4.1 Debug Connection Mode ..... 3007

43.5 Debug Access Range ....3007
43.6 Operation....3008
43.6.1 Debug Related Reset ....3008
43.6.2 DAP ....3008
43.6.3 Trace ....3008
43.6.3.1 Data Flow....3008
43.6.3.2 Timestamp ....3008
43.6.4 Cross Trigger....3009
43.6.4.1 CoreSight Cross Trigger Connectiion....3009
43.6.4.2 Cortex-A55 Cross Trigger Connectiion ....3010
43.6.4.3 Cortex-M335 Cross Trigger Connectiion....3011
43.6.5 WDT Counter Stop Control ....3011
43.6.6 GTM Counter Stop Control....3011
43.6.7 SYC Counter Stop Control ....3011
44. Thermal Sensor Unit (TSU) ....3012
44.1 Overview ....3012
44.1.1 Features ....3012
44.1.2 Block Diagram ....3013
44.1.2.1 APB_REG....3014
44.1.2.2 Thermal Sensor ....3014
44.1.2.3 DIV40_TS and DIV10_TS ....3014
44.1.2.4 SOC_TS_GEN....3014
44.1.2.5 EOC_SY_TS....3014
44.1.2.6 Read Buffer (RB) ....3014
44.1.3 External Pins ....3015
44.1.4 Interrupts ....3015
44.2 Register Configuration ....3016
44.2.1 List of Register....3016
44.3 Register Descriptions ....3017
44.3.1 Sensor Mode Register (TSU_SM)....3017
44.3.2 Sensor Trigger Register (TSU_ST)....3018
44.3.3 Sensor ADC Data Register (TSU_SAD) ....3019
44.3.4 Sensor Status Register (TSU_SS)....3020
44.3.5 TSU OTP Calibration Register 0 (OTPTSUTRIM0_REG) ....3021
44.3.6 TSU OTP Calibration Register 1 (OTPTSUTRIM1_REG) ....3022
44.4 Operation....3023
44.4.1 Procedure for Starting the A/D Conversion....3023
44.4.2 Procedure for Stopping the A/D Conversion ....3023
44.4.3 Confirming the State of the A/D Conversion by Monitoring the CONV Bit....3024
44.4.4 Procedure for Measuring the Temperature ....3024

44.5 Usage Note ....3025
45. Trusted Secure IP ....3026
45.1 Overview ....3026
45.2 Operation....3029
45.2.1 Operating Modes and State Transitions....3029
45.2.2 Encryption Engine ....3030
45.2.3 Key Installation ....3031
45.2.4 Encryption and Decryption ....3033
45.2.5 Generating Key Generation Information (by Using Random Numbers)....3036
45.2.6 Random Number Generation ....3036
45.3 Interrupt....3037
45.4 Usage Notes....3038
45.4.1 Trusted Secure IP Driver....3038
48. Electrical Characteristics ....3039
48.1 Absolute Maximum Ratings ....3039
48.2 Power Supply ....3040
48.3 Power-On/Power-Off Sequence....3041
48.4 DC Characteristics ....3043
48.5 AC Characteristics ....3050
48.5.1 Clock Timing....3050
48.5.2 SDHI Access Timing ....3052
48.5.2.1 SDHI Access Timing (SDR 3.3-V)....3052
48.5.3 eMMC Access Timing ....3053
48.5.3.1 eMMC Host Interface Timing (Default)....3053
48.5.3.2 eMMC host interface timing (HS-SDR) ....3054
48.5.3.3 eMMC host interface timing (HS200) ....3055
48.5.4 LCDC Access Timing ....3056
48.5.5 USB 2.0 Host/Function Module Access Timing ....3057
48.5.5.1 USB 2.0 Low-Speed Access Timing ....3057
48.5.5.2 USB 2.0Full-Speed Access Timing ....3058
48.5.5.3 USB 2.0 Hi-Speed Access Timing....3059
48.5.6 Ethernet Interface Access Timing ....3060
48.5.6.1 Ethernet-IF (Ether MII)....3061
48.5.6.2 Ethernet-IF (Ether RGMII) ....3062
48.5.7 JTAG Debugger Interface Access Timing....3064
48.5.8 SPI Multi I/O Bus Controller Access Timing....3066
48.5.9 Control Signal Access Timing ....3069
48.5.10 Serial Sound Interface (SSIF-2) Access Timing....3071
48.5.11 CAN-FD Interface Access Timing ....3073
48.5.12 Multi-Function Timer Pulse Unit 3 (MTU3a) Access Timing ....3074
48.5.13 Port Output Enable 3 (POE3) Access Timing ....3075
48.5.14 $I^2C$ Bus Interface Access Timing....3076

48.5.15 Serial Communications Interface with FIFO (SCIFA) Access Timing ..... 3078
48.5.16 Serial Communications Interface (SCIg) Access Timing ..... 3080
48.5.17 Renesas Serial Peripheral Interface (RSPI) Access Timing ..... 3082
48.5.18 A/D Converter Access Timing ..... 3085
48.5.19 Watchdog Timer Access Timing ..... 3085
Appendix A Package Dimensions ..... 3086

# 1. Overview

## 1.1 Introduction

The RZ/G2UL includes:

- RZ/G2UL (Type-1) RZ/G2UL (Type-2)
  - 1.0 GHz Arm® Cortex®-A55 Single MPCore core,
  - 200-MHz Arm® Cortex®-M33 core,
  - Memory controller for DDR4-1600 / DDR3L-1333 with 16 bits,
  - USB2.0 host / function interface,
  - Gigabit Ethernet interface,
  - SD card host interface,
  - CAN interface,
  - Sound interface,
  - 1 channel MIPI CSI-2 input interface.

- RZ/G2UL (Type-1)
  - 1 channel parallel output interface

Note: There are 2 types in RZ/G2UL.

Type-1: Full function version
Type-2: Pin compatible version with RZ/G2LC.*[1]

**Note 1.** RZ/G2UL Type-2 and RZ/G2LC are pin compatible. The number of channels for specific functions is limited.

NOTE

Arm and Cortex are registered trademark of Arm Limited. All other brands or product names are the property of their respective holders.

# 1.2 List of Specifications

## 1.2.1 CPU Core

| Item | Description |
|---|---|
| System CPU Cortex-A55 | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Arm Cortex-A55 Single MPCore 1.0 GHz<br>• L1 I-cache 32 Kbytes (Parity) / D-cache 32 Kbytes (ECC)<br>• L2 cache 0 Kbyte<br>• L3 cache 256 Kbytes (ECC)<br>• Arm® NEON™ / FPU supported<br>• Cryptographic Extension supported<br>• Arm® v8.2-A architecture |
| System CPU Cortex-M33 | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Arm Cortex-M33 Processor 200 MHz<br>• Security Extension supported<br>• Arm® v8-M architecture |
| Boot | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 6 boot modes<br>Boot Mode 0: Booting from eSD<br>Boot Mode 1: Booting from eMMC (1.8 V)<br>Boot Mode 2: Booting from eMMC (3.3 V)<br>Boot Mode 3: Booting from a serial flash memory (Single / Quad) connected to the SPI Multi I/O bus space (1.8 V)<br>Boot Mode 4: Booting from a serial flash memory (Single / Quad) connected to the SPI Multi I/O bus space (3.3 V)<br>Boot Mode 5: Booting from SCIF download |
| Debug Interface | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Arm® CoreSight™ architecture<br>• JTAG / SWD interface supported<br>• ETF 16 Kbytes for program flow trace (each cluster)<br>• JTAG Disable supported |

### 1.2.2 CPU Peripheral

| Item | Description |
|---|---|
| Clock Pulse Generator (CPG) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Generates the clocks from external clock (EXCLK 24 MHz).<br>Maximum Arm Cortex-A55 clock: 1.0 GHz<br>Maximum Arm Cortex-M33 clock: 200 MHz<br>Maximum DDR clock: 666 MHz (DDR3L-1333), 800 MHz (DDR4-1600)<br>Maximum AXI-bus clock: 200 MHz<br>Maximum APB-bus clock: 100 MHz<br>• SSC (Spread Spectrum Clock) supported |
| Direct Memory Access Controller (DMAC) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 modules, 16 channels per module<br>• Transfer request: On-chip peripheral request / auto request (software trigger)<br>• A specific DMA transfer interval can be specified to adjust the bus occupancy.<br>• LINK mode (DMA transfer under descriptor control) supported<br>• Transfer information can be automatically reloaded |
| Interrupt Controller | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Arm® CoreLink™ Generic Interrupt Controller (GIC-600) for Arm Cortex-A55<br>• Nested Vectored Interrupt Controller (NVIC) for Arm Cortex-M33<br>• External Interrupt pins (NMI, IRQ7 to IRQ0, TINT31-0)<br>• On-chip peripheral Interrupts: Priority level set for each module |
| Message Handling Unit (MHU) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Message handling function between Arm Cortex-A55 and Arm Cortex-M33<br>• Assert interrupt to inform message and response from/to Arm Cortex-A55, Cortex-M33 |
| General-purpose I/O (GPIO) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• General-purpose I/O ports |
| Thermal Sensor Unit (TSU) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 1 channel |

### 1.2.3 Internal Memory

| Item | Description |
|---|---|
| On-chip RAM | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• RAM of 128 Kbytes (ECC) |

### 1.2.4 External Memory Interface

| Item | Description |
|---|---|
| External Bus Controller for DDR3L / DDR4 SDRAM (DDR) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Support DDR3L-1333 / DDR4-1600<br>• Bus Width: 16-bit<br>• In line ECC supported (Support error detection interrupt)<br>• Memory Size: Up to 4 Gbyes<br>• Auto Refresh supported<br>• Memory access protection for secure regions using TZC-400 (Arm® TrustZone® supported) |
| SPI Multi I/O Bus Controller | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 1 channel (4-bit Double data rate)<br>• 1 serial flash memory with multiple I/O bus sizes (single / quad) can be connected<br>• External address space read mode (built-in read cache)<br>• SPI operation mode<br>• Maximum Clock Frequency:<br>– 50 MHz (Quad-SPI DDR)<br>– 66 MHz (Quad-SPI SDR) |
| SD Card Host Interface / Multimedia Card Interface (SD/MMC) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 channels<br>• Channel 0 supports SDHI / e-MMC (boot supported)<br>• Channel 1 supports SDHI<br>• SD memory I/O card interface (1-bit / 4-bit SD bus)<br>• SD, SDHC and SDXC SD memory card access supported<br>• Compliant with SD 3.0<br>• Default, high-speed, UHS-I/SDR50, SDR104 transfer modes supported<br>• Error check function: CRC7 (Command), CRC16 (Data)<br>• Card detection function, write protect supported<br>• MMC interface (1-bit / 4-bit / 8-bit MMC bus)<br>• e-MMC device access supported<br>• Compliant with eMMC 4.51<br>• High-speed, HS200 transfer modes supported |

### 1.2.5 Video Processing Unit

| Item | Description |
|---|---|
| Image Scaling Unit (ISU) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Scaling down function with bilinear interpolation<br>• Input image Size (max): 5M (2800 × 2047)<br>• Output image Size (max): Full HD (1920 × 1080)<br>• Support Color format Conversion<br>• RGB / ARGB / YcbCr422 / YcbCr420 / RAW (Grayscale) |

### 1.2.6 Camera Interfaces

| Item | Description |
|---|---|
| MIPI CSI-2 Interface | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 1 channel<br>• The number of Lane: 1-/2-/4-lane<br>• Support 5MP, 30 fps (RAW12)<br>• Maximum Bandwidth: 1.5 Gbps per lane<br>• Select 1 VC from 4 VC (virtual channel) supported<br>• Support Input Image Data Formats:<br>– YUV420 8-bit / 10-bit<br>– Legacy YUV420 8-bit<br>– YUV420 8-bit / 10-bit (Chroma Shifted Pixel Sampling)<br>– YUV422 8-bit / 10-bit<br>– RGB444 / RGB555 / RGB565/ RGB666 / RGB888<br>– RAW6 / RAW7 / RAW8 / RAW10 / RAW12 / RAW14 / RAW16 / RAW20<br>• Generic short packet data type 1 / 2 / 3 / 4 / 5 / 6 / 7 / 8<br>• Generic long packet data type 1 / 2 / 3 / 4<br>• User Defined 8-bit data type 1 / 2 / 3 / 4 / 5 / 6 / 7 / 8 |
| MIPI CSI-2 to AXI Bridge Module | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 1 channel (MIPI CSI-2 Input)<br>• Support Image Processing:<br>– Clipping<br>– Frame Sampling<br>– LUT<br>– Color format conversion<br>– Color space conversion<br>– Demosaicing<br>– Linear Matirix<br>– Statistics<br>• Support Color Formats for Image Processing:<br>– YUV422 8-/10-bit<br>– RGB565 / RGB666 / RGB888<br>– RAW8 / 10 / 12 / 14 / 16 (Clipping and Frame Sampling only)<br>• Support Output Data Formats:<br>– YCbCr422 8-bit (Interleave/Semi planar, Progressive)<br>– YCbCr420 8-bit (Interleave, Interlace)<br>– Y-Only<br>– RGB888 / ARGB8888<br>– RAW8 / 10 / 12 / 14 / 16 (without Image Processing)<br>– MIPI CSI-2 V2.1 Recommended Memory storage data (without Image Processing) |

### 1.2.7 Display Interface

| Item | Description |
|---|---|
| LCD Controller | [RZ/G2UL (Type-1)]<br>• 1 channel (Parallel output)<br>• 2 planes blending (can blend 2 different size images)<br>• Support Image Processing:<br>– Dither processing (RGB666)<br>– Clipping<br>– RGB Gamma Correction LUT<br>• Support Input Data Format:<br>– RGB565 / RGB666 / RGB888<br>– ARGB1555 / ARGB4444 / ARGB8888<br>– YcbCr444 8-bit / YcbCr422 8-bit / YcbCr420 8-bit |
| Parallel Output Interface | [RZ/G2UL (Type-1)]<br>• 1 channel<br>• Support WXGA (1280 × 800), 60 fps<br>• Support Output Data Format:<br>– RGB666 / RGB888<br>• CLK / HD / VD timing signal supported |

### 1.2.8 Sound Interface

| Item | Description |
|---|---|
| Serial Sound Interface (SSI) | [RZ/G2UL (Type-1)]<br>• 4 channels bidirectional serial transfer<br>[RZ/G2UL (Type-2)]<br>• 3 channels bidirectional serial transfer<br>[RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 external clock sources available<br>• Duplex communication (channel 0, 1, and 3)<br>• Support of I2S / Monaural / TDM audio formats<br>• Support of master and slave functions<br>• Generation of programmable word clock and bit clock<br>• Multi-channel formats<br>• Support of 8, 16, 18, 20, 22, 24, and 32-bit data formats<br>• Support of 32-stage FIFO for transmission and reception<br>• Support of LR-clock continue function in which the LR-clock signal is not stopped |

### 1.2.9 Storage and Network

| Item | Description |
|---|---|
| USB2.0 Host / Function (USB) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 channels (ch0: Host-Function ch1: Host only)<br>• Compliance with USB2.0<br>• Supports On-The-Go (OTG) Function<br>• Supports Battery Charging Function<br>• Internal dedicated DMA |
| Gigabit Ethernet Interface (GbE) | [RZ/G2UL (Type-1)]<br>• 2 channels<br>[RZ/G2UL (Type-2)]<br>• 1 channel<br>[RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Supports transfer at 1000 Mbps and 100 Mbps, 10 Mbps<br>• Supports filtering of Ethernet frames<br>• Supports interface conforming to IEEE802.3 PHY RGMII (Reduced Gigabit Media Independent Interface)<br>• Supports interface conforming to IEEE802.3 PHYMII (Media Independent Interface) |
| CANFD Interface (RS-CANFD) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 channels<br>• ISO 11898-1 (2003) compliant<br>• CAN-FD ISO 11898-1 (CD2014) compliant<br>• Message buffer<br>– Up to 64 × 2-channel receive message buffer: Shared among all channels<br>– 16 transmit message buffers per channel |

### 1.2.10 Timer

| Item | Description |
|---|---|
| Multi-function Timer Pulse Unit 3 (MTU3a) | [RZ/G2UL (Type-1)]<br>• 9 channels (16 bits × 8 channels, 32 bits × 1 channel)<br>[RZ/G2UL (Type-2)]<br>• 8 channels (16 bits × 7 channels, 32 bits × 1 channel)<br>[RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Module clock frequency (P0ϕ): 100 MHz<br>• Maximum 28 lines of pulse inputs/outputs and 3 lines of pulse inputs<br>• 14 types of count clocks selectable<br>• Input capture function<br>• 39 outputs compare and input capture registers<br>• Counter clear operation (Simultaneous counter clearing by Compare match or Input capture is available)<br>• Simultaneous writing to multiple timer counters (TCNT)<br>• Synchronous input/output of each register due to synchronous operation of the counter<br>• Buffered operation<br>• Cascade-connected operation<br>• 43 types of interrupt sources<br>• Automatic transfer of register data<br>• Pulse output modes<br>Toggle, PWM, complementary PWM, and reset-synchronized PWM modes<br>• Synchronization of multiple counters<br>• Phase counting mode<br>– 16-bit mode (channel 1 and 2)<br>– 32-bit mode (channel 1 and 2)<br>• Counter function of dead time compensation<br>• Digital filter functions for the input capture and external count clock pin |
| Port Output Enable 3 (POE3) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Control of the high-impedance state of the MTU3a waveform output pins<br>• Activation with four input pins<br>• Activation on detection of short-circuited outputs<br>• Activation by register write<br>• Additional programming of output control target pins is possible. |
| Watchdog Timer (WDT) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 channels<br>• A counter overflow can reset the LSI<br>• CPU parity error can reset the LSI |
| General Timer (GTM) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 32 bits × 3 channels<br>• Two operating modes<br>– Interval timer mode<br>– Free-running comparison mode |

### 1.2.11 Peripheral Module

| Item | Description |
|---|---|
| I2C Bus Interface<br>(I2C) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 4 channels (ch0,1 = Dedicated pin, ch2,3 = Multiplexed pin)<br>• Master mode and slave mode supported<br>• Support for 7-bit and 10-bit slave address formats<br>• Support for multi-master operation<br>• Timeout detection |
| Serial Communication Interface with FIFO<br>(SCIFA) | [RZ/G2UL (Type-1)]<br>• 5 channels<br>[RZ/G2UL (Type-2)]<br>• 4 channels<br>[RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Clock synchronous mode or asynchronous mode selectable<br>• Simultaneous transmission and reception (full-duplex communication) supported<br>• Dedicated baud rate generator<br>• Separate 16-byte FIFO registers for transmission and reception<br>• Modem control function (channel 0, 1, and 2 in asynchronous mode) |
| Serial Communication Interface<br>(SCIg) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 2 channels<br>• Clock synchronous mode, asynchronous mode, or smart card interface mode is selectable<br>• Simultaneous transmission and reception (full-duplex communication) supported<br>• Dedicated baud rate generator<br>• LSB first / MSB first selectable<br>• Modem control function<br>• Encoding and decoding of IrDA communications waveforms in accord with version 1.0 of the IrDA standard (on channel 0) |
| Renesas Serial Peripheral Interface (RSPI) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• 3 channels<br>• SPI operation<br>• Master mode and slave mode supported<br>• Programmable bit length, clock polarity, clock phase can be selected<br>• Consecutive transfers<br>• LSB first / MSB first selectable |

### 1.2.12 Security

| Item | Description |
|---|---|
| Trusted Secure IP<br>(TSIP)<br>[option] | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Security algorism<br>– Common key encryption: AES<br>– Non-common key encryption: RSA, ECC<br>• Other features<br>– TRNG (true-random number generator)<br>– Hash value generation: SHA-1, SHA-224, SHA-256, GHASH<br>– Support of Unique ID |
| One Time Programmable memory<br>(OTP) | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• A nonvolatile memory that can be written only once<br>• Security setting, authentication setting are possible<br>• Support one time read function (128 bytes) |

### 1.2.13 Analog

| Item | Description |
|---|---|
| A/D Converter (ADC) | [RZ/G2UL (Type-1)]<br>• 2 channels<br>• Resolution: 12-bit<br>• Input Range: 0 V ~ 1.8 V<br>• Conversion Time: 1 µs<br>• Operation Mode: Single Scan / Continuous Scan<br>• Conversion Mode: Single mode / repeat mode<br>• Condition for A/D conversion start<br>– Software trigger<br>– Asynchronous trigger: External trigger supported<br>– Synchronous trigger: MTU timer |

### 1.2.14 Others

| Item | Description |
|---|---|
| Boundary Scan | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Boundary scan based on IEEE 1149.1 via JTAG interface is supported.<br>Note that some module pins are not available on this boundary scan. |

### 1.2.15 Power Supply Voltage

| Item | Description |
|---|---|
| Power supply voltage | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• $V_{DD}$, PLLn_$DV_{DD11}$ (n = 23, 5): 1.05 to 1.15 V<br>• DDR_$V_{DDQ}$: 1.14 to 1.26 V (DDR4) / 1.283 to 1.45 V (DDR3L)<br>• $V_{DD18}$, ADC_$AV_{DD18}$, PLLn_$AV_{DD18}$ (n = 1, 23, 4, 5, 6): 1.62 to 1.98 V<br>• OTP_$V_{DD18}$, USB_$V_{DD18}$, CSI_$V_{DD18}$: 1.65 to 1.95 V<br>• $PV_{DD}$: 2.97 to 3.63 V<br>• USB_$V_{DD33}$: 3.00 to 3.60 V<br>• SDn_$PV_{DD}$ (n = 0, 1), SPI_$PV_{DD}$: 2.97 to 3.63 V / 1.70 to 1.95 V<br>• $PV_{DD182533}$: 2.97 to 3.63 V / 2.25 to 2.75 V / 1.62 to 1.98 V |

### 1.2.16 Temperature Range

| Item | Description |
|---|---|
| Temperature range | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• $T_a$: −40°C to +85°C*1<br>• $T_j$: −40°C to +125°C |

Note 1. If wider temp is required than this range, use case has to be investigated.

### 1.2.17 Quality level

| Item | Description |
|---|---|
| Quality level | [RZ/G2UL (Type-1) RZ/G2UL (Type-2)]<br>• Industrial usage, etc. |

### 1.2.18 Package

| Item | Description |
|---|---|
| Package | [RZ/G2UL (Type-1)]<br>• 361-pin LFBGA, 13-mm square, 0.5-mm pitch<br>[RZ/G2UL (Type-2)]<br>• 361-pin LFBGA, 13-mm square, 0.5-mm pitch |

## 1.3 Product Lineup

Table 1.1 Product Lineup

| Group | Package | Part Number | Security*1 |
|---|---|---|---|
| RZ/G2UL | 13 mm BGA | R9A07G043U15GBG | Available |
| | (Type-1) | R9A07G043U11GBG | Not supported |
| | 13 mm BGA | R9A07G043U16GBG | Available |
| | (Type-2) | R9A07G043U12GBG | Not supported |

Note 1. The product with security function supports the following features.
- — Crypto Extension (Cortex-A55 configuration)
- — Trusted Secure IP
- — Trust Zone*2
- — Secure Boot
- — Secure Debug
- — HW Key protection
- — True Random Generator
- — Trusted Execution Environment (TEE)*2

Note 2. The product without security function also supports them.

# 1.4 Pin

This section describes the pins of this LSI.

## 1.4.1 Pin Assignment

Refer to attached excel file for the “ball view” about pin assignment of this LSI.

(Please double-click the icon on the right side)

## 1.4.2 External Pins and Multiplexed Functional Pins

Refer to attached excel file for the “pn function list” about information of external pins and multiplexed functional pins of this LSI.

(Please double-click the icon on the right side)

# 2. System CPU Cortex-A55

The Cortex-A55 system CPU is a core block equipped with single Cortex-A55 core. For details on the functions including interrupts of the Cortex-A55, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents in **Section 2.4**. For details of interrupt type and control, see the chapter on Interrupt Controller.

## 2.1 Features

The Cortex-A55 incorporates an extensively redesigned microarchitecture system that improves performance across the board while being very competitive in area and power efficiency.

Table 2.1 Function Summary

| | Description |
|---|---|
| CPU | • 1.0 GHz Single Cortex-A55 r2p0 (Armv8-A) core |
| Cache memory | • L1$ (I/D) = 32 KB(Parity) / 32 KB (ECC)<br>• L2$ = None<br>• L3$ = 256 KB (ECC) |

Table 2.2 Core Configuration

| | Value | Description |
|---|---|---|
| L1 instruction cache size | 32 KB | L1 instruction cache = 32 KB (Parity) |
| L1 data cache size | 32 KB | L1 data cache = 32 KB (ECC) |
| L3 cache size | 256 KB | L3 cache = 256KB (ECC) |
| ECC or parity core cache protection | Included | Support for core cache ECC |
| Advanced SIMD and floating-point support (including dot product instruction support) | Included | Support for NEON™ FPU engine |
| Cryptographic extension | Included (option) | Support for cryptography engine |
| Big endian | N/A | Not supported |

## 2.2 Resets

**Table 2.3** shows the supported types of reset and the areas that are reset by the respective types. For the procedures of handling the individual resets, see **Section 2.2.1** and the subsequent parts. See the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

Table 2.3 Areas to be Reset

| Reset Function | Areas to be Reset |
|---|---|
| Cold reset | Entire area |
| Cluster warm reset | Entire area of the cluster except for the debug, RAS, and ETM registers + core 0 |
| Core warm reset | Entire area of the target core except for the debug, RAS, and ETM registers |
| Debug reset | DebugBlock |

The P-Channels can be used to control safety in resetting. For details on the P-Channels, see the AMBA® Low Power Interface Specification Arm® Q-Channel and P-Channel Interfaces. For details on registers for controlling the P-Channel and reset pins, see the chapter on the clock pulse generator (CPG). **Table 2.4** shows the supported power modes for each P-Channel. Transitions to power modes other than those listed in the table below are not supported.

Table 2.4 Supported Power Modes

| PSTATE | Power Mode |
|---|---|
| CLUSTERPSTATE[6:0] | • 100_1000b (ON)<br>• 000_0000b (OFF) |
| COREPSTATE0[5:0] | • 00_1000b (ON)<br>• 00_0001b (OFF_EMU)<br>• 00_0000b (OFF) |
| COREPSTATE1[5:0] | • 00_1000b (ON)<br>• 00_0001b (OFF_EMU)<br>• 00_0000b (OFF) |

Reset address vector can be set by below Reset Vector Address Configuration Registers. For details, see the chapter of System Controller.

CA55 Core0 Reset Vector Address High/Low Configuration Register:
SYS_CA55_CFG_RVAH0 / SYS_CA55_CFG_RVAL0

To change reset vector address, follow the procedure below.

1. Store codes to new reset address.
2. Write the new reset address to CA55 Reset Vector Address Configuration Registers.
3. Issue reset to target core.

### 2.2.1 Cold Reset

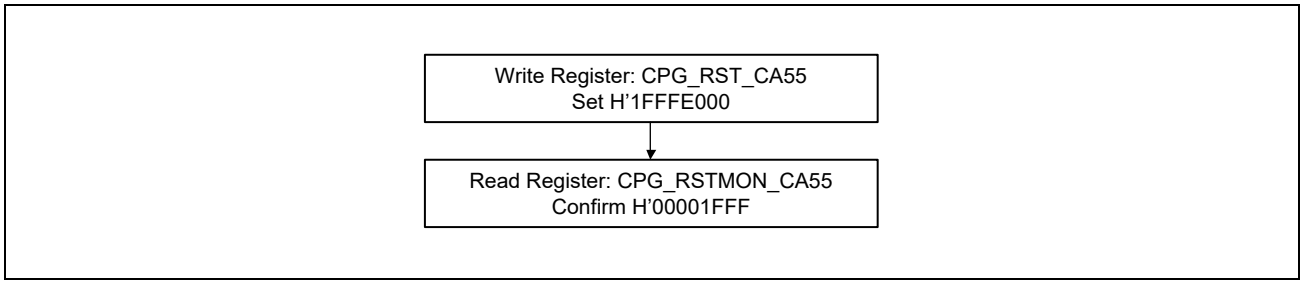
A cold reset is applied at any of the following cases.

(a) The sequence of a power-on reset by the CPG is executed.

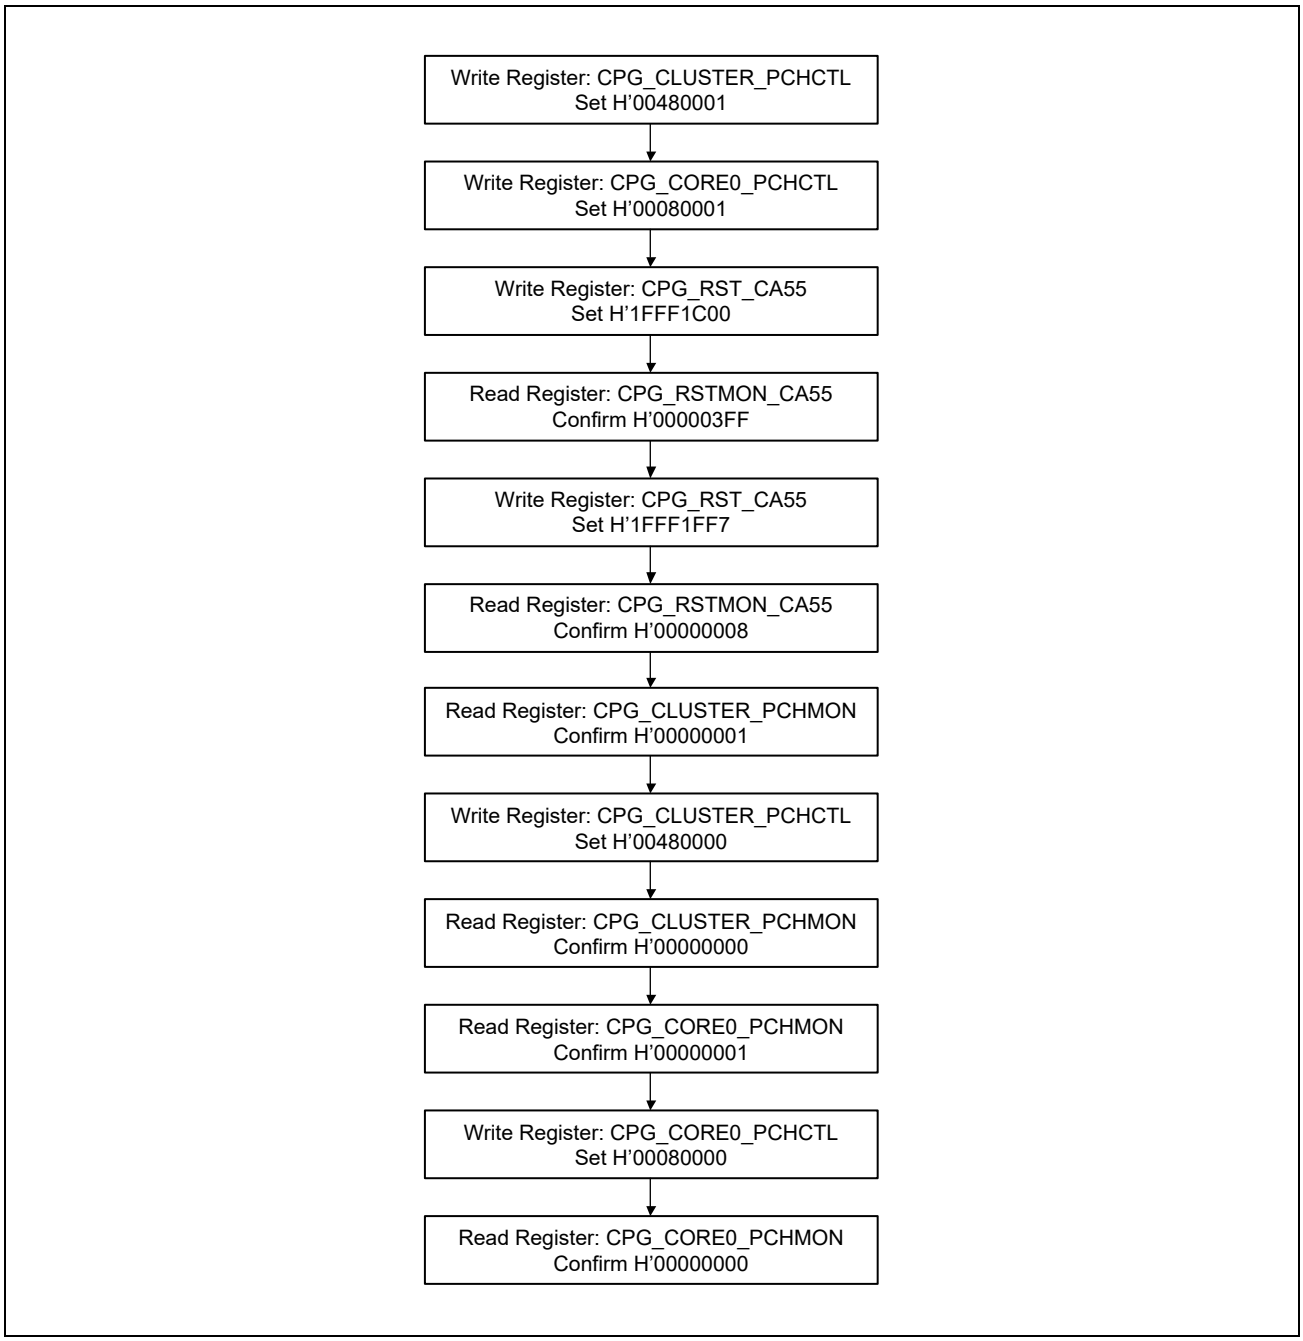
(b) The WDT counter has overflowed or a non-correctable error has been detected.

(c) Software control by the Cortex-M33 system CPU is applied.

For details on (a) and (b) reset, see the chapters on the clock pulse generator (CPG) and watchdog timer (WDT), respectively. To apply a cold reset by case c reset, follow the procedure below.



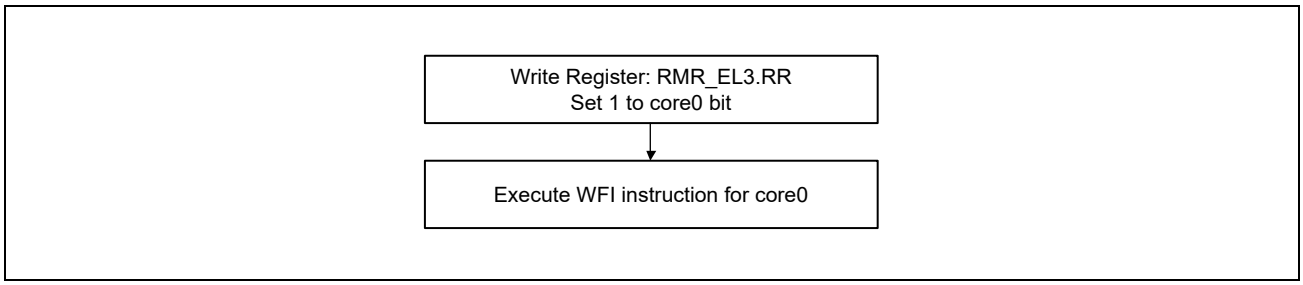
To release cold reset and start core 0 by case c reset, follow the procedure below.



### 2.2.2 Core Warm Reset

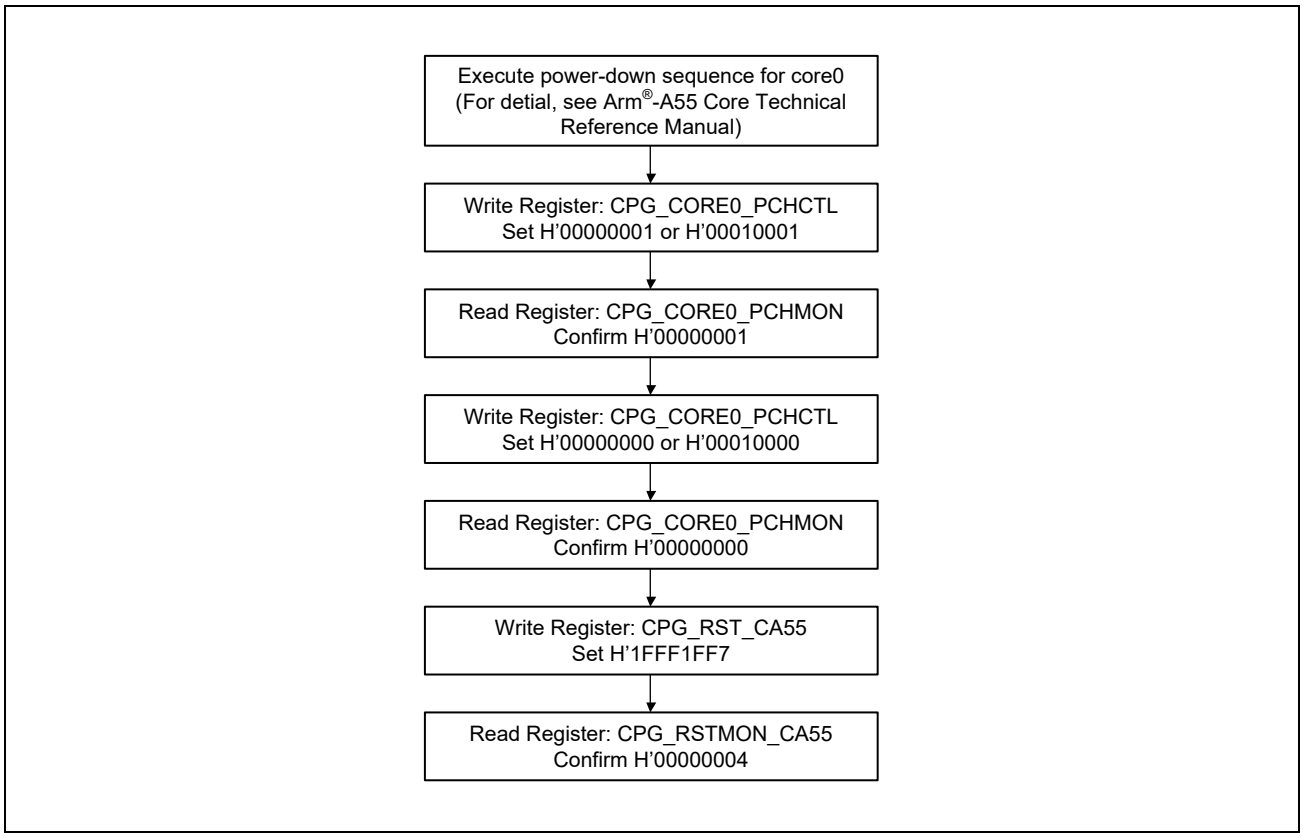
There are the two types of core warm reset: internal and external resets. The former requires software control by the Cortex-A55 system CPU itself and the latter requires software control by the Cortex-A55 and Cortex-M33 system CPUs. Though the Cortex-A55 system CPU handles an internal reset in the same way as an external reset, if you intend to reset a single core, we recommend using an internal reset because handling this requires fewer steps than an external reset. An external reset is mainly used as part of a cluster warm reset, which is described in **Section 2.2.3**.

To apply an internal reset to core 0, follow the procedure below.

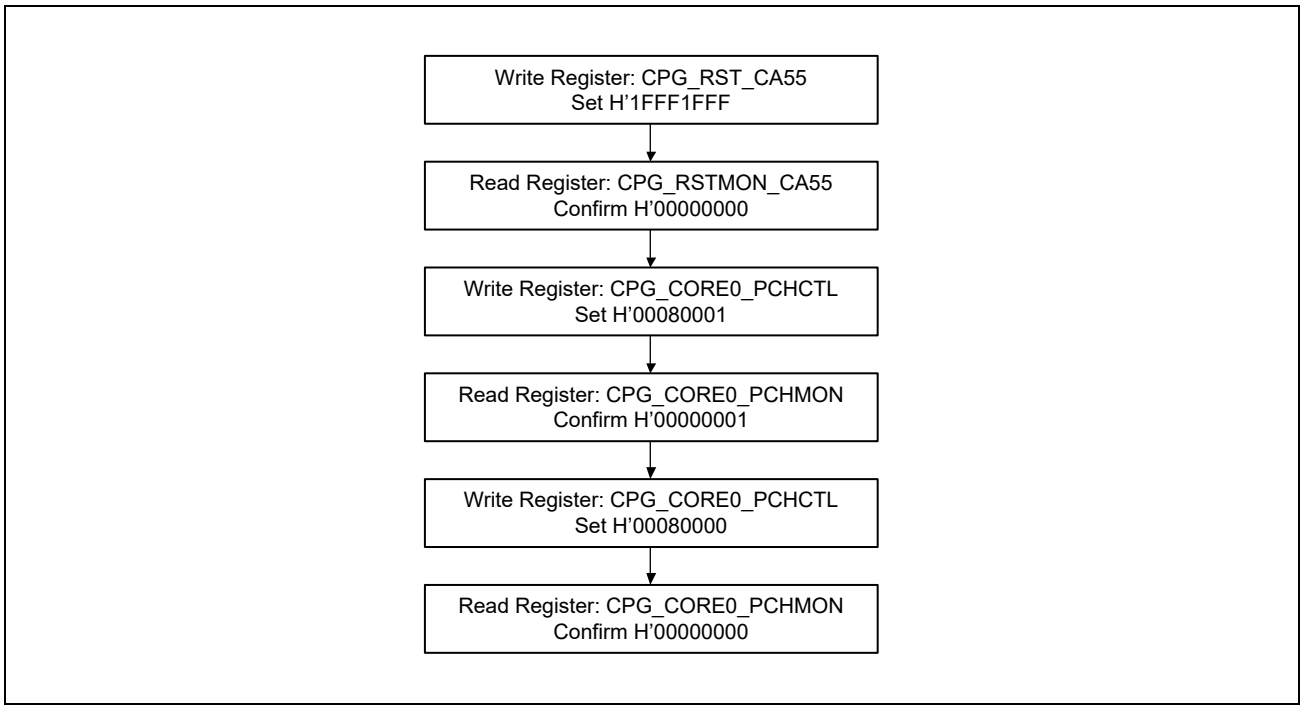


Release from an internal reset is automatic following application of the reset. No specific processing is required. For details, see the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

To apply an external reset to core 0, follow the procedure below.



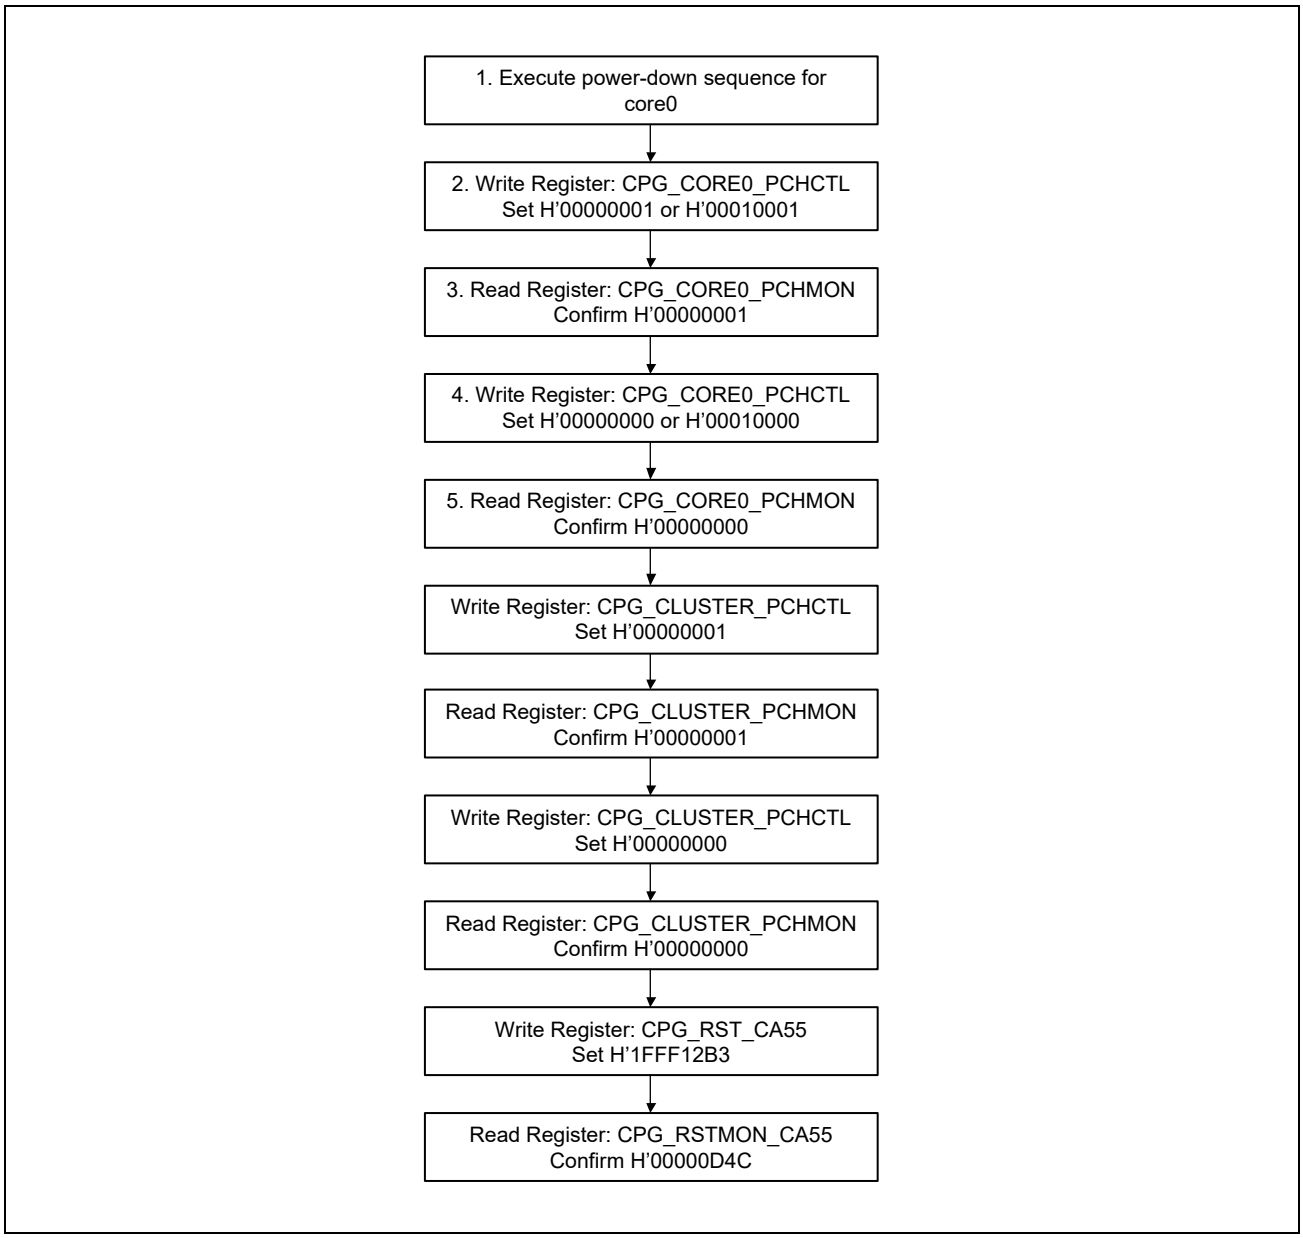
To release core 0 from the core warm reset state and start the core, follow the procedure below.



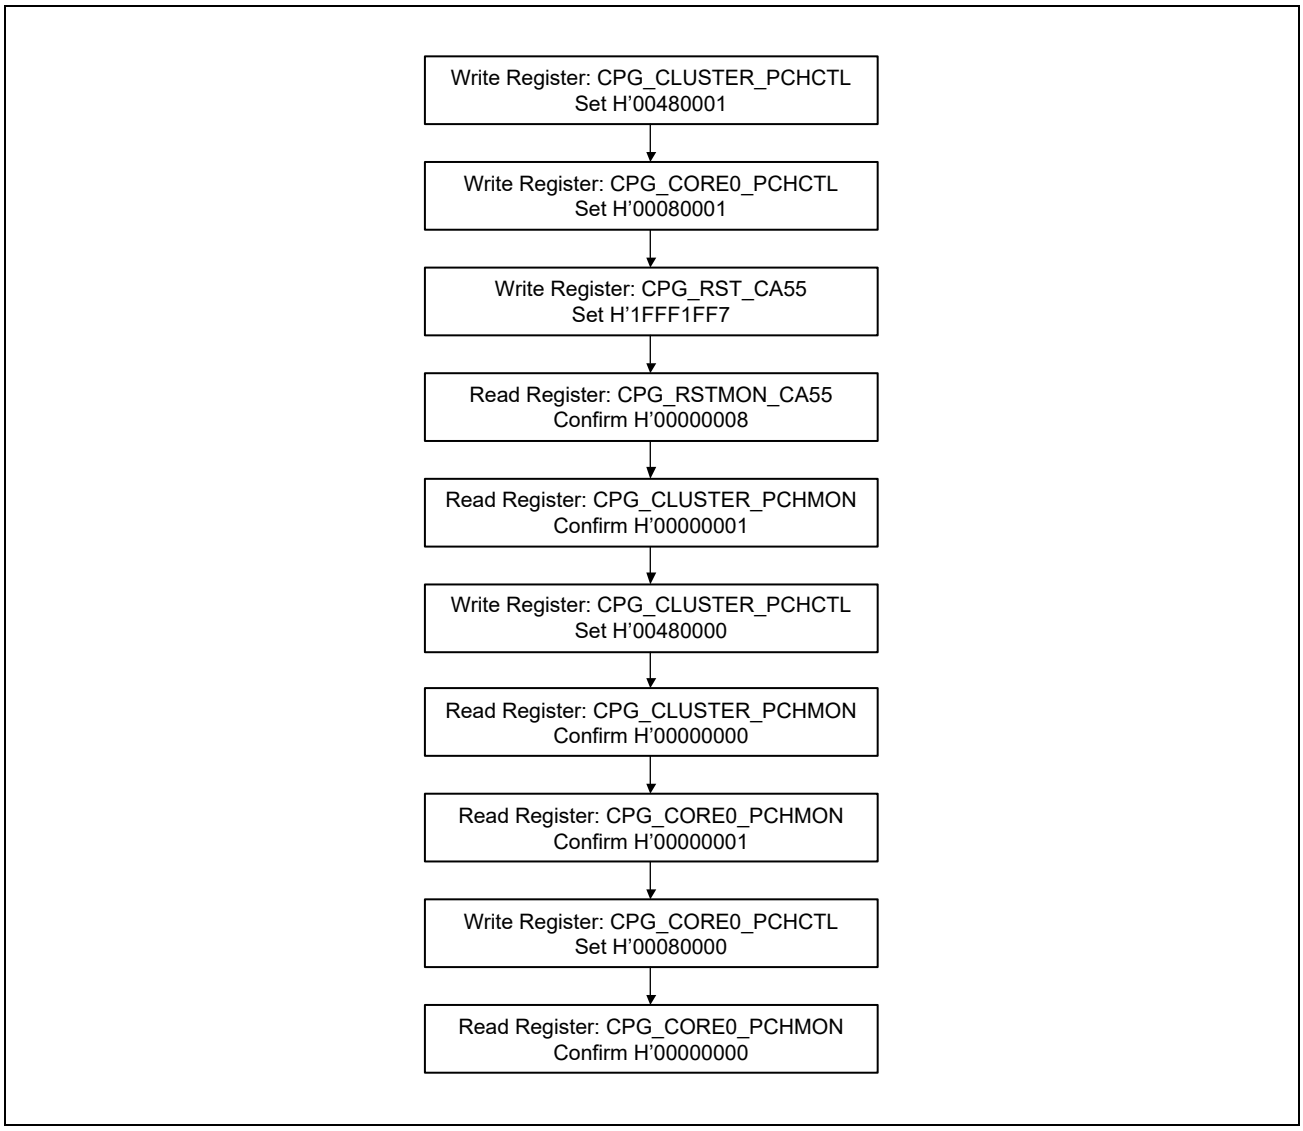
### 2.2.3 Cluster Warm Reset

This reset requires software control by the Cortex-A55 and Cortex-M33 system CPUs.

To apply this reset for core0, follow the procedure below.



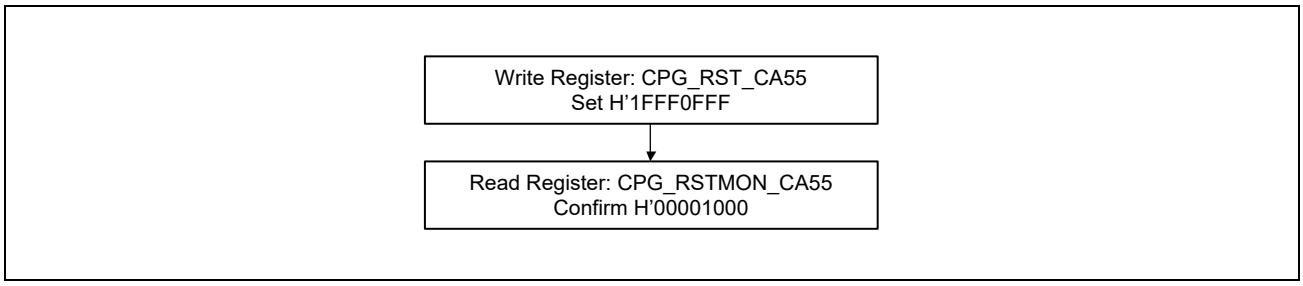
To release from the cluster warm reset state and start core 0, follow the procedure below.



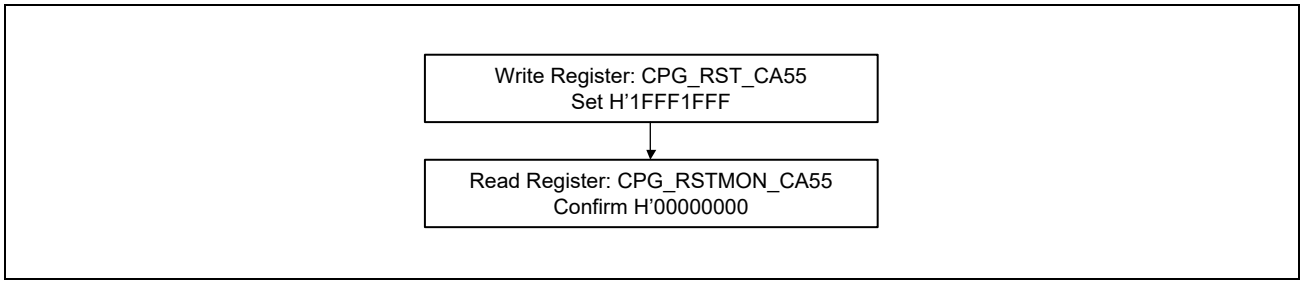
### 2.2.4 Debug Reset

Debug resets can only be applied under software control.

To apply a debug reset, follow the procedure below.



To release from the debug reset state, follow the procedure below.

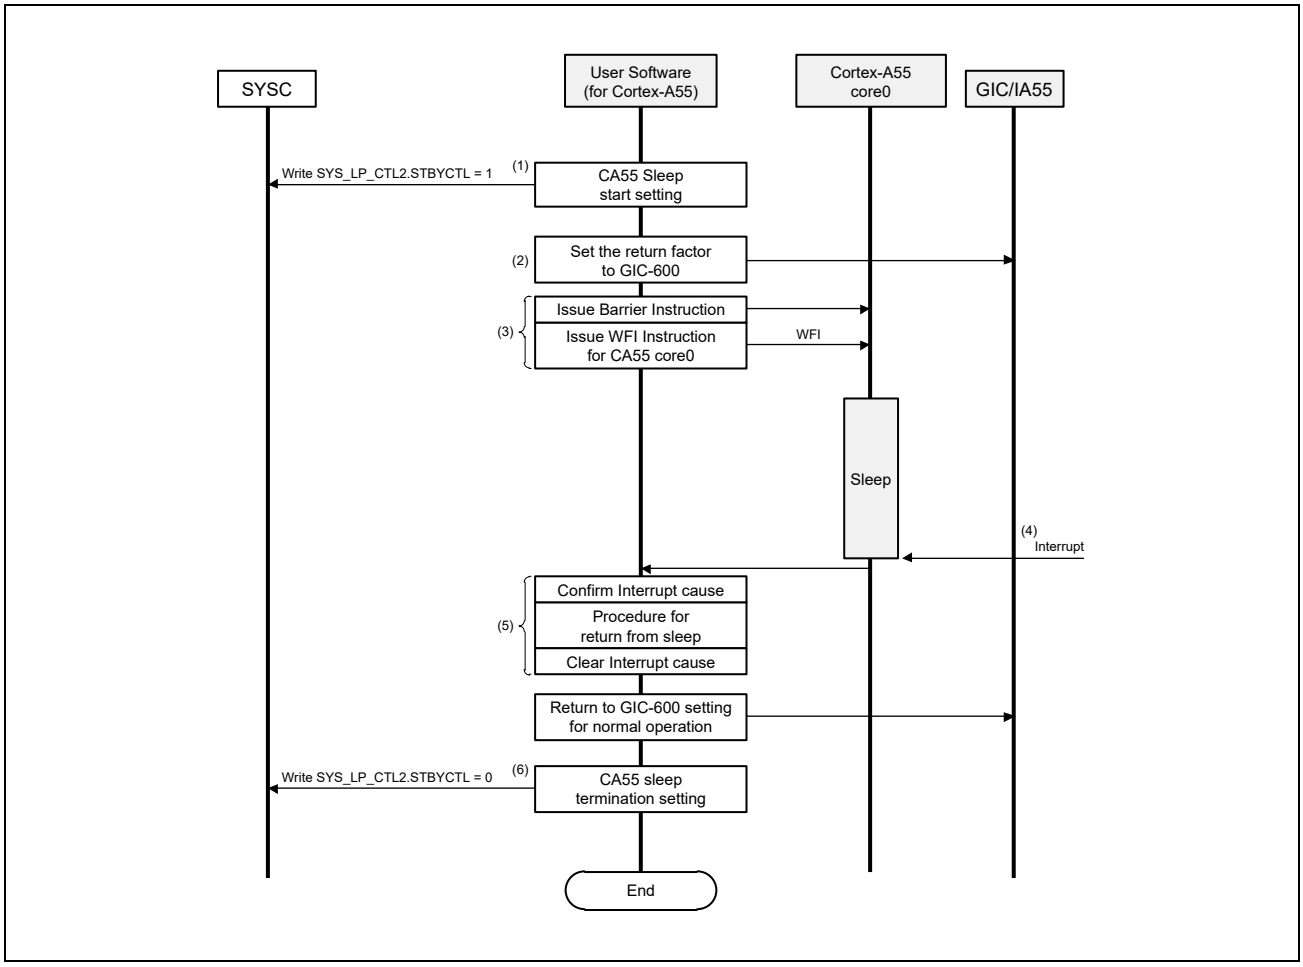


# 2.3 Low Power Consumption Mode

## 2.3.1 Cortex-A55 Sleep Mode

Cortex-A55 Sleep Mode of this LSI is a low power consumption mode obtained by having a core execute the WFI instruction. For details on the WFI instructions, see the Arm® Cortex®-A55 Core Technical Reference Manual and Arm® DynamIQ Shared Unit Technical Reference Manual.

The following procedure is the example sequence of a transition to Cortex-A55 Sleep Mode (core0).



(1) Set the STBYCTL bit of the SYS_LP_CTL2 register to 1 to start the Cortex-A55 Sleep Mode.

(2) Set the return factor to GIC. Enables only the interrupts used for return from the sleep mode and disables the interrupts used for the normal operation.

(3) Issue Barrier instruction.
Issue the WFI instruction for Cortex-A55 core0. The Cortex-A55 core0 is put into the sleep mode.

(4) Return from the sleep mode when the event occurs or the interrupt set in GIC occurs.

(5) Confirm the interrupt cause and perform the processing required for returning from the sleep mode.
And then clear the interrupt cause.
Set the end of interrupt to GIC.
Set the interrupt causes for the normal operation to GIC.

(6) Clear the STBYCTL bit of the SYS_LP_CTL2 register.

## 2.4 Function Reference

For details on the functions of the DynamIQ™ Shared Unit and Cortex-A55, see the documents listed below.

- Arm® DynamIQ Shared Unit Technical Reference Manual
- Arm® Cortex®-A55 Core Technical Reference Manual
- Arm® Cortex®-A55 Core Advanced SIMD and Floating-point Support Technical Reference Manual
- Arm® Cortex®-A55 Core Cryptographic Extension Technical Reference Manual

For details on clock and the controls, see the chapter on the clock pulse generator (CPG).

# 3. System CPU Cortex-M33

The Cortex-M33 system CPU is a core block equipped with an Arm Cortex-M33 CPU.

For details on the functions of the Cortex-M33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Refer to **5.2.2, Cortex-M33 Address Space** in section 5 Internal BUS for CM33 address space.

## 3.1 Features

The Cortex-M33 processor is a highly energy-efficient processor that is intended for a microcontroller and deeply embedded applications. The processor is based on the Armv8-M architecture. For details on the functions of the Cortex-M33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Table 3.1 Cortex-M33 Configuration

| Description | Configuration |
|---|---|
| CPU | Cortex-M33 r0p4 (ARMv8-M) |
| Floating-point | No floating-points |
| DSP extension | No Armv8-M DSP extension |
| Security extension | Armv8-M security extension |
| Non-secure protected memory regions | 16 regions |
| Secure protected memory regions | 16 regions |
| Security attribution unit (SAU) | 8 regions |
| Interrupts | 480 interrupts |
| Number of bits of interrupt priority | 8 bits are supported.<br>256 levels of priority are implemented. |
| Debug watchpoints and breakpoints | Full set<br>4 data watchpoint comparators and 8 breakpoint comparators |
| ITM and data watchpoint and trace (DWT) trace functionality | Complete ITM and DWT trace |
| Embedded trace macrocell (ETM) | ETM instruction execution trace |
| Micro trace buffer (MTB) | MTB is not supported. |
| Cross trigger interface (CTI) | CTI is included. |
| Wakeup interrupt controller (WIC) | WIC is included. |
| External coprocessor interface | Coprocessor hardware is not supported. |

## 3.2 Address Space

For details on the address space, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

### 3.2.1 IDAU Setting

The Cortex-M33 system CPU uses the IDAU. **Table 3.2** shows the security attributes assigned by the IDAU.

Table 3.2 IDAU Security Attributes

| Area No. | Security Attribute | Lower Limit of Address Range | Upper Limit of Address Range |
|---|---|---|---|
| 0 | Non-secure | H'0000_0000 | H'0FFF_FFFF |
| 1 | Secure | H'1000_0000 | H'1FFF_FFFF |
| 2 | Non-secure | H'2000_0000 | H'2FFF_FFFF |
| 3 | Secure | H'3000_0000 | H'3FFF_FFFF |
| 4 | Non-secure | H'4000_0000 | H'4FFF_FFFF |
| 5 | Secure | H'5000_0000 | H'5FFF_FFFF |
| 6 | Non-secure | H'6000_0000 | H'6FFF_FFFF |
| 7 | Secure | H'7000_0000 | H'7FFF_FFFF |
| 8 | Non-secure | H'8000_0000 | H'8FFF_FFFF |
| 9 | Secure | H'9000_0000 | H'9FFF_FFFF |
| 10 | Non-secure | H'A000_0000 | H'AFFF_FFFF |
| 11 | Secure | H'B000_0000 | H'BFFF_FFFF |
| 12 | Non-secure | H'C000_0000 | H'CFFF_FFFF |
| 13 | Secure | H'D000_0000 | H'DFFF_FFFF |
| 14 | Non-secure | H'E000_0000 | H'EFFF_FFFF |
| 15 | Secure | H'F000_0000 | H'FFFF_FFFF |

## 3.3 Register Descriptions

For details on registers, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

For the device-specific Cortex-M33 system CPU control registers, see the section on the system controller (SYSC).

## 3.4 Description of Functions

For the registers and functions of Cortex-M33, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual and Arm®v8-M Architecture Reference Manual.

### 3.4.1 Startup Sequence

The startup sequence of the Cortex-M33 system CPU is shown in the figure below.

It is designed to execute by other processor (Cortex-A55) for the function and sequence of Cortex-M33 control here.

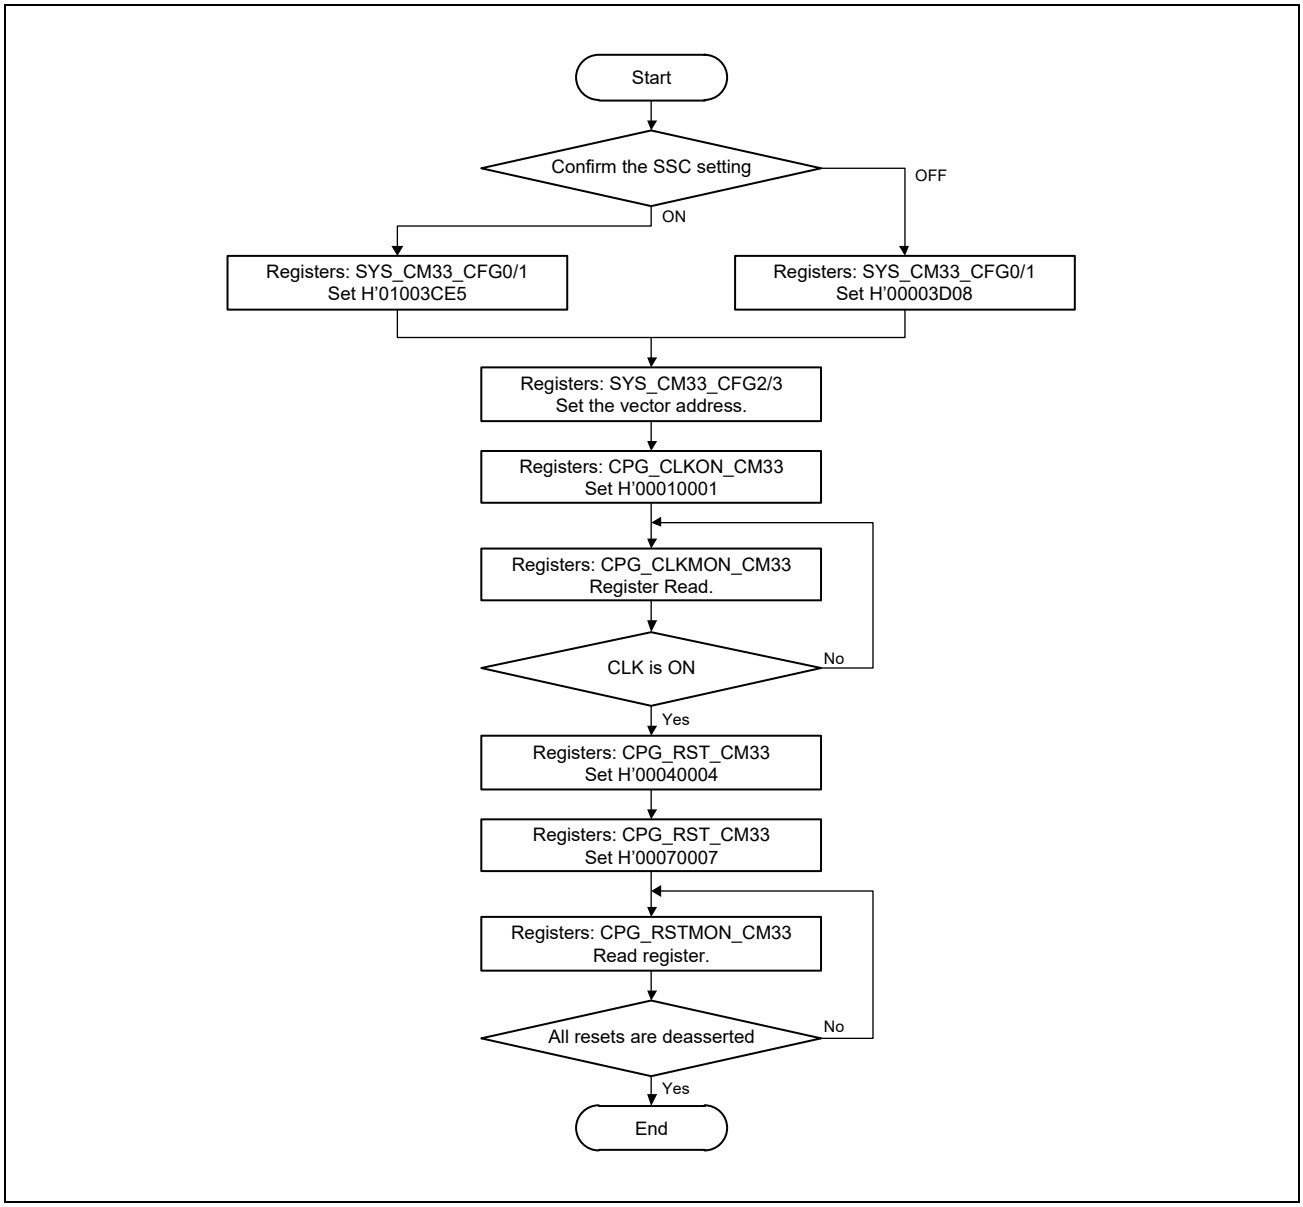


Figure 3.1 Startup Sequence

### 3.4.2 Control by the SYSC

In this LSI, the system controller (SYSC) is used to control the functions of the Cortex-M33 system CPU. For details of SYSC registers, see the section on the system controller (SYSC).

Table 3.3 List of Functions Controlled by the SYSC

| No. | Description |
|---|---|
| 1 | Cortex-M33 control registers<br>• CM33 Config registers (SysTick timer, reset vector address): (SYS_CM33_CFGx),<br>• Low-power Sequence CM33 Control Register0: (SYS_LP_CM33CTL0) |
| 2 | Warm reset request<br>Cooperation with the SYSC is necessary for executing a warm reset. For details, see **Section 3.4.3**. |
| 3 | Control of low power consumption function<br>The Cortex-M33 system CPU supports two low power modes .<br>For details on how to control Cortex-M33 Sleep Mode, see **Section 3.4.4**. |

### 3.4.3 Warm Reset

When executing a warm reset, the WFI instruction is used to guarantee that no transaction is issued.

The warm reset sequence is shown below. For a details of SYSC registers, see the section on the system controller (SYSC).

1. Set the SYSRESETREQ bit in the Cortex-M33 register AIRCR to 1.
2. Confirm that the value of the SYSRESETREQ bit in the SYSC register SYS_LP_CM33CTL0 is 1.
3. Set the IM33_MASK bit in the SYSC register SYS_LP_CTL7 to 1.
4. Issue a WFI instruction.*[1]

The above procedure is used to execute a warm reset. Clearing the IM33_MASK bit and release from the warm reset state are controlled by hardware.

**Note 1.** If the WFE instruction is executed during a warm reset in this LSI, correct operation cannot be guaranteed.

### 3.4.4 Cortex-M33 Sleep Mode

In this LSI, the sleep mode for the Cortex-M33 system CPU is Cortex-M33 Sleep Mode. In this mode, some modules (SysTick timers, NVIC, etc.) of the core can operate.

The following procedure is the example sequence of a transition to Cortex-M33 Sleep Mode.

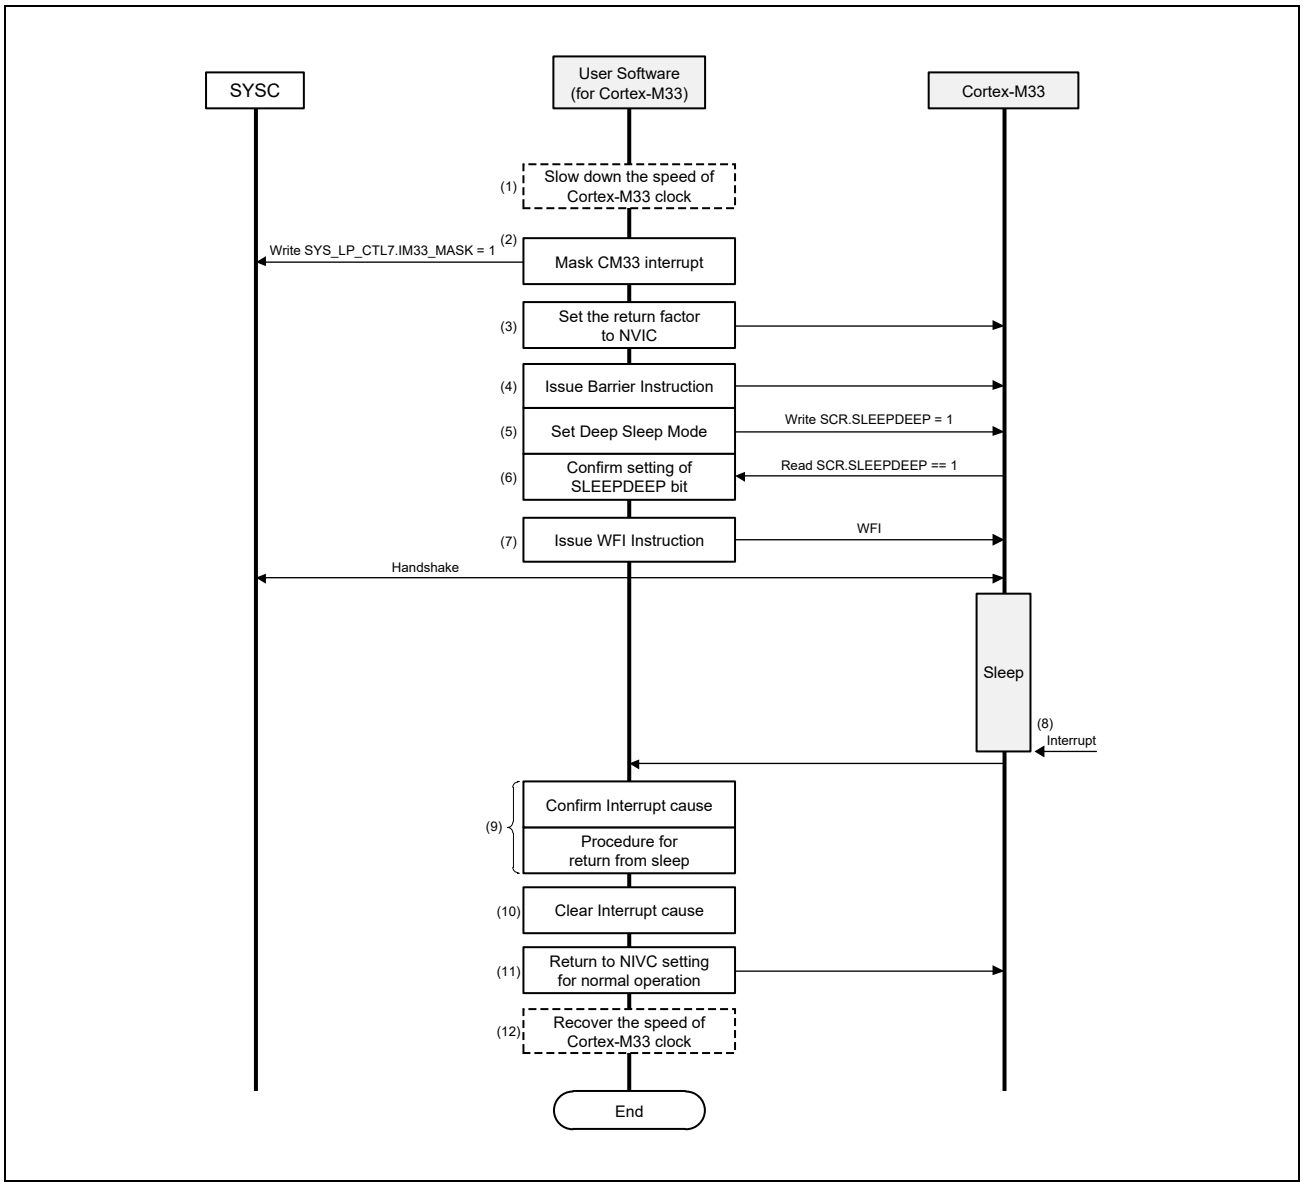

Figure 3.2 Cortex-M33 Sleep Mode procedure

(1) Slow down the speed of Cortex-M33 clock.*1

(2) Set the IM33_MASK bit of the SYS_LP_CTL7 register to 1.
Interrupts to IM33 are masked and interrupts from IM33 to Cortex-M33 are not accepted.
The IM33_MASK bit is automatically cleared after completing the transition to Cortex-M33 Sleep Mode.
Refer to the SYS_LP_CTL7 register in the SYSC section.

(3) Set the return factor to NVIC. Enables only the interrupts used for return from Cortex-M33 Sleep Mode and disables the interrupts used for the normal operation.*2

(4) Issue Barrier instruction.

(5) Set the SLEEPDEEP bit of the SCR register in Cortex-M33 to 1.*3

(6) Read SCR register to confirm whether the SLEEPDEEP bit is set to 1.

(7) Issue a WFI instruction to enter Cortex-M33 Sleep Mode.

(8) Return from Cortex-M33 Sleep Mode when the event ocurrs or the interrupt set in NVIC occurs.

(9) Confirm the interrupt cause and perform the processing required for returning from Cortex-M33 Sleep Mode.*2

(10) And then clear the interrupt cause.*2

(11) Set the interrupt causes for the normal operation to NVIC.*2

(12) Recover the speed of Cortex-M33 clock.*1

**Note 1.** Switching clock (I2ϕ, all Cortex-M33 clock systems ) frequency is controlled by software in this LSI. Refer to the CPG_PL3B_DDIV register in the CPG section. Note that the step of slowing down clock (I2ϕ) is not mandatory.

**Note 2.** See Arm® Cortex®-M33 Processor Technical Reference Manual for NVIC.

**Note 3.** To make SLEEPDEEP bit 1 in the case of non-secure mode, SLEEPDEEPS bit is required to be 0. See Armv8-M Architecture Reference Manual for details.

### 3.4.5 SysTick Timers

The SysTick timers in the Cortex-M33 are described below.

- There is one Secure SysTick timer and one Non-secure SysTick timer.
- The count cycle of SysTick timers is common to Secure and Non-secure.
- A reference clock for counting by a SysTick timer is implemented in this LSI.
- Though the cycle of the reference clock is constant regardless of the clock(I2ϕ) cycle, the accuracy is degraded when the clock(I2ϕ) frequency is switched. Therefore, the accuracy of counting is not guaranteed when there is clock(I2ϕ) frequency switchover.
- The configuration of SysTick timers can be set in the SYSC registers SYS_CM33_CFG0 and SYS_CM33_CFG1*[1]. Before the Cortex-M33 system CPU is started up, set the following values in accordance with the PLL3 SSCG being turned on or off*[2]. SSCG clock is used for SysTick timer when turned on.

  When turned on: H'01003CE5
  When turned off: H'00003D08

The above settings are reflected in the Cortex-M33 register SYST_CALIB*[3]. The settings of the 24 lower-order bits and the 25th bit are reflected in the TENMS and SKEW bits, respectively. When the SSCG is ON, set the SKEW bit to 1. The setting of the 26th bit is reflected in the NOREF bit. Set the bit to 0 because a reference clock is implemented in this LSI.

**Note 1.** The register settings are reflected after release from the cold reset state.
**Note 2.** For details on turning on and off the SSCG, see the section on the clock pulse generator (CPG).
**Note 3.** For details on the SYST_CALIB register, refer to the Arm®v8-M Architecture Reference Manual.

### 3.4.6 Restrictions of Functions

The Cortex-M33 system CPU has some restrictions on the functions due to specification of this LSI. **Table 3.4** lists the restrictions on the functions.

Table 3.4 List of Restrictions of Functions

| No. | Description |
|---|---|
| 1 | WFE instruction is not supported in a warm reset.<br>In this LSI, operation of the WFE instruction is not guaranteed while a warm reset is being executed. |
| 2 | SysTick timer accuracy<br>Though the clock(I2ϕ) frequency can be switched dynamically in this LSI, the timer accuracy cannot be guaranteed when there is a dynamic frequency switchover during the measurement period. |

# 4. Boot Mode

## 4.1 Overview

This LSI has six boot modes.

Boot mode 0: Booting from eSD*1

Boot mode 1: Booting from 1.8-V eMMC*2

Boot mode 2: Booting from 3.3-V eMMC*2

Boot mode 3: Booting from the 1.8-V Single or Quad serial flash memory connected to the SPI multi I/O bus space

Boot mode 4: Booting from the 3.3-V Single or Quad serial flash memory connected to the SPI multi I/O bus space

Boot mode 5: Booting from the program downloaded through the serial communications with FIFO (SCIF)

**Note 1.** Embedded SD (eSD) defined in the SD Specification Part 1 eSD Addendum (Version 2.10)

**Note 2.** eMMC supporting the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4)

NOTES

- Boot operation is only possible with Cortex-A55 (AArch64).
- Boot operation is not possible with Cortex-M33.

Once this LSI is released from the system reset state, the clock pulse generator (CPG) executes a specified sequence, and then Cortex-A55 Core 0 is started first to boot from the device selected according to the settings through the MD_BOOT2 to MD_BOOT0 pins. The values of the MD_BOOT2 to MD_BOOT0 pins are read once the LSI is released from the system reset state. After the LSI is booted up, the user program should enable or disable the operation of Cortex-A55 Core 0, Cortex-A55 Core 1, and Cortex-M33 as required.

The CPG_PL1_DDIV register must be set when the user program starts.

Table 4.1 Selection of Boot Mode

| MD_BOOT2 to MD_BOOT0 | | | Boot Mode | Interface Module | Connected Device | Reference Section |
|---|---|---|---|---|---|---|
| 0 | 0 | 0 | Boot mode 0 | SDHI0 | eSD (3.3 V at startup) | **4.2.1** |
| 0 | 0 | 1 | Boot mode 1 | SDHI0 | 1.8-V eMMC | **4.2.2** |
| 0 | 1 | 0 | Boot mode 2 | SDHI0 | 3.3-V eMMC | **4.2.3** |
| 0 | 1 | 1 | Boot mode 3 | SPIBSC | 1.8-V Single or Quad serial flash memory | **4.2.4** |
| 1 | 0 | 0 | Boot mode 4 | SPIBSC | 3.3-V Single or Quad serial flash memory | **4.2.5** |
| 1 | 0 | 1 | Boot mode 5 | SCIF0 | Downloading through SCIF | **4.2.6** |
| 1 | 1 | 0 | Reserved | — | Reserved | — |
| 1 | 1 | 1 | Reserved | — | Reserved | — |

## 4.2 Operation

### 4.2.1 Boot Mode 0 (eSD)

**Table 4.2** shows the interface signals used for connection with the external device in boot mode 0 (eSD). This LSI supports the embedded SD (eSD) defined in the SD Specification Part 1 eSD Addendum (Version 2.10).

Table 4.2 External Interface Signals Used in Boot Mode 0

| Interface Module | Pin Name | I/O | Function | Pin Type |
|---|---|---|---|---|
| SDHI/eMMC (SDHI0) | SD0_CLK | Output | SD clock | Dedicated pins |
| | SD0_CMD | Input/output | SD command or response | |
| | SD0_DATA0 | Input/output | SD data 0 | |
| | SD0_DATA1 | Input/output | SD data 1 | |
| | SD0_DATA2 | Input/output | SD data 2 | |
| | SD0_DATA3 | Input/output | SD data 3 | |
| | SD0_CD | Input | SD card detection | Multiplexed pins |
| | SD0_WP | Input | SD write protection | |

#### 4.2.1.1 External Connections

**Figure 4.1** shows the connections with the eSD device.

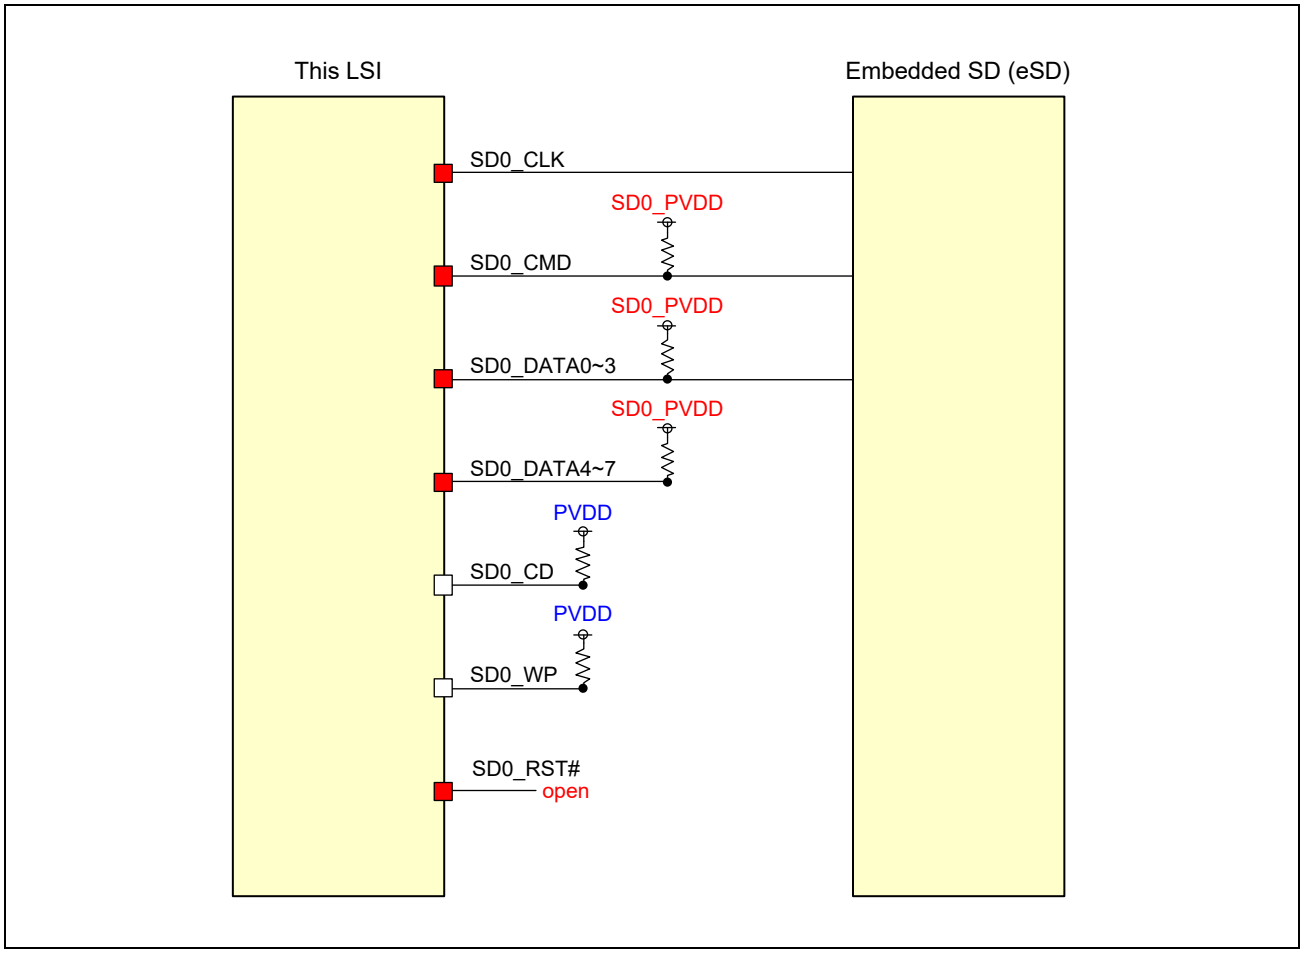

Figure 4.1 Connections in Boot Mode 0

#### 4.2.1.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the eSD device. The operating voltage is set to 3.3 V and the width of the data bus connected to the eSD device is fixed to four bits in this mode. SDHI0 used as the interface controller in this mode is placed in the module standby mode at the startup of the LSI. Once SDHI0 is released from the module standby mode, the boot program in this LSI sets up the CPG so that the frequency of the external output clock becomes 16.6 MHz, initializes SDHI0, and then begins the booting process with the I/O buffers set to the maximum driving ability.

#### 4.2.1.3 Operation of Booting from eSD

In boot mode 0 (booting from eSD), this LSI is booted from the loader program in the eSD device connected to channel 0 of the SD host interface (SDHI) as follows.

The boot program executes the following processing to access the eSD device.

1. Setting up the necessary peripheral modules (SDHI channel 0 and GPIO)
2. Mounting the eSD device
3. Issuing a read command to the eSD device through the SDHI to obtain the size of the loader program data from sector 1 of the selected partition

After obtaining the size of the loader program data, the SDHI issues a read command to the eSD device to transfer the loader program from sector 8 of the selected partition to the addresses H'0_0001_2000 to H'0_0002_EFFF of the on-chip RAM for the obtained data size.

Then, execution branches to the start address (H'0_0001_2000) of the loader program transferred to the on-chip RAM to execute the loader program that was stored in the eSD device.

If the boot program has failed to read data, it reads data from a reserved area. If reading has failed for all reserved areas, the boot program enters fail-safe mode (SCIF downloading mode). If the fail-safe processing has failed, execution enters an infinite loop in the on-chip ROM and the boot processing is terminated.

#### 4.2.1.4 Allocation of the Loader Programs in the eSD Device

##### (1) Allocation in eSD V2.0 (Single Partition)

**Figure 4.2** shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.0 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device.

The loader program size blocks are allocated to sectors 1 to 7. In a loader program size block, the loader program size is stored in the first four bytes and the signature H'AA55 is stored in the last two bytes. **Figure 4.3** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The following describes the operation of transferring the loader program.

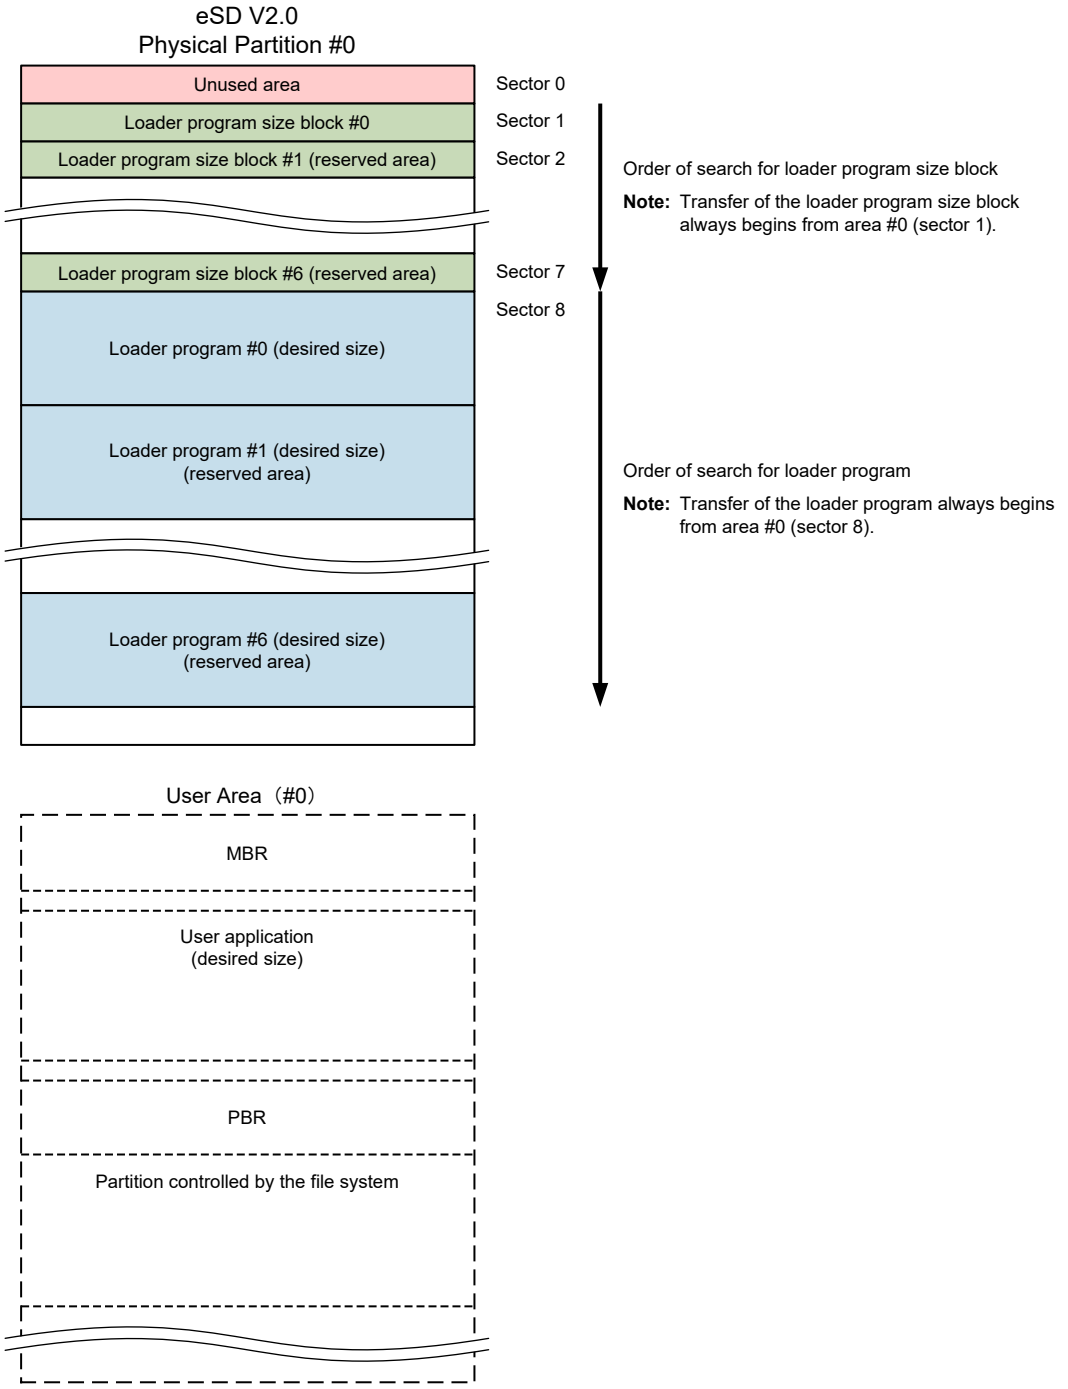
(1) The loader program size block is transferred from sector 1 in physical partition #0 of the eSD device to the on-chip RAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (H'AA55), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed.
If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from sector 8 in physical partition #0 of the eSD device. The loader program is transferred to the on-chip RAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.



**Note 1.** Write the same data to loader program size block areas #0 to #6.

**Note 2.** Write the same data to loader program areas #0 to #6.

**Note 3.** The start sector location of the loader program is calculated as follows.
8 + obtained size (number of sectors) × n

Figure 4.2 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.0 Standard

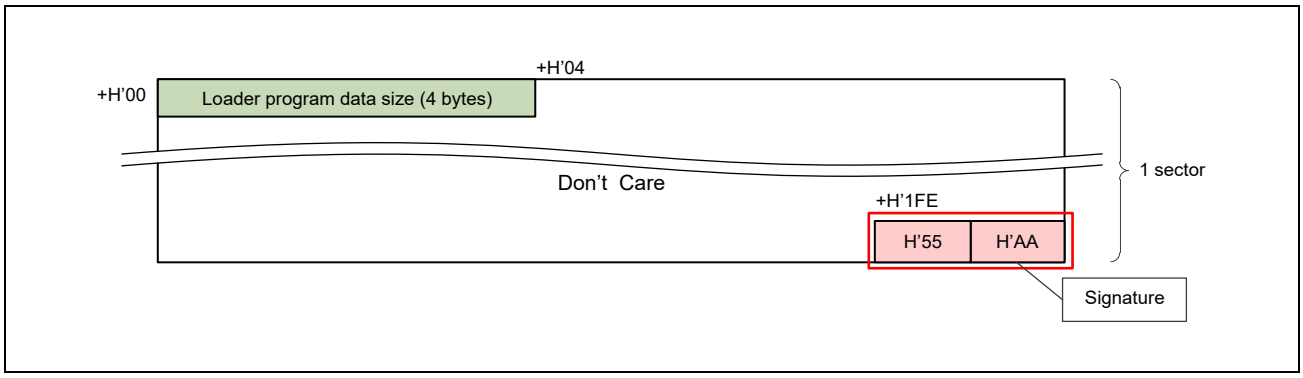


Figure 4.3 Structure of the Loader Program Size Block

NOTE

Store the loader program data size in 4-byte little endian.

### (2) Allocation in eSD V2.1 (Multi Partitions)

**Figure 4.4** shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.1 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device

The specifications and allocation of loader program size blocks are the same as those in eSD V2.0. For the structure of the loader program size block, see **Figure 4.3**.

The following describes the operation of transferring the loader program.

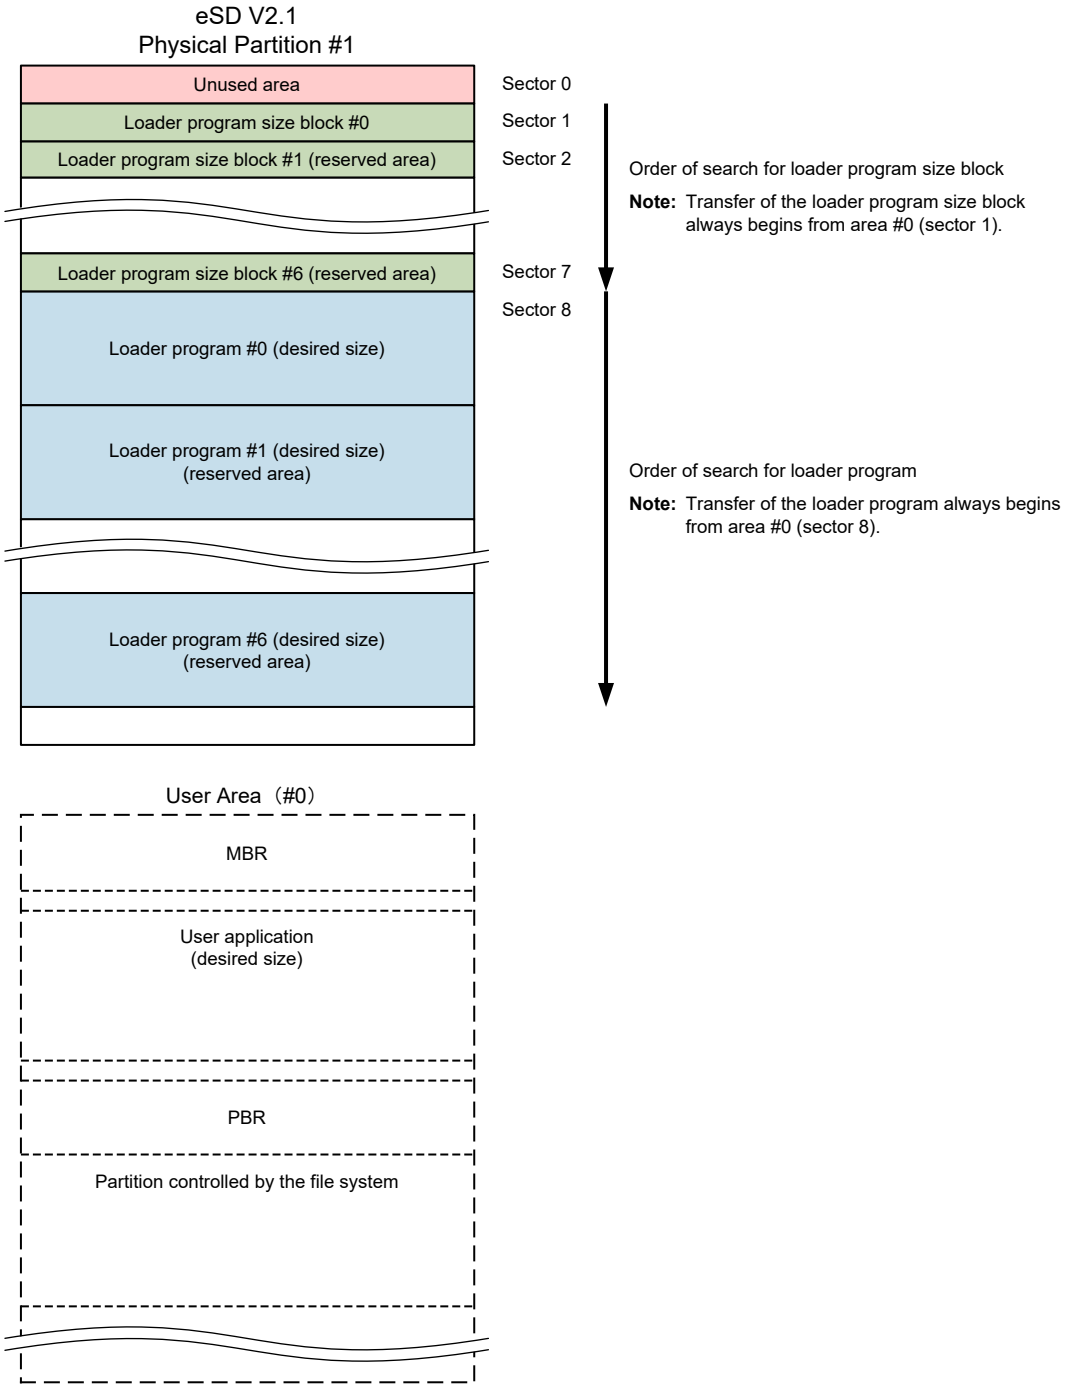
(1) The loader program size block is transferred from sector 1 in physical partition #1 of the eSD device to the on-chip RAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (H'AA55), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed. If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from sector 8 in physical partition #1 of the eSD device. The loader program is transferred to the on-chip RAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.



**Note 1.** Write the same data to loader program size block areas #0 to #6.

**Note 2.** Write the same data to loader program areas #0 to #6.

**Note 3.** The start sector location of the loader program is calculated as follows.
8 + obtained size (number of sectors) × n

Figure 4.4 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.1 Standard

#### (3) How to Distinguish between eSD V2.0 (Single Partition) and V2.1 (Multi Partitions)

This boot program first assumes that an eSD device supporting multi partitions is connected and begins loader program transfer from physical partition #1. If an error regarding a command for multi partitions shown in the following table occurs, the boot program assumes that an eSD device with a single partition is connected and transfers the loader program from physical partition #0.

Table 4.3 Errors Regarding Commands for Multi Partitions

| No. | Issued Command | Command Function | Error | Remarks |
|---|---|---|---|---|
| 1 | CMD43 (SELECT_PARTITION) | Selects physical partition #1. | Multi partitions are not supported. | |
| 2 | CMD45 (QUERY_PARTITION) | Obtains the physical partition ID. | The specified partition does not exist. | |

### 4.2.1.5 Note

The shared bus and 8-bit SD bus of the embedded SDIO cannot be used in this mode.

### 4.2.2 Boot Mode 1 (1.8-V eMMC)

**Table 4.4** shows the interface signals used for connection with the external device in boot mode 1 (eMMC). This LSI supports the eMMC that operates in the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4).

Table 4.4 External Interface Signals Used in Boot Mode 1

| Interface Module | Pin Name | I/O | Function | Pin Type |
|---|---|---|---|---|
| SDHI/eMMC (SDHI0) | SD0_CLK | Output | eMMC clock | Dedicated pins (1.8 V) |
| | SD0_CMD | Input/output | eMMC command or response | |
| | SD0_DATA0 | Input/output | eMMC data 0 | |
| | SD0_DATA1 | Input/output | eMMC data 1 | |
| | SD0_DATA2 | Input/output | eMMC data 2 | |
| | SD0_DATA3 | Input/output | eMMC data 3 | |
| | SD0_DATA4 | Input/output | eMMC data 4 | |
| | SD0_DATA5 | Input/output | eMMC data 5 | |
| | SD0_DATA6 | Input/output | eMMC data 6 | |
| | SD0_DATA7 | Input/output | eMMC data 7 | |
| | SD0_CD | Input | SD card detection | |
| | SD0_WP | Input | SD write protection | |
| | SD0_RST# | Output | eMMC reset | |

#### 4.2.2.1 External Connections

**Figure 4.5** shows the connections with the eMMC device. The boot program in this LSI does not monitor the state of the SD0_CD and SD0_WP pins.

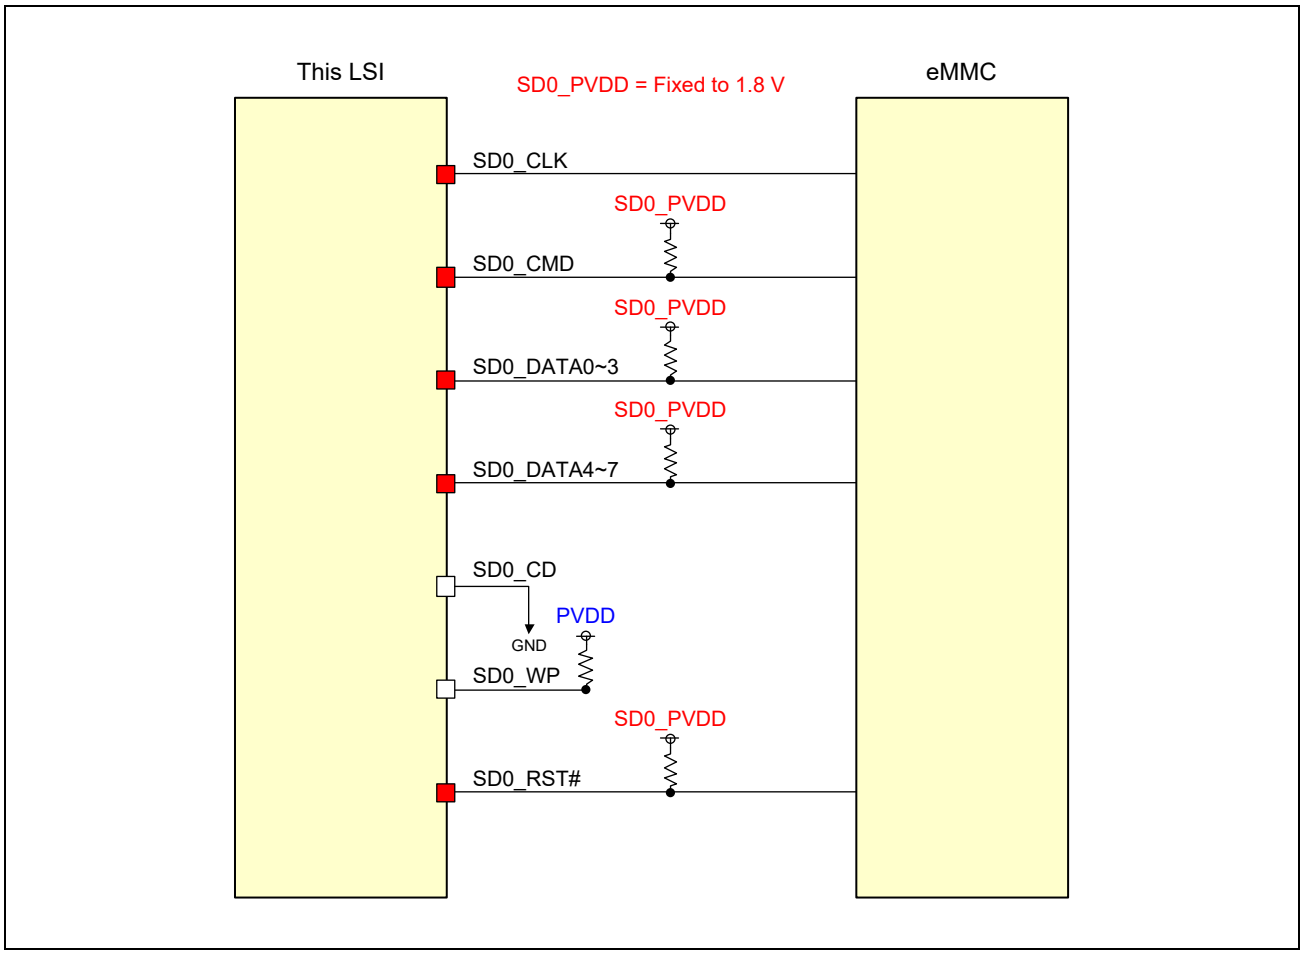


Figure 4.5 Connections in Boot Mode 1

#### 4.2.2.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the eMMC device. The operating voltage is set to 1.8 V and the width of the data bus connected to the eMMC device is fixed to eight bits in this mode. SDHI0 used as the interface controller in this mode is placed in the module standby mode at the startup of the LSI. Once SDHI0 is released from the module standby mode, the boot program in this LSI sets up the CPG so that the frequency of the external output clock becomes 16.6 MHz, initializes SDHI0, and then begins the booting process.

#### 4.2.2.3 Operation of Booting from 1.8-V eMMC

In boot mode 1 (booting from 1.8-V eMMC), this LSI is booted from the loader program in the 1.8-V eMMC device connected to channel 0 of the SD host interface (SDHI) as follows.

The boot program executes the following processing to access the eMMC device.

1. Setting up the necessary peripheral modules (SDHI channel 0 and OSTM channel 0)
2. Starting the alternative boot operation mode of the eMMC device
   Read access begins from sector 0 of the partition selected by the [179] field (PARTITION_CONFIG) of the extended CSD (EXT_CSD) register in the eMMC device. For details, refer to **Section 4.2.2.5** and **Section 4.2.2.5(1)**.
3. Dummy reading from sector 0 and obtaining the size of the loader program data from sector 1

After the size of the loader program data is obtained, the loader program is transferred from sector 2 to the addresses H'0_0001_2000 to H'0_0002_EFFF of the on-chip RAM for the obtained data size.

Then, execution branches to the start address (H'0_0001_2000) of the loader program transferred to the on-chip RAM to execute the loader program that was stored in the eMMC device.

If the boot program has failed to read the loader program, it enters fail-safe mode (SCIF downloading mode). If the fail-safe processing has failed, execution enters an infinite loop in the on-chip ROM and the boot processing is terminated.

Note that the data bus width is set to eight bits for booting from the eMMC device.

#### 4.2.2.4 Allocation of the Loader Program in the eMMC Device

**Figure 4.6** shows the allocation of the loader program in the eMMC device conforming to the MMCA 4.4 standard.

In the loader program size block, the loader program size is stored in the first four bytes and the signature H'AA55 is stored in the last two bytes. **Figure 4.7** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The transfer of the loader program begins from the first address (sector 0) of the boot partition. A dummy read from sector 0 is done, and then the size of the loader program data is obtained from the data read from sector 1. The loader program is transferred from sector 2 to the addresses H'0_0001_2000 to H'0_0002_EFFF of the on-chip RAM for the obtained loader program size.

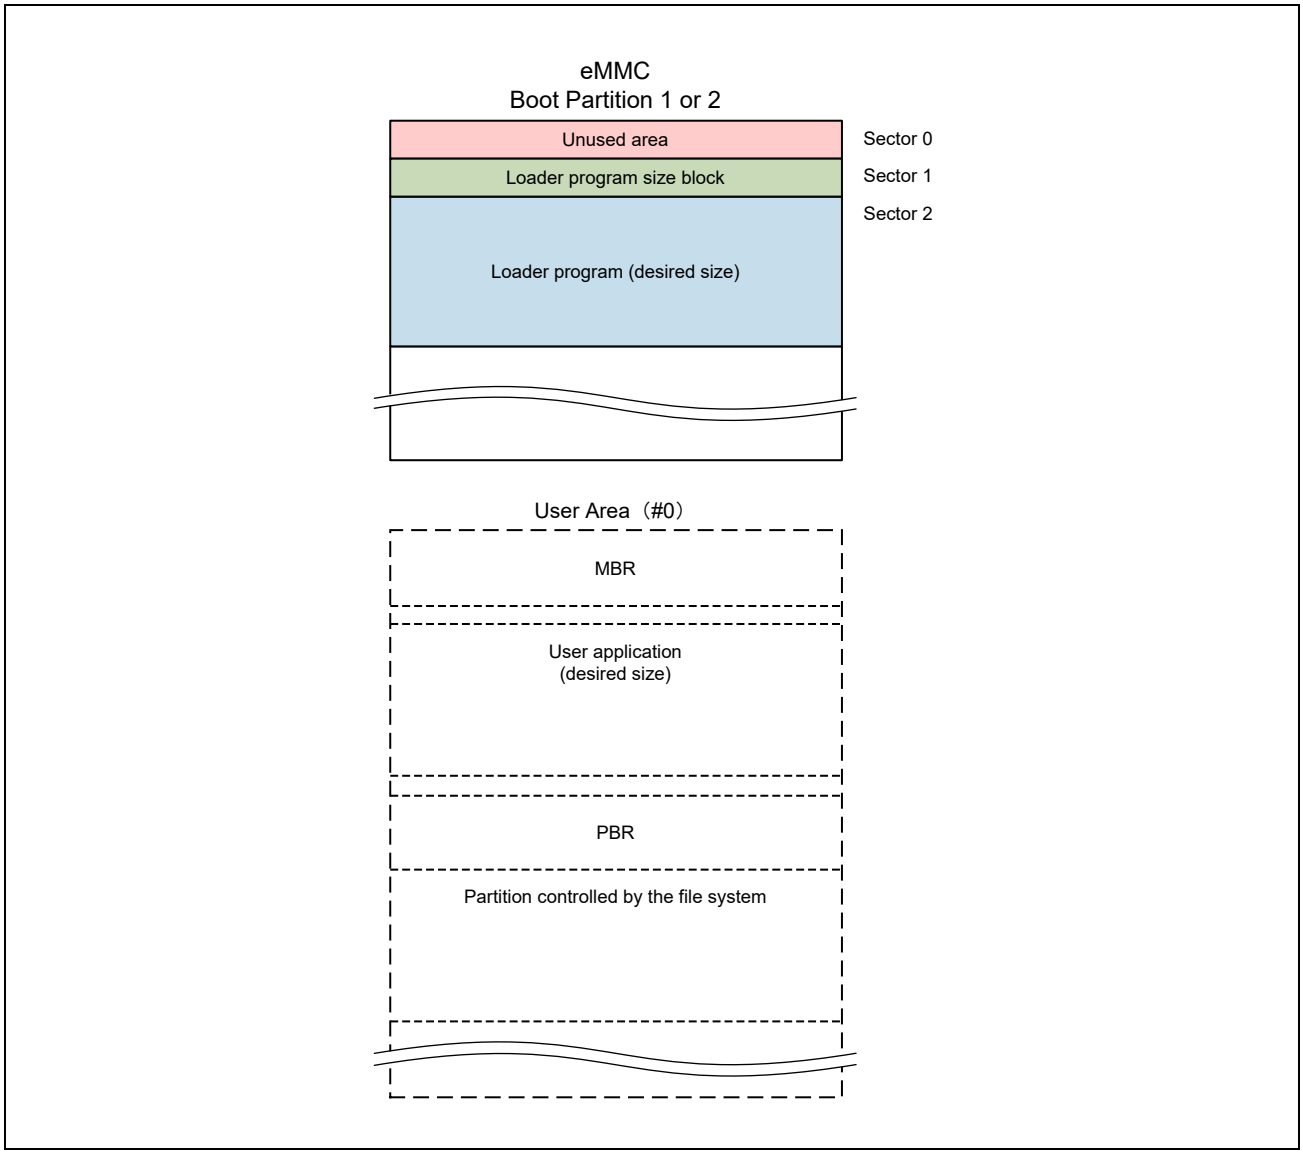

Figure 4.6 Allocation of Loader Program in the eMMC Device

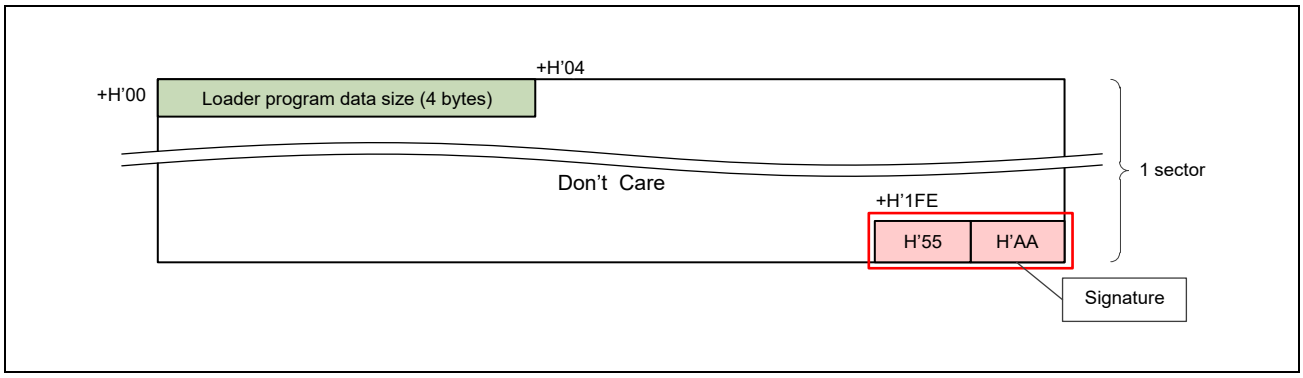

Figure 4.7 Structure of the Loader Program Size Block

In the eMMC device, the loader program is read from the partition specified by the BOOT_PARTITION_ENABLE bits in the PARTITION_CONFIG (ECSD[179]) field of the extended CSD register. Write the loader program to the partition selected by this register. **Table 4.5** shows the specifications of the extended CSD register.

Table 4.5 Specifications of the Extended CSD Register

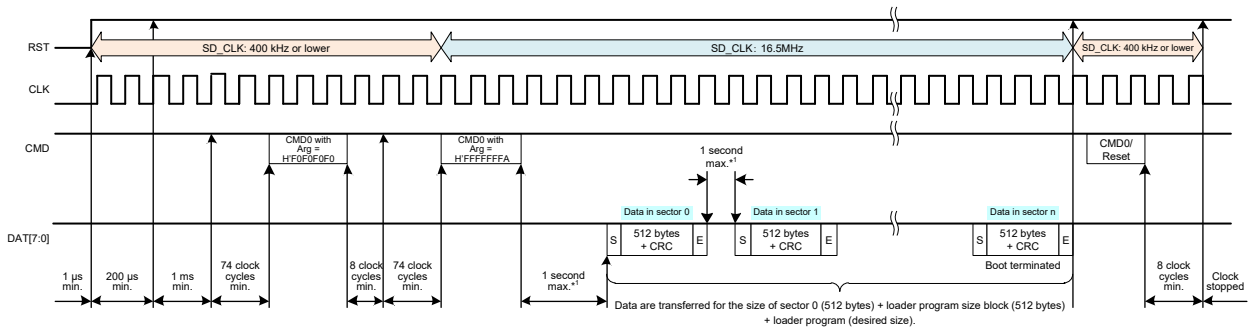
| No. | Field Name | Bit Name | Setting | Remarks |
|---|---|---|---|---|
| 1 | PARTITION_CONFIG (ECSD[179]) | BOOT_PARTITION_ENABLE bits [5:3] | H'0: Device not boot enabled (default)<br>H'1: Boot partition 1 enabled for boot<br>H'2: Boot partition 2 enabled for boot<br>H'7: User area enabled for boot | |

Allocate partitions as follows.

- Store the loader program in boot partition 1.
- Store the application program in boot partition 2.
- Allocate the user area to a partition controlled by the file system.

### 4.2.2.5 Alternative Boot Operation

**Figure 4.8** shows the alternative boot operation to read the loader program. This boot program sets up the registers in SDHI channel 0 so that the SDHI operates with an 8-bit bus width when booting from the eMMC device. On the eMMC device side, the data bus width in the alternative boot operation is determined by the setting of the BOOT_BUS_WIDTH[177] field in the extended CSD register. To boot up from the eMMC device correctly, set up the extended CSD register in the eMMC device as shown in **Table 4.6** when writing a program to the eMMC device.



- This CPU accesses the eMMC device with a data bus width of 8 bits in the alternative boot operation. The data bus width of the eMMC device can be specified in the BOOT_BUS_WIDTH[177] field of the extended CSD register. When writing a loader program to the eMMC device, specify the 8-bit bus width in this field.
- The eMMC device sequentially outputs data from sector 0 of the partition selected in the PARTITION_CONFIG[179] field of the extended CSD register in the alternative boot operation.
- This CPU does not detect Boot Ack.
  The output of Boot Ack from the eMMC device can be specified in the PARTITION_CONFIG[179] field. Be sure to stop the output of Boot Ack by using this field.

Note 1. For a maximum of one second, the BRE, ERR3, and ERR1 bits of the SD_INFO2 register are polled to check whether data have been received, a timeout has occurred, and a CRC error has occurred, respectively.
<Normal operation>
SD_INFO2.BRE = 1
Data are transferred from SD_BUF to the on-chip RAM.
<Error>
CRC error: SD_INFO2.ERR1 = 1
The loader program is read from a reserved area.
Timeout error: SD_INFO2.ERR3 = 1
Execution of the boot program for eMMC is terminated.

Figure 4.8 Alternative Boot Operation to Read the Loader Program

Table 4.6 Setting of the Data Bus Width in Alternative Boot Operation

| Field in Extended CSD Register of eMMC Device | Setting |
|---|---|
| BOOT_BUS_WIDTH [177] | Bits 1 and 0: BOOT_BUS_WIDTH = 10b<br>(The bus width is set to 8 bits in alternative boot operation.) |

### (1) Partitions

An eMMC device has multiple partitions (**Figure 4.9**). The partition used for booting can be specified in the PARTITION_CONFIG[179] field of the extended CSD (EXT_CSD) register. To boot up correctly, specify the boot partition in the extended CSD (EXT_CSD) register of the eMMC device as shown in **Table 4.7** when writing a program to the eMMC device.

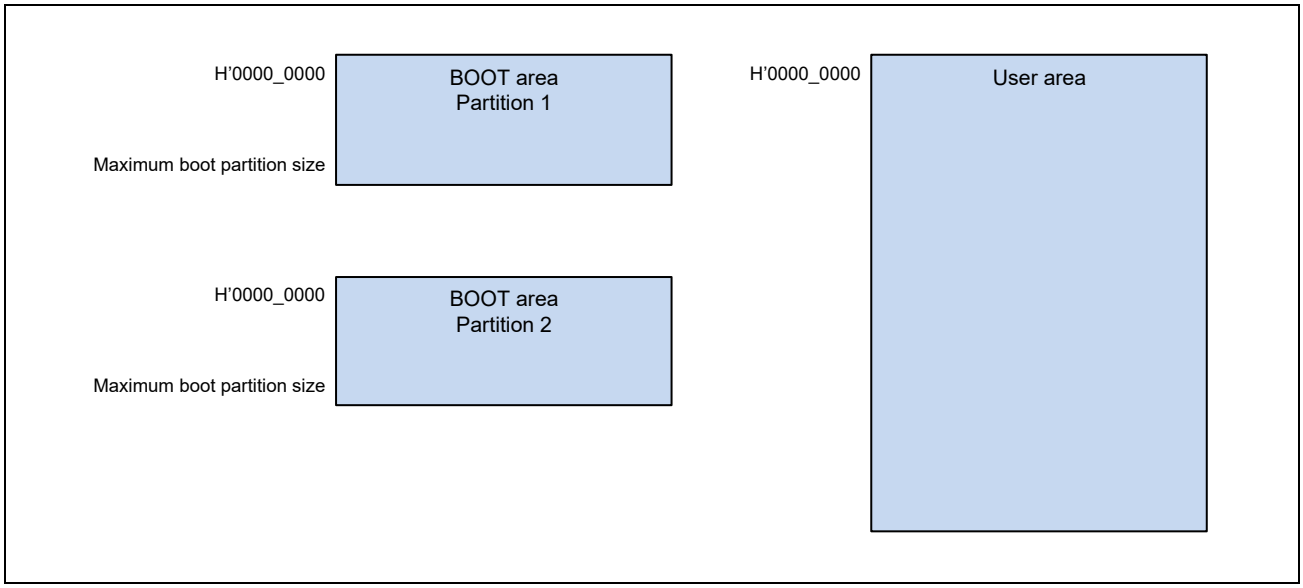


Figure 4.9 Partitions in the eMMC Device

Table 4.7 Boot Partition Setting in the Alternative Boot Operation

| Field in Extended CSD Register of eMMC Device | Setting |
|---|---|
| PARTITION_CONFIG [179] | • Set bit 6 (BOOT_ACK) to 0b (the eMMC device does not output a boot acknowledge in the alternative boot operation).<br>• Specify the boot partition in bits 5 to 3 (BOOT_PARTITION_ENABLE).<br>000b: Booting is disabled.<br>001b: Booting from sector 0 in boot partition 1 in the boot operation.<br>010b: Booting from sector 0 in boot partition 2 in the boot operation.<br>011b to 110b: Reserved<br>111b: Booting from sector 0 in the user area in the boot operation. |

### 4.2.2.6 Notes

- This mode does not support booting from an MMC card.
- The width of the data bus is fixed to eight bits; 1-bit or 4-bit data bus cannot be used in this mode.

### 4.2.3 Boot Mode 2 (3.3-V eMMC)

**Table 4.8** shows the interface signals used for connection with the external device in boot mode 2 (eMMC). This LSI supports the eMMC that operates in the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4).

Table 4.8 External Interface Signals Used in Boot Mode 2

| Interface Module | Pin Name | I/O | Function | Pin Type |
|---|---|---|---|---|
| SDHI/eMMC (SDHI0) | SD0_CLK | Output | eMMC clock | Dedicated pins (3.3 V) |
| | SD0_CMD | Input/output | eMMC command or response | |
| | SD0_DATA0 | Input/output | eMMC data 0 | |
| | SD0_DATA1 | Input/output | eMMC data 1 | |
| | SD0_DATA2 | Input/output | eMMC data 2 | |
| | SD0_DATA3 | Input/output | eMMC data 3 | |
| | SD0_DATA4 | Input/output | eMMC data 4 | |
| | SD0_DATA5 | Input/output | eMMC data 5 | |
| | SD0_DATA6 | Input/output | eMMC data 6 | |
| | SD0_DATA7 | Input/output | eMMC data 7 | |
| | SD0_CD | Input | SD card detection | |
| | SD0_WP | Input | SD write protect | |
| | SD0_RST# | Output | eMMC reset | |

#### 4.2.3.1 External Connections

**Figure 4.10** shows the connections with the eMMC device. The boot program in this LSI does not monitor the state of the SD0_CD and SD0_WP pins.

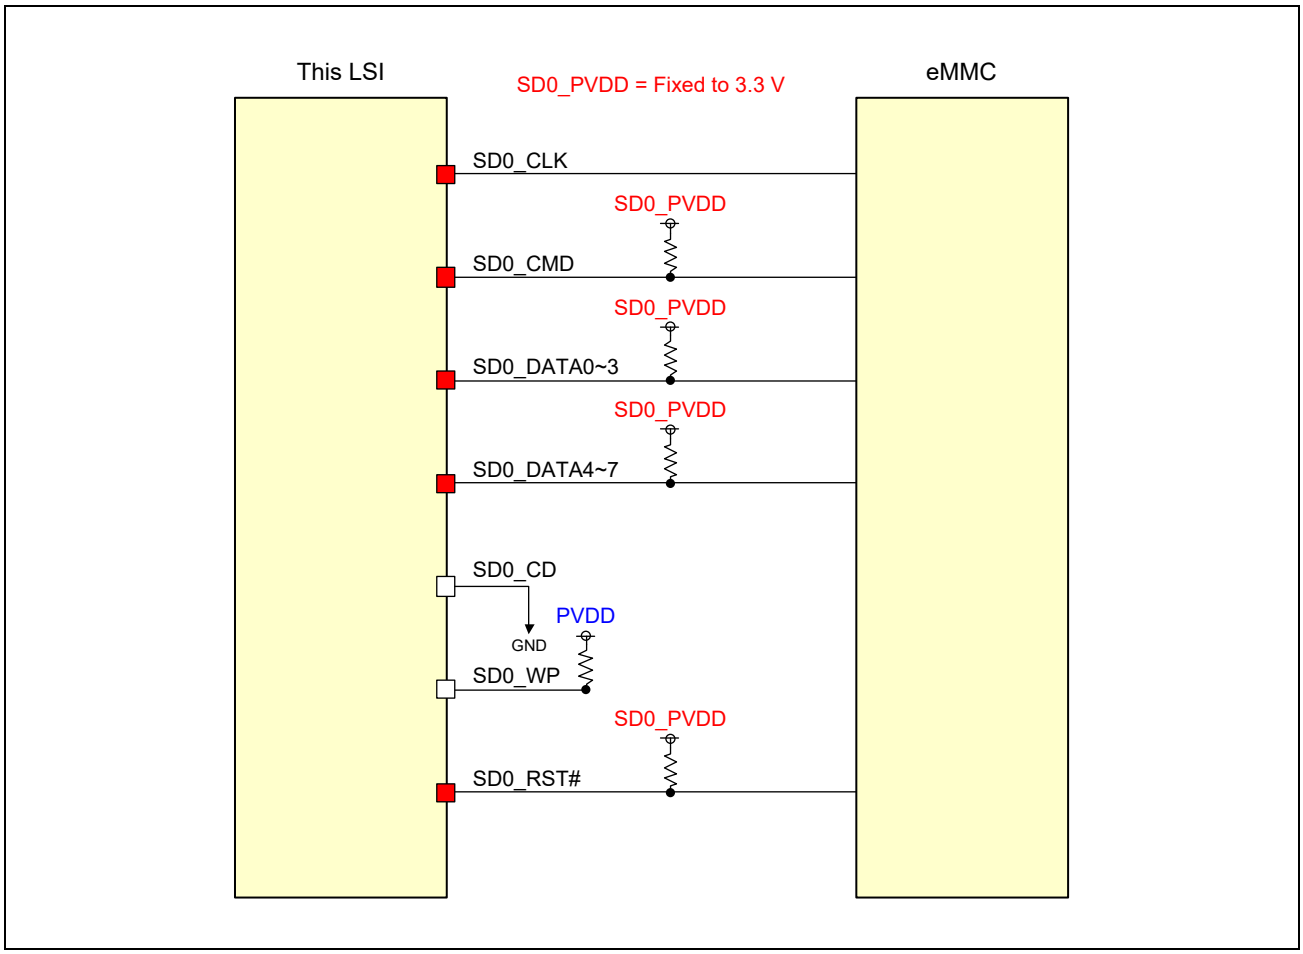

Figure 4.10 Connections in Boot Mode 2

#### 4.2.3.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the eMMC device in the same way as boot mode 1. This mode only differs from boot mode 1 in that the external device operates at 3.3 V. The operating voltage is set to 3.3 V in this mode.

#### 4.2.3.3 Operation of Booting from 3.3-V eMMC

Boot mode 2 (booting from 3.3-V eMMC) only differs from boot mode 1 (booting from 1.8-V eMMC) in the setting of supplied voltage as shown in **Table 4.9**.

Table 4.9 Resources Used by the Boot Program for 3.3-V eMMC (Difference from 1.8-V eMMC)

| No. | Register Name | Address | Initial Value | Value after Booting | Remarks |
|---|---|---|---|---|---|
| 1 | GPIO_SD_CH0 | H'0_1103_3000 | H'0000_0000 | H'0000_0000 | SD0_PVDD: 0 = 3.3 V<br>In boot mode 1 or 2, this is automatically set by hardware. The user does not need to set this register. |

#### 4.2.3.4 Notes

- This mode does not support booting from an MMC card.
- The width of the data bus is fixed to eight bits; 1-bit or 4-bit data bus cannot be used in this mode.

### 4.2.4 Boot Mode 3 (1.8-V Single or Quad Serial Flash Memory)

**Table 4.10** shows the interface signals used for connection with the external device in boot mode 3 (1.8-V serial flash memory).

Table 4.10 External Interface Signals Used in Boot Mode 3

| Interface Module | Pin Name | I/O | Function | Pin Type |
|---|---|---|---|---|
| QSPI0 | QSPI0_SPCLK | Input/output | QSPI clock | Dedicated pins (1.8 V) |
| | QSPI0_IO0 | Input/output | QSPI data 0 | |
| | QSPI0_IO1 | Input/output | QSPI data 1 | |
| | QSPI0_IO2 | Input/output | QSPI data 2 | |
| | QSPI0_IO3 | Input/output | QSPI data 3 | |
| | QSPI0_SSL | Output | Slave select | |
| | QSPI_RESET# | Output | QSPI reset | |
| | QSPI_WP# | Output | QSPI write protect | |

#### 4.2.4.1 External Connections

**Figure 4.11** and **Figure 4.12** show the connections with the Single SPI memory and Quad SPI memory, respectively.

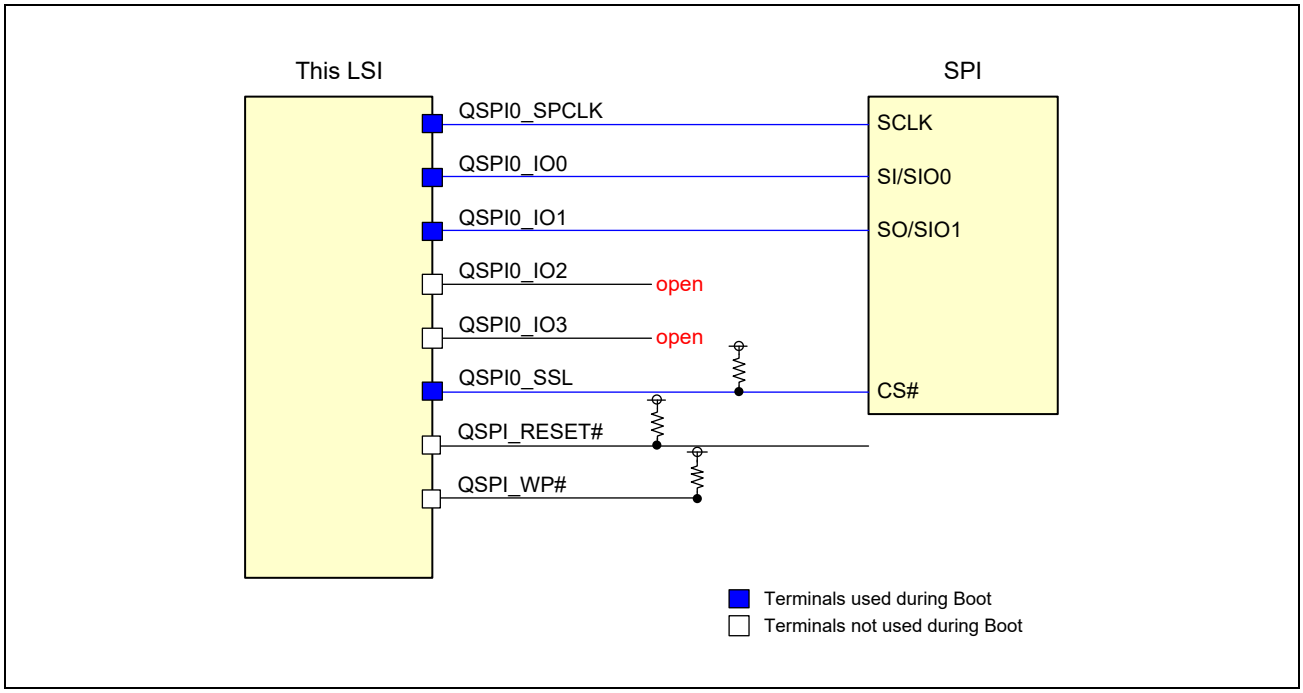

Figure 4.11 Connections with Single SPI Memory in Boot Mode 3

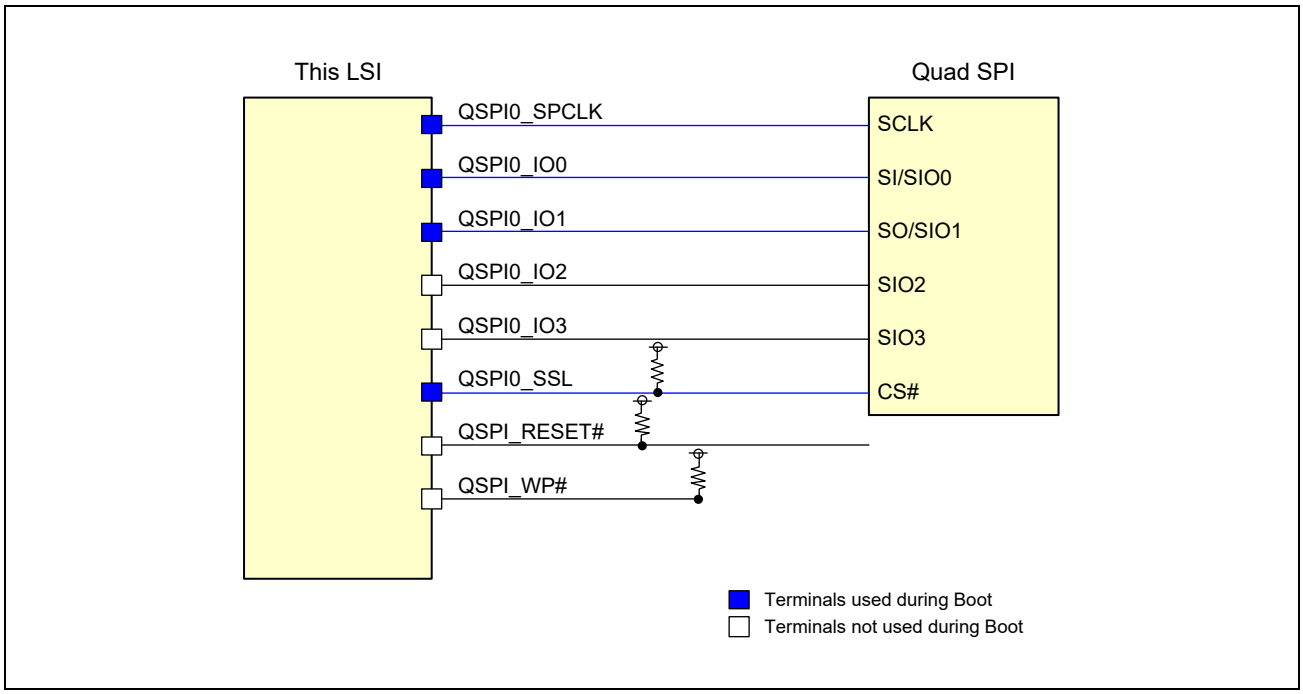

Figure 4.12 Connections with Quad SPI Memory in Boot Mode 3

#### 4.2.4.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the Single or Quad flash memory device.

The serial flash memory mounted in advance on the board is used in this mode. The target device operates at 1.8 V and the I/O power of this LSI is also fixed to 1.8 V in this mode. The clock frequency at the startup is set to 16.6 MHz. The LSI is booted up through an SPI handshake with the Single or Quad flash memory device.

Upon detecting boot mode 3 according to the value read from the SYSC, the boot program makes the necessary settings of the SPI multi I/O bus controller to access memory. The boot program handles the following steps to control the booting process.

1. The CPG is set up to supply clocks, and the SPI multi I/O bus controller receives the operating clock and is released from the reset state.
2. The necessary information to control the I/O buffers is read from the registers in the SYSC.
   The given information is copied from the OTPC to the SYSC registers in advance.
3. The properties such as the driving ability of the I/O buffers of the signals to be used are set up.
4. After the above setup, the SPI multi I/O bus controller performs a handshake process with the target memory device.
5. When a Quad SPI handshake is required, the user program should control the process.

#### 4.2.4.3 Operation of Booting from 1.8-V Serial Flash Memory

In boot mode 3 (booting from the serial flash memory), this LSI is booted from the loader program in the 1.8-V serial flash memory connected to the SPI multi I/O bus controller (SPIBSC).

The boot program executes the following processing to access the SPI multi I/O bus space.

1. Releasing the SPIBSC from module standby mode
2. Setting up the registers in the necessary peripheral modules (SPIBSC and GPIO)
3. Obtaining the size of the loader program data stored in the area starting from "the start address of the SPI multi I/O bus space (H’0_2000_0000) + offset" through the SPIBSC

After obtaining the size of the loader program data, the SPIBSC transfers the loader program stored in the area starting from "the start address of the SPI multi I/O bus space (H’0_2000_0000) + offset" to the addresses H’0_0001_2000 to H’0_0002_EFFF of the on-chip RAM for the obtained data size.

Then, execution branches to the start address (H’0_0001_2000) of the loader program transferred to the on-chip RAM to execute the loader program that was stored in the serial flash memory.

If the boot program has failed to read data, the boot program enters fail-safe mode (SCIF downloading mode). If the fail-safe processing has failed, execution enters an infinite loop in the on-chip ROM and the boot processing is terminated.

#### 4.2.4.4 Allocation of the Loader Program in the Serial Flash Memory

**Figure 4.13** shows the allocation of the loader program size block and loader program in the serial flash memory.

In the loader program size block, the loader program size is stored in the first four bytes and the signature H'AA55 is stored in the last two bytes. **Figure 4.14** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The loader program is transferred from the area starting from the address "H'0_2000_0000 + H'0200 (offset)" to the addresses H'0_0001_2000 to H'0_0002_EFFF of the on-chip RAM for the obtained loader program size.

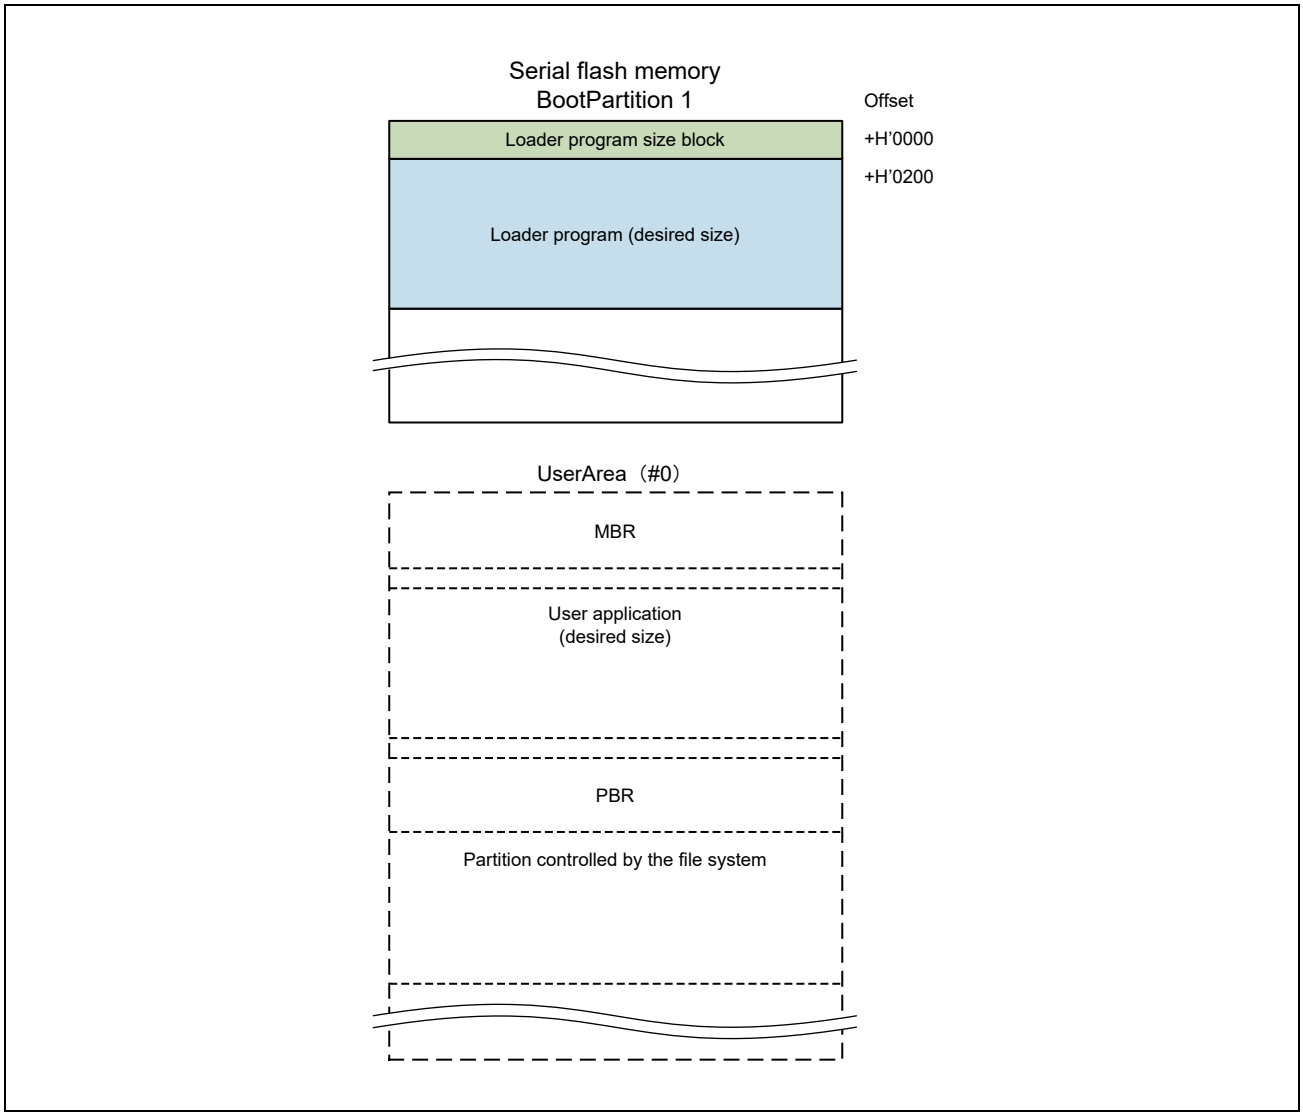

Figure 4.13 Allocation of Loader Program in the Serial Flash Memory Device

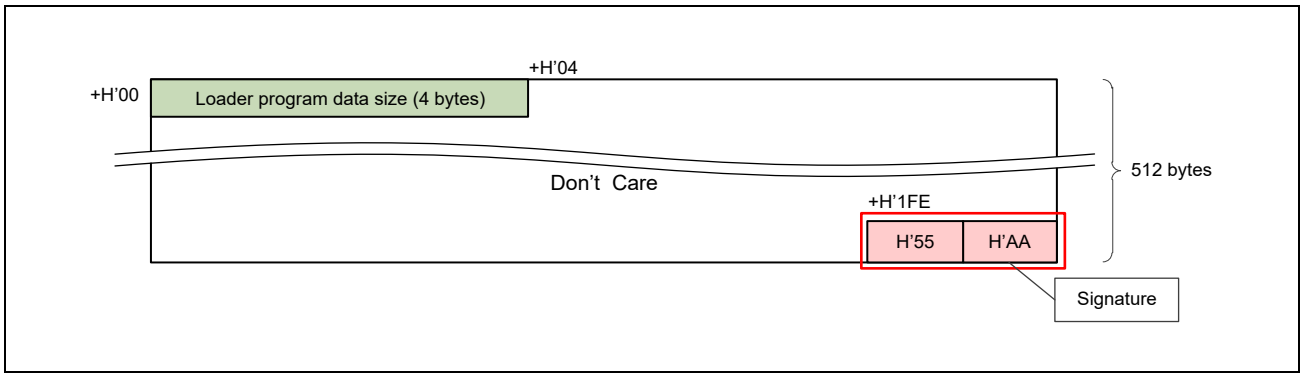

Figure 4.14 Structure of the Loader Program Size Block

### 4.2.5 Boot Mode 4 (3.3-V Single or Quad Serial Flash Memory)

**Table 4.11** shows the interface signals used for connection with the external device in boot mode 4 (3.3-V serial flash memory).

Table 4.11 External Interface Signals Used in Boot Mode 4

| Interface Module | Pin Name | I/O | Function | Pin Type |
|---|---|---|---|---|
| QSPI0 | QSPI0_SPCLK | Input/output | QSPI clock | Dedicated pins (3.3 V) |
| | QSPI0_IO0 | Input/output | QSPI data 0 | |
| | QSPI0_IO1 | Input/output | QSPI data 1 | |
| | QSPI0_IO2 | Input/output | QSPI data 2 | |
| | QSPI0_IO3 | Input/output | QSPI data 3 | |
| | QSPI0_SSL | Output | QSPI data 4 | |
| | QSPI_RESET# | Output | QSPI reset | |
| | QSPI_WP# | Output | QSPI write protect | |

**Note:** Only interface 0 is used and the pins shaded in gray are not controlled in this mode. To use the shaded pins after booting, control them by the user program.

#### 4.2.5.1 External Connections

**Figure 4.15** and **Figure 4.16** show the connections with the 3.3-V Single SPI memory and 3.3-V Quad SPI memory, respectively.

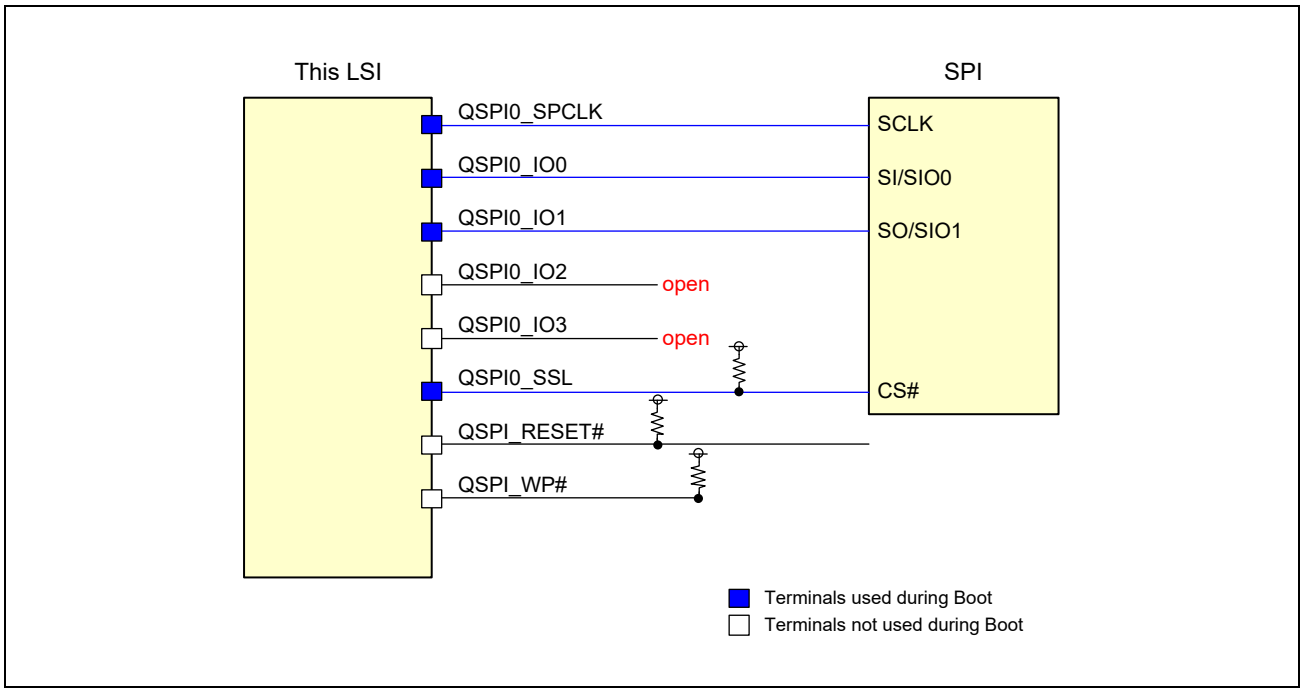

Figure 4.15 Connections with Single SPI Memory in Boot Mode 4

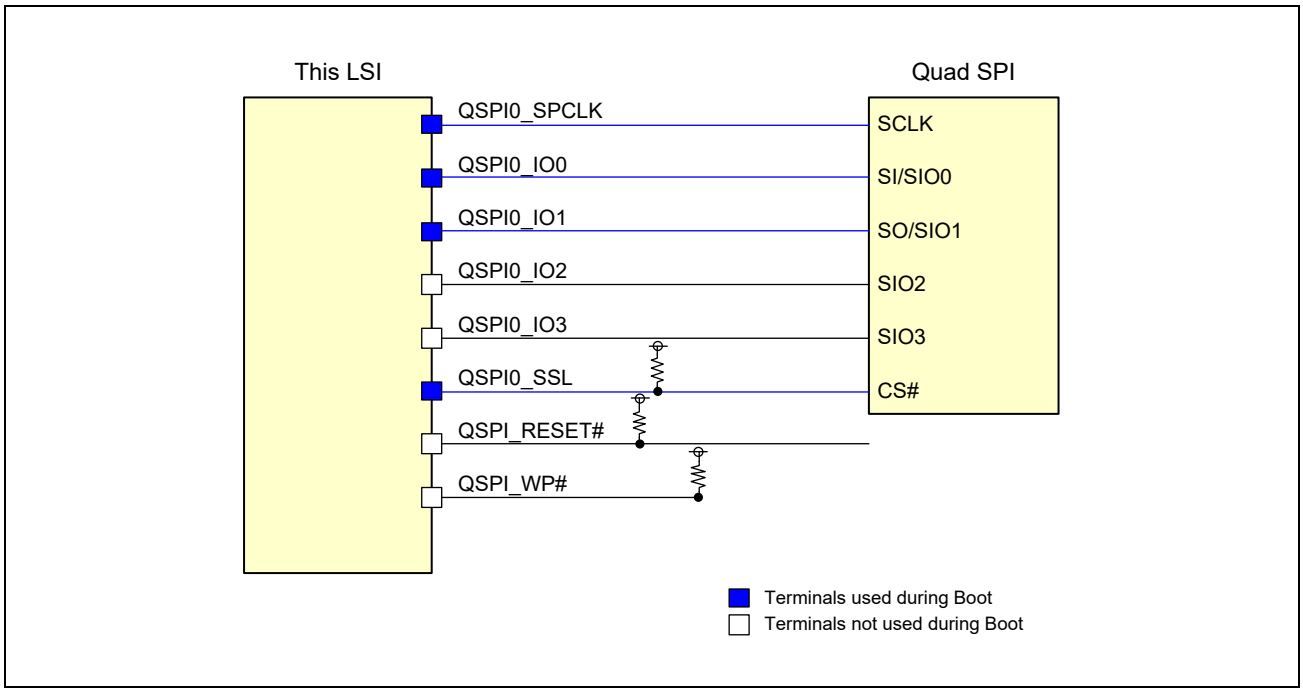

Figure 4.16 Connections with Quad SPI Memory in Boot Mode 4

#### 4.2.5.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the Single or Quad SPI memory device. The serial flash memory mounted in advance on the board is used in this mode. The target device operates at 3.3 V and the I/O power of this LSI is also fixed to 3.3 V in this mode. The clock frequency at the startup is set to 16.6 MHz.

Upon detecting boot mode 4 according to the value read from the SYSC, the boot program makes the necessary settings of the SPI multi I/O bus controller to access memory. The boot program handles the following steps to control the booting process.

1. The CPG is set up to supply clocks, and the SPI multi I/O bus controller receives the operating clock and is released from the reset state.
2. The necessary information to control the I/O buffers is read from the registers in the SYSC.
   The information is copied from the OTPC to the SYSC registers in advance.
3. The properties such as the driving ability of the I/O buffers of the signals to be used are set up.
4. After the above setup, the SPI multi I/O bus controller performs a handshake process with the target memory device.
5. When a Quad SPI handshake is required, the user program should control the process.

#### 4.2.5.3 Operation of Booting from 3.3-V Serial Flash Memory

Boot mode 4 (booting from 3.3-V serial flash memory) only differs from boot mode 3 (booting from 1.8-V serial flash memory) in the setting of supplied voltage as shown in **Table 4.12**.

Table 4.12 Resources Used by the Boot Program for 3.3-V Serial Flash Memory (Difference from 1.8-V Serial Flash Memory)

| Register Name | Address | Initial Value | Value after Booting | Remarks |
|---|---|---|---|---|
| GPIO_QSPI | H'0_1101_3008 | H'0000_0000 | H'0000_0000 | QSPI_PVDD: 0 = 3.3 V<br>In boot mode 3 or 4, this is automatically set by hardware. The user does not need to set this register. |

#### 4.2.5.4 Note

When interface 0 of the SPI multi I/O bus controller is connected with the SPI or QSPI memory, interface 1 can only be used to connect the same type of memory.

### 4.2.6 Boot Mode 5 (SCIF Downloading)

**Table 4.13** shows the interface signals used for connection with the external device in boot mode 5 (SCIF downloading).

Table 4.13 External Interface Signals Used in Boot Mode 5

| Interface Module | Pin Name | I/O | Function | Pin Type |
|---|---|---|---|---|
| SCIF0 | SCIF0_SCK | Input/output | SCIF0 serial clock | Multiplexed pins (3.3 V) |
| | SCIF0_RXD | Input | SCIF0 receive data | |
| | SCIF0_TXD | Output | SCIF0 transmit data | |
| | SCIF0_CTS# | Input/output | SCIF0 transmission enable | |
| | SCIF0_RTS# | Output | SCIF0 transmission request | |

#### 4.2.6.1 External Connections

**Figure 4.17** shows the external connections for downloading through the SCIF.

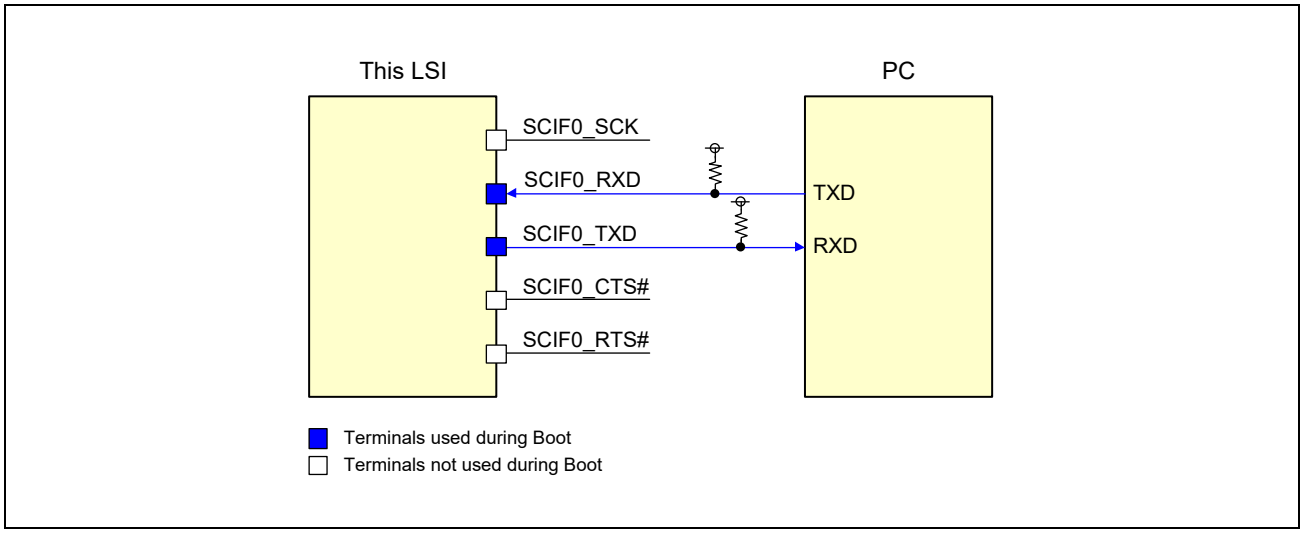

Figure 4.17 Connections for Downloading through the SCIF in Boot Mode 5

#### 4.2.6.2 Overview of Operation

This mode is used to download the user program from the host PC. Upon detecting boot mode 5 according to the value read from the SYSC, the boot program makes the necessary settings of the SCIFA module to access memory. The boot program handles the following steps to control the booting process.

1. The SCIFA module is set up to handle communications as shown below. Asynchronous communications proceed in this mode. The SCIF0_RXD and SCIF0_TXD pins are used.
   Baud rate: 115200 bps
   Data length: 8 bits
   Stop bit: 1 bit
   Flow control: None
   Data format: Motorola S-record
2. The sequence shown in **Figure 4.18** is used to download the user program through the SCIF.

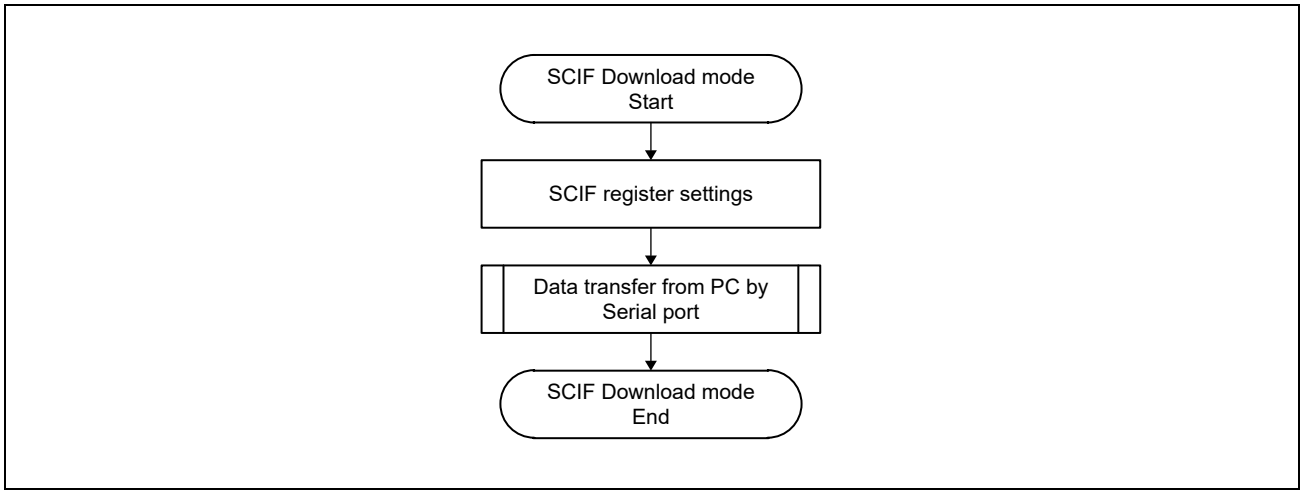

Figure 4.18 Sequence of Downloading through the SCIFA

#### 4.2.6.3 Operation of Booting through SCIF Downloading

In boot mode 5 (booting through SCIF downloading), this LSI is booted from the loader program downloaded from the external host PC through the serial communications interface with FIFO (SCIFA).

The boot program executes the following processing.

1. Setting up the necessary peripheral modules (SCIFA channel 0 and GPIO) and specifying the parameters for communications.

   When the LSI becomes ready for data reception, the boot program outputs the following message to the SCIFA.
   "SCIF Download mode"

   If execution enters boot mode 5 due to the fail-safe processing, the boot program outputs the following message to the SCIFA.
   "SCIF Download mode due to parameter error"

2. Upon receiving the Motorola S0 record sent from the external host PC through the SCIFA, the boot program converts the S3 record to binary data and copies the data to the addresses H'0_0001_2000 to H'0_0002_EFFE (up to 116 Kbytes) of the on-chip RAM.

   The boot program outputs the following message to the SCIFA.
   "-- Load Program to System RAM ----------"

   **Note:** The S0 record must always be generated because the boot program requires an S0 record as a trigger for the reception processing.

3. Upon receiving the S7 record, the boot program outputs the following message to the SCIFA and terminates copying to the on-chip RAM. After that, execution branches to the address H'0_0001_2000 of the on-chip RAM.
   "-- Start Boot Program on System RAM ---------"

   If the data in the Motorola S records sent from the external host PC satisfies any of the following error conditions, the corresponding error message is output to the SCIFA and copying to the on-chip RAM is aborted.

   — An S1 or S2 record is received: "Invalid Record Type Error!!! "

   — An address outside the on-chip RAM area is specified: "Address Error!!! "

   — An illegal character code is found: "Invalid Character Error!!! "

   — An illegal byte count is found: "Invalid Byte Count Error!!! "

The data transmission and reception operation in SCIF communications (asynchronous) is shown in **Figure 4.19**.

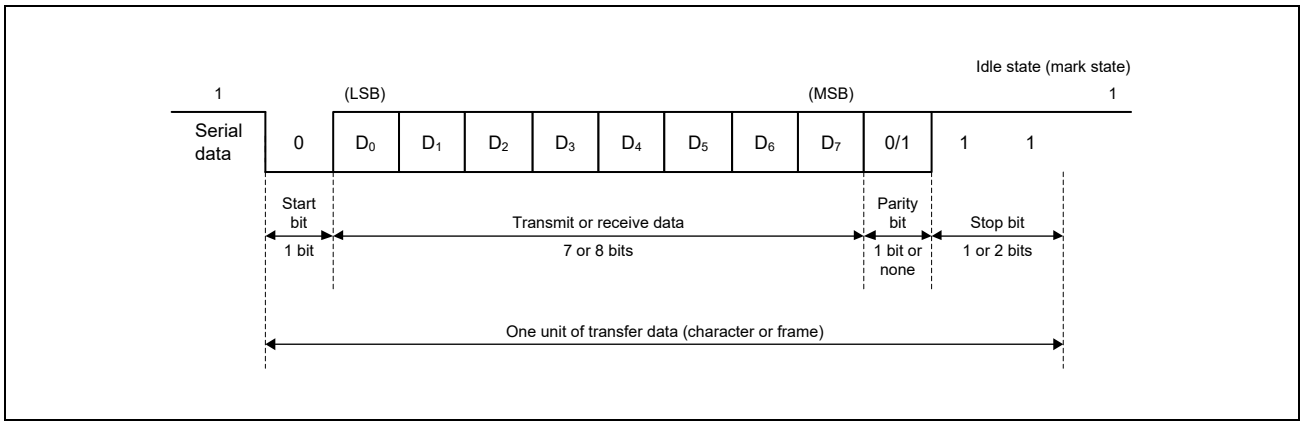

Figure 4.19 Data Transmission and Reception Operation in SCIF Communications

### 4.2.6.4 Allocation of the Loader Program for SCIF Downloading

**Figure 4.20** shows the allocation of the loader program copied to the on-chip RAM.

In the loader program size block (512 bytes), the loader program size is stored in the first four bytes and the signature H'AA55 is stored in the last two bytes. Be sure to store the loader program size in 4-byte little endian.

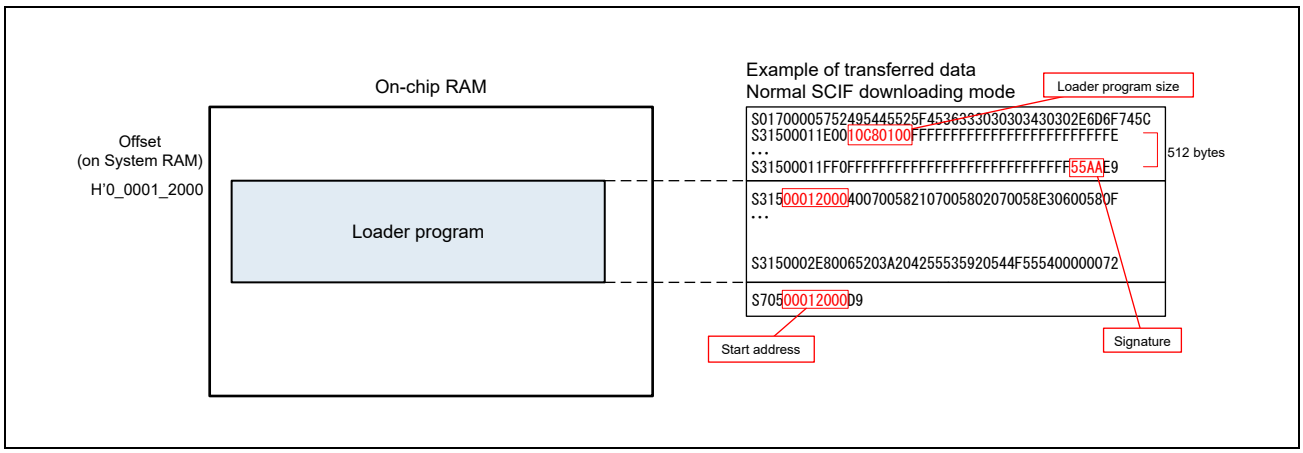

Figure 4.20 Allocation of the Loader Program for SCIF Downloading Copied to the On-chip RAM

#### 4.2.6.5 Note

The pins assigned to the SCIF0_SCK, SCIF0_CTS, and SCIF0_RTS signals, which are not used in this mode, must not be changed from the initial settings (GPIO pins). If such a pin is set to operate as an SCIF0 pin, it becomes an input pin or an input/output pin. In this case, when the pin is externally placed in the Hi-Z state, this LSI cannot communicate with the host PC correctly.

To use the SCIFA for normal serial communications after booting, the SCIF0_SCK, SCIF0_CTS, and SCIF0_RTS pins should be pulled up or down in accordance with the communication mode and the driver software specifications.

# 5. LSI Internal Bus

## 5.1 Overview

### 5.1.1 Features

The bus system of this LSI provides a physical address space of 16 Gbytes (address bus width of 34 bits). The LSI internal bus of this LSI incorporates Arm CoreLink NIC-400, etc., and controls the following bus functions.

**Security control:**

Security attribute re-setting, Security level determination

**Address translation:**

34-bit address space access

**Interrupt generation:**

AXI bus error interrupt generation

**Unit state detection:**

Slave unit stop state detection

NOTE

The security control function is valid only for secure products.
For information on secure products, please contact our sales.

### 5.1.2 Block Diagram of LSI Internal Bus

The LSI internal bus of this LSI consists of the ACPU bus, MCPU bus, and system bus. **Figure 5.1** shows the configuration of the buses.

**ACPU bus:**

A bus connected to Cortex-A55, DDR memory controllers, image processing units, and Storage and Network

**MCPU bus:**

A bus connected to Cortex-M33 and serial interface units

**System bus:**

A bus connected to the control registers of each unit

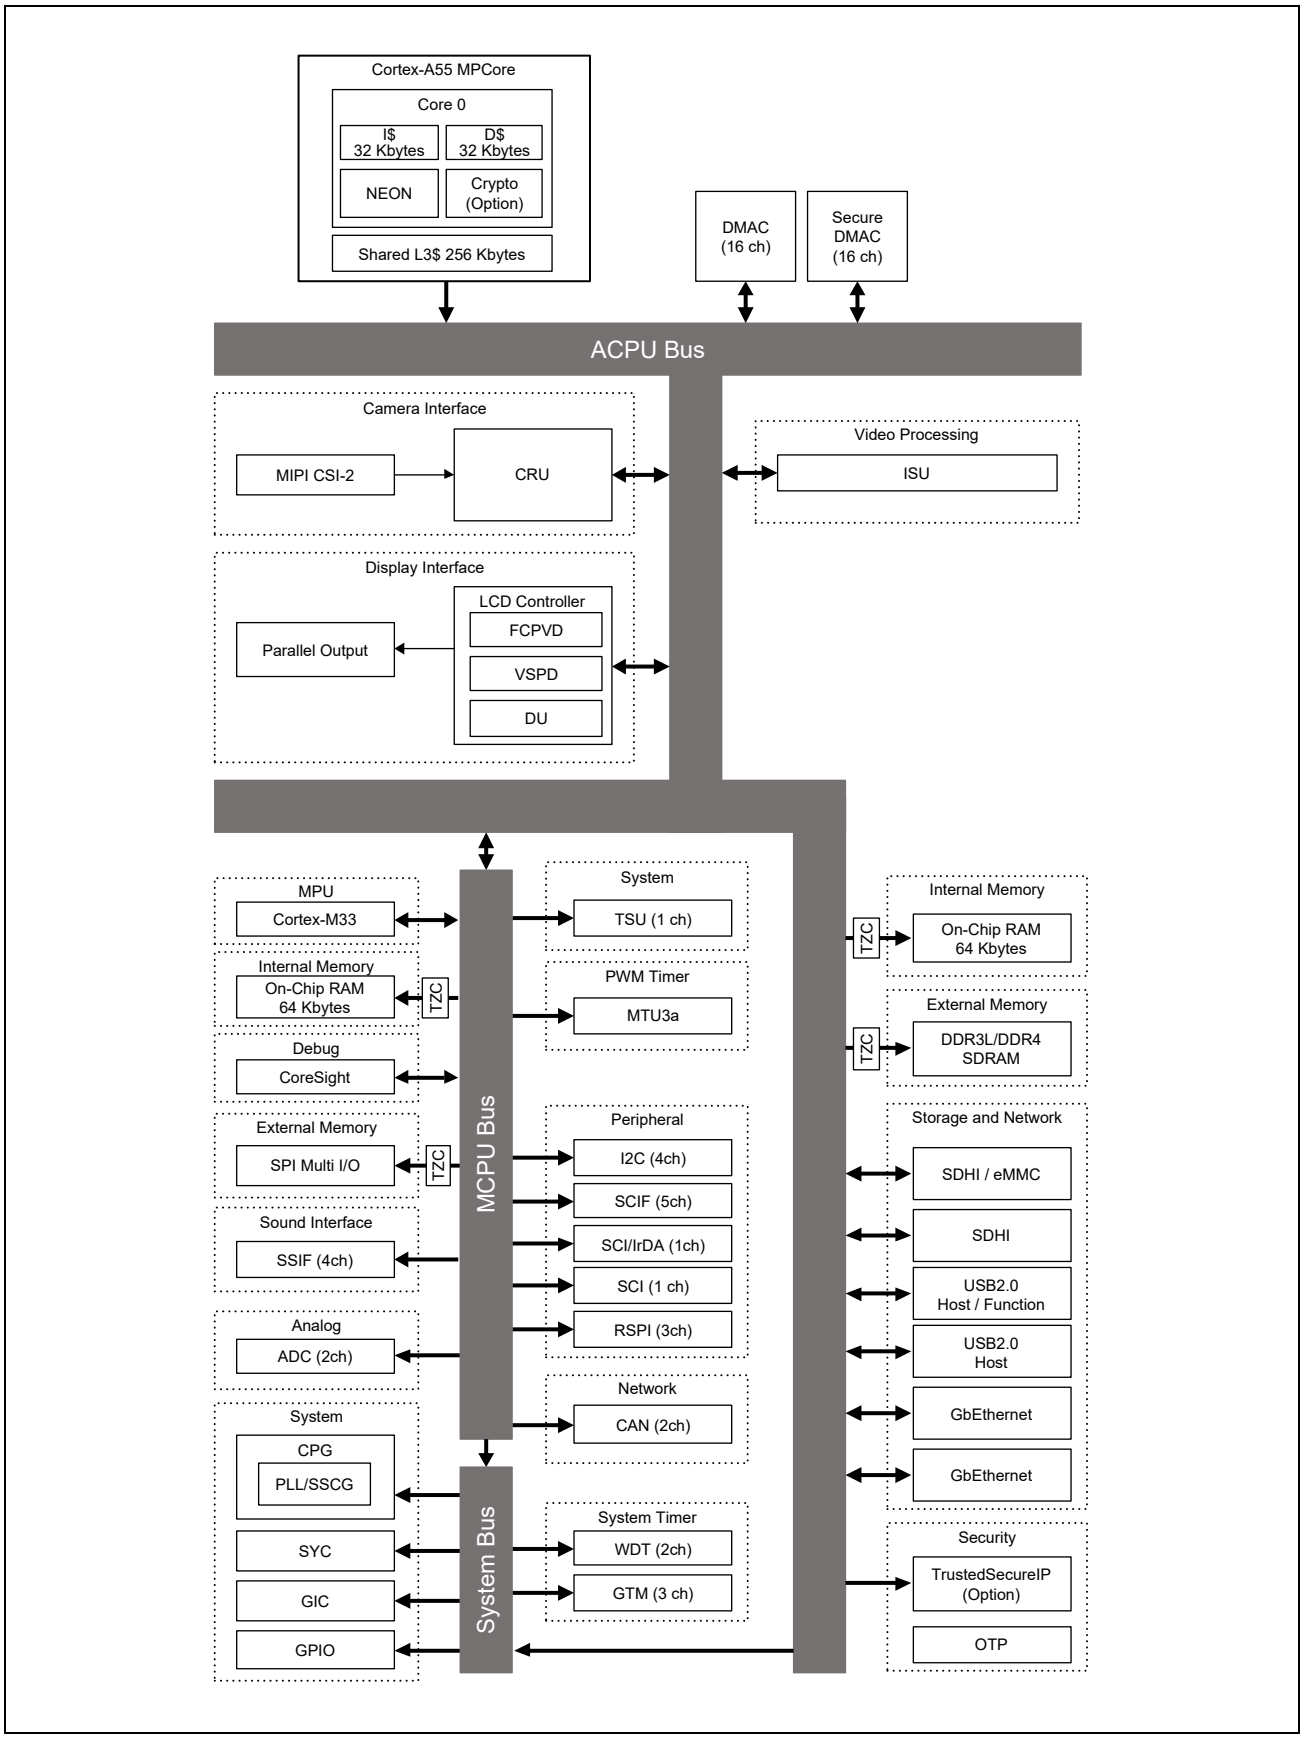

Figure 5.1 Configuration of LSI Internal Bus

## 5.2 Area Maps

### 5.2.1 Overall Address Space

**Figure 5.2** shows the overall address space of this LSI and **Table 5.1** shows the detailed address space.

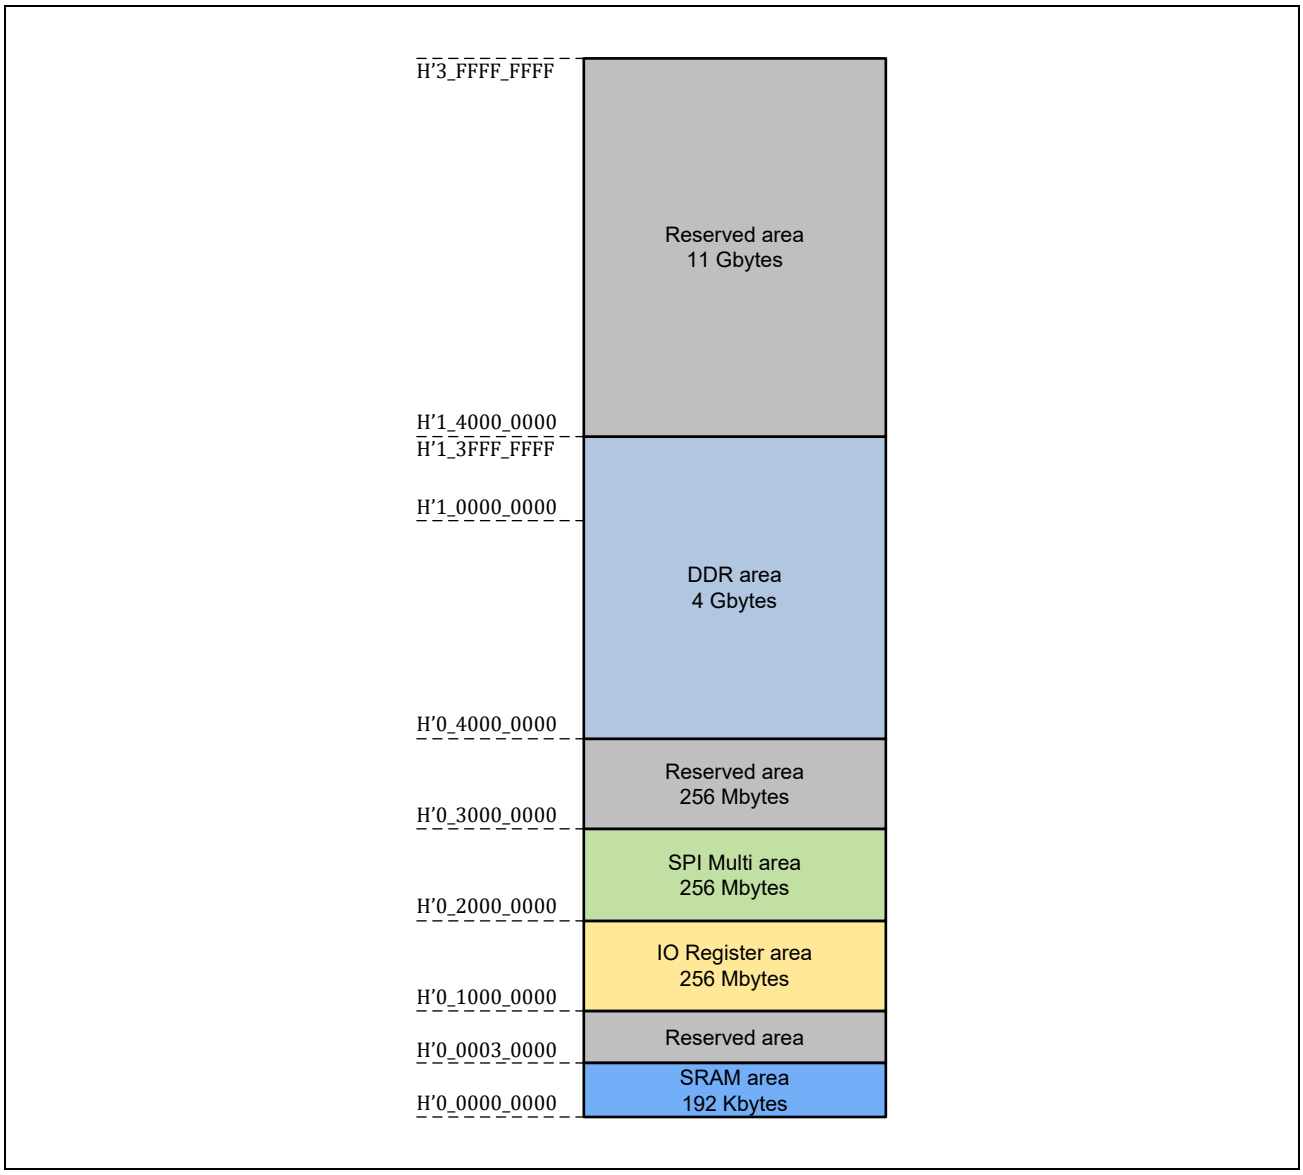

Figure 5.2 Overall Address Space

Some bus master units of this LSI require 34-bit address space access to access an address space of greater than 4 Gbytes in the whole 16-Gbyte address space of this LSI. For details, see **Section 5.4.2.1, 34-Bit Address Space Access**.

The Cortex-M33 address space for this LSI differs from the overall address space. It is the same as the address space of the default memory map of Cortex-M33. For details, see **Section 5.2.2, Cortex-M33 Address Space**.

Table 5.1 Detailed Address Space (1/3)

| Start Address | End Address | Size | Space | Remarks |
|---|---|---|---|---|

Note 1. Access to the reserved areas is prohibited.
If access to the reserved area is attempted, incorrect operation may occur.

Note 2. Access to the addresses H'4000_0000 to H'4000_001F (for DDR3L) or H'4000_0000 to H'4000_003F (for DDR4) in the DDR area is prohibited because these are used for DDR training. For details, see **Section 9**, **DDR3L/DDR4 SDRAM Memory Controller (MEMC)**.

### 5.2.2 Cortex-M33 Address Space

**Figure 5.3** shows the default memory map of Cortex-M33 and an overview of the Cortex-M33 address space for this LSI, and **Table 5.2** shows the detailed address space. For the concept of the secure and non-secure states, see **Section 3, System CPU Cortex-M33**.

In this LSI, addresses H'0000_0000 to H'1FFF_FFFF are used as the code (program) area and addresses H'2000_0000 to H'3FFF_FFFF are used as the data area in the 1-Gbyte SRAM area (H'0000_0000 to H'3FFF_FFFF).

In this LSI, the hardware automatically translates the addresses in the Cortex-M33 address space to those in the overall address space of this LSI. Users can therefore write programs using the addresses in the address space shown in **Figure 5.3** and **Table 5.2**, without considering the overall address space.

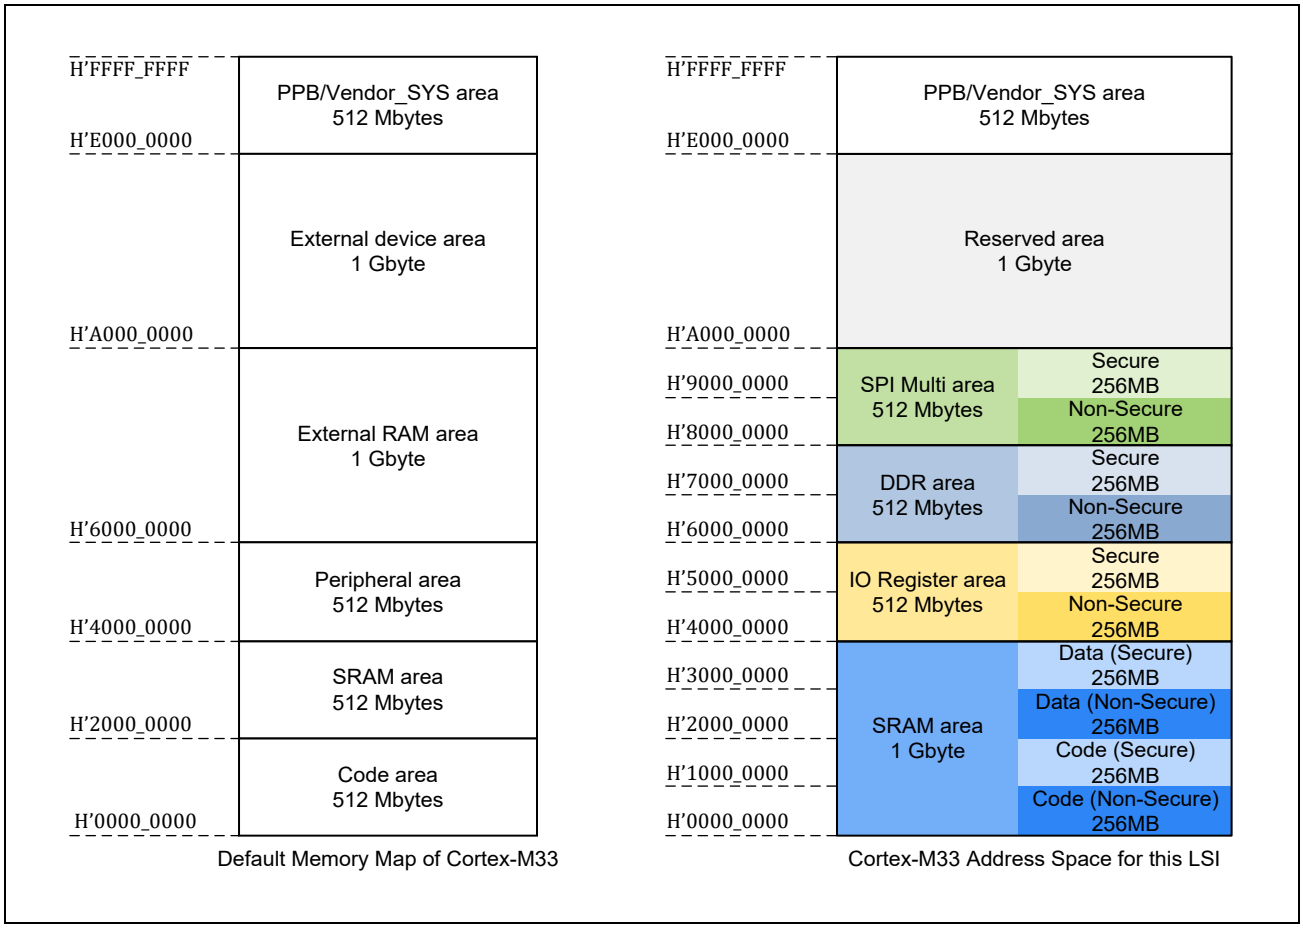

Figure 5.3 Overview of Cortex-M33 Address Space

Table 5.2 Detailed Address Space of Cortex-M33 (1/6)

| Start Address | End Address | Size | Space | Remarks |

| H'0000_0000 | H'0000_FFFF | 64 Kbytes | Reserved | *1 |

Note 1. Access to the reserved areas is prohibited.
If access to the reserved area is attempted, incorrect operation may occur.

Note 2. Access to the addresses H'6000_0000 to H'6000_001F and H'7000_0000 to H'7000_001F (for DDR3L) or H'6000_0000 to H'6000_003F and H'7000_0000 to H'7000_003F (for DDR4) in the DDR area is prohibited because these are used for DDR training. For details, see **Section 9, DDR3L/DDR4 SDRAM Memory Controller (MEMC)**.

Note 3. For details on the PPB/Vendor_SYS area, refer to "Arm Cortex-M33 Processor Technical Reference Manual".

## 5.3 Accessible Areas

In the bus system of this LSI, each bus master unit can only access the areas that are used for register access or data transfer. **Table 5.3** shows the areas that can be accessed from each master.

The register area of TZC can be accessed only when Secure (AxPROT[1] = 0).

Table 5.3 Accessible Areas (1/2)

| | Master Unit | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|

Table 5.3 Accessible Areas (2/2)

| Slave Unit | Master Unit | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Cortex-A55 | DMAC_S | DMAC_NS | Cortex-M33 [C,S-AHB] | CoreSight [AXI-AP] | CoreSight [ETR] | SDHI (ch0, ch1) | Gether (ch0, ch1) | USB2.0 (ch0, ch1) | CRU [Video, Statistics] | FCPVD | ISU |
| CoreSight | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| SYSC | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| SRAM ACPU (Reg) | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| SRAM MCPU (Reg) | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| TZC (SRAM ACPU) | ✓ | ✓ | ×*1 | ✓ | ✓ | × | × | × | × | × | × | × |
| TZC (SRAM MCPU) | ✓ | ✓ | ×*1 | ✓ | ✓ | × | × | × | × | × | × | × |
| TZC (SPI Multi I/O) | ✓ | ✓ | ×*1 | ✓ | ✓ | × | × | × | × | × | × | × |
| TZC (DDR) | ✓ | ✓ | ×*1 | ✓ | ✓ | × | × | × | × | × | × | × |
| SYC | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| GPIO | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| CPG | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| IA55 (Interrupt controller) | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| IM33 (Interrupt controller) | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| GIC | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| DDR (Control Reg) | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |
| DDR (PHY) | ✓ | ✓ | ✓ | ✓ | ✓ | × | × | × | × | × | × | × |

Note 1. Access to TZC-400 registers is prohibited because DMAC_NS is always fixed to the Non-secure state and unprivileged mode by control signals from the SYSC.

**Remarks:** ✓: Accessible path, ×: Prohibited path

**Note:** Usage of paths marked with × in the table is prohibited.
If access to such a path is attempted, incorrect operation may occur.

# 5.4 Bus System Control

## 5.4.1 Security Control

### 5.4.1.1 Re-Setting the Security Attribute Output from Bus Masters

This facility is for re-setting the security attributes of bus transactions that are by bus master units. Specifically, use the master access control register (SYS_MSTACCCTLn: n = 0 to 4) to re-set the security attributes. For details on the SYS_MSTACCCTLn register, see **Section 6.3, Register Descriptions**.

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Use the SYS_MSTACCCTLn register to make the following settings.

- Selection of security attribute source

  Selection of whether to use the unchanged values of ARPROT[1:0] or AWPROT[1:0] of the ARPROT[2:0] or AWPROT[2:0] signals, which are output from the bus master units, or to re-set ARPROT[1:0] or AWPROT[1:0] according to the settings of the SYS_MSTACCCTL register

- Value to be re-set for ARPROT[1:0] or AWPROT[1:0]

**Table 5.4** shows the relation between the registers and bits for use in re-setting the security attributes and the target masters for control.

Table 5.4 List of Register Bits for Use in Re-setting of Security Attributes

| Target Master for Control*1 | Control Register*2 | Write Access Control Bits*3,*4 | | | Read Access Control Bits*3,*5 | | |
|---|---|---|---|---|---|---|---|
| | | Bit for use in re-setting the security attributes immediately below | | Bit for use in selecting the security attribute source | Bit for use in re-setting the security attributes immediately below | | Bit for use in selecting the security attribute source |
| | | AWPROT[0] | AWPROT[1] | | ARPROT[0] | ARPROT[1] | |
| Secure DMAC | SYS_MSTACCCTL0 | Bit 0: AWPU | Bit 1: AWNS | Bit 3: AWSEL | Bit 4: ARPU | Bit 5: ARNS | Bit 7: ARSEL |
| Non-Secure DMAC*6 | SYS_MSTACCCTL0 | Bit 8: AWPU | Bit 9: AWNS | Bit 11: AWSEL | Bit 12: ARPU | Bit 13: ARNS | Bit 15: ARSEL |
| SDHI/eMMC ch0 | SYS_MSTACCCTL1 | Bit 0: AWPU | Bit 1: AWNS | Bit 3: AWSEL | Bit 4: ARPU | Bit 5: ARNS | Bit 7: ARSEL |
| SDHI ch1 | SYS_MSTACCCTL1 | Bit 8: AWPU | Bit 9: AWNS | Bit 11: AWSEL | Bit 12: ARPU | Bit 13: ARNS | Bit 15: ARSEL |
| GbEthernet ch0 | SYS_MSTACCCTL1 | Bit 16: AWPU | bit17: AWNS | Bit 19: AWSEL | Bit 20: ARPU | Bit 21: ARNS | Bit 23: ARSEL |
| GbEthernet ch1 | SYS_MSTACCCTL1 | Bit 24: AWPU | Bit 25: AWNS | Bit 27: AWSEL | Bit 28: ARPU | Bit 29: ARNS | Bit 31: ARSEL |
| USB2.0 ch0 Host*7 | SYS_MSTACCCTL2 | Bit 0: AWPU | Bit 1: AWNS | Bit 3: AWSEL | Bit 4: ARPU | Bit 5: ARNS | Bit 7: ARSEL |
| USB2.0 ch1 Host*7 | SYS_MSTACCCTL2 | Bit 8: AWPU | Bit 9: AWNS | Bit 11: AWSEL | Bit 12: ARPU | Bit 13: ARNS | Bit 15: ARSEL |
| USB2.0 ch0 Function*7 | SYS_MSTACCCTL2 | Bit 16: AWPU | Bit 17: AWNS | Bit 19: AWSEL | Bit 20: ARPU | Bit 21: ARNS | Bit 23: ARSEL |
| LCDC | SYS_MSTACCCTL3 | Bit 8: AWPU | Bit 9: AWNS | Bit 11: AWSEL | Bit 12: ARPU | Bit 13: ARNS | Bit 15: ARSEL |
| ISU*8 | SYS_MSTACCCTL4 | Bit 0: AWPU | Bit 1: AWNS | Bit 3: AWSEL | Bit 4: ARPU | Bit 5: ARNS | Bit 7: ARSEL |
| CRU (Video)*8 | SYS_MSTACCCTL4 | Bit 16: AWPU | Bit 17: AWNS | Bit 19: AWSEL | | | |

Note 1. Re-setting of security attributes for the Cortex-A55, Cortex-M33, and CoreSight bus masters is not possible.

Note 2. See **Section 6.3, Register Descriptions** for details on the registers.

Note 3. See **Section 6.3, Register Descriptions** for details on the bits.

Note 4. The values set in AWPU and AWNS are effective when the setting of the corresponding AWSEL bit is 1. For details, see the specifications of the registers in **Section 6.3, Register Descriptions**.

Note 5. The values set in ARPU and ARNS are effective when the setting of the corresponding ARSEL bit is 1. For details, see the specifications of the registers in **Section 6.3, Register Descriptions**.

Note 6. AWPU and ARPU, AWNS and ARNS, and AWSEL and ARSEL for use in control of the non-secure DMAC are respectively fixed to 1, 1, 0, 0, and 1, 1. Accordingly, access to the non-secure DMAC is always non-secure and non-privileged.

Note 7. When the setting of AWSEL for use in control of the USB2.0 module is 0, the values in AWPROT[0] and ARPROT[0] are the same as the value of HPROT[1] output from the USB2.0 module, and the values of AWPROT[1] and ARPROT[1] are always 1. For control of HPROT[1] in the USB2.0 module, see **Section 32A, USB 2.0 Host Module**. The HPROT signal is prescribed in the HB-Lite protocol. For details, see the AMBA 3 AHB-Lite Protocol Specification published by Arm Ltd.

Note 8. AWSEL and ARSEL for use in control of the ISU and CRU (video) should be set to 1. Set AWPU, AWNS, ARPU, and ARNS for the desired security attributes. Operation is not guaranteed if AWSEL and ARSEL are set to 0. For details, see the specifications of the registers in **Section 6.3, Register Descriptions**.

### 5.4.1.2 Determining the Security Levels of Bus Slaves

This facility is for enabling or disabling access to a bus slave unit by comparing the security attribute that is input to the bus slave unit in a bus transaction with the security setting of the given slave. The security level can be set in one of the following ways. The applicable way depends on the slave.

- Setting by using the SL[1:0] bits in the slave control register (SYS_SLVACCCTLn: n = 0 to 8, 10, 12 to 14)
- Setting by using the nsaid_wr_en[31:16] and nsaid_rd_en[15:0] bits in the region ID access register (REGION_ID_ACCESS_<n>: n = 0 to 2) of the TrustZone address space controller (TZC). For details on the TZC, see **Section 13, TrustZone Address Space Controller (TZC)**.

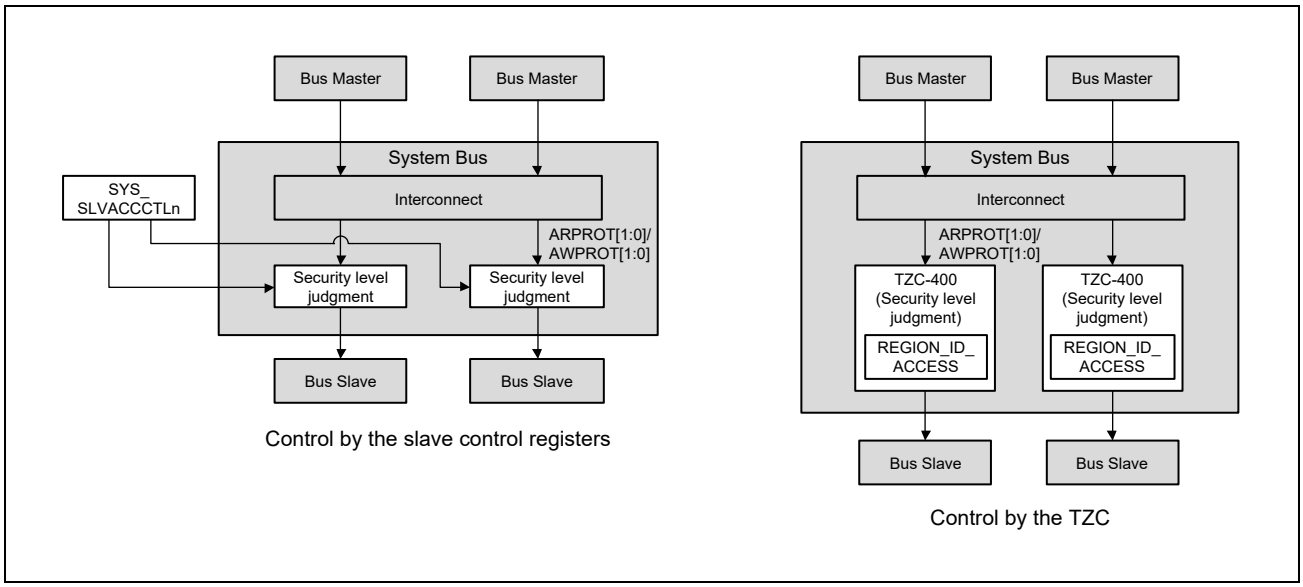

Figure 5.4 Security level determination ways

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

**Table 5.5** shows the correspondence between the settings of the slave control register and the security levels for input transactions. **Table 5.6** shows the correspondence between the settings of the region ID access register of the TZC and the security levels for input bus transactions.

If comparison indicates that access is disabled, a bus error is generated in response to the corresponding attempted bus transaction. Stopping of a slave unit is detected by reference to the module stop state (MSTOP) setting in the CPG. Attempted access to a slave unit in the module stop state leads to a bus error.

Table 5.5 Security Levels Set by Using the Slave Control Register

| Setting of SL[1:0] | Security Attribute for Input Bus Transactions | | | |
|---|---|---|---|---|
| | Non-privileged Non-secure | Privileged Non-secure | Non-privileged Secure | Privileged Secure |
| 00 | Access allowed | Access allowed | Access allowed | Access allowed |
| 01 | Access not allowed | Access allowed | Access allowed | Access allowed |
| 10 | Access not allowed | Access not allowed | Access allowed | Access allowed |
| 11 | Access not allowed | Access not allowed | Access not allowed | Access allowed |

Table 5.6 Security Levels Set by Using the TZC

| Setting of nsaid_wr_en[31:16] and nsaid_rd_en[15:0] | Security Attribute for Input Bus Transactions | | | |
|---|---|---|---|---|
| | Non-privileged Non-secure | Privileged Non-secure | Non-privileged Secure | Privileged Secure |
| H'000F | Access allowed | Access allowed | Access allowed | Access allowed |
| H'000B | Access not allowed | Access allowed | Access allowed | Access allowed |

| Registers within the SYSC to control the Low Power Mode*4 | SYS_SLVACCCTL13 | Bits [1:0] |
| General-purpose registers within the SYSC*4 | SYS_SLVACCCTL14 | Bits [1:0] |
| IPCONT registers within the SYSC | SYS_SLVACCCTL16 | Bits [1:0] |

Note 1. The security levels for the following bus slaves incorporated in this product are determined by using TZC-400. For details on the registers for controlling the security levels of these bus slaves, see **Table 5.8**.
- DDR3L and DDR4
- Memory areas of the SRAM ACU and SRAM MCPU
- Memory area, write buffer area, and control register area of SPI Multi I/O

Note 2. See **Section 6.3, Register Descriptions** for details on the registers.

Note 3. See **Section 6.3, Register Descriptions** for details on the bits.

Note 4. The SYSC has registers to control these functions. Setting of the security levels for each of the functions is possible. For details on the SYSC registers, see **Section 6.3, Register Descriptions**.

Table 5.8 Bus Slaves for which Security Levels are Determined by Using the Region ID Access Registers of the TZC

| Target Bus Slave for Control | Security Control Unit (locations of the control registers) | Control Register*1 | Control Bits*2 |
|---|---|---|---|
| DDR | TZC (DDR) | REGION_ID_ACCESS_<n> (n: 0,1,2)*3 | nsaid_wr_en[31:16], nsaid_rd_en[15:0] |
| SPI Multi I/O | TZC (SPI Multi I/O) | REGION_ID_ACCESS_0 | nsaid_wr_en[31:16], nsaid_rd_en[15:0] |
| SRAM MCPU | TZC (SRAM MCPU) | REGION_ID_ACCESS_0 | nsaid_wr_en[31:16], nsaid_rd_en[15:0] |
| SRAM ACPU | TZC (SRAM ACPU) | REGION_ID_ACCESS_0 | nsaid_wr_en[31:16], nsaid_rd_en[15:0] |

Note 1. For details on the related registers, see the Technical Reference Manual of CoreLink TZC-400 TrustZone Address Space Controller published by Arm Ltd.

Note 2. For details on the related bits, see the Technical Reference Manual of CoreLink TZC-400 TrustZone Address Space Controller published by Arm Ltd.

Note 3. REGION_ID_ACCESS_0 is for setting the security level for access to the DDR memory by using port 0 of the MEMC.
REGION_ID_ACCESS_1 is for setting the security level for access to the DDR memory by using port 1 of the MEMC.
REGION_ID_ACCESS_2 is for setting the security level for access to the DDR memory by using port 2 of the MEMC.
See **Section 13.1.2, Block Diagram** and **Figure 13.1** for the port number of the MEMC for use in access to the DDR memory from the bus masters.

## 5.4.2 Address Translation

### 5.4.2.1 34-Bit Address Space Access

This LSI has bus master units that can handle up to a 34-bit address space and bus master units that can only handle up to a 32-bit address space (actual size of 4 Gbytes). This function enables a bus master unit that can only handle up to a 32-bit address space (actual size of 4 Gbytes) to access an address space of greater than 4 Gbytes. The target bus master units are as follows.

- SDHI/eMMC
- GEthernet
- USB2.0
- DMAC
- FCPVD

This function translates bus transaction addresses that are output from a bus master unit in 1-Gbyte units according to the settings of the address offset registers (SYS_AOFn: n = 0 to 6), as shown in the figure below. For details on the SYS_AOFn register, see **Section 6.3, Register Descriptions** in **Section 6, System Controller (SYSC)**.

- In the SYS_AOF registers, set bits [33:30] of the remapping destination address in each 1-Gbyte space corresponding to bits [31:30] of the address that is output from the bus master unit.
- Select the 4-bit value of the SYS_AOF register corresponding to the upper two bits (bits [31:30]) of the 32-bit address that is output from the bus master unit.
- In the selected 4-bit value, use the lower two bits to overwrite bits [31:30] of the original address that was output from the bus master unit, and add the upper two bits as bits [33:32] to the original address.

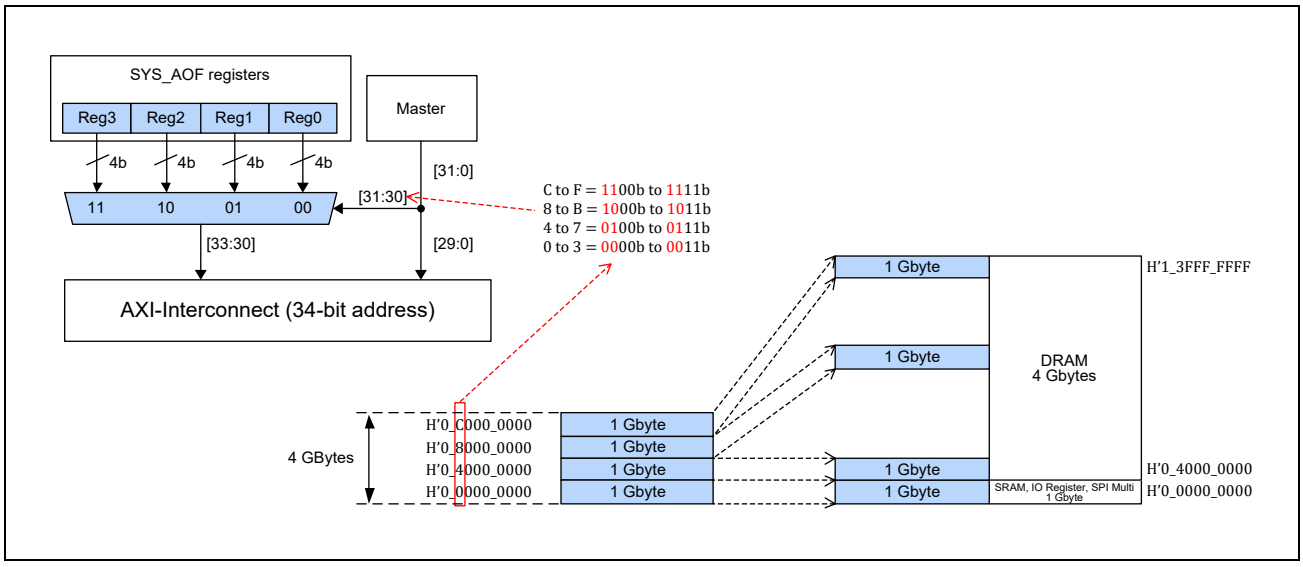

Figure 5.5 Address Space Extension (Overview)

**CAUTION**

When accessing DRAM from these bus master units, accesses that exceed a 4-Gbyte boundary are prohibited.

### 5.4.3 Bus Error Interrupt Generation

This LSI generates a bus error interrupt when any of the following conditions is met.

- A bus error is generated when access is disabled by the security setting.
- A bus error is generated when access to a slave unit in the module stop state (MSTOP) is attempted.
- A bus error is generated by a slave unit.

This function is supported for all bus master units included in this LSI.

Bus error interrupts are controlled (retained, cleared, and gathered into a single signal) by the interrupt synchronization circuits (IA55 and IM33). For details, including the types of the bus errors, see **Section 8, Interrupt Controller**.

NOTE

This function cannot distinguish between a bus error generated when access is disabled by the security setting and a bus error generated due to other causes.

In addition to the above bus error, an ERRINT interrupt is generated in any of the following cases.

- When the response to a write transaction with the bufferable attribute from the Cortex-M33 Code AHB interface is ERROR.
- When the response to a write transaction with the bufferable attribute from the Cortex-M33 System AHB interface is ERROR.

# 6. System Controller (SYSC)

## 6.1 Overview

### 6.1.1 Features

SYSC is a unit that performs system control of this LSI and has the following functions.

- Product information, external terminal state capture function
  - Management of product information of this LSI, and external terminal status
- Security control function
  - Re-setting the security attribute of transaction from each bus master
  - Judgement the security level of each bus slave (access management)
- 34-bit address space access function (see **Section 5.4.2.1, 34-Bit Address Space Access** for details)
  - If the bus master address is 32bit, do a 2bit extension to access the 34bit address space
- Low power consumption control (see **Section 42, Low Power Mode** for details)
  - Control the transition of this LSI to each mode of low power consumption
  - Setting cancellation conditions and confirming factors at the time of cancellation
- WDT stop control
  - Control WDT stop from CoreSight
  - Stop control of specified channel of WDT from CPU

### 6.1.2 Block Diagram of SYSC

The block diagram of SYSC is shown in **Figure 6.1**.

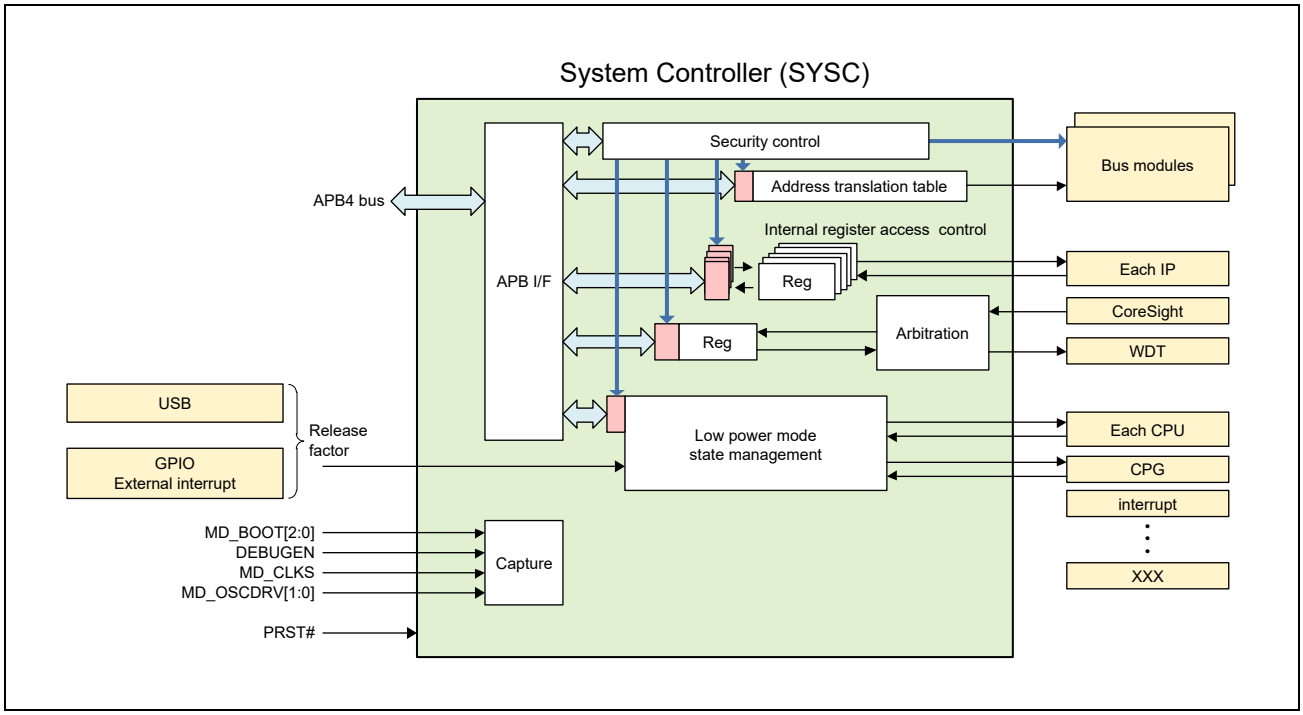

Figure 6.1 SYSC Block Diagram

## 6.2 Register Configuration

**Table 6.1** shows the register configuration of SYSC. The address of the SYSC register is represented by the offset address from the base address. SYSC base address is as follows:

SYSC base address: H'0_1102_0000 (Overall Address Space)
SYSC base address: H'5102_0000 (Cortex-M33 Address Space Secure)
SYSC base address: H'4102_0000 (Cortex-M33 Address Space Non-Secure)

Table 6.1 SYSC Register Configuration (1/2)

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| Master Access Control Register0 | SYS_MSTACCCTL0 | R/W | H'00AA_AA00 | H'0000 | 32 |

| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | ISU_ARSEL | 1 | R/W | ISU read access security attributed source selection*1<br>Always write the initial value of 1 for this register. Operation is not guaranteed when 0 is written.<br>0: Setting prohibited<br>1: ISU_ARPU is selected for ARPROT[0], and ISU_ARNS is selected for ARPROT[1]. |
| 6 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 | ISU_ARNS | 1 | R/W | ISU read access secure attribute*1<br>0: Secure<br>1: Non-secure |
| 4 | ISU_ARPU | 0 | R/W | ISU read access privilege attribute*1<br>0: Non-privileged access<br>1: Privileged access |
| 3 | ISU_AWSEL | 1 | R/W | ISU write access security attribute source selection*1<br>Always write the initial value of 1 for this register. Operation is not guaranteed when 0 is written.<br>0: Setting prohibited<br>1: ISU_AWPU is selected for AWPROT[0], and ISU_AWNS is selected for AWPROT[1]. |
| 2 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | ISU_AWNS | 1 | R/W | ISU write access secure attribute*1<br>0: Secure<br>1: Non-secure |
| 0 | ISU_AWPU | 0 | R/W | ISU write access privilege attribute*1<br>0: Non-privileged access<br>1: Privileged access |

Note 1. This register setting is prohibited changing the setting while the target master is operating. Change it before the master initiates access.

