| 5 | MOIFE | 0 | R/W | MOSI Idle Value Fixing Enable<br>Fixes the MOSI output value when this module in master mode is in an SSL negation period (including the SSL retention period during a burst transfer). When MOIFE is 0, this module outputs the last output value from the previous serial transfer during the SSL negation period to the MOSI pin. (The value is undefined when CPHA is 0). When MOIFE is 1, this module outputs the fixed value set in the MOIFV bit to the MOSI pin.<br>0: MOSI output value equals the last output value from previous transfer. (The value is undefined when CPHA is 0).<br>1: MOSI output value equals the value set in the MOIFV bit. |
| 4 | MOIFV | 0 | R/W | MOSI Idle Fixed Value<br>If the MOIFE bit is 1 in master mode, this module, according to MOIFV bit settings, determines the MOSI signal value during the SSL negation period (including the SSL retention period during a burst transfer).<br>0: MOSI Idle fixed value equals 0.<br>1: MOSI Idle fixed value equals 1. |
| 3 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 0 | SPLP | 0 | R/W | Loopback<br>When the SPLP bit is set to 1, this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects (reverses) the input path and the output path for the shift register.<br>0: Normal mode<br>1: Loopback mode |

### 24.3.4 Status Register (SPSR)

SPSR indicates the operating status.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPRF | TEND | SPTEF | — | — | MODF | — | OVRF |
| Initial Value | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/(W)*1 | R | R/(W)*1 |

Note 1. Only 0 can be written to clear the flag after reading 1.

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | SPRF | 0 | R | Receive Buffer Full Flag<br>Indicates that the number of receive data units in the receive buffer (SPRX) is equal to or greater than the receive buffer data triggering number specified in the buffer control register (SPBFCR).<br>0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number.<br>1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number.<br>[Clearing conditions]<br>• The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number.<br>• Receive buffer data reset is enabled.<br>• Power-on reset<br>[Setting condition]<br>• The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number. |
| 6 | TEND | 1 | R | Transmit End<br>This bit is set to 1 when transmission is completed, and this bit is 0 when transmission is not completed.<br>[Clearing condition]<br>• When transmit data are transferred from the transmit register to the shift register.<br>[Setting condition]<br>• When the number of data units in the transmit buffer (SPTX) is zero when a serial transfer is completed.<br>*Note*: This bit is valid only in SPI master mode. |
| 5 | SPTEF | 1 | R | Transmit Buffer Empty Flag<br>Indicates that the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the transmit buffer data triggering number specified in the buffer control register (SPBFCR).<br>0: The number of transmit data units in the transmit buffer is equal to or greater than the specified transmit buffer data triggering number.<br>1: The number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number.<br>[Clearing condition]<br>• When data is written to the transmit buffer until the number of transmit data units in the transmit buffer exceeds the specified transmit buffer data triggering number.<br>[Setting conditions]<br>• When the number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number.<br>• When transmit buffer data reset is enabled.<br>• Power-on reset |
| 4, 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | MODF | 0 | R/(W) *1 | Mode Fault Error Flag<br>Indicates the occurrence of a mode fault error. If the MODFEN bit is set to 1 when this module is in slave mode and the SSL pin is negated before the RSPCK cycle necessary for data transfer ends, this module detects a mode fault error. The active level of the SSL signal is determined by the SSL0P bit in the slave select polarity register (SSLP).<br>[Clearing conditions]<br>• SPSR is read when the MODF bit is 1, and then 0 is written to the MODF bit.<br>• Power-on reset<br>0: No mode fault error occurred<br>1: A mode fault error occurred<br>*Note*: This bit is valid only in SPI slave mode. |
| 1 | — | 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 0 | OVRF | 0 | R/(W) *1 | Overrun Error Flag<br>Indicates the occurrence of an overrun error. If a serial transfer ends when there is not enough space for receiving the specified length of data in the receive buffer (SPRX), this module detects an overrun error, and sets the OVRF bit to 1.<br>[Clearing conditions]<br>• SPSR is read when the OVRF bit is 1, and then 0 is written to the OVRF bit.<br>• Power-on reset<br>0: No overrun error occurred<br>1: An overrun error occurred<br>*Note*: This bit is valid only in SPI slave mode. |

Note 1. Only 0 can be written to clear the flag after reading 1.

### 24.3.5 Data Register (SPDR)

SPDR is a buffer that holds data for transmission and reception.

The transmit buffer (SPTX) and receive buffer (SPRX) are independent and are mapped to SPDR.

SPDR should be read or written to in byte, word, or longword units according to the access width specification bit (SPLW) in the data control register (SPDCR).

The bit length to be used is determined by the data length specification bits (SPB3 to SPB0) in the command register (SPCMD).

The access width set by SPDCR must agree with the data length set by SPCMD.

When data is written to SPDR, the data will be written to the transmit buffer from SPDR if the transmit buffer has a space equal to or more than the SPDR access width. If there is not enough space, data will not be written to the transmit buffer. Even if an attempt is made to write data to the buffer, the data is ignored.

When data is read from SPDR, receive data in the receive buffer will be read. If SPDR is read when there is no receive data in the receive buffer, the read value is undefined.

When SPDR is written to with the longword-, word-, or byte-access width, the transmit data should be written to address 0 irrespective of the access width. If data is written to the other addresses, the data is not guaranteed.

When SPDR is read with the longword-, word-, or byte-access width, the receive data should be read from address 0. If data is read from the other addresses, the data is not guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SPD31 | SPD30 | SPD29 | SPD28 | SPD27 | SPD26 | SPD25 | SPD24 | SPD23 | SPD22 | SPD21 | SPD20 | SPD19 | SPD18 | SPD17 | SPD16 |
| Initial Value | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

### 24.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence control method when this module operates in master mode. If the contents of SPSCR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | SPSLN1 | SPSLN0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 1 | SPSLN1 | 0 | R/W | Sequence Length Specification<br>These bits specify a sequence length when this module in master mode performs sequential operations. This module in master mode changes command registers 0 to 3 (SPCMD0 to SPCMD3) to be referenced and the order in which they are referenced according to the sequence length that is set in the SPSLN1 and SPSLN0 bits.<br>The relationship among the setting of bits SPSLN1 and SPSLN0, sequence length, and SPCMD0 to SPCMD3 referenced by this module is shown below. In slave mode, SPCMD0 is always referenced.<br><br>Sequence Length / Referenced SPCMD #<br>00: 1 — 0 → 0 → …<br>01: 2 — 0 → 1 → 0 → …<br>10: 3 — 0 → 1 → 2 → 0 → …<br>11: 4 — 0 → 1 → 2 → 3 → 0 → … |
| 0 | SPSLN0 | 0 | R/W | |

### 24.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status when this module operates in master mode.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | SPCP1 | SPCP0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 2 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 1 | SPCP1 | 0 | R | Command Pointer<br>During sequence control, these bits indicate one of the command registers 0 to 3 (SPCMD0 to SPCMD3) that is currently pointed to by the pointer. The relationship between the setting of SPCP1 and SPCP0 and SPCMD0 to SPCMD3 is shown below.<br>For the sequence control, see **Section 24.4.8(1)(c), Sequence Control**.<br>00: SPCMD0<br>01: SPCMD1<br>10: SPCMD2<br>11: SPCMD3 |
| 0 | SPCP0 | 0 | R | |

### 24.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | SPR7 | SPR6 | SPR5 | SPR4 | SPR3 | SPR2 | SPR1 | SPR0 |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

When this module is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings of SPBR and BRDV.

The bit rate is determined by combinations of SPBR settings and the bit settings in the BRDV1 and BRDV0 bits in the command registers (SPCMD0 to SPCMD3). The equation for calculating the bit rate is given below. In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV1 and BRDV0 bit setting (0, 1, 2, 3).

$$\text{Bit rate} = \frac{\text{f (P0}\phi\text{)}}{2 \times (\text{n} + 1) \times 2^{\text{N}}}$$

**Table 24.3** shows examples of the relationship between the SPBR register and BRDV1 and BRDV0 bit settings.

Table 24.3 Relationship between SPBR and BRDV1 and BRDV0 Settings

| SPBR (n) | BRDV[1:0] (N) | Division Ratio | Bit Rate*1 |
|---|---|---|---|
| | | | P0ϕ = 100 MHz |
| 0 | 0 | 2 | Not Available |
| 1 | 0 | 4 | 25.00 Mbps |
| 2 | 0 | 6 | 16.67 Mbps |
| 3 | 0 | 8 | 12.50 Mbps |
| 4 | 0 | 10 | 10.00 Mbps |
| 5 | 0 | 12 | 8.33 Mbps |
| 5 | 1 | 24 | 4.17 Mbps |
| 5 | 2 | 48 | 2.08 Mbps |
| 5 | 3 | 96 | 1.04 Mbps |
| 255 | 3 | 4096 | 24.41 Kbps |

Note 1. Decide the bit rate to be actually used in the system considering timing specifications.

### 24.3.9 Data Control Register (SPDCR)

SPDCR selects the width to access SPDR from longword-, word-, and byte-width, and enables or disables dummy data transmission for the master mode operation.

If the contents of SPDCR are changed while bit TEND in the status register (SPSR) indicates that transmission is not completed, the subsequent operation cannot be guaranteed.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | TXDMY | SPLW1 | SPLW0 | — | — | — | — | — |
| Initial Value | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | TXDMY | 0 | R/W | Dummy Data Transmission Enable<br>Enables or disables dummy data transmission.<br>When communication is performed with this bit set to 1, dummy data is transmitted from the MOSI pin and a serial communication can be performed even if there is no transmit data in the transmit buffer.<br>Specifically, if there is no transmit data in the transmit buffer and this bit is set to 1, dummy data is transferred to the shift register. Data previously transmitted from the pin is used as dummy data. If this bit is set to 1 after the initialization and a transfer is performed, the transmitted dummy data is undefined.<br>0: Disables dummy data transmission.<br>1: Enables dummy data transmission.<br>*Note*: This bit is valid only in the master mode. |
| 6 | SPLW1 | 0 | R/W | Access Width Specification<br>Specifies the width for accessing the data register (SPDR). If the length of data transferred to SPDR does not agree with these bit settings, operation is not guaranteed.*1<br>00: Setting prohibited<br>01: SPDR is accessed in bytes (8 bits).<br>10: SPDR is accessed in words (16 bits).<br>11: SPDR is accessed in longwords (32 bits). |
| 5 | SPLW0 | 1 | R/W | |
| 4 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

Note 1. The data length is specified by the SPB3 to SPB0 bits in the command register (SPCMD).
See **Section 24.3.5, Data Register (SPDR)**.

### 24.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period from the beginning of SSL signal assertion to RSPCK oscillation (RSPCK delay) when the SCKDEN bit in the command register (SPCMD) is 1. If the contents of SPCKD are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SCKDL2 to SCKDL0.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SCKDL2 | SCKDL1 | SCKDL0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2 | SCKDL2 | 0 | R/W | RSPCK Delay Setting<br>These bits set an RSPCK delay value when the SCKDEN bit in SPCMD is 1.<br>The relationship between the setting of SCKDL2 to SCKDL0 and the RSPCK delay value is shown below.<br>000: 1 RSPCK<br>001: 2 RSPCK<br>010: 3 RSPCK<br>011: 4 RSPCK<br>100: 5 RSPCK<br>101: 6 RSPCK<br>110: 7 RSPCK<br>111: 8 RSPCK |
| 1 | SCKDL1 | 0 | R/W | |
| 0 | SCKDL0 | 0 | R/W | |

### 24.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (SSL negation delay) from the transmission of a final RSPCK edge to the negation of the SSL signal during a serial transfer by this module in master mode. If the contents of SSLND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SLNDL2 to SLNDL0.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SLNDL2 | SLNDL1 | SLNDL0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2 | SLNDL2 | 0 | R/W | SSL Negation Delay Setting<br>These bits set an SSL negation delay when the SLNDEN bit in SPCMD is 1.<br>The relationship between the setting of SLNDL2 to SLNDL0 and the SSL negation delay value is shown below.<br>000: 1 RSPCK<br>001: 2 RSPCK<br>010: 3 RSPCK<br>011: 4 RSPCK<br>100: 5 RSPCK<br>101: 6 RSPCK<br>110: 7 RSPCK<br>111: 8 RSPCK |
| 1 | SLNDL1 | 0 | R/W | |
| 0 | SLNDL0 | 0 | R/W | |

### 24.3.12 Next-Access Delay Register (SPND)

SPND sets a non-active period (next-access delay) after termination of a serial transfer when the SPNDEN bit in the command register (SPCMD) is 1. If the contents of SPND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SPNDL2 to SPNDL0.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SPNDL2 | SPNDL1 | SPNDL0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 2 | SPNDL2 | 0 | R/W | Next-Access Delay Setting<br>These bits set a next-access delay when the SPNDEN bit in SPCMD is 1.<br>The relationship between the setting of SPNDL2 to SPNDL0 and the next-access delay value is shown below.<br>000: 1 RSPCK + 2 P0ϕ<br>001: 2 RSPCK + 2 P0ϕ<br>010: 3 RSPCK + 2 P0ϕ<br>011: 4 RSPCK + 2 P0ϕ<br>100: 5 RSPCK + 2 P0ϕ<br>101: 6 RSPCK + 2 P0ϕ<br>110: 7 RSPCK + 2 P0ϕ<br>111: 8 RSPCK + 2 P0ϕ |
| 1 | SPNDL1 | 0 | R/W | |
| 0 | SPNDL0 | 0 | R/W | |

### 24.3.13 Command Register (SPCMD)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format for master mode operation. Some of the bits in SPCMD0 are used to set a transfer mode for slave mode operation. In master mode, this module sequentially references SPCMD0 to SPCMD3 according to the settings in bits SPSLN1 and SPSLN0 in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD. While bit TEND in the status register (SPSR) indicates that transmission is not completed, correct operation of this module cannot be guaranteed if SPCMD is changed that is referred by this module. SPCMD referenced by this module in master mode can be checked by means of bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the function of this module in slave mode is enabled, operation cannot be guaranteed if the value set in SPCMD0 is changed.

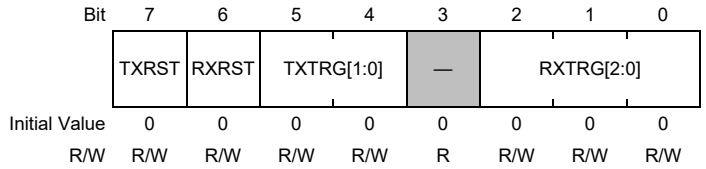
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SCKDEN | SLNDEN | SPNDEN | LSBF | SPB3 | SPB2 | SPB1 | SPB0 | SSLKP | — | — | — | BRDV1 | BRDV0 | CPOL | CPHA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | SCKDEN | 0 | R/W | RSPCK Delay Setting Enable<br>Sets the period from the point this module in master mode activates the SSL signal until the RSPCK starts oscillation (RSPCK delay). If the SCKDEN bit is 0, this module sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, this module starts the oscillation of RSPCK at an RSPCK delay in compliance with the clock delay register (SPCKD) settings.<br>To use this module in slave mode, the SCKDEN bit should be set to 0.<br>0: An RSPCK delay of 1 RSPCK<br>1: An RSPCK delay equal to SPCKD settings. |
| 14 | SLNDEN | 0 | R/W | SSL Negation Delay Setting Enable<br>Sets the period from the point this module in master mode stops RSPCK oscillation until this module sets the SSL signal inactive (SSL negation delay). If the SLNDEN bit is 0, this module sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, this module negates the SSL signal at an SSL negation delay in compliance with the slave select negation delay register (SSLND) settings.<br>To use this module in slave mode, the SLNDEN bit should be set to 0.<br>0: An SSL negation delay of 1 RSPCK<br>1: An SSL negation delay equal to SSLND settings. |
| 13 | SPNDEN | 0 | R/W | Next-Access Delay Enable<br>Sets the period from the point this module in master mode terminates a serial transfer and sets the SSL signal inactive until this module enables the SSL signal assertion for the next access (next-access delay). If the SPNDEN bit is 0, this module sets the next-access delay to 1 RSPCK + 2P0ϕ. If the SPNDEN bit is 1, this module inserts a next-access delay in compliance with the next-access delay register (SPND) settings.<br>To use this module in slave mode, the SPNDEN bit should be set to 0.<br>0: A next-access delay of 1 RSPCK + 2 P0ϕ<br>1: A next-access delay equal to SPND settings. |
| 12 | LSBF | 0 | R/W | LSB First<br>Sets the data format in master mode or slave mode to MSB first or LSB first.<br>0: MSB first<br>1: LSB first |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 11 | SPB3 | 0 | R/W | Data Length Setting<br>These bits set a transfer data length in master mode or slave mode.<br>0100 to 0111: 8 bits<br>1111: 16 bits<br>0010, 0011: 32 bits<br>Others: Setting prohibited |
| 10 | SPB2 | 1 | R/W | |
| 9 | SPB1 | 1 | R/W | |
| 8 | SPB0 | 1 | R/W | |
| 7 | SSLKP | 0 | R/W | SSL Signal Level Keeping<br>When this module in master mode performs a serial transfer, this bit specifies whether the SSL signal level for the current command is to be kept or negated between the SSL negation timing associated with the current command and the SSL assertion timing associated with the next command.<br>To use this module in slave mode, the SSLKP bit should be set to 0.<br>0: Negates the SSL signal upon completion of transfer.<br>1: Keeps the SSL signal level from the end of the transfer until the beginning of the next access. |
| 6 to 4 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 3 | BRDV1 | 1 | R/W | Bit Rate Division Setting<br>These bits are used to determine the bit rate. A bit rate is determined by combinations of bits BRDV1 and BRDV 0 and the settings in the bit rate register (SPBR) (see **Section 24.3.8, Bit Rate Register (SPBR)**). The settings in SPBR determine the base bit rate. The settings in bits BRDV1 and BRDV0 are used to select a bit rate which is obtained by dividing the base bit rate by 1, 2, 4, or 8. In the bits SPCMD0 to SPCMD3, different BRDV1 and BRDV0 settings can be specified. This permits the execution of serial transfers at a different bit rate for each command.<br>00: Select the base bit rate.<br>01: Select the base bit rate divided by 2.<br>10: Select the base bit rate divided by 4.<br>11: Select the base bit rate divided by 8. |
| 2 | BRDV0 | 1 | R/W | |
| 1 | CPOL | 0 | R/W | RSPCK Polarity Setting<br>Sets an RSPCK polarity in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK polarity should be set for both modules.<br>0: RSPCK = 0 when idle<br>1: RSPCK = 1 when idle |
| 0 | CPHA | 1 | R/W | RSPCK Phase Setting<br>Sets an RSPCK phase in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK phase should be set for both modules.<br>0: Data sampling on odd edge, data variation on even edge<br>1: Data variation on odd edge, data sampling on even edge |

### 24.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTX) or receive buffer (SPRX) and sets the number of triggering data units.

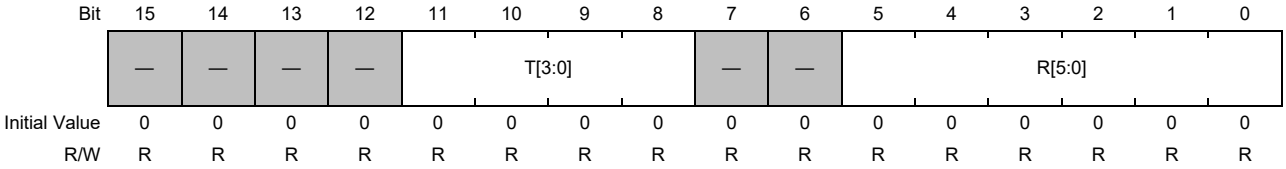


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 | TXRST | 0 | R/W | Transmit Buffer Data Reset<br>Resets the transmit buffer to an empty state. Transmit data in the transmit buffer becomes invalid when this bit is set to 1.<br>0: Disables the reset operation.*1<br>1: Enables the reset operation<br>*Note 1.* The reset operation is performed after a power-on reset. |
| 6 | RXRST | 0 | R/W | Receive Buffer Data Reset<br>Resets the receive buffer to an empty state. Receive data in the receive buffer becomes invalid when this bit is set to 1.<br>0: Disables the reset operation.*1<br>1: Enables the reset operation<br>*Note 1.* The reset operation is performed after a power-on reset. |
| 5, 4 | TXTRG[1:0] | 00 | R/W | Transmit Buffer Data Triggering Number*2<br>Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTX) is equal to or less than the specified triggering number, the SPTEF flag is set to 1.<br>00: 7 bytes (1)*1<br>01: 6 bytes (2)*1<br>10: 4 bytes (4)*1<br>11: 0 bytes (8)*1<br>*Note 1.* The value in the parenthesis shows the number of available bytes in the transmit buffer (SPTX).<br>*Note 2.* When transferring the data by using DMA, set the following values according to the data transfer length.<br>(The data transfer length is set in SPBn (n = 0-3) of the command register (SPCMD)).<br>1) Data transfer length is 1 byte<br>SPBFCR (TXTRG): 01 (6 bytes) or 10 (4 byte) or 11 (0 byte)<br>2) Data transfer length is 2 bytes<br>SPBFCR (TXTRG): 10 (4 bytes) or 11 (0 byte)<br>3) Data transfer length is 4bytes<br>SPBFCR (TXTRG): 11 (0 byte) |
| 3 | — | 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 to 0 | RXTRG[2:0] | 000 | R/W | Receive Buffer Data Triggering Number<br>Specifies the timing at which the receive buffer full state is determined, that is when the SPRF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRX) is equal to or greater than the specified triggering number, the SPRF flag is set to 1.<br>000: 1 byte (31)*1<br>001: 2 bytes (30)*1<br>010: 4 bytes (28)*1<br>011: 8 bytes (24)*1<br>100: 16 bytes (16)*1<br>101: 24 bytes (8)*1<br>110: 32 bytes (0)*1<br>111: 5 bytes (27)*1<br>*Note 1.* The value in the parenthesis shows the number of available bytes in the receive buffer (SPRX). |

### 24.3.15 Buffer Data Count Setting Register (SPBFDR)

SPBFDR indicates the number of data units stored in the transmit buffer (SPTX) and receive buffer (SPRX). The upper eight bits indicate the number of transmit data units in SPTX and the lower eight bits indicate the number of receive data units in SPRX.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 12 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 11 to 8 | T[3:0] | 0000 | R | Indicates the number of bytes of data to be transmitted in SPTX.<br>0000b indicates that SPTX is empty.<br>1000b indicates that SPTX is full. |
| 7, 6 | — | All 0 | R | Reserved<br>The write value should always be 0. Otherwise, operation cannot be guaranteed. |
| 5 to 0 | R[5:0] | 000000 | R | Shows the number of bytes of received data in SPRX.<br>000000b indicates that SPRX is empty.<br>100000b indicates that SPRX is full. |

## 24.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data.

### 24.4.1 Overview of Operations

This module is capable of serial transfers in slave mode and master mode. A particular mode of this module can be selected by using the MSTR bit in the control register (SPCR). **Table 24.4** gives the relationship between the modes and SPCR settings, and a description of each mode.

Table 24.4 Relationship between Modes and SPCR and Description of Each Mode

| Mode | Slave (SPI Operation) | Master (SPI Operation) |
|---|---|---|
| MSTR bit setting | 0 | 1 |
| MODFEN bit setting | 0 or 1 | 0 |
| RSPCK signal | Input | Output |
| MOSI signal | Input | Output |
| MISO signal | Output/Hi-Z | Input |
| SSL signal | Input | Output |
| SSL polarity modification function | Supported | Supported |
| Transfer rate | Up to P0ϕ/8 | Up to P0ϕ/2<br>(Up to P0ϕ/4 when P0ϕ is 100 MHz) |
| Clock source | RSPCK input | On-chip baud rate generator |
| Clock polarity | Two | Two |
| Clock phase | Two | Two |
| First transfer bit | MSB/LSB | MSB/LSB |
| Transfer data length | 8, 16, or 32 bits | 8, 16, or 32 bits |
| Burst transfer | Possible (CPHA = 1) | Possible (CPHA = 0, 1) |
| RSPCK delay control | Not supported | Supported |
| SSL negation delay control | Not supported | Supported |
| Next-access delay control | Not supported | Supported |
| Transfer activation method | SSL input active or RSPCK oscillation | Transmit buffer is written when SPE = 1 |
| Sequence control | Not supported | Supported |
| Transmit buffer empty detection | Supported | Supported |
| Receive buffer full detection | Supported | Supported |
| Overrun error detection | Supported | Not Supported |
| Mode fault error detection | Supported (MODFEN = 1) | Not supported |

### 24.4.2 Pin Control

According to the MSTR bit in the control register (SPCR), this module can automatically switch pin directions and output modes. **Table 24.5** shows the relationship between pin states and bit settings.

Table 24.5 Relationship between Pin States and Bit Settings

| Mode | Pin | Pin State*1 |
|---|---|---|
| Master mode (SPI operation) (MSTR = 1) | RSPCK | CMOS output |
| | SSL | CMOS output |
| | MOSI | CMOS output |
| | MISO | Input |
| Slave mode (SPI operation) (MSTR = 0) | RSPCK | Input |
| | SSL | Input |
| | MOSI | Input |
| | MISO*1 | CMOS output/Hi-Z |

Note 1. When SSL is at the non-active level or the SPE bit in SPCR is cleared to 0, the pin state is Hi-Z.

This module in master mode (SPI operation) determines MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) according to MOIFE and MOIFV bit settings in SPPCR, as shown in **Table 24.6**.

Table 24.6 MOSI Signal Value Determination during SSL Negation Period

| MOIFE | MOIFV | MOSI Signal Value during SSL Negation Period |
|---|---|---|
| 0 | 0, 1 | Last output value from previous transfer (The value is undefined when CPHA is 0) |
| 1 | 0 | Always 0 |
| 1 | 1 | Always 1 |

### 24.4.3 System Configuration Example

#### (1) Master/Slave (with This LSI Acting as Master)

**Figure 24.2** shows a master/slave system configuration example when this LSI is used as a master. In master/slave configuration, the SSL output of this LSI (master) is not used. The SSL input of the slave is fixed to the low level, and the slave is always maintained in a selected state. In the transfer format corresponding to the case where the CPHA bit in the control register (SPCR) is 0, there are slave devices for which the SSL signal cannot be fixed to the active level. In situations where the SSL signal cannot be fixed, the SSL output of this LSI should be connected to the SSL input of the slave device.

This LSI (master) always drives the RSPCK and MOSI. The slave always drives the MISO.

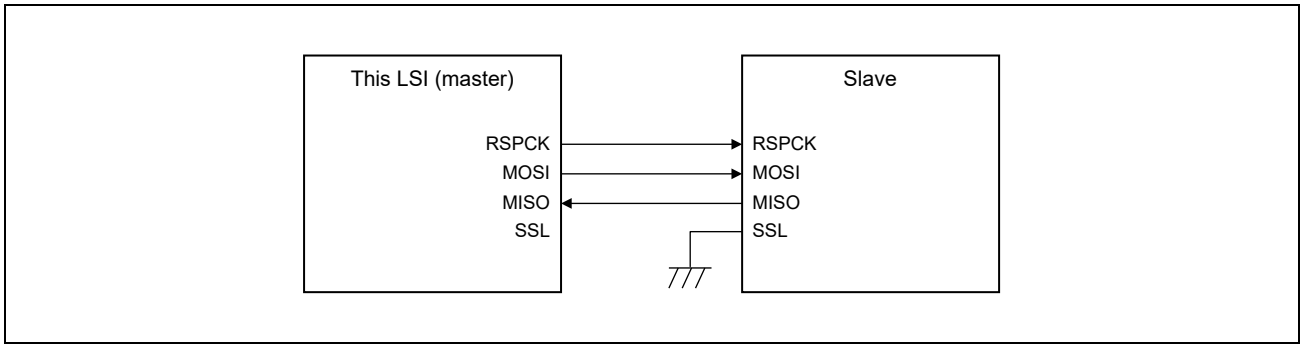


Figure 24.2 Master/Slave Configuration Example (This LSI = Master)

#### (2) Master/Slave (with This LSI Acting as Slave)

**Figure 24.3** shows a master/slave system configuration example when this LSI is used as a slave. When this LSI is to operate as a slave, the SSL pin is used as SSL input. The master always drives the RSPCK and MOSI. This LSI (slave) always drives the MISO. When SSL is at the non-active level, the pin state is Hi-Z.

In the slave configuration in which the CPHA bit in the command register (SPCMD) is set to 1, the SSL input of this LSI (slave) is fixed to the 0 level, this LSI (slave) is always maintained in a selected state, and in this manner it is possible to execute serial transfer (**Figure 24.4**).

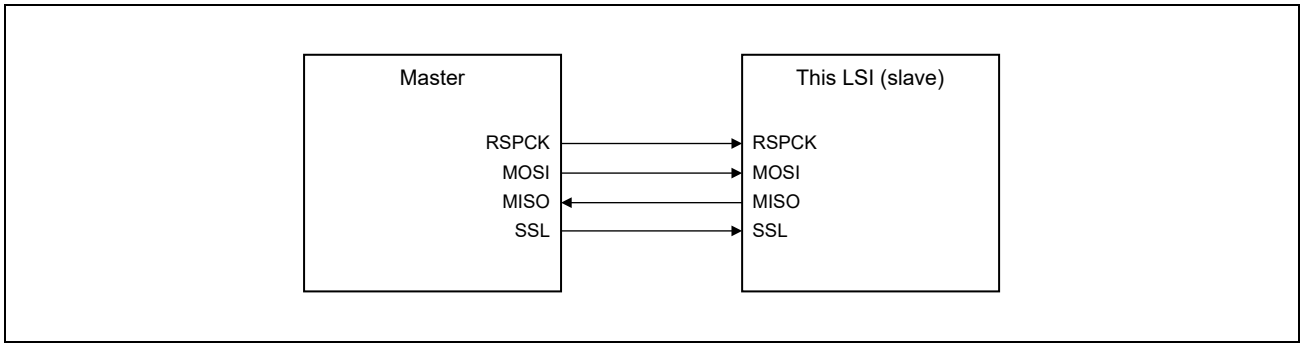

Figure 24.3 Master/Slave Configuration Example (This LSI = Slave)

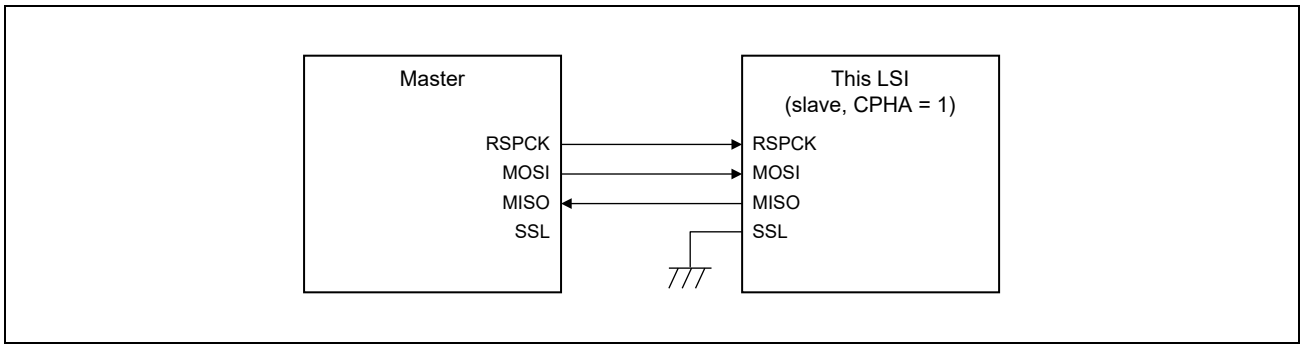

Figure 24.4 Master/Slave Configuration Example (This LSI = Slave, CPHA = 1)

### (3) Master/Multi-Slave (with This LSI Acting as Slave)

**Figure 24.5** shows a master/multi-slave system configuration example when this LSI is used as a slave. In the example of **Figure 24.5**, the system is comprised of a master and two LSIs (slave X and slave Y).

The RSPCK and MOSI outputs of the master are connected to the RSPCK and MOSI inputs of the LSIs (slave X and slave Y). The MISO outputs of the LSIs (slave X and slave Y) are all connected to the MISO input of the master. SSLX and SSLY outputs of the master are connected to the SSL inputs of the LSIs (slave X and slave Y), respectively.

The master always drives RSPCK, MOSI, SSLX, and SSLY. Of the LSIs (slave X and slave Y), the slave that receives low level input into the SSL0 input drives MISO.

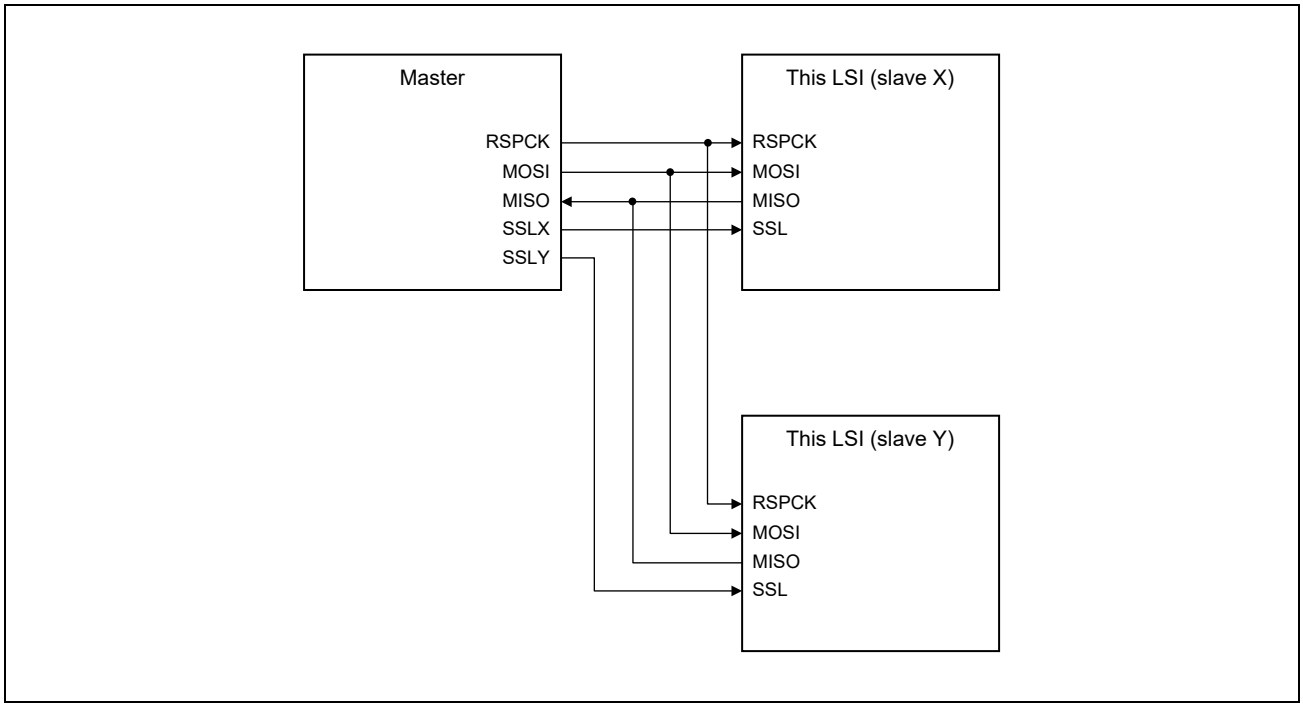

Figure 24.5 Master/Multi-Slave Configuration Example (This LSI = Slave)

### 24.4.4 Transfer Format

#### (1) CPHA = 0

**Figure 24.6** shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 0. In **Figure 24.6**, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the settings of this module. For details, see **Section 24.4.2, Pin Control**.

When the CPHA bit is 0, the driving of valid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The first RSPCK signal change timing that occurs after the SSL signal assertion becomes the first transfer data fetching timing. After this timing, data is sampled at every 1 RSPCK cycle. The change timing for MOSI and MISO signals is always 1/2 RSPCK cycle after the transfer data fetch timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1 denotes a period from an SSL signal assertion to RSPCK oscillation (RSPCK delay). t2 denotes a period from the cessation of RSPCK oscillation to an SSL signal negation (SSL negation delay). t3 denotes a period in which SSL signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the system. For a description of t1, t2, and t3 when this module is in master mode, see **Section 24.4.3(1), Master/Slave (with This LSI Acting as Master)**.

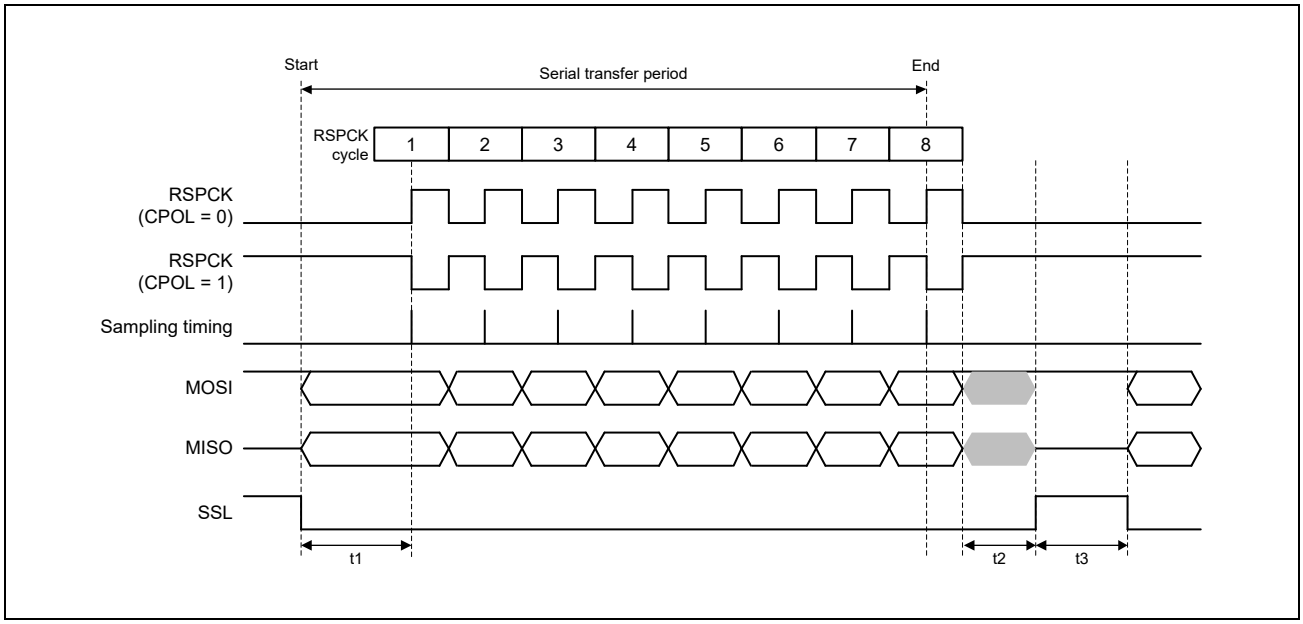

Figure 24.6 Transfer Format (CPHA = 0)

### (2) CPHA = 1

**Figure 24.7** shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 1. In **Figure 24.7**, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the modes (master or slave). For details, see **Section 24.4.2, Pin Control**.

When the CPHA bit is 1, the driving of invalid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The driving of valid data to the MOSI and MISO signals commences at the first RSPCK signal change timing that occurs after the SSL signal assertion. After this timing, data is updated at every 1 RSPCK cycle. The transfer data fetch timing is always 1/2 RSPCK cycle after the data update timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1, t2, and t3 are the same as those in the case of CPHA = 0. For a description of t1, t2, and t3 when this module is in master mode, see **Section 24.4.3(1), Master/Slave (with This LSI Acting as Master)**.

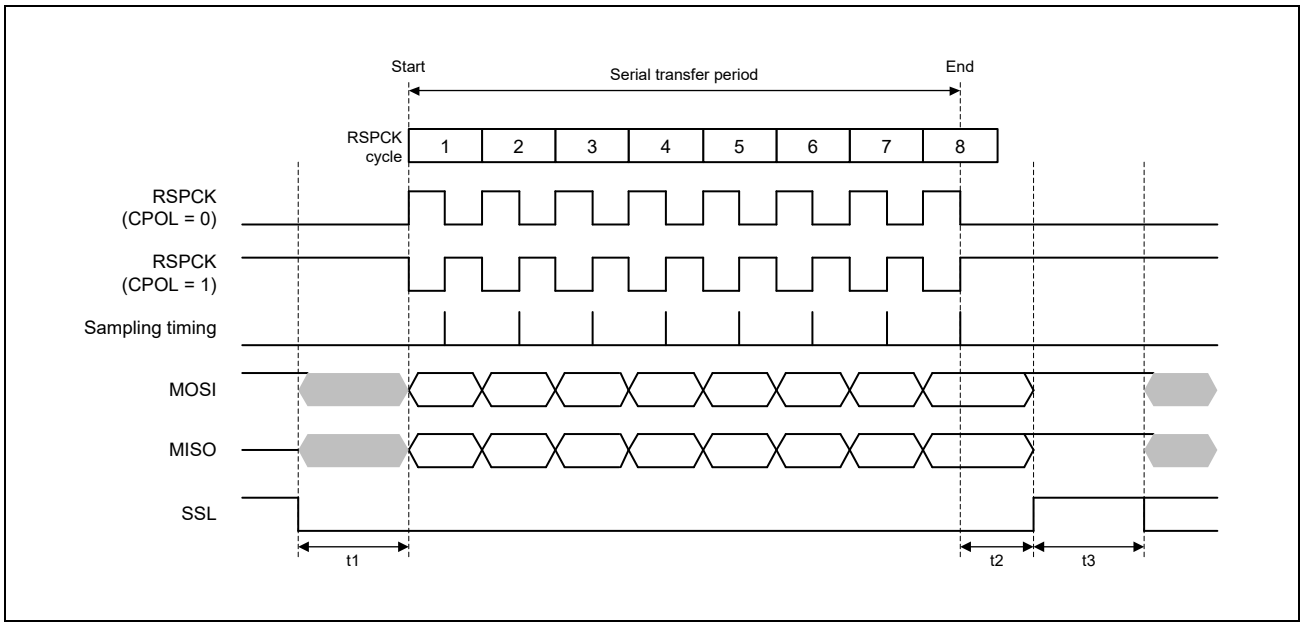

Figure 24.7 Transfer Format (CPHA = 1)

### 24.4.5 Data Format

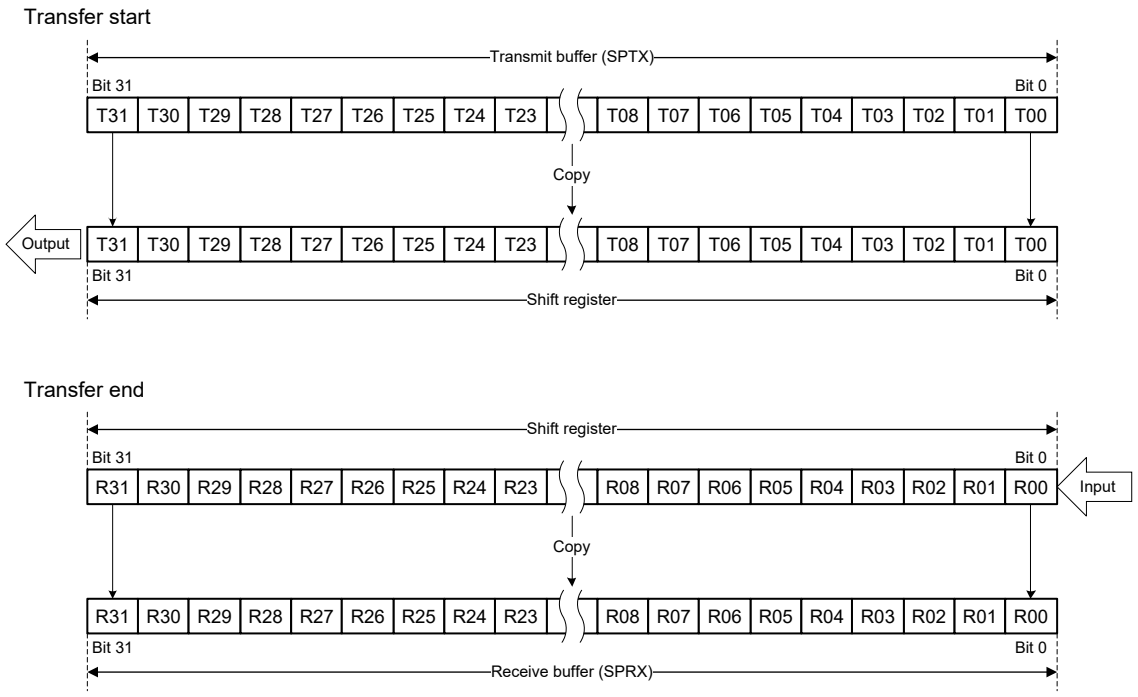
The data format depends on the settings in the command register (SPCMD). Irrespective of MSB/LSB first, this module treats the range from the LSB of the data register (SPDR) to the assigned data length as transfer data.

#### (1) MSB First Transfer (32-Bit Data)

**Figure 24.8** shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer of SPDR. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R31 to R00 is stored in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R31 to R00 is shifted out from the shift register.



**Note:** Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

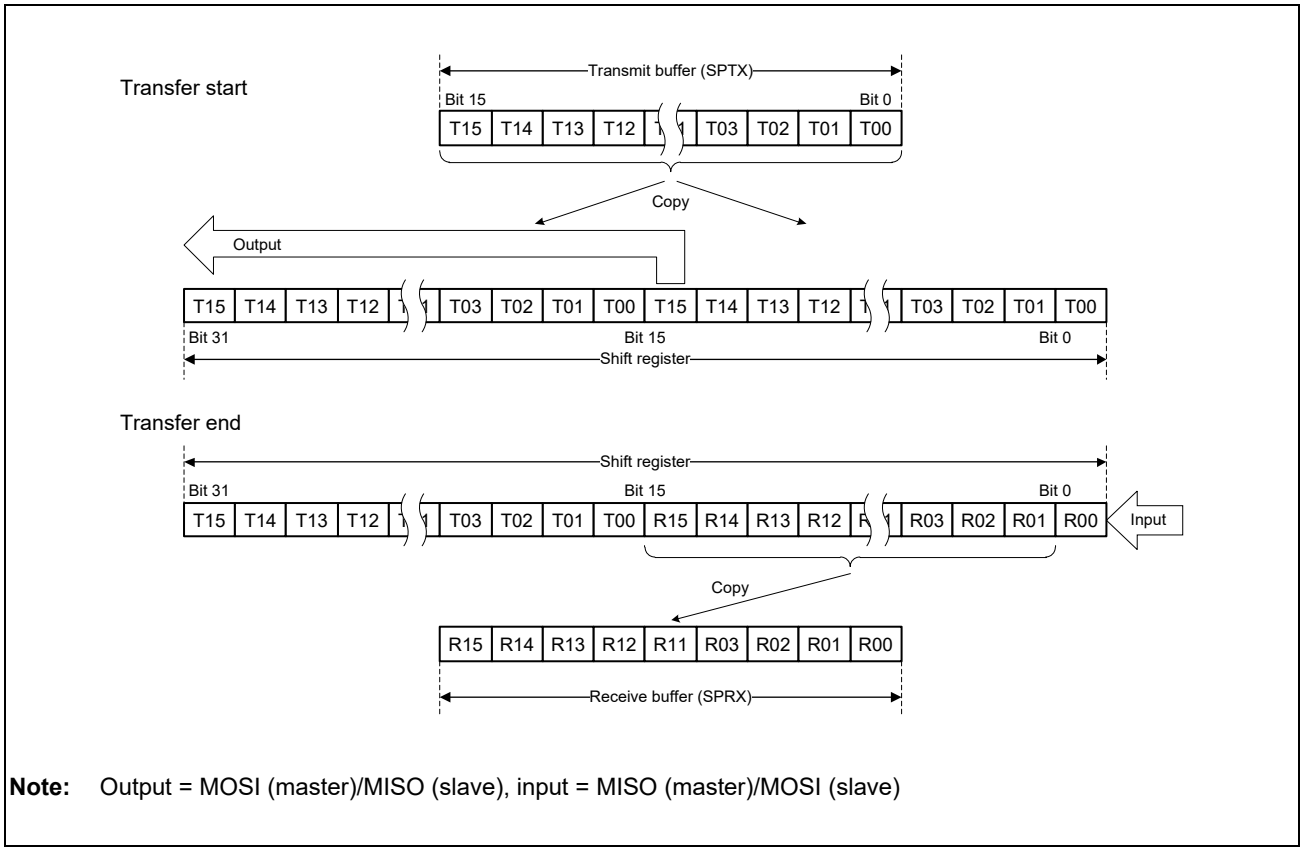
Figure 24.8 MSB First Transfer (32-Bit Data)

### (2) MSB First Transfer (16-Bit Data)

**Figure 24.9** shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 15 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R15 to R00 is stored in bits 15 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 16 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R15 to R00 is shifted out from the shift register.



**Note:** Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

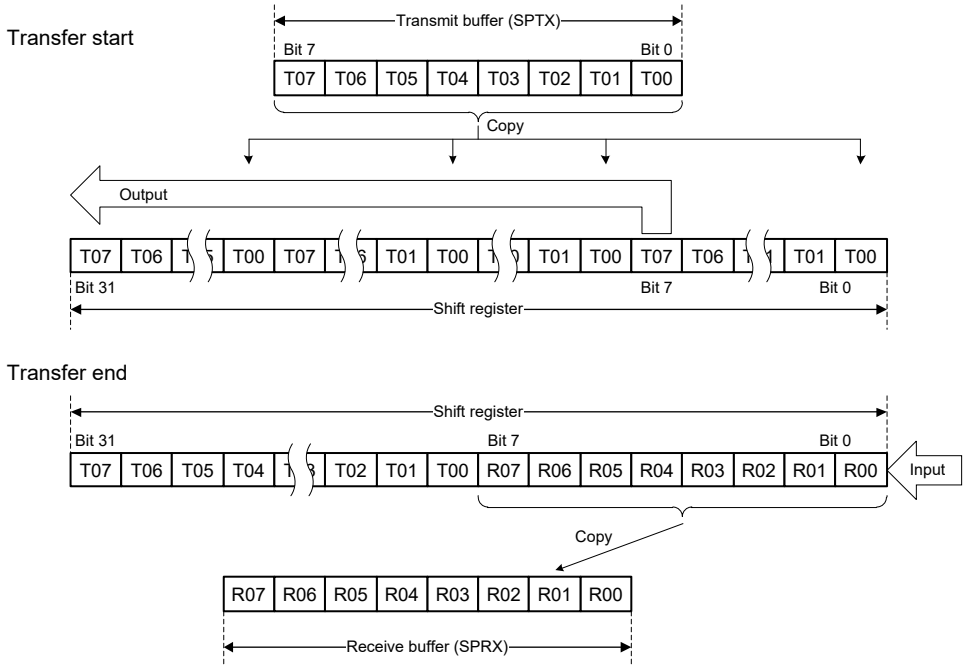
Figure 24.9 MSB First Transfer (16-Bit Data)

### (3) MSB First Transfer (8-Bit Data)

**Figure 24.10** shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 7 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R07 to R00 is stored in bits 7 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 8 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary area in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R07 to R00 is shifted out from the shift register.



**Note:** Output = MOSI (master)/MISO (slave), input = MOSI (master)/MISO (slave)

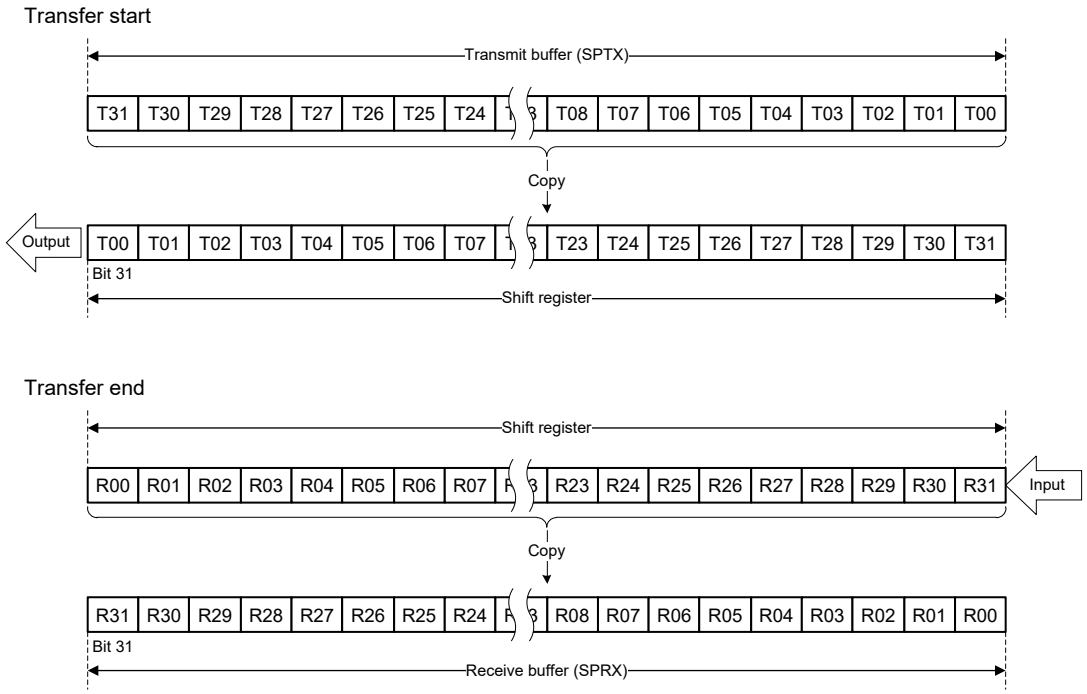
Figure 24.10 MSB First Transfer (8-Bit Data)

### (4) LSB First Transfer (32-Bit Data)

**Figure 24.11** shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R00 to R31 is stored in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of the SPDR, received data R00 to R31 is shifted out from the shift register.



**Note:** Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

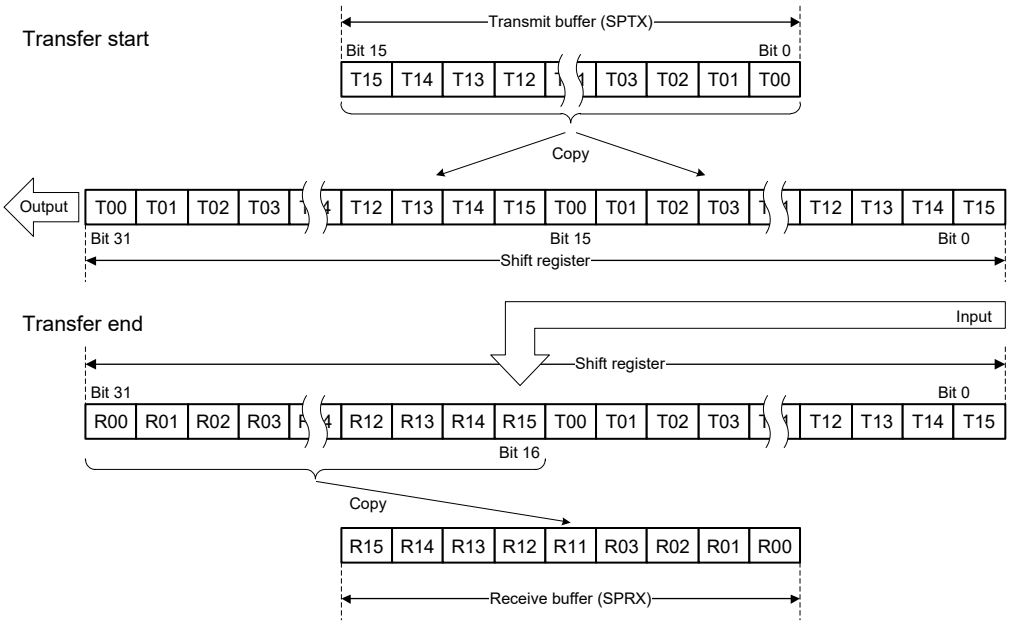
Figure 24.11 LSB First Transfer (32-Bit Data)

### (5) LSB First Transfer (16-Bit Data)

**Figure 24.12** shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 16 in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R00 to R15 is stored in bits 31 to 16 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 15 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R15 is shifted out from the shift register.



**Note:** Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

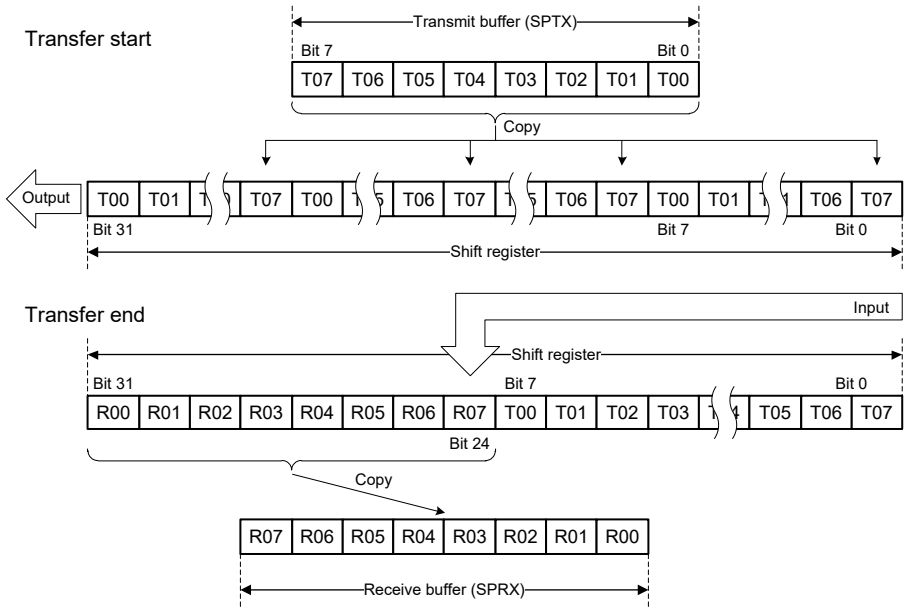
Figure 24.12 LSB First Transfer (16-Bit Data)

### (6) LSB First Transfer (8-Bit Data)

**Figure 24.13** shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 24 in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R00 to R07 is stored in bits 31 to 24 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 23 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R07 is shifted out from the shift register.



**Note:** Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 24.13 LSB First Transfer (8-Bit Data)

### 24.4.6 Error Detection

In the normal serial transfer, the data written to the transmit buffer of the data register (SPDR) is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer or the status at the beginning or end of serial transfer, in some cases non-normal transfers can be executed.

If a non-normal transfer operation occurs, this module detects the event as an overrun error or a mode fault error. **Table 24.7** shows the relationship between non-normal transfer operations and the error detection function.

Table 24.7 Relationship between Non-Normal Transfer Operations and Error Detection Function

| | Occurrence Condition | Operation | Error Detection |
|---|---|---|---|
| A | SPDR is written when the transmit buffer is full. | Missing write data. | None |
| B | Serial transfer is started in slave mode when transmit data is still not loaded on the shift register. | Data received in previous serial transfer is serially transmitted. | None |
| C | SPDR is read when the receive buffer is empty. | The output data is undefined. | None |
| D | Serial transfer terminates when the receive buffer is full. | Missing serial receive data. | Overrun error (only in slave mode) |
| E | The SSL input signal is negated during serial transfer in slave mode. | Serial transfer suspended.<br>Missing send/receive data.<br>Operation disabled. | Mode fault error |

On operation A shown in **Table 24.7**, this module does not detect an error. Whether SPDR can be written to or not can be checked using the T[3:0] bits in the buffer data count setting register (SPBFDR).

Likewise, this module does not detect an error on operation B. In a serial transfer that was started before the shift register was updated, this module sends the data that was received in the previous serial transfer, and does not treat the operation indicated in B as an error. Note that the received data from the previous serial transfer is retained in the receive buffer of SPDR, thus it can be correctly read.

Similarly, this module does not detect an error on operation C. To prevent extraneous data from being read, the number of receive data units stored in the receive buffer should be read from the R[5:0] bits in the buffer data count setting register (SPBFDR).

An overrun error shown in D is described in **Section 24.4.6(1), Overrun Error**. A mode fault error shown in E is described in **Section 24.4.6(2), Mode Fault Error**.

### (1) Overrun Error

If serial transfer ends when the receive buffer of the data register (SPDR) is full, this module detects an overrun error, and sets the OVRF bit in SPSR to 1. When the OVRF bit is 1, this module does not copy data from the shift register to the receive buffer so that the data prior to the occurrence of the error is retained in the receive buffer. To reset the OVRF bit in SPSR to 0, either perform a power-on reset, or write a 0 to the OVRF bit after SPSR has been read with the OVRF bit set to 1.

**Figure 24.14** shows an example of operation of the SPRF and OVRF bits in SPSR. The SPSR and SPDR accesses shown in **Figure 24.14** indicate the condition of accesses to SPSR and SPDR, respectively, where I denotes an idle cycle, W a write cycle, and R a read cycle. In the example of **Figure 24.14**, this module performs an 8-bit serial transfer in which the CPHA bit in the command register (SPCMD) is 1, and CPOL is 0. The numbers given under the RSPCK waveform represent the number of RSPCK cycles (i.e., the number of transferred bits).

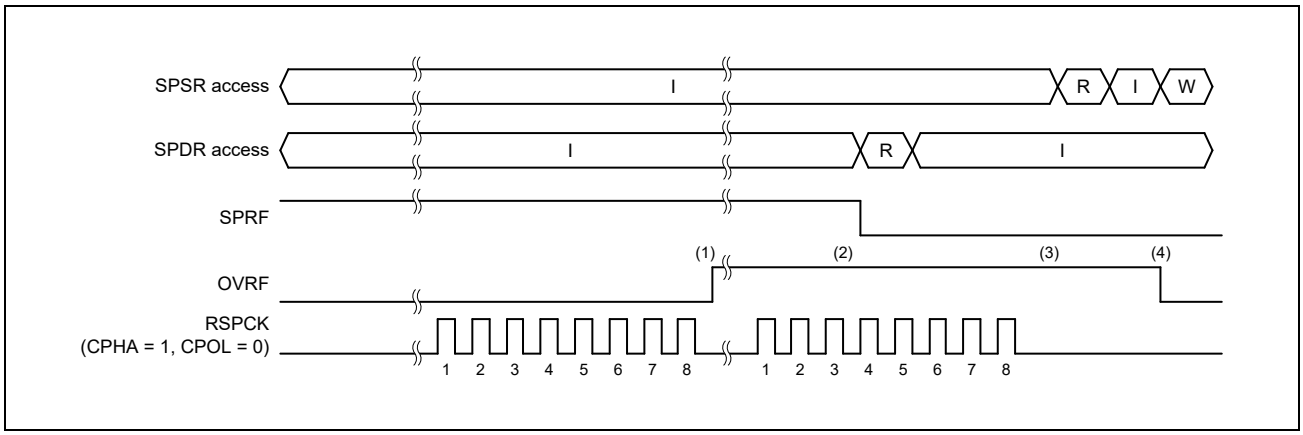


Figure 24.14 SPRF and OVRF Bit Operation Example

The operation of the flags at the timing shown in steps (1) to (4) in the figure is described below.

1. If a serial transfer terminates when the receive buffer does not have a space for the receive data length, this module detects an overrun error, and sets the OVRF bit to 1. This module does not copy the data in the shift register to the receive buffer.
2. The OVFR bit is not cleared even when SPDR is read and thus the number of data bytes in the receive buffer becomes less than the number of the receive buffer data triggering number specified by the RXTRG bits.
3. If the serial transfer terminates in an overrun error state, this module determines that the shift register is empty; in this manner, data transfer is enabled from the transmit buffer to the shift register.
4. If 0 is written to the OVRF bit after SPSR is read with OVRF = 1, this module clears the OVRF bit.

The occurrence of an overrun can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. When executing a serial transfer without using an error interrupt, measures should be taken to ensure the early detection of overrun errors, such as reading SPSR immediately after SPDR is read.

The OVRF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition in which the OVRF bit is set to 1, 0 is written to the OVRF bit.
- Power-on reset

NOTE

When the receive buffer has area enough to store receive data with an overrun error, this module receives receive data.

### (2) Mode Fault Error

When the MSTR bit is 0, this module operates in slave mode. This module detects a mode fault error if the SSL input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched) when the MODFEN bit is 1 in slave mode.

Upon detecting a mode fault error, this module stops driving of the output signals and clears the SPE bit in SPCR to 0. When the SPE bit is cleared to 0, the function of this module is disabled, and this module stops driving external signals. For details of disabling the function of this module by clearing the SPE bit to 0, see **Section 24.4.7, Initialization**.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. To detect a mode fault error without using an error interrupt, it is necessary to poll SPSR.

When the MODF bit is 1, writing 1 to the SPE bit is ignored. To enable the function of this module after the detection of a mode fault error, the MODF bit must be set to 0. The MODF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition where the MODF bit has turned 1, 0 is written to the MODF bit.
- Power-on reset

### 24.4.7 Initialization

If 0 is written to the SPE bit in the control register (SPCR) or this module clears the SPE bit to 0 because of the detection of a mode fault error, this module disables the module function, and initializes a part of the module function. When a power-on reset is generated, this module initializes all of the module function. An explanation follows of initialization by the clearing of the SPE bit.

#### (1) Initialization by Clearing SPE Bit

When the SPE bit in SPCR is cleared, this module performs the following initialization:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state
- Initializing the TEND bit in SPSR

Initialization by the clearing of the SPE bit does not initialize the control bits of this module. For this reason, this module can be started in the same transfer mode as prior to the initialization if the SPE bit is re-set to 1.

## 24.4.8 SPI Operation

### (1) Multi-Master Mode Operation

This section explains the operation in multi-master mode.

#### (a) Starting Serial Transfer

A serial transfer is started when transmit data is copied from the transmit buffer to the shift register, the shift register becomes full, and the receive buffer has a space for the receive data length. If transmit data has already been written to the shift register, data is not copied from the transmit buffer to the shift register.

For details of the transfer format, see **Section 24.4.4, Transfer Format**.

#### (b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register (SPCMD), this module terminates the serial transfer after transmitting an RSPCK edge corresponding to the final sampling timing. After the serial transfer is completed, receive data is copied from the shift register to the receive buffer. If the receive buffer does not have a space for the receive data length after receive data is copied from the shift register to the receive buffer, another serial transfer will not be performed. In order to perform another serial transfer, data for the receive data length should be read from the receive buffer to secure the space for the receive data.

It should be noted that the final sampling timing varies depending on the bit length of transfer data. In master mode, the data length depends on the settings in bits SPB3 to SPB0 in SPCMD. For details on the transfer format, see **Section 24.4.4, Transfer Format**.

#### (c) Sequence Control

The transfer format that is employed in master mode is determined by the sequence control register (SPSCR), command registers 0 to 3 (SPCMD0 to SPCMD3), the bit rate register (SPBR), the clock delay register (SPCKD), the slave select negation delay register (SSLND), and the next-access delay register (SPND).

SPSCR is a register used to determine the sequence configuration for serial transfers that are executed by this module in master mode. The following items are set in command registers SPCMD0 to SPCMD3: SSL output signal value, MSB/ LSB first, data length, some of the bit rate settings, RSPCK polarity/phase, whether SPCKD is to be referenced, whether SSLND is to be referenced, and whether SPND is to be referenced. SPBR holds some of the bit rate settings; SPCKD, a clock delay value; SSLND, an SSL negation delay; and SPND, a next-access delay value.

According to the sequence length that is assigned to SPSCR, this module makes up a sequence comprised of a part or all of SPCMD0 to SPCMD3. This module contains a pointer to the SPCMD that makes up the sequence. The value of this pointer can be checked by reading bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the SPE bit in the control register (SPCR) is set to 1 and the function of this module is enabled, this module loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. This module increments the pointer each time the next-access delay period for a data transfer ends. Upon completion of the serial transfer that corresponds to the final command comprising the sequence, this module sets the pointer in SPCMD0, and in this manner the sequence is executed repeatedly.

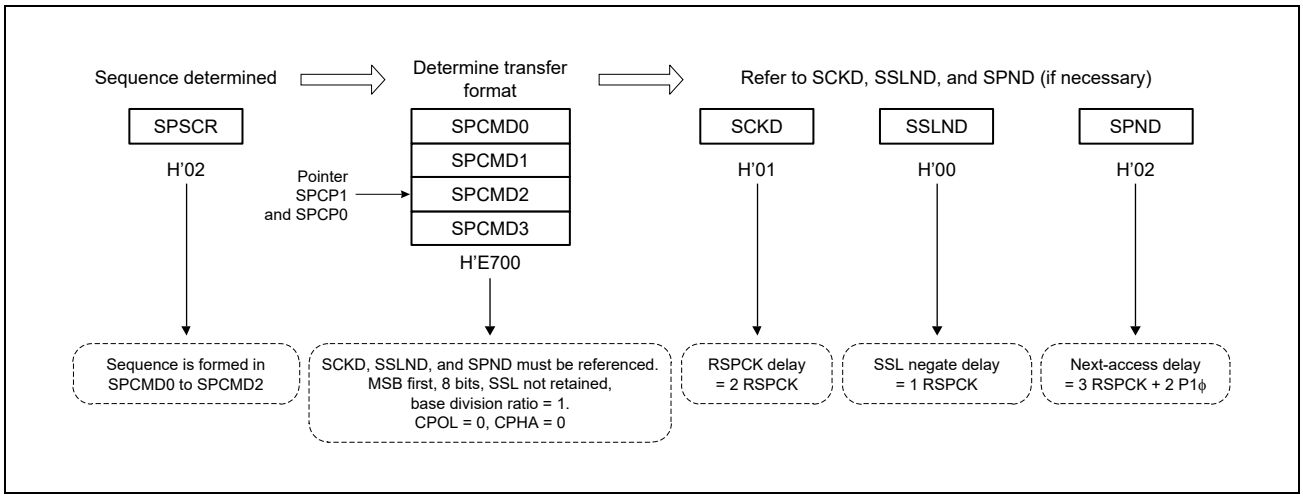

Figure 24.15 Determination Procedure of Serial Transfer Mode in Master Mode

### (d) Burst Transfer

If the SSLKP bit in the command register (SPCMD) that this module references during the current serial transfer is 1, this module keeps the SSL signal level during the serial transfer until the beginning of the SSL signal assertion for the next serial transfer. If the SSL signal level for the next serial transfer is the same as the SSL signal level for the current serial transfer, this module can execute continuous serial transfers while keeping the SSL signal assertion status (burst transfer).

**Figure 24.16** shows an example of an SSL signal operation for the case where a burst transfer is implemented using SPCMD0 and SPCMD1 settings. The text below explains operations (1) to (7) as depicted in **Figure 24.16**. It should be noted that the polarity of the SSL output signal depends on the settings in the slave select polarity register (SSLP).

1. Based on SPCMD0, this module asserts the SSL signal and inserts RSPCK delays.
2. Serial transfers are executed according to SPCMD0.
3. SSL negation delays are inserted.
4. Because the SSLKP bit in SPCMD0 is 1, this module keeps the SSL signal value on SPCMD0. This period is sustained, at the shortest, for a period equal to the next-access delay of SPCMD0. If the shift register is empty after the passage of a minimum period, this period is sustained until such time as the transmit data is stored in the shift register for another transfer.
5. Based on SPCMD1, this module asserts the SSL signal and inserts RSPCK delays.
6. Serial transfers are executed according to SPCMD1.
7. Because the SSLKP bit in SPCMD1 is 0, this module negates the SSL signal. In addition, a next-access delay is inserted according to SPCMD1.

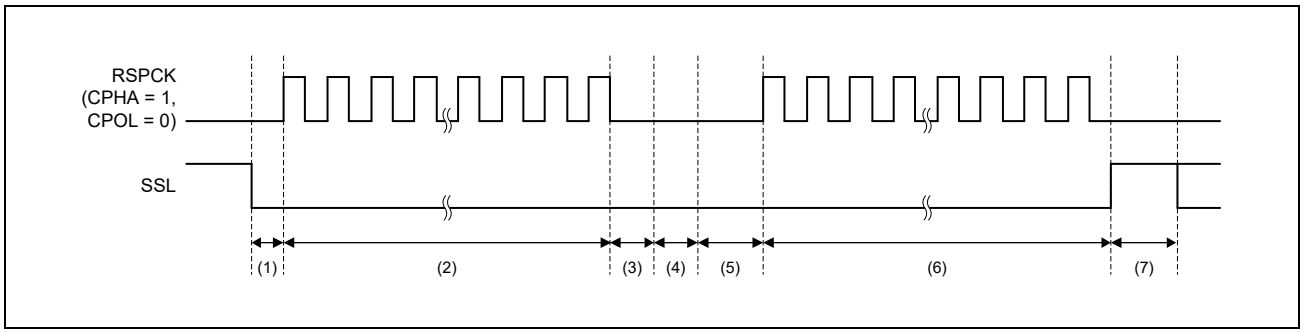

Figure 24.16 Example of Burst Transfer Operation using SSLKP Bit

If the SSL signal settings in the SPCMD in which 1 is assigned to the SSLKP bit are different from the SSL signal output settings in the SPCMD to be used in the next transfer, this module switches the SSL signal status to SSL signal assertion ((5) in **Figure 24.16**) corresponding to the command for the next transfer. Notice that if such an SSL signal switching occurs, the slaves that drive the MISO signal compete, and the possibility arises of the collision of signal levels.

This module in master mode references within the module the SSL signal operation for the case where the SSLKP bit is not used. Even when the CPHA bit in SPCMD is 0, this module can accurately start serial transfers by asserting the SSL signal for the next transfer. For this reason, burst transfers in master mode can be executed irrespective of CPHA bit settings (see **Section 24.4.8(2), Slave Mode Operation**).

### (e) RSPCK Delay (t1)

The RSPCK delay value in master mode depends on SCKDEN bit settings in the command register (SPCMD) and on clock delay register (SPCKD) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an RSPCK delay value during serial transfer by using the SCKDEN bit in the selected SPCMD and SPCKD, as shown in **Table 24.8**. For a definition of RSPCK delay, see **Section 24.4.4, Transfer Format**.

Table 24.8 Relationship among SCKDEN and SPCKD Settings and RSPCK Delay Values

| SCKDEN | SPCKD | RSPCK Delay Value |
|---|---|---|
| 0 | 000 to 111 | 1 RSPCK |
| 1 | 000 | 1 RSPCK |
| | 001 | 2 RSPCK |
| | 010 | 3 RSPCK |
| | 011 | 4 RSPCK |
| | 100 | 5 RSPCK |
| | 101 | 6 RSPCK |
| | 110 | 7 RSPCK |
| | 111 | 8 RSPCK |

### (f) SSL Negation Delay (t2)

The SSL negation delay value in master mode depends on SLNDEN bit settings in the command register (SPCMD) and on SSL negation delay register (SSLND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an SSL negation delay value during serial transfer by using the SLNDEN bit in the selected SPCMD and SSLND, as shown in **Table 24.9**. For a definition of SSL negation delay, see **Section 24.4.4, Transfer Format**.

Table 24.9 Relationship among SLNDEN and SSLND Settings and SSL Negation Delay Values

| SLNDEN | SSLND | SSL Negation Delay Value |
|---|---|---|
| 0 | 000 to 111 | 1 RSPCK |
| 1 | 000 | 1 RSPCK |
| | 001 | 2 RSPCK |
| | 010 | 3 RSPCK |
| | 011 | 4 RSPCK |
| | 100 | 5 RSPCK |
| | 101 | 6 RSPCK |
| | 110 | 7 RSPCK |
| | 111 | 8 RSPCK |

### (g) Next-Access Delay (t3)

The next-access delay value in master mode depends on SPNDEN bit settings in the command register (SPCMD) and on next-access delay register (SPND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines a next-access delay value during serial transfer by using the SPNDEN bit in the selected SPCMD and SPND, as shown in **Table 24.10**. For a definition of next-access delay, see **Section 24.4.4, Transfer Format**.

Table 24.10 Relationship among SPNDEN and SPND Settings and Next-Access Delay Values

| SPNDEN | SPND | Next-Access Delay Value |
|---|---|---|
| 0 | 000 to 111 | 1 RSPCK + 2 P0ϕ |
| 1 | 000 | 1 RSPCK + 2 P0ϕ |
| | 001 | 2 RSPCK + 2 P0ϕ |
| | 010 | 3 RSPCK + 2 P0ϕ |
| | 011 | 4 RSPCK + 2 P0ϕ |
| | 100 | 5 RSPCK + 2 P0ϕ |
| | 101 | 6 RSPCK + 2 P0ϕ |
| | 110 | 7 RSPCK + 2 P0ϕ |
| | 111 | 8 RSPCK + 2 P0ϕ |

### (h) Initialization Flowchart

**Figure 24.17** is a flowchart illustrating an example of initialization in SPI operation when this module is used in master mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

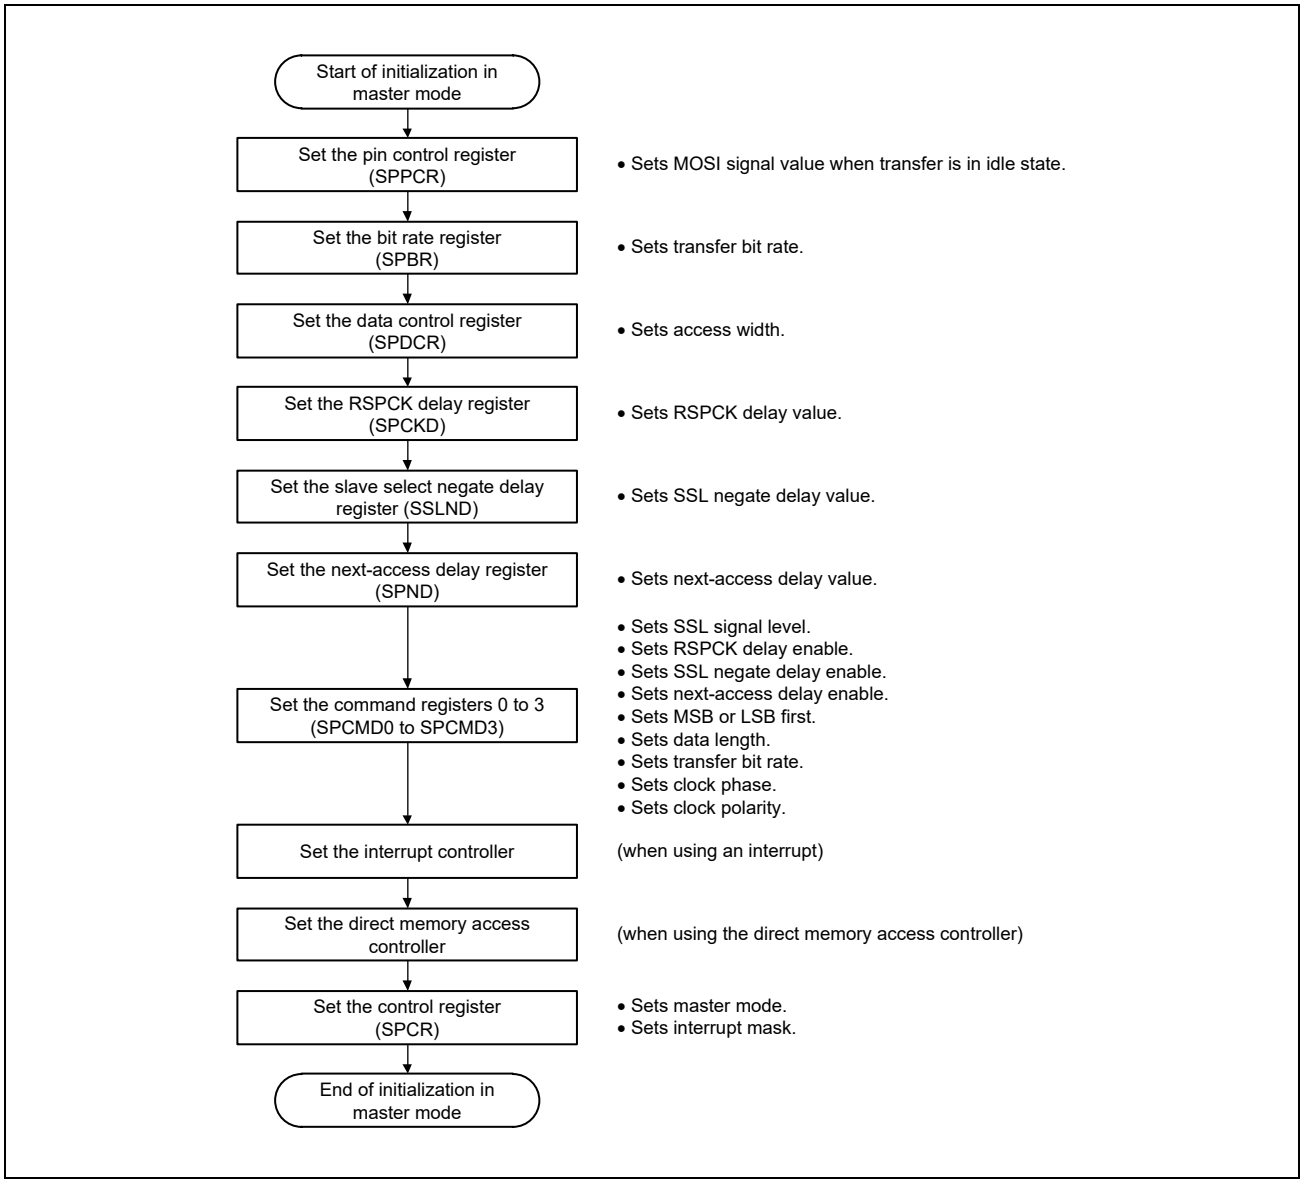

Figure 24.17 Example of Initialization Flowchart in Master Mode

### (i) Transfer Operation Flowchart

**Figure 24.18** is a flowchart illustrating a transfer in SPI operation when this module is used in master mode.

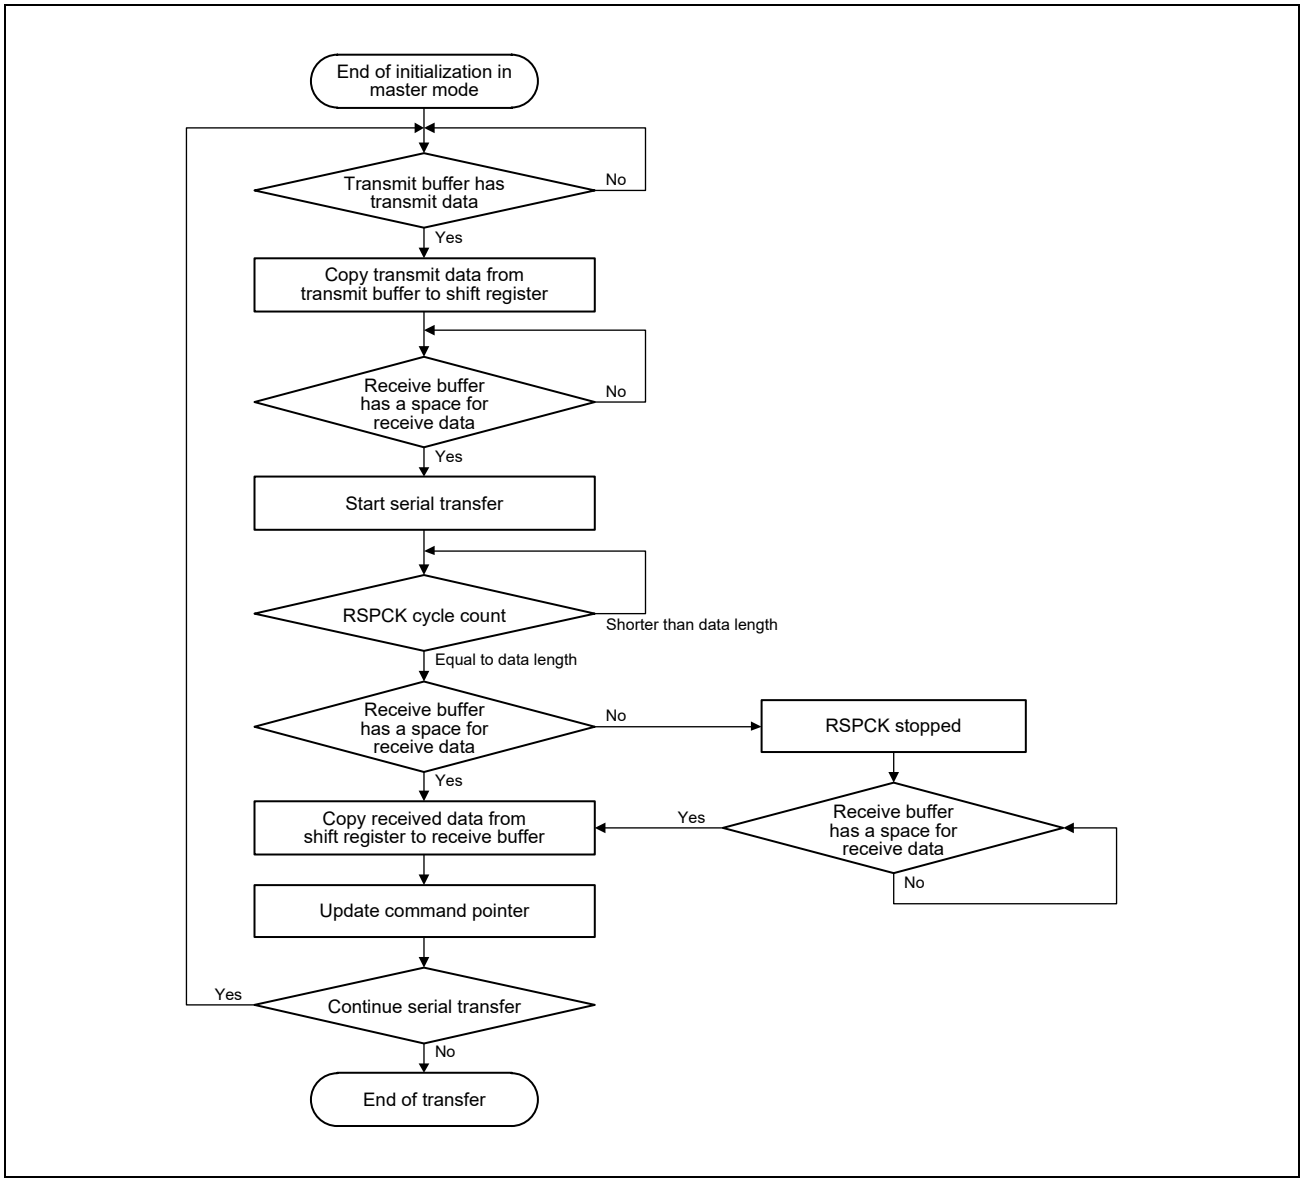

Figure 24.18 Transfer Operation Flowchart in Master Mode

### (2) Slave Mode Operation

#### (a) Starting Serial Transfer

If this module detects an SSL input signal assertion when the CPHA bit in the command register 0 (SPCMD0) is 0, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 0, the asserting of the SSL input signal triggers the start of a serial transfer.

If this module detects the first RSPCK edge in an SSL signal asserted condition when the CPHA bit is 1, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 1, the first RSPCK edge in an SSL signal asserted condition triggers the start of a serial transfer.

When detecting the start of a serial transfer in a condition in which the shift register is empty, this module changes the status of the shift register to “full”, so that data cannot be copied from the transmit buffer to the shift register when serial transfer is in progress. If the shift register was full before the serial transfer started, this module leaves the status of the shift register intact, in the full state.

Irrespective of CPHA bit settings, this module starts driving MISO output signals at the SSL signal assertion timing. Whether the data output from this module is valid or invalid differs depending on CPHA bit settings.

For details on the transfer format, see **Section 24.4.4, Transfer Format**. The polarity of the SSL input signal depends on the setting of the SSL0P bit in the slave select polarity register (SSLP).

#### (b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register 0 (SPCMD0), this module terminates the serial transfer after detecting an RSPCK edge corresponding to the final sampling timing. When the receive buffer has an enough space for receive data, this module copies received data from the shift register to the receive buffer of the data register (SPDR) upon termination of the serial transfer. Irrespective of the value of the SPRF bit, this module changes the status of the shift register to “empty” upon termination of the serial transfer. If this module detects an SSL input signal negation from the beginning of serial transfer to the end of serial transfer, a mode fault error occurs (see **Section 24.4.6, Error Detection**).

The final sampling timing changes depending on the bit length of the transfer data. In slave mode, the data length depends on the settings in bits SPB3 to SPB0 bits in SPCMD0. The polarity of the SSL input signal depends on the setting in the SSL0P bit in the slave select polarity register (SSLP). For details on the transfer format, see **Section 24.4.4, Transfer Format**.

#### (c) Notes on Slave Operations

If the CPHA bit in the command register 0(SPCMD0) is 0, this module starts serial transfers when it detects the assertion edge for an SSL input signal. In the type of configuration shown in **Figure 24.4** as an example, if this module is used in single-slave mode, the SSL signal is always fixed at active state. Therefore, when the CPHA bit is set to 0, this module cannot correctly start a serial transfer. To correctly execute send/receive operation in a configuration in which the SSL input signal is fixed at active state, the CPHA bit should be set to 1. When it is necessary to set the CPHA bit to 0, the SSL input signal should not be fixed.

### (d) Burst Transfer

If the CPHA bit in the command register 0 (SPCMD0) is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSL input signal. If the CPHA bit is 1, the period from the first RSPCK edge to the sampling timing for the reception of the final bit in an SSL signal active state corresponds to a serial transfer period. Even when the SSL input signal remains at the active level, this module can accommodate burst transfers because it can detect the start of access.

If the CPHA bit is 0, for the reason given in **Section 24.4.8(2)(c), Notes on Slave Operations**, second and subsequent serial transfers during the burst transfer cannot be executed correctly.

### (e) Initialization Flowchart

**Figure 24.19** is a flowchart illustrating an example of initialization in SPI operation when this module is used in slave mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

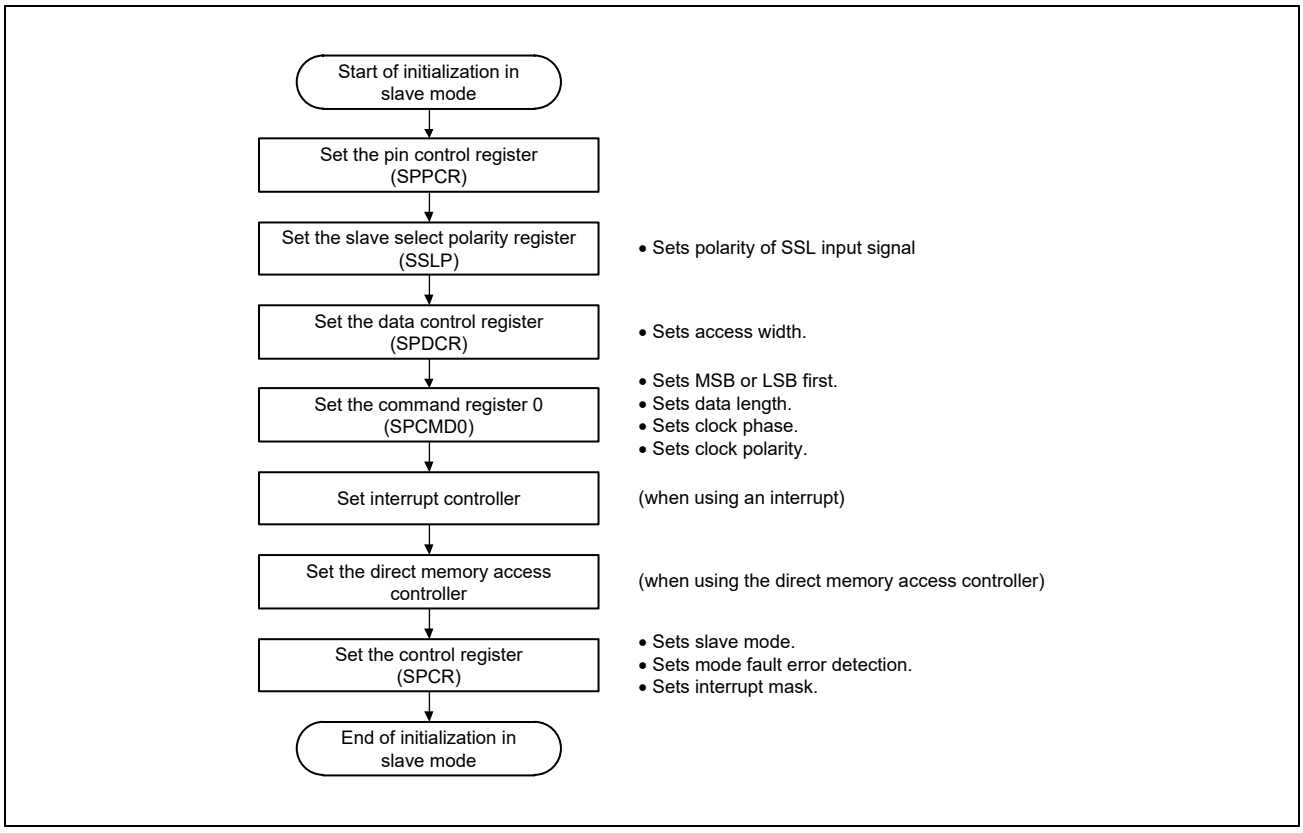

Figure 24.19 Example of Initialization Flowchart in Slave Mode

### (f) Transfer Operation Flowchart (CPHA = 0)

**Figure 24.20** is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) set to 0.

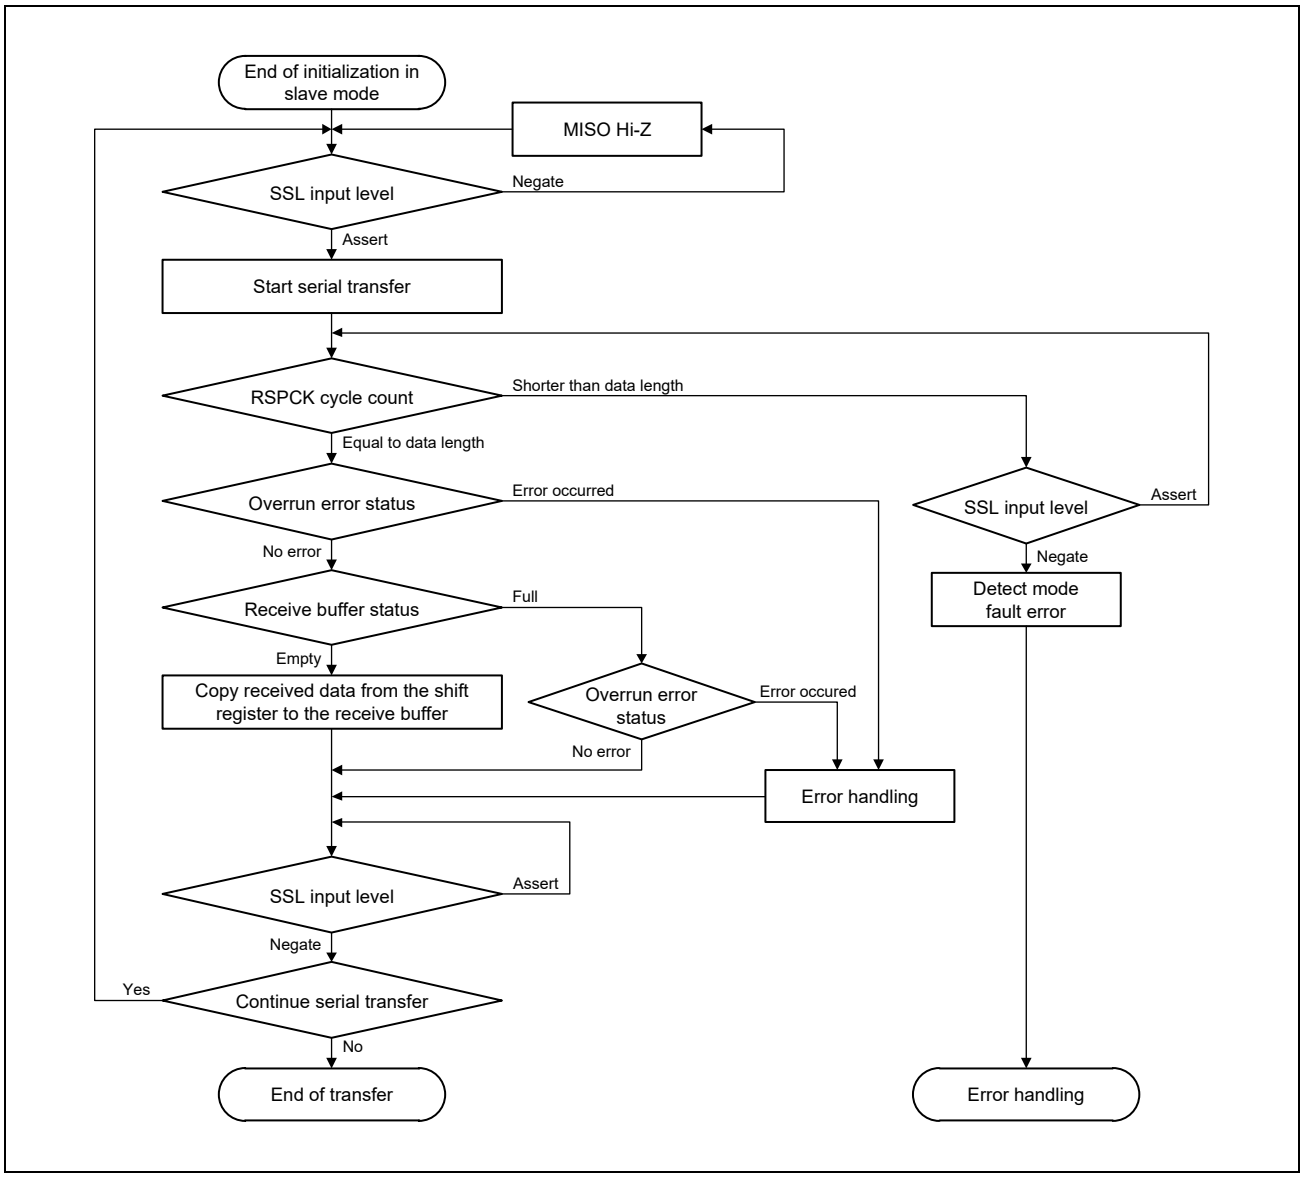

Figure 24.20 Transfer Operation Flowchart in Slave (CPHA = 0)

### (g) Transfer Operation Flowchart (CPHA = 1)

**Figure 24.21** is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) and the MODFEN bit in the control register (SPCR) set to 1, respectively. The subsequent operation is not guaranteed when the serial transfer is started with the MODFEN bit set to 0 and the SSL input level is negated with the number of RSPCK cycles shorter than the data length.

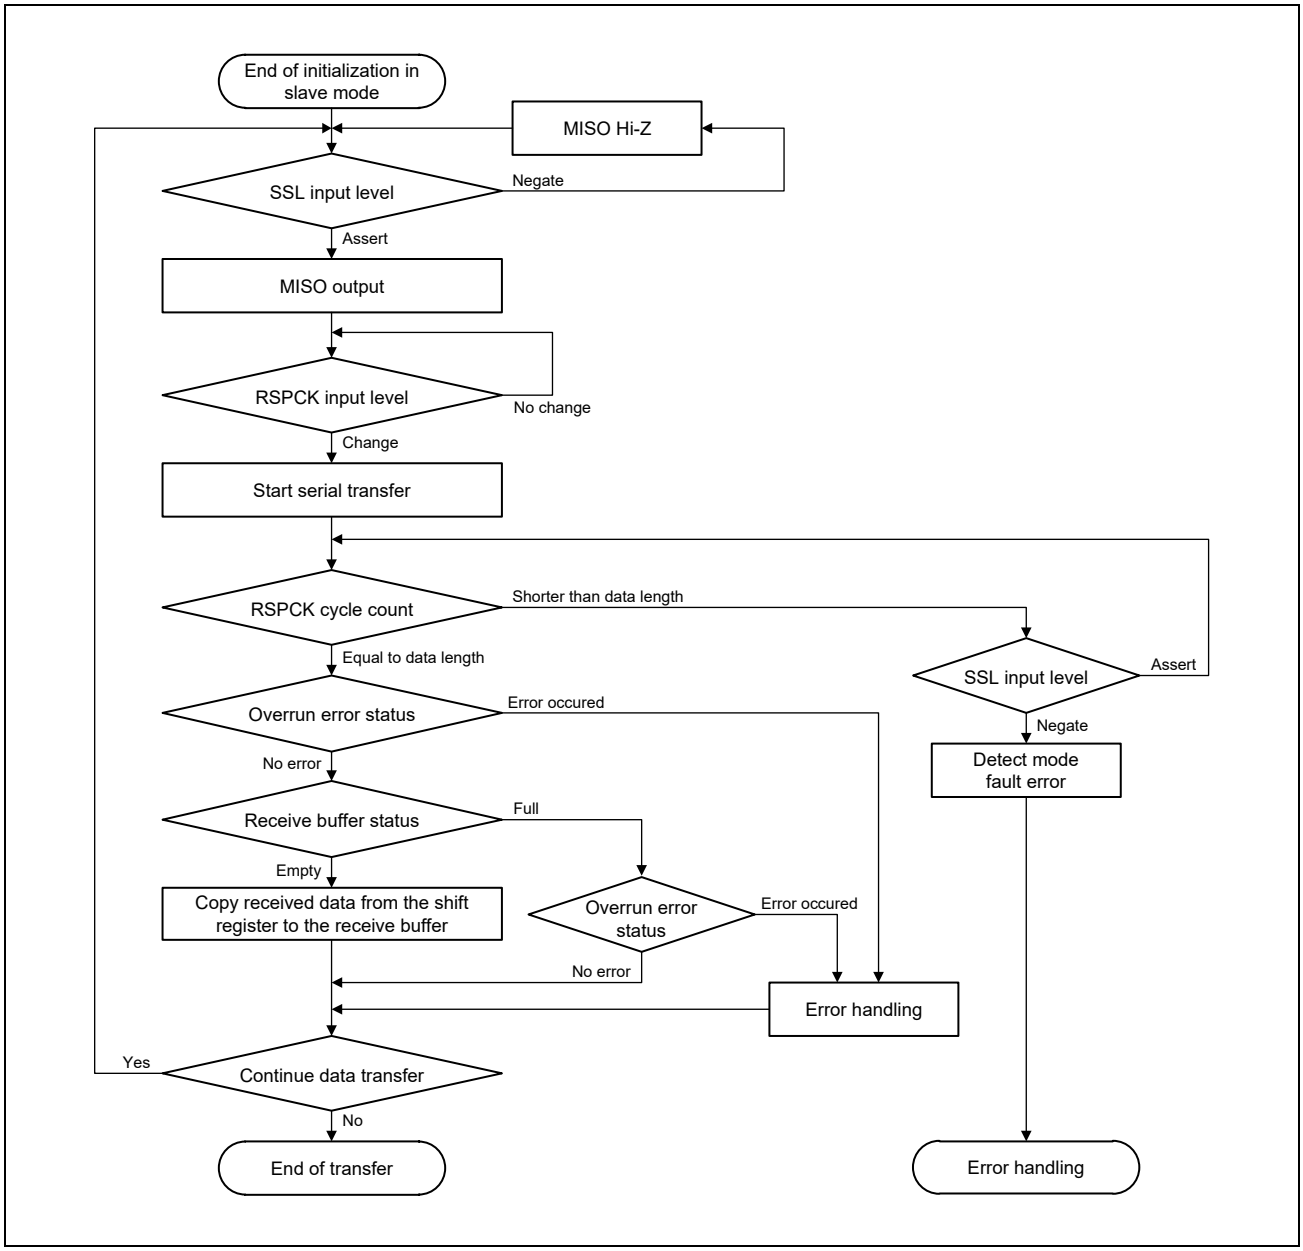

Figure 24.21 Transfer Operation Flowchart in Slave Mode (CPHA = 1)

### 24.4.9 Error Handling

**Figure 24.22** and **Figure 24.23** show the error handling. The following error handling is used to return from the error state after an error in master or slave mode.

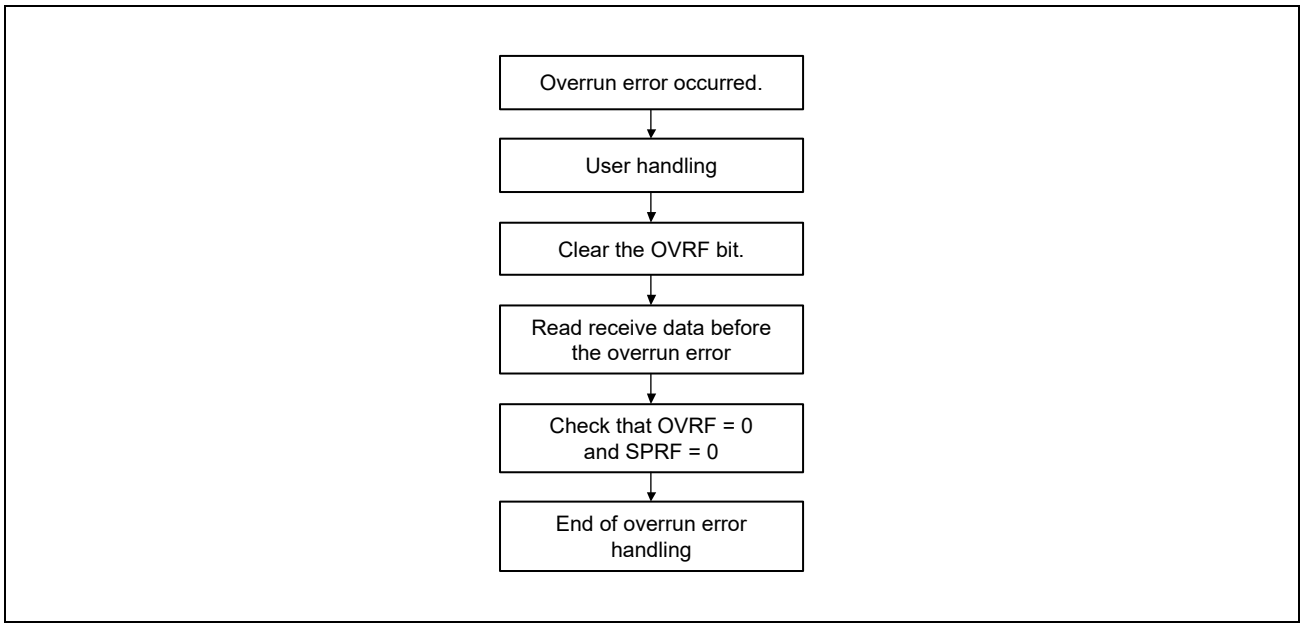

Figure 24.22 Error Handling (Overrun Error)

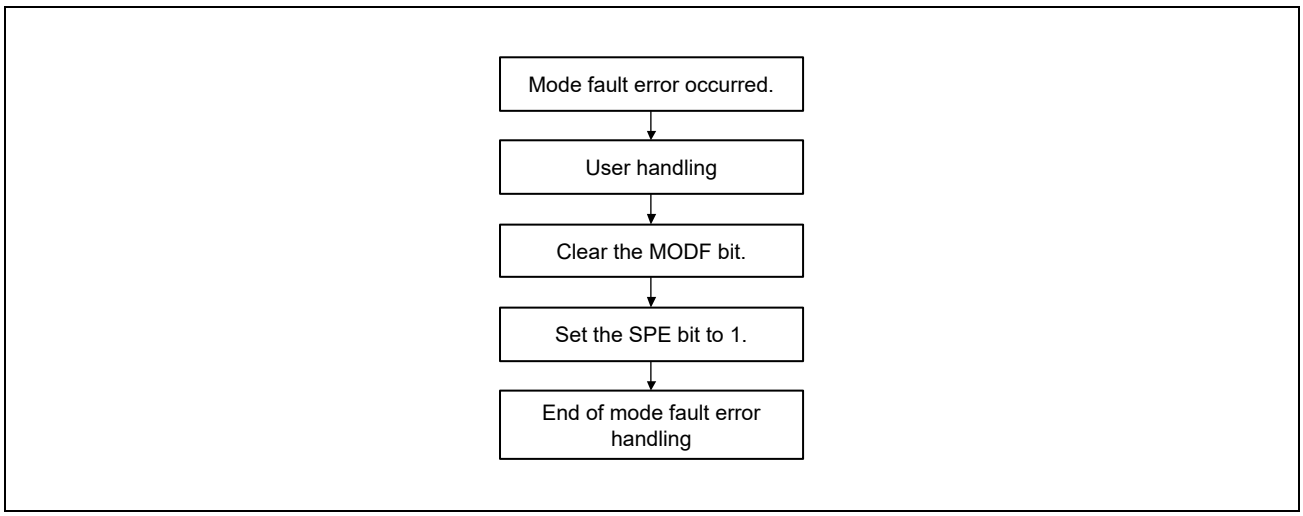

Figure 24.23 Error Handling (Mode Fault Error)

### 24.4.10 Loopback Mode

When 1 is written to the SPLP bit in the pin control register (SPPCR), this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects the input path and the output path (reversed) of the shift register. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data becomes the received data. **Figure 24.24** shows the configuration of the shift register input/output paths for the case where this module in master mode is set in loopback mode.

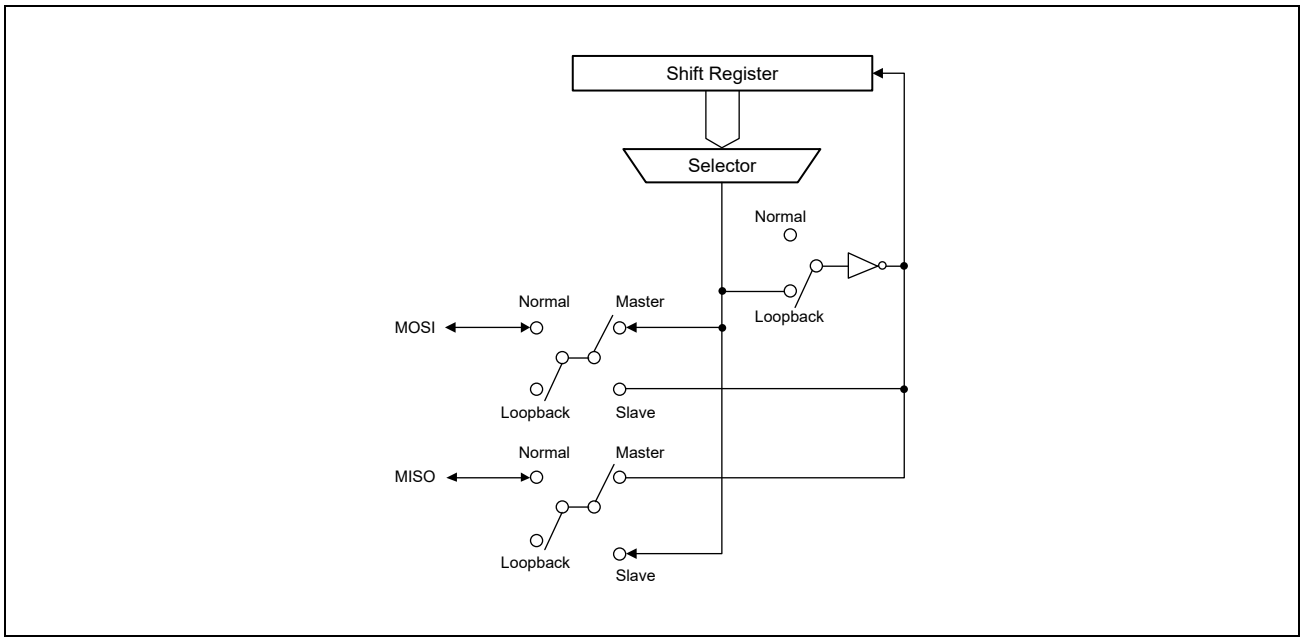

Figure 24.24 Configuration of Shift Register Input/Output Paths in Loopback Mode (Master Mode)

### 24.4.11 Interrupt Sources

This module has interrupt sources of receive buffer full, transmit buffer empty, mode fault, and overrun. In addition, the direct memory access controller can be activated by the receive buffer full or transmit buffer empty interrupt for data transfer.

**Table 24.11** shows the interrupt sources.

When any of the interrupt conditions in **Table 24.11** is met, an interrupt is generated. The interrupt sources should be cleared with data transfer by the CPU or direct memory access controller.

Table 24.11 Interrupt Sources

| Name | Interrupt Source | Abbreviation | Interrupt Condition | Activation of Direct Memory Access Controller |
|---|---|---|---|---|
| SPRI | Receive buffer full | RXI | (SPRIE = 1) • (SPRF = 1) | Possible |
| SPTI | Transmit buffer empty | TXI | (SPTIE = 1) • (SPTEF = 1) | Possible |
| SPEI | Mode fault | MOI | (SPEIE = 1) • (MODF = 1) | — |
| | Overrun | OVI | (SPEIE = 1) • (OVRF = 1) | — |

# 25. SPI Multi I/O Bus Controller

The SPI multi I/O bus controller enables the direct connection of serial flash memory device to this LSI chip.

## 25.1 Features

This module allows the connected serial flash memory device to be accessed by reading the external address space, or using Manual mode to transmit and receive data.

### 25.1.1 Serial Flash Memory Interface

- SPI_PVDD: 1.8V/3.3V
- QSPI0_SPCLK: 66MHz (SDR), 50MHz (DDR)
- A data bus size of 1 bit or 4 bits can be selected for one serial flash memory device.
- Both single data rate (SDR) and double data rate (DDR) transfers are supported.
- Supports master operation. (Slave operation is not supported.)

### 25.1.2 External Address Space Read Mode

- Read access from the bus master to the SPI multi I/O space is automatically converted to a read command, and the read data is returned to the bus master.
- Normal read operation and burst read operation
- Efficient data reception due to built-in read cache (64-bit line × 32 entries)

### 25.1.3 Manual Mode

- Read and write commands are available for serial flash memory.
- A write buffer is provided to improve the efficiency of data write operations.
- The cache is not usable for reading.

## 25.2 Block Diagram

**Figure 25.1** shows a block diagram of this module.

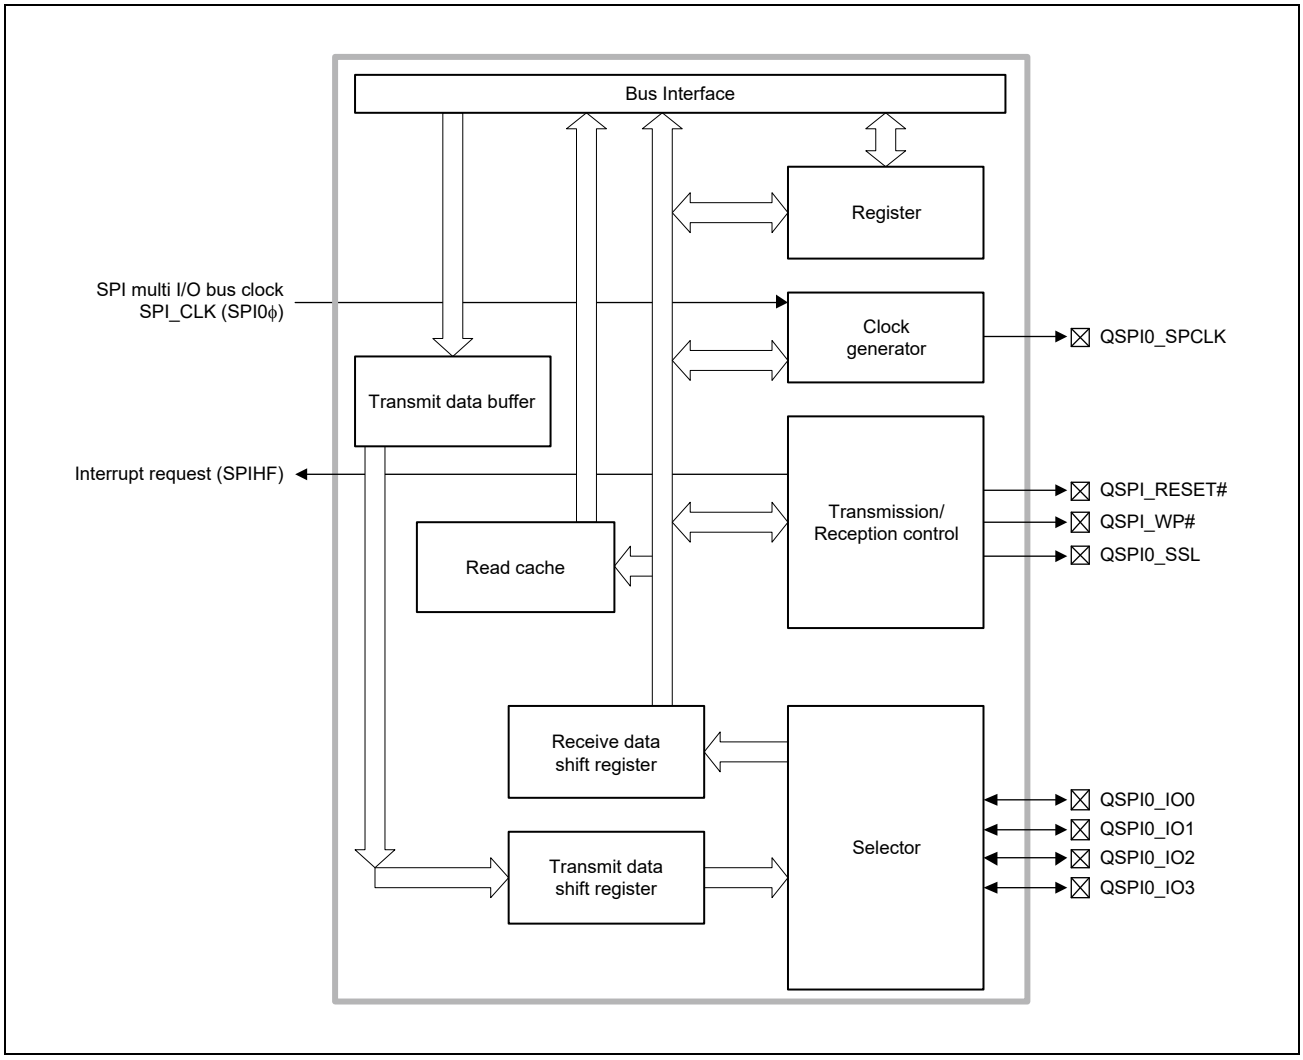

Figure 25.1 Block Diagram

## 25.3 Input/Output Pins

**Table 25.1** shows the pin configuration for one channel.

The operating voltage on pins of the SPI multi I/O bus controller is 3.3 V or 1.8 V.

Before using the pins of the SPI multi I/O bus controller, be sure to set up the QSPI IO Voltage Control Register(QSPI) and Driving Ability Control Register (IOLH).

For details, see **Section 41.3.19, QSPI IO Voltage Control Register(QSPI)** and **Section 41.3.7, Driving Ability Control Register(IOLH)**.

Table 25.1 Pin Configuration

| Pin Name | Symbol | I/O | One 4-bit Serial Flash connected.<br>CMNCR.BSZ = 00 |
|---|---|---|---|
| Clock*1 | QSPI0_SPCLK*3 | Output | SCK |
| Data 0*1 | QSPI0_IO0 | I/O | SI/IO0 |
| Data 1*1 | QSPI0_IO1 | I/O | SO/IO1 |
| Data 2*1 | QSPI0_IO2 | I/O | WP#/IO2 |
| Data 3*1 | QSPI0_IO3 | I/O | HOLD#/IO3 |
| Slave select*1 | QSPI0_SSL | Output | CS# |
| Reset*2 | QSPI_RESET# | Output | RESET# |
| Write protect*2 | QSPI_WP# | Output | For one 1-bit serial flash memory: WP#/IO2 |

Note 1. When connecting a serial flash memory device with the BSZ[1:0] bits set to 00, connect the serial flash memory to the QSPI0 pin group of this LSI.

Note 2. These pin connections must meet to the flash specifications.

Note 3. QSPI0_SPCLK is one-half frequency of SPI0ϕ.

## 25.4 Register Descriptions

**Table 25.2** shows the register configuration.

Base Address: H'0_1006_0000 (Cortex-A55 Address Space)
Base Address: H'4006_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'5006_0000 (Cortex-M33 Address Space Secure)

Table 25.2 Register Configuration

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| Common control register | CMNCR | R/W | H'01557301 | H'0000 | 32 |
| SSL delay register | SSLDR | R/W | H'00000000 | H'0004 | 32 |

**Note:** Do not write to any address those listed in the table. Otherwise, correct operation cannot be guaranteed. Reading from a non-listed address returns an undefined value.

### 25.4.1 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the SPI multi I/O bus controller. The settings of this register are reflected both in external address space read mode and manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1, 0 | BSZ[1:0] | 01 | R/W | Data Bus Size<br>Specifies the number of serial flash memories to be connected.<br>00: one serial flash memory connected<br>01: Setting prohibited<br>1X: Setting prohibited<br>*Note*: After changing (the value of) this bit field, all the entries in the read cache must be cleared by setting the RCF bit in DRCR to 1. |

**Note:** The settings of the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits for control over fixing the output values are reflected at the time QSPIn_SSL is negated on completion of data transfer.

## 25.4.2 SSL Delay Register (SSLDR)

SSLDR is a 32-bit register that adjusts the timing between the QSPIn_SSL signal and the QSPIn_SPCLK signal. The settings of this register are reflected both in external address space read mode and manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 25.4.3 Data Read Control Register (DRCR)

DRCR is a 32-bit register that sets the operation in external address space read mode.

The bits except the SSLN bit should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SSLN | — | — | — | RBURST[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RCF | RBE | — | — | — | — | — | — | — | SSLE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 24 | SSLN | 0 | W | QSPIn_SSL Negation<br>Asserted QSPIn_SSL can be negated by writing 1 to this bit when both the RBE and SSLE bits are 1.<br>This bit is always read as 0.<br>*Note*: To start next access after QSPIn_SSL negation using this bit, read SSLF in CMNSR = 0 to confirm that the QSPIn_SSL has been negated. |
| 23 to 21 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 20 to 16 | RBURST[4:0] | 11111 | R/W | Read Data Burst Length<br>Sets the burst length (data unit count) when reading.<br>This bit field is enabled when the RBE bit is set to 1.<br>00000: 1 data unit<br>00001: 2 continuous data units<br>:<br>11110: 31 continuous data units<br>11111: 32 continuous data units<br>One data unit is 64 bits long. |
| 15 to 10 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 9 | RCF | 0 | W | Read Cache Flush<br>When 1 is written to this bit, all the entries in the read cache are cleared.<br>This bit is always read as 0.<br>After using the cache area as the write buffer, the cache area must be cleared by writing 1 to the RCF bit.<br>*Note*: After flushing the read cache by writing 1 to the RCF bit, read the DRCR register before proceeding to read from the external address space. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | RBE | 1 | R/W | Read Burst<br>Turns burst ON or OFF when reading.<br>0: Data is read according to the access size.<br>1: Read cache is enabled, and as many data units as the burst count specified in RBURST[4:0] bits is read.<br>*Note*: When the cache is enabled and read access reaches the last address of the flash memory, the access address does not match the address held in the cache. Control the read address and access size so that read access does not reach the last address of the flash memory. |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 0 | SSLE | 0 | R/W | QSPIn_SSL Negation<br>Sets the conditions for QSPIn_SSL negation during read burst.<br>QSPIn_SSL is negated for each access during normal read.<br>0: QSPIn_SSL is negated after transfer of data set in burst length.<br>1: QSPIn_SSL is negated when the accessed address is not continuous with the previously transferred address.<br>*Note 1.* Set up this bit when a serial flash memory device is connected.<br>*Note 2.* When this bit is set to 1, setting the RBURST[4:0] bits to H'01 is prohibited. |

### 25.4.4 Data Read Command Setting Register (DRCMR)

DRCMR is a 32-bit register that sets the commands issued in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CMD[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | OCMD[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | CMD[7:0] | H'A0 | R/W | Command<br>Sets the command. |
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | OCMD[7:0] | H'00 | R/W | Optional Command<br>Sets the optional command. |

### 25.4.5 Data Read Extended Address Setting Register (DREAR)

DREAR is a 32-bit register that sets the address when the serial flash address is output in 32-bit mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | EAV[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

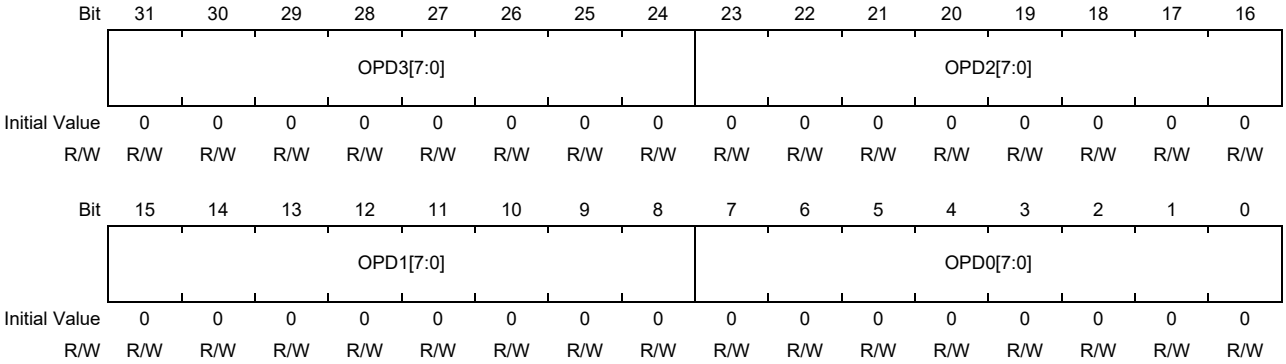
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | EAC[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | EAV[7:0] | H'00 | R/W | 32-Bit Extended Upper Address Fixed Value<br>Sets the upper address bit values of the external address specified by the EAC[2:0] bits when the serial flash address is output in 32-bit mode.<br>Bit 0 corresponds to the serial flash address bit [25], and bit 7 corresponds to the bit [32].<br>This setting is valid when the ADE[3] bit in DRENR is 1.<br>When EAC[2:0] are 000, serial flash address [32:25] fixed values should set to EAV[7:0].<br>When EAC[2:0] are 001, serial flash address [32:26] fixed values should set to EAV[7:1].<br>When EAC[2:0] are 010, serial flash address [32:27] fixed values should set to EAV[7:2].<br>When EAC[2:0] are 011, serial flash address [32:28] fixed values should set to EAV[7:3].<br>When BSZ[1:0] in CMNCR = 00 (one serial flash memory connected) Serial flash addresses [31:0] are used for accessing. |
| 15 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | EAC[2:0] | 000 | R/W | 32-Bit Extended External Address Valid Range<br>Sets the range of the external address to be used as serial flash address when the serial flash address is output in 32-bit mode.<br>This setting is valid when the ADE[3] bit in DRENR is 1.<br>000: External address bits [24:0] enabled<br>001: External address bits [25:0] enabled<br>010: External address bits [26:0] enabled<br>011: External address bits [27:0] enabled<br>Other than above: Setting prohibited |

### 25.4.6 Data Read Option Setting Register (DROPR)

DROPR is a 32-bit register that sets the option data in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | OPD3[7:0] | H'00 | R/W | Option Data 3<br>Sets the option data 3. |
| 23 to 16 | OPD2[7:0] | H'00 | R/W | Option Data 2<br>Sets the option data 2. |
| 15 to 8 | OPD1[7:0] | H'00 | R/W | Option Data 1<br>Sets the option data 1. |
| 7 to 0 | OPD0[7:0] | H'00 | R/W | Option Data 0<br>Sets the option data 0. |

**Note:** OPD3, OPD2, OPD1, and OPD0 are output in this order.

### 25.4.7 Data Read Enable Setting Register (DRENR)

DRENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and read data in external address space read mode and enables outputting them other than read data.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CDB[1:0] | | OCDB[1:0] | | — | — | ADB[1:0] | | — | — | OPDB[1:0] | | — | — | DRDB[1:0] | |
| Initial Value | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 19, 18 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 17, 16 | DRDB[1:0] | 10 | R/W | Data Read Bit Size<br>Sets the data read size in bit units.<br>00: 1 bit<br>10: 4 bits<br>Other than above: Setting prohibited |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | DME | 1 | R/W | Dummy Cycle Enable<br>Enables insertion of the dummy cycle before the read data.<br>*Note*: A setting is prohibited for a transfer starting with a dummy cycle.<br>0: Dummy cycle insertion disabled<br>1: Dummy cycle insertion enabled |
| 14 | CDE | 1 | R/W | Command Enable<br>Sets whether or not the command is to be output.<br>0: Command output disabled<br>1: Command output enabled |
| 13 | — | 0 | R | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 12 | OCDE | 1 | R/W | Optional Command Enable<br>Sets whether or not the optional command is to be output.<br>0: Optional command output disabled<br>1: Optional command output enabled |
| 11 to 8 | ADE[3:0] | 0100 | R/W | Address Enable<br>Sets the address to be output.<br>Be sure to use the following setting; otherwise, the operation is not guaranteed.<br>When a serial flash memory device is connected<br>0000: Output disabled<br>0111: Address[23:0]<br>1111: Address[31:0]<br>Other than above: Setting prohibited |
| 7 to 4 | OPDE[3:0] | 0000 | R/W | Option Data Enable<br>Sets the option data to be output.<br>Use only the settings given below. Otherwise, the operation cannot be guaranteed.<br>0000: Output disabled<br>1000: OPD3<br>1100: OPD3, OPD2<br>1110: OPD3, OPD2, OPD1<br>1111: OPD3, OPD2, OPD1, OPD0<br>Other than above: Setting prohibited |
| 3 to 0 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

## 25.4.8 Manual Mode Control Register (SMCR)

SMCR is a 32-bit register that sets the operation in Manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

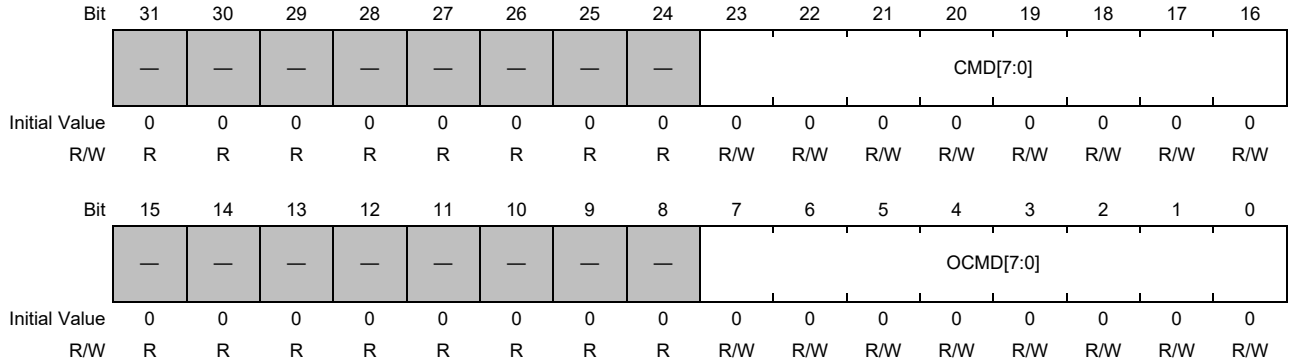
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | SSLKP | — | — | — | — | — | SPIRE | SPIWE | SPIE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R/W | R/W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 8 | SSLKP | 0 | R/W | QSPIn_SSL Signal Level<br>Determines the QSPIn_SSL status after the end of transfer.<br>0: QSPIn_SSL signal is negated at the end of transfer.<br>1: QSPIn_SSL signal level is maintained from the end of transfer to the start of next access.<br>*Note*: The setting to start data transfer for reading is prohibited while the setting of SSLKP is 1. |
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 2 | SPIRE | 0 | R/W | Data Read Enable<br>Enables reading in manual mode.<br>0: Data reading disabled<br>1: Data reading enabled<br>*Note*: When the transfer data bit size is set to 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time. |
| 1 | SPIWE | 0 | R/W | Data Write Enable<br>Enables writing in manual mode.<br>0: Data writing disabled<br>1: Data writing enabled<br>*Note*: When the transfer data bit size is set to 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time. |
| 0 | SPIE | 0 | W | SPI Data Transfer Enable<br>Data is transferred by setting this bit to 1.<br>This bit is enabled only when the TEND bit in CMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0.<br>This bit is always read as 0.<br>*Note*: When the QSPIn_SSL pin is de-asserted, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0. When the QSPIn_SSL pin is asserted, follow the notes described in **Section 25.6.3, Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode**. |

### 25.4.9 Manual Mode Command Setting Register (SMCMR)

SMCMR is a 32-bit register that sets the commands issued in Manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

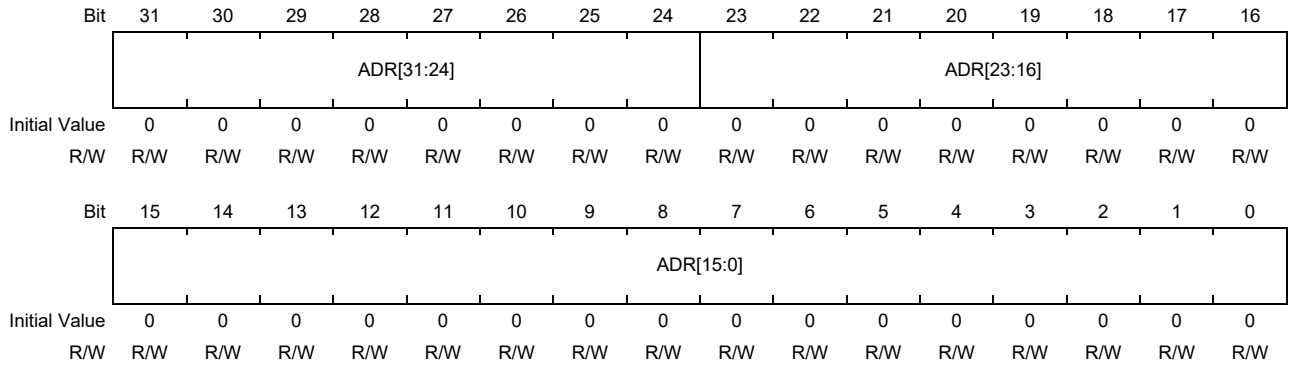


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | CMD[7:0] | H'00 | R/W | Command<br>Sets the command. |
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | OCMD[7:0] | H'00 | R/W | Optional Command<br>Sets the optional command. |

## 25.4.10 Manual Mode Address Setting Register (SMADR)

SMADR is a 32-bit register that sets the addresses in Manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | ADR[31:24] | H'00 | R/W | Address<br>Sets the value of bits 31 to 24 when the serial flash address is output in 32-bit units.<br>This setting is valid when ADE[3] in SMENR is 1. |
| 23 to 0 | ADR[23:0] | H'000000 | R/W | Address<br>Sets the address. |

### 25.4.11 Manual Mode Option Setting Register (SMOPR)

SMOPR is a 32-bit register that sets the option data in Manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OPD3[7:0] | | | | | | | | OPD2[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OPD1[7:0] | | | | | | | | OPD0[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | OPD3[7:0] | H'00 | R/W | Option Data 3<br>Sets the option data 3. |
| 23 to 16 | OPD2[7:0] | H'00 | R/W | Option Data 2<br>Sets the option data 2. |
| 15 to 8 | OPD1[7:0] | H'00 | R/W | Option Data 1<br>Sets the option data 1. |
| 7 to 0 | OPD0[7:0] | H'00 | R/W | Option Data 0<br>Sets the option data 0. |

**Note:** OPD3, OPD2, OPD1, and OPD0 are output in this order.

## 25.4.12 Manual Mode Enable Setting Register (SMENR)

SMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in Manual mode and enables their output. SMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CDB[1:0] | | OCDB[1:0] | | — | — | ADB[1:0] | | — | — | OPDB[1:0] | | — | — | SPIDB[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W |

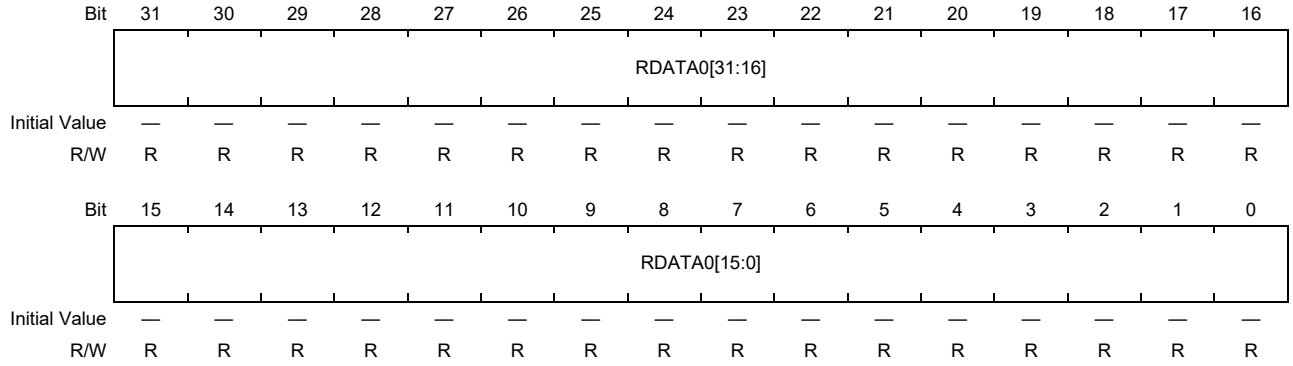
### 25.4.13 Manual Mode Read Data Register 0 (SMRDR0)

SMRDR0 is a 32-bit register that stores the read data in Manual mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the Manual mode enable setting register (SMENR). Be sure to access from LSB.

The settings of this register should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | RDATA0[31:0] | Undefined | R | Read Data<br>Holds the data read in Manual mode.<br>Data bits differ depending on the BSZ[1:0] bit setting in CMNCR. |

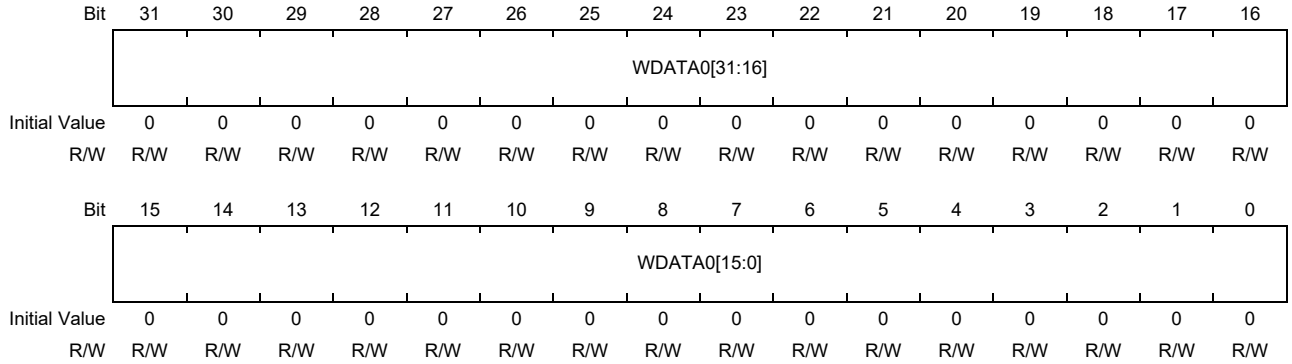
**Note:** The contents of this register is modified upon completion of reception in manual mode. Be sure to read data when reception in manual mode is completed.

### 25.4.14 Manual Mode Write Data Register 0 (SMWDR0)

SMWDR0 is a 32-bit register that sets the write data in Manual mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the Manual mode enable setting register (SMENR). Be sure to access from address 0.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | WDATA0 [31:0] | All 0 | R/W | Write Data<br>Holds the data to be written in Manual mode.<br>Data bits differ depending on the BSZ[1:0] bit setting in CMNCR. |

### 25.4.15 Common Status Register (CMNSR)

CMNSR is a 32-bit register that holds flags indicating the operating state.

The settings of this register are reflected both in external address space read mode and Manual mode.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SSLF | TEND |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 1 | SSLF | 0 | R | QSPIn_SSL Pin Monitor<br>0: QSPIn_SSL pin is negated<br>1: QSPIn_SSL pin is asserted |
| 0 | TEND | 1 | R | Transfer End Flag<br>Indicates whether the data transfer has ended.<br>0: Indicates that data transfer is in progress<br>1: Indicates that data transfer has ended |

## 25.4.16 Data Read Dummy Cycle Setting Register (DRDMCR)

DRDMCR is a 32-bit register that sets the number of dummy cycles to be inserted in external address space read mode. The settings of this register are enabled when the DME bit in the data read enable setting register (DRENR) is 1.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | DMCYC[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 4 to 0 | DMCYC[4:0] | H'0B | R/W | Number of Dummy Cycles<br>Sets the number of dummy cycles to be inserted when the DME bit in the data read enable setting register (DRENR) is 1.<br>00001: 2 cycles<br>00010: 3 cycles<br>…<br>10010: 19 cycles<br>10011: 20 cycles<br>Other than above: Setting prohibited |

## 25.4.17 Data Read DDR Enable Register (DRDRENR)

DRDRENR is a 32-bit register that sets SDR or DDR transfer of the address, option data, and read data in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | HYPE | | | — | — | — | ADDRE | — | — | — | OPDRE | — | — | — | DRDRE |

## 25.4.18 Manual Mode Dummy Cycle Setting Register (SMDMCR)

SMDMCR is a 32-bit register that sets the number of dummy cycles to be inserted in Manual mode.

The settings of this register are enabled when the DME bit in the Manual mode enable setting register (SMENR) is 1. The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | DMCYC[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 4 to 0 | DMCYC[4:0] | 00000 | R/W | Number of Dummy Cycles<br>Sets the number of dummy cycles to be inserted when the DME bit in the Manual mode enable setting register (SMENR) is 1.<br>00001: 2 cycles<br>00010: 3 cycles<br>....<br>10010: 19 cycles<br>10011: 20 cycles<br>Other than above: Setting prohibited |

## 25.4.19 Manual Mode DDR Enable Register (SMDRENR)

SMDRENR is a 32-bit register that sets SDR or DDR transfer of the address, option data, and transfer data in Manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | ADDRE | — | — | — | OPDRE | — | — | — | SPIDRE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 15 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 14 to 12 | — | 000 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 11 to 9 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |
| 8 | ADDRE | 0 | R/W | Address DDR Enable<br>Sets SDR or DDR transfer of the address.<br>0: SDR transfer<br>1: DDR transfer |
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are always read as 0. The write value should always be 0. |

| 0 | SPIDRE | 0 | R/W | Transfer Data DDR Enable<br>Sets SDR or DDR transfer of the transfer data.<br>0: SDR transfer<br>1: DDR transfer |

## 25.4.20 PHY Control Register (PHYCNT)

PHYCNT is a 32-bit register that sets the PHY operation mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 25.4.21 PHY Offset Register 1 (PHYOFFSET1)

PHYOFFSET1 is a 32-bit register that sets the timing adjustment in the DDR operation.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 25.4.24 PHY Adjustment Register 1 (PHYADJ1)

PHYADJ1 is a 32-bit register used to adjust the timing when serial flash memory is connected.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

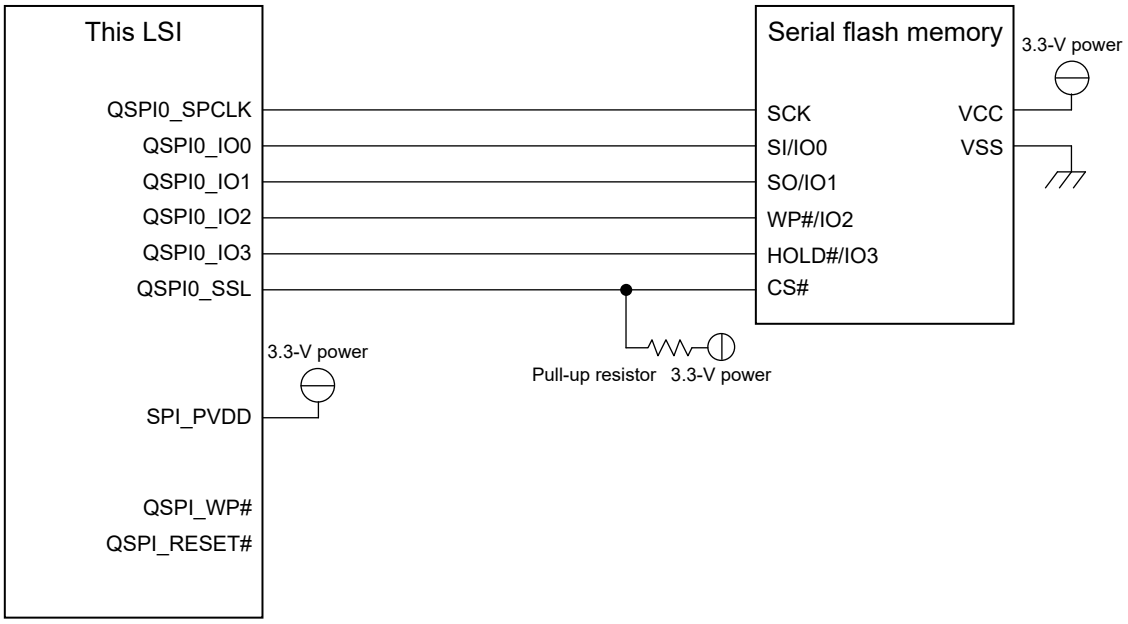
## 25.5 Operation

### 25.5.1 System Configuration

This module can connect one serial flash memory device.

Examples of system configuration are shown in **Figure 25.2**.



**Note:** When connecting this LSI to a single serial flash memory device, use the pins for channel 0. The pins for channel 1 cannot be used in this configuration.

Figure 25.2 System Configuration Example with 4-Bit Data Size and One Serial Flash Memory Connected

### 25.5.2 Address Map

In external address space read mode, the serial flash connected is assigned in the SPI multi I/O bus space. In combination with DREAR, a maximum of 4 Gbytes can be accessed when one serial flash memory is connected.

Table 25.3 Address Map

| Internal Address for Cortex-A55 | Max. Access Area |
|---|---|
| H'0_20000000 to H'0_2FFFFFFF | One serial flash memory connected: 4 G-byte |

| Internal Address for Cortex-M33 (Secure) | Max. Access Area |
|---|---|
| H'90000000 to H'9FFFFFFF | One serial flash memory connected: 4 G-byte |

| Internal Address for Cortex-M33 (Non-Secure) | Max. Access Area |
|---|---|
| H'80000000 to H'8FFFFFFF | One serial flash memory connected: 4 G-byte |

**Note:** When access protection is set, not only this address space, but also the register area is protected.

### 25.5.3 32-bit Serial Flash Addresses

Since the SPI multi I/O bus space is 256 Mbytes, only a part of the 32-bit serial flash address area can be directly accessed. Here, the fixed value set in the pertinent register is used as the upper bit value of a 32-bit address.

To output serial flash addresses in 32 bits, set the ADE[3] bit in DRENR to 1, set the range of the external addresses used as the serial flash addresses to the EAC[2:0] bits in DREAR, and set the upper bit value of the 32-bit address as the fixed value to the EAV[7:0] bits in DREAR.

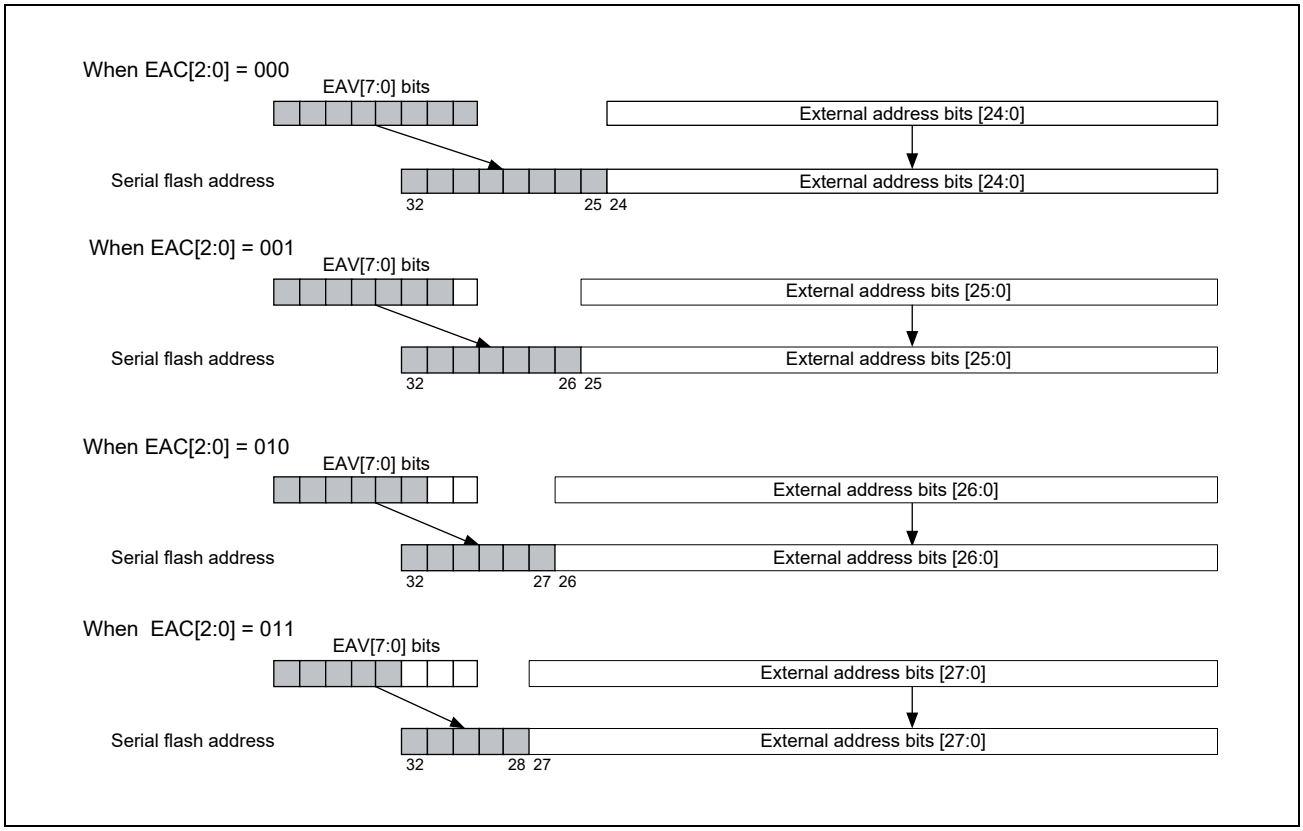


Figure 25.3 32-Bit Address Setting

Setting the ADE[3] bit in DRENR to 1 allows the serial flash address to be output using [31:0] bits.

When EAC[2:0] = 000, external address bits [24:0] are valid; set the value for [32:25] bits to EAV[7:0].
When EAC[2:0] = 001, external address bits [25:0] are valid; set the value for [32:26] bits to EAV[7:1].
When EAC[2:0] = 010, external address bits [26:0] are valid; set the value for [32:27] bits to EAV[7:2].
When EAC[2:0] = 011, external address bits [27:0] are valid; set the value for [32:28] bits to EAV[7:3].

The addresses actually used for external devices are as follows.

- Use the address [31: 0] when connecting one serial flash.

## 25.5.4 Operating Modes

This module has two operating modes: external address space read mode and Manual mode.

In external address space read mode, a read access to the SPI multi I/O bus space is converted into Data read protocol and data is received. After data acquisition, data is returned to the bus master that is the issuing source. For details, see **Section 25.5.5, External Address Space Read Mode**.

In Manual mode, arbitrary protocol is carried out using register settings. For details, see **Section 25.5.7, Manual mode**.

## 25.5.5 External Address Space Read Mode

A read access to the SPI multi I/O bus space can be converted into Data read protocol in external address space read mode. Further, the commands, optional commands, option data, and dummy cycle issued for reading can be modified using registers.

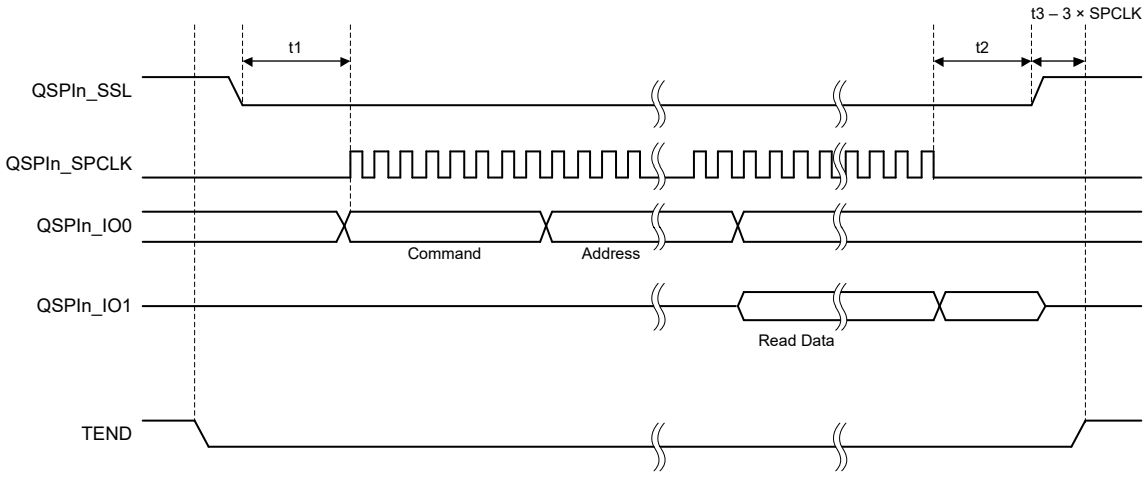
In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), data read control register (DRCR), data read command setting register (DRCMR), data read extended address setting register (DREAR), data read option setting register (DROPR), data read enable setting register (DRENR), data read dummy cycle setting register (DRDMCR), and data read DDR enable register (DRDRENR).

### (1) Normal Read Operation

When the RBE bit in the DRCR register is set to 0, normal read operation is performed. In the normal read operation, data is read from the external device when the bus master executes read access. After data is read, the QSPIn_SSL pins are negated.

The timing of normal read operation for the serial flash memory is shown in **Figure 25.4**.

t1 is the time period from QSPIn_SSL pin assertion to QSPIn_SPCLK oscillation (clock delay), t2 is the time period from transmission of the last QSPIn_CLK edge of a transfer to QSPIn_SSL pin negation (QSPIn_SSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access).



**Note:** t1, t2, and t3 are specified with SSLDR.SCKDL, SSLDR.SLNDL and SSLDR.SPNDL bits, respectively.

Figure 25.4 Normal Read Operation Timing

### (2) Burst Read Operation

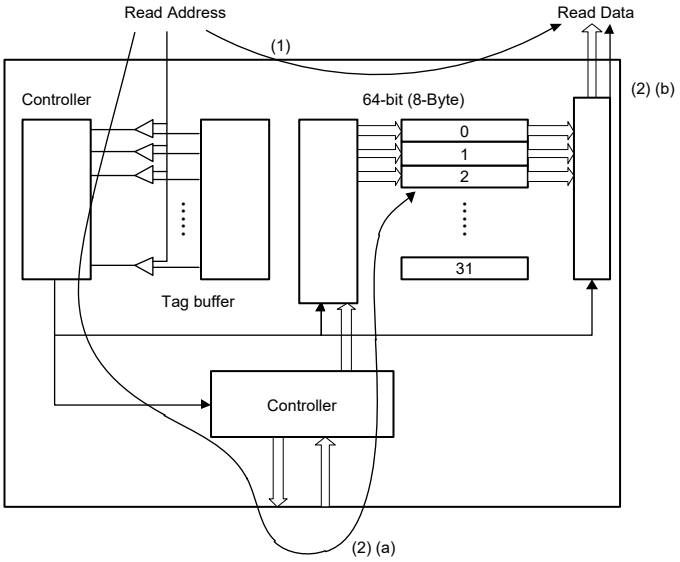
When the RBE bit in DRCR is set to 1, burst read operation is performed.

Read cache is enabled in the burst read operation. For read cache operation, see **Section 25.5.6, Read Cache**.

When the bus master executes read access, the read cache is first searched for the target data. When the read cache contains the data, it is read from the cache instead of accessing the external device. When the read cache does not contain the data, the external device is read in the burst mode and the read data is stored in the read cache and returned to the bus master. In this operation, the data transfer length is 64 bits × the value in the RBURST[4:0] bits, and data is always read from a 64-bit boundary address.

The QSPIn_SSL pin status after data transfer can be selected by using the SSLE bit in DRCR. When the SSLE bit is set to 0, the QSPIn_SSL pin is negated after data transfer. For an operation performed when the SSLE bit is set to 1, see **Section 25.5.5(3), Burst Read Operation with Automatic QSPIn_SSL Negation**, just below.

A pattern diagram of this operation and a burst read operation timing diagram when SSLE bit is set to 0 are shown in **Figure 25.5** and **Figure 25.6**.



(1) When the read cache contains the data
The data is read from the read cache without accessing external devices.

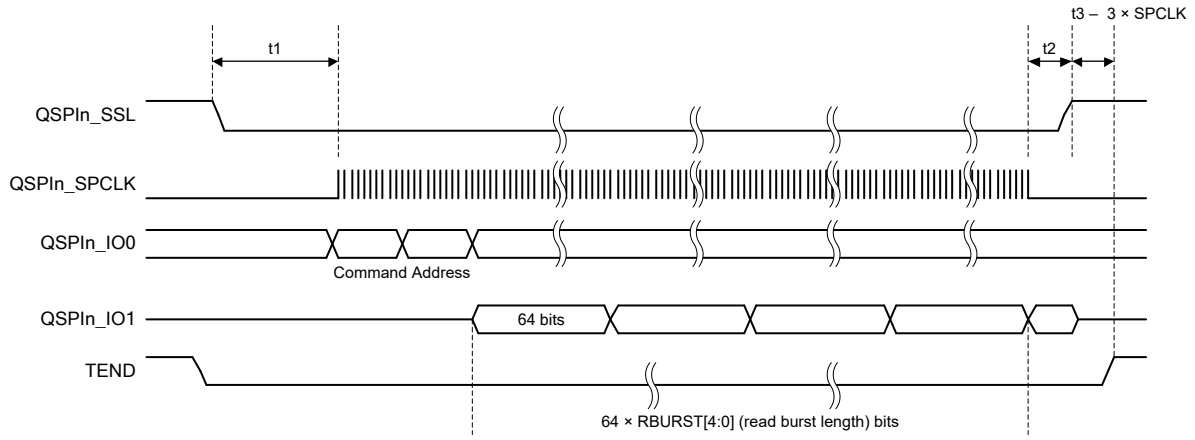
(2) When the read cache does not contain the data
(a) The data is read from the external device and stored in the read cache.
(b) The data is read from the read cache and returned to the bus master.

Figure 25.5 Burst Read Operation

NOTE

When connecting this LSI to a single serial flash memory device, use the pins for channel 0.

The pins for channel 1 cannot be used in this configuration.



**Note:** t1, t2, and t3 are specified with SSLDR.SCKDL, SSLDR.SLNDL and SSLDR.SPNDL bits, respectively.

Figure 25.6 Burst Read Operation Timing

### (3) Burst Read Operation with Automatic QSPIn_SSL Negation

When SSLE bit in DRCR is set to 1, this module does not negate the QSPIn_SSL pin after the burst read transfer. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the QSPIn_SSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.

Burst read timing diagrams for continuous address and non-continuous address are shown in **Figure 25.7** and **Figure 25.8**.

For the next access after negation of the QSPIn_SSL with the SSLN bit in DRCR with this operation, read SSLF = 0 in CMNSR to confirm that the QSPIn_SSL has been negated.

This function is available when serial flash memory is connected.

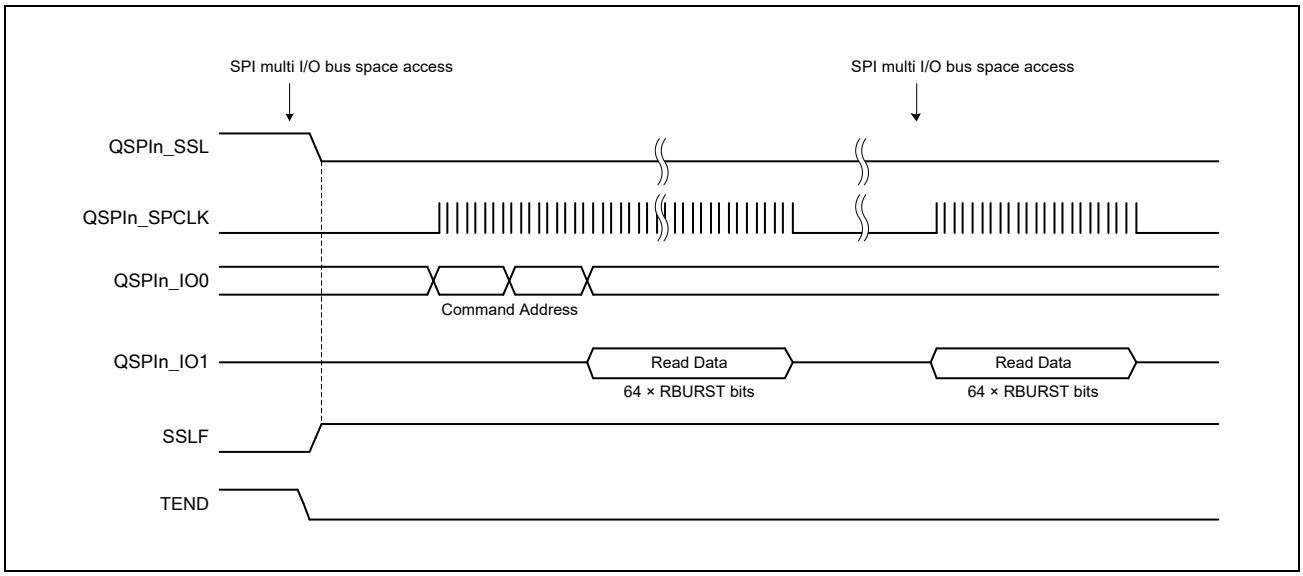


Figure 25.7 Burst Read Timing for Continuous Address (SSLE Bit = 1)

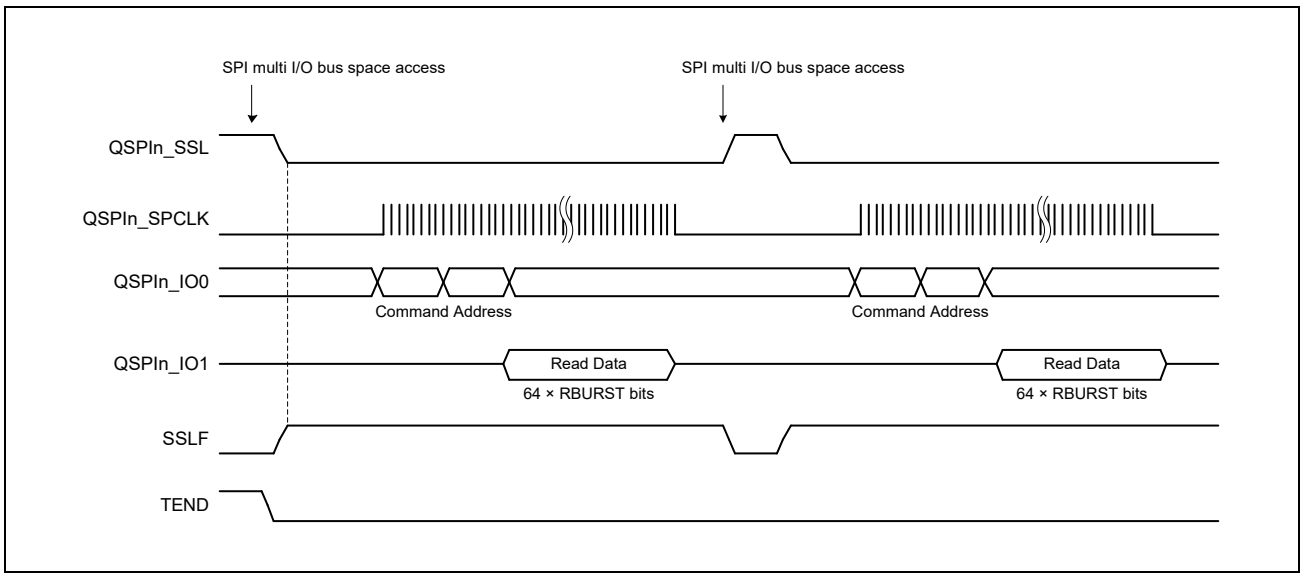

Figure 25.8 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)

### (4) Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in **Figure 25.9**.

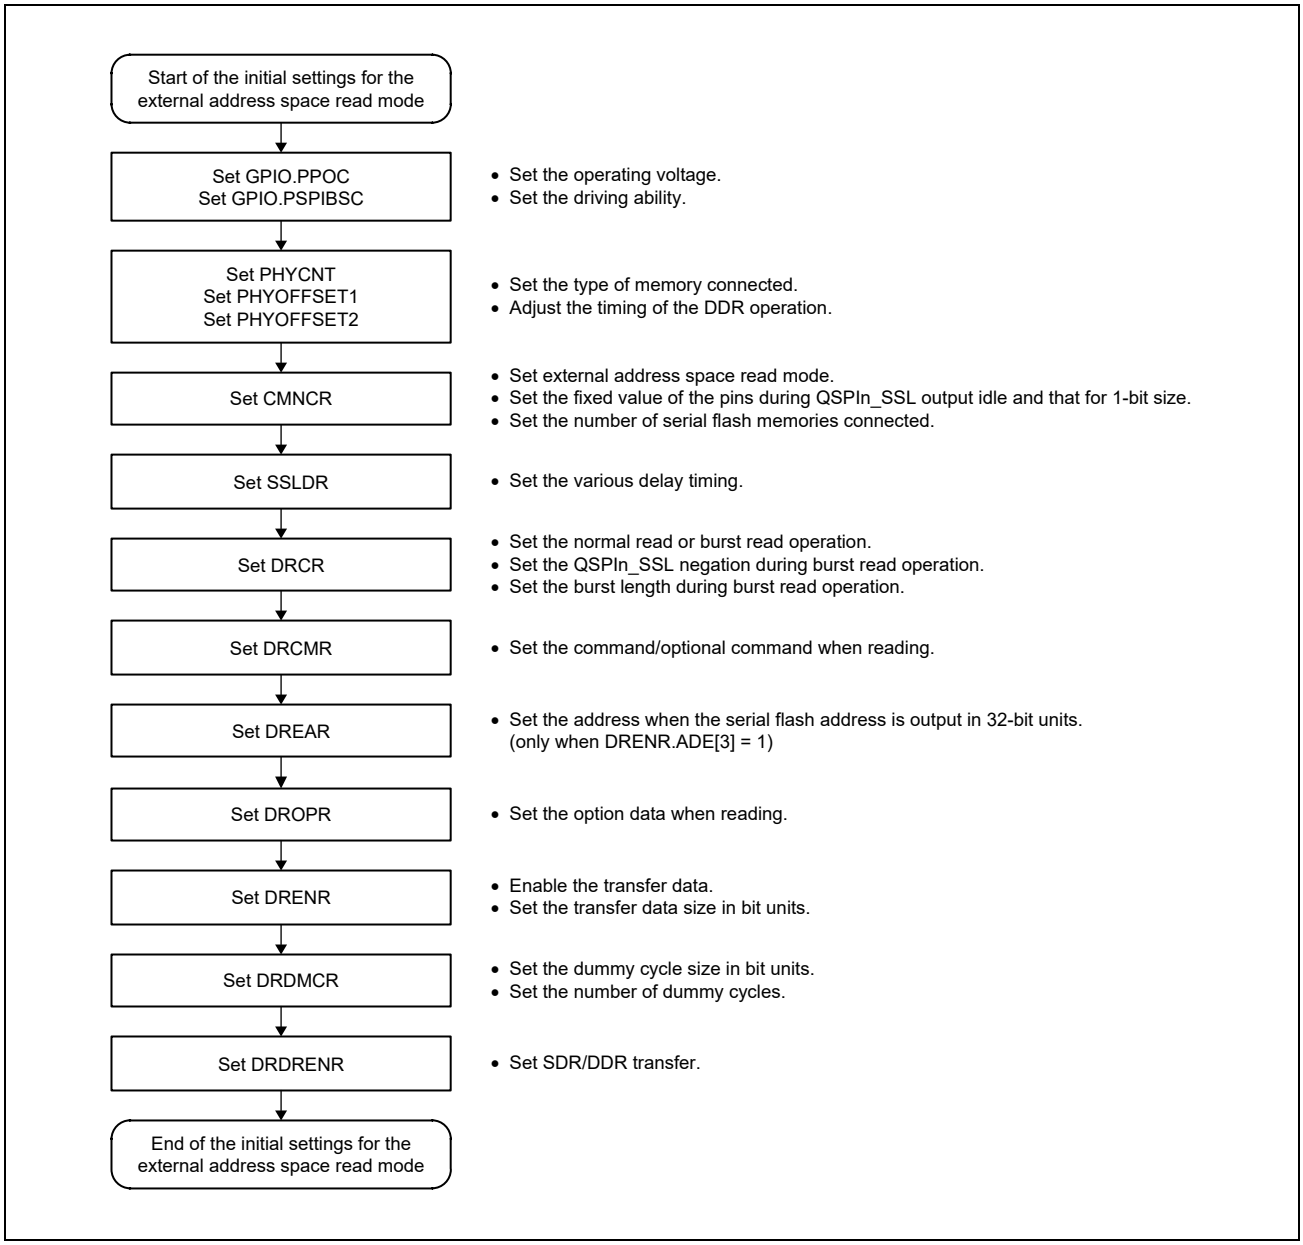

Figure 25.9 Example of Initial Setting Flow in External Address Space Read Mode

### 25.5.6 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 32 entries.

Read cache configuration is shown in **Figure 25.10**.

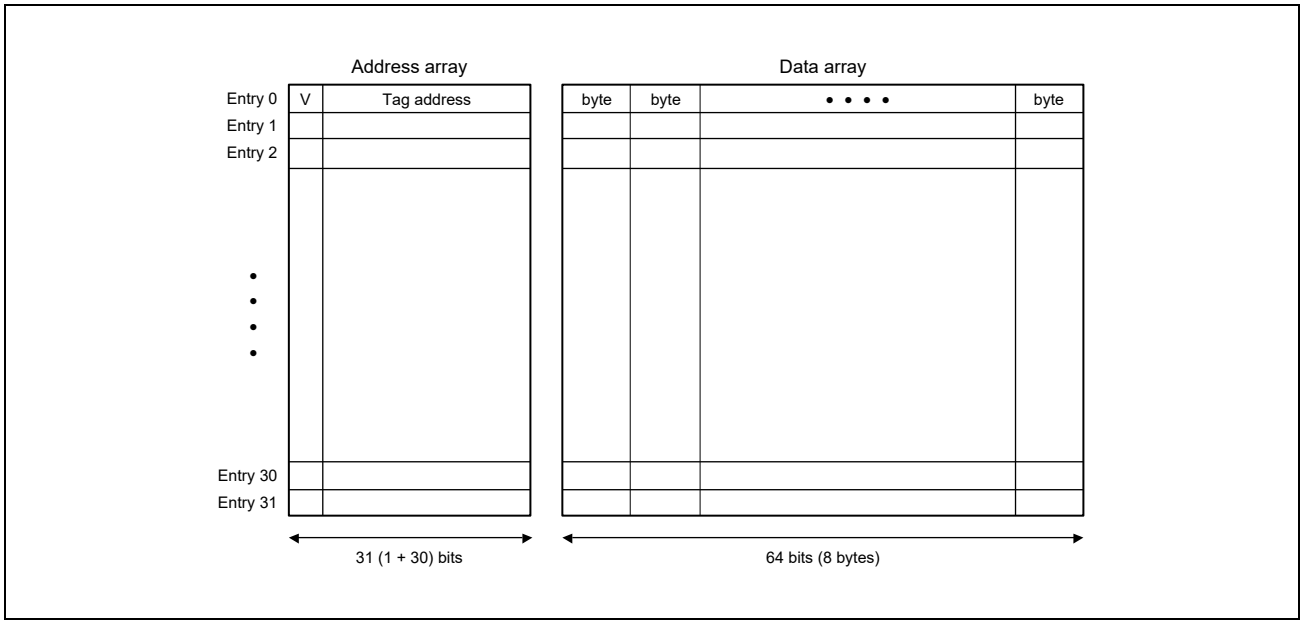

Figure 25.10 Read Cache Configuration

#### (1) Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.

The tag address bits hold the address used for the serial flash memory. Address bits 32 to 3 are used for the purpose. Address bits 23 to 3 are enabled when address output is 24 bits and one serial flash memory is connected; and address bits 24 to 3 are enabled when two serial flash memories are connected.

Address bits 31 to 3 are enabled when address output is 32 bits and one serial flash memory is connected; and address bits 32 to 3 are enabled when two serial flash memories are connected.

#### (2) Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

#### (3) Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 × RBURST (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

#### (4) Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

## 25.5.7 Manual mode

This module can carry out an arbitrary serial transmission operation by using the register settings.

The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), Manual mode control register (SMCR), Manual mode command setting register (SMCMR), Manual mode address setting register (SMADR), Manual mode option setting register (SMOPR), and Manual mode enable setting register (SMENR), Manual mode read data register (SMRDR), Manual mode write data register (SMWDR), Manual mode dummy cycle setting register (SMDMCR), and Manual mode DDR enable register (SMDRENR).

Manual mode can be used for reading the status of the serial flash memory and writing to the serial flash memory.

In this mode, one transfer refers to the operation from when the SPIE bit in SMCR is set to 1 to when the TEND bit is set to 1.

### (1) Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SMCR to 1. When write operation is enabled, the Manual mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the Manual mode read data register.

The Manual operation timing is shown in **Figure 25.11**.

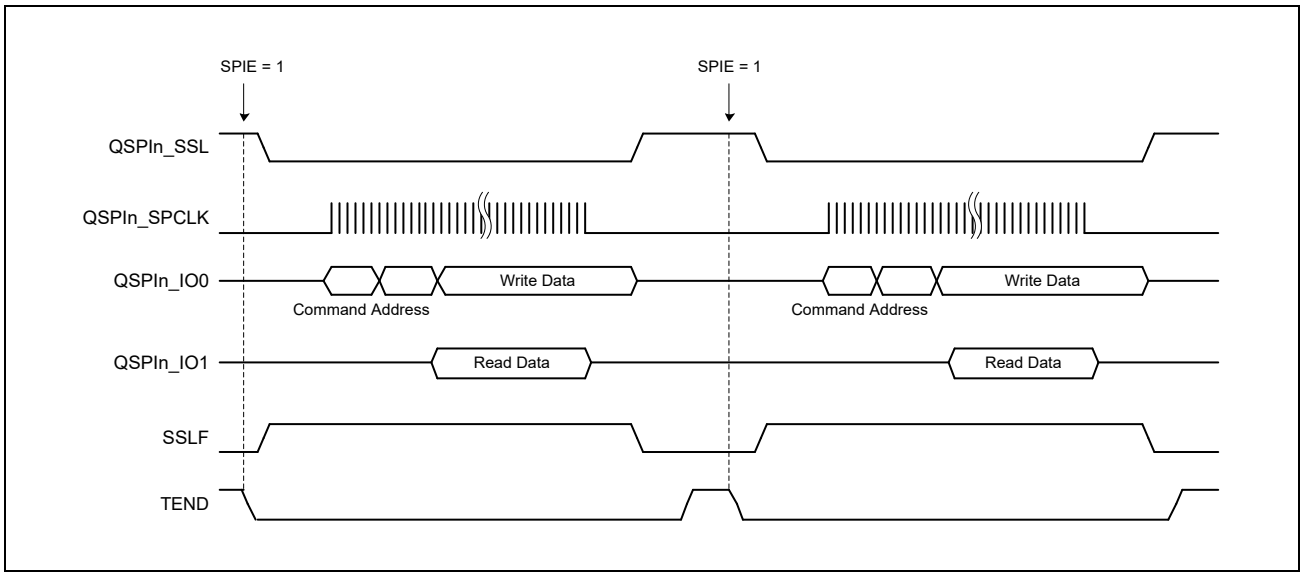

Figure 25.11 Serial transmission operation timing

### (2) Read/Write Enable

- Read operation: Data can be read by setting the SPIRE bit in SMCR to 1. The read data is stored into SMRDR.
- Write operation: Data can be written by setting the SPIWE bit in SMCR to 1. The data stored in SMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if the both bits are enabled.

### (3) Retention of QSPIn_SSL Pin Assertion

By setting the SSLKP bit in SMCR to 1, assertion of the QSPIn_SSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the QSPIn_SSL kept in the asserted state.

The data transfer timing using the SSLKP bit is shown in **Figure 25.12**.

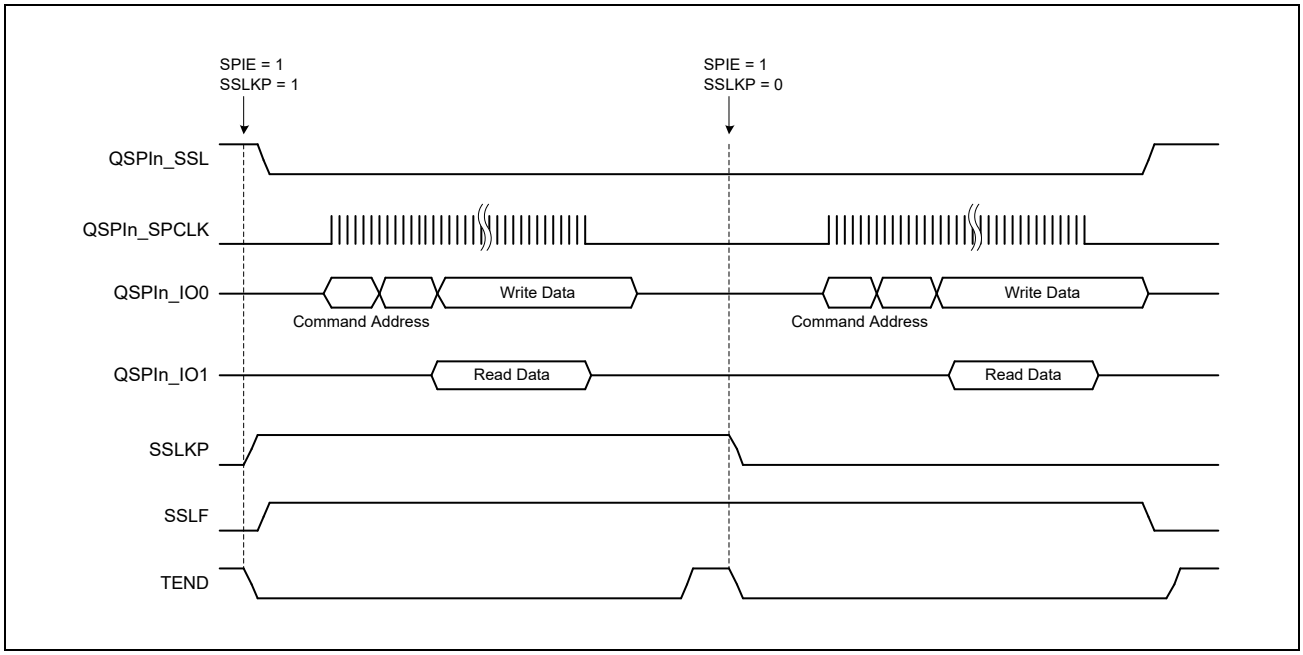

Figure 25.12 Data Transfer Timing using the SSLKP Bit

### (4) Initial Setting Flow

An example of an initial setting flow in Manual mode is shown in **Figure 25.13**.

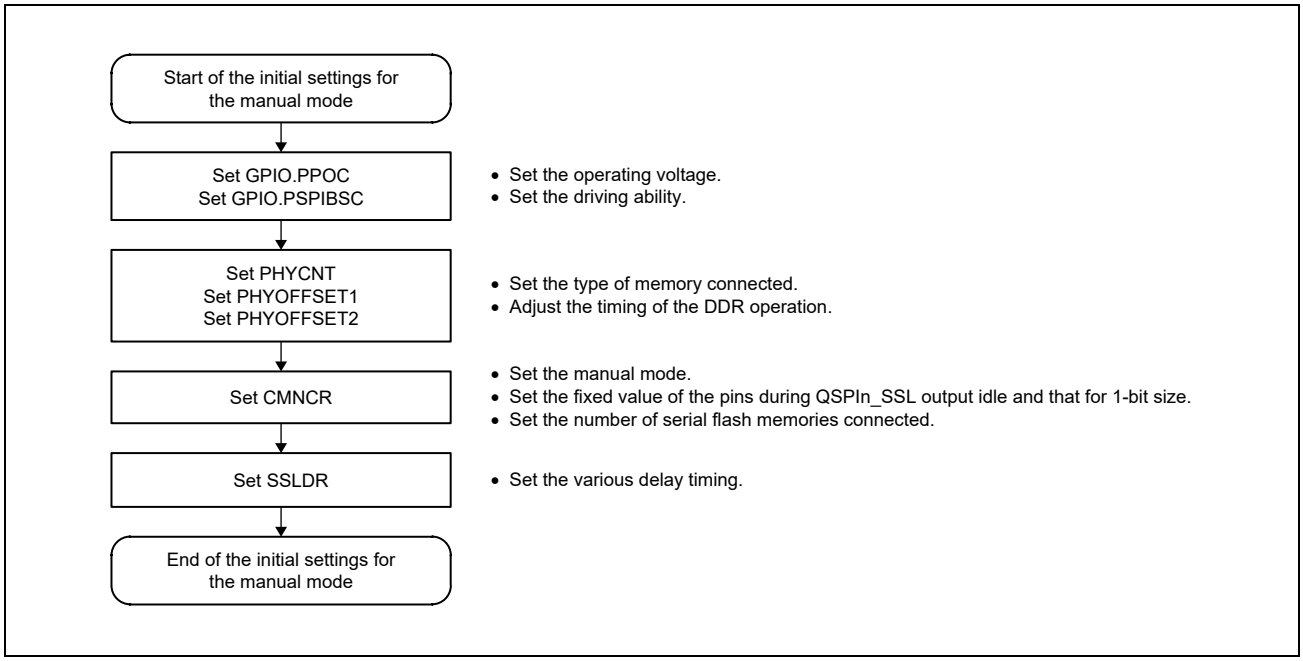

Figure 25.13 Example of Initial Setting Flow in Manual mode

### (5) Data Transfer Setting Flow

An example of a data transfer setting flow in manual mode is shown in **Figure 25.14**.

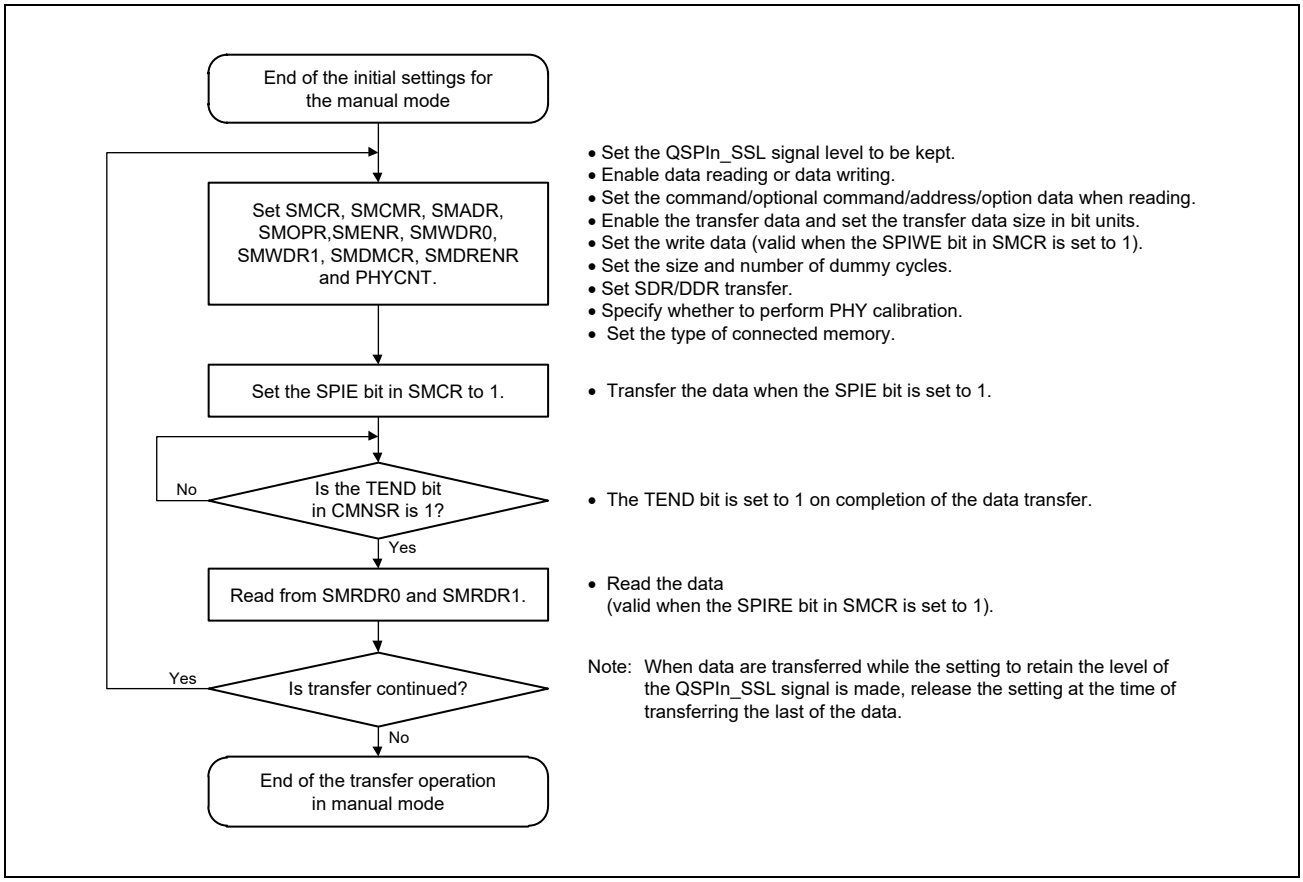

Figure 25.14 Example of a Data Transfer Setting Flow in Manual Mode

## 25.5.8 Command Sequence

This module can input and output data in the order of command, optional command, address, option data, dummy cycle, and data.

### (1) Data Registers

**Table 25.4** shows the input and output data.

Table 25.4 Data Registers

| Data | | External Address Space Read Mode | Manual Mode |
|---|---|---|---|
| Command (8 bits) | | CMD[7:0] bits in DRCMR | CMD[7:0] bits in SMCMR |
| Optional command (8 bits) | | OCMD[7:0] bits in DRCMR | OCMD[7:0] bits in SMCMR |
| Address (32/24 bits) | BSZ[1:0] = 00 (one flash memory connected) | 32 bits: DREAR.EAV[6:3 to 0] bits + lower [27 to 24:0] bits of the read address.<br>24 bits: Lower [23:0] bits of the read address. | 32 bits: ADR[31:0] bits in SMADR<br>24 bits: ADR[23:0] bits in SMADR |
| Option data (8 bits × 4) | | DROPR | SMOPR |
| Dummy cycle (2 to 20 cycles) | | DRDMCR | SMDMCR (only when read) |
| Transfer data | | Normal read: 8, 16, and 32 bits<br>Burst read: 64 × RBURST bits | Read: SMRDR0, SMRDR1<br>Write: SMWDR0, SMWDR1 |

### (2) Data Enable

In external address space read mode, enabling or disabling transfer of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in DRENR, respectively. The number of dummy cycles can be controlled with the data read dummy cycle setting register (DRDMCR).

Similarly, in manual mode, enabling or disabling the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SMENR, respectively. However, disabling all the above parameters is prohibited in manual mode. At least one of them except dummy cycle must be enabled. The number of dummy cycles can be controlled with the Manual mode dummy cycle setting register (SMDMCR).

For the address and option data in external address space read mode and the address, option data, and transfer data in manual mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent register.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in manual mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SMCR.

There are some restrictions on dummy cycle insertion; refer to the description of the DME bits in DRENR and SMENR for details.

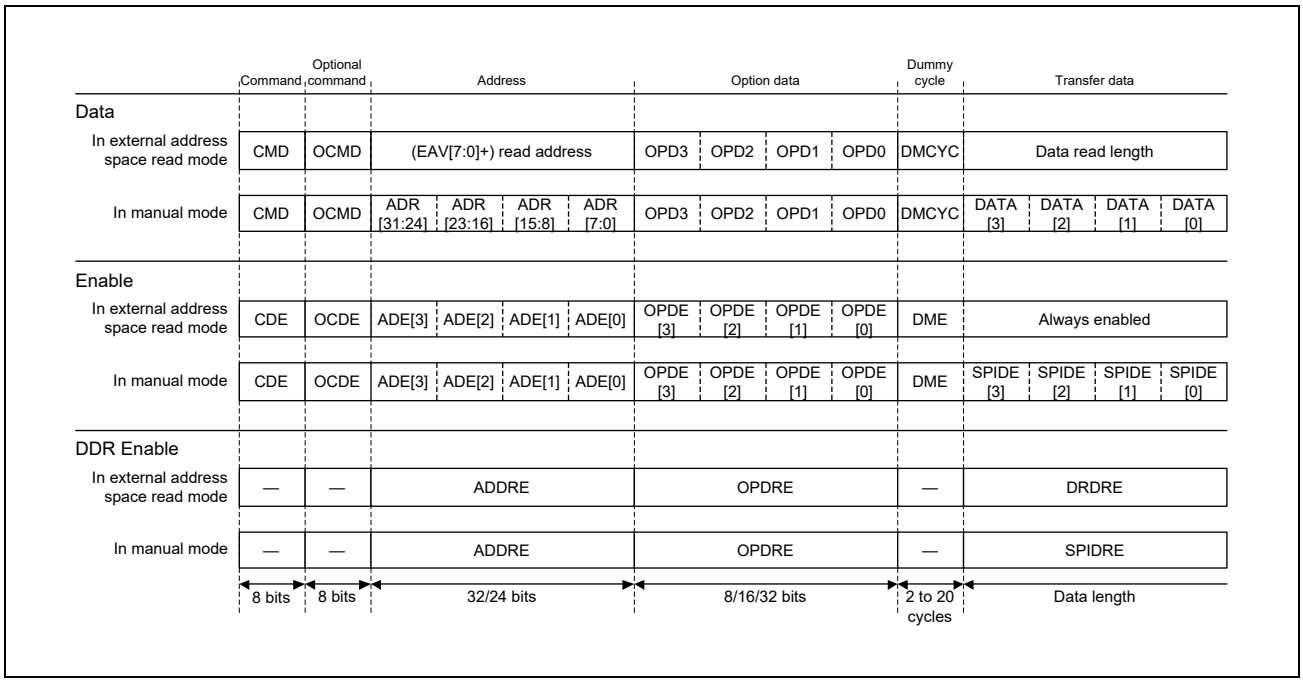

Figure 25.15 Data and Enable (Serial Flash)

### (3) Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in DRENR.

Similarly, in manual mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SMENR.

#### (a) 1-bit Size

When the size is set to 1 bit, QSPI0_IO1 pin will be the input pin and QSPI0_IO0 pin will be the output pin. QSPI0_IO2 and QSPI0_IO3 pins are not used.

**Figure 25.16** show the transfer format examples.

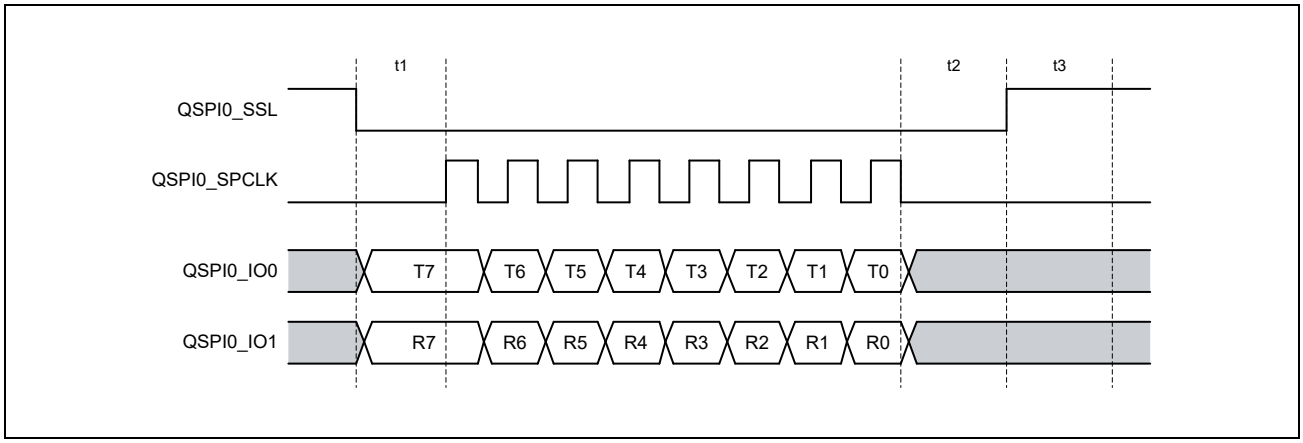

Figure 25.16 Transfer Format Example with 1-Bit Data Size and One Serial Flash Memory Connected

### (b) 4-bit Size (Serial Flash)

When the size is set to 4 bits, QSPI0_IO0, QSPI0_IO1, QSPI0_IO2, and QSPI0_IO3 pins will be either the input pins or the output pins.

**Figure 25.17** show the transfer format examples.

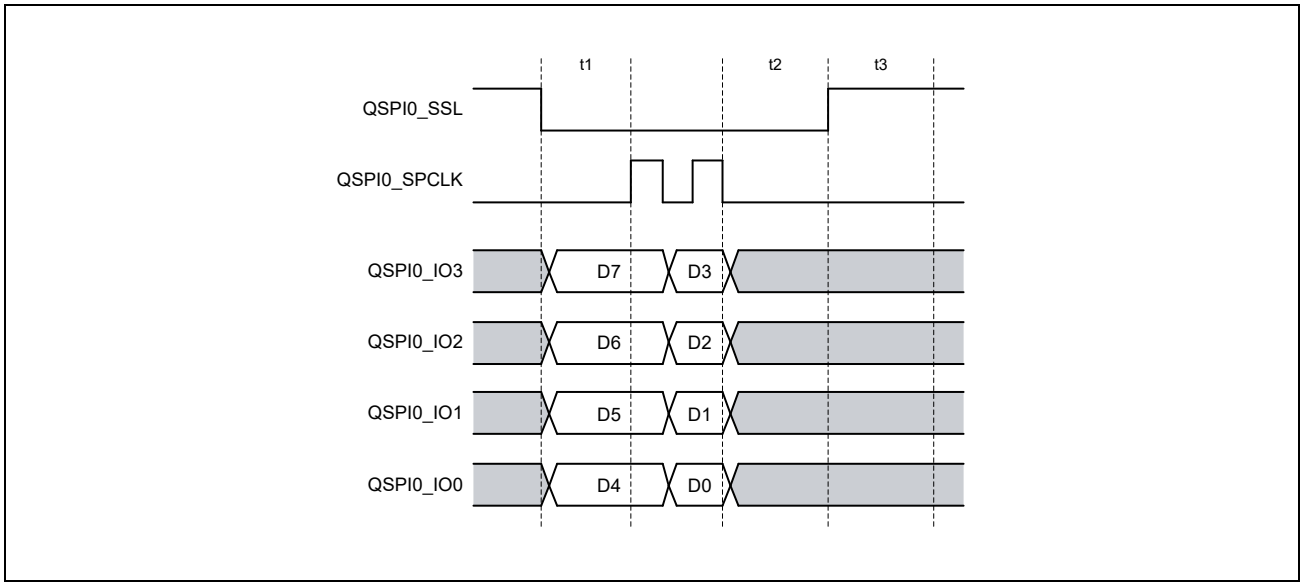

Figure 25.17 Transfer Format Example with 4-Bit Data Size and One Serial Flash Memory Connected

### 25.5.9 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the QSPIn_SSL negation can be set with the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits in CMNCR. The QSPIn_SSL and QSPIn_SPCLK pins are always output pins.

The status of respective pins is specified in **Table 25.5** to **Table 25.8**.

Table 25.5 Pin Status (1)

| Pin | QSPIn_SSL Negation | QSPIn_SSL Assertion | |
|---|---|---|---|
| | | Command, Optional Command, Address, Option Data | |
| | | 1-bit Size | 4-bit Size |
| QSPI0_IO0 | MOIIO0 bit value | Output | Output |
| QSPI0_IO1 | MOIIO1 bit value | Hi-Z | Output |
| QSPI0_IO2 | MOIIO2 bit value | IO2FV bit value | Output |
| QSPI0_IO3 | MOIIO3 bit value | IO3FV bit value | Output |

Table 25.6 Pin Status (2)

| Pin | Transfer Data | | | |
|---|---|---|---|---|
| | External Address Space Read Mode | | SPI Operation | |
| | | | SPIRE Bit = 1, SPIWE Bit = 0 | |
| | 1-bit Size | 4-bit Size | 1-bit Size | 4-bit Size |
| QSPI0_IO0 | IO0FV bit value | Input | IO0FV bit value | Input |
| QSPI0_IO1 | Input | Input | Input | Input |
| QSPI0_IO2 | Hi-Z | Input | Hi-Z | Input |
| QSPI0_IO3 | Hi-Z | Input | Hi-Z | Input |

Table 25.7 Pin Status (3)

| Pin | Transfer Data | | | |
|---|---|---|---|---|
| | SPI Operation | | | |
| | SPIRE Bit = 0, SPIWE Bit = 1 | | SPIRE Bit = 1, SPIWE Bit = 1 | |
| | 1-bit Size | 4-bit Size | 1-bit Size | 4-bit Size |
| QSPI0_IO0 | Output | Output | Output | Setting prohibited |
| QSPI0_IO1 | Hi-Z | Output | Input | Setting prohibited |
| QSPI0_IO2 | IO2FV bit value | Output | IO2FV bit value | Setting prohibited |
| QSPI0_IO3 | IO3FV bit value | Output | IO3FV bit value | Setting prohibited |

Table 25.8 Pin Status (4)

| Pin | Dummy Cycle |
|---|---|
| QSPI0_IO0 | IO0FV bit value |
| QSPI0_IO1 | Hi-Z |
| QSPI0_IO2 | Hi-Z |
| QSPI0_IO3 | Hi-Z |

### 25.5.10 QSPIn_SSL Pin Control

Negation conditions of the QSPIn_SSL pin are as follows.

#### (1) External Address Space Read Mode

##### (a) Normal read operation (RBE bit in DRCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

##### (b) Burst read without automatic QSPIn_SSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

##### (c) Burst read with automatic QSPIn_SSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 1)

- QSPIn_SSL negated after t2 cycle when the read address is not continuous with the previously read address
- QSPIn_SSL negated after the SSLN bit in DRCR is set to 1

#### (2) Manual Mode

##### (a) QSPIn_SSL pin assertion not retained (SSLKP bit in SMCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

##### (b) QSPIn_SSL pin assertion retained (SSLKP bit in SMCR = 1)

QSPIn_SSL not negated.

When to be negated, data should be transferred after setting the SSLKP bit to 0.

### 25.5.11 Flags

This module has two flag bits SSLF and TEND in CMNSR. These bits are read-only bits.

#### (1) SSLF Bit

This bit indicates the QSPIn_SSL pin status. The status is 1 when the QSPIn_SSL is asserted, and the status is 0 when the QSPIn_SSL is negated.

#### (2) TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.

During t1 time period, data transfer, t2 time period, t3 time period, and waiting for read access by burst read and QSPIn_SSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.

Otherwise, the TEND bit is read as 1 to indicate that transfer of data has ended.

#### (3) Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.

The registers which can be written to, except the SSLN bit in DRCR, should be modified when TEND = 1. Read SMRDR0 and SMRDR1 when TEND = 1. CMNSR can always be read.

### 25.5.12 Write Buffer Operation

This module uses the read cache space also as the write buffer space during write operation. The write buffer improves the performance of write access.

Table 25.9 Write Buffer Space

| Address for Cortex-A55 | Access Size |
|---|---|
| H'0_1007 0000 ~ H'0_1007 00FF | 4, 8, 16, 32, or 64 bytes |

| Address for Cortex-M33 (Secure) | Access Size |
|---|---|
| H'5007 0000 ~ H'5007 00FF | 4, 8, 16, 32, or 64 bytes |

| Address for Cortex-M33 (Non-Secure) | Access Size |
|---|---|
| H'4007 0000 ~ H'4007 00FF | 4, 8, 16, 32, or 64 bytes |

**Note:** Be sure to sequentially access this space beginning from its start address with the transfer size set to eight bytes.
If access is non-sequential or random, correct operation is not guaranteed.
After an operation in Manual mode or with the use of the cache area as the write buffer, clearing of this cache area by writing 1 to the RCF bit is required.

**Figure 25.18** shows the procedure for using the write buffer. For the initial settings in Manual mode, see **Figure 25.13**.

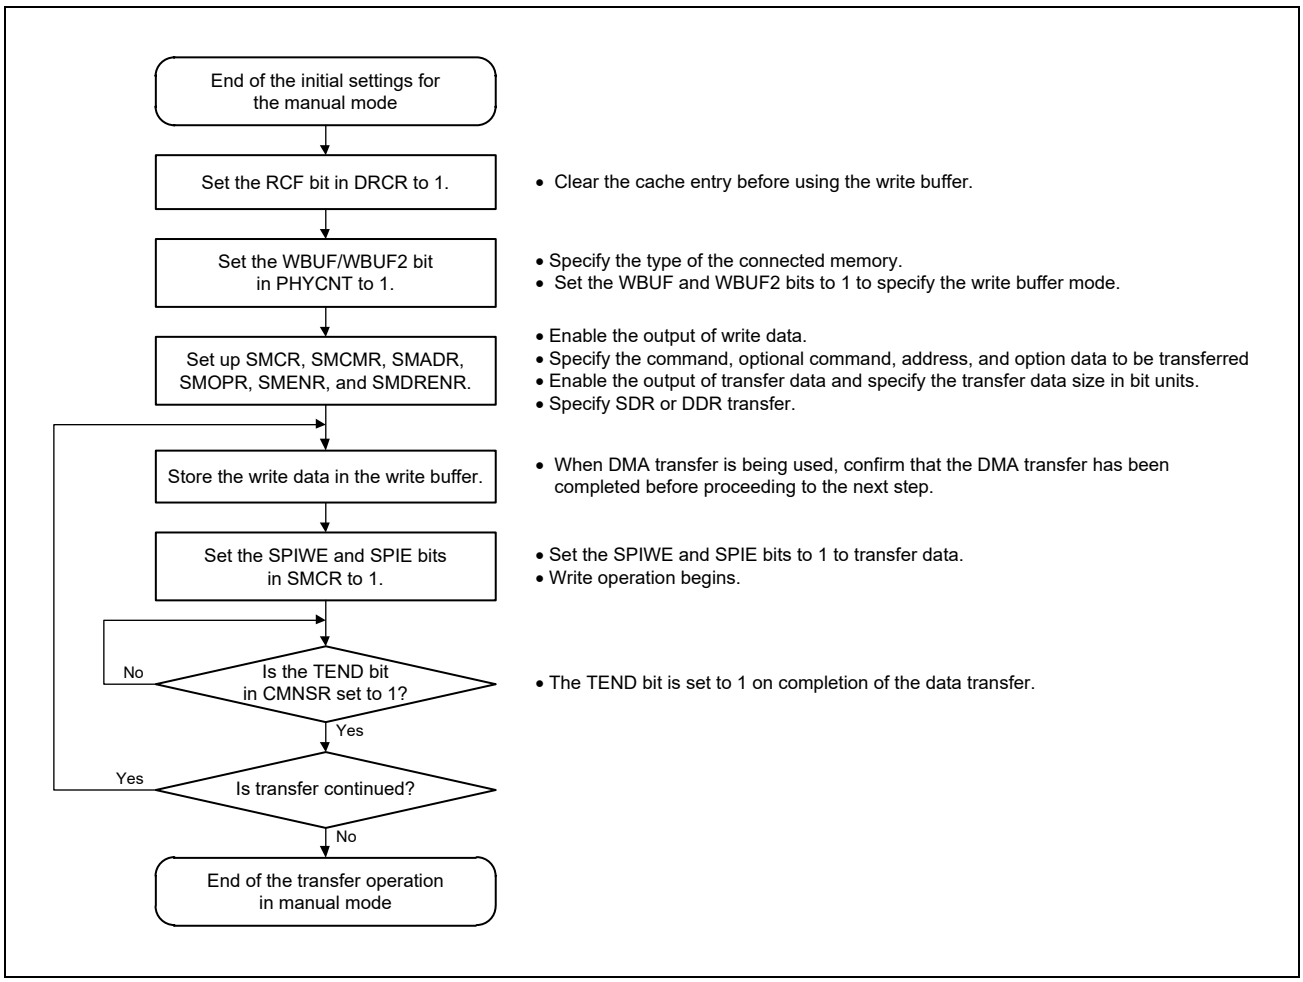

Figure 25.18 Procedure for Using the Write Buffer

### 25.5.13 Supported Protocol for Serial Flash Memory

The protocol for serial flash memory that this LSI supports is indicated in **Table 25.10**.

Table 25.10 Supported Protocol for Serial Flash Memory

| Bit Width (Command-Address-Data) | Command | Address | Data |
|---|---|---|---|
| 1-0-0 | SDR | NA | NA |
| 1-0-1 | SDR | NA | SDR |
| 1-1-1 | SDR | SDR | SDR |
| | SDR | DDR | DDR |
| 1-1-4 | SDR | SDR | SDR |
| 1-4-4 | SDR | SDR | SDR |
| | SDR | DDR | DDR |

### 25.5.14 Timing Adjustment

When data is transferred with serial flash memory connected, adjustment of the timing between the clock operation and the acquisition of input data is required.

**Figure 25.19** shows the timing adjustment flow for serial flash (SDR mode) connection.

Execute this flow before changing the setting of SCLKSEL.SPICR[1:0] from its initial value when the serial flash memory is connected (SDR mode). Execution of this flow at regular intervals is not required.

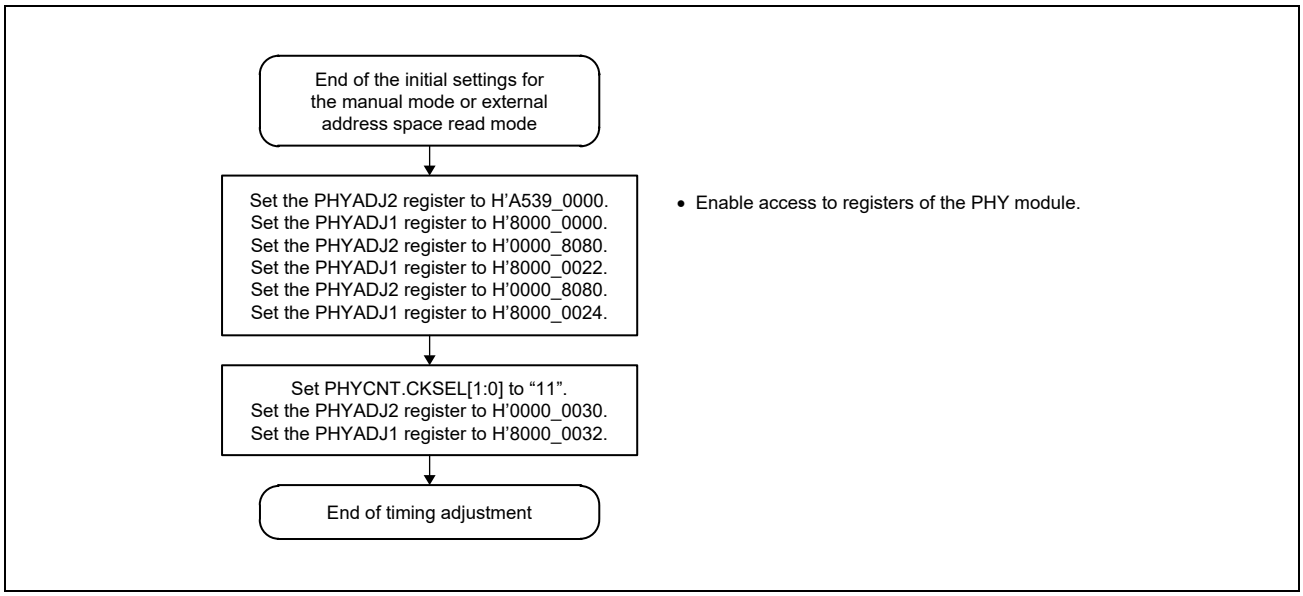

Figure 25.19 Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode)

**Figure 25.20** shows the timing adjustment flow for serial flash (DDR mode) connection.

Since the set value acquired in this timing adjustment flow is affected by voltage and temperature variation, this flow should be performed periodically.

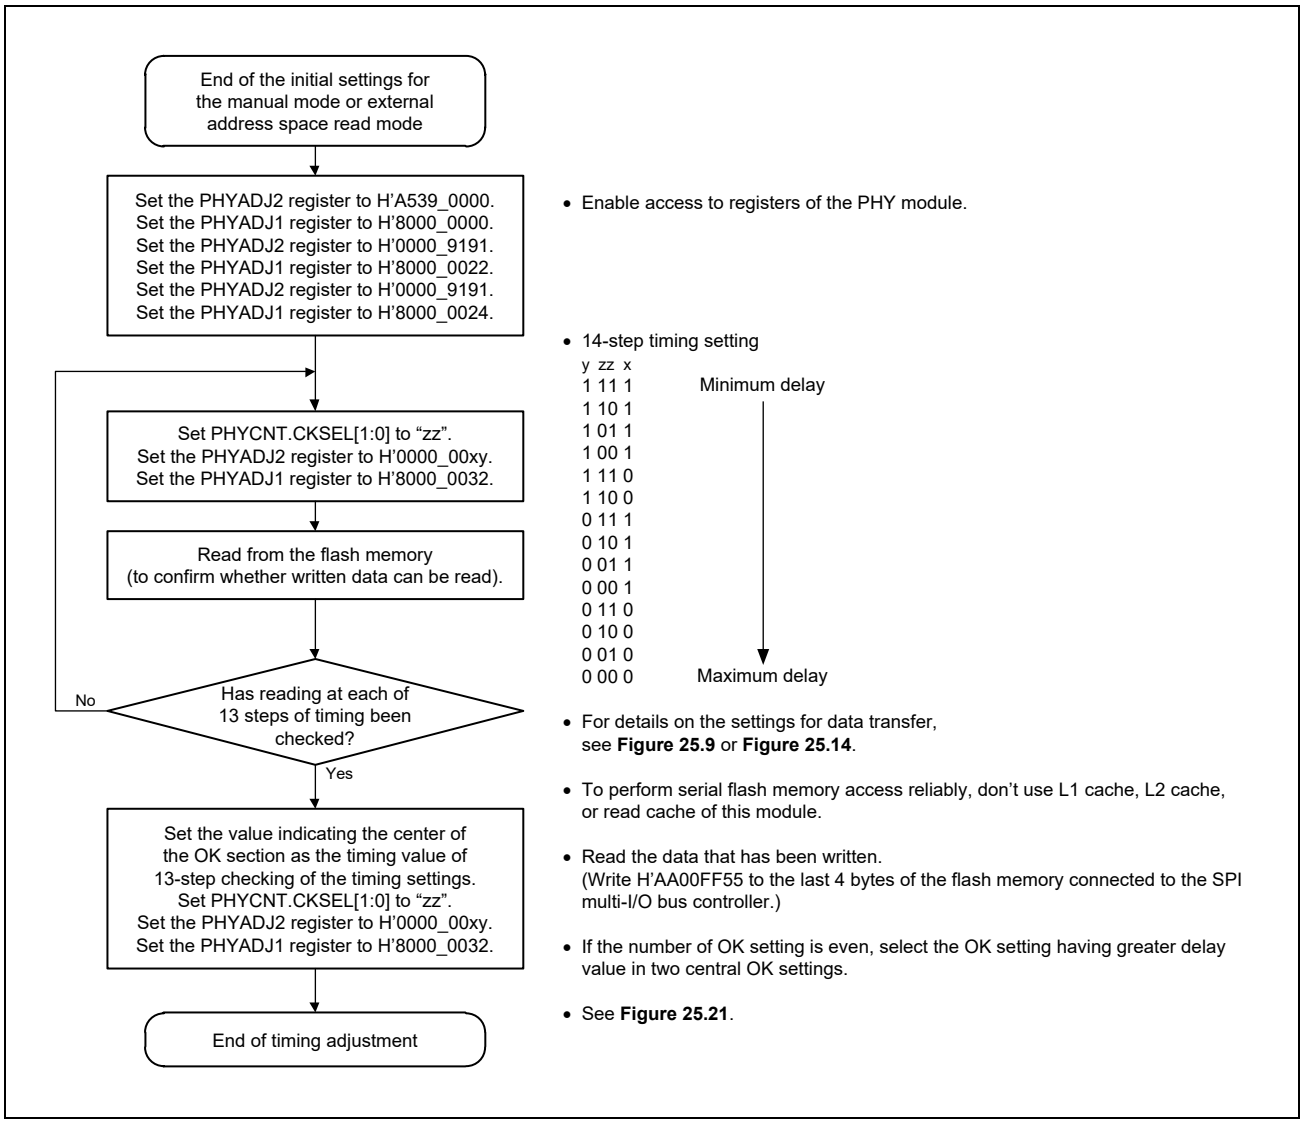

Figure 25.20 Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode)

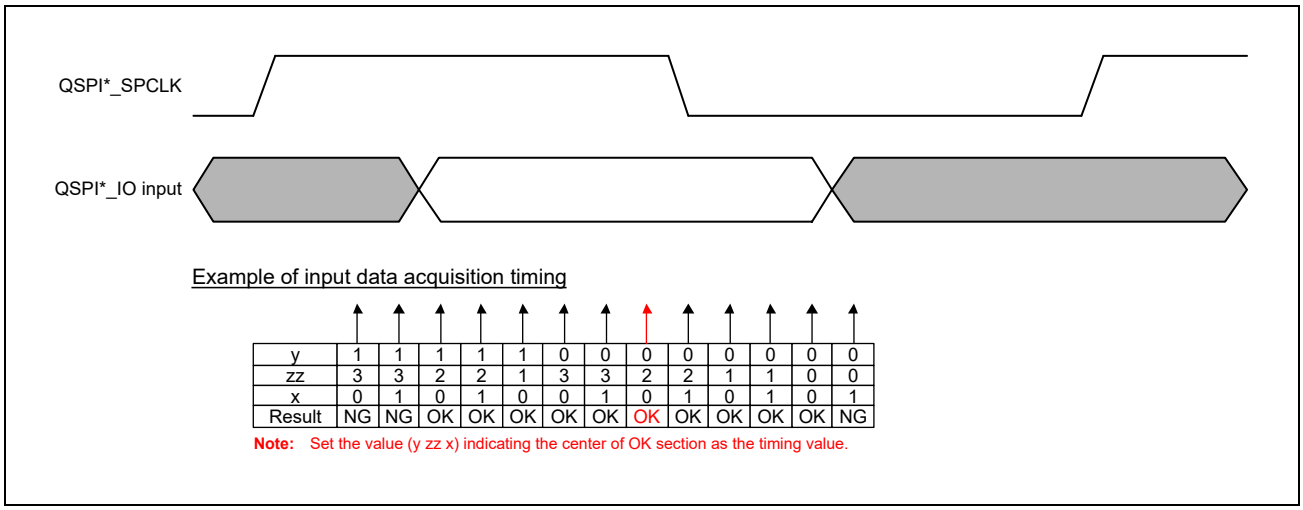
**Figure 25.21** shows an example of timing setting for serial flash (DDR mode) connection.



| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| y | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| zz | 3 | 3 | 2 | 2 | 1 | 3 | 3 | 2 | 2 | 1 | 1 | 0 | 0 |
| x | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| Result | NG | NG | OK | OK | OK | OK | OK | OK | OK | OK | OK | OK | NG |

**Note:** Set the value (y zz x) indicating the center of OK section as the timing value.

Figure 25.21 Example of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode)

## 25.5.15 Data Alignment

Data alignments in external address space read mode and Manual mode are shown in **Figure 25.22** and **Figure 25.23**, respectively.

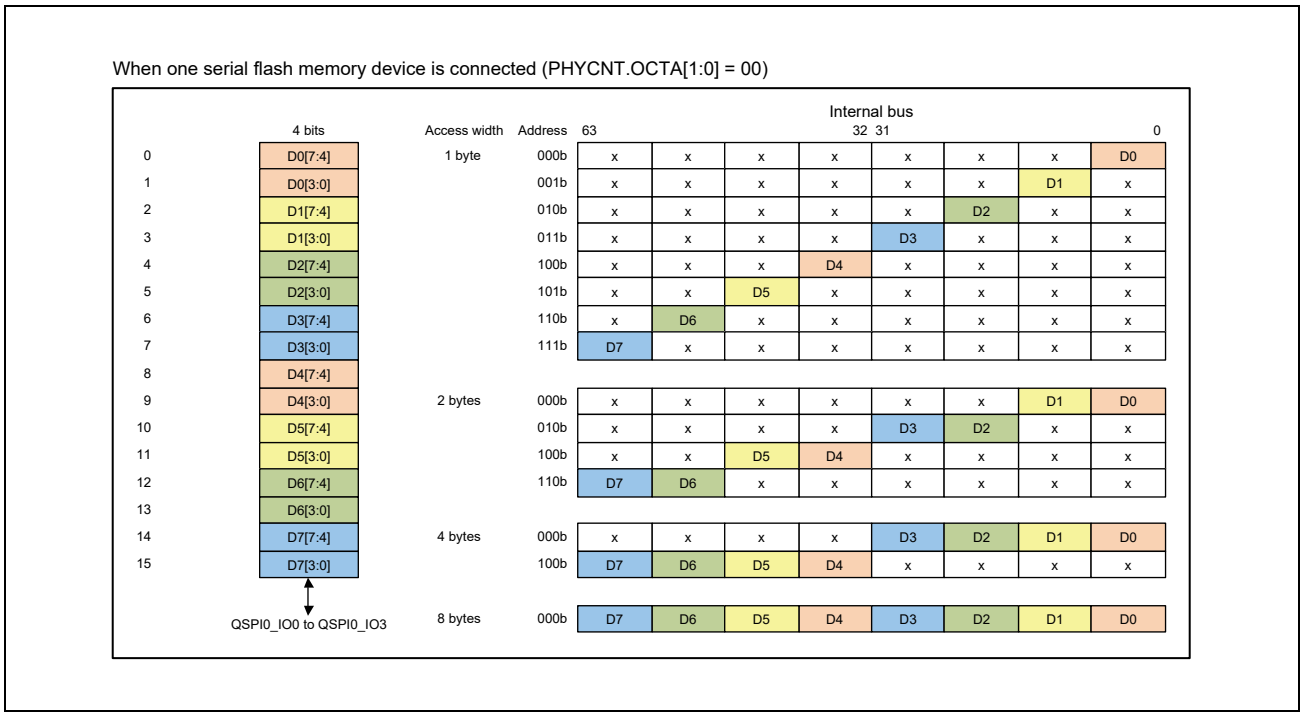


Figure 25.22 Data Alignment in External Address Space Read Mode

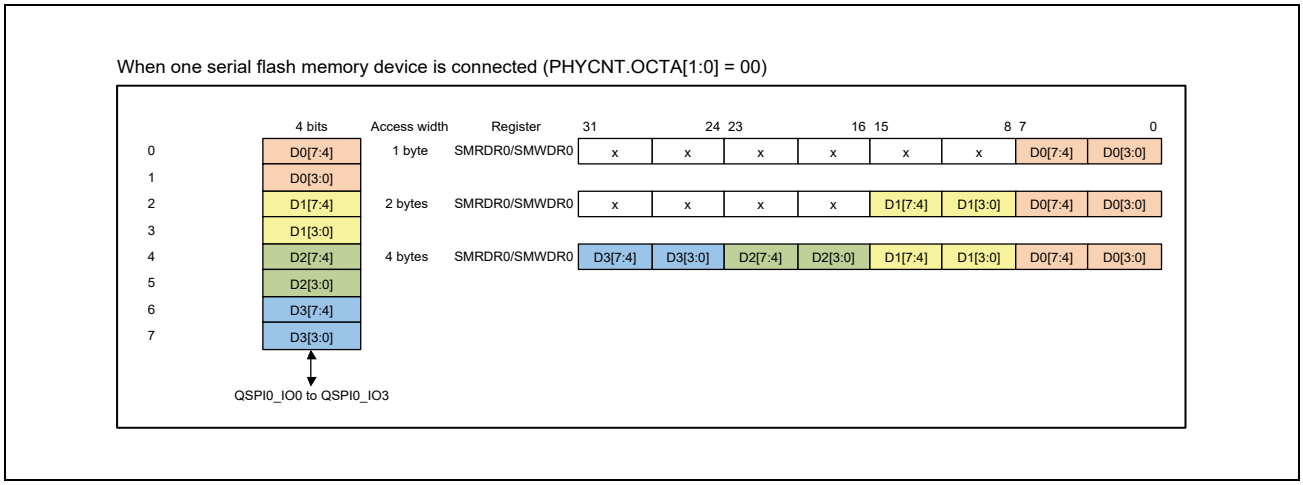

Figure 25.23 Data Alignment in Manual Mode

## 25.6 Usage Notes

### 25.6.1 Transfer to read data while the signal on the QSPIn_SSL pin is de-asserted

Set the SMENR.SPIDE[3:0] bits to 1100 or 1111 when transfer only for reading data is to proceed.

Transfer will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is 1000.

### 25.6.2 Transfer to read data while the signal on the QSPIn_SSL pin is asserted

When transfer only for reading data is to proceed, set the SMENR.SPIDE[3:0] bits to 1100 or 1111, or end the immediately preceding transfer with reading data.

When the immediately preceding transfer is of a command, optional command, address, or option data, or is transfer for writing data, the subsequent transfer only for reading data will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is 1000.

### 25.6.3 Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode

Be sure to set the SPIWE bit in the SMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the QSPIn_SSL pin is being asserted in Manual mode.

In addition, while the QSPIn_SSL signal is being asserted in Manual mode, the setting to start data transfer for reading is prohibited.

### 25.6.4 Handling of QSPI_RESET#

The state of the QSPI_RESET# pin can be changed in the following two ways.

1. Use the RSTEN and RSTVAL bits in the PHYINT register.
   The state of the QSPI_RESET# pin depends on the value of the RETVAL bits in the PHYINT register.
2. Activate the reset to this module.
   While a power-on reset or a software reset is applied to this LSI, the signal on the QSPI_RESET# pin goes low.
   When the reset is deactivated, the signal on the QSPI_RESET# pin goes high.

### 25.6.5 Software Reset after Release from the Module Stop State

When resetting SPI Multi I/O using the CPG reset ON/OFF register, set the clock ON/OFF register to ON before releasing the reset to supply the clock. While the SPI Multi I/O is in the reset state, the state of the QSPI_RESET# pin is L. Guarantee the reset period and accessible period after reset required by the connected device.

# 26. I²C Bus Interface

This section gives an overall description of the I²C bus interface (RIIC).

The first section describes the features specific to this LSI, including the number of units and the register base addresses. The subsequent sections describe the RIIC's functions and registers.

## 26.1 Features

### 26.1.1 Channels

This LSI has the following number of channels of the I²C bus interface (RIIC).

Table 26.1 Channels of RIIC

| Item | Description |
|---|---|
| Number of channels | 4 |
| Name | RIICn (n = 0 to 3) |

Table 26.2 Index

| Index | Description |
|---|---|
| n | Throughout this section, the individual channels of the I²C bus interface are identified by the index "n" (n = 0 to 3); for example, RIICnCR1 for the I²C bus control register 1. |

### 26.1.2 Register Base Addresses

The base address <RIICn_base> of each RIICn is listed in the following table.

All RIICn register addresses are given as values obtained by adding offsets to the register base address <RIICn_base> for each channel.

Table 26.3 Register Base Address

| Channel | Base Address Name | Base Address |
|---|---|---|
| RIIC0 | <RIIC0_base> | H'0_1005_8000 (Cortex-A55 Address Space) |
| RIIC1 | <RIIC1_base> | H'0_1005_8400 (Cortex-A55 Address Space) |
| RIIC2 | <RIIC2_base> | H'0_1005_8800 (Cortex-A55 Address Space) |
| RIIC3 | <RIIC3_base> | H'0_1005_8C00 (Cortex-A55 Address Space) |
| RIIC0 | <RIIC0_base> | H'4005_8000 (Cortex-M33 Address Space Non-Secure) |
| RIIC1 | <RIIC1_base> | H'4005_8400 (Cortex-M33 Address Space Non-Secure) |
| RIIC2 | <RIIC2_base> | H'4005_8800 (Cortex-M33 Address Space Non-Secure) |
| RIIC3 | <RIIC3_base> | H'4005_8C00 (Cortex-M33 Address Space Non-Secure) |
| RIIC0 | <RIIC0_base> | H'5005_8000 (Cortex-M33 Address Space Secure) |
| RIIC1 | <RIIC1_base> | H'5005_8400 (Cortex-M33 Address Space Secure) |
| RIIC2 | <RIIC2_base> | H'5005_8800 (Cortex-M33 Address Space Secure) |
| RIIC3 | <RIIC3_base> | H'5005_8C00 (Cortex-M33 Address Space Secure) |

### 26.1.3 External I/O Signals

The following table shows the external I/O signals of the RIIC.

Table 26.4 RIICn Pin Configuration

| Channel | Alternative Port Pin Name | Function |
|---|---|---|
| RIIC0 | RIIC0_SCL | RIIC0 serial clock I/O pin |
| | RIIC0_SDA | RIIC0 serial data I/O pin |
| RIIC1 | RIIC1_SCL | RIIC1 serial clock I/O pin |
| | RIIC1_SDA | RIIC1 serial data I/O pin |
| RIIC2 | RIIC2_SCL | RIIC2 serial clock I/O pin |
| | RIIC2_SDA | RIIC2 serial data I/O pin |
| RIIC3 | RIIC3_SCL | RIIC3 serial clock I/O pin |
| | RIIC3_SDA | RIIC3 serial data I/O pin |

Table 26.5 I2C Bus Interface

| Channel Number*3 | Pin Name*1 | I/O | Function | This LSI Output Buffer Type*2 |
|---|---|---|---|---|
| 0 | SCL | I/O | SCL: I2C serial clock input/output pin<br>SDA: I2C serial data input/output pin | OD |
| | SDA | | | |
| 1 | SCL | | | OD |
| | SDA | | | |
| 2 | SCL | | | LVTTL |
| | SDA | | | |
| 3 | SCL | | | LVTTL |
| | SDA | | | |

Note 1. The actual pin names are RIICnSCL and RIICnSDA.

Note 2. Output buffer type: “OD” is open drain buffer and “LVTTL” is low level drive only LVTTL buffer.

Note 3. AC specification is different between channel 0, 1 and channel 2, 3.

## 26.2 Overview

### 26.2.1 Functional Overview

#### Communications format

- I²C bus format or SMBus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times for the transfer rate

#### Transfer rate

Up to 1 Mbps

#### SCL clock

For master operation, the duty cycle of the SCL clock is selectable in the following range. 0% < Duty cycle < 100%.

#### Issuing and detecting conditions

- Start, restart, and stop conditions are automatically generated.
- Start conditions (including restart conditions) and stop conditions are detected.

#### Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses, device ID addresses, and SMBus host addresses are detected.

#### Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

#### Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

#### SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

### Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching between the signal on the SDA line and the internal signal for the SDA line.
- Loss of arbitration due to detection of the start condition while the bus is busy is detectable (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching is detectable.
- Loss of arbitration due to non-matching of internal and line levels for data is detectable in slave transmission.

### Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

### Noise removal

The interface incorporates analog noise filters and digital noise filters for input on the RIICnSCL and RIICnSDA pins, and the width for noise cancellation by the digital noise filters is adjustable by software.

### Interrupt sources

- Eight sources:
  - Transmission complete
  - Receive-data-full
  - Transmit-data-empty
  - Detection of a stop condition
  - Detection of a start condition
  - Reception of a NACK
  - Arbitration lost
  - Timeout

### Low power consumption function

Module-stop state can be set.

### 26.2.2 Block Diagram

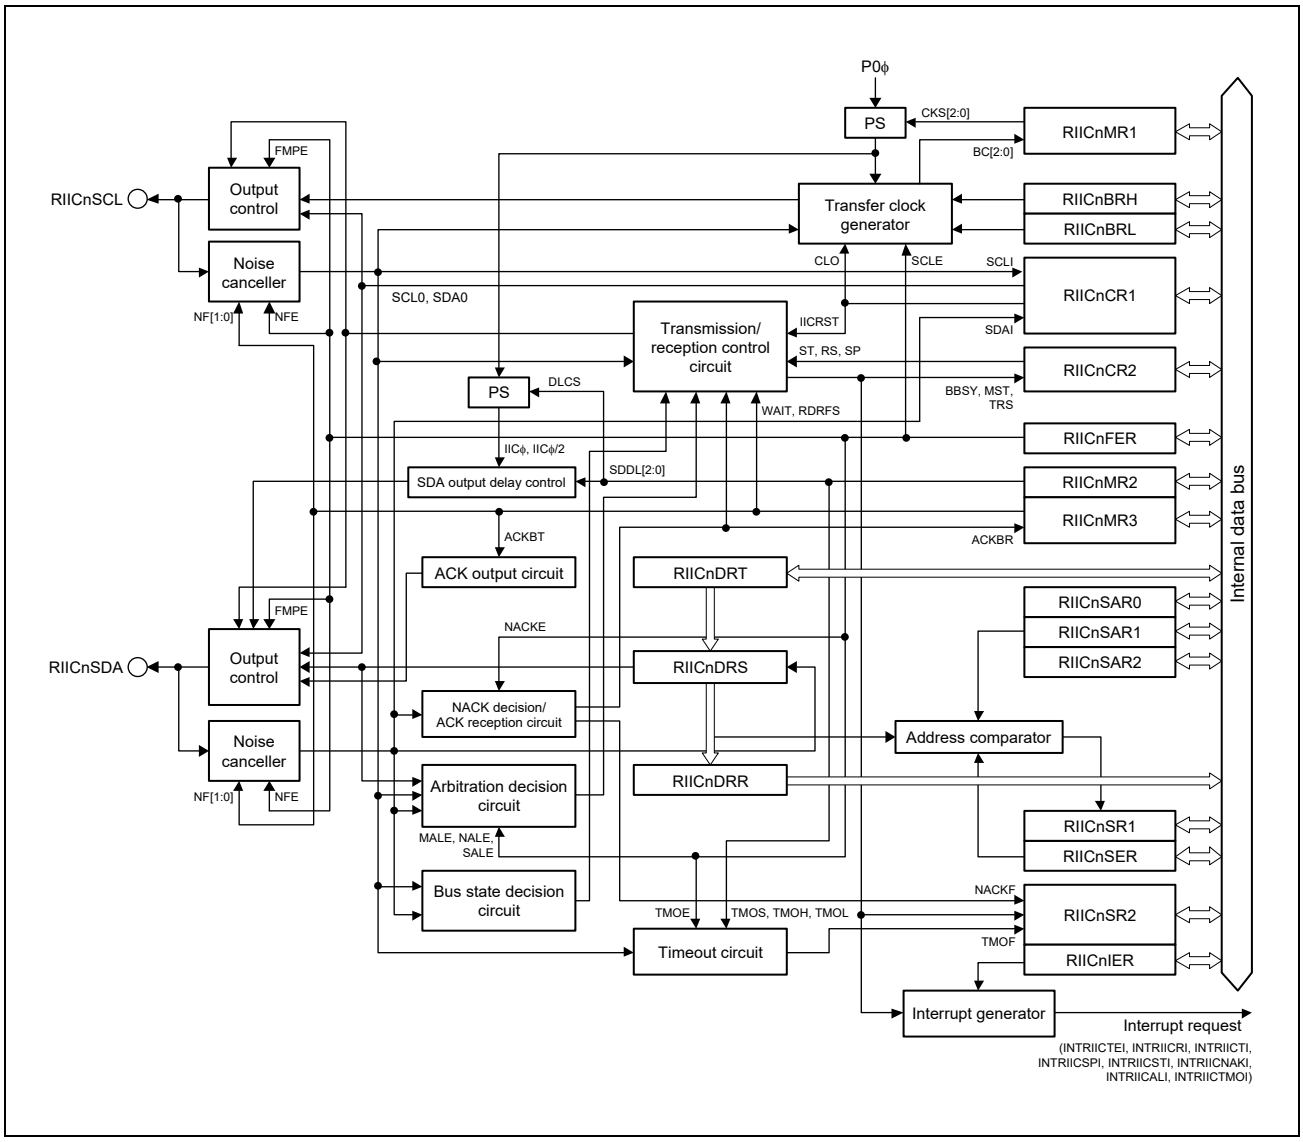

Figure 26.1 Block Diagram of RIIC

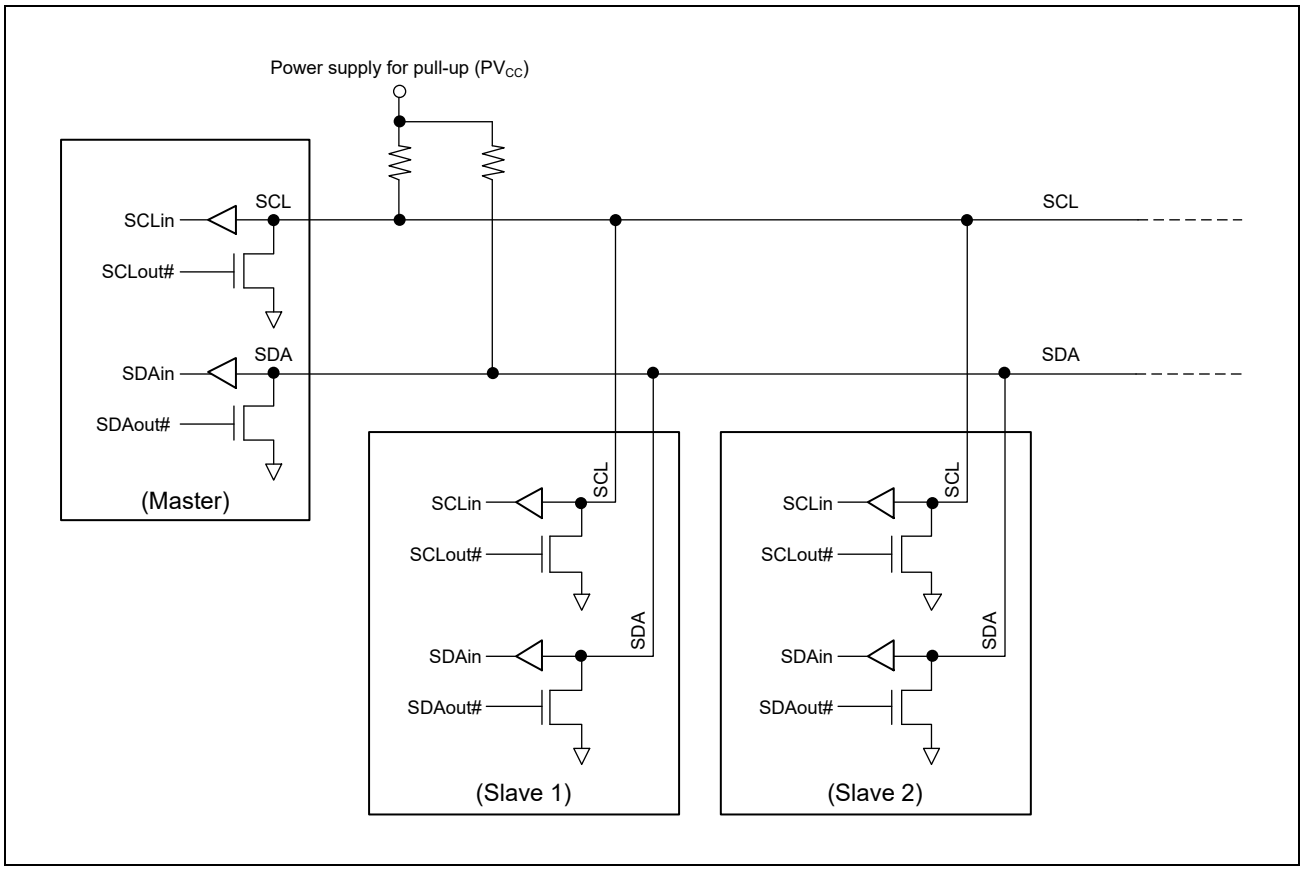

Figure 26.2 Connections to the External Circuit by the I/O Pins (I²C Bus Configuration Example)

RIICnSCL and RIICnSDA are Schmitt input/open-drain output pins for both master and slave operations. Because the output is open drain, an external pull-up resistor is required.

## 26.3 Registers

| Channel | Register Name | Abbreviation | Offset Address | Access Size |
|---|---|---|---|---|
| RIICn | I²C bus control register 1 | ICCR1 | H'00 | 8, 16, 32 |
| (n = 0 to 3) | I²C bus control register 2 | ICCR2 | H'04 | 8, 16, 32 |
| | I²C bus mode register 1 | ICMR1 | H'08 | 8, 16, 32 |
| | I²C bus mode register 2 | ICMR2 | H'0C | 8, 16, 32 |
| | I²C bus mode register 3 | ICMR3 | H'10 | 8, 16, 32 |
| | I²C bus function enable register | ICFER | H'14 | 8, 16, 32 |
| | I²C bus status enable register | ICSER | H'18 | 8, 16, 32 |
| | I²C bus interrupt enable register | ICIER | H'1C | 8, 16, 32 |
| | I²C bus status register 1 | ICSR1 | H'20 | 8, 16, 32 |
| | I²C bus status register 2 | ICSR2 | H'24 | 8, 16, 32 |
| | I²C slave address register 0 | ICSAR0 | H'28 | 8, 16, 32 |
| | I²C slave address register 1 | ICSAR1 | H'2C | 8, 16, 32 |
| | I²C slave address register 2 | ICSAR2 | H'30 | 8, 16, 32 |
| | I²C bus bit rate low-level register | ICBRL | H'34 | 8, 16, 32 |
| | I²C bus bit rate high-level register | ICBRH | H'38 | 8, 16, 32 |
| | I²C bus transmit data register | ICDRT | H'3C | 8, 16, 32 |
| | I²C bus receive data register | ICDRR | H'40 | 8, 16, 32 |

### 26.3.1 RIICnCR1 — I²C Bus Control Register 1

**Access Size:** RIICnCR1 is a 32-bit readable/writable register.
RIICnCR1L and RIICnCR1H are 16-bit readable/writable registers.
RIICnCR1LL, RIICnCR1LH, RIICnCR1HL, and RIICnCR1HH are 8-bit readable/writable registers.

**Address(es):** RIICnCR1: <RIICn_base> + H'0000
RIICnCR1L: <RIICn_base> + H'0000, RIICnCR1H: <RIICn_base> + H'0002
RIICnCR1LL: <RIICn_base> + H'0000, RIICnCR1LH: <RIICn_base> + H'0001,
RIICnCR1HL: <RIICn_base> + H'0002, RIICnCR1HH: <RIICn_base> + H'0003

**Initial Value:** H'0000 001F. This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| 4 | SOWP*2 | 1 | R/W | SCLO/SDAO Write Protect<br>0: Allows the SCLO and SDAO bits to be rewritten.<br>(This bit is read as 1.) |
| 3 | SCLO*1, *2 | 1 | R/W | SCL Output Control<br>• Read:<br>0: RIICnSCL pin output is at a low level.<br>1: RIICnSCL pin is in a high-impedance state.<br>• Write:<br>0: Changes the RIICnSCL pin output to a low level.<br>1: Changes the RIICnSCL pin in a high-impedance state.<br>(High level output is achieved through an external pull-up resistor.) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | SDAO*1,*2 | 1 | R/W | SDA Output Control<br>• Read:<br>0: RIICnSDA pin output is at a low level.<br>1: RIICnSDA pin is in a high-impedance state.<br>• Write:<br>0: Changes the RIICnSDA pin output to a low level.<br>1: Changes the RIICnSDA pin in a high-impedance state.<br>(High level output is achieved through an external pull-up resistor.) |
| 1 | SCLI | 1 | R | SCL Bus Input Monitor<br>0: RIICnSCL pin input is at a low level.<br>1: RIICnSCL pin input is at a high level. |
| 0 | SDAI | 1 | R | SDA Bus Input Monitor<br>0: RIICnSDA pin input is at a low level.<br>1: RIICnSDA pin input is at a high level. |

Note 1. Do not write to these bits during communication. Changing a value during communication may cause a transmission or reception failure or an AL error.

Note 2. To change the SDAO and SCLO bits, set the SOWP bit to 0 at the same timing to set the SDAO and SCLO bits to 0.

### CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error. For details on this function, see **Section 26.13.2, Extra SCL Clock Cycle Output Function**.

### IICRST Bit (I²C Bus Interface Internal Reset)

This bit is used to reset the internal states of the RIIC. Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. **Table 26.6** lists the resets of the RIIC.

The RIIC reset resets all registers including the RIICnCR2.BBSY flag (except ICE and IICRST) and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I²C bus shift register (RIICnDRS), and the I²C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see **Section 26.15, Reset Function of RIIC**.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication error.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

**CAUTION**

If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

Table 26.6 RIIC Resets

| IICRST | ICE | State | Specifications |
|---|---|---|---|
| 1 | 0 | RIIC reset | Resets all registers (except ICE and IICRST) and internal states of the RIIC. |
| | 1 | Internal reset | Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC. |

### ICE Bit (I²C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 26.6**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins. Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 disables output from the RIICnSCL and RIICnSDA pins.

## 26.3.2 RIICnCR2 — I²C Bus Control Register 2

**Access Size:** RIICnCR2 is a 32-bit readable/writable register.
RIICnCR2L and RIICnCR2H are 16-bit readable/writable registers.
RIICnCR2LL, RIICnCR2LH, RIICnCR2HL, and RIICnCR2HH are 8-bit readable/writable registers.

**Address(es):** RIICnCR2: <RIICn_base> + H'0004
RIICnCR2L: <RIICn_base> + H'0004, RIICnCR2H: <RIICn_base> + H'0006
RIICnCR2LL: <RIICn_base> + H'0004, RIICnCR2LH: <RIICn_base> + H'0005,
RIICnCR2HL: <RIICn_base> + H'0006, RIICnCR2HH: <RIICn_base> + H'0007

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 3 | SP | 0 | R/W | Stop Condition Issuance Request<br>0: Does not request to issue a stop condition.<br>1: Requests to issue a stop condition. |
| 2 | RS | 0 | R/W | Restart Condition Issuance Request<br>0: Does not request to issue a restart condition.<br>1: Requests to issue a restart condition. |
| 1 | ST | 0 | R/W | Start Condition Issuance Request<br>0: Does not request to issue a start condition.<br>1: Requests to issue a start condition. |
| 0 | — | 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |

### ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see **Section 26.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).

Note that arbitration may be lost if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

### RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see **Section 26.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTIONS**

1. Do not set the RS bit to 1 while issuing a stop condition.
2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the restart condition issuance request bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

### SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see **Section 26.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTIONS**

1. Wring to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
2. Do not set the SP bit to 1 while a restart condition is being issued.

### TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to the value for transmission mode or reception mode by detection or issuing of a start condition, setting or clearing of the R/W# bit, etc.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the R/W# bit added to the slave address is set to 0 in master mode
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave mode, a match between the received address and the address enabled in RIICnSER when the value of the received R/W# bit is 0 (including cases where the received address is the general call address)
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to the value for master mode or slave mode by detection or issuing of a start condition, etc.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the I²C bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

- When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

### 26.3.3 RIICnMR1 — I²C Bus Mode Register 1

**Access Size:** RIICnMR1 is a 32-bit readable/writable register.
RIICnMR1L and RIICnMR1H are 16-bit readable/writable registers.
RIICnMR1LL, RIICnMR1LH, RIICnMR1HL, and RIICnMR1HH are 8-bit readable/writable registers.

**Address(es):** RIICnMR1: <RIICn_base> + H'0008
RIICnMR1L: <RIICn_base> + H'0008, RIICnMR1H: <RIICn_base> + H'000A
RIICnMR1LL: <RIICn_base> + H'0008, RIICnMR1LH: <RIICn_base> + H'0009,
RIICnMR1HL: <RIICn_base> + H'000A, RIICnMR1HH: <RIICn_base> + H'000B

**Initial Value:** H'0000 0008 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 7 | — | All 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |
| 6 to 4 | CKS[2:0] | All 0 | R/W | Internal Reference Clock (IICϕ) Selection<br>b6 b4<br>0 0: IICϕ = P0ϕ/1<br>0 0: IICϕ = P0ϕ/2<br>0 1: IICϕ = P0ϕ/4<br>0 1: IICϕ = P0ϕ/8<br>1 0: IICϕ = P0ϕ/16<br>1 0: IICϕ = P0ϕ/32<br>1 1: IICϕ = P0ϕ/64<br>1 1: IICϕ = P0ϕ/128 |
| 3 | BCWP*1 | 1 | R/W | BC Write Protect<br>0: Enables a value to be written in the BC[2:0] bits.<br>(This bit is read as 1.) |
| 2 to 0 | BC[2:0] | All 0 | R/W | Bit Counter<br>b2 b0<br>0 0: 9 bits<br>0 0: 2 bits<br>0 1: 3 bits<br>0 1: 4 bits<br>1 0: 5 bits<br>1 0: 6 bits<br>1 1: 7 bits<br>1 1: 8 bits |

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

### BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames when the SCL line is at a low level.

The values of the BC[2:0] bits return to 000b at the end of a data transfer including the acknowledge bit or when a start condition including a restart condition is detected.

## 26.3.4 RIICnMR2 — I²C Bus Mode Register 2

**Access Size:** RIICnMR2 is a 32-bit readable/writable register.
RIICnMR2L and RIICnMR2H are 16-bit readable/writable registers.
RIICnMR2LL, RIICnMR2LH, RIICnMR2HL, and RIICnMR2HH are 8-bit readable/writable registers.

**Address(es):** RIICnMR2: <RIICn_base> + H'000C
RIICnMR2L: <RIICn_base> + H'000C, RIICnMR2H: <RIICn_base> + H'000E
RIICnMR2LL: <RIICn_base> + H'000C, RIICnMR2LH: <RIICn_base> + H'000D,
RIICnMR2HL: <RIICn_base> + H'000E, RIICnMR2HH: <RIICn_base> + H'000F

**Initial Value:** H'0000 0006 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 3 | — | 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | TMOH | 1 | R/W | Timeout H Count Control<br>0: Count is disabled while the SCL line is at a high level.<br>1: Count is enabled while the SCL line is at a high level. |
| 1 | TMOL | 1 | R/W | Timeout L Count Control<br>0: Count is disabled while the SCL line is at a low level.<br>1: Count is enabled while the SCL line is at a low level. |
| 0 | TMOS | 0 | R/W | Timeout Detection Time Selection<br>0: Long mode is selected.<br>1: Short mode is selected. |

Note 1. The setting DLCS = 1 (IICϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICϕ).

### TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on the timeout function, see **Section 26.13.1, Timeout Function**.

### TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see **Section 26.7, Facility for Delaying SDA Output**.

**CAUTION**

Set the SDA output delay time to meet the I²C bus standard (within the data enable time/acknowledge enable time*1) or the SMBus standard (within the data hold time: 300 [ns] or more, and SCL-clock low-level period - the data setup time: 250 [ns]). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

**Note 1.** Data enable time/acknowledge enable time
3,450 [ns] (0 to 100 [kbps]: standard mode (Sm))
900 [ns] (0 to 400 [kbps]: fast mode (Fm))
450 [ns] (0 to 1 [Mbps]: fast mode plus (Fm+))

## 26.3.5 RIICnMR3 — I²C Bus Mode Register 3

**Access Size:** RIICnMR3 is a 32-bit readable/writable register.
RIICnMR3L and RIICnMR3H are 16-bit readable/writable registers.
RIICnMR3LL, RIICnMR3LH, RIICnMR3HL, and RIICnMR3HH are 8-bit readable/writable registers.

**Address(es):** RIICnMR3: <RIICn_base> + H'0010
RIICnMR3L: <RIICn_base> + H'0010, RIICnMR3H: <RIICn_base> + H'0012
RIICnMR3LL: <RIICn_base> + H'0010, RIICnMR3LH: <RIICn_base> + H'0011,
RIICnMR3HL: <RIICn_base> + H'0012, RIICnMR3HH: <RIICn_base> + H'0013

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |
| 7 | SMBE | 0 | R/W | SMBus/I²C Bus Selection<br>0: I²C bus is selected.<br>1: SMBus is selected. |
| 6 | WAIT*2 | 0 | R/W | WAIT<br>0: No WAIT<br>(The period between ninth clock cycle and first clock cycle is not held low.)<br>1: WAIT<br>(The period between ninth clock cycle and first clock cycle is held low.) Low-hold is released by reading RIICnDRR. |
| 5 | RDRFS*2 | 0 | R/W | RDRF Flag Set Timing Selection<br>0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle.<br>(The SCL line is not held low at the falling edge of the eighth clock cycle.)<br>1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle.<br>(The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit. |
| 4 | ACKWP*1 | 0 | W | ACKBT Write Protect<br>0: Modification of the ACKBT bit is disabled.<br>1: Modification of the ACKBT bit is enabled. |
| 3 | ACKBT*1 | 0 | R/W | Transmit Acknowledge<br>0: A 0 is sent as the acknowledge bit (ACK transmission).<br>1: A 1 is sent as the acknowledge bit (NACK transmission). |
| 2 | ACKBR | 0 | R | Receive Acknowledge<br>0: A 0 is received as the acknowledge bit (ACK reception).<br>1: A 1 is received as the acknowledge bit (NACK reception). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1, 0 | NF[1:0] | All 0 | R/W | Noise Filter Stage Selection<br>b1 b0<br>0 0: Noise of up to one IICϕ cycle is filtered out (single-stage filter).<br>0 1: Noise of up to two IICϕ cycles is filtered out (2-stage filter).<br>1 0: Noise of up to three IICϕ cycles is filtered out (3-stage filter).<br>1 1: Noise of up to four IICϕ cycles is filtered out (4-stage filter). |

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

### NF[1:0] Bits (Noise Filter Stage Selection)

These bits are used to select the width of noise that can be removed from the signals input to RIICnSCL or RIICnSDA pin.

### ACKBR Bit (Receive Acknowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

### ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit with the ACKWP bit set to 1
- When stop condition issuance is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

**CAUTION**

The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

### ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

### RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

### WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode. When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

**CAUTION**

When the value of the WAIT bit is to be read, be sure to read the RIICnDRR beforehand.

### SMBE Bit (SMBus Select)

Setting this bit to 1 enables the RIICnSER.HOAE bit.

## 26.3.6 RIICnFER — I²C Bus Function Enable Register

**Access Size:** RIICnFER is a 32-bit readable/writable register.
RIICnFERL and RIICnFERH are 16-bit readable/writable registers.
RIICnFERLL, RIICnFERLH, RIICnFERHL, and RIICnFERHH are 8-bit readable/writable registers.

**Address(es):** RIICnFER: <RIICn_base> + H'0014
RIICnFERL: <RIICn_base> + H'0014, RIICnFERH: <RIICn_base> + H'0016
RIICnFERLL: <RIICn_base> + H'0014, RIICnFERLH: <RIICn_base> + H'0015,
RIICnFERHL: <RIICn_base> + H'0016, RIICnFERHH: <RIICn_base> + H'0017

**Initial Value:** H'0000 0072 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | TMOE | 0 | R/W | Timeout Function Enable<br>0: The timeout function is disabled.<br>1: The timeout function is enabled. |

### TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.

For details on the timeout function, see **Section 26.13.1, Timeout Function**.

### MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to specify whether to use the arbitration-lost detection function in master mode. Normally, set this bit to 1.

### NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when ACK is detected during transmission of NACK in receive mode (such as when slaves with the same address exist on the bus or when two or more masters select the same slave device simultaneously with different number of receive bytes).

### SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

### NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

### SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with the SCL input clock. Normally, set this bit to 1. When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the I²C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

### FMPE Bit (Fast-mode Plus Enable)

This bit is used to specify whether to use a slope control circuit for Fast-mode Plus [fm+].

When this bit is set to 1, a slope control circuit conforming to the Fast-mode Plus [fm+] slope control standard (tof) of the I²C bus is selected. When this bit is cleared to 0, a slope control circuit conforming to the Standard-mode [Sm] and Fast- mode [fm] slope control standard (tof) of the I²C bus is selected.

Set this bit to 1 when using the transmission rate within a range up to 1 Mbps (Fast-mode Plus[fm+]) of the I²C bus standard. Clear this bit to 0 when using the transmission rate at other rates (up to 100 kbps[Sm], up to 400 kbps[fm]) or for SMBus (10 to 100 kbps).

## 26.3.7 RIICnSER — I²C Bus Status Enable Register

**Access Size:** RIICnSER is a 32-bit readable/writable register.
RIICnSERL and RIICnSERH are 16-bit readable/writable registers.
RIICnSERLL, RIICnSERLH, RRIICnSERHL, and RIICnSERHH are 8-bit readable/writable registers.

**Address(es):** RIICnSER: <RIICn_base> + H'0018
RIICnSERL: <RIICn_base> + H'0018, RIICnSERH: <RIICn_base> + H'001A
RIICnSERLL: <RIICn_base> + H'0018, RIICnSERLH: <RIICn_base> + H'0019,
RIICnSERHL: <RIICn_base> + H'001A, RIICnSERHH: <RIICn_base> + H'001B

**Initial Value:** H'0000 0009 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 | HOAE | 0 | R/W | Host Address Enable<br>0: Host address detection is disabled.<br>1: Host address detection is enabled. |
| 6 | — | 0 | R | Reserved<br>This bit is read as 0. The write value should be 0. |
| 5 | DIDE | 0 | R/W | Device-ID Address Detection Enable<br>0: Device-ID address detection is disabled.<br>1: Device-ID address detection is enabled. |
| 4 | — | 0 | R | Reserved<br>This bit is read as 0. The write value should be 0. |
| 3 | GCE | 1 | R/W | General Call Address Enable<br>0: General call address detection is disabled.<br>1: General call address detection is enabled. |
| 2 | SAR2 | 0 | R/W | Slave Address Register 2 Enable<br>0: Slave address in RIICnSAR2 is disabled.<br>1: Slave address in RIICnSAR2 is enabled. |
| 1 | SAR1 | 0 | R/W | Slave Address Register 1 Enable<br>0: Slave address in RIICnSAR1 is disabled.<br>1: Slave address in RIICnSAR1 is enabled. |
| 0 | SAR0 | 1 | R/W | Slave Address Register 0 Enable<br>0: Slave address in RIICnSAR0 is disabled.<br>1: Slave address in RIICnSAR0 is enabled. |

#### SARy Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the received slave address and the slave address set in RIICnSARy.

When this bit is set to 1, the slave address set in RIICnSARy is enabled and is compared with the received slave address. When this bit is cleared to 0, the slave address set in RIICnSARy is disabled and is ignored even if it matches the received slave address.

#### GCE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address (0000 000b + 0 [W]: All 0) when it is received. When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

#### DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID (1111 100b) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 26.9.3, Device-ID Address Detection**.

#### HOAE Bit (Host Address Enable)

This bit is used to specify whether to ignore received host address (0001 000b) when the RIICnMR3.SMBS bit is 1. When this bit is set to 1 while the RIICnMR3.SMBS bit is 1, if the received slave address matches the host address, the RIIC recognizes the received slave address as the host address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs the receive operation.

When the RIICnMR3.SMBS bit or the HOAE bit is cleared to 0, the received slave address is ignored even if it matches the host address.

## 26.3.8 RIICnIER — I²C Bus Interrupt Enable Register

**Access Size:** RIICnIER is a 32-bit readable/writable register.
RIICnIERL and RIICnIERH are 16-bit readable/writable registers.
RIICnIERLL, RIICnIERLH, RIICnIERHL, and RIICnIERHH are 8-bit readable/writable registers.

**Address(es):** RIICnIER: <RIICn_base> + H'001C
RIICnIERL: <RIICn_base> + H'001C, RIICnIERH: <RIICn_base> + H'001E
RIICnIERLL: <RIICn_base> + H'001C, RIICnIERLH: <RIICn_base> + H'001D,
RIICnIERHL: <RIICn_base> + H'001E, RIICnIERHH: <RIICn_base> + H'001F

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 | TIE | 0 | R/W | Transmit Data Empty Interrupt Enable<br>0: Transmit data empty interrupt request (INTRIICTI) is disabled.<br>1: Transmit data empty interrupt request (INTRIICTI) is enabled. |
| 6 | TEIE | 0 | R/W | Transmit End Interrupt Enable<br>0: Transmit end interrupt request (INTRIICTEI) is disabled.<br>1: Transmit end interrupt request (INTRIICTEI) is enabled. |
| 5 | RIE | 0 | R/W | Receive Data Full Interrupt Enable<br>0: Receive data full interrupt request (INTRIICRI) is disabled.<br>1: Receive data full interrupt request (INTRIICRI) is enabled. |
| 4 | NAKIE | 0 | R/W | NACK Reception Interrupt Enable<br>0: NACK reception interrupt request (INTRIICNAKI) is disabled.<br>1: NACK reception interrupt request (INTRIICNAKI) is enabled. |
| 3 | SPIE | 0 | R/W | Stop Condition Detection Interrupt Enable<br>0: Stop condition detection interrupt request (INTRIICSPI) is disabled.<br>1: Stop condition detection interrupt request (INTRIICSPI) is enabled. |
| 2 | STIE | 0 | R/W | Start Condition Detection Interrupt Enable<br>0: Start condition detection interrupt request (INTRIICSTI) is disabled.<br>1: Start condition detection interrupt request (INTRIICSTI) is enabled. |
| 1 | ALIE | 0 | R/W | Arbitration-Lost Interrupt Enable<br>0: Arbitration-lost interrupt request (INTRIICALI) is disabled.<br>1: Arbitration-lost interrupt request (INTRIICALI) is enabled. |
| 0 | TMOIE | 0 | R/W | Timeout Interrupt Enable<br>0: Timeout interrupt request (INTRIICTMOI) is disabled.<br>1: Timeout interrupt request (INTRIICTMOI) is enabled. |

#### TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (INTRIICTMOI) when the RIICnSR2.TMOF flag is set to 1. An INTRIICTMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

#### ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (INTRIICALII) when the RIICnSR2.AL flag is set to 1. An INTRIICALII interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

#### STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (INTRIICSTI) when the RIICnSR2.START flag is set to 1. An INTRIICSTI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

#### SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (INTRIICSPI) when the RIICnSR2.STOP flag is set to 1. An INTRIICSPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

#### NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (INTRIICNAKI) when the RIICnSR2.NACKF flag is set to 1. An INTRIICNAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

#### RIE Bit (Receive Data Full Interrupt Enable)

This bit is used to enable or disable receive data full interrupt requests (INTRIICRI) when the RIICnSR2.RDRF flag in ICSR2 is set to 1. An INTRIICRI interrupt request is canceled by clearing the RDRF flag or the RIE bit to 0.

#### TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICTEI) when the RIICnSR2.TEND flag is set to 1. An INTRIICTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

#### TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICTI) when the RIICnSR2.TDRE flag is set to 1.

## 26.3.9 RIICnSR1 — I²C Bus Status Register 1

**Access Size:** RIICnSR1 is a 32-bit readable/writable register.
RIICnSR1L and RIICnSR1H are 16-bit readable/writable registers.
RIICnSR1LL, RIICnSR1LH, RIICnSR1HL, and RIICnSR1HH are 8/1-bit readable/writable registers.

**Address(es):** RIICnSR1: <RIICn_base> + H'0020
RIICnSR1L: <RIICn_base> + H'0020, RIICnSR1H: <RIICn_base> + H'0022
RIICnSR1LL: <RIICn_base> + H'0020, RIICnSR1LH: <RIICn_base> + H'0021,
RIICnSR1HL: <RIICn_base> + H'0022, RIICnSR1HH: <RIICn_base> + H'0023

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. Only 0 can be written to this bit.

### AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARy.FSy = 0>

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

When the received slave address matches a value of (1111 0b + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARy.FSy = 0>

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

- When the received slave address does not match a value of (1111 0b + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111 0b + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

### GCA Flag (General Call Address Detection)

[Setting condition]

When the received slave address matches the general call address (0000 000b + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 000b + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100b) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled) This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address (1111 100b) + 1 [R] has matched with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID (1111 100b)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled) This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100b) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### HOA Flag (Host Address Detection)

[Setting condition]

When the received slave address matches the host address (0001 000b) while the RIICnMR3.SMBE bit and RIICnSER.HOAE bit are set to 1 (host address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the HOA bit after reading HOA = 1
- When a stop condition is detected
- When 0 is written to the RIICnMR3.SMBS bit in ICMR3 or the RIICnSER.HOAE bit
- When the received slave address does not match the host address (0001 000b) with the RIICnSER.HOAE bit set to 1 (host address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit 1 to apply an RIIC reset or an internal reset

## 26.3.10 RIICnSR2 — I²C Bus Status Register 2

**Access Size:** RIICnSR2 is a 32-bit readable/writable register.
RIICnSR2L and RIICnSR2H are 16-bit readable/writable registers.
RIICnSR2LL, RIICnSR2LH, RIICnSR2HL, and RIICnSR2HH are 8/1-bit readable/writable registers.

**Address(es):** RIICnSR2: <RIICn_base> + H'0024
RIICnSR2L: <RIICn_base> + H'0024, RIICnSR2H: <RIICn_base> + H'0026
RIICnSR2LL: <RIICn_base> + H'0024, RIICnSR2LH: <RIICn_base> + H'0025,
RIICnSR2HL: <RIICn_base> + H'0026, RIICnSR2HH: <RIICn_base> + H'0027

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4 | NACKF | 0 | R(/W) *1 | NACK Reception Flag<br>0: NACK is not received.<br>1: NACK is received. |
| 3 | STOP | 0 | R(/W) *1 | Stop Condition Detection Flag<br>0: Stop condition is not detected.<br>1: Stop condition is detected. |
| 2 | START | 0 | R(/W) *1 | Start Condition Detection Flag<br>0: Start condition is not detected.<br>1: Start condition is detected. |
| 1 | AL | 0 | R(/W) *1 | Arbitration-Lost Flag<br>0: Arbitration is not lost.<br>1: Arbitration is lost. |
| 0 | TMOF | 0 | R(/W) *1 | Timeout Flag<br>0: No timeout has occurred.<br>1: Timeout has occurred. |

Note 1. Only 0 can be written to this bit.

### TMOF Flag (Timeout)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.
[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is held low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1).
- The slave address matches that of this module (RIICnSR1 register is not H'00) and the bus is busy (RIICnCR2.BBSY = 1) in slave mode (RIICnCR2.MST = 0).
- Issuing of a start condition is being requested (RIICnCR2.ST = 1) and the bus is free (RIICnCR2.BBSY = 0).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### AL Flag (Arbitration-Lost)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Table 26.7 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions

| RIICnFER | | | RIICnSR2 | | |
|---|---|---|---|---|---|
| MALE | NALE | SALE | AL | Error | Arbitration-Lost Generation Source |
| 1 | x | x | 1 | Start condition issuance error | When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1 |
| | | | | | When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1 |
| | | | 1 | Transmit data mismatch | When transmit data (including slave address) does not match the bus state in master transmit mode |
| x | 1 | x | 1 | NACK transmission mismatch | When ACK is detected during transmission of NACK in master receive mode or slave receive mode |
| x | x | 1 | 1 | Transmit data mismatch | When transmit data does not match the bus state in slave transmit mode |

**Note:** x: Don't care

### START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### NACKF Flag (NACK Reception)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/ receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

RDRF Flag (Receive Data Full)

[Setting conditions]

- Slave receive mode
  - When the received slave address matches and the RIICnCR2.TRS bit is cleared to 0 after a start condition (or a restart condition) is detected
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR
- Master receive mode
  - When the slave address and the data direction are transmitted and the receive mode is entered (the RIICnCR2.TRS bit is set to 1) after a start condition (or a restart condition) is issued
  - At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit) after receive data is transferred from RIICnDRS to RIICnDRR

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

#### TEND Flag (Transmit End)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

#### TDRE Flag (Transmit Data Empty)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition (or a restart condition) is detected
  - When the RIIC enters transmit mode from receive mode
- When the received slave address matches while the TRS bit is 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/ reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

## 26.3.11 RIICnSARy — I²C Slave Address Register y (y = 0 to 2)

**Access Size:** RIICnSARy is a 32-bit readable/writable register.
RIICnSARyL and RIICnSARyH are 16-bit readable/writable registers.
RIICnSARyLL, RIICnSARyLH, RIICnSARyHL, and RIICnSARyHH are 8-bit readable/writable registers.

**Address(es):** RIICnSAR0: <RIICn_base> + H'0028
RIICnSAR0L: <RIICn_base> + H'0028, RIICnSAR0H: <RIICn_base> + H'002A
RIICnSAR0LL: <RIICn_base> + H'0028, RIICnSAR0LH: <RIICn_base> + H'0029,
RIICnSAR0HL: <RIICn_base> + H'002A, RIICnSAR0HH: <RIICn_base> + H'002B
RIICnSAR1: <RIICn_base> + H'002C
RIICnSAR1L: <RIICn_base> + H'002C, RIICnSAR1H: <RIICn_base> + H'002E
RIICnSAR1LL: <RIICn_base> + H'002C, RIICnSAR1LH: <RIICn_base> + H'002D,
RIICnSAR1HL: <RIICn_base> + H'002E, RIICnSAR1HH: <RIICn_base> + H'002F
RIICnSAR2: <RIICn_base> + H'0030
RIICnSAR2L: <RIICn_base> + H'0030, RIICnSAR2H: <RIICn_base> + H'0032
RIICnSAR2LL: <RIICn_base> + H'0030, RIICnSAR2LH: <RIICn_base> + H'0031,
RIICnSAR2HL: <RIICn_base> + H'0032, RIICnSAR2HH: <RIICn_base> + H'0033

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FSy | — | — | — | — | — | SVA[9:1] | | | | | | | | | SVA0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |
| 15 | FSy | 0 | R/W | 7-Bit/10-Bit Address Format Selection<br>0: The 7-bit address format is selected.<br>1: The 10-bit address format is selected. |
| 14 to 10 | — | All 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |
| 9 to 1 | SVA[9:1] | All 0 | R/W | 7-Bit Address/10-Bit Address Upper Bits A slave address is set.<br>• When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are Valid and form a 7-bit slave address.<br>• When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit). |
| 0 | SVA0 | 0 | R/W | 10-Bit Address LSB<br>The least significant bit (LSB) of a 10-bit slave address is set.<br>• When the FSy bit is 0 (7-bit address format), this bit is invalid.<br>• When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits). |

#### SVA0 Bit (10-Bit Address LSB)

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

#### SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.

While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

#### FSy Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.

While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

## 26.3.12 RIICnBRL — I²C Bus Bit Rate Low-Level Register

**Access Size:** RIICnBRL is a 32-bit readable/writable register.
RIICnBRLL and RIICnBRLH are 16-bit readable/writable registers.
RIICnBRLLL, RIICnBRLLH, RIICnBRLHL, and RIICnBRLHH are 8-bit readable/writable registers.

**Address(es):** RIICnBRL: <RIICn_base> + H'0034
RIICnBRLL: <RIICn_base> + H'0034, RIICnBRLH: <RIICn_base> + H'0036

| 4 to 0 | BRL[4:0] | All 1 | R/W | Bit Rate Low-Level Period Low-level period of SCL clock |

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see **Section 26.10, Automatically Low-Hold Function for SCL**); when the RIIC is used only in slave mode, this register needs to be set to a value at least the same as the data setup time*[1].

RIICnBRL counts the low-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

**Note 1.** Data setup time (tSU: DAT)
250 [ns] (0 to 100 [kbps]: standard mode (Sm))
100 [ns] (0 to 400 [kbps]: fast mode (Fm))
50 [ns] (0 to 1 [Mbps]: fast mode plus (Fm+))

## 26.3.13 RIICnBRH — I²C Bus Bit Rate High-Level Register

**Access Size:** RIICnBRH is a 32-bit readable/writable register.
RIICnBRHL and RIICnBRHH are 16-bit readable/writable registers.
RIICnBRHLL, RIICnBRHLH, RIICnBRHHL, and RIICnBRHHH are 8-bit readable/writable registers.

**Address(es):** RIICnBRH: <RIICn_base> + H'0038
RIICnBRHL: <RIICn_base> + H'0038, RIICnBRHH: <RIICn_base> + H'003A
RIICnBRHLL: <RIICn_base> + H'0038, RIICnBRHLH: <RIICn_base> + H'0039,
RIICnBRHHL: <RIICn_base> + H'003A, RIICn- BRHHH:<RIICn_base> + H'003B

**Initial Value:** H'0000 00FF This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are read as 0. The write value should be 0. |
| 7 to 5 | — | All 1 | R | Reserved<br>These bits are read as 1. The write value should be 1. |
| 4 to 0 | BRH[4:0] | All 1 | R/W | Bit Rate High-Level Period High-level period of SCL clock |

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits in ICMR1.

The frequency and duty cycle are calculated using one of the following expressions (1) to (5) according to the register settings.

**CAUTION**

The minimum value that can be specified in RIICnBRL and RIICnBRH is determined according to the values of the SCLE and NFE bits in RIICnFER and the NF bit in RIICnMR3. For details of the minimum specifiable value, see **Table 26.8**.

(1) When SCLE = 0
Frequency = 1 / {[ (BRH + 1) + (BRL + 1)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 1) / IICϕ} / {tr + tf + [(BRH + 1) + (BRL + 1)] / IICϕ}

(2) When SCLE = 1, NFE = 0, CKS = 000 (IICϕ = P0ϕ) Frequency = 1 / {[(BRH + 3) + (BRL + 3)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 3) / IICϕ} / {tr + tf + [(BRH + 3) + (BRL + 3) ] / IICϕ}

(3) When SCLE = 1, NFE = 1, CKS = 000 (IICϕ = P0ϕ)
Frequency = 1 / {[(BRH + 3 + nf) + (BRL + 3 + nf)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 3 + nf) / IICϕ} / {tr + tf + [(BRH + 3 + nf) + (BRL + 3 + nf)] / IICϕ}

(4) When SCLE = 1, NFE = 0, CKS [1] 000 (IICϕ < P0ϕ)
Frequency = 1 / {[(BRH + 2) + (BRL + 2)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 2) / IICϕ} / {tr + tf + [(BRH + 2) + (BRL + 2) ] / IICϕ}

(5) When SCLE = 1, NFE = 1, CKS [1] 000 (IICϕ < P0ϕ)
Frequency = 1 / {[(BRH + 2 + nf) + (BRL + 2 + nf)] / IICϕ + tr + tf}
Duty cycle = {tr + (BRH + 2 + nf) / IICϕ} / {tr + tf + [(BRH + 2 + nf) + (BRL + 2 + nf) ] / IICϕ}

Symbols in the expressions
SCLE: RIICnFER.SCLE bit
BRH: RIICnBRH.BRH[4:0] bits
BRL: RIICnBRL.BRL[4:0] bits
CKS: RIICnMR1.CKS bits
NFE: RIICnFER.NFE bit
IICϕ: Internal reference clock selected by the CKS bits
tf: SCL signal falling time [s]*[1]
tr: SCL signal rising time [s]* [1]
nf: Number of digital noise filter stages specified in the RIICnMR3.NF[1:0] bits

**Note 1.** The rising time (tr) and falling time (tf) of the SCL signal depend on the total capacitance of the bus line (Cb) and pull-up resistor (Rp). For details, see I²C Bus Standard from NXP Semiconductors.

Table 26.8 Minimum Specifiable Value for RIICnBRL and RIICnBRH

| SCLE | NFE | nf | Minimum Pulse Width that Passes through Digital Filter | Minimum Specifiable Value for BRH and BRL | Pulse Width when Minimum Value is Specified |
|---|---|---|---|---|---|
| 0 | 0 | — | 1 × IICϕ | 1 | 2 × IICϕ |
| 0 | 1 | 1 | 2 × IICϕ | 2 | 3 × IICϕ |
| 0 | 1 | 2 | 3 × IICϕ | 3 | 4 × IICϕ |
| 0 | 1 | 3 | 4 × IICϕ | 4 | 5 × IICϕ |
| 0 | 1 | 4 | 5 × IICϕ | 5 | 6 × IICϕ |
| IICϕ cycle > P0ϕ cycle (CKS ≠ 000) | | | | | |
| 1 | 0 | — | 1 × IICϕ | 0 | 2 × IICϕ |
| 1 | 1 | 1 | 2 × IICϕ | 1 | 4 × IICϕ |
| 1 | 1 | 2 | 3 × IICϕ | 2 | 6 × IICϕ |
| 1 | 1 | 3 | 4 × IICϕ | 3 | 8 × IICϕ |
| 1 | 1 | 4 | 5 × IICϕ | 4 | 10 × IICϕ |
| IICϕ cycle = P0ϕ cycle (CKS = 000) | | | | | |
| 1 | 0 | — | 2 × P0ϕ | 0 | 3 × IICϕ |
| 1 | 1 | 1 | 3 × P0ϕ | 1 | 5 × IICϕ |

## 26.3.14 RIICnDRT — I²C Bus Transmit Data Register

**Access Size:** RIICnDRT is a 32-bit readable/writable register.
RIICnDRTL and RIICnDRTH are 16-bit readable/writable registers.
RIICnDRTLL, RIICnDRTLH, RIICnDRTHL, and RIICnDRTHH are 8-bit readable/writable registers.

**Address(es):** RIICnDRT: <RIICn_base> + H'003C
RIICnDRTL: <RIICn_base> + H'003C, RIICnDRTH: <RIICn_base> + H'003E
RIICnDRTLL: <RIICn_base> + H'003C, RIICnDRTLH: <RIICn_base> + H'003D,
RIICnDRTHL: <RIICn_base> + H'003E, RIICnDRTHH: <RIICn_base> + H'003F

**Initial Value:** H'0000 00FF This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | DRT[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

When RIICnDRT detects a space in the I²C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICTI) request is generated. When writing to bits 8 to 15, be sure to write 0 to these bits.

## 26.3.15 RIICnDRR — I²C Bus Receive Data Register

**Access Size:** RIICnDRR is a 32-bit readable/writable register.
RIICnDRRL and RIICnDRRH are 16-bit readable/writable registers.
RIICnDRRLL, RIICnDRRLH, RIICnDRRHL, and RIICnDRRHH are 8-bit readable/writable registers.

**Address(es):** RIICnDRR: <RIICn_base> + H'0040
RIICnDRRL: <RIICn_base> + H'0040, RIICnDRRH: <RIICn_base> + H'0042
RIICnDRRLL: <RIICn_base> + H'0040, RIICnDRRLH: <RIICn_base> + H'0041,
RIICnDRRHL: <RIICn_base> + H'0042, RIICnDRRHH: <RIICn_base> + H'0043

**Initial Value:** H'0000 0000 This register is initialized by any reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | DRR[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

When 1 byte of data has been received, the received data is transferred from the I²C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive data full interrupt (INTRIICRI) request is generated.

If DRR receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

## 26.3.16 RIICnDRS — I²C Bus Shift Register

**Access Size:** This register is not accessible.

**Address(es):** —

**Initial Value:** H'0000 00FF

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

RIICnDRS is an 8-bit shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

## 26.4 Interrupt Sources

The RIIC issues eight types of interrupt request: transmit end, receive data full, transmit data empty, stop condition detection, start condition detection, NACK reception, arbitration-lost, and timeout.

**Table 26.11** lists details of the several interrupt requests. The receive data full and transmit data empty sources are both capable of launching data transfer by the DMAC.

Table 26.11 Interrupt Sources

| Symbol | Interrupt Source | Interrupt Flag | DMAC Launching | Priority*1 | Interrupt Condition |
|---|---|---|---|---|---|
| INTRIICRI | Receive-data-full | RDRF | Possible | High | RDRF = 1 • RIE = 1 |
| INTRIICTI | Transmit-data-empty | TDRE | Possible | | TDRE = 1 • TIE = 1 |
| INTRIICTEI | Transmission complete | TEND | Not possible | | TEND = 1 • TEIE = 1 |
| INTRIICNAKI | Reception of a NACK | NACKF | Not possible | | NACKF = 1 • NAKIE = 1 |
| INTRIICSPI | Detection of a stop condition | STOP | Not possible | | STOP = 1 • SPIE = 1 |
| INTRIICSTI | Detection of a start condition | START | Not possible | | START = 1 • STIE = 1 |
| INTRIICALI | Arbitration lost | AL | Not possible | | AL = 1 • ALIE = 1 |
| INTRIICTMOI | Timeout | TMOF | Not possible | Low | TMOF = 1 • TMOIE = 1 |

Note 1. When the interrupt priority register (ICDIPRn) setting is the same

Clear or mask the each flag during interrupt handling.

**CAUTIONS**

1. There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.
2. Since INTRIICRI and INTRIICTI are edge-detected interrupts, they do not require clearing.
3. When using the INTRIICTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICTEI interrupt processing.
4. When using the INTRIICSPI interrupt, clear the RIICnSR2.STOP flag in the INTRIICSPI interrupt processing.
5. When using the INTRIICSTI interrupt, clear the RIICnSR2.START flag in the INTRIICSTI interrupt processing.
6. When using the INTRIICNAKI interrupt, clear the RIICnSR2.NACKF flag in the INTRIICNAKI interrupt processing.
7. When using the INTRIICALI interrupt, clear the RIICnSR2.AL flag in the INTRIICALI interrupt processing.
8. When using the INTRIICTMOI interrupt, clear the RIICnSR2.TMOF flag in the INTRIICTMOI interrupt processing.

# 26.5 Operation

## 26.5.1 Communication Data Format

The I²C bus format consists of 8-bit data and 1-bit acknowledge (one frame). After a start condition or restart condition is issued, the master device sends the slave address and data direction in the first frame. The specified slave is valid until a stop condition is issued or a new slave is specified by a restart condition.

**Figure 26.3** shows the I²C bus format, and **Figure 26.4** shows the I²C bus timing.

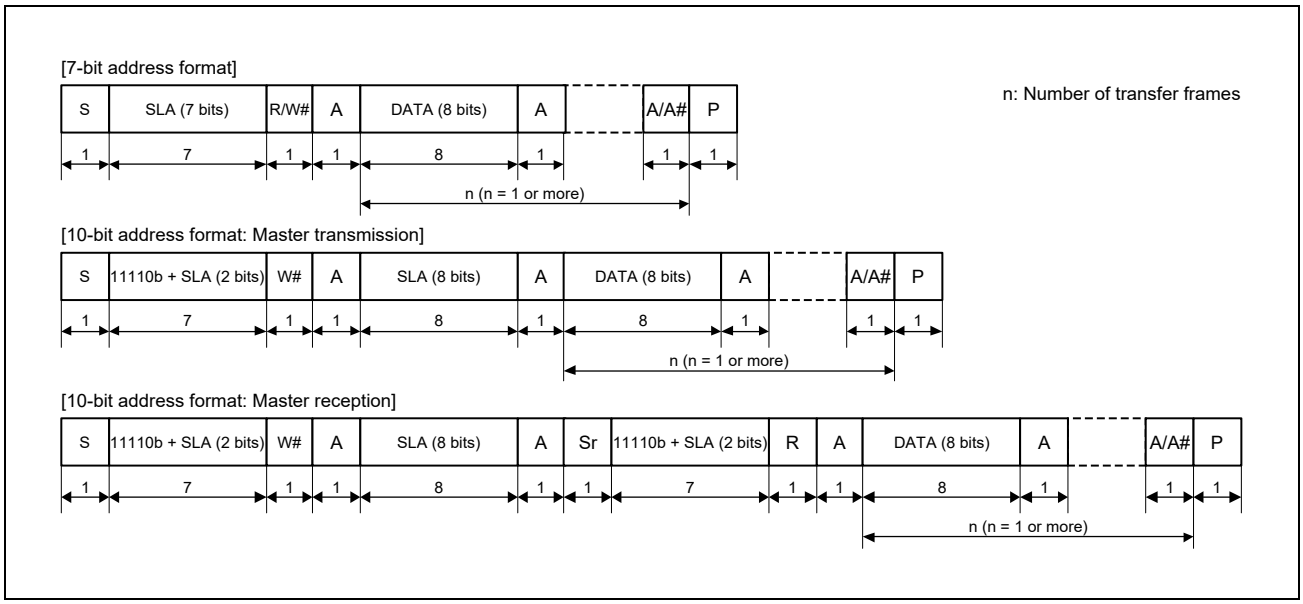

Figure 26.3 I²C Bus Format

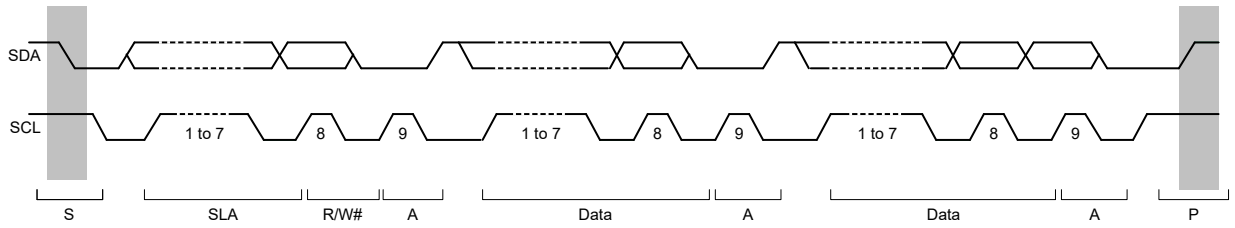


S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.

Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

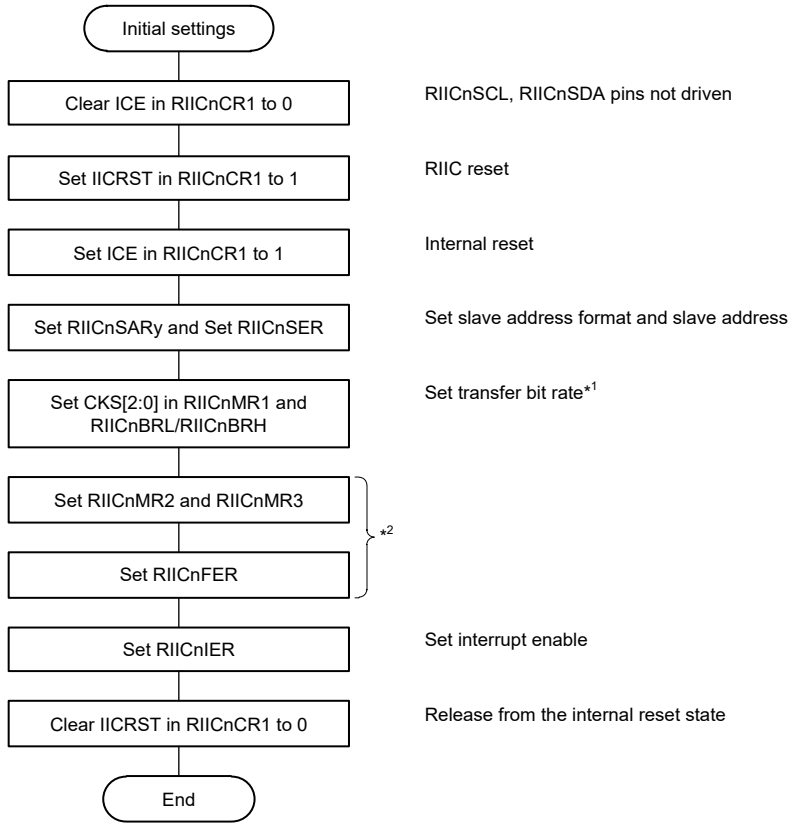
DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

Figure 26.4 I²C Bus Timing (SLA = 7 Bits)

### 26.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in **Figure 26.5**.



**Note:** y = 0 to 2

Note 1. When the RIIC is used only in slave mode, set the RIICnBRL register to a value at least the same as the data setup time.

Note 2. Set these registers as necessary.

Figure 26.5 Example of RIIC Initialization Flowchart

### 26.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. **Figure 26.6** shows an example of usage of master transmission and **Figure 26.7** to **Figure 26.9** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 26.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.

Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.

For data transmission with an address in the 10-bit format, start by writing 1111 0b, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After the last byte of the data to be transmitted is written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00b and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) Clear the RIICnSR2.NACKF and STOP flags to 0.

**CAUTION**

Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

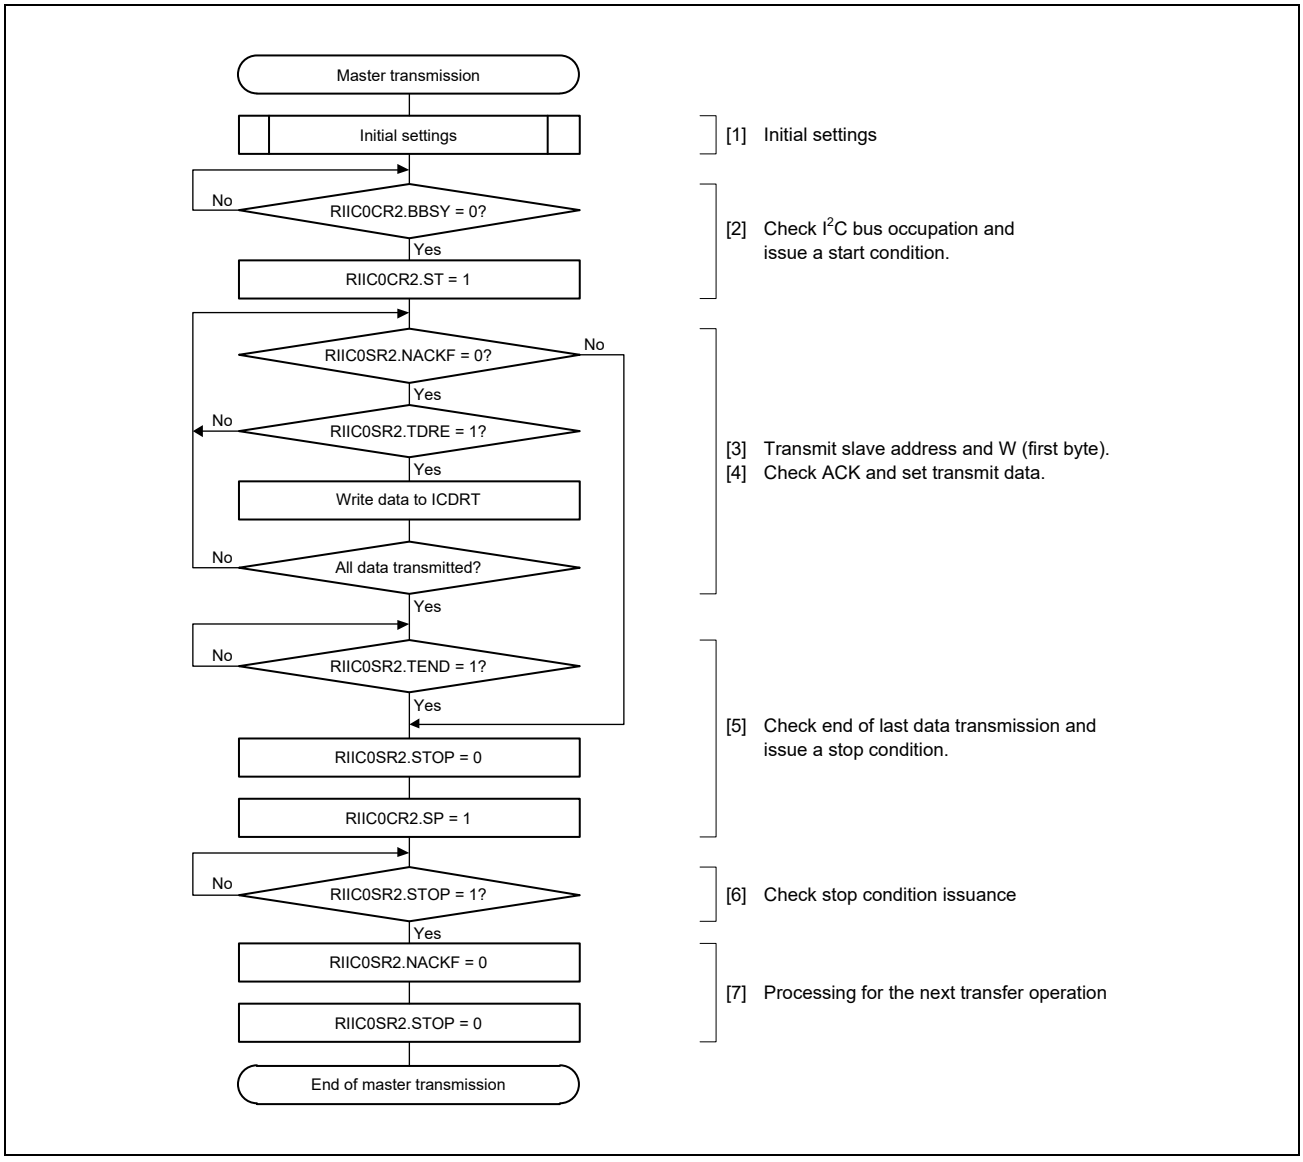


Figure 26.6 Example of Master Transmission Flowchart

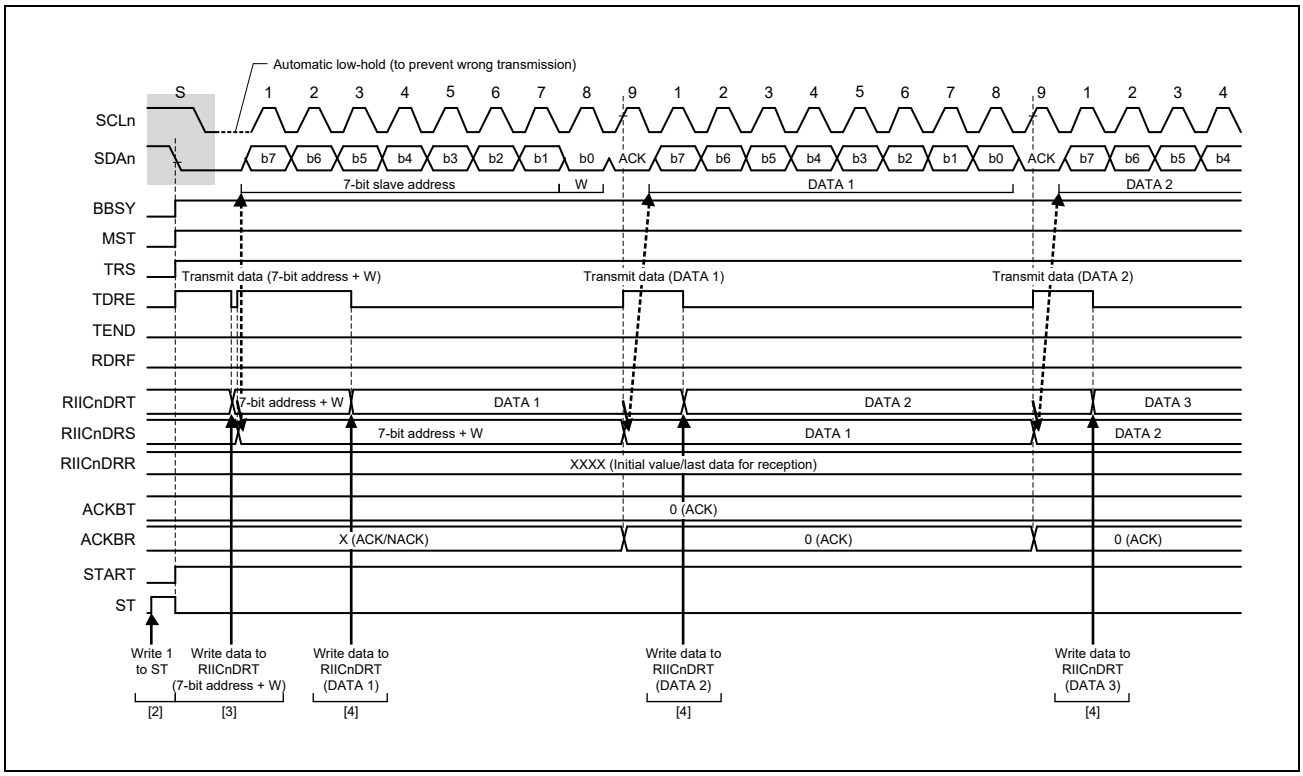

Figure 26.7 Master Transmit Operation Timing (1) (7-Bit Address Format)

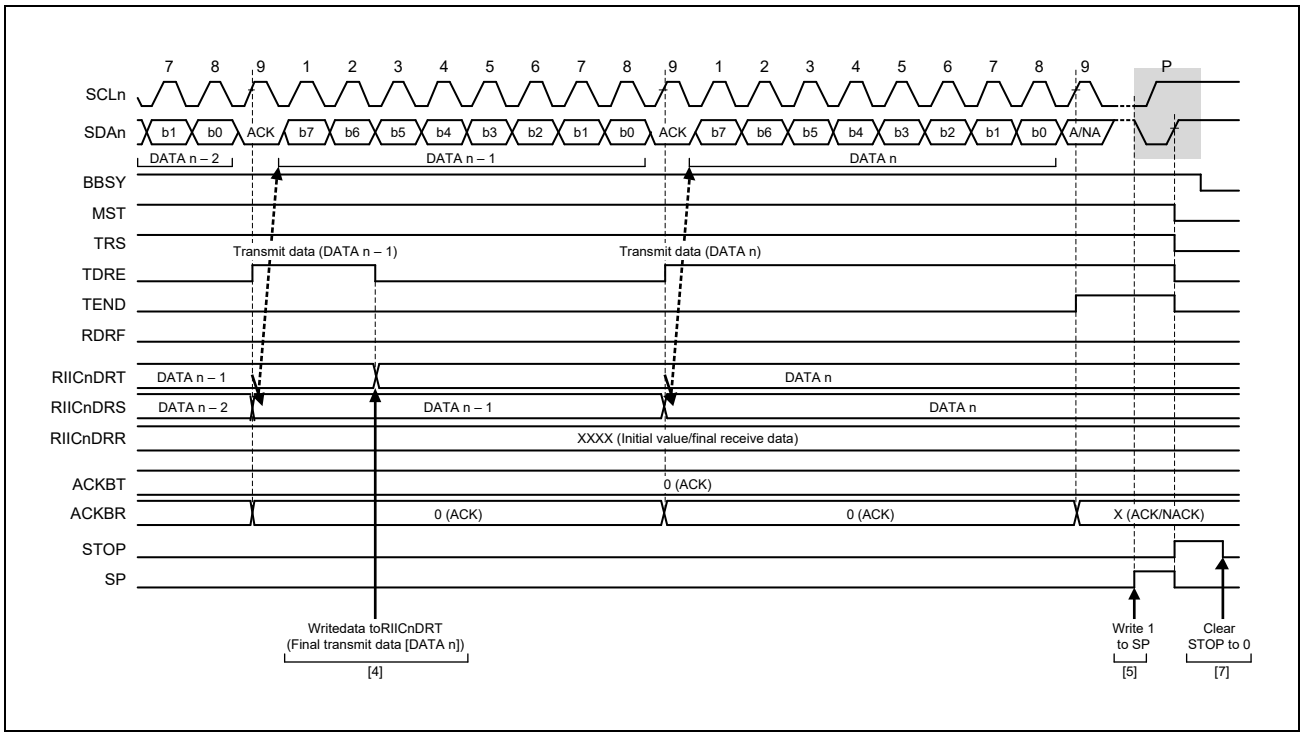

Figure 26.9 Master Transmit Operation Timing (3)

### 26.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

**Figure 26.10** shows an example of usage for the master reception of 3 or more bytes (7-bit address format), **Figure 26.14** shows an example of usage for the master reception of 1 or 2 bytes (7-bit address format), and **Figure 26.11** to **Figure 26.13** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 26.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. Once the byte containing the slave address and R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.

Since the RIICnSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.

For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmitting 1111 0b, the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit

to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00b and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

### 26.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

**Figure 26.15** shows an example of usage of slave transmission and **Figure 26.16** and **Figure 26.17** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in **Figure 26.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TEND flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait unit the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode.

(7) Clear the RIICnSR2.NACKF and STOP flags to 0.

**CAUTION**

Operations for transfer start if the RIICnSR2.NACKF flag is cleared to 0 before RIICnSR2.STOP is set to 1. Be sure to confirm that RIICnSR2.STOP is set to 1 before clearing RIICnSR2.NACKF to 0. In particular, when the NACK receive interrupt (INTRIICNAKI) is in use, take care not to clear the NACKF flag to 0 before the STOP flag is set to 1 during interrupt processing.

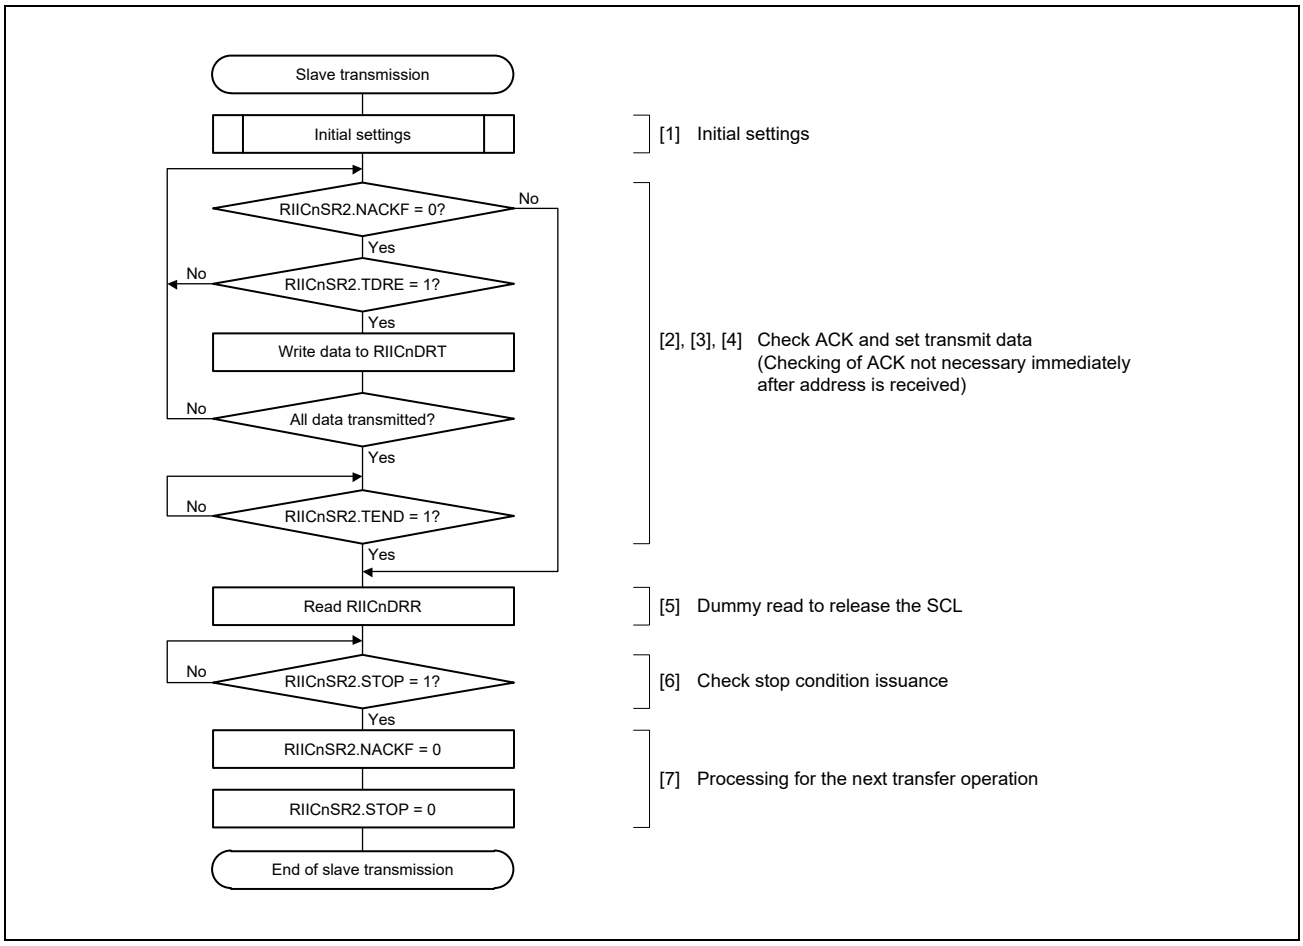

Figure 26.15 Example of Slave Transmission Flowchart

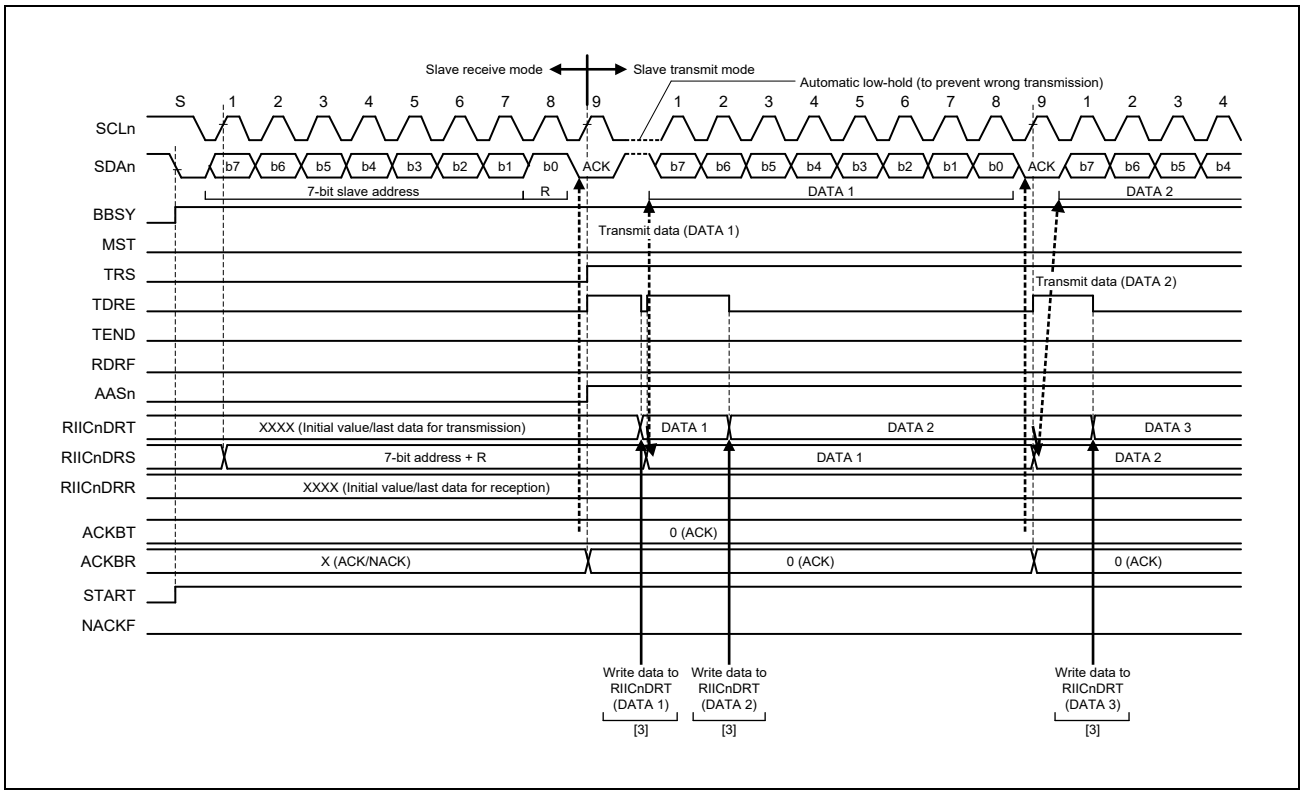

Figure 26.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)

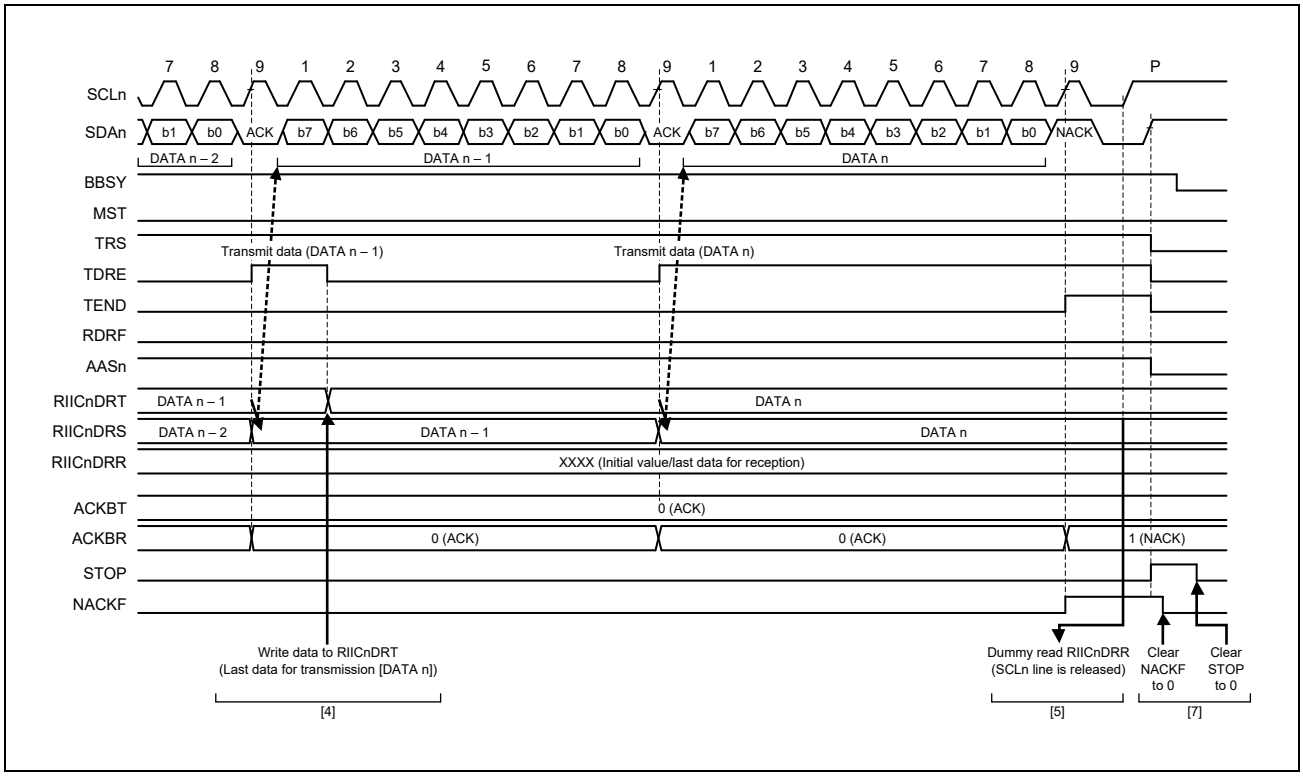

Figure 26.17 Slave Transmit Operation Timing (2)

### 26.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

**Figure 26.18** shows an example of usage of slave reception and **Figure 26.19** and **Figure 26.20** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

(1) Follow the procedure in **Figure 26.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC will stay in the standby state until it receives a slave address that it matches.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and outputs the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.

(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).

(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.

When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.

(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.HOA, GCA, and AASy (y = 0 to 2) to 0.

(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

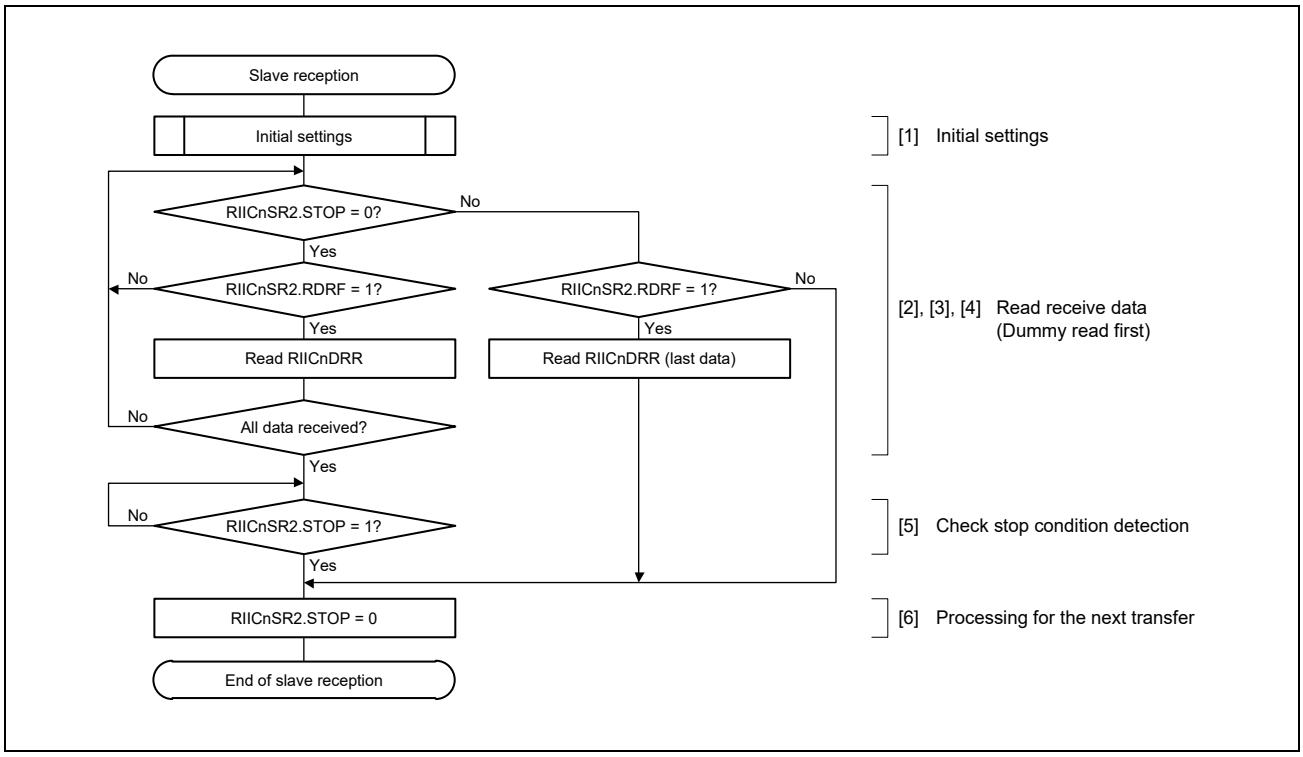

Figure 26.18 Example of Slave Reception Flowchart

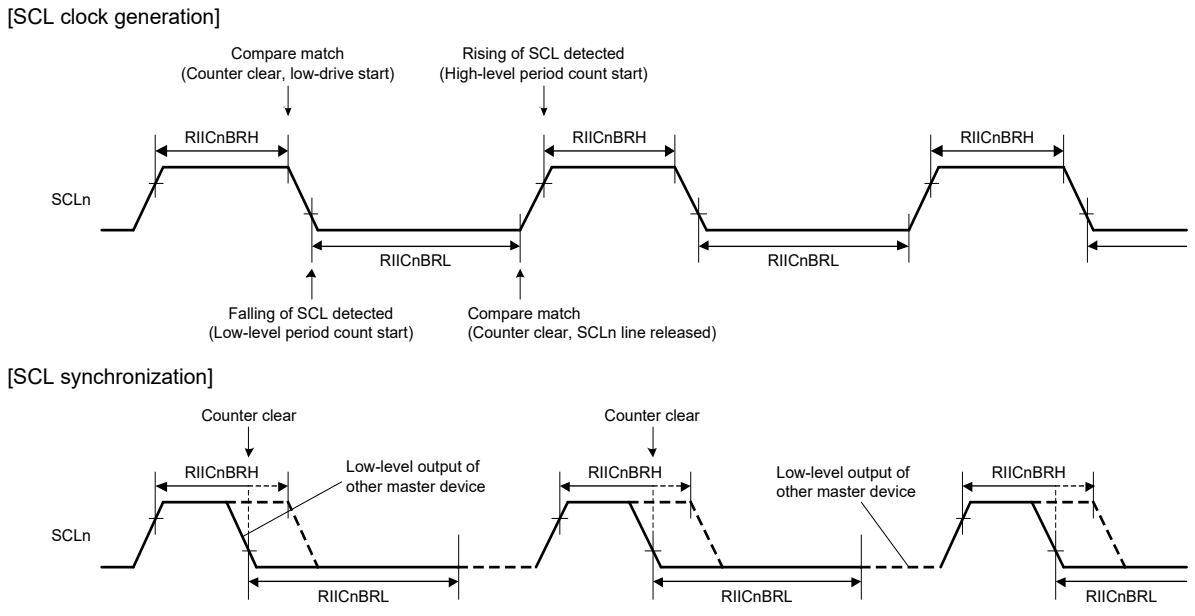
## 26.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I²C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. When the RIIC finishes outputting the low-level period of the SCL clock, the SCL line is released and the SCL clock rises. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.



**Note:** RIICnBRH: I²C bus bit rate high-level register (SCL clock high-level period counter)
RIICnBRL: I²C bus bit rate low-level register (SCL clock low-level period counter)

Figure 26.21 Generation and Synchronization of the SCL Signal from the RIIC

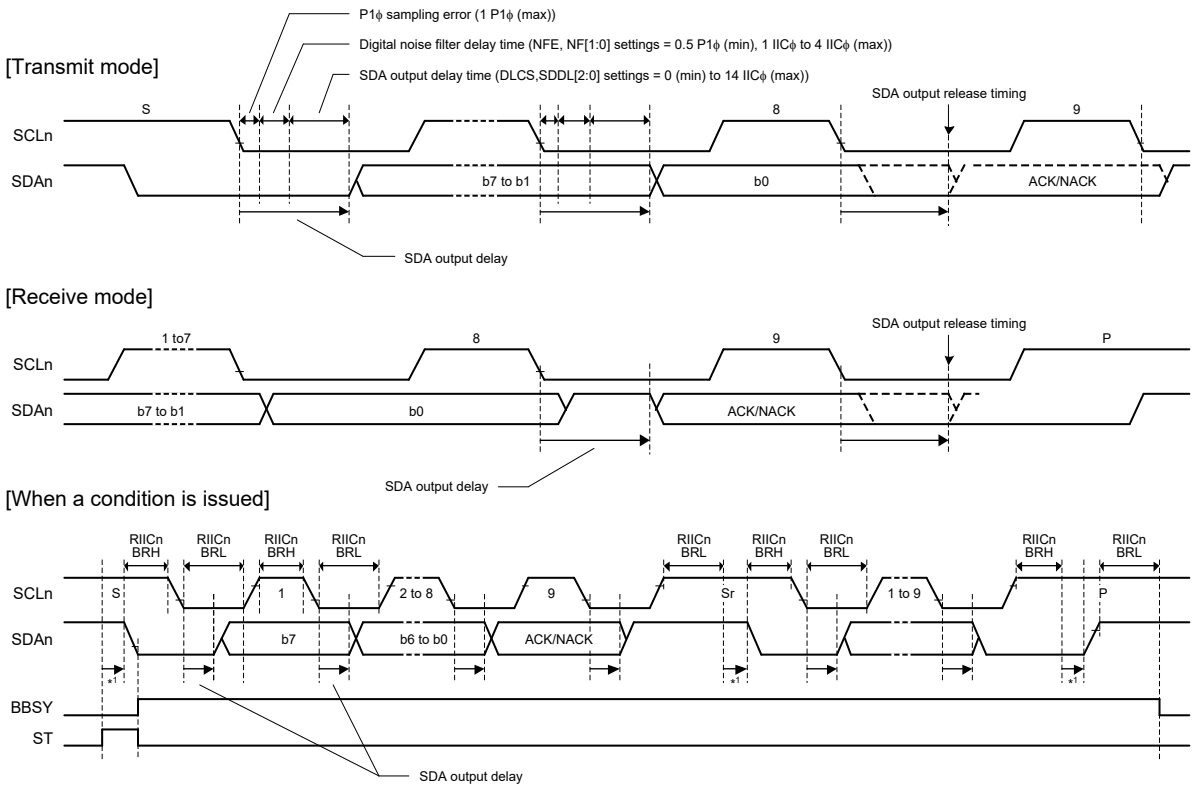
## 26.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices, with the aim of satisfying the 300-ns (min.) data-hold time requirement of the SMBus specification.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than 000b, and disabled by setting the same bits to 000b.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits in IMCR2 are set to any value other than 000b), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICϕ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in IMCR2. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.



Note 1. The output is delayed by the number of cycles set by the SDDL [2:0] bits when a start (S), restart (Sr), or stop (P) condition is issued.

Figure 26.22 SDA Output Delay Facility

## 26.8 Digital Noise-Filter Circuits

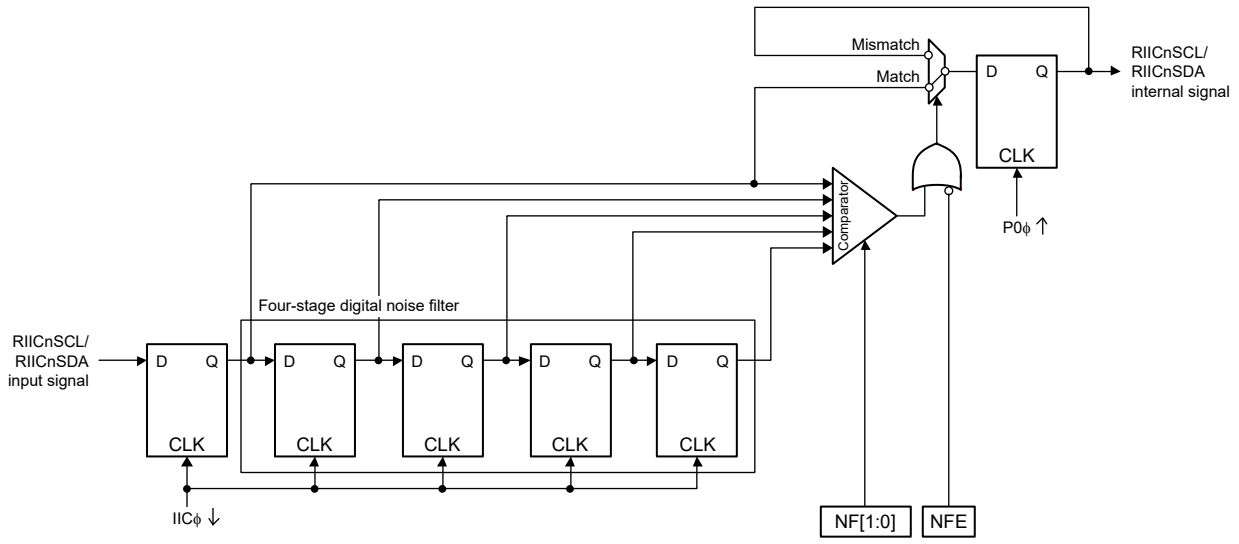
**Figure 26.23** is a block diagram of the digital noise-filter circuit. When the NFE bit in the RIICnFER register is set to 1, input to the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through digital noise-filter circuits.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match- detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICϕ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed to the subsequent stage. If the signal levels do not match, the previous value is retained.

If the ratio between P0ϕ and IICϕ is small when the RIICnMR1.CKS[2:0] bits are set to 000b, note that the characteristics of the digital noise filter may lead to the elimination of needed signals as noise.



**Note:** NFE: Digital noise filter circuit enable bit
NF[1:0]: Digital noise filter stage selection bits

Figure 26.23 Block Diagram of Digital Noise Filter Circuit

## 26.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and host address, and also can set 7- bit or 10-bit slave addresses.

### 26.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected. When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle, and the RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive data full interrupt (INTRIICRI) or transmit data empty interrupt (INTRIICTI) to be generated. The AASy flag is used to identify which slave address has been specified.

**Figure 26.24** to **Figure 26.26** show the AASy flag set timing in three cases.

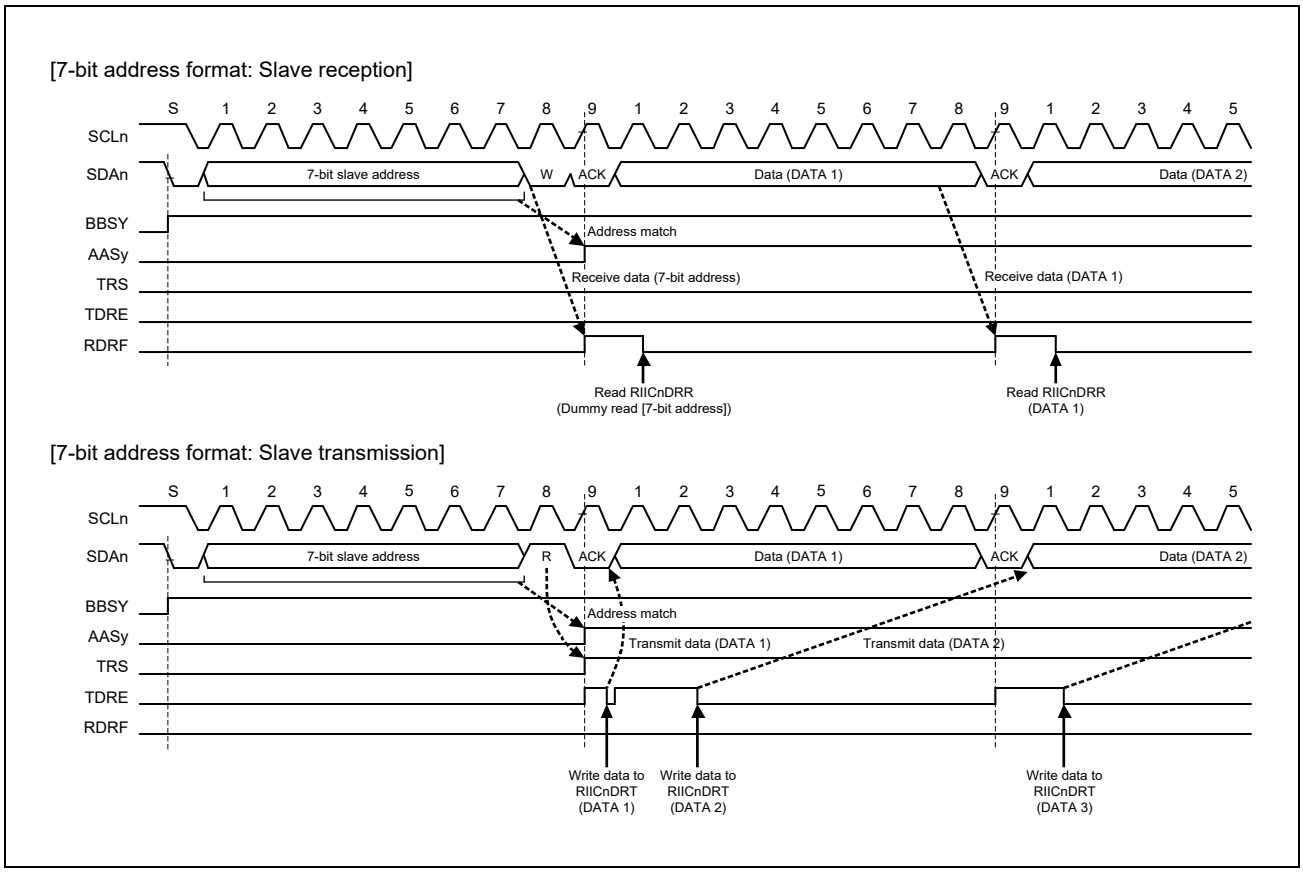


Figure 26.24 AASy Flag Set Timing with 7-Bit Address Format Selected

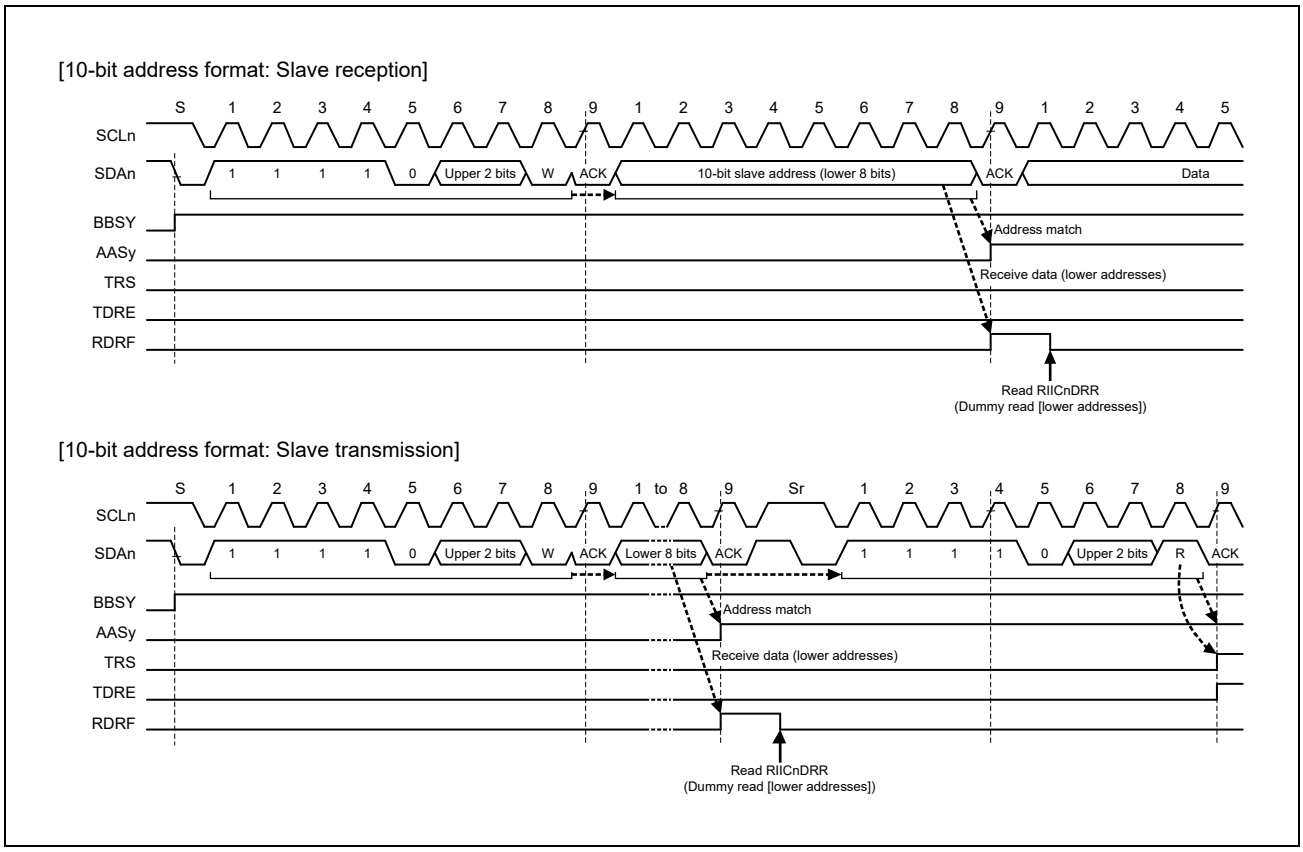

Figure 26.25 AASy Flag Set Timing with 10-Bit Address Format Selected

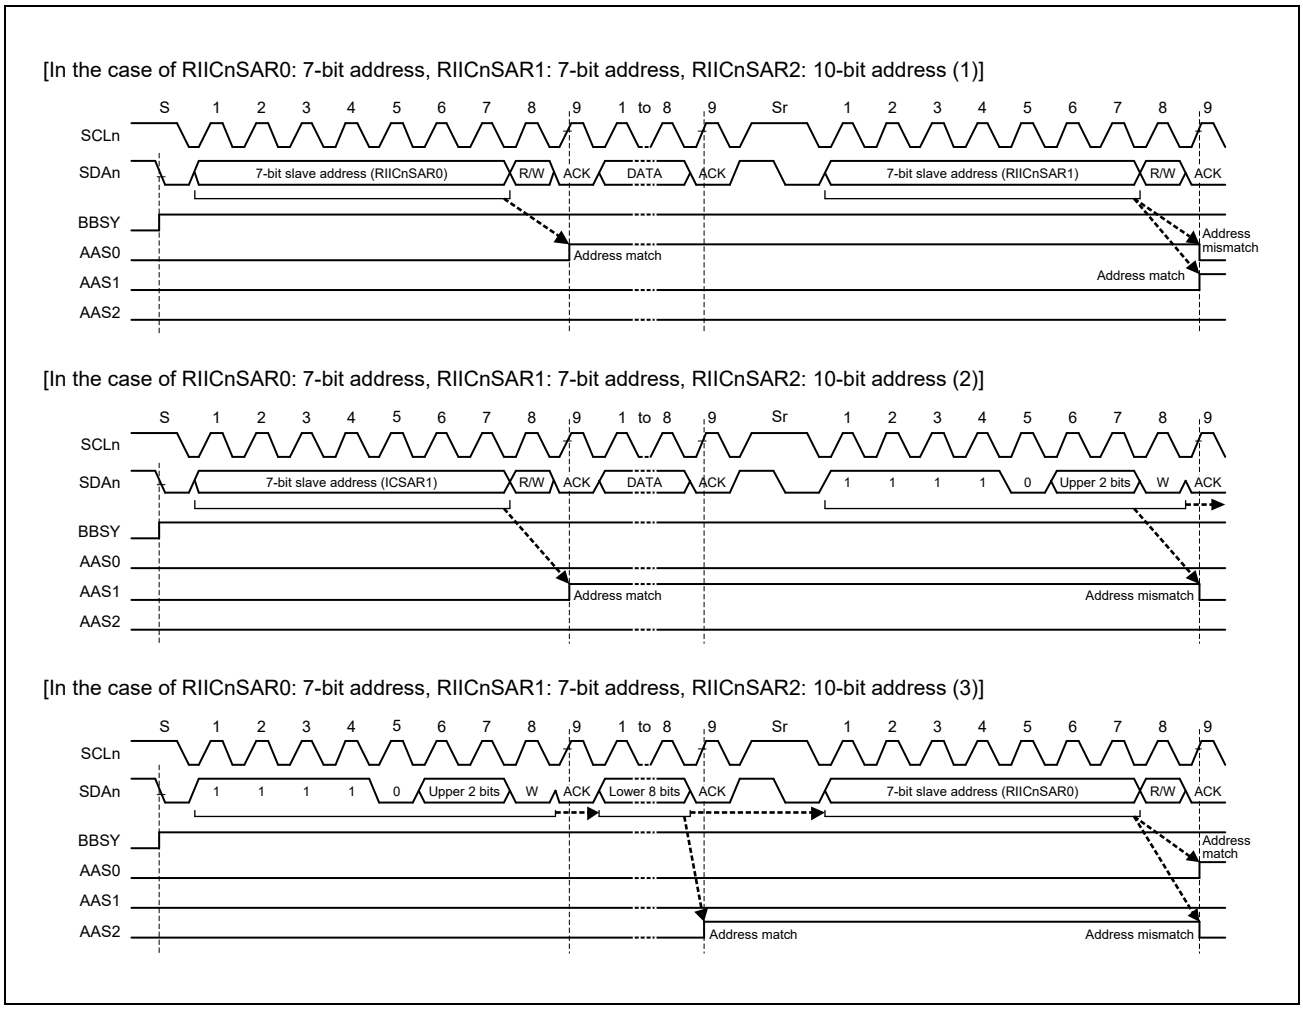

Figure 26.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed

### 26.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address (0000 000b + 0 [W]). This is enabled by setting the RIICnSER.GCE bit to 1.