### 6.3.6 Slave Access Control Register 0 (SYS_SLVACCCTL0)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the SRAM ACPU (Reg) and SRAM MCPU (Reg).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 6.3.7 Slave Access Control Register 1 (SYS_SLVACCCTL1)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the DMAC, MHU, GPIO, IA55/IM33, GIC, SYC, SYSC, CPG, CoreSight and TZC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 23, 22 | DDR_SL | 00b | R/W | DDR <Reg> slave access permission control<br>Set the security level SL [1:0] for the slave DDR <Reg>. |
| 21 to 18 | — | 0000b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 17, 16 | POE3_SL | 00b | R/W | POE3 slave access permission control<br>Set the security level SL [1:0] for the slave POE3. |
| 15, 14 | MTU3A_SL | 00b | R/W | MTU3a slave access permission control<br>Set the security level SL [1:0] for the slave MTU3a. |
| 13, 12 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 11, 10 | WDT2_SL | 00b | R/W | WDT channel 2 slave access permission control<br>Set the security level SL [1:0] for the slave WDT channel 2. |
| 9, 8 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 7, 6 | WDT0_SL | 00b | R/W | WDT channel 0 slave access permission control<br>Set the security level SL [1:0] for the slave WDT channel 0. |
| 5, 4 | OSTM2_SL | 00b | R/W | GTM channel 2 slave access permission control<br>Set the security level SL [1:0] for the slave GTM channel 2. |
| 3, 2 | OSTM1_SL | 00b | R/W | GTM channel 1 slave access permission control<br>Set the security level SL [1:0] for the slave GTM channel 1. |
| 1, 0 | OSTM0_SL | 10b | R/W | GTM channel 0 slave access permission control<br>Set the security level SL [1:0] for the slave GTM channel 0. |

### 6.3.9 Slave Access Control Register 3 (SYS_SLVACCCTL3)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the CRU, ISU, LCD Controller, USB2.0, SDHI/eMMC and GbEthernet.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31, 30 | IRDA_SL | 00b | R | SCI channel 0 (IrDA) slave access permission control<br>Set the security level SL [1:0] for the slave SCI channel 0 (IrDA). |
| 29, 28 | SCI1_SL | 00b | R/W | SCI channel 1 slave access permission control<br>Set the security level SL [1:0] for the slave SCI channel 1. |
| 27, 26 | SCI0_SL | 00b | R/W | SCI channel 0 slave access permission control<br>Set the security level SL [1:0] for the slave SCI channel 0. |
| 25, 24 | SCIF4_SL | 00b | R/W | SCIF channel 4 slave access permission control<br>Set the security level SL [1:0] for the slave SCIF channel 4. |
| 23, 22 | SCIF3_SL | 00b | R/W | SCIF channel 3 slave access permission control<br>Set the security level SL [1:0] for the slave SCIF channel 3. |
| 21, 20 | SCIF2_SL | 00b | R/W | SCIF channel 2 slave access permission control<br>Set the security level SL [1:0] for the slave SCIF channel 2. |
| 19, 18 | SCIF1_SL | 00b | R/W | SCIF channel 1 slave access permission control<br>Set the security level SL [1:0] for the slave SCIF channel 1. |
| 17, 16 | SCIF0_SL | 00b | R/W | SCIF channel 0 slave access permission control<br>Set the security level SL [1:0] for the slave SCIF channel 0. |
| 15 to 12 | — | H'0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11, 10 | RSPI_SL | 00b | R/W | RSPI slave access permission control<br>Set the security level SL [1:0] for the slave RSPI. RSPI has a common security level for channel 0 to channel 2. |
| 9, 8 | CANFD_SL | 00b | R/W | CANFD slave access permission control<br>Set the security level SL [1:0] for the slave CANFD. |
| 7, 6 | I2C3_SL | 00b | R/W | I2C channel 3 slave access permission control<br>Set the security level SL [1:0] for the slave I2C channel 3. |
| 5, 4 | I2C2_SL | 00b | R/W | I2C channel 2 slave access permission control<br>Set the security level SL [1:0] for the slave I2C channel 2. |
| 3, 2 | I2C1_SL | 00b | R/W | I2C channel 1 slave access permission control<br>Set the security level SL [1:0] for the slave I2C channel 1. |
| 1, 0 | I2C0_SL | 00b | R/W | I2C channel 0 slave access permission control<br>Set the security level SL [1:0] for the slave I2C channel 0. |

### 6.3.11 Slave Access Control Register 5 (SYS_SLVACCCTL5)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the SSIF.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SSIF_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5, 4 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 3, 2 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | SSIF_SL | 00b | R/W | SSIF slave access permission control<br>Set the security level SL [1:0] for the slave SSIF. SSIF has a common security level for channel 0 to channel 3. |

### 6.3.12 Slave Access Control Register 6 (SYS_SLVACCCTL6)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the ADC and TSU.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | TSU_SL | | ADC_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3, 2 | TSU_SL | 00b | R/W | TSU slave access permission control<br>Set the security level SL [1:0] for the slave TSU. |
| 1, 0 | ADC_SL | 00b | R/W | ADC slave access permission control<br>Set the security level SL [1:0] for the slave ADC. |

### 6.3.13 Slave Access Control Register 7 (SYS_SLVACCCTL7)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the OTP.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

### 6.3.14 Slave Access Control Register 8 (SYS_SLVACCCTL8)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the Cortex-A55 control register and Cortex-M33 control register in SYSC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 3, 2 | CA55_SL | 00b | R/W | SYSC <Cortex-A55 Control Reg> slave access permission control<br>Set the security level SL [1:0] for the Cortex-A55 control register in SYSC. |
| 1, 0 | CM33_SL | 00b | R/W | SYSC <Cortex-M33 Control Reg> slave access permission control<br>Set the security level SL [1:0] for the Cortex-M33 control register in SYSC. |

### 6.3.15 Slave Access Control Register 10 (SYS_SLVACCCTL10)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the LSI control register in SYSC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LSI_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | LSI_SL | 00b | R/W | SYSC <LSI Control Reg> slave access permission control<br>Set the security level SL [1:0] for the LSI control register in SYSC. |

### 6.3.16 Slave Access Control Register 12 (SYS_SLVACCCTL12)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the AOF control register in SYSC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | AOF_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | AOF_SL | 00b | R/W | SYSC <AOF Control Reg> slave access permission control<br>Set the security level SL [1:0] for the AOF control register in SYSC. |

### 6.3.17 Slave Access Control Register 13 (SYS_SLVACCCTL13)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the Low Power Mode control register in SYSC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LP_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | LP_SL | 00b | R/W | SYSC <Low Power Mode Control Reg> slave access permission control<br>Set the security level SL [1:0] for the Low Power Mode control register in SYSC. |

### 6.3.18 Slave Access Control Register 14 (SYS_SLVACCCTL14)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the general-purpose register in SYSC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GPREG_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | GPREG_SL | 00b | R/W | SYSC <GPREG> slave access permission control<br>Set the security level SL [1:0] for the General purpose register(GPREG) in SYSC. |

### 6.3.19 Slave Access Control Register 16 (SYS_SLVACCCTL16)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the general purpose register in SYSC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IPCONT_SL | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | IPCONT_SL | 00b | R/W | SYSC <IPCONT> slave access permission control<br>Set the security level SL [1:0] for the General purpose register(IPCONT) in SYSC. |

### 6.3.20 ECCRAM0 ECC Setting Register (SYS_RAM0_ECC)

This register is a register that enables and disables the ECC function of ECCRAM0 (SRAM ACPU).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | VECCEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | VECCEN | 0 | R/W | Set enable or disable error correction for ECCRAM0 (SRAM ACPU)<br>0: ECC function disabled<br>1: ECC function enabled |

### 6.3.21 ECCRAM0 Access Control Register (SYS_RAM0_EN)

This register is a register that controls access to ECCRAM0 (SRAM ACPU).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | VLWEN | VCEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | VLWEN | 1 | R/W | Set enable or disable writes to ECRAM0 (SRAM ACPU)<br>0: Write disabled<br>1: Write enabled |
| 0 | VCEN | 1 | R/W | Set enable or disable access to ECRAM0 (SRAM ACPU)<br>0: Access disabled<br>1: Access enabled |

### 6.3.22 ECCRAM1 ECC Setting Register (SYS_RAM1_ECC)

This register is a register that enables and disables the ECC function of ECCRAM1 (SRAM MCPU).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | VECCEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | VECCEN | 0 | R/W | Set enable or disable error correction for ECCRAM1 (SRAM MCPU)<br>0: ECC function disabled<br>1: ECC function enabled |

### 6.3.23 ECCRAM1 Access Control Register (SYS_RAM1_EN)

This register is the register that controls access to ECCRAM1 (SRAM M CPU).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | VLWEN | VCEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | VLWEN | 1 | R/W | Set enable or disable writes to ECCRAM1 (SRAM MCPU)<br>0: Write disabled<br>1: Write enabled |
| 0 | VCEN | 1 | R/W | Set enable or disable access to ECRAM1 (SRAM MCPU)<br>0: Access disabled<br>1: Access enabled |

### 6.3.24 WDT0 Control Register (SYS_WDT0_CTRL)

This register is the register that set the count control of WDT0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | WDTSTOPMASK |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | WDTSTOP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | WDTSTOPMASK | 1 | R/W | Controls the stop function of WDT0 (for Cortex-A55 Core0) from CoreSight during debugging.<br>0: Stops WDT0 counting during debugging.<br>1: Not stop WDT0 counting during debugging. |
| 15 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 0 | WDTSTOP | 0 | R/W | Set whether the WDT0 (for Cortex-A55 Core0) counter is forced to stop<br>0: Continue counting<br>1: Stop counting and hold the counter value |

### 6.3.25 WDT2 Control Register (SYS_WDT2_CTRL)

This register is the register that set the count control of WDT2.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | WDTSTOPMASK |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | WDTSTOP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | WDTSTOPMASK | 1 | R/W | Controls the stop function of WDT2 (for Cortex-M33) from CoreSight during debugging.<br>0: Stops WDT2 counting during debugging.<br>1: Not stop WDT2 counting during debugging. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | WDTSTOP | 0 | R/W | Set whether the WDT2 (for Cortex-M33) counter is forced to stop<br>0: Continue counting<br>1: Stop counting and hold the counter value |

### 6.3.26 GEther0 Config Register (SYS_GETH0_CFG)

This register is the register that indicates the state of Ether ch0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | FEC_GIGA_ENABLE | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 24 | FEC_GIGA_ENABLE | 0 | R | Indicates the mode of speed for Ether ch0<br>0: 100M/1Mbps mod<br>1: 1Gbps mode |
| 23 to 0 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

## 6.3.27 GEther1 Config Register (SYS_GETH1_CFG)

This register is the register that indicates the state of Ether ch1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | FEC_GIGA_ENABLE | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 24 | FEC_GIGA_ENABLE | 0 | R | Indicates the mode of speed for Ether ch1<br>0: 100M/1Mbps mode<br>1: 1Gbps mode |
| 23 to 0 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

## 6.3.28 I2C0 Config Register (SYS_I2C0_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | af_bypass |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | af_bypass | 0 | R/W | Set whether to bypass the analog filter for noise removal for the input terminals (RIIC0_SDA, RIIC0_SCL) of I2C ch0.<br>0: Noise reduction is performed using an analog filter for the input signal.<br>1: The input signal is bypassed an analog filter and noise reduction is not performed. |

## 6.3.29 I2C1 Config Register (SYS_I2C1_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | af_bypass |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | af_bypass | 0 | R/W | Set whether to bypass the analog filter for noise removal for the input terminals (RIIC1_SDA, RIIC1_SCL) of I2C ch1.<br>0: Noise reduction is performed using an analog filter for the input signal.<br>1: The input signal is bypassed an analog filter and noise reduction is not performed. |

## 6.3.30 I2C2 Config Register (SYS_I2C2_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch2.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | af_bypass |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | af_bypass | 0 | R/W | Set whether to bypass the analog filter for noise removal for the input terminals (RIIC2_SDA, RIIC2_SCL) of I2C ch2.<br>0: Noise reduction is performed using an analog filter for the input signal.<br>1: The input signal is bypassed an analog filter and noise reduction is not performed. |

### 6.3.31 I2C3 Config Register (SYS_I2C3_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch3.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | af_bypass |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | af_bypass | 0 | R/W | Set whether to bypass the analog filter for noise removal for the input terminals (RIIC3_SDA, RIIC3_SCL) of I2C ch3.<br>0: Noise reduction is performed using an analog filter for the input signal.<br>1: The input signal is bypassed an analog filter and noise reduction is not performed. |

### 6.3.32 CM33 Config Register0 (SYS_CM33_CFG0)

This register is the register that set the secure Systick of Cortex-M33.

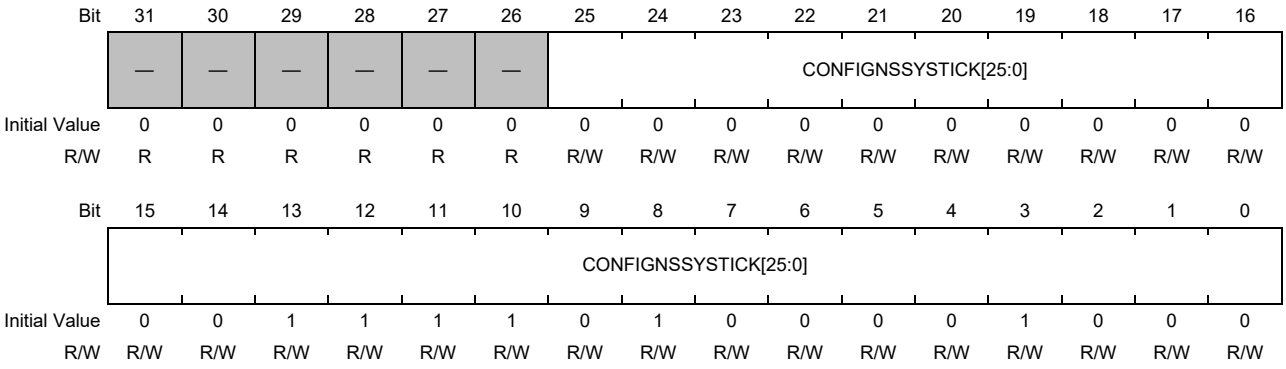
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CONFIGSSYSTICK[25:0] | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CONFIGSSYSTICK[25:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25 to 0 | CONFIGSSYSTICK[25:0] | H'000_3D08 | R/W | Configuration register for secure Systick.<br>The value must be determined before the cold reset of Cortex-M33 is released. See the Cortex-M33 chapter for more information on settings. |

### 6.3.33 CM33 Config Register1 (SYS_CM33_CFG1)

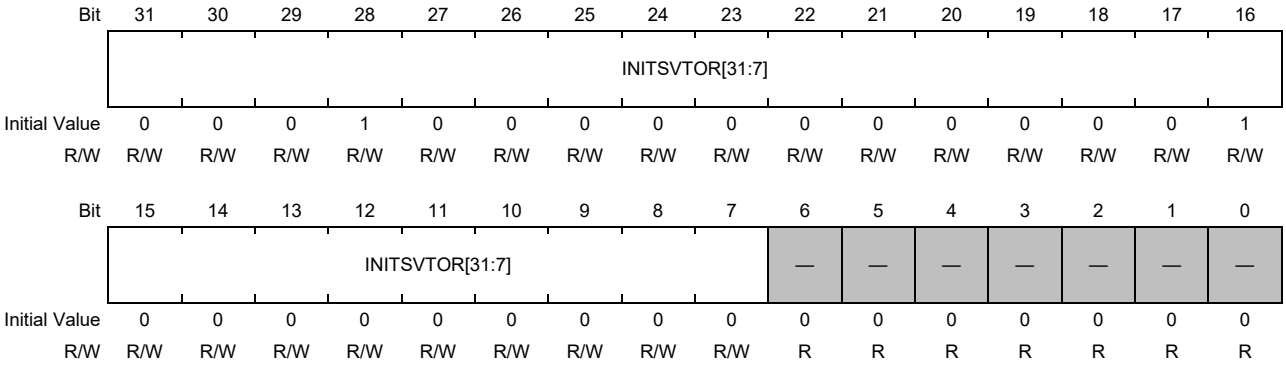
This register is the register that set cortex-M33 non-secure Systick.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25 to 0 | CONFIGNSSYSTICK[25:0] | H'000_3D08 | R/W | Configuration register for non-secure Systick.<br>The value must be determined before the cold reset of Cortex-M33 is released. See the Cortex-M33 chapter for more information on settings. |

### 6.3.34 CM33 Config Register2 (SYS_CM33_CFG2)

This register is the register that set the secure vector address of Cortex-M33.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 7 | INITSVTOR[31:7] | H'020_0200 | R/W | A register that indicates the secure vector address.<br>The address value must be determined before the Cortex-M33 cold reset is released. |
| 6 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 6.3.35 CM33 Config Register3 (SYS_CM33_CFG3)

This register is the register that set the non-secure vector address of Cortex-M33.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | INITNSVTOR[31:7] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | INITNSVTOR[31:7] | | | | | | | | | — | — | — | — | — | — | — |
| Initial Value | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 7 | INITNSVTOR[31:7] | H'000_0300 | R/W | A register that indicates the non-secure vector address.<br>The address value must be determined before the Cortex-M33 cold reset is released. |
| 6 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 6.3.36 CM33 Lock Register (SYS_CM33_LOCK)

This register is a register that set the vector-address change permission of Cortex-M33.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LOCKNSVTOR | LOCKSVTAIRCR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1 | LOCKNSVTOR | 0 | R/W | Control the non-secure vector address change permission.<br>0: Changeable<br>1: Cannot be changed |
| 0 | LOCKSVTAIRCR | 0 | R/W | Control changing permission of the Secure Vector address, and the PRIS bit and the BFHFNMINS bit of the AIRCR register of Cortex-M33.<br>0: Changeable<br>1: Cannot be changed |

## 6.3.37 CA55 Core0 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL0)

This register is a register that set the reset vector address of Cortex-A55 core0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RVBARADDRL0[31:2] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RVBARADDRL0[31:2] | | | | | | | | | | | | | | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | RVBARADDRL0[31: 2] | H'0000_0000 | R/W | Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core0.<br>When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **Section 2, System CPU Cortex-A55** for the sequence of each reset. |
| 1, 0 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

## 6.3.38 CA55 Core0 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH0)

This register is a register that set the reset vector address of Cortex-A55 core0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RVBARADDRH0[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 0 | RVBARADDRH0[7:0] | H'00 | R/W | Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core0.<br>When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **Section 2, System CPU Cortex-A55** for the sequence of each reset. |

### 6.3.39 LSI Mode Signal Register (SYS_LSI_MODE)

This register indicates the state of the MD_BOOT terminal, the DEBUGEN terminal, the MD_CLKS terminal, and the MD_OSCDRV terminal.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STAT_SEC_EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | STAT_MD_OSCDRV[1:0] | | — | STAT_MD_CLKS | — | — | STAT_DEBUGEN | — | — | — | — | — | — | STAT_MD_BOOT[2:0] | | |
| Initial Value | — | — | 0 | — | 0 | 0 | — | 0 | 0 | 0 | 0 | 0 | 0 | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | STAT_SEC_EN | — | R | Indicates whether this LSI support the security function or not.<br>0: Not supported<br>1: Available |
| 15, 14 | STAT_MD_OSCDRV[1:0] | — | R | Indicates the terminal state of the external terminal MD_OSCDRV[1:0].<br>The value is updated at the rising edge of PRST#.<br>If a reset occurs inside the LSI, this register is not updated. |
| 13 | — | 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | STAT_MD_CLKS | — | R | Indicates the terminal state of the external terminal MD_CLKS.<br>The value is updated at the rising edge of PRST#.<br>If a reset occurs inside the LSI, this register is not updated. |
| 11, 10 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 | STAT_DEBUGEN | — | R | Indicates the terminal state of the external terminal DEBUGEN.<br>The value is updated at the rising edge of PRST#.<br>If a reset occurs inside the LSI, this register is not updated. |
| 8 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |

### 6.3.40 LSI Device ID Register (SYS_LSI_DEVID)

This register indicates the product specific device ID.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DEV_ID[31:28] | | | | DEV_ID[27:0] | | | | | | | | | | | |
| Initial Value | — | — | — | — | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DEV_ID[27:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | DEV_ID [31:28] | — | R | Indicates the product revision. |
| 27 to 0 | DEV_ID[27:0] | H'845_04 47 | R | Indicates the product specific fixed value.<br>*Note*: RZ/G2UL Type1 and RZ/G2UL Type2 are the same value.<br>If identification between Type1 and Type2 is needed, read the value of address H'0_1186_1178.<br>The value is below.<br>H'0000_0000: RZ/G2UL Type1<br>H'0000_0001: RZ/G2UL Type2 |

### 6.3.41 LSI Product Register (SYS_LSI_PRR)

This register indicates information about product options.

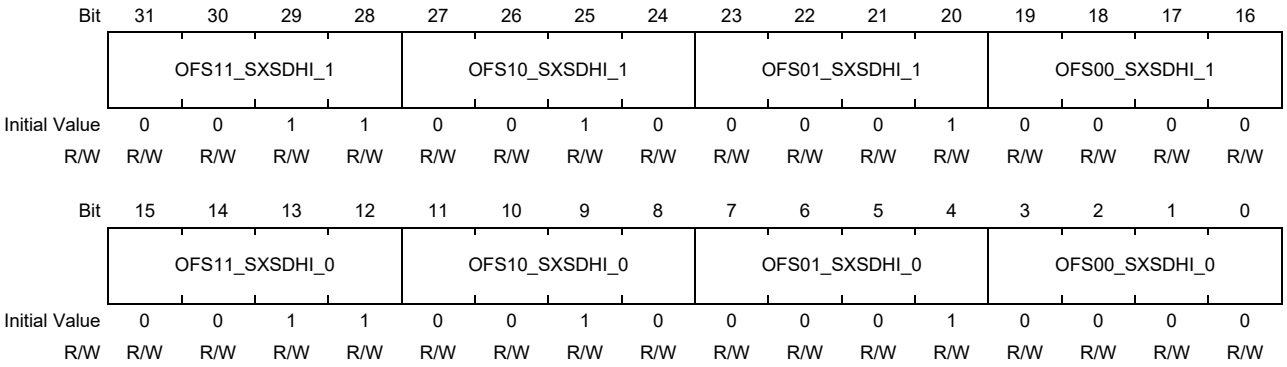
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 | 0 | 0 | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | — | 0 | 0 | 0 | — | 0 | 0 | 0 | — | 0 | 0 | 0 | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 19 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 11 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 3 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | — | — | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |

## 6.3.42 Address Offset Register0 (SYS_AOF0)

This register is an address offset register for accessing the 34-bit address space from SD ch0/ch1.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | OFS11_SXSDHI_1 | 0011b | R/W | Conversion value to address [33:30] when SD ch1 address [31:30] = 11*1 |
| 27 to 24 | OFS10_SXSDHI_1 | 0010b | R/W | Conversion value to address [33:30] when SD ch1 address [31:30] = 10*1 |
| 23 to 20 | OFS01_SXSDHI_1 | 0001b | R/W | Conversion value to address [33:30] when SD ch1 address [31:30] = 01*1 |
| 19 to 16 | OFS00_SXSDHI_1 | 0000b | R/W | Conversion value to address [33:30] when SD ch1 address [31:30] = 00*1 |
| 15 to 12 | OFS11_SXSDHI_0 | 0011b | R/W | Conversion value to address [33:30] when SD ch0 address [31:30] = 11*1 |
| 11 to 8 | OFS10_SXSDHI_0 | 0010b | R/W | Conversion value to address [33:30] when SD ch0 address [31:30] = 10*1 |
| 7 to 4 | OFS01_SXSDHI_0 | 0001b | R/W | Conversion value to address [33:30] when SD ch0 address [31:30] = 01*1 |
| 3 to 0 | OFS00_SXSDHI_0 | 0000b | R/W | Conversion value to address [33:30] when SD ch0 address [31:30] = 00*1 |

Note 1. Master SD ch0/ch1 are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

### 6.3.43 Address Offset Register1 (SYS_AOF1)

This register is an address offset register for accessing the 34-bit address space from Ether ch0/ch1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OFS11_SXGIGE_1 | | | | OFS10_SXGIGE_1 | | | | OFS01_SXGIGE_1 | | | | OFS00_SXGIGE_1 | | | |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

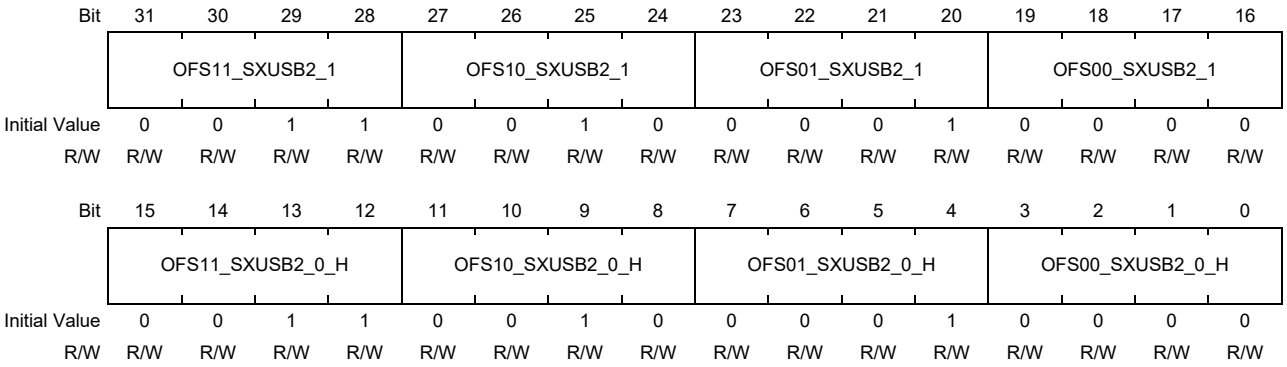
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OFS11_SXGIGE_0 | | | | OFS10_SXGIGE_0 | | | | OFS01_SXGIGE_0 | | | | OFS00_SXGIGE_0 | | | |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | OFS11_SXGIGE_1 | 0011b | R/W | Conversion value to address [33:30] when Ether ch1 address [31:30] = 11*1 |
| 27 to 24 | OFS10_SXGIGE_1 | 0010b | R/W | Conversion value to address [33:30] when Ether ch1 address [31:30] = 10*1 |
| 23 to 20 | OFS01_SXGIGE_1 | 0001b | R/W | Conversion value to address [33:30] when Ether ch1 address [31:30] = 01*1 |
| 19 to 16 | OFS00_SXGIGE_1 | 0000b | R/W | Conversion value to address [33:30] when Ether ch1 address [31:30] = 00*1 |
| 15 to 12 | OFS11_SXGIGE_0 | 0011b | R/W | Conversion value to address [33:30] when Ether ch0 address [31:30] = 11*1 |
| 11 to 8 | OFS10_SXGIGE_0 | 0010b | R/W | Conversion value to address [33:30] when Ether ch0 address [31:30] = 10*1 |
| 7 to 4 | OFS01_SXGIGE_0 | 0001b | R/W | Conversion value to address [33:30] when Ether ch0 address [31:30] = 01*1 |
| 3 to 0 | OFS00_SXGIGE_0 | 0000b | R/W | Conversion value to address [33:30] when Ether ch0 address [31:30] = 00*1 |

Note 1. Master Ether ch0/ch1 are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

### 6.3.44 Address Offset Register2 (SYS_AOF2)

This register is an address offset register for accessing the 34-bit address space from USB2.0 ch0/ch1 Host.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | OFS11_SXUSB2_1 | 0011b | R/W | Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 11*1 |
| 27 to 24 | OFS10_SXUSB2_1 | 0010b | R/W | Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 10*1 |
| 23 to 20 | OFS01_SXUSB2_1 | 0001b | R/W | Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 01*1 |
| 19 to 16 | OFS00_SXUSB2_1 | 0000b | R/W | Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 00*1 |
| 15 to 12 | OFS11_SXUSB2_0_H | 0011b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 11*1 |
| 11 to 8 | OFS10_SXUSB2_0_H | 0010b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 10*1 |
| 7 to 4 | OFS01_SXUSB2_0_H | 0001b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 01*1 |
| 3 to 0 | OFS00_SXUSB2_0_H | 0000b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 00*1 |

Note 1. Master USB2.0 ch0/ch1 Host are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

### 6.3.45 Address Offset Register3 (SYS_AOF3)

This register is an address offset register for accessing the 34-bit address space from USB2.0 ch0 Function.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OFS11_SXUSB2_0_F | | | | OFS10_SXUSB2_0_F | | | | OFS01_SXUSB2_0_F | | | | OFS00_SXUSB2_0_F | | | |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 12 | OFS11_SXUSB2_0_F | 0011b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 11*1 |
| 11 to 8 | OFS10_SXUSB2_0_F | 0010b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 10*1 |
| 7 to 4 | OFS01_SXUSB2_0_F | 0001b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 01*1 |
| 3 to 0 | OFS00_SXUSB2_0_F | 0000b | R/W | Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 00*1 |

Note 1. Master USB2.0 ch0 Function is the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

### 6.3.46 Address Offset Register4 (SYS_AOF4)

This register is an address offset register for accessing the 34-bit address space from LCDC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OFS11_SXLCDC | | | | OFS10_SXLCDC | | | | OFS01_SXLCDC | | | | OFS00_SXLCDC | | | |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | 0011 0010 0001 0000b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 15 to 12 | OFS11_SXLCDC | 0011b | R/W | Conversion value to address [33:30] when LCDC address [31:30] = 11*1 |
| 11 to 8 | OFS10_SXLCDC | 0010b | R/W | Conversion value to address [33:30] when LCDC address [31:30] = 10*1 |
| 7 to 4 | OFS01_SXLCDC | 0001b | R/W | Conversion value to address [33:30] when LCDC address [31:30] = 01*1 |
| 3 to 0 | OFS00_SXLCDC | 0000b | R/W | Conversion value to address [33:30] when LCDC address [31:30] = 00*1 |

Note 1. Master LCDC is the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

### 6.3.47 Address Offset Register6 (SYS_AOF6)

This register is an address offset register for accessing the 34-bit address space from Secure/Non-Secure DMAC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OFS11_SXDMAC_NS | | | | OFS10_SXDMAC_NS | | | | OFS01_SXDMAC_NS | | | | OFS00_SXDMAC_NS | | | |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OFS11_SXDMAC_S | | | | OFS10_SXDMAC_S | | | | OFS01_SXDMAC_S | | | | OFS00_SXDMAC_S | | | |
| Initial Value | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | OFS11_SXDMAC_NS | 0011b | R/W | Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 11*1 |
| 27 to 24 | OFS10_SXDMAC_NS | 0010b | R/W | Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 10*1 |
| 23 to 20 | OFS01_SXDMAC_NS | 0001b | R/W | Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 01*1 |
| 19 to 16 | OFS00_SXDMAC_NS | 0000b | R/W | Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 00*1 |
| 15 to 12 | OFS11_SXDMAC_S | 0011b | R/W | Conversion value to address [33:30] when Secure DMAC address [31:30] = 11*1 |
| 11 to 8 | OFS10_SXDMAC_S | 0010b | R/W | Conversion value to address [33:30] when Secure DMAC address [31:30] = 10*1 |
| 7 to 4 | OFS01_SXDMAC_S | 0001b | R/W | Conversion value to address [33:30] when Secure DMAC address [31:30] = 01*1 |
| 3 to 0 | OFS00_SXDMAC_S | 0000b | R/W | Conversion value to address [33:30] when Secure DMAC address [31:30] = 00*1 |

Note 1. Master Secure/Non-Secure DMAC are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

## 6.3.48 SYS_LP_CTL1

This register is a register that requests the transition to low power consumption mode and confirms the status.

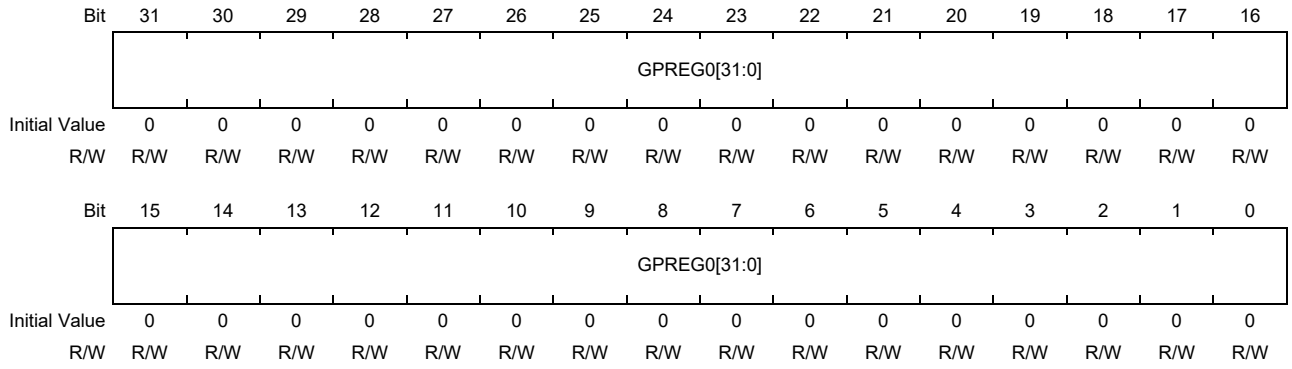
## 6.3.57 General Register0 (SYS_GPREG_0)

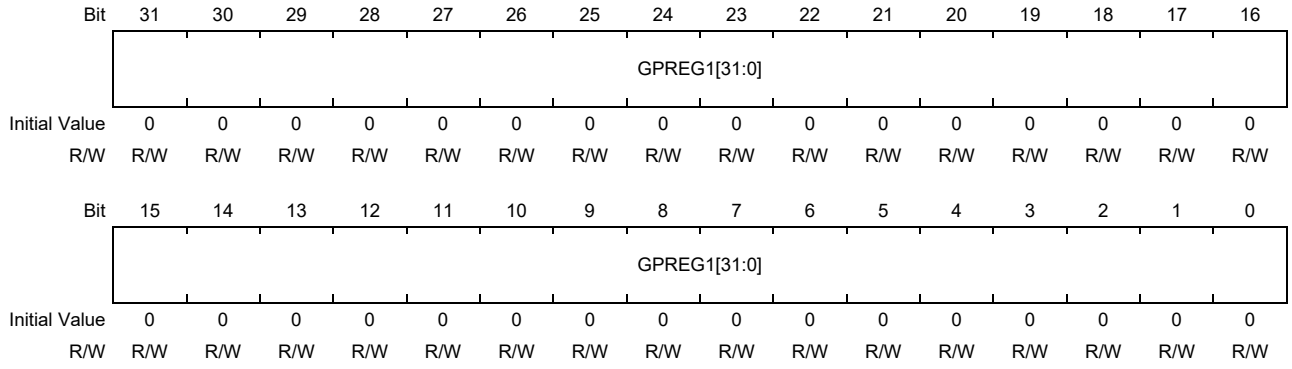
This register is a general-purpose register.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | GPREG0 [31:0] | H'0000_0000 | R/W | General-purpose register 0<br>It is a 32-bit register.<br>It is possible to write any value, read the written value. |

## 6.3.58 General Register1 (SYS_GPREG_1)

This register is a general-purpose register.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | GPREG1 [31:0] | H'0000_0000 | R/W | General-purpose register 1<br>It is a 32-bit register.<br>It is possible to write any value, read the written value. |

## 6.3.59 General Register2 (SYS_GPREG_2)

This register is a general-purpose register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GPREG2[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GPREG2[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | GPREG2 [31:0] | H'0000_0000 | R/W | General-purpose register 2<br>It is a 32-bit register.<br>It is possible to write any value, read the written value. |

## 6.3.60 General Register3 (SYS_GPREG_3)

This register is a general-purpose register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GPREG3[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GPREG3[31:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | GPREG3 [31:0] | H'0000_0000 | R/W | General-purpose register 3<br>It is a 32-bit register.<br>It is possible to write any value, read the written value. |

# 6.4 Operation

## 6.4.1 External Terminal State Capture Function

Captures the state of the following four external terminals at the rising edge of PRST# terminal and holds them into the SYS_LSI_MODE register. The value is not updated by a reset that occurs inside the LSI.

- MD_BOOT[2:0]
- DEBUGEN
- MD_CLKS
- MD_OSCDRV[1:0]

## 6.4.2 WDT Stop Control Function

By writing 1 to the WDTSTOP bit of the SYS_WDTn_CTRL register (n: 0, 2), the following WDT corresponding to n is forcibly stopped and the count value is retained.

Also, by writing 1 to the WDTSTOPMASK bit of the SYS_WDTn_CTRL register (n: 0, 2), the following WDT count corresponding to n can be continued even during debugging. If 0 is written, the WDT count will stop during debugging.

| n | Stop WDT |
|---|---|
| 0 | WDT0 (for Cortex-A55 core0) |
| 2 | WDT2 (for Cortex-M33) |

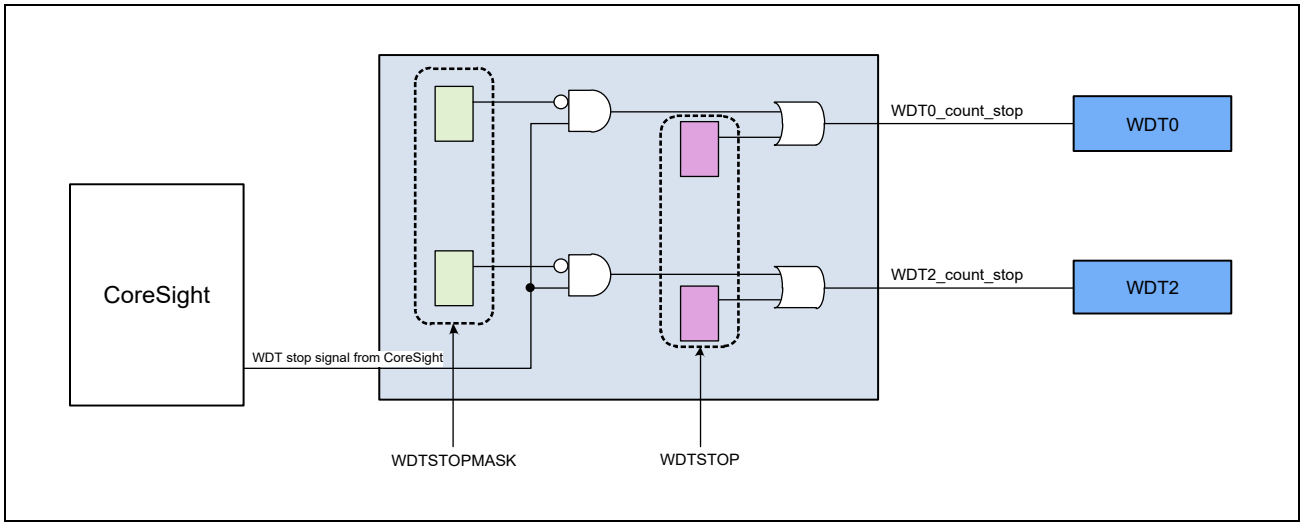


Figure 6.2 Overview of WDT Stop Function

# 7. Clock Pulse Generator (CPG)

This chapter describes the functions of the clock pulse generator module (CPG).

## 7.1 Features

### 7.1.1 Overview

**Table 7.1** provides a list of CPG features.

Table 7.1 List of functions

| Features | Specification |
|---|---|
| PLL control | • SSCG control, PLL multiplication factor setting, and ON/OFF control are performed by register setting.<br>• This LSI is equipped with 6 PLLs. The roles of each are as follows:<br>– PLL1 (SSCG-PLL: Default SSCG ON): Cortex-A55 only<br>– PLL2 (SSCG-PLL: Default SSCG OFF): For SYSTEM-BUS & Module (no SSCG)<br>– PLL3 (SSCG-PLL: Default SSCG ON): For SYSTEM-BUS & Module (SSCG Yes)<br>– PLL4 (SSCG-PLL: Default SSCG ON): DDR-SDRAM Only<br>– PLL5 (SSCG-PLL: Default SSCG ON): Video-Out (LCDC) / Gigabit Ethernet Interface<br>– PLL6 (SSCG-PLL: Default SSCG OFF): Gigabit Ethernet Interface<br>• Initial value of SSCG for each PLL (PLL3 is fixed):<br>– Fmod: 31.25kHz<br>– Spread: Down spread<br>– Modulation Depth: 2.25% (PLL1, PLL4 and, PLL6)<br>2.20% (PLL3 and PLL5) |
| Clock generation and control | The clock to be supplied to each module is generated from the external clock input (EXCLK), crystal oscillator input / output (XIN / XOUT), or PLL output clock.<br>• Selection of the peri-ratio by register setting<br>• Clock path selection by clock selector by register setting<br>• Clock supply ON/OFF control is performed by register setting. (Module Standby Mode control)<br>• Cortex-M33 Sleep Mode control |
| Reset generation and control | A reset is generated from the reset factor in (). The types of reset are as follows.<br>• System reset (external pin)<br>• Software reset (system reboot, reset control of each module)<br>• Watchdog reset (WDT module)<br>• Cortex-A55 Warm reset control (software control)<br>• Cortex-M33 Warm reset control (software control)<br>• ON/OFF control for each unit clock (software control) |
| Monitor | • PLL clock monitor<br>– The function to monitor the operation of the output clocks from PLL1 to PLL6<br>• Clock monitor for each module<br>– Function to monitor that the clock monitor is operating<br>• Reset monitor<br>– Function to monitor the reset status of each module |

### 7.1.2 CPG configuration

**Figure 7.1** shows the CPG configuration.

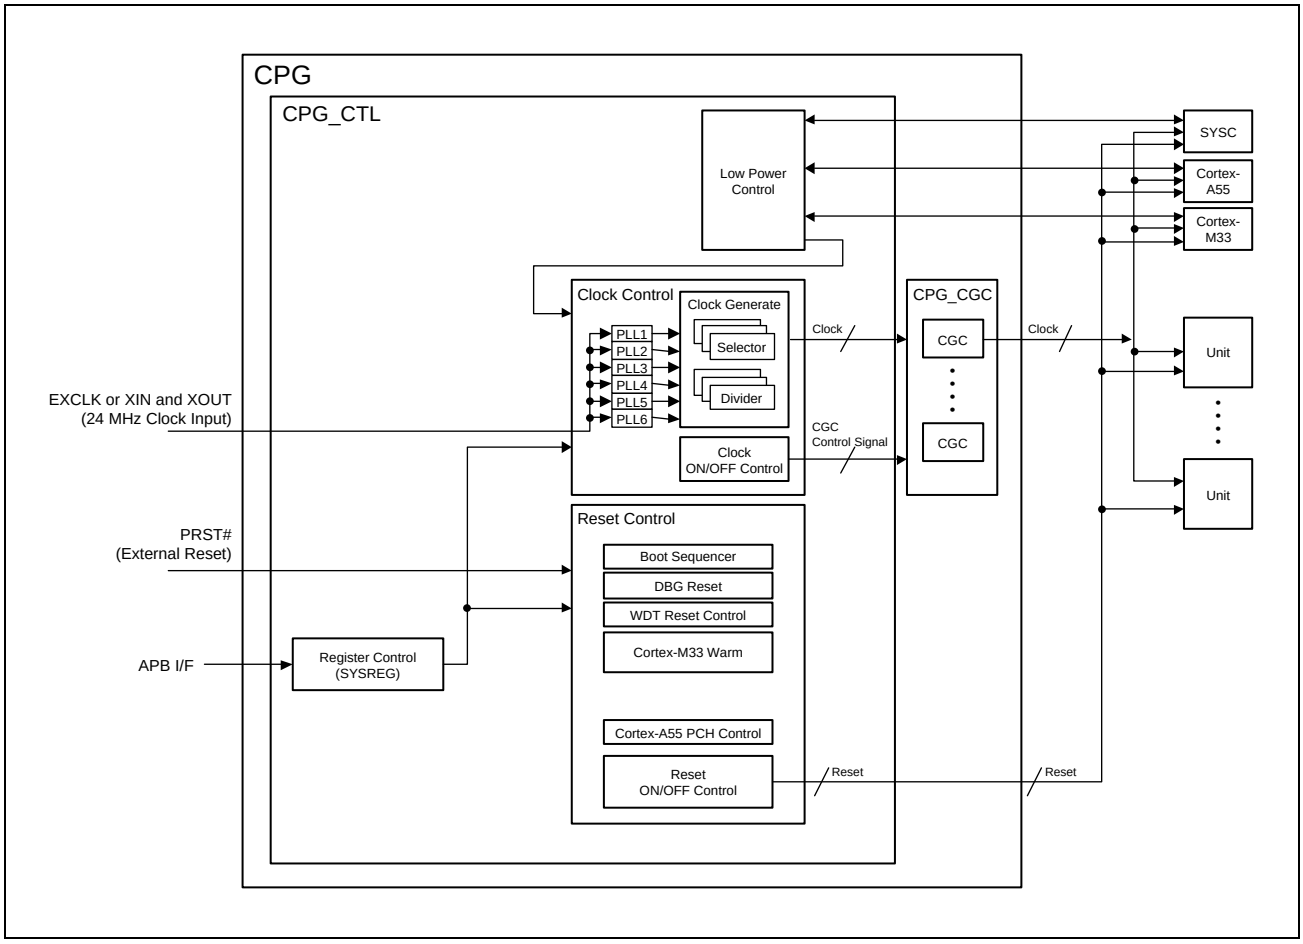

Figure 7.1 CPG Configuration

### 7.1.3 Pin description

The table below shows a list of CPG pins.

Table 7.2 Pin List

| Name | Pin Name | IO | Functions |
|---|---|---|---|
| Mode control pin | MD_BOOT0 | I | Set the operating mode.<br>Do not change during PRST# pin asserts and after negating until the operating mode is confirmed. |
| | MD_BOOT1 | I | |
| | MD_BOOT2 | I | |
| | MD_CLKS | I | Set ON/OFF of SSCG circuit operation of PLL3.<br>Do not change during PRST# terminal asserts and after negating until the operating mode is confirmed. |
| External clock Input pin*2 | EXCLK | I | This is the pin to input the external clock. |
| Crystal oscillator input/output pin*1 | XIN*3 | I | This is the pin to connect the crystal oscillator. |
| | XOUT*3 | O | |
| Power on reset input pin | PRST# | I | When this pin becomes low level, it will be in the power on reset state. |
| OSC drive capacity setting pin 0 | MD_OSCDRV0 | I | This is a pin for adjusting the drive capacity of the OSC buffer. |
| OSC drive capacity setting pin 1 | MD_OSCDRV1 | I | This is a pin for adjusting the drive capacity of the OSC buffer. |

Note 1. When using a crystal oscillator, fix the pins of MD_OSCDRV0 and MD_OSCDRV1 to Low Level. Also, refer to the C/R constraints and implementation precautions described in the PCB design checklist.

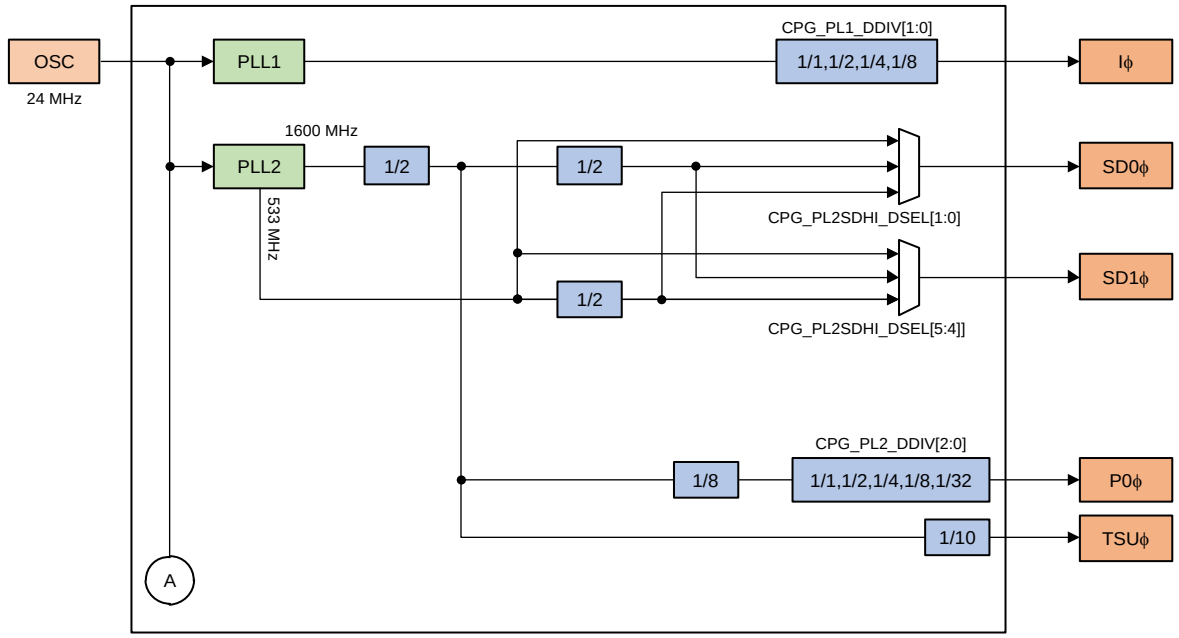
Note 2. When using crystal oscillation, fix the EXCLK pin externally to Low Level.

Note 3. When using the clock from the outside without using the crystal oscillator, set the XIN pin to the external low level fixing process and the XOUT pin to Open.

## 7.1.4 Clock

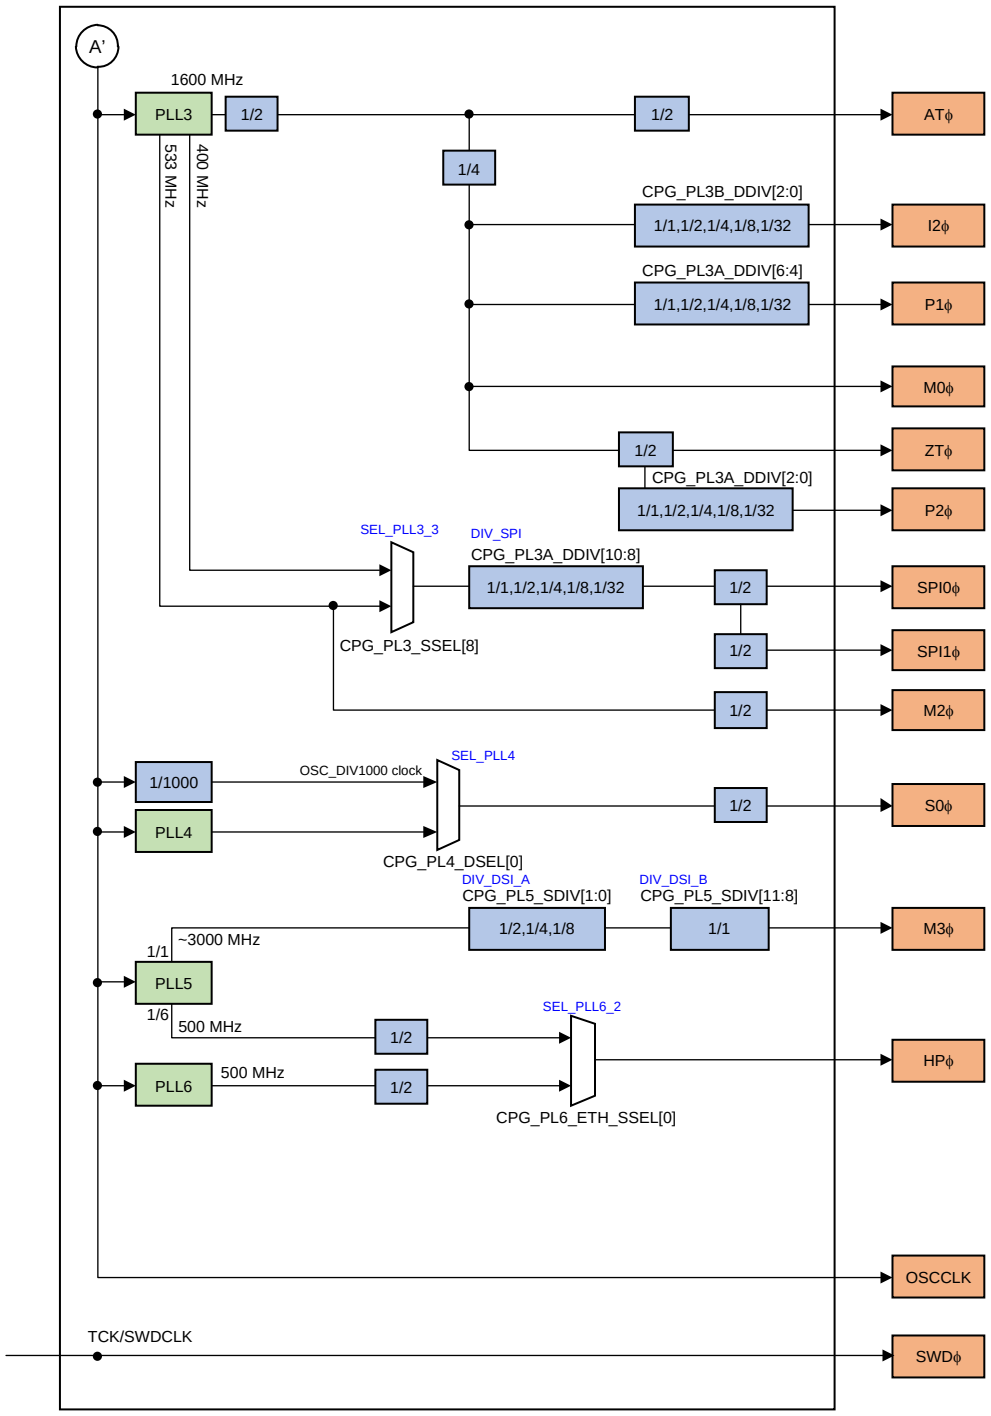
### 7.1.4.1 Clock System Diagram

**Figure 7.2** and **Figure 7.3** show the clock system diagram.



**Note:** SEL_SDHI0 and SEL_SDHI1 collectively control multiple selectors.
The control register for SEL_SDHI0 and SEL_SDHI1 is CPG_PL2SDHI_DSEL.

Figure 7.2 Clock System Diagram (1)



**Note:** The control registers of each selector are as follows.

- SEL_PLL3_3: CPG_PL3_SSEL
- SEL_PLL4: CPG_PL4_DSEL
- SEL_PLL6_2: CPG_PL6_ETH_SSEL

Figure 7.3 Clock System Diagram (2)

#### 7.1.4.2 Clock List

Please refer to another file for the clock list. (Please double-click the icon on the right side)

## 7.2 Register description

### 7.2.1 Register attributes

The following table shows the register attributes described in Register Details.

Table 7.3 Register attributes

| Register attributes | Description |
|---|---|
| RW | A register that can be read and written. |
| RW0 | A register that can read and 0b write. 1b Write is invalid. |
| RW1 | A register that can read and 1b write. 0b Write is invalid. |
| R0W | It is a register that can be written with 0b Read at all times. |
| R1W | It is a register that can be written with 1b Read at all times. |
| R | A register that can read. Write is invalid. |
| R0W0 | It is a register that can always read 0b and write 0b. 1b Write is invalid. |
| R0W1 | It is a register that can always read 0b and write 1b. 0b Write is invalid. |
| R1W0 | It is a register that can always read 1b and write 0b. 1b Write is invalid. |
| R1W1 | It is a register that can always read 1b and write 1b. 0b Write is invalid. |
| RCW0 | A register that can be cleared by Read and 0b Write is possible. 1b Write is invalid. |
| RCW1 | A register that can be cleared by Read and 1b Write is possible. 0b Write is invalid. |

**Note:** This LSI does not guarantee the access result to the Reserved bit area and the undefined bit area.
At the same time, the Reserved bit area and undefined area may have values other than the initial value “0”. We do not guarantee the result of changing these values.

### 7.2.2 Register classification

The table below shows the general classification of the register space in this module.

The address of the CPG register is represented by an offset address from the CPG-based address.

Base Address: H’0_1101_0000 (Cortex-A55 Address Space)
Base Address: H’4101_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5101_0000 (Cortex-M33 Address Space Secure)

Table 7.4 Register Address space

| Classification | Offset Address |
|---|---|
| SSCG PLL Control Registers (PLL1, 4, 6) | H’000 - H’0FF |
| Fast PLL Control Registers (PLL2, 3, 5) | H’100 - H’17F |
| Reserved | H’180 - H’1FF |
| Frequency Dynamic Change Control Registers | H’200 - H’3FF |
| Frequency Static Change Control Registers | H’400 - H’4FF |
| Clock Control Registers | H’500 - H’67F |
| Clock Monitor Registers | H’680 - H’7FF |
| Reset Control Registers | H’800 - H’97F |
| Reset Monitor Registers | H’980 - H’AFF |
| Other Registers | H’B00 - H’FFF |

### 7.2.3 Register configuration

Table 7.5 Register list (1/5)

| Register Name | Abbreviation | R/W | Initial value*1 | Address*2 | Access Size |
|---|---|---|---|---|---|
| PLL1 (SSCG) Standby Control Register | CPG_SAMPLL1_STBY | RW | H'0000 0005 | H'000 | 32 |
| PLL4 (SSCG) Standby Control Register | CPG_SAMPLL4_STBY | RW | H'0000 0004 | H'010 | 32 |
| PLL6 (SSCG) Standby Control Register | CPG_SAMPLL6_STBY | RW | H'0000 0000 | H'020 | 32 |
| PLL4 (SSCG) Output Clock Setting Register 1 | CPG_SAMPLL4_CLK1 | RW | H'0000 3203 | H'014 | 32 |
| PLL6 (SSCG) Output Clock Setting Register 1 | CPG_SAMPLL6_CLK1 | RW | H'0000 3E83 | H'024 | 32 |
| PLL4 (SSCG) Output Clock Setting Register 2 | CPG_SAMPLL4_CLK2 | RW | H'0008 2400 | H'018 | 32 |
| PLL6 (SSCG) Output Clock Setting Register 2 | CPG_SAMPLL6_CLK2 | RW | H'0008 2D02 | H'028 | 32 |
| PLL1 (SSCG) Monitor Register | CPG_SAMPLL1_MON | R | H'0000 0011 | H'00C | 32 |
| PLL4 (SSCG) Monitor Register | CPG_SAMPLL4_MON | R | H'0000 0000 | H'01C | 32 |
| PLL6 (SSCG) Monitor Register | CPG_SAMPLL6_MON | R | H'0000 0000 | H'02C | 32 |
| PLL1_SEL_SETTING Register | CPG_PLL1_SETTING | RW | H'0000 0001 | H'040 | 32 |
| CPG_OTPPLL0_MON Register | CPG_OTPPLL0_MON | R | H'xxxx xxxx | H'044 | 32 |
| CPG_OTPPLL1_MON Register | CPG_OTPPLL1_MON | R | H'xxxx xxxx | H'048 | 32 |
| CPG_OTPPLL2_MON Register | CPG_OTPPLL2_MON | R | H'xxxx xxxx | H'04C | 32 |
| PLL5 (SSCG) Standby Control Register | CPG_SIPLL5_STBY | RW | H'0000 0014 | H'140 | 32 |
| PLL5 (SSCG) Output Clock Setting Register 1 | CPG_SIPLL5_CLK1 | RW | H'0000 0111 | H'144 | 32 |
| PLL5 (SSCG) Output Clock Setting Register 2 | CPG_SIPLL5_CLK2 | RW | H'0000 0100 | H'148 | 32 |
| PLL5 (SSCG) Output Clock Setting Register 3 | CPG_SIPLL5_CLK3 | RW | H'0000 0006 | H'14C | 32 |
| PLL5 (SSCG) Output Clock Setting Register 4 | CPG_SIPLL5_CLK4 | RW | H'007D 00FF | H'150 | 32 |
| PLL5 (SSCG) Output Clock Setting Register 5 | CPG_SIPLL5_CLK5 | RW | H'0000 0016 | H'154 | 32 |
| PLL2(SSCG) Monitor Register | CPG_SIPLL2_MON | R | H'0000 0011 | H'11C | 32 |
| PLL3(SSCG) Monitor Register | CPG_SIPLL3_MON | R | H'0000 0011 | H'13C | 32 |
| PLL5(SSCG) Monitor Register | CPG_SIPLL5_MON | R | H'0000 0000 | H'15C | 32 |
| Division Ratio Setting (PLL1) Register | CPG_PL1_DDIV | RW | H'0000 000x | H'200 | 32 |
| Division Ratio Setting (PLL2) Register | CPG_PL2_DDIV | RW | H'0000 0000 | H'204 | 32 |
| Division Ratio Setting (PLL3A) Register | CPG_PL3A_DDIV | RW | H'0000 0000 | H'208 | 32 |
| Division Ratio Setting (PLL3B) Register | CPG_PL3B_DDIV | RW | H'0000 0000 | H'20C | 32 |
| Source Clock Setting (SDHI) Register | CPG_PL2SDHI_DSEL | RW | H'0000 0011 | H'218 | 32 |
| Source Clock Setting (DDR) Register | CPG_PL4_DSEL | RW | H'0000 0000 | H'21C | 32 |
| Clock Status Monitor Register | CPG_CLKSTATUS | R | H'0000 0000 | H'280 | 32 |
| Source Clock Setting Register | CPG_PL3_SSEL | RW | H'0000 0111 | H'408 | 32 |
| Source Clock Setting Register | CPG_PL6_ETH_SSEL | RW | H'0000 0010 | H'418 | 32 |
| Division Ratio Setting (PLL5) Register | CPG_PL5_SDIV | RW | H'0000 0001 | H'420 | 32 |
| Clock Control Register Cortex-A55 | CPG_CLKON_CA55 | RW | H'0000 003F | H'500 | 32 |
| Clock Control Register Cortex-M33 | CPG_CLKON_CM33 | RW | H'0000 0000 | H'504 | 32 |
| Clock Control Register ACPU | CPG_CLKON_SRAM_ACPU | RW | H'0000 0001 | H'508 | 32 |
| Clock Control Register MCPU | CPG_CLKON_SRAM_MCPU | RW | H'0000 0001 | H'50C | 32 |
| Clock Control Register GIC600 | CPG_CLKON_GIC600 | RW | H'0000 0001 | H'514 | 32 |
| Clock Control Register IA55 | CPG_CLKON_IA55 | RW | H'0000 0003 | H'518 | 32 |
| Clock Control Register IM33 | CPG_CLKON_IM33 | RW | H'0000 0003 | H'51C | 32 |
| Clock Control Register MHU | CPG_CLKON_MHU | RW | H'0000 0000 | H'520 | 32 |
| Clock Control Register CST | CPG_CLKON_CST | RW | H'0000 07FF | H'524 | 32 |

Table 7.5 Register list (2/5)

| Register Name | Abbreviation | R/W | Initial value*1 | Address*2 | Access Size |
|---|---|---|---|---|---|
| Clock Control Register SYC | CPG_CLKON_SYC | RW | H'0000 0000 | H'528 | 32 |
| Clock Control Register DMAC_REG | CPG_CLKON_DAMC_REG | RW | H'0000 0000 | H'52C | 32 |
| Clock Control Register GTM | CPG_CLKON_GTM | RW | H'0000 0001 | H'534 | 32 |
| Clock Control Register MTU | CPG_CLKON_MTU | RW | H'0000 0000 | H'538 | 32 |
| Clock Control Register POE3 | CPG_CLKON_POE3 | RW | H'0000 0000 | H'53C | 32 |
| Clock Control Register WDT | CPG_CLKON_WDT | RW | H'0000 00C3 | H'548 | 32 |
| Clock Control Register DDR | CPG_CLKON_DDR | RW | H'0000 0000 | H'54C | 32 |
| Clock Control Register SPI_MULTI | CPG_CLKON_SPI_MULTI | RW | H'0000 0000 | H'550 | 32 |
| Clock Control Register SDHI | CPG_CLKON_SDHI | RW | H'0000 0000 | H'554 | 32 |
| Clock Control Register ISU | CPG_CLKON_ISU | RW | H'0000 0000 | H'55C | 32 |
| Clock Control Register CRU | CPG_CLKON_CRU | RW | H'0000 0000 | H'564 | 32 |
| Clock Control Register LCDC | CPG_CLKON_LCDC | RW | H'0000 0000 | H'56C | 32 |

Note 1. **Initial value:** The reset is released according to the sequence of the system reset, and the initial value is the one immediately after the last reset release in the sequence.

Note 2. **Address:** The offset address from the base address.

## 7.2.4 Register Descriptions

### 7.2.4.1 PLLn (SSCG) Standby Control Register (CPG_SAMPLLn_STBY) (n = 1, 4, or 6)

This register is used to control the power-saving mode and standby state and enable or disable the SSCG.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | SSCG_MODE_WEN | — | SSCG_EN_WEN | — | RESETB_WEN |
| Initial Value n = 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Initial Value n = 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Initial Value n = 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R | R0W1 | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Initial Value n = 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| Initial Value n = 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| Initial Value n = 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | RW | RW | R | RW | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | SSCG_MODE_WEN | 0b | R0W1 | Flag for enabling the writing to the SSCG_MODE[1:0] bits (bits 5 and 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | SSCG_EN_WEN | 0b | R0W1 | Flag for enabling the writing to the SSCG_EN bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | RESETB_WEN | 0b | R0W1 | Flag for enabling the writing to the RESETB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 5, 4 | SSCG_MODE[1:0] | 00b | RW | SSCG center spread or down spread setting (see the mode setting table below.*1)<br>When writing to these bits, set the SSCG_MODE_WEN bit to 1 at the same time.<br>00b: Down spread<br>01b: Setting prohibited<br>10b: Setting prohibited<br>11b: Setting prohibited |
| 3 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | SSCG_EN | n=1,4: 1b<br>n=6: 0b | RW | SSCG enable or disable setting (see the mode setting table below.*1)<br>When writing to this bit, set the SSCG_EN_WEN bit to 1 at the same time.<br>0: SSCG is disabled.<br>1: SSCG is enabled. |
| 1 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RESETB | n=1: 1b<br>n=4,6: 0b | RW | PLL reset setting (see the mode setting table below.*1)<br>When writing to this bit, set the RESETB_WEN bit to 1 at the same time.<br>0: Reset state<br>1: Active state (PLL is released from the reset state.) |

Note 1. Mode Setting Table

| Mode | | Bit Name | | |
|---|---|---|---|---|
| | | RESETB | SSCG_EN | SSCG_MODE[1:0] |
| Reset state | | 0 | — | — |
| SSCG disabled | | 1 | 0 | — |
| SSCG enabled | Down spread | | 1 | 00b |
| Setting prohibited | | | | 11b |

### 7.2.4.2 PLLn (SSCG) Output Clock Setting Register 1 (CPG_SAMPLLn_CLK1) (n = 1, 4, or 6)

This register is used to specify the frequency division values k, m, and p for SSCG PLLn (n = 1, 4, or 6).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Note 1. The PLL oscillation frequency ($F_{FVCO}$) and output frequency ($F_{FOUT}$) can be calculated by the following equations.

- Equations

$$F_{FVCO} = \frac{((m + k/65536) \times F_{Fin})}{p}$$

$$F_{Fout} = \frac{((m + k/65536) \times F_{Fin})}{(p \times 2^{s})}^{*3}$$

- Restrictions

  $F_{Fin}$: 24 MHz

  6 MHz ≤ $F_{FREF}$ = $F_{FIN}$/p ≤ 30 MHz

  1,125 MHz ≤ $F_{FVCO}$ ≤ 2,500 MHz

Note 2. Specify DIV_K, DIV_M, DIV_P, and DIV_S*3 within the allowable ranges of $F_{FVCO}$ and $F_{Fout}$ for each PLL shown below.

| SSCG PLL | FFout Min. | Default FFout Setting | FFout Max. |
|---|---|---|---|
| PLL1 | 1,000 MHz | 1,000 MHz | 1,000 MHz |
| PLL4 | 800 MHz | 1,600 MHz | 1,600 MHz |
| PLL6 | 100 MHz | 500 MHz | 500 MHz |

Note 3. For DIV_S (value “s”), see **Section 7.2.4.3, PLLn (SSCG) Output Clock Setting Register 2 (CPG_SAMPLLn_CLK2) (n = 1, 4, or 6)**.

Note 4. The PLL should be reset after the PLL settings are modified. For details, refer to **Section 7.4.5, Procedures for PLL Setup**.

### 7.2.4.3 PLLn (SSCG) Output Clock Setting Register 2 (CPG_SAMPLLn_CLK2) (n = 1, 4, or 6)

This register is used to specify the frequency division value s and SSCG modulation values mfr and mrr for SSCG PLLn (n = 1, 4, or 6).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 3 | — | 00000b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 to 0 | DIV_S | 'n = 1: 001b<br>'n = 4: 000b<br>'n = 6: 010b | RW | Divider s setting*2<br>Specify a value from 0 to 6 (decimal).<br>111b: Setting prohibited<br>110b: Division value s = 6 (Division ratio = 64)<br>101b: Division value s = 5 (Division ratio = 32)<br>100b: Division value s = 4 (Division ratio = 16)<br>011b: Division value s = 3 (Division ratio = 8)<br>010b: Division value s = 2 (Division ratio = 4)<br>001b: Division value s = 1 (Division ratio = 2)<br>000b: Division value s = 0 (Division ratio = 1) |

Note 1. The modulation frequency (MF) and modulation ratio (pk-pk) (MR) can be calculated by the following equations.

- Equations

$$MF = \frac{(F_{Fin})}{p \times mfr \times (2^5)}$$

$$MR = \frac{mfr \times mrr}{m \times (2^6)} \times 100[\%]$$

- Restrictions

$F_{Fin}$: 24 MHz
0000_0000b ≤ MFR[7:0] ≤ 1111_1111b
00_0001b ≤ MRR[5:0] ≤ 11_1111b
0 ≤ mrr × mfr ≤ 512

Note 2. For DIV_M (value "m") and DIV_P (value "p"), see **Section 7.2.4.2, PLLn (SSCG) Output Clock Setting Register 1 (CPG_SAMPLLn_CLK1) (n = 1, 4, or 6)**.

Note 3. Change the SSC setting of PLL4 from the default setting to the following value.

- Modulation Depth [%]: −1.0%
- Fmod [kHz]: About 30 kHz

**Important:**

For the procedures for setting up the PLL, see **Section 7.4.5, Procedures for PLL Setup**.

**Initial Values:**

The initial values of the registers for PLL1, PLL4, and PLL6 and output clocks are shown below.

- Initial values of registers

| | CPG_SAMPLLn_STBY (n = 1, 4, or 6) | | |
|---|---|---|---|
| | SSCG_MODE | SSCG_EN | RESETB |
| PLL | Bits 5 and 4 | Bit 2 | Bit 0 |
| PLL1 | H'0 (Down spread) | 1 (SSCG is enabled) | 1 (Released from the reset state) |
| PLL4 | H'0 (Down spread) | 1 (SSCG is enabled) | 0 (Reset state) |
| PLL6 | H'0 (Down spread) | 0 (SSCG is disabled) | 0 (Reset state) |

| | CPG_SAMPLLn_CLK1 (n = 1, 4, or 6) | | | CPG_SAMPLLn_CLK2 (n = 1, 4, or 6) | | |
|---|---|---|---|---|---|---|
| | DIV_K | DIV_M | DIV_P | DIV_S | MFR | MRR |
| PLL | Bits 31 to 16 | Bits 15 to 6 | Bits 5 to 0 | Bits 2 to 0 | Bits 23 to 16 | Bits 13 to 8 |
| PLL1 | H'0000 (k = 0) | H'0FA (m = 250) | H'3 (p = 3) | H'1 (s = 1) | H'08 (mfr = 8) | H'2D (mrr = 45) |
| PLL4 | H'0000 (k = 0) | H'0C8 (m = 200) | H'3 (p = 3) | H'0 (s = 0) | H'08 (mfr = 8) | H'24 (mrr = 36) |
| PLL6 | H'0000 (k = 0) | H'0FA (m = 250) | H'3 (p = 3) | H'2 (s = 2) | H'08 (mfr = 8) | H'2D (mrr = 45) |

- Output clocks (initial values)

| PLL | PLL Operating Mode | Frequency ($F_{Fout}$) [MHz] | SSCG | Fmod [kHz] | Spread | Modulation Depth [%] |
|---|---|---|---|---|---|---|
| PLL1 | Active state | 1,000 | Enabled | 31.25 | Down spread | 2.25 |
| PLL4 | Reset state | 1,600 | Enabled | 31.25 | Down spread | 2.25 |
| PLL6 | Reset state | 500 | Disabled | 31.25 | Down spread | 2.25 |

### 7.2.4.4 PLLn (SSCG) Monitor Register (CPG_SAMPLLn_MON) (n = 1, 4, or 6)

This register is used to monitor the state of the SSCG PLLn (n = 1, 4, or 6).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | OTPn_MON [n = 31 to 0] | — | R | These bits indicate the state of the OTP_OTPPLL2[31:0] pins of the CPG.<br>*Note*: The values specified in the OTP are set in these bits as the initial values. |

### 7.2.4.9 PLL5 (SSCG) Standby Control Register (CPG_SIPLL5_STBY)

This register is used to control the power-saving mode and standby state and enable or disable the SSC in PLL5 that operates at 3 GHz or a higher frequency. When enable PLL5, change to SSCG_EN=0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | DOWNSPREAD_WEN | — | SSCG_EN_WEN | — | RESETB_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R | R0W1 | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | DOWNSPREAD | — | SSCG_EN | — | RESETB |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | DOWNSPREAD_WEN | 0b | R0W1 | Flag for enabling the writing to the DOWNSPREAD bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | SSCG_EN_WEN | 0b | R0W1 | Flag for enabling the writing to the SSCG_EN bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | RESETB_WEN | 0b | R0W1 | Flag for enabling the writing to the RESETB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | DOWNSPREAD | 1b | RW | SSC center spread or down spread setting<br>When writing to this bit, set the DOWNSPREAD_WEN bit to 1 at the same time.<br>0: Setting prohibited<br>1: Down spread |
| 3 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | SSCG_EN*2 | 1b | RW | SSC enable or disable setting (see the mode setting table below.*1)<br>When writing to this bit, set the SSCG_EN_WEN bit to 1 at the same time.<br>0: SSC is disabled.<br>1: SSC is enabled. |
| 1 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | RESETB | 0b | RW | PLL reset setting (see the mode setting table below.*1)<br>When writing to this bit, set the RESETB_WEN bit to 1 at the same time.<br>0: Reset state<br>1: Active state (PLL is released from the reset state.) |

Note 1. Mode Setting Table

Note 2. Set the SSCG_EN bit to 0, when operating PLL5.

| Mode | | Bit Name | | |
|---|---|---|---|---|
| | | RESETB | SSCG_EN | DOWNSPREAD |
| Reset state | | 0 | — | — |
| SSCG disabled | | 1 | 0 | — |
| SSCG enabled | Down spread | | 1 | 1b |

### 7.2.4.10 PLL5 (SSCG) Output Clock Setting Register 1 (CPG_SIPLL5_CLK1)

This register is used to set up PLL5.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | REFDIV | | | | | | — | POSTDIV2 | | | — | POSTDIV1 | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| R/W | R | R | RW | RW | RW | RW | RW | RW | R | RW | RW | RW | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 to 8 | REFDIV | 00_0001b | RW | REFDIV setting for PLL<br>Specify a value from 1 to 63. |
| 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 to 4 | POSTDIV2 | 001b | RW | POSTDIV2 setting for PLL<br>Specify a value from 1 to 7.<br>The POSTDIV value is obtained by POSTDIV1 × POSTDIV2. |
| 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 to 0 | POSTDIV1 | 001b | RW | POSTDIV1 setting for PLL<br>Specify a value from 1 to 7.<br>The POSTDIV value is obtained by POSTDIV1 × POSTDIV2. |

### 7.2.4.11 PLL5 (SSCG) Output Clock Setting Register 2 (CPG_SIPLL5_CLK2)

This register is used to set up PLL5.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | FOUTVCOPD_WEN | — | FOUTPOSTDIVPD_WEN | — | FOUT4PHASEPD_WEN | — | DSMPD_WEN | — | DACPD_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R0W1 | R | R0W1 | R | R0W1 | R | R0W1 | R | R0W1 |

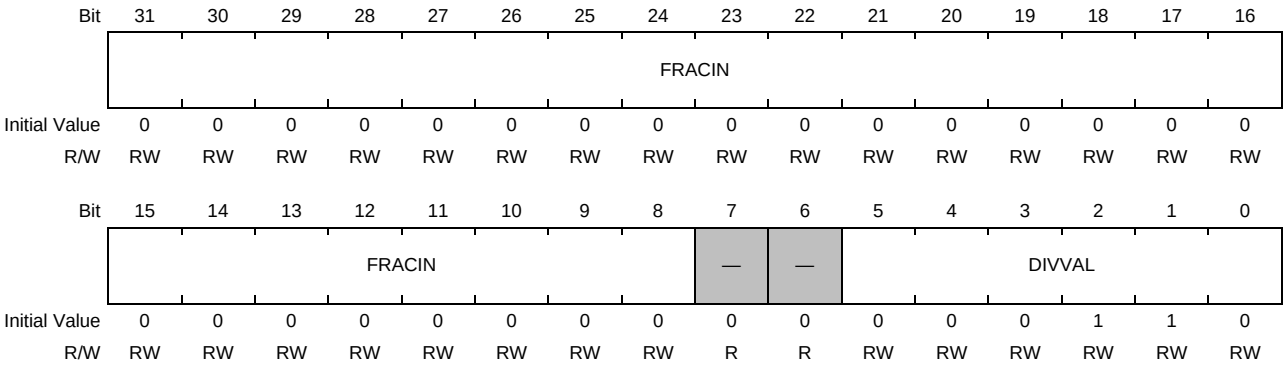
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | FOUTVCOPD | — | FOUTPOSTDIVPD | — | FOUT4PHASEPD | — | DSMPD | — | DACPD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | RW | R | RW | R | RW | R | RW | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 24 | FOUTVCOPD_WEN | 0b | R0W1 | Flag for enabling the writing to the FOUTVCOPD bit (bit 8)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 23 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 22 | FOUTPOSTDIVPD_WEN | 0b | R0W1 | Flag for enabling the writing to the FOUTPOSTDIVPD bit (bit 6)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 21 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | FOUT4PHASEPD_WEN | 0b | R0W1 | Flag for enabling the writing to the FOUT4PHASEPD bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | DSMPD_WEN | 0b | R0W1 | Flag for enabling the writing to the DSMPD bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | DACPD_WEN | 0b | R0W1 | Flag for enabling the writing to the DACPD bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | FOUTVCOPD | 1b | RW | FOUTVCOPD setting for the PLL<br>Power-down of FOUTVCO is specified.<br>0: FOUTVCO is active.<br>1: FOUTVCO power is turned down. |
| 7 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 | FOUTPOSTDIVPD | 0b | RW | FOUTPOSTDIVPD setting for the PLL<br>Power-down of FOUTPOSTDIVPD is specified.<br>(Target: FOUTPOSTDIVPD, FOUT1PH0, FOUT2, FOUT3, and FOUT4)<br>0: FOUTPOSTDIVPD is active.<br>1: FOUTPOSTDIVPD power is turned down. |
| 5 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | FOUT4PHASEPD | 0b | RW | FOUT4PHASEPD setting for the PLL<br>Power-down of FOUT4PHASEPD is specified.<br>(Target: FOUT1PH0, FOUT2, FOUT3, and FOUT4)<br>0: FOUT4PHASEPD is active.<br>1: FOUT4PHASEPD power is turned down. |
| 3 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | DSMPD | 0b | RW | Delta-sigma modulator (DSM) power-down setting<br>0: DSM is active.<br>1: DSM power is turned down. |
| 1 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | DACPD | 0b | RW | Noise-cancelling DAC power-down setting in the FRAC mode<br>0: DAC is active (default mode).<br>1: DAC power is turned down (for test mode only). |

### 7.2.4.12 PLL5 (SSCG) Output Clock Setting Register 3 (CPG_SIPLL5_CLK3)

This register is used to set up the SSCG for PLL5.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | FRACIN | H'00_0000 | RW | Division value setting for frequency division |
| 7, 6 | — | 00b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 to 0 | DIVVAL | 00_0110b | RW | Modulation frequency setting<br>When DIVVAL = 6'd0, the division value is set to 1.<br>When DIVVAL > 0, the DIVVAL value is used as the division value. |

### 7.2.4.13 PLL5 (SSCG) Output Clock Setting Register 4 (CPG_SIPLL5_CLK4)

This register is used to set up the SSCG for PLL5.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | INTIN | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 27 to 16 | INTIN | H'07D | RW | Setting of integer part of division value. |
| 15 to 8 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 7 to 0 | — | H'FF | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

### 7.2.4.14 PLL5 (SSCG) Output Clock Setting Register 5 (CPG_SIPLL5_CLK5)

This register is used to set up the SSCG for PLL5.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | SPREAD | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 to 0 | SPREAD | 1_0110b | RW | Spread depth setting<br>00000b: Setting prohibited<br>00001b: 0.1%<br>00010b: 0.2%<br>:<br>10000b: 1.6%<br>:<br>11111b: 3.1% |

**Important:**

For the procedures for setting up the PLL, see **Section 7.4.5, Procedures for PLL Setup**.

**Initial Values:**

The initial values of the registers for PLL5 and output clock are shown below.

- Initial values of registers

| | CPG_SIPLL5_STBY | | |
|---|---|---|---|
| | DOWNSPREAD | SSCG_EN | RESETB |
| PLL | Bit 4 | Bit 2 | Bit 0 |
| PLL5 | H'1 (Down spread) | 1 (SSCG is enabled) | 0 (Reset state) |

| | CPG_SIPLL5_CLK1 | | |
|---|---|---|---|
| | REFDIV | POSTDIV2 | POSTDIV1 |
| PLL | Bits 13 to 8 | Bits 6 to 4 | Bits 2 to 0 |
| PLL5 | H'01 (REFDIV = 1) | H'1 (POSTDIV2 = 1) | H'1 (POSTDIV1 = 1) |

| | CPG_SIPLL5_CLK3 | |
|---|---|---|
| | FRACIN | DIVVAL |
| PLL | Bits 31 to 8 | Bits 5 to 0 |
| PLL5 | H'00_0000 (FRACIN = 0) | H'6 (DIVVAL = 6) |

| | CPG_SIPLL5_CLK4 | CPG_SIPLL5_CLK5 |
|---|---|---|
| | INTIN | SPREAD |
| PLL | Bits 27 to 16 | Bits 4 to 0 |
| PLL5 | H'07D (INTIN = 125) | H'16 (SPREAD = 22) |

- Output clock (initial values)

| PLL | PLL Operating Mode | Frequency ($F_{Fout}$) [MHz] | SSCG | Fmod [kHz] | Spread | Modulation Depth [%] |
|---|---|---|---|---|---|---|
| PLL5 | Reset state | 3,000 | Enabled | 31.25 | Down spread | 2.20 |

FOUTVCO = FREF/REFDIV × (INTIN + FRACIN / 2^24)

FOUTPOSTDIV = FOUTVCO / (POSTDIV1 × POSTDIV2)

The specifiable ranges of parameters for PLL5 are shown below.

| Parameter | Restrictions | Specifiable Range |
|---|---|---|
| FREF | Fixed to the OSC frequency (24) | 24 |
| REFDIV | 10 ≤ FREF/REFDIV ≤ FOUTVCO/20 (Frac) | 1 to 2 |
| INTIN*1 | 20 to 320 (Frac)<br>and<br>800 ≤ FOUTVCO ≤ 3000 (PLL5) | Values that satisfy the restriction shown to the left |
| FRACIN*1 | 800 ≤ FOUTVCO ≤ 3000 (PLL5) | Values that satisfy the restriction shown to the left |
| POSTDIV1 | — | 1 to 7 |
| POSTDIV2 | — | 1 to 7 |

Note 1. The restrictions when the SSCG is disabled are shown. When the SSCG is enabled, the restrictions should be satisfied with the modulation depth taken into account.

### 7.2.4.15 PLLn (SSCG) Monitor Register (CPG_SIPLLn_MON) (n = 2, 3, or 5)

This register is used to monitor the state of the SSCG PLLn (n = 2, 3, or 5).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value n = 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Initial Value n = 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Initial Value n = 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | PLLn_LOCK | — | — | — | PLLn_RESETB |
| Initial Value n = 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| Initial Value n = 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| Initial Value n = 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | PLLn_LOCK [n = 2, 3, or 5] | n = 2: 1b<br>n = 3: 1b<br>n = 5: 0b | R | SSCG PLL lock state monitoring<br>0: PLL is not locked.<br>1: PLL is locked. |
| 3 to 1 | — | 000b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | PLLn_RESETB [n = 2, 3, or 5] | n = 2: 1b<br>n = 3: 1b<br>n = 5: 0b | R | SSCG PLL operating mode monitoring<br>1: Normal mode<br>0: Reset state (standby mode) |

### 7.2.4.16 Division Ratio Setting (PLL1) Register (CPG_PL1_DDIV)

This register is used to set the division ratio of the clock for the Cortex-A55.

The PLL1 (1,000 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DIV_PLL1SET_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DIVPL1_SET | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>These bits are always read as 0. Writing to these bits is ignored. |
| 16 | DIV_PLL1SET_WEN | 0b | R0W1 | Flag for enabling the writing to the DIVPL1_SET bits<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. Writing to these bits is ignored. |
| 1, 0 | DIVPL1_SET | 00b | RW | Iϕ division ratio setting<br>00b: 1/1 (1,000MHz)<br>01b: 1/2 (500MHz)<br>10b: 1/4 (250MHz)<br>11b: 1/8 (125MHz) |

### 7.2.4.17 Division Ratio Setting (PLL2) Register (CPG_PL2_DDIV)

This register is used to set the division ratios of the clocks for the system bus and the IP modules that cannot use SSCG clocks.

The PLL2 (up to 3,200 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DIV_PLL2_A_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | DIVPL2A_SET | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |

### 7.2.4.18 Division Ratio Setting (PLL3A) Register (CPG_PL3A_DDIV)

This register is used to set the division ratios of the clocks for the system bus and the IP modules that can use SSCG clocks.

The clock obtained by dividing the output of PLL3 is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

### 7.2.4.19 Division Ratio Setting (PLL3B) Register (CPG_PL3B_DDIV)

This register is used to set the division ratio of the clock for the Cortex-M33.

The source clock uses a clock (200MHz) that is 1/8 of the output of PLL3 (1,600MHz).

The setting of this register can be dynamically modified while the clock is operating.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 7.2.4.20 Source Clock Setting (SDHI) Register (CPG_PL2SDHI_DSEL)

This register is used to switch the clocks for the SDHI.

The setting of this register can be dynamically modified while the clock is operating.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 19 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | SEL_SDHI0_WEN | 0b | R0W1 | Flag for enabling the writing to the SEL_SDHI0_SET bits<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5, 4 | SEL_SDHI1_SET | 01b | RW | SEL_SDHI1 clock switching*1<br>00b: Setting prohibited<br>01b: 533 MHz<br>10b: 400 MHz<br>11b: 266 MHz |
| 3, 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1, 0 | SEL_SDHI0_SET | 01b | RW | SEL_SDHI0 clock switching*1<br>00b: Setting prohibited<br>01b: 533 MHz<br>10b: 400 MHz<br>11b: 266 MHz |

**Note:** When 1 is written to the SEL_SDHI1_WEN or SEL_SDHI0_WEN bit placed in the upper 16 bits of this register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

Note 1. To change the setting from 01b (533 MHz) to 10b (400 MHz) or vice versa, do not directly switch to the target clock. Switch to 11b (266 MHz) first, and then switch to the target setting (01b (533 MHz) or 10b (400 MHz)). Switching the clock directly between the above frequencies can temporarily generate pulses faster than 533MHz, which can cause malfunctions.

### 7.2.4.21 Source Clock Setting (DDR) Register (CPG_PL4_DSEL)

This register is used to switch the source clock for the DDR.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | — | 1b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 3 to 1 | — | 000b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | SEL_PLL6_2_SET | 0b | RW | Source clock setting<br>0: PLL6 clock (250MHz)<br>1: PLL5 clock (250MHz) |

### 7.2.4.25 Division Ratio Setting (PLL5) Register (CPG_PL5_SDIV)

This register is used to set the division ratio of the clock for the LCDC.

The clock obtained by dividing the PLL5 (Up to 3000 MHz) output is used as the source clock.

This register does not support dynamic modification.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21 | CLK5_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK5_ON bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 20 | CLK4_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK4_ON bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 | CLK5_ON | 1b | RW | The CA55_TSCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 4 | CLK4_ON | 1b | RW | The CA55_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | CLK3_ON | 1b | RW | The CA55_GICCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 1b | RW | The CA55_ATCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 1b | RW | The CA55_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 1b | RW | The CA55_SCLK/PERICLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.27 Clock Control Register Cortex-M33 (CPG_CLKON_CM33)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The CM33_TSCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The CM33_CLKIN clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.28 Clock Control Register ACPU (CPG_CLKON_SRAM_ACPU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 1b | RW | The SRAM_ACPU_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.29 Clock Control Register MCPU (CPG_CLKON_SRAM_MCPU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 1b | RW | The SRAM_MCPU_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.30 Clock Control Register GIC600 (CPG_CLKON_GIC600)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 1b | RW | The GIC600_GICCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.31 Clock Control Register IA55 (CPG_CLKON_IA55)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 1b | RW | The IA55_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 1b | RW | The IA55_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.32 Clock Control Register IM33 (CPG_CLKON_IM33)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 1b | RW | The IM33_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 1b | RW | The IM33_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.33 Clock Control Register MHU (CPG_CLKON_MHU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The MHU_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.34 Clock Control Register CST (CPG_CLKON_CST)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | CLK10_ONWEN | CLK9_ONWEN | CLK8_ONWEN | CLK7_ONWEN | CLK6_ONWEN | CLK5_ONWEN | CLK4_ONWEN | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | CLK10_ON | CLK9_ON | CLK8_ON | CLK7_ON | CLK6_ON | CLK5_ON | CLK4_ON | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |

| 0 | CLK0_ON | 1b | RW | The CST_CS_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.35 Clock Control Register SYC (CPG_CLKON_SYC)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The SYC_CNT_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.36 Clock Control Register DMAC_REG (CPG_CLKON_DMAC_REG)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The DMAC_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The DMAC_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.37 Clock Control Register GTM (CPG_CLKON_GTM)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | CLK2_ON | 0b | RW | The OSTM2_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The OSTM1_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 1b | RW | The OSTM0_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.38 Clock Control Register MTU (CPG_CLKON_MTU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The MTU_X_MCK_MTU3 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.39 Clock Control Register POE3 (CPG_CLKON_POE3)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The POE3_CLKM_POE clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.40 Clock Control Register WDT (CPG_CLKON_WDT)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CLK5_ONWEN | CLK4_ONWEN | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CLK5_ON | CLK4_ON | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | RW | RW | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21 | CLK5_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK5_ON bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 20 | CLK4_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK4_ON bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19, 18 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | — | 1b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 6 | — | 1b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 5 | CLK5_ON | 0b | RW | The WDT2_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 4 | CLK4_ON | 0b | RW | The WDT2_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3, 2 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1 | CLK1_ON | 1b | RW | The WDT0_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 1b | RW | The WDT0_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.41 Clock Control Register DDR (CPG_CLKON_DDR)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The DDR_REG_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The DDR_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.42 Clock Control Register SPI_MULTI (CPG_CLKON_SPI_MULTI)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The SPI_CLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The SPI_CLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.43 Clock Control Register SDHI (CPG_CLKON_SDHI)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK7_ONWEN | CLK6_ONWEN | CLK5_ONWEN | CLK4_ONWEN | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK7_ON | CLK6_ON | CLK5_ON | CLK4_ON | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 | CLK7_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK7_ON bit (bit 7)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 22 | CLK6_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK6_ON bit (bit 6)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 21 | CLK5_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK5_ON bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 20 | CLK4_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK4_ON bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | CLK7_ON | 0b | RW | The SDHI1_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 6 | CLK6_ON | 0b | RW | The SDHI1_CLK_HS clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 5 | CLK5_ON | 0b | RW | The SDHI1_IMCLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 4 | CLK4_ON | 0b | RW | The SDHI1_IMCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 3 | CLK3_ON | 0b | RW | The SDHI0_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 0b | RW | The SDHI0_CLK_HS clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The SDHI0_IMCLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The SDHI0_IMCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.44 Clock Control Register ISU (CPG_CLKON_ISU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The ISU_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The ISU_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.45 Clock Control Register CRU (CPG_CLKON_CRU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 3 | CLK3_ON | 0b | RW | The CRU_ACLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 0b | RW | The CRU_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The CRU_VCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | CLK0_ON | 0b | RW | The CRU_SYSCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.46 Clock Control Register LCDC (CPG_CLKON_LCDC)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The LCDC_CLK_D clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The LCDC_CLK_A and LCDC_CLK_P clocks are supplied or stopped.<br>0: Clocks are stopped.<br>1: Clocks are supplied. |

### 7.2.4.47 Clock Control Register SSI (CPG_CLKON_SSI)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK7_ONWEN | CLK6_ONWEN | CLK5_ONWEN | CLK4_ONWEN | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK7_ON | CLK6_ON | CLK5_ON | CLK4_ON | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 | CLK7_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK7_ON bit (bit 7)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 22 | CLK6_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK6_ON bit (bit 6)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 21 | CLK5_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK5_ON bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 20 | CLK4_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK4_ON bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | CLK7_ON | 0b | RW | The SSI3_PCLK_SFR clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 6 | CLK6_ON | 0b | RW | The SSI3_PCLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 5 | CLK5_ON | 0b | RW | The SSI2_PCLK_SFR clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 4 | CLK4_ON | 0b | RW | The SSI2_PCLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 3 | CLK3_ON | 0b | RW | The SSI1_PCLK_SFR clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 0b | RW | The SSI1_PCLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The SSI0_PCLK_SFR clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The SSI0_PCLK2 clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.48 Clock Control Register USB (CPG_CLKON_USB)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | CLK3_ON | 0b | RW | The USB_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 0b | RW | The USB_U2P_EXR_CPUCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The USB_U2H1_HCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The USB_U2H0_HCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.49 Clock Control Register ETH (CPG_CLKON_ETH)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The ETH1_CLK_AXI/CHI clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The ETH0_CLK_AXI/CHI clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.50 Clock Control Register I2C (CPG_CLKON_I2C)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | CLK3_ON | 0b | RW | The I2C3_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 0b | RW | The I2C2_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The I2C1_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The I2C0_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.51 Clock Control Register SCIF (CPG_CLKON_SCIF)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | CLK4_ONWEN | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | CLK4_ON | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | CLK4_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK4_ON bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | CLK3_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | CLK4_ON | 0b | RW | The SCIF4_CLK_PCK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 3 | CLK3_ON | 0b | RW | The SCIF3_CLK_PCK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 2 | CLK2_ON | 0b | RW | The SCIF2_CLK_PCK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The SCIF1_CLK_PCK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | CLK0_ON | 0b | RW | The SCIF0_CLK_PCK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.52 Clock Control Register SCI (CPG_CLKON_SCI)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The SCI1_CLKP clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The SCI0_CLKP clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.53 Clock Control Register IRDA (CPG_CLKON_IRDA)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The IRDA_CLKP clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.54 Clock Control Register RSPI (CPG_CLKON_RSPI)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | CLK2_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | CLK2_ON | 0b | RW | The RSPI2_CLKB clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 1 | CLK1_ON | 0b | RW | The RSPI1_CLKB clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The RSPI0_CLKB clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.55 Clock Control Register CANFD (CPG_CLKON_CANFD)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The CANFD_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.56 Clock Control Register GPIO (CPG_CLKON_GPIO)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The GPIO_HCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.57 Clock Control Register ADC (CPG_CLKON_ADC)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | CLK1_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_ON | 0b | RW | The ADC_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 0 | CLK0_ON | 0b | RW | The ADC_ADCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.58 Clock Control Register TSU (CPG_CLKON_TSU)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | CLK0_ONWEN | 0b | R0W1 | Flag for enabling the writing to the CLK0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_ON | 0b | RW | The TSU_PCLK clock is supplied or stopped.<br>0: Clock is stopped.<br>1: Clock is supplied. |

### 7.2.4.59 Clock Control Register AXI_TZCDDR (CPG_CLKON_AXI_TZCDDR)

This register is used to supply or stop clocks for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | CLK4_ONWEN | CLK3_ONWEN | CLK2_ONWEN | CLK1_ONWEN | CLK0_ONWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | CLK4_ON | CLK3_ON | CLK2_ON | CLK1_ON | CLK0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 5 | CLK5_MON | 1b | R | The state of the CA55_TSCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 4 | CLK4_MON | 1b | R | The state of the CA55_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3 | CLK3_MON | 1b | R | The state of the CA55_GICCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 1b | R | The state of the CA55_ATCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 1b | R | The state of the CA55_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 1b | R | The state of the CA55_SCLK/PERICLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.61 Clock Monitor Register Cortex-M33 (CPG_CLKMON_CM33)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the CM33_TSCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the CM33_CLKIN clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.62 Clock Monitor Register SRAM_ACPU (CPG_CLKMON_SRAM_ACPU)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 1b | R | The state of the SRAM_ACPU_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.63 Clock Monitor Register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 1b | R | The state of the SRAM_MCPU_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.64 Clock Monitor Register GIC600 (CPG_CLKMON_GIC600)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 1b | R | The state of the GIC600_GICCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.65 Clock Monitor Register IA55 (CPG_CLKMON_IA55)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 1b | R | The state of the IA55_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 1b | R | The state of the IA55_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.66 Clock Monitor Register IM33 (CPG_CLKMON_IM33)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 1b | R | The state of the IM33_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 1b | R | The state of the IM33_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.67 Clock Monitor Register MHU (CPG_CLKMON_MHU)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the MHU_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.68 Clock Monitor Register CST (CPG_CLKMON_CST)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | CLK10_MON | CLK9_MON | CLK8_MON | CLK7_MON | CLK6_MON | CLK5_MON | CLK4_MON | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 11 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 10 | CLK10_MON | 1b | R | The state of the CST_AXI_ETR_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 9 | CLK9_MON | 1b | R | The state of the CST_AXI_SB_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 8 | CLK8_MON | 1b | R | The state of the CST_ATB_CM33_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 7 | CLK7_MON | 1b | R | The state of the CST_ATB_CA55_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 6 | CLK6_MON | 1b | R | The state of the CST_AHB_ATH_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 5 | CLK5_MON | 1b | R | The state of the CST_AHB_CM33_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 4 | CLK4_MON | 1b | R | The state of the CST_APB_CA55_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3 | CLK3_MON | 1b | R | The state of the CST_APB_CM33_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 1b | R | The state of the CST_APB_SB_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 1b | R | The state of the CST_TS_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 1b | R | The state of the CST_CS_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

**Note:** No CGC is provided for CST_SWCLKTCK.

### 7.2.4.69 Clock Monitor Register SYC (CPG_CLKMON_SYC)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the SYC_CNT_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.70 Clock Monitor Register DMAC_REG (CPG_CLKMON_DMAC_REG)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the DMAC_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the DMAC_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.71 Clock Monitor Register GTM (CPG_CLKMON_GTM)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the MTU_X_MCK_MTU3 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.73 Clock Monitor Register POE3 (CPG_CLKMON_POE3)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the POE3_CLKM_POE clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.74 Clock Monitor Register WDT (CPG_CLKMON_WDT)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CLK5_MON | CLK4_MON | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | — | 1b | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 6 | — | 1b | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 5 | CLK5_MON | 0b | R | The state of the WDT2_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 4 | CLK4_MON | 0b | R | The state of the WDT2_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3, 2 | — | 00b | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 1 | CLK1_MON | 1b | R | The state of the WDT0_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 1b | R | The state of the WDT0_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.75 Clock Monitor Register DDR (CPG_CLKMON_DDR)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the DDR_REG_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the DDR_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.76 Clock Monitor Register SPI_MULTI (CPG_CLKMON_SPI_MULTI)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the SPI_CLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the SPI_CLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.77 Clock Monitor Register SDHI (CPG_CLKMON_SDHI)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK7_MON | CLK6_MON | CLK5_MON | CLK4_MON | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | CLK7_MON | 0b | R | The state of the SDHI1_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 6 | CLK6_MON | 0b | R | The state of the SDHI1_CLK_HS clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 5 | CLK5_MON | 0b | R | The state of the SDHI1_IMCLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 4 | CLK4_MON | 0b | R | The state of the SDHI1_IMCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3 | CLK3_MON | 0b | R | The state of the SDHI0_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 0b | R | The state of the SDHI0_CLK_HS clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the SDHI0_IMCLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the SDHI0_IMCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.78 Clock Monitor Register ISU (CPG_CLKMON_ISU)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the ISU_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the ISU_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.79 Clock Monitor Register CRU (CPG_CLKMON_CRU)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 3 | CLK3_MON | 0b | R | The state of the CRU_ACLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 0b | R | The state of the CRU_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the CRU_VCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the CRU_SYSCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.80 Clock Monitor Register LCDC (CPG_CLKMON_LCDC)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the LCDC_CLK_D clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the LCDC_CLK_A/P clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.81 Clock Monitor Register SSI (CPG_CLKMON_SSI)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK7_MON | CLK6_MON | CLK5_MON | CLK4_MON | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 | CLK7_MON | 0b | R | The state of the SSI3_PCLK_SFR clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 6 | CLK6_MON | 0b | R | The state of the SSI3_PCLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 5 | CLK5_MON | 0b | R | The state of the SSI2_PCLK_SFR clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 4 | CLK4_MON | 0b | R | The state of the SSI2_PCLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3 | CLK3_MON | 0b | R | The state of the SSI1_PCLK_SFR clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 0b | R | The state of the SSI1_PCLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the SSI0_PCLK_SFR clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the SSI0_PCLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.82 Clock Monitor Register USB (CPG_CLKMON_USB)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | CLK3_MON | 0b | R | The state of the USB_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 0b | R | The state of the USB_U2P_EXR_CPUCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the USB_U2H1_HCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the USB_U2H0_HCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.83 Clock Monitor Register ETH (CPG_CLKMON_ETH)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the ETH1_CLK_AXI/CHI clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the ETH0_CLK_AXI/CHI clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

**Note:** No CGC is provided for ETH1_REFCLK and ETH0_REFCLK.

### 7.2.4.84 Clock Monitor Register I2C (CPG_CLKMON_I2C)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | CLK3_MON | 0b | R | The state of the I2C3_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 0b | R | The state of the I2C2_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the I2C1_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the I2C0_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.85 Clock Monitor Register SCIF (CPG_CLKMON_SCIF)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | CLK4_MON | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | CLK4_MON | 0b | R | The state of the SCIF4_CLK_PCK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3 | CLK3_MON | 0b | R | The state of the SCIF3_CLK_PCK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 0b | R | The state of the SCIF2_CLK_PCK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the SCIF1_CLK_PCK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the SCIF0_CLK_PCK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.86 Clock Monitor Register SCI (CPG_CLKMON_SCI)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored.. |
| 1 | CLK1_MON | 0b | R | The state of the SCI1_CLKP clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the SCI0_CLKP clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.87 Clock Monitor Register IRDA (CPG_CLKMON_IRDA)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the IRDA_CLKP clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.88 Clock Monitor Register RSPI (CPG_CLKMON_RSPI)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | CLK2_MON | 0b | R | The state of the RSPI2_CLKB clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 0b | R | The state of the RSPI1_CLKB clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the RSPI0_CLKB clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.89 Clock Monitor Register CANFD (CPG_CLKMON_CANFD)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the CANFD_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.90 Clock Monitor Register GPIO (CPG_CLKMON_GPIO)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the GPIO_HCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.91 Clock Monitor Register ADC (CPG_CLKMON_ADC)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | CLK1_MON | 0b | R | The state of the ADC_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 0b | R | The state of the ADC_ADCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.92 Clock Monitor Register TSU (CPG_CLKMON_TSU)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLK0_MON | 0b | R | The state of the TSU_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.93 Clock Monitor Register AXI_TZCDDR (CPG_CLKMON_AXI_TZCDDR)

This register is used to monitor the state of the clocks supplied to individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | CLK4_MON | CLK3_MON | CLK2_MON | CLK1_MON | CLK0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | CLK4_MON | 1b | R | The state of the BUS_TZCDDR_ACLK3 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 3 | CLK3_MON | 1b | R | The state of the BUS_TZCDDR_ACLK2 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 2 | CLK2_MON | 1b | R | The state of the BUS_TZCDDR_ACLK1 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 1 | CLK1_MON | 1b | R | The state of the BUS_TZCDDR_ACLK0 clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |
| 0 | CLK0_MON | 1b | R | The state of the BUS_TZCDDR_PCLK clock is monitored.<br>0: Clock is not supplied.<br>1: Clock is supplied. |

### 7.2.4.94 Reset Control Register Cortex-A55 (CPG_RST_CA55)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 28 | UNIT12_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT12_RSTB bit (bit 12)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 27 | UNIT11_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT11_RSTB bit (bit 11)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 26 | UNIT10_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT10_RSTB bit (bit 10)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 25 | UNIT9_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT9_RSTB bit (bit 9)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 24 | UNIT8_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT8_RSTB bit (bit 8)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 23 | UNIT7_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT7_RSTB bit (bit 7)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 22 | UNIT6_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT6_RSTB bit (bit 6)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 21 | UNIT5_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT5_RSTB bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 20 | UNIT4_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT4_RSTB bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 18 | UNIT2_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | UNIT12_RSTB | 1b | RW | The CA55_RST12 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 11 | UNIT11_RSTB | 1b | RW | The CA55_RST11 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 10 | UNIT10_RSTB | 1b | RW | The CA55_RST10 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 9 | UNIT9_RSTB | 1b | RW | The CA55_RST9 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 8 | UNIT8_RSTB | 1b | RW | The CA55_RST8 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 7 | UNIT7_RSTB | 1b | RW | The CA55_RST7 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 6 | UNIT6_RSTB | 1b | RW | The CA55_RST6reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 5 | UNIT5_RSTB | 1b | RW | The CA55_RST5 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 4 | UNIT4_RSTB | 1b | RW | The CA55_RST4 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 3 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | UNIT2_RSTB | 1b | RW | The CA55_RST3_0 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 0 | UNIT0_RSTB | 1b | RW | The CA55_RST1_0 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.95 Reset Control Register Cortex-M33 (CPG_RST_CM33)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | UNIT2_RSTB | 0b | RW | The CM33_MISCRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The CM33_NSYSRESET reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The CM33_NPORESET reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.96 Reset Control Register SRAM_ACPU (CPG_RST_SRAM_ACPU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 1b | RW | The SRAM_ACPU_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.97 Reset Control Register SRAM_MCPU (CPG_RST_SRAM_MCPU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 1b | RW | The SRAM_MCPU_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.98 Reset Control Register GIC600 (CPG_RST_GIC600)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 1b | RW | The GIC600_DBG_GICRESET_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 1b | RW | The GIC600_GICRESET_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.99 Reset Control Register IA55 (CPG_RST_IA55)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 1b | RW | The IA55_RESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.100 Reset Control Register IM33 (CPG_RST_IM33)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 1b | RW | The IM33_RESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.101 Reset Control Register MHU (CPG_RST_MHU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The MHU_RESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.102 Reset Control Register SYC (CPG_RST_SYC)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The SYC_RESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.103 Reset Control Register DMAC (CPG_RST_DMAC)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The DMAC_RST_ASYNC reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The DMAC_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.104 Reset Control Register GTM (CPG_RST_GTM)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | UNIT2_RSTB | 0b | RW | The OSTM2_PRESETZ reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The OSTM1_PRESETZ reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 1b | RW | The OSTM0_PRESETZ reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.105 Reset Control Register MTU (CPG_RST_MTU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The MTU_X_PRESET_MTU3 reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.106 Reset Control Register POE3 (CPG_RST_POE3)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The POE3_RST_M_REG reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.107 Reset Control Register WDT (CPG_RST_WDT)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RST WEN | — | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RSTB | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | — | 1b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 2 | UNIT2_RSTB | 0b | RW | The WDT2_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | UNIT0_RSTB | 1b | RW | The WDT0_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.108 Reset Control Register DDR (CPG_RST_DDR)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | UNIT6_RST WEN | UNIT5_RST WEN | UNIT4_RST WEN | UNIT3_RST WEN | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | UNIT6_RSTB | UNIT5_RSTB | UNIT4_RSTB | UNIT3_RSTB | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 23 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 22 | UNIT6_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT6_RSTB bit (bit 6)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 21 | UNIT5_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT5_RSTB bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 20 | UNIT4_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT4_RSTB bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | UNIT3_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT3_RSTB bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 | UNIT6_RSTB | 0b | RW | The DDR_REG_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 5 | UNIT5_RSTB | 0b | RW | The DDR_AXI3_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 4 | UNIT4_RSTB | 0b | RW | The DDR_AXI2_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 3 | UNIT3_RSTB | 0b | RW | The DDR_AXI1_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 2 | UNIT2_RSTB | 0b | RW | The DDR_AXI0_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The DDR_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The DDR_RESET_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.109 Reset Control Register SPI (CPG_RST_SPI)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The SPI_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.110 Reset Control Register SDHI (CPG_RST_SDHI)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The SDHI1_IXRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The SDHI0_IXRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.111 Reset Control Register ISU (CPG_RST_ISU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The ISU_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The ISU_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.112 Reset Control Register CRU (CPG_RST_CRU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | UNIT2_RSTB | 0b | RW | The CRU_ARESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The CRU_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The CRU_CMN_RSTB reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.113 Reset Control Register LCDC (CPG_RST_LCDC)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The LCDC_RESET_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.114 Reset Control Register SSIF (CPG_RST_SSIF)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UNIT3_RSTWEN | UNIT2_RSTWEN | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UNIT3_RSTB | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | UNIT3_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT3_RSTB bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | UNIT2_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | UNIT3_RSTB | 0b | RW | The SSI3_RST_M2_REG reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 2 | UNIT2_RSTB | 0b | RW | The SSI2_RST_M2_REG reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The SSI1_RST_M2_REG reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The SSI0_RST_M2_REG reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.115 Reset Control Register USB (CPG_RST_USB)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UNIT3_RST WEN | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UNIT3_RSTB | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | UNIT3_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT3_RSTB bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | UNIT3_RSTB | 0b | RW | The USB_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 2 | UNIT2_RSTB | 0b | RW | The USB_U2P_EXL_SYSRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The USB_U2H1_HRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The USB_U2H0_HRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.116 Reset Control Register ETH (CPG_RST_ETH)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The ETH1_RST_HW_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The ETH0_RST_HW_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.117 Reset Control Register I2C (CPG_RST_I2C)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UNIT3_RST WEN | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UNIT3_RSTB | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | UNIT3_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT3_RSTB bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | UNIT3_RSTB | 0b | RW | The I2C3_MRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 2 | UNIT2_RSTB | 0b | RW | The I2C2_MRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The I2C1_MRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The I2C0_MRST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.118 Reset Control Register SCIF (CPG_RST_SCIF)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | UNIT4_RST WEN | UNIT3_RST WEN | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | UNIT4_RSTB | UNIT3_RSTB | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | UNIT4_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT4_RSTB bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | UNIT3_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT3_RSTB bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | UNIT4_RSTB | 0b | RW | The SCIF4_RST_SYSTEM_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 3 | UNIT3_RSTB | 0b | RW | The SCIF3_RST_SYSTEM_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 2 | UNIT2_RSTB | 0b | RW | The SCIF2_RST_SYSTEM_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The SCIF1_RST_SYSTEM_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | UNIT0_RSTB | 0b | RW | The SCIF0_RST_SYSTEM_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.119 Reset Control Register SCI (CPG_RST_SCI)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The SCI1_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The SCI0_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.120 Reset Control Register IRDA (CPG_RST_IRDA)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The IRDA_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.121 Reset Control Register RSPI (CPG_RST_RSPI)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | UNIT2_RSTB | 0b | RW | The RSPI2_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The RSPI1_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The RSPI0_RST reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.122 Reset Control Register CANFD (CPG_RST_CANFD)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The CANFD_RSTC_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The CANFD_RSTP_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.123 Reset Control Register GPIO (CPG_RST_GPIO)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | UNIT2_RSTB | 0b | RW | The GPIO_SPARE_RESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 0b | RW | The GPIO_PORT_RESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The GPIO_RSTN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.124 Reset Control Register ADC (CPG_RST_ADC)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTWEN | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | UNIT1_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | UNIT1_RSTB | 0b | RW | The ADC_ADRST_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 0 | UNIT0_RSTB | 0b | RW | The ADC_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.125 Reset Control Register TSU (CPG_RST_TSU)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTWEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | UNIT0_RSTWEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | UNIT0_RSTB | 0b | RW | The TSU_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.126 Reset Control Register AXI_TZCDDR (CPG_RST_AXI_TZCDDR)

This register is used to control the reset signals for individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | UNIT4_RST WEN | UNIT3_RST WEN | UNIT2_RST WEN | UNIT1_RST WEN | UNIT0_RST WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | UNIT4_RSTB | UNIT3_RSTB | UNIT2_RSTB | UNIT1_RSTB | UNIT0_RSTB |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 | UNIT4_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT4_RSTB bit (bit 4)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 19 | UNIT3_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT3_RSTB bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | UNIT2_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT2_RSTB bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | UNIT1_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT1_RSTB bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | UNIT0_RST WEN | 0b | R0W1 | Flag for enabling the writing to the UNIT0_RSTB bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | UNIT4_RSTB | 1b | RW | The BUS_TZCDDR_ARESET3N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 3 | UNIT3_RSTB | 1b | RW | The BUS_TZCDDR_ARESET2N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 2 | UNIT2_RSTB | 1b | RW | The BUS_TZCDDR_ARESET1N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |
| 1 | UNIT1_RSTB | 1b | RW | The BUS_TZCDDR_ARESET0N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | UNIT0_RSTB | 1b | RW | The BUS_TZCDDR_PRESETN reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

### 7.2.4.127 Reset Monitor Register Cortex-A55 (CPG_RSTMON_CA55)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | RST12_MON | RST11_MON | RST10_MON | RST9_MON | RST8_MON | RST7_MON | RST6_MON | RST5_MON | RST4_MON | — | RST2_MON | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | RST12_MON | 0b | R | The state of the CA55_RST12 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 11 | RST11_MON | 0b | R | The state of the CA55_RST11 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 10 | RST10_MON | 0b | R | The state of the CA55_RST10 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 9 | RST9_MON | 0b | R | The state of the CA55_RST9 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 8 | RST8_MON | 0b | R | The state of the CA55_RST8 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 7 | RST7_MON | 0b | R | The state of the CA55_RST7 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 6 | RST6_MON | 0b | R | The state of the CA55_RST6 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 5 | RST5_MON | 0b | R | The state of the CA55_RST5 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 4 | RST4_MON | 0b | R | The state of the CA55_RST4 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 3 | — | 1b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 1 | RST1_MON | 0b | R | The state of the CA55_RST1_1 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | — | 1b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 0 | RST0_MON | 0b | R | The state of the CA55_RST1_0 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.128 Reset Monitor Register Cortex-M33 (CPG_RSTMON_CM33)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | RST2_MON | 1b | R | The state of the CM33_MISCRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the CM33_NSYSRESET reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the CM33_NPORESET reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.129 Reset Monitor Register SRAM_ACPU (CPG_RSTMON_SRAM_ACPU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 0b | R | The state of the SRAM_ACPU_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.130 Reset Monitor Register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 0b | R | The state of the SRAM_MCPU_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.131 Reset Monitor Register GIC600 (CPG_RSTMON_GIC600)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 0b | R | The state of the GIC600_DBG_GICRESET_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 0b | R | The state of the GIC600_GICRESET_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.132 Reset Monitor Register IA55 (CPG_RSTMON_IA55)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 0b | R | The state of the IA55_RESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.133 Reset Monitor Register IM33 (CPG_RSTMON_IM33)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 0b | R | The state of the IM33_RESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.134 Reset Monitor Register MHU (CPG_RSTMON_MHU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the MHU_RESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.135 Reset Monitor Register SYC (CPG_RSTMON_SYC)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the SYC_RESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.136 Reset Monitor Register DMAC (CPG_RSTMON_DMAC)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the DMAC_RST_ASYNC reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the DMAC_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.137 Reset Monitor Register GTM (CPG_RSTMON_GTM)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | RST2_MON | 1b | R | The state of the OSTM2_PRESETZ reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the OSTM1_PRESETZ reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 0b | R | The state of the OSTM0_PRESETZ reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.138 Reset Monitor Register MTU (CPG_RSTMON_MTU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the MTU_X_PRESET_MTU3 reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.139 Reset Monitor Register POE3 (CPG_RSTMON_POE3)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the POE3_RST_M_REG reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.140 Reset Monitor Register WDT (CPG_RSTMON_WDT)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RST2_MON | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | RST2_MON | 1b | R | The state of the WDT2_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | — | 1b | R | Reserved<br>Whenever it is read, 1 is read. The written value will be ignored. |
| 0 | RST0_MON | 0b | R | The state of the WDT0_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.141 Reset Monitor Register DDR (CPG_RSTMON_DDR)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RST6_MON | RST5_MON | RST4_MON | RST3_MON | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 | RST6_MON | 1b | R | The state of the DDR_REG_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 5 | RST5_MON | 1b | R | The state of the DDR_AXI3_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.142 Reset Monitor Register SPI (CPG_RSTMON_SPI)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the SPI_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.143 Reset Monitor Register SDHI (CPG_RSTMON_SDHI)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the SDHI1_IXRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the SDHI0_IXRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.144 Reset Monitor Register ISU (CPG_RSTMON_ISU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the ISU_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the ISU_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.145 Reset Monitor Register CRU (CPG_RSTMON_CRU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | RST2_MON | 1b | R | The state of the CRU_ARESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the CRU_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the CRU_CMN_RSTB reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.146 Reset Monitor Register LCDC (CPG_RSTMON_LCDC)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the LCDC_RESET_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.147 Reset Monitor Register SSIF (CPG_RSTMON_SSIF)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | RST3_MON | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | RST3_MON | 1b | R | The state of the SSI3_RST_M2_REG reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 2 | RST2_MON | 1b | R | The state of the SSI2_RST_M2_REG reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the SSI1_RST_M2_REG reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the SSI0_RST_M2_REG reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.148 Reset Monitor Register USB (CPG_RSTMON_USB)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | RST3_MON | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | RST3_MON | 1b | R | The state of the USB_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 2 | RST2_MON | 1b | R | The state of the USB_U2P_EXL_SYSRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the USB_U2H1_HRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the USB_U2H0_HRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.149 Reset Monitor Register ETH (CPG_RSTMON_ETH)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the ETH1_RST_HW_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the ETH0_RST_HW_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.150 Reset Monitor Register I2C (CPG_RSTMON_I2C)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | RST3_MON | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | RST3_MON | 1b | R | The state of the I2C3_MRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 2 | RST2_MON | 1b | R | The state of the I2C2_MRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the I2C1_MRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the I2C0_MRST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.151 Reset Monitor Register SCIF (CPG_RSTMON_SCIF)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | RST4_MON | RST3_MON | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | RST4_MON | 1b | R | The state of the SCIF4_RST_SYSTEM_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 3 | RST3_MON | 1b | R | The state of the SCIF3_RST_SYSTEM_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 2 | RST2_MON | 1b | R | The state of the SCIF2_RST_SYSTEM_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the SCIF1_RST_SYSTEM_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the SCIF0_RST_SYSTEM_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.152 Reset Monitor Register SCI (CPG_RSTMON_SCI)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the SCI1_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the SCI0_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.153 Reset Monitor Register IRDA (CPG_RSTMON_IRDA)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the IRDA_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.154 Reset Monitor Register RSPI (CPG_RSTMON_RSPI)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | RST2_MON | 1b | R | The state of the RSPI2_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the RSPI1_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the RSPI0_RST reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.155 Reset Monitor Register CANFD (CPG_RSTMON_CANFD)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the CANFD_RSTC_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the CANFD_RSTP_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.156 Reset Monitor Register GPIO (CPG_RSTMON_GPIO)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | RST2_MON | 1b | R | The state of the GPIO_SPARE_RESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 1b | R | The state of the GPIO_PORT_RESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the GPIO_RSTN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.157 Reset Monitor Register ADC (CPG_RSTMON_ADC)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | RST1_MON | 1b | R | The state of the ADC_ADRST_N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 1b | R | The state of the ADC_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.158 Reset Monitor Register TSU (CPG_RSTMON_TSU)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RST0_MON | 1b | R | The state of the TSU_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.159 Reset Monitor Register AXI_TZCDDR (CPG_RSTMON_AXI_TZCDDR)

This register is used to monitor the reset signals of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | RST4_MON | RST3_MON | RST2_MON | RST1_MON | RST0_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | RST4_MON | 0b | R | The state of the BUS_TZCDDR_ARESET3N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 3 | RST3_MON | 0b | R | The state of the BUS_TZCDDR_ARESET2N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 2 | RST2_MON | 0b | R | The state of the BUS_TZCDDR_ARESET1N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 1 | RST1_MON | 0b | R | The state of the BUS_TZCDDR_ARESET0N reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |
| 0 | RST0_MON | 0b | R | The state of the BUS_TZCDDR_PRESETN reset signal is monitored.<br>0: Reset signal is not applied (released from the reset state).<br>1: Reset signal is applied (reset state). |

### 7.2.4.160 WDT Overflow System Reset Register (CPG_WDTOVF_RST)

After the release from a system reset applied by the WDT reset circuit in response to a reset request such as a WDT overflow, this register can be used to identify the WDT channel that generated the reset request. If a system reset is not applied according to the WDTRSTSEL register setting, the WDT is not reset and the source of the reset request can be identified by checking the interrupt from the WDT and the status register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | WDTOVF2_WEN | — | WDTOVF0_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 | R | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | WDTOVF2 | — | WDTOVF0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | RW | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 19 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | WDTOVF2_WEN | 0b | R0W1 | Flag for enabling the writing to the WDTOVF2 bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 16 | WDTOVF0_WEN | 0b | R0W1 | Flag for enabling the writing to the WDTOVF0 bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | WDTOVF2 | 0b | RW | The system reset generated by WDT channel 2 for the Cortex-M33 is indicated.<br>0: System reset has not been generated by WDT channel 2 for the Cortex-M33.<br>1: System reset has been generated by WDT channel 2 for the Cortex-M33.<br>*Note*: This bit is cleared by writing 1. |
| 1 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | WDTOVF0 | 0b | RW | The system reset generated WDT channel 0 for Cortex-A55 Core 0 is indicated.<br>0: System reset has not been generated by WDT channel 0 for Cortex-A55 Core 0.<br>1: System reset has been generated by WDT channel 0 for Cortex-A55 Core 0.<br>*Note*: This bit is cleared by writing 1. |

### 7.2.4.161 WDT Reset Selector Register (CPG_WDTRST_SEL)

This register is used to mask reset requests from the WDT.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | WDTRSTSEL10 | — | WDTRSTSEL8 | — | WDTRSTSEL6 | — | WDTRSTSEL4 | — | WDTRSTSEL2 | — | WDTRSTSEL0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | RW | RW | RW | R | RW | RW | RW | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 11 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 10 | WDTRSTSEL10 | 0b | RW | Whether to mask the reset request by WDT channel 2 is specified.<br>0: Cold reset of the Cortex-M33 is masked.<br>1: Cold reset of the Cortex-M33 is enabled. |
| 9 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 8 | WDTRSTSEL8 | 0b | RW | Whether to mask the reset request by WDT channel 0 is specified.<br>0: Cold reset of the Cortex-A55 is masked.<br>1: Cold reset of the Cortex-A55 is enabled. |
| 7 | — | 1b | R | Reserved<br>Whenever it is read, 1 is read. The written value will be ignored. |
| 6 | WDTRSTSEL6 | 0b | RW | Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel 2 for the Cortex-M33 is specified.<br>0: Assertion of WDTOVFOUT is masked.<br>1: Assertion of WDTOVFOUT is enabled. |
| 5 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 4 | WDTRSTSEL4 | 0b | RW | Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel 0 for Cortex-A55 Core 0 is specified.<br>0: Assertion of WDTOVFOUT is masked.<br>1: Assertion of WDTOVFOUT is enabled. |
| 3 | — | 1b | R | Reserved<br>Whenever it is read, 1 is read. The written value will be ignored. |
| 2 | WDTRSTSEL2 | 0b | RW | Whether to mask WDTSYSREST[2] due to a request from WDT channel 2 for the Cortex-M33 is specified.<br>0: System reset is masked.<br>1: System reset is enabled. |
| 1 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 0 | WDTRSTSEL0 | 0b | RW | Whether to mask WDTSYSREST[0] due to a request from WDT channel 0 for Cortex-A55 Core 0 is specified.<br>0: System reset is masked.<br>1: System reset is enabled. |

**Note:** Do not make the settings WDTRSTSEL3 = 1 and WDTRSTSEL7 = 0. If these settings are attempted, a system reset initializes the WDTRSTSEL7 bit to 1 (initial value) and WDTOVFOUT is unexpectedly asserted.

### 7.2.4.162 Cortex-A55 Cluster Power Status Monitor Register (CPG_CLUSTER_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is monitored by the CPU for software control of the handshake.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PDENY_MON | PACCEPT_MON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | PDENY_MON | — | R | Signal indicating the denial of power mode transition in the cluster |
| 0 | PACCEPT_MON | — | R | Signal indicating the acceptance of power mode transition in the cluster |

### 7.2.4.163 Cortex-A55 Cluster Power Status Control Register (CPG_CLUSTER_PCHCTL)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is used for software control of the handshake.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | PSTATE0_SET | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | RW | RW | RW | RW | RW | RW | RW |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PREQ_SET |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 22 to 16 | PSTATE0_SET | 100_1000b | RW | Destination power mode of the cluster<br>100_1000b: ON<br>000_0000b: OFF |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | PREQ_SET | 0b | RW | Signal for indicating a request of power mode transition in the cluster |

### 7.2.4.164 Cortex-A55 Core 0 Power Status Monitor Register (CPG_CORE0_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is monitored by the CPU for software control of the handshake.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | PDENY0_MON | — | R | Signal indicating the denial of power mode transition in the core 0 |
| 0 | PACCEPT0_MON | — | R | Signal indicating the acceptance of power mode transition in the core 0 |

### 7.2.4.165 Cortex-A55 Core 0 Power Status Control Register (CPG_CORE0_PCHCTL)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is used for software control of the handshake.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | MSTOP0_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | MSTOP0_ON | 0b | RW | The state of BUS_ACPU_MSTOP_MXSRAM_A operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |

### 7.2.4.167 MSTOP Register MCPU1 (CPG_BUS_MCPU1_MSTOP)

This register indicates the stop state of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MSTOP15_ON_WEN | MSTOP14_ON_WEN | MSTOP13_ON_WEN | MSTOP12_ON_WEN | MSTOP11_ON_WEN | MSTOP10_ON_WEN | MSTOP9_ON_WEN | — | — | — | — | — | MSTOP3_ON_WEN | MSTOP2_ON_WEN | MSTOP1_ON_WEN | MSTOP0_ON_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MSTOP15_ON | MSTOP14_ON | MSTOP13_ON | MSTOP12_ON | MSTOP11_ON | MSTOP10_ON | MSTOP9_ON | — | — | — | — | — | — | MSTOP2_ON | MSTOP1_ON | MSTOP0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | R | R | R | R | R | R | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | MSTOP15_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP15_ON bit (bit 15)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 30 | MSTOP14_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP14_ON bit (bit 14)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 29 | MSTOP13_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP13_ON bit (bit 13)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 28 | MSTOP12_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP12_ON bit (bit 12)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 27 | MSTOP11_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP11_ON bit (bit 11)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 26 | MSTOP10_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP10_ON bit (bit 10)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 25 | MSTOP9_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP9_ON bit (bit 9)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 24 to 20 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 19 | MSTOP3_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 18 | MSTOP2_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | MSTOP1_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | MSTOP0_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 | MSTOP15_ON | 0b | RW | The state of BUS_MCPU_MSTOP13_MHRSPI_1 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 14 | MSTOP14_ON | 0b | RW | The state of BUS_MCPU_MSTOP12_MHRSPI_0 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 13 | MSTOP13_ON | 0b | RW | The state of BUS_MCPU_MSTOP11_MHSSIF_3 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 12 | MSTOP12_ON | 0b | RW | The state of BUS_MCPU_MSTOP10_MHSSIF_2 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 11 | MSTOP11_ON | 0b | RW | The state of BUS_MCPU_MSTOP9_MHSSIF_1 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 10 | MSTOP10_ON | 0b | RW | The state of BUS_MCPU_MSTOP8_MHSSIF_0 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 9 | MSTOP9_ON | 0b | RW | The state of BUS_MCPU_MSTOP7_MHPOE3 operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 8 to 3 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 2 | MSTOP2_ON | 0b | RW | The state of BUS_MCPU_MSTOP0_MHMTU3A operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 1 | MSTOP1_ON | 0b | RW | The state of BUS_MCPU_MSTOP_MHSPI operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 0 | MSTOP0_ON | 0b | RW | The state of BUS_MCPU_MSTOP_MXSRAM_M operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |

### 7.2.4.168 MSTOP Register MCPU2 (CPG_BUS_MCPU2_MSTOP)

This register indicates the stop state of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 7.2.4.174 MSTOP Register REG1 (CPG_BUS_REG1_MSTOP)

This register indicates the stop state of individual modules.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | MSTOP7_ON_WEN | MSTOP6_ON_WEN | MSTOP5_ON_WEN | — | MSTOP3_ON_WEN | MSTOP2_ON_WEN | MSTOP1_ON_WEN | MSTOP0_ON_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R0W1 | R0W1 | R0W1 | R | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | MSTOP7_ON | MSTOP6_ON | MSTOP5_ON | — | MSTOP3_ON | MSTOP2_ON | MSTOP1_ON | MSTOP0_ON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | RW | RW | RW | R | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 | MSTOP7_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP7_ON bit (bit 7)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 22 | MSTOP6_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP6_ON bit (bit 6)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 21 | MSTOP5_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP5_ON bit (bit 5)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 20 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 19 | MSTOP3_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP3_ON bit (bit 3)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 18 | MSTOP2_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP2_ON bit (bit 2)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | MSTOP1_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP1_ON bit (bit 1)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | MSTOP0_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the MSTOP0_ON bit (bit 0)<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | MSTOP7_ON | 0b | RW | The state of BUS_REG1_MSTOP7_MXGIC operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 6 | MSTOP6_ON | 0b | RW | The state of BUS_REG1_MSTOP6_MPTSIPG_OTP operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 5 | MSTOP5_ON | 0b | RW | The state of BUS_REG1_MSTOP5_MHTSIPG operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 4 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 3 | MSTOP3_ON | 0b | RW | The state of BUS_REG1_MSTOP3_MPDMAC_NS operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 2 | MSTOP2_ON | 0b | RW | The state of BUS_REG1_MSTOP2_MXDMAC_NS operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |
| 1 | MSTOP1_ON | 0b | RW | The state of BUS_REG1_MSTOP1_MPDMAC_S operation is indicated.<br>0: Normal operation<br>1: Module stop state (MSTP) |

|---|---|---|---|---|
| 31 to 17 | RESn_ON_WEN [n=15 to 1] | All 0 | R0W1 | Flags for enabling the writing to the RESn_SET bits. These bits are always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 15 to 1 | RESn_SET [n = 15 to 1] | All 0 | RW | No function is assigned to these bits.<br>When the flags for enabling the writing are set to 1, these bits can be written to.<br>The written value is read from these bits. |
| 0 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

### 7.2.4.178 Other Function Register 2 (CPG_OTHERFUNC2_REG)

This register is used for miscellaneous functions.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RES15_ON_WEN | RES14_ON_WEN | RES13_ON_WEN | RES12_ON_WEN | RES11_ON_WEN | RES10_ON_WEN | RES9_ON_WEN | RES8_ON_WEN | RES7_ON_WEN | RES6_ON_WEN | RES5_ON_WEN | RES4_ON_WEN | RES3_ON_WEN | RES2_ON_WEN | RES1_ON_WEN | RES0_ON_WEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 | R0W1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RES15_SET | RES14_SET | RES13_SET | RES12_SET | RES11_SET | RES10_SET | RES9_SET | RES8_SET | RES7_SET | RES6_SET | RES5_SET | RES4_SET | RES3_SET | RES2_SET | RES1_SET | RES0_SET |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW | RW |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | RESn_ON_WEN [n=15 to 1] | All 0 | R0W1 | Flags for enabling the writing to the RESn_SET bits. These bits are always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 16 | RES0_ON_WEN | 0b | R0W1 | Flag for enabling the writing to the RES0_SET bit (bit 0) (DDR_RST_N).<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 15 to 1 | RESn_SET [n = 15 to 1] | All 0 | RW | No function is assigned to these bits.<br>When the flags for enabling the writing are set to 1, these bits can be written to.<br>The written value is read from these bits. |
| 0 | RES0_SET | 0b | RW | The DDR_RST_N reset terminal is controlled.<br>0: Reset signal is applied (reset state).<br>1: Reset signal is stopped (released from the reset state). |

**Note:** The change to the setting in this register is immediately reflected in the reset signal. Therefore, no register is provided to monitor the result of the change.

### 7.2.4.179 Clock Control Register MBUS (CPG_CLKON_MBUS)

This register is used to supply or stop clocks for individual modules.

Use this register only when switching SEL_PLL3_3. Reserved bit is prohibited from setting anything other than the initial value.The clocks listed in this register are not listed in the separate clock list.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CLK9_ON_WEN | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R0W1 | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 11, 10 | — | 11b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 | CLK9_MON | 1b | R | The state of the MBUS_CLK9 clock is monitored.<br>0: Clock is stopped.<br>1: Clock is supplied. |
| 8 to 0 | — | All 1 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

## 7.3 Functions of the CPG

This section describes the functions of the CPG.

### 7.3.1 Clock Control

The CPG has the following five types of clock control functions.

- PLL control, setting, and monitoring functions
- Clock frequency dividers and selectors
- Fixed frequency dividers
- Clock enabling function

#### 7.3.1.1 PLL Control, Setting, and Monitoring Functions

This section describes the functions for controlling, setting, and monitoring the PLL (PLL1 to PLL6).

The PLL is controlled through the registers in the CPG.

The PLL control module counts the PLL lock wait time to generate the PLL lock signal and it is used to control the PLL output clocks by the CGC so that invalid clocks are not output before the PLL is locked.

The reset state and lock state of the PLL can be monitored through registers in the CPG.

The following shows the PLL control, setting, and monitoring functions.

- PLL operating mode control
- Output clock setting
- PLL reset and lock state monitoring

These functions are described in detail in the following sections.

**(1) PLL Operating Mode Control**

The CPG registers are used to specify the SSCG PLL operating mode and make SSCG settings.

The normal mode or standby mode can be selected as the operating mode.

The following can be set up through CPG registers.

- Operating mode setting (normal mode or standby mode)
- SSCG enable or disable setting (valid in the normal mode)

The following table shows the registers to be used.

For details of the settings, refer to the functional description of the target register.

Table 7.6 Registers for Controlling the PLL Operating Mode

| Register Name | Abbreviation | Function |
|---|---|---|
| PLLn (SSCG) standby control registers | CPG_SAMPLLn_STBY (n = 1, 4, or 6)<br>CPG_SIPLL5_STBY | Standby mode setting (reset state) and SSCG enable or disable setting |

### (2) Output Clock Setting

The CPG registers are used to specify the clocks output from the PLL.

The following values can be set up.

- Output clock frequency setting
- SSCG modulation value setting

Table 7.7 Registers for Setting PLL Output Clocks

| Register Name | Abbreviation | Function |
|---|---|---|
| PLLn (SSCG) output clock setting register 1 | CPG_SAMPLLn_CLK1 | Frequency setting |
| PLLn (SSCG) output clock setting register 2 | CPG_SAMPLLn_CLK2 | Frequency setting and SSCG modulation value setting |

**Note:** n = 1, 4, or 6

Table 7.8 Registers for Setting PLL Output Clocks 2

| Register Name | Abbreviation | Function |
|---|---|---|
| PLLn (SSCG) output clock setting register 1 | CPG_SIPLL5_CLK1 | Frequency setting |
| PLLn (SSCG) output clock setting register 3 | CPG_SIPLL5_CLK3 | Frequency setting and SSCG modulation value setting |
| PLLn (SSCG) output clock setting register 4 | CPG_SIPLL5_CLK4 | Frequency setting |
| PLLn (SSCG) output clock setting register 5 | CPG_SIPLL5_CLK5 | SSCG modulation value setting |

### (3) PLL State Monitoring

The reset state and lock state of the PLL can be monitored through CPG registers.

The following table shows the registers to be used.

Table 7.9 Registers for Monitoring the PLL State

| Register Name | Abbreviation | Function |
|---|---|---|
| PLLn monitor registers | CPG_SAMPLLn_MON (n = 1, 4, or 6)<br>CPG_SIPLLn_MON (n = 2, 3, or 5) | PLL state monitoring |

#### (4) SSCG Switching in PLL3

In PLL3, the SSCG function is enabled or disabled through the MD_CLKS signal from the SYSC.

The state of the MD_CLKS signal is determined when the LSI is released from the system reset (PRST#) state and the signal state does not change after the system is activated.

The SSCG enabled or disable state in PLL3 cannot be switched through register settings.

MD_CLKS = 0: SSCG is disabled.

MD_CLKS = 1: SSCG is enabled.

### 7.3.1.2 Clock Frequency Dividers and Selectors

The CPG uses several frequency dividers and selectors to provide appropriate clocks that meet the specifications of individual modules. The frequency dividers and selectors are classified into the dynamic switching type that can be switched without generating a glitch and the static switching type that should be switched after the clock for the target module is stopped because a glitch is generated if this type of divider or selector is switched while the clock is supplied.

The following frequency dividers and selectors are provided.

- Fixed frequency dividers
- Dynamic switching selectors
- Dynamic switching variable-frequency dividers
  (with a duty ratio of 50:50 when divided by an even number)
- Static switching selectors
- Static switching variable-frequency dividers
  (with a duty ratio of 50:50 when divided by an even number)

A specific procedure should be used to switch each frequency divider or selector. Refer to **Section 7.4.6, Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers**, **Section 7.4.7, Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors**, and **Section 7.4.8, Procedure for Switching Clocks by the Static Switching Frequency Dividers and Selectors (Procedure for Switching Source Clocks)**.

### 7.3.1.3 Fixed Frequency Dividers

A fixed frequency divider uses a fixed division value. The CPG provides 1/2, 1/4, 1/8, 1/10, 1/16, and 1/32 dividers, and all fixed dividers generate clocks with a duty ratio of 50:50.

#### 7.3.1.4 PLL Clock Monitoring

This function monitors whether the PLL1 to PLL6 output clocks are operating.

The frequency in the CPG is divided to obtain the frequency that can be monitored through the external pin of this LSI and then output to the upper layer.

The following table shows the instance names and clock frequencies of the monitor points.

Table 7.10 Instance Names and Clock Frequencies of the Monitor Points

| PLL Name | Instance Name of Monitor Point | Maximum Frequency (MHz) | Divider Value | Output Clock Frequency (MHz) |
|---|---|---|---|---|
| PLL1 | CPG_CTL/PLL1/FOUT | 1200 | 32 | 38 |
| PLL2 | CPG_CTL/PLL2/FOUT1PH0 | 1600 (1/2 of 3200) | 32 | 50 |
| PLL2 | CPG_CTL/PLL2/FOUT3 | 533 (1/6 of 3200) | 16 | 34 |
| PLL3 | CPG_CTL/PLL3/FOUT1PH0 | 1600 (1/2 of 3200) | 32 | 50 |
| PLL3 | CPG_CTL/PLL3/FOUT3 | 533 (1/6 of 3200) | 16 | 34 |
| PLL3 | CPG_CTL/PLL3/FOUT4 | 400 (1/8 of 3200) | 8 | 50 |
| PLL4 | CPG_CTL/PLL4/FOUT | 1600 | 32 | 50 |
| PLL5 | CPG_CTL/PLL5/FOUTPOSTDIV | 3000 | 64 | 47 |
| PLL5 | CPG_CTL/PLL5/FOUT3 | 500 (1/6 of 3000) | 16 | 32 |
| PLL5 | CPG_CTL/PLL5/FOUT1PH0 | 1500 (1/2 of 3000) | 32 | 47 |
| PLL6 | CPG_CTL/PLL6/FOUT | 500 | 16 | 32 |

## 7.3.2 Clock Generation and Control Functions

The following types of reset are provided.

Table 7.11 Reset Types

| No. | Type | Method | Source | Range of Reset |
|---|---|---|---|---|
| 1 | System reset | Hardware reset | Reset by PRST# | All |
| 2 | | WDT system reset | WDT overflow, etc. | All<br>(The WDTOVF register is excluded.) |
| 3 | Module reset | WDT system reset | WDT overflow, etc. | CPU corresponding to each WDT |
| 4 | | Software reset | Control through CPG registers | individual on-chip modules |

### 7.3.2.1 Range of Reset Application

The following shows the application (target) range of the reset generated by each reset source.

(1) Hardware sources (PRST#, TRST#, and DEBUGEN)

(2) WDT system reset sources

Table 7.12 Range of Reset Application (1/2)

| No. | Operating Mode | Reset Source | | | JTAG Interface | Range of Reset Application | | | | Description of Reset |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Modules Related to Debugging | | WDT | | |
| | DEBUGEN | Debug Reset TRST# | System Reset PRST# | WDT Reset | | Cortex-A55 Debug Reset (nPDGRESET) | Coresight Reset | Reset for WDTOVF Register | All Modules*1 | |
| 1 | 0 | 0 | 0 | 0 | Reset | Reset | Reset | Reset | Reset | User mode,<br>Hardware system reset |
| 2 | 0 | 0 | 0 | 1 | Reset | Reset | Reset | Reset | Reset | User mode,<br>Hardware system reset |
| 3 | 0 | 0 | 1 | 0 | Reset | Reset | Reset | Reset | Reset | User mode,<br>WDT system reset |

| 13 | 1 | 1 | 0 | 0 | Reset | Reset | Reset | Released | Reset | Debug mode,<br>Hardware system reset |

Table 7.12 Range of Reset Application (2/2)

| No. | Operating Mode DEBUGEN | Reset Source: Debug Reset TRST# | Reset Source: System Reset PRST# | Reset Source: WDT Reset | JTAG Interface | Range of Reset Application: Modules Related to Debugging: Cortex-A55 Debug Reset (nPDGRESET) | Range of Reset Application: Modules Related to Debugging: Coresight Reset | Range of Reset Application: WDT: Reset for WDTOVF Register | Range of Reset Application: All Modules*1 | Description of Reset |
|---|---|---|---|---|---|---|---|---|---|---|
| 14 | 1 | 1 | 0 | 1 | Reset | Reset | Reset | Reset | Reset | Debug mode, Hardware system reset |
| 15 | 1 | 1 | 1 | 0 | Reset*2 | Reset*3 | Reset*2 | Released | Reset*2 | Debug mode, WDT system reset |
| 16 | 1 | 1 | 1 | 1 | Released | Released | Released | Released | Released | Debug mode, Normal operation state |

Note 1. Reset when the system reset is enabled by the WDTRSTSEL register.

Note 2. Reset when the Cortex-A55 reset is enabled by the WDTRSTSEL register.

### 7.3.2.2 System Reset (External Pin)

A system reset is applied when the reset signal from the external PRST# pin is asserted and it initializes the entire LSI.

### 7.3.2.3 WDT System Reset

This LSI has three WDT channels and the CPG issues a reset request when any of the following sources is generated.

| WDT Channel | Target of Monitoring | Function |
|---|---|---|
| Channel 0 | Cortex-A55 Core 0 | Reset due to a parity error in Cortex-A55 Core 0 |
| Channel 2 | Cortex-M33 | Reset due to the LOCK signal in Cortex-M33 |

### (1) WDT System Reset Circuit

The reset requests from three WDT channels can be assigned to the desired signals shown below by using the masking function specified through the settings of the WDTRSTSEL register implemented in the CPG.

If a bit in the WDTRSTSEL register is set to 1, the corresponding signal is asserted when the WDT issues a reset request.

| Target of Monitoring | Function |
|---|---|
| WDT system reset | The reset request signal WDTRST# is sent to the reset generation circuit to apply a system reset. |
| WDTOVF_PERROUT | The WDTOVF_PERR signal is asserted to notify the external devices of the application of a system reset. |
| Cortex-A55 cold reset | A cold reset request is issued when either WDT channel 0 detects an error. |

| Bit | Bit Name | Initial Value | R/W | Reset Source Module | Function |
|---|---|---|---|---|---|
| 0 | WDTRSTSEL0 | 0 | R/W | WDT (channel 0)<br>Cortex-A55 Core 0 | When the corresponding WDT issues a reset request due to an overflow, etc.<br>0: WDT system reset is masked.<br>1: WDT system reset is applied. |
| 1 | Reserved | 0 | R | — | — |
| 2 | WDTRSTSEL2 | 0 | R/W | WDT (channel 2)<br>Cortex-M33 | When the corresponding WDT issues a reset request due to an overflow, etc.<br>0: WDT system reset is masked.<br>1: WDT system reset is applied. |
| 3 | Reserved | 1 | R | — | — |
| 4 | WDTRSTSEL4 | 0 | R/W | WDT (channel 0)<br>Cortex-A55 Core 0 | When the corresponding WDT issues a reset request due to an overflow, etc.<br>0: Assertion of WDTOVFOUT is masked.<br>1: WDTOVFOUT is asserted. |
| 5 | Reserved | 0 | R | — | — |
| 6 | WDTRSTSEL6 | 0 | R/W | WDT (channel 2)<br>Cortex-M33 | When the corresponding WDT issues a reset request due to an overflow, etc.<br>0: Assertion of WDTOVFOUT is masked.<br>1: WDTOVFOUT is asserted. |
| 7 | Reserved | 1 | R | — | — |
| 8 | WDTRSTSEL8 | 0 | R/W | WDT (channel 0)<br>Cortex-A55 Core 0 | When WDT channel 0 issues a reset request*1,*2<br>0: Cold reset of the Cortex-A55 is masked.<br>1: Cold reset of the Cortex-A55 is applied. |
| 9 | Reserved | 0 | R | — | — |
| 10 | WDTRSTSEL10 | 0 | R/W | WDT (channel 2)<br>Cortex-M33 | When WDT channel 2 issues a reset request*3<br>0: Cold reset of the Cortex-M33 is masked.<br>1: Cold reset of the Cortex-M33 is applied. |

Note 1. When an error occurs in Core 0 in the Cortex-A55, a cold reset is applied to the entire Cortex-A55.

Note 2. For the timing of the cold reset in the Cortex-A55, refer to **Section 7.3.2.3(4), Timing of Cortex-A55 Cold Reset due to the WDT Source**.

Note 3. For the timing of the cold reset in the Cortex-M33, refer to **Section 7.3.2.3(5), Timing of Cortex-M33 Cold Reset due to the WDT Source**.

### (2) WDTOVF_PERROUT Signal

This is an external signal that notifies the system that the WDT has applied a WDT system reset to this LSI.

If another WDT system reset is requested before the output of this signal pulse is completed, it is ignored.

The GPIO settings of the WDTOVF_PERROUT# pin such as the driving capability are reset by the GPIO_RST_WDTOVFN signal for the CPG_WDTOVFRST[3:0] register bits.

The following shows the sequence of reset by the WDT.

(1) The WDT channel selected by the WDTRSTSEL[7:4] bits generates a reset request.

(2) The CPG applies a WDT system reset.

(3) 64 cycles of the 24-MHz clock are waited.
* This is the period until the necessary settings are reflected in the entire LSI.

(4) A low pulse is output from the WDTOVF_PERROUT pin for 64 cycles of the 24-MHz clock.

(5) 64 cycles of the 24-MHz clock are waited.

(6) The WDT system reset signal is deasserted and the boot sequence is performed.

### (3) WDT Overflow System Reset Register (CPG_WDTOVF_RST)

After the release from the WDT system reset applied by the WDT system reset circuit in response to a reset request such as a WDT overflow, this register is used to identify the WDT channel that generated the reset request.

This register is not reset by the WDT system reset generated by the WDT.

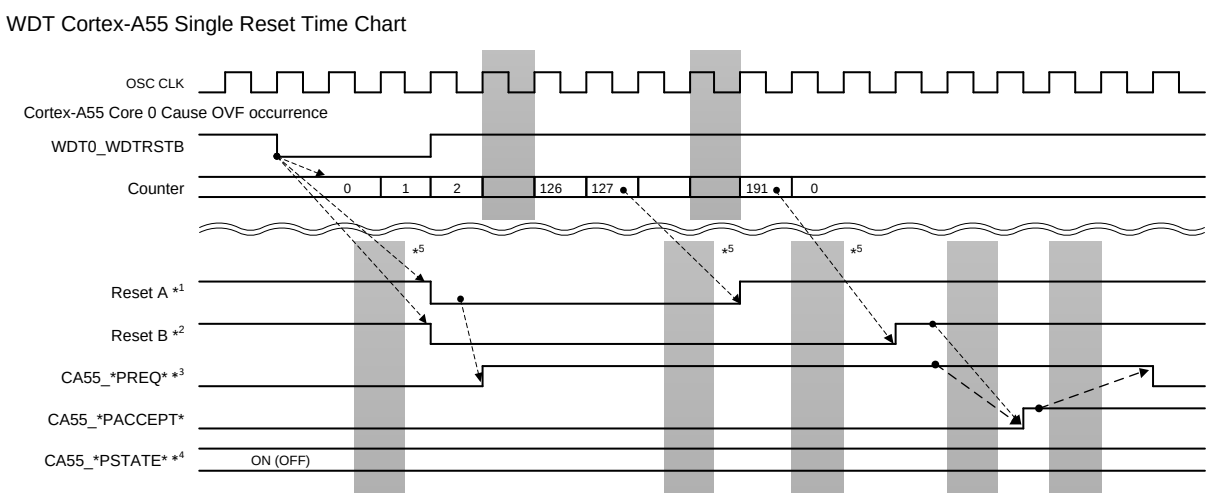
If a WDT system reset is not applied according to the WDTRSTSEL register setting, the WDT is not reset and the source of the reset request can be identified by checking the interrupt from the WDT and the status register in the WDT.

Table 7.13 WDT Overflow System Reset Register (CPG_WDTOVF_RST)

| Bit | Bit Name | Initial Value | R/W | Reset Source Module | Function |
|---|---|---|---|---|---|
| 0 | WDTOVF0 | 0 | R/W | WDT (channel 0) Cortex-A55 Core 0 | When a WDT channel has applied a WDT system reset, the corresponding bit is set to 1.<br>These bits are cleared by writing 1. |
| 1 | Reserved | 0 | R | — | — |
| 2 | WDTOVF2 | 0 | R/W | WDT (channel 2) Cortex-M33 | When a WDT channel has applied a WDT system reset, the corresponding bit is set to 1.<br>These bits are cleared by writing 1. |
| 15 to 3 | Reserved | 0 | R | — | — |
| 16 | WDTOVF0_WEN | 0 | R0W1 | — | Writing to the WDTOVF0 bit (bit 0) is masked.<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 17 | Reserved | 0 | R | — | — |
| 18 | WDTOVF2_WEN | 0 | R0W1 | — | Writing to the WDTOVF2 bit (bit 2) is masked.<br>This bit is always read as 0.<br>0: Writing is disabled.<br>1: Writing is enabled. |
| 31 to 19 | Reserved | 0 | R | — | — |

### (4) Timing of Cortex-A55 Cold Reset due to the WDT Source

The following figure shows the timing of the cold reset for the Cortex-A55 alone due to the WDT source.



Note 1. CA55_RST10/CA55_RST11/CA55_RST12

Note 2. CA55_RST1[0]/CA55_RST3[0]/CA55_RST4/CA55_RST5/CA55_RST6/CA55_RST7/CA55_RST8/CA55_RST9

Note 3. The SYSREG setting must be set to '0'.

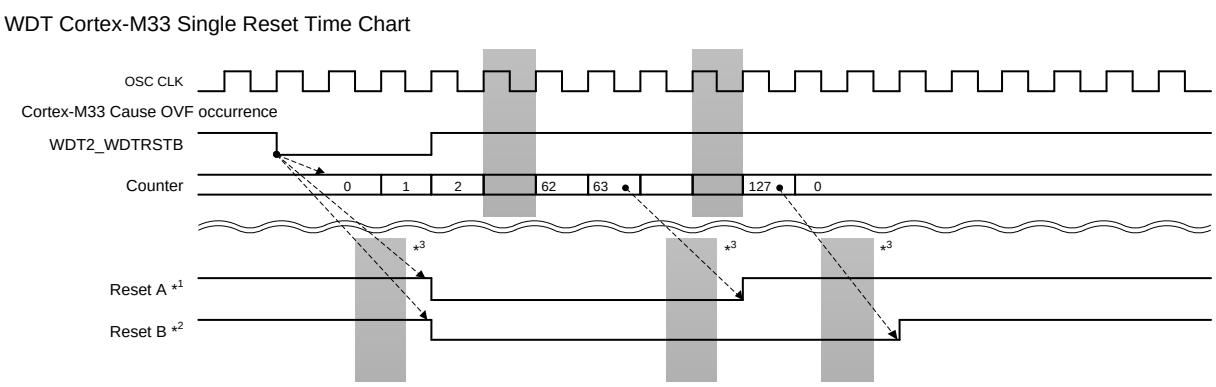
Note 4. The SYSREG setting is 'ON' for Core 0/Cluster.

Note 5. Cortex-A55 reset generation has a certain time lag (approximately 35CLK@24MHz).

Figure 7.4 Timing of Cold Reset for the Cortex-A55 Alone due to the WDT Source

### (5) Timing of Cortex-M33 Cold Reset due to the WDT Source

The following figure shows the timing of the cold reset for the Cortex-M33 alone due to the WDT source.



Note 1. CM33_MISCRESETN

Note 2. CA55_NPORESET/CM33_NSYSRESET

Note 3. Cortex-M33 reset generation has a certain time lag (approximately 35CLK@24MHz)

Figure 7.5 Timing of Cold Reset for the Cortex-M33 Alone due to the WDT Source

#### 7.3.2.4 Cortex-A55 Reset

The following four types of reset corresponding to the target ranges of reset are provided for the Cortex-A55.

When the P-Channel circuit receives a request for a warm reset ((2), (3) below), the P-Channel control is required before the application of a reset to the Cortex-A55.

(1) Cold reset
(2) Cluster warm reset
(3) Core 0 warm reset

When a request to reset the Cortex-A55 alone is generated in the WDT, an error has probably occurred in the Cortex-A55, and the application of a warm reset may be difficult because the warm reset requires a handshake through the P-Channel. Therefore, a cold reset is applied to the Cortex-A55 instead of a warm reset.

- A warm reset for the Cortex-A55 is controlled by software executed in the Cortex-M33.
- After a cold reset (system reset) (normal), Cortex-A55 Core 0 is automatically activated by hardware.
- Refer to **Section 7.3.2.3(4), Timing of Cortex-A55 Cold Reset due to the WDT Source** for the operation of a cold reset (reset of a single core requested from the WDT). Reset control from CPG is performed by hardware.

##### (1) P-Channel Control for Cortex-A55 Reset

A handshake through the P-Channel is necessary before the application of a warm reset to the Cortex-A55. The registers in the CPG are monitored by the CPU for software control of the handshake. Three types of P-Channel are provided corresponding to the warm reset types. The CPG incorporates the registers (shown in the next page) for the following P-Channel signals and performs a handshake triggered by the PREQ signal. After the handshake, the reset signals for the target of the warm reset should be asserted and then negated by software to apply a warm reset.

Only the negation of the PREQ signal at the release of a cold reset (a system reset or a cold reset from the WDT) is controlled by the CPG hardware.

NOTES

1. The LSI that does not incorporate the Cortex-M33 does not support the warm reset of Cortex-A55.
2. When controlling the P-Channel by software, mask the cold reset of a single core of the Cortex-A55 from the WDT so that the cold reset is not applied. The system reset from the WDT does not need to be masked (the WDT system reset takes priority over the warm reset).
3. When enabling the cold reset of a single core of the Cortex-A55 from the WDT, make the “ON” setting through the PSTATE signal in the corresponding channel so that the PREQ signal is automatically controlled after the release from the reset state.

### (a) P-Channel Control Registers in the Cortex-A55

The Cortex-A55 provides a P-Channel for power control for each of the regions — that is, the cluster region including the L3 and SCU, Core 0 region.

The P-Channel is driven in the PERIPHCLK domain, and the CPG contains the registers for controlling and monitoring the P-Channel signals other than the PACTIVE signal.

The CPG performs synchronization for the PACCEPT and PDENY signals.

For the PREQ and PSTATE signals, the Cortex-A55 has a synchronization circuit; the CPG does not perform synchronization.

For the P-Channel control registers, refer to following sections.

**Section 7.2.4.162, Cortex-A55 Cluster Power Status Monitor Register (CPG_CLUSTER_PCHMON)**

### (b) P-Channel Handshake Control

The following describes the operation of the handshake through the P-Channel in the Cortex-A55.

#### Cold Reset (System Reset)

A handshake is necessary for a transition to the “ON” state.

Core 0: PREQ = 1 and PSTATE = ON in the initial state. After the release from the reset state, a handshake will be performed automatically and core 0 will be activated.
The CPG automatically clears PREQ for Core 0 to 0 after the release from the reset state.

#### Cold Reset (Cold Reset of the Cortex-A55 Alone Requested from the WDT)

A handshake is necessary for a transition to the “ON” state.

Core 0: When the cold reset of the Cortex-A55 alone requested from the WDT is enabled, set PREQ to 0 and PSTATE to "ON" in the register in advance. After the release from the reset state, a handshake is automatically executed to activate Core 0.
The CPG automatically clears PREQ for Core 0 to 0 after the release from the reset state.

### Warm Reset

Although the CPG has P-Channel control registers, it does not automatically control the P-Channel when a warm reset is requested; the user should control the P-Channel by software.

**Figure 7.6** shows a flowchart and **Figure 7.7** shows a timing chart of the handshake for a warm reset through the Cortex-A55 P-Channel.

To execute the handshake, the user should manipulate registers in the CPG by software.

For a single-core Cortex-A55:

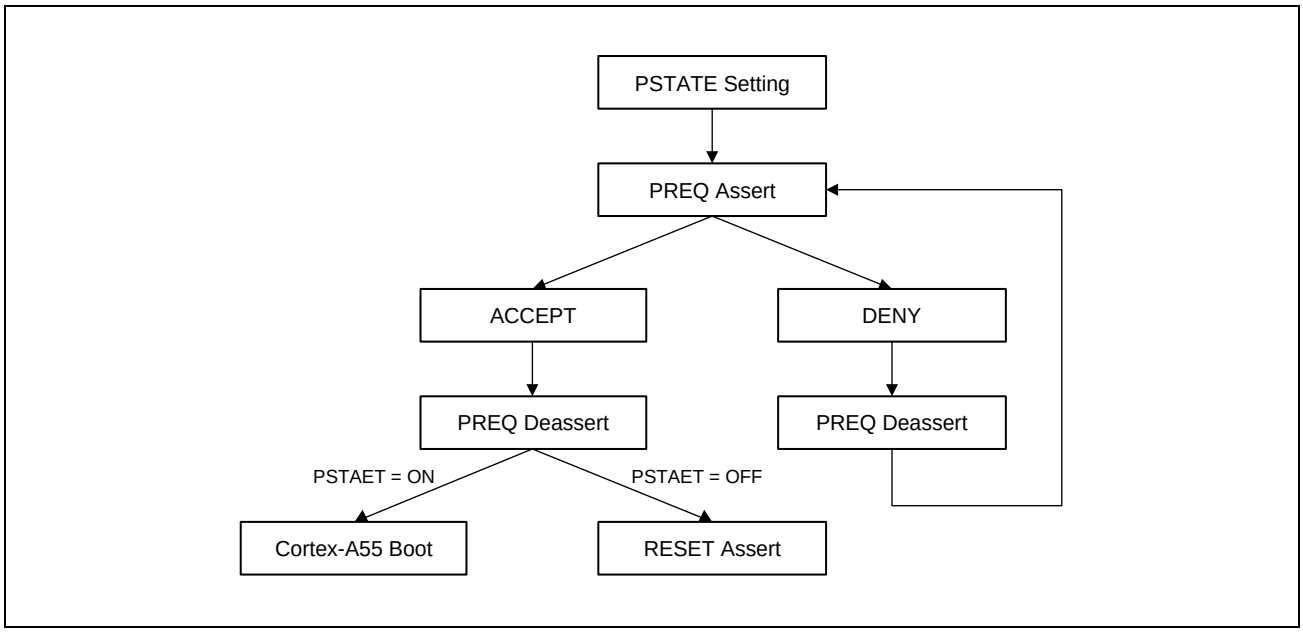


Figure 7.6 Flowchart of a Handshake through the Cortex-A55 P-Channel

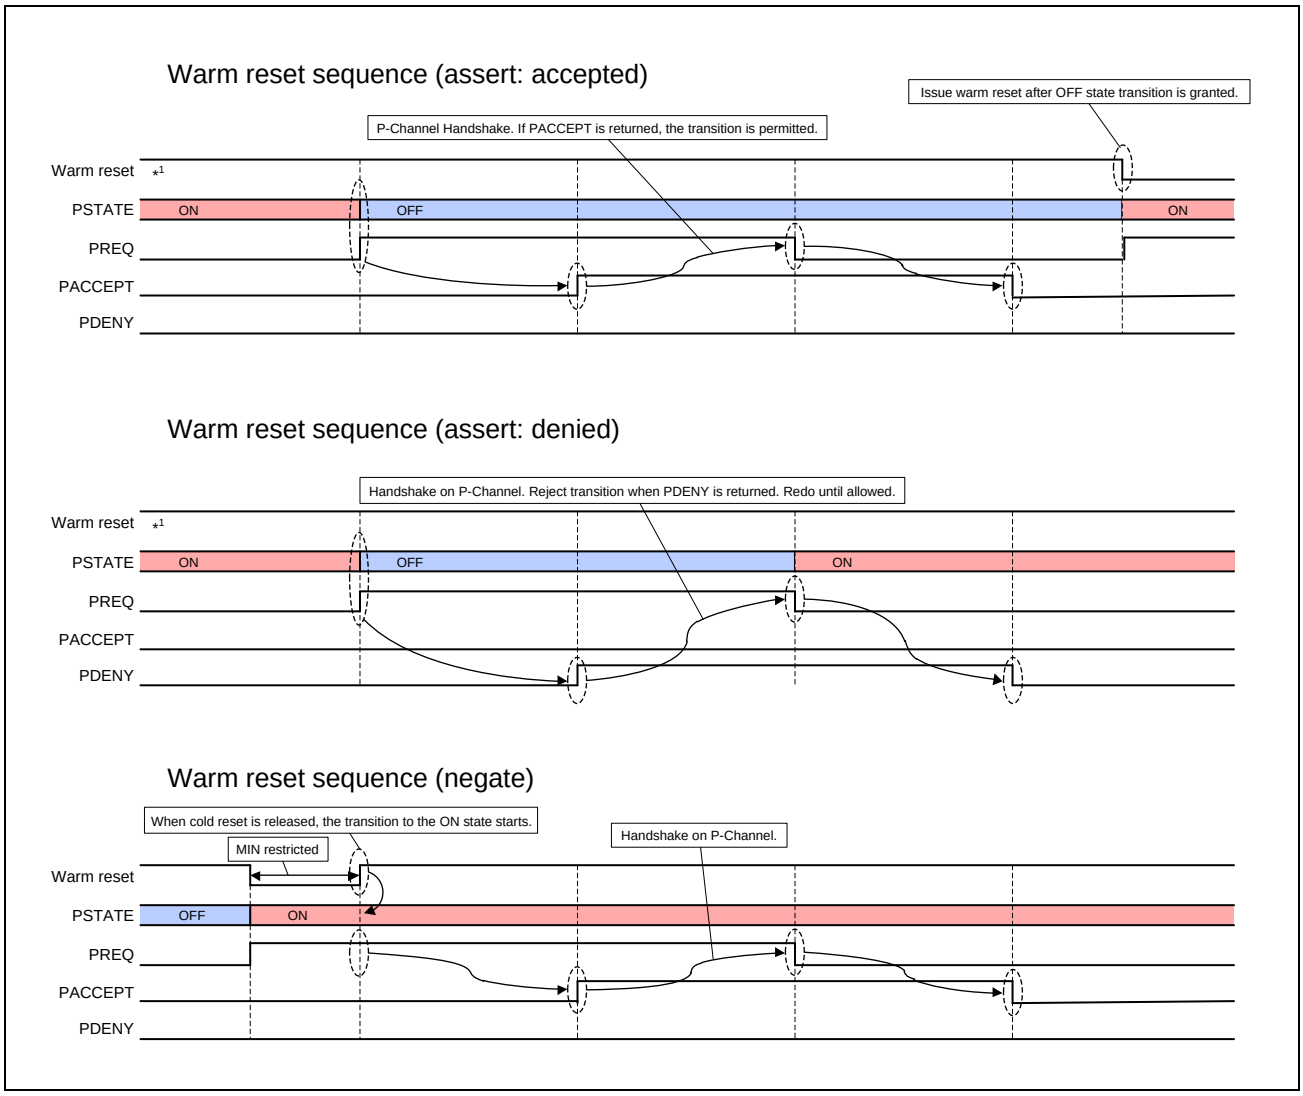

Figure 7.7 Timing Chart of a Handshake through the Cortex-A55 P-Channel (Warm Reset)

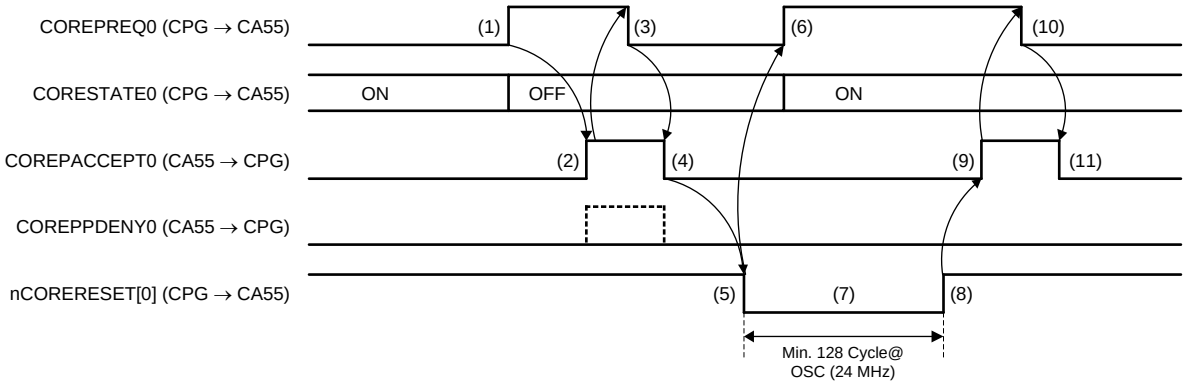
### (c) Cortex-A55 Warm Reset Sequence

The following describes the warm reset sequence through the P-Channel.

**Figure 7.8** shows a waveform when a warm reset of Cortex-A55 Core 0 is requested and accepted. When the request is denied, steps 1 to 4 are repeated until the request is accepted. The same sequence is used for the warm reset of the cluster.



(1) The Cortex-M33 asserts COREPREQ0 according to CPG register settings (PSTATE = OFF).

(2) The Cortex-A55 asserts COREPACCEPT0.

(3) The Cortex-M33 deasserts COREPREQ0 according to CPG register settings.

(4) The Cortex-A55 deasserts COREPACCEPT0.

(5) The Cortex-M33 asserts the target reset signal (nCORERESET[0]) assigned to the warm reset of Cortex-A55 Core 0 according to CPG register settings.

(6) The Cortex-M33 asserts COREPREQ0 according to CPG register settings (PSTATE = ON).

(7) The Cortex-M33 waits for a certain period after the assertion of the reset signal.
18 cycles of the Cortex-A55 clock or 128 cycles at 24 MHz

(8) The Cortex-M33 deasserts the target reset signal (nCORERESET[0]) assigned to the warm reset of Cortex-A55 Core 0 according to CPG register settings.

(9) The Cortex-A55 asserts COREPACCEPT0.

(10) The Cortex-M33 deasserts COREPREQ0 according to CPG register settings.

(11) The Cortex-A55 deasserts COREPACCEPT0.

Figure 7.8 Cortex-A55 Warm Reset Sequence

### (2) Operation of the Cortex-A55 Reset Control Circuit

The reset control circuit asserts the reset signal assigned to the reset request from the reset generator or software.

| Reset Request Source | Reset Signal Assertion | Reset Signal Deassertion |
|---|---|---|
| System reset (including the reset from the WDT) | The CPG asserts the reset signal assigned to the cold reset. | The reset sequencer (boot sequencer) in the CPG releases the reset terminal assigned to the cold reset from the reset state. (The software reset register bit that corresponds to the reset terminal assigned to the cold reset indicates the reset released state in the initial state.) |
| Cold reset (software reset)*1 | The Cortex-M33 asserts the reset signal assigned to the cold reset. | The Cortex-M33 deasserts the asserted signal so that the timing described in **Section 7.3.2.4(3), Timing of Cortex-A55 Reset**. |
| Cold reset (WDT) | The CPG asserts the reset signal assigned to the cold reset. | The CPG deasserts the asserted signal so that the timing described in **Section 7.3.2.3(4), Timing of Cortex-A55 Cold Reset due to the WDT Source**, is satisfied. |
| Cluster warm reset | The Cortex-M33 asserts the reset signal assigned to the cluster warm reset. | The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed. |
| Core 0 warm reset | The Cortex-M33 asserts the reset signal assigned to the Core 0 warm reset. | The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed. |
| Software reset*1 | A software reset is applied by asserting the reset signal according to the data written to the register by software. | The CPG does not automatically deassert the reset signal. The reset signal retains the asserted state until the next access to the registers. |

Note 1. The target reset signal should be controlled by software.

### (3) Timing of Cortex-A55 Reset

There is a restriction on the timing of the release of the Cortex-A55 from the reset state.

When a reset is controlled by software, the restriction should be satisfied by software.

Hardware control is done for the system reset (including the reset from the WDT source) and the Cortex-A55 cold reset from the WDT.

The reset signals are classified into two groups:

Group (A): nCPUPORESET[1:0], nCORERESET[1:0], nSPORESET, nSRESET, nPRESET, nATRESET, nGICRESET, and nPERIPHRESET

Group (B): nARESET, nMISCRESET, and nPDBGRESET

To satisfy the restriction, the CPG deasserts group (B) after a period of 64 cycles at 24 MHz has elapsed since the deassertion of group (A).

### 7.3.2.5 Cortex-M33 Reset

Two types of reset corresponding to the target ranges of reset are provided for the Cortex-M33.

When a request to reset the Cortex-M33 alone is generated in the WDT, an error has probably occurred in the Cortex-M33, and the application of a warm reset may be difficult. Therefore, a cold reset is applied to the Cortex-M33 instead of a warm reset.

- For the warm reset, refer to **Section 7.3.2.5(1), Handshake Control for Cortex-M33 Reset**, and **Section 7.3.2.5(2), Cortex-M33 Warm Reset** Sequence. The reset control from the CPG is performed by hardware.
- To release the Cortex-M33 from the cold reset (system reset) state, refer to **Section 7.3.2.5(4), Timing of Cortex-M33 Reset**, and satisfy the described restriction. The reset control from the CPG needs software operation.
- The reset control from the CPG is performed by hardware.

MISCRESETn is a reset signal for the sub-system (SS) layer. This signal is used for a cold reset.
(For details, refer to the restriction on the timing of the Cortex-M33 cold reset.)

#### (1) Handshake Control for Cortex-M33 Reset

Like the warm reset for the Cortex-A55, the Cortex-M33 requires a handshake process to control the warm reset. After SYSRESETREQ is set to 1 in the Cortex-M33 and the Cortex-M33 enters the WFI state, the CPG executes a handshake with the Cortex-M33 to apply a warm reset to the Cortex-M33.

#### (2) Cortex-M33 Warm Reset Sequence

For a warm reset for the Cortex-A55, the reset request signal nSYSRESET is issued as a result of the handshake between the CPG and Cortex-M33 and the signal pulse is generated for 128 cycles of the 24-MHz clock after the assertion of the signal.

The nSYSRESET signal is asserted under the conditions of SYSRESETREQ = high and SLEEPING = high.

### (3) Operation of the Cortex-M33 Reset Control Circuit

The reset control circuit asserts the reset signal assigned to the reset request from the reset generator or software.

| Reset Request Source | Reset Signal Assertion | Reset Signal Deassertion |
|---|---|---|
| System reset (including the reset from the WDT) | The software reset register is set to the initial value (initial value = cold reset). | The reset state is retained until the Cortex-A55 releases it. |
| Cold reset (software reset)*1 | The Cortex-A55 asserts the following signals assigned to the cold reset.<br>nPORESET<br>nSYSRESET<br>MISCRESTn | The Cortex-A55 deasserts MISCRESETn after a period of 64 cycles at 24 MHz has elapsed since the assertion of MISCRESETn.<br><br>nSYSRESET and nPORESET are deasserted after a period of 64 cycles at 24 MHz has elapsed since the deassertion of MISCRESETn. |
| Cold reset (WDT) | The CPG asserts the following signals assigned to the cold reset.<br>nPORESET<br>nSYSRESET<br>MISCRESTn | The CPG deasserts MISCRESETn after a period of 64 cycles at 24 MHz has elapsed since the assertion of MISCRESETn.<br><br>nSYSRESET and nPORESET are deasserted after a period of 128 cycles at 24 MHz has elapsed since the deassertion of MISCRESETn.<br><br>(See **Figure 7.5, Timing of Cold Reset for the Cortex-M33 Alone due to the WDT Source**.) |
| Warm reset | The CPG asserts the nSYSRESET signal assigned to the Cortex-M33 warm reset according to the procedure of Cortex-M33 warm reset. | The CPG deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed. |
| Software reset*1 | A software reset is applied by asserting the reset signal according to the data written to the register by software. | The reset signal is not deasserted. The reset signal retains the asserted state until the next access to the registers. |

Note 1. The target reset signal should be controlled by software.

### (4) Timing of Cortex-M33 Reset

There is a restriction on the timing of the release of the Cortex-M33 from the reset state.

When a reset is controlled by software, the restriction should be satisfied by software.

Hardware control is done for the Cortex-M33 cold reset from the WDT.

The reset signals are classified into two groups:

Group (A): MISCRESETn

Group (B): nPORESET and nSYSRESET

To satisfy the restriction, the CPG deasserts group (B) after a period of 64 cycles at 24 MHz has elapsed since the deassertion of group (A).

#### 7.3.2.6 Module Reset Application Control

The application of a reset is controlled for individual modules.

In addition to a reset applied to individual modules according to register settings by software, some modules are reset in a certain reset mode.

For register setting specifications, refer to the descriptions of the reset control register *** (CPG_RST_***).

For a clock that is controlled by the corresponding CGC and is synchronized with a reset signal, the processing for stopping the clock is performed at the release of the reset state.

## 7.4 Operating Procedures

This section describes the procedures for operating the CPG.

### 7.4.1 Procedures for Supplying and Stopping Module Clocks

Use the following procedures to switch between the supply and stop of the target clock for a module.

* Sample procedures for the SRAM_MCPU clock (SRAM_MCPU_ACLK) are described here.

**Supplying a Clock:**

1. Setting the register for supplying the SRAM_MCPU clock (SRAM_MCPU_ACLK)

   Set up the following bits in the clock control register SRAM_MCPU (CPG_CLKON_SRAM_MCPU).
   — Setting for supplying the clock: Bit 0 (CLK0_ON) = 1 and bit 16 (CLK0_ONWEN) = 1

2. Confirming that the output of the SRAM_MCPU clock (SRAM_MCPU_ACLK) has started

   Read the following bit in the clock monitor register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU) to confirm that the output of the clock has started.
   — Clock state: Bit 0 (UNIT0_CLK_MON), 1: Clock is supplied. (0: Clock is stopped.)

**Stopping a Clock:**

1. Setting the register for stopping the SRAM_MCPU clock (SRAM_MCPU_ACLK)

   Set up the following bits in the clock control register SRAM_MCPU (CPG_CLKON_SRAM_MCPU).
   — Setting for stopping the clock: Bit 0 (CLK0_ON) = 0 and bit 16 (CLK0_ONWEN) = 1

2. Confirming that the output of the SRAM_MCPU clock (SRAM_MCPU_ACLK) has been stopped

   Read the following bit in the clock monitor register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU) to confirm that the output of the clock has been stopped.
   — Clock state: Bit 0 (UNIT0_CLK_MON), 0: Clock is stopped. (1: Clock is supplied.)

The following registers are used in the above procedures.

— 7.2.4.x Clock control registers ***** (CPG_CLKON_*****)

— 7.2.4.x Clock monitor registers ***** (CPG_CLKMON_*****)

For the procedures for supplying and stopping a clock signal, refer also to the section on the target module. If specific procedures for the module are described, use them.

### 7.4.2 Procedures for Supplying and Stopping Reset Signals

Use the following procedures to switch between the supply (reset state) and stop (released from the reset state) of the target reset signal for a module.

* Sample procedures for the SRAM_MCPU reset (SRAM_MCPU_ARESETN) are described here.

**Supplying a Reset Signal:**

1. Setting the register for supplying the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN)

   Set up the following bits in the reset control register SRAM_MCPU (CPG_RST_SRAM_MCPU).
   — Setting for supplying the reset signal: Bit 0 (UNIT0_RSTB) = 0 and bit 16 (UNIT0_RST WEN) = 1

2. Confirming that the output of the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN0) has been started

   Read the following bit in the reset monitor register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU) to confirm that the output of the reset signal has been started.
   — Reset state: Bit 1 (UNIT0_RST_MON)
   0: Reset signal is stopped (released from the reset state)
   1: Reset signal is output.

**Stopping a Reset Signal:**

1. Setting the register for stopping the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN)

   Set up the following bits in the reset control register SRAM_MCPU (CPG_RST_SRAM_MCPU).

   - Setting for stopping the reset signal: Bit 0 (UNIT0_RSTB) = 1 and bit 16 (UNIT0_RST WEN) = 1

2. Confirming that the output of the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN) has been stopped

   Read the following bit in the reset monitor register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU) to confirm that the output of the reset signal has been stopped.
   — Reset state: Bit 0 (UNIT0_RST_MON)
   0: Reset signal is stopped (released from the reset state)
   1: Reset signal is output.

The following registers are used in the above procedures.

— 7.2.4.x Reset control registers ***** (CPG_RST_*****)

— 7.2.4.x Reset monitor registers ***** (CPG_RSTMON_*****)

For the procedures for supplying and stopping a reset signal, refer also to the section on the target module. If specific procedures for the module are described, use them.

### 7.4.3 Procedure for Activating Modules

Use the following procedure to activate an inactive module after a system reset.

For the specific procedure for activating the target module, refer to the section on the module.

1. Set up the clock control register for the clock signal connected to the target module to start the supply of the clock. Note that the PLL for the clock should be started before the clock if the PLL is stopped.
2. Read the clock monitor register to confirm that the supply of the target clock has started.
3. Set up the reset control register for the reset signal connected to the target module to release the module from the reset state.
4. Read the reset monitor register to conform that the module has been released from the reset state.

### 7.4.4 Procedure for Activating the Modules Related to PLL5

The synchronizer is intentionally removed from some PLL5 clock paths. For the following modules that use PLL5 clocks, use the activation flow and software control procedures shown in **Figure 7.9** and described later to avoid malfunctions due to hazards.

Applicable module

- LCDC

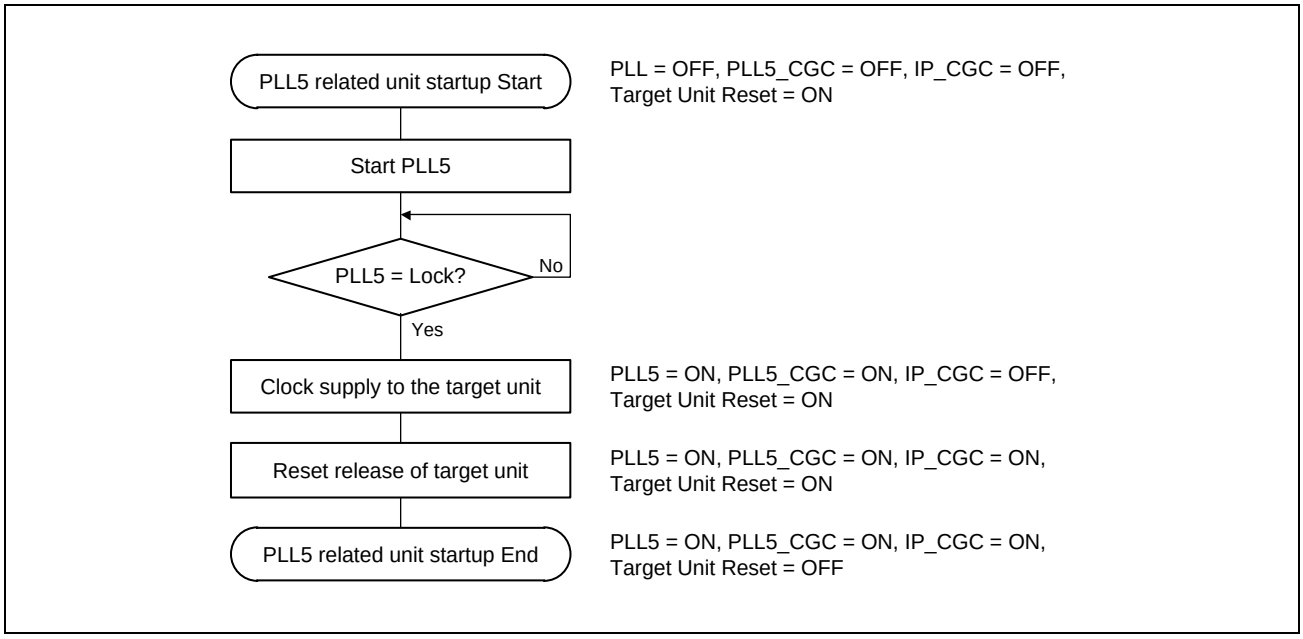


Figure 7.9 Flowchart of Activation of the Modules Related to PLL5

**[Activation Flow]**

<Initial state>

PLL5 = stopped, PLL5_CGC = activated, IP_CGC = activated,
and reset signals = applied (by hardware)

**1) From the activation of PLL5 to the wait for the lock of PLL5:**

PLL5 = activated (by software), PLL5_CGC = stopped, IP_CGC = stopped,
and reset signals for the target module = applied
In this period, the unstable clock before PLL5 is stopped by PLL5_CGC and does not propagate to the frequency divider or target module in the subsequent stages.

**2) From the lock of PLL5 to the supply of the clock to the frequency divider DIV_DSI_A/B:**

When PLL5 is locked, PLL5_CGC is automatically activated.

PLL5 = activated, PLL5_CGC = activated (by hardware), IP_CGC = stopped,
and reset signals for the applicable modules = applied

As soon as PLL5_CGC is activated, a clock hazard is momentarily present on the frequency divider but the incorrect output from the divider is stopped by the IP_CGC.
The frequency divider DIV_DSI_A will be stable in a short time.

The time until the divider becomes stable depends on the frequency setting in PLL5 but it is very short; there is no need to check whether it is stable by software.

**3) Supplying clocks to the target module**

Start the supply of the clocks to the target module by software.

PLL5 = activated, PLL5_CGC = activated, IP_CGC = activated (by software),
and reset signals for the target module = applied

Whether the IP_CGC is released from the reset state in synchronization with the clock differs between the PLLCLK_IN line and other lines.

For the PLLCLK_IN line, a synchronizer that synchronizes the maximum frequency (3 GHz) of PLLCLK_IN cannot be implemented by primitives. Therefore, the IP_CGC is released from the reset state asynchronously and a clock hazard will be present.

**4) Releasing the target module from the reset state**

Release the target module from the reset state by software.

PLL5 = activated, PLL5_CGC = activated, IP_CGC = activated,
and reset signals = stopped (by software)

Before and after the release from the reset state, the clocks with which the reset signals are synchronized are stopped in the target module for several tens of clock cycles to avoid contention or adjust the timing flexibly.

## 7.4.5 Procedures for PLL Setup

The following shows the procedures for PLL setup.

### 7.4.5.1 Procedure for Setting PLL Normal Mode (Changing the Output Clock and SSCG Mode)

Use the following procedure to shift the PLL from the standby mode to the normal mode (change the output clock and SSCG mode).

**[n = 1, 4, or 6: PLL1, PLL4, or PLL6]**

**1) Confirming the PLL operating mode (confirming that the PLL is in the standby mode)**

- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Shift to the standby mode: Confirm that bit 0 (PLLn_RESETB) = 0 (standby mode).
- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Unlock of PLL: Confirm that bit 4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

**2) Setting the output clock 1**

- Modify the following bits in PLLn (SSCG) output clock setting register 1 (CPG_SAMPLLn_CLK1).
- For details of the settings, refer to **Section 7.2.4, Register Descriptions**.
- Setting of output clock (desired setting): Bits 5 to 0 (DIV_P_5 to DIV_P_0), bits 15 to 6 (DIV_M_9 to DIV_M_0), and bits 31 to 16 (DIV_K_15 to DIV_K_0)

**3) Setting the output clock and SSCG modulation value 2**

- Modify the following bits in PLLn (SSCG) output clock setting register 2 (CPG_SAMPLLn_CLK2).
- For details of the settings, refer to **Section 7.2.4, Register Descriptions**.
- Setting of output clock (desired setting): Bits 2 to 0 (DIV_S_2 to DIV_S_0)
- Setting of SSCG modulation value (desired setting): Bits 13 to 8 (MRR_5 to MRR_0) and bits 23 to 16 (MFR_7 to MFR_0)

**4) Setting the PLL normal mode**

- Set up the following bits in the PLLn (SSCG) standby control register (CPG_SAMPLLn_STBY).
- Setting of operating mode: Bit 0 (RESETB) = 1 (normal mode)
- Setting of SSCG mode: Bit 2 (SSCG_EN) = Desired setting

**5) Confirming the shift to the PLL normal mode and the stable output of the clock**

- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Shift to standby mode: Confirm that bit 0 (PLLn_RESETB) = 1 (normal mode).
- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Lock of PLL: Confirm that bit 4 (PLLn_LOCK) = 1 (PLL is locked).

Wait until the above conditions are satisfied.

NOTE

If there is no change in a parameter in step (2) or (3), the corresponding register does not need to be modified.

**[PLL5]**

**1) PLL operation mode status check (confirmation that it is in standby mode)**

- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).
- Standby mode transition confirmation: bit0 (PLLn_RESETB) = 0 (standby mode).
- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).
- Confirmation of PLL lock release: bit4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

**2) Output clock setting 1**

- Change the following bits of PLL5 (SSCG) output clock setting register 1 (CPG_SIPLL5_CLK1).
- For details on the setting values, refer to **Section 7.2.4, Register Descriptions**.
- Output frequency setting (optional):bit2-0(POSTDIV1)、bit6-4(POSTDIV2)、bit13-8(REFDIV)

**3) Output clock setting, SSCG modulation value setting 3**

- Change the following bits of PLLn (SSCG) output clock setting register 3 (CPG_SIPLL5_CLK3).
- For details of the setting values, refer to **Section 7.2.4, Register Descriptions**.
- Output frequency setting (optional): bit31-8(FRACIN)
- SSCG modulation value setting (optional): bit5-0(DIVVAL)

**4) Output clock setting 4**

- Change the following bits of PLL5 (SSCG) output clock setting register 4 (CPG_SIPLL5_CLK4).
- For details of the setting values, refer to **Section 7.2.4, Register Descriptions**.
- Output frequency setting (optional): bit27-16(INTIN)

**5) SSCG modulation value setting 5**

- Change the following bits of PLL5 (SSCG) output clock setting register 5 (CPG_SIPLL5_CLK5).
- For details of the setting values, refer to **Section 7.2.4, Register Descriptions**.
- SSCG modulation value setting (optional): bit4-0(SPREAD)

**6) PLL normal mode setting**

- Set the following bits of the PLLn (SSCG) standby control register (CPG_SIPLL5_STBY).
- Operation mode setting: bit0 (RESETB) = 1 (normal mode)
- SSCG mode setting: bit2 (SSC_EN) = optional

**7) PLL normal mode transition, output clock stability check**

- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).

- Confirmation of transition to normal mode: bit0 (PLLn_RESETB) = 1 (normal mode).
- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).
- PLL Lock confirmation: Bit4 (PLLn_LOCK) = 1 (PLL Lock).

Wait until the above conditions are satisfied.

NOTE

If there is no change in a parameter in step (2), (3), (4) or (5), the corresponding register does not need to be modified.

### 7.4.5.2 Procedure for Setting PLL Standby Mode

Use the following procedure to shift the PLL from the normal standby mode to the standby mode.

**[n = 1, 4, or 6: PLL1, PLL4, or PLL6]**

**1) Setting the PLL standby mode**

- Set the following bits of the PLL5 (SSCG) standby control register (CPG_SAM / SIPLL5_STBY).
- Operation mode setting: bit0 (RESETB) = 0 (standby mode) (other bits are “0”).

**2) Confirming the shift to the PLL standby mode**

- Check the following bits of the PLLn (SSCG) monitor register (CPG_SAM / SIPLL5_MON).
- Standby mode transition confirmation: bit0 (PLLn_RESETB) = 0 (standby mode).
- Check the following bits of the PLLn (SSCG) monitor register (CPG_SAM / SIPLL5_MON).
- Confirmation of PLL lock release: bit4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

### 7.4.5.3 PLLs with Restrictions

PLL1 to PLL3 cannot be switched to desired clock settings by the user because these PLLs output clocks for the CPU and bus operation.

PLL1 outputs clocks dedicated to the Cortex-A55. To modify its settings after booting, the registers should be manipulated from the Cortex-M33.

The PLL2 and PLL3 settings cannot be modified after booting because these PLLs output system clocks for bus operation.

PLL4 to PLL6 can be set up, started, or stopped by the user at the desired timing under the allowable conditions of use for the target module.

### 7.4.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers

Use the following procedure to set the division ratio of the dynamic switching frequency dividers.

* A sample procedure for DIV_PLL2_A is described here.

#### 1) Confirming the DIV_PLL2_A state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- DIV_PLL2_A state: Confirm that bit 0 (DIVPL2A_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

#### 2) Setting the DIV_PLL2_A division ratio

- Set up the following bits in the division ratio setting (PLL2) register (CPG_PL2_DDIV).
- Setting of division ratio: Bits 1 and 0 (DIVPL2A_SET) = desired value and bit 16 (DIV_PLL2_A_WEN) = 1

#### 3) Confirming the DIV_PLL2_A state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- DIV_PLL2_A state: Confirm that bit 0 (DIVPL2A_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

The following registers are used in the above procedure.

— Division ratio setting (PLL1) register (CPG_PL1_DDIV)

— Division ratio setting (PLL2) register (CPG_PL2_DDIV)

— Division ratio setting (PLL3) register (CPG_PL3A_DDIV)

— Division ratio setting (PLL3) register (CPG_PL3B_DDIV)

The following status monitor register is used.

— Clock status monitor register (CPG_CLKSTATUS)

When 1 is written to a xx_WEN bit placed in the upper 16 bits of a division ratio setting register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register (CPG_CLKSTATUS) and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

### 7.4.7 Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors

Use the following procedure to switch clocks by the dynamic switching frequency selectors.

* A sample procedure for SEL_PLL4 is described here.

#### 1) Confirming the SEL_PLL4 state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- SEL_PLL4 state: Confirm that bit 31 (SELPLL4_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

#### 2) Setting the switching of the clock output from SEL_PLL4

- Set up the following bits in the source clock setting (DDR) register (CPG_PL4_DSEL).
- Setting of clocks switching (switch from PLL4 to OSC_DIV1000): Bits 31 to 0 = H’0001_0000
  (switch from OSC_DIV1000 to PLL4): Bits 31 to 0 = H’0001_0001

#### Confirming the SEL_PLL4 state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- SEL_PLL4 state: Confirm that bit 31 (SELPLL4_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

The following registers are used in the above procedure.

— Source clock setting (DDR) register (CPG_PL4_DSEL)

— Source clock setting (SDHI) register (CPG_PL2SDHI_DSEL)

When 1 is written to a xx_WEN bit placed in the upper 16 bits of a source clock setting register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register (CPG_CLKSTATUS) and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

### 7.4.8 Procedure for Switching Clocks by the Static Switching Frequency Dividers and Selectors (Procedure for Switching Source Clocks)

Use the following procedure to set the division ratio of the static switching frequency dividers and to switch clocks by the static switching frequency selectors.

When a source clock is active: Stop the clock. → Make settings for switching clocks. → Start the clock.

When a source clock is stopped: Make settings for switching.

The following registers are used in the above procedure.

— Source clock setting register (CPG_PL3_SSEL)*1

— Source clock setting register (CPG_PL6_ETH_SSEL)*2

— Division ratio setting (PLL5) register (CPG_PL5_SDIV)

**Note 1.** When switching SEL_PLL3_3 in CPG_PL3_SSEL, please note the following points.

1) Do not access SPI-Multi during switching.
2) If a TZC2INT interrupt is occurring, allow the interrupt to complete before stopping the clock on the CPG_CLKON_MBUS.
3) Before switching, stop the following clocks.
   - CPG_CLKON_SPI_MULTI (bit1, bit0)
   - CPG_CLKON_MBUS (bit9)
4) CPG_CLKON_SPI_MULTI and CPG_CLKON_MBUS are not in the order to stop the clock.

**Note 2.** Set the CPG_PL6_ETH_SSEL in the ETHER module stopped state (reset state).

### 7.4.9 Boot Sequence (Normal Operation)

After the reset sequence ends, perform the following operations if necessary.

- Start PLLs.
- Set up clock selectors.
- Set up clock division ratios.
- Supply clocks to modules.
- Release modules from the reset state.

## 7.4.10 Boot Sequence (Debug Mode)

After the reset sequence (debug mode) ends, perform the following operations if necessary.

- Start PLLs.
- Set up clock selectors.
- Set up clock division ratios.
- Supply clocks to modules.
- Release modules from the reset state.

## 7.4.11 General Operating Procedures

The following describes general operating procedures.

### 7.4.11.1 Procedure for Writing to Registers

The registers in the CPG have write-enable flags in the upper 16 bits and normal data fields in the lower 16 bits except for the registers shown below. Therefore, only the desired bit can be modified without read-modify-write operation.

To modify the value of a bit, write 1 to the write-enable flag having the target bit number + 16 and write a desired value to the target bit.

(Examples: To modify bit 0 to 1b, write H’0001_0001. To modify it to 0b, write H’0001_0000. When H’0000_xxxx is written, the value of bits 15 to 0 does not change.)

NOTE

In some registers, a single write-enable flag controls multiple data bit. Refer to the description of each register.

Registers that have data fields in the upper bits instead of write-enable flags:

— PLLn (SSCG) output clock setting register 1 (CPG_SAMPLLn_CLK1): (n = 1, 4, or 6)

— PLLn (SSCG) output clock setting register 2 (CPG_SAMPLLn_CLK2): (n = 1, 4, or 6)

— PLLn (SSCG) output clock setting register 3 (CPG_SIPLLn_CLK3): (n = 5)

— PLLn (SSCG) output clock setting register 4 (CPG_SIPLLn_CLK4): (n = 5)

— PLLn (SSCG) output clock setting register 5 (CPG_SIPLLn_CLK5): (n = 5)

— Cortex-A55 cluster power status control register (CPG_CLUSTER_PCHCTL)

— Cortex-A55 Core 0 power status control register (CPG_CORE0_PCHCTL)

# 8. Interrupt Controller

The interrupt controller decides the priority of interrupt sources and controls interrupt requests to the CPU.

The interrupt controller registers set the order of priority of each interrupt, allowing the user to process interrupt requests according to the user-set priority.

## 8.1 Features

### ■ Equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller*1 for Arm Cortex-A55.

- 32 levels of priority.
- SGI (Software Generated Interrupt): 16 interrupts
- PPI (Private Peripheral Interrupt): 16 interrupts
- SPI (Shared Peripheral Interrupt): 480 interrupts
- LPI (Locality-specific Peripheral Interrupt): Not supported

### ■ Nested Vectored Interrupt Controller (NVIC)*2 built in Arm Cortex-M33.

- 256 levels of priority
- 480 interrupts

### ■ External Interrupts

- NMI, IRQ0-7, TINT0-31
- Noise filter function.*3

### ■ Internal Interrupts

- On-chip peripheral interrupts
- On-chip Bus error interrupts
- On-chip RAM ECC error interrupts

**Note 1.** Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.
**Note 2.** Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual.
**Note 3.** Refer to **Section 41, General Purpose Input Output Port (GPIO)**.

### 8.1.1 External Signal Pins

The following table shows external signal pins for Interrupt Controller.

Table 8.1 External Signal Pins

| Name | Width | I/O | Description |
|---|---|---|---|
| NMI | 1 | I | NMI (Non Maskable Interrupt) pin.<br>Refer to **Section 8.7.1**. |
| IRQ0 – IRQ7 | 8 | I | IRQ (Interrupt Request) pins.<br>GPIO pins can be used as IRQ pins.<br>Refer to **Section 8.7.2**. |
| P0_0 – P18_5 | 82 | I | GPIO pins.<br>GPIO pins can be used as external interrupt input pins (GPIOINT0-81).<br>Assign only 32 pins in GPIOINT0-81 to TINT0-31.<br>Refer to **Section 8.7.3**. |

### 8.1.2 Block Diagram

The block diagram of Interrupt Controller is as follows.

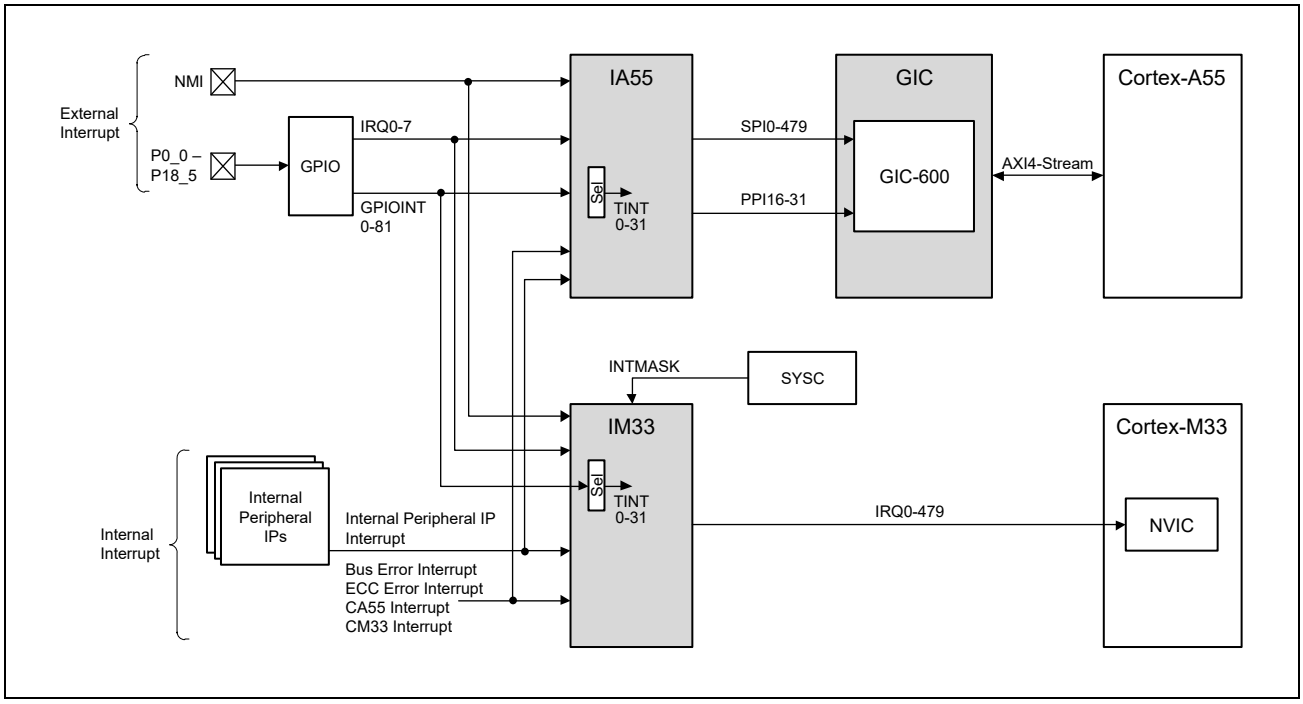

Figure 8.1 Interrupt Controller Block Diagram

#### GIC

GIC is equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller for Cortex-A55.

#### IA55

IA55 performs various interrupt controls including synchronization for the external interrupts of NMI, IRQ, and GPIOINT and the interrupts of the built-in peripheral interrupts output by each IP. And it notifies the interrupt to the GIC.

- Select 32 TINT from 82 GPIOINT.
- Integration of bus error interrupts from system bus.
- Integration of ECC error interrupts from On-chip RAM.
- Indicate interrupt status. (NMI, IRQ, TINT, integrated bus error interrupt and integrated ECC error interrupt)
- Setting of interrupt detection method. (NMI, IRQ and TINT)

#### IM33

IM33 performs various interrupt controls including synchronization for the external interrupts of NMI, IRQ and GPIOINT and internal peripheral interrupts output by each IP. And it notifies the interrupt to the built-in interrupt controller (NVIC) for Cortex-M33.

- Select 32 TINT from 82 GPIOINT.
- Integration of bus error interrupts from system bus.
- Integration of ECC error interrupts from On-chip RAM.
- Indicate interrupt status. (NMI, IRQ, TINT, integrated bus error interrupt and integrated ECC error interrupt)

- Set interrupt detection method. (NMI, IRQ and TINT)
- All interrupts can be masked by setting of SYSC Register. (IM33_MASK bit of SYS_LP_CLT7 register.)
  Refer to **Section 42, Low Power Mode**.

## 8.2 Interrupt Mapping

The following table indicates interrupt mapping for Cortex-A55 and Cortex-M33.

Refer to **Section 14, Direct Memory Access Controller** with the interrupts through DMA Controller, and **Section 8.8.1**.

Table 8.2 Interrupt mapping (1/13)

| Interrupt Source*3 | Cause of Interrupt | Cortex-A55 | | Cortex-M33 | Interrupt Type*2 | Note |

| Reserved | — | 511 | SPI 479 | IRQ 479 | — | |

Note 1. Exception handlers of Cortex-M33 has Interrupt Service Routines (ISRs), Fault handler and System handler.
IRQ0-479 is treated as Interrupt Service Routines (ISRs).
Refer to “Arm Cortex-M33 Processor Technical Reference Manual” and “Arm Cortex-M33 Processor User Guide” for details and targets of Fault handler and System handler.

Note 2. Set GICD_ICFGR<n> of the interrupt controller for Cortex-A55 (GIC-600) according to the description of Interrupt Type for each Interrupt ID.
Refer to “ARM CoreLink GIC-600 Generic Interrupt Controller Technical Reference Manual” for the specification of GIC-600 registers.
Equivalent settings are not required for the interrupt controller for Cortex-M33 (Cortex-M33 built-in NVIC).

Note 3. Refer to the source unit section for the specification of each interrupt source.

Note 4. NMI is not treated as NMI exception.
NMI interrupt setting can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.1** for details.

Note 5. IRQ0-7 interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.2** for details.

Note 6. TINT0-31 interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.3** for details.

Note 7. BUS_ERR_INT is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.4.1** for details.

Note 8. Each EC7TIE1, TC7TIE2 and EC7TIOVF is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.4.2** for details.

## 8.3 GIC-600 and NVIC Register Configuration

### ■ GIC-600 Register

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.
ITS and LPI are not supported.

Base Address: H'0_1190_0000 (Cortex-A55 Address Space)

Base Address: H'4190_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'5190_0000 (Cortex-M33 Address Space Secure)

### ■ NVIC Register

Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual.

## 8.4 GIC-600 and NVIC Register Descriptions

### ■ GIC-600 Register

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual for detail.

### ■ NVIC Register

Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual for detail.

## 8.5 IA55 and IM33 Register Configuration

### ■ IA55

Base Address: H'0_110A_0000 (Cortex-A55 Address Space)

Base Address: H'410A_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'510A_0000 (Cortex-M33 Address Space Secure)

### ■ IM33

Base Address: H'0_110B_0000 (Cortex-A55 Address Space)

Base Address: H'410B_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'510B_0000 (Cortex-M33 Address Space Secure)

The following table shows IA55 and IM33 Register list.
Prohibit to write undefined area.

Table 8.3 IA55 and IM33 Register List

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| NMI Status Control Register | NSCR | R/W | H'0000_0000 | H'0000 | 32 |
| NMI Interrupt Type Selection Register | NITSR | R/W | H'0000_0000 | H'0004 | 32 |
| IRQ Status Control Register | ISCR | R/W | H'0000_0000 | H'0010 | 32 |
| IRQ Interrupt Type Selection Register | IITSR | R/W | H'0000_0000 | H'0014 | 32 |
| TINT Status Control Register | TSCR | R/W | H'0000_0000 | H'0020 | 32 |
| TINT Interrupt Type Selection Register0 | TITSR0 | R/W | H'0000_0000 | H'0024 | 32 |
| TINT Interrupt Type Selection Register1 | TITSR1 | R/W | H'0000_0000 | H'0028 | 32 |
| TINT Source Selection Register0 | TSSR0 | R/W | H'0000_0000 | H'0030 | 32 |
| TINT Source Selection Register1 | TSSR1 | R/W | H'0000_0000 | H'0034 | 32 |
| TINT Source Selection Register2 | TSSR2 | R/W | H'0000_0000 | H'0038 | 32 |
| TINT Source Selection Register3 | TSSR3 | R/W | H'0000_0000 | H'003C | 32 |
| TINT Source Selection Register4 | TSSR4 | R/W | H'0000_0000 | H'0040 | 32 |
| TINT Source Selection Register5 | TSSR5 | R/W | H'0000_0000 | H'0044 | 32 |

# 8.6 IA55 and IM33 Register Descriptions

## 8.6.1 NMI Status Control Register (NSCR)

This register shows NMI status.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NSMON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NSTAT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | NSMON | 0 | R | This bit indicates NMI pin signal level.<br><br>[Read operation]<br>0: NMI pin is Low-level.<br>1: NMI pin is High-level.<br>[Write operation]<br>Invalid to write. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | NSTAT | 0 | R/W | This bit indicates NMI interrupt status.<br>NMI interrupt status can be cleared writing 0 in case NSTAT is 1.<br><br>[Read operation]<br>0: NMI interrupt is not detected.<br>1: NMI interrupt is detected.<br>[Write operation]<br>• In case NSTAT is 1<br>0: NMI interrupt status is cleared.<br>1: Invalid to write.<br>• In case NSTAT is 0<br>Invalid to write. |

## 8.6.2 NMI Interrupt Type Selection Register (NITSR)

This register selects NMI detecting method.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NTSEL |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | NTSEL | 0 | R/W | This bit is used to select NMI interrupt detection method.<br>0: Falling-edge detection.<br>1: Rising-edge detection. |

### 8.6.3 IRQ Status Control Register (ISCR)

This register shows IRQ status.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

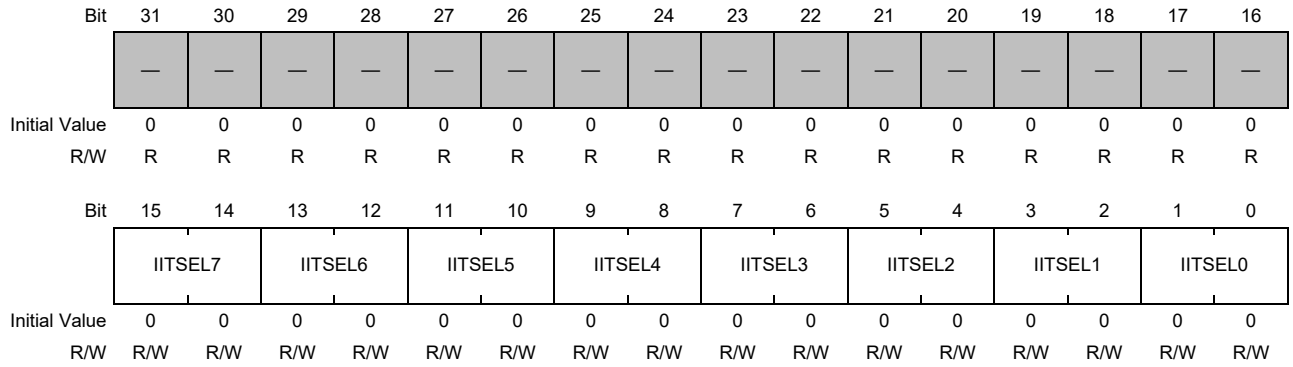
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ISTAT7 | ISTAT6 | ISTAT5 | ISTAT4 | ISTAT3 | ISTAT2 | ISTAT1 | ISTAT0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| n | ISTATn | 0 | R/W | This bit indicates IRQn interrupt status.<br>When the interrupt detection method is set to an edge type detection in IITSR, IRQn interrupt status can be cleared writing 0 in case ISTATn is 1.<br><br>[Read operation]<br>0: IRQn interrupt is not detected.<br>1: IRQn interrupt is detected.<br>[Write operation]<br>When “Falling-edge detection”, “Rising-edge detection” or “Falling/Rising-edge detection” is set in ITSR.:<br>• In case ISTAT is 1<br>0: IRQn interrupt detection status is cleared.<br>1: Invalid to write.<br>• In case ISTAT is 0<br>Invalid to write.<br>When “Low-level detection” is set in IITSR.:<br>Invalid to write. |

**Note:** n = 7 to 0

### 8.6.4 IRQ Interrupt Type Selection Register (IITSR)

This register selects IRQ detecting method.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2n+1 to 2n | IITSEL | All 0 | R/W | This bit is used to select IRQn interrupt detection method.<br>00: Low-level detection.<br>01: Falling-edge detection.<br>10: Rising-edge detection.<br>11: Falling/Rising-edge detection. |

**Note:** n = 7 to 0

### 8.6.5 TINT Status Control Register (TSCR)

This register shows TINT status.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TSTAT31 | TSTAT30 | TSTAT29 | TSTAT28 | TSTAT27 | TSTAT26 | TSTAT25 | TSTAT24 | TSTAT23 | TSTAT22 | TSTAT21 | TSTAT20 | TSTAT19 | TSTAT18 | TSTAT17 | TSTAT16 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TSTAT15 | TSTAT14 | TSTAT13 | TSTAT12 | TSTAT11 | TSTAT10 | TSTAT9 | TSTAT8 | TSTAT7 | TSTAT6 | TSTAT5 | TSTAT4 | TSTAT3 | TSTAT2 | TSTAT1 | TSTAT0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| n | TSTATn | All 0 | R/W | This bit indicates TINTn interrupt status.<br>When the interrupt detection method is set to edge type detection in TITSR0/1, TINTn interrupt status can be cleared writing 0 in case TSTATn is 1.<br><br>[Read operation]<br>0: TINTn interrupt is not detected.<br>1: TINTn interrupt is detected.<br>[Write operation]<br>When “Rising-edge detection” or “Falling-edge detection” is set in TITSR0/1.:<br>• In case TSTAT is 1<br>0: TINTn interrupt detection status is cleared.<br>1: Invalid to write.<br>• In case TSTAT is 0<br>Invalid to write.<br>When “Low-level detection” or ”High-Level detection” is set in TITSR0/1.:<br>Invalid to write. |

**Note:** n = 31 to 0

### 8.6.6 TINT Interrupt Type Selection Register0 (TITSR0)

This register selects detecting method of TINT15 to TINT0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TITSEL15 | | TITSEL14 | | TITSEL13 | | TITSEL12 | | TITSEL11 | | TITSEL10 | | TITSEL9 | | TITSEL8 | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TITSEL7 | | TITSEL6 | | TITSEL5 | | TITSEL4 | | TITSEL3 | | TITSEL2 | | TITSEL1 | | TITSEL0 | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2n+1 to 2n | TITSELn | All 0 | R/W | This bit is used to select TINTn interrupt detection method.<br>00: Rising-edge detection.<br>01: Falling-edge detection.<br>10: High-level detection.<br>11: Low-level detection. |

**Note:** n = 15 to 0

### 8.6.7 TINT Interrupt Type Selection Register1 (TITSR1)

This register selects detecting method of TINT31 to TINT16.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TITSEL31 | | TITSEL30 | | TITSEL29 | | TITSEL28 | | TITSEL27 | | TITSEL26 | | TITSEL25 | | TITSEL24 | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TITSEL23 | | TITSEL22 | | TITSEL21 | | TITSEL20 | | TITSEL19 | | TITSEL18 | | TITSEL17 | | TITSEL16 | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

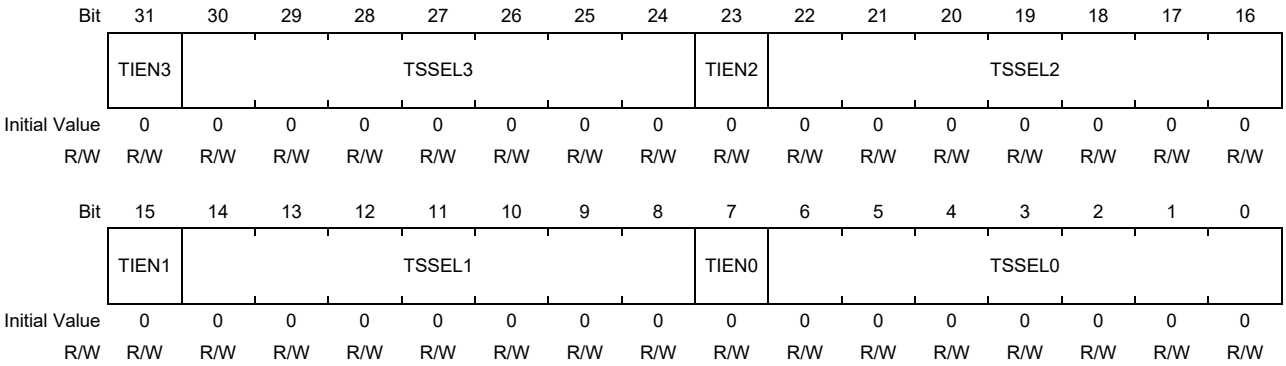
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2n+1 to 2n | TITSEL n+16 | All 0 | R/W | This bit is used to select TINTn+16 interrupt detection method.<br>00: Rising-edge detection.<br>01: Falling-edge detection.<br>10: High-level detection.<br>11: Low-level detection. |

**Note:** n = 15 to 0

## 8.6.8 TINT Source Selection Register0 (TSSR0)

This register selects the interrupt source of TINT3 to TINT0.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8n+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8n+6 to 8n | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 3 to 0

### 8.6.9 TINT Source Selection Register1 (TSSR1)

This register selects the interrupt source of TINT7 to TINT4.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIEN7 | TSSEL7 | | | | | | | TIEN6 | TSSEL6 | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIEN5 | TSSEL5 | | | | | | | TIEN4 | TSSEL4 | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-4)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8(n-4)+6 to 8(n-4) | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 7 to 4

## 8.6.10 TINT Source Selection Register2 (TSSR2)

This register selects the interrupt source of TINT11 to TINT8.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIEN11 | TSSEL11 | | | | | | | TIEN10 | TSSEL10 | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIEN9 | TSSEL9 | | | | | | | TIEN8 | TSSEL8 | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

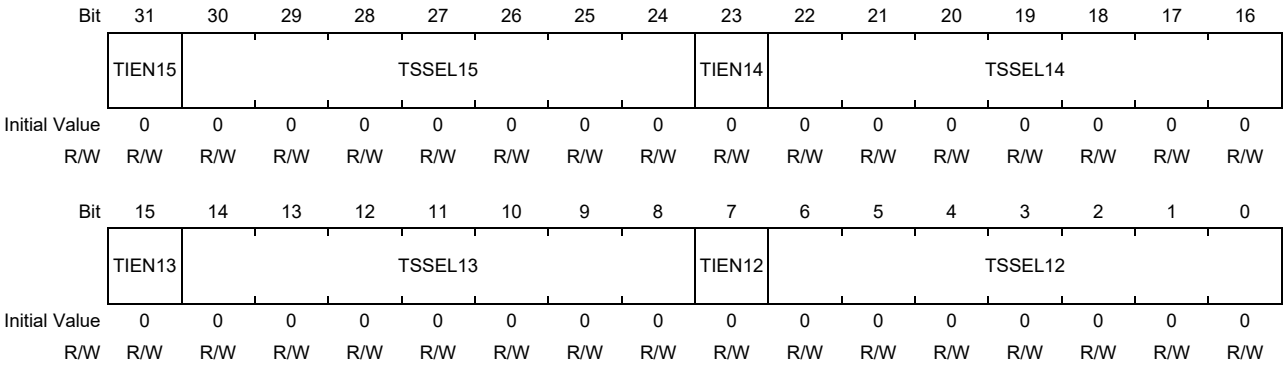
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-8)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8(n-8)+6 to 8(n-8) | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 11 to 8

### 8.6.11 TINT Source Selection Register3 (TSSR3)

This register selects the interrupt source of TINT15 to TINT12.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-12)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8(n-12)+6 to 8(n-12) | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 15 to 12

## 8.6.12 TINT Source Selection Register4 (TSSR4)

This register selects the interrupt source of TINT19 to TINT16.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIEN19 | TSSEL19 | | | | | | | TIEN18 | TSSEL18 | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TIEN17 | TSSEL17 | | | | | | | TIEN16 | TSSEL16 | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

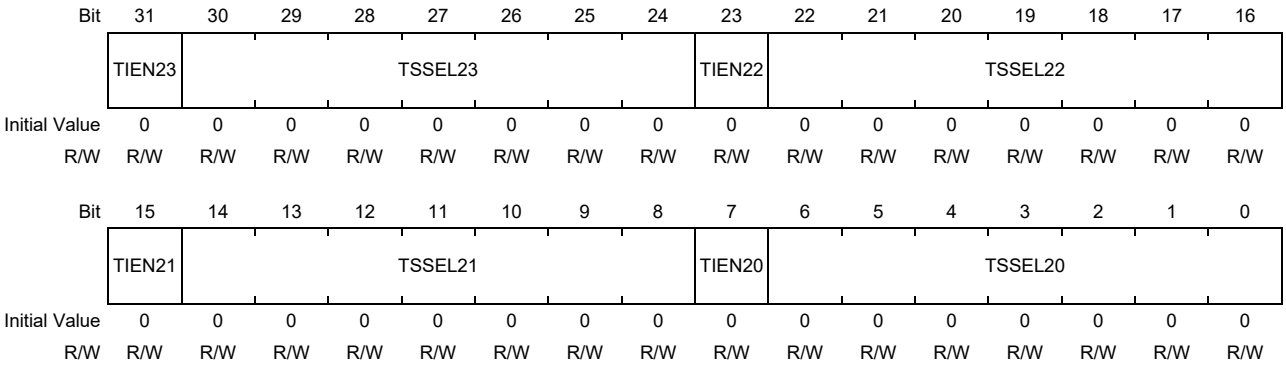
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-16)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8(n-16)+6 to 8(n-16) | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 19 to 16

### 8.6.13 TINT Source Selection Register5 (TSSR5)

This register selects the interrupt source of TINT23 to TINT20.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.