If the address received after a start or restart condition is issued is 0000 000b + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive data full interrupt (INTRIICRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

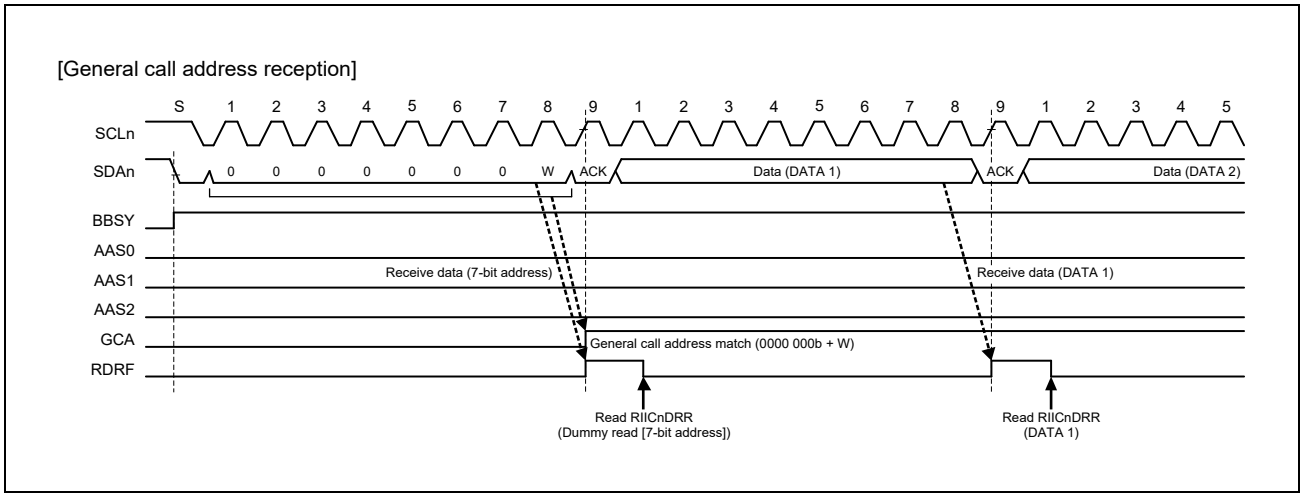

Figure 26.27 Timing of GCA Flag Setting during Reception of General Call Address

### 26.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conformant with the I²C bus specification (Rev. 03). When the RIIC receives 1111 100b as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 100b) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 100b) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I²C Bus Standard from NXP Semiconductors.

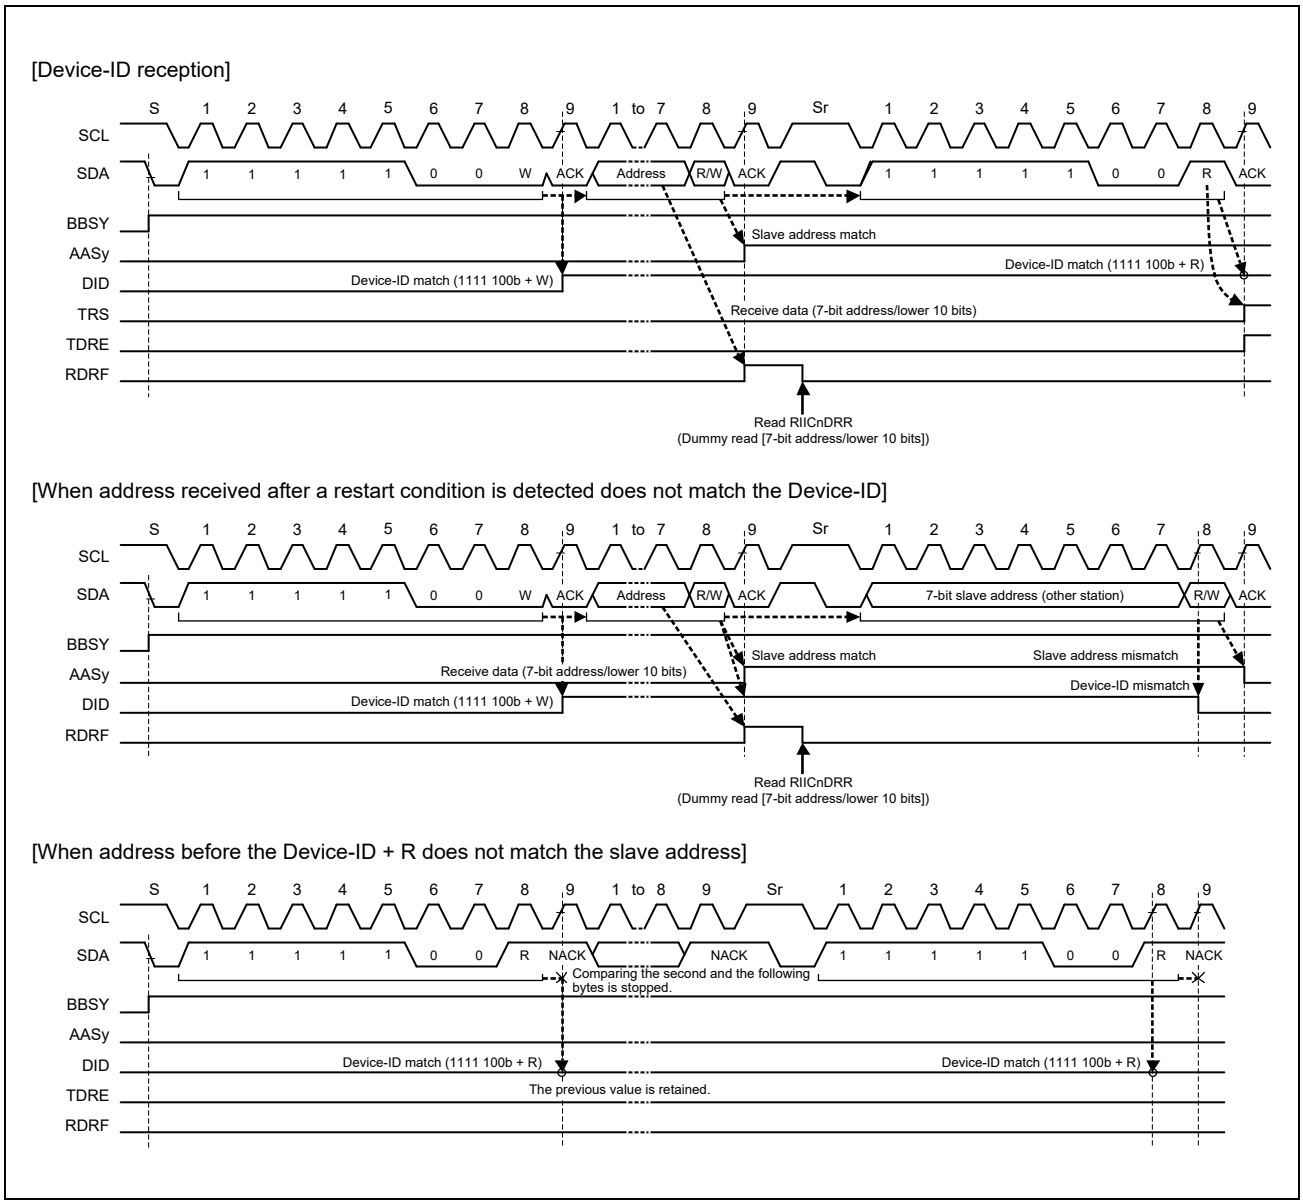

Figure 26.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID

### 26.9.4 Host Address Detection

The RIIC has a function to detect the host address while the SMBus is operating. When the RIICnSER.HOAE bit is set to 1 while the RIICnMR3.SMBS bit is 1, the RIIC can detect the host address (0001 000b) in slave receive mode (RIICnCR2.MST and TRS bits = 00b).

When the RIIC detects the host address, the RIICnSR1.HOA flag is set to 1 at the rising edge of the ninth SCL clock cycle, and at the same time, the RIICnSR2.RDRF flag is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (INTRIICRI) to be generated. The HOA flag is used to recognize that the host address was sent from the smart battery or other devices.

If the bit following the host address (0001 000b) is an Rd bit (R/W# bit = 1), the RIIC can also detect the host address. After the host address is detected, the RIIC operates in the same manner as normal slave operation.

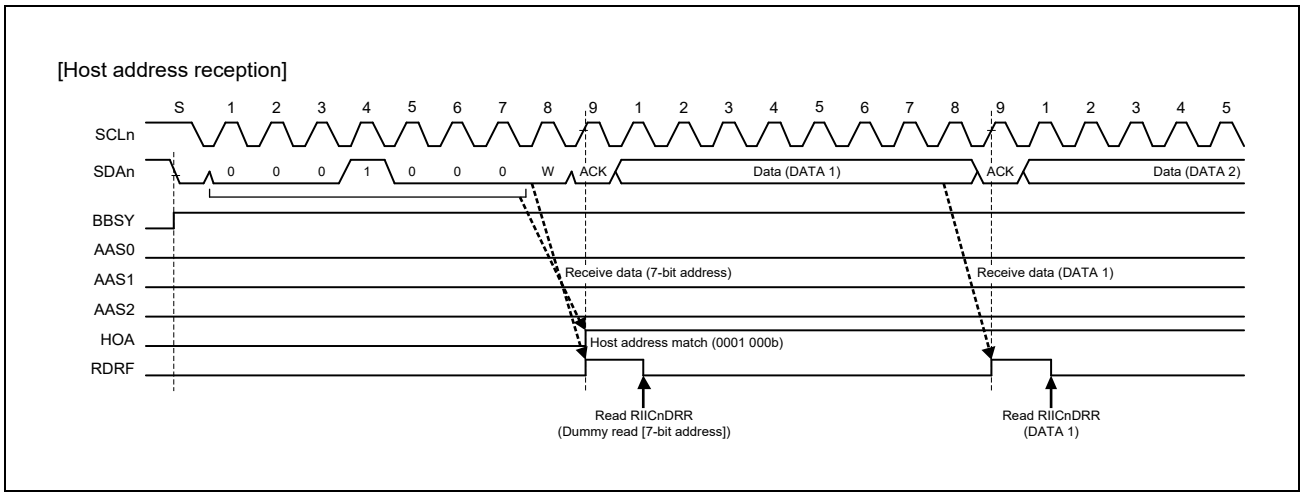

Figure 26.29 HOA Flag Set Timing during Reception of Host Address

# 26.10 Automatically Low-Hold Function for SCL

## 26.10.1 Function to Prevent Wrong Transmission of Transmit Data

If the shift register (RIICnDRS) is empty when data have not been written to the transmit data register (RIICnDRT) with the RIIC in transmission mode (RIICnCR2.TRS bit = 1), the SCL signal is automatically held at the low level over the intervals shown below. This low-hold period is extended until data for transmission have been written, which prevents the unintended transmission of erroneous data.

**<Master transmit mode>**

- Low-level interval after a start condition or restart condition is issued
- Low-level interval of one clock cycle between the ninth clock cycle of one transfer and the first clock cycle of the next

**<Slave transmit mode>**

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next

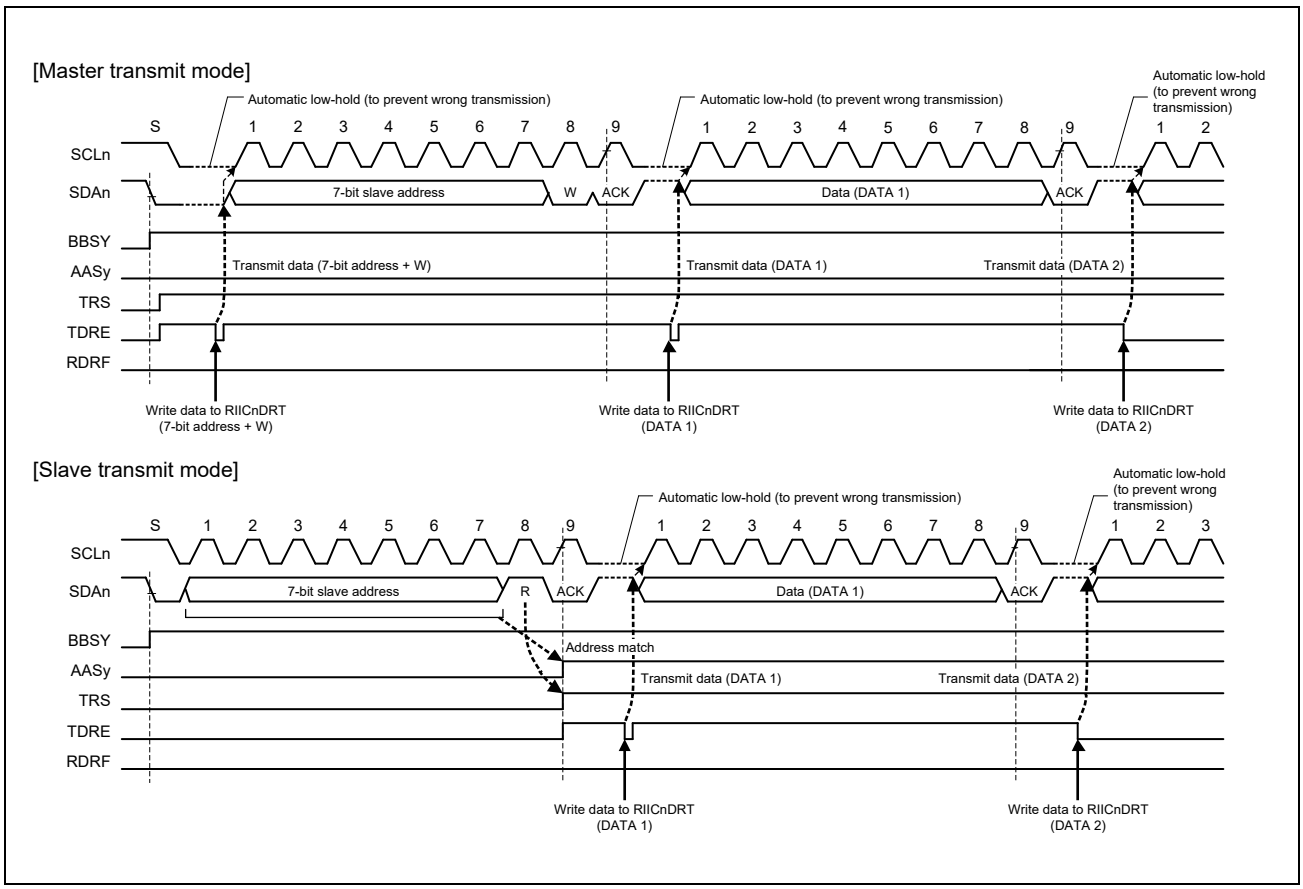

Figure 26.30 Automatic Low-Hold Operation in Transmit Mode

## 26.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0 after issuing a restart condition or clear the NACKF and STOP flags to 0 after confirming that a stop condition has been issued, and then issue a start condition.

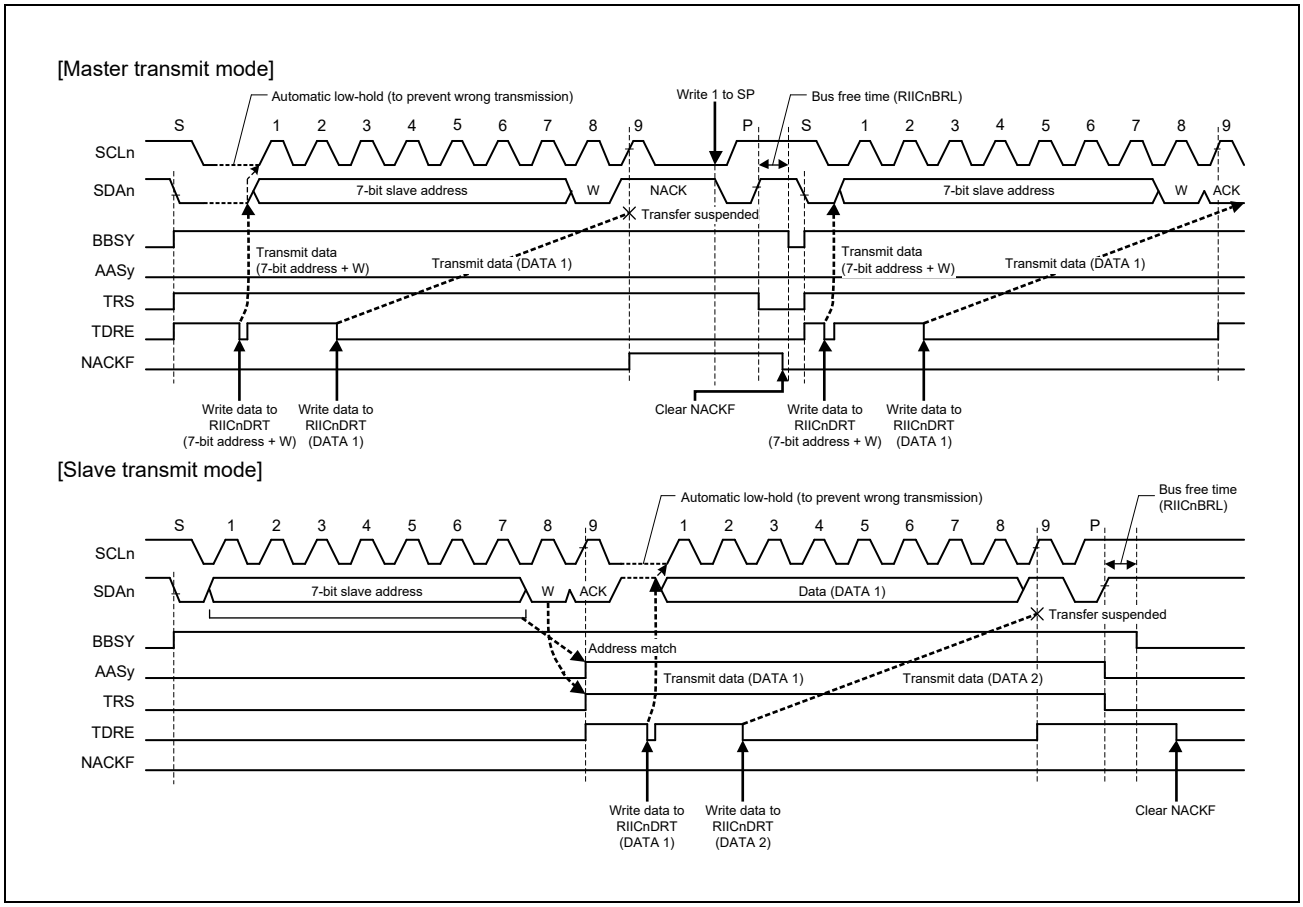

Figure 26.31 Suspension of Data Transfer when NACK is Received (NACKE = 1)

### 26.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive data full (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

#### (1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function. Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

#### (2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function. When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive data full) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and host address) is obtained in master receive mode or slave receive mode.

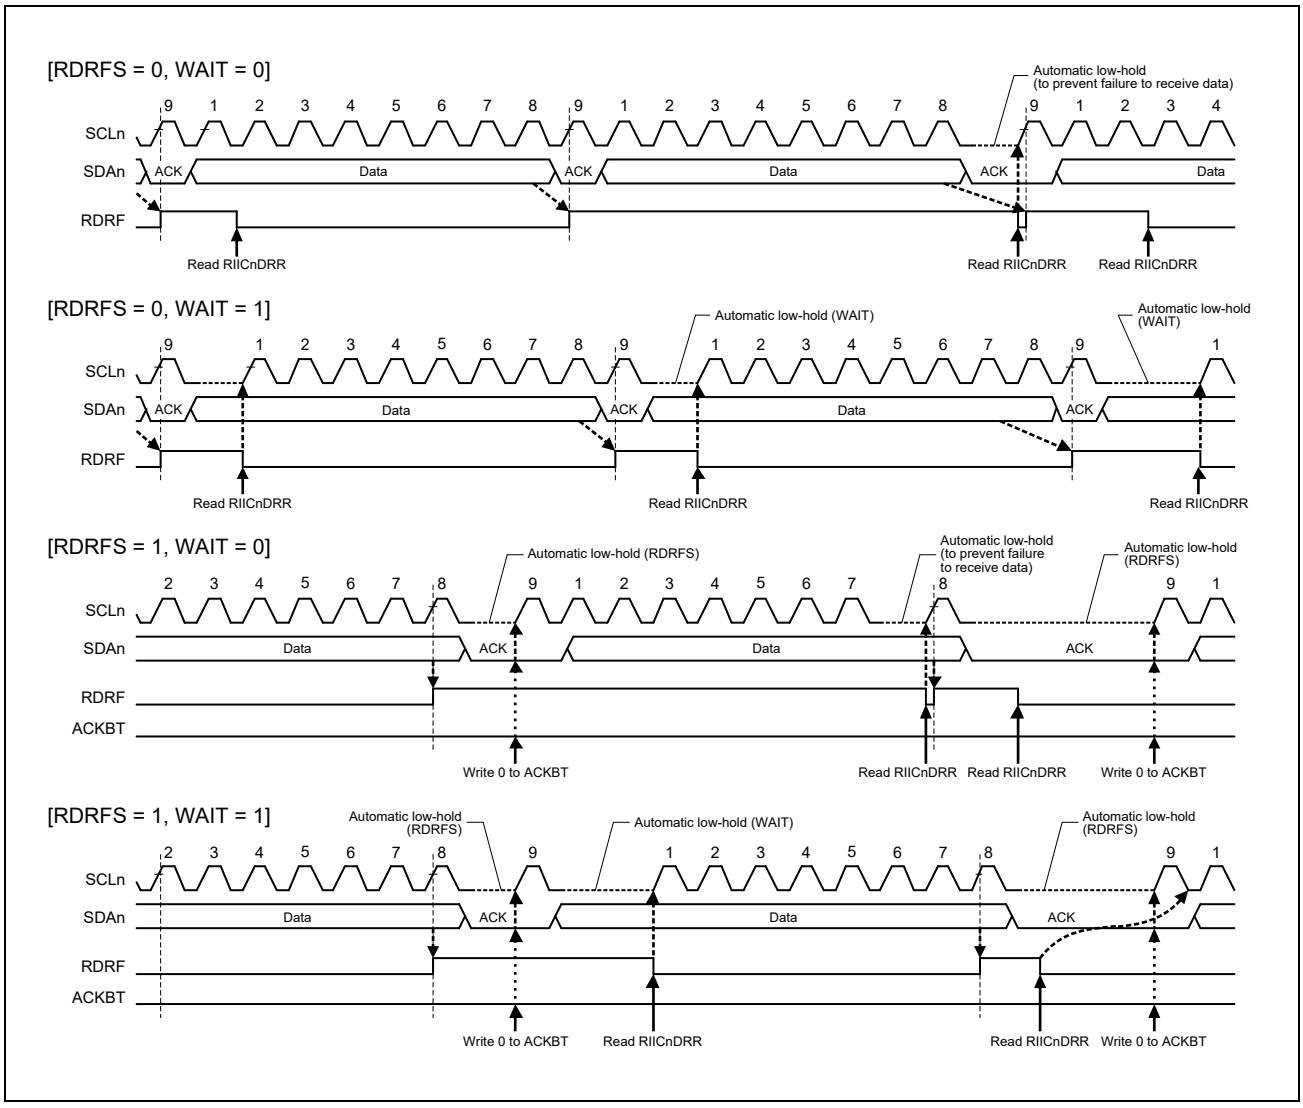

Figure 26.32 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)

## 26.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I²C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

### 26.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC regards its own issuing of a start condition as an error and considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the RIICnCR2.ST bit to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC regards this as a double-issuing-of-start-condition error and considers itself to have lost in arbitration, thus preventing a failure of transfer due to issuing of a start condition while transfer is in progress.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line, the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = 11b)

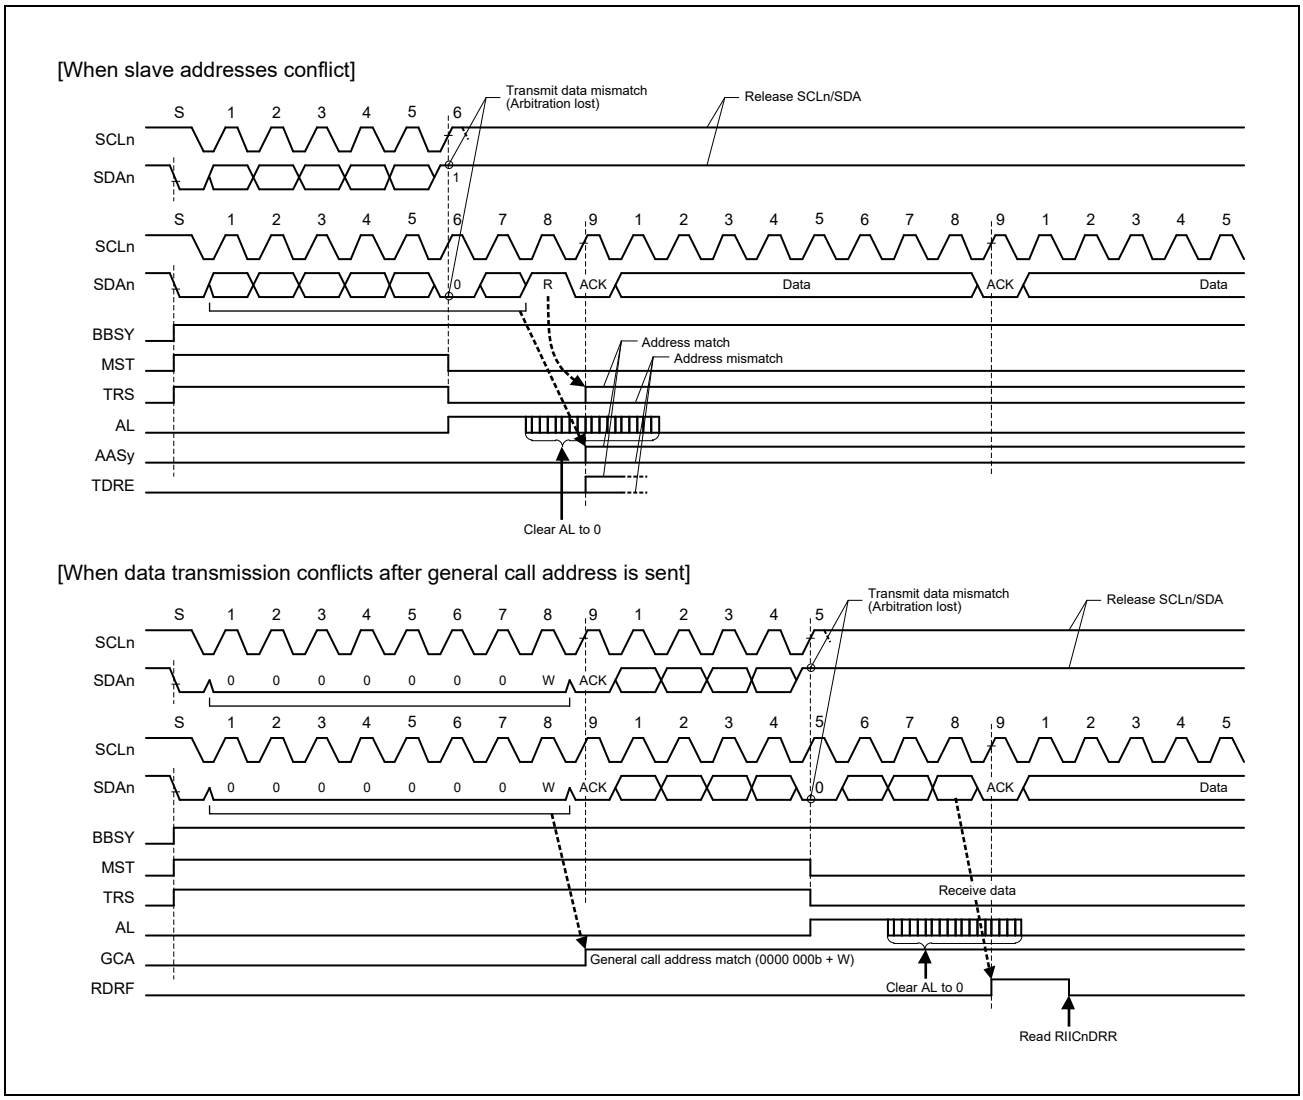

Figure 26.33 Examples of Master Arbitration-Lost Detection (MALE = 1)

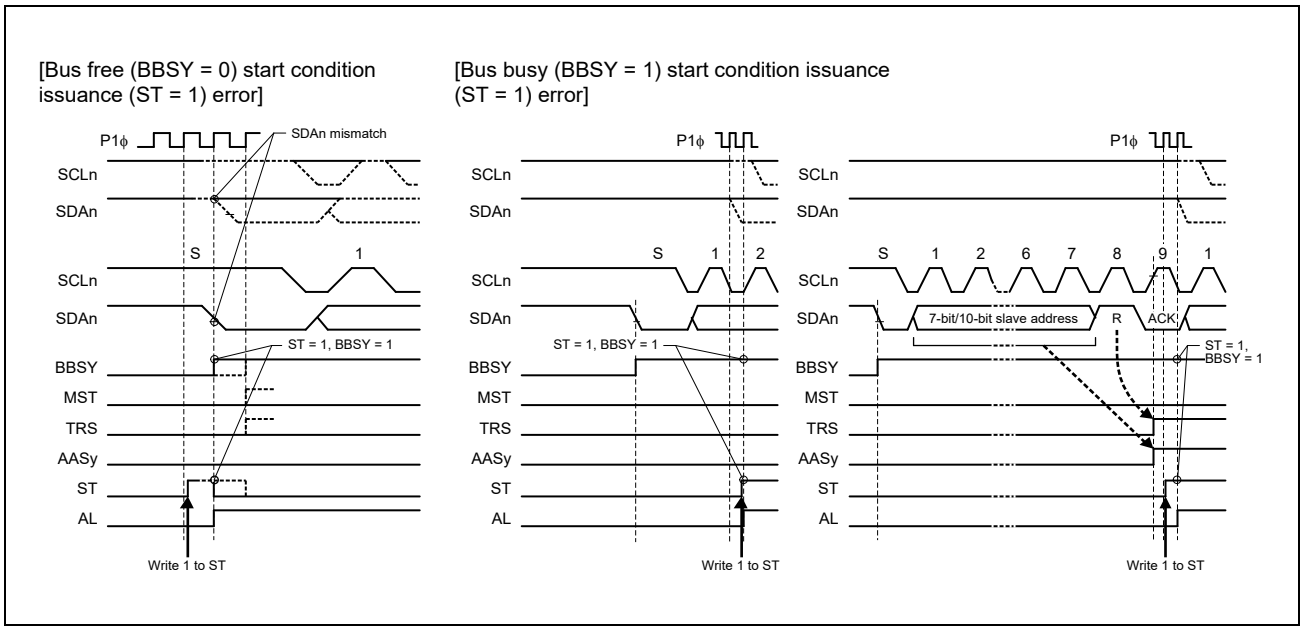

Figure 26.34 Arbitration-Lost when a Start Condition is Issued (MALE = 1)

### 26.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state) and the low level is detected on the SDA line during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. **Figure 26.35** shows an example of arbitration-lost detection during transmission of NACK.

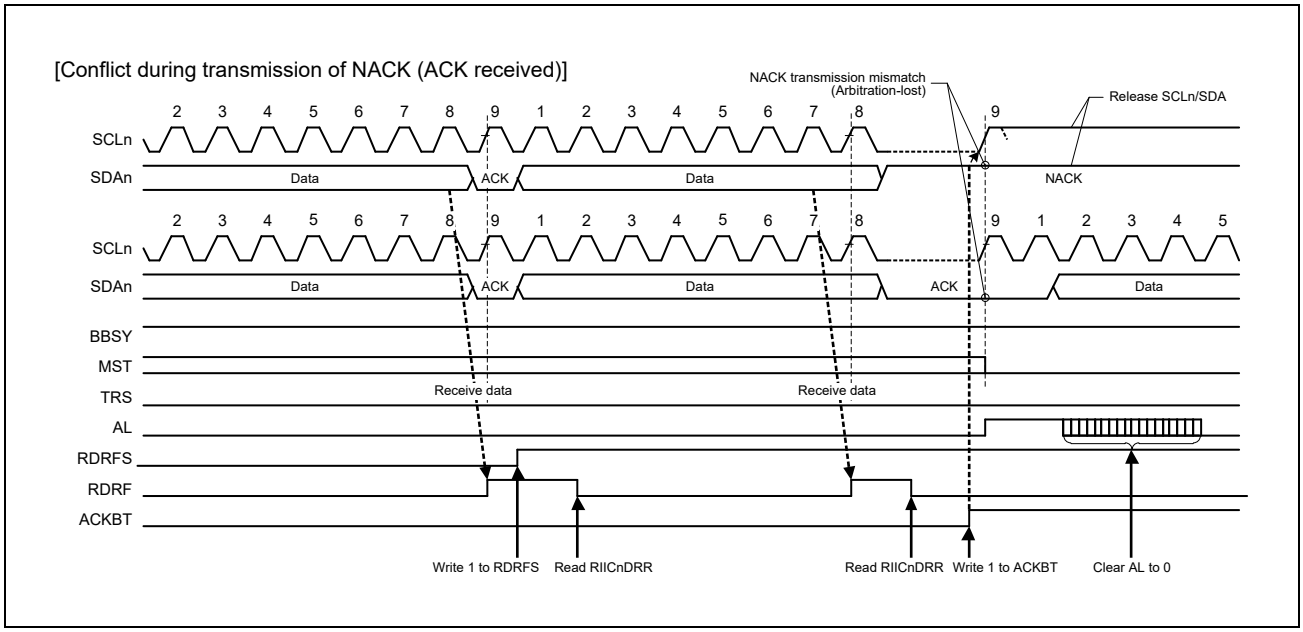

Figure 26.35 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition. Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing (such as H'FF transmission processing)

necessary if the UDID (Unique Device Identifier) of assign address does not match in the Get UDID (general) processing after the Assign address command.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1).

### 26.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state) and the low level is detected on the SDA line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When it loses slave arbitration, the RIIC enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing (processing for the transmission of H'FF).

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled). [Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = 01b)

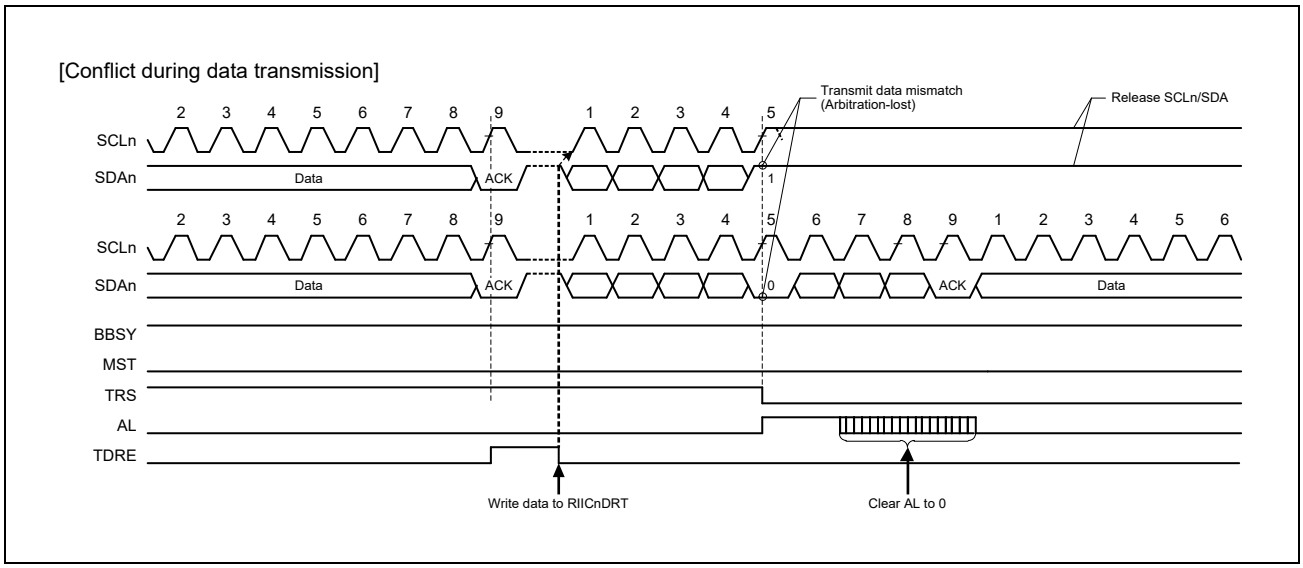

Figure 26.36 Example of Slave Arbitration-Lost Detection (SALE = 1)

# 26.12 Start Condition/Restart Condition/Stop Condition Issuing Function

## 26.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

## 26.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

**CAUTION**

To issue a restart condition request, set RIICnSR2.RS to 1 after setting RIICnSR2.START to 0. After checking that RIICnSR2.START is 1, set RIICnSR2.START to 0, and then write the slave address to RIICnDRT.

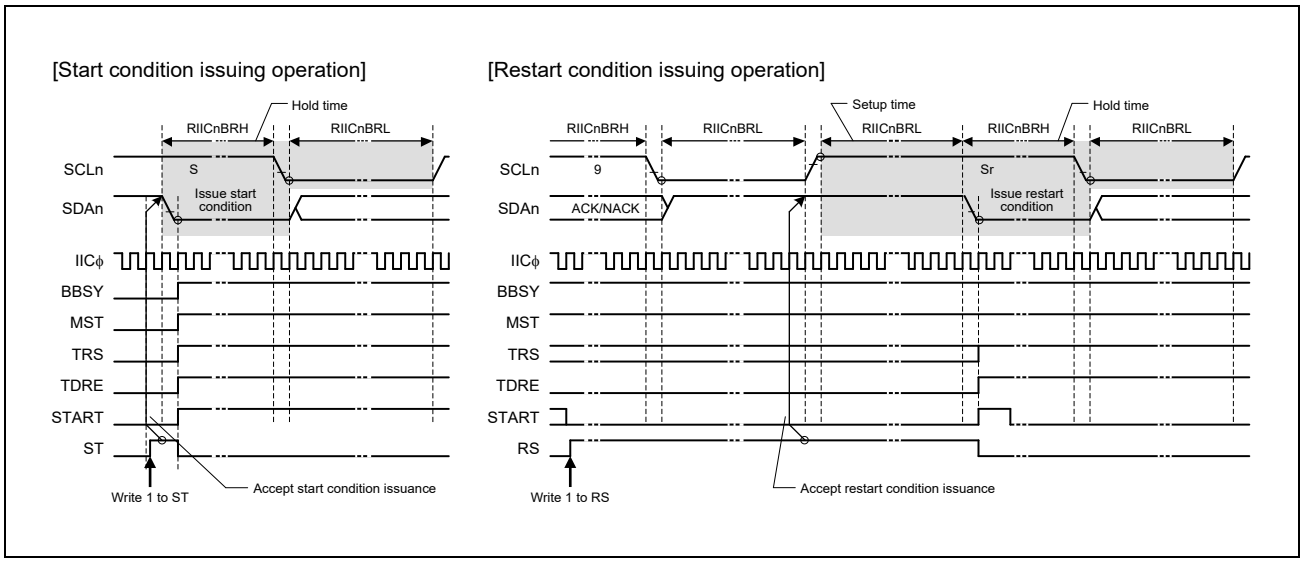

Figure 26.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits)

### 26.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

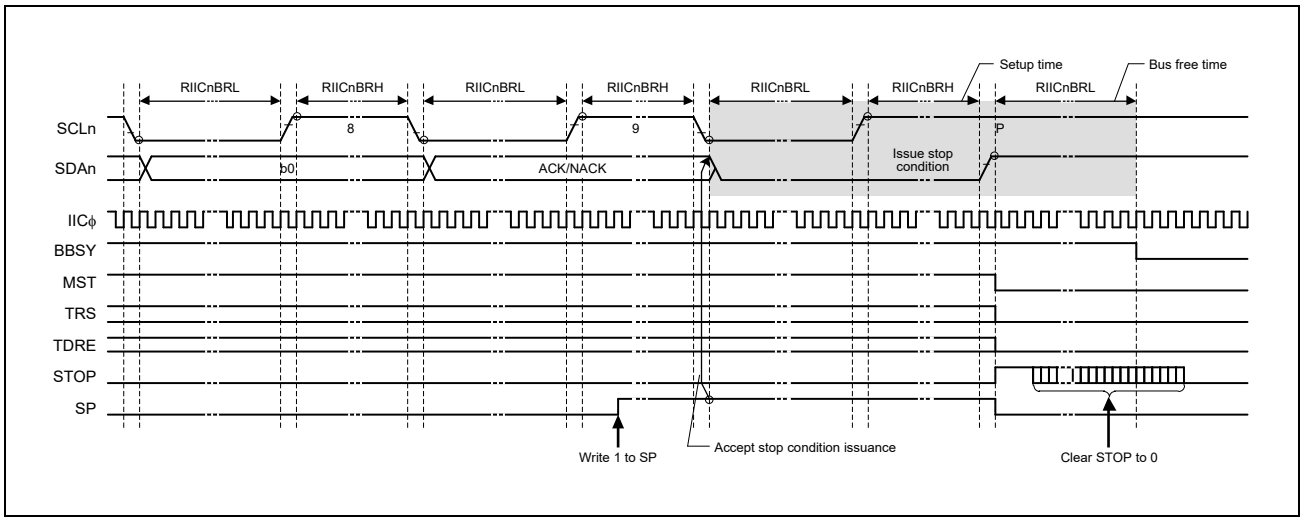

Figure 26.38 Stop Condition Issue Timing (SP Bit)

## 26.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I²C bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

### 26.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time. The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state in which the SCL line is held low or high in the following cases.

1. When the bus is busy (RIICnCR2.BBSY = 1) in master mode (RIICnCR2.MST = 1)
2. When the bus is busy (RIICnCR2.BBSY = 1) and the RIIC's own slave address matches (RIICnSR1 is not H'00) in slave mode (RIICnCR2.MST = 0)
3. While the bus is free (RIICnCR2.BBSY = 0) and issuing of a start condition is being requested (RIICnCR2.ST = 1).

The internal counter of the timeout function works using the internal reference clock (IICϕ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

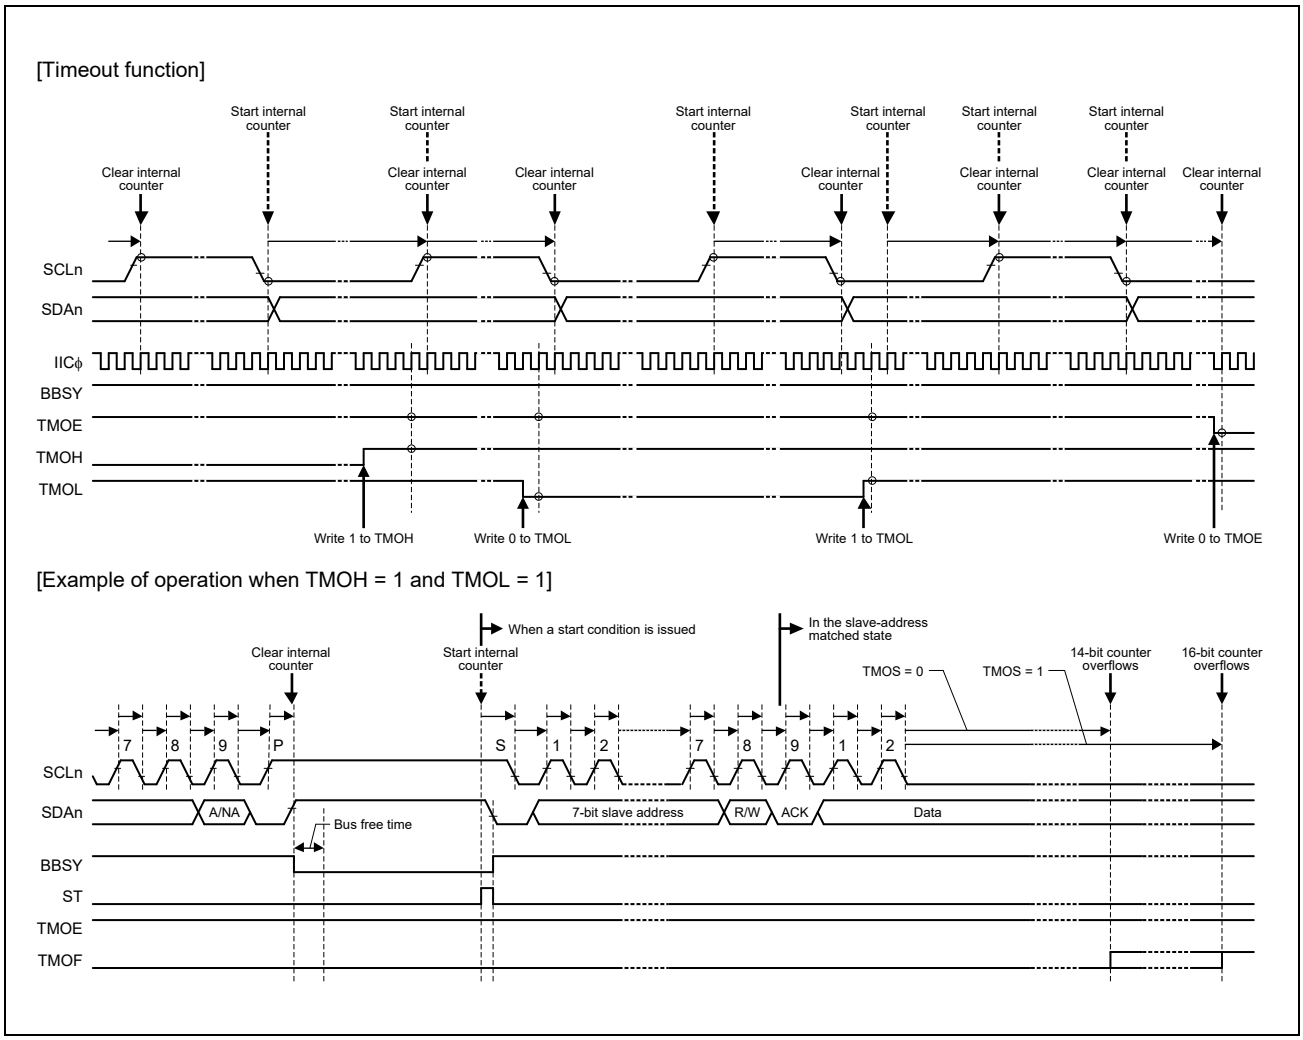

Figure 26.39 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)

### 26.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. At this point, the SCL pin output is held at a low level if the BBSY flag is 1, or the SCL pin outputs at high level if the BBSY flag is 0. Further clock cycles can consecutively be output by writing 1 to the CLO bit after having read CLO is 0 by software.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

[Output conditions for using the RIICnCR1.CLO bit]

- When the bus is free (RIICnCR2.BBSY flag = 0) or in master mode (RIICnCR2.MST bit = 1 and BBSY flag = 1)
- When the communication device does not hold the SCL line low

**Figure 26.40** shows the operation timing of the extra SCL clock cycle output function (CLO bit).

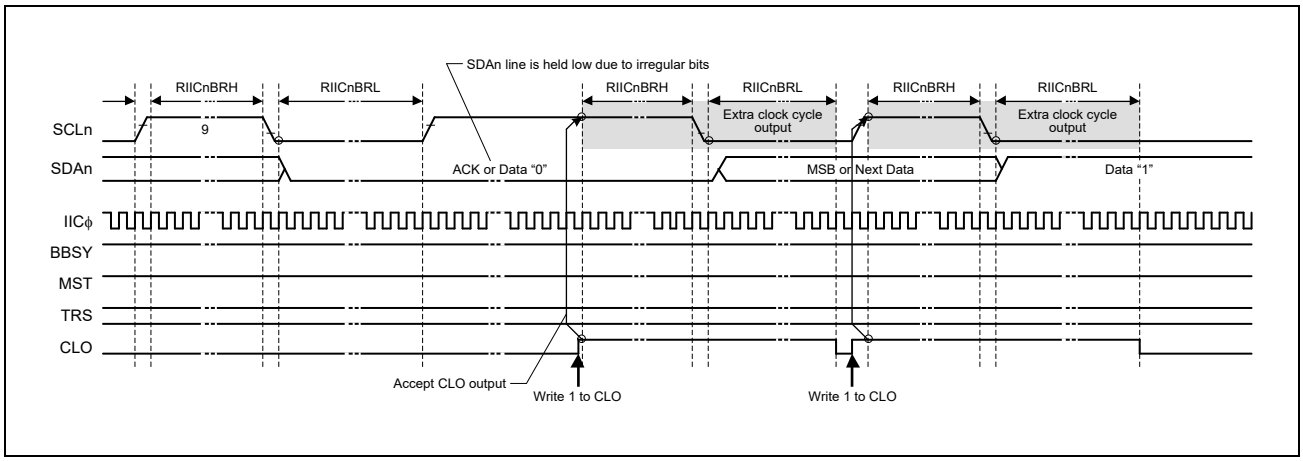

Figure 26.40 Extra SCL Clock Cycle Output Function (CLO Bit)

### 26.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings. After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoided this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = 01b).

For a detailed description of the RIIC and internal resets, see **Section 26.15, Reset Function of RIIC**.

## 26.14 SMBus Operation

The RIIC is available for data communication conforming to the SMBus (Version 2.0). To perform SMBus communication, set the RIICnMR3.SMBS bit to 1. To use the transfer rate within a range of 10 kbps to 100 kbps of the SMBus standard, set the RIICnMR1.CKS[2:0] bits, RIICnCBRH, and RIICnBRL. In addition, determine the values of the RIICnMR2.DLCS bit and the RIICnMR2.SDDL[2:0] bits to meet the data hold time specification of 300 ns or more. If the RIIC is used only as a slave device, the transfer rate setting is not necessary. When the RIIC is used only as a slave device, the transfer rate setting is not necessary, whereas the RIICnBRL needs to be set to a value at least the same as the data setup time (250 ns).

For the SMBus device default address (1100 001b), use one of the slave address registers L0 to L2 (RIICnSAR0, RIICnSAR1, and RIICnSAR2), and set the corresponding RIICnSARy.FSy bit (7-bit/10-bit address format select) (y = 0 to 2) to 0 (7-bit address format).

When transmitting the UDID (Unique Device Identifier), set the RIICnFER.SALE bit to 1 to enable the slave arbitration lost detection function.

### 26.14.1 SMBus Timeout Measurement

#### (1) Measuring timeout of slave device

The following period (timeout interval: $T_{LOW:SEXT}$) must be measured for slave devices in SMBus communication.

- From start condition to stop condition

  To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the internal timer using a start condition detection interrupt (INTRIICSTI) and stop condition detection interrupt (INTRIICSPI) of the RIIC. The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW:SEXT}$: 25 ms (max.) of the SMBus standard.

  If the time measured with the internal timer exceeds the clock low-level detection timeout TTIMEOUT: 25 ms (min.) of the SMBus standard, the slave device must release the bus by writing 1 to the RIICnCR1.IICRST bit to issue an internal reset of the RIIC. When an internal reset is issued, the RIIC stops driving the bus for the SCL pin and SDA pin and make the SCL/SDA pin outputs high impedance, which releases the bus.

#### (2) Measuring timeout of master device

The following periods (timeout interval: $T_{LOW:MEXT}$) must be measured for master devices in SMBus communication.

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition

To measure timeout for master devices, measure these periods with the internal timer using a start condition detection interrupt (INTRIICSTI), stop condition detection interrupt (INTRIICSPI), and transmit end interrupt (INTRIICTEI) or receive data full interrupt (INTRIICRI) of the RIIC. The measured timeout period must be within the total clock low-level extended period [master device] $T_{LOW:MEXT}$: 10 ms (max.) of the SMBus standard, and the total of all $T_{LOW:MEXT}$ from start condition to stop condition must be within $T_{LOW:SEXT}$: 25 ms (max.).

For the ACK receive timing (rising edge of the ninth SMBCLK clock cycle), monitor the RIICnSR2.TEND flag in master transmit mode (master transmitter) and the RIICnSR2.RDRF flag in master receive mode (master receiver). For this reason, perform bytewise transmit operation in master transmit mode, and hold the RIICnMR3.RDRFS bit 0 until the byte just before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 at the rising edge of the ninth SMBCLK clock cycle.

If the period measured with the internal timer exceeds the total clock low-level extended period [master device] $T_{LOW:MEXT}$: 10 ms (max.) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout TTIMEOUT: 25 ms (min.) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (writing data to RIICnDRT).

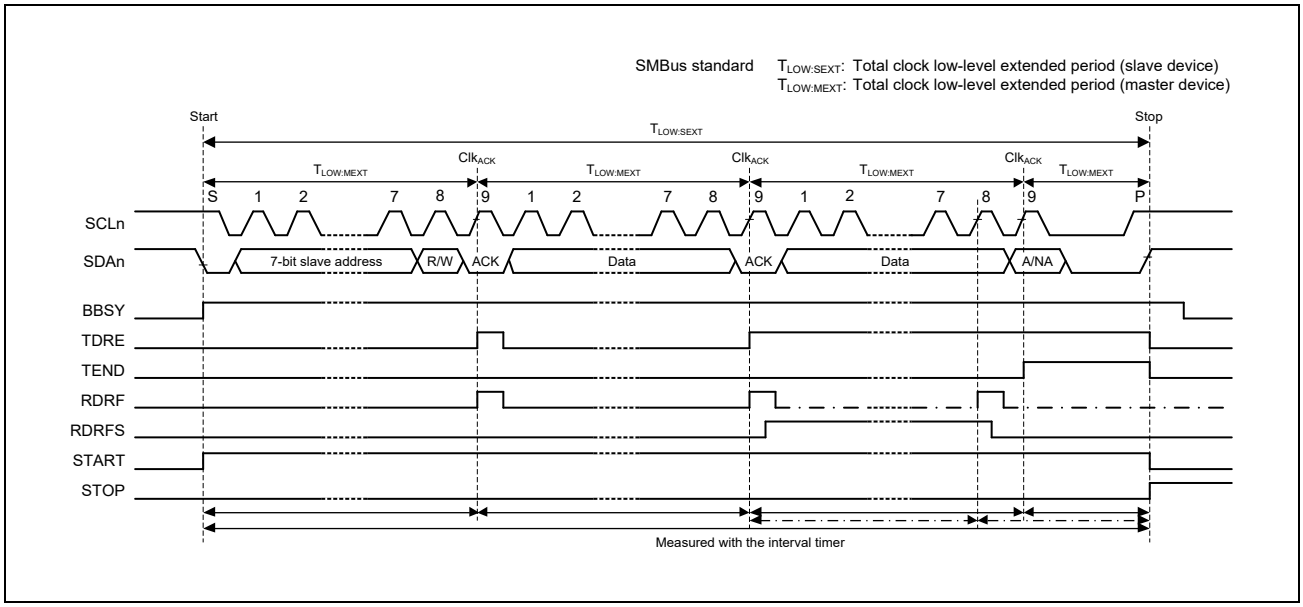

Figure 26.41 SMBus Timeout Measurement

## 26.14.2 SMBus Host Notification Protocol/Notify ARP Master

In communications over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of (or request the SMBus host for) its own slave address or to request its own slave address from the SMBus host.

For this LSI to operate as an SMBus host (or ARP master), the host address (0001 000b) sent from the slave device must be detected as a slave address, so the RIIC has a function for detecting the host address. To detect the host address as a slave address, set the RIICnMR3.SMBS bit and the RIICnSER.HOAE bit to 1. Operation after the host address has been detected is the same as normal slave operation.

## 26.15 Reset Function of RIIC

The RIIC has chip reset, RIIC reset, and internal reset functions. **Table 26.12** lists the scope of each reset and reset conditions.

Table 26.12 RIIC Reset Functions (1/2)

| Register | | RIIC Reset (ICE = 0, IICRST = 1) | Internal Reset (ICE = 1, IICRST = 1) | Start Condition/Restart Condition Detection | Stop Condition Detection |

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

# 27. Serial Sound Interface (SSIF-2)

## 27.1 Overview

The serial sound interface (SSIF-2) transmits and receives audio data to and from various devices that are compatible with $I^2S$ format, monaural format and TDM format.

### 27.1.1 Features

Table 27.1 Features of SSIF-2

| Item | | Description |
|---|---|---|
| Number of interfaces | | • 4 (n = 0, 1, 2, 3) (RZ/G2UL Type1)<br>• 3 (n = 0, 1, 2) (RZ/G2UL Type2) |
| Communication mode | | • Master/slave<br>• Full-duplex communication is available in interfaces 0, 1, and 3. Half-duplex communication is only available in interface 2. |
| Communication format | | • $I^2S$ format<br>• Monaural format<br>• TDM format |
| Serial data | | • MSB first<br>• Data can be left-justified or right-justified.<br>• Data delay (one clock cycle) or no delay selectable for the period from SSI_RCK to SSI_TXD/SSI_RXD<br>• System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits<br>• Data word length: 8, 16, 18, 20, 22, 24, or 32 bits<br>• Padding polarity: Low or high |
| Bit clock (SSIBCK) | In master mode | • Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128.<br>• Supply/stop of SSI_BCK is selectable while communication is halted. |
| | In slave mode | • SSI_BCK input method:Direct input or via the noise canceller |
| | In master/slave mode | • Polarity: Rising/falling edge canceler |
| Left and right clock/frame synchronization (SSILRCK/SSIFS) | In master mode | • Polarity: Low/high level selectable<br>• Supply/stop of SSI_RCK is selectable while communication is halted. |
| | In slave mode | • Two input methods: Direct input or via the noise canceller |
| Transmit data (SSITxD) and receive data (SSIRxD) | Transmission | • Mute: Transmission of transmit FIFO data or fixed value 0 selectable |
| | Reception (in slave mode) | • Two input methods: Direct input or via the noise canceller |
| FIFO | Capacity | • Transmit FIFO/receive FIFO: 4 bytes × 32 stages,<br>• Receive FIFO: 4 bytes × 32 stages |
| | Data alignment | • Method of data transfer between FIFO and shift register ( Left-justification and right-justification ) selectable. |
| Interrupt | Interrupt output | • Communication error/idle mode error (level)<br>• Receive data full interrupt (edge)<br>• Transmit data empty interrupt (edge)<br>• Receive data full/transmit data empty interrupt (edge) |
| | Interrupt capture spilling solution function | • Edge Interrupt supports inhibition function of capture spilling. |
| Low power consumption function | | • Supply/stop of audio clock is selectable in master-mode communication. |

The definition of words and phrases used by the format of the communication of SSIF-2 is as follows.

Table 27.2 Word Definition List

| Word | Definition |
|---|---|
| Start trigger | The first edge that reaches value that set to LRCKP in SSI_RCK pin after SSIF-2 permit communication. |
| Frame boundary | When SSIF-2 begins to transmit the first data of one frame.<br>When SSIF-2 forwarding ends final data of one frame. |
| Frame word number | Sound channel number in one frame |
| System word length | Bit length in one frame. |
| Data word length | Effective bit length in one frame. |
| Control bit of communication format | • SSICR register: FRM,DWL,SWL,LRCKP,SPDP,SDTA,PDTA,DEL<br>• SSIFCR register: BSW<br>• SSIOFR register: OMOD<br>• SSISCR register: TDES, RDFS |

## 27.3 List of Registers

**Table 27.4** shows the register configuration of SSIF-2. The address of the SSIF-2 register is represented by the offset address from the base address. SSIF-2 base address is as follows:

SSIF-2 base address: H'0_1004_9C00 (ch0), H'0_1004_A000 (ch1), H'0_1004_A400 (ch2), H'0_1004_A800 (ch3) (Overall Address Space)

SSIF-2 base address: H'5004_9C00 (ch0), H'5004_A000 (ch1), H'5004_A400 (ch2), H'5004_A800 (ch3) (Cortex-M33 Address Space Secure)

SSIF-2 base address: H'4004_9C00 (ch0), H'4004_A000 (ch1), H'4004_A400 (ch2), H'4004_A800 (ch3) (Cortex-M33 Address Space Non-Secure)

Table 27.4 List of Control Registers (1/2)

| Channel | Register Name | Symbol | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|---|
| 0 | Control register | SSICR | RW | H'0000_0000 | H'00 | 32 bits |

| | Status control register | SSISCR | RW | H'0000_0000 | H'24 | 32 bits |

**Note:** Access to the addresses other than those listed above is prohibited.

# 27.4 Function Details

## 27.4.1 Register Descriptions

### 27.4.1.1 Control Register (SSICR)

This is a 32-bit readable/writable register. With this register, select an audio clock, control IRQ, select data formats, and set an operation mode.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | CKS | TUIEN | TOIEN | RUIEN | ROIEN | IIEN | — | FRM[1:0] | | DWL[2:0] | | | SWL[2:0] | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| 2 | — | 0 | R | Reserved. Write 0. The read value is 0. |
| 1 | TEN | 0 | RW | Transmission and reception enable*2 |
| 0 | REN | 0 | RW | (TEN, REN): Operating<br>00: Disables transmission and reception<br>01: Enables reception (starts reception)<br>10: Enables transmission (starts transmission)<br>11: Enables transmission and reception (starts transmission and reception) |

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If written, the operation performed immediately after writing is not guaranteed. For example, after enabling operation, make sure that SSISR.IIRQ = 0 and after disabling operation, make sure that SSISR.IIRQ = 1.

### CKS Bit

This bit sets the audio clock in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of this bit is invalid.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 27.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

### TUIEN Bit

This bit enables/disables output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

### TOIEN Bit

This bit enables/disables output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

### RUIEN Bit

This bit enables/disables output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

### ROIEN Bit

This bit enables/disables output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIRQ = 1.

### IIEN Bit

This bit enables/disables output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

### FRM[1:0] Bits

These bits set system word number in one frame of the communication formats.

Rewrite these bits when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 27.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

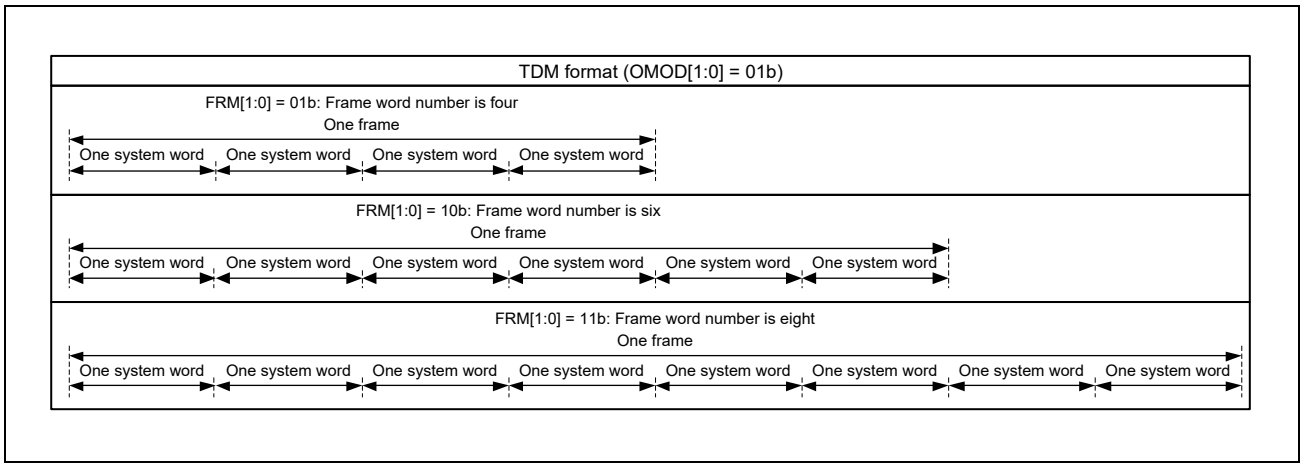

Figure 27.4 Frame word number

### DWL[2:0] Bits

These bits set the number of bits in one data word. The setting whose number of data of system word lengths is shorter than that of the data word length is a prohibition. Refer to **Table 27.13** in **Section 27.4.2, Communication Formats** for details.

### SWL[2:0] Bits

These bits set the number of bits in one system word. Padding bits are sent and received in relation with one data word set with DWL[2:0]. See **Table 27.13** in **Section 27.4.2, Communication Formats** for details.

Rewrite these bits when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 27.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

### MST Bit

This bit sets master-/slave-mode communication.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 27.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

### BCKP Bit

This bit sets the bit clock polarity (**Table 27.5**).

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 27.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

Table 27.5 Bit Clock Polarity

| Communication | Master/Slave | Timing | BCKP = 0 | BCKP = 1 |
|---|---|---|---|---|
| Reception | Slave | At SSILRCK/SSIFS sampling | SSIBCK rising edge | SSIBCK falling edge |
| | Master/slave | At SSIFRxD sampling | SSIBCK rising edge | SSIBCK falling edge |
| Transmission | Master | At change of SSILRCK/SSIFS output | SSIBCK falling edge | SSIBCK rising edge |
| | Master/slave | At change of SSIFTxD output | SSIBCK falling edge | SSIBCK rising edge |

### LRCKP Bit

This bit sets the initial value and polarity of SSILRCK/SSIFS. Set this bit according to the communication format to be used in SSIF-2 (**Table 27.6**). Only the start trigger is used at slave communication (MST=0).

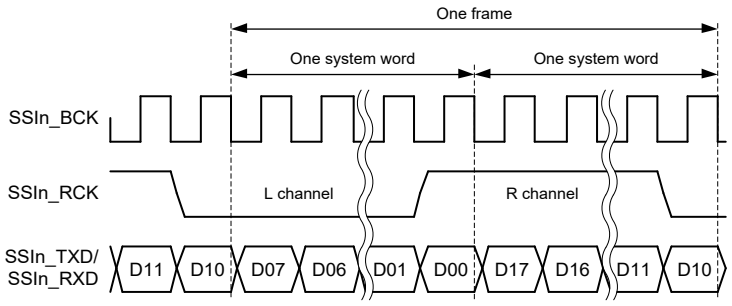
Rewrite this bit when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 27.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

Table 27.6 Initial Output Value and Polarity of SSILRCK/SSIFS Pin

| Communication Format | Expected Initial State | Setting Value of LRCKP |
|---|---|---|
| $I^2S$ | H | 0 |
| Monaural | L | 1 |
| TDM | L | 1 |

**Note:** Do the setting that can be communicated respectively to $I^2S$, monaural, and TDM at the compatible format.

System word length: 8 bits (SWL = 000b), Data word length: 8 bits (DWL = 000b),
LR clock polarity: L channel = low, R channel = high (LRCKP = 0)
Other control bits of communication format are at their initial values.



System word length: 8 bits (SWL = 000b), Data word length: 8 bits (DWL = 000b),
LR clock polarity: L channel = high, R channel = low (LRCKP = 1)
Other control bits of communication format are at their initial values.

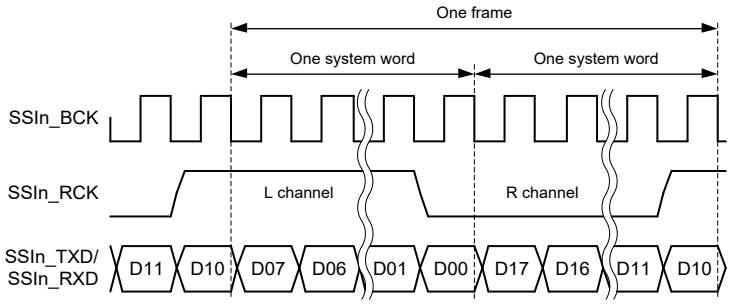


Figure 27.5 LRCK/FS Polarity Setting

### SPDP Bit

This bit sets polarity of padding bits.

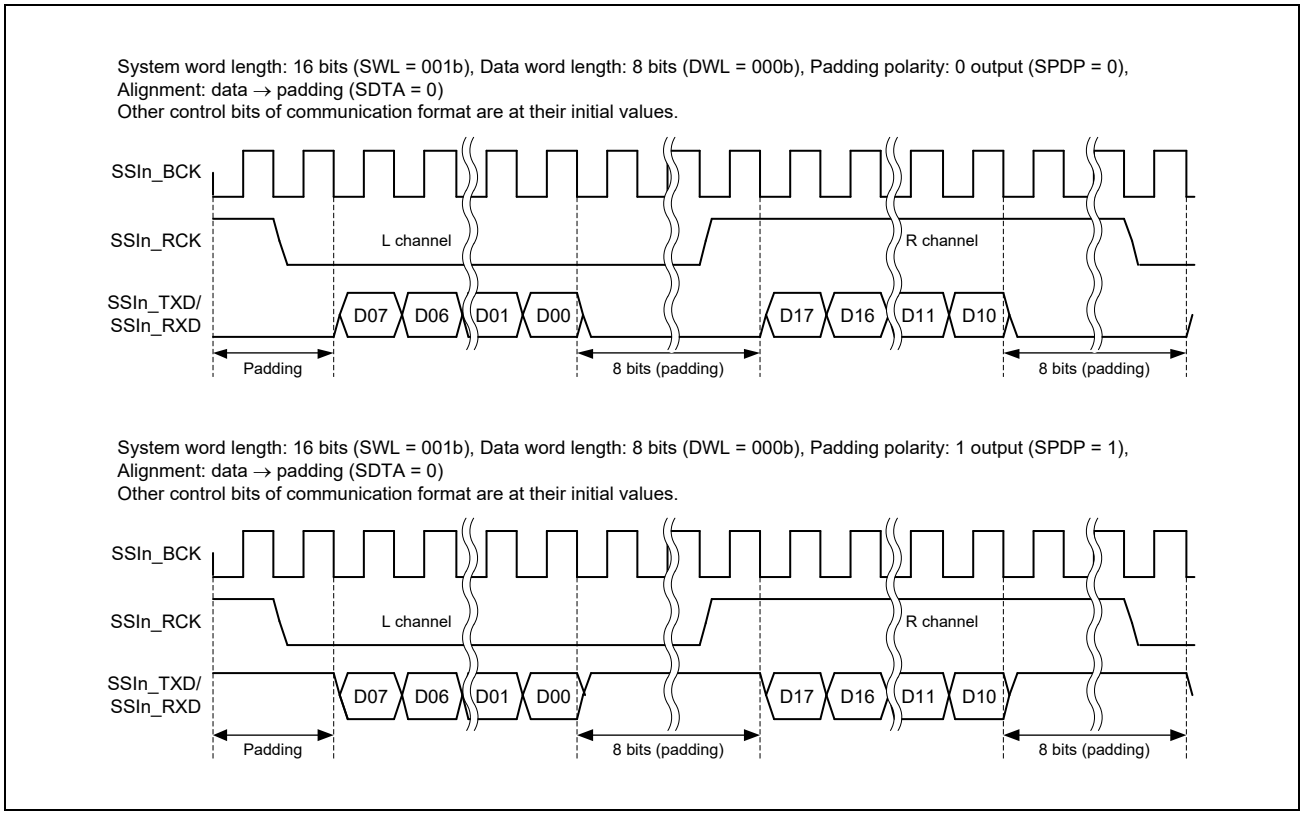

Figure 27.6 Padding Bit Polarity

### SDTA Bit

This bit sets alignment of serial data (data bits and padding bits). For communication without padding bits, this bit is invalid.

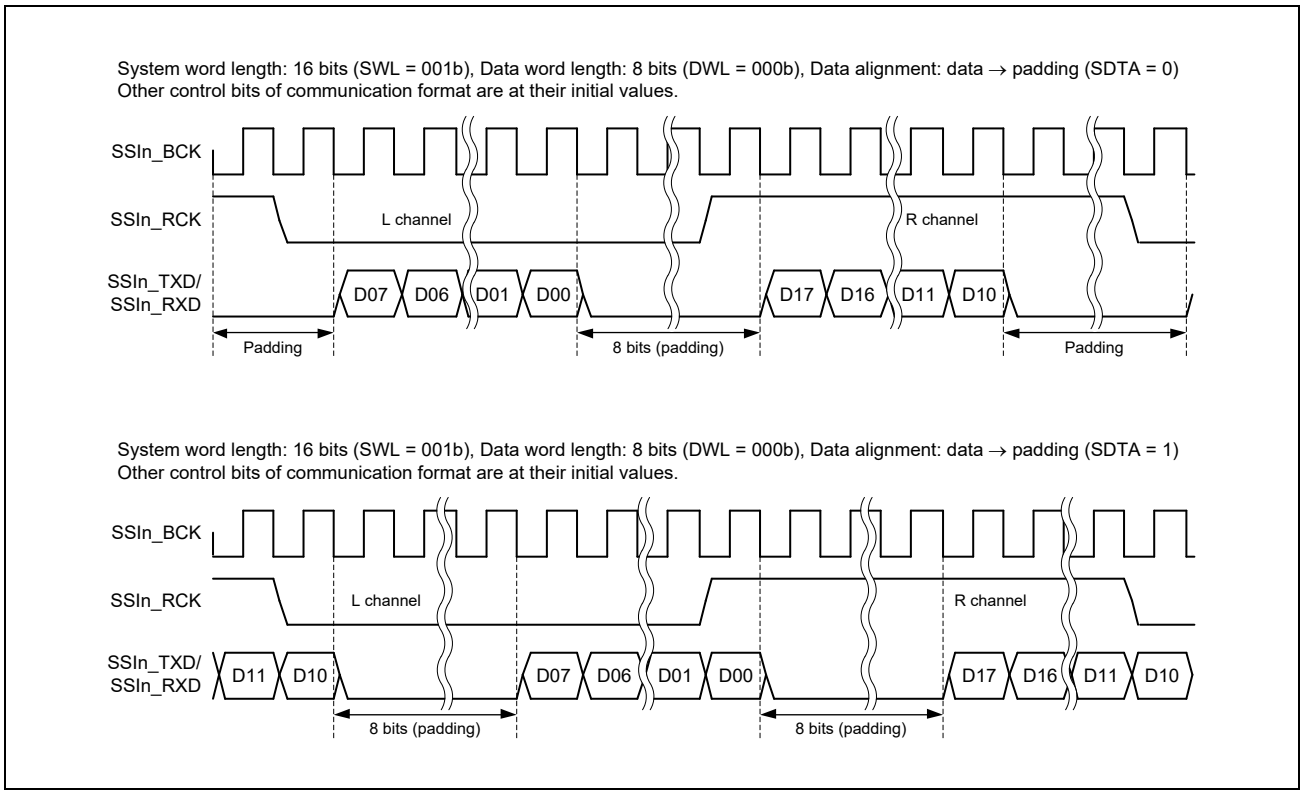

Figure 27.7 Alignment Setting of Serial Data with Padding Bits

### PDTA Bit

This bit sets alignment of placement data. With the setting of data word length as 32 bits (DWL[2:0] = 110b), this bit is invalid.

At transmission:

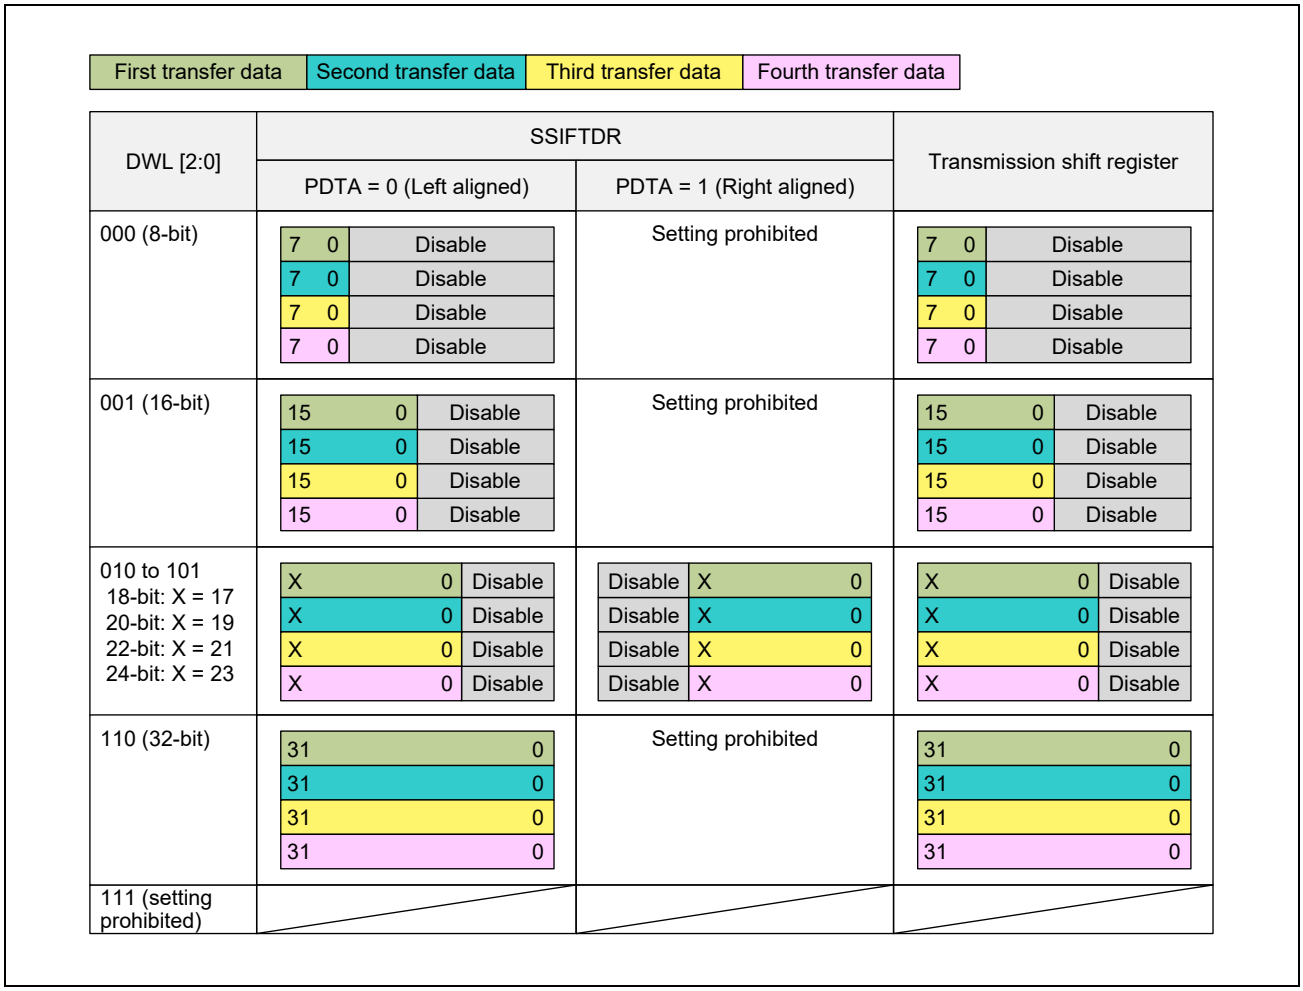

Figure 27.8 Alignment Setting of Placement Data in Transmission

At reception:

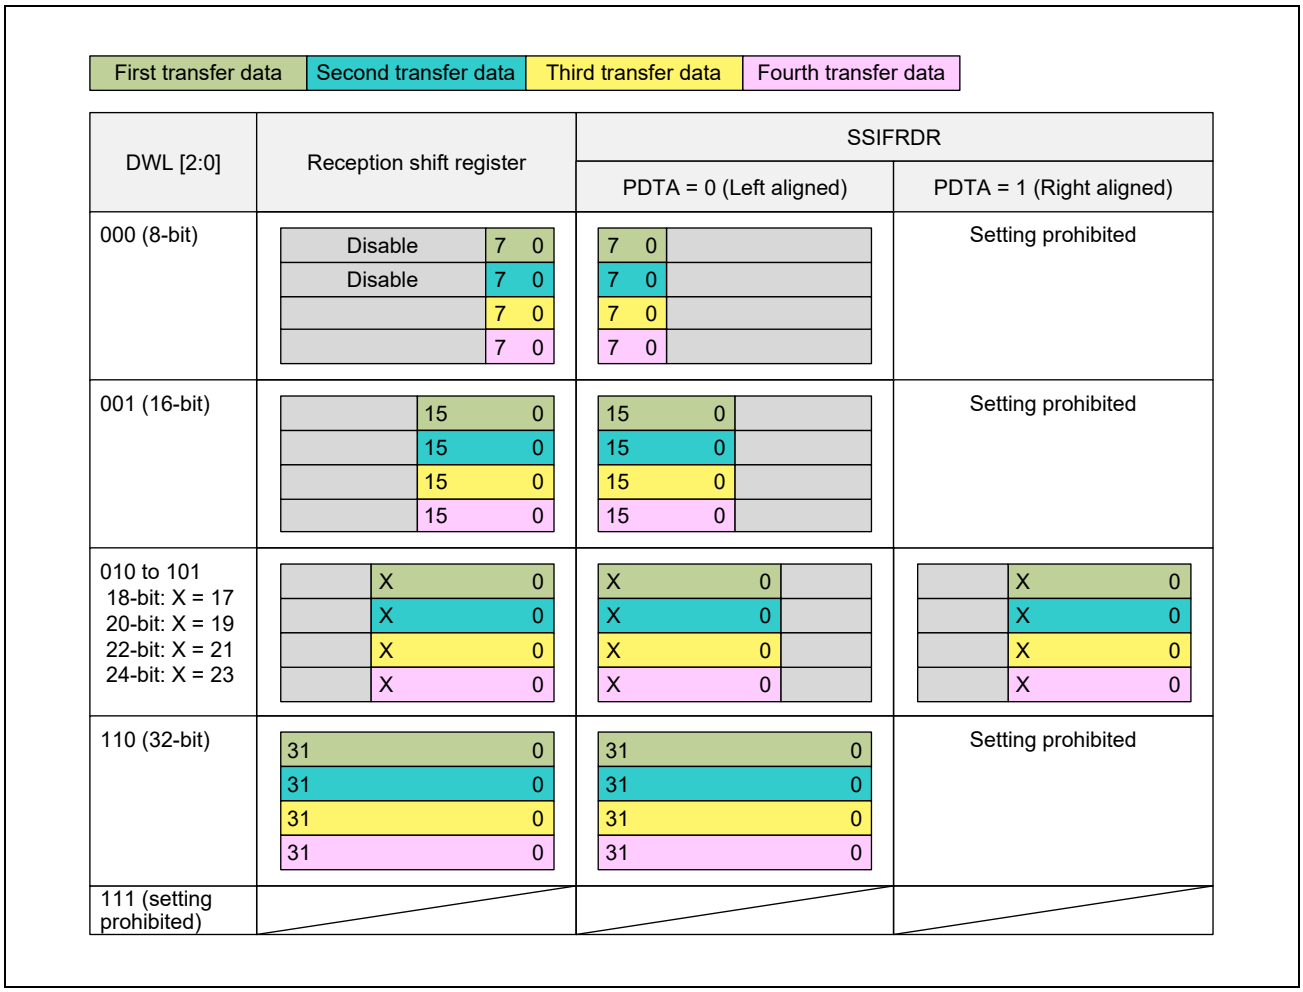

Figure 27.9 Alignment Setting of Placement Data in Reception

### DEL Bit

This bit sets whether or not there will be a delay between SSILRCK/SSIFS and SSITxD/SSIRxD.

With the I²S format and TDM format, set 0 to DEL (**Figure 27.10**). With the monaural format, this bit changes the high period width. Refer to **Section 27.4.2.2, Monaural Format** for details. Do the setting that can be communicated at the compatible communication format.

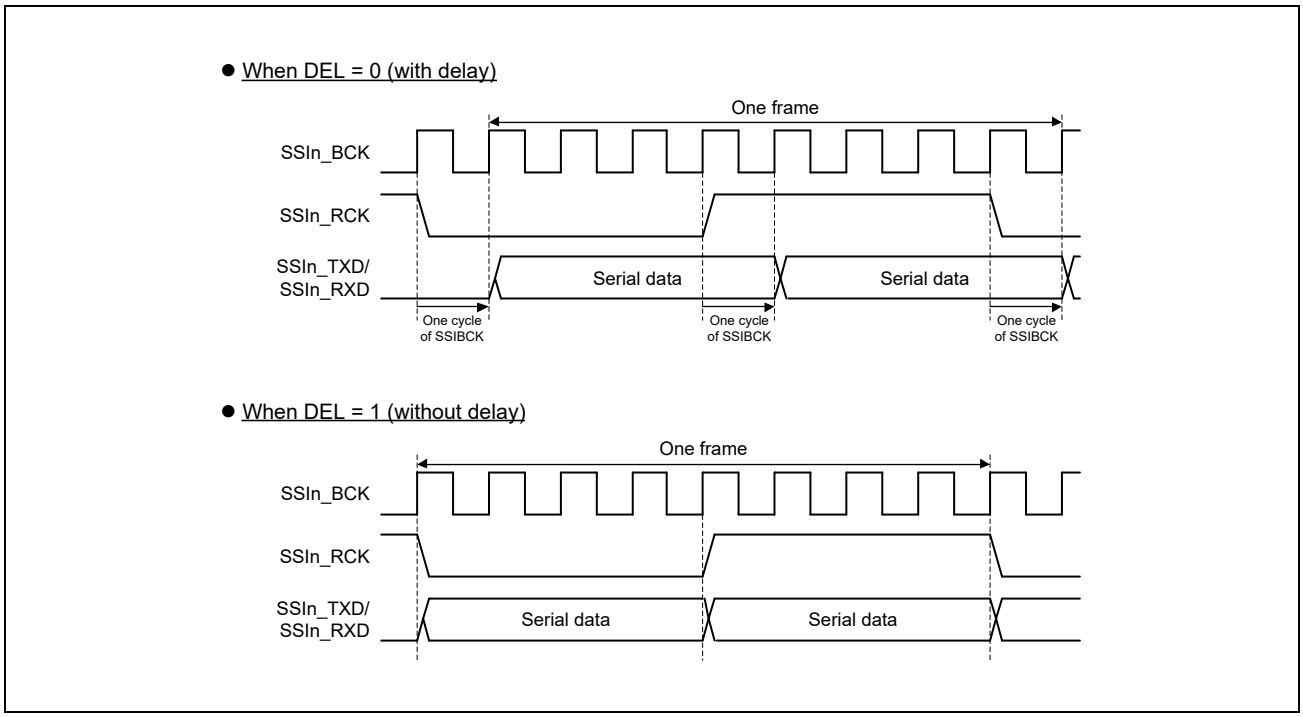

Figure 27.10 Setting of Delay in Serial Data

**CKDV[3:0] Bits**

These bits set the division ratio of the bit clock based on AUDIO_MCK in master-mode communication (MST = 1) (**Figure 27.11**). In slave-mode communication (MST = 0), setting of these bits are invalid.

To write this bit, do so when AUDIO_MCK is not supplied. Refer to the AUCKE bit details explanation in **Section 27.4.1.3, FIFO Control Register (SSIFCR)** for detailed timing.

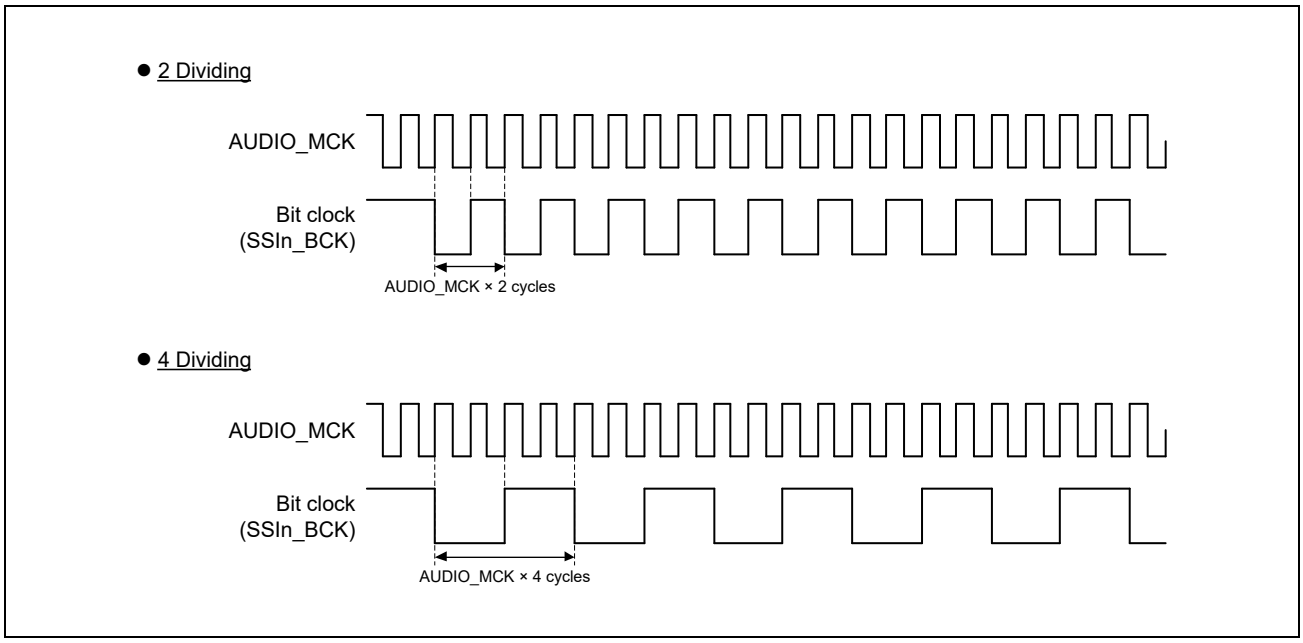

Figure 27.11 Sampling Frequencies in Master-mode Communication

### MUEN Bit

This bit sets/clears the mute function for the data output from the terminal SSITxD. When you set this bit to 1, the output value of SSITxD becomes 0 from the next frame boundary. When you set this bit to 0, the output value of SSITxD can be made the data of the FIFO transmission data register from the following frame boundary.

Note that this bit controls data only. Status flags and interrupt signals are normally generated. Set this bit after setting completing the communication format.

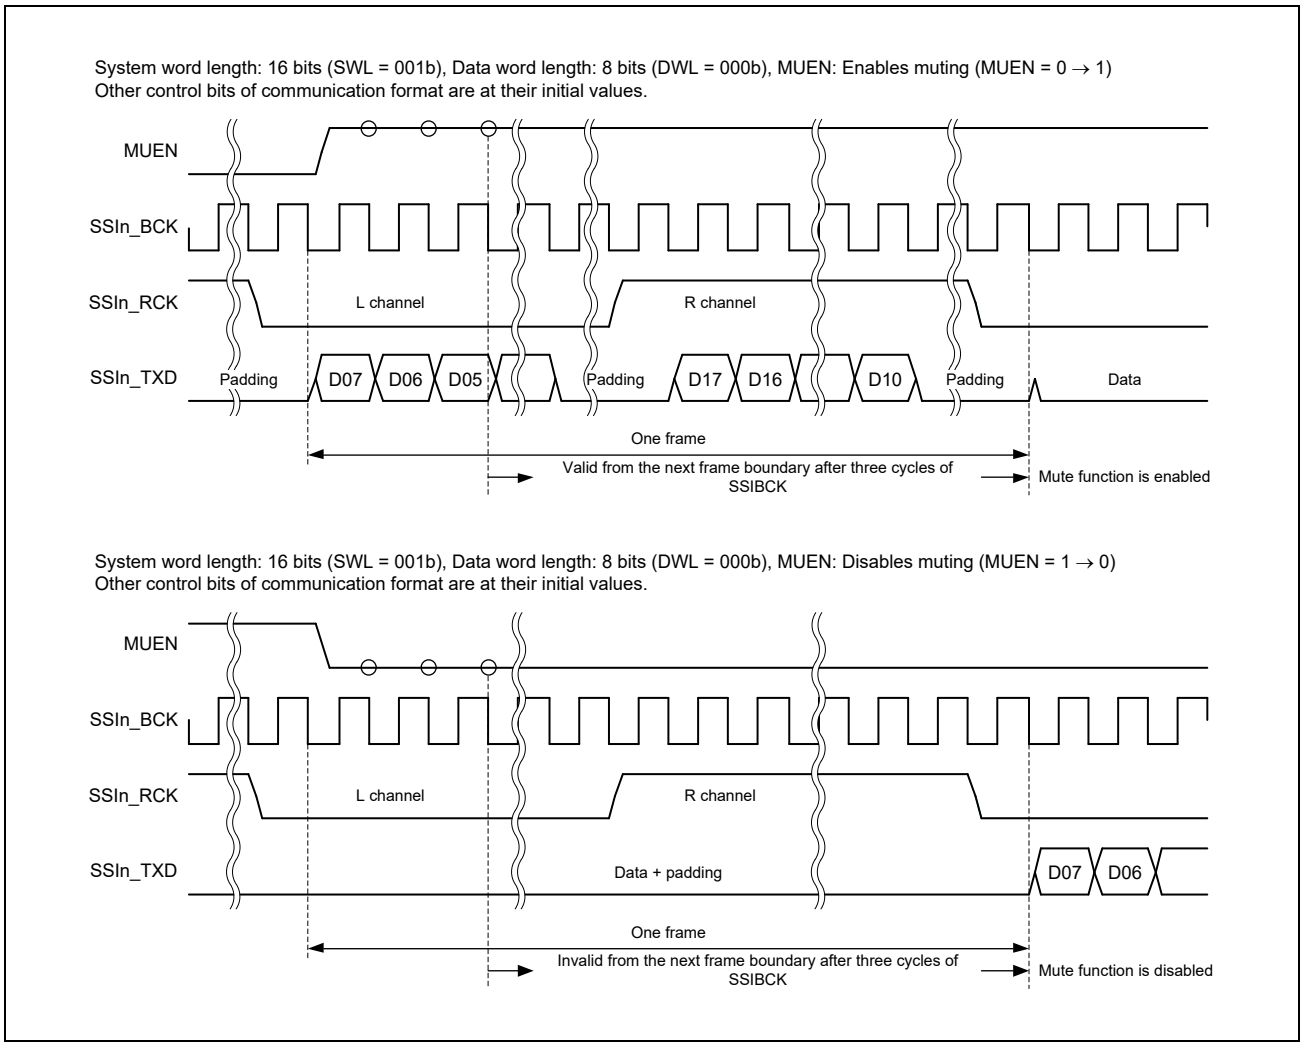

Figure 27.12 Transmit Data with the Mute Function Set

### TEN and REN Bits

These bits enable/disable transmission and reception. Writing 1 to these bits, transmission starts in synchronization with start trigger. Refer to **Section 27.5.2.2, Transmission**, **Section 27.5.2.3, Reception**, and **Section 27.5.2.4, Transmission and Reception** for details. Writing 0 to these bits, transmission stops in synchronization with next frame boundary. Set 1 at the same time when you use SSIF-2 as transmission and reception. To stop communication, make sure to stop transmission and reception (TEN = 0 and REN = 0).

To stop communication without waiting for the frame boundary, follow the software reset procedure.

### 27.4.1.2 Status Register (SSISR)

This is a readable/writable 32-bit register. It is configured with status flags that indicate SSIF-2 operational state.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | TUIRQ | TOIRQ | RUIRQ | ROIRQ | IIRQ | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W0 | R/W0 | R/W0 | R/W0 | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | 00b | R | Reserved. Write 0. The read value is 0. |
| 29 | TUIRQ | 0 | RW0 | Transmit underflow error status flag<br>0: No transmit underflow error is generated.<br>1: A transmit underflow error is generated. |
| 28 | TOIRQ | 0 | RW0 | Transmit overflow error status flag<br>0: No transmit overflow error is generated.<br>1: A transmit overflow error is generated. |
| 27 | RUIRQ | 0 | RW0 | Receive underflow error status flag<br>0: No receive underflow error is generated.<br>1: A receive underflow error is generated. |
| 26 | ROIRQ | 0 | RW0 | Receive overflow error status flag<br>0: No receive overflow error is generated.<br>1: A receive overflow error is generated. |
| 25 | IIRQ | 1 | R | Idle mode status flag<br>0: In the communication state<br>1: In the idle state |
| 24 to 0 | — | H'0000000 | R | Reserved. Write 0. The read value is 0. |

#### TUIRQ Bit

This is a status flag that indicates a transmit underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that writing serial data necessary for one frame to SSIFTDR was slower than one frame of the transmission operation. Even if this flag is cleared after this flag becomes '1', the output value of SSIFTxD is 0. Follow the communication stop procedure (**Figure 27.55**) and the error procedure (**Figure 27.56**) to output the data written in transmission FIFO data register (SSIFTDR) to the terminal SSIFTxD. See **Section 27.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by transmission FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.TEN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (**Figure 27.13**).

(2) Write 1 in SSICR.TEN, complete, and after one cycle of P0ϕ (**Figure 27.13**).

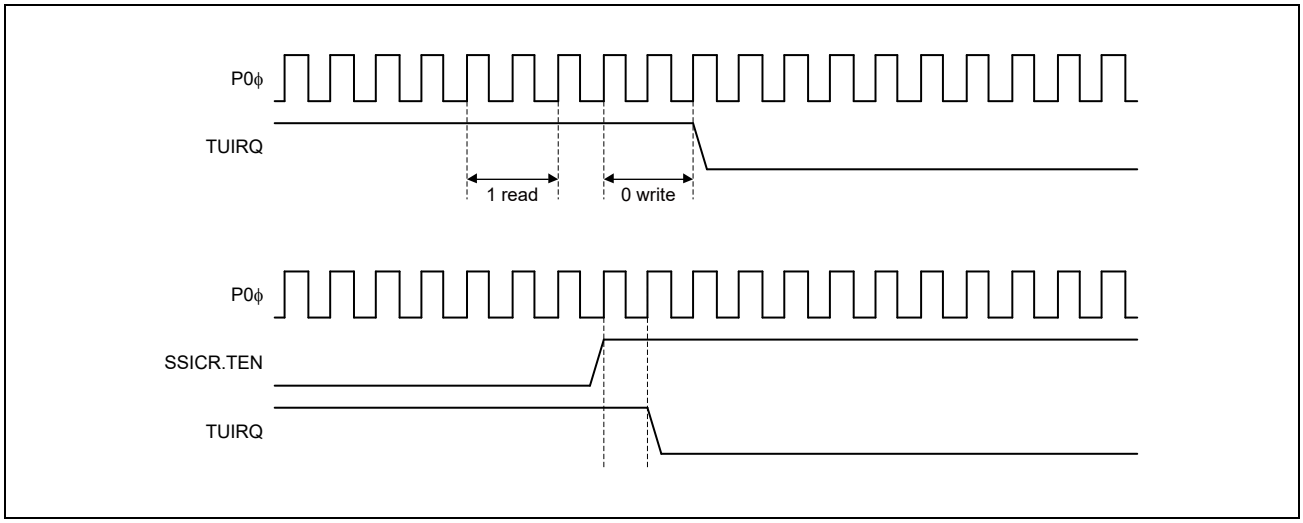

Figure 27.13 TUIRQ Clearing Timing

**Note 1.** This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

**Note 2.** The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

NOTE

After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

[Setting condition]

When data to be transmitted in the next frame is not fully written to SSIFTDR at the frame boundary of continuance communication.

[Setting timing]

After three cycles of P0ϕ from frame boundary (**Figure 27.14**).

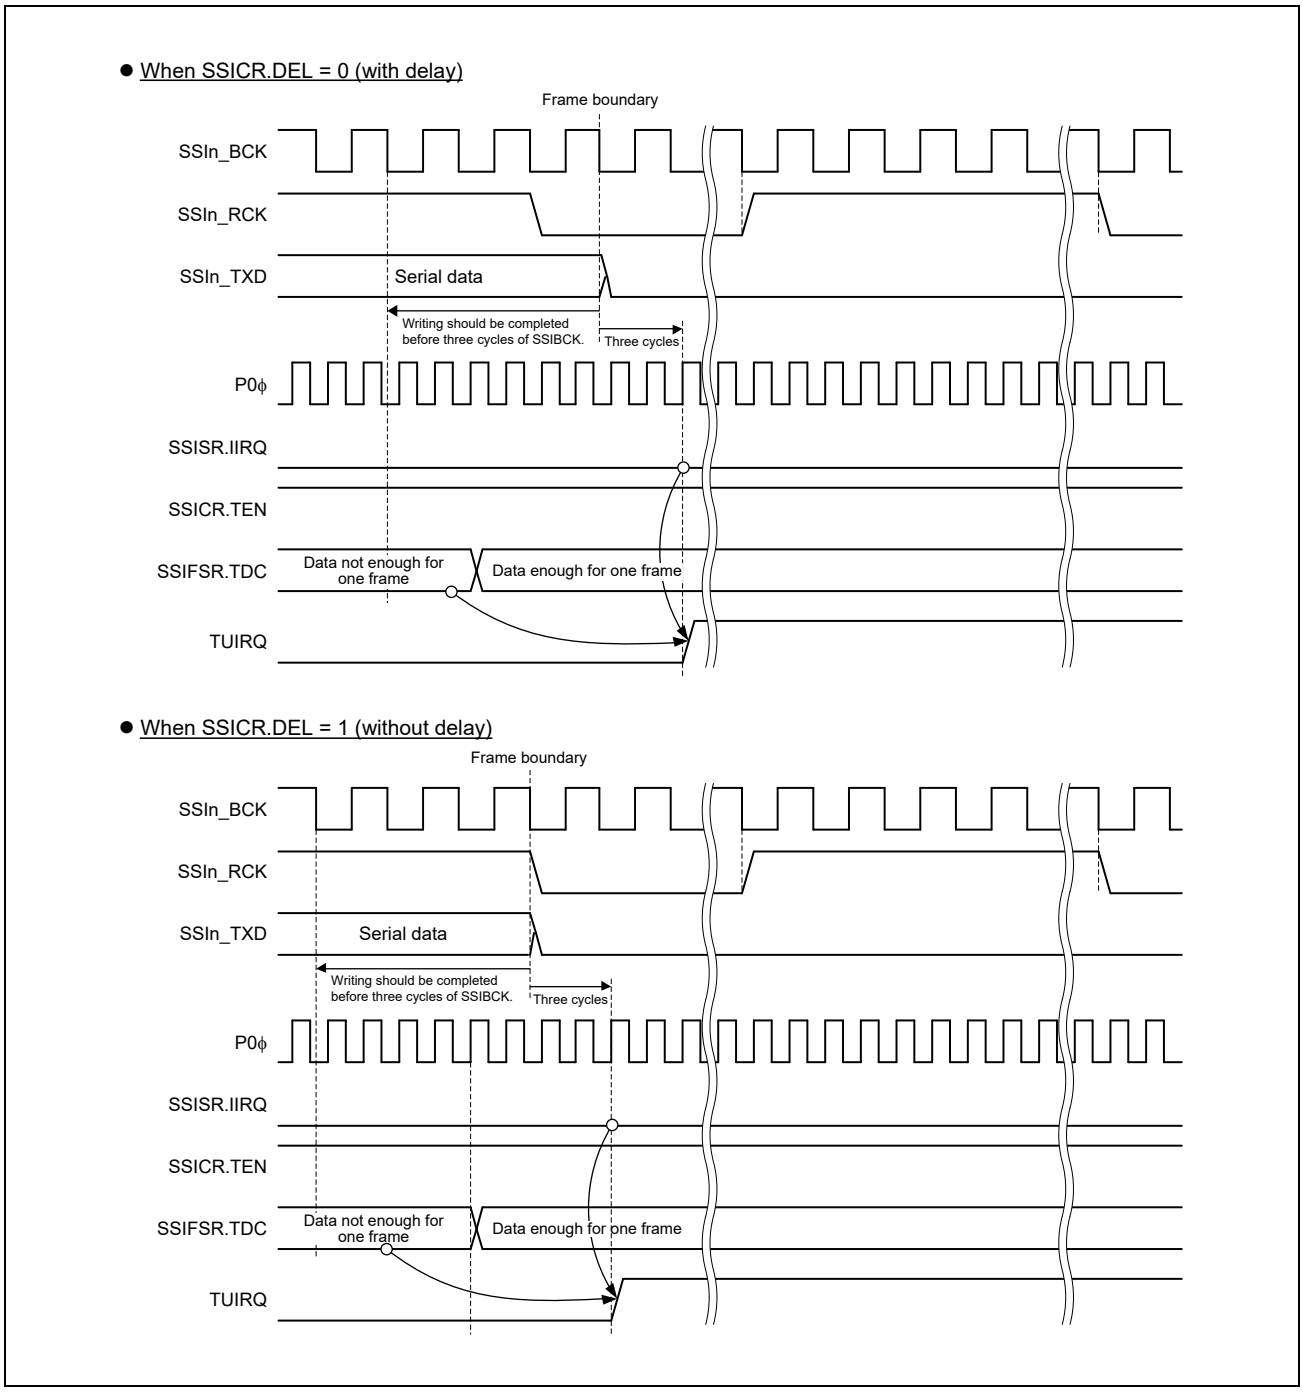

Figure 27.14 TUIRQ Setting Timing (When you continue communicating)

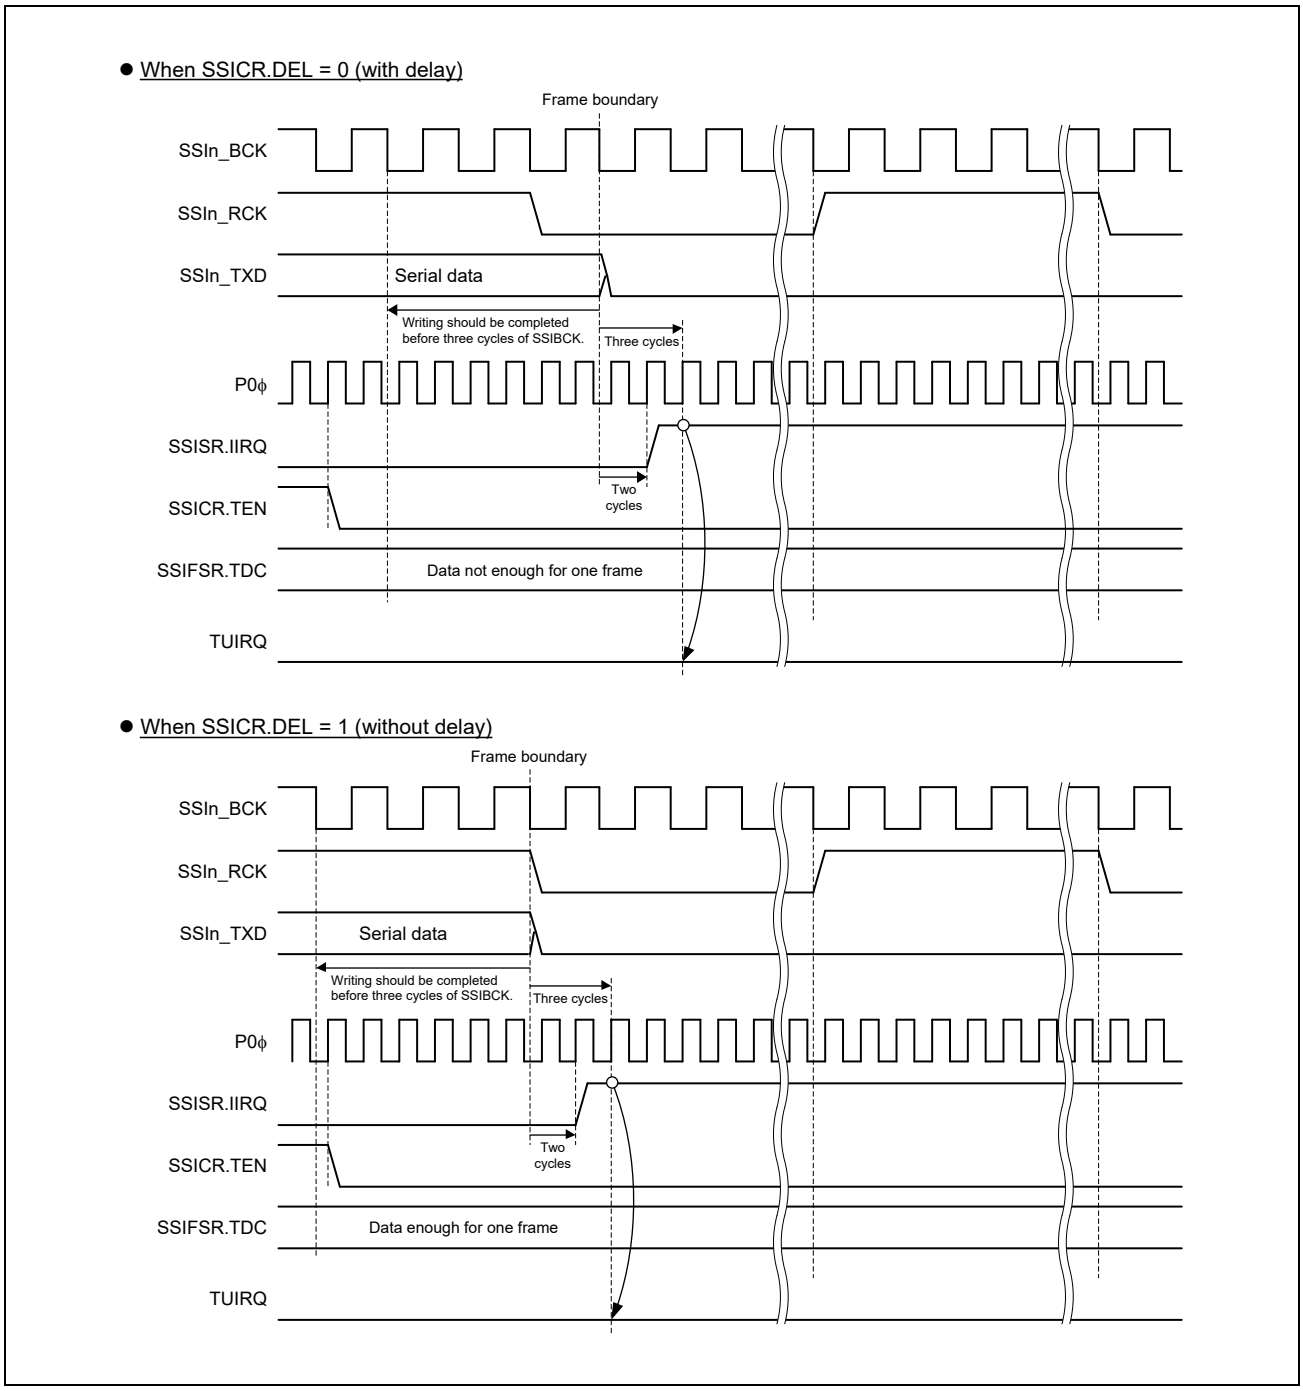

Figure 27.15 TUIRQ Setting Timing (When you stop communicating)

### TOIRQ Bit

This is a status flag that indicates a transmit overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that serial data is written to SSIFTDR when it is full during transmission (SSICR.TEN=1). Data is not written to SSIFTDR where a transmit overflow error is generated. See **Section 27.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by transmission FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.TEN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as **Figure 27.13**).

(2) Write 1 in SSICR.TEN, complete, and after one cycle of P0ϕ (same as **Figure 27.13**).

**Note 1.** This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

**Note 2.** The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

NOTE

After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

[Setting condition]

During transmission operation (SSICR.TEN = 1), data is written to SSIFTDR while it is full.

[Setting timing]

At completion of writing to SSIFTDR (**Figure 27.16**)

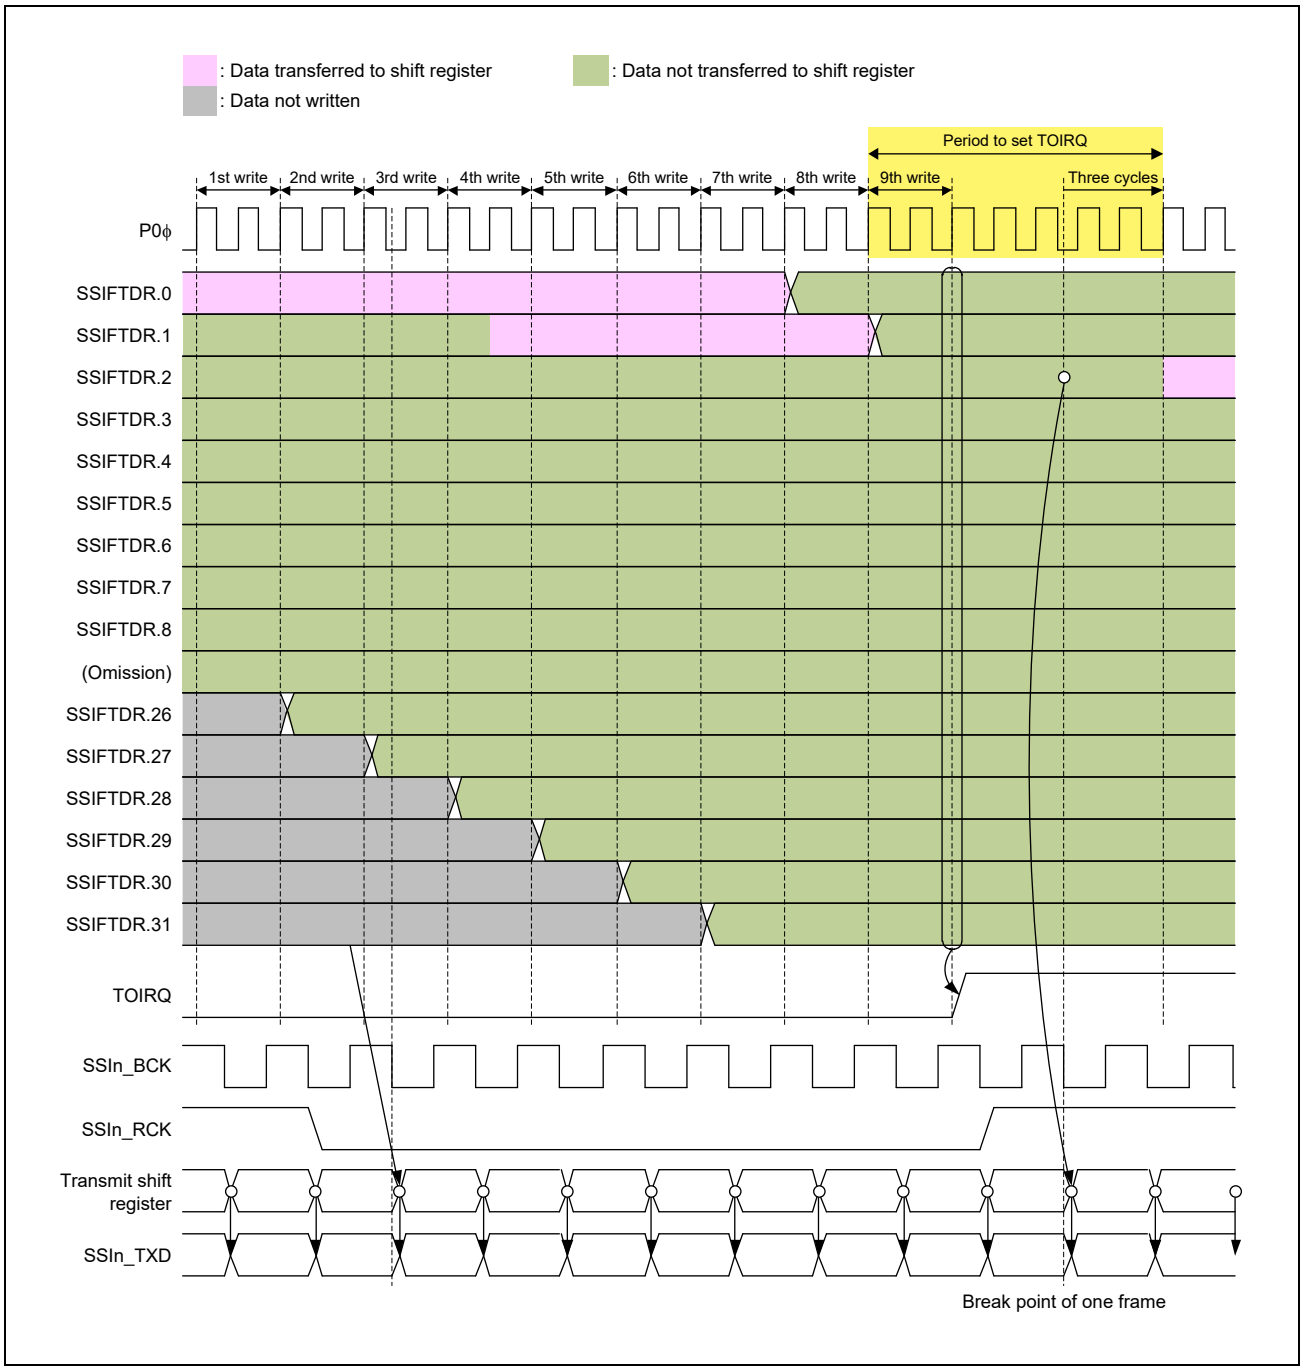

Figure 27.16 TOIRQ Setting Timing

**RUIRQ Bit**

This is a status flag that indicates a receive underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. See **Section 27.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by reception FIFO data register reset (SSIFCR.RFRST). Even if SSIFRDR is read to (SSIFCR.RFRST=1) while resetting reception FIFO data register, it doesn't set 1.

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.REN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as **Figure 27.13**).

(2) Write 1 in SSICR.REN, complete, and after one cycle of P0ϕ (same as **Figure 27.13**).

**Note 1.** This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

**Note 2.** The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

NOTE

After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

[Setting condition]

Reading from SSIFRDR while it is empty.

[Setting timing]

At completion of reading from SSIFRDR (**Figure 27.17**).

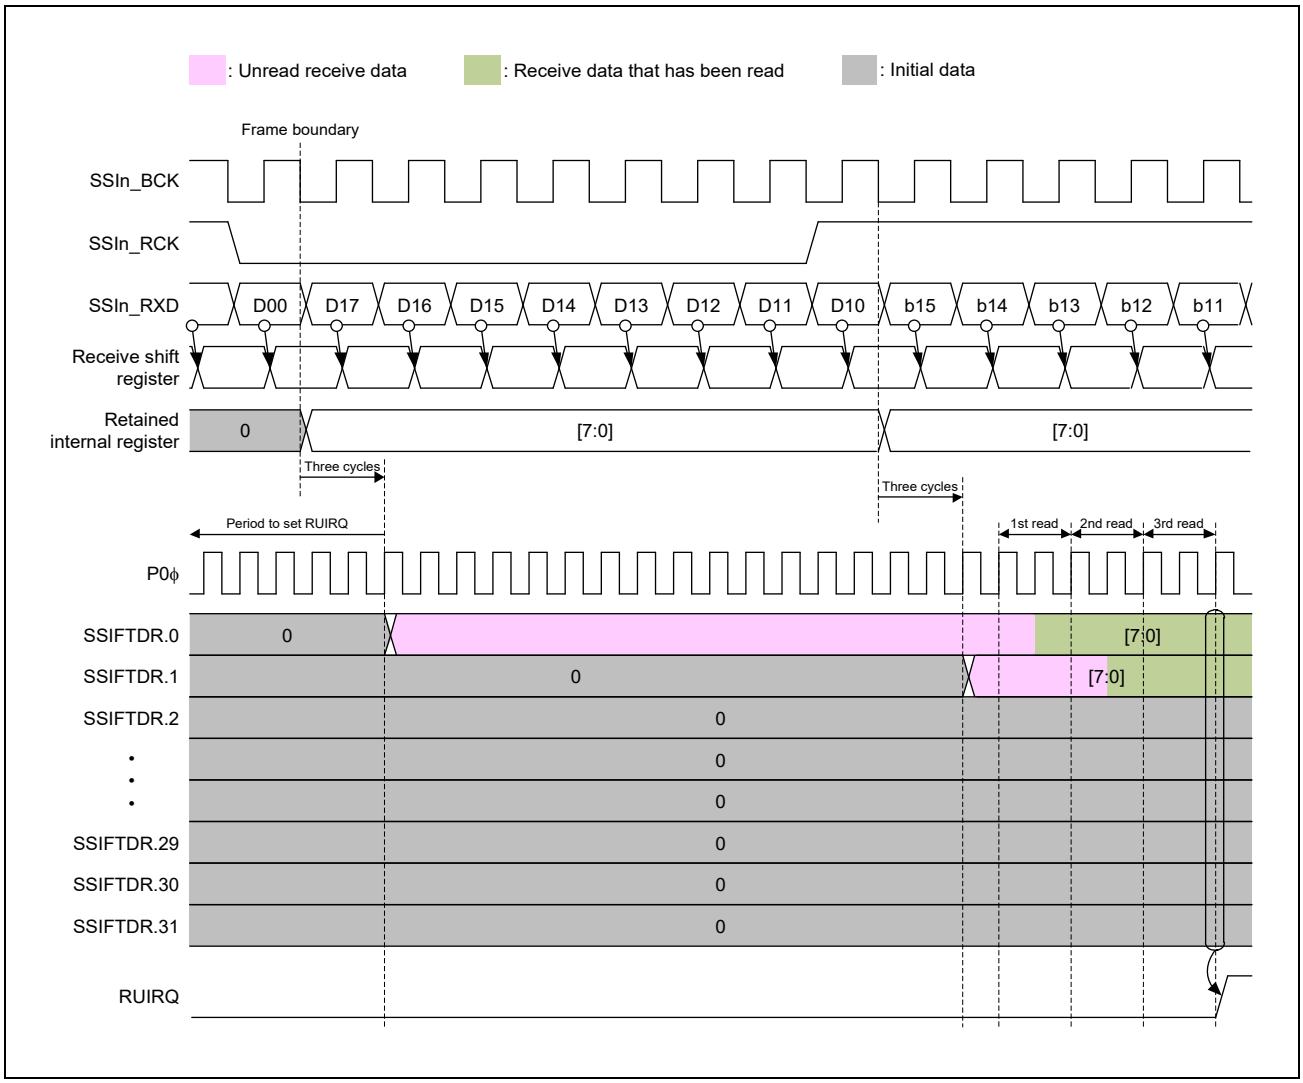

Figure 27.17 RUIRQ Setting Timing

**ROIRQ Bit**

This is a status flag that indicates a receive overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the receive shift register to SSIFRDR where a receive overflow error is generated. See **Section 27.5.2.6, Error Handling** for the error recovery procedure. This flag is not cleared by reception FIFO data register reset (SSIFCR.RFRST).

[Priority order for setting and clearing]

Setting is prioritized.

[Clearing condition]

Writing 0 to this flag after reading this flag as 1.

[Clearing timing]

At completion of writing 0 after reading 1 from an SFR (same as **Figure 27.13**).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following is approved.

(1) Writing 0 to this flag after reading this flag as 1.*2

(2) When you do the communication permission (SSICR.REN is changed from 0 to 1)

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this flag after reading this flag as 1 (same as **Figure 27.13**).

(2) Write 1 in SSICR.REN, complete, and after one cycle of P0ϕ (same as **Figure 27.13**).

**Note 1.** This bit is also cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

**Note 2.** The state of reading this bit as one is cleared by any of the following three conditions being met:
- Software reset (SSIFCR.SSIRST=1).
- Completion of writing 0 to this flag after having read it as 1.
- One cycle of P0ϕ elapsing after the completion of writing 1 to SSICR.TEN.

NOTE

After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

[Setting condition]

At completion of receiving new data while SSIFRDR is full.

[Setting timing]

Three cycles of P0ϕ after reception is completed (**Figure 27.18**).

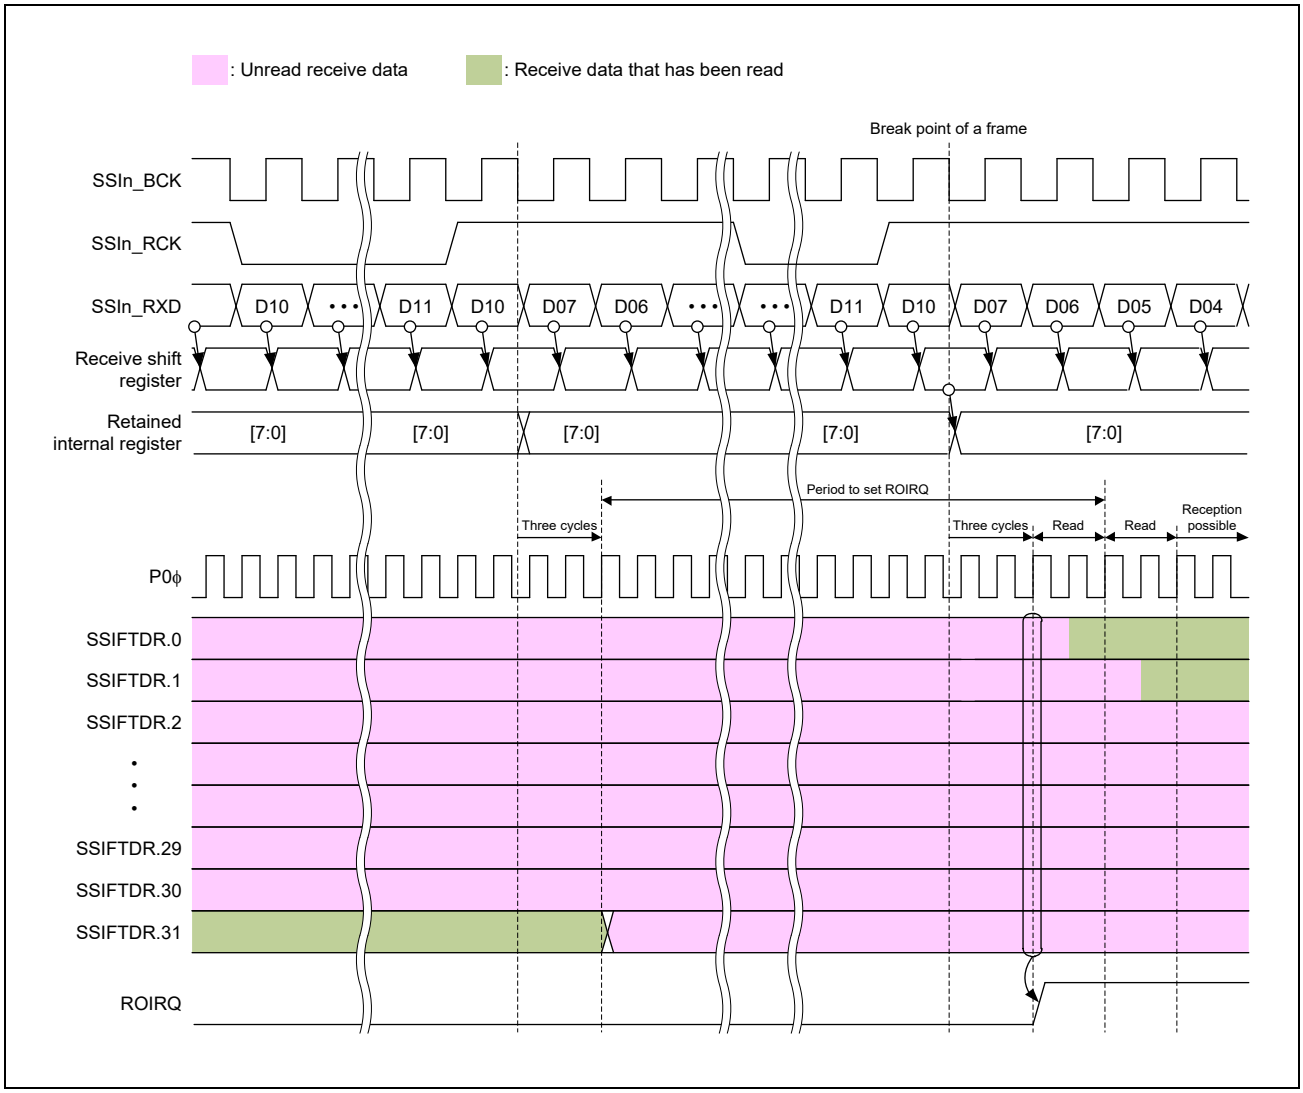

Figure 27.18 ROIRQ Setting Timing

### IIRQ Bit

This is a status flag that indicates the idle state. It indicates whether SSIF-2 is in the idle state or communication state (**Figure 27.19** and **Figure 27.20**).

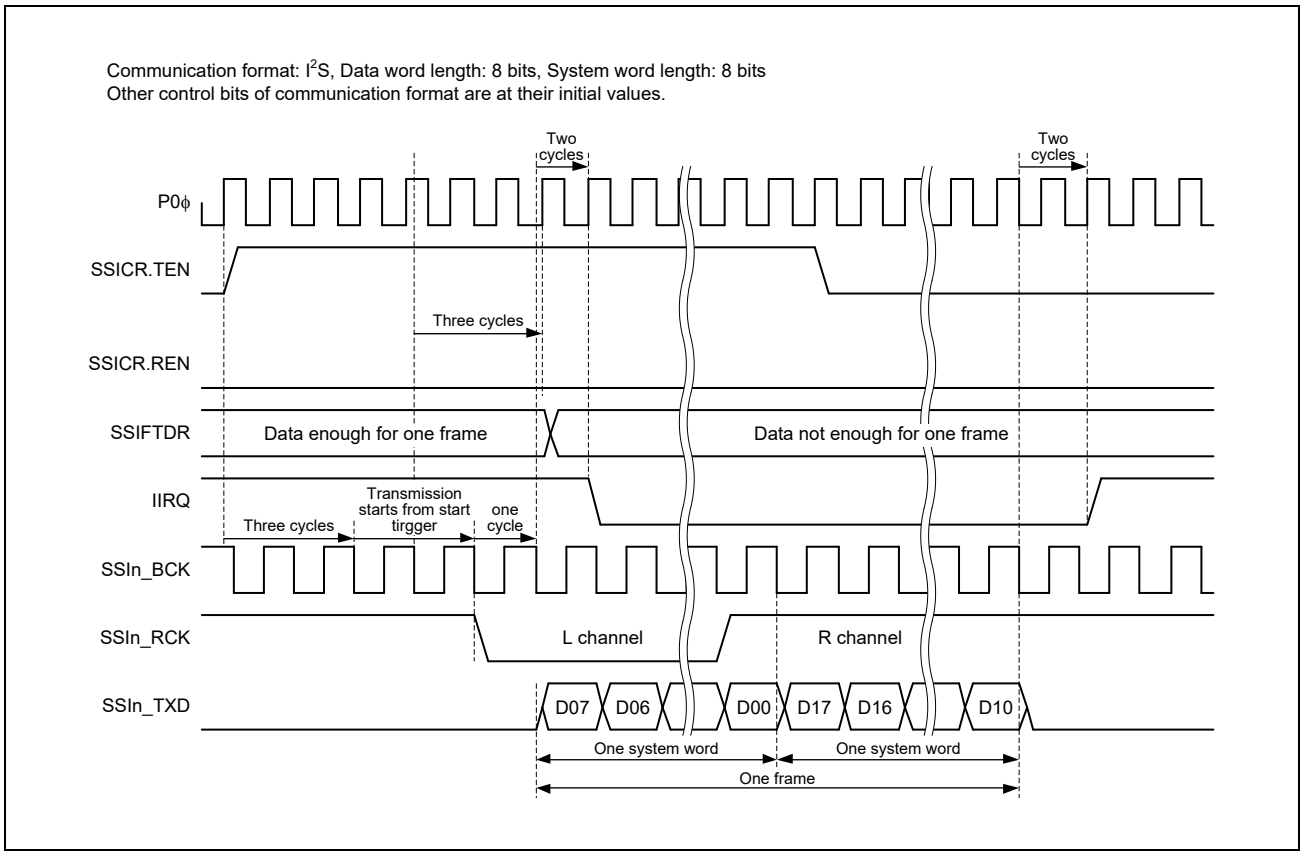

Figure 27.19 IIRQ Setting Timing (Transmission)

**Transmitter (dedicated to transmission)**

[Clearing condition]

While transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), one frame of data to be transmitted has been written to SSIFTDR, and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P0ϕ after one cycle of SSIBCK where a start trigger is generated.

[Setting condition]

One frame of data has been transmitted while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P0ϕ after transmission is complete according to the setting condition (frame boundary).

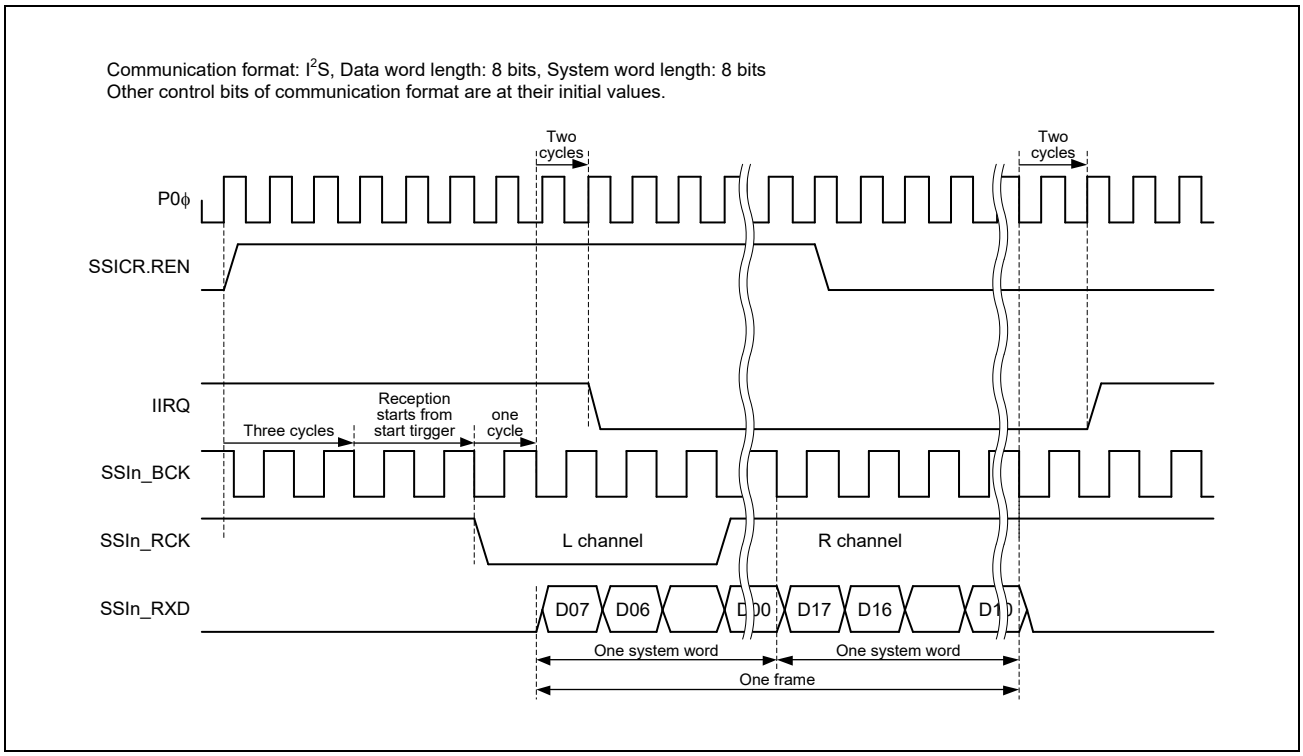

Figure 27.20 IIRQ Setting Timing (Reception)

### Receiver (dedicated to reception)

[Clearing condition]

While reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P0ϕ after one cycle of SSIBCK when a start trigger of the clearing condition is generated.

[Setting condition]

One frame of data has been received while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P0ϕ after reception of the setting condition is completed (frame boundary).

### Transceiver (transmission and reception)

[Clearing condition]

While transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), one frame of data to be transmitted has been written to SSIFTDR, and a start trigger is generated in SSILRCK/SSIFS.

[Clearing timing]

Two cycles of P0ϕ after one cycle of SSIBCK when a start trigger of the clearing condition is generated.

[Setting condition]

One frame of data has been transmitted while transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0).

[Setting timing]

Two cycles of P0ϕ after transmission is completed according to the setting condition (frame boundary).

### 27.4.1.3 FIFO Control Register (SSIFCR)

This is a readable/writable 32-bit register. It sets a software reset, byte swap, noise canceller, and enable/disable of interrupt requests.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Note 2. This bit can only be set to 1 in slave-mode communication (SSICR.MST = '0') except in the case of transmission (SSICR.TEN = '1') while SSICR.DEL = '1'. Be sure to clear this bit to 0 in master-mode communication (SSICR.MST = '1') or during transmission in slave mode (SSICR.MST = '0', SSICR.TEN = '1') while SSICR.DEL = '1'. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

### AUCKE Bit

This bit enables/disables supply to AUDIO_MCK while in master-mode communication (MST = 1). Select AUDIO_MCK (SSICR.CKS bit) before writing 1 to this bit.

Rewrite this bit after completing the setting (CKS, MST, BCKP, and CKDV of the SSICR register) that relates to AUDIO_MCK.

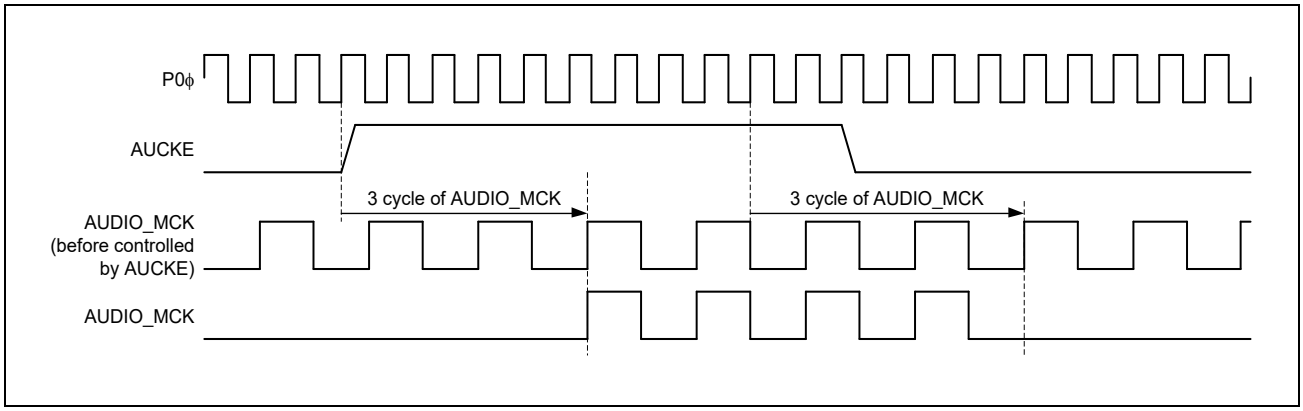

Figure 27.21 Stop/Resume of AUDIO_MCK

**CAUTION**

- In slave-mode communication (SSICR.MST = 0), SSIF-2 needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIF-2 becomes idle, take the procedure to start communication (**Figure 27.52**) or wait for an idle state by taking the procedure to resume communication (**Figure 27.57**).
- In master-mode communication (SSICR.MST = 1), SSIF-2 operates with the audio clock (AUDIO_MCK). To stop SSIF-2 completely, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIF-2 becomes idle, take the procedure to start communication (**Figure 27.52**) or wait for the idle state by taking the procedure to resume communication (**Figure 27.57**).

**Figure 27.22** and **Figure 27.23** show timing until outputting it to the terminal SSIBCK after this bit is set to '1'.

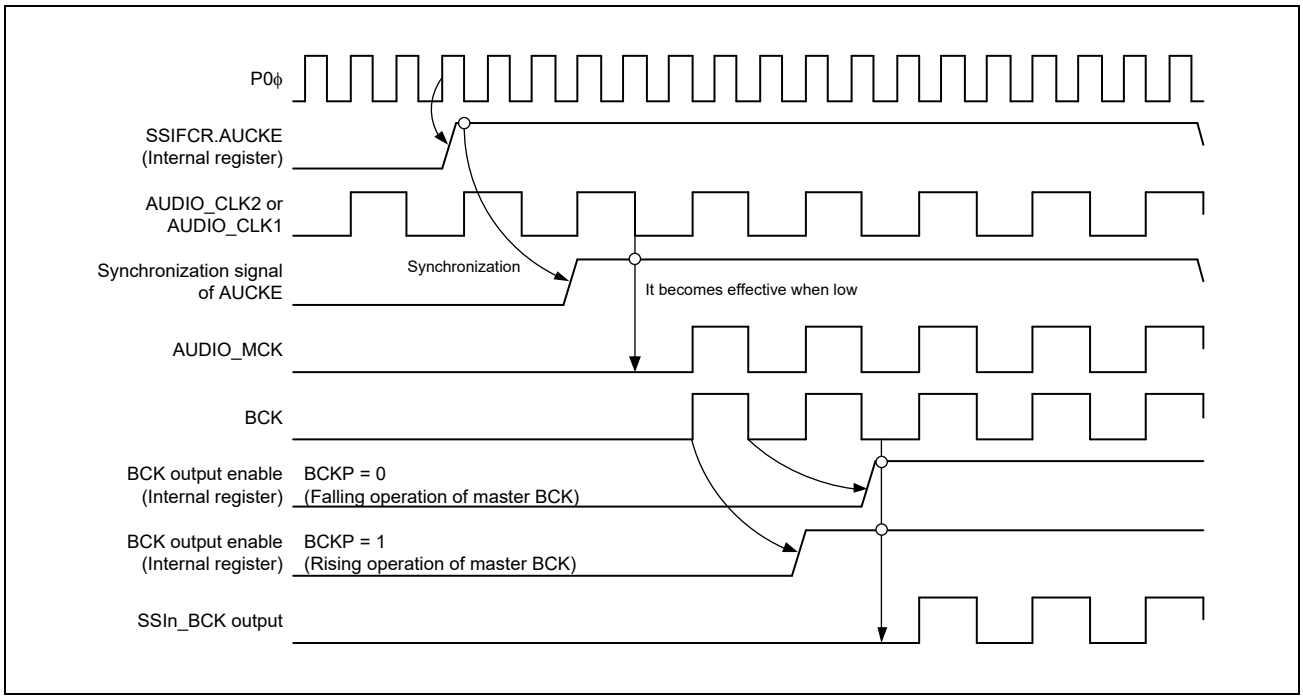

Figure 27.22 Timing chart when it begins to communicate master from system reset

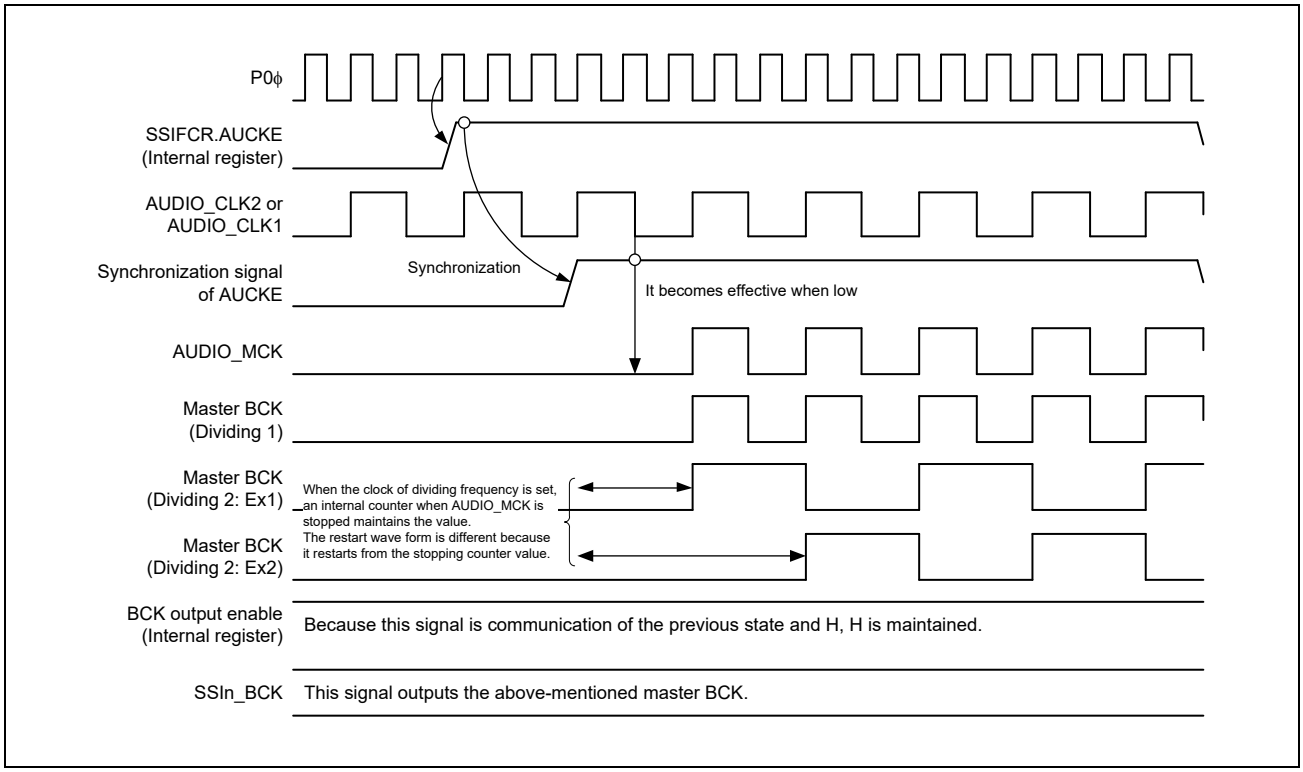

Figure 27.23 Timing chart when it begins to communicate master from communication stop

NOTE

When the supply of AUDIO_MCK is stopped, the terminal SSIBCK maintains the value. The terminal SSIBCK might stop in the state of “H”.

### SSIRST Bit

This bit sets a software reset of SSIF-2. Writing 1 to this bit initializes the internal state of SSIF-2. After a reset by writing 1, write 0 to release the reset because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.

To stop communication of SSIF-2 immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation with the bit clock.

Table 27.7 Bits Initialized by Software Reset of the SSIFCR.SSIRST Bit

### BSW Bit

This bit enables/disables byte swap of register access for the transmit FIFO data register (SSIFTDR) and the receive FIFO data register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR (**Figure 27.24**).

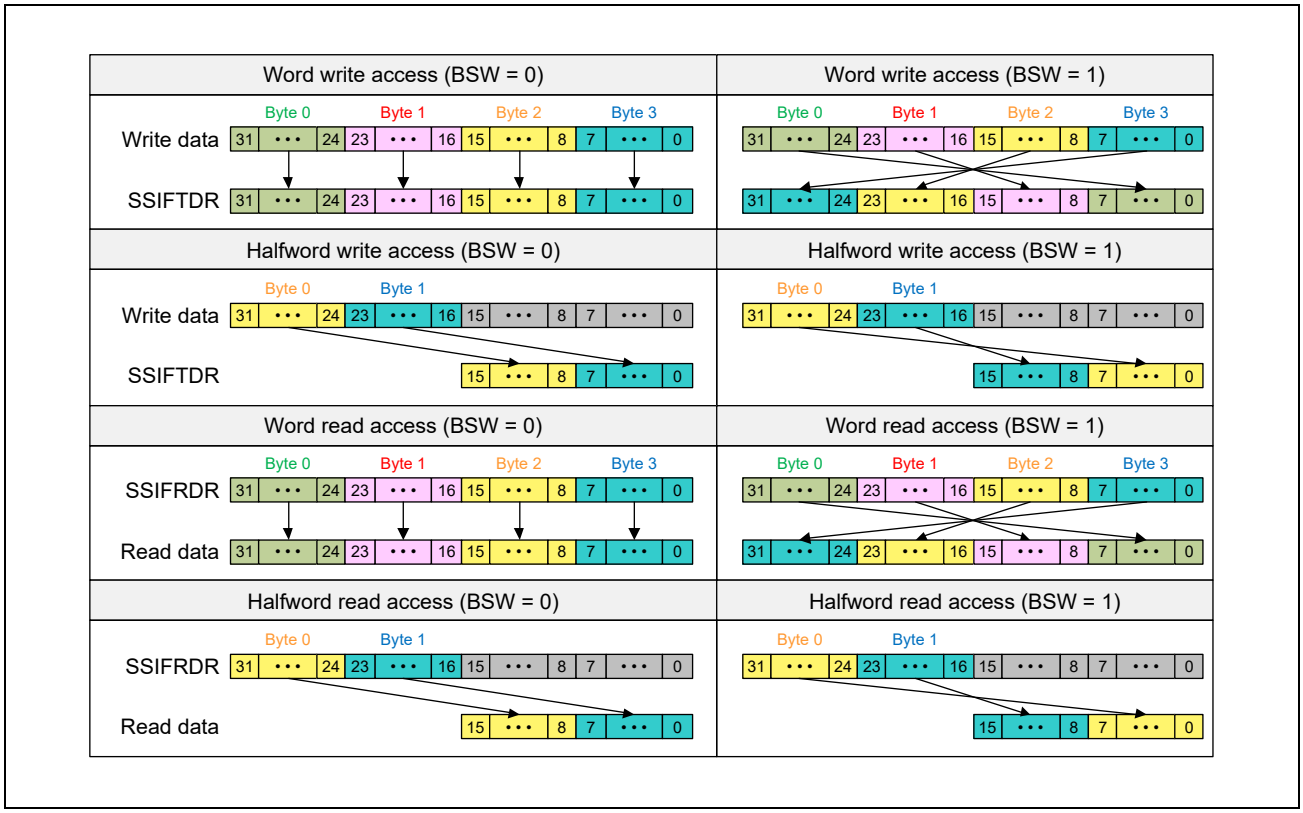

Figure 27.24 Operation Example of Byte Swap

### BCKNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSIBCK pin in slave-mode communication (SSICR.MST = ‘0’) except in the case of transmission (SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. The setting of this bit in master-mode communication (SSICR.MST = ‘1’) is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = ‘0’, SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

### LRCKNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSILRCK and SSIFS pins in slave-mode communication (SSICR.MST = ‘0’) except in the case of transmission (SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. The setting of this bit in master-mode communication (SSICR.MST = ‘1’) is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = ‘0’, SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

### RXDNCE Bit

This bit enables or disables the noise cancellation function supporting the suppression of transients 15-ns in length (typ.) in input signals on the SSIRxD pin in slave-mode communication (SSICR.MST = ‘0’) except in the case of transmission (SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’ and while reception is enabled (SSICR.REN = ‘1’).

The setting of this bit in master-mode communication (SSICR.MST = ‘1’) or while reception is disabled (SSICR.REN = ‘0’) is disabled.

Be sure to clear this bit to 0 in master-mode communication or during transmission in slave mode (SSICR.MST = ‘0’, SSICR.TEN = ‘1’) while SSICR.DEL = ‘1’. Set the BCKNCE, LRCKNCE, and RXDNCE bits to the same value.

### TIE Bit

This bit enables/disables output of transmit data empty interrupts. Transmission data empty interrupt is used as an interrupt factor written in the FIFO transmission data register. Set this bit to 1 after setting set condition (SSISCR.TDES) of transmission data empty interrupt. See **Figure 27.25** for the generation timing of a transmit data empty interrupt.

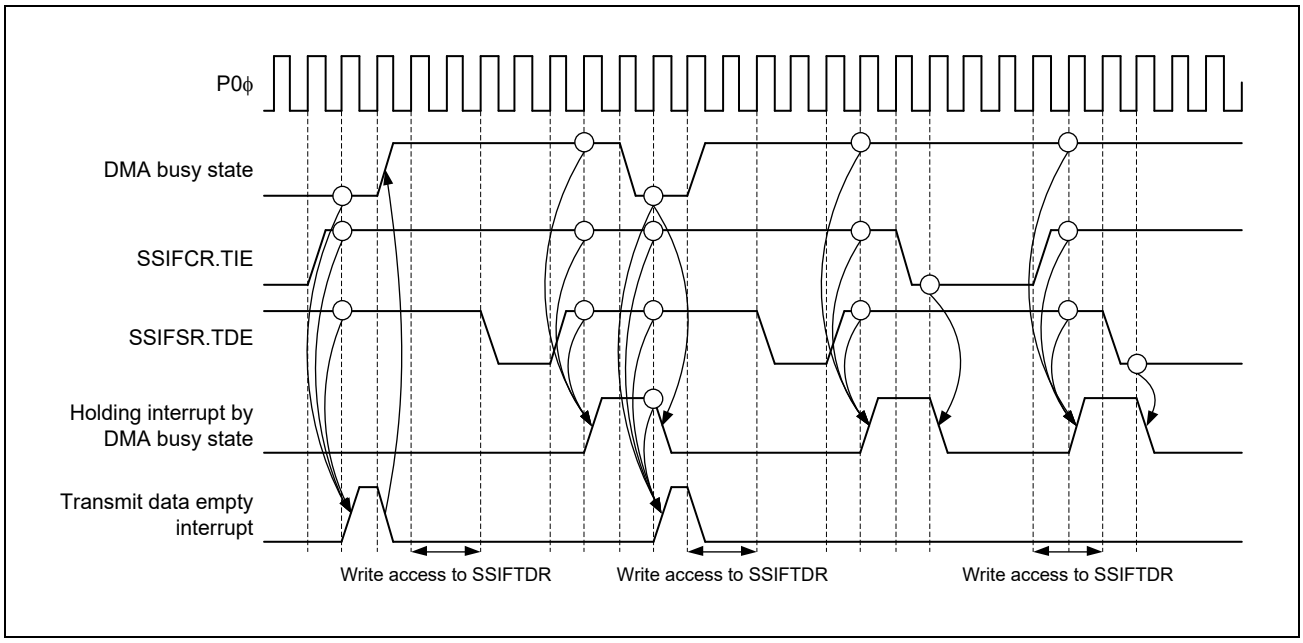

Figure 27.25 Generation timing of transmit data empty interrupt

### RIE Bit

This bit enables/disables output of receive data full interrupts. Receive data empty interrupt is used as an interrupt factor to read the FIFO receive data register. Set this bit to 1 after setting set condition (SSISCR.RDFS) of Receive data empty interrupt. See **Figure 27.26** for the generation timing of a receive data full interrupt.

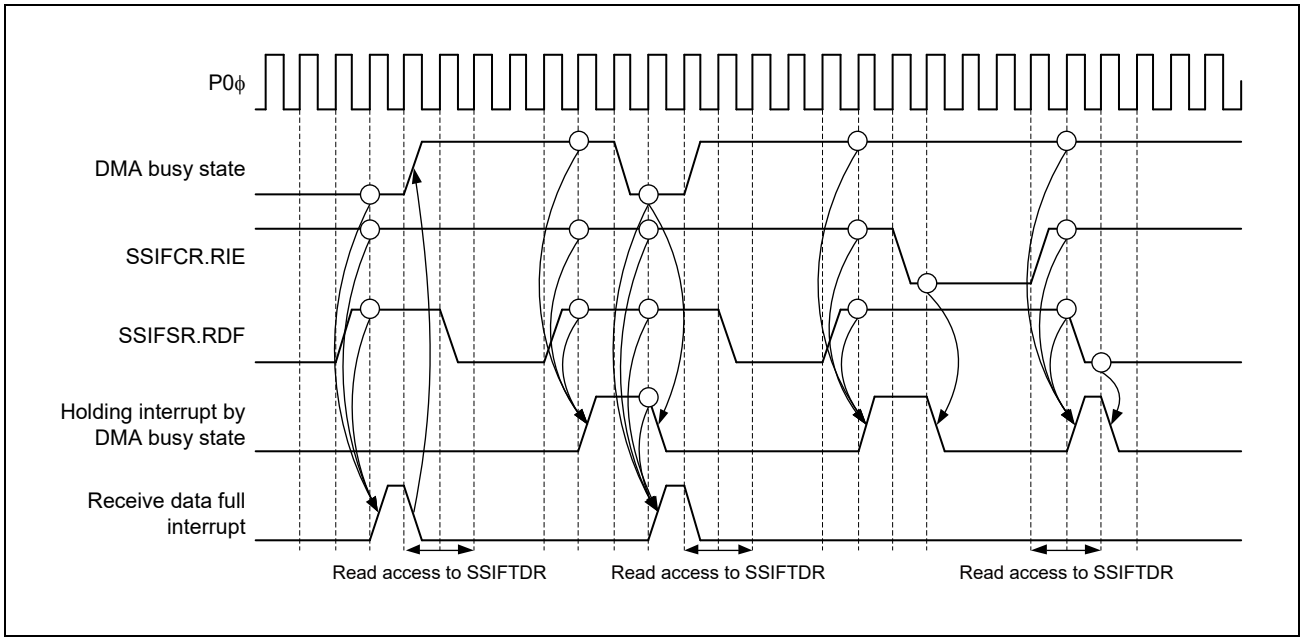

Figure 27.26 Generation timing of receive data empty interrupt

### TFRST Bit

This bit sets a software reset of the transmit FIFO data register (SSIFTDR). Writing 1 to this bit initializes the internal state related to SSIFTDR. See **Table 27.8** for the registers to which this software reset is applied. After a reset by writing 1, write 0 to clear the reset condition because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.

This bit is a bit of SSIRST for reset. Software reset by SSIRST becomes and writing this bit becomes invalid because of priority.

Table 27.8 Bits Initialized by Software Reset of the SSIFCR.TFRST Bit

### RFRST Bit

This bit sets a software reset of the receive FIFO data register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. After a reset by writing 1, write 0 to clear the reset condition because this bit is not automatically cleared to 0. After writing 0 to this bit, make sure that the bit becomes 0 before the next procedure.

This bit is a bit of SSIRST for reset. Software reset by SSIRST becomes and writing this bit becomes invalid because of priority.

Table 27.9 Bits Initialized by Software Reset of the SSIFCR.TFRST Bit

| Symbol | Address (Base+) | | +0 | | | | | | | | +1 | | | | | | | |

### 27.4.1.4 FIFO Status Register (SSIFSR)

This register is configured with status flags that indicate the status of the transmit FIFO data register and the receive FIFO data register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | TDC[5:0] | | | | | | — | — | — | — | — | — | — | TDE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | RDC[5:0] | | | | | | — | — | — | — | — | — | — | RDF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | H'0 | R | Reserved. Write 0. The read value is 0. |
| 29 to 24 | TDC[5:0] | H'00 | R | Number of Transmit FIFO Data Indication Flag |
| 23 to 17 | — | H'00 | R | Reserved. Write 0. The read value is 0. |
| 16 | TDE | 1 | RW0 | Transmit Data Empty Flag<br>0: The free space of SSIFTDR is not more than the value of SSISCR.TDES<br>1: The free space of SSIFTDR is not less than the value of SSISCR.TDES plus one. |
| 15, 14 | — | H'0 | R | Reserved. Write 0. The read value is 0. |
| 13 to 8 | RDC[5:0] | H'00 | R | Number of Receive FIFO Data Indication Flag |
| 7 to 1 | — | H'00 | R | Reserved. Write 0. The read value is 0. |
| 0 | RDF | 0 | RW0 | Receive Data Full Flag<br>0: The size of received data in SSIFRDR is not more than the value of SSISCR.RDFS<br>1: The size of received data in SSIFRDR is not less than the value of SSISCR.RDFS plus one. |

### TDC[5:0] Bits

These bits indicate the number of valid data that are stored in the transmit FIFO data register (SSIFTDR). With this flag as H'0, there is no data to be transmitted. With H'20, there is no space to write data.