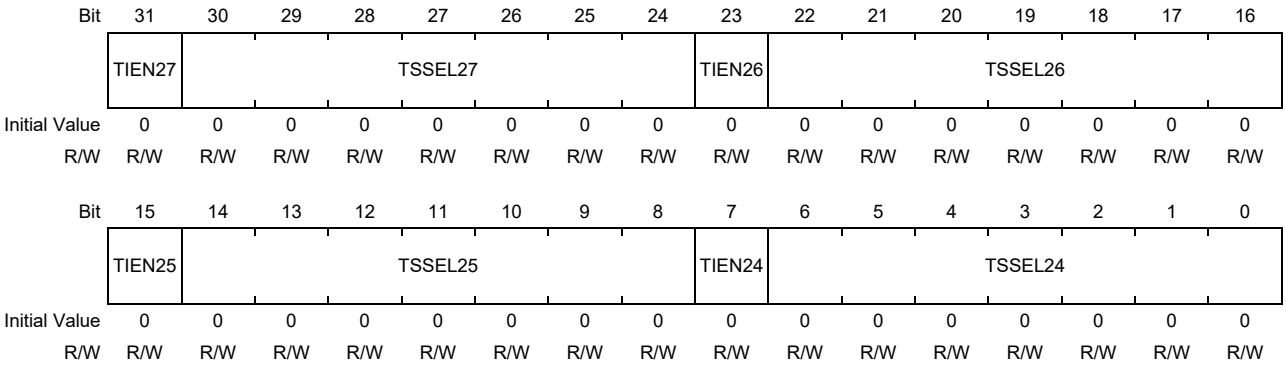
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-20)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8(n-20)+6 to 8(n-20) | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 23 to 20

### 8.6.14 TINT Source Selection Register6 (TSSR6)

This register selects the interrupt source of TINT27 to TINT24.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-24)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |

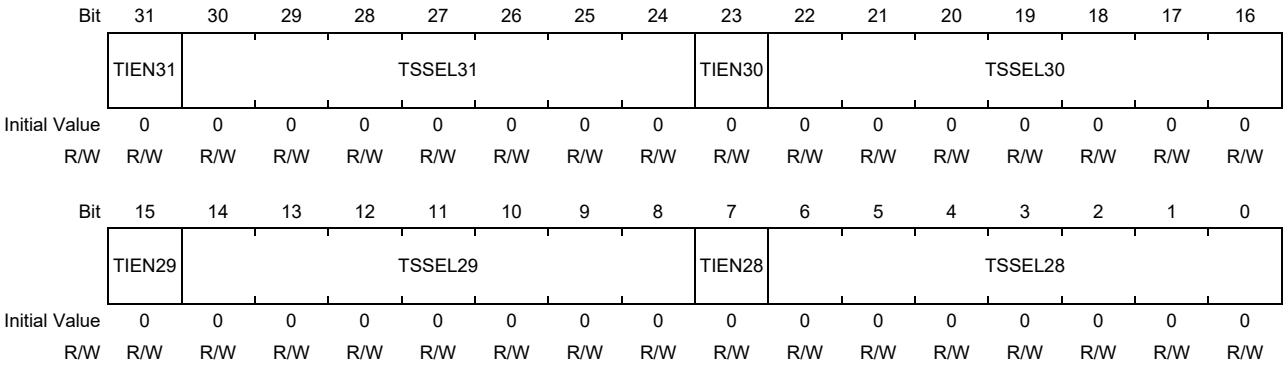
**Note:** n = 27 to 24

### 8.6.15 TINT Source Selection Register7 (TSSR7)

This register selects the interrupt source of TINT31 to TINT28.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8(n-28)+7 | TIENn | 0 | R/W | This bit enables TINTn.<br>1: Enable.<br>0: Invalid. |
| 8(n-28)+6 to 8(n-28) | TSSELn | All 0 | R/W | This bit selects a source of TINTn.<br>0000000: TINTn = GPIOINT0<br>0000001: TINTn = GPIOINT1<br>~<br>1010001: TINTn = GPIOINT81<br>1010010: Cannot be set.<br>~<br>1111011: Cannot be set.<br>1111100: Cannot be set.<br>1111101: Cannot be set.<br>1111110: Cannot be set.<br>1111111: Cannot be set.<br><br>Assign different sources to TINT0-31. |

**Note:** n = 31 to 28

## 8.6.16 Bus Error Interrupt Status Control Register0 (BEISR0)

This register shows Bus error status.

Refer to LSI Internal Bus section and **Section 8.7.4.1** for bus error interrupt cause.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 23 to 16 | OFSTATn | All 0 | R/W | This bit indicates ECCRAM1_OFn interrupt status.<br>ECCRAM1_OFn interrupt status can be cleared writing 0 in case OFSTATn is 1.<br><br>[Read operation]<br>0: ECCRAM1_OFn is not detected.<br>1: ECCRAM1_OFn is detected.<br>[Write operation]<br>• In case OFSTATn is 1<br>0: ECCRAM1_OFn interrupt status is cleared.<br>1: Invalid to write.<br>• In case OFSTATn is 0<br>Invalid to write. |
| 15 to 8 | E2STATn | All 0 | R/W | This bit indicates ECCRAM1_2En interrupt status.<br>ECCRAM1_2En interrupt status can be cleared writing 0 in case E2STATn is 1.<br><br>[Read operation]<br>0: ECCRAM1_2En is not detected.<br>1: ECCRAM1_2En is detected.<br>[Write operation]<br>• In case E2STATn is 1<br>0: ECCRAM1_2En interrupt status is cleared.<br>1: Invalid to write.<br>• In case E2STATn is 0<br>Invalid to write. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 0 | E1STATn | All 0 | R/W | This bit indicates ECCRAM1_1En interrupt status.<br>ECCRAM1_1En interrupt status can be cleared writing 0 in case E1STATn is 1.<br><br>[Read operation]<br>0: ECCRAM1_1En is not detected.<br>1: ECCRAM1_1En is detected.<br>[Write operation]<br>• In case E1STATn is 1<br>0: ECCRAM1_1En interrupt status is cleared.<br>1: Invalid to write.<br>• In case E1STATn is 0<br>Invalid to write. |

**Note:** n = 7 to 0

# 8.7 Operation

## 8.7.1 NMI Interrupt

NMI interrupt is the highest priority interrupt by default even though it can be masked.

NMI is not treated as NMI exception.

[Setting]

- A noise filter function of NMI pin can be enabled by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for detail.
- NMI pin input is detected by edge. A detection method is set by NTSEL bit of NMI Interrupt Type Selection Register (NITSR) in IA55/IM33. It can be selected “Rising-edge detection” or “Falling-edge detection”.

[Status Control]

- NMI interrupt request can be confirmed by reading NSTAT bit of NMI Status Control Register (NSCR) in IA55/IM33.
  The interrupt request can be cleared by writing 0 to NSTAT bit.
- A signal level (High or Low) of NMI pin can be confirmed by reading NSMON bit of NMI Status Control Register (NSCR) in IA55/IM33.

## 8.7.2 IRQ Interrupt

IRQ interrupt is the interrupt from IRQ0-7 input pins.

[Setting]

- Using IRQ pins as interrupt must be mapped GPIO pins onto IRQ pins by GPIO register setting.
  Refer to **Section 41.4.2, Operation for Peripheral Function** for detail.
- A noise filter function of IRQ pins can be enabled by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for detail.
- IRQ pin inputs are detected by a level or an edge. A detection method is set by ITSEL bit of IRQ Interrupt Type Selection Register (IITSR) in IA55/IM33. It can be selected “Low-level detection”, “Falling-edge detection”, “Rising-edge detection” or “Falling/Rising-edge detection”.

[Status Control]

- IRQ interrupt requests can be confirmed by reading ISTATn bit of IRQ Status Control Register (ISCR) in IA55/IM33.
- In case selected a level detection in IITSR, the interrupt requests are cleared when the interrupt sources de-assert the interrupts.
- In case selected an edge detection in IITSR, the interrupt requests can be cleared by writing 0 to ISTATn bit.

### 8.7.3 GPIO Interrupt (TINT)

GPIO interrupt is the interrupt using GPIO pins as external interrupt input pins.

[Setting]

- When using GPIO pins as interrupts, assign GPIO pins as external interrupt input pins (GPIOINT0-81) by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for details.
  Refer to **Table 8.4** for mapping GPIO pins onto GPIOINT0-81.
- The noise filter function of GPIO pins assigned to TINT can be enabled by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for details.
- Assign any 32 interrupt sources to TINT from GPIOINT0-81 by TINT Source Selection Register (TSSR0-7) in IA55/IM33.

  *Note*: Even if the TINT is assigned by TSSR0-7, no interrupt request is generated unless it is assigned to an external pin interrupt by GPIO registers.
- TINT inputs are detected by a level or an edge. A detection method is set by TTSEL bit of TINT Interrupt Type Selection Register (TITSR0/1) in IA55/IM33. It can be selected “Rising-edge detection”, “Falling-edge detection”, “High-level detection” or “Low-level detection”.

[Status Control]

- TINT interrupt requests can be confirmed by reading TSTATn bit of TINT Status Control Register (TSCR) in IA55/IM33.
- In case selected a level detection in TITSR0/1, the interrupt requests are cleared when the interrupt sources de-assert the interrupts.
- In case selected an edge detection in TITSR0/1, the interrupt requests can be cleared by writing 0 to TSTATn bit.

Table 8.4 GPIOINT Mapping

| No. | GPIO Pin | GPIOINT |
|---|---|---|
| 1 | P0_0 | GPIOINT0 |
| 2 | P0_1 | GPIOINT1 |
| 3 | P0_2 | GPIOINT2 |
| 4 | P0_3 | GPIOINT3 |

## 8.7.4 Internal Interrupt

### 8.7.4.1 Bus Error Interrupt

Bus error interrupts (BUSERR_INT0-41) generated by system bus are integrated into one interrupt (BUS_ERR_INT) by IA55/IM33 and the integrated interrupt is notified to CPU.

[Status Control]

- Bus error interrupt requests can be confirmed by reading BUS Error Interrupt Status Control Register (BEISR0/1) in IA55/IM33.
  Refer to **Table 8.5** and **Table 8.6** for mapping BESTAT0-41 onto bus error interrupt causes.
- The interrupt requests can be cleared by writing 0 to BESTAT0-41 bit.

Table 8.5 BEISR0 Bus Error Mapping

| BEISR0 | Interrupt | Description |
|---|---|---|
| BESTAT0 | BUSERR_INT0 | Bus Write Error Interrupt for CA55 |
| BESTAT1 | BUSERR_INT1 | Bus Read Error Interrupt for CA55 |
| BESTAT2 | BUSERR_INT2 | Reserved |
| BESTAT3 | BUSERR_INT3 | Reserved |
| BESTAT4 | BUSERR_INT4 | Bus Write Error Interrupt for DMAC_S |
| BESTAT5 | BUSERR_INT5 | Bus Read Error Interrupt for DMAC_S |
| BESTAT6 | BUSERR_INT6 | Bus Write Error Interrupt for DMAC_NS |
| BESTAT7 | BUSERR_INT7 | Bus Read Error Interrupt for DMAC_NS |
| BESTAT8 | BUSERR_INT8 | Bus Write Error Interrupt for CST_ETR |
| BESTAT9 | BUSERR_INT9 | Bus Read Error Interrupt for CST_ETR |
| BESTAT10 | BUSERR_INT10 | Bus Write Error Interrupt for CST_AP |
| BESTAT11 | BUSERR_INT11 | Bus Read Error Interrupt for CST_AP |
| BESTAT12 | BUSERR_INT12 | Bus Write Error Interrupt for CM33_S |
| BESTAT13 | BUSERR_INT13 | Bus Read Error Interrupt for CM33_S |
| BESTAT14 | BUSERR_INT14 | Bus Write Error Interrupt for CM33_C |
| BESTAT15 | BUSERR_INT15 | Bus Read Error Interrupt for CM33_C |
| BESTAT16 | BUSERR_INT16 | Bus Write Error Interrupt for SDHI Ch0 |
| BESTAT17 | BUSERR_INT17 | Bus Read Error Interrupt for SDHI Ch0 |
| BESTAT18 | BUSERR_INT18 | Bus Write Error Interrupt for SDHI Ch1 |
| BESTAT19 | BUSERR_INT19 | Bus Read Error Interrupt for SDHI Ch1 |
| BESTAT20 | BUSERR_INT20 | Bus Write Error Interrupt for Gether Ch0 |

| BESTAT42 | — | Reserved |
| BESTAT43 | — | Reserved |
| BESTAT44 | — | Reserved |

### 8.7.4.2 ECCRAM Error Interrupt

ECCRAM error interrupts generated by On-Chip RAM (ECCRAM0, ECCRAM1) are integrated into one interrupt from eight interrupts by IA55/IM33 and the integrated interrupt is notified to CPU.

Integrated 1bit error interrupt: EC7TIE1_0, EC7TIE1_1
Integrated 2bit error interrupt: EC7TIE2_0, EC7TIE2_1
Integrated overflow interrupt: EC7TIOVF_0, EC7TIOVF_1

[Status Control]

- ECCRAM error interrupt requests can be confirmed by reading ECCRAM Error Interrupt Status Control Register (EREISR0/1) in IA55/IM33.
  Refer to **Table 8.7** and **Table 8.8** for mapping E1STAT0-7, E2STAT0-7 and OFSTAT0-7 onto ECCRAM error interrupt causes.
- The interrupt requests can be cleared by writing 0 to E1STAT0-7, E2STAT0-7 and OFSTAT0-7 bit.

Table 8.7 ECCRAM0 ECC Error Mapping

| EREISR0 | Interrupt | Description | Integrated Interrupt |
|---|---|---|---|
| E1STAT0 | ECCRAM0_1E0 | ECC 1bit error interrupt bit[31:0] | EC7TIE1_0 |
| E1STAT1 | ECCRAM0_1E1 | ECC 1bit error interrupt bit[63:32] | |
| E1STAT2 | ECCRAM0_1E2 | ECC 1bit error interrupt bit[95:64] | |
| E1STAT3 | ECCRAM0_1E3 | ECC 1bit error interrupt bit[127:96] | |
| E1STAT4 | ECCRAM0_1E4 | ECC 1bit error interrupt bit[159:128] | |
| E1STAT5 | ECCRAM0_1E5 | ECC 1bit error interrupt bit[191:160] | |
| E1STAT6 | ECCRAM0_1E6 | ECC 1bit error interrupt bit[223:192] | |
| E1STAT7 | ECCRAM0_1E7 | ECC 1bit error interrupt bit[255:224] | |
| E2STAT0 | ECCRAM0_2E0 | ECC 2bit error interrupt bit[31:0] | EC7TIE2_0 |
| E2STAT1 | ECCRAM0_2E1 | ECC 2bit error interrupt bit[63:32] | |
| E2STAT2 | ECCRAM0_2E2 | ECC 2bit error interrupt bit[95:64] | |
| E2STAT3 | ECCRAM0_2E3 | ECC 2bit error interrupt bit[127:96] | |
| E2STAT4 | ECCRAM0_2E4 | ECC 2bit error interrupt bit[159:128] | |
| E2STAT5 | ECCRAM0_2E5 | ECC 2bit error interrupt bit[191:160] | |
| E2STAT6 | ECCRAM0_2E6 | ECC 2bit error interrupt bit[223:192] | |
| E2STAT7 | ECCRAM0_2E7 | ECC 2bit error interrupt bit[255:224] | |
| OFSTAT0 | ECCRAM0_OF0 | ECC error overflow interrupt bit[31:0] | EC7TIOVF_0 |
| OFSTAT1 | ECCRAM0_OF1 | ECC error overflow interrupt bit[63:32] | |
| OFSTAT2 | ECCRAM0_OF2 | ECC error overflow interrupt bit[95:64] | |
| OFSTAT3 | ECCRAM0_OF3 | ECC error overflow interrupt bit[127:96] | |
| OFSTAT4 | ECCRAM0_OF4 | ECC error overflow interrupt bit[159:128] | |
| OFSTAT5 | ECCRAM0_OF5 | ECC error overflow interrupt bit[191:160] | |
| OFSTAT6 | ECCRAM0_OF6 | ECC error overflow interrupt bit[223:192] | |
| OFSTAT7 | ECCRAM0_OF7 | ECC error overflow interrupt bit[255:224] | |

Table 8.8 ECCRAM1 ECC Error Mapping

| EREISR1 | Interrupt | Description | Integrated Interrupt |
|---|---|---|---|
| E1STAT0 | ECCRAM1_1E0 | ECC 1bit error interrupt bit[31:0] | EC7TIE1_1 |
| E1STAT1 | ECCRAM1_1E1 | ECC 1bit error interrupt bit[63:32] | |
| E1STAT2 | ECCRAM1_1E2 | ECC 1bit error interrupt bit[95:64] | |
| E1STAT3 | ECCRAM1_1E3 | ECC 1bit error interrupt bit[127:96] | |
| E1STAT4 | ECCRAM1_1E4 | ECC 1bit error interrupt bit[159:128] | |
| E1STAT5 | ECCRAM1_1E5 | ECC 1bit error interrupt bit[191:160] | |
| E1STAT6 | ECCRAM1_1E6 | ECC 1bit error interrupt bit[223:192] | |
| E1STAT7 | ECCRAM1_1E7 | ECC 1bit error interrupt bit[255:224] | |
| E2STAT0 | ECCRAM1_2E0 | ECC 2bit error interrupt bit[31:0] | EC7TIE2_1 |
| E2STAT1 | ECCRAM1_2E1 | ECC 2bit error interrupt bit[63:32] | |
| E2STAT2 | ECCRAM1_2E2 | ECC 2bit error interrupt bit[95:64] | |
| E2STAT3 | ECCRAM1_2E3 | ECC 2bit error interrupt bit[127:96] | |
| E2STAT4 | ECCRAM1_2E4 | ECC 2bit error interrupt bit[159:128] | |
| E2STAT5 | ECCRAM1_2E5 | ECC 2bit error interrupt bit[191:160] | |
| E2STAT6 | ECCRAM1_2E6 | ECC 2bit error interrupt bit[223:192] | |
| E2STAT7 | ECCRAM1_2E7 | ECC 2bit error interrupt bit[255:224] | |
| OFSTAT0 | ECCRAM1_OF0 | ECC error overflow interrupt bit[31:0] | EC7TIOVF_1 |
| OFSTAT1 | ECCRAM1_OF1 | ECC error overflow interrupt bit[63:32] | |
| OFSTAT2 | ECCRAM1_OF2 | ECC error overflow interrupt bit[95:64] | |
| OFSTAT3 | ECCRAM1_OF3 | ECC error overflow interrupt bit[127:96] | |
| OFSTAT4 | ECCRAM1_OF4 | ECC error overflow interrupt bit[159:128] | |
| OFSTAT5 | ECCRAM1_OF5 | ECC error overflow interrupt bit[191:160] | |
| OFSTAT6 | ECCRAM1_OF6 | ECC error overflow interrupt bit[223:192] | |
| OFSTAT7 | ECCRAM1_OF7 | ECC error overflow interrupt bit[255:224] | |

## 8.8 Usage Note

### 8.8.1 Precaution when use the peripheral modules which can initiate DMA Controller.

Some on-chip peripheral modules use the same signal both for an interrupt request and for a DMA transfer request. Refer to **Section 14.4.25, DMA Extension Resource Selectors 0/0S to 7/7S** for detail.

If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked.

To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0).
In addition, need following register settings even if DMA controller is not used.

- Set CPG_CLKON_DMAC_REG register to supply a clock for DMA Controller.
  Refer to **Section 7.2.4, Clock Control Register DMAC_REG** for register detail.
- Set CPG_RST_DMAC register to release a reset for DMA Controller.
  Refer to **Section 7.2.4, Reset Control Register DMAC** for register detail.

### 8.8.2 Clear Timing of Interrupt Cause

Clear the interrupt cause flag in the interrupt exception service routine. It takes time from clearing the interrupt cause flag until the interrupt cause to the CPU is actually removed. Therefore, to prevent the interrupt cause that should have been cleared from being accidentally accepted again, the interrupt cause flag is read after clearing, and then the return instruction is executed.

### 8.8.3 Precaution when Changing Interrupt Settings

To change the NMI, IRQ, TINT interrupt settings, mask the interrupts and change the settings.

- When changing the noise filter settings.
- When switching the GPIO pins to IRQ or GPIOINT.
- When changing the source of TINT.
- When changing the interrupt detection method.

When changing the NMI, IRQ, TINT interrupt detection method to the edge type, perform the process of clearing the interrupt status after changing the setting.

- NMI: Write 0 to the NSTAT bit of NSCR.
- IRQ: Write 0 to the ISTATn bit of ISCR.
- TINT: Write 0 to the TSTATn bit of TSCR.

# 9. DDR3L/DDR4 SDRAM Memory Controller (MEMC)

DDR3L/DDR4 SDRAM Memory Controller (MEMC) is External Bus Controller for DDR3L/DDR4 SDRAM (DDR). This block supports up to DDR4-1600 and DDR3L-1333 SDRAM. Interface bus width is 16 bits. In line ECC can be supported.
For sepup and configuration to this block, please use and refer to the linux software package of this LSI including DDR setup codes.

## 9.1 Features

This unit consists of MC (Memory controller) and PHY. It supports the following specifications.

- DDR3L (JEDEC STANDARD JESD79-3F, JESD79-3-1A.01)
- DDR4 (JEDEC STANDARD JESD79-4C)

**Figure 9.1** shows features of this block.

Table 9.1 DDR3L/DDR4 SDRAM Memory Controller (MEMC) features

| Feature | Description |
|---|---|
| DRAM IF | • DDR3L: 800 to 1333 Mbps (400 to 666 MHz)<br>• DDR4: 1333 to 1600 Mbps (666 to 800 MHz)<br>• Width: 16 bits (Full (16 bits) or Half (8 bits) datawidth mode)<br>• Rank: 1, 2 |
| MC (Memory controller) | • Fully pipelined command, read and write data interfaces to the controller.<br>• Advanced bank look-ahead features for high memory throughput.<br>• A programmable register interface to control memory parameters and protocols including auto pre-charge.<br>• Full initialization of memory on controller reset.<br>• ECC function for single bit and double bit error reporting, single bit error correction, and programmable removal of ECC storage. |
| PHY | • Write Leveling (Deskew CK vs Write-DQS)<br>• Bit Leveling (Deskew DQS vs DQ/DM, Read and Write)<br>• Vref Training (Read and Write)<br>• Self Calibration Logic (Deskew Read vs Internal clock)<br>• Command/Address Swizzling |

The diagrams of this unit are follows.

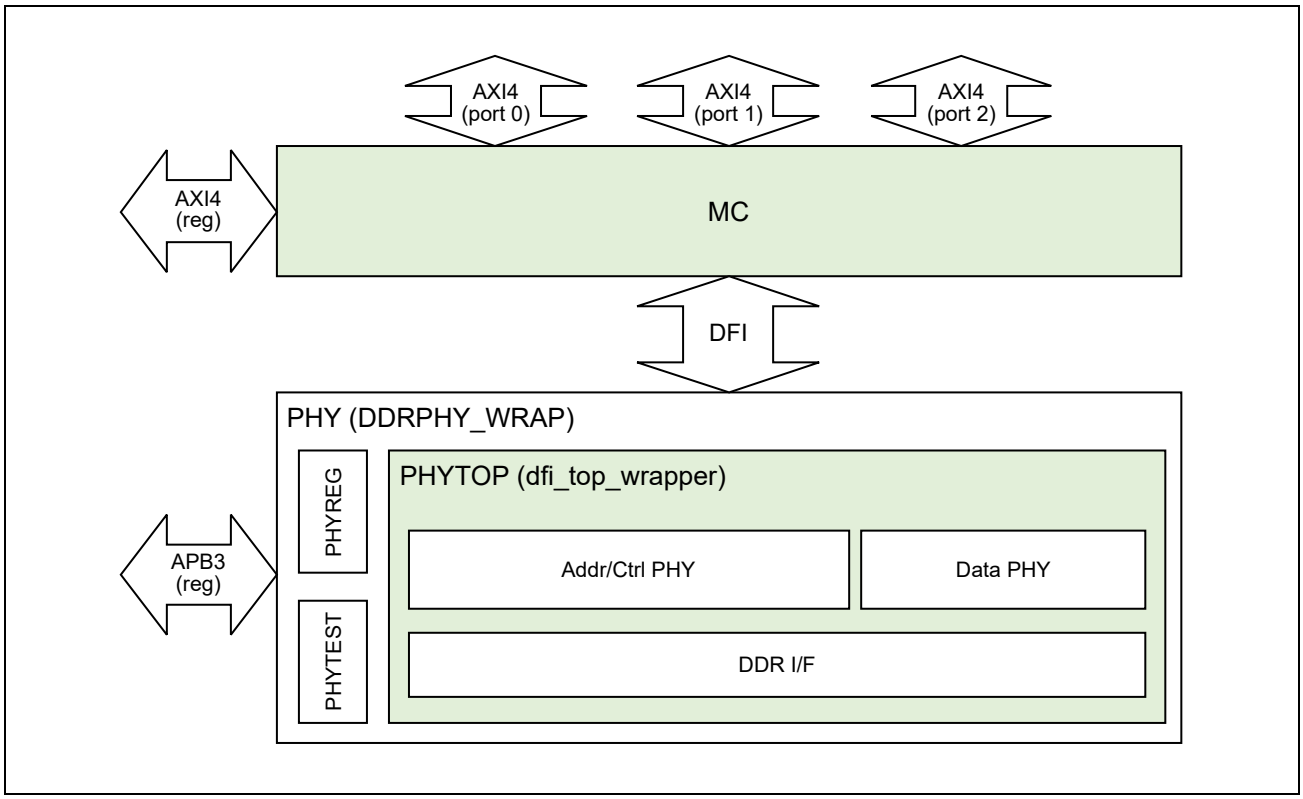

Figure 9.1 Block Diagram

This unit has the following restrictions.

**DDR3L**

- BC4 is not supported.
- Interleave is not supported.

**DDR4**

- BC4 is not supported.
- Interleave is not supported.
- Geardown Mode is not supported.
- Fine granularity refresh mode is supported, but only in Fixed x1 mode.
- CAL Mode is not supported.
- DBI is not supported.
- CRC is not supported.
- CA Parity is not supported.

## 9.2 Interface

### 9.2.1 Power, Ground

**Table 9.2** shows the power and ground pins of this unit.

Table 9.2 Power, Ground

| Name | I/O | Description |
|---|---|---|
| DDR_VDDQ | Supply | Power supply for I/O |
| VDD | Supply | Power supply for core |
| VSS | Ground | Ground for core |

### 9.2.2 External Pins

**Table 9.3** shows the external pins for DDR interface.

Table 9.3 External pin list

| External pin | I/O | Description |
|---|---|---|
| DDR_CLK_P | O | DDR Clock (Pos) |
| DDR_CLK_N | O | DDR Clock (Neg) |
| DDR_RESET# | O | DDR Active Low Asynchronous Reset |
| DDR_CKE | O | DDR Clock Enable |
| DDR_CS0# | O | DDR Address or Command |
| DDR_CS1# | O | DDR Address or Command |
| DDR_RAS# | O | DDR Address or Command |
| DDR_CAS# | O | DDR Address or Command |
| DDR_WE# | O | DDR Address or Command |
| DDR_BA0 to DDR_BA2 | O | DDR Address or Command |
| DDR_ADDR0 to DDR_ADDR15 | O | DDR Address or Command |
| DDR_ODT0 | O | DDR On Die Termination |
| DDR_ODT1 | O | DDR On Die Termination |
| DDR_DQS0_P | IO | DDR Data Strobe (Pos) |
| DDR_DQS0_N | IO | DDR Data Strobe (Neg) |
| DDR_DQS1_P | IO | DDR Data Strobe (Pos) |
| DDR_DQS1_N | IO | DDR Data Strobe (Neg) |
| DDR_DQ0 to DDR_DQ15 | IO | DDR Data |
| DDR_DM0 | O | DDR Data Mask |
| DDR_DM1 | O | DDR Data Mask |
| DDR_CALIBRATION | IO | Should be connected to an external 240-ohm resistor. It is used for drive and termination impedance calibration of IOs. |

## 9.3 Usage Note

This unit has the following restrictions.

Table 9.4 External pin list

| Item | Restriction |
|---|---|
| Address map | It has the area (address) that access is prohibited, because it is used by the periodic training. It is as below.<br><br>DRAM address:<br>BA = 0, ROW = H'0, COL = H'000 to H'00F<br>BG = 0 and 1 (only DDR4)<br>System address:<br>H'040000000 to H'04000003F (if DDR4)<br>H'040000000 to H'04000001F (if DDR3L) |
| Period of DRAM inaccessibility | It has the period of DRAM inaccessibility to execute the periodic training. It depends only on the Bit Rate, and not on the kind of DRAM. It is belows:<br>1600Mbps: 5.0 µsec every 1000 msec<br>1333Mbps: 1.5 µsec every 1000 msec<br>1066Mbps: 1.875 µsec every 1000 msec<br>800Mbps: 2.5 µsec every 1000 msec |

### 9.3.1 Power On

The power on sequence for the DDR_VDDQ and VDD domains is such that either the 2 voltages should be ramped up together or VDD should be ramped up prior to DDR_VDDQ in order to prevent voltage stress in the DDR IOs.

# 10. On-chip RAM

This LSI has an on-chip RAM for work area. These memory units can be used to store instructions or data. The operation and write access to the on-chip RAM can be enabled or disabled through the RAM enable bit (VCEN in SYS_RAMn_EN register) (n = 0-1) and RAM write enable bit (VLWEN in SYS_RAMn_EN register) (n = 0-1).

For details on the register, refer to the **Section 6.3** in chapter SYSC.

## 10.1 Features

### ■ Memory size

128 Kbytes (SRAM ACPU: 64 Kbytes, SRAM MCPU: 64 Kbytes)

### ■ Ports

On-chip RAM has one read and write port and is connected to the AXI bus.

### ■ Method of arbitration

When the same port of the on-chip RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.

### ■ Number of access cycles

The number of cycles for access to read or write is one cycle of SRAM_ACPU_ACLK (P1ϕ).

The number of cycles for access to read or write is one cycle of SRAM_MCPU_ACLK (I2ϕ).

# 11. Error Correcting Code (ECC) for On-Chip RAM

## 11.1 Overview

This LSI chip has two 64-Kbyte areas of on-chip RAM for use as the working area.

Each of on-chip RAM incorporates an ECC function, which allows the detection and correction of 1-bit errors and the detection of 2-bit errors. When a 1-bit or 2-bit error occurs, the address where the error occurred can be stored in an ECC error address register.

The data bus width is 256 bits. This is divided into eight channels as shown in **Figure 11.1**, with detection handled in each 32-bit channel.

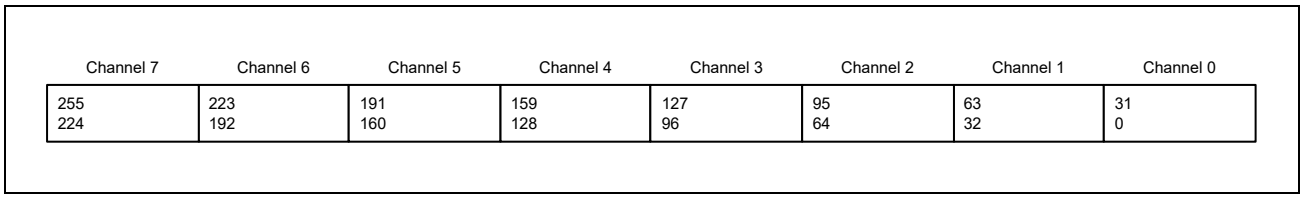

Figure 11.1 Division for ECC Processing

### 11.1.1 Features

- Error detection and correction
  - Detection and correction of 1-bit errors and detection of 2-bit errors are possible.
  - An error involving 3 or more bits cannot be correctly handled and may result in erroneous detection and correction.
- Control of error detection and correction
  - Error detection and correction, and correction of 1-bit errors can respectively be enabled or disabled.
- Capture of the addresses where errors occurred
  - When a 1-bit or 2-bit error is detected, the address where the error was encountered is stored in an ECC error address register. Each channel has eight ECC error address registers.
- Interrupt request
  - An interrupt request can be generated on the detection of a 1-bit error (selectable as enabled or disabled).
  - An interrupt request can be generated on the detection of a 2-bit error (selectable as enabled or disabled).
  - An overflow interrupt is generated from each channel on detection of an error when all ECC error address registers contain values.

## 11.2 Register Configuration

**Table 11.1** and **Table 11.2** respectively show the base register and base address. The addresses of the ECC registers are represented by offsets from the base address.

Table 11.1 Base Register

| Base Register Name | On-Chip RAM | Register Abbreviation |
|---|---|---|
| <REG_base> | SRAM ACPU | ECCRAM0 |
| | SRAM MCPU | ECCRAM1 |

Table 11.2 Base Register

| Base Register Name | On-Chip RAM | Register Abbreviation |
|---|---|---|
| <ADR_base> | SRAM ACPU | H'0_1108_0000 (Overall Address Space)<br>H'4108_0000 (Cortex-M33 Address Space Non-Secure)<br>H'5108_0000 (Cortex-M33 Address Space Secure) |
| | SRAM MCPU | H'0_1109_0000 (Overall Address Space)<br>H'4109_0000 (Cortex-M33 Address Space Non-Secure)<br>H'5109_0000 (Cortex-M33 Address Space Secure) |

**Table 11.3** lists the ECC registers.

Do not attempt access to the on-chip RAM areas while the registers listed in **Table 11.3** are being set.

Table 11.3 List of the ECC Registers (1/2)

| Channel | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | ECC control register_0 | <REG_base>CTL_0 | R/W | H'0000_0010 | <ADR_base> + H'0000 | 32 |
| | ECC error address register 0_0 | <REG_base>EAD0_0 | R | H'0000_0000 | <ADR_base> + H'0010 | 32 |
| | ECC error address register 1_0 | <REG_base>EAD1_0 | R | H'0000_0000 | <ADR_base> + H'0014 | 32 |
| | ECC error address register 2_0 | <REG_base>EAD2_0 | R | H'0000_0000 | <ADR_base> + H'0018 | 32 |
| | ECC error address register 3_0 | <REG_base>EAD3_0 | R | H'0000_0000 | <ADR_base> + H'001C | 32 |
| | ECC error address register 4_0 | <REG_base>EAD4_0 | R | H'0000_0000 | <ADR_base> + H'0020 | 32 |
| | ECC error address register 5_0 | <REG_base>EAD5_0 | R | H'0000_0000 | <ADR_base> + H'0024 | 32 |
| | ECC error address register 6_0 | <REG_base>EAD6_0 | R | H'0000_0000 | <ADR_base> + H'0028 | 32 |

## 11.3 Register Descriptions

### 11.3.1 ECC Control Registers_n (<REG_base>CTL_n) (n = 0 to 7)

Each ECC control register_n is used to control the ECC function in the corresponding channel n shown in **Figure 11.1**.

After writing the initial value to the entire usage area of the on-chip RAM, set the given ECERVF bits to 1 to enable error detection. Be sure to write 01b to the corresponding EMCA[1:0] bits to enable writing to an ECERVF bit.

For writing the initial value to the on-chip RAM areas, refer to **Section 11.5, Initializing the Detection-Usage Areas of the On-Chip RAM**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ECDEDF7 | ECSEDF7 | ECDEDF6 | ECSEDF6 | ECDEDF5 | ECSEDF5 | ECDEDF4 | ECSEDF4 | ECDEDF3 | ECSEDF3 | ECDEDF2 | ECSEDF2 | ECDEDF1 | ECSEDF1 | ECDEDF0 | ECSEDF0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 15, 14 | EMCA[1:0] | 00b | R/W | Enable Writing to ECERVF<br>01b: Enabled<br>Others: Disabled<br>These bits are always read as 00b. |
| 13, 12 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

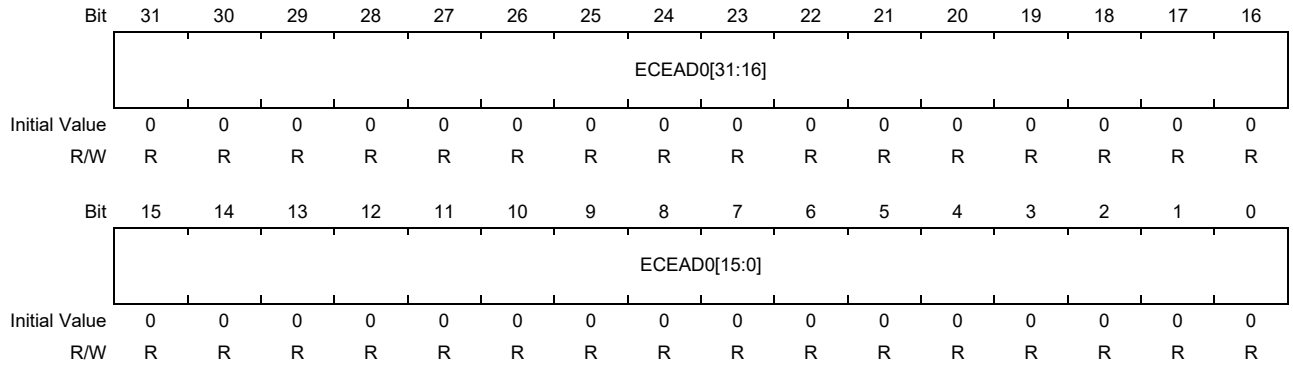
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 11 | ECOVFF | 0 | R | ECC Overflow Detection Flag<br>This bit is set to 1 and an overflow interrupt is output on detection of an error when the ECC error address registers (<REG_base>EADm_n (m = 0 to 7)) all contain data. An overflow interrupt is output even if the error is detected while the setting of this bit is already 1.<br>This bit is cleared to 0 under any of the following conditions.<br>1. Power-on reset<br>2. Writing 1 to the corresponding ECER2C bit or ECER1C bit<br>3. Setting the ECC error detection enable bit to “disabled” (ECERVF = 0) |
| 10 | ECER2C | 0 | R/W | 2-Bit Error Detection Flag Clear<br>0: The internal state does not change.<br>1: The corresponding 2-bit error detection flag ECER2F is cleared.<br>This bit is always read as 0. |
| 9 | ECER1C | 0 | R/W | 1-Bit Error Detection Flag Clear<br>0: The internal state does not change.<br>1: The corresponding 1-bit error detection flag ECER1F is cleared.<br>This bit is always read as 0. |
| 8, 7 | — | 00b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 6 | ECERVF | 0 | R/W | ECC Error Detection Enable<br>0: Disables error detection.<br>1: Enables error detection.<br>1-bit error correction (EC1ECP) and interrupt control (EC2EDIC and EC1EDIC) are only possible when error detection is enabled.<br>*Note*: To write to this bit, the corresponding EMCA[1:0] bits must be set to 01b. |
| 5 | EC1ECP | 0 | R/W | 1-Bit Error Correction Enable<br>0: The error is corrected when a 1-bit error is detected.<br>1: The error is not corrected when a 1-bit error is detected. |
| 4 | EC2EDIC | 1 | R/W | 2-Bit Error Detection Interrupt Control<br>0: An interrupt is not generated when a 2-bit error is detected.<br>1: An interrupt is generated when a 2-bit error is detected.<br>The interrupt is only generated when the corresponding 2-bit error detection flag (ECER2F) changes from 0 to 1. |
| 3 | EC1EDIC | 0 | R/W | 1-Bit Error Detection Interrupt Control<br>0: An interrupt is not generated when a 1-bit error is detected.<br>1: An interrupt is generated when a 1-bit error is detected.<br>The interrupt is only generated when the corresponding 1-bit error detection flag (ECER1F) changes from 0 to 1. |
| 2 | ECER2F | 0 | R | 2-Bit Error Detection Flag<br>0: A 2-bit error has not occurred.<br>1: A 2-bit error has occurred.<br>This bit is cleared to 0 under any of the following conditions.<br>1. Power-on reset<br>2. Writing 1 to the corresponding ECER2C bit<br>3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0) |
| 1 | ECER1F | 0 | R | 1-Bit Error Detection Flag<br>0: A 1-bit error has not occurred.<br>1: A 1-bit error has occurred.<br>This bit is cleared to 0 under any of the following conditions.<br>1. Power-on reset<br>2. Writing 1 to the corresponding ECER1C bit<br>3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

### 11.3.2 ECC Error Address Registers m_n (<REG_base>EADm_n) (m = 0 to 7) (n = 0 to 7)

When a 1- or 2-bit error occurs, up to eight error addresses are sequentially stored in the registers from <REG_base>EAD0_n to <REG_base>EAD7_n.

When a 2-bit error is detected while only 1-bit error addresses were stored up to <REG_base>EAD7_n, <REG_base>EAD7_n is overwritten by the address of the 2-bit error. Otherwise, it will not be overwritten. For details, refer to **Section 11.6.4, ECC Error Address Register Overwrite Conditions**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | ECEAD0 [31:0] | All 0 | R | These bits hold the address of the (m + 1)th error to have been detected.<br>These bits are cleared to 0 under the following condition:<br>clearing ECER2F or ECER1F in the <REG_base>CTL_n register. |

## 11.4 Initializing the ECC Function

Initialize the ECC by following the procedure below to enable the ECC function.

1. Set the VECCEN bit in the ECCRAM setting register corresponding to the RAM area for which the ECC function is to be enabled to 1.
2. Write the initial value to the entire usage area of the RAM for which the ECC function is to be enabled.
3. Set the ECERVF bits in the ECC control registers_n to 1 to enable error detection. Then, set the respective bits to control 1-bit error correction and interrupts.

For notes on the settings of registers of this module, refer to **Section 11.6.1, Notes on Setting the Registers of This Module**.

## 11.5 Initializing the Detection-Usage Areas of the On-Chip RAM

Before using the ECC function, write the initial value to the entire usage area of the on-chip RAM for which the ECC function is to be enabled. The initial value can be any value. Since the detection of ECC errors is handled in 32-bit units in each channel, the initial value should also be written in 32-bit units.

Enabling error detection without initialization may cause an ECC error due to unintended reading.

### Examples of Operations that May Lead to Errors

1. When writing is to proceed in 8- or 16-bit units, reading the 32-bit value from the given address and then writing the data
2. If the locations are not initialized, an ECC error may occur when the 32-bit value is read. For details on writing in 8- or 16-bit units, refer to **section 11.6.2, 8- or 16-Bit Access**.
3. When the CPU cache is enabled, if a cache miss occurs in writing, the cache being refilled by a 1-line unit
   At this time if data are not initialized, an ECC error may occur because data are read in 1-line (32-byte) units.

## 11.6 Usage Notes

### 11.6.1 Notes on Setting the Registers of This Module

Ensure that none of the bus masters proceeds with access to the on-chip RAM areas while the registers listed in **Table 11.3** are being set up.

### 11.6.2 8- or 16-Bit Access

The ECC function for the on-chip RAM areas handles error detection in 32-bit units. Accordingly, when access is to be in 8- or 16-bit units, the operations proceed as follows.

#### (1) 8- or 16-bit reading

(a) The 32 bits of data are read and the ECC is used to determine whether or not an error is present.

(b) The 8 or 16 bits of data are then returned to the bus master that issued the read request.

#### (2) 8- or 16-bit writing

(a) The 32 bits of data from the address that contains the location for writing are read and the ECC is used to determine whether or not an error is present.

(b) The 32 bits of data that have been read are then overwritten with the 8- or 16-bit data.

(c) The ECC value for the overwritten 32-bit data in (b) is added by writing it to the RAM.

### 11.6.3 Numbers of Cycles for Reading from or Writing to a RAM Area with the ECC Function Enabled

The numbers of cycles for reading from or writing to an on-chip RAM area with the ECC function enabled are as follows.

#### (1) Reading

The number of cycles for reading in 8- or 16-bit and 32-bit units when the ECC function is enabled is one cycle of SRAM_ACPU_ACLK or SRAM_MCPU_ACLK longer than when the ECC function is disabled.

#### (2) Writing

The number of cycles for writing in 8- or 16-bit units when the ECC function is enabled is two cycles of SRAM_ACPU_ACLK or SRAM_MCPU_ACLK longer than when the ECC function is disabled. The number of cycles for writing in 32-bit units when the ECC function is enabled is the same as when the ECC function is disabled.

### 11.6.4 ECC Error Address Register Overwrite Conditions

If a new ECC error occurs with the ECC error address stored up to <REG_base> EAD7_n, <REG_base> EAD7_n may or may not be overwritten. The conditions to be overwritten are shown below.

| Error Address Storage Status Up to <REG_base> EAD7_n | New ECC Error | <REG_base>EAD7_n Overwrite | Overflow Interrupt |
|---|---|---|---|
| Only 1-bit error | 1-bit error | Not overwritten | Occur |
| Only 1-bit error | 2-bit error | Overwritten | Occur |
| Only 2-bit error | 1-bit error | Not overwritten | Occur |
| Only 2-bit error | 2-bit error | Not overwritten | Occur |
| 1-bit error and 2-bit error | 1-bit error | Not overwritten | Occur |
| 1-bit error and 2-bit error | 2-bit error | Not overwritten | Occur |

# 12. Message Handling Unit (MHU)

MHU is a function for message communication between Cortex-A55(CA55) cores and Cortex-M33(CM33). Message communication is done by shared RAM (On-chip RAM) for passing message and response between CPUs and the function (MHU) for notifying when messages and responses are stored in the memory.

## 12.1 Features

**Table 12.1** shows MHU feature summary.

Table 12.1 Feature summary

| Feature | Description |
|---|---|
| Interrupt by Message and response | Generate interrupt to notify each Cortex-A55 or Cortex-M33 when the message/response is stored in shared RAM (On-chip RAM or External RAM). |
| Software interrupt control | Control registers for interrupt setting, clearing, and status confirmation |

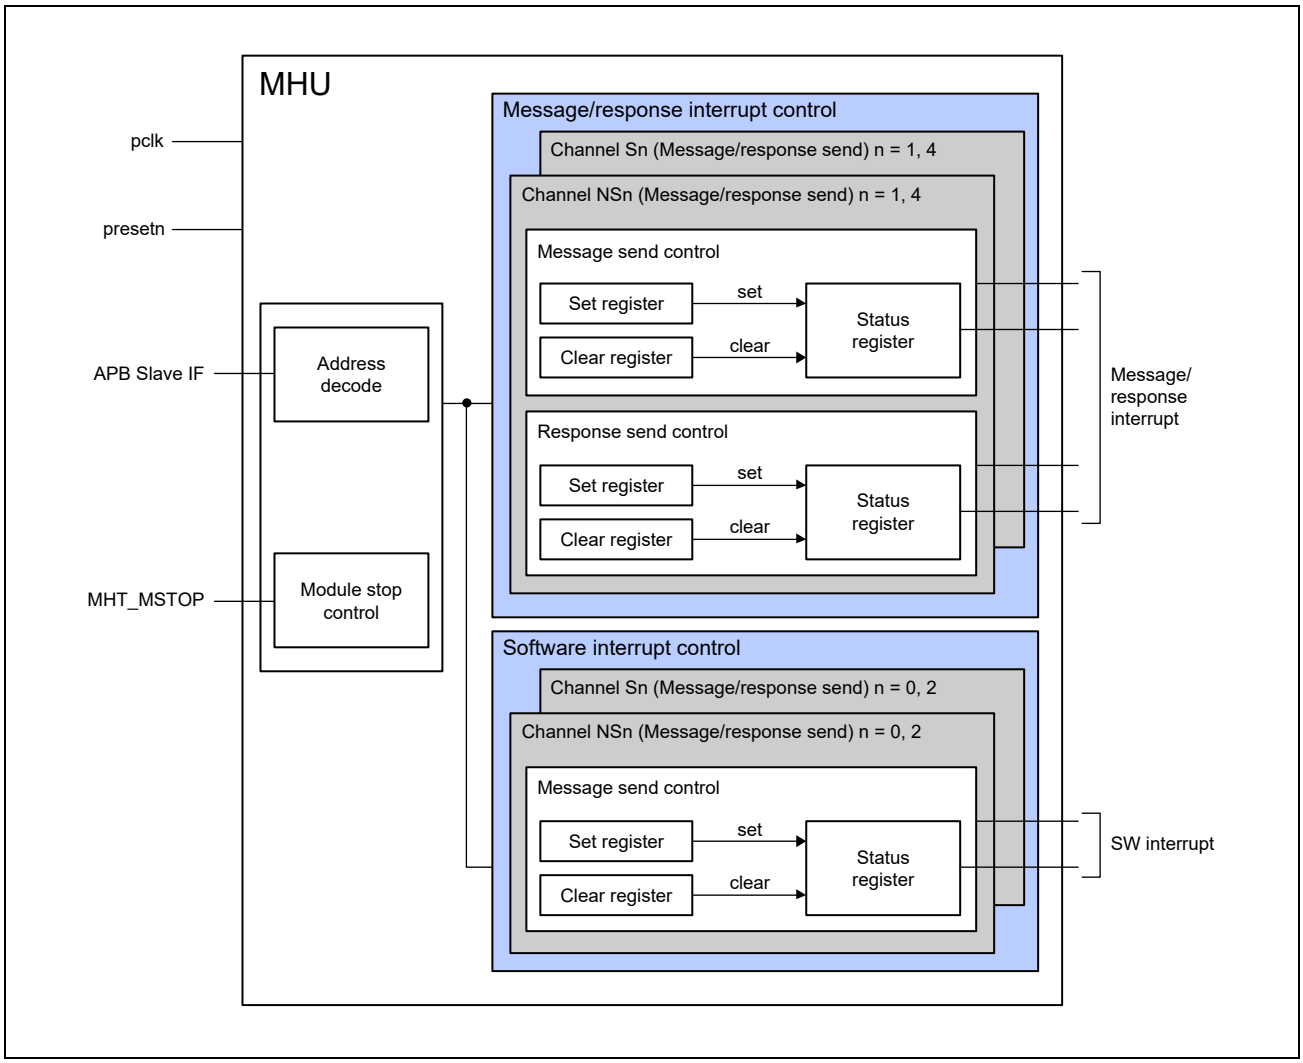


Figure 12.1 MHU Block diagram

### Message/response interrupt control registers

Registers that control message/response interrupts.

The message/response interrupt control register controls interrupts with the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. The status can be checked by reading the status register. With these as one set, the message transmission processing register

One channel is composed of a pair of data transmission processing register and response transmission processing register, and a total of 4 channels are mounted. The breakdown of 4 channels is as follows.

Shows MHU feature summary.

### Non-Secure interrupt control register(Channel NS1 and 4):

Channel NS1 (CA55 Core0: Message transmission/CM33: Response transmission)

Channel NS4 (CM33: Message transmission/CA55 Core0: Response transmission)

### Secure interrupt control register(Channel S1 and 4):

Channel S1 (CA55 Core0: Message transmission/CM33 : Response transmission)

Channel S4 (CM33: Message transmission/CA55 Core0: Response transmission)

### Software interrupt control register

Registers that control software interrupts.

The software interrupt control register controls interrupts using the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. You can also check the interrupt status by reading the status register. With these as one set, the message transmission processing register and response.

One channel is composed of a pair of transmission processing registers, and a total of 2 channels are mounted.

### Module stop control

This circuit refers to the module stop control (MHU_MSTOP) in CPG_MHU_MSTOP register on Clock Pulse Generator (CPG) and returns an error response if an access occurs while the module is stopped.

## 12.2 Interrupt

**Table 12.2** shows interrupt output.

Table 12.2 Interrupt type

| Output | Description | Pulse/Level | Active Level |
|---|---|---|---|
| msg_ch1_ns | Non secure message transmission interrupt (CA55 Core0 -> CM33) | Level | HIGH |
| rsp_ch1_ns | Non secure response transmission interrupt (CM33 -> CA55 Core0) | Level | HIGH |
| msg_ch4_ns | Non secure message transmission interrupt (CM33 -> CA55 Core0) | Level | HIGH |
| rsp_ch4_ns | Non secure response transmission interrupt (CA55 Core0 -> CM33) | Level | HIGH |
| msg_ch1_s | Secure message transmission interrupt (CA55 Core0 -> CM33) | Level | HIGH |
| rsp_ch1_s | Secure response transmission interrupt (CM33 -> CA55 Core0) | Level | HIGH |
| msg_ch4_s | Secure message transmission interrupt (CM33 -> CA55 Core0) | Level | HIGH |
| rsp_ch4_s | Secure response transmission interrupt (CA55 Core0 -> CM33) | Level | HIGH |
| sw_mhu_int_0 | software interrupt 0 (CA55-CM33) | Level | HIGH |
| sw_mhu_int_2 | software interrupt 2 (CA55-CM33) | Level | HIGH |

## 12.3 Register Configuration

**Table 12.3** shows address mapping for MHU. MHU has 4KB address space.

Table 12.3 MHU Address map

| Offset Address<br>(CA55 MHU Base address: H'0_1040_0000)<br>(CM33 non-secure MHU Base address: H'4040_0000)<br>(CM33 secure MHU Base address: H'5040_0000) | Description |
|---|---|
| H'0000 - H'07FF | Non secure message/response interrupt control register |
| H'0800 - H'0FFF | Non secure software interrupt control register |
| H'1000 - H'17FF | Secure message/response interrupt control register |
| H'1800 - H'1FFF | Reserved |
| H'2000 - H'FFFF | Reserved |

**Note:** Prohibit to access Reserved area.

**Table 12.4** shows register attributes

Table 12.4 Register attributes

| Attribute | Description |
|---|---|
| RW | Read&Write register |
| RW0 | Read &Write 0 register. Invalid Write 1. |
| RW1 | Read&Write 1 register. Invalid Write 0. |
| R0W | Read0&Write register. Always Read 0. |
| R1W | Read1&Write register. Always Read 1. |
| R | Read Only |
| R0W0 | Read0&Write0 register. Always Read 0. Invalid Write 1. |
| R0W1 | Read0&Write1 register. Always Read 0. Invalid Write 0. |
| R1W0 | Read1&Write0 register. Always Read 1. Invalid Write 1. |
| R1W1 | Read1&Write1 register. Always Read 1. Invalid Write 0. |
| RCW0 | Read by clear. Write0 register. Invalid Write 1. |
| RCW1 | Read by clear. Write1 register. Invalid Write 0. |

**Note:** No guarantee function for access to Reserved area, Debug and undefined area.

**Table 12.5** shows registers

Table 12.5 List of Registers (1/2)

| Offset Address | Register Name | Abbreviation | Initial value | Access Size |
|---|---|---|---|---|
| Non Secure message/response interrupt | | | | |

**Note:** Access size must be 32bit. Prohibit to access to Reserved register.

## 12.4 Register Descriptions

### 12.4.1 Non secure message transmission interrupt Status register (CA55 Core0 -> CM33)

### 12.4.2 Non secure message transmission interrupt Status register (CM33 -> CA55 Core0)

Status register for Non secure message transmission interrupt (Name: MSG_INT_STSn_NS <n=1, 4>)

**Access Size:** 32bit

**Address(es):** MSG_INT_STS1_NS : H'020
MSG_INT_STS4_NS : H'080

**Initial Value:** H'0000_0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | STAT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | STAT | 0 | R | Show status of message transmission interrupt. Read only. Write is invalid.<br>0: No message transmission interrupt<br>(No interrupt being notified to the interrupt controller at the message destination)<br>1: Assert message transmission interrupt<br>(There is an interrupt being notified to the interrupt controller at the message destination.) |

### 12.4.3 Non secure message transmission interrupt Set register (CA55 Core0 -> CM33)

### 12.4.4 Non secure message transmission interrupt Set register (CM33 -> CA55 Core0)

Set register for Non secure message transmission interrupt (Name: MSG_INT_SETn_NS <n=1, 4>)

**Access Size:** 32bit

**Address(es):** MSG_INT_SET1_NS : H'024
MSG_INT_SET4_NS : H'084

**Initial Value:** H'0000_0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | SET | 0 | R0W1 | Set message transmission interrupt.<br>Write “1” only. Always read “0”.<br>0: invalid<br>1: Issue interrupt to interrupt controller of the message destination. |

### 12.4.5 Non secure message transmission interrupt Clear register (CA55 Core0 -> CM33)

### 12.4.6 Non secure message transmission interrupt Clear register (CM33 -> CA55 Core0)

Clear register of Non secure message transmission interrupt (Name: MSG_INT_CLRn_NS <n=1, 4>)

**Access Size:** 32bit

**Address(es):** MSG_INT_CLR1_NS : H'028
MSG_INT_CLR4_NS : H'088

**Initial Value:** H'0000_0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R0W1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CLEAR | 0 | R0W1 | Clear message transmission interrupt<br>Write “1” only. Always read “0”.<br>0: invalid<br>1: Clear interrupt to interrupt controller of the message destination. |

### 12.4.7 Non secure response transmission interrupt Status register (CM33 -> CA55 Core0)

### 12.4.8 Non secure response transmission interrupt Status register (CA55 Core0 -> CM33)

Status register for Non secure response transmission interrupt (Name: RSP_INT_STSn_NS <n=1, 4>)

**Access Size:** 32bit

**Address(es):** RSP_INT_STS1_NS : H'030
RSP_INT_STS4_NS : H'090

**Initial Value:** H'0000_0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 0 | STAT | 0 | R | Show status of response transmission interrupt. Read only. Write is invalid.<br>0: No response transmission interrupt<br>(No interrupt being notified to the interrupt controller at the message destination)<br>1: Assert response transmission interrupt<br>(There is an interrupt being notified to the interrupt controller at the message destination.) |

### 12.4.9 Non secure response transmission interrupt Set register (CM33 -> CA55 Core0

### 12.4.10 Non secure response transmission interrupt Set register (CA55 Core0 -> CM33)

Set register of Non secure response transmission interrupt (Name: RSP_INT_SETn_NS <n=1, 4>)

**Access Size:** 32bit

**Address(es):** RSP_INT_SET1_NS : H'034
RSP_INT_SET4_NS : H'094

**Initial Value:** H'0000_0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

## 12.5 Function description

### 12.5.1 Inter CPU communication

The hardware configuration is shown in **Figure 12.2**. Inter-CPU communication is established by sending a message from the message source to the message destination and sending a response from the message destination to the message source. The MHU uses an interrupt to notify that the message / response to the CPU has been written to Shared RAM(On-chip RAM). Interrupts are controlled by the Set register, Clear register, and Status register. Interrupt can be asserted by writing “1” to the Set register. Interrupt is negated by writing “1” to the Clear register, and check the interrupt status by reading the Status register. With these registers as one set, one channel is composed of a message transmission processing / response transmission processing pair. A total of 12 channels are installed so that bidirectional communication can be performed between Cortex-A55 Core0 and Cortex-M33. **Table 12.6** shows the channel and message source / destination correspondence.

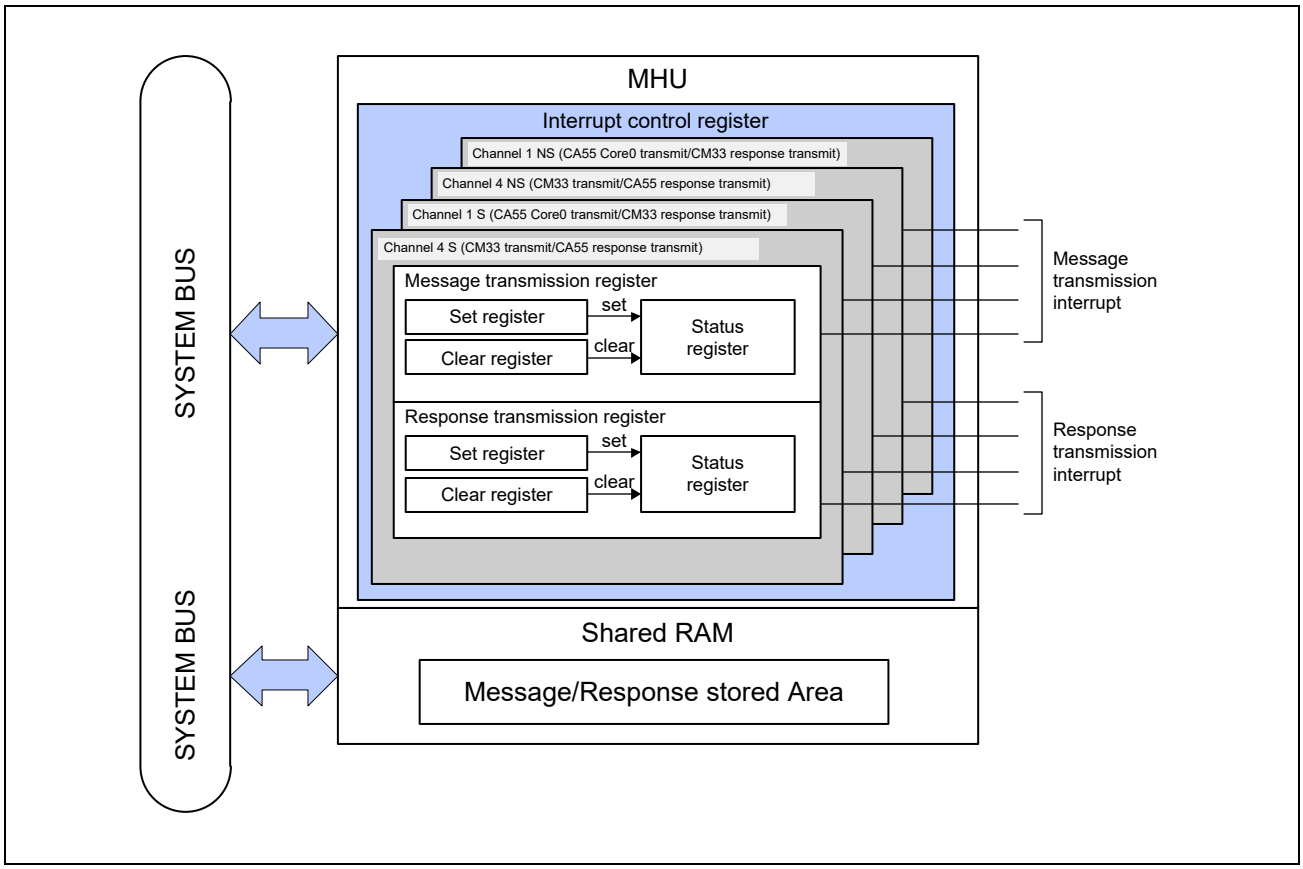

Figure 12.2 Hardware configuration

Table 12.6 Channel and message destination/source reference

| channel | Source | Destination | Message transmit register | Response transmit register |
|---|---|---|---|---|
| channel 1 NS | CA55 Core0 | CM33 | MSG_INT_(SET/CLR/STS)1_NS | RSP_INT_(SET/CLR/STS)1_NS |
| channel 4 NS | CM33 | CA55 Core0 | MSG_INT_(SET/CLR/STS)4_NS | RSP_INT_(SET/CLR/STS)4_NS |
| channel 1 S | CA55 Core0 | CM33 | MSG_INT_(SET/CLR/STS)1_S | RSP_INT_(SET/CLR/STS)1_S |
| channel 4 S | CM33 | CA55 Core0 | MSG_INT_(SET/CLR/STS)4_S | RSP_INT_(SET/CLR/STS)4_S |

## 12.6 Operation sequence

### 12.6.1 Message transmit sequence

Show Message transmit sequence from Cortex-M33 to Cortex-A55 Core0 in below and **Figure 12.3**.

(1) Cortex-M33: Check “0” for bit0 in register: MSG_INT_STS4.
(Confirm cleared status and move to (2))

(2) Cortex-M33: Write message to Shared RAM

(3) Cortex-M33: Write “1” to bit 0 in register: MSG_INT_SET4

(4) MHU channel 4: Assert interrupt: int_msg_ch4 for Cortex-A55

(5) Cortex-A55 Core0: Check interrupt reason (Detect message transmit)

(6) Cortex-A55 Core0: Check “1” for bit 0 in register: MSG_INT_STS4

(7) Cortex-A55 Core0: Read message from shared RAM

(8) Cortex-A55 Core0: Write “1” to bit0 in register: MSG_INT_CLR4

(9) MHU channel 4: Negate interrupt: int_msg_ch4 to Cortex-A55

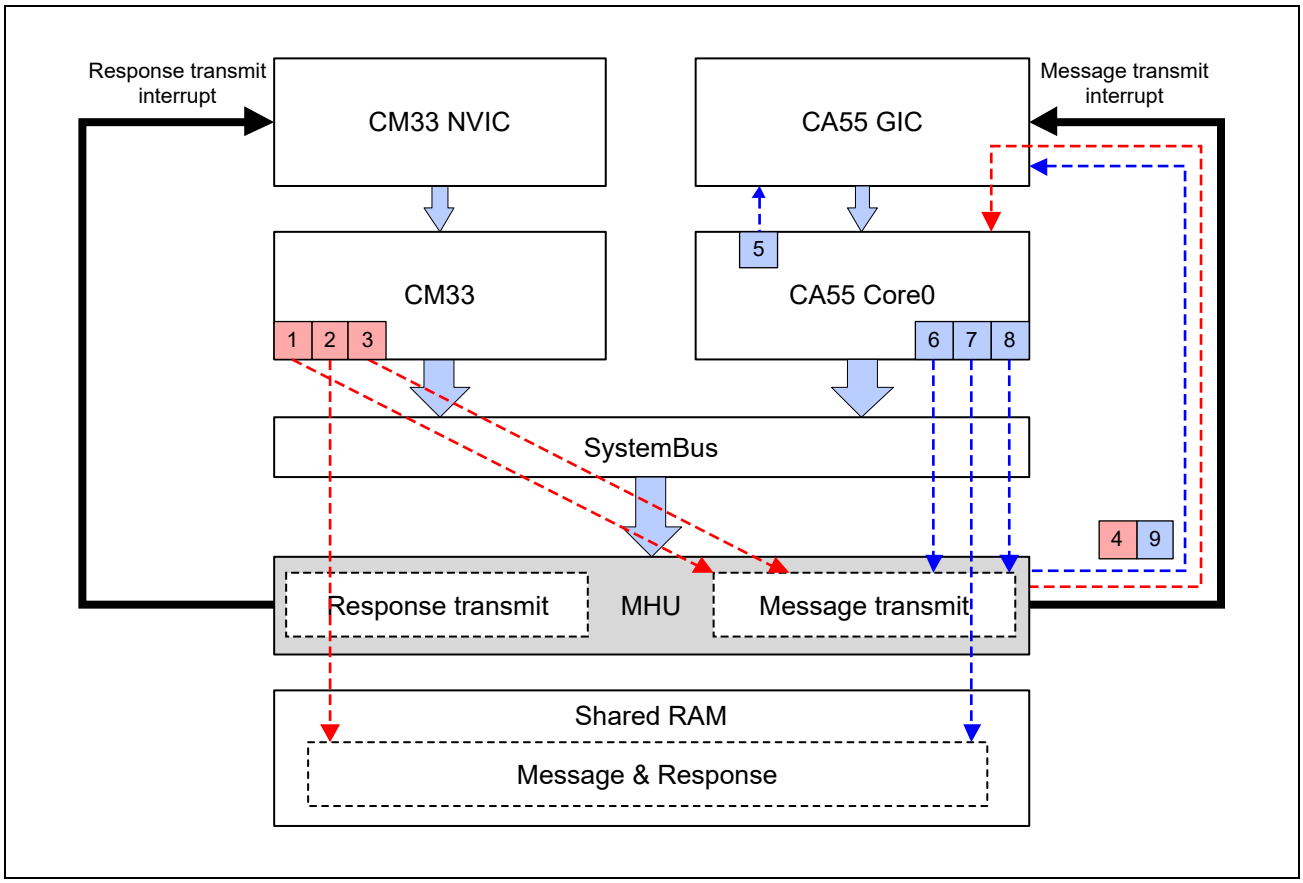

Figure 12.3 Message transmit sequence (CM33 -> CA55 Core0)

### 12.6.2 Response transmit sequence

Show Response transmit sequence from Cortex-A55 Core0 to Cortex-M33 in below and **Figure 12.4**.

(1) Cortex-A55 Core0: Check “0” for bit0 in register: RSP_INT_STS4.
(Confirm cleared status and move to (2))

(2) Cortex-A55 Core0: Write Response to Shared RAM

(3) Cortex-A55 Core0: Write “1” to bit 0 in register: RSP_INT_SET4

(4) MHU channel 4: Assert interrupt: int_rsp_ch2 for Cortex-M33

(5) Cortex-M33: Check interrupt reason (Detect response transmit)

(6) Cortex-M33: Check “1” for bit 0 in register: RSP_INT_STS4

(7) Cortex-M33: Read response from shared RAM

(8) Cortex-M33: Write “1” to bit0 in register: RSP_INT_CLR4

(9) MHU channel 4: Negate interrupt:int_rsp_ch4 to Cortex-M33

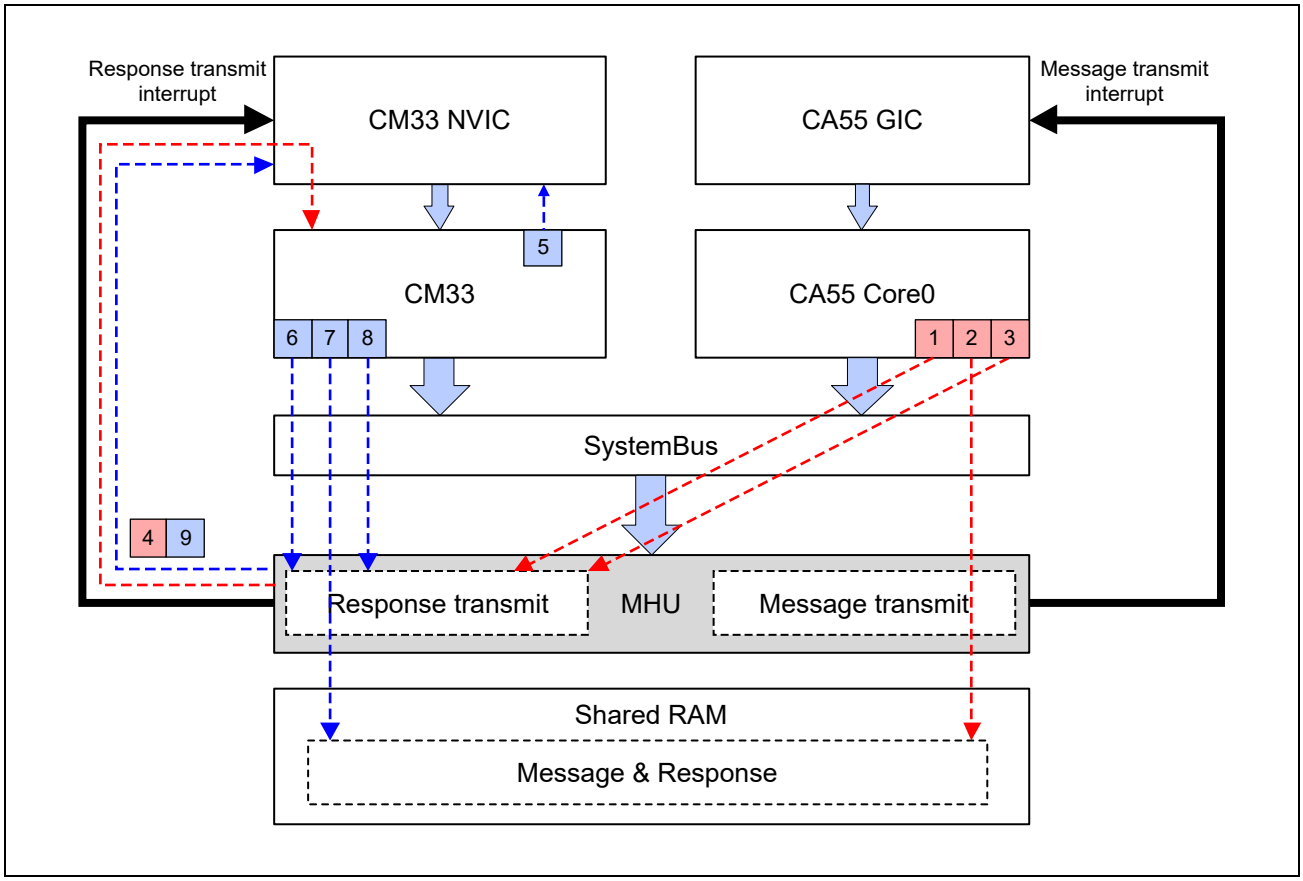

Figure 12.4 Response transmit sequence (CA55 Core0 -> CM33)

# 13. TrustZone Address Space Controller (TZC)

## 13.1 Overview

This LSI has four TrustZone Address Space Controller (TZC) to realize memory access in a safe area. It performs security checks on transactions to memory or peripherals. Transactions must meet security requirements to access memory or peripherals. This is an IP (“CoreLink™ TrustZone Address Space Controller TZC-400”) provided by Arm, for details on the functions of TZC-400, see the relevant Technical Reference Manual.

### 13.1.1 Features

The TZC works between TrustZone system ACE-Lite masters and ACE-Lite slaves to filter bus access from master to slave. It performs filtering based on the security requirements specified in the address space.

Each TZC is installed on the interface of the following modules of this LSI.

- Internal RAM for ACPU (64 KB)
- Internal RAM for MCPU (64 KB)
- SPI Multi I/O Bus Controller
- DDR3L/DDR4 SDRAM Memory Controller

For details on the internal bus, please refer to **Section 5, LSI Internal Bus**.

The TZC provides the following key features:

- The ability to define up to eight address regions in the area map.
- A default base region to cover all remaining portions of the address map.
- Software programmable security access permissions for each address region through an APB interface. This includes the default base region, Region 0.
- Filter units only allow data transfer between an ACE-Lite master and an ACE-Lite slave if the security status of the ACE-Lite transaction and its identity match the security settings of the memory region it addresses.
- Common region configuration register settings shared between multiple filter units.
- Normal path for accesses with a much higher outstanding access support.
- Identity-based filtering of Non-secure accesses.
- Reporting and interrupt signaling that is configurable from software to manage failed permission checks. You can program the TZC to assert TZCnINT (n = 0, 1, 2, 3) when an access fails its security check.
- Gate keeper to allow or block accesses to each filter unit.
- Support for 256 outstanding transactions on the normal paths.

### 13.1.2 Block Diagram

**Figure 13.1** shows a block diagram.

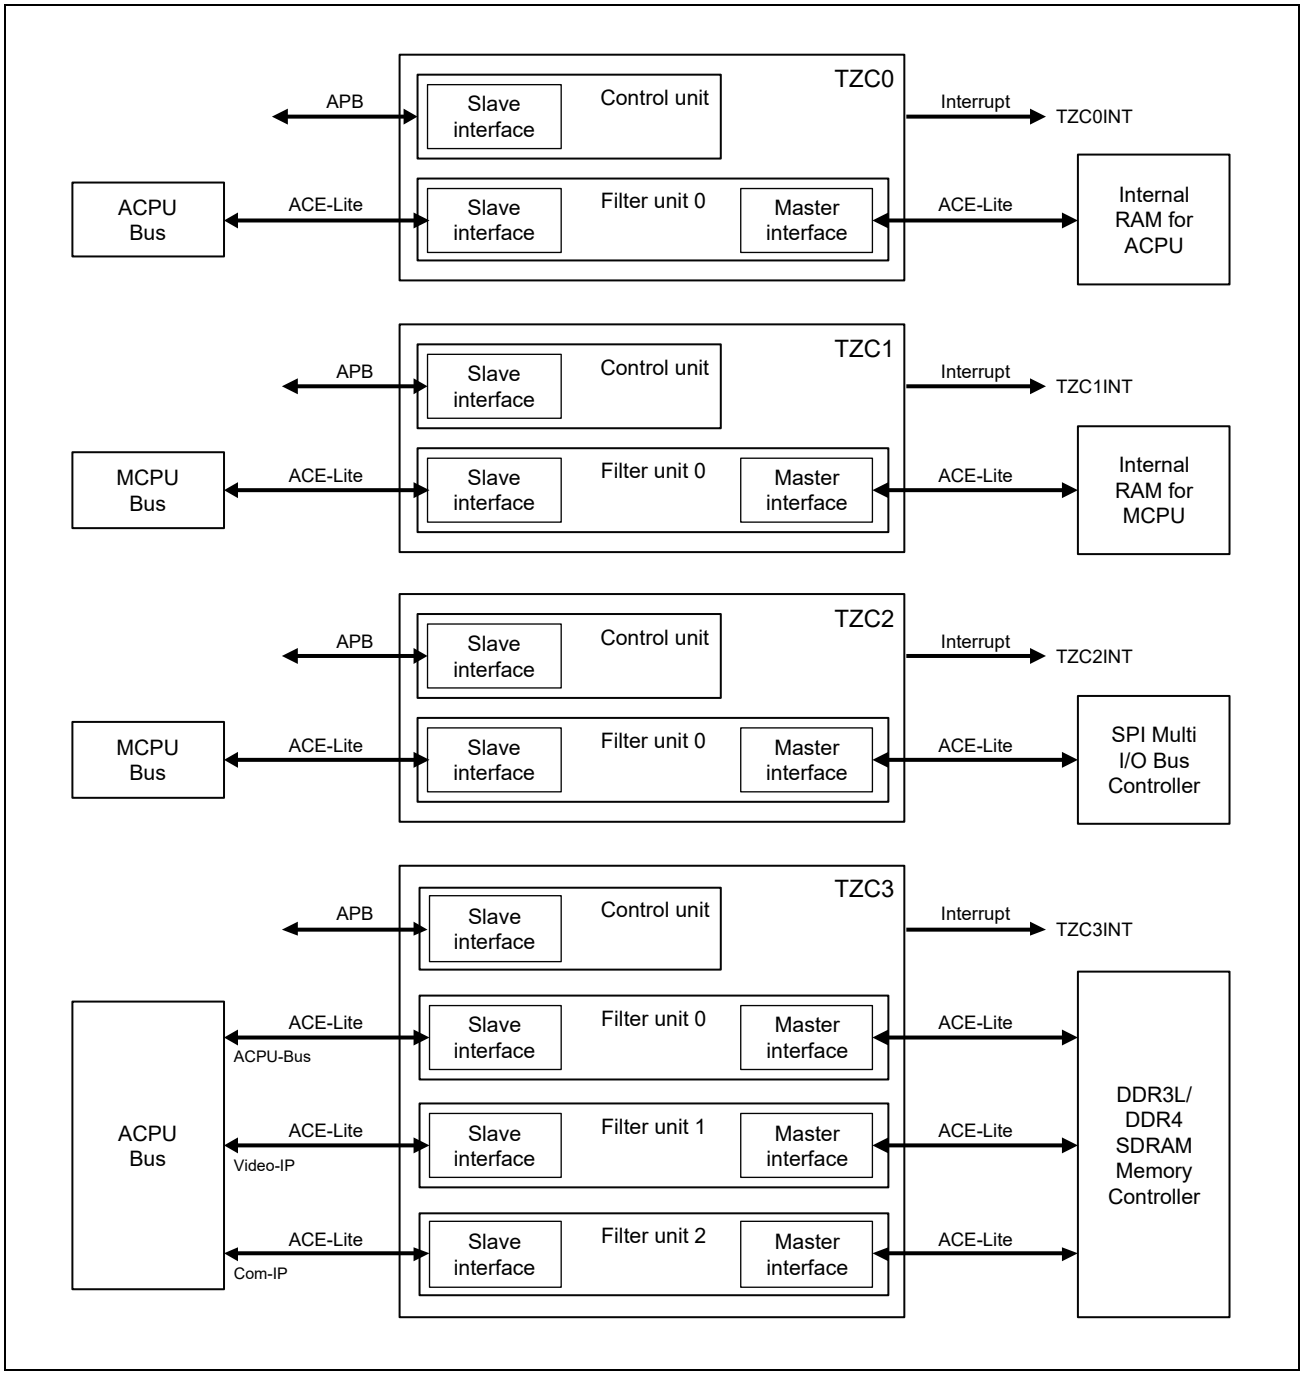

Figure 13.1 Block Diagram

Filter units perform security checks. Each filter unit has an ACE-Lite slave interface and an ACE-Lite master interface. All filter units operate from one set of shared region configuration registers. This ensures consistency across all filter units.

The number of filter units of TZC installed on each interface is as follows.

- Internal RAM for ACPU (64 KB): 1 filter unit
- Internal RAM for MCPU (64 KB): 1 filter unit
- SPI Multi I/O Bus Controller: 1 filter unit
- DDR3L/DDR4 SDRAM Memory Controller: 3 filter units
  - filter unit 0: Access from the ACPU bus passes
  - filter unit 1: Access from the Video IP passes
  - filter unit 2: Access from the Communication IP passes

### 13.1.3 External Pins

In TZC, there are no external pins.

## 13.2 Register Configuration

The base address of the TZC associated with each module is as follows:

- TZC0: Internal RAM for ACPU (64KB)

  H'0_1104_0000 (Cortex-A55 Address Space)
  H'4104_0000 (Cortex-M33 Address Space Non-Secure)
  H'5104_0000 (Cortex-M33 Address Space Secure)

- TZC1: Internal RAM for MCPU (64KB)

  H'0_1105_0000 (Cortex-A55 Address Space)
  H'4105_0000 (Cortex-M33 Address Space Non-Secure)
  H'5105_0000 (Cortex-M33 Address Space Secure)

- TZC2: SPI Multi I/O Bus Controller

  H'0_1106_0000 (Cortex-A55 Address Space)
  H'4106_0000 (Cortex-M33 Address Space Non-Secure)
  H'5106_0000 (Cortex-M33 Address Space Secure)

- TZC3: DDR3L/DDR4 SDRAM Memory Controller

  H'0_1107_0000 (Cortex-A55 Address Space)
  H'4107_0000 (Cortex-M33 Address Space Non-Secure)
  H'5107_0000 (Cortex-M33 Address Space Secure)

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

## 13.3 Register Descriptions

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

TZC has registers to specify the address area where access is controlled. Please refer Overall Address Space (**Table 5.1, Detailed Address Space**) for the addresses specified in these registers.

## 13.4 Operation

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

## 13.5 Usage Note

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

# 14. Direct Memory Access Controller

The direct memory access controller can be used in place of the CPU to perform high-speed transfers between external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral modules.

This module has controllers that handles secure and non-secure access. Do not assign the same DMA transfer request to secure access and non- secure access, respectively.

## 14.1 Features

- Number of channels selectable: 16 channels (CH0 to CH15).
- 4-Gbyte address space (according to the architecture)
- Transfer data size: Byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes, and 128 bytes
- Maximum transfer count: $2^{32} - 1$ bytes
- Address mode: Dual address mode
- Transfer requests: Can be selected from the two types of on-chip peripheral module request, and auto request (software trigger)
- Transfer mode: Single transfer mode and block transfer mode are selectable.
- Priority: The channel priority levels within channels 0 to 7 and within channels 8 to 15 are selectable between fixed mode and round-robin mode (the channel priority level between the group of channels 0 to 7 and the group of channels 8 to 15 is round-robin mode).
- Interrupt request: An interrupt request can be sent to the CPU on completion of data transfer (DMA transfer end interrupt per channel) or on occurrence of a transfer error (DMA error interrupt).
- The DMA registers have a continuous execution function that allows the next DMA transfer to be executed continuously by making settings for the next DMA transfer during execution of the current DMA transfer. This continuous execution function can be enabled or disabled independently in each channel.
- Link mode: In this mode, the setting data (descriptor data) located in the memory by the CPU is automatically retrieved by the DMAC, and DMA transfer is performed according to those values.
- Buffer sweep: If an ongoing DMA transfer is forced to end, the data already retrieved into the buffer can be output before DMA transfer ends.
- Interval: A specific DMA transfer interval can be specified to adjust the bus occupancy.

## 14.2 Input/Output Pins

Requests from external pins are not supported.

## 14.3 Register Configuration

The register configuration is shown in the figure below.

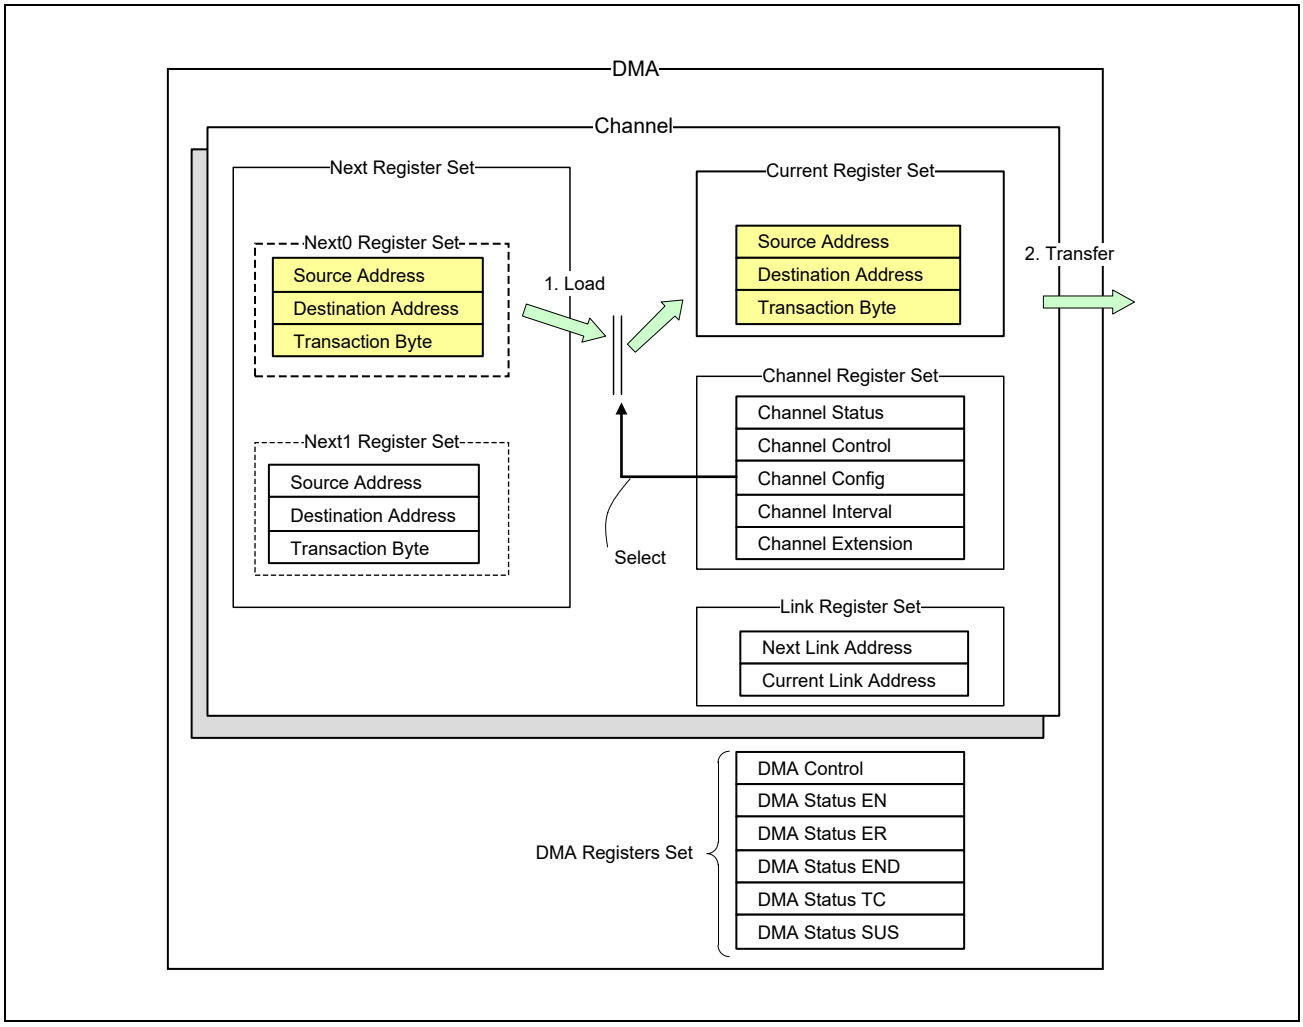

Figure 14.1 Register Configuration

### (a) Next Register Set

This register set is used to set the source address, destination address, and transfer byte count of the DMA transaction to be executed next.

It consists of the Next0 register set and the Next1 register set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These registers set values are loaded to the Current Register Set and used for DMA transfer.

### (b) Current Register Set

This register set indicates the source address, destination address, and transfer byte count of the currently executed DMA transaction.

The values are loaded from the Next0/1 register set (register mode) or from the descriptor read data (link mode). The user cannot write directly to this register set.

The register set is automatically updated each time a DMA transaction is executed.

### (c) Channel Register Set

This register set is used to make the DMA transfer settings.
The settings to be made with this register set include channel status indication, channel control, DMA transaction setting, and DMA transaction interval.

### (d) Link Register Set

This register set consists of a register that sets the address of the descriptor to be loaded next in link mode (Next Link Address Register) and a register that indicates the address of the currently executed descriptor (Current Link Address Register).

The Current Link Address Register is automatically updated when a descriptor is read. The user cannot write directly to this register set.

### (e) DMA Register Set

This register set consists of a register that controls DMA as a whole and registers that indicate the status of the corresponding channels. It enables channel priority control as well as the monitoring of the channel status (EN, ER, END, TC, and SUS).

### (f) Extended Resource Selector Register Set

This register set is used to select the on-chip peripheral module to perform DMA transfer request.

## 14.4 Register Descriptions

**Table 14.1** lists the register configuration. There are eleven control registers and five status registers for each channel, and twelve common control registers are used by all channels. In addition, there is one extension resource selector per two channels.

The notation for the registers of each channel is as follows.

- Next 0 Source Address Register of channel 0 for secure access:
  Next 0 Source Address Register 0S (abbreviation: N0SA_0S)
- Next 0 Source Address Register of channel 0 for non-secure access:
  Next 0 Source Address Register 0 (abbreviation: N0SA_0)

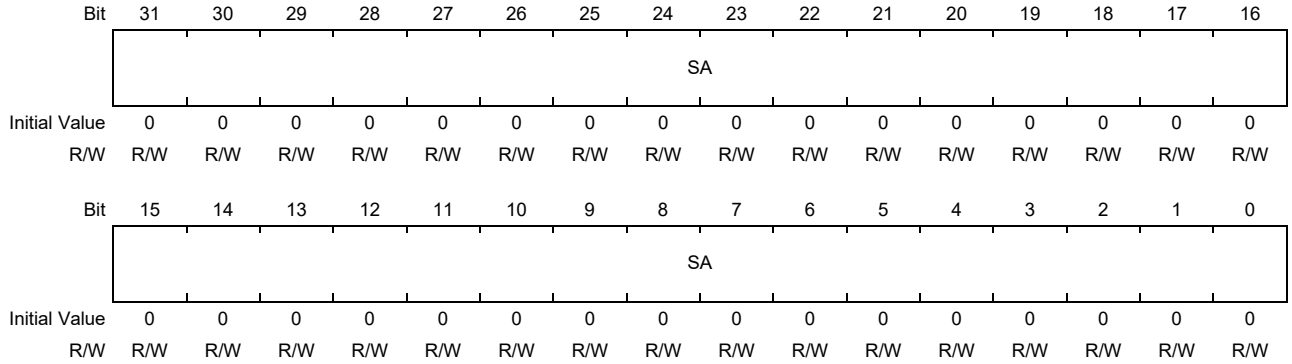
### 14.4.1 Next Source Address Register n/nS (N0SA_n/nS, N1SA_n/nS)

This register sets the DMA transfer source address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next. N0SA_n/nS is for the Next0 Register Set, and N1SA_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SA | All 0 | R/W | Source Address<br>Sets the start address of the DMA transfer source. |

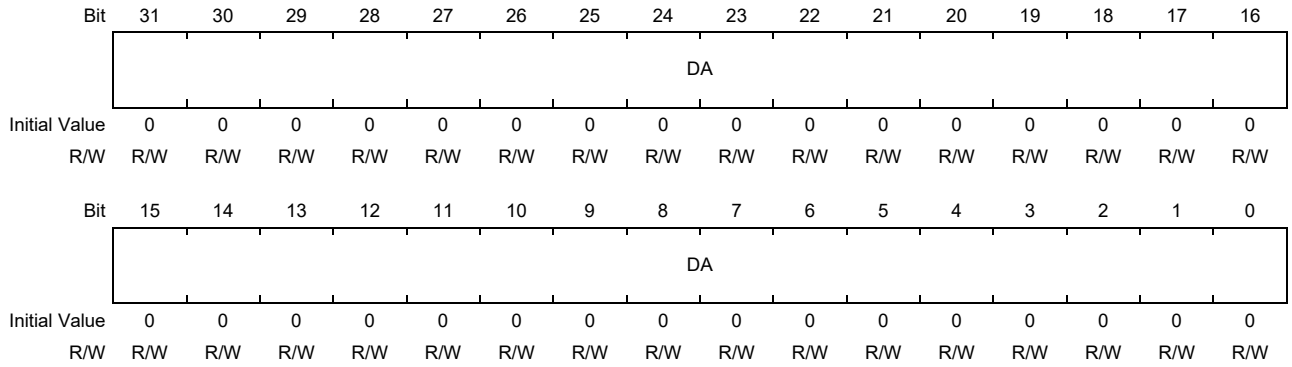
### 14.4.2 Next Destination Address Register n/nS (N0DA_n/nS, N1DA_n/nS)

This register sets the DMA transfer destination address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.

N0DA_n/nS is for the Next0 Register Set, and N1DA_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DA | All 0 | R/W | Destination Address<br>Sets the start address of the DMA transfer destination. |

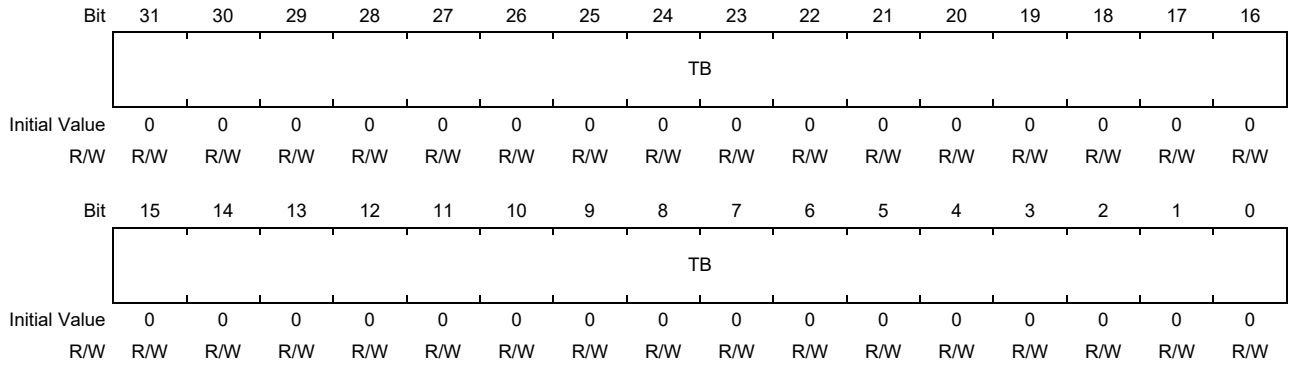
### 14.4.3 Next Transaction Byte Register n/nS (N0TB_n/nS, N1TB_n/nS)

This register sets the total transfer byte count (DMA transaction) of DMA channel (n = 0 to 15) which is to be executed next.

N0TB_n/nS is for the Next0 Register Set, and N1TB_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | TB | All 0 | R/W | Transaction Byte<br>Sets the total transfer byte count.<br>*Note*: Do not start a DMA transaction with 0 set in this register. |

### 14.4.4 Current Source Address Register n/nS (CRSA_n/nS)

This register indicates the DMA transfer source address of DMA channel n (n = 0 to 15).

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRSA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRSA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRSA | All 0 | R | Current Source Address Register<br>Indicates the read address of the next DMA transaction.<br>The value automatically increments during the DMA transaction.<br>(The value is fixed when 1 is set in SAD of the CHCFG_n/nS register.)<br>The value increments when a read transfer starts.<br>Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.) |

### 14.4.5 Current Destination Address Register n/nS (CRDA_n/nS)

This register indicates the DMA transfer destination address of DMA channel n (n = 0 to 15).

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRDA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRDA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRDA | All 0 | R | Current Destination Address Register<br>Indicates the write address of the next DMA transaction.<br>The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in DAD of the CHCFG_n/nS register.)<br>The value increments when a write transfer starts.<br>Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.) |

### 14.4.6 Current Transaction Byte Register n/nS (CRTB_n/nS)

This register indicates the total transfer byte count of DMA channel n (n = 0 to 15). The value of this register becomes 0 when the transaction ends.

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRTB | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRTB | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRTB | All 0 | R | Current Transaction Byte Register<br>Indicates the remaining transfer byte count of the currently executed DMA transaction.<br>The value automatically decrements during the DMA transaction.<br>The value decrements when a write transfer is completed.<br>Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.) |

### 14.4.7 Channel Status Register n/nS (CHSTAT_n/nS)

This register indicates the status of DMA channel n (n = 0 to 15).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | INTMSK |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MODE | DER | DW | DL | SR | TC | END | ER | SUS | TACT | RQST | EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 16 | INTMSK | 0 | R | Indicates the temporary mask status of the DMA transfer end interrupt.<br>1: Masked temporarily<br>0: Unmasked temporarily<br>Set condition(s):<br>• When SETINTMSK (CHCTRL_n/nS) is set to 1<br>Reset condition(s):<br>• When CLRINTMSK (CHCTRL_n/nS) is set to 1<br>• When SWRST (CHCTRL_n/nS) is set to 1 |
| 15 to 12 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 11 | MODE | 0 | R | DMA Mode<br>Indicates the DMA mode. It corresponds to the value set in the DMS bit of the CHCFG_n/nS register.<br>0: Register mode<br>1: Link mode |
| 10 | DER | 0 | R | Descriptor Error<br>Indicates whether the link valid value of the read descriptor is invalid (LV = 0) (this is not dependent on the DIM level of the descriptor). If a descriptor error has occurred, the transfer is stopped but no DMA error interrupt occurs.<br>0: Descriptor Error not detected<br>1: Descriptor Error detected<br>Set condition(s):<br>• When the LV value loaded with the descriptor in link mode is 0<br>Reset condition(s):<br>• When SWRST (CHCTRL_n/nS) is set to 1 |
| 9 | DW | 0 | R | Descriptor WriteBack<br>Indicates the descriptor writeback status. The bit maintains 1 if a bus error is received during descriptor writeback.<br>0: Operation other than writeback is being performed for the header in link mode.<br>1: (ER = 0)<br>Writeback is being performed for the header in link mode.<br>(ER = 1)<br>A bus error occurs during writeback for the header in link mode.<br>Set condition(s):<br>• When header writeback in link mode starts<br>Reset condition(s):<br>• When header writeback in link mode ends with an OK response<br>• When SWRST (CHCTRL_n/nS) is set to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | DL | 0 | R | Descriptor Load<br>Indicates whether the descriptor is being loaded. The bit maintains 1 if a bus error is received during descriptor load.<br>0: Operation other than descriptor load<br>1: (ER = 0)<br>Descriptor load is in progress in link mode.<br>(ER = 1)<br>A bus error occurs during descriptor load in link mode.<br>Set condition(s):<br>• When descriptor load in link mode starts<br>Reset condition(s):<br>• When descriptor load in link mode ends with an OK response<br>• When SWRST (CHCTRL_n/nS) is set to 1 |
| 7 | SR | 0 | R | Selected Register Set<br>Indicates the register set currently selected in register mode.<br>0: Next0 Register Set<br>1: Next1 Register Set<br>Set condition(s):<br>• When RSEL (CHCFG_n/nS) is set to 1<br>Reset condition(s):<br>• When RSEL (CHCFG_n/nS) is set to 0 |
| 6 | TC | 0 | R | Terminal Count<br>Indicates whether the DMA transaction is completed.<br>0: DMA transfer not completed<br>1: DMA transfer completed<br>Set condition(s):<br>• When data equivalent to the total transfer byte count set in the CRTB register has been transferred in register mode<br>• When data equivalent to the total transfer byte count set in the CRTB register has been transferred in link mode, with 1 set in WBD of the descriptor header<br>• When descriptor writeback is completed in link mode, with 0 set in WBD of the descriptor header<br>Clear condition(s):<br>• When the CLRTC (CHCTRL_n/nS) bit is set to 1<br>• When the SWRST (CHCTRL_n/nS) bit is set to 1 |
| 5 | END | 0 | R | DMAEND Interrupted<br>Indicates whether the DMA transaction is completed and whether the DMA transfer end interrupt has occurred.<br>0: DMA transfer not completed<br>1: DMA transfer completed<br>Set condition(s):<br>• When one of the set conditions for the TC bit is met and 0 is set in DEM of the CHCFG_n/nS register<br>• When the descriptor is read in link mode and both LV of the header and DIM are set to 0<br>Clear condition(s):<br>• When CLREND (CHCTRL_n/nS) is set to 1<br>• When SWRST (CHCTRL_n/nS) is set to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 4 | ER | 0 | R | Error bit<br>Indicates that a DMA error interrupt has occurred because an error response has been received from the transfer source or destination and a bus error has occurred during the DMA transfer.<br>0: No bus error has occurred<br>1: A DMA error interrupt has occurred due to a bus error<br>Set condition(s):<br>• When a bus error has occurred during a bus cycle<br>Clear condition(s):<br>• When SWRST (CHCTRL_n/nS) is set to 1 |
| 3 | SUS | 0 | R | Suspend<br>Indicates whether the channel is suspended.<br>0: Channel_n not suspended<br>1: Channel_n suspended<br>Set condition(s):<br>• When SETSUS (CHCTRL_n/nS) is set to 1 during a DMA transfer on Channel_n, creating a SUSPEND status internally<br>Clear condition(s):<br>• When CLRSUS (CHCTRL_n/nS) is set to 1<br>• When CLREN (CHCTRL_n/nS) is set to 1 |
| 2 | TACT | 0 | R | Transaction Active<br>Indicates whether the DMAC is active. This bit is intended to check that the channel is completely inactive.<br>0: DMA on Channel_n inactive<br>1: DMA on Channel_n active<br>Set condition(s):<br>• When a DMA transaction starts on Channel_n<br>Clear condition(s):<br>• When a DMA transaction is completed |
| 1 | RQST | 0 | R | Request<br>Indicates whether a transfer request is being received.<br>0: DMA transfer request not being received<br>1: DMA transfer request being received<br>Set condition(s):<br>• When the STG bit (CHCTRL_n/nS) is set to 1 (auto request)<br>• When a transfer request is received from the DMA request source set in the CHCFG_n/nS register<br>Clear condition(s):<br>• When SWRST (CHCTRL_n/nS) is set to 1<br>• When CLRRQ (CHCTRL_n/nS) is set to 1<br>• When a transfer is executed on the side specified by REQD (CHCFG_n/nS) in single transfer mode (TM = 0).<br>• When all DMA transactions are completed in register mode (the transaction ends with REN set to 0)<br>• When the DMA transfer of the last descriptor (LE = 1) is completed in link mode<br>• When descriptor read stops (LV = 0) in link mode<br>• When a bus error is received due to an error response |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | EN | 0 | R | Enable<br>Indicates whether the operation of DMA channel n is enabled or disabled.<br>0: Operation disabled<br>1: Operation enabled<br>Set condition(s):<br>• When SETEN (CHCTRL_n/nS) is set to 1<br>Clear condition(s):<br>• When SWRST (CHCTRL_n/nS) is set to 1<br>• When CLREN (CHCTRL_n/nS) is set to 1<br>• When a bus error is received due to an error response during the transfer<br>• When all DMA transactions are completed in register mode (the transaction ends with REN set to 0)<br>• When the DMA transfer of the last descriptor (LE = 1) is completed in link mode (writeback when WBD is set to 0)<br>• When descriptor read stops (LV = 0) in link mode |

**CAUTION**

If the ER bit is set to 1 for any transfer, the whole transfer should be handled as invalid.

To suspend a DMA transaction, mask or clear the transfer request or clear the Enable bit (for the procedure, see **Section 14.7.8(2), Transfer Stop**).

If a transfer request from an on-chip peripheral module input is made concurrently with an auto request (by setting 1 in the STG bit) for the same one channel, the trigger source that takes effect cannot be identified. Make sure that only one of these transfer requests is used in the system.

When transfer is requested by an auto request, wait for the last requested DMA transfer to complete (use the Current Register or other data to check the status) before setting the STG bit for the next transfer request.

### 14.4.8 Channel Control Register n/nS (CHCTRL_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CLRINTMSK | SETINTMSK |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CLRSUS | SETSUS | — | CLRTC | CLRENDD | CLRRQ | SWRST | STG | CLREN | SETEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 17 | CLRINTMSK | 0 | R/W | When this bit is set to 1, the mask of the DMA transfer end interrupt is cleared. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 0.<br>If the mask is cleared when 1 is set in both LVINT of the DCTRL register and END of the CHSTAT_n/nS register, the DMA transfer end interrupt becomes active. (It does not become active when 0 is set in LVINT.)<br>A read operation results in 0 being read.<br>1: Clears the mask set by SETINTMSK.<br>0: Does not affect the operation. |
| 16 | SETINTMSK | 0 | R/W | When this bit is set to 1, the DMA transfer end interrupt is temporarily masked. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 1.<br>A read operation results in 0 being read.<br>1: Masks the DMA transfer end interrupt.<br>0: Does not affect the operation. |
| 15 to 10 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 9 | CLRSUS | 0 | R/W | Clear Suspend<br>Clears the suspend status. Setting this bit to 1 when 1 is set in SUS of the CHSTAT_n/nS register can clear the suspend status.<br>An attempt to read this bit results in 0 being read.<br>1: Clears the suspend status of the current DMA transfer.<br>0: Does not affect the operation. |
| 8 | SETSUS | 0 | R/W | Set Suspend<br>Suspends the current DMA transfer. Setting this bit to 1 when 1 is set in EN of the CHSTAT_n/nS register can suspend the current DMA transfer.<br>An attempt to read this bit results in 0 being read.<br>1: Suspends the current DMA transfer.<br>0: Does not affect the operation. |
| 7 | — | 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 6 | CLRTC | 0 | R/W | Clear TC bit<br>Setting this bit to 1 can clear the TC bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read.<br>1: Clears the TC bit.<br>0: Does not affect the operation. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 5 | CLREND | 0 | R/W | Clear End bit<br>Setting this bit to 1 can clear the END bit of the CHSTAT_n/nS register.<br>Also, the DMA transfer end interrupt is cleared.<br>An attempt to read this bit results in 0 being read.<br>1: Clears the END bit.<br>0: Does not affect the operation. |
| 4 | CLRRQ | 0 | R/W | Clear Request bit<br>Setting this bit to 1 can clear the RQST bit of the CHSTAT_n/nS register.<br>An attempt to read this bit results in 0 being read.<br>1: Clears the RQST bit.<br>0: Does not affect the operation. |
| 3 | SWRST | 0 | R/W | Software Reset<br>Setting this bit to 1 can clear the channel status register (CHSTAT_n/nS). When setting this bit to 1, make sure that both the EN bit and TACT bit are set to 0.<br>An attempt to read this bit results in 0 being read.<br>1: Resets the channel status register.<br>0: Does not affect the operation. |
| 2 | STG | 0 | R/W | Software Trigger<br>Setting this bit to 1 sets an auto request. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence.<br>An attempt to read this bit results in 0 being read.<br>1: Sets a transfer request triggered by an auto request (sets 1 in the RQST bit).<br>0: Does not affect the operation. |
| 1 | CLREN | 0 | R/W | Clear Enable<br>Setting this bit to 1 can clear the EN bit (for details, see **Section 14.7.8(2), Transfer Stop**).<br>An attempt to read this bit results in 0 being read.<br>1: Stops the DMA transfer (clears the EN bit).<br>0: Does not affect the operation. |
| 0 | SETEN | 0 | R/W | Set Enable<br>Enables a DMA transfer on DMA channel n. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence and the transfer does not start.<br>An attempt to read this bit results in 0 being read.<br>1: Enables a DMA transfer (sets 1 in the EN bit).<br>0: Does not affect the operation. |

### 14.4.9 Channel Configuration Register n/nS (CHCFG_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | DMS | 0 | R/W | DMA Mode Select<br>Sets the DMA mode.<br>0: Register mode (initial value)<br>1: Link mode |
| 30 | REN | 0 | R/W | Register Set Enable<br>After a DMA transaction is completed, DMA transfers are continued using the Next register set selected by RSEL. This bit is valid only in register mode.<br>0: Does not continue DMA transfers.<br>1: Continues DMA transfers.<br>Set condition(s):<br>• When 1 is written to this bit<br>Clear condition(s):<br>• When 0 is written to this bit<br>• When a DMA transaction is completed, with REN set to 1 |
| 29 | RSW | 0 | R/W | Register Select Switch<br>Inverts RSEL automatically after a DMA transaction is completed. This bit is valid only in register mode.<br>0: Does not invert RSEL automatically after a DMA transaction (initial value).<br>1: Inverts RSEL automatically after a DMA transaction. |
| 28 | RSEL | 0 | R/W | Register Set Select<br>Selects the Next register set to be executed next. This bit is valid only in register mode. When RSW is set to 1, this bit is inverted automatically when a DMA transaction is completed.<br>0: Executes the Next0 Register Set (initial value).<br>1: Executes the Next1 Register Set.<br>Transition condition(s):<br>• When a DMA transaction is completed, with RSW set to 1 |
| 27 | SBE | 0 | R/W | Sweep Buffer Enable<br>Selects whether to sweep (write) the data already read into the buffer and stop the DMA transfer if the Enable bit is cleared to 0 during a DMA transaction.<br>The sweep mode is available only when REQD is set to 0.<br>0: Stops the DMA transfer without sweeping the buffer (initial value).<br>1: Stops the DMA transfer after sweeping the buffer. |
| 26, 25 | — | 0 | R | Reserved. Set 0. A read operation results in 0 being read. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 24 | DEM | 0 | R/W | DMA Transfer End Interrupt Mask<br>Masks the DMA transfer end interrupt for register mode transfer.<br>If 1 is set in this bit when a DMA transfer end interrupt is output, the DMA transfer end interrupt signal is not asserted. In this case, DEM is cleared to 0 automatically.<br>0: Does not mask the DMA transfer end interrupt (initial value).<br>1: Masks the DMA transfer end interrupt.<br>Clear condition(s):<br>• When a DMA transaction is completed with DEM set to 1 |
| 23 | — | 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 22 | TM | 0 | R/W | Transfer Mode<br>Sets the DMA transfer mode.<br>0: Single transfer mode (initial value)<br>1: Block transfer mode |
| 21 | DAD | 0 | R/W | Sets the destination address counting direction of DMA channel n.<br>0: Increment (initial value)<br>1: Fixed |
| 20 | SAD | 0 | R/W | Sets the source address counting direction of DMA channel n.<br>0: Increment (initial value)<br>1: Fixed |
| 19 to 16 | DDS[3:0] | 0000 | R/W | Destination Data Size<br>Sets the DMA transfer size of the transfer destination. |

| Value | Size | Remark |
|---|---|---|
| 0000 | 8 bits | Initial value |
| 0001 | 16 bits | |
| 0010 | 32 bits | |
| 0011 | 64 bits | |
| 0100 | 128 bits | |
| 0101 | 256 bits | |
| 0110 | 512 bits | |
| 0111 | 1024 bits | |
| Other than the above | — | Setting prohibited |

| | | | | |
|---|---|---|---|---|
| 15 to 12 | SDS[3:0] | 0000 | R/W | Source Data Size<br>Sets the DMA transfer size of the transfer source. |

| Value | Size | Remark |
|---|---|---|
| 0000 | 8 bits | Initial value |
| 0001 | 16 bits | |
| 0010 | 32 bits | |
| 0011 | 64 bits | |
| 0100 | 128 bits | |
| 0101 | 256 bits | |
| 0110 | 512 bits | |
| 0111 | 1024 bits | |
| Other than the above | — | Setting prohibited |

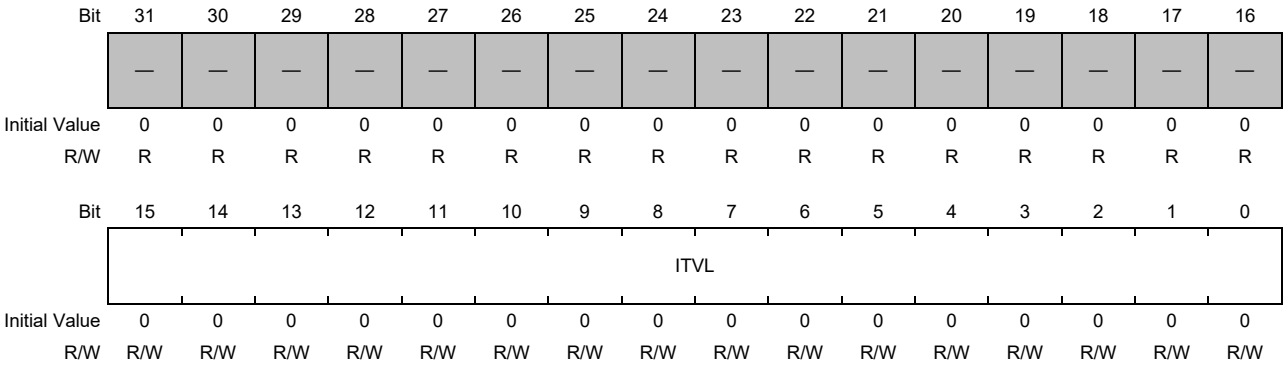
| | | | | |
|---|---|---|---|---|
| 11 | — | 0 | R | Reserved. Set 0. A read operation results in 0 being read. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 10 to 8 | AM[2:0] | 000 | R/W | ACK Mode<br>Sets the DMAACK output mode.<br>In case of Auto-Request Mode, DMAACK is not output. Any value can be set in AM bit.<br>In case of On-Chip Peripheral Module Request Mode, see **Table 14.3** and set the appropriate value.<br>000: Not used.<br>001: Level mode (active until the transfer request from an on-chip peripheral module input becomes inactive)<br>01x: Bus cycle mode (active while the DMA transfer is in a bus cycle)<br>1xx: DMAACK not to be output |
| 7 | — | 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 6 | LVL | 0 | R/W | Level<br>Selects whether to detect a DMA request based on the level or edge of the signal.<br>0: Detects based on the edge (initial value).<br>1: Detects based on the level. |
| 5 | HIEN | 0 | R/W | High Enable<br>Selects whether to detect a DMA request using the High level or rising edge of the signal.<br>When LVL = 0:<br>HIEN = 1: Detects a request in response to the rising edge of the signal.<br>HIEN = 0: Does not detect a request in response to the rising edge of the signal (initial value).<br>When LVL = 1:<br>HIEN = 1: Detects a request when the signal is at the High level.<br>HIEN = 0: Does not detect a request even when the signal is at the High level (initial value). |
| 4 | LOEN | 0 | R/W | Low Enable<br>Selects whether to detect a DMA request using the Low level or falling edge of the signal.<br>When LVL = 0:<br>LOEN = 1: Detects a request in response to the falling edge of the signal.<br>LOEN = 0: Does not detect a request in response to the falling edge of the signal (initial value).<br>When LVL = 1:<br>LOEN = 1: Detects a request when the signal is at the Low level.<br>LOEN = 0: Does not detect a request even when the signal is at the Low level (initial value). |
| 3 | REQD | 0 | R/W | Request Direction<br>Selects whether DMAREQ selected by the SEL bit is the source or destination. This bit is also used to define when DMAACK is to become active.<br>0: Source; DMAACK is to become active when read (initial value).<br>1: Destination; DMAACK is to become active when written. |
| 2 to 0 | SEL[2:0] | 000 | R/W | These bits are used to set a DMAC channel. Set one of the following values so that the channel set by the SEL bits matches the CHCFG_n/nS channel.<br>000: CH0/CH8<br>001: CH1/CH9<br>010: CH2/CH10<br>011: CH3/CH11<br>100: CH4/CH12<br>101: CH5/CH13<br>110: CH6/CH14<br>111: CH7/CH15 |

### 14.4.10 Channel Interval Register n/nS (CHITVL_n/nS)

This register sets the transfer interval for DMA channel n (n = 0 to 15).

For details, see **Section 14.7.6, Interval Count Function**.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 15 to 0 | ITVL | All 0 | R/W | Sets the channel transfer interval. |

### 14.4.11 Channel Extension Register n/nS (CHEXT_n/nS)

This is an extension register for DMA channel n (n = 0 to 15).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DCA[3:0] | | | | — | DPR[2:0] | | | SCA[3:0] | | | | — | SPR[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Set 0. A read operation results in 0 being read. |
| 15 to 12 | DCA[3:0] | 0000 | R/W | Destination CACHE<br>Sets the value to be output to AWCACHE[3:0] for DMA write transfer.<br>See Note 1 below. |
| 11 | — | 0 | R | Set 0. A read operation results in 0 being read. |
| 10 to 8 | DPR[2:0] | 000 | R/W | Destination PROT<br>Sets the value to be output to AWPROT[2:0] for DMA write transfer.<br>In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the DPR[1] bit.<br>See Note 2 below. |
| 7 to 4 | SCA[3:0] | 0000 | R/W | Source CACHE<br>Sets the value to be output to ARCACHE[3:0] for DMA read transfer.<br>See Note 1 below. |
| 3 | — | 0 | R | Set 0. A read operation results in 0 being read. |
| 2 to 0 | SPR[2:0] | 000 | R/W | Source PROT<br>Sets the value to be output to ARPROT[2:0] for DMA read transfer.<br>In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the SPR[1] bit.<br>See Note 2 below. |

Note 1. Cache support: Bits SCA and DCA are used to change the settings.

Note 2. Protection unit support: Bits SPR and DPR are used to change the settings.
For the setting value, see AMBA AXI Protocol Specification from Arm Limited.

### 14.4.12 Next Link Address Register n/nS (NXLA_n/nS)

This is a 32-bit register that sets the link address of DMA channel n (n = 0 to 15).

For information about the link mode, see **Section 14.6.3, Link Mode**.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NXLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NXLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | NXLA | All 0 | R/W | Sets a link address. The low-order 2 bits are masked with 0s. Only an address aligned with a 4-byte boundary can be set. |

### 14.4.13 Current Link Address Register n/nS (CRLA_n/nS)

This is a 32-bit register that indicates the link address of DMA channel n (n = 0 to 15).

For information about the link mode, see **Section 14.6.3, Link Mode**.

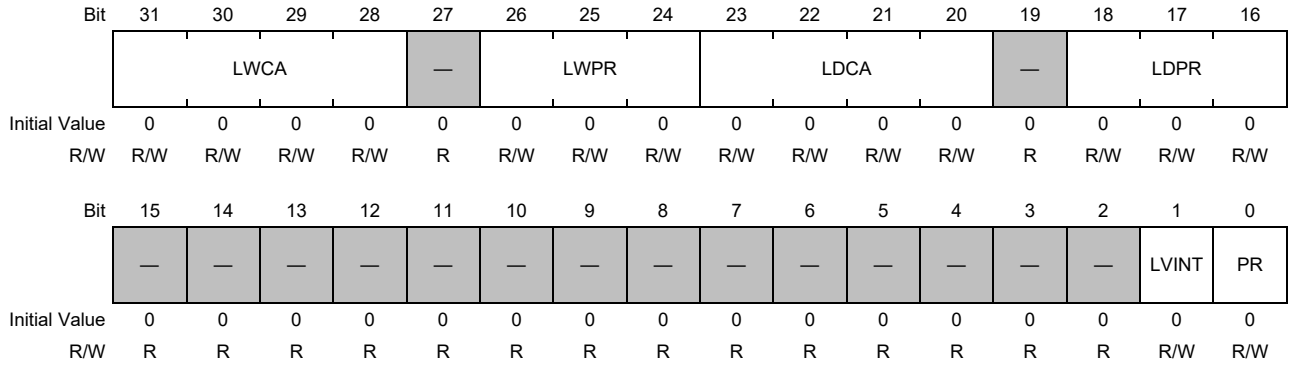
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRLA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRLA | All 0 | R | Indicates the address of the currently executed descriptor. |

### 14.4.14 DMA Control Register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S)

This register sets the transfer type for descriptor access and the arbitration between channels.
(DCTRL_0_7/0_7S is common for channels 0 to 7 and DCTRL_8_15/8_15S is common for channels 8 to 15.)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | LWCA | 0000 | R/W | Link WriteBack CACHE<br>Sets the value to be output to AWCACHE[3:0] during descriptor writeback in link mode.<br>For the setting value, see Note in **Section 14.4.11, Channel Extension Register n/nS (CHEXT_n/nS)**. |
| 27 | — | 0 | R | Reserved. Set 0. The initial value is 0. |
| 26 to 24 | LWPR | 000 | R/W | Link WriteBack PROT<br>Sets the value to be output to AWPROT[2:0] during descriptor writeback in link mode.<br>In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the LWPR[1] bit.<br>For the setting value, see AMBA AXI Protocol Specification from Arm Limited. |
| 23 to 20 | LDCA | 0000 | R/W | Link Descriptor CACHE<br>Sets the value to be output to ARCACHE[3:0] during descriptor load in link mode.<br>For the setting value, see Note in **Section 14.4.11, Channel Extension Register n/nS (CHEXT_n/nS)**. |
| 19 | — | 0 | R | Reserved. Set 0. The initial value is 0. |
| 18 to 16 | LDPR | 000 | R/W | Link Descriptor PROT<br>Sets the value to be output to ARPROT[2:0] during descriptor load in link mode.<br>In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the LDPR[1] bit.<br>For the setting value, see AMBA AXI Protocol Specification from Arm Limited. |
| 15 to 2 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 1 | LVINT | 0 | R/W | Sets whether to use pulse output or level output for the DMA transfer end interrupt and DMA error interrupt. Set pulse output for this product.<br>0: Pulse output (initial value)<br>1: Level output |
| 0 | PR | 0 | R/W | Sets the transfer priority control mode between channels (see **Section 14.7.2, Priority Control for DMA Channels**).<br>0: Fixed priority mode (initial value)<br>1: Round robin mode |

### 14.4.15 DMA Status EN Register (DSTAT_EN_0_7/0_7S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | EN7 | 0 | R | Indicates the EN bit status of DMA channel 7. |
| 6 | EN6 | 0 | R | Indicates the EN bit status of DMA channel 6. |
| 5 | EN5 | 0 | R | Indicates the EN bit status of DMA channel 5. |
| 4 | EN4 | 0 | R | Indicates the EN bit status of DMA channel 4. |
| 3 | EN3 | 0 | R | Indicates the EN bit status of DMA channel 3. |
| 2 | EN2 | 0 | R | Indicates the EN bit status of DMA channel 2. |
| 1 | EN1 | 0 | R | Indicates the EN bit status of DMA channel 1. |
| 0 | EN0 | 0 | R | Indicates the EN bit status of DMA channel 0. |

### 14.4.16 DMA Status EN Register (DSTAT_EN_8_15/8_15S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | EN15 | EN14 | EN13 | EN12 | EN11 | EN10 | EN9 | EN8 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | EN15 | 0 | R | Indicates the EN bit status of DMA channel 15. |
| 6 | EN14 | 0 | R | Indicates the EN bit status of DMA channel 14. |
| 5 | EN13 | 0 | R | Indicates the EN bit status of DMA channel 13. |
| 4 | EN12 | 0 | R | Indicates the EN bit status of DMA channel 12. |
| 3 | EN11 | 0 | R | Indicates the EN bit status of DMA channel 11. |
| 2 | EN10 | 0 | R | Indicates the EN bit status of DMA channel 10. |
| 1 | EN9 | 0 | R | Indicates the EN bit status of DMA channel 9. |
| 0 | EN8 | 0 | R | Indicates the EN bit status of DMA channel 8. |

### 14.4.17 DMA Status ER Register (DSTAT_ER_0_7/0_7S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ER7 | ER6 | ER5 | ER4 | ER3 | ER2 | ER1 | ER0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | ER7 | 0 | R | Indicates the ER bit status of DMA channel 7. |
| 6 | ER6 | 0 | R | Indicates the ER bit status of DMA channel 6. |
| 5 | ER5 | 0 | R | Indicates the ER bit status of DMA channel 5. |
| 4 | ER4 | 0 | R | Indicates the ER bit status of DMA channel 4. |
| 3 | ER3 | 0 | R | Indicates the ER bit status of DMA channel 3. |
| 2 | ER2 | 0 | R | Indicates the ER bit status of DMA channel 2. |
| 1 | ER1 | 0 | R | Indicates the ER bit status of DMA channel 1. |
| 0 | ER0 | 0 | R | Indicates the ER bit status of DMA channel 0. |

### 14.4.18 DMA Status ER Register (DSTAT_ER_8_15/8_15S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ER15 | ER14 | ER13 | ER12 | ER11 | ER10 | ER9 | ER8 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | ER15 | 0 | R | Indicates the ER bit status of DMA channel 15. |
| 6 | ER14 | 0 | R | Indicates the ER bit status of DMA channel 14. |
| 5 | ER13 | 0 | R | Indicates the ER bit status of DMA channel 13. |
| 4 | ER12 | 0 | R | Indicates the ER bit status of DMA channel 12. |
| 3 | ER11 | 0 | R | Indicates the ER bit status of DMA channel 11. |
| 2 | ER10 | 0 | R | Indicates the ER bit status of DMA channel 10. |
| 1 | ER9 | 0 | R | Indicates the ER bit status of DMA channel 9. |
| 0 | ER8 | 0 | R | Indicates the ER bit status of DMA channel 8. |

### 14.4.19 DMA Status END Register (DSTAT_END_0_7/0_7S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | END7 | END6 | END5 | END4 | END3 | END2 | END1 | END0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | END7 | 0 | R | Indicates the END bit status of DMA channel 7. |
| 6 | END6 | 0 | R | Indicates the END bit status of DMA channel 6. |
| 5 | END5 | 0 | R | Indicates the END bit status of DMA channel 5. |
| 4 | END4 | 0 | R | Indicates the END bit status of DMA channel 4. |
| 3 | END3 | 0 | R | Indicates the END bit status of DMA channel 3. |
| 2 | END2 | 0 | R | Indicates the END bit status of DMA channel 2. |
| 1 | END1 | 0 | R | Indicates the END bit status of DMA channel 1. |
| 0 | END0 | 0 | R | Indicates the END bit status of DMA channel 0. |

### 14.4.20 DMA Status END Register (DSTAT_END_8_15/8_15S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | END15 | END14 | END13 | END12 | END11 | END10 | END9 | END8 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | END15 | 0 | R | Indicates the END bit status of DMA channel 15. |
| 6 | END14 | 0 | R | Indicates the END bit status of DMA channel 14. |
| 5 | END13 | 0 | R | Indicates the END bit status of DMA channel 13. |
| 4 | END12 | 0 | R | Indicates the END bit status of DMA channel 12. |
| 3 | END11 | 0 | R | Indicates the END bit status of DMA channel 11. |
| 2 | END10 | 0 | R | Indicates the END bit status of DMA channel 10. |
| 1 | END9 | 0 | R | Indicates the END bit status of DMA channel 9. |
| 0 | END8 | 0 | R | Indicates the END bit status of DMA channel 8. |

### 14.4.21 DMA Status TC Register (DSTAT_TC_0_7/0_7S)

This register indicates the TC bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TC7 | TC6 | TC5 | TC4 | TC3 | TC2 | TC1 | TC0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | TC7 | 0 | R | Indicates the TC bit status of DMA channel 7. |
| 6 | TC6 | 0 | R | Indicates the TC bit status of DMA channel 6. |
| 5 | TC5 | 0 | R | Indicates the TC bit status of DMA channel 5. |
| 4 | TC4 | 0 | R | Indicates the TC bit status of DMA channel 4. |
| 3 | TC3 | 0 | R | Indicates the TC bit status of DMA channel 3. |
| 2 | TC2 | 0 | R | Indicates the TC bit status of DMA channel 2. |
| 1 | TC1 | 0 | R | Indicates the TC bit status of DMA channel 1. |
| 0 | TC0 | 0 | R | Indicates the TC bit status of DMA channel 0. |

### 14.4.22 DMA Status TC Register (DSTAT_TC_8_15/8_15S)

This register indicates the TC bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TC15 | TC14 | TC13 | TC12 | TC11 | TC10 | TC9 | TC8 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | TC15 | 0 | R | Indicates the TC bit status of DMA channel 15. |
| 6 | TC14 | 0 | R | Indicates the TC bit status of DMA channel 14. |
| 5 | TC13 | 0 | R | Indicates the TC bit status of DMA channel 13. |
| 4 | TC12 | 0 | R | Indicates the TC bit status of DMA channel 12. |
| 3 | TC11 | 0 | R | Indicates the TC bit status of DMA channel 11. |
| 2 | TC10 | 0 | R | Indicates the TC bit status of DMA channel 10. |
| 1 | TC9 | 0 | R | Indicates the TC bit status of DMA channel 9. |
| 0 | TC8 | 0 | R | Indicates the TC bit status of DMA channel 8. |

### 14.4.23 DMA Status SUS Register (DSTAT_SUS_0_7/0_7S)

This register indicates the SUS bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | SUS7 | SUS6 | SUS5 | SUS4 | SUS3 | SUS2 | SUS1 | SUS0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | SUS7 | 0 | R | Indicates the SUS bit status of DMA channel 7. |
| 6 | SUS6 | 0 | R | Indicates the SUS bit status of DMA channel 6. |
| 5 | SUS5 | 0 | R | Indicates the SUS bit status of DMA channel 5. |
| 4 | SUS4 | 0 | R | Indicates the SUS bit status of DMA channel 4. |
| 3 | SUS3 | 0 | R | Indicates the SUS bit status of DMA channel 3. |
| 2 | SUS2 | 0 | R | Indicates the SUS bit status of DMA channel 2. |
| 1 | SUS1 | 0 | R | Indicates the SUS bit status of DMA channel 1. |
| 0 | SUS0 | 0 | R | Indicates the SUS bit status of DMA channel 0. |

### 14.4.24 DMA Status SUS Register (DSTAT_SUS_8_15/8_15S)

This register indicates the SUS bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | SUS15 | SUS14 | SUS13 | SUS12 | SUS11 | SUS10 | SUS9 | SUS8 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved. Set 0. A read operation results in 0 being read. |
| 7 | SUS15 | 0 | R | Indicates the SUS bit status of DMA channel 15. |
| 6 | SUS14 | 0 | R | Indicates the SUS bit status of DMA channel 14. |
| 5 | SUS13 | 0 | R | Indicates the SUS bit status of DMA channel 13. |
| 4 | SUS12 | 0 | R | Indicates the SUS bit status of DMA channel 12. |
| 3 | SUS11 | 0 | R | Indicates the SUS bit status of DMA channel 11. |
| 2 | SUS10 | 0 | R | Indicates the SUS bit status of DMA channel 10. |
| 1 | SUS9 | 0 | R | Indicates the SUS bit status of DMA channel 9. |
| 0 | SUS8 | 0 | R | Indicates the SUS bit status of DMA channel 8. |

### 14.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S)

DMARSn/nS (n = 0 to 7) are 32-bit readable/writable registers that specify the DMA transfer sources from peripheral modules in each channel. DMARS0/0S is for channels 0/0S and 1/1S, DMARS1/1S is for channels 2/2S and 3/3S, and so on.

**Table 14.3** shows the specifiable combinations.

Some on-chip peripheral modules in this product use the same signal both for an interrupt request and for a DMA transfer request. If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked. To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0). See **Table 14.3** for possible combinations of MID[7:0] and RID[1:0].

- DMARS0/0S

## 14.5 Operation

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority order; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request, and on-chip peripheral module request.

### 14.5.1 Transfer Flow

After the next source address register (N0SA_n/nS, N1SA_n/nS), next destination address register (N0DA_n/nS, N1DA_n/nS), next transaction byte register (N0TB_n/nS, N1TB_n/nS), channel control register (CHCTRL_n/nS), channel configuration register (CHCFG_n/nS), channel extension register (CHEXT_n/nS), DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S), and DMA extension resource selector (DMARSn/nS) are set for the target transfer conditions, the DMAC transfers data according to the following procedure:

1. Checks to see if transfer is enabled (EN = 0 and TACT = 0 in channel status register).
2. Clears the channel status register (set 1 in the SWRST bit of the channel control register).
3. Enables DMA transfer (set 1 in the SETEN bit of the channel control register).
4. When a transfer request comes and transfer is enabled, the DMAC transfers one transfer unit of data (depending on the DDS[3:0] and SDS[3:0] bit settings). For an auto request, the transfer begins automatically when 1 is set in the STG bit of the channel control register. The CRTB_n/nS value will be decremented by 1 for each transfer.
5. If 0 is set in the REN bit of the channel configuration register when transfer has been completed for the specified count (when CRTB_n/nS reaches 0), transfer ends normally. If the DEM bit of the channel configuration register is set to 0 at this time, a DMA transfer end interrupt is sent to the CPU. If the REN bit is 1 when CRTB_n/nS reaches 0, transfer operations are continued with the values of N0SA_n/nS, N1SA_n/nS, N0DA_n/nS, N1DA_n/nS, N0TB_n/nS, and N1TB_n/nS set by the RSEL bit of the channel configuration register until there are no more transfer requests.
6. When an address error in the DMAC is generated, the transfer is stopped. Transfers are also stopped when 1 is set in the CLREN bit of CHCTRL_n/nS.

### 14.5.2 DMA Transfer Requests

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated in on-chip peripheral modules that are neither the transfer source nor destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. On-chip peripheral module request is selected by the DMARS0/0S to DMARS7/7S registers.

#### (1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the DMAC to automatically generate a transfer request signal internally. When the STG bit in channel control register n is set to 1, the transfer begins so long as the TACT bit in channel status register is 0.

#### (2) On-Chip Peripheral Module Request Mode

In this mode, the transfer is performed in response to the DMA transfer request signal from an on-chip peripheral module.

When a transfer request signal is sent in on-chip peripheral module request mode while DMA transfer is enabled, the DMA transfer is performed.

The DMA transfer request signals to be sent from on-chip peripheral modules or external pin input are listed in **Table 14.3**.

The transfer source or destination is fixed for some on-chip peripheral module requests. For details, see **Table 14.3**.

1: Block transfer

AM 001: ACK level output
010: ACK bus cycle output
100: No ACK

LVL 0: REQ edge detection
1: REQ level detection

REQD 0: ACK output at read
1: ACK output at write

Note 2. Only in products with a Trusted Secure IP

## 14.6 DMA Mode

### 14.6.1 Mode Setting

The DMS field of the CHCFG_n/nS register can be used to toggle between register mode and link mode.

Table 14.4 DMA Mode Setting

| DMS (CHCFG_n/nS) | Mode | Description |
|---|---|---|
| 0 | Register mode | A DMA transfer is executed using the values set in the Next Register Set. |
| 1 | Link mode | A DMA transfer is executed using the descriptor set in the Current register. The DMAC repeatedly loads the descriptor and executes the DMA transfer unless otherwise set by the descriptor or stopped by the control register. |

### 14.6.2 Register Mode

In register mode, a DMA transfer is executed using the values set in the internal registers.

Two sets of the source address, destination address, and transfer byte count (Next0 Register Set and Next1 Register Set) can be set. It is possible to select the Next register set to be used for the DMA transfer, as well as to execute two Next register sets continuously for the DMA transfer.

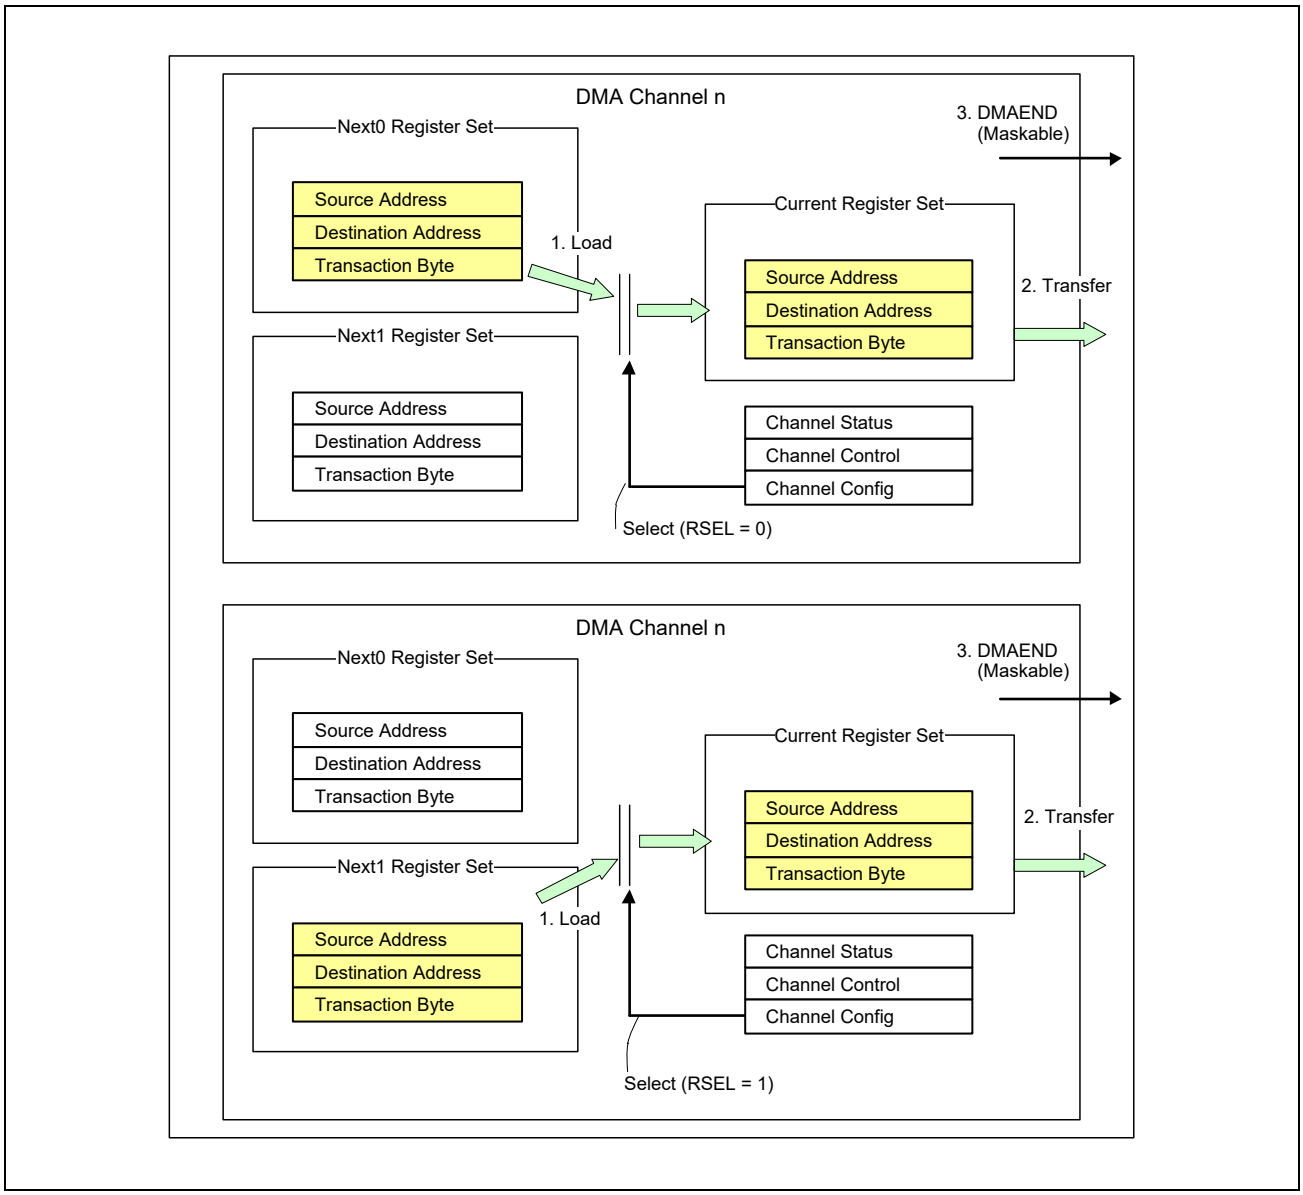

Figure 14.2 Outline of Normal Register Mode

The above figure shows how the transfer is executed when the Next0 Register Set is used (upper part of the figure) and when the Next1 Register Set is used (lower part of the figure).

### (1) Operation Flow

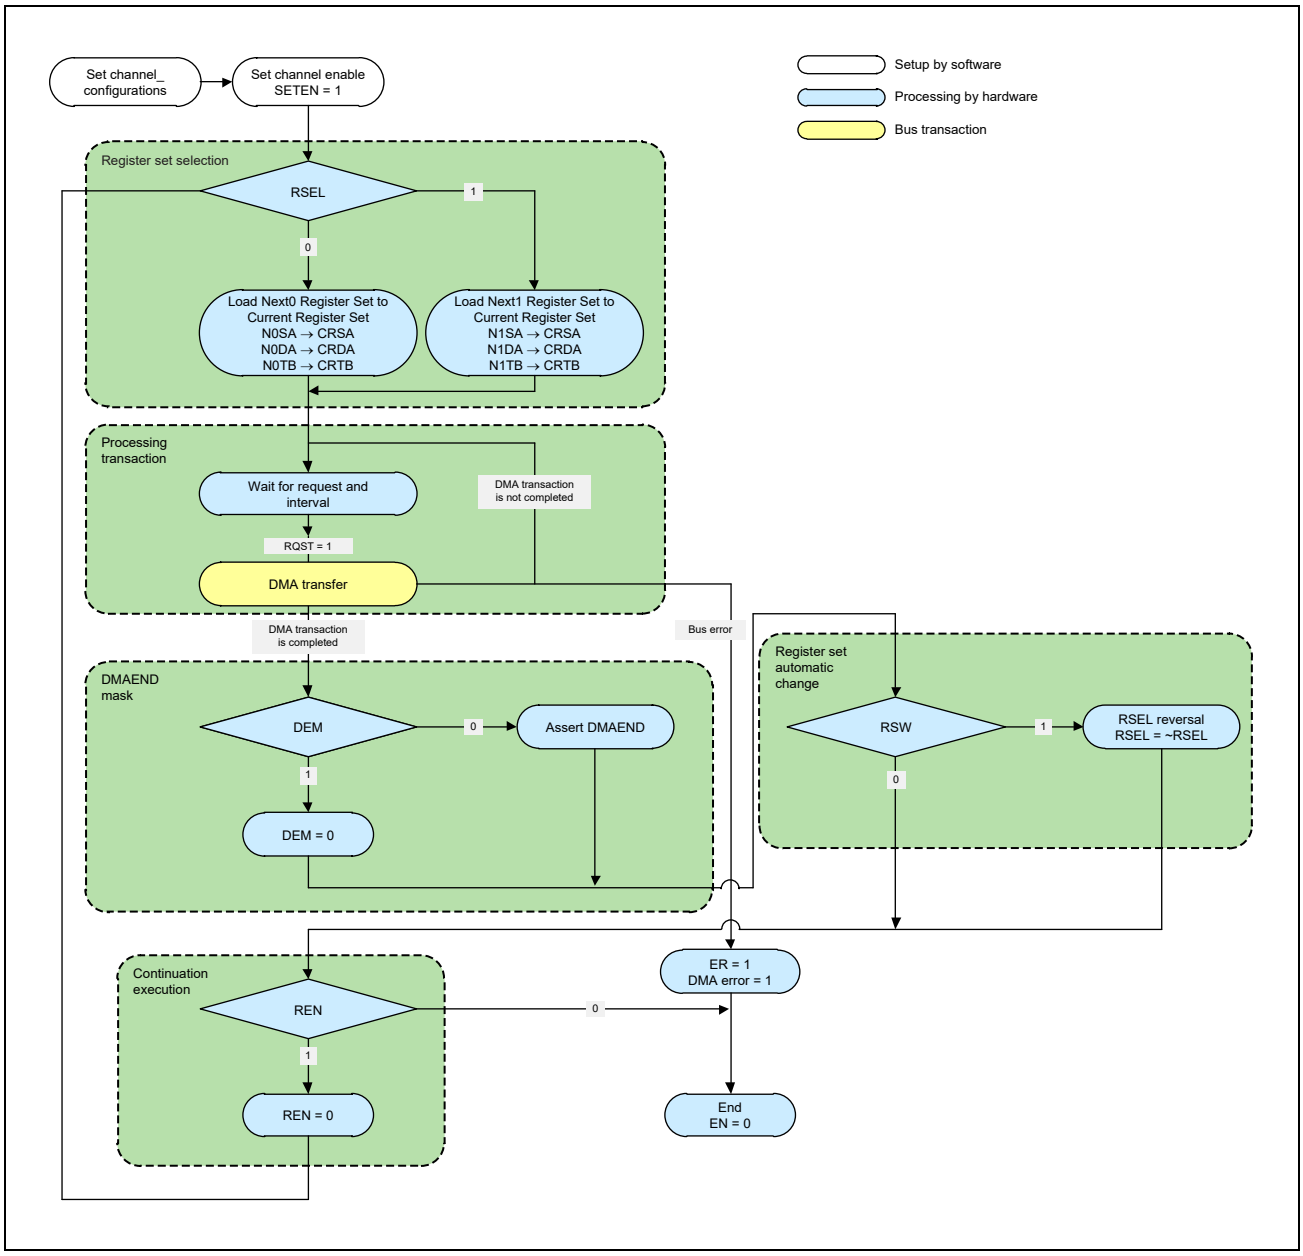

Figure 14.3 Register Mode Flow

<Explanation of the register mode flow>

1. Channel setting (set channel configuration)

   The Next0 or Next1 register set (destination address, source address, and total transfer byte count) is set.

   In the Channel register set, the DMA register set (REQ, DMAACK, transfer size, etc.) is set. (See **Section 14.7, DMA Transfer**.)

2. Register set selection (register set selection)

   When 1 is set in EN, the values set in the Next register set selected by RSEL are loaded to the Current register set.

3. DMA transaction (processing transaction)

   A DMA transfer is executed according to the set values. For details of the transfer, see **Section 14.7, DMA Transfer**.

4. DMA transfer end interrupt mask (DMAINT mask)

   The DMA transfer end interrupt is masked according to the value set in the DEM bit of CHCFG_n/nS. When 1 is set in DEM, the DMA transfer end interrupt is not output. Also, immediately after that, DEM is automatically cleared to 0.

5. Automatic register set change (register set automatic change)

   Whether to use the other Next register set is determined by the value set in the RSW bit of CHCFG_n/nS.

6. Continuation of execution (continuation execution)

   Whether to continue the execution of the DMA transfer is determined by the value set in the REN bit of CHCFG_n/nS. When 1 is set in REN, the execution of the DMA transfer is continued. Also, immediately after that, REN is automatically cleared to 0.

### (2) Register Setting

#### (a) Register mode setting

Select the register set to be executed.

Table 14.5 Register Mode Setting

| DMS (CHCFG_n/nS) | RSEL (CHCFG_n/nS) | Description |
|---|---|---|
| 0 | 0 | Executes the Next0 Register Set. |
| | 1 | Executes the Next1 Register Set. |

#### (b) DMA transfer end interrupt mask setting

The DMA transfer end interrupt can be masked individually for each register set.

Table 14.6 DMAINT Mask Setting

| DEM (CHCFG_n/nS) | Operation |
|---|---|
| 0 | When the DMA transaction is completed, a DMA transfer end interrupt is issued. |
| 1 | Even when the DMA transaction is completed, a DMA transfer end interrupt is not issued. After the DMA transaction is completed, DEM is cleared to 0 by hardware. |

### (c) Automatic register set execution setting

After DMA transfers, the DMA transaction of the selected register set is automatically executed.

Table 14.7 Automatic Register Set Execution Setting

| REN (CHCFG_n/nS) | Operation | Remark |
|---|---|---|
| 0 | When the DMA transaction of the register set selected by RSEL is completed, the EN bit is cleared and the DMA operation ends. | Set this value to execute a DMA transaction once. |
| 1 | When a DMA transaction is completed, the DMAC continues to execute a DMA transfer by using the data set in the selected register set. When continuous transfers are successful, REN is cleared to 0. | Set this value to continuously execute DMA transfers by using the data set in separate register sets. |

### (d) Automatic register set change setting

When 1 is set in REN, the DMAC can automatically change to the register set to be executed next, after a DMA transaction is completed.

Table 14.8 Automatic Register Set Change Setting

| RSW (CHCFG_n/nS) | Operation | Remark |
|---|---|---|
| 0 | If 1 is set in REN when a DMA transaction is completed, the register set is not changed. | Set this value to use only one register set. |
| 1 | If 1 is set in REN when a DMA transaction is completed, the value of RSEL is automatically inverted and the other register set is selected. | Set this value to change the register set. |

### (3) Setting Examples

#### (a) When only the Next0 register set is used

Table 14.9 Register Mode Setting Example 1

| DMS (CHCFG_n/nS) | RSEL (CHCFG_n/nS) | DEM (CHCFG_n/nS) | RSW (CHCFG_n/nS) | REN (CHCFG_n/nS) |
|---|---|---|---|---|
| 0 (Register mode) | 0 (Next0) | 0 (not masked) | 0 (not switched) | 0 (not continuously executed) |

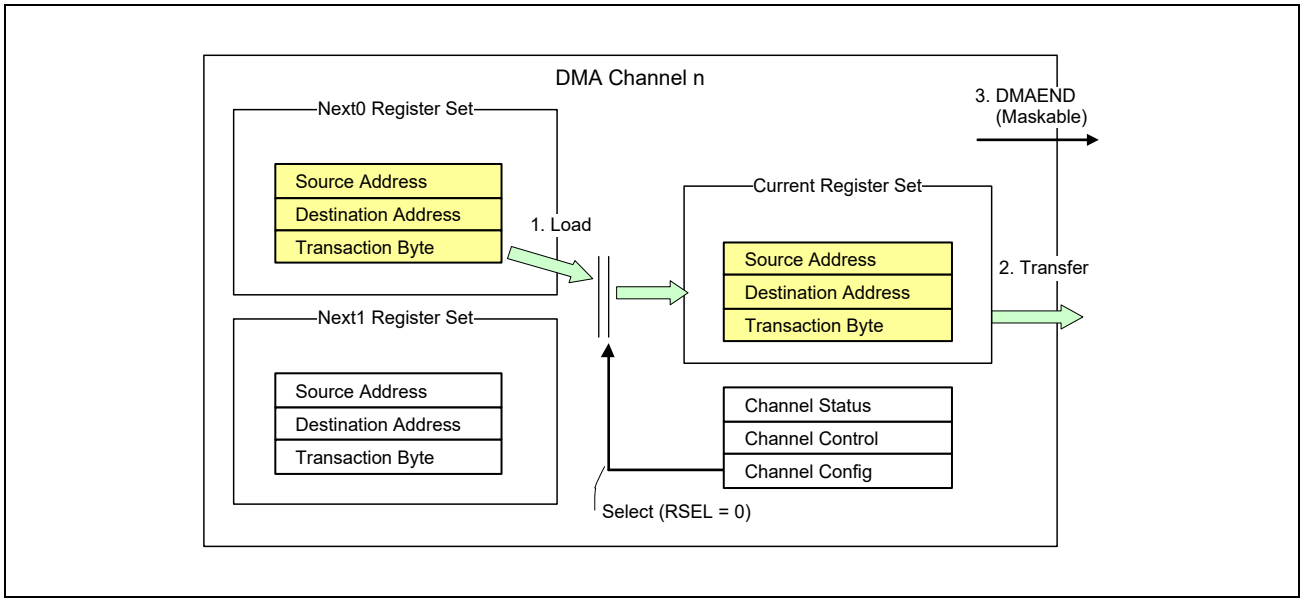

Figure 14.4 Register Mode Setting Example 1

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
4. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

### (b) When two register sets are used continuously

Table 14.10 Automatic Register Set Execution Setting

| DMS (CHCFG_n/nS) | RSEL (CHCFG_n/nS) | DEM (CHCFG_n/nS) | RSW (CHCFG_n/nS) | REN (CHCFG_n/nS) |
|---|---|---|---|---|
| 0 (Register mode) | 0 (Next0) | 1 (masked) | 1 (switched) | 1 (continuously executed) |

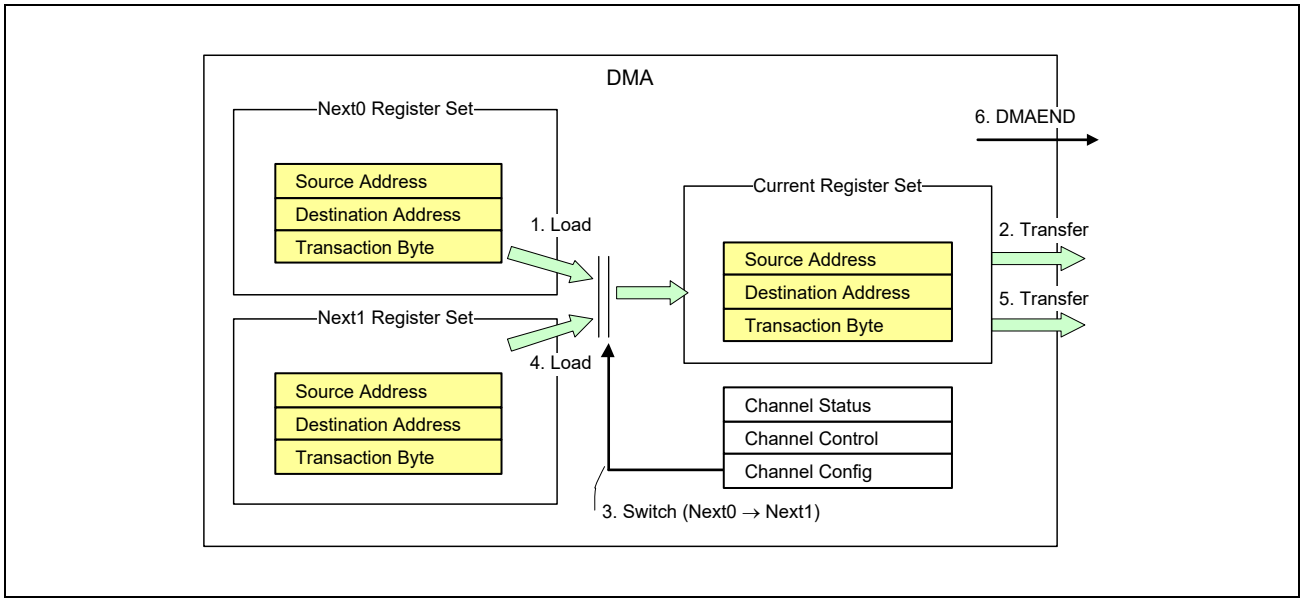

Figure 14.5 Register Mode Setting Example 2

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 1 is set in DEM, DMA transfer end interrupt is not output after the DMA transaction is completed. Also, DEM is automatically cleared to 0.
4. Because 1 is set in REN, the execution is continued. Also, REN is automatically cleared to 0.
5. Because 1 is set in RSW, the register set to be executed next is switched (RSEL = 0 → 1).
6. The Next1 register set is loaded to the Current register set.
7. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
8. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
9. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

### 14.6.3 Link Mode

In link mode, a descriptor stored in external memory is loaded as set values and a DMA transaction is executed using the loaded values. The DMAC contains a Next Link address and a Current Link address for each channel, and these addresses are used to set the descriptor address to be executed next and to indicate the descriptor address of the currently executed DMA transaction, respectively.

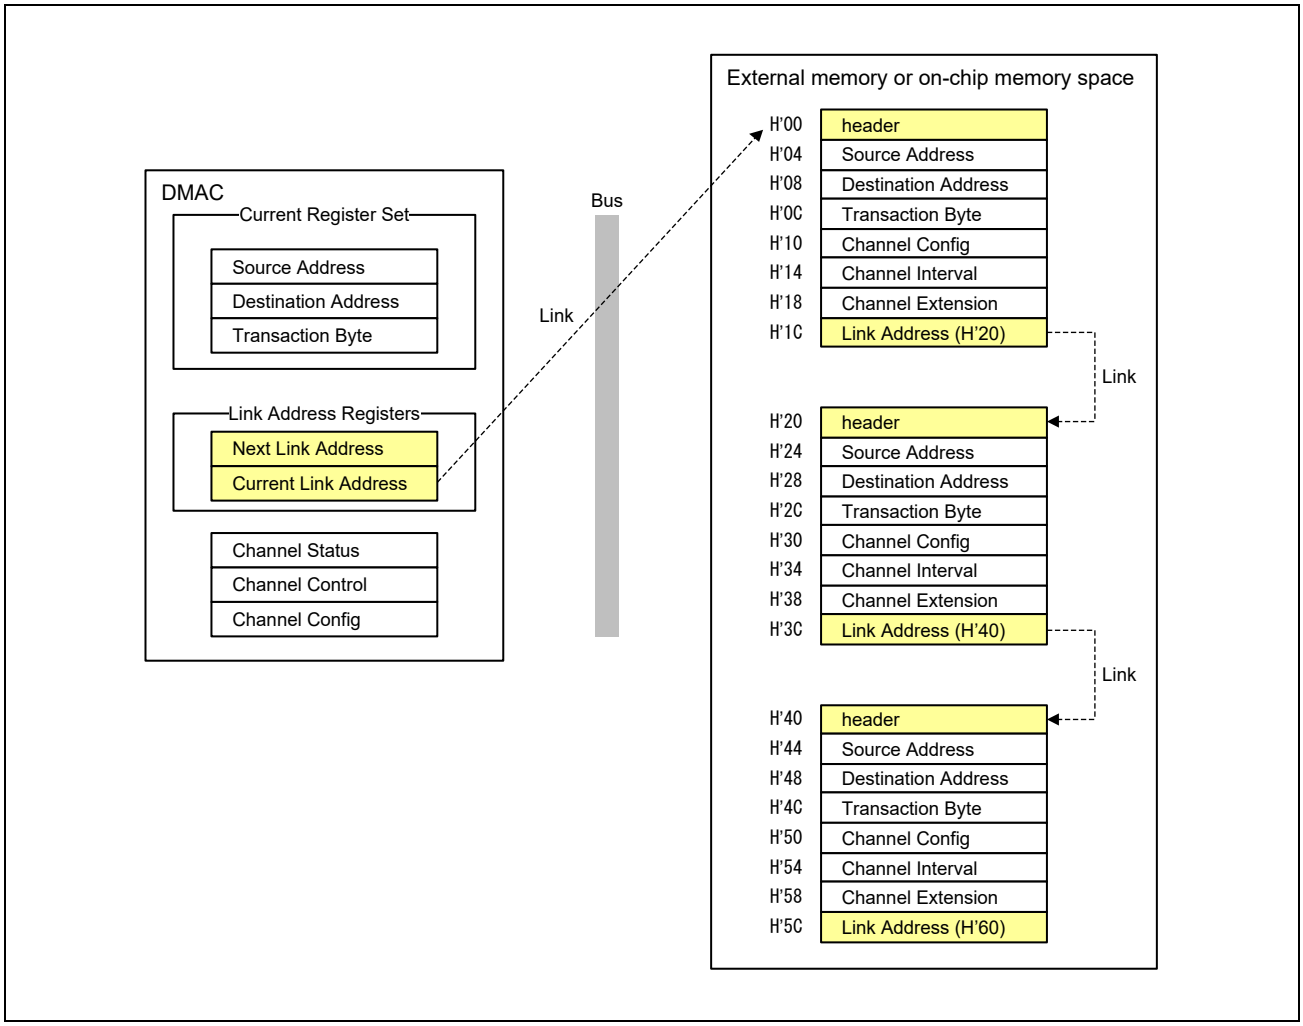

Figure 14.6 Link Mode Outline

### (1) Operation Flow

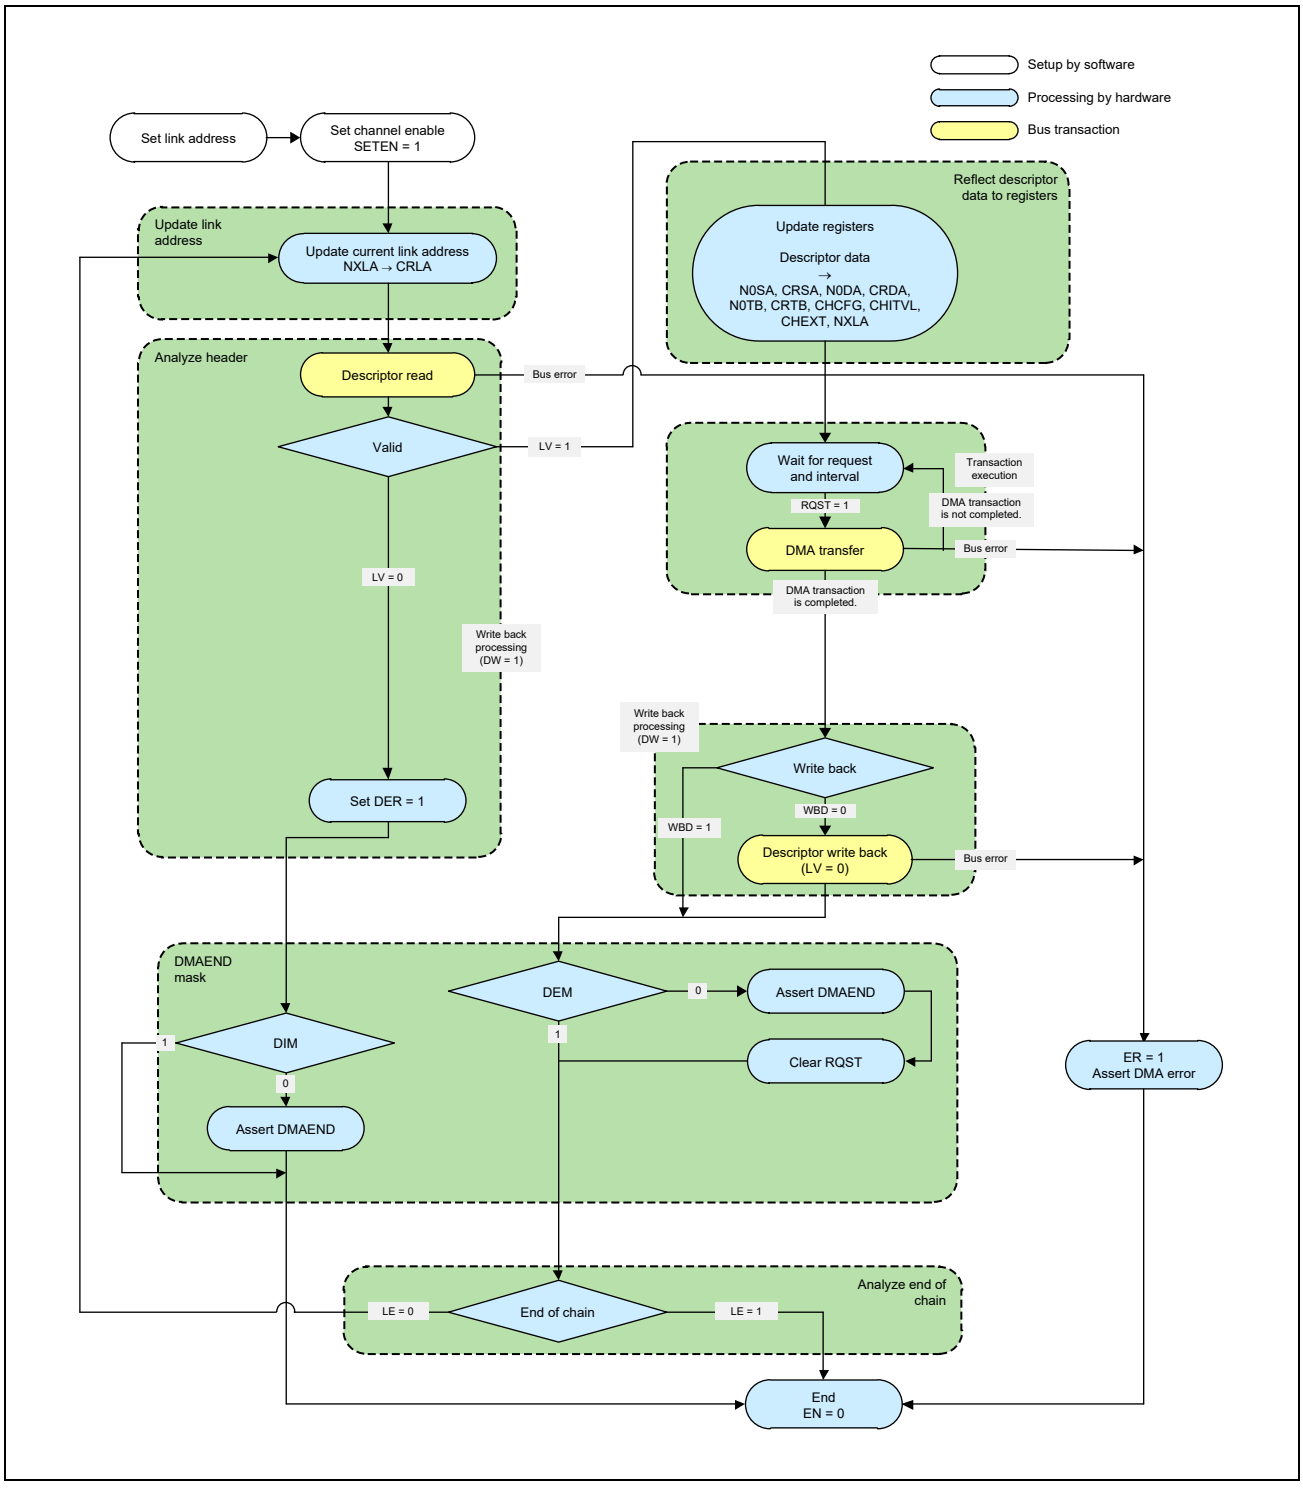

Figure 14.7 Link Mode Flow

<Explanation of the link mode flow>

1. Channel setting

   The start address of the link destination is set in NXLA_n/nS.

2. Link address update

   When 1 is set in EN (1 is set in SETEN), the Link address set in NXLA_n/nS is loaded to CRLA_n/nS.

3. Descriptor load and header analysis

   The DMAC begins to load the descriptor and then analyzes the content of the header. When LV is 0, the DMAC discards the loaded descriptor and sets 1 in DER to end the operation (EN = 0). In this case, if 0 is set in DIM of the header, DMAEND is issued.

4. Descriptor setting

   The loaded descriptor is set in the Current register set and Channel register set. Also, the next link address is set in NXLA_n/nS.

5. DMA transaction

   A DMA transaction is executed according to the set values.

6. Header writeback

   When 0 is set in WBD of the header, the DMAC writes back the header with 0 set in its LV bit.

7. DMAINT mask

   When 0 is set in the DEM bit of CHCFG_n/nS, the DMA transfer end interrupt is issued.

8. Link end analysis

   When 1 is set in LE of the header, the operation is ended by clearing EN to 0, after transfer using the settings of the descriptor is completed. If the setting of LE is 0, the Current registers are then updated and loading of the next descriptor begins. The TEND signal is issued after the transfer of each descriptor.

### (2) Register Setting

#### (a) Link mode setting

To use the link mode, set 1 in the DMS bit of the CHCFG_n/nS register.

Table 14.11 Link Mode Setting

| DMS (CHCFG_n/nS) | Description |
|---|---|
| 1 | Operates in link mode.<br>This bit cannot be changed using a descriptor. |

#### (b) Link address setting

There are two registers that indicate a link address:
Next Link address register and Current Link address register.
To start the link mode, set a link address in the Next Link address register.

The Next Link address indicates the next link address after a descriptor is loaded. The Current Link address indicates the currently executed link address.

Table 14.12 Link Address Register Set

| Register | Description |
|---|---|
| Next Link Address Register (NXLA_n/nS) | Sets and indicates the next link address. Before starting the link mode, set a link address in this register. |
| Current Link Address Register (CRLA_n/nS) | Indicates the currently executed link address. This register is read-only. |

**CAUTION**

In link mode, the settings can be changed by reading a descriptor. It is not possible, however, to synchronize the change of the settings with a peripheral module request or external request. Therefore, when using a peripheral module request or external request, set AM, LVL, HIEN, LOEN, and SEL of the CHCFG_n/nS register before setting Enable and do not change any of these bits in the descriptor.

### (3) Descriptor Setting

In a link address, prepare a descriptor with data arranged in the order shown below.

The DMAC reads the descriptor in burst mode.

#### (a) Descriptor data arrangement

Table 14.13 Descriptor Data Arrangement

| Address | Data | Remarks |
|---|---|---|
| Link address + H'00 | header | |
| Link address + H'04 | Source Address | |
| Link address + H'08 | Destination Address | |
| Link address + H'0C | Transaction Byte | |
| Link address + H'10 | Config | The register mode cannot be set. |
| Link address + H'14 | Interval | |
| Link address + H'18 | Extension | |
| Link address + H'1C | Next Link Address | |

**Note:** As a link address, set an address aligned along the 32-bit boundary.

#### (b) header

The header indicates the status of the descriptor, as shown below.

The DMAC reads this area when a DMA transfer is started in link mode. Also, after a DMA transaction is completed, the DMAC writes back the transfer status to the area.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| — | — | — | — | — | — | — | — | — | — | — | — | DIM | WBD | LE | LV |

If 0 is set in WBD when the header is read, the DMAC writes back to this 4-byte area after a DMA transaction using a descriptor is completed.

0 is written back to LV, and the values obtained when reading the header are written back to the other fields.

Figure 14.8 Header Area

Table 14.14 Header Area

| Bit Position | Bit Name | Meaning |
|---|---|---|
| 31 to 4 | — | — |
| 3 | DIM | Descriptor Interrupt Mask<br>Sets whether to mask the DMA transfer end interrupt if 0 is set in LV when the header is loaded.<br>0: Issues a DMA transfer end interrupt.<br>1: Does not issue a DMA transfer end interrupt. |
| 2 | WBD | Write Back Disable<br>Sets whether to mask LV bit writeback. When 1 is set in this bit, the DMAC does not perform writeback.<br>0: Writes the LV bit back to 0.<br>1: Does not write back the LV bit. |
| 1 | LE | Link End<br>Indicates whether the link ends with the DMA transaction of this descriptor.<br>Set 1 in this bit to indicate the end of the link.<br>0: The link continues.<br>1: The link ends. |
| 0 | LV | Link Valid<br>Indicates whether this descriptor is valid.<br>If 0 is set in WBD, the DMAC writes 0 in this bit after the DMA transaction written in the descriptor is executed. When setting the header, set 1 in this bit.<br>0: Descriptor invalid<br>1: Descriptor valid |

### (c) Descriptor data other than the header

The data items of the descriptor other than the header are the same as defined in the internal register specifications (note that the DMS bit of the CHCFG_n/nS register cannot be changed using the descriptor). For information about the internal register specifications, see **Section 14.4, Register Descriptions**.

For descriptor setting examples, see **Section 14.8, DMA Setting Examples**.

### (d) CACHE settings for descriptor access

The CACHE settings for descriptor access can be set in LWCA and LDCA of the DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S). Make these settings as appropriate for the access destination in which the descriptor is prepared.

### (e) Descriptor area and DMA transfer area

The following figure outlines the descriptor area and DMA transfer area that are accessed by the DMAC.

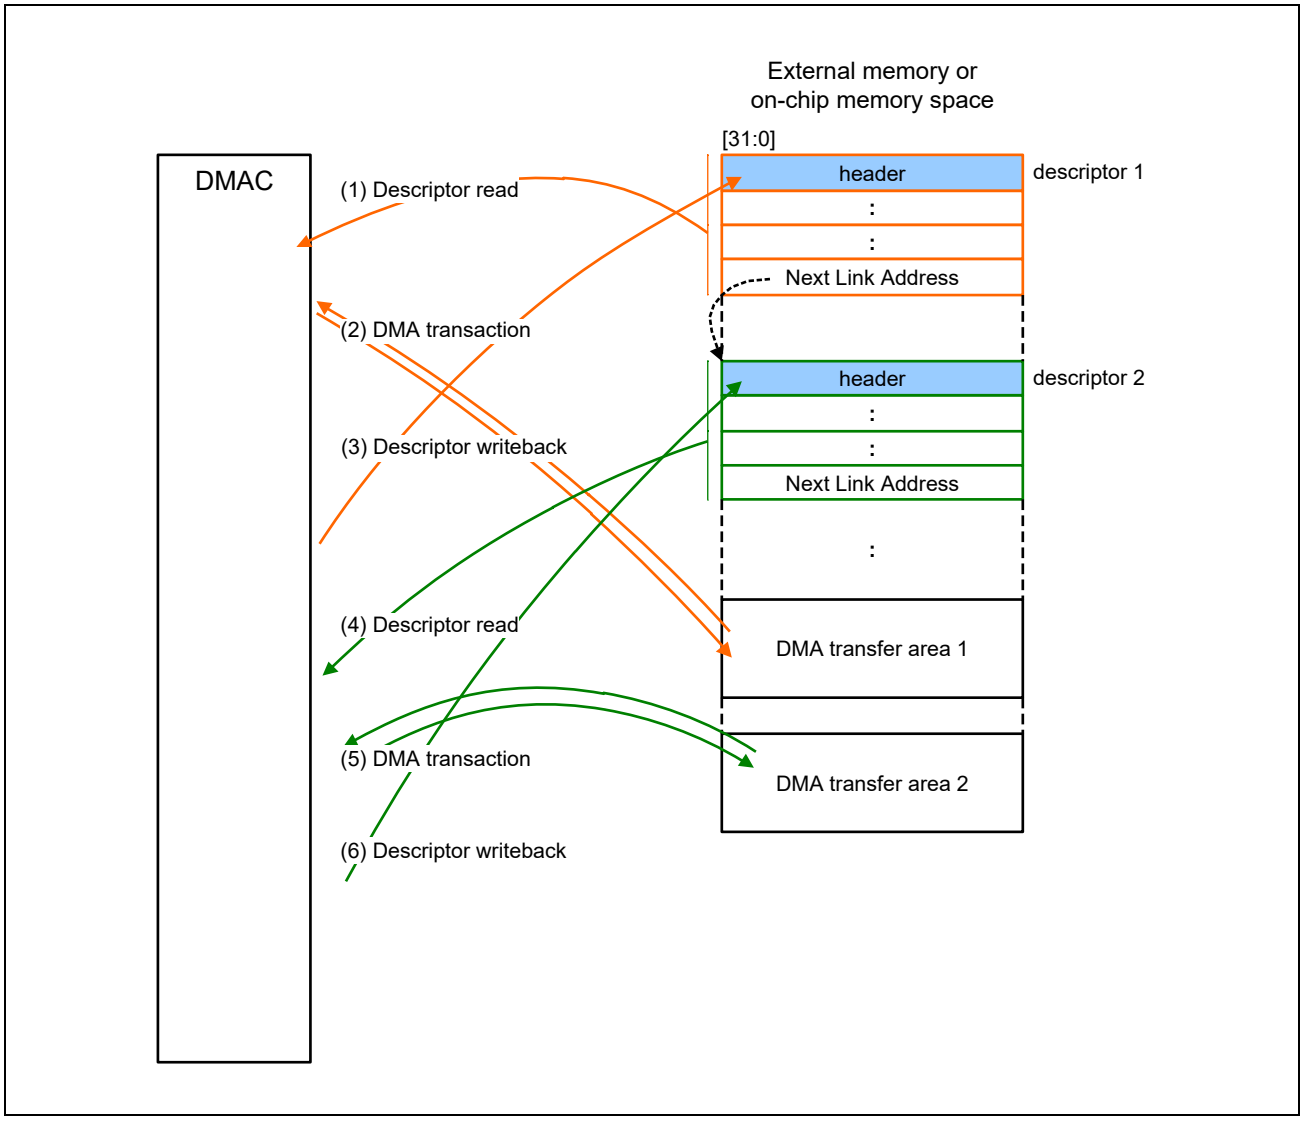

Figure 14.9 Outline of the Descriptor Area and DMA Transfer Area

1. Descriptor read

   The values set in the internal Next Link Address register are loaded to the Current Link Address register, and a descriptor is read from the external memory space (descriptor1) pointed to by the Current Link Address register.

2. DMA transfer

   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.

3. Descriptor writeback

   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor1, with 0 set in LV and the other bits containing the values read in <1>.

4. Descriptor read

   When 0 is set in the LE bit of the header in the last read descriptor (<1>), the next descriptor is read from the address (descriptor2) indicated by Next Link Address in the descriptor.

5. DMA transfer

   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.

6. Descriptor writeback

   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor2, with 0 set in LV and the other bits containing the values read in <4>.

4 through 6 are repeated.

When the header contains 1 in LE and 0 in WBD, the DMAC executes a DMA transfer using the settings of that descriptor, writes back data with 0 set in the LV bit of the header and ends the operation.

When the header contains 1 in both LE and WBD, the DMAC executes a DMA transfer using the settings of that descriptor and ends the operation (without writing back).

When the header contains 0 in LV, the DMAC ends the operation (without executing a DMA transfer).

### (4) Descriptor Configuration Examples

In link mode, a descriptor can be configured as shown below.

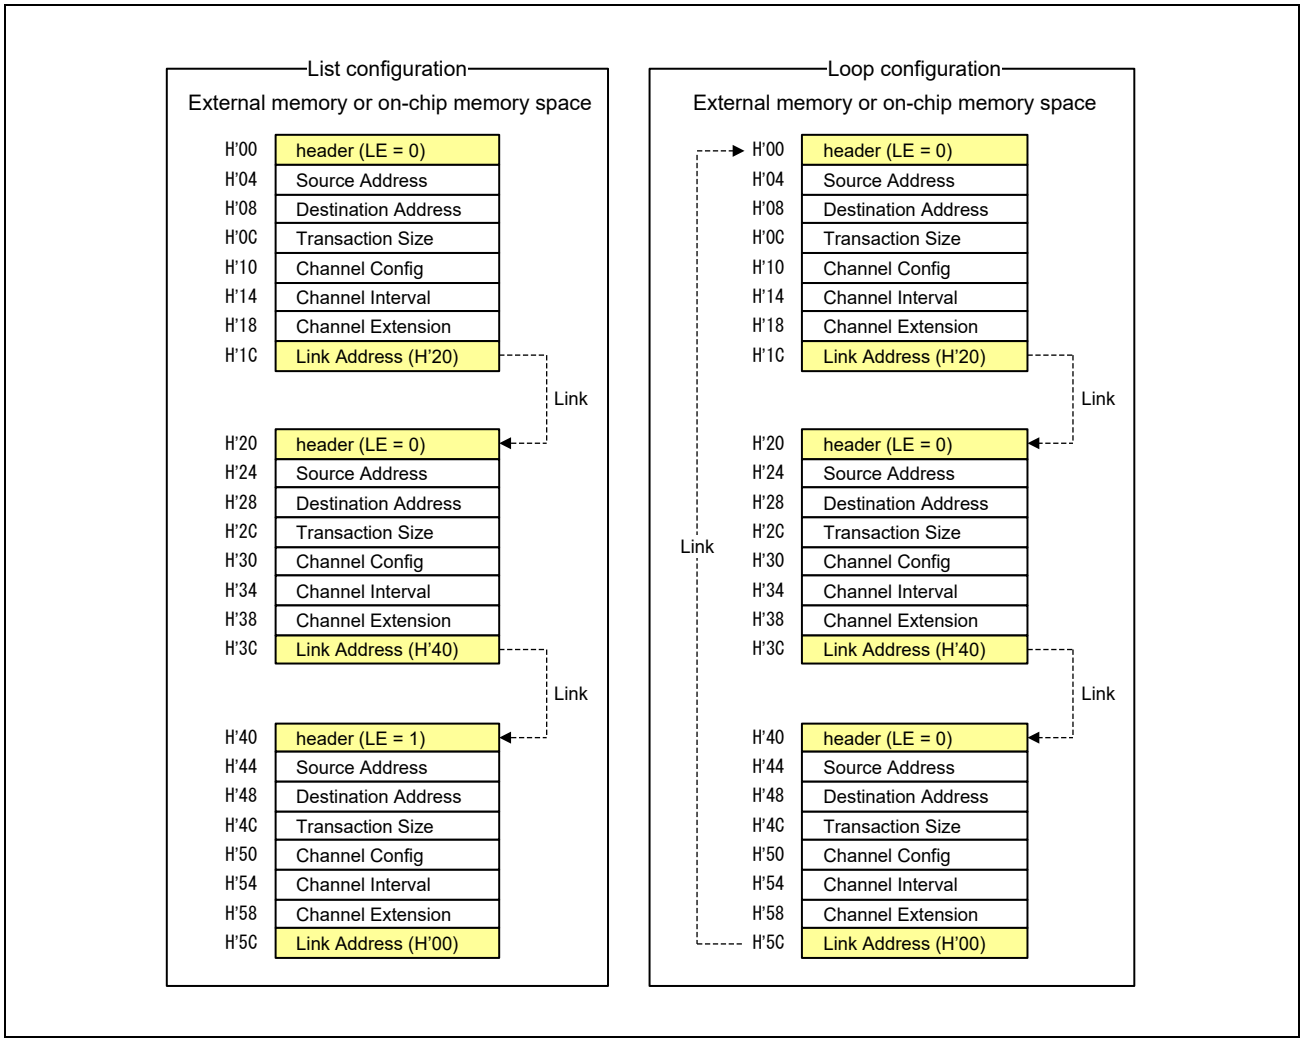

Figure 14.10 Descriptor Configuration Examples

- List configuration
  The link is ended by setting 1 in the LE bit of the header in the last descriptor.
- Loop configuration
  A descriptor can be created with a loop configuration, by setting the address of the top descriptor in the link address of the last descriptor. To end the loop, change the value of the LE bit of the header to 1 before the DMAC reads the descriptor, or follow the transfer suspension procedure.

## 14.7 DMA Transfer

The basic operation of DMA transfer is described here.

### 14.7.1 Transfer Mode

Two transfer modes are supported: single transfer mode and block transfer mode.

To select a transfer mode, set the TM bit of CHCFG_n/nS for each channel.

Table 14.15 Basic Transfer Setting

| Transfer Mode | TM (CHCFG_n/nS) | Function |
|---|---|---|
| Single transfer | 0 | A single DMA transfer is executed in response to a DMAREQ. |
| Block transfer | 1 | In response to a DMAREQ, the DMAC continues to execute the transfer until the DMA transaction is completed. |

#### (1) Single Transfer Mode

When a DMA transfer request is received, a DMA transfer is executed once in the direction indicated by REQD (source or destination). A DMA transfer is executed once each time a transfer request is received, and this operation continues until the number of bytes loaded to CRTB_n/nS is reached (arbitration between channels is accomplished for each DMA transfer).

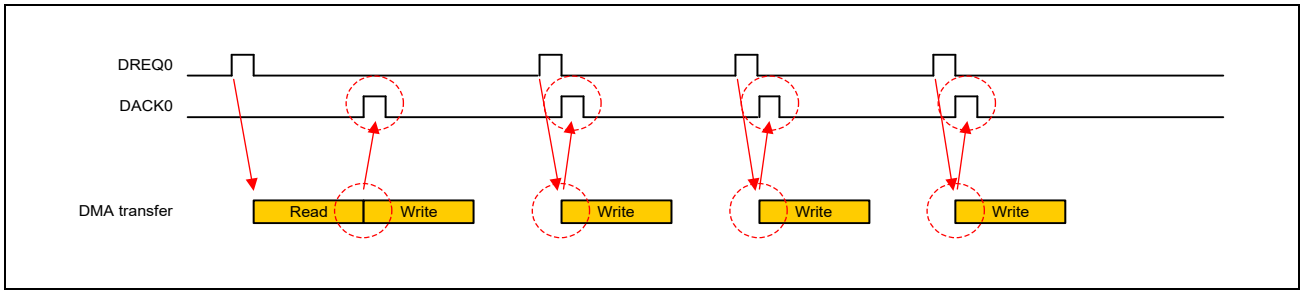

Figure 14.11 Single Transfer Mode (REQD = 1, SDS > DDS)

#### (2) Block Transfer Mode

Once a DMA transfer request is received, the DMAC continues to execute the transfer until data equivalent to the number of bytes loaded to the DMA transfer byte register (CRTB_n/nS register) is transferred (the DMA transaction is completed) (arbitration between channels is accomplished for each DMA transfer).

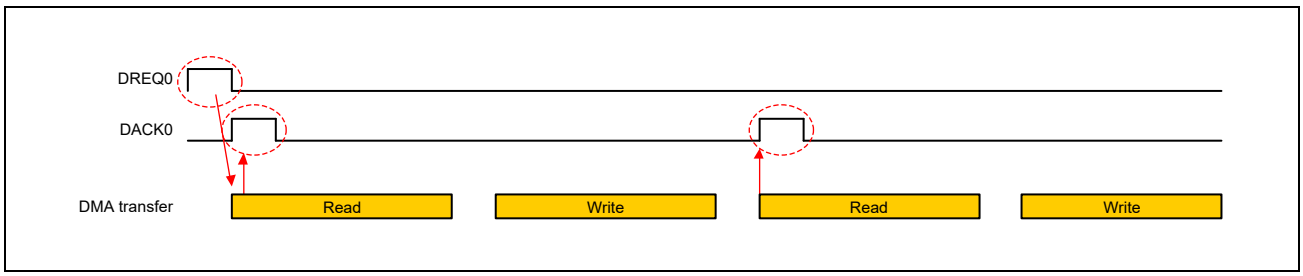

Figure 14.12 Block Transfer Mode (REQD = 0, SDS < DDS)

### 14.7.2 Priority Control for DMA Channels

Within channels 0 to 7 and 8 to 15, two priority control modes are supported: fixed priority mode and round robin mode. Only round robin mode is supported for priority control between the group of channels 0 to 7 and the group of channels 8 to 15. To select a priority control mode, use the PR bit of the DMA control register (DCTRL register). The fixed priority mode is selected when 0 is set in the PR bit, and the round robin mode is selected when 1 is set.

Read priority and write priority are controlled independently.

The DMAC issues transfer requests to different channels concurrently without waiting for the completion of any particular transfer and processes responses in the order it receives them. Therefore, the order in which the channels start transactions is not necessarily consistent with the order in which the transactions end.

Table 14.16 Priority Control Setting

| Mode | PR (DCTRL) | Function | Purpose |
|---|---|---|---|
| Fixed priority | 0 | Requests are controlled based on the fixed order of priority for channels 0 to 7 and 8 to 15 (High: CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15): Low). | Use this mode when the channels have a specific order of priority. |
| Round robin | 1 | Requests are controlled in a round robin fashion. | Use this mode to execute all requests evenly. |

#### (1) Fixed Priority Mode

In fixed priority mode, the channels have a fixed order of priority in channels 0 to 7 and 8 to 15. Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is as follows.

High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If there is a transfer request from DMA channel 0 in this state, a transfer is executed on DMA channel 0. After the transfer is completed, the order of priority is as follows.

High CH8 > CH0 > CH9 > CH1 > CH10 > CH2 > CH11 > CH3 > CH12 > CH4 > CH13 > CH5 > CH14 > CH6 > CH15 > CH7 Low

If a DMA transfer request occurs on multiple channels simultaneously, the DMA transfer request of the channel having the smallest channel number is given priority. The following figure shows an example where a DMA transfer request occurs on a channel having a higher priority while a DMA transfer is being executed in fixed priority mode.

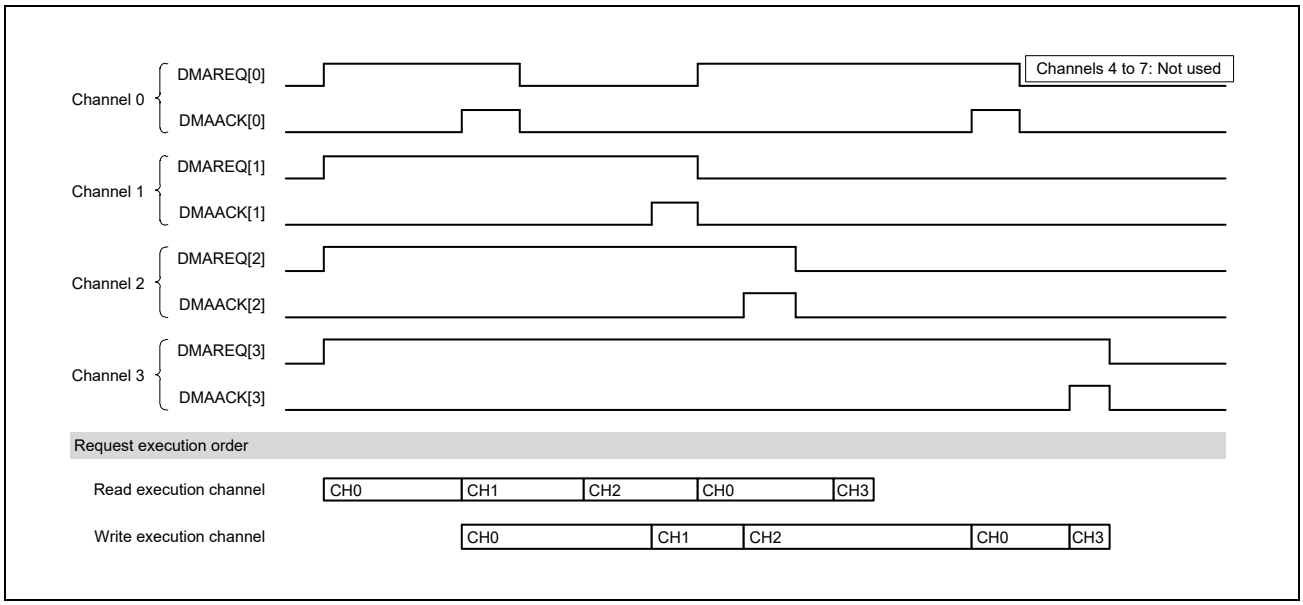

Figure 14.13 Fixed Priority Mode (Number of Channels = 4, REQD = 1)

### (2) Round Robin Mode

In round robin mode, each time a transfer request is received from a channel in the group of channels 0 to 7 and the group of channels 8 to 15, the order of priority is changed in such a way that the channel that executed a transfer last has the lowest priority.
Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is the same as that of the fixed priority mode, which is as follows.
High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If a transfer request is received from DMA channel 2 in this state, a transfer is executed on DMA channel 2. After the transfer is completed, the order of priority is as follows.
High CH8 > CH3 > CH9 > CH4 > CH10 > CH5 > CH11 > CH6 > CH12 > CH7 > CH13 > CH0 > CH14 > CH1 > CH15 > CH2 Low

The following figure shows an example where DMA transfers are executed in round robin mode.

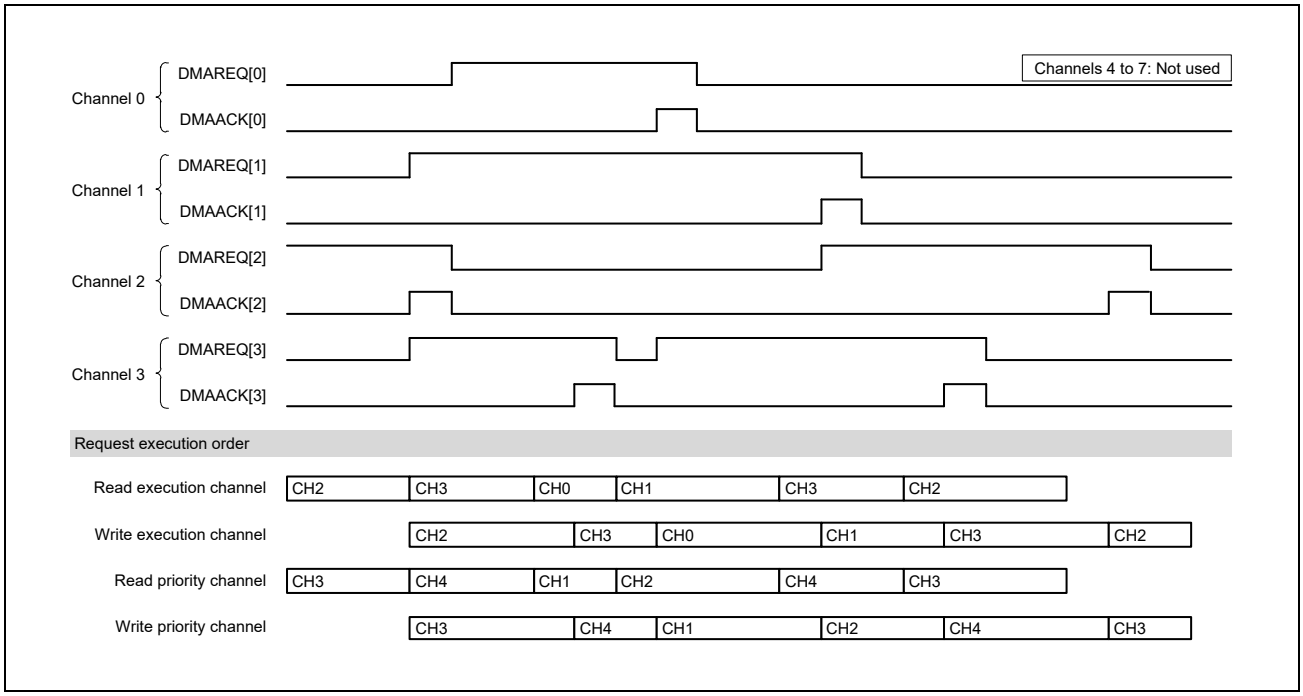

Figure 14.14 Round Robin Mode (Number of Channels = 4, REQD = 0)

The channel whose channel number is the number of the currently transferring channel + 1 gets to execute a DMA transfer next. If there is no transfer request from this channel, the channel whose channel number is the number of this channel + 1 gets to execute a DMA transfer.

### 14.7.3 DMA Transfer Request

Edge detection or level detection can be selected using the LVL bit of the CHCFG_n/nS register.

The HIEN and LOEN bits of the CHCFG_n/nS register are used to select either the rising edge or falling edge in the case of edge detection or either the high level or low level in the case of level detection.

When the transfer request is by an on-chip peripheral module, set the CHCFG_n/nS register according to **Table 14.3**.

#### (1) Edge Detection

Setting 0 in the LVL bit of the CHCFG_n/nS register enables edge detection.

#### (2) Level Detection

Setting 1 in the LVL bit of the CHCFG_n/nS register enables level detection.

### 14.7.4 DMA Transfer End Interrupt

The DMA transfer end interrupt is an interrupt request signal that indicates that a DMA transaction is completed. There is an independent DMA transfer end interrupt for each channel.

When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed, 1 is set in END of the CHSTAT_n/nS register. In this case, when 0 is set in DEM of the CHCFG_n/nS register, the DMA transfer end interrupt (DMAINTn_NS/S) is output (n = 0 to 15). (When writeback is performed in link mode, the signal is output after the writeback operation.)

When 0 is set in LV of the header in the read descriptor in link mode, 1 is set in DER of the CHSTAT_n/nS register. In this case, when 0 is set in DIM of the header, the DMA transfer end interrupt is output.

Table 14.17 Assertion Conditions of DMA Transfer End Interrupt

| Source | Condition | DMA Transfer End Interrupt Mask Signal |
|---|---|---|
| DMA transaction end | When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed with an OKAY response (or after the writeback operation when writeback is performed in link mode) | DEM bit of the CHCFG_n/nS register |
| Descriptor invalid | When 0 is set in LV of the header in the read descriptor in link mode while 0 is set in DIM of the header | DIM bit of the header |

### 14.7.5 DMA Error Interrupt

If an error response is received for a DMA transfer or descriptor access, the DMAC regards it as an error and stops the transfer. Upon receiving an error response, the EN bit of the CHSTAT_n/nS register of transferring channel n is cleared to 0 and 1 is set in the ER bit (n = 0 to 15). Also, the DMA error interrupt (DMAERR_NS/S) is output.

The DMA error interrupt cannot be masked.

Once an error occurs, the data of the whole transfer cannot be guaranteed. Be sure to start the transaction again from the beginning by following the procedure below.

1. Set 1 in the SWRST bit of the CHCTRL_n/nS register.
2. Set each register again.

### 14.7.6 Interval Count Function

The interval at which a DMA transfer is executed can be adjusted by setting the ITVL bit of the channel interval register (CHITVL_n/nS). This function is intended to prevent the DMA controller from occupying the bus all the time.

When a read or write operation is completed, a countdown starts from the value set in CHITVL_n/nS. The next internal request is not executed until the count value reaches 0.

The following figure shows an example of how this works.

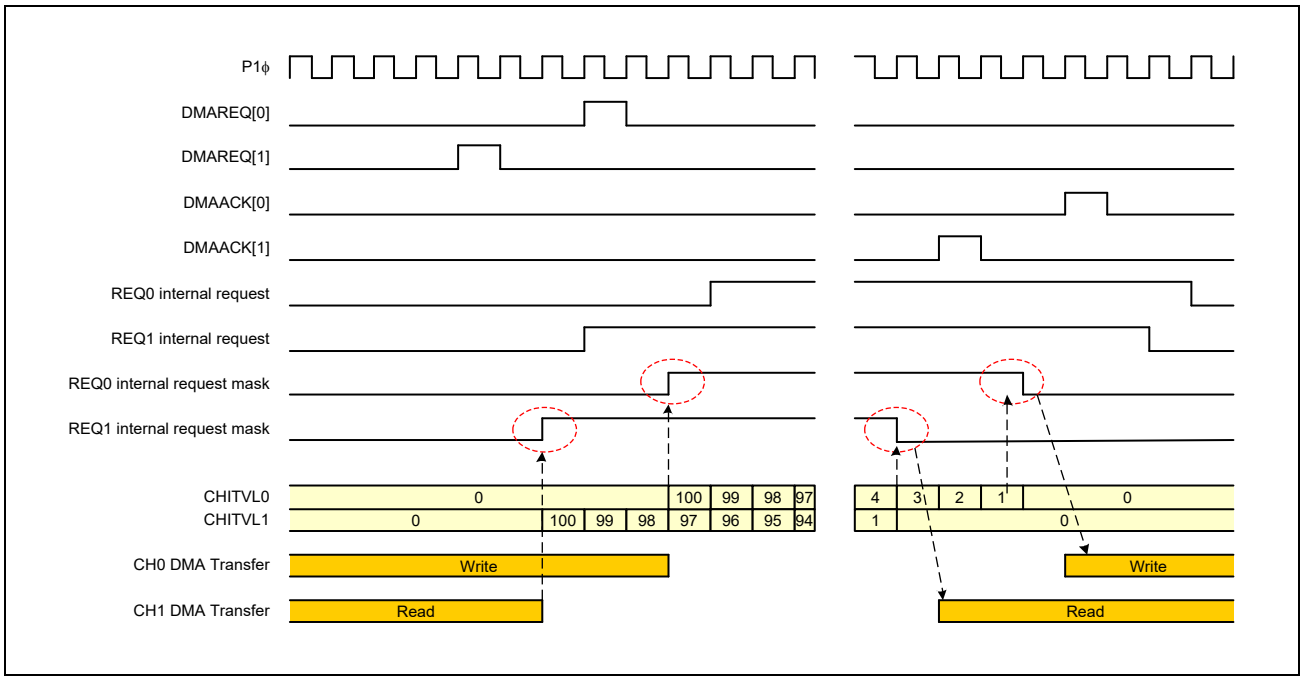

Figure 14.15 Interval Count

### 14.7.7 Difference in Operation Due to the Transfer Size

#### (1) When the Source Transfer Size Is Smaller

When the read of data equivalent to the destination data size is completed, the data is written to the destination.

The following figure shows a timing chart where the source transfer size is 8 bits and the destination transfer size is 32 bits (in the case of rising edge detection).

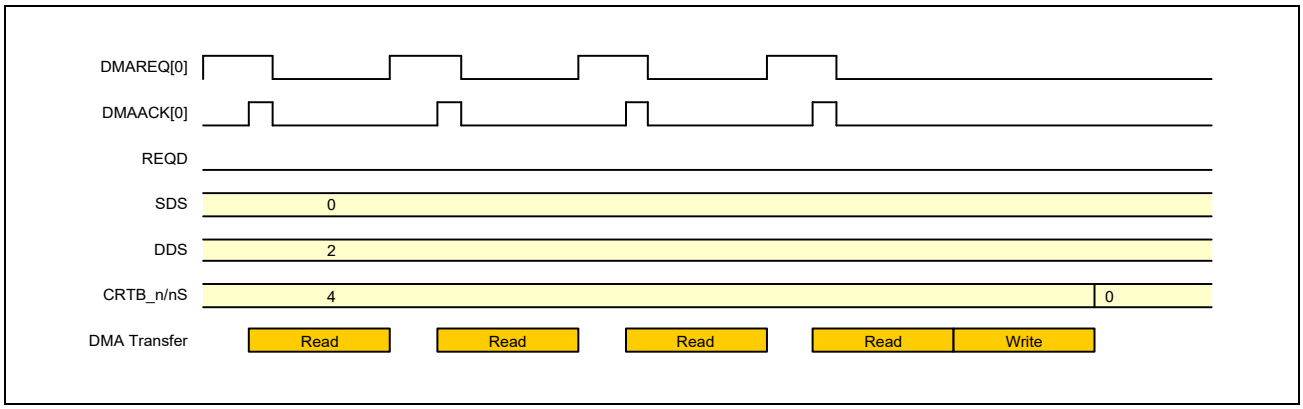

Figure 14.16 When the Source Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 0, SDS < DDS in CHCFG_n/nS)

#### (2) When the Destination Transfer Size Is Smaller

Since the source transfer size is larger, multiple destination writes occur after a single source read. The following figure shows a timing chart where the source transfer size is 64 bits and the destination transfer size is 16 bits (in the case of rising edge detection) (1 is set in REQD of the CHCFG_n/nS register).

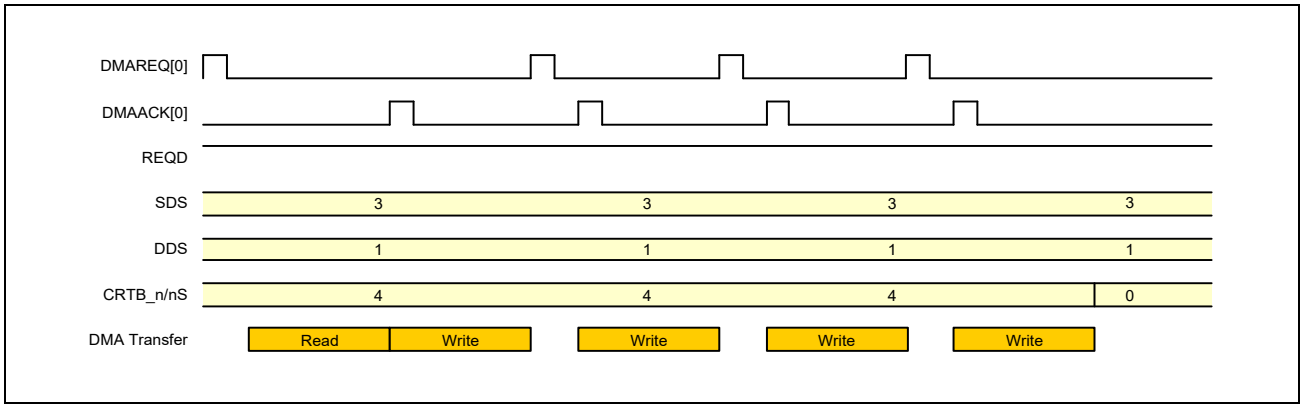

Figure 14.17 When the Destination Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 1, SDS > DDS in CHCFG_n/nS)

### (3) When the Source Transfer Size Is the Same as the Destination Transfer Size

Every time a DMA transfer request is detected, a source read and a destination write occur.

The following figure shows a timing chart where the source transfer size and the destination transfer size are both 8 bits (in the case of rising edge detection, with 1 set in REQD of the CHCFG_n/nS register).

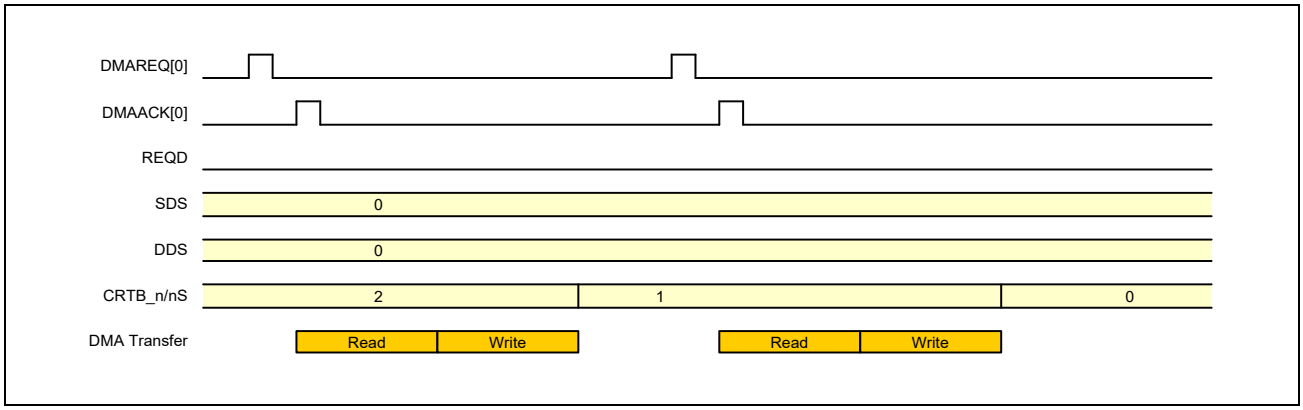

Figure 14.18 When the Source Transfer Size Is the Same as the Destination Transfer Size (LVL = 0, HIEN = 1, REQD = 0, SDS = DDS in CHCFG_n/nS)

## 14.7.8 Transfer Status

The channel status register indicates the status of DMA transfer execution on a channel.

### (1) Suspend

A DMA transfer can be suspended by using the SETSUS bit of CHCTRL_n/nS. In this case, if an ongoing bus cycle exists, the DMAC waits for that cycle to end before suspending the transfer. Writing 1 in the CLRSUS bit restores the DMA transfer from the suspend status.

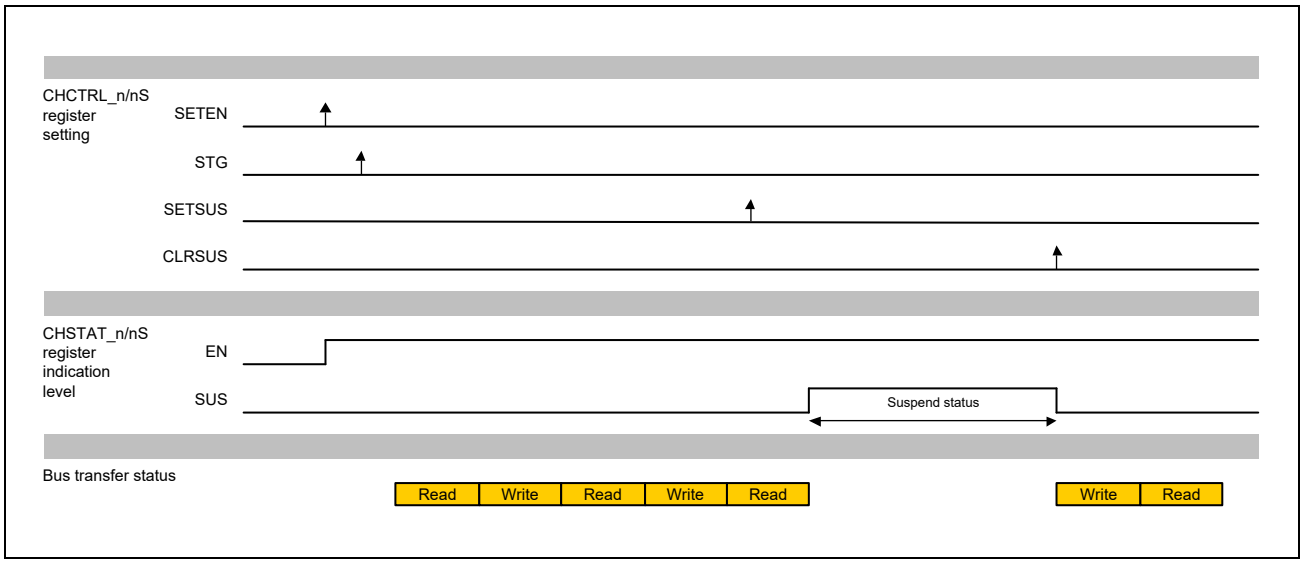

Figure 14.19 DMAC Suspend Status (Auto Request/Block Transfer)

In the above case, the DMA transfer is suspended after the read transfer is completed.

If there is any ongoing DMA transfer, the suspend status starts when that transfer is completed. To make sure that the transfer is suspended, read the CHSTAT or DSTAT_SUS register, after setting SETSUS, and check that 1 is set in the SUS bit for the relevant channel.

### (2) Transfer Stop

If 1 is written to CLREN while a DMA transaction is in progress, the DMA transaction for the corresponding channel can be stopped. For the post-stop processing, two modes are supported: one sweeps out the data remaining in the buffer when the transaction is stopped (SBE = 1) and the other does not (SBE = 0). One of these modes can be selected using the SBE bit of the CHCFG_n/nS register. By default, SBE is set to 0.

When this sweep mode is enabled and CLREN is set to 1, and if a DMA transaction is stopped with data remaining in the DMAC buffer, the transaction is completed after the DMAC sweeps the data.

### (a) Transfer Stop (Buffer Sweep Disabled - SBE = 0)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. The stop timing depends on the value set in REQD. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMA internal status before setting the next transfer.

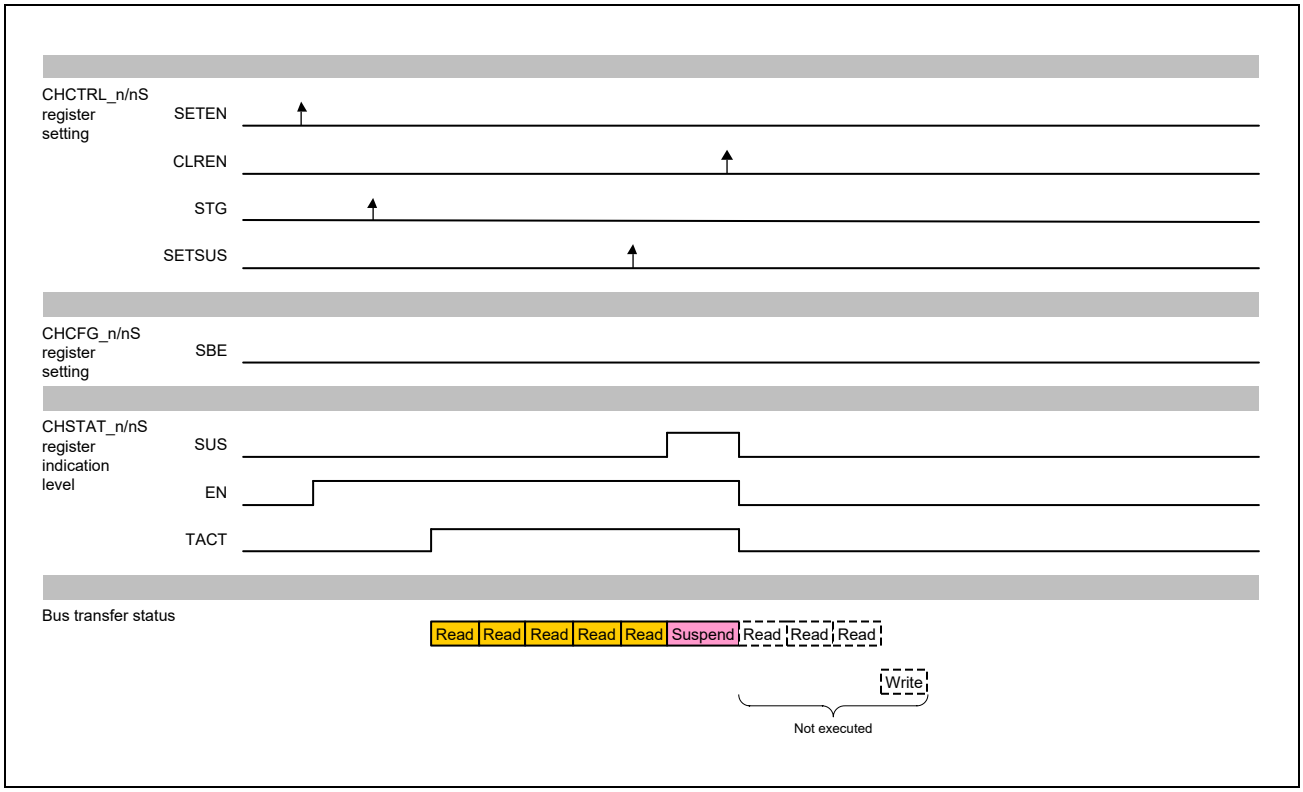

Figure 14.20 DMAC Transfer Stop

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If an ongoing DMA transfer is stopped before it is completed, the DMA transfer end interrupt is not asserted.
- If 0 is set in REQD, the DMA transfer is stopped when the next read is completed. (If the buffer contains any data that can be written, the DMA transfer is stopped after the data is written.)
- If 1 is set in REQD, the DMA transfer is stopped when the next write is completed.

### (b) Transfer Stop (Buffer Sweep Enabled - SBE = 1)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. When 0 is set in REQD, the DMA transfer is stopped after the DMAC sweeps (writes) the already read data. If 1 is set in REQD to use hardware requests, do not use the sweep mode. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMAC internal status before setting the next transfer.

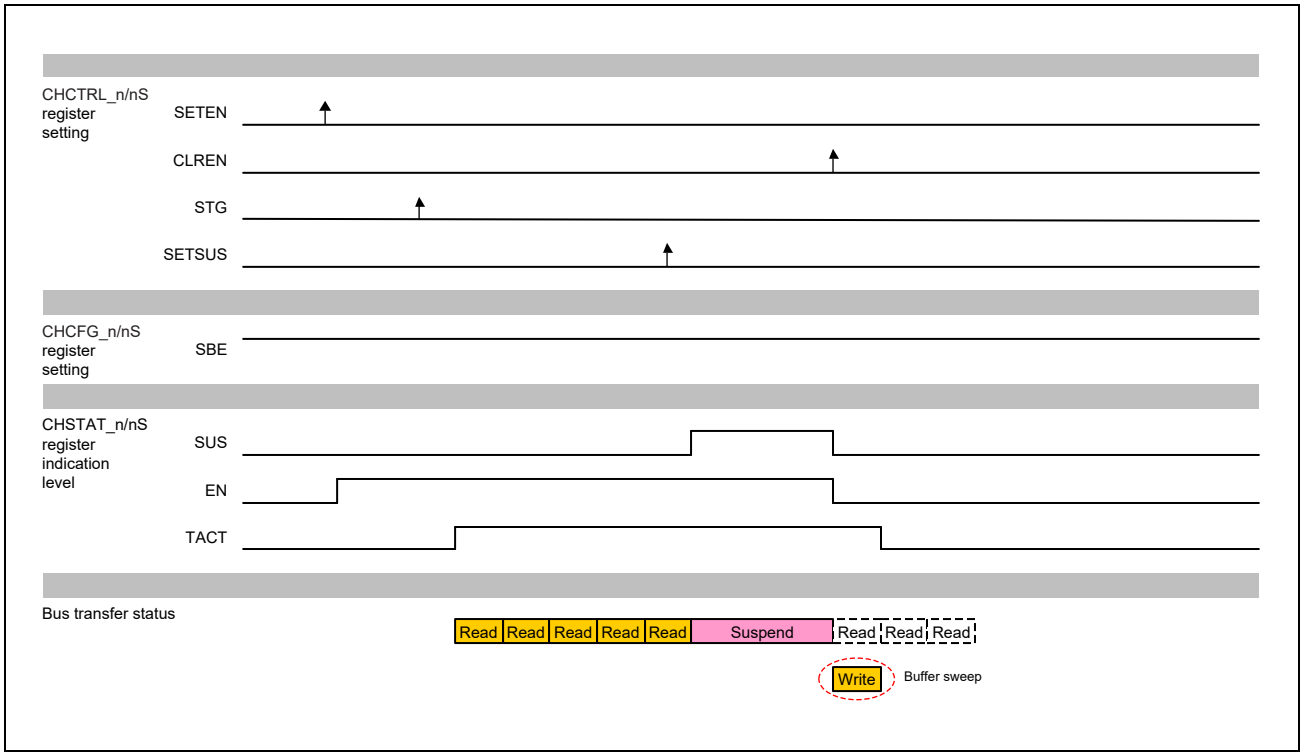

Figure 14.21 DMA Transfer Stop (Buffer Sweep Mode)

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If a transfer is stopped in sweep mode (SBE = 1) during the fifth read transfer by setting SETSUS and then CLREN, the read data is written before the DMA transfer is stopped.

### (c) Channel Stop Check Method

Even when the EN bit is cleared to 0, the DMA transfer cannot be stopped immediately, if the bus is already executing the transfer. Therefore, in order to make sure that the DMAC has been brought to a complete stop, check that the EN bit and TACT bit are both set to 0.

### (d) Transfer Stop Procedure

The transfer stop procedure is described below.

1. Set 1 in SETSUS of CHCTRL_n/nS.
2. Repeat polling until the SUS bit of CHSTAT_n/nS is set to 1. (If EN is already set to 0, the DMAC has already been stopped. Go to step 6.)
3. Set 1 in CLREN of CHCTRL_n/nS.

4. When 0 is set in SBE, the transfer is stopped according to the value of REQD. When 1 is set in SBE, the sweep mode is enabled. When 1 is set in SBE, set 0 in REQD.
5. Read CHSTAT_n/nS to check that 0 is set in the TACT bit. When TACT is set to 0, it means that the DMAC has been brought to a complete stop. When TACT is set to 1, repeat polling until this bit is set to 0.
6. To execute the next DMA transfer after stopping a transfer, be sure to set 1 in the SWRST (software reset) bit of CHCTRL_n/nS before the next DMA transfer starts.

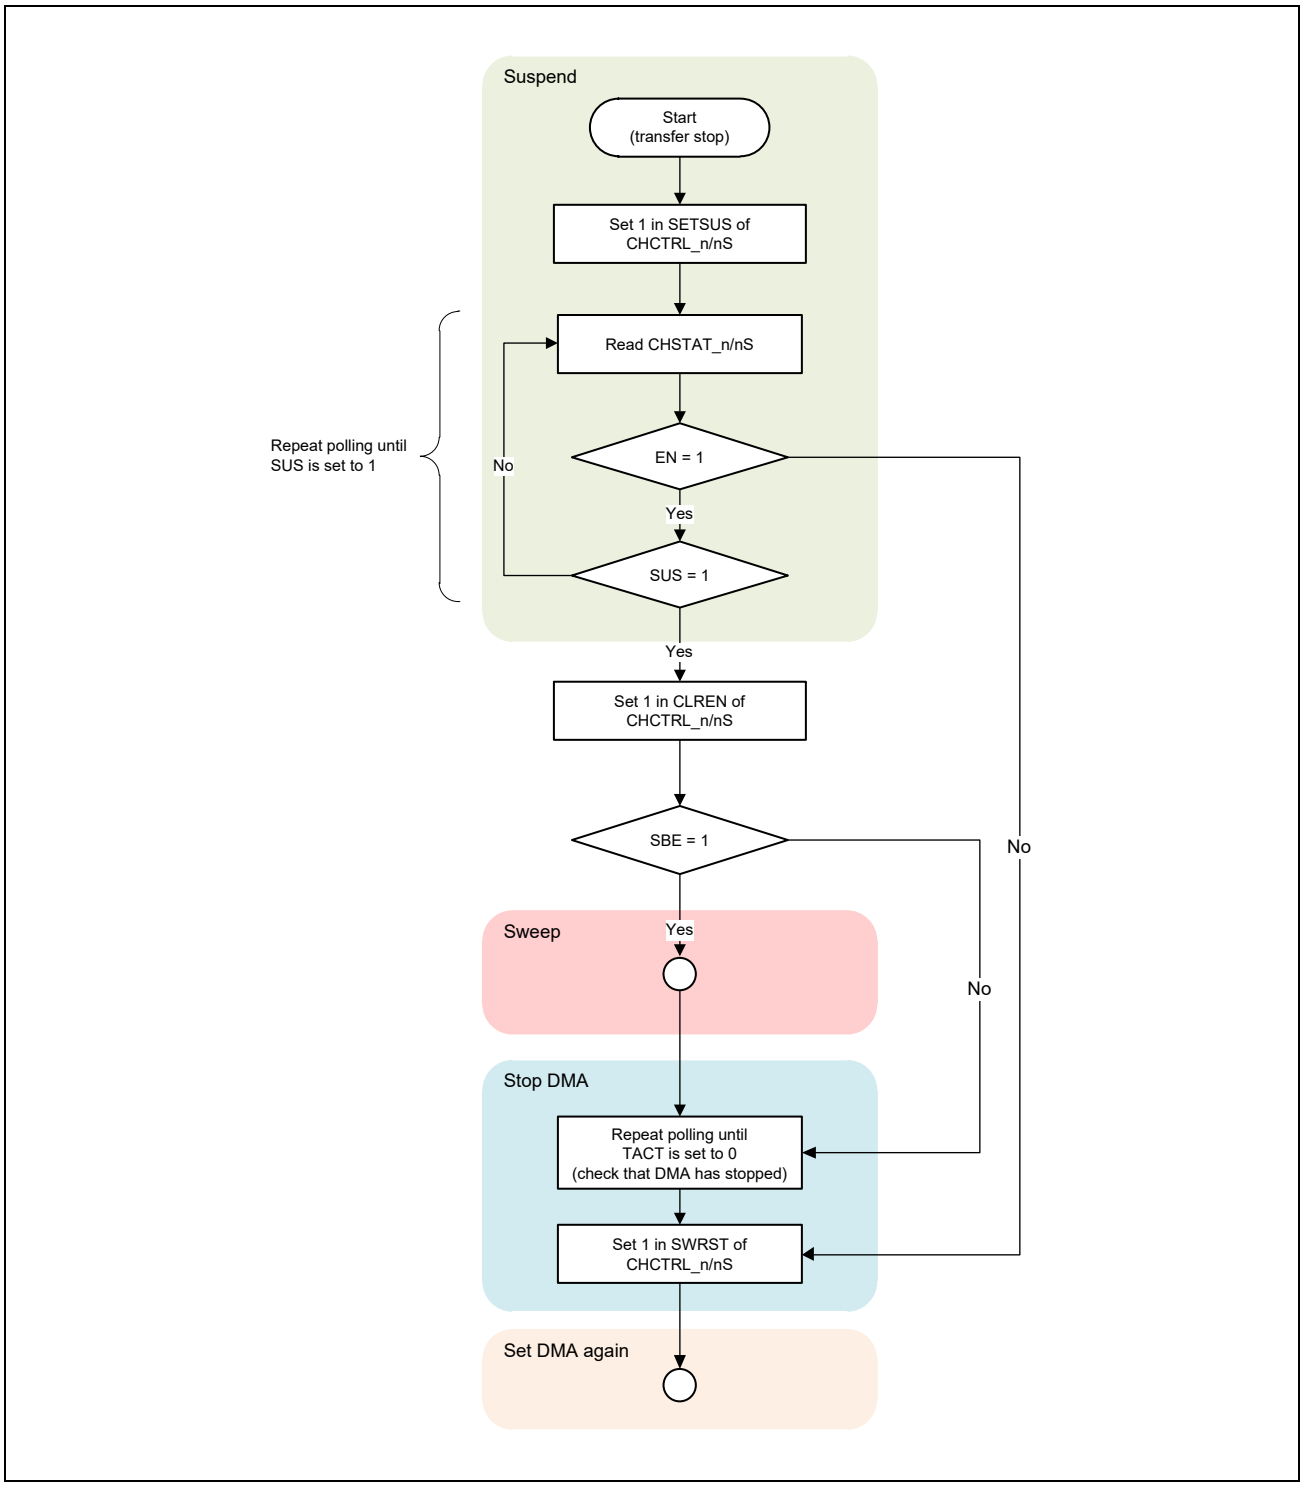

Figure 14.22 Transfer Stop Flow

## 14.8 DMA Setting Examples

Setting examples applicable when DMA transfer is executed using the direct memory access controller are shown in the following.

The transfer conditions for these setting examples are as follows.

Table 14.18 Transfer Condition List for DMA Transfer Setting Examples

| | DMA Mode | Transfer Mode | Transfer Request |
|---|---|---|---|
| Setting example 1 | Register | Single | Hardware |
| Setting example 2 | Register | Block | Software |
| Setting example 3 | Register (continuous execution) | Block | Software |
| Setting example 4 | Link | Block | Software |

For details of the settings, see the individual setting examples.

### 14.8.1 Setting Example 1 (Register Mode/Hardware Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.19 DMA Transfer Setting Example 1

| Item | | Description | |
|---|---|---|---|
| Channel used | | 3 | |
| DMA mode | | Register | |
| Transfer mode | | Single transfer | |
| Register set used | | Next0 | |
| Source/destination | | Source | Destination |
| | Start address | H’11110000 | H’22220000 |
| | Address direction | Increment | Increment |
| | Data size | 32 bits | 32 bits |
| DMA transfer byte count | | 64 bytes | |
| DMA transfer request | | Rising edge detection by hardware | |
| DMAACK signal | | Level output during read | |
| DMA transfer end interrupt mask | | Not masked | |
| CACHE setting | | Default value | |

#### Setting example 1

N0SA = H’11110000 (source address)
N0DA = H’22220000 (destination address)
N0TB = H’00000040 (transfer byte count)

CHCFG = H’00022123 (configuration)
CHITVL = H’00000000 (interval)
CHEXT = H’00000000 (CACHE setting)

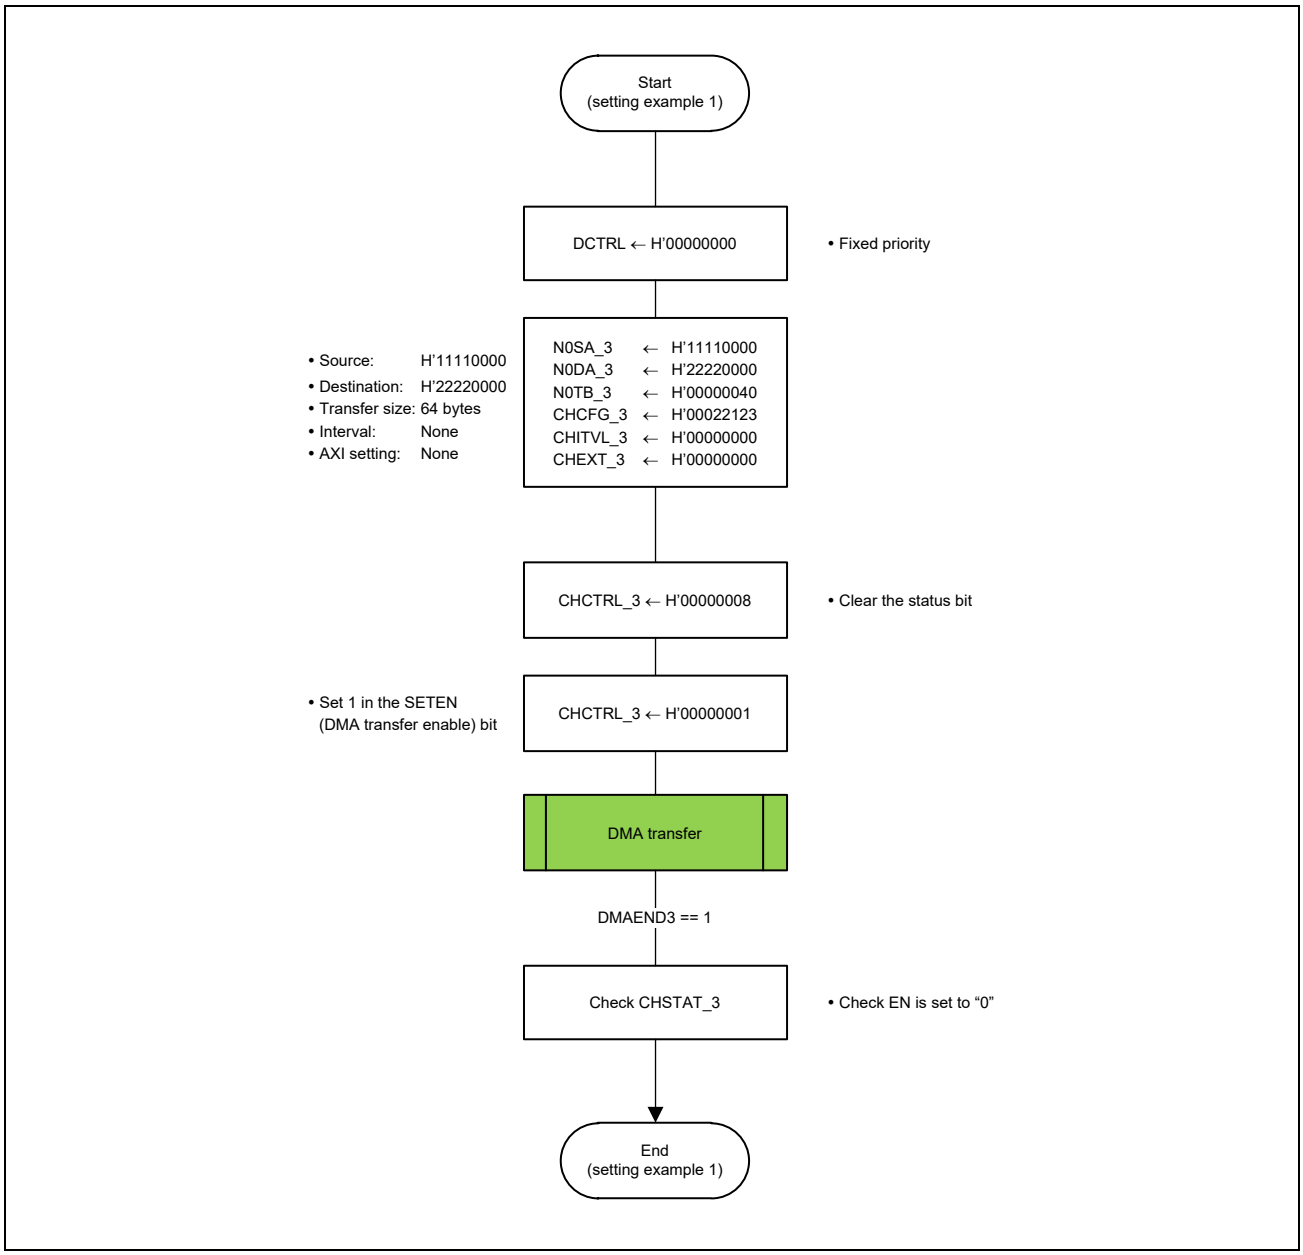

Figure 14.23 Setting Example 1

### 14.8.2 Setting Example 2 (Register Mode/Software Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.20 DMA Transfer Setting Example 2

| Item | | Description | |
|---|---|---|---|
| Channel used | | 2 | |
| Priority control | | Round robin | |
| DMA mode | | Register | |
| Transfer mode | | Block transfer | |
| Register set used | | Next1 | |
| Source/destination | | Source | Destination |
| | Start address | H'0FFFE000 | H'33330000 |
| | Address direction | Increment | Increment |
| | Data size | 8 bits | 256 bits |
| DMA transfer byte count | | 128 bytes | |
| DMA transfer request | | Auto request | |
| DMAACK signal | | Masked | |
| DMA transfer end interrupt mask | | Not masked | |
| CACHE setting | | Default value | |

**Setting example 2**

DCTRL = H'00000001 (DMA setting)

N1SA = H'0FFFE000 (source address)
N1DA = H'33330000 (destination address)
N1TB = H'00000080 (transfer byte count)

CHCFG = H'10450402 (configuration)
CHITVL = H'00000000 (interval)
CHEXT = H'00000000 (CACHE setting)

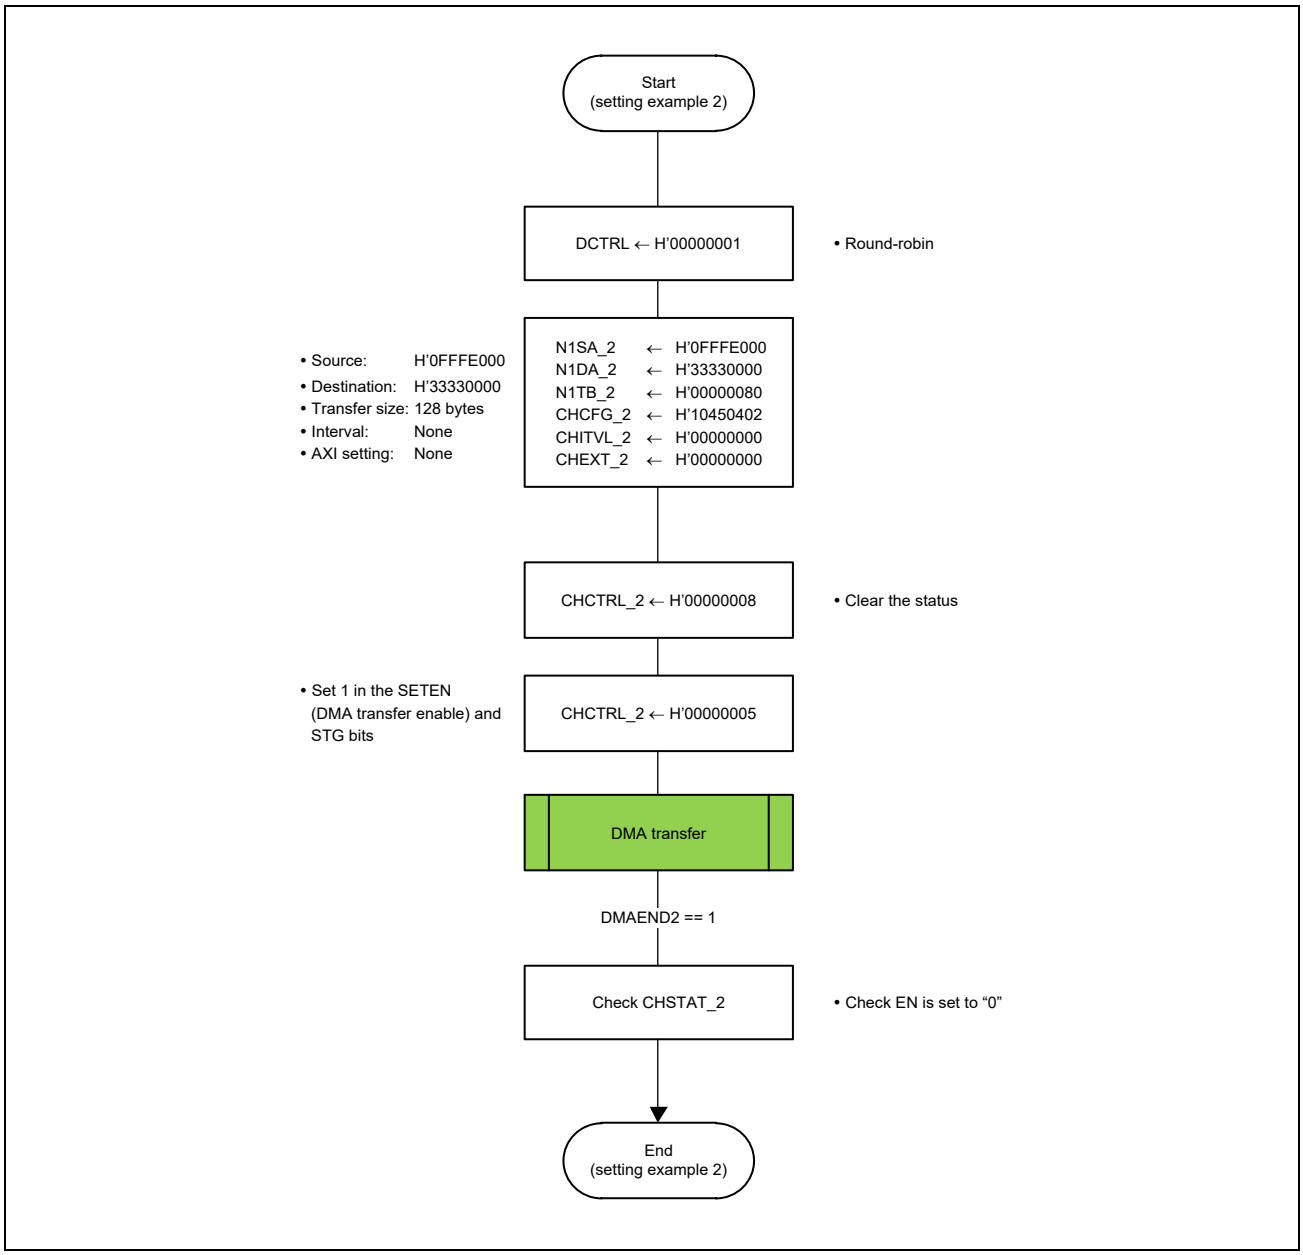

Figure 14.24 Setting Example 2

### 14.8.3 Setting Example 3 (Register Mode/Continuous Execution)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.21 DMA Transfer Setting Example 3

| Item | | Description | |
|---|---|---|---|
| Channel used | | 1 | |
| Priority control | | Round robin | |
| DMA mode | | Register | |
| Transfer mode | | Block transfer | |
| Register set used | | Use Next0 and then Next1 continuously | |
| Next0 | | Source | Destination |
| | Start address | H'11110000 | H'33330000 |
| | Address direction | Fixed | Fixed |
| | Data size | 32 bits | 512 bits |
| | DMA transfer byte count | 512 bytes | |
| Next1 | | Source | Destination |
| | Start address | H'22220000 | H'44440000 |
| | Address direction | Fixed | Fixed |
| | Data size | 32 bits | 512 bits |
| | DMA transfer byte count | 2048 bytes | |
| DMA transfer request | | Auto request | |
| DMAACK signal | | Not output | |
| DMA transfer end interrupt mask | | Mask the DMA transfer end interrupt upon completion of Next0 | |
| CACHE setting | | Default value | |

**Setting example 3**

DCTRL = H'00000001 (DMA setting)

N0SA = H'11110000 (source address)
N0DA = H'33330000 (destination address)
N0TB = H'00000200 (transfer byte count)

N1SA = H'22220000 (source address)
N1DA = H'44440000 (destination address)
N1TB = H'00000800 (transfer byte count)

CHCFG = H'61762001 (configuration)
CHITVL = H'00000000 (interval)
CHEXT = H'00000000 (CACHE setting)

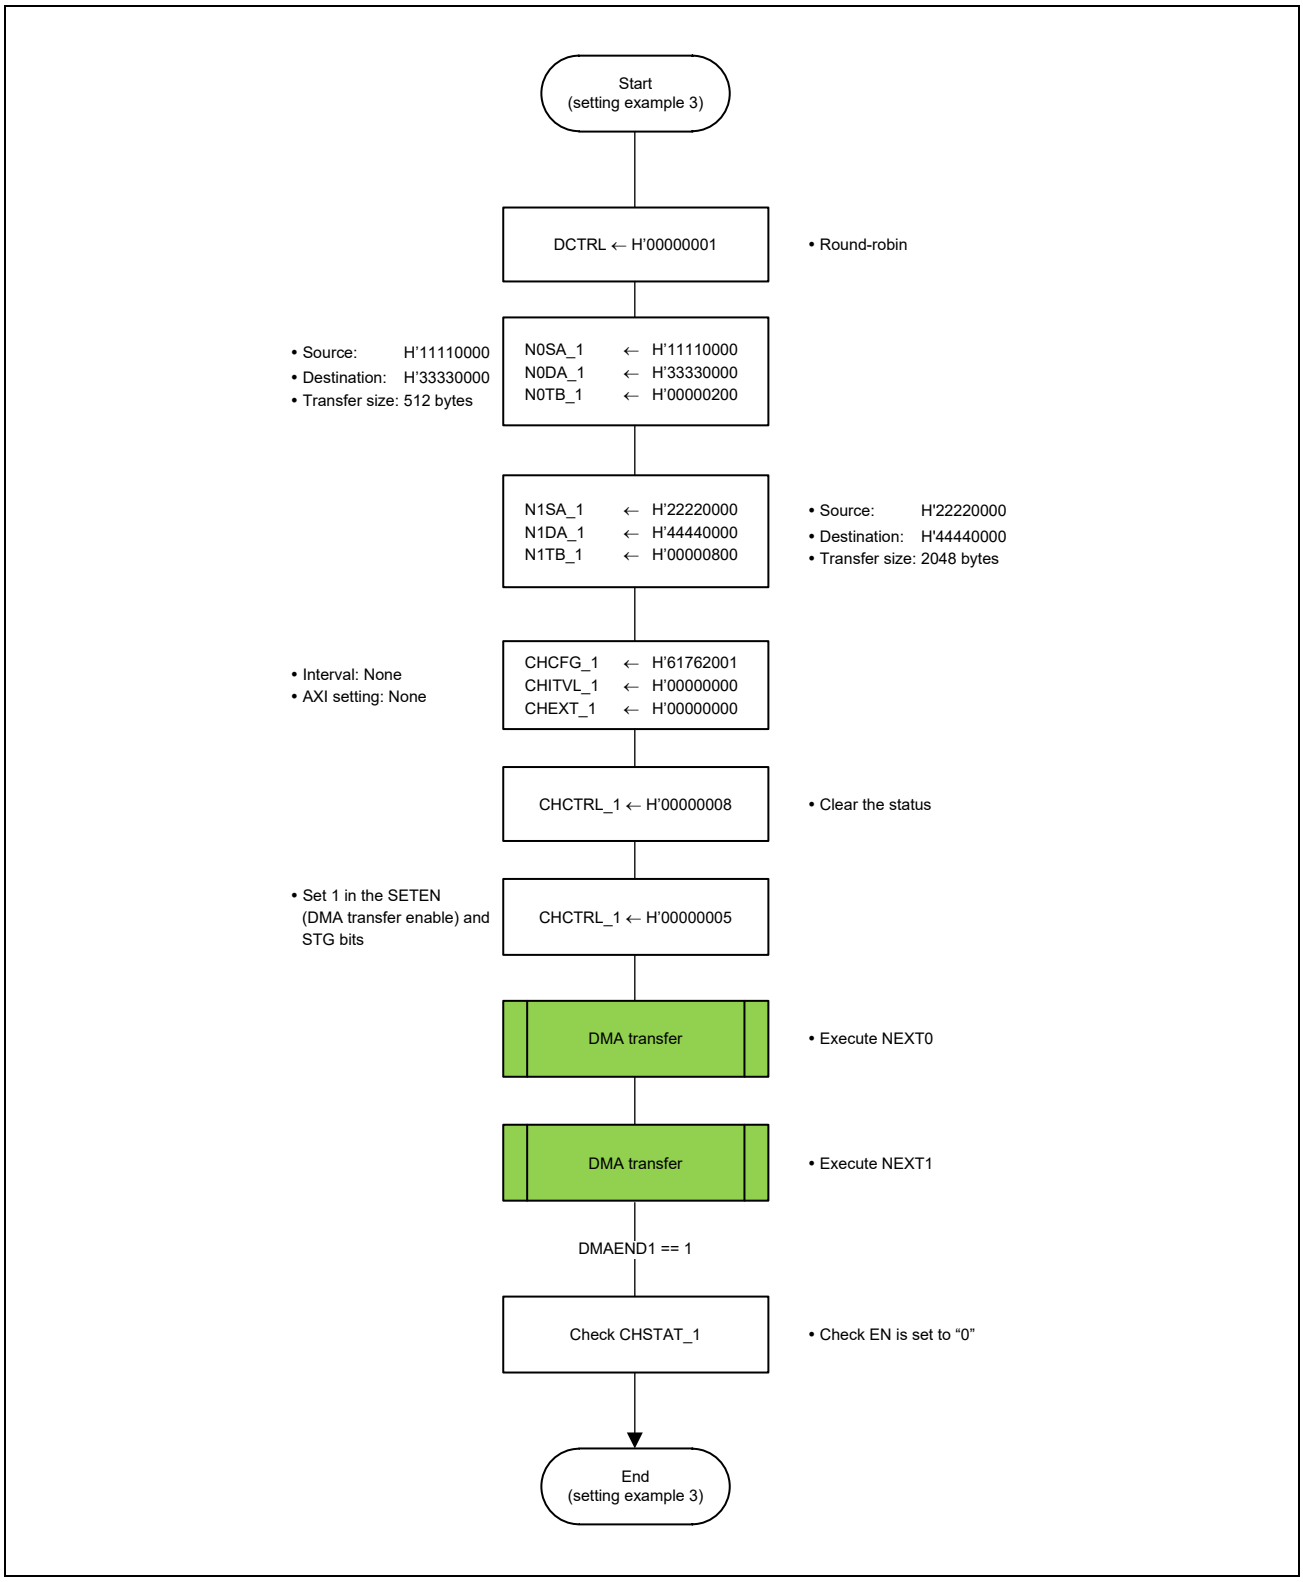

Figure 14.25 Setting Example 3

### 14.8.4 Setting Example 4 (Link Mode)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.22 DMA Transfer Setting Example 4

| Item | Description |
|---|---|
| Channel used | 0 |
| Priority control | Round robin |
| DMA mode | Link |
| Transfer mode | Block transfer |
| Register set used | — |
| Descriptor start address | H'00001000 |

| EXT (Extension) | H'00000000 | H'00000000 | H'00000000 |
| NXLA (Next Link Address) | H'00002000 | H'00005000 | H'00000000 |

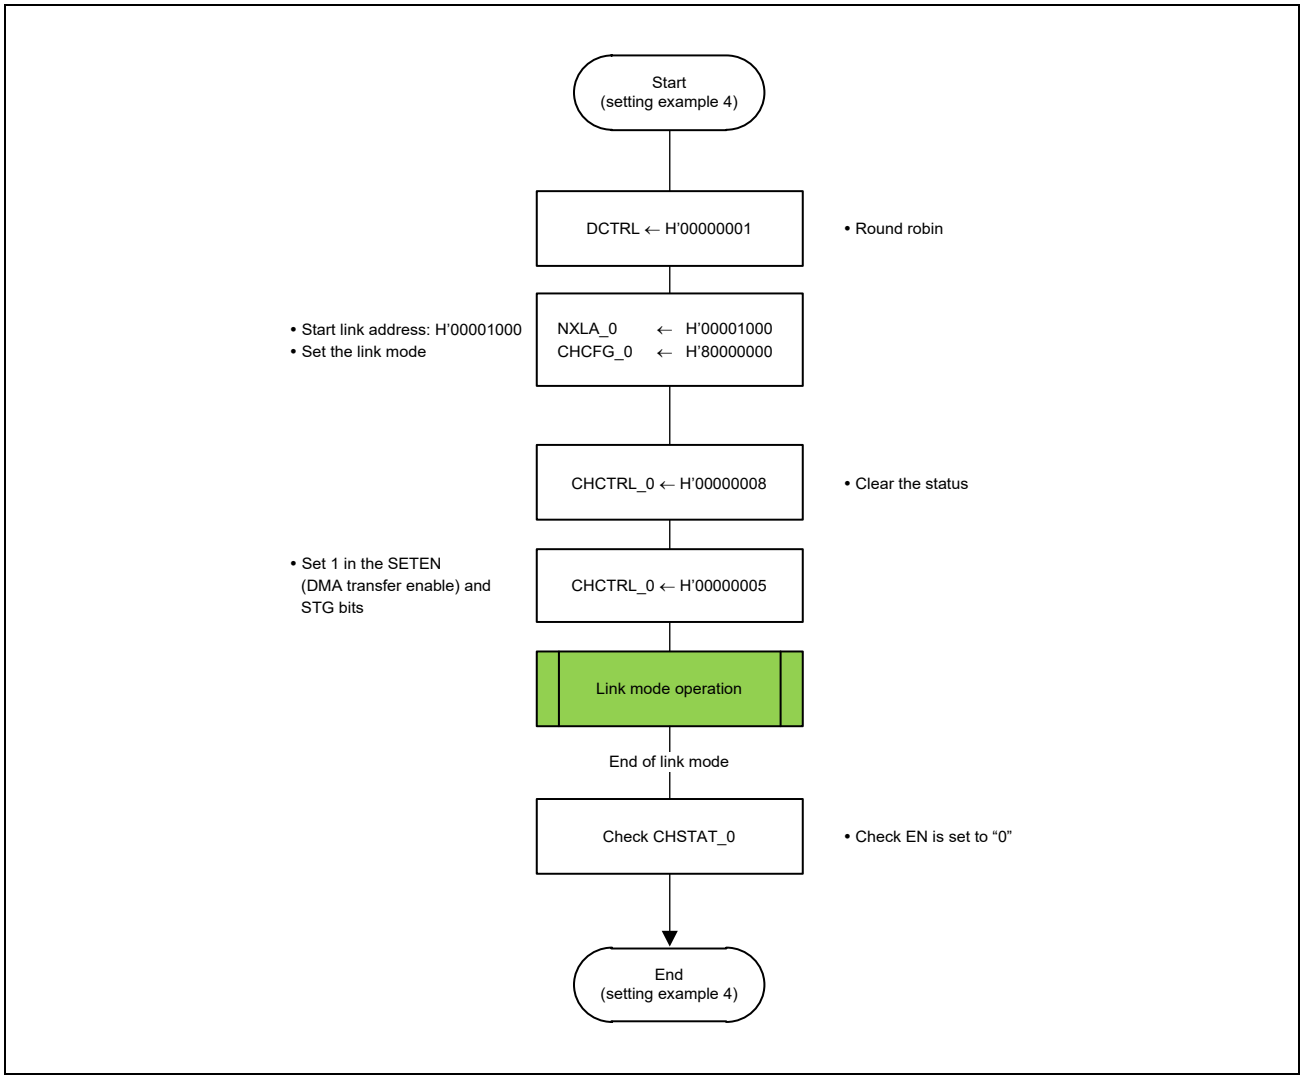

Figure 14.26 Setting Example 4

### 14.8.5 Next Register Set Continuous Execution Setting

The following figure shows the flowchart for executing DMA transfers continuously by using two Next register sets in register mode. While a DMA transaction is being executed using one Next register set, the other Next register set is set in order to continue to execute DMA transfers.

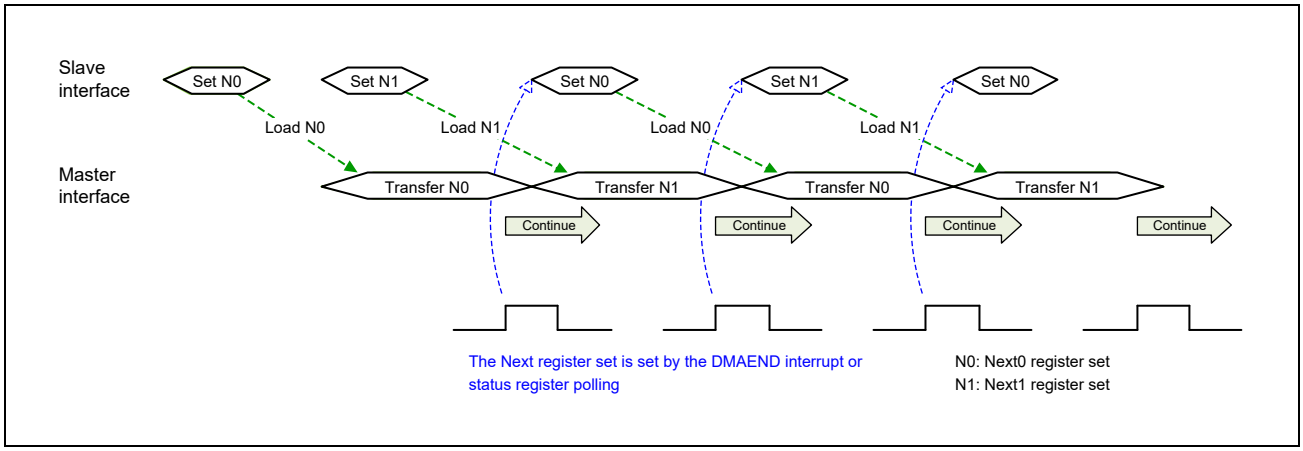

Figure 14.27 Image of Next Register Set Continuous Execution

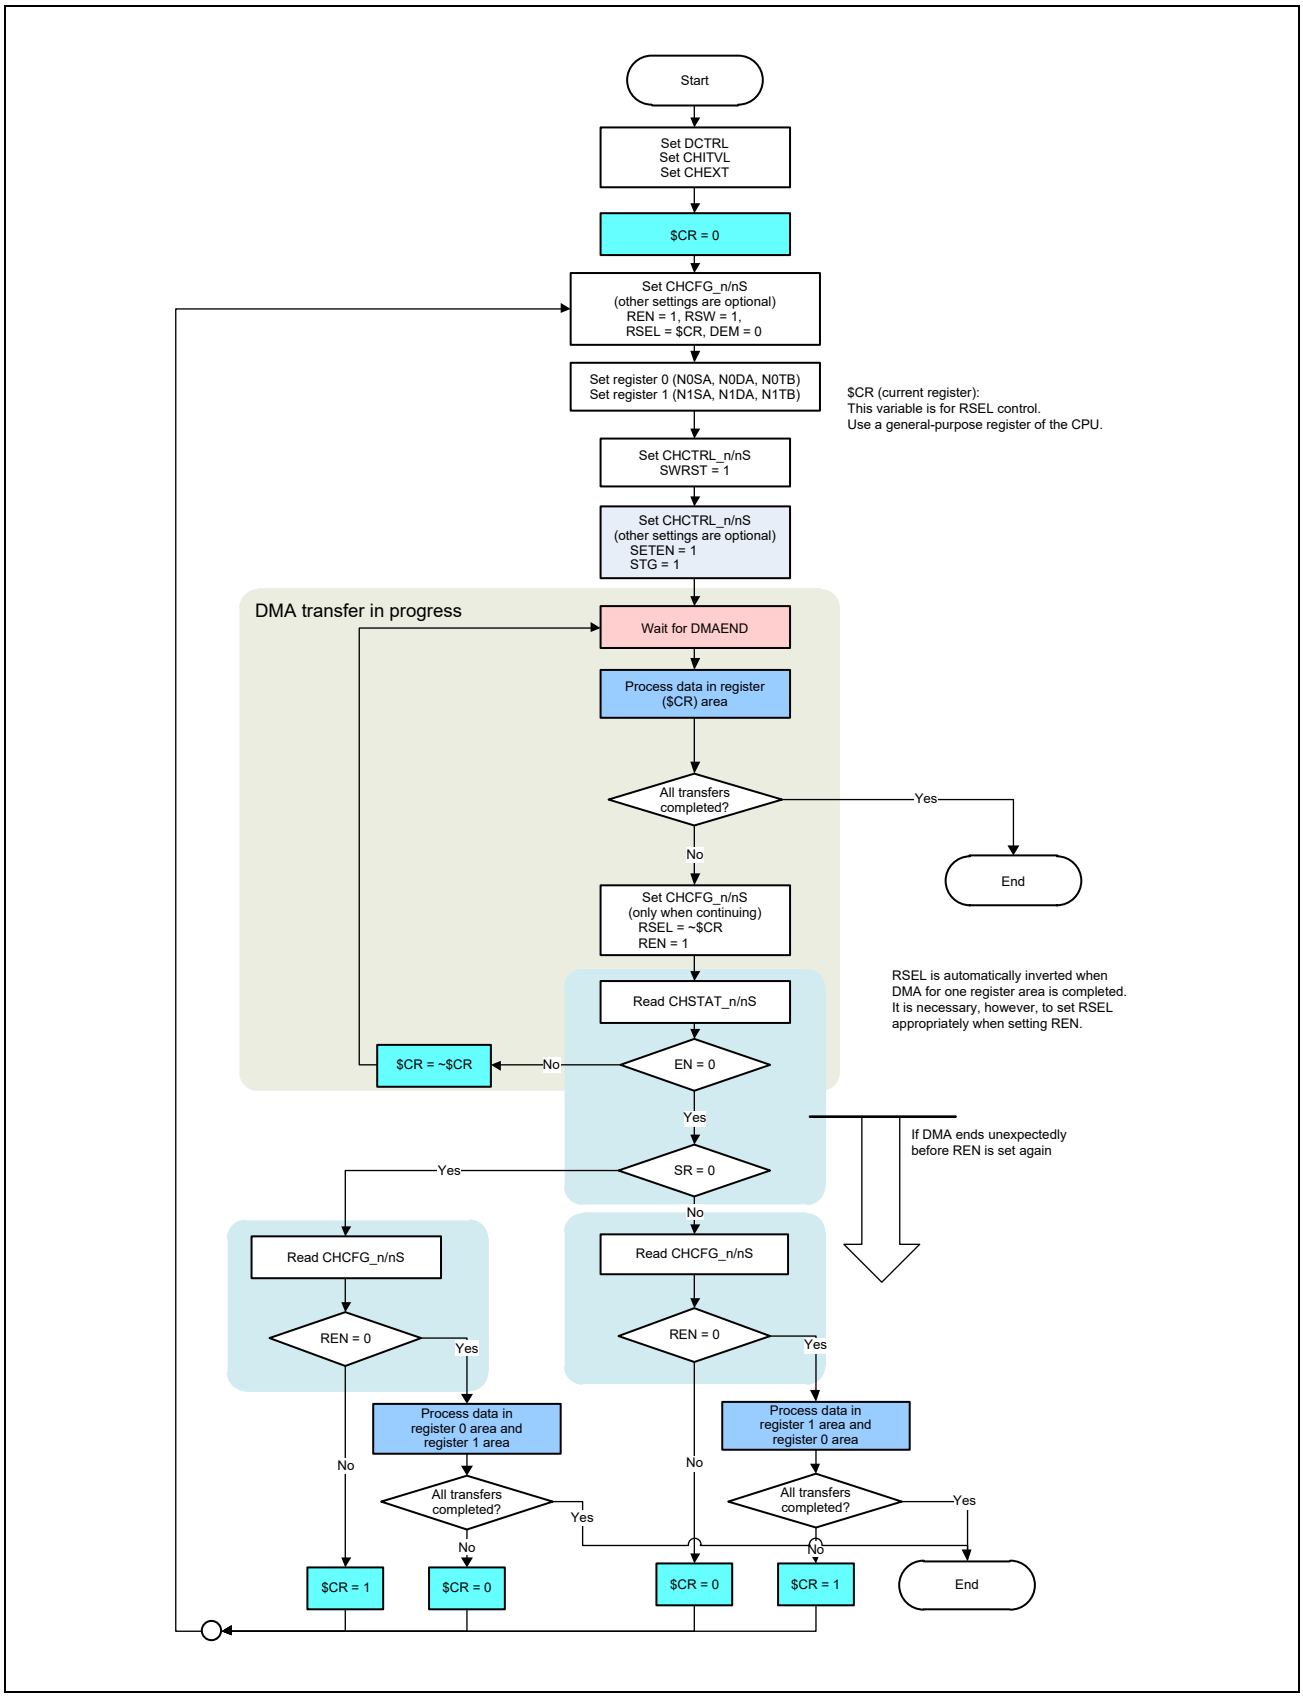

Figure 14.28 Example of Continuous DMA Execution by Using a Next Register Set

- Supplementary information

  First, save the data of the register sets to be used for DMA transfers (0 (N0SA, N0DA, and N0TB) and 1 (N1SA, N1DA, and N1TB)) to a general-purpose register of the CPU (the values of this register is referred to as $CR for the sake of convenience).

  Each time the DMA transfers for one register set are completed (the DMA transfer end interrupt is output), REN is automatically cleared to 0. In order to continue to execute DMA transfers, it is necessary to set REN of the CHCFG_n/nS register every time the DMA transfer end interrupt is asserted. This register also contains the RSEL bit, and the value of this bit needs to be set appropriately as well. Therefore, use $CR.

  In this mode, two Next register sets are executed continuously. However, if CLREN is not set before the DMA transaction is completed (the next DMA transfer end interrupt is output), continuous execution stops. In this case, how much of data has been transferred can be checked by reading the SR and EN bits of the CHSTAT_n/nS register and the REN bit of the CHCFG_n/nS register. To restart the DMA transaction, follow the flowchart shown above.

# 14.9 Points for Caution

## 14.9.1 Problem of the Interrupt Signal Overtaking DMA Transfer

### 14.9.1.1 Overview

This unit asserts the DMAINT interrupt signal on completion of transfer and this serves as a trigger for the CPU to start processing the data.

However, in cases such as where the device for writing is on another bus, the final data to be written may not yet have reached the device for writing at the time the DMAINT interrupt signal is asserted.

If the CPU accesses a device that has detected the DMAINT interrupt signal before the final data of the DMA transaction have been written to the device, it may be using some old data from before the writing.

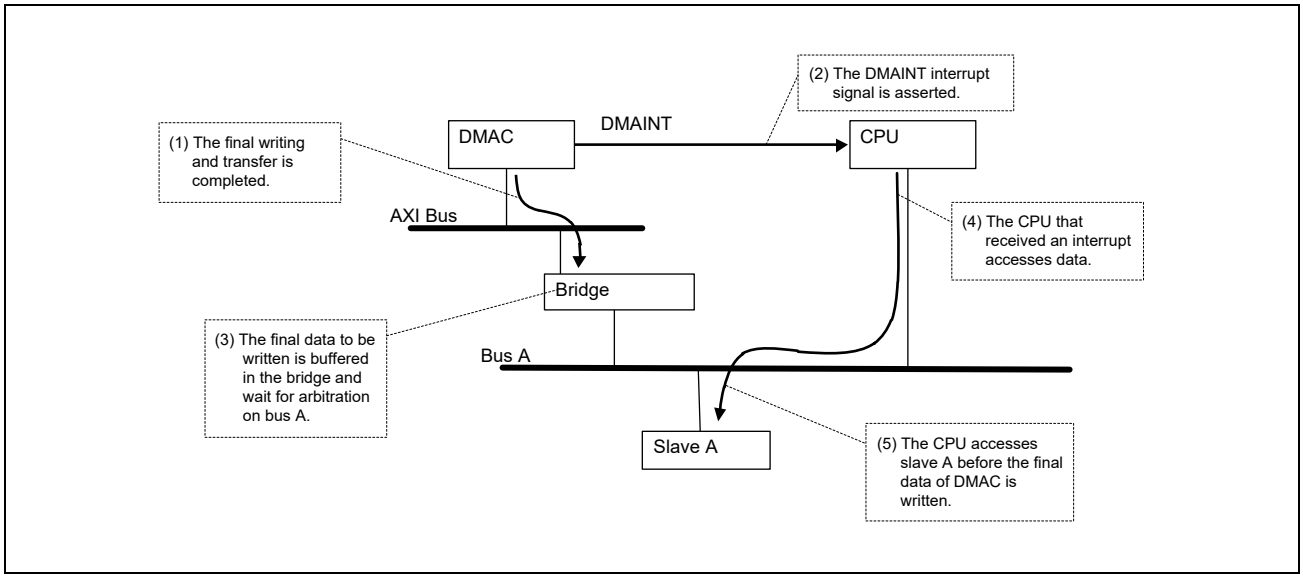

Figure 14.29 Example when Access by the CPU Overtakes Writing of the Final Data by the DMAC

### 14.9.1.2 Workaround

The following describes workaround for the above problems.

#### Setting AWCACHE as non-bufferable

Set the AWCACHE signal as non-bufferable for DMA transactions. By doing this, the above problems can be avoided because the DMAINT interrupt signal will only be asserted after the completion of writing to the device for access.

Setting all transfers to non-bufferable may reduce the efficiency of transfer. In such cases, divide up the register sets or descriptors by setting most of the transactions to bufferable for transfer, and then set only the last transfer to non-bufferable.

*Exception*)

The effect is not obtained if the device in the access path does not refer to AWCACHE.

# 15. System Counter (SYC)

SYC generates the count value used by the generic timer built into Cortex-A55.

It uses the Timestamp generator, which is one of the components of Arm CoreSight SoC-400, to generate a 64-bit count value. For more information on the Timestamp generator, please refer to *the ARM CoreSight SoC-400 Technical Reference Manual*.

## 15.1 Overview

### 15.1.1 Features

- Count by 24 MHz clock (SYC_CNT_CLK)

- 64 bit gray code counter value generation
  - Convert the value generated by Timestamp generator to Gray code and output

- Access control
  - Access control for the two interfaces of the Timestamp generator
  - Control secure access/non-secure access

- Halt on Debug function
  - Counting can be stopped/restarted during debugging according to request from CoreSight

### 15.1.2 Block Diagram of SYC

The SYC connection diagram is shown in **Figure 15.1** and the SYC block diagram is shown in **Figure 15.2**.

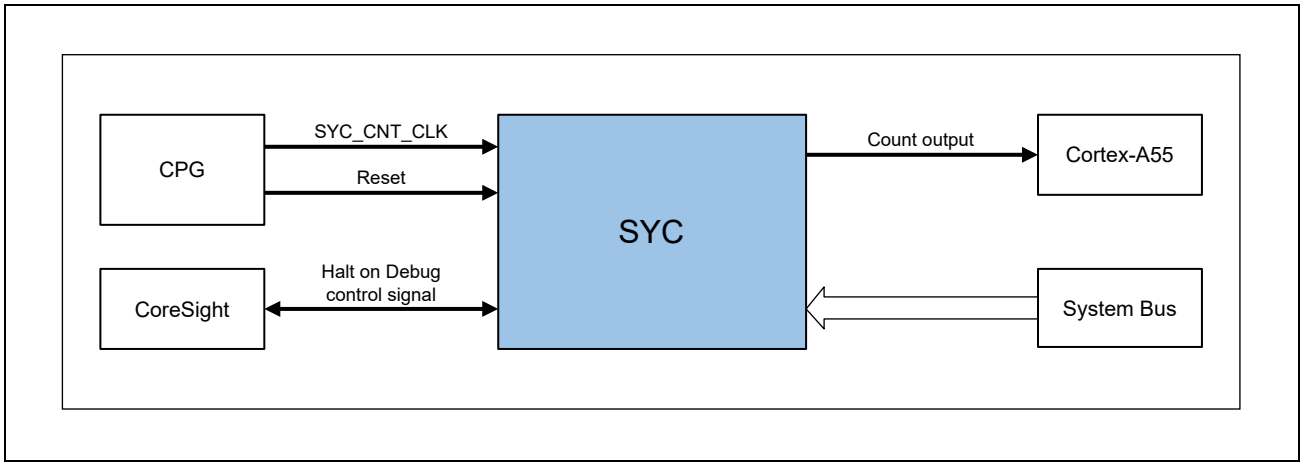

Figure 15.1 SYC Connection Diagram

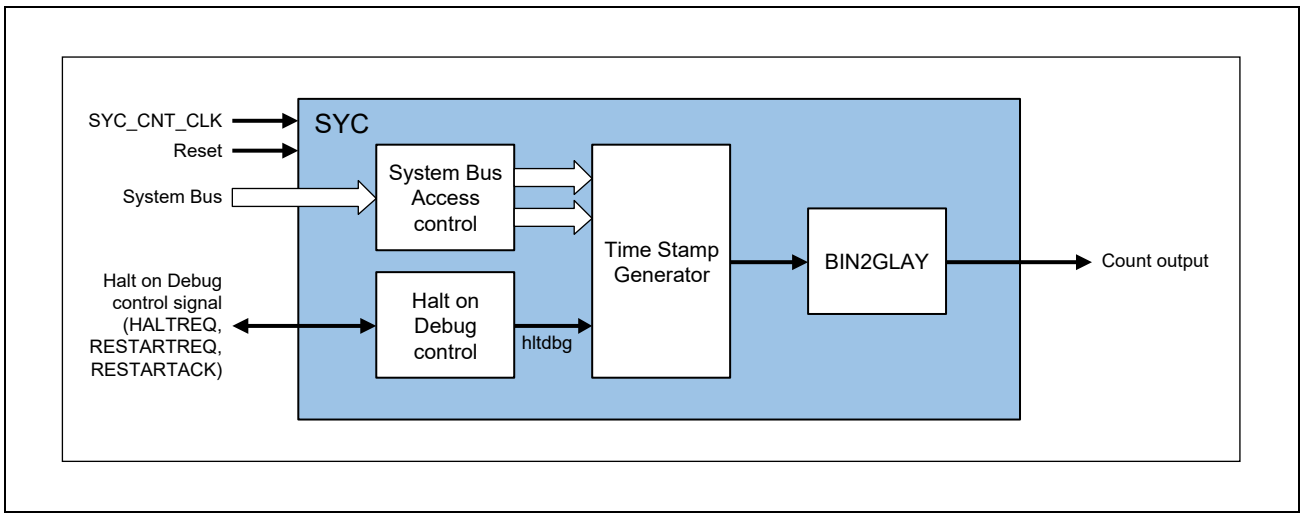

Figure 15.2 SYC Block Diagram

## 15.2 Address Space

**Table 15.1** shows the SYC address space. SYC has an address space of 8 KB. The SYC address space is offset from the base address. The base address of SYC is as follows.

SYC base address: H'0_1100_0000 (Overall Address Space)
SYC base address: H'5100_0000 (Cortex-M33 Address Space Secure)
SYC base address: H'4100_0000 (Cortex-M33 Address Space Non-Secure)

Table 15.1 SYC Address Space

| Offset Address | Region Name | Access Target |
|---|---|---|
| H'0000 to H'0FFF | PSELCTRL region | PSELCTRL region & PSELCTRL region Management registers |
| H'1000 to H'1FFF | PSELREAD region | PSELREAD region & PSELREAD region Management registers |

**Note:** Secure access and non-secure access are possible for the PSELCTRL region and PSELREAD region.

## 15.3 Register Descriptions

For more information on SYC registers, please refer ARM CoreSight SoC-400 Technical Reference Manual 3.10 Timestamp generator.

## 15.4 Operation

### 15.4.1 System Bus Access Control

Access control from one system bus interface of SYC to two APB interfaces of Timestamp Generator is performed.

Controls so that the PSELCTRL area can be accessed when accessing the first half 4 KB of the 8 KB address area of SYC, and the PSELREAD area can be accessed when accessing the latter 4 KB.

The PSELCTRL area and PSELREAD area accept secure access and non-secure access.

### 15.4.2 Halt on Debug Function

SYC supports the Halt on Debug function included in Timestamp Generator. When HALTREQ is asserted from CoreSight, the counting operation of Timestamp Generator is stopped.

When RESTARTREQ is asserted from CoreSight, the counting operation of Timestamp Generator is restarted.

HALTREQ and RESTARTREQ are controlled by CoreSight's CTI (Cross Trigger Interface).

# 16. Multi-Function Timer Pulse Unit 3 (MTU3a)

## 16.1 Overview

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3a), consisting of eight 16-bit timer channels and one 32- bit timer channel.

**Table 16.1** shows the specifications of the MTU and **Table 16.2** lists the functions of the MTU. **Figure 16.1** and **Figure 16.2** are block diagrams of the MTU.

Table 16.1 MTU Specifications (1/2)

| Item | Description |
|---|---|
| Pulse input/output | 28 lines max. |
| Pulse input | 3 lines |
| Count clock | 11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU2, and 10 clocks for MTU5, four clocks for MTU1-MTU2 combination (when LWA = 1)) |
| Operating frequency | Up to 100 MHz |
| Available operations | [MTU0 to MTU4, MTU6, MTU7, and MTU8]<br>• Waveform output on compare match<br>• Input capture function (noise filter setting available)<br>• Counter-clearing operation<br>• Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8)<br>• Simultaneous clearing on compare match or input capture (excluding MTU8)<br>• Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8)<br>• Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8) |
| | [MTU0 MTU3, MTU4, MTU6, MTU7, and MTU8]<br>• Buffer operation specifiable |
| | [MTU1, MTU2]<br>• Phase counting mode can be specified independently<br>• 32-bit phase counting mode can be specified for interlocked operation of MTU1 and MTU2 (when TMDR3.LWA = 1)<br>• Cascade connection operation available |
| | [MTU3, MTU4, MTU6, and MTU7]<br>• Through interlocked operation of MTU3/4 and MTU6/7, the positive and negative signals in six phases (12 phases in total) can be output in complementary PWM and reset-synchronized PWM operation.<br>• In complementary PWM mode, values can be transferred from buffer registers to temporary registers at crests and troughs of the timer-counter values or when the buffer registers (TGRD registers in MTU4 and MTU7) are written to.<br>• Double-buffering selectable in complementary PWM mode |
| | [MTU3 and MTU4]<br>• Through interlocking with MTU0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset-synchronized PWM output is settable and allows the selection of two types of waveform output (chopping or level) |
| | [MTU5]<br>• Capable of operation as a dead-time compensation counter |
| | [MTU0/MTU5, MTU1, MTU2, and MTU8]<br>32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8 |
| Interrupt-skipping function | • In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped |
| Interrupt sources | 43 sources |
| Buffer operation | Automatic transfer of register data (transfer from the buffer register to the timer register) |

Table 16.1 MTU Specifications (2/2)

| Item | Description |
|---|---|
| Trigger generation | A/D converter start triggers can be generated |
| | A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output |
| Low power consumption function | The MTU3a can be placed in the module-stop state. |

| Interrupt skipping 2 | — | — | — | — | — | • Skipping in compare count between TADCORA and TCNT, and TADCORB and TCNT | — | — | • Skipping in compare count between TADCORA and TCNT, and TADCORB and TCNT | — |

**Remarks:** ✓: Possible —: Not possible

Note 1. When LWA is 1, the TGRALW capture source can be selected from either of the following: an input from MTIOC1A or MTU0.TGRA compare match/input capture event.
The TGRBLW capture source can be selected from any of the following: an input from MTIOC1B, MTU0.TGRC compare match/ input capture event, or MTU8.TGRC compare match event.

Note 2. Capture in MTU8 is supported only in normal mode.

Note 3. The underflow interrupt source is valid only in complementary PWM mode.

## 16.2 Register Descriptions

**Table 16.4** shows the register configuration. The MTU address space is offset from the base address. The base address of MTU is as follows.

MTU base address: H'0_1000_0000 (Overall Address Space)

MTU base address: H'5000_0000 (Cortex-M33 Address Space Secure)

MTU base address: H'4000_0000 (Cortex-M33 Address Space Non-Secure)

Table 16.4 Register configuration (1/5)

| Channel | Register Name | Abbreviation | Address | Access size |
|---|---|---|---|---|
| MTU0 | Timer control register | TCR | H'1300 | 8 |
| | Timer mode register 1 | TMDR1 | H'1301 | 8 |

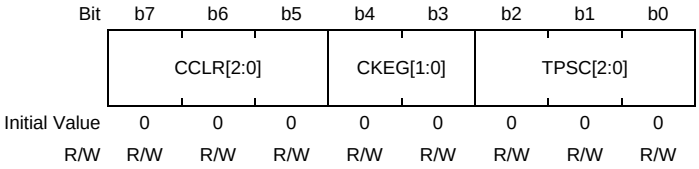
## 16.2.1 Timer Control Register (TCR)

### (1) MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, MTU8.TCR

**Address(es):** MTU0.TCR H'0_1000_1300, MTU1.TCR H'0_1000_1380, MTU2.TCR H'0_1000_1400, MTU3.TCR H'0_1000_1200, MTU4.TCR H'0_1000_1201, MTU6.TCR H'0_1000_1A00, MTU7.TCR H'0_1000_1A01, MTU8.TCR H'0_1000_1600



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TPSC[2:0] | All 0 | R/W | Time Prescaler Select<br>See **Table 16.7** to **Table 16.10**. |
| b4, b3 | CKEG[1:0] | All 0 | R/W | Clock Edge Select<br>b4 b3<br>0 0: Count at rising edge<br>0 1: Count at falling edge<br>1 x: Count at both edges |
| b7 to b5 | CCLR[2:0] | All 0 | R/W | Counter Clear Source Select<br>See **Table 16.5** and **Table 16.6**. |

**Remarks:** x: Don't care

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCRU, TCRV, and TCRW) for MTU5. TCR values should be specified only while TCNT operation is stopped.

#### TPSC[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See **Table 16.7** to **Table 16.10** for details.

#### CKEG[1:0] Bits (Clock Edge Select)

These bits select the count clock source edge, including the MTIOC1A pin. When the internal clock is counted at both edges, the count clock period is halved (e.g. P0ϕ/4 at both edges = P0ϕ/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the count clock source is P0ϕ/2 or slower. When P0ϕ/1 or the overflow/underflow in another channel is selected for the count clock source, a value can be written to these bits but counter operation compiles with the initial value.

#### CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See **Table 16.5** and **Table 16.6** for details.

Table 16.5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8)

| Channel | Bit 7 CCLR2 | Bit 6 CCLR1 | Bit 5 CCLR0 | Description |
|---|---|---|---|---|
| MTU0 MTU3 MTU4 MTU6 MTU7 MTU8 | 0 | 0 | 0 | TCNT clearing disabled |
| | 0 | 0 | 1 | TCNT cleared by TGRA compare match/input capture |
| | 0 | 1 | 0 | TCNT cleared by TGRB compare match/input capture |
| | 0 | 1 | 1 | TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1 |
| | 1 | 0 | 0 | TCNT clearing disabled |
| | 1 | 0 | 1 | TCNT cleared by TGRC compare match/input capture*2 |
| | 1 | 1 | 0 | TCNT cleared by TGRD compare match/input capture*2 |
| | 1 | 1 | 1 | TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1 |

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1 except for MTU8.

Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 16.6 CCLR[2:0] (MTU1 and MTU2)

| Channel | Bit 7 Reserved*2 | Bit 6 CCLR1 | Bit 5 CCLR0 | Description |
|---|---|---|---|---|
| MTU1 MTU2 | 0 | 0 | 0 | TCNT clearing disabled |
| | 0 | 0 | 1 | TCNT cleared by TGRA compare match/input capture |
| | 0 | 1 | 0 | TCNT cleared by TGRB compare match/input capture |
| | 0 | 1 | 1 | TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1 |

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1.

Note 2. Bit 7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

### (2) MTU5.TCRU, MTU5.TCRV, MTU5.TCRW

**Address(es):** MTU5.TCRU H'0_1000_1C84, MTU5.TCRV H'0_1000_1C94, MTU5.TCRW H'0_1000_1CA4

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TPSC[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | TPSC[1:0] | All 0 | R/W | Time Prescaler Select<br>See **Table 16.11**. |
| b7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

#### TPSC[1:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See **Table 16.11** for details.

## 16.2.2 Timer Control Register 2 (TCR2)

### (1) MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, MTU8.TCR2

**Address(es):** MTU0.TCR2 H'0_1000_1328, MTU3.TCR2 H'0_1000_124C, MTU4.TCR2 H'0_1000_124D, MTU6.TCR2 H'0_1000_1A4C, MTU7.TCR2 H'0_1000_1A4D, MTU8.TCR2 H'0_1000_1606

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TPSC2[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (2) MTU1.TCR2, MTU2.TCR2

**Address(es):** MTU1.TCR2 H'0_1000_1394, MTU2.TCR2 H'0_1000_140C

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | PCB[1:0] | | TPSC2[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TPSC2[2:0] | All 0 | R/W | Time Prescaler Select<br>See **Table 16.7** to **Table 16.10**. |
| b4, b3 | PCB[1:0] | All 0 | R/W | Phase Counting Mode Function Expansion Control<br>Functional Expansion Control for Phase Counting Modes 2, 3, and 5 |
| b7 to b5 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. The MTU has a total of 11 TCR2 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCR2U, TCR2V, and TCR2W) for MTU5. TCR2 values should be specified only while TCNT operation is stopped.

#### TPSC2[2:0] Bits (Time Prescaler Select)

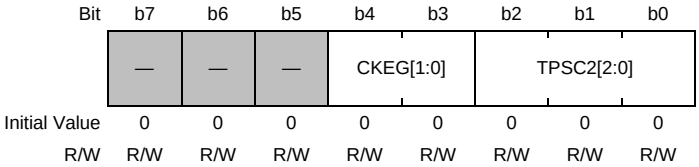
These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See **Table 16.7** to **Table 16.10** for details.

#### PCB[1:0] Bits (Phase Counting Mode Function Expansion Control)

These bits control extended functions for phase counting mode 2, 3, and 5 in MTU1 and MTU2. See **Section 16.3.6, Phase Counting Mode**.

### (3) MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W

**Address(es):** MTU5.TCR2U H'0_1000_1C85, MTU5.TCR2V H'0_1000_1C95, MTU5.TCR2W H'0_1000_1CA5



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TPSC2[2:0] | All 0 | R/W | Time Prescaler Select<br>See **Table 16.11**. |
| b4, b3 | CKEG[1:0] | All 0 | R/W | Clock Edge Select<br>b4 b3<br>0 0: Counts at the rising edge.<br>0 1: Counts at the falling edge.<br>1 x: Counts at both edges. |
| b7 to b5 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

**Remarks:** x: Don't care

#### TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See **Table 16.11** for details.

#### CKEG[1:0] Bits (Clock Edge Select)

These bits select the edge of the count clock source signal output from the MTIOC1A pin.

Table 16.7 TPSC[2:0], TPSC2[2:0] (MTU0)

| | TCR2[2:0] | | | TCR[2:0] | | | |
|---|---|---|---|---|---|---|---|
| | Bit 2 | Bit 1 | Bit 0 | Bit 2 | Bit 1 | Bit 0 | |
| Channel | TPSC22 | TPSC21 | TPSC20 | TPSC2 | TPSC1 | TPSC0 | Description |
| MTU0 | 0 | 0 | 0 | 0 | 0 | 0 | Internal clock: counts on P0ϕ/1 |
| | 0 | 0 | 0 | 0 | 0 | 1 | Internal clock: counts on P0ϕ/4 |
| | 0 | 0 | 0 | 0 | 1 | 0 | Internal clock: counts on P0ϕ/16 |
| | 0 | 0 | 0 | 0 | 1 | 1 | Internal clock: counts on P0ϕ/64 |
| | 0 | 0 | 0 | 1 | 0 | 0 | External clock: counts on MTCLKA pin input |

## 16.2.3 Timer Mode Register 1 (TMDR1)

### (1) MTU0.TMDR1

**Address(es):** MTU0.TMDR1 H'0_1000_1301

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | BFE | BFB | BFA | MD[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (2) MTU1.TMDR1, MTU2.TMDR1

**Address(es):** MTU1.TMDR1 H'0_1000_1381, MTU2.TMDR1 H'0_1000_1401

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MD[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (3) MTU3.TMDR1, MTU4.TMDR1, MTU6.TMDR1, MTU7.TMDR1, MTU8.TMDR1

**Address(es):** MTU3.TMDR1 H'0_1000_1202, MTU4.TMDR1 H'0_1000_1203, MTU6.TMDR1 H'0_1000_1A02, MTU7.TMDR1 H'0_1000_1A03, MTU8.TMDR1 H'0_1000_1601

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | BFB | BFA | MD[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b3 to b0 | MD[3:0] | All 0 | R/W | Mode Select<br>These bits specify the timer operating mode. See **Table 16.12** for details. |
| b4 | BFA | 0 | R/W | Buffer Operation A<br>0: TGRA and TGRC operate normally<br>1: TGRA and TGRC used together for buffer operation |
| b5 | BFB | 0 | R/W | Buffer Operation B<br>0: TGRB and TGRD operate normally<br>1: TGRB and TGRD used together for buffer operation |
| b6 | BFE | 0 | R/W | Buffer Operation E<br>0: MTU0.TGRE and MTU0.TGRF operate normally<br>1: MTU0.TGRE and MTU0.TGRF used together for buffer operation |
| b7 | — | 0 | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

Table 16.12 Operating Mode Setting by MD[3:0] Bits (MTU0 to MTU4, MTU6 to MTU8)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | | MTU0 | MTU1 | MTU2 | MTU1 & MTU2 (LWA = 1) | MTU3 | MTU4 | MTU6 | MTU7 | MTU8 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| MD3 | MD2 | MD1 | MD0 | Description | | | | | | | | | |
| 0 | 0 | 0 | 0 | Normal mode | ✓ | ✓ | ✓ | | ✓ | ✓ | ✓ | ✓ | ✓ |
| 0 | 0 | 0 | 1 | Setting prohibited | | | | | | | | | |
| 0 | 0 | 1 | 0 | PWM mode 1 | ✓ | ✓ | ✓ | | ✓ | ✓ | ✓ | ✓ | |
| 0 | 0 | 1 | 1 | PWM mode 2 | ✓ | ✓ | ✓ | | | | | | |
| 0 | 1 | 0 | 0 | Phase counting mode 1 | | ✓ | ✓ | ✓ | | | | | |
| 0 | 1 | 0 | 1 | Phase counting mode 2 | | ✓ | ✓ | ✓ | | | | | |
| 0 | 1 | 1 | 0 | Phase counting mode 3 | | ✓ | ✓ | ✓ | | | | | |
| 0 | 1 | 1 | 1 | Phase counting mode 4 | | ✓ | ✓ | ✓ | | | | | |
| 1 | 0 | 0 | 0 | Reset-synchronized PWM mode*1 | | | | | ✓ | | ✓ | | |
| 1 | 0 | 0 | 1 | Phase counting mode 5 | | ✓ | ✓ | ✓ | | | | | |
| 1 | 0 | 1 | x | Setting prohibited | | | | | | | | | |
| 1 | 1 | 0 | 0 | Setting prohibited | | | | | | | | | |
| 1 | 1 | 0 | 1 | Complementary PWM mode 1 (transfer at crest)*1 | | | | | ✓ | | ✓ | | |
| 1 | 1 | 1 | 0 | Complementary PWM mode 2 (transfer at trough)*1 | | | | | ✓ | | ✓ | | |
| 1 | 1 | 1 | 1 | Complementary PWM mode 3 (transfer at crest and trough)*1 | | | | | ✓ | | ✓ | | |

**Note:** Only set the corresponding operating mode listed above for each channel.

**Remarks:** x: Don't care

Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

### BFA Bit (Buffer Operation A)

This bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRC occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIEC bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1 (MTU6.TMDR1). The BFA bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0. See **Figure 16.50** for an illustration of the Tb interval in complementary PWM mode.

#### BFB Bit (Buffer Operation B)

This bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRD occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIED bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1 (MTU6.TMDR1). The BFB bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. See **Figure 16.50** for an illustration of the Tb interval in complementary PWM mode.

#### BFE Bit (Buffer Operation E)

This bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. Compare match with TGRF occurs even when TGRF is used as a buffer register.

In MTU0 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

## 16.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B)

**Address(es):** MTU.TMDR2A H'0_1000_1270, MTU.TMDR2B H'0_1000_1A70

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | DRS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | DRS | 0 | R/W | Double Buffer Select<br>0: Double buffer function is disabled<br>1: Double buffer function is enabled |
| b7 to b1 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

### DRS Bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

## 16.2.5 Timer Mode Register 3 (TMDR3)

**Address(es):** MTU1.TMDR3 H'0_1000_1391

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PHCKSEL | LWA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | LWA | 0 | R/W | MTU1/MTU2 Combination Longword Access Control<br>0: 16-bit access is enabled.<br>1: 32-bit access is enabled. |
| b1 | PHCKSEL | 1 | R/W | External Input Phase Clock Select<br>Selects the external clock pin for phase counting mode.<br>0: MTCLKA and MTCLKB are selected for the external phase clock.<br>1: MTCLKC and MTCLKD are selected for the external phase clock. |
| b7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

The TMDR3 register controls longword access to a 32-bit register or counter in a combination of MTU1 and MTU2. There is only one TMDR3 register in MTU1. The counter (TCNTLW), general register A (TGRALW), and general register B (TGRBLW) of MTU1 and MTU2 are accessed in the combinations listed in **Table 16.13**.

### LWA Bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in a combination of MTU1 and MTU2.

When the LWA bit is set to 0, MTU1 and MTU2 operate independently as 16-bit timers and the TCNTLW, TGRALW, and TGRBLW registers cannot be accessed.

When the LWA bit is set to 1, MTU1 and MTU2 are cascaded and operate as a 32-bit timer, which is controlled through the TCR, TCR2, TIOR, and TMDR1 registers in MTU1. The TCR, TCR2, TIOR, and TMDR1 register settings in MTU2 are ignored. The 16-bit registers (TCNT, TGRA, and TGRB) in MTU1 and MTU2 cannot be accessed. MTU2 input capture and compare match are disabled.

Note that MTU1 and MTU2 can be cascaded by setting the LWA bit to 1 only in phase-counting mode. Cascade connection cannot be used in normal, PWM1, or PWM2 mode. When setting the LWA bit to 1, be sure to select phase-counting mode.

In addition, initialize the TCNT, TGRA, and TGRB registers in MTU1 and MTU2 before setting the LWA bit to 1.

### PHCKSEL Bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects either the A- or B-phase signal from the external clock. See **Table 16.66, Clock Input Pins in Phase Counting Mode** for details.

Table 16.13 Setting and Combination of the TMDR3 Register

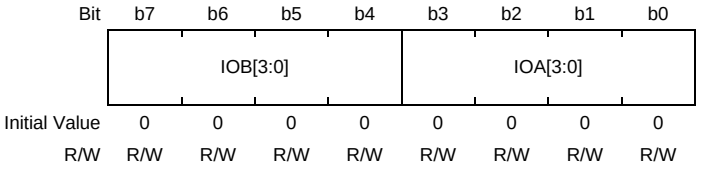
| | TMDR3.LWA = 0 | | TMDR3.LWA = 1 | |
|---|---|---|---|---|
| Register | Symbol | Access mode | Symbol | Access mode |
| Counter in MTU1*1 | MTU1.TCNT | Word | MTU1.TCNT_1_LW | Longword |
| Counter in MTU2 | MTU2.TCNT | Word | | |
| General register A in MTU1 | MTU1.TGRA | Word | MTU1.TGRA_1_LW | Longword |
| General register A in MTU2 | MTU2.TGRA | Word | | |
| General register B in MTU1 | MTU1.TGRB | Word | MTU1.TGRB_1_LW | Longword |
| General register B in MTU2 | MTU2.TGRB | Word | | |

Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

## 16.2.6 Timer I/O Control Register (TIOR)

### (1) MTU0.TIORH, MTU1.TIOR, MTU2.TIOR, MTU3.TIORH, MTU4.TIORH, MTU6.TIORH, MTU7.TIORH, MTU8.TIORH

**Address(es):** MTU0.TIORH H'0_1000_1302, MTU1.TIOR H'0_1000_1382, MTU2.TIOR H'0_1000_1402, MTU3.TIORH H'0_1000_1204, MTU4.TIORH H'0_1000_1206, MTU6.TIORH H'0_1000_1A04, MTU7.TIORH H'0_1000_1A06, MTU8.TIORH H'0_1000_1602

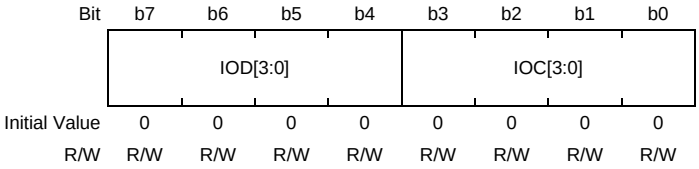


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b3 to b0 | IOA[3:0] | All 0 | R/W | I/O Control A*1<br>See the following tables.<br>MTU0.TIORH: **Table 16.28**<br>MTU1.TIOR: **Table 16.30**<br>MTU2.TIOR: **Table 16.31**<br>MTU3.TIORH: **Table 16.32**<br>MTU4.TIORH: **Table 16.34**<br>MTU6.TIORH: **Table 16.36**<br>MTU7.TIORH: **Table 16.38**<br>MTU8.TIORH: **Table 16.40** |
| b7 to b4 | IOB[3:0] | All 0 | R/W | I/O Control B*1<br>See the following tables.<br>MTU0.TIORH: **Table 16.14**<br>MTU1.TIOR: **Table 16.16**<br>MTU2.TIOR: **Table 16.17**<br>MTU3.TIORH: **Table 16.18**<br>MTU4.TIORH: **Table 16.20**<br>MTU6.TIORH: **Table 16.22**<br>MTU7.TIORH: **Table 16.24**<br>MTU8.TIORH: **Table 16.26** |

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

### (2) MTU0.TIORL, MTU3.TIORL, MTU4.TIORL, MTU6.TIORL, MTU7.TIORL, MTU8.TIORL

**Address(es):** MTU0.TIORL H'0_1000_1303, MTU3.TIORL H'0_1000_1205, MTU4.TIORL H'0_1000_1207, MTU6.TIORL H'0_1000_1A05,MTU7.TIORL H'0_1000_1A07, MTU8.TIORL H'0_1000_1603

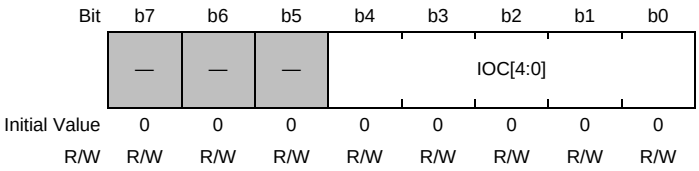


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b3 to b0 | IOC[3:0] | All 0 | R/W | I/O Control C*1<br>See the following tables.<br>MTU0.TIORL: **Table 16.29**<br>MTU3.TIORL: **Table 16.33**<br>MTU4.TIORL: **Table 16.35**<br>MTU6.TIORL: **Table 16.37**<br>MTU7.TIORL: **Table 16.39**<br>MTU8.TIORL: **Table 16.41** |
| b7 to b4 | IOD[3:0] | All 0 | R/W | I/O Control D*1<br>See the following tables.<br>MTU0.TIORL: **Table 16.15**<br>MTU3.TIORL: **Table 16.19**<br>MTU4.TIORL: **Table 16.21**<br>MTU6.TIORL: **Table 16.23**<br>MTU7.TIORL: **Table 16.25**<br>MTU8.TIORL: **Table 16.27** |

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

### (3) MTU5.TIORU, MTU5.TIORV, MTU5.TIORW

**Address(es):** MTU5.TIORU H'0_1000_1C86, MTU5.TIORV H'0_1000_1C96, MTU5.TIORW H'0_1000_1CA6



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b4 to b0 | IOC[4:0] | All 0 | R/W | I/O Control C<br>See the following table.<br>MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: **Table 16.42** |
| b7 to b5 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

The TIOR register controls the TGR register. The MTU has a total of 17 TIOR registers, two each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, one each for MTU1 and MTU2, and three (MTU5.TIORU/TIORV/TIORW) for MTU5. The TIOR register should be set when the TMDR register setting is normal mode, PWM mode, or phase counting mode.

Note that TIOR is affected by the TMDR1 setting.

The initial output specified by TIOR is valid when the counter is stopped (the CSTn bits in TSTRA and TSTRB are cleared to 0). Note also that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified. When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

Table 16.14 TIORH (MTU0)

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Description | |
|---|---|---|---|---|---|
| IOB3 | IOB2 | IOB1 | IOB0 | MTU0.TGRB Function | MTIOC0B Pin Function |
| 0 | 0 | 0 | 0 | Output compare register | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | 0 | 0 | 0 | Input capture register | Input capture at rising edge. |
| 1 | 0 | 0 | 1 | | Input capture at falling edge. |
| 1 | 0 | 1 | x | | Input capture at both edges. |
| 1 | 1 | x | x | | Capture input source is the clock source for counting in MTU1.<br>Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*1 |

**Remarks:** Don't care

Note 1. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.15 TIORL (MTU0)

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Description | |
|---|---|---|---|---|---|
| IOD3 | IOD2 | IOD1 | IOD0 | MTU0.TGRD Function | MTIOC0D Pin Function |
| 0 | 0 | 0 | 0 | Output compare register*1 | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | 0 | 0 | 0 | Input capture register*1 | Input capture at rising edge. |
| 1 | 0 | 0 | 1 | | Input capture at falling edge. |
| 1 | 0 | 1 | x | | Input capture at both edges. |
| 1 | 1 | x | x | | Capture input source is the clock source for counting in MTU1.<br>Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*2 |

**Remarks:** Don’t care

Note 1. When the MTU0.TMDR1.BFB is set to 1 and MTU0.TGRD is used as a buffer register, this setting is invalid and input capture/ output compare is not generated.

Note 2. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.16 TIOR (MTU1)

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Description | |
|---|---|---|---|---|---|
| IOB3 | IOB2 | IOB1 | IOB0 | MTU1.TGRB/TGRBLW Function | MTIOC1B Pin Function |
| 0 | 0 | 0 | 0 | Output compare register | Output prohibited |

| 0 | 0 | 0 | 0 | Output compare register*1 | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | x | 0 | 0 | Input capture register*1 | Input capture at rising edge. |
| 1 | x | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don’t care

Note 1. When the BFA bit in MTU4.TMDR1 is set to 1 and MTU4.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.36 TIORH (MTU6)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|
| IOA3 | IOA2 | IOA1 | IOA0 | MTU6.TGRA Function | MTIOC6A Pin Function |
| 0 | 0 | 0 | 0 | Output compare register | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | x | 0 | 0 | Input capture register | Input capture at rising edge. |
| 1 | x | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don’t care

Table 16.37 TIORL (MTU6)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|
| IOC3 | IOC2 | IOC1 | IOC0 | MTU6.TGRC Function | MTIOC6C Pin Function |
| 0 | 0 | 0 | 0 | Output compare register*1 | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | x | 0 | 0 | Input capture register*1 | Input capture at rising edge. |
| 1 | x | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don’t care

Note 1. When the BFA bit in MTU6.TMDR1 is set to 1 and MTU6.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.38 TIORH (MTU7)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|
| IOA3 | IOA2 | IOA1 | IOA0 | MTU7.TGRA Function | MTIOC7A Pin Function |
| 0 | 0 | 0 | 0 | Output compare register | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | x | 0 | 0 | Input capture register | Input capture at rising edge. |
| 1 | x | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don't care

Table 16.39 TIORL (MTU7)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|
| IOC3 | IOC2 | IOC1 | IOC0 | MTU7.TGRC Function | MTIOC7C Pin Function |
| 0 | 0 | 0 | 0 | Output compare register*1 | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | x | 0 | 0 | Input capture register*1 | Input capture at rising edge. |
| 1 | x | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don't care

Note 1. When the BFA bit in MTU7.TMDR1 is set to 1 and MTU7.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.40 TIORH (MTU8)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|
| IOA3 | IOA2 | IOA1 | IOA0 | MTU8.TGRA Function | MTIOC8A Pin Function |
| 0 | 0 | 0 | 0 | Output compare register | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | 0 | 0 | 0 | Input capture register | Input capture at rising edge. |
| 1 | 0 | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don’t care

Table 16.41 TIORL (MTU8)

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|
| IOC3 | IOC2 | IOC1 | IOC0 | MTU8.TGRC Function | MTIOC8C Pin Function |
| 0 | 0 | 0 | 0 | Output compare register*1 | Output prohibited |
| 0 | 0 | 0 | 1 | | Initial output is low.<br>Low output at compare match. |
| 0 | 0 | 1 | 0 | | Initial output is low.<br>High output at compare match. |
| 0 | 0 | 1 | 1 | | Initial output is low.<br>Toggle output at compare match. |
| 0 | 1 | 0 | 0 | | Output prohibited |
| 0 | 1 | 0 | 1 | | Initial output is high.<br>Low output at compare match. |
| 0 | 1 | 1 | 0 | | Initial output is high.<br>High output at compare match. |
| 0 | 1 | 1 | 1 | | Initial output is high.<br>Toggle output at compare match. |
| 1 | x | 0 | 0 | Input capture register | Input capture at rising edge. |
| 1 | x | 0 | 1 | | Input capture at falling edge. |
| 1 | x | 1 | x | | Input capture at both edges. |

**Remarks:** x: Don’t care

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and the MTU8.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.42 TIORU, TIORV, and TIORW (MTU5)

| Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description | |
|---|---|---|---|---|---|---|
| IOC4 | IOC3 | IOC2 | IOC1 | IOC0 | MTU5.TGRU, MTU5.TGRV, MTU5.TGRW Function | MTIC5U, MTIC5V, MTIC5W Pin Function |
| 0 | 0 | 0 | 0 | 0 | Output compare register | No function |
| 0 | 0 | 0 | 0 | 1 | | Setting prohibited |
| 0 | 0 | 0 | 1 | x | | Setting prohibited |
| 0 | 0 | 1 | x | x | | Setting prohibited |
| 0 | 1 | x | x | x | | Setting prohibited |
| 1 | 0 | 0 | 0 | 0 | Input capture register*1 | Setting prohibited |
| 1 | 0 | 0 | 0 | 1 | | Input capture at rising edge. |
| 1 | 0 | 0 | 1 | 0 | | Input capture at falling edge. |
| 1 | 0 | 0 | 1 | 1 | | Input capture at both edges. |
| 1 | 0 | 1 | x | x | | Input capture on generation of compare match with MTU8.TGRC |
| 1 | 1 | 0 | 0 | 0 | | Setting prohibited |
| 1 | 1 | 0 | 0 | 1 | | Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode. |
| 1 | 1 | 0 | 1 | 0 | | Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode. |
| 1 | 1 | 0 | 1 | 1 | | Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode. |
| 1 | 1 | 1 | 0 | 0 | | Setting prohibited |
| 1 | 1 | 1 | 0 | 1 | | Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode. |
| 1 | 1 | 1 | 1 | 0 | | Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode. |
| 1 | 1 | 1 | 1 | 1 | | Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode. |

**Remarks:** x: Don't care

Note 1. Setting the IOC[4:0] bits to "H'19", "H'1A", "H'1B", "H'1D", "H'1E", or "H'1F" is only allowed when the external pulse width measurement function is used or the dead time compensation function, in coordination with MTU6 and MTU7, is used. For details, refer to **Section 16.3.11, External Pulse Width Measurement**, and **Section 16.3.12, Dead Time Compensation**.

## 16.2.7 Timer Compare Match Clear Register (TCNTCMPCLR)

**Address(es):** MTU5.TCNTCMPCLR H'0_1000_1CB6

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | CMPCLR5U | CMPCLR5V | CMPCLR5W |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | CMPCLR5W | 0 | R/W | TCNT Compare Clear 5W<br>0: Disables MTU5.TCNTW to be cleared to H'0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture<br>1: Enables MTU5.TCNTW to be cleared to H'0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture |
| b1 | CMPCLR5V | 0 | R/W | TCNT Compare Clear 5V<br>0: Disables MTU5.TCNTV to be cleared to H'0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture<br>1: Enables MTU5.TCNTV to be cleared to H'0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture |
| b2 | CMPCLR5U | 0 | R/W | TCNT Compare Clear 5U<br>0: Disables MTU5.TCNTU to be cleared to H'0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture<br>1: Enables MTU5.TCNTU to be cleared to H'0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

## 16.2.8 Timer Interrupt Enable Register (TIER)

### (1) MTU1.TIER, MTU2.TIER

**Address(es):** MTU1.TIER H'0_1000_1384, MTU2.TIER H'0_1000_1404

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TTGE | — | TCIEU | TCIEV | — | — | TGIEB | TGIEA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (2) MTU0.TIER, MTU3.TIER, MTU6.TIER

**Address(es):** MTU0.TIER H'0_1000_1304, MTU3.TIER H'0_1000_1208, MTU6.TIER H'0_1000_1A08

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TTGE | — | — | TCIEV | TGIED | TGIEC | TGIEB | TGIEA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (3) MTU4.TIER, MTU7.TIER

**Address(es):** MTU4.TIER H'0_1000_1209, MTU7.TIER H'0_1000_1A09

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TTGE | TTGE2 | — | TCIEV | TGIED | TGIEC | TGIEB | TGIEA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (4) MTU8.TIER

**Address(es):** MTU8.TIER H'0_1000_1604

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | TCIEV | TGIED | TGIEC | TGIEB | TGIEA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | TGIEA | 0 | R/W | TGR Interrupt Enable A<br>0: Interrupt requests (TGIA) disabled<br>1: Interrupt requests (TGIA) enabled |
| b1 | TGIEB | 0 | R/W | TGR Interrupt Enable B<br>0: Interrupt requests (TGIB) disabled<br>1: Interrupt requests (TGIB) enabled |
| b2 | TGIEC | 0 | R/W | TGR Interrupt Enable C<br>0: Interrupt requests (TGIC) disabled<br>1: Interrupt requests (TGIC) enabled |
| b3 | TGIED | 0 | R/W | TGR Interrupt Enable D<br>0: Interrupt requests (TGID) disabled<br>1: Interrupt requests (TGID) enabled |
| b4 | TCIEV | 0 | R/W | Overflow Interrupt Enable<br>0: Interrupt requests (TCIV) disabled<br>1: Interrupt requests (TCIV) enabled |
| b5 | TCIEU | 0 | R/W | Underflow Interrupt Enable<br>0: Interrupt requests (TCIU) disabled<br>1: Interrupt requests (TCIU) enabled |
| b6 | TTGE2 | 0 | R/W | A/D Converter Start Request Enable 2<br>0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled<br>1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled |
| b7 | TTGE | 0 | R/W | A/D Converter Start Request Enable<br>0: A/D converter start request generation disabled<br>1: A/D converter start request generation enabled |

**Note:** n = 4, 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

### TGIEA and TGIEB Bits (TGR Interrupt Enable A and B)

Each bit enables or disables interrupt requests (TGIn) (n = A, B).

### TGIEC and TGIED Bits (TGR Interrupt Enable C and D)

Each bit enables or disables an interrupt request (TGIn) (n = C, D).

In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

### TCIEV Bit (Overflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIV).

### TCIEU Bit (Underflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIU).

In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

### TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4, 7).

In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

### TTGE Bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match. MTU8 is a reserved bit. It is read as 0. The write value should be 0.

## (5) MTU0.TIER2

**Address(es):** MTU0.TIER2 H'0_1000_1324

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TTGE2 | — | — | — | — | — | TGIEF | TGIEE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | TGIEE | 0 | R/W | TGR Interrupt Enable E<br>0: Interrupt requests (TGIE) disabled<br>1: Interrupt requests (TGIE) enabled |
| b1 | TGIEF | 0 | R/W | TGR Interrupt Enable F<br>0: Interrupt requests (TGIF) disabled<br>1: Interrupt requests (TGIF) enabled |
| b6 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b7 | TTGE2 | 0 | R/W | A/D Converter Start Request Enable 2<br>0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled<br>1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled |

### TGIEE and TGIEF Bits (TGR Interrupt Enable E and F)

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRn (n = E, F).

### TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables AD converter start requests by compare match between TCNT and TGRE in MTU0.

### (6) MTU5.TIER

**Address(es):** MTU5.TIER H'0_1000_1CB2

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TGIE5U | TGIE5V | TGIE5W |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | TGIE5W | 0 | R/W | TGR Interrupt Enable 5W<br>0: Interrupt requests TGIW5 disabled<br>1: Interrupt requests TGIW5 enabled |
| b1 | TGIE5V | 0 | R/W | TGR Interrupt Enable 5V<br>0: Interrupt requests TGIV5 disabled<br>1: Interrupt requests TGIV5 enabled |
| b2 | TGIE5U | 0 | R/W | TGR Interrupt Enable 5U<br>0: Interrupt requests TGIU5 disabled<br>1: Interrupt requests TGIU5 enabled |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

#### TGIE5n Bits (TGR Interrupt Enable 5n)

Each bit enables or disables interrupt requests (TGIn5) (n = U, V, W).

## 16.2.9 Timer Status Register (TSR)

### (1) MTU1.TSR, MTU2.TSR

**Address(es):** MTU1.TSR H'0_1000_1385, MTU2.TSR H'0_1000_1405

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TCFD | — | — | — | — | — | — | — |
| Initial Value | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (2) MTU3.TSR, MTU4.TSR, MTU6.TSR, MTU7.TSR

**Address(es):** MTU3.TSR H'0_1000_122C, MTU4.TSR H'0_1000_122D, MTU6.TSR H'0_1000_1A2C, MTU7.TSR H'0_1000_1A2D

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TCFD | — | — | — | — | — | — | — |
| Initial Value | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b5 to b0 | — | All 0 | R/W | Reserved<br>The read value is undefined. The write value should be 1. |
| b6 | — | 1 | R/W | Reserved<br>This bit is read as 1. The write value should be 1. |
| b7 | TCFD | 1 | R | Count Direction Flag<br>0: TCNT counts down<br>1: TCNT counts up |

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

#### TCFD Flag (Count Direction Flag)

Status flag that indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

## 16.2.10 Timer Buffer Operation Transfer Mode Register (TBTM)

### (1) MTU0.TBTM

**Address(es):** MTU0.TBTM H'0_1000_1326

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TTSE | TTSB | TTSA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### (2) MTU3.TBTM, MTU4.TBTM, MTU6.TBTM, MTU7.TBTM

**Address(es):** MTU3.TBTM H'0_1000_1238, MTU4.TBTM H'0_1000_1239, MTU6.TBTM H'0_1000_1A38, MTU7.TBTM H'0_1000_1A39

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TTSB | TTSA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | TTSA | 0 | R/W | Timing Select A<br>0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA<br>1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA |
| b1 | TTSB | 0 | R/W | Timing Select B<br>0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB<br>1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB |
| b2 | TTSE | 0 | R/W | Timing Select E<br>0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE<br>1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

#### TTSA Bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

#### TTSB Bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

#### TTSE Bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

## 16.2.11 Timer Input Capture Control Register (TICCR)

**Address(es):** MTU1.TICCR H'0_1000_1390

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | I2BE | I2AE | I1BE | I1AE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | I1AE | 0 | R/W | Input Capture Enable<br>0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions<br>1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions |
| b1 | I1BE | 0 | R/W | Input Capture Enable<br>0: Does not include the TMTIOC1B pin in the MTU2.TGRB input capture conditions<br>1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions |
| b2 | I2AE | 0 | R/W | Input Capture Enable<br>0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions<br>1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions |
| b3 | I2BE | 0 | R/W | Input Capture Enable<br>0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions<br>1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions |
| b7 to b4 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

## 16.2.12 Timer Synchronous Clear Register (TSYCR)

**Address(es):** MTU6.TSYCR H'0_1000_1A50

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | CE0A | CE0B | CE0C | CE0D | CE1A | CE1B | CE2A | CE2B |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | CE2B | 0 | R/W | Clear Enable 2B<br>0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing.<br>1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing. |
| b1 | CE2A | 0 | R/W | Clear Enable 2A<br>0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing*1. |
| b2 | CE1B | 0 | R/W | Clear Enable 1B<br>0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing*1. |
| b3 | CE1A | 0 | R/W | Clear Enable 1A<br>0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing*1. |
| b4 | CE0D | 0 | R/W | Clear Enable 0D<br>0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing*1. |
| b5 | CE0C | 0 | R/W | Clear Enable 0C<br>0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing*1. |
| b6 | CE0B | 0 | R/W | Clear Enable 0B<br>0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing*1. |
| b7 | CE0A | 0 | R/W | Clear Enable 0A<br>0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing*1.<br>1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing*1. |

Note 1. This does not depend on the TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU1.

### CEnm Bits (Clear Enable nm; n = 0, 1, 2; m = A, B, C, D)

These bits enable or disable counter clearing by the MTUn.TGImn interrupt generation timing.

## 16.2.13 Timer Counter (TCNT)

### (1) MTU0.TCNT to MTU7.TCNT

**Address(es):** MTU0.TCNT H'0_1000_1306, MTU1.TCNT H'0_1000_1386, MTU2.TCNT H'0_1000_1406, MTU3.TCNT H'0_1000_1210, MTU4.TCNT H'0_1000_1212, MTU5.TCNTU H'0_1000_1C80, MTU5.TCNTV H'0_1000_1C90, MTU5.TCNTW H'0_1000_1CA0, MTU6.TCNT H'0_1000_1A10, MTU7.TCNT H'0_1000_1A12

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TCNT must not be accessed in eight bits; it should be accessed in 16 bits.

### (2) MTU8.TCNT

**Address(es):** MTU8.TCNT H'0_1000_1608

| Bit | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TCNT must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

MTU0.TCNT to MTU7.TCNT are 16-bit readable/writable counters and MTU8.TCNT is a 32-bit readable/writable counter. The MTU has a total of 11 TCNT counters, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8 and three (TCNTU, TCNTV, and TCNTW) for MTU5. The TCNT counters in MTU0 to MTU4, MTU6, and MTU7 are initialized to H'0000 by a reset, and the TCNT counter in MTU8 is initialized to H'00000000 by a reset. The TCNTU, TCNTV, and TCNTW counters in MTU5 are initialized to H'0000 by a reset. In MTU0 to MTU4, MTU6, and MTU7, the TCNT counters must not be accessed in 8-bit units; they should be accessed in 16-bit units. The MTU8.TCNT counter must not be accessed in 8- or 16-bit units; it should be accessed in 32-bit units.

The MTU1.TCNT and MTU2.TCNT counters are read as H'0000 when TMDR3.LWA is 1. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details.

## 16.2.14 Timer Longword Counter (TCNTLW)

**Address(es):** MTU1.TCNTLW H'0_1000_13A0

| Bit | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TCNTLW must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA is 1. The TCNTLW counter is initialized to H'0000 0000 by a reset. This counter is read as H'0000 0000 when TMDR3.LWA is 0. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details. This register can only be used in 32-bit phase counting mode.

## 16.2.15 Timer General Register (TGR)

### (1) MTU0.TGR to MTU7.TGR

**Address(es):** MTU0.TGRA H'0_1000_1308, MTU0.TGRB H'0_1000_130A, MTU0.TGRC H'0_1000_130C, MTU0.TGRD H'0_1000_130E, MTU0.TGRE H'0_1000_1320, MTU0.TGRF H'0_1000_1322, MTU1.TGRA H'0_1000_1388, MTU1.TGRB H'0_1000_138A, MTU2.TGRA H'0_1000_1408, MTU2.TGRB H'0_1000_140A, MTU3.TGRA H'0_1000_1218, MTU3.TGRB H'0_1000_121A, MTU3.TGRC H'0_1000_1224, MTU3.TGRD H'0_1000_1226, MTU3.TGRE H'0_1000_1272, MTU4.TGRA H'0_1000_121C, MTU4.TGRB H'0_1000_121E, MTU4.TGRC H'0_1000_1228, MTU4.TGRD H'0_1000_122A, MTU4.TGRE H'0_1000_1274, MTU4.TGRF H'0_1000_1276, MTU5.TGRU H'0_1000_1C82, MTU5.TGRV H'0_1000_1C92, MTU5.TGRW H'0_1000_1CA2, MTU6.TGRA H'0_1000_1A18, MTU6.TGRB H'0_1000_1A1A, MTU6.TGRC H'0_1000_1A24, MTU6.TGRD H'0_1000_1A26, MTU6.TGRE H'0_1000_1A72, MTU7.TGRA H'0_1000_1A1C, MTU7.TGRB H'0_1000_1A1E, MTU7.TGRC H'0_1000_1A28, MTU7.TGRD H'0_1000_1A2A, MTU7.TGRE H'0_1000_1A74, MTU7.TGRF H'0_1000_1A76

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TGR must not be accessed in eight bits; it should be accessed in 16 bits. The initial value of TGR is H'FFFF.

### (2) MTU8.TGR

**Address(es):** MTU8.TGRA H'0_1000_160C, MTU8.TGRB H'0_1000_1610, MTU8.TGRC H'0_1000_1614, MTU8.TGRD H'0_1000_1618

| Bit | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TGR must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The MTU0.TGR to MTU7.TGR registers are 16-bit readable/writable registers; the MTU8.TGR register is a 32-bit readable/writable register. The MTU has a total of 39 TGR registers, six for MTU0, two each for MTU1 and MTU2, five each for MTU3 and MTU6, six each for MTU4 and MTU7, three for MTU5 and four for MTU8.

The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.

MTU0.TGRE and MTU0.TGRF function as compare registers. When the MTU0.TCNT count matches the MTU0.TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF. MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.

The MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers are read as H'0000 when TMDR3.LWA is 1. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details.

## 16.2.16 Timer Longword General Registers (TGRALW and TGRBLW)

**Address(es):** MTU1.TGRALW H'0_1000_13A4, MTU1.TGRBLW H'0_1000_13A8

| Bit | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TGRALW and TGRBLW must not be accessed in 8 or 16 bits; they should be accessed in 32 bits.

The TGRALW (TGRBLW) register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining the TGRA (TGRB) registers in MTU1 and MTU2. Such operation is only effective when TMDR3.LWA is 1.

The TGRALW (TGRBLW) register is initialized to H'FFFF FFFF by a reset, but it is read as H'0000 0000 when TMDR3.LWA is 0. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details.

The TGRALW (TGRBLW) register functions as an output compare or input capture register when TMDR3.LWA is 1. This register can only be used in 32-bit phase counting mode.

## 16.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR)

### (1) MTU.TSTRA (MTU0, MTU1, MTU2, MTU3, MTU4, MTU8)

**Address(es):** MTU.TSTRA H'0_1000_1280

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | CST4 | CST3 | — | — | CST8 | CST2 | CST1 | CST0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | CST0 | 0 | R/W | Counter Start 0<br>0: MTU0.TCNT counting is stopped<br>1: MTU0.TCNT performs count operation |
| b1 | CST1 | 0 | R/W | Counter Start 1<br>0: MTU1.TCNT counting is stopped<br>1: MTU1.TCNT performs count operation |
| b2 | CST2 | 0 | R/W | Counter Start 2<br>0: MTU2.TCNT counting is stopped<br>1: MTU2.TCNT performs count operation |
| b3 | CST8 | 0 | R/W | Counter start 8<br>0: MTU8.TCNT counting is stopped<br>1: MTU8.TCNT performs count operation. |
| b5, b4 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b6 | CST3 | 0 | R/W | Counter Start 3<br>0: MTU3.TCNT counting is stopped<br>1: MTU3.TCNT performs count operation |
| b7 | CST4 | 0 | R/W | Counter Start 4<br>0: MTU4.TCNT counting is stopped<br>1: MTU4.TCNT performs count operation |

**Note:** When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

The TSTRA register starts or stops TCNT operation in MTU0 to MTU4 and MTU8. TSTRA starts or stops TCNT operation in MTU0 to MTU4.

TSTRB starts or stops TCNT operation in MTU6 and MTU7. TSTR starts or stops TCNT operation in MTU5.

Before setting the operating mode in TMDR1 or setting the TCNT count clock in TCR, be sure to stop the TCNT counting.

#### CSTn Bits (Counter Start n) (n = 0, 1, 2, 3, 4, 8)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1A or TOCR2A register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

### (2) MTU.TSTRB(MTU6, MTU7)

**Address(es):** MTU.TSTRB H'0_1000_1A80

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | CST7 | CST6 | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b5 to b0 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b6 | CST6 | 0 | R/W | Counter Start 6<br>0: MTU6.TCNT counting is stopped<br>1: MTU6.TCNT performs count operation |
| b7 | CST7 | 0 | R/W | Counter Start 7<br>0: MTU7.TCNT counting is stopped<br>1: MTU7.TCNT performs count operation |

**Note:** When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

#### CSTn Bits (Counter Start n) (n = 6, 7)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1B or TOCR2B register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

### (3) MTU5.TSTR(MTU5)

**Address(es):** MTU5.TSTR H'0_1000_1CB4

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|

## 16.2.18 Timer Synchronous Registers (TSYRA and TSYRB)

### (1) MTU.TSYRA(MTU0, MTU1, MTU2, MTU3, MTU4)

**Address(es):** MTU.TSYRA H'0_1000_1281

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | SYNC4 | SYNC3 | — | — | — | SYNC2 | SYNC1 | SYNC0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | SYNC0 | 0 | R/W | Timer Synchronous Operation 0<br>0: MTU0.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU0.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |
| b1 | SYNC1 | 0 | R/W | Timer Synchronous Operation 1<br>0: MTU1.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU1.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |
| b2 | SYNC2 | 0 | R/W | Timer Synchronous Operation 2<br>0: MTU2.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU2.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |
| b5 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b6 | SYNC3 | 0 | R/W | Timer Synchronous Operation 3<br>0: MTU3.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU3.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |
| b7 | SYNC4 | 0 | R/W | Timer Synchronous Operation 4<br>0: MTU4.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU4.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4. TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

#### SYNCn Bits (Timer Synchronous Operation n) (n = 0, 1, 2, 3, 4)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

### (2) MTU.TSYRB(MTU6, MTU7)

**Address(es):** MTU.TSYRB H'0_1000_1A81

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | SYNC7 | SYNC6 | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b5 to b0 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b6 | SYNC6 | 0 | R/W | Timer Synchronous Operation 6<br>0: MTU6.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU6.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |
| b7 | SYNC7 | 0 | R/W | Timer Synchronous Operation 7<br>0: MTU7.TCNT operates independently (TCNT setting/clearing is not related to other channels).<br>1: MTU7.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.) |

#### SYNCn Bits (Timer Synchronous Operation n) (n = 6, 7)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

## 16.2.19 Timer Counter Synchronous Start Register (TCSYSTR)

**Address(es):** MTU.TCSYSTR H'0_1000_1282

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | SCH0 | SCH1 | SCH2 | SCH3 | SCH4 | — | SCH6 | SCH7 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R | R/(W)*1 | R/(W)*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | SCH7 | 0 | R/(W) *1 | Synchronous Start 7<br>0: Does not specify synchronous start for MTU7.TCNT<br>1: Specifies synchronous start for MTU7.TCNT |
| b1 | SCH6 | 0 | R/(W) *1 | Synchronous Start 6<br>0: Does not specify synchronous start for MTU6.TCNT<br>1: Specifies synchronous start for MTU6.TCNT |
| b2 | — | 0 | R | Reserved<br>This bit is read as 0. The write value should be 0. |
| b3 | SCH4 | 0 | R/(W) *1 | Synchronous Start 4<br>0: Does not specify synchronous start for MTU4.TCNT<br>1: Specifies synchronous start for MTU4.TCNT |
| b4 | SCH3 | 0 | R/(W) *1 | Synchronous Start 3<br>0: Does not specify synchronous start for MTU3.TCNT<br>1: Specifies synchronous start for MTU3.TCNT |
| b5 | SCH2 | 0 | R/(W) *1 | Synchronous Start 2<br>0: Does not specify synchronous start for MTU2.TCNT<br>1: Specifies synchronous start for MTU2.TCNT |
| b6 | SCH1 | 0 | R/(W) *1 | Synchronous Start 1<br>0: Does not specify synchronous start for MTU1.TCNT<br>1: Specifies synchronous start for MTU1.TCNT |
| b7 | SCH0 | 0 | R/(W) *1 | Synchronous Start 0<br>0: Does not specify synchronous start for MTU0.TCNT<br>1: Specifies synchronous start for MTU0.TCNT |

Note 1. Only 1 can be written to this bit. It is automatically cleared to 0 when counting begins.

TCSYSTR specifies synchronous start of the counters.

### SCH7 Bit (Synchronous Start 7)

This bit controls synchronous start of TCNT in MTU7. [Clearing condition]

- When the CST7 bit in TSTRB is set to 1 while SCH7 = 1

### SCH6 Bit (Synchronous Start 6)

This bit controls synchronous start of TCNT in MTU6. [Clearing condition]

- When the CST6 bit in TSTRB is set to 1 while SCH6 = 1

**SCH4 Bit (Synchronous Start 4)**

This bit controls synchronous start of TCNT in MTU4. [Clearing condition]

- When the CST4 bit in TSTRA is set to 1 while SCH4 = 1

**SCH3 Bit (Synchronous Start 3)**

This bit controls synchronous start of TCNT in MTU3. [Clearing condition]

- When the CST3 bit in TSTRA is set to 1 while SCH3 = 1

**SCH2 Bit (Synchronous Start 2)**

This bit controls synchronous start of TCNT in MTU2. [Clearing condition]

- When the CST2 bit in TSTRA is set to 1 while SCH2 = 1

**SCH1 Bit (Synchronous Start 1)**

This bit controls synchronous start of TCNT in MTU1. [Clearing condition]

- When the CST1 bit in TSTRA is set to 1 while SCH1 = 1

**SCH0 Bit (Synchronous Start 0)**

This bit controls synchronous start of TCNT in MTU0. [Clearing condition]

- When the CST0 bit in TSTRA is set to 1 while SCH0 = 1

## 16.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB)

**Address(es):** MTU.TRWERA H'0_1000_1284, MTU.TRWERB H'0_1000_1A84

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | RWE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | RWE | 1 | R/W | Read/Write Enable<br>0: Read/write access to the registers is disabled<br>1: Read/write access to the registers is enabled |
| b7 to b1 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.

TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

### RWE Bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.

[Clearing condition]

When 0 is written to the RWE bit after reading RWE = 1

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)

  24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERA, TOCR1A, TOCR2A, TGCRA, TCDRA, TDDRA, and MTUn.TCNT (n = 3, 4)

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)

  23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERB, TOCR1B, TOCR2B, TCDRB, TDDRB, and MTUn.TCNT (n = 6, 7)

## 16.2.21 Timer Output Master Enable Registers (TOERA and TOERB)

### (1) MTU.TOERA

**Address(es):** MTU.TOERA H'0_1000_120A

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | OE4D | OE4C | OE3D | OE4B | OE4A | OE3B |
| Initial Value | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | OE3B | 0 | R/W | Master Enable MTIOC3B<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b1 | OE4A | 0 | R/W | Master Enable MTIOC4A<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b2 | OE4B | 0 | R/W | Master Enable MTIOC4B<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b3 | OE3D | 0 | R/W | Master Enable MTIOC3D<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b4 | OE4C | 0 | R/W | Master Enable MTIOC4C<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b5 | OE4D | 0 | R/W | Master Enable MTIOC4D<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b7, b6 | — | All 1 | R/W | Reserved<br>These bits are read as 1. The write value should be 1. |

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the port mode register (PMn) and port register (Pn) of I/O ports to output the inactive level from general I/O ports, and then set the port mode control register (PMCn) to use general I/O ports. For details, refer to **Section 41**, **General Purpose Input Output Port**.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output values correctly if the bits of the TOERA register are not appropriately set. Write a desired value to the TOERA register before setting up the TIOR registers in MTU3 and MTU4.

Set the TOERA register after clearing the CST3 and CST4 bits in the TSTRA register to 0 (see **Figure 16.44** and **Figure 16.48**).

### (2) MTU.TOERB

**Address(es):** MTU.TOERB H'0_1000_1A0A

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | OE7D | OE7C | OE6D | OE7B | OE7A | OE6B |
| Initial Value | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | OE6B | 0 | R/W | Master Enable MTIOC6B<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b1 | OE7A | 0 | R/W | Master Enable MTIOC7A<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b2 | OE7B | 0 | R/W | Master Enable MTIOC7B<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b3 | OE6D | 0 | R/W | Master Enable MTIOC6D<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b4 | OE7C | 0 | R/W | Master Enable MTIOC7C<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b5 | OE7D | 0 | R/W | Master Enable MTIOC7D<br>0: MTU output is disabled*1<br>1: MTU output is enabled |
| b7, b6 | — | All 1 | R/W | Reserved<br>These bits are read as 1. The write value should be 1. |

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the port mode register (PMn) and port register (Pn) of I/O ports to output the inactive level from general I/O ports, and then set the port mode control register (PMCn) to use general I/O ports. For details, refer to **Section 41**, **General Purpose Input Output Port**.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output values correctly if the bits of the TOERB register are not appropriately set. Write a desired value to the TOERB register before setting up the TIOR registers in MTU6 and MTU7.

Set the TOERB register after clearing the CST6 and CST7 bits in the TSTRB register to 0 (see **Figure 16.44** and **Figure 16.48**).

## 16.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B)

**Address(es):** MTU.TOCR1A H'0_1000_120E, MTU.TOCR1B H'0_1000_1A0E

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | PSYE | — | — | TOCL | TOCS | OLSN | OLSP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | OLSP | 0 | R/W | Output Level Select P*1 *3<br>See **Table 16.43**. |
| b1 | OLSN | 0 | R/W | Output Level Select N*1 *3<br>See **Table 16.44**. |
| b2 | TOCS | 0 | R/W | TOC Select<br>0: TOCR1j setting is selected (j = A, B)<br>1: TOCR2j setting is selected |
| b3 | TOCL | 0 | R/W | TOC Register Write Protection*2 *4<br>0: Write access to the TOCS, OLSN, and OLSP bits is enabled<br>1: Write access to the TOCS, OLSN, and OLSP bits is disabled |
| b5, b4 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b6 | PSYE | 0 | R/W | PWM Synchronous Output Enable<br>0: Toggle output is disabled<br>1: Toggle output is enabled |
| b7 | — | 0 | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |

Note 1. Clearing the TOCR1j.TOCS bit to 0 makes this bit setting valid.

Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.

Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.

Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset-synchronized PWM mode, and control inversion of PWM output level.

### OLSP Bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

### OLSN Bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

### TOCS Bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

### TOCL Bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A, B).

### PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM cycle.

Table 16.43 Output Level Select Function

| Bit 0 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLSP | Initial Output | Active Level | Up-Counting | Down-Counting |
| 0 | High level | Low level | Low level | High level |
| 1 | Low level | High level | High level | Low level |

Table 16.44 Output Level Select Function

| Bit 1 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLSN | Initial Output | Active Level | Up-Counting | Down-Counting |
| 0 | High level | Low level | High level | Low level |
| 1 | Low level | High level | Low level | High level |

**Note:** The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

**Figure 16.3** shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

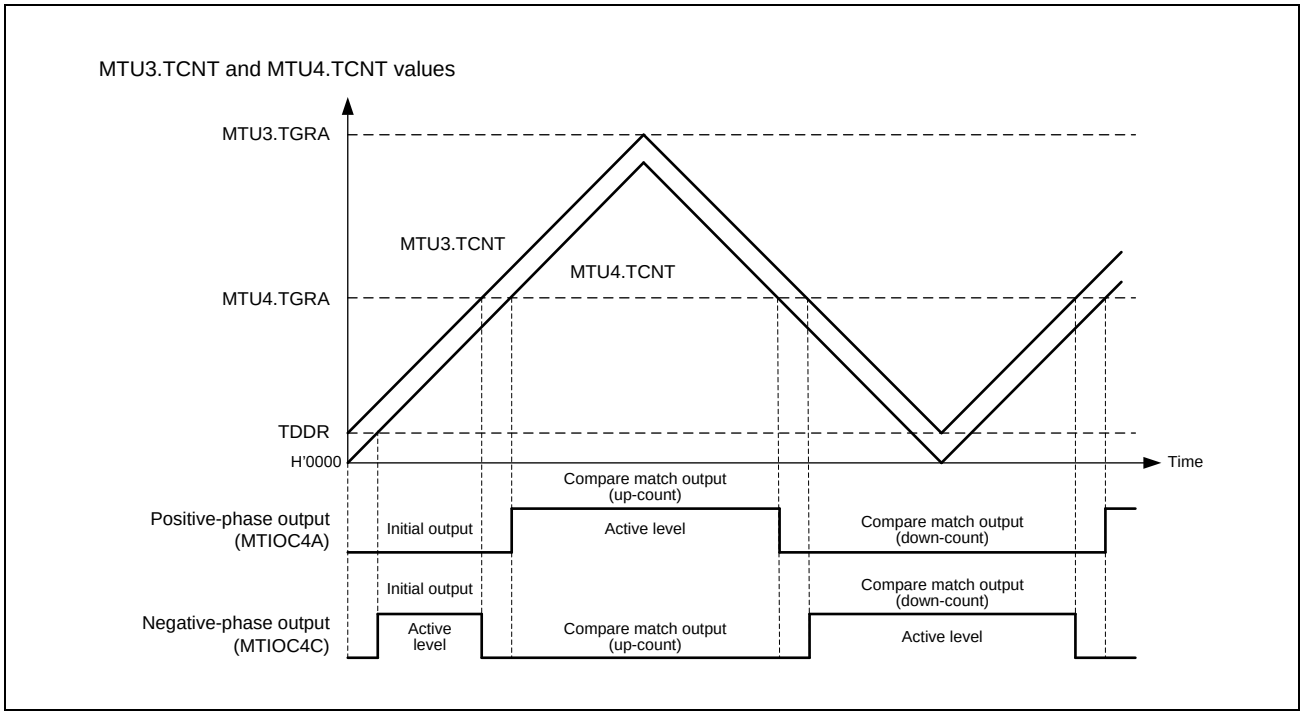

Figure 16.3 Example of Output in Complementary PWM Mode

## 16.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B)

**Address(es):** MTU.TOCR2A H'0_1000_120F, MTU.TOCR2B H'0_1000_1A0F

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | BF[1:0] | | OLS3N | OLS3P | OLS2N | OLS2P | OLS1N | OLS1P |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | OLS1P | 0 | R/W | Output Level Select 1P*1 *2<br>This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode.<br>See **Table 16.45**. |
| b1 | OLS1N | 0 | R/W | Output Level Select 1N*1 *2<br>This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode.<br>See **Table 16.46**. |
| b2 | OLS2P | 0 | R/W | Output Level Select 2P*1 *2<br>This bit selects the output level on MTIOC4A or MTIOC7Ain reset-synchronized PWM mode and complementary PWM mode.<br>See **Table 16.47**. |
| b3 | OLS2N | 0 | R/W | Output Level Select 2N*1 *2<br>This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode.<br>See **Table 16.48**. |
| b4 | OLS3P | 0 | R/W | Output Level Select 3P*1 *2<br>This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode.<br>See **Table 16.49**. |
| b5 | OLS3N | 0 | R/W | Output Level Select 3N*1 *2<br>This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode.<br>See **Table 16.50**. |
| b7, b6 | BF[1:0] | All 0 | R/W | TOLBR Buffer Transfer Timing Select<br>These bits select the timing for transferring data from TOLBRj to TOCR2j.<br>See **Table 16.51** for details. |

**Note:** j = A, B

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid.

Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

Table 16.45 MTIOCmB Output Level Select Function

| Bit 0 | Function | | | |
|---|---|---|---|---|
| | | | Compare Match Output | |
| OLS1P | Initial Output | Active Level | Up-Counting | Down-Counting |
| 0 | High level | Low level | Low level | High level |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | OLS1P | 0 | R/W | Output Level Select 1P<br>Specify the buffer value to be transferred to the OLS1P bit in TOCR2j. |
| b1 | OLS1N | 0 | R/W | Output Level Select 1N<br>Specify the buffer value to be transferred to the OLS1N bit in TOCR2j. |
| b2 | OLS2P | 0 | R/W | Output Level Select 2P<br>Specify the buffer value to be transferred to the OLS2P bit in TOCR2j. |
| b3 | OLS2N | 0 | R/W | Output Level Select 2N<br>Specify the buffer value to be transferred to the OLS2N bit in TOCR2j. |
| b4 | OLS3P | 0 | R/W | Output Level Select 3P<br>Specify the buffer value to be transferred to the OLS3P bit in TOCR2j. |
| b5 | OLS3N | 0 | R/W | Output Level Select 3N<br>Specify the buffer value to be transferred to the OLS3N bit in TOCR2j. |
| b7, b6 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

**Note:** j = A, B

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

**Figure 16.4** shows an example of the PWM output level setting procedure in buffer operation.

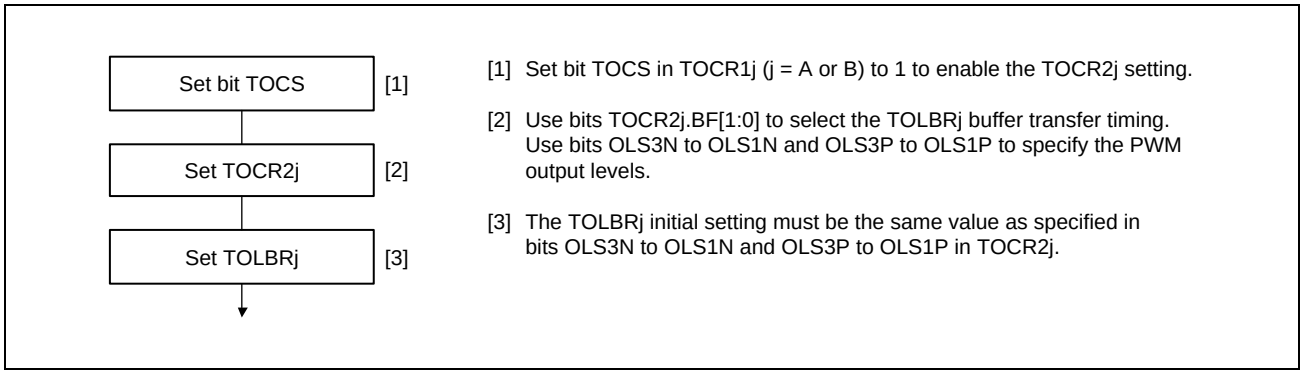

Figure 16.4 Example of PWM Output Level Setting Procedure in Buffer Operation

## 16.2.25 Timer Gate Control Register A (TGCRA)

**Address(es):** MTU.TGCRA H'0_1000_120D

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | BDC | N | P | FB | WF | VF | UF |
| Initial Value | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | UF | 0 | R/W | Output Phase Switch<br>These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See **Table 16.52**. |
| b1 | VF | 0 | R/W | |
| b2 | WF | 0 | R/W | |
| b3 | FB | 0 | R/W | External Feedback Signal Enable<br>0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0)<br>1: Output is switched by software (TGCRA's UF, VF, and WF settings) |
| b4 | P | 0 | R/W | Positive-Phase Output (P) Control<br>0: Level output<br>1: Reset-synchronized PWM or complementary PWM output |
| b5 | N | 0 | R/W | Negative-Phase Output (N) Control<br>0: Level output<br>1: Reset-synchronized PWM or complementary PWM output |
| b6 | BDC | 0 | R/W | Brushless DC Motor<br>0: Ordinary output<br>1: Functions of this register are effective. |
| b7 | — | 1 | R/W | Reserved<br>This bit is read as 1. The write value should be 1. |

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

### UF, VF, and WF Bits (Output Phase Switch)

The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See **Table 16.52** for details.

### FB Bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA.

When the FB bit in the TGCRA register is 0, the output signals from MTU3 and MTU4 are switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0.

### P Bit (Positive-Phase Output (P) Control)

This bit selects either the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

### N Bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

### BDC Bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

Table 16.52 Output Level Select Function

| Bit 2 | Bit 1 | Bit 0 | Function | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | MTIOC3B | MTIOC4A | MTIOC4B | MTIOC3D | MTIOC4C | MTIOC4D |
| WF | VF | UF | U Phase | V Phase | W Phase | U Phase | V Phase | W Phase |
| 0 | 0 | 0 | OFF | OFF | OFF | OFF | OFF | OFF |
| | | 1 | ON | OFF | OFF | OFF | OFF | ON |
| | 1 | 0 | OFF | ON | OFF | ON | OFF | OFF |
| | | 1 | OFF | ON | OFF | OFF | OFF | ON |
| 1 | 0 | 0 | OFF | OFF | ON | OFF | ON | OFF |
| | | 1 | ON | OFF | OFF | OFF | ON | OFF |
| | 1 | 0 | OFF | OFF | ON | ON | OFF | OFF |
| | | 1 | OFF | OFF | OFF | OFF | OFF | OFF |

## 16.2.26 Timer Subcounters (TCNTSA and TCNTSB)

**Address(es):** MTU.TCNTSA H'0_1000_1220, MTU.TCNTSB H'0_1000_1A20

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Note:** TCNTSA and TCNTSB must not be accessed in eight bits; it should be accessed in 16 bits.

TCNTSA and TCNTSB are 16-bit read-only counters that are used only in complementary PWM mode. The initial value of TCNTSA and TCNTSB after a reset is H'0000.

## 16.2.27 Timer Cycle Data Registers (TCDRA and TCDRB)

**Address(es):** MTU.TCDRA H'0_1000_1214, MTU.TCDRB H'0_1000_1A14

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TCDRA and TCDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier cycle as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count). The initial value of TCDRA and TCDRB after a reset is H'FFFF.

## 16.2.28 Timer Cycle Buffer Registers (TCBRA and TCBRB)

**Address(es):** MTU.TCBRA H'0_1000_1222, MTU.TCBRB H'0_1000_1A22

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TCBRA and TCBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1. The initial value of TCBRA and TCBRB after a reset is H'FFFF.

## 16.2.29 Timer Dead Time Data Registers (TDDRA and TDDRB)

**Address(es):** MTU.TDDRA H'0_1000_1216, MTU.TDDRB H'0_1000_1A16

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TDDRA and TDDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts. The initial value of TDDRA and TDDRB after a reset is H'FFFF.

## 16.2.30 Timer Dead Time Enable Registers (TDERA and TDERB)

**Address(es):** MTU.TDERA H'0_1000_1234, MTU.TDERB H'0_1000_1A34

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TDER |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/(W) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | TDER | 1 | R/(W) | Dead Time Enable<br>0: No dead time is generated<br>1: Dead time is generated*1 |
| b7 to b1 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. TDDRA and TDDRB must be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

### TDER Bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

## 16.2.31 Timer Buffer Transfer Set Registers (TBTERA and TBTERB)

**Address(es):** MTU.TBTERA H'0_1000_1232, MTU.TBTERB H'0_1000_1A32

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | BTE[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | BTE[1:0] | All 0 | R/W | Buffer Transfer Disable and Interrupt Skipping Link Setting<br>These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1.<br>For details, see **Table 16.53**. |
| b7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTERB):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Table 16.53 Setting of BTE[1:0] Bits in TBTERA and TBTERB

| Bit 1 | Bit 0 | |
|---|---|---|
| BTE1 | BTE0 | Description |
| 0 | 0 | Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1. |
| | 1 | Disables transfer from the buffer registers to the temporary registers. |
| 1 | 0 | Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2 |
| | 1 | Setting prohibited |

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, refer to **Section 16.3.8, Complementary PWM Mode**.

Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits are cleared to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

## 16.2.32 Timer Waveform Control Registers (TWCRA and TWCRB)

**Address(es):** MTU.TWCRA H'0_1000_1260, MTU.TWCRB H'0_1000_1A60

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | CCE | — | — | — | — | — | SCC | WRE |
| Initial Value | 0*2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/(W) | R/W | R/W | R/W | R/W | R/W | R/(W) | R/(W)*3 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | WRE | 0 | R/(W) *3 | Waveform Retain Enable<br>0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output<br>1: Initial output is inhibited |
| b1 | SCC*1 *3 | 0 | R/(W) | Synchronous Clearing Control<br>(Only valid in register TWCRB)<br>0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is enabled.<br>1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is disabled. |
| b6 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b7 | CCE*2 | 0 | R/(W) | Compare Match Clear Enable<br>0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match<br>1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match |

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.

Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.

Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TNCT and MTU4.TNCT (MTU6.TNCT and MTU7.TNCT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.

The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

### WRE Bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode. The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values

specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start operation.

For the Tb interval at the trough in complementary PWM mode, see **Figure 16.50**.

[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

### SCC Bit (Synchronous Clearing Control)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2–MTU6, MTU7 in complementary PWM mode.

Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do not change the values of the CCE and WRE bits.

Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.

Regarding the Tb interval in the trough in complementary PWM mode, see **Figure 16.50**.

[Setting condition]

- Writing of 1 to the SCC bit after reading it as 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

### CCE Bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

When 1 is written to CCE after reading CCE = 0

## 16.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C)

### (1) MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, MTU8.NFCR8

**Address(es):** MTU0.NFCR0 H'0_1000_1290, MTU1.NFCR1 H'0_1000_1291, MTU2.NFCR2 H'0_1000_1292, MTU3.NFCR3 H'0_1000_1293, MTU4.NFCR4 H'0_1000_1294, MTU6.NFCR6 H'0_1000_1A93, MTU7.NFCR7 H'0_1000_1A94, MTU8.NFCR8 H'0_1000_1298

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | NFCS[1:0] | | NFDEN | NFCEN | NFBEN | NFAEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | NFAEN | 0 | R/W | Noise Filter A Enable<br>0: The noise filter for the MTIOCnA pin is disabled.<br>1: The noise filter for the MTIOCnA pin is enabled. |
| b1 | NFBEN | 0 | R/W | Noise Filter B Enable<br>0: The noise filter for the MTIOCnB pin is disabled.<br>1: The noise filter for the MTIOCnB pin is enabled. |
| b2 | NFCEN | 0 | R/W*1 | Noise Filter C Enable<br>0: The noise filter for the MTIOCnC pin is disabled.<br>1: The noise filter for the MTIOCnC pin is enabled. |
| b3 | NFDEN | 0 | R/W*1 | Noise Filter D Enable<br>0: The noise filter for the MTIOCnD pin is disabled.<br>1: The noise filter for the MTIOCnD pin is enabled. |
| b5, b4 | NFCS[1:0] | All 0 | R/W | Noise Filter Clock Select<br>b5 b4<br>0 0: P0ϕ/1<br>0 1: P0ϕ/8<br>1 0: P0ϕ/32<br>1 1: Clock source for counting |
| b7, b6 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. These bits are reserved in the NFCR1 and NFCR2 registers. These bits are read as 0 and writing to them has no effect.

The NFCRn register (n = 0 to 4, 6, 7, or 8) specifies the noise filter function of the input capture input pin of the corresponding channel.

#### NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

#### NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

### (2) MTU0.NFCRC

**Address(es):** MTU0.NFCRC H'0_1000_1299

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | NFCS[1:0] | | NFDEN | NFCEN | NFBEN | NFAEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | NFAEN | 0 | R/W | Noise Filter A Enable<br>0: The noise filter for the MTCLKA pin is disabled.<br>1: The noise filter for the MTCLKA pin is enabled. |
| b1 | NFBEN | 0 | R/W | Noise Filter B Enable<br>0: The noise filter for the MTCLKB pin is disabled.<br>1: The noise filter for the MTCLKB pin is enabled. |
| b2 | NFCEN | 0 | R/W | Noise Filter C Enable<br>0: The noise filter for the MTCLKC pin is disabled.<br>1: The noise filter for the MTCLKC pin is enabled. |
| b3 | NFDEN | 0 | R/W | Noise Filter D Enable<br>0: The noise filter for the MTCLKD pin is disabled.<br>1: The noise filter for the MTCLKD pin is enabled. |
| b5, b4 | NFCS[1:0] | All 0 | R/W | Noise Filter Clock Select<br>b5 b4<br>0 0: P0$\phi$/1<br>0 1: P0$\phi$/2<br>1 0: P0$\phi$/8<br>1 1: P0$\phi$/32 |
| b7, b6 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

The NFCRC register is used in common with all channels and specifies the noise filter function of the external clock pins.

#### NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

#### NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

#### NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

#### NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

#### NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the input capture function.

## 16.2.34 Noise Filter Control Register 5 (NFCR5)

**Address(es):** MTU5.NFCR5 H'0_1000_1A95

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | NFCS[1:0] | | — | NFWEN | NFVEN | NFUEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | NFUEN | 0 | R/W | Noise Filter U Enable<br>0: The noise filter for the MTIC5U pin is disabled.<br>1: The noise filter for the MTIC5U pin is enabled. |
| b1 | NFVEN | 0 | R/W | Noise Filter V Enable<br>0: The noise filter for the MTIC5V pin is disabled.<br>1: The noise filter for the MTIC5V pin is enabled. |
| b2 | NFWEN | 0 | R/W | Noise Filter W Enable<br>0: The noise filter for the MTIC5W pin is disabled.<br>1: The noise filter for the MTIC5W pin is enabled. |
| b3 | — | 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b5, b4 | NFCS[1:0] | All 0 | R/W | Noise Filter Clock Select<br>b5 b4<br>0 0: P0ϕ/1<br>0 1: P0ϕ/8<br>1 0: P0ϕ/32<br>1 1: Clock source for counting |
| b7, b6 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

### NFUEN Bit (Noise Filter U Enable)

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

### NFVEN Bit (Noise Filter V Enable)

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

### NFWEN Bit (Noise Filter W Enable)

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

### NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

## 16.2.35 Timer A/D Converter Start Request Control Register (TADCR)

### (1) MTU4.TADCR

**Address(es):** MTU4.TADCR H'0_1000_1240

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| b6 | DT4AE | 0 | R/W | Down-Count TRG4AN Enable*3<br>0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT down-count operation<br>1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT down-count operation |
| b7 | UT4AE | 0 | R/W | Up-Count TRG4AN Enable<br>0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation<br>1: A/D converter up requests (TRG4AN) enabled during MTU4.TCNT down-count operation |
| b13 to b8 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b15, b14 | BF[1:0] | All 0 | R/W | MTU4.TADCOBRA/TADCOBRB Transfer Timing Select<br>See **Table 16.54** for details.<br>These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB. |

**Note:** The TADCR register in MTU4 must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T3AEN or T4VEN bit in TITCR1A is cleared to 0 or the T3ACOR or T4VCOR bits in TITCR1A are cleared to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.

Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

Table 16.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4)

| Bit 15 | Bit 14 | Description | | | |
|---|---|---|---|---|---|
| BF[1] | BF[0] | Complementary PWM Mode | Reset-Synchronized PWM Mode | PWM Mode 1 | Normal Mode |
| 0 | 0 | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4). | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4). | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4). | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4). |
| 0 | 1 | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest of the TCNT count in MTU4. | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU3. | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4. | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4. |
| 1 | 0 | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the trough of the TCNT count in MTU4. | Setting prohibited | Setting prohibited | Setting prohibited |
| 1 | 1 | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest and trough of the TCNT count in MTU4. | Setting prohibited | Setting prohibited | Setting prohibited |

### (2) MTU7.TADCR

**Address(es):** MTU7.TADCR H'0_1000_1A40

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

| b13 to b8 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b15, b14 | BF[1:0] | All 0 | R/W | MTU7.TADCOBRA/TADCOBRB Transfer Timing Select<br>See **Table 16.55** for details.<br>These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB. |

**Note:** The TADCR register in MTU7 must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T6AEN or T7VEN bit in TITCR1B is cleared to 0 or the T6ACOR or T7VCOR bits in TITCR1B are cleared to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.

Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

Table 16.55 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7)

| Bit 15 | Bit 14 | Description | | | |
|---|---|---|---|---|---|
| BF[1] | BF[0] | Complementary PWM Mode | Reset-Synchronized PWM Mode | PWM Mode 1 | Normal Mode |
| 0 | 0 | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7). | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7). | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7). | Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7). |
| 0 | 1 | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest of the TCNT count in MTU7. | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU6. | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7. | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7. |
| 1 | 0 | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the trough of the TCNT count in MTU7. | Setting prohibited | Setting prohibited | Setting prohibited |
| 1 | 1 | Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest and trough of the TCNT count in MTU7. | Setting prohibited | Setting prohibited | Setting prohibited |

## 16.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB)

**Address(es):** MTU4.TADCORA H'0_1000_1244, MTU4.TADCORB H'0_1000_1246, MTU7.TADCORA H'0_1000_1A44, MTU7.TADCORB H'0_1000_1A46

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TADCORA and TADCORB must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. When the A/D converter start request delaying function linked with skipping function 1 (for details, see **Section 16.3.9(5), A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1**) is used, the value of this register should be H'0002 to TCDRA setting - 2 in MTU4 and H'0002 to TCDRB setting - 2 in MTU7.

Note 2. When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

(1) When skipping function 2 is specified with the skipping count set to 0
- The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
- The TADCORA compare interval should be equal to or greater than 4 P0ϕ cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value - 4 or smaller).
- The TADCORB compare interval should be equal to or greater than 4 P0ϕ cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value - 4 or smaller).

(2) When skipping function 2 is specified with the skipping count set to 1 or greater
- The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
- The TADCORB compare interval should be equal to or greater than 2 P0ϕ cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value - 2 or smaller).

TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.

MTUn.TADCORA and TADCORB are initialized to H'FFFF by a reset.

## 16.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA and TADCOBRB)

**Address(es):** MTU4.TADCORA H'0_1000_1248, MTU4.TADCORB H'0_1000_124A, MTU7.TADCORA H'0_1000_1A48, MTU7.TADCORB H'0_1000_1A4A

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Note:** TADCOBRA and TADCOBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.

TADCOBRA and TADCOBRB are initialized to H'FFFF by a reset.

## 16.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB)

**Address(es):** MTU.TITMRA H'0_1000_123A, MTU.TITMRB H'0_1000_1A3A

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TITM |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | TITM | 0 | R/W | Interrupt Skipping Function Select<br>Selects one of the two types of interrupt skipping functions.<br>0: Selects interrupt skipping function 1*1<br>1: Selects interrupt skipping function 2*2 |
| b7 to b1 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. TITCR1A or TITCR1B is used to enable interrupt skipping function 1.

Note 2. TITCR2A or TITCR2B is used to enable interrupt skipping function 2.

TITMRA and TITMRB are used to select either of two skipping functions for the TITMRA and TITMRB registers.

## 16.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B)

### (1) MTU.TITCR1A

**Address(es):** MTU.TITMRA H'0_1000_1230

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | T3AEN | T3ACOR[2:0] | | | T4VEN | T4VCOR[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | T4VCOR[2:0] | All 0 | R/W | TCIV4 Interrupt Skipping Count Setting<br>These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1<br>For details, see **Table 16.56**. |
| b3 | T4VEN | 0 | R/W | T4VEN<br>0: TCIV4 interrupt skipping disabled<br>1: TCIV4 interrupt skipping enabled |
| b6 to b4 | T3ACOR[2:0] | All 0 | R/W | TGIA3 Interrupt Skipping Count Setting<br>These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7.<br>For details, see **Table 16.57**. |
| b7 | T3AEN | 0 | R/W | T3AEN<br>0: TGIA3 interrupt skipping disabled<br>1: TGIA3 interrupt skipping enabled |

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

### (2) MTU.TITCR1B

**Address(es):** MTU.TITCR1B H'0_1000_1A30

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | T6AEN | T6ACOR[2:0] | | | T7VEN | T7VCOR[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | T7VCOR[2:0] | All 0 | R/W | TCIV7 Interrupt Skipping Count Setting<br>These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1<br>For details, see **Table 16.58**. |
| b3 | T7VEN | 0 | R/W | T7VEN<br>0: TCIV7 interrupt skipping disabled<br>1: TCIV7 interrupt skipping enabled |
| b6 to b4 | T6ACOR[2:0] | All 0 | R/W | TGIA6 Interrupt Skipping Count Setting<br>These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1<br>For details, see **Table 16.59**. |
| b7 | T6AEN | 0 | R/W | T6AEN<br>0: TGIA6 interrupt skipping disabled<br>1: TGIA6 interrupt skipping enabled |

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

TITCR1A and TITCR1B enable or disable interrupt skipping and specify the interrupt skipping count.

The setting in the TITCR1A (TITCR1B) register is valid only while the TITM bit in TITMRA (TITMRB) is set to 0; when the TITM bit in TITMRA (TITMRB) is set to 1, the setting in TITCR1A (TITCR1B) is cleared.

Table 16.56 Setting of Interrupt Skipping Count by T4VCOR[2:0] Bits

| Bit 2 | Bit 1 | Bit 0 | |
|---|---|---|---|
| T4VCOR2 | T4VCOR1 | T4VCOR0 | Description |
| 0 | 0 | 0 | Does not skip TCIV4 interrupts. |
| | | 1 | Sets the TCIV4 interrupt skipping count to 1. |
| | 1 | 0 | Sets the TCIV4 interrupt skipping count to 2. |
| | | 1 | Sets the TCIV4 interrupt skipping count to 3. |
| 1 | 0 | 0 | Sets the TCIV4 interrupt skipping count to 4. |
| | | 1 | Sets the TCIV4 interrupt skipping count to 5. |
| | 1 | 0 | Sets the TCIV4 interrupt skipping count to 6. |
| | | 1 | Sets the TCIV4 interrupt skipping count to 7. |

## 16.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B)

### (1) MTU.TITCNT1A

**Address(es):** MTU.TITCNT1A H'0_1000_1231

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | T3ACNT[2:0] | | | — | T4VCNT[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | T4VCNT[2:0] | All 0 | R | TCIV4 Interrupt Counter<br>While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs. |
| b3 | — | 0 | R | Reserved<br>This bit is read as 0. |
| b6 to b4 | T3ACNT[2:0] | All 0 | R | TGIA3 Interrupt Counter<br>While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs. |
| b7 | — | 0 | R | Reserved<br>This bit is read as 0. |

**Note:** To clear the TITCNT1A, clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A and TITCNT1B are 8-bit readable/writable counters. TITCNTA and TITCNTB retain their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

#### T4VCNT[2:0] Bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is cleared to 0
- When the T4VCOR[2:0] bits in TITCR1A are cleared to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

#### T3ACNT[2:0] Bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is cleared to 0
- When the T3ACOR[2:0] bits in TITCR1A are cleared to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

### (2) MTU.TITCNT1B

**Address(es):** MTU.TITCNT1B H'0_1000_1A31

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | T6ACNT[2:0] | | | — | T7VCNT[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | T7VCNT[2:0] | All 0 | R | TCIV7 Interrupt Counter<br>While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs. |
| b3 | — | 0 | R | Reserved<br>This bit is read as 0. |
| b6 to b4 | T6ACNT[2:0] | All 0 | R | TGIA6 Interrupt Counter<br>While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs. |
| b7 | — | 0 | R | Reserved<br>This bit is read as 0. |

**Note:** To clear the TITCNT1B, clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

#### T7VCNT[2:0] Bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is cleared to 0
- When the T7VCOR[2:0] bits in TITCR1B are cleared to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

#### T6ACNT[2:0] Bits (TGIA6 Interrupt Counter)

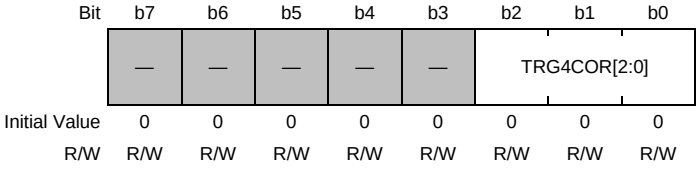
[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is cleared to 0
- When the T6ACOR[2:0] bits in TITCR1B are cleared to 000b
- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

## 16.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B)

### (1) MTU.TITCR2A

**Address(es):** MTU.TITCR2A H'0_1000_123B



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TRG4COR [2:0] | All 0 | R/W | TRG4AN/TRG4BN Interrupt Skipping Count Setting<br>These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7.<br>For details, see **Table 16.60**. |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

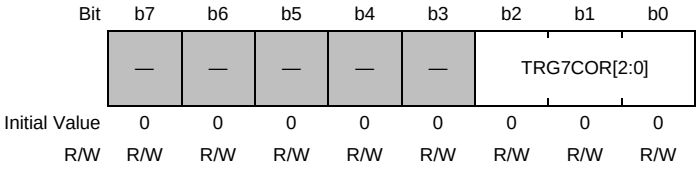
TITCR2A and TITCR2B specify the interrupt skipping count for TRG4AN and TRG4BN (TRG7AN and TRG7BN). This setting is valid only while TITMRA or TITMRB is set to 1.

Table 16.60 Setting of Interrupt Skipping Count by TRG4COR[2:0] Bits

| Bit 2 | Bit 1 | Bit 0 | |
|---|---|---|---|
| TRG4COR2 | TRG4COR1 | TRG4COR0 | Description |
| 0 | 0 | 0 | Does not skip TRG4AN and TRG4BN interrupts. |
| | | 1 | Sets the TRG4AN and TRG4BN interrupt skipping count to 1. |
| | 1 | 0 | Sets the TRG4AN and TRG4BN interrupt skipping count to 2. |
| | | 1 | Sets the TRG4AN and TRG4BN interrupt skipping count to 3. |
| 1 | 0 | 0 | Sets the TRG4AN and TRG4BN interrupt skipping count to 4. |
| | | 1 | Sets the TRG4AN and TRG4BN interrupt skipping count to 5. |
| | 1 | 0 | Sets the TRG4AN and TRG4BN interrupt skipping count to 6. |
| | | 1 | Sets the TRG4AN and TRG4BN interrupt skipping count to 7. |

### (2) MTU.TITCR2B

**Address(es):** MTU.TITCR2B H'0_1000_1A3B



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TRG7COR [2:0] | All 0 | R/W | TRG7AN/TRG7BN Interrupt Skipping Count Setting<br>These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7.<br>For details, see **Table 16.61**. |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Table 16.61 Setting of Interrupt Skipping Count by TRG7COR[2:0] Bits

| Bit 2 | Bit 1 | Bit 0 | |
|---|---|---|---|
| TRG7COR2 | TRG7COR1 | TRG7COR0 | Description |
| 0 | 0 | 0 | Does not skip TRG7AN and TRG7BN interrupts. |
| | | 1 | Sets the TRG7AN and TRG7BN interrupt skipping count to 1. |
| | 1 | 0 | Sets the TRG7AN and TRG7BN interrupt skipping count to 2. |
| | | 1 | Sets the TRG7AN and TRG7BN interrupt skipping count to 3. |
| 1 | 0 | 0 | Sets the TRG7AN and TRG7BN interrupt skipping count to 4. |
| | | 1 | Sets the TRG7AN and TRG7BN interrupt skipping count to 5. |
| | 1 | 0 | Sets the TRG7AN and TRG7BN interrupt skipping count to 6. |
| | | 1 | Sets the TRG7AN and TRG7BN interrupt skipping count to 7. |

## 16.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B)

### (1) MTU.TITCNT2A

**Address(es):** MTU.TITCNT2A H'0_1000_123C

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TRG4CNT[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TRG4CNT [2:0] | All 0 | R | TRG4AN/TRG4BN Interrupt Counter<br>These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid. |
| b7 to b3 | — | All 0 | R | Reserved<br>These bits are read as 0. |

TITCNT2A and TITCNT2B start counting from the values set in the TRG4COR[2:0] and TRG7COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN (TITCNT2A) is generated or TRG7AN or TRG7BN (TITCNT2B) is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts or the TRG7AN and TRG7BN interrupts become valid.

#### TRG4CNT[2:0] Bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are cleared to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

### (2) MTU.TITCNT2B

**Address(es):** MTU.TITCNT2B H'0_1000_1A3C

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TRG7CNT[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | TRG7CNT [2:0] | All 0 | R | TRG7AN/TRG7BN Interrupt Counter<br>These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid. |
| b7 to b3 | — | All 0 | R | Reserved<br>These bits are read as 0. |

#### TRG7CNT[2:0] Bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0
- When the TRG7COR[2:0] bits in TITCR2B are cleared to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

### 16.2.43 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Access these registers in 32-bit units.

Excluding MTU8, the timer counters (MTU0.TCNT to MTU7.TCNT), general registers (MTU0.TGRn to MTU7.TGRn), timer subcounters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/ write is not allowed. Access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. Read from/write to these registers in 8-bit units.

# 16.3 Operation

## 16.3.1 Basic Functions

Each channel has TCNT and TGR. TCNT in each channel performs up-counting and is also capable of free-running count, periodic count, and external event count operations.

Each TGR can be used as an input capture register or an output compare register.

### (1) Counter Operation

When one of bits CST0 to CST4 and CST8 in TSTRA, bits CST6 and CST7 in TSTRB, and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR is set to 1, TCNT for the corresponding channel begins counting. TCNT can perform various count operations such as free-running count or periodic count operations.

#### (a) Example of Count Operation Setting Procedure

**Figure 16.5** shows an example of the count operation setting procedure.

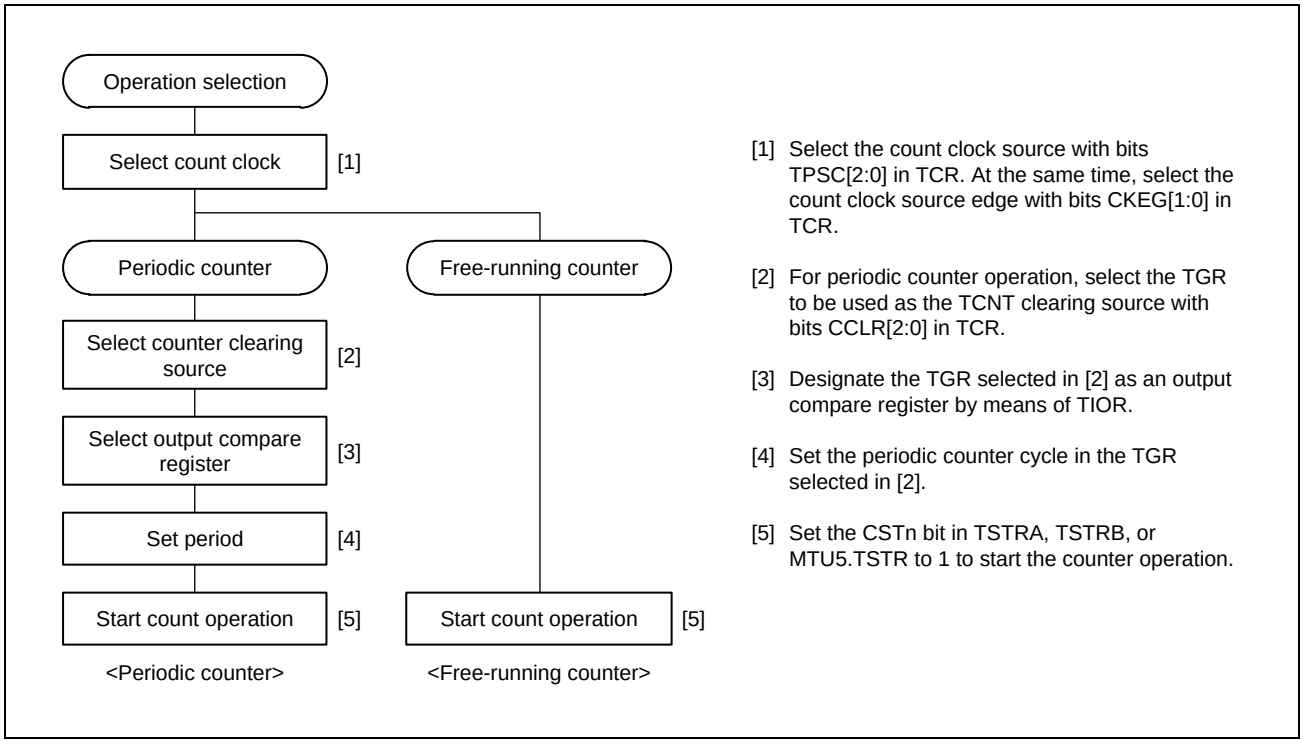


Figure 16.5 Example of Count Operation Setting Procedure

### (b) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, all TCNT counters are designated as free-running counters. When the CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1, the corresponding TCNT counter starts up-counting as a free-running counter. When TCNT overflows (from H'FFFF to H'0000), if the corresponding TIER.TCIEV bit is 1, an interrupt request is issued to the CPU. After an overflow, TCNT starts counting up again from H'0000.

**Figure 16.6** illustrates free-running counter operation.

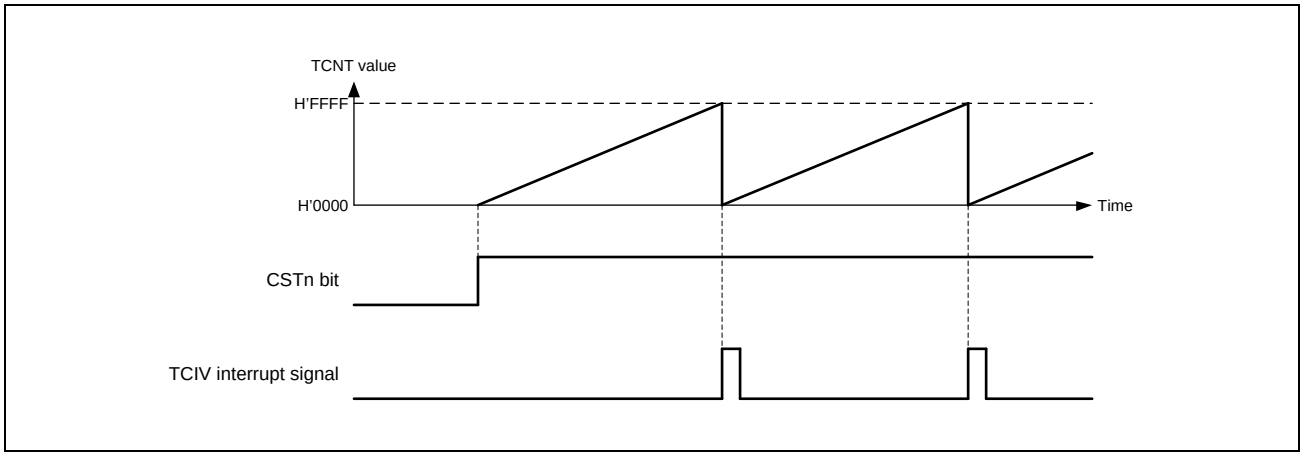

Figure 16.6 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-counting as a periodic counter when the corresponding CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1. When the count matches the value in TGR, TCNT is cleared to H'0000.

If the value of the corresponding TIER.TGIE bit is 1 at this point, an interrupt request is issued to the CPU. After a compare match, TCNT starts counting up again from H'0000.

**Figure 16.7** illustrates periodic counter operation.

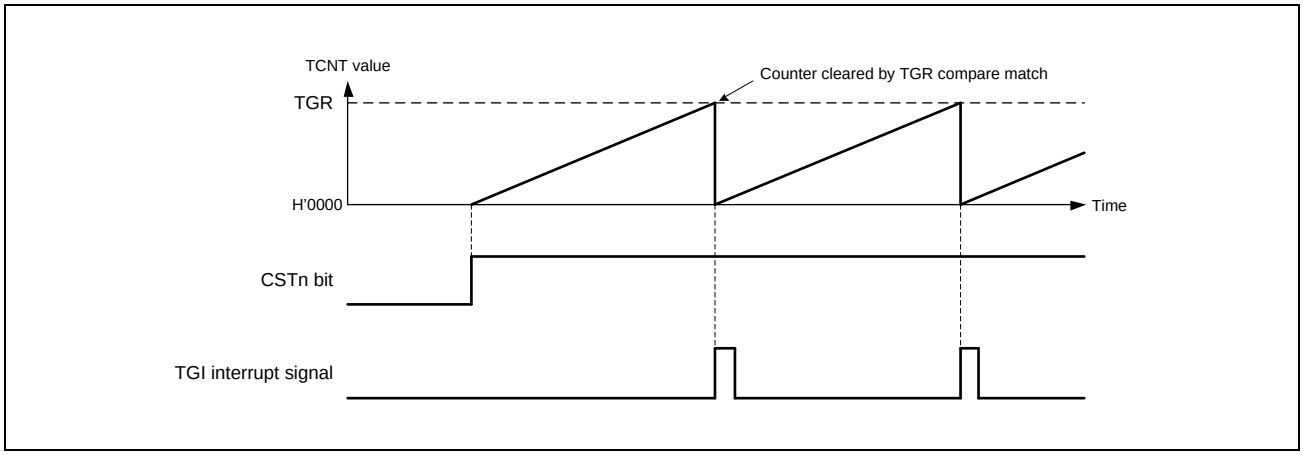

Figure 16.7 Periodic Counter Operation

### (2) Waveform Output by Compare Match

Upon compare match, low, high, or toggle output from the corresponding pin can be performed. The compare match output operation is not available in MTU5.

#### (a) Example of Procedure for Setting Waveform Output by Compare Match

**Figure 16.8** shows an example of the procedure for setting waveform output by compare match

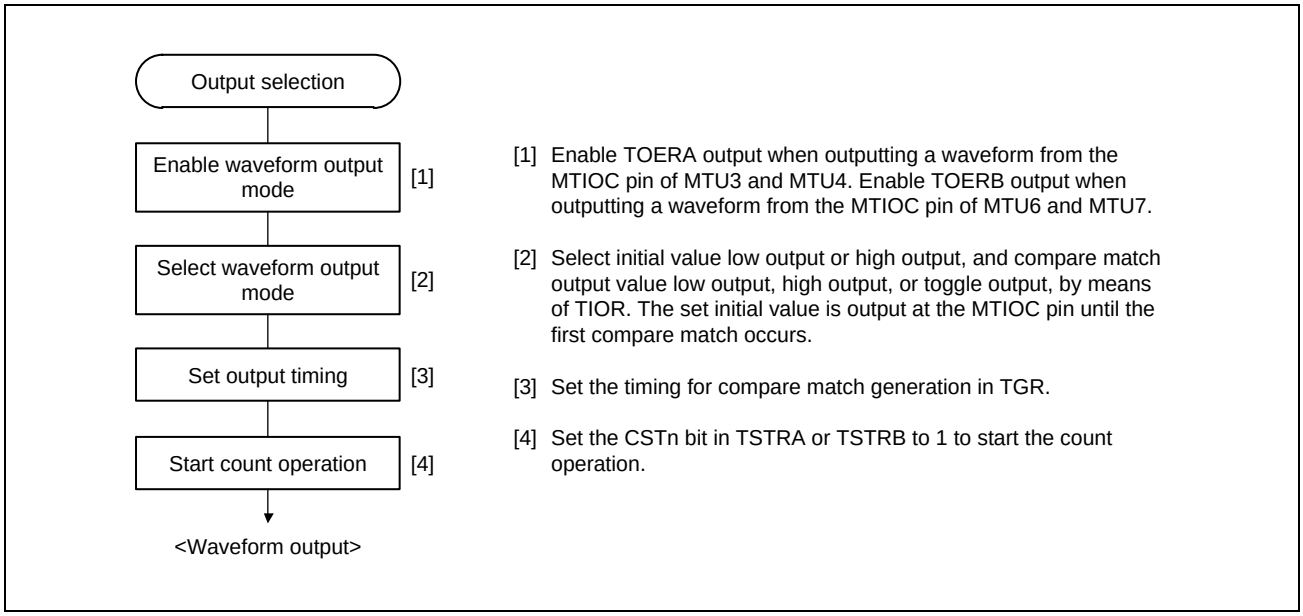

Figure 16.8 Example of Procedure for Setting Waveform Output by Compare Match

### (b) Examples of Waveform Output Operation

**Figure 16.9** shows an example of low output and high output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

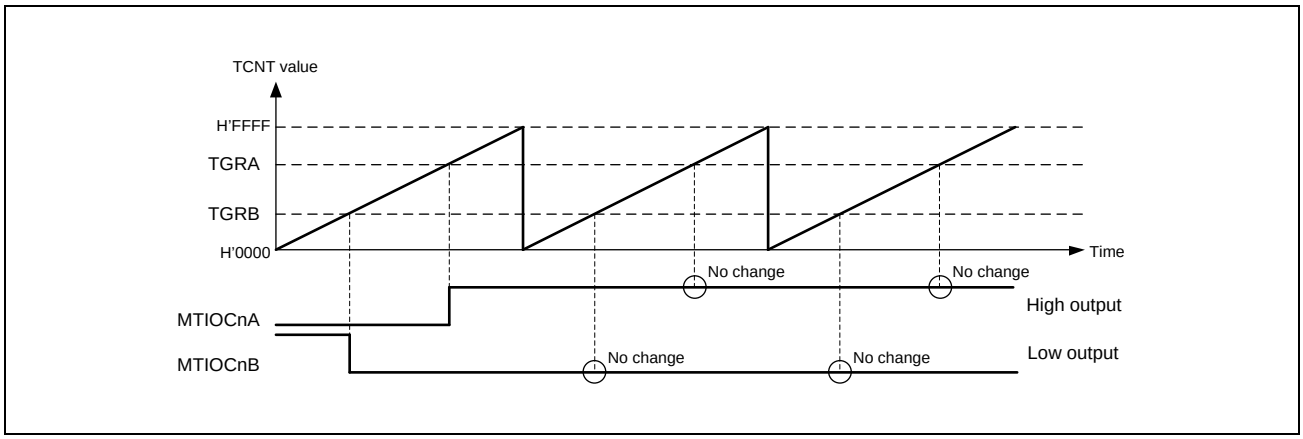

Figure 16.9 Example of low output and high output Operation (n = 0 to 4, 6, 7, 8)

**Figure 16.10** shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

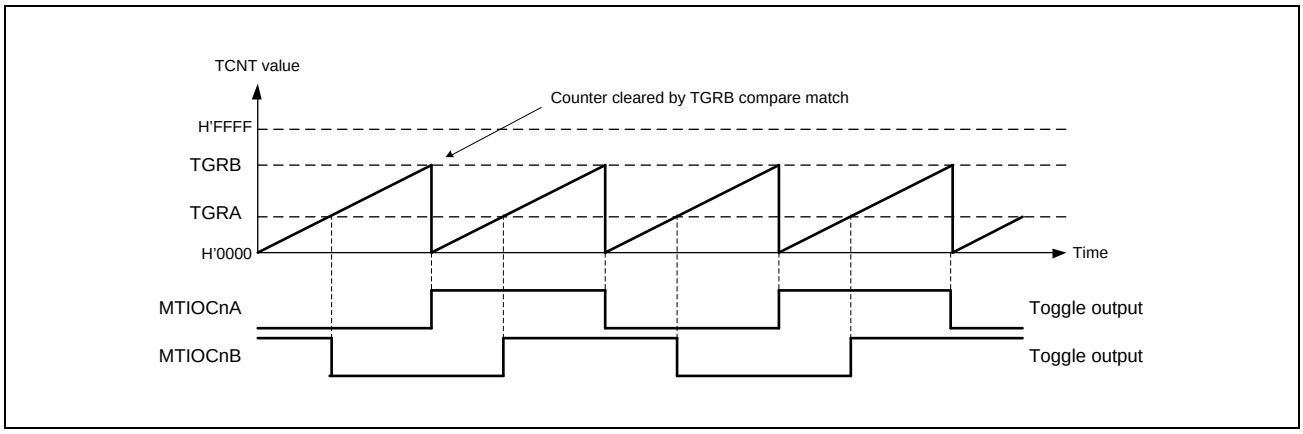

Figure 16.10 Example of Toggle Output Operation (n = 0 to 4, 6, 7, 8)

### (3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the MTIOCnm, MTIC5U, MTIC5V, or MTIC5W pin (n = 0 to 4, 6, 7, 8; m = A to D), input edge.

The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, another channel's count clock or compare match signal can also be specified as the input capture source.

NOTE

When another channel's count clock is used as the input capture input for MTU0 and MTU1, P0ϕ/1 should not be selected as the count clock used for input capture input. Input capture will not be generated if P0ϕ/1 is selected.

#### (a) Example of Input Capture Operation Setting Procedure

**Figure 16.11** shows an example of the input capture operation setting procedure.

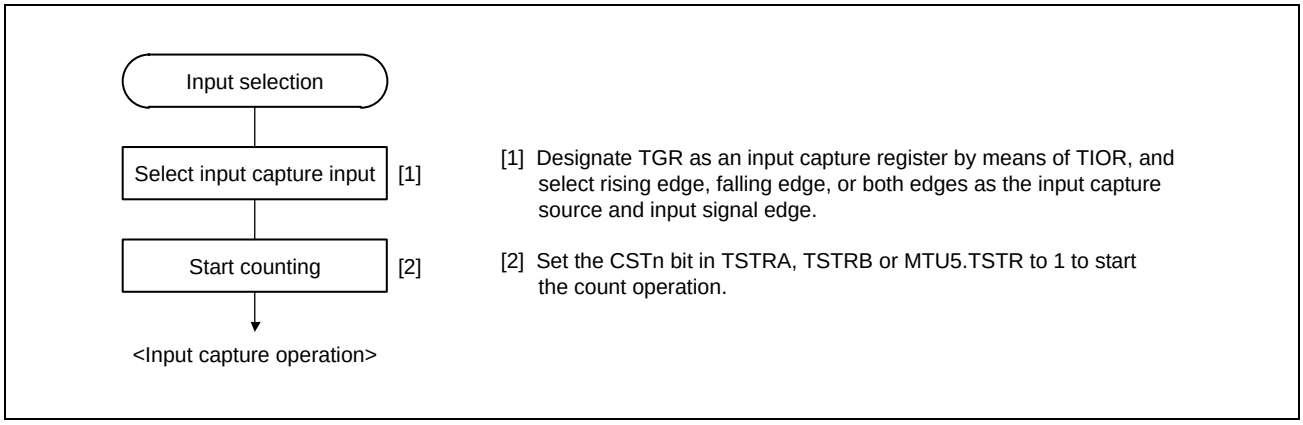

Figure 16.11 Example of Input Capture Operation Setting Procedure

### (b) Example of Input Capture Operation

**Figure 16.12** shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 8)

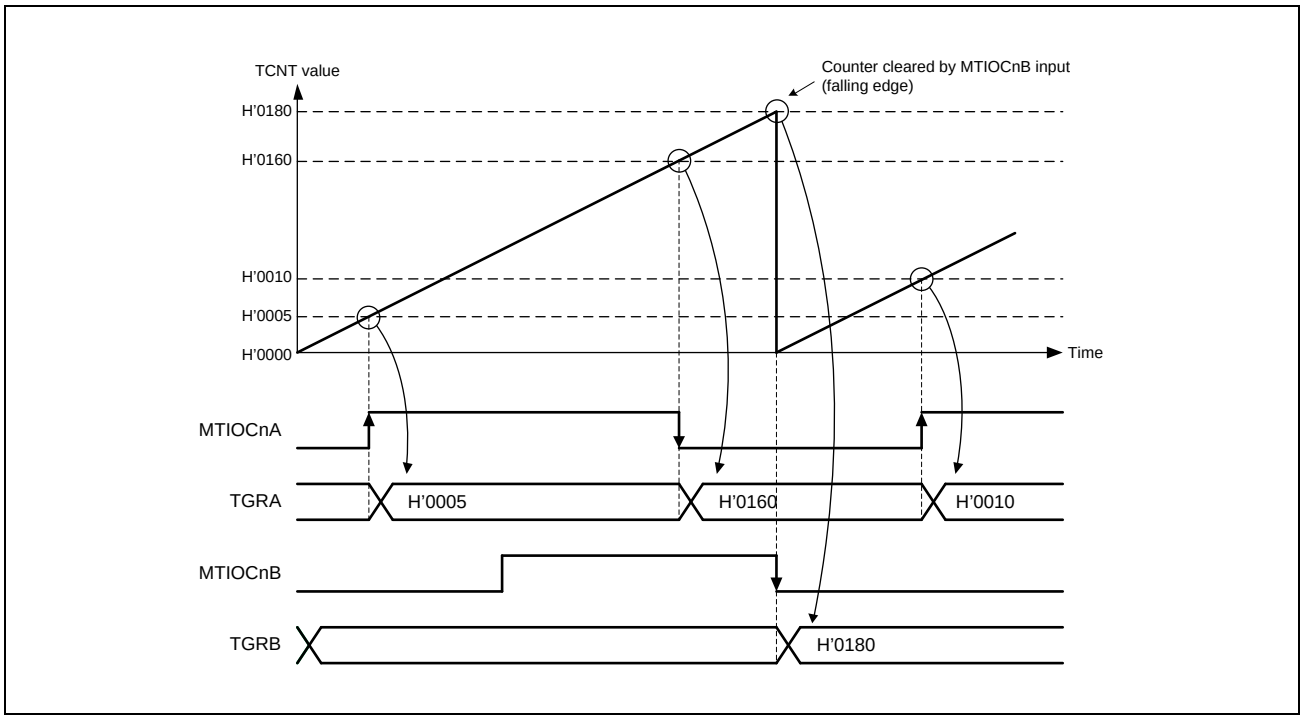

Figure 16.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 8)

## 16.3.2 Synchronous Operation

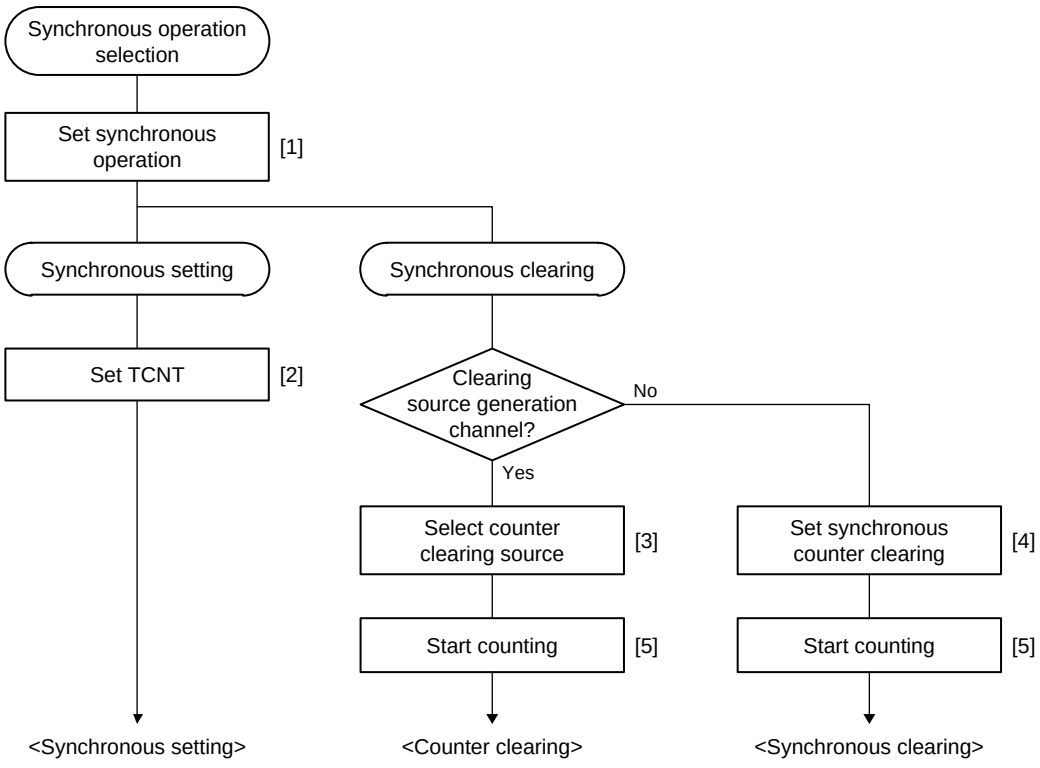
In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous setting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation can increase the number of TGR registers assigned to the same time base.

MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation. MTU5 and MTU8 cannot be used for synchronous operation.

### (1) Example of Synchronous Operation Setting Procedure

**Figure 16.13** shows an example of the synchronous operation setting procedure.



[1] Set to 1 in the SYNC bits in TSYRA and TSYRB corresponding to the channels to be designated for synchronous operation.
[2] When the TCNT counter of any of the channels designated for synchronous operation is written to, the same value is simultaneously written to the other TCNT counters.
[3] Use the CCLR[2:0] bits in TCR to specify TCNT clearing by input capture/output compare, etc.
[4] Use the CCLR[2:0] bits in TCR to designate synchronous clearing for the counter clearing source.
[5] Set to 1 in the CSTn bits in TSTRA and TSTRB for the relevant channels, to start the count operation.

Figure 16.13 Example of Synchronous Operation Setting Procedure

### (2) Example of Synchronous Operation

**Figure 16.14** shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU 2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.

Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous setting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.

For details of PWM modes, see **Section 16.3.5, PWM Modes**.

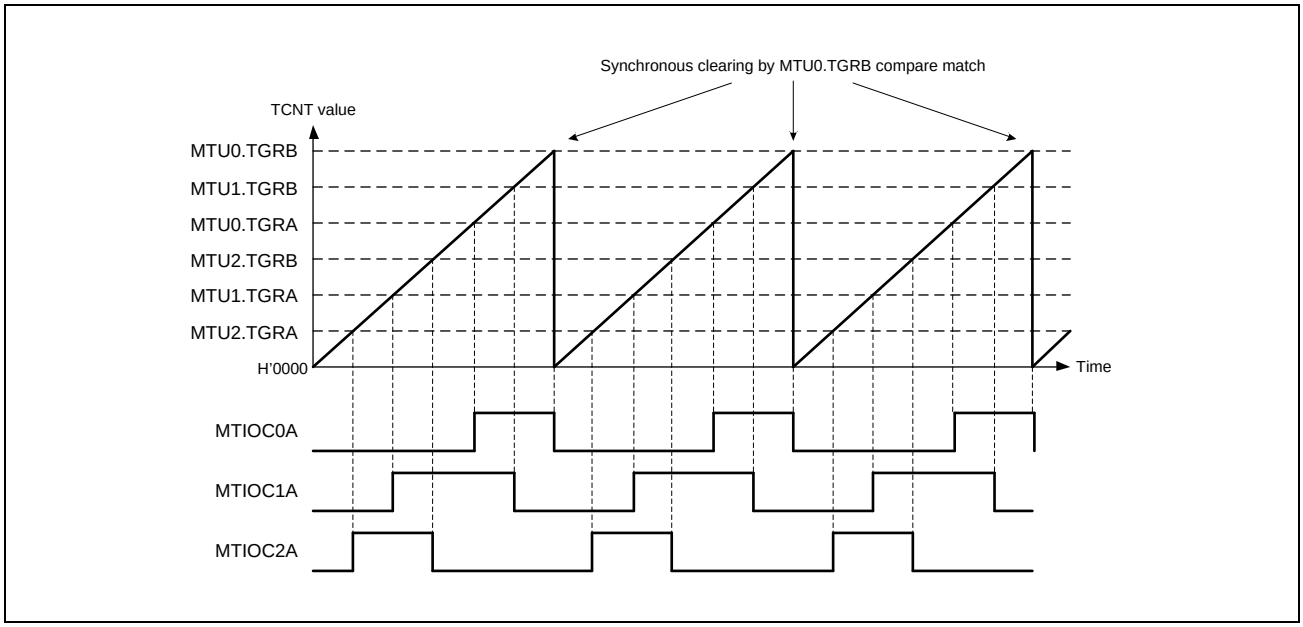


Figure 16.14 Example of Synchronous Operation

### 16.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

NOTE

MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

**Table 16.62** shows the register combinations used in buffer operation.

Table 16.62 Register Combinations in Buffer Operation

| Channel | Timer General Register | Buffer Register |
|---|---|---|
| MTU0 | TGRA | TGRC |
| | TGRB | TGRD |
| | TGRE | TGRF |
| MTU3 | TGRA | TGRC |
| | TGRB | TGRD |
| MTU4 | TGRA | TGRC |
| | TGRB | TGRD |
| MTU6 | TGRA | TGRC |
| | TGRB | TGRD |
| MTU7 | TGRA | TGRC |
| | TGRB | TGRD |
| MTU8 | TGRA | TGRC |
| | TGRB | TGRD |

#### When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in **Figure 16.15**.

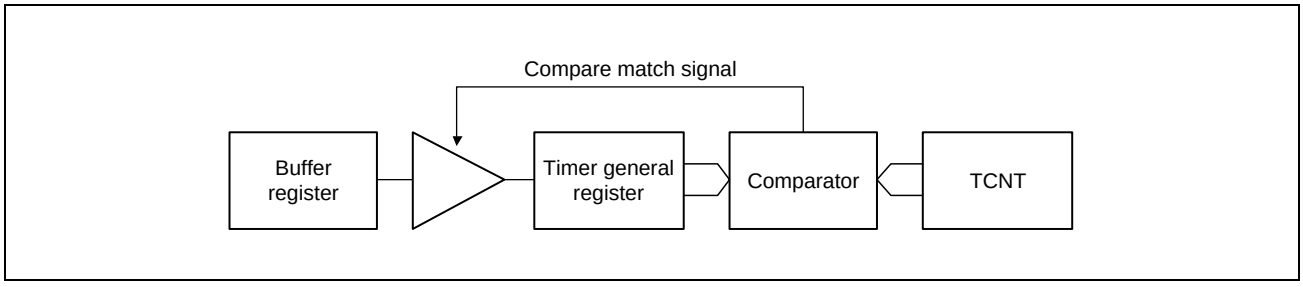

Figure 16.15 Compare Match Buffer Operation

### When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in **Figure 16.16**.

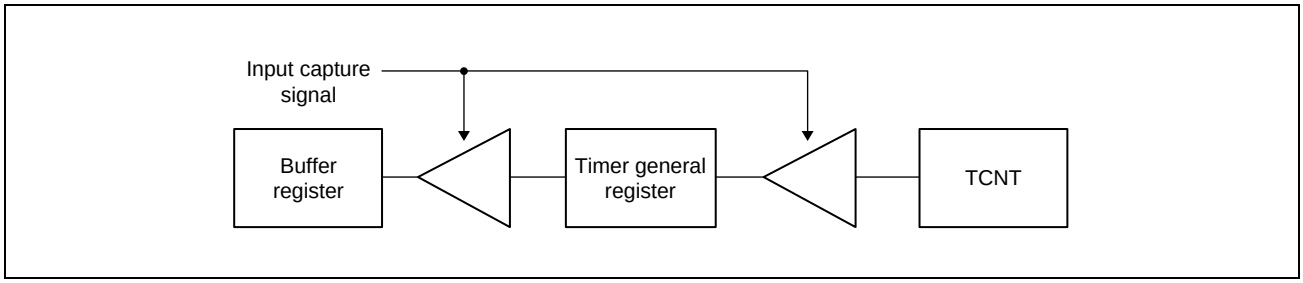

Figure 16.16 Input Capture Buffer Operation

### (1) Example of Buffer Operation Setting Procedure

**Figure 16.17** shows an example of the buffer operation setting procedure.

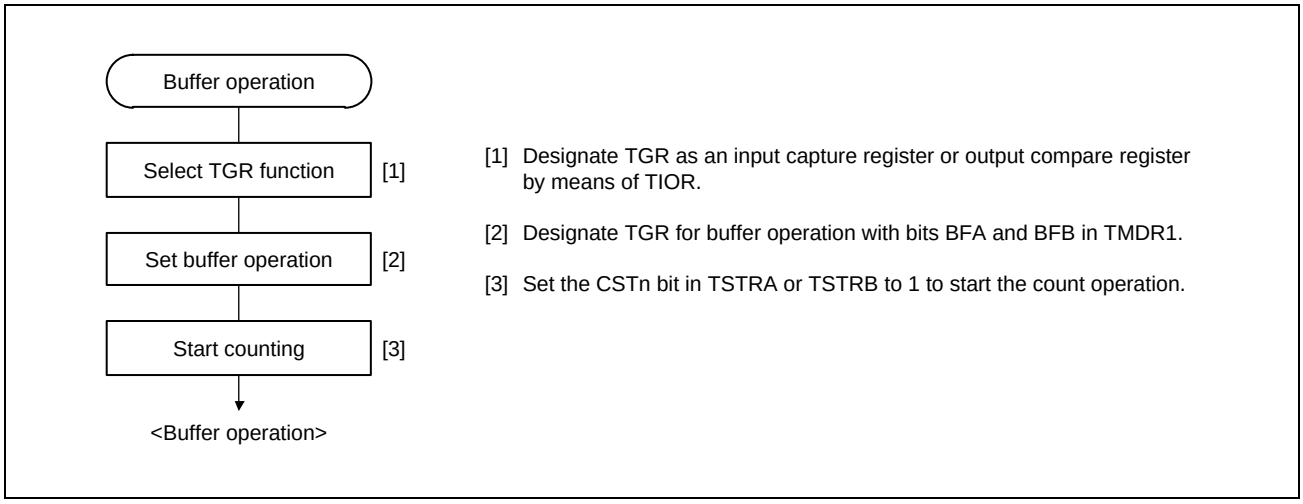

Figure 16.17 Example of Buffer Operation Setting Procedure

### (2) Examples of Buffer Operation

#### (a) When TGR is an Output Compare Register

**Figure 16.18** shows an operation example in which PWM mode 1 has been designated for MTU0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see **Section 16.3.5, PWM Modes**.

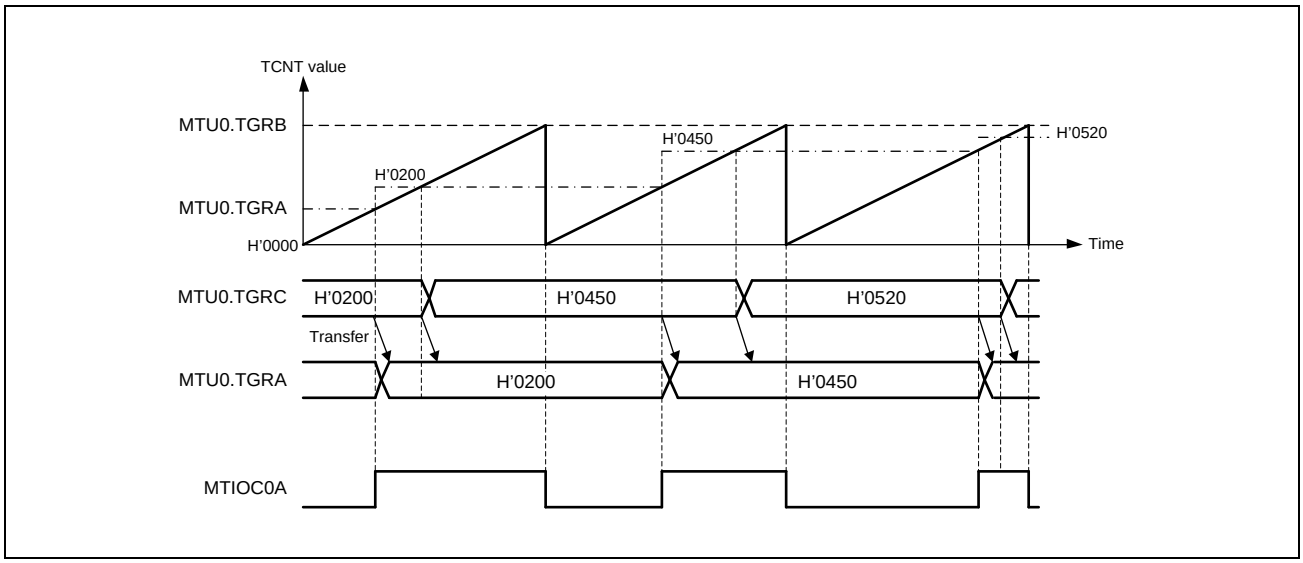

Figure 16.18 Example of Buffer Operation (1)

### (b) When TGR is an Input Capture Register

**Figure 16.19** shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 8)

As buffer operation has been set, when the TCNT value is transferred to TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

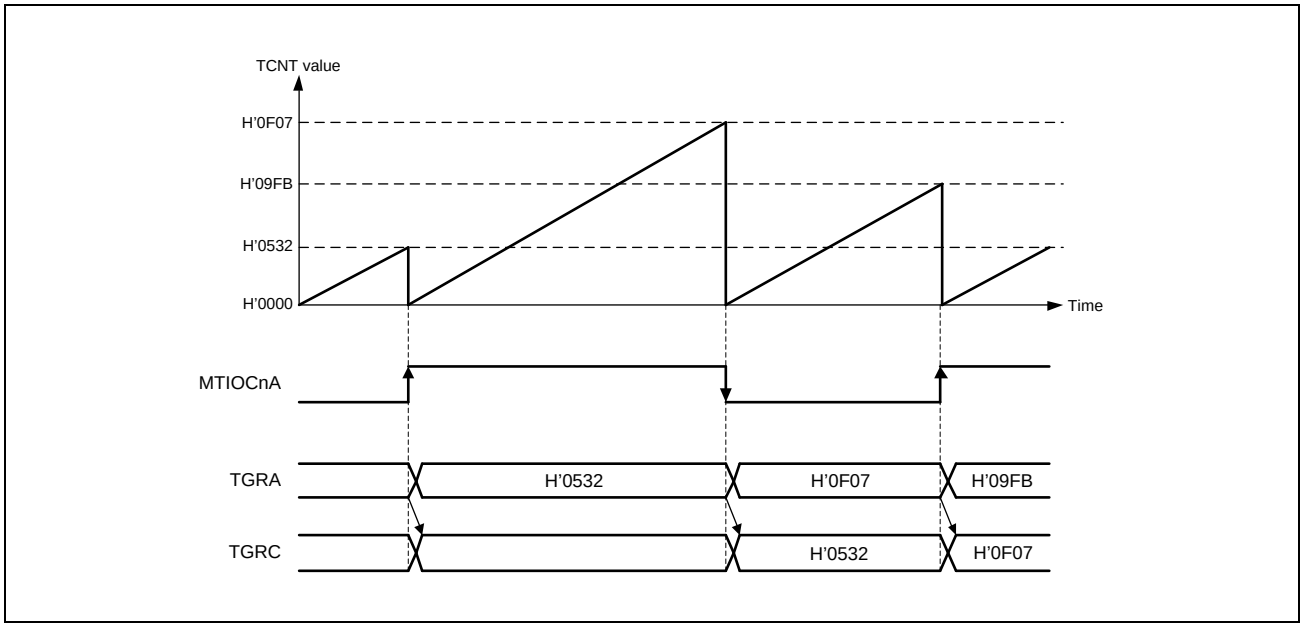

Figure 16.19 Example of Buffer Operation (2) (n = 0 to 4, 6, 7, 8)

### (3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, 7)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (H'FFFF to H'0000)
- When H'0000 is written to TCNT during counting
- When TCNT is cleared to H'0000 under the condition specified in the CCLR[2:0] bits in TCR

NOTE

TBTM must be modified only while TCNT stops.

**Figure 16.20** shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

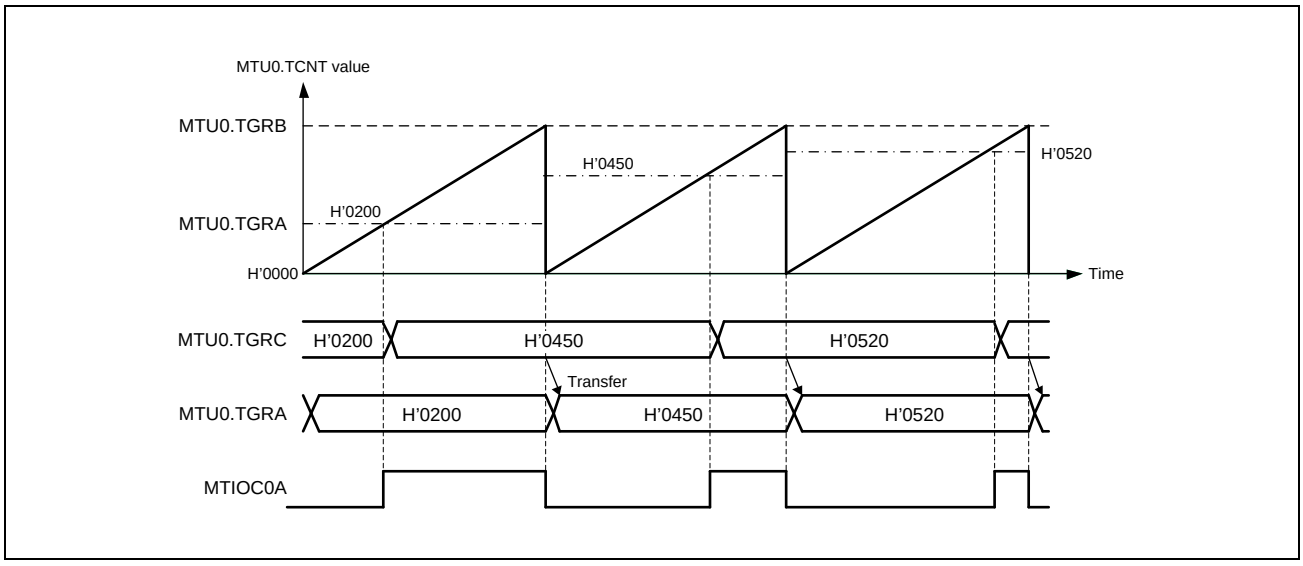

Figure 16.20 Example of Buffer Operation When MTU0.TCNT Clearing is Selected for MTU0.TGRC to MTU0.TGRA Transfer Timing

### 16.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.

There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, refer to **Section 16.3.6.2, Cascade Connection 32-Bit Phase Counting Mode**. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.

This function works when the LWA bit of TMDR3 in MTU1 is set to 0 and the TPSC[2:0] bits of TCR in MTU1 are set so that TCNT in MTU1 counts at an overflow/underflow of TCNT in MTU2.

Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

**Table 16.63** shows the register combinations used in cascaded operation.

NOTE

When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

Table 16.63 Cascaded Combinations

| Combination | Upper 16 Bits | Lower 16 Bits |
|---|---|---|
| MTU1 and MTU2 | MTU1.TCNT | MTU2.TCNT |

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection. For details, see **Section 16.3.4(4), Cascaded Operation Example (c)**. For input capture in cascade connection, refer to **Section 16.6.20, Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection**.

**Table 16.64** shows the TICCR setting and input capture input pins.

Table 16.64 TICCR Setting and Input Capture Input Pins

| Target Input Capture | TICCR Setting | Input Capture Input Pin |
|---|---|---|
| Input capture from MTU1.TCNT to MTU1.TGRA | I2AE bit = 0 (Initial value) | MTIOC1A |
| | I2AE bit = 1 | MTIOC1A, MTIOC2A |
| Input capture from MTU1.TCNT to MTU1.TGRB | I2BE bit = 0 (Initial value) | MTIOC1B |
| | I2BE bit = 1 | MTIOC1B, MTIOC2B |
| Input capture from MTU2.TCNT to MTU2.TGRA | I1AE bit = 0 (Initial value) | MTIOC2A |
| | I1AE bit = 1 | MTIOC2A, MTIOC1A |
| Input capture from MTU2.TCNT to MTU2.TGRB | I1BE bit = 0 (Initial value) | MTIOC2B |
| | I1BE bit = 1 | MTIOC2B, MTIOC1B |

### (1) Example of Cascaded Operation Setting Procedure

**Figure 16.21** shows an example of the cascaded operation setting procedure.

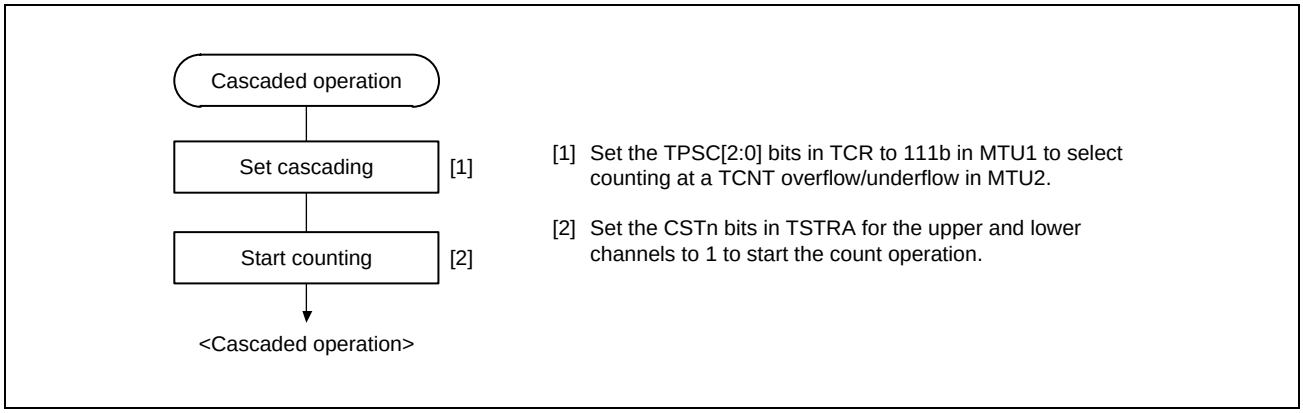

Figure 16.21 Cascaded Operation Setting Procedure

### (2) Cascaded Operation Example (a)

**Figure 16.22** shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode 1 while MTU1.TCNT and MTU2.TCNT are cascaded.

MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

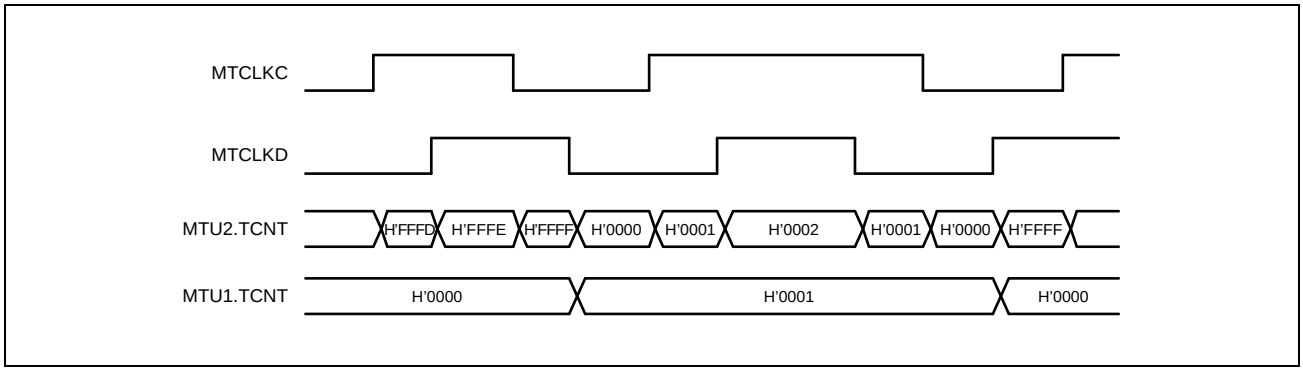

Figure 16.22 Cascaded Operation Example (a)

### (3) Cascaded Operation Example (b)

**Figure 16.23** illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.

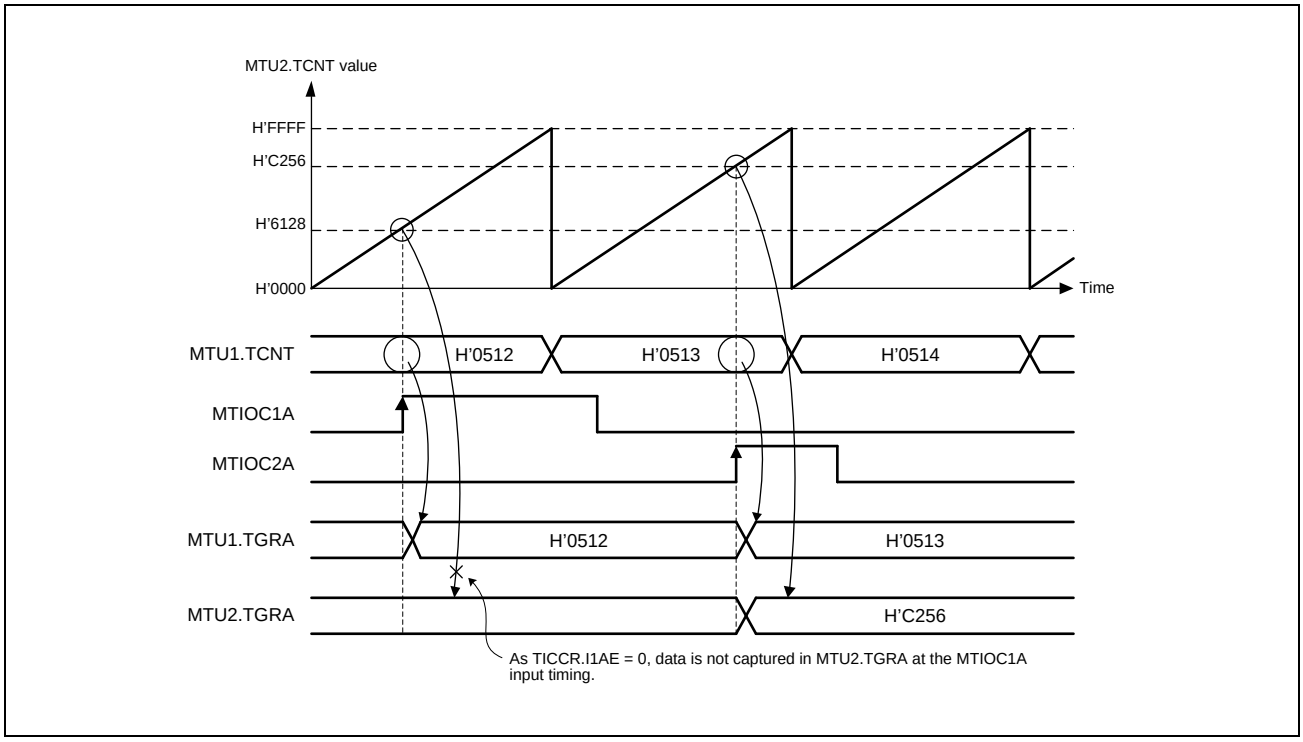

Figure 16.23 Cascaded Operation Example (b)

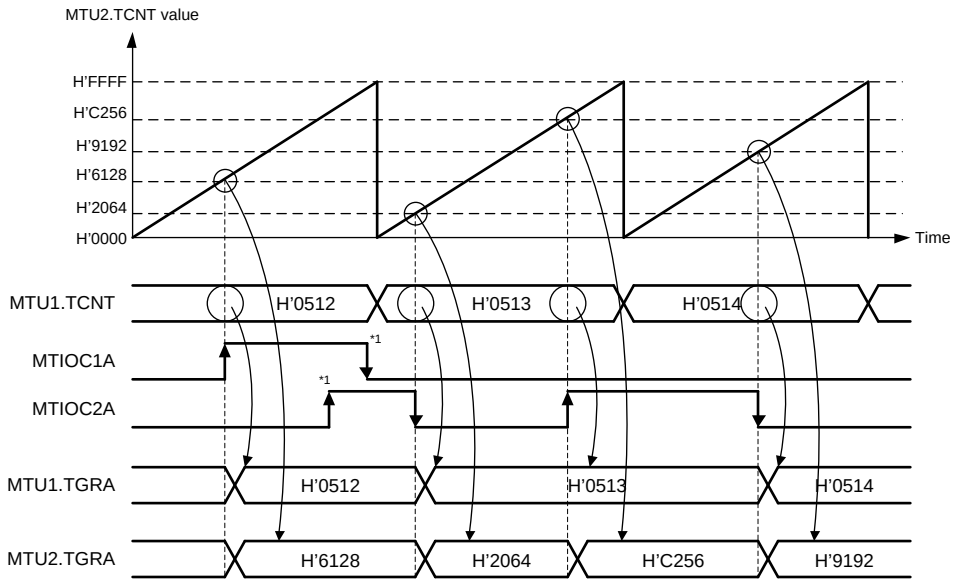
### (4) Cascaded Operation Example (c)

**Figure 16.24** illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.



Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 16.24 Cascaded Operation Example (c)

### (5) Cascaded Operation Example (d)

**Figure 16.25** illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

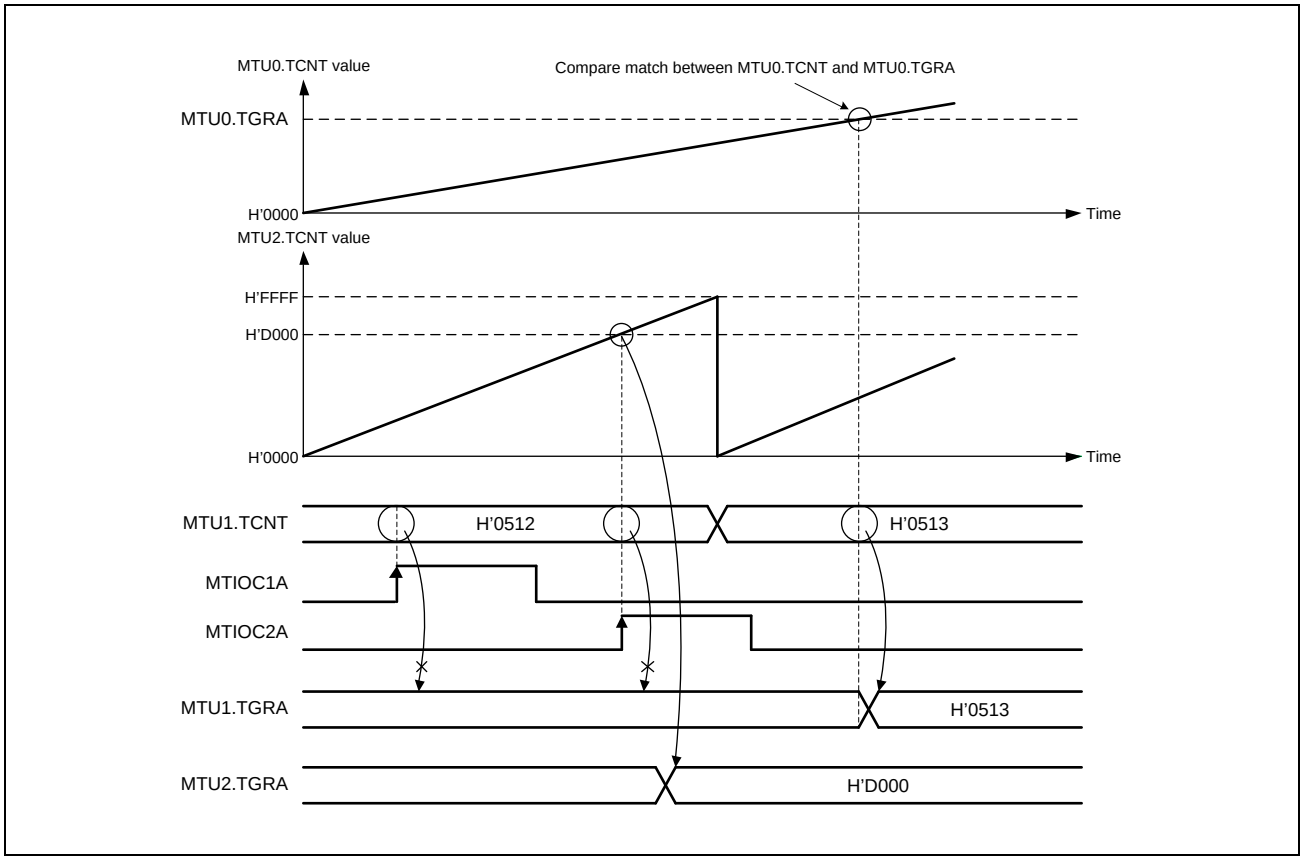


Figure 16.25 Cascaded Operation Example (d)

### 16.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.

PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.

By designating TGR compare match as the counter clearing source, the PWM cycle can be specified in that register. Every channel except MTU5 and MTU8 can be set to PWM mode independently. Synchronous operation is also possible between the channels placed in PWM mode or between a channel in PWM mode and another channel in a different mode.

There are two PWM modes as described below.

#### PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 12 phases can be output.

#### PWM Mode 2

PWM waveform output is generated using one TGR as the cycle register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a cycle register compare match, the initial value set in TIOR is output from each pin. If the values set in the cycle and duty registers are identical, the output value does not change even when a compare match occurs.

In PWM mode 2, up to eight phases of PWM waveforms can be output when synchronous clearing is used as synchronous operation in the channels that cannot be placed in PWM mode 2.

The correspondence between PWM output pins and registers is shown in **Table 16.65**.

Table 16.65 PWM Output Registers and Output Pins

| Channel | Register | Output Pins | |
|---|---|---|---|
| | | PWM Mode 1 | PWM Mode 2 |
| MTU0 | TGRA | MTIOC0A | MTIOC0A |
| | TGRB | | MTIOC0B |
| | TGRC | MTIOC0C | MTIOC0C |
| | TGRD | | MTIOC0D |
| MTU1 | TGRA | MTIOC1A | MTIOC1A |
| | TGRB | | MTIOC1B |
| MTU2 | TGRA | MTIOC2A | MTIOC2A |
| | TGRB | | MTIOC2B |
| MTU3 | TGRA | MTIOC3A | Setting prohibited |
| | TGRB | | |
| | TGRC | MTIOC3C | |
| | TGRD | | |
| MTU4 | TGRA | MTIOC4A | |
| | TGRB | | |
| | TGRC | MTIOC4C | |
| | TGRD | | |
| MTU6 | TGRA | MTIOC6A | |
| | TGRB | | |
| | TGRC | MTIOC6C | |
| | TGRD | | |
| MTU7 | TGRA | MTIOC7A | |
| | TGRB | | |
| | TGRC | MTIOC7C | |
| | TGRD | | |

**Note:** In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM cycle is set.

### (1) Example of PWM Mode Setting Procedure

**Figure 16.26** shows an example of the PWM mode setting procedure.

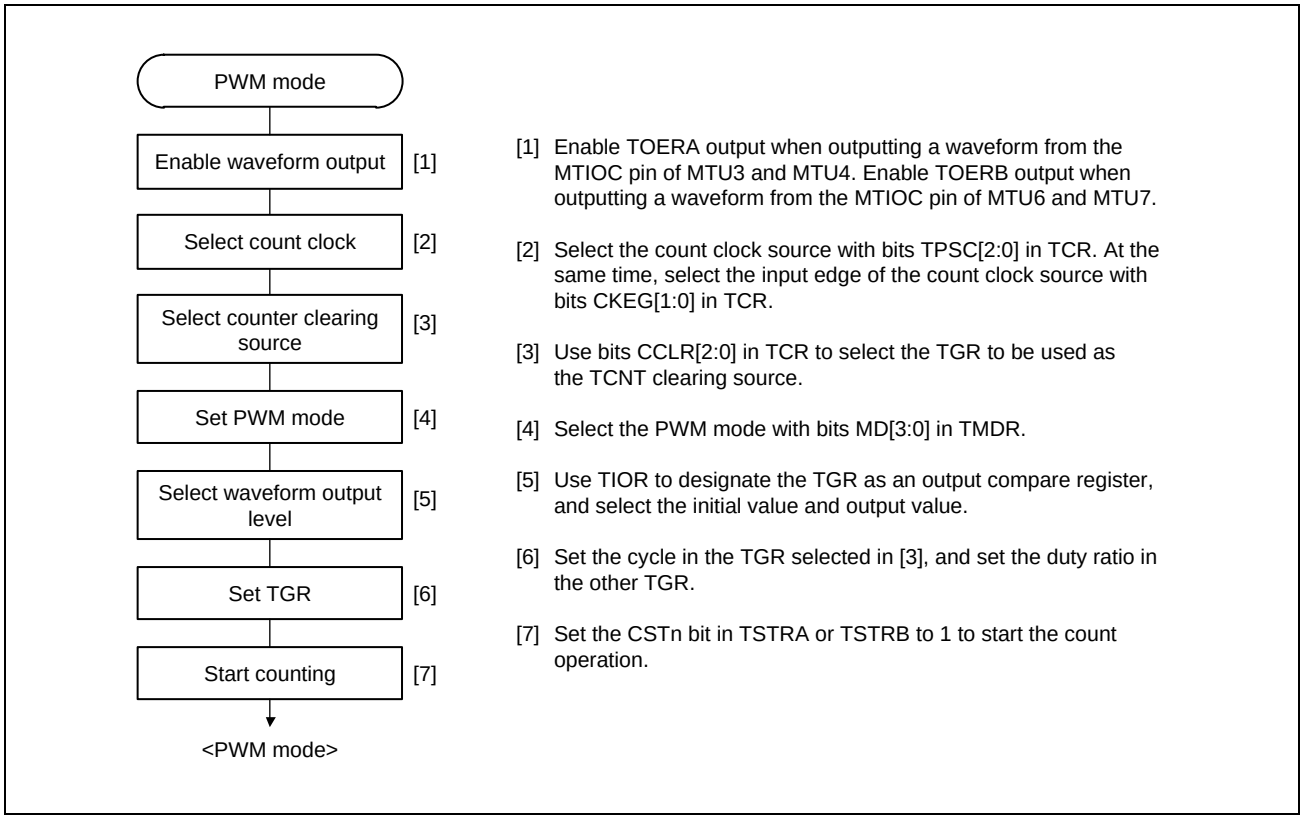

Figure 16.26 Example of PWM Mode Setting Procedure

### (2) Examples of PWM Mode Operation

**Figure 16.27** shows an example of operation in PWM mode 1.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.

In this case, the value set in TGRA is used as the cycle, and the value set in TGRB is used as the duty ratio.