### TDE Bit

This bit indicates that the transmit FIFO data register (SSIFTDR) has free space not less than the amount set with the SSISCR.TDES bit plus one. This flag is set by automatic determination but it must be cleared by register access.
[Priority order for setting and clearing]

Clearing is prioritized.*1

[Clearing condition]

Either of the following two:

(1) Writing 0 to this bit after reading this bit as 1.*2

(2) When writing data to SSIFTDR.

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this bit after reading this bit as 1 (**Figure 27.13**).

(2) When writing data to SSIFTDR.

**Note 1.** This bit is also cleared by a software reset (SSIFCR.SSIRST = 1) and transmit FIFO data register reset (SSIFCR.TFRST = 1). The software reset and transmit FIFO data register reset have priority over all the clearing conditions described above.

**Note 2.** The state of reading this bit as one is cleared by any of the following four conditions being met:
- Software reset (SSIFCR.SSIRST = 1)
- Resetting of the transmit FIFO data register (SSIFCR.TFRST = 1)
- Completion of writing 0 to this flag after having read it as 1.
- When writing data to SSIFTDR.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSISCR.TDES bit plus one.

[Setting timing]

While operating on P0ϕ, SSIFTDR is found to have free space not less than “size set in the SSISCR.TDES bits + 1.”

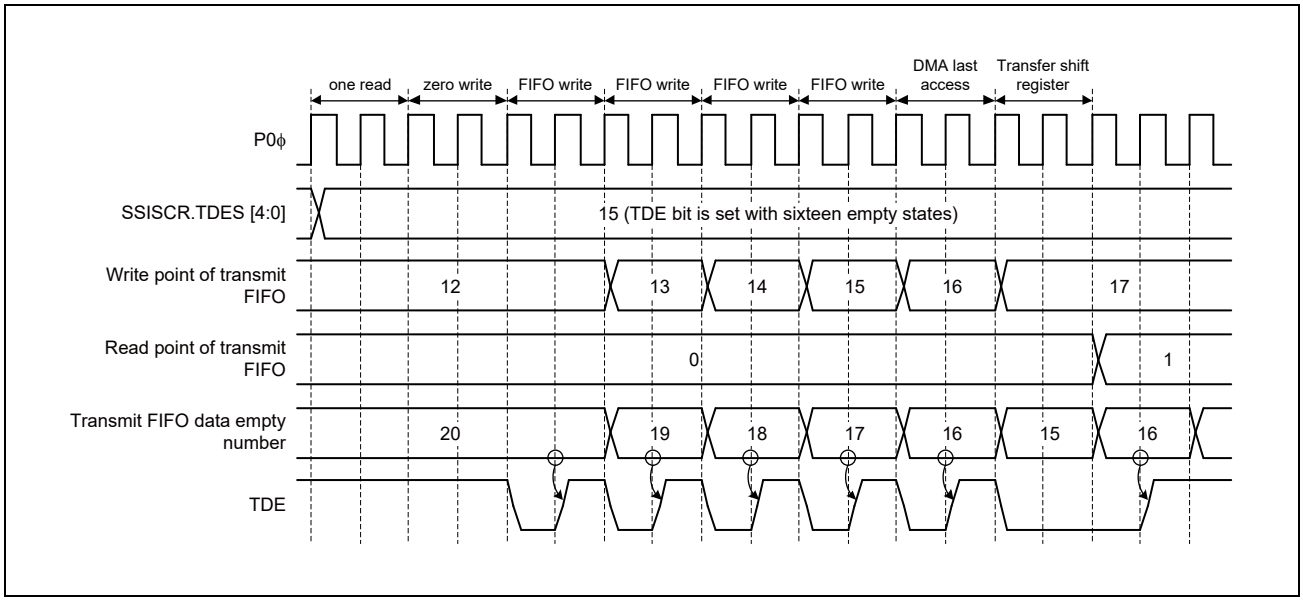

Figure 27.27 Set timing and clear timing of TDE

### RDC[5:0] Bits

These bits indicate the number of valid data that are stored in the receive FIFO data register (SSIFRDR). With this flag as H’0, there is no received data. With H’20, the register is filled with received data and there is no free space.

### RDF Bit

This bit indicates that the receive FIFO data register (SSIFRDR) has unread received data not less than the amount set with the SSISCR.RDFS bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.*1

[Clearing condition]

Either of the following two:

(1) Writing 0 to this bit after reading this bit as 1.*2

(2) When reading data from SSIFRDR.

[Clearing timing]

Timing according to the above-mentioned clear condition.

(1) At completion of writing 0 to this bit after reading this bit as 1 (**Figure 27.13**).

(2) After reading data from SSIFRDR.

**Note 1.** This bit is also cleared by a software reset (SSIFCR.SSIRST = 1) and receive FIFO data register reset (SSIFCR.RFRST = 1). Clearing conditions available for these bits are the software reset and receive FIFO data register reset as well as the clearing conditions described above.

**Note 2.** The state of reading this bit as one is cleared by any of the following four conditions being met:
- Software reset (SSIFCR.SSIRST = 1)
- Receive FIFO data register reset (SSIFCR.RFRST = 1)
- Completion of writing 0 to this flag after having read it as 1.
- When reading data from SSIFRDR.

[Setting condition]

SSIFRDR has data not less than the amount set with the SSISCR.RDFS bit plus one.

[Setting timing]

At completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set with the SSISCR.RDFS bit plus one.

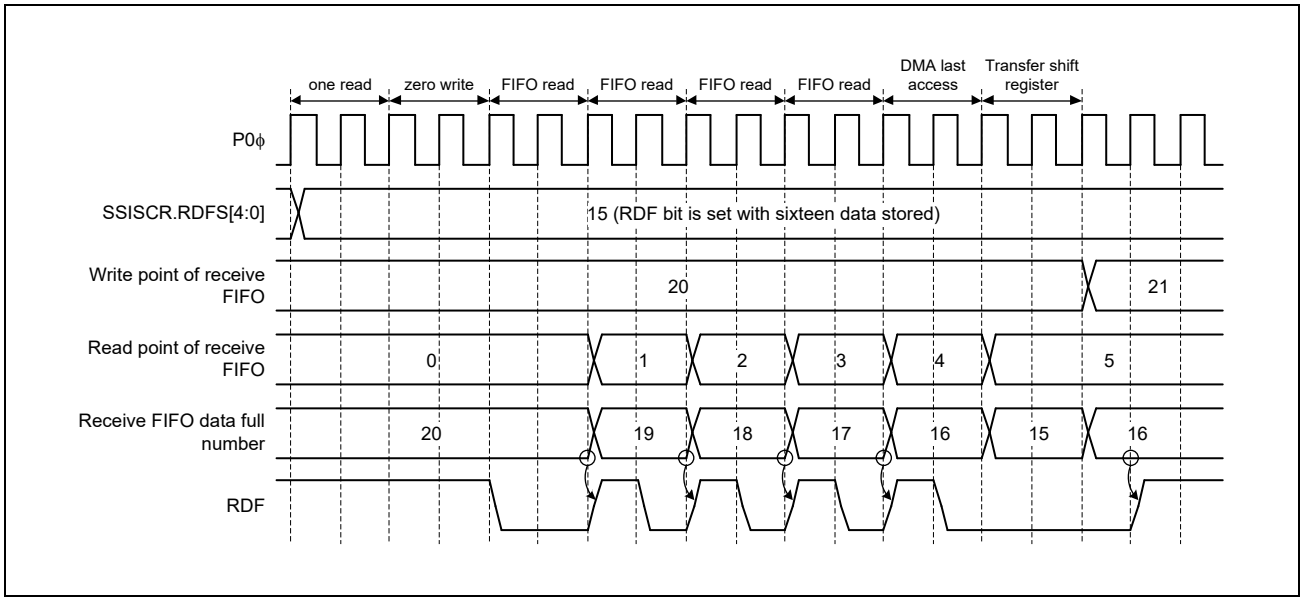

Figure 27.28 Set timing and clear timing of RDF

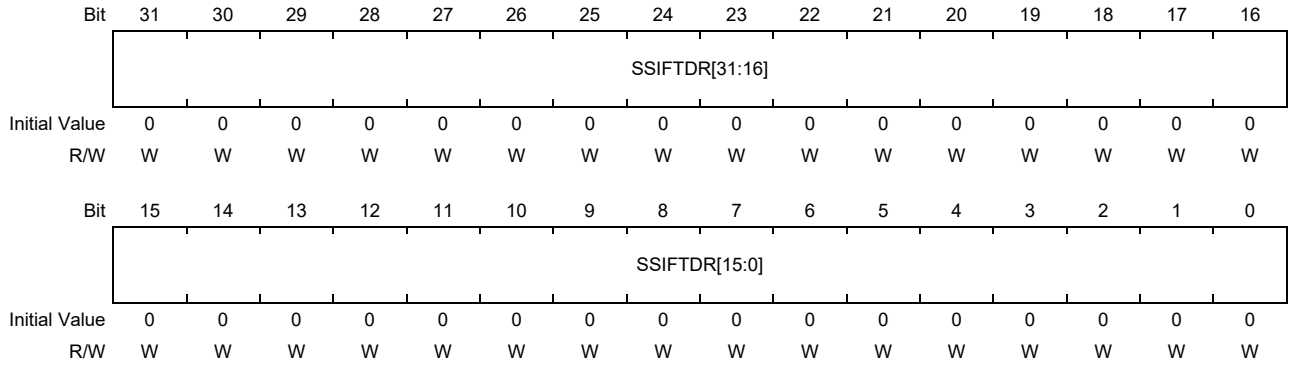
### 27.4.1.5 Transmit FIFO Data Register (SSIFTDR)

This is a 32-bit writable register. 0 is returned when this register is read. This register stores data to be serially transmitted.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SSIFTDR[31:0] | H'00000000 | W | Transmit FIFO data |

To use this register for transmission, set DMA operation handling of a transmit data empty interrupt as writing to this register. Determine the access size to this register according to the data word length to be communicated (**Table 27.10**).

Table 27.10 Register Access Restriction to FIFOs

| Access Size | | | | |
|---|---|---|---|---|
| SSICR.DWL[2:0] | Data Word Length | Byte | Halfword | Word |
| 000b | 8 | ✓ | — | — |
| 001b | 16 | — | ✓ | — |
| 010b | 18 | — | — | ✓ |
| 011b | 20 | — | — | ✓ |
| 100b | 22 | — | — | ✓ |
| 101b | 24 | — | — | ✓ |
| 110b | 32 | — | — | ✓ |
| 111b | Setting prohibited | — | — | — |

**Figure 27.29** shows register access to the transmit FIFO data register.

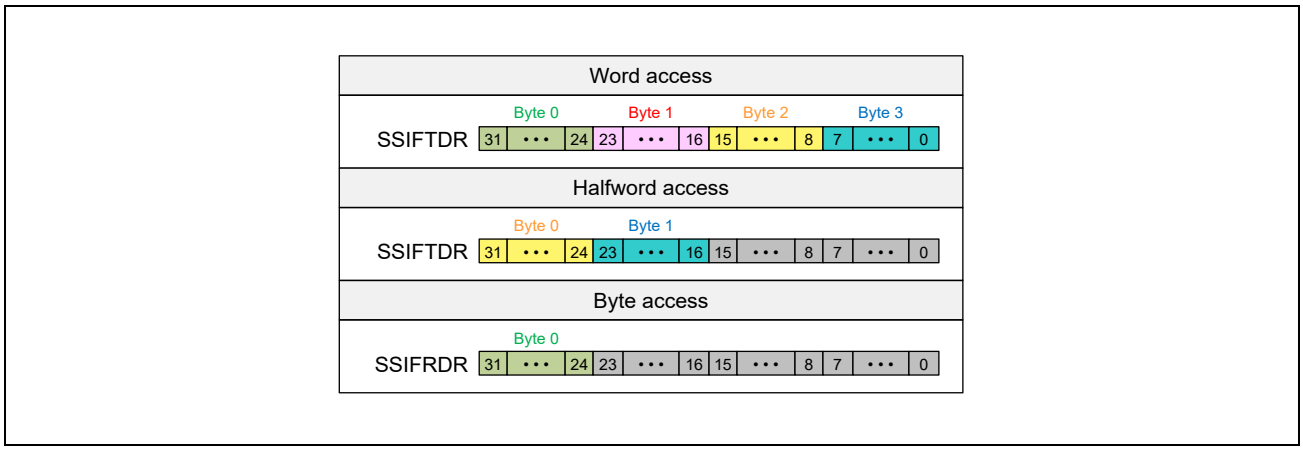


Figure 27.29 Example of Register Access to the Transmit FIFO Data Register

**Figure 27.30** shows the configurations and operation examples of the transmit FIFO data register and transmit shift register. The configurations are for storing data to FIFO and not related with communication.

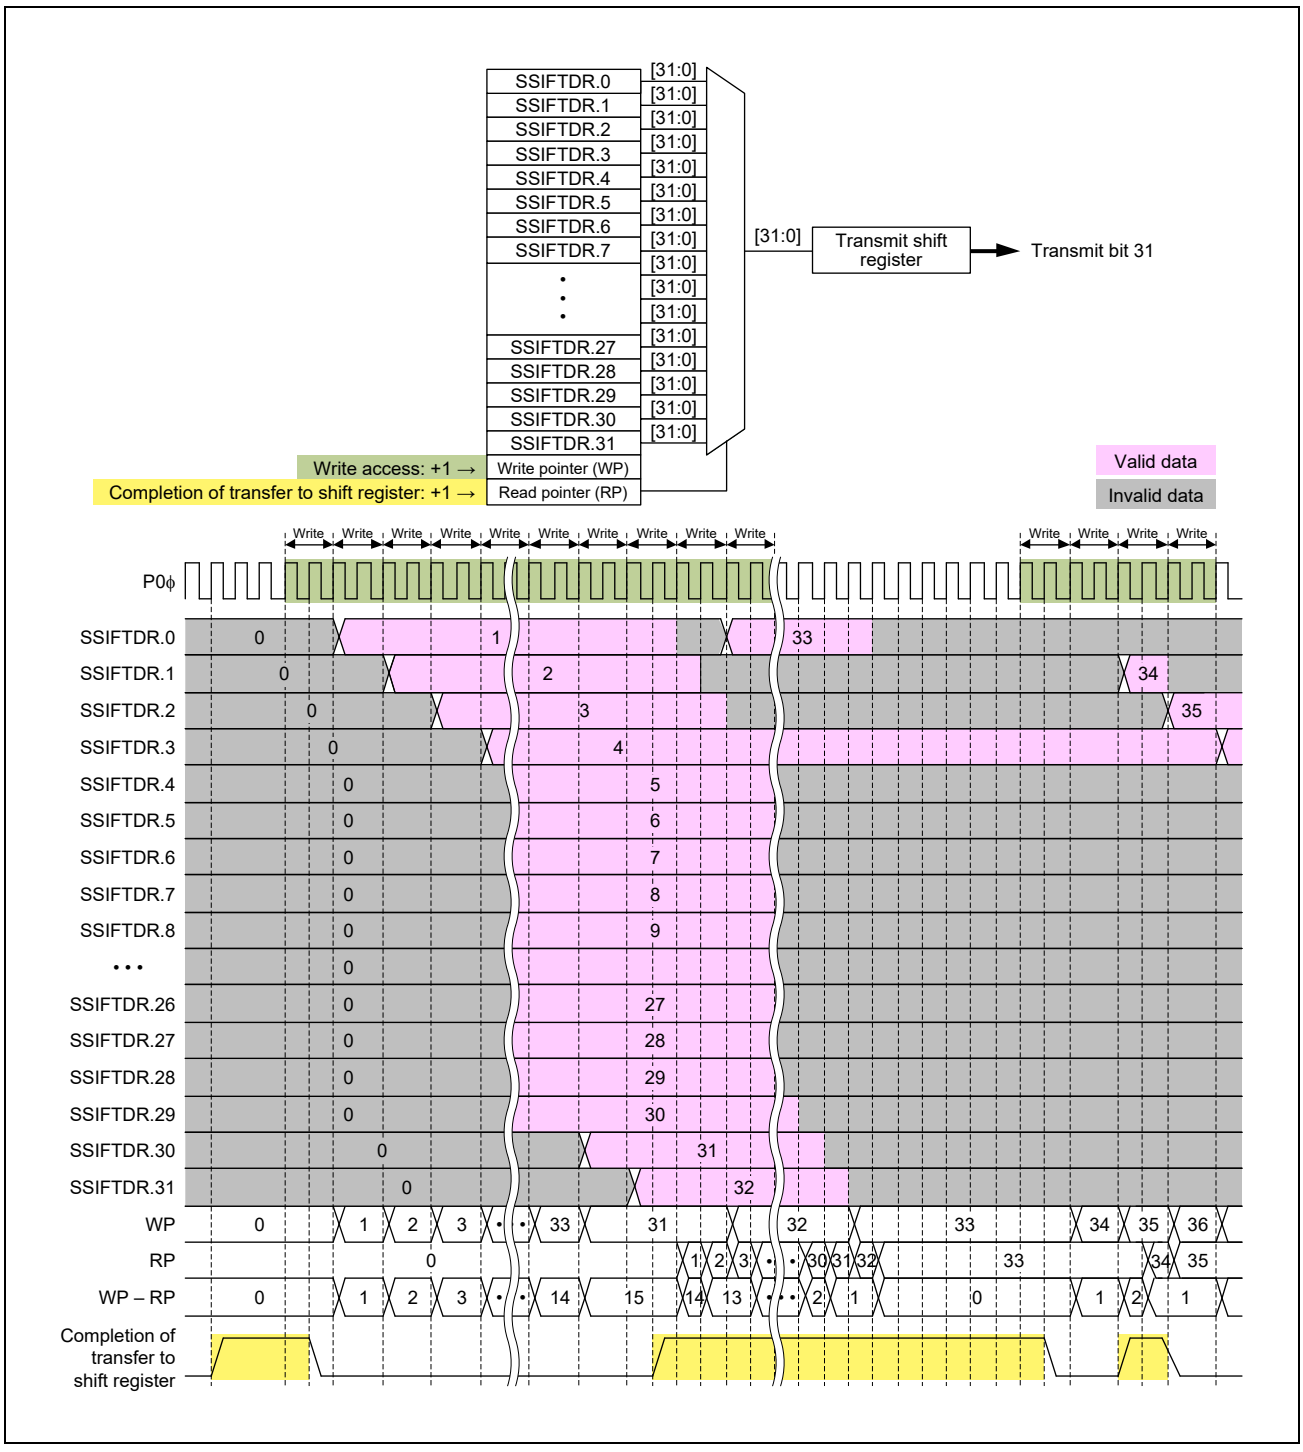

Figure 27.30 Configuration of the Transmit FIFO Data Register and Transmit Shift Register, and FIFO Operation Example

### 27.4.1.6 Receive FIFO Data Register (SSIFRDR)

This is a readable 32-bit register. This register stores received serial data.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SSIFRDR[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SSIFRDR[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SSIFRDR[31:0] | H'00000000 | R | Receive FIFO data |

To use this register for reception, set DMA operation handling of a receive data full interrupt as reading from this register. Determine the access size to this register according to the data word length to be communicated (**Table 27.10**). Register access to the receive FIFO data register is same as for the transmit FIFO data register (**Figure 27.29**).

**Figure 27.31** shows the configurations and operation examples of the receive FIFO data register and receive shift register.

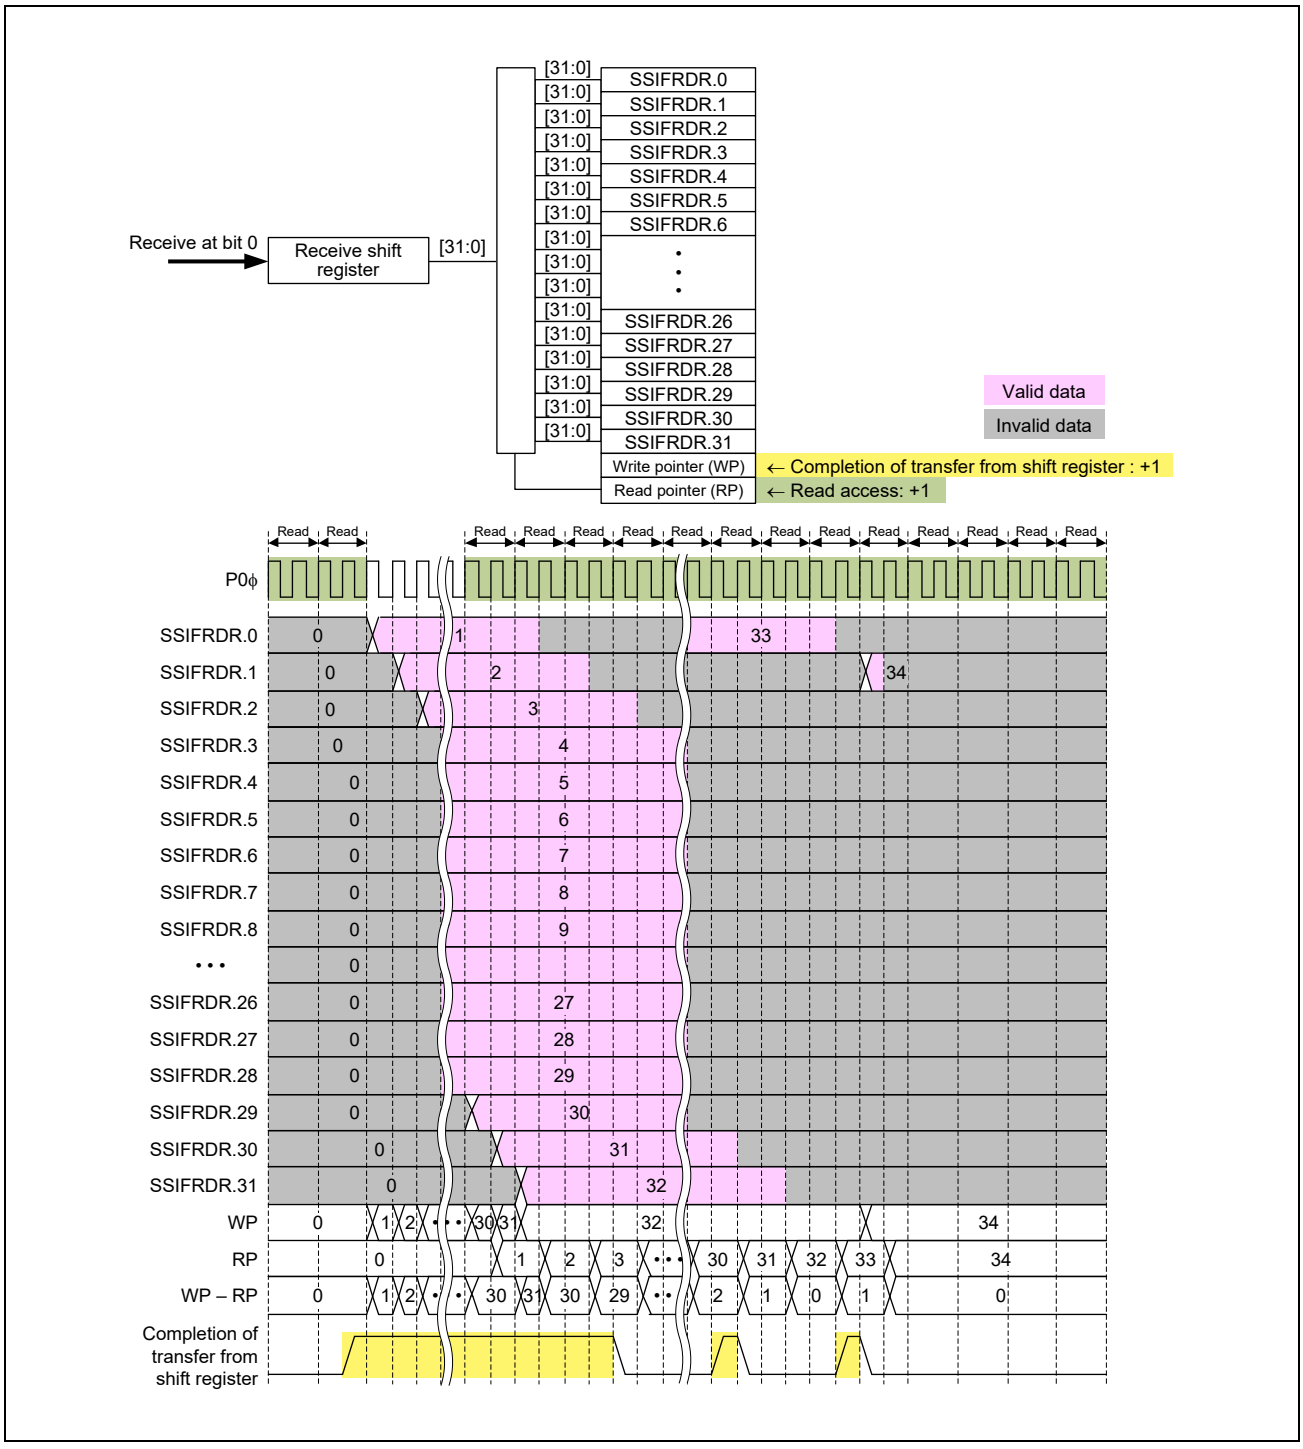

Figure 27.31 Configuration of the Receive FIFO Data Register and Receive Shift Register, and FIFO Operation Example

### 27.4.1.7 Audio Format Register (SSIOFR)

This is a readable/writable 32-bit register. It sets an audio format including the communication format, LRCK/FS continuation mode, and BCK output stop.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | BCKSTP | LRCONT | — | — | — | — | — | — | OMOD[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 10 | — | H'000000 | R | Reserved. Write 0. The read value is 0. |
| 9 | BCKASTP | 0 | RW | BCK Output Stop Enable*1,*2<br>0: Enables output of BCK<br>1: Disables output of BCK |
| 8 | LRCONT | 0 | RW | LRCK/FS Continuation Enable*1,*2<br>0: Disables LRCK continuation<br>1: Enables LRCK continuation |
| 7 to 2 | — | H'00 | R | Reserved. Write 0. The read value is 0. |
| 1, 0 | OMOD[1:0] | 0 | RW | Audio Format Select*3,*4<br>OMOD[1:0]: Format<br>00: $I^2S$ format<br>01: TDM format<br>10: Monaural format<br>11: Setting prohibited |

Note 1. This bit is valid only in master-mode communication (SSICR.MST = 1). The setting is invalid in slave-mode communication (SSICR.MST = 0).

Note 2. BCKASTP=1 and LRCONT=1 is prohibitions.

Note 3. Writing in this bit is a prohibition when SSIF-2 is communication state (SSISR.IIRQ=0). Operation is not guaranteed when rewriting it.

Note 4. Use the communication format setting that can be communicated when the format of the communication of the opposing device is compatible format of SSIF-2.

#### BCKASTP Bit

This bit turns on or off the function to output BCK to the SSIBCK pin according to the communication shown in **Figure 27.32** and **Figure 27.33** in master-mode communication (SSICR.MST = 1). Set this bit after setting completing the communication format.

This bit must defend the following usage. Start communication with BCKASTP = 0, and set 1 to BCKASTP while communicating. As a result, the bit clock output to the terminal SSIBCK stops by the automatic operation when the communication stop is done. When you will restart the communication, set 0 to BCKASTP with idle state (SSICR.IIRQ=1) and the AUDIO_MCK supply state (SSIFCR.AUCKE = 1)

When master communication (SSICR.MST=1) and idle state (SSICR.IIRQ=1).

Table 27.11 BCKASTP state, and Output state of SSIBCK pin.

| BCKASTP bit | output state of SSIBCK pin |
|---|---|
| 0 | Enable |
| 1 | Disable |

**Note:** When the opposing device who is the slave needs the clock of the terminal SSIBCK before the communication operates, it is not possible to use it. Use it to stop clocking after the communication ends (**Figure 27.33**). Refer to **Figure 27.32** for timing that the function becomes effective.

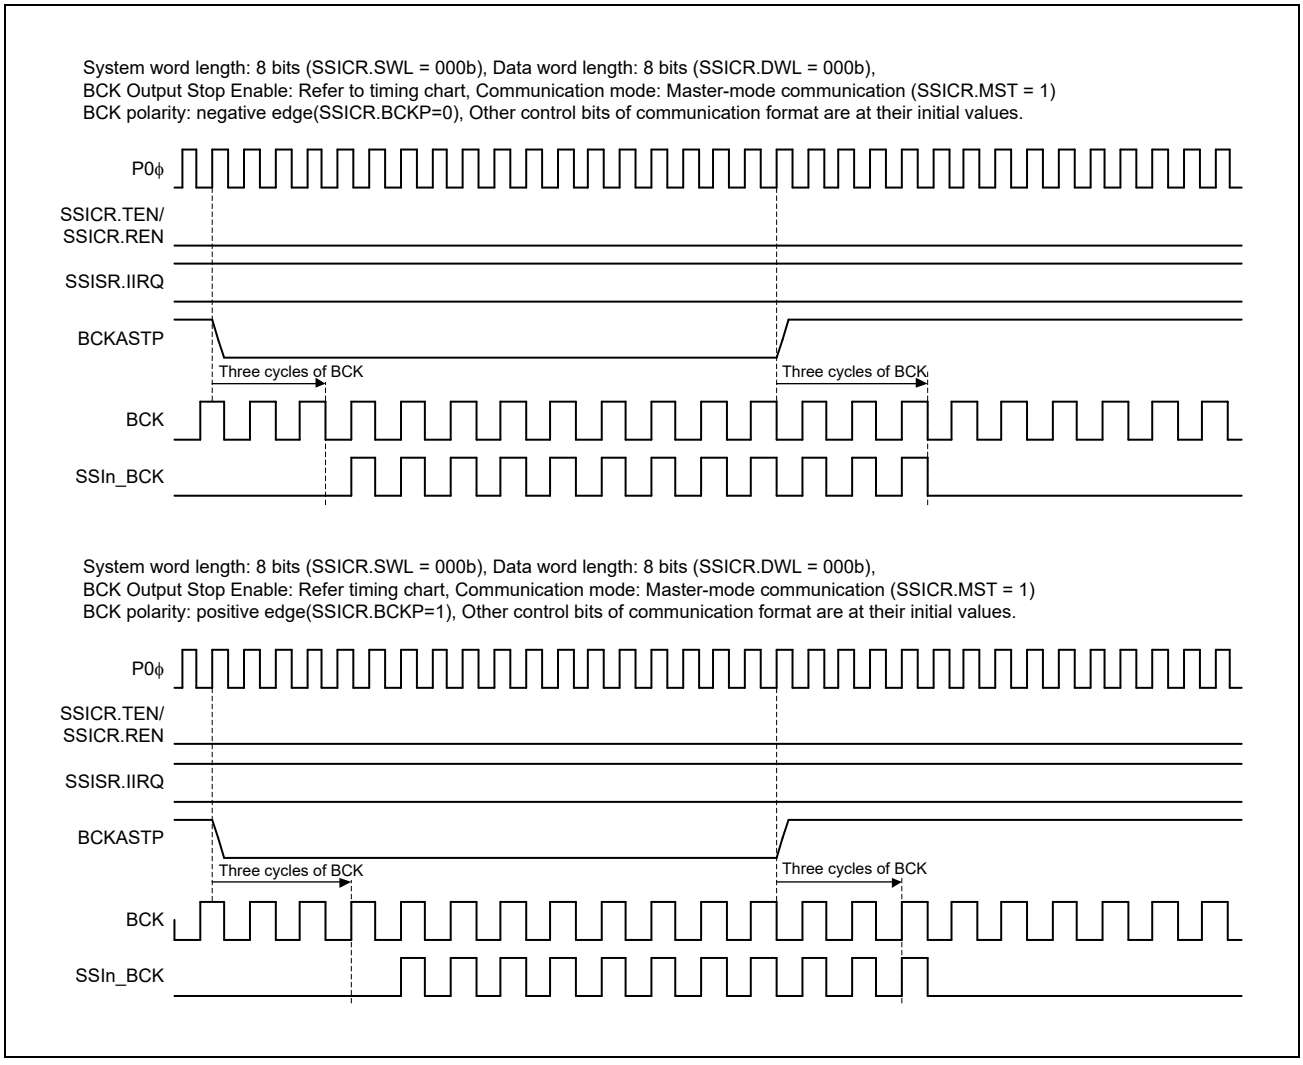

Figure 27.32 Example Operation of the BCKASTP Bit (in idle state)

When master communication (SSICR.MST=1) and the BCK output automatic operation stop function (BCKASTP = 1) (**Figure 27.33**).

Details of the BCK output to SSIBCK pin are as follows.

- Output start timing: To generate an effective edge in timing that LRCK/FS is changed into the valid value, BCK is output.
- Output stop timing: Frame boundary from 1 to 1.5 clock

Refer to the timing chart of **Figure 27.33** for detailed timing.

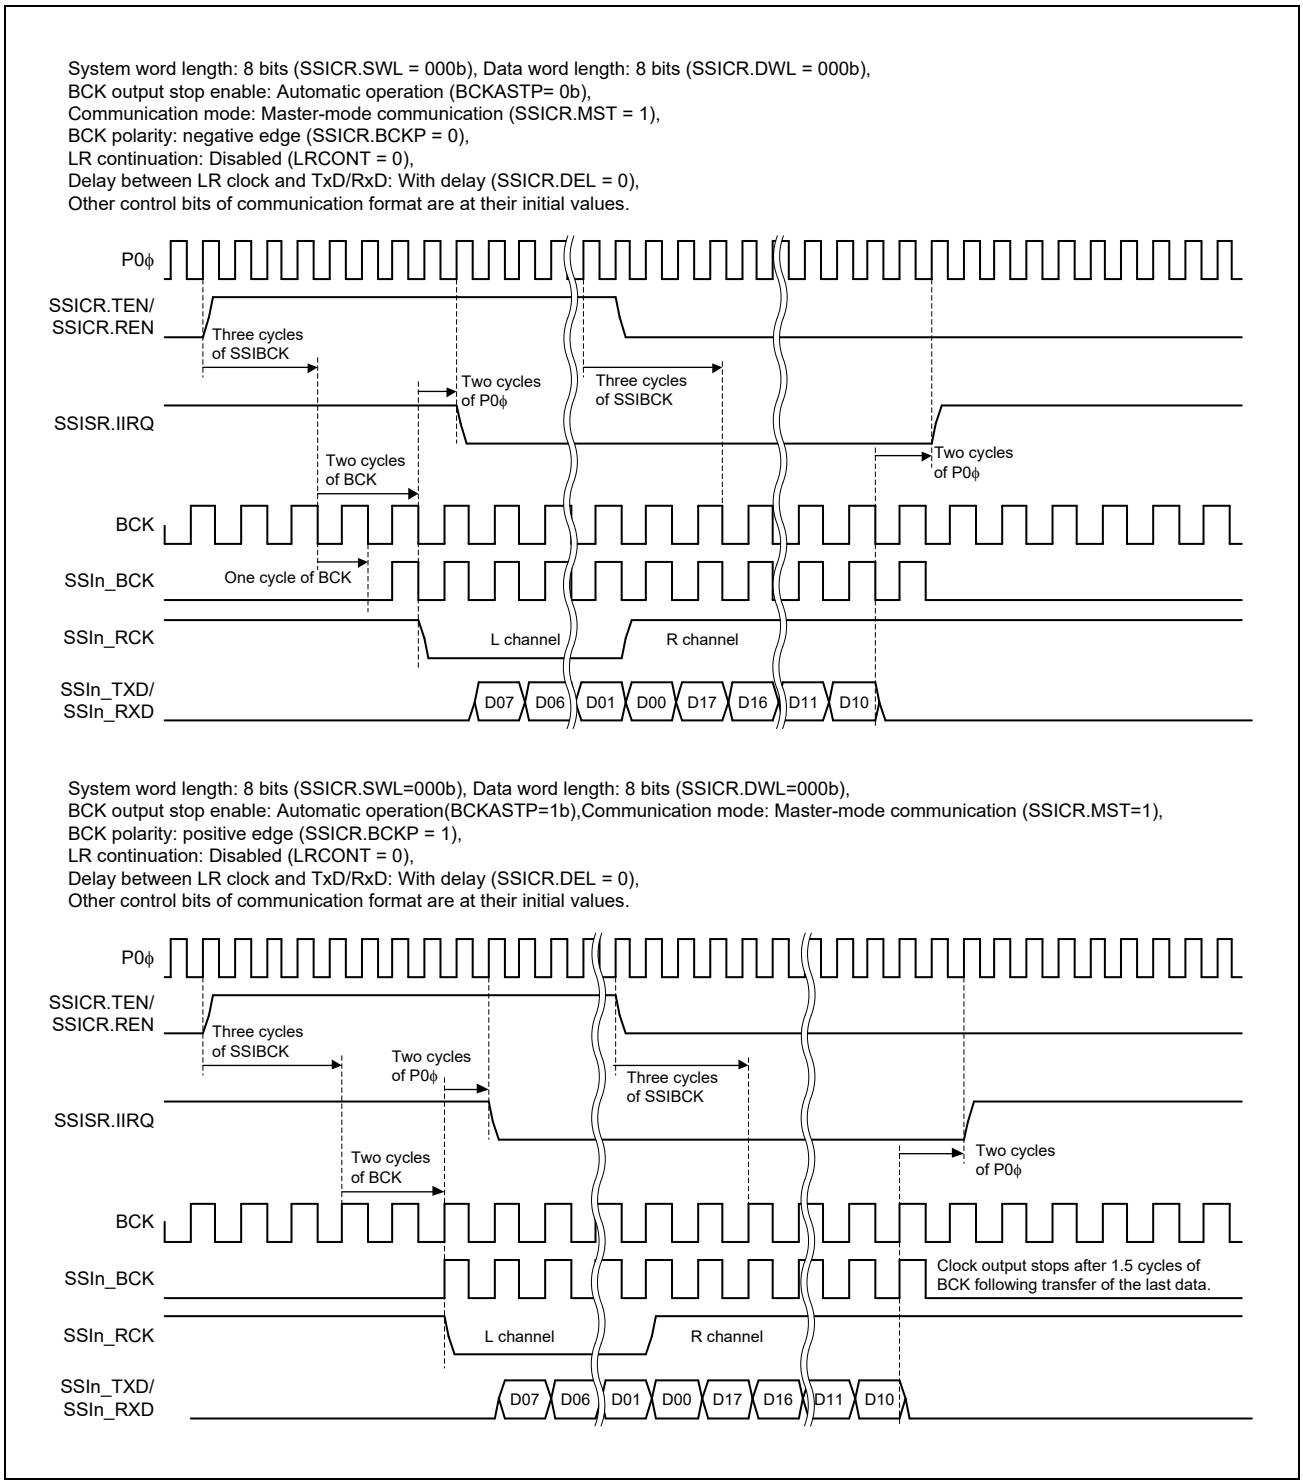

Figure 27.33 Example Operation of the BCKASTP Bit (Communication behavior in BCKASTP=1)

### LRCONT Bit

This bit enables/disables the output from the SSILRCK/SSIFS pin when SSIF-2 is master communication (SSICR.MST=1) and idle state (SSISR.IIRQ=1). Writing 1 to this bit (enables LRCK/FS continuation) in master mode (SSICR.MST = 1) enables continuation of the output from the SSILRCK/SSIFS pins even when idle state.

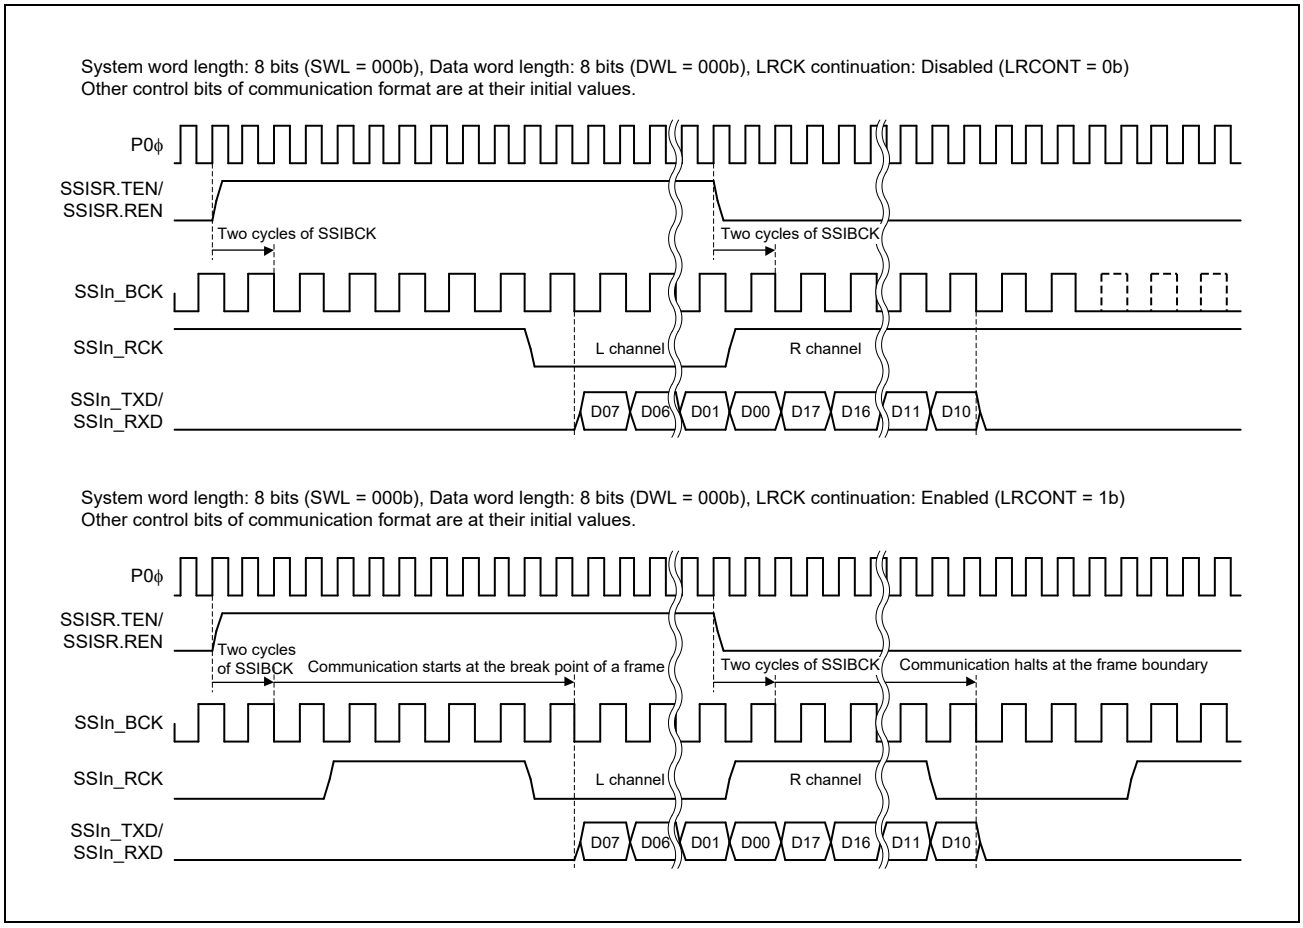

Figure 27.34 Operation Example of LRCK/FS Continuation (in idle state)

### OMOD[1:0] Bits

These bits set an audio format.

Rewrite this bit when the LR clock supply to the terminal SSILRCK stops. Refer to the LRCONT bit details explanation in **Section 27.4.1.7, Audio Format Register (SSIOFR)** for the output operation of the LR clock.

### 27.4.1.8 Status Control Register (SSISCR)

This is a readable/writable 32-bit register. It sets the operation of the TDE and RDF flags.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | TDES[4:0] | | | | | — | — | — | RDFS[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | H'00000 | R | Reserved. Write 0. The read value is 0. |
| 12 to 8 | TDES[4:0] | H'00 | RW | TDE Setting Condition Select*1<br>TDES[4:0]: Operation<br>00000b: SSIFTDR has one stage or more free space<br>00001b: SSIFTDR has two stages or more free space<br>(snip)<br>11110b: SSIFTDR has thirty-one stages or more free space<br>11111b: SSIFTDR has thirty-two stages or more free space |
| 7 to 5 | — | H'0 | R | Reserved. Write 0. The read value is 0. |
| 4 to 0 | RDFS[4:0] | H'00 | RW | RDF Setting Condition Select*1<br>RDFS[4:0]: Operation<br>00000b: SSIFRDR has one stage or more data size<br>00001b: SSIFRDR has two stages or more data size<br>(snip)<br>01110b: SSIFRDR has thirty-one or more data size<br>01111b: SSIFRDR has thirty-two stages or more data size |

Note 1. Writing to these bits while SSIF-2 is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

#### TDES[4:0] Bits

These bits set the setting condition of the transmit data empty flag (TDE). Set these bits in byte units.

#### RDFS[4:0] Bits

These bits set the setting condition of the receive data full flag (RDF). Set these bits in byte units.

### 27.4.2 Communication Formats

SSIF-2 supports three communication formats (**Table 27.12**).

Table 27.12 Supported Communication Formats

| Communication Format | SSIOFR.OMOD[1:0] |
|---|---|
| $I^2S$ format | 00 |
| TDM format | 01 |
| Monaural format | 10 |

The following figure shows the serial data configuration common to communication formats. Serial data is determined according to the system word length (SSICR.SWL[2:0]) and the data word length (SSICR.DWL[2:0]). When the system word length is longer than the data word length, padding bits are transferred (**Figure 27.35**).

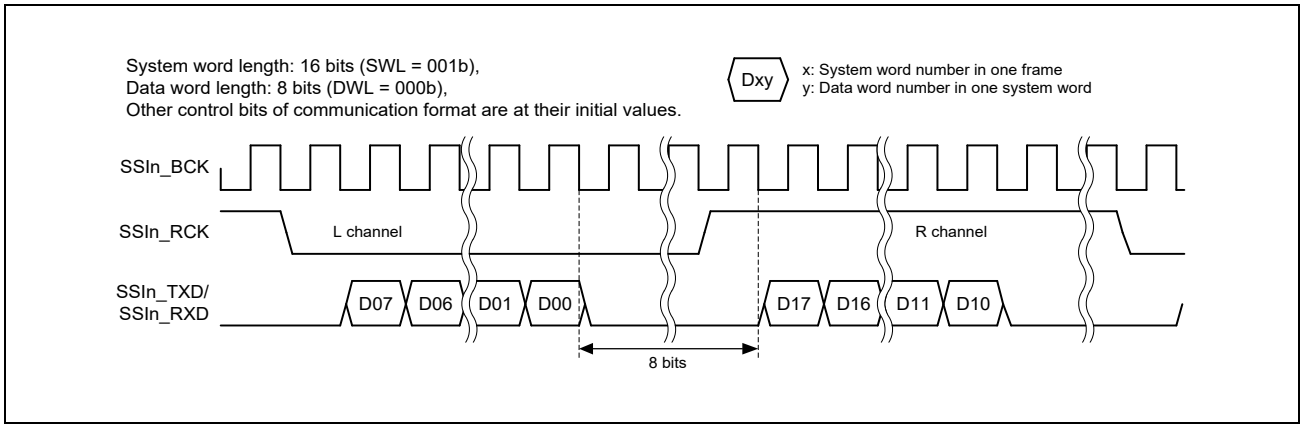

Figure 27.35 Example of Padding Bit Transfer ($I^2S$ Format: System Word Length > Data Word Length)

**Table 27.13** lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]). "-" indicates that the setting is prohibited.

Table 27.13 Number of Padding Bits

| | SSICR.DWL[2:0] | 000b | 001b | 010b | 011b | 100b | 101b | 110b | 111b |
|---|---|---|---|---|---|---|---|---|---|
| SSICR.SWL[2:0] | System Word Length | 8 | 16 | 18 | 20 | 22 | 24 | 32 | Set prohibition |
| 000b | 8 | 0 | — | — | — | — | — | — | — |
| 001b | 16 | 8 | 0 | — | — | — | — | — | — |
| 010b | 24 | 16 | 8 | 6 | 4 | 2 | 0 | — | — |
| 011b | 32 | 24 | 16 | 14 | 12 | 10 | 8 | 0 | — |
| 100b | 48 | 40 | 32 | 30 | 28 | 26 | 24 | 16 | — |
| 101b | 64 | 56 | 48 | 46 | 44 | 42 | 40 | 32 | — |
| 110b | 128 | 120 | 112 | 110 | 108 | 106 | 104 | 96 | — |
| 111b | 256 | 248 | 240 | 238 | 236 | 234 | 232 | 224 | — |

### 27.4.2.1 I²S Format

The I²S format is a communication format used for connection with I²S-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 00b), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for the channel L and at a high level for the channel R. Set the polarity of the signals with the SSICR.LRCKP bit. **Figure 27.36** shows the I²S format without padding. See **Figure 27.35** for the format with padding.

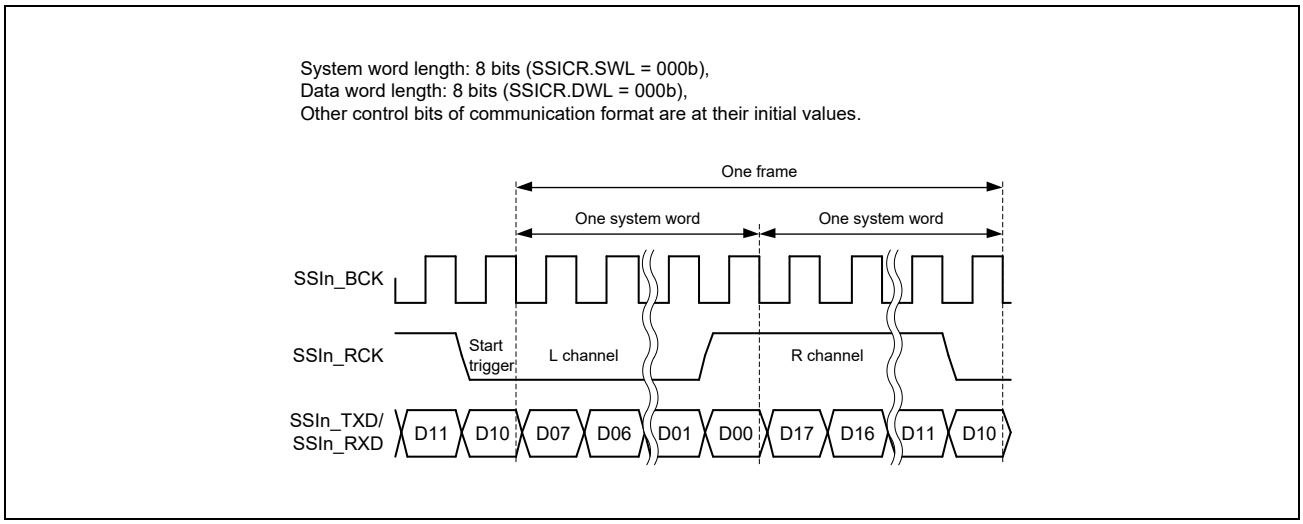

Figure 27.36 I²S Format (Without Padding: System Word Length = Data Word Length)

For the state of external pins when SSIF-2 is in the idle state, see **Section 27.5.1.1, Idle State**.

NOTE

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/ SSIFS only as a communication start trigger.

### 27.4.2.2 Monaural Format

The monaural format is a communication format used for connection with monaural-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 10b), one frame is configured with the number of system words set with the SSICR.FRM[1:0] bits (**Figure 27.37**). A rising of the SSILRCK/SSIFS signal means a start trigger. **Figure 27.37** and **Figure 27.38** respectively show the monaural formats without and with padding.

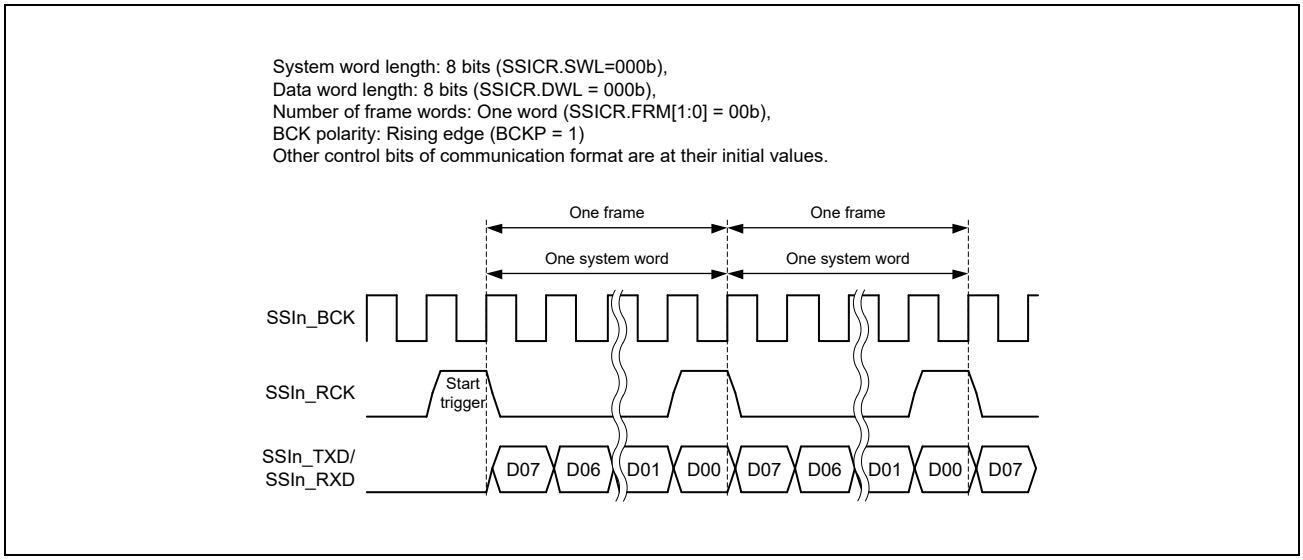

Figure 27.37 Short Frame in Monaural Format (Without Padding: System Word Length = Data Word Length)

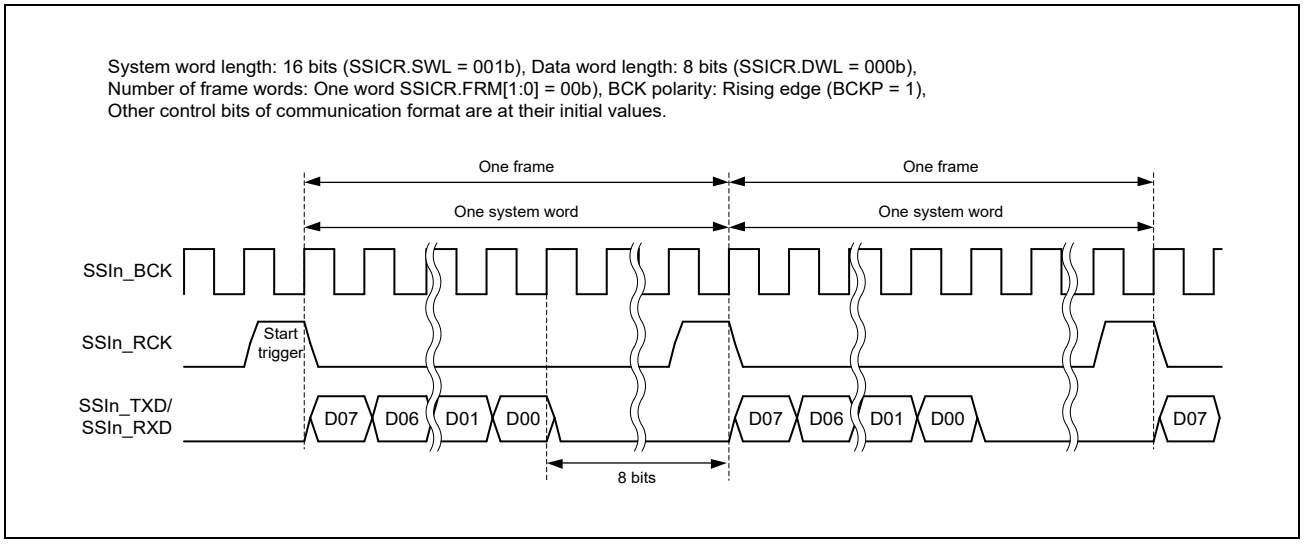

Figure 27.38 Short Frame in Monaural Format (With Padding: System Word Length > Data Word Length)

The monaural formats supported by SSIF-2 consist of short frames and long frames. See **Section 27.4.2.2(1), Short Frame** and **Section 27.4.2.2(2), Long Frame** for the difference between these two frames.

For the state of external pins state when SSIF-2 is in the idle state, see **Section 27.5.1.1, Idle State**.

NOTE

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

### (1) Short Frame

With the short frame (SSICR.DEL = 0), the SSILRCK/SSIFS signal that indicates a start of serial data is at a high level for one cycle of SSIBCK. Data transfer starts at the falling edge of the signal (**Figure 27.37** and **Figure 27.38**).

### (2) Long Frame

With the long frame (SSICR.DEL = 1), the SSILRCK/SSIFS signal that indicates a start of serial data is at a high level for two cycles of SSIBCK. Data transfer starts at the rising edge of the signal (**Figure 27.39**).

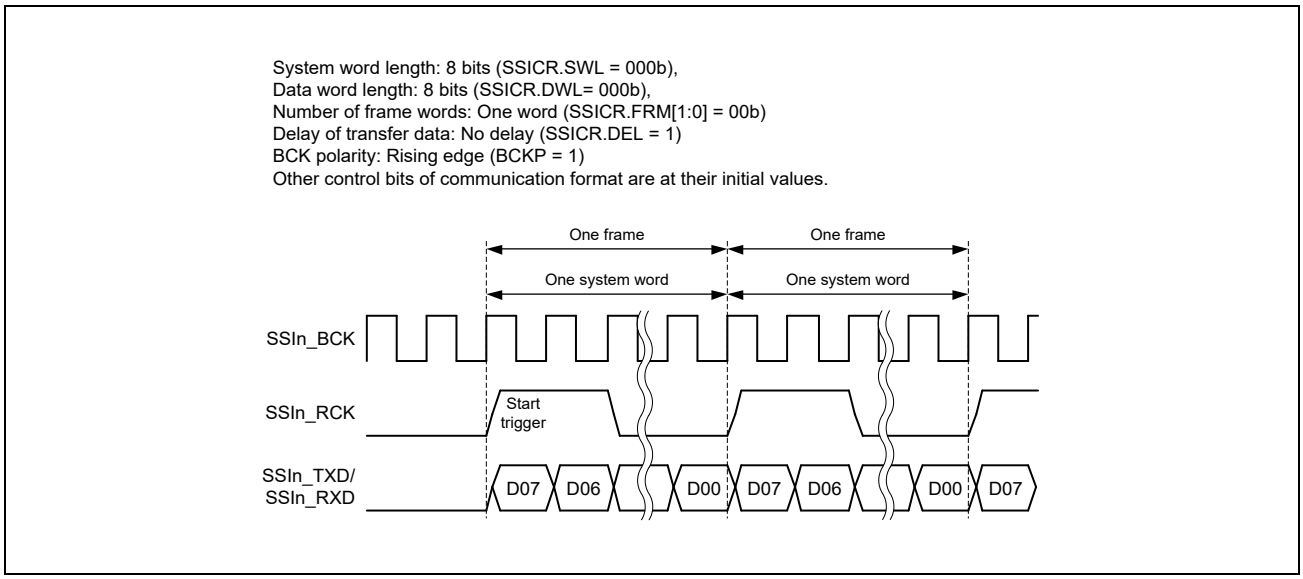

Figure 27.39 Long Frame in Monaural Format (Without Padding)

### 27.4.2.3 TDM Format

The TDM format is a communication format used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01b), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge means a start of one frame. **Figure 27.40** and **Figure 27.41** respectively show the TDM formats with and without padding.

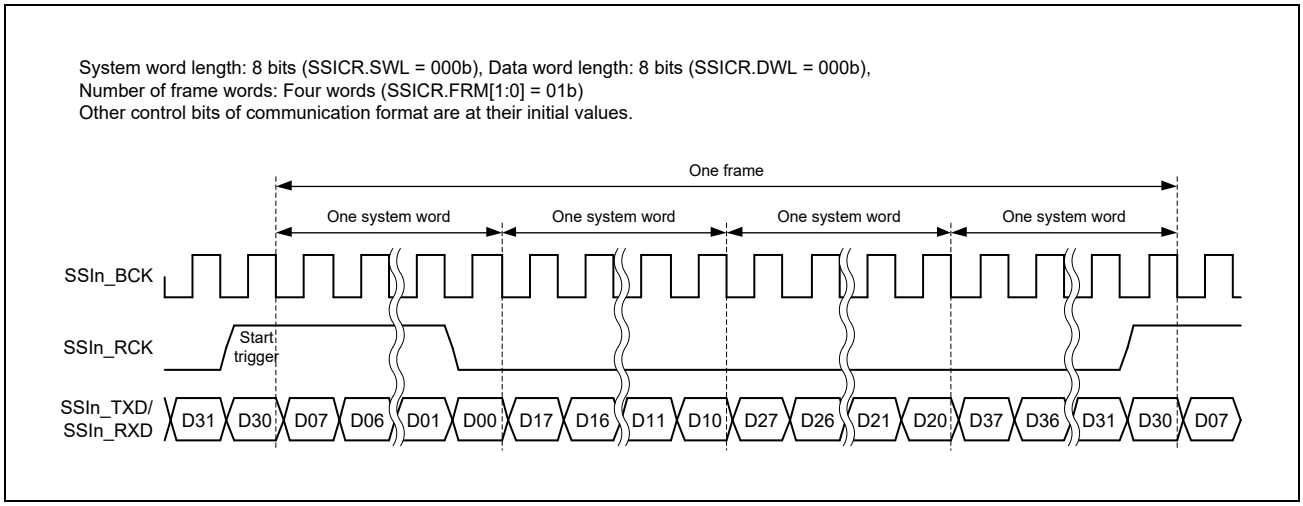

Figure 27.40 TDM Format (Without Padding: System Word Length = Data Word Length)

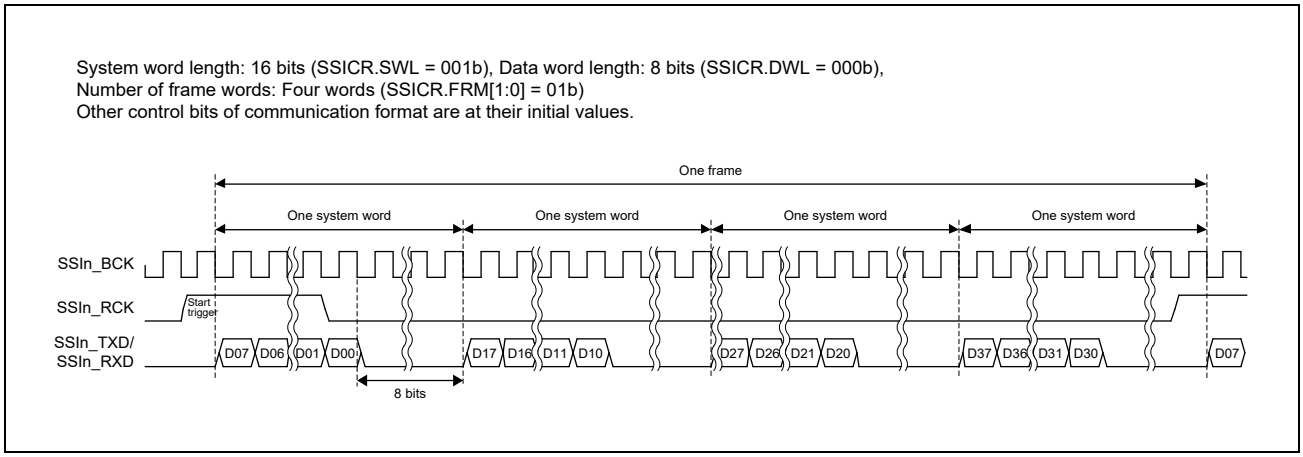

Figure 27.41 TDM Format (With Padding: System Word Length > Data Word Length)

For the state of external pins when SSIF-2 is in the idle state, see **Section 27.5.1.1, Idle State**.

NOTE

SSIF-2 has the terminal SSILRCK/SSIFS that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSILRCK/SSIFS only as a communication start trigger.

### 27.4.3 Communication Modes

SSIF-2 supports the following communication modes. **Table 27.15** lists the control bits that are not available with each communication mode. See **Section 27.4.3.1** to **Section 27.4.3.5** for details of these communication modes.

Table 27.14 Communication Modes

| Communication Mode | SSICR.MST Bit | SSICR.REN Bit | SSICR.TEN Bit |
|---|---|---|---|
| Slave-mode transmission | 0 | 0 | 1 |
| Slave-mode reception | 0 | 1 | 0 |
| Slave-mode transmission and reception | 0 | 1 | 1 |
| Master-mode transmission | 1 | 0 | 1 |
| Master-mode reception | 1 | 1 | 0 |
| Master-mode transmission and reception | 1 | 1 | 1 |

Table 27.15 Control Bits that Cannot be Used in Each Communication Mode

| Communication Mode Control Bit | Slave-mode Reception | Slave-mode Transmission | Slave-mode Transmission and Reception | Master-mode Reception | Master-mode Transmission | Master-mode Transmission and Reception |
|---|---|---|---|---|---|---|
| SSICR.CKS | Invalid | Invalid | Invalid | Available | Available | Available |
| SSICR.CKDV | Invalid | Invalid | Invalid | Available | Available | Available |
| SSICR.MUEN | Invalid | Available | Available | Invalid | Available | Available |
| SSICR.TEN | Invalid | Available | Available | Invalid | Available | Available |
| SSICR.REN | Available | Invalid | Available | Available | Invalid | Available |
| SSIFCR.AUCKEN | Invalid | Invalid | Invalid | Available | Available | Available |
| SSIFCR.BCKNCE | Available | Available*1 | Available*2 | Invalid | Invalid | Invalid |

Note 1. Disabled when SSICR.DEL = ‘1’

Note 2. Note 2. Disabled during transmission (SSICR.TEN = ‘1’) when SSICR.DEL = ‘1’

#### 27.4.3.1 Slave-mode Communication

SSIF-2 operates in slave mode with SSICR.MST = 0. Supply the SSIBCK signal and the SSILRCK/SSIFS signal used for the serial data communication from external devices. If these signals do not match the communication format set for SSIF-2, operation is not guaranteed.

#### 27.4.3.2 Master-mode Communication

SSIF-2 operates in master mode with SSICR.MST = 1. The SSIBCK signal and SSILRCK/SSIFS signal used for the serial data communication are internally generated from the audio clock. These signals use the format according to the setting of SSIF-2. If the communication format of another device working as the slave device does not match the communication format set for SSIF-2, operation is not guaranteed.

#### 27.4.3.3 Transmission

SSIF-2 transmits serial data to opposing device when SSICR.TEN = 1 and SSICR.REN = 0. If the communication format of the opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

#### 27.4.3.4 Reception

SSIF-2 receives serial data from opposing device when SSICR.TEN = 0 and SSICR.REN = 1. If the communication format of the opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

#### 27.4.3.5 Transmission and Reception

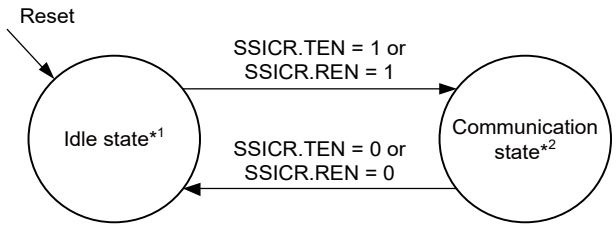
SSIF-2 transmits and receives serial data to and from opposing device when SSICR.TEN = 1, SSICR.REN = 1. If the communication format of opposing device does not match the communication format set for SSIF-2, operation is not guaranteed.

# 27.5 Operation

## 27.5.1 Operational State

SSIF-2 has the following two main operation states (**Figure 27.42**).

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0)



Note 1. See **Section 27.5.1.1** for details of the idle state.

Note 2. See **Section 27.5.1.2** for details of the communication state.

Figure 27.42 SSIF-2 State Transition

### 27.5.1.1 Idle State

In this state, communication of SSIF-2 is halted. However, when SSICR.MST = 1, output of BCK and LRCK/FS to external pins is enabled depending on the settings in the SSIOFR.BCKASTP bit and the SSIOFR.LRCONT bit (**Table 27.16**). This function is common to all formats.

Table 27.16 Output from External Pins in the Idle State

| | | | Output from Pins | | |
|---|---|---|---|---|---|
| SSICR.MST | SSIOFR.BCKASTP | SSIOFR.LRCONT | SSIBCK | SSILRCK/SSIFS | SSITxD |
| 0 | — | — | Stop | Stop | Stop |
| 1 | 0 | 0 | Supply | Stop | Stop |
| 1 | 0 | 1 | Supply | Supply | Stop |
| 1 | 1 | 0 | Stop | Stop | Stop |
| 1 | 1 | 1 | Stop | Supply | Stop |

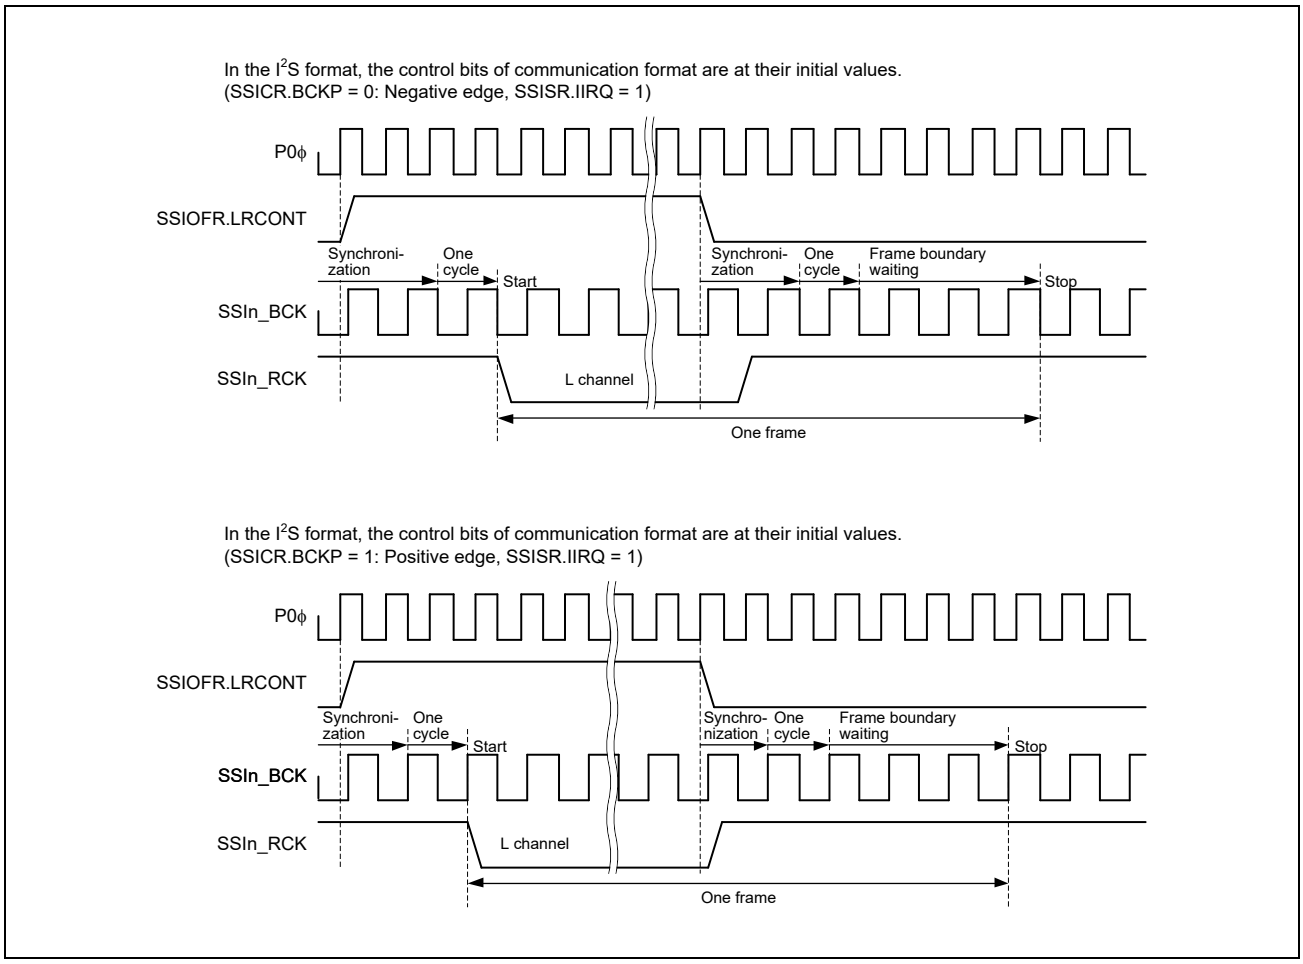


Figure 27.43 Example of LRCK/FS Continuation Release with SSIOFR.LRCONT

NOTE

To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIF-2 is in the idle state in master- mode communication (SSICR.MST = 1), note the following: The output stops when 0 is written from 1 to SSIOFR.LRCONT. (**Figure 27.43**). Make sure that the remote device is not affected.

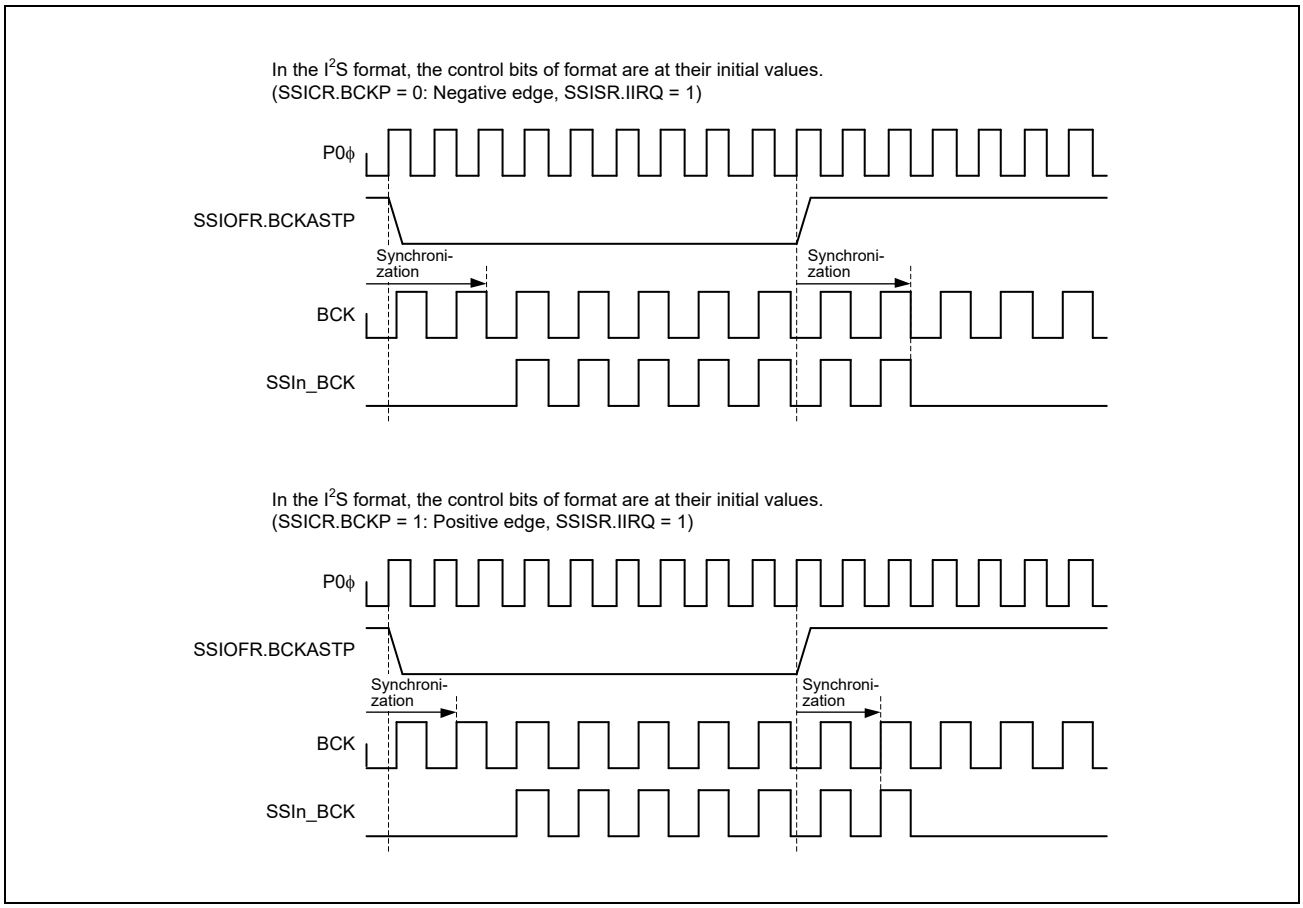

Figure 27.44 Example of Stopping SSIBCK with SSIOFR.BCKASTP

NOTE

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIF-2 is in the idle state, note the following; By writing 0 to SSIOFR.BCKASTP while it is 1, the output stops immediately (**Figure 27.44**). So, make sure that the remote device is not affected.

### 27.5.1.2 Communication States

In this state, SSIF-2 is during communication. **Figure 27.45** shows transitions of communication states and **Table 27.17** lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

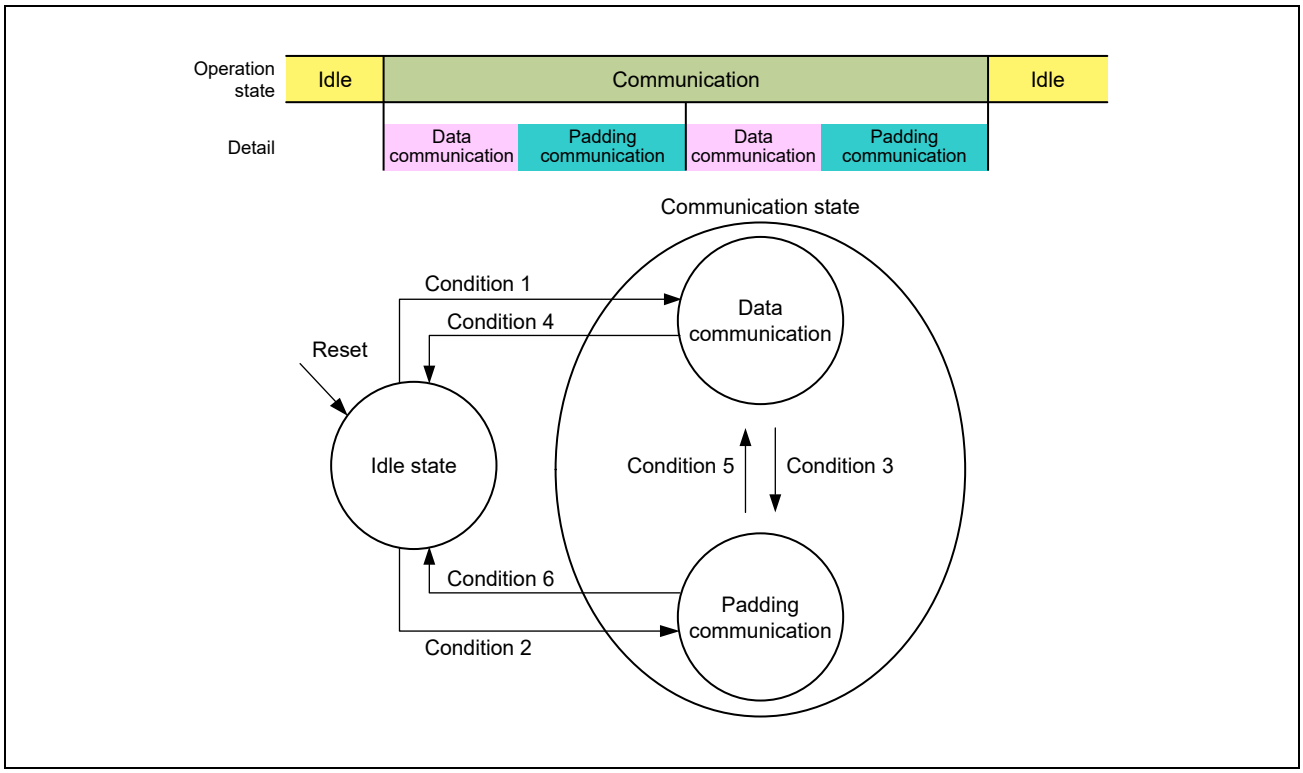

Figure 27.45 Communication State Transition

Table 27.17 Condition for Communication State Transition

| Condition No. | Condition for Transition |
|---|---|
| 1 | Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0 or in the setting without padding bits. |
| 2 | Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1 and in the setting with padding bits. |
| 3 | The following all of three conditions are satisfied:<br>• SSICR.TEN = 1 or SSICR.REN = 1<br>• In the setting without padding bits<br>• Transfer data words of the last data bit is completed. |
| 4 | The following all of two conditions are satisfied:<br>• SSICR.SDTA = 1 or without padding bits<br>• Transfer data words of the last data bit of one frame is completed while SSICR.TEN = 0 and SSICR.REN = 0 |
| 5 | Transfer of the last padding bit is completed while SSICR.TEN = 1 or SSICR.REN = 1 |
| 6 | The following all of two conditions are satisfied:<br>• SSICR.SDTA = 0 and with padding bits<br>• Transfer of the last data bit of one frame is completed while SSICR.TEN = 0 and SSICR.REN = 0. |

See **Table 27.13** for the setting with/without padding bits.

### (1) Data Communication State

In this state, SSIF-2 is during communication. Data of the data word length set with the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

#### State Transition in the Setting without Padding Bits

During communication (SSISR.IIRQ = 0), SSIF-2 is during data communication for all the time (**Figure 27.46**). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0), SSIF-2 transits to the idle state (**Figure 27.47**).

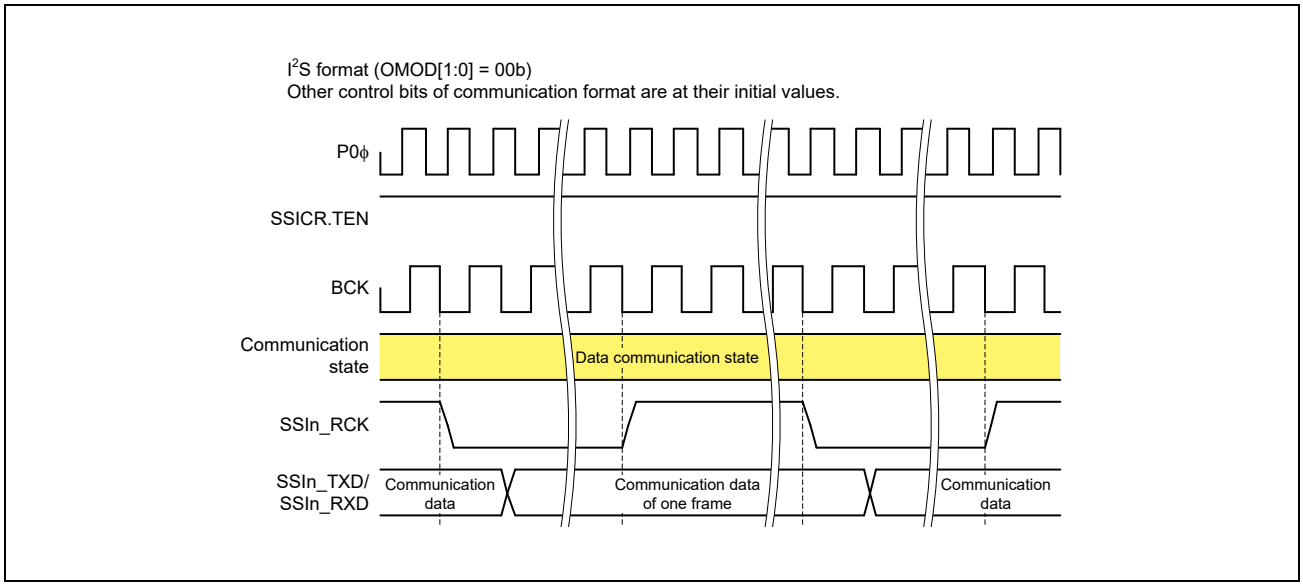

Figure 27.46 Continuation of the Data Communication State

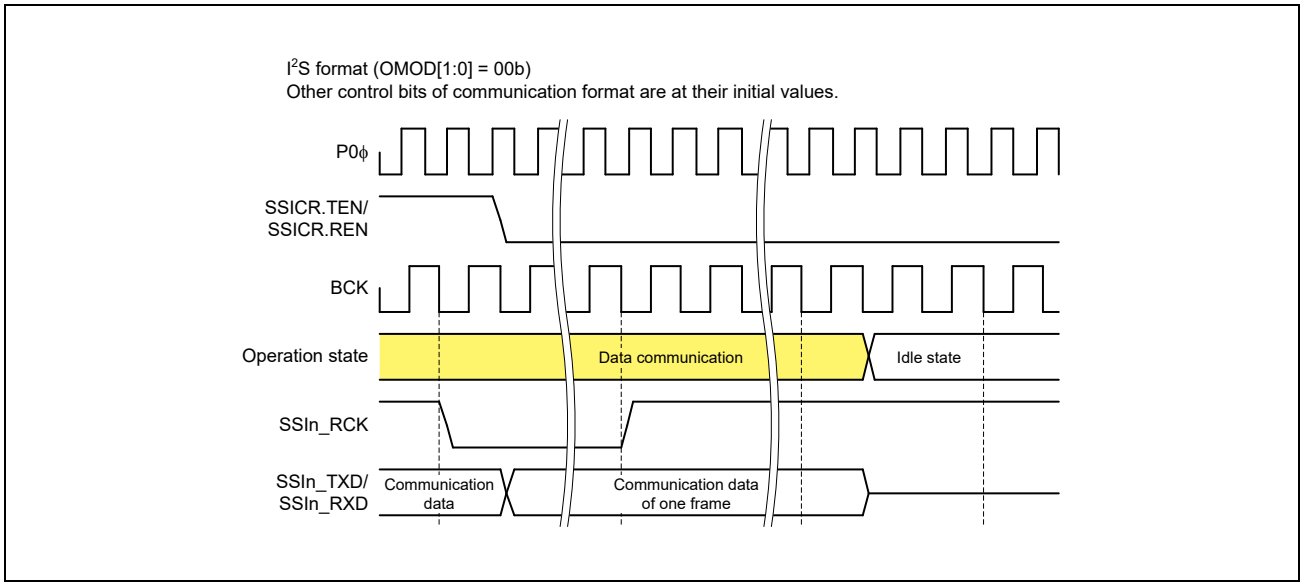

Figure 27.47 Halt from the Data Communication State (without Padding Bits)

### State Transition in the Setting with Padding Bits

During communication (SSISR.IIRQ = 0), after completing transfer of the last bit of a data word, SSIF-2 transits to the padding communication state from data communication state (**Figure 27.48**). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0) while SSICR.SDTA = 1, SSIF-2 transits to the idle state from data communication state when the communication stop is done. (**Figure 27.49**).

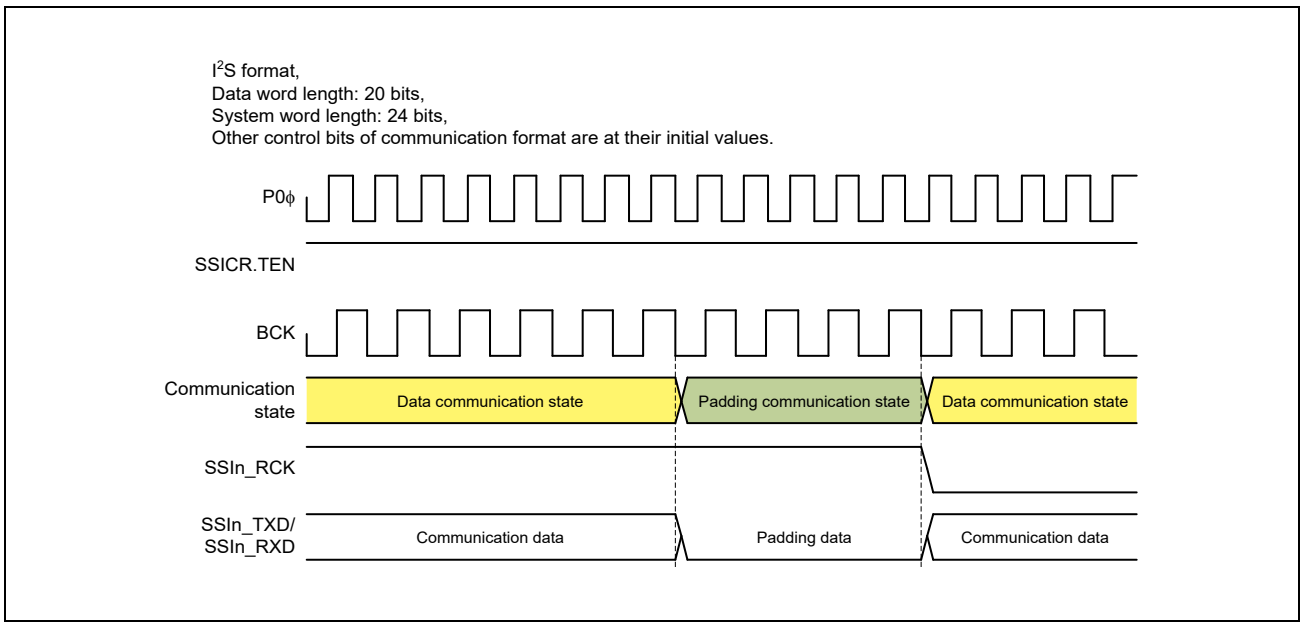

Figure 27.48 Transition from Data Communication to Padding Communication

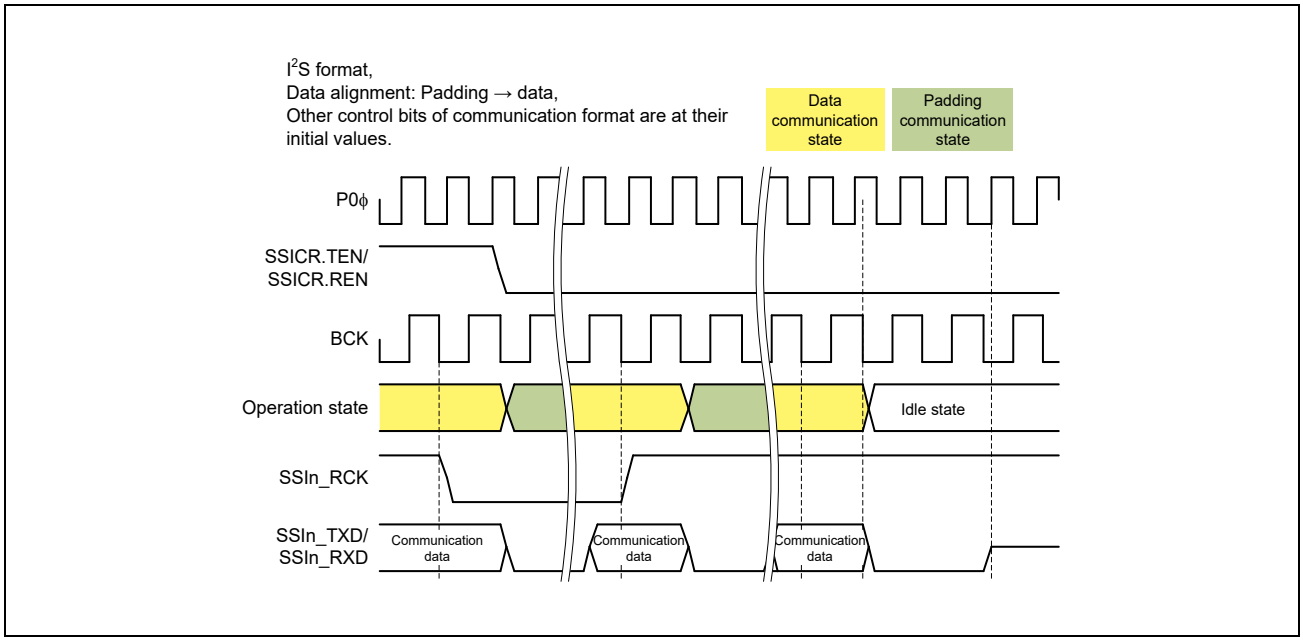

Figure 27.49 Halt from Data Communication (with Padding Bits)

### (2) Padding Communication State

In this state, SSIF-2 is during communication. The padding bits set with the SSICR.SWL[2:0] bits and SSICR.DWL[2:0] bits are transmitted, received, or transmitted and received.

#### State Transition in the Setting with Padding Bits

During communication (SSISR.IIRQ = 0), after completing transfer of the last padding bit, SSIF-2 transits to data communication state (**Figure 27.48**). By disabling transmission and reception (SSICR.TEN = 0 and SSICR.REN = 0) while SSICR.SDTA = 0, SSIF-2 transits to the idle state from padding communication when the communication stop is done. (**Figure 27.50**).

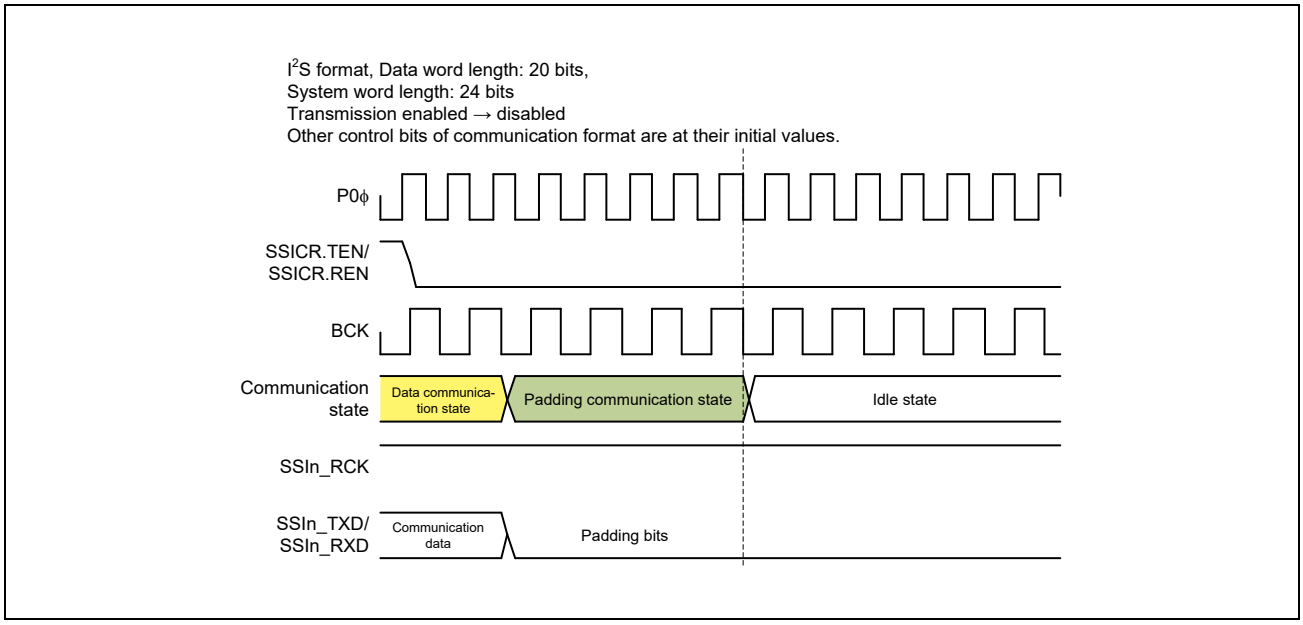

Figure 27.50 Halt from the Padding Communication State

### 27.5.2 Communication Operation

**Figure 27.51** shows the communication flow of SSIF-2.

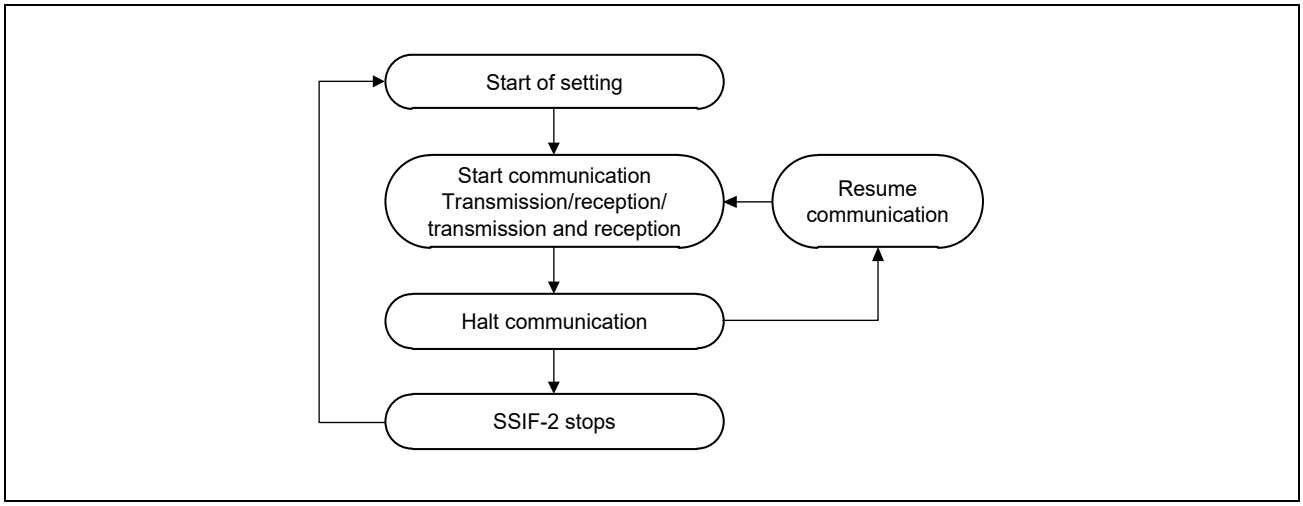

Figure 27.51 SSIF-2 Communication Operation

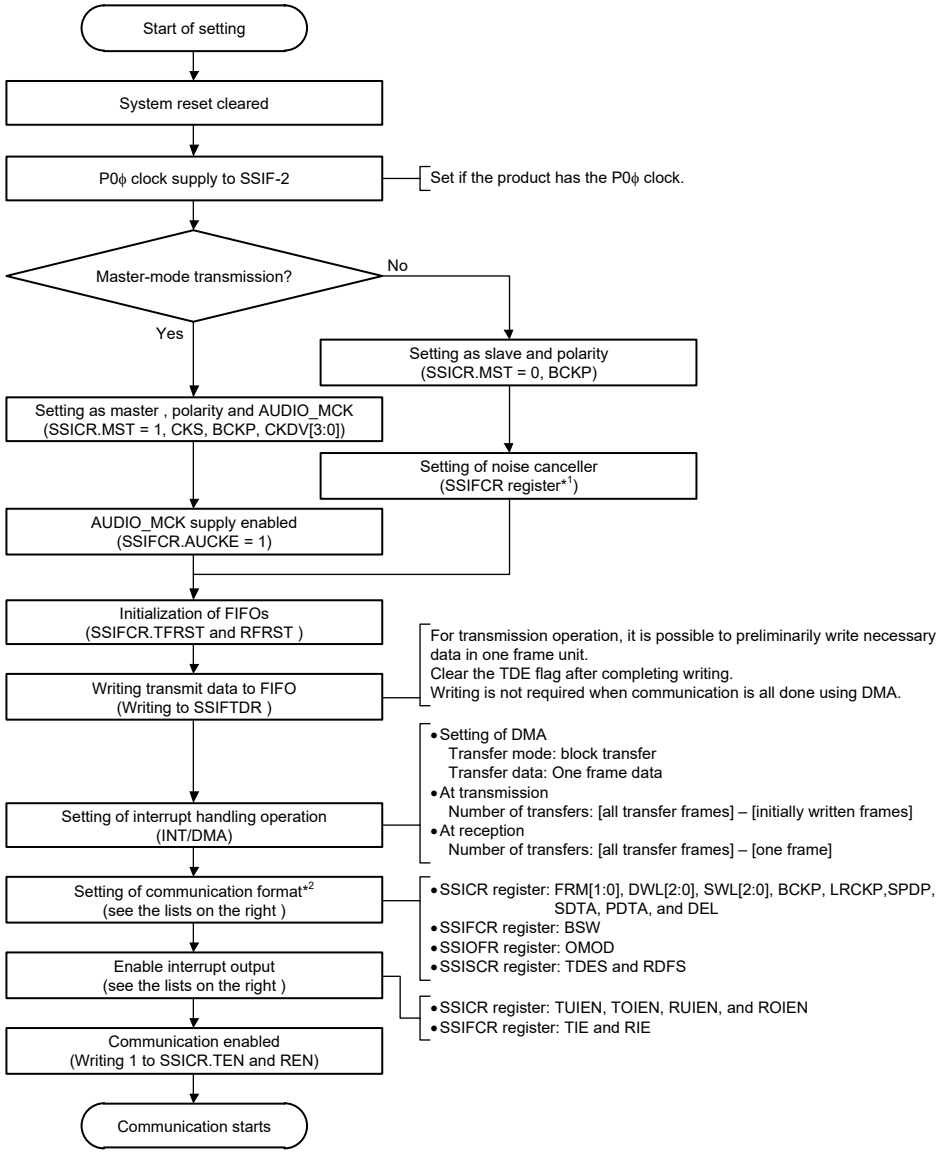
The procedure of each operation is described in **Section 27.5.2.1, Start Communication** to **Section 27.5.2.7, Resume Communication**.

### 27.5.2.1 Start Communication

This section describes how to start communication of SSIF-2. **Figure 27.52** shows the procedure to start communication. Be sure to follow the procedure. See **Section 27.5.2.2** for transmission operation and **Section 27.5.2.3** for reception operation.



Note 1. BCKNCE, LRCKNCE, LRCKNCE
Change all the settings of the noise cancellation to the same setting.

Note 2. Set SSICR.MUEN, SSIOFR.BCKASTP, and SSIOFR.LRCONT after completing the setting of the communication format.

Figure 27.52 Procedure to Start Communication (CPU Procedure)

For SSIF-2 communication, continuous communication is possible with DMA interrupt handling. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIEN. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.

#### 27.5.2.2 Transmission

Follow the transmission operation procedure (**Figure 27.53**) while the transmission is operating.

Transmission starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0) and while there is one or more frame of serial data in the transmit FIFO data register (SSIFTDR).

SSIF-2 outputs a transmit data empty interrupt to DMA according to the setting condition of TDE (SSISCR.TDES) and transmit data empty interrupt (SSIFCR.TIE) being enabled.

This interrupt requests writing to the transmit FIFO data register (SSIFTDR). By writing to SSIFTDR at each generation of an interrupt, serial data transmission is realized.

In the procedure to start communication, set DMA handling for transmit data empty interrupts as writing to the transmit FIFO data register (SSIFTDR). As a result, SSIF-2 is able not to mediate CPU and to transmit continuous data. When it becomes empty capacity of transmission FIFO data register set with SSISCR.TDES, transmission data empty interrupt is generated. Set the writing number of times according to empty capacity of transmission FIFO data register that transmission data empty interrupt shows. In a case of an error, stop receive procedure (**Section 27.5.2.5**) and then take the error procedure (**Section 27.5.2.6**).

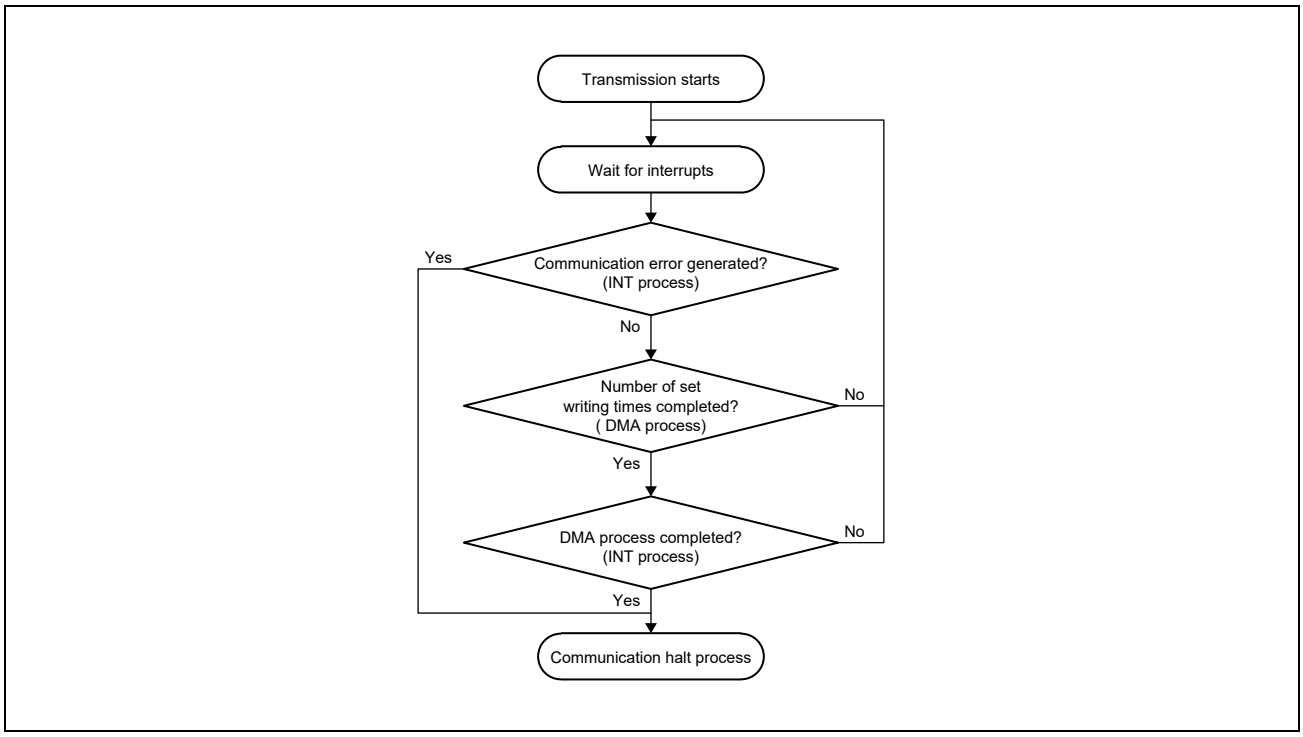


Figure 27.53 Transmission Procedure

NOTE

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe one of SSIFSR.TDE, and write it in SSIFTDR. Follow empty capacity of transmission FIFO data register set with SSISCR.TDES about the number of times written in SSIFTDR detecting 1 of SSIFSR.TDE. After writing the transmission data corresponding to the free space to SSIFTDR, polling ‘1’ of SSIFSR.TDE and repeating this enables continuous transmission operation.

### 27.5.2.3 Reception

Follow the reception operation procedure (**Figure 27.54**) while the reception is operating.

Reception starts in synchronization with the start trigger of the SSILRCK/SSIFS signal while reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1). SSIF-2 outputs a receive data full interrupt to DMA according to the setting of RDF (SSISCR.RDFS) and receive data empty interrupt (SSIFCR.RIE) being enabled. This interrupt requests reading from the receive FIFO data register (SSIFRDR). By reading from SSIFRDR at each generation of an interrupt, serial data reception is realized.

In the procedure to start communication, set DMA handling for receive data full interrupts as reading from receive FIFO data register (DDIFRDR). As a result, SSIF-2 is able not to mediate CPU and to receive continuous data. If the data capacity of reception FIFO data register set with SSISCR.RDFS is stored, receive data full interrupt is generated. Set the writing number of times according to the data capacity of reception FIFO data register that receive data full interrupt shows.

In the case of an error, stop the receive operation (**Section 27.5.2.6**) and then take the error procedure (**Section 27.5.2.6**).

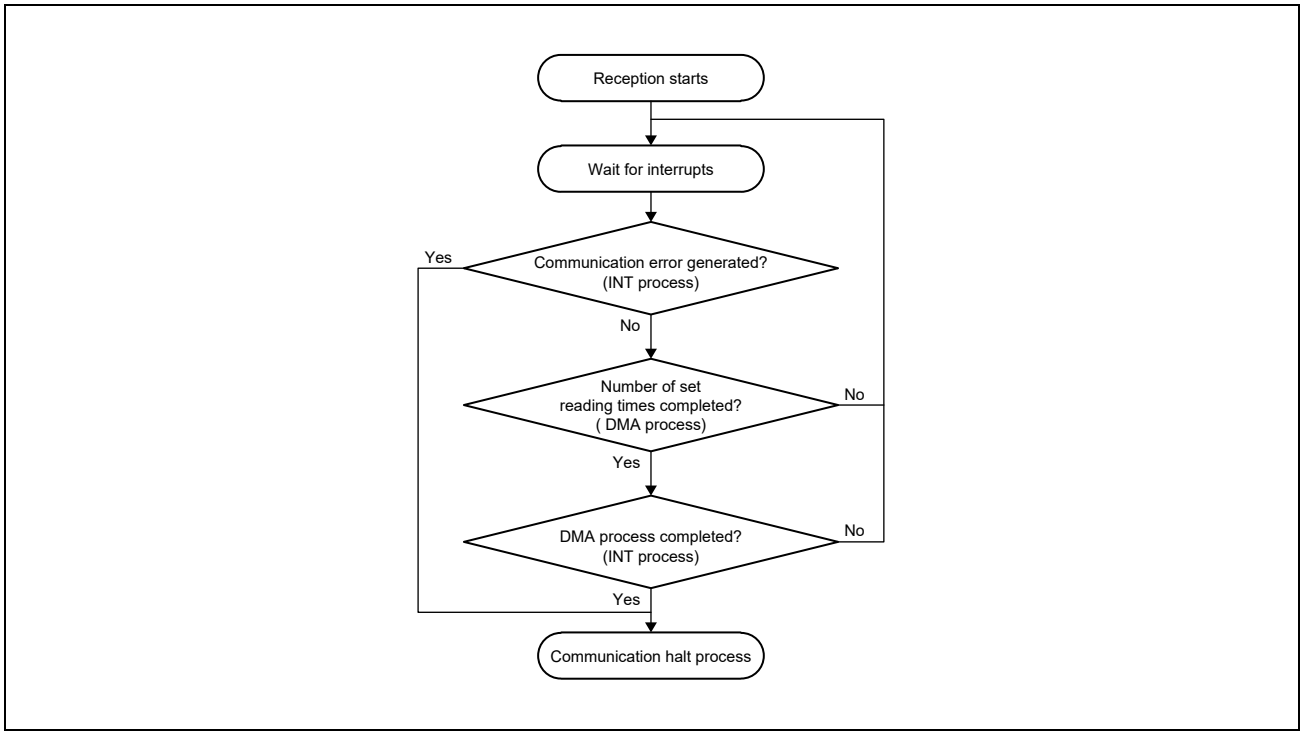

Figure 27.54 Reception Procedure

NOTE

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe 1 of SSIFSR.RDF, and read SSIFRDR. Follow the receive data capacity of reception FIFO data register set with SSISCR.RDFS about the number of times in which SSIFRDR is read detecting 1 of SSIFSR.RDF. After reading the received data from SSIFRDR, Continuous reception operation is possible by polling ‘1’ of SSIFSR.RDF and repeating this.

#### 27.5.2.4 Transmission and Reception

Transmission and reception start in synchronization with the start trigger of the SSILRCK/SSIFS signal while transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1) and while there is one or more frames of serial data in the transmit FIFO data register (SSIFTDR). The transmission and reception operation of SSIF-2 can be transmitted and received continuously by each doing the procedure for showing in the transmission operation (**Section 27.5.2.2**) and the reception operation (**Section 27.5.2.3**). As transmission and reception are independent in SSIF-2, see sections of transmission and reception respectively. See **Section 27.5.2.5, Halt Communication** to halt communication.

### 27.5.2.5 Halt Communication

This section describes how to halt communication of SSIF-2. **Figure 27.55** shows the procedure to halt communication. Be sure to follow the procedure.

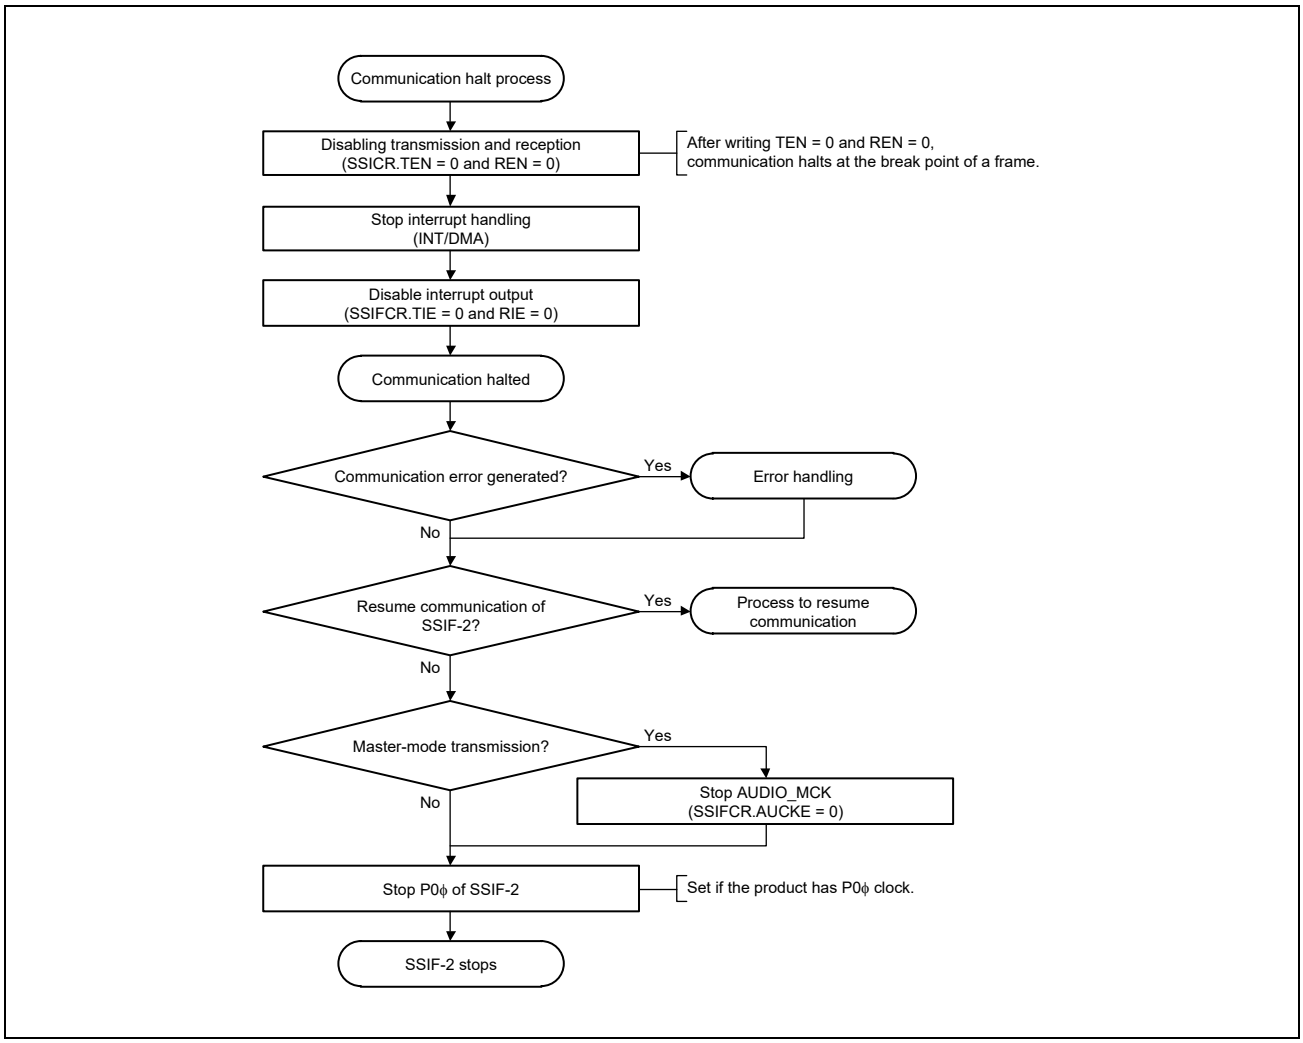

Figure 27.55 Procedure to Halt Communication (CPU Procedure)

To halt the communication of SSIF-2, supply of the following clocks are required until the SSISR.IIRQ bit indicates an idle state.

- Input clock from the SSIBCK pin when SSICR.MST = 0
- AUDIO_MCK when SSICR.MST = 1

To resume communication of SSIF-2 in the previous setting, see **Section 27.5.2.7, Resume Communication**.

NOTE

When communication of SSIF-2 is halted according to the procedure to halt communication in **Figure 27.55**, resume communication according to the procedure to start communication in **Figure 27.52**.

#### 27.5.2.6 Error Handling

SSIF-2 has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIF-2 need to be restarted. Take the error procedure (**Figure 27.56**) according to the procedure to halt communication (**Figure 27.55**).

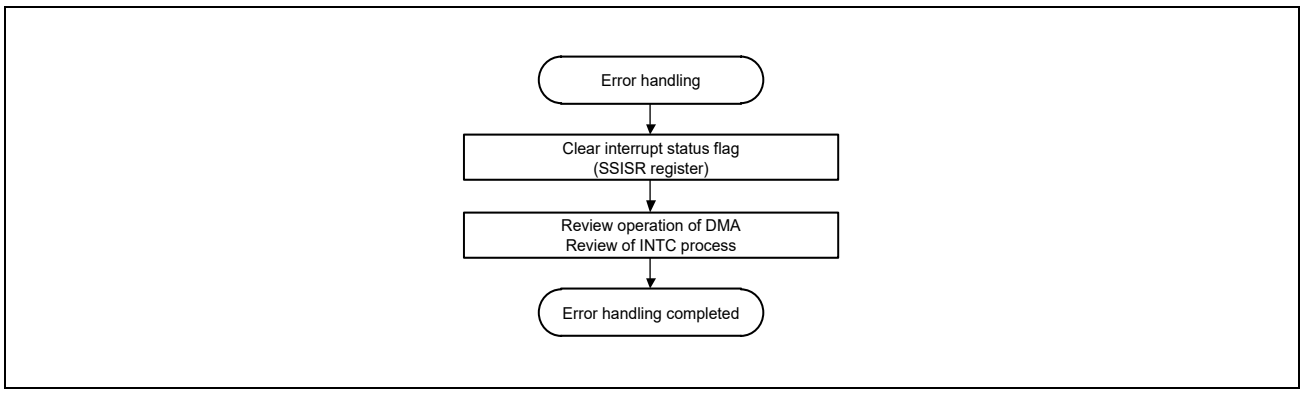

Figure 27.56 Error Handling Procedure

Four error operations are described as follows. When the interrupt output enable bit of the SSICR register is enabled and error flags are set, an error interrupt is generated. See descriptions of flags in **Section 27.4.1.2, Status Register (SSISR)** for the setting conditions of error flags.

##### (1) Transmit Underflow Error

In the case a transmit underflow error is generated during transmission (SSICR.TEN = 1, SSISR.IIRQ = 0), review the number of write operations to the transmit FIFO data register (SSIFTDR) according to serial data empty interrupts. After generation of a transmit underflow error, data to be transmitted from SSIF-2 are 0 output. To transmit data written to SSIFTxD pin normally, run the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**). When this error is generated, serial data is consumed as usual. To resume transmission of SSIF-2, write data from the beginning of one frame.

##### (2) Transmit Overflow Error

In the case a transmit overflow error is generated, review the number of write operations to the transmit FIFO data register (SSIFTDR) according to transmit data empty interrupts. Data is not written to SSIFTDR where a transmit overflow error is generated. This error is generated regardless of while the transmission is operating. To resume transmission of SSIF-2, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**). When communication is resumed, consider the lost serial data.

### (3) Receive Underflow Error

In the case a receive underflow error is generated, review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. The value read from SSIFRDR is undefined where a receive underflow error is generated. This error is generated regardless of while the reception is operating. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**).

### (4) Receive Overflow Error

In the case a receive overflow error is generated during reception (SSICR.REN = 1, SSISR.IIRQ = 0), review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. Data is not stored in SSIFRDR when a receive overflow error is generated. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 27.55**) and then take the error handling procedure (**Figure 27.56**).

### 27.5.2.7 Resume Communication

To resume communication of SSIF-2, follow the procedure shown in **Figure 27.57**. After communication is halted, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication (**Figure 27.52**). For communication after resume, see **Section 27.5.2.2** and **Section 27.5.2.3**.

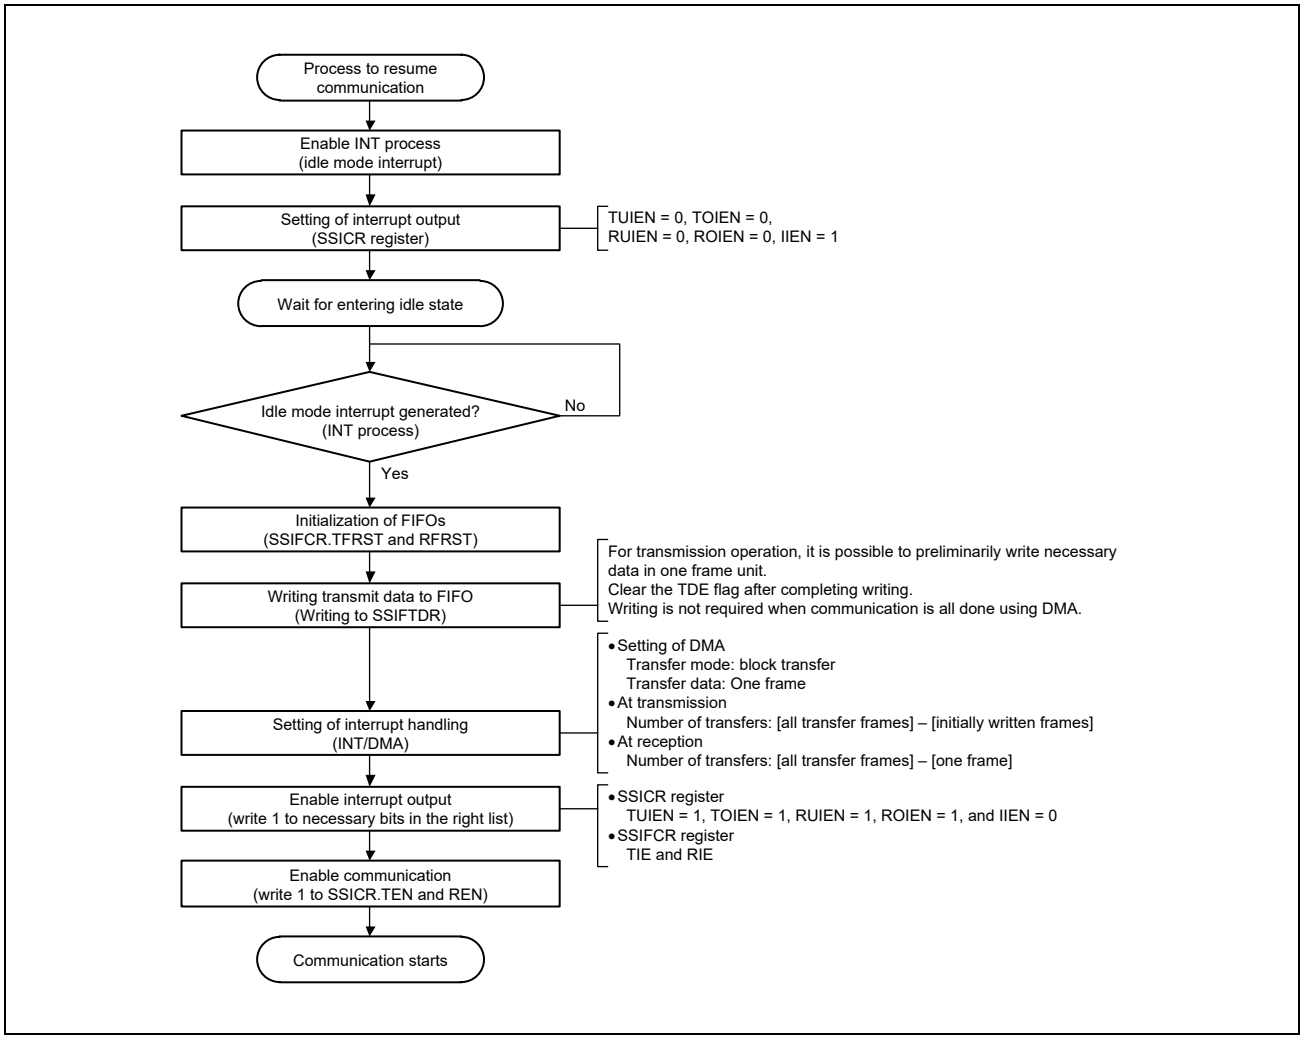

Figure 27.57 Procedure to Resume Communication (CPU Procedure)

### 27.5.3 Interrupt Sources

**Table 27.18** lists the interrupt sources. Set enable/disable of interrupt output of each source with the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register and the TIE and RIE bits in the SSIFCR register.

Table 27.18 Interrupt Sources

| Interrupt Source | Interrupt | Interrupt Flag | Interrupt Sense | DMA Activation |
|---|---|---|---|---|
| INT_ssif_int_req | Transmit underflow interrupt/ Transmit overflow interrupt/ Receive underflow interrupt/ Receive overflow interrupt/ Idle mode interrupt | SSISR.TUIRQ<br>SSISR.TOIRQ<br>SSISR.RUIRQ<br>SSISR.ROIRQ<br>SSISR.IIRQ | Level | Not available |
| INT_ssif_dma_tx | Transmit data empty interrupt | SSIFSR.TDE | Edge | Available |
| INT_ssif_dma_rx | Receive data full interrupt | SSIFSR.RDF | Edge | Available |
| INT_ssif_dma_rt | Receive data full interrupt/ Transmit data empty interrupt | SSIFSR.TDE/SSIFSR.RDF | Edge | Available |

#### 27.5.3.1 INT_ssif_int_req Interrupt

This interrupt source combines five interrupts. Enable output of necessary interrupts before using SSIF-2. This interrupt moves from the flag and the output enable permission that five factors have respectively (**Figure 27.58**). To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

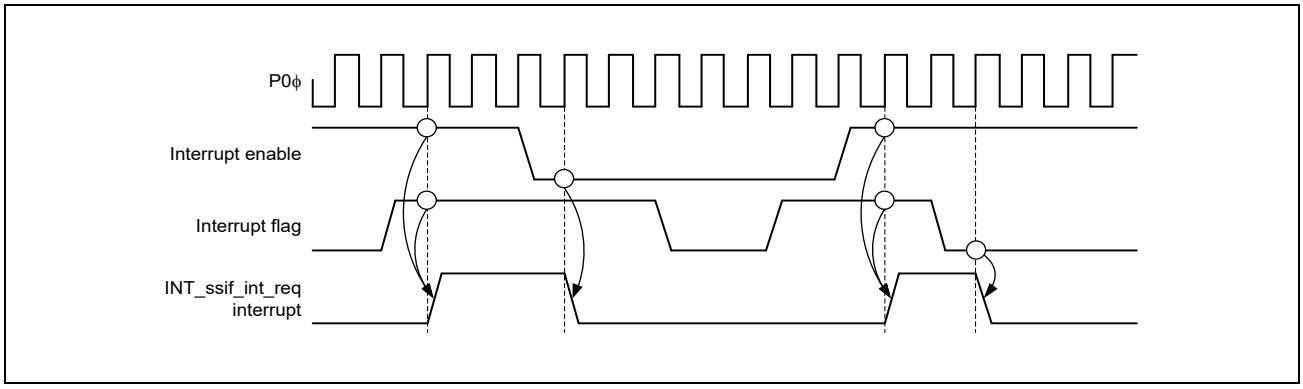

Figure 27.58 Timing Chart of the Common Interrupt Source, INT_ssif_int_req

**(1) Transmit underflow interrupt**

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. To restart transmission (SSICR.TEN = 1), enable the output of this interrupt (SSICR.TUIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**).

**(2) Transmit overflow interrupt**

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. To restart transmission (SSICR.TEN = 1), enable the output of this interrupt (SSICR.TOIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**).

### (3) Receive underflow interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. To restart reception (SSICR.REN = 1), enable the output of this interrupt (SSICR. RUIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**).

### (4) Receive overflow interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. To restart reception (SSICR.REN = 1), enable the output of this interrupt (SSICR. ROIRQ = 1). In the case this interrupt is generated, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**).

### (5) Idle mode interrupt

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. When the thing that the communication has stopped completely is confirmed, this interrupt is used (**Figure 27.57**).

### 27.5.3.2 INT_ssif_dma_tx Interrupt [full-duplex communication]

As the transmit data empty interrupt, a pulse interrupt is output by the following condition.

- SSIFSR.TDE and SSIFCR.TIE becomes 1.
  SSIF-2 operation: SSIFSR.TDE becomes 1 from 0 while SSIFCR.TIE = 1
  CPU operation: SSIFCR.TIE is changed to 1 from 0 while SSIFSR.TDE = 1

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable (**Figure 27.59**).

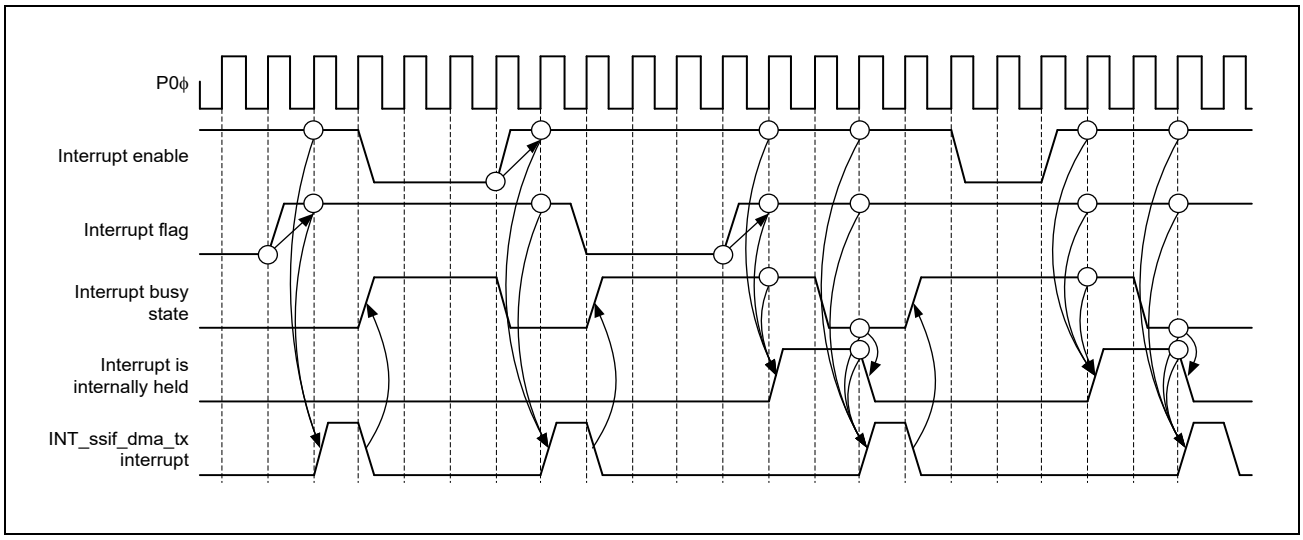

Figure 27.59 INT_ssif_dma_tx Interrupt Timing Chart

### 27.5.3.3 INT_ssif_dma_rx Interrupt [full-duplex communication]

As the receive data full interrupt, a pulse interrupt is output by the following condition.

- SSIFSR.RDF and SSIFCR.RIE becomes 1.
  SSIF-2 operation: SSIFSR.RDF becomes 1 from 0 while SSIFCR.RIE = 1.
  CPU operation: SSIFCR.RIE is changed to 1 from 0 while SSIFSR.RDF = 1.

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable. It operates in the same way as in **Figure 27.59**.

#### 27.5.3.4 INT_ssif_dma_rt Interrupt [half-duplex communication]

This interrupt is output by two sources, transmit data empty interrupt and receive data full interrupt. When this interrupt is generated, read the interrupt flag and specify the interrupt source.

An interrupt suppression function is available for this interrupt to prevent the thing that cannot be taken. When the DMA is busy state (Interrupt cannot be accepted), and the interruption condition occurs, output of this interrupt is held. This interrupt is output after the DMA becomes acceptable (**Figure 27.59**).

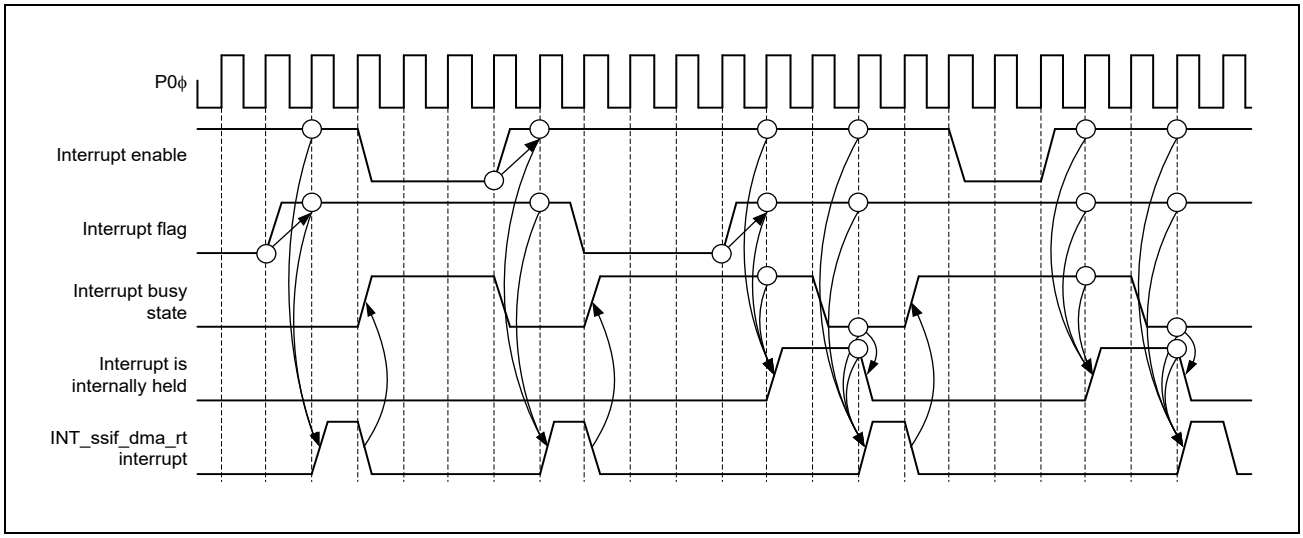

Figure 27.60 INT_ssif_dma_rt Interrupt Timing Chart

## 27.5.4 Software Resets

SSIF-2 has three software reset bits to reset its states.

- SSIF-2 software reset (SSIFCR.SSIRST)
- Transmit FIFO data register reset (SSICR.TFRST)
- Receive FIFO data register reset (SSIFCR.RFRST)

It explains the procedure of three software reset.

### 27.5.4.1 Software Reset Procedure

#### (1) SSIF-2 Software Reset

For the SSIF-2 software reset bit (SSIFCR.SSIRST), follow the procedure shown in **Figure 27.61**. After a reset, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication (**Figure 27.52**). See **Section 27.5.2.2, Transmission** and **Section 27.5.2.3, Reception** respectively for transmission and reception after communication is resumed.

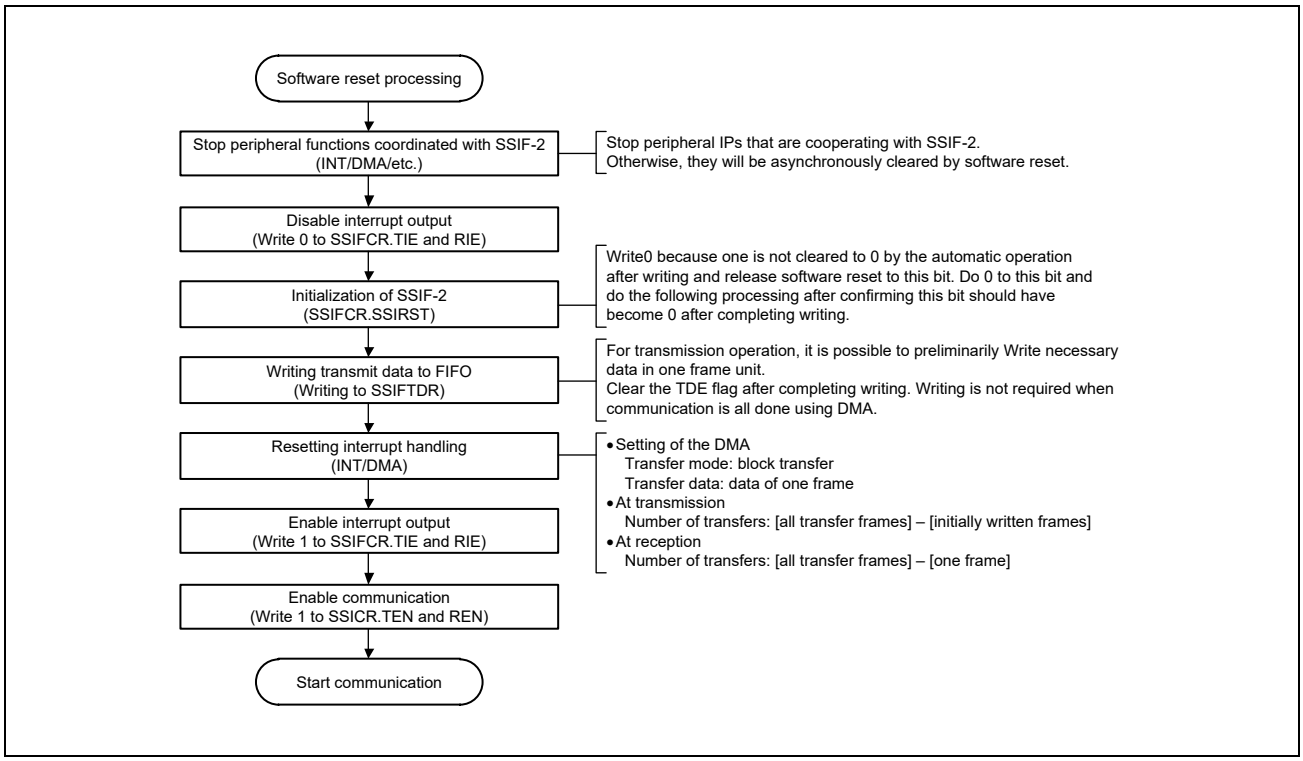

Figure 27.61 Software Reset Procedure (CPU Procedure)

### (2) Transmit FIFO Data Register Reset

To initiate a transmit FIFO data register reset, follow the procedure to start communication (**Figure 27.52**) and resume communication (**Figure 27.57**).

### (3) Receive FIFO Data Register Reset

To initiate a receive FIFO data register reset, follow the procedure to start communication (**Figure 27.52**) and resume communication (**Figure 27.57**).

# 27.6 Notes

## 27.6.1 Notes

### 27.6.1.1 Attention by communication using DMA

SSIF-2 assumes the DMA access as follows.

Table 27.19 Interrupt to expect DMA access

| Communication operation | Interrupt | DMA access | LSI specification | Remarks |
|---|---|---|---|---|
| Transmission | INT_ssif_dma_tx | Write to SSIFTDR | Full duplex transmission | |
| | INT_ssif_dma_rt | | Half duplex transmission | |
| Reception | INT_ssif_dma_rx | Read SSIFRDR | Full duplex transmission | |
| | INT_ssif_dma_rt | | Half duplex transmission | |
| Transmission and Reception | INT_ssif_dma_tx | Write to SSIFTDR | Full duplex transmission | |
| | INT_ssif_dma_rx | Read SSIFRDR | Half duplex transmission | |

### 27.6.1.2 Notes for Slave-mode Communication

#### (1) ADCKE Control

In slave-mode communication (SSICR.MST = 0), SSIF-2 needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIF-2 becomes idle, take the procedure to start communication (**Figure 27.52**) or wait for an idle state by taking the procedure to resume communication (**Figure 27.57**).

#### (2) SSI_RCK

SSIF-2 has the terminal SSI_RCK that shows the synchronization of the communication. Match communication format of the opposing device and SSIF-2 when SSIF-2 is slave communication (SSICR.MST=0). SSIF-2 uses the signal of SSI_RCK only as a communication start trigger.

### 27.6.1.3 Notes for Master-mode Communication

#### (1) ADCKE Control

In master-mode communication (SSICR.MST = 1), SSIF-2 operates with the audio clock (AUDIO_MCK). To stop SSIF- 2 completely, make sure that SSIF-2 is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIF-2 becomes idle, take the procedure to start communication (**Figure 27.52**).

#### (2) LRCONT Control

To stop the output to the SSI_RCK pin with SSIOFR.LRCONT when SSIF-2 is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when 0 is written from 1 to SSIOFR.LRCONT. (**Figure 27.43**). Make sure that the remote device is not affected.

#### (3) BCKASTP Control

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIF-2 is in the idle state, note the following; By writing 0 to SSIOFR.BCKASTP while it is 1, the output stops immediately (**Figure 27.44**). So, make sure that the remote device is not affected.

NOTE

When the opposing device who is the slave needs the clock of the terminal SSI_BCK before the communication operates, it is not possible to use it.

### 27.6.1.4 Notes for Communication Flow

#### (1) When an Error Interrupt is Generated

SSIF-2 has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIF-2 need to be restarted. Take the error procedure (**Figure 27.56**) according to the procedure to halt communication (**Figure 27.55**).

##### (a) Transmit Underflow Error

In the case a transmit underflow error is generated during transmission (SSICR.TEN = 1, SSISR.IIRQ = 0), review the number of write operations to the transmit FIFO data register (SSIFTDR) according to serial data empty interrupts. After generation of a transmit underflow error, data to be transmitted from SSIF-2 are 0 output. To transmit data written to SSIFTxD pin normally, run the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**). When this error is generated, serial data is consumed as usual. To resume transmission of SSIF-2, write data from the beginning of one frame.

##### (b) Transmit Overflow Error

In the case a transmit overflow error is generated, review the number of write operations to the transmit FIFO data register (SSIFTDR) according to transmit data empty interrupts. Data is not written to SSIFTDR where a transmit

overflow error is generated. This error is generated regardless of while the transmission is operating. To resume transmission of SSIF-2, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**). When communication is resumed, consider the lost serial data.

#### (c) Receive Underflow Error

In the case a receive underflow error is generated, review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. The value read from SSIFRDR is undefined where a receive underflow error is generated. This error is generated regardless of while the reception is operating. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 27.55**) and then take the error procedure (**Figure 27.56**).

#### (d) Receive Overflow Error

In the case a receive overflow error is generated during reception (SSICR.REN = 1, SSISR.IIRQ = 0), review the number of reading operations from the receive FIFO data register (SSIFRDR) according to receive data full interrupts. Data is not stored in SSIFRDR when a receive overflow error is generated. To resume reception of SSIF-2, take the procedure to halt communication (**Figure 27.55**) and then take the error handling procedure (**Figure 27.56**).

### (2) Transmit Data Empty Interrupt

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe one of SSIFSR.TDE, and write it in SSIFTDR. Follow empty capacity of transmission FIFO data register set with SSISCR.TDES about the number of times written in SSIFTDR detecting 1 of SSIFSR.TDE. Clear the transmission data that corresponds to empty capacity and clear the SSIFSR.TDE flag to SSIFTDR after writing. Transmission operation consecutive by the repeated thing is possible. SSIFSR.TDE is not cleared when not clearing.

### (3) Receive Data Full Interrupt

The communication flow defined in SSIF-2 uses the DMA. In the case the DMA is not used, observe 1 of SSIFSR.RDF, and read SSIFRDR. Follow the receive data capacity of reception FIFO data register set with SSISCR.RDFS about the number of times in which SSIFRDR is read detecting 1 of SSIFSR.RDF. Clear data that does the reception completion and clear the SSIFSR.RDF flag from SSIFRDR after reading. Reception operation consecutive by the repeated thing is possible. SSIFSR.RDF is not cleared when not clearing.

### (4) Switching Transfer Modes

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm it is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

### (5) Resume Communication after Halting SSIF-2

When communication of SSIF-2 is halted according to the procedure to halt communication in **Figure 27.55**, resume communication according to the procedure to resume communication in **Figure 27.52**.

#### 27.6.1.5 Write Access Restriction

**(1) SSICR Register**

If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If written, the operation performed immediately after writing is not guaranteed. For example, after enabling operation, make sure that SSISR.IIRQ = 0 and after disabling operation, make sure that SSISR.IIRQ = 1.

**(a) TEN Bit and REN Bit**

Writing 1 to these bits, transmission starts in synchronization with start trigger. Refer to **Section 27.5.2.2, Transmission**, **Section 27.5.2.3, Reception**, and **Section 27.5.2.4, Transmission and Reception** for details. Writing 0 to these bits, transmission stops in synchronization with next frame boundary. Set 1 at the same time when you use SSIF-2 as transmission and reception. To stop communication, make sure to stop transmission and reception (TEN = 0 and REN = 0).

**(2) SSICR Register**

**(a) Clear operation of TUIRQ and TOIRQ**

After the communication is permitted (SSICR.TEN is written and '1' is written from '0'), the transmission error flag (TOIRQ and TUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the transmission error flag might not be able to be read.

**(b) Clear operation of RUIRQ and ROIRQ**

After the communication is permitted (SSICR.REN is written and '1' is written from '0'), the transmission error flag (ROIRQ and RUIRQ of the SSISR register) is cleared. However, when the SSISR register is continuously read, the clearness of the reception error flag might not be able to be read.

### (3) Communication State

Writing to the bits with shaded area in **Table 27.20** is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Table 27.20 Bits Protected from Writing during Communication

# 28. CANFD Interface (RS-CANFD)

This section contains a generic description of the CANFD interface (RS-CANFD).

The first part of this section describes all this LSI specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

## 28.1 Features of RS-CANFD

### 28.1.1 Number of Units and Channels

This product has the following number of RS-CANFD units.

Table 28.1 Number of Units

| RS-CANFD | |
|---|---|
| Number of Units | 1 |
| Name | RSCFD0 |

This product has the CANFD interface channel listed below.

Table 28.2 Unit Configurations and Channels

| RS-CANFD | |
|---|---|
| Number of Channels | 2 |
| Name | CAN0, CAN1 |

The RS-CANFD has two interface modes (classical CAN mode and CANFD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 28.3 Index

| Index | Meaning |
|---|---|
| n | Throughout this section, the individual RS-CANFD units are generically indicated by the index “n” (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFDn unit. |
| m | Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m” (m = 0, 1); for example, RSCFDn(CFD)CmSTS is the channel m status register. |
| j | The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register. |
| k | The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to 5); for example, RSCFDn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register. |
| x | The individual receive FIFO buffers are generically identified by the index “x” (x = 0 to 7); for example, RSCFDn(CFD)RFSTSx is the receive FIFO buffer status register. |
| d | Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d” (classical CAN mode: d = 0, 1, CANFD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCFDn(CFD)CFDFd_k. |
| q | The individual receive buffers are generically indicated by the index “q” (q = 0 to 31); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register. |
| p | The individual transmit buffers are generically indicated by the index “p” (p = 0 to 31); for example, RSCFDn(CFD)TMCp is the transmit buffer control register. |
| b | Data field registers of receive buffers and transmit buffers are identified by “b” (classical CAN mode: b = 0, 1, CANFD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCFDn(CFD)RMDFb_q. |
| r | The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register. |
| y | The registers not covered above are indicated by the letter “y” (y = 0); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register. |

**Note:** The functions and descriptions of registers in this section are for the RS-CANFDs that has 2 channels (m = 0, 1). When referring to information with indexes, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

### 28.1.2 Register Base Address

RSCFDn base addresses are listed in the following table.

RSCFDn register addresses are given as offsets from the base addresses in general.

Table 28.4 Register Base Address

| Base Address Name | Base Address |
|---|---|
| <RSCFD0_base> | H'0_1005_0000 (Cortex-A55 Address Space)<br>H'4005_0000 (Cortex-M33 Address Space Non-Secure)<br>H'5005_0000 (Cortex-M33 Address Space Secure) |

### 28.1.3 Clock Supply

The RSCFDn clock supply is shown in the following table.

Table 28.5 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
|---|---|---|
| RSCFDn | clk_xincan | CAN_CLK |
| | clkc | P0ϕ/2 |
| | pclk | P0ϕ |

The operating frequency of the RSCFDn depends on the transfer rate and the number of channels in use. **Table 28.6** shows the range of the frequency.

Table 28.6 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI

| Condition | | | Range of Operating Frequency | | |
|---|---|---|---|---|---|
| Mode | Transfer Rate | No. of Channels in Use | pclk | clk_xincan*1 | clkc*1 *2 |
| CANFD | 4 Mbps | 2ch | pclk ≥ 64 MHz | 32 MHz | 32MHz |
| | | 1ch | | | |
| | 2 Mbps | 2ch | pclk ≥ 32 MHz | 16 MHz ≤ clk_xincan ≤ pclk/2 | 16 MHz ≤ clkc ≤ pclk/2 |
| | | 1ch | | | |
| CAN/CANFD | 1 Mbps | 2ch | pclk ≥ 30.6 MHz | 8 MHz ≤ clk_xincan ≤ pclk/2 | 8 MHz ≤ clkc ≤ pclk/2 |
| | | 1ch | pclk ≥ 27.5 MHz | | |
| | 500 kbps | 2ch | pclk ≥ 27.5 MHz | 4 MHz ≤ clk_xincan ≤ pclk/2 | 4 MHz ≤ clkc ≤ pclk/2 |
| | | 1ch | | | |
| | 125 kbps | 2ch | pclk ≥ 27.5 MHz | 1 MHz ≤ clk_xincan ≤ pclk/2 | 1 MHz ≤ clkc ≤ pclk/2 |
| | | 1ch | | | |

Note 1. Setting the DCS bit in the RSCFDn(CFD)GCFG register enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2. CAN clock source uses external clock.

Note 2. When pclk< 25 MHz, select clk_xincan.

### 28.1.4 Interrupt Request

RSCFDn interrupt requests are listed in the following table.

Table 28.7 Interrupt Requests

| Unit Interrupt Signal | | Outline |
|---|---|---|
| INTRCANGERR | | CAN global error interrupt |
| INTRCANGRECC | | CAN receive FIFO interrupt |
| CAN0 | INTRCAN0ERR | CAN0 error interrupt |
| | INTRCAN0REC | CAN0 transmit/receive FIFO receive completion interrupt |
| | INTRCAN0TRX | CAN0 transmit interrupt |
| CAN1 | INTRCAN1ERR | CAN1 error interrupt |
| | INTRCAN1REC | CAN1 transmit/receive FIFO receive completion interrupt |
| | INTRCAN1TRX | CAN1 transmit interrupt |

### 28.1.5 External Input/Output Signals

External input/output signals of RSCFDn are listed below.

Table 28.8 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
|---|---|---|
| CANm_RX (m = 0, 1) | CANm receive data input | CANm_RX (m = 0, 1) |
| CANm_TX (m = 0, 1) | CANm transmit data output | CANm_TX (m = 0, 1) |
| CANm_RX_DATARATE_EN (m = 0, 1) | CANm receive data phase output | CANm_RX_DATARATE_EN (m = 0, 1) |
| CANm_TX_DATARATE_EN (m = 0, 1) | CANm transmit data phase output | CANm_TX_DATARATE_EN (m = 0, 1) |
| CAN_CLK | Clock source for CAN communication | CAN_CLK |

# 28.2 Overview

## 28.2.1 Functional Overview

**Table 28.9** shows the RS-CANFD module specifications. **Figure 28.1** shows the RS-CANFD module block diagram.

Table 28.9 RS-CANFD Module Specifications (1/3)

| Item | Specification |
|---|---|
| Number of channels | 2 |
| Protocol | ISO11898-1 compliant<br>Using CANFD frames is selectable by switching interface modes. |
| Communication speed | Classical CAN mode:<br>• Maximum 1 Mbps<br>$\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$<br>CANm bit time = CANmTq × Tq count per bit<br>$\text{CANmTq} = \frac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$<br>CANm bit time = CANmTq × Tq count per bit<br>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register)<br>CANFD mode:<br>• Nominal bit rate: max.1 Mbps, data bit rate: max. 4 Mbps<br>$\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$<br>$\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$<br>CANm nominal bit time = CANmTq(N) × Tq count per nominal bit<br>CANm data bit time = CANmTq(D) × Tq count per data bit<br>$\text{CANmTq(N)} = \frac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$<br>$\text{CANmTq(D)} = \frac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$<br>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register)<br>m = 0, 1<br>Tq: Time quantum |
| Buffer | 160 buffers in total<br>• Individual buffers: 32 buffers (16 buffers × 2 channels) Transmit buffer: 16 buffers per channel<br>Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable)<br>• Shared buffers: 128 buffers for all channels Receive buffer: 0 to 32 buffers<br>Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each)<br>Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) |
| Reception function | • Receives data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be received.<br>• Sets interrupt enable/disable for each FIFO.<br>• Mirror function (reception of messages transmitted from the own CAN node)<br>• Timestamp function (to record message reception time as a 16-bit timer value) |

Table 28.9 RS-CANFD Module Specifications (2/3)

| Item | Specification |
|---|---|
| Reception filter function | • Selects receive messages according to 128 receive rules.<br>• Sets the number of receive rules (0 to 128) for each channel.<br>• Acceptance filter processing: Sets ID and mask for each receive rule.<br>• DLC filter processing: Enables DLC filter check for each acceptance rule. |
| Receive message transfer function | • Routing function<br>Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer<br>• Label addition function<br>Stores label information together with a message in a receive buffer and FIFO buffer. |
| Transmission function | • Transmits data frames and remote frames.<br>• Selects ID format (standard ID, extended ID, or both IDs) to be transmitted.<br>• Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer.<br>• Selects ID priority transmission or transmit buffer number priority transmission.<br>• Transmit request can be aborted (possible to confirm with a flag)<br>• One-shot transmission function |
| Interval transmission function | Transmit messages at configurable intervals<br>(transmit mode or gateway mode of transmit/receive FIFO buffers) |
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmission-completed messages<br>Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information. |
| Gateway function | Transmits a received message automatically. |
| Bus off recovery mode selection | Selects the method for returning from bus off state.<br>• ISO11898-1 compliant<br>• Automatic entry to channel halt mode at bus-off entry<br>• Automatic entry to channel halt mode at bus-off end<br>• Transition to channel halt mode by program request<br>• Transition to the error-active state by program request (forcible return from the bus off state) |
| Error status monitoring | • Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock).<br>• Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery)<br>• Reads the error counter.<br>• Monitors DLC errors. |
| Interrupt source | 8 sources<br>• Global Interrupts (2 sources)<br>Receive FIFO interrupt<br>Global error interrupt<br>• Channel interrupts (3 sources/channel)<br>CANm transmit interrupt (m = 0, 1)<br>– CANm transmit complete interrupt<br>– CANm transmit abort interrupt<br>– CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)<br>– CANm transmit history interrupt<br>– CANm transmit queue interrupt<br>CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)<br>CANm error interrupt |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CANFD module. |
| CAN clock source | Selects the clkc or the clk_xincan.<br>As for the range of operating frequency, see **Table 28.6**. |

Table 28.9 RS-CANFD Module Specifications (3/3)

| Item | Specification |
|---|---|
| Test function | Test function for user evaluation<br>• Listen-only mode<br>• Self-test mode 0 (external loopback)<br>• Self-test mode 1 (internal loopback)<br>• Restricted operation mode<br>• RAM test (read/write test)<br>• Inter-channel communication test [CRC error test enabled] |

### 28.2.2 Interface Modes

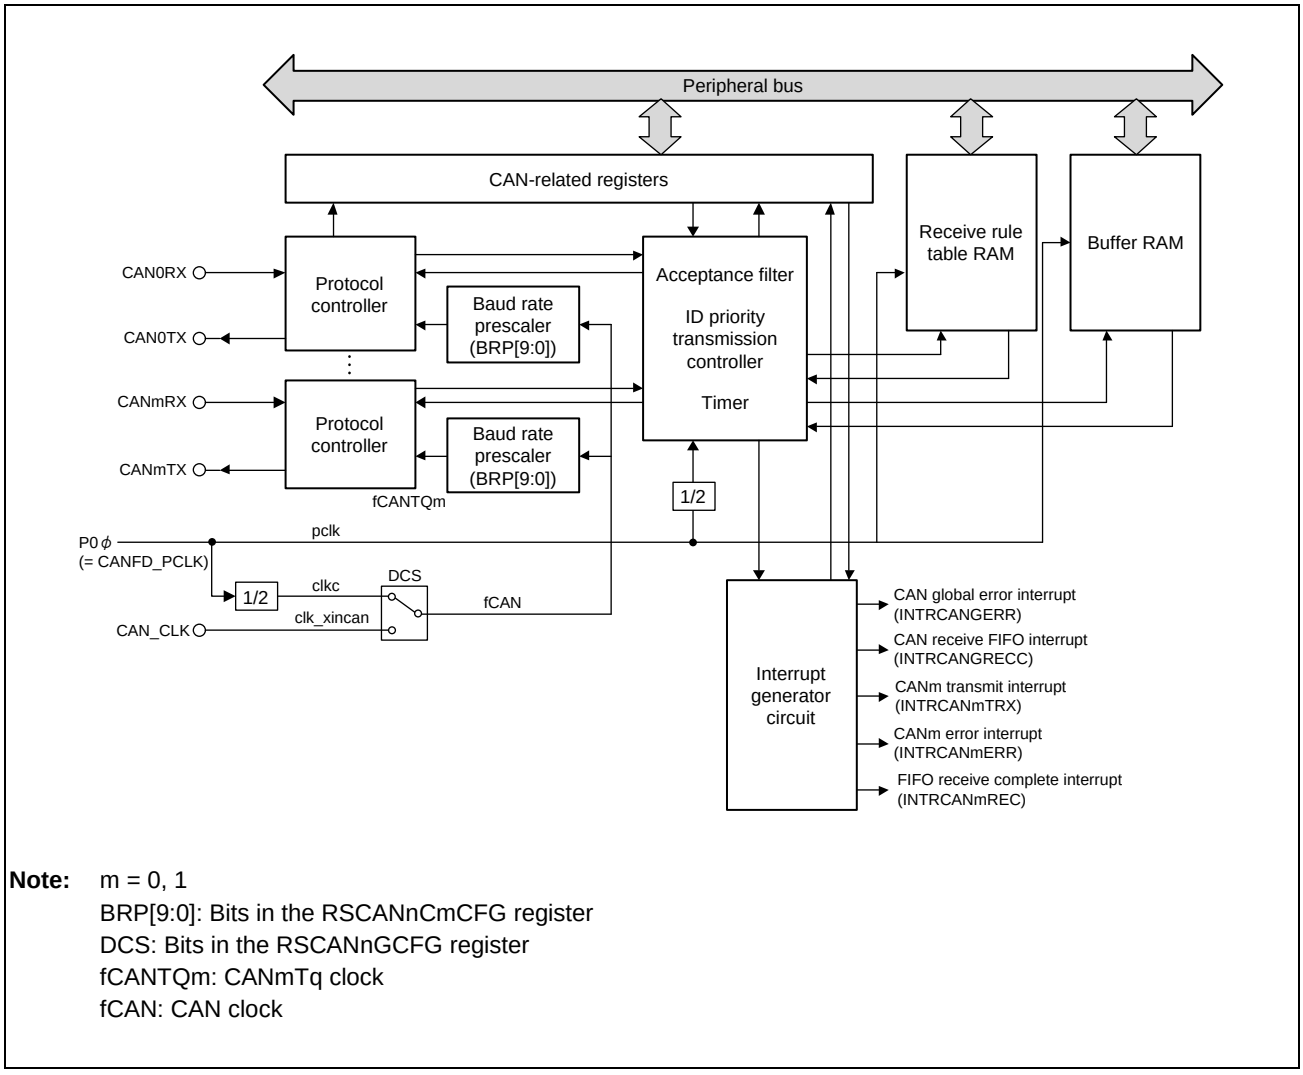
The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CANFD mode: Handles classical CAN frames and CANFD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

### 28.2.3 Block Diagram



**Note:** m = 0, 1
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 28.1 RS-CANFD Module Block Diagram (Classical CAN Mode)

In CANFD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See **Section 28.11.1.3, Communication Speed Setting**.

# 28.3 Registers (Classical CAN Mode)

## 28.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode. For details about <RSCFDn_base>, see **Section 28.1.2, Register Base Address**.

For registers initialized in global reset mode and channel reset mode, refer to the following.

- **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 28.38, Registers Initialized Only in Global Reset Mode**

Table 28.10 Registers (1/3)

| Module | Register | Symbol | Address |
|---|---|---|---|
| Interface mode-related registers | | | |
| RSCANn | Global interface mode select register | RSCANnGRMCFG | <RSCFDn_base> + H'04FC |
| Channel-related registers | | | |
| RSCANn | Channel m Configuration Register | RSCANnCmCFG | <RSCFDn_base> + H'0000 + (H'10 × m) |
| RSCANn | Channel m control register | RSCANnCmCTR | <RSCFDn_base> + H'0004 + (H'10 × m) |
| RSCANn | Channel m status register | RSCANnCmSTS | <RSCFDn_base> + H'0008 + (H'10 × m) |
| RSCANn | Channel m error flag register | RSCANnCmERFL | <RSCFDn_base> + H'000C + (H'10 × m) |
| Global-related registers | | | |
| RSCANn | Global configuration register | RSCANnGCFG | <RSCFDn_base> + H'0084 |
| RSCANn | Global control register | RSCANnGCTR | <RSCFDn_base> + H'0088 |
| RSCANn | Global status register | RSCANnGSTS | <RSCFDn_base> + H'008C |
| RSCANn | Global error flag register | RSCANnGERFL | <RSCFDn_base> + H'0090 |
| RSCANn | Global timestamp counter register | RSCANnGTSC | <RSCFDn_base> + H'0094 |
| RSCANn | Global TX Interrupt Status Register 0 | RSCANnGTINTSTS0 | <RSCFDn_base> + H'0460 |
| RSCANn | Global FD Configuration Register | RSCANnGFDCFG | <RSCFDn_base> + H'0474 |
| Receive rule-related registers | | | |
| RSCANn | Receive Rule Entry Control Register | RSCANnGAFLECTR | <RSCFDn_base> + H'0098 |
| RSCANn | Receive Rule Configuration Register 0 | RSCANnGAFLCFG0 | <RSCFDn_base> + H'009C |
| RSCANn | Receive Rule ID Register j | RSCANnGAFLIDj | <RSCFDn_base> + H'0500 + (H'10 × j) |
| RSCANn | Receive Rule Mask Register j | RSCANnGAFLMj | <RSCFDn_base> + H'0504 + (H'10 × j) |
| RSCANn | Receive Rule Pointer 0 Register j | RSCANnGAFLP0_j | <RSCFDn_base> + H'0508 + (H'10 × j) |
| RSCANn | Receive Rule Pointer 1 Register j | RSCANnGAFLP1_j | <RSCFDn_base> + H'050C + (H'10 × j) |
| Receive buffer-related registers | | | |
| RSCANn | Receive Buffer Number Register | RSCANnRMNB | <RSCFDn_base> + H'00A4 |
| RSCANn | Receive Buffer New Data Register y | RSCANnRMNDy | <RSCFDn_base> + H'00A8 + (H'04 × y) |
| RSCANn | Receive Buffer ID Register q | RSCANnRMIDq | <RSCFDn_base> + H'0600 + (H'10 × q) |
| RSCANn | Receive Buffer Pointer Register q | RSCANnRMPTRq | <RSCFDn_base> + H'0604 + (H'10 × q) |
| RSCANn | Receive Buffer Data Field 0 Register q | RSCANnRMDF0_q | <RSCFDn_base> + H'0608 + (H'10 × q) |
| RSCANn | Receive Buffer Data Field 1 Register q | RSCANnRMDF1_q | <RSCFDn_base> + H'060C + (H'10 × q) |

Table 28.10 Registers (2/3)

| Module | Register | Symbol | Address |
|---|---|---|---|
| Receive FIFO buffer-related registers | | | |
| RSCANn | Receive FIFO Buffer Configuration and Control Register x | RSCANnRFCCx | <RSCFDn_base> + H'00B8 + (H'04 × x) |
| RSCANn | Receive FIFO Buffer Status Register x | RSCANnRFSTSx | <RSCFDn_base> + H'00D8 + (H'04 × x) |
| RSCANn | Receive FIFO Buffer Pointer Control Register x | RSCANnRFPCTRx | <RSCFDn_base> + H'00F8 + (H'04 × x) |
| RSCANn | Receive FIFO Buffer Access ID Register x | RSCANnRFIDx | <RSCFDn_base> + H'0E00 + (H'10 × x) |
| RSCANn | Receive FIFO Buffer Access Pointer Register x | RSCANnRFPTRx | <RSCFDn_base> + H'0E04 + (H'10 × x) |
| RSCANn | Receive FIFO Buffer Access Data Field 0 Register x | RSCANnRFDF0_x | <RSCFDn_base> + H'0E08 + (H'10 × x) |
| RSCANn | Receive FIFO Buffer Access Data Field 1 Register x | RSCANnRFDF1_x | <RSCFDn_base> + H'0E0C + (H'10 × x) |
| Transmit/Receive FIFO buffer related registers | | | |
| RSCANn | Transmit/receive FIFO Buffer Configuration and Control Register k | RSCANnCFCCk | <RSCFDn_base> + H'0118 + (H'04 × k) |
| RSCANn | Transmit/receive FIFO Buffer Status Register k | RSCANnCFSTSk | <RSCFDn_base> + H'0178 + (H'04 × k) |
| RSCANn | Transmit/receive FIFO Buffer Pointer Control Register k | RSCANnCFPCTRk | <RSCFDn_base> + H'01D8 + (H'04 × k) |
| RSCANn | Transmit/receive FIFO Buffer Access ID Register k | RSCANnCFIDk | <RSCFDn_base> + H'0E80 + (H'10 × k) |
| RSCANn | Transmit/receive FIFO Buffer Access Pointer Register k | RSCANnCFPTRk | <RSCFDn_base> + H'0E84 + (H'10 × k) |
| RSCANn | Transmit/receive FIFO Buffer Access Data Field 0 Register k | RSCANnCFDF0_k | <RSCFDn_base> + H'0E88 + (H'10 × k) |
| RSCANn | Transmit/receive FIFO Buffer Access Data Field 1 Register k | RSCANnCFDF1_k | <RSCFDn_base> + H'0E8C + (H'10 × k) |
| FIFO status-related registers | | | |
| RSCANn | FIFO Empty Status Register | RSCANnFESTS | <RSCFDn_base> + H'0238 |
| RSCANn | FIFO Full Status Register | RSCANnFFSTS | <RSCFDn_base> + H'023C |
| RSCANn | FIFO Message Lost Status Register | RSCANnFMSTS | <RSCFDn_base> + H'0240 |
| RSCANn | RSCANn FIFO Receive FIFO Buffer Interrupt Flag Status Register | RSCANnRFISTS | <RSCFDn_base> + H'0244 |
| RSCANn | Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register | RSCANnCFRISTS | <RSCFDn_base> + H'0248 |
| RSCANn | Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register | RSCANnCFTISTS | <RSCFDn_base> + H'024C |
| Transmit buffer-related registers | | | |
| RSCANn | Transmit Buffer Control Register p | RSCANnTMCp | <RSCFDn_base> + H'0250 + (H'01 × p) |
| RSCANn | Transmit Buffer Status Register p | RSCANnTMSTSp | <RSCFDn_base> + H'02D0 + (H'01 × p) |

## 28.3.2 Details of Interface Mode-related Registers

### 28.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register

**Access Size:** RSCANnGRMCFG register can be read/written in 32-bit units
RSCANnGRMCFGL, RSCANnGRMCFGHregisters can be read/written in 16-bit units
RSCANnGRMCFGLL, RSCANnGRMCFGLH, RSCANnGRMCFGHL, RSCANnGRMCFGHHregisters can be read/written in 8-bit units

**Address(es):** RSCANnGRMCFG: <RSCFDn_base> + H'04FC, RSCANnGRMCFGL: <RSCFDn_base> + H'04FC, RSCANnGRMCFGH: <RSCFDn_base> + H'04FE, RSCANnGRMCFGLL: <RSCFDn_base> + H'04FC, RSCANnGRMCFGLH: <RSCFDn_base> + H'04FD, RSCANnGRMCFGHL: <RSCFDn_base> + H'04FE, RSCANnGRMCFGHH: <RSCFDn_base> + H'04FF

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | 0 | R/W | Interface Mode Select<br>0: Classical CAN mode<br>1: CANFD mode |

**Note:** The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

#### RCMC Bit

Setting this bit to 0 places the RS-CANFD module in classical CAN mode.

Setting this bit to 1 places the RS-CANFD module in CANFD mode. To switch CANFD mode to classical CAN mode, set the value after reset in all registers and bits allocated to the register map of CANFD mode and then modify the RSCANnGRMCFG register.

## 28.3.3 Details of Channel-related Registers

### 28.3.3.1 RSCANnCmCFG — Channel Configuration Register (m = 0, 1)

**Access Size:** RSCANnCmCFG register can be read/written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read/written in 16-bit units
RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read/written in 8-bit unitsa

**Address(es):** RSCANnCmCFG: <RSCFDn_base> + H'0000 + (H'10 × m)
RSCANnCmCFGL: <RSCFDn_base> + H'0000 + (H'10 × m),
RSCANnCmCFGH: <RSCFDn_base> + H'0002 + (H'10 × m)
RSCANnCmCFGLL: <RSCFDn_base> + H'0000 + (H'10 × m),
RSCANnCmCFGLH: <RSCFDn_base> + H'0001 + (H'10 × m),
RSCANnCmCFGHL: <RSCFDn_base> + H'0002 + (H'10 × m),
RSCANnCmCFGHH: <RSCFDn_base> + H'0003 + (H'10 × m)

**Initial Value:** H'0000 0000

| 15 to 10 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 9 to 0 | BRP[9:0] | All 0 | R/W | Prescaler Division Ratio Set<br>When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1. |

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before shifting to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 28.11.1, Initial Settings**.

#### SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width.

Allowed values are 1 Tq to 4 Tq, inclusive.

Set a value less than or equal to the value of the TSEG2 bits.

#### TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the TSEG1 bits.

#### TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).

Allowed values are 4 Tq to 16 Tq, inclusive.

#### BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

### 28.3.3.2 RSCANnCmCTR — Channel Control Register (m = 0, 1)

**Access Size:** RSCANnCmCTR register can be read/written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read/written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCmCTR: <RSCFDn_base> + H'0004 + (H'10 × m)
RSCANnCmCTRL: <RSCFDn_base> + H'0004 + (H'10 × m),
RSCANnCmCTRH: <RSCFDn_base> + H'0006 + (H'10 × m)
RSCANnCmCTRLL: <RSCFDn_base> + H'0004 + (H'10 × m),
RSCANnCmCTRLH: <RSCFDn_base> + H'0005 + (H'10 × m),
RSCANnCmCTRHL: <RSCFDn_base> + H'0006 + (H'10 × m),
RSCANnCmCTRHH: <RSCFDn_base> + H'0007 + (H'10 × m)

**Initial Value:** H'0000 0005

#### CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

#### CTMS[1:0] Bit

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

#### CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

#### ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.

When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order. Modify this bit only in channel reset mode or channel halt mode.

#### BOM[1:0] Bit

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00b, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10b (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01b, the CHMDC[1:0] bits in the RSCFDnCmCTRRSCANnCmCTR register (m = 0, 1) are set to 10b and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCmSTSRSCANnCmSTS register are cleared to H’00.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10b, the CHMDC[1:0] bits are set to 10b and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H’00.

When the BOM[1:0] bits are set to 11b and the CHMDC[1:0] bits are set to 10b while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H'00. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10b, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01b or at bus off end when the BOM[1:0] bits are 10b), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

#### TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

#### ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

#### RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to H'00 and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTR register are 00b (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

#### CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode. Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

#### CHMDC[1:0] Bit

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 28.6.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11b. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10b.

### 28.3.3.3 RSCANnCmSTS — Channel Status Register (m = 0, 1)

**Access Size:** RSCANnCmSTS register can be read only in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers can be read only in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSLH, RSCANnCmSTSHL, RSCANnCmSTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnCmSTS: <RSCFDn_base> + H'0008 + (H'10 × m)
RSCANnCmSTSL: <RSCFDn_base> + H'0008 + (H'10 × m),
RSCANnCmSTSH: <RSCFDn_base> + H'000A + (H'10 × m)
RSCANnCmSTSLL: <RSCFDn_base> + H'0008 + (H'10 × m),
RSCANnCmSTSLH: <RSCFDn_base> + H'0009 + (H'10 × m),
RSCANnCmSTSHL: <RSCFDn_base> + H'000A + (H'10 × m),
RSCANnCmSTSHH: <RSCFDn_base> + H'000B + (H'10 × m)

**Initial Value:** H'0000 0005

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | CRSTSTS | 1 | R | Channel Reset Status Flag<br>0: Not in channel reset mode<br>1: In channel reset mode |

### TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

### REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

### COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

### RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

### TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

### BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

### EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

### CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

### CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

**CRSTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

### 28.3.3.4 RSCANnCmERFL — Channel Error Flag Register (m = 0, 1)

**Access Size:** RSCANnCmERFL register can be read/written in 32-bit units
RSCANnCmERFLL, RSCANnCmERFLH registers can be read/written in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH, RSCANnCmERFLHL, RSCANnCmERFLHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCmERFL: <RSCFDn_base> + H'000C + (H'10 × m)
RSCANnCmERFLL: <RSCFDn_base> + H'000C + (H'10 × m),
RSCANnCmERFLH: <RSCFDn_base> + H'000E + (H'10 × m)
RSCANnCmERFLLL: <RSCFDn_base> + H'000C + (H'10 × m),
RSCANnCmERFLLH: <RSCFDn_base> + H'000D + (H'10 × m),
RSCANnCmERFLHL: <RSCFDn_base> + H'000E + (H'10 × m),
RSCANnCmERFLHH: <RSCFDn_base> + H'000F + (H'10 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 6 | BLF | 0 | R/W*1 | Bus Lock Flag<br>0: No channel bus is detected.<br>1: Channel bus is detected. |
| 5 | OVLF | 0 | R/W*1 | Overload Flag<br>0: No overload is detected.<br>1: Overload is detected. |
| 4 | BORF | 0 | R/W*1 | Bus Off Recovery Flag<br>0: No bus off recovery is detected.<br>1: Bus off recovery is detected. |
| 3 | BOEF | 0 | R/W*1 | Bus Off Entry Flag<br>0: No bus off entry is detected.<br>1: Bus off entry is detected. |
| 2 | EPF | 0 | R/W*1 | Error Passive Flag<br>0: No error passive is detected.<br>1: Error passive is detected. |
| 1 | EWF | 0 | R/W*1 | Error Warning Flag<br>0: No error warning is detected.<br>1: Error warning is detected. |
| 0 | BEF | 0 | R/W*1 | Bus Error Flag<br>0: No channel bus error is detected.<br>1: Channel bus error is detected. |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCmCTR register is set to 0 (i.e., only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

### CRCREG[14:0] Flag

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

### ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

#### B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

#### B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

#### CERR Flag

This flag is set to 1 when a CRC error has been detected.

#### AERR Flag

This flag is set to 1 when an ACK error has been detected.

#### FERR Flag

This flag is set to 1 when a form error has been detected.

#### SERR Flag

This flag is set to 1 when a stuff error has been detected.

#### ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

#### BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0

#### OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

#### BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 01b (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to 01b (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 10b (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11b (transition to channel halt mode upon a request from the program during bus off).

### BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0, 1) set to 01b (transition to channel halt mode at bus off entry).

### EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127).

This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

### EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

### BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

## 28.3.4 Details of Global-related Registers

### 28.3.4.1 RSCANnGCFG — Global Configuration Register

**Access Size:** RSCANnGCFG register can be read/written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read/written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGCFG: <RSCFDn_base> + H'0084
RSCANnGCFGL: <RSCFDn_base> + H'0084, RSCANnGCFGH: <RSCFDn_base> + H'0086
RSCANnGCFGLL: <RSCFDn_base> + H'0084, RSCANnGCFGLH: <RSCFDn_base> + H'0085,
RSCANnGCFGHL: <RSCFDn_base> + H'0086, RSCANnGCFGHH: <RSCFDn_base> + H'0087

**Initial Value:** H'0000 0000

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000b.

Note 2. For the CAN clock frequency settings, see **Section 28.1.3, Clock Supply**.

Modify the RSCANnGCFG register only in global reset mode.

### ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 28.8.3.1, Interval Transmission Function**.

### TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

#### TSSS Bits

This bit is used to select a clock source of the timestamp counter.

#### TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

#### TMTSCE Bits

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

#### DCS Bits

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN). For the CAN clock frequency settings, see **Table 28.6**.

#### MME Bits

Setting this bit to 1 makes the mirror function available.

#### DRE Bits

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of H’00 is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

#### DCE Bits

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to 0000b before clearing the DCE bit in the RSCANnGCFG register to 0.

#### TPRI Bits

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

### 28.3.4.2 RSCANnGCTR — Global Control Register

**Access Size:** RSCANnGCTR register can be read/written in 32-bit units
RSCANnGCTRL, RSCANnGCTRH registers can be read/written in 16-bit units
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL, RSCANnGCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGCTR: <RSCFDn_base> + H'0088
RSCANnGCTRL: <RSCFDn_base> + H'0088, RSCANnGCTRH: <RSCFDn_base> + H'008A
RSCANnGCTRLL: <RSCFDn_base> + H'0088, RSCANnGCTRLH: <RSCFDn_base> + H'0089,
RSCANnGCTRHL: <RSCFDn_base> + H'008A, RSCANnGCTRHH: <RSCFDn_base> + H'008B

**Initial Value:** H'0000 0005

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TSRST |

#### TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSCregister is cleared to H’0000.

#### THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

#### GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.

Clearing this bit to 0 makes the RSCAN module leave from global stop mode.

This bit should not be modified in global operating mode or global test mode.

#### GMDC[1:0] Bit

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 28.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

### 28.3.4.3 RSCANnGSTS — Global Status Register

**Access Size:** RSCANnGSTS register can be read only in 32-bit units
RSCANnGSTSL, RSCANnGSTSH registers can be read only in 16-bit units
RSCANnGSTSLL, RSCANnGSTSLH, RSCANnGSTSHL, RSCANnGSTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnGSTS: <RSCFDn_base> + H'008C
RSCANnGSTSL: <RSCFDn_base> + H'008C, RSCANnGSTSH: <RSCFDn_base> + H'008E
RSCANnGSTSLL: <RSCFDn_base> + H'008C, RSCANnGSTSLH: <RSCFDn_base> + 008D,
RSCANnGSTSHL: <RSCFDn_base> + H'008E, RSCANnGSTSHH: <RSCFDn_base> + H'008F

**Initial Value:** H'0000 000D

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | GRAMINIT | GSLPSTS | GHLTSTS | GRSTSTS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 3 | GRAMINIT | 1 | R | CAN RAM Initialization Status Flag<br>0: CAN RAM initialization is completed.<br>1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | 1 | R | Global Stop Status Flag<br>0: Not in global stop mode<br>1: In global stop mode |
| 1 | GHLTSTS | 0 | R | Global Test Status Flag<br>0: Not in global test mode<br>1: In global test mode |
| 0 | GRSTSTS | 1 | R | Global Reset Status Flag<br>0: Not in global reset mode<br>1: In global reset mode |

#### GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

#### GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

### GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

### GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

### 28.3.4.4 RSCANnGERFL — Global Error Flag Register

**Access Size:** RSCANnGERFL register can be read/written in 32-bit units
RSCANnGERFLL, RSCANnGERFLH registers can be read/written in 16-bit units
RSCANnGERFLLL, RSCANnGERFLLH, RSCANnGERFLHL, RSCANnGERFLHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGERFL: <RSCFDn_base> + H'0090
RSCANnGERFLL: <RSCFDn_base> + H'0090, RSCANnGERFLH: <RSCFDn_base> + H'0092
RSCANnGERFLLL: <RSCFDn_base> + H'0090, RSCANnGERFLLH: <RSCFDn_base> + H'0091,
RSCANnGERFLHL: <RSCFDn_base> + H'0092, RSCANnGERFLHH: <RSCFDn_base> + H'0093

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | THLES | MES | DEF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14, 7, 6, 4, 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 13 to 8, 5 | — | All 0 | R | Reserved<br>When read, an undefined value is returned. The write value should be the value after reset. |
| 2 | THLES | 0 | R | Transmit History Buffer Overflow Status Flag<br>0: No transmit history buffer overflow has occurred.<br>1: A transmit history buffer overflow has occurred. |
| 1 | MES | 0 | R | FIFO Message Lost Status Flag<br>0: No FIFO message lost error has occurred.<br>1: A FIFO message lost error has occurred. |
| 0 | DEF | 0 | R/W*1 | DLC Error Flag<br>0: No DLC error has occurred.<br>1: A DLC error has occurred. |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

#### THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0, 1) is set to 1. This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

### MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 5) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

### DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”

### 28.3.4.5 RSCANnGTSC — Global Timestamp Counter Register

**Access Size:** RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSCL, RSCANnGTSCH registers can be read only in 16-bit units.

**Address(es):** RSCANnGTSC: <RSCFDn_base> + H'0094
RSCANnGTSCL: <RSCFDn_base> + H'0094, RSCANnGTSCH: <RSCFDn_base> + H'0096

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 15 to 0 | TS[15:0] | All 0 | R | Timestamp Value<br>The timestamp counter value can be read.<br>Counter Value: H'0000 to H'FFFF |

#### TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the GRSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode. This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 28.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

**Access Size:** RSCANnGTINTSTS0 register can be read only in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers can be read only in 8-bit units

**Address(es):** RSCANnGTINTSTS0: <RSCFDn_base> + H'0460
RSCANnGTINTSTS0L: <RSCFDn_base> + H'0460, RSCANnGTINTSTS0H: <RSCFDn_base> + H'0462
RSCANnGTINTSTS0LL: <RSCFDn_base> + H'0460, RSCANnGTINTSTS0LH: <RSCFDn_base> + H'0461,
RSCANnGTINTSTS0HL: <RSCFDn_base> + H'0462, RSCANnGTINTSTS0HH: <RSCFDn_base> + H'0463

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|
| 1 | TAIF0 | 0 | R*1 | Channel 0 Transmit Buffer Abort Interrupt Status Flag<br>0: Transmit buffer abort interrupt is not requested.<br>1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | 0 | R*1 | Channel 0 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

### TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10b (transmit completed without abort request) or 11b (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00b under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

### TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01b (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00b after the transmit abort is completed.

### TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

### CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

### THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 28.3.4.7 RSCANnGFDCFG — Global FD configuration register

**Access Size:** RSCANnGFDCFG register can be read/written in 32-bit unit
RSCANnGFDCFGL and RSCANnGFDCFGH registers can be read/written in 16-bit unit
RSCANnGFDCFGLL, RSCANnGFDCFGLH, RSCANnGFDCFGHL, RSCANnGFDCFGHH registers can be read/written in 8-bit unit

**Address(es):** RSCANnGFDCFG: <RSCFDn_base> + H'0474
RSCANnGFDCFG L: <RSCFDn_base> + H'0474, RSCANnGFDCFG H: <RSCFDn_base> + H'0476
RSCANnGFDCFG LL: <RSCFDn_base> + H'0474, RSCANnGFDCFG LH: <RSCFDn_base> + H'0475,
RSCANnGFDCFG HL: <RSCFDn_base> + H'0476, RSCANnGFDCFG HH: <RSCFDn_base> + H'0477

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | — | 0 | R/W | Reserved<br>When read, an undefined value is returned. The write value should be the value after reset. |

#### TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

## 28.3.5 Details of Receive Rule-related Registers

### 28.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

**Access Size:** RSCANnGAFLECTR register can be read/written in 32-bit units
RSCANnGAFLECTRL, RSCANnGAFLECTRH registers can be read/written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH, RSCANnGAFLECTRHL, RSCANnGAFLECTRHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGAFLECTR: <RSCFDn_base> + H'0098
RSCANnGAFLECTRL: <RSCFDn_base> + H'0098, RSCANnGAFLECTRH: <RSCFDn_base> + H'009A
RSCANnGAFLECTRLL: <RSCFDn_base> + H'0098, RSCANnGAFLECTRLH: <RSCFDn_base> + H'0099,
RSCANnGAFLECTRHL: <RSCFDn_base> + H'009A, RSCANnGAFLECTRHH: <RSCFDn_base> + H'009B

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | AFLDAE | — | — | — | AFLPN[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | AFLDAE | 0 | R/W | Receive Rule Table Write Enable<br>0: Receive rule table write is disabled.<br>1: Receive rule table write is enabled. |
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 4 to 0 | AFLPN[4:0] | All 0 | R/W | Receive Rule Table Page Number Configuration<br>A page number can be selected from a range of page 0 (00000b) to page 7 (00111b). |

#### AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

#### AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page. Set these bits to a value within the range of 00000b to 00111b.

### 28.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

**Access Size:** RSCANnGAFLCFG0 register can be read/written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8- bit units

**Address(es):** RSCANnGAFLCFG0: <RSCFDn_base> + H'009C
RSCANnGAFLCFG0L: <RSCFDn_base> + H'009C, RSCANnGAFLCFG0H: <RSCFDn_base> + H'009E
RSCANnGAFLCFG0LL: <RSCFDn_base> + H'009C, RSCANnGAFLCFG0LH: <RSCFDn_base> + H'009D,
RSCANnGAFLCFG0HL: <RSCFDn_base> + H'009E, RSCANnGAFLCFG0HH: <RSCFDn_base> + H'009F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RNC0[7:0] | | | | | | | | RNC1[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | RNC0[7:0] | All 0 | R/W | Number of Rules for Channel 0<br>Set the number of receive rules exclusively used for channel 0. |
| 23 to 16 | RNC1[7:0] | All 0 | R/W | Number of Rules for Channel 1<br>Set the number of receive rules exclusively used for channel 1. |
| 15 to 0 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

#### RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of H'00 to H'80.

#### RNC1[7:0] Bits

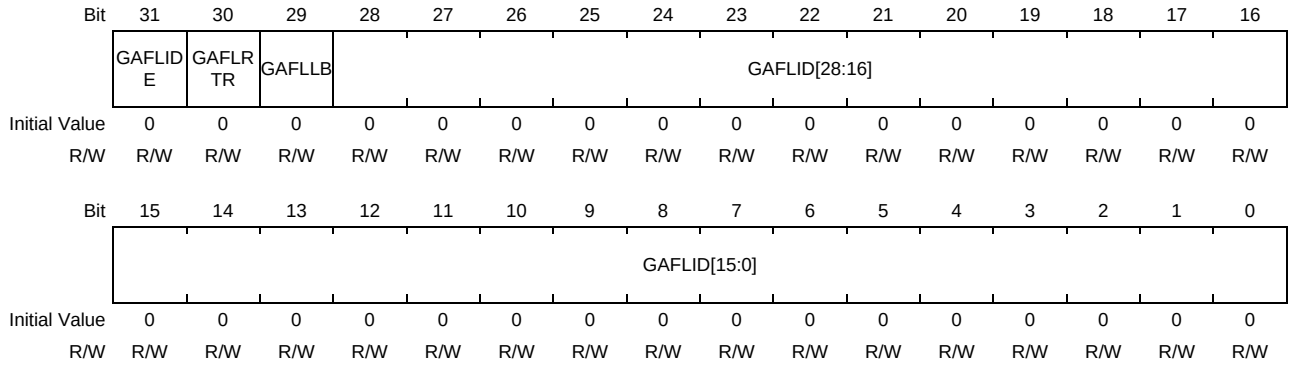
These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of H'00 to H'80.

### 28.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

**Access Size:** RSCANnGAFLIDj register can be read/written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGAFLIDj: <RSCFDn_base> + H'0500 + (H'10 × j)
RSCANnGAFLIDjL: <RSCFDn_base> + H'0500 + (H'10 × j),
RSCANnGAFLIDjH: <RSCFDn_base> + H'0502 + (H'10 × j)
RSCANnGAFLIDjLL: <RSCFDn_base> + H'0500 + (H'10 × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + H'0501 + (H'10 × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + H'0502 + (H'10 × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + H'0503 + (H'10 × j)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | GAFLIDE | 0 | R/W | IDE Select<br>0: Standard ID<br>1: Extended ID |
| 30 | GAFLRTR | 0 | R/W | RTR Select<br>0: Data frame<br>1: Remote frame |
| 29 | GAFLLB | 0 | R/W | Receive Rule Target Message Select<br>0: When a message transmitted from another CAN node is received<br>1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | All 0 | R/W | ID<br>Set the ID of the receive rule.<br>For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

#### GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

### GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

### GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

### 28.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

**Access Size:** RSCANnGAFLMj register can be read/written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGAFLMj: <RSCFDn_base> + H'0504 + (H'10 × j)
RSCANnGAFLMjL: <RSCFDn_base> + H'0504 + (H'10 × j),
RSCANnGAFLMjH: <RSCFDn_base> + H'0506 + (H'10 × j)
RSCANnGAFLMjLL: <RSCFDn_base> + H'0504 + (H'10 × j),
RSCANnGAFLMjLH: <RSCFDn_base> + H'0505 + (H'10 × j),
RSCANnGAFLMjHL: <RSCFDn_base> + H'0506 + (H'10 × j),
RSCANnGAFLMjHH: <RSCFDn_base> + H'0507 + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDEM | GAFLRTRM | — | GAFLIDM[28:16] | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDM[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | GAFLIDEM | R/W | R/W | IDE Mask<br>0: The IDE bit is not compared.<br>1: The IDE bit is compared. |
| 30 | GAFLRTRM | R/W | R/W | RTR Mask<br>0: The RTR bit is not compared.<br>1: The RTR bit is compared |
| 29 | — | 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 28 to 0 | GAFLIDM [28:0] | All 0 | R/W | ID Mask<br>0: The corresponding ID bit is not compared.<br>1: The corresponding ID bit is compared. |

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

### GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

### GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

### 28.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access Size:** RSCANnGAFLP0_j register can be read/written in 32-bit units
RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units
RSCANnGAFLP0_jLL, RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGAFLP0_j: <RSCFDn_base> + H'0508 + (H'10 × j)
RSCANnGAFLP0_jL: <RSCFDn_base> + H'0508 + (H'10 × j),
RSCANnGAFLP0_jH: <RSCFDn_base> + H'050A + (H'10 × j)
RSCANnGAFLP0_jLL: <RSCFDn_base> + H'0508 + (H'10 × j),
RSCANnGAFLP0_jLH: <RSCFDn_base> + H'0509 + (H'10 × j),
RSCANnGAFLP0_jHL: <RSCFDn_base> + H'050A + (H'10 × j),
RSCANnGAFLP0_jHH: <RSCFDn_base> + H'050B + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLDLC[3:0] | | | | GAFLPTR[11:0] | | | | | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLRMV | GAFLRMDP[6:0] | | | | | | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | GAFLDLC [3:0] | All 0 | R/W | Receive Rule DLC<br>b31 b30 b29 b28<br>0 0 0 0: DLC check is disabled.<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 16 | GAFLPTR [11:0] | All 0 | R/W | Receive Rule Label<br>Set the 12-bit label information. |
| 15 | GAFLRMV | 0 | R/W | Receive Buffer Enable<br>0: No receive buffer is used.<br>1: A receive buffer is used. |
| 14 to 8 | GAFLRMDP [6:0] | All 0 | R/W | Receive Buffer Number Select<br>Set the receive buffer number to store receive messages. |
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000b disables the DLC check function allowing messages with any data length to pass the DLC check.

#### GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

#### GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

#### GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

### 28.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access Size:** RSCANnGAFLP1_j register can be read/written in 32-bit units
RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units
RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGAFLP1_j: <RSCFDn_base> + H'050C + (H'10 × j)
RSCANnGAFLP1_jL: <RSCFDn_base> + H'050C + (H'10 × j),
RSCANnGAFLP1_jH: <RSCFDn_base> + H'050E + (H'10 × j)
RSCANnGAFLP1_jLL: <RSCFDn_base> + H'050C + (H'10 × j),
RSCANnGAFLP1_jLH: <RSCFDn_base> + H'050D + (H'10 × j),
RSCANnGAFLP1_jHL: <RSCFDn_base> + H'050E + (H'10 × j),
RSCANnGAFLP1_jHH: <RSCFDn_base> + H'050F + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 13 to 8 | GAFLFDP [13:8] | All 0 | R/W | Transmit/Receive FIFO Buffer k Select<br>(Bit position –8 = target transmit/receive FIFO buffer number k)<br>0: Transmit/receive FIFO buffer is not selected.<br>1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP [7:0] | All 0 | R/W | Receive FIFO Buffer x Select<br>(Bit position = target receive FIFO buffer number x)<br>0: Receive FIFO buffer is not selected.<br>1: Receive FIFO buffer is selected. |

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLFDP[13:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/ receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00b (receive mode) or 10b (gateway mode) are selectable.

## 28.3.6 Details of Receive Buffer-related Registers

### 28.3.6.1 RSCANnRMNB — Receive Buffer Number Register

**Access Size:** RSCANnRMNB register can be read/written in 32-bit units
RSCANnRMNBL, RSCANnRMNBH registers can be read/written in 16-bit units
RSCANnRMNBLL, RSCANnRMNBLH, RSCANnRMNBHL, RSCANnRMNBHH registers can be read/written in 8-bit units

**Address(es):** RSCANnRMNB: <RSCFDn_base> + H'00A4
RSCANnRMNBL: <RSCFDn_base> + H'00A4, RSCANnRMNBH: <RSCFDn_base> + H'00A6
RSCANnRMNBLL: <RSCFDn_base> + H'00A4, RSCANnRMNBLH: <RSCFDn_base> + H'00A5,
RSCANnRMNBHL: <RSCFDn_base> + H'00A6, RSCANnRMNBHH: <RSCFDn_base> + H'00A7

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 7 to 0 | NRXMB[7:0] | All 0 | R/W | Receive Buffer Number Configuration<br>Set the number of receive buffers.<br>Set a value of 0 to 32. |

Modify the RSCANnRMNB register only in global reset mode.

#### NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

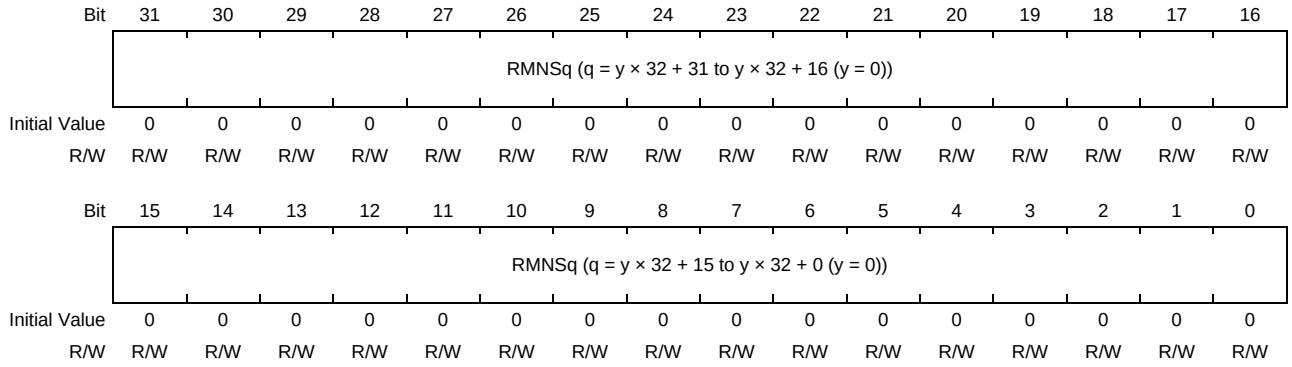
Setting these bits all to 0 makes receive buffers unavailable.

### 28.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0)

**Access Size:** RSCANnRMNDy register can be read/written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units

**Address(es):** RSCANnRMNDy: <RSCFDn_base> + H'00A8 + (H'04 × y)
RSCANnRMNDyL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCANnRMNDyH: <RSCFDn_base> + H'00AA + (H'04 × y)
RSCANnRMNDyLL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCANnRMNDyLH: <RSCFDn_base> + H'00A9 + (H'04 × y),
RSCANnRMNDyHL: <RSCFDn_base> + H'00AA + (H'04 × y),
RSCANnRMNDyHH: <RSCFDn_base> + H'00AB + (H'04 × y)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | RMNSq | All 0 | R/W | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |
| 15 to 0 | RMNSq | All 0 | R/W | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

#### RMNSq Flags (q = 0 to 31)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write "0" to the flag and "1" to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message. These flags are cleared to 0 in global reset mode.

### 28.3.6.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 31)

**Access Size:** RSCANnRMIDq register can be read only in 32-bit units
RSCFDnRMIDqRSCANnRMIDqL, RSCFDnRMIDqRSCANnRMIDqH registers can be read only in 16-bit units
RSCFDnRMIDqRSCANnRMIDqLL, RSCFDnRMIDqRSCANnRMIDqLH, RSCFDnRMIDqRSCANnRMIDqHL, RSCFDnRMIDqRSCANnRMIDqHH registers can be read only in 8-bit units

**Address(es):** RSCANnRMIDq: <RSCFDn_base> + H'0600 + (H'10 × q)
RSCANnRMIDqL: <RSCFDn_base> + H'0600 + (H'10 × q),
RSCANnRMIDqH: <RSCFDn_base> + H'0602 + (H'10 × q)
RSCANnRMIDqLL: <RSCFDn_base> + H'0600 + (H'10 × q),
RSCANnRMIDqLH: <RSCFDn_base> + H'0601 + (H'10 × q),
RSCANnRMIDqHL: <RSCFDn_base> + H'0602 + (H'10 × q),
RSCANnRMIDqHH: <RSCFDn_base> + H'0603 + (H'10 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 28 to 0 | RMID[28:0] | All 0 | R | Receive Buffer ID Data<br>These bits contain the standard ID or extended ID of the received message.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer

#### RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

#### RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

### 28.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)

**Access Size:** RSCANnRMPTRq register can be read only in 32-bit units
RSCFDnRMPTRqRSCANnRMPTRqL, RSCFDnRMPTRqRSCANnRMPTRqH registers can be read only in 16-bit units
RSCFDnRMPTRqRSCANnRMPTRqLL, RSCFDnRMPTRqRSCANnRMPTRqLH, RSCFDnRMPTRqRSCANnRMPTRqHL, RSCFDnRMPTRqRSCANnRMPTRqHH registers can be read only in 8-bit units

**Address(es):** RSCANnRMPTRq: <RSCFDn_base> + H'0604 + (H'10 × q)
RSCANnRMPTRqL: <RSCFDn_base> + H'0604 + (H'10 × q),
RSCANnRMPTRqH: <RSCFDn_base> + H'0606 + (H'10 × q)
RSCANnRMPTRqLL: <RSCFDn_base> + H'0604 + (H'10 × q),
RSCANnRMPTRqLH: <RSCFDn_base> + H'0605 + (H'10 × q),
RSCANnRMPTRqHL: <RSCFDn_base> + H'0606 + (H'10 × q),
RSCANnRMPTRqHH: <RSCFDn_base> + H'0607 + (H'10 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | RMTS[15:0] | All 0 | R | Receive Buffer Timestamp Data<br>Timestamp value of the received message. |

#### RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

#### RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

**RMTS[15:0] Bits**

These bits indicate the timestamp value of the message stored in the receive buffer.

### 28.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 31)

**Access Size:** RSCANnRMDF0_q register can be read only in 32-bit units
RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units
RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units

**Address(es):** RSCANnRMDF0_q: <RSCFDn_base> + H'0608 + (H'10 × q)
RSCANnRMDF0_qL: <RSCFDn_base> + H'0608 + (H'10 × q),
RSCANnRMDF0_qH: <RSCFDn_base> + H'060A + (H'10 × q)
RSCANnRMDF0_qLL: <RSCFDn_base> + H'0608 + (H'10 × q),
RSCANnRMDF0_qLH: <RSCFDn_base> + H'0609 + (H'10 × q),
RSCANnRMDF0_qHL: <RSCFDn_base> + H'060A + (H'10 × q),
RSCANnRMDF0_qHH: <RSCFDn_base> + H'060B + (H'10 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | RMDB3[7:0] | All 0 | R | Receive Buffer Data Byte 3 |
| 23 to 16 | RMDB2[7:0] | All 0 | R | Receive Buffer Data Byte 2 |
| 15 to 8 | RMDB1[7:0] | All 0 | R | Receive Buffer Data Byte 1 |
| 7 to 0 | RMDB0[7:0] | All 0 | R | Receive Buffer Data Byte 0<br>Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000b, data bytes for which no data is set are read as H'00.

### 28.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register (q = 0 to 31)

**Access Size:** RSCANnRMDF1_q register can be read only in 32-bit units
RSCANnRMDF1_qL, RSCANnRMDF1_qH registers can be read only in 16-bit units
RSCANnRMDF1_qLL, RSCANnRMDF1_qLH, RSCANnRMDF1_qHL, RSCANnRMDF1_qHH registers can be read only in 8-bit units

**Address(es):** RSCANnRMDF1_q: <RSCFDn_base> + H'060C + (H'10 × q)
RSCANnRMDF1_qL: <RSCFDn_base> + H'060C + (H'10 × q),
RSCANnRMDF1_qH: <RSCFDn_base> + H'060E + (H'10 × q)
RSCANnRMDF1_qLL: <RSCFDn_base> + H'060C + (H'10 × q),
RSCANnRMDF1_qLH: <RSCFDn_base> + H'060D + (H'10 × q),
RSCANnRMDF1_qHL: <RSCFDn_base> + H'060E + (H'10 × q),
RSCANnRMDF1_qHH: <RSCFDn_base> + H'060F + (H'10 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | RMDB7[7:0] | All 0 | R | Receive Buffer Data Byte 7 |
| 23 to 16 | RMDB6[7:0] | All 0 | R | Receive Buffer Data Byte 6 |
| 15 to 8 | RMDB5[7:0] | All 0 | R | Receive Buffer Data Byte 5 |
| 7 to 0 | RMDB4[7:0] | All 0 | R | Receive Buffer Data Byte 4<br><br>Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000b, data bytes for which no data is set are read as H'00.

## 28.3.7 Details of Receive FIFO Buffer-related Registers

### 28.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

**Access Size:** RSCANnRFCCxregister can be read/written in 32-bit units
RSCANnRFCCxL, RSCANnRFCCxH registers can be read/written in 16-bit units
RSCANnRFCCxLL, RSCANnRFCCxLH, RSCANnRFCCxHL, RSCANnRFCCxHH registers can be read/written in 8-bit units

**Address(es):** RSCANnRFCCx: <RSCFDn_base> + H'00B8 + (H'04 × x)
RSCANnRFCCxL: <RSCFDn_base> + H'00B8 + (H'04 × x),
RSCANnRFCCxH: <RSCFDn_base> + H'00BA + (H'04 × x)
RSCANnRFCCxLL: <RSCFDn_base> + H'00B8 + (H'04 × x),
RSCANnRFCCxLH: <RSCFDn_base> + H'00B9 + (H'04 × x),
RSCANnRFCCxHL: <RSCFDn_base> + H'00BA + (H'04 × x),
RSCANnRFCCxHH: <RSCFDn_base> + 0 H'0BB + (H'04 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001b (4 messages), set the RFIGCV[2:0] bits to 001b, 011b, 101b, or 111b. Modify these bits only in global reset mode.

### RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

### RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000b, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

### RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

### RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnRFSTSxRSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done. This bit is cleared to 0 in global reset mode.

### 28.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

**Access Size:** RSCANnRFSTSx register can be read/written in 32-bit units
RSCANnRFSTSxL, RSCANnRFSTSxH registers can be read/written in 16-bit units
RSCANnRFSTSxLL, RSCANnRFSTSxLH, RSCANnRFSTSxHL, RSCANnRFSTSxHH registers can be read/written in 8-bit units

**Address(es):** RSCANnRFSTSx: <RSCFDn_base> + H'00D8 + (H'04 × x)
RSCANnRFSTSxL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCANnRFSTSxH: <RSCFDn_base> + H'00DA + (H'04 × x)
RSCANnRFSTSxLL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCANnRFSTSxLH: <RSCFDn_base> + H'00D9 + (H'04 × x),
RSCANnRFSTSxHL: <RSCFDn_base> + H'00DA + (H'04 × x),
RSCANnRFSTSxHH: <RSCFDn_base> + H'00DB + (H'04 × x)

**Initial Value:** H'0000 0001

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 15 to 8 | RFMC[7:0] | All 0 | R | Receive FIFO Unread Message Counter<br>The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 3 | RFIF | 0 | R/W*1 | Receive FIFO Interrupt Request Flag<br>0: No receive FIFO interrupt request is present.<br>1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | 0 | R/W*1 | Receive FIFO Message Lost Flag<br>0: No receive FIFO message is lost.<br>1: A receive FIFO message is lost. |
| 1 | RFFLL | 0 | R | Receive FIFO Buffer Full Status Flag<br>0: The receive FIFO buffer is not full.<br>1: The receive FIFO buffer is full. |
| 0 | RFEMP | 0 | R | Receive FIFO Buffer Empty Status Flag<br>0: The receive FIFO buffer contains unread message.<br>1: The receive FIFO buffer contains no unread message (buffer empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes H'00 when the RFE bit in the RSCANnRFCCx register is set to 0.

#### RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

#### RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

#### RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

#### RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

### 28.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

**Access Size:** RSCANnRFPCTRx register can only be written in 32-bit units
RSCANnRFPCTRxL, RSCANnRFPCTRxH registers can only be written in 16-bit units
RSCANnRFPCTRxLL, RSCANnRFPCTRxLH, RSCANnRFPCTRxHL, RSCANnRFPCTRxHH registers can only be written in 8-bit units

**Address(es):** RSCANnRFPCTRx: <RSCFDn_base> + H'00F8 + (H'04 × x)
RSCANnRFPCTRxL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCANnRFPCTRxH: <RSCFDn_base> + H'00FA + (H'04 × x)
RSCANnRFPCTRxLL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCANnRFPCTRxLH: <RSCFDn_base> + H'00F9 + (H'04 × x),
RSCANnRFPCTRxHL: <RSCFDn_base> + H'00FA + (H'04 × x),
RSCANnRFPCTRxHH: <RSCFDn_base> + H'00FB + (H'04 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should be the value after reset. |
| 7 to 0 | RFPC[7:0] | All 0 | W | Receive FIFO Pointer Control<br>When these bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer. |

#### RFPC[7:0] Bits

When the RFPC[7:0] bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write H'FF to the RFPC[7:0] bits.

When writing H'FF to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

### 28.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

**Access Size:** RSCANnRFIDx register can be read only in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units

**Address(es):** RSCANnRFIDx: <RSCFDn_base> + H'0E00 + (H'10 × x)
RSCANnRFIDxL: <RSCFDn_base> + H'0E00 + (H'10 × x),
RSCANnRFIDxH: <RSCFDn_base> + H'0E02 + (H'10 × x)
RSCANnRFIDxLL: <RSCFDn_base> + H'0E00 + (H'10 × x),
RSCANnRFIDxLH: <RSCFDn_base> + H'0E01 + (H'10 × x),
RSCANnRFIDxHL: <RSCFDn_base> + H'0E02 + (H'10 × x),
RSCANnRFIDxHH: <RSCFDn_base> + H'0E03 + (H'10 × x)

**Initial Value:** H'0000 0000

#### RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

#### RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

#### RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 28.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

**Access Size:** RSCANnRFPTRx register can be read only in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units

**Address(es):** RSCANnRFPTRx: <RSCFDn_base> + H'0E04 + (H'10 × x)
RSCANnRFPTRxL: <RSCFDn_base> + H'0E04 + (H'10 × x),
RSCANnRFPTRxH: <RSCFDn_base> + H'0E06 + (H'10 × x)
RSCANnRFPTRxLL: <RSCFDn_base> + H'0E04 + (H'10 × x),
RSCANnRFPTRxLH: <RSCFDn_base> + H'0E05 + (H'10 × x),
RSCANnRFPTRxHL: <RSCFDn_base> + H'0E06 + (H'10 × x),
RSCANnRFPTRxHH: <RSCFDn_base> + H'0E07 + (H'10 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | RFTS[15:0] | All 0 | R | Receive FIFO Buffer Timestamp Data<br>Timestamp value of the received message can be read. |

#### RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

#### RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

#### RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

### 28.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

**Access Size:** RSCANnRFDF0_x register can be read only in 32-bit units
RSCANnRFDF0_xL, RSCANnRFDF0_xH registers can be read only in 16-bit units
RSCANnRFDF0_xLL, RSCANnRFDF0_xLH, RSCANnRFDF0_xHL, RSCANnRFDF0_xHH registers can be read only in 8-bit units

**Address(es):** RSCANnRFDF0_x: <RSCFDn_base> + H'0E08 + (H'10 × x)
RSCANnRFDF0_xL: <RSCFDn_base> + H'0E08 + (H'10 × x),
RSCANnRFDF0_xH: <RSCFDn_base> + H'0E0A + (H'10 × x)
RSCANnRFDF0_xLL: <RSCFDn_base> + H'0E08 + (H'10 × x),
RSCANnRFDF0_xLH: <RSCFDn_base> + H'0E09 + (H'10 × x),
RSCANnRFDF0_xHL: <RSCFDn_base> + H'0E0A + (H'10 × x),
RSCANnRFDF0_xHH: <RSCFDn_base> + H'0E0B + (H'10 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 0 | RFDB4[7:0] | All 0 | R | Receive FIFO Buffer Data Byte 4<br><br>Data for a message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than 1000b, data bytes for which no data is set are read as H'00.

## 28.3.8 Details of Transmit/Receive FIFO Buffer-related Registers

### 28.3.8.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)

**Access Size:** RSCANnCFCCk register can be read/written in 32-bit units
RSCANnCFCCkL, RSCANnCFCCkH registers can be read/written in 16-bit units
RSCANnCFCCkLL, RSCANnCFCCkLH, RSCANnCFCCkHL, RSCANnCFCCkHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCFCCk: <RSCFDn_base> + H'0118 + (H'04 × k)
RSCANnCFCCkL: <RSCFDn_base> + H'0118 + (H'04 × k),
RSCANnCFCCkH: <RSCFDn_base> + H'011A + (H'04 × k)
RSCANnCFCCkLL: <RSCFDn_base> + H'0118 + (H'04 × k),
RSCANnCFCCkLH: <RSCFDn_base> + H'0119 + (H'04 × k),
RSCANnCFCCkHL: <RSCFDn_base> + H'011A + (H'04 × k),
RSCANnCFCCkHH: <RSCFDn_base> + H'011B + (H'04 × k)

**Initial Value:** H'0000 0000

| 0 | CFE | 0 | R/W | Transmit/Receive FIFO Buffer Enable<br>0: No transmit/receive FIFO buffer is used.<br>1: Transmit/receive FIFO buffers are used. |

#### CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

#### CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 28.11** and **Table 28.12**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p. Setting the CFDC[2:0] bits to 001b or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

#### CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00b (receive mode) or 10b (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001b (4 messages), set the CFIGCV[2:0] bits to 001b, 011b, 101b, or 111b. Modify these bits only in global reset mode.

#### CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

#### CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000b, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

### CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

### CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

### CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/ receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

### 28.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)

**Access Size:** RSCANnCFSTSk register can be read/written in 32-bit units
RSCANnCFSTSkL, RSCANnCFSTSkH registers can be read/written in 16-bit units
RSCANnCFSTSkLL, RSCANnCFSTSkLH, RSCANnCFSTSkHL, RSCANnCFSTSkHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCFSTSk: <RSCFDn_base> + H'0178 + (H'04 × k)
RSCANnCFSTSkL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCANnCFSTSkH: <RSCFDn_base> + H'017A + (H'04 × k)
RSCANnCFSTSkLL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCANnCFSTSkLH: <RSCFDn_base> + H'0179 + (H'04 × k),
RSCANnCFSTSkHL: <RSCFDn_base> + H'017A + (H'04 × k),
RSCANnCFSTSkHH: <RSCFDn_base> + H'017B + (H'04 × k)

**Initial Value:** H'0000 0001

| 0 | CFEMP | 1 | R | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: The transmit/receive FIFO buffer contains messages.<br>1: The transmit/receive FIFO buffer contains no message (buffer empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

### CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01b (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00b (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10b (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00b: In global reset mode
- When CFM[1:0] value is 01b or 10b: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

### CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01b or 10b, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

### CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01b: A value of H’FF has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 28.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)

**Access Size:** RSCANnCFPCTRk register can only be written in 32-bit units
RSCANnCFPCTRkL, RSCANnCFPCTRkH registers can only be written in 16-bit units
RSCANnCFPCTRkLL, RSCANnCFPCTRkLH, RSCANnCFPCTRkHL, RSCANnCFPCTRkHH registers can only be written in 8-bit units

**Address(es):** RSCANnCFPCTRk: <RSCFDn_base> + H'01D8 + (H'04 × k)
RSCANnCFPCTRkL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCANnCFPCTRkH: <RSCFDn_base> + H'01DA + (H'04 × k)
RSCANnCFPCTRkLL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCANnCFPCTRkLH: <RSCFDn_base> + H'01D9 + (H'04 × k),
RSCANnCFPCTRkHL: <RSCFDn_base> + H'01DA + (H'04 × k),
RSCANnCFPCTRkHH: <RSCFDn_base> + H'01DB + (H'04 × k)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CFPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should be the value after reset. |
| 7 to 0 | CFPC[7:0] | All 0 | W | Transmit/Receive FIFO Pointer Control<br>• Receive mode:<br>Writing H'FF to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer.<br>• Transmit mode:<br>Writing H'FF to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer.<br>• Gateway mode:<br>Setting prohibited |

**CFPC[7:0] Bits**

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00b):
  Writing H'FF to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01b):
  Writing H'FF to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers before writing H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10b):
  Setting prohibited

### 28.3.8.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)

**Access Size:** RSCANnCFIDk register can be read/written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCFIDk: <RSCFDn_base> + H'0E80 + (H'10 × k)
RSCANnCFIDkL: <RSCFDn_base> + H'0E80 + (H'10 × k),
RSCANnCFIDkH: <RSCFDn_base> + H'0E82 + (H'10 × k)
RSCANnCFIDkLL: <RSCFDn_base> + H'0E80 + (H'10 × k),
RSCANnCFIDkLH: <RSCFDn_base> + H'0E81 + (H'10 × k),
RSCANnCFIDkHL: <RSCFDn_base> + H'0E82 + (H'10 × k),
RSCANnCFIDkHH: <RSCFDn_base> + H'0E83 + (H'10 × k)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | CFIDE | 0 | R/W | Transmit/Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | CFRTR | 0 | R/W | Transmit/Receive FIFO Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | THLEN | 0 | R/W | Transmit History Data Store Enable<br>This bit is valid only when the CFM[1:0] value is 01b (transmit mode).<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID[28:0] | All 0 | R/W | Transmit/Receive FIFO Buffer ID Data<br>• When CFM[1:0] value is 01b (transmit mode):<br>Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.<br>• When CFM[1:0] value is 00b (receive mode):<br>Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This RSCFDnCFIDk register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

#### CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

#### CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01b (transmit mode).

#### CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b.

When the CFM[1:0] value is 01b, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

### 28.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)

**Access Size:** RSCANnCFPTRk register can be read/written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCFPTRk: <RSCFDn_base> + H'0E84 + (H'10 × k)
RSCANnCFPTRkL: <RSCFDn_base> + H'0E84 + (H'10 × k),
RSCANnCFPTRkH: <RSCFDn_base> + H'0E86 + (H'10 × k)
RSCANnCFPTRkLL: <RSCFDn_base> + H'0E84 + (H'10 × k),
RSCANnCFPTRkLH: <RSCFDn_base> + H'0E85 + (H'10 × k),
RSCANnCFPTRkHL: <RSCFDn_base> + H'0E86 + (H'10 × k),
RSCANnCFPTRkHH: <RSCFDn_base> + H'0E87 + (H'10 × k)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 27 to 16 | CFPTR[11:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Label Data<br>• When CFM[1:0] value is 01b (transmit mode):<br>Set the label information to be stored in the transmit history buffer.<br>Only bits CFPTR[7:0] are valid.<br>• When CFM[1:0] value is 00b (receive mode):<br>The label information of the received message can be read. |
| 15 to 0 | CFTS[15:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Timestamp Data<br>These bits are valid only when the CFM[1:0] value is 00b (receive mode).<br>The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

### CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001b or more, the actual transmit data defaults to 8 bytes.

### CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

### CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer. These bits are valid when the CFM[1:0] value is 00b.

### 28.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 5)

**Access Size:** RSCANnCFDF0_k register can be read/written in 32-bit units
RSCANnCFDF0_kL, RSCANnCFDF0_kH registers can be read/written in 16-bit units
RSCANnCFDF0_kLL, RSCANnCFDF0_kLH, RSCANnCFDF0_kHL, RSCANnCFDF0_kHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCFDF0_k: <RSCFDn_base> + H'0E88 + (H'10 × k)
RSCANnCFDF0_kL: <RSCFDn_base> + H'0E88 + (H'10 × k),
RSCANnCFDF0_kH: <RSCFDn_base> + H'0E8A + (H'10 × k)
RSCANnCFDF0_kLL: <RSCFDn_base> + H'0E88 + (H'10 × k),
RSCANnCFDF0_kLH: <RSCFDn_base> + H'0E89 + (H'10 × k),
RSCANnCFDF0_kHL: <RSCFDn_base> + H'0E8A + (H'10 × k),
RSCANnCFDF0_kHH: <RSCFDn_base> + H'0E8B + (H'10 × k)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CFDB3[7:0] | | | | | | | | CFDB2[7:0] | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | CFDB3[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 3 |
| 23 to 16 | CFDB2[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 2 |
| 15 to 8 | CFDB1[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 1 |
| 7 to 0 | CFDB0[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 0<br>• When CFM[1:0] value is 01b (transmit mode): Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is 00b (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000b, data bytes for which no data is set are read as H'00.

This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

### 28.3.8.7 RSCANnCFDF1_k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 5)

**Access Size:** RSCANnCFDF1_k register can be read/written in 32-bit units
RSCANnCFDF1_kL, RSCANnCFDF1_kH registers can be read/written in 16-bit units
RSCANnCFDF1_kLL, RSCANnCFDF1_kLH, RSCANnCFDF1_kHL, RSCANnCFDF1_kHH registers can be read/written in 8-bit units

**Address(es):** RSCANnCFDF1_k: <RSCFDn_base> + H'0E8C + (H'10 × k)
RSCANnCFDF1_kL: <RSCFDn_base> + H'0E8C + (H'10 × k),
RSCANnCFDF1_kH: <RSCFDn_base> + H'0E8E + (H'10 × k)
RSCANnCFDF1_kLL: <RSCFDn_base> + H'0E8C + (H'10 × k),
RSCANnCFDF1_kLH: <RSCFDn_base> + H'0E8D + (H'10 × k),
RSCANnCFDF1_kHL: <RSCFDn_base> + H'0E8E + (H'10 × k),
RSCANnCFDF1_kHH: <RSCFDn_base> + H'0E8F + (H'10 × k)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | CFDB7[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | CFDB6[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | CFDB5[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | CFDB4[7:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Data Byte 4<br>• When CFM[1:0] value is 01b (transmit mode):<br>Set the transmit/receive FIFO buffer data.<br>• When CFM[1:0] value is 00b (receive mode):<br>The message data stored in the transmit/receive FIFO buffer can be read. |

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000b, data bytes for which no data is set are read as H'00.

This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

## 28.3.9 Details of FIFO Status-related Registers

### 28.3.9.1 RSCANnFESTS — FIFO Empty Status Register

**Access Size:** RSCANnFESTS register can be read only in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnFESTS: <RSCFDn_base> + H'0238
RSCANnFESTSL: <RSCFDn_base> + H'0238, RSCANnFESTSH: <RSCFDn_base> + H'023A
RSCANnFESTSLL: <RSCFDn_base> + H'0238, RSCANnFESTSLH: <RSCFDn_base> + H'0239,
RSCANnFESTSHL: <RSCFDn_base> + H'023A, RSCANnFESTSHH: <RSCFDn_base> + H'023B

**Initial Value:** H'03FF FFFF

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | H'0_0FFF | R | Reserved<br>These bits are read as the value after reset. |
| 13 | CF5EMP | 1 | R | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: Transmit/receive FIFO buffer k contains a message.<br>1: Transmit/receive FIFO buffer k contains no message.<br>(k = 0 to 5) |
| 12 | CF4EMP | 1 | R | |
| 11 | CF3EMP | 1 | R | |
| 10 | CF2EMP | 1 | R | |
| 9 | CF1EMP | 1 | R | |
| 8 | CF0EMP | 1 | R | |
| 7 | RF7EMP | 1 | R | Receive FIFO Buffer Empty Status Flag<br>0: Receive FIFO buffer x contains a unread messages.<br>1: Receive FIFO buffer x contains no unread message.<br>(x = 0 to 7) |
| 6 | RF6EMP | 1 | R | |
| 5 | RF5EMP | 1 | R | |
| 4 | RF4EMP | 1 | R | |
| 3 | RF3EMP | 1 | R | |
| 2 | RF2EMP | 1 | R | |
| 1 | RF1EMP | 1 | R | |
| 0 | RF0EMP | 1 | R | |

The RSCANnFESTS register is set to H'03FF FFFF in global reset mode.

#### CFkEMP Flag (k = 0 to 5)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

#### RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

### 28.3.9.2 RSCANnFFSTS — FIFO Full Status Register

**Access Size:** RSCANnFFSTS register can be read only in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnFFSTS: <RSCFDn_base> + H'023C
RSCANnFFSTSL: <RSCFDn_base> + H'023C, RSCANnFFSTSH: <RSCFDn_base> + H'023E
RSCANnFFSTSLL: <RSCFDn_base> + H'023C, RSCANnFFSTSLH: <RSCFDn_base> + H'023D,
RSCANnFFSTSHL: <RSCFDn_base> + H'023E, RSCANnFFSTSHH: <RSCFDn_base> + H'023F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 13 | CF5FLL | 0 | R | Transmit/Receive FIFO Buffer Full Status Flag<br>0: Transmit/receive buffer k is not full.<br>1: Transmit/receive buffer k is full.<br>(k = 0 to 5) |
| 12 | CF4FLL | 0 | R | |
| 11 | CF3FLL | 0 | R | |
| 10 | CF2FLL | 0 | R | |
| 9 | CF1FLL | 0 | R | |
| 8 | CF0FLL | 0 | R | |
| 7 | RF7FLL | 0 | R | Receive FIFO Buffer Full Status Flag<br>0: Receive FIFO buffer x is not full.<br>1: Receive FIFO buffer x is full.<br>(x = 0 to 7) |
| 6 | RF6FLL | 0 | R | |
| 5 | RF5FLL | 0 | R | |
| 4 | RF4FLL | 0 | R | |
| 3 | RF3FLL | 0 | R | |
| 2 | RF2FLL | 0 | R | |
| 1 | RF1FLL | 0 | R | |
| 0 | RF0FLL | 0 | R | |

The RSCANnFFSTS register is cleared to H'0000 0000 in global reset mode.

#### CFkFLL Flag (k = 0 to 5)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

**RFxFLL Flag (x = 0 to 7)**

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

### 28.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register

**Access Size:** RSCANnFMSTS register can be read only in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnFMSTS: <RSCFDn_base> + H'0240
RSCANnFMSTSL: <RSCFDn_base> + H'0240, RSCANnFMSTSH: <RSCFDn_base> + H'0242
RSCANnFMSTSLL: <RSCFDn_base> + H'0240, RSCANnFMSTSLH: <RSCFDn_base> + H'0241,
RSCANnFMSTSHL: <RSCFDn_base> + H'0242, RSCANnFMSTSHH: <RSCFDn_base> + H'0243

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | CF5MLT | CF4MLT | CF3MLT | CF2MLT | CF1MLT | CF0MLT | RF7MLT | RF6MLT | RF5MLT | RF4MLT | RF3MLT | RF2MLT | RF1MLT | RF0MLT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 13 | CF5MLT | 0 | R | Transmit/Receive FIFO Buffer Message Lost Status Flag<br>0: No transmit/receive FIFO buffer k message is lost.<br>1: A transmit/receive FIFO buffer k message is lost.<br>(k = 0 to 5) |
| 12 | CF4MLT | 0 | R | |
| 11 | CF3MLT | 0 | R | |
| 10 | CF2MLT | 0 | R | |
| 9 | CF1MLT | 0 | R | |
| 8 | CF0MLT | 0 | R | |
| 7 | RF7MLT | 0 | R | Receive FIFO Buffer Message Lost Status Flag<br>0: No receive FIFO buffer x message is lost.<br>1: A receive FIFO buffer x message is lost.<br>(x = 0 to 7) |
| 6 | RF6MLT | 0 | R | |
| 5 | RF5MLT | 0 | R | |
| 4 | RF4MLT | 0 | R | |
| 3 | RF3MLT | 0 | R | |
| 2 | RF2MLT | 0 | R | |
| 1 | RF1MLT | 0 | R | |
| 0 | RF0MLT | 0 | R | |

The RSCANnFMSTS register is cleared to H'0000 0000 in global reset mode.

#### CFkMLT Flag (k = 0 to 5)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

**RFxMLT Flag (x = 0 to 7)**

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

### 28.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

**Access Size:** RSCANnRFISTS register can be read only in 32-bit units
RSCANnRFISTSL, RSCANnRFISTSH registers can be read only in 16-bit units
RSCANnRFISTSLL, RSCANnRFISTSLH, RSCANnRFISTSHL, RSCANnRFISTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnRFISTS: <RSCFDn_base> + H'0244
RSCANnRFISTSL: <RSCFDn_base> + H'0244, RSCANnRFISTSH: <RSCFDn_base> + H'0246
RSCANnRFISTSLL: <RSCFDn_base> + H'0244, RSCANnRFISTSLH: <RSCFDn_base> + H'0245,
RSCANnRFISTSHL: <RSCFDn_base> + H'0246, RSCANnRFISTSHH: <RSCFDn_base> + H'0247

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RF7IF | RF6IF | RF5IF | RF4IF | RF3IF | RF2IF | RF1IF | RF0IF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 7 | RF7IF | 0 | R | Receive FIFO Buffer Interrupt Request Status Flag<br>0: No receive FIFO buffer x interrupt request is present.<br>1: A receive FIFO buffer x interrupt request is present.<br>(x = 0 to 7) |
| 6 | RF6IF | 0 | R | |
| 5 | RF5IF | 0 | R | |
| 4 | RF4IF | 0 | R | |
| 3 | RF3IF | 0 | R | |
| 2 | RF2IF | 0 | R | |
| 1 | RF1IF | 0 | R | |
| 0 | RF0IF | 0 | R | |

The RSCANnRFISTS register is cleared to H'0000 0000 in global reset mode.

#### RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

### 28.3.9.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

**Access Size:** RSCANnCFRISTS register can be read only in 32-bit units
RSCANnCFRISTSL, RSCANnCFRISTSH registers can be read only in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL, RSCANnCFRISTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnCFRISTS: <RSCFDn_base> + H'0248
RSCANnCFRISTSL: <RSCFDn_base> + H'0248, RSCANnCFRISTSH: <RSCFDn_base> + H'024A
RSCANnCFRISTSLL: <RSCFDn_base> + H'0248, RSCANnCFRISTSLH: <RSCFDn_base> + H'0249,
RSCANnCFRISTSHL: <RSCFDn_base> + H'024A, RSCANnCFRISTSHH: <RSCFDn_base> + H'024B

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CF5RXIF | CF4RXIF | CF3RXIF | CF2RXIF | CF1RXIF | CF0RXIF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 5 | CF5RXIF | 0 | R | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k receive interrupt request is present.<br>1: A transmit/receive FIFO buffer k receive interrupt request is present.<br>(k = 0 to 5) |
| 4 | CF4RXIF | 0 | R | |
| 3 | CF3RXIF | 0 | R | |
| 2 | CF2RXIF | 0 | R | |
| 1 | CF1RXIF | 0 | R | |
| 0 | CF0RXIF | 0 | R | |

The RSCANnCFRISTS register is cleared to H'0000 0000 in global reset mode.

#### CFkRXIF Flag (k = 0 to 5)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

### 28.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

**Access Size:** RSCANnCFTISTS register can be read only in 32-bit units
RSCANnCFTISTSL, RSCANnCFTISTSH registers can be read only in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL, RSCANnCFTISTSHH registers can be read only in 8-bit units

**Address(es):** RSCANnCFTISTS: <RSCFDn_base> + H'024C
RSCANnCFTISTSL: <RSCFDn_base> + H'024C, RSCANnCFTISTSH: <RSCFDn_base> + H'024E
RSCANnCFTISTSLL: <RSCFDn_base> + H'024C, RSCANnCFTISTSLH: <RSCFDn_base> + H'024D,
RSCANnCFTISTSHL: <RSCFDn_base> + H'024E, RSCANnCFTISTSHH: <RSCFDn_base> + H'024F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CF5TXIF | CF4TXIF | CF3TXIF | CF2TXIF | CF1TXIF | CF0TXIF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 5 | CF5TXIF | 0 | R | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k transmit interrupt request is present.<br>1: A transmit/receive FIFO buffer k transmit interrupt request is present.<br>(k = 0 to 5) |
| 4 | CF4TXIF | 0 | R | |
| 3 | CF3TXIF | 0 | R | |
| 2 | CF2TXIF | 0 | R | |
| 1 | CF1TXIF | 0 | R | |
| 0 | CF0TXIF | 0 | R | |

The RSCANnCFTISTS register is cleared to H'0000 0000 in global reset mode.

#### CFkTXIF Flag (k = 0 to 5)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

## 28.3.10 Details of Transmit Buffer-related Registers

### 28.3.10.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 31)

**Access Size:** RSCANnTMCp registers can be read/written in 8-bit units

**Address(es):** RSCANnTMCp: <RSCFDn_base> + H'0250 + (H'01 × p)

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TMOM | TMTAR | TMTR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMOM | 0 | R/W | One-Shot Transmission Enable<br>0: One-shot transmission is disabled.<br>1: One-shot transmission is enabled. |
| 1 | TMTAR | 0 | R/W*1 | Transmit Abort Request<br>0: Transmit abort is not requested.<br>1: Transmit abort is requested. |
| 0 | TMTR | 0 | R/W*1 | Transmit Request<br>0: Transmission is not requested.<br>1: Transmission is requested. |

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

When the RSCANnTMCp register meets any of the following conditions, set it to H'00.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0, 1) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

#### TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

#### TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

#### TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00b.

### 28.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

**Access Size:** RSCANnTMSTSp registers can be read/written in 8-bit units

**Address(es):** RSCANnTMSTSp: <RSCFDn_base> + H'02D0 + (H'01 × p)

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | TMTARM | TMTRM | TMTRF[1:0] | | TMTSTS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 4 | TMTARM | 0 | R | Transmit Buffer Transmit Abort Request Status Flag<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 3 | TMTRM | 0 | R | Transmit Buffer Transmit Request Status Flag<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | All 0 | R/W | Transmit Buffer Transmit Result Status Flag<br>b2 b1<br>0 0: Transmission is in progress or no transmit request is present.<br>0 1: Transmit abort has been completed.<br>1 0: Transmission has been completed (without transmit abort request).<br>1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | 0 | R | Transmit Buffer Transmit Status Flag<br>0: Transmission is not in progress.<br>1: Transmission is in progress. |

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

#### TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

#### TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

#### TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00b: Transmission is in progress or no transmit request is present.

01b: Transmission from the transmit buffer was aborted.

10b: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11b: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00b to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00b to this flag.

#### TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

### 28.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 31)

**Access Size:** RSCANnTMIDp register can be read/written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTMIDp: <RSCFDn_base> + H'1000 + (H'10 × p)
RSCANnTMIDpL: <RSCFDn_base> + H'1000 + (H'10 × p),
RSCANnTMIDpH: <RSCFDn_base> + H'1002 + (H'10 × p)
RSCANnTMIDpLL: <RSCFDn_base> + H'1000 + (H'10 × p),
RSCANnTMIDpLH: <RSCFDn_base> + H'1001 + (H'10 × p),
RSCANnTMIDpHL: <RSCFDn_base> + H'1002 + (H'10 × p),
RSCANnTMIDpHH: <RSCFDn_base> + H'1003 + (H'10 × p)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMIDE | TMRTR | THLEN | TMID[28:16] | | | | | | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMID[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | TMIDE | 0 | R/W | Transmit Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | TMRTR | 0 | R/W | Transmit Buffer RTR<br>0: Data frame<br>1: Remote frame |
| 29 | THLEN | 0 | R/W | Transmit History Data Store Enable<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | All 0 | R/W | Transmit Buffer ID Data<br>Set standard ID or extended ID.<br>For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

#### TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

**THLEN Bit**

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

**TMID[28:0] Bits**

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 28.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

**Access Size:** RSCANnTMPTRp register can be read/written in 32-bit units
RSCANnTMPTRpL, RSCANnTMPTRpH registers can be read/written in 16-bit units
RSCANnTMPTRpLL, RSCANnTMPTRpLH, RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTMPTRp: <RSCFDn_base> + H'1004 + (H'10 × p)
RSCANnTMPTRpL: <RSCFDn_base> + H'1004 + (H'10 × p),
RSCANnTMPTRpH: <RSCFDn_base> + H'1006 + (H'10 × p)
RSCANnTMPTRpLL: <RSCFDn_base> + H'1004 + (H'10 × p),
RSCANnTMPTRpLH: <RSCFDn_base> + H'1005 + (H'10 × p),
RSCANnTMPTRpHL: <RSCFDn_base> + H'1006 + (H'10 × p),
RSCANnTMPTRpHH: <RSCFDn_base> + H'1007 + (H'10 × p)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | TMDLC[3:0] | All 0 | R/W | Transmit Buffer DLC Data<br>b31 b30 b29 b28<br>0 0 0 0: 0 data bytes<br>0 0 0 1: 1 data byte<br>0 0 1 0: 2 data bytes<br>0 0 1 1: 3 data bytes<br>0 1 0 0: 4 data bytes<br>0 1 0 1: 5 data bytes<br>0 1 1 0: 6 data bytes<br>0 1 1 1: 7 data bytes<br>1 X X X: 8 data bytes |
| 27 to 24 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 23 to 16 | TMPTR[7:0] | All 0 | R/W | Transmit Buffer Label Data<br>Set the label information to be stored in the transmit history buffer. |
| 15 to 0 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001b or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

#### TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

### 28.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 31)

**Access Size:** RSCANnTMDF0_p register can be read/written in 32-bit units
RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units
RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTMDF0_p: <RSCFDn_base> + H'1008 + (H'10 × p)
RSCANnTMDF0_pL: <RSCFDn_base> + H'1008 + (H'10 × p),
RSCANnTMDF0_pH: <RSCFDn_base> + H'100A + (H'10 × p)
RSCANnTMDF0_pLL: <RSCFDn_base> + H'1008 + (H'10 × p),
RSCANnTMDF0_pLH: <RSCFDn_base> + H'1009 + (H'10 × p),
RSCANnTMDF0_pHL: <RSCFDn_base> + H'100A + (H'10 × p),
RSCANnTMDF0_pHH: <RSCFDn_base> + H'100B + (H'10 × p)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDB3[7:0] | | | | | | | | TMDB2[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDB1[7:0] | | | | | | | | TMDB0[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | TMDB3[7:0] | All 0 | R/W | Transmit Buffer Data Byte 3 |
| 23 to 16 | TMDB2[7:0] | All 0 | R/W | Transmit Buffer Data Byte 2 |
| 15 to 8 | TMDB1[7:0] | All 0 | R/W | Transmit Buffer Data Byte 1 |
| 7 to 0 | TMDB0[7:0] | All 0 | R/W | Transmit Buffer Data Byte 0<br><br>Set the transmit buffer data. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### 28.3.10.6 RSCANnTMDF1_p — Transmit Buffer Data Field 1 Register (p = 0 to 31)

**Access Size:** RSCANnTMDF1_p register can be read/written in 32-bit units
RSCANnTMDF1_pL, RSCANnTMDF1_pH registers can be read/written in 16-bit units
RSCANnTMDF1_pLL, RSCANnTMDF1_pLH, RSCANnTMDF1_pHL, RSCANnTMDF1_pHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTMDF1_p: <RSCFDn_base> + H'100C + (H'10 × p)
RSCANnTMDF1_pL: <RSCFDn_base> + H'100C + (H'10 × p),
RSCANnTMDF1_pH: <RSCFDn_base> + H'100E + (H'10 × p)
RSCANnTMDF1_pLL: <RSCFDn_base> + H'100C + (H'10 × p),
RSCANnTMDF1_pLH: <RSCFDn_base> + H'100D + (H'10 × p),
RSCANnTMDF1_pHL: <RSCFDn_base> + H'100E + (H'10 × p),
RSCANnTMDF1_pHH: <RSCFDn_base> + H'100F + (H'10 × p)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | TMDB7[7:0] | All 0 | R/W | Transmit Buffer Data Byte 7 |
| 23 to 16 | TMDB6[7:0] | All 0 | R/W | Transmit Buffer Data Byte 6 |
| 15 to 8 | TMDB5[7:0] | All 0 | R/W | Transmit Buffer Data Byte 5 |
| 7 to 0 | TMDB4[7:0] | All 0 | R/W | Transmit Buffer Data Byte 4<br><br>Set the transmit buffer data. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### 28.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0)

**Access Size:** RSCANnTMIECy register can be read/written in 32-bit units
RSCANnTMIECyL, RSCANnTMIECyH registers can be read/written in 16-bit units
RSCANnTMIECyLL, RSCANnTMIECyLH, RSCANnTMIECyHL, RSCANnTMIECyHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTMIECy: <RSCFDn_base> + H'0390 + (H'04 × y)
RSCANnTMIECyL: <RSCFDn_base> + H'0390 + (H'04 × y),
RSCANnTMIECyH: <RSCFDn_base> + H'0392 + (H'04 × y)
RSCANnTMIECyLL: <RSCFDn_base> + H'0390 + (H'04 × y),
RSCANnTMIECyLH: <RSCFDn_base> + H'0391 + (H'04 × y),
RSCANnTMIECyHL: <RSCFDn_base> + H'0392 + (H'04 × y),
RSCANnTMIECyHH: <RSCFDn_base> + H'0393 + (H'04 × y)

**Initial Value:** H'0000 0000

#### TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

**Table 28.15** shows the bit assignment.

Table 28.15 TMIEp Bit Assignment

| Bit | Channel | Transmit Buffer Number |

## 28.3.11 Details of Transmit Buffer Status-related Registers

### 28.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)

**Access Size:** RSCANnTMTRSTSy register can be read only in 32-bit units
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers can be read only in 16-bit units
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers can be read only in 8-bit units

**Address(es):** RSCANnTMTRSTSy: <RSCFDn_base> + H'0350 + (H'04 × y)
RSCANnTMTRSTSyL: <RSCFDn_base> + H'0350 + (H'04 × y),
RSCANnTMTRSTSyH: <RSCFDn_base> + H'0352 + (H'04 × y)
RSCANnTMTRSTSyLL: <RSCFDn_base> + H'0350 + (H'04 × y),
RSCANnTMTRSTSyLH: <RSCFDn_base> + H'0351 + (H'04 × y),
RSCANnTMTRSTSyHL: <RSCFDn_base> + H'0352 + (H'04 × y),
RSCANnTMTRSTSyHH: <RSCFDn_base> + H'0353 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTRSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTRSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMTRSTSp | All 0 | R | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 15 to 0 | TMTRSTSp | All 0 | R | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit request is present.<br>1: A transmit request is present. |

#### TMTRSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

**Table 28.16** shows the bit assignment.

Table 28.16 TMTRSTSp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |

| 30 | 1 | 14 |
| 31 | 1 | 15 |

### 28.3.11.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0)

**Access Size:** RSCANnTMTARSTSy register can be read only in 32-bit units
RSCANnTMTARSTSyL, RSCANnTMTARSTSyH registers can be read only in 16-bit units
RSCANnTMTARSTSyLL, RSCANnTMTARSTSyLH, RSCANnTMTARSTSyHL, RSCANnTMTARSTSyHH registers can be read only in 8- bit units

**Address(es):** RSCANnTMTARSTSy: <RSCFDn_base> + H'0360 + (H'04 × y)
RSCANnTMTARSTSyL: <RSCFDn_base> + H'0360 + (H'04 × y),
RSCANnTMTARSTSyH: <RSCFDn_base> + H'0362 + (H'04 × y)
RSCANnTMTARSTSyLL: <RSCFDn_base> + H'0360 + (H'04 × y),
RSCANnTMTARSTSyLH: <RSCFDn_base> + H'0361 + (H'04 × y),
RSCANnTMTARSTSyHL: <RSCFDn_base> + H'0362 + (H'04 × y),
RSCANnTMTARSTSyHH: <RSCFDn_base> + H'0363 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTARSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTARSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| 31 to 16 | TMTARSTSp | All 0 | R | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 15 to 0 | TMTARSTSp | All 0 | R | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |

#### TMTARSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTAR bit in the RSCANnTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

**Table 28.17** shows the bit assignment.

Table 28.17 TMTARSTSp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |
| . | . | . |
| 30 | 1 | 14 |
| 31 | 1 | 15 |

### 28.3.11.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0)

**Access Size:** RSCFDnTMTCSTSyRSCANnTMTCSTSy register can be read only in 32-bit units RSCANnTMTCSTSyL, RSCANnTMTCSTSyH registers can be read only in 16-bit units
RSCANnTMTCSTSyLL, RSCANnTMTCSTSyLH, RSCANnTMTCSTSyHL, RSCANnTMTCSTSyHH registers can be read only in 8-bit units

**Address(es):** RSCANnTMTCSTSy: <RSCFDn_base> + H'0370 + (H'04 × y)
RSCANnTMTCSTSyL: <RSCFDn_base> + H'0370 + (H'04 × y),
RSCANnTMTCSTSyH: <RSCFDn_base> + H'0372 + (H'04 × y)
RSCANnTMTCSTSyLL: <RSCFDn_base> + H'0370 + (H'04 × y),
RSCANnTMTCSTSyLH: <RSCFDn_base> + H'0371 + (H'04 × y),
RSCANnTMTCSTSyHL: <RSCFDn_base> + H'0372 + (H'04 × y),
RSCANnTMTCSTSyHH: <RSCFDn_base> + H'0373 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTCSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTCSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMTCSTSp | All 0 | R | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |
| 15 to 0 | TMTCSTSp | All 0 | R | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |

#### TMTCSTSp Flags (p = 0 to 31)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to 10b (transmission has been completed (without transmit abort request)) or 11b (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to 00b or in channel reset mode.

**Table 28.18** shows the bit assignment.

Table 28.18 TMTCSTSp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |
| . | . | . |
| 30 | 1 | 14 |
| 31 | 1 | 15 |

### 28.3.11.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0)

**Access Size:** RSCANnTMTASTSy register can be read only in 32-bit units
RSCANnTMTASTSyL, RSCANnTMTASTSyH registers can be read only in 16-bit units
RSCANnTMTASTSyLL, RSCANnTMTASTSyLH, RSCANnTMTASTSyHL, RSCANnTMTASTSyHH registers can be read only in 8-bit units

**Address(es):** RSCANnTMTASTSy: <RSCFDn_base> + H'0380 + (H'04 × y)
RSCANnTMTASTSyL: <RSCFDn_base> + H'0380 + (H'04 × y),
RSCANnTMTASTSyH: <RSCFDn_base> + H'0382 + (H'04 × y)
RSCANnTMTASTSyLL: <RSCFDn_base> + H'0380 + (H'04 × y),
RSCANnTMTASTSyLH: <RSCFDn_base> + H'0381 + (H'04 × y),
RSCANnTMTASTSyHL: <RSCFDn_base> + H'0382 + (H'04 × y),
RSCANnTMTASTSyHH: <RSCFDn_base> + H'0383 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## 28.3.12 Details of Transmit Queue-related Registers

### 28.3.12.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0, 1)

**Access Size:** RSCANnTXQCCm register can be read/written in 32-bit units
RSCANnTXQCCmL, RSCANnTXQCCmH registers can be read/written in 16-bit units
RSCANnTXQCCmLL, RSCANnTXQCCmLH, RSCANnTXQCCmHL, RSCANnTXQCCmHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTXQCCm: <RSCFDn_base> + H'03A0 + (H'04 × m)
RSCANnTXQCCmL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCANnTXQCCmH: <RSCFDn_base> + H'03A2 + (H'04 × m)
RSCANnTXQCCmLL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCANnTXQCCmLH: <RSCFDn_base> + H'03A1 + (H'04 × m),
RSCANnTXQCCmHL: <RSCFDn_base> + H'03A2 + (H'04 × m),
RSCANnTXQCCmHH: <RSCFDn_base> + H'03A3 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | TXQE | 0 | R/W | Transmit Queue Enable<br>0: The transmit queue is not used.<br>1: The transmit queue is used. |

#### TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

#### TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated. Set the TXQE bit to 0 before modifying the TXQIE bit.

#### TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 28.9**. Modify these bits only in channel reset mode.

#### TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010b or more.

### 28.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0, 1)

**Access Size:** RSCANnTXQSTSm register can be read/written in 32-bit units
RSCANnTXQSTSmL, RSCANnTXQSTSmH registers can be read/written in 16-bit units
RSCANnTXQSTSmLL, RSCANnTXQSTSmLH, RSCANnTXQSTSmHL, RSCANnTXQSTSmHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTXQSTSm: <RSCFDn_base> + H'03C0 + (H'04 × m)
RSCANnTXQSTSmL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCANnTXQSTSmH: <RSCFDn_base> + H'03C2 + (H'04 × m)
RSCANnTXQSTSmLL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCANnTXQSTSmLH: <RSCFDn_base> + H'03C1 + (H'04 × m),
RSCANnTXQSTSmHL: <RSCFDn_base> + H'03C2 + (H'04 × m),
RSCANnTXQSTSmHH: <RSCFDn_base> + H'03C3 + (H'04 × m)

**Initial Value:** H'0000 0001

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TXQIF | TXQFLL | TXQEMP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 12 to 8 | — | All 0 | R | Reserved<br>When read, an undefined value is returned.The write value should be the value after reset. |
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TXQIF | 0 | R/W*1 | Transmit Queue Interrupt Request Flag<br>0: No transmit queue interrupt request is present.<br>1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | 0 | R | Transmit Queue Full Status Flag<br>0: The transmit queue is not full.<br>1: The transmit queue is full. |
| 0 | TXQEMP | 1 | R | Transmit Queue Empty Status Flag<br>0: The transmit queue contains messages.<br>1: The transmit queue contains no message (transmit queue empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred. The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

### TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

### TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 28.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)

**Access Size:** RSCANnTXQPCTRm register can only be written in 32-bit units
RSCANnTXQPCTRmL, RSCANnTXQPCTRmH registers can only be written in 16-bit units
RSCANnTXQPCTRmLL, RSCANnTXQPCTRmLH, RSCANnTXQPCTRmHL, RSCANnTXQPCTRmHH registers can only be written in 8-bit units

**Address(es):** RSCANnTXQPCTRm: <RSCFDn_base> + H'03E0 + (H'04 × m)
RSCANnTXQPCTRmL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCANnTXQPCTRmH: <RSCFDn_base> + H'03E2 + (H'04 × m)
RSCANnTXQPCTRmLL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCANnTXQPCTRmLH: <RSCFDn_base> + H'03E1 + (H'04 × m),
RSCANnTXQPCTRmHL: <RSCFDn_base> + H'03E2 + (H'04 × m),
RSCANnTXQPCTRmHH: <RSCFDn_base> + H'03E3 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TXQPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should be the value after reset. |
| 7 to 0 | TXQPC[7:0] | All 0 | W | Transmit Queue Pointer Control<br>Writing H'FF to these bits moves the write pointer of the transmit queue to the next queue buffer. |

#### TXQPC[7:0] Bits

Writing H'FF to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, and RSCANnTMDF1_p registers (p = 15, 31) before writing H'FF to the TXQPC[7:0] bits.

When writing H'FF to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (the transmit queue is not full).

## 28.3.13 Details of Transmit history-related Registers

### 28.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)

**Access Size:** RSCANnTHLCCm register can be read/written in 32-bit units
RSCANnTHLCCmL, RSCANnTHLCCmH registers can be read/written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH, RSCANnTHLCCmHL, RSCANnTHLCCmHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTHLCCm: <RSCFDn_base> + H'0400 + (H'04 × m)
RSCANnTHLCCmL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCANnTHLCCmH: <RSCFDn_base> + H'0402 + (H'04 × m)
RSCANnTHLCCmLL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCANnTHLCCmLH: <RSCFDn_base> + H'0401 + (H'04 × m),
RSCANnTHLCCmHL: <RSCFDn_base> + H'0402 + (H'04 × m),
RSCANnTHLCCmHH: <RSCFDn_base> + H'0403 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | THLDTE | THLIM | THLIE | — | — | — | — | — | — | — | THLE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 11 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 10 | THLDTE | 0 | R/W | Transmit History Target Buffer Select<br>0: Entry from transmit/receive FIFO buffers and transmit queue<br>1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue |
| 9 | THLIM | 0 | R/W | Transmit History Interrupt Source Select<br>0: When 12 sets of data have been stored in the transmit history buffer<br>1: When a single set of transmit history data has been stored |
| 8 | THLIE | 0 | R/W | Transmit History Interrupt Enable<br>0: Transmit history interrupt is disabled.<br>1: Transmit history interrupt is enabled. |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | THLE | 0 | R/W | Transmit History Buffer Enable<br>0: Transmit history buffer is not used.<br>1: Transmit history buffer is used. |

#### THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

#### THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

#### THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

#### THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer. Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

### 28.3.13.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0, 1)

**Access Size:** RSCANnTHLSTSm register can be read/written in 32-bit units
RSCANnTHLSTSmL, RSCANnTHLSTSmH registers can be read/written in 16-bit units
RSCANnTHLSTSmLL, RSCANnTHLSTSmLH, RSCANnTHLSTSmHL, RSCANnTHLSTSmHH registers can be read/written in 8-bit units

**Address(es):** RSCANnTHLSTSm: <RSCFDn_base> + H'0420 + (H'04 × m)
RSCANnTHLSTSmL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCANnTHLSTSmH: <RSCFDn_base> + H'0422 + (H'04 × m)
RSCANnTHLSTSmLL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCANnTHLSTSmLH: <RSCFDn_base> + H'0421 + (H'04 × m),
RSCANnTHLSTSmHL: <RSCFDn_base> + H'0422 + (H'04 × m),
RSCANnTHLSTSmHH: <RSCFDn_base> + H'0423 + (H'04 × m)

**Initial Value:** H'0000 0001

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | — | — | — | THLMC[4:0] | | | | | — | — | — | — | THLIF | THLELT | THLFLL | THLEMP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 12 to 8 | THLMC[4:0] | All 0 | R | Transmit History Buffer Unread Data Counter<br>These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 3 | THLIF | 0 | R/W*1 | Transmit History Interrupt Request Flag<br>0: No transmit history interrupt request is present.<br>1: A transmit history interrupt request is present. |
| 2 | THLELT | 0 | R/W*1 | Transmit History Buffer Overflow Flag<br>0: Transmit history buffer overflow has not occurred.<br>1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | 0 | R | Transmit history Buffer Full Status Flag<br>0: Transmit history buffer is not full.<br>1: Transmit history buffer is full. |
| 0 | THLEMP | 1 | R | Transmit History Buffer Empty Status Flag<br>0: Transmit history buffer contains unread data.<br>1: Transmit history buffer contains no unread data (buffer empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

#### THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

#### THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 28.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)

**Access Size:** RSCANnTHLPCTRm register can only be written in 32-bit units
RSCANnTHLPCTRmL, RSCANnTHLPCTRmH registers can only be written in 16-bit units
RSCANnTHLPCTRmLL, RSCANnTHLPCTRmLH, RSCANnTHLPCTRmHL, RSCANnTHLPCTRmHH registers can only be written in 8- bit units

**Address(es):** RSCANnTHLPCTRm: <RSCFDn_base> + H'0440 + (H'04 × m)
RSCANnTHLPCTRmL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCANnTHLPCTRmH: <RSCFDn_base> + H'0442 + (H'04 × m)
RSCANnTHLPCTRmLL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCANnTHLPCTRmLH: <RSCFDn_base> + H'0441 + (H'04 × m),
RSCANnTHLPCTRmHL: <RSCFDn_base> + H'0442 + (H'04 × m),
RSCANnTHLPCTRmHH: <RSCFDn_base> + H'0443 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | THLPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>When writing to these bits, write the value after reset. |
| 7 to 0 | THLPC[7:0] | All 0 | W | Transmit History List Pointer Control<br>Writing H'FF to these bits moves the read pointer to the next unread data in the transmit history buffer. |

#### THLPC[7:0] Bits

When the THLPC[7:0] bits are set to H'FF, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write H'FF to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

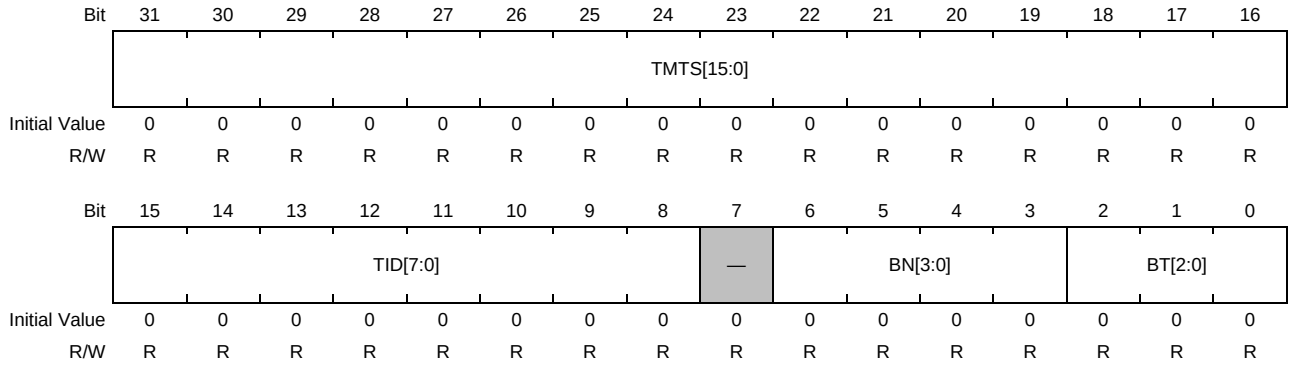
When writing H'FF to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

### 28.3.13.4 RSCANnTHLACCm — Transmit History Access Register (m = 0, 1)

**Access Size:** RSCANnTHLACCm register can be read only in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units

**Address(es):** RSCANnTHLACCm: <RSCFDn_base> + H'1800 + (H'04 × m)
RSCANnTHLACCmL: <RSCFDn_base> + H'1800 + (H'04 × m),
RSCANnTHLACCmH: <RSCFDn_base> + H'1802 + (H'04 × m)
RSCANnTHLACCmLL: <RSCFDn_base> + H'1800 + (H'04 × m),
RSCANnTHLACCmLH: <RSCFDn_base> + H'1801 + (H'04 × m),
RSCANnTHLACCmHL: <RSCFDn_base> + H'1802 + (H'04 × m),
RSCANnTHLACCmHH: <RSCFDn_base> + H'1803 + (H'04 × m)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMTS[15:0] | All 0 | R | Timestamp Data<br>The timestamp data of stored data can be read. |
| 15 to 8 | TID[7:0] | All 0 | R | Label Data<br>The label information of stored data can be read. |
| 7 | — | 0 | R | Reserved<br>This bit is read as the value after reset. |
| 6 to 3 | BN[3:0] | All 0 | R | Buffer Number Data<br>The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | All 0 | R | Buffer Type Data<br>b2 b1 b0<br>0 0 1: Transmit buffer<br>0 1 0: Transmit/receive FIFO buffer<br>0 0 0: Transmit queue |

#### TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

#### TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

**BN[3:0] Bits**

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

**BT[2:0] Bits**

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

## 28.3.14 Details of Test-related Registers

### 28.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register

**Access Size:** RSCANnGTSTCFG register can be read/written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGLH, RSCANnGTSTCFGHL, RSCANnGTSTCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGTSTCFG: <RSCFDn_base> + H'0468
RSCANnGTSTCFGL: <RSCFDn_base> + H'0468, RSCANnGTSTCFGH: <RSCFDn_base> + H'046A
RSCANnGTSTCFGLL: <RSCFDn_base> + H'0468, RSCANnGTSTCFGLH: <RSCFDn_base> + H'0469,
RSCANnGTSTCFGHL: <RSCFDn_base> + H'046A, RSCANnGTSTCFGHH: <RSCFDn_base> + H'046B

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RTMPS[6:0] | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | C1ICBCE | C0ICBCE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 23 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 22 to 16 | RTMPS[6:0] | All 0 | R/W | RAM Test Page Configuration<br>Set a value within a range of page 0 (H'00) to page 19 (H'13). |
| 15 to 2 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | C1ICBCE | 0 | R/W | CAN1 Inter-Channel Communication Test Enable<br>0: CAN1 inter-channel communication test is disabled.<br>1: CAN1 inter-channel communication test is enabled. |
| 0 | C0ICBCE | 0 | R/W | CAN0 Inter-Channel Communication Test Enable<br>0: CAN0 inter-channel communication test is disabled.<br>1: CAN0 inter-channel communication test is enabled. |

Modify the RSCANnGTSTCFG register only in global test mode.

#### RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of H'00 to H'13, inclusive.

#### C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

**C0ICBCE Bit**

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

### 28.3.14.2 RSCANnGTSTCTR — Global Test Control Register

**Access Size:** RSCANnGTSTCTR register can be read/written in 32-bit units
RSCANnGTSTCTRL, RSCANnGTSTCTRH registers can be read/written in 16-bit units
RSCANnGTSTCTRLL, RSCANnGTSTCTRLH, RSCANnGTSTCTRHL, RSCANnGTSTCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCANnGTSTCTR: <RSCFDn_base> + H'046C
RSCANnGTSTCTRL: <RSCFDn_base> + H'046C, RSCANnGTSTCTRH: <RSCFDn_base> + H'046E
RSCANnGTSTCTRLL: <RSCFDn_base> + H'046C, RSCANnGTSTCTRLH: <RSCFDn_base> + H'046D,
RSCANnGTSTCTRHL: <RSCFDn_base> + H'046E, RSCANnGTSTCTRHH: <RSCFDn_base> + H'046F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RTME | — | ICBCTME |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | RTME | 0 | R/W | RAM Test Enable<br>0: RAM test is disabled.<br>1: RAM test is enabled. |
| 1 | — | 0 | R | Reserved<br>This bit is read as the value after reset. The write value should be the value after reset. |
| 0 | ICBCTME | 0 | R/W | Communication Test between Channels Enable<br>0: Communication test between channels disabled<br>1: Communication test between channels enabled |

#### RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10b (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

#### ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0, 1) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

### 28.3.14.3 RSCANnGLOCKK — Global Lock Key Register

**Access Size:** RSCANnGLOCKK register can only be written in 32-bit units
RSCANnGLOCKKL, RSCANnGLOCKKH registers can only be written in 16-bit units

**Address(es):** RSCANnGLOCKK: <RSCFDn_base> + H'047C
RSCANnGLOCKKL: <RSCFDn_base> + H'047C, RSCANnGLOCKKH: <RSCFDn_base> + H'047E

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>When writing these bits, write the value after reset. |
| 15 to 0 | LOCK[15:0] | All 0 | W*1 | Lock Key<br>These bits are key bits to release protection of test mode. |

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 28.11.4.2, Procedure for Releasing the Protection**.

#### LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + H'0000 to <RSCFDn_base> + H'04FF) of the CAN (except the RAM) enables the protection again.

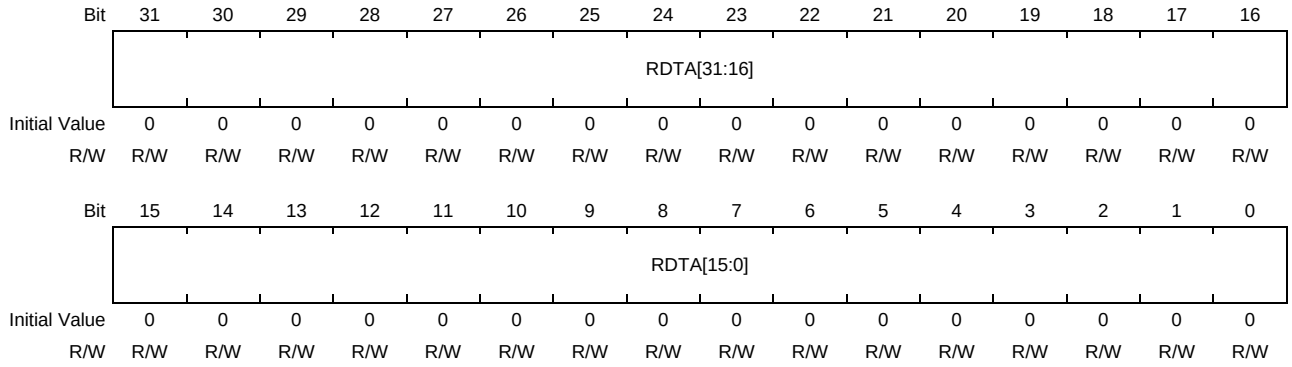
Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

### 28.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

**Access Size:** RSCANnRPGACCr register can be read/written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read/written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read/written in 8-bit units

**Address(es):** RSCANnRPGACCr: <RSCFDn_base> + H'1900 + (H'04 × r)
RSCANnRPGACCrL: <RSCFDn_base> + H'1900 + (H'04 × r),
RSCANnRPGACCrH: <RSCFDn_base> + H'1902 + (H'04 × r)
RSCANnRPGACCrLL: <RSCFDn_base> + H'1900 + (H'04 × r),
RSCANnRPGACCrLH: <RSCFDn_base> + H'1901 + (H'04 × r),
RSCANnRPGACCrHL: <RSCFDn_base> + H'1902 + (H'04 × r),
RSCANnRPGACCrHH: <RSCFDn_base> + H'1903 + (H'04 × r)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | RDTA[31:0] | All 0 | R/W | RAM Data Test Access<br>Data can be read and written in RSCAN RAM. |

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

## 28.4 Registers (CANFD Mode)

This section describes all registers to be used when the RS-CANFD is used in CANFD mode.

### 28.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CANFD mode.

For details about <RSCFDn_base>, see **Section 28.1.2, Register Base Address**.

- **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 28.38, Registers Initialized Only in Global Reset Mode**

Table 28.20 Registers (1/3)

| Module | Register | Symbol | Address |
|---|---|---|---|
| Interface mode-related register | | | |
| RSCFDn | Global interface mode select register | RSCFDnCFDGRMCFG | <RSCFDn_base> + H'04FC |
| Channel-related registers | | | |
| RSCFDn | Channel m nominal bit rate configuration register | RSCFDnCFDCmNCFG | <RSCFDn_base> + H'0000 + (H'10 × m) |
| RSCFDn | Channel m control register | RSCFDnCFDCmCTR | <RSCFDn_base> + H'0004 + (H'10 × m) |
| RSCFDn | Channel m status register | RSCFDnCFDCmSTS | <RSCFDn_base> + H'0008 + (H'10 × m) |
| RSCFDn | Channel m error flag register | RSCFDnCFDCmERFL | <RSCFDn_base> + H'000C + (H'10 × m) |
| RSCFDn | Channel m data bit rate configuration register | RSCFDnCFDCmDCFG | <RSCFDn_base> + H'0500 + (H'20 × m) |
| RSCFDn | Channel m CANFD configuration register | RSCFDnCFDCmFDCFG | <RSCFDn_base> + H'0504 + (H'20 × m) |
| RSCFDn | Channel m CANFD control register | RSCFDnCFDCmFDCTR | <RSCFDn_base> + H'0508 + (H'20 × m) |
| RSCFDn | Channel m CANFD status register | RSCFDnCFDCmFDSTS | <RSCFDn_base> + H'050C + (H'20 × m) |
| RSCFDn | Channel m CANFD CRC register | RSCFDnCFDCmFDCRC | <RSCFDn_base> + H'0510 + (H'20 × m) |
| Global-related registers | | | |
| RSCFDn | Global configuration register | RSCFDnCFDGCFG | <RSCFDn_base> + H'0084 |
| RSCFDn | Global control register | RSCFDnCFDGCTR | <RSCFDn_base> + H'0088 |
| RSCFDn | Global status register | RSCFDnCFDGSTS | <RSCFDn_base> + H'008C |
| RSCFDn | Global error flag register | RSCFDnCFDGERFL | <RSCFDn_base> + H'0090 |
| RSCFDn | Global timestamp counter register | RSCFDnCFDGTSC | <RSCFDn_base> + H'0094 |
| RSCFDn | Global TX Interrupt Status Register 0 | RSCFDnCFDGTINTSTS0 | <RSCFDn_base> + H'0460 |
| RSCFDn | Global FD configuration register | RSCFDnCFDGFDCFG | <RSCFDn_base> + H'0474 |
| Receive rule-related registers | | | |
| RSCFDn | Receive Rule Entry Control Register | RSCFDnCFDGAFLECTR | <RSCFDn_base> + H'0098 |
| RSCFDn | Receive Rule Configuration Register 0 | RSCFDnCFDGAFLCFG0 | <RSCFDn_base> + H'009C |
| RSCFDn | Receive Rule ID Register j | RSCFDnCFDGAFLIDj | <RSCFDn_base> + H'1000 + (H'10 × j) |
| RSCFDn | Receive Rule Mask Register j | RSCFDnCFDGAFLMj | <RSCFDn_base> + H'1004 + (H'10 × j) |
| RSCFDn | Receive Rule Pointer 0 Register j | RSCFDnCFDGAFLP0_j | <RSCFDn_base> + H'1008 + (H'10 × j) |
| RSCFDn | Receive Rule Pointer 1 Register j | RSCFDnCFDGAFLP1_j | <RSCFDn_base> + H'100C + (H'10 × j) |

Table 28.20 Registers (2/3)

| Module | Register | Symbol | Address |
|---|---|---|---|
| Receive buffer-related registers | | | |
| RSCFDn | Receive Buffer Number Register | RSCFDnCFDRMNB | <RSCFDn_base> + H'00A4 |
| RSCFDn | Receive Buffer New Data Register y | RSCFDnCFDRMNDy | <RSCFDn_base> + H'00A8 + (H'04 × y) |
| RSCFDn | Receive Buffer ID Register q | RSCFDnCFDRMIDq | <RSCFDn_base> + H'2000 + (H'20 × q) |
| RSCFDn | Receive Buffer Pointer Register q | RSCFDnCFDRMPTRq | <RSCFDn_base> + H'2004 + (H'20 × q) |
| RSCFDn | Receive Buffer CANFD status register q | RSCFDnCFDRMFDSTSq | <RSCFDn_base> + H'2008 + (H'20 × q) |
| RSCFDn | Receive Buffer Data Field b Register q | RSCFDnCFDRMDFb_q | <RSCFDn_base> + H'200C + (H'04 × b) + (H'20 × q) |
| Receive FIFO buffer-related registers | | | |
| RSCFDn | Receive FIFO Buffer Configuration and Control Register x | RSCFDnCFDRFCCx | <RSCFDn_base> + H'00B8 + (H'04 × x) |
| RSCFDn | Receive FIFO Buffer Status Register x | RSCFDnCFDRFSTSx | <RSCFDn_base> + H'00D8+ (H'04 × x) |
| RSCFDn | Receive FIFO Buffer Pointer Control Register x | RSCFDnCFDRFPCTRx | <RSCFDn_base> + H'00F8 + (H'04 × x) |
| RSCFDn | Receive FIFO Buffer Access ID Register x | RSCFDnCFDRFIDx | <RSCFDn_base> + H'3000 + (H'80 × x) |
| RSCFDn | Receive FIFO Buffer Access Pointer Register x | RSCFDnCFDRFPTRx | <RSCFDn_base> + H'3004 + (H'80 × x) |
| RSCFDn | Receive FIFO CANFD status register x | RSCFDnCFDRFFDSTSx | <RSCFDn_base> + H'3008 + (H'80 × x) |
| RSCFDn | Receive FIFO Buffer Access Data Field d Register x | RSCFDnCFDRFDFd_x | <RSCFDn_base> + H'300C + (H'04 × d) + (H'80 × x) |
| Transmit/Receive FIFO buffer related registers | | | |
| RSCFDn | Transmit/receive FIFO Buffer Configuration and Control Register k | RSCFDnCFDCFCCk | <RSCFDn_base> + H'0118 + (H'04 × k) |
| RSCFDn | Transmit/receive FIFO Buffer Status Register k | RSCFDnCFDCFSTSk | <RSCFDn_base> + H'0178 + (H'04 × k) |
| RSCFDn | Transmit/receive FIFO Buffer Pointer Control Register k | RSCFDnCFDCFPCTRk | <RSCFDn_base> + H'01D8 + (H'04 × k) |
| RSCFDn | Transmit/receive FIFO Buffer Access ID Register k | RSCFDnCFDCFIDk | <RSCFDn_base> + H'3400 + (H'80 × k) |
| RSCFDn | Transmit/receive FIFO Buffer Access Pointer Register k | RSCFDnCFDCFPTRk | <RSCFDn_base> + H'3404 + (H'80 × k) |
| RSCFDn | Transmit/receive FIFO CANFD configuration/status register k | RSCFDnCFDCFFDCSTSk | <RSCFDn_base> + H'3408 + (H'80 × k) |
| RSCFDn | Transmit/receive FIFO Buffer Access Data Field d Register k | RSCFDnCFDCFDFd_k | <RSCFDn_base> + H'340 + (H'04 × d) + (H'80 × k) |
| FIFO status-related registers | | | |
| RSCFDn | FIFO Empty Status Register | RSCFDnCFDFESTS | <RSCFDn_base> + H'0238 |
| RSCFDn | FIFO Full Status Register | RSCFDnCFDFFSTS | <RSCFDn_base> + H'023C |
| RSCFDn | FIFO Message Lost Status Register | RSCFDnCFDFMSTS | <RSCFDn_base> + H'0240 |
| RSCFDn | Receive FIFO Buffer Interrupt Flag Status Register | RSCFDnCFDRFISTS | <RSCFDn_base> + H'0244 |
| RSCFDn | Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register | RSCFDnCFDCFRISTS | <RSCFDn_base> + H'0248 |
| RSCFDn | Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register | RSCFDnCFDCFTISTS | <RSCFDn_base> + H'024C |
| FIFO DMA-related registers | | | |
| RSCFDn | DMA enable register | RSCFDnCFDCDTCT | <RSCFDn_base> + H'0490 |
| RSCFDn | DMA status register | RSCFDnCFDCDTSTS | <RSCFDn_base> + H'0494 |
| Transmit buffer-related registers | | | |
| RSCFDn | Transmit Buffer Control Register p | RSCFDnCFDTMCp | <RSCFDn_base> + H'0250 + (H'01 × p) |
| RSCFDn | Transmit Buffer Status Register p | RSCFDnCFDTMSTSp | <RSCFDn_base> + H'02D0 + (H'01 × p) |
| RSCFDn | Transmit Buffer ID Register p | RSCFDnCFDTMIDp | <RSCFDn_base> + H'4000 + (H'20 × p) |
| RSCFDn | Transmit Buffer Pointer Register p | RSCFDnCFDTMPTRp | <RSCFDn_base> + H'4004 + (H'20 × p) |
| RSCFDn | Transmit Buffer CANFD configuration register p | RSCFDnCFDTMFDCTRp | <RSCFDn_base> + H'4008 + (H'20 × p) |
| RSCFDn | Transmit Buffer Data Field b Register p | RSCFDnCFDTMDFb_p | <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p) |
| RSCFDn | Transmit Buffer Interrupt Enable Configuration Register y | RSCFDnCFDTMIECy | <RSCFDn_base> + H'0390 + (H'04 × y) |

Table 28.20 Registers (3/3)

| Module | Register | Symbol | Address |
|---|---|---|---|
| Transmit buffer status-related registers | | | |
| RSCFDn | Transmit Buffer Transmit Request Status Register y | RSCFDnCFDTMTRSTSy | <RSCFDn_base> + H'0350 + (H'04 × y) |
| RSCFDn | Transmit Buffer Transmit Abort Request Status Register y | RSCFDnCFDTMTARSTSy | <RSCFDn_base> + H'0360 + (H'04 × y) |
| RSCFDn | Transmit Buffer Transmit Complete Status Register y | RSCFDnCFDTMTCSTSy | <RSCFDn_base> + H'0370 + (H'04 × y) |
| RSCFDn | Transmit Buffer Transmit Abort Status Register y | RSCFDnCFDTMTASTSy | <RSCFDn_base> + H'0380 + (H'04 × y) |
| Transmit queue-related registers | | | |
| RSCFDn | Transmit Queue Configuration and Control Register m | RSCFDnCFDTXQCCm | <RSCFDn_base> + H'03A0 + (H'04 × m) |
| RSCFDn | Transmit Queue Status Register m | RSCFDnCFDTXQSTSm | <RSCFDn_base> + H'03C0 + (H'04 × m) |
| RSCFDn | Transmit Queue Pointer Control Register m | RSCFDnCFDTXQPCTRm | <RSCFDn_base> + H'03E0 + (H'04 × m) |
| Transmit history-related registers | | | |
| RSCFDn | Transmit History Configuration and Control Register m | RSCFDnCFDTHLCCm | <RSCFDn_base> + H'0400 + (H'04 × m) |
| RSCFDn | Transmit History Status Register m | RSCFDnCFDTHLSTSm | <RSCFDn_base> + H'0420 + (H'04 × m) |
| RSCFDn | Transmit History Pointer Control Register m | RSCFDnCFDTHLPCTRm | <RSCFDn_base> + H'0440 + (H'04 × m) |
| RSCFDn | Transmit History Access Register m | RSCFDnCFDTHLACCm | <RSCFDn_base> + H'6000 + (H'04 × m) |
| Test-related registers | | | |
| RSCFDn | Global Test Configuration Register | RSCFDnCFDGTSTCFG | <RSCFDn_base> + H'0468 |
| RSCFDn | Global Test Control Register | RSCFDnCFDGTSTCTR | <RSCFDn_base> + H'046C |
| RSCFDn | Global Lock Key Register | RSCFDnCFDGLOCKK | <RSCFDn_base> + H'047C |
| RSCFDn | RAM Test Page Access Register r | RSCFDnCFDRPGACCr | <RSCFDn_base> + H'6400 + (H'04 × r) |

Table 28.21 Transmit Buffer p Allocated to Each Channel

| | CANm |
|---|---|
| Transmit buffer p | Transmit buffer 16 × m + 0 |
| | Transmit buffer 16 × m + 1 |
| | Transmit buffer 16 × m + 2 |
| | Transmit buffer 16 × m + 3 |
| | Transmit buffer 16 × m + 4 |
| | Transmit buffer 16 × m + 5 |
| | Transmit buffer 16 × m + 6 |
| | Transmit buffer 16 × m + 7 |
| | Transmit buffer 16 × m + 8 |
| | Transmit buffer 16 × m + 9 |
| | Transmit buffer 16 × m + 10 |
| | Transmit buffer 16 × m + 11 |
| | Transmit buffer 16 × m + 12 |
| | Transmit buffer 16 × m + 13 |
| | Transmit buffer 16 × m + 14 |
| | Transmit buffer 16 × m + 15 |

Table 28.22 Transmit/Receive FIFO Buffer k Allocated to Each Channel

| | CANm |
|---|---|
| Transmit buffer k | Transmit/receive FIFO buffer 3 × m + 0 |

## 28.4.2 Details of Interface Mode-related Registers

### 28.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register

**Access Size:** RSCFDnCFDGRMCFG register can be read/written in 32-bit units
RSCFDnCFDGRMCFGL, RSCFDnCFDGRMCFGH registers can be read/written in 16-bit units
RSCFDnCFDGRMCFGLL, RSCFDnCFDGRMCFGLH, RSCFDnCFDGRMCFGHL, RSCFDnCFDGRMCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGRMCFG: <RSCFDn_base> + H'04FC
RSCFDnCFDGRMCFGL: <RSCFDn_base> + H'04FC, RSCFDnCFDGRMCFGH: <RSCFDn_base> + H'04FE
RSCFDnCFDGRMCFGLL: <RSCFDn_base> + H'04FC, RSCFDnCFDGRMCFGLH: <RSCFDn_base> + H'04FD,
RSCFDnCFDGRMCFGHL: <RSCFDn_base> + H'04FE, RSCFDnCFDGRMCFGHH: <RSCFDn_base> + H'04FF

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | 0 | R/W | Interface Mode Select<br>0: Classical CAN mode<br>1: CANFD mode |

**Note:** The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

#### RCMC Bit

Setting this bit to 0 places the RS-CANFD module in classical CAN mode. Setting this bit to 1 places the RS-CANFD module in CANFD mode. To switch classical CAN mode to CANFD mode, set the value after reset in all registers and bits allocated to the register map of classical CAN mode and then modify the RSCFDnCFDGRMCFG register.

## 28.4.3 Details of Channel-related Registers

### 28.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmNCFG register can be read/written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL, RSCFDnCFDCmNCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmNCFG: <RSCFDn_base> + H'0000 + (H'10 × m)
RSCFDnCFDCmNCFGL: <RSCFDn_base> + H'0000 + (H'10 × m),
RSCFDnCFDCmNCFGH: <RSCFDn_base> + H'0002 + (H'10 × m)
RSCFDnCFDCmNCFGLL: <RSCFDn_base> + H'0000 + (H'10 × m),
RSCFDnCFDCmNCFGLH: <RSCFDn_base> + H'0001 + (H'10 × m),
RSCFDnCFDCmNCFGHL: <RSCFDn_base> + H'0002 + (H'10× m),
RSCFDnCFDCmNCFGHH: <RSCFDn_base> + H'0003 + (H'10 × m)

**Initial Value:** H'0000 0000

| 10 | — | 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 9 to 0 | NBRP[9:0] | All 0 | R/W | Nominal Bit Rate Prescaler Division Ratio Setting<br>When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1). |

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see **Section 28.11.1, Initial Settings**.

### NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate. Allowed values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

### NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

A value of 4 to 128 Tq is settable.

### NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq is settable. Specify a value equal to or smaller than the NTSEG2[4:0] value.

### NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

### 28.4.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmCTR register can be read/written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmCTR: <RSCFDn_base> + H'0004 + (H'10 × m)
RSCFDnCFDCmCTRL: <RSCFDn_base> + H'0004 + (H'10 × m),
RSCFDnCFDCmCTRH: <RSCFDn_base> + H'0006 + (H'10 × m)
RSCFDnCFDCmCTRLL: <RSCFDn_base> + H'0004 + (H'10 × m),
RSCFDnCFDCmCTRLH: <RSCFDn_base> + H'0005 + (H'10 × m),
RSCFDnCFDCmCTRHL: <RSCFDn_base> + H'0006 + (H'10 × m),
RSCFDnCFDCmCTRHH: <RSCFDn_base> + H'0007 + (H'10 × m)

**Initial Value:** H'0000 0005

### ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00b (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

### CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

### CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

### CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

### ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register.

When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order. Modify this bit only in channel reset mode or channel halt mode.

#### BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00b, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10b (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01b, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0, 1) are set to 10b and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to H’00.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10b, the CHMDC[1:0] bits are set to 10b and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H’00.

When the BOM[1:0] bits are set to 11b and the CHMDC[1:0] bits are set to 10b while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H’00. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10b, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01b or at bus off end when the BOM[1:0] bits are 10b), the program’s writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

#### TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

#### SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

#### EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

#### TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

#### ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BLIE Bit**

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**OLIE Bit**

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BORIE Bit**

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BOEIE Bit**

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**EPIE Bit**

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**EWIE Bit**

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BEIE Bit**

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**RTBO Bit**

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to H’00 and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00b (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

**CSLPR Bit**

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

**CHMDC[1:0] Bits**

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Figure 28.5**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode.

Do not set the CHMDC[1:0] bits to 11b. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10b.

### 28.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmSTS register can be read/written in 32-bit units
RSCFDnCFDCmSTSL, RSCFDnCFDCmSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSLH, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers can be read/written in 8- bit units

**Address(es):** RSCFDnCFDCmSTS: <RSCFDn_base> + H'0008 + (H'10 × m)
RSCFDnCFDCmSTSL: <RSCFDn_base> + H'0008 + (H'10 × m),
RSCFDnCFDCmSTSH: <RSCFDn_base> + H'000A + (H'10 × m)
RSCFDnCFDCmSTSLL: <RSCFDn_base> + H'0008 + (H'10 × m),
RSCFDnCFDCmSTSLH: <RSCFDn_base> + H'0009 + (H'10 × m),
RSCFDnCFDCmSTSHL: <RSCFDn_base> + H'000A + (H'10 × m),
RSCFDnCFDCmSTSHH: <RSCFDn_base> + H'000B + (H'10 × m)

**Initial Value:** H'0000 0005

| 0 | CRSTSTS | 1 | R | Channel Reset Status Flag<br>0: Not in channel reset mode<br>1: In channel reset mode |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

#### REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

#### ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is 0 in channel reset mode.

#### COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

#### RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

#### TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

### BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

### EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

### CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

### CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

### CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

### 28.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmERFL register can be read/written in 32-bit units
RSCFDnCFDCmERFLL, RSCFDnCFDCmERFLH registers can be read/written in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH, RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmERFL: <RSCFDn_base> + H'000C + (H'10 × m)
RSCFDnCFDCmERFLL: <RSCFDn_base> + H'000C + (H'10 × m),
RSCFDnCFDCmERFLH: <RSCFDn_base> + H'000E + (H'10 × m)
RSCFDnCFDCmERFLLL: <RSCFDn_base> + H'000C + (H'10 × m),
RSCFDnCFDCmERFLLH: <RSCFDn_base> + H'000D + (H'10 × m),
RSCFDnCFDCmERFLHL: <RSCFDn_base> + H'000E + (H'10 × m),
RSCFDnCFDCmERFLHH: <RSCFDn_base> + H'000F + (H'10 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 6 | BLF | 0 | R/W*1 | Bus Lock Flag<br>0: No channel bus is detected.<br>1: Channel bus is detected. |
| 5 | OVLF | 0 | R/W*1 | Overload Flag<br>0: No overload is detected.<br>1: Overload is detected. |
| 4 | BORF | 0 | R/W*1 | Bus Off Recovery Flag<br>0: No bus off recovery is detected.<br>1: Bus off recovery is detected. |
| 3 | BOEF | 0 | R/W*1 | Bus Off Entry Flag<br>0: No bus off entry is detected.<br>1: Bus off entry is detected. |
| 2 | EPF | 0 | R/W*1 | Error Passive Flag<br>0: No error passive is detected.<br>1: Error passive is detected. |
| 1 | EWF | 0 | R/W*1 | Error Warning Flag<br>0: No error warning is detected.<br>1: Error warning is detected. |
| 0 | BEF | 0 | R/W*1 | Bus Error Flag<br>0: No channel bus error is detected.<br>1: Channel bus error is detected. |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (i.e., only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

### CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CANFD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

#### ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

#### B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

#### B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

#### CERR Flag

This flag is set to 1 when a CRC error has been detected.

#### AERR Flag

This flag is set to 1 when an ACK error has been detected.

#### FERR Flag

This flag is set to 1 when a form error has been detected.

#### SERR Flag

This flag is set to 1 when a stuff error has been detected.

#### ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

#### BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

#### OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

### BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01b (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01b (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10b (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11b (transition to channel halt mode upon a request from the program during bus off).

### BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0, 1) set to 01b (transition to channel halt mode at bus off entry).

### EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127).

This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

### EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

### BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

### 28.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmDCFG register can be read/written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmDCFG: <RSCFDn_base> + H'0500 + (H'20 × m)
RSCFDnCFDCmDCFGL: <RSCFDn_base> + H'0500 + (H'20 × m),
RSCFDnCFDCmDCFGH: <RSCFDn_base> + H'0502 + (H'20 × m)
RSCFDnCFDCmDCFGLL: <RSCFDn_base> + H'0500 + (H'20 × m),
RSCFDnCFDCmDCFGLH: <RSCFDn_base> + H'0501 + (H'20 × m),
RSCFDnCFDCmDCFGHL: <RSCFDn_base> + H'0502 + (H'20 × m),
RSCFDnCFDCmDCFGHH: <RSCFDn_base> + H'0503 + (H'20 × m)

**Initial Value:** H'0000 0000

|---|---|---|---|---|
| 19 to 16 | DTSEG1[3:0] | All 0 | R/W | Data Bit Rate Time Segment 1 Control<br>b19 b18 b17 b16<br>0 0 0 0: Setting prohibited<br>0 0 0 1: 2 Tq<br>0 0 1 0: 3 Tq<br>0 0 1 1: 4 Tq<br>0 1 0 0: 5 Tq<br>0 1 0 1: 6 Tq<br>0 1 1 0: 7 Tq<br>0 1 1 1: 8 Tq<br>1 0 0 0: 9 Tq<br>1 0 0 1: 10 Tq<br>1 0 1 0: 11 Tq<br>1 0 1 1: 12 Tq<br>1 1 0 0: 13 Tq<br>1 1 0 1: 14 Tq<br>1 1 1 0: 15 Tq<br>1 1 1 1: 16 Tq |
| 15 to 8 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 7 to 0 | DBRP[7:0] | All 0 | R/W | Data Bit Rate Prescaler Division Ratio Setting<br>When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1). |

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CANFD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 28.11.1, Initial Settings**.

### DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq is settable. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

### DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate. Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the DTSEG1[3:0] bits.

### DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

A value of 2 to 16 Tq is settable.

**DBRP[7:0] Bits**

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Make sure to set the same value in the NBRP[9:0] bits and the DBRP[7:0] bits. To set the nominal bit rate and data bit rate of different values, change the NTSEG 1 bit and NTSEG 2 bit in the RSCFDnCFDCmNCFG register and the DTSEG 1 bit and DTSEG 2 bit in the RSCFDnCFDCmDCFG register to the desired bit rate values respectively. When the TDCE bit of the RSCFDnCFDCmFDCFG register is 1 (transmission delay correction enabled), set the same value of 1 or less to the NBRP [9:0] and DBRP [7:0] bits.

### 28.4.3.6 RSCFDnCFDCmFDCFG — Channel CANFD Configuration Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmFDCFG register can be read/written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL, RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmFDCFG: <RSCFDn_base> + H'0504 + (H'20 × m)
RSCFDnCFDCmFDCFGL: <RSCFDn_base> + H'0504 + (H'20 × m),
RSCFDnCFDCmFDCFGH: <RSCFDn_base> + H'0506 + (H'20 × m)
RSCFDnCFDCmFDCFGLL: <RSCFDn_base> + H'0504 + (H'20 × m),
RSCFDnCFDCmFDCFGLH: <RSCFDn_base> + H'0505 + (H'20 × m),
RSCFDnCFDCmFDCFGHL: <RSCFDn_base> + H'0506 + (H'20 × m),
RSCFDnCFDCmFDCFGHH: <RSCFDn_base> + H'0507 + (H'20 × m)

**Initial Value:** H'0000 0000

### REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

### FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CANFD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

### TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

### GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CANFD frame to be transmitted by the gateway function is set. Write 0 to this bit to clear the GWBRS bit to 0. Modify this bit only in channel reset mode.

### GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CANFD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

### GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10b (gateway mode).

Setting this bit to 1 enables the CAN-CANFD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001b or more and the GWFDF bit is 1 (CANFD frame), the DLC value is replaced with 1000b.

While this bit is 1, do not perform routing the following frames by using the gateway function.

- CANFD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frames should be transmitted.
- When GWFDF bit is set to 1, only CANFD frames should be transmitted.

**Table 28.25** shows the settings and formats of transmit frame and receive frame while the CAN-CANFD gateway is enabled.

Table 28.25 Operation when the CAN-CANFD Gateway is Enabled

| Receive Frame | | | | Transmit Frame | | |
|---|---|---|---|---|---|---|
| Format | BRS Bit | Received DLC Value | GWFDF Bit | Format | BRS Bit | DLC Value to be Transmitted |
| Classical CAN | None | DLC ≤ 1000b | 0 | Classical CAN | None | Not replaced |
| | | DLC > 1000b | | | | |
| CANFD | Arbitrary | DLC ≤ 1000b | | | | |
| Classical CAN | None | DLC ≤ 1000b | 1 | CANFD | According to GWBRS bit setting | Not replaced |
| | | DLC > 1000b | | | | Replaced with 1000b |
| CANFD | Arbitrary | DLC ≤ 1000b | | | | Not replaced |

### TDCO[6:0] Bits

These bits are set to the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value. The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

### ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 28.26 ESI Value to Be Transmitted

| ESIC Bit | Channel Status | ESI Value to be Transmitted |
|---|---|---|
| 0 | Error active | 0 (error active node) |
| | Error passive | 1 (error passive node) |
| 1 | Error active | ESI value set in the transmit/receive FIFO buffer or transmit buffer CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) |
| | Error passive | 1 (error passive node) |

### TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

### TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is 1, the SSP position is defined only by the SSP offset value. Modify this bit only in channel reset mode or channel halt mode.

### EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

### 28.4.3.7 RSCFDnCFDCmFDCTR — Channel CANFD Control Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmFDCTR register can be read/written in 32-bit units
RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCTRLL, RSCFDnCFDCmFDCTRLH, RSCFDnCFDCmFDCTRHL, RSCFDnCFDCmFDCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmFDCTR: <RSCFDn_base> + H'0508 + (H'20 × m)
RSCFDnCFDCmFDCTRL: <RSCFDn_base> + H'0508 + (H'20 × m),
RSCFDnCFDCmFDCTRH: <RSCFDn_base> + H'050A + (H'20 × m)
RSCFDnCFDCmFDCTRLL: <RSCFDn_base> + H'0508 + (H'20 × m),
RSCFDnCFDCmFDCTRLH: <RSCFDn_base> + H'0509 + (H'20 × m),
RSCFDnCFDCmFDCTRHL: <RSCFDn_base> + H'050A + (H'20 × m),
RSCFDnCFDCmFDCTRHH: <RSCFDn_base> + H'050B + (H'20 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 2 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | SOCCLR | 0 | R/W | Successful Occurrence Counter Clear<br>Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0. |
| 0 | EOCCLR | 0 | R/W | Error Occurrence Counter Clear<br>Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0. |

#### SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

#### EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

### 28.4.3.8 RSCFDnCFDCmFDSTS — Channel CANFD Status Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmFDSTS register can be read/written in 32-bit units
RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH, RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCmFDSTS: <RSCFDn_base> + H'050C + (H'20 × m)
RSCFDnCFDCmFDSTSL: <RSCFDn_base> + H'050C + (H'20 × m),
RSCFDnCFDCmFDSTSH: <RSCFDn_base> + H'050E + (H'20 × m)
RSCFDnCFDCmFDSTSLL: <RSCFDn_base> + H'050C + (H'20 × m),
RSCFDnCFDCmFDSTSLH: <RSCFDn_base> + H'050D + (H'20 × m),
RSCFDnCFDCmFDSTSHL: <RSCFDn_base> + H'050E + (H'20 × m),
RSCFDnCFDCmFDSTSHH: <RSCFDn_base> + H'050F + (H'20 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | SOC[7:0] | All 0 | R | Successful Occurrence Counter<br>The successful occurrence counter value can be read. |
| 23 to 16 | EOC[7:0] | All 0 | R | Error Occurrence Counter<br>The error occurrence counter value can be read. |
| 15 to 10 | — | All 0 | R | Reserved<br>When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 9 | SOCO | 0 | R/W*1 | Successful Occurrence Counter Overflow Flag<br>0: The successful occurrence counter does not overflow.<br>1: The successful occurrence counter has overflowed. |
| 8 | EOCO | 0 | R/W*1 | Error Occurrence Counter Overflow Flag<br>0: The error occurrence counter does not overflow.<br>1: The error occurrence counter has overflowed. |
| 7 | TDCVF | 0 | R/W*1 | Transmitter Delay Compensation Violation Flag<br>0: No transmitter delay compensation violation is present.<br>1: A transmitter delay compensation violation is present. |
| 6 to 0 | TDCR[6:0] | All 0 | R | Transmitter Delay Compensation Result Status<br>The transmitter delay compensation result can be read. |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches H'FF. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

#### EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches H'FF.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

#### SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached H'FF. This flag is 0 in channel reset mode.

#### EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached H'FF. This flag is 0 in channel reset mode.

#### TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 Tq (CANm bit time and Tq are the values of data bit rate).

This flag is 0 in channel reset mode.

#### TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit (transmitter delay compensation enable) in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit (transmitter delay compensation measurement select) in the RSCFDnCFDCmFDCFG register is set to 0.

This flag is 0 in channel reset mode.

### 28.4.3.9 RSCFDnCFDCmFDCRC — Channel CANFD CRC Register (m = 0, 1)

**Access Size:** RSCFDnCFDCmFDCRC register can be read only in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDCmFDCRC: <RSCFDn_base> + H'0510 + (H'20 × m)
RSCFDnCFDCmFDCRCL: <RSCFDn_base> + H'0510 + (H'20 × m),
RSCFDnCFDCmFDCRCH: <RSCFDn_base> + H'0512 + (H'20 × m)
RSCFDnCFDCmFDCRCLL: <RSCFDn_base> + H'0510 + (H'20 × m),
RSCFDnCFDCmFDCRCLH: <RSCFDn_base> + H'0511 + (H'20 × m),
RSCFDnCFDCmFDCRCHL: <RSCFDn_base> + H'0512 + (H'20 × m),
RSCFDnCFDCmFDCRCHH: <RSCFDn_base> + H'0513 + (H'20 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRCREG[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 27 to 24 | SCNT[3:0] | All 0 | R | Stuff count<br>Indicate a value of the stuff count in a CANFD frame.<br>Bits 25 to 27 indicate the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames.<br>Bit 24 indicates an even parity value of bits 25 to 27. |
| 23 to 21 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 20 to 0 | CRCREG [20:0] | All 0 | R | CRC Calculation Data (CRC Length:17 Bits or 21 Bits)<br>These bits show the CRC value calculated based on the transmit message or receive message.<br>When the CRC length is 17 bits, bits b20 to b17 are read as 0. |

#### SCNT[3:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CANFD frame can be read if a message transmitted/received is a CANFD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CANFD frame. These bits are cleared to 0 in channel reset mode.

**CRCREG[20:0] Flag**

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CANFD frame (CRC length = 17 or 21 bits), this flag is updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

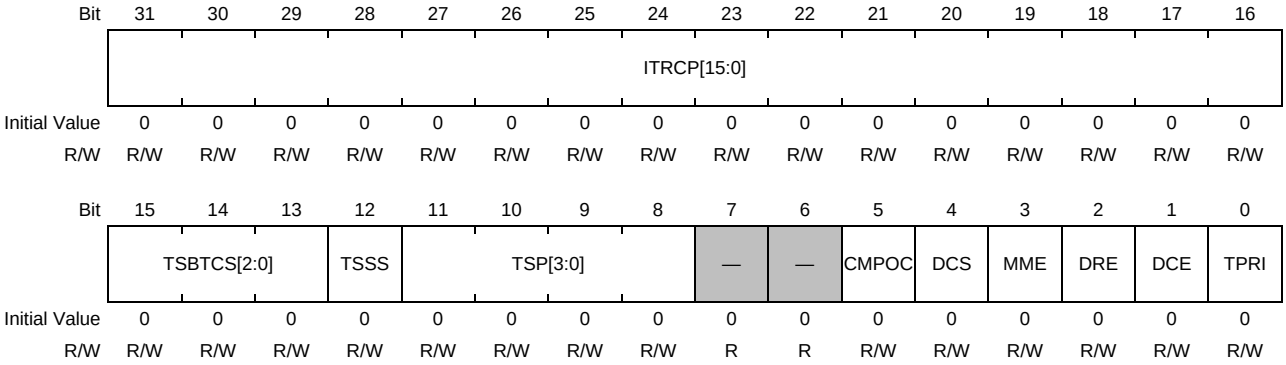
## 28.4.4 Details of Global-related Registers

### 28.4.4.1 SCFDnCFDGCFG — Global Configuration Register

**Access Size:** RSCFDnCFDGCFG register can be read/written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read/written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGCFG: <RSCFDn_base> + H'0084
RSCFDnCFDGCFGL: <RSCFDn_base> + H'0084, RSCFDnCFDGCFGH: <RSCFDn_base> + H'0086
RSCFDnCFDGCFGLL: <RSCFDn_base> + H'0084, RSCFDnCFDGCFGLH: <RSCFDn_base> + H'0085,
RSCFDnCFDGCFGHL: <RSCFDn_base> + H'0086, RSCFDnCFDGCFGHH: <RSCFDn_base> + H'0087

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |

| 1 | DCE | 0 | R/W | DLC Check Enable<br>0: DLC check is disabled.<br>1: DLC check is enabled. |
| 0 | TPRI | 0 | R/W | Transmit Priority Select<br>0: ID priority<br>1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000b.

Note 2. For the CAN clock frequency settings, see **Section 28.1.3, Clock Supply**.

Modify the RSCFDnCFDGCFG register only in global reset mode.

### ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 28.8.3.1, Interval Transmission Function**.

### TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CANFD frames.

#### TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

#### TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

#### CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

#### DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 28.6, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI**.

#### MME Bit

Setting this bit to 1 makes the mirror function available.

#### DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of H’00 is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

#### DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000b before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

**TPRI Bit**

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

### 28.4.4.2 RSCFDnCFDGCTR — Global Control Register

**Access Size:** RSCFDnCFDGCTR register can be read/written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL, RSCFDnCFDGCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGCTR: <RSCFDn_base> + H'0088
RSCFDnCFDGCTRL: <RSCFDn_base> + H'0088, RSCFDnCFDGCTRH: <RSCFDn_base> + H'008A
RSCFDnCFDGCTRLL: <RSCFDn_base> + H'0088, RSCFDnCFDGCTRLH: <RSCFDn_base> + H'0089,
RSCFDnCFDGCTRHL: <RSCFDn_base> + H'008A, RSCFDnCFDGCTRHH: <RSCFDn_base> + H'008B

**Initial Value:** H'0000 0005

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to H'0000.

### CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

### THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

### MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

### DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

### GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.

Clearing this bit to 0 makes the RSCAN module leave from global stop mode.

This bit should not be modified in global operating mode or global test mode.

### GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 28.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

### 28.4.4.3 RSCFDnCFDGSTS — Global Status Register

**Access Size:** RSCFDnCFDGSTS register can be read only in 32-bit units
RSCFDnCFDGSTSL, RSCFDnCFDGSTSH registers can be read only in 16-bit units
RSCFDnCFDGSTSLL, RSCFDnCFDGSTSLH, RSCFDnCFDGSTSHL, RSCFDnCFDGSTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDGSTS: <RSCFDn_base> + H'008C
RSCFDnCFDGSTSL: <RSCFDn_base> + H'008C, RSCFDnCFDGSTSH: <RSCFDn_base> + H'008E
RSCFDnCFDGSTSLL: <RSCFDn_base> + H'008C, RSCFDnCFDGSTSLH: <RSCFDn_base> + H'008D,
RSCFDnCFDGSTSHL: <RSCFDn_base> + H'008E, RSCFDnCFDGSTSHH: <RSCFDn_base> + H'008F

**Initial Value:** H'0000 000D

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 3 | GRAMINIT | 1 | R | CAN RAM Initialization Status Flag<br>0: CAN RAM initialization is completed.<br>1: CAN RAM initialization is ongoing. |
| 2 | GSLPSTS | 1 | R | Global Stop Status Flag<br>0: Not in global stop mode<br>1: In global stop mode |
| 1 | GHLTSTS | 0 | R | Global Test Status Flag<br>0: Not in global test mode<br>1: In global test mode |
| 0 | GRSTSTS | 1 | R | Global Reset Status Flag<br>0: Not in global reset mode<br>1: In global reset mode |

#### GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

#### GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

#### GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

**GRSTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

### 28.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

**Access Size:** RSCFDnCFDGERFL register can be read/written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLLH, RSCFDnCFDGERFLHL, RSCFDnCFDGERFLHH registers can be read/written in 8- bit units

**Address(es):** RSCFDnCFDGERFL: <RSCFDn_base> + H'0090
RSCFDnCFDGERFLL: <RSCFDn_base> + H'0090, RSCFDnCFDGERFLH: <RSCFDn_base> + H'0092
RSCFDnCFDGERFLLL: <RSCFDn_base> + H'0090, RSCFDnCFDGERFLLH: <RSCFDn_base> + H'0091,
RSCFDnCFDGERFLHL: <RSCFDn_base> + H'0092, RSCFDnCFDGERFLHH: <RSCFDn_base> + H'0093

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CMPOF | THLES | MES | DEF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14, 7, 6, 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 13 to 8, 5 | — | All 0 | R | Reserved<br>When read, an undefined value is returned.The write value should be the value after reset. |
| 3 | CMPOF | 1 | R/W*1 | Payload Overflow Flag<br>0: No payload overflow has occurred.<br>1: A payload overflow has occurred. |
| 2 | THLES | 1 | R | Transmit History Buffer Overflow Status Flag<br>0: No transmit history buffer overflow has occurred.<br>1: A transmit history buffer overflow has occurred. |
| 1 | MES | 0 | R | FIFO Message Lost Status Flag<br>0: No FIFO message lost error has occurred.<br>1: A FIFO message lost error has occurred. |
| 0 | DEF | 1 | R/W*1 | DLC Error Flag<br>0: No DLC error has occurred.<br>1: A DLC error has occurred. |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

#### CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0, 1), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

### THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0, 1) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

### MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 5) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

### DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

Note

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

### 28.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

**Access Size:** RSCFDnCFDGTSC register can be read only in 32-bit units
RSCFDnCFDGTSCL, RSCFDnCFDGTSCH registers can be read only in 16-bit units

**Address(es):** RSCFDnCFDGTSC: <RSCFDn_base> + H'0094
RSCFDnCFDGTSCL: <RSCFDn_base> + H'0094, RSCFDnCFDGTSCH: <RSCFDn_base> + H'0096

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 15 to 0 | TS[15:0] | All 0 | R | Timestamp Value<br>The timestamp counter value can be read.<br>Counter Value: H'0000 to H'FFFF |

#### TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode. This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 28.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

**Access Size:** RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL, RSCFDnCFDGTINTSTS0HH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDGTINTSTS0: <RSCFDn_base> + H'0460
RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + H'0460,
RSCFDnCFDGTINTSTS0H: <RSCFDn_base> + H'0462
RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + H'0460,
RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> + H'0461,
RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + H'0462,
RSCFDnCFDGTINTSTS0HH: <RSCFDn_base> + H'0463

**Initial Value:** H'0000 0000

| 0 | TSIF0 | 0 | R*1 | Channel 0 Transmit Buffer Interrupt Status Flag<br>0: Transmit buffer transmit complete interrupt is not requested.<br>1: Transmit buffer transmit complete interrupt is requested. |

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

### TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10b (transmit completed without abort request) or 11b (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00b under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

### TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01b (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00b after the transmit abort is completed.

### TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

### CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

### THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 28.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register

**Access Size:** RSCFDnCFDGFDCFG register can be read/written in 32-bit units
RSCFDnCFDGFDCFG L, RSCFDnCFDGFDCFG H registers can be read/written in 16-bit units
RSCFDnCFDGFDCFG LL, RSCFDnCFDGFDCFG LH, RSCFDnCFDGFDCFG HL, RSCFDnCFDGFDCFG HH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGFDCFG: <RSCFDn_base> + H'0474
RSCFDnCFDGFDCFG L: <RSCFDn_base> + H'0474, RSCFDnCFDGFDCFG H: <RSCFDn_base> + H'0476
RSCFDnCFDGFDCFG LL: <RSCFDn_base> + H'0474, RSCFDnCFDGFDCFG LH: <RSCFDn_base> + H'0475,
RSCFDnCFDGFDCFG HL: <RSCFDn_base> + H'0476, RSCFDnCFDGFDCFG HH: <RSCFDn_base> + H'0477

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 10 | — | All 0 | R/W | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 9, 8 | TSCCFG[1:0] | All 0 | R/W | Time-stamp capture setting bit<br>b9 b8<br>0 0: Captured at a sample point in the SOF bit.<br>0 1: Captured when a valid frame has been transmitted/received.<br>1 0: Captured at a sample point of the res bit.*1<br>1 1: Setting prohibited. |
| 7 to 1 | — | All 0 | R/W | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | PRED | 0 | R/W | Protocol exception event detection disabled bit<br>0: Protocol exception event detection enabled<br>1: Protocol exception event detection disabled |

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

#### TSCCFG[1:0] Bits

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

#### PRED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame is output. Modify this bit only in global reset mode.

## 28.4.5 Details of Receive Rule-related Registers

### 28.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

**Access Size:** RSCFDnCFDGAFLECTR register can be read/written in 32-bit units
RSCFDnCFDGAFLECTRL, RSCFDnCFDGAFLECTRH registers can be read/written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH, RSCFDnCFDGAFLECTRHL, RSCFDnCFDGAFLECTRHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGAFLECTR: <RSCFDn_base> + H'0098
RSCFDnCFDGAFLECTRL: <RSCFDn_base> + H'0098,
RSCFDnCFDGAFLECTRH: <RSCFDn_base> + H'009A
RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + H'0098,
RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + H'0099,
RSCFDnCFDGAFLECTRHL: <RSCFDn_base> + H'009A,
RSCFDnCFDGAFLECTRHH: <RSCFDn_base> + H'009B

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | AFLDAE | — | — | — | AFLPN[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | AFLDAE | 0 | R/W | Receive Rule Table Write Enable<br>0: Receive rule table write is disabled.<br>1: Receive rule table write is enabled. |
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are read as the value after reset.<br>The write value should be the value after reset. |
| 4 to 0 | AFLPN[4:0] | All 0 | R/W | Receive Rule Table Page Number Configuration<br>A page number can be selected from a range of page 0 (00000b) to page 7 (00111b). |

#### AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

#### AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page. Set these bits to a value within the range of 00000b to 00111b.

### 28.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

**Access Size:** RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL, RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGAFLCFG0: <RSCFDn_base> + H'009C
RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + H'009C,
RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + H'009E
RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + H'009C,
RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + H'009D,
RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + H'009E,
RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + H'009F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | RNC0[7:0] | All 0 | R/W | Number of Rules for Channel 0<br>Set the number of receive rules exclusively used for channel 0. |
| 23 to 16 | RNC1[7:0] | All 0 | R/W | Number of Rules for Channel 1<br>Set the number of receive rules exclusively used for channel 1. |
| 15 to 0 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

#### RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of H'00 to H'80.

#### RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of H'00 to H'80.

### 28.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

**Access Size:** RSCFDnCFDGAFLIDj register can be read/written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGAFLIDj: <RSCFDn_base> + H'1000 + (H'10 × j)
RSCFDnCFDGAFLIDjL: <RSCFDn_base> + H'1000 + (H'10 × j),
RSCFDnCFDGAFLIDjH: <RSCFDn_base> + H'1002 + (H'10 × j)
RSCFDnCFDGAFLIDjLL: <RSCFDn_base> + H'1000 + (H'10 × j),
RSCFDnCFDGAFLIDjLH: <RSCFDn_base> + H'1001 + (H'10 × j),
RSCFDnCFDGAFLIDjHL: <RSCFDn_base> + H'1002 + (H'10 × j),
RSCFDnCFDGAFLIDjHH: <RSCFDn_base> + H'1003 + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLIDE | GAFLRTR | GAFLLB | GAFLID[28:16] | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GAFLID[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | GAFLIDE | 0 | R/W | IDE Select<br>0: Standard ID<br>1: Extended ID |
| 30 | GAFLRTR | 0 | R/W | RTR Select<br>0: Data frame<br>1: Remote frame |
| 29 | GAFLLB | 0 | R/W | Receive Rule Target Message Select<br>0: When a message transmitted from another CAN node is received<br>1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | All 0 | R/W | ID Set<br>Set the ID of the receive rule.<br>For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

#### GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

#### GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

#### GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

### 28.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

**Access Size:** RSCFDnCFDGAFLMj register can be read/written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGAFLMj: <RSCFDn_base> + H'1004 + (H'10 × j)
RSCFDnCFDGAFLMjL: <RSCFDn_base> + H'1004 + (H'10 × j),
RSCFDnCFDGAFLMjH: <RSCFDn_base> + H'1006 + (H'10 × j)
RSCFDnCFDGAFLMjLL: <RSCFDn_base> + H'1004 + (H'10 × j),
RSCFDnCFDGAFLMjLH: <RSCFDn_base> + H'1005 + (H'10 × j),
RSCFDnCFDGAFLMjHL: <RSCFDn_base> + H'1006 + (H'10 × j),
RSCFDnCFDGAFLMjHH: <RSCFDn_base> + H'1007 + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | GAFLIDEM | 0 | R/W | IDE Mask<br>0: The IDE bit is not compared.<br>1: The IDE bit is compared. |
| 30 | GAFLRTRM | 0 | R/W | RTR Mask<br>0: The RTR bit is not compared.<br>1: The RTR bit is compared |
| 29 | — | 0 | R | Reserved<br>This bit is read as the value after reset. The write value should be the value after reset. |
| 28 to 0 | GAFLIDM [28:0] | All 0 | R/W | ID Mask<br>0: The corresponding ID bit is not compared.<br>1: The corresponding ID bit is compared. |

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

#### GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

#### GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

### 28.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access Size:** RSCFDnCFDGAFLP0_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP0jLL, RSCFDnCFDGAFLP0jLH, RSCFDnCFDGAFLP0jHL, RSCFDnCFDGAFLP0jHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGAFLP0_j: <RSCFDn_base> + H'1008 + (H'10 × j)
RSCFDnCFDGAFLP0_jL: <RSCFDn_base> + H'1008 + (H'10 × j),
RSCFDnCFDGAFLP0_jH: <RSCFDn_base> + H'100A + (H'10 × j)
RSCFDnCFDGAFLP0_jLL: <RSCFDn_base> + H'1008 + (H'10 × j),
RSCFDnCFDGAFLP0_jLH: <RSCFDn_base> + H'1009 + (H'10 × j),
RSCFDnCFDGAFLP0_jHL: <RSCFDn_base> + H'100A + (H'10 × j),
RSCFDnCFDGAFLP0_jHH: <RSCFDn_base> + H'100B + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 1 | 1 | 0 | 1 | | 32 data bytes |
| 1 | 1 | 1 | 0 | | 48 data bytes |
| 1 | 1 | 1 | 1 | | 64 data bytes |

| | | | | |
|---|---|---|---|---|
| 27 to 16 | GAFLPTR [11:0] | All 0 | R/W | Receive Rule Label<br>Set the 12-bit label information. |
| 15 | GAFLRMV | 0 | R/W | Receive Buffer Enable<br>0: No receive buffer is used.<br>1: A receive buffer is used. |
| 14 to 8 | GAFLRMDP [6:0] | All 0 | R/W | Receive Buffer Number Select<br>Set the receive buffer number to store receive messages. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 0 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check.

Setting these bits to 0000b disables the DLC check function allowing messages with any data length to pass the DLC check.

### GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

### GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

### GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

### 28.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

**Access Size:** RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL, RSCFDnCFDGAFLP1_jHH registers can be read/ written in 8-bit units

**Address(es):** RSCFDnCFDGAFLP1_j: <RSCFDn_base> + H'100$C_H$ + (H'10 × j)
RSCFDnCFDGAFLP1_jL: <RSCFDn_base> + H'100$C_H$ + (H'10 × j),
RSCFDnCFDGAFLP1_jH: <RSCFDn_base> + H'100$E_H$ + (H'10 × j)
RSCFDnCFDGAFLP1_jLL: <RSCFDn_base> + H'100$C_H$ + (H'10 × j),
RSCFDnCFDGAFLP1_jLH: <RSCFDn_base> + H'100$D_H$ + (H'10 × j),
RSCFDnCFDGAFLP1_jHL: <RSCFDn_base> + H'100$E_H$ + (H'10 × j),
RSCFDnCFDGAFLP1_jHH: <RSCFDn_base> + H'100$F_H$ + (H'10 × j)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 13 to 8 | GAFLFDP [13:8] | All 0 | R/W | Transmit/Receive FIFO Buffer k Select<br>(Bit position –8 = target transmit/receive FIFO buffer number k)<br>0: Transmit/receive FIFO buffer is not selected.<br>1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP [7:0] | All 0 | R/W | Receive FIFO Buffer x Select<br>(Bit position = target receive FIFO buffer number x)<br>0: Receive FIFO buffer is not selected.<br>1: Receive FIFO buffer is selected. |

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLFDP[13:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00b (receive mode) or 10b (gateway mode) are selectable.

## 28.4.6 Details of Receive Buffer-related Registers

### 28.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

**Access Size:** RSCFDnCFDRMNB register can be read/written in 32-bit units
RSCFDnCFDRMNBL, RSCFDnCFDRMNBH registers can be read/written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDRMNB: <RSCFDn_base> + H'00A4
RSCFDnCFDRMNBL: <RSCFDn_base> + H'00A4, RSCFDnCFDRMNBH: <RSCFDn_base> + H'00A6
RSCFDnCFDRMNBLL: <RSCFDn_base> + H'00A4, RSCFDnCFDRMNBLH: <RSCFDn_base> + H'00A5,
RSCFDnCFDRMNBHL: <RSCFDn_base> + H'00A6, RSCFDnCFDRMNBHH: <RSCFDn_base> + H'00A7

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 10 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 9, 8 | RMPLS[1:0] | All 0 | R/W | Receive Buffer Payload Storage Size Select<br>b9 b8<br>0 0: 8 bytes<br>0 1: 12 bytes<br>1 0: 16 bytes<br>1 1: 20 bytes |
| 7 to 0 | NRXMB[7:0] | All 0 | R/W | Receive Buffer Number Configuration<br>Set the number of receive buffers.<br>Set a value of 0 to 32. |

Modify the RSCFDnCFDRMNB register only in global reset mode.

#### RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

#### NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

### 28.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0)

**Access Size:** RSCFDnCFDRMNDy register can be read/written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8- bit units

**Address(es):** RSCFDnCFDRMNDy: <RSCFDn_base> + H'00A8 + (H'04 × y)
RSCFDnCFDRMNDyL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCFDnCFDRMNDyH: <RSCFDn_base> + H'00AA + (H'04 × y)
RSCFDnCFDRMNDyLL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCFDnCFDRMNDyLH: <RSCFDn_base> + H'00A9 + (H'04 × y),
RSCFDnCFDRMNDyHL: <RSCFDn_base> + H'00AA + (H'04 × y),
RSCFDnCFDRMNDyHH: <RSCFDn_base> + H'00AB + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMNSq (q = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMNSq (q = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | RMNSq | All 0 | R/W | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |
| 15 to 0 | RMNSq | All 0 | R/W | Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0)<br>0: There is no new message in receive buffer q.<br>1: There is a new message in receive buffer q. |

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

#### RMNSq Flags (q = 0 to 31)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write "0" to the flag and "1" to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00b (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11b (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

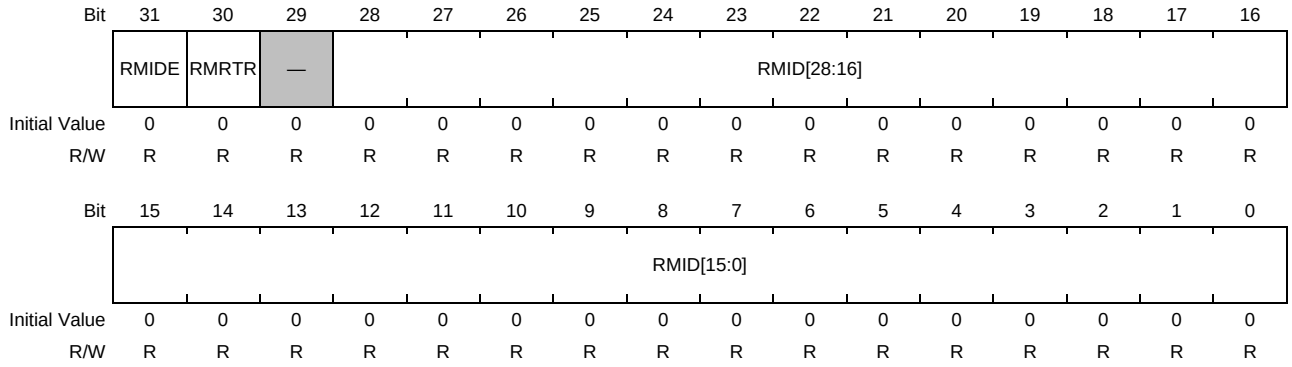
These flags are cleared to 0 in global reset mode.

### 28.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 31)

**Access Size:** RSCFDnCFDRMIDq register can be read only in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRMIDq: <RSCFDn_base> + H'2000 + (H'20 × q)
RSCFDnCFDRMIDqL: <RSCFDn_base> + H'2000 + (H'20 × q),
RSCFDnCFDRMIDqH: <RSCFDn_base> + H'2002 + (H'20 × q)
RSCFDnCFDRMIDqLL: <RSCFDn_base> + H'2000 + (H'20 × q),
RSCFDnCFDRMIDqLH: <RSCFDn_base> + H'2001 + (H'20 × q),
RSCFDnCFDRMIDqHL: <RSCFDn_base> + H'2002 + (H'20 × q),
RSCFDnCFDRMIDqHH: <RSCFDn_base> + H'2003 + (H'20 × q)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RMIDE | 0 | R | Receive Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | RMRTR | 0 | R | Receive Buffer RTR/RRS<br>• When the received message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>• When the received message is a CANFD frame<br>The RRS bit value of the received message can be read. |
| 29 | — | 0 | R | Reserved<br>This bit is read as the value after reset. |
| 28 to 0 | RMID[28:0] | All 0 | R | Receive Buffer ID Data<br>These bits contain the standard ID or extended ID of the received message.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

#### RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CANFD frame, this bit indicates the RRS bit value in the message.

**RMID[28:0] Bits**

These bits contain the ID of the message stored in the receive buffer.

### 28.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)

**Access Size:** RSCFDnCFDRMPTRq register can be read only in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRMPTRq: <RSCFDn_base> + H'2004 + (H'20 × q)
RSCFDnCFDRMPTRqL: <RSCFDn_base> + H'2004 + (H'20 × q),
RSCFDnCFDRMPTRqH: <RSCFDn_base> + H'2006 + (H'20 × q)
RSCFDnCFDRMPTRqLL: <RSCFDn_base> + H'2004 + (H'20 × q),
RSCFDnCFDRMPTRqLH: <RSCFDn_base> + H'2005 + (H'20 × q),
RSCFDnCFDRMPTRqHL: <RSCFDn_base> + H'2006 + (H'20 × q),
RSCFDnCFDRMPTRqHH: <RSCFDn_base> + H'2007 + (H'20 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RMDLC[3:0] | | | | RMPTR[11:0] | | | | | | | | | | | |

| 1 | 1 | 1 | 0 | | 48 data bytes |
| 1 | 1 | 1 | 1 | | 64 data bytes |

#### RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

#### RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

#### RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

### 28.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CANFD Status Register (q = 0 to 31)

**Access Size:** RSCFDnCFDRMFDSTSq register can be read only in 32-bit units
RSCFDnCFDRMFDSTSqL, RSCFDnCFDRMFDSTSqH registers can be read only in 16-bit units
RSCFDnCFDRMFDSTSqLL, RSCFDnCFDRMFDSTSqLH, RSCFDnCFDRMFDSTSqHL, RSCFDnCFDRMFDSTSqHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRMFDSTSq: <RSCFDn_base> + H'2008 + (H'20 × q)
RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + H'2008 + (H'20 × q),
RSCFDnCFDRMFDSTSqH: <RSCFDn_base> + H'200A + (H'20 × q)
RSCFDnCFDRMFDSTSqLL: <RSCFDn_base> + H'2008 + (H'20 × q),
RSCFDnCFDRMFDSTSqLH: <RSCFDn_base> + H'2009 + (H'20 × q),
RSCFDnCFDRMFDSTSqHL: <RSCFDn_base> + H'200A + (H'20 × q),
RSCFDnCFDRMFDSTSqHH: <RSCFDn_base> + H'200B + (H'20 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 2 | RMFDF | 0 | R | FDF<br>0: Classical CAN frame<br>1: CANFD frame |
| 1 | RMBRS | 0 | R | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | RMESI | 0 | R | ESI<br>0: Error active node<br>1: Error passive node |

#### RMFDF Bit

This bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the receive buffer.

#### RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

#### RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

### 28.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 31)

**Access Size:** RSCFDnCFDRMDFb_q register can be read only in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRMDFb_q: <RSCFDn_base> + H'200C + (H'04 × b) + (H'20 × q)
RSCFDnCFDRMDFb_qL: <RSCFDn_base> + H'200C + (H'04 × b) + (H'20 × q),
RSCFDnCFDRMDFb_qH: <RSCFDn_base> + H'200E + (H'04 × b) + (H'20 × q)
RSCFDnCFDRMDFb_qLL: <RSCFDn_base> + H'200C + (H'04 × b) + (H'20 × q),
RSCFDnCFDRMDFb_qLH: <RSCFDn_base> + H'200D + (H'04 × b) + (H'20 × q),
RSCFDnCFDRMDFb_qHL: <RSCFDn_base> + H'200E + (H'04 × b) + (H'20 × q),
RSCFDnCFDRMDFb_qHH: <RSCFDn_base> + H'200F + (H'04 × b) + (H'20 × q)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | Receive Buffer Data Byte 4 × b + 0 |
| 15 to 8 | RMDB4 × b + 1 [7:0] | All 0 | R | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RMDB4 × b + 0 [7:0] | All 0 | R | |

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as H'00.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

## 28.4.7 Details of Receive FIFO Buffer-related Registers

### 28.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

**Access Size:** RSCFDnCFDRFCCx register can be read/written in 32-bit units
RSCFDnCFDRFCCxL, RSCFDnCFDRFCCxH registers can be read/written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH, RSCFDnCFDRFCCxHL, RSCFDnCFDRFCCxHH registers can be read/written in 8- bit units

**Address(es):** RSCFDnCFDRFCCx: <RSCFDn_base> + H'00B8 + (H'04 × x)
RSCFDnCFDRFCCxL: <RSCFDn_base> + H'00B8 + (H'04 × x),
RSCFDnCFDRFCCxH: <RSCFDn_base> + H'00BA + (H'04 × x)
RSCFDnCFDRFCCxLL: <RSCFDn_base> + H'00B8 + (H'04 × x),
RSCFDnCFDRFCCxLH: <RSCFDn_base> + H'00B9 + (H'04 × x),
RSCFDnCFDRFCCxHL: <RSCFDn_base> + H'00BA + (H'04 × x),
RSCFDnCFDRFCCxHH: <RSCFDn_base> + H'00BB + (H'04 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001b (4 messages), set the RFIGCV[2:0] bits to 001b, 011b, 101b, or 111b. Modify these bits only in global reset mode.

### RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

### RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000b, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

### RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

### RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

### RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

### 28.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

**Access Size:** RSCFDnCFDRFSTSx register can be read/written in 32-bit units
RSCFDnCFDRFSTSxL, RSCFDnCFDRFSTSxH registers can be read/written in 16-bit units
RSCFDnCFDRFSTSxLL, RSCFDnCFDRFSTSxLH, RSCFDnCFDRFSTSxHL, RSCFDnCFDRFSTSxHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDRFSTSx: <RSCFDn_base> + H'00D8 + (H'04 × x)
RSCFDnCFDRFSTSxL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCFDnCFDRFSTSxH: <RSCFDn_base> + H'00DA + (H'04 × x)
RSCFDnCFDRFSTSxLL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCFDnCFDRFSTSxLH: <RSCFDn_base> + H'00D9 + (H'04 × x),
RSCFDnCFDRFSTSxHL: <RSCFDn_base> + H'00DA + (H'04 × x),
RSCFDnCFDRFSTSxHH: <RSCFDn_base> + H'00DB + (H'04 × x)

**Initial Value:** H'0000 0001

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFMC[7:0] | | | | | | | | — | — | — | — | RFIF | RFMLT | RFFLL | RFEMP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 15 to 8 | RFMC[7:0] | All 0 | R | Receive FIFO Unread Message Counter<br>The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset.<br>When writing to these bits, write the value after reset. |
| 3 | RFIF | 0 | R/W*1 | Receive FIFO Interrupt Request Flag<br>0: No receive FIFO interrupt request is present.<br>1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | 0 | R/W*1 | Receive FIFO Message Lost Flag<br>0: No receive FIFO message is lost.<br>1: A receive FIFO message is lost. |
| 1 | RFFLL | 0 | R | Receive FIFO Buffer Full Status Flag<br>0: The receive FIFO buffer is not full.<br>1: The receive FIFO buffer is full. |
| 0 | RFEMP | 1 | R | Receive FIFO Buffer Empty Status Flag<br>0: The receive FIFO buffer contains unread message.<br>1: The receive FIFO buffer contains no unread message (buffer empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes H'00 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is H'00 in global reset mode.

#### RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

#### RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

#### RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

#### RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

### 28.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

**Access Size:** RSCFDnCFDRFPCTRx register can only be written in 32-bit units
RSCFDnCFDRFPCTRxL, RSCFDnCFDRFPCTRxH registers can only be written in 16-bit units
RSCFDnCFDRFPCTRxLL, RSCFDnCFDRFPCTRxLH, RSCFDnCFDRFPCTRxHL, RSCFDnCFDRFPCTRxHH registers can only be written in 8-bit units

**Address(es):** RSCFDnCFDRFPCTRx: <RSCFDn_base> + H'00F8 + (H'04 × x)
RSCFDnCFDRFPCTRxL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCFDnCFDRFPCTRxH: <RSCFDn_base> + H'00FA + (H'04 × x)
RSCFDnCFDRFPCTRxLL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCFDnCFDRFPCTRxLH: <RSCFDn_base> + H'00F9 + (H'04 × x),
RSCFDnCFDRFPCTRxHL: <RSCFDn_base> + H'00FA + (H'04 × x),
RSCFDnCFDRFPCTRxHH: <RSCFDn_base> + H'00FB + (H'04 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RFPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should be the value after reset. |
| 7 to 0 | RFPC[7:0] | All 0 | W | Receive FIFO Pointer Control<br>When these bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer. |

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

#### RFPC[7:0] Bits

When the RFPC[7:0] bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write H'FF to the RFPC[7:0] bits. When writing H'FF to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

### 28.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

**Access Size:** RSCFDnCFDRFIDx register can be read only in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRFIDx: <RSCFDn_base> + H'3000 + (H'80 × x)
RSCFDnCFDRFIDxL: <RSCFDn_base> + H'3000 + (H'80 × x),
RSCFDnCFDRFIDxH: <RSCFDn_base> + H'3002 + (H'80 × x)
RSCFDnCFDRFIDxLL: <RSCFDn_base> + H'3000 + (H'80 × x),
RSCFDnCFDRFIDxLH: <RSCFDn_base> + H'3001 + (H'80 × x),
RSCFDnCFDRFIDxHL: <RSCFDn_base> + H'3002 + (H'80 × x),
RSCFDnCFDRFIDxHH: <RSCFDn_base> + H'3003 + (H'80 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 29 | — | 0 | R | Reserved<br>This bit is read as the value after reset. |
| 28 to 0 | RFID[28:0] | All 0 | R | Receive FIFO Buffer ID Data<br>The standard ID or extended ID of received message can be read.<br>Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

#### RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

#### RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CANFD frame, this bit indicates the RRS bit value in the message.

**RFID[28:0] Bits**

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 28.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

**Access Size:** RSCFDnCFDRFPTRx register can be read only in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers can be read only in 8- bit units

**Address(es):** RSCFDnCFDRFPTRx: <RSCFDn_base> + H'3004 + (H'80 × x)
RSCFDnCFDRFPTRxL: <RSCFDn_base> + H'3004 + (H'80 × x),
RSCFDnCFDRFPTRxH: <RSCFDn_base> + H'3006 + (H'80 × x)
RSCFDnCFDRFPTRxLL: <RSCFDn_base> + H'3004 + (H'80 × x),

| 15 to 0 | RFTS[15:0] | All 0 | R | Receive FIFO Buffer Timestamp Data<br>Timestamp value of the received message can be read. |

**RFDLC[3:0] Bits**

These bits contain the data length of the message stored in the receive FIFO buffer.

**RFPTR[11:0] Bits**

These bits contain the label information of the message stored in the receive FIFO buffer.

**RFTS[15:0] Bits**

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

### 28.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CANFD Status Register (x = 0 to 7)

**Access Size:** RSCFDnCFDRFFDSTSx register can be read only in 32-bit units
RSCFDnCFDRFFDSTSxL, RSCFDnCFDRFFDSTSxH registers can be read only in 16-bit units
RSCFDnCFDRFFDSTSxLL, RSCFDnCFDRFFDSTSxLH, RSCFDnCFDRFFDSTSxHL, RSCFDnCFDRFFDSTSxHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRFFDSTSx: <RSCFDn_base> + H'3008 + (H'80 × x)
RSCFDnCFDRFFDSTSxL: <RSCFDn_base> + H'3008 + (H'80 × x),
RSCFDnCFDRFFDSTSxH: <RSCFDn_base> + H'300A + (H'80 × x)
RSCFDnCFDRFFDSTSxLL: <RSCFDn_base> + H'3008 + (H'80 × x),
RSCFDnCFDRFFDSTSxLH: <RSCFDn_base> + H'3009 + (H'80 × x),
RSCFDnCFDRFFDSTSxHL: <RSCFDn_base> + H'300A + (H'80 × x),
RSCFDnCFDRFFDSTSxHH: <RSCFDn_base> + H'300B + (H'80 × x)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

#### RFFDF Bit

This bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the receive FIFO buffer.

#### RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

#### RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

### 28.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)

**Access Size:** RSCFDnCFDRFDFd_x register can be read only in 32-bit units
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers can be read only in 16-bit units
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRFDFd_x: <RSCFDn_base> + H'300C + (H'04 × d) + (H'80 × x)
RSCFDnCFDRFDFd_xL: <RSCFDn_base> + H'300C + (H'04 × d) + (H'80 × x),
RSCFDnCFDRFDFd_xH: <RSCFDn_base> + H'300E + (H'04 × d) + (H'80 × x)

| | | | | Receive Buffer Data Byte 4 × d + 0 |
| 15 to 8 | RFDB4 × d + 1 [7:0] | All 0 | R | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RFDB4 × d + 0 [7:0] | All 0 | R | |

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as H'00.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register.

Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area larger than the specified size.

## 28.4.8 Transmit/Receive FIFO Buffer-related Registers

### 28.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)

**Access Size:** RSCFDnCFDCFCCk register can be read/written in 32-bit units
RSCFDnCFDCFCCkL, RSCFDnCFDCFCCkH registers can be read/written in 16-bit units
RSCFDnCFDCFCCkLL, RSCFDnCFDCFCCkLH, RSCFDnCFDCFCCkHL, RSCFDnCFDCFCCkHH registers can be read/written in 8- bit units

**Address(es):** RSCFDnCFDCFCCk: <RSCFDn_base> + H'0118 + (H'04 × k)
RSCFDnCFDCFCCkL: <RSCFDn_base> + H'0118 + (H'04 × k),
RSCFDnCFDCFCCkH: <RSCFDn_base> + H'011A + (H'04 × k)
RSCFDnCFDCFCCkLL: <RSCFDn_base> + H'0118 + (H'04 × k),
RSCFDnCFDCFCCkLH: <RSCFDn_base> + H'0119 + (H'04 × k),
RSCFDnCFDCFCCkHL: <RSCFDn_base> + H'011A + (H'04 × k),
RSCFDnCFDCFCCkHH: <RSCFDn_base> + H'011B + (H'04 × k)

**Initial Value:** H'0000 0000

| 0 | CFE | 0 | R/W | Transmit/Receive FIFO Buffer Enable<br>0: No transmit/receive FIFO buffer is used.<br>1: Transmit/receive FIFO buffers are used. |

#### CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

#### CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 28.11** and **Table 28.12**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p. Setting the CFDC[2:0] bits to 001b or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel that does not handle the CANFD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

#### CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00b (receive mode) or 10b (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001b (4 messages), set the CFIGCV[2:0] bits to 001b, 011b, 101b, or 111b.

Modify these bits only in global reset mode.

#### CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

#### CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000b, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

#### CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

#### CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/ receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

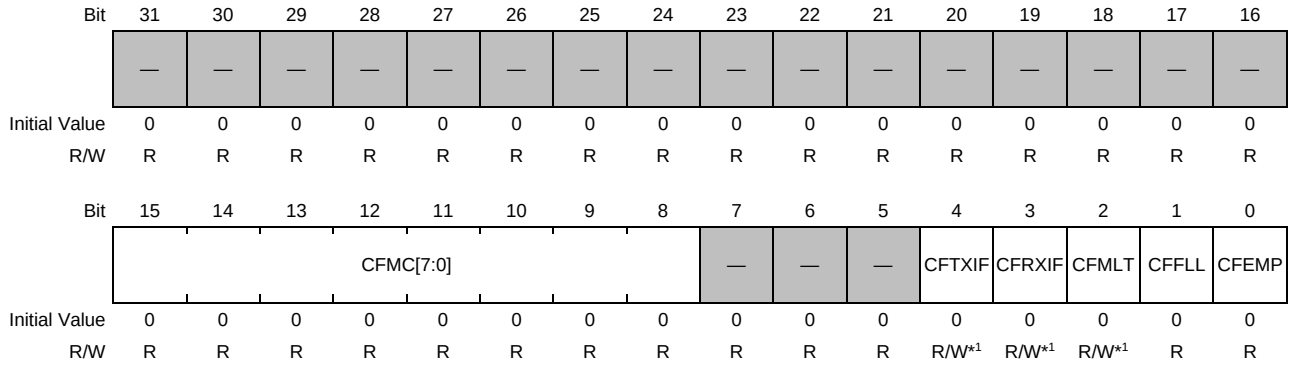
After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

### 28.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)

**Access Size:** RSCFDnCFDCFSTSk register can be read/written in 32-bit units
RSCFDnCFDCFSTSkL, RSCFDnCFDCFSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFSTSkLL, RSCFDnCFDCFSTSkLH, RSCFDnCFDCFSTSkHL, RSCFDnCFDCFSTSkHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCFSTSk: <RSCFDn_base> + H'0178 + (H'04 × k)
RSCFDnCFDCFSTSkL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCFDnCFDCFSTSkH: <RSCFDn_base> + H'017A + (H'04 × k)
RSCFDnCFDCFSTSkLL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCFDnCFDCFSTSkLH: <RSCFDn_base> + H'0179 + (H'04 × k),
RSCFDnCFDCFSTSkHL: <RSCFDn_base> + H'017A + (H'04 × k),
RSCFDnCFDCFSTSkHH: <RSCFDn_base> + H'017B + (H'04 × k)

**Initial Value:** H'0000 0001



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 15 to 8 | CFMC[7:0] | All 0 | R | Transmit/Receive FIFO Message Counter<br>The number of messages stored in the transmit/receive FIFO buffer. |
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are read as the value after reset.<br>When writing to these bits, write the value after reset. |
| 4 | CFTXIF | 0 | R/W*1 | Transmit/Receive FIFO Transmit Interrupt Request Flag<br>0: No transmit/receive FIFO transmit interrupt request is present.<br>1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | 0 | R/W*1 | Transmit/Receive FIFO Receive Interrupt Request Flag<br>0: No transmit/receive FIFO receive interrupt request is present.<br>1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | 0 | R/W*1 | Transmit/Receive FIFO Message Lost Flag<br>0: No transmit/receive FIFO message is lost.<br>1: A transmit/receive FIFO message is lost. |
| 1 | CFFLL | 0 | R | Transmit/Receive FIFO Buffer Full Status Flag<br>0: The transmit/receive FIFO buffer is not full.<br>1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | 0 | R | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: The transmit/receive FIFO buffer contains messages.<br>1: The transmit/receive FIFO buffer contains no message (buffer empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01b (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00b (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10b (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00b: In global reset mode
- When CFM[1:0] value is 01b or 10b: In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0.

#### CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01b or 10b, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

### CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

### CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01b: A value of H’FF has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 28.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)

**Access Size:** RSCFDnCFDCFPCTRk register can only be written in 32-bit units
RSCFDnCFDCFPCTRkL, RSCFDnCFDCFPCTRkH registers can only be written in 16-bit units
RSCFDnCFDCFPCTRkLL, RSCFDnCFDCFPCTRkLH, RSCFDnCFDCFPCTRkHL, RSCFDnCFDCFPCTRkHH registers can only be written in 8-bit units

**Address(es):** RSCFDnCFDCFPCTRk: <RSCFDn_base> + H'01D8 + (H'04 × k)
RSCFDnCFDCFPCTRkL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCFDnCFDCFPCTRkH: <RSCFDn_base> + H'01DA + (H'04 × k)
RSCFDnCFDCFPCTRkLL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCFDnCFDCFPCTRkLH: <RSCFDn_base> + H'01D9 + (H'04 × k),
RSCFDnCFDCFPCTRkHL: <RSCFDn_base> + H'01DA + (H'04 × k),
RSCFDnCFDCFPCTRkHH: <RSCFDn_base> + H'01DB + (H'04 × k)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CFPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should be the value after reset. |
| 7 to 0 | CFPC[7:0] | All 0 | W | Transmit/Receive FIFO Pointer Control<br>• Receive mode:<br>Writing H'FF to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer.<br>• Transmit mode:<br>Writing H'FF to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer.<br>• Gateway mode:<br>Setting prohibited |

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

**CFPC[7:0] Bits**

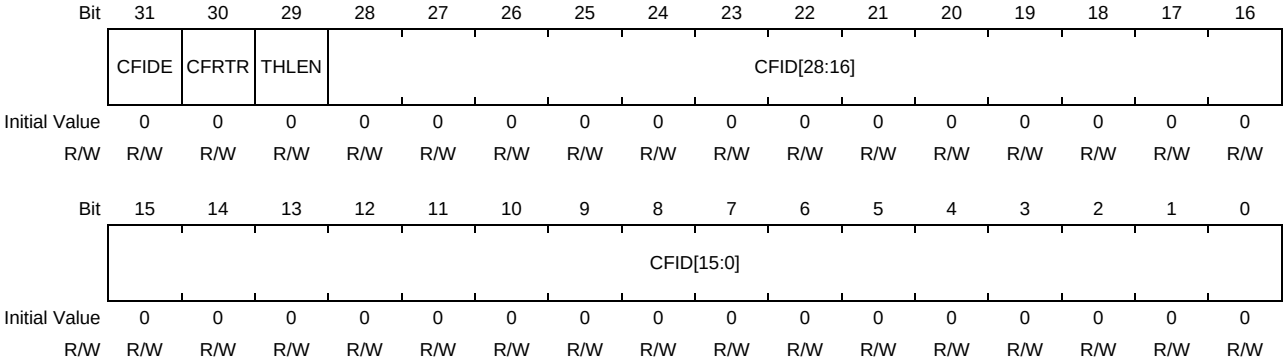
- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00b):
  Writing H'FF to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b):
  Writing H'FF to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10b):
  Setting prohibited

### 28.4.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)

**Access Size:** RSCFDnCFDCFIDk register can be read/written in 32-bit units
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read/written in 16-bit units
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCFIDk: <RSCFDn_base> + H'3400 + (H'80 × k)
RSCFDnCFDCFIDkL: <RSCFDn_base> + H'3400 + (H'80 × k),
RSCFDnCFDCFIDkH: <RSCFDn_base> + H'3402 + (H'80 × k)
RSCFDnCFDCFIDkLL: <RSCFDn_base> + H'3400 + (H'80 × k),
RSCFDnCFDCFIDkLH: <RSCFDn_base> + H'3401 + (H'80 × k),
RSCFDnCFDCFIDkHL: <RSCFDn_base> + H'3402 + (H'80 × k),
RSCFDnCFDCFIDkHH: <RSCFDn_base> + H'3403 + (H'80 × k)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | CFIDE | 0 | R/W | Transmit/Receive FIFO Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | CFRTR | 0 | R/W | Transmit/Receive FIFO Buffer RTR/RRS<br>• When the CFM[1:0] value is 01b (transmit mode)<br>– When the transmit message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>– When the transmit message is a CANFD frame Write 0 to this bit.<br>• When the CFM[1:0] value is 00b (receive mode)<br>– When the received message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>– When the received message is a CANFD frame<br>The RRS bit value of the received message can be read. |
| 29 | THLEN | 0 | R/W | Transmit History Data Store Enable<br>This bit is valid only when the CFM[1:0] value is 01b (transmit mode).<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 28 to 0 | CFID[28:0] | All 0 | R/W | Transmit/Receive FIFO Buffer ID Data<br>• When CFM[1:0] value is 01b (transmit mode):<br>Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.<br>• When CFM[1:0] value is 00b (receive mode):<br>Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0. |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

### CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

### CFRTR Bit

If the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. If the received message is a CANFD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01b, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CANFD frame), set this bit to 0.

### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01b (transmit mode).

### CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b.

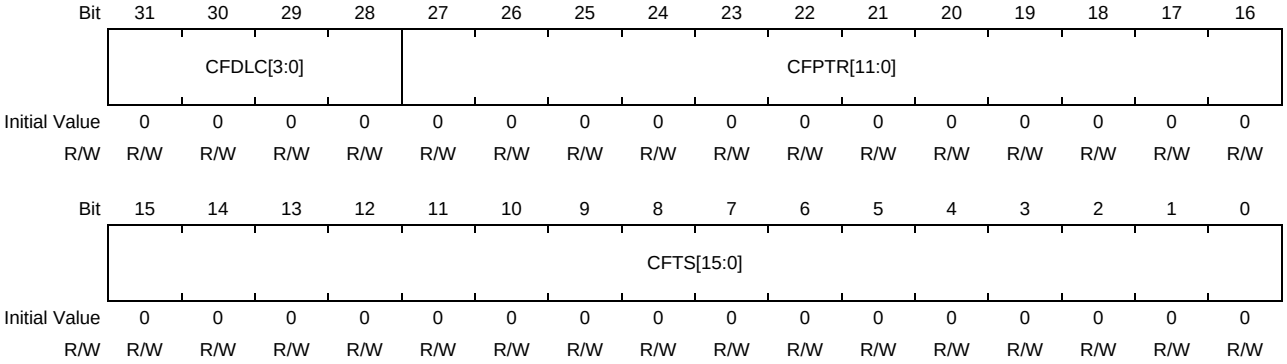
When the CFM[1:0] value is 01b, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

### 28.4.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)

**Access Size:** RSCFDnCFDCFPTRk register can be read/written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read/written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCFPTRk: <RSCFDn_base> + H'3404 + (H'80 × k)
RSCFDnCFDCFPTRkL: <RSCFDn_base> + H'3404 + (H'80 × k),
RSCFDnCFDCFPTRkH: <RSCFDn_base> + H'3406 + (H'80 × k)
RSCFDnCFDCFPTRkLL: <RSCFDn_base> + H'3404 + (H'80 × k),
RSCFDnCFDCFPTRkLH: <RSCFDn_base> + H'3405 + (H'80 × k),
RSCFDnCFDCFPTRkHL: <RSCFDn_base> + H'3406 + (H'80 × k),
RSCFDnCFDCFPTRkHH: <RSCFDn_base> + H'3407 + (H'80 × k)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 30 to 28 | CFDLC[3:0] | All 0 | R/W | Transmit/Receive FIFO Buffer DLC Data |

| 1 | 1 | 1 | 0 | | 48 data bytes |
| 1 | 1 | 1 | 1 | | 64 data bytes |

| | | | | |
|---|---|---|---|---|
| 27 to 16 | CFPTR[11:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Label Data<br>• When CFM[1:0] value is 01b (transmit mode):<br>Set the label information to be stored in the transmit history buffer.<br>Only bits CFPTR[7:0] are valid.<br>• When CFM[1:0] value is 00b (receive mode):<br>The label information of the received message can be read. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 0 | CFTS[15:0] | All 0 | R/W | Transmit/Receive FIFO Buffer Timestamp Data<br>These bits are valid only when the CFM[1:0] value is 00b (receive mode).<br>The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

### CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b.

When the CFM[1:0] value is 01b, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001b or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CANFD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000b to 1111b is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by H’CC.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

### CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

### CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer. These bits are valid when the CFM[1:0] value is 00b.

### 28.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CANFD Configuration/ Status Register (k = 0 to 5)

**Access Size:** RSCFDnCFDCFFDCSTSk register can be read/written in 32-bit units
RSCFDnCFDCFFDCSTSkL, RSCFDnCFDCFFDCSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFFDCSTSkLL, RSCFDnCFDCFFDCSTSkLH, RSCFDnCFDCFFDCSTSkHL, RSCFDnCFDCFFDCSTSkHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCFFDCSTSk: <RSCFDn_base> + H'3408 + (H'80 × k)
RSCFDnCFDCFFDCSTSkL: <RSCFDn_base> + H'3408 + (H'80 × k),
RSCFDnCFDCFFDCSTSkH: <RSCFDn_base> + H'340A + (H'80 × k)
RSCFDnCFDCFFDCSTSkLL: <RSCFDn_base> + H'3408 + (H'80 × k),
RSCFDnCFDCFFDCSTSkLH: <RSCFDn_base> + H'3409 + (H'80 × k),
RSCFDnCFDCFFDCSTSkHL: <RSCFDn_base> + H'340A + (H'80 × k),
RSCFDnCFDCFFDCSTSkHH: <RSCFDn_base> + H'340B + (H'80 × k)

**Initial Value:** H'0000 0000

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 2 | CFFDF | 0 | R/W | FDF<br>0: Classical CAN frame<br>1: CANFD frame |
| 1 | CFBRS | 0 | R/W | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | CFESI | 0 | R/W | ESI<br>0: Error active node<br>1: Error passive node |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). Do not read or write this register when the CFM[1:0] value is 10b (gateway mode).

#### CFFDF Bit

When the CFM[1:0] value is 00b, this bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01b, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

### CFBRS Bit

When the CFM[1:0] value is 00b, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01b, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

### CFESI Bit

When the CFM[1:0] value is 00b, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01b, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

### 28.4.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 5)

**Access Size:** RSCFDnCFDCFDFd_k register can be read/written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read/written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDCFDFd_k: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k)
RSCFDnCFDCFDFd_kL: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kH: <RSCFDn_base> + H'340E + (H'04 × d) + (H'80 × k)
RSCFDnCFDCFDFd_kLL: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kLH: <RSCFDn_base> + H'340D + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kHL: <RSCFDn_base> + H'340E + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kHH: <RSCFDn_base> + H'340F + (H'04 × d) + (H'80 × k)

**Initial Value:** H'0000 0000

| 15 to 8 | CFDB4 × d + 1 [7:0] | All 0 | R/W | |
| 7 to 0 | CFDB4 × d + 0 [7:0] | All 0 | R/W | |

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as H'00.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size.

This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

## 28.4.9 Details of FIFO Status-related Registers

### 28.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

**Access Size:** RSCFDnCFDFESTS register can be read only in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers can be read only in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDFESTS: <RSCFDn_base> + H'0238
RSCFDnCFDFESTSL: <RSCFDn_base> + H'0238, RSCFDnCFDFESTSH: <RSCFDn_base> + H'023A
RSCFDnCFDFESTSLL: <RSCFDn_base> + H'0238, RSCFDnCFDFESTSLH: <RSCFDn_base> + H'0239,
RSCFDnCFDFESTSHL: <RSCFDn_base> + H'023A, RSCFDnCFDFESTSHH: <RSCFDn_base> + H'023B

**Initial Value:** H'03FF FFFF

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | H'0_0FFF | R | Reserved<br>These bits are read as the value after reset. |
| 13 | CF5EMP | 1 | R | Transmit/Receive FIFO Buffer Empty Status Flag<br>0: Transmit/receive FIFO buffer k contains a message.<br>1: Transmit/receive FIFO buffer k contains no message.<br>(k = 0 to 5) |
| 12 | CF4EMP | 1 | R | |
| 11 | CF3EMP | 1 | R | |
| 10 | CF2EMP | 1 | R | |
| 9 | CF1EMP | 1 | R | |
| 8 | CF0EMP | 1 | R | |
| 7 | RF7EMP | 1 | R | Receive FIFO Buffer Empty Status Flag<br>0: Receive FIFO buffer x contains an unread message.<br>1: Receive FIFO buffer x contains no unread message (buffer empty).<br>(x = 0 to 7) |
| 6 | RF6EMP | 1 | R | |
| 5 | RF5EMP | 1 | R | |
| 4 | RF4EMP | 1 | R | |
| 3 | RF3EMP | 1 | R | |
| 2 | RF2EMP | 1 | R | |
| 1 | RF1EMP | 1 | R | |
| 0 | RF0EMP | 1 | R | |

This RSCFDnCFDFESTS register is set to 03FF H'FFFF in global reset mode.

### CFkEMP Flag (k = 0 to 5)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

### RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

### 28.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

**Access Size:** RSCFDnCFDFFSTS register can be read only in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers can be read only in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDFFSTS: <RSCFDn_base> + H'023C
RSCFDnCFDFFSTSL: <RSCFDn_base> + H'023C, RSCFDnCFDFFSTSH: <RSCFDn_base> + H'023E
RSCFDnCFDFFSTSLL: <RSCFDn_base> + H'023C, RSCFDnCFDFFSTSLH: <RSCFDn_base> + H'023D,
RSCFDnCFDFFSTSHL: <RSCFDn_base> + H'023E, RSCFDnCFDFFSTSHH: <RSCFDn_base> + H'023F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 13 | CF5FLL | 0 | R | Transmit/Receive FIFO Buffer Full Status Flag<br>0: Transmit/receive buffer k is not full.<br>1: Transmit/receive buffer k is full.<br>(k = 0 to 5) |
| 12 | CF4FLL | 0 | R | |
| 11 | CF3FLL | 0 | R | |
| 10 | CF2FLL | 0 | R | |
| 9 | CF1FLL | 0 | R | |
| 8 | CF0FLL | 0 | R | |
| 7 | RF7FLL | 0 | R | Receive FIFO Buffer Full Status Flag<br>0: Receive FIFO buffer x is not full.<br>1: Receive FIFO buffer x is full.<br>(x = 0 to 7) |
| 6 | RF6FLL | 0 | R | |
| 5 | RF5FLL | 0 | R | |
| 4 | RF4FLL | 0 | R | |
| 3 | RF3FLL | 0 | R | |
| 2 | RF2FLL | 0 | R | |
| 1 | RF1FLL | 0 | R | |
| 0 | RF0FLL | 0 | R | |

The RSCFDnCFDFFSTS register is cleared to H'0000 0000 in global reset mode.

#### CFkFLL Flag (k = 0 to 5)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

**RFxFLL Flag (x = 0 to 7)**

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

### 28.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

**Access Size:** RSCFDnCFDFMSTS register can be read only in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers can be read only in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDFMSTS: <RSCFDn_base> + H'0240
RSCFDnCFDFMSTSL: <RSCFDn_base> + H'0240, RSCFDnCFDFMSTSH: <RSCFDn_base> + H'0242
RSCFDnCFDFMSTSLL: <RSCFDn_base> + H'0240, RSCFDnCFDFMSTSLH: <RSCFDn_base> + H'0241,
RSCFDnCFDFMSTSHL: <RSCFDn_base> + H'0242, RSCFDnCFDFMSTSHH: <RSCFDn_base> + H'0243

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | CF5MLT | CF4MLT | CF3MLT | CF2MLT | CF1MLT | CF0MLT | RF7MLT | RF6MLT | RF5MLT | RF4MLT | RF3MLT | RF2MLT | RF1MLT | RF0MLT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 13 | CF5MLT | 0 | R | Transmit/Receive FIFO Buffer Message Lost Status Flag<br>0: No transmit/receive FIFO buffer k message is lost.<br>1: A transmit/receive FIFO buffer k message is lost.<br>(k = 0 to 5) |
| 12 | CF4MLT | 0 | R | |
| 11 | CF3MLT | 0 | R | |
| 10 | CF2MLT | 0 | R | |
| 9 | CF1MLT | 0 | R | |
| 8 | CF0MLT | 0 | R | |
| 7 | RF7MLT | 0 | R | Receive FIFO Buffer Message Lost Status Flag<br>0: No receive FIFO buffer x message is lost.<br>1: A receive FIFO buffer x message is lost.<br>(x = 0 to 7) |
| 6 | RF6MLT | 0 | R | |
| 5 | RF5MLT | 0 | R | |
| 4 | RF4MLT | 0 | R | |
| 3 | RF3MLT | 0 | R | |
| 2 | RF2MLT | 0 | R | |
| 1 | RF1MLT | 0 | R | |
| 0 | RF0MLT | 0 | R | |

The RSCFDnCFDFMSTS register is cleared to H'0000 0000 in global reset mode.

#### CFkMLT Flag (k = 0 to 5)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

**RFxMLT Flag (x = 0 to 7)**

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

### 28.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

**Access Size:** RSCFDnCFDRFISTS register can be read only in 32-bit units
RSCFDnCFDRFISTSL, RSCFDnCFDRFISTSH registers can be read only in 16-bit units
RSCFDnCFDRFISTSLL, RSCFDnCFDRFISTSLH, RSCFDnCFDRFISTSHL, RSCFDnCFDRFISTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDRFISTS: <RSCFDn_base> + H'0244
RSCFDnCFDRFISTSL: <RSCFDn_base> + H'0244, RSCFDnCFDRFISTSH: <RSCFDn_base> + H'0246
RSCFDnCFDRFISTSLL: <RSCFDn_base> + H'0244, RSCFDnCFDRFISTSLH: <RSCFDn_base> + H'0245,
RSCFDnCFDRFISTSHL: <RSCFDn_base> + H'0246, RSCFDnCFDRFISTSHH: <RSCFDn_base> + H'0247

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | RF7IF | RF6IF | RF5IF | RF4IF | RF3IF | RF2IF | RF1IF | RF0IF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 7 | RF7IF | 0 | R | Receive FIFO Buffer Interrupt Request Status Flag<br>0: No receive FIFO buffer x interrupt request is present.<br>1: A receive FIFO buffer x interrupt request is present.<br>(x = 0 to 7) |
| 6 | RF6IF | 0 | R | |
| 5 | RF5IF | 0 | R | |
| 4 | RF4IF | 0 | R | |
| 3 | RF3IF | 0 | R | |
| 2 | RF2IF | 0 | R | |
| 1 | RF1IF | 0 | R | |
| 0 | RF0IF | 0 | R | |

The RSCFDnCFDRFISTS register is cleared to H'0000 0000 in global reset mode.

#### RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

### 28.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

**Access Size:** RSCFDnCFDCFRISTS register can be read only in 32-bit units
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers can be read only in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL, RSCFDnCFDCFRISTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDCFRISTS: <RSCFDn_base> + H'0248
RSCFDnCFDCFRISTSL: <RSCFDn_base> + H'0248, RSCFDnCFDCFRISTSH: <RSCFDn_base> + H'024A
RSCFDnCFDCFRISTSLL: <RSCFDn_base> + H'0248, RSCFDnCFDCFRISTSLH: <RSCFDn_base> + H'0249,
RSCFDnCFDCFRISTSHL: <RSCFDn_base> + H'024A, RSCFDnCFDCFRISTSHH: <RSCFDn_base> + H'024B

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CF5RXIF | CF4RXIF | CF3RXIF | CF2RXIF | CF1RXIF | CF0RXIF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 5 | CF5RXIF | 0 | R | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k receive interrupt request is present.<br>1: A transmit/receive FIFO buffer k receive interrupt request is present.<br>(k = 0 to 5) |
| 4 | CF4RXIF | 0 | R | |
| 3 | CF3RXIF | 0 | R | |
| 2 | CF2RXIF | 0 | R | |
| 1 | CF1RXIF | 0 | R | |
| 0 | CF0RXIF | 0 | R | |

The RSCFDnCFDCFRISTS register is cleared to H'0000 0000 in global reset mode.

#### CFkRXIF Flag (k = 0 to 5)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

### 28.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

**Access Size:** RSCFDnCFDCFTISTS register can be read only in 32-bit units
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers can be read only in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL, RSCFDnCFDCFTISTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDCFTISTS: <RSCFDn_base> + H'024C
RSCFDnCFDCFTISTSL: <RSCFDn_base> + H'024C, RSCFDnCFDCFTISTSH: <RSCFDn_base> + H'024E
RSCFDnCFDCFTISTSLL: <RSCFDn_base> + H'024C, RSCFDnCFDCFTISTSLH: <RSCFDn_base> + H'024D,
RSCFDnCFDCFTISTSHL: <RSCFDn_base> + H'024E, RSCFDnCFDCFTISTSHH: <RSCFDn_base> + H'024F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | CF5TXIF | CF4TXIF | CF3TXIF | CF2TXIF | CF1TXIF | CF0TXIF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 6 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. |
| 5 | CF5TXIF | 0 | R | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag<br>0: No transmit/receive FIFO buffer k transmit interrupt request is present.<br>1: A transmit/receive FIFO buffer k transmit interrupt request is present.<br>(k = 0 to 5) |
| 4 | CF4TXIF | 0 | R | |
| 3 | CF3TXIF | 0 | R | |
| 2 | CF2TXIF | 0 | R | |
| 1 | CF1TXIF | 0 | R | |
| 0 | CF0TXIF | 0 | R | |

The RSCFDnCFDCFTISTS register is cleared to H'0000 0000 in global reset mode.

#### CFkTXIF Flag (k = 0 to 5)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

## 28.4.10 Details of FIFO DMA-related Registers

### 28.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register

**Access Size:** RSCFDnCFDCDTCT register can be read/written in 32-bit units
RSCFDnCFDCDTCTL, RSCFDnCFDCDTCTH registers can be read/written in 16-bit units
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH, RSCFDnCFDCDTCTHL, RSCFDnCFDCDTCTHH registers can be read/written in 8- bit units

**Address(es):** RSCFDnCFDCDTCT: <RSCFDn_base> + H'0490
RSCFDnCFDCDTCTL: <RSCFDn_base> + H'0490
RSCFDnCFDCDTCTH: <RSCFDn_base> + H'0492
RSCFDnCFDCDTCTLL: <RSCFDn_base> + H'0490, RSCFDnCFDCDTCTLH: <RSCFDn_base> + H'0491,
RSCFDnCFDCDTCTHL: <RSCFDn_base> + H'0492, RSCFDnCFDCDTCTHH: <RSCFDn_base> + H'0493

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| 1 | RFDMAE1 | 0 | R/W | |
| 0 | RFDMAE0 | 0 | R/W | |

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

### CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to 00b (receive mode). Set this bit to 0 when the CFM[1:0] value is 01b (transmit mode) or 10b (gateway mode).

### RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

### 28.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register

**Access Size:** RSCFDnCFDCDTSTS register can be read only in 32-bit units
RSCFDnCFDCDTSTSL, RSCFDnCFDCDTSTSH registers can be read only in 16-bit units
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH, RSCFDnCFDCDTSTSHL, RSCFDnCFDCDTSTSHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDCDTSTS: <RSCFDn_base> + H'0494
RSCFDnCFDCDTSTSL: <RSCFDn_base> + H'0494
RSCFDnCFDCDTSTSH: <RSCFDn_base> + H'0496
RSCFDnCFDCDTSTSLL: <RSCFDn_base> + H'0494, RSCFDnCFDCDTSTSLH: <RSCFDn_base> + H'0495,
RSCFDnCFDCDTSTSHL: <RSCFDn_base> + H'0496, RSCFDnCFDCDTSTSHH: <RSCFDn_base> + H'0497

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 2 | RFDMASTS2 | 0 | R | |
| 1 | RFDMASTS1 | 0 | R | |
| 0 | RFDMASTS0 | 0 | R | |

**CFDMASTSm Bit**

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

**RFDMASTSx Bit**

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMAEx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area)

These bits are cleared to 0 in global reset mode.

## 28.4.11 Details of Transmit Buffer-related Registers

### 28.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 31)

**Access Size:** RSCFDnCFDTMCp registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMCp: <RSCFDn_base> + H'0250 + (H'01 × p)

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | TMOM | TMTAR | TMTR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMOM | 0 | R/W | One-Shot Transmission Enable<br>0: One-shot transmission is disabled.<br>1: One-shot transmission is enabled. |
| 1 | TMTAR | 0 | R/W*1 | Transmit Abort Request<br>0: Transmit abort is not requested.<br>1: Transmit abort is requested. |
| 0 | TMTR | 0 | R/W*1 | Transmit Request<br>0: Transmission is not requested.<br>1: Transmission is requested. |

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to H'00.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0, 1) register (p = (m × 16 + 15) to (m × 16 + 15 . the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2, (m × 16) + 4, or (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

#### TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

#### TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

#### TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00b.

### 28.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

**Access Size:** RSCFDnCFDTMSTSp registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMSTSp: <RSCFDn_base> + H'02D0 + (H'01 × p)

**Initial Value:** H'00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | TMTARM | TMTRM | TMTRF[1:0] | | TMTSTS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 5 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 4 | TMTARM | 0 | R | Transmit Buffer Transmit Abort Request Status Flag<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 3 | TMTRM | 0 | R | Transmit Buffer Transmit Request Status Flag<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | All 0 | R/W | Transmit Buffer Transmit Result Status Flag<br>b2 b1<br>0 0: Transmission is in progress or no transmit request is present.<br>0 1: Transmit abort has been completed.<br>1 0: Transmission has been completed (without transmit abort request).<br>1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | 0 | R | Transmit Buffer Transmit Status Flag<br>0: Transmission is not in progress.<br>1: Transmission is in progress. |

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

#### TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

#### TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

### TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00b: Transmission is in progress or no transmit request is present.

01b: Transmission from the transmit buffer was aborted.

10b: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

11b: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write 00b to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00b to this flag.

### TMTSTS Flag

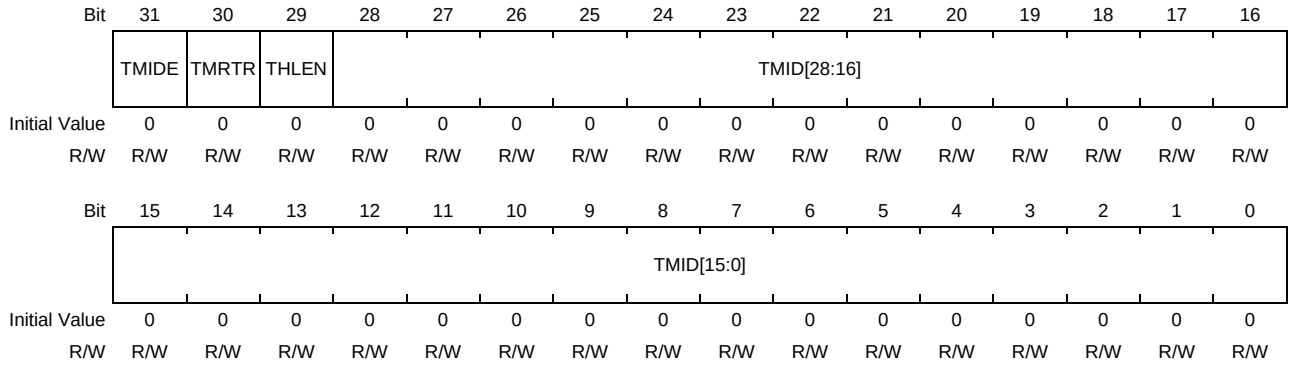
This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

### 28.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 31)

**Access Size:** RSCFDnCFDTMIDp register can be read/written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read/written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMIDp: <RSCFDn_base> + H'4000 + (H'20 × p)
RSCFDnCFDTMIDpL: <RSCFDn_base> + H'4000 + (H'20 × p),
RSCFDnCFDTMIDpH: <RSCFDn_base> + H'4002 + (H'20 × p)
RSCFDnCFDTMIDpLL: <RSCFDn_base> + H'4000 + (H'20 × p),
RSCFDnCFDTMIDpLH: <RSCFDn_base> + H'4001 + (H'20 × p),
RSCFDnCFDTMIDpHL: <RSCFDn_base> + H'4002 + (H'20 × p),
RSCFDnCFDTMIDpHH: <RSCFDn_base> + H'4003 + (H'20 × p)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | TMIDE | 0 | R/W | Transmit Buffer IDE<br>0: Standard ID<br>1: Extended ID |
| 30 | TMRTR | 0 | R/W | Transmit Buffer RTR/RRS<br>• When the transmit message is a classical CAN frame<br>0: Data frame<br>1: Remote frame<br>• When the transmit message is a CANFD frame<br>Write 0 to this bit. |
| 29 | THLEN | 0 | R/W | Transmit History Data Store Enable<br>0: Transmit history data is not stored in the buffer.<br>1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | All 0 | R/W | Transmit Buffer ID Data<br>Set standard ID or extended ID.<br>For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

#### TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

#### TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CANFD frame).

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

#### TMID[28:0] Bits

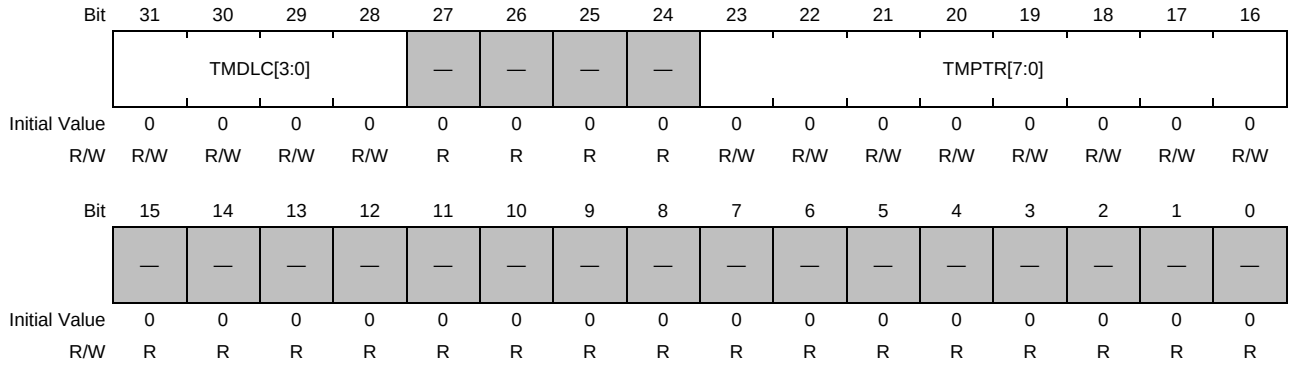
These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 28.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

**Access Size:** RSCFDnCFDTMPTRp register can be read/written in 32-bit units
RSCFDnCFDTMPTRpL, RSCFDnCFDTMPTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMPTRpLL, RSCFDnCFDTMPTRpLH, RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMPTRp: <RSCFDn_base> + H'4004 + (H'20 × p)
RSCFDnCFDTMPTRpL: <RSCFDn_base> + H'4004 + H'(20 × p),
RSCFDnCFDTMPTRpH: <RSCFDn_base> + H'4006 + (H'20 × p)
RSCFDnCFDTMPTRpLL: <RSCFDn_base> + H'4004 + (H'20 × p),
RSCFDnCFDTMPTRpLH: <RSCFDn_base> + H'4005 + (H'20 × p),
RSCFDnCFDTMPTRpHL: <RSCFDn_base> + H'4006 + (H'20 × p),
RSCFDnCFDTMPTRpHH: <RSCFDn_base> + H'4007 + (H'20 × p)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | TMDLC[3:0] | All 0 | R/W | Transmit Buffer DLC Data |

| b31 | b30 | b29 | b28 | Classical CAN Frame | CANFD Frame |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 data bytes | |
| 0 | 0 | 0 | 1 | 1 data byte | |
| 0 | 0 | 1 | 0 | 2 data bytes | |
| 0 | 0 | 1 | 1 | 3 data bytes | |
| 0 | 1 | 0 | 0 | 4 data bytes | |
| 0 | 1 | 0 | 1 | 5 data bytes | |
| 0 | 1 | 1 | 0 | 6 data bytes | |
| 0 | 1 | 1 | 1 | 7 data bytes | |
| 1 | 0 | 0 | 0 | 8 data bytes | |
| 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |
| 1 | 0 | 1 | 0 | | 16 data bytes |
| 1 | 0 | 1 | 1 | | 20 data bytes |
| 1 | 1 | 0 | 0 | | 24 data bytes |
| 1 | 1 | 0 | 1 | | 32 data bytes |
| 1 | 1 | 1 | 0 | | 48 data bytes |
| 1 | 1 | 1 | 1 | | 64 data bytes |

| | | | | |
|---|---|---|---|---|
| 27 to 24 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 23 to 16 | TMPTR[7:0] | All 0 | R/W | Transmit Buffer Label Data<br>Set the label information to be stored in the transmit history buffer. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 0 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001b or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the MFDF bit is 1 (CANFD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000b to 1111b is settable. If a value larger than 1100b is set, payloads exceeding 20 bytes are padded by H’CC.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of 0000b to 1111b is settable. In other cases, set a value of 0000b to 1011b (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

### TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

### 28.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CANFD Configuration Register (p = 0 to 31)

**Access Size:** RSCFDnCFDTMFDCTRp register can be read/written in 32-bit units
RSCFDnCFDTMFDCTRpL, RSCFDnCFDTMFDCTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMFDCTRpLL, RSCFDnCFDTMFDCTRpLH, RSCFDnCFDTMFDCTRpHL, RSCFDnCFDTMFDCTRpHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMFDCTRp: <RSCFDn_base> + H'4008 + (H'20 × p)
RSCFDnCFDTMFDCTRpL: <RSCFDn_base> + H'4008 + (H'20 × p),
RSCFDnCFDTMFDCTRpH: <RSCFDn_base> + H'400A + (H'20 × p)
RSCFDnCFDTMFDCTRpLL: <RSCFDn_base> + H'4008 + (H'20 × p),
RSCFDnCFDTMFDCTRpLH: <RSCFDn_base> + H'4009 + (H'20 × p),
RSCFDnCFDTMFDCTRpHL: <RSCFDn_base> + H'400A + (H'20 × p),
RSCFDnCFDTMFDCTRpHH: <RSCFDn_base> + H'400B + (H'20 × p)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TMFDF | TMBRS | TMESI |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMFDF | 0 | R/W | FDF<br>0: Classical CAN frame<br>1: CANFD frame |
| 1 | TMBRS | 0 | R/W | BRS<br>0: The bit rate in the data area does not change.<br>1: The bit rate in the data area changes. |
| 0 | TMESI | 0 | R/W | ESI<br>0: Error active node<br>1: Error passive node |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

#### TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

### TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

### TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

### 28.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 31)

**Access Size:** RSCFDnCFDTMDFb_p register can be read/written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read/written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMDFb_p: <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p)
RSCFDnCFDTMDFb_pL: <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pH: <RSCFDn_base> + H'400E + (H'04 × b) + (H'20 × p)
RSCFDnCFDTMDFb_pLL: <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pLH: <RSCFDn_base> + H'400D + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pHL: <RSCFDn_base> + H'400E + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pHH: <RSCFDn_base> + H'400F + (H'04 × b) + (H'20 × p)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDB4 × b + 3 [7:0] | | | | | | | | TMDB4 × b + 2 [7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMDB4 × b + 1 [7:0] | | | | | | | | TMDB4 × b + 0 [7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | TMDB4 × b + 3 [7:0] | All 0 | R/W | Transmit Buffer Data Byte 4 × b + 3 |
| | | | | Transmit Buffer Data Byte 4 × b + 2 |
| 23 to 16 | TMDB4 × b + 2 [7:0] | All 0 | R/W | Transmit Buffer Data Byte 4 × b + 1 |
| | | | | Transmit Buffer Data Byte 4 × b + 0 |
| 15 to 8 | TMDB4 × b + 1 [7:0] | All 0 | R/W | Set the transmit buffer data. |
| 7 to 0 | TMDB4 × b + 0 [7:0] | All 0 | R/W | |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

### 28.4.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0)

**Access Size:** RSCFDnCFDTMIECy register can be read/written in 32-bit units
RSCFDnCFDTMIECyL, RSCFDnCFDTMIECyH registers can be read/written in 16-bit units
RSCFDnCFDTMIECyLL, RSCFDnCFDTMIECyLH, RSCFDnCFDTMIECyHL, RSCFDnCFDTMIECyHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTMIECy: <RSCFDn_base> + H'0390 + (H'04 × y)
RSCFDnCFDTMIECyL: <RSCFDn_base> + H'0390 + (H'04 × y),
RSCFDnCFDTMIECyH: <RSCFDn_base> + H'0392 + (H'04 × y)
RSCFDnCFDTMIECyLL: <RSCFDn_base> + H'0390 + (H'04 × y),
RSCFDnCFDTMIECyLH: <RSCFDn_base> + H'0391 + (H'04 × y),
RSCFDnCFDTMIECyHL: <RSCFDn_base> + H'0392 + (H'04 × y),
RSCFDnCFDTMIECyHH: <RSCFDn_base> + H'0393 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMIEp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMIEp | All 0 | R/W | Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmit buffer interrupt is disabled<br>1: Transmit buffer interrupt is enabled |
| 15 to 0 | TMIEp | All 0 | R/W | Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmit buffer interrupt is disabled.<br>1: Transmit buffer interrupt is enabled. |

#### TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

**Table 28.27** shows the bit assignment.

Table 28.27 TMIEp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |
| . | . | . |
| 30 | 1 | 14 |
| 31 | 1 | 15 |

## 28.4.12 Details of Transmit Buffer Status-related Registers

### 28.4.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)

**Access Size:** RSCFDnCFDTMTRSTSy register can be read only in 32-bit units
RSCFDnCFDTMTRSTSyL, RSCFDnCFDTMTRSTSyH registers can be read only in 16-bit units
RSCFDnCFDTMTRSTSyLL, RSCFDnCFDTMTRSTSyLH, RSCFDnCFDTMTRSTSyHL, RSCFDnCFDTMTRSTSyHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDTMTRSTSy: <RSCFDn_base> + H'0350 + (H'04 × y)
RSCFDnCFDTMTRSTSyL: <RSCFDn_base> + H'0350 + (H'04 × y),
RSCFDnCFDTMTRSTSyH: <RSCFDn_base> + H'0352 + (H'04 × y)
RSCFDnCFDTMTRSTSyLL: <RSCFDn_base> + H'0350 + (H'04 × y),
RSCFDnCFDTMTRSTSyLH: <RSCFDn_base> + H'0351 + (H'04 × y),
RSCFDnCFDTMTRSTSyHL: <RSCFDn_base> + H'0352 + (H'04 × y),
RSCFDnCFDTMTRSTSyHH: <RSCFDn_base> + H'0353 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTRSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTRSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMTRSTSp | All 0 | R | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit request is present.<br>1: A transmit request is present. |
| 15 to 0 | TMTRSTSp | All 0 | R | Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit request is present.<br>1: A transmit request is present. |

#### TMTRSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

**Table 28.28** shows the bit assignment.

Table 28.28 TMTRSTSp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |
| . | . | . |

| 31 | 1 | 15 |

### 28.4.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0)

**Access Size:** RSCFDnCFDTMTARSTSy register can be read only in 32-bit units
RSCFDnCFDTMTARSTSyL, RSCFDnCFDTMTARSTSyH registers can be read only in 16-bit units
RSCFDnCFDTMTARSTSyLL, RSCFDnCFDTMTARSTSyLH, RSCFDnCFDTMTARSTSyHL, RSCFDnCFDTMTARSTSyHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDTMTARSTSy: <RSCFDn_base> + H'0360 + (H'04 × y)
RSCFDnCFDTMTARSTSyL: <RSCFDn_base> + H'0360 + (H'04 × y),
RSCFDnCFDTMTARSTSyH: <RSCFDn_base> + H'0362 + (H'04 × y)
RSCFDnCFDTMTARSTSyLL: <RSCFDn_base> + H'0360 + (H'04 × y),
RSCFDnCFDTMTARSTSyLH: <RSCFDn_base> + H'0361 + (H'04 × y),
RSCFDnCFDTMTARSTSyHL: <RSCFDn_base> + H'0362 + (H'04 × y),
RSCFDnCFDTMTARSTSyHH: <RSCFDn_base> + H'0363 + (H'04 × y)

**Initial Value:** H'0000 0001

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTARSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTARSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |

| 31 to 16 | TMTARSTSp | All 0 | R | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |
| 15 to 0 | TMTARSTSp | All 0 | R | Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: No transmit abort request is present.<br>1: A transmit abort request is present. |

#### TMTARSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTAR bit in the RSCFDnCFDTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

**Table 28.29** shows the bit assignment.

Table 28.29 TMTARSTSp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |
| . | . | . |
| 30 | 1 | 14 |
| 31 | 1 | 15 |

### 28.4.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0)

**Access Size:** RSCFDnCFDTMTCSTSy register can be read only in 32-bit units
RSCFDnCFDTMTCSTSyL, RSCFDnCFDTMTCSTSyH registers can be read only in 16-bit units
RSCFDnCFDTMTCSTSyLL, RSCFDnCFDTMTCSTSyLH, RSCFDnCFDTMTCSTSyHL, RSCFDnCFDTMTCSTSyHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDTMTCSTSy: <RSCFDn_base> + H'0370 + (H'04 × y)
RSCFDnCFDTMTCSTSyL: <RSCFDn_base> + H'0370 + (H'04 × y),
RSCFDnCFDTMTCSTSyH: <RSCFDn_base> + H'0372 + (H'04 × y)
RSCFDnCFDTMTCSTSyLL: <RSCFDn_base> + H'0370 + (H'04 × y),
RSCFDnCFDTMTCSTSyLH: <RSCFDn_base> + H'0371 + (H'04 × y),
RSCFDnCFDTMTCSTSyHL: <RSCFDn_base> + H'0372 + (H'04 × y),
RSCFDnCFDTMTCSTSyHH: <RSCFDn_base> + H'0373 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTCSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TMTCSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0)) | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMTCSTSp | All 0 | R | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 31 to y × 32 + 16)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |
| 15 to 0 | TMTCSTSp | All 0 | R | Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0)<br>0: Transmission has not been completed.<br>1: Transmission has been completed. |

#### TMTCSTSp Flags (p = 0 to 31)

When the TMTRF[1:0] flag in the RSCFDnCFDTMSTSp register is set to 10b (transmission has been completed (without transmit abort request)) or 11b (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to 00b or in channel reset mode.

**Table 28.30** shows the bit assignment.

Table 28.30 TMTCSTSp Bit Assignment

| Bit | Channel | Transmit Buffer Number |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| . | . | . |
| . | . | . |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| . | . | . |
| . | . | . |
| 30 | 1 | 14 |
| 31 | 1 | 15 |

### 28.4.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0)

**Access Size:** RSCFDnCFDTMTASTSy register can be read only in 32-bit units
RSCFDnCFDTMTASTSyL, RSCFDnCFDTMTASTSyH registers can be read only in 16-bit units
RSCFDnCFDTMTASTSyLL, RSCFDnCFDTMTASTSyLH, RSCFDnCFDTMTASTSyHL, RSCFDnCFDTMTASTSyHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDTMTASTSy: <RSCFDn_base> + H'0380 + (H'04 × y)
RSCFDnCFDTMTASTSyL: <RSCFDn_base> + H'0380 + (H'04 × y),
RSCFDnCFDTMTASTSyH: <RSCFDn_base> + H'0382 + (H'04 × y)
RSCFDnCFDTMTASTSyLL: <RSCFDn_base> + H'0380 + (H'04 × y),
RSCFDnCFDTMTASTSyLH: <RSCFDn_base> + H'0381 + (H'04 × y),
RSCFDnCFDTMTASTSyHL: <RSCFDn_base> + H'0382 + (H'04 × y),
RSCFDnCFDTMTASTSyHH: <RSCFDn_base> + H'0383 + (H'04 × y)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## 28.4.13 Details of Transmit Queue-related Registers

### 28.4.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0, 1)

**Access Size:** RSCFDnCFDTXQCCm register can be read/written in 32-bit units
RSCFDnCFDTXQCCmL, RSCFDnCFDTXQCCmH registers can be read/written in 16-bit units
RSCFDnCFDTXQCCmLL, RSCFDnCFDTXQCCmLH, RSCFDnCFDTXQCCmHL, RSCFDnCFDTXQCCmHH registers can be read/ written in 8-bit units

**Address(es):** RSCFDnCFDTXQCCm: <RSCFDn_base> + H'03A0 + (H'04 × m)
RSCFDnCFDTXQCCmL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCFDnCFDTXQCCmH: <RSCFDn_base> + H'03A2 + (H'04 × m)
RSCFDnCFDTXQCCmLL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCFDnCFDTXQCCmLH: <RSCFDn_base> + H'03A1 + (H'04 × m),
RSCFDnCFDTXQCCmHL: <RSCFDn_base> + H'03A2 + (H'04 × m),
RSCFDnCFDTXQCCmHH: <RSCFDn_base> + H'03A3 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | TXQIM | TXQIE | TXQDC[3:0] | | | | — | — | — | — | — | — | — | TXQE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 13 | TXQIM | 0 | R/W | Transmit Queue Interrupt Source Select<br>0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated.<br>1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | 0 | R/W | Transmit Queue Interrupt Enable<br>0: Transmit queue interrupt is disabled.<br>1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC[3:0] | All 0 | R/W | Transmit Queue Depth Configuration<br>Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available.<br>Setting these bits to 0 disables the transmit queue.<br>Setting these bits to 1 is prohibited.<br>For transmit buffer merge mode, set g to 2 to 9. |
| 7 to 1 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | TXQE | 0 | R/W | Transmit Queue Enable<br>0: The transmit queue is not used.<br>1: The transmit queue is used. |

#### TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

#### TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

#### TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 28.9**.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

#### TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010b or more.

### 28.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0, 1)

**Access Size:** RSCFDnCFDTXQSTSm register can be read/written in 32-bit units
RSCFDnCFDTXQSTSmL, RSCFDnCFDTXQSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTXQSTSmLL, RSCFDnCFDTXQSTSmLH, RSCFDnCFDTXQSTSmHL, RSCFDnCFDTXQSTSmHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTXQSTSm: <RSCFDn_base> + H'03C0 + (H'04 × m)
RSCFDnCFDTXQSTSmL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCFDnCFDTXQSTSmH: <RSCFDn_base> + H'03C2 + (H'04 × m)
RSCFDnCFDTXQSTSmLL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCFDnCFDTXQSTSmLH: <RSCFDn_base> + H'03C1 + (H'04 × m),
RSCFDnCFDTXQSTSmHL: <RSCFDn_base> + H'03C2 + (H'04 × m),
RSCFDnCFDTXQSTSmHH: <RSCFDn_base> + H'03C3 + (H'04 × m)

**Initial Value:** H'0000 0001

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | TXQIF | TXQFLL | TXQEMP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | — | All 0 | R | Reserved<br>When read, the undefined value is returned. When writing to these bits, write the value after reset. |
| 7 to 3 | — | All 0 | R | Reserved<br>When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | TXQIF | 0 | R/W*1 | Transmit Queue Interrupt Request Flag<br>0: No transmit queue interrupt request is present.<br>1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | 0 | R | Transmit Queue Full Status Flag<br>0: The transmit queue is not full.<br>1: The transmit queue is full. |
| 0 | TXQEMP | 1 | R | Transmit Queue Empty Status Flag<br>0: The transmit queue contains messages.<br>1: The transmit queue contains no message (transmit queue empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

#### TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

#### TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

#### TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 28.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)

**Access Size:** RSCFDnCFDTXQPCTRm register can only be written in 32-bit units
RSCFDnCFDTXQPCTRmL, RSCFDnCFDTXQPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTXQPCTRmLL, RSCFDnCFDTXQPCTRmLH, RSCFDnCFDTXQPCTRmHL, RSCFDnCFDTXQPCTRmHH registers can only be written in 8-bit units

**Address(es):** RSCFDnCFDTXQPCTRm: <RSCFDn_base> + H'03E0 + (H'04 × m)
RSCFDnCFDTXQPCTRmL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCFDnCFDTXQPCTRmH: <RSCFDn_base> + H'03E2 + (H'04 × m)
RSCFDnCFDTXQPCTRmLL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCFDnCFDTXQPCTRmLH: <RSCFDn_base> + H'03E1 + (H'04 × m),
RSCFDnCFDTXQPCTRmHL: <RSCFDn_base> + H'03E2 + (H'04 × m),
RSCFDnCFDTXQPCTRmHH: <RSCFDn_base> + H'03E3 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | TXQPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should be the value after reset. |
| 7 to 0 | TXQPC[7:0] | All 0 | W | Transmit Queue Pointer Control<br>Writing H'FF to these bits moves the write pointer of the transmit queue to the next queue buffer. |

#### TXQPC[7:0] Bits

Writing H'FF to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15 and 31) before writing H'FF to the TXQPC[7:0] bits.

When writing H'FF to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (he transmit queue is not full).

## 28.4.14 Details of Transmit History-related Registers

### 28.4.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)

**Access Size:** RSCFDnCFDTHLCCm register can be read/written in 32-bit units
RSCFDnCFDTHLCCmL, RSCFDnCFDTHLCCmH registers can be read/written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH, RSCFDnCFDTHLCCmHL, RSCFDnCFDTHLCCmHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTHLCCm: <RSCFDn_base> + H'0400 + (H'04 × m)
RSCFDnCFDTHLCCmL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCFDnCFDTHLCCmH: <RSCFDn_base> + H'0402 + (H'04 × m)
RSCFDnCFDTHLCCmLL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCFDnCFDTHLCCmLH: <RSCFDn_base> + H'0401 + (H'04 × m),
RSCFDnCFDTHLCCmHL: <RSCFDn_base> + H'0402 + (H'04 × m),
RSCFDnCFDTHLCCmHH: <RSCFDn_base> + H'0403 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | THLDTE | THLIM | THLIE | — | — | — | — | — | — | — | THLE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 11 | — | All 0 | R | Reserved<br>When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 10 | THLDTE | 0 | R/W | Transmit History Target Buffer Select<br>0: Entry from transmit/receive FIFO buffers and transmit queue<br>1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue |
| 9 | THLIM | 0 | R/W | Transmit History Interrupt Source Select<br>0: When 12 sets of data have been stored in the transmit history buffer<br>1: When a single set of transmit history data has been stored |
| 8 | THLIE | 0 | R/W | Transmit History Interrupt Enable<br>0: Transmit history interrupt is disabled.<br>1: Transmit history interrupt is enabled. |
| 7 to 1 | — | All 0 | R | Reserved<br>When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 0 | THLE | 0 | R/W | Transmit History Buffer Enable<br>0: Transmit history buffer is not used.<br>1: Transmit history buffer is used. |

#### THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

#### THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

#### THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

#### THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

### 28.4.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0, 1)

**Access Size:** RSCFDnCFDTHLSTSm register can be read/written in 32-bit units
RSCFDnCFDTHLSTSmL, RSCFDnCFDTHLSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTHLSTSmLL, RSCFDnCFDTHLSTSmLH, RSCFDnCFDTHLSTSmHL, RSCFDnCFDTHLSTSmHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDTHLSTSm: <RSCFDn_base> + H'0420 + (H'04 × m)
RSCFDnCFDTHLSTSmL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCFDnCFDTHLSTSmH: <RSCFDn_base> + H'0422 + (H'04 × m)
RSCFDnCFDTHLSTSmLL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCFDnCFDTHLSTSmLH: <RSCFDn_base> + H'0421 + (H'04 × m),
RSCFDnCFDTHLSTSmHL: <RSCFDn_base> + H'0422 + (H'04 × m),
RSCFDnCFDTHLSTSmHH: <RSCFDn_base> + H'0423 + (H'04 × m)

**Initial Value:** H'0000 0001

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | THLMC[4:0] | | | | | — | — | — | — | THLIF | THLELT | THLFLL | THLEMP |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 12 to 8 | THLMC[4:0] | All 0 | R | Transmit History Buffer Unread Data Counter<br>These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 3 | THLIF | 0 | R/W*1 | Transmit History Interrupt Request Flag<br>0: No transmit history interrupt request is present.<br>1: A transmit history interrupt request is present. |
| 2 | THLELT | 0 | R/W*1 | Transmit History Buffer Overflow Flag<br>0: Transmit history buffer overflow has not occurred.<br>1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | 0 | R | Transmit history Buffer Full Status Flag<br>0: Transmit history buffer is not full.<br>1: Transmit history buffer is full. |
| 0 | THLEMP | 1 | R | Transmit History Buffer Empty Status Flag<br>0: Transmit history buffer contains unread data.<br>1: Transmit history buffer contains no unread data (buffer empty). |

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state

#### THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

#### THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

#### THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

#### THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 28.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)

**Access Size:** RSCFDnCFDTHLPCTRm register can only be written in 32-bit units
RSCFDnCFDTHLPCTRmL, RSCFDnCFDTHLPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTHLPCTRmLL, RSCFDnCFDTHLPCTRmLH, RSCFDnCFDTHLPCTRmHL, RSCFDnCFDTHLPCTRmHH registers can only be written in 8-bit units

**Address(es):** RSCFDnCFDTHLPCTRm: <RSCFDn_base> + H'0440 + (H'04 × m)
RSCFDnCFDTHLPCTRmL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCFDnCFDTHLPCTRmH: <RSCFDn_base> + H'0442 + H'(04 × m)
RSCFDnCFDTHLPCTRmLL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCFDnCFDTHLPCTRmLH: <RSCFDn_base> + H'0441 + (H'04 × m),
RSCFDnCFDTHLPCTRmHL: <RSCFDn_base> + H'0442 + (H'04 × m),
RSCFDnCFDTHLPCTRmHH: <RSCFDn_base> + H'0443 + (H'04 × m)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | THLPC[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>When writing to these bits, write the value after reset. |
| 7 to 0 | THLPC[7:0] | All 0 | W | Transmit History List Pointer Control<br>Writing H'FF to these bits moves the read pointer to the next unread data in the transmit history buffer. |

#### THLPC[7:0] Bits

When the THLPC[7:0] bits are set to H'FF, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented. Write H'FF to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

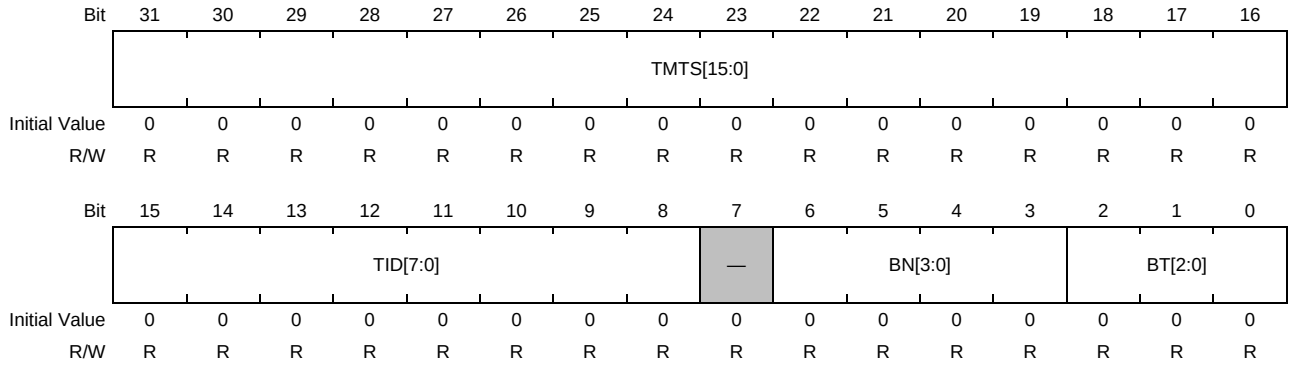
When writing H'FF to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

### 28.4.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0, 1)

**Access Size:** RSCFDnCFDTHLACCm register can be read only in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers can be read only in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL, RSCFDnCFDTHLACCmHH registers can be read only in 8-bit units

**Address(es):** RSCFDnCFDTHLACCm: <RSCFDn_base> + H'6000 + (H'04 × m)
RSCFDnCFDTHLACCmL: <RSCFDn_base> + H'6000 + (H'04 × m),
RSCFDnCFDTHLACCmH: <RSCFDn_base> + H'6002 + (H'04 × m)
RSCFDnCFDTHLACCmLL: <RSCFDn_base> + H'6000 + (H'04 × m),
RSCFDnCFDTHLACCmLH: <RSCFDn_base> + H'6001 + (H'04 × m),
RSCFDnCFDTHLACCmHL: <RSCFDn_base> + H'6002 + (H'04 × m),
RSCFDnCFDTHLACCmHH: <RSCFDn_base> + H'6003 + (H'04 × m)

**Initial Value:** H'0000 0000



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TMTS[15:0] | All 0 | R | Timestamp Data<br>The timestamp data of stored data can be read. |
| 15 to 8 | TID[7:0] | All 0 | R | Label Data<br>The label information of stored data can be read. |
| 7 | — | All 0 | R | Reserved<br>This bit is read as the value after reset. |
| 6 to 3 | BN[3:0] | All 0 | R | Buffer Number Data<br>The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | All 0 | R | Buffer Type Data<br>b2 b1 b0<br>0 0 1: Transmit buffer<br>0 1 0: Transmit/receive FIFO buffer<br>1 0 0: Transmit queue |

#### TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

#### TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

#### BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

**BT[2:0] Bits**

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

## 28.4.15 Details of Test-related Registers

### 28.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

**Access Size:** RSCFDnCFDGTSTCFG register can be read/written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGLH, RSCFDnCFDGTSTCFGHL, RSCFDnCFDGTSTCFGHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGTSTCFG: <RSCFDn_base> + H'0468
RSCFDnCFDGTSTCFGL: <RSCFDn_base> + H'0468, RSCFDnCFDGTSTCFGH: <RSCFDn_base> + H'046A
RSCFDnCFDGTSTCFGLL: <RSCFDn_base> + H'0468, RSCFDnCFDGTSTCFGLH: <RSCFDn_base> + H'0469,
RSCFDnCFDGTSTCFGHL: <RSCFDn_base> + H'046A, RSCFDnCFDGTSTCFGHH: <RSCFDn_base> + H'046B

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RTMPS[6:0] | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 23 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 22 to 16 | RTMPS[6:0] | All 0 | R/W | RAM Test Page Configuration<br>Set a value within a range of page 0 (H'00) to page 27 (H'1B). |
| 15 to 2 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | C1ICBCE | 0 | R/W | CAN1 Inter-Channel Communication Test Enable<br>0: CAN1 inter-channel communication test is disabled.<br>1: CAN1 inter-channel communication test is enabled. |
| 0 | C0ICBCE | 0 | R/W | CAN0 Inter-Channel Communication Test Enable<br>0: CAN0 inter-channel communication test is disabled.<br>1: CAN0 inter-channel communication test is enabled. |

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

#### RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of H'00 to H'1B, inclusive. Do not access the RAM area higher than the 192th byte on the last page (the setting of the RTMPS bit is H'1B).

**C1ICBCE Bit**

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

**C0ICBCE Bit**

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

### 28.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

**Access Size:** RSCFDnCFDGTSTCTR register can be read/written in 32-bit units
RSCFDnCFDGTSTCTRL, RSCFDnCFDGTSTCTRH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCTRLL, RSCFDnCFDGTSTCTRLH, RSCFDnCFDGTSTCTRHL, RSCFDnCFDGTSTCTRHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDGTSTCTR: <RSCFDn_base> + H'046C
RSCFDnCFDGTSTCTRL: <RSCFDn_base> + H'046C, RSCFDnCFDGTSTCTRH: <RSCFDn_base> + H'046E
RSCFDnCFDGTSTCTRLL: <RSCFDn_base> + H'046C, RSCFDnCFDGTSTCTRLH: <RSCFDn_base> + H'046D,
RSCFDnCFDGTSTCTRHL: <RSCFDn_base> + H'046E, RSCFDnCFDGTSTCTRHH: <RSCFDn_base> + H'046F

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RTME | — | ICBCTME |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | RTME | 0 | R/W | RAM Test Enable<br>0: RAM test is disabled.<br>1: RAM test is enabled. |
| 1 | — | 0 | R | Reserved<br>This bit is read as the value after reset. The write value should be the value after reset. |
| 0 | ICBCTME | 0 | R/W | Communication Test between Channels Enable<br>0: Communication test between channels disabled<br>1: Communication test between channels enabled |

#### RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode. This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10b (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

**ICBCTME Bit**

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0, 1) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

### 28.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

**Access Size:** RSCFDnCFDGLOCKK register can only be written in 32-bit units
RSCFDnCFDGLOCKKL, RSCFDnCFDGLOCKKH registers can only be written in 16-bit units

**Address(es):** RSCFDnCFDGLOCKK: <RSCFDn_base> + H'047C
RSCFDnCFDGLOCKKL: <RSCFDn_base> + H'047C, RSCFDnCFDGLOCKKH: <RSCFDn_base> + H'047E

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 | W*1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>When writing these bits, write the value after reset. |
| 15 to 0 | LOCK[15:0] | All 0 | W*1 | Lock Key<br>These bits are key bits to release protection of test mode. |

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 28.11.4.2, Procedure for Releasing the Protection**.

#### LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + H'0000 to <RSCFDn_base> + H'05FF) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

### 28.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

**Access Size:** RSCFDnCFDRPGACCr register can be read/written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read/written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL, RSCFDnCFDRPGACCrHH registers can be read/written in 8-bit units

**Address(es):** RSCFDnCFDRPGACCr: <RSCFDn_base> + H'6400 + (H'04 × r)
RSCFDnCFDRPGACCrL: <RSCFDn_base> + H'6400 + (H'04 × r),
RSCFDnCFDRPGACCrH: <RSCFDn_base> + H'6402 + (H'04 × r)
RSCFDnCFDRPGACCrLL: <RSCFDn_base> + H'6400 + (H'04 × r),
RSCFDnCFDRPGACCrLH: <RSCFDn_base> + H'6401 + (H'04 × r),
RSCFDnCFDRPGACCrHL: <RSCFDn_base> + H'6402 + (H'04 × r),
RSCFDnCFDRPGACCrHH: <RSCFDn_base> + H'6403 + (H'04 × r)

**Initial Value:** H'0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RDTA[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | RDTA[31:0] | All 0 | R/W | RAM Data Test Access<br>Data can be read and written in RSCAN RAM. |

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

## 28.5 Interrupt Sources and DMA Trigger

### 28.5.1 Interrupt Sources

The RS-CANFD module has 8 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):

  Receive FIFO interrupt

  Global error interrupt

- Channel interrupts (3 sources/channel):

  CANm transmit interrupt (m = 0, 1)

  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)

  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

**Table 28.32** lists the CAN interrupt sources. **Figure 28.2** shows the CAN global interrupt block diagram. **Figure 28.3** shows the CAN channel interrupt block diagram.

Table 28.32 List of CAN Interrupt Sources (1/2)

| RCAN | | | | | INTC | DMA |

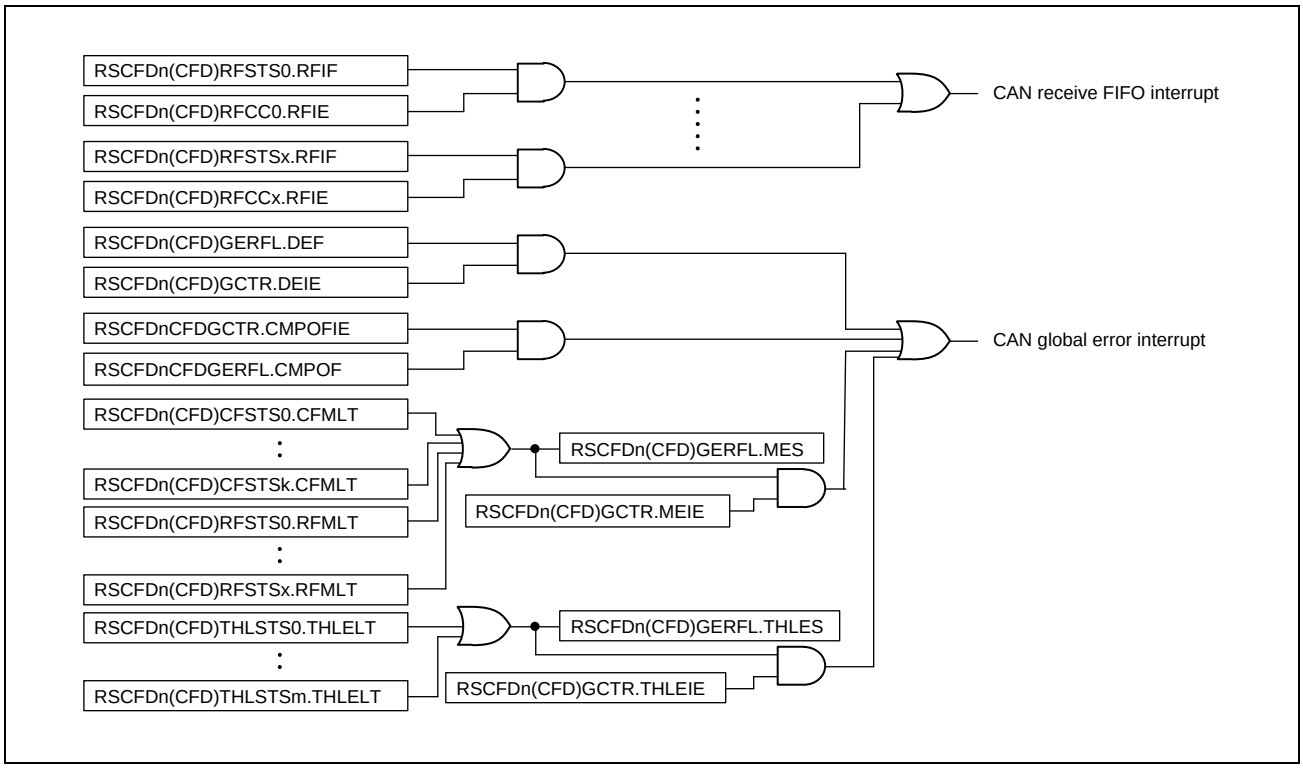

Figure 28.2 CAN Global Interrupt Block Diagram

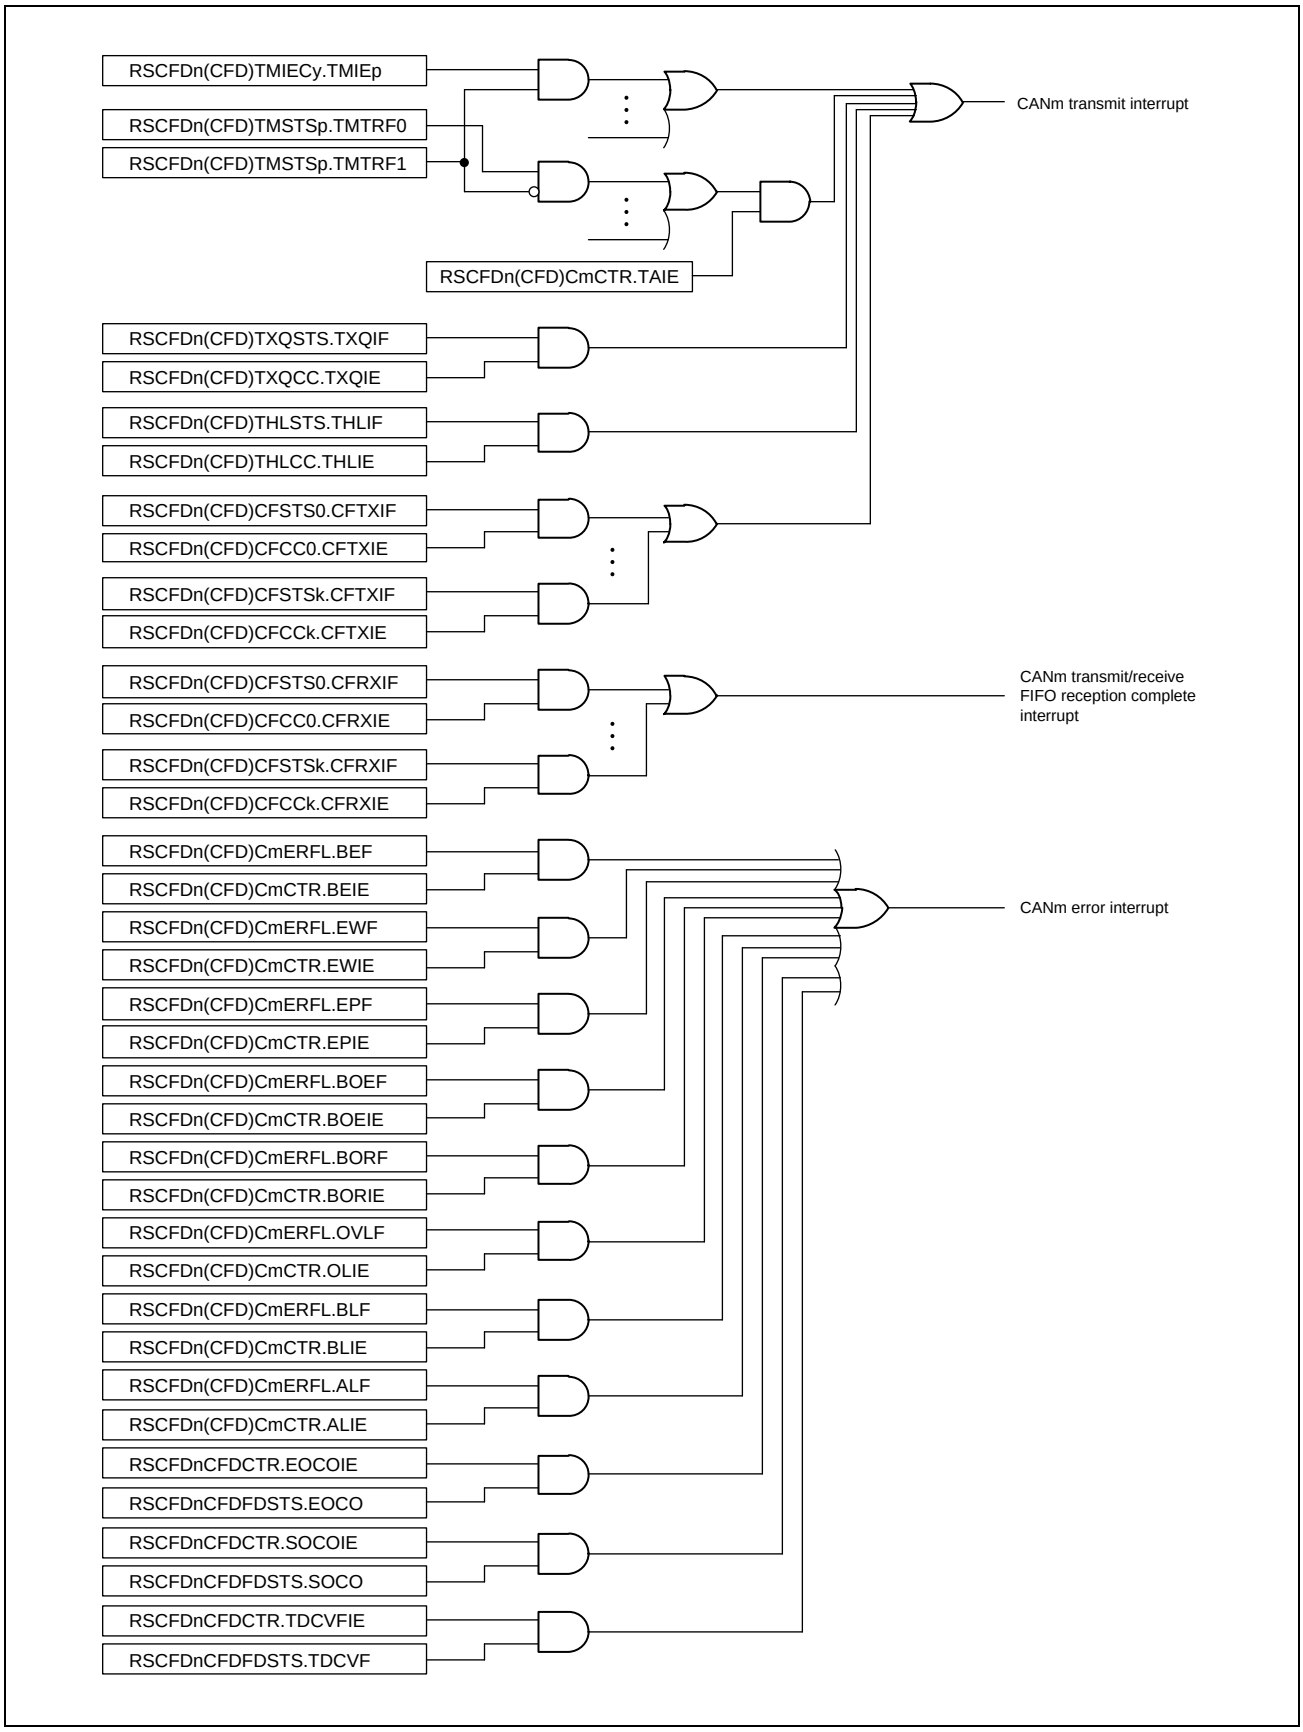

Figure 28.3 CAN Channel Interrupt Block Diagram

### 28.5.2 DMA Trigger (Only in CANFD Mode)

In CANFD mode, receive FIFO buffers can be related to DMA channels. The following 10 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0, 1) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

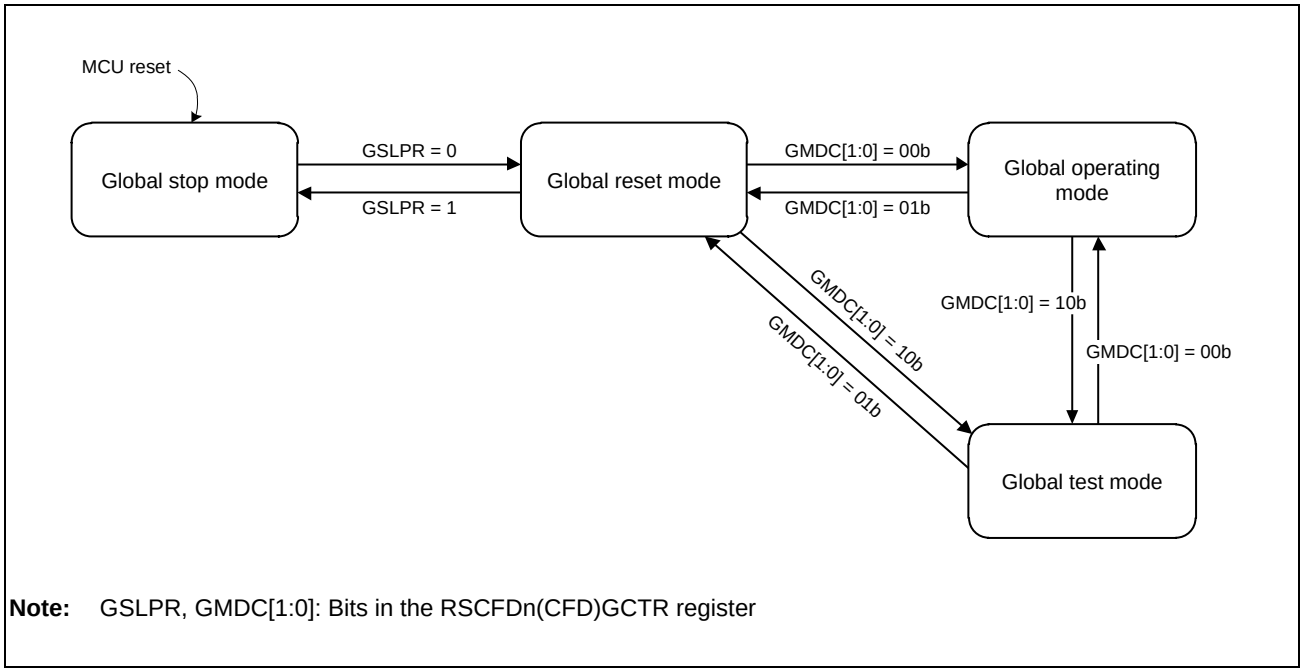
## 28.6 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 28.6.1, Global Modes**, and details of channel modes are described in **Section 28.6.2**, **Figure 28.5, Channel Mode State Transition Chart**.

- Global stop mode:Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode:Performs initial settings for the entire module.
- Global test mode:Performs test settings and performs the RAM test.
- Global operating mode:Makes the entire module operable.
- Channel stop mode:Stops the channel clock.
- Channel reset mode:Performs initial settings for the channels.
- Channel halt mode:Stops CAN communication and allows channel testing.
- Channel communication mode:Performs CAN communication.

### 28.6.1 Global Modes

**Figure 28.4** shows the transitions of global modes.



**Note:** GSLPR, GMDC[1:0]: Bits in the RSCFDn(CFD)GCTR register

Figure 28.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 28.33** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 28.33 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

| | Channel Mode after Setting | | | |
|---|---|---|---|---|
| Channel Mode before Setting | GMDC[1:0] = 00b<br>GSLPR = 0<br>(Global Operation) | GMDC[1:0] = 10b<br>GSLPR = 0<br>(Global Test) | GMDC[1:0] = 01b<br>GSLPR = 0<br>(Global Reset) | GMDC[1:0] = 01b<br>GSLPR = 1<br>(Global Stop) |
| Channel communication | Channel communication | Channel halt | Channel reset | Transition prohibited |
| Channel halt | Channel halt | Channel halt | Channel reset | Transition prohibited |
| Channel reset | Channel reset | Channel reset | Channel reset | Channel stop |
| Channel stop | Channel stop | Channel stop | Channel stop | Channel stop |

**Note:** GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

**Table 28.34** shows the global mode transition time.

Table 28.34 Global Mode Transition Time

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Global stop | Global reset | Three pclk cycles |
| Global reset | Global stop | Three pclk cycles |
| Global reset | Global test | Ten pclk cycles |
| Global reset | Global operating | Ten pclk cycles |
| Global test | Global reset | Two CAN bit times*1 *2 |
| Global test | Global operating | Three pclk cycles |
| Global operating | Global reset | Two CAN bit times*1 *2 |
| Global operating | Global test | Two CAN frames*1 |

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CANFD mode, this time value is the CAN bit time of the nominal bit rate.

#### 28.6.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

#### 28.6.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode** and **Table 28.38, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 01b sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR registers (m = 0, 1) to 01b (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01b).

#### 28.6.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 10b sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register to 10b (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

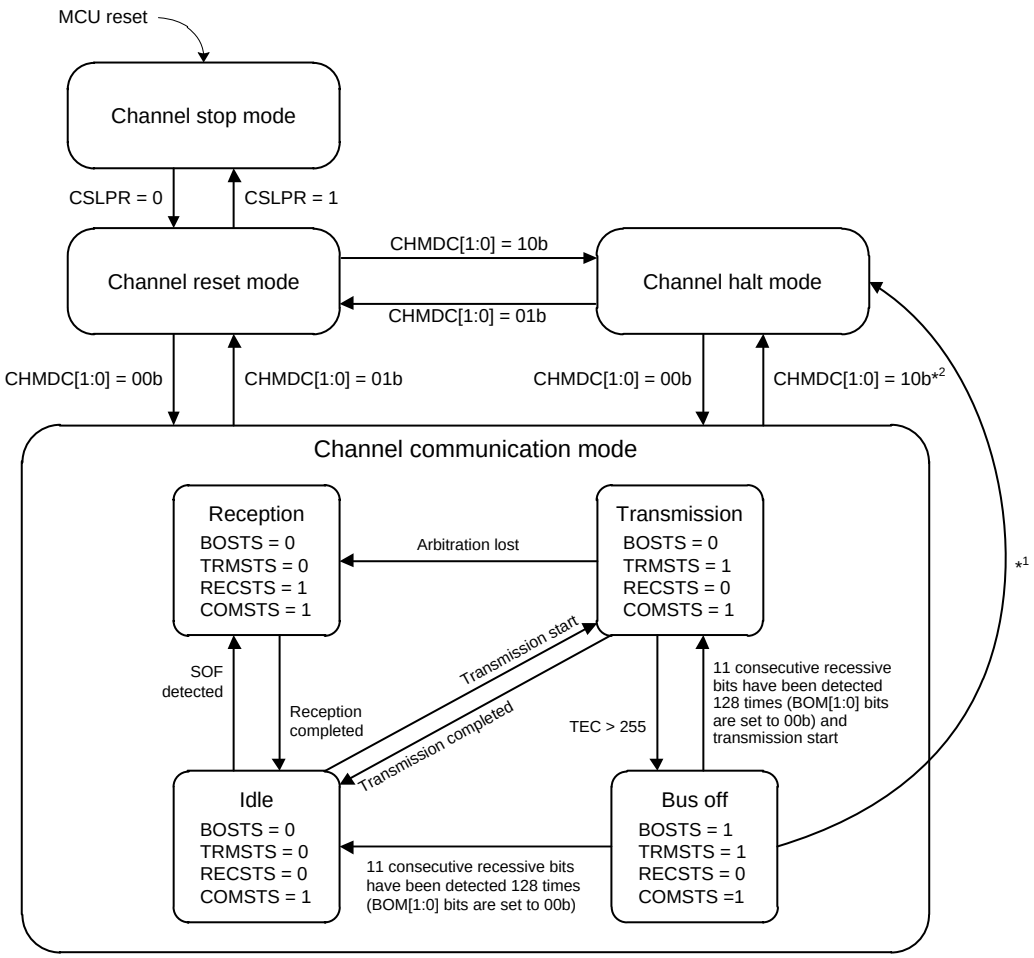
#### 28.6.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to 00b, the RS-CANFD module transitions to global operating mode.

## 28.6.2 Channel Modes

**Figure 28.5** shows a channel mode state transition chart. **Table 28.35** shows the channel mode transition time.



**Note:** CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register (m = 0 to 1) BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01b: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10b: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11b: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10b

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Figure 28.5 Channel Mode State Transition Chart

Table 28.35 Channel Mode Transition Time

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|---|---|---|
| Channel stop | Channel reset | Three pclk cycles |
| Channel reset | Channel stop | Three pclk cycles |
| Channel reset | Channel halt | Three CANm bit times*1 |
| Channel reset | Channel communication | Four CANm bit times*1 |
| Channel halt | Channel reset | Two CANm bit times*1 |
| Channel halt | Channel communication | Four CANm bit times*1 |
| Channel communication | Channel reset | Two CANm bit times*1 |
| Channel communication | Channel halt | Two CANm frames |

Note 1. In CANFD mode, this time value is the CANm bit time of the nominal bit rate.

#### 28.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the GSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0, 1) is set to 1 (channel stop mode) in channel reset mode. The GSLPR bit should not be modified in channel communication mode and channel halt mode.

#### 28.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel- related registers are initialized. For registers to be initialized, see **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 01b (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 28.36** shows the operation when the CHMDC[1:0] bits are set to 01b (channel reset mode) during CAN communication.

### 28.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

**Table 28.36** shows operation when the CHMDC[1:0] bits are set to 10b (channel halt mode) during CAN communication.

Table 28.36 Operation in Transitions to Channel Reset Mode/Channel Halt Mode

| Mode | During Reception | During Transmission | Bus Off State |
|---|---|---|---|
| Channel reset (CHMDC[1:0] = 01b) | Transitions to channel reset mode before reception is completed.*1 | Transitions to channel reset mode before transmission is completed.*1 | Transitions to channel reset mode before bus off recovery. |
| Channel halt*3 (CHMDC[1:0] = 10b) | Transitions to channel halt mode after reception is completed.*2 | Transitions to channel halt mode after transmission is completed. | [When BOM[1:0] = 00b]<br>Transitions to channel halt mode (CHMDC[1:0] = 10b) only after bus off recovery.<br>[When BOM[1:0] = 01b]<br>Transitions to channel halt mode automatically when the condition for transition to bus off state is met.<br>[When BOM[1:0] = 10b]<br>Transitions to channel halt mode automatically after bus off recovery.<br>[When BOM[1:0] = 11b]<br>Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10b before bus off recovery. |

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10b and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01b.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CANFD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

### 28.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 00b, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0, 1) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

#### 28.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = 00b:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to H’00, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 10b (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01b:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10b and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H’00. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10b:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10b. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H’00, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11b:
  When the CHMDC[1:0] bits are set to 10b in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H’00, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10b.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01b or 10b is made only when the CHMDC[1:0] bits are 00b (channel communication mode). Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to H’00. Write 1 to the RTBO bit only when the BOM[1:0] value is 00b. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

### 28.6.3 Initializing Registers by Transition to CAN Mode

**Table 28.37** lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 28.38** lists bits and flags to be initialized only by a transition to global reset mode.

Table 28.37 Registers Initialized in Global Reset Mode or Channel Reset Mode

| Register | Bit/Flag |
|---|---|
| RSCFDn(CFD)CmCTR register | (ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0] |
| RSCFDn(CFD)CmSTS register | CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0] |
| RSCFDn(CFD)CmERFL register | CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF |
| RSCFDnCFDCmFDCTR register | EOCCLR, SOCCLR |
| RSCFDnCFDCmFDSTS register | SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0] |
| RSCFDnCFDCmFDCRC register | CRCREG[20:0], SCNT[3:0] |
| RSCFDn(CFD)CFCCk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE |
| RSCFDn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF |
| RSCFDn(CFD)CFTISTS register | CFkTXIF |
| RSCFDn(CFD)TMCp register | TMOM, TMTAR, TMTR |
| RSCFDn(CFD)TMSTSp register | TMTARM, TMTRM, TMTRF[1:0], TMTSTS |
| RSCFDn(CFD)TMTRSTSy register | TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTARSTSy register | TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTCSTSy register | TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTASTSy register | TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TXQCCm register | TXQE |
| RSCFDn(CFD)TXQSTSm register | TXQIF, TXQFLL, TXQEMP |
| RSCFDn(CFD)THLCCm register | THLE |
| RSCFDn(CFD)THLSTSm register | THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP |
| RSCFDn(CFD)GTINTSTS0 register | TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m =0, 1) |

**Note:** Bits and flags in parentheses exist only in registers for use in CANFD mode.

Table 28.38 Registers Initialized Only in Global Reset Mode

| Register | Bit/Flag |
|---|---|
| RSCFDn(CFD)GSTS register | GHLTSTS |
| RSCFDn(CFD)GERFL register | EEF0, EEF1, (CMPOF), THLES, MES, DEF |
| RSCFDn(CFD)GTSC register | TS[15:0] |
| RSCFDn(CFD)RMNDy register | RMNSq |
| RSCFDn(CFD)RFCCx register | RFE |
| RSCFDn(CFD)RFSTSx register | RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP |
| RSCFDn(CFD)CFCCk register | When transmit/receive FIFO buffer is in receive mode: CFE |
| RSCFDn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT |
| RSCFDn(CFD)FESTS register | CFkEMP, RFxEMP |
| RSCFDn(CFD)FFSTS register | CFkFLL, RFxFLL |
| RSCFDn(CFD)FMSTS register | CFkMLT, RFxMLT |
| RSCFDn(CFD)RFISTS register | RFxIF |
| RSCFDn(CFD)CFRISTS register | CFkRXIF |
| RSCFDnCFDCDTCT register | CFDMAEm, RFDMAEx |
| RSCFDnCFDCDTSTS register | CFDMASTSm, RFDMASTSx |
| RSCFDn(CFD)GTSTCFG register | RTMPS[6:0], C0ICBCE, C1ICBCE |
| RSCFDn(CFD)GTSTCTR register | RTME, ICBCTME |

**Note:** Bits and flags in parentheses exist only in registers for use in CANFD mode.

## 28.7 Reception Function

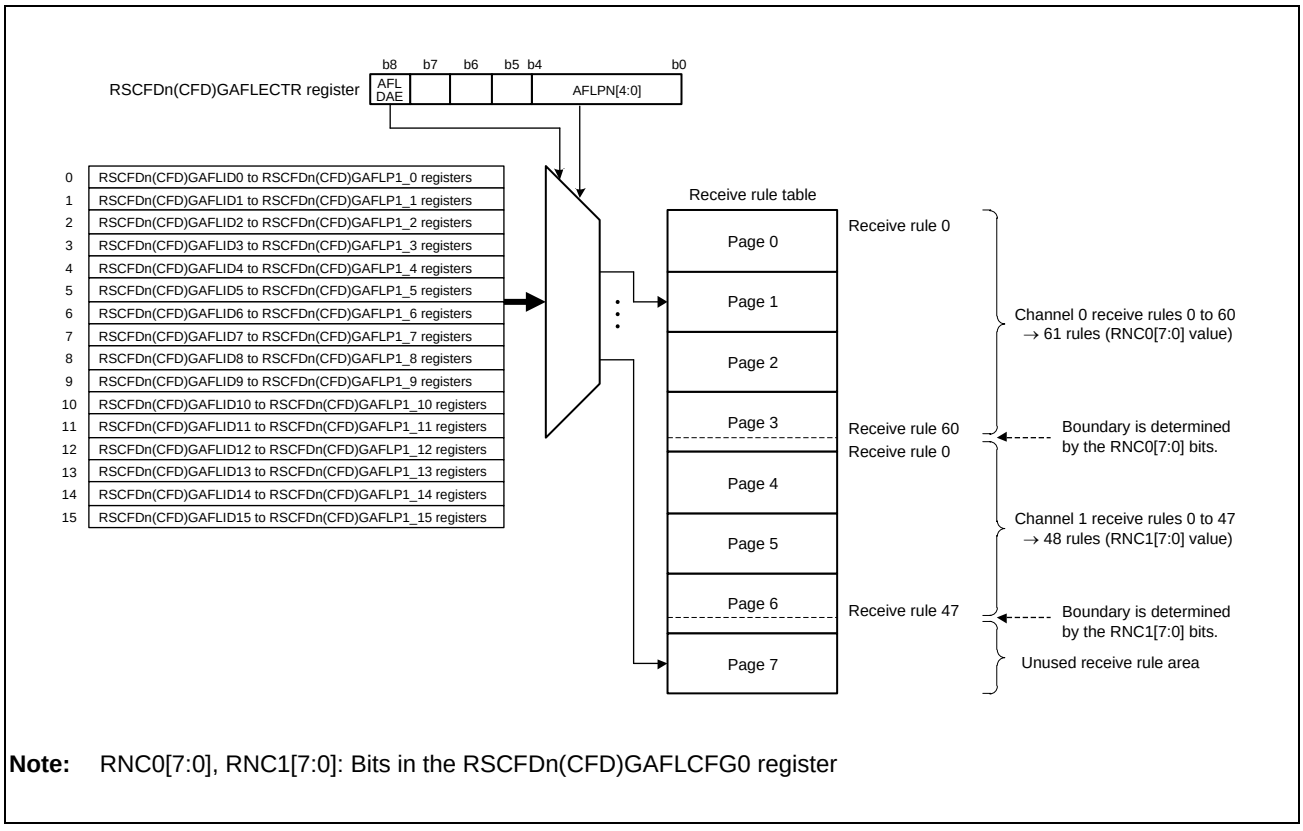
There are two reception types.

- Reception by receive buffers:
  Zero to 32 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

### 28.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 128 receive rules can be registered in this module that has two channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 28.6** illustrates how receive rules are registered.



**Note:** RNC0[7:0], RNC1[7:0]: Bits in the RSCFDn(CFD)GAFLCFG0 register

Figure 28.6 Entry of Receive Rules (for Setting Channels 0 and 1)

NOTE

Receive rules for each channel must be set in contiguous blocks.

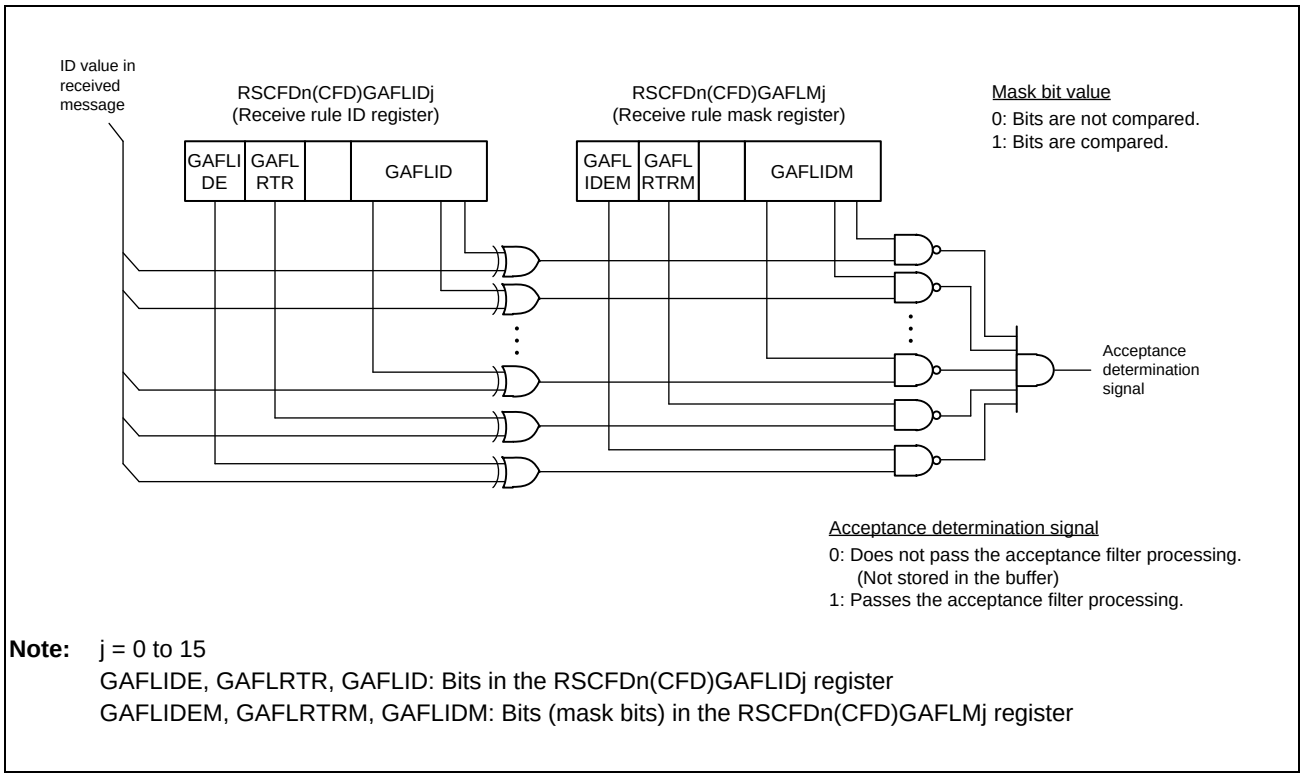
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

### 28.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.



**Note:** j = 0 to 15
GAFLIDE, GAFLRTR, GAFLID: Bits in the RSCFDn(CFD)GAFLIDj register
GAFLIDEM, GAFLRTRM, GAFLIDM: Bits (mask bits) in the RSCFDn(CFD)GAFLMj register

Figure 28.7 Acceptance Filter Function

#### 28.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of H'00 is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

#### 28.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

In CANFD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded.

#### 28.7.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

#### 28.7.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).

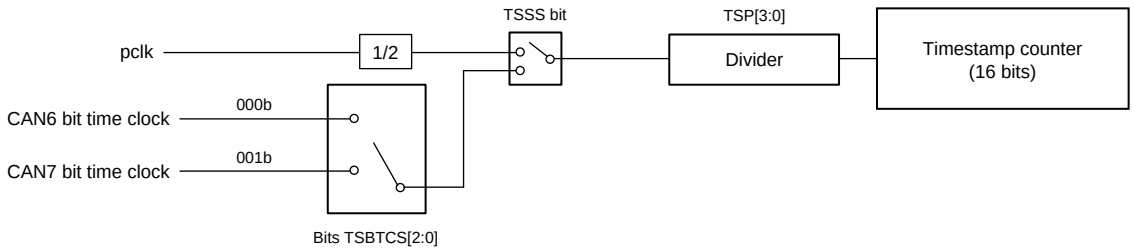
When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

### 28.7.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDn(CFD)GCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0, 1). In CANFD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CANFD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCFDn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to H'0000 by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.



**Note:** TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register
When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000b.

Figure 28.8 Timestamp Function Block Diagram

## 28.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CANFD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CANFD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CANFD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CANFD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

**Figure 28.9** shows the allocation of transmit queues and transmit/receive FIFO buffer link.

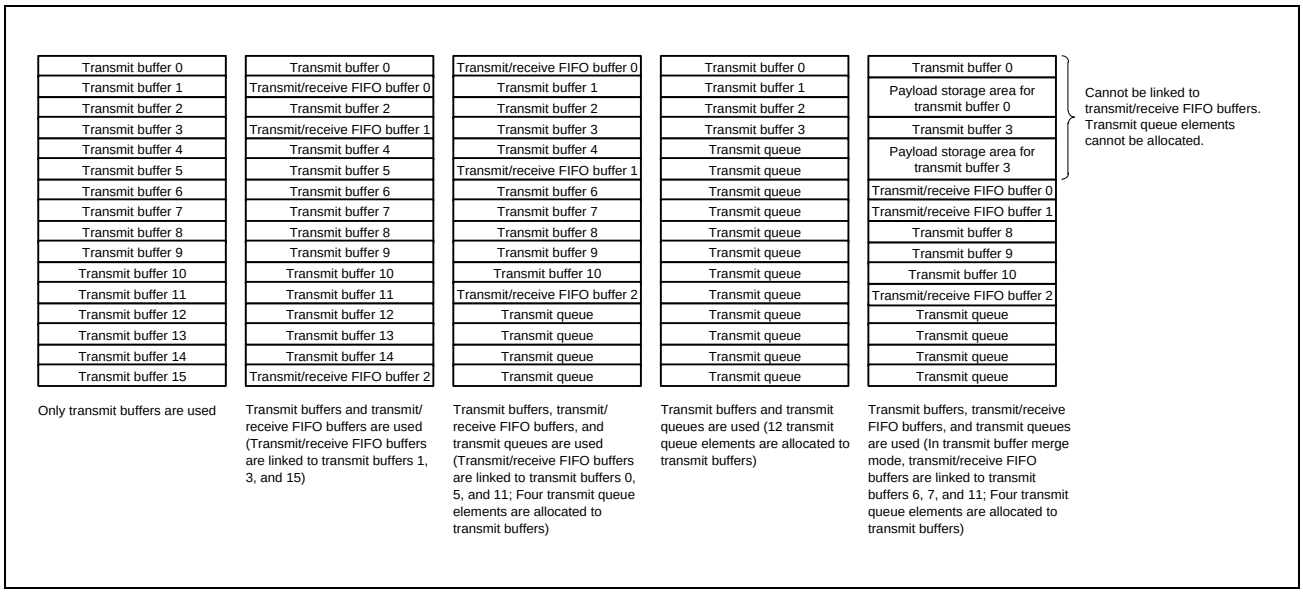


Figure 28.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

### 28.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit.

## 28.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 31). When transmit completes successfully, the TMTRF[1:0] flag is set to 10b (transmission has been completed (without transmit abort request)) or 11b (transmission has been completed (with transmit abort request)).

### 28.8.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to 01b (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

### 28.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10b or 11b. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01b (transmit abort has been completed).

### 28.8.2.3 Transmit Buffer Merge Mode (Only in CANFD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to the merged buffers or allocate it to the transmit queue.

### 28.8.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

#### 28.8.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to H’00.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to 00b, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10b, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits in the RSCFDn(CFD)GCFG register × 10). When the CFITR and CFITSS bits are set to x1b, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CANFD mode. Use this count source only for the channel that does not handle the CANFD frames. The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00b:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10b:

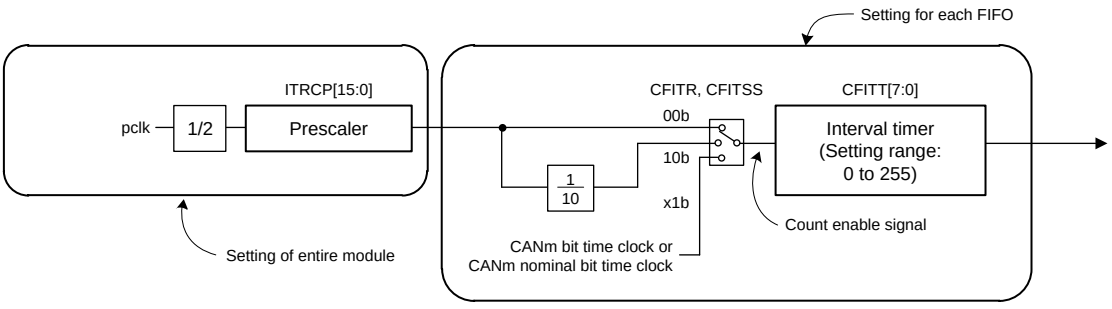
$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = x1b:

$$\text{Classical CAN mode: } \frac{1}{\text{CANm bit time clock frequency}} \times N$$

$$\text{CANFD mode: } \frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

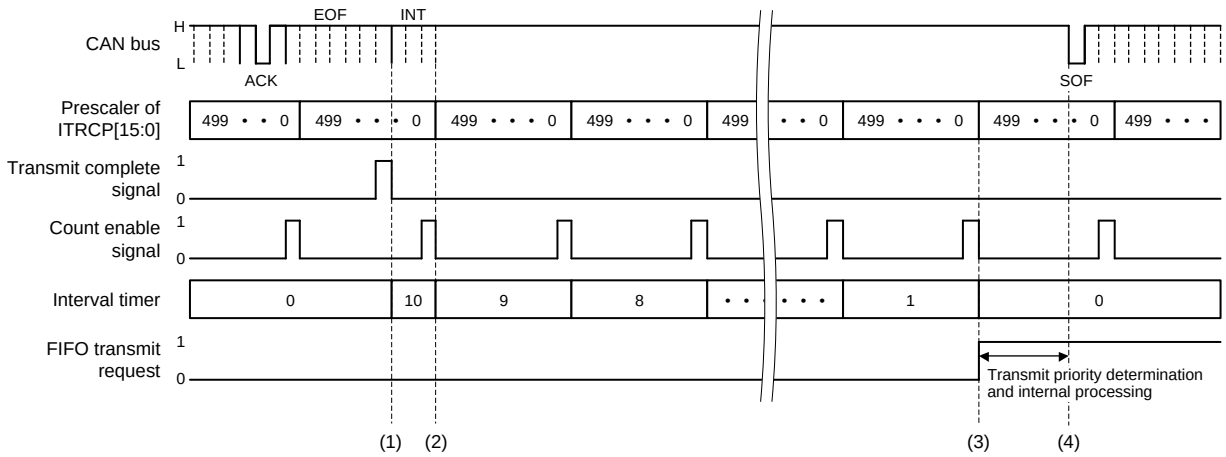
**Figure 28.10** shows the interval timer block diagram.



**Note:** ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register
m = 0, 1, k = 0 to 5

Figure 28.10 Interval Timer Block Diagram

**Figure 28.11** shows the interval timer timing diagram.



$$\text{Interval time (logical value)} = \frac{2}{\text{pclk frequency}} \times \text{(set ITRCP[15:0] value)} \times \text{set CFITT[7:0] value}$$

**Note:** ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register (The set value is 500 in this figure.)
CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register (The set value is 10 in this figure.)

Figure 28.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 644 cycles of the pclk may be generated.

### 28.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

### 28.8.5 Transmit Data Padding (Only in CANFD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by H’CC.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

### 28.8.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register (k = 0 to 5) determines whether transmit history data is stored for each message.

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CANFD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 128 cycles of pclk in classical CAN mode or 396 cycles of pclk in CANFD mode.

- Buffer type: 001b: Transmit buffer
  010b: Transmit/receive FIFO buffer
  100b: Transmit queue
- Buffer number: Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer.
  This number depends on buffer types. See **Table 28.39**.
- Label data: Label information of the transmit message
- Timestamp: Timestamp value of the transmit message
  (When the TMTSCE bit is 1 in classical CAN mode)

Table 28.39 Transmit History Data Buffer Numbers

| Buffer Type<br>Buffer No. | 001b | 010b | 100b |
|---|---|---|---|
| 0000b | Transmit buffer 16 × m + 0 | Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5) | Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission |
| 0001b | Transmit buffer 16 × m + 1 | | |
| 0010b | Transmit buffer 16 × m + 2 | | |
| 0011b | Transmit buffer 16 × m + 3 | | |
| 0100b | Transmit buffer 16 × m + 4 | | |
| 0101b | Transmit buffer 16 × m + 5 | | |
| 0110b | Transmit buffer 16 × m + 6 | | |
| 0111b | Transmit buffer 16 × m + 7 | | |
| 1000b | Transmit buffer 16 × m + 8 | | |
| 1001b | Transmit buffer 16 × m + 9 | | |
| 1010b | Transmit buffer 16 × m + 10 | | |
| 1011b | Transmit buffer 16 × m + 11 | | |
| 1100b | Transmit buffer 16 × m + 12 | | |
| 1101b | Transmit buffer 16 × m + 13 | | |
| 1110b | Transmit buffer 16 × m + 14 | | |
| 1111b | Transmit buffer 16 × m + 15 | | |

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 28.7.1.6, Timestamp**.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

## 28.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RSCFDn(CFD)CFCCk register are set to 10b (gateway mode) for the transmit/receive FIFO buffer selected by the RSCFDn(CFD)GAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

### 28.9.1 CAN-CANFD Gateway (Only in CANFD Mode)

When the gateway function is used in CANFD mode, a frame to be transmitted can be replaced with a classical CAN frame or a CANFD frame.

Setting the GWEN bit in the RSCFDnCFDCmFDCFG register to 1 enables the CAN-CANFD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001b or more and the GWFDF bit is 1 (CANFD frame), the DLC value is replaced with 1000b.

When the CAN-CANFD gateway is enabled, do not perform routing for the following frames.

- CANFD frames with a payload length of more than 8 bytes
- Remote frames

When the CAN-CANFD gateway is enabled, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frames should be transmitted.
- When GWFDF bit is set to 1, only CANFD frames should be transmitted.

## 28.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CANFD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

### 28.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CANFD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 28.10.6.1, CRC Error Test**.

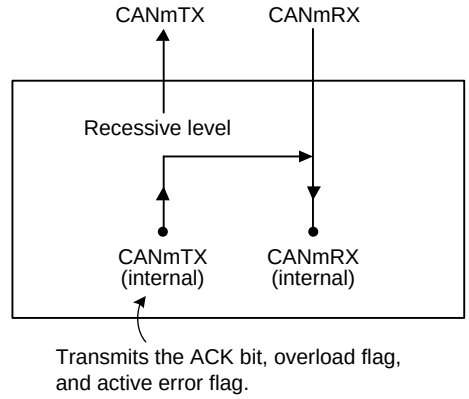
### 28.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

**Figure 28.12** shows the connection when listen-only mode is selected.



**Note:** m = 0, 1

Figure 28.12 Connection when Listen-Only Mode is Selected

### 28.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

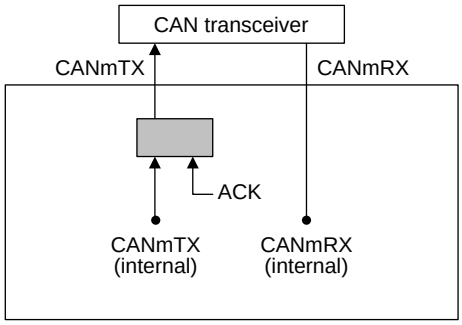
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

### 28.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

**Figure 28.13** shows the connection when self-test mode 0 is selected.



**Note:** m = 0, 1

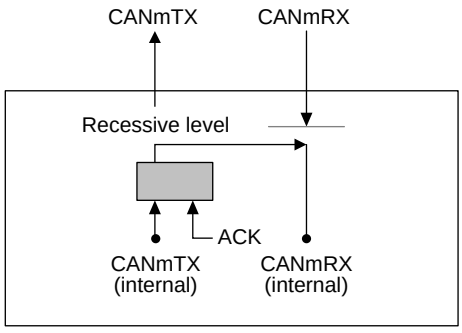
Figure 28.13 Connection when Self-Test Mode 0 is Selected

### 28.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0, 1) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

**Figure 28.14** shows the connection when self-test mode 1 is selected.



**Note:** m = 0, 1

Figure 28.14 Connection when Self-Test Mode 1 is Selected

### 28.10.4 Restricted Operation Mode (Only in CANFD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

### 28.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 5120 bytes (H'1400) in classical CAN mode or 7104 bytes (H'1BC0) in CANFD mode. Do not access the RAM area higher than the 192th byte on the last page (the setting of the RTMPS bit is H'1B) in CANFD mode.

### 28.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

**Figure 28.15** shows the connection for inter-channel communication test.

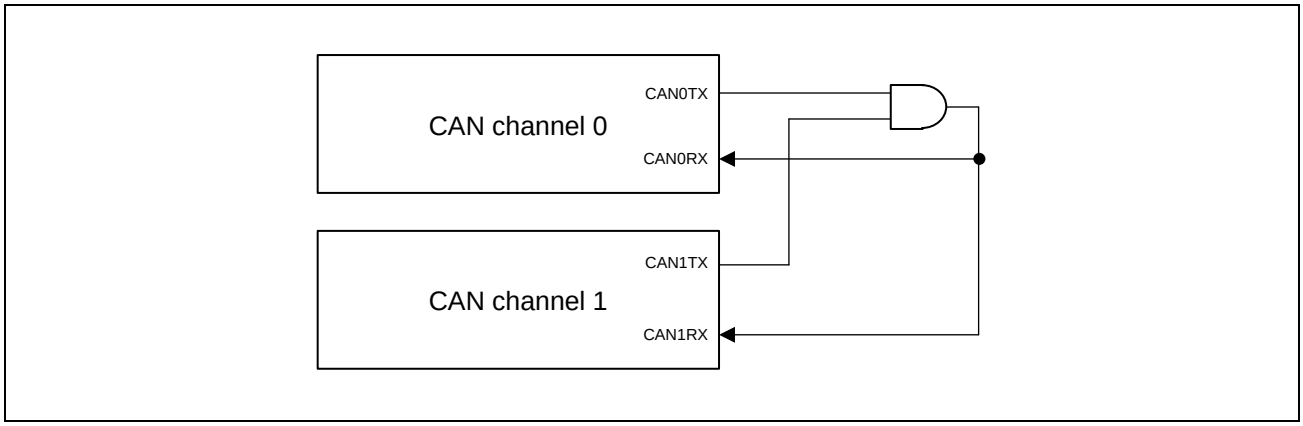


Figure 28.15 Connection for Inter-Channel Communication Test

#### 28.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

**Preconditions**

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

**Procedure**

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).

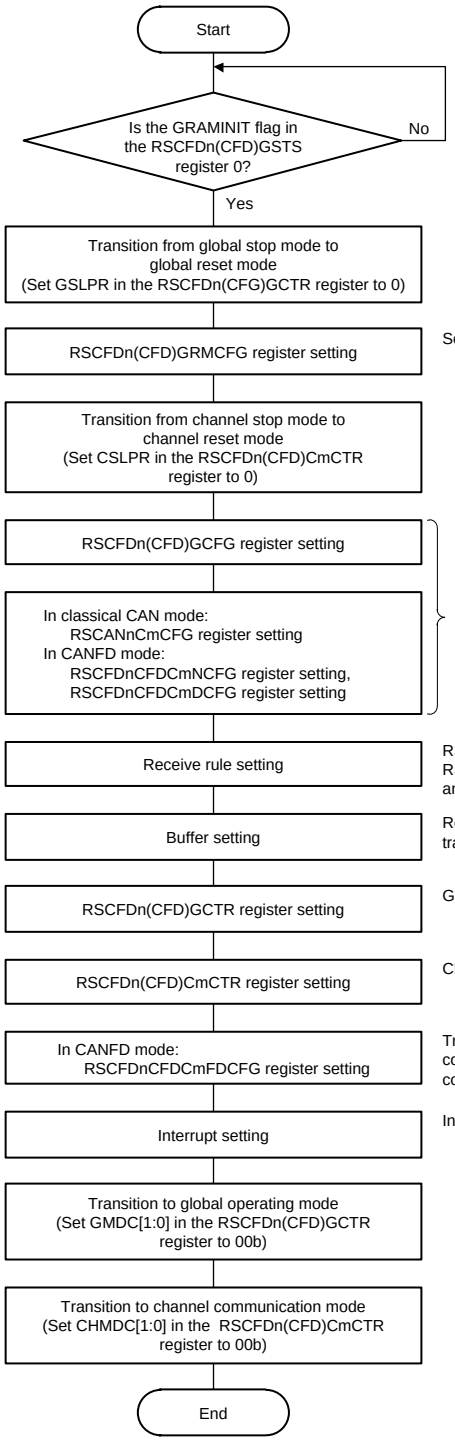
The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID’s upper 5-bit value is 10000b or ID’s upper 6-bit value is 011111b is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

## 28.11 RS-CANFD Setting Procedure

### 28.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 2530 cycles of the pclk. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 28.16** shows the CAN setting procedure after the MCU is reset.



**Note:** m = 0, 1, j = 0 to 15

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Note 2. For the setting of CAN clock frequency, see **Section 28.1.3, Clock Supply**.

Figure 28.16 CAN Setting Procedure after the MCU is Reset

### 28.11.1.1 Clock Setting

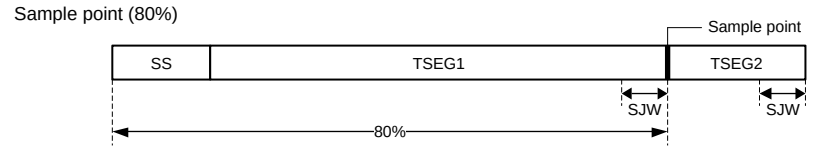
Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCFDn(CFD)GCFG register.

### 28.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CANFD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDn(CFD)GCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CANFD mode (CANmTq(N) clock and CANmTq(D) clock). Be sure to specify the same values for both NBRP[9:0] and DBRP[7:0]. To specify different values for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

**Figure 28.17** shows the bit timing chart. **Table 28.40** shows an example of bit timing setting.



Classical CAN mode:
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 4 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 > TSEG2 ≥ SJW

CANFD mode:

<Nominal bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 128 Tq
- Set TSEG2 to a range of 2 Tq to 32 Tq
- Set SJW to a range of 1 Tq to 32 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
- TSEG1 > TSEG2 ≥ SJW

<Data bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 2 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 8 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 ≥ TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 28.17 Bit Timing Chart

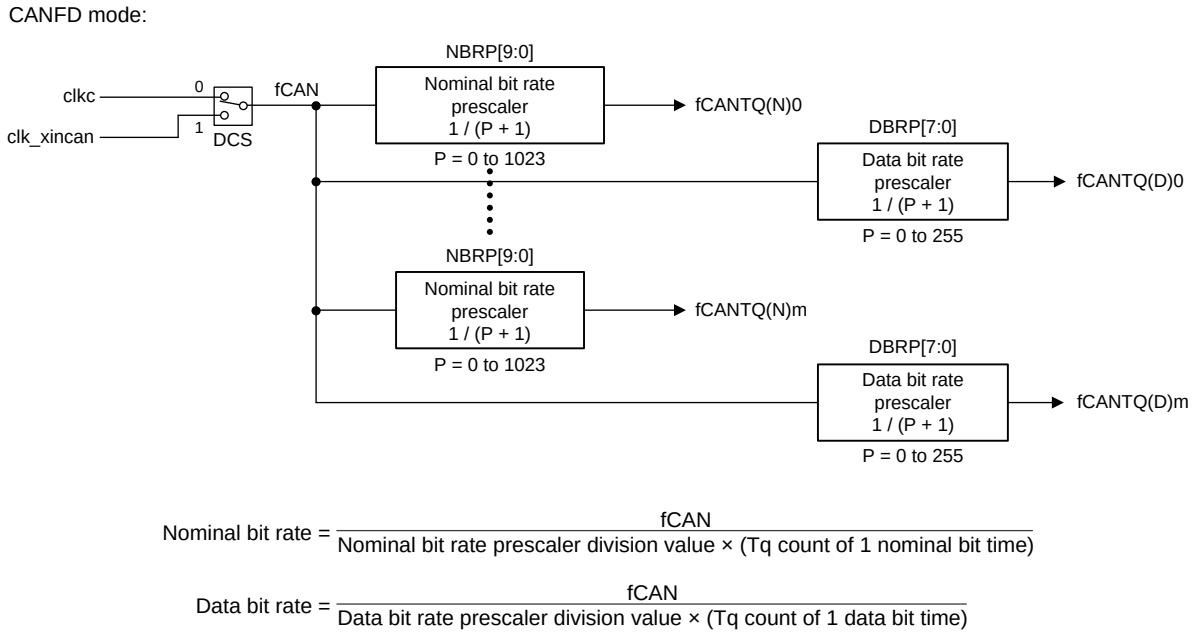
Table 28.40 Example of Bit Timing Setting

| 1 Bit | Set Value (Tq) | | | | Sample Point (%) |
|---|---|---|---|---|---|
| | SS | TSEG1 | TSEG2 | SJW | *Note*: See **Figure 28.17**. |
| | 1 | 4 | 3 | 1 | 62.50 |
| 8 Tq | 1 | 5 | 2 | 1 | 75.00 |
| | 1 | 6 | 3 | 1 | 70.00 |
| 10 Tq | 1 | 7 | 2 | 1 | 80.00 |
| | 1 | 10 | 5 | 1 | 68.75 |
| 16 Tq | 1 | 11 | 4 | 1 | 75.00 |
| | 1 | 12 | 7 | 1 | 65.00 |
| 20 Tq | 1 | 13 | 6 | 1 | 70.00 |
| 50 Tq*1 | 1 | 39 | 10 | 4 | 80.00 |

Note 1. Only in CANFD mode

### 28.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CANFD mode, set two types of transmission rate (arbitration phase and data phase) for each channel. **Figure 28.18** shows the CAN clock control block diagram, and **Table 28.41** and **Table 28.42** show examples of the communication speed setting.



$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

**Note:** m = 0, 1
DCS: Bit in the RSCFDn(CFD)GCFG register
BRP[9:0]: Bits in the RSCFDnCmCFG RSCANnCmCFG register
NBRP[9:0]: Bits in the RSCFDnCFDCmNCFG register
DBRP[7:0]: Bits in the RSCFDnCFDCmDCFG register
fCAN: CAN clock
fCANTQm: CANmTq clock
fCANTQ(N)m: CANmTq(N) clock
fCANTQ(D)m: CANmTq(D) clock

| Nominal bit rate 500 Kbps<br>Data bit rate 2 Mbps | Nominal bit rate 64 Tq (1)<br>Data bit rate 16 Tq (1) | Nominal bit rate 32 Tq (1)<br>Data bit rate 8 Tq (1) |

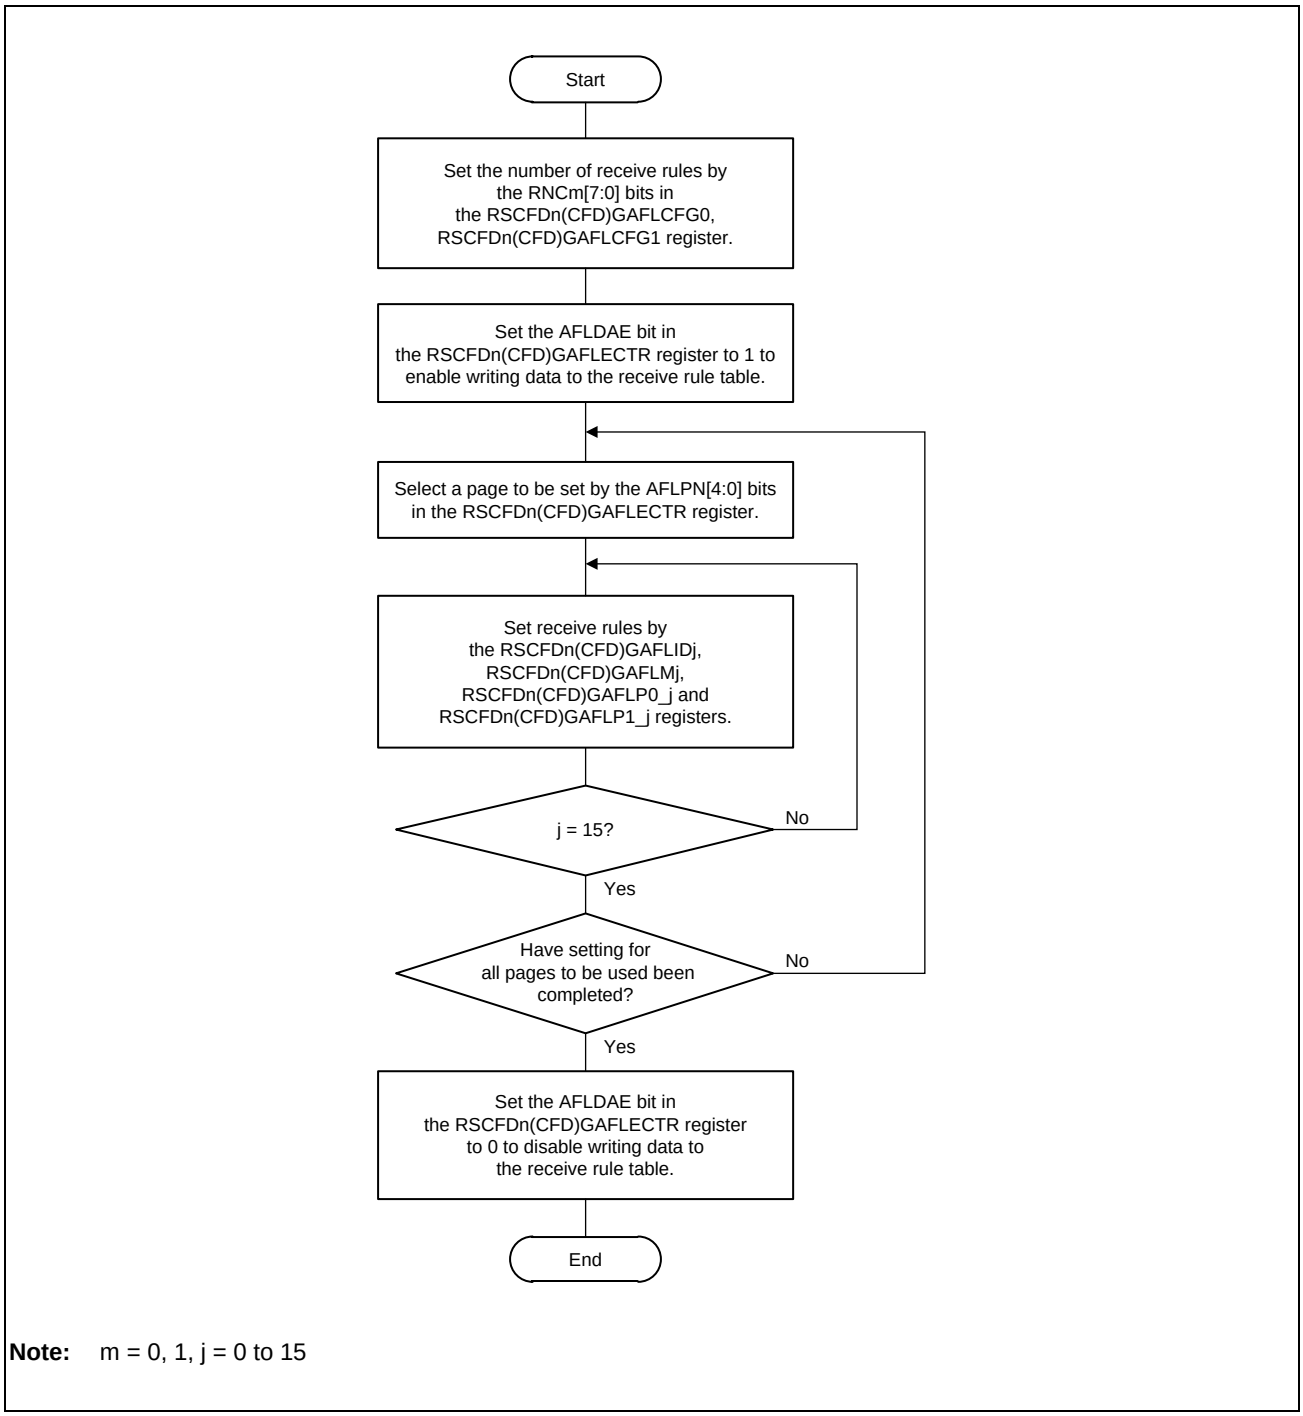
**Note:** Values in ( ) are baud rate prescaler division values.

### 28.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (for 6-channel unit) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

**Figure 28.19** shows the receive rule setting procedure.



**Note:** m = 0, 1, j = 0 to 15

Figure 28.19 Receive Rule Setting Procedure

### 28.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CANFD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

In classical CAN mode, up to 2048 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 128 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers + total number of depth of receive FIFO buffers x + total number of depth of transmit/receive FIFO buffers k ≤ 128 buffers

In CANFD mode, up to 3584 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 3584 bytes

**Figure 28.20** shows the buffer configuration. **Figure 28.21** shows the buffer setting procedure.

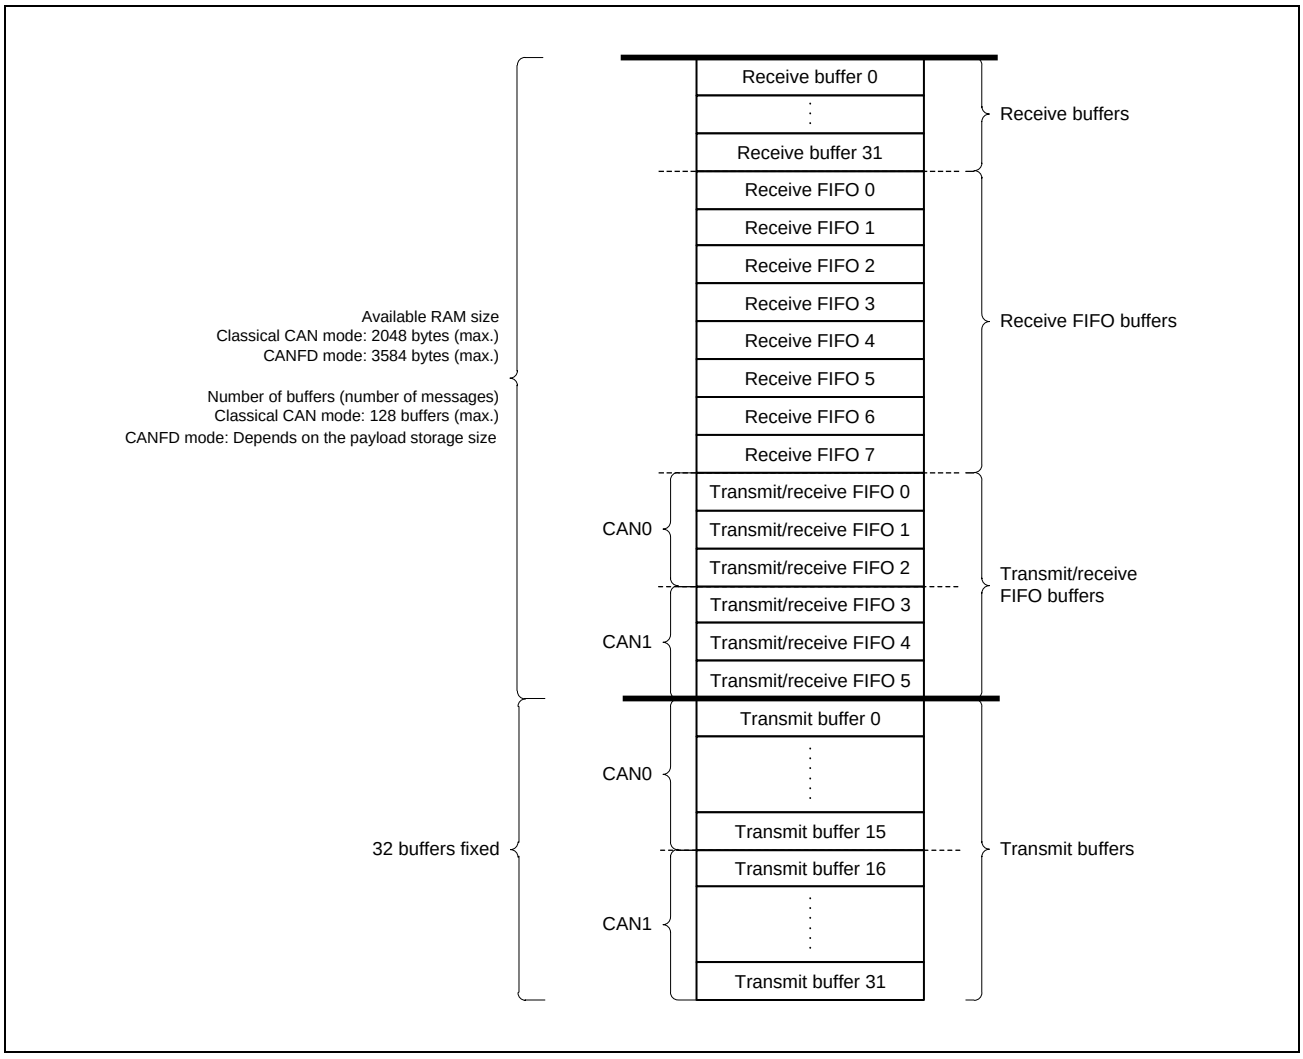


Figure 28.20 Buffer Configuration

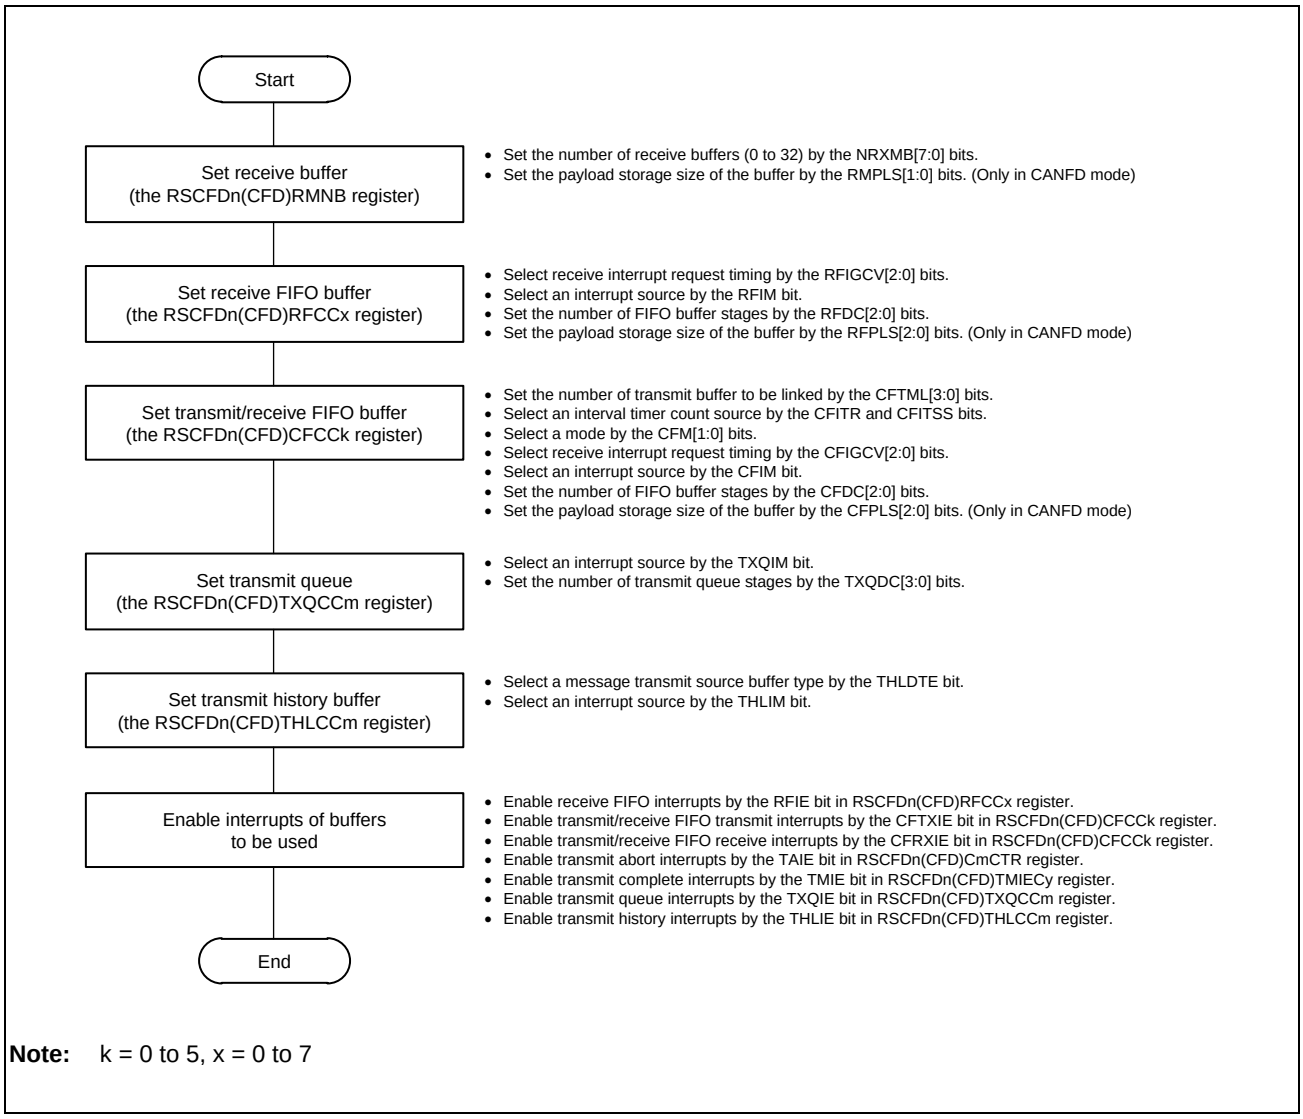
NOTE

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.



**Note:** k = 0 to 5, x = 0 to 7

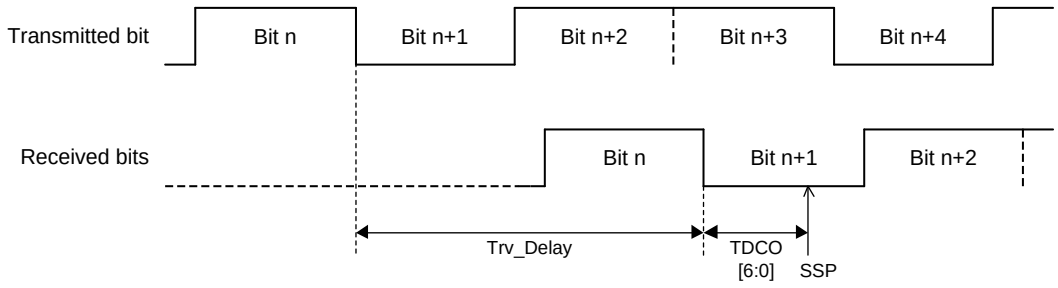
Figure 28.21 Buffer Setting Procedure

### 28.11.1.6 Transmitter Delay Compensation (Only in CANFD Mode)

A high baud rate is used in CANFD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.



**Note:** Bit n: arbitrary bit of data phase
TDCO[6:0]: RSCFDnCFDCmFDCFG register bits

Figure 28.22 SSP Timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

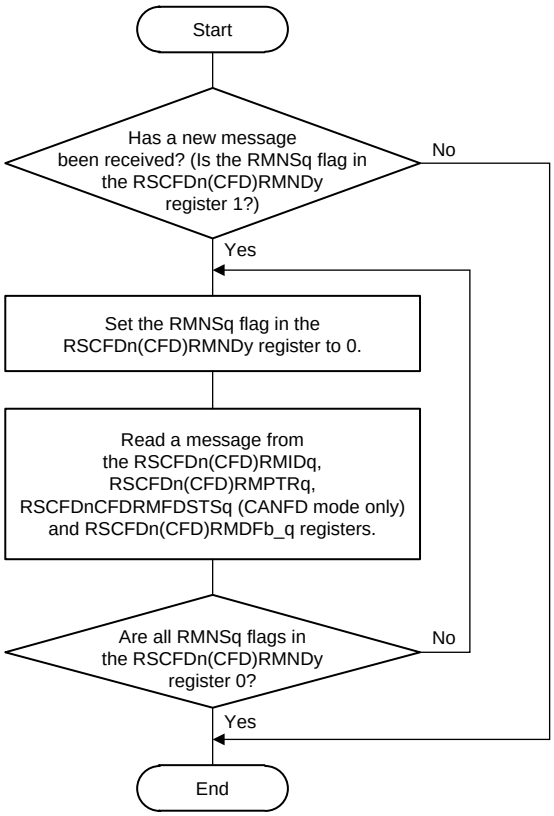
The RS-CANFD module compensates a delay up to (3 CANm bit time − 2 Tq). (Both CANm bit time and Tq are data bit rate values.)

When the TDCE bit in RSCFDnCFDCmFDCFG register is 1 (transmitter delay compensation is enabled), set bits NBRP[9:0] and DBRP[7:0] to the same value that is less than 1.

## 28.11.2 Reception Procedure

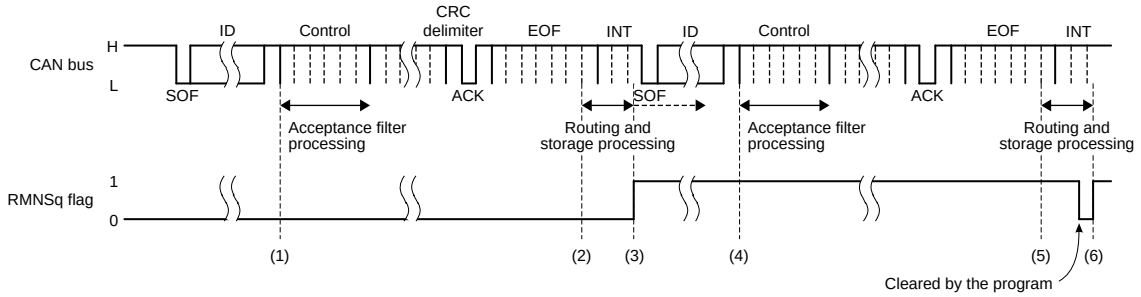
### 28.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0, q = 0 to 31) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CANFD mode), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CANFD mode). **Figure 28.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.



**Note:** y = 0, q = 0 to 31, b = 0 or 1 (classical CAN mode), 0 to 4 (CANFD mode)

Figure 28.23 Receive Buffer Reading Procedure



**Note:** y = 0, q = 0 to 31
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 28.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

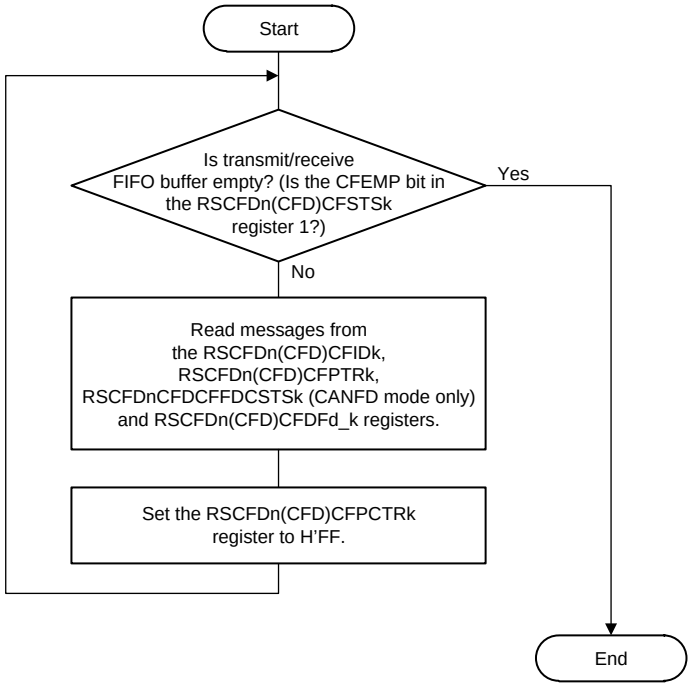
### 28.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register (k = 0 to 17)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CANFD mode), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CANFD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CANFD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.



**Note:** k = 0 to 5, d = 0 or 1 (classical CAN mode), 0 to 15 (CANFD mode)

Figure 28.25 Transmit/Receive FIFO Buffer Reading Procedure

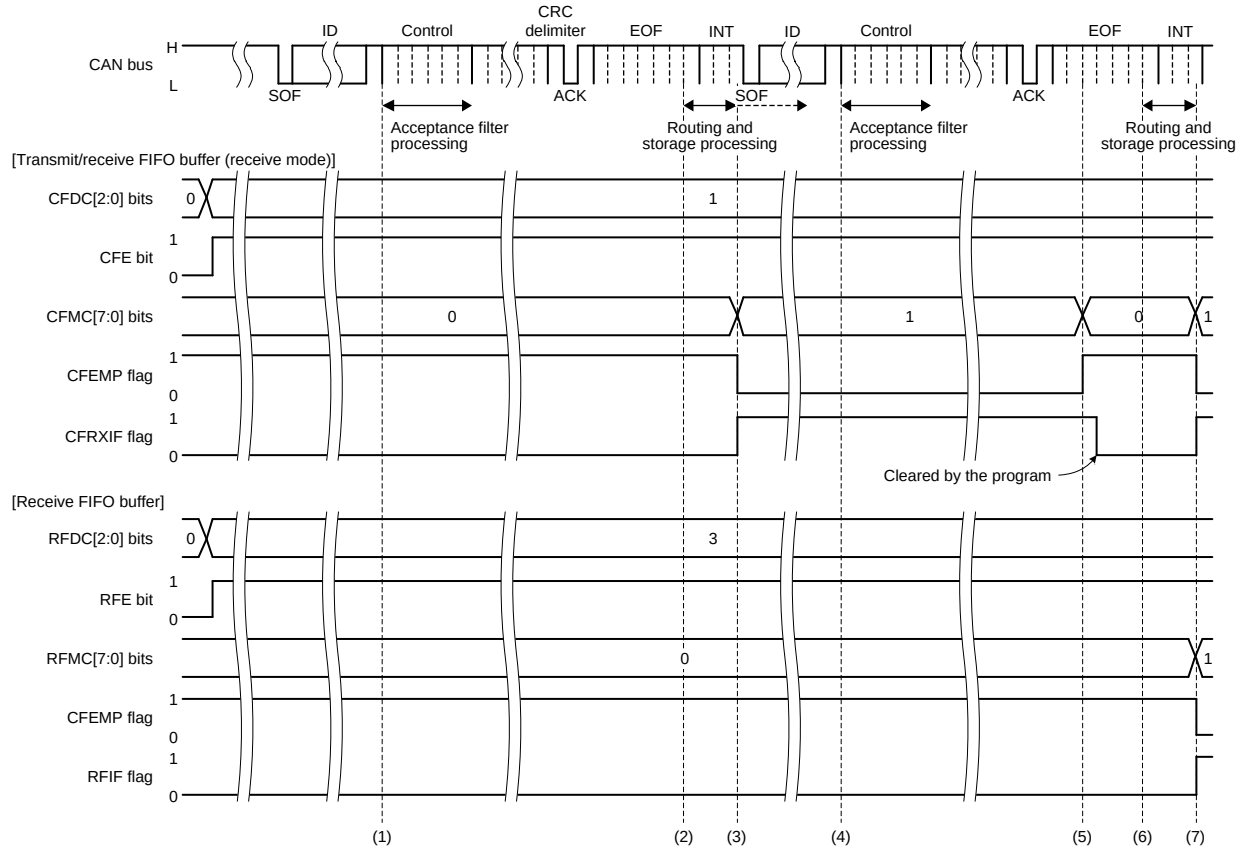
When reading a message in CANFD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 28.43 Payload Storage Area of Receive FIFO Buffer

| Set RFPLS[2:0] Value | Payload Storage Size | Corresponding Data Field Registers |
|---|---|---|
| 000b | 8 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x |
| 001b | 12 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x |
| 010b | 16 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x |
| 011b | 20 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x |
| 100b | 24 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x |
| 101b | 32 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x |
| 110b | 48 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x |
| 111b | 64 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x |

Table 28.44 Payload Storage Area of Transmit/Receive FIFO Buffer

| Set CFPLS[2:0] Value | Payload Storage Size | Corresponding Data Field Registers |
|---|---|---|
| 000b | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| 001b | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| 010b | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| 011b | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| 100b | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| 101b | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| 110b | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| 111b | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |



**Note:** CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RSCFDn(CFD)RFSTSx register
k = 0 to 5, x = 0 to 7

Figure 28.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is 001b or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented and becomes H'01. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write H'FF to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes H'00, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001b or more. The CFMC[7:0] bit value is incremented by 1 to be H'01. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to 001b or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register are set to H'01 by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

#### 28.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CANFD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0, 1)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTC register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

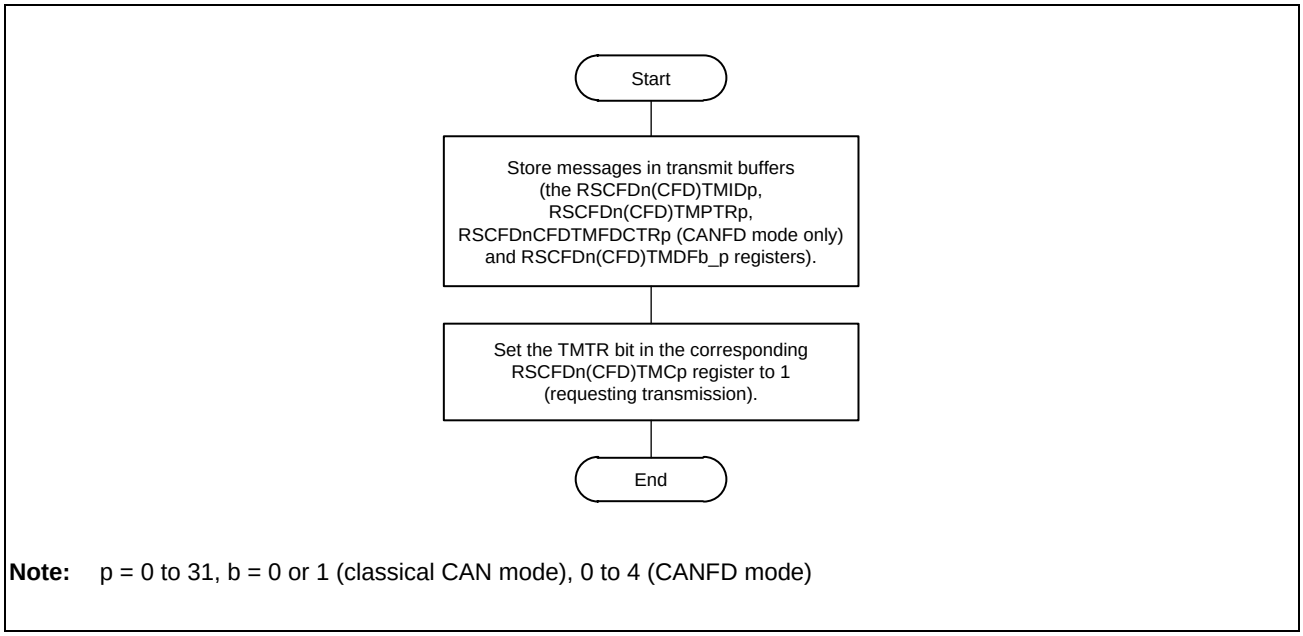
When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

## 28.11.3 Transmission Procedure

### 28.11.3.1 Procedure for Transmission from Transmit Buffers

**Figure 28.27** shows the procedure for transmission from transmit buffers.

**Figure 28.28** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 28.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



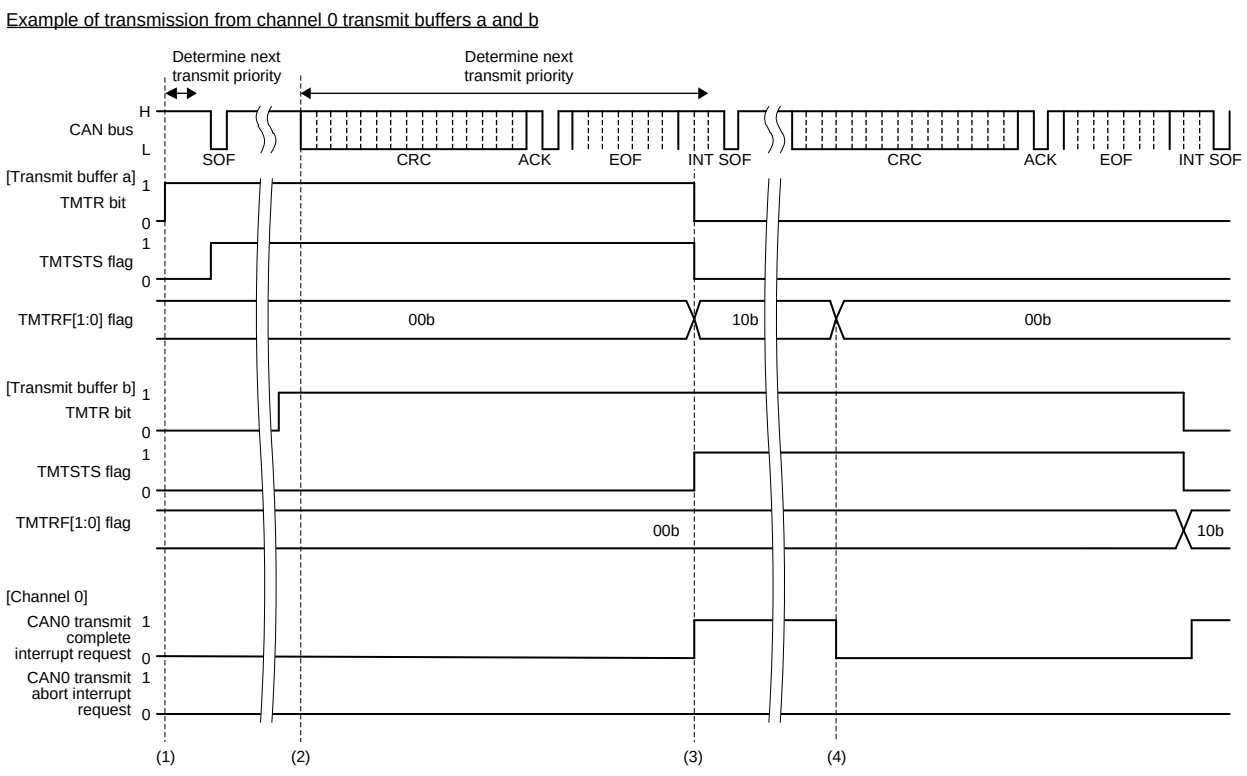
**Note:** p = 0 to 31, b = 0 or 1 (classical CAN mode), 0 to 4 (CANFD mode)

Figure 28.27 Procedure for Transmission from Transmit Buffers

In CANFD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 28.45** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

Table 28.45 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

| Transmit Buffer | Offset from Base Address | Symbol | Register Function in Transmit Buffer Merge Mode |
|---|---|---|---|
| Transmit buffer 0 | H'4000 | RSCFDnCFDTMID0 | Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit, and IDE bit |
| | H'4004 | RSCFDnCFDTMPTR0 | Transmit buffer 0 label data and DLC data |
| | H'4008 | RSCFDnCFDTMFDCTR0 | Transmit buffer 0 ESI bit, BRS bit, and FDF bit |
| | H'400C to H'401C | RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0 | Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19 |
| Transmit buffer 1 | H'4020 | RSCFDnCFDTMID1 | Transmit buffer 0 data bytes 20, 21, 22, and 23 |
| | H'4024 | RSCFDnCFDTMPTR1 | Transmit buffer 0 data bytes 24, 25, 26, and 27 |
| | H'4028 | RSCFDnCFDTMFDCTR1 | Transmit buffer 0 data bytes 28, 29, 30, and 31 |
| | H'402C to H'403C | RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1 | Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51 |
| Transmit buffer 2 | H'4040 | RSCFDnCFDTMID2 | Transmit buffer 0 data bytes 52, 53, 54, and 55 |
| | H'4044 | RSCFDnCFDTMPTR2 | Transmit buffer 0 data bytes 56, 57, 58, and 59 |
| | H'4048 | RSCFDnCFDTMFDCTR2 | Transmit buffer 0 data bytes 60, 61, 62, and 63 |
| | H'404C to H'405C | RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2 | Not used |



**Note:** a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp registers

Figure 28.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

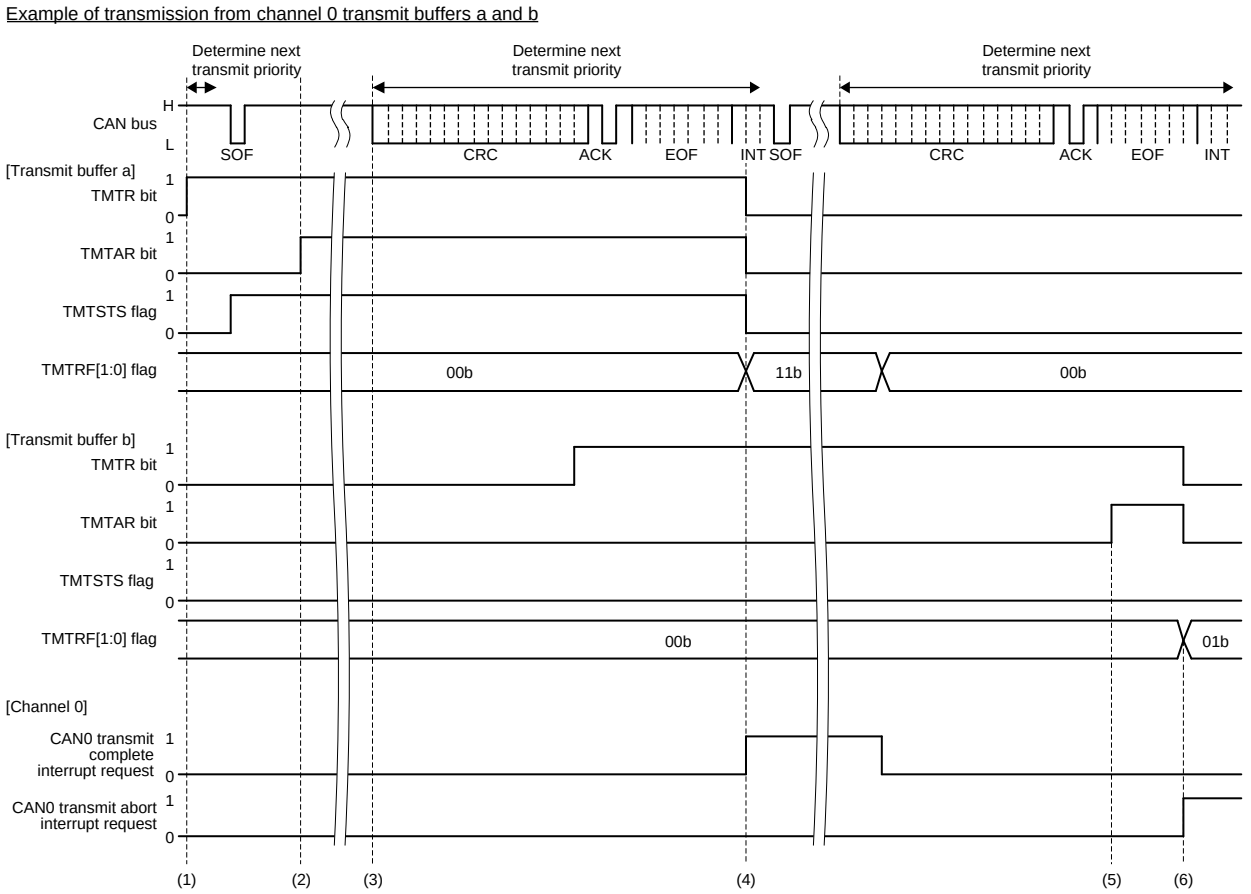
(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 10b (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00b (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00b. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00b.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.