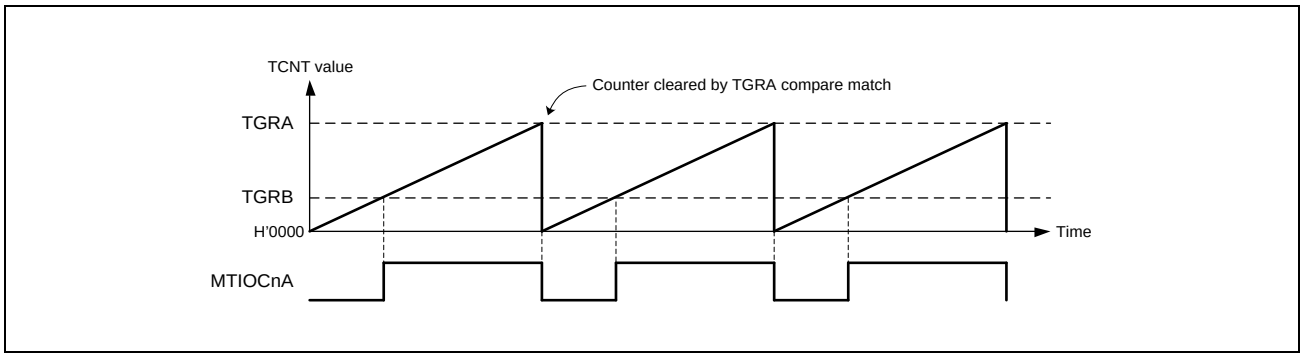

Figure 16.27 Example of PWM Mode 1 Operation (n = 0 to 4, 6, 7)

**Figure 16.28** shows an example of operation in PWM mode 2.

In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.

In this case, the value set in MTU1.TGRB is used as the cycle, and the values set in the other TGRs are used as the duty ratio.

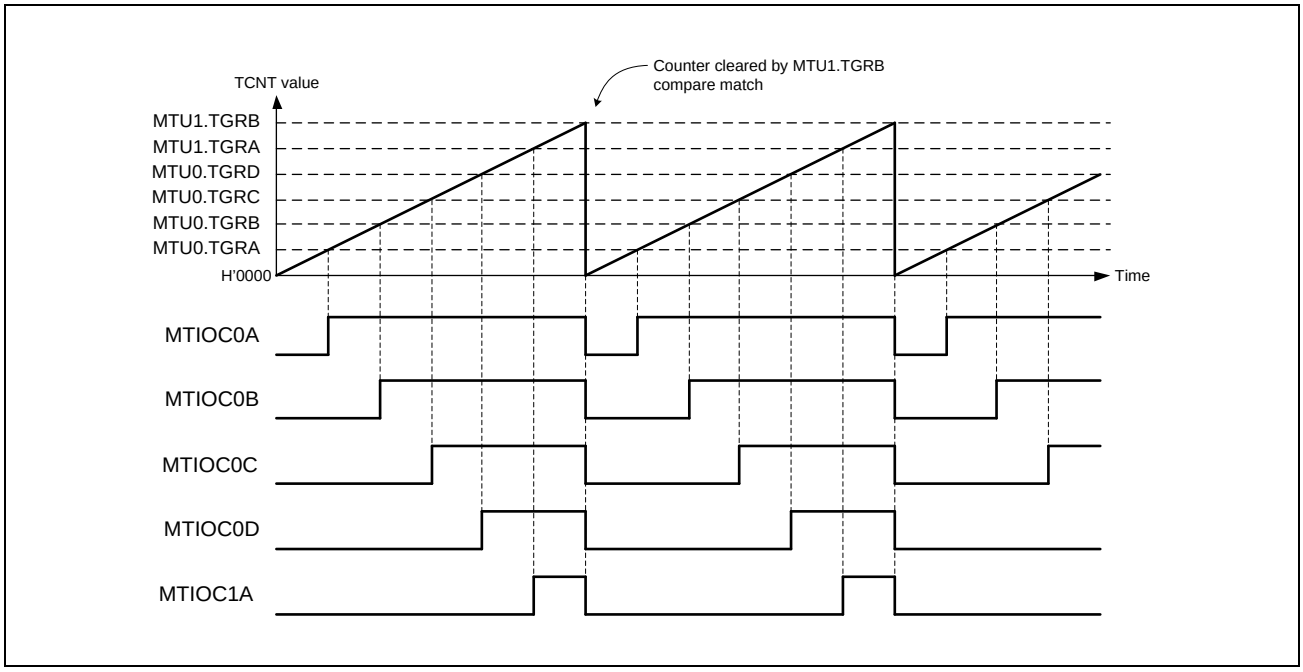

Figure 16.28 Example of PWM Mode 2 Operation

**Figure 16.29** shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1. In these examples, TGRA compare match is selected as the TCNT clearing source, the initial output value and the output value for TGRA are set to the low level, and the output value for TGRB is set to the high level.

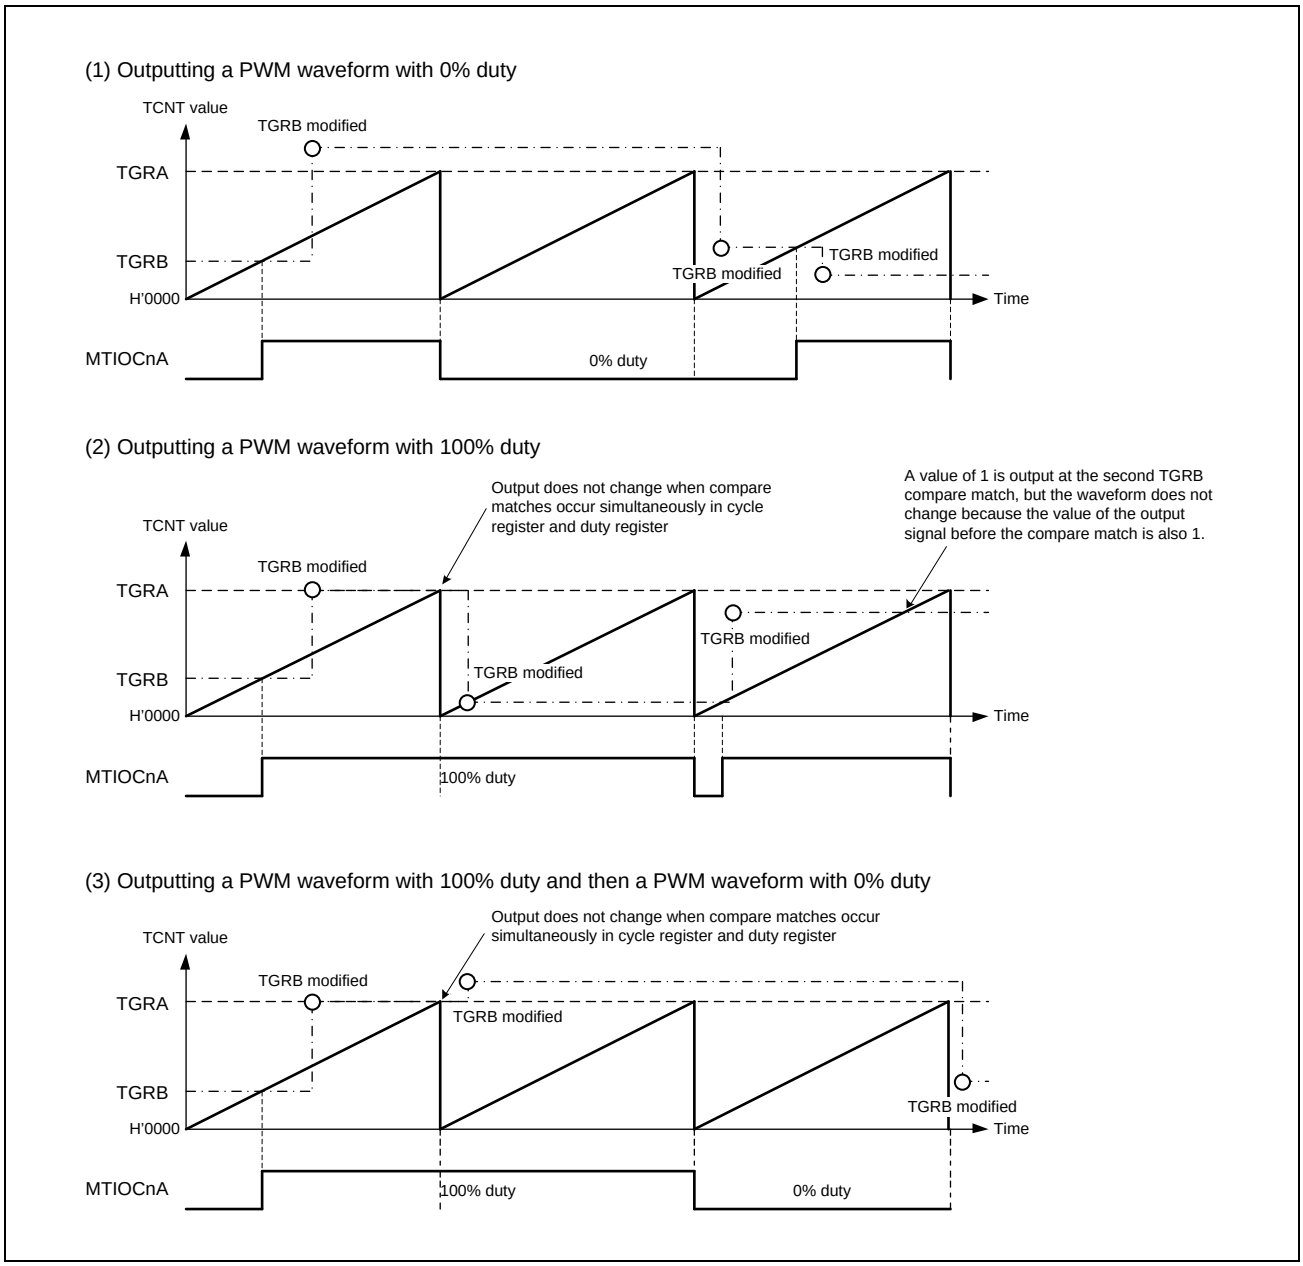

Figure 16.29 Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty) (n = 0 to 4, 6, 7)

### 16.3.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

**Table 16.66** lists the external clock input pins to be connected in each phase counting mode.

Table 16.66 Clock Input Pins in Phase Counting Mode

| | | External Clock Input Pins | |
|---|---|---|---|
| Phase Counting Mode | TMDR3.PHCKSEL bit | A-Phase | B-Phase |
| MTU1 16-bit phase counting mode | x (Don't care) | MTCLKA | MTCLKB |
| MTU2 16-bit phase counting mode | 0 | MTCLKA | MTCLKB |
| | 1 (initial value) | MTCLKC | MTCLKD |
| Cascade connection 32-bit phase counting mode | 0 | MTCLKA | MTCLKB |
| | 1 (initial value) | MTCLKC | MTCLKD |

#### 16.3.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.

In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.

When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0],TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.

These external input pins can be used for two-phase encoder pulse input.

If an overflow occurs during TCNT up-counting, a TCIV interrupt is generated when the corresponding TCIEV bit in the TIER register is set to 1.

If an underflow occurs during TCNT down-counting, a TCIU interrupt is generated when the corresponding TCIEU bit in the TIER register is set to 1.

The TCFD bit in TSR is the count direction flag. Read the TCFD flag to check whether TCNT is counting up or down.

##### (1) Example of 16-Bit Phase Counting Mode Setting Procedure

**Figure 16.30** shows an example of the phase counting mode setting procedure.

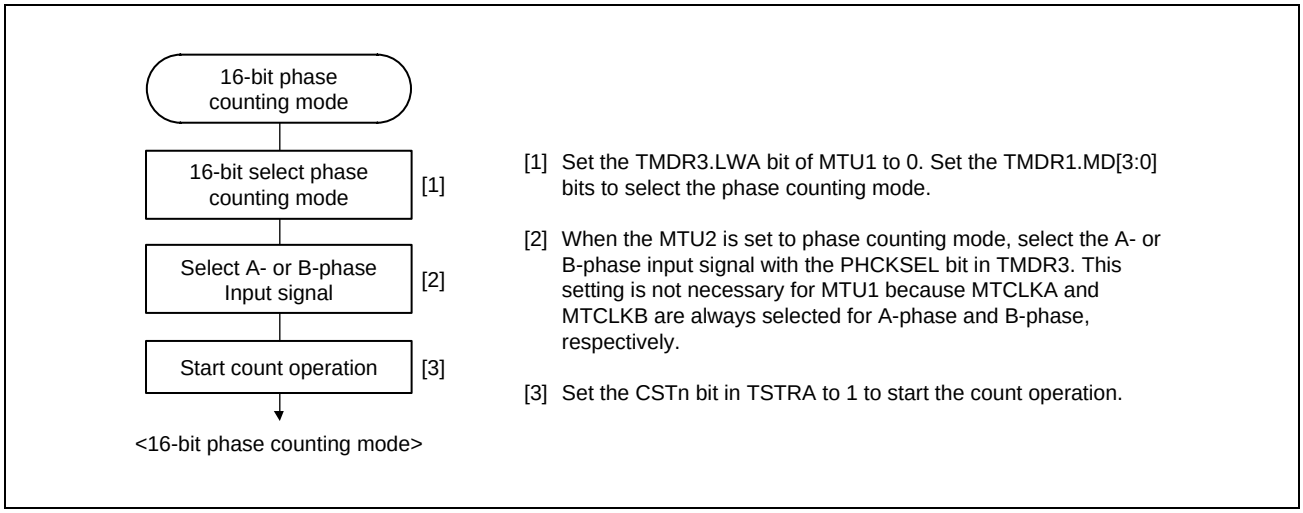

Figure 16.30 Example of 16-Bit Phase Counting Mode Setting Procedure

### (2) Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

#### (a) Phase Counting Mode 1

**Figure 16.31** shows an example of operation in phase counting mode 1, and **Table 16.67** summarizes the TCNT up- counting and down-counting conditions.

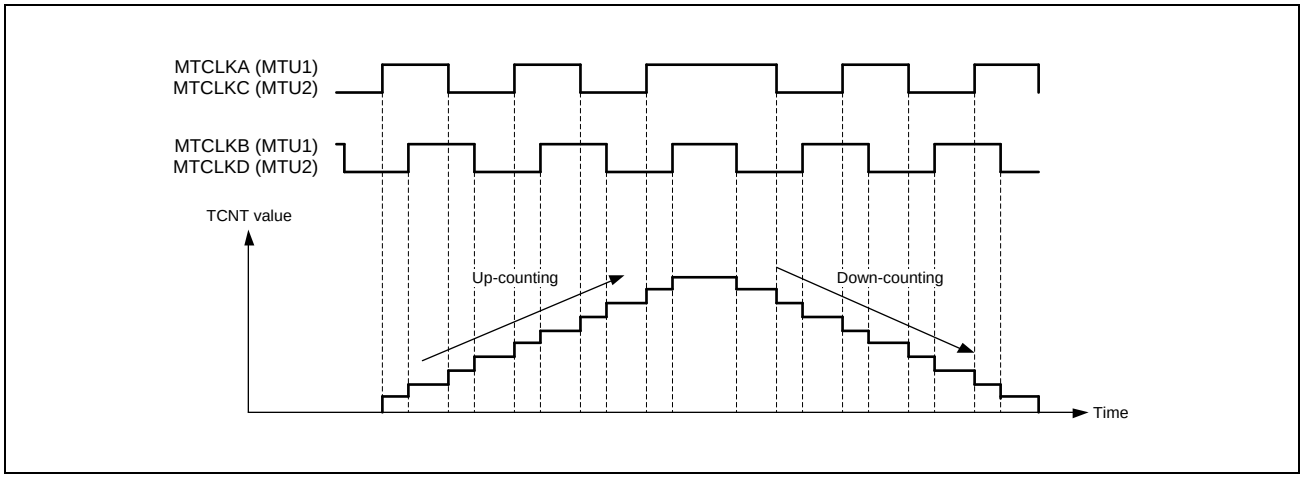

Figure 16.31 Example of Operation in Phase Counting Mode 1

Table 16.67 Up-Counting and Down-Counting Conditions in Phase Counting Mode 1

| MTCLKA (MTU1)<br>MTCLKC (MTU2) | MTCLKB (MTU1)<br>MTCLKD (MTU2) | Operation |
|---|---|---|
| High | ↑ | Up-counting |
| Low | ↓ | |
| ↑ | Low | |
| ↓ | High | |
| High | ↓ | Down-counting |
| Low | ↑ | |
| ↑ | High | |
| ↓ | Low | |

**Remarks:** ↑: Rising edge
↓: Falling edge

### (b) Phase Counting Mode 2

**Figure 16.32** to **Figure 16.34** show the examples of operation in phase counting mode 2 and **Table 16.68** summarizes the TCNT up-counting and down-counting conditions.

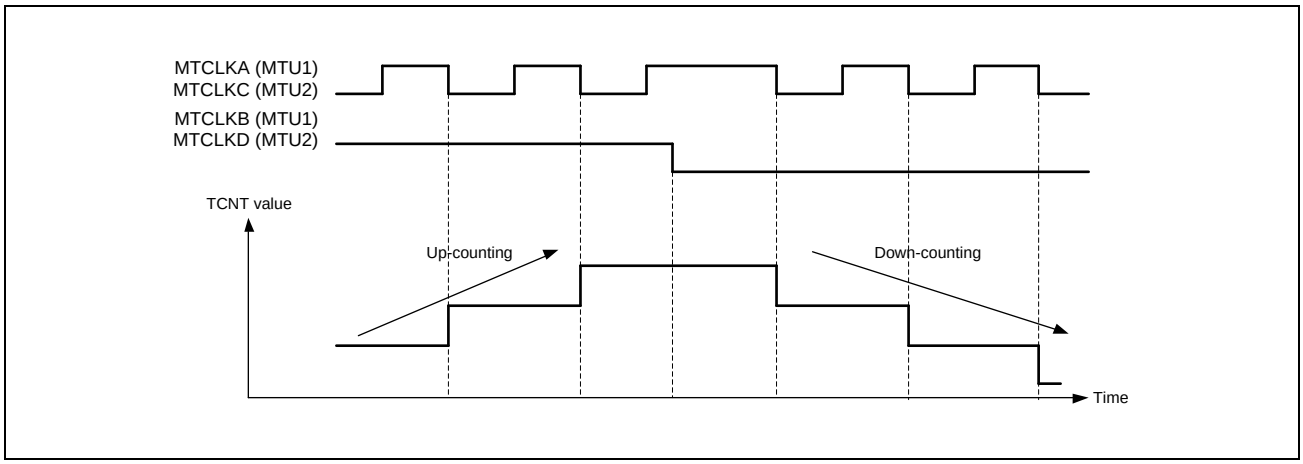

Figure 16.32 Example of Operation in Phase Counting Mode 2 (When MTUn.TCR2.PCB[1:0] is 00b (n = 1, 2))

**Remarks:** ↑ : Rising edge
↓ : Falling edge

### (3) 16-Bit Phase Counting Mode Application Example

**Figure 16.41** shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.

MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.

In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control cycle and position control cycle.

MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.

MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control cycles.

This procedure enables the accurate detection of position and speed.

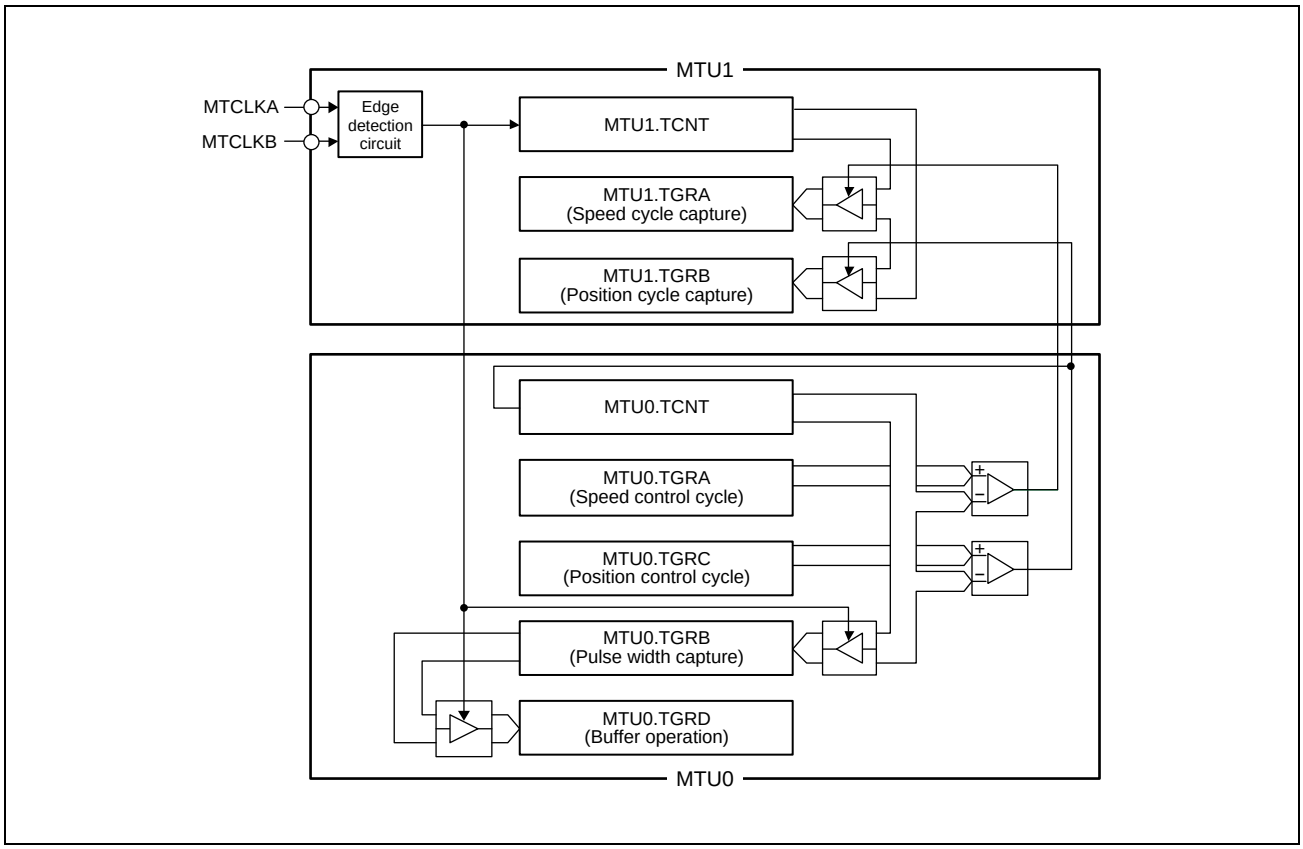

Figure 16.41 16-Bit Phase Counting Mode Application Example

#### 16.3.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in **Figure 16.42**. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. See **Figure 16.43** for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. See **Table 16.70** for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

An input capture can also be generated using a Z-phase signal; thus, an angular velocity can be measured using the value captured in the general register.

Furthermore, MTU8 can be used as a channel for measuring a 1-ms interval, and a compare match signal can be output at a 1-ms interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a 1-ms period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring Z-phase signal pulses, this compare match signal of TGRC in MTU8 can be output as a capture signal or a clear signal to MTU0 or MTU5; thus, the Z-phase count can be measured at 1-ms intervals.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of TGRD in MTU8, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the TGRD register in MTU8 should be set to buffer operation.

Refer to **Section 16.3.4, Cascaded Operation**, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.

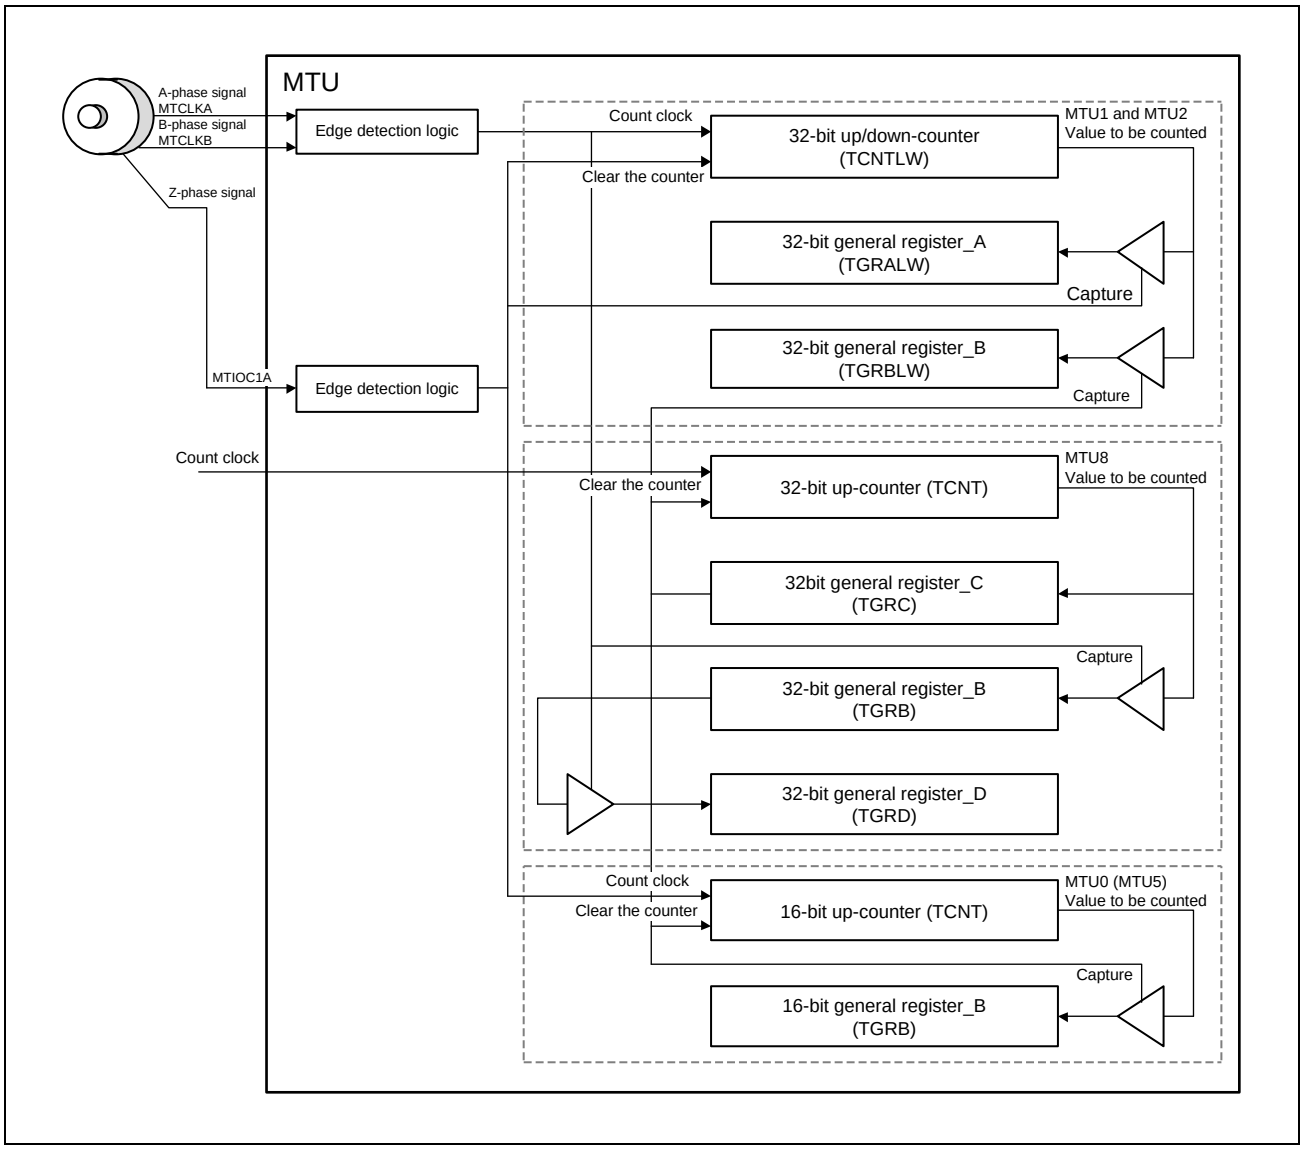

Figure 16.42 Block Diagram for Operation in Cascade Connection 32-Bit Phase Counting Mode

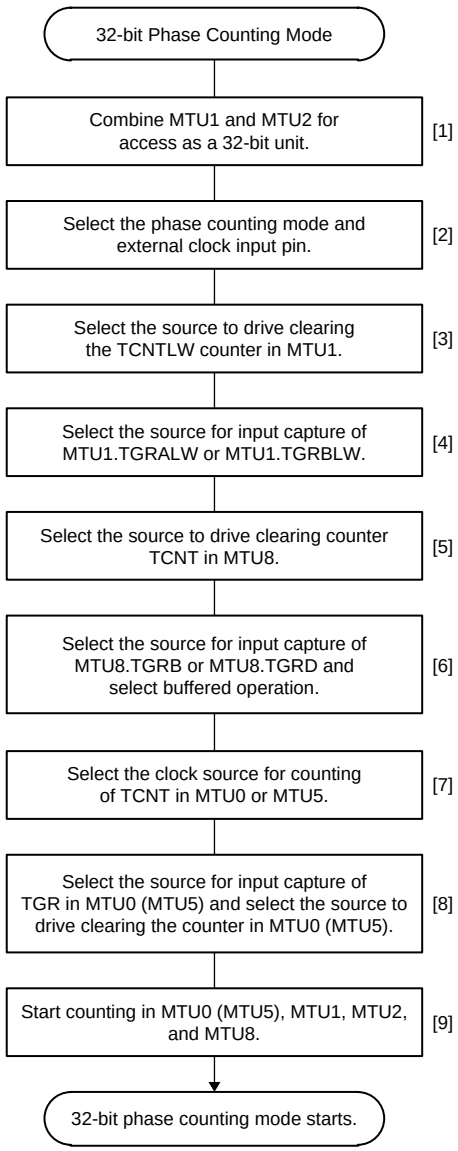
### (1) Example of Setting Cascade Connection 32-Bit Phase Counting Mode

**Figure 16.43** shows an example of the procedure for setting cascade connection 32-bit phase counting mode.



[1] Set the LWA bit in MTU1.TMDR3 to 1 and combine MTU1 and MTU3 for access as a 32-bit unit.*1

[2] Select phase counting mode with the MD[3:0] bits in MTU1.TMDR1 and select the external clock input pin with the PHCKSEL bits in MTU1.TMDR3.

[3] Set the CCLR[2:0] bits of TCR in MTU1 to 001b to select input capture of TGRALW in MTU1 as the source of the signal to drive clearing the TCNTLW counter in MTU1.

[4] Set the IOA[3:0] bits in MTU1.TIOR to select the effective edge (rising, falling or both) of the signal produced by input capture of TGRALW in MTU1. After that, set the IOB[3:0] bits in MTU1.TIOR to 1110b to select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU1.TGRBLW.

[5] Set the CCLR[2:0] bits in MTU8.TCR to 101b to select the compare match signal of MTU8.TGRC as the source to drive clearing counter TCNT in MTU8.

[6] Select the source for input capture of MTU8.TGRB as the clock for counting of TCNTLW in MTU1 by setting the IOB[3:0] bits in MTU8.TIORH to 1110b. At the same time, select buffered operation for TGRB and TGRD by setting the BFB bit in MTU8.TMDR1 to 1.

[7] Set the TPSC2[2:0] bits in MTU0.TCR2 to 111b to select the MTIOC1A pin as the clock source for counting of TCNT in MTU0.
(When using TCNT in MTU5, set the TPSC2[2:0] bits in MTU5.TCR2 to 111b).

[8] Select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU0.TGRA by setting the IOA[3:0] bits in MTU0.TIORH to 1110b. (When using TCNT in MTU5, set the TIORU, TIORV, or TIORW bit in MTU5 is set to 10100b).
After that, select input capture of MTU0.TGRA as the source to drive clearing counter TCNT in MTU0 by setting the CCLR[2:0] bits in MTU0.TCR to 001b.

[9] Start counting in MTU0, MTU1, MTU2, and MTU8 by setting the CST0, CST1, CST2, and CST8 bits in TSTRA to 1 at the same time.
(When using TCNT in MTU5, set the counter corresponding to TSTR in MTU5 to 1).

Note 1. When the LWA bit in MTU1.TMDR3 is set to 1, the TCR, TCR2, TMDR, and TIOR registers in MTU1 are effective in controlling cascaded operation. In this case, the settings of these registers in MTU2 are ignored.

Figure 16.43 Procedure for Setting Cascade Connection 32-Bit Phase Counting Mode

### 16.3.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, three phases of positive and negative PWM waveforms (six phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.

When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 6 and 12 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

**Table 16.72** shows the PWM output pins used. **Table 16.73** shows the settings of the registers.

Table 16.72 Output Pins for Reset-Synchronized PWM Mode

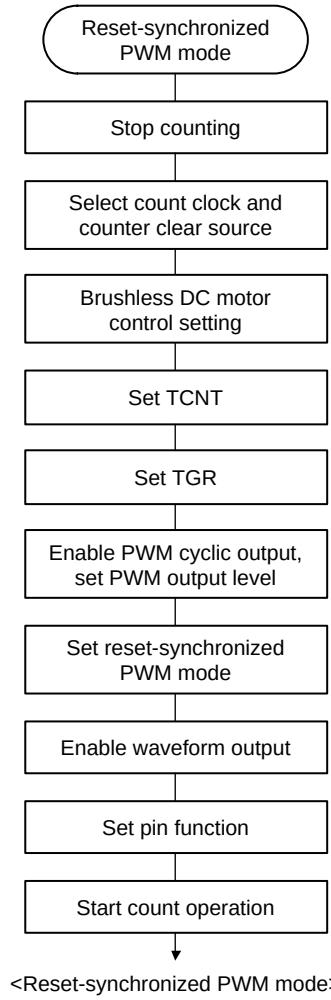
| Channel | Output Pin | Description |
|---|---|---|
| MTU3 | MTIOC3B | PWM output pin 1 |
| | MTIOC3D | PWM output pin 1' (negative-phase waveform of PWM output 1) |
| MTU4 | MTIOC4A | PWM output pin 2 |
| | MTIOC4C | PWM output pin 2' (negative-phase waveform of PWM output 2) |
| | MTIOC4B | PWM output pin 3 |
| | MTIOC4D | PWM output pin 3' (negative-phase waveform of PWM output 3) |
| MTU6 | MTIOC6B | PWM output pin 4 |
| | MTIOC6D | PWM output pin 4' (negative-phase waveform of PWM output 4) |
| MTU7 | MTIOC7A | PWM output pin 5 |
| | MTIOC7C | PWM output pin 5' (negative-phase waveform of PWM output 5) |
| | MTIOC7B | PWM output pin 6 |
| | MTIOC7D | PWM output pin 6' (negative-phase waveform of PWM output 6) |

Table 16.73 Register Settings for Reset-Synchronized PWM Mode

| Register | Setting |
|---|---|
| MTU3.TCNT | Initial setting (H’0000) |
| MTU4.TCNT | Initial setting (H’0000) |
| MTU3.TGRA | Set the count cycle for MTU3.TCNT |
| MTU3.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins |
| MTU4.TGRA | Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins |
| MTU4.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins |
| MTU6.TCNT | Initial setting (H’0000) |
| MTU7.TCNT | Initial setting (H’0000) |
| MTU6.TGRA | Set the count cycle for MTU6.TCNT |
| MTU6.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins |
| MTU7.TGRA | Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins |
| MTU7.TGRB | Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins |

### (1) Example of Procedure for Setting Reset-Synchronized PWM Mode

**Figure 16.44** shows an example of the procedure for specifying the reset-synchronized PWM mode.



[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation. Specify the reset-synchronized PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 (MTU6) to select the count clock source and clock edge for MTU3 (MTU6). Set the TCR.CCLR[2:0] bits to select TGRA compare match as the counter clear source.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) to H'0000.

[5] MTU3.TGRA (MTU6.TGRA) is the cycle register. Set the PWM cycle in MTU3.TGRA (MTU6.TGRA).
Set the PWM output transition timing in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB).
Note that the setting values should be within the range of compare match with MTU3.TCNT (MTU6.TCNT).

$X \leq$ MTU3.TGRA (X: Set value)

[6] Set the PSYE bit in the TOCR1A (TOCR1B) register to enable or disable toggle output synchronized with the PMW cycle, and set the OLSP and OLSN bits to select the PWM output level.
When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRB) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[7] Set the MD[3:0] bits in MTU3.TMDR1 (MTU6.TMDR1) register to 1000b to select the reset-synchronized PWM mode. Specify the buffer operation (BFA = 1) of the MTU3.TGRA (MTU6.TGRA) register and the buffer operation (BFB = 1) of the MTU3.TGRB register when necessary. Set the MTU4.TMDR1 (MTU7.TMDR1) register to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) registers to H'00.

[9] Set the port mode control registers (PMCn) and Pmn port fuction control reigister (PFCm) of the GPIO ports.

[10] Set the TSTRA.CST3 (TSTRB.CST6) bit to 1 to start count operation.

**Note:** The output waveform starts to toggle at the point of MTU3.TCNT (MTU6.TCNT) = MTU3.TGRA (MTU6.TGRA) = X by setting X = MTU3.TGRA (MTU6.TGRA), i.e., cycle = duty ratio.

Figure 16.44 Procedure for Selecting Reset-Synchronized PWM Mode

### (2) Example of Reset-Synchronized PWM Mode Operation

**Figure 16.45** shows an example of operation in the reset-synchronized PWM mode.

MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from H’0000. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

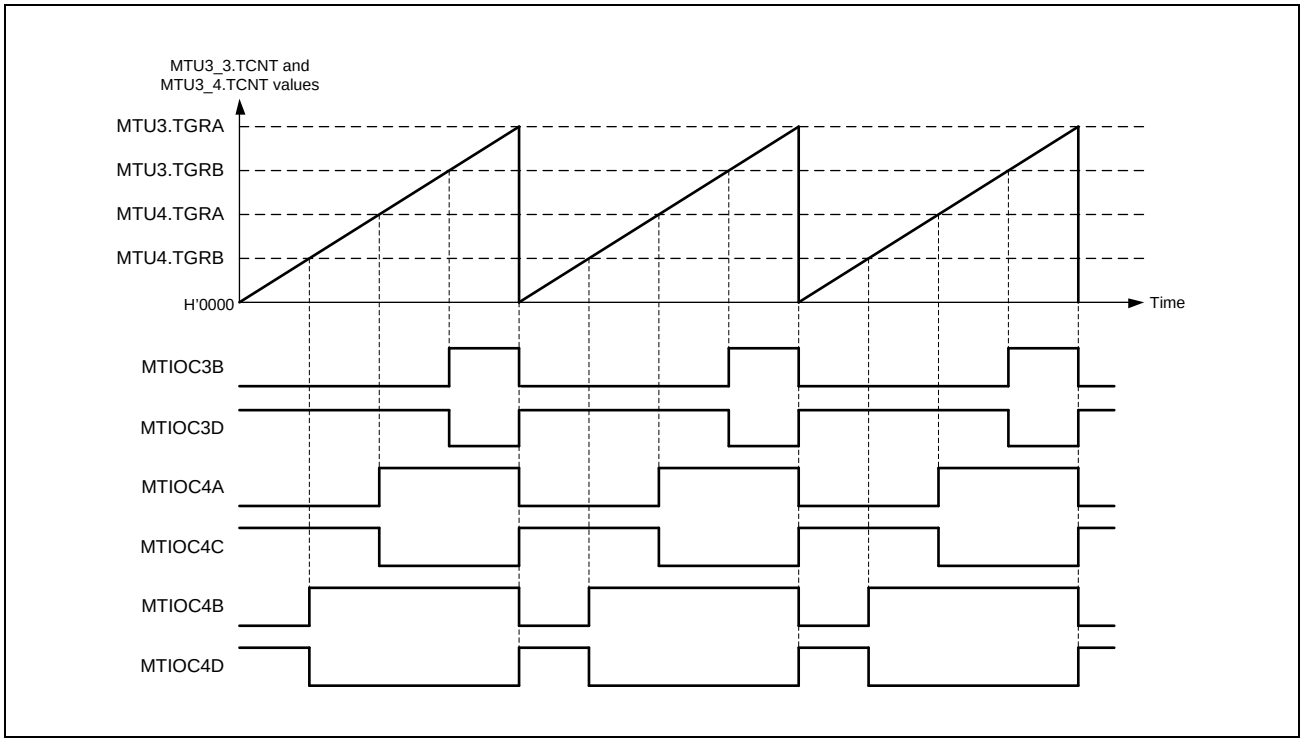


Figure 16.45 Example of Reset-Synchronized PWM Mode Operation
(When OLSN = 1 and OLSP = 1 in MTU3.TOCR1 and MTU4.TOCR1)

### 16.3.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.

Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.

In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B,

MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM cycle.

MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

**Table 16.74** shows the PWM output pins used. **Table 16.75** shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 16.74 Output Pins for Complementary PWM Mode

| Channel | Output Pin | Description |
|---|---|---|
| MTU3 | MTIOC3A | Toggle output synchronized with PWM cycle (or I/O port) |
| | MTIOC3B | PWM output pin 1 |
| | MTIOC3C | I/O port*1 |
| | MTIOC3D | PWM output pin 1' (negative-phase waveform output of PWM output 1) |
| MTU4 | MTIOC4A | PWM output pin 2 |
| | MTIOC4C | PWM output pin 2' (negative-phase waveform output of PWM output 1) |
| | MTIOC4B | PWM output pin 3 |
| | MTIOC4D | PWM output pin 3' (negative-phase waveform output of PWM output 1) |
| MTU6 | MTIOC6A | Toggle output synchronized with PWM cycle (or I/O port) |
| | MTIOC6B | PWM output pin 4 |
| | MTIOC6C | I/O port*1 |
| | MTIOC6D | PWM output pin 4' (negative-phase waveform output of PWM output 4) |
| MTU7 | MTIOC7A | PWM output pin 5 |
| | MTIOC7C | PWM output pin 5' (negative-phase waveform output of PWM output 5) |
| | MTIOC7B | PWM output pin 6 |
| | MTIOC7D | PWM output pin 6' (negative-phase waveform output of PWM output 6) |

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 16.75 Register Settings for Complementary PWM Mode (1/2)

| Channel | Counter / Register | Description | Read/Write from CPU |
|---|---|---|---|
| MTU3 | TCNT | Starts up-counting from the value set in the dead time register | Maskable by TRWERA setting*1 |
| | TGRA | Set MTU3.TCNT upper limit value (1/2 carrier cycle + dead time) | Maskable by TRWERA setting*1 |
| | TGRB | PWM output 1 compare register | Maskable by TRWERA setting*1 |
| | TGRC | MTU3.TGRA buffer register | Readable/writable |
| | TGRD | PWM output 1/MTU3.TGRB buffer register | Readable/writable |
| | TGRE | MTU3.TGRB buffer register B (when double buffer function is used) | Readable/writable |
| MTU4 | TCNT | Starts up-counting after being initialized to H'0000 | Maskable by TRWERA setting*1 |
| | TGRA | PWM output 2 compare register | Maskable by TRWERA setting*1 |
| | TGRB | PWM output 3 compare register | Maskable by TRWERA setting*1 |
| | TGRC | PWM output 2/MTU4.TGRA buffer register | Readable/writable |
| | TGRD | PWM output 3/MTU4.TGRB buffer register | Readable/writable |
| | TGRE | MTU4.TGRA buffer register B (when double buffer function is used) | Readable/writable |
| | TGRF | MTU4.TGRB buffer register B (when double buffer function is used) | Readable/writable |
| MTU6 | TCNT | Starts up-counting from the value set in the dead time register | Maskable by TRWERB setting*2 |
| | TGRA | Set MTU6.TCNT upper limit value (1/2 carrier cycle + dead time) | Maskable by TRWERB setting*2 |
| | TGRB | PWM output 4 compare register | Maskable by TRWERB setting*2 |
| | TGRC | MTU6.TGRA buffer register | Readable/writable |
| | TGRD | PWM output 4/MTU6.TGRB buffer register | Readable/writable |
| | TGRE | MTU6.TGRB buffer register B (when double buffer function is used) | Readable/writable |
| MTU7 | TCNT | Starts up-counting after being initialized to H'0000 | Maskable by TRWERB setting*2 |
| | TGRA | PWM output 5 compare register | Maskable by TRWERB setting*2 |
| | TGRB | PWM output 6 compare register | Maskable by TRWERB setting*2 |
| | TGRC | PWM output 5/MTU7.TGRA buffer register | Readable/writable |
| | TGRD | PWM output 6/MTU7.TGRB buffer register | Readable/writable |
| | TGRE | MTU7.TGRA buffer register B (when double buffer function is used) | Readable/writable |
| | TGRF | MTU7.TGRB buffer register B (when double buffer function is used) | Readable/writable |

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

Table 16.76 Register Settings for Complementary PWM Mode (2/2)

| Counter / Register | Description | Read/Write from CPU |
|---|---|---|
| Timer dead time data register A (TDDRA) | Set MTU4.TCNT and MTU3.TCNT offset value (dead time value) | Maskable by TRWERA setting*1 |
| Timer dead time data register B (TDDRB) | Set MTU7.TCNT and MTU6.TCNT offset value (dead time value) | Maskable by TRWERB setting*2 |
| Timer cycle data register A (TCDRA) | Set MTU4.TCNT upper limit value (1/2 carrier cycle) | Maskable by TRWERA setting*1 |
| Timer cycle data register B (TCDRB) | Set MTU7.TCNT upper limit value (1/2 carrier cycle) | Maskable by TRWERB setting*2 |
| Timer cycle buffer register A (TCBRA) | TCDRA buffer register | Readable/writable |
| Timer cycle buffer register B (TCBRB) | TCDRB buffer register | Readable/writable |
| Subcounter A (TCNTSA) | Subcounter A for dead time generation | Read-only |
| Subcounter B (TCNTSB) | Subcounter B for dead time generation | Read-only |
| Temporary register 1A (TEMP1A) | PWM output 1/MTU3.TGRB temporary register A | Not readable or writable |
| Temporary register 1B (TEMP1B) | PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used) | Not readable or writable |
| Temporary register 2A (TEMP2A) | PWM output 2/MTU4.TGRA temporary register A | Not readable or writable |
| Temporary register 2B (TEMP2B) | PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used) | Not readable or writable |
| Temporary register 3A (TEMP3A) | PWM output 3/MTU4.TGRB temporary register A | Not readable or writable |
| Temporary register 3B (TEMP3B) | PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used) | Not readable or writable |
| Temporary register 4A (TEMP4A) | PWM output 4/MTU6.TGRB temporary register A | Not readable or writable |
| Temporary register 4B (TEMP4B) | PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used) | Not readable or writable |
| Temporary register 5A (TEMP5A) | PWM output 5/MTU7.TGRA temporary register A | Not readable or writable |
| Temporary register 5B (TEMP5B) | PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used) | Not readable or writable |
| Temporary register 6A (TEMP6A) | PWM output 6/MTU7.TGRB temporary register A | Not readable or writable |
| Temporary register 6B (TEMP6B) | PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used) | Not readable or writable |

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

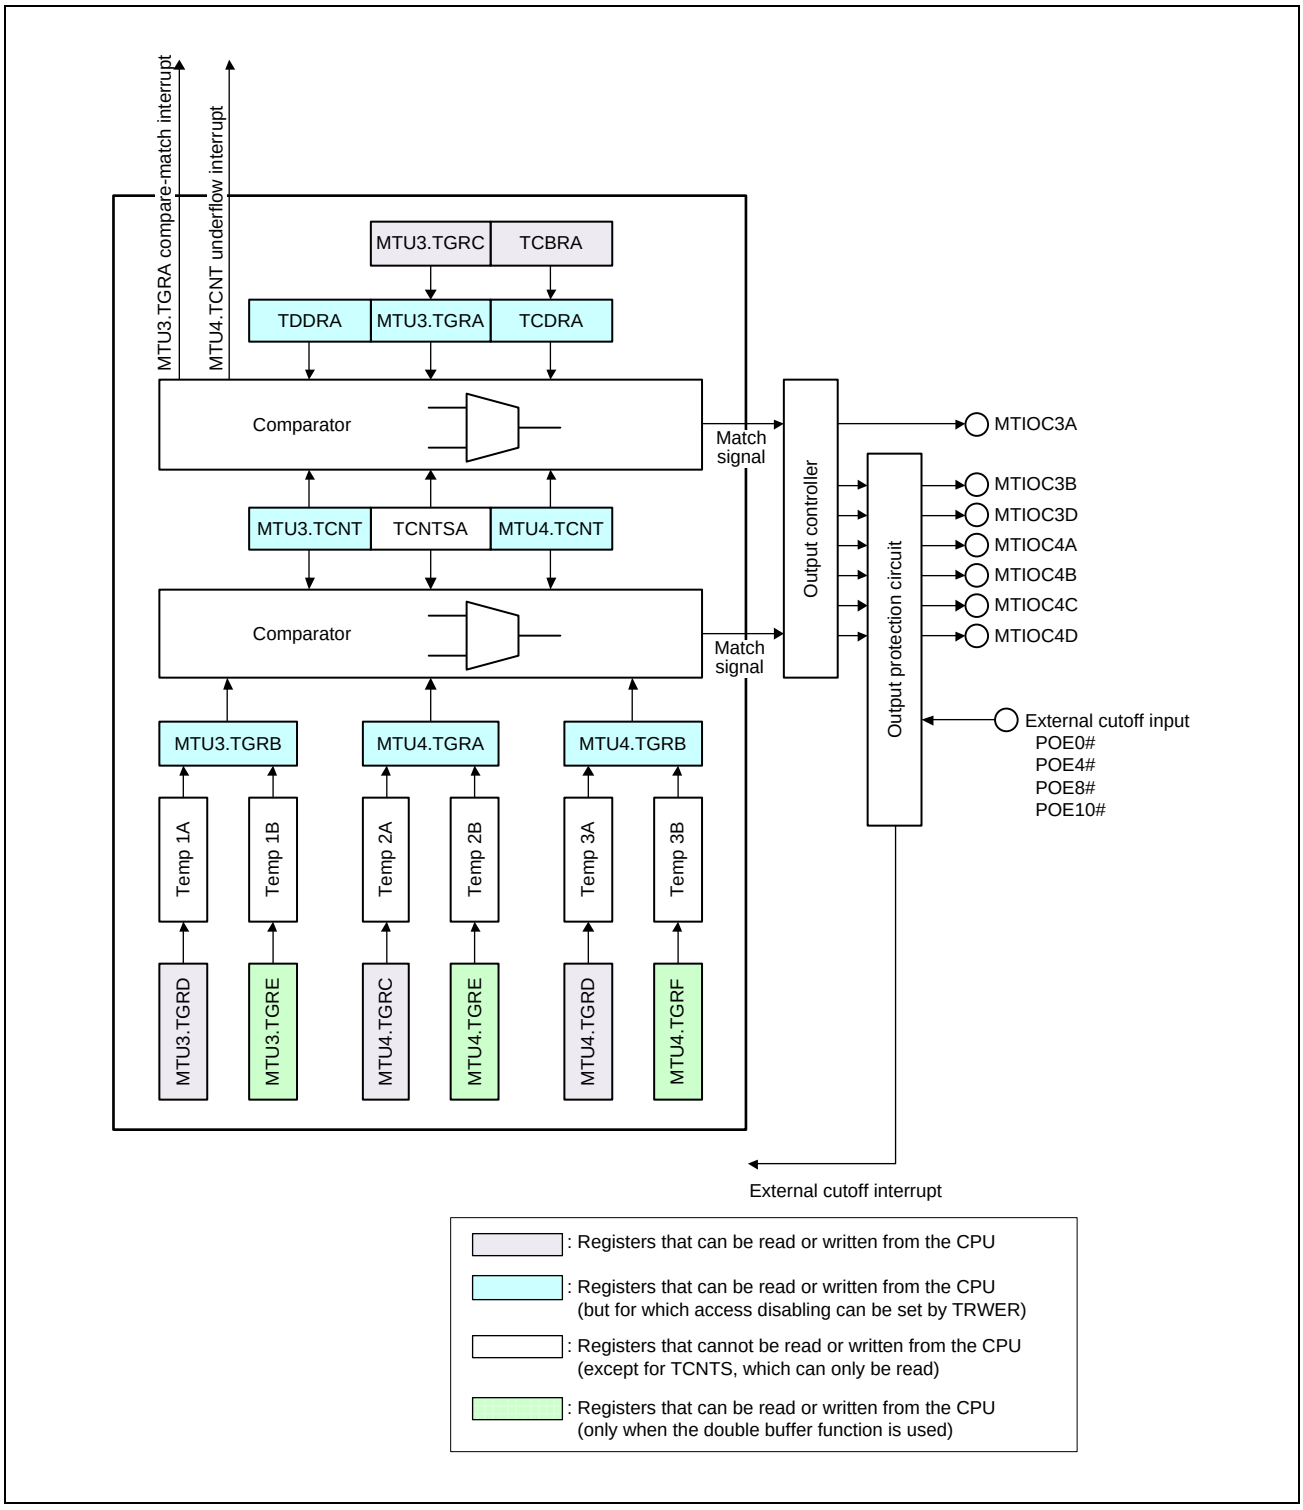

Figure 16.46 Block Diagram of MTU3 and MTU4 in Complementary PWM Mode

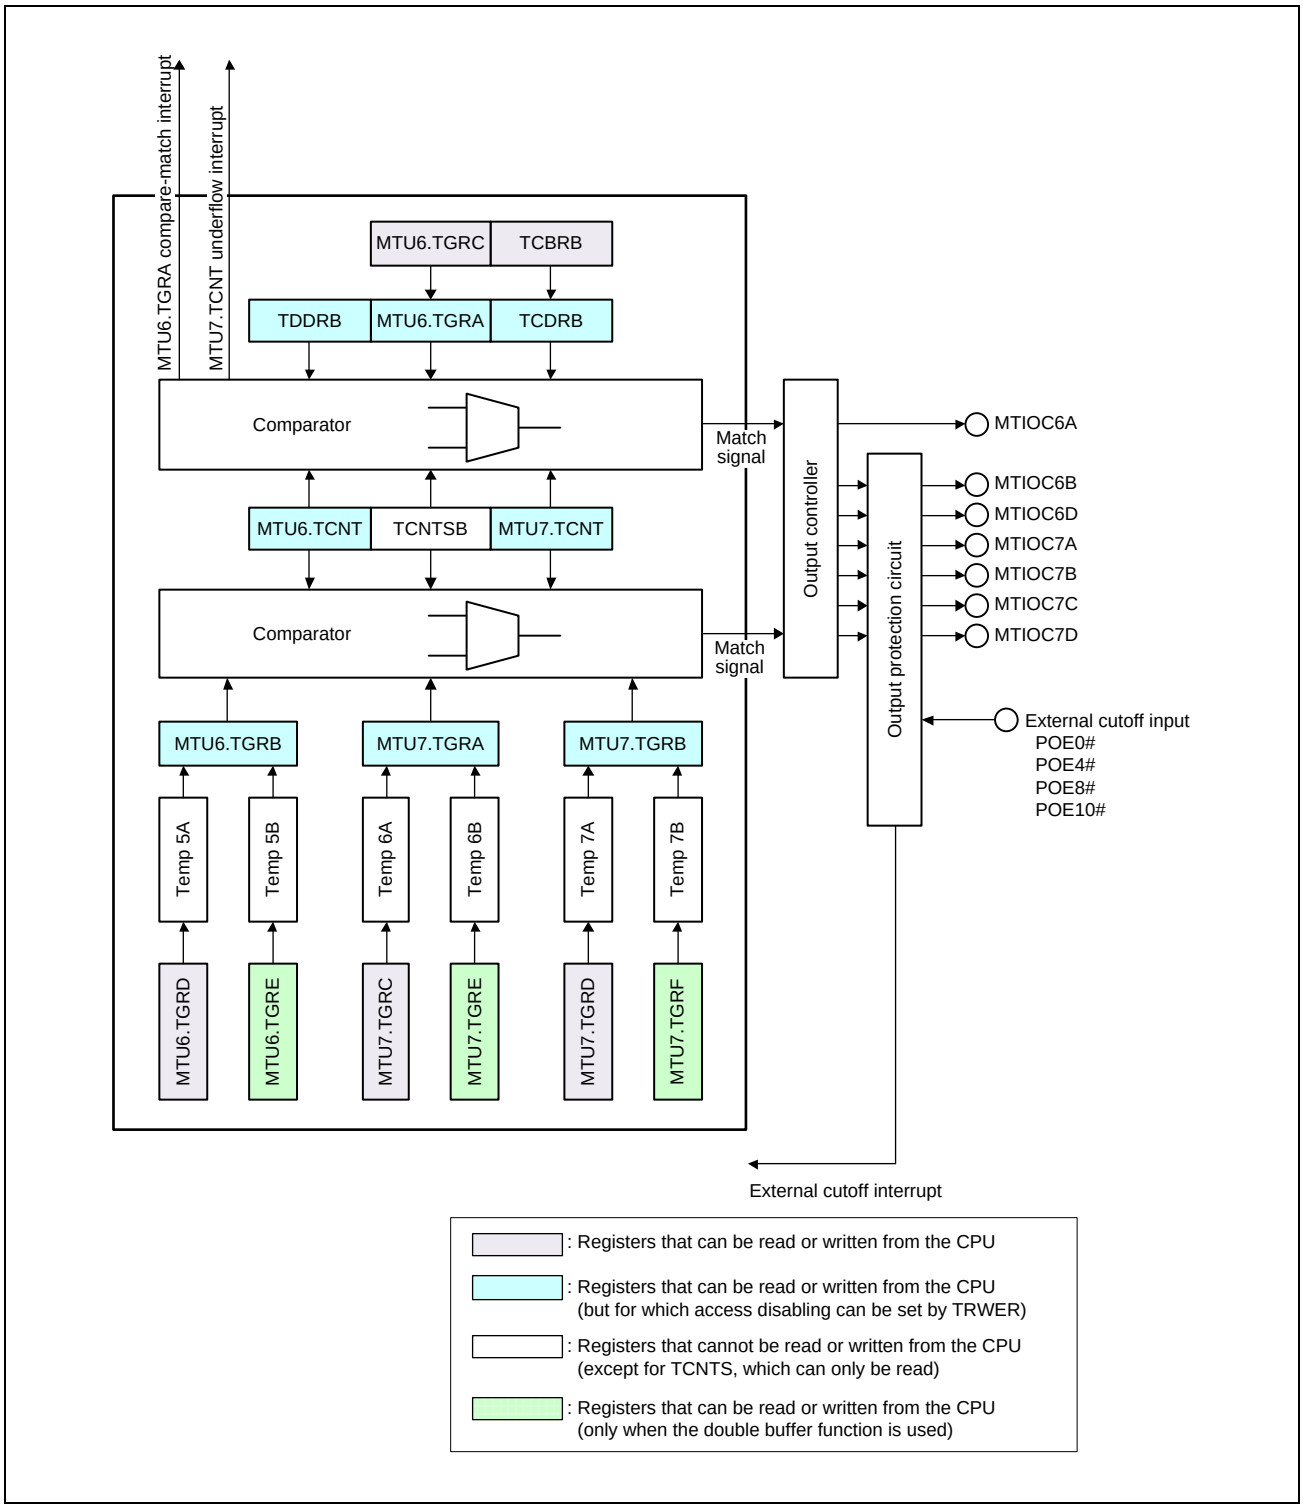

Figure 16.47 Block Diagram of MTU6 and MTU7 in Complementary PWM Mode

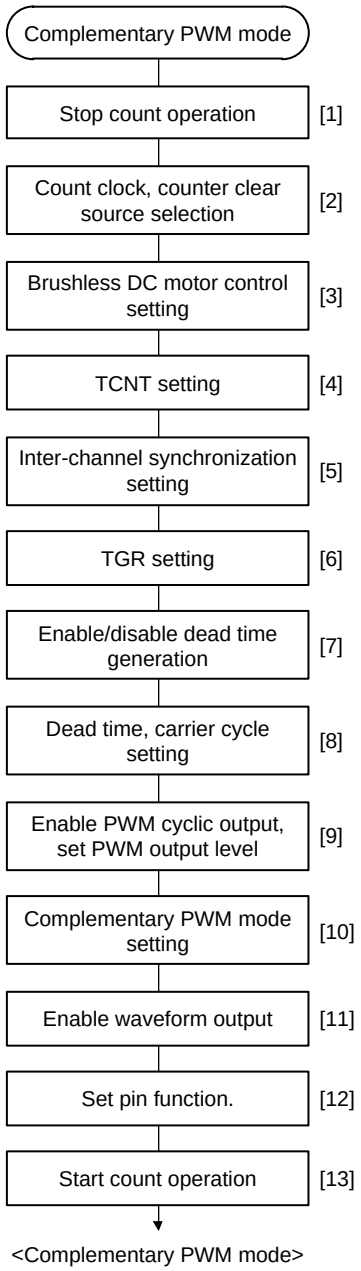
### (1) Example of Complementary PWM Mode Setting Procedure

**Figure 16.48** shows an example of the complementary PWM mode setting procedure.



[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation.
Specify complementary PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 and MTU4 (MTU6 and MTU7) to select the same count clock source and clock edge for MTU3 and MTU4 (MTU6 and MTU7).
Set the TCR.CCLR[2:0] bits only when restarting by synchronous clearing with another channel during complementary PWM operation.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set the dead time in MTU3.TCNT (MTU6.TCNT). Set MTU4.TCNT (MTU7.TCNT) to H'0000.

[5] Make this setting only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, set the TSYRA register (TSYRB) to synchronize the channel generating the synchronous clear with MTU3 and MTU4 (MTU6 and MTU7).

[6] When MTU3 and MTU6 are used, set the PWM output duty ratio in the duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD).
Be sure to set the same value in each pair of the duty registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD) and buffer registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB).
Only when the double buffer function is used, set the PWM output duty value − 1 in the buffer registers (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF).
When MTU6 and MTU7 are used, set the value to the following registers:
Duty registers (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)
Buffer registers (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)
Buffer registers when the double buffer function is used (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the TDERA (TDERB) register so that no dead time generated.

[8] Set the dead time in the TDDRA (TDDRB) register, 1/2 the PWM cycle in the TCDRA (TCDRB) register and TCBRA (TCBRB) register, and 1/2 the PWM cycle plus the dead time in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).
When no dead time generation is selected, set 1 in the TDDRA (TDDRB) register and 1/2 the PWM cycle + 1 in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).

[9] Set the PSYE bit in the TOCR1A register to enable or disable toggle output synchronized with the PWM cycle, and set the OLSP and OLSN bits to select the PWM output level. When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRA) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[10] Select complementary PWM mode in MTU3.TMDR1 (MTU6.TMDR1). Specify the buffer operation (BFA = 1) of MTU3.TGRA (MTU6.TGRA) and the buffer operation (BFB = 1) of MTU3.TGRB (MTU6.TGRB).
Only when the double buffer function is used, set the TMDR2A (TMDR2B) register to enable the double buffer function.

[11] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) to H'00.

[12] Set the port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports.

[13] Set the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 1 simultaneously to start count operation.

Figure 16.48 Example of Complementary PWM Mode Setting Procedure

### (2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. **Figure 16.49** illustrates counter operation in complementary PWM mode (MTU3 and MTU4), and **Figure 16.50** shows an example of operation in complementary PWM mode.

#### (a) Counter Operation

In complementary PWM mode, three counters — MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) — in each unit perform up-/down-count operations.

MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST3 bit in TSTRA (TSTRB) is 0. When the CST3 bit is set to 1, MTU3.TCNT (MTU6.TCNT) counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches H’0000, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.

TCNT in MTU4 (MTU7) should be initialized to H’0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching H’0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.

In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.

When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches H’0000, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) is cleared to H’0000 and stops counting.

TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

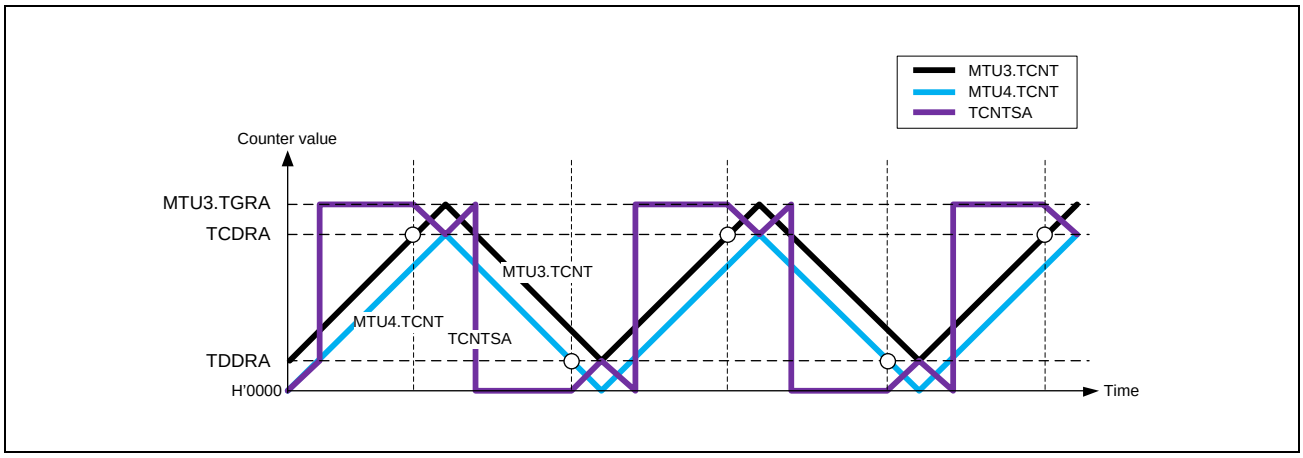


Figure 16.49 Count Operation in Complementary PWM Mode (MTU3 and MTU4)

### (b) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used to control the duty ratio for the PWM output. **Figure 16.50** shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are constantly compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin. MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, refer to **Section 16.3.8(2)(s), Double Buffer Function in Complementary PWM Mode**.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer cycle registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register at the end of the Tb1 interval (when matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up), or at the end of the Tb2 interval (when matches H’0000 while TCNTSA (TCNTSB) is counting down). The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). **Figure 16.50** shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in **Figure 16.50**), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

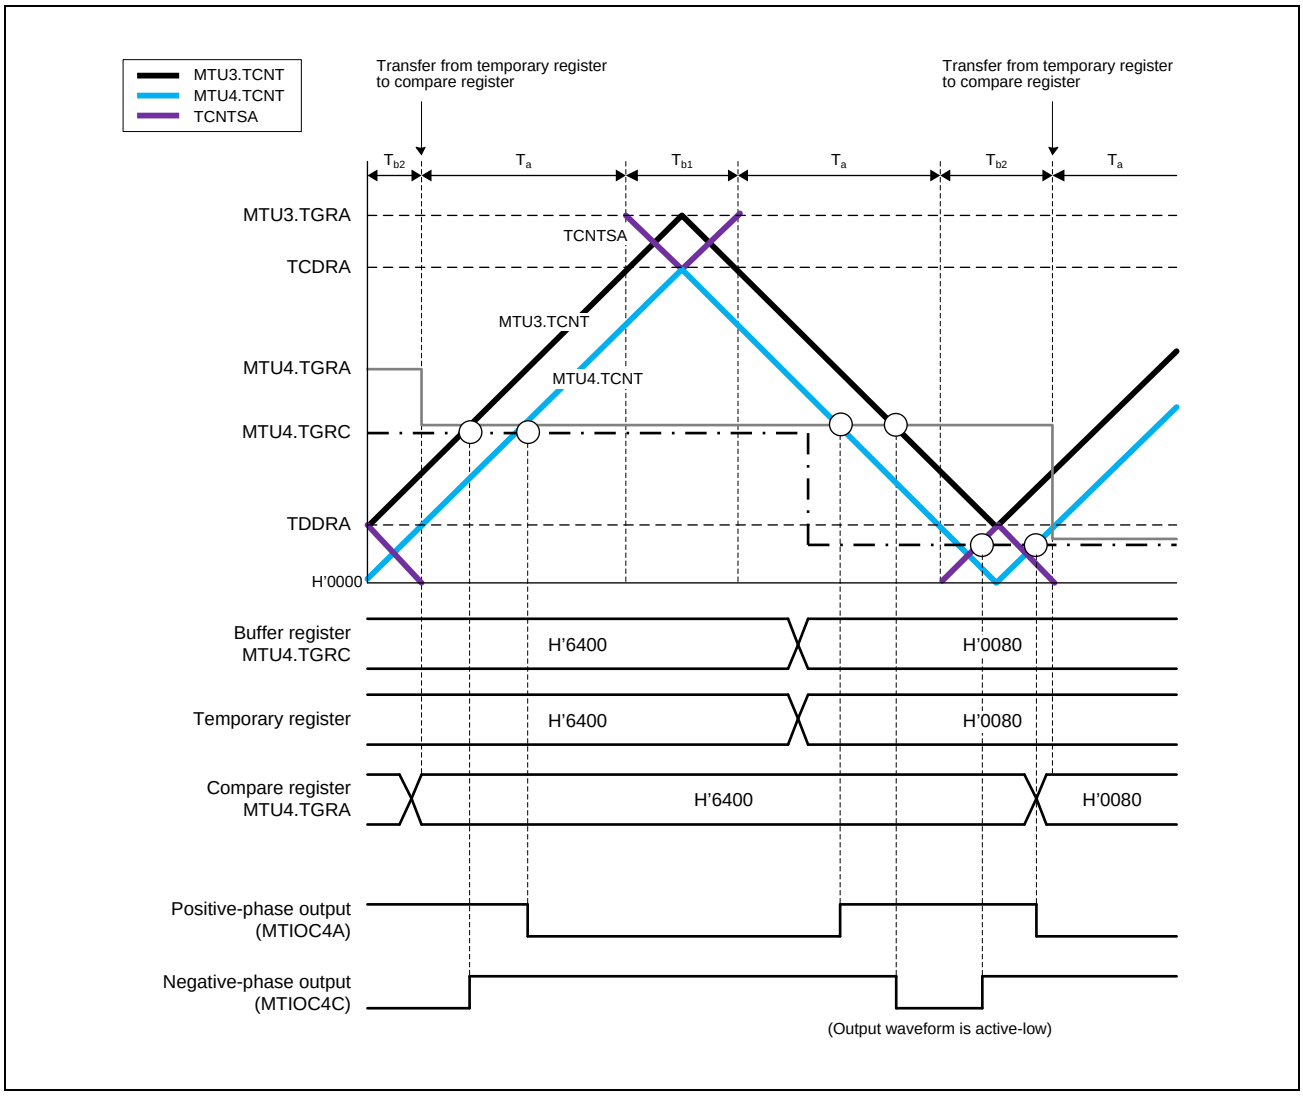

Figure 16.50 Example of Operation in Complementary PWM Mode (MTU3 and MTU4)

### (c) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.

The TOCR1A, TOCR2A, TOCR1B, and TOCR2B registers are used to set the PWM output level. MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM cycle + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM cycle. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be cleared to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier cycle + 1, and TDDRA (TDDRB) should be set to 1.

Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).

Set the respective (initial PWM duty – 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.

The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.

Set MTU4.TCNT (MTU7.TCNT) to H’0000 before setting complementary PWM mode.

Table 16.77 Registers and Counters Requiring Initial Setting

| Register and Counter | Setting |
|---|---|
| TOCR1A, TOCR2A, TOCR1B, TOCR2B | PWM output level |
| MTU3.TGRC MTU6.TGRC | 1/2 PWM cycle + dead time Td<br>(1/2 PWM cycle + 1 when dead time generation is disabled by the TDERA or TDERB setting) |
| TDDRA, TDDRB | Dead time Td<br>(1 when dead time generation is disabled by the TDERA or TDERB setting) |
| TCBRA, TCBRB | 1/2 PWM cycle |
| MTU3.TGRD, MTU4.TGRC, MTU4.TGRD<br>MTU6.TGRD, MTU7.TGRC, MTU7.TGRD | Initial PWM duty ratio value for each phase |
| MTU3.TGRE, MTU4.TGRE, MTU4.TGRF<br>MTU6.TGRE, MTU7.TGRE, MTU7.TGRF | Initial PWM duty ratio – 1 value for each phase<br>(only when double buffer function is used) |
| MTU4.TCNT MTU7.TCNT | H’0000 |

**Note:** The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM cycle set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM cycle + 1.

### (d) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output. Complementary PWM mode should be cleared before setting or changing output levels.

### (e) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.

The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

### (f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be cleared to 0 only when 0 is written to it after reading TDER = 1.

MTU3.TGRA and MTU4.TGRC (MTU6.TGRA and MTU7.TGRC) should be set to 1/2 PWM cycle + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. **Figure 16.51** shows an example of operation without dead time (MTU3 and MTU4).

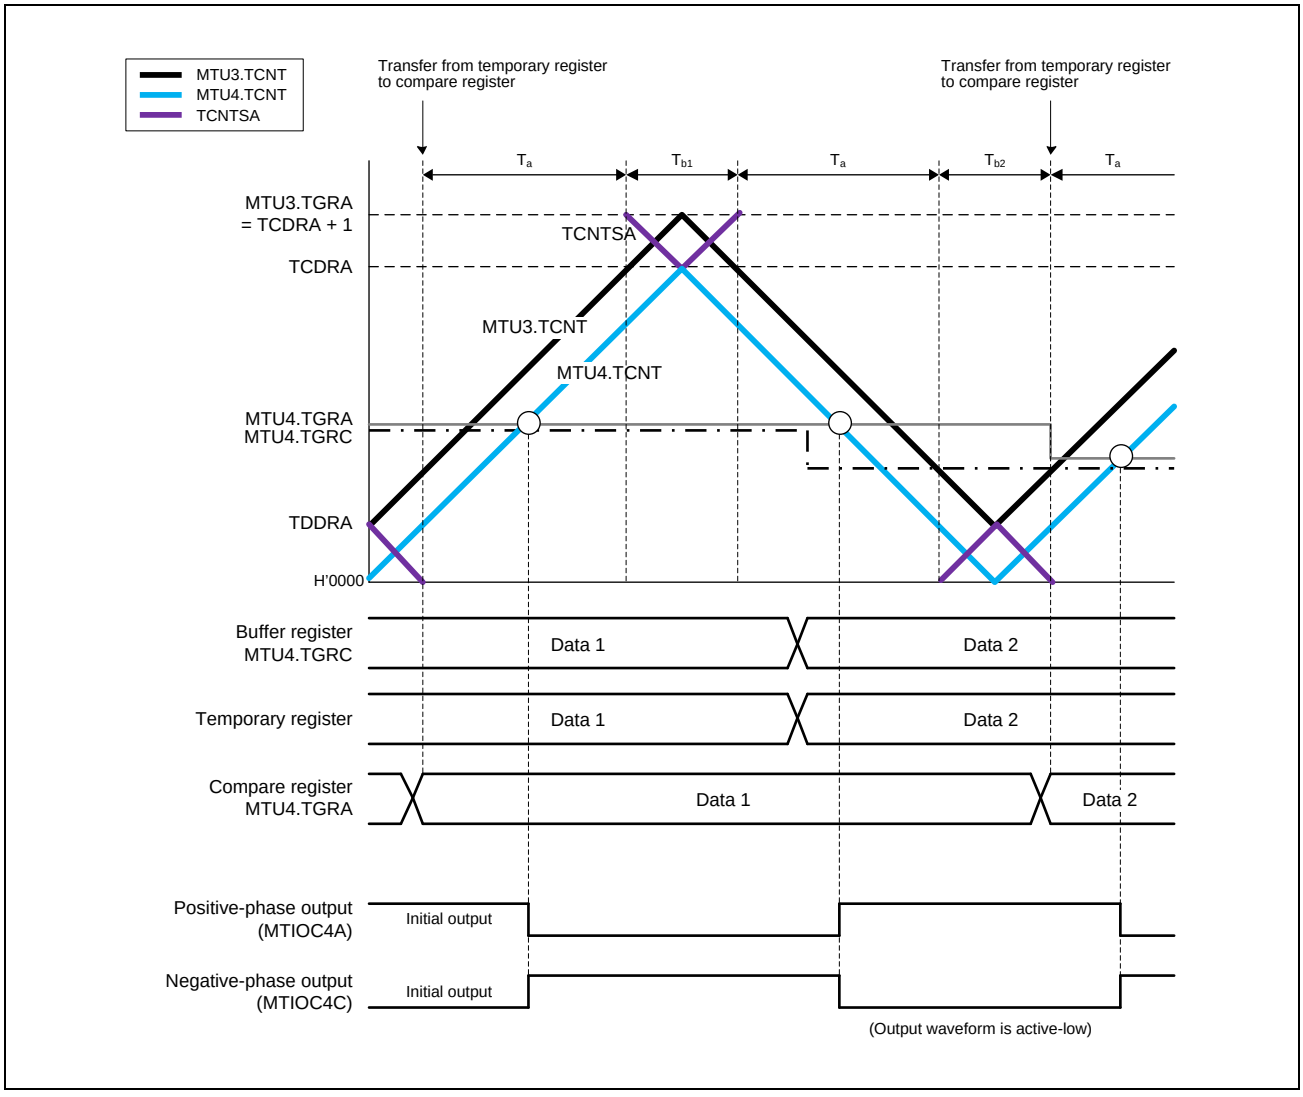

Figure 16.51 Example of Operation without Dead Time (MTU3 and MTU4)

### (g) PWM Cycle Setting

In complementary PWM mode, the PWM cycle is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting
Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:

TCDRA (TCDRB) setting > TDDRA (TDDRB) setting × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). When data is written to MTU4.TGRD (MTU7.TGRD) to enable transfers, the values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to the MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with the MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits.

The new PWM cycle is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. **Figure 16.52** illustrates the operation when the PWM cycle is updated at the crest.

See the following **Section 16.3.8(2)(h), Register Data Updating**, for the method of updating the data in each buffer register.

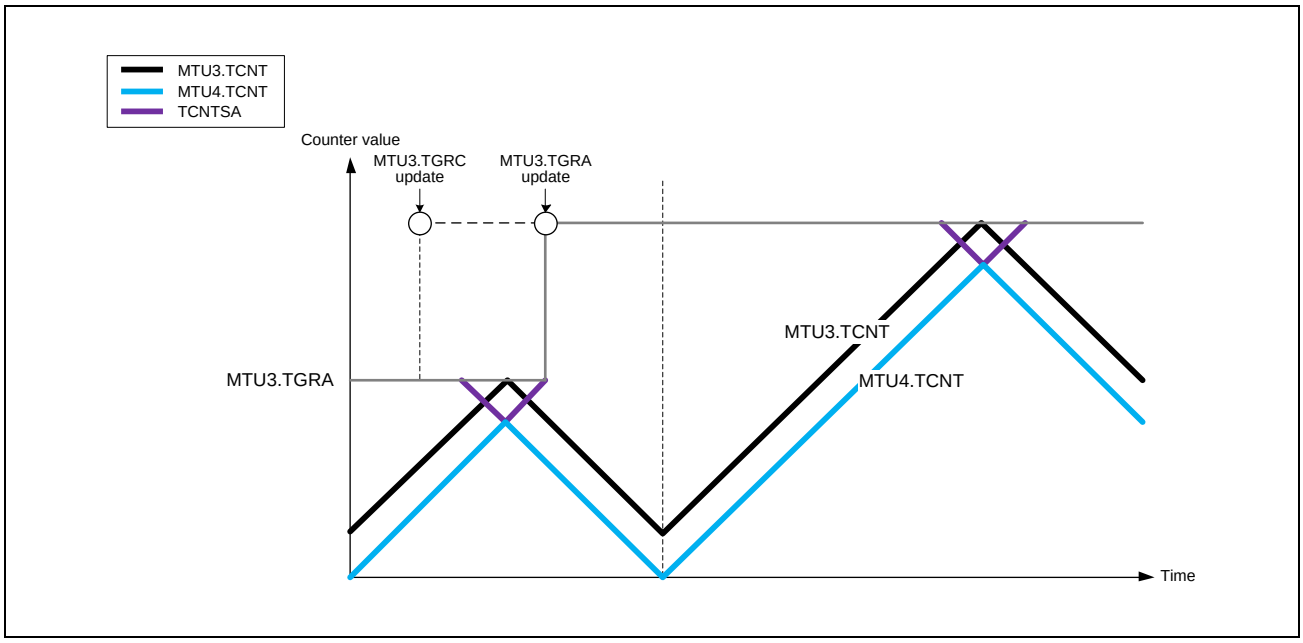

Figure 16.52 Example of PWM Cycle Updating (MTU3 and MTU4)

### (h) Register Data Updating

In complementary PWM mode, buffer registers are used to update the data in five compare registers for PWM duty and PWM cycle. The update data can be written to the buffer registers at any time.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits. **Figure 16.53** shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See **Section 16.3.8(2)(s), Double Buffer Function in Complementary PWM Mode**, for data updating when the double buffer function is used.

● Data update timing: counter crest and trough

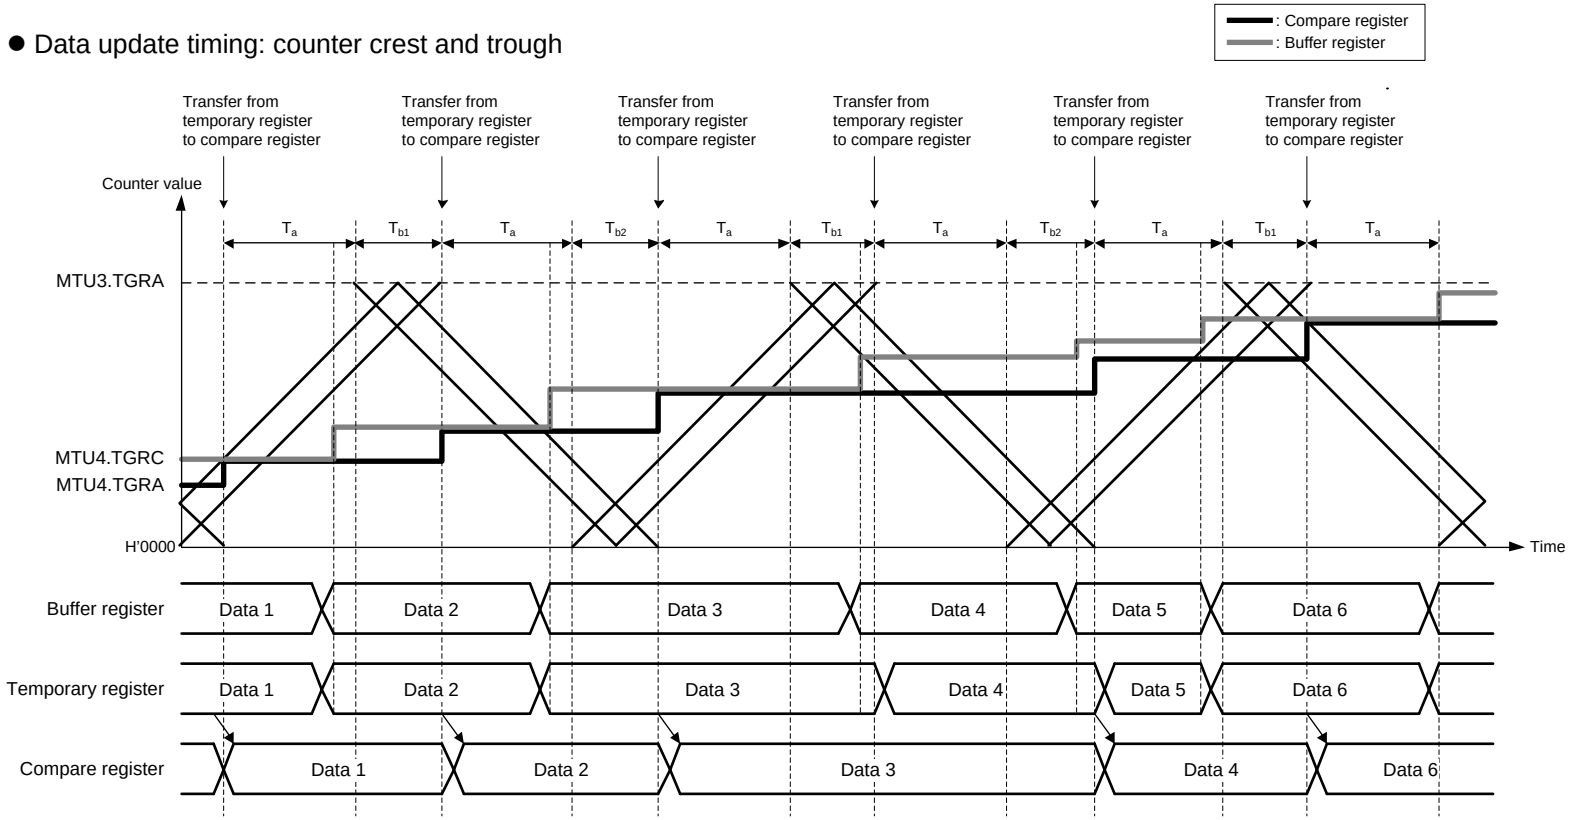

Figure 16.53 Example of Data Updating in Complementary PWM Mode (MTU3 and MTU4)

### (i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of the OLSN and OLSP bits in the TOCR1A (TOCR1B) register or the OLS1N to OLS3N and OLS1P to OLS3P bits in the TOCR2A register (TOCR2B). This initial output is the non-active level of the PWM output and continues from when complementary PWM mode is set with the MTU3.TMDR1 (MTU6.TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the TDDRA (TDDRB) register. **Figure 16.54** shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA (TDDRB) value is shown in **Figure 16.55**.

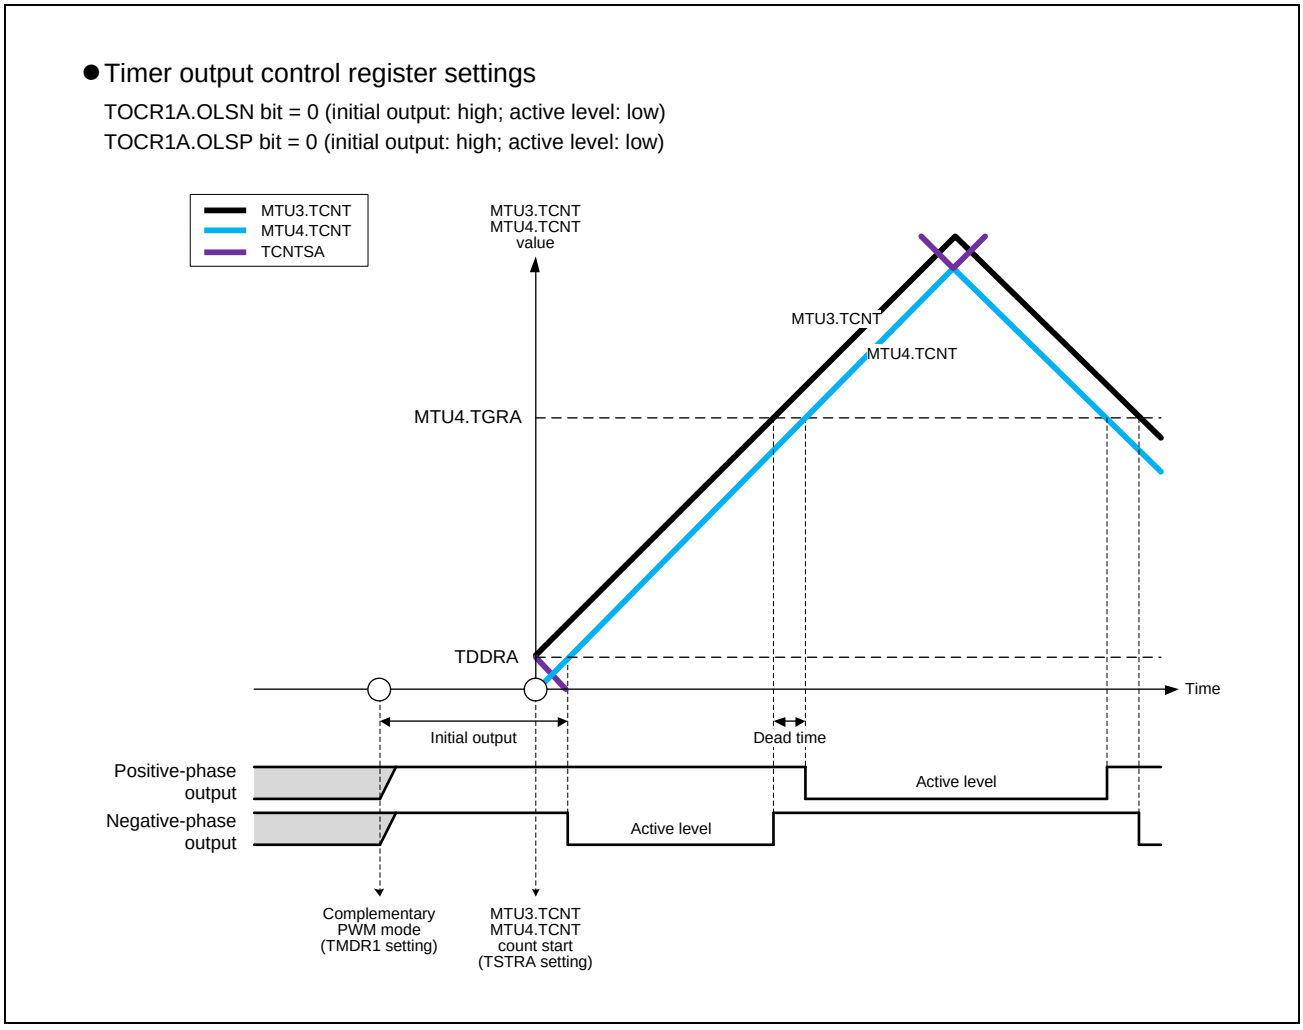

Figure 16.54 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (1)

● Timer output control register settings

TOCR1A.OLSN bit = 0 (initial output: high; active level: low)
TOCR1A.OLSP bit = 0 (initial output: high; active level: low)

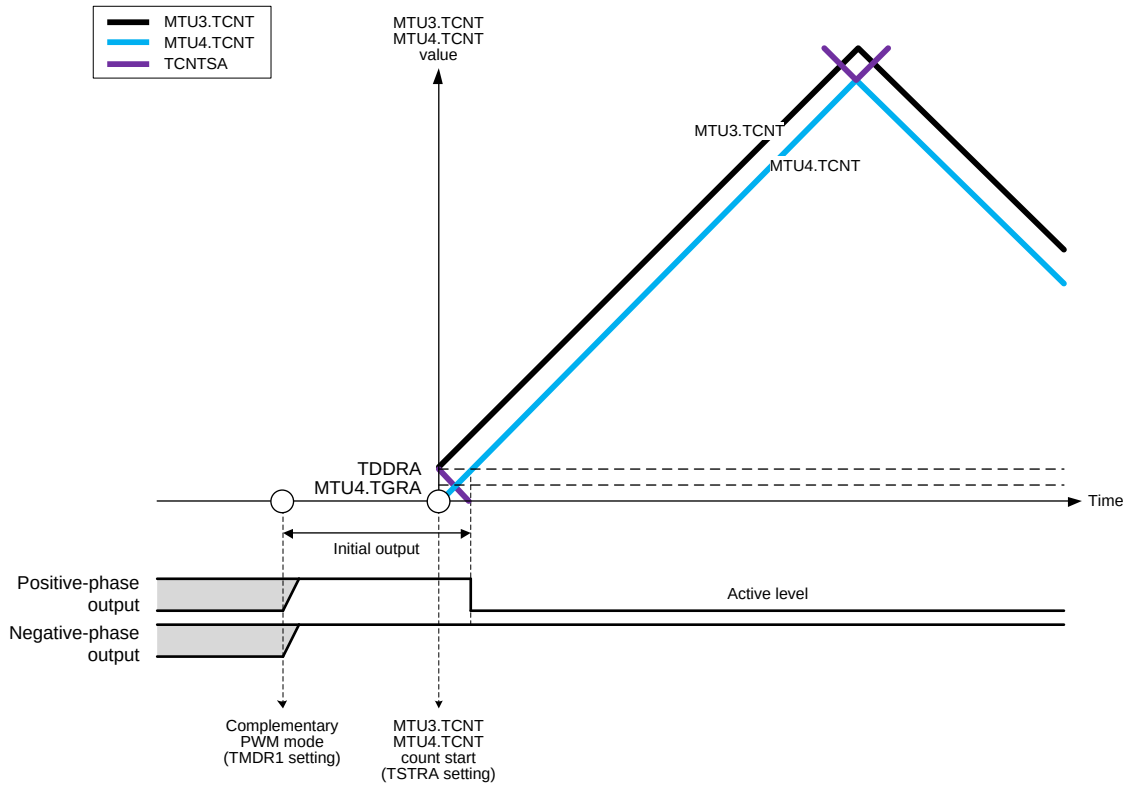

Figure 16.55 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (2)

### (j) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the timer output control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM output from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. **Figure 16.56** to **Figure 16.58** show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in **Figure 16.56**.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on. As shown in **Figure 16.57**, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in **Figure 16.58**, turning off the negative phase has priority due to the occurrence of compare match a' (negative-phase off timing) before compare match d (negative-phase on timing). As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

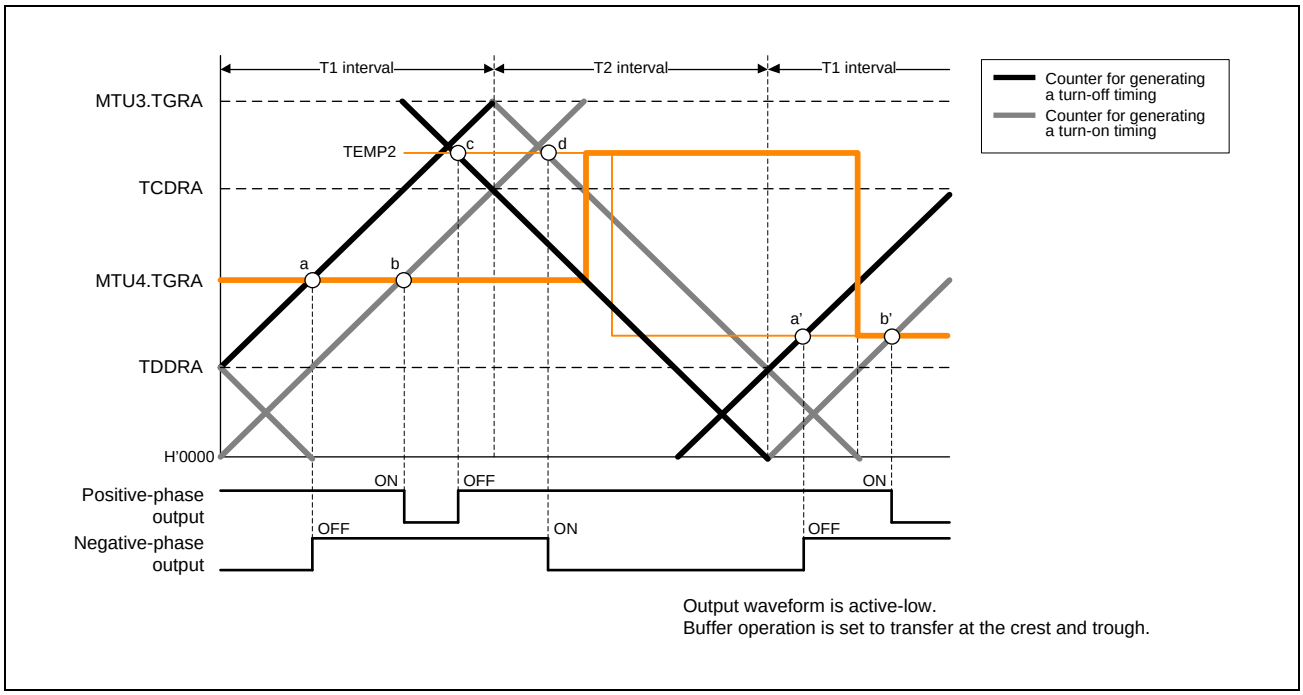

Figure 16.56 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

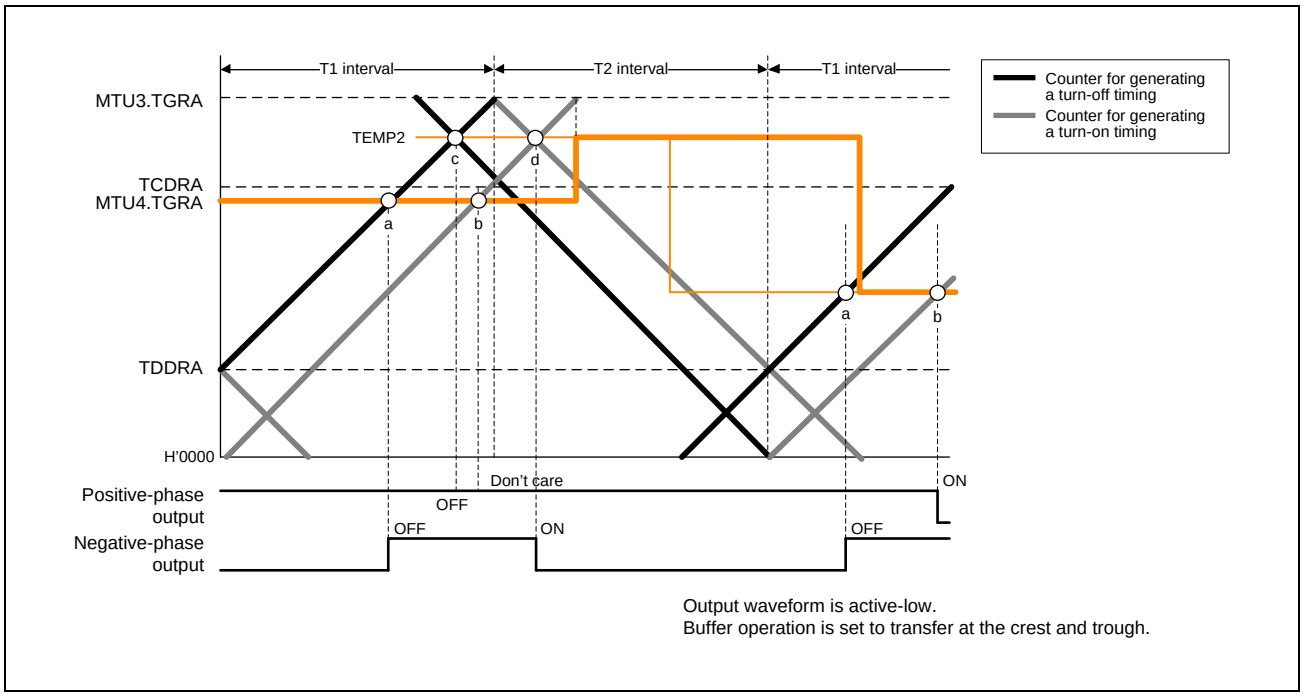

Figure 16.57 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

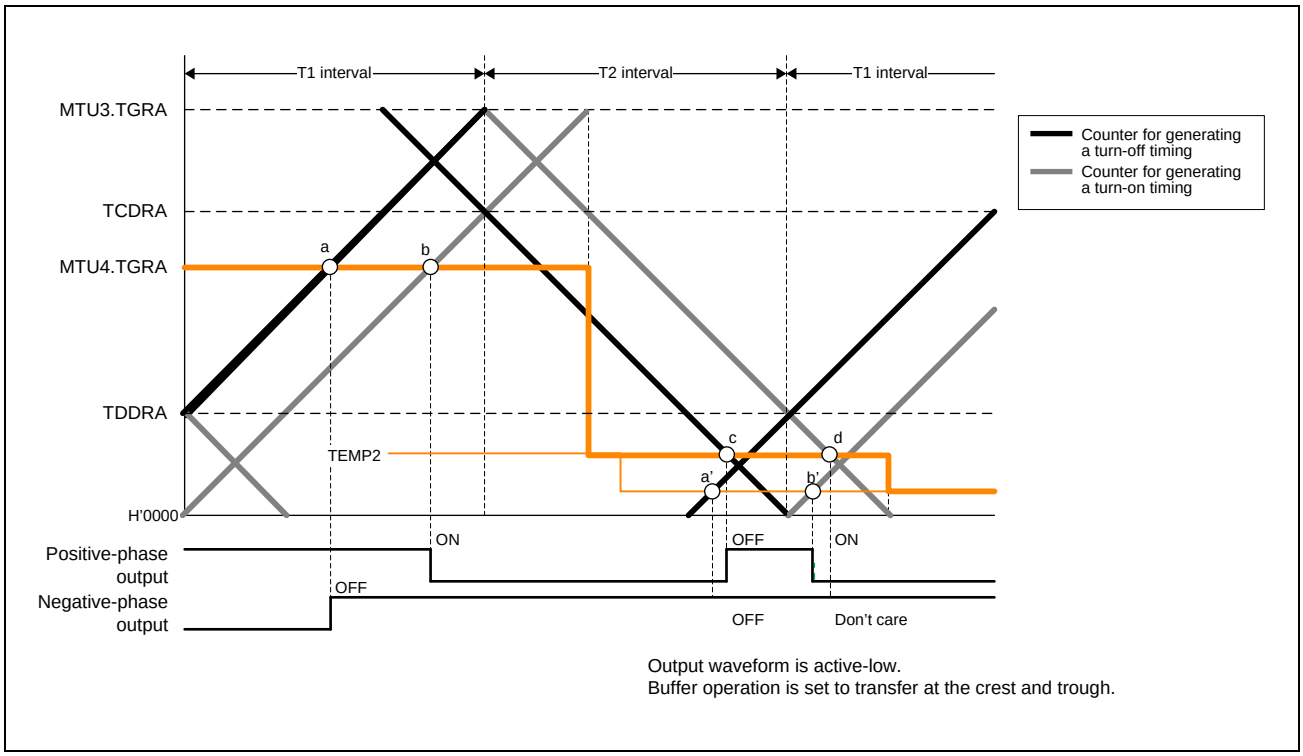

Figure 16.58 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (3)

### (k) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM output can be output as required. **Figure 16.59** to **Figure 16.63** show output examples.

A 100% duty waveform is output when the compare register value is set to H'0000. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

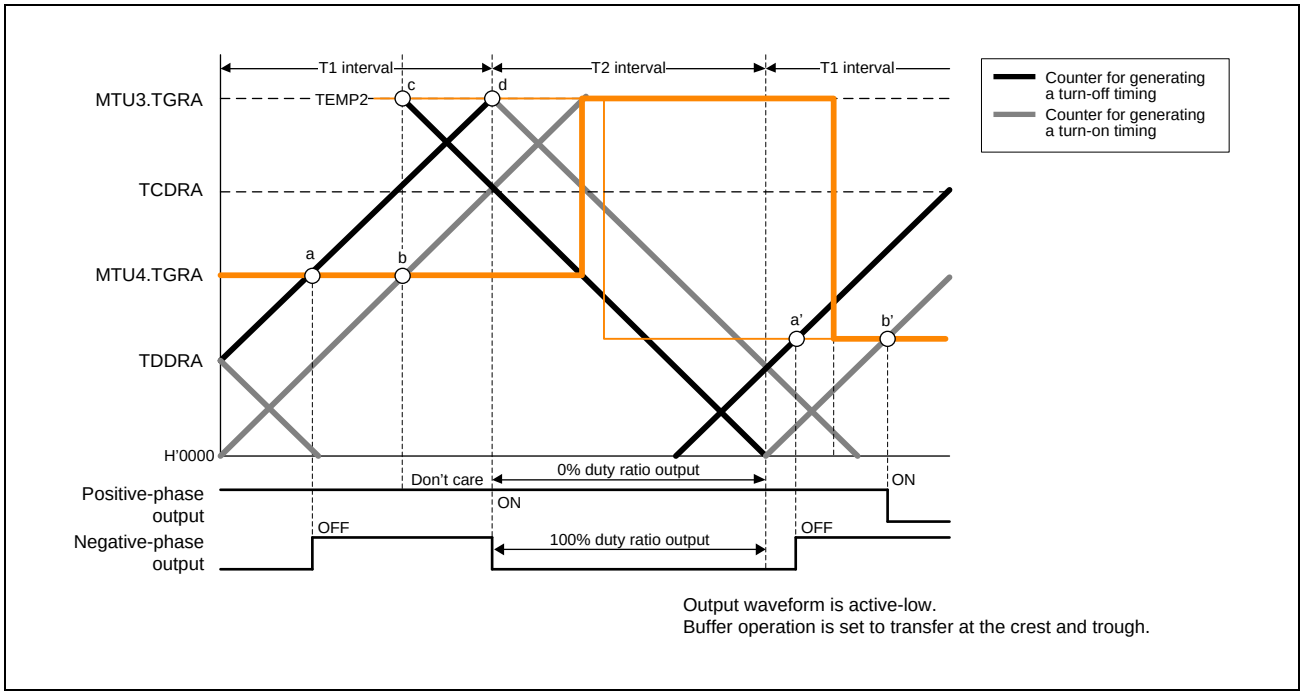

Figure 16.59 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

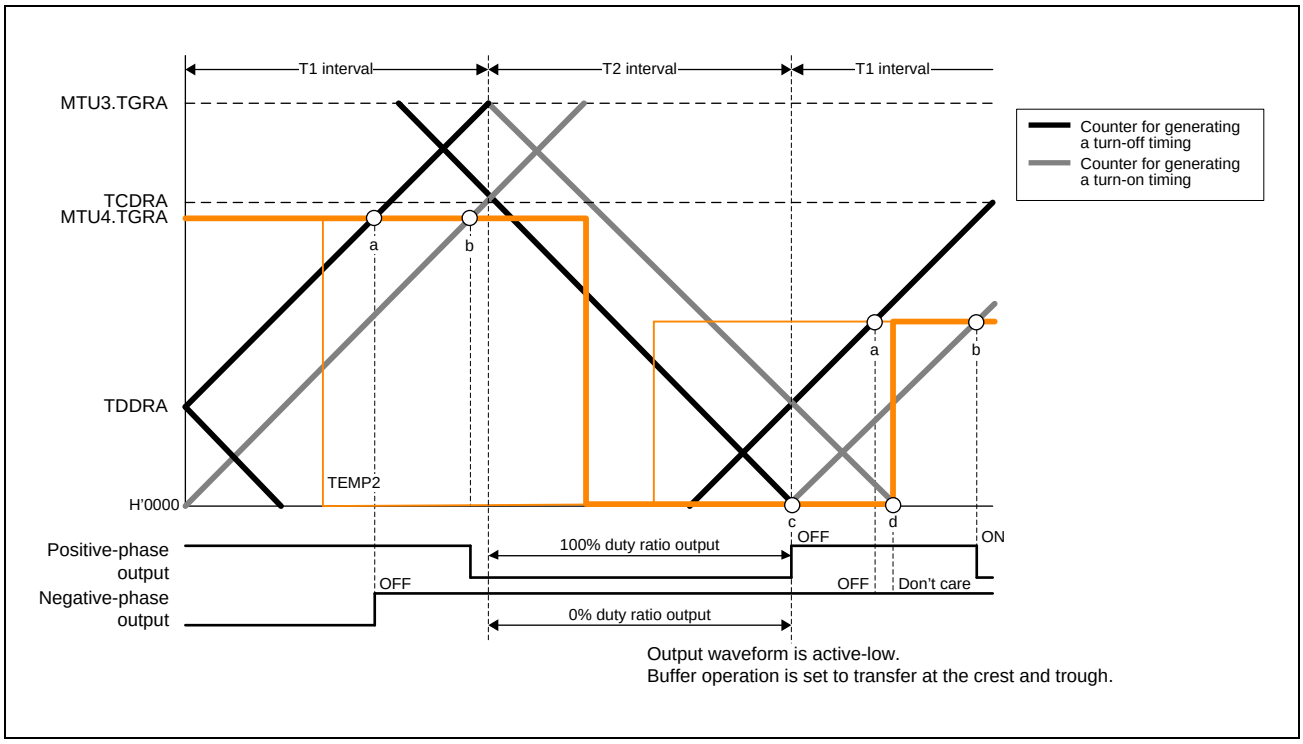

Figure 16.60 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

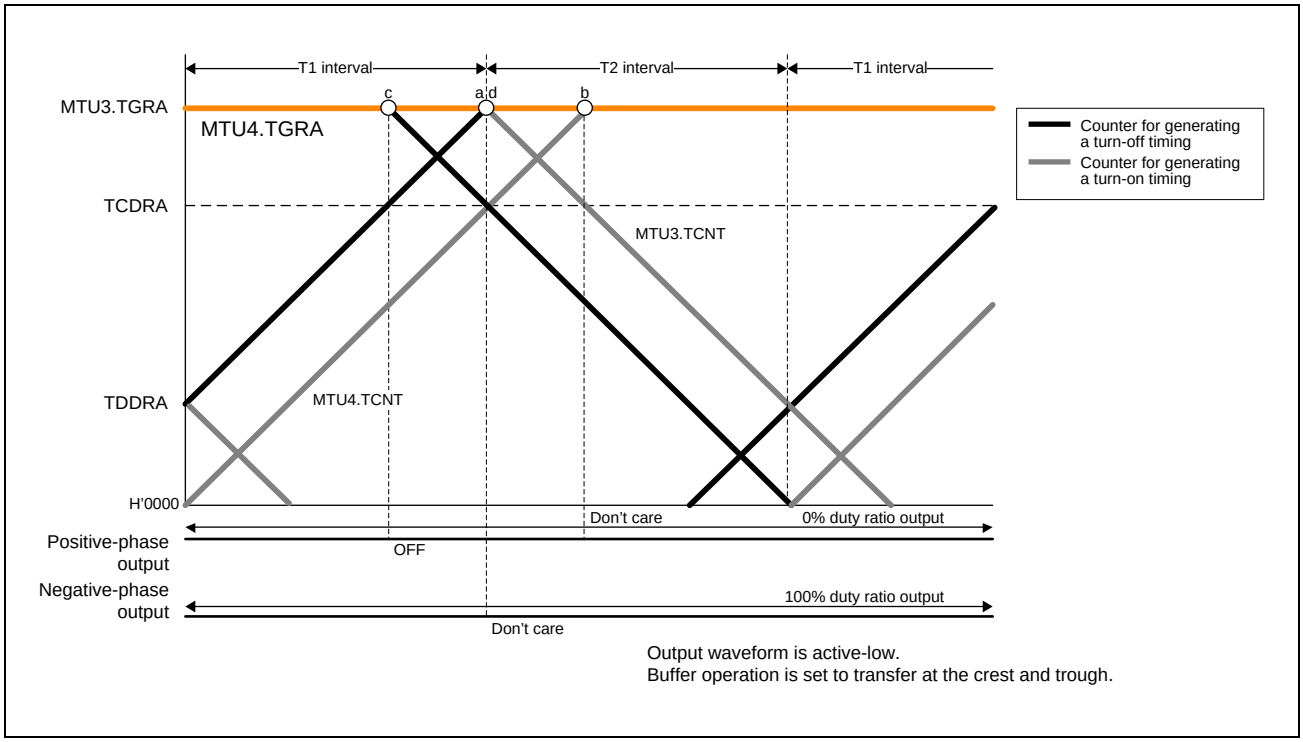

Figure 16.63 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (5)

### (l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM cycle can be enabled by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in **Figure 16.64**.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and H’0000.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level output.

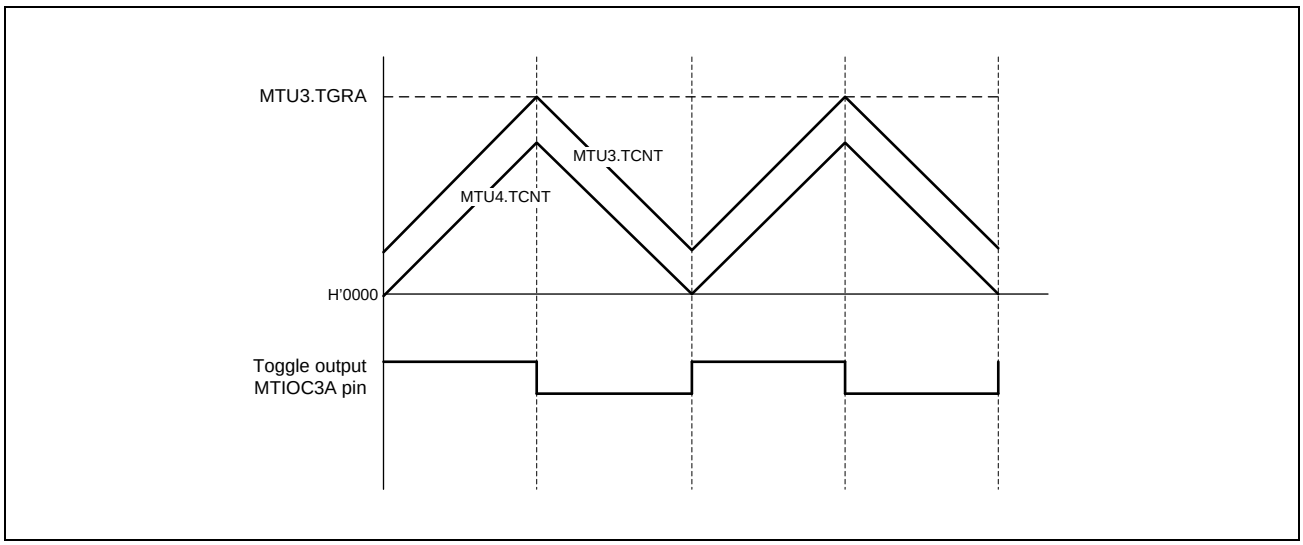

Figure 16.64 Example of Toggle Output Waveform Synchronized with PWM Output (MTU3 and MTU4)

### (m) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel source when a mode for synchronization with another channel is specified through the TSYRA (TSYRB) register and synchronous clearing is selected with MTU3.TCR.CCLR[2:0] (MTU6.TCR.CCLR[2:0]) bits.

**Figure 16.65** illustrates an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

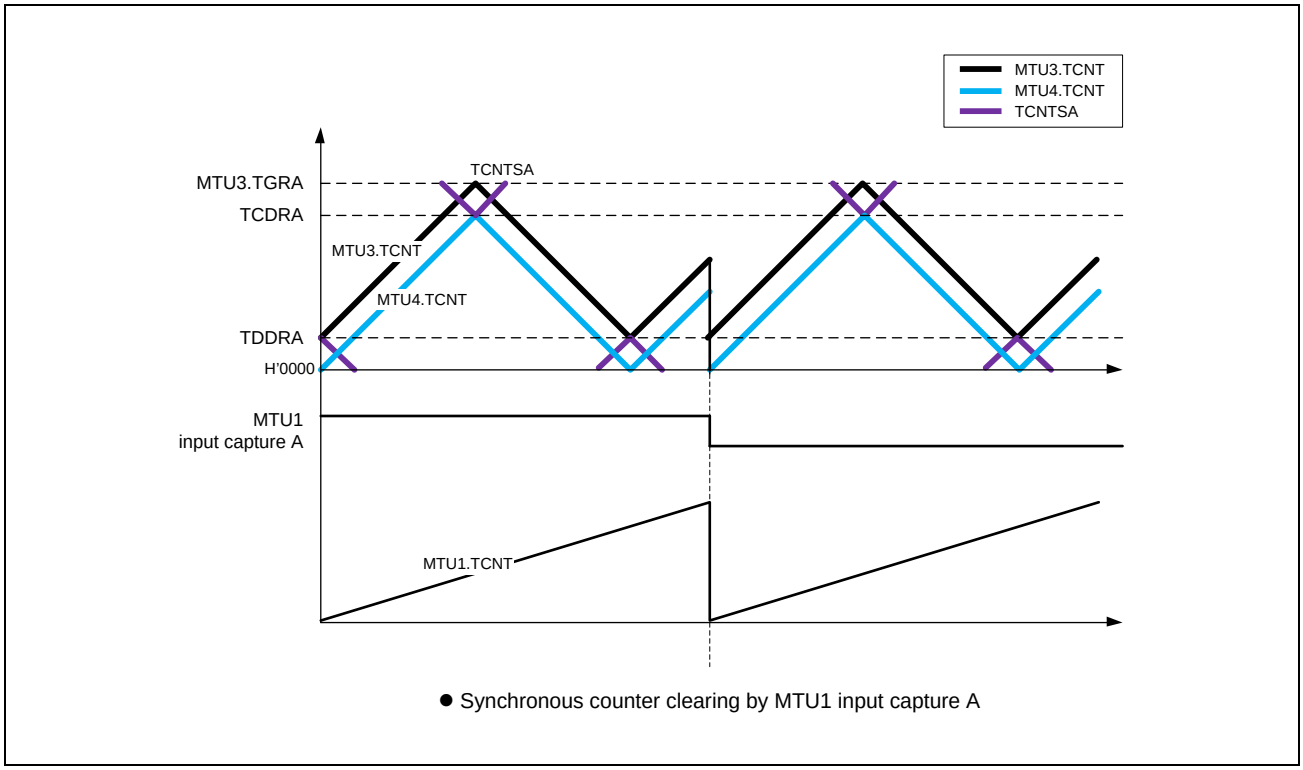

Figure 16.65 Counter Clearing Synchronized with Another Channel (MTU3 and MTU4)

### (n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval (Tb2 interval) at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb2 interval as indicated by (10) or (11) in **Figure 16.66**. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb2 interval, if synchronous clearing occurs in the initial value output period (indicated by (1) in **Figure 16.66**) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU 3 and MTU4 and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing in MTU0, MTU1, and MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture generated in MTU0, MTU1, and MTU2 can cause counter clearing.

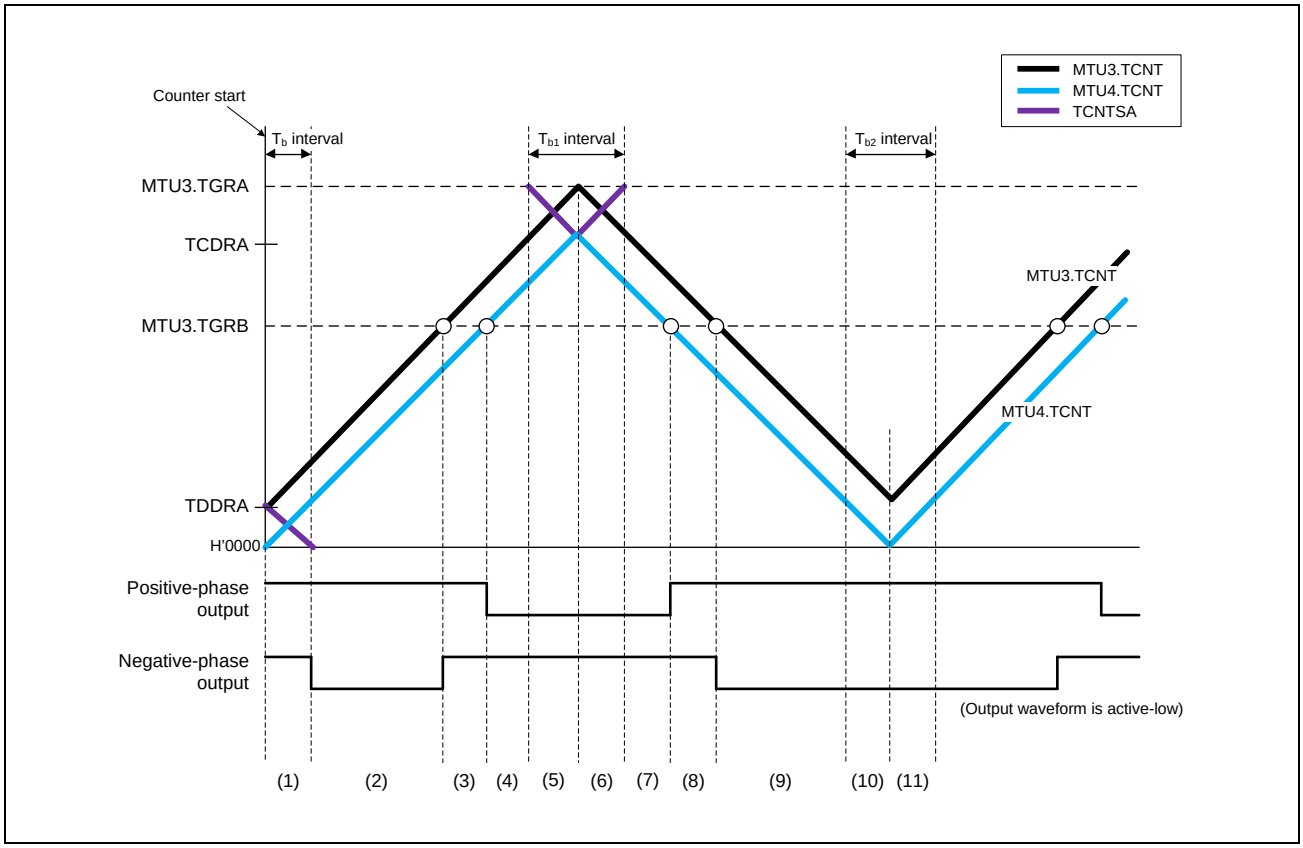

Figure 16.66 Timing for Synchronous Counter Clearing (MTU3 and MTU4)

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode.

  An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in **Figure 16.67**.

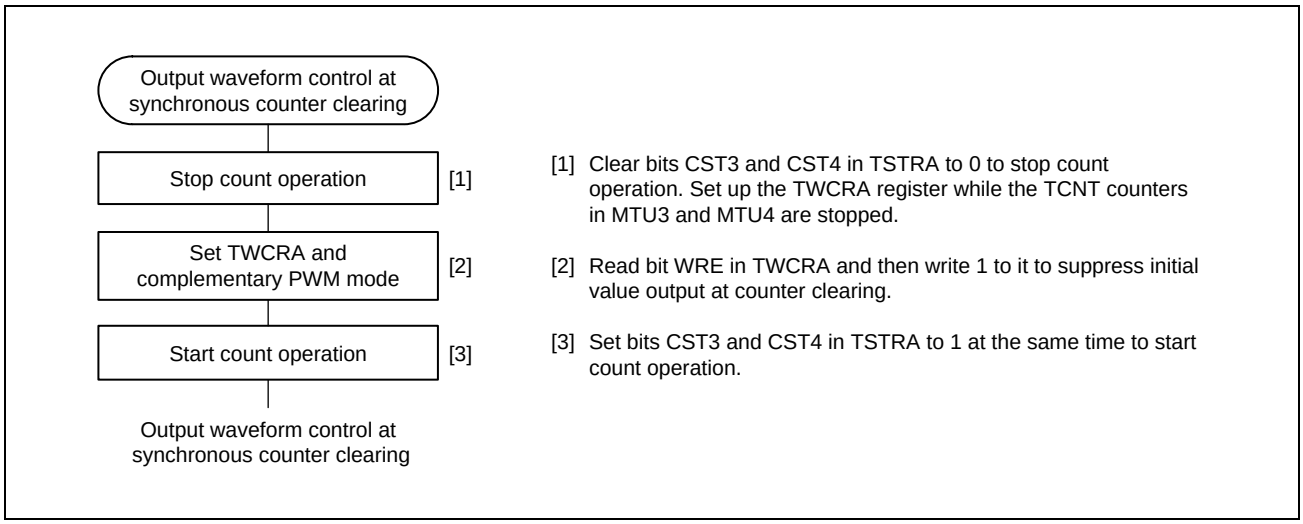

Figure 16.67 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode (MTU3 and MTU4)

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

**Figure 16.68** to **Figure 16.71** show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in **Figure 16.68** to **Figure 16.71**, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in **Figure 16.66**, respectively.
In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is cleared to 0 and the WRE bit is set to 1 in TWCRB.

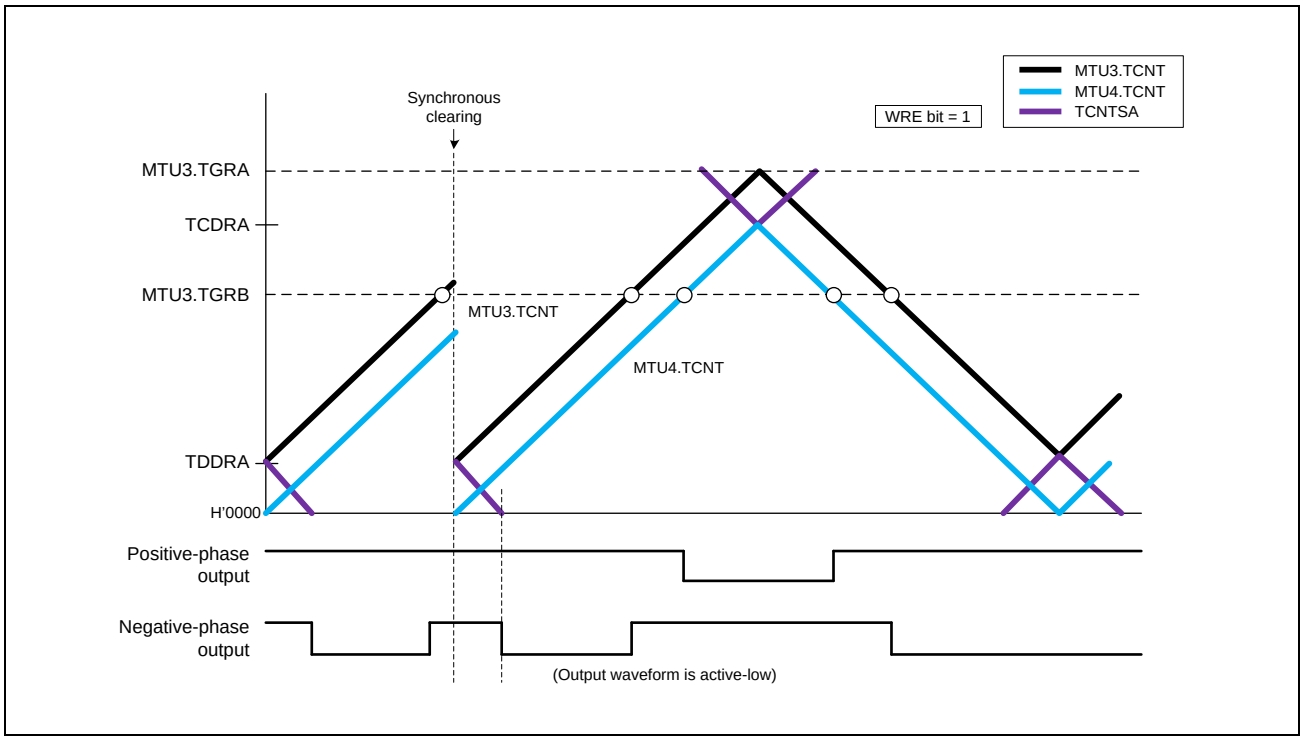

Figure 16.68 Example of Synchronous Clearing in Dead Time during Up-Counting

### (o) Suppressing Synchronous Counter Clearing for MTU0 to MTU2 and MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing is suppressed only within the interval shown in **Figure 16.72**. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, refer to **Section 16.3.10(2), Synchronous Counter Clearing for MTU6 and MTU7**.

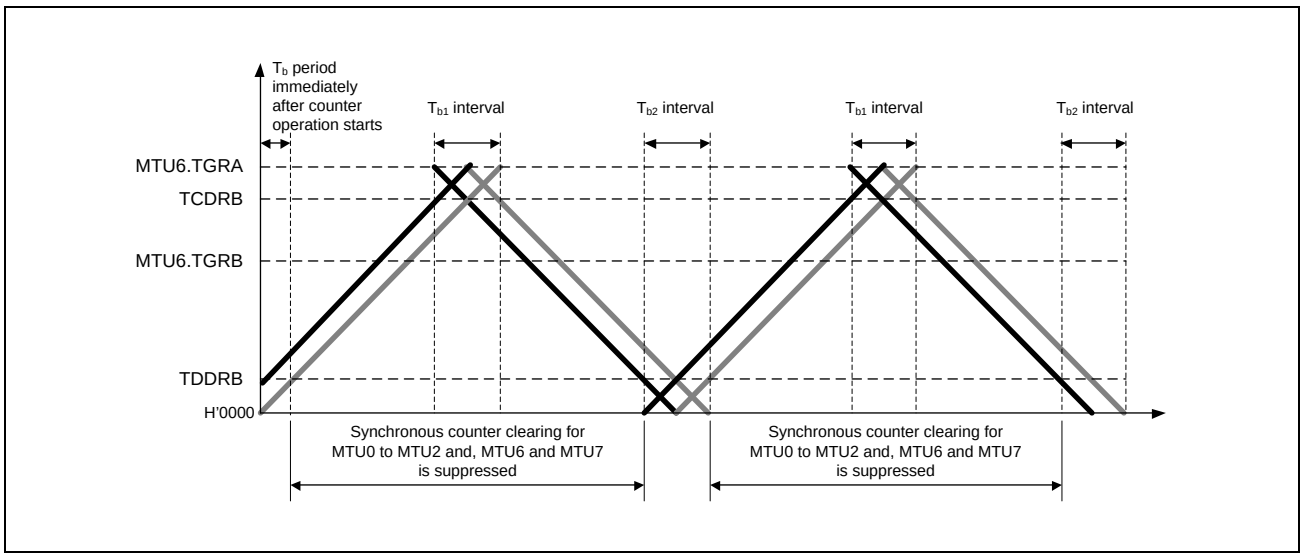

Figure 16.72 Synchronous Clearing-Suppressed Interval Specified by TWCRB.SCC Bit for MTU0, MTU1 and MTU2, and MTU6 and MTU7

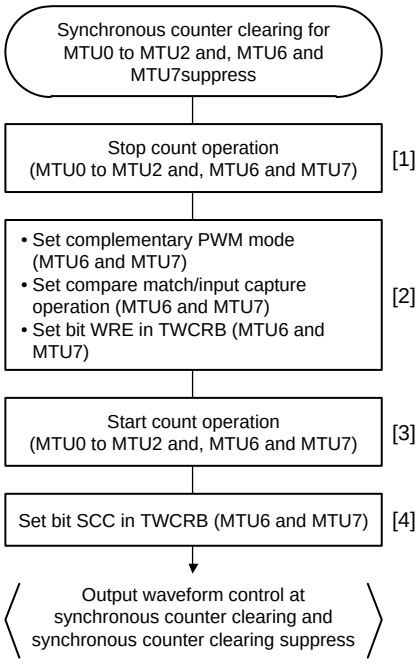
- Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is shown in **Figure 16.73**.



[1] Clear bits CSTn of the timer start register (TSTRB) in MTU6 and MTU7 to 0 to stop count operation. Clear bits CSTn of TSTRA in MTU0 to MTU2 to 0 to stop count operation.

[2] Set the complementary PWM mode in MTU6 and MTU7 and compare match/input capture operation in MTU0 to MTU2. When bit WRE in TWCRA or TWCRB should be set, make appropriate setting here.

[3] Set bits CST6 and CST7 in MTU6 and MTU7 to 1 to start count operation. For synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7, set bits CSTn of TSTRA in MTU0 to MTU2 to 1 to start count operation in any one of MTU0.TCNT to MTU2.TCNT.

[4] Read TWCRB and then set bit SCC in TWCRB to 1 to suppress synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7*1. Here, do not modify the CCE and WRE bit values in TWCRB of MTU6 and MTU7. Synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7 is suppressed in the synchronous counter clearing-suppressed periods.

Note 1. The TWCRB.SCC bit value can be modified during count operation. However, if a synchronous clearing occurs when bit TWCRB.SCC is modified from 0 to 1, the synchronous clearing may not be suppressed. If a synchronous clearing occurs when bit TWCRB.SCC is modified from 1 to 0, the synchronous clearing may be suppressed.

Figure 16.73 Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

- Examples of Suppression of Synchronous Counter Clearing for MTU 0 to MTU2, and MTU6 and MTU7

**Figure 16.74** to **Figure 16.77** show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing for MTU 0 to MTU2, and MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in **Figure 16.74** to **Figure 16.77**, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in **Figure 16.66**, respectively. In these examples, the WRE bit in TWCRB in MTU6 and MTU7 is set to 1.

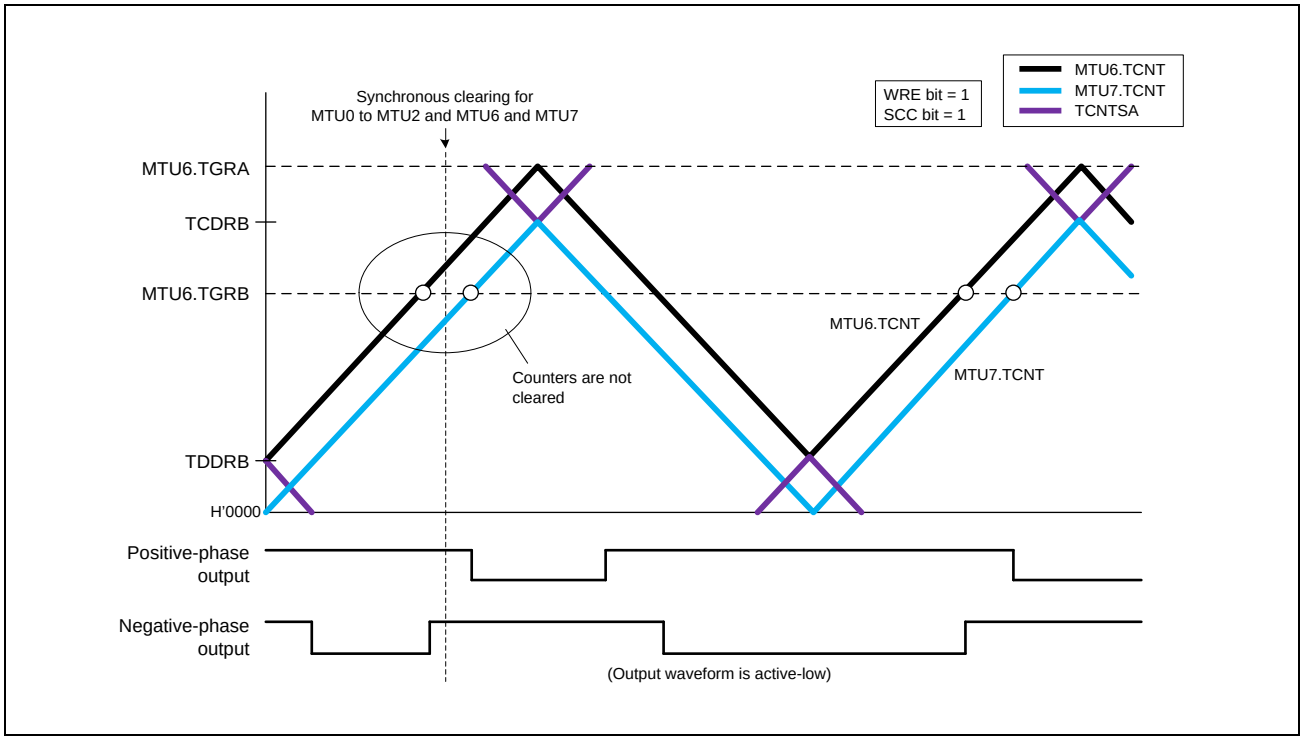


Figure 16.74 Example of Synchronous Clearing in Dead Time during Up-Counting

### (p) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit.

**Figure 16.78** illustrates an operation example.

NOTES

1. Use this function only in complementary PWM mode 1 (transfer at crest).
2. Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4 or SYNC6 to SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CEOA to CEOD or CEIA to CEID bits in TSYCR).
3. Do not set the PWM duty value to H'0000.
4. Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

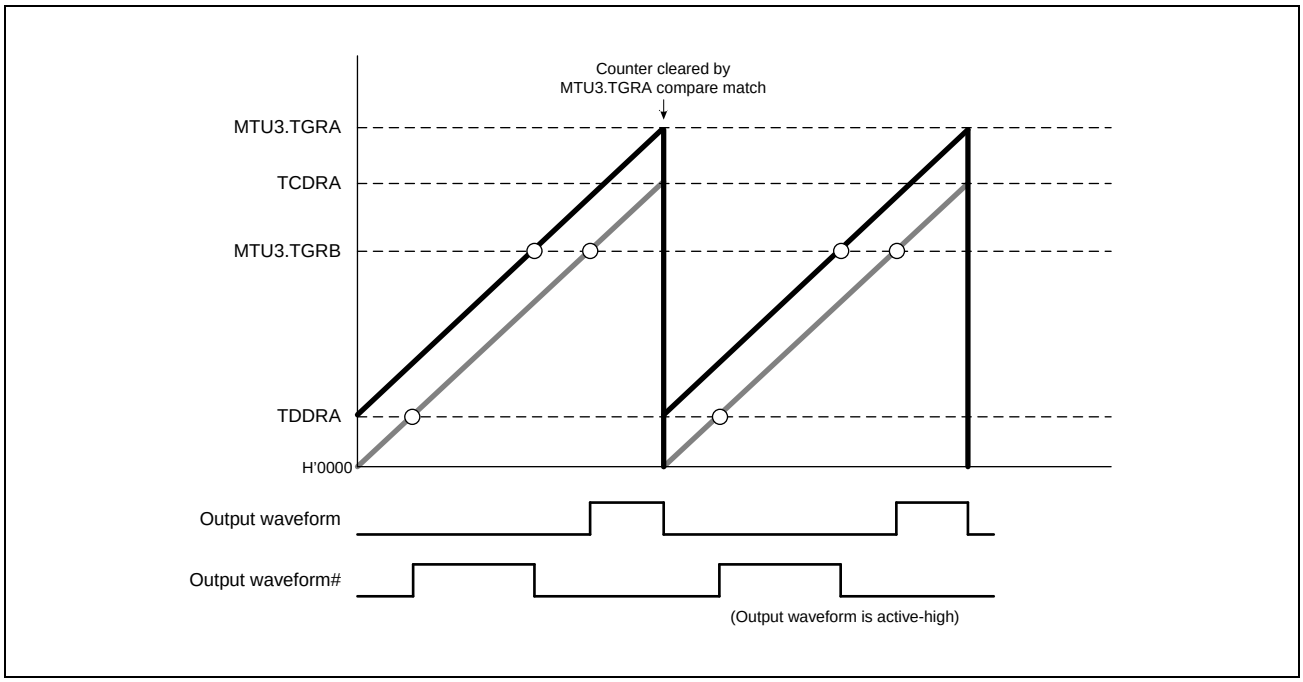

Figure 16.78 Example of Counter Clearing Operation by MTU3.TGRA Compare Match

### (q) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode when MTU3 and MTU4 are used, a brushless DC motor can easily be controlled using TGCRA. **Figure 16.79** to **Figure 16.82** show examples of brushless DC motor driving waveforms created using TGCRA.

To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., clear the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (make appropriate settings with the port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is cleared to 0 or set to 1.

The driving waveforms are output from the 6-phase PWM output pins for complementary PWM mode.

With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN and TOCR1A.OLSP bits regardless of the setting of the N and P bits.

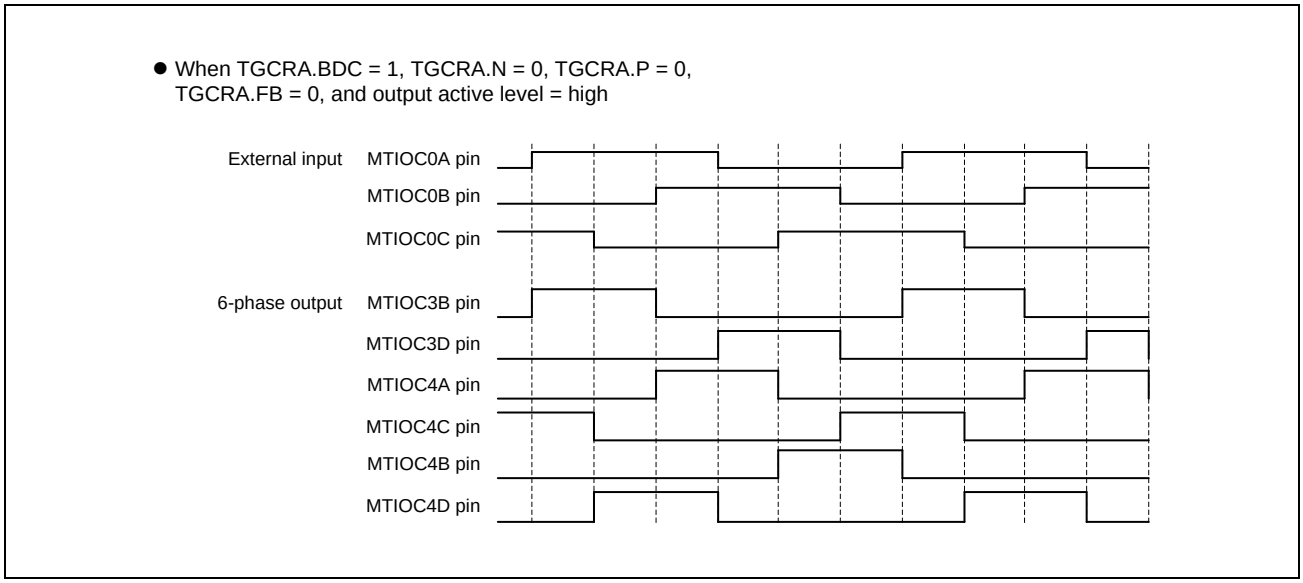

Figure 16.79 Example of Output Phase Switching by External Input (1)

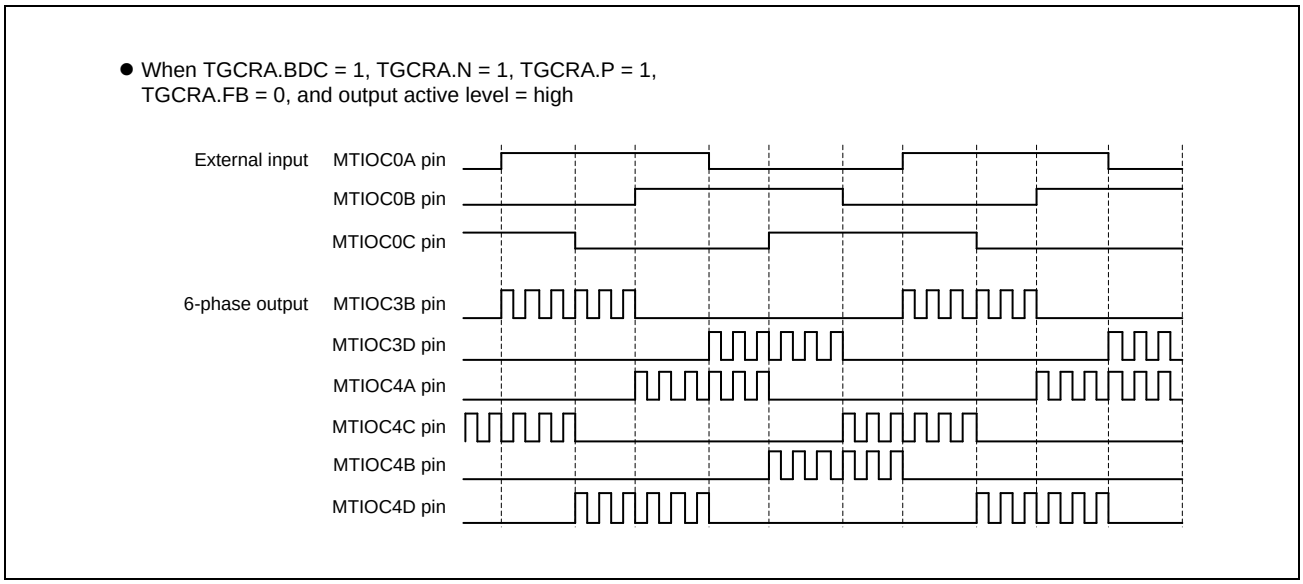

Figure 16.80 Example of Output Phase Switching by External Input (2)

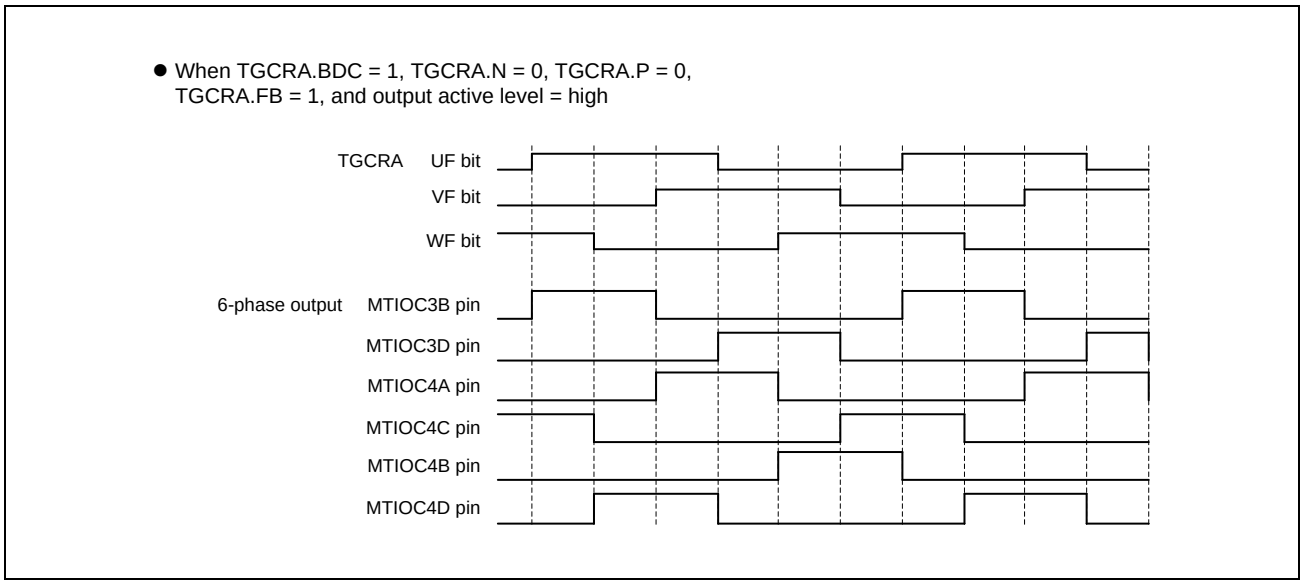

Figure 16.81 Example of Output Phase Switching through UF, VF, and WF Bit Settings (1)

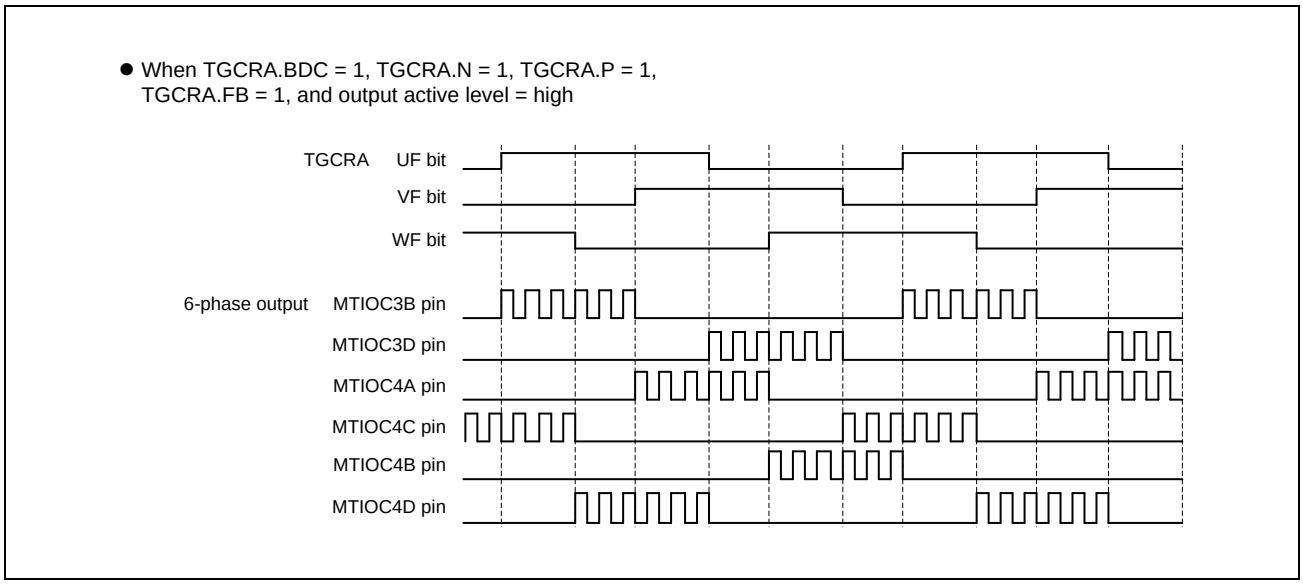

Figure 16.82 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2)

### (r) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).

When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.

A/D converter start requests can be specified by setting the TIER.TTGE bit. To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

### (s) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.

When setting buffer registers A (TGRD in MTU3, TGRC and TGRD in MTU4, TGRD in MTU6, and TGRC and TGRD in MTU7), set also buffer registers B (TGRE in MTU3, TGRE and TGRF in MTU4, TGRE in MTU6, and TGRE and TGRF in MTU7) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register A value – 1). For details of the setting procedure, refer to **Section 16.3.8(1), Example of Complementary PWM Mode Setting Procedure**.

NOTE

When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value – 1), asymmetric PWM waveforms are output.

**Figure 16.83** shows an example of double buffer operation. Each register data is transferred as follows.

- After TGRD (buffer A) in MTU4 or MTU7 is written to, data is transferred from TGRD (buffer A) in MTU4 or MTU7 to Temp3A or Temp6A (temporary A) and from TGRF (buffer B) in MTU4 or MTU7 to Temp3B or Temp6B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A or Temp6A (temporary A) to TGRB (compare) in MTU4 or MTU7.
- With timing (2) in the figure, data is transferred from Temp3B or Temp6B (temporary B) to TGRB (compare) in MTU4 or MTU7.

In the crest interval (Tb1 interval), the compare register and temporary register A are valid; in the trough interval (Tb2 interval), the compare register and temporary register B are valid.

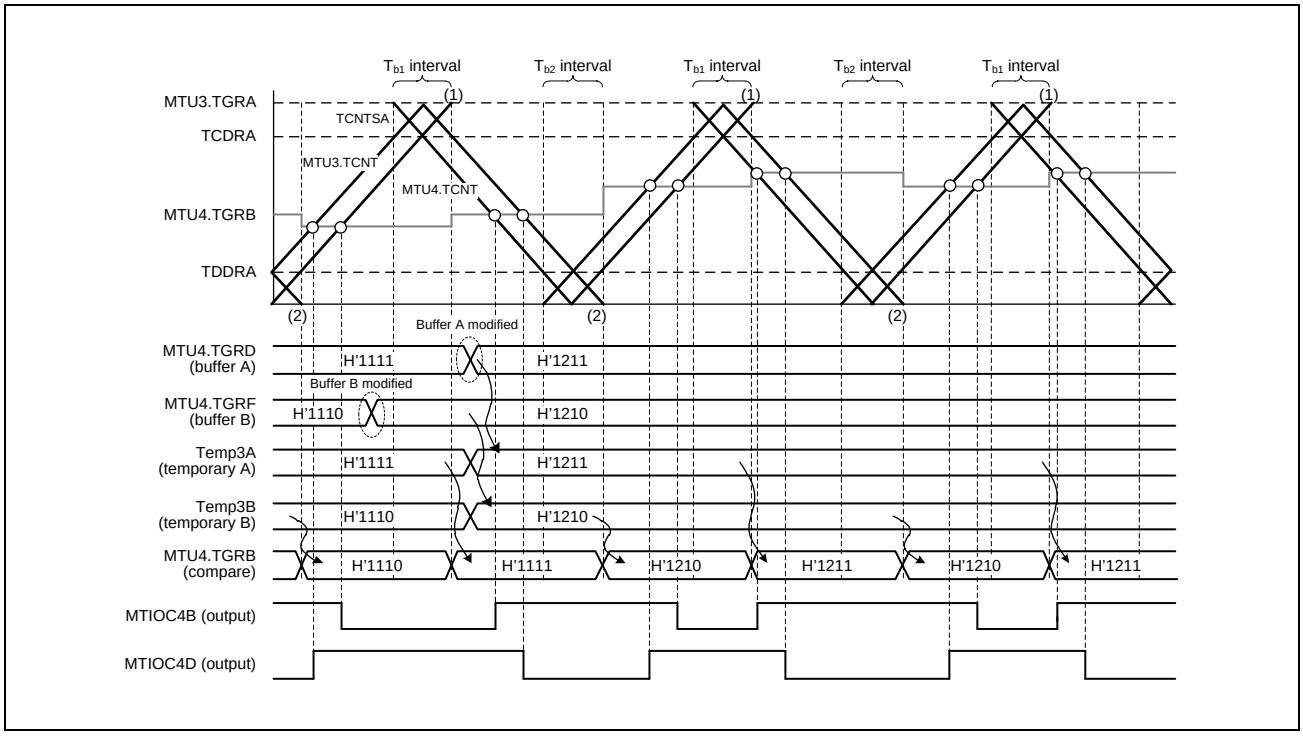

Figure 16.83 Example of Double Buffer Operation

**Figure 16.84** shows an example when the buffer write value is smaller than the TDDRA (TDDRB) value, and **Figure 16.85** shows an example when the write value is greater than TCDRA (TCDRB).

In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

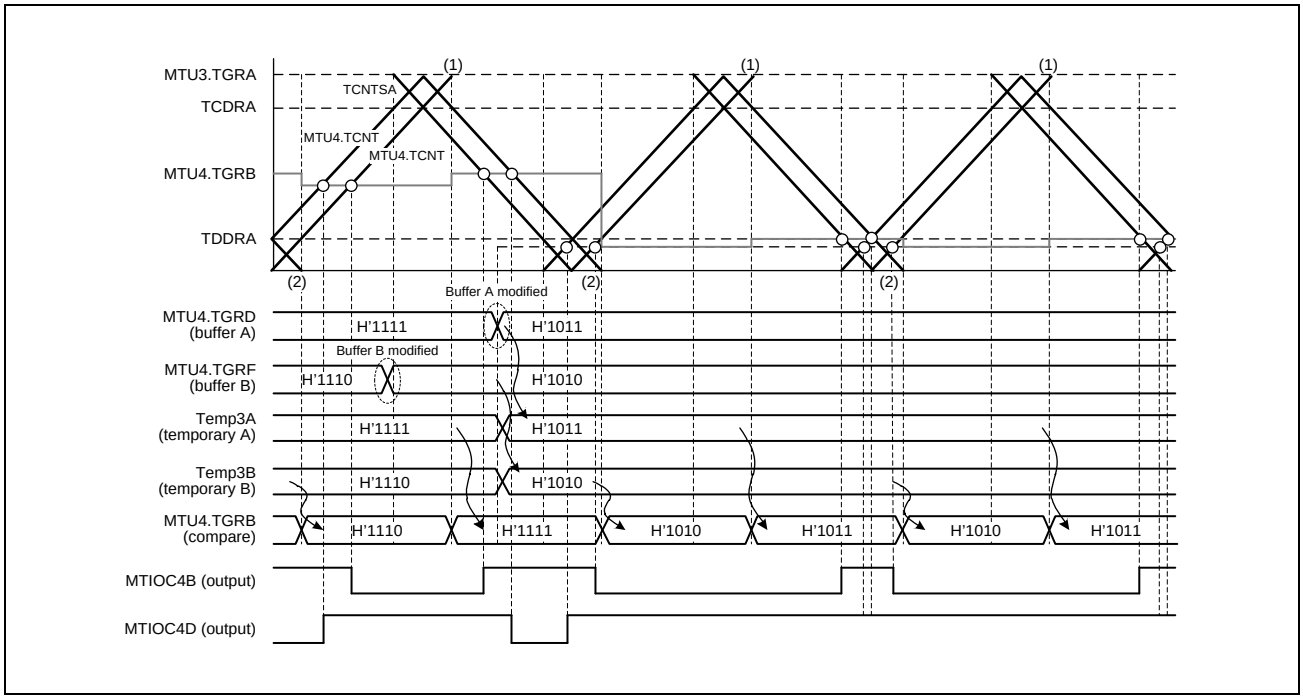

Figure 16.84 Example of Double Buffer Operation (Buffer Write Value is Smaller than TDDRA)

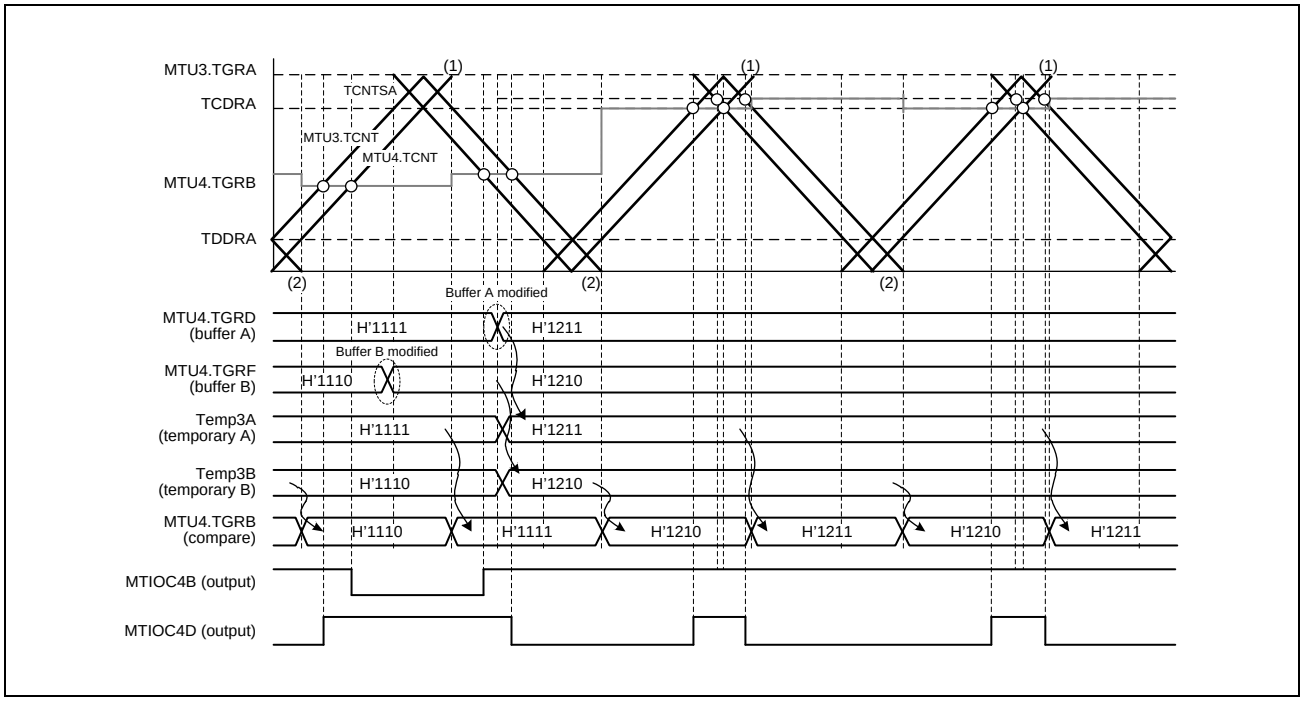

Figure 16.85 Example of Double Buffer Operation (Buffer Write Value is Greater than TCDRA)

### (3) Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.

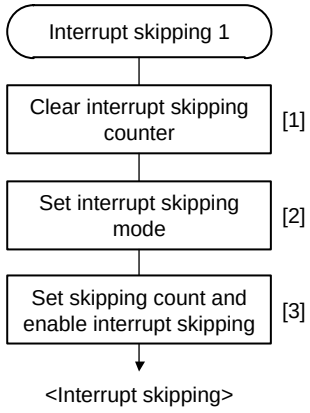
Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D converter start request delaying function, refer to **Section 16.3.9, A/D Converter Start Request Delaying Function**.

The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

#### (a) Example of Interrupt Skipping Function 1 Setting Procedure

**Figure 16.86** shows an example of the interrupt skipping function 1 setting procedure. **Figure 16.87** shows the periods during which interrupt skipping count can be changed.



[1] Set bits T3AEN and T4VEN in the timer interrupt skipping set register 1 (TITCR1A) to 0 to clear the skipping counter.

[2] Set bit TITM in the timer interrupt skipping mode register (TITMRA) to 0 to select interrupt skipping function 1.

[3] Specify the interrupt skipping count within the range from 0 to 7 times in bits T3ACOR2 to T3ACOR0 and T4VCOR2 to T4VCOR0 in TITCR1A, and enable interrupt skipping through bits T3AEN and T4VEN.

**Note:** The setting of TITCR1A must be done while the TGIA3 and TCIV4 interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER under the conditions in which a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter.

Figure 16.86 Example of Interrupt Skipping Function 1 Setting Procedure

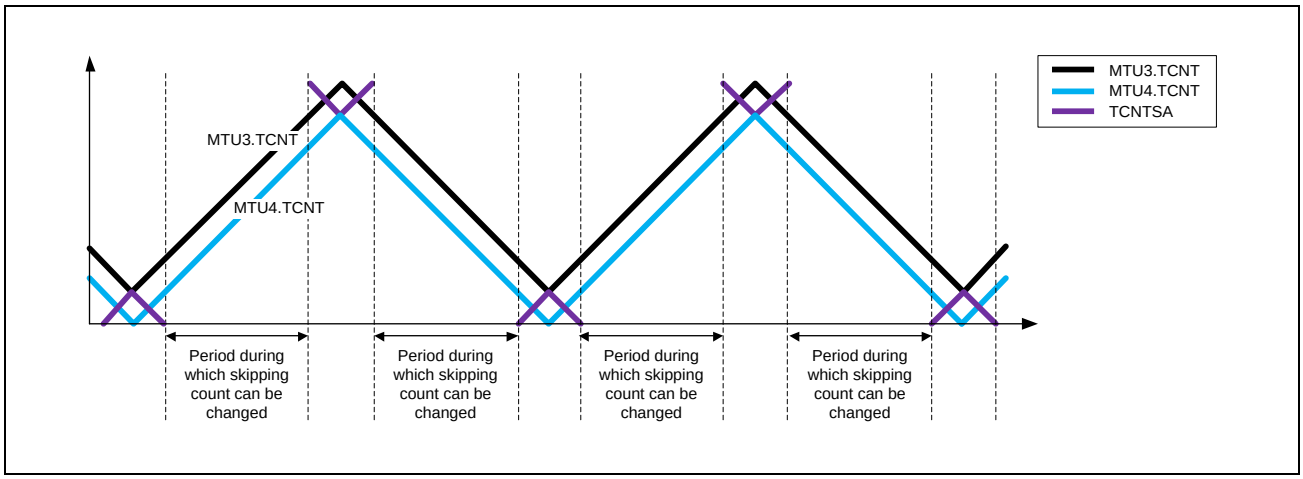


Figure 16.87 Periods during which Interrupt Skipping Count can be Changed

### (b) Example of Interrupt Skipping Function 1

**Figure 16.88** shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

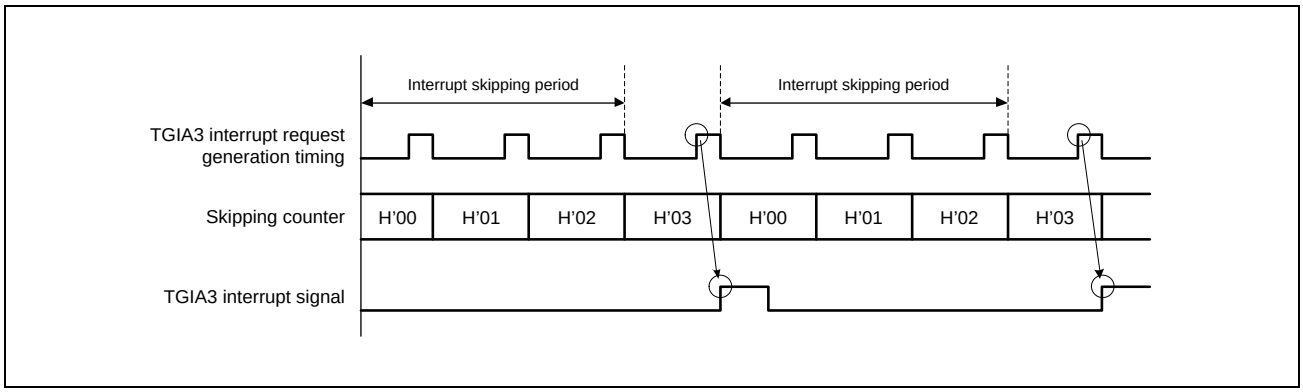

Figure 16.88 Example of Interrupt Skipping Function 1

### (c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.

**Figure 16.89** shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

**Figure 16.90** shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b). While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period.

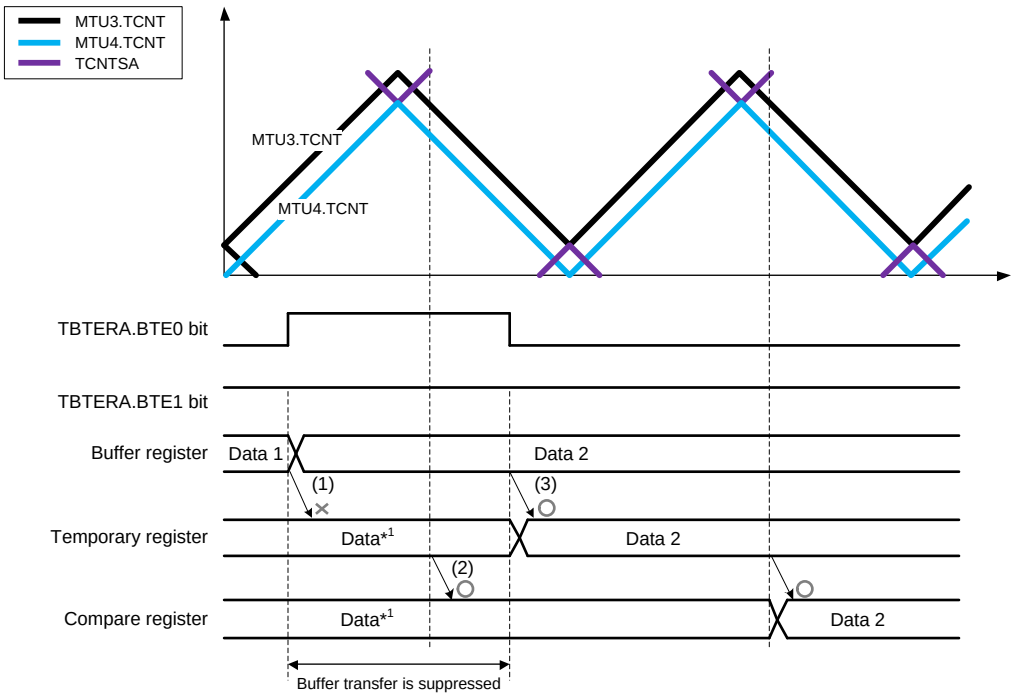
Note that the buffer transfer-enabled period differs depending on whether only the T3AEN (T6AEN) bit in the TITCR1A (TITCR1B) register is set to 1, only the T4VEN (T7VEN) bit in the TITCR1A (TITCR1B) register is set to 1, or both the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 1. **Figure 16.91** shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

NOTE

This function must be used in combination with interrupt skipping function 1.

When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in TBTERA or TBTERB to 0).

If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



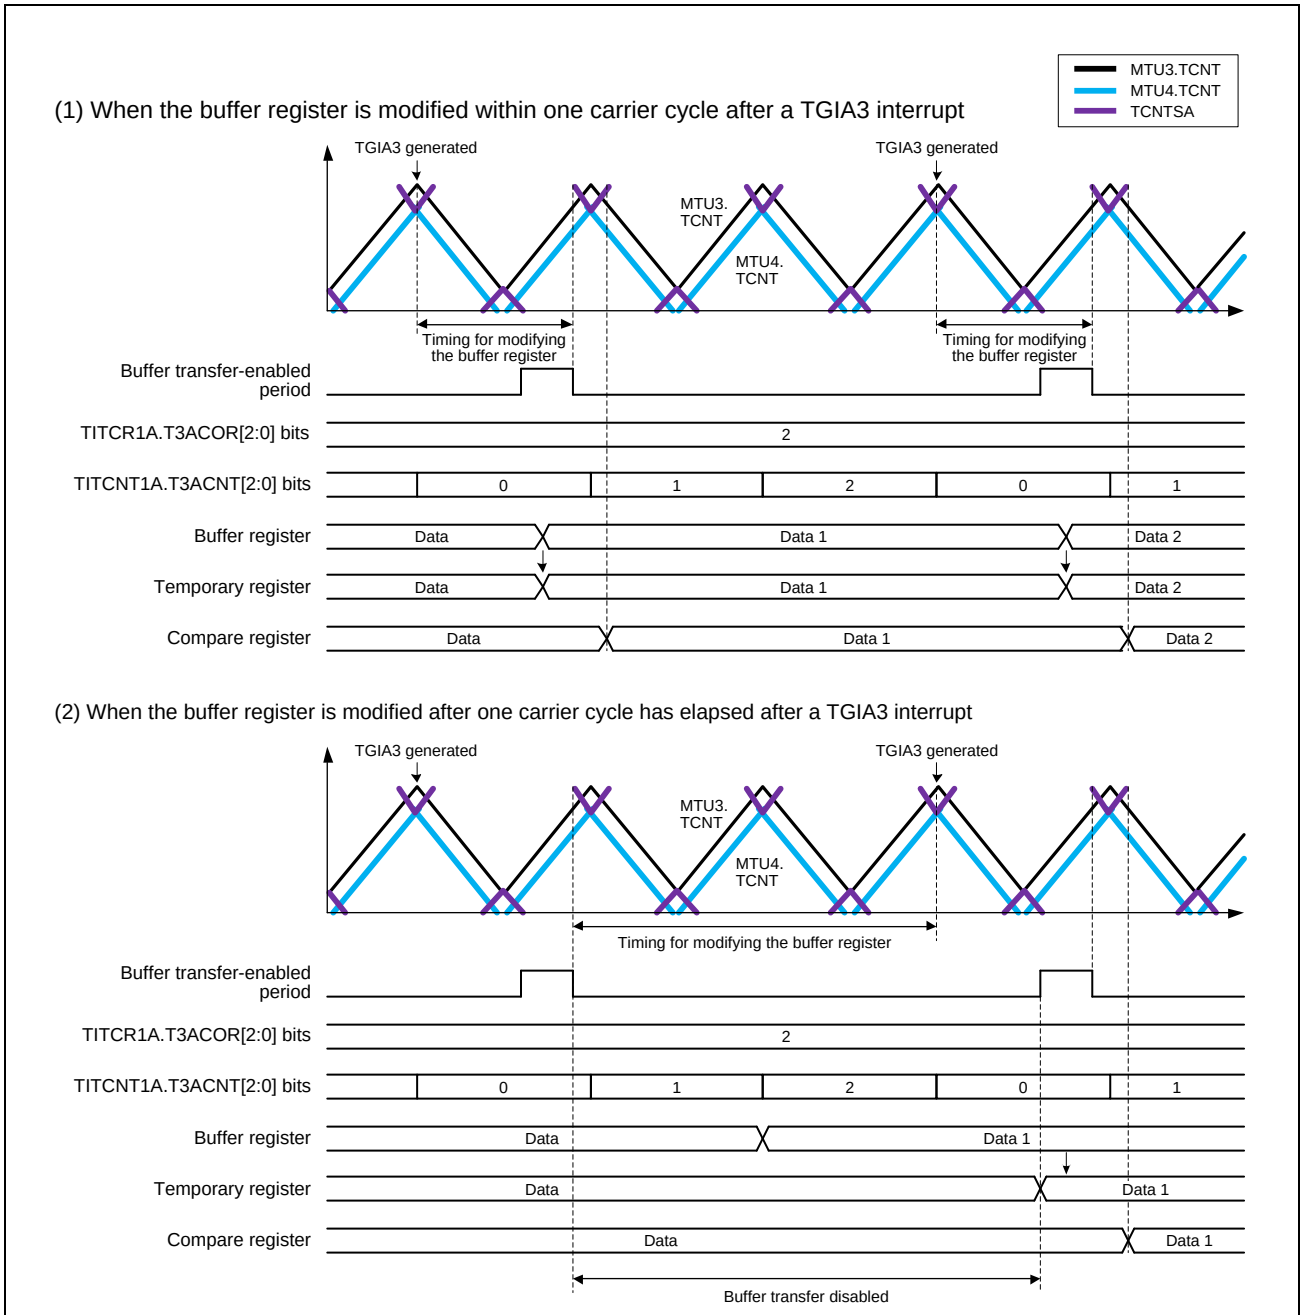
(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).

(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.

(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.

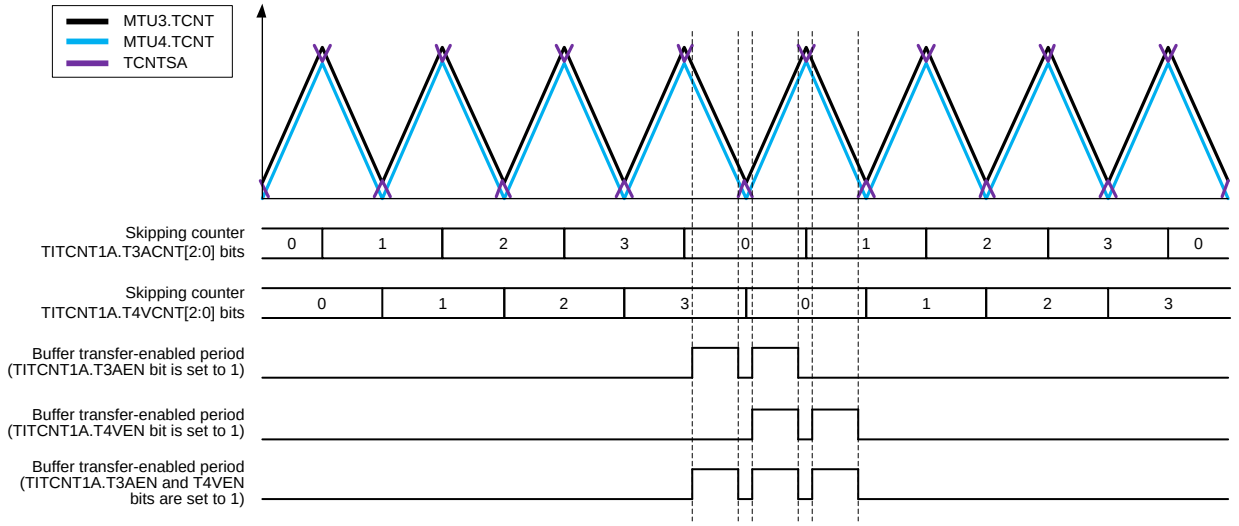
Note 1. When buffer transfer at the crest is selected.

Figure 16.89 Example of Operation When Buffer Transfer is Disabled (BTE[1:0] = 01b)



**Note:** Buffer transfer at the crest is selected.
The skipping count is set to two. The TITCR1A.T3AEN bit is set to 1.

Figure 16.90 Example of Operation When Buffer Transfer is Linked with Interrupt Skipping (BTE[1:0] = 10b)



**Note:** The skipping count is set to three.
Buffer operation is set to transfer at the crest and trough.

Figure 16.91 Relationship between Bits T3AEN and T4VEN in TITCR1A and Buffer Transfer-Enabled Period

### (4) Complementary PWM Mode Output Protection Functions

The following output protection functions are provided for complementary PWM mode.

#### (a) Register and Counter Miswrite Prevention Function

Access from the CPU to the mode registers, control registers, compare registers, and counters can be enabled or disabled by setting the RWE bit in the TRWERA (TRWERB) register. The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER, MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH, MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT, MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, and MTU.TDDRB

47 registers in total

This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

#### (b) Halting of PWM Output by External Signal

The PWM output pins of MTU0, MTU3, MTU4, MTU6, and MTU7 can be set to the high-impedance state automatically.

See **Section 17, Port Output Enable 3 (POE3)**, for details.

## 16.3.9 A/D Converter Start Request Delaying Function

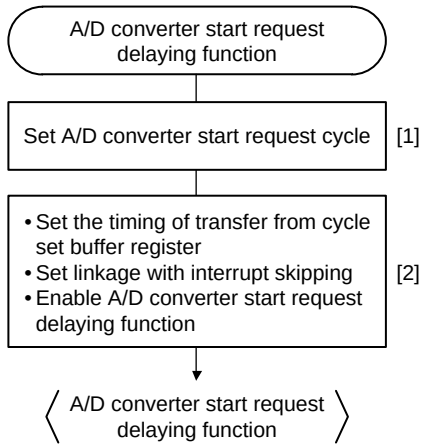
A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the TADCR register in MTU4 (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in the TADCR register in MTU7).

### (1) Example of Procedure for Specifying A/D Converter Start Request Delaying Function

**Figure 16.92** shows an example of procedure for specifying the A/D converter start request delaying function.



[1] Set the cycle in the timer A/D converter start request cycle buffer register (MTU4.TADCOBRA or MTU4.TADCOBRB) and timer A/D converter start request cycle register (MTU4.TADCORA or MTU4.TADCORB).
(When the timing of transfer from the cycle buffer register to cycle register is set to the trough, or both trough and crest in step [2] below, the same initial value must be specified in the cycle buffer register and cycle register because transfer is performed immediately after counting starts.)

[2] Use bits BF[1:0] in the timer A/D converter start request control register (TADCR in MTU4) to specify the timing of transfer from the timer A/D converter start request cycle buffer register to the A/D converter start request cycle register.
- Specify whether to link with interrupt skipping through bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE.
- Use bits UT4AE, DT4AE, UT4BE, and DT4BE to enable A/D converter start requests (TRG4AN or TRG4BN).

**Note 1.** Set up TADCR in MTU4 while TCNT in MTU4 is stopped.

**Note 2.** Set bit BF1 of TADCR in MTU4 to 0 when complementary PWM mode is not selected.

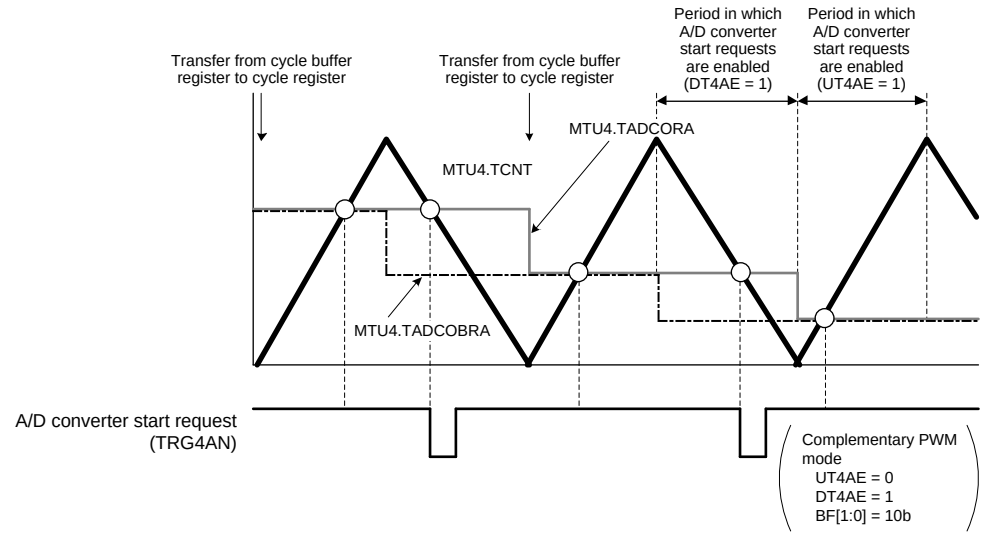
**Note 3.** Set bits ITA3AE, ITA4VE, ITB3AE, ITB4VE, DT4AE, and DT4BE to 0 when complementary PWM mode is not selected.

**Note 4.** Set bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE to 0 when interrupt skipping is disabled.

Figure 16.92 Example of Procedure for Specifying A/D Converter Start Request Delaying Function (MTU3 and MTU4)

### (2) Basic Example of A/D Converter Start Request Delaying Function Operation

**Figure 16.93** shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.



Period in which A/D converter start requests are enabled (UT4AE = 1): 0 ≤ MTU4.TCNT ≤ TCDR – 1
Period in which A/D converter start requests are enabled (DT4AE = 1): TCDR ≥ MTU4.TCNT ≥ 1
UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Figure 16.93 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation

### (3) Period in which A/D Converter Start Requests are Enabled

An A/D converter start request (TRG4AN or TRG4BN) can be issued when the TCNT counter value in MTU4 (MTU7) matches the value of the corresponding cycle set register (TADCORA or TADCORB) in MTU4 (MTU7) within the period specified by the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7).

When the UT4AE or UT4BE (UT7AE or UT7BE) bit is set to 1 in complementary PWM mode, issuing of AD converter start requests is enabled for the period of TCNT up-counting (0 ≤ TCNT ≤ TCDR - 1) in MTU4 (MTU7). When the DT4AE or DT4BE (DT7AE or DT7BE) bit is set to 1, issuing of AD converter start requests is enabled for the period of TCNT down-counting (TCDR ≥ TCNT ≥ 1) in MTU4 (MTU7) (**Figure 16.93**).

### (4) Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

When using buffer transfer in complementary PWM mode, pay attention to the buffer transfer timing. For details, refer to **Section 16.6.26, Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode**. When complementary PWM mode is not selected, be sure to clear the BF1 bit of the TADCR register in MTU4 or MTU7.

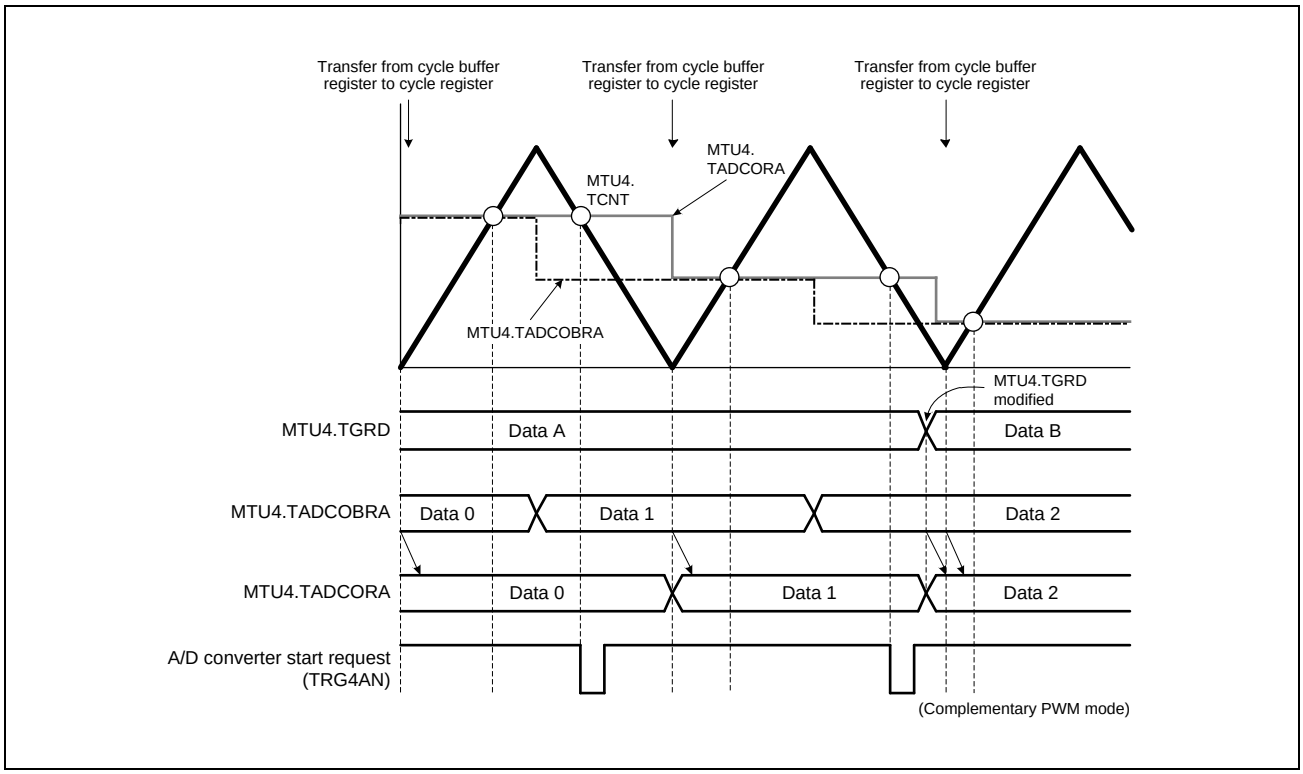


Figure 16.94 Example of A/D Converter Start Request Signal (TRG4AN) and Buffer Transfer Operation

### (5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

In complementary PWM mode, A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by setting the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register in MTU4 (MTU7).

**Figure 16.95** shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.

**Figure 16.96** shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.

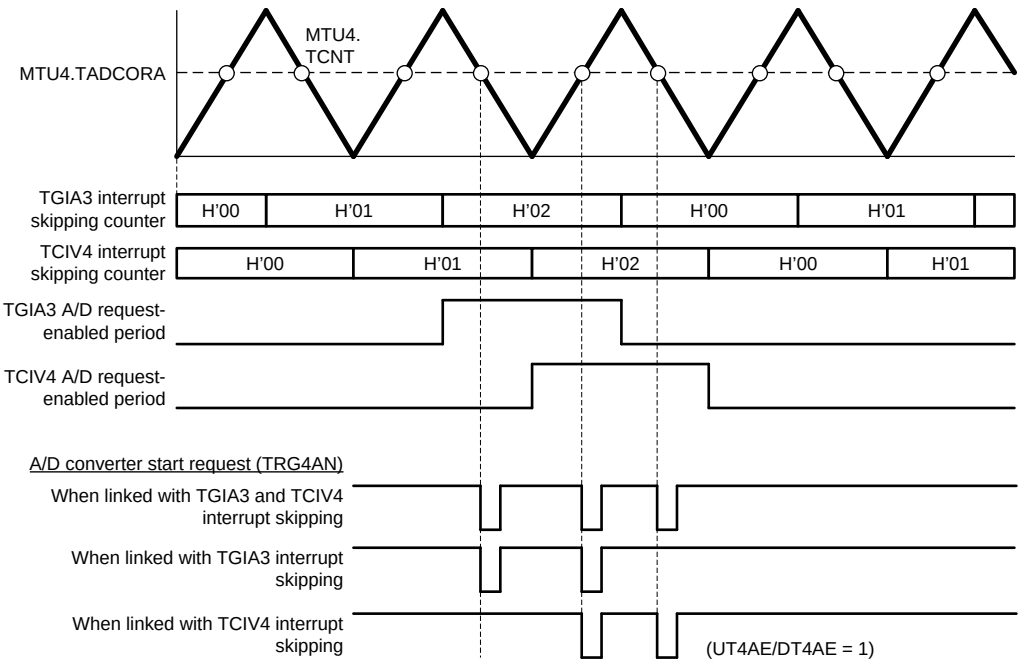
When complementary PWM mode is not selected, A/D converter start request delaying function cannot be used in coordination with interrupt skipping 1; clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register to 0 in MTU4 (MTU7).

NOTE

This function should be used in combination with interrupt skipping 1.

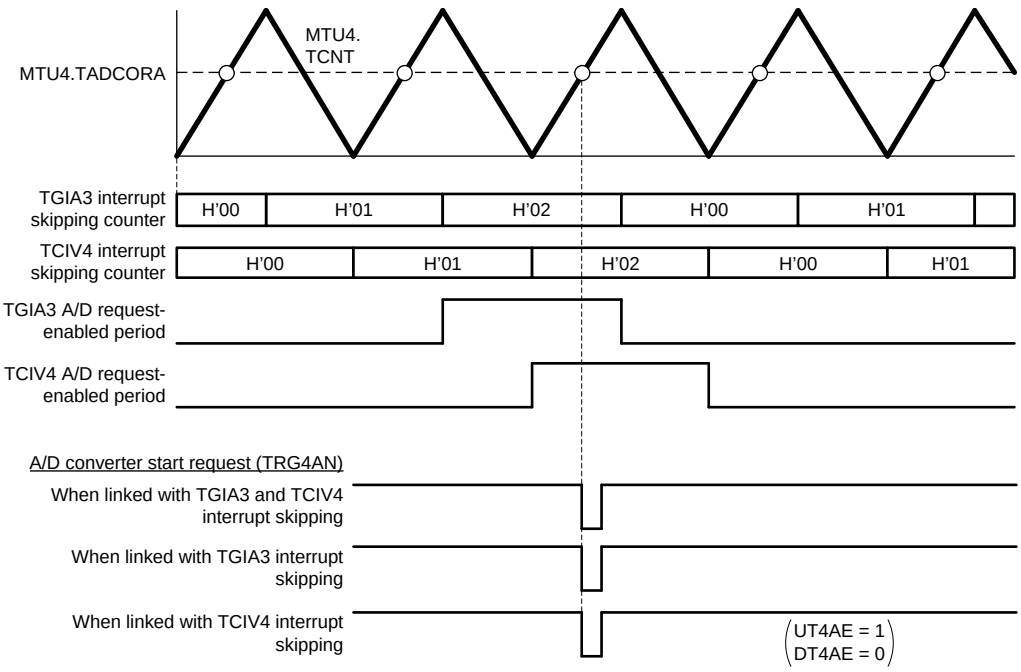
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).

When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging H'0002 to the value set in TCDRA minus 2 (value set in TCDRB minus 2).



**Note:** When the interrupt skipping count is set to two.

Figure 16.95 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE and DT4AE = 1)



**Note:** When the interrupt skipping count is set to two.

Figure 16.96 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE = 1, DT4AE = 0)

### (6) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D converter start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.

This function is valid only when the A/D converter request delaying function is enabled.

#### (a) Example of Procedure for Setting Interrupt Skipping Function 2

**Figure 16.97** shows an example of procedure for setting interrupt skipping function 2.

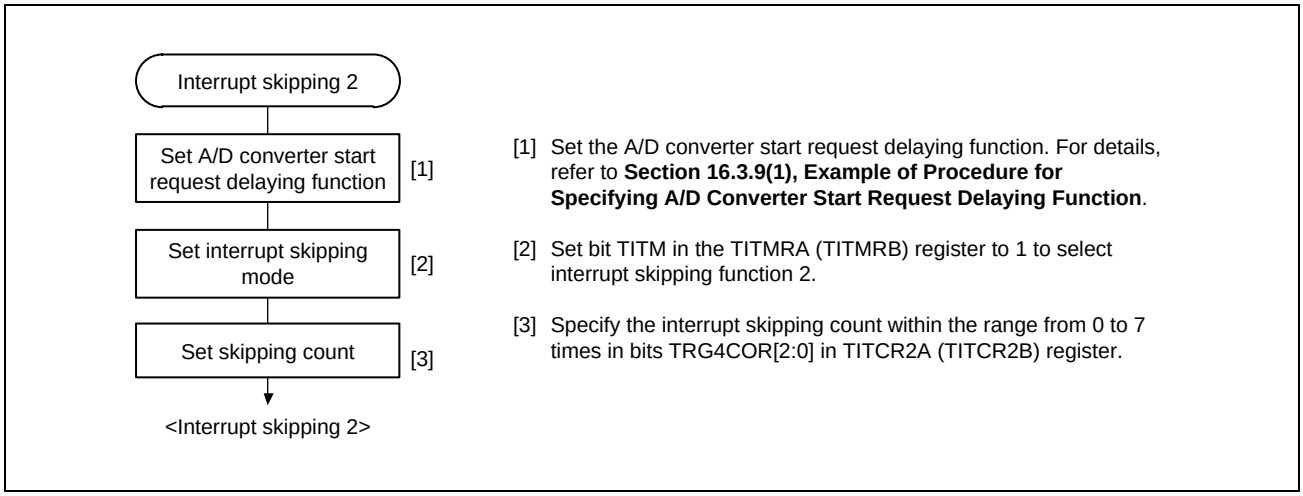


Figure 16.97 Example of Procedure for Setting Interrupt Skipping Function 2

### (b) Example of Interrupt Skipping Function 2 Operation

**Figure 16.98** shows an example of interrupt skipping 2 operation.

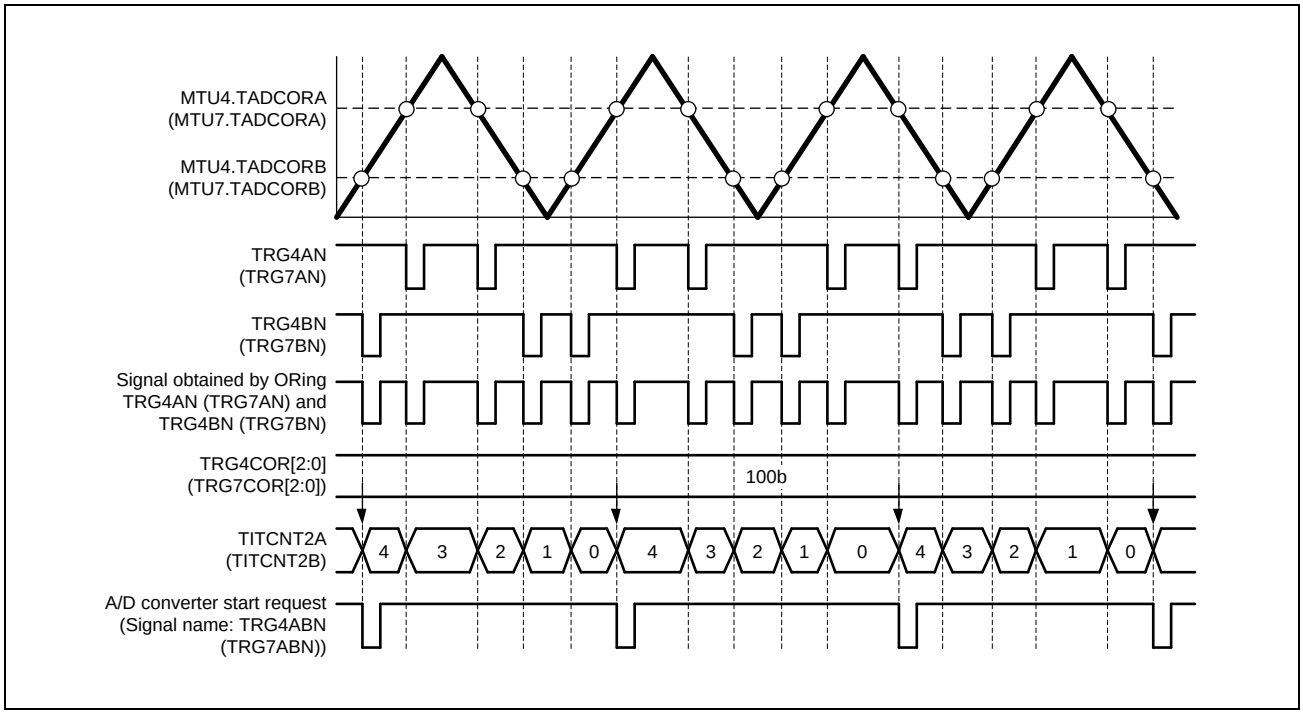

Figure 16.98 Example of Interrupt Skipping 2 Operation (Skipping Count is Set to Four)

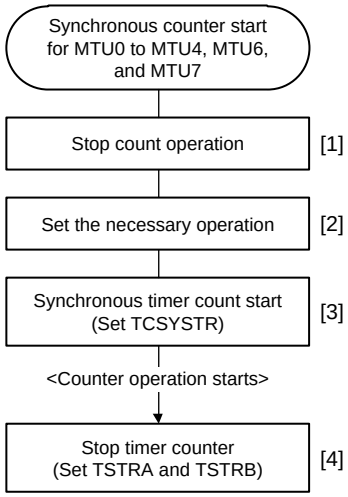
## 16.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

### (1) Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

#### (a) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

**Figure 16.99** shows an example of the procedure for specifying synchronous counter start in MTU0 to MTU4, MTU6, and MTU7.



[1] Set TSTRA and TSTRB to stop the counters used for synchronous start operation.

[2] Specify the necessary operation with appropriate registers such as TCR, TMDR1, and TMDR2.

[3] In TCSYSTR, set the bits corresponding to the counters to be started synchronously to 1 at the same time. When TCSYSTR is set, TSTRA and TSTRB for the target timer counters are automatically set appropriately, the counters start synchronously, and TCSYSTR is automatically cleared.

[4] To stop a timer counter, clear the bit in TSTRA or TSTRB that corresponds to the counter to 0.

**Note 1.** Clearing a bit in TCSYSTR corresponding to an operating counter to 0 does not stop the counter.

**Note 2.** To start counters synchronously in reset-synchronized PWM mode or complementary PWM mode using MTU3 and MTU4 or MTU6 and MTU7, set the bits in TCSYSTR that correspond to MTU 3 to MTU4, MTU6, and MTU7 to 1 at the same time.

Figure 16.99 Example of Procedure for Specifying Synchronous Counter Start in MTU0 to MTU4, MTU6, and MTU7

### (b) Examples of Synchronous Counter Start Operation

**Figure 16.100** shows an example of the synchronous counter start operation in MTU0 to MTU4, MTU6, and MTU7.

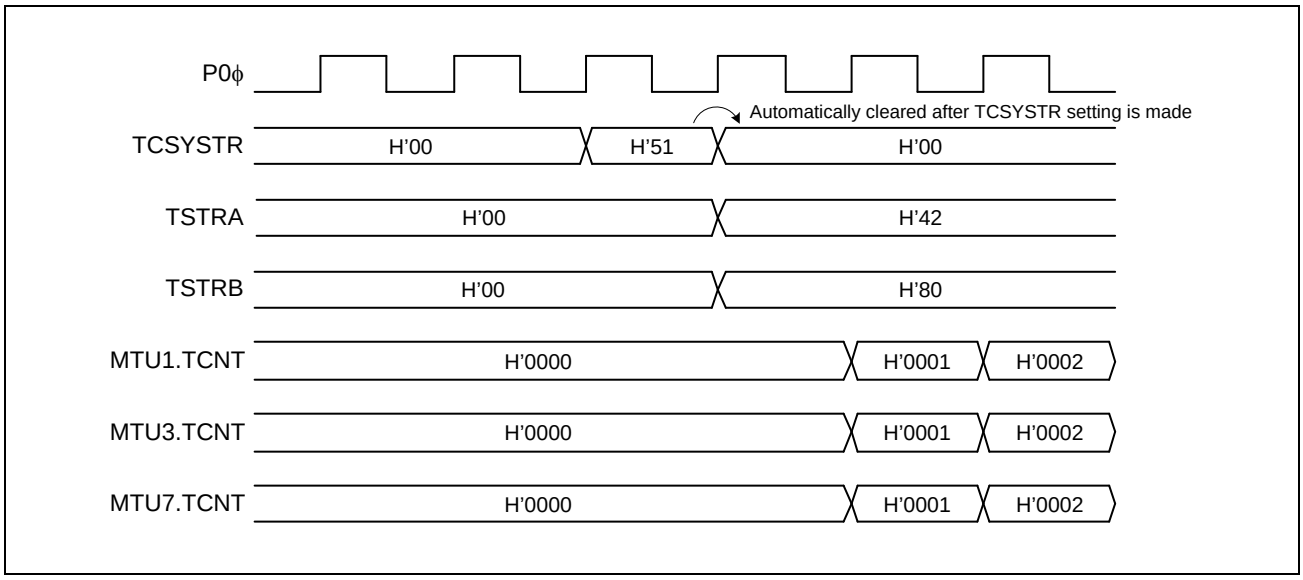


Figure 16.100 Example of Synchronous Counter Start Operation in MTU0 to MTU4, MTU6, and MTU7

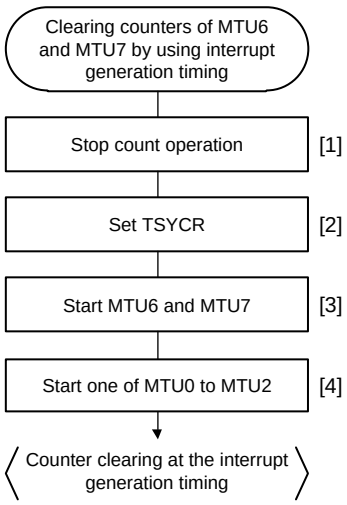
### (2) Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

#### (a) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

**Figure 16.101** shows an example of the procedure for specifying synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.



[1] Set TSTRA and TSTRB to stop the counters used for this function.

[2] Use TSYCR to specify the source to be used for the MTU6.TCNT and MTU7.TCN counter clearing.

[3] Start MTU6.TCNT or MTU7.TCNT.

[4] Start MTU0.TCNT, MTU1.TCNT, or MTU2.TCNT.

**Note:** The TSYCR setting is ignored while the counter is stopped. The setting becomes valid after MTU6.TCNT or MTU7.TCNT is started.

Figure 16.101 Example of Procedure for Specifying Synchronous Counter Clearing in MTU6 and MTU7

### (b) Examples of Synchronous Counter Clearing in MTU6 and MTU7

**Figure 16.102** and **Figure 16.103** show examples of synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.

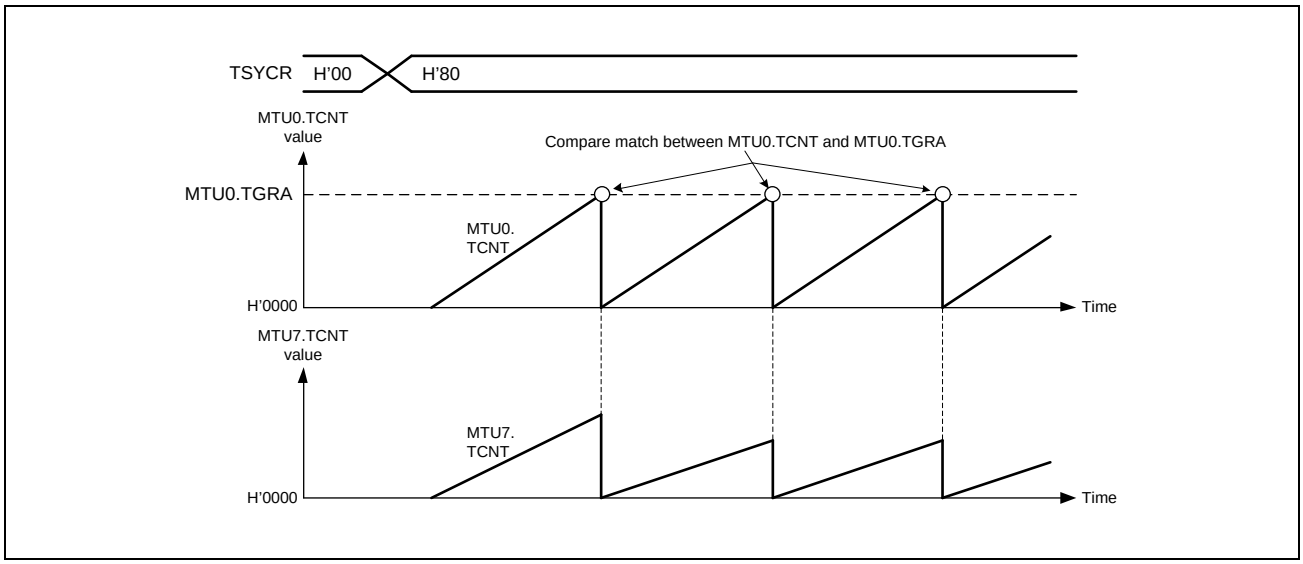


Figure 16.102 Example of Synchronous Counter Clearing in MTU6 and MTU7 (1)

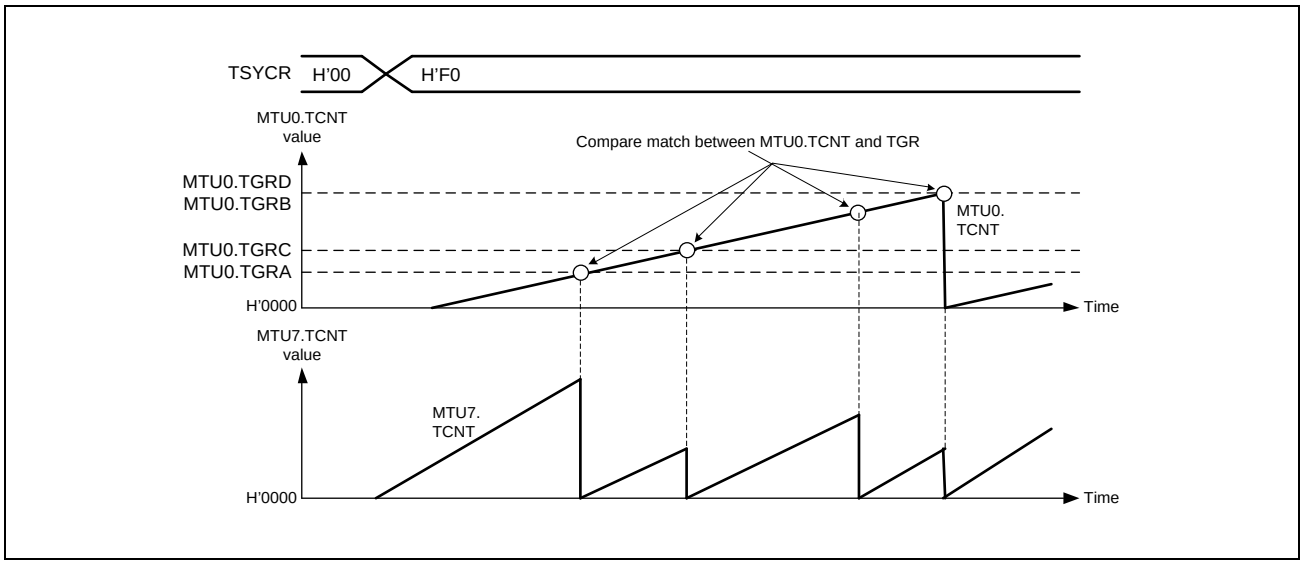

Figure 16.103 Example of Synchronous Counter Clearing in MTU6 and MTU7 (2)

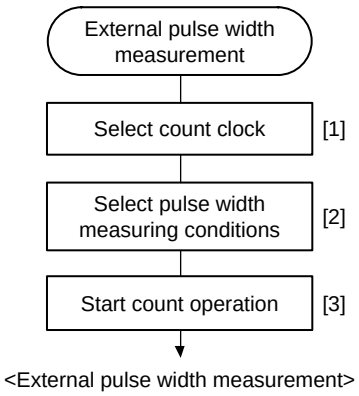
### 16.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.

**Figure 16.104** shows an example of setting external pulse width measurement, and **Figure 16.105** an example of external pulse width measurement.



[1] Use the TPSC1 and TPSC0 bits in MTU5.TCRU, MTU5.TCRV, or MTU5.TCRW to select the count clock.

[2] In MTU5.TIORU, MTU5.TIORV, or MTU5.TIORW, select the high level or low level for the pulse width measuring condition.

[3] Set bit CSTU5, CSTV5, or CSTW5 in MTU5.TSTR to 1 to start count operation.

**Note:** When MTU6 and MTU7 are not operating in complementary PWM mode, note the following 1 to 3.
1. Set the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCMPCLR register to 0.
2. Set the TGIE5U, TGIE5V, and TGIE5W bits in MTU5.TIER to 0.
3. The TCNT value is not captured in the TGR register.

Figure 16.104 Example of External Pulse Width Measurement Setting Procedure

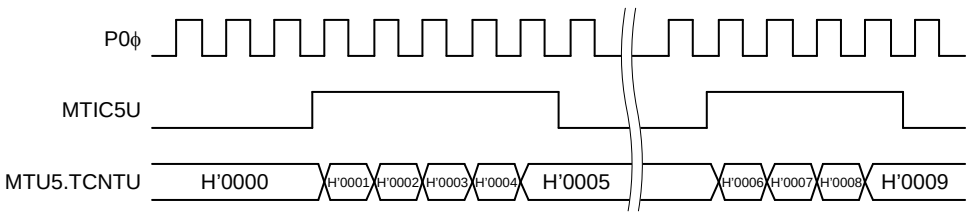


Figure 16.105 Example of External Pulse Width Measurement (Measuring High Pulse Width)

## 16.3.12 Dead Time Compensation

MTU5 to MTU7 can be used in combination to compensate for the delay in the dead time (the delay between complementary PWM output and inverter output).

**Figure 16.106** shows an example of a motor control circuit in which the combination of MTU5 to MTU7 is used to compensate for the dead time delay.

The external pulse measurement function of MTU5 allows the specification of a correction to the duty cycle specified in the PWM output compare registers by measuring the delay between the complementary PWM output and inverter output. This can be used for dead time compensation for the PWM output waveform during complementary PWM operation of MTU6 and MTU7 (**Figure 16.107**).

**Figure 16.108** shows the procedure for setting dead time compensation using MTU5 to MTU7. For details on MTU5 operation at this time, refer to **Section 16.3.13, TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode**.

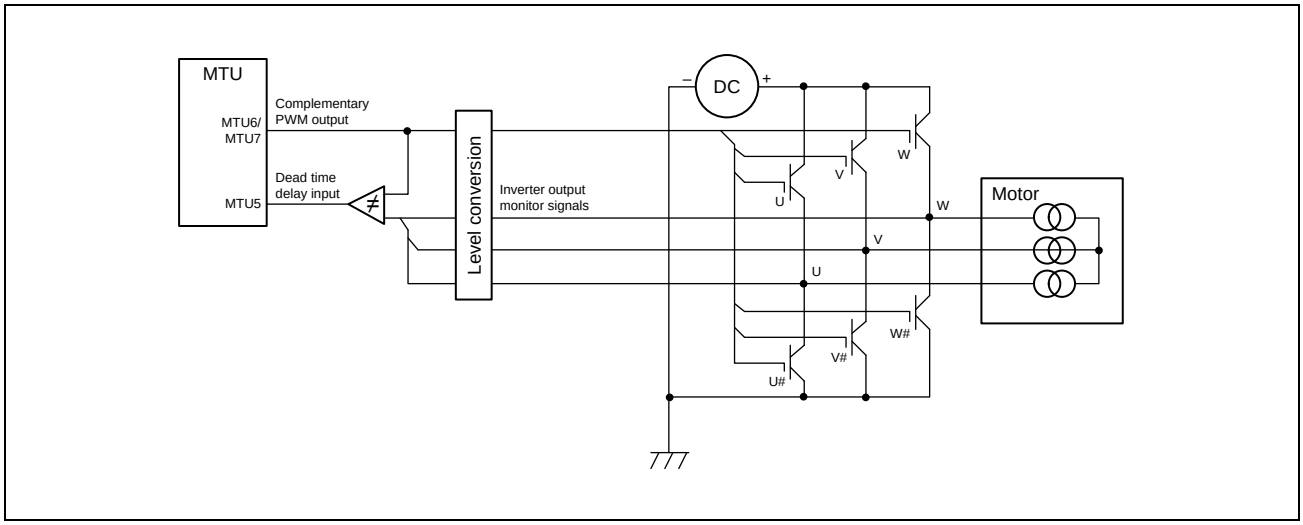

Figure 16.106 Motor Control Circuit Example

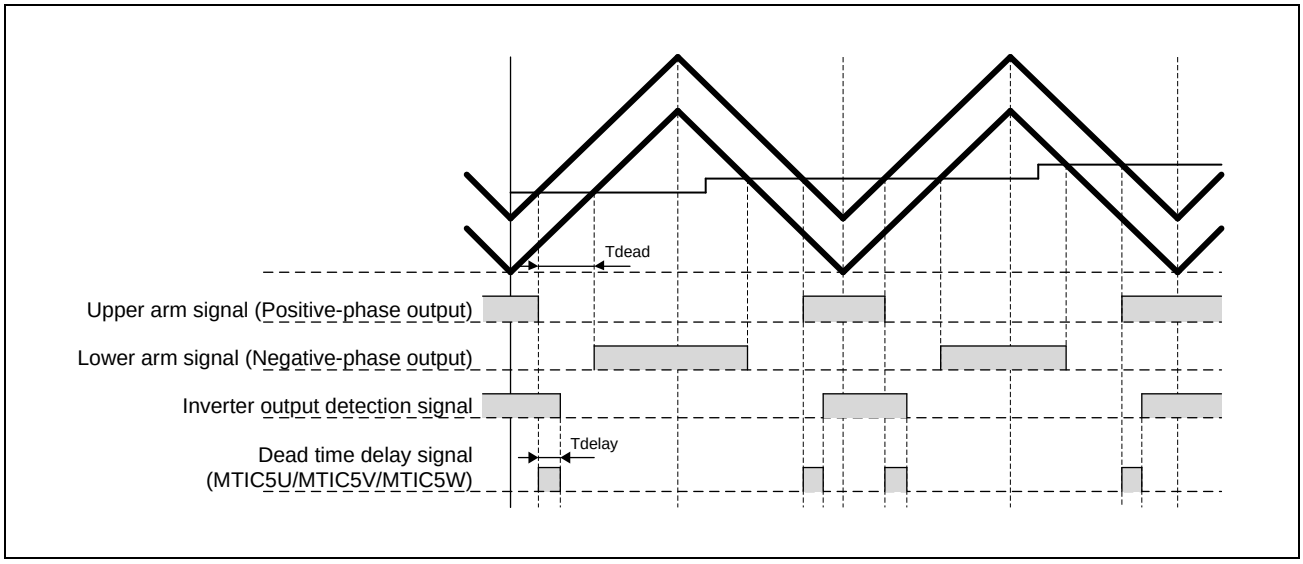

Figure 16.107 Delay in Dead Time in Complementary PWM Operation

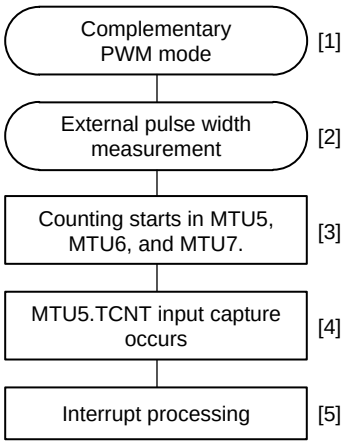
### (1) Example of Dead Time Compensation Setting Procedure

**Figure 16.108** shows an example of dead time compensation setting procedure by using three counters in MTU5.



[1] Set MTU6 and MTU7 to complementary PWM mode. For details, refer to **Section 16.3.8, Complementary PWM Mode**.

[2] Specify the external pulse width measurement function for the target TIOR in MTU5. For details, refer to **Section 16.3.11, External Pulse Width Measurement**.

[3] Set bits CST6 and CST7 in TSTRB and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR to 1 to start count operation.

[4] When the capture condition specified in TIOR is satisfied, the MTU5.TCNT value is captured in MTU5.TGR.
To prevent the generation of the MTU5.TGIm5 interrupt (m = U, V, W) request under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

[5] For U-phase dead time compensation, when an interrupt is generated at the crest (TGIA6) or trough (TCIV7) in complementary PWM mode, read the MTU5.TGRU value, calculate the difference in time between MTU6.TGRB and MTU5.TGRU, and write the corrected value to MTU6.TGRD in the interrupt processing.
For the V phase and W phase, read the MTU5.TGRV and MTU5.TGRW values and write the corrected values to MTU7.TGRC and TGRD, respectively, in the same way as for U-phase compensation.
The MTU5.TCNT value should be cleared through the TCNTCMPCLR setting or by software.

**Note:** The port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports should be set up in advance.
As the interrupt flag is set under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

Figure 16.108 Example of Dead Time Compensation Setting Procedure

### 16.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The external pulse width measurement function of MTU5 can be used to transfer the values of TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crests, troughs, or both crests and troughs of the complementary PWM output when MTU6 and MTU7 are being used in complementary PWM mode. The type of transfer timing is specified in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCNPCLR register are set to 1, TCNTU, TCNTV, and TCNTW are cleared to H'0000 at the timing for transfer to TGRU, TGRV, and TGRW.

Note that the TCNTU, TCNTV, and TCNTW capture operation at the crest and/or trough of complementary PWM output in MTU5 is not available when MTU3 and MTU4 are used in complementary PWM mode.

**Figure 16.109** shows an operation example in which TCNTU is used as a free-running counter without being cleared and the value is captured in TGRU at the crest and trough in complementary PWM mode.

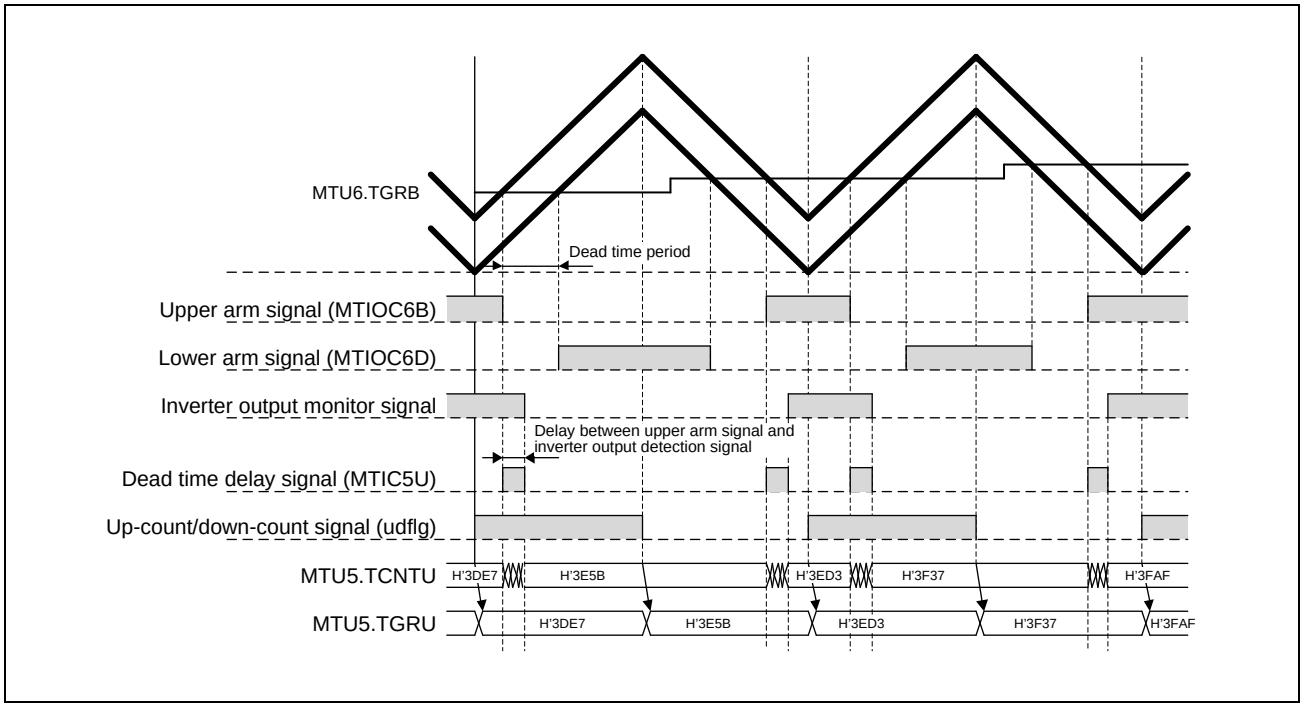


Figure 16.109 TCNTU Capture at Crest and Trough in Complementary PWM Operation

### 16.3.14 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.

Set the NFCRn register (n = 0 to 7, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.

**Figure 16.110** shows the timing of noise filtering.

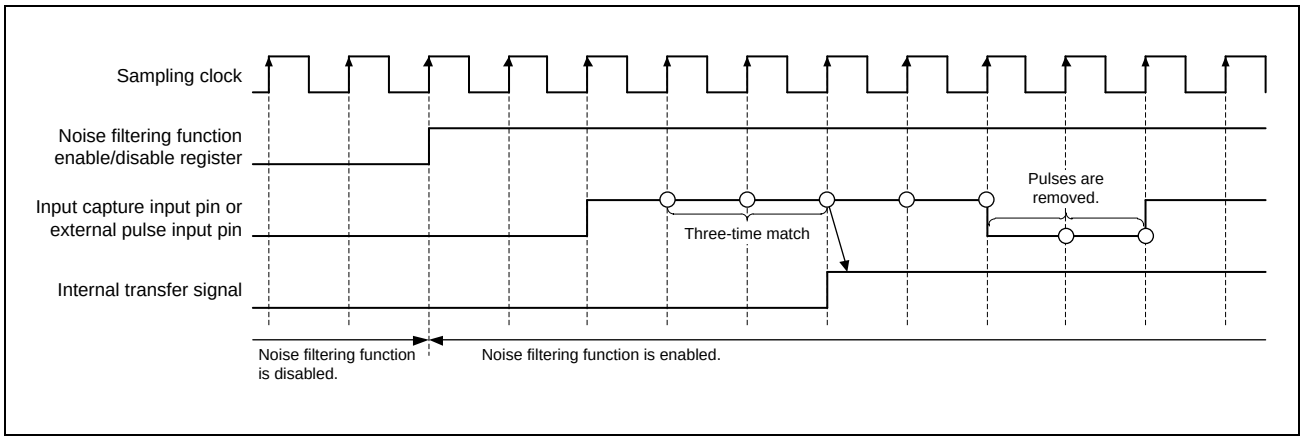

Figure 16.110 Timing of Noise Filtering

# 16.4 Interrupt Sources

## 16.4.1 Interrupt Sources and Priorities

There are three kinds of interrupt source; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller; however the priority within a channel is fixed. For details, refer to **Section 8, Interrupt Controller**. **Table 16.78** lists the MTU interrupt sources.

Table 16.78 MTU Interrupt Sources (1/2)

| Channel | Name | Interrupt Source | DMAC Activation |
|---|---|---|---|
| MTU0 | TGIA0 | MTU0.TGRA input capture/compare match | Possible |
| | TGIB0 | MTU0.TGRB input capture/compare match | Possible |
| | TGIC0 | MTU0.TGRC input capture/compare match | Possible |
| | TGID0 | MTU0.TGRD input capture/compare match | Possible |
| | TCIV0 | MTU0.TCNT overflow | Not possible |
| | TGIE0 | MTU0.TGRE compare match | Not possible |
| | TGIF0 | MTU0.TGRF compare match | Not possible |
| MTU1 | TGIA1 | MTU1.TGRA input capture/compare match | Possible |
| | TGIB1 | MTU1.TGRB input capture/compare match | Possible |
| | TCIV1 | MTU1.TCNT overflow | Not possible |
| | TCIU1 | MTU1.TCNT underflow | Not possible |
| MTU2 | TGIA2 | MTU2.TGRA input capture/compare match | Possible |
| | TGIB2 | MTU2.TGRB input capture/compare match | Possible |
| | TCIV2 | MTU2.TCNT overflow | Not possible |
| | TCIU2 | MTU2.TCNT underflow | Not possible |
| MTU3 | TGIA3 | MTU3.TGRA input capture/compare match | Possible |
| | TGIB3 | MTU3.TGRB input capture/compare match | Possible |
| | TGIC3 | MTU3.TGRC input capture/compare match | Possible |
| | TGID3 | MTU3.TGRD input capture/compare match | Possible |
| | TCIV3 | MTU3.TCNT overflow | Not possible |
| MTU4 | TGIA4 | MTU4.TGRA input capture/compare match | Possible |
| | TGIB4 | MTU4.TGRB input capture/compare match | Possible |
| | TGIC4 | MTU4.TGRC input capture/compare match | Possible |
| | TGID4 | MTU4.TGRD input capture/compare match | Possible |
| | TCIV4 | MTU4.TCNT overflow/underflow*1 | Possible |
| MTU5 | TGIU5 | MTU5.TGRU input capture/compare match | Possible |
| | TGIV5 | MTU5.TGRV input capture/compare match | Possible |
| | TGIW5 | MTU5.TGRW input capture/compare match | Possible |
| MTU6 | TGIA6 | MTU6.TGRA input capture/compare match | Possible |
| | TGIB6 | MTU6.TGRB input capture/compare match | Possible |
| | TGIC6 | MTU6.TGRC input capture/compare match | Possible |
| | TGID6 | MTU6.TGRD input capture/compare match | Possible |
| | TCIV6 | MTU6.TCNT overflow | Not possible |

Table 16.78 MTU Interrupt Sources (2/2)

| Channel | Name | Interrupt Source | DMAC Activation |
|---|---|---|---|
| MTU7 | TGIA7 | MTU7.TGRA input capture/compare match | Possible |
| | TGIB7 | MTU7.TGRB input capture/compare match | Possible |
| | TGIC7 | MTU7.TGRC input capture/compare match | Possible |
| | TGID7 | MTU7.TGRD input capture/compare match | Possible |
| | TCIV7 | MTU7.TCNT overflow/underflow*1 | Possible |
| MTU8 | TGIA8 | MTU8.TGRA input capture/compare match | Possible |
| | TGIB8 | MTU8.TGRB input capture/compare match | Possible |
| | TGIC8 | MTU8.TGRC input capture/compare match | Possible |
| | TGID8 | MTU8.TGRD input capture/compare match | Possible |
| | TCIV8 | MTU8.TCNT overflow | Possible |

**Note:** This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Note 1. The underflow interrupt source is valid only in complementary PWM mode.

#### (1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5).

#### (2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, clearing an interrupt is requested. The MTU provides a total of eight overflow interrupts (one for each channel except MTU5).

In complementary PWM mode, an overflow interrupt is generated even when an underflow occurs in TCNT in MTU4 or MTU7.

#### (3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1, and MTU2).

### 16.4.2 DMAC Activation

#### (1) DMAC Activation

The DMAC can be activated by the TGR input capture/compare match interrupt and the overflow interrupt in MTU4 and MTU7. For details, see **Section 14, Direct Memory Access Controller**.

The MTU provides a total of 33 interrupts (input capture/compare match and overflow interrupts) that can be used as DMAC activation sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

### 16.4.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in the MTU. **Table 16.79** shows the relationship between interrupt sources and A/D converter start request signals.

#### (1) A/D Converter Activation by TGRA Input Capture/Compare Match or at MTU4.TCNT (MTU7.TCNT) Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1, the A/D converter can be activated at the trough of MTU4.TCNT (MTU7.TCNT) count (MTU4.TCNT (MTU7.TCNT) = H'0000).

A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, or 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTG bit is set to 1
- When the MTU4.TCNT (MTU7.TCNT) count reaches the trough (MTU4.TCNT (MTU7.TCNT) = H'0000) during complementary PWM operation while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

#### (2) A/D Converter Activation by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE.

When a compare match occurs between MTU0.TCNT and MTU0.TGRE in MTU0 while the TTGE2 bit.TIER2 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

#### (3) A/D Converter Activation by A/D Converter Start Request Delaying Function

The A/D converter can be activated by generating A/D converter start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, refer to **Section 16.3.9, A/D Converter Start Request Delaying Function**.

A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D converter start signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

Table 16.79 Interrupt Sources and A/D Converter Start Request Signals

| Target Registers | Interrupt Source | A/D Converter Start Request Signal |
|---|---|---|
| MTU0.TGRA and MTU0.TCNT | Input capture/compare match | TRGA0N |
| MTU1.TGRA and MTU1.TCNT | | TRGA1N |
| MTU2.TGRA and MTU2.TCNT | | TRGA2N |
| MTU3.TGRA and MTU3.TCNT | | TRGA3N |
| MTU4.TGRA and MTU4.TCNT*1 | | TRGA4N |
| MTU4.TCNT | MTU4.TCNT trough in complementary PWM mode | |
| MTU6.TGRA and MTU6.TCNT | Input capture/compare match | TRGA6N |
| MTU7.TGRA and MTU7.TCNT*1 | | TRGA7N |
| MTU7.TCNT | MTU7.TCNT trough in complementary PWM mode | |
| MTU0.TGRE and MTU0.TCNT | Compare match | TRG0N |
| MTU4.TADCORA and MTU4.TCNT | | TRG4AN |
| MTU4.TADCORB and MTU4.TCNT | | TRG4BN |
| MTU7.TADCORA and MTU7.TCNT | | TRG7AN |
| MTU7.TADCORB and MTU7.TCNT | | TRG7BN |
| MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT | Compare match (interrupt skipping function 2) | TRG4ABN |
| MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT | | TRG7ABN |

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated.
When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA or TADCORB (MTU7.TADCORA or TADCORB).

# 16.5 Operation Timing

## 16.5.1 Input/Output Timing

### (1) TCNT Count Timing

**Figure 16.111** and **Figure 16.112** show the TCNT count timing in internal clock operation, **Figure 16.113** shows the TCNT count timing in external clock operation (normal mode), and **Figure 16.114** shows the TCNT count timing in external clock operation (phase counting mode).

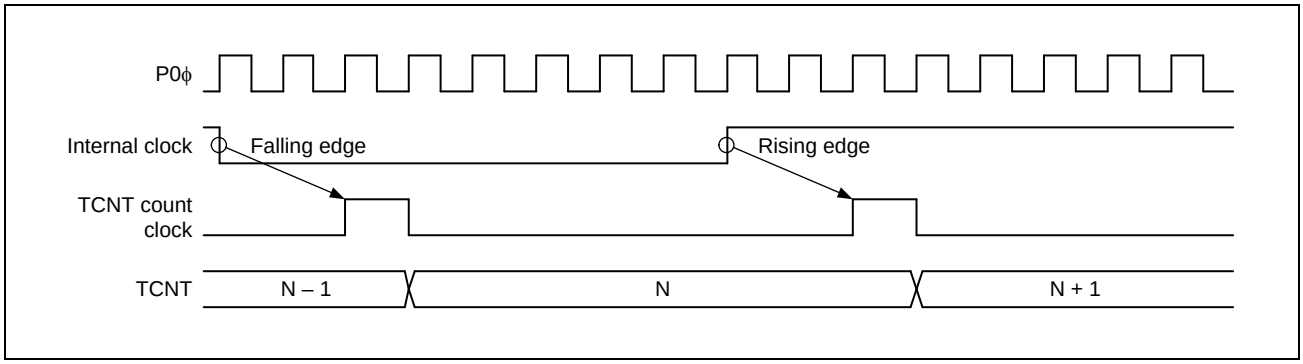

Figure 16.111 Count Timing in Internal Clock Operation (MTU0 to MTU4 and MTU6 to MTU8)

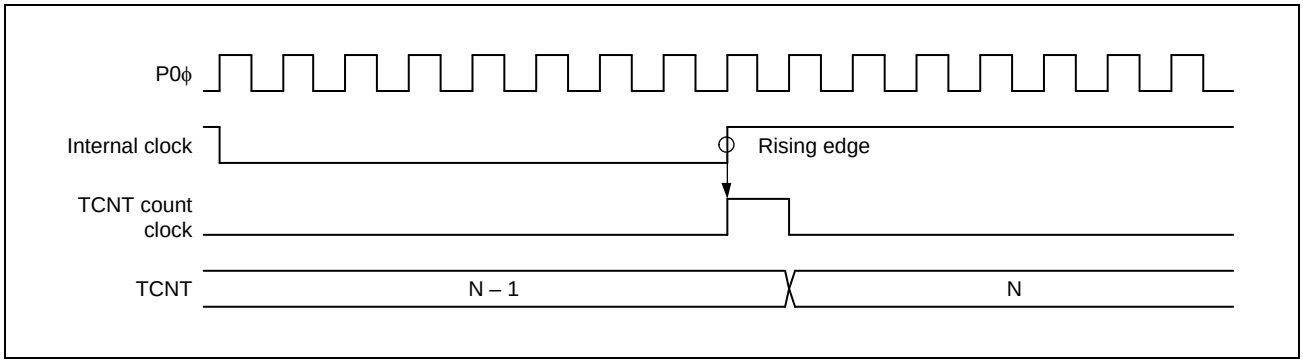

Figure 16.112 Count Timing in Internal Clock Operation (MTU5)

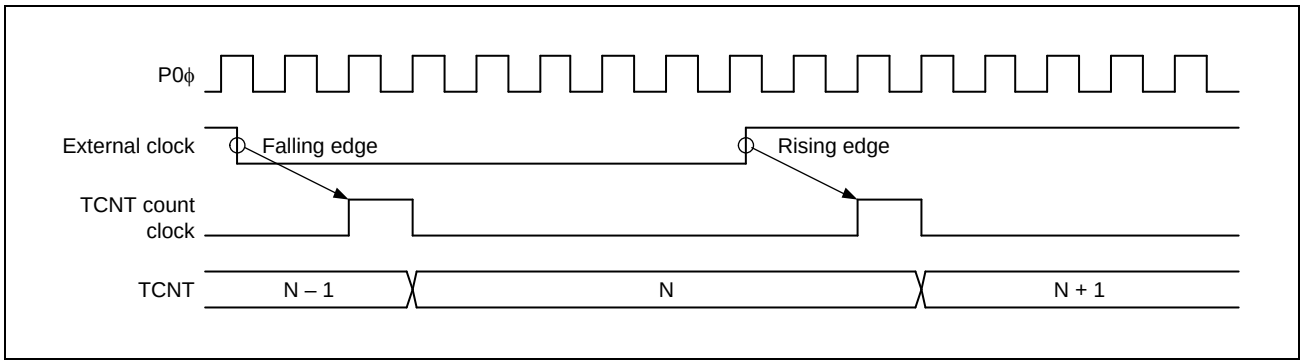

Figure 16.113 Count Timing in External Clock Operation (MTU0 to MTU4, MTU6 to MTU8)

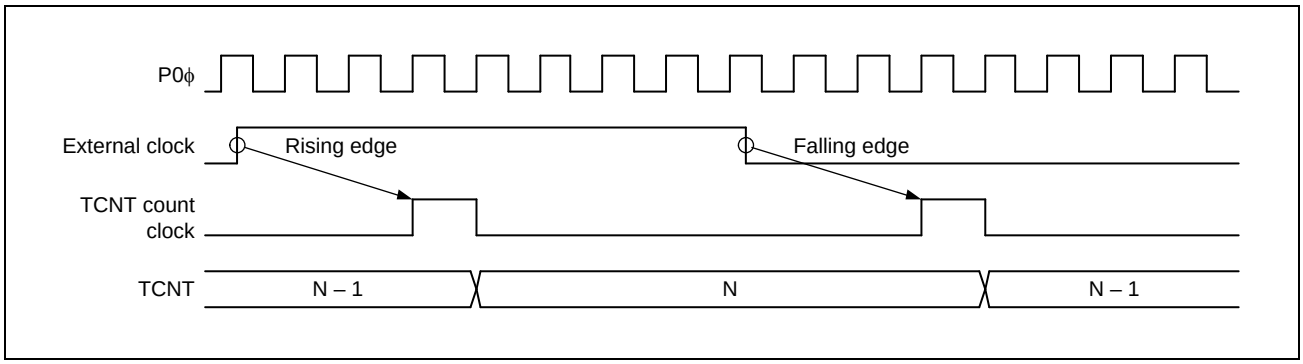

Figure 16.114 Count Timing in External Clock Operation (Phase Counting Mode)

### (2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCnm pin (n = 0 to 4, 6, 7, 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT count clock is generated.

**Figure 16.115** shows the output compare output timing (normal mode or PWM mode) and **Figure 16.116** shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

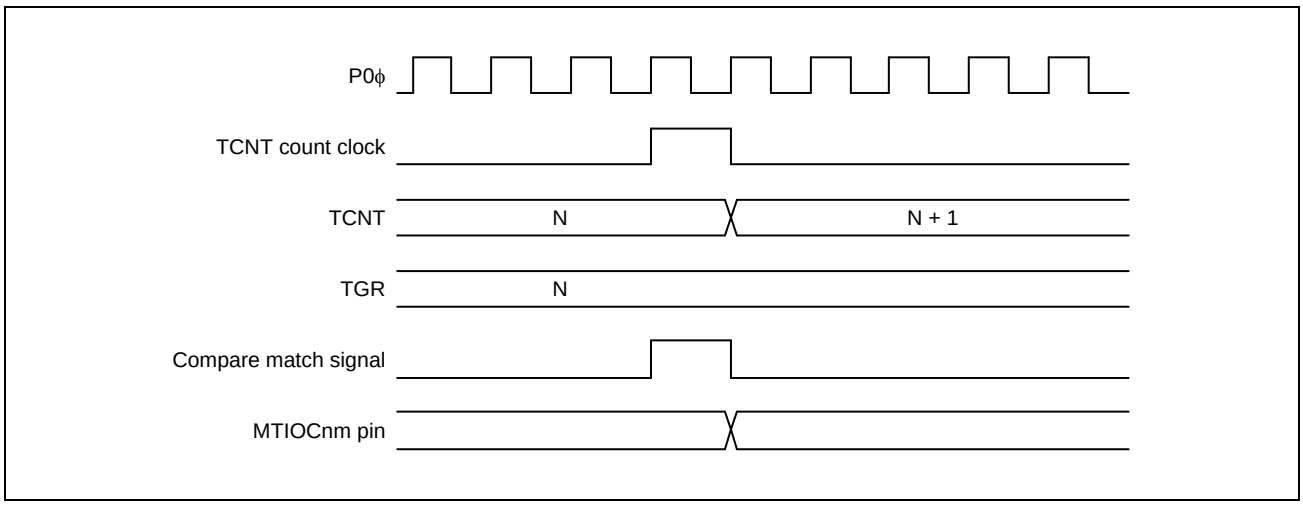

Figure 16.115 Output Compare Output Timing (Normal Mode or PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

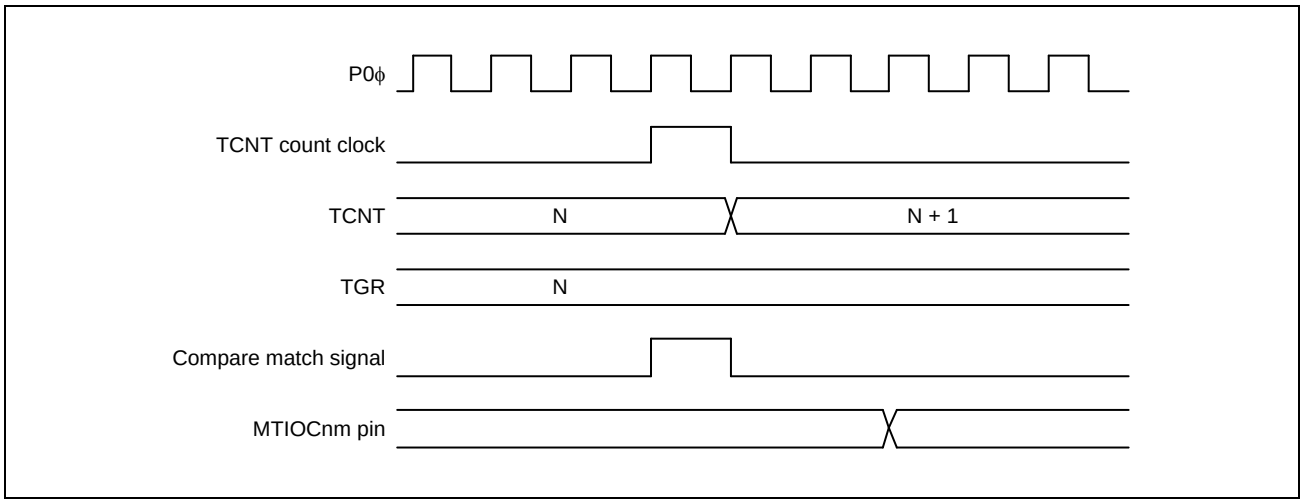

Figure 16.116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

### (3) Input Capture Signal Timing

**Figure 16.117** shows the input capture signal timing.

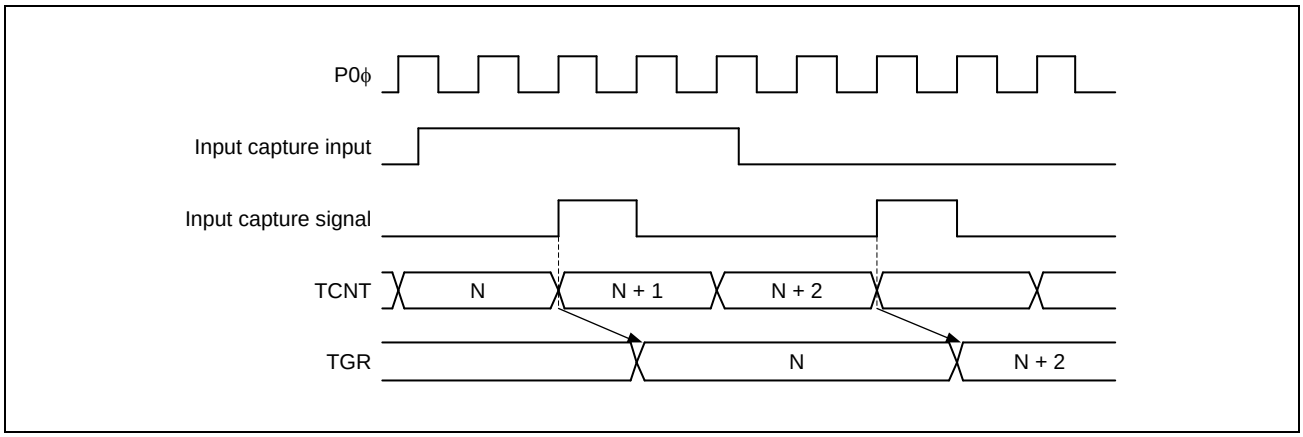

Figure 16.117 Input Capture Input Signal Timing

### (4) Timing for Counter Clearing by Compare Match/Input Capture

**Figure 16.118** and **Figure 16.119** show the timing when counter clearing on compare match is specified, and **Figure 16.120** shows the timing when counter clearing on input capture is specified.

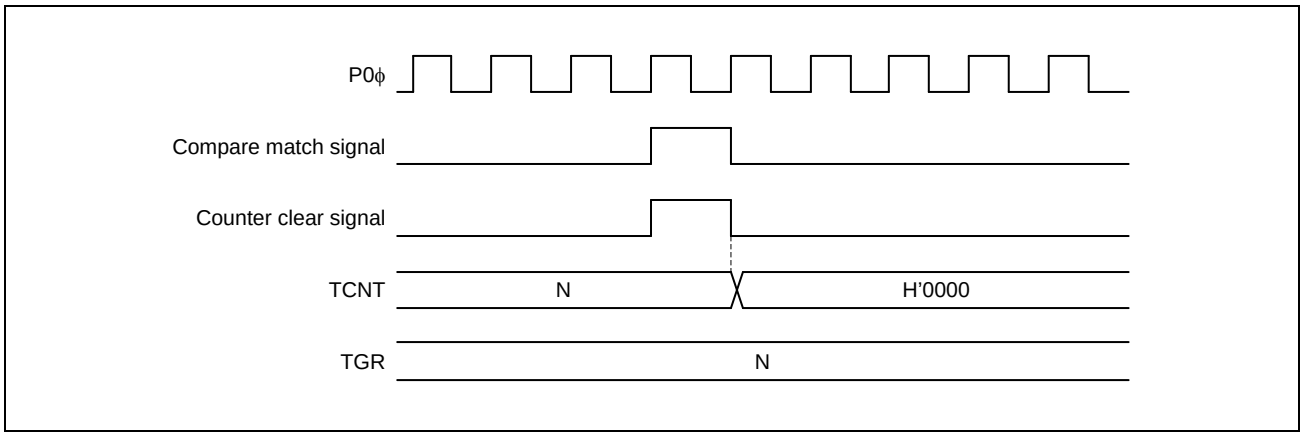

Figure 16.118 Counter Clear Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

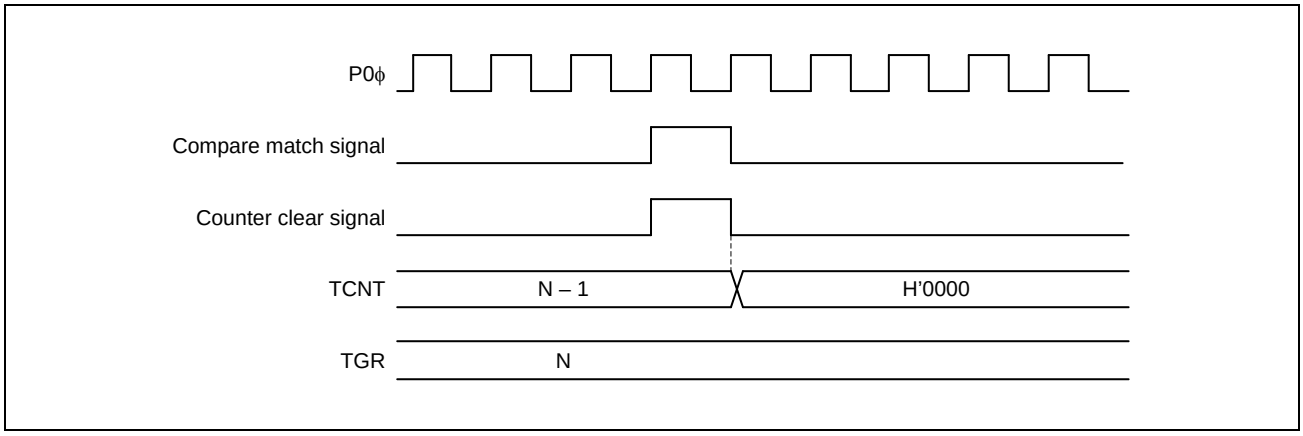

Figure 16.119 Counter Clear Timing (Compare Match) (MTU5)

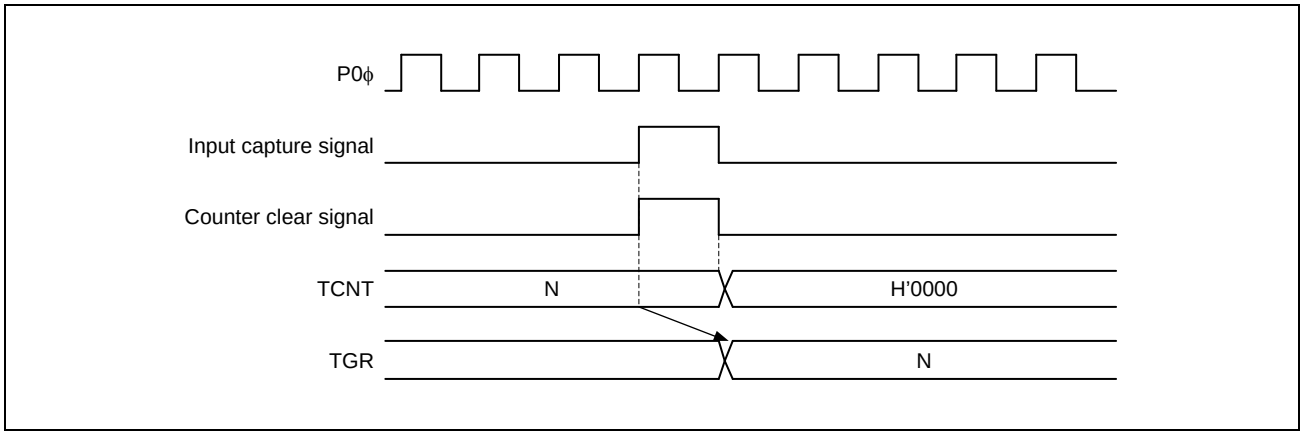

Figure 16.120 Counter Clear Timing (Input Capture) (MTU0 to MTU8)

### (5) Buffer Operation Timing

**Figure 16.121** to **Figure 16.123** show the timing in buffer operation.

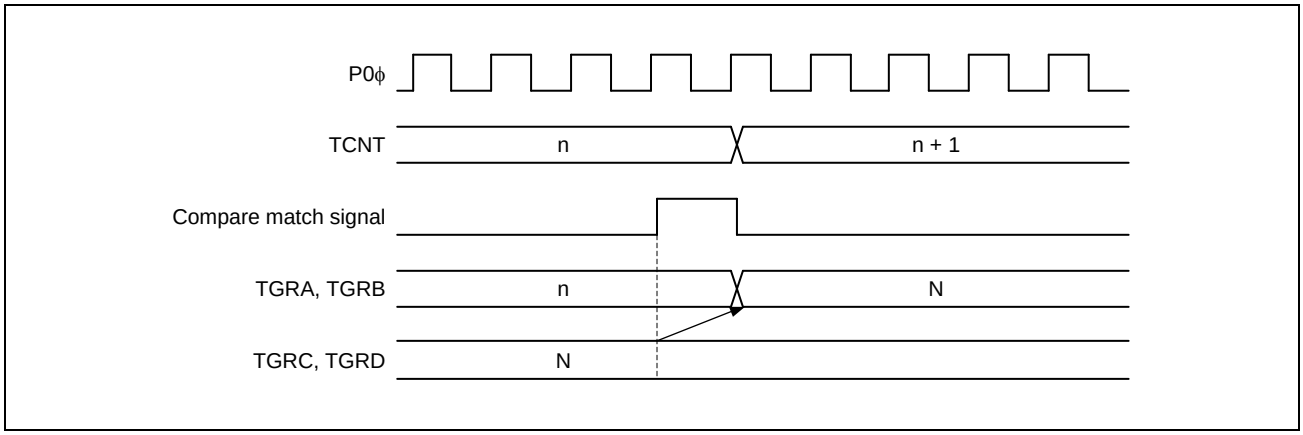

Figure 16.121 Buffer Operation Timing (Compare Match)

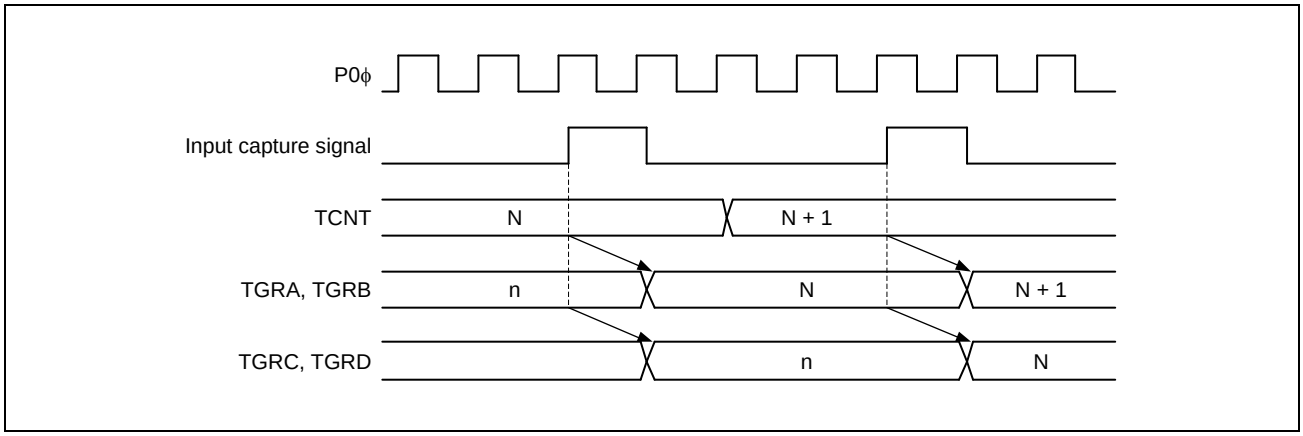

Figure 16.122 Buffer Operation Timing (Input Capture)

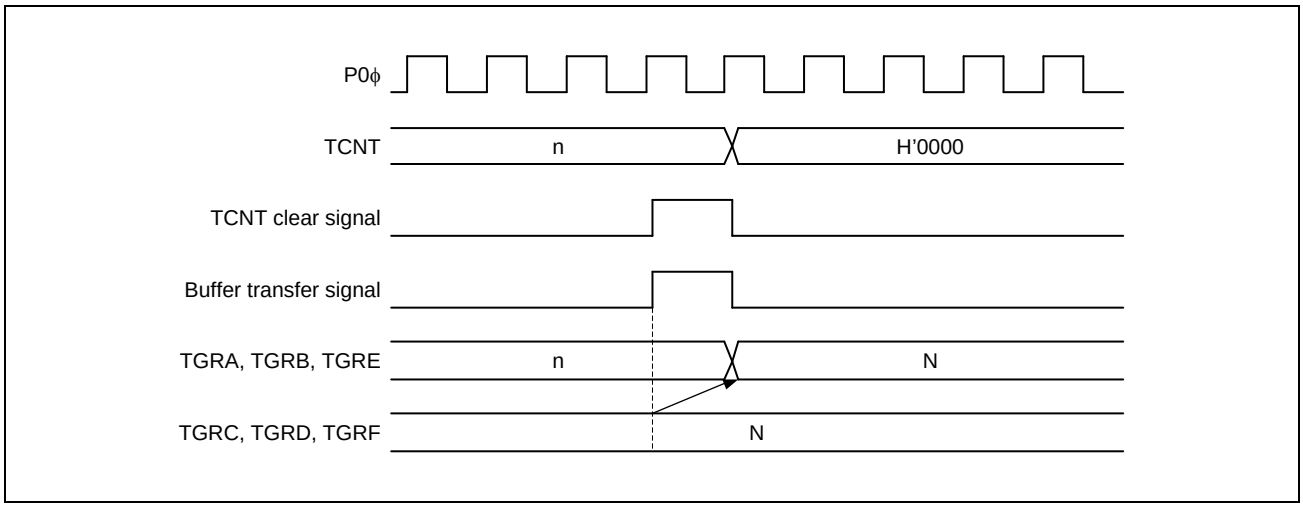

Figure 16.123 Buffer Operation Timing (When TCNT Cleared)

### (6) Buffer Transfer Timing (Complementary PWM Mode)

**Figure 16.124** to **Figure 16.126** show the buffer transfer timing in complementary PWM mode.

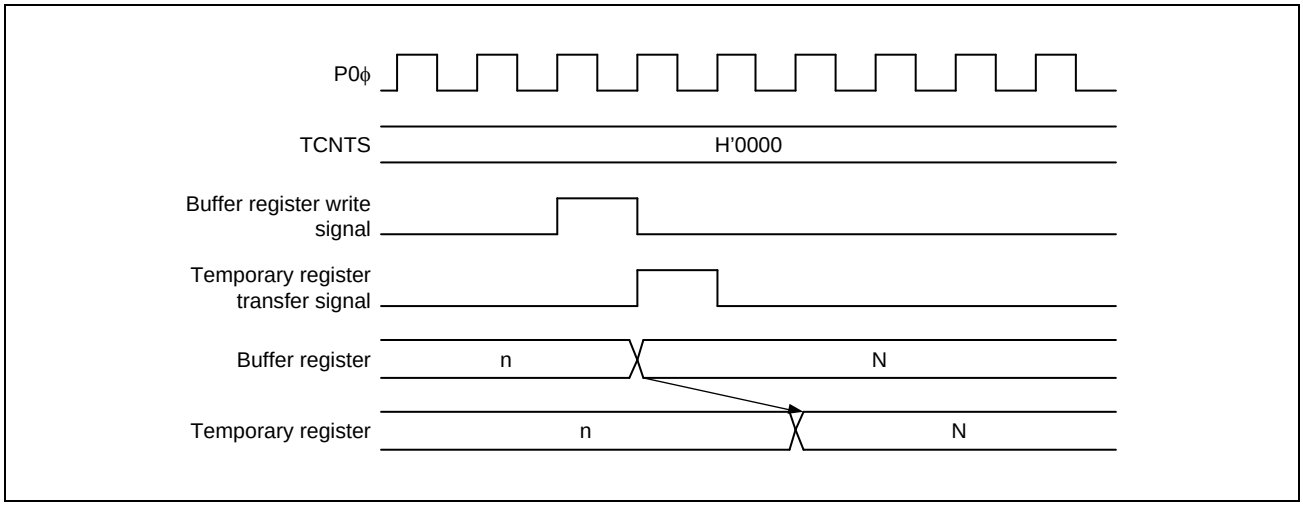

Figure 16.124 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Stopped)

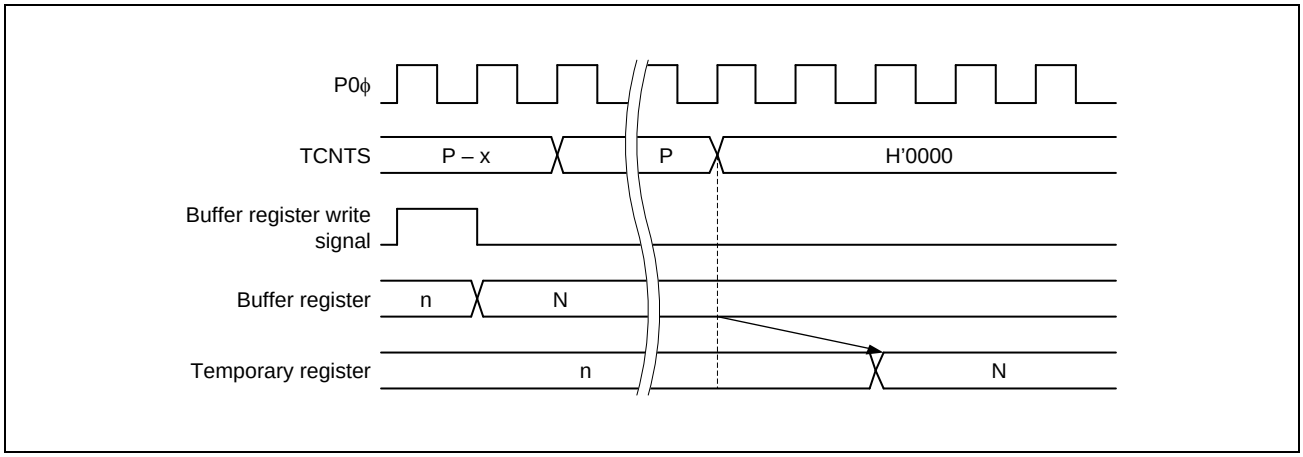

Figure 16.125 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Operating)

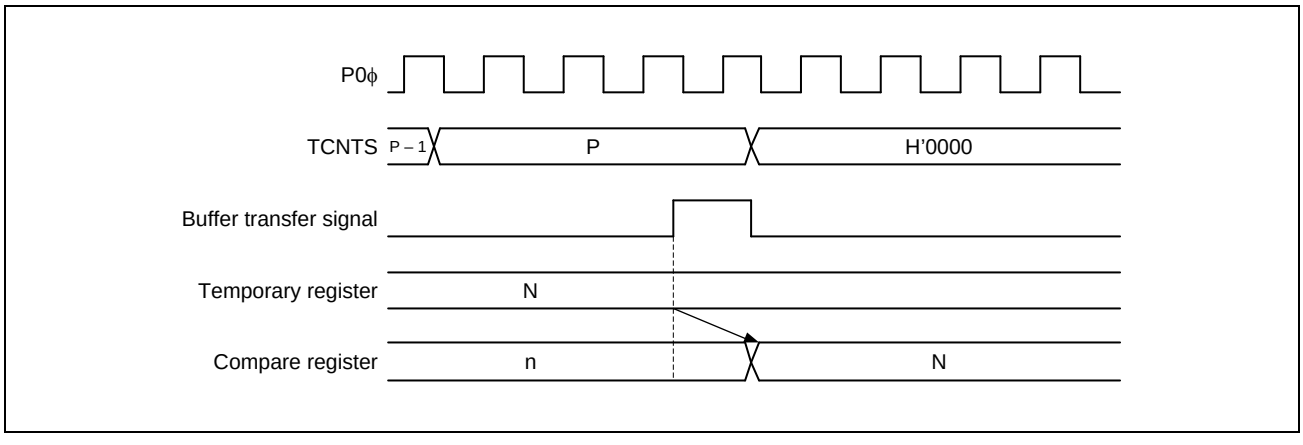

Figure 16.126 Transfer Timing from Temporary Register to Compare Register

## 16.5.2 Interrupt Signal Timing

### (1) TGI Interrupt Timing by Compare Match

**Figure 16.127** and **Figure 16.128** show the TGI interrupt request signal timing when a compare match occurs.

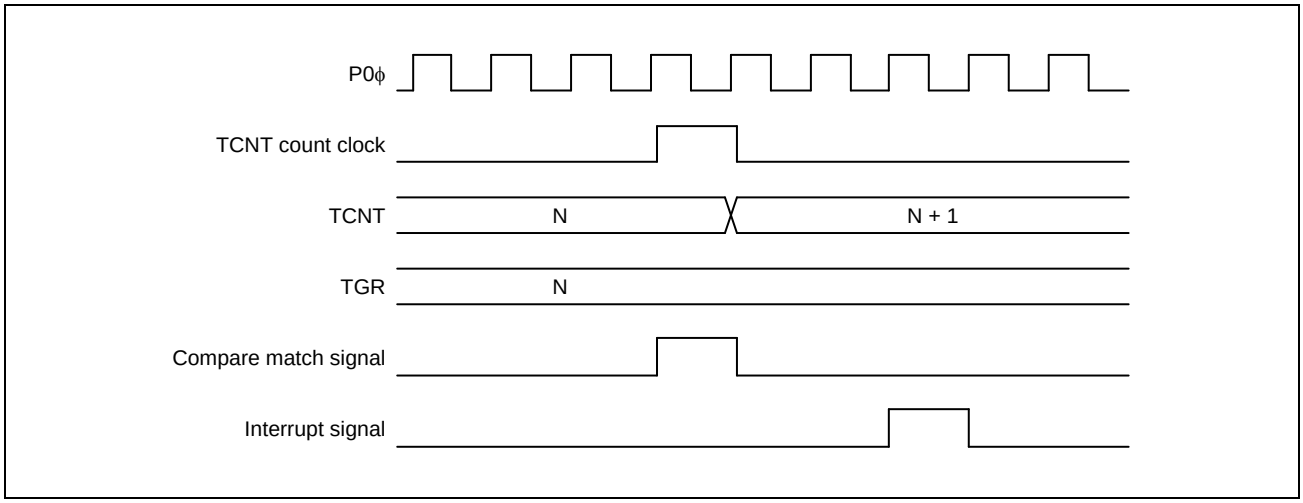

Figure 16.127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

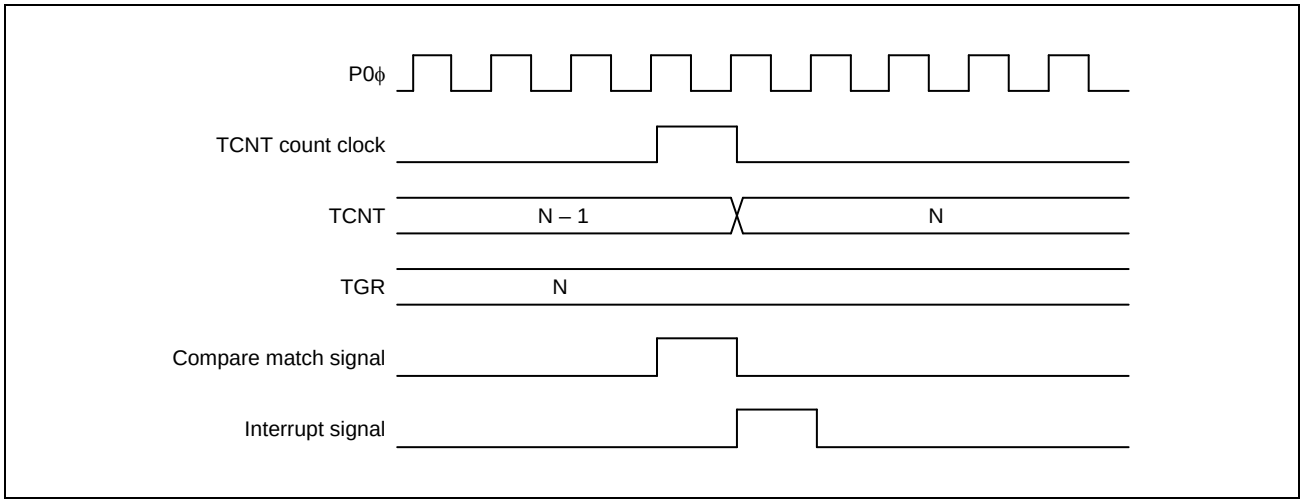

Figure 16.128 TGI Interrupt Timing (Compare Match) (MTU5)

### (2) TGI Interrupt Timing by Input Capture

**Figure 16.129** and **Figure 16.130** show the TGI interrupt request signal timing when an input capture occurs.

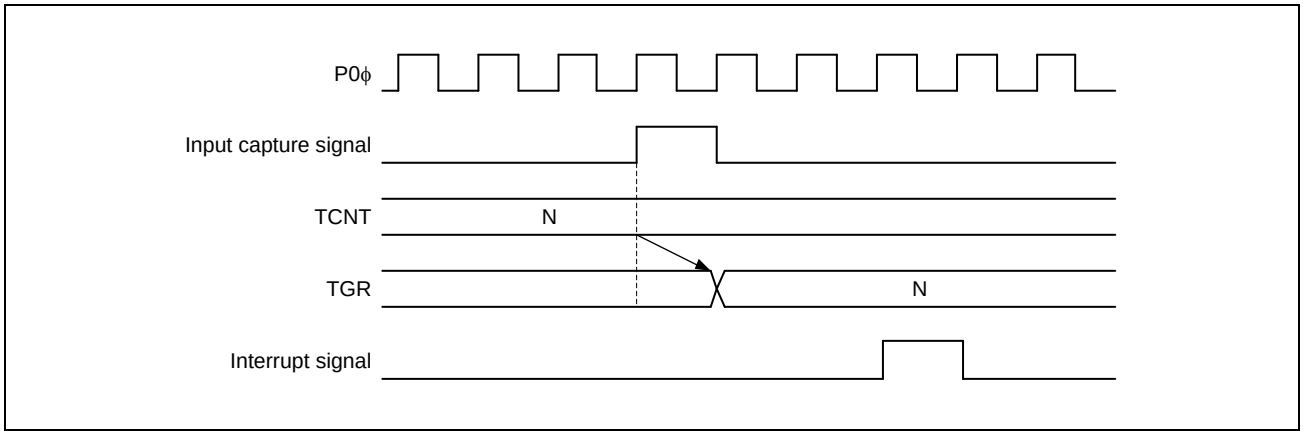

Figure 16.129 TGI Interrupt Timing (Input Capture) (MTU0 to MTU4 and MTU6 to MTU8)

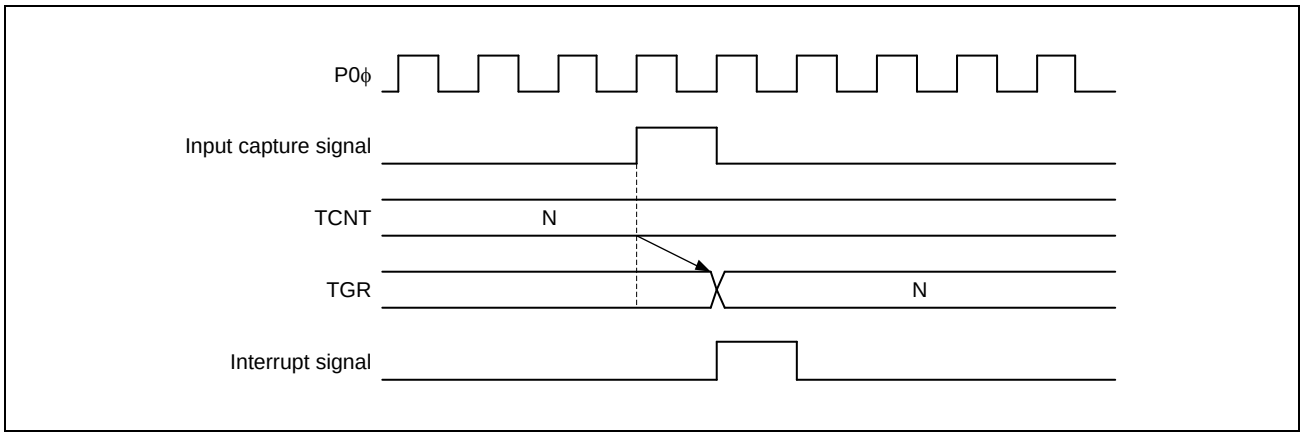

Figure 16.130 TGI Interrupt Timing (Input Capture) (MTU5)

### (3) TCFV and TCFU Interrupt Timing

**Figure 16.131** shows the TCIV interrupt request signal timing when an overflow is generated.

**Figure 16.132** shows the TCIU interrupt request signal timing when an underflow is generated.

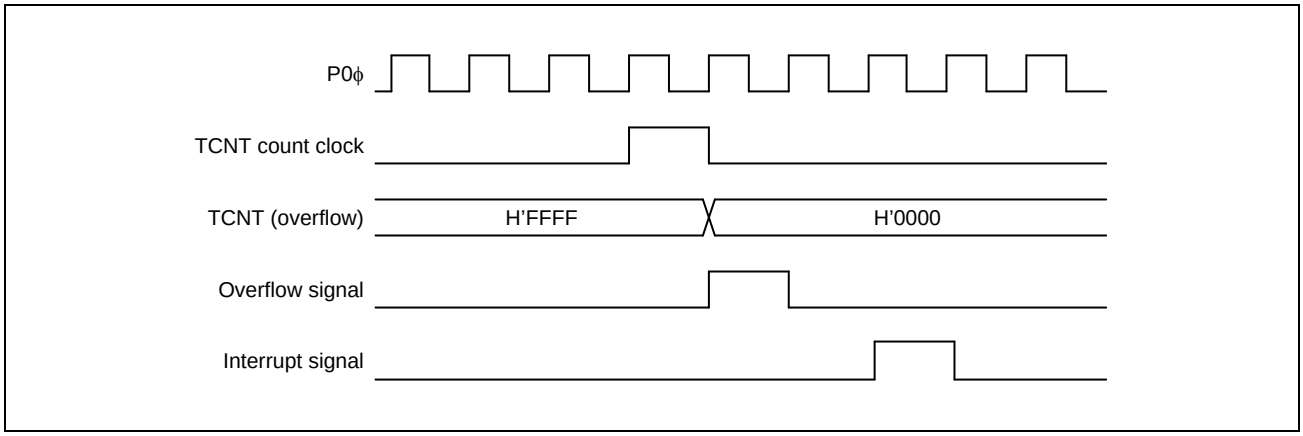

Figure 16.131 TCIV Interrupt Timing

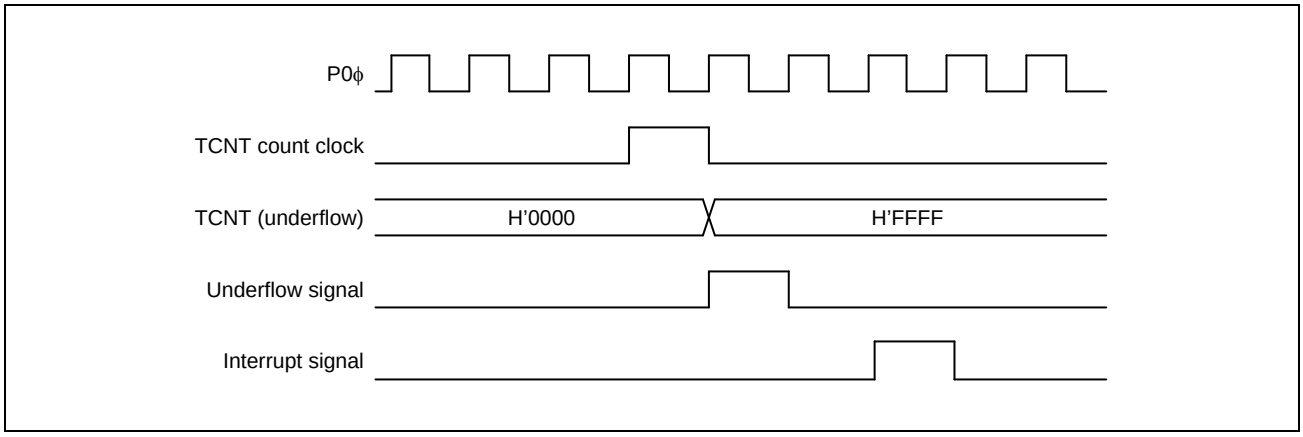

Figure 16.132 TCIU Interrupt Timing

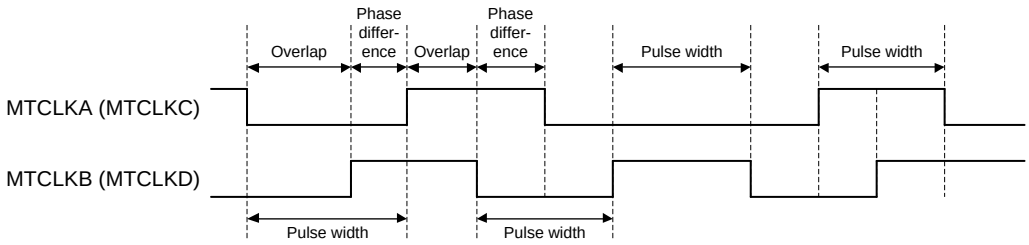
# 16.6 Usage Note

## 16.6.1 Count Clock Restrictions

The count clock source pulse width must be at least three P0ϕ clock cycles for single-edge detection, and at least five P0ϕ clock cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least three P0ϕ clock cycles, and the pulse width must be at least 5P0ϕ clock cycles. **Figure 16.133** shows the input clock conditions in phase counting mode.



**Note:** Phase difference and overlap: 3 P0ϕ clock cycles or more

**Note:** Pulse width: 5 P0ϕ clock cycles or more

Figure 16.133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

## 16.6.2 Note on Cycle Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNU updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8

$$f = \frac{CNTCLK}{N + 1}$$

- MTU5

$$f = \frac{CNTCLK}{N}$$

f: Counter frequency

CNTCLK: The count clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]

N: TGR setting

### 16.6.3 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

**Figure 16.134** shows the timing in this case.

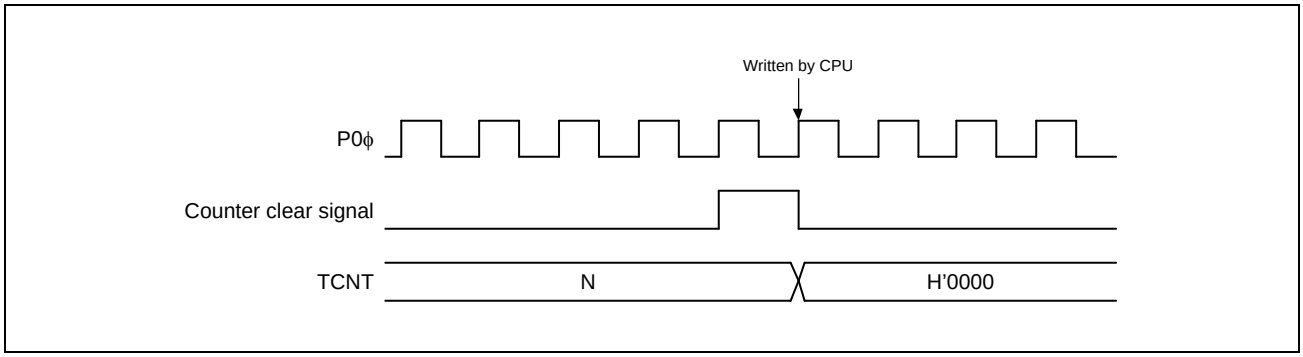


Figure 16.134 Contention between TCNT Write and Clear Operations

### 16.6.4 Contention between TCNT Write and Increment Operations

If incrementing occurs in a TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

**Figure 16.135** shows the timing in this case.

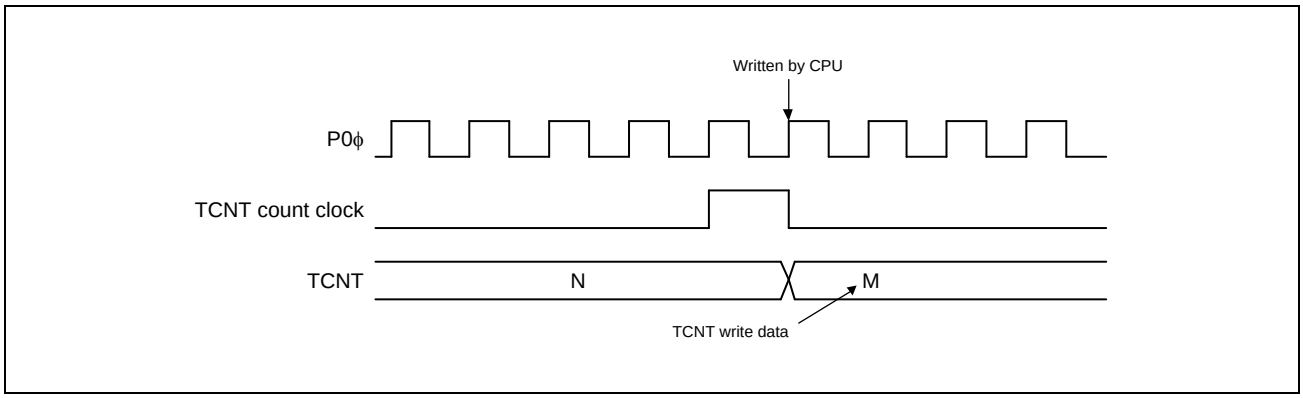

Figure 16.135 Contention between TCNT Write and Increment Operations

### 16.6.5 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

**Figure 16.136** shows the timing in this case.

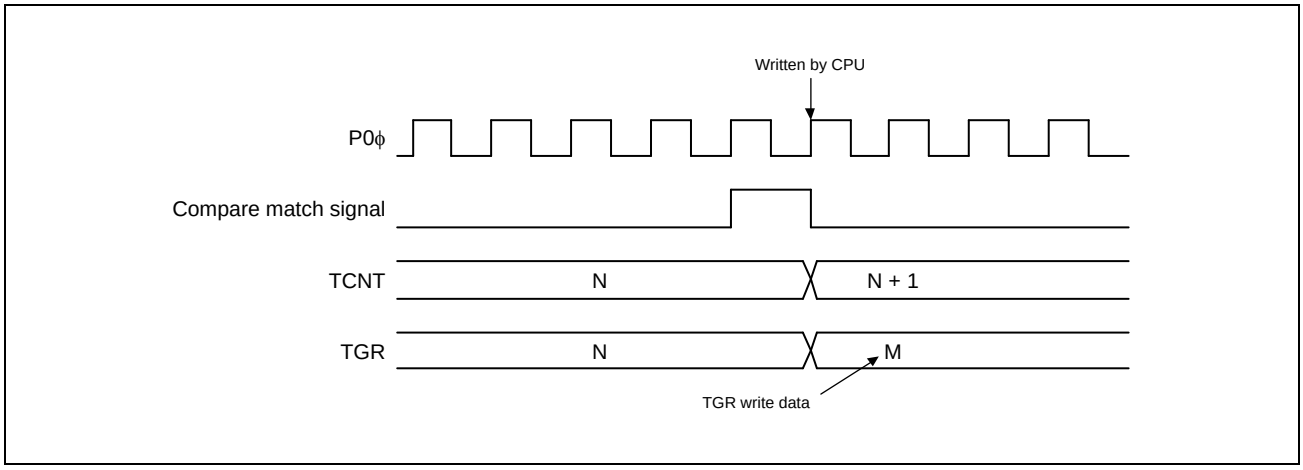

Figure 16.136 Contention between TGR Write Operation and Compare Match

### 16.6.6 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in the T2 state in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

**Figure 16.137** shows the timing in this case.

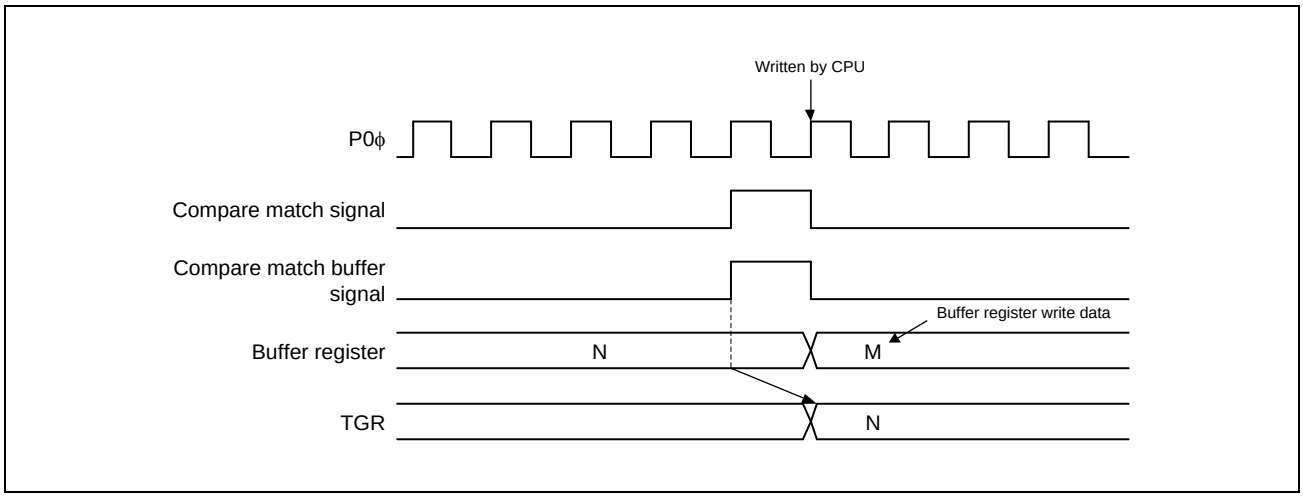

Figure 16.137 Contention between Buffer Register Write Operation and Compare Match

### 16.6.7 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set to the TCNT clear timing by the timer buffer transfer mode register (TBTM), if TCNT is cleared during the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

**Figure 16.138** shows the timing in this case.

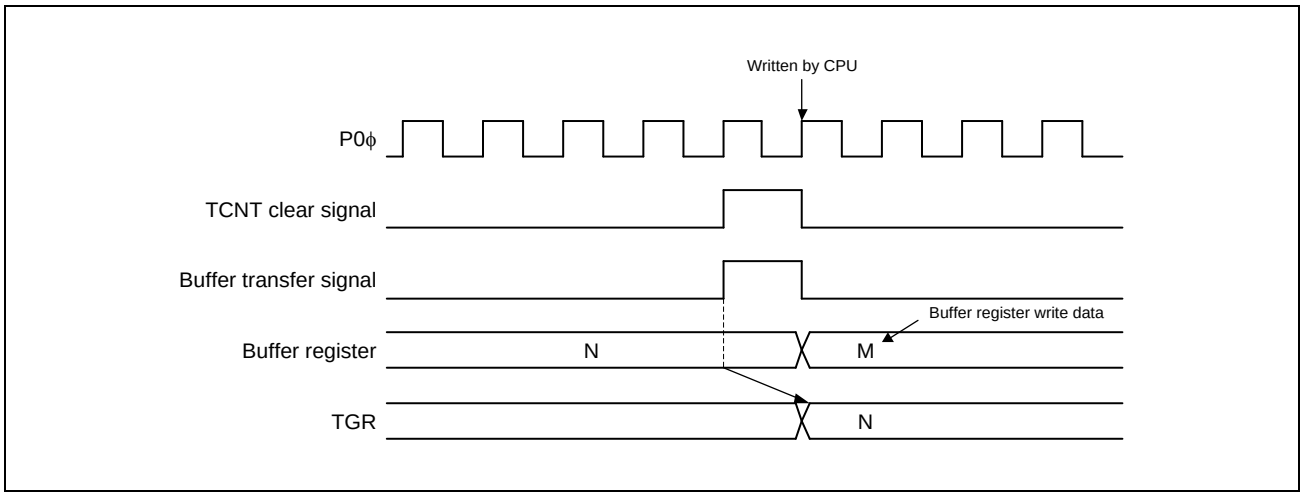

Figure 16.138 Contention between Buffer Register Write and TCNT Clear Operations

### 16.6.8 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in a TGR read cycle, the data before input capture transfer is read.

**Figure 16.139** shows the timing in this case.

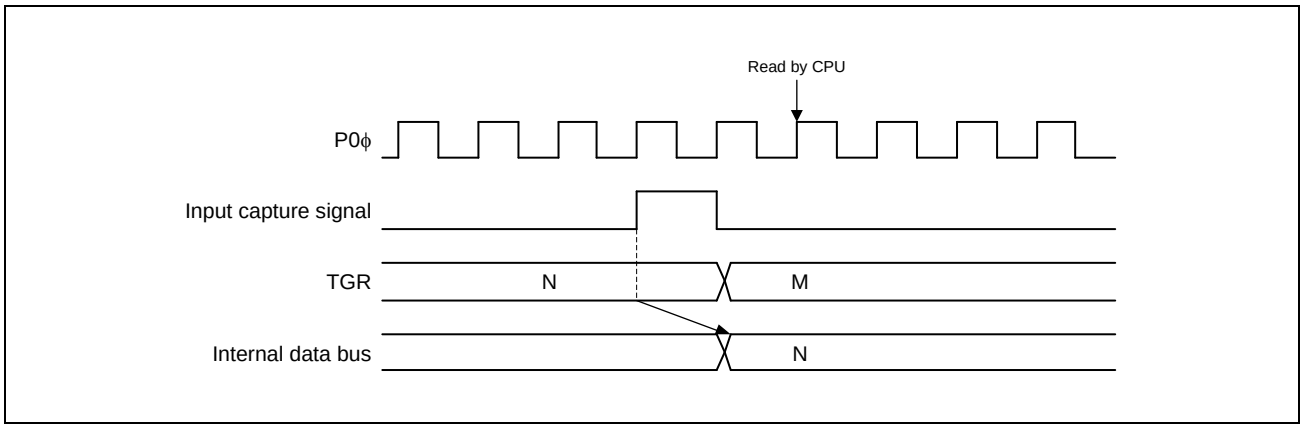

Figure 16.139 Contention between TGR Read Operation and Input Capture (MTU0 to MTU8)

### 16.6.9 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in the TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.

**Figure 16.140** and **Figure 16.141** show the timing in this case.

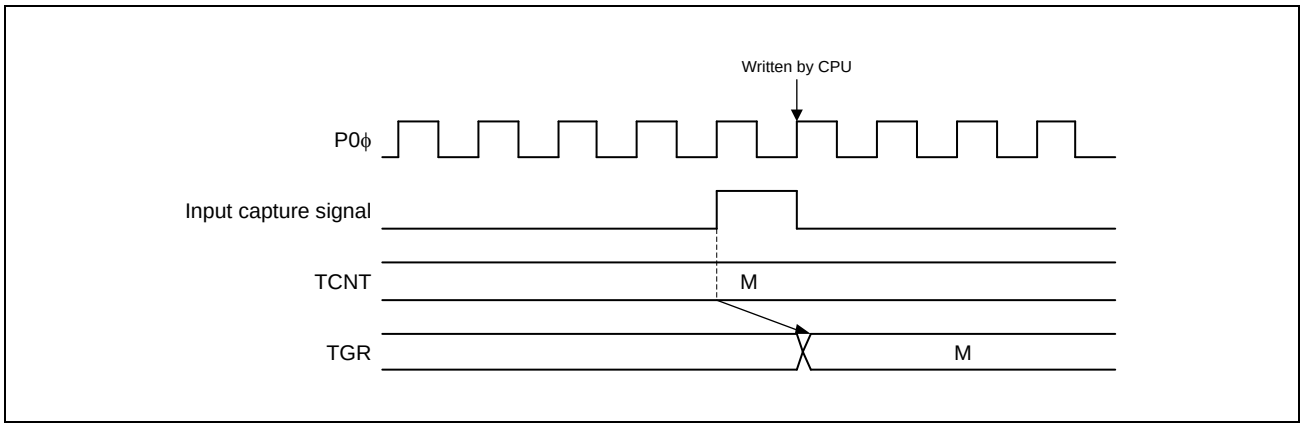

Figure 16.140 Contention between TGR Write Operation and Input Capture (MTU0 to MTU4 and MTU6 to MTU8)

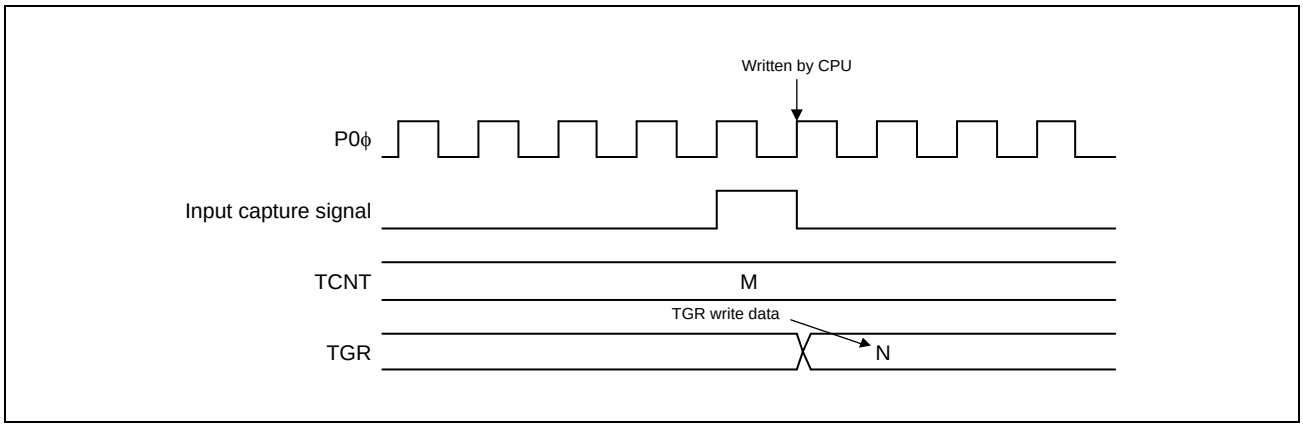

Figure 16.141 Contention between TGR Write Operation and Input Capture (MTU5)

### 16.6.10 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in the buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

**Figure 16.142** shows the timing in this case.

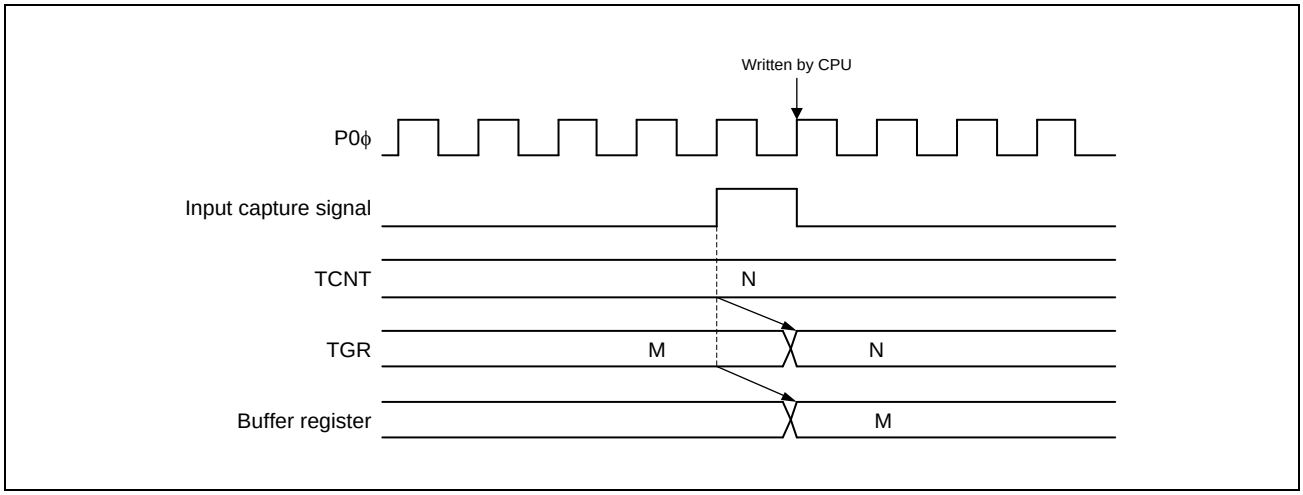

Figure 16.142 Contention between Buffer Register Write Operation and Input Capture

### 16.6.11 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters TCNT in MTU1 and MTU2 cascaded, when a contention occurs between the counting by TCNT in MTU1 (a TCNT overflow/underflow in MTU2) and the writing to TCNT in MTU2, the TCNT write operation is performed in MTU2 and the TCNT count signal in MTU1 is disabled. In this case, if TGRA in MTU1 works as a compare match register and there is a match between the values of TGRA and TCNT in MTU1, a compare match signal is issued.

Furthermore, when the TCNT count clock in MTU1 is selected as the input capture source of MTU0, TGRA to TGRD in MTU0 work in input capture mode. In addition, when the TGRC compare match/input capture in MTU0 is selected as the input capture source of TGRB in MTU1, TGRB in MTU1 works in input capture mode.

**Figure 16.143** shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

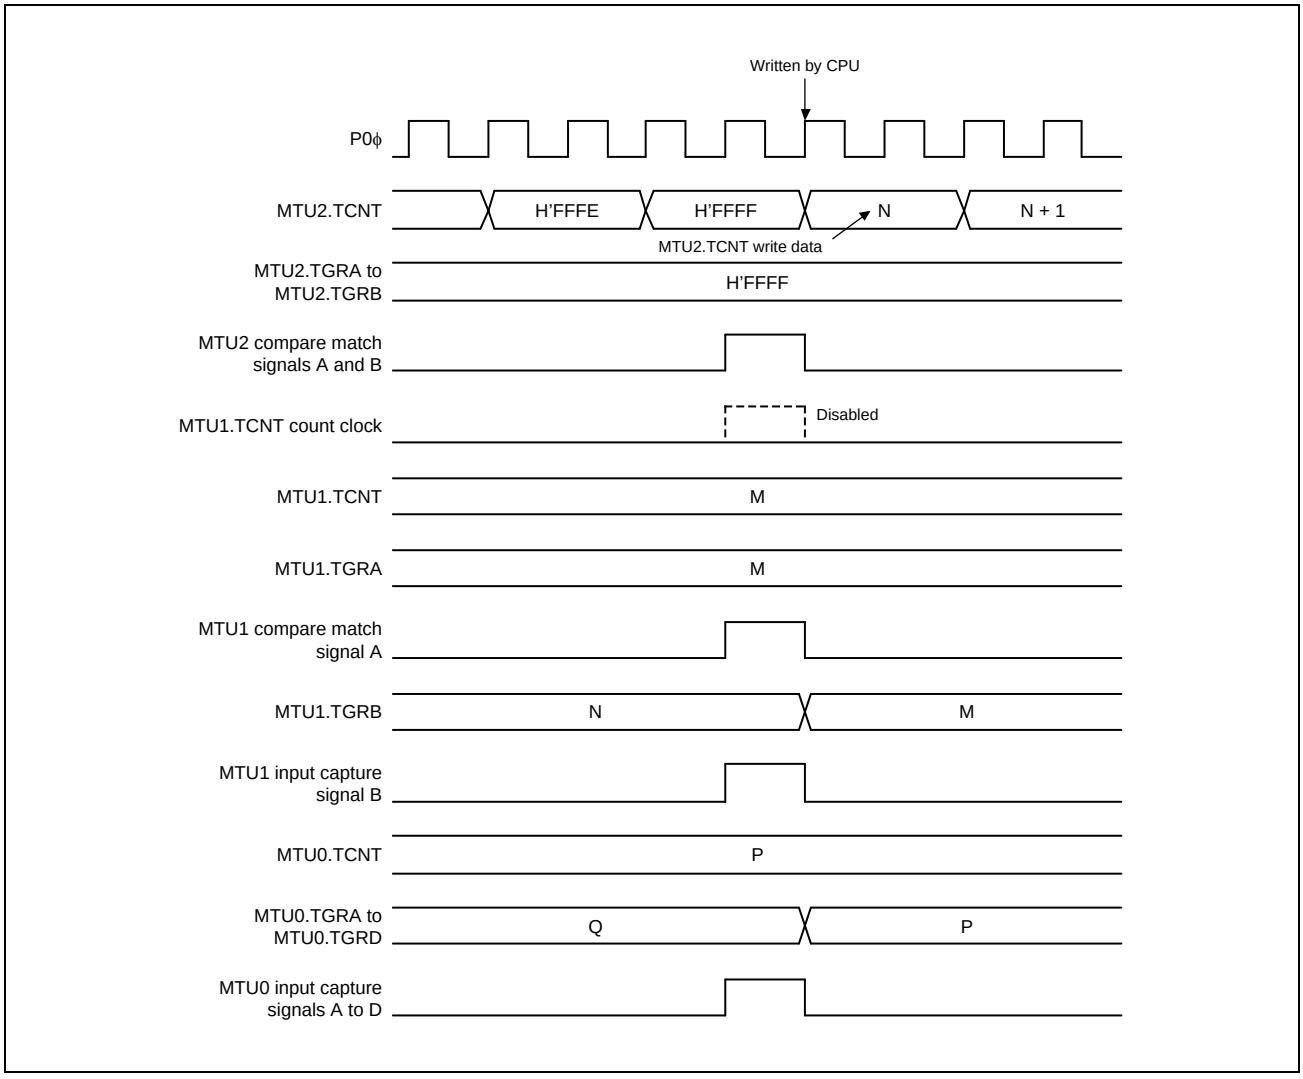

Figure 16.143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

### 16.6.12 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to H'0000.

When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state.

**Figure 16.144** shows this operation.

When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

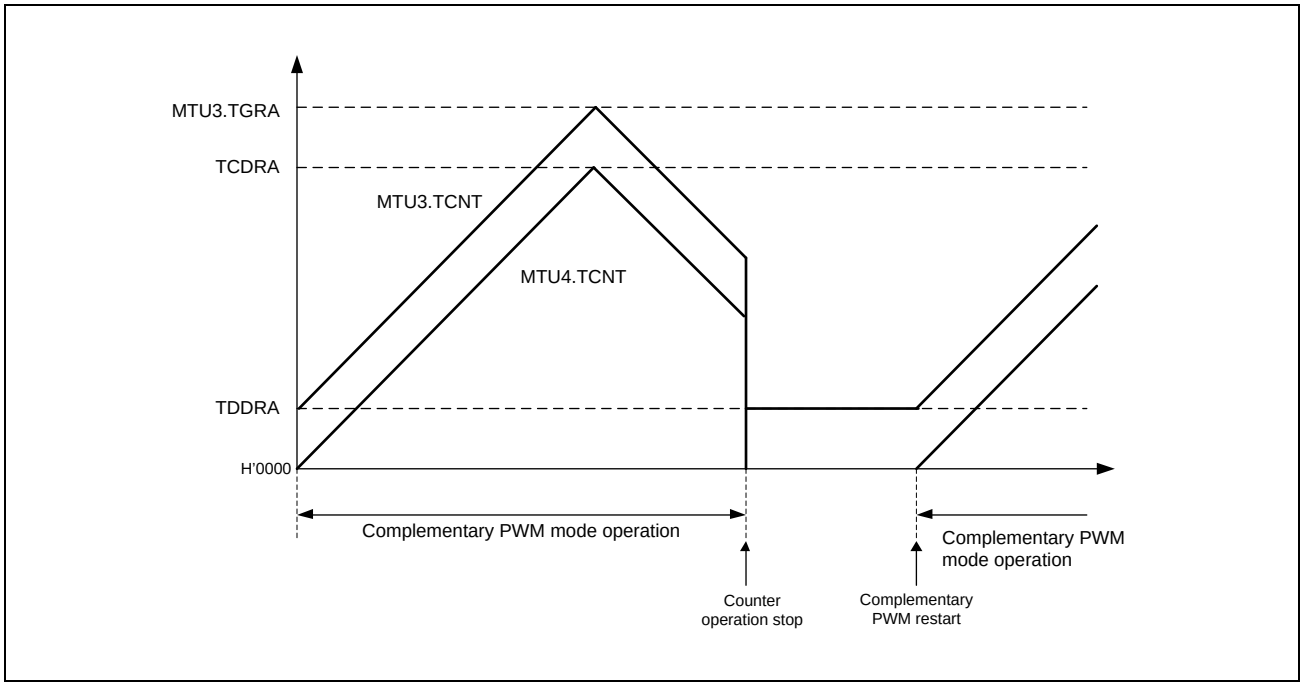

Figure 16.144 Counter Value When Stopped in Complementary PWM Mode

### 16.6.13 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM cycle set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

### 16.6.14 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU 6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C or D; n = 3, 4, 6, or 7) is not generated.

**Figure 16.145** shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

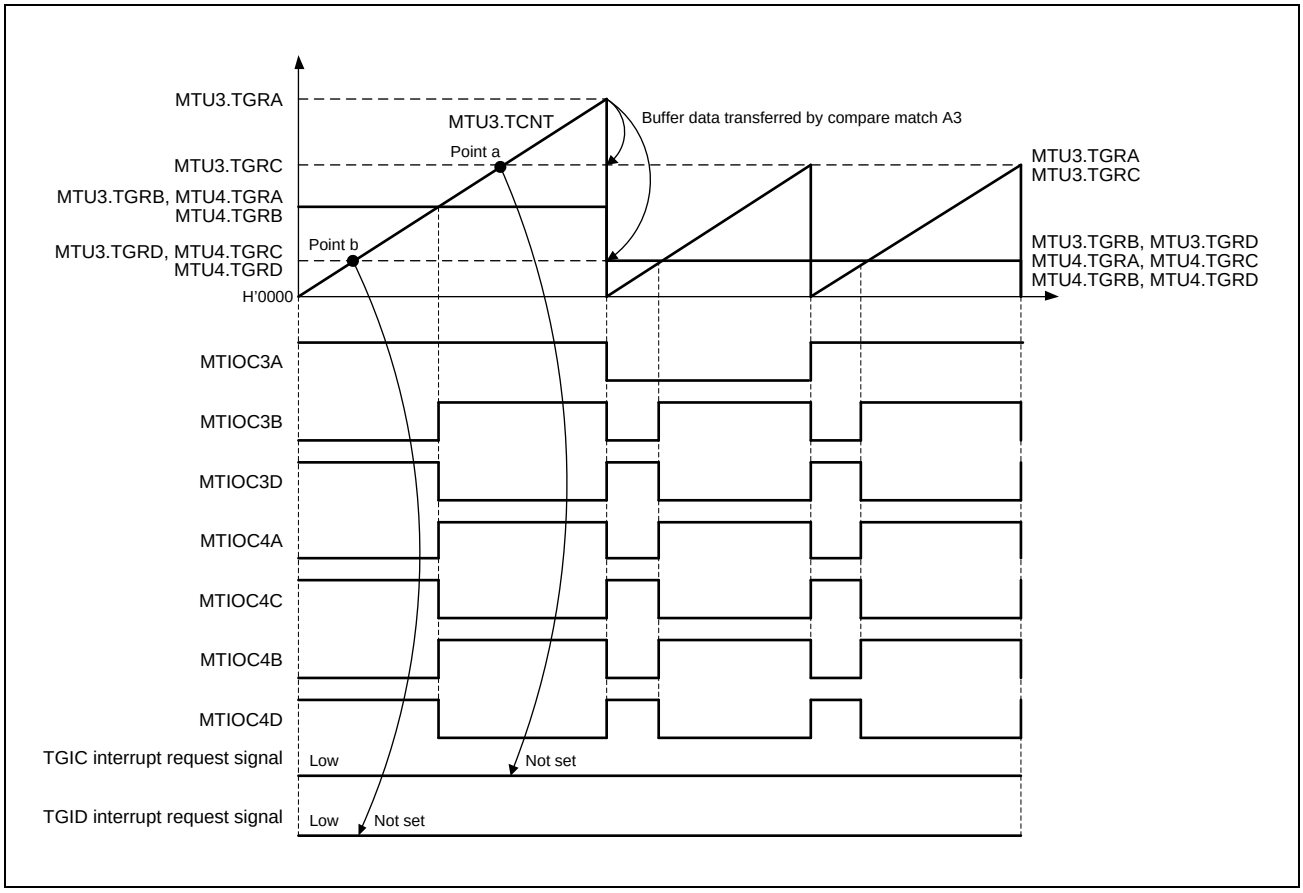

Figure 16.145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

### 16.6.15 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the TCNT count clock source and count edge in MTU4 (MTU7) are determined by the setting of TCR in MTU3 (MTU6).

In reset-synchronized PWM mode, with cycle register TGRA in MTU3 (MTU6) set to H'FFFF and the TGRA compare match in MTU3 (MTU6) selected as the counter clearing source, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) count up to H'FFFF, then a compare match occurs with TGRA in MTU3 (MTU6), and the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) are both cleared. In this case, a TCIVn interrupt (n = 3, 4, 6, or 7) is not generated.

**Figure 16.146** shows an example of the operation in reset-synchronized PWM mode with cycle register TGRA in MTU3 (MTU6) set to H'FFFF and the TGRA compare match in MTU3 (MTU6) specified for the counter clearing source.

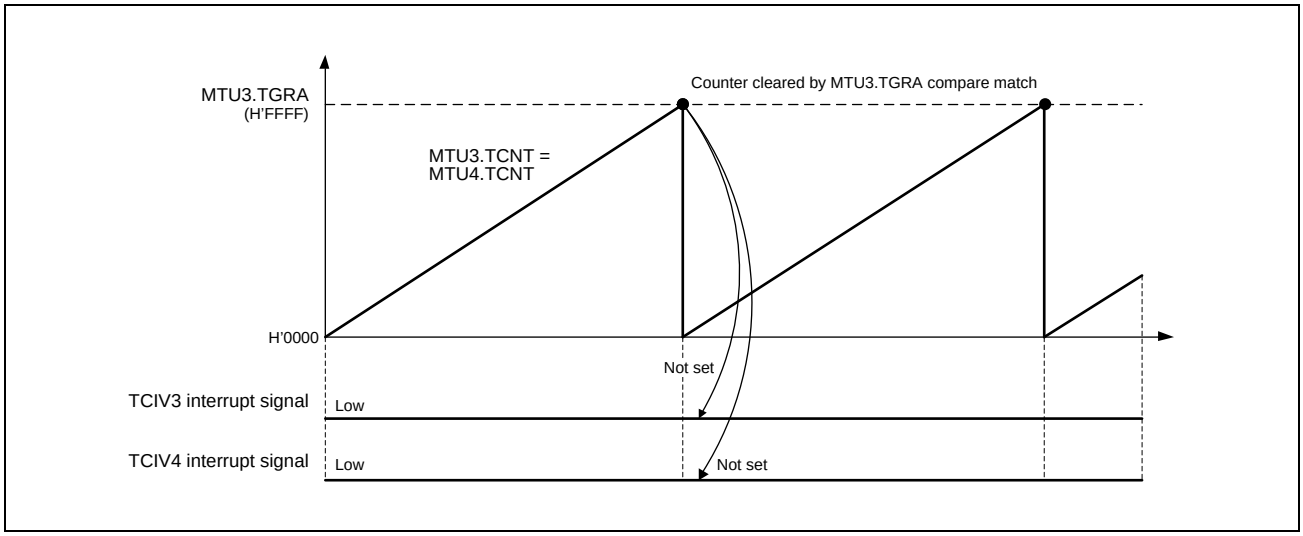

Figure 16.146 Overflow in Reset-Synchronized PWM Mode

### 16.6.16 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, a TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated and TCNT clearing takes precedence.

**Figure 16.147** shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to H'FFFF.

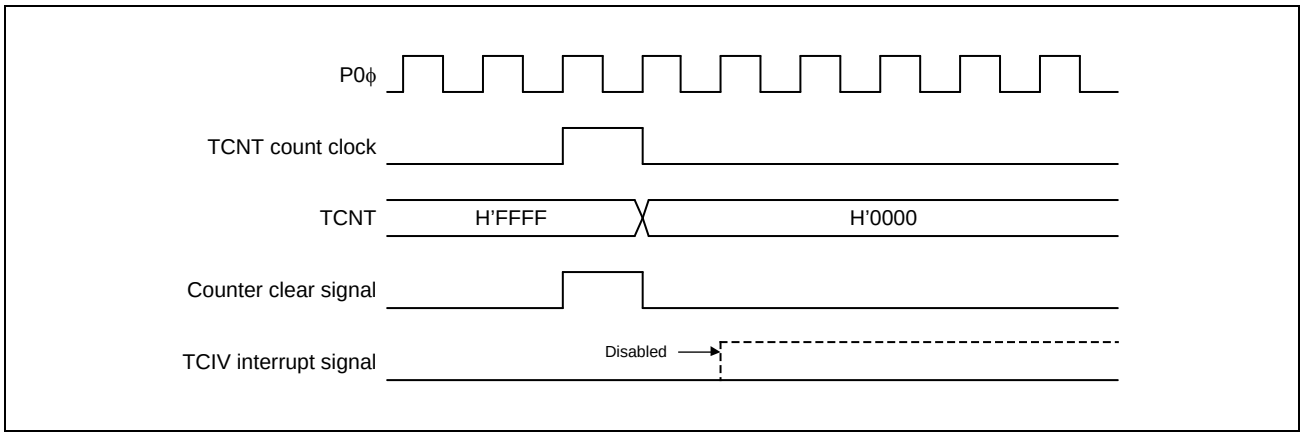

Figure 16.147 Contention between Overflow and Counter Clearing

### 16.6.17 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated.

**Figure 16.148** shows the operation timing when there is contention between TCNT write operation and overflow.

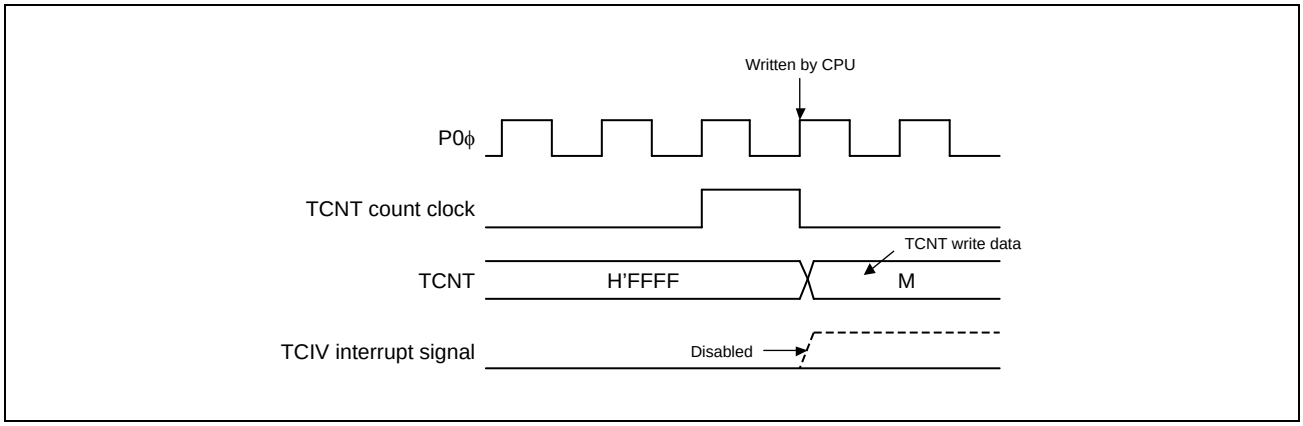

Figure 16.148 Contention between TCNT Write Operation and Overflow

### 16.6.18 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal mode or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.

When making a transition from normal mode to reset-synchronized PWM mode, write H'11 to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (H'00) before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (H'00) before making the transition to reset-synchronized PWM mode.

### 16.6.19 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to H'00. The output level in negative phase when the TDER bit in TDERA (TDERB) is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the OLSN bit in TOCR1A (TOCR1B). It is equivalent to the inverted level of positive phase output based on the setting of the OLSP bit in TOCR1A (TOCR1B).

### 16.6.20 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.

For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = H'FFF1 and MTU2.TCNT = H'0000 should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = H'FFF0 and MTU2.TCNT = H'0000 are erroneously transferred.

The MTU has a function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see **Section 16.2.11, Timer Input Capture Control Register (TICCR)**.

### 16.6.21 Interrupt-Skipping Function 2

When interrupt-skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.

For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

(1) When the number skipped is zero for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
- The interval of comparison for MTU4.TADCORA must be at least four cycles of P0ϕ clock (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
- The interval of comparison for MTU4.TADCORB must be at least four cycles of P0ϕ clock (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).

(2) When the number skipped is one or more for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
- The interval of comparison for MTU4.TADCORB must be at least two cycles of P0ϕ (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

### 16.6.22 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. For details, refer to **Section 17, Port Output Enable 3 (POE3)**.

### 16.6.23 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set TGRj (j = U, V, or W) in MTU5 to the value of the corresponding TCNTj in MTU5 plus one while counting by TCNTj in MTU5 is stopped. If such a setting is made, a compare match will be generated even though counting is stopped.

In this case, if the value of the compare match enable bit (TGIE5j bit of TIER in MTU5) is 1 (enabled), a compare match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the TCNTj counter in MTU5 is automatically cleared to H’0000 when the compare match is generated, regardless of whether compare match interrupts are enabled or disabled.

### 16.6.24 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (the WRE bit of TWCRA or TWCRB is 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

Condition 1:

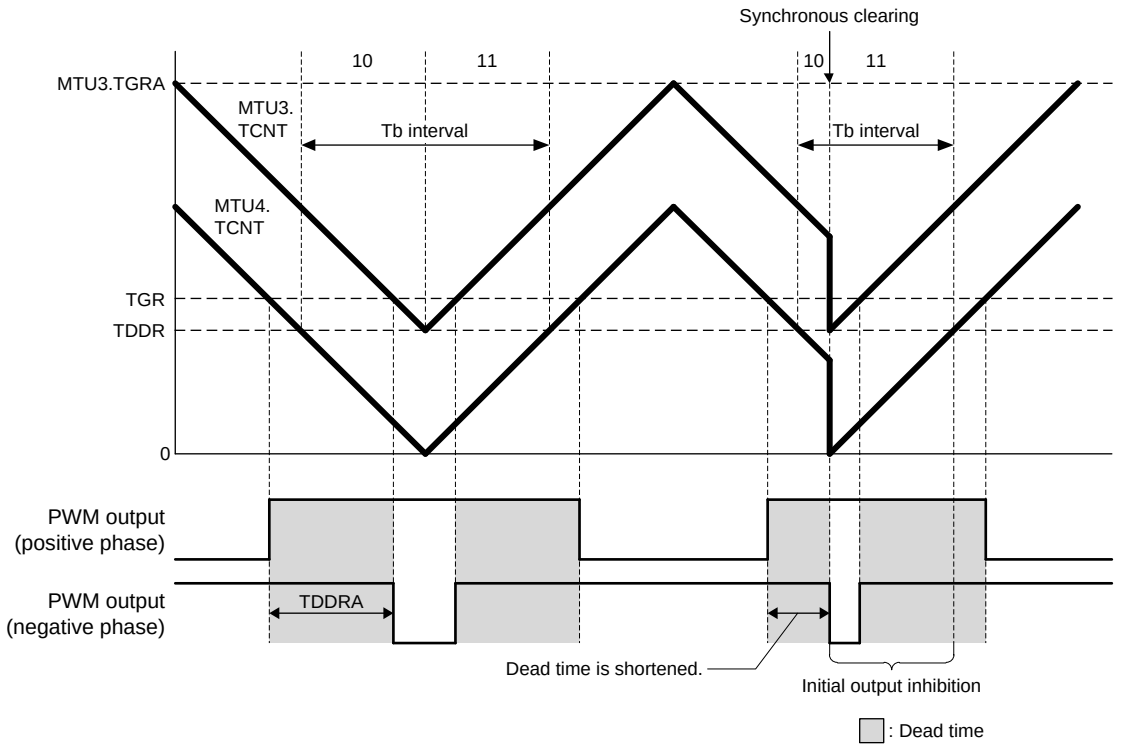
In portion (10) of the initial output inhibition period in **Figure 16.149**, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2:

In portions (10) and (11) of the initial output inhibition period in **Figure 16.150**, synchronous clearing occurs when any condition from among TGRB in MTU3 (MTU6) ≤ TDDR (TDDRB), TGRA in MTU4 (MTU7) ≤ TDDR (TDDRB), and TGRB in MTU4 (MTU7) ≤ TDDR (TDDRB) is satisfied.

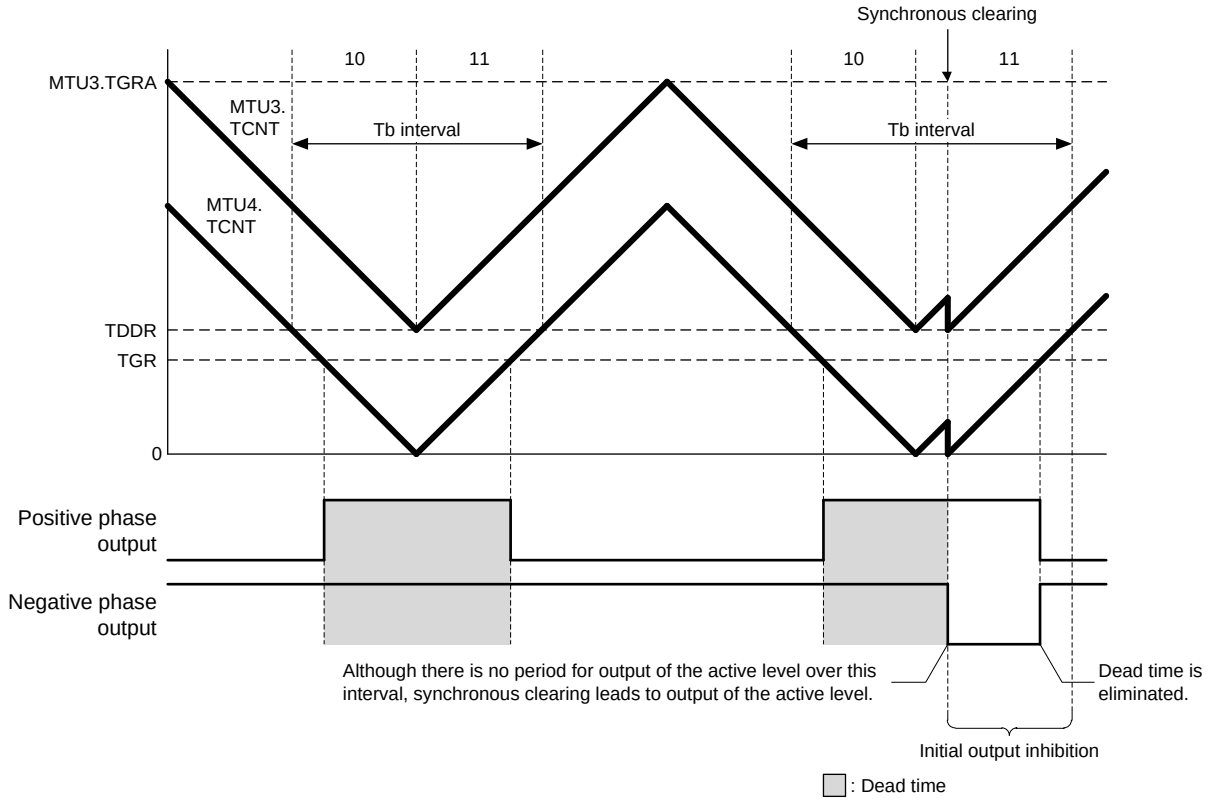
The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each comparison register (TGRB in MTU3 (MTU6), TGRA in MTU4 (MTU7), and TGRB in MTU4 (MTU7)) set to at least double the value of the TDDRA register (TDDRB register).



**Note:** PWM output is active low.

Figure 16.149 Example of Synchronous Clearing (When Condition 1 Applies)



**Note:** PWM output is active low.

Figure 16.150 Example of Synchronous Clearing (When Condition 2 Applies)

### 16.6.25 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to H’0000, the P0ϕ/1 clock is set as the count clock, and compare match is set as the trigger for clearing of the count clock, the value of the TCNT counter remains H’0000, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches.

**Figure 16.151** shows the timing for continuous output of the interrupt signal in response to a compare match.

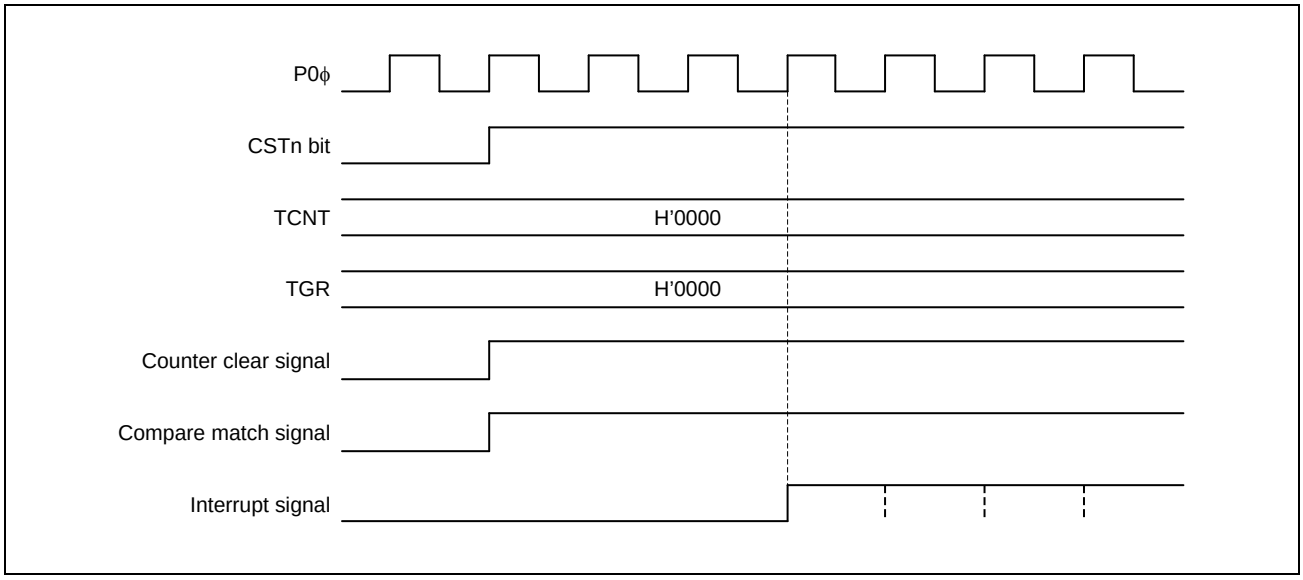


Figure 16.151 Continuous Output of Interrupt Signal in Response to a Compare Match

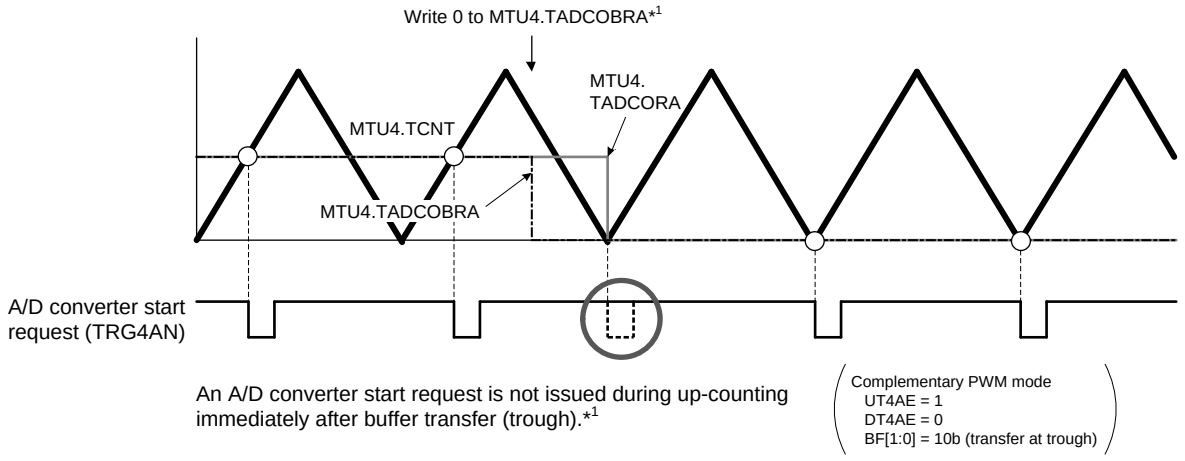
### 16.6.26 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode

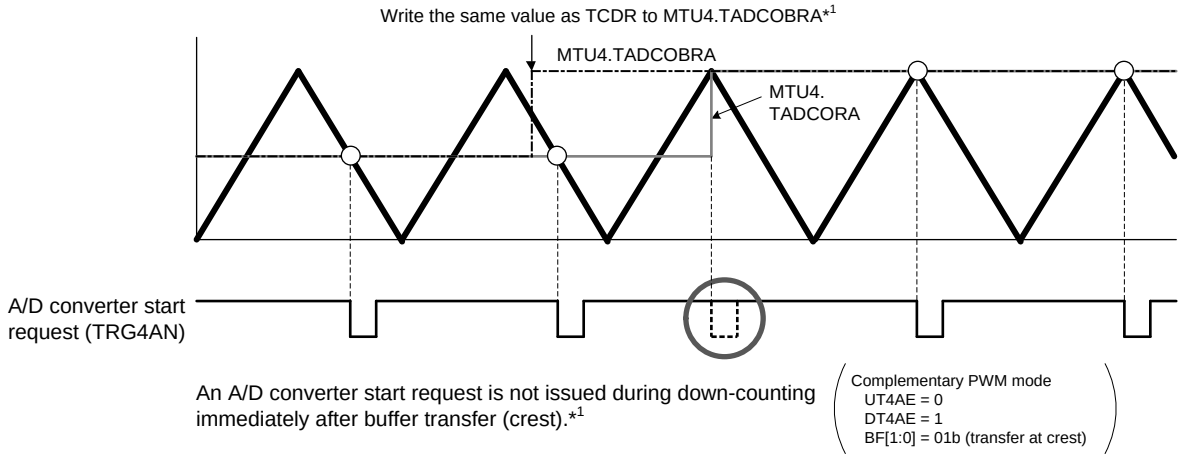
- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to 0, the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the trough of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during up-counting immediately after the transfer (**Figure 16.152**).
- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to the same value as that in the TCDR register, the DT4AE or DT4BE (DT7AE or DT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the crest of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during down-counting immediately after the transfer (**Figure 16.153**).
- When using A/D converter start requests in coordination with the interrupt skipping function, set up the TADCORA or TADCORB register in MTU4 (MTU7) so that the setting satisfies the condition "2 ≤ TADCORA or TADCORB in MTUn ≤ TCDR - 2" (n = 4 or 7).



**Note:** UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Note 1. An A/D converter start request is issued when TCDR − 1 ≥ MTU4.TADCOBRA/TADCOBRB ≥ 1 is written.

Figure 16.152 A/D Converter Start Request when TADCOBRA is Set to 0 in MTU4



**Note:** UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Note 1. An A/D converter start request is issued when TCDR −1 ≥ MTU4.TADCOBRA/TADCOBRB ≥ 1 is written.

Figure 16.153 A/D Converter Start Request when TADCOBRA is Set to the Same Value as TCDR in MTU4

# 16.7 MTU Output Pin Initialization

## 16.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

## 16.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in **Table 16.80**.

Table 16.80 Mode Transition Combinations

| | Normal | PWM1 | PWM2 | PCM | CPWM | RPWM |
|---|---|---|---|---|---|---|
| Normal | (1) | (2) | (3) | (4) | (5) | (6) |
| PWM1 | (7) | (8) | (9) | (10) | (11) | (12) |
| PWM2 | (13) | (14) | (15) | (16) | Not available | Not available |
| PCM | (17) | (18) | (19) | (20) | Not available | Not available |
| CPWM | (21) | (22) | Not available | Not available | (23) (24) | (25) |
| RPWM | (26) | (27) | Not available | Not available | (28) | (29) |

**Note:** Normal: Normal mode
PWM1: PWM mode 1
PWM2: PWM mode 2
PCM: Phase counting modes 1 to 5
CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

### 16.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD pins (n = 3, 4, 6, or 7). If the MTIOCnB or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. If the MTIOCnm output (n = 0 to 2 and m = A to D) is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the timer output control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the timer output master enable register (TOERA or TOERB). If the MTIOCnm output (n =3, 4, 6, or 7 and m = A to D) is selected as the function of pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

NOTE

Channel number is substituted for “n” indicated in this section.

Pin initialization procedures are described below for the numbered combinations in **Table 16.80**. The active level is assumed to be low.

### (1) Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

**Figure 16.154** shows a case in which an error occurs in normal mode and operation is restarted in normal mode after re- setting.

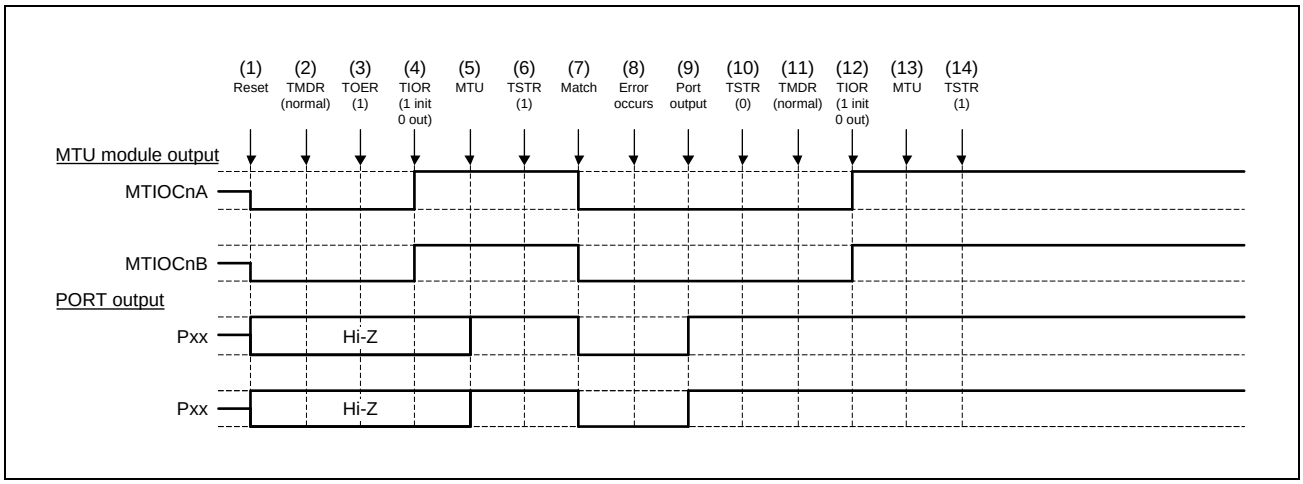


Figure 16.154 Error Occurrence in Normal Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) After a reset, the TMDR1 setting is for normal mode.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.

(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(5) Set MTU output using the port mode control registers (PMCn) and port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB).

(11) This step is not necessary when restarting in normal mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (2) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

**Figure 16.155** shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

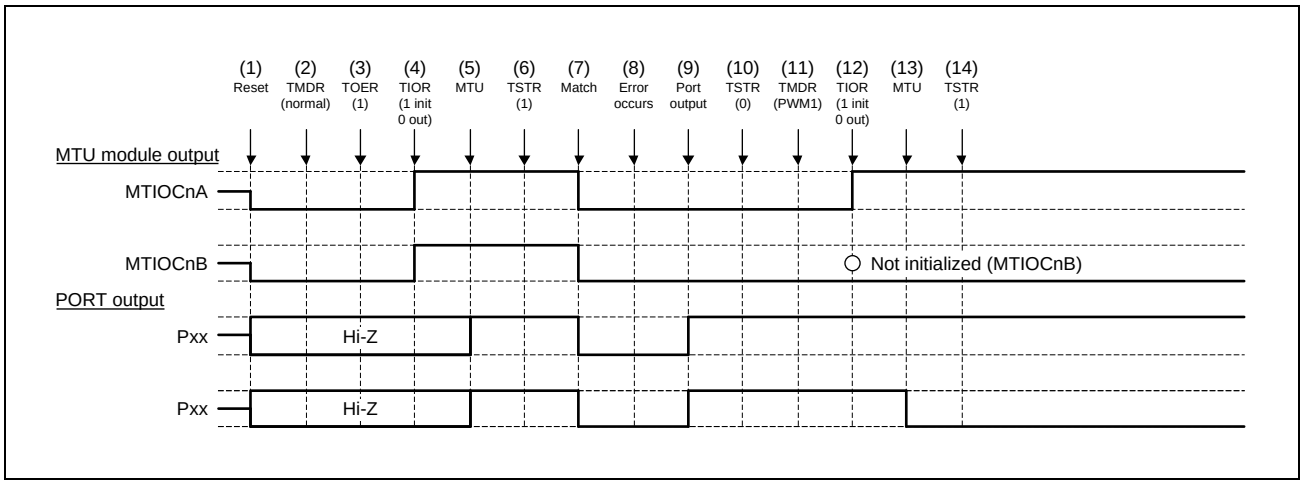

Figure 16.155 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.154**.

(11) Set PWM mode 1.

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (3) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

**Figure 16.156** shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

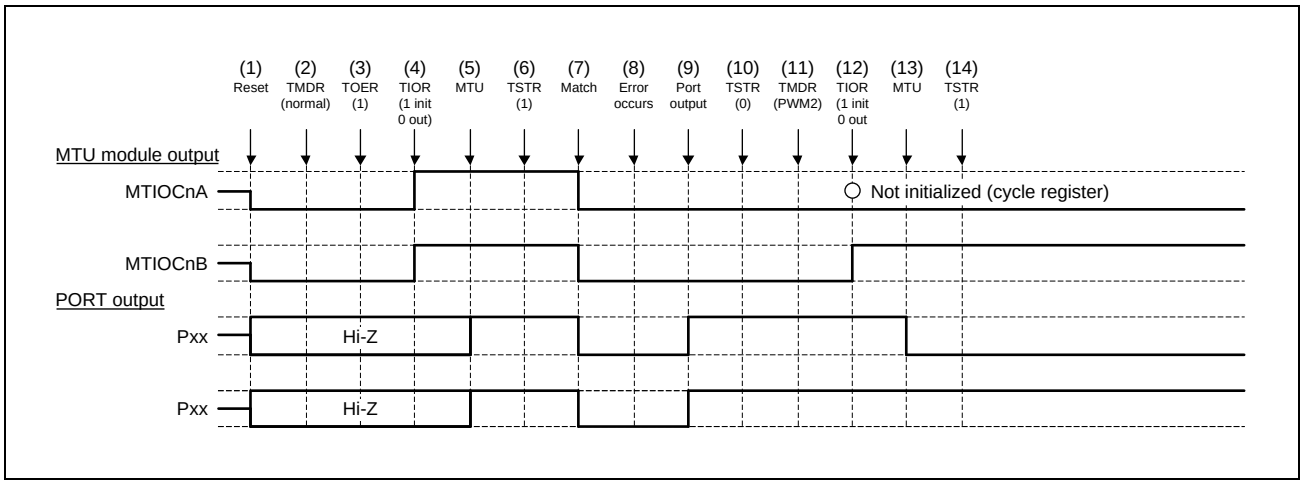

Figure 16.156 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

(1) to (10) are the same as in **Figure 16.154**.

(11) Set PWM mode 2.

(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. To output a specified level, set up the general output ports with the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

### (4) Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

**Figure 16.157** shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

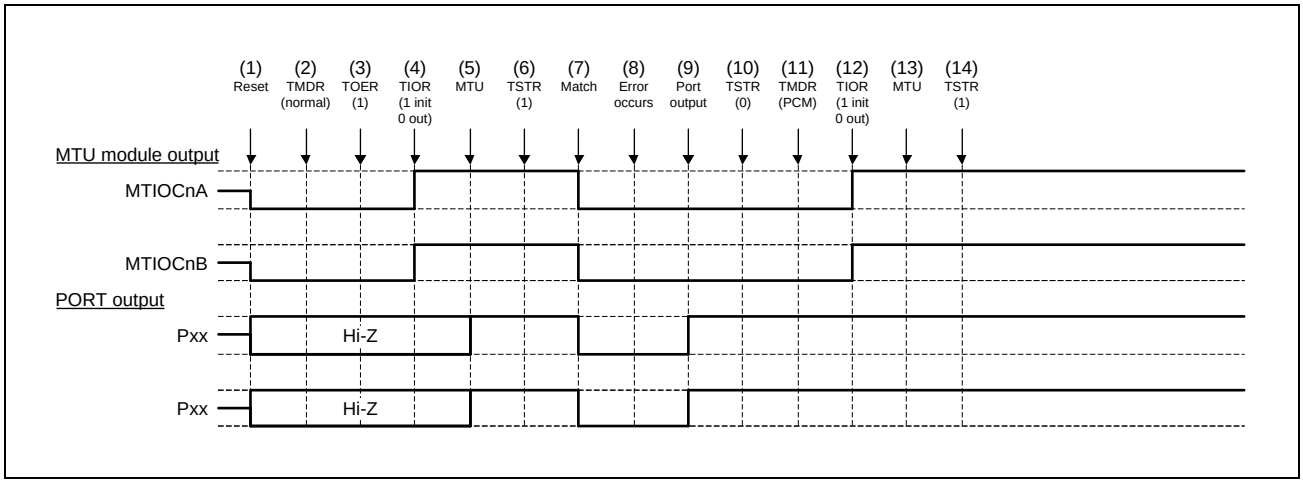

Figure 16.157 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode

(1) to (10) are the same as in **Figure 16.154**.

(11) Set the phase counting mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

### (5) Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

**Figure 16.158** shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

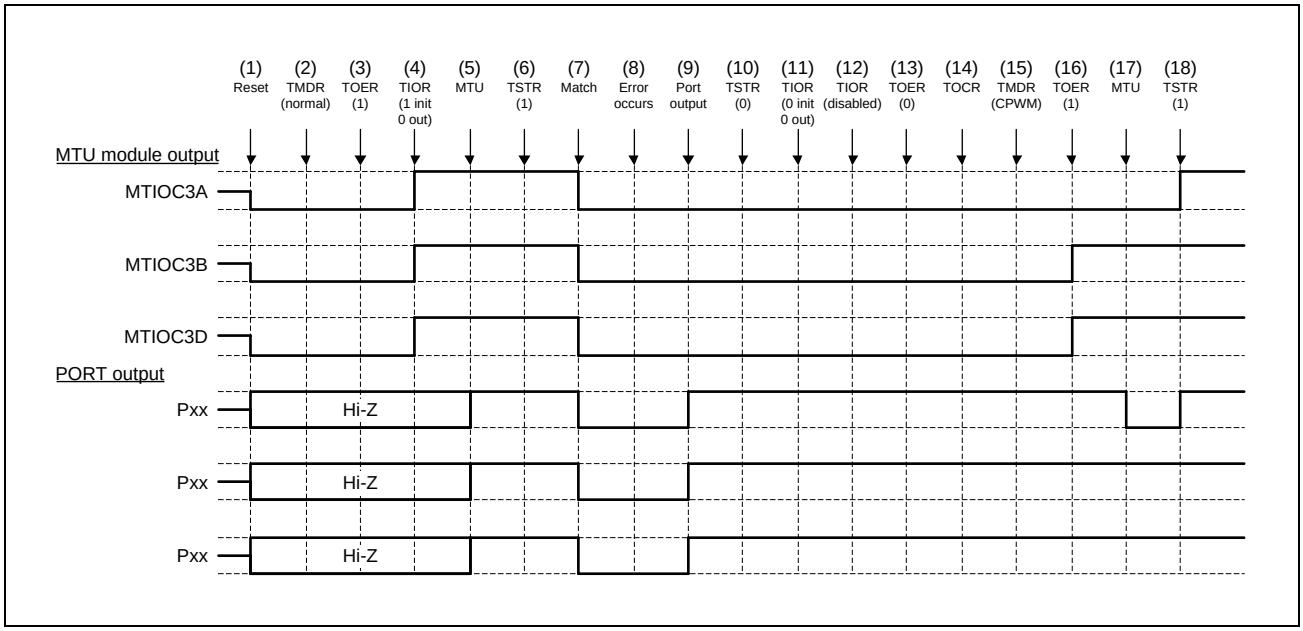

Figure 16.158 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 16.154**.

(11) Initialize the normal mode waveform generation section with TIOR.

(12) Disable operation of the normal mode waveform generation section with TIOR.

(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(14) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set complementary PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(17) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(18) Restart operation by setting TSTRA (TSTRB).

### (6) Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

**Figure 16.159** shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

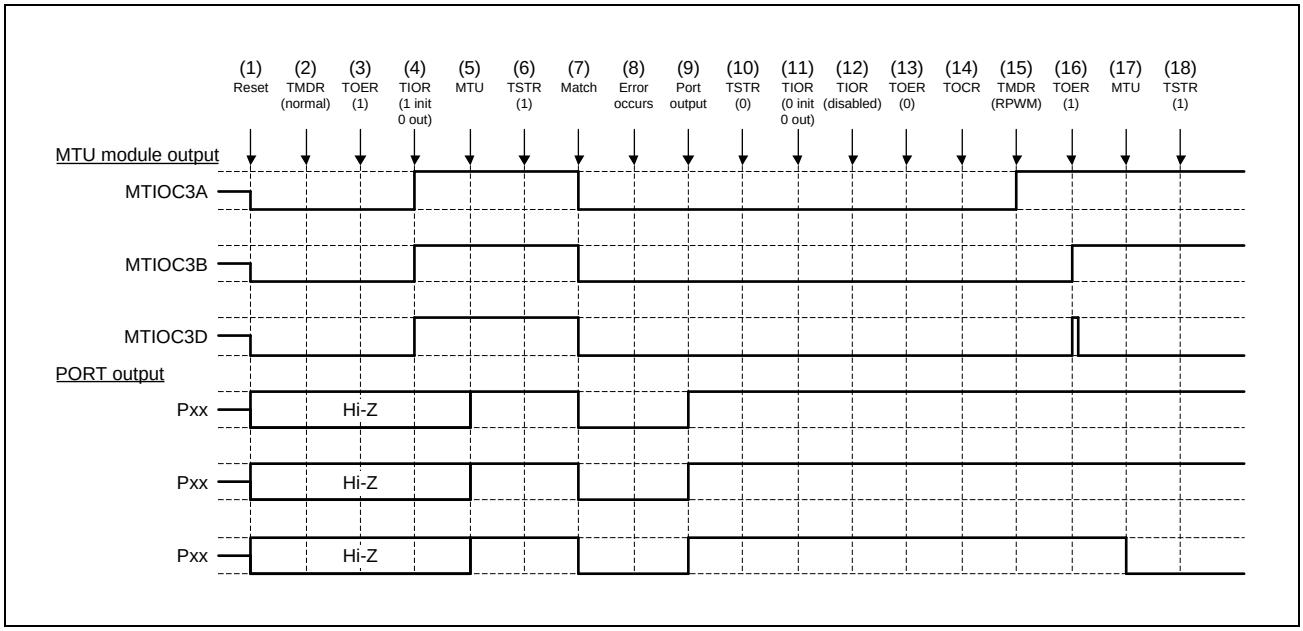

Figure 16.159 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (13) are the same as in **Figure 16.156**.

(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set reset-synchronized PWM mode.

(16) Enable output from MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(17) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(18) Restart operation by setting TSTRA (TSTRB).

### (7) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

**Figure 16.160** shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

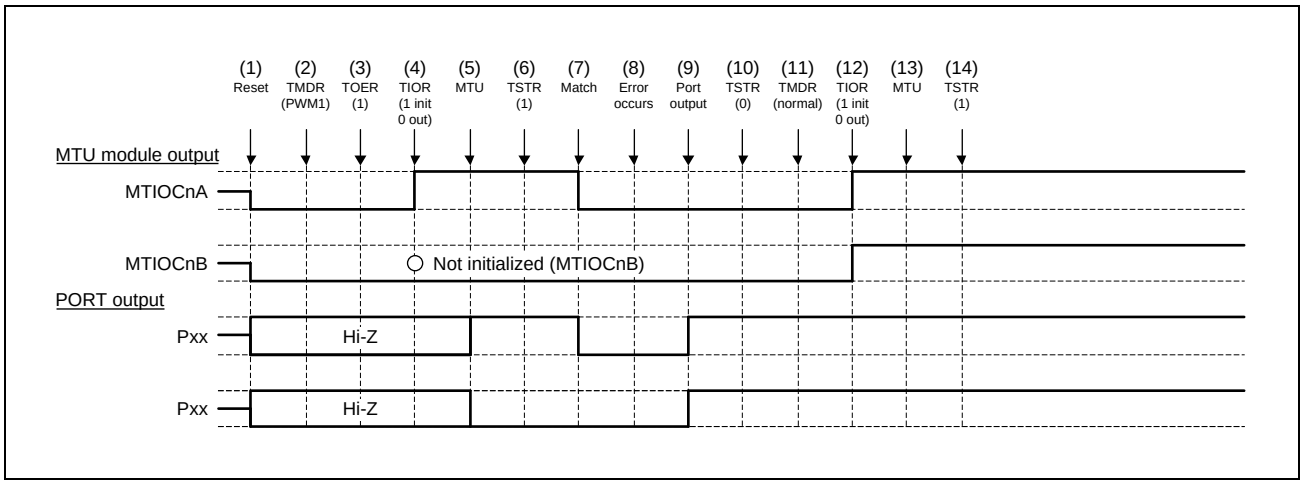

Figure 16.160 Error Occurrence in PWM Mode 1, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 1.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.

(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB).

(11) Set normal mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (8) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

**Figure 16.161** shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

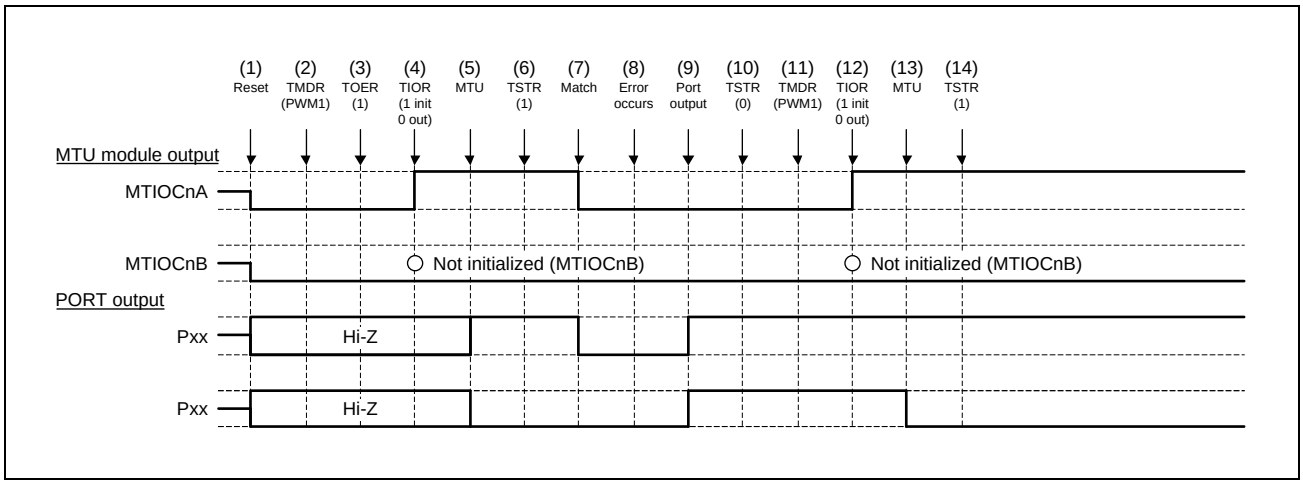

Figure 16.161 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.160**.

(11) This step is not necessary when restarting in PWM mode 1.

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (9) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

**Figure 16.162** shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

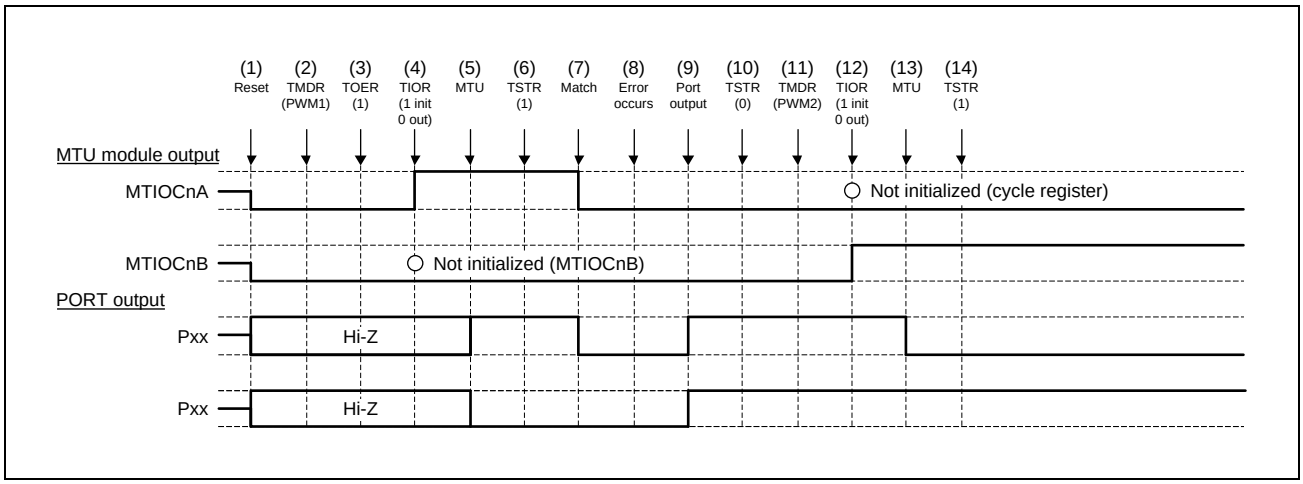

Figure 16.162 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

(1) to (10) are the same as in **Figure 16.160**.

(11) Set PWM mode 2.

(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

### (10) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

**Figure 16.163** shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

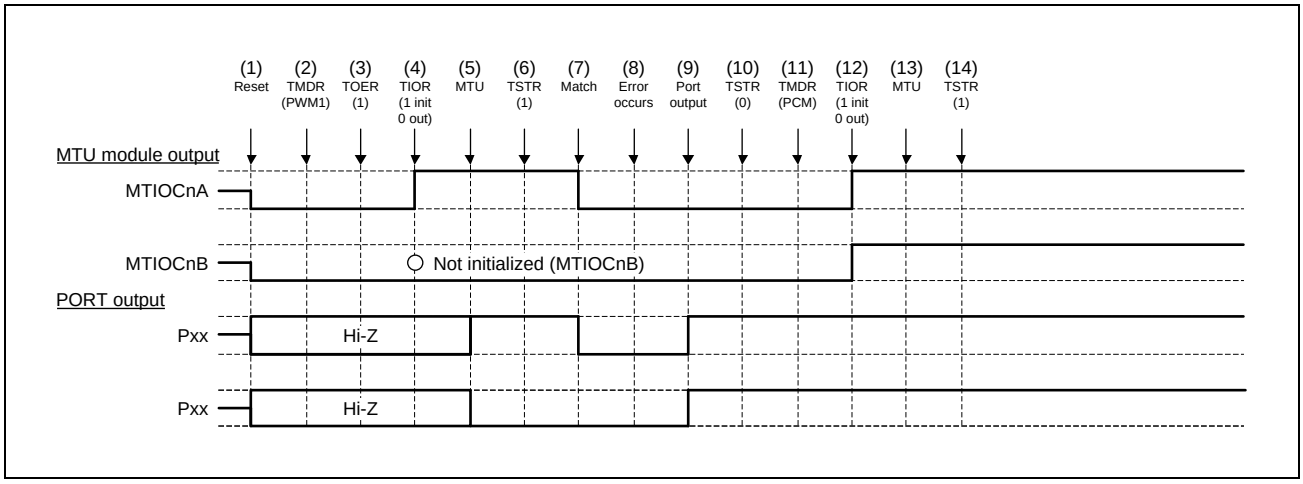

Figure 16.163 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

(1) to (10) are the same as in **Figure 16.160**.

(11) Set the phase counting mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

### (11) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

**Figure 16.164** shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

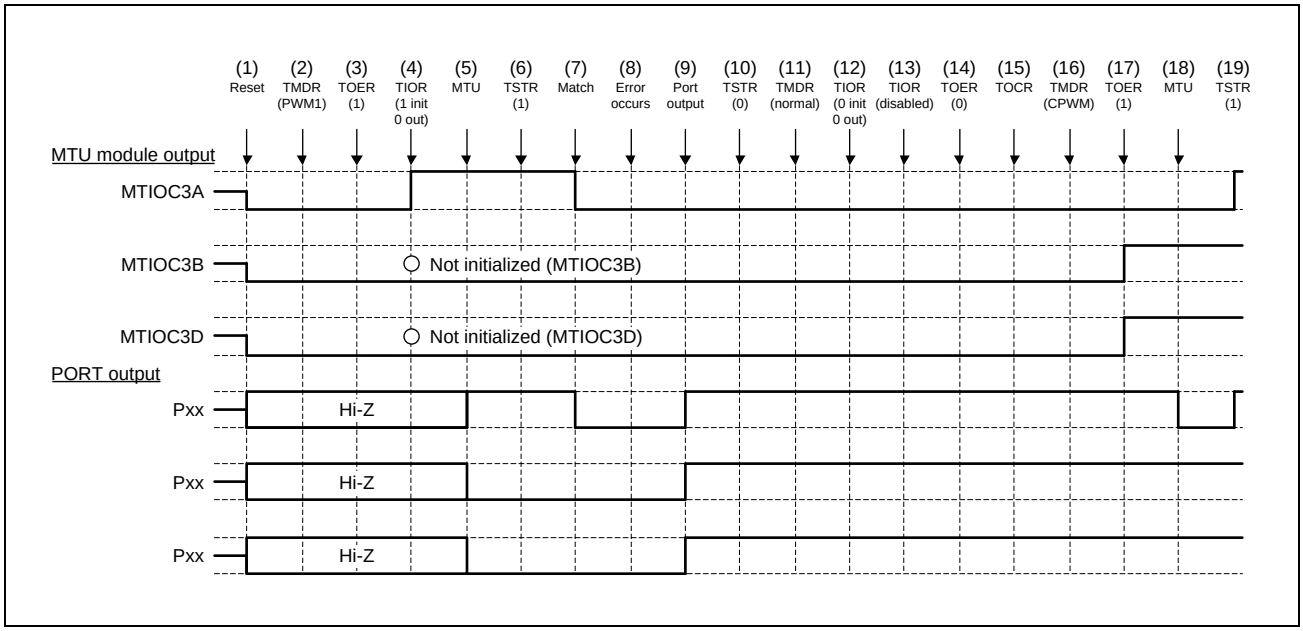

Figure 16.164 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 16.160**.

(11) Set normal mode to initialize the normal mode waveform generation section.

(12) Initialize the PWM mode 1 waveform generation section with TIOR.

(13) Disable operation of the PWM mode 1 waveform generation section with TIOR

(14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(15) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set complementary PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(18) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(19) Restart operation by setting TSTRA (TSTRB).

### (12) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset- Synchronized PWM Mode

**Figure 16.165** shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

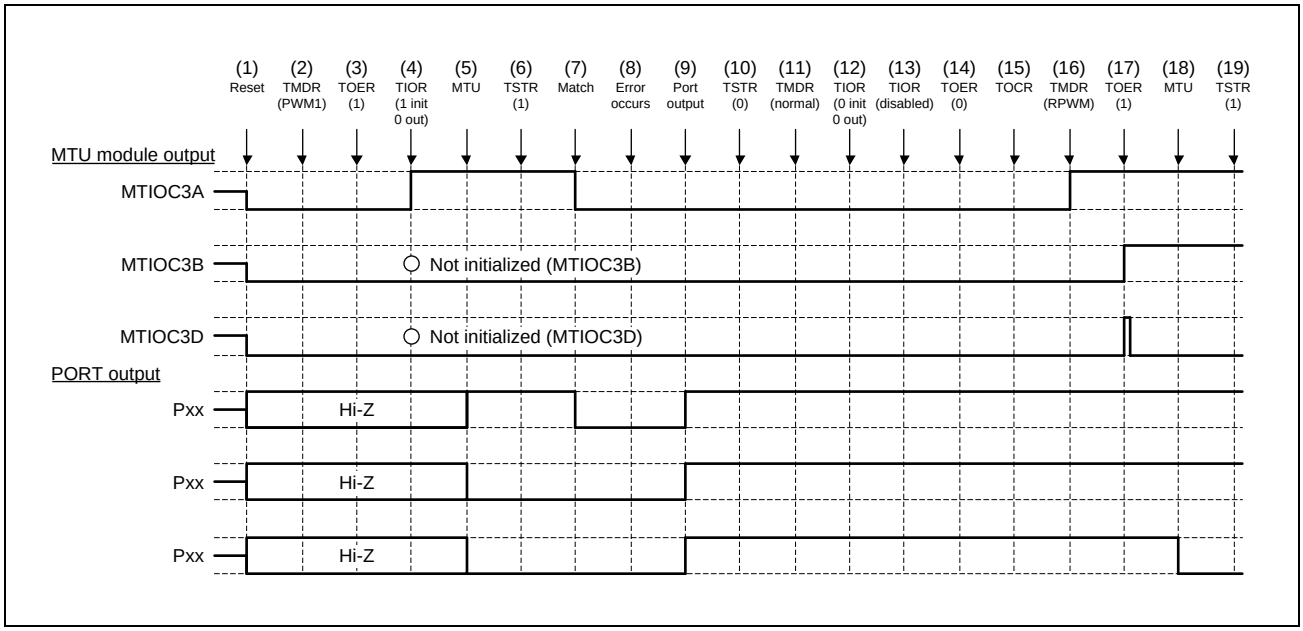

Figure 16.165 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

(1) to (14) are the same as in **Figure 16.164**.

(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set reset-synchronized PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(18) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(19) Restart operation by setting TSTRA (TSTRB).

### (13) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

**Figure 16.166** shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

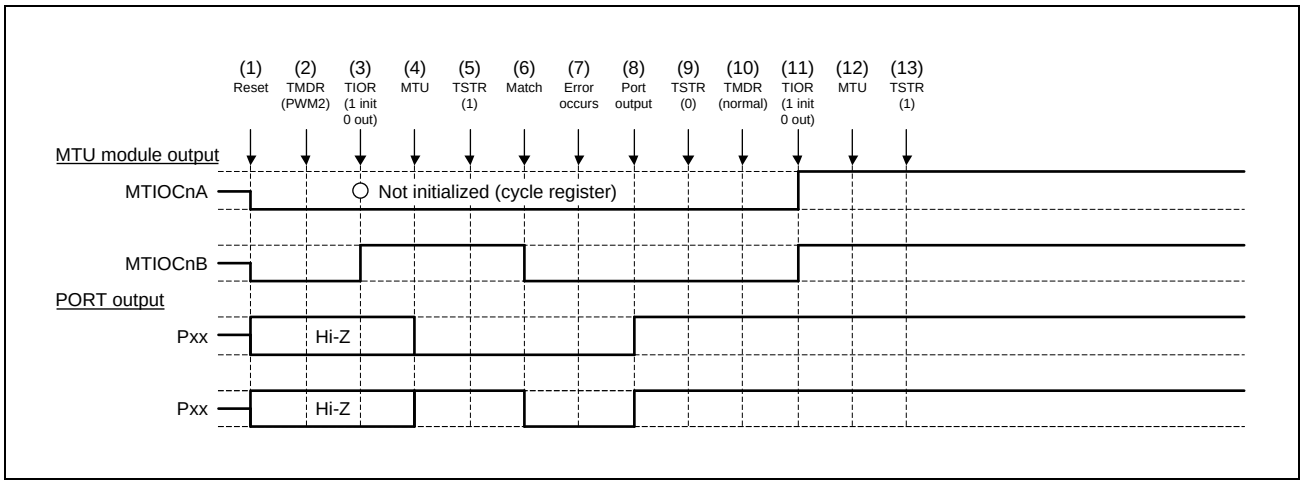

Figure 16.166 Error Occurrence in PWM Mode 2, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 2.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the pins corresponding to the TGR registers used as cycle registers are not initialized. In the example, TGRA in MTUn is used as a cycle register.)

(4) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(5) Start count operation by setting TSTRA.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(9) Stop count operation by setting TSTRA.

(10) Set normal mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (14) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

**Figure 16.167** shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

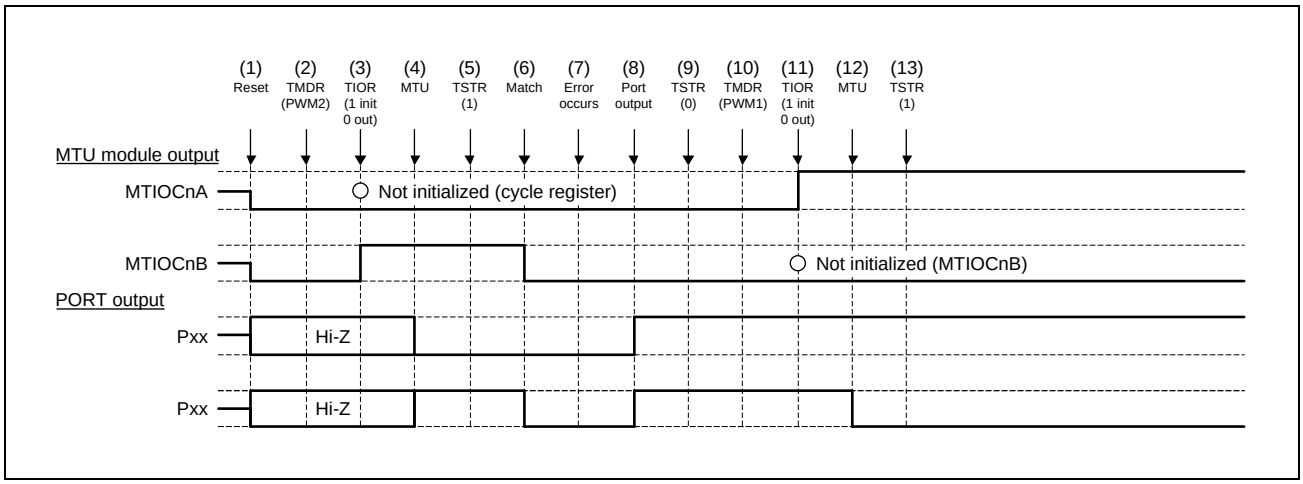

Figure 16.167 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1

(1) to (9) are the same as in **Figure 16.166**.

(10) Set PWM mode 1.

(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (15) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

**Figure 16.168** shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

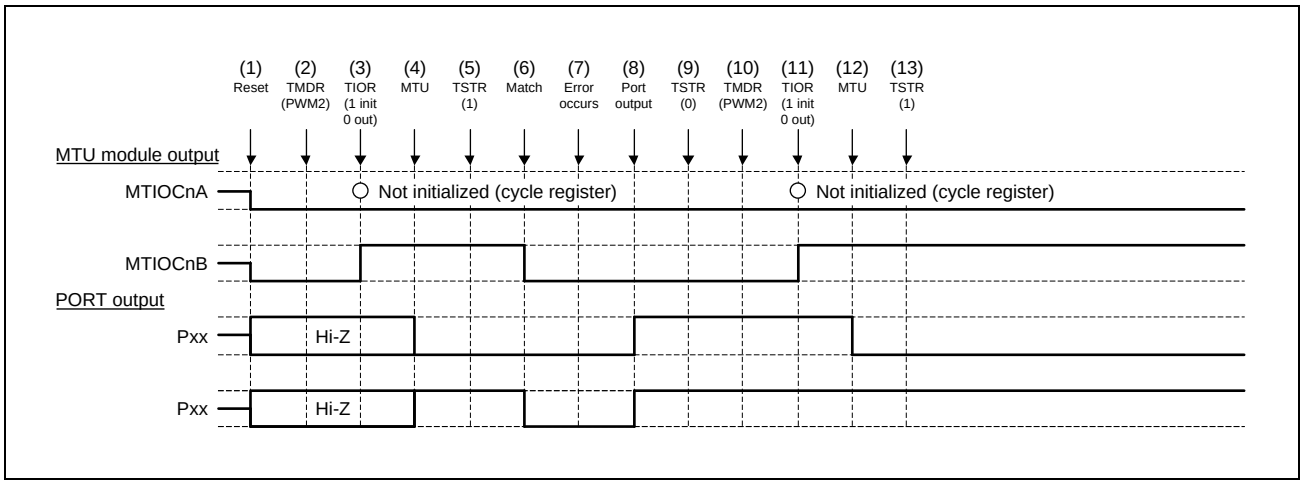

Figure 16.168 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

(1) to (9) are the same as in **Figure 16.166**.

(10) This step is not necessary when restarting in PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (16) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

**Figure 16.169** shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

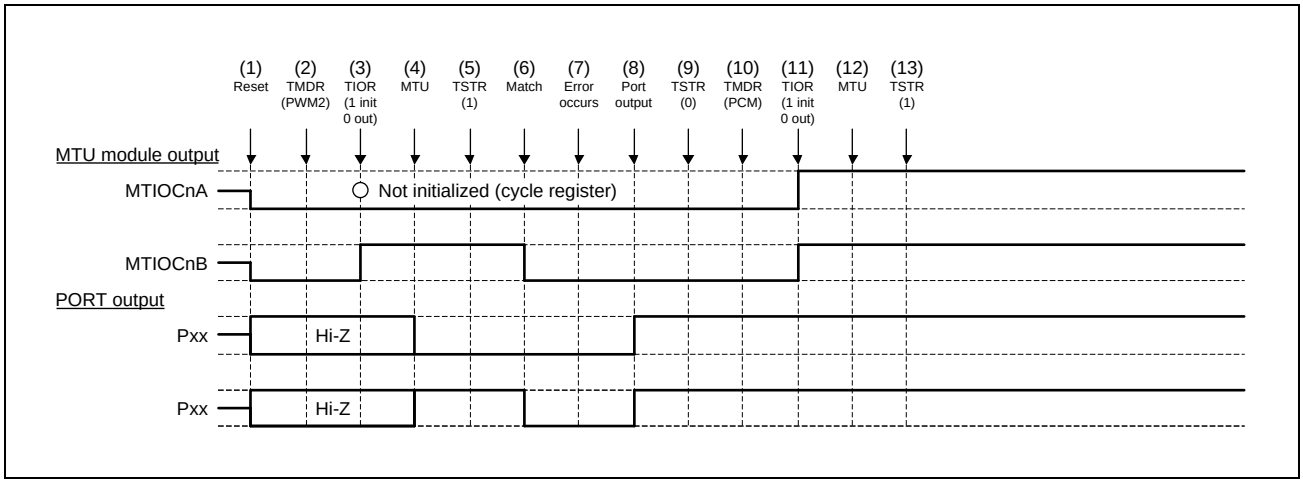

Figure 16.169 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

(1) to (9) are the same as in **Figure 16.166**.

(10) Set the phase counting mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (17) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

**Figure 16.170** shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

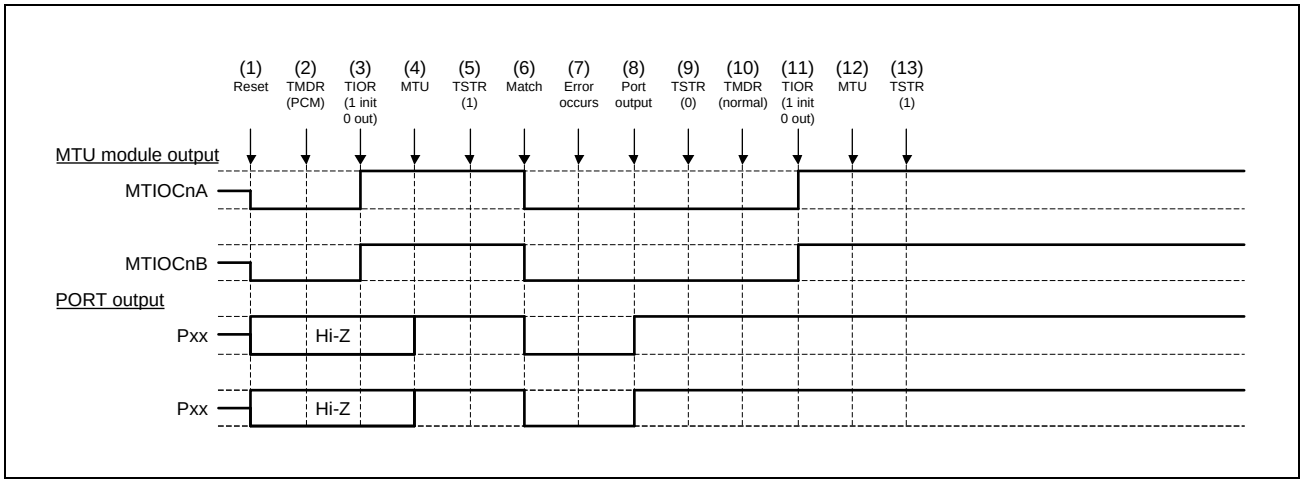

Figure 16.170 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set phase counting mode.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(4) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(5) Start count operation by setting TSTRA.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(9) Stop count operation by setting TSTRA.

(10) Set normal mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (18) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

**Figure 16.171** shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

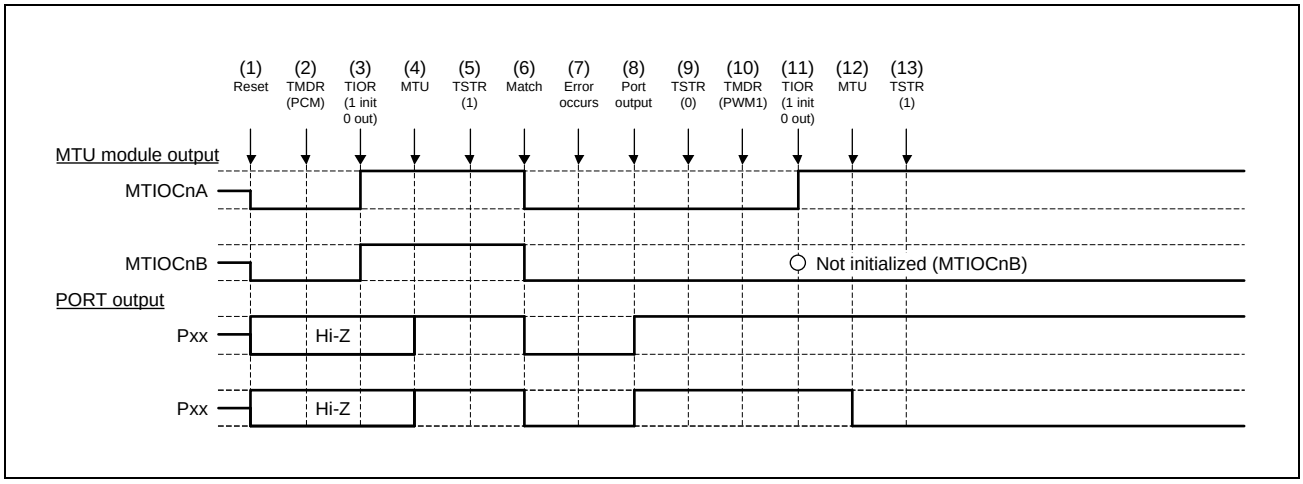

Figure 16.171 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

(1) to (9) are the same as in **Figure 16.170**.

(10) Set PWM mode 1.

(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (19) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

**Figure 16.172** shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

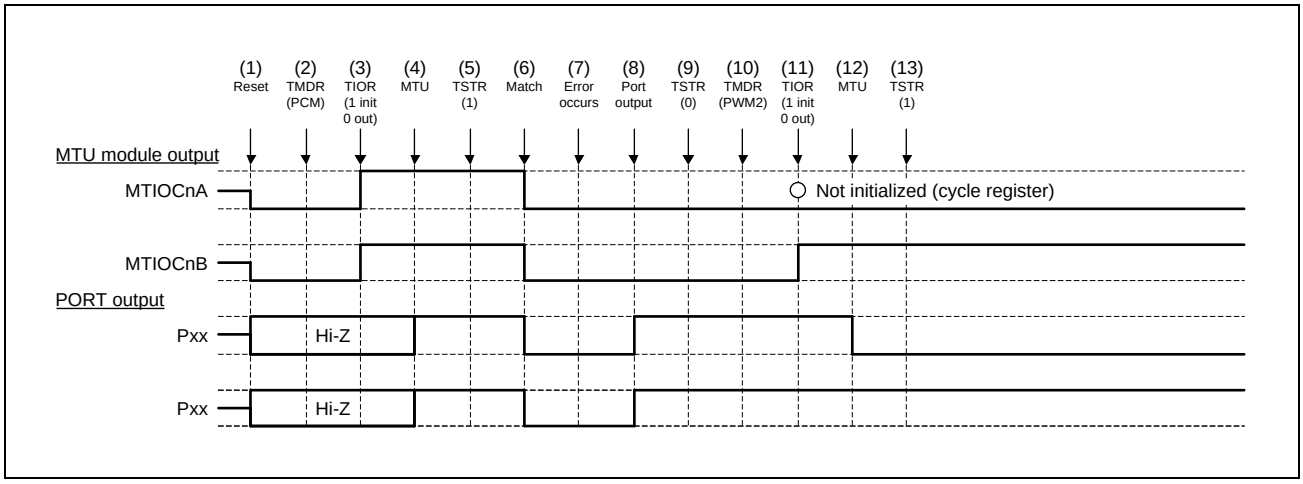

Figure 16.172 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

(1) to (9) are the same as in **Figure 16.170**.

(10) Set PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (20) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

**Figure 16.173** shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

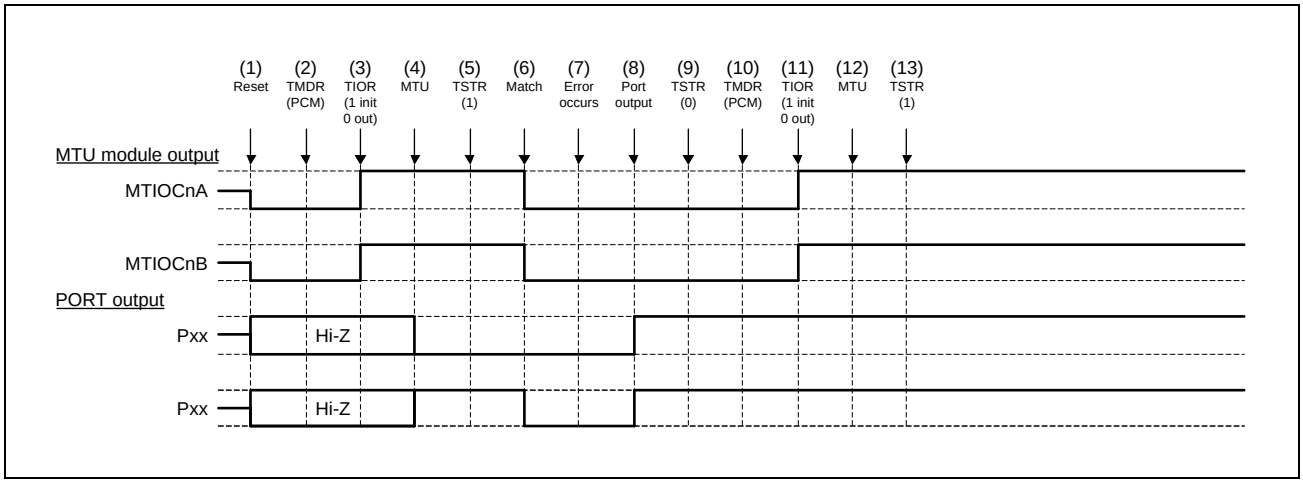

Figure 16.173 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

(1) to (9) are the same as in **Figure 16.170**.

(10) This step is not necessary when restarting in phase counting mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

### (21) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

**Figure 16.174** shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

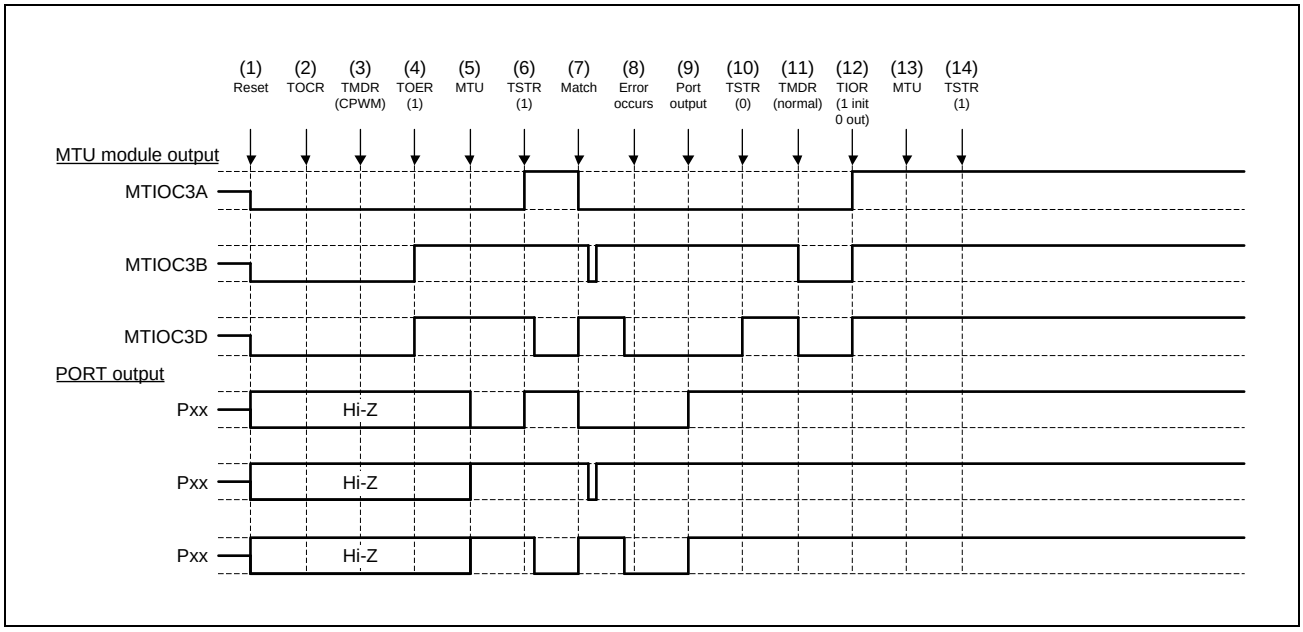

Figure 16.174 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU3 output goes low and the ports enter high-impedance state.

(2) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set complementary PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) The complementary PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial complementary PWM output value).

(11) Set normal mode (MTU output goes low).

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (22) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

**Figure 16.175** shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

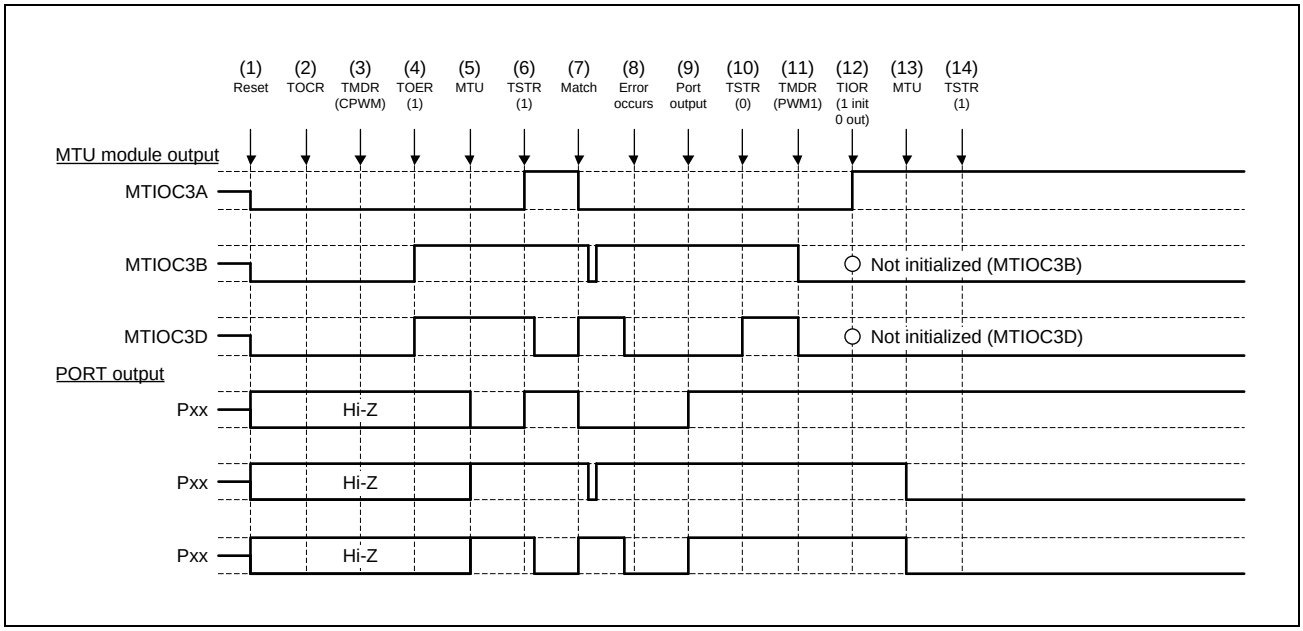

Figure 16.175 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.174**.

(11) Set PWM mode 1 (MTU output goes low).

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (23) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

**Figure 16.176** shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time of stopping the counter).

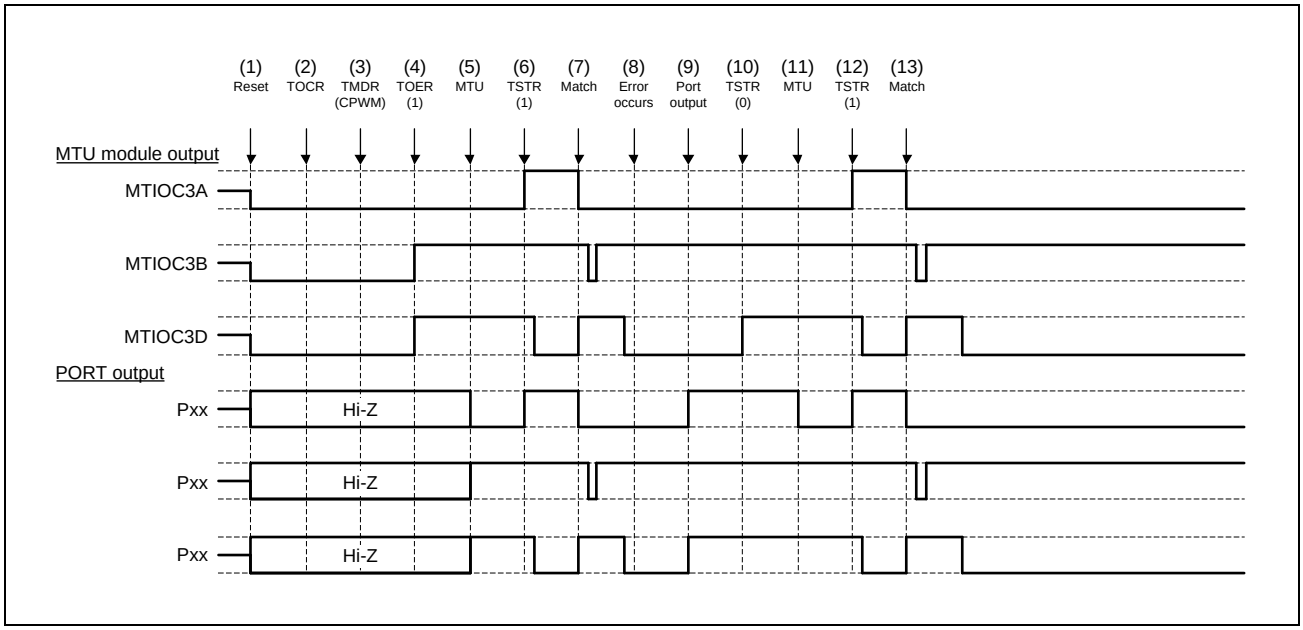

Figure 16.176 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (1)

(1) to (10) are the same as in **Figure 16.174**.

(11) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(12) Restart operation by setting TSTRA (TSTRB).

(13) The complementary PWM waveform is output on compare match occurrence.

### (24) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

**Figure 16.177** shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new cycle and duty ratio settings).

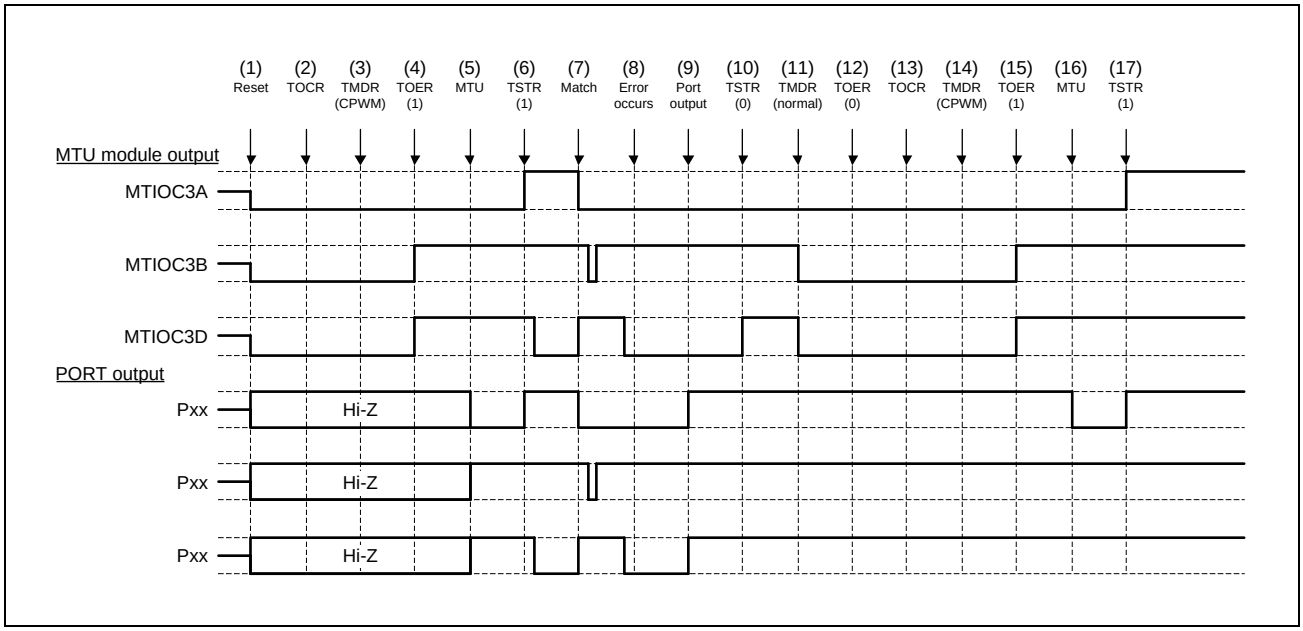

Figure 16.177 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (2)

(1) to (10) are the same as in **Figure 16.174**.

(11) Set normal mode and make new settings (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(13) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set complementary PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(16) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(17) Restart operation by setting TSTRA (TSTRB).

### (25) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

**Figure 16.178** shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset- synchronized PWM mode after re-setting.

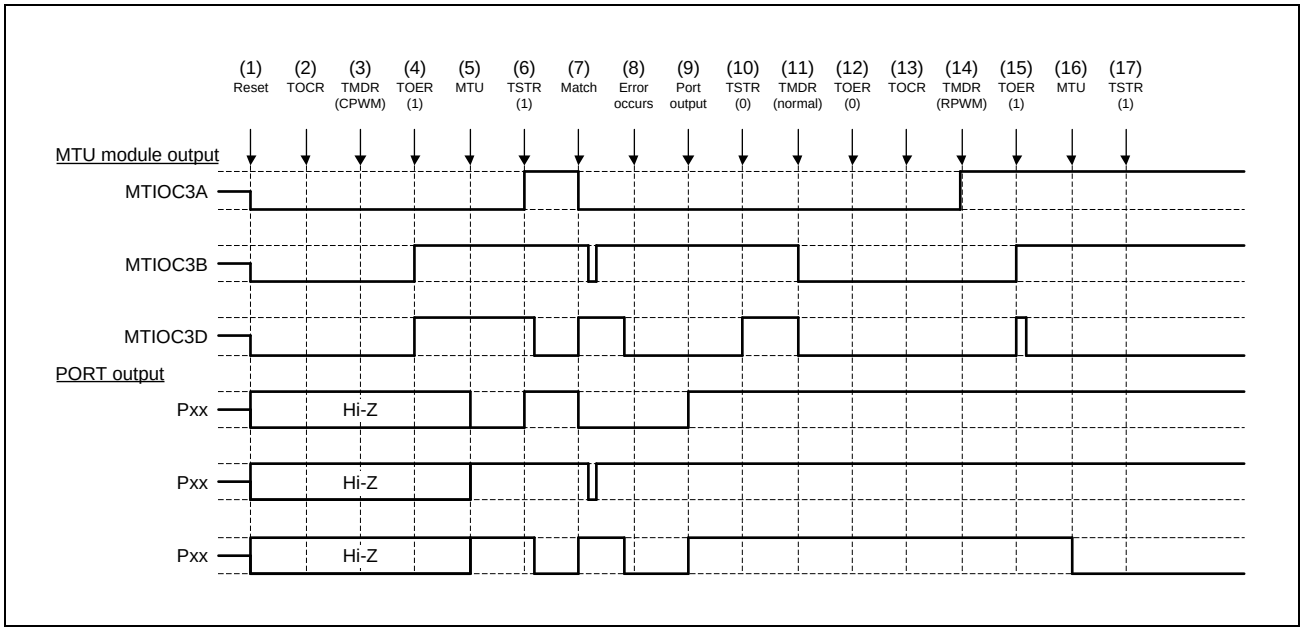

Figure 16.178 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in **Figure 16.174**.

(11) Set normal mode (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set reset-synchronized PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(16) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(17) Restart operation by setting TSTRA (TSTRB).

### (26) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

**Figure 16.179** shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

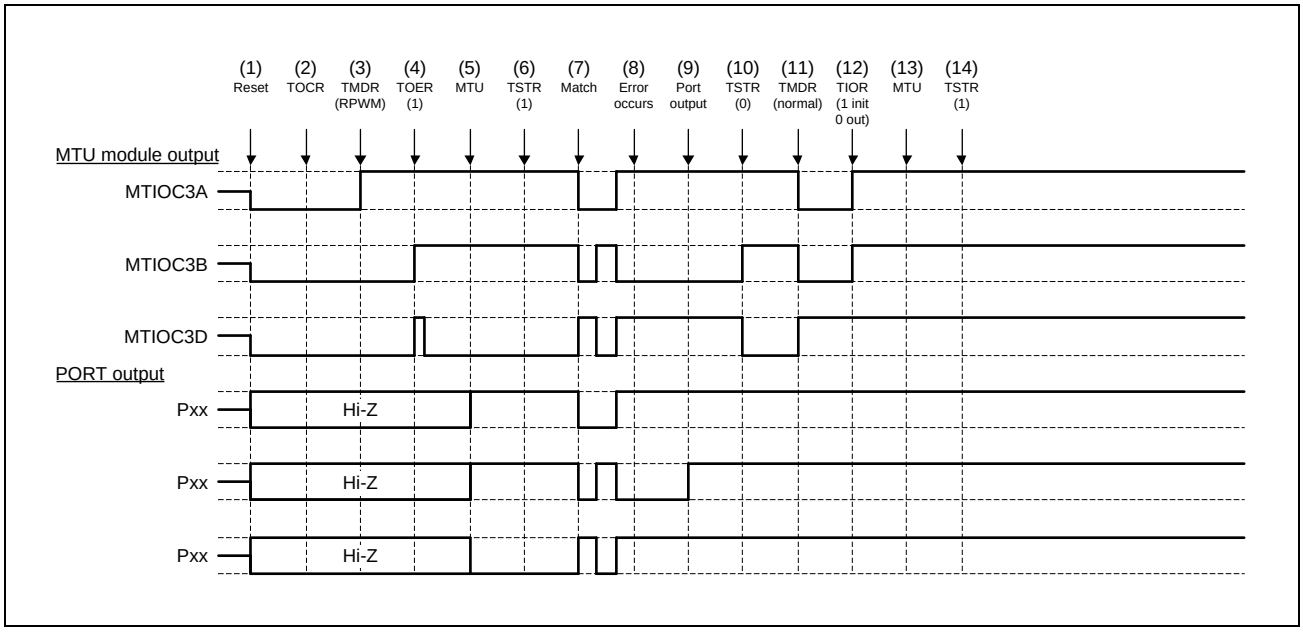

Figure 16.179 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set reset-synchronized PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) The reset-synchronized PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial reset-synchronized PWM output value.)

(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (27) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

**Figure 16.180** shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

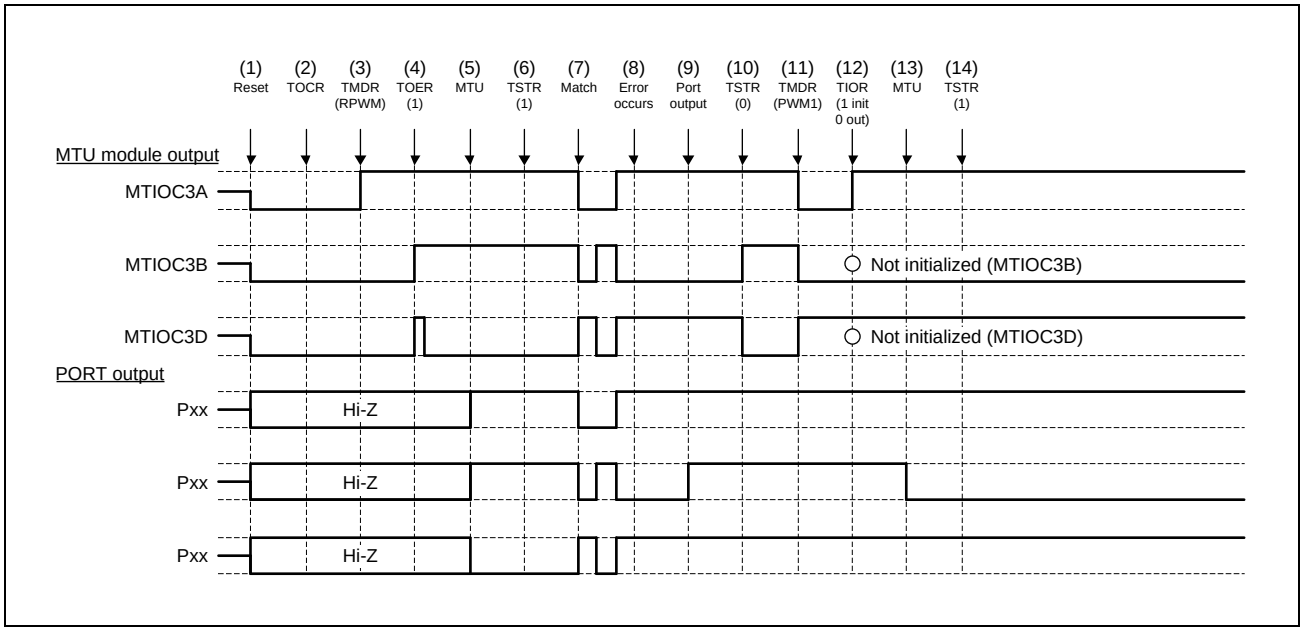

Figure 16.180 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.179**.

(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

### (28) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

**Figure 16.181** shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

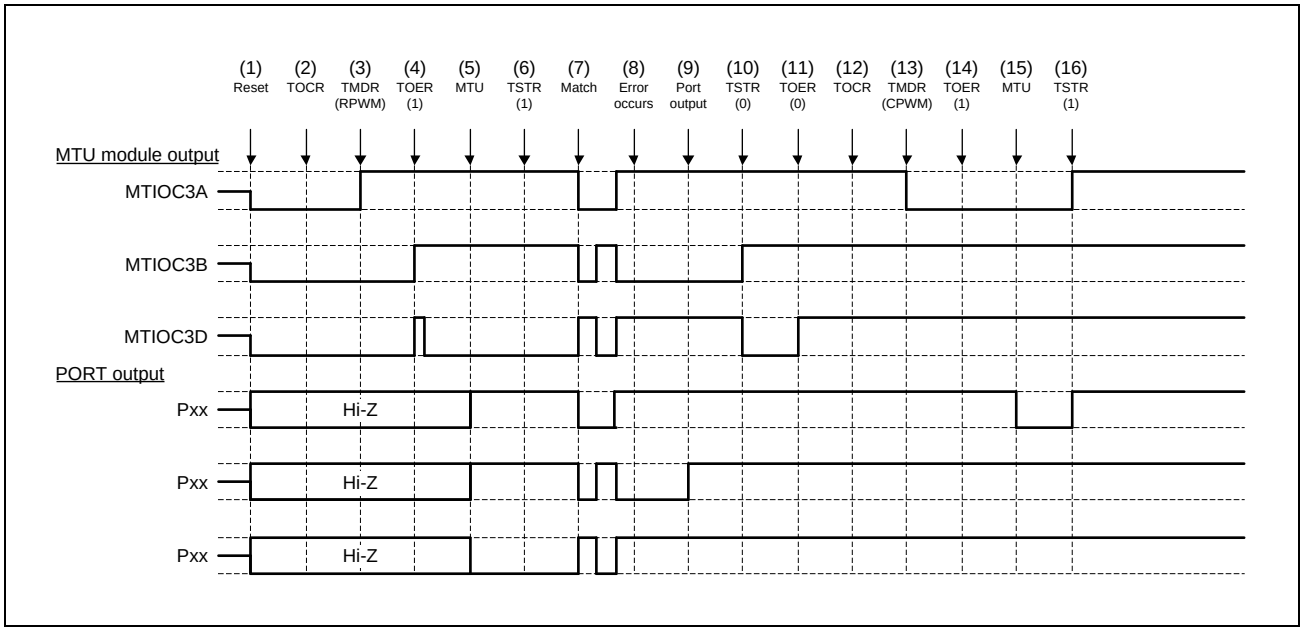

Figure 16.181 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 16.179**.

(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(12) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(13) Set complementary PWM mode (MTU cyclic output pin goes low).

(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(15) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(16) Restart operation by setting TSTRA (TSTRB).

### (29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

**Figure 16.182** shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

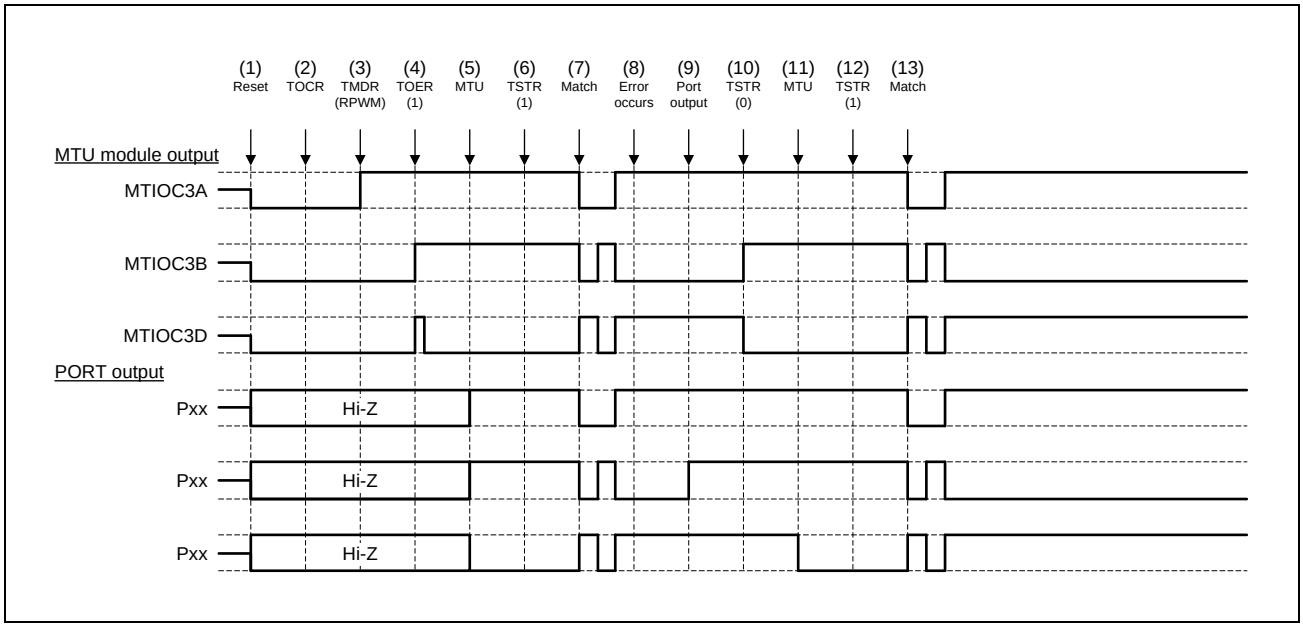

Figure 16.182 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in **Figure 16.179**.

(11) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(12) Restart operation by setting TSTRA (TSTRB).

(13) The reset-synchronized PWM waveform is output on compare match occurrence.

# 17. Port Output Enable 3 (POE3)

The port output enable 3 (POE3) can be used to place output pins for the MTU3a in the high-impedance state in response to various conditions.

## 17.1 Overview

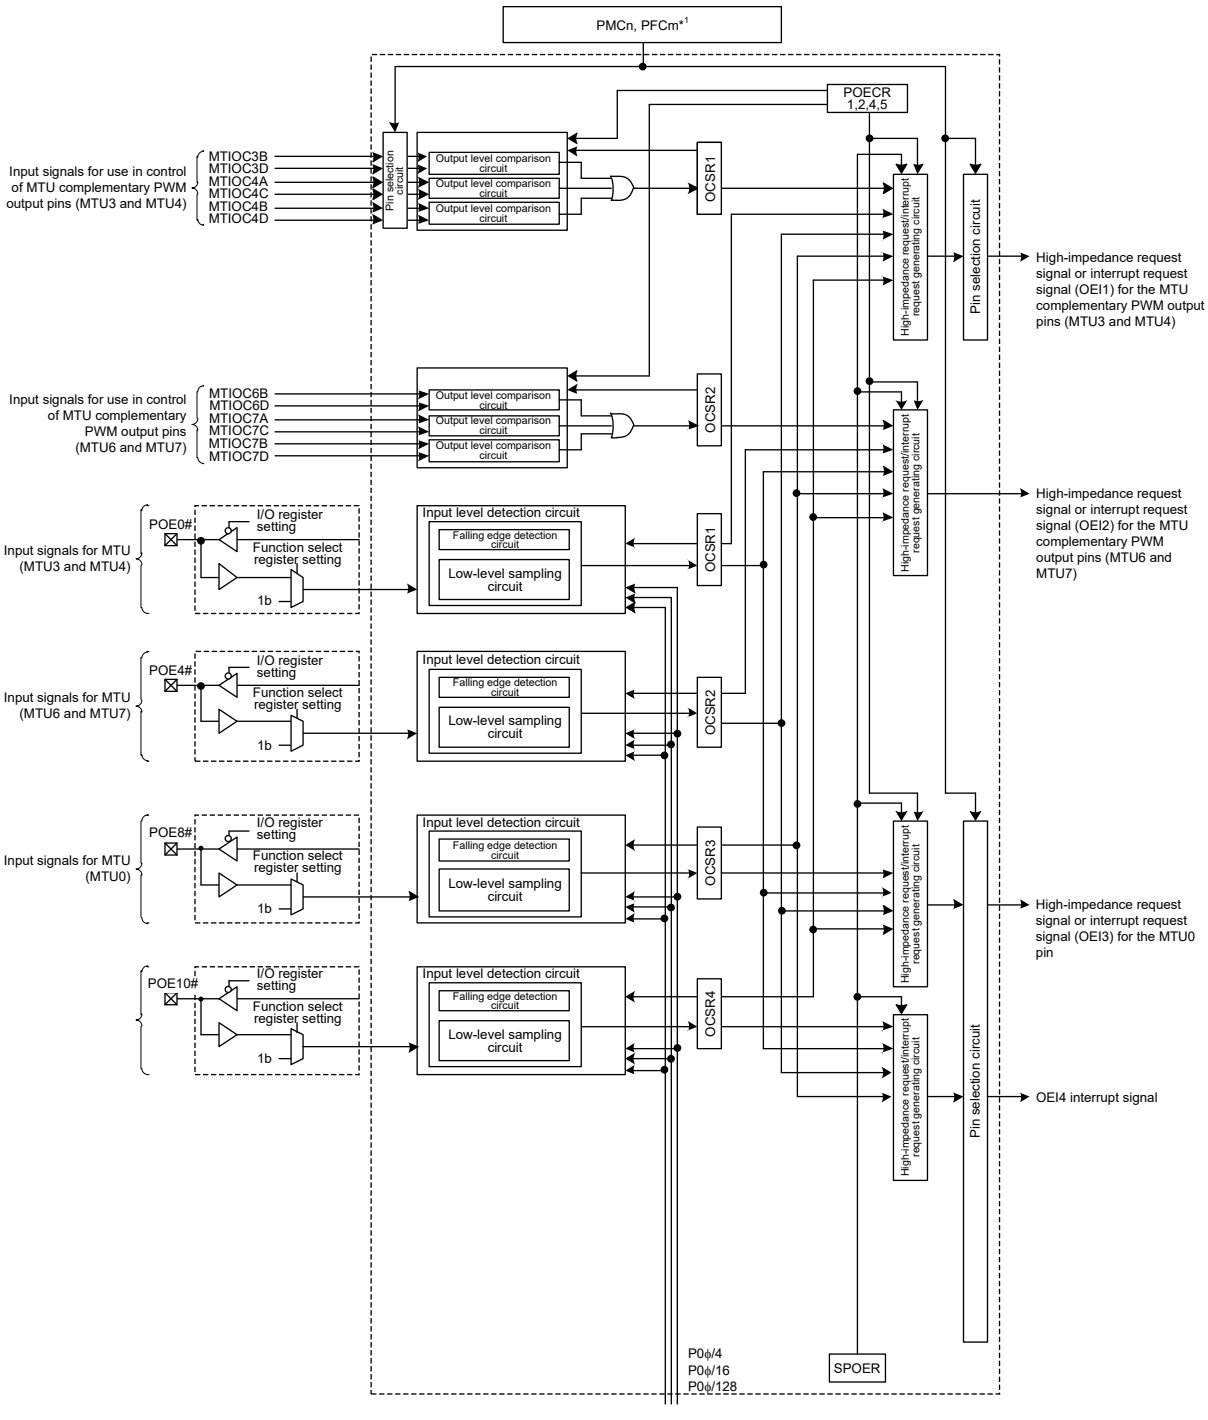
**Table 17.1** lists the specifications of the POE3, and **Figure 17.1** shows a block diagram of the POE3.

Table 17.1 POE3 Specifications

| Item | Description |
|---|---|
| Target pins to be placed in the high-impedance state | • MTU3a output pins<br>MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D)<br>MTU3 pin (MTIOC3B, MTIOC3D)<br>MTU4 pin (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D)<br>MTU6 pin (MTIOC6B, MTIOC6D)<br>MTU7 pin (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D) |
| Conditions for the high-impedance state | • Setting pins as inputs: setting the POE0#, POE4#, POE8#, or POE10# pins as inputs (falling edge or low- level sampling).<br>• Short-circuits between output pins: A match (short circuit) between the output signal levels at the active level over one or more cycle on (the following combination of pins)<br>• SPOER register setting being made |
| Function | • Each of the POE0#, POE4#, POE8#, and POE10# input pins can be set for falling edge, P0$\phi$/4 × 16, P0$\phi$/ 16 × 16, or P0$\phi$/128 × 16 low-level sampling.<br>• Pins for the MTU complementary PWM output, and MTU0 pin can be placed in high-impedance state by POE0#, POE4#, POE8#, and POE10# pin falling-edge or low-level sampling.<br>• Pins for the MTU complementary PWM output can be placed in high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more.<br>• Pins for the MTU complementary PWM output, and MTU0 can be placed in the high-impedance state by modifying the settings of the SPOER register of POE3.<br>• Interrupts can be generated by input-level sampling or output level comparison results. |

| | MTU complementary PWM output pins |
|---|---|
| 1 | MTIOC3B and MTIOC3D |
| 2 | MTIOC4A and MTIOC4C |
| 3 | MTIOC4B and MTIOC4D |
| 4 | MTIOC6B and MTIOC6D |
| 5 | MTIOC7A and MTIOC7C |
| 6 | MTIOC7B and MTIOC7D |

The POE3 has input level detection circuits, pin selection circuits, output level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in **Figure 17.1**.



Note 1. Refer to chapter of GPIO.

Figure 17.1 POE3 Block Diagram

**Table 17.2** shows input/output pins to be used by the POE3.

Table 17.2 POE3 Input/Output Pins

| Pin Name | I/O | Description |
|---|---|---|
| POE0# | Input | Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, and MTU7 pins in the high-impedance state. |
| POE4# | Input | Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, and MTU4 pins in the high-impedance state. |
| POE8# | Input | Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. |
| POE10# | Input | In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output, and MTU0 pins in high-impedance state. |

**Table 17.3** shows output level comparisons with pin combinations.

Table 17.3 Pin Combinations

| Pin Combination | I/O | Description |
|---|---|---|
| MTIOC3B and MTIOC3D | Output | The MTU3 and MTU4 pins for MTU complementary PWM output set in the M3SELR, M4SELR1, and M4SELR2 registers are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the POE3_CLKM_POE (P0ϕ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3.<br>*Note 1.* The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1. |
| MTIOC4A and MTIOC4C | Output | |
| MTIOC4B and MTIOC4D | Output | |
| MTIOC6B and MTIOC6D | Output | The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the POE3_CLKM_POE (P0ϕ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3.<br>*Note 1.* The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1. |
| MTIOC7A and MTIOC7C | Output | |
| MTIOC7B and MTIOC7D | Output | |

## 17.2 Register Descriptions

**Table 17.4** shows the register configuration. The POE3 registers are initialized by a reset.

Base Address: H'0_1004_9800 (Cortex-A55 Address Space)
Base Address: H'4004_9800 (Cortex-M33 Address Space Non-Secure)
Base Address: H'5004_9800 (Cortex-M33 Address Space Secure)

Table 17.4 Register configuration

| Register Name | Abbreviation | Offset Address | Access size |
|---|---|---|---|
| Input level control/status register 1 | ICSR1 | H'00 | 16 |
| Output level control/status register 1 | OCSR1 | H'02 | 16 |
| Input level control/status register 2 | ICSR2 | H'04 | 16 |
| Output level control/status register 2 | OCSR2 | H'06 | 16 |
| Input level control/status register 3 | ICSR3 | H'08 | 16 |
| Software port output enable register | SPOER | H'0A | 8 |
| Port output enable control register 1 | POECR1 | H'0B | 8 |
| Port output enable control register 2 | POECR2 | H'0C | 16 |
| Port output enable control register 4 | POECR4 | H'10 | 16 |
| Port output enable control register 5 | POECR5 | H'12 | 16 |
| Input level control/status register 4 | ICSR4 | H'16 | 16 |

### 17.2.1 Input Level Control/Status Register 1 (ICSR1)

ICSR1 selects the input modes for the POE0# pins, controls the enable/disable of interrupts, and indicates status.

**Address(es):** H'1004_9800

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | POE0F | — | — | — | PIE1 | — | — | — | — | — | — | POE0M[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/(W)*2 | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | POE0M[1:0] | All 0 | R/W*1 | POE0 Mode Select<br>b1 b0<br>0 0: Accepts a request on the falling edge of POE0# input.<br>0 1: Accepts a request when POE0# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level.<br>1 0: Accepts a request when POE0# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level.<br>1 1: Accepts a request when POE0# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level. |
| b7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b8 | PIE1 | 0 | R/W | Port Interrupt Enable 1<br>0: Interrupt requests disabled<br>1: Interrupt requests enabled |
| b11 to b9 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b12 | POE0F | 0 | R/(W)*2 | POE0 Flag<br>0: Indicates that a high-impedance request has not been input to the POE0# pin.<br>1: Indicates that a high-impedance request has been input to the POE0# pin. |
| b15 to b13 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

#### POE0M[1:0] Bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

#### PIE1 Bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when any one of the POE0F bit of the ICSR1 is set to 1.

#### POE0F Flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.

[Setting condition]

- When the input set by POE0M[1:0] occurs at the POE0# pin

[Clearing condition]

- By writing 0 to POE0F after reading POE0F = 1

## 17.2.2 Input Level Control/Status Register 2 (ICSR2)

ICSR2 selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

**Address(es):** H'1004_9804

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | POE4F | — | — | — | PIE2 | — | — | — | — | — | — | POE4M[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/(W)*2 | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | POE4M[1:0] | All 0 | R/W*1 | POE4 Mode Select<br>b1 b0<br>0 0: Accepts a request on the falling edge of POE4# input<br>0 1: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level.<br>1 0: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level.<br>1 1: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level. |
| b7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b8 | PIE2 | 0 | R/W | Port Interrupt Enable 2<br>0: Interrupt requests disabled<br>1: Interrupt requests enabled |
| b11 to b9 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b12 | POE4F | 0 | R/(W)*2 | POE4 Flag<br>0: Indicates that a high-impedance request has not been input to the POE4# pin.<br>1: Indicates that a high-impedance request has been input to the POE4# pin. |
| b15 to b13 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

### POE4M[1:0] Bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

### PIE2 Bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

### POE4F Flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.

[Setting condition]

- When the input set by POE4M[1:0] occurs at the POE4# pin

[Clearing condition]

- By writing 0 to POE4F after reading POE4F = 1

### 17.2.3 Input Level Control/Status Register 3 (ICSR3)

ICSR3 selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

**Address(es):** H'1004_9808

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | POE8F | — | — | POE8E | PIE3 | — | — | — | — | — | — | POE8M[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/(W)*2 | R/W | R/W | R/W*1 | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | POE8M[1:0] | All 0 | R/W*1 | POE8 Mode Select<br>b1 b0<br>0 0: Accepts a request on the falling edge of POE8# input<br>0 1: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level.<br>1 0: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level.<br>1 1: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level. |
| b7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b8 | PIE3 | 0 | R/W | Port Interrupt Enable 3<br>0: Interrupt requests disabled<br>1: Interrupt requests enabled |
| b9 | POE8E | 0 | R/W*1 | POE8 High- Impedance Enable<br>0: Does not place the pin in high-impedance state.<br>1: Places the pin in high-impedance state. |
| b11, b10 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b12 | POE8F | 0 | R/(W)*2 | POE8 Flag<br>0: Indicates that a high-impedance request has not been input to the POE8# pin.<br>1: Indicates that a high-impedance request has been input to the POE8# pin. |
| b15 to b13 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

#### POE8M[1:0] Bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

#### PIE3 Bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F bit in ICSR3 is set to 1.

#### POE8E Bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE8F bit is set to 1.

**POE8F Flag (POE8 Flag)**

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by POE8M[1:0] occurs at the POE8# pin

[Clearing condition]

- By writing 0 to POE8F after reading POE8F = 1

## 17.2.4 Input Level Control/Status Register 4 (ICSR4)

ICSR4 selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

**Address(es):** H'1004_9816

| b15 to b13 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

### POE10M[1:0] Bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

### PIE4 Bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F bit is set to 1.

### POE10E Bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE10F bit is set to 1.

**POE10F Bit (POE10 Flag)**

This flag indicates that a request for the high-impedance state has been input to the POE10# pin.

[Setting condition]

- When the input set by POE10M[1:0] occurs at the POE10# pin

[Clearing condition]

- By writing 0 to POE10F after reading POE10F = 1

## 17.2.5 Output Level Control/Status Register 1 (OCSR1)

OCSR1 controls the enable/disable of output level comparison and interrupts, and indicates status.

**Address(es):** H'1004_9802

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSF1 | — | — | — | — | — | OCE1 | OIE1 | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/(W)*2 | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|
| b7 to b0 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b8 | OIE1 | 0 | R/W | Output Short Interrupt Enable 1<br>0: Interrupt requests disabled<br>1: Interrupt requests enabled |
| b9 | OCE1 | 0 | R/W*1 | Output Short High-Impedance Enable 1<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b14 to b10 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b15 | OSF1 | 0 | R/(W)*2 | Output Short Flag 1<br>0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level. |

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

### OIE1 Bit (Output Short Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 bit in OCSR1 is set to 1.

### OCE1 Bit (Output Short High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

### OSF1 Flag (Output Short Flag 1)

This flag indicates that any one of the three pairs of two-phase MTU3 and MTU4 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF1 after reading OSF1 = 1

## 17.2.6 Output Level Control/Status Register 2 (OCSR2)

OCSR2 controls the enable/disable of output level comparison and interrupts, and indicates status.

**Address(es):** H'1004_9806

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSF2 | — | — | — | — | — | OCE2 | OIE2 | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/(W)*2 | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b7 to b0 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b8 | OIE2 | 0 | R/W | Output Short Interrupt Enable 2<br>0: Interrupt requests disabled<br>1: Interrupt requests enabled |
| b9 | OCE2 | 0 | R/W*1 | Output Short High-Impedance Enable 2<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b14 to b10 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b15 | OSF2 | 0 | R/(W)*2 | Output Short Flag 2<br>0: Indicates that outputs have not simultaneously become an active level.<br>1: Indicates that outputs have simultaneously become an active level. |

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

### OIE2 Bit (Output Short Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 bit in OCSR2 is set to 1.

### OCE2 Bit (Output Short High-Impedance Enable 2)

This bit specifies whether to place the pins in high-impedance state when the OSF2 bit in OCSR2 is set to 1.

### OSF2 Flag (Output Short Flag 2)

This flag indicates that any one of the three pairs of two-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF2 after reading OSF2 = 1

### 17.2.7 Software Port Output Enable Register (SPOER)

SPOER controls high-impedance state of the pins.

**Address(es):** H'1004_980A

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | MTUCH0HIZ | MTUCH67HIZ | MTUCH34HIZ |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | MTUCH34HIZ | 0 | R/W | MTU3 or MTU4 Output High-Impedance Enable<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b1 | MTUCH67HIZ | 0 | R/W | MTU6 and MTU7 Output High- Impedance Enable<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b2 | MTUCH0HIZ | 0 | R/W | MTU0 Output High-Impedance Enable<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

#### MTUCH34HIZ Bit (MTU3 or MTU4 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH34HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH34HIZ after reading MTUCH34HIZ = 1*1

**Note 1.** To write 0 to this bit, be sure to read 1 and then write 0.

#### MTUCH67HIZ Bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH67HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH67HIZ after reading MTUCH67HIZ = 1*1

**Note 1.** To write 0 to this bit, be sure to read 1 and then write 0.

**MTUCH0HIZ Bit (MTU0 Output High-Impedance Enable)**

This bit specifies whether to place the MTU0 pins in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH0HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH0HIZ after reading MTUCH0HIZ = 1*1

**Note 1.** To write 0 to this bit, be sure to read 1 and then write 0.

## 17.2.8 Port Output Enable Control Register 1 (POECR1)

POECR1 controls high-impedance state of the MTU0 pins.

**Address(es):** H'1004_980B

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MTU0DZE | MTU0CZE | MTU0BZE | MTU0AZE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | MTU0AZE | 0 | R/W*1 | MTIOC0A High-Impedance Enable<br>0: Does not place the pin in high-impedance state.<br>1: Places the pin in high-impedance state. |
| b1 | MTU0BZE | 0 | R/W*1 | MTIOC0B High-Impedance Enable<br>0: Does not place the pin in high-impedance state.<br>1: Places the pin in high-impedance state. |
| b2 | MTU0CZE | 0 | R/W*1 | MTIOC0C High-Impedance Enable<br>0: Does not place the pin in high-impedance state.<br>1: Places the pin in high-impedance state. |
| b3 | MTU0DZE | 0 | R/W*1 | MTIOC0D High-Impedance Enable<br>0: Does not place the pin in high-impedance state.<br>1: Places the pin in high-impedance state. |
| b7 to b4 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

### MTU0AZE Bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

### MTU0BZE Bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

### MTU0CZE Bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

### MTU0DZE Bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

### 17.2.9 Port Output Enable Control Register 2 (POECR2)

POECR2 controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins).

**Address(es):** H'1004_980C

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | MTU3BDZE | MTU4ACZE | MTU4BDZE | — | — | — | — | — | MTU6BDZE | MTU7ACZE | MTU7BDZE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 | R/W*1 | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | MTU7BDZE | 1 | R/W*1 | MTIOC7B/7D High-Impedance Enable*2<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b1 | MTU7ACZE | 1 | R/W*1 | MTIOC7A/7C High-Impedance Enable*2<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b2 | MTU6BDZE | 1 | R/W*1 | MTIOC6B/6D High-Impedance Enable*2<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b8 | MTU4BDZE | 1 | R/W*1 | MTIOC4B/4D High-Impedance Enable<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b9 | MTU4ACZE | 1 | R/W*1 | MTIOC4A/4C High-Impedance Enable<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b10 | MTU3BDZE | 1 | R/W*1 | MTIOC3B/3D High-Impedance Enable<br>0: Does not place the pins in high-impedance state.<br>1: Places the pins in high-impedance state. |
| b15 to b11 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Set this bit to 0 when MTU6 or MTU7 is not used.

#### MTU7BDZE Bit (MTIOC7B/7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

#### MTU7ACZE Bit (MTIOC7A/7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

#### MTU6BDZE Bit (MTIOC6B/6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

#### MTU4BDZE Bit (MTIOC4B/4D High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

#### MTU4ACZE Bit (MTIOC4A/4C High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

#### MTU3BDZE Bit (MTIOC3B/3D High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

## 17.2.10 Port Output Enable Control Register 4 (POECR4)

The POECR4 is used to extend the control conditions of the high-impedance state for the MTU3, MTU4, MTU6, and MTU7 pins for the MTU complementary PWM output.

For details about the targets and conditions of high-impedance control, see **Figure 17.2**.

**Address(es):** H'1004_9810

| b15 to b13 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

#### IC2ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

#### IC3ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

#### IC4ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

#### IC1ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

#### IC3ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

#### IC4ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

## 17.2.11 Port Output Enable Control Register 5 (POECR5)

The POECR5 is used to extend the control conditions of the high-impedance for the MTU0 pin.

For details about the targets and conditions of high-impedance control, see **Figure 17.2**.

**Address(es):** H'1004_9812

| b15 to b5 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

### IC1ADDMT0ZE Bit (MTU0 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

### IC2ADDMT0ZE Bit (MTU0 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

### IC4ADDMT0ZE Bit (MTU0 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

## 17.3 Operation

**Table 17.5** shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

Table 17.5 Target Pins and Conditions for High-Impedance Control (1/2)

| Pins | Conditions | Detailed Conditions |

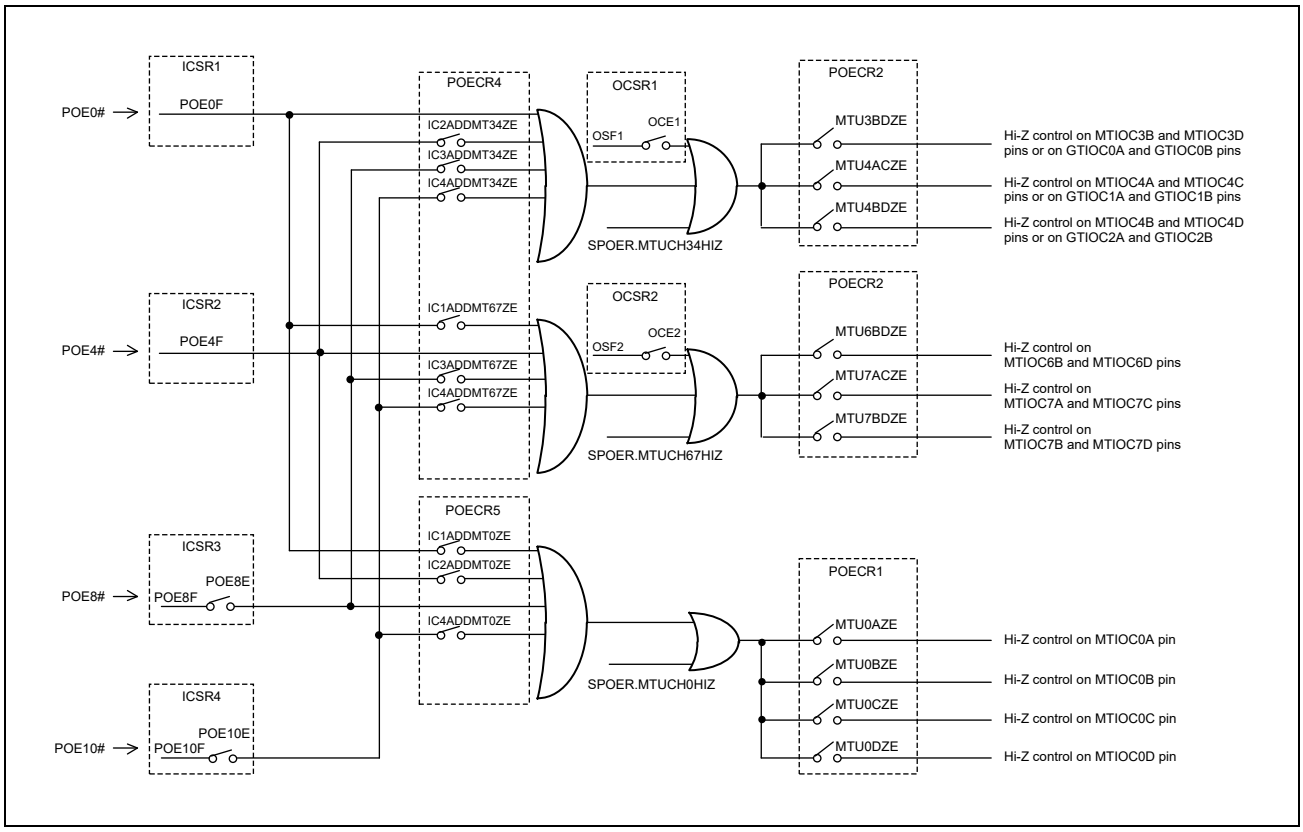

Figure 17.2 Target Pins and Conditions for High-Impedance Control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR2 registers.

The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR5 registers: input pins other than the POE0# pin for the MTU3 and MTU4 pins; input pins other than the POE4# pin for the MTU6 and MTU7 pins; input pins other than the POE8# pin for the MTU0 pins.

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3 and MTU4 pins even when the POE4# input is detected.

High-impedance requests due to the detection of POE8# input or POE10# input can be controlled by the settings in the ICSR3 to ICSR4 registers. (The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.)

High-impedance requests to the MTU3, MTU4, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

### 17.3.1 MTU Pin Selection

In this LSI, each terminal function for MTU is assigned to multiple ports. **Table 17.6** shows the correspondence table of MTU terminal functions and compatible ports. The pin used as the MTU must be set separately in the general-purpose I / O port register. (Set by PMCn and PFCm registers of IO_TOP)

Table 17.6 Correspondence between MTU Pins (1/2)

| MTU Pin Functions | Corresponding Ports |

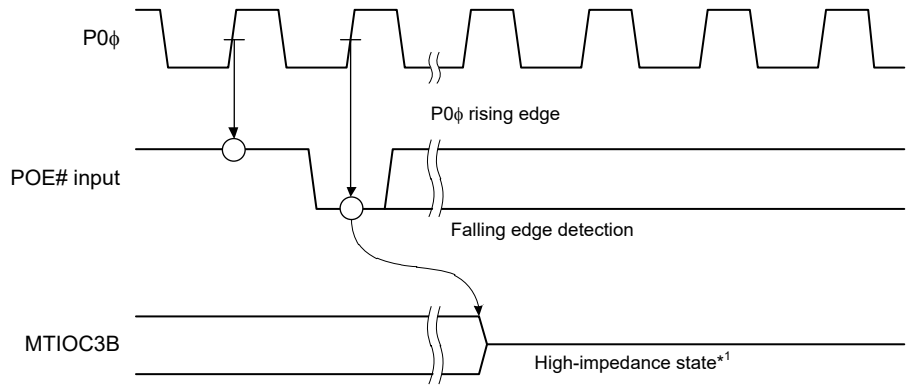
## 17.3.2 Input Level Detection Operation

If the input conditions set by ICSR1 to ICSR4 occur on the POE0#, POE4#, POE8#, and POE10# pins, the MTU3 and MTU4 or MTU6 and MTU7 pins for the MTU complementary PWM output, and MTU0 pin are placed in high-impedance state. Note however, that these pins are still placed in the high-impedance state even when the MTU functions are not selected for the pins.

### (1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, and POE10# pins, the pins for the MTU complementary PWM output, and pin functions multiplexed with the MTU0 pins are placed in high-impedance state.

**Figure 17.3** shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, and POE10# pins until the respective pins enter high-impedance state.