**Note:** a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp register

Figure 28.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 11b (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCFDn(CFD)TMIEC0 register

is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00b (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

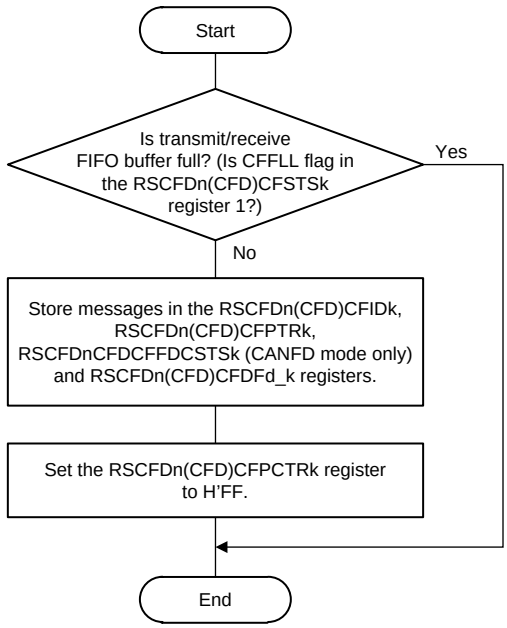
(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01b. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01b. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00b.

If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

### 28.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

**Figure 28.30** shows the procedure for transmission from transmit/receive FIFO buffers.

**Figure 28.31** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 28.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



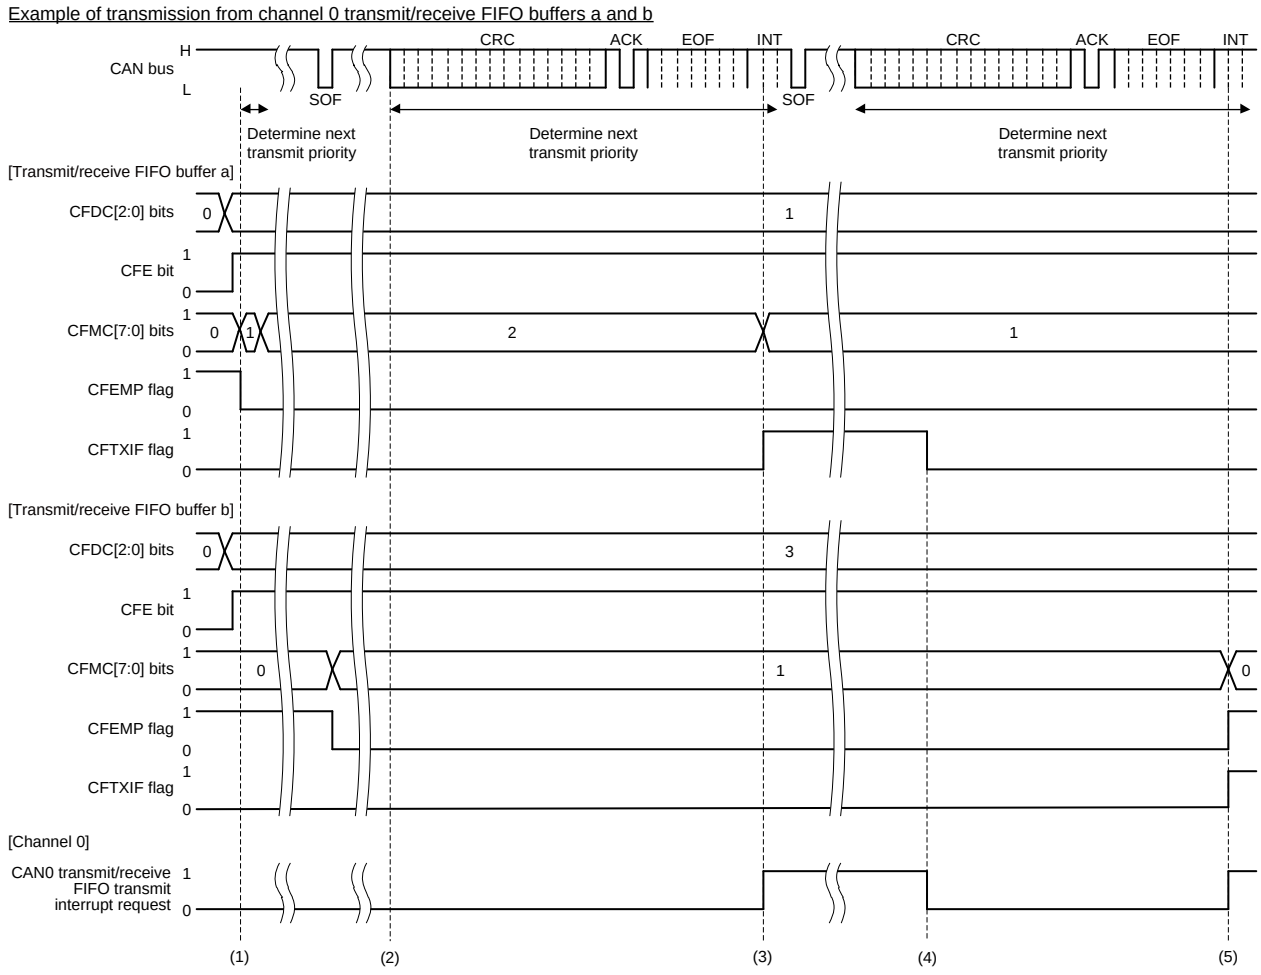
**Note:** k = 0 to 5, d = 0 or 1 (classical CAN mode), 0 to 15 (CANFD mode)

Figure 28.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 28.46 Payload Storage Area of Transmit/Receive FIFO Buffer

| Set CFPLS[2:0] Value | Payload Storage Size | Corresponding Data Field Registers |
|---|---|---|
| 000b | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| 001b | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| 010b | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| 011b | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| 100b | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| 101b | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| 110b | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| 111b | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |



**Note:** a = 0 to 2, b = 0 to 2
CFDC[2:0],CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 28.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001b (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is H'01 or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

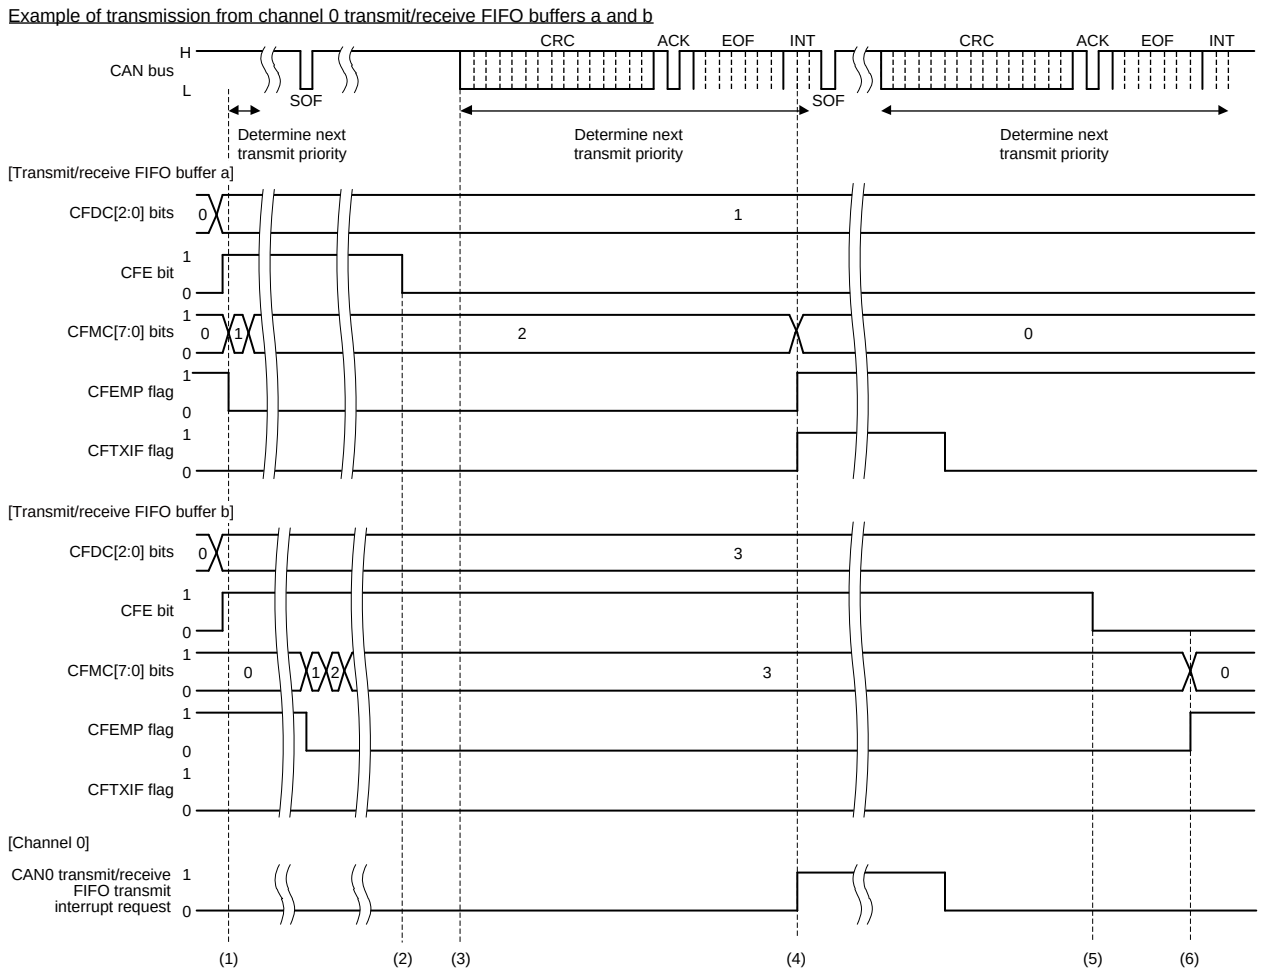
(3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is

generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSb register is decremented. The CFMC[7:0] bits are cleared to H'00 and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa and RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/ receive FIFO buffer is full).



Note: a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 28.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001b (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is H’01 or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

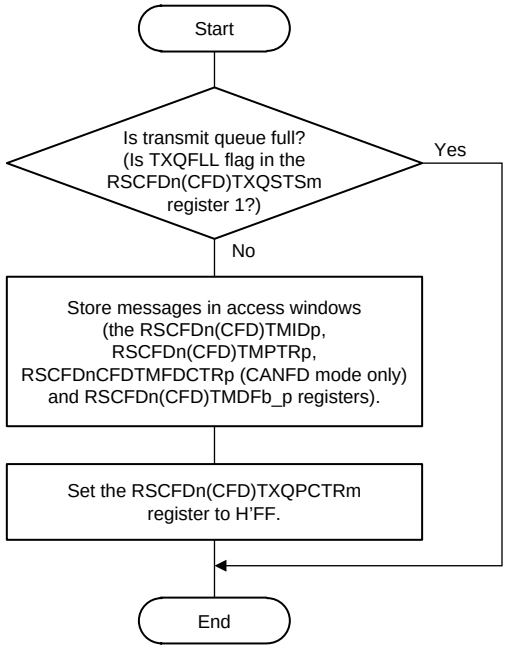
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to H’00. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSb register are cleared to H’00 and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to H’00 and the CFEMP flag is set to 1.)

### 28.11.3.3 Procedure for Transmission from the Transmit Queue

**Figure 28.33** shows the procedure for transmission from the transmit queue.

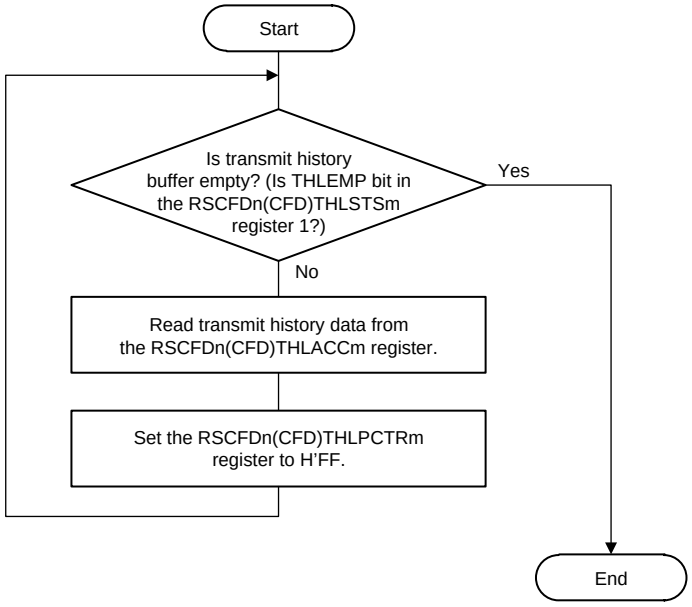


**Note:** p = m × 16 + 15, m = 0, 1

Figure 28.33 Procedure for Transmission from the Transmit Queue

### 28.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing H'FF to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0, 1) after reading a set of data. **Figure 28.34** shows the transmit history buffer reading procedure.



**Note:** m = 0, 1

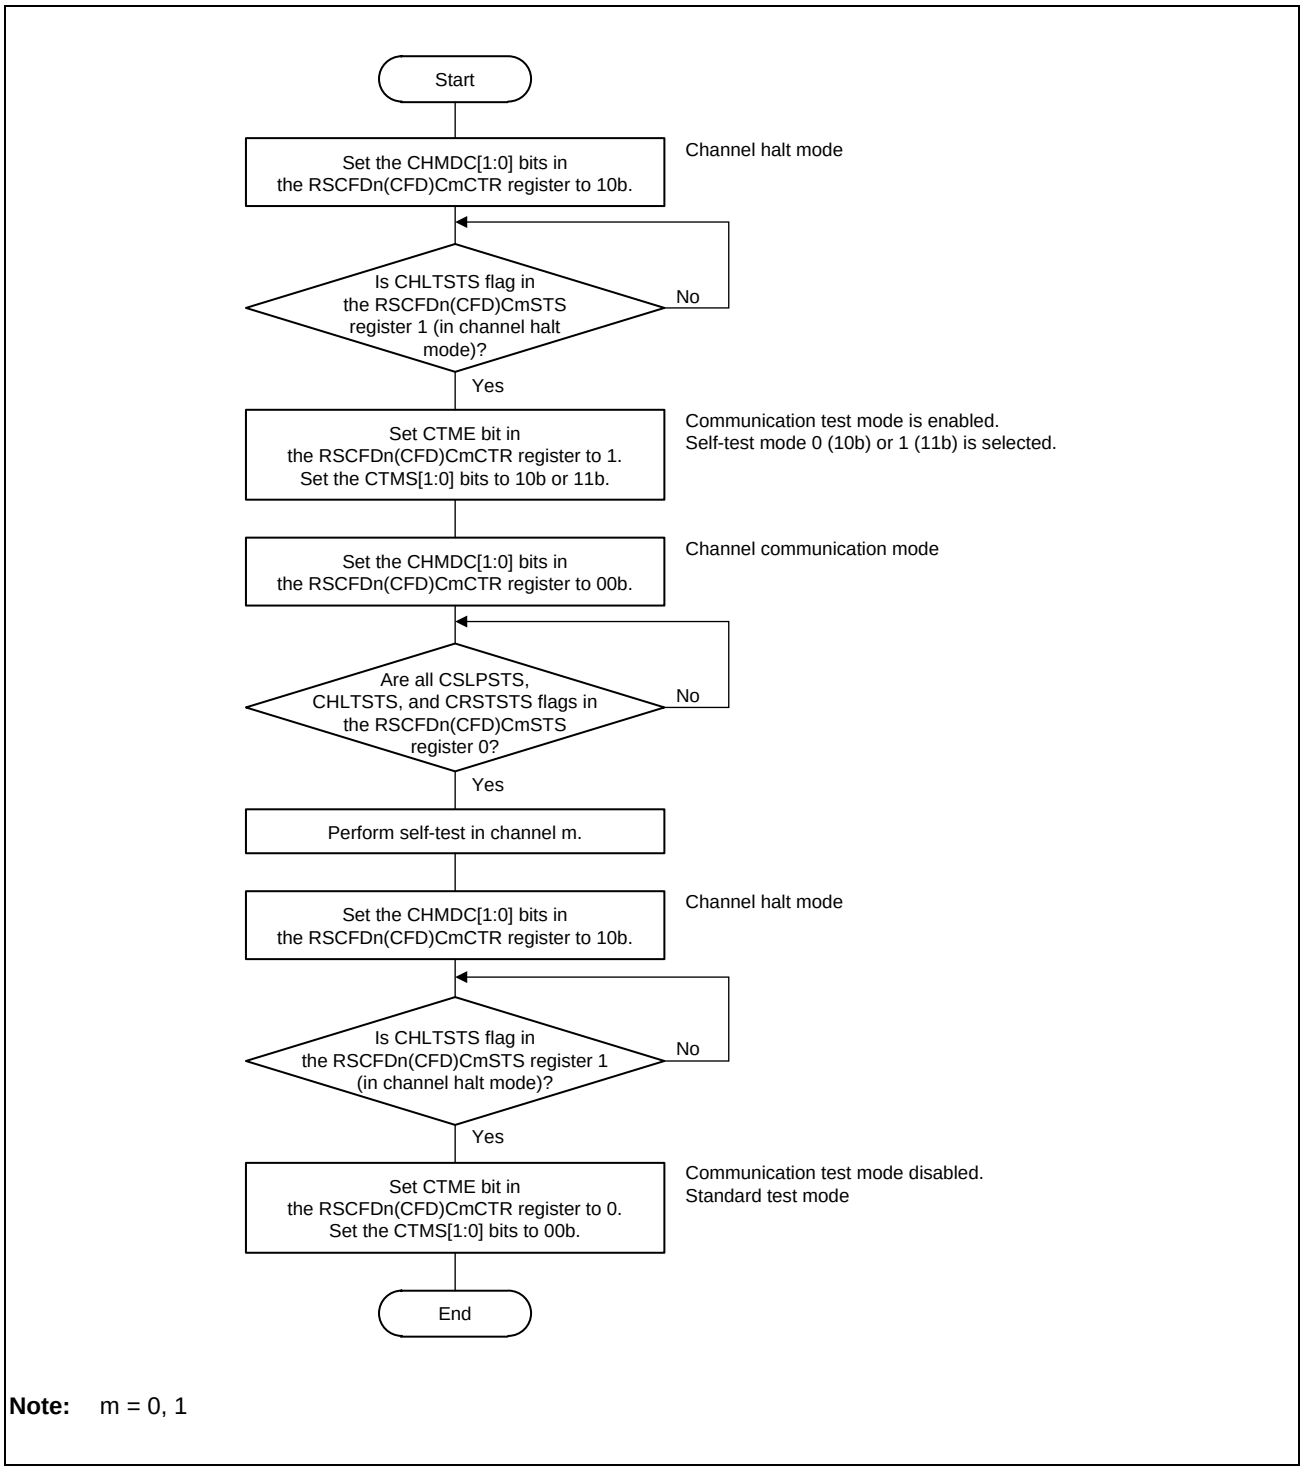
Figure 28.34 Transmit History Buffer Reading Procedure

## 28.11.4 Test Settings

### 28.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

**Figure 28.35** shows the self-test mode setting procedure.



**Note:** m = 0, 1

Figure 28.35 Self-Test Mode Setting Procedure

### 28.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 28.47** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 28.47 Protection Release Data for Test Function

| Test Function | Protection Release Data 1 | Protection Release Data 2 | Target Bit |
|---|---|---|---|
| RAM test | H'7575 | H'8A8A | RTME bit in the RSCFDn(CFD)GTSTCTR register |

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 28.36** shows the procedure for releasing the protection.

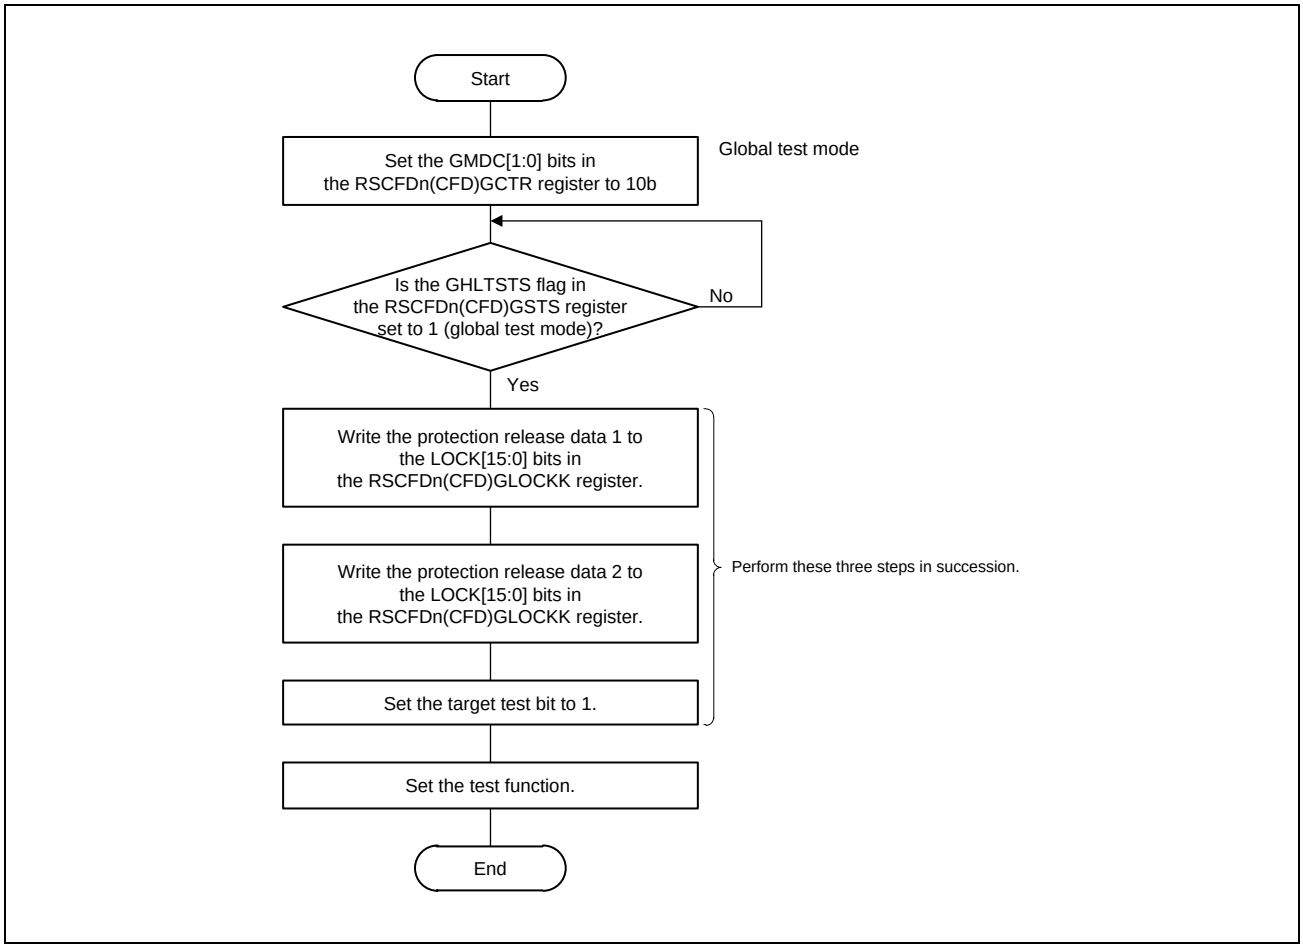


Figure 28.36 Protection Release Procedure

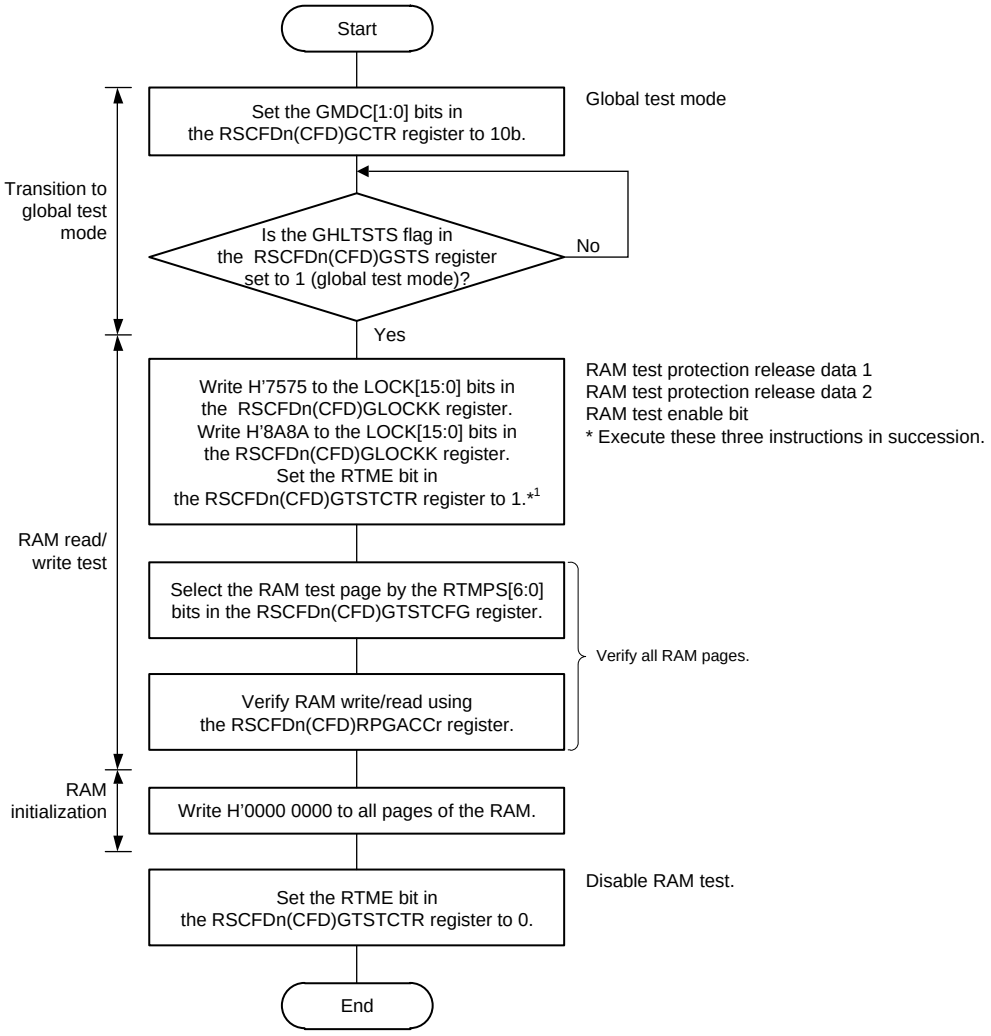
### 28.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write H'0000 0000 to all pages of the CAN RAM.

**Figure 28.37** shows the RAM test setting procedure.



**Note:** r = 0 to 63

Note 1. Before transitioning to the RAM test, perform the following.
- Cancel transmission request.
- Disable of each FIFO and transmission queue
- Clear flag of receive buffer

Figure 28.37 RAM Test Setting Procedure

#### 28.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

**Figure 28.38** shows the inter-channel communication test setting procedure.

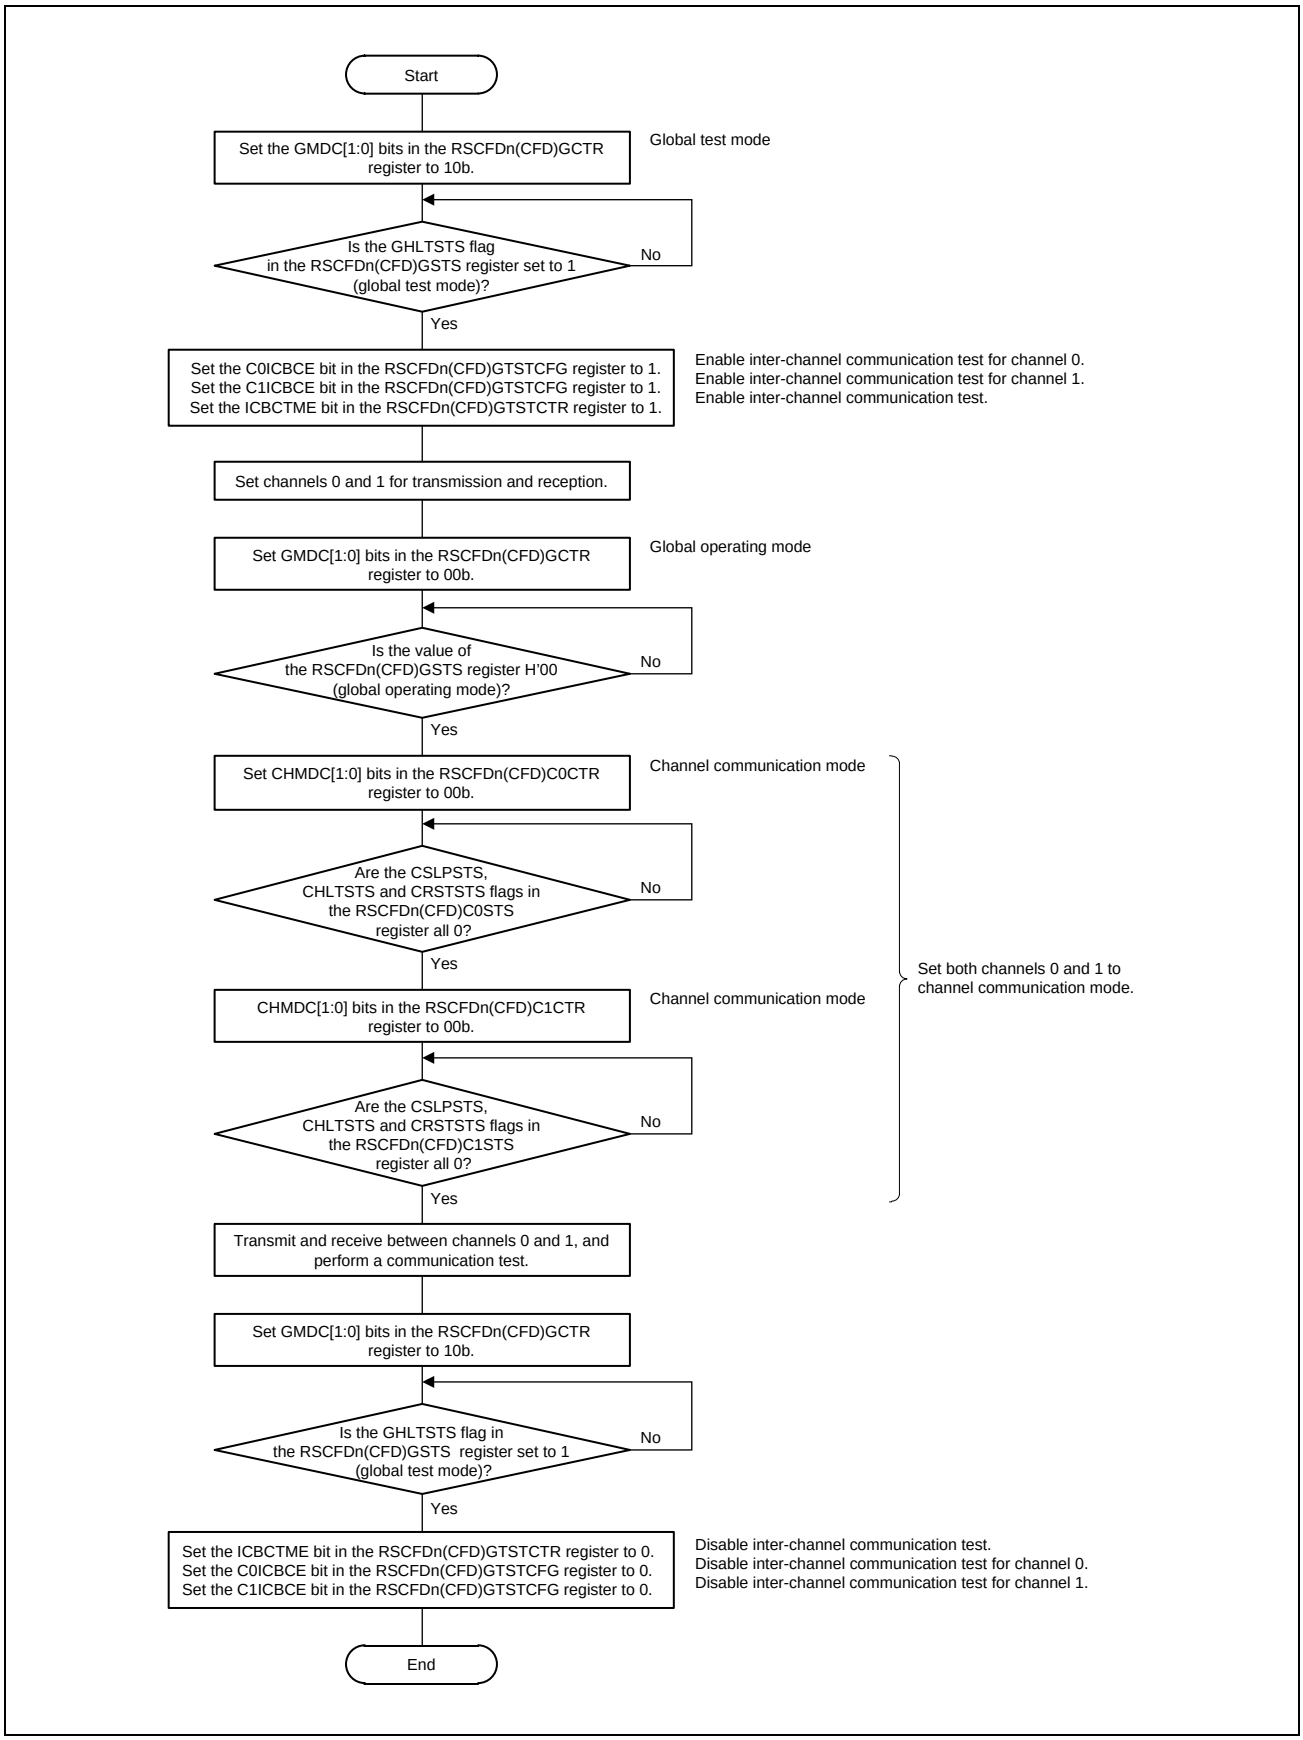


Figure 28.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

## 28.12 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0, 1) for transitions.
- When only classical CAN frames are used in CANFD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to H’00. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTS0 to RSCFDn(CFD)TMTRSTS2, RSCFDn(CFD)TMTARSTS0 to RSCFDn(CFD)TMTARSTS2, RSCFDn(CFD)TMTCSTS0 to RSCFDn(CFD)TMTCSTS2, and RSCFDn(CFD)TMTASTS0 to RSCFDn(CFD)TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CANFD mode), write H’00 to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not bet allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CANFD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/ receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 28.3, Registers (Classical CAN Mode)** and **Section 28.4, Registers (CANFD Mode)** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
  - Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)

- Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)
- Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)
- Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
- Transmit history access register (RSCFDn(CFD)THLACCm registers)
- RAM test page access register (RSCFDn(CFD)RPGACCr registers)

- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

# 30. Gigabit Ethernet Interface

Gigabit Ethernet Interface includes Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard. When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

Internal TCP/IP Offload Engine (TOE) calculates Checksum by hardware and has functions filtering Ethernet Frames and automatically responding specific frames. Dedicated Direct memory access controller (DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the URAM at high speed.

## 30.1 Features

### 30.1.1 Specification

- 2 channels
- Supports transfer at 1000 Mbps and 100 Mbps, 10 Mbps
- Supports filtering of Ethernet frames
- Supports interface conforming to IEEE802.3 PHY RGMII (Reduced Gigabit Media Independent Interface)
- Supports interface conforming to IEEE802.3 PHYMII (Media Independent Interface)

**Table 30.1** lists the features of the Gigabit Ethernet Interface block.

Table 30.1 Specifications (Functions) (1/2)

| IP Name | 1. Function |
|---|---|
| E-MAC | (1) Transmission and reception of Ethernet (IEEE 802.3) frames<br>(2) Supports transfer at 10, 100 and 1000 Mbps in Full-duplex Mode,<br>10, 100 Mbps in Half-duplex Mode<br>(3) Flow control conforming with the IEEE 802.3x standard<br>(4) Supports MII (Media Independent Interface) and RGMII (Reduced Gigabit Media Independent Interface)<br>(5) Transmission/Reception Low Power Idle Code |
| TOE | (1) Calculation of Checksum for following part of frames<br>– IPv4 Header<br>– IPv4 TCP/UDP/ICMP<br>– IPv6 TCP/UDP/ICMP<br>(2) Filtering of Ethernet Frames<br>The Possible Configuration of Filter Condition are followings.<br>– Ethernet Type<br>– IP Protocol No.<br>– UDP destination port No.<br>– Destination MAC address (Unicast)<br>– Destination MAC address (Broadcast)<br>– Destination MAC address (Multicast)<br>– ARP Request of Local Station<br>– Neighbor Solicitation of Local Station<br>– Except IPv6 Next Header (Analyzable)<br>(3) Automatically Responding to ARP Request and Neighbor Solicitation |

Table 30.1 Specifications (Functions) (2/2)

| IP Name | 1. Function |
|---|---|
| DMAC | (1) Supports AXI for DMA (128bit data width)<br>(2) Supports APB for register access (32bit data width)<br>(3) Direct Memory Access between URAM and TOE/E-MAC by Descriptor Method<br>(4) Supported Maximum Frame Size are followings.<br>– Transmission Frame is 1.5 KByte<br>– Reception Frame is 8 Kbyte |

## 30.1.2 Block Diagram

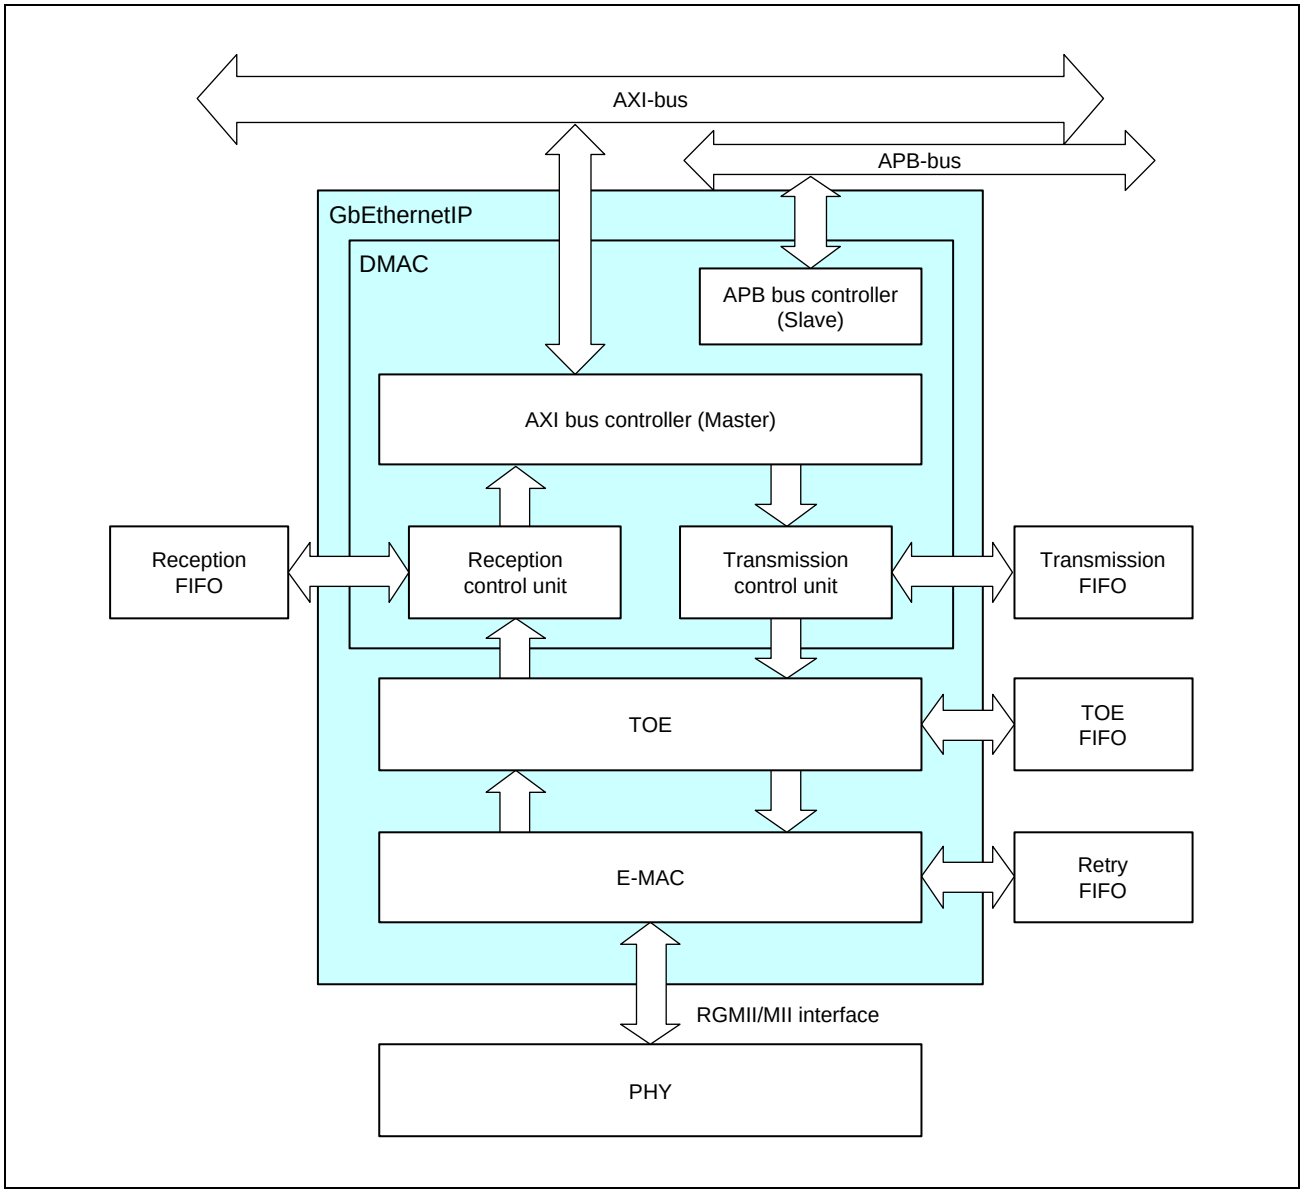

Figure 30.1 Block Diagram of Gigabit Ethernet Interface

## 30.2 External Signal Pins

**Table 30.2** shows external signal pins for Gigabit Ethernet Interface.

Table 30.2 External Pin Interface

| Name | I/O | | Description | Active Level | Initial Value | |
|---|---|---|---|---|---|---|
| | RGMII | MII | | | RGMII | MII |
| ET0_TXC/TX_CLK | Output | Input | Ch0 transmit clock signal | — | 0b | — |
| ET0_TX_CTL/TX_EN | Output | Output | Ch0 Transmit control/enable signal | H | 0b | 0b |
| ET0_TXD[3-0] | Output | Output | Ch0 Transmit data signal | — | 0b | 0b |
| ET0_TX_ERR | Unused | Output | Ch0 Transmit error signal | H | — | 0b |
| ET0_TX_COL | Unused | Input | Ch0 Transmit collision signal | H | — | — |
| ET0_TX_CRS | Unused | Input | Ch0 Transmit carrier sense signal | H | — | — |
| ET0_RXC/RX_CLK | Input | Input | Ch0 Receive clock signal | — | — | — |

| ET1_LINKSTA | Input | Input | Ch1 PHY Link status signal | H | — | — |

## 30.3 Register Configuration

### 30.3.1 Register Base Address

The base addresses of each channel are listed in the following table.

Table 30.3 Register Base Address

| Register Name | Base Address Name | Base Address |
|---|---|---|
| ETH0 | <ETH0_CA55_base> | H'0_11C2_0000 |
| | <ETH0_CM33_NS_base> | H'41C2_0000 |
| | <ETH0_CM33_S_base> | H'51C2_0000 |
| ETH1 | <ETH1_CA55_base> | H'0_11C3_0000 |
| | <ETH1_CM33_NS_base> | H'41C3_0000 |
| | <ETH1_CM33_S_base> | H'51C3_0000 |

### 30.3.2 IO Mode Registers

Refer to **Section 41, General Purpose Input Output Port (GPIO)** for Gigabit Ethernet Interface IO mode configuration.

### 30.3.3 DMAC Registers

Table 30.4 Configuration of DMAC-related Registers (From H'000 to H'4FF) (1/2)

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| DMAC mode register | CCC | R/W | H'0000 0000 | H'000 | 32 |
| Descriptor base address table register | DBAT | R/W | H'0000 0000 | H'004 | 32 |
| Descriptor base address load request register | DLR | R/W | H'003F FFFF | H'008 | 32 |
| DMAC status register | CSR | R | H'0000 0001 | H'00C | 32 |
| Current descriptor address register q (q = 0,4) | CDARq | R | H'0000 0000 | H'010 + q × 4 | 32 |
| Error status register | ESR | R | H'0000 0000 | H'088 | 32 |
| Receive configuration register | RCR | R/W | H'6000 0000 | H'090 | 32 |
| Reception Truncation Configuration register | RTC | R/W | H'7FFC 7FFC | H'0B4 | 32 |
| Transmit configuration register | TGC | R/W | H'0022 2200 | H'300 | 32 |
| Transmit configuration control register | TCCR | R/W | H'0000 0000 | H'304 | 32 |
| Transmit status register | TSR | R | H'0000 0000 | H'308 | 32 |
| MAC status FIFO Access register | MFA | R | H'0000 0000 | H'30C | 32 |
| MAC status FIFO Access 2 register | MFA2 | R | H'0000 0000 | H'340 | 32 |
| Descriptor interrupt control register | DIC | R/W | H'0000 0000 | H'350 | 32 |
| Descriptor interrupt status register | DIS | R/W | H'0000 0000 | H'354 | 32 |
| Error interrupt control register | EIC | R/W | H'0000 0000 | H'358 | 32 |
| Error interrupt status register | EIS | R/W | H'0000 0000 | H'35C | 32 |
| Receive interrupt control register 0 | RIC0 | R/W | H'0000 0000 | H'360 | 32 |
| Receive interrupt status register 0 | RIS0 | R/W | H'0000 0000 | H'364 | 32 |
| Receive interrupt control register 1 | RIC1 | R/W | H'0000 0000 | H'368 | 32 |

Table 30.4 Configuration of DMAC-related Registers (From H'000 to H'4FF) (2/2)

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| Receive interrupt status register 1 | RIS1 | R/W | H'0000 0000 | H'36C | 32 |
| Receive interrupt control register 2 | RIC2 | R/W | H'0000 0000 | H'370 | 32 |
| Receive interrupt status register 2 | RIS2 | R/W | H'0000 0000 | H'374 | 32 |
| Transmit interrupt control register | TIC | R/W | H'0000 0000 | H'378 | 32 |
| Transmit interrupt status register | TIS | R/W | H'0000 0000 | H'37C | 32 |
| Interrupt summary status register | ISS | R | H'0000 0000 | H'380 | 32 |
| Common Interrupt Enable register | CIE | R/W | H'0000 0000 | H'384 | 32 |
| Receive Interrupt Control register 3 | RIC3 | R/W | H'0000 0000 | H'388 | 32 |
| Receive Interrupt Status register 3 | RIS3 | R/W | H'0000 0000 | H'38C | 32 |
| Descriptor Interrupt Enable register | DIE | R/W | H'0000 0000 | H'450 | 32 |
| Descriptor Interrupt Disable register | DID | R/W | H'0000 0000 | H'454 | 32 |
| Error Interrupt Enable register | EIE | R/W | H'0000 0000 | H'458 | 32 |
| Error Interrupt Disable register | EID | R/W | H'0000 0000 | H'45C | 32 |
| Receive Interrupt Enable register 0 | RIE0 | R/W | H'0000 0000 | H'460 | 32 |
| Receive Interrupt Disable register 0 | RID0 | R/W | H'0000 0000 | H'464 | 32 |
| Receive Interrupt Enable register 1 | RIE1 | R/W | H'0000 0000 | H'468 | 32 |
| Receive Interrupt Disable register 1 | RID1 | R/W | H'0000 0000 | H'46C | 32 |

### 30.3.5 TOE Registers

Table 30.6 Configuration of TOE-related Registers (From H'800 to H'9FF) (1/2)

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| Checksum operating mode register | CSR0 | R/W | H'0000 0000 | H'800 | 32 |
| Tx Frame Checksum Enable register | CSR1 | R/W | H'0000 0000 | H'804 | 32 |
| Rx Frame Checksum Enable register | CSR2 | R/W | H'0000 0000 | H'808 | 32 |
| Tx Extended Header Number register | CSR3 | R/W | H'0000 0008 | H'80C | 32 |
| Rx Extended Header Number register | CSR4 | R/W | H'0000 0008 | H'810 | 32 |
| Unsupported Tx Frame Counter register | CSR20 | R/W | H'0000 0000 | H'820 | 32 |
| Unsupported Rx Frame Counter register | CSR30 | R/W | H'0000 0000 | H'824 | 32 |
| Rx IPv4 Header checksum Error Counter register | CSR31 | R/W | H'0000 0000 | H'828 | 32 |
| Rx TCP/UDP/ICMP checksum Error Counter register | CSR32 | R/W | H'0000 0000 | H'82C | 32 |
| Filter Operation/Auto Response Enable register | CSFR00 | R/W | H'1020 0000 | H'840 | 32 |
| Local IPv4 address register | CSFR01 | R/W | H'0000 0000 | H'844 | 32 |
| Local IPv6 address register i (i=0 to 3) | CSFR02_i | R/W | H'0000 0000 | H'848 + 4 × i | 32 |
| Upper Local MAC address register | CSFR03_U | R/W | H'0000 0000 | H'858 | 32 |
| Lower Local MAC address register | CSFR03_L | R/W | H'0000 0000 | H'85C | 32 |
| IPv6 no_next_header Protocol Number register | CSFR04 | R/W | H'0000 003B | H'860 | 32 |
| Ethernet Type Condition register i (i=0 to 3) | CSFR10_i | R/W | H'0000 0000 | H'870 + 4 × i | 32 |
| Ethernet Type Condition Enable register | CSFR10 | R/W | H'0000 0000 | H'880 | 32 |
| Protocol Condition register i (i=0 to 3) | CSFR11_i | R/W | H'0000 0000 | H'884 + 4 × i | 32 |
| Protocol Condition Enable register | CSFR11 | R/W | H'0000 0000 | H'894 | 32 |
| UDP Por Condition register i (i=0 to 11) | CSFR12_i | R/W | H'0000 0000 | H'898 + 4 × i | 32 |
| UDP Port Condition Enable register | CSFR12 | R/W | H'0000 0000 | H'8C8 | 32 |
| Upper MAC DA unicast address Condition register | CSFR13_U | R/W | H'0000 0000 | H'8CC | 32 |
| Lower MAC DA unicast address Condition register | CSFR13_L | R/W | H'0000 0000 | H'8D0 | 32 |
| Upper MAC DA broadcast address Condition register | CSFR14_U | R/W | H'0000 FFFF | H'8D4 | 32 |
| Lower MAC DA broadcast address Condition register | CSFR14_L | R/W | H'FFFF FFFF | H'8D8 | 32 |
| Upper MAC DA multicast address Condition register i (i=0 to 19) | CSFR15_U_i | R/W | H'0000 0100 | H'8DC + 8 × i | 32 |
| Lower MAC DA multicast address Condition register i (i=0 to 19) | CSFR15_L_i | R/W | H'5E00 0000 | H'8E0 + 8 × i | 32 |
| MAC DA Condition Enable register | CSFR15 | R/W | H'0000 0000 | H'97C | 32 |
| IPv6 analysis Protocol Condition register 0 | CSFR16_0 | R/W | H'2911 0600 | H'980 | 32 |
| IPv6 analysis Protocol Condition register 1 | CSFR16_1 | R/W | H'3A33 2C2B | H'984 | 32 |
| IPv6 analysis Protocol Condition register 2 | CSFR16_2 | R/W | H'0000 003C | H'988 | 32 |
| IPv6 analysis Protocol Condition Enable register | CSFR16 | R/W | H'0000 01FF | H'98C | 32 |
| Wake Up Interrupt Status register | CSFR20 | R/W | H'0000 0000 | H'9A0 | 32 |
| Wake Up Interrupt Mask register | CSFR21 | R/W | H'101F FFFF | H'9A4 | 32 |

Table 30.6 Configuration of TOE-related Registers (From H'800 to H'9FF) (2/2)

| Register Name | Abbreviation | R/W | Initial Value | Offset Address | Access Size |
|---|---|---|---|---|---|
| Auto Response Configuration register1 | CSFR30 | R/W | H'0001 7B35 | H'9B0 | 32 |
| Auto Response Configuration register2 | CSFR31 | R/W | H'0000 0000 | H'9B4 | 32 |
| ARPREQ/Neighbor Solicitations Receive Interrupt Status register | CSFR40 | R/W | H'0000 0000 | H'9C0 | 32 |
| ARPREQ/Neighbor Solicitations Receive Interrupt Mask register | CSFR41 | R/W | H'0000 0007 | H'9C4 | 32 |
| Rx ARPREQ/Neighbor Solicitation Upper MAC SA register | CSFR42_U | R | H'0000 0000 | H'9C8 | 32 |
| Rx ARPREQ/Neighbor Solicitation Lower MAC SA register | CSFR42_L | R | H'0000 0000 | H'9CC | 32 |
| Rx ARPREQ/Neighbor Solicitation IP SA register i (i=0 to 3) | CSFR43_i | R | H'0000 0000 | H'9D0 + 4 × i | 32 |

# 30.4 Register Descriptions

## 30.4.1 DMAC Registers

### 30.4.1.1 DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the DMAC.

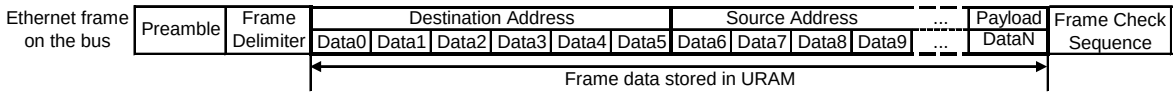
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | FCE | — | — | — | — | BOC | — | ERCS | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R | R | R | R | R/W | R | R/W | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RDFD | DTSR | — | — | — | — | — | — | OPC[1:0] | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 25 | FCE | 0b | R/W | Flow Control Enable<br>0b Flow control disabled<br>1b Flow control enabled<br>This bit enables the flow control support of E-MAC.<br>When flow control is enabled, the E-MAC gets informed about the Reception FIFO level (Reception FIFO fill level reached RCR.RFCL). |
| 24 to 21 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 20 | BOC | 0b | R/W | Byte Order Configuration<br>0b First Ethernet byte in URAM [7:0]<br>This bit defines the byte ordering of frame data in URAM in relation to the byte order in the Ethernet frame.<br>The CPU can only write 0b to this bit.*1 |
| 19 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 18 | ERCS | 0b | R/W | Enable Reference 250MHz Clock Stop function<br>0b Disable reference 250 MHz clock(clk_miitx_gtx_refclk) stop function.<br>1b Enable reference 250 MHz clock(clk_miitx_gtx_refclk) stop function.<br>This bit enables the stop function of reference clock of Ethernet. When this bit is '1', Gigabit Ethernet Interface asserts Output Signal “refclk_stop_en” during it does not need reference clock.<br>*Note*: If PHY does not support stopping TXC of RGMII Interface, set “0” to this bit. Because TXC is generated from clk_miitx_gtx_refclk.<br>[Changing condition]<br>This bit is set to 0b when RESET mode is entered. |
| 17 to 10 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 9 | RDFD | 0b | R/W | Reception Descriptor Fetch Disable<br>0b Reception Descriptor Fetch Enable<br>1b Reception Descriptor Fetch Disable<br>This register is used to stop the fetch of reception descriptor. By fetch stops, the state of Reception Descriptor Controller of DMAC will stop at IDLE.<br>CSR.RDFDM indicates the current fetch status of reception descriptor.<br>The CPU should not change any configuration or mode until CSR.RDFDM is updated once the Reception Descriptor Fetch Disable request is given.<br>The CPU should not cancel the Reception Descriptor Fetch Disable request (set this bit to 0b) before CSR.RDFDM is read as 1b. |
| 8 | DTSR | 0b | R/W | Data Transfer Suspend Request<br>0b Normal operation<br>1b Request suspension of data transfer<br>This bit requests to suspend further Gigabit Ethernet Interface accesses to URAM. A currently on-going access is completed. CSR.DTS indicates the current suspend status.<br>The CPU should not change any configuration or mode until CSR.DTS is updated once data transfer suspend request is given.<br>The CPU should not cancel the data transfer suspend request (set this bit to 0b) before CSR.DTS is read as 1b. |
| 7 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 to 0 | OPC | 00b | R/W | OPeration Command<br>00b Enter RESET mode<br>01b Enter CONFIG mode<br>10b Enter OPERATION mode<br>11b Reserved<br>These bits define the operating mode DMAC should enter.<br>Refer to **Section 4.1** for details about the operating modes.<br>The CPU can write to these bits in any operating mode.<br>[Changing condition]<br>These bits are set to 00b when RESET mode is entered. |

Note 1. Following illustrates a received Ethernet frame and the part of the frame stored in URAM.

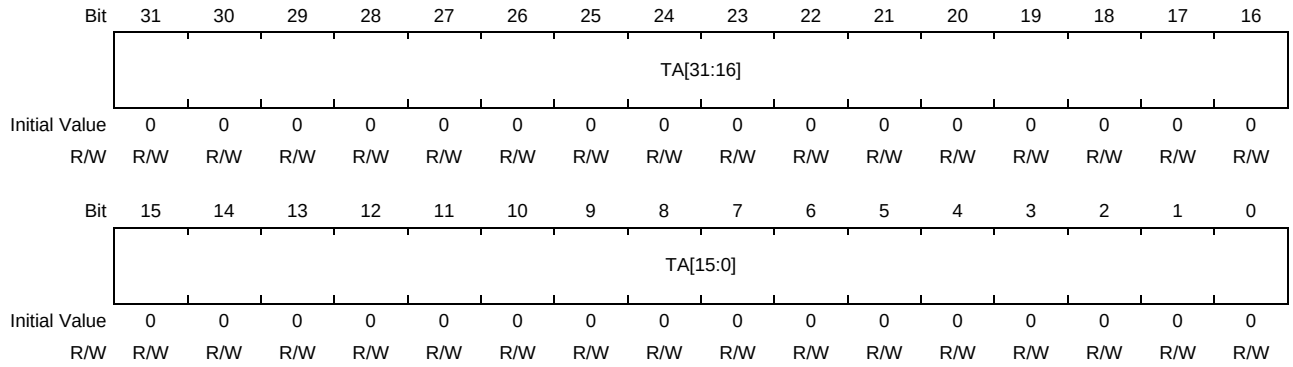


When CCC.BOC is 0b, an Ethernet frame is represented in URAM as:

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **DPTR**+0 | Data3 | | | | | | | | Data2 | | | | | | | | Data1 | | | | | | | | Data0 | | | | | | | |
| **DPTR**+4 | Data7 | | | | | | | | Data6 | | | | | | | | Data5 | | | | | | | | Data4 | | | | | | | |
| **DPTR**+8 | Data11 | | | | | | | | Data10 | | | | | | | | Data9 | | | | | | | | Data8 | | | | | | | |

### 30.4.1.2 Descriptor Base Address Table Register (DBAT)

The DBAT register specifies the base address of the descriptor table in the URAM.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | TA[31:0] | H'0000_0000 | R/W | Table Address<br>Address of descriptor base address table in URAM<br>These bits define the address of the first entry of the descriptor base address table.<br>Refer to **Section 4.2.3** about function and structure of the descriptor base address table.<br>The CPU can only write to these bits if CSR.OPS is CONFIG and OPERATION.<br>The CPU should only write values which are a multiple of 4 to these bits. |

### 30.4.1.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the count descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | LBA4 | — | — | — | LBA0 |
| Initial Value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21 to 5 | — | All 1 | R | Reserved<br>Whenever it is read, all bits 1 are read. The written value will be ignored. |
| 4 | LBA4 | 1b | R/W | Load Base Address 4(Rx0)<br>0b No pending load request<br>1b Pending load request<br>This bit requests to set the current descriptor address of queue q (CDARq.CDA) to an entry of the descriptor base address table (DBAT.TA + 8*4).<br>By setting this bit to 1b CPU requests a load of the current descriptor address of queue q.<br>If there is an on-going transfer for queue q, the load is processed after the whole frame has been transferred. Note: In case of a transmission queue, the load function is not influencing the transmit start request (TCCR.TSRQ); so, fetching continues at base address. To prevent this behavior, it is recommended to request the load of transmission queues only when TCCR.TSRQ is 0b.<br>The CPU can only write to this bit if CSR.OPS is OPERATION.<br>The CPU can only write 1b to this bit.<br>[Changing condition]<br>This bit is set to 1b when leaving OPERATION mode.<br>This bit is set to 0b when there is no on-going transfer (related to old chain) for queue q.<br>Note for verification: In Rx, if the entirety or the final part of a frame is stored into a FEMPTY_ND descriptor, then there is no actual frame transfer to URAM but still LBA reload is processed only when the transfer from RxRAM to BMI is completed for that frame. |
| 3 to 1 | — | All 1 | R | Reserved<br>Whenever it is read, all bits 1 are read. The written value will be ignored. |
| 0 | LBA0 | 1b | R/W | Load Base Address 0(Tx0)<br>0b No pending load request<br>1b Pending load request<br>This bit requests to set the current descriptor address of queue q (CDARq.CDA) to an entry of the descriptor base address table (DBAT.TA + 8*0).<br>For the other description, refer to LBA4 bit of this register. |

### 30.4.1.4 DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the DMAC is running and the individual communications states.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | TDUO | RPO | — | — | — | TPO |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

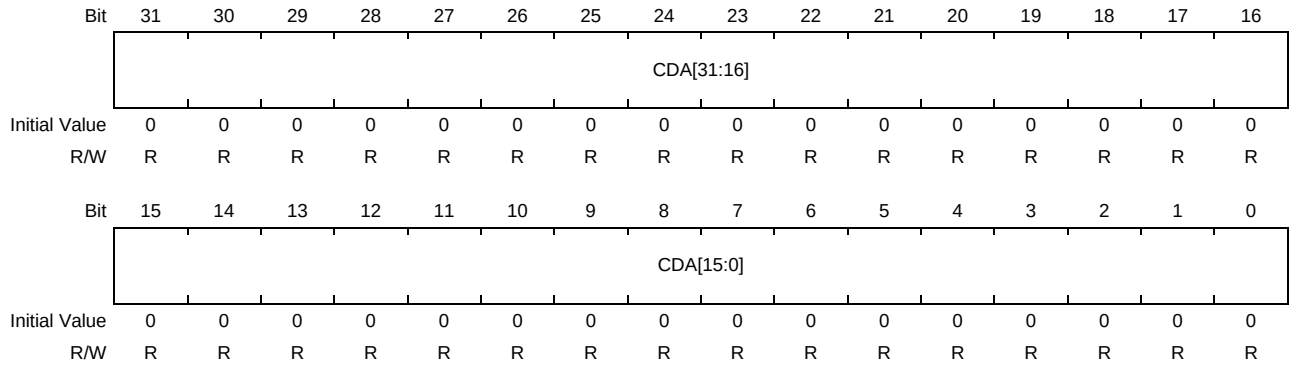
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | RCSI | RDFDM | DTS | — | — | — | — | OPS[3:0] | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21 | TDUO | 0b | R | Transmission Descriptor Update On-going<br>0b No pending descriptor update<br>1b Pending descriptor update in URAM<br>This bit indicates that there is pending descriptor update for a transmit queue.<br>When this bit is 1b, there are descriptors of already or currently processed transmit storage elements not updated in URAM.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when all transmit queue related storage elements processed.<br>This bit is set to 1b when descriptor related status update procedure starts (descriptor update and SFR flagging). |
| 20 | RPO | 0b | R | Reception Process On-going<br>0b No pending reception<br>1b Pending received frames in Reception FIFO<br>This bit indicates that there is pending receive data for a receive queues.<br>When this bit is 1b, there are frames in Reception FIFO that are not completely stored in URAM.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when a frame is completely stored in URAM, the descriptor update has been completed, and there are no pending frames in Reception FIFO for storage to URAM.<br>This bit is set to 1b when a frame received by E-MAC is completely stored in Reception FIFO. |
| 19 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | TPO | 0b | R | Transmission Process On-going<br>0b No pending transmission<br>1b Pending frames for transmission<br>This bit indicates that there is pending or on-going transmission process for transmit queue.<br>When this bit is 1b, a frame fetch from the queue in URAM has been started or completed but this frame has not been completely transmitted by E-MAC Descriptor write back is not included in this bit. |
| 15 to 11 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 10 | RCSI | 0b | R | Reference 250 MHz Clock is being Stopped Internally<br>0b Reference 250 MHz Clock is being not stopped internally<br>1b Reference 250 MHz Clock is being stopped internally<br>This bit indicates that Gigabit Ethernet Interface has stopped Reference 250 MHz Clock (clk_miitx_gtx_refclk) internally or not. When this bit is 1b, Internal Gated Clock Cell for Reference 250 MHz Clock is closed. During that time, this clock is not provided to internal logics.<br>[Changing condition]<br>This bit is set to 0b when the condition of input signal “refclk_stop” changes to 0b.<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when CCC.ERCS is 0b.<br>This bit is set to 1b when the condition of output signal “refclk_stop_en” changes to 1b. |
| 9 | RDFDM | 0b | R | Reception Descriptor Fetch Disable Monitor<br>0b Reception Descriptor Fetch will happen<br>1b Reception Descriptor Fetch is stopped<br>This bit is for monitoring. It can be used in order to confirm a state of Reception Descriptor Controller of DMAC. If this bit is '1', it means the fetch of Reception Descriptor from URAM by DMAC is completely stopped.<br>[Changing condition]<br>This bit is set to 0b when CCC.RDFD is 0b.<br>This bit is set to 0b when RESET mode is entered.<br>This bit is set to 1b when CCC.RDFD is 1b and fetch of Reception Descriptor from URAM is completely stopped. |
| 8 | DTS | 0b | R | Data Transfer Suspended<br>0b Access to URAM will happen<br>1b Access to URAM is suspended<br>This bit indicates if DMAC is allowed to access URAM.<br>[Changing condition]<br>This bit is set to 0b when CCC.DTSR is 0b.<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when CCC.DTSR is 1b and there is no on-going URAM access. |
| 7 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 to 0 | OPS | 0001b | R | OPerating mode Status<br>0001b RESET<br>0010b CONFIG<br>0100b OPERATION<br>others reserved<br>These bits represent the current operating mode of DMAC.<br>[Changing condition]<br>These bits are updated when an operating mode changes is processed. |

### 30.4.1.5 Current Descriptor Address Register q (CDARq) (q = 0,4)

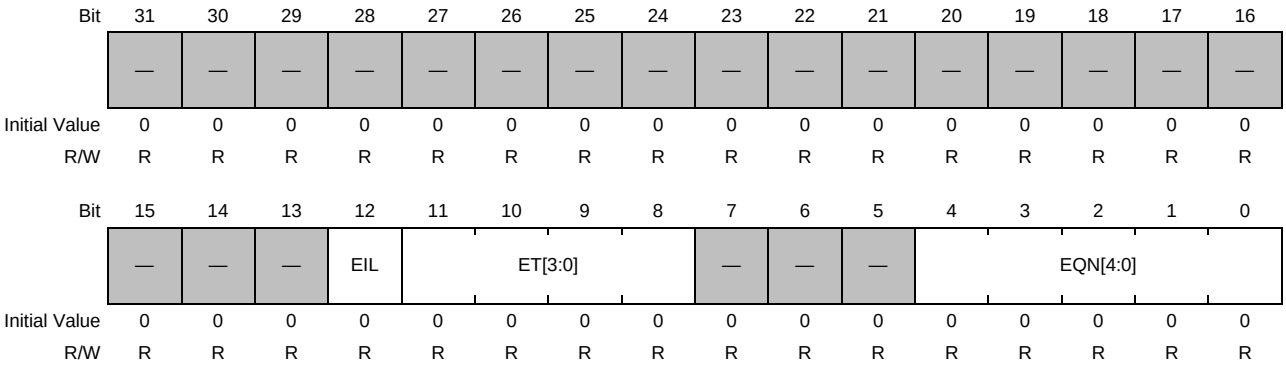
The CDARq register indicates the current descriptor address.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CDA | All 0 | R | Current Descriptor Address<br>Current descriptor address of transmission / receive queue q<br>These bits indicate the address of the descriptor which is currently being processed by queue q or which will be processed when queue q gets active.<br>For q=0 the addresses refer to the transmit queues.<br>From q=4 the addresses refer to the receive queues.<br>*Note*: The current descriptor address cannot be used for HW/SW synchronization. CDARq.CDA may one or more descriptors ahead from information available in URAM.<br>[Changing condition]<br>These bits are set to 0 when leaving OPERATION mode.<br>These bits are set to DBAT.TA + 8*q when entering OPERATION mode.<br>These bits are set to DBAT.TA + 8*q when the load base address request of queue (DLR.LBA) has been processed.<br>These bits are set to DESCR.DPTR when a link descriptor (LINK, LINKFIX) has been processed.<br>These bits are incremented by the size of the descriptor control structure (8 for normal) when a frame data descriptor has been processed. |

### 30.4.1.6 Error Status Register (ESR)

Error Status Register

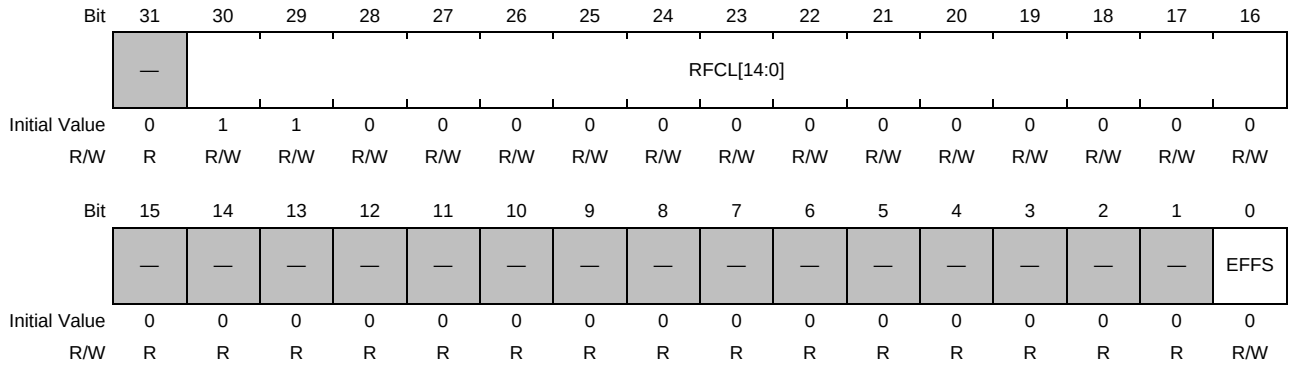


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | EIL | 0b | R | Error Information Lost<br>0b No loss of error information<br>1b Lost of error information detected<br>This bit indicates that error information detected by Gigabit Ethernet Interface is lost because the previous reported error has not been processed by CPU.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when CPU writes 0b to EIS.QEF.<br>This bit is set to 1b when the set condition of EIS.QEF is fulfilled while EIS.QEF is 1b. |
| 11 to 8 | ET | 0000b | R | Error Type<br>0000b (0) Read descriptor from URAM<br>0001b (1) Write descriptor to URAM<br>0010b (2) Interpret read descriptor<br>0011b (3) Transmission FIFO is corrupted<br>0100b (4) Read data from URAM<br>0101b (5) Write data to URAM<br>0110b (6) Reading data from Reception FIFO<br>0111b (7) Reception FIFO is corrupted<br>1000b (8) Frame size error during reception detected<br>1001b (9) Reserved<br>1010b (10) Transmission FIFO Data access error<br>others reserved<br>These bits indicate details about the transfer stage which was handled when Gigabit Ethernet Interface has detected an error.<br>When the fault is related to the read descriptor (ESR.ET=0 or 2), CPU needs to correct the faulty descriptor before the related queue can continue processing. In this case the queue halts at the faulty descriptor and CDARq.CDA (with q=ESR.EQN) identifies faulty descriptor.<br>All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction.<br>The CPU should only evaluate these bits when EIS.QEF is 1b.<br>[Changing condition]<br>These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0b. |
| 7 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 4 to 0 | EQN | 00000b | R | Number of faulty queue<br>These bits indicate the queue number which was being handled when Gigabit Ethernet Interface has detected an error.<br>A fault reported for ESR.EQN= 0 is related to transmit queue.<br>From ESR.EQN=4 the fault is related to receive queue.<br>The CPU should only evaluate these bits when EIS.QEF is 1b.<br>The CPU should not evaluate these bits when ESR.ET is 0011b, 0111b.<br>[Changing condition]<br>These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0b. |

### 30.4.1.7 Receive Configuration Register (RCR)

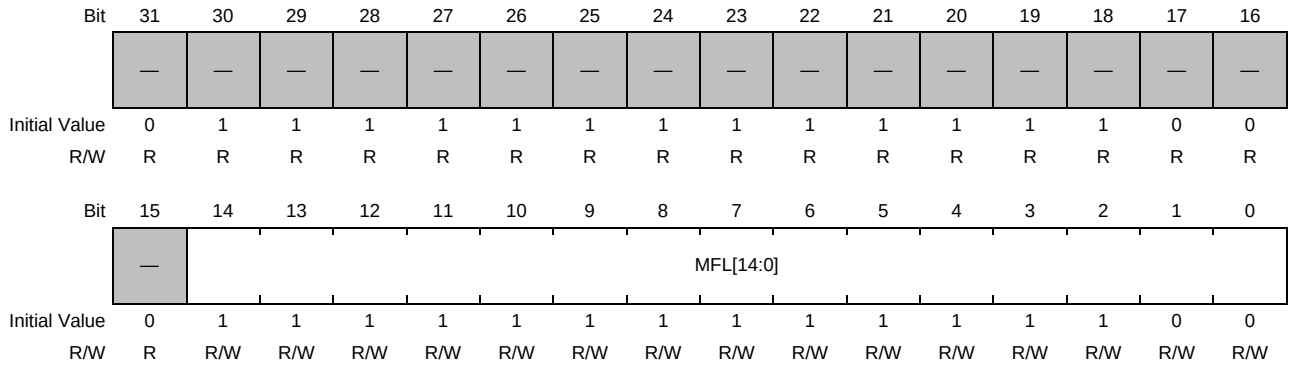
The RCR register is used to make settings related to reception for the DMAC.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 30 to 16 | RFCL[14:0] | H'6000 | R/W | Reception FIFO Critical Level<br>Number of bytes stored in Reception FIFO before critical level is reached (RFCL[1:0] are fixed to 0).<br>These bits define a fill level of the Reception FIFO in bytes to generate FIFO critical level reached warning notification (RIS1.RFWF).<br>The CPU can only write to these bits if CSR.OPS is CONFIG.<br>The CPU should only write values which are a multiple of 4 to these bits. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | EFFS | 0b | R/W | Enable Faulty Frame Storage<br>0b Storage of faulty frames disabled<br>1b Storage of faulty frames enabled (for debug)<br>This bit enables the storage of received frames classified as faulty by the TOE or E-MAC.<br>Faulty received frames will always be stored in receive queue.<br>*Note*: DESCR.MSC informs about the reception fault detected by the TOE or E-MAC.<br>The CPU can only write to this bit if CSR.OPS is CONFIG.<br>*Note*: This bit is used only for debug. Do not set RCR.EFFS=1 during normal operation. |

### 30.4.1.8 Reception Truncation Configuration Register I (RTC)

Reception Truncation Configuration register



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 30 to 18 | — | All 1 | R | Reserved<br>Whenever it is read, all bits 1 are read. The written value will be ignored. |
| 17 to 15 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 to 0 | MFL | H'7FFC | R/W | Maximum Frame Length<br>These bits define the maximum frame length (64 to 8k bytes) stored to URAM.<br>When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is 1000b). Additionally, the DESCR.TI in the updated descriptor is set to 1b.<br>The CPU can only write to these bits if CSR.OPS is CONFIG.<br>The CPU should only write values which are a multiple of 4 to these bits.<br>The CPU should not write values less than 64 to these bits. |

### 30.4.1.9 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the DMAC.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TBD[1:0] | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 21 | — | 1b | R | Reserved<br>Whenever it is read, 1 is read. The written value will be ignored. |
| 20 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | — | 1b | R | Reserved<br>Whenever it is read, 1 is read. The written value will be ignored. |
| 16 to 14 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 13 | — | 1b | R | Reserved<br>Whenever it is read, 1 is read. The written value will be ignored. |
| 12 to 10 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 to 8 | TBD | 10b | R/W | Transmission FIFO Depth<br>This bit defines the depth of the Transmission FIFO used for transmit queue. Gigabit Ethernet Interface fetches up to TGC.TBD frames from URAM to Transmission FIFO for transmit queue.<br>The CPU can only write “10b” to this bit.<br>Frame transmission by E-MAC can start for transmission queue when at least one frame from transmit queue is available in Transmission FIFO.<br>The CPU can only write to these bits if CSR.OPS is CONFIG. |
| 7 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.10 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the DMAC and is used to make related settings.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 19 | MFR2 | 0b | R/W | MAC status FIFO2 Release<br>0b No requests to MAC status FIFO2<br>1b Release oldest entry of MAC status FIFO2<br>This bit releases the oldest entry of the MAC status FIFO2.<br>When 1b is written to this bit, Gigabit Ethernet Interface gets informed that CPU has processed the oldest MAC status FIFO2 entry as visible in MFA2 register. The oldest entry is removed from MAC status FIFO2.<br>This bit is always read as 0b.<br>*Note*: Do not use the function of this bit in the Duplex Mode (CXR20.DPM=1). |
| 18 | MFEN2 | 0b | R/W | MAC status FIFO2 Enable<br>0b Disabled<br>1b Enabled<br>This bit enables the storage of transmission status information (the E-MAC flags for frame transmission) in the MAC status FIFO2.<br>When this bit is set to 0b all pending FIFO entries are removed.<br>*Note*: Do not use the function of this bit in the Duplex Mode (CXR20.DPM=1). |
| 17 | MFR | 0b | R/W | MAC status FIFO Release<br>0b No request to MAC status FIFO<br>1b Release oldest entry of MAC status FIFO<br>This bit releases the oldest entry of the MAC status FIFO.<br>When 1b is written to this bit, DMAC gets informed that CPU has processed the oldest MAC status FIFO entry as visible in MFA register. The oldest entry is removed from MAC status FIFO.<br>This bit is always read as 0b. |
| 16 | MFEN | 0b | R/W | MAC status FIFO Enable<br>0b Disabled<br>1b Enabled<br>This bit enables the storage of transmission status information (the TOE flags for frame transmission) in the MAC status FIFO. Additionally, CPU can control the status storage for each frame provided for transmission using DESCR.MSR.<br>When this bit is set to 0b all pending FIFO entries are removed. |
| 15 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | TSRQ | 0b | R/W | Transmission Start Request Queue<br>0b Transmission queue empty or stopped<br>1b Pending frames in queue to fetch<br>This bit defines that frames, provided by CPU in transmit queue in URAM should be transmitted.<br>When this bit is 1b, there are pending frames in transmit queue which have not been fetched to the Transmission FIFO.<br>*Note*: The transmission start request cannot be used for HW/SW synchronization. TCCR.TSRQ may be cleared before frame data is completely fetched from URAM.<br>*Note*: The frame transmission by E-MAC is decoupled from the fetching to the Transmission FIFO. Transmission scheduling for a queue depends on the transmission priority. CSR.TPO gives an indication about pending transmissions.<br>The CPU can only write to this bit if CSR.OPS is OPERATION.<br>The CPU can only write 1b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when CPU writes 1b to it.<br>This bit is set to 0b when DMAC has processed an EEMPTY, FEMPTY or LEMPTY descriptor (no data available).<br>This bit is set to 0b when DMAC has processed an EOS descriptor (end of set).<br>This bit is set to 0b when DMAC has processed a faulty descriptor.<br>This bit is set to 0b when CCC.OPC is 01b and there is no on-going fetch transfer for queue. |

### 30.4.1.11 Transmit Status Register (TSR)

The TSR register indicates the state of transmission by the DMAC.

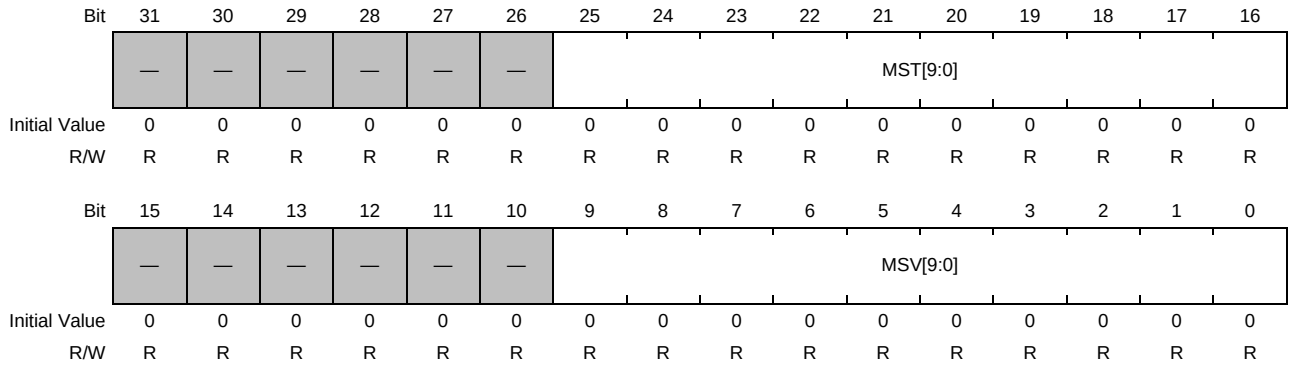
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | MFFL2[4:0] | | | | | — | — | — | MFFL[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 28 to 24 | MFFL2 | 0000b | R | MAC status FIFO2 Fill Level<br>Number of entries stored in the MAC status FIFO2<br>These bits indicate the number of entries available in the MAC status FIFO2.<br>If this value is 0, the FIFO2 is empty. If this value is 16, the FIFO2 is full. The values 17 to 31 are reserved.<br>[Changing condition]<br>These bits are set to 0 when leaving OPERATION mode.<br>These bits are set to 0 when TCCR.MFEN2 is 0b.<br>This value is incremented when TCCR.MFEN2 is 1b, TSR.MFFL2 is not 16, and E-MAC detects an error during transmission of frame.<br>This value is decremented when 1b is written to TCCR.MFR2 and TSR.MFFL2 is not 0. |
| 23 to 21 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 20 to 16 | MFFL | 00000b | R | MAC status FIFO Fill Level<br>Number of entries stored in the MAC status FIFO<br>These bits indicate the number of entries available in the MAC status FIFO.<br>If this value is 0, the FIFO is empty. If this value is 16, the FIFO is full. The values 17 to 31 are reserved.<br>[Changing condition]<br>These bits are set to 0 when leaving OPERATION mode.<br>These bits are set to 0 when TCCR.MFEN is 0b.<br>This value is incremented when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is not 16.<br>This value is decremented when 1b is written to TCCR.MFR and TSR.MFFL is not 0. |
| 15 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.12 MAC status FIFO Access Register (MFA)

MAC status FIFO Access register



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 25to 16 | MST | H'00 | R | MAC Status Tag<br>Tag number from descriptor identifying the frame MAC status relation<br>These bits represent the DESCR.TAG bits from the descriptor defining the data for frame transmission. The tag is used to get the relation between the frame inside a transmit queue and the TOE status available in the FIFO (MFA.MSV).<br>The CPU should not read these bits when TSR.MFFL is 0.<br>[Changing condition]<br>These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1).<br>These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR).<br>These bits are updated when the FIFO is overwritten (a frame with DESCR.MSR in descriptor has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16).<br>Note for verification: These bits are set to 0 when leaving OPERATION mode. |
| 15 to 10 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9to 0 | MSV | H'00 | R | MAC status value<br>These bits represent the TOE status bits as stored in the oldest MAC status FIFO entry.<br>MSV [9] Unsupported transmission frame<br>MSV [8:0] Reserved<br>The CPU should not read these bits when TSR.MFFL is 0.<br>[Changing condition]<br>These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1).<br>These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR).<br>These bits are updated when the FIFO overwritten (a frame with DESCR.MSR in descriptor has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16).<br>Note for verification: These bits are set to 0 when leaving OPERATION mode. |

### 30.4.1.13 MAC status FIFO Access 2 Register (MFA2)

MAC status FIFO Access 2 register

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | MSV2[8:0] | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 to 0 | MSV2 | H'00 | R | MAC Status Value2<br>These bits represent the MAC status bits as stored in the oldest MAC status FIFO2 entry.<br>MSV [8] abort information<br>MSV [7:3] Reserved<br>MSV [2] Carrier lost during frame transmission<br>MSV [1] Delay collision<br>MSV [0] Transmission time out<br>The CPU should not read these bits when TSR.MFFL2 is 0.<br>[Changing condition]<br>These bits are updated when the first entry is stored in FIFO2 (TSR.MFFL2 changes from 0 to 1).<br>These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR2).<br>These bits are updated when the FIFO2 is overwritten when TCCR.MFEN2 is 1b, TSR.MFFL2 is 16, and E-MAC detects an error during transmission of frame. |

### 30.4.1.14 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DPF15 | DPF14 | DPF13 | DPF12 | DPF11 | DPF10 | DPF9 | DPF8 | DPF7 | DPF6 | DPF5 | DPF4 | DPF3 | DPF2 | DPF1 | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 1 | DPFi | All 0 | R/W | Descriptor Processed Flag i (i = 1 to 15)<br>0b No interrupt pending<br>1b Descriptor interrupt pending<br>This bit indicates that a descriptor in a reception or transmit queue has been processed where DESCR.DIE is i.<br>*Note*: When DESCR.DIE is 0000b, no descriptor interrupt is generated.<br>*Note*: When DESCR.DIE is 0001b, in addition a queue specific descriptor interrupt is generated.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when a descriptor has been processed where DESCR.DIE is i. |
| 0 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.15 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DPE15 | DPE14 | DPE13 | DPE12 | DPE11 | DPE10 | DPE9 | DPE8 | DPE7 | DPE6 | DPE5 | DPE4 | DPE3 | DPE2 | DPE1 | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 1 | DPEi | All 0 | R/W | Descriptor Processed interrupt Enable i (i = 1 to 15)<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when DIS.DPFi is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to DID.DPDi.<br>This bit is set to 1b when writing 1b to DIE.DPSi. |
| 0 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.16 Descriptor Interrupt Enable Register (DIE)

The DIE register set to 1 each bit in descriptor interrupt control register (DIC).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 1 | DPDi | All 0 | R/W | Descriptor Processed interrupt Disable i (i = 1 to 15)<br>0b No change of DIC.DPEi<br>1b Set DIC.DPEi to 0b<br>This bit supports interrupt enable. It controls set of DIC.DPEi.<br>This bit is always read as 0b. |
| 0 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.18 Error Interrupt Status Register (EIS)

The EIS register indicates the states of DMAC-related error interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | QFS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MFFF2 | — | MFFF | — | — | — | — | — | — | QEF | MTEF | MREF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R | R/W | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | QFS | 0b | R | Queue Full Summary<br>0b No interrupt pending<br>1b Queue full interrupt pending<br>Summary bit to indicate that at least one queue is full.<br>[Changing condition]<br>This bit is set when any matching pair of RIC2.QFE enable and RIS2.QFF flag are both 1b; or when both the RIS2.RFFF flag and RIC2.RFFE enable are 1b. |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | MFFF2 | 0b | R/W | MAC status FIFO2 Full Flag<br>0b No interrupt pending<br>1b MAC status FIFO2 full, oldest MAC status lost<br>MAC status FIFO2 Full Flag<br>This bit indicates that a transmission MAC status is overwritten because the MAC status FIFO2 is full (overwrite condition).<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when TCCR.MFEN2 is 1b, TSR.MFFL2 is 16, and E-MAC detects an error during transmission of frame. |
| 10 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 | MFFF | 0b | R/W | MAC status FIFO Full Flag<br>0b No interrupt pending<br>1b MAC status FIFO full, oldest MAC status lost<br>This bit indicates that a transmission MAC status is overwritten because the MAC status FIFO is full (overwrite condition).<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16. |
| 8 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | QEF | 0b | R/W | Queue Error Flag<br>0b No interrupt pending<br>1b Interrupt pending<br>This bit indicates that an error has been detected while processing receive or transmit queue.<br>Detail about the detected error is indicated by ESR.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when an error condition is detected. |
| 1 | MTEF | 0b | R/W | MAC Transmission Error Flag<br>0b No interrupt pending<br>1b MAC has reported an error during transmission<br>This bit indicates that the E-MAC has detected a fault during transmission.<br>For detail, the E-MAC registers have to be checked.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when E-MAC detects an error during frame transmission. |
| 0 | MREF | 0b | R/W | MAC Reception Error Flag<br>0b No interrupt pending<br>1b MAC has reported an error during reception<br>This bit indicates that the E-MAC has detected a fault during reception.<br>For detail, the E-MAC registers have to be checked.<br>*Note*: When the storage of faulty received frames (RCR.EFFS) is enabled, the E-MAC error code is stored in the descriptor (DESCR.MSC). By evaluating this information CPU can identify corrupted frames in URAM.<br>The CPU can only write 0b to this bit. |

### 30.4.1.19 Error Interrupt Control Register (EIC)

The EIC register controls the DMAC-related error interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MFFE2 | — | MFFE | — | — | — | — | — | — | QEE | MTEE | MREE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R | R/W | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | MFFE2 | 0b | R/W | MAC status FIFO2 Full interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when EIS.MFFF2 is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to EID.MFFD2.<br>This bit is set to 1b when writing 1b to EIE.MFFS2. |
| 10 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 | MFFE | 0b | R/W | MAC status FIFO Full interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when EIS.MFFF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to EID.MFFD.<br>This bit is set to 1b when writing 1b to EIE.MFFS. |
| 8 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | QEE | 0b | R/W | Queue Error interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when EIS.QEF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to EID.QED.<br>This bit is set to 1b when writing 1b to EIE.QES. |
| 1 | MTEE | 0b | R/W | MAC Transmission Error interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when EIS.MTEF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to EID.MTED.<br>This bit is set to 1b when writing 1b to EIE.MTES. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | MREE | 0b | R/W | MAC Reception Error interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when EIS.MREF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to EID.MRED.<br>This bit is set to 1b when writing 1b to EIE.MRES. |

### 30.4.1.20 Error Interrupt Enable Register (EIE)

The EIE register set to 1 each bit in error interrupt control register (EIC).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MFFS2 | — | MFFS | — | — | — | — | — | — | QES | MTES | MRES |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R | R/W | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | MFFS2 | 0b | R/W | MAC status FIFO2 Full interrupt Set<br>0b No change of EIC.MFFE2<br>1b Set EIC.MFFE2 to 1b<br>This bit supports interrupt enable. It controls set of EIC.MFFE2.<br>This bit is always read as 0b. |
| 10 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 | MFFS | 0b | R/W | MAC status FIFO Full interrupt Set<br>0b No change of EIC.MFFE<br>1b Set EIC.MFFE to 1b<br>This bit supports interrupt enable. It controls set of EIC.MFFE.<br>This bit is always read as 0b. |
| 8 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | QES | 0b | R/W | Queue Error interrupt Set<br>0b No change of EIC.QEE<br>1b Set EIC.QEE to 1b<br>This bit supports interrupt enable. It controls set of EIC.QEE.<br>This bit is always read as 0b. |
| 1 | MTES | 0b | R/W | MAC Transmission Error interrupt Set<br>0b No change of EIC.MTEE<br>1b Set EIC.MTEE to 1b<br>This bit supports interrupt enable. It controls set of EIC.MTEE.<br>This bit is always read as 0b. |
| 0 | MRES | 0b | R/W | MAC Reception Error interrupt Set<br>0b No change of EIC.MREE<br>1b Set EIC.MREE to 1b<br>This bit supports interrupt enable. It controls set of EIC.MREE.<br>This bit is always read as 0b. |

### 30.4.1.21 Error Interrupt Disable Register (EID)

The EID register set to 0 each bit in error interrupt control register (EIC).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MFFD2 | — | MFFD | — | — | — | — | — | — | QED | MTED | MRED |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R | R/W | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 | MFFD2 | 0b | R/W | MAC status FIFO2 Full interrupt Disable<br>0b No change of EIC.MFFE<br>1b Set EIC.MFFE to 0b<br>This bit supports interrupt enable. It controls set of EIC.MFFE2.<br>This bit is always read as 0b. |
| 10 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 | MFFD | 0b | R/W | MAC status FIFO Full interrupt Disable<br>0b No change of EIC.MFFE<br>1b Set EIC.MFFE to 0b<br>This bit supports interrupt enable. It controls set of EIC.MFFE.<br>This bit is always read as 0b. |
| 8 to 3 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 2 | QED | 0b | R/W | Queue Error interrupt Disable<br>0b No change of EIC.QEE<br>1b Set EIC.QEE to 0b<br>This bit supports interrupt enable. It controls set of EIC.QEE.<br>This bit is always read as 0b. |
| 1 | MTED | 0b | R/W | MAC Transmission Error interrupt Disable<br>0b No change of EIC.MTEE<br>1b Set EIC.MTEE to 0b<br>This bit supports interrupt enable. It controls set of EIC.MTEE.<br>This bit is always read as 0b. |
| 0 | MRED | 0b | R/W | MAC Reception Error interrupt Disable<br>0b No change of EIC.MREE<br>1b Set EIC.MREE to 0b<br>This bit supports interrupt enable. It controls set of EIC.MREE.<br>This bit is always read as 0b. |

### 30.4.1.22 Receive Interrupt Status Register 0 (RIS0)

The RIS0 register indicates the states of the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FRF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | FRF | 0b | R/W | Frame Received Flag<br>0b No interrupt pending<br>1b New frame data is available in URAM<br>This bit indicates that in receive queue r a frame is stored, and data is available to be processed by CPU.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when a frame is stored in receive queue. |

### 30.4.1.23 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FRE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | FRE | 0b | R/W | Frame Received interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when RIS0.FRF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to RID0.FRD.<br>This bit is set to 1b when writing 1b to RIE0.FRS. |

### 30.4.1.24 Receive Interrupt Enable Register 0 (RIE0)

The RIE0 register set to 1 each bit in receive interrupt control register (RIC0).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FRS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | FRS | 0b | R/W | Frame Received interrupt Set r<br>0b No change of RIC0.FRE<br>1b Set RIC0.FRE to 1b<br>This bit supports interrupt enable. It controls set of RIC0.FRE.<br>This bit is always read as 0b. |

### 30.4.1.25 Receive Interrupt Disable Register 0 (RID0)

The RID0 register set to 0 each bit in receive interrupt control register (RIC0).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FRD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | FRD | 0b | R/W | Frame Received interrupt Disable<br>0b No change of RIC0.FRE<br>1b Set RIC0.FRE to 0b<br>This bit supports interrupt enable. It controls set of RIC0.FRE.<br>This bit is always read as 0b. |

### 30.4.1.26 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFWF | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFWF | 0b | R/W | Reception FIFO Warning Flag<br>0b No interrupt pending<br>1b Reception FIFO warning level reached<br>This bit indicates that the Reception FIFO has reached the configured critical warning level.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when a complete frame is received in the Reception FIFO and the fill level goes above the configured critical warning level during reception of this frame (RCR.RFCL). |
| 30 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.27 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFWE | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFWE | 0b | R/W | Reception FIFO Warning interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when RIS1.RFWF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to RID1.RFWD.<br>This bit is set to 1b when writing 1b to RIE1.RFWS. |
| 30 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.28 Receive Interrupt Enable Register 1 (RIE1)

The RIE register set to 1 each bit in error receive control register (RIC1).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFWS | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFWS | 0b | R/W | Reception FIFO Warning interrupt Set<br>0b No change of RIC1.RFWE<br>1b Set RIC1.RFWE to 1b<br>This bit supports interrupt enable. It controls set of RIC1.RFWE.<br>This bit is always read as 0b. |
| 30 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.29 Receive Interrupt Disable Register 1 (RID1)

The RID1 register set to 1 each bit in receive interrupt control register (RIC1).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFWD | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFWD | 0b | R/W | Reception FIFO Warning interrupt Disable<br>0b No change of RIC1.RFWE<br>1b Set RIC1.RFWE to 0b<br>This bit supports interrupt enable. It controls set of RIC1.RFWE.<br>This bit is always read as 0b. |
| 30 to 0 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

### 30.4.1.30 Receive Interrupt Status Register 2 (RIS2)

The RIS2 register indicates the states of the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFFF | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | QFF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFFF | 0b | R/W | Reception FIFO Full Flag<br>0b No interrupt pending<br>1b Reception FIFO full, received frame data lost<br>This bit indicates that a frame was received by E-MAC which could not be completely stored in the Reception FIFO.<br>The incomplete frame is lost.<br>There is no information available which receive queue would handle this frame.<br>Frames which are marked by E-MAC as faulty after complete reception can also trigger an overrun.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when frame data provided by E-MAC cannot be stored in the Reception FIFO. |
| 30 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | QFF | 0b | R/W | Queue Full Flag<br>0b No interrupt pending<br>1b Queue full, received frame data lost<br>This bit indicates that there was no sufficient space in receive queue to store completely a received frame.<br>A receive queue is treated as full when no empty descriptor (read descriptor with DESCR.DT = FEMPTY or FEMPTY_ND) is available.<br>*Note*: If there is no empty descriptor left in queue during storage of a split frame, an incomplete frame will be stored in the queue. Such incomplete frame can be identified based on a descriptor sequence error (no FEND).<br>*Note*: Reading descriptor may be one or more storage elements ahead from actual storage in URAM. CDARq.CDA provides information where queue has been stopped.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when there is pending receive data in Reception FIFO for receive queue and there is no space left for storage.<br>This bit is set to 1b when a SW defined stop point (EOS descriptor) reached within a split frame. |

### 30.4.1.31 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFFE | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | QFE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFFE | 0b | R/W | Reception FIFO Full interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when RIS2.RFFF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to RID2.RFFD.<br>This bit is set to 1b when writing 1b to RIE2.RFFS. |
| 30 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | QFE | 0b | R/W | Queue Full interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when RIS2.QFF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to RID2.QFD.<br>This bit is set to 1b when writing 1b to RIE2.QFS. |

### 30.4.1.32 Receive Interrupt Enable Register 2 (RIE2)

The RIE2 register set to 1 each bit in receive interrupt control register (RIC2).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFFS | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | QFS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFFS | 0b | R/W | Reception FIFO Full interrupt Set<br>0b No change of RIC2.RFFE<br>1b Set RIC2.RFFE to 1b<br>This bit supports interrupt enable. It controls set of RIC2.RFFE.<br>This bit is always read as 0b. |
| 30 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | QFS | 0b | R/W | Queue Full interrupt Set<br>0b No change of RIC2.QFE<br>1b Set RIC2.QFE to 1b<br>This bit supports interrupt enable. It controls set of RIC2.QFE.<br>This bit is always read as 0b. |

### 30.4.1.33 Receive Interrupt Disable Register 2 (RID2)

The RID2 register set to 1 each bit in receive interrupt control register (RIC2).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RFFD | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | QFD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | RFFD | 0b | R/W | Reception FIFO Full interrupt Disable<br>0b No change of RIC2.RFFE<br>1b Set RIC2.RFFE to 0b<br>This bit supports interrupt enable. It controls set of RIC2.RFFE.<br>This bit is always read as 0b. |
| 30 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | QFD | 0b | R/W | Queue Full interrupt Disable<br>0b No change of RIC2.QFE<br>1b Set RIC2.QFE to 0b<br>This bit supports interrupt enable. It controls set of RIC2.QFE.<br>This bit is always read as 0b. |

### 30.4.1.34 Receive Interrupt Status Register 3 (RIS3)

The RIS3 register indicates the states of the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RDPF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RDPF | 0b | R/W | Receive Descriptor Processed Flag<br>0b No interrupt pending<br>1b Descriptor interrupt pending<br>This bit indicates that a descriptor in reception queue has been processed where DESCR.DIE is 0001b.<br>*Note*: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when a descriptor in reception queue has been processed where DESCR.DIE is 1. |

### 30.4.1.35 Receive Interrupt Control Register 3 (RIC3)

The RIC3 register controls the DMAC receive interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RDPE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RDPE | 0b | R/W | Receive Descriptor Processed interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when RIS3.RDPF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to RID3.RDPD.<br>This bit is set to 1b when writing 1b to RIE3.RDPS. |

### 30.4.1.36 Receive Interrupt Enable Register 3 (RIE3)

The RIE3 register set to 1 each bit in receive interrupt control register (RIC3).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RDPS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RDPS | 0b | R/W | Receive Descriptor Processed interrupt Set<br>0b No change of RIC3.RDPE<br>1b Set RIC3.RDPE to 1b<br>This bit supports interrupt enable. It controls set of RIC3.RDPE.<br>This bit is always read as 0b. |

### 30.4.1.37 Receive Interrupt Disable Register 3 (RID3)

The RID3 register set to 0 each bit in receive interrupt control register (RIC3).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RDPD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | RDPD | 0b | R/W | Receive Descriptor Processed interrupt Disable<br>0b No change of RIC3.RDPE<br>1b Set RIC3.RDPE to 0b<br>This bit supports interrupt enable. It controls set of RIC3.RDPE.<br>This bit is always read as 0b. |

### 30.4.1.38 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the DMAC transmit interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TDPF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | RCSRF | MFWF2 | MFUF2 | MFWF | MFUF | — | — | — | — | — | — | — | — | — | FTF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | TDPF | 0b | R/W | Transmit Descriptor Processed Flag<br>0b No interrupt pending<br>1b Descriptor interrupt pending<br>This bit indicates that a descriptor in transmit queue has been processed where DESCR.DIE is 0001b.<br>*Note*: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when a descriptor in transmit queue has been processed where DESCR.DIE is 1. |
| 15 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 | RCSRF | 0b | R/W | Reference Clock Stop Req Flag<br>0b No interrupt pending<br>1b Reference Clock Stop Request occurred<br>This bit indicates that Gigabit Ethernet Interface expects to stop “clk_miitx_gtx_refclk”. Whenever this flag is asserted, CPU has to stop ETH_PLL (PLL to generate “clk_miitx_gtx_refclk”). To stop ETH_PLL, refer to the document of System Controller.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when CCC.ERCS is 0b.<br>This bit is set to 1b when Gigabit Ethernet Interface has expected to stop “clk_miitx_gtx_refclk”. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 13 | MFWF2 | 0b | R/W | MAC status FIFO2 Warning Flag<br>0b No interrupt pending<br>1b Tx Status FIFO2 warning level has been reached<br>This bit indicates that the warning level of the MAC status FIFO2 (12 out of 16 entries) has been reached.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when TCCR.MFEN2 is 0b.<br>This bit is set to 0b when writing 1b to TCCR.MFR2.<br>This bit is set to 1b when TCCR.MFEN2 is 1b, the MAC Status FIFO2 contains already 11 entries (TSR.MFFL2 is 11), and E-MAC detects an error during transmission of frame. |
| 12 | MFUF2 | 0b | R/W | MAC status FIFO2 Updated Flag<br>0b No interrupt pending<br>1b Tx Status FIFO2 has been updated<br>This bit indicates that the MAC status FIFO2 has been updated when the E-MAC detects an error during transmission of frame.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when TCCR.MFEN2 is 0b.<br>This bit is set to 0b when writing 1b to TCCR.MFR2.<br>This bit is set to 1b when TCCR.MFEN2 is 1b and E-MAC detects an error during transmission of frame. |
| 11 | MFWF | 0b | R/W | MAC status FIFO Warning Flag<br>0b No interrupt pending<br>1b Tx Status FIFO warning level has been reached<br>This bit indicates that the warning level of the MAC status FIFO (12 out of 16 entries) has been reached.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when TCCR.MFEN is 0b.<br>This bit is set to 0b when writing 1b to TCCR.MFR.<br>This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and the MAC Status FIFO contains already 11 entries (TSR.MFFL is 11). |
| 10 | MFUF | 0b | R/W | MAC status FIFO Updated Flag<br>0b No interrupt pending<br>1b Tx Status FIFO has been updated<br>This bit indicates that the MAC status FIFO has been updated after the TOE has transmitted a frame.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 0b when TCCR.MFEN is 0b.<br>This bit is set to 0b when writing 1b to TCCR.MFR.<br>This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE and TCCR.MFEN is 1b. |
| 9 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | FTF | 0b | R/W | Frame Transmitted Flag<br>0b No interrupt pending<br>1b Frame transmitted by E-MAC<br>This bit indicates that from transmit queue a frame is transmitted from DMAC.<br>The CPU can only write 0b to this bit.<br>[Changing condition]<br>This bit is set to 0b when leaving OPERATION mode.<br>This bit is set to 1b when a frame from transmit queue has been transmitted from DMAC. |

### 30.4.1.39 Transmit Interrupt Control Register (TIC)

The TIC register controls the DMAC transmit interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TDPE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | RCSRE | MFWE2 | MFUE2 | MFWE | MFUE | — | — | — | — | — | — | — | — | — | FTE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | TDPE | 0b | R/W | Transmit Descriptor Processed interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.TDPF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.TDPD.<br>This bit is set to 1b when writing 1b to TIE.TDPS. |
| 15 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 | RCSRE | 0b | R/W | Reference Clock Stop Req interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.RCSRF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.RCSRD.<br>This bit is set to 1b when writing 1b to TIE.RCSRS. |
| 13 | MFWE2 | 0b | R/W | MAC status FIFO2 Warning interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.MFWF2 is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.MFWD2.<br>This bit is set to 1b when writing 1b to TIE.MFWS2. |
| 12 | MFUE2 | 0b | R/W | MAC status FIFO2 Updated interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.MFUF2 is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.MFUD2.<br>This bit is set to 1b when writing 1b to TIE.MFUS2. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 11 | MFWE | 0b | R/W | MAC status FIFO Warning interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.MFWF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.MFWD.<br>This bit is set to 1b when writing 1b to TIE.MFWS. |
| 10 | MFUE | 0b | R/W | MAC status FIFO Updated interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.MFUF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.MFUD.<br>This bit is set to 1b when writing 1b to TIE.MFUS. |
| 9 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | FTE | 0b | R/W | Frame Transmitted interrupt Enable<br>0b Disabled<br>1b Enabled<br>While this bit is 1b an interrupt will be generated when TIS.FTF is 1b.<br>[Changing condition]<br>This bit is set to 0b when writing 1b to TID.FTD.<br>This bit is set to 1b when writing 1b to TIE.FTS. |

### 30.4.1.40 Transmit Interrupt Enable Register (TIE)

The TIE register set to 1 each bit in transmit interrupt control register (TIC).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TDPS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | RCSRS | MFWS2 | MFUS2 | MFWS | MFUS | — | — | — | — | — | — | — | — | — | FTS |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | TDPS | 0b | R/W | Transmit Descriptor Processed interrupt Set<br>0b No change of TIC.TDPE<br>1b Set TIC.TDPE to 1b<br>This bit supports interrupt enable. It controls set of TIC.TDPE.<br>This bit is always read as 0b. |
| 15 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 | RCSRS | 0b | R/W | Reference Clock Stop Req interrupt Set<br>0b No change of TIC.RCSRE<br>1b Set TIC.RCSRE to 1b<br>This bit supports interrupt enable. It controls set of TIC.RCSRE.<br>This bit is always read as 0b. |
| 13 | MFWS2 | 0b | R/W | MAC status FIFO2 Warning interrupt Set<br>0b No change of TIC.MFWE2<br>1b Set TIC.MFWE2 to 1b<br>This bit supports interrupt enable. It controls set of TIC.MFWE2.<br>This bit is always read as 0b. |
| 12 | MFUS2 | 0b | R/W | MAC status FIFO2 Updated interrupt Set<br>0b No change of TIC.MFUE2<br>1b Set TIC.MFUE2 to 1b<br>This bit supports interrupt enable. It controls set of TIC.MFUE2.<br>This bit is always read as 0b. |
| 11 | MFWS | 0b | R/W | MAC status FIFO Warning interrupt Set<br>0b No change of TIC.MFWE<br>1b Set TIC.MFWE to 1b<br>This bit supports interrupt enable. It controls set of TIC.MFWE.<br>This bit is always read as 0b. |
| 10 | MFUS | 0b | R/W | MAC status FIFO Updated interrupt Set<br>0b No change of TIC.MFUE<br>1b Set TIC.MFUE to 1b<br>This bit supports interrupt enable. It controls set of TIC.MFUE.<br>This bit is always read as 0b. |
| 9 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | FTS | 0b | R/W | Frame Transmitted interrupt Set<br>0b No change of TIC.FTE<br>1b Set TIC.FTE to 1b<br>This bit supports interrupt enable. It controls set of TIC.FTE.<br>This bit is always read as 0b. |

### 30.4.1.41 Transmit Interrupt Disable Register (TID)

The TID register set to 0 each bit in transmit interrupt control register (TIC).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TDPD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | RCSRD | MFWD2 | MFUD2 | MFWD | MFUD | — | — | — | — | — | — | — | — | — | FTD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 16 | TDPD | 0b | R/W | Transmit Descriptor Processed interrupt Disable<br>0b No change of TIC.TDPE<br>1b Set TIC.TDPE to 0b<br>This bit supports interrupt enable. It controls set of TIC.TDPE.<br>This bit is always read as 0b. |
| 15 | — | 0b | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 14 | RCSRD | 0b | R/W | Reference Clock Stop Req interrupt Disable<br>0b No change of TIC.RCSRE<br>1b Set TIC.RCSRE to 0b<br>This bit supports interrupt enable. It controls set of TIC.RSCRE.<br>This bit is always read as 0b. |
| 13 | MFWD2 | 0b | R/W | MAC status FIFO2 Warning interrupt Disable<br>0b No change of TIC.MFWE2<br>1b Set TIC.MFWE2 to 0b<br>This bit supports interrupt enable. It controls set of TIC.MFWE2.<br>This bit is always read as 0b. |
| 12 | MFUD2 | 0b | R/W | MAC status FIFO2 Updated interrupt Disable<br>0b No change of TIC.MFUE2<br>1b Set TIC.MFUE2 to 0b<br>This bit supports interrupt enable. It controls set of TIC.MFUE2.<br>This bit is always read as 0b. |
| 11 | MFWD | 0b | R/W | MAC status FIFO Warning interrupt Disable<br>0b No change of TIC.MFWE<br>1b Set TIC.MFWE to 0b<br>This bit supports interrupt enable. It controls set of TIC.MFWE.<br>This bit is always read as 0b. |
| 10 | MFUD | 0b | R/W | MAC status FIFO Updated interrupt Disable<br>0b No change of TIC.MFUE<br>1b Set TIC.MFUE to 0b<br>This bit supports interrupt enable. It controls set of TIC.MFUE.<br>This bit is always read as 0b. |
| 9 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | FTD | 0b | R/W | Frame Transmitted interrupt Disable<br>0b No change of TIC.FTE<br>1b Set TIC.FTE to 0b<br>This bit supports interrupt enable. It controls set of TIC.FTE.<br>This bit is always read as 0b. |

### 30.4.1.42 Common Interrupt Enable register (CIE)

The CIE register is used to control interrupts line.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CTIE | — | — | — | — | — | — | — | CRIE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | CTIE | 0b | R/W | Common Transmit Interrupt Enable<br>0b Disabled<br>1b Enabled<br>This bit controls transmit related interrupt outputs of Gigabit Ethernet Interface. It has no influence on internal flagging in Gigabit Ethernet Interface SFR (e.g. ISS). |
| 7 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | CRIE | 0b | R/W | Common Receive Interrupt Enable<br>0b Disabled<br>1b Enabled<br>This bit controls receive related interrupt outputs of Gigabit Ethernet Interface. It has no influence on internal flagging in Gigabit Ethernet Interface SFR (e.g. ISS). |

### 30.4.1.43 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of DMAC-related interrupts.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DPM15 | DPM14 | DPM13 | DPM12 | DPM11 | DPM10 | DPM9 | DPM8 | DPM7 | DPM6 | DPM5 | DPM4 | DPM3 | DPM2 | DPM1 | RCSRM |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MFWM2 | MFUM2 | — | RFWM | MFWM | MFUM | — | — | MM | EM | — | — | — | FTM | — | FRM |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | DPMi | All 0 | R | Descriptor Processed Mirror i<br>0b No interrupt pending<br>1b Descriptor interrupt pending<br>Descriptor Processed Mirror i (i = 1 to 15)<br>[Changing condition]<br>This bit is set when any matching pair of DIC.DPEi enable and DIS.DPFi flag are both 1b. |
| 16 | RCSRM | 0b | R | Reference Clock Stop Req Mirror<br>0b No interrupt pending<br>1b Reference Clock Stop Req interrupt pending<br>This bit indicates that TIS.RCSRF is 1b and TIC.RCSRE is 1b.<br>[Changing condition]<br>This bit is updated when TIS.RCSRF or TIC.RCSRE changes. |
| 15 | MFWM2 | 0b | R | MAC status FIFO2 Warning Mirror<br>0b No interrupt pending<br>1b MAC status FIFO2 warning interrupt pending<br>This bit indicates that TIS.MFWF2 is 1b and TIC.MFWE2 is 1b.<br>[Changing condition]<br>This bit is updated when TIS.MFWF2 or TIC.MFWE2 changes. |

## 30.4.2 E-MAC Registers

### 30.4.2.1 E-MAC operating mode register 1 (CXR20)

CXR20 sets the E-MAC operating mode.

Rewriting the bits in this register is prohibited when the transmission function is enabled (TPE=1) and reception function is enabled (RPE=1).

Write restrictions:

Rewrite all the bits except for TPE and RPE when transmission function is disabled (TPE=0) and reception function is disabled (RPE=0).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Self-addressed unicast, different address unicast, multicast, and broadcast frames are all transferred to TOE. PAUSE frame reception is controlled by PFR bit.<br>0: Self-addressed unicast, multicast, and broadcast frames are received, then transferred to TOE. |

### 30.4.2.2 Maximum receive frame length register (CXR2A)

CXR2A sets the maximum receive frame length.

Write restrictions:

If CXR20_bit6 is set to 1, it is not allowed to rewrite to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 30.4.2.3 Interrupt status register (CXR21)

CXR21 indicates interrupt status.

Read restrictions:

When the PHY used does not have an INT signal, consider the read value of PHYI bit (bit3) as undefined.

Write restrictions:

Writing 0 is invalid. 1 or 0 cannot be written to bit 3.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | PFRI | 0b | R/W | PAUSE Frame Retry Interrupt<br>Interrupt source based on the PAUSE frame transmission retry count: Indicates that the PAUSE frame transmission is retried for the number of times specified using the CXR81 register.<br>This bit can be cleared to 0 in the following way.<br>(1) Read the CXR82 register to clear CXR82.<br>(2) Write 1 to this bit. |
| 3 | PHYI | Xb | R/W | PHY Interrupt<br>PHY chip interrupt source: Indicates status of 'PHY INT' of the E-MAC input/output signals.<br>1: Interrupt from PHY is asserted.<br>0: Interrupt from PHY is negated.<br>Signal polarity of 'PHY INT' can be set using CXR2C.<br>*Note*: When the PHY used does not have an INT signal, the read value of this bit should be undefined. |
| 2 | LINKI | 0b | R/W | LINK Interrupt<br>Link status change interrupt source: Indicates that on/off of bit 0 (LINK) of CXR2B has changed.<br>Write 1 to clear this bit.<br>*Note*: Before referring to this bit, determine whether to use PHY_LINK input signal or RGMII-Inband Status<br>LINK bit as the link using SEL_LINK (bit 0) in the CXR31 register. |
| 1 | — | 0b | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | FCI | 0b | R/W | False Carrier Interrupt<br>Invalid carrier detected interrupt source: Indicates that an invalid carrier was detected in the PHY chip.<br>Write 1 to clear this bit to 0. |

### 30.4.2.4 Enables/disables interrupts register (CXR22)

CXR22 enables/disables interrupts.

It is possible to enable/disable interrupts for each interrupt source indicated in CXR21 (bit unit).

Write restrictions:

If the PHY used does not have an INT signal, set PHYIM bit (bit 3) to 0. In the case of without using PHY_LINK signal and without using RGMII Inband Status function (case of setting ‘10’ or ‘11’ to SEL_LINK of CXR31), set PHYIM bit (bit 2) to 0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 30.4.2.5 PHY register access register (CXR23)

There are two methods to access the PHY register: using the E-MAC-MDIOC block and using the CXR23 register.

Which access method to be used can be set using the MDIOMOD register.

For PHY register access using CXR23, see **Section 30.5.14.3(2), PHY Register Access Method (Using CXR23)** and IEEE Standard 802.3, 2000 Edition “22.2.4.5 Management frame structure.”

Write restrictions:

Writing bit 3 is invalid.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 30.4.2.7 Polarity set register (CXR2C)

CXR2C sets the polarity of ‘PHY_LINK’ and ‘PHY_INT’ signals.

Write restrictions:

Rewrite to this register with bits 2 and 3 in CXR22 being 0.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | PHYLINKP | 0b | R/W | PHY_LINK Polarity<br>Sets polarity of input signal ‘avb_miimg_link’.<br>1: High active (LINK ON [LINK UP] status with high)<br>0: Low active (LINK ON [LINK UP] status with low) |
| 0 | PHYIP | 0b | R/W | PHY Interrupt Polarity<br>Sets polarity of input signal ‘avb_miimg_int’.<br>1: High active (interrupt status with high)<br>0: Low active (interrupt status with low) |

### 30.4.2.8 In-Band Status set register (CXR31)

CXR31 sets whether to apply In-Band Status function*1 of RGMII-IF to the E-MAC operating mode.

It is possible to select the configured value by software for Link status.

**Note 1.** In-Band Status function (optional) is a notification function from PHY to E-MAC about Link Status (Up/Down), transmission speed (10 M/100 M/1 G) and Duplex (Half/Full) via RGMII-IF.

Write restrictions:

Rewrite to this register with transmission function disabled (CXR20 TPE = 0) and reception function also disabled (CXR20 RPE = 0). If the PHY used does not support In-band Status, set ‘H’0000000’ to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 4 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 3 | SEL_LINK[1] | 0b | R/W | Select LINK<br>See bit0 of this register. |
| 2 | SEL_SPEED | 0b | R/W | Select Speed*1, *2<br>‘1’: The information from In-band Status is used for setting the E-MAC operation speed.<br>‘0’: CXR2D register value is used for setting the E-MAC operation speed. |
| 1 | SEL_DUPLEX | 0b | R/W | Select Duplex*1, *2<br>‘1’: The information from In-band Status is used for setting Full/Half Duplex.<br>‘0’: CXR20 DPM bit value is used for setting Full/Half Duplex. |
| 0 | SEL_LINK[0] | 0b | R/W | Select LINK*1, *2<br>SEL_LINK [1:0]<br>‘11’: The information from CXR20 TPE bit value is used for setting the LINK.*3<br>The status of CXR20 TPE bit is set to CXR2B LINK bit.<br>When this value is set, set ‘0’ (disable LINK interrupt) to CXR22 LINKIM bit.<br>‘10’: The information from CXR2B SOFTWR_LINK bit value is used for setting the LINK.*3<br>The status of CXR2G SOFT_LINK bit is set to CXR2B LINK bit.<br>When this value is set, set ‘0’ (disable LINK interrupt) to CXR22 LINKIM bit.<br>‘01’: The information from In-band Status is used for setting the LINK.<br>‘00’: The information from the PHY_LINK input signal is used for setting the LINK. |

Note 1. If the PHY does not support In-band Status is used or If MII-IF is used, do not set value using In-band Status.

Note 2. If the device driver software is developed as common for MII-IF and RGMII-IF, not using this register is recommended.

Note 3. When Low Power Mode E-MAC is used, it needs to know the status of PHY as Link Up (Link ON). But, when it does not have the information to judge the status of LINK (because MII-IF is used and PHY_LINK signal is not used), set ‘10’ or ‘11’.
In the case of SEL_LINK [1:0] = ‘10’, CXR2B SOFT_LINK is used. So, software has to check the LINK status by register of

PHY and set that information to CXR2G.
In the case of SEL_LINK [1:0] = ‘11’, CXR20 TPE is used as LINK status.

### 30.4.2.9 In-Band Status indicate register (CXR32)

CXR32 indicates In-Band-Status of RGMII-IF.

In-Band Status function (option) is the function that the PHY notifies the E-MAC of link status (Up/Down), transfer rate (10 M/100 M/1 G) and duplex (full or half duplex), using the RGMII interface signal.

Write restrictions:

Write disabled

### 30.4.2.11 PHY interface select register (CXR35)

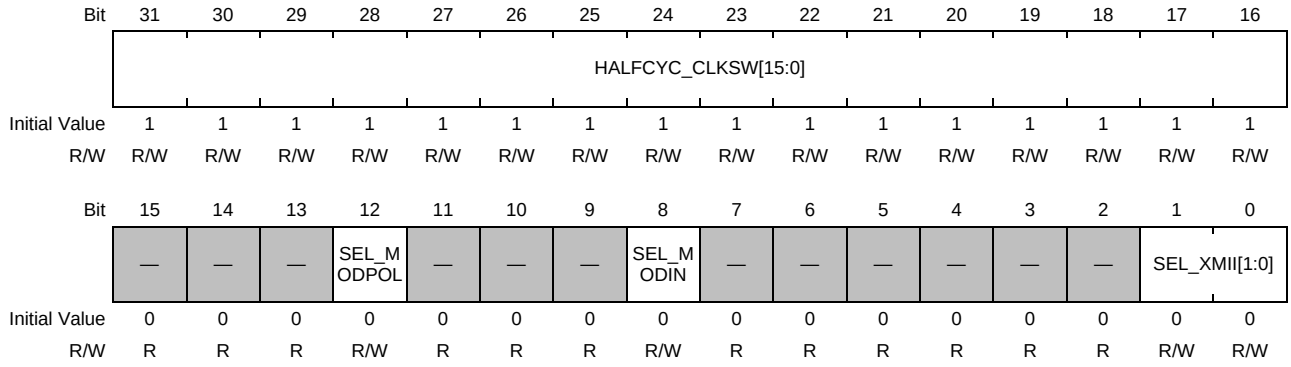
CXR35 selects RGMII or MII interface.

Write restrictions:

(1) After release reset, make write-access to this register before making write-access to other registers (except MDIOMOD). Even if not need to change the value of this register, make write-access to this register at least one time. Because RGMII/MII MODE is recognized by accessing this register.

(2) If need to re-write the value of this register after making write-access to other register, reset to E-MAC is needed.

(3) If need to re-write the value of this register without making write-access to other register, wait the quadruple time which is set at HALFCYC_CLKSW.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | HALFCYC_CLKSW | H'FFFF | R/W | A clock stop time at the clock switching<br>The wait time (over 20 us) is needed when PHY interface is selected at initializing Gigabit Ethernet Interface.<br>Set the number of clk_chi (APB clock) cycle to be half of wait time (over 10 us).<br>H'0000: 1 cycle of clk_chi<br>H'0001: 2 cycle of clk_chi<br>H'0002: 3 cycle of clk_chi<br>…<br>H'03E8: 1000 cycle of clk_chi (If clk_chi is 100 MHz (10 ns), half of wait time will be 10 us)<br>H'07D0: 2000 cycle of clk_chi (If clk_chi is 200 MHz (5 ns), half of wait time will be 10 us)<br>…<br>H'FFFF: 65536 cycle of clk_chi (default value) |
| 15 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | SEL_MODPOL | 0b | R/W | polar selection of RGMII/MII Mode input signal<br>'0': (default value) E-MAC recognizes RGMII-IF is used.<br>'1': E-MAC recognizes MII-IF is used. |
| 11 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | SEL_MODIN | 0b | R/W | method for selection of RGMII/MII<br>'0': SEL_XMII field of this register is used for RGMII/MII selection (default value)<br>'1': Reserved |
| 7 to 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 to 0 | SEL_XMII | 00b | R/W | Selection of PHY interface to be used<br>'00': RGMII interface is used (default value)<br>'01': Reserved<br>'10': MII interface is used<br>'11': Reserved<br>*Note*: The case of SEL_MODIN (bit8) = '0', this field is used to select PHY interface.<br>The case of SEL_MODIN (bit8) = '1', this field is not used and Mode signals which is provided from out of E-MAC is used to select PHY interface. |

**Note:** This register needs to write access at least one time.

[A] The case which CXR35 SEL_XMII is used for the selection of RGMII/MII in APB Clock 100 MHz.

(1) To use RGMII interface, Set 'H'03E8 0000' to this register.

(2) To use MII interface, Set 'H'03E8 0002' to this register.

### 30.4.2.12 PHY interface indicate register (CXR36)

CXR36 indicates the status of RGMII/MII Interface.

Write restrictions:

Write disabled

| 15 to 0 | PFRTC | H’FFFF | R | Pause Frame Retry Counter<br>Indicates the number of times of Auto PAUSE frame transmission from “Reception FIFO Critical Level Notification” from DMAC assertion to negation.<br>This register is cleared to 0 when read and at the start of “Reception FIFO Critical Level Notification” from DMAC assertion. |

### 30.4.2.19 E-MAC operating mode register 2 (CXR2D)

CXR2D sets the operating mode of the E-MAC.

Rewriting this register bits is prohibited with transmission function enabled (CXR20<TPE> = 1) and reception function enabled (CXR20<RPE> = 1).

Write restrictions:

Rewriting this register is prohibited when 1 is set to CXR20_bit 5 or 6.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 30.4.2.20 Software LINK status register (CXR2G)

CXR2G indicates the status of Software LINK.

Write restrictions:

Before setting ‘1’ to this register, set SEL_LINK of CXR31 whether using PHY_LINK input signal, using LINK bit of RGMII-Inband Status or using LINK setting by software.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | SOFT_LINK | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 3 | SOFT_LINK | 0b | R/W | Software LINK<br>This bit is used when the LINK status is set by software.<br>‘1’: Link ON (Link Up)<br>‘0’: Link OFF (Link Down)<br>*Note*: Before setting ‘1’ to this bit, set SEL_LINK of CXR31 whether using PHY_LINK input signal, using LINK bit of RGMII-Inband Status or using LINK setting by software.<br>Additionally, if PHY_LINK input signal is used, set the polar of PHY_LINK input signal by PHYLINKP of CXR2C. |
| 2 to 0 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |

### 30.4.2.21 Mac Address register 1 (CXR24)

CXR24 set the universal MAC address (upper 32 bits).

Write restrictions:

Rewriting this register is prohibited when 1 is set to CXR20_bit 5 or 6.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | UMADR[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | UMADR[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | UMADR | H'0000_0000 | R/W | Upper MAC Address<br>Upper-32bit MAC address |

### 30.4.2.22 Mac Address register 2 (CXR25)

CXR25 set the universal MAC address (lower 16 bits).

Write restrictions:

Rewriting this register is prohibited when 1 is set to CXR20_bit 5 or 6.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LMADR[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | LMADR | H'0000 | R/W | Lower MAC Address<br>Lower-16bit MAC address |

### 30.4.2.23 TINT1 counter register (CXR40)

CXR40 indicates the number of occurrences of TINT1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TINT1_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | TINT1_CNT | H'0000 | R/W | TINT1 Counter<br>Indicates the number of occurrences of TINT1.<br>TINT1: Frame transmission timeout<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.24 TINT2 counter register (CXR41)

CXR41 indicates the number of occurrences of TINT2.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TINT2_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | TINT2_CNT | H'0000 | R/W | TINT2 Counter<br>Indicates the number of occurrences of TINT2.<br>TINT2: Delayed collision detection<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.25 TINT3 counter register (CXR42)

CXR42 indicates the number of occurrences of TINT3.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TINT3_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | TINT3_CNT | H'0000 | R/W | TINT3 Counter<br>Indicates the number of occurrences of TINT3.<br>TINT3:<br>Transmission is terminated in error with TINT3 generated under the following conditions:<br>Delay collision occurs at the end of transmit frame, the receive frame at the time of the collision continues until the start of next frame transmission, but does not continue until the end of the transmission. However, these conditions do not occur in normal operation. |

### 30.4.2.26 RINT1 counter register (CXR50)

CXR50 indicates the number of occurrences of RINT1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RINT1_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT1_CNT | H'0000 | R/W | RINT1 Counter<br>Indicates the number of occurrences of RINT1.<br>RINT1: Receive frame CRC error<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.27 RINT2 counter register (CXR51)

CXR51 indicates the number of occurrences of RINT2.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RINT2_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT2_CNT | H'0000 | R/W | RINT2 Counter<br>Indicates the number of occurrences of RINT2.<br>RINT2: Frame reception error<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.28 RINT3 counter register (CXR52)

CXR52 indicates the number of occurrences of RINT3.

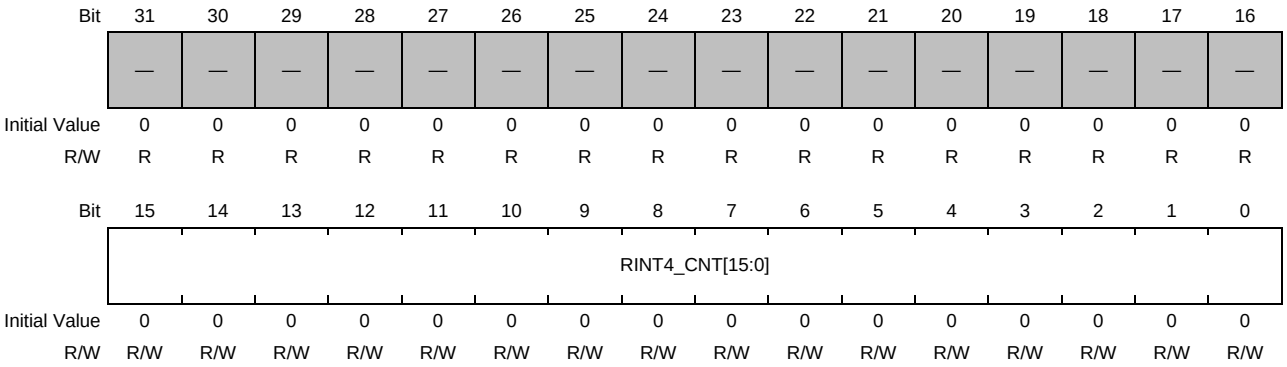
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RINT3_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT3_CNT | H'0000 | R/W | RINT3 Counter<br>Indicates the number of occurrences of RINT3.<br>RINT3: Erroneous frame length (less than 64 bytes frame was received.)<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.29 RINT4 counter register (CXR53)

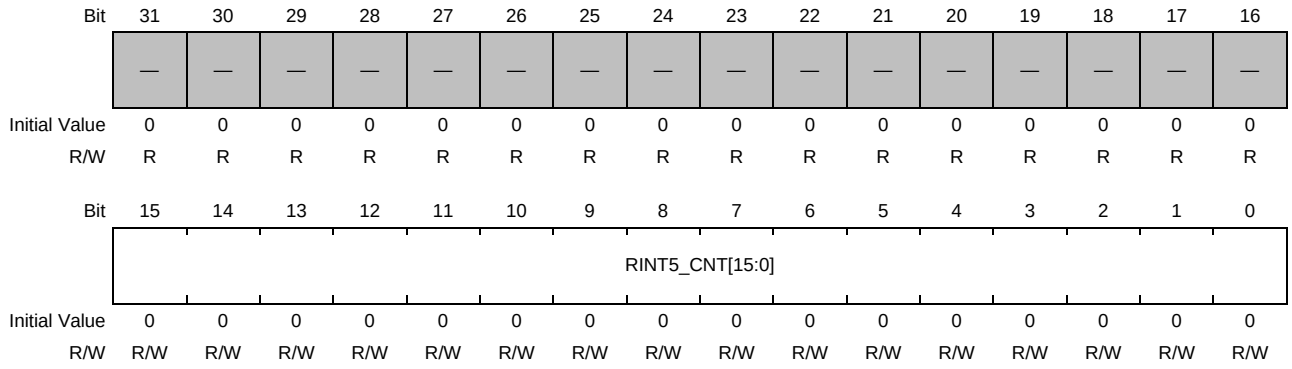
CXR53 indicates the number of occurrences of RINT4.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT4_CNT | H'0000 | R/W | RINT4 Counter<br>Indicates the number of occurrences of RINT4.<br>RINT4: Erroneous frame length<br>{A frame longer than the maximum frame length was received.<br>Maximum frame length (including CRC) can be specified using the LEN_LMT field in the CXR2A register.}<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.30 RINT5 counter register (CXR54)

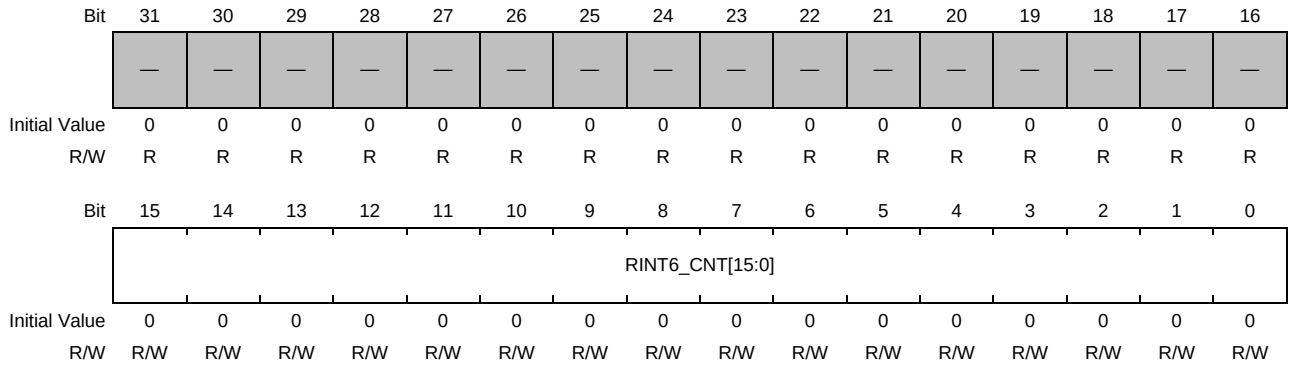
CXR54 indicates the number of occurrences of RINT5.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT5_CNT | H'0000 | R/W | RINT5 Counter<br>Indicates the number of occurrences of RINT5.<br>RINT5: Fractional bit error<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data) |

### 30.4.2.31 RINT6 counter register (CXR55)

CXR55 indicates the number of occurrences of RINT6.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT6_CNT | H'0000 | R/W | RINT6 Counter<br>Indicates the number of occurrences of RINT6.<br>RINT6: Carrier extension lost<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.32 RINT7 counter register (CXR56)

CXR56 indicates the number of occurrences of RINT7.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RINT7_CNT[15:0] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | RINT7_CNT | H'0000 | R/W | RINT7 Counter<br>Indicates the number of occurrences of RINT7.<br>RINT7: Carrier extension error<br>When CXR20_bit 26 = 1, this register is cleared to 0 when read.<br>When CXR20_bit 26 = 0, this register is cleared to 0 when written to.<br>(Cleared to 0 when written to, irrespective of the write data.) |

### 30.4.2.33 RINT8 counter register (CXR57)

CXR57 indicates the number of occurrences of RINT8.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### 30.4.2.34 MDIO status register (MDIOSTS)

MDIOSTS indicates the status of PHY register access (MDIO access).

Write restrictions:

Write disabled

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 30.4.2.35 MDIO command register (MDIOCMD)

MDIOCMD specifies the commands for PHY register access (MDIO access).

Write restrictions:

Do not write to this register when the BSY bit in the MDIOSTS register is 1.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 30.4.2.36 MDIO address register (MDIOADR)

MDIOADR specifies PHY address and PHY register address.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | A[9:5] | | | | | A[4:0] | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

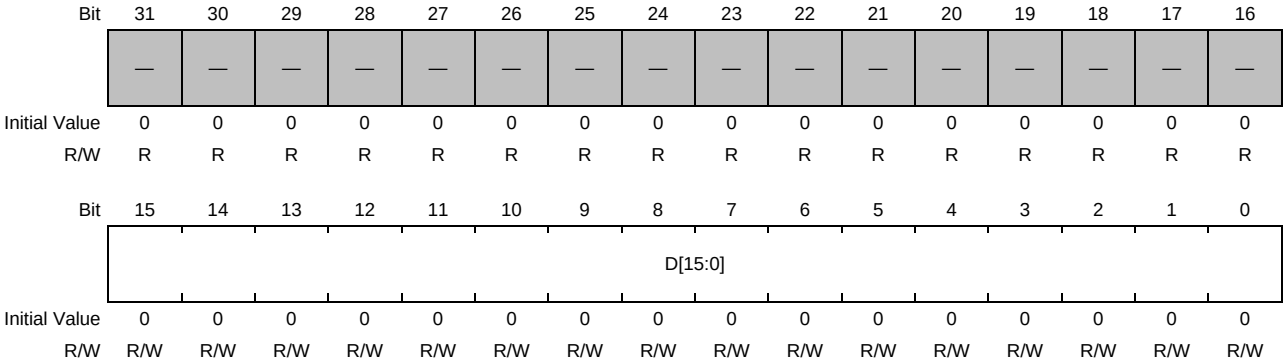
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 10 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 9 to 5 | A[9:5] | 00000b | R/W | PHY address 5 bits |
| 4 to 0 | A[4:0] | 00000b | R/W | PHY register address 5 bits |

### 30.4.2.37 MDIO data register (MDIODAT)

MDIODAT specifies PHY write data and indicates read data.

Write restrictions:

Do not write to this register when the BSY bit in the MDIOSTS register is 1.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | D[15:0] | H'0000 | R/W | PHY register data<br>When writing: Write data<br>When reading: Read data |

### 30.4.2.38 MDIO mode register (MDIOMOD)

MDIOMOD sets the operating mode of the MDIO controller.

Write restrictions:

Writing to this bit is prohibited during PHY register access.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SEL_MDIO_N | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

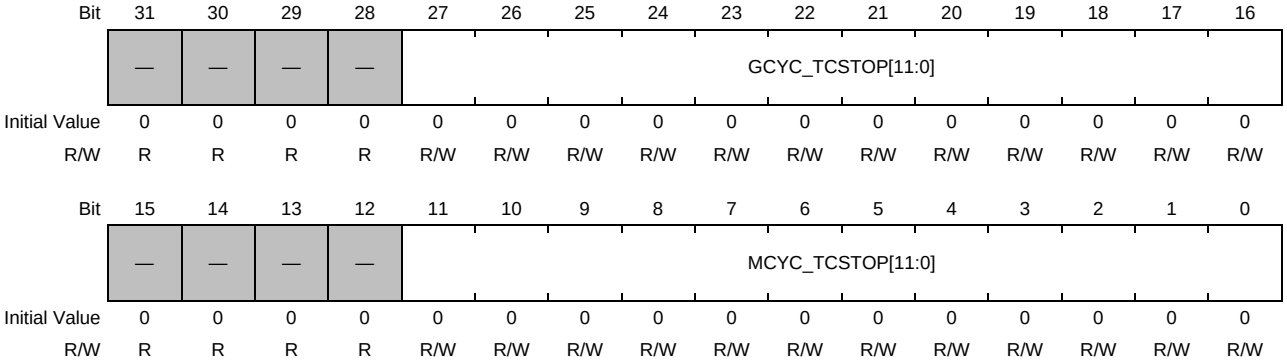
### 30.4.2.39 Low Power Mode register 1 (LPTXMOD1)

LPTXMOD1 sets the operating mode of the Low Power Transmission.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’ and CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 27 to 16 | GCYC_TCSTOP | H’000 | R/W | Number of minimum clock cycles until stopping RGMII TXC (1 Gbps)<br>0: 10 cycles (Initial value)<br>1 to 8: (Setting prohibited)<br>9: 9 cycles<br>10: 10 cycles<br>11: 11 cycles<br>(skip the rest) |
| 15 to 12 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 11 to 0 | MCYC_TCSTOP | H’000 | R/W | Number of minimum clock cycles until stopping RGMII TXC (100 Mbps)<br>0: 10 cycles (Initial value)<br>1 to 8: (Setting prohibited)<br>9: 9 cycles<br>10: 10 cycles<br>11: 11 cycles<br>(skip the rest) |

### 30.4.2.40 Low Power Mode register 2 (LPTXMOD2)

LPTXMOD2 sets the operating mode of the Low Power Transmission.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’ and CXR20_bit5 = ‘0’. When set ‘1’ to this register, check the configuration of Clock stoppable of PHY is ‘1’.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | MAC_TLPI_TYPE | — | — | — | STP_TXC_LPI |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 4 | MAC_TLPI_TYPE | 0b | R/W | Transmission LPI Operation Type of MAC<br>‘1’: MAC TX LPI Slave Mode<br>E-MAC does not transmit LPI code during LPI period.<br>But using LPI Wakeup parameters (LPTXGTH3/LPTXMTH3) to make the delay time of transmitting such as for PAUSE Frame.<br>When making PHY control the operation of LPI (Low Power Idle), set ‘1’ to this bit.<br>‘0’: MAC TX LPI Master Mode<br>E-MAC controls the operation of LPI. (Initial value) |
| 3 to 1 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 0 | STP_TXC_LPI | 0b | R/W | Setting of stopping LPI TXC (this bit is used only RGMII Mode)<br>‘1’: The clock for RGMII transmitting (fet_miitx_gtx_clk) is stopped during output of LPI code.<br>‘0’: The clock for RGMII transmitting (fet_miitx_gtx_clk) is not stopped during output of LPI code. (Initial value)<br>Set ‘1’ to this bit when TX Clock stop capable (Note1) of PHY is ‘1’<br>*Note 1.* See the Bit 6 Clock Stop Capable (MAC may stop clock during LPI) of PCS Status register in PHY MMD extended register (MMD address 3, REG address 1)<br>*Note 2.* In the case of CCC.ERCS = 1 (The “clk_miitx_gtx_refclk” stop function is enable), even if this bit was set to ‘0’, the clock for RGMII transmitting (fet_miitx_gtx_clk) is stopped during the stopping period of “clk_miitx_gtx_refclk”. Because “fet_miitx_gtx_clk” is generated from “clk_miitx_gtx_refclk”. |

### 30.4.2.41 RGMII Low Power parameter register 1 (LPTXGTH1)

LPTXGTH1 sets the change timing to Low Power Idle Transmission Mode at 1 Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

MAC starts transmitting LPI code.<br>...<br>31250: When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code.<br>...<br>(skip the rest)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. |

### 30.4.2.42 RGMII Low Power parameter register 2 (LPTXGTH2)

LPTXGTH2 sets the change timing to Low Power Idle Transmission Mode after enabled function of transmitting LPI code at 1Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LPTX_GSTH2[31:16] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | LPTX_GSTH2 | H’0000_0000 | R/W | Threshold value of starting LPI code transmission standby status (1 Gbps) (Unit is 32 ns)<br>0: (Initial value)<br>MAC will be ready for transmitting LPI code after 1.01 s later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>1 to 7: Setting prohibited<br>...<br>32: MAC will be ready for transmitting LPI code after 1024 ns later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>31250000: MAC will be ready for transmitting LPI code after 1 s later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>31562500: MAC will be ready for transmitting LPI code after 1.01 s later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>100000000: MAC will be ready for transmitting LPI code after 3.2 s later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>(skip the rest)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.<br>Recommended setting value<br>In the standard, the behavior of PHY is undefined if PHY receives LPI code within 1 s after Link Up.<br>Therefore, the recommended value was determined as 1.01 s. (1 s plus 1% margin)<br>The following is reason why “LPM bit of CXR20 is set to ‘1’” was include to the condition.<br>Internal Clock (32 ns:1 Gbps, 320 ns:100 Mbps) is used to measure the time after Link Up. But Internal Clock will change during transmission rate is un-determined. So, it is difficult to measure the time after Link Up exactly.<br>Therefore, “LPM bit of CXR20 is set to ‘1’” was include to the condition as determined point of transmission rate of Low Power Mode. |

### 30.4.2.43 RGMII Low Power parameter register 3 (LPTXGTH3)

LPTXGTH3 sets the operation return from Low Power Idle Transmission Mode at 1 Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value). Do not set 262144 (H’00040000) or more to this register.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LPTX_GRTH[31:16] | | | | | | | | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | LPTX_GRTH | H'0000_0000 | R/W | Transmission Low Power resume time (1 Gbps) (Unit 32 ns)<br>0: (Initial value)<br>After received transmit request, MAC transmits Normal Idle code during 17.184 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>1 to 7: Setting prohibited<br>...<br>32: After received transmit request, MAC transmits Normal Idle code during 1024 ns<br>And then MAC returns to Normal Mode from Low Power Mode.<br>...<br>516: After received transmit request, MAC transmits Normal Idle code during 16.512 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>521: After received transmit request, MAC transmits Normal Idle code during 16.672 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>532: After received transmit request, MAC transmits Normal Idle code during 17.024 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>537: After received transmit request, MAC transmits Normal Idle code during 17.184 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>...<br>1000: After received transmit request, MAC transmits Normal Idle code during 17.184 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>...<br>262144 or more: Reserved (Setting prohibited)<br>(skip the rest)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.<br>Recommended setting value<br>The basic value of this field is LPI WakeUp Time (Tw_sys_tx) with 1% margin. In the case of 1000BASE-T, Tw_sys_tx is 16.5 us. But some of PHY needs 1 us for Wakeup Time. Therefore, recommended value was determined as 17.184 us.<br>The setting value of this field will be the overhead time return from Low Power Mode.<br>Do not set the value will be under the 16.5 us (Minimum Wakeup Time which is defined by standard) to this field.<br>In addition, if PHY has the LPI transmission control function, PHY also make overhead time same as Wake-Up Time. |

### 30.4.2.44 RGMII Low Power parameter register 4 (LPTXGTH4)

LPTXGTH4 sets the minimum period for Low Power Idle Transmission Mode at 1 Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 0 | LPTX_GCTH | H’0000_0000 | R/W | Minimum Transmission Low Power time (1 Gbps) (Unit is 32 ns)<br>0: (Initial value)<br>After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 1024 ns.<br>1 to 7: Setting prohibited<br>8: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 256 ns.<br>...<br>32: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 1024 ns.<br>...<br>6469: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 207.008 us (Sleep Time + α).<br>...<br>10000: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 320 us.<br>...<br>(skip the rest)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.<br>Recommended setting value<br>Recommended value of this field is 1 us (1024 ns) for 1000BASE-T.<br>This value based on followings:<br>[1] This value should be sufficiency longer than 72 ns<br>[2] This value should be sufficiency shorter than Wake Up Time (16.5 us).<br>And selected the value which is close to geometric mean of [1] and [2]. |

### 30.4.2.45 MII Low Power parameter register 1 (LPTXMTH1)

LPTXMTH1 sets the change timing to Low Power Idle Transmission Mode at 100 Mbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

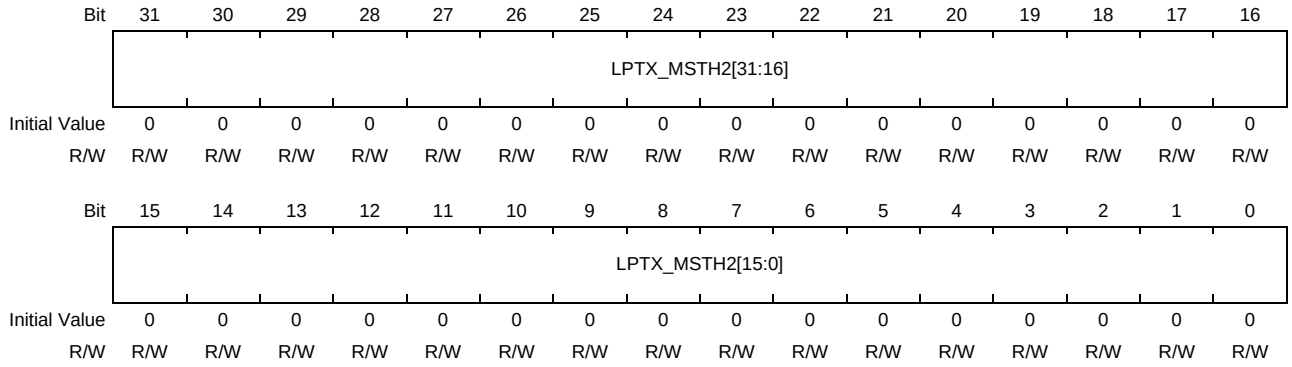
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | LPTX_MSTH1 | H’0000_0000 | R/W | Threshold value of LPI code transmission standby status (100 Mbps) (Unit is 320 ns)<br>0: (Initial value)<br>When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code.<br>1 to 7: Setting prohibited<br>8: When MAC does not receive transmission request during 10240 ns, MAC starts transmitting LPI code.<br>...<br>3125: When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code.<br>...<br>(skip the rest)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. |

### 30.4.2.46 MII Low Power parameter register 2 (LPTXMTH2)

LPTXMTH2 sets the change timing to Low Power Idle Transmission Mode after enabled function of transmitting LPI code at 100 Mbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).



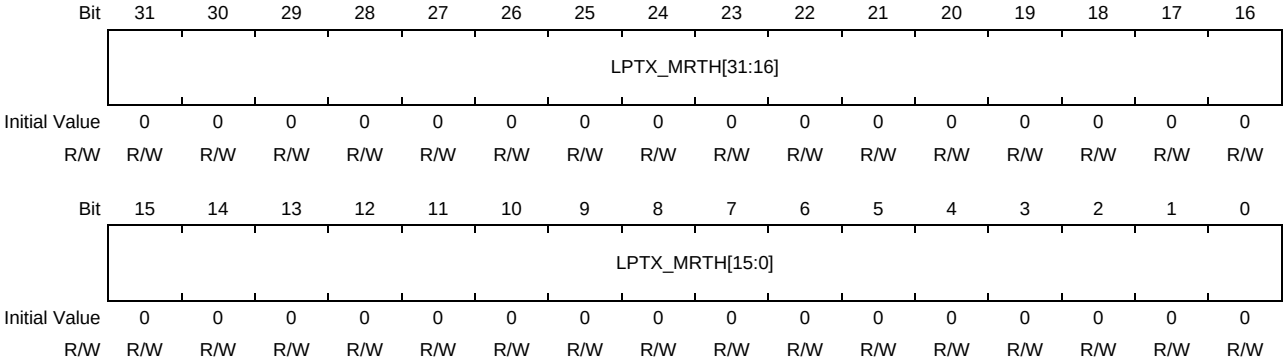
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | LPTX_MSTH2 | H’0000_0000 | R/W | Threshold value of starting LPI code transmission standby status (100 Mbps) (Unit is 320 ns)<br>0: (Initial value)<br>MAC will be ready for transmitting LPI code after 1.01 s later from Link Up or LPM bit of CXR20 is set to ‘1’.<br>1 to 7: Setting prohibited<br>...<br>32: MAC will be ready for transmitting LPI code after 10240 ns later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>3125000: MAC will be ready for transmitting LPI code after 1.0 s later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>3156250: MAC will be ready for transmitting LPI code after 1.01 s from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>10000000: MAC will be ready for transmitting LPI code after 3.2 s later from LinkUp/LPM bit of CXR20 is set to ‘1’.<br>...<br>(skip the rest)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.<br>Recommended setting value<br>In the standard, the behavior of PHY is undefined if PHY receives LPI code within 1 s after Link Up. Therefore, the recommended value was determined as 1.01 s. (1 s plus 1% margin)<br>The following is reason why “LPM bit of CXR20 is set to ‘1’” was include to the condition.<br>Internal Clock (32 ns:1 Gbps, 320 ns:100 Mbps) is used to measure the time after Link Up. But Internal Clock will change during transmission rate is un-determined. So, it is difficult to measure the time after Link Up exactly.<br>Therefore, “LPM bit of CXR20 is set to ‘1’” was include to the condition as determined point of transmission rate of Low Power Mode. |

### 30.4.2.47 MII Low Power parameter register 3 (LPTXMTH3)

LPTXMTH3 sets the operation return from Low Power Idle Transmission Mode at 100 Mbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value). Do not set 262144 (H’00040000) or more to this register.