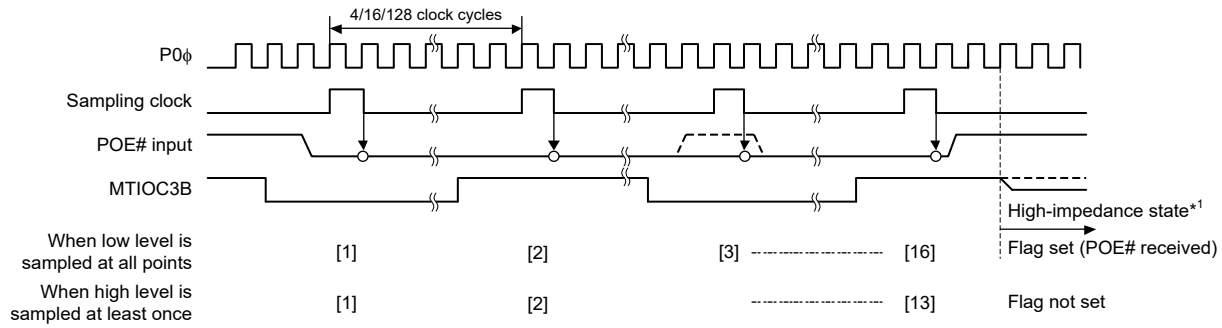


Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 17.3 Falling Edge Detection

### (2) Low-Level Detection

**Figure 17.4** shows the low-level detection operation. Sixteen continuous low levels are sampled with the sampling clock selected by ICSR1 to ICSR4. If even one high level is detected during this interval, the low level is not accepted. The timing when pins for the MTU complementary PWM output, and MTU0 pins enter the high-impedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 17.4 Low-Level Detection Operation

### 17.3.3 Output Level Compare Operation

**Figure 17.5** shows an example of the output level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

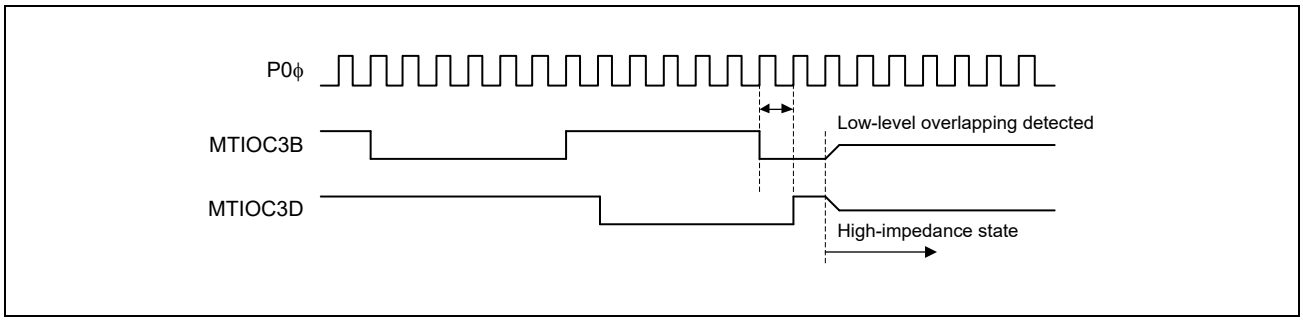


Figure 17.5 Output Level Compare Operation

### 17.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) can be directly controlled by using the software port output enable register (SPOER).

For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the port output enable control register 2 (POECR2) in the high-impedance state.

The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

### 17.3.5 Additional Functions for Controlling High-Impedance States

Settings in port enable registers 4 to 5 (POECR4 and POECR5) can add further high-impedance control conditions for the MTU complementary PWM output and MTU0 pins.

For instance, the settings listed below can be added as high-impedance control conditions for the MTU3 and MTU4 pins.

- Setting the IC2ADDMT34ZE bit in POECR4 to 1 adds the input level detection by the POE4#
- Setting the IC3ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE8#
- Setting the IC4ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE10# (ICSR4.POE10F)

The high-impedance state of other pins can also be controlled by setting the appropriate bits in the POECR4 and POECR5.

### 17.3.6 Release from High-Impedance State

MTU pins which have entered high-impedance state due to input-level detection can be released from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, and ICSR4.POE10F flags. However, note that when low-level sampling is selected with the ICSR1.POE0M[1:0], ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE10M[1:0] bits, just writing 0 to a flag is ignored (the flag is not cleared); flags can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, and POE10# pins and is sampled.

MTU pins which have entered high-impedance state due to output level detection can be released from the state either by returning them to their initial state with a reset, or by clearing the OCSR1.OSF1 flag or the OCSR2.OSF2 flag.

## 17.4 POE3 Setting Procedure

**Figure 17.6** shows the POE3 configuration procedure. As an example, high impedance control by comparing the output levels of the MTU 3 terminals (MTIOC3B / MTIOC3D) is shown. In **Figure 17.6**, select P32_1 for the MTIOC3B terminal and P36_1 for the MTIOC3D terminal.

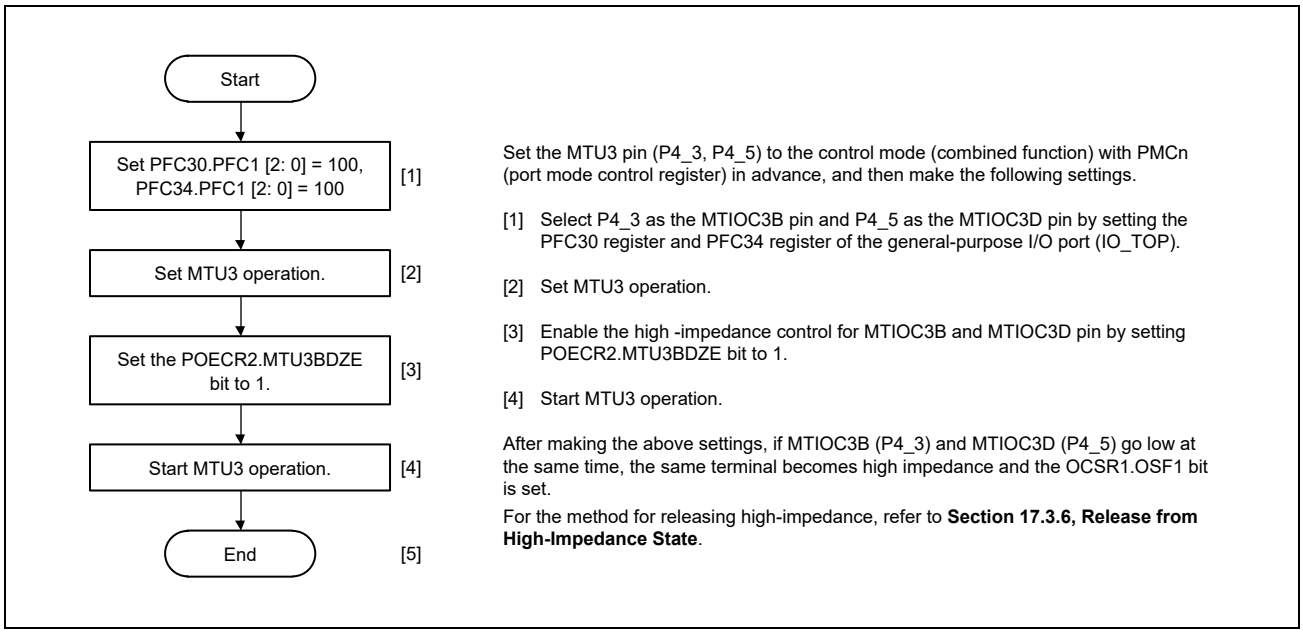

Figure 17.6 Procedure for Setting POE3

## 17.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input level detection or output level comparison. **Table 17.7** shows the interrupt sources and their conditions.

Table 17.7 Interrupt Sources and Conditions

| Name | Interrupt Source | Interrupt Flag | Condition |
|---|---|---|---|
| OEI1 | Output enable interrupt 1 | POE0F and OSF1 | PIE1•POE0F+OIE1•OSF1 |
| OEI2 | Output enable interrupt 2 | POE4F and OSF2 | PIE2•POE4F+OIE2•OSF2 |
| OEI3 | Output enable interrupt 3 | POE8F | PIE3•POE8F |
| OEI4 | Output enable interrupt 4 | ICSR4.POE10F | PIE4•ICSR4.POE10F |

## 17.6 Usage Notes

### 17.6.1 High-Impedance Control when MTU6 and MTU7 are not Used

When MTU6 and MTU7 are not to be used, set the POECR2.MTU6BDZE, MTU7ACZE, and MTU7BDZE bits to 0 to disable high-impedance control.

# 20. General Timer (GTM)

## 20.1 Functional Overview

The General timer has the following features.

- Two operating modes
  - Interval timer mode
  - Free-running comparison mode
- Choice between startup of DMA by compare match and generation of interrupt

### 20.1.1 Features of GTM

#### Channels

This product has the following number of channels of the General timer.

Table 20.1 Channels of General Timer

| General Timer | |
|---|---|
| Number of Channels | 3 |
| Name | OSTMn |

**Note:** n = 0, 1, 2

#### Meaning of n

Throughout this section, the individual channels of the General timer are identified by the index “n” (n = 0, 1, 2), for example OSTMnTO for the General timer n output register.

#### Register address

The register addresses of the General timer are given as offsets from the individual base addresses <OSTMn_base>. The register base addresses of each OSTMn are listed in the following table.

Table 20.2 Register Base Addresses

| Base Address Name | Base Address |
|---|---|
| <OSTM0_base> | H’0_1280_1000 (H’4280_1000*1, H’5280_1000*2) |
| <OSTM1_base> | H’0_1280_1400 (H’4280_1400*1, H’5280_1400*2) |
| <OSTM2_base> | H’0_1280_1800 (H’4280_1800*1, H’5280_1800*2) |

Note 1. Cortex-M33 Address Space Non-Secure

Note 2. Cortex-M33 Address Space Secure

### Interrupts

The General timers can generate the following interrupt requests.

Table 20.3 OSTMn Interrupt Requests

| OSTMn Signal | Function | Startup of Direct Memory Access Controller |
|---|---|---|
| OSTM0TINT | OSTM0 interrupt | ✓ |
| OSTM1TINT | OSTM1 interrupt | ✓ |
| OSTM2TINT | OSTM2 interrupt | ✓ |

## 20.2 Registers

The General timer is controlled by the following registers.

### 20.2.1 Registers Overview

The list of OSTMn (n = 0, 1, 2) registers and the memory addresses are as follows.

For the base addresses, see **Table 20.2**.

For the actual addresses, the offset values indicated in the following table are added to the base addresses.

| Register Name | Function | R/W | Reset Value | Access Unit (bit) | | | Address |
|---|---|---|---|---|---|---|---|
| | | | | 8 | 16 | 32 | |
| OSTMnCMP | OSTM compare register | R/W | H'0000 0000 | — | — | ✓ | <OSTMn_base> + H'00 |
| OSTMnCNT | OSTM counter register | R | H'FFFF FFFF | — | — | ✓ | <OSTMn_base> + H'04 |
| OSTMnTE | OSTM count enable status register | R | H'00 | ✓ | — | — | <OSTMn_base> + H'10 |
| OSTMnTS | OSTM count start trigger register | W | H'00 | ✓ | — | — | <OSTMn_base> + H'14 |
| OSTMnTT | OSTM count stop trigger register | W | H'00 | ✓ | — | — | <OSTMn_base> + H'18 |
| OSTMnCTL | OSTM control register | R/W | H'00 | ✓ | — | — | <OSTMn_base> + H'20 |

## 20.2.2 Details of OSTM Registers

### 20.2.2.1 OSTMnCMP — OSTM Compare Register

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

**Access Size:** This register is readable/writable in 32-bit units.

**Address(es):** <OSTMn_base>

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCMP[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OSTMnCMP[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | OSTMnCMP[31:0] | All 0 | R/W | • In interval timer mode: start value of the down-counter<br>• In free-running comparison mode: value for comparison |

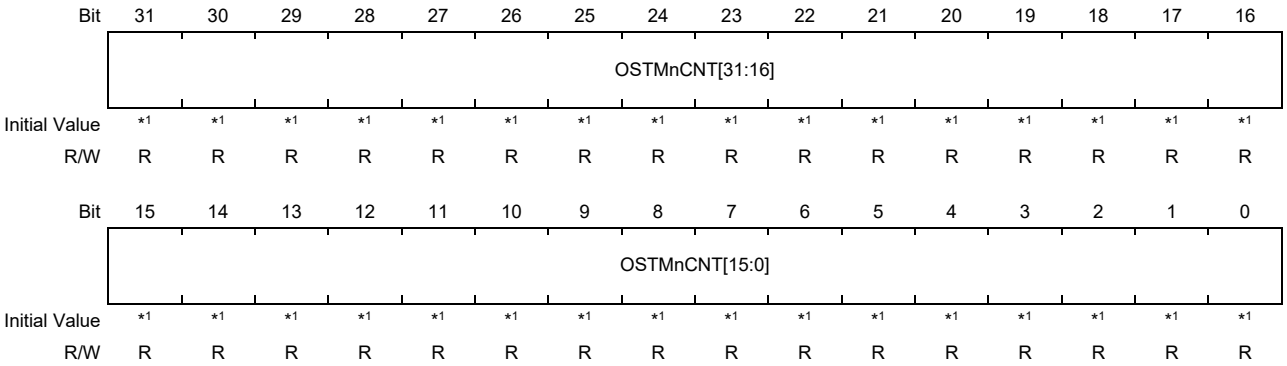
### 20.2.2.2 OSTMnCNT — OSTM Counter Register

This register indicates the counter value of the timer.

**Access Size:** This register is readable in 32-bit units.

**Address(es):** <OSTMn_base> + H'4

**Initial Value:** The initial value depends on the operating mode of the General timer. Refer to **Table 20.4**



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | OSTMnCNT [31:0] | *1 | R | 32-bit counter value |

Note 1. The initial value depends on the operating mode of the General timer. Refer to **Table 20.4**

The following table shows the correspondence between operating mode, counting direction and initial value. The initial value is the value read from the counter after a change to the operating mode.

Table 20.4 Correspondence between Operating Mode, Counting Direction and Initial Value

| Timer Operating Mode | OSTMnCTL.OSTMnMD1 | Counting Direction | Initial value |
|---|---|---|---|
| Interval timer mode | 0*1 | Down | H'FFFF FFFF |
| Free-running comparison mode | 1 | Up | H'0000 0000 |

Note 1. Value after reset

### 20.2.2.3 OSTMnTE — OSTM Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

**Access Size:** This register is readable in 8-bit units.

**Address(es):** <OSTMn_base>+ H'10

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | OSTMnTE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | OSTMnTE | 0 | R | This bit indicates whether the counter is enabled or disabled.<br>0: Counter disabled<br>1: Counter enabled<br>This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1.<br>This bit is reset to 0 in response to OSTMnTT.OSTMnTT being set to 1. |

Note 1. When OSTMnTE = 0, the counter retains its value.
If the counter is restarted, it
• restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
• restarts counting up from the counter value H'0000 0000 if it is in free running comparison mode.

Note 2. For debugging, the GTM counter can be paused by the counter stop request.

### 20.2.2.4 OSTMnTS — OSTM Count Start Trigger Register

This register starts the counter.

**Access Size:** This register is writable in 8-bit units. It is always read as H'00.

**Address(es):** <OSTMn_base>+ H'14

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

### 20.2.2.5 OSTMnTT — OSTM Count Stop Trigger Register

This register stops the counter.

**Access Size:** This register is writable in 8-bit units. It is always read as H'00.

**Address(es):** <OSTMn_base>+ H'18

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 0 | OSTMnTT | 0 | W | Stops the counter.<br>0: This setting has no effect.<br>1: Stops the counter and clears the OSTMnTE.OSTMnTE bit. |

### 20.2.2.6 OSTMnCTL — OSTM Control Register

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

**Access Size:** This register is readable/writable in 8-bit units. Writing to this register is only possible if the counter is disabled (OSTMnTOE.OSTMnTOE = 0).

**Address(es):** <OSTMn_base>+ H'20

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|

## 20.3 Functional Description

Each General timer is a 32-bit timer/counter.

The settings for operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

### 20.3.1 Block Diagram

The following block diagram shows the main components of GTM.

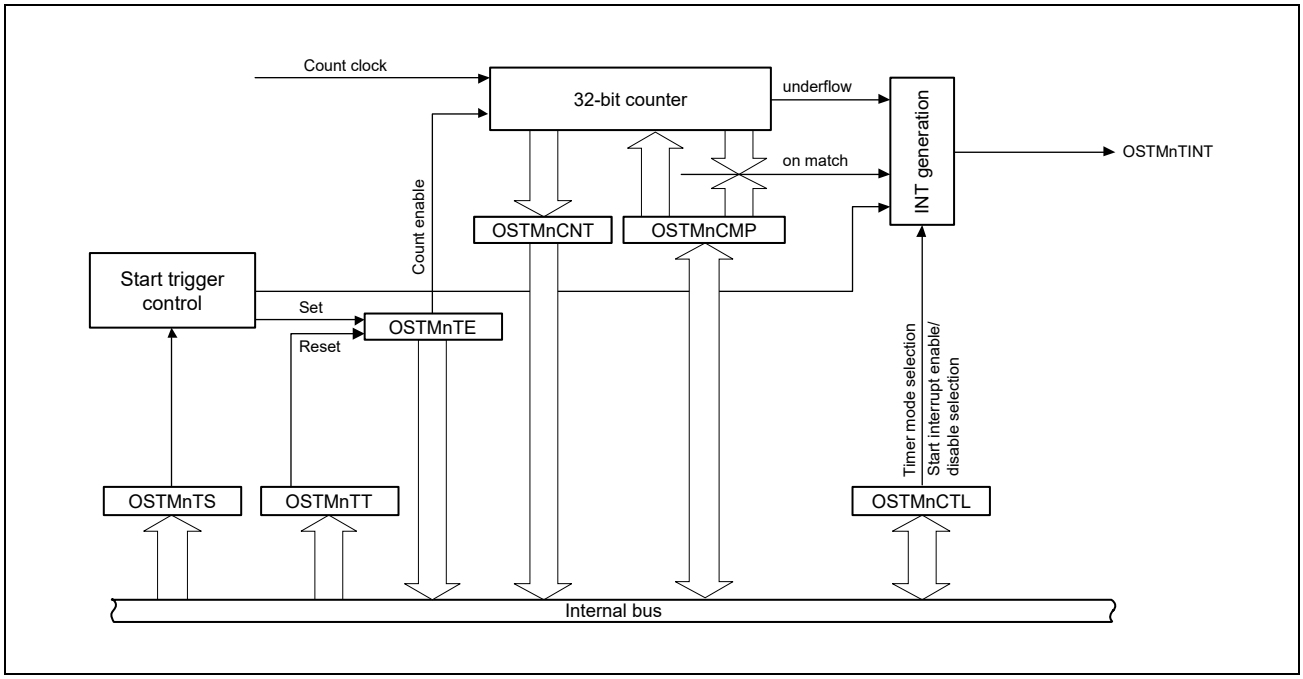

Figure 20.1 Block Diagram of GTM

### 20.3.2 Count Clock

The count clock of OSTMn is P0ϕ (OSTMn_PCLK).

### 20.3.3 Generation of Interrupt Request

An OSTMnTINT interrupt request is generated whenever the counter reaches H’0000 0000 (in interval timer mode) or matches the comparison value (in free-running comparison mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This operation is shown in the following figure.

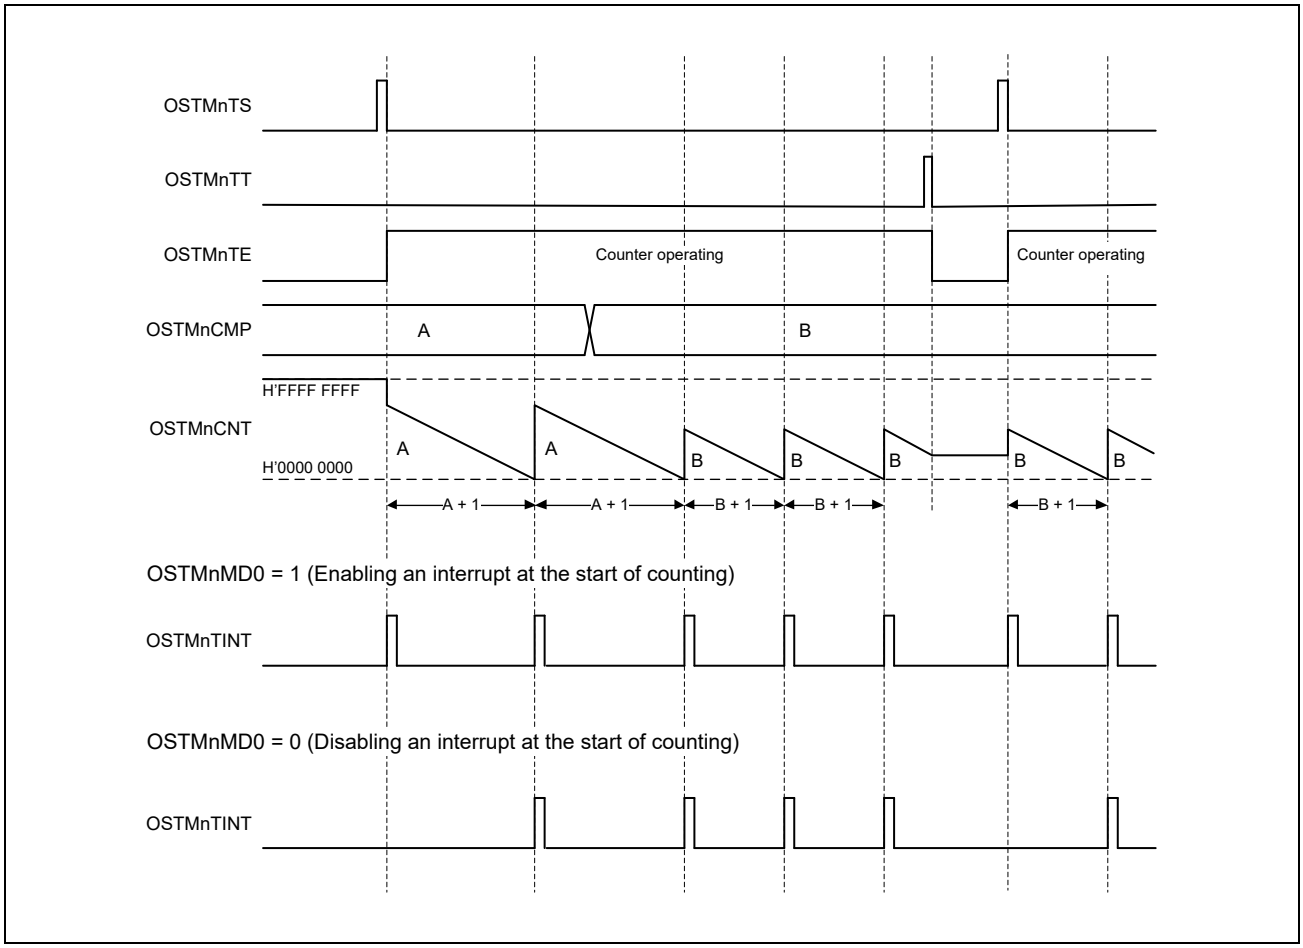

Figure 20.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

### 20.3.4 Starting and Stopping the Timer

The General timer is started and stopped as follows.

#### Starting the timer

The timer is started in either of the following way:

- setting the OSTMnTS.OSTMnTSF bit to 1

Status bit OSTMnTE.OSTMnTE is set to 1.

The counter starts to count up or down in accord with the settings for operating mode.

#### Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.

This also clears the OSTMnTE.OSTMnTE status flag.

## 20.3.5 Interval Timer Mode

Select the interval timer mode when an General timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

### 20.3.5.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter reaches H'0000 0000.

Select interval timer mode by setting OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next H'0000 0000 is reached.

#### Cycles of OSTMnTINT output

The cycle of OSTMnTINT output is as follows.

- OSTMnTINT generation cycle = counter-clock cycle × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

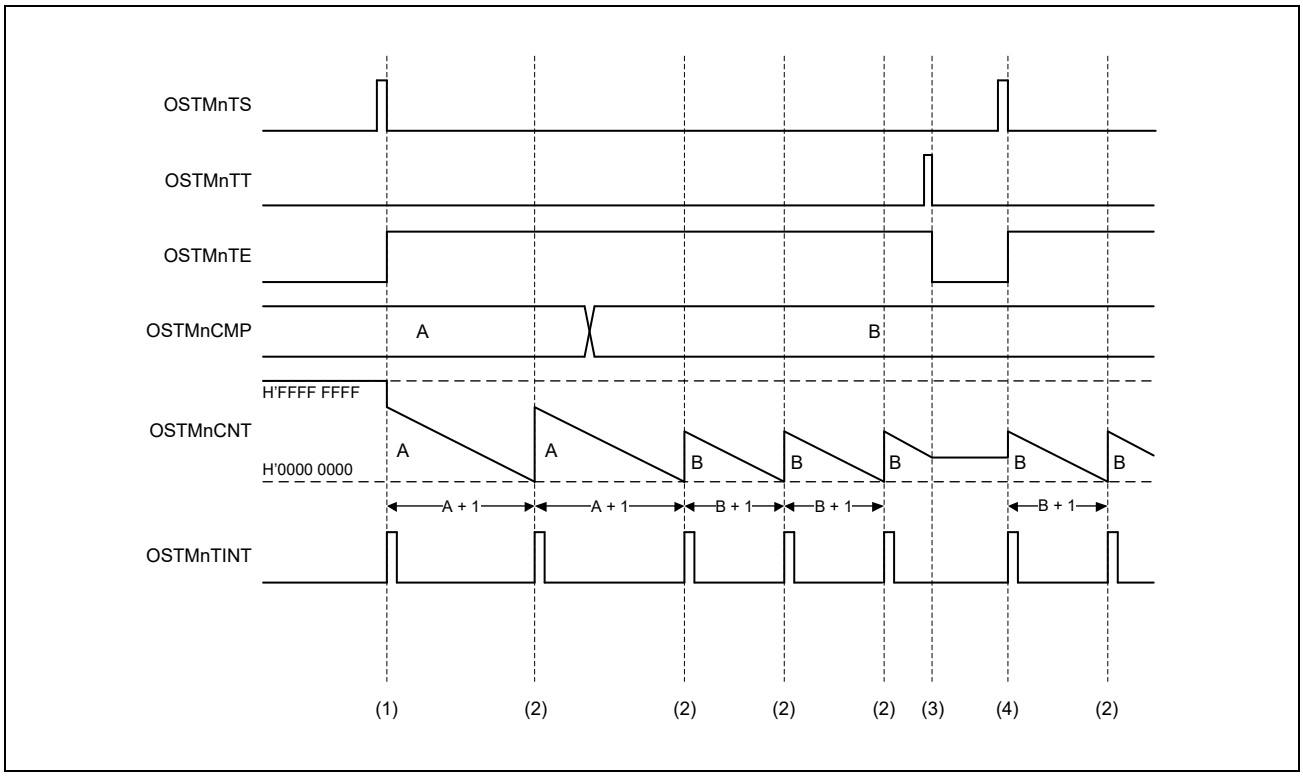

Figure 20.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register contains the current value as the counter.

(2) When the counter reaches H'0000 0000, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

### Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the forced restart of the General Timer in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

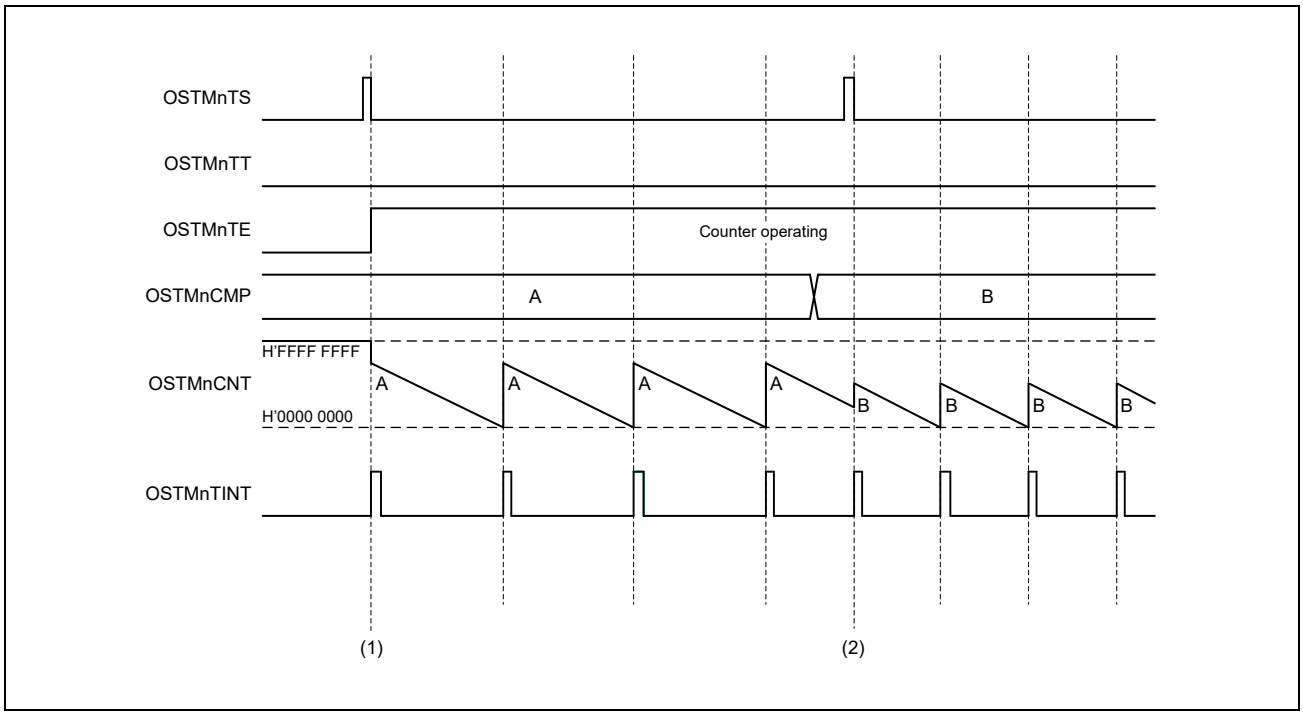

Figure 20.4 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under **Figure 20.3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

### 20.3.5.2 Operation when OSTMnCMP = H’0000 0000

When OSTMnCMP = H’0000 0000, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = H’0000 0000, and counter-start interrupts are enabled.

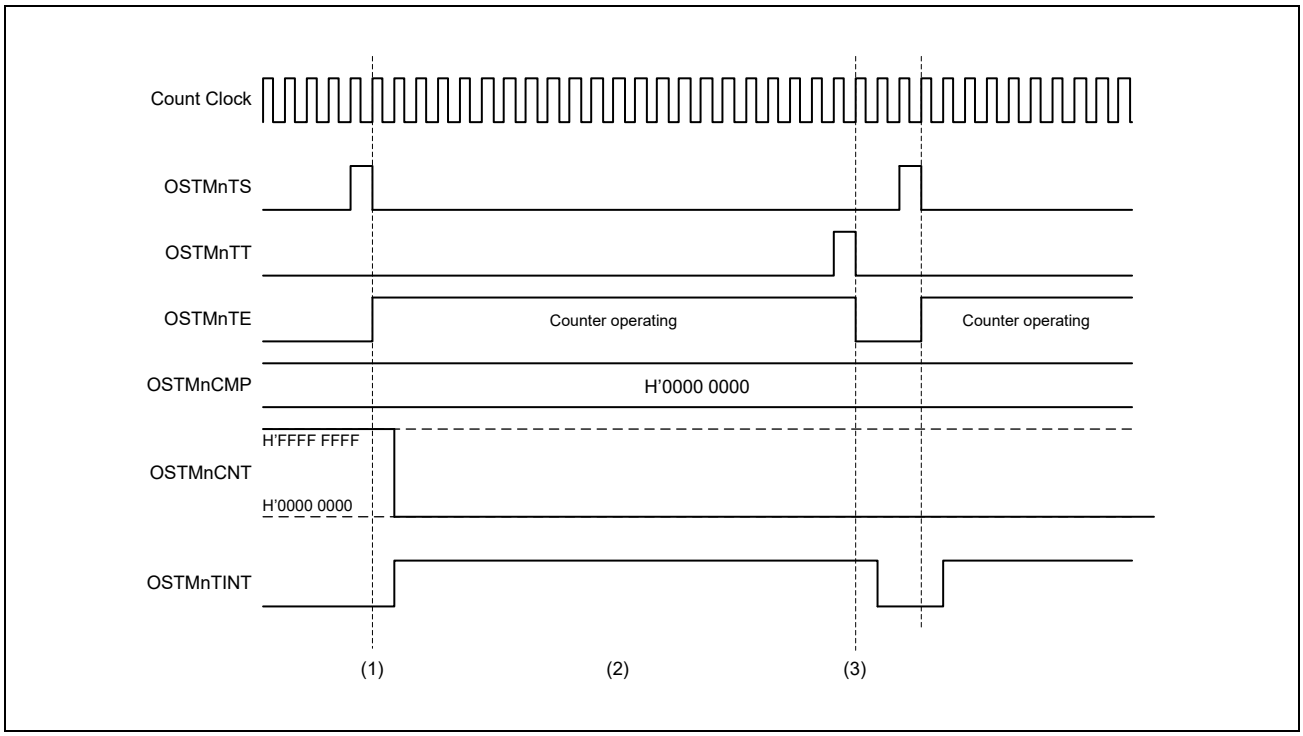

Figure 20.5 Timing Diagram when OSTMnCMP = H’0000 0000 in Interval Timer Mode

T he timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value H’0000 0000 is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

(4) When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

## 20.3.6 Free-Running Comparison Mode

### 20.3.6.1 Basic Operation in Free-Running Comparison Mode

In free-running comparison mode, the counter counts up from H'0000 0000 to H'FFFF FFFF. An OSTMnTINT interrupt request is output when the current value of the counter matches the value of the OSTMnCMP register. The free-running comparison mode is selected by setting the OSTMnCTL.OSTMnMD1 bit to 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

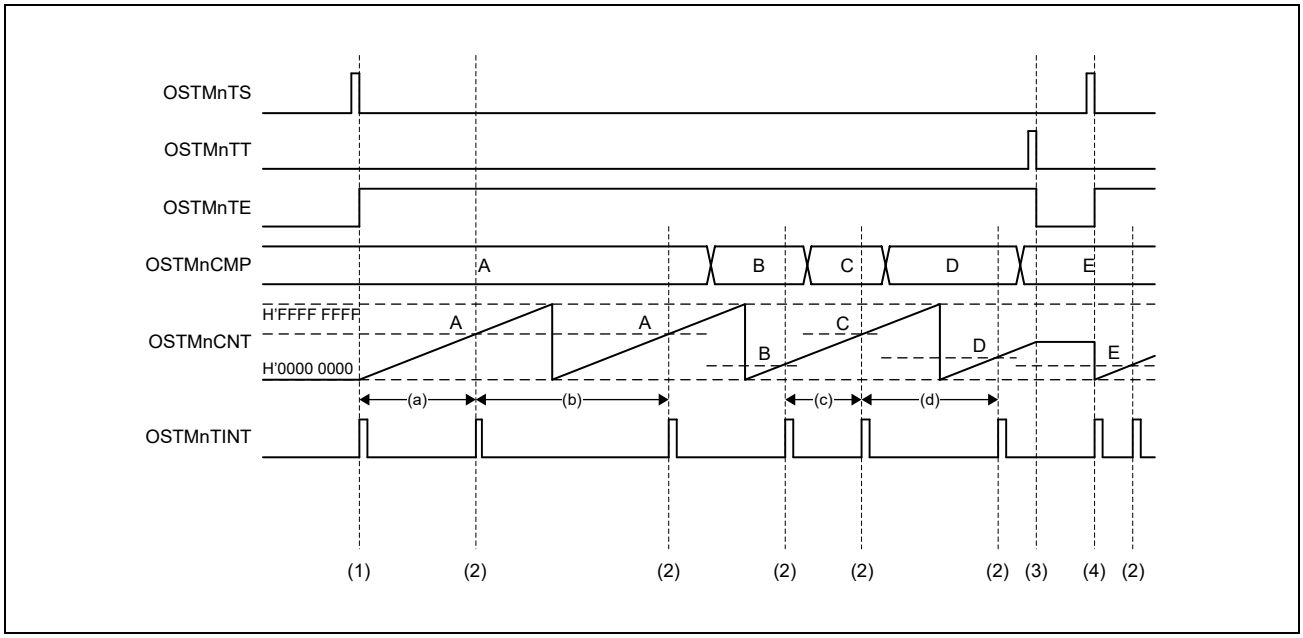

Figure 20.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from H'0000 0000 to H'FFFF FFFF. The OSTMnCNT register is the counter, so it contains the current value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from H'0000 0000 when OSTMnTS.OSTMnTS = 1.

### OSTMTINT period

The OSTMTINT generation period is different at the start of counting and depends on the old and new compare values if OSTMnCMP is rewritten during operation.

Table 20.5 OSTMTINT Generation Timing

| Old Value for Comparison | New Value for Comparison | Counter Value at Time of Rewriting | Period of OSTMTINT Generation | Label in Timing Diagram |
|---|---|---|---|---|
| Counter starts | | | (A + 1) × counter clock period | (a) |
| A | A | No rewriting | (H'FFFF FFFF + 1) × counter clock period | (b) |
| B | C > B | B < counter value < C | (C – B) × counter clock period | (c) |
| C | D < C | Counter value > D,C | (H'FFFF FFFF – C + D + 1) × counter clock period | (d) |

### Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set. The counter ignores the attempted setting and continues counting.

### 20.3.6.2 Operation when OSTMnCMP = H’0000 0000

The following figure shows the operation of OSTM when OSTMnCMP = H’0000 0000, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

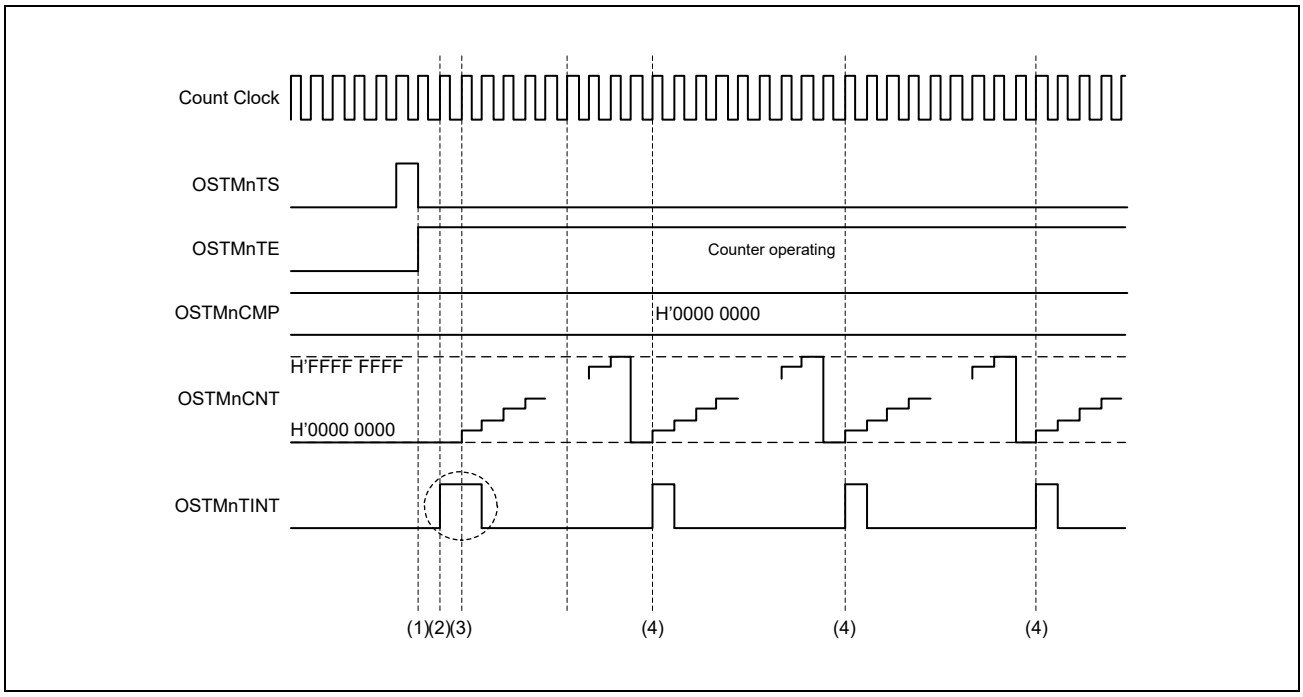

Figure 20.7 Timing Diagram when OSTMnCMP = H’0000 0000 in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from H’0000 0000 to H’FFFF FFFF.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = H’0000 0000 in the above case, OSTMTINT is generated over two clock cycles.

(4) Every (H’FFFF FFFF + 1) clock cycles the OSTMTINT interrupt request is asserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

# 21. Watchdog Timer (WDT)

This LSI has 2 channels of watchdog timer as **Table 21.1** and generates a reset request signal when the counter value is not rewritten and overflows due to system runaway.

Table 21.1 WDT Channels

| Channel | Functions |
|---|---|
| WDT CH0 | WDT to check the operation of Cortex-A55-CPU Core0 |
| WDT CH2 | WDT to check the operation of Cortex-M33 CPU |

Also, a reset request signal or interrupt signal can be generated by inputting a parity error signal due to a parity error in the CPU of this LSI.

## 21.1 Features

All WDT modules have the following functions implemented in common as basic WDT functions.

### 21.1.1 Normal Watchdog Timer Function

- Bus interface: Compatible with AMBA® 2.0 APB.
- Operating frequency: Bus interface 100 [MHz], counter control 24 [MHz]
- The counter operation and the bus interface are asynchronous and can operate without depending on the size relationship of the clock cycles of each other.
- A 32-bit counter that operates with the clock (WDTn_CLK (n = 0, 2)) input to this module.
- An interrupt request signal is generated every cycle set in the counter of this module.
- When WDTn_CLK (n = 0, 2) = 24 MHz, the counter cycle can be set in 43.69 msec unit from 43.69 msec to 178956.97 msec.
- After the interrupt request signal is generated, if the software does not clear the watchdog timer until the next counter overflow, the reset request signal is generated.
- The set value of each register and the Elapsed time of the watchdog timer can be read.

### 21.1.2 Reset Request Function due to CPU Parity Error

- A reset request signal (WDTRSTB) or interrupt signal (PERROUT) is generated by inputting a parity error signal.
- The reset request signal is generated as the OR of the reset request of this module and the reset request of the parity error circuit.
- The polarity of the parity error signal can be set with this module.
- Function can be turned ON/OFF for each 32-bit parity error signal.
- The output of the reset request signal and the interrupt signal can be switched by inputting the parity error signal.
- It is possible to force a parity error to occur by register setting.

### 21.1.3 Internal Block Diagram

**Figure 21.1** shows the internal block of WDT. WDT consists of a WDT-CORE part that implements the function of a normal watchdog timer and a part that detects a parity error.

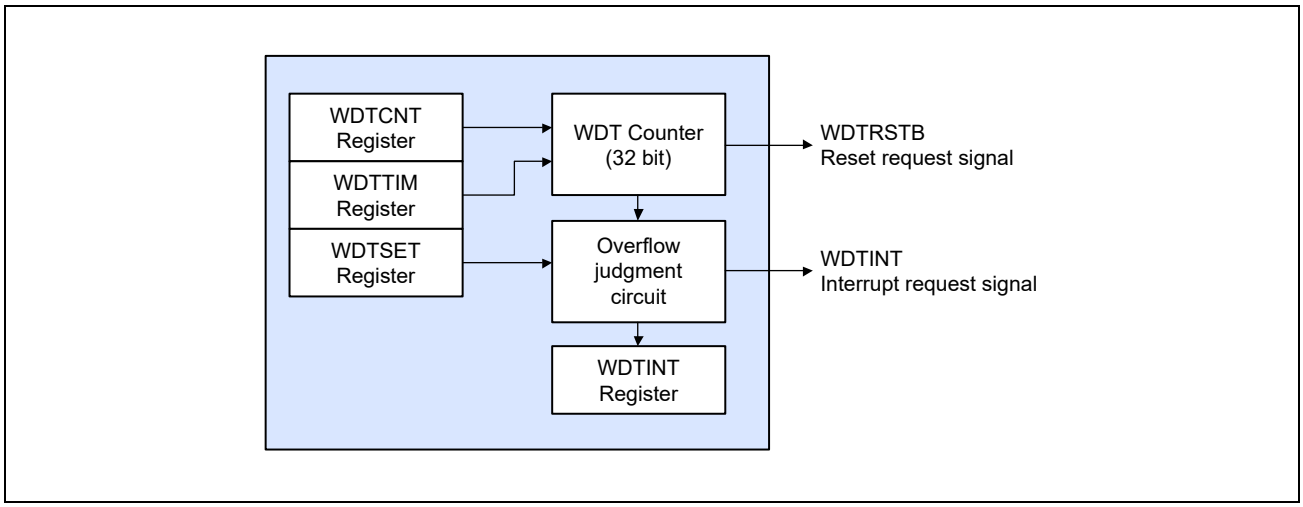

Figure 21.1 WDT_CORE Internal Block

In addition to the above WDT-Core function, WDT receives a parity error interrupt signal generated by the CPU when a Parity Error occurs in the CPU monitored by WDT and generates a reset request signal or interrupt request signal.

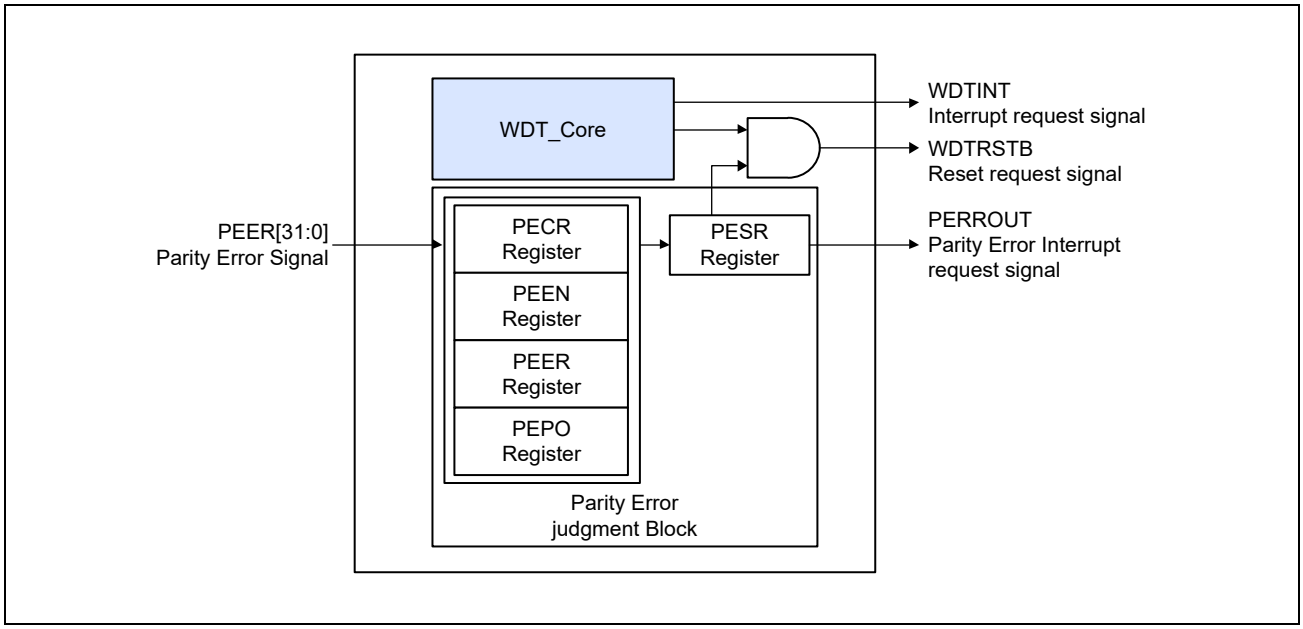

Figure 21.2 WDT_CORE and Parity Error handling block

### 21.1.4 Input/Output Pin

**Table 21.2** shows the pin configuration.

Table 21.2 Pin Configuration

| | | | |
|---|---|---|---|
| Watchdog timer overflow/ CPU parity error | WDTOVF_PERROUT# | Output | Watchdog timer counter overflow signal output/ Interrupt signal output when CPU parity error occurs |

## 21.2 Register Configuration

**Table 21.3** shows the base address for each WDT channel.

Table 21.3 Base Address for each WDT channel

| | Channel | WDT | Base Address |
|---|---|---|---|
| Cortex-A55 Address Space | WDT CH0 | WDT to check the operation of Cortex-A55-CPU Core0 | H'0_1280_0800 |
| | WDT CH2 | WDT to check the operation of Cortex-M33 CPU | H'0_1280_0400 |
| Cortex-M33 Address Space Non-Secure | WDT CH0 | WDT to check the operation of Cortex-A55-CPU Core0 | H'4280_0800 |
| | WDT CH2 | WDT to check the operation of Cortex-M33 CPU | H'4280_0400 |
| Cortex-M33 Address Space Secure | WDT CH0 | WDT to check the operation of Cortex-A55-CPU Core0 | H'5280_0800 |
| | WDT CH2 | WDT to check the operation of Cortex-M33 CPU | H'5280_0400 |

**Table 21.4** shows WDT Register Configuration on all WDT Channels.

Table 21.4 WDT Register Configuration

| Channel | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |

## 21.3 Register Descriptions

### 21.3.1 WDT Control Register_n (WDTCNT_n) (n = 0, 2)

This register sets the operation enable of the watchdog timer function. Once the software activates the watchdog timer, the watchdog timer does not stop*1 until it is reset. Also, the setting register*2 of the watchdog timer cannot be changed. The setting register change must be completed*2 before enabling the watchdog timer operation.

**Note 1.** For debugging, the internal counter can be paused with the CNTSTOP signal.

**Note 2.** WDT cycle setting register (WDTSET) and WDT Elapsed time register (WDTTIM)

**Note 3.** When changing the setting register, wait until the write data value of the setting register is reflected before enabling the watchdog timer operation. The reflection time of the setting register is 6 × P0ϕ + 9 × OSCCLK or more. If this reflection time is not observed, the setting register value will not be reflected and will be ignored.

### 21.3.2 WDT Period Setting Register_n (WDTSET_n) (n = 0, 2)

This register is used to set the cycle of the 32-bit counter that composes the watchdog timer. Writing is not possible while the watchdog timer is running. If you write continuously, the data written later will be valid. Calculate the watchdog timer cycle using the following formula.

$$\text{Watchdog timer cycle} = \text{WDTn_CLK (n = 0,2) cycle} \times 1024 \times 1024 \times (\text{WDTTIME setting value} + 1)$$

$$\text{WDTTIME setting value} = \frac{\text{WDT cycle}}{(\text{WDTn_CLK (n = 0,2) cycle} \times 1024 \times 1024) - 1}$$

For example, WDTn_CLK (n = 0, 2) = 24 MHz, the counter cycle can be set in 43.69 msec unit from 43.69 msec to 178956.97 msec.

It can be set in units. The setting value of WDTTIME is the value set in WDTSET[31:20], and the value from H'000 to H'FFF can be set.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | WDTTIME11 | WDTTIME10 | WDTTIME9 | WDTTIME8 | WDTTIME7 | WDTTIME6 | WDTTIME5 | WDTTIME4 | WDTTIME3 | WDTTIME2 | WDTTIME1 | WDTTIME0 | — | — | — | — |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | WDTTIME [11:0] | All 1 | R/W | Watchdog timer period cycle setting<br>It cannot be written while the watchdog timer is running. |
| 19 to 0 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |

**CAUTION**

The value that the watchdog timer compares when an interrupt occurs is "WDTSET[31:0] + H'000F_FFFF". Therefore, when the setting value of this register is H'0010_0000, the interrupt occurrence count is "H'001F_FFFF" (not H'0010_0000).

### 21.3.3 WDT Elapsed Time Register_n (WDTTIM_n (n = 0, 2))

This register indicates the 32-bit count value that composes the watchdog timer. If the watchdog timer is read during operation, the Elapsed time from the time it is cleared to the time of reading can be read.

By writing to this register when the watchdog timer is stopped, the value at the start of counting can be set in the 32-bit counter that configures the watchdog timer. When a value larger than the counter cycle (value when clearing) set in the WDT cycle setting register is written and the watchdog timer operation is started, the 32-bit counter once overflows and returns to 0. It operates at the set correct cycle.

You cannot write while the watchdog timer is running. If you write continuously, the data written later will be valid.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRTTIME [31:0] | All 0 | R/W | Watchdog timer count value.<br>It cannot be written while the watchdog timer is running. |

**CAUTION**

When setting a value in the WDTTIM register, do not set a value that is WDTSET[31:0] register + H'000F_FFFF.

### 21.3.4 WDT Interrupt Control Register_n (WDTINT_n (n = 0, 2))

This register reads the interrupt status of the watchdog timer, clears interrupts, and clears the counters that compose the watchdog timer. Set the INTDISP bit of this register to “1” within the time set by WDTSET. If not set, the WDTINT pin is asserted. After that, within the time set by WDTSET

When the INTDISP bit is not set to “1”, the WDTRSTB pin is asserted.

When performing continuous write access to the WDTINT register, leave a write interval of 5 × P0ϕ + 5 × OSCCLK or more. If the write interval is not observed, the register will not be written.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 21.3.5 Parity Error Control Register_n (PECR_n (n = 0, 2))

This register controls whether a reset (WDTRSTB) or an interrupt (PERROUT) is generated due to a CPU parity error.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PECR31 | PECR30 | PECR29 | PECR28 | PECR27 | PECR26 | PECR25 | PECR24 | PECR23 | PECR22 | PECR21 | PECR20 | PECR19 | PECR18 | PECR17 | PECR16 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | PESR[31:0] | All 0 | R/W | Parity error flag 0 to 31 Indicates that a parity error has occurred.<br>Read: Interrupt status<br>1: With interrupt<br>0: Without interrupt<br>Write: Interrupt clear<br>1: Interrupt clear<br>0: Invalid (nothing changed) |

### 21.3.8 Parity Error Enable Register_n (PEER_n (n = 0, 2))

This register controls the assertion of the WDTRSTB signal and PERROUT signal due to a CPU parity error. Each bit controls the behavior of parity error.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PEER31 | PEER30 | PEER29 | PEER28 | PEER27 | PEER26 | PEER25 | PEER24 | PEER23 | PEER22 | PEER21 | PEER20 | PEER19 | PEER18 | PEER17 | PEER16 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | PEPO [31:0] | All 0 | R/W | Active polarity of parity 31-0<br>Set the Active polarity (H/L) of each parity error signal connected to PEERR.<br>0: Active High<br>1: Active Low |

### 21.3.10 Register Setting Order for Each WDT Channel

The following shows the register setting sequence for controlling the watchdog timer and parity error circuit of each channel. The control of the original watchdog timer and the parity error circuit do not affect each other, so there is no restriction on the setting order in the following diagrams (1) and (2).

The parity error circuit cannot accept the parity error that occurred before setting PEER = 1. When rewriting PEEN from 0 to 1, it is possible to rewrite at any timing. However, when rewriting PEEN from 1 to 0, once PEER = 0 and (2) flow execution is required.

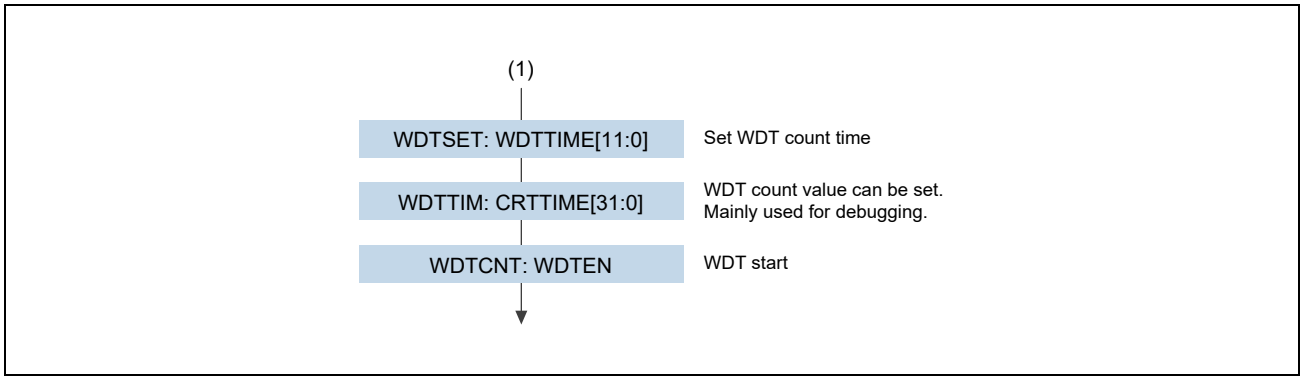

Figure 21.3 WDT Register Setting Order

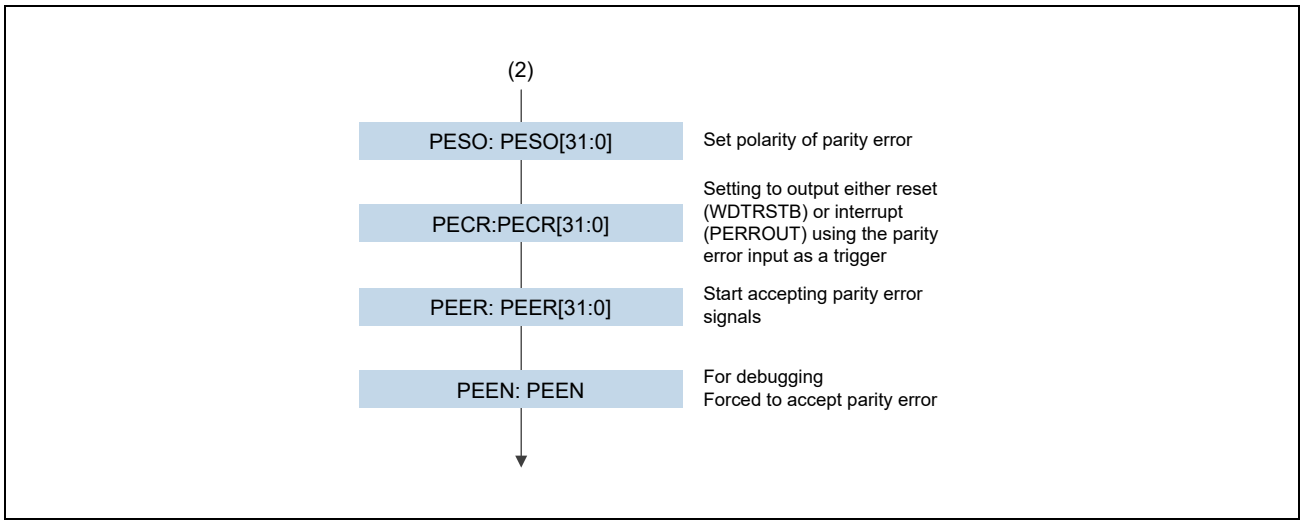

Figure 21.4 Parity Error Circuit Register Setting Order

## 21.4 Operation

### 21.4.1 WDT_CORE Operaton Timing

**Figure 21.5** shows the operation diagram of the WDT-Core block. When 1 is set in Bit [0] of the WDTCNT register, the 32-bit internal counter WDT-Counter starts counting. If the counter value matches the value set in the WDTSET register, the counter becomes overflow, clears the counter to 0, and then generates an interrupt request signal.

An interrupt signal is output at the first counter overflow, and a reset request signal is output if the counter is not cleared and the second counter overflow occurs.

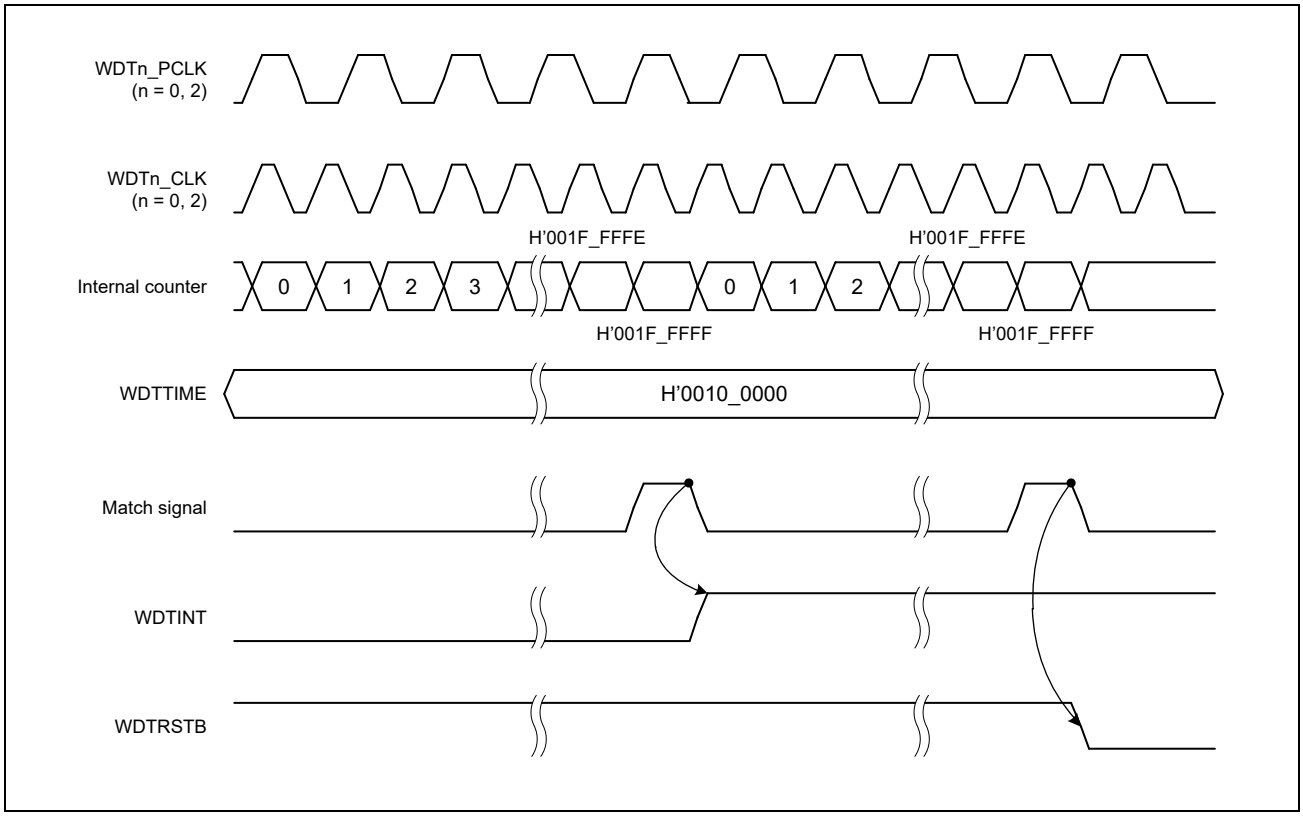

Figure 21.5 WDT Output Signal Operation Timing

### 21.4.2 WDT Interrupt Control Register (WDTINT) Specification for Write Access Interval

After the write access to the WDT interrupt control register is completed, the written data is synchronized with WDTn_CLK (n = 0, 2), so a synchronization period is required. When performing write access to the WDTINT register, it is necessary to leave a write interval of 5 × P0ϕ + 5 × OSCCLK or more between the next write access.*1

**Note 1.** If the write interval is not observed, the interrupt request may not be cleared.
In this case, after making a write access and confirming that the interrupt factor has been cleared, perform the following write access.

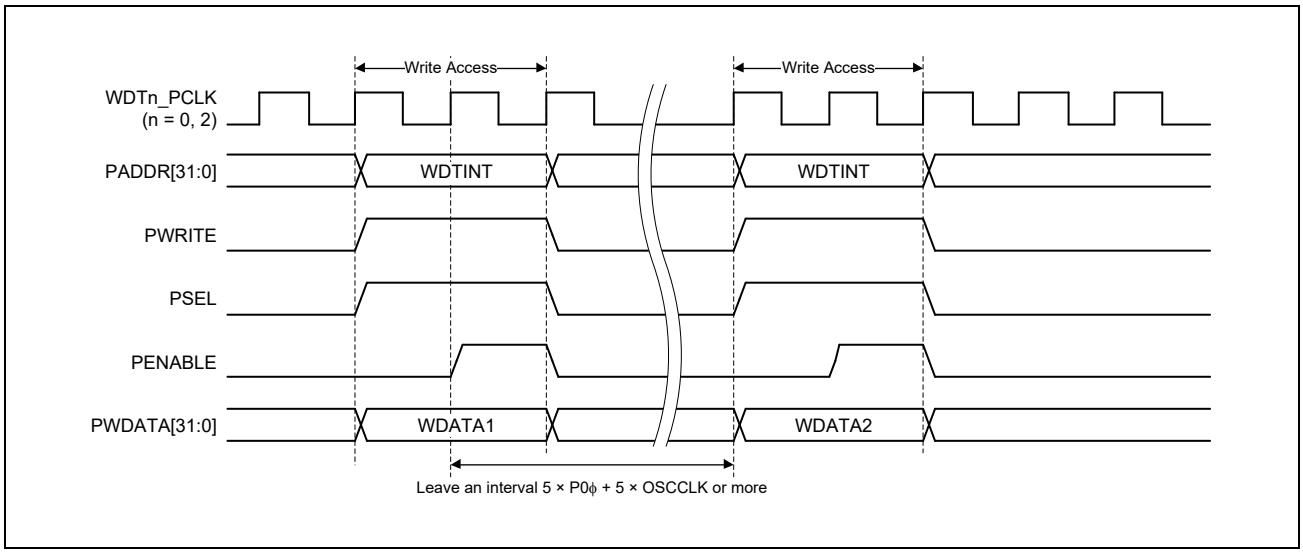

Figure 21.6 WDTINT Write Access Interval Regulation

### 21.4.3 Watchdog Timer Operation Reflection Timing of Register Setting Value

Each register other than the WDT interrupt control register (WDTINT) is always synchronized with WDTn_CLK (n = 0, 2) at regular intervals. The timing at which the written data is reflected in the watchdog timer operation is in the range of small 2 × P0ϕ + 4 × OSCCLK) to large value (6 × P0ϕ +9 × OSCCLK).

**Figure 21.7** (Watchdog timer operation reflection timing 1 of register setting value) shows how write data is small and synchronized.

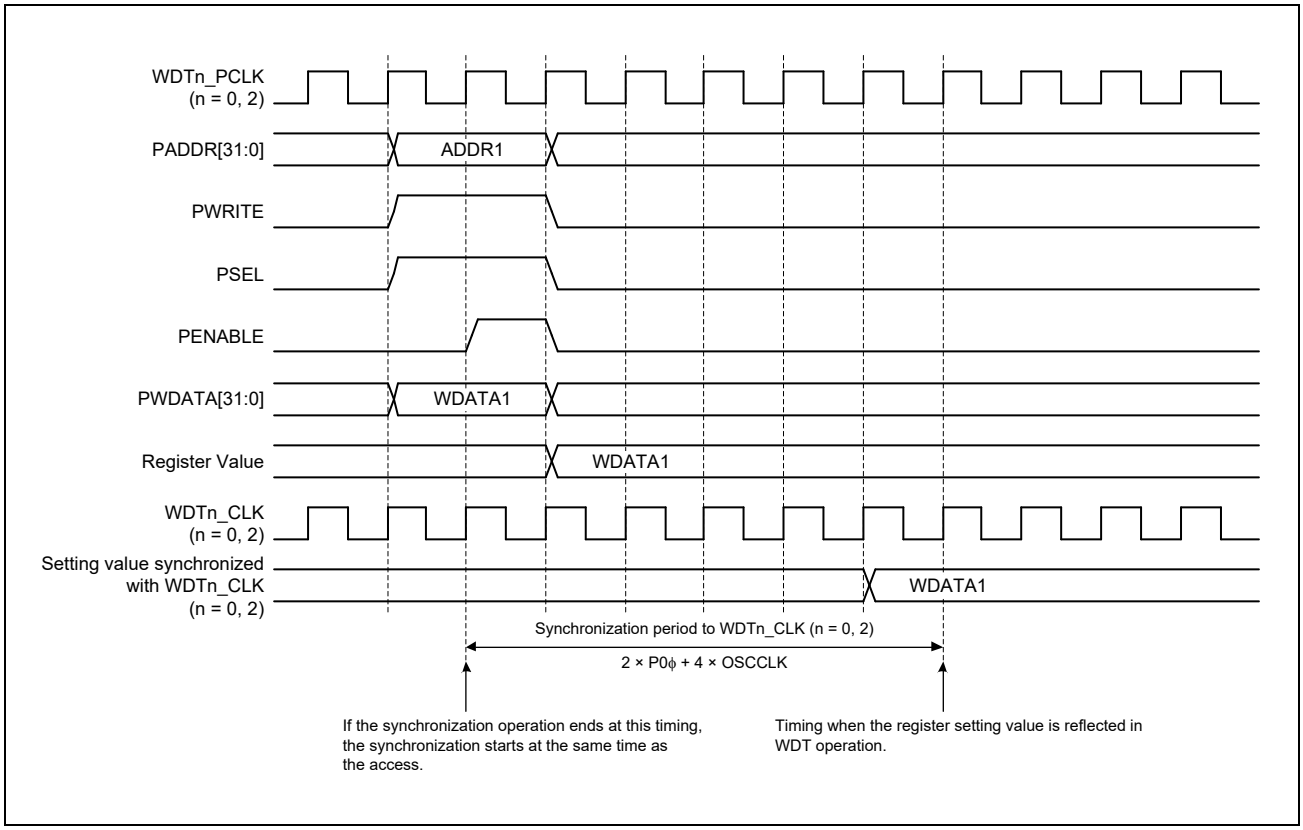

Figure 21.7 Watchdog Timer Operation Reflection Timing of Register Setting Value - 1

In addition, **Figure 21.8** (Watchdog timer operation reflection timing 2 of register setting value) shows how write data is large and synchronized.

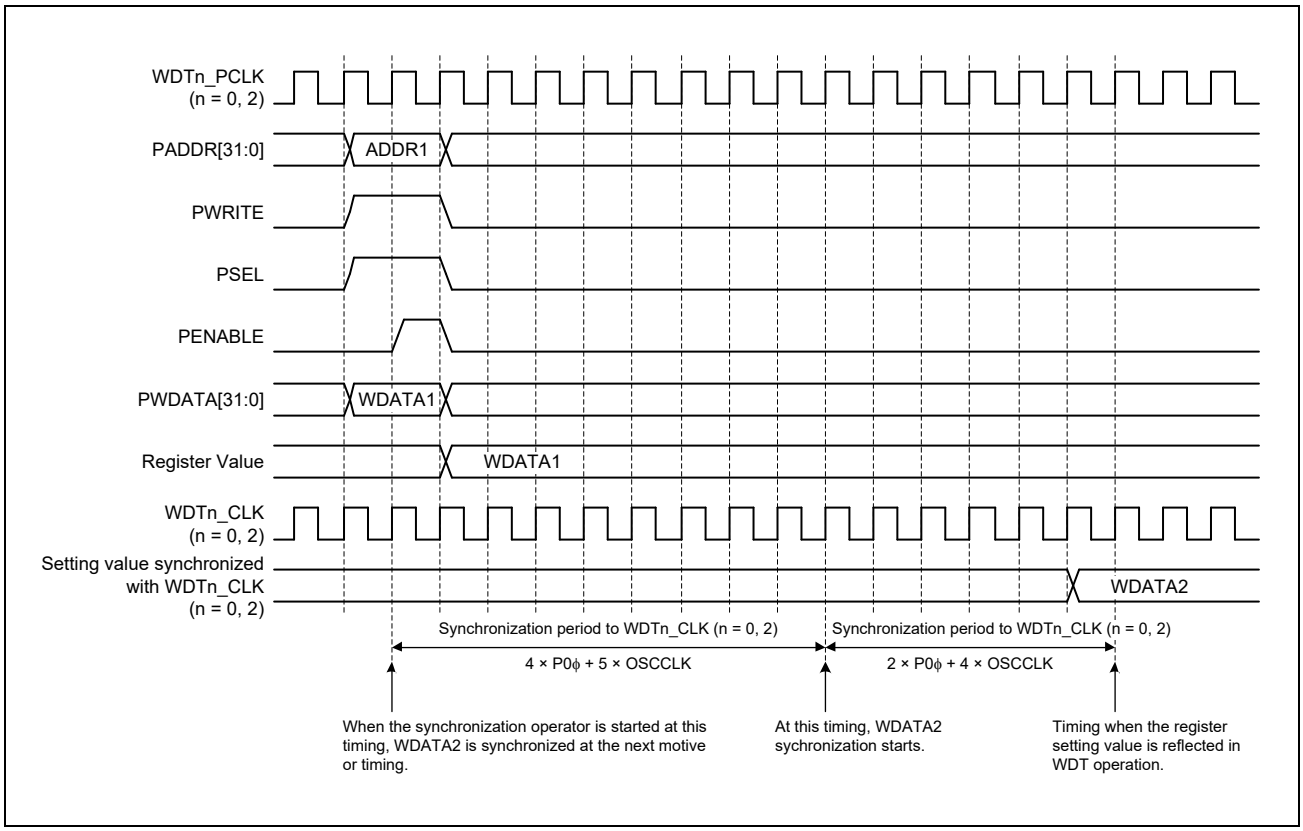

Figure 21.8 Watchdog Timer Operation Reflection Timing of Register Setting Value - 2

### 21.4.4 Timing of Reflecting WDT Counter Value to WDTTIM Register

The value stored in the WDTTIM register is the value obtained by synchronizing the counter value with P0φ. Therefore, the interval at which the value is updated in the WDTTIM register is 5 × OSCCLK+5 × P0ϕ at most, and the value before the actual counter value is read.

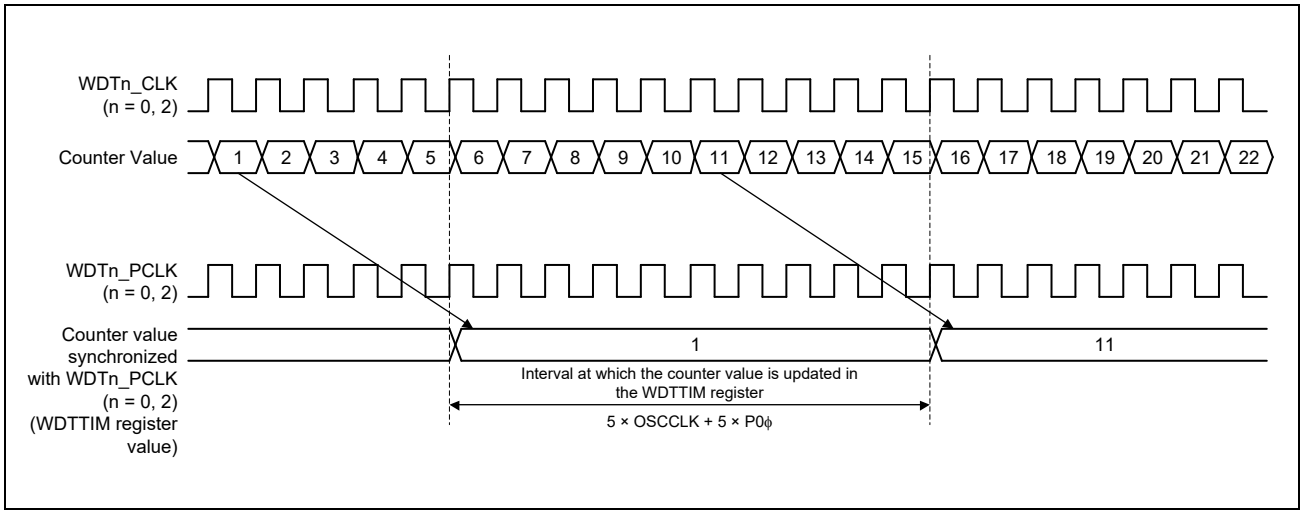

Figure 21.9 Timing of Reflecting the Counter Value to the WDTTIM Register

### 21.4.5 Conditions Under which WDTRSTB and PERROUT Operate

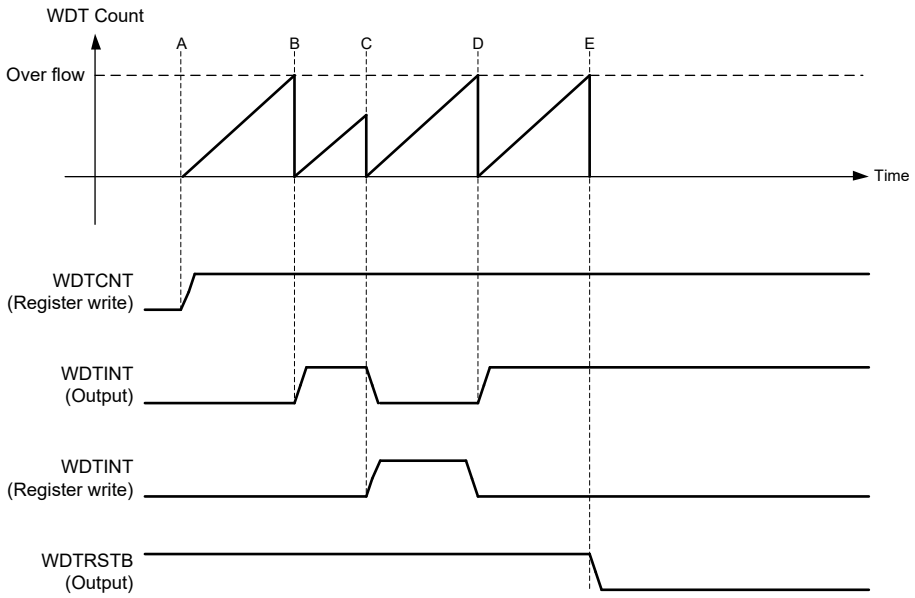
**Table 21.5** shows the conditions under which WDTRSTB and PERROUT operate.

When PEER = 0, WDTRSTB follows the watchdog timer operation described in **Section 21.4.1** to **Section 21.4.5** regardless of the occurrence of parity error. PERROUT holds 0. (No. 1, No. 2) No. 3 to No. 6 show the operating conditions when the parity error input is enabled by PEER = 1. When a parity error occurs (No. 3, No. 4), PESR holds the error status, and WDTRSTB or PERROUT is asserted depending on the value of PECR. If no parity error occurs, PESR = 0, WDTRSTB propagates the WDT-Core logic, and PERROUT is in the unasserted state. (No. 5, No. 6) When PEEN = 1 forces a parity error to occur, WDTRSTB or PERROUT is asserted depending on the PECR value regardless of the parity error.

Table 21.5 WDTRSTB/PERROUT Operating Conditions

| No. | PEERR | PEPO | PEER | PEEN | PECR | PESR | WDTRSTB | PERROUT |
|---|---|---|---|---|---|---|---|---|
| 1 | X | 1/0 | 0 | 0 | 0 | 0 (Fixed) | Original WDT | 0: de-assert |
| 2 | | 1/0 | 0 | 0 | 1 | 0 (Fixed) | Original WDT | 0: de-assert |
| 3 | With parity | 1/0 | 1 | 0 | 0 | 1 | 0: assert | 0: de-assert |
| 4 | | 1/0 | 1 | 0 | 1 | 1 | Original WDT | 1: assert |
| 5 | No parity | 1/0 | 1 | 0 | 0 | 0 | Original WDT | 0: de-assert |
| 6 | | 1/0 | 1 | 0 | 1 | 0 | Original WDT | 0: de-assert |
| 7 | X | X | X | 1 | 0 | X | 0: assert | 0: de-assert |
| 8 | | X | X | 1 | 1 | X | Original WDT | 1: assert |

The timing waveforms for No. 1 to No. 4 in **Table 21.5** are shown below.



**Note:** A) Set WDTCNT = 1 to start WDT counting.

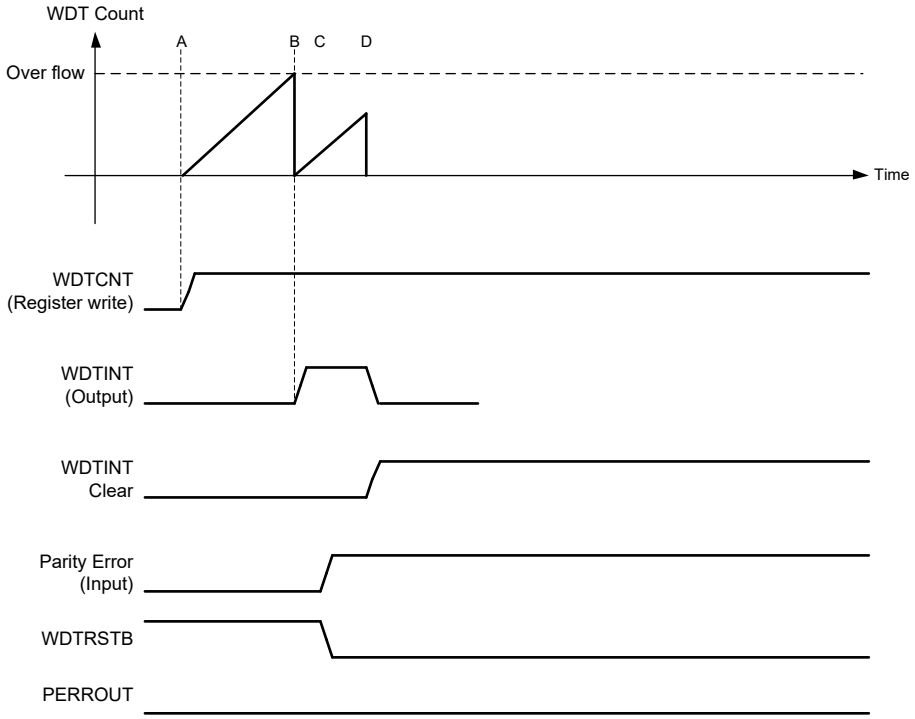
B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) If WDTINT (INTDISP) = 1 is written before the WDT count overflows, the interrupt request is cleared and the WDT count becomes zero.

D) Again, the interrupt request signal is asserted at the first overflow.

E) When the WDT count overflows for the second time, WDTRSTB is asserted.

Figure 21.10 Normal Watchdog Timer Operation No. 1/No. 2



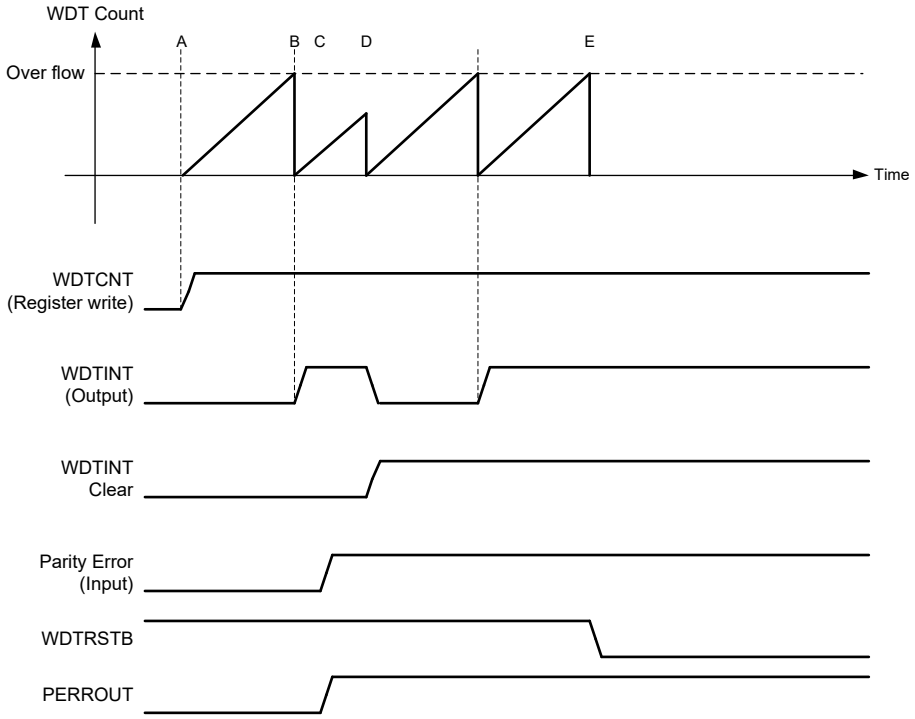
**Note:** A) Set WDTCNT = 1 to start WDT counting.

B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) When a parity error occurs, WDTRSTB = 0. At the same time, hold PERROUT = 0.

D) Even if WDT Count is reset by WDTINT = 1, WDTRSTB = 0 and PERROUT = 0 are retained.

Figure 21.11 Watchdog Timer Operation when a Parity Error Signal Occurs No. 3



**Note:** A) Set WDTCNT = 1 to start WDT counting.

B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) When a parity error occurs, WDTRSTB = 1. At the same time, hold PERROUT = 1.

D) Even if WDT Count is reset by WDTINT = 1, WDTRSTB = 1 and PERROUT = 1 are retained.

E) WDTRSTB = 0 is asserted due to WDT Count overflow.

Figure 21.12 Watchdog Timer Operation when a Parity Error Signal Occurs No. 4

## 21.5 Reset Control

### 21.5.1 WDTRST Control of Each WDT Channels

WDT CH0 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-A55-Core0) receives the WDT CH0 interrupt signal WDTINT, clears the WDT CH0 counter at regular intervals, and suppresses the overflow of the WDT counter.

WDT CH2 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-M33) receives the WDT CH2 interrupt signal WDTINT and clears the WDT CH2 counter at regular intervals to prevent the WDT counter from overflowing.

If the counter is not cleared before the cycle set for each WDT elapses, the uncleared WDT sends a reset request signal to the CPG. Based on the setting of the built-in register CPG_WDTRST_SEL, CPG can select whether to reset only the CPU corresponding to the WDT that caused the reset from the WDT reset request signal from each channel, or to reset the entire system. is. You can also choose whether to assert the WDTOVF_PERROUT# pin to notify the outside world that the entire system has been reset.

(For details about CPG_WDTRST_SEL register in CPG, refer to the CPG chapter.)

Table 21.6 WDT Reset Target by CPG_WDTRST_SEL Register

| Bit | Initial Value | R/W | Reset Factor | Function |
|---|---|---|---|---|
| CPG_WDTRST_SEL[0] | 0 | R/W | WDT CH0 | When the target WDT executes a reset request due to overflow etc.<br>0: Mask system reset<br>1: System reset implementation |
| CPG_WDTRST_SEL[2] | 0 | R/W | WDT CH2 | |
| CPG_WDTRST_SEL[4] | 0 | R/W | WDT CH0 | When the target WDT executes a reset request due to overflow etc.<br>0: Mask WDTOVF_PERROUT assert<br>1: WDTOVF_PERROUT assert |
| CPG_WDTRST_SEL[6] | 0 | R/W | WDT CH2 | |
| CPG_WDTRST_SEL[8] | 0 | R/W | WDT CH0 | When either WDT CH0 or WDT CH1 makes a reset request<br>0: Mask the Cold-Reset of Cortex-A55<br>1: Implemented Cortex-A55 Cold-Reset |
| CPG_WDTRST_SEL[10] | 0 | R/W | WDT CH2 | 0: Mask the Cold reset of the paired Cortex-M33<br>1: Perform Cold reset |

When the WDT system reset is executed, it is also possible to set the CPG_WDTRST_SEL[6, 4] bit to notify the system outside the LSI from the WDTOVF_PERROUT# pin of the GPIO pin that the system reset has occurred due to the WDT overflow. When using WDTOVF_PERROUT# as a signal to notify the system reset to the outside, set the CPG_WDTRST_SEL[6, 4] bit to 1 when CPG_WDTRST_SEL[2:0] is 1 as shown below.

CPG_WDTRST_SEL[4] Set 1 when CPG_WDTRST_SEL[0] = 1
CPG_WDTRST_SEL[6] Set 1 when CPG_WDTRST_SEL[2] = 1

For example, if CPG_WDTRST_SEL[0] = 0 and WDTRST_SEL[4] = 1 are set, the system reset will not be executed even if WDT CH0 asserts a reset request because CPG_WDTRST_SEL[0] = 0, but WDTRST_SEL[4] = 1 so WDTOVF_PERROUT# pin will be asserted. In other words, the system reset execution status and WDTOVF_PERROUT do not match.

## 21.6 Usage Note

[Cautions]

- When setting a value in the WDTTIM register, do not set a value that is WDTSET register + H'F_FFFF.
- The reset request signal WDTRSTB and WDT interrupt signal WDTINT cannot be masked.

# 22. Serial Communications Interface with FIFO (SCIFA)

This LSI has five channels of serial communication interface (SCIFA) with FIFO that support both asynchronous and clock synchronous serial communication. The SCIFA has 16-stage FIFO buffers for transmission and reception, respectively, for each channel that enable this LSI to perform efficient high-speed continuous communication.

## 22.1 Overview

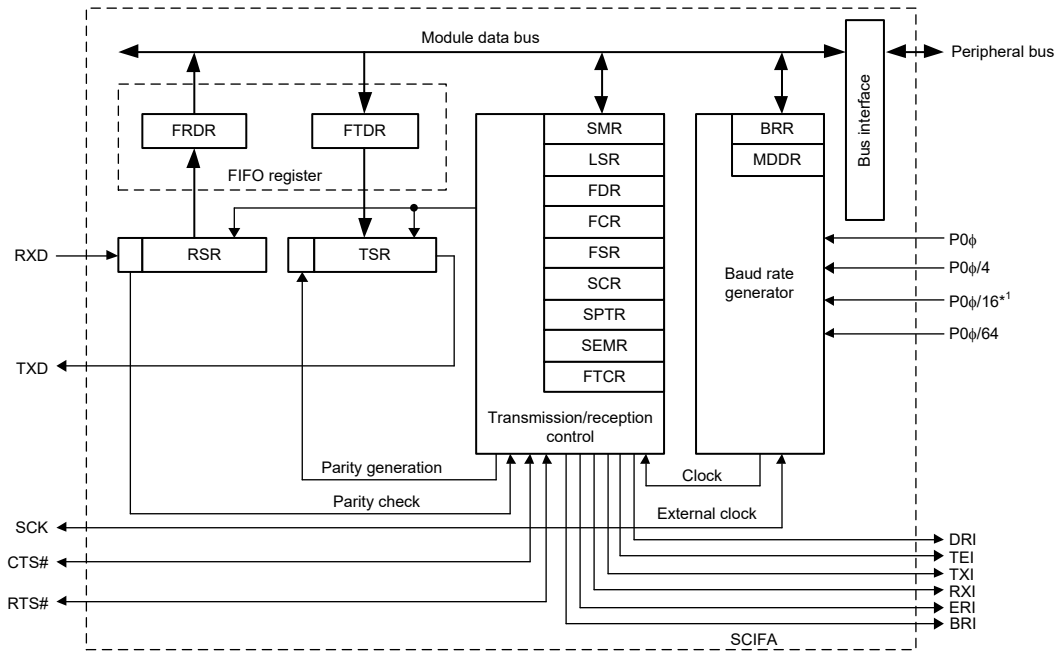
**Table 22.1** lists the specifications of the SCIFA.

Table 22.1 Specifications of SCIFA

| Item | | Description |
|---|---|---|
| Channel | | • 5 channels (ch 0,1,2,3,4) [RZ/G2UL (Type-1)]<br>• 4 channels (ch 0,1,2,3) [RZ/G2UL (Type-2)] |
| Serial communication method | | Asynchronous communication mode and clock synchronous communication mode |
| Transfer speed | | Selectable bit rate with an on-chip baud rate generator |
| Full duplex communication | | Transmitting section: realizes continuous data transmission using 16-stage FIFO buffer<br>Receiving section: realizes continuous data reception using 16-stage FIFO buffer |
| Data transmission | | Selectable either LSB-first or MSB-first transfer |
| Interrupt source | | The following six sources:<br>• Transmit-end (TEIF)<br>• Transmit-FIFO-data-empty (TXIF)<br>• Receive-FIFO-data-full (RXIF)<br>• Receive-data-ready (DRIF)*1<br>• Receive-error (ERIF)<br>• Break detection or overrun (BRIF) |
| Asynchronous communication mode | Character length | 7 or 8 bits |
| | Transmission stop bit length | 1 or 2 bits |
| | Parity | Even, odd, or none |
| | Receive error detection | Parity, overrun, and framing errors |
| | Hardware flow control | Controls data transmission and reception using the CTS# and RTS# pins.<br>Not applicable to channel 3 (SCIF3) and channel 4 (SCIF4) |
| | Break detection | Break signal detection function by hardware. |
| | Clock source | Selectable from internal or external clock |
| | Noise cancellation | Incorporates a digital noise filter in the RXD pin input path. |
| Clock synchronous communication mode | Character length | 8 bits |
| | Receive error detection | Detects an overrun error as a receive error. |
| | Clock source | Selectable either internal or external clock |
| Bit rate modulation | | Enables errors to be decreased by correcting the output of the on-chip baud rate generator. |

Note 1. Effective only for asynchronous communication mode

**Figure 22.1** shows a block diagram of the SCIFA.



RSR: Receive shift register
FRDR: Receive FIFO data register
TSR: Transmit shift register
FTDR: Transmit FIFO data register
SMR: Serial mode register
SCR: Serial control register
FSR: Serial status register
MDDR: Modulation duty register
BRR: Bit rate register
SPTR: Serial port register
FCR: FIFO control register
FDR: FIFO data count register
LSR: Line status register
SEMR: Serial extended mode register
FTCR: FIFO trigger control register

Note 1. The Pϕ/16 clock is not input in the case of the channel 0 interface.

Figure 22.1 Block Diagram of SCIFA

**Table 22.2** lists the input/output pins of the SCIFA.

Table 22.2 Pin Configuration of the SCIFA

| Channel | Item | Pin Name | I/O | Function |
|---|---|---|---|---|
| 0 to 4 (n = 0-4) | Serial clock pin | SCIFn_SCK | I/O | Transmission/reception clock input/output, general output |
| | Receive data pin | SCIFn_RXD | Input | Receive data input |
| | Transmit data pin | SCIFn_TXD | Output | Transmit data output |
| 0 to 2 (n = 0-2) | Transmission/reception start control pin | SCIFn_CTS# | I/O | Input for hardware flow control (transmission enable signal) / general output |
| | | SCIFn_RTS# | Output | Output for hardware flow control (transmission request signal) / general output |

**Note:** Channels of each pin is omitted.

## 22.2 Register Descriptions

Table 22.3 Base Address Table

| Address Space | Channel 0 | Channel 1 | Channel 2 | Channel 3 | Channel 4 |
|---|---|---|---|---|---|
| Cortex-A55 Address Space | H'0_1004_B800 | H'0_1004_BC00 | H'0_1004_C000 | H'0_1004_C400 | H'0_1004_C800 |
| Cortex-M33 Address Space Non-Secure | H'4004_B800 | H'4004_BC00 | H'4004_C000 | H'4004_C400 | H'4004_C800 |
| Cortex-M33 Address Space Secure | H'5004_B800 | H'5004_BC00 | H'5004_C000 | H'5004_C400 | H'5004_C800 |

Table 22.4 List of Registers

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| Serial mode register | SMR | R/W | H'0000 | H'00 | 16 |
| Bit rate register | BRR | R/W | H'FF | H'02 | 8 |
| Modulation duty register | MDDR | R/W | H'FF | H'02 | 8 |
| Serial control register | SCR | R/W | H'0000 | H'04 | 16 |
| Transmit FIFO data register | FTDR | W | Undefined | H'06 | 8 |
| Serial status register | FSR | R/W | H'0020 | H'08 | 16 |
| Receive FIFO data register | FRDR | R | Undefined | H'0A | 8 |
| FIFO control register | FCR | R/W | H'0000 | H'0C | 16 |
| FIFO data count register | FDR | R | H'0000 | H'0E | 16 |
| Serial port register | SPTR | R/W | H'00xx | H'10 | 16 |
| Line status register | LSR | R/W | H'0000 | H'12 | 16 |
| Serial extended mode register | SEMR | R/W | H'00 | H'14 | 8 |
| FIFO trigger control register | FTCR | R/W | H'1F1F | H'16 | 16 |

**Note:** BRR and MDDR are located in the same address. Setting the MDDRS bit of the SEMR register switches these registers.

### 22.2.1 Receive Shift Register (RSR)

The RSR register receives serial data and temporally stores the data. The SCIFA stores the serial data input via the RXD pin into the RSR register and converts the data to the parallel form. When one byte of data has been received, it is automatically transferred to the receive FIFO data register (FRDR).

The CPU cannot read from or write to the RSR register directly.

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 22.2.2 Receive FIFO Data Register (FRDR)

The FRDR register is a 8-bit, 16-stage FIFO register that stores the received serial data. When the SCIFA receives one byte of serial data, it transfers the received data from the receive shift register (RSR) to the FRDR register and completes the receive operation. Continuous reception is possible until the received 16 bytes of data are stored. If the FRDR register is read when there is no received data in the FRDR register, an undefined value is read.

When the FRDR register is full of received data, subsequently received serial data is lost.

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

### 22.2.3 Transmit Shift Register (TSR)

The SCIFA transfers the transmit data from the transmit FIFO data register (FTDR) to the TSR register, and then transmits the data serially to the TXD pin. After transmitting one byte of data, the SCIFA automatically transfers the next transmit data from the FTDR register into the TSR register and starts transmission.

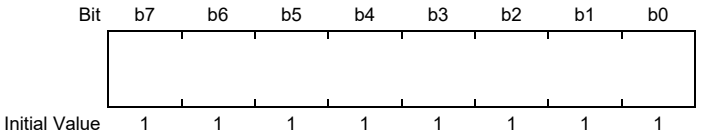
The CPU cannot read from or write to the TSR register directly.

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

### 22.2.4 Transmit FIFO Data Register (FTDR)

The FTDR register is a 8-bit, 16-stage FIFO register that stores serial transmission data. When the SCIFA detects that the transmit shift register (TSR) is empty, it transmits data written in the FTDR register to the TSR register and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the FTDR register. Writing the transmit data to the FTDR register should be done when a transmit data empty interrupt (TXI) request is generated. When the FTDR register becomes full of transmit data (16 bytes), no more data can be written. Even if new data is written, the data is ignored.

CPU can read from the FTDR register but cannot write to it.



### 22.2.5 Serial Mode Register (SMR)

The SMR register specifies the SCIFA serial communication format and selects the clock source for the baud rate generator.

The CPU can always read and write to the SMR register.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CM | CHR | PE | PM | STOP | — | CKS[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | CKS[1:0] | All 0 | R/W | Clock Select<br>b1 b0<br>0 0: 1 × Pϕ*1<br>0 1: 1/4 × Pϕ*1<br>1 0: 1/16 × Pϕ*1,*2<br>1 1: 1/64 × Pϕ*1 |
| b2 | — | 0 | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |
| b3 | STOP | 0 | R/W | Stop Bit Length<br>0: One stop bit<br>1: Two stop bits |
| b4 | PM | 0 | R/W | Parity Mode<br>0: Even parity<br>1: Odd parity |
| b5 | PE | 0 | R/W | Parity Enable<br>0: Parity bit addition or check is disabled.<br>1: Parity bit addition or check is enabled. |
| b6 | CHR | 0 | R/W | Character Length<br>0: 8-bit data<br>1: 7-bit data*3 |
| b7 | CM | 0 | R/W | Communication Mode<br>0: Asynchronous mode<br>1: Clock synchronous mode |
| b15 to b8 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Pϕ: SCIFn_CLK_PCK (n = 0 to 4)

Note 2. This setting is not applicable to channel 0. It is only applicable to channels 1 to 4.

Note 3. When 7-bit data is selected, the MSB (bit 7) of the transmit FIFO data register is not transmitted.

### CKS[1:0] Bits (Clock Select)

Select an internal clock source for the on-chip baud rate generator. For further information on the clock source, bit rate register settings, and baud rates, see **Section 22.2.8, Bit Rate Register (BRR)**.

### STOP Bit (Stop Bit Length)

Selects one bit or two bits as the stop bit length in asynchronous mode. This setting is used only in asynchronous mode. It is ignored in clock synchronous mode because no stop bits are added. When receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit, but if the second stop bit is 0, it is treated as the start bit of the next incoming character.

*Note*: When transmitting with one stop bit, a single 1 bit (stop bit) is added at the end of each transmission character.

*Note*: When transmitting with two stop bits, two 1 bits (stop bits) are added at the end of each transmission character.

### PM Bit (Parity Mode)

Selects either the even or odd parity check. The setting of this bit is effective only when the parity enable (PE) bit of this register is set to 1 in asynchronous mode. The setting of this bit is ignored in clock synchronous mode, or when parity addition/check is disabled in asynchronous mode.

*Note*: If even parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s even in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is even.

*Note*: If odd parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s odd in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is odd.

### PE Bit (Parity Enable)

Selects whether to add a parity bit on data transmission and whether to enable/disable the parity check on data reception in asynchronous mode. In clock synchronous mode, a parity bit is neither added nor checked, regardless of the setting of this bit.

*Note*: When this bit is set to 1, an even or odd parity bit specified in the PM bit is added to data to be transmitted. The SCIFA verifies whether the parity bit of the received data is even or odd as specified in the PM bit when receiving.

### CHR Bit (Character Length)

Selects 7- or 8-bit data length in asynchronous mode. In clock synchronous mode, the data length is always 8 bits, regardless of the CHR setting.

### CM Bit (Communication Mode)

Selects whether the SCIFA operates in asynchronous or clock synchronous mode.

### 22.2.6 Serial Control Register (SCR)

The SCR register enables or disables the SCIFA transmission/reception and interrupt requests, and selects the transmit/receive clock source. The CPU can always read from and write to the SCR register.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TIE | RIE | TE | RE | REIE | TEIE | CKE[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | CKE[1:0] | All 0 | R/W | Clock Enable<br>In asynchronous mode:<br>b1 b0<br>0 0: Internal clock or SCK pin is used for input pin (input signal is ignored). The SCK pin state depends on the SCKIO and SCKDT bits in SPTR.<br>0 1: Internal clock or SCK pin is used for clock output (The output clock frequency is 16 or 8 times of the bit rate).<br>1 0: External clock or SCK pin is used for clock input (The input clock frequency is 16 or 8 times of the bit rate).<br>1 1: Setting prohibited<br>In clock synchronous mode:<br>b1 b0<br>0 0: Internal clock or SCK pin is used for synchronous clock output.<br>0 1: Internal clock or SCK pin is used for synchronous clock output.<br>1 0: External clock or SCK pin is used for synchronous clock input.<br>1 1: Setting prohibited |
| b2 | TEIE*1 | 0 | R/W | Transmit End Interrupt Enable<br>0: Transmit end interrupt (TEI) request is disabled.<br>1: Transmit end interrupt (TEI) request is enabled. |
| b3 | REIE | 0 | R/W | Receive Error Interrupt Enable<br>0: Receive-error interrupt (ERI) and break interrupt (BRI) requests are disabled.<br>1: Receive-error interrupt (ERI) and break interrupt (BRI) requests are enabled. |
| b4 | RE | 0 | R/W | Receive Enable<br>0: Data reception is disabled.<br>1: Data reception is enabled. |
| b5 | TE | 0 | R/W | Transmit Enable<br>0: Data transmission is disabled.<br>1: Data transmission is enabled. |
| b6 | RIE | 0 | R/W | Receive Interrupt Enable<br>0: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are disabled.<br>1: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are enabled. |
| b7 | TIE | 0 | R/W | Transmit Interrupt Enable<br>0: Transmit-FIFO-data-empty interrupt request (TXI) is disabled.<br>1: Transmit-FIFO-data-empty interrupt request (TXI) is enabled. |
| b15 to b8 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. TEI interrupt requests can be cleared by reading 1 from the TEND flag, and then clearing the setting to 0, or by setting the TEIE bit to 0.

### CKE[1:0] Bits (Clock Enable)

Select the SCIFA clock source and enable or disable clock output from the SCK pin. Depending on the settings of these bits, the SCK pin can be used for serial clock output or serial clock input. If the SCK pin is set for the synchronous clock output in the clock synchronous mode, set the CM bit in the SMR register to 1, and then set the CKE[1:0] bits. The settings of the CKE[1:0] bits are listed in **Table 22.17**.

### REIE Bit (Receive Error Interrupt Enable)

Specifies whether to enable or disable a receive-error interrupt (ERI) request and a break interrupt (BRI) request. The setting of this bit is only valid when the RIE bit is set to 0.

*Note*: ERI interrupt requests can be cleared by reading 1 from the ER bit in the FSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0. BRI interrupt requests can be cleared by reading 1 from the BRK bit in the FSR register, or from the ORER flag in the LSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0.

### RE Bit (Receive Enable)

Specifies whether to enable or disable the serial data reception.

*Note*: Setting this bit to 0 does not affect the receive flags (DR, ER, BRK, RDF, FER, and PER in the FSR register, and ORER in the LSR register). These flags retain their previous values.

*Note*: Serial reception starts when a start bit is detected in asynchronous mode, or a synchronous clock input is detected in clock synchronous mode. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the receive format and reset the receive FIFO.

### TE Bit (Transmit Enable)

Specifies whether to enable or disable the serial data transmission.

*Note*: Serial transmission starts after writing of data to be transmitted into the FTDR register under this condition. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the transmit format and reset the transmit FIFO.

### RIE Bit (Receive Interrupt Enable)

Specifies whether to enable or disable a receive-FIFO-data-full (RXI) interrupt request when the RDF flag in the serial status register (FSR) is set to 1, a receive-data ready (DRI) interrupt request when the DR flag in the FSR register is set to 1, a receive-error (ERI) interrupt request when the ER flag in the FSR register is set to 1, and a break (BRI) interrupt request when the BRK flag in the FSR register or the ORER flag in the line status register (LSR) is set to 1.

*Note*: RXI interrupt requests can be cleared by reading 1 from the DR or RDF flag in the FSR register, then clearing the flag to 0, or by clearing the RIE bit to 0. DRI interrupt requests can be cleared by reading 1 from the DR flag in the FSR register, and then clearing the setting to 0, or by clearing the RIE bit in this register to 0. Receive error interrupt (ERI) requests and break interrupt (BRI) requests can be cleared by clearing both the RIE and REIE bits in this register to 0.

### TIE Bit (Transmit Interrupt Enable)

Specifies whether to enable or disable a transmit-FIFO-data-empty interrupt (TXI) request when the serial transmit data is transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the transmit FIFO data register falls below the specified trigger number for transmission, and the TDFE flag in the serial status register (FSR) is set to 1.

*Note*: TXI interrupt requests can be cleared either by writing a greater quantity of transmit data than the specified transmission trigger number into the FTDR register, reading 1 from the TDFE flag, and then clearing the TDFE flag to 0, or by clearing this bit to 0.

### 22.2.7 Serial Status Register (FSR)

The FSR register is a 16-bit register. The 8 lower-order bits indicate the status flag representing the SCIFA operating state.

The CPU can always read and write to the FSR register, but cannot write 1 to the status flags (ER, TEND, TDFE, BRK, RDF, and DR bits) in this register. These flags can be only cleared to 0 when they have first been read (after being set to 1). b3 (FER) and b2 (PER) are read-only bits that cannot be written.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | ER | TEND | TDFE | BRK | FER | PER | RDF | DR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R(/W)*1 | R(/W)*1 | R(/W)*1 | R(/W)*1 | R | R | R(/W)*1 | R(/W)*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | DR | 0 | R/(W) *1 | Receive Data Ready Flag<br>0: Reception is in progress, or no received data has remained in the FRDR register after normally completed receiving.<br>1: Next receive data has not been received. |
| b1 | RDF | 0 | R/(W) *1 | Receive FIFO Data Full Flag<br>0: The quantity of receive data in the FRDR register falls below the specified reception trigger number.<br>1: The quantity of receive data written in the FRDR register is equal to or greater than the specified reception trigger number. |
| b2 | PER | 0 | R | Parity Error Flag*4<br>0: No receive parity error occurred in the next receive data read from the FRDR register.<br>1: A receive parity error occurred in the next receive data read from the FRDR register. |
| b3 | FER | 0 | R | Framing Error Flag*4<br>0: No receive framing error occurred in the next data read from the FRDR register.<br>1: A receive framing error occurred in the next data read from the FRDR register. |
| b4 | BRK | 0 | R/(W) *1 | Break Detect Flag<br>0: No break signal is received.<br>1: A break signal is received.*2 |
| b5 | TDFE | 1 | R/(W) *1 | Transmit FIFO Data Empty Flag<br>0: The quantity of transmit data written in the FTDR register exceeds the specified transmission trigger number.<br>1: The quantity of transmit data written in the FTDR register is equal to or less than the specified transmission trigger number.*3 |
| b6 | TEND | 0 | R/(W) *1 | Transmit End Flag<br>0: Transmission is in the waiting state or in progress.<br>1: Transmission is completed. |
| b7 | ER | 0 | R/(W) *1 | Receive Error Flag<br>0: Reception is in progress or has normally completed.<br>1: A framing error or parity error has occurred during reception. |
| b15 to b8 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. 0 can be only written to clear the flag after 1 is read.

Note 2. When a break signal is detected, transfer of the receive data (H'00) to the FRDR register stops after the detection. When the break ends and the receive signal becomes mark state (high level), the transfer of receive data resumes.

Note 3. Since the FTDR register is a 16-byte FIFO register, the maximum quantity of data that can be written when TDFE is 1 is "16 minus the number of non-transmitted data units". If additional data is written, the data is ignored. The quantity of data in the FTDR register is indicated by the 8 higher-order bits of the FDR register.

Note 4. When the DMAC is used to read data, the generation of errors cannot be checked by reading this flag.

### DR Bit (Receive Data Ready Flag)

Indicates that the quantity of data stored in the receive FIFO data register (FRDR) falls below the specified reception trigger number, and that no next data has been received yet after the elapse of 15 ETUs from the last stop bit in asynchronous mode. In clock synchronous mode, this bit is not set to 1.

[Setting condition]

- DR is set to 1 when the FRDR register contains less data than the specified reception trigger number, and no next data has been received yet after the elapse of 15 ETUs*[1] from the last stop bit.

[Clearing conditions]

When either of the following is satisfied:

- DR is cleared to 0 when DR = 1 is read and then 0 is written to the DR flag.
- DR is cleared to 0 when all received data in the FRDR register are read.

**Note 1.** This is equivalent to one and a half (1.5) frames in the 8-bit format with one stop bit (ETU: elementary time unit).

*Note*: When the RE bit in SCR is cleared to 0, the DR bit is not affected and retains its previous value.

### RDF Bit (Receive FIFO Data Full Flag)

Indicates that receive data has been transferred to the receive FIFO data register (FRDR), and the quantity of data in FRDR becomes equal to or greater than the specified reception trigger number.

[Setting condition]

- RDF is set to 1 when the quantity of receive data which is equal to or greater than the specified reception trigger number are stored in the FRDR register*[1].

[Clearing conditions]

- RDF is cleared to 0 when RDF = 1 is read and then 0 is written to this bit.
- RDF is cleared to 0 when the FRDR register is read.

**Note 1.** Since the FRDR register is a 16-byte FIFO register, the maximum quantity of data that can be read when this bit is 1 is equivalent to the specified reception trigger number. If an attempt is made to read after all the data in the FRDR register has been read, the read data is undefined. The quantity of receive data in the FRDR register is indicated by the 8 lower-order bits of the FDR register.

### PER Bit (Parity Error Flag)

Indicates whether there is a parity error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- PER is set to 1 when a parity error is present in the next data read from the FRDR register.

[Clearing condition]

- PER is cleared to 0 when no parity error is present in the next data read from the FRDR register.

### FER Bit (Framing Error Flag)

Indicates whether there is a framing error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- FER is set to 1 when a framing error is present in the next data read from the FRDR register.

[Clearing condition]

- FER is cleared to 0 when no framing error is present in the next data read from the FRDR register.

### BRK Bit (Break Detect Flag)

Indicates that a break signal has been detected in receive data.

[Setting condition]

- BRK is set to 1 when data including a framing error is received, and the framing error is followed by at least one frame of data received at the space 0 level (low level).

[Clearing condition]

- BRK is cleared to 0 when software reads BRK after it has been set to 1 and then writes 0 to BRK.

### TDFE Bit (Transmit FIFO Data Empty Flag)

Indicates that data has been transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the FRDR register becomes equal to or less than the specified transmission trigger number, and writing of transmit data to the FRDR register is enabled.

[Setting conditions]

When either of the following is satisfied:

- TDFE is set to 1 when the TE bit in SCR is 0.
- TDFE is set to 1 when the quantity of transmit data written in the FRDR register is equal to or less than the specified transmission trigger number.

[Clearing conditions]

- TDFE is cleared to 0 when 0 is written in the TDFE bit after reading TDFE = 1.
- When transmit data is written to the FTDR register

### TEND Bit (Transmit End Flag)

Indicates that the FRDR register contains no more valid data and transmission is completed when transmitting the last bit of the transmit data.

[Setting condition]

When the following is satisfied:

- TEND is set to 1 when the FTDR register does not contain transmit data when the last bit of the serial transmission data is transmitted.

[Clearing conditions]

- When transmit data is written to the FTDR register
- When 0 is written to TEND after it has been read as 1

### ER Bit (Receive Error Flag)

Indicates the occurrence of a framing error, or of a parity error when receiving the parity-added data*[1].

[Setting conditions]

When either of the following is satisfied:

- ER is set to 1 when the stop bit is found to be 0 after checking whether the stop bit of the received data is 1 at the end of one data receive operation*[1].
- ER is set to 1 when the total number of 1s in the received data and parity bit combined does not match the even or odd parity setting specified by the PM bit in the SMR register.

[Clearing condition]

- When 0 is written to ER after it has been read as 1

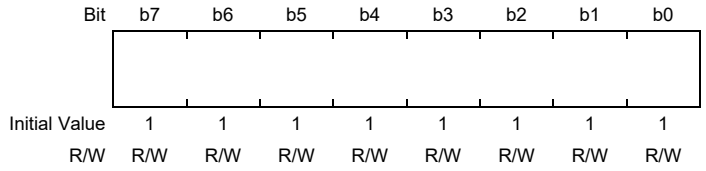
**Note 1.** Clearing the RE bit to 0 in the SCR register does not affect this bit, which retains its previous value. Even if a receive error occurs, the receive data is transferred to the FRDR register and the receive operation is continued. Whether the data read from the FRDR register includes a receive error can be detected by the FER and PER bits in the FSR register.

*Note*: In two stop bits mode, only the first stop bit is checked; the second stop bit is not checked.

### 22.2.8 Bit Rate Register (BRR)

The BRR register is an 8-bit register that, together with the baud rate generator clock source selected by the CKS[1:0] bits in the serial mode register (SMR), determines the serial transmit/receive bit rate.

This register is located in the same address as that of the MDDR register and selected when the MDDRS bit in SEMR is 0. The CPU can read and write to BRR. Writing to BRR should be executed when TE = RE = 0 in the SCR register.



| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The BRR setting is calculated using the following formulae.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$N = \frac{P0\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P0\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$N = \frac{P0\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P0\phi}{16 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

[Clock synchronous mode]

$$N = \frac{P0\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)
N: Setting of the BRR register ($0 \leq N \leq 255$) (The setting must satisfy the electrical characteristics).
P0ϕ: Operating frequency for peripheral modules (MHz)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see **Table 22.5**).

NOTE

The MDDR register is used to adjust the bit rate. For details, see **Section 22.2.9, Modulation Duty Register (MDDR)**.

Table 22.5 SMR Register Setting

| n | Clock Source | SMR Register Settings | |
|---|---|---|---|
| | | CKS1 | CKS0 |
| 0 | Pϕ | 0 | 0 |
| 1 | Pϕ/4 | 0 | 1 |
| 2 | Pϕ/16 | 1 | 0 |
| 3 | Pϕ/64 | 1 | 1 |

The bit rate error in asynchronous mode is calculated using the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\text{Error (\%)} = \left\{\frac{\text{P}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 64 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 32 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{\frac{\text{P}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 32 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 16 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

**Table 22.6** list the examples of the BRR register setting in asynchronous mode, and **Table 22.7** list the examples of the BRR register setting in clock synchronous mode.

Table 22.6 Bit Rates and BRR Register Settings in Asynchronous Mode

| | P0ϕ (MHz) | | |
|---|---|---|---|
| | 100 | | |
| Bit Rate (bps) | n | N | Error (%) |
| 150 | — | — | — |
| 300 | 3 | 162 | −0.15 |
| 600 | 3 | 80 | 0.47 |
| 1200 | 2 | 162 | −0.15 |
| 2400 | 2 | 80 | 0.47 |
| 4800 | 1 | 162 | −0.15 |
| 9600 | 1 | 80 | 0.47 |
| 14400 | 0 | 216 | 0.01 |
| 19200 | 0 | 162 | −0.15 |
| 28800 | 0 | 108 | −0.45 |
| 31250 | 0 | 99 | 0.00 |
| 38400 | 0 | 80 | 0.47 |
| 115200 | 0 | 26 | 0.47 |
| 500000 | 0 | 5 | *1 |

**Note:** These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0.
When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled.
When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled.
Configure settings so the range of error is no greater than 1%.

Note 1. Values for the blank cells in the table can be set using the MDDR register.
For details, see **Section 22.2.9, Modulation Duty Register (MDDR)** and the **Table 22.12**.

Table 22.7 Bit Rates and BRR Register Settings in Clock Synchronous Mode

| | P0ϕ (MHz) | |
|---|---|---|
| | 100 | |
| Bit Rate (bps) | n | N |
| 250 | — | — |
| 500 | — | — |
| 1000 | — | — |
| 2500 | 3 | 155 |
| 5000 | 3 | 77 |
| 10000 | 3 | 38 |
| 25000 | 1 | 249 |
| 50000 | 1 | 124 |
| 100000 | 0 | 249 |
| 250000 | 0 | 99 |
| 500000 | 0 | 49 |
| 1000000 | 0 | 24 |
| 2500000 | 0 | 9 |
| 5000000 | 0 | 4 |

**Note:** Continuous transmission or reception is not possible.
Set the BRR register so that the range of error can fall within 1% or less.

**Remarks:** —: Setting is prohibited.

**Table 22.8** lists the maximum bit rates for various frequencies in asynchronous mode when the baud rate generator is used. **Table 22.9** lists the maximum bit rates for various frequencies in clock synchronous mode when the baud rate generator is used. **Table 22.10** and **Table 22.11** list the maximum rates for external clock inputs in asynchronous mode and clock synchronous mode, respectively.

Table 22.8 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Asynchronous Mode)

| | | Settings | |
|---|---|---|---|
| Pϕ (MHz) | Maximum Bit Rate (bit/s) | n | N |
| 100 | 12500000 | 0 | 0 |

**Note:** These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 1. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is 1/2. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is 1/4.

Table 22.9 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Clock Synchronous Mode)

| | Discontinuous Transmission/Reception | | | Continuous Transmission/Reception | | |
|---|---|---|---|---|---|---|
| | | Settings | | | Settings | |
| Pϕ (MHz) | Maximum Bit Rate (bit/s) | n | N | Maximum Bit Rate (bit/s) | n | N |
| 100 | 25000000 | 0 | 0 | 12500000 | 0 | 1 |

Table 22.10 Maximum Bit Rates with External Clock Input (in Asynchronous Mode)

| Pϕ (MHz) | External Input Clock (MHz) | Maximum Bit Rate (bit/s) |
|---|---|---|
| 100 | 25.00 | 3125000 |

**Note:** This is an example when the SEMR.ABCS0 bit is 1. When the ABCS0 bit is set to 0, the bit rate is 1/2.

Table 22.11 Maximum Bit Rates with External Clock Input (in Clock Synchronous Mode)

| Pϕ (MHz) | External Input Clock (MHz) | Maximum Bit Rate (bit/s) |
|---|---|---|
| 100 | 8.33 | 8330000 |

### 22.2.9 Modulation Duty Register (MDDR)

The MDDR register corrects the bit rate adjusted by the BRR register. The value after reset of this register is H'FF. When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (MDDR/256). The relationship between the MDDR register setting and the bit rate (B) is given by the following formula. The MDDR register is located in the same address as that of the BRR register and is selected when the MDDRS bit in SEMR is 1. This register is only writable when TE = RE = 0 in the SCR register. b7 in this register is fixed to 1.

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | | |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The formulae below show the relationships between the MDDR setting and the bit rate (B) when the bit rate modulation function is used.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$B = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$B = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

[Clock synchronous mode]

$$B = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

When the bit rate modulation is used, the bit rate average error is given by the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\text{Error (\%)} = \left\{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

B: Bit rate (bits/s)
N: BRR register setting ($0 \leq N \leq 255$)
The setting must satisfy the electrical characteristics).
P0ϕ: Operating frequency for peripheral modules (MHz)
MDDR: MDDR setting ($128 \leq MDDR \leq 256$)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see **Table 22.5**).

Table 22.12 Bit Rates and BRR and MDDR Registers Settings in Asynchronous Mode

| | P0ϕ (MHz) | | | |
|---|---|---|---|---|
| | 100 | | | |
| Bit Rate (bps) | n | N | MDDR | Error (%) |
| 150 | 3 | 252 | 199 | 0.02 |
| 300 | 3 | 161 | 255 | 0.08 |
| 600 | 3 | 80 | 255 | 0.08 |
| 1200 | 2 | 161 | 255 | 0.08 |
| 2400 | 2 | 80 | 255 | 0.08 |
| 4800 | 1 | 161 | 255 | 0.08 |
| 9600 | 1 | 80 | 255 | 0.08 |
| 14400 | — | — | — | — |
| 19200 | 0 | 161 | 255 | 0.08 |
| 28800 | 0 | 107 | 254 | 0.08 |
| 31250 | — | — | — | — |
| 38400 | 0 | 80 | 253 | 0.08 |
| 115200 | 0 | 26 | 255 | 0.08 |
| 500000 | 0 | 5 | 246 | 0.10 |

**Note:** These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled. Configure settings so the range of error is no greater than 1%.

## 22.2.10 FIFO Control Register (FCR)

The FCR register resets the quantity of data in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR) and specifies the number of triggers. This register also specifies whether to enable the loop-back test.

The CPU can always read and write to the FCR register.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | RSTRG[2:0] | | | RTRG[1:0] | | TTRG[1:0] | | MCE | TFRST | RFRST | LOOP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | LOOP | 0 | R/W | Loop-Back Test<br>0: Loop back test is disabled.<br>1: Loop back test is enabled |
| b1 | RFRST | 0 | R/W | Receive FIFO Data Register Reset<br>0: Normal operation<br>1: Resets the FRDR register. |
| b2 | TFRST | 0 | R/W | Transmit FIFO Data Register Reset<br>0: Normal operation<br>1: Resets the FTDR register. |
| b3 | MCE | 0 | R/W | Modem Control Enable<br>0: Model signal is disabled.*1<br>1: Model signal is enabled. |
| b5, b4 | TTRG[1:0] | All 0 | R/W | Transmit FIFO Data Trigger Number Select<br>b5 b4<br>0 0: 8 (8)*2<br>0 1: 4 (12)*2<br>1 0: 2 (14)*2<br>1 1: 0 (16)*2 |
| b7, b6 | RTRG[1:0] | All 0 | R/W | Receive FIFO Data Trigger Number Select<br>In asynchronous mode:<br>b7 b6<br>0 0: 1<br>0 1: 4<br>1 0: 8<br>1 1: 14<br>In clock synchronous mode:<br>b7 b6<br>0 0: 1<br>0 1: 2<br>1 0: 8<br>1 1: 14 |
| b10 to b8 | RSTRG[2:0] | All 0 | R/W | RTS# Output Active Trigger Number Select<br>b10 b8<br>0 0 0: 15<br>0 0 1: 1<br>0 1 0: 4<br>0 1 1: 6<br>1 0 0: 8<br>1 0 1: 10<br>1 1 0: 12<br>1 1 1: 14 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b15 to b11 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. The CTS# input level does not affect the transmit operation. Similarly, the RTS# input level does not affect the receive operation.

Note 2. Values in parentheses mean the number of empty bytes in the FTDR register when the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

### LOOP Bit (Loop-Back Test)

Internally connects between the transmit output pin (TXD) and the receive input pin (RXD) and between the RTS# pin and the CTS# pin, to perform loop-back testing.

### RFRST Bit (Receive FIFO Data Register Reset)

Disables the receive data in the receive FIFO data register (FRDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

### TFRST Bit (Transmit FIFO Data Register Reset)

Disables the transmit data in the transmit FIFO data register (FTDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

### MCE Bit (Modem Control Enable)

Specifies whether to enable or disable the modem control signals, CTS# and RTS#. In clock synchronous mode, this bit should always be set to 0.

### TTRG[1:0] Bits (Transmit FIFO Data Trigger Number Select)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR). When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

The setting in these bits is valid when the TTRGS bit in the FTCR register is 0. When the TTRGS bit in the FTCR register is 1, the setting of the TFTC[4:0] bits in the FTCR register is valid.

### RTRG[1:0] Bits (Receive FIFO Data Trigger Number Select)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR). When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

The setting in these bits is valid when the RTRGS bit in the FTCR register is 0. When the RTRGS bit in the FTCR register is 1, the setting of the RFTC[4:0] bits in the FTCR register is valid.

### RSTRG[2:0] Bits (RTS# Output Active Trigger Number Select)

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number, the RTS# signal is in the high state.

The setting in these bits is only valid when a modem signal is enabled by the MCE bit in this register in asynchronous mode.

## 22.2.11 FIFO Data Count Register (FDR)

The FDR register indicates the quantity of data stored in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR).

This register indicates the quantity of transmit data in the FTDR register with the 8 higher-order bits, and the quantity of receive data in the FRDR register with the 8 lower-order bits. The CPU can always read the FDR register.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | T[4:0] | | | | | — | — | — | R[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b4 to b0 | R[4:0] | All 0 | R | Receive Data Quantity in FRDR<br>Indicate the quantity of receive data stored in the FRDR register. |
| b7 to b5 | — | All 0 | R | Reserved<br>These bits are read as 0. |
| b12 to b8 | T[4:0] | All 0 | R | Non-Transmitted Data Quantity in FTDR<br>Indicate the quantity of non-transmitted data stored in the FTDR register. |
| b15 to b13 | — | All 0 | R | Reserved<br>These bits are read as 0. |

### R[4:0] Bits

Indicate the quantity of receive data stored in the FRDR register.

H’00 means no received data, and H’10 means that all of the received data is stored in the FRDR register.

### T[4:0] Bits

Indicate the quantity of non-transmitted data stored in the FTDR register.

H’00 means no transmit data, and H’10 means that all of the data for transmission is stored in the FTDR register.

## 22.2.12 Serial Port Register (SPTR)

The SPTR register controls input/output and data of the pins multiplexed to SCIFA function. The CPU can always read and write to the SPTR register.

NOTE

b6, b4, b2, and b0 of this register respectively indicate the input status of their corresponding pins. See the descriptions for each bit for details. Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RTS2IO | RTS2DT | CTS2IO | CTS2DT | SCKIO | SCKDT | SPB2IO | SPB2DT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | 0 | x | 0 | x | 0 | x |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Remarks:** x: Undefined

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | SPB2DT | x | R/W | Serial Port Break Data Select<br>Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2IO bit. See **Table 22.15**. |
| b1 | SPB2IO | 0 | R/W | Serial Port Break Input/Output<br>Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit. |
| b2 | SCKDT | x | R/W | SCK Port Data Select<br>Controls the SCK pin in combination with the CM bit in the SMR register, the SCKIO bit, and the CKE1 and CKE0 bits in the SCR register. See **Table 22.17**. |
| b3 | SCKIO | 0 | R/W | SCK Port Input/Output<br>Controls the SCK pin in combination with the CM bit in the SMR register, the SCKDT bit, and the CKE1 and CKE0 bits in the SCR register. See **Table 22.17**. |
| b4 | CTS2DT | x | R/W | CTS# Port Data Select<br>Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See **Table 22.14**.<br>The SCIF 3 and SCIF 4 channels are not supported. |
| b5 | CTS2IO | 0 | R/W | CTS# Port Output Specify<br>Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See **Table 22.14**.<br>The SCIF 3 and SCIF 4 channels are not supported. |
| b6 | RTS2DT | x | R/W | RTS# Port Data Select<br>Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See **Table 22.13**.<br>The SCIF 3 and SCIF 4 channels are not supported. |
| b7 | RTS2IO | 0 | R/W | RTS# Port Output Specify<br>Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See **Table 22.13**.<br>The SCIF 3 and SCIF 4 channels are not supported. |
| b15 to b8 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

**Remarks:** x: Undefined

### SPB2DT Bit (Serial Port Break Data Select)

This bit specifies the output level of the TXD pin when the setting of the SCR.TE bit is 0. The RXD pin input status can be read from this bit regardless of the SPB2IO bit setting. However, the RXD pin function must have been selected with the general I/O port.

### SPB2IO Bit (Serial Port Break Input/Output)

Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.

### SCKDT Bit (SCK Port Data Select)

The SCK pin status can be read from this bit regardless of the SCKIO bit setting. (When the SCK pin is used for input, the input signal is invalid (has no means) but the pin status can be read.) However, the SCK pin function must have been selected with the general I/O port.

### SCKIO Bit (SCK Port Input/Output)

Specifies input or output status of the SCK pin. This bit controls the SCK pin in combination with the SCKDT bit, the CM bit in the SMR register, and the CKE1 and CKE0 bits in the SCR register.

### CTS2DT Bit (CTS# Port Data Select)

The status of the CTS# pin can be read from this bit regardless of the CTS2IO bit setting. However, the CTS# pin function must have been selected with the general I/O port.

### RTS2DT Bit (RTS# Port Data Select)

The status of the RTS# pin can be read from this bit regardless of the RTS2IO bit setting. However, the RTS# pin function must have been selected with the general I/O port

Table 22.13 RTS# Pin Status

| FCR.MCE Bit Setting | RTS2IO Bit Setting | RTS2DT Bit Setting | RTS# Pin Status |
|---|---|---|---|
| 0 | 0 | × | Setting prohibited*1 |
| 0 | 1 | 0 | Low output |
| 0 | 1 | 1 | High output |
| 1 | × | × | Modem control output |

**Remarks:** ×: Don't care

Note 1. There is no problem with the initial setting if the RTS# pin is not used.

Table 22.14 CTS# Pin Status

| FCR.MCE Bit Setting | CTS2IO Bit Setting | CTS2DT Bit Setting | CTS# Pin Status |
|---|---|---|---|
| 0 | 0 | × | Setting prohibited*1 |
| 0 | 1 | 0 | Low output |
| 0 | 1 | 1 | High output |
| 1 | × | × | Modem control input |

**Remarks:** ×: Don't care

Note 1. There is no problem with the initial setting if the CTS# pin is not used.

Table 22.15 TXD Pin Status

| SCR.TE Bit Setting | SPB2IO Bit Setting | SPB2DT Bit Setting | TXD Pin Status |
|---|---|---|---|
| 0 | 0 | × | Setting prohibited |
| 0 | 1 | 0 | Low output |
| 0 | 1 | 1 | High output |
| 1 | × | × | Transmit data output |

**Remarks:** ×: Don’t care

## 22.2.13 Line Status Register (LSR)

The LSR register is a 16-bit register. The PER and FER bits indicate the number of receive errors in the receive FIFO data register. 1 cannot be written to the OREER status flag. The flag should be read as 1 prior to clearing it to 0.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | PER[3:0] | | | | — | — | FER[3:0] | | | | — | ORER |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R(W)*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | ORER | 0 | R/(W) *1 | Overrun Error Flag<br>0: Reception is in progress or has normally completed.<br>1: An overrun error has occurred during reception. |
| b1 | — | 0 | R | Reserved<br>This bit is read as 0. |
| b5 to b2 | FER[3:0] | All 0 | R | Framing Error Count<br>Indicates the quantity of data with a framing error among the receive data stored in the receive FIFO data register (FRDR). |
| b7, b6 | — | All 0 | R | Reserved<br>These bits are read as 0. |
| b11 to b8 | PER[3:0] | All 0 | R | Parity Error Count<br>Indicates the quantity of data with a parity error among the receive data stored in the receive FIFO data register (FRDR). |
| b15 to b12 | — | All 0 | R | Reserved<br>These bits are read as 0. |

Note 1. To clear the flag, 0 can be only written after 1 is read.

### ORER Bit (Overrun Error Flag)

Indicates that receive operation abnormally stops due to occurrence of an overrun error. This flag is not affected and retains its previous state if the RE bit in the serial control register (SCR) is cleared to 0. The receive FIFO data register (FRDR) retains the data before an overrun error occurred, and newly received data is lost. When the ORER bit is set to 1, the SCIFA cannot continue subsequent serial reception.

[Setting condition]

- When the next serial reception is completed with the receive FIFO in full state (16-byte data is received)

[Clearing condition]

- When 0 is written to ORER after being read as 1.

*Note*: When the internal clock is selected while the SCIFA is in clock synchronous mode, the amount of receive data can be controlled, so no overrun occurs.

### FER[3:0] Bits (Framing Error Count)

The values of bits 5 to 2 indicate the quantity of data with a framing error after the ER bit in the FSR register is set. Reading 0000 from the FER[3:0] bits means all 16-byte receive data in the FRDR register have a framing error.

### PER[3:0] Bits (Parity Error Count)

The values of bits 11 to 8 indicate the quantity of data with a parity error after the ER bit in the FSR register is set. Reading 0000 from the PER[3:0] bits means all 16-byte receive data in the FRDR register have a parity error.

## 22.2.14 Serial Extended Mode Register (SEMR)

The SEMR register specifies either LSB or MSB first, enables the noise cancellation, operation in normal or double-speed mode of the baud rate generator, and bit rate modulation, and selects the modulation register and the sampling count (either 8 or 16 times).

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | BGDM | — | BRME | MDDRS | DIR | NFEN | — | ABCS0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | ABCS0 | 0 | R/W | Asynchronous Base Clock Select<br>0: Operates on a frequency 16 times the transfer rate as the base clock.<br>1: Operates on a frequency 8 times the transfer rate as the base clock. |
| b1 | — | 0 | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |
| b2 | NFEN | 0 | R/W | Noise Cancellation Enable<br>0: Noise cancellation for the RxD pin is disabled.<br>1: Noise cancellation for the RxD pin is enabled. |
| b3 | DIR | 0 | R/W | Data Transfer Direction Select<br>0: Transmits the data in the FTDR register by the LSB-first method.<br>The received data is stored in the FRDR register by the LSB- first method.<br>1: Transmits the data in the FTDR register by the MSB-first method.<br>The received data is stored in the FRDR register by the MSB- first method. |
| b4 | MDDRS | 0 | R/W | Modulation Duty Register Select<br>0: BRR register is accessible.<br>1: MDDR register is accessible. |
| b5 | BRME | 0 | R/W | Bit Rate Modulation Enable<br>0: Bit rate modulation is disabled.<br>1: Bit rate modulation is enabled. |
| b6 | — | 0 | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |
| b7 | BGDM | 0 | R/W | Baud Rate Generator Double- Speed Mode Select<br>0: Baud rate generator normal mode:<br>Baud rate generator operates on the clock signal produced by dividing the clock source by two.<br>1: Baud rate generator double-speed mode:<br>Baud rate generator operates on the clock signal produced by the clock source (no frequency division). |

### ABCS0 Bit (Asynchronous Base Clock Select)

Selects the base clock for 1-bit period in asynchronous mode.

This bit setting is valid only in asynchronous mode (i.e., when the CM bit in the SMR register is 0).

### NFEN Bit (Noise Cancellation Enable)

Reduces noise of the input to the RxD pin. This function is only valid in asynchronous mode. For details, see **Section 22.7, Noise Cancellation**.

In clock synchronous mode, this bit should always be set to 0.

### DIR Bit (Data Transfer Direction Select)

Selects the serial communication format. This bit is valid only when the transmit/receive data is in 8-bit formats.*1

**Note 1.** Asynchronous mode or clock synchronous mode with the 8-bit data length

### MDDRS Bit (Modulation Duty Register Select)

Selects the register to be enabled access to it.

### BRME Bit (Bit Rate Modulation Enable)

Specifies whether to enable or disable the bit rate modulation.

### BGDM Bit (Baud Rate Generator Double-Speed Mode Select)

Selects operating mode of the baud rate generator. When setting 1 in this bit, the baud rate generator included in the SCIFA operates in double-speed mode. The setting of this bit is only effective in asynchronous mode (SMR.CM bit = 0) when the internal clock is selected as the clock source (SCR.CKE[1:0] = 00b). Use normal mode under any other settings.

## 22.2.15 FIFO Trigger Control Register (FTCR)

The FTCR register is a 16-bit register that specifies FIFO trigger conditions. The CPU can always read from and write to the FTCR register.

| Bit | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RTRGS | — | — | RFTC[4:0] | | | | | TTRGS | — | — | TFTC[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b4 to b0 | TFTC[4:0] | All 1 | R/W | Transmit FIFO Data Trigger Number<br>H'00: Transmit data trigger number is 0.<br>H'0F: Transmit data trigger number is 15.<br>Do not set H'10 to H'1F in these bits. |
| b6, b5 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b7 | TTRGS | 0 | R/W | Transmit Trigger Select<br>0: TTRG[1:0] bits in FCR are valid.<br>1: TFTC[4:0] bits in FTCR are valid. |
| b12 to b8 | RFTC[4:0] | All 1 | R/W | Receive FIFO Data Trigger Number<br>H'01: Receive data trigger number is 1.<br>H'10: Receive data trigger number is 16.<br>Do not set H'00 and H'11 to H'1F in these bits. |
| b14, b13 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |
| b15 | RTRGS | 0 | R/W | Receive Trigger Select<br>0: RTRG[1:0] bits in FCR are valid.<br>1: RFTC[4:0] bits in FTCR are valid. |

### TFTC[4:0] Bits (Transmit FIFO Data Trigger Number)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR).

When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

### RFTC[4:0] Bits (Receive FIFO Data Trigger Number)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR).

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

## 22.3 Operation

### 22.3.1 Overview

For serial communication, the SCIFA can select either asynchronous mode in which characters are synchronized individually or a clock synchronous mode in which communication is synchronized with clock pulses.

The SCIFA has a 16-stage FIFO buffer for both transmission and receptions, reducing the overhead of the CPU and enabling continuous high-speed communication. The RTS# and CTS# signals are provided as modem control signals. Selection of a transmission/reception format is enabled with the serial mode register (SMR). **Table 22.16** shows the transmission format which can be selected in the serial mode register (SMR). As shown in **Table 22.17**, the SCIFA clock source can be selected by the combination of the CKE1 and CKE0 bits in the serial control register (SCR).

#### (1) Asynchronous Mode

- Data length is selectable either 7 or 8 bits
- Parity addition and 1- or 2-bit stop bit addition are selectable.
  (The combination of the preceding selections determines the transmission/reception format and character length).
- In reception, it is possible to detect framing errors, parity errors, receive FIFO data full, overrun errors, receive data ready, and breaks.
- The stored data quantities are indicated in the FIFO data count register (FDR), respectively for transmit and receive FIFO data.
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of on-chip baud rate generator and can output the clock with a frequency 16 (or 8) times the bit rate.
  When an external clock is selected, the external clock input must have a frequency 16 (or 8) times the bit rate. (The on-chip baud rate generator is not used.)

#### (2) Clock Synchronous Mode

- The transmission/reception format is fixed to the 8-bit data length.
- In reception, it is possible to detect overrun errors (ORER).
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of the on-chip baud rate generator, and outputs this clock to external devices as the synchronous clock.
  When an external clock is selected, the SCIFA operates on the input synchronous clock not using the on-chip baud rate generator.

Table 22.16 SMR Register Settings and SCIFA Communication Formats

| SMR Register | | | | | SCIFA Transmission/Reception Format | | |
|---|---|---|---|---|---|---|---|
| b7 | b6 | b5 | b3 | | | | |
| CM | CHR | PE | STOP | Mode | Data Length | Parity Bit | Stop Bit Length |
| 0 | 0 | 0 | 0 | Asynchronous mode | 8 bits | Not set | 1 bit |
| | | | 1 | | | | 2 bits |
| | | 1 | 0 | | | Set | 1 bit |
| | | | 1 | | | | 2 bits |
| | 1 | 0 | 0 | | 7 bits | Not set | 1 bit |
| | | | 1 | | | | 2 bits |
| | | 1 | 0 | | | Set | 1 bit |
| | | | 1 | | | | 2 bits |
| 1 | × | × | × | Clock synchronous mode | 8 bits | Not set | None |

**Remarks:** ×: Don't care

Table 22.17 SMR, SCR, and SPTR Register Settings and SCIFA Clock Source Selection

| SMR Register | SCR Register | | SPTR Register | | | | |
|---|---|---|---|---|---|---|---|
| b7 | b1 | b0 | b3 | b2 | | | |
| CM | CKE1 | CKE0 | SCKIO | SCKDT | Mode | Clock Source | SCK Pin Function |
| 0 | 0 | 0 | 0 | × | Asynchronous mode | Internal | Input pin (input signal invalid) (Initial state) |
| | | | 1 | 0 | | | SCK pin state: Low |
| | | | 1 | 1 | | | SCK pin state: High |
| | | 1 | × | × | | | Outputs a clock with frequency 16/8 times the bit rate*1 |
| | 1 | 0 | × | × | | External | Inputs a clock with frequency 16/8 times the bit rate*2 |
| | | 1 | × | × | | Setting prohibited | |
| 1 | 0 | × | × | × | Clock synchronous mode | Internal | Outputs the synchronous clock |
| | 1 | 0 | × | × | | External | Inputs the synchronous clock |
| | | 1 | × | × | | Setting prohibited | |

**Remarks:** ×: Don't care

Note 1. SEMR.ABCS0 = 0: Output a clock that has a frequency 16 times the bit rate. SEMR.ABCS0 = 1: Output a clock that has a frequency 8 times the bit rate.

Note 2. SEMR.ABCS0 = 0: Input a clock that has a frequency 16 times the bit rate. SEMR.ABCS0 = 1: Input a clock that has a frequency 8 times the bit rate.

### 22.3.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCIFA are independent, so full duplex communication is possible. The transmitter and receiver are 16-stage FIFO buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmission and reception.

**Figure 22.2** shows the general format of asynchronous serial communication.

In asynchronous serial communication, the communication line is normally held in the mark (high) state. The SCIFA monitors the line and starts serial communication when the line goes to the space (low) state, considered as a start bit. One serial character consists of a start bit (low), data (LSB first when LSB-first transfer is selected), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, the SCIFA synchronizes at the falling edge of the start bit. The SCIFA samples each data bit on the eighth pulse of a clock with a frequency 16 or 8 times the bit rate*[1]. Receive data is latched at the center of each bit.

**Note 1.** When the SEMR.ABCS0 bit = 0, data is sampled on the eighth pulse of a clock with a frequency 16 times the bit rate.
When the SEMR.ABCS0 bit = 1, data is sampled on the fourth pulse of a clock with a frequency 8 times the bit rate.

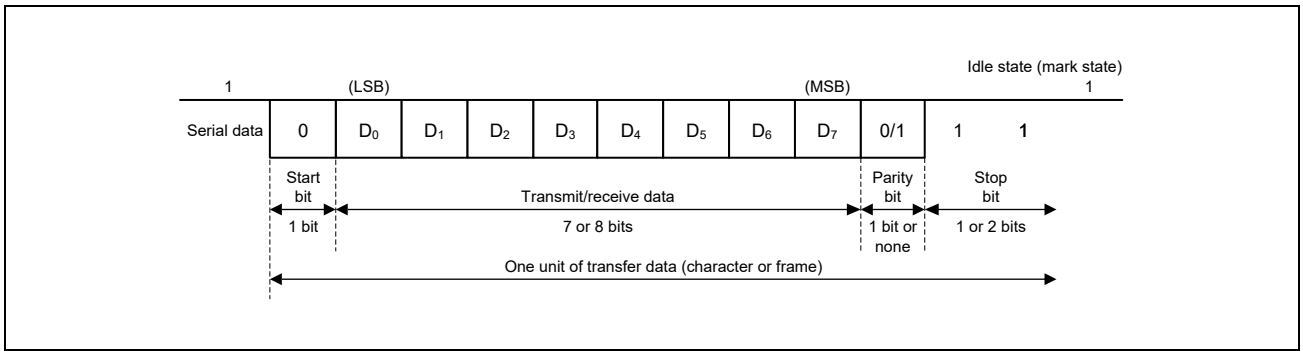


Figure 22.2 Data Format in Asynchronous Communication
(8-Bit Data with Parity and Two Stop Bits when LSB-First Transfer is Selected)

### (1) Transmit/Receive Formats

**Table 22.18** lists the eight communications formats that can be selected in asynchronous mode. The format is selected by setting in the serial mode register (SMR).

Table 22.18 Serial Communications Formats (in Asynchronous Mode)

| SMR Setting | | | Serial Transmit/Receive Format and Frame Length | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CHR | PE | STOP | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| 0 | 0 | 0 | START | 8-bit data | | | | | | | | STOP | | |
| | | 1 | START | 8-bit data | | | | | | | | STOP | STOP | |
| | 1 | 0 | START | 8-bit data | | | | | | | | P | STOP | |
| | | 1 | START | 8-bit data | | | | | | | | P | STOP | STOP |
| 1 | 0 | 0 | START | 7-bit data | | | | | | | STOP | | | |
| | | 1 | START | 7-bit data | | | | | | | STOP | STOP | | |
| | 1 | 0 | START | 7-bit data | | | | | | | P | STOP | | |
| | | 1 | START | 7-bit data | | | | | | | P | STOP | STOP | |

**Note:** START: Start bit
STOP: Stop bit
P: Parity bit

### (2) Clock

An SCIFA transmit/receive clock can be selected from two types of clock sources: the internal clock generated by the on- chip baud rate generator, the external clock input from the SCK pin. The clock source is selected by the settings of the CM bit in the serial mode register (SMR), the CKE[1:0] bits in the serial control register (SCR), and the ACS0 bit in the serial extended mode register (SEMR). For clock source selection, refer to **Table 22.17**.

When an external clock is input at the SCK pin, it must have a frequency equal to 16/8 times the desired bit rate.

When the SCIFA operates on an internal clock, it can output a clock signal on the SCK pin. The frequency of this output clock is 16/8 times the desired bit rate.

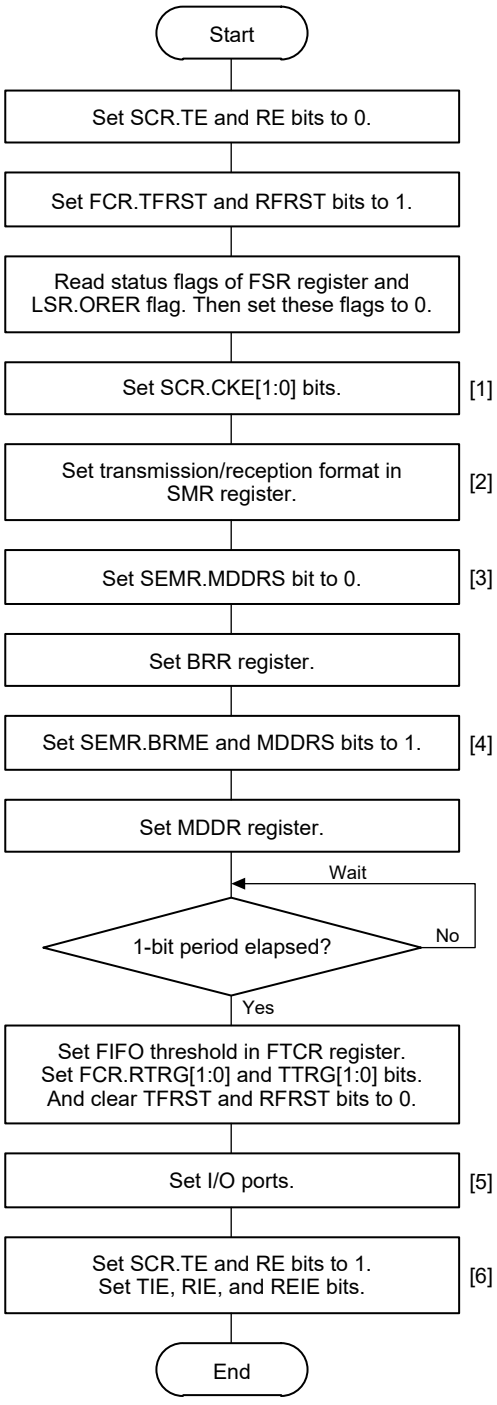
### (3) Transmitting and Receiving Data

#### SCIFA Initialization (in Asynchronous Mode)

Before transmitting or receiving data, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA as follows.

When changing operating mode or communication format, always clear the TE and RE bits in the SCR register to 0 before following the procedure given below. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing TE and RE to 0, however, does not initialize the serial status register (FSR), transmit FIFO data register (FTDR), or receive FIFO data register (FRDR), which retain their previous contents. Clear TE to 0 after all transmit data has been transmitted and the TEND flag in the FSR register is set. The TE bit can be cleared to 0 during transmission, but the transmit data (the TXD pin output level) after the TE bit is cleared to 0 depends on the settings of the SPB2IO and SPB2DT bits in the SPTR register. Set the TFRST bit in the FCR register to 1 and reset the FTDR register before TE is set to 1 again to start transmission.

When an external clock is used, the clock should not be stopped during initialization or subsequent operation. SCIFA operation becomes unreliable if the clock is stopped. **Figure 22.3** shows a sample flowchart for initializing the SCIFA in asynchronous mode.



[1] Set the TIE, RIE, TE, and RE bits in the SCR register to 0 before setting the CKE[1:0] bits.

[2] Set the transmission/reception format in the SMR register.

[3] Clear the SEMR.MDDRS bit to 0 and write a value corresponding to the bit rate in the BRR register. Not necessary if an external clock is used.

[4] Set the SEMR.BRME and MDDRS bits to 1 and write a value corresponding to the bit rate in the MDDR register. Not necessary if an external clock is used. Wait for at least 1-bit period before proceeding to the next step.

[5] Set I/O ports and the MPC register so that they can be used as the SCK, TXD, and RXD pins.

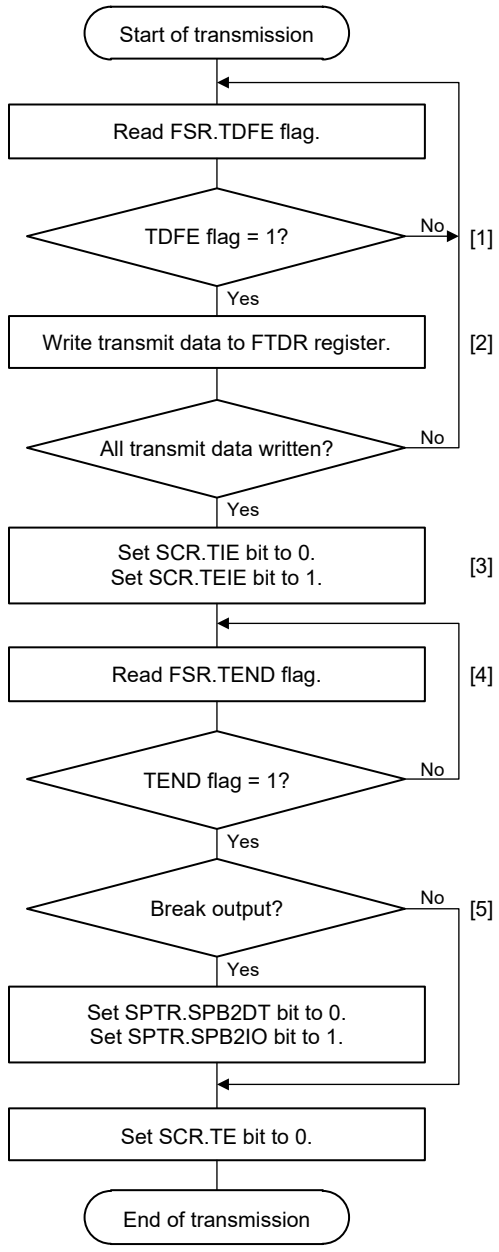
[6] After setting the MDDR register, wait for at least 1-bit period and then write 1 to the SCR.TE or RE bit. To permit interrupt requests, set TIE, RIE and REIE bits to 1. Setting the TE and RE bits to 1 makes the TXD and RXD pins available to be used. The TXD pin enters the mark state and the RXD pin enters the idle state waiting for a start bit.

Figure 22.3 Sample Flowchart for SCIFA Initialization in Asynchronous Mode

### Transmitting Serial Data (in Asynchronous Mode)

**Figure 22.4** shows a sample flowchart for serial transmission in asynchronous mode.

Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.



[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data to the FTDR register. The transmit data quantity that can be written is “16 - FDR.T[4:0]”. A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Serial transmission end procedure (when TXIF or TEIF interrupt is used):
After the last transmission data is written to the FTDR register, set the TIE bit to 0 and the TEIE bit to 1 in the SCR register. If the DMAC is activated to write the transmit data to the FTDR register, enable the transmit end interrupt. This will generate a CPU interrupt request when the last transmit data is written in the FTDR register. The TIE and TEIE bit settings will be changed by the CPU interrupt process.
This procedure is unnecessary if the TXIF or TEIF interrupt is not used.

[4] Serial transmission end confirmation:
Read the FSR register and confirm that the TEND flag has changed to 1.
A change of the TEND flag from 0 to 1 can be known by a TEIF interrupt request.

[5] Break output during serial transmission:
To cause a break to be output during serial transmission, set the SPB2DT bit to 0 and the SPB2IO bit to 1 in the SPTR register. Then set the SCR.TE bit to 0.*1

In Step [1], the number of data bytes that can be written can be checked by the FDR.T[4:0] flag (non-transmitted data quantity in the FTDR register).

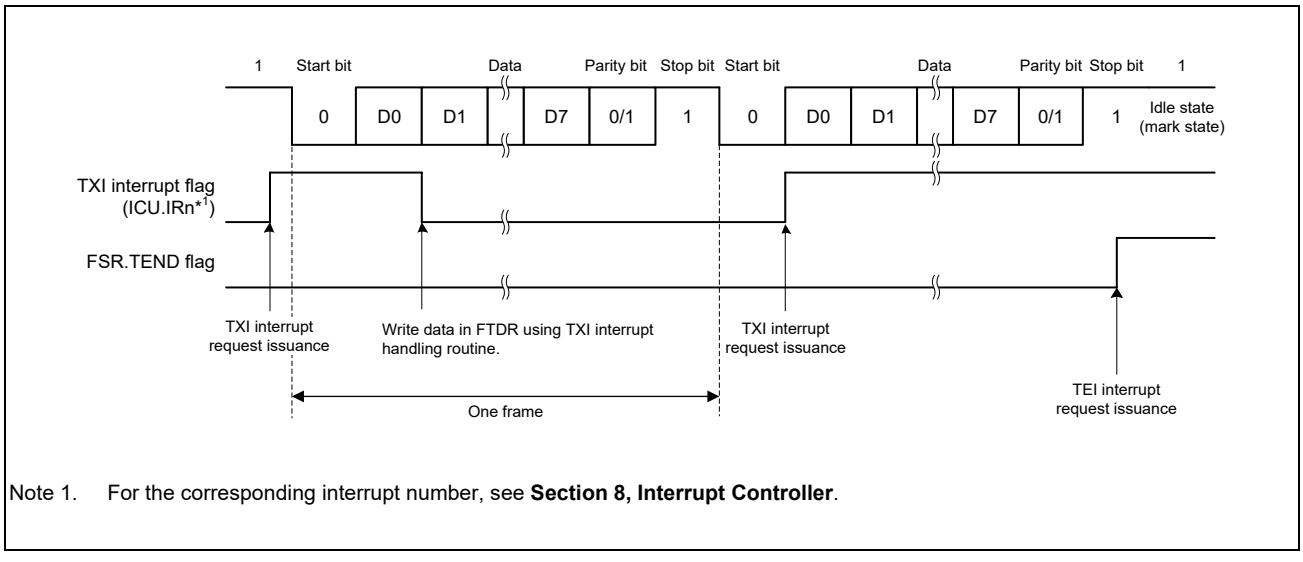
Note 1. The SPB2DT bit of the SPTR register indicates the input status of the RXD pin. Writings to the SPB2DT and SPB2IO bits of this register in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written to the SPB2DT bit. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

Figure 22.4 Sample Flowchart for Transmitting Serial Data in Asynchronous Mode

In asynchronous mode, the SCIFA performs serial transmission as described below.

1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number specified in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag is set. If the TIE bit in the serial control register (SR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated. The serial transmit data is output from the TXD pin in the following order.
   a) Start bit: One-bit 0 is output.
   b) Transmit data: 8- or 7-bit data is output in LSB-first order (when LSB-first transfer is selected).
   c) Parity bit: One parity bit (even or odd parity) is output. (A format in which a parity bit is not output can also be selected.)
   d) Stop bit(s): One or two 1 bits (stop bits) are output.
   e) Mark state: 1 is output continuously until the start bit that starts the next transmission is output.
3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the stop bit. If data is present, the data is transferred from the FTDR register to the TSR register, the stop bit is output, and then serial transmission of the next frame is started. If there is no data to be transmitted, the TEND flag in the FSR register is set to 1, the stop bit is output, and then the SCIFA enters the mark state (high level) in which 1 is output continuously.

**Figure 22.5** shows an example of the operation for transmission in asynchronous mode.



Note 1. For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

Figure 22.5 Example of Transmit Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

4. When modem control is enabled, transmission can be stopped/resumed by the input level to the CTS# pin. When a high level is input to the CTS# pin during transmission, the SCIFA enters the mark state (high level) after completion of one-frame data transmission. When a low level is input to the CTS# pin, output of the next data to be transmitted begins with a start bit. **Figure 22.6** shows an example of the operation for transmission when using the modem control function.

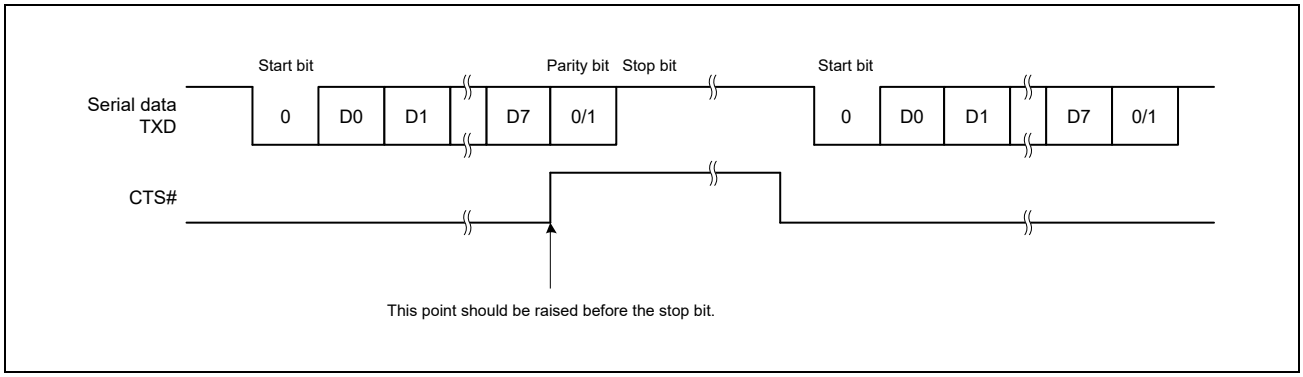


Figure 22.6 Example of Transmit Operation in Asynchronous Mode Using Modem Control Function (CTS#)

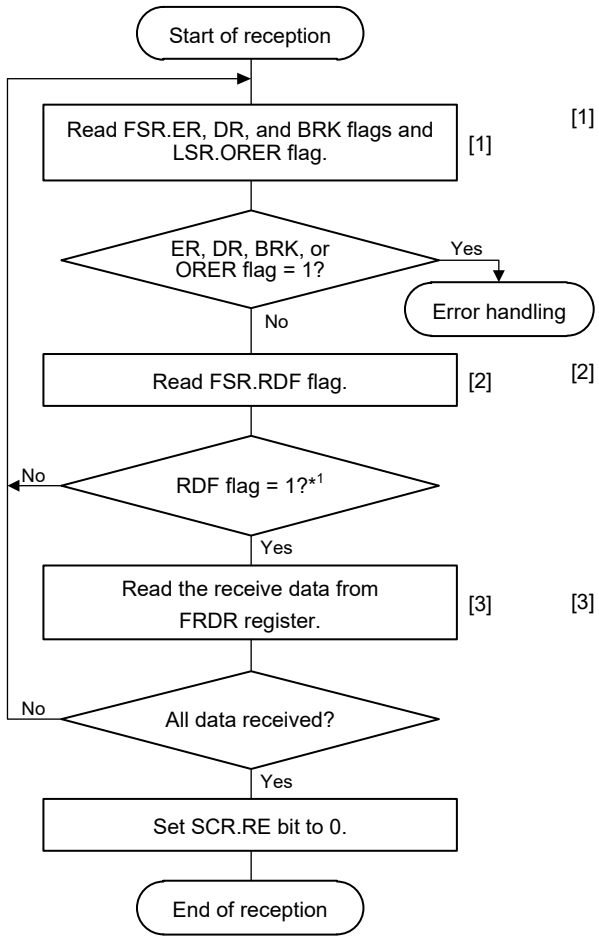
Receiving Serial Data (in Asynchronous Mode)

**Figure 22.7** and **Figure 22.8** show sample flowcharts for serial reception in asynchronous mode. Follow the procedure given below for serial data reception after enabling the SCIFA for reception.



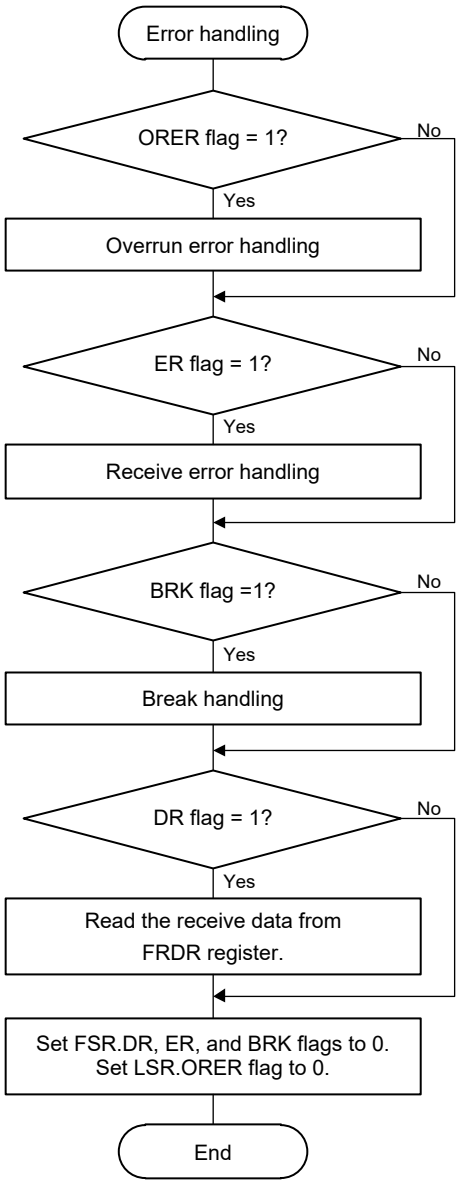
[1] Receive error handling and break detection:
When a receive error occurs, read the ER, DR, and BRK flags in the FSR register and the LSR.ORER flag to identify the error. After handling the error as specified, clear the ER, DR, BRK, and ORER flags to 0.
In the case where a framing error occurs, a break can be detected by reading the value of the RXD pin.
Error occurrence can be known by a BRIF, ERIF, or DRIF interrupt request.

[2] Check the SCIFA status and read the receive data:
Read the FSR register, confirm that the RDF flag is set to 1, and then read the receive data at least as much as the amount specified by the receive FIFO threshold from those stored in the FEDR register. The receive data quantity that can be read can be checked by the FDR.R[4:0] flag.
A change of the RDF flag from 0 to 1 can be known by an RXIF interrupt request.

[3] Serial reception continuation procedure:
When receive data is read from the FRDR register, the RDF flag is automatically cleared to 0.

Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 22.7 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (1)



- Whether a framing error or parity error has occurred in the received data that is read from the FRDR register can be checked with the FER and PER flags in the FSR register.
- When a break signal is received, the received data is not transferred to the FRDR register while the BRK flag is set to 1. However, note that the last data in the FRDR register is H'00 and the break data in which a framing error occurred is stored.

Figure 22.8 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (2)

In asynchronous mode, the SCIFA performs serial reception as described below.

1. The SCIFA monitors the communication line, and if a 0 start bit is detected, it performs internal synchronization to start reception.
2. The received data is stored into the RSR register in LSB-to-MSB order (when LSB-first transfer is selected).
3. The parity bit and stop bit are received.
   After receiving these bits, the SCIFA carries out the following checks.
   a) Stop bit check: The SCIFA checks whether the stop bit is 1. If there are two stop bits, only the first is checked.
   b) The SCIFA checks whether receive data can be transferred from the receive shift register (RSR) to the receive FIFO data register (FRDR).
   c) Parity bit check: The SCIFA checks whether the parity bit is an expected value.
   d) Overrun error check: The SCIFA checks whether the ORER flag is 0, indicating that the overrun error has not occurred.
   e) Break check: The SCIFA checks whether the BRK flag is 0, indicating that the break state is not set.

If all the above checks are passed, the receive data is stored in the FRDR register.

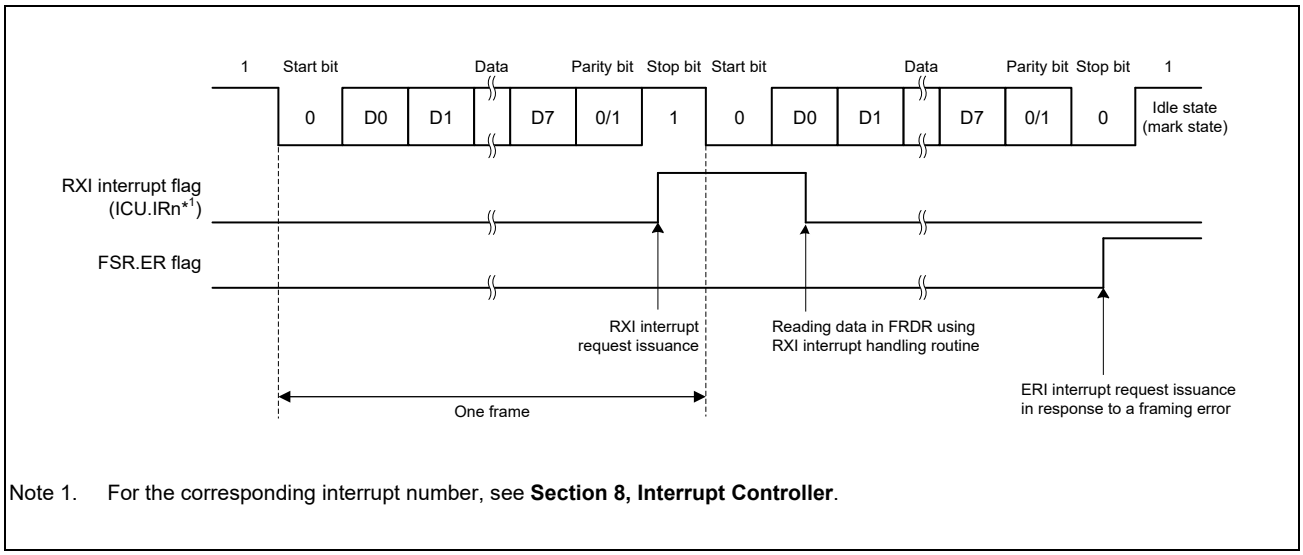
NOTE

When a parity error or a framing error occurs, reception is not suspended.

4. When receive data units equaling or exceeding the specified reception trigger number are stored in the receive FIFO data register (FRDR) and the RDF flag is changed to 1, a receive FIFO data full interrupt (RXI) request is generated while the RIE bit in the SCR register is set to 1. When the quantity of data in the FRDR register falls below the specified reception trigger number and the RIE bit in the SCR register is set to 1, a receive data ready interrupt (DRI) request is generated if no next data is received after the elapse of 15 ETUs*[1] from the last stop bit (the DR flag in the FSR register is 1). When the ER flag in the FSR register is changed to 1, a receive error interrupt (ERI) request is generated while the RIE or REIE bit in the SCR register is set to 1. When the BRK or ORER flag is changed to 1 in the FSR register, a break reception interrupt (BRI) request is generated while the RIE or REIE bit in the SCR register is set to 1.

**Note 1.** It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

**Figure 22.9** shows an example of the operation for reception in asynchronous mode.



Note 1. For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

Figure 22.9 Example of SCIFA Receive Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

5. When modem control is enabled, the RTS# signal that indicates the FRDR register has space is output. When the RTS# pin is at low level, reception is possible. The RTS# pin being at the high level indicates that the number of entries in the FRDR register is equal to or greater than the threshold for output of the active level of the RTS# signal and that the transmission of further data needs to be suspended until the FRDR register has enough space. **Figure 22.10** shows an example of the operation for reception in asynchronous mode when using the modem control function.

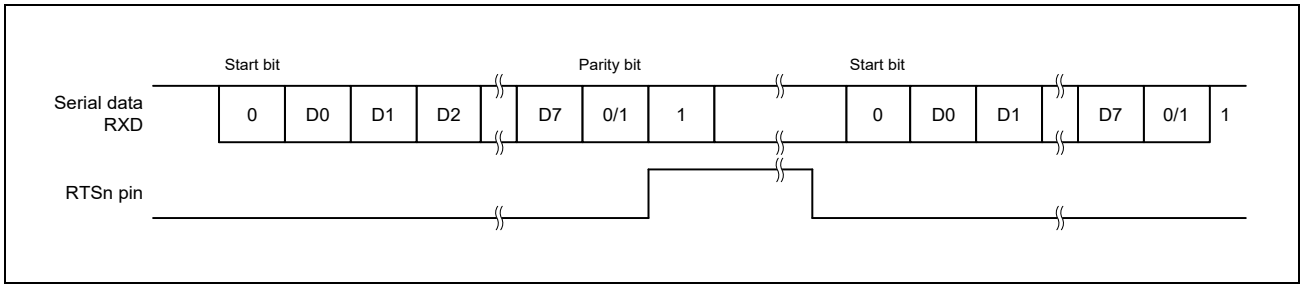


Figure 22.10 Example of SCIFA Receive Operation in Asynchronous Mode Using Model Control Function (RTS#)

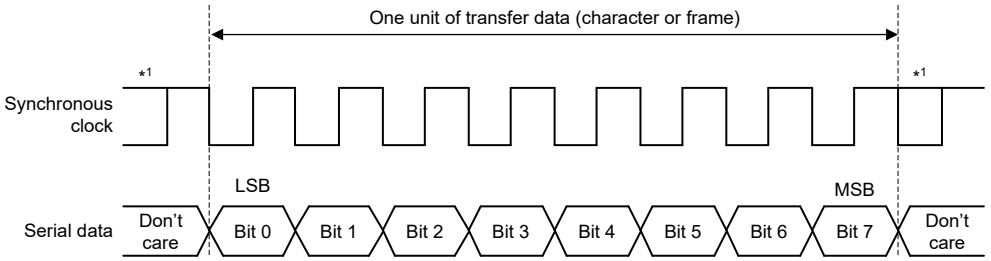
### 22.3.3 Operation in Clock Synchronous Mode

In clock synchronous mode, the SCIFA transmits and receives data in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

Full-duplex communication is possible because the SCIFA transmitter and receiver are independent and share the same clock. Since the transmitter and the receiver have 16-stage FIFO buffers, respectively, continuous transmission or reception is possible by reading or writing data while transmission or reception is in progress.

**Figure 22.11** shows the general format in clock synchronous serial communication.



Note 1. High level except in continuous transmission/reception

Figure 22.11 Data Format in Clock Synchronous Communication (when LSB-First Transfer is Selected)

In clock synchronous serial communication, each data bit is output on the communication line from one falling edge of the synchronous clock to the next. Data is guaranteed valid at the rising edge of the synchronous clock.

In each character, the serial data bits are transmitted in order from the LSB (first) to the MSB (last). After output of the MSB, the communication line remains in the state of the MSB (when LSB-first transfer is selected).

In clock synchronous mode, the SCIFA receives data by synchronizing with the rising edge of the synchronous clock.

#### (1) Transmit/Receive Formats

The data length is fixed at eight bits.

No parity bit can be added.

#### (2) Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the SCIFA transmit/receive clock according to the settings of the CM bit in the serial mode register (SMR) and the CKE[1:0] bits in the serial control register (SCR).

When the SCIFA operates on an internal clock, it outputs the synchronous clock signal at the SCK pin. Eight synchronous clock pulses are output per transmitted or received character. Unless the SCIFA is transmitting or receiving, the synchronous clock signal remains in the high state. When the SCIFA only receives data on an internal clock, the internal clock signal outputs while the RE bit in the SCR register is 1 until the number of data units in the receive FIFO reaches the specified reception trigger number.

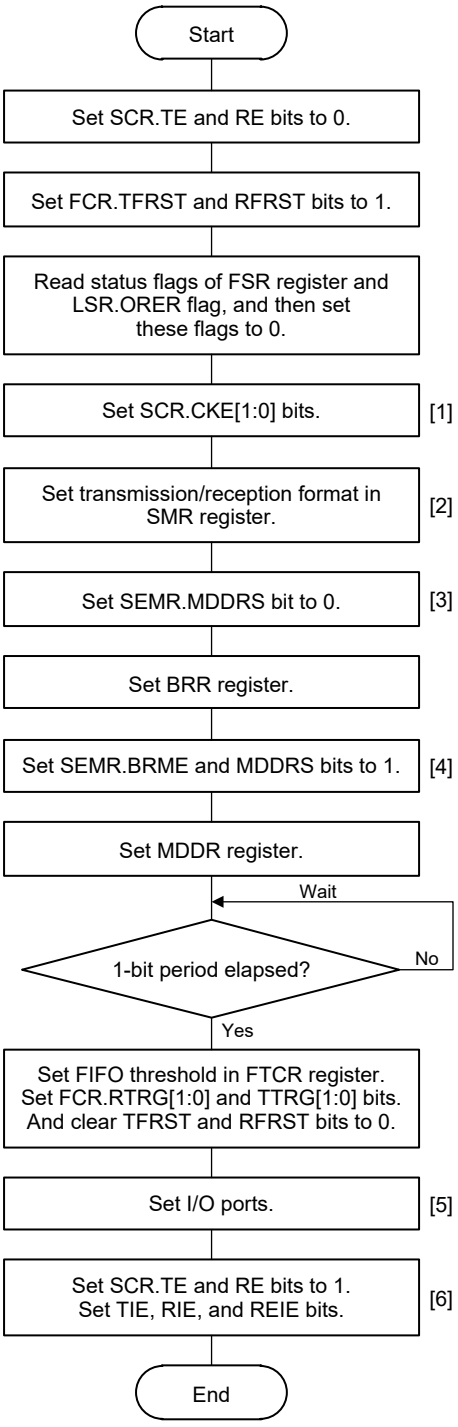
### (3) Transmitting and Receiving Data

#### SCIFA Initialization (in Clock Synchronous Mode)

Before transmitting or receiving, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA by performing the following procedure.

Similarly, before changing the mode or communication format, clear the TE and RE bits to 0, and then change it by performing the following procedure. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing RE to 0, however, does not initialize the RDF, PER, FER, and ORER flags and the receive FIFO data register (FRDR), which retain their previous contents.

**Figure 22.12** shows a sample flowchart for initializing the SCIFA in clock synchronous mode.



[1] Set the TIE, RIE, TE, and RE bits in the SCR register to 0 before setting the CKE[1:0] bits.

[2] Set the transmission/reception format in the SMR register.

[3] Clear the SEMR.MDDRS bit to 0 and write a value corresponding to the bit rate in the BRR register. Not necessary if an external clock is used.

[4] Set the SEMR.BRME and MDDRS bits to 1 and write a value corresponding to the bit rate in the MDDR register. Not necessary if an external clock is used. Wait for at least 1-bit period before proceeding to the next step.

[5] Set I/O ports and the MPC register so that they can be used as the SCK, TXD, and RXD pin.

[6] After setting the MDDR register, wait for at least 1-bit, and then write 1 to the SCR.TE or RE bit. To permit interrupt requests, set TIE, RIE, and REIE bits to 1. Setting the TE and RE bits to 1 makes the TXD and RXD pins available to be used. In transmission, those pins enter the mark state, and in reception, they enter the idle state waiting for a start bit.

Figure 22.12 Sample Flowchart for SCIFA Initialization in Clock Synchronous Mode

### Transmitting Serial Data (in Clock Synchronous Mode)

**Figure 22.13** shows a sample flowchart for transmitting serial data in clock synchronous mode.

Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.

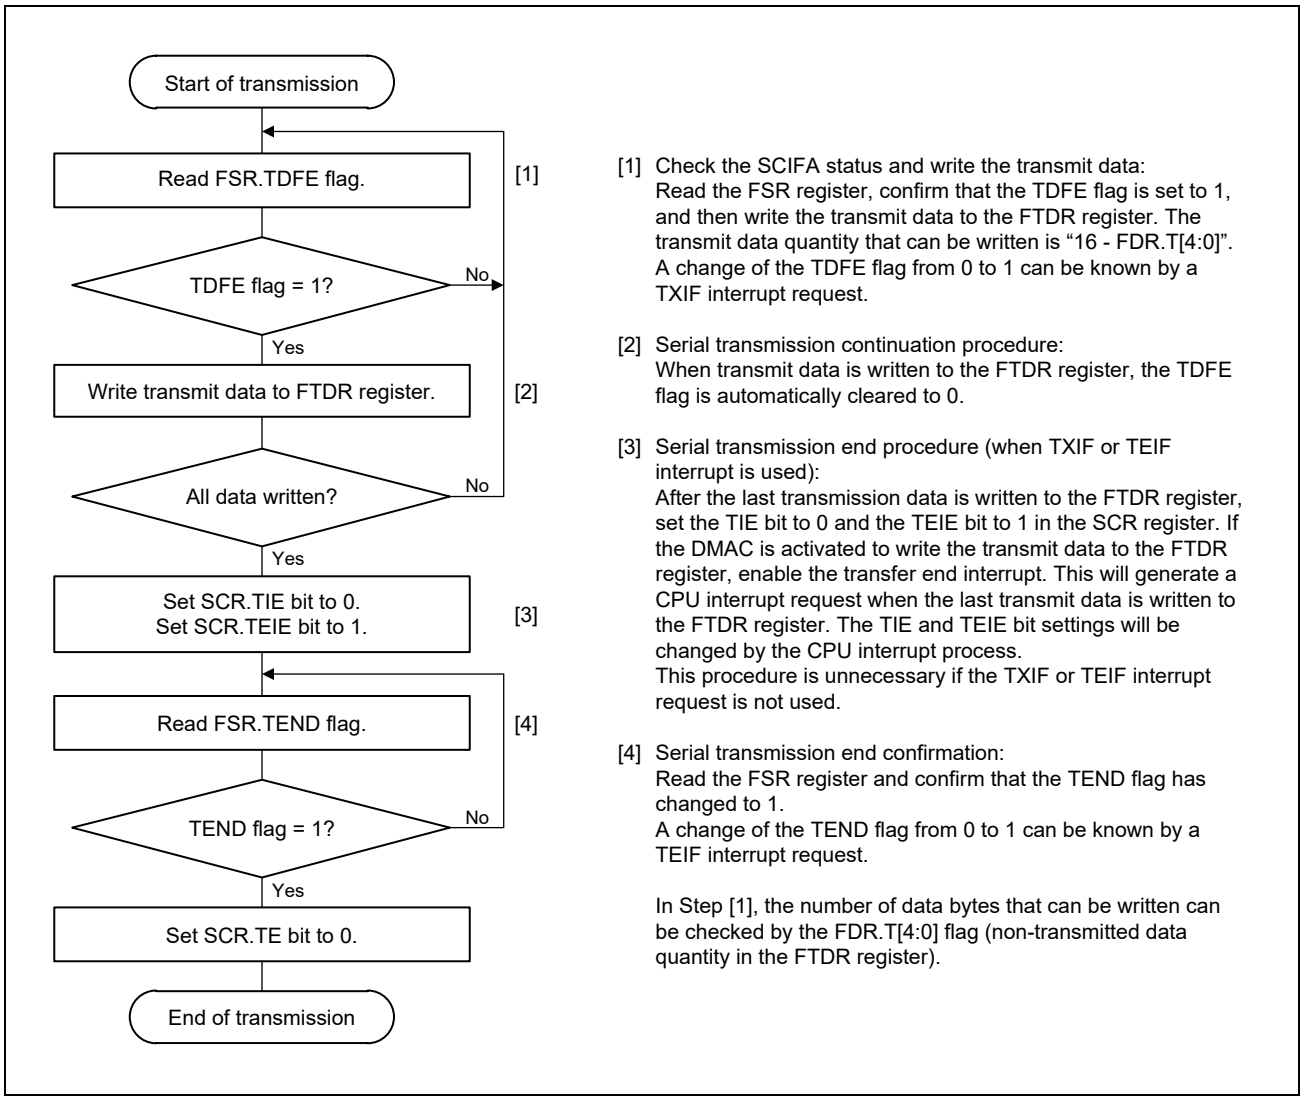


Figure 22.13 Sample Flowchart for Transmitting Serial Data in Clock Synchronous Mode

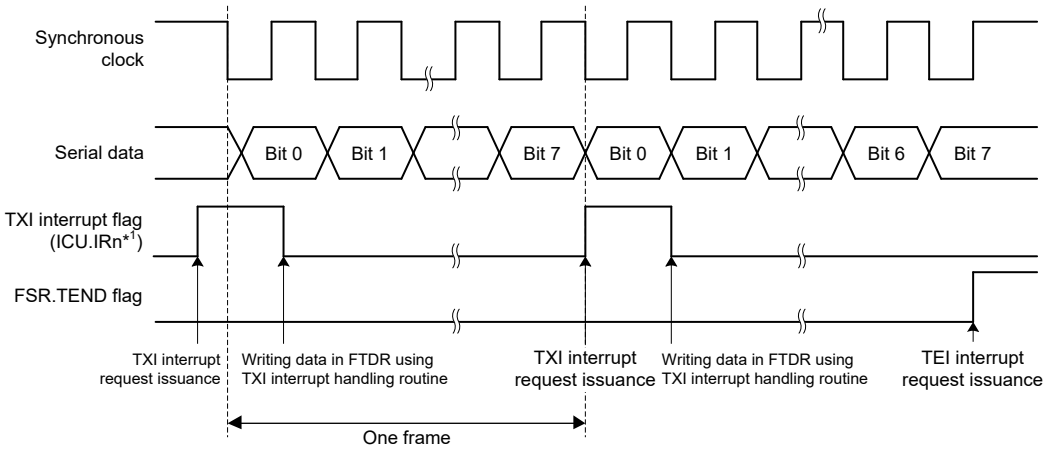
In clock synchronous mode, the SCIFA performs serial transmission as described below.

1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the specified number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number set in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag in the FSR register is set. If the TIE bit in the serial control register (SCR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.
   If clock output mode is selected, the SCIFA outputs eight synchronous clock pulses. If an external clock source is selected, the SCIFA outputs data in synchronization with the input clock. Data is output from the TXD pin in order from the LSB (b0) to the MSB (b7) (when LSB-first transfer is selected).
3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the MSB (bit 7). If data is present, the data is transferred from the FTDR register to the TSR register, and then serial transmission of the next frame is started. If there is no data, the TXD pin holds the output level of the last data after the TEND flag in the FSR register is set to 1 and the MSB (bit 7) is output.
4. After the end of serial transmission, the SCK pin is held in the high state.

**Figure 22.14** shows an example of SCIFA transmit operation in clock synchronous mode.



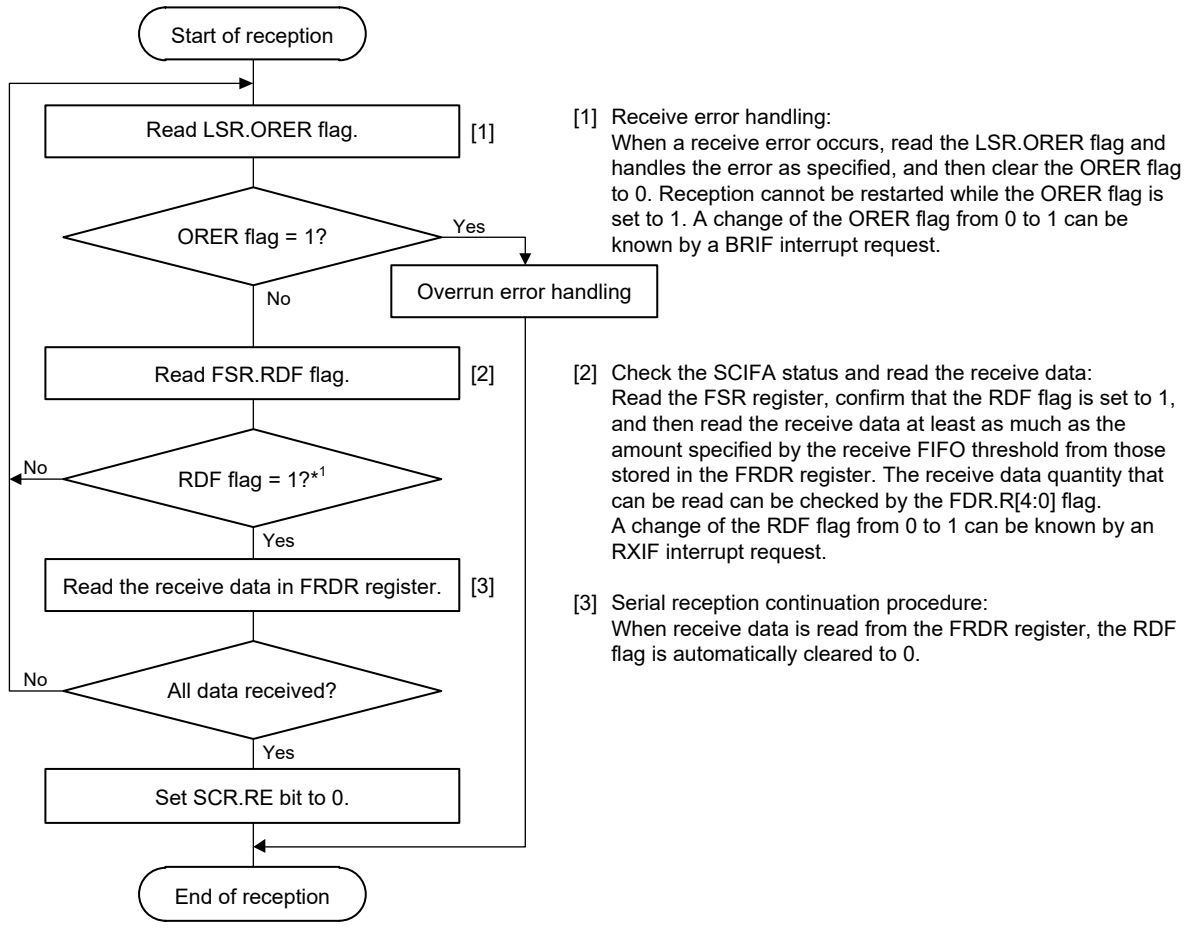
**Note:** For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

Figure 22.14 Example of SCIFA Transmit Operation in Clock Synchronous Mode (when LSB-First Transfer is Selected)

### Receiving Serial Data (in Clock Synchronous Mode)

**Figure 22.15** and **Figure 22.16** show sample flowcharts for receiving serial data in clock synchronous mode.

Follow the procedure given below for serial data reception after enabling the SCIFA for reception. When switching from asynchronous mode to clock synchronous mode without SCIFA initialization, make sure that the ORER, PER, and FER flags in the line status register (LSR) are cleared to 0.



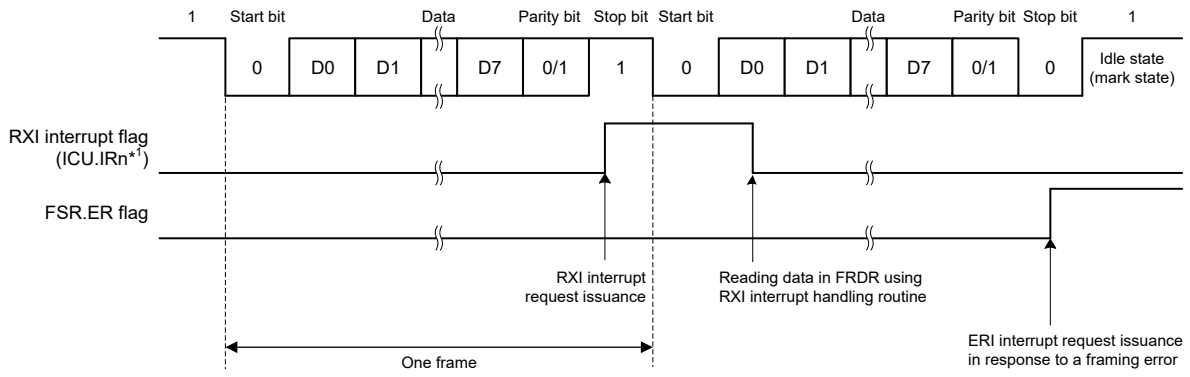
Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 22.15 Sample Flowchart for Receiving Serial Data in Clock Synchronous Mode

In clock synchronous mode, the SCIFA performs serial reception as described below.

1. The SCIFA synchronizes with the synchronous clock input or output and starts reception.
2. Receive data is stored into the receive shift register (RSR) in order from the LSB to the MSB (when LSB-first transfer is selected). After receiving the data, the SCIFA checks whether the receive data can be transferred from the RSR register to the FRDR register. If data can be transferred, the SCIFA stores the received data in the FRDR register. If an overrun error is detected during the error check, further reception is not performed.
3. After the received data units equaling or exceeding the specified reception trigger number are stored in the FRDR register and the RDF flag is set to 1, a receive-data-full interrupt (RXI) request is generated when the RIE bit in the serial control register (SCR) is set to 1. When the ORER flag in the line status register (LSR) is set to 1 and the RIE or REIE bit in the SCR register is also set to 1, a break interrupt (BRI) request is generated.

**Figure 22.16** shows an example of SCIFA receive operation in clock synchronous mode.



Note 1. For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

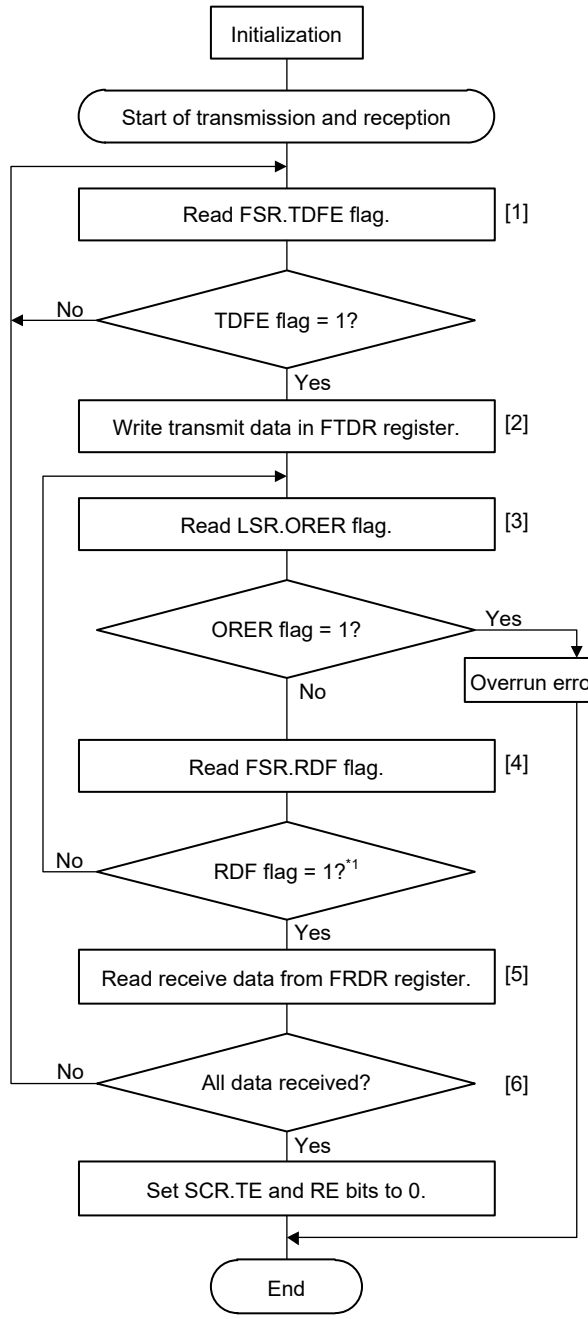
Figure 22.16 Example of SCIFA Receive Operation (when LSB-First Transfer is Selected)

### Transmitting and Receiving Serial Data Simultaneously (in Clock Synchronous Mode)

**Figure 22.17** shows a sample flowchart for transmitting and receiving serial data simultaneously in clock synchronous mode.

In simultaneous transmission/reception of serial data, number of receive data = number of transmit data = number of transmit data to be written to the FTDR register.

Follow the procedure given below for the simultaneous transmission/reception of serial data, after enabling the SCIFA for transmission/reception.



[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data in the FTDR register.
A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Receive error handling:
When a receive error occurs, read the LSR.ORER flag and handles the error as specified, and then clear the ORER flag to 0. Reception cannot be restarted while the ORER flag is set to 1.
A change of the ORER flag from 0 to 1 can be known by a BRIF interrupt request.

[4] Check the SCIFA status and read the receive data:
Read the FSR register, confirm that the RDF flag is set to 1, and then read the receive data stored in the FRDR register.
A change of the RDF flag from 0 to 1 can be known by an RXIF interrupt request.

[5] Serial reception continuation procedure:
When receive data is read from the FRDR register, the RDF flag is automatically cleared to 0.

[6] Serial transmission/reception continuation procedure (supplementary):
To continue serial transmission/reception, read the FRDR register and clear the RDF flag to 0 before the FRDR register overflows and the ORER flag changes to 1. In addition, before the last bit of the last data written to the FTDR register is transmitted, write the data in the FTDR register and clear the TDFE flag to 0.
When writing data to the FTDR register or reading data from the FRDR register, the TDFE flag and RDF flag are automatically cleared to 0.

**Note:** When switching the operation from transmission or reception to the simultaneous transmission and reception, clear the TE and RE bits to 0 and then simultaneously set these bits to 1.

Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 22.17 Sample Flowchart for Simultaneous Transmitting/Receiving Serial Data in Clock Synchronous Mode

## 22.4 Bit Rate Modulation

Using the bit rate modulation, the bit rate can be corrected by skipping the specified number of clock pulses input to the baud rate generator. To correct the bit rate, only the number of clock pulses specified in the MDDR register are enabled among 256 internal clock pulses specified by the CKS1 and CKS0 bits in the SMR register in a way that forms average intervals.

**Figure 22.18** shows an example where P0φ is selected by the CKS[1:0] bits in SMR and BRR and MDDR are set to 0 and 160, respectively, in asynchronous mode. In this example, the cycle of the base clock is evenly corrected (256/160) and the bit rate is also corrected (160/256). Note that skipping an internal clock causes bias and expansion or contraction is generated in the pulse width of the base clock.

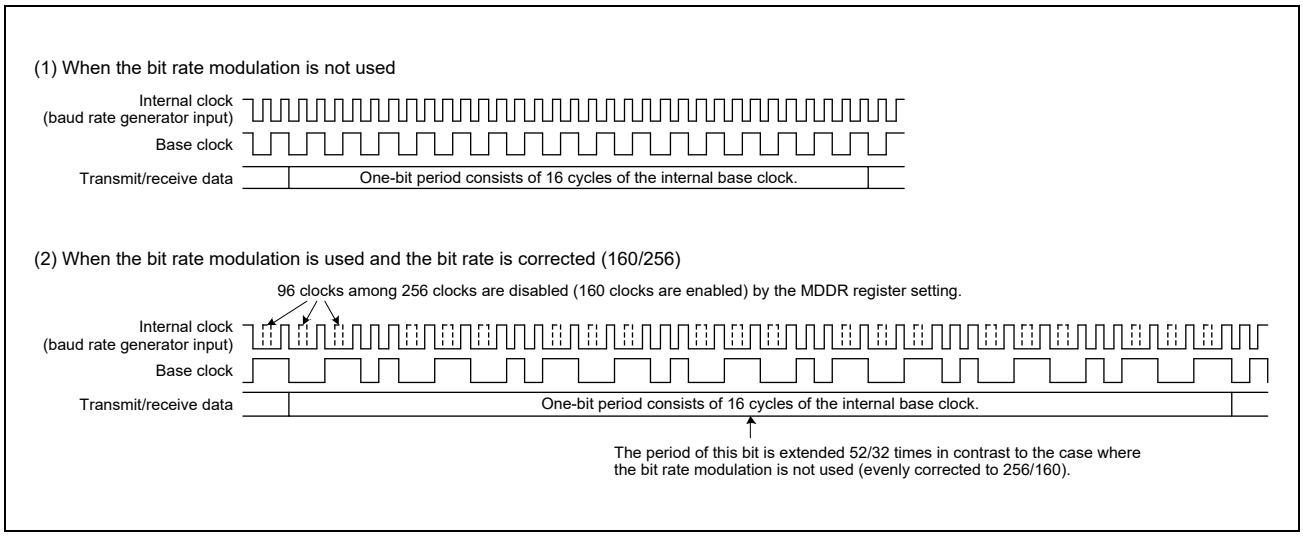


Figure 22.18 Example of Internal Base Clock when Bit Modulation is Used

## 22.5 Interrupt Sources

The SCIFA has six interrupt sources: transmit-FIFO-data-empty (TXI), receive-error (ERI), receive-FIFO-data-full (RXI), break (BRI), transmit-end (TEI), receive-data-ready (DRI). The TEI, DRI, ERI, and BRI interrupts share the same vector number.

**Table 22.19** shows the interrupt sources and priority. The interrupt sources can be enabled or disabled using the TIE, RIE, REIE, TEIE bits in the SCR register and are separately input to the interrupt controller.

When the quantity of transmit data written in the FTDR register as a result of transmission is equal to or less than the specified transmission trigger number, the TDFE flag in the serial status register (FSR) is set to 1 and a TXI interrupt request is generated.

When the data units equaling or exceeding the specified transmission trigger number are stored in the receive FIFO register (FRDR) and the RDF flag in the FSR register is set to 1, a receive data full interrupt (RXI) request is generated. When the quantity of received data in the FRDR register is below the specified reception trigger number and no next data has been received yet even after the period of 15 ETUs elapsed*1 from the last stop bit, the DR flag in the FSR register is set to 1 and a receive data ready interrupt (DRI) request is generated. In clock synchronous mode, a DRI interrupt request is not generated.

When the BRK flag in the FSR register or the ORER flag in the LSR register is set to 1, a BRI interrupt request is issued. When the ER flag in the FSR register is set to 1, an ERI interrupt request is issued.

When the TEND flag in the FSR register is set to 1, a TEI interrupt request is issued.

When the RIE bit is cleared to 0 and the REIE bit in the SCR register is set to 1, an ERI and a BRI interrupt requests are issued but an RXI interrupt request is not.

An TXI interrupt indicates that transmit data can be written and an RXI interrupt indicates that receive data is stored in the FRDR register.

**Note 1.** It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

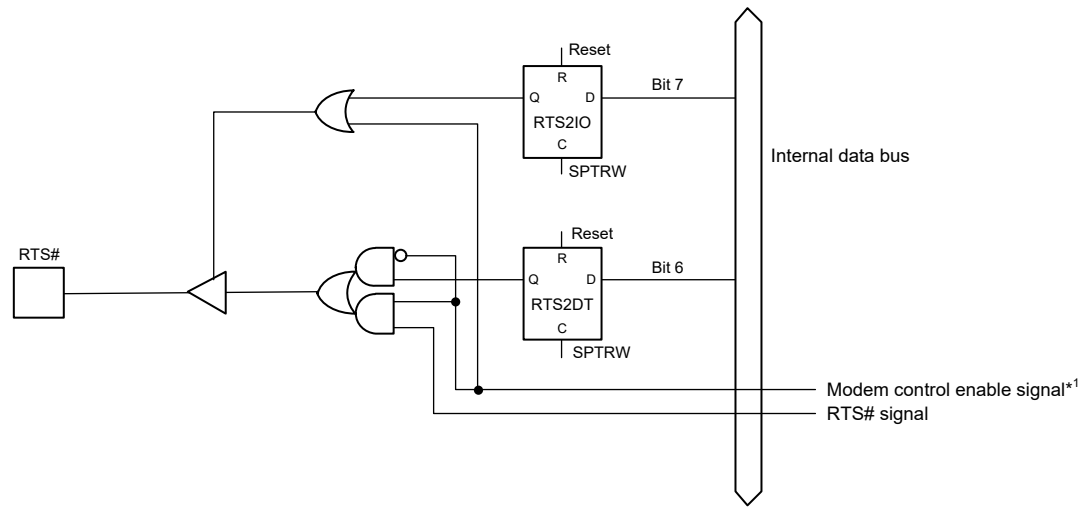
Table 22.19 SCIFA Interrupt Sources

| Name | Level/Edge | Interrupt Source | Interrupt Enable Bit | DMAC Activation | Priority |
|---|---|---|---|---|---|
| BRI | Level | Interrupt caused by break (BRK) or overrun (ORER). | RIE or REIE | Impossible | High |
| ERI | Level | Interrupt caused by framing or parity (ER). | RIE or REIE | Impossible | ↕ |
| RXI | Level | Interrupt caused by receive FIFO data full (RDF). | RIE | Possible | |
| TXI | Level | Interrupt caused by transmit FIFO data empty (TDFE). | TIE | Possible | |
| TEI | Level | Interrupt caused by transmit end (TEND). | TEIE | Impossible | |
| DRI | Level | Interrupt caused by receive data ready (DR). | RIE | Impossible | Low |

**Note:** The TEI and DRI interrupts share the same vector number.
The ERI and BRI interrupts share the same vector number.
If CPU processing is used, clear the flag after the block transfer. If the DMAC is activated, access to the flags is prohibited.

## 22.6 Serial Port Register (SPTR) and SCIFA-Related Pins

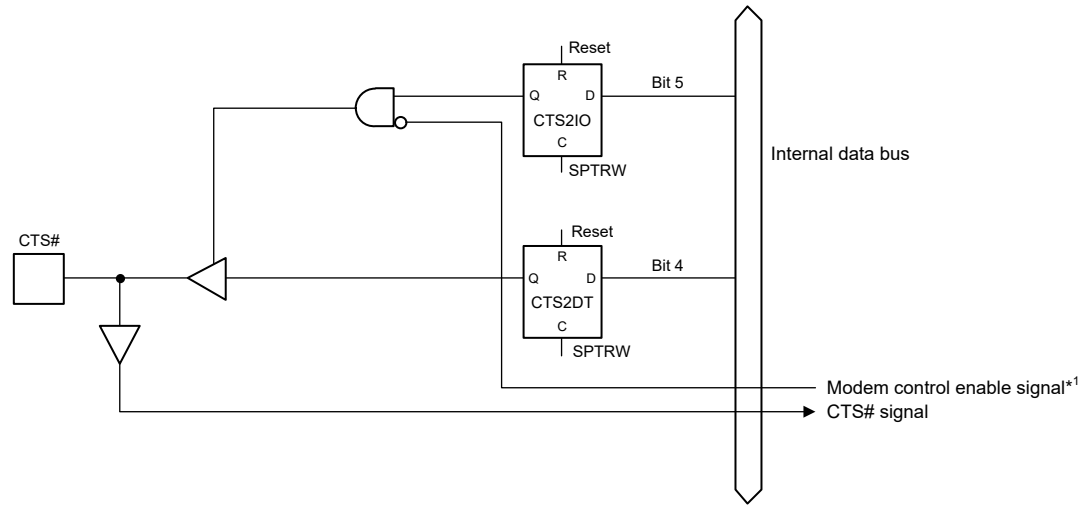
**Figure 22.19** to **Figure 22.22** show the relationships between the SPTR register and the SCIFA-related pins.



**Note:** SPTRW: SPTR write

Note 1. These signals allow the RTS# pin to enter the modem control state with the MCE bits in FCR.

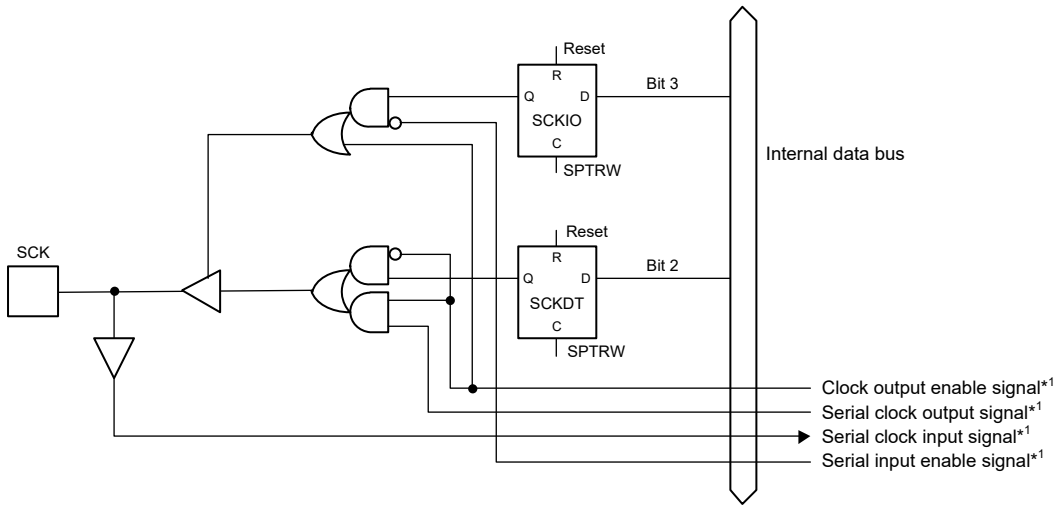
Figure 22.19 RTS2IO Bit and RTS2DT Bit in the SPTR Register, and RTS# Pin



**Note:** SPTRW: SPTR write

Note 1. These signals allow the CTS# pin to enter the modem control state with the MCE bits in FCR.

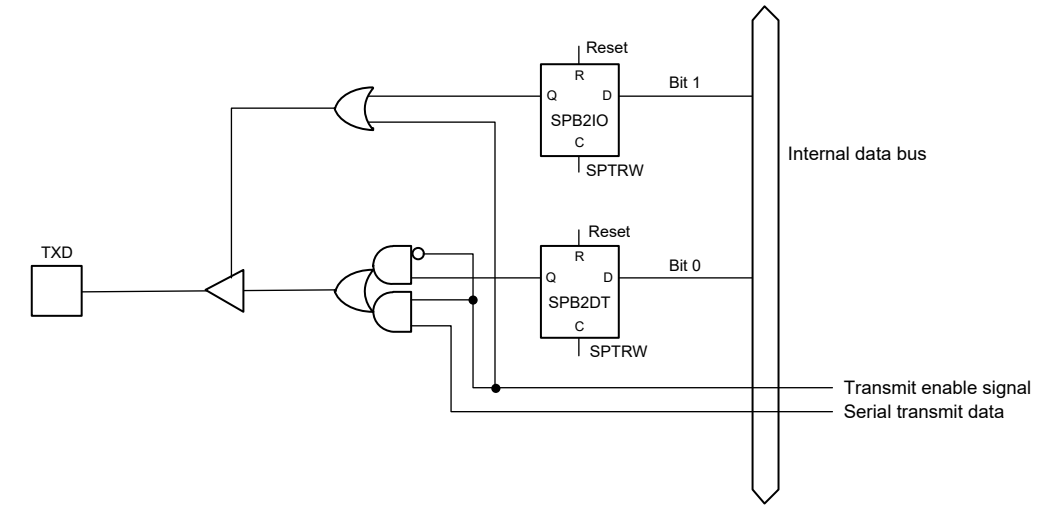
Figure 22.20 CTS2IO Bit and CTS2DT Bit in the SPTR Register, and CTS# Pin



**Note:** SPTRW: SPTR write

Note 1. These signals control the SCK pin according to the settings of the CM bit in SMR and CKE[1:0] bits in SCR.

Figure 22.21 SCKIO Bit and SCKDT Bit in the SPTR Register, and SCK Pin



**Note:** SPTRW: SPTR write

Figure 22.22 SPB2IO Bit and SPB2DT Bit in the SPTR Register, and TXD Pin

## 22.7 Noise Cancellation

**Figure 22.23** shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a two-stage flip-flop circuits and a match detection circuit. When the input signals of the noise filter and the output signals of the two-stage flip-flop circuits completely match, the matched level is conveyed as an internal signal. Unless otherwise matched, the previous value is retained. (When the levels sampled on three consecutive cycles of the sampling clock of the noise filter match, the signal is considered valid. If three consecutive sampled values do not match, the signal is considered to be noise rather than a received signal).

In asynchronous mode, the noise cancellation can be applied to the receive signal input to the RXDn pin. The receive level of the RXDn pin is taken in the flip-flop circuit of the noise filter on the base clock (the clock with a frequency 16 or 8 times the transfer rate*[1]).

If the base clock is stopped once with the noise filter enabled and then the base clock input is restarted again, the noise filter operation resumes from the state where the clock was stopped. When SCR.RE is set to 0 during input of the base clock, the noise filter outputs 0 as the internal RxDn signal. The internal match detector continues operating even while operations for reception are stopped, and the result from the last time previous consecutive samples matched is output at the same time as operations for reception are resumed.

**Note 1.** A frequency 16 times bit rate when the SEMR.ABCS0 bit and the SEMR.BGDM bit are both 0, and a frequency 8 times bit rate when either the SEMR.ABCS0 bit or the SEMR.BGDM bit is 1.

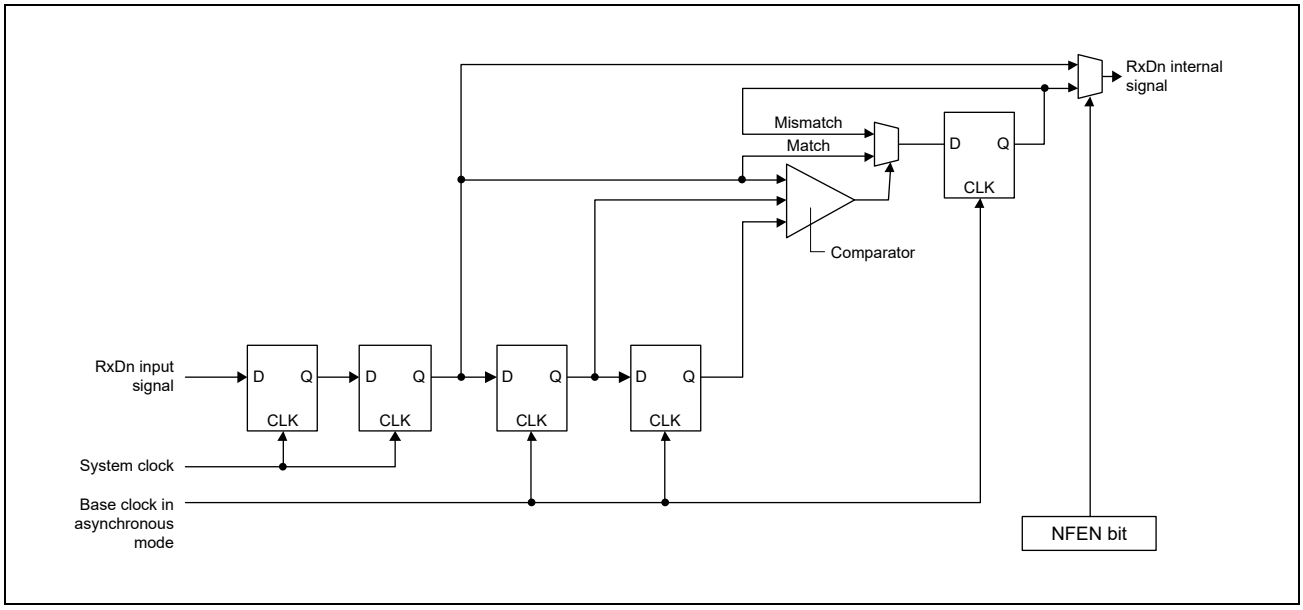


Figure 22.23 Block Diagram of Digital Noise Filter Circuit

## 22.8 Usage Notes

The following is the notes on using the SCIFA.

### 22.8.1 FTDR Register Writing and TDFE Flag

The TDFE flag in the serial status register (FSR) is set when the number of transmit data bytes written in the transmit FIFO data register (FTDR) has fallen below the transmission trigger number set by bits TTRG[1:0] in the FIFO control register (FCR) or bits TFTC[4:0] in the FIFO trigger control register (FTCR). After the TDFE flag is set, transmit data up to the number of empty bytes in the FTDR register can be written, allowing efficient continuous transmission.

However, if the number of data bytes written in the FTDR register is equal to or less than the specified transmission trigger number, the TDFE flag will be set to 1 again even after being read as 1 and cleared to 0.

The number of transmit data bytes in the FTDR register can be checked by the 8 higher-order bits of the FIFO data count register (FDR).

### 22.8.2 FRDR Register Reading and RDF Flag

The RDF flag in the serial status register (FSR) is set when the number of receive data bytes in the receive FIFO data register (FRDR) has become equal to or greater than the reception trigger number set by bits RTRG[1:0] in the FIFO control register (FCR) or bits RFTC[4:0] in the FIFO trigger control register (FTCR). After the RDF flag is set, receive data equivalent to the trigger number can be read from the FRDR register, allowing efficient continuous reception.

However, if the number of data bytes in the FRDR register exceeds the reception trigger number, the RDF flag will be set to 1 again even after being read as 1 and cleared to 0.

The number of receive data bytes in the FRDR register can be checked by the 8 lower-order bits of the FIFO data count register (FDR).

### 22.8.3 Break Detection and Processing

When a framing error (FER) is detected, a break signal can be detected by reading the RXD pin value directly. In a break, the input from the RXD pin becomes all low. Therefore, the FER flag in the serial status register (FSR) is set to 1 and the parity error flag (PER) may also be set to 1.

Upon detection of a break signal, the SCIFA stops the received data transfer to the FRDR register but continues the receive operation.

### 22.8.4 Writing to the SPTR Register

b6, b4, b2, and b0 of the SPTR register respectively indicate the input status of their corresponding pins. (See the description of each bit of **Section 22.2.12, Serial Port Register (SPTR)** for details.)

Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

### 22.8.5 Break Signal Transmission

The output signal from the TXD pin is determined by the SPB2IO bit and the SPB2DT bit in the serial port register (SPTR). The break signal can be sent by using these bits.

The TXD pin does not function as a transmit data output pin during the period from when the SCIFA is initialized to when the TE bit in the SCR register is set to 1 (transmission possible). The TXD pin status during this period is replaced by the SPB2DT bit value. Therefore, the SPB2IO and SPB2DT bits in the SPTR register must have been set to 1 (high output) at first (mark (high) status).

To transmit the break signal during serial transmission, set the SPB2IO bit in the SPTR register to 1, clear the SPB2DT bit to 0 (specify a low level), and then clear the TE bit in the SCR register to 0 (transmission stop). Clearing the TE bit to 0 initializes the transmitter regardless of the current transmission status, and outputs a low level from the TXD pin.

### 22.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode

The SCIFA operates on a base clock with a frequency 16 times the transfer rate*1. In reception, the SCIFA internally latches the received data at the rising edge of the eighth base clock pulse*1. The timing is shown in **Figure 22.24**.

**Note 1.** This is an example when the SEMR.ABCS0 bit is 0. When the ABCS0 bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock. The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

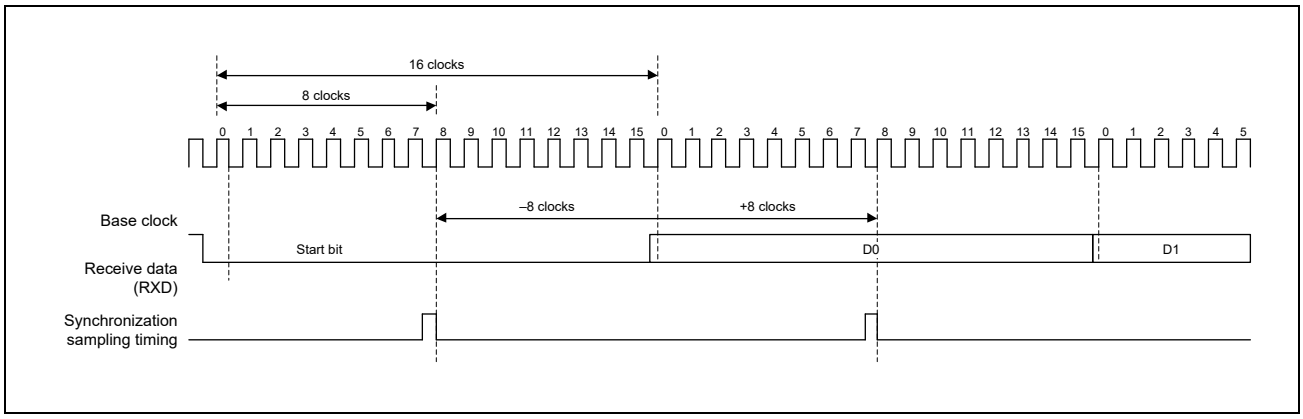

Figure 22.24 Receive Data Sampling Timing in Asynchronous Mode

The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

[Equation 1]

$$M = \{0.5 - \frac{1}{2N} - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\} \times 100[\%]$$

Where: M: Receive margin (%)

N: Ratio of clock frequency to bit rate (N = 16)

D: Clock duty (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute deviation of clock frequency

From equation 1, if F = 0 and D = 0.5, the receive margin is 46.875%, as given by equation 2.

[Equation 2]

When D = 0.5 and F = 0:

$$M = (0.5 - 1/(2 \times 16)) \times 100\% = 46.875\%$$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

### 22.8.7 Note on FER Flag and PER Flag in Serial Status Register (FSR)

The FER flag and PER flag in the serial status register (FSR) are status flags that apply to next entry to be read from the receive FIFO data register (FRDR). After the CPU or DMAC reads the receive FIFO data register, the flags of framing errors and parity errors in the receive data will be cleared. To check the received data for the states of framing errors and parity errors, only read the receive FIFO data register after reading the serial status register.

### 22.8.8 Notes on External Clock Input in Clock Synchronous Mode

Before setting the TE and RE bits in the serial control register (SCR) to 1, wait for four or more cycles of the peripheral operating clock after the external clock (SCK) is changed from 0 (low) to 1 (high). To input the external clock (SCK) (to start communication), wait for one or more cycles of the external clock after the TE and RE bits in the SCR register are set to 1.

### 22.8.9 Module Standby Mode Setting

SCIFA operation can be disabled or enabled using the standby control register. As the initial setting, the SCIFA operation is halted. Register access is enabled by clearing module standby mode. For details, refer to **Section 42, Low Power Mode**.

### 22.8.10 Notes on Operation for Reception when an Internal Clock is Selected in Clock Synchronous Mode

When an internal clock is selected as the clock for reception in clock-synchronous mode, if the number of data stored through the receive FIFO data register (FRDR) becomes equal to or greater than the specified reception trigger number, the RDF flag is set, the RXI interrupt request is generated and, at the same time, output of the synchronizing clock and reception of serial data are stopped. Once the number of data are again less than the specified reception trigger number, output of the synchronizing clock and the reception of serial data are restarted. In addition, if an internal clock is selected for reception in clock synchronous mode, the ORER flag is not set to 1 since no overrun occurs. Accordingly, overruns (indicated by the ORER flag) cannot be used as a BRI interrupt source.

# 23. Serial Communications Interface (SCIg)

This MCU has two independent serial communications interface (SCI) channels. The SCIs consist of the SCI0 and SCI1 modules, referred to in common as “SCIg modules”.

The SCIg modules (SCI0 and SCI1) can handle both asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communications chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communications Interface Adapter (ACIA). As an extended function in asynchronous communications mode, the SCI also supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards).

## 23.1 Overview

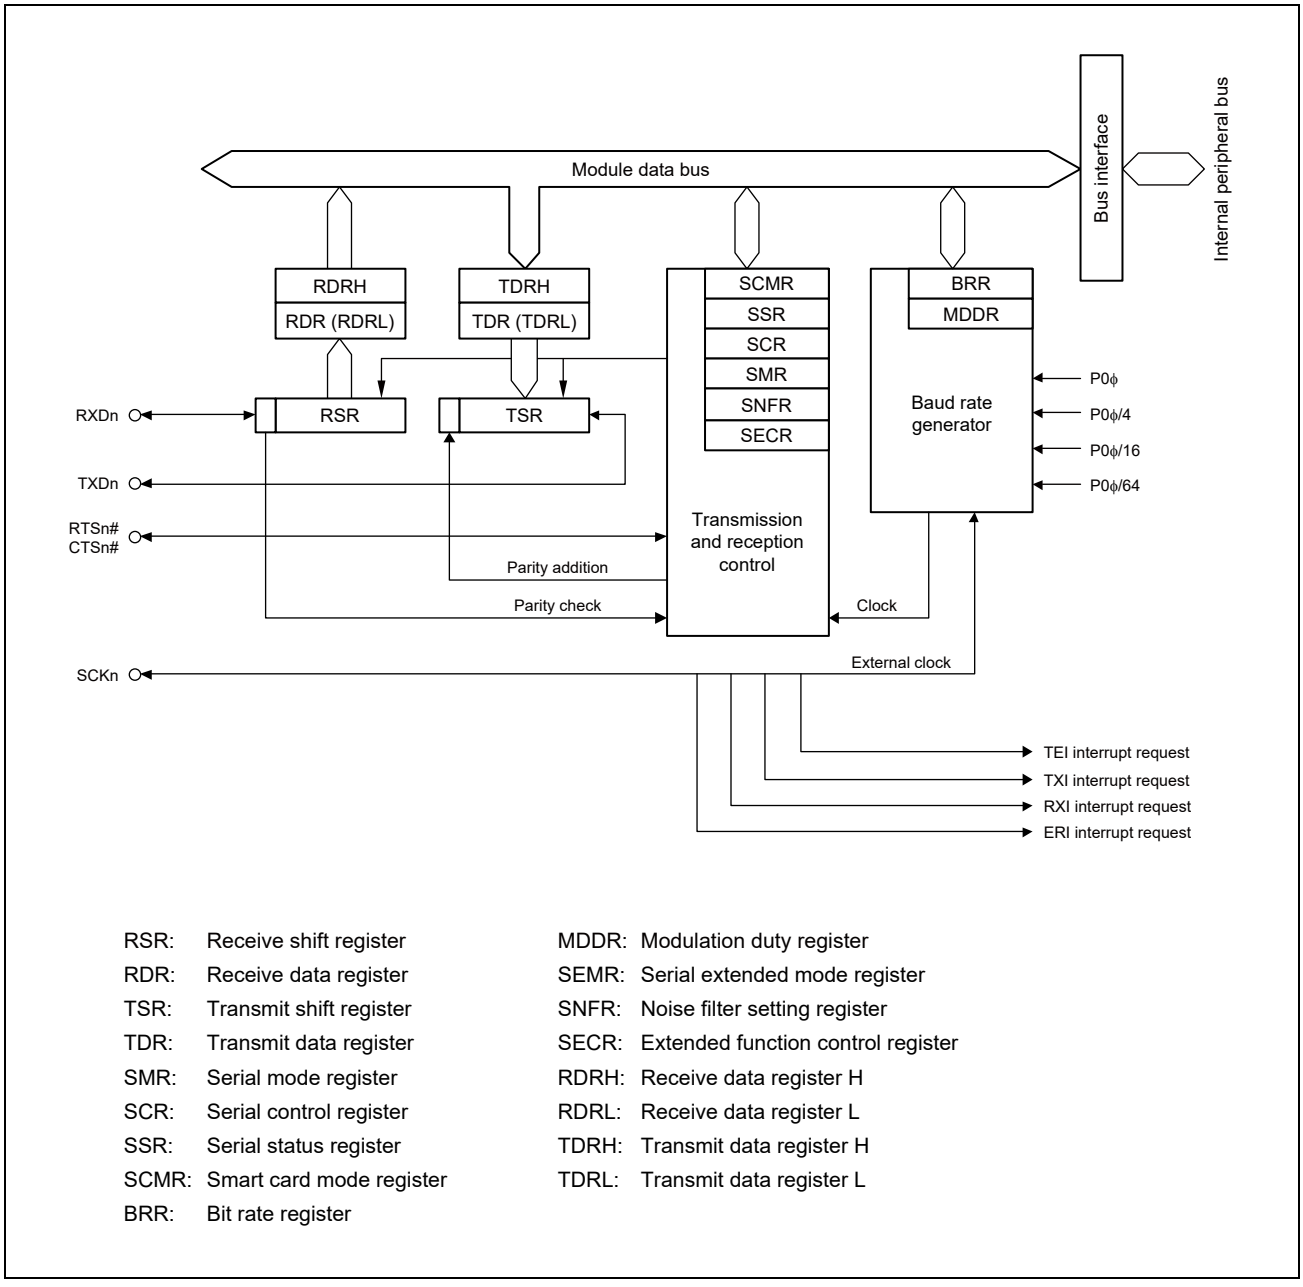
**Table 23.1** lists the specifications of the SCIg modules. **Figure 23.1** shows the block diagram of the SCI0 and SCI1 modules.

Table 23.1 SCIg Specifications (1/2)

| Item | | Description |
|---|---|---|
| Serial communications modes | | • Asynchronous<br>• Clock synchronous<br>• Smart card interface<br>• IrDA (only for channel 0) |
| Transfer speed | | Bit rate specifiable with the on-chip baud rate generator. |
| Full-duplex communications | | Transmitter: Continuous transmission possible using double-buffer structure.<br>Receiver: Continuous reception possible using double-buffer structure. |
| I/O pins | | See **Table 23.2**. |
| Data transfer | | Selectable as LSB first or MSB first transfer |
| Interrupt sources | | Transmit end, transmit data empty, receive data full, and receive error |
| Low power consumption function | | Module stop state can be set for each channel. |
| Asynchronous mode | Data length | 7, 8, or 9 bits |
| | Transmission stop bit | 1 or 2 bits |
| | Parity | Even parity, odd parity, or no parity |
| | Receive error detection | Parity, overrun, and framing errors |
| | Hardware flow control | CTSn# and RTSn# pins can be used in controlling transmission/reception. |
| | Start-bit detection | Low level or falling edge is selectable. |
| | Break detection | When a framing error occurs, a break can be detected by reading the RXDn pin level directly. |
| | Clock source | An internal or external clock can be selected. |
| | Double-speed mode | Baud rate generator double-speed mode is selectable. |
| | Multi-processor communications function | Serial communication among multiple processors |
| | Noise cancellation | The signal paths from input on the RXDn pins incorporate digital noise filters. |
| Clock synchronous mode | Data length | 8 bits |
| | Receive error detection | Overrun error |
| | Hardware flow control | CTSn# and RTSn# pins can be used in controlling transmission/reception. |

Table 23.1 SCIg Specifications (2/2)

| Item | | Description |
|---|---|---|
| Smart card interface mode | Error processing | An error signal can be automatically transmitted when detecting a parity error during reception |
| | | Data can be automatically retransmitted when receiving an error signal during transmission |
| | Data type | Both direct convention and inverse convention are supported. |
| Bit rate modulation function | | Correction of outputs from the on-chip baud rate generator can reduce errors. |



RSR: Receive shift register
RDR: Receive data register
TSR: Transmit shift register
TDR: Transmit data register
SMR: Serial mode register
SCR: Serial control register
SSR: Serial status register
SCMR: Smart card mode register
BRR: Bit rate register
MDDR: Modulation duty register
SEMR: Serial extended mode register
SNFR: Noise filter setting register
SECR: Extended function control register
RDRH: Receive data register H
RDRL: Receive data register L
TDRH: Transmit data register H
TDRL: Transmit data register L

Figure 23.1 Block Diagram of SCIg (SCI0 and SCI1)

**Table 23.2** lists the pin configuration of the SCIs for the individual modes.

Table 23.2 SCI Pin Configuration in Asynchronous Mode and Clock Synchronous Mode

| Channel | Pin Name | I/O | Function |
|---|---|---|---|
| SCI0 | SCI0_SCK | I/O | SCI0 clock input/output |
| | SCI0_RXD | Input | SCI0 receive data input |
| | SCI0_TXD | Output | SCI0 transmit data output |
| | SCI0_CTS#/RTS# | I/O | SCI0 transfer start control input/output |
| SCI1 | SCI1_SCK | I/O | SCI1 clock input/output |
| | SCI1_RXD | Input | SCI1 receive data input |
| | SCI1_TXD | Output | SCI1 transmit data output |
| | SCI1_CTS#/RTS# | I/O | SCI1 transfer start control input/output |

## 23.2 Register Descriptions

Table 23.3 Register configuration

BASE Address (Cortex A55 Address Space): (ch0) H'0_1004_D000 (ch1) H'0_1004_D400
BASE Address (Cortex M33 address Space Non Secure): (ch0) H'4004_D000 (ch1) H'4004_D400
BASE Address (Cortex M33 Address Space Secure): (ch0) H'5004_D000 (ch1) H'5004_D400

| Channel | Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Serial Mode Register | SMR | R/W | H'00 | BASE(ch0) + H'0000 | 8 |
| | Bit Rate Register | BRR | R/W | H'FF | BASE(ch0) + H'0001 | 8 |
| | Serial Control Register | SCR | R/W | H'00 | BASE(ch0) + H'0002 | 8 |
| | Transmit Data Register | TDR | R/W | H'FF | BASE(ch0) + H'0003 | 8 |
| | Serial Status Register | SSR | R/W*1 | H'84 | BASE(ch0) + H'0004 | 8 |
| | Receive Data Register | RDR | R | H'00 | BASE(ch0) + H'0005 | 8 |
| | Smart Card Mode Register | SCMR | R/W*1 | H'F2 | BASE(ch0) + H'0006 | 8 |
| | Serial Extended Mode Register | SEMR | R | H'00 | BASE(ch0) + H'0007 | 8 |
| | Noise Filter Setting Register | SNFR | R | H'00 | BASE(ch0) + H'0008 | 8 |
| | Extended Function Control Register | SECR | R/W | H'00 | BASE(ch0) + H'000D | 8 |
| | Transmit Data Register H | TDRH | R/W | H'FF | BASE(ch0) + H'000E | 8 |
| | Transmit Data Register L | TDRL | R/W | H'FF | BASE(ch0) + H'000F | 8 |
| | Transmit Data Register HL | TDRHL | R/W | H'FFFF | BASE(ch0) + H'000E | 16 |
| | Receive Data Register H | RDRH | R | H'00 | BASE(ch0) + H'0010 | 8 |
| | Receive Data Register L | RDRL | R | H'00 | BASE(ch0) + H'0011 | 8 |
| | Receive Data Register HL | RDRHL | R | H'0000 | BASE(ch0) + H'0010 | 16 |
| | Modulation Duty Register | MDDR | R/W | H'FF | BASE(ch0) + H'0012 | 8 |
| 1 | Serial Mode Register | SMR | R/W | H'00 | BASE(ch1) + H'0000 | 8 |
| | Bit Rate Register | BRR | R/W | H'FF | BASE(ch1) + H'0001 | 8 |
| | Serial Control Register | SCR | R/W | H'00 | BASE(ch1) + H'0002 | 8 |
| | Transmit Data Register | TDR | R/W | H'FF | BASE(ch1) + H'0003 | 8 |
| | Serial Status Register | SSR | R/W*1 | H'84 | BASE(ch1) + H'0004 | 8 |
| | Receive Data Register | RDR | R | H'00 | BASE(ch1) + H'0005 | 8 |
| | Smart Card Mode Register | SCMR | R/W*1 | H'F2 | BASE(ch1) + H'0006 | 8 |
| | Serial Extended Mode Register | SEMR | R | H'00 | BASE(ch1) + H'0007 | 8 |
| | Noise Filter Setting Register | SNFR | R | H'00 | BASE(ch1) + H'0008 | 8 |
| | Extended Function Control Register | SECR | R/W | H'00 | BASE(ch1) + H'000D | 8 |
| | Transmit Data Register H | TDRH | R/W | H'FF | BASE(ch1) + H'000E | 8 |
| | Transmit Data Register L | TDRL | R/W | H'FF | BASE(ch1) + H'000F | 8 |
| | Transmit Data Register HL | TDRHL | R/W | H'FFFF | BASE(ch1) + H'000E | 16 |
| | Receive Data Register H | RDRH | R | H'00 | BASE(ch1) + H'0010 | 8 |
| | Receive Data Register L | RDRL | R | H'00 | BASE(ch1) + H'0011 | 8 |
| | Receive Data Register HL | RDRHL | R | H'0000 | BASE(ch1) + H'0010 | 16 |
| | Modulation Duty Register | MDDR | R/W | H'FF | BASE(ch1) + H'0012 | 8 |

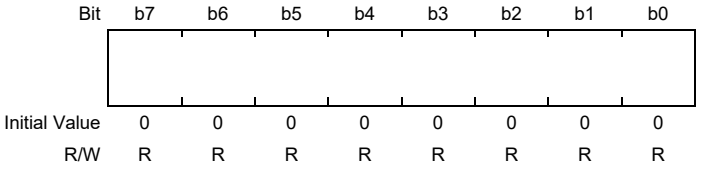
Note 1. Partly, R only

### 23.2.1 Receive Shift Register (RSR)

RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is automatically transferred to the RDR register.

The RSR register cannot be directly accessed by the CPU.

### 23.2.2 Receive Data Register (RDR)



| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

RDR is an 8-bit register that stores receive data.

When one frame of serial data has been received, the received serial data is transferred from RSR to RDR. Then the RSR register can receive the next data.

Since RSR and RDR function as a double buffer in this way, continuous receive operations can be performed.

Read RDR only once after a receive data full interrupt (RXI) has occurred. Note that if next one frame of data is received before reading receive data from RDR, an overrun error occurs.

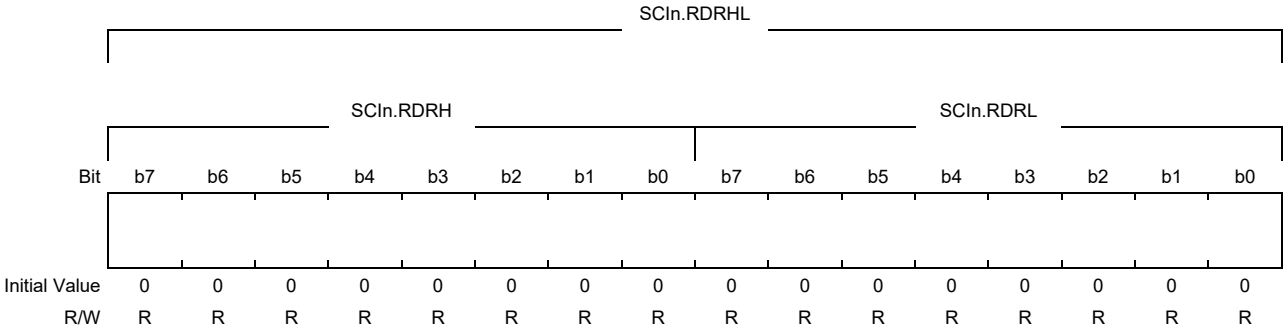
RDR cannot be written to by the CPU.

### 23.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL)

**Receive Data Register H (RDRH)**

**Receive Data Register L (RDRL)**

**Receive Data Register HL (RDRHL)**



RDRH and RDRL are 8-bit registers that store receive data. Use these registers when asynchronous mode and 9-bit data length are selected.

RDRL is the shadow register of RDR; i.e. access to RDRL is equivalent to access to RDR.

After one frame of data is received, the received data is transferred from the RSR register to these registers, thus allowing the RSR register to receive the next data.

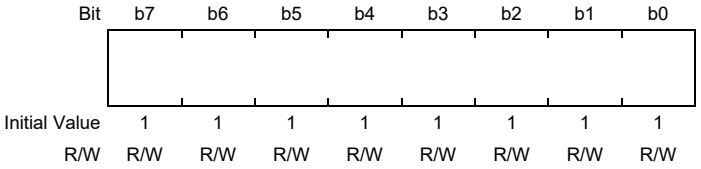
The RSR, RDRH and RDRL registers have a double-buffered construction to enable continuous reception.

Read RDRH and RDRL should be performed only once in the order from RDRH to RDRL when a receive data full interrupt (RXI) request is issued. Note that an overrun error occurs when the next frame of data is received before the received data has been read from RDRL.

The CPU cannot write to the RDRH and RDRL registers. Bits 0 to 7 in RDRH are fixed to 0. These bits are read as 0. The write value should be 0.

The RDRHL register can be accessed in 16-bit units.

### 23.2.4 Transmit Data Register (TDR)



TDR is an 8-bit register that stores transmit data.

When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission. The double-buffered structures of TDR and TSR enable continuous serial transmission. If the next transmit data has already been written to TDR when one frame of data is transmitted, the SCI transfers the written data to TSR to continue transmission.

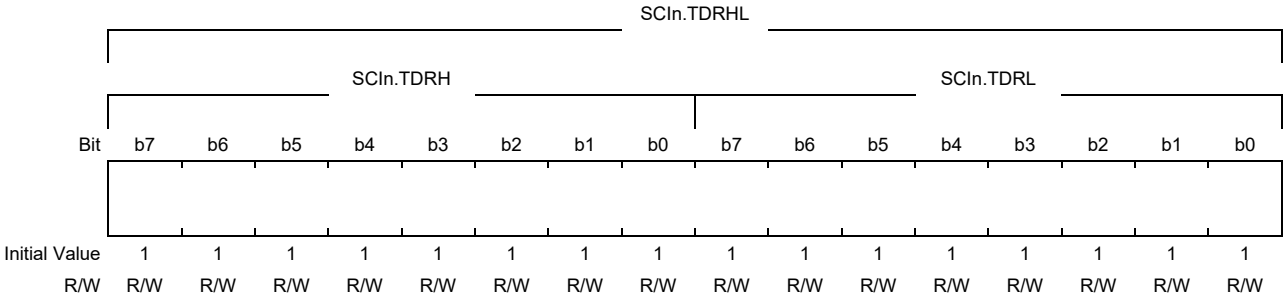
The CPU is able to read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (TXI).

## 23.2.5 Transmit Data Register H, L, HL (TDRH, TDRL, TDRHL)

**Transmit Data Register H (TDRH)**

**Transmit Data Register L (TDRL)**

**Transmit Data Register HL (TDRHL)**



TDRH and TDRL are 8-bit registers that store transmit data. Use these registers when asynchronous mode and 9-bit data length are selected.

TDRL is the shadow register of TDR; i.e. access to TDRL is equivalent to access to TDR.

When empty space is detected in the TSR register, the transmit data stored in the TDRH and TDRL registers is transferred to TSR; i.e., transmitting is started.

The TSR, TDRH and TDRL registers have a double-buffered construction to realize continuous reception. When the next data to be transmitted is stored in TDRL after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.

The CPU can read and write to the TDRH and TDRL registers. Bits 0 to 7 in RDRH are fixed to 1. These bits are read as 1. The write value should be 1.

Writing transmit data to the TDRH and TDRL registers should be performed only once in the order from TDRH to TDRL when a transmit data empty interrupt (TXI) request is issued.

The TDRHL register can be accessed in 16-bit units.

## 23.2.6 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data.

To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.

TSR cannot be directly accessed by the CPU.

## 23.2.7 Serial Mode Register (SMR)

NOTE

Some bits in SMR have different functions in smart card interface mode and non-smart card interface mode.

### (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | CM | CHR | PE | PM | STOP | MP | CKS[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*4 | R/W*4 | R/W*4 | R/W*4 | R/W*4 | R/W*4 | R/W*4 | R/W*4 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | CKS[1:0] | 00b | R/W*4 | Clock Select<br>b1 b0<br>0 0: P0ϕ clock (n = 0)*1<br>0 1: P0ϕ/4 clock (n = 1)*1<br>1 0: P0ϕ/16 clock (n = 2)*1<br>1 1: P0ϕ/64 clock (n = 3)*1 |
| b2 | MP | 0b | R/W*4 | Multi-Processor Mode<br>(Valid only in asynchronous mode)<br>0: Multi-processor communications function is disabled<br>1: Multi-processor communications function is enabled |
| b3 | STOP | 0b | R/W*4 | Stop Bit Length<br>(Valid only in asynchronous mode)<br>0: 1 stop bit<br>1: 2 stop bits |
| b4 | PM | 0b | R/W*4 | Parity Mode<br>(Valid only when the PE bit is 1)<br>0: Selects even parity<br>1: Selects odd parity |
| b5 | PE | 0b | R/W*4 | Parity Enable<br>(Valid only in asynchronous mode)<br>● When transmitting<br>0: Parity bit addition is not performed<br>1: The parity bit is added<br>● When receiving<br>0: Parity bit checking is not performed<br>1: The parity bit is checked |
| b6 | CHR | 0b | R/W*4 | Character Length<br>(Valid only in asynchronous mode*2)<br>Selects in combination with the SCMR.CHR1 bit.<br>CHR1 CHR<br>0 0: Transmit/receive in 9-bit data length<br>0 1: Transmit/receive in 9-bit data length<br>1 0: Transmit/receive in 8-bit data length (initial value)<br>1 1: Transmit/receive in 7-bit data length*3 |
| b7 | CM | 0b | R/W*4 | Communications Mode<br>0: Asynchronous mode<br>1: Clock synchronous mode |

Note 1. n is the decimal notation of the value of n in BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**).

Note 2. In other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.

Note 3. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.

Note 4. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

#### CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relation between the settings of these bits and the baud rate, refer to **Section 23.2.11, Bit Rate Register (BRR)**.

#### MP Bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi-processor mode.

#### STOP Bit (Stop Bit Length)

Selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

#### PM Bit (Parity Mode)

Selects the parity mode (even or odd) for transmission and reception. The setting of the PM bit is invalid in multi-processor mode.

#### PE Bit (Parity Enable)

When this bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception. Irrespective of the setting of the PE bit, the parity bit is not added or checked in multi-processor format.

#### CHR Bit (Character Length)

Selects the data length for transmission and reception. Selects in combination with the CHR1 bit in SCMR.

In other than asynchronous mode, a fixed data length of 8 bits is used.

### (2) Smart Card Interface Mode (SCMR.SMIF = 1)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | GM | BLK | PE | PM | BCP[1:0] | | CKS[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | CKS[1:0] | 00b | R/W*2 | Clock Select<br>b1 b0<br>0 0: P0ϕ clock (n = 0)*1<br>0 1: P0ϕ/4 clock (n = 1)*1<br>1 0: P0ϕ/16 clock (n = 2)*1<br>1 1: P0ϕ/64 clock (n = 3)*1 |
| b3, b2 | BCP[1:0] | 00b | R/W*2 | Base Clock Pulse<br>Selects the number of base clock cycles in combination with the SCMR.BCP2 bit.<br>**Table 23.4** lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits. |
| b4 | PM | 0b | R/W*2 | Parity Mode<br>(Valid only when the PE bit is 1)<br>0: Selects even parity<br>1: Selects odd parity |
| b5 | PE | 0b | R/W*2 | Parity Enable<br>When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode. |
| b6 | BLK | 0b | R/W*2 | Block Transfer Mode<br>0: Normal mode operation<br>1: Block transfer mode operation |
| b7 | GM | 0b | R/W*2 | GSM Mode<br>0: Normal mode operation<br>1: GSM mode operation |

Note 1. n is the decimal notation of the value of n in BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**).

Note 2. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

#### CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relationship between the settings of these bits and the baud rate, refer to **Section 23.2.11, Bit Rate Register (BRR)**.

#### BCP[1:0] Bits (Base Clock Pulse)

These bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set these bits in combination with the SCMR.BCP2 bit.

For details, refer to **Section 23.6.4, Receive Data Sampling Timing and Reception Margin**.

Table 23.4 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

| SCMR.BCP2 Bit | SMR.BCP[1:0] Bits | | Number of Base Clock Cycles for 1-Bit Transfer Period |
|---|---|---|---|
| 0 | 0 | 0 | 93 clock cycles (S = 93)*1 |
| 0 | 0 | 1 | 128 clock cycles (S = 128)*1 |
| 0 | 1 | 0 | 186 clock cycles (S = 186)*1 |
| 0 | 1 | 1 | 512 clock cycles (S = 512)*1 |
| 1 | 0 | 0 | 32 clock cycles (S = 32)*1 (Initial Value) |
| 1 | 0 | 1 | 64 clock cycles (S = 64)*1 |
| 1 | 1 | 0 | 372 clock cycles (S = 372)*1 |
| 1 | 1 | 1 | 256 clock cycles (S = 256)*1 |

Note 1. S is the value of Base Clock Cycles for 1-bit Period in BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**, **Table 23.8 Base Clock Settings in Smart Card Interface Mode**).

### PM Bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd).

For details on the usage of this bit in smart card interface mode, refer to **Section 23.6.2, Data Format (Except in Block Transfer Mode)**.

### PE Bit (Parity Enable)

Set the PE bit to 1.

The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

### BLK Bit (Block Transfer Mode)

Setting this bit to 1 allows block transfer mode operation.

For details, refer to **Section 23.6.3, Block Transfer Mode**.

### GM Bit (GSM Mode)

Setting this bit to 1 allows GSM mode operation.

In GSM mode, the SSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, refer to **Section 23.6.6, Serial Data Transmission (Except in Block Transfer Mode)** and **Section 23.6.8, Clock Output Control**.

## 23.2.8 Serial Control Register (SCR)

NOTE

Some bits in SCR have different functions in smart card interface mode and non-smart card interface mode.

### (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W*2 | R/W*2 | R/W | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | CKE[1:0] | 00b | R/W*1 | Clock Enable<br>• For SCI0 and SCI1<br>(Asynchronous mode)<br>b1 b0<br>0 0: On-chip baud rate generator<br>The SCKn pin functions as I/O port.<br>0 1: On-chip baud rate generator<br>The clock with the same frequency as the bit rate is output from the SCKn pin.<br>1 x: External clock<br>The clock with a frequency 16 times the bit rate should be input from the SCKn pin. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1.<br>(Clock synchronous mode)<br>b1 b0<br>0 x: Internal clock<br>The SCKn pin functions as the clock output pin.<br>1 x: External clock<br>The SCKn pin functions as the clock input pin. |
| b2 | TEIE | 0b | R/W | Transmit End Interrupt Enable<br>0: A TEI interrupt request is disabled<br>1: A TEI interrupt request is enabled |
| b3 | MPIE | 0b | R/W | Multi-Processor Interrupt Enable<br>(Valid in asynchronous mode when SMR.MP = 1)<br>0: Normal reception<br>1: When the data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE bit is automatically cleared to 0, and normal reception is resumed. |
| b4 | RE | 0b | R/W*2 | Receive Enable<br>0: Serial reception is disabled<br>1: Serial reception is enabled |
| b5 | TE | 0b | R/W*2 | Transmit Enable<br>0: Serial transmission is disabled<br>1: Serial transmission is enabled |
| b6 | RIE | 0b | R/W | Receive Interrupt Enable<br>0: RXI and ERI interrupt requests are disabled<br>1: RXI and ERI interrupt requests are enabled |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b7 | TIE | 0b | R/W | Transmit Interrupt Enable<br>0: A TXI interrupt request is disabled<br>1: A TXI interrupt request is enabled |

**Remarks:** x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0, while the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. While the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.

### CKE[1:0] Bits (Clock Enable)

These bits select the clock source and SCKn pin function.

The combination of the settings of these bits and of the SEMR.ACS0 bit sets the internal TMR clock.

### TEIE Bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.

A TEI interrupt request is disabled by setting the TEIE bit to 0.

### MPIE Bit (Multi-Processor Interrupt Enable)

When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE is automatically cleared to 0, and normal reception is resumed. For details, refer to **Section 23.4, Multi-Processor Communications Function**.

When the receive data includes the MPB bit is SSR set to 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.

When the receive data includes the MPB bit set to 1, the MPB bit is set to 1, the MPIE bit is automatically cleared to 0, the RXI and ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting the flags ORER and FER to 1 is enabled.

MPIE should be set to 0 if multi-processor communications function is not to be used.

### RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

### TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

**RIE Bit (Receive Interrupt Enable)**

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

### (2) Smart Card Interface Mode (SCMR.SMIF = 1)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W*2 | R/W*2 | R/W | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | CKE[1:0] | 00b | R/W*1 | Clock Enable<br>• When SMR.GM = 0<br>b1 b0<br>0 0: Output disabled (The SCKn pin is available for use as an I/O port according to the I/O port settings.)<br>0 1: Clock output<br>1 x: (Setting prohibited)<br>• When SMR.GM = 1<br>b1 b0<br>0 0: Output fixed low<br>x 1: Clock output<br>1 0: Output fixed high |
| b2 | TEIE | 0b | R/W | Transmit End Interrupt Enable<br>This bit should be 0 in smart card interface mode. |
| b3 | MPIE | 0b | R/W | Multi-Processor Interrupt Enable<br>This bit should be 0 in smart card interface mode. |
| b4 | RE | 0b | R/W*2 | Receive Enable<br>0: Serial reception is disabled<br>1: Serial reception is enabled |
| b5 | TE | 0b | R/W*2 | Transmit Enable<br>0: Serial transmission is disabled<br>1: Serial transmission is enabled |
| b6 | RIE | 0b | R/W | Receive Interrupt Enable<br>0: RXI and ERI interrupt requests are disabled<br>1: RXI and ERI interrupt requests are enabled |
| b7 | TIE | 0b | R/W | Transmit Interrupt Enable<br>0: A TXI interrupt request is disabled<br>1: A TXI interrupt request is enabled |

**Remarks:** x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written in TE and RE.

For details on interrupt requests, refer to **Section 23.8, Interrupt Sources**.

#### CKE[1:0] Bits (Clock Enable)

These bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, refer to **Section 23.6.8, Clock Output Control**.

#### TEIE Bit (Transmit End Interrupt Enable)

This bit should be 0 in smart card interface mode.

#### MPIE Bit (Multi-Processor Interrupt Enable)

This bit should be 0 in smart card interface mode.

#### RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

#### TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

#### RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

## 23.2.9 Serial Status Register (SSR)

Some bits in SSR have different functions in smart card interface mode and non-smart card interface mode.

### (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MPBT |
| Initial Value | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/(W)*2 | R/(W)*2 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | MPBT | 0b | R/W | Multi-Processor Bit Transfer<br>Sets the multi-processor bit for adding to the transmission frame<br>0: Data transmission cycles<br>1: ID transmission cycles |
| b1 | MPB | 0b | R | Multi-Processor<br>Value of the multi-processor bit in the reception frame<br>0: Data transmission cycles<br>1: ID transmission cycles |
| b2 | TEND | 1b | R | Transmit End Flag<br>0: A character is being transmitted.<br>1: Character transfer has been completed. |
| b3 | PER | 0b | R/(W) *1 | Parity Error Flag<br>0: No parity error occurred<br>1: A parity error has occurred |
| b4 | FER | 0b | R/(W) *1 | Framing Error Flag<br>0: No framing error occurred<br>1: A framing error has occurred |
| b5 | ORER | 0b | R/(W) *1 | Overrun Error Flag<br>0: No overrun error occurred<br>1: An overrun error has occurred |
| b6 | RDRF | 0b | R/(W) *2 | Receive Data Full Flag<br>0: When data is transferred from RDR<br>1: When data has been received normally, and transferred from RSR to RDR |
| b7 | TDRE | 1b | R/(W) *2 | Transmit Data Empty Flag<br>0: When data is transferred to TDR<br>1: When data is transferred from TDR to TSR |

Note 1. Only 0 can be written to this bit, to clear the flag.

Note 2. Write 1 when writing is necessary.

#### MPB Bit (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

#### TEND Flag (Transmit End Flag)

Indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

#### PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

#### FER Flag (Framing Error Flag)

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When the stop bit is 0
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after reading FER = 1
  Even when the SCR.RE bit is set to 0, the FER flag is not affected and retains its previous value.

### ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed. Note that, in clock synchronous mode, serial transmission also cannot continue.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

### RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

### TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

### (2) Smart Card Interface Mode (SCMR.SMIF = 1)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | TDRE | RDRF | ORER | ERS | PER | TEND | MPB | MPBT |
| Initial Value | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/(W)*2 | R/(W)*2 | R/(W)*1 | R/(W)*1 | R/(W)*1 | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | MPBT | 0b | R/W | Multi-Processor Bit Transfer<br>This bit should be set to 0 in smart card interface mode. |
| b1 | MPB | 0b | R | Multi-Processor<br>This bit is not used in smart card interface mode. It should be set to 0. |
| b2 | TEND | 1b | R | Transmit End Flag<br>0: A character is being transmitted.<br>1: Character transfer has been completed. |
| b3 | PER | 0b | R/(W)*1 | Parity Error Flag<br>0: No parity error occurred<br>1: A parity error has occurred |
| b4 | ERS | 0b | R/(W)*1 | Error Signal Status Flag<br>0: Low error signal not responded<br>1: Low error signal responded |
| b5 | ORER | 0b | R/(W)*1 | Overrun Error Flag<br>0: No overrun error occurred<br>1: An overrun error has occurred |
| b6 | RDRF | 0b | R/(W)*2 | Receive Data Full Flag<br>0: When data is transferred from RDR<br>1: When data has been received normally, and transferred from RSR to RDR |
| b7 | TDRE | 1b | R/(W)*2 | Transmit Data Empty Flag<br>0: When data is transferred to TDR<br>1: When data is transferred from TDR to TSR |

Note 1. Only 0 can be written to this bit, to clear the flag.

Note 2. Write 1 when writing is necessary.

### TEND Flag (Transmit End Flag)

With no error signal from the receiving side, this bit is set to 1 when further data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR.TE bit = 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When a specified period has elapsed after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated
  The set timing is determined by register settings as listed below.
  When SMR.GM = 0 and SMR.BLK = 0, 12.5 etu after the start of transmission
  When SMR.GM = 0 and SMR.BLK = 1, 11.5 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 0, 11.0 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 1, 11.0 etu after the start of transmission

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

### PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

### ERS Flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1
  Even when the SCR.RE bit is set to 0, the ERS flag is not affected and retains its previous value.

### ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, the receive data prior to an overrun error occurrence is retained, but data received following the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

### RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

### TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

## 23.2.10 Smart Card Mode Register (SCMR)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | BCP2 | — | — | CHR1 | SDIR | SINV | — | SMIF |
| Initial Value | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |
| R/W | R/W*1 | R/W | R/W | R/W*1 | R/W*1 | R/W*1 | R/W | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | SMIF | 0b | R/W*1 | Smart Card Interface Mode Select<br>0: Non-smart card interface mode (Asynchronous mode, clock synchronous mode,)<br>1: Smart card interface mode |
| b1 | — | 1b | R/W | Reserved<br>This bit is read as 1. The write value should be 1. |
| b2 | SINV | 0b | R/W*1 | Transmitted/Received Data Invert<br>0: TDR contents are transmitted as they are. Receive data is stored as it is in RDR.<br>1: TDR contents are inverted before being transmitted. Receive data is stored in inverted form in RDR. |
| b3 | SDIR | 0b | R/W*1 | Transmitted/Received Data Transfer Direction<br>This bit can be used in the following modes.<br>• Smart card interface mode<br>• Asynchronous mode (multi-processor mode)<br>• Clock synchronous mode<br>0: Transfer with LSB first<br>1: Transfer with MSB first |
| b4 | CHR1 | 1b | R/W*1 | Character Length 1<br>(Only valid in asynchronous mode)*2<br>Selects in combination with the SMR.CHR bit.<br>CHR1 CHR<br>0 0: Transmit/receive in 9-bit data length<br>0 1: Transmit/receive in 9-bit data length<br>1 0: Transmit/receive in 8-bit data length (initial value)<br>1 1: Transmit/receive in 7-bit data length*3 |
| b6, b5 | — | 1b | R/W | Reserved<br>These bits are read as 1. The write value should be 1. |
| b7 | BCP2 | 1b | R/W*1 | Base Clock Pulse 2<br>Selects the number of base clock cycles in combination with the SMR.BCP[1:0] bits.<br>**Table 23.5** lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits. |

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.

Note 3. LSB first should be selected and the value of MSB (b7) in TDR cannot be transmitted.

### SMIF Bit (Smart Card Interface Mode Select)

When this bit is set to 1, smart card interface mode is selected.

When this bit is set to 0, non-smart card interface mode, i.e., asynchronous mode (including multi-processor mode), clock synchronous mode is selected.

### SINV Bit (Transmitted/Received Data Invert)

Inverts the transmit/receive data logic level. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR.

### CHR1 bit (Character Length 1)

Selects the data length of transmit/receive data. Selects in combination with the CHR bit in SMR.

A fixed data length of 8 bits is used in modes other than asynchronous mode.

### BCP2 Bit (Base Clock Pulse 2)

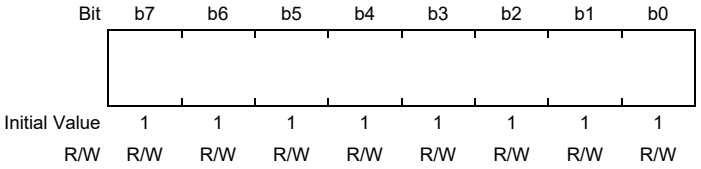
Selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR.BCP[1:0] bits.

Table 23.5 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

| SCMR.BCP2 Bit | SMR.BCP[1:0] Bits | | Number of Base Clock Cycles for 1-Bit Transfer Period |
|---|---|---|---|
| 0 | 0 | 0 | 93 clock cycles (S = 93)*1 |
| 0 | 0 | 1 | 128 clock cycles (S = 128)*1 |
| 0 | 1 | 0 | 186 clock cycles (S = 186)*1 |
| 0 | 1 | 1 | 512 clock cycles (S = 512)*1 |
| 1 | 0 | 0 | 32 clock cycles (S = 32)*1 (Initial Value) |
| 1 | 0 | 1 | 64 clock cycles (S = 64)*1 |
| 1 | 1 | 0 | 372 clock cycles (S = 372)*1 |
| 1 | 1 | 1 | 256 clock cycles (S = 256)*1 |

Note 1. S is the value of Base Clock Cycles for 1-bit Period BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**, **Table 23.8 Base Clock Settings in Smart Card Interface Mode**).

### 23.2.11 Bit Rate Register (BRR)



BRR is an 8-bit register that adjusts the bit rate.

As each SCI channel has independent baud rate generator control, different bit rates can be set for each. **Table 23.6** shows the relationship between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor communication, clock synchronous mode, and smart card interface mode.

The initial value of BRR is H'FF.

BRR can be read from by the CPU, but it can be written to only when the TE and RE bits in SCR are 0.

Table 23.6 Relationship between N Setting in BRR and Bit Rate B

| Mode | SEMR BGDM Bit | SEMR ABCS Bit | BRR Setting | Error |
|---|---|---|---|---|
| Asynchronous or multi-processor communication | 0 | 0 | $N = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$ |
| | 0 | 1 | $N = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$ |
| | 1 | 0 | | |
| | 1 | 1 | $N = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$ |
| Clock synchronous | | | $N = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times B} - 1$ | |
| Smart card interface | | | $N = \frac{P0\phi \times 10^6}{S \times 2^{2n+1} \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\} \times 100$ |

**Remarks:** B: Bit rate (bps)
N: BRR setting for on-chip baud rate generator (0 ≤ N ≤ 255)
P0ϕ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in the table below.

Table 23.7 Clock Source Settings

| SMR.CKS[1:0] Bit Setting | Clock Source | n |
|---|---|---|
| 0 0 | P0$\phi$ clock | 0 |
| 0 1 | P0$\phi$/4 clock | 1 |
| 1 0 | P0$\phi$/16 clock | 2 |
| 1 1 | P0$\phi$/64 clock | 3 |

Table 23.8 Base Clock Settings in Smart Card Interface Mode

| SCMR.BCP2 Bit Setting | SMR.BCP[1:0] Bit Setting | Base Clock Cycles for 1-bit Period | S |
|---|---|---|---|
| 0 | 0 0 | 93 clock cycles | 93 |
| 0 | 0 1 | 128 clock cycles | 128 |
| 0 | 1 0 | 186 clock cycles | 186 |
| 0 | 1 1 | 512 clock cycles | 512 |
| 1 | 0 0 | 32 clock cycles | 32 |
| 1 | 0 1 | 64 clock cycles | 64 |
| 1 | 1 0 | 372 clock cycles | 372 |
| 1 | 1 1 | 256 clock cycles | 256 |

**Table 23.9** lists examples of N settings in BRR in normal asynchronous mode. **Table 23.10** lists the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode are listed in **Table 23.12**. Examples of BRR (N) settings in smart card interface mode are listed in **Table 23.14**. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, refer to **Section 23.6.4, Receive Data Sampling Timing and Reception Margin**. **Table 23.11** and **Table 23.13** list the maximum bit rates with external clock input.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) in the serial extended mode register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice that listed in **Table 23.9**. When both of those registers are set to 1, the bit rate becomes four times the listed value.

Table 23.9 Examples of BRR Settings for Various Bit Rates (Asynchronous Mode)

| | Operating Frequency P0$\phi$ (MHz) | | |
|---|---|---|---|
| | 100 | | |
| Bit Rate (bps) | n | N | Error (%) |
| 110 | — | — | — |
| 150 | — | — | — |
| 300 | 3 | 162 | −0.15 |
| 600 | 3 | 80 | 0.47 |
| 1200 | 2 | 162 | −0.15 |
| 2400 | 2 | 80 | 0.47 |
| 4800 | 1 | 162 | −0.15 |
| 9600 | 1 | 80 | 0.47 |
| 19200 | 0 | 162 | −0.15 |
| 31250 | 0 | 99 | 0.00 |
| 38400 | 0 | 80 | 0.47 |

**Note:** This is an example when the ABCS and BGDM bits in SEMR are 0.
When either the ABCS bit or BGDM bit is set to 1, the bit rate doubles.
When both ABCS and BGDM bits in SEMR are set to 1, the bit rate increases four times.

Table 23.10 Maximum Bit Rate for Each Operating Frequency (Asynchronous Mode)

| | SEMR Settings | | | | |
|---|---|---|---|---|---|
| P0ϕ (MHz) | BGDM Bit | ABCS Bit | n | N | Maximum Bit Rate (bps) |
| 100 | 0 | 0 | 0 | 0 | 3125000 |
| | | 1 | 0 | 0 | 6250000 |
| | 1 | 0 | 0 | 0 | 6250000 |
| | | 1 | 0 | 0 | 12500000 |

Table 23.11 Maximum Bit Rate with External Clock Input (Asynchronous Mode)

| | Maximum Bit Rate (bps) | | |
|---|---|---|---|
| P0ϕ (MHz) | External Input Clock (MHz) | SEMR.ABCS Bit = 0 | SEMR.ABCS Bit = 1 |
| 100 | 25.000 | 1562500 | 3125000 |

Table 23.12 BRR Settings for Various Bit Rates (Clock Synchronous Mode)

| | Operating Frequency P0ϕ (MHz) | |
|---|---|---|
| | 100 | |
| Bit Rate (bps) | n | N |
| 110 | — | — |
| 250 | — | — |
| 500 | — | — |
| 1 k | — | — |
| 2.5 k | 3 | 155 |
| 5 k | 3 | 77 |
| 10 k | 2 | 155 |
| 25 k | 1 | 249 |
| 50 k | 1 | 124 |
| 100 k | 0 | 249 |
| 250 k | 0 | 99 |
| 500 k | 0 | 49 |
| 1 M | 0 | 24 |
| 2.5 M | 0 | 9 |
| 5 M | 0 | 4 |
| 7.5 M | 0 | 2 |

**Note:** Continuous transmission or reception is impossible. After transmitting or receiving one frame of data, there is an interval of a 1-bit period before starting transmitting or receiving the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. For this reason, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate.

**Remarks:** Space: Setting prohibited.
—: Can be set, but an error will occur.

Table 23.13 Maximum Bit Rate with External Clock Input (Clock Synchronous Mode)

| P0φ (MHz) | External Input Clock (MHz) | Maximum Bit Rate (Mbps) |
|---|---|---|
| 100 | 16.6667 | 16.6667 |

Table 23.14 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372)

| Bit Rate (bps) | P0φ (MHz) | n | N | Error (%) |
|---|---|---|---|---|
| 9600 | 100 | 0 | 13 | 0.01 |

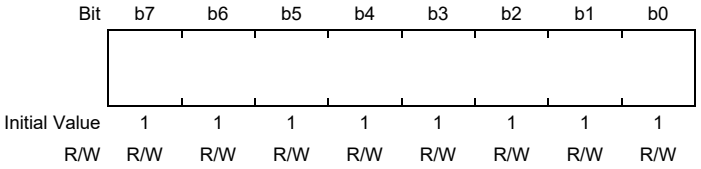
Table 23.15 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 32)

| P0φ (MHz) | Maximum Bit Rate (bps) | n | N |
|---|---|---|---|
| 100.00 | 1562500 | 0 | 0 |

Table 23.16 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 372)

| P0φ (MHz) | Maximum Bit Rate (bps) | n | N |
|---|---|---|---|
| 100.00 | 134409 | 0 | 0 |

### 23.2.12 Modulation Duty Register (MDDR)



MDDR corrects the bit rate adjusted by the BRR register.

When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in **Table 23.17**.

The initial value of MDDR is H'FF. Bit 7 in this register is fixed to 1.

The CPU can read the MDDR register, but this register is only writable when the TE and RE bits in SCR are 0.

Table 23.17 Relationship between MDDR Setting (M) and Bit Rate (B)
When Bit Rate Modulation Function is Used

| Mode | SEMR Setting BGDM Bit | SEMR Setting ABCS Bit | BRR Setting | Error |
|---|---|---|---|---|
| Asynchronous or multi-processor communication | 0 | 0 | $N = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (256M) \times (N+1)} - 1\} \times 100$ |
| | 0 | 1 | $N = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256M) \times (N+1)} - 1\} \times 100$ |
| | 1 | 0 | | |
| | 1 | 1 | $N = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (256M) \times (N+1)} - 1\} \times 100$ |
| Clock synchronous | | | $N = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$ | |
| Smart card interface | | | $N = \frac{P0\phi \times 10^6}{S \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error\ (\%) = \{\frac{P0\phi \times 10^6}{B \times S \times 2^{2n-1} \times (256M) \times (N+1)} - 1\} \times 100$ |

**Note:** Do not use this function in clock synchronous mode with the highest speed setting (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).

**Remarks:** B: Bit rate (bps)
M: MDDR setting (128 ≤ MDDR ≤ 256)
N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
P0ϕ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in **Table 23.7** and **Table 23.8**, **Section 23.2.11, Bit Rate Register (BRR)**.

## 23.2.13 Serial Extended Mode Register (SEMR)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | RXDESEL | BGDM | NFEN | ABCS | — | BRME | — | ACS0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W*1 | R/W | R/W*1 | R/W*1 | R/W | R/W | R/W | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | ACS0 | 0b | R/W*1 | Asynchronous Mode Clock Source Select<br>(Valid only in asynchronous mode)<br>0: External clock input<br>1: Reserved bit |
| b1 | — | 0b | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |
| b2 | BRME | 0b | R/W | Bit Rate Modulation Enable<br>0: Bit rate modulation function is disabled.<br>1: Bit rate modulation function is enabled. |
| b3 | — | 0b | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |
| b4 | ABCS | 0b | R/W*1 | Asynchronous Mode Base Clock Select<br>(Valid only in asynchronous mode)<br>0: Selects 16 base clock cycles for 1-bit period.<br>1: Selects 8 base clock cycles for 1-bit period. |
| b5 | NFEN | 0b | R/W*1 | Digital Noise Filter Function Enable<br>(In asynchronous mode)<br>0: Noise cancellation function for the RXDn input signal is disabled.<br>1: Noise cancellation function for the RXDn input signal is enabled. |
| b6 | BGDM | 0b | R/W | Baud Rate Generator Double-Speed Mode Select<br>(Only valid the CKE[1] bit in SCR is 0 in asynchronous mode).<br>0: Baud rate generator outputs the clock with normal frequency.<br>1: Baud rate generator outputs the clock with doubled frequency. |
| b7 | RXDESEL | 0b | R/W*1 | Asynchronous Start Bit Edge Detection Select<br>(Valid only in asynchronous mode)<br>0: The low level on the RXDn pin is detected as the start bit.<br>1: A falling edge on the RXDn pin is detected as the start bit. |

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

SEMR selects the clock source for 1-bit period in asynchronous mode.

### ACS0 Bit (Asynchronous Mode Clock Source Select)

Selects the clock source in the asynchronous mode.

The ACS0 bit is valid in asynchronous mode (CM bit in SMR = 0) and when an external clock input is selected (CKE[1:0] bits in SCR = 10b or 11b).

Set the ACS0 bit to 0 in other than asynchronous mode.

### BRME bit (Bit Rate Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by on-chip baud rate generator is evenly corrected when this function is enabled.

### NFEN Bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function.

When the function is enabled, noise cancellation is applied to the RXDn input signal in asynchronous mode. In any mode other than above, set the NFEN bit to 0 to disable the digital noise filter function.

When the function is disabled, input signals are transferred as is, as internal signals.

### BGDM bit (Baud Rate Generator Double-Speed Mode Select)

Selects the cycle of output clock for the baud rate generator.

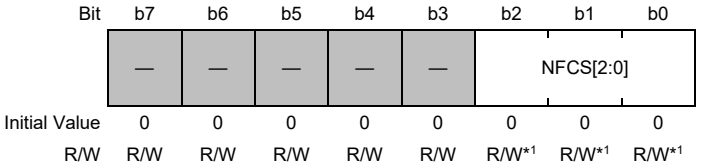
This bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0). For the clock output from the baud rate generator, either normal or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved and the bit rate is doubled. Set this bit to 0 in modes other than asynchronous mode.

### RXDESEL Bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1 when reception should be stopped while a break occurs or when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.

Set this bit to 0 in modes other than asynchronous mode.

## 23.2.14 Noise Filter Setting Register (SNFR)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b2 to b0 | NFCS[2:0] | All 0 | R/W*1 | Noise Filter Clock Select<br>In asynchronous mode, the standard setting for the base clock is as follows.<br>b2 b0<br>0 0 0: The clock signal divided by 1 is used with the noise filter.<br>Settings other than above are prohibited. |
| b7 to b3 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR are 0 (serial reception and transmission disabled).

### NFCS[2:0] Bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b.

### 23.2.15 Extended function control register (SECR)

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | CTSE | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W*1 | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b0 | — | 0b | R/W | Reserved<br>This bit is read as 0. The write value should be 0. |
| b1 | CTSE | 0b | R/W*1 | CTS Enable<br>0: CTS function is disabled (RTS output function is enabled).<br>1: CTS function is enabled. |
| B7 to b2 | — | All 0 | R/W | Reserved<br>These bits are read as 0. The write value should be 0. |

Note 1. Writing to the bit is only possible when the SCR.RE and SCR.TE bits are 0.

SECR is used to select the extension settings in asynchronous and clock synchronous modes.

#### CTSE Bit (CTS Enable)

Set this bit to 1 if the SSn# pin is to be used for inputting of the CTS control signal to control of transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode. Do not set both the CTSE and SSE bits to enabled (even if this setting is made, operation is the same as that when these bits are set to 0).

## 23.3 Operation in Asynchronous Mode

**Figure 23.2** shows the general format for asynchronous serial communications.

One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).

In asynchronous serial communications, the communications line is usually held in the mark state (high level).

The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

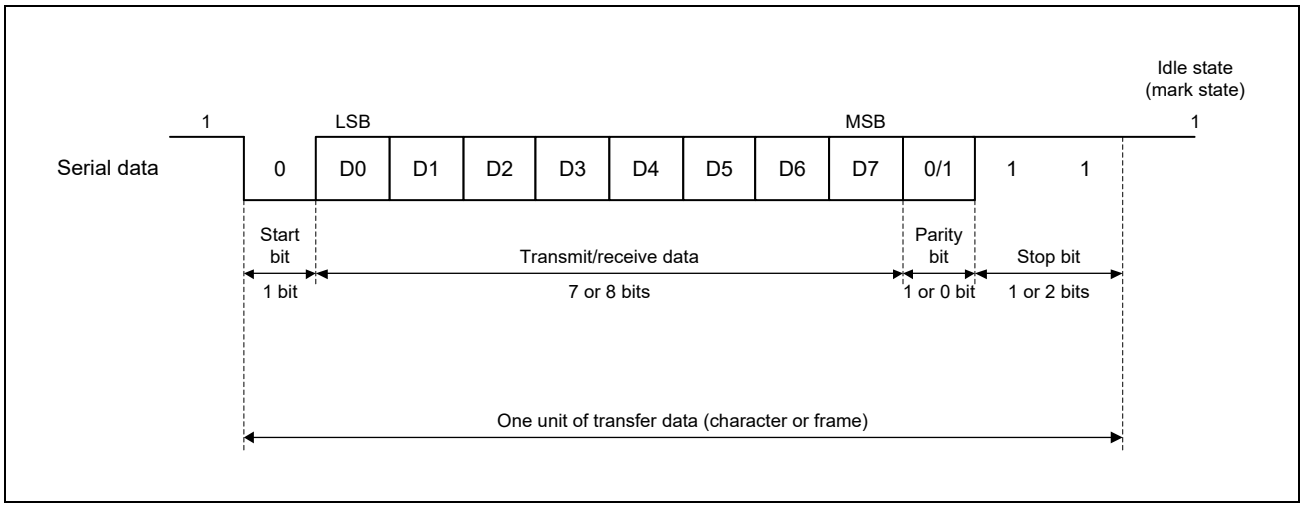


Figure 23.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, 2 Stop Bits)

### 23.3.1 Serial Data Transfer Format

**Table 23.18** lists the serial data transfer formats that can be used in asynchronous mode.

Any of 18 transfer formats can be selected according to the SMR and SCMR setting. For details of multi-processor function, refer to **Section 23.4, Multi-Processor Communications Function**.

Table 23.18 Serial Transfer Formats (Asynchronous Mode)

| SCMR Setting | SMR Setting | | | | Serial Transfer Format and Frame Length | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| CHR1 | CHR | PE | MP | STOP | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 |
| 0 | 0 | 0 | 0 | 0 | S | 9-bit data | | | | | | | | | STOP | | |
| 0 | 0 | 0 | 0 | 1 | S | 9-bit data | | | | | | | | | STOP | STOP | |
| 0 | 0 | 1 | 0 | 0 | S | 9-bit data | | | | | | | | | P | STOP | |
| 0 | 0 | 1 | 0 | 1 | S | 9-bit data | | | | | | | | | P | STOP | STOP |
| 1 | 0 | 0 | 0 | 0 | S | 8-bit data | | | | | | | | STOP | | | |
| 1 | 0 | 0 | 0 | 1 | S | 8-bit data | | | | | | | | STOP | STOP | | |
| 1 | 0 | 1 | 0 | 0 | S | 8-bit data | | | | | | | | P | STOP | | |
| 1 | 0 | 1 | 0 | 1 | S | 8-bit data | | | | | | | | P | STOP | STOP | |
| 1 | 1 | 0 | 0 | 0 | S | 7-bit data | | | | | | | STOP | | | | |
| 1 | 1 | 0 | 0 | 1 | S | 7-bit data | | | | | | | STOP | STOP | | | |
| 1 | 1 | 1 | 0 | 0 | S | 7-bit data | | | | | | | P | STOP | | | |
| 1 | 1 | 1 | 0 | 1 | S | 7-bit data | | | | | | | P | STOP | STOP | | |
| 0 | 0 | — | 1 | 0 | S | 9-bit data | | | | | | | | | MPB | STOP | |
| 0 | 0 | — | 1 | 1 | S | 9-bit data | | | | | | | | | MPB | STOP | STOP |
| 1 | 0 | — | 1 | 0 | S | 8-bit data | | | | | | | | MPB | STOP | | |
| 1 | 0 | — | 1 | 1 | S | 8-bit data | | | | | | | | MPB | STOP | STOP | |
| 1 | 1 | — | 1 | 0 | S | 7-bit data | | | | | | | MPB | STOP | | | |
| 1 | 1 | — | 1 | 1 | S | 7-bit data | | | | | | | MPB | STOP | STOP | | |

**Note:** S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

### 23.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate.

In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization. Since receive data is sampled at the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in **Figure 23.3**. Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left|(0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\right| \times 100\ [\%] \cdots \text{Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SEMR = 0, N = 8 when ABCS in SEMR = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

**Note 1.** This is an example when the ABCS bit in SEMR is 0. When the ABCS bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock.

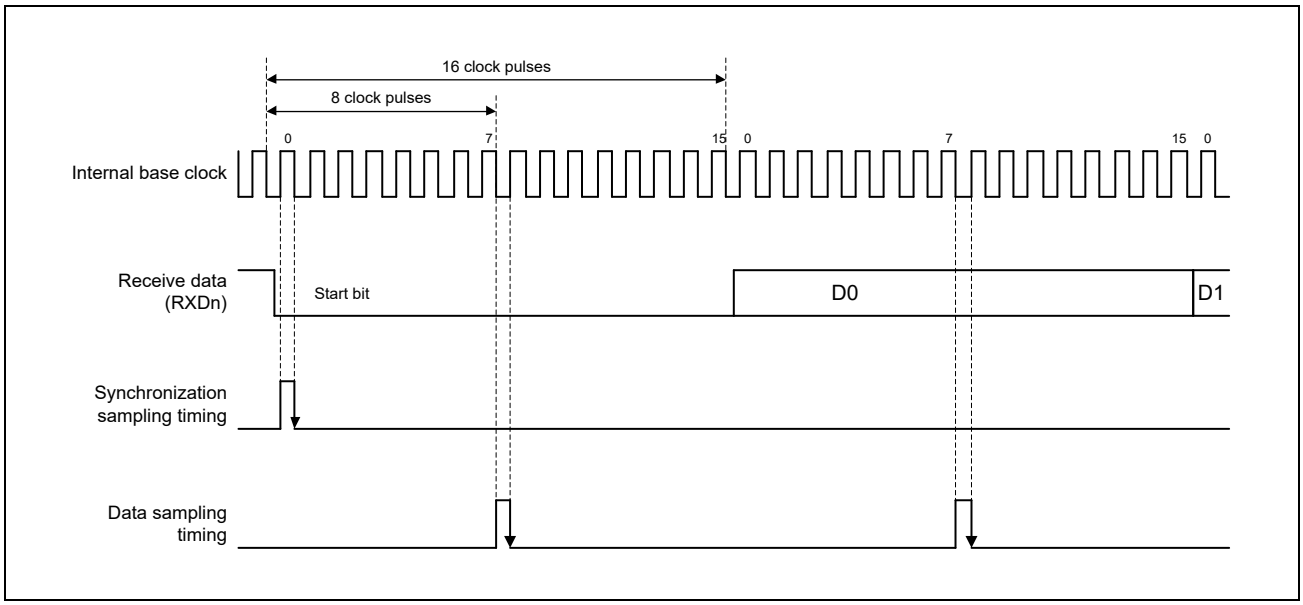

Figure 23.3 Receive Data Sampling Timing in Asynchronous Mode

### 23.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the SCI's transfer clock, according to the setting of the CM bit in SMR and the CKE[1:0] bits in SCR. When an external clock is input to the SCKn pin, the clock frequency should be 16 times the bit rate (when ABCS in SEMR = 0) and 8 times the bit rate (when ABCS in SEMR = 1).

When the SCI is operated on an internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in **Figure 23.4**.

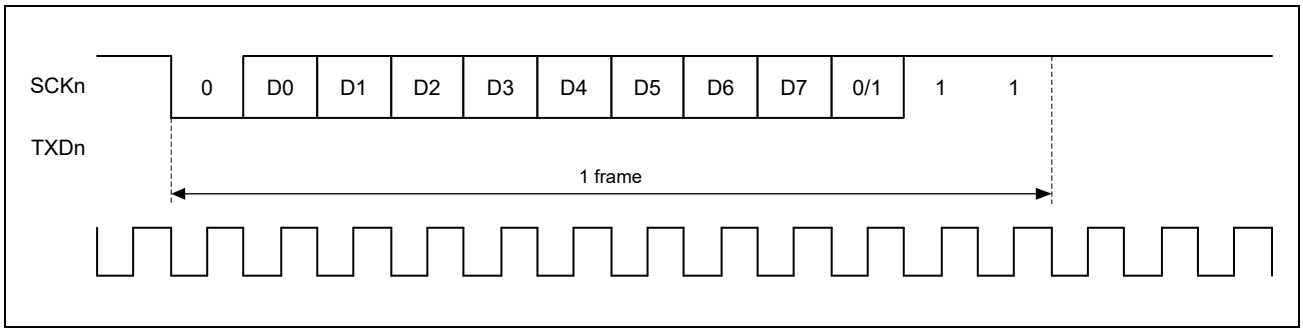

Figure 23.4 Phase Relationship between Output Clock and Transmit Data
(Asynchronous Mode: SMR.CHR = 0, PE = 1, MP = 0, STOP = 1)

### 23.3.4 Double-Speed Mode

The output clock frequency of the on-chip baud rate generator is doubled by setting the SEMR.BGDM bit to 1, enabling high-speed communication at a doubled bit rate. If the SEMR.ABCS bit is set to 1 under the above condition, the number of base clock cycles changes from 16 to 8, so the bit rate becomes four times faster than the initial state.

As shown by Formula (1) in **Section 23.3.2, Receive Data Sampling Timing and Reception Margin in Asynchronous Mode**, setting the SEMR.ABCS bit to 1 changes the number of cycles to 8, and the sampling interval becomes longer. This causes the reception margin to decrease. Therefore, setting the SEMR.BGDM bit to 1 and the SEMR.ABCS bit to 0 is recommended instead of setting the SEMR.BGDM bit to 0 and the SEMR.ABCS bit to 1 for high-speed operation at a doubled bit rate.

### 23.3.5 CTS and RTS Functions

The CTS function is the use of input on the CTSn# pin in transmission control. Setting the SECR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, placing the low level on the CTSn# pin causes transmission to start.

Applying the high level to the CTS# pin while transmission is in progress does not affect transmission of the current frame, which continues.

In the RTS function, by using the function of output on the RTSn# pin, a low level is output when reception becomes possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]

Satisfaction of all conditions listed below

- The value of the RE bit in the SCR is 1
- Reception is not in progress
- There are no received data yet to be read
- The ORER, FER, and PER flags in the SSR are all 0

[Condition for high-level output]

- The conditions for low-level output have not been satisfied.

### 23.3.6 SCI Initialization (Asynchronous Mode)

Before transmitting and receiving data, start by writing the initial value H'00 to SCR and then continue through the procedure for SCI given in **Figure 23.5**. Whenever the operating mode or transfer format is changed, SCR must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization. Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR, RDRH, and RDRL.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.

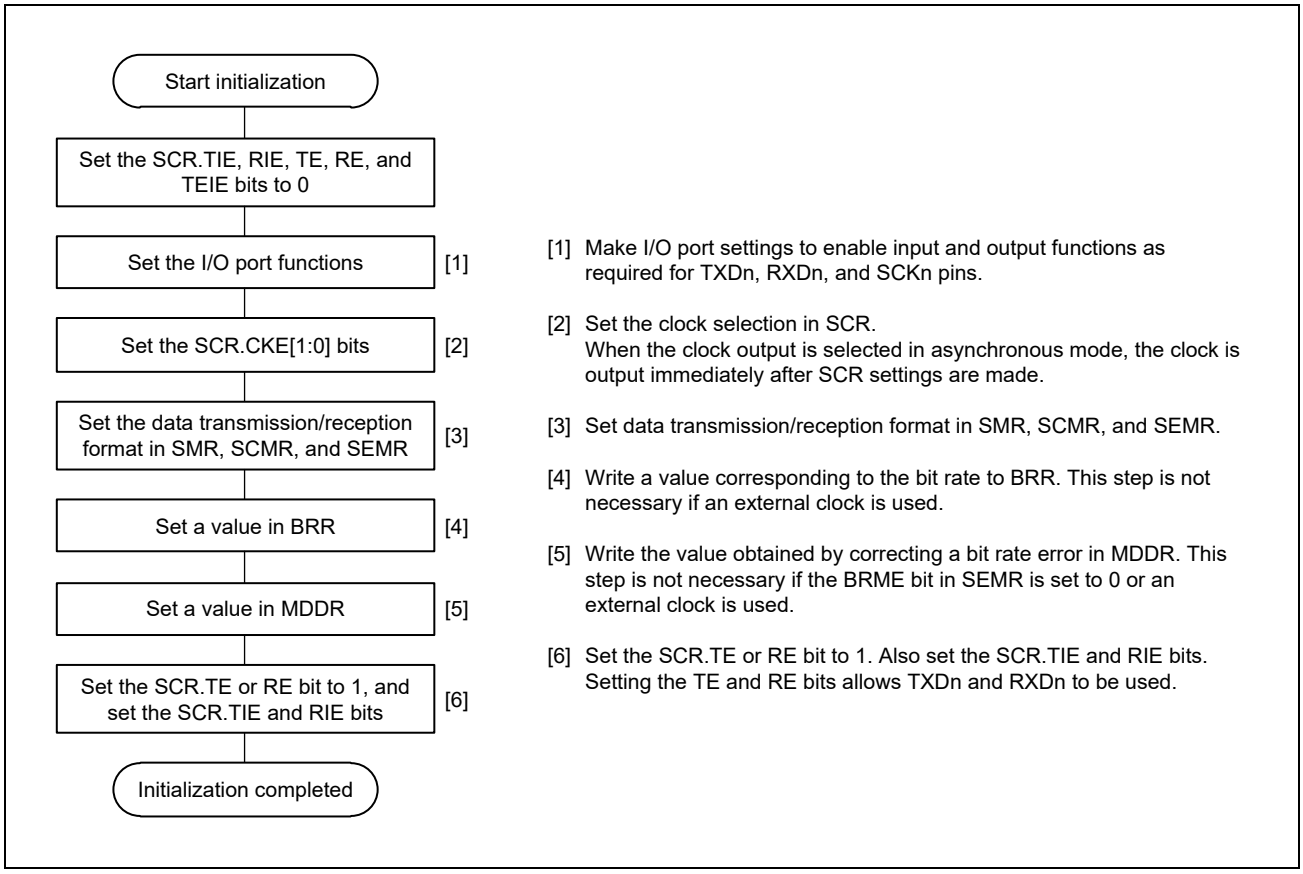

Figure 23.5 Sample SCI Initialization Flowchart (Asynchronous Mode)

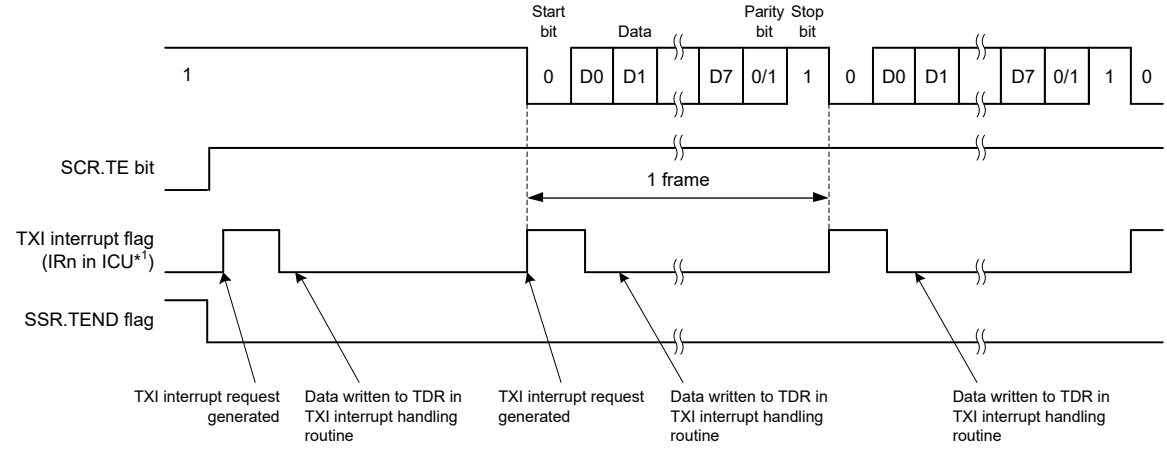
### 23.3.7 Serial Data Transmission (Asynchronous Mode)

**Figure 23.6** to **Figure 23.8** show an example of the operation for serial transmission in asynchronous mode. In serial transmission, the SCI operates as described below.

1. The SCI transfers data from TDR*1 to TSR when data is written to TDR*1 in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the CTSE bit in SECR is set to 0 (CTS function is disabled) and a low level on the CTSn# pin causes data transfer from TDR*1 to TSR. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR*1 in the TXI interrupt handling routine before transmission of the current transmit data is completed. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR*1*2 from the handling routine for TXI requests.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR*3 at the time of stop bit output.
5. When TDR*3 is updated, setting of the CTSE bit in SECR to 0 (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from TDR*1 to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR*3 is not updated, the TEND flag in SSR is set to 1, the stop bit is sent, and then the mark state is entered in which 1 is output. If the TEIE bit in SCR is 1 at this time, the TEND flag in SSR is set to 1 and a TEI interrupt request is generated.

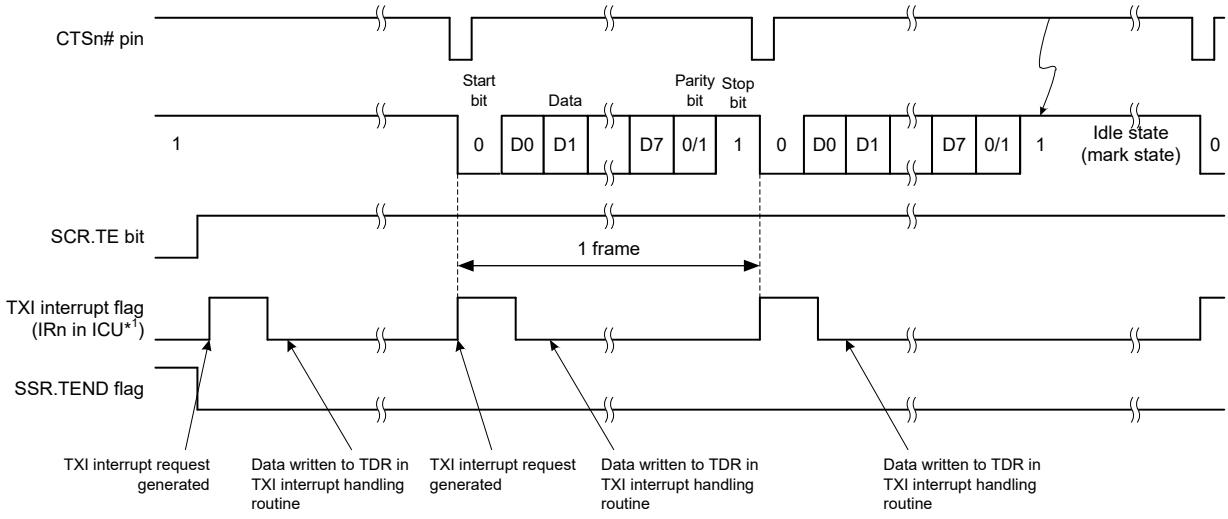
**Note 1.** Write data not to TDR but to the TDRH and TDRL registers when 9-bit data length is selected.
**Note 2.** Write data in the order from TDRH to TDRL when 9-bit data length is selected.
**Note 3.** The SCI checks for updating of the TDRL register only and does not check for updating of the TDRH register when 9-bit data length is selected.

**Figure 23.9** shows a sample flowchart for serial transmission in asynchronous mode.



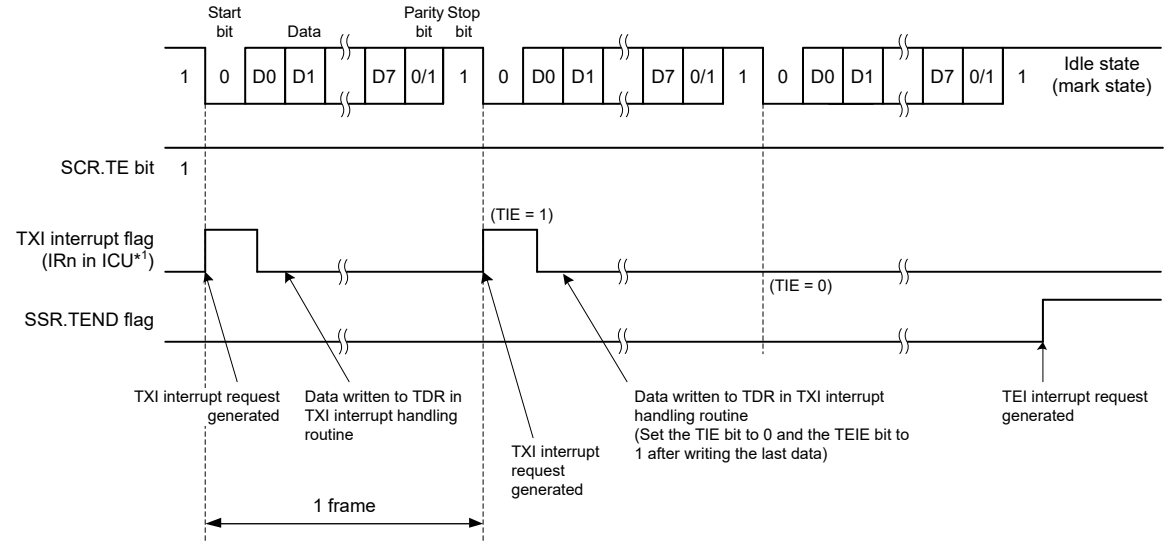
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.6 Example of Operation for Serial Transmission in Asynchronous Mode (1)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission)



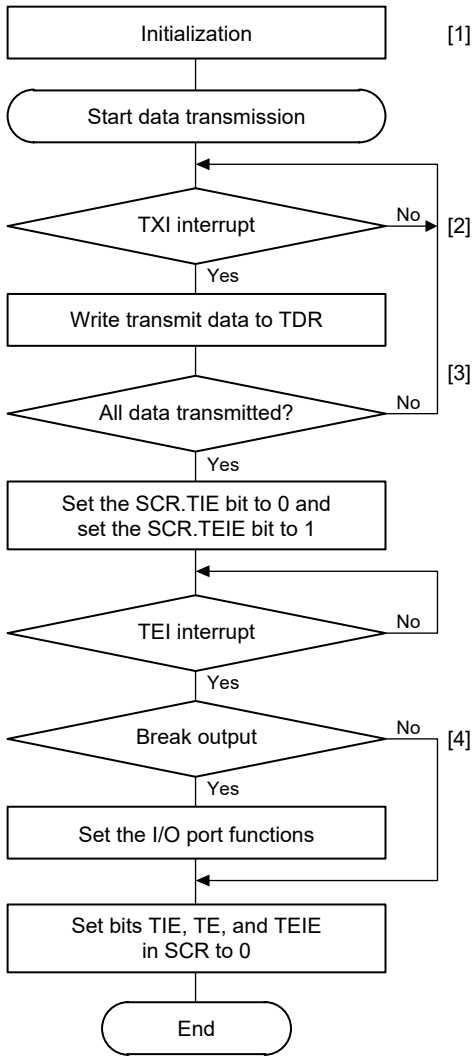
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.7 Example of Operation for Serial Transmission in Asynchronous Mode (2)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.8 Example of Operation for Serial Transmission in Asynchronous Mode (3)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] Transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

**Note:** The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

Figure 23.9 Example of Serial Transmission Flowchart in Asynchronous Mode

### 23.3.8 Serial Data Reception (Asynchronous Mode)

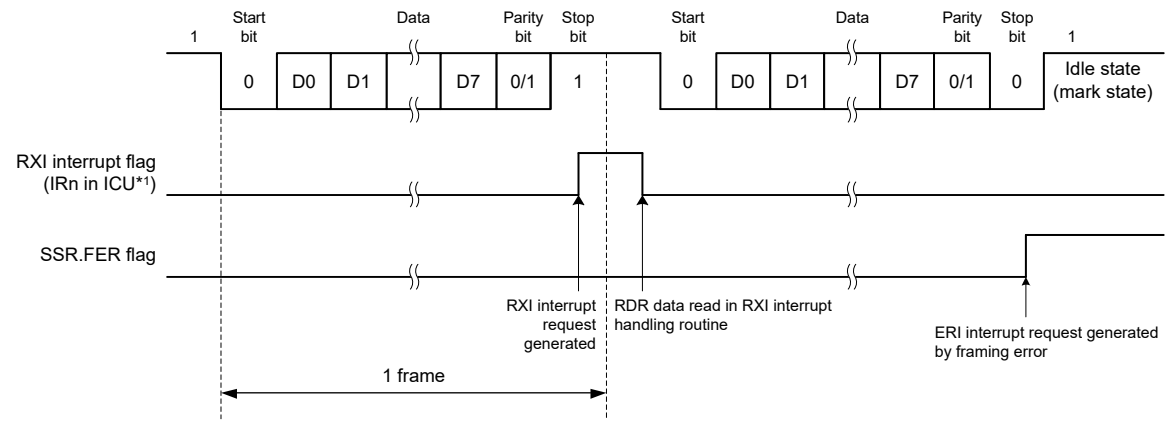
**Figure 23.10** and **Figure 23.11** show an example of the operation for serial data reception in asynchronous mode. In serial data reception, the SCI operates as described below.

1. When the value of the RE bit in SCR becomes 1, the output signal on the RTSn# pin goes to the low level.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, the ORER flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR*1.
4. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR*1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0) is detected, the FER bit in SSR is set to 1 and receive data is transferred to RDR*1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR*1. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR*1 in this RXI interrupt handling routine before reception of the next receive data is completed. Reading the received data that have been transferred to RDR*1 causes the RTSn# pin to output the low level.

**Note 1.** Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.

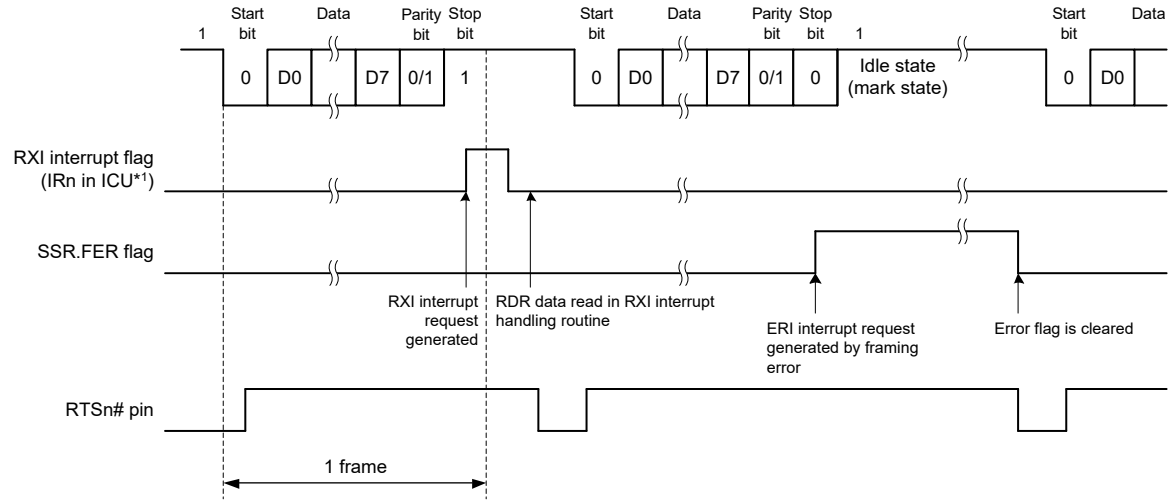
NOTE

The SCI checks for reading of the RDRL register only and does not check for reading of the RDRH register when 9-bit data length is selected.



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.10 Example of SCI Operation for Serial Reception in Asynchronous Mode (1)
(When RTS Function is Not Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.11 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (When RTS Function is Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)

**Table 23.19** lists the states of the flags in the SSR status register and receive data handling when a receive error is detected.

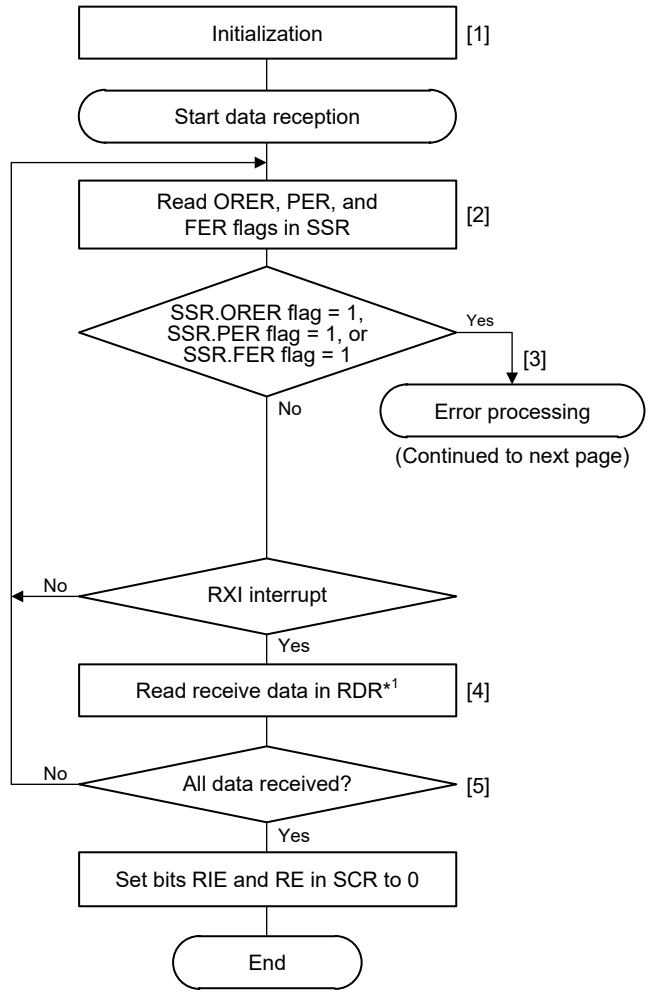
If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0 before resuming reception. Moreover, be sure to read the RDR (or the RDRL) during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR (or the RDRL) register because received data which has not yet been read may be left in RDR (or the RDRL).

**Figure 23.12** and **Figure 23.13** show samples of flowcharts for serial data reception.

Table 23.19 Flags in the SSR Status Register and Receive Data Handling

| Flags in the SSR Status Register | | | | |
|---|---|---|---|---|
| ORER | FER | PER | Receive Data | Receive Error Type |
| 1 | 0 | 0 | Lost | Overrun error |
| 0 | 1 | 0 | Transferred to RDR*1 | Framing error |
| 0 | 0 | 1 | Transferred to RDR*1 | Parity error |
| 1 | 1 | 0 | Lost | Overrun error + framing error |
| 1 | 0 | 1 | Lost | Overrun error + parity error |
| 0 | 1 | 1 | Transferred to RDR*1 | Framing error + parity error |
| 1 | 1 | 1 | Lost | Overrun error + framing error + parity error |

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.



[1] SCI initialization:
Set data reception.

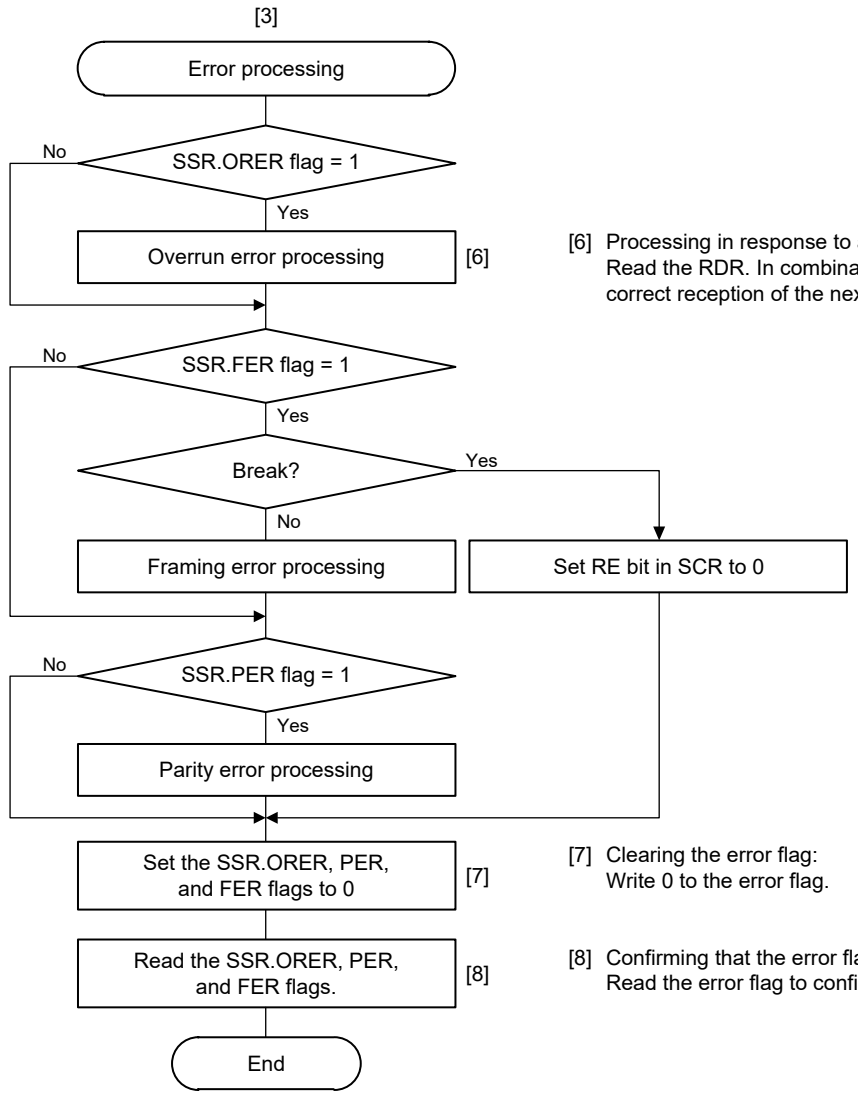
[2][3] Receive error processing and break detection:
If a receive error occurs, an ERI interrupt is generated. An error is identified by reading the ORER, PER, and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER, PER, and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. In the case of a framing error, a break can be detected by reading the value of the input port corresponding to the RXDn pin.

[4] Read the receive data in RDR once in the RXI interrupt handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the stop bit of the current frame is received, read data from RDR in the RXI interrupt processing routine.
The RDR data can also be read by activating the DMAC.

Note 1. The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 23.12 Example Flowchart of Serial Reception in Asynchronous Mode (1)



[6] Processing in response to an overrun error:
Read the RDR. In combination with step [7], this will make correct reception of the next frame possible

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Note 1. The RDR register becomes the RDRL register when 9-bit data length is selected. Reading the RDRH register is not necessary.

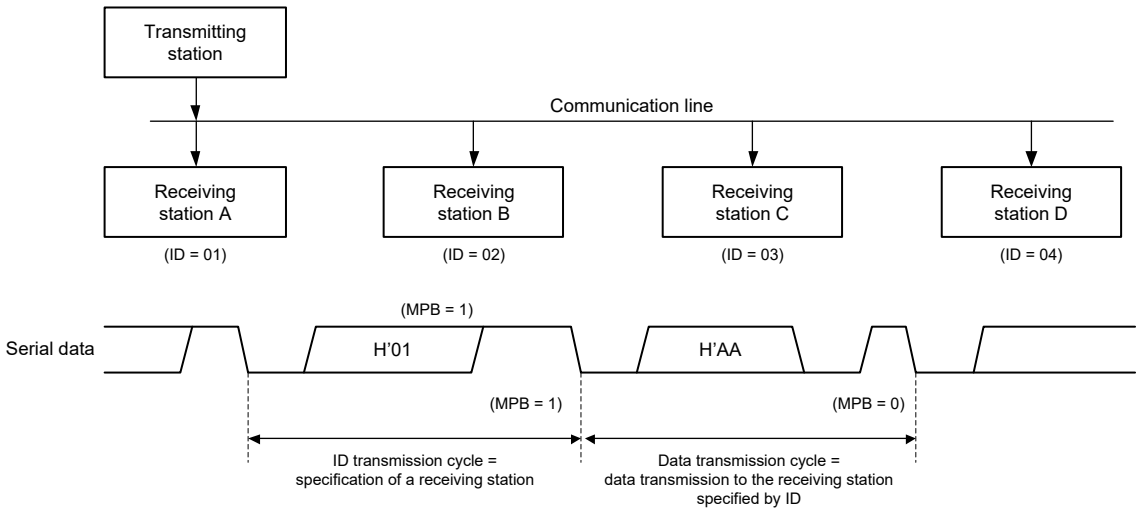
Figure 23.13 Example Flowchart of Serial Reception in Asynchronous Mode (2)

## 23.4 Multi-Processor Communications Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle and when the multi- processor bit is set to 0, it indicates the data transmission cycle. **Figure 23.14** shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1 is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0 is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself and if the two match, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1.

For supporting this function, the SCI provides the MPIE bit in SCR. When the MPIE bit is set to 1, transfer of receive data from the RSR to the RDR (the RDRH and RDRL registers when 9-bit data length is selected), detection of a receive error, and setting the respective status flags ORER and FER in SSR are disabled until reception of data in which the multi-processor bit is set to 1. Upon receiving a reception character in which the multi-processor bit is set to 1, the MPBT bit in SSR is set to 1 and the MPIE bit in SCR is automatically cleared, thus returning to a normal reception operation. During this time, an RXI interrupt is generated if the RIE bit in SCR is set.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the normal asynchronous mode.

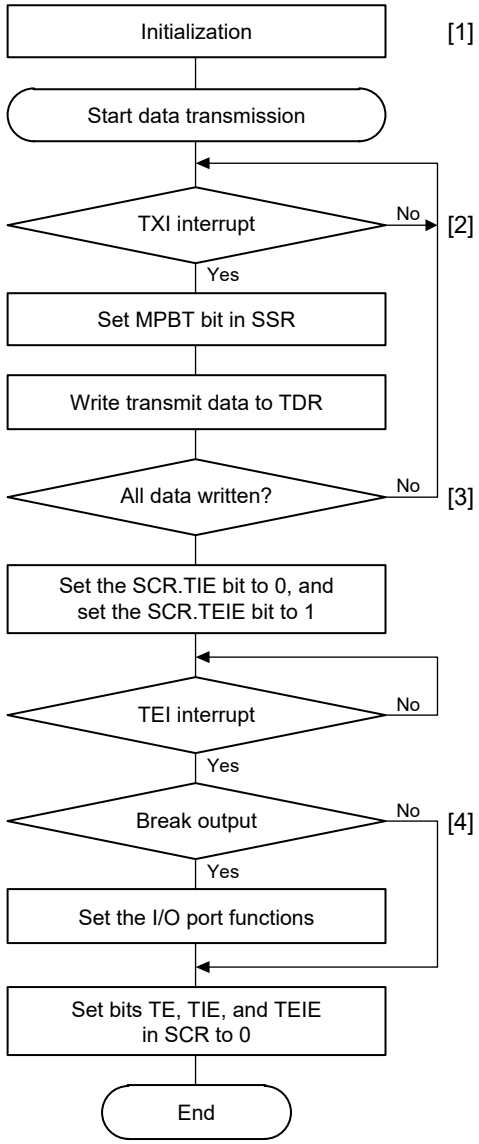


**Note:** MPB: Multi-processor bit

Figure 23.14 An Example of Communication using the Multi-Processor Format
(Example of Transmission of Data H'AA to Receiving Station A)

### 23.4.1 Multi-Processor Serial Data Transmission

**Figure 23.15** is a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in SSR set to 1. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0. The other operations are the same as the operations in asynchronous mode.



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Set the MPBT bit in SSR to 0 or 1, and write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

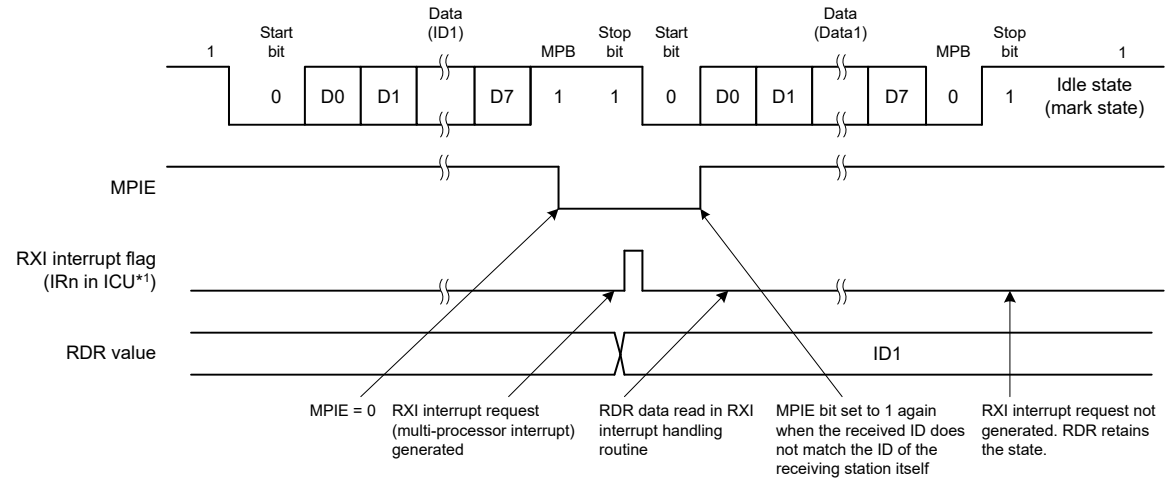
**Note:** The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

Figure 23.15 Example of Multi-Processor Serial Transmission Flowchart

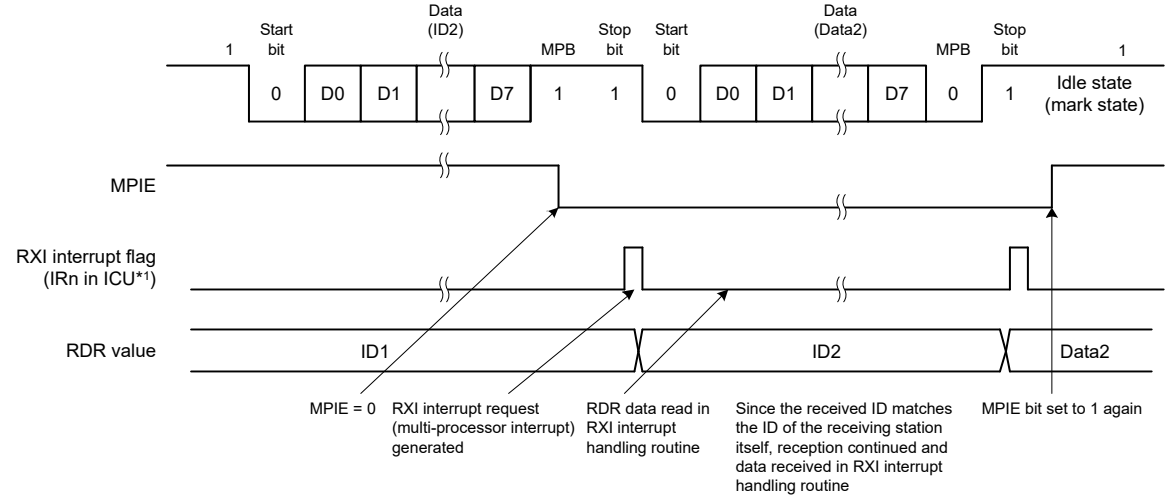
### 23.4.2 Multi-Processor Serial Data Reception

**Figure 23.17** and **Figure 23.18** are sample flowcharts of multi-processor data reception. When the MPIE bit in SCR is set to 1, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1. When the communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to RDR (the RDRH and RDRL registers when 9-bit data length is selected). During this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode.

**Figure 23.16** is the example of operation for reception.



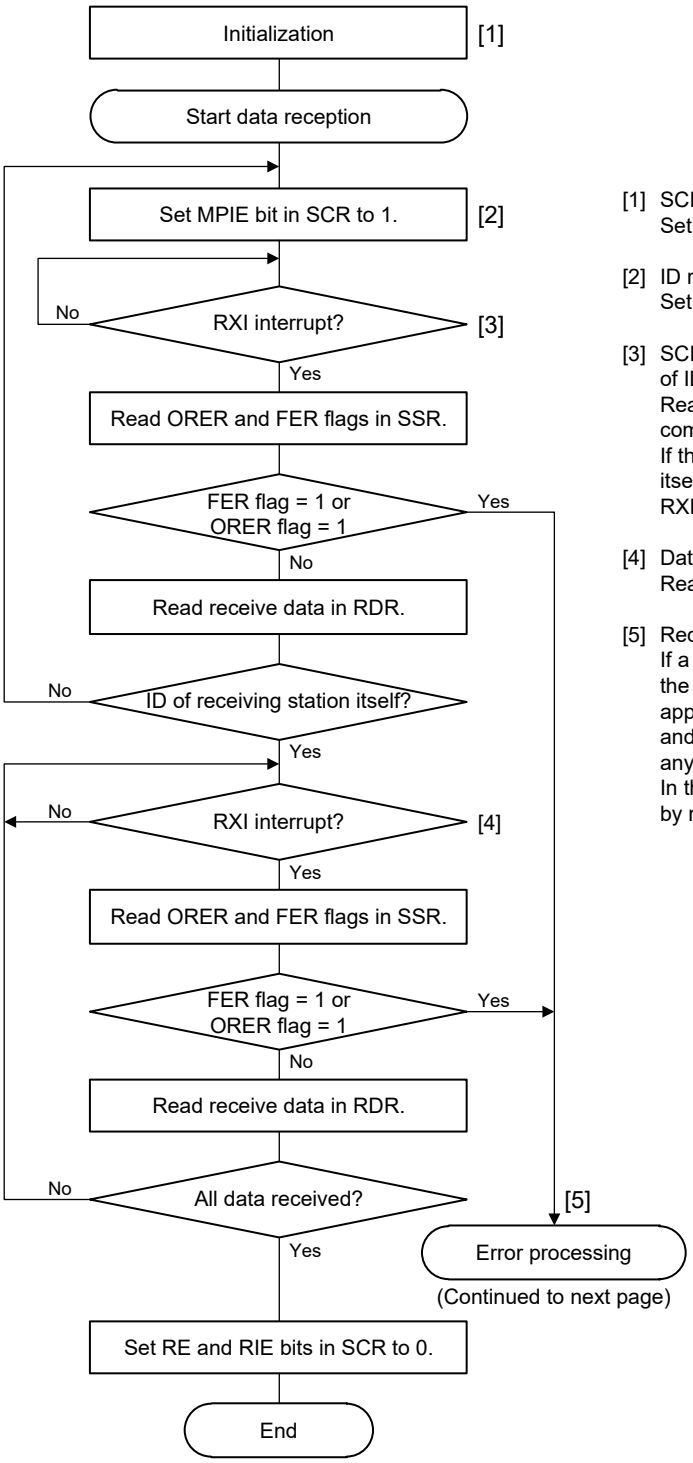
(a) When the received ID does not match the ID of the receiving station itself



(b) When the received ID matches the ID of the receiving station itself

Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.16 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit)



[1] SCI initialization:
Set data reception.

[2] ID reception cycle:
Set the MPIE bit in SCR to 1 and wait for ID reception.

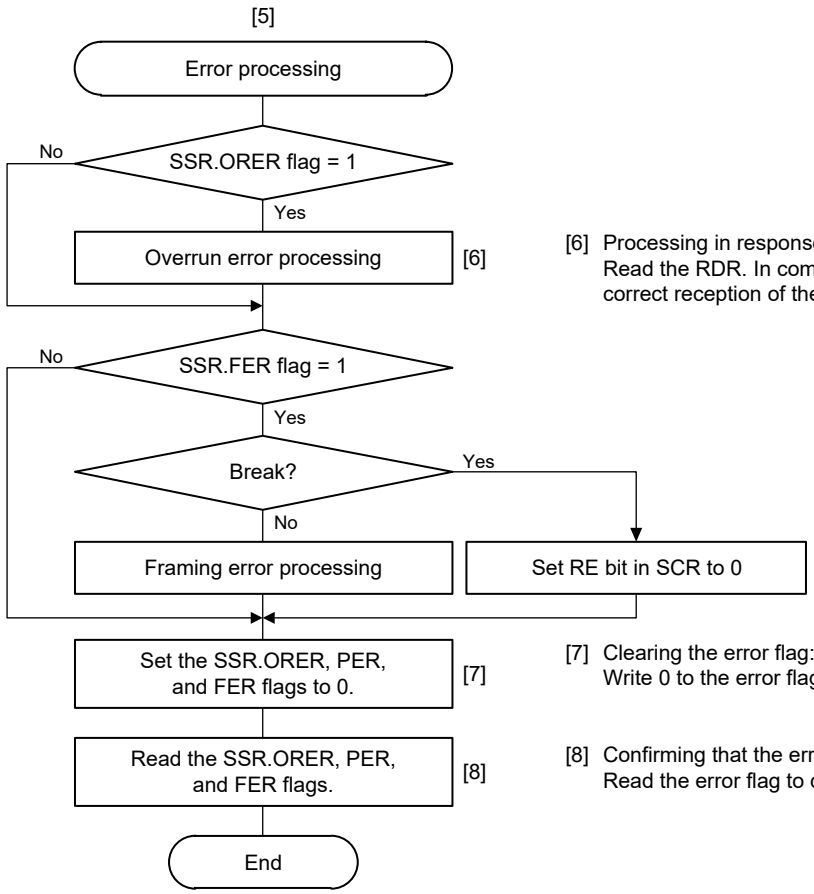
[3] SCI status confirmation and reception and comparison of ID:
Read data in RDR at the first RXI interrupt, and compare it with the ID of the receiving station itself.
If the ID does not match the ID of the receiving station itself, set the MPIE bit to 1 again, and wait for another RXI interrupt RXI interrupt request.

[4] Data reception at an RXI interrupt:
Read data in RDR once in the RXI interrupt routine.

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading the ORER and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1.
In the case of a framing error, a break can be detected by reading the value of the RXDn pin.

**Note:** The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 23.17 Example of Multi-Processor Serial Reception Flowchart (1)



[6] Processing in response to an overrun error:
Read the RDR. In combination with step [7], this will make correct reception of the next frame possible.

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

**Note:** The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 23.18 Example of Multi-Processor Serial Reception Flowchart (2)

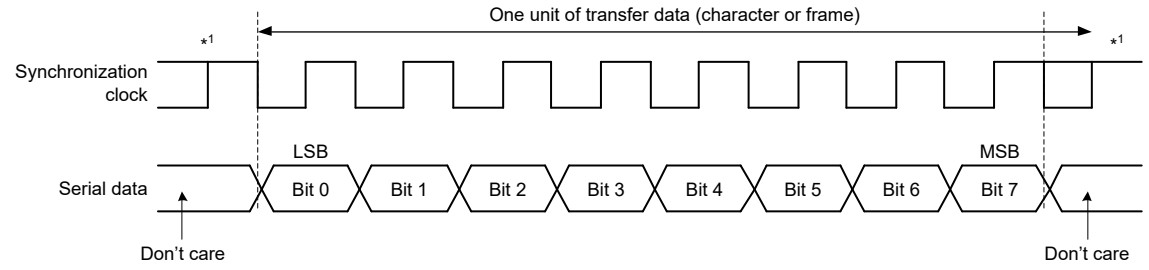
## 23.5 Operation in Clock Synchronous Mode

**Figure 23.19** shows the data format for clock synchronous serial data communications.

In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.

In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last bit output state.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.



Note 1. Holds a high level except during continuous transfer.

Figure 23.19 Data Format in Clock Synchronous Serial Communications (LSB First)

### 23.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected, according to the setting of the SCR.CKE[1:0] bits.

When the SCI is operated on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character, and when no transfer is performed the clock is held high. However, when only data reception is performed while the CTS function is disabled, the synchronization clock output is started at the same time when the SCR.RE bit set to 1. The synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

When only data reception is performed and the CTS function is enabled, the clock output is not started even when the SCR.RE bit set to 1 if the CTSn# pin input is high when the SCR.RE bit is 0. The synchronization clock output is started when the SCR.RE bit is set to 1 and the CTSn# pin input is low. After that, if the CTSn# pin input is high on completion of the frame reception, the synchronization clock output is stopped at the high level. If the CTSn# pin input continues to be low, the synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

### 23.5.2 CTS and RTS Functions

In the CTS function, CTSn# pin input is used to control reception/transmission start when the clock source is the internal clock. Setting the SECR.CTSE bit to 1 enables the CTS function.

When the CTS function is enabled, placing the low level on the CTSn# pin causes reception/transmission to start.

In the RTS function, RTSn# pin output is used to request reception/transmission start when the clock source is an external synchronizing clock. A low level is output when serial communications become possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output] Satisfaction of all conditions listed below

- The value of the RE or TE bit in the SCR is 1
- Neither transmission nor reception is in progress
- There are no received data yet to be read (when the SCR.RE bit is 1)
- Transmit data has been written (when the SCR.TE bit is 1)
- ORER flag in SSR is 0

[Condition for high-level output]

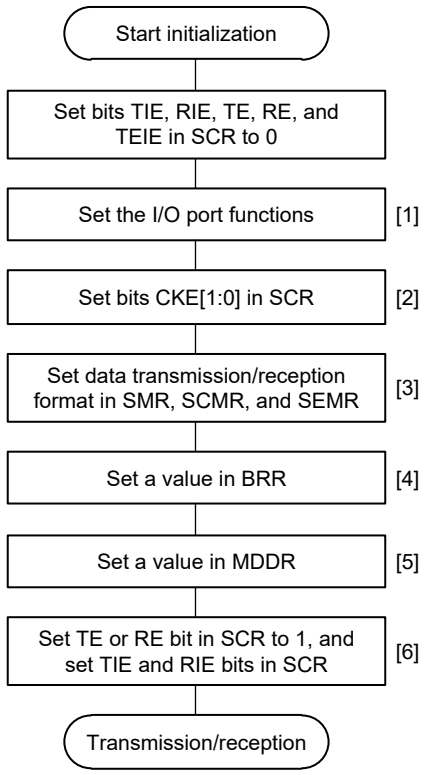
- The conditions for low-level output have not been satisfied.

### 23.5.3 SCI Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, start by writing the initial value H'00 to the SCR and then continue through the procedure for SCI given in **Figure 23.20**. Whenever the operating mode or transfer format is changed, the SCR must be initialized before the change is made.

Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.



[1] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[2] Set the clock selection in SCR.
When an internal clock is selected, the SCK pin functions as the clock output pin.

[3] Set the data transmission/reception format in SMR, SCMR, and SEMR.

[4] Write a value corresponding to the bit rate to BRR. This step is not necessary if an external clock is used.

[5] Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is cleared to 0 or an external clock is used.

[6] Set the TE bit or RE bit in SCR to 1. Also set the TIE and RIE bits in SCR.
Setting the TE and RE bits allows TXDn and RXDn to be used.

**Note:** In simultaneous transmit and receive operations, the TE and RE bits in SCR should both be set to 0 or 1 simultaneously.

Figure 23.20 Example of SCI Initialization Flowchart (Clock Synchronous Mode)

### 23.5.4 Serial Data Transmission (Clock Synchronous Mode)

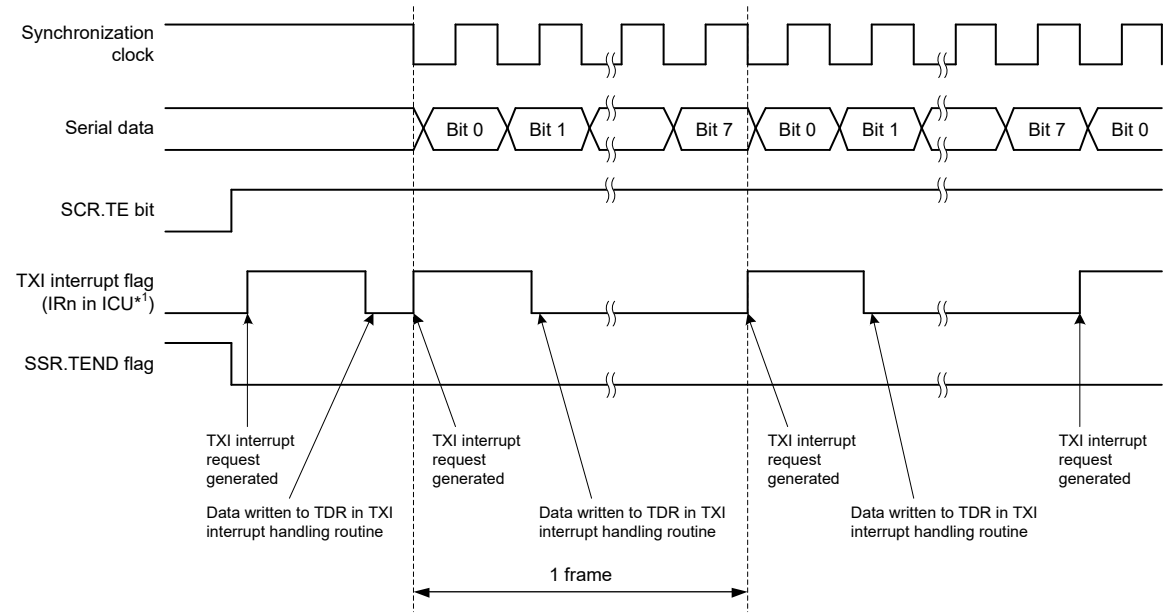
**Figure 23.21**, **Figure 23.22**, and **Figure 23.23** show an example of the operation for serial transmission in clock synchronous mode.

In serial data transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in this TXI interrupt handling routine before transmission of the current transmit data has finished. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR from the handling routine for TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when clock output mode has been specified and in synchronization with the input clock when use of an external clock has been specified. Output of the clock signal is suspended until the input CTS signal is at the low level while the CTSE bit in SECR is 1 (CTS function is enabled).
4. The SCI checks for updating of (writing to) the TDR at the time of the last bit output.
5. When TDR is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame is started.
6. If TDR is not updated, set the SSR.TEND flag to 1 and the TXDn pin retains the output state of the last bit. If the TEIE bit in SCR is 1 at this time, a TEI interrupt request is generated. The SCKn pin is held high.

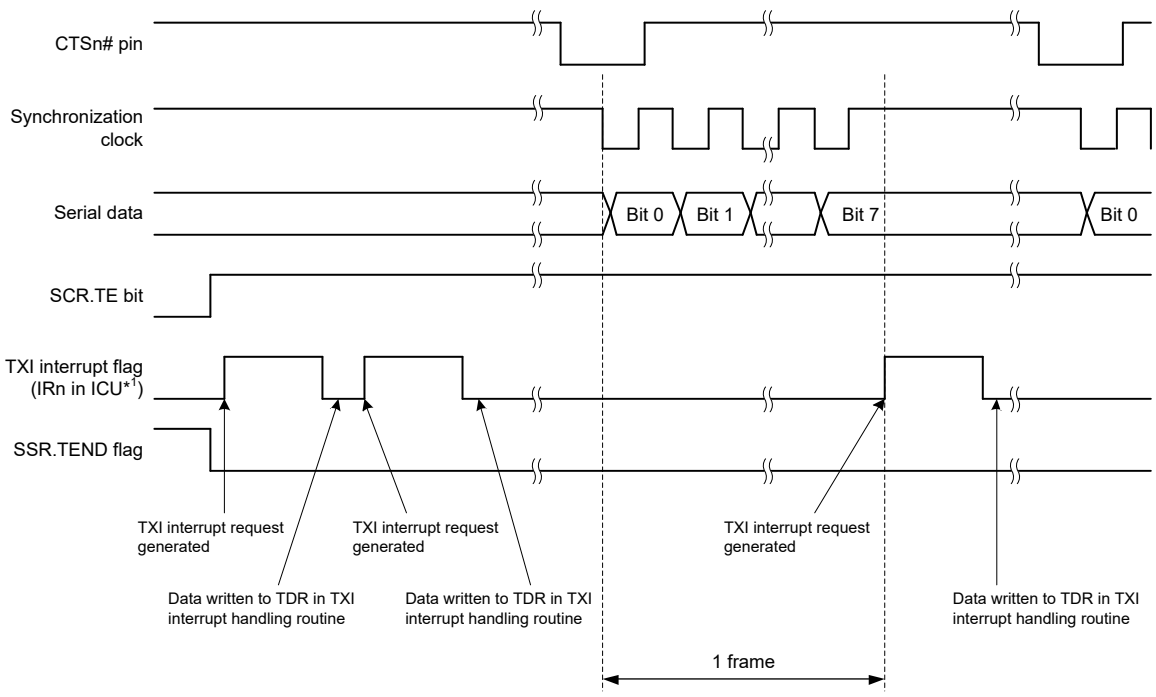
**Figure 23.24** shows a sample flowchart of serial data transmission.

Transmission will not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Be sure to set the receive error flags to 0 before starting transmission. Note that setting the RE bit in SCR to 0 does not clear the receive error flags.



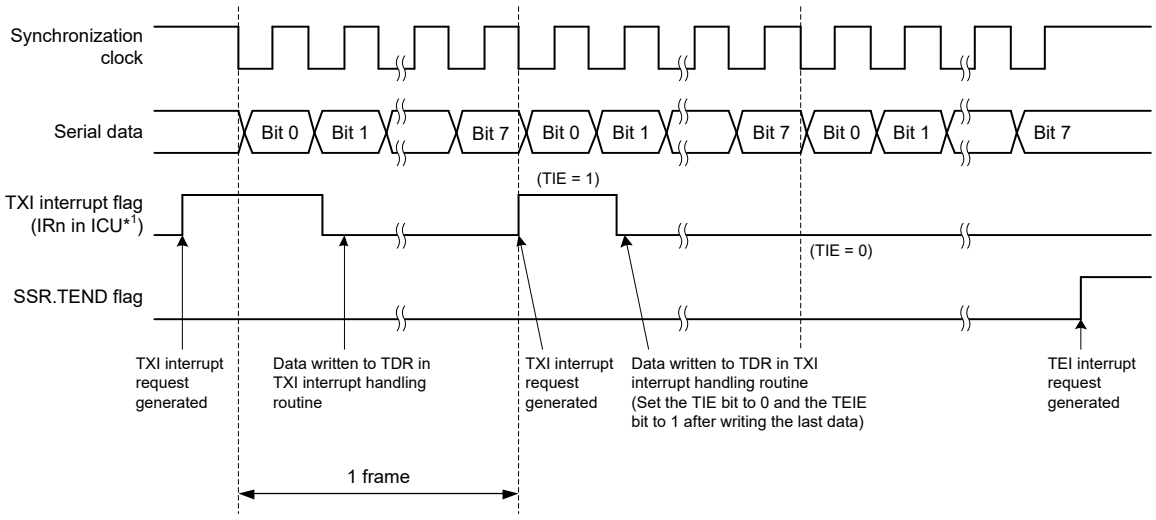
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.21 Example of Serial Data Transmission in Clock Synchronous Mode (1)
(When the CTS Function is Not Used at the Beginning of Transmission)



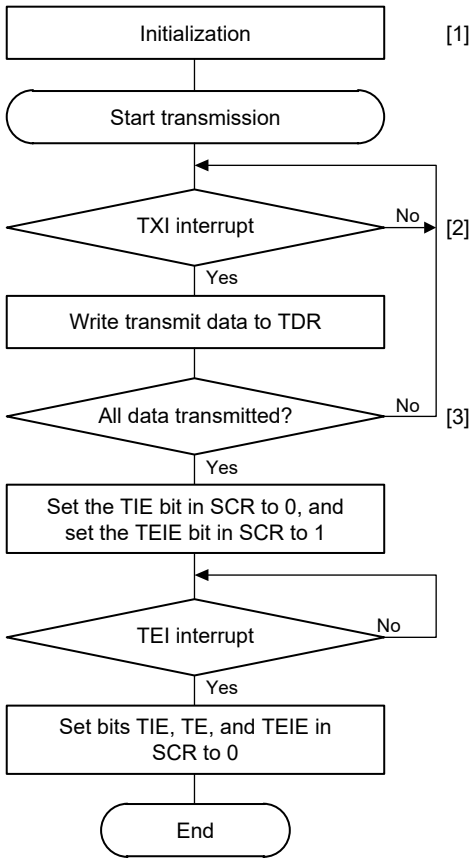
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.22 Example of Serial Data Transmission in Clock Synchronous Mode (2)
(When the CTS Function is Used at the Beginning of Transmission)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.23 Example of Serial Data Transmission in Clock Synchronous Mode (3)
(From the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.

[2] Writing transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Transmit data is written to TDR once from the handling routine for TXI requests.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR upon accepting a transmit data empty interrupt (TXI) request. Transmit data can also be written to TDR by activating the DMAC by the TXI interrupt request. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

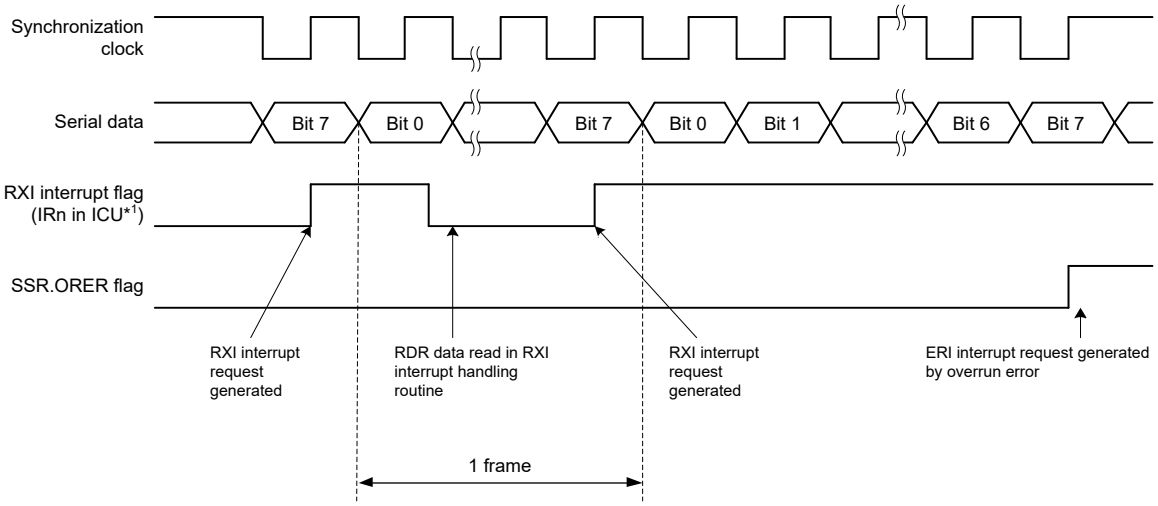
**Note:** When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR.TEND flag to 1. Setting the SCR.TE bit to 0 immediately after this may lead to insufficient received-data hold time on the receiver side.

Figure 23.24 Example Flowchart of Serial Transmission in Clock Synchronous Mode

### 23.5.5 Serial Data Reception (Clock Synchronous Mode)

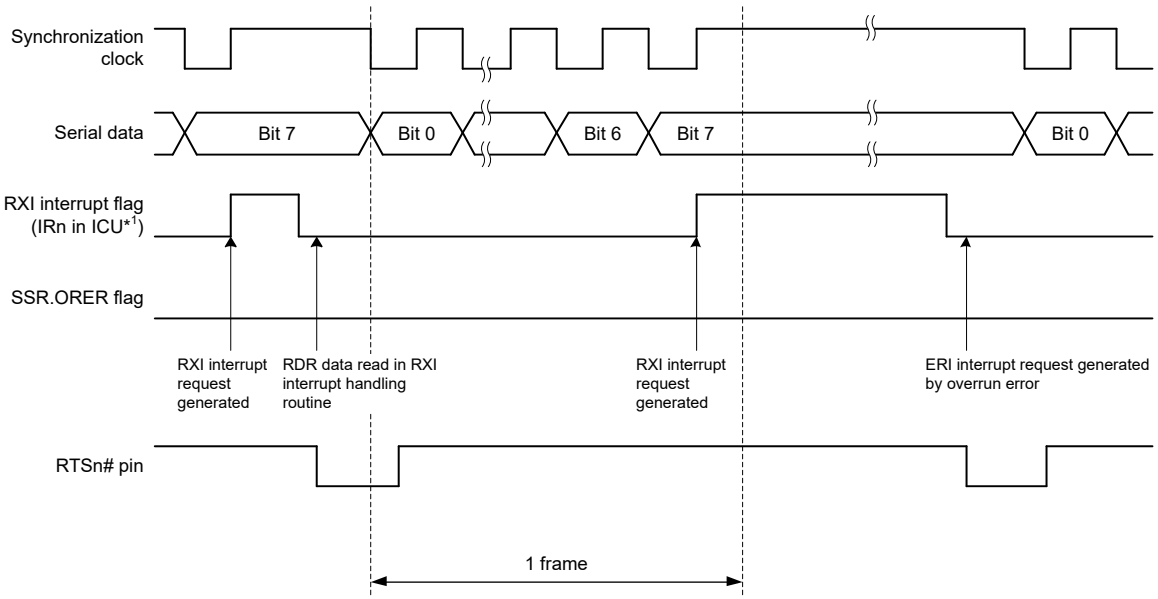
**Figure 23.25** and **Figure 23.26** show an example of SCI operation for serial reception in clock synchronous mode. In serial data reception, the SCI operates as described below.

1. The value of the RE bit in SCR becoming 1 places the signal output on the RTSn# pin at the low level (when the RTS function is in use).
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in RSR.
3. If an overrun error occurs, the ORER bit in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. When reception finishes successfully, receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt handling routine before reception of the next receive data is completed. Reading out the received data that have been transferred to RDR causes the RTSn# pin to output the low level (when the RTS function is in use).



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.25 Example of Operation for Serial Reception in Clock Synchronous Mode (1)
(When RTS Function is Not Used)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.26 Example of Operation for Serial Reception in Clock Synchronous Mode (2) (When RTS Function is Used)

Data transfer cannot be resumed while a receive error flag is 1. Accordingly, clear the ORER, FER, and PER bits in SSR to 0 before resuming reception. Moreover, be sure to read the RDR during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read RDR because received data which has not yet been read may be left in RDR.

**Figure 23.27** shows a sample flowchart for serial data reception.

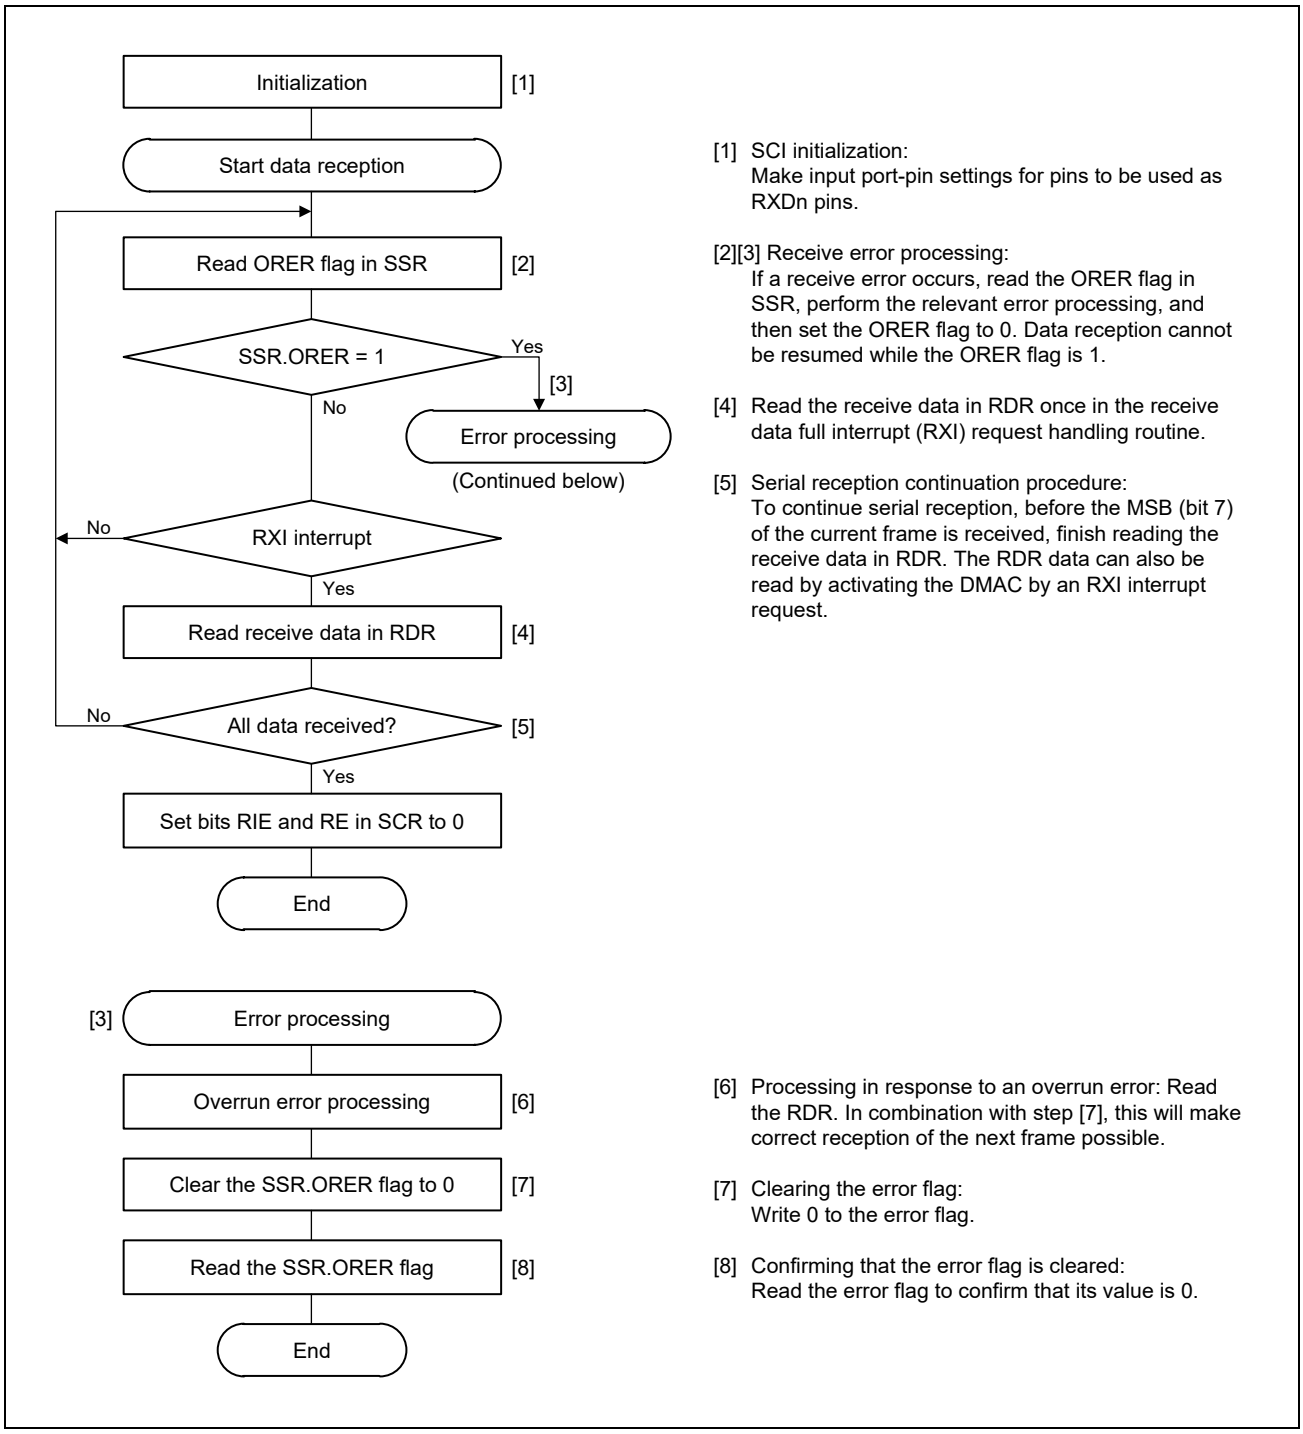


Figure 23.27 Example Flowchart of Serial Reception in Clock Synchronous Mode

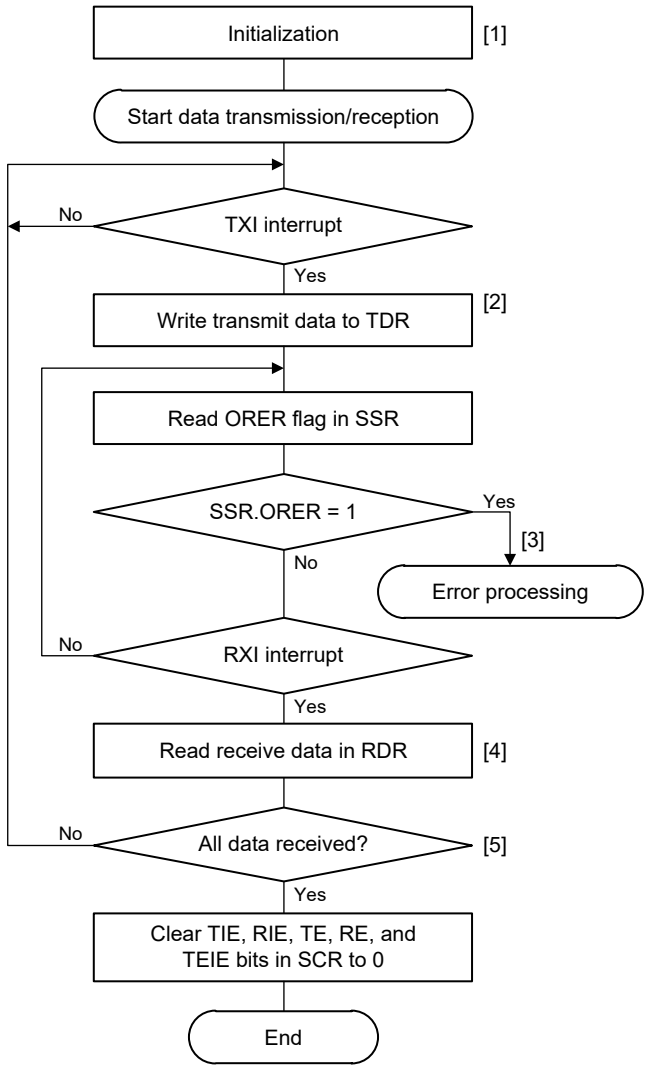
### 23.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

**Figure 23.28** shows a sample flowchart for simultaneous serial transmit and receive operations in clock synchronous mode.

After initializing the SCI, the following procedure should be used for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI has finished transmission by reading that the TEND flag in SSR is 1, and then initialize the SCR register. Then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode, check that the SCI has finished reception, and then set the RIE and RE bits to 0. Then check that the receive error flags (ORER, FER, and PER in SSR) are 0, and then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.



[1] SCI initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[2] Transmit data write:
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[4] Reading receive data:
Read the receive data in RDR once in the RXI interrupt request handling routine.

[5] Serial transmission/reception continuation procedure:
To continue serial transmission and reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR by the RXI interrupt. Also, before the MSB (bit 7) of the current frame is transmitted, write data to TDR by the TXI interrupt.
Transmit data can also be written to TDR by activating the DMAC by a transmit data empty interrupt (TXI) request. Similarly, the RDR data can also be read by activating the DMAC by a receive data full interrupt (RXI) request.

**Note:** When switching from transmit or receive operation to simultaneous transmit and receive operations first set the TIE, RIE, TE, RE, and TEIE bits in SCR to 0, and then set TIE, RIE, TE, and RE bits to 1 simultaneously.

Figure 23.28 Example Flowchart of Simultaneous Serial Transmission and Reception in Clock Synchronous Mode

## 23.6 Operation in Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function of the SCI.

Smart card interface mode can be selected using the appropriate register.

### 23.6.1 Sample Connection

**Figure 23.29** shows a sample connection between a smart card (IC card) and this MCU.

As in the figure, since this MCU communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor.

Setting the TE and RE bits in SCR to 1 with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.

To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card. The output port of this MCU can be used to output a reset signal.

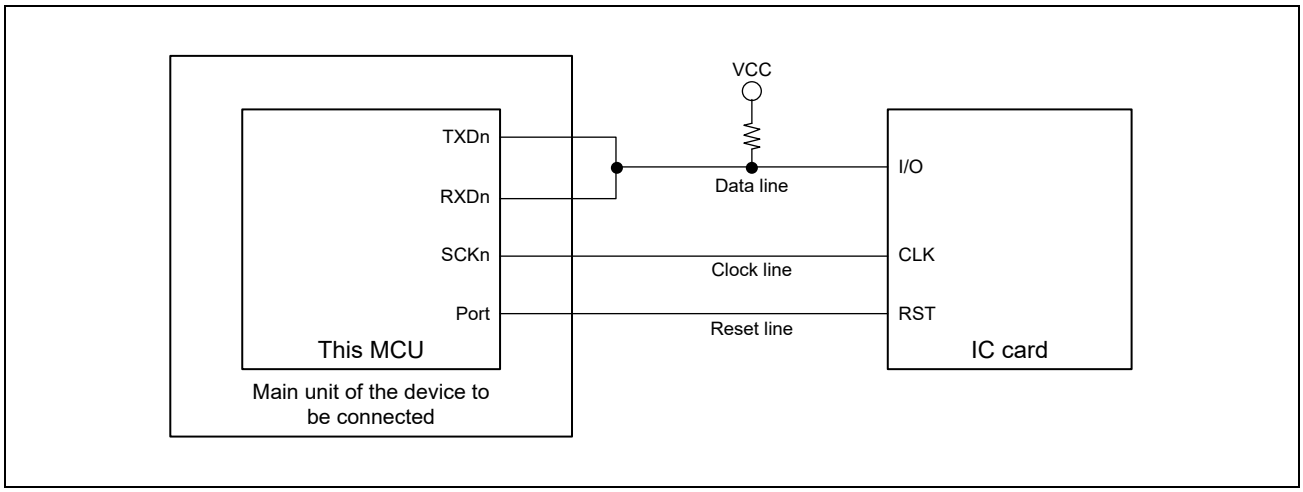


Figure 23.29 Sample Connection with a Smart Card (IC Card)

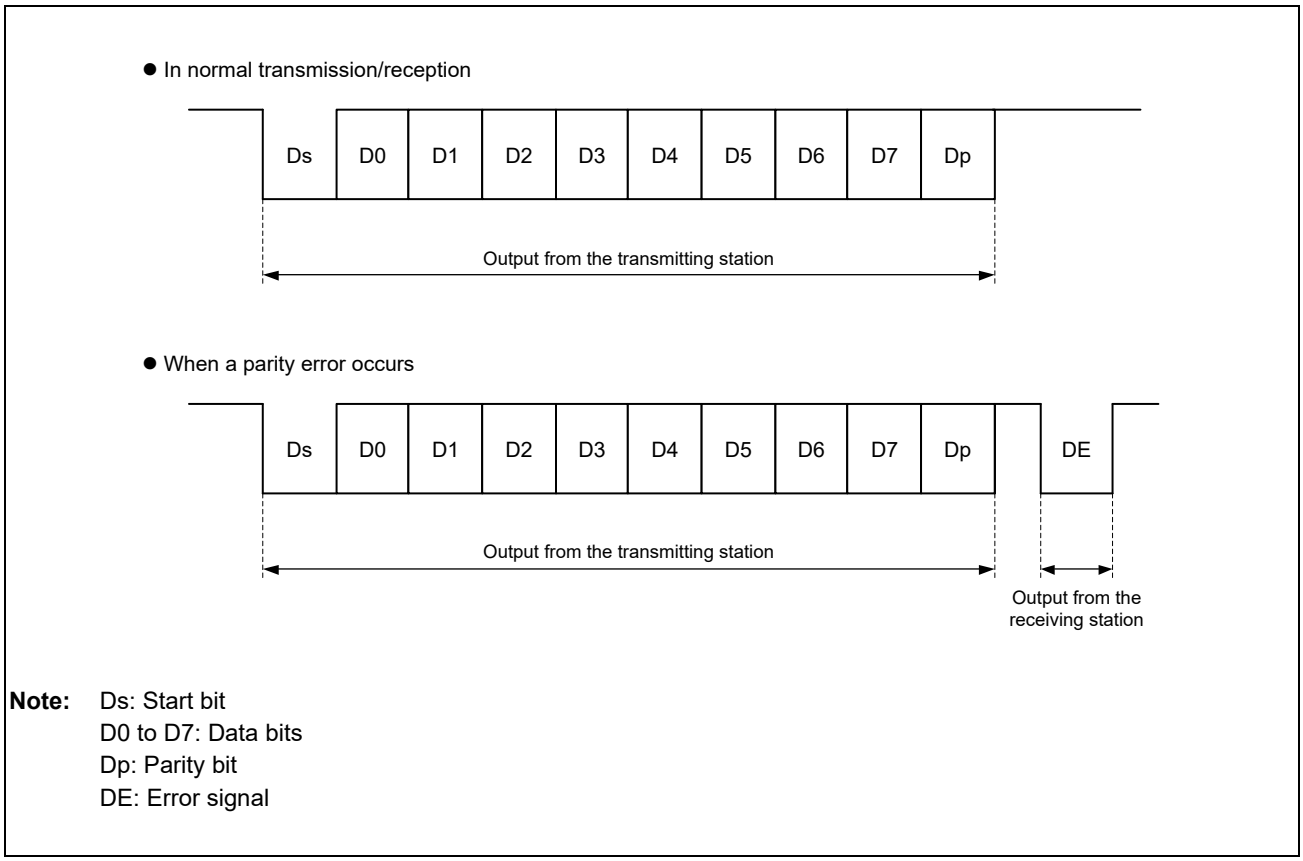
### 23.6.2 Data Format (Except in Block Transfer Mode)

**Figure 23.30** shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring 1 bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 etu.



**Note:** Ds: Start bit
D0 to D7: Data bits
Dp: Parity bit
DE: Error signal

Figure 23.30 Data Formats in Smart Card Interface Mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

### (1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB first as the start character, as shown in **Figure 23.31**. Therefore, data in the start character in the figure is H'3B.

When using the direct convention type, write 0 to both the SDIR and SINV bits in SCMR. Write 0 to the PM bit in SMR in order to use even parity, which is prescribed by the smart card standard.

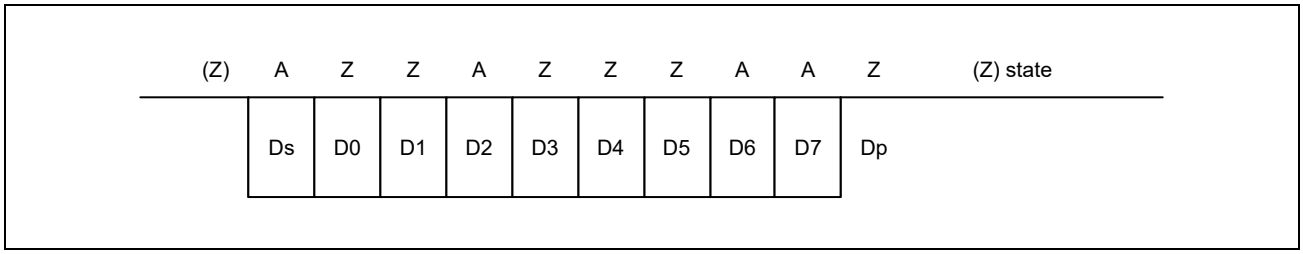


Figure 23.31 Direct Convention (SDIR in SCMR = 0, SINV in SCMR = 0, PM in SMR = 0)

### (2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB first as the start character, as shown in **Figure 23.32**. Therefore, data in the start character in the figure is H'3F. When using the inverse convention type, write 1 to both the SDIR and SINV bits in SCMR. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SINV bit of this MCU only inverts data bits D7 to D0, write 1 to the PM bit in SMR to invert the parity bit for both transmission and reception.

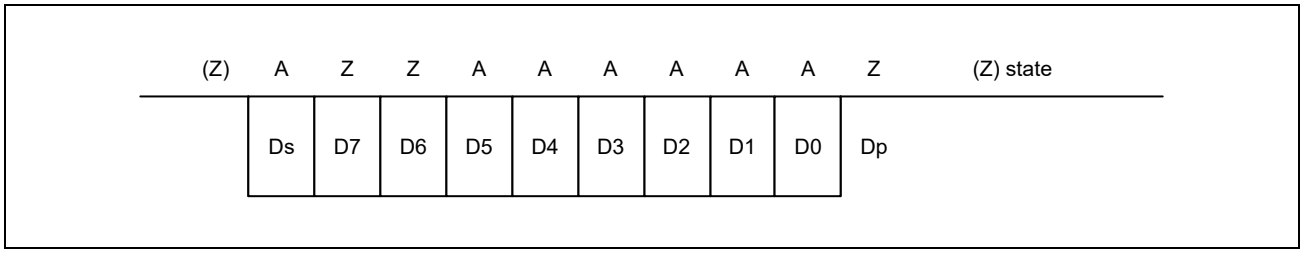

Figure 23.32 Inverse Convention (SDIR in SCMR = 1, SINV in SCMR = 1, PM in SMR = 1)

### 23.6.3 Block Transfer Mode

Block transfer mode is different from normal smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since the PER bit in SSR is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not retransmitted during transmission, the TEND flag in SSR is set 11.5 etu after transmission start.
- In block transfer mode, the ERS flag in SSR indicates the error signal status as in normal smart card interface mode, but the flag is read as 0 because no error signal is transferred.

### 23.6.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.

In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of the BCP2 bit in SCMR and the BCP[1:0] bits in SMR (the frequency is always 16 times the bit rate in normal asynchronous mode).

For data reception, the falling edge of the start bit is sampled with the base clock to perform internal synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in **Figure 23.33**. The reception margin here is determined by the following formula.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ [\%]$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256) D: Duty cycle of clock (D = 0 to 1.0)
L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \{0.5 - 1/(2 \times 372)\} \times 100\ [\%] = 49.866\%$$

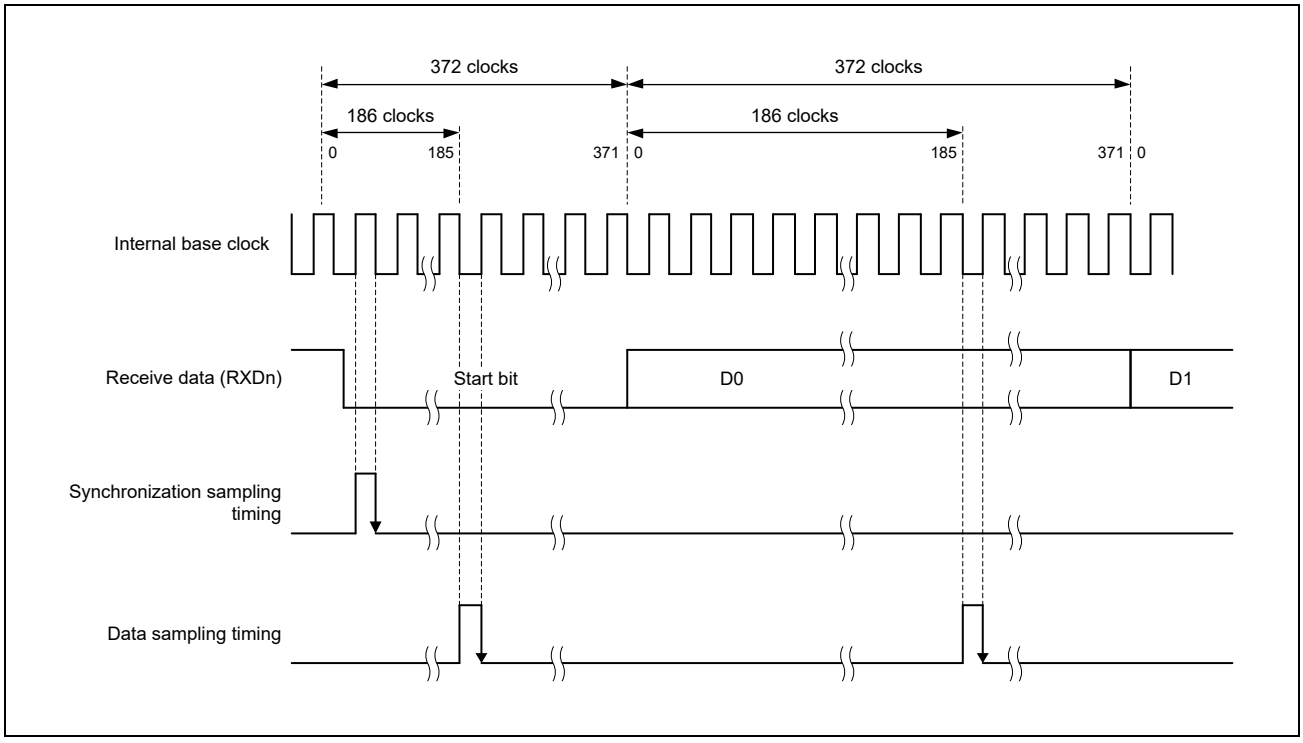

Figure 23.33 Receive Data Sampling Timing in Smart Card Interface Mode (When Clock Frequency is 372 Times the Bit Rate)

### 23.6.5 SCI Initialization (Smart Card Interface Mode)

Initialize the SCI following the example of flowchart shown in **Figure 23.34**.

Be sure to initialize the SCI before switching from transmission mode to reception mode and vice versa. Even if the RE bit is set to 0, the RDR register is not initialized.

To change reception mode to transmission mode, first check that reception has completed, and then initialize the SCI. At the end of initialization, set TE = 1 and RE = 0. Reception completion can be verified by reading the RXI request, ORER, or PER flag in SSR.

To change transmission mode to reception mode, first check that transmission has completed, and then initialize the SCI. At the end of initialization, set TE = 0 and RE = 1. Transmission completion can be verified by reading the TEND flag in SSR.

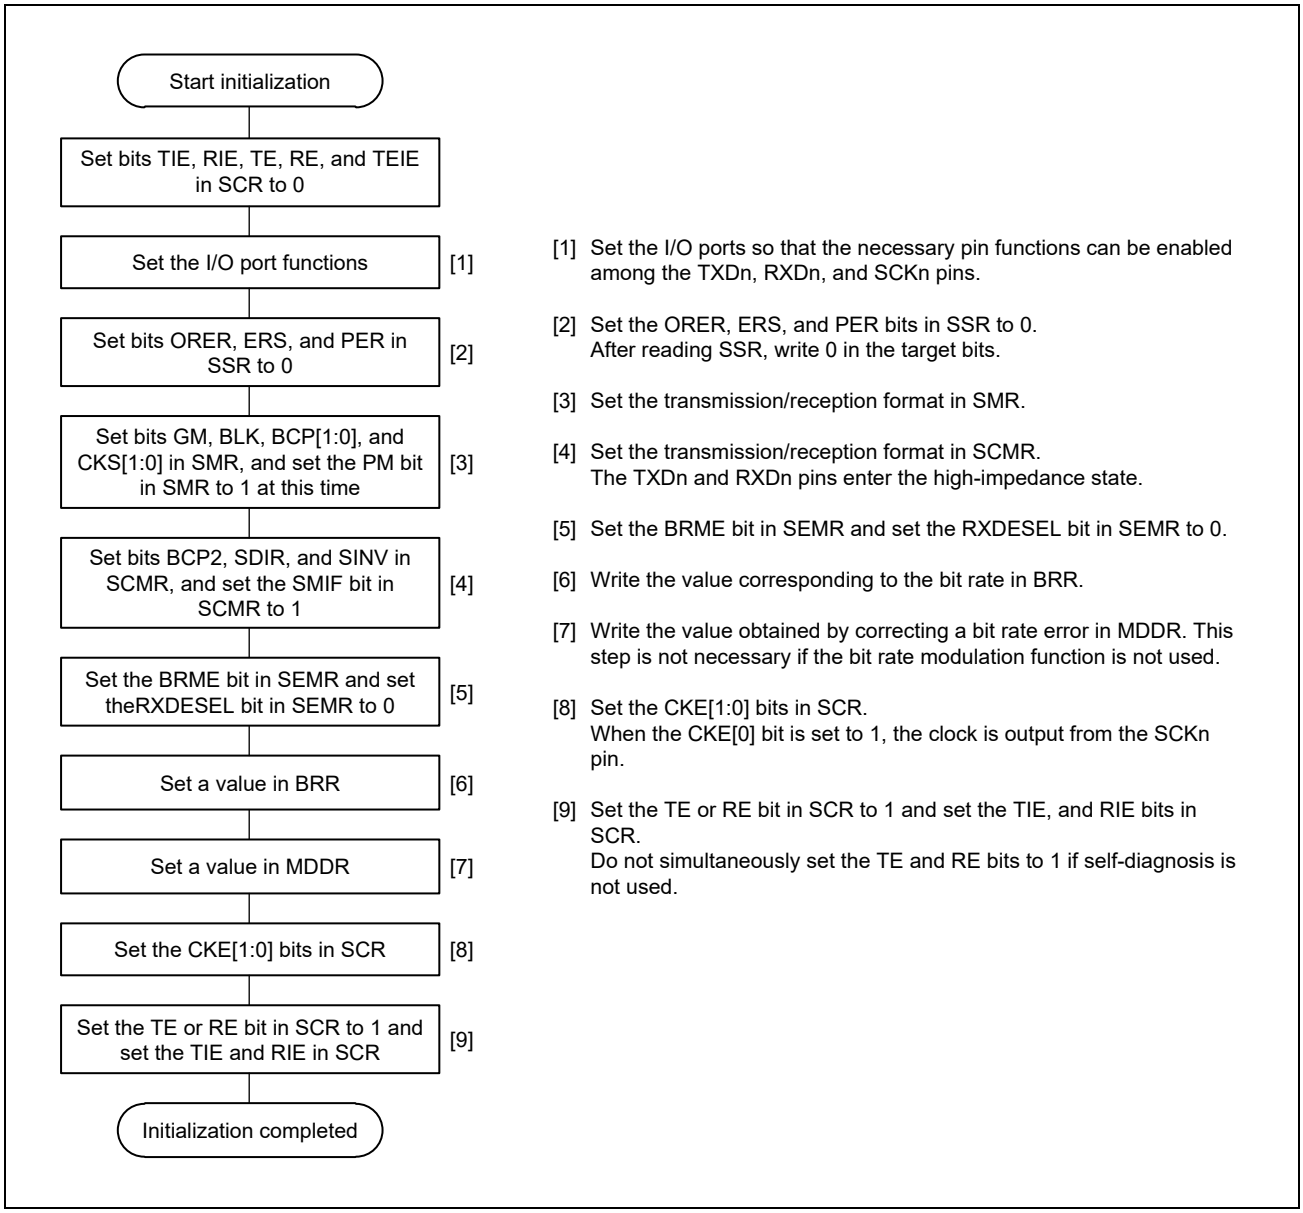

Figure 23.34 Example of SCI Initialization Flowchart (Smart Card Interface Mode)

### 23.6.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be retransmitted, is different from that in non-smart card interface mode. **Figure 23.35** shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, the ERS flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the ERS flag to 0 before the next parity bit is sampled.
2. For a frame in which an error signal is received, the TEND flag in SSR is not set. Data is retransferred from TDR to TSR allowing automatic data retransmission.
3. If no error signal is returned from the receiver, the ERS flag is not set to 1.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.

**Figure 23.37** shows a sample flowchart of serial transmission. All the processing steps are automatically performed using a TXI interrupt request to activate the DMAC.

When the TEND flag in SSR is set to 1 in transmission, if the TIE bit in SCR is 1, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag is automatically set to 0 when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag is not automatically cleared, set the RIE bit to 1 beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag to 0. When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings.

For DMAC settings, refer to **Section 14, Direct Memory Access Controller**.

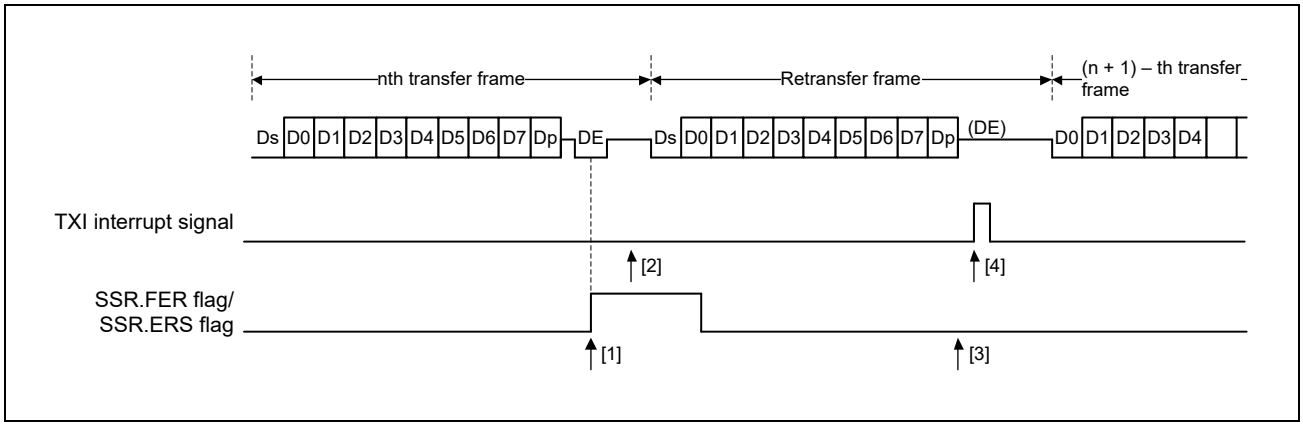

Figure 23.35 Data Retransfer Operation in SCI Transmission Mode

Note that the SSR.TEND flag is set in different timings depending on the GM bit setting in SMR. **Figure 23.36** shows the TEND flag generation timing.

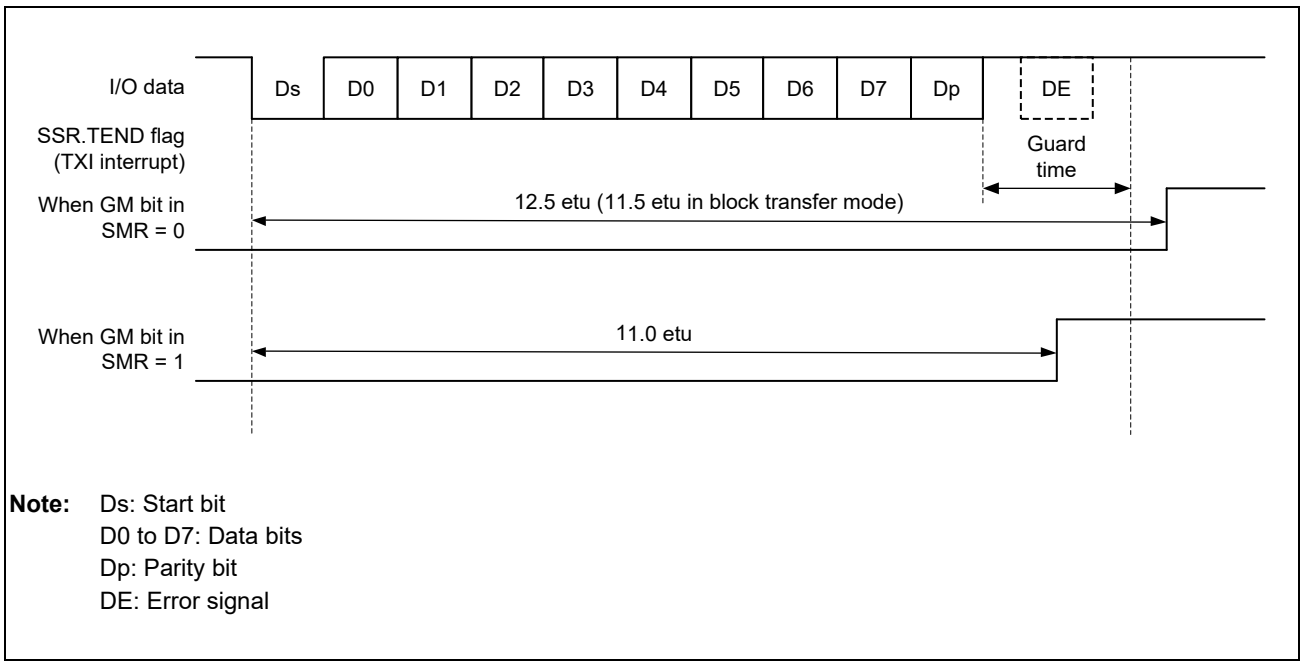

Figure 23.36 SSR.TEND Flag Generation Timing during Transmission

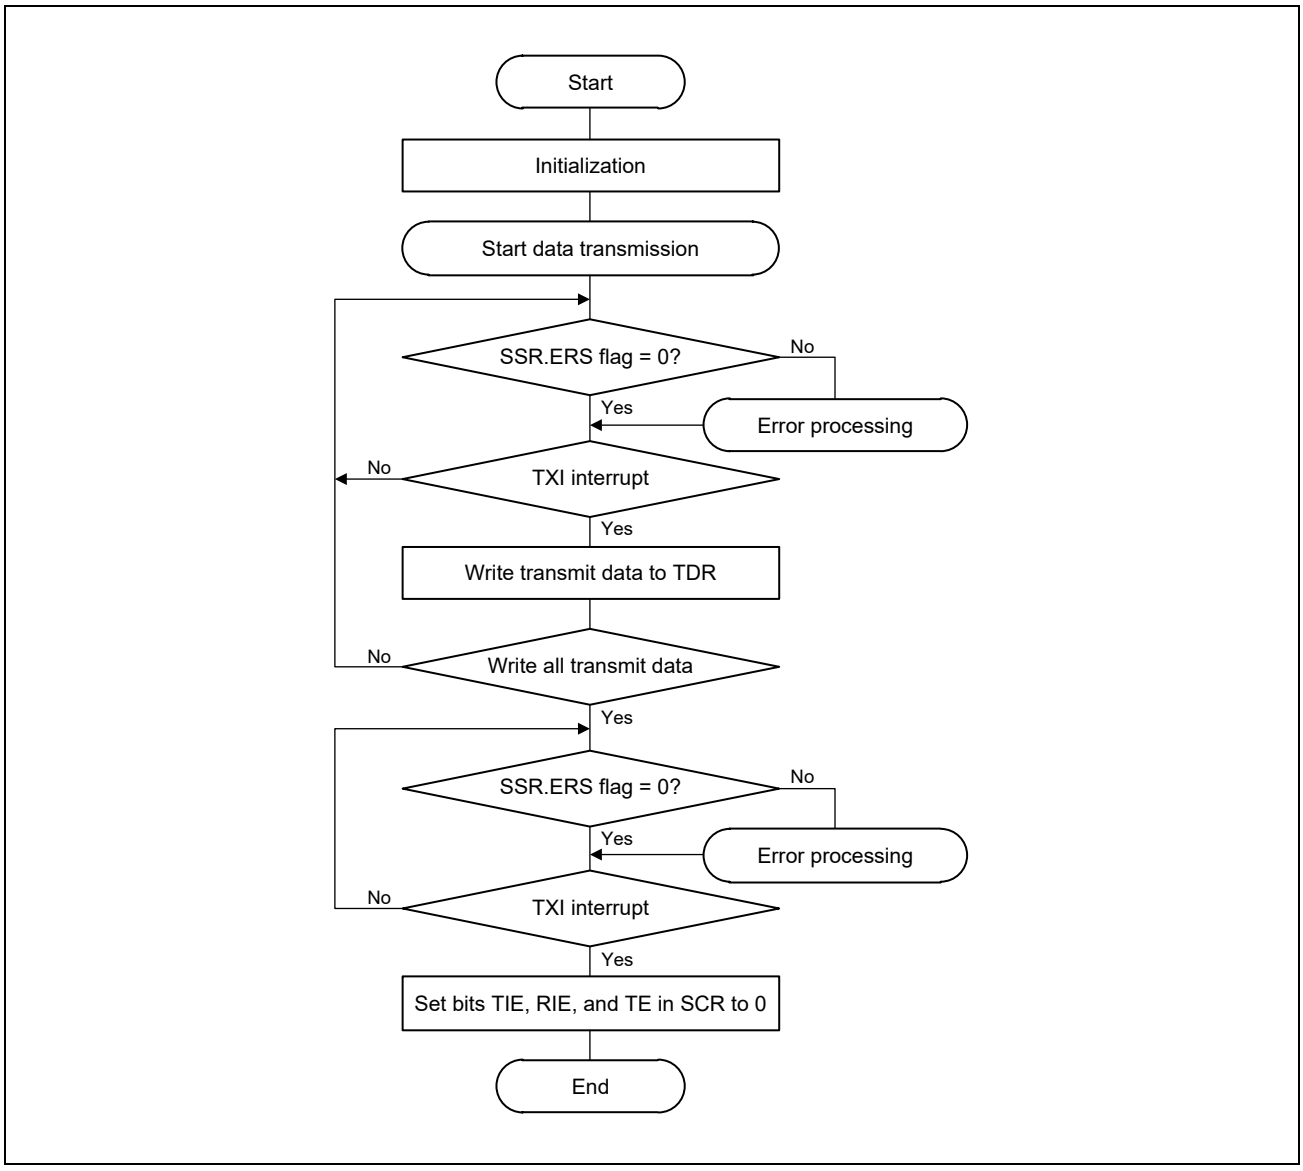

Figure 23.37 Sample Smart Card Interface Transmission Flowchart

### 23.6.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in non-smart card interface mode. **Figure 23.38** shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the PER flag in SSR is set to 1. When the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the PER flag to 0 before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the PER flag in SSR is not set to 1.
4. In this case, data is determined to have been received successfully. When the RIE bit in SCR is 1, an RXI interrupt request is generated.

**Figure 23.39** shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC.

In reception, setting the RIE bit to 1 allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data.

If an error occurs during reception and either the ORER or PER flag in SSR is set to 1, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.

Even if a parity error occurs and the PER flag is set to 1 during reception, receive data is transferred to RDR, thus allowing the data to be read.

When a reception is forcibly terminated by setting the RE bit in SCR to 0 during operation, read the RDR register because the received data which has not yet been read may be left in RDR.

NOTE

For operations in block transfer mode, refer to **Section 23.3, Operation in Asynchronous Mode**.

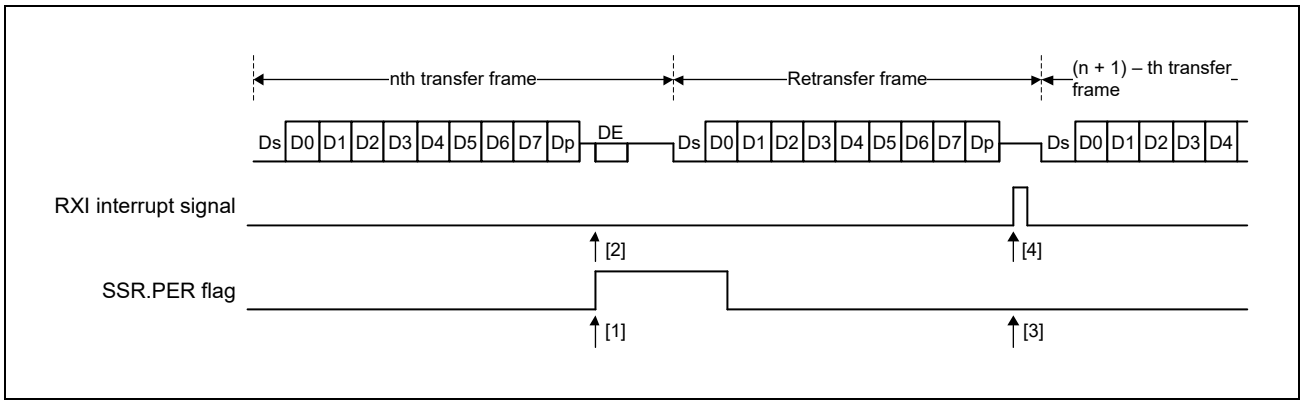

Figure 23.38 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception)

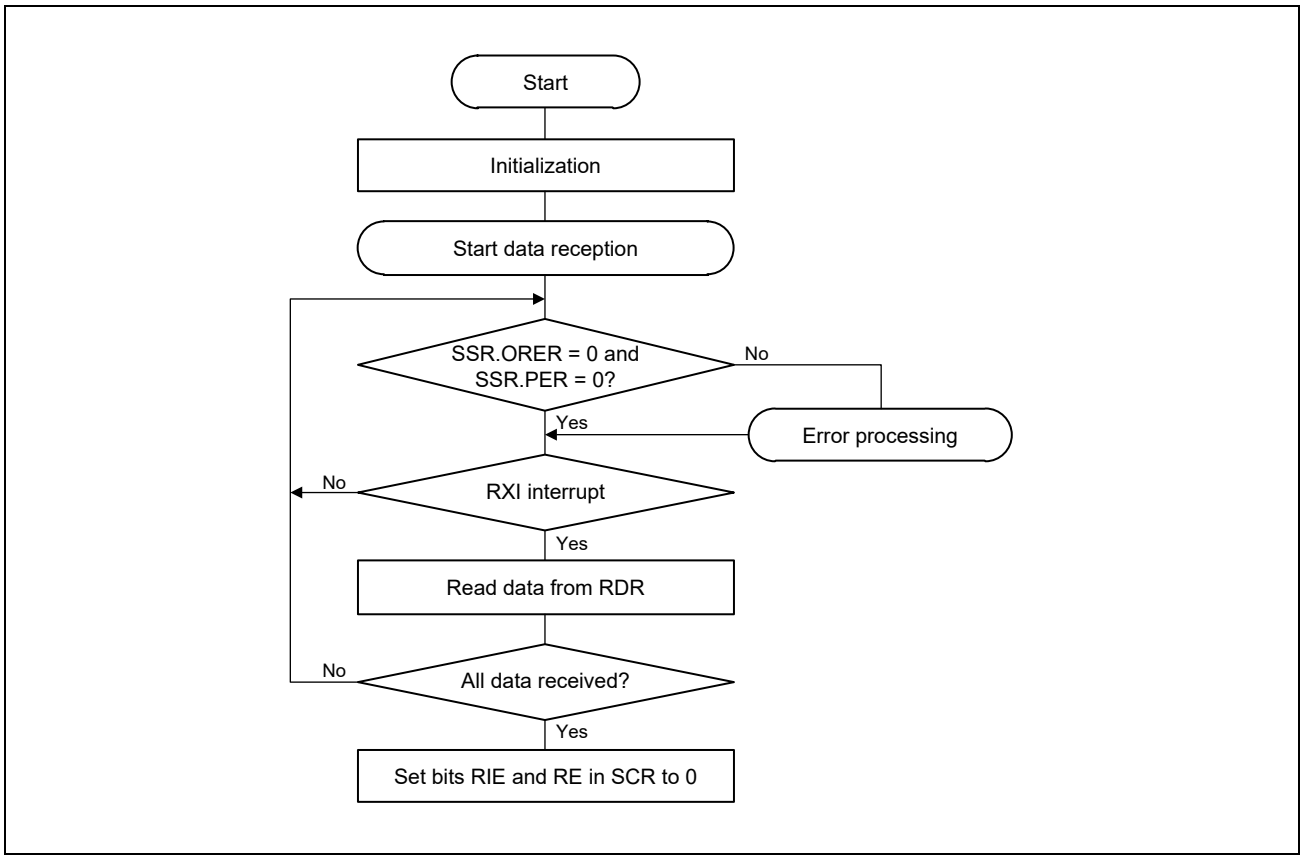

Figure 23.39 Sample Smart Card Interface Reception Flowchart

### 23.6.8 Clock Output Control

Clock output can be fixed using the CKE[1:0] bits in SCR when the GM bit in SMR is 1. Specifically, the minimum width of a clock pulse can be specified.

**Figure 23.40** shows an example of clock output fixing timing when the CKE[0] bit is controlled with GM = 1 and CKE[1] = 0.

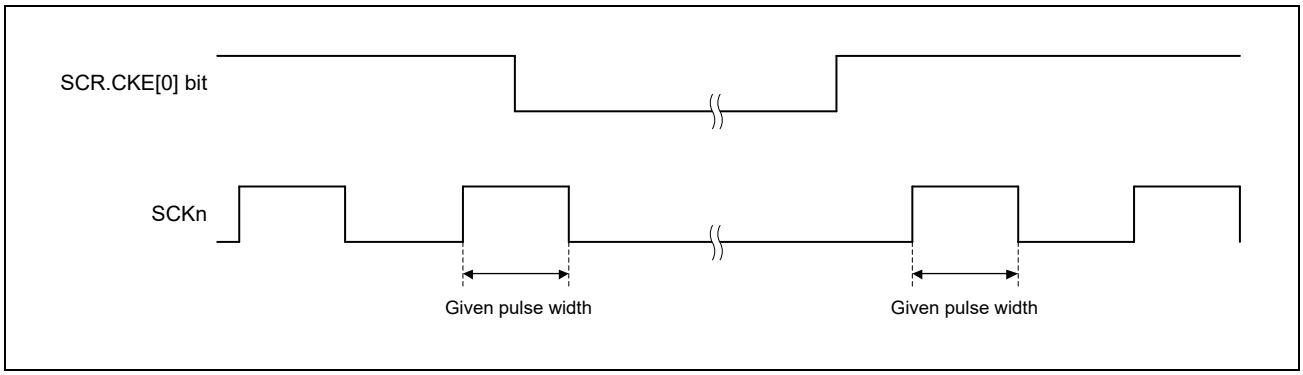

Figure 23.40 Clock Output Fixing Timing

At power-on, use the following procedure to secure the appropriate clock duty cycle.

#### (1) At Power-On

To secure the appropriate clock duty cycle simultaneously with power-on, use the following procedure.

1. Initially, port input is enabled in the high-impedance state. To fix the potential level, use a pull-up or pull-down resistor.
2. Fix the SCKn pin to the specified output by setting the SCR.CKE[1] bit and I/O port functions.
3. Set SMR and SCMR to enable smart card interface mode.
4. Set the SCR.CKE[0] bit to 1 to start clock output.

## 23.7 Noise Cancellation Function

**Figure 23.41** shows the configuration of the noise filter used for noise cancellation. The noise filter consists of two stages of flip-flop circuits and a match-detection circuit. When the level on the pin matches in three consecutive samples taken at the set sampling interval, the matching level continues to be conveyed internally until the level on the pin again matches in three consecutive samples.

In asynchronous mode, the noise cancellation function can be applied on the RXDn input signal. The period of the base clock (1/16th of a bit-period when SEMR.ABCS = 0 and 1/8th of a bit-period when SEMR.ABCS = 1) is the sampling interval.

If the base clock is stopped with the noise filter enabled and then the clock input is started again, the noise filter operation resumes from where the clock was stopped. If SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, it is determined that a level match is detected and is conveyed to the internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in three consecutive samples.

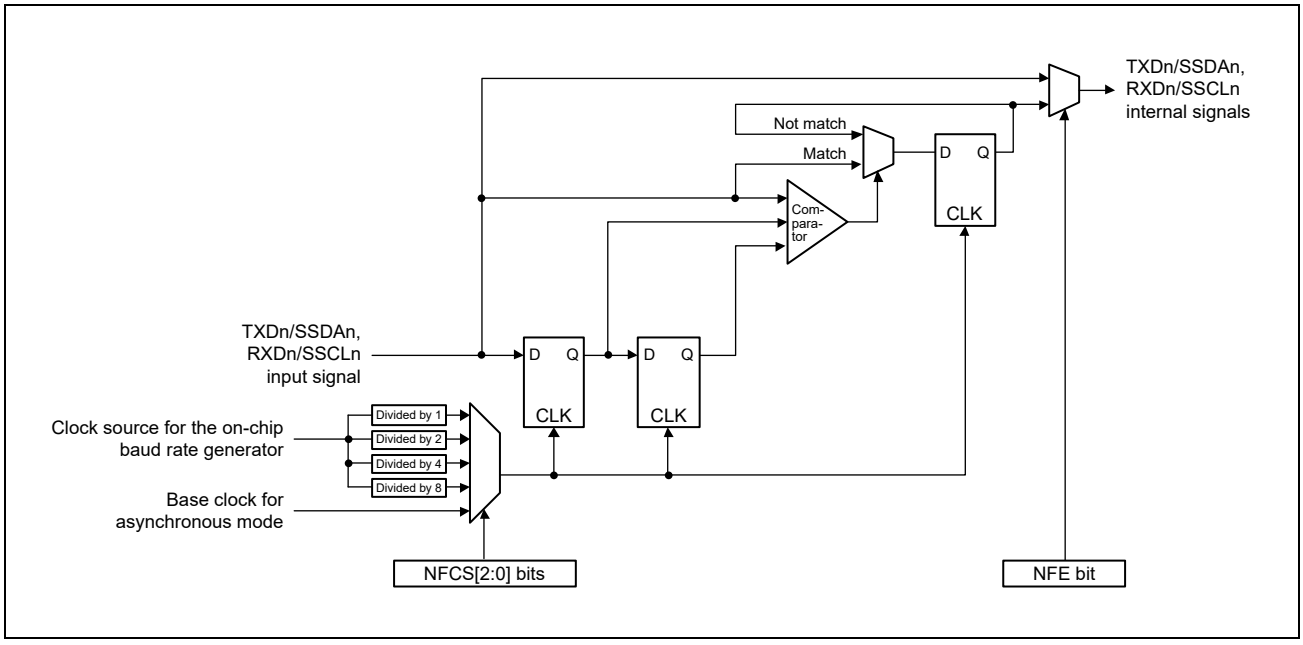

Figure 23.41 Block Diagram of Digital Noise Filter Circuit

## 23.8 Interrupt Sources

### 23.8.1 Buffer Operations for TXI and RXI Interrupts

If the conditions for a TXI and RXI interrupt are satisfied while the interrupt status flag in the interrupt controller is 1, the interrupt controller does not output the interrupt request but retains it internally (with a capacity for retention of one request per source).

When the value of the interrupt status flag in the interrupt controller becomes 0, the interrupt request retained within the interrupt controller is output. The internally retained interrupt request is automatically discarded once the actual interrupt is output. Clearing of the corresponding interrupt enable bit (the TIE or RIE bit in the SCR) can also be used to discard an internally retained interrupt request.

### 23.8.2 Interrupts in Asynchronous Mode and Clock Synchronous Mode

**Table 23.20** lists interrupt sources in asynchronous mode and clock synchronous mode. A different interrupt vector is assigned to each interrupt source, and individual interrupt sources can be enabled or disabled with the enable bits in SCR. If the SCR.TIE bit is 1, a TXI interrupt request is generated when transmit data is transferred from the TDR or TDRL register*[1] to the TSR. A TXI interrupt request can also be generated by setting the SCR.TE bit to 1 after setting the SCR.TIE bit to 1 or by using a single instruction to set the SCR.TE and SCR.TIE bit to 1 at the same time. A TXI interrupt request can activate the DMAC to handle data transfer.

A TXI interrupt request is not generated by setting the SCR.TE bit to 1 while the setting of the SCR.TIE bit is 0 or by setting the SCR.TIE bit to 1 while the setting of the SCR.TE bit is 1.*[1]

When new data is not written by the time of transmission of the last bit of the current transmit data and the setting of the SCR.TEIE bit is 1, the SSR.TEND flag becomes 1 and a TEI interrupt request is generated. Furthermore, when the setting of the SCR.TE bit is 1, the SSR.TEND flag retains the value 1 until further transmit data are written to the TDR or TDRL register*[1], and setting the SCR.TEIE bit to 1 leads to the generation of a TEI interrupt request.

Writing data to the TDR or TDRL register*[1] leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the TEI interrupt request.

If the SCR.RIE bit is 1, an RXI interrupt request is generated when received data is stored in the RDR. An RXI interrupt request can activate the DMAC to handle data transfer.

Setting of any from among the ORER, FER, and PER flags in the SSR to 1 while the SCR.RIE bit is 1 leads to the generation of an ERI interrupt request. An RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, and PER) leads to discarding of the ERI interrupt request.

**Note 1.** In the case where asynchronous mode and 9-bit data length are selected

NOTE

To temporarily prohibit TXI interrupts at the time of transmission of the last of the data and so on when you wish a new round of transmission to start after handling of the transmission-completed interrupt, control prohibiting and permitting of the interrupt by using the interrupt request enable bit in the interrupt controller rather than using the SCR.TIE bit. This can prevent the suppression of TXI interrupt requests in the transfer of new data.

Table 23.20 Interrupt Sources

| Name | Interrupt Source | Interrupt Flag | DMAC Activation | Priority |
|---|---|---|---|---|
| ERI | Receive error | ORER, FER, or PER | Not possible | High |
| RXI | Receive data full | — | Possible | ↑ |
| TXI | Transmit data empty | — | Possible | |
| TEI | Transmit end | TEND | Not possible | Low |

### 23.8.3 Interrupts in Smart Card Interface Mode

**Table 23.21** lists interrupt sources in smart card interface mode. A transmit end interrupt (TEI) request cannot be used in this mode.

Table 23.21 SCI Interrupt Sources

| Name | Interrupt Source | Interrupt Flag | DMAC Activation | Priority |
|---|---|---|---|---|
| ERI | Receive error or error signal detection | ORER, PER, or ERS | Not possible | High |
| RXI | Receive data full | — | Possible | ↑ |
| TXI | Transmit data empty | TEND | Possible | Low |

Data transmission/reception using the DMAC is also possible in smart card interface mode, similar to in the normal SCI mode. In transmission, when the TEND flag in SSR is set to 1, a TXI interrupt request is generated. This TXI interrupt request activates the DMAC allowing transfer of transmit data if the TXI request is specified beforehand as a source of DMAC activation. The TEND flag is automatically set to 0 when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, the ERS flag in SSR is not automatically cleared to 0 at error occurrence. Therefore, the ERS flag must be cleared by previously setting the RIE bit in SCR to 1 to enable an ERI interrupt request to be generated at error occurrence.

When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, refer to **Section 14, Direct Memory Access Controller**.

In reception, an RXI interrupt request is generated when receive data is set to RDR. This RXI interrupt request activates the DMAC allowing transfer of receive data if the RXI request is specified beforehand as a source of DMAC activation. If an error occurs, the error flag is set. Therefore, the DMAC is not activated and an ERI interrupt request is issued to the CPU instead; the error flag must be cleared.

## 23.9 Usage Notes

### 23.9.1 Break Detection and Processing

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and so the FER flag in SSR is set to 1 (framing error has occurred), and the PER flag in SSR may also be set to 1 (parity error has occurred). The SCI continues the receive operation even after a break is received. Therefore, note that even if the FER flag is set to 0 (no framing error occurred), it will be set to 1 again. When the SEMR.RXDESEL bit is 1, the SCI sets the SSR.FER flag to 1 and stops receiving operation until a start bit of the next data frame is detected. If the SSR.FER flag is set to 0 at this time, the SSR.FER flag retains 0 during the break.

When the RXDn pin is set to 1 and the break ends, detecting the beginning of the start bit at the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

### 23.9.2 Mark State and Production of Breaks

When the SCR.TE bit is 0 (serial transmission is disabled), setting the I/O port function makes selection of the level and direction (input or output) of the TXDn pin possible. If this is done, the TXDn pin can be placed in the mark state to send a break at the time of data transmission. Until the SCR.TE bit is set to 1 (serial transmission is enabled), the I/O port function is used to set the TXDn pin to output 1 and set the pin mode to a general I/O port pin, and thus place the communication line in the mark state (state of having the value 1). On the other hand, to output a break at the time of data transmission, set the TXDn pin to output 0 and make the pin mode settings for a general I/O port pin. When the SCR.TE bit is set to 0, the transmitter is initialized regardless of the current state of transmission.

### 23.9.3 Receive Error Flags and Transmit Operations (Clock Synchronous Mode)

Transmission cannot be started when a receive error flag (ORER) in SSR is set to 1, even if data is written to TDR. Be sure to set the receive error flags to 0 before starting transmission. Note also that the receive error flags cannot be set to 0 even if the RE bit in SCR is set to 0 (serial reception is disabled).

### 23.9.4 Writing Data to TDR

Data can be written to TDR, TDRH, and TDRL. However, if new data is written to TDR, TDRH, and TDRL when transmit data is remaining in TDR, TDRH, and TDRL, the previous data in TDR, TDRH, and TDRL is lost because it has not been transferred to TSR yet. Be sure to write transmit data to TDR, TDRH, and TDRL in the TXI interrupt request handling routine.

### 23.9.5 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode)

When the external clock source is used as a synchronization clock, the following restrictions apply.

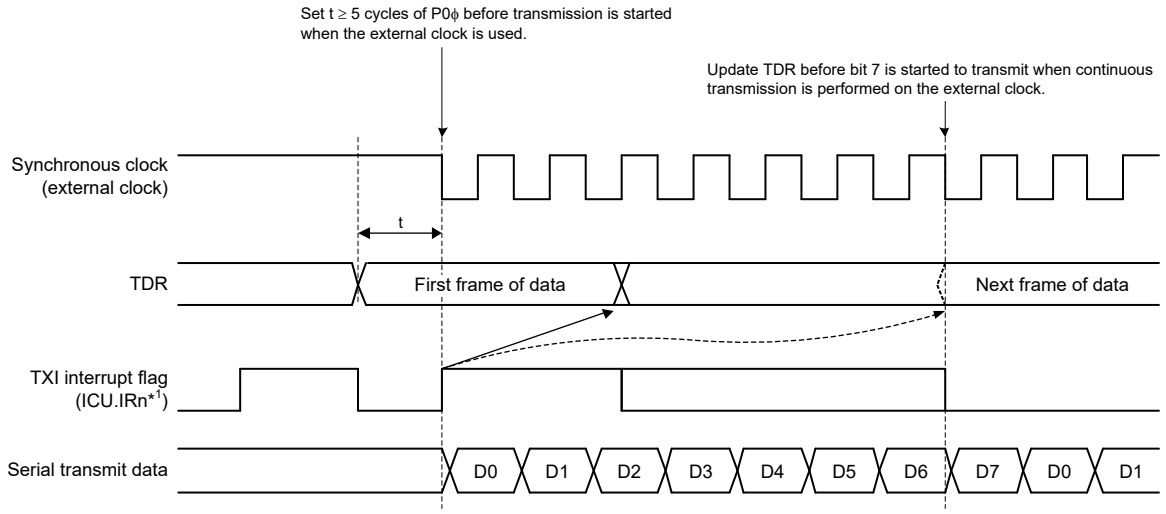
#### (1) Start of transmission

Update TDR by the CPU or DMAC and wait for at least five P0ϕ cycles before allowing the transmit clock to be input (see **Figure 23.42**).

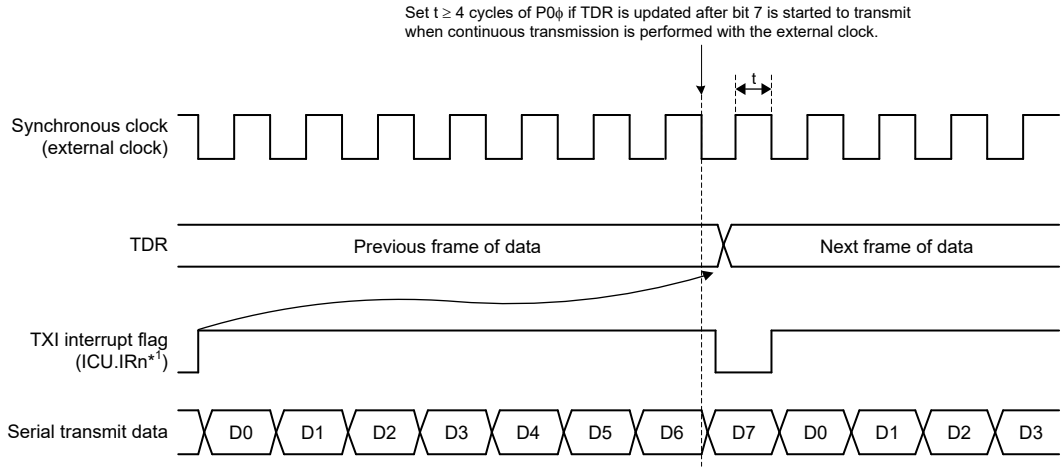
#### (2) Continuous transmission

(a) Write the next transmit data to TDR or TDRL before the falling edge of the transmit clock (bit 7) (see **Figure 23.42**).

(b) When updating TDR after bit 7 has started to transmit, update TDR while the synchronization clock is in the low-level period, and set the high-level width of the transmit clock (bit 7) to four P0ϕ cycles or longer (see **Figure 23.42**).



(a) Start of transmission and Continuous transmission (1)



(b) Continuous transmission (2)

Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.42 Restrictions on Use of External Clock in Clock Synchronous Transmission

### 23.9.6 Restrictions on Using DMAC

When using the DMAC or DTC to read RDR, RDRH, and RDRL, be sure to set the receive data full interrupt (RXI) as the activation source of the relevant SCI.

### 23.9.7 Notes on Starting Transfer

At the point where transfer starts when the interrupt status flag (IRn.IR bit) in the interrupt controller is 1, follow the procedure below to clear interrupt requests before permitting operations (by setting the SCR.TE or SCR.RE bit to 1). For details on the interrupt status flag, refer to **Section 8, Interrupt Controller**.

- Confirm that transfer has stopped (the setting of the SCR.TE or SCR.RE bits is 0).
- Set the corresponding interrupt enable bit (SCR.TIE or SCR.RIE) to 0.
- Read the corresponding interrupt enable bit (SCR.TIE or SCR.RIE bit) to check that it has become 0.
- Set the interrupt status flag (IRn.IR bit) in the interrupt controller to 0.

### 23.9.8 External Clock Input in Clock Synchronous Mode

In clock synchronous mode, the external clock SCKn must be input as follows:

High-pulse period, low-pulse period = 2 P0ϕ cycles or more, period = 6 P0ϕ cycles or more

### 23.9.9 Note on Transmit Enable Bit (TE bit)

When setting the SCR.TE bit to 0 (serial transmission is disabled) while the pin function is “TXDn”, output of the pin becomes high impedance.

Prevent the TXDn line from becoming high impedance by any of the following ways:

(1) Connect a pull-up resistor to the TXDn line.

(2) Change the pin function to “general-purpose I/O port, output” before setting the SCR.TE bit to 0. Set the SCR.TE bit to 1 before changing the pin function to “TXDn”.

## 23.10 IrDA Communications

The channel 0 serial communications interface (SCI) is capable of working with the Infrared Data Association (IrDA) module to handle transfer through IrDA communications in conformance with version 1.0 of the IrDA protocol.

Using the IRE bit in IRCR to enable the IrDA function leads to encoding and decoding of the SCI0_TXD and SCI0_RXD signals of the channel 0 serial communications interface, respectively, to convert them to and from waveforms in conformance with version 1.0 of the IrDA protocol. Infrared transfer in conformance with version 1.0 of the IrDA protocol can be handled by connecting a transceiver for use in infrared communications.

In version 1.0 of the IrDA protocol, IrDA transfer starts at a transfer rate of 9600 bps. The transfer rate is changeable during transfer as required. The IrDA module itself does not have a function for automatically changing the transfer rate. Accordingly, change the transfer rate by changing that for the serial communications interface.

A block diagram and pin configuration for IrDA transfer are shown in **Figure 23.43** and **Table 23.22**, respectively.

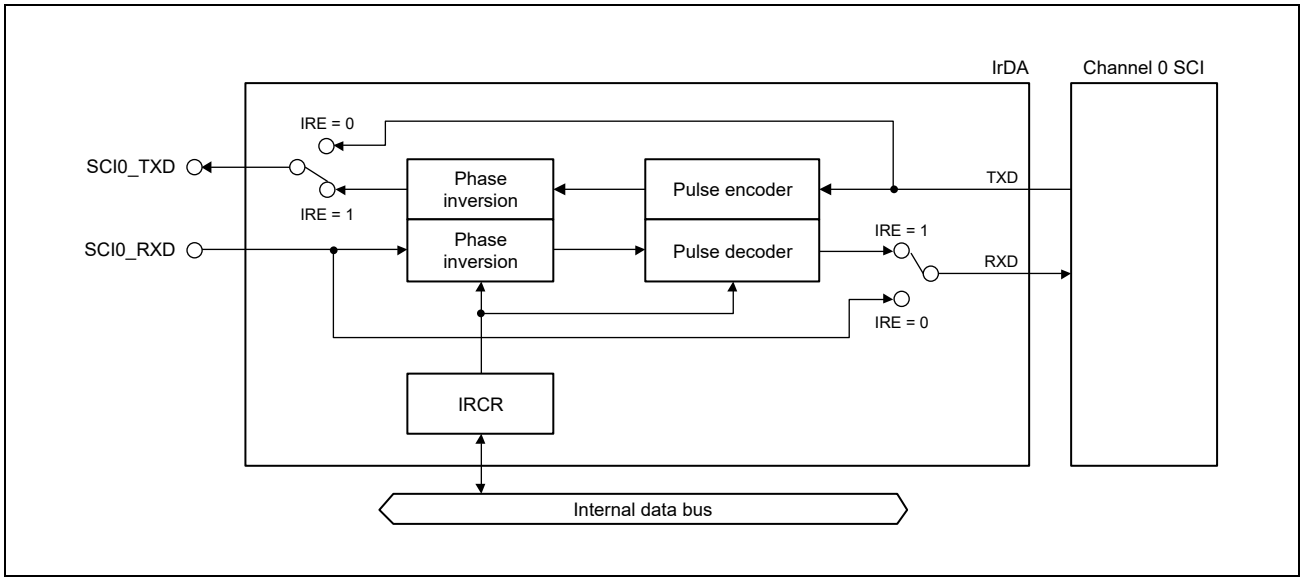


Figure 23.43 Block Diagram

Table 23.22 Pin Configuration

| Pin Name | Symbol | I/O | Function |
|---|---|---|---|
| IrDA data transmission pin | SCI0_TXD | Output | IrDA data transmission output |
| IrDA data reception pin | SCI0_RXD | Input | IrDA data reception input |

## 23.11 Description of the IrDA Register

**Table 23.23** shows the register configuration.

BASE Address (Cortex-A55 Address Space): H'0_1004_CC00
BASE Address (Cortex-M33 Address Space Non-Secure): H'4004_CC00
BASE Address (Cortex-M33 Address Space Secure): H'5004_CC00

Table 23.23 Register Configuration

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| IrDA Control Register | IRCR | R/W | H'00 | H'0_1004_CC00 | 8 |

### 23.11.1 IrDA Control Register (IRCR)

IRCR sets the operation of the IrDA module.

| Bit | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---|---|---|---|---|---|---|---|
| | IRE | IRCKS[2:0] | | | IRTXINV | IRRXINV | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| b1, b0 | — | | R | Reserved<br>These bits are read as 0. The write value should be 0. |
| b2 | IRRXINV | | R/W | SCI_RXD0 Data Level Switching<br>Sets inversion of the logic level of inputs on SCI0_RXD.<br>0: The input on SCI0_RXD is used without change as the received data.<br>1: The input on SCI0_RXD is inverted before it is treated as the received data. |
| b3 | IRTXINV | | R/W | SCI_TXD0 Data Level Switching<br>Sets inversion of the logic level of outputs on SCI0_TXD.<br>0: Data for transmission is output without change to SCI0_TXD.<br>The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the high level.<br>1: Data for transmission is inverted before being output to SCI0_TXD.<br>The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the low level. |
| b6 to b4 | IRCKS[2:0] | | R/W | IrDA Clock Select<br>Selects the pulse width for use in encoding output pulses from SCI0_TXD when the setting of the IRE bit is 1.<br>000: Bit rate × 3/16<br>Settings other than above are prohibited. |
| b7 | IRE | | R/W | IrDA Enable<br>Sets the function for use with the SCI0_TXD and SCI0_RXD pins as normal serial or IrDA.<br>0: Disables the IrDA function.<br>Data from the TXD pin of the channel 0 serial communications interface is output without change to SCI0_TXD.<br>Data on SCI0_RXD is output without change to the RXD pin of the channel 0 serial communications interface.<br>1: Enables the IrDA function.<br>Data from the TXD pin of the channel 0 serial communications interface is encoded before being output through SCI0_TXD.<br>Data on SCI0_RXD is decoded before being output to the RXD pin of the channel 0 serial communications interface. |

# 23.12 IrDA Operation

## 23.12.1 Flow of Settings for IrDA Operation

Set up IrDA operation by following the procedure listed below.

1. Make the general-purpose I/O port-pin settings.
2. Set the IRCR register.
3. Set the registers related to the serial communications interface.

## 23.12.2 Transmission

In transmission with the IrDA function enabled, serial data (UART frames of data) from the TXD pin of the serial communications interface are converted to IR frames (see **Figure 23.44**). If the IRTXINV bit is set to 0, when the value of the serial data is 0, a high-level pulse with the width equivalent to three sixteenths of the bit period is output to the SCI0_TXD pin by default. In the IrDA protocol, the specifiable high-level pulse widths are from a minimum of 1.41 µs to a maximum of (3/16 + 2.5%) × bit period or (3/16 × bit period) + 1.08 µs. On the other hand, if the value of the serial data is 1, no high-level pulse is output.

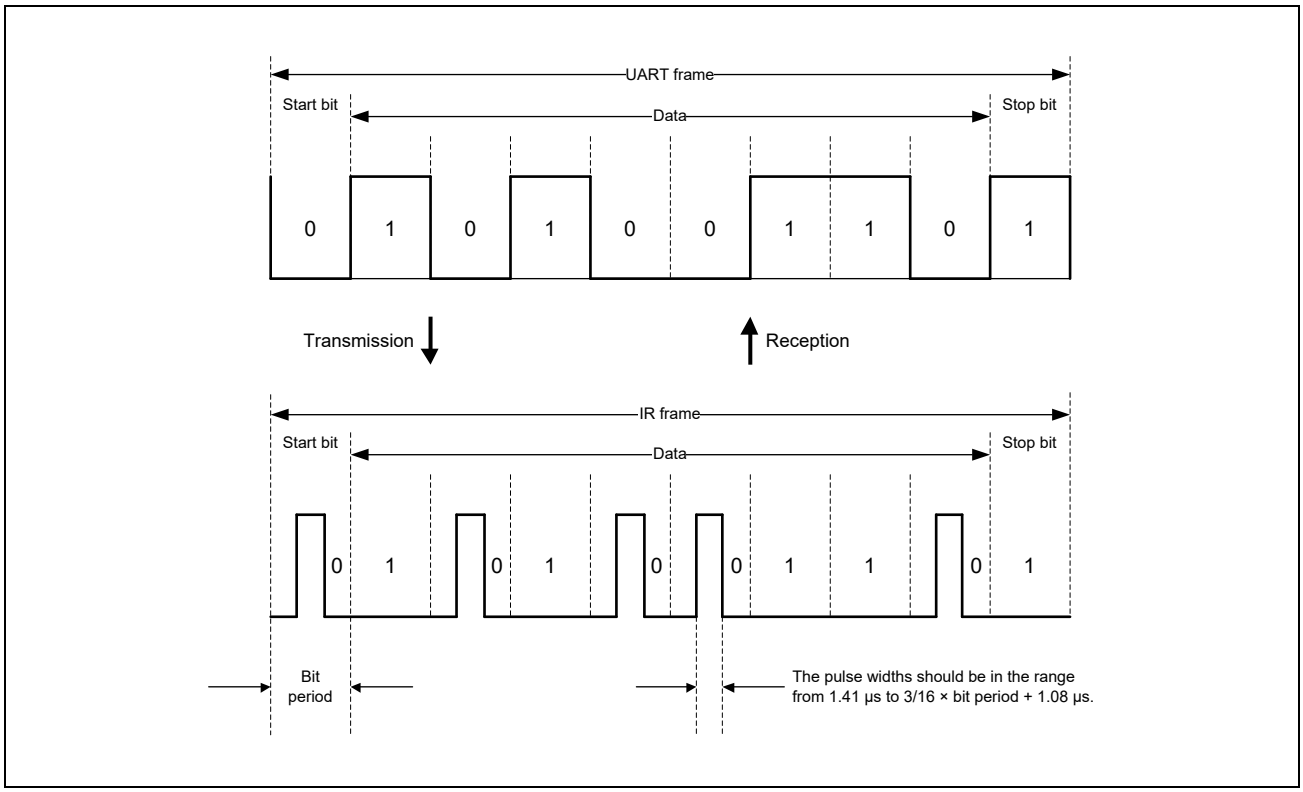

Figure 23.44 Example of the Operation in IrDA Transfer

### 23.12.3 Reception

In reception with the IrDA function enabled, IR frames of data from the SCI0_RXD pin are converted to serial data and output to the RXD pin of the serial communications interface. If the setting of the IRRXINV bit is 0, the value 0 is output when a high-level pulse is detected and the value 1 is output when no high-level pulse is detected during each bit period. Note that pulses with a width shorter than the minimum pulse width of 1.41 µs cannot be recognized.

### 23.12.4 Relationship between Bit Rate and High-Level Pulse Width

The relationship between the Bit Rate during transmission and the High-Level Pulse is shown in **Table 23.24**.

Table 23.24 Upper Row: Bit Rate (bps); Lower Row: Bit Period × 3/16 (µs)

| | | | | | |
|---|---|---|---|---|---|
| 2400 | 9600 | 19200 | 38400 | 57600 | 115200 |
| 78.13 | 19.53 | 9.77 | 4.88 | 3.26 | 1.63 |

## 23.13 Note on IrDA Usage

### 23.13.1 Minimum Pulse Width in Reception

Pulses with a width shorter than the minimum pulse width of 1.41 μs cannot be recognized

### 23.13.2 Base Clock in Asynchronous Mode for the Serial Communications Interface

The IrDA module works with the serial communications interface by receiving the base clock with a frequency 16 times the bit rate for communications from the interface. For the serial communications interface, either 16 or 8 cycles of the base clock are selectable as the bit period. On the other hand, the IrDA module is only capable of operation when the setting for the bit period of the serial communications interface is 16 cycles of the base clock.

# 24. Renesas Serial Peripheral Interface

This LSI circuit includes three independent Renesas serial peripheral interfaces.

This module is capable of full-duplex synchronous serial communication.

## 24.1.1 Features

This module has the following features.

### SPI transfer functions

- Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows for serial communications through SPI operation (four-wire method).
- Capable of serial communications in master/slave mode
- Supports mode fault error detection (only in SPI slave mode)
- Supports overrun error detection (only in SPI slave mode)
- Switching of the polarity of the serial transfer clock
- Switching of the clock phase of serial transfer

### Data format

- MSB-first/LSB-first selectable
- Transfer bit-length is selectable as 8, 16, or 32 bits.

### Bit rate

- RSPCK can be divided by a maximum of 4096 in master mode
- RSPCK can be generated by dividing P0ϕ by the on-chip baud rate generator.
- An externally input clock can be used as a serial clock.

### Buffer configuration

- 8 bytes for transmission and 32 bytes for reception

### SSL control function

- One SSL signal for each channel
  - In master mode, outputs SSL signal.
  - In slave mode, inputs SSL signal.
- Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay)
  - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Controllable delay from RSPCK stoppage to SSL output negation (SSL negation delay)
  - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Controllable wait for next-access SSL output assertion (next-access delay)
  - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Function for changing SSL polarity

### Control in master transfer

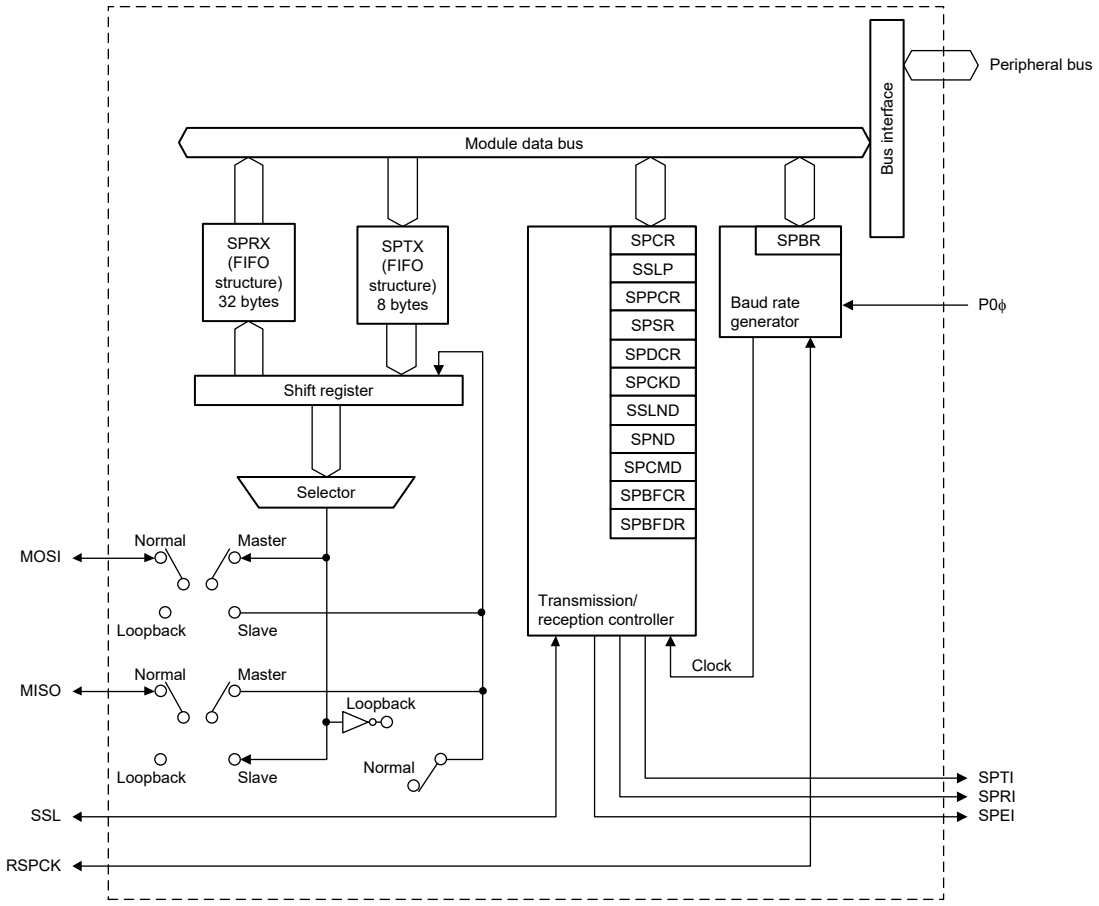
- A transfer of up to four commands can be executed sequentially in looped execution.
- For each command, the following can be set:
  - SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB first, burst, RSPCK delay, SSL negation delay, and next-access delay.
  - A transfer can be initiated by writing to the transmit buffer.
  - A transfer can be initiated by clearing the SPTEF bit.
  - MOSI signal value specifiable in SSL negation

### Interrupt sources

- Maskable interrupt sources:
  - Receive interrupt (receive buffer full)
  - Transmit interrupt (transmit buffer empty)
  - Error interrupt (mode fault, overrun)

### Others

- Provides loop back mode
- Provides a function for disabling (initializing) this module



[Legend]

| | | | |
|---|---|---|---|
| SPCR: | Control register | SPCMD: | Command register |
| SSLP: | Slave select polarity register | SPBR: | Bit rate register |

Figure 24.1 Block Diagram (for One Channel)

## 24.2 Input/Output Pins

**Table 24.1** shows the pin configuration. This module automatically switches the input/output direction of the SSL pin. SSL is set as an output in master mode and as an input in slave mode. Pins RSPCK, MOSI, and MISO are automatically set as inputs or outputs according to the setting of master or slave and the level input on SSL (see **Section 24.4.2, Pin Control**).

Table 24.1 Pin Configuration

| Channel | Pin Name | Pin Name | I/O | Function |
|---|---|---|---|---|
| 0 | Clock pin | RSPI0_CK | I/O | Clock input/output |
| | Master transmit data pin | RSPI0_MOSI | I/O | Master transmit data |
| | Slave transmit data pin | RSPI0_MISO | I/O | Slave transmit data |
| | Slave select 0 pin | RSPI0_SSL | I/O | Slave selection |
| 1 | Clock pin | RSPI1_CK | I/O | Clock input/output |
| | Master transmit data pin | RSPI1_MOSI | I/O | Master transmit data |
| | Slave transmit data pin | RSPI1_MISO | I/O | Slave transmit data |
| | Slave select 0 pin | RSPI1_SSL | I/O | Slave selection |
| 2 | Clock pin | RSPI2_CK | I/O | Clock input/output |
| | Master transmit data pin | RSPI2_MOSI | I/O | Master transmit data |
| | Slave transmit data pin | RSPI2_MISO | I/O | Slave transmit data |
| | Slave select 0 pin | RSPI2_SSL | I/O | Slave selection |

**Note:** In the description of the pins, the channel is omitted, and pin names are described as RSPCK, MOSI, MISO, and SSL.

## 24.3 Register Descriptions

**Table 24.2** shows the register configuration. The address of the RSPI register is represented by the offset address from the base address. RSPI base address is as follows:

Base address: H'0_1004_0000 (Overall Address Space)
Base address: H'5004_0000 (Cortex-M33 Address Space Secure)
Base address: H'4004_0000 (Cortex-M33 Address Space Non-Secure)

Table 24.2 Register Configuration (1/2)

| Channel | Register Name | Abbreviation*1 | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Control register_0 | SPCR_0 | R/W | H'00 | H'AC00 | 8 |
| | Slave select polarity register_0 | SSLP_0 | R/W | H'00 | H'AC01 | 8 |

Note 1. In the description of the register names, the channel is omitted.

Note 2. Only 0 can be written to clear the flag.

### 24.3.1 Control Register (SPCR)

SPCR sets the operating mode. If the MSTR and MODFEN bits are changed while the function of this module is enabled by setting the SPE bit to 1, subsequent operations cannot be guaranteed.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPRIE | SPE | SPTIE | SPEIE | MSTR | MODFEN | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | SPRIE | 0 | R/W | Receive Interrupt Enable<br>Enables or disables generation of receive interrupt requests (SPRI) when the number of receive data units in the receive buffer (SPRX) is equal to or greater than the specified receive buffer data triggering number and the SPRF flag in SPSR is set to 1.<br>0: Disables the generation of receive interrupt requests.<br>1: Enables the generation of receive interrupt requests. |
| 6 | SPE | 0 | R/W | Function Enable<br>Setting this bit to 1 enables the module function. When the MODF bit in the status register (SPSR) is 1, the SPE bit cannot be set to 1 (see **Section 24.4.6, Error Detection**). Setting the SPE bit to 0 disables the module function, and initializes a part of the module function (see **Section 24.4.7, Initialization**).<br>0: Disables the module function.<br>1: Enables the module function. |
| 5 | SPTIE | 0 | R/W | Transmit Interrupt Enable<br>Enables or disables generation of transmit interrupt requests (SPTI) when the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the specified transmit buffer data triggering number and the SPTEF flag in SPSR is set to 1.<br>0: Disables the generation of transmit interrupt requests.<br>1: Enables the generation of transmit interrupt requests. |
| 4 | SPEIE | 0 | R/W | Error Interrupt Enable<br>Enables or disables the generation of error interrupt requests when this module detects a mode fault error and sets the MODF bit in the status register (SPSR) to 1, or when this module detects an overrun error and sets the OVRF bit in SPSR to 1 (see **Section 24.4.6, Error Detection**).<br>0: Disables the generation of error interrupt requests.<br>1: Enables the generation of error interrupt requests.<br>*Note*: This bit is valid only in SPI slave mode. |
| 3 | MSTR | 0 | R/W | Master/Slave Mode Select<br>Selects master/slave mode. According to MSTR bit settings, this module determines the direction of the RSPCK, MOSI, MISO, and SSL pins.<br>0: Slave mode<br>1: Master mode |
| 2 | MODFEN | 0 | R/W | Mode Fault Error Detection Enable<br>Enables or disables the detection of a mode fault error (see **Section 24.4.6, Error Detection**).<br>0: Disables the detection of a mode fault error.<br>1: Enables the detection of a mode fault error.<br>*Note*: This bit is valid only in SPI slave mode. When master mode is specified with the MSTR bit, this bit should always be cleared to 0. |
| 1, 0 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

### 24.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the SSL signal. If the contents of SSL0P are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SSL0P |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 0 | SSL0P | 0 | R/W | SSL Signal Polarity Setting<br>Sets the polarity of the SSL signal. The value of SSL0P indicates the active polarity of the SSL signal.<br>0: SSL signal 0-active<br>1: SSL signal 1-active |

### 24.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of this register are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | MOIFE | MOIFV | — | — | — | SPLP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7, 6 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