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | LPTX_MRTH | H’0000_0000 | R/W | Transmission Low Power resume time (100 Mbps) (Unit 320 ns)<br>0: (Initial value)<br>After received transmit request, MAC transmits Normal Idle code during 30.40 us.<br>And then MAC returns to Normal Mode from Low Power Mode.<br>1 to 7: Setting prohibited<br>...<br>32: After received transmit request, MAC transmits Normal Idle code during 10240 ns<br>And then MAC returns to Normal Mode from Low Power Mode.<br>...<br>94: After received transmit request, MAC transmits Normal Idle code during 30.08 us<br>And then MAC returns to Normal Mode from Low Power Mode.<br>95: After received transmit request, MAC transmits Normal Idle code during 30.40 us<br>And then MAC returns to Normal Mode from Low Power Mode.<br>...<br>262144 or more: Reserved (Setting prohibited)<br>*Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.<br>Recommended setting value<br>The basic value of this field is LPI WakeUp Time (Tw_sys_tx) with 1% margin. In the case of 100BASE-TX, Tw_sys_tx is 30 us. Therefore, recommended value was determined as 30.4 us.<br>The setting value of this field will be the overhead time return from Low Power Mode.<br>Do not set the value under the 30 us (Minimum Wakeup Time which is defined by standard) to this field. |

### 30.4.2.48 MII Low Power parameter register 4 (LPTXMTH4)

LPTXMTH4 sets the minimum period for Low Power Idle Transmission Mode at 100 Mbps

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
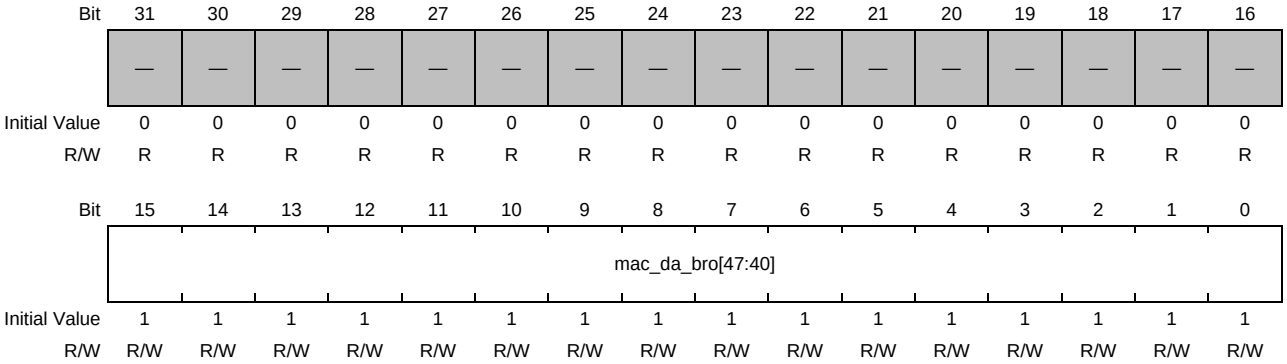
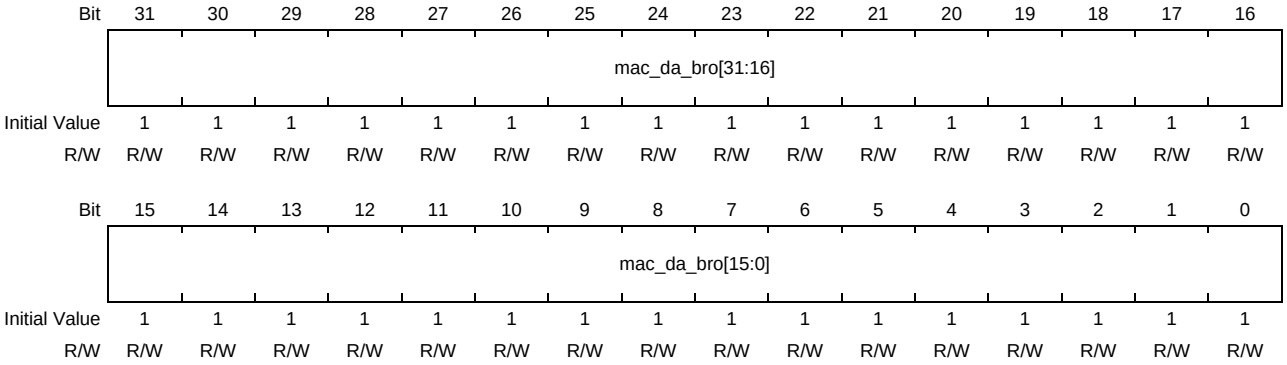
| 31 to 0 | mac_da_uni | H'0000_0000 | R/W | MAC DA Unicast address<br>Configuration of the MAC DA unicast Address [31:0] for Filter Condition and Interrupt Condition.<br>Write to this field when CSFR15.mac_da_uni_en = "0". |

### 30.4.3.24 Upper MAC DA broadcast address Condition register (CSFR14_U)



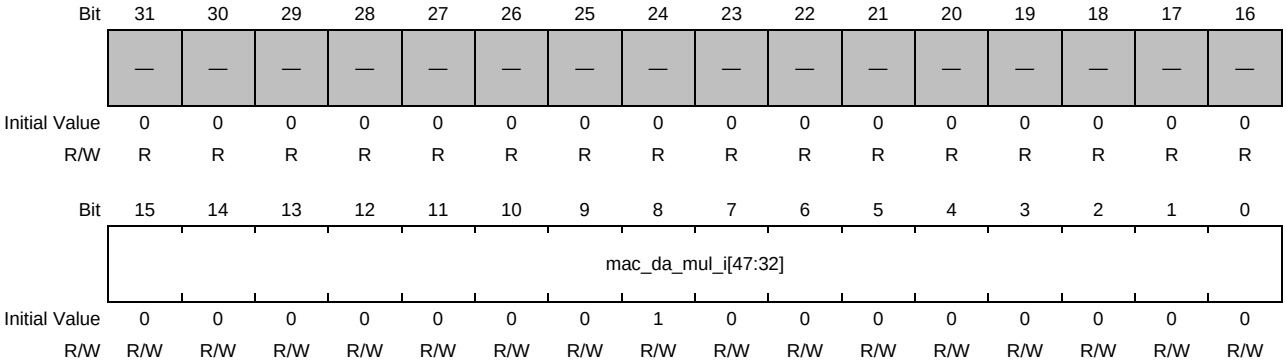
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | mac_da_bro | H'FFFF | R/W | MAC DA Broadcast address<br>Configuration of the MAC DA broadcast Address [47:32] for Filter Condition and Interrupt Condition.<br>Write to this field when CSFR15.mac_da_bro_en = "0". |

### 30.4.3.25 Lower MAC DA broadcast address Condition register (CSFR14_L)



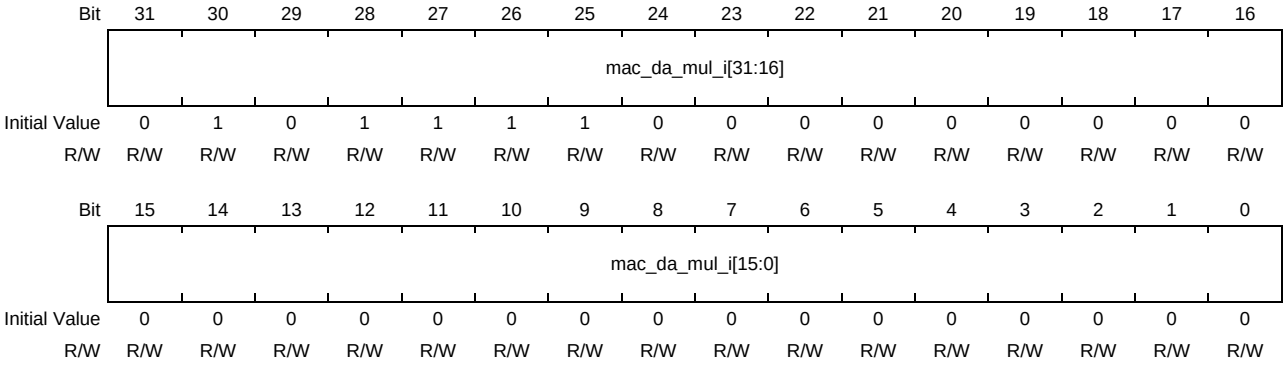
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | mac_da_bro | H'FFFF_FFFF | R/W | MAC DA Broadcast address<br>Configuration of the MAC DA broadcast Address [31:0] for Filter Condition and Interrupt Condition.<br>Write to this field when CSFR15.mac_da_bro_en = "0". |

### 30.4.3.26 Upper MAC DA multicast address Condition register i (i = 0 to 19) (CSFR15_U_i)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 15 to 0 | mac_da_mul_i | H’0100 | R/W | MAC DA Multicast address<br>Configuration of the MAC DA multicast Address [47:32] for Filter Condition and Interrupt Condition.<br>Write to this field when CSFR15.mac_da_mul_i_en = “0”. |

### 30.4.3.27 Lower MAC DA multicast address Condition register i (i = 0 to 19) (CSFR15_L_i)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | mac_da_mul_i | H’5E00_0000 | R/W | MAC DA Multicast address<br>Configuration of the MAC DA multicast Address [31:0] for Filter Condition and Interrupt Condition.<br>Write to this field when CSFR15.mac_da_mul_i _en = “0”. |

### 30.4.3.28 MAC DA Condition Enable register (CSFR15)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

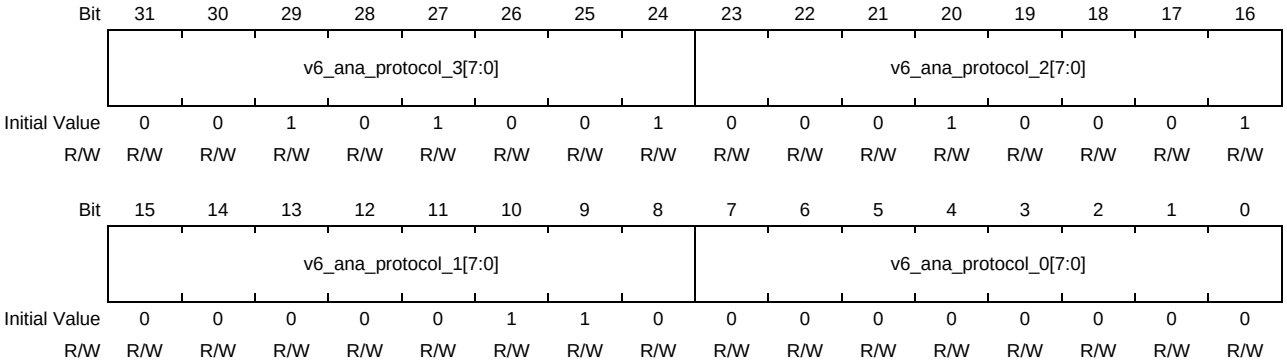
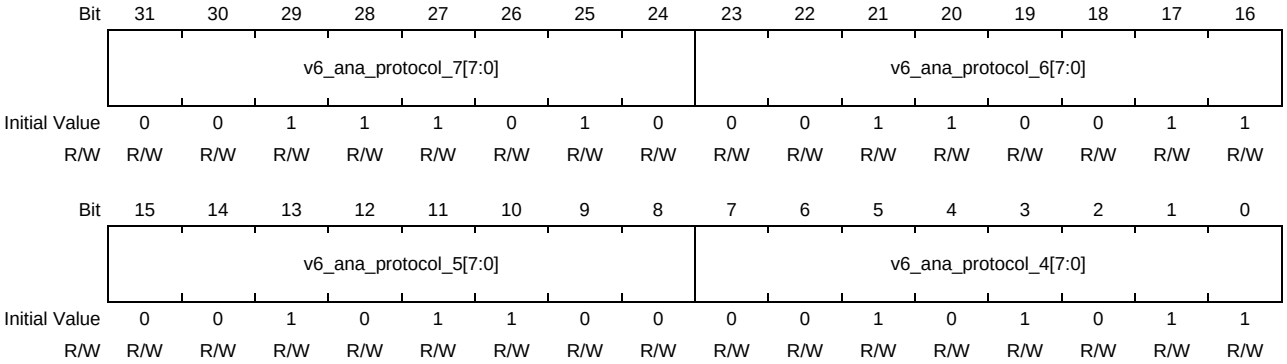
### 30.4.3.29 IPv6 analysis Protocol Condition register 0 (CSFR16_0)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | v6_ana_protocol_3 | H'29 | R/W | IPv6 Analyzable Protocol No 3<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'29 IPV6 (41).<br>Write to this field when CSFR16. v6_ana_protocol_3_en is '0b'. |
| 23 to 16 | v6_ana_protocol_2 | H'11 | R/W | IPv6 Analyzable Protocol No 2<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'11 UDP (17).<br>Write to this field when CSFR16. v6_ana_protocol_2_en is '0b'. |
| 15 to 8 | v6_ana_protocol_1 | H'06 | R/W | IPv6 Analyzable Protocol No 1<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'06 TCP (6).<br>Write to this field when CSFR16. v6_ana_protocol_1_en is '0b'. |
| 7 to 0 | v6_ana_protocol_0 | H'00 | R/W | IPv6 Analyzable Protocol No 0<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'00 Hop-by-Hop (0).<br>Write to this field when CSFR16. v6_ana_protocol_0_en is '0b'. |

### 30.4.3.30 IPv6 analysis Protocol Condition register 1 (CSFR16_1)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | v6_ana_protocol_7 | H'3A | R/W | IPv6 Analyzable Protocol No.7<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'3A ICMPv6 (58).<br>Write to this field when CSFR16. v6_ana_protocol_7_en is '0b'. |
| 23 to 16 | v6_ana_protocol_6 | H'33 | R/W | IPv6 Analyzable Protocol No.6<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'33 Authentication (51).<br>Write to this field when CSFR16. v6_ana_protocol_6_en is '0b'. |
| 15 to 8 | v6_ana_protocol_5 | H'2C | R/W | IPv6 Analyzable Protocol No.5<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'2C Flag (44).<br>Write to this field when CSFR16. v6_ana_protocol_5_en is '0b'. |
| 7 to 0 | v6_ana_protocol_4 | H'2B | R/W | IPv6 Analyzable Protocol No.4<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'2B Routing (43).<br>Write to this field when CSFR16. v6_ana_protocol_4_en is '0b'. |

### 30.4.3.31 IPv6 analysis Protocol Condition register 2 (CSFR16_2)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | v6_ana_protocol_8[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 7 to 0 | v6_ana_protocol_8 | H'3C | R/W | IPv6 Analyzable Protocol No 8<br>IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt.<br>Initial value is H'3C Destination Options (60).<br>Write to this field when CSFR16. v6 ana protocol 8 en is '0b'. |

### 30.4.3.32 IPv6 analysis Protocol Condition Enable register (CSFR16)

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|
| 1 | mac_da_bro | 0b | R/W | MAC DA broadcast filter<br>Wake Up Interrupt which occurs by match of Broadcast MAC DA.<br>‘1’ Write: Clear<br>‘0’ Write: Invalid |
| 0 | mac_da_uni | 0b | R/W | MAC DA unicast filter<br>Wake Up Interrupt which occurs by match of Unicast MAC DA.<br>‘1’ Write: Clear<br>‘0’ Write: Invalid |

NOTE

- From b[0] to b[20] are set to “1” when TOE received the Rx Frame which matches to Filter Conditions even if that frame has any error (such as CRC error, short length error or etc.). Therefore, use these bits only for Debug.
- b [28] is set to “1” only when TOE sent a normal Rx Frame to DMAC.

| | arp_sa_mac[47:32] | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

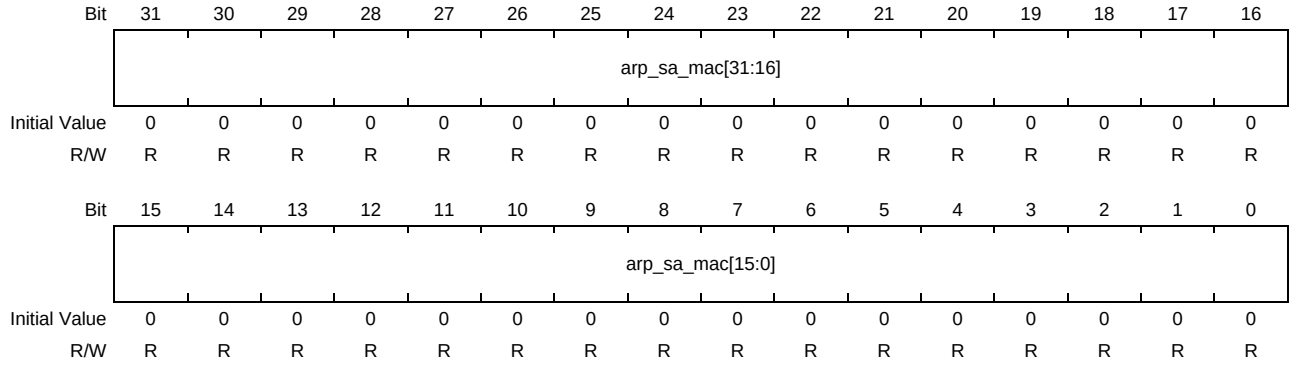
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | ns_option_type | H'00 | R | Neighbor Solicitations option type<br>This field indicates Received Neighbor Solicitations Option Type.<br>"H'00" means that Received Frame did not have Option.<br>When rx_arp_ns = 0 (ARPREQ), this field is invalid. |
| 23 to 18 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 17 | arp_ns_spec | 0b | R | ARP Neighbor Solicitations spec<br>This field indicates Received ARPREQ/Neighbor Solicitations Frame Type.<br>The Case of ARPREQ (rx_arp_ns = 0)<br>0b: ARPREQ<br>1b: GARPREQ<br>The Case of Neighbor Solicitations (rx_arp_ns = 1)<br>0b: Multicast Neighbor Solicitations<br>1b: Unicast Neighbor Solicitations |
| 16 | rx_arp_ns | 0b | R | ARP Neighbor Solicitations<br>This field indicates which frame did TOE receive ARPREQ or Neighbor Solicitations.<br>0b: ARPREQ<br>1b: Neighbor Solicitations |
| 15 to 0 | arp_sa_mac | H'0000 | R | ARP source Address MAC<br>This field indicates the Source MAC Address [47:32] of Received ARPREQ/Neighbor Solicitation.<br>When rx_arp_ns = 1 and ns_option_type = H'00, this field is invalid. |

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is cleared by CSFR40.arp_ns.

### 30.4.3.40 Rx ARPREQ/Neighbor Solicitation Lower MAC SA register (CSFR42_L)



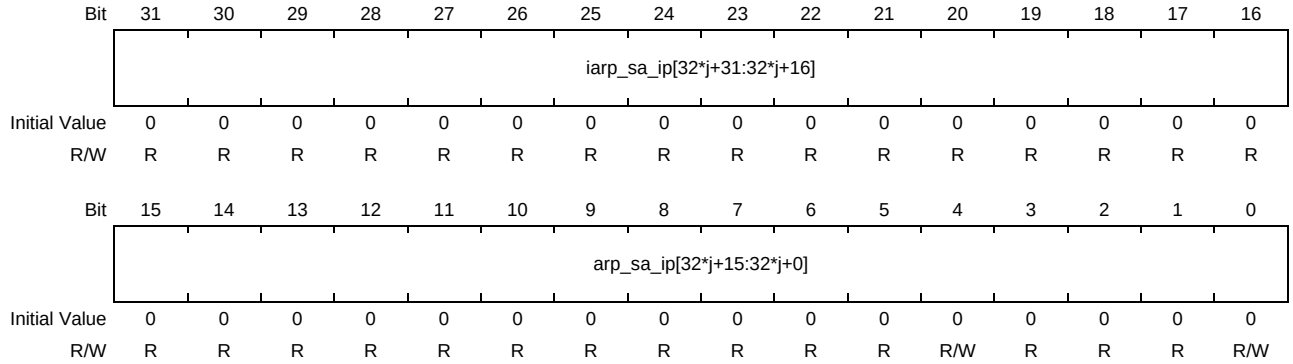
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | arp_sa_mac | H'0000_0000 | R | ARP source Address MAC<br>This field indicates the Source MAC Address [31:0] of Received ARPREQ/Neighbor Solicitation.<br>When rx_arp_ns = 1 and ns_option_type = H'00, this field is invalid. |

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is cleared by CSFR40.arp_ns.

### 30.4.3.41 Rx ARPREQ/Neighbor Solicitation IP SA register i (i = 0 to 3) (CSFR43_i)



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | arp_sa_ip | All 0 | R | ARP source Address IP<br>This field indicates the Source IP Address[32*j+31:32*j] of Received ARPREQ/Neighbor Solicitations.<br><br>The relationship between ‘i’ and ‘j’ is the following.<br>i = 0 -> j = 3<br>i = 1 -> j = 2<br>i = 2 -> j = 1<br>i = 3 -> j = 0<br><br>When rx_arp_ns = 0 (ARPREQ), Only Lower 32bit (CSFR43_3) is valid. |

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by “Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO” is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by “Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO” is cleared by CSFR40.arp_ns.

## 30.5 Operation

The Gigabit Ethernet Interface consists of the following functional units:

- DMA transfer controller (DMAC):
  Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO
- TCP/IP Offload Engine (TOE):
  Calculates Checksum by hardware. And also filters Ethernet Frames and responds specific frames automatically.
- MAC controller (E-MAC):
  Handles reception/transmission transfer from/to the RGMII or MII.

Using its direct memory access (DMA) function, the DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO for reception and transmission. Data cannot be directly read from or written to the FIFO.

To handle DMA transfer, the DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

TOE calculates checksum of received frames from E-MAC. And then it outputted to DMAC. TOE also calculates checksum of transmission frames from DMAC. And then it outputted to E-MAC. When TOE received any frames from E-MAC, it analyzes them. By the configuration of registers, TOE filters received frames. If received frame does not correspond to the configured filter conditions by registers, it will be discarded. By using this analysis function, TOE is also able to respond to ARP Request and Neighbor Solicitation automatically.

The E-MAC supports a RGMII and MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC transmits frames from TOE to the RGMII or MII. It also transmits frames from the RGMII or MII to TOE.

### 30.5.1 DMAC Operating Modes

**Figure 30.2** illustrates the operating modes of the DMAC.

Transitions of DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset)
- Configuration of the operating mode configuration bits (CCC.OPC) in the DMAC mode register

The operating mode can be confirmed by reading the operating mode status bits in the DMAC status register (CSR.OPS).

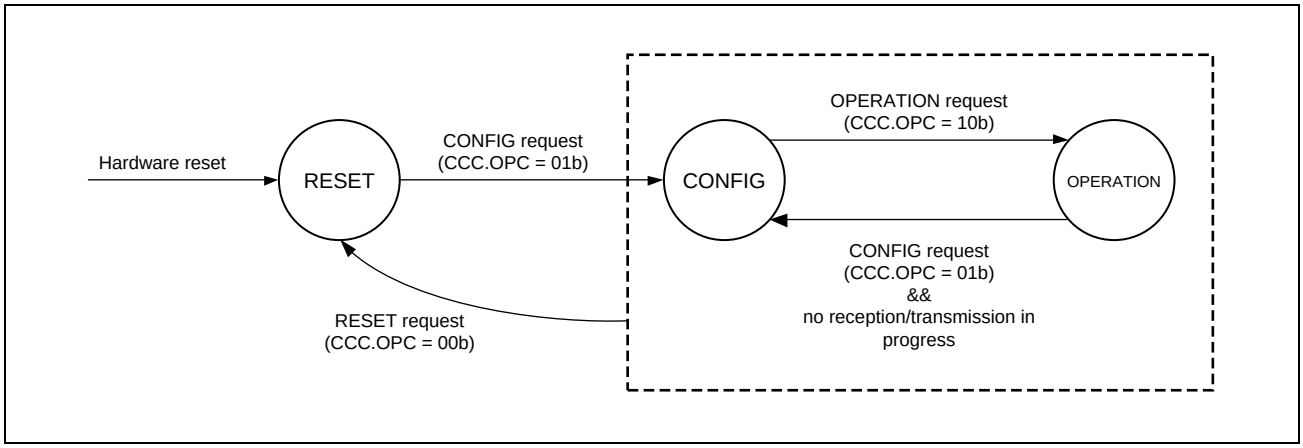


Figure 30.2 Operating Mode of DMAC

#### 30.5.1.1 Operating Modes

##### (1) RESET mode

After a hardware reset, the DMAC enters RESET mode.

In RESET mode, only the DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

##### (2) CONFIG mode

In CONFIG mode, various settings for the DMAC can be made.

The operation of most functions is stopped, and all status registers are initialized to their reset values.

##### (3) OPERATION mode

In OPERATION mode, all functions of the DMAC can operate. Ethernet communications can only proceed in this mode.

#### 30.5.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the operating mode can be checked by reading the operating mode status bits in the DMAC status register (CSR.OPS).

Transitions other than leaving from OPERATION mode are made after the value is written to the operating mode configuration bits (CCC.OPC).

For transitions leaving from OPERATION mode, it is not executed immediately because any transmission and reception in progress will be executed before leaving from OPERATION mode. To prevent any trouble, follow the “Stop Procedure” of **Section 30.5.13.4**.

#### 30.5.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the DMAC operating mode.

##### (1) Hardware reset

Resetting of the LSI chip leads to resetting of the entire Gigabit Ethernet Interface. The operating mode shifts to RESET mode.

### 30.5.2 Descriptors

#### 30.5.2.1 Data Representation in URAM

The DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the DMAC.

**Figure 30.3** shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor processed interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.

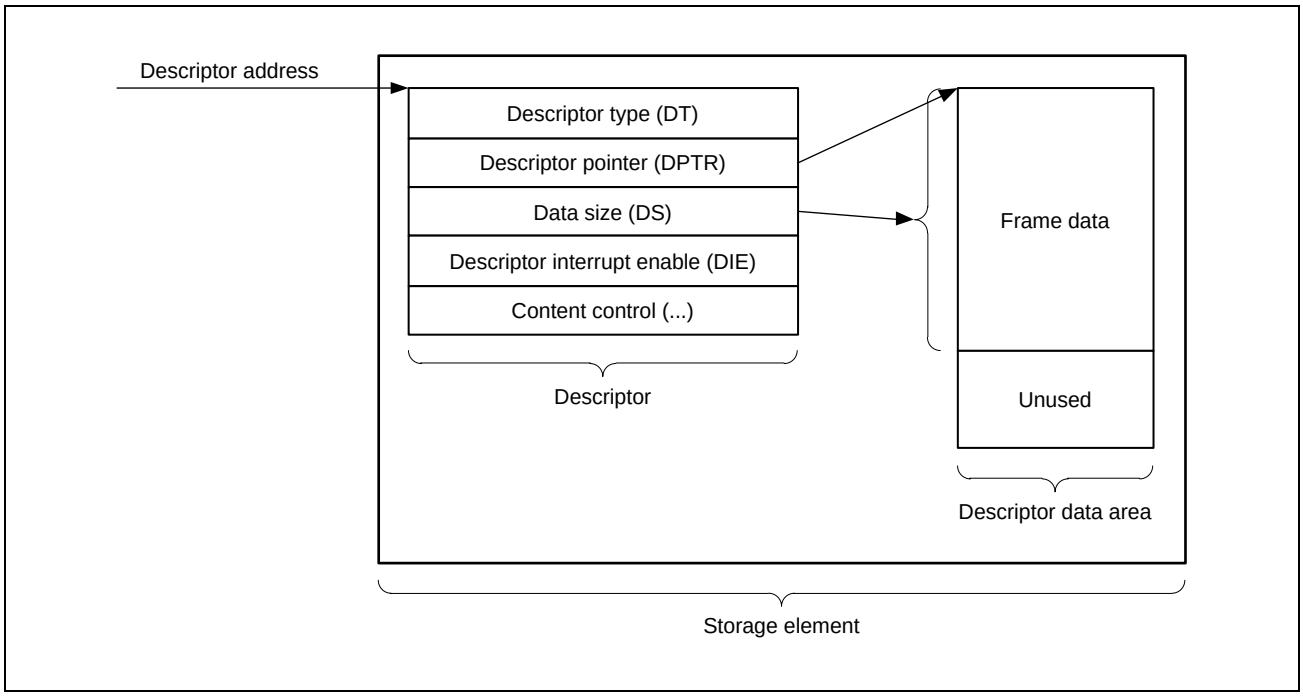

Figure 30.3 Outline of Storage Element Used for Receive and Transmit Queues

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are configured of 64 bits.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

### 30.5.2.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. The queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see **Section 30.5.2.6, Descriptor Type**.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

**Figure 30.4** shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).

- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

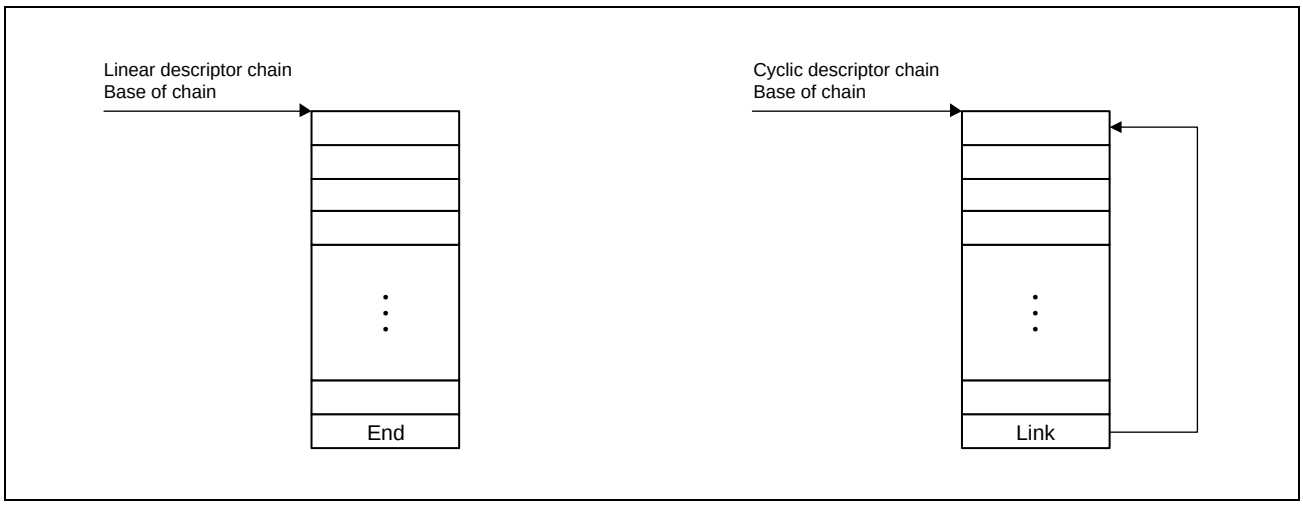

Figure 30.4 Outline of the Basic Descriptor Chains

The relationship between queue and descriptor chain is defined by the base addresses of chain. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in OPERATION mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure should be used or which topology is suitable depend on the application. A description of how to design descriptor chains to suit various applications is given in **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.

### 30.5.2.3 Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entry 0 is used to access transmission queues. Entry 4 is used to access reception queue.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

**Figure 30.5** shows an example of a base address table for controlling transmission and reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

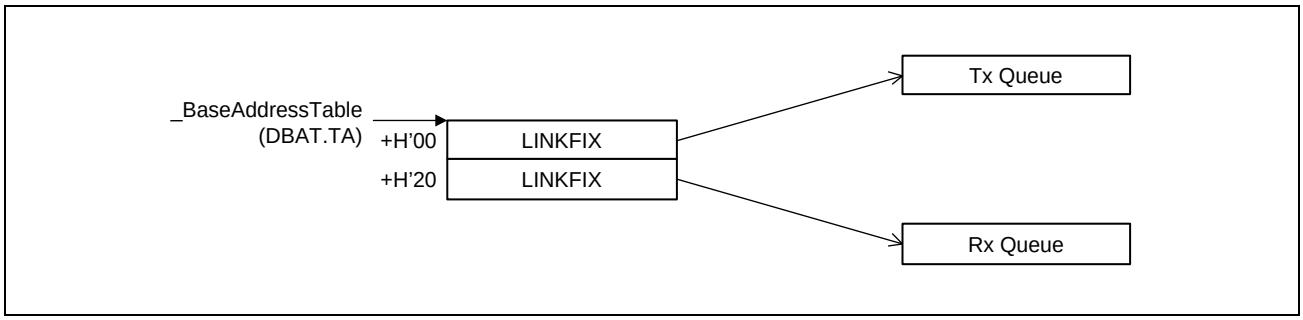

Figure 30.5 Example of a Base Address Table for Reception and Transmission Queues

#### 30.5.2.4 Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8*q) when the operating mode shifts to OPERATION mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue. The DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

#### 30.5.2.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enables bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

**Figure 30.6** illustrates the way in which the DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

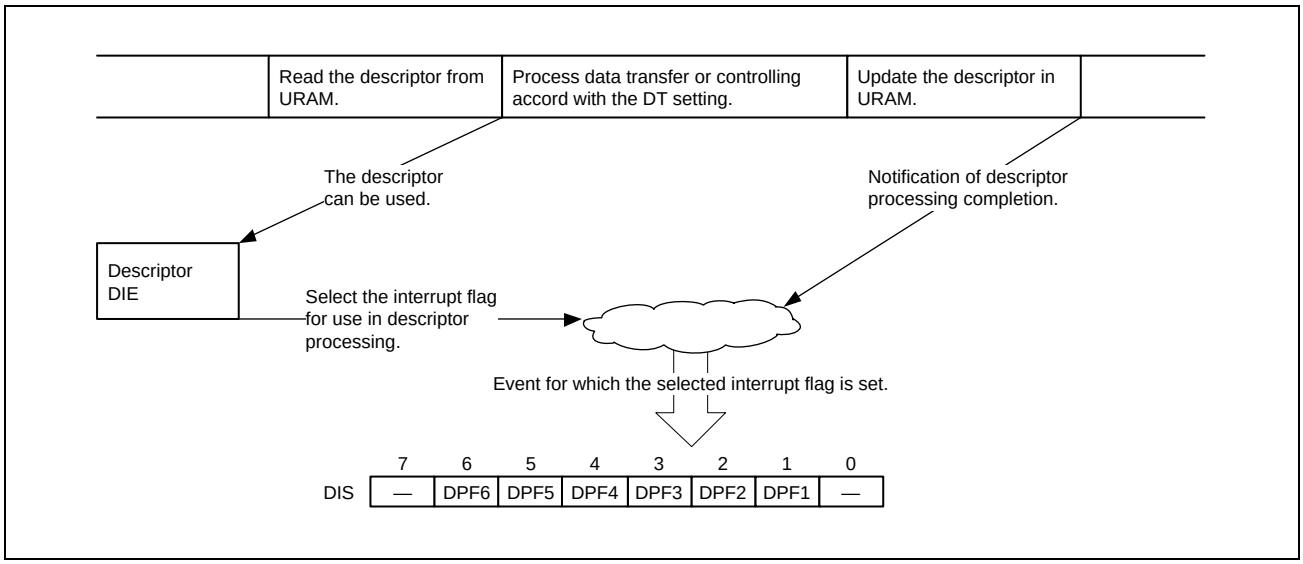

Figure 30.6 Method of Descriptor Interrupt Generation

### 30.5.2.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

**Table 30.7** is a summary of the descriptor types available for the DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (DMAC).

Definition of HW:

- The descriptor is processed by hardware (DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

- This descriptor type is not used in transfer in the given direction (transmission or reception).
- Do not write to this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

- Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 30.7 Summary of Descriptor Types

| Name | DT | Description | Reception | Transmission |
|---|---|---|---|---|
| Frame data | | | | |
| FSTART | 5 | Frame Start<br>The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor. | SW | HW |
| FMID | 4 | Frame Middle<br>The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor. | SW | HW |
| FEND | 6 | Frame End<br>The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor. | SW | HW |
| FSINGLE | 7 | Frame Single<br>The descriptor points to valid data for a complete frame. | SW | HW |
| Chain control | | | | |
| LINK | 8 | Link<br>Defines the next descriptor in the chain. | HW | HW |
| LINKFIX | 9 | Fixed Link<br>Same as LINK, but not changed by DMAC after processing. | SW | SW |
| EOS | 10 | End Of Set<br>Control element to split a descriptor chain. The chain stops and waits for user interaction. | HW | HW |
| HW/SW arbitration | | | | |
| FEMPTY | 12 | Frame Empty<br>A descriptor related to frame data but not containing valid data for a frame | HW | SW |
| DT13 | 13 | Reserved | Invalid | Invalid |
| DT14 | 14 | Reserved | Invalid | Invalid |
| FEMPTY_ND | 15 | Frame Empty No Data storage<br>A descriptor related to frame data but not containing valid data for a frame.<br>The descriptor is processed in the same way as FEMPTY, but data are not stored in the URAM. | HW | Invalid |
| LEMPTY | 2 | Link Empty<br>A link descriptor for processing by the DMAC | SW | SW |
| EEMPTY | 3 | EOS Empty<br>An EOS descriptor for processing by the DMAC | SW | SW |
| DT0 | 0 | Reserved | Invalid | Invalid |
| DT1 | 1 | Reserved | Invalid | Invalid |
| DT11 | 11 | Reserved | Invalid | Invalid |

### 30.5.2.7 Layout of General Descriptors in the URAM

The DMAC updates processed descriptors in the URAM. The field to be changed in the descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

#### (1) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.
usable in both reception and transmission

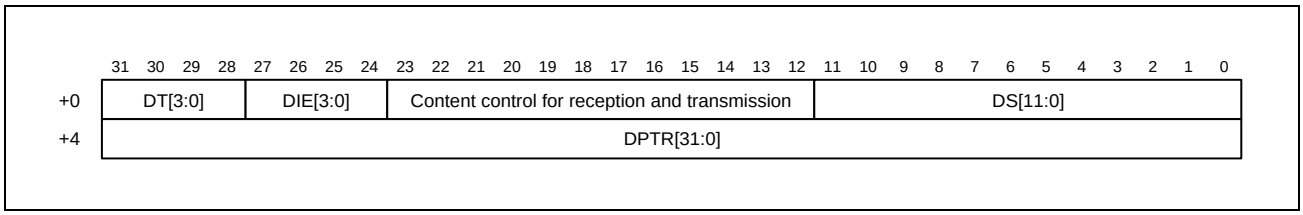

Figure 30.7 The allocation of bits in the frame data descriptors

Table 30.8 Contents of Frame Data Descriptors (DESCR)

| Bit Name | Function |
|---|---|
| DT[3:0] | Descriptor Type<br>5: FSTART<br>4: FMID<br>6: FEND<br>7: FSINGLE<br>For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**. |
| DIE[3:0] | Descriptor Interrupt Enable<br>0000b: Descriptor interrupt is disabled.<br>0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi). |
| — | Content Control<br>For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**. |
| DS[11:0] | Data Size<br>Size of the data area/frame data for the descriptor (in bytes) |
| DPTR[31:0] | Descriptor Pointer<br>Pointer to the data area for the descriptor |

**Note:** Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

### (2) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

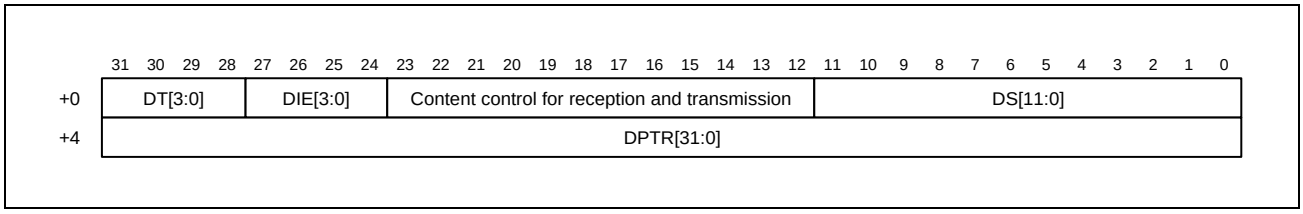

Figure 30.8 The allocation of bits in the arbitration descriptors

Table 30.9 Contents of Hardware/Software Arbitration Descriptors (DESCR)

| Bit Name | Function |
|---|---|
| DT[3:0] | Descriptor Type<br>12: FEMPTY<br>15: FEMPTY_ND<br>For details, see **Table 30.7, Summary of Descriptor Types**. |
| DIE[3:0] | Descriptor Interrupt Enable<br>0000b: Descriptor interrupt is disabled.<br>0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi). |
| — | Content Control<br>For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**. |
| DS[11:0] | Data Size<br>Size of the data area/frame data for the descriptor (in bytes) |
| DPTR[31:0] | Descriptor Pointer<br>Pointer to the data area for the descriptor |

**Note:** Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

### (3) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

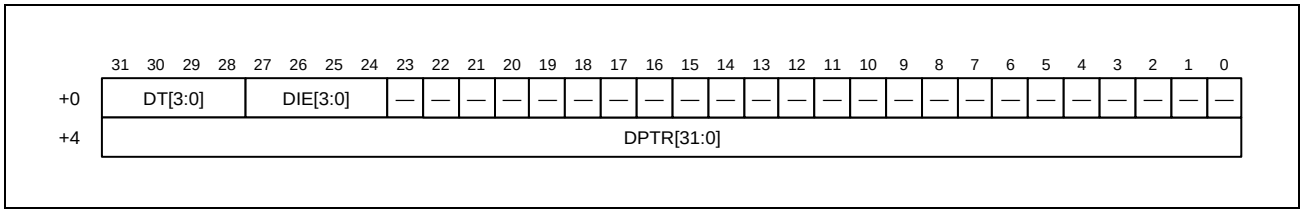

Figure 30.9 The allocation of bits in the link descriptors

Table 30.10 Contents of Link Descriptors (DESCR)

| Bit Name | Function |
|---|---|
| DT[3:0] | Descriptor Type<br>8: LINK<br>9: LINKFIX<br>For details, see **Table 30.7, Summary of Descriptor Types**. |
| DIE[3:0] | Descriptor Interrupt Enable<br>0000b: Descriptor interrupt is disabled.<br>0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi). |
| DPTR[31:0] | Descriptor Pointer<br>Pointer to the data area for the descriptor<br>Register an address on a 32-bit boundary. |

**Note:** Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

### (4) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

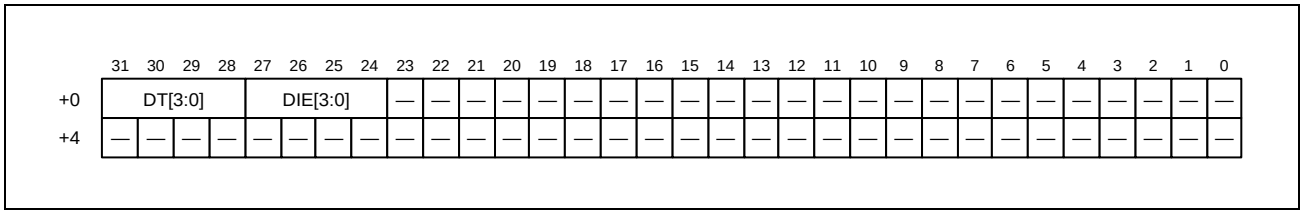

Figure 30.10 The allocation of bits in the other descriptors

Table 30.11 Contents of Other Descriptors (DESCR)

| Bit Name | Function |
|---|---|
| DT[3:0] | Descriptor Type<br>10: EOS<br>12: FEMPTY (only for transmission)<br>2: LEMPTY<br>3: EEMPTY<br>For details, see **Table 30.7, Summary of Descriptor Types**. |
| DIE[3:0] | Descriptor Interrupt Enable<br>0000b: Descriptor interrupt is disabled.<br>0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi). |

### 30.5.2.8 How to Use Frame Data Descriptors

In general, Ethernet frames are not of uniform length. The DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle frames and descriptors, four descriptor types (DESCR.DT) as FSTART, FEND, FMID and FSINGLE are defined.

**Figure 30.11** shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

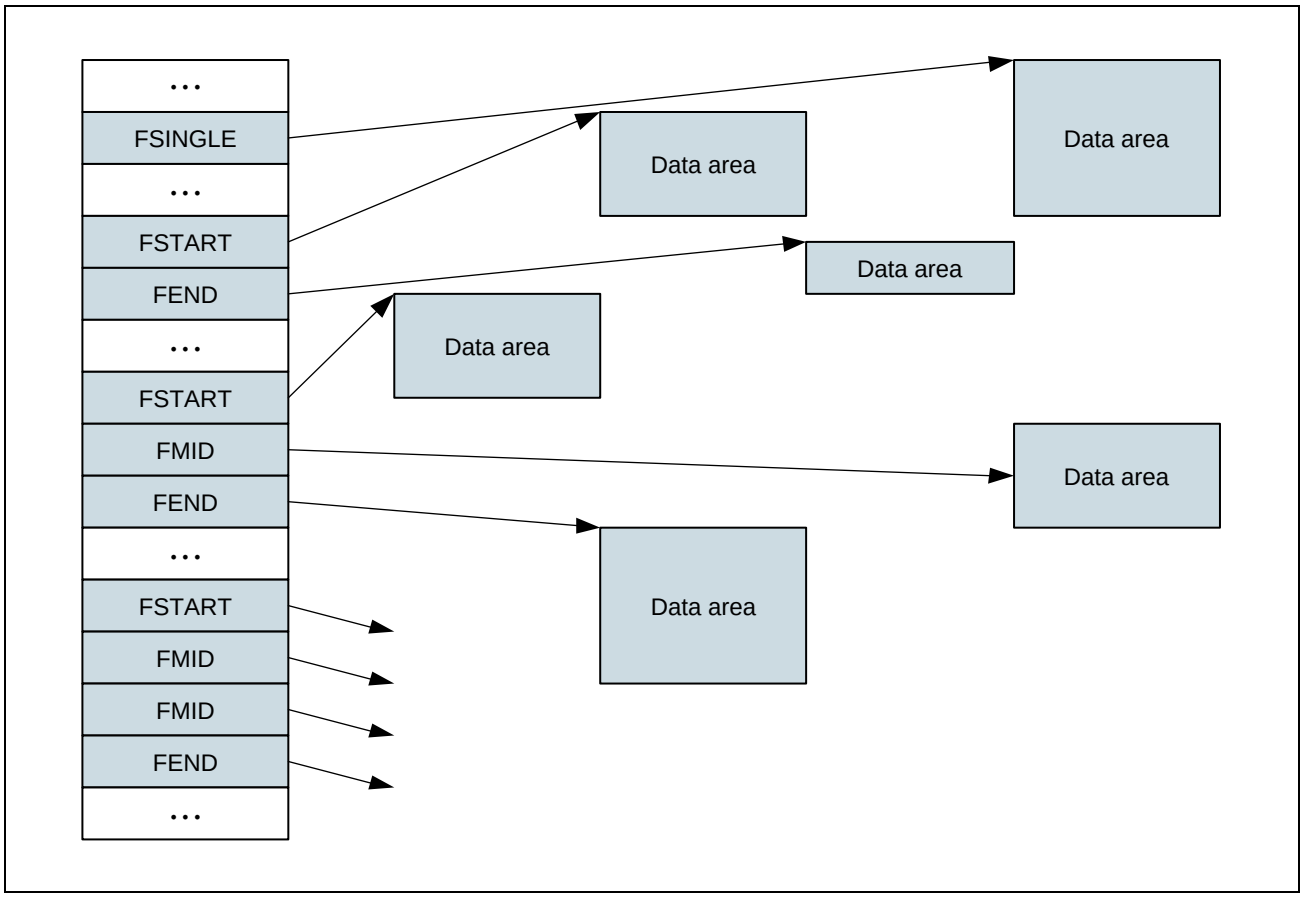

Figure 30.11 Mapping of Frame Data

For reception, the DMAC will store received frame data in the given area. If a received frame has more data than the descriptor data size (DESCR.DS), the DMAC will divide the data up.

For transmission, set the descriptor data size (DESCR.DS) to the actual data size. The DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

### 30.5.2.9 How to Use Chain Control Descriptors

#### (1) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see **Section 30.5.2.2, Using Descriptor Chains in Queues**)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

#### (2) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFF), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

### 30.5.2.10 How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

#### (1) FEMPTY and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission. The descriptor pointer of a FEMPTYxxx descriptor refers to a descriptor data area.

#### (2) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

#### (3) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

#### 30.5.2.11 Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. By this, the number of CPU accesses to registers of Gigabit Ethernet Interface can be minimized and performance can be increased.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see **Table 30.7, Summary of Descriptor Types**).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

#### 30.5.2.12 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment.
- While in OPERATION mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Frame data is accessed in blocks up to 128 bytes.
- The number of 128 byte borders (addresses H’xxx00 and H’xxx80) and frame data inside should be minimized.
- Design the descriptor chains in ways that minimize parallelism of processing. This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

### 30.5.3 Reception Control

The point of the DMAC is to transfer data between the TOE/E-MAC and URAM without intervention by the CPU.

DMAC needs descriptors that define the amounts of frame data to be stored and the locations. When the E-MAC received a frame, it is transferred to TOE and the conditions of reception is also transferred to DMAC as the E-MAC state. The checksum of received frame is calculated by TOE, the received frame is stored to Reception FIFO temporary. If TOE detects any errors from received frame (such as it was unsupported frame or checksum error), the error information is notified to DMAC. After that, the received frame is transferred to URAM by DMAC. At the time, MAC-Status and Error Information of TOE are written to Reception Descriptor by Write Back. For a description of how to set up descriptors for use in reception, see **Section 30.5.3.2, Setting Up Reception Descriptors**.

**Figure 30.12** shows the reception data bus.

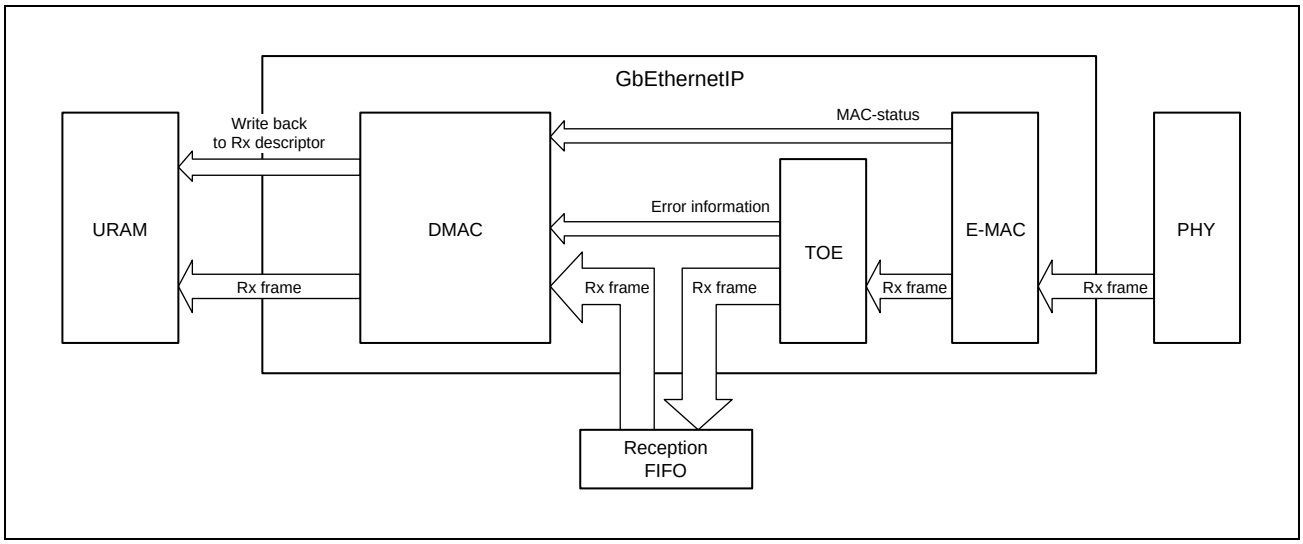

Figure 30.12 Mechanism of General Reception

### 30.5.3.1 Reception Queues

The DMAC stores all received frames in the URAM.

There is a condition for the DMAC to discard a received frame.

- Detection of an error during reception by the TOE and E-MAC
  - Whether error frames are discarded or stored in reception queue depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1*[1]), they are always stored in queue. In this case, characteristics specific to the queue (e.g. truncation) will vary.

**Note 1.** RCR.EFFS = 1 is only for debug. Do not set this condition during normal operation.

The flowchart in **Figure 30.13** shows how the DMAC selects the reception queue in accord with the frame type. The result is storage of the frame in the proper queue or the frame being discarded.

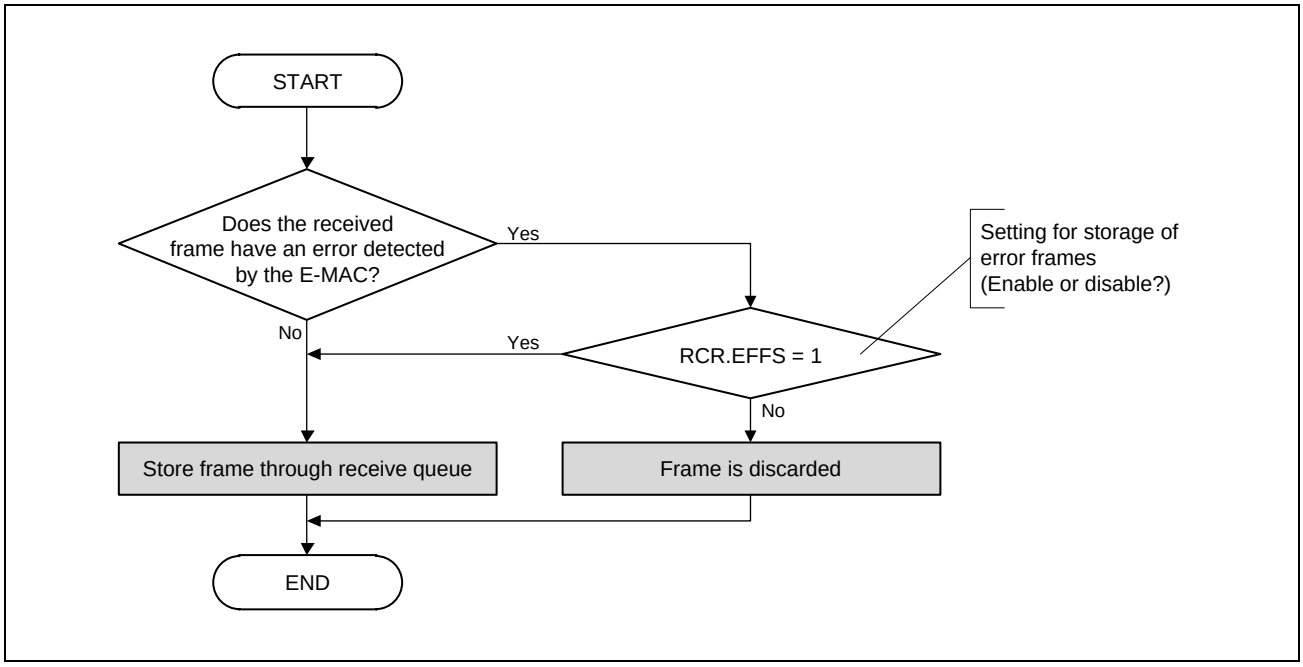

Figure 30.13 Mechanism of Reception Queue Selection

### 30.5.3.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in **Section 30.5.2, Descriptors**.

This section describes memory operations that are especially required in handling reception queues.

#### (1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

**Table 30.12** shows the descriptor types used in reception.

Table 30.12 Descriptor Types in Reception

| Descriptor Type (DESCR.DT) | Operation | Write-back |
|---|---|---|
| Frame Start (FSTART) | Condition for data not being stored in a reception queue:<br>The RIS2.QFF bit indicates that queue r is full, and the received frame is not stored.<br>Descriptor processing proceeds again in response to further reception. | Not changed |
| Frame Middle (FMID) | Same as FSTART | Not changed |
| Frame End (FEND) | Same as FSTART | Not changed |
| Frame Single (FSINGLE) | Same as FSTART | Not changed |
| Link (LINK) | Processing proceeds to the descriptor specified by DESCR.DPTR. | LEMPTY |
| Fixed Link (LINKFIX) | Same as LINK | Not changed |
| End Of Set (EOS) | A stop point defined by software has been reached.<br>A descriptor of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFF indicates that the frame has been lost.<br>If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor.<br>In either case, processing shifts to the next descriptor in the chain. | EEMPTY |
| Frame Empty (FEMPTY) | The descriptor can be used to store received data.<br>Up to DESCR.DS bytes are stored in the descriptor data area.<br>For details, see **Section 30.5.3.3(1), Storing Frame Data in the Descriptor Data Area**. | FSTART, FMID, FEND, or FSINGLE |
| Frame Empty<br>No Data storage (FEMPTY_ND) | The descriptor can be used to store received data.<br>Up to DESCR.DS bytes are captured from the Reception FIFO but not stored. After processing, DESCR.DS is written back as 0. | FSTART, FMID, FEND or FSINGLE |
| Link Empty (LEMPTY) | Same as FSTART | Not changed |
| EOS Empty (EEMPTY) | Same as FSTART | Not changed |

### (2) Configuration of Reception Frame Data Descriptors

**Figure 30.14** shows the configuration of descriptors for use with reception queues. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TI) are described in **Table 30.8**.

For the other fields and the descriptor types, see **Section 30.5.2.6, Descriptor Type**.

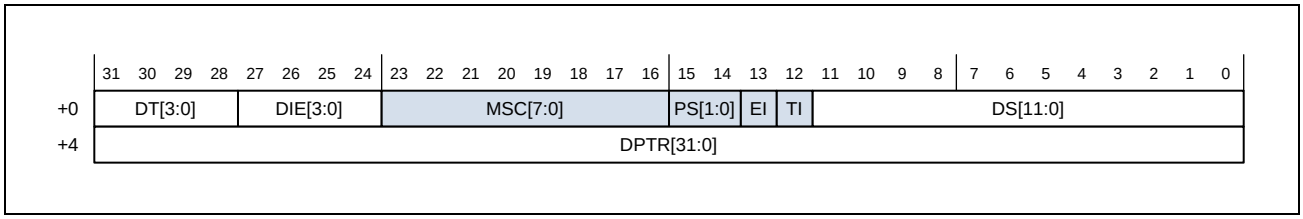

Figure 30.14 Configuration of Descriptor for a Received Frame

Table 30.13 Configuration of a Received Descriptor

| Bit Name | Function |
|---|---|
| MSC | E-MAC/TOE Status Code<br>These bits indicate errors in reception detected by the E-MAC and TOE.<br>In the case of a divided frame, the bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows.<br>MSC [7]: Received frame has a multicast address. (E-MAC)<br>MSC [6]: Check-sum error (TOE)<br>MSC [5]: Received Unsupported frame (TOE)<br>MSC [4]: Received frame has alignment error. (E-MAC)<br>MSC [3]: Received frame is too long. (E-MAC)<br>MSC [2]: Received frame is too short (E-MAC)<br>MSC [1]: Error in frame reception (E-MAC)<br>MSC [0]: Received frame has a CRC error. (E-MAC) |
| PS | Padding Selection<br>00b: Padding is not to be inserted. |
| EI | Error Indication<br>This bit indicates the detection of an error in frame data while a frame was being stored.<br>The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted.<br>0: No error<br>1: Error is detected |
| TI | Truncation Indication<br>This bit indicates whether frame data received from the E-MAC have been truncated before being stored.<br>The bits are set to the same value within all frame data descriptors for a divided frame.<br>0: Data have not been truncated. |

**Note:** The RCR.EFFS bit specifies whether frames with errors detected by the TOE or E-MAC are to be stored in the URAM or not. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

#### 30.5.3.3 Reception Processing

After initialization, the DMAC can store received frames in the data area in the URAM as indicated by the descriptor. The DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

If the Reception FIFO contains even one frame, storing is executed to the reception queue.

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor) are discarded from the Reception FIFO.

##### (1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first descriptor of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

The CPU can write FEMPTY (or FEMPTY_ND) directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTY (or FEMPTY_ND) is written to DESCR.DT.

(1) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FSINGLE descriptor is stored in place of the FEMPTY or FEMPTY_ND descriptor after processing.

(2) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI is only valid in the last descriptor of the sequence for a divided frame.

NOTE

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the Reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

(3) No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

### (2) Flow of Reception Descriptor Processing

Constructing a descriptor chain requires software (see **Figure 30.15**).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after OPERATION mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

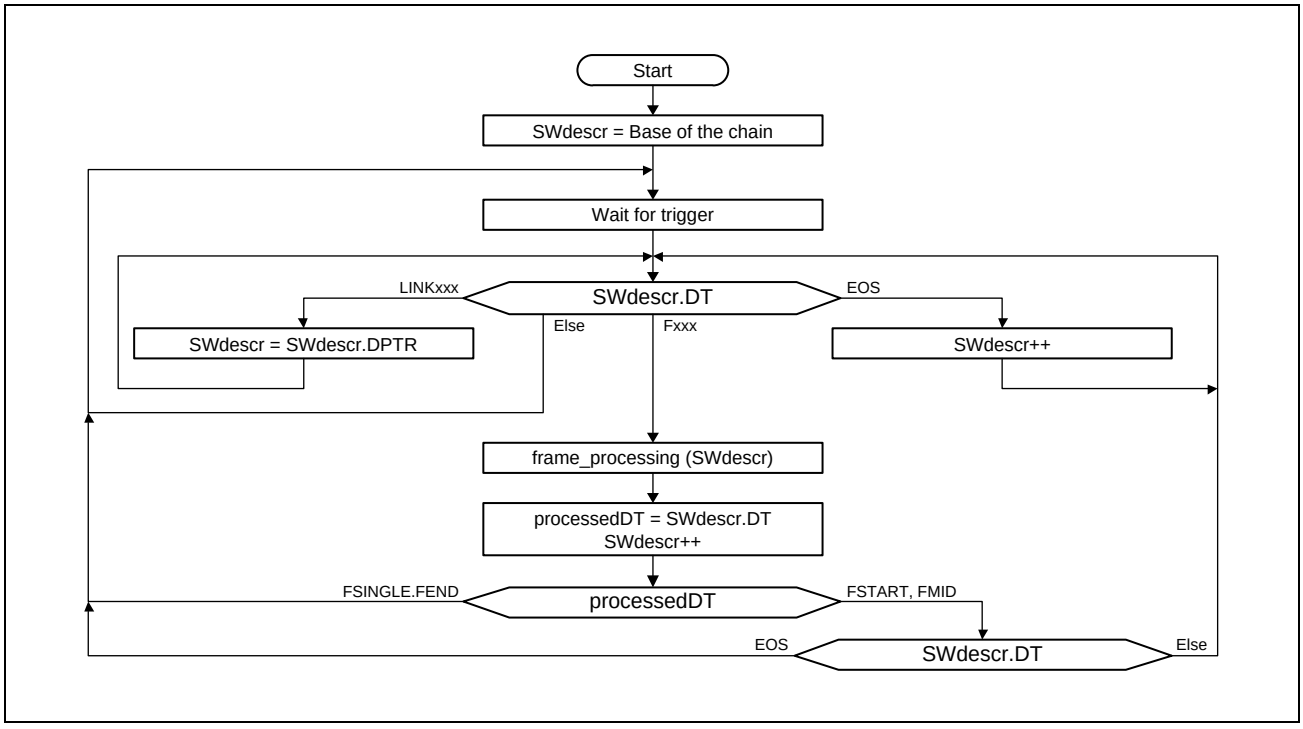

Figure 30.15 Flow of Reception Descriptor Processing

### 30.5.4 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see **Section 30.5.2, Descriptors**).

The DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between status for the software and the DMAC. The status information for transmitted frames remains accessible after their transmission is completed.

When DMAC started to transfer a frame, it reaches to TOE via Transmission FIFO and TOE FIFO. And after the calculation of transmission frame checksum by TOE, it is transferred to PHY by E-MAC. If any error information is detected by TOE or E-MAC, they are notified to DMAC and stored to MAC Status FIFO/MAC Status FIFO2. The oldest information in them is indicated to MFA/MFA2 of DMAC register.

**Figure 30.16** shows the transmission data bus

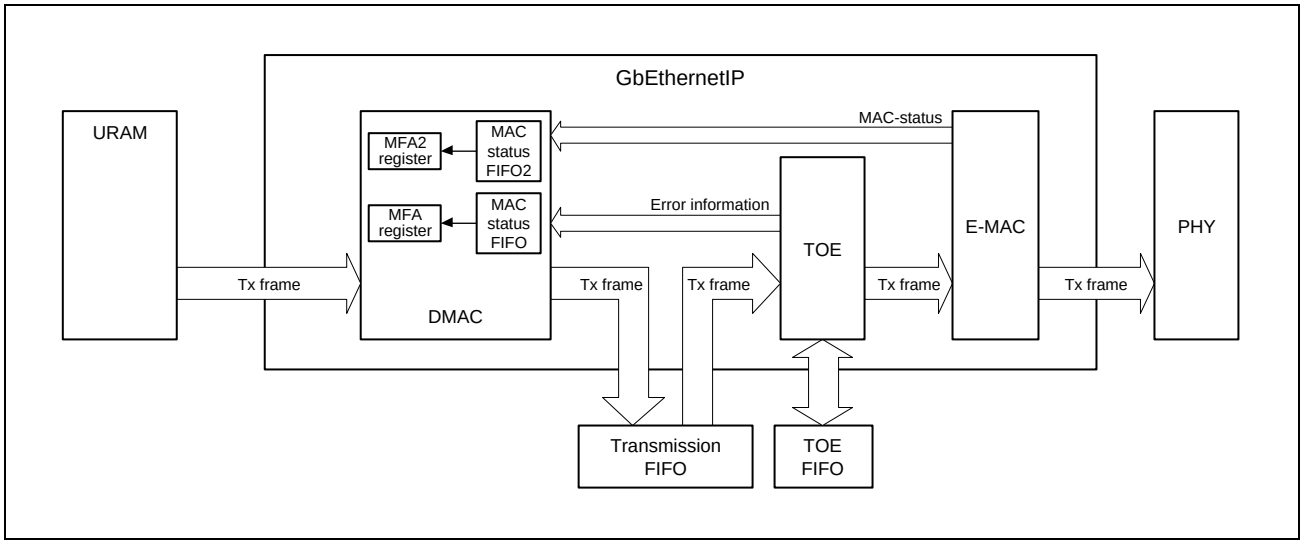

Figure 30.16 Mechanism of General Transmission

### 30.5.4.1 Setting Up Transmission Descriptors

#### (1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

**Table 30.14** shows the descriptor types used in transmission.

Table 30.14 Descriptor Types in Transmission

| Descriptor Type (DESCR.DT) | Operation | Write-back |
|---|---|---|
| Frame Start (FSTART) | The DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor. | FEMPTY |
| Frame Middle (FMID) | The DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor. | FEMPTY |
| Frame End (FEND) | The DMAC fetches the last of the data for the divided frame.<br>The frame of data that has been fetched to the Transmission FIFO is ready for transmission by the E-MAC, and then the DMAC proceeds to processing of the next descriptor. | FEMPTY |
| Frame Single (FSINGLE) | The DMAC fetches the frame of data.<br>The frame of data that has been fetched to the Transmission FIFO is ready for transmission by the E-MAC, and then the DMAC proceeds to processing of the next descriptor. | FEMPTY |
| Link (LINK) | Processing proceeds to the descriptor specified by DESCR.DPTR. | LEMPTY |
| Fixed Link (LINKFIX) | Same as LINK | Not changed |
| End Of Set (EOS) | This is a transmission stop point defined by software<br>This leads to clearing of the transmit start request bit (TCCR.TSRQ), which stops transmission.<br>When the TCCR.TSRQ is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor. | EEMPTY |
| Frame Empty (FEMPTY) | No frame data are ready for transmission<br>This leads to clearing of the transmit start request bit (TCCR.TSRQ), which stops transmission.<br>When the TCCR.TSRQ is again set to 1 (a new transmission start request is issued), processing starts at this descriptor. | Not changed |
| Link Empty (LEMPTY) | Same as FEMPTY | Not changed |
| EOS Empty (EEMPTY) | Same as FEMPTY | Not changed |

### (2) Configuration of Transmission Frame Data Descriptors

**Figure 30.17** shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in **Table 30.15**.

For the other fields and the descriptor types, see **Section 30.5.2.6, Descriptor Type**.

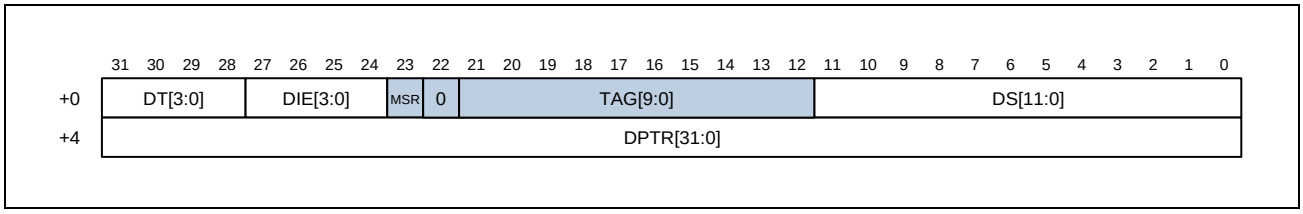

Figure 30.17 Configuration of Descriptor for a Transmitted Frame

Table 30.15 Configuration of a Transmission Descriptor

| Bit Name | Function |
|---|---|
| MSR | MAC Status storage Request<br>This bit configures if MAC transmission status of the frame is stored in MAC status FIFO.<br>0b: No status information is stored<br>1b: Status information is to be kept for this frame in MAC status FIFO<br>This bit is considered only if DESCR.DT = FEND or FSINGLE.<br>*Note*: If there is error during transmission of frame then status is always stored. |
| TAG | Frame Tag<br>This TAG field is used to associate each frame data. Frame TAG is not required but is recommended.<br>This bit is available while the current DESCR.DT is FEND or FSINGLE. |

### 30.5.4.2 Transmission

#### (1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA) for the queue (with q = 0) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in **Section 30.5.2, Descriptors**).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

**Figure 30.18** shows descriptor processing during transmission.

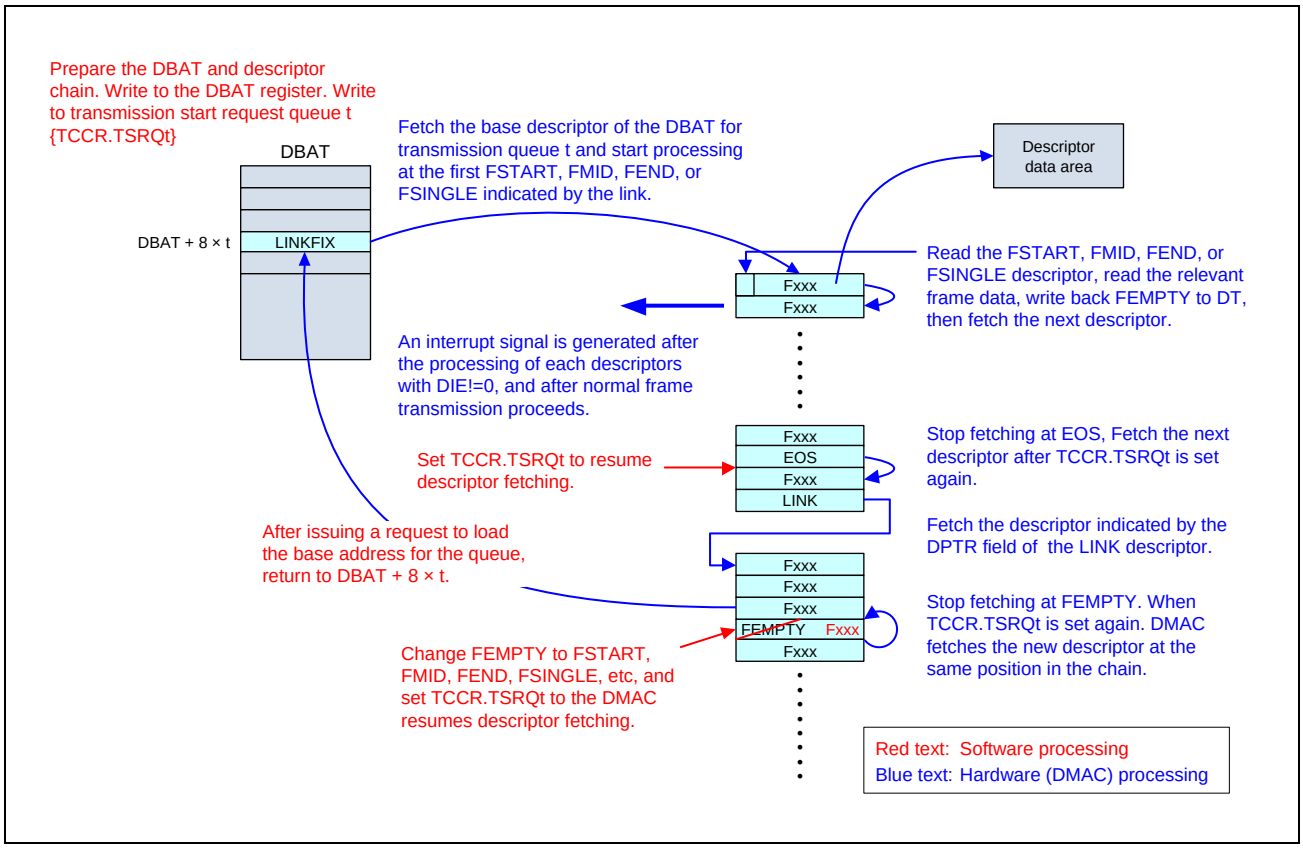

Figure 30.18 Descriptor Processing During Transmission

### (2) Examples of Descriptor Usage

(1) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

Create descriptor chains that have FEMTPY descriptors at the stop points.

**Figure 30.19** shows the flow for software implementing this pattern. SW should read back written descriptor between changing FEMPTY descriptor before writing to TCCR.TSRQ.

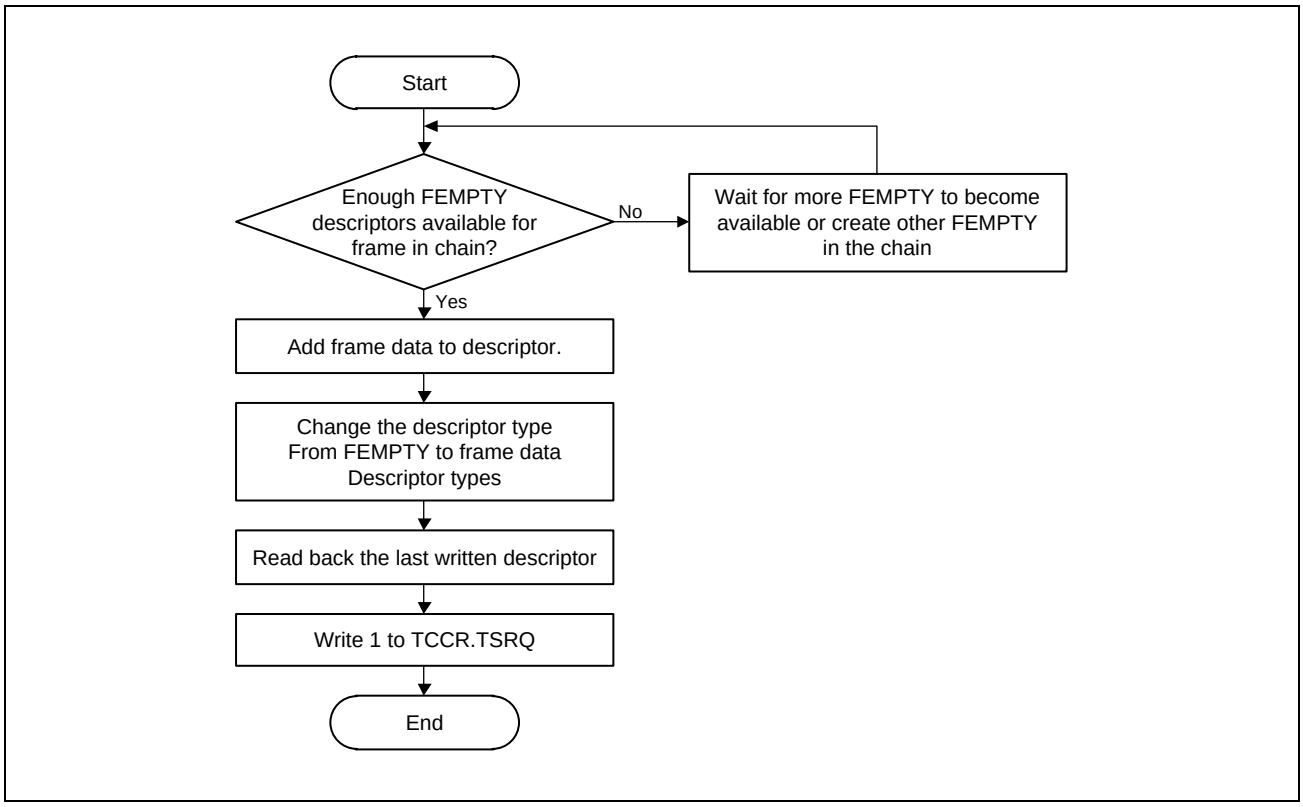

Figure 30.19 Software Flow for Immediate Frame Transmission

**Figure 30.20** shows software and DMAC operations for immediate frame transmission.

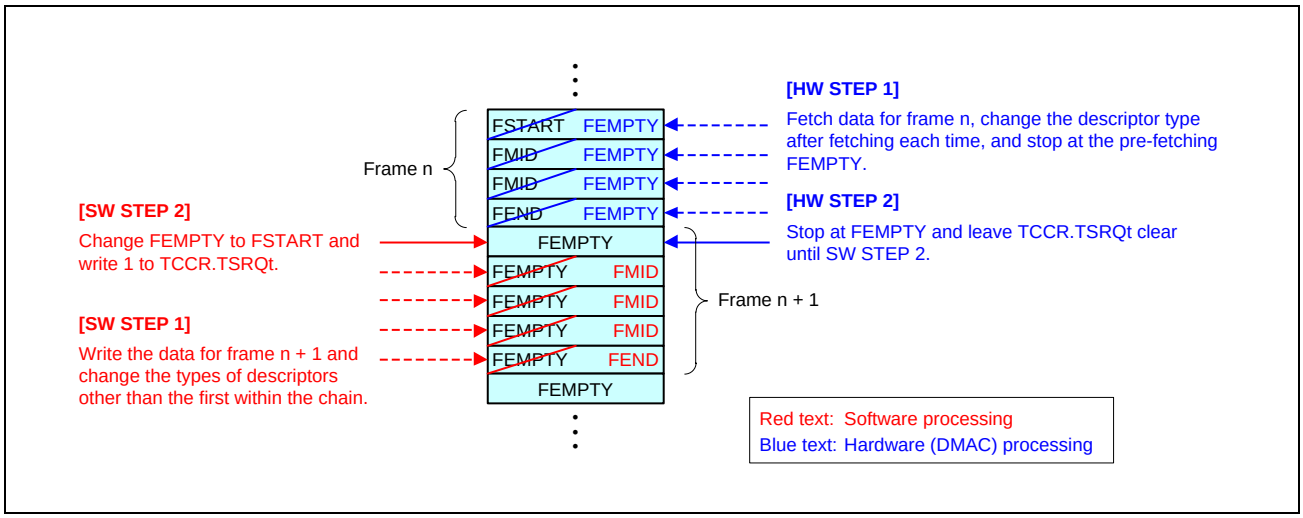

Figure 30.20 Software and DMAC Operations for Immediate Frame Transmission

(2) Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points. Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

**Figure 30.21** shows the software flow in this pattern.

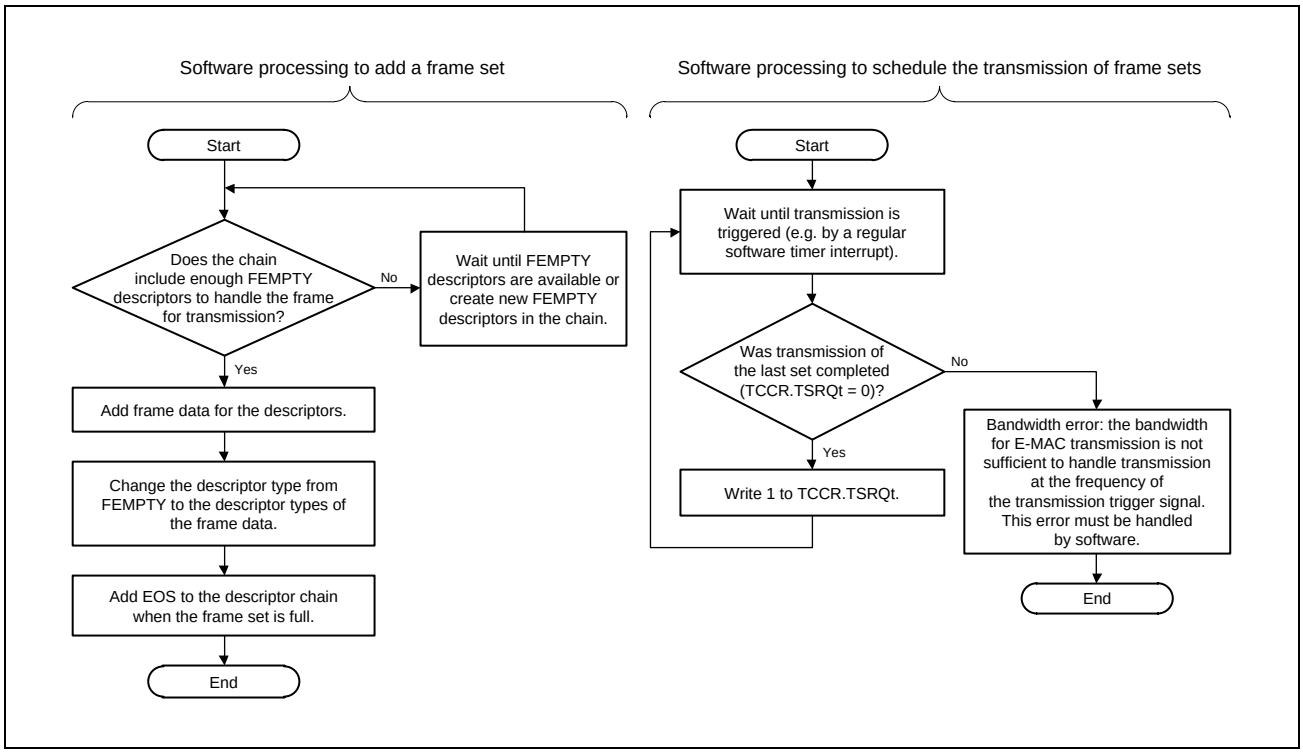

Figure 30.21 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

**Figure 30.22** shows software and DMAC operations for frame set transmission.

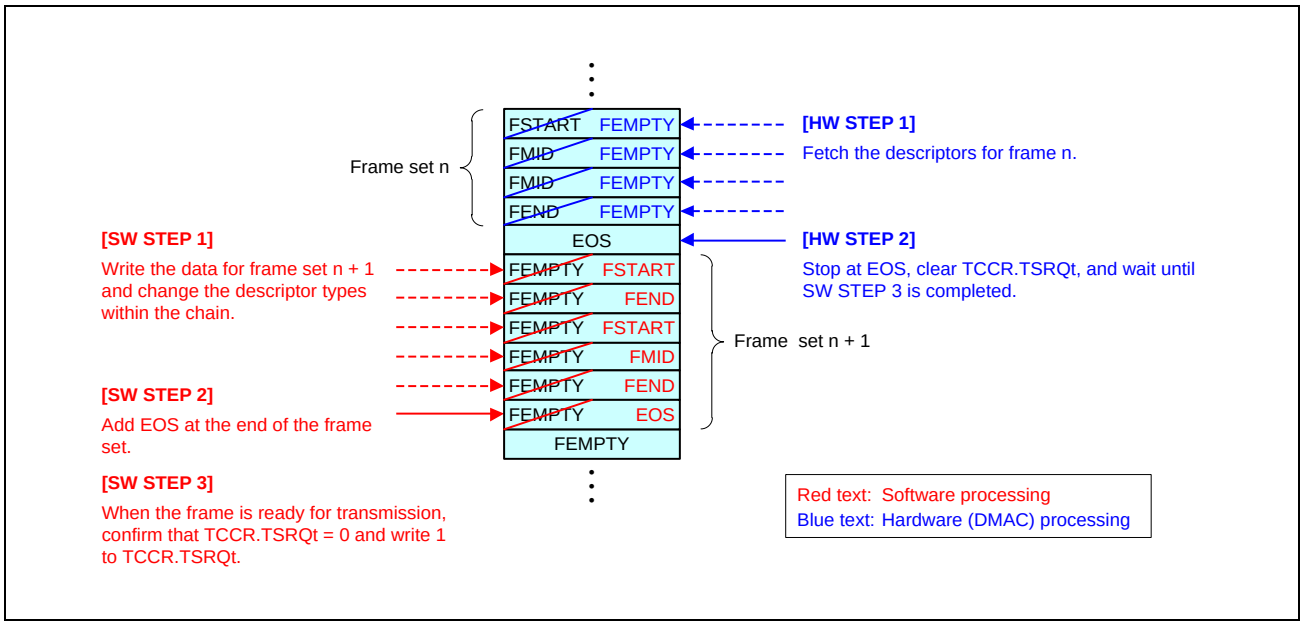

Figure 30.22 SW and DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

(3) Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

**Figure 30.23** shows the flow for software implementing this pattern.

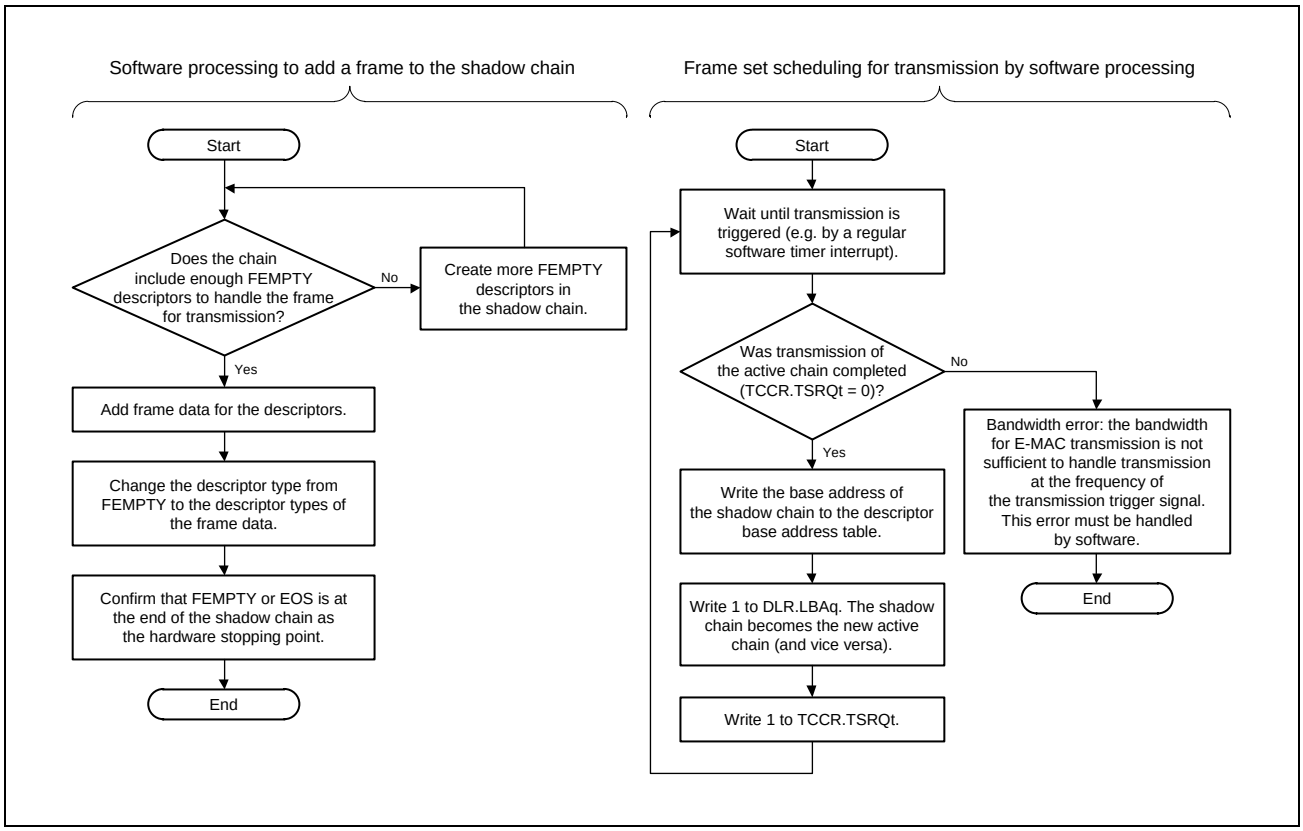

Figure 30.23 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

**Figure 30.24** shows software and DMAC operations for frame set transmission.

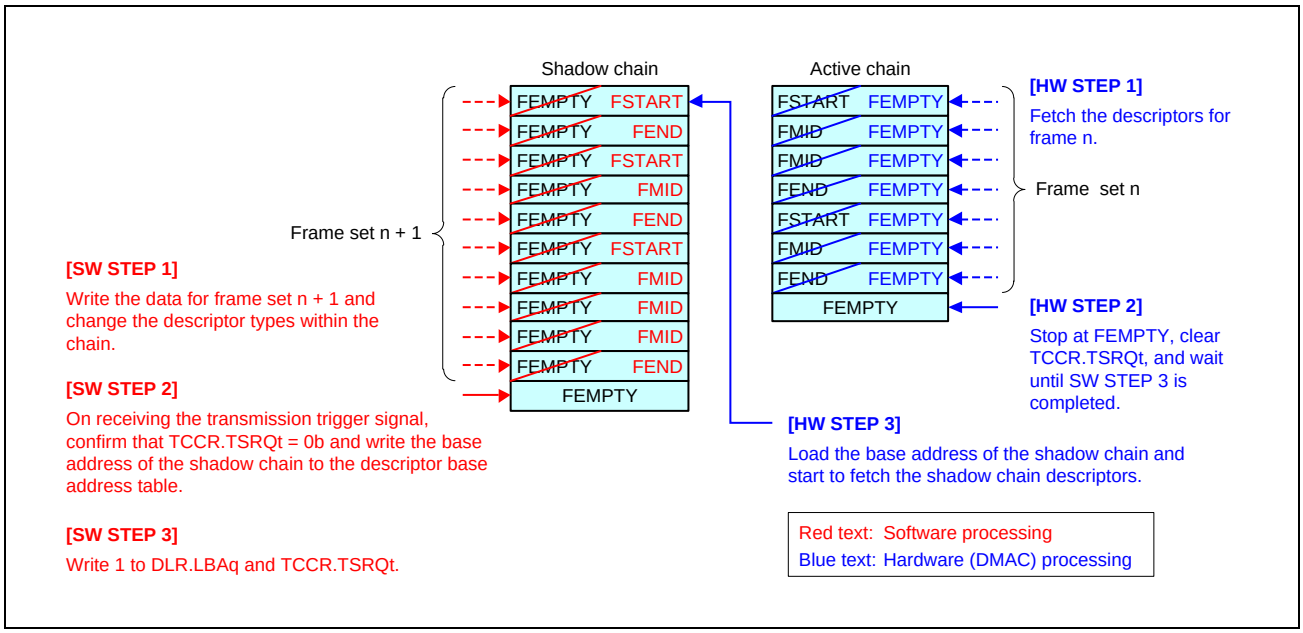

Figure 30.24 SW and DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

## 30.5.5 Integrity Checking

The DMAC can detect and identify errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

### 30.5.5.1 Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

### 30.5.5.2 Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

### 30.5.5.3 Monitoring in Both Reception and Transmission

#### (1) Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.
- The frame will be lost from the Transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus.

#### (2) Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.
- The frame will be lost from the Transmission FIFO.

#### (3) Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

### 30.5.5.4 Monitoring in Reception

#### (1) Errors in access to the URAM for writing of data

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

#### (2) Error of the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the Reception FIFO RAM faults, DMAC detects the fault as error of the Reception FIFO.

#### 30.5.5.5 Monitoring in Transmission

**(1) Errors in Access for Reading Data from the URAM**

- Data that have already been fetched are discarded from the Transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:z
  As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQ) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  The current descriptor address (CDARq.CDA) is not updated.
  The transmit start bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

**(2) Overflow of the Transmission FIFO**

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQ) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

**(3) Damaged Data in the Transmission FIFO**

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.
- The information of MAC Status FIFO and MAC Status FIFO2 will be inconsistent.

If damaged data in the Transmission FIFO is an error due to the Transmission FIFO, this is detected by the DMAC.

## 30.5.6 Checksum Calculation

TOE calculates Checksum of received frames from E-MAC. And then it is outputted to DMAC. TOE also calculates Checksum of transmission frames from DMAC. And then it is outputted to E-MAC.

To use this function, configure E-MAC as CRC Pass Through Mode (CXR20.RCPT = 1).

TOE supports Checksum Calculation for following part of frames. See **Section 30.5.6.4** for about the details of Supported Frames.

- IPv4 Header
- IPv4 TCP/UDP/ICMP
- IPv6 TCP/UDP/ICMP

### 30.5.6.1 Checksum Calculation handling

(1) Reception Handling

The result of Checksum Calculation is attached to last 4 bytes of Ethernet Frames like **Figure 30.25**. And then the handled frames are transferred to memory by DMAC. If the frame does not have checksum error at the part of IPv4 Header or TCP/UDP/ICMP, the value of “H’0000” is attached to each part as the result of Checksum Calculation. The case of Unsupported Frame, the value of “H’FFFF” is attached. For example, if the part of IP Header is unsupported, “H’FFFF” is set to both field of IPv4 Header and TCP/UDP/ICMP. The case of IPv6, IPv4 Header field is always set to “H’FFFF”. And the set value of TCP/UDP/ICMP field depends on configuration for support conditions.

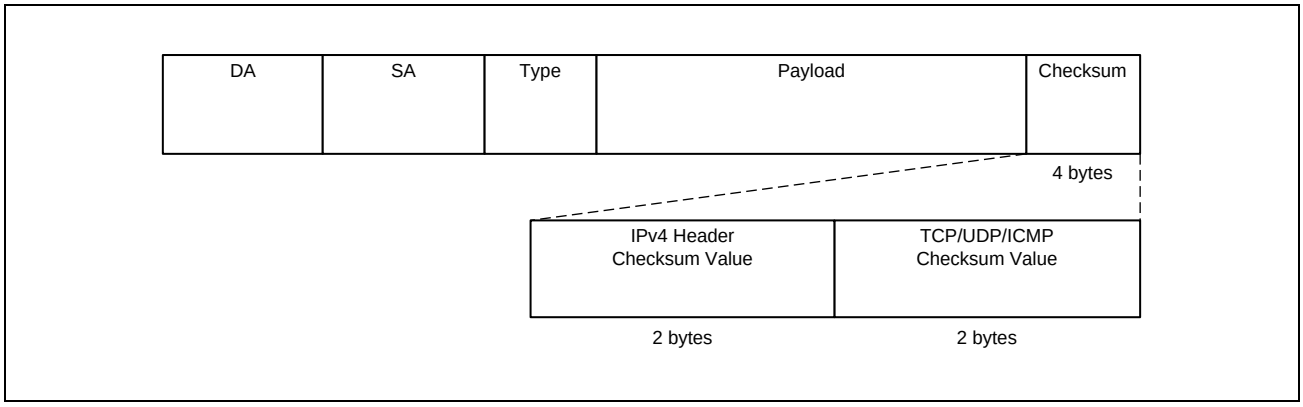

Figure 30.25 The field of checksum attaching field (Ex. Ethernet Frame of DIX)

(2) Transmission Handling

The result of Checksum Calculation is set to the Checksum field of each IPv4 Header/TCP/UDP/ICPM. For the Unsupported Frames, those fields are not changed. If a transmission frame is an UDP frame of IPv4 and its Checksum value in the UDP Header field is “H’0000”, TOE does not calculate Checksum for UDP part of this frame. Because Checksum for IPv4 UDP frame is defined as optional function in standards. If a transmission IPv4 UDP frame does not need to Checksum Value, set “H’0000” to the Checksum field in the UDP Header.

#### 30.5.6.2 Error Notification

When TOE detects any errors by Checksum Calculation, the error information is notified to DMAC. The errors are detected by TOE are followings:

- Unsupported Transmission Frame Error (This error information is indicated to “MFA” register)
- Unsupported Reception Frame Error (This error information is stored to Descriptor by Write Back)
- Reception Frame has Checksum Error (This error information is stored to Descriptor by Write Back)

#### 30.5.6.3 Individually Configuration by the frame type

The Enable/Disable setting of Checksum Calculation is configurable by CSR1 and CSR2 register. And CSR1 and CSR2 register are able to configure Enable/Disable setting individually for frame type. For example, it is possible to disable the checksum calculation for only UDP part of IPv4 frame.

The relationship between the Frame Type and Error Notification to DMAC are indicated at **Table 30.16** and **Table 30.17**. **Table 30.16** is for Transmission Frames. **Table 30.17** is for Reception Frames. The condition of both tables is that the checksum calculation for all frame type is enabled by CSR1 and CSR2 register.

If the checksum calculation of each Frame Type is configured as Disable individually by CSR1 and CSR2 register, the operation is followings. (Following descriptions are for the normal frames)

(1) Disabled Transmission Checksum Calculation

TOE notifies an Unsupported Transmission Frame Error to DMAC. And the Checksum Values which Type is configured as “Disable” are not changed.

(2) Disabled Reception Checksum Calculation

The frames which have Disabled configuration Types are handled as Unsupported Frame. So, the error notification to DAMC is same as the case of Unsupported Frames.

If the other checksum field which is configured as Enable has Checksum Error, Received Checksum Error is notified to DMAC. Received Unsupported Error also is notified. The value of “H’FFFF” is set to the checksum field which is configured as Disable.

Table 30.16 Relationship between Transmission Frame Type and Error Notification to DMAC

| Transmission Frame Type | | | | | | Checksum Operation | | |
|---|---|---|---|---|---|---|---|---|
| VLAN-tag | | IP | | Transport protocol | | Error Notification to DMAC | Checksum Value | |
| Number of tags | TPID | Protocol | Condition | Protocol | Condition | Unsupported Frame Error | IPv4 Header | TCP/UDP/ICMP |
| 0 or 1 | Nothing or H'8100 | IPv4 | Not Fragmented Packet | TCP/ICMP | — | Non-Asserted | Calculated Value | Calculated Value |
| | | | | UDP | Checksum Field is not H'0000 | Non-Asserted | Calculated Value | Calculated Value |
| | | | | | Checksum Field is H'0000 | Non-Asserted | Calculated Value | Through (H'0000) |
| | | | | Except TCP/ICMP/UDP | — | Asserted | Calculated Value | — |
| | | | Fragmented Packet | don't care | don't care | Asserted | Calculated Value | — |
| | | IPv6 | Non-Extended Header or The number of Supported Extended Header is from 1 to 8*1 | TCP/ICMP | — | Non-Asserted | — | Calculated Value |
| | | | | UDP | — | Non-Asserted | — | Calculated Value |
| | | | | Except TCP/ICMP/UDP | — | Asserted | — | — |
| | | | The number of Supported Extended Header is 9 or more*1 | don't care | don't care | Asserted | — | — |
| | | | Has Unsupported Extended Header*1 | don't care | don't care | Asserted | — | — |
| | | Except IPv4/IPv6 | — | don't care | don't care | Asserted | — | — |
| 1 | Except H'8100 | don't care | don't care | don't care | don't care | Asserted | — | — |
| 2 or more | don't care | don't care | don't care | don't care | don't care | Asserted | — | — |
| Illegal Frames*2 | | | | | | Asserted | — | — |

Note 1. See the **Section 30.5.6.4** for about the Supported Extended Headers.

Note 2. The Frame Length is shorter than the result of Frame Analysis by TOE.

Table 30.17 Relationship between Reception Frame Type and Error Notification to DMAC

| Reception Frame Type | | | | | | Field of Checksum Error | Checksum Operation | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| VLAN-tag | | IP | | Transport protocol | | | Error Notification to DMAC | | Checksum Value | |
| Number of tags | TPID | Protocol | Condition | Protocol | Condition | | Checksum Error | Unsupported Frame Error | IPv4 Header | TCP/ UDP/ ICMP |
| 0 or 1 | Nothing or H'8100 | IPv4 | Not Fragmented Packet | TCP/ICMP | — | Non-Error | Non-Asserted | Non-Asserted | H'0000 | H'0000 |
| | | | | | — | IPv4 Header | Asserted | Non-Asserted | Calculated Value | H'0000 |
| | | | | | — | TCP/ICMP | Asserted | Non-Asserted | H'0000 | Calculated Value |
| | | | | | — | IPv4 Header and TCP/ICMP | Asserted | Non-Asserted | Calculated Value | Calculated Value |
| | | | | UDP | Checksum Field is not H'0000 | Non-Error | Non-Asserted | Non-Asserted | H'0000 | H'0000 |
| | | | | | | IPv4 Header | Asserted | Non-Asserted | Calculated Value | H'0000 |
| | | | | | | UDP | Asserted | Non-Asserted | H'0000 | Calculated Value |
| | | | | | | IPv4 Header and UDP | Asserted | Non-Asserted | Calculated Value | Calculated Value |
| | | | | | Checksum Field is H'0000 | Non-Error | Non-Asserted | Non-Asserted | H'0000 | H'FFFF |
| | | | | | | IPv4 Header | Asserted | Non-Asserted | Calculated Value | H'FFFF |
| | | | | Except TCP/ ICMP/ UDP | — | Non-Error | Non-Asserted | Asserted | H'0000 | H'FFFF |
| | | | | | — | IPv4 Header | Asserted | Asserted | Calculated Value | H'FFFF |
| | | | Fragmented Packet | don't care | don't care | Non-Error | Non-Asserted | Asserted | H'0000 | H'FFFF |
| | | | | don't care | don't care | IPv4 Header | Asserted | Asserted | Calculated Value | H'FFFF |
| | | IPv6 | Non-Extended Header or The number of Supported Extended Header is from 1 to 8*1 | TCP/ICMP | — | Non-Error | Non-Asserted | Non-Asserted | H'FFFF | H'0000 |
| | | | | | — | TCP/ICMP | Asserted | Non-Asserted | H'FFFF | Calculated Value |
| | | | | UDP | Checksum Field is not H'0000 | Non-Error | Non-Asserted | Non-Asserted | H'FFFF | H'0000 |
| | | | | | | UDP | Asserted | Non-Asserted | H'FFFF | Calculated Value |
| | | | | | Checksum Field is H'0000 | — | Asserted | Non-Asserted | H'FFFF | H'FFFF |
| | | | | Except TCP/ ICMP/ UDP | — | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |
| | | | The number of Supported Extended Header is 9 or more*1 | don't care | don't care | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |
| | | | Has Unsupported Extended Header*1 | don't care | don't care | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |
| | | Except IPv4/IPv6 | — | don't care | don't care | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |
| 1 | Except H'8100 | don't care | don't care | don't care | don't care | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |
| 2 or more | don't care | don't care | don't care | don't care | don't care | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |
| Illegal Frames*2 | | | | | | — | Non-Asserted | Asserted | H'FFFF | H'FFFF |

Note 1. See the **Section 30.5.6.4** for about the Supported Extended Headers.

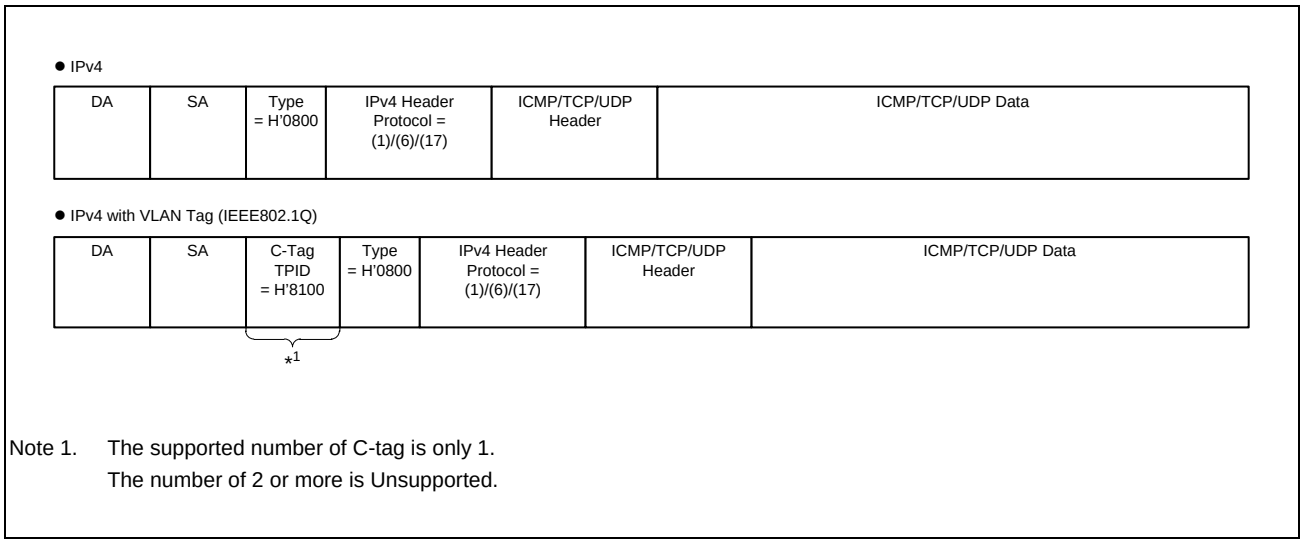
Note 2. The Frame Length is shorter than the result of Frame Analysis by TOE. Or the case of E-MAC detected Errors.

### 30.5.6.4 Supported Frame for Checksum Calculation

Following Frames are example of Supported/Unsupported Frame Formats for Checksum Calculation.

(1) For IPv4 Checksum Calculation

**Figure 30.26** is Supported Frame Format for the Checksum Calculation of IPv4 Header and IPv4 TCP/UDP/ICMP.

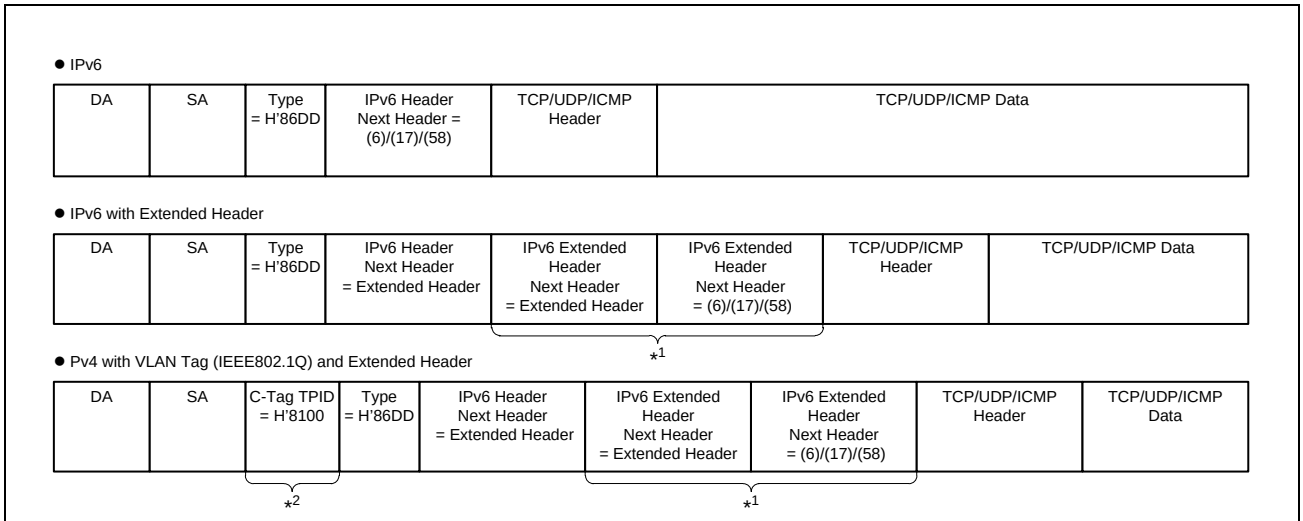


Note 1. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 30.26 Supported Frame Format for IPv4 Checksum Calculation

(2) For IPv6 Checksum Calculation

**Figure 30.27** is Supported Frame Format for the Checksum Calculation of IPv6 TCP/UDP/ICMP.



Note 1. Supported IPv6 Extended Headers (except TCP(6)/UDP(17)/ICMP(58)) are followings.
- Hop-by-Hop Options header (0)
- Routing type 0 Routing header (43)
- Destination Options header (60)
- Authentication header (51)

The Number of Supported Extended Headers is from 1 to 8.
The Number of 9 or more is Unsupported.

Note 2. The supported number of C-tag is only 1. The number of 2 or more is Unsupported.

Figure 30.27 Supported Frame Format for IPv6 Checksum Calculation

(3) Unsupported Frame Format (example)

**Figure 30.28** is an Example Unsupported Frame Format.

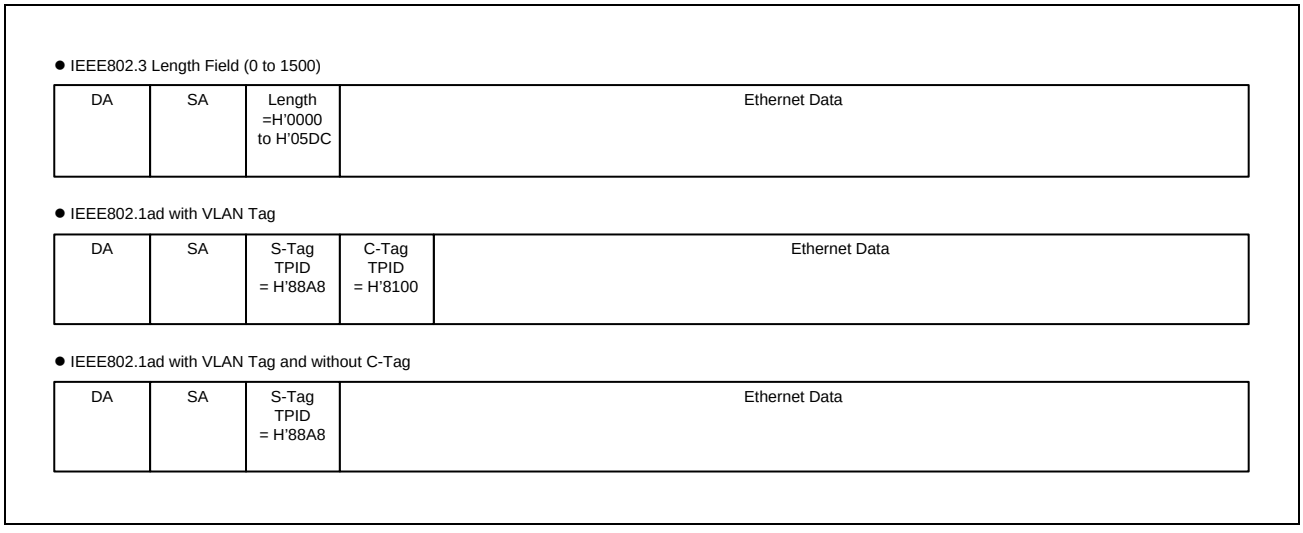


Figure 30.28 Unsupported Frame Format (example)

### 30.5.6.5 Checksum Calculation Flow

**Figure 30.29** and **Figure 30.30** are Flows for Checksum Calculation by TOE.

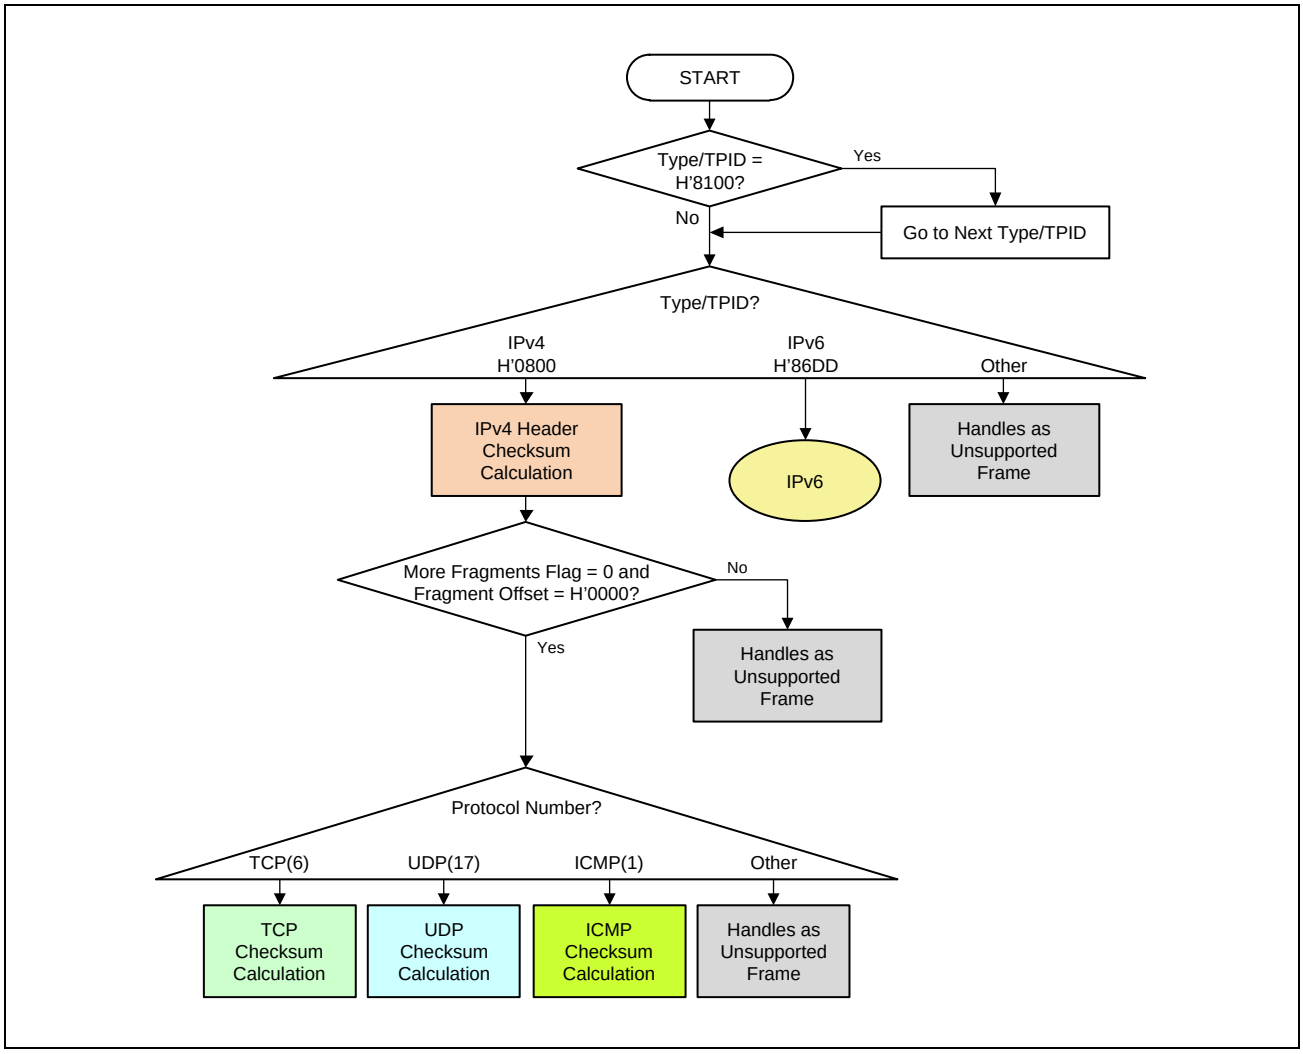

Figure 30.29 Checksum Calculation Flow (Part1)

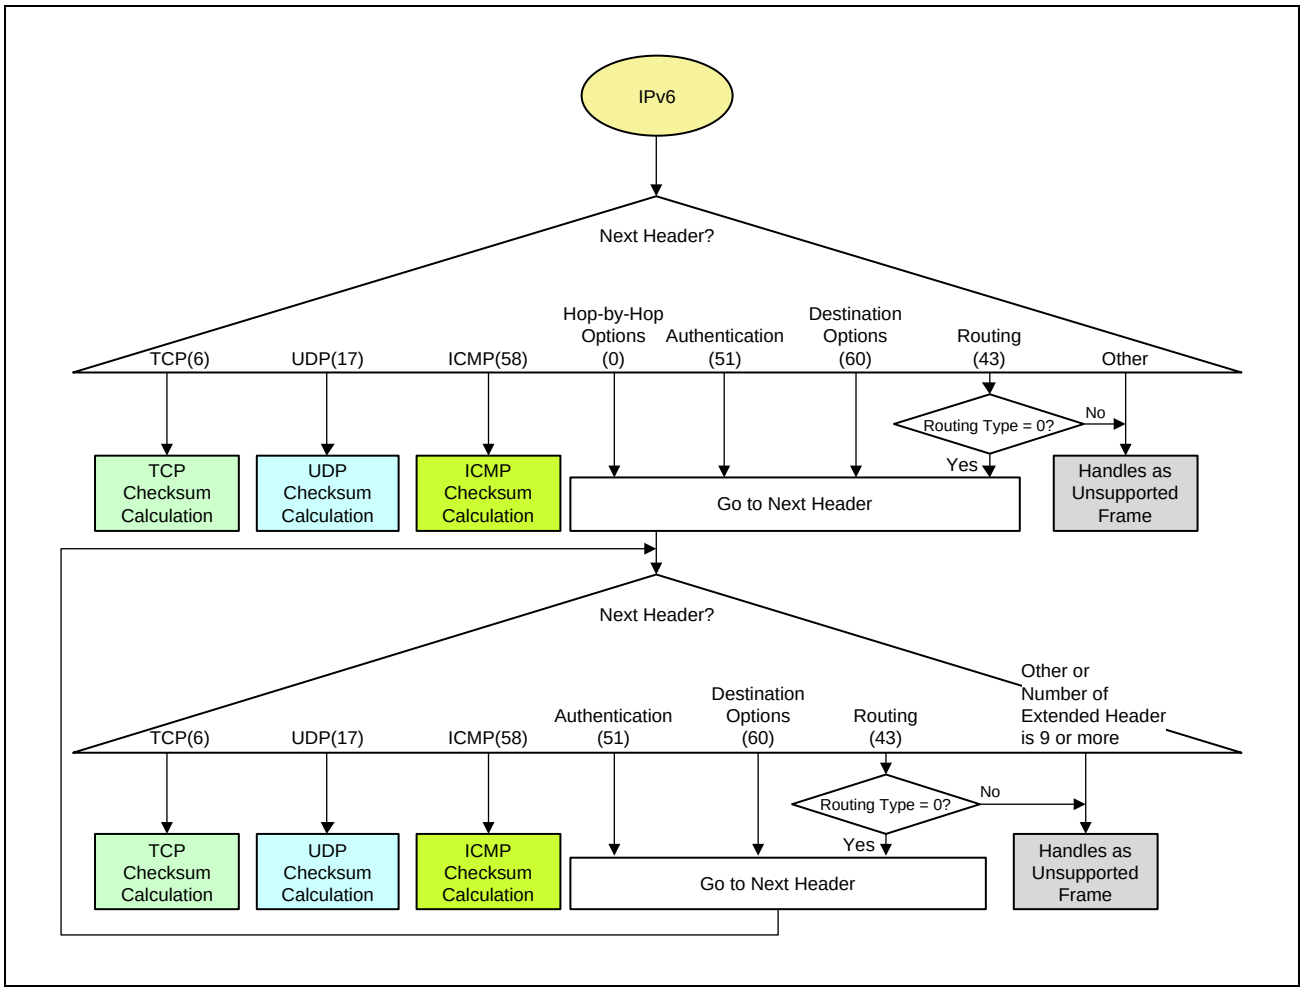

Figure 30.30 Checksum Calculation Flow (Part2)

### 30.5.7 Received Frame Filter

TOE has Received Frame Filters. When TOE received the frame which is not match to filters, TOE discards (abort) that frame. TOE is also able to assert an interrupt if TOE received the frame which is match to filters.

The Possible Configuration of Filter Condition are followings.

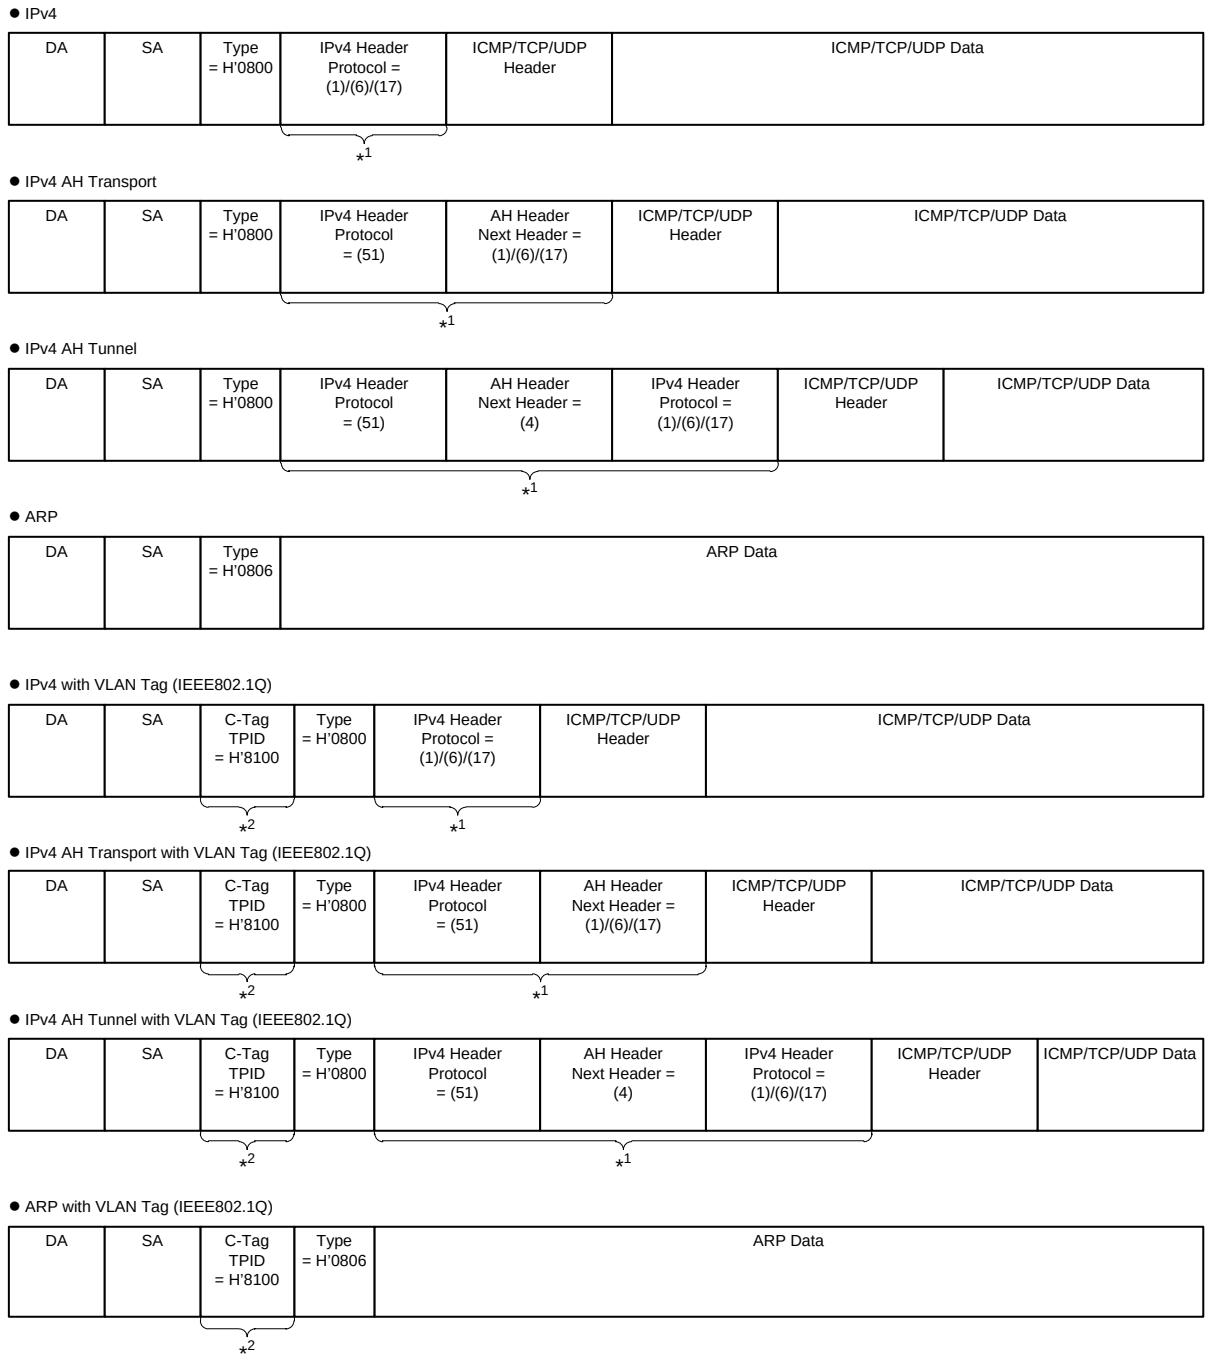
- Ethernet Type
- IP Protocol No.
- UDP destination port No.
- Destination MAC address (Unicast)
- Destination MAC address (Broadcast)
- Destination MAC address (Multicast)
- ARP Request of Local Station
- Neighbor Solicitation of Local Station
- Except IPv6 Next Header (Analyzable)

#### 30.5.7.1 Supported Frame for Received Frame Filter

Followings are Supported /Unsupported Frame Formats by Received Frame Filter.

(1) For IPv4 Frame Filter

**Figure 30.31** is Supported Frame format of IPv4.



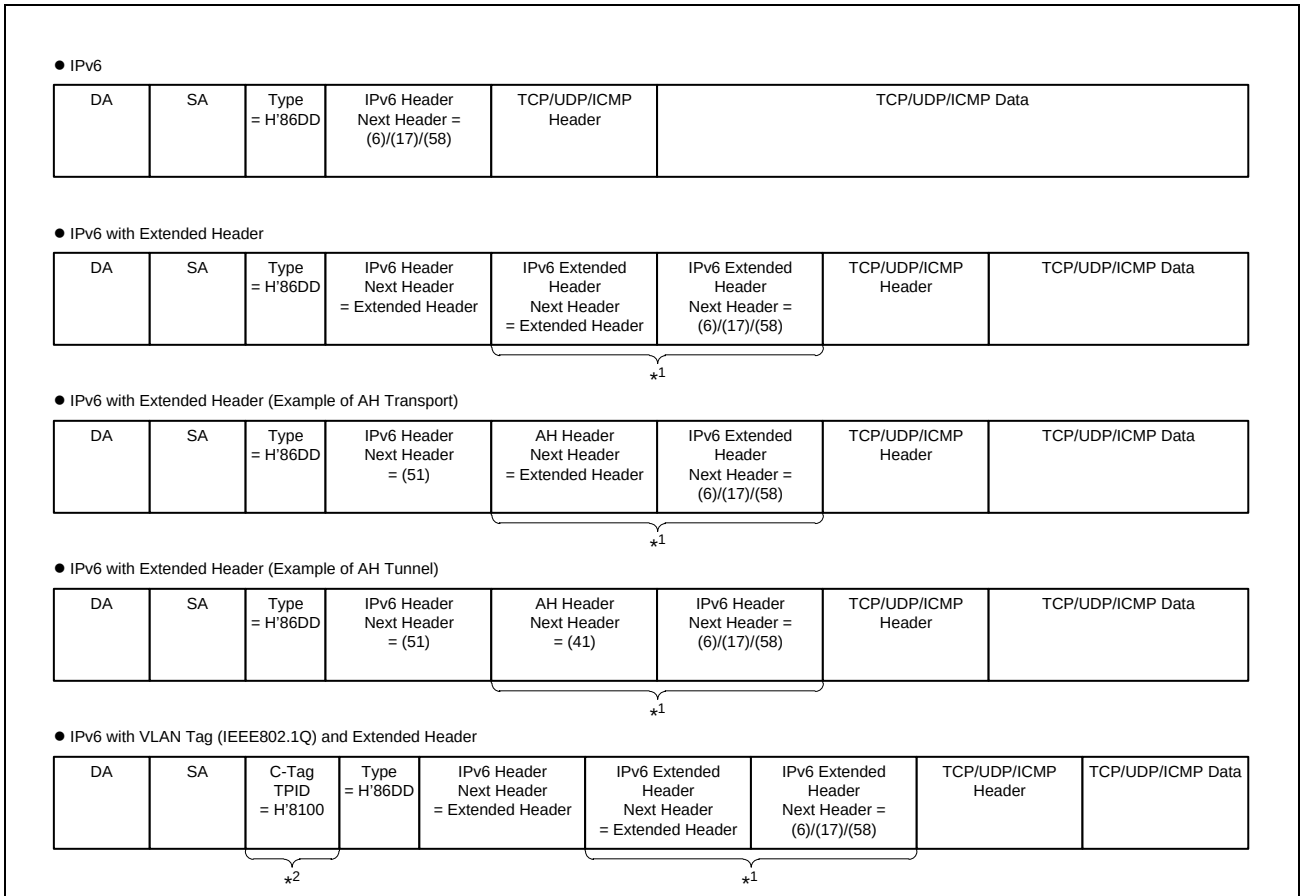
Note 1. Frame analysis is stopped if the Protocol No. is not ICMP (1), IPinIP (4), TCP (6),UDP(17) or AH(51)

Note 2. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 30.31 Supported Frame of IPv4

(2) For IPv6 Frame Filter

**Figure 30.32** is Supported Frame format of IPv6.



Note 1. Supported Extended Header (except TCP(6),UDP(17) and ICMP(58) are followings.
- Hop-by-Hop Options header (0)
- IPv6(41)
- Routing type 0 Routing header (43)
- Flag (44)
- Authentication header (51)
- Destination Options header (60)

Others are Unsupported and Frame analysis is stopped.

Note 2. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 30.32 Supported Frame Format of IPv6

(3) Unsupported Frame Format (Example)

**Figure 30.33** is Example Unsupported Frame Format.

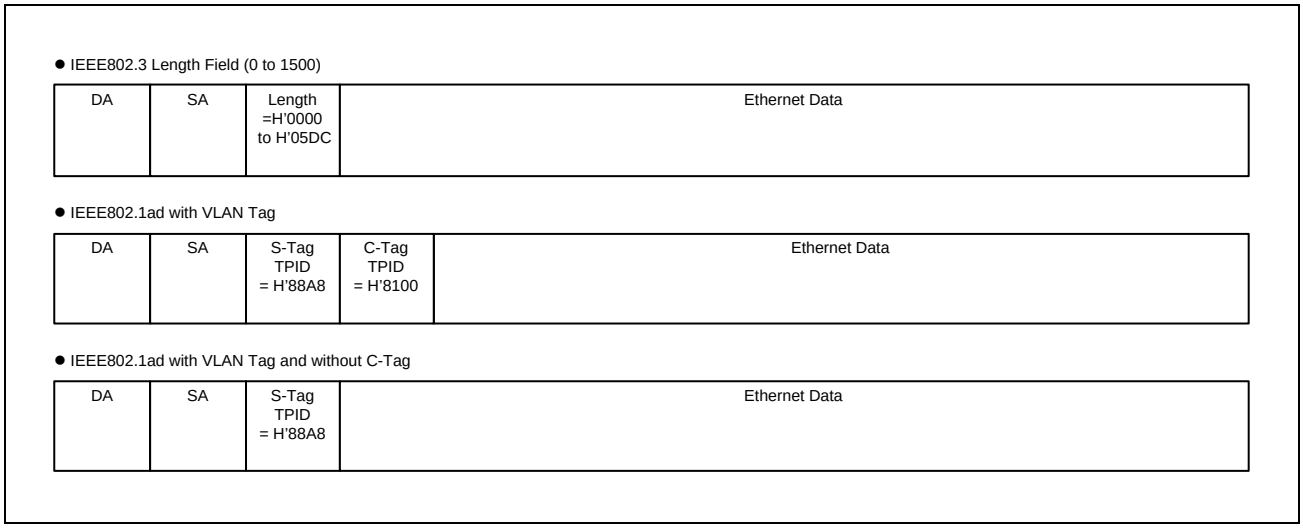


Figure 30.33 Example Unsupported Frame Format

### 30.5.7.2 Received Frame Filtering Flow

**Figure 30.34** to **Figure 30.40** are Received Frame Filtering Flows.

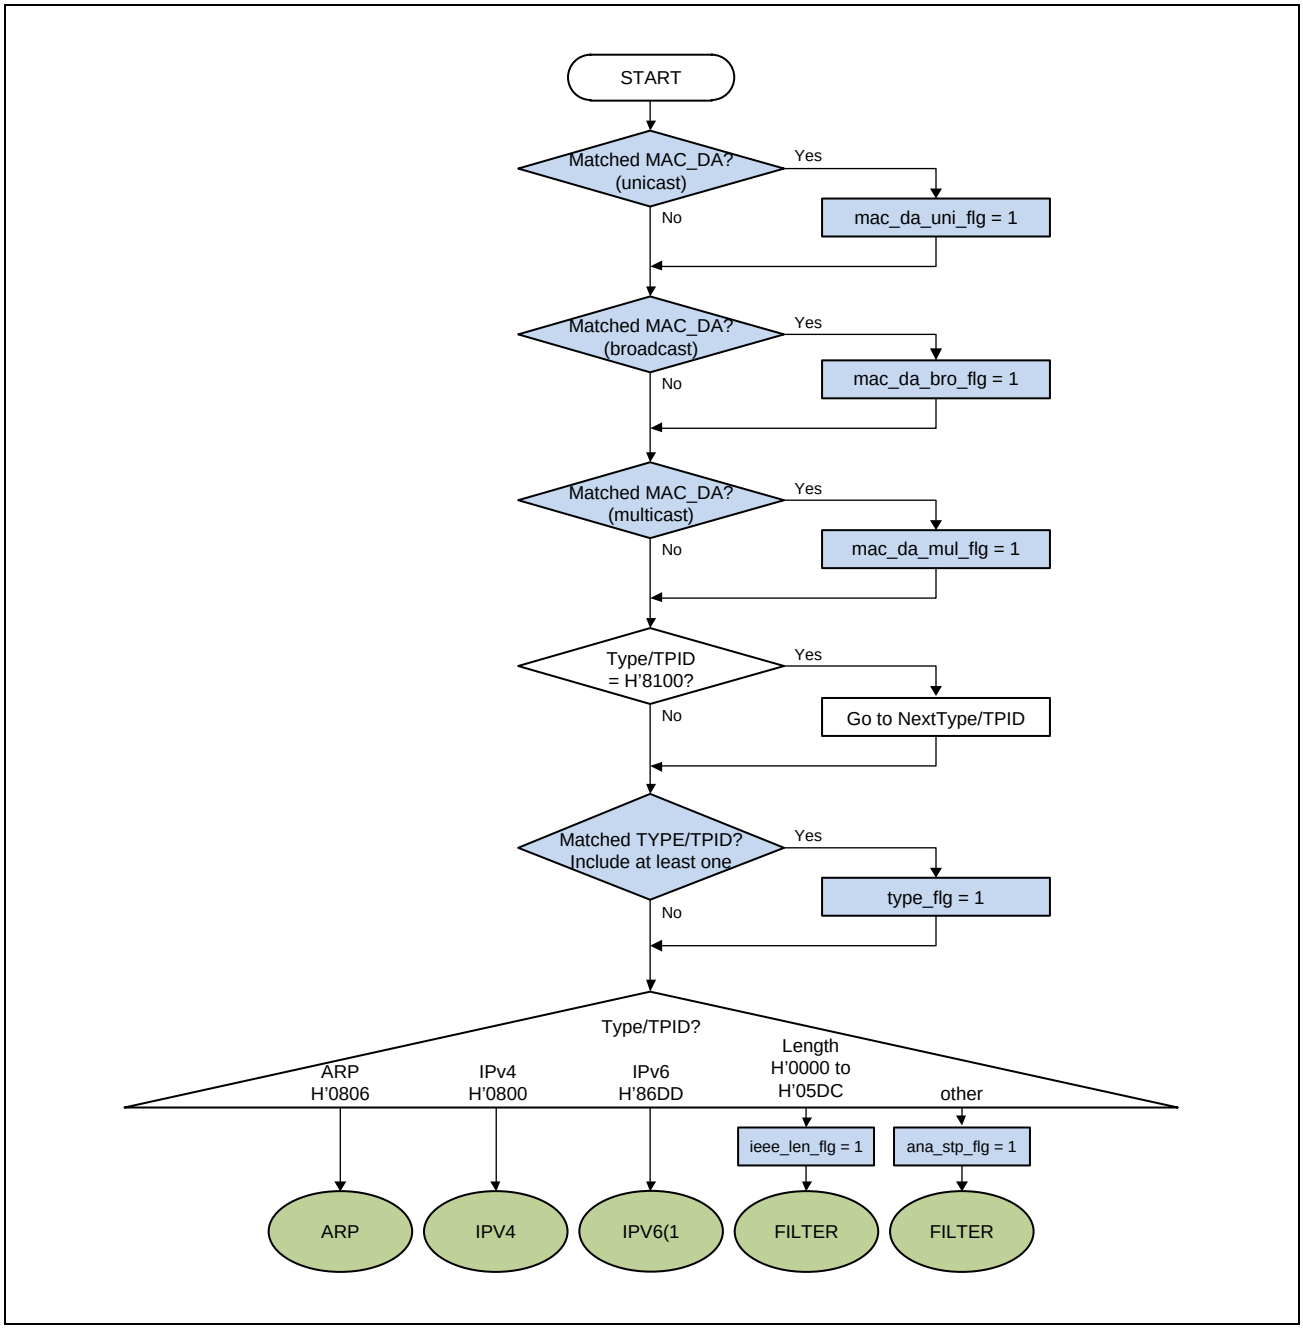

Figure 30.34 Received Frame Filtering Flow (Part1)

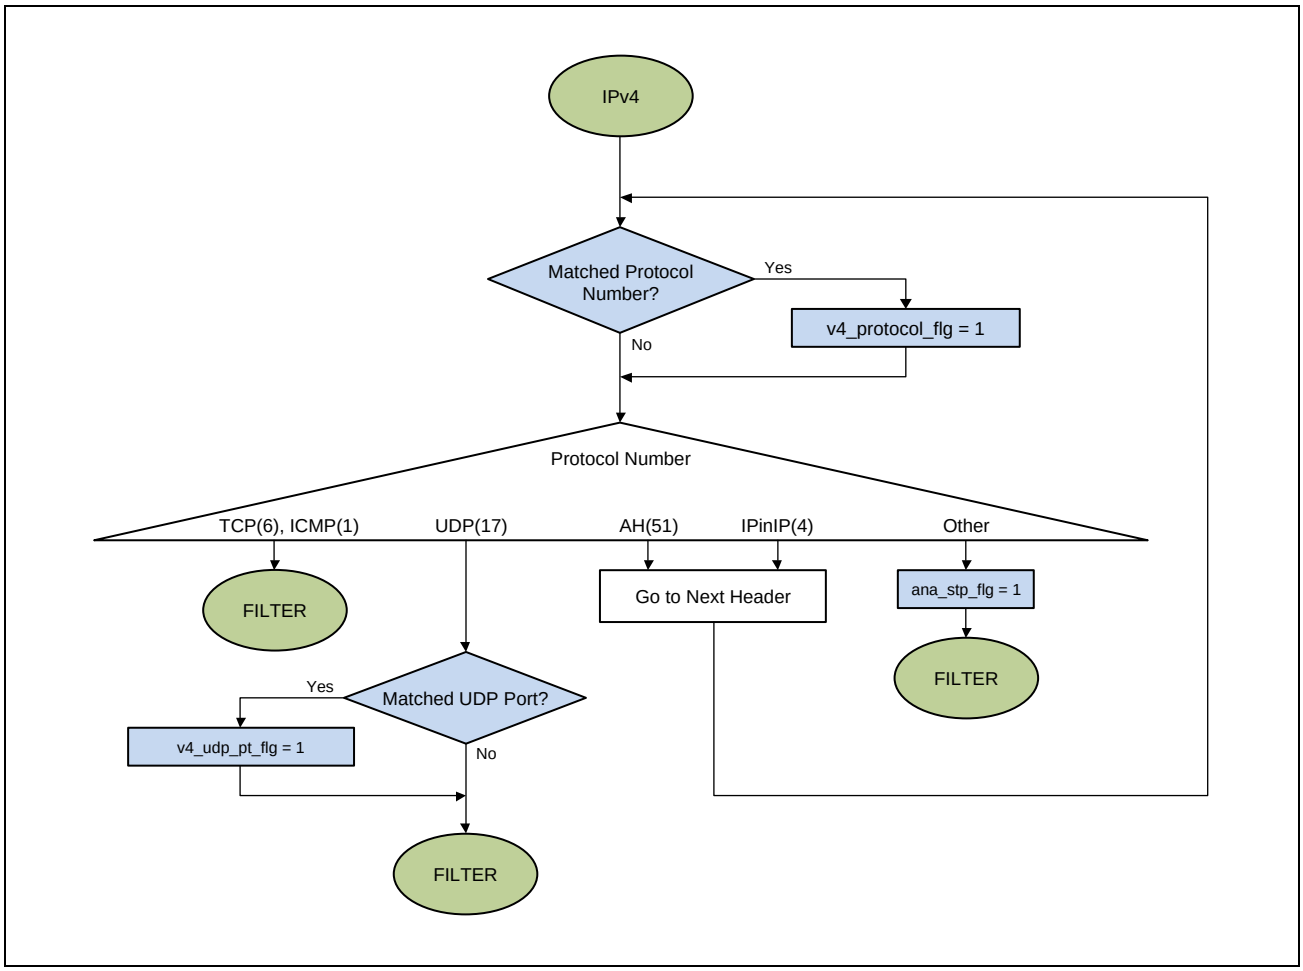

Figure 30.35 Received Frame Filtering Flow (Part2)

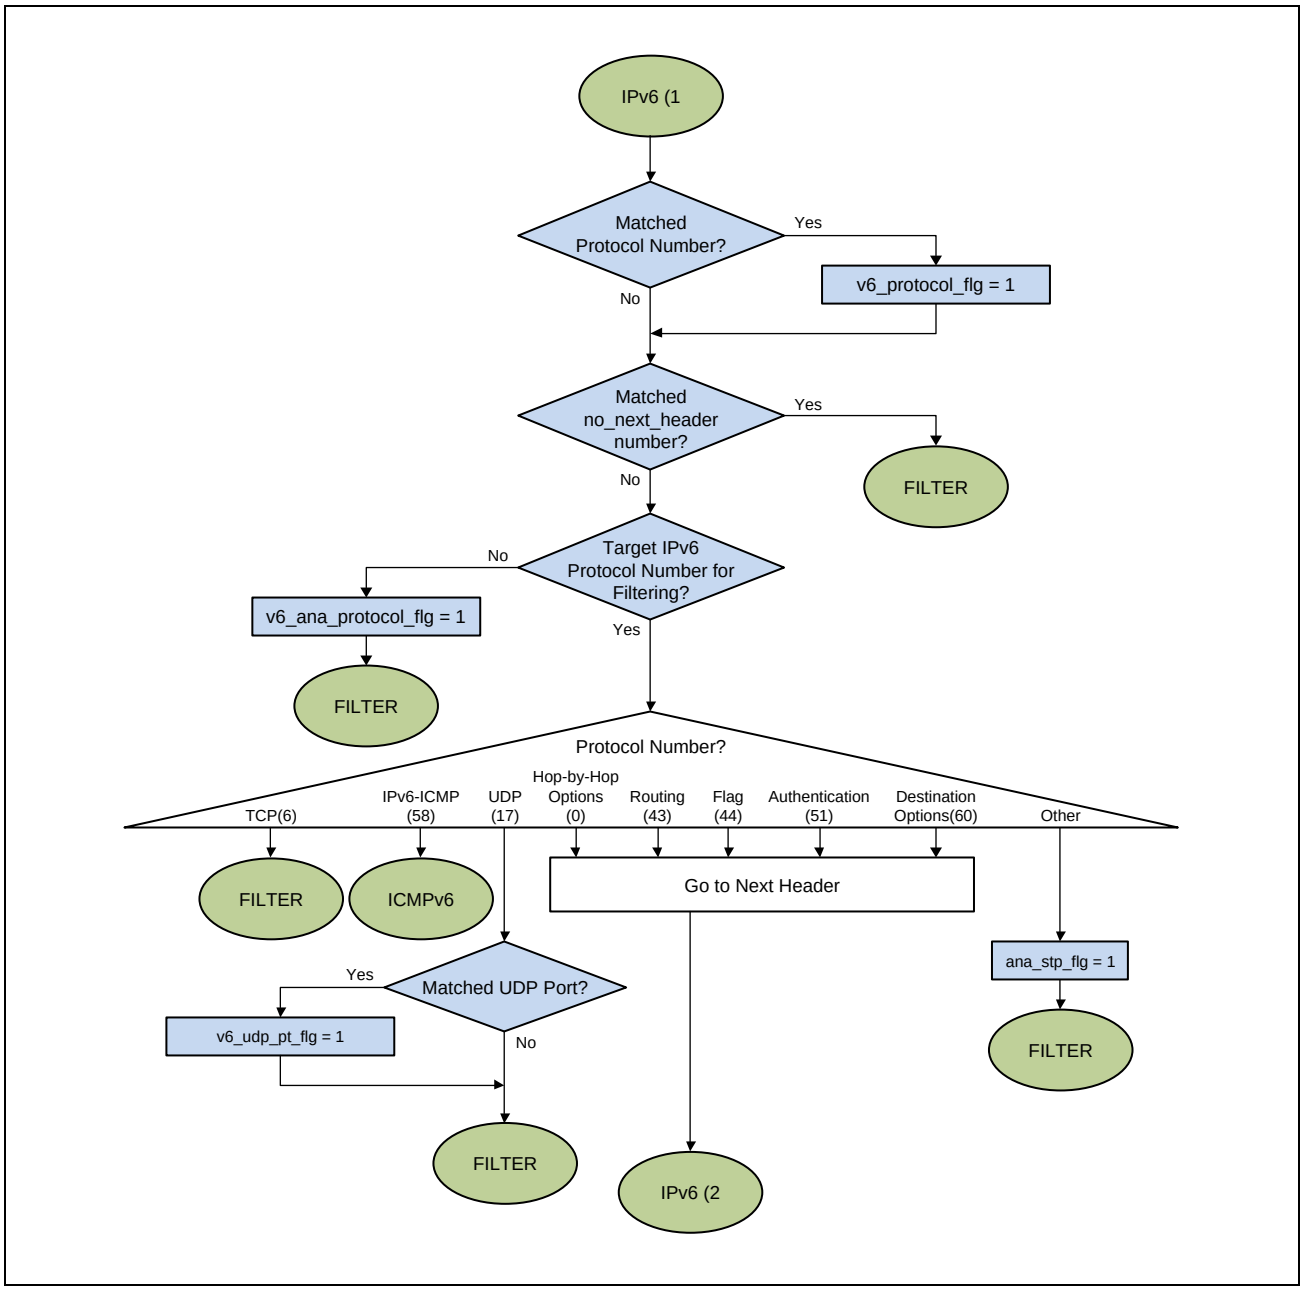

Figure 30.36 Received Frame Filtering Flow (Part3)

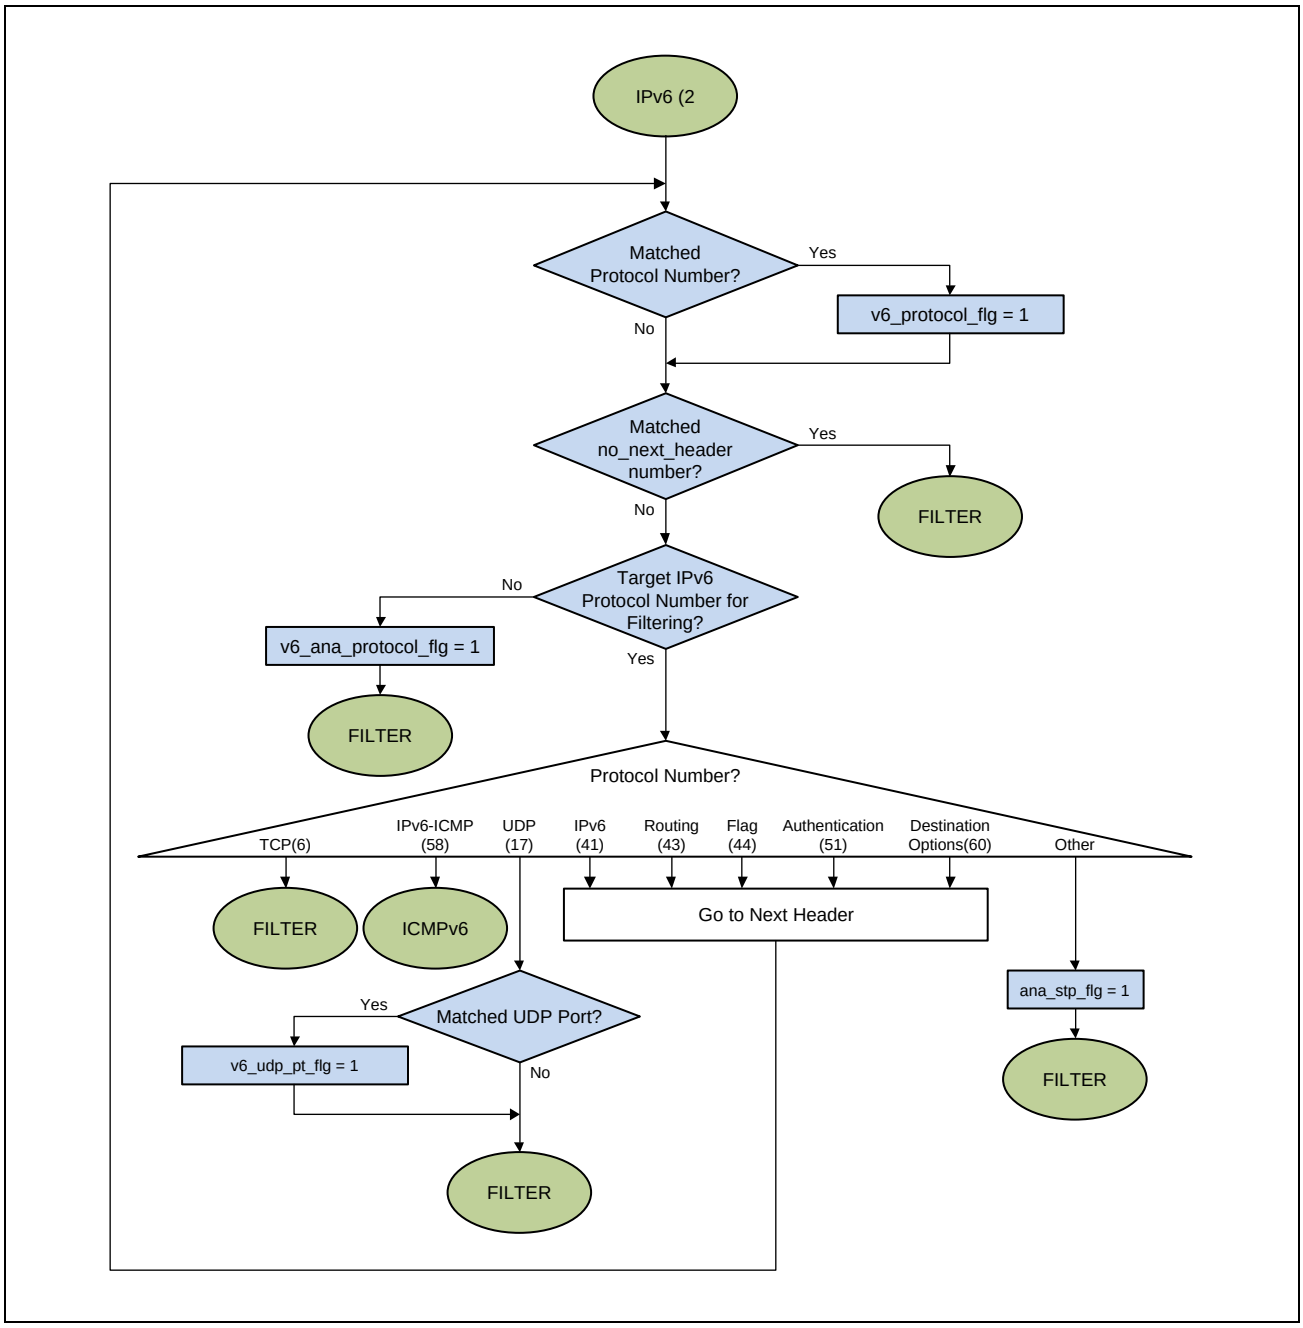

Figure 30.37 Received Frame Filtering Flow (Part4)

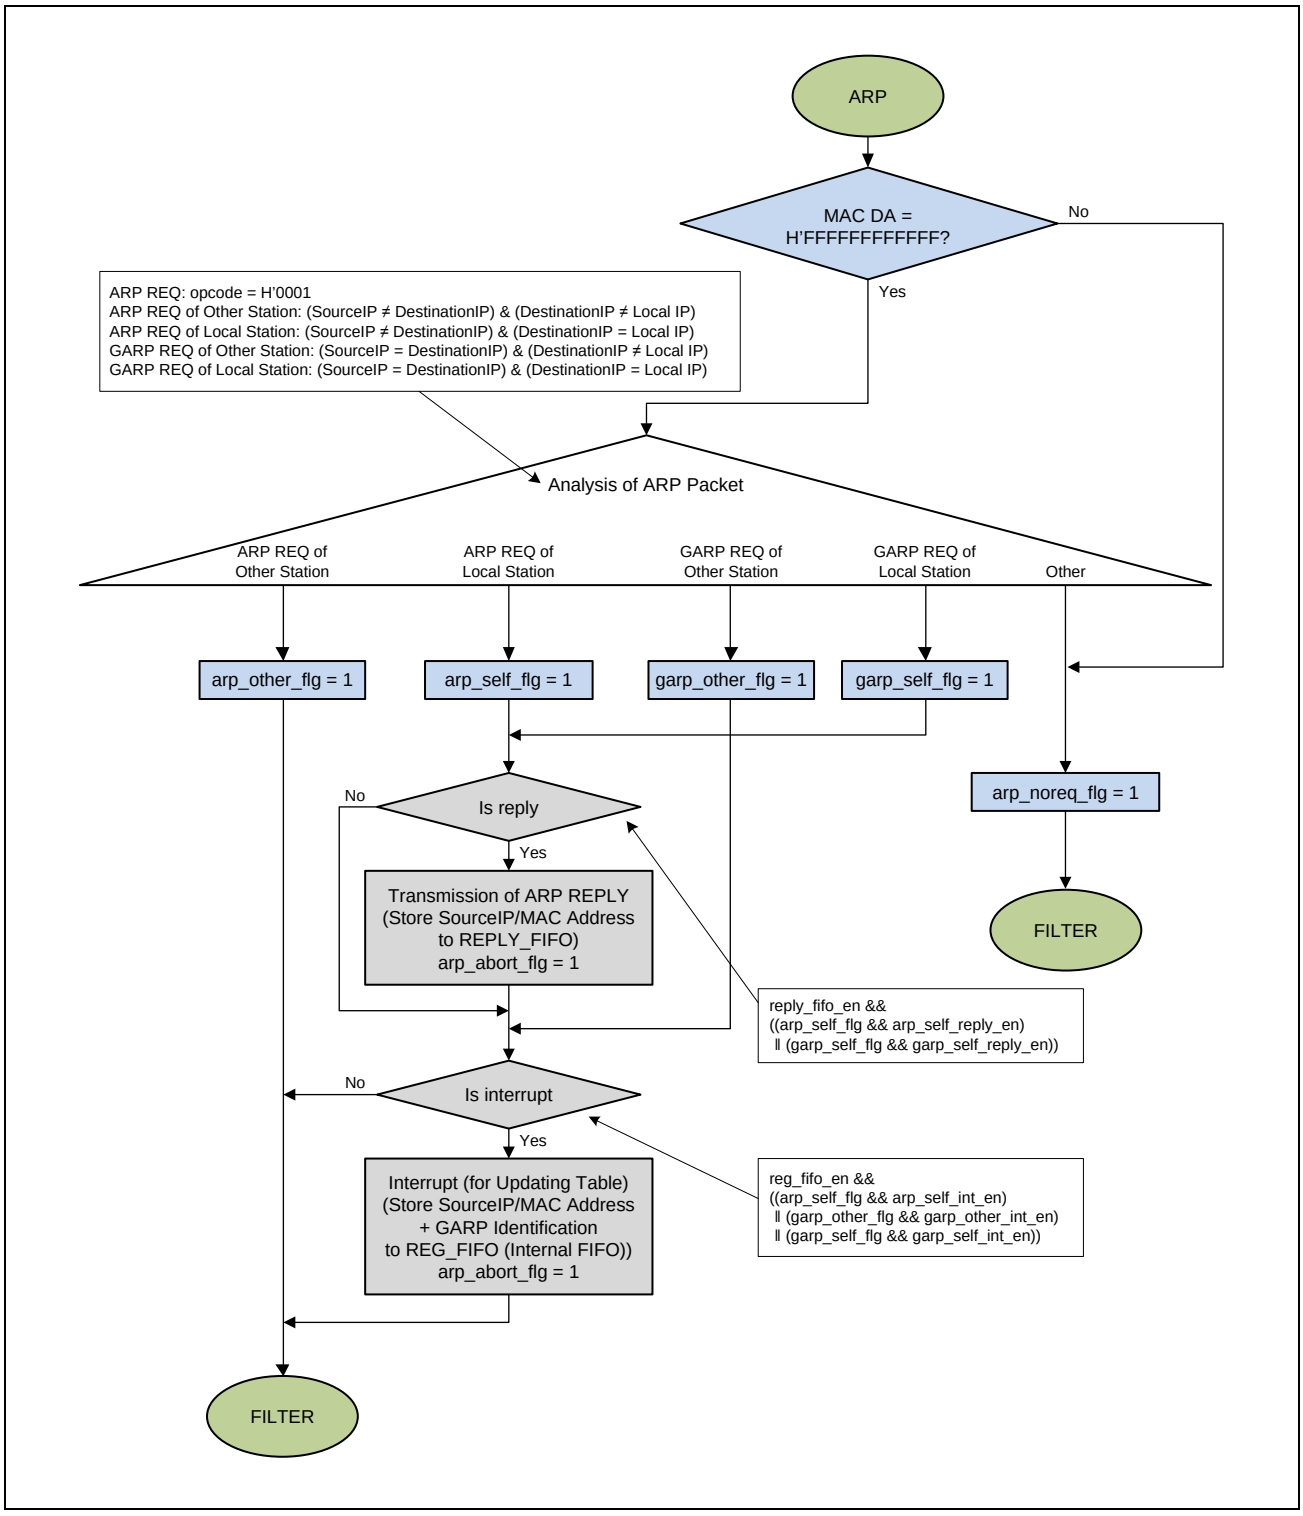

Figure 30.38 Received Frame Filtering Flow (Part5)

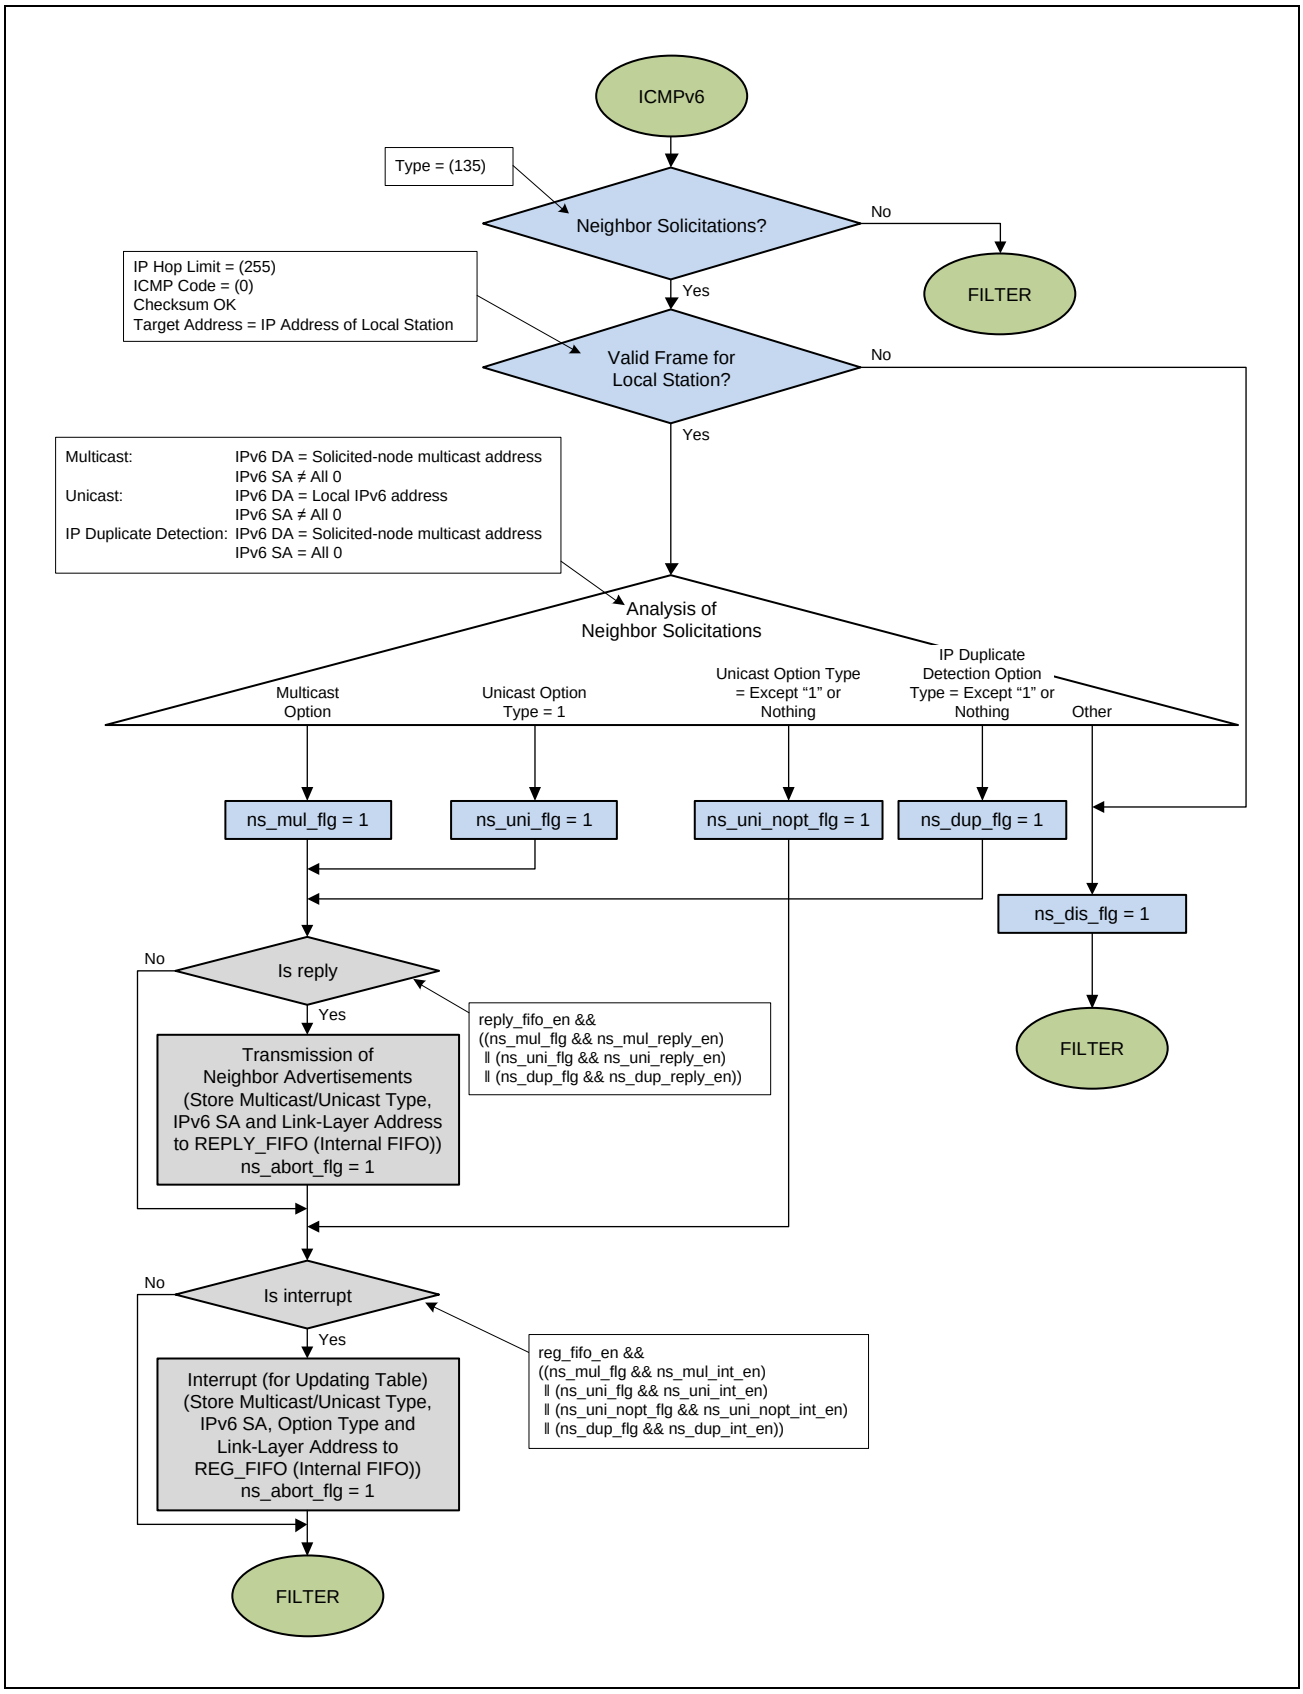

Figure 30.39 Received Frame Filtering Flow (Part6)

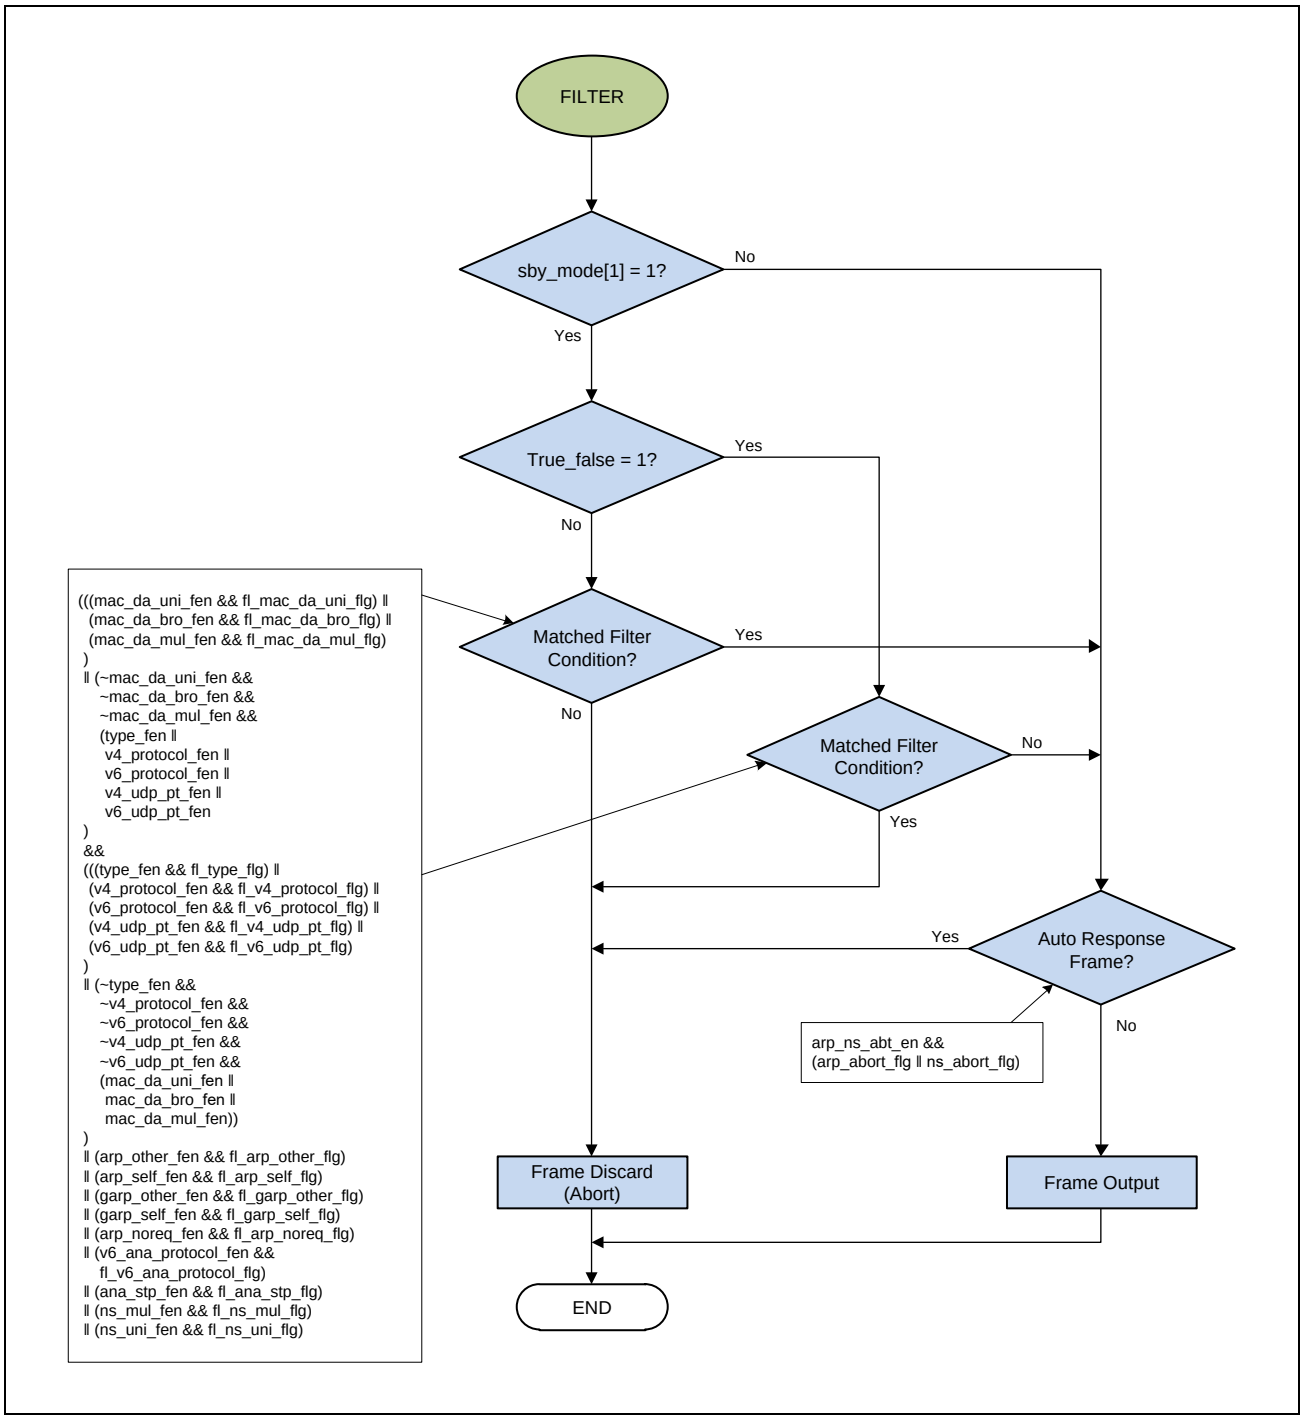

Figure 30.40 Received Frame Filtering Flow (Part7)

#### 30.5.7.3 Filtering and Interrupts

**Figure 30.41** is an overview for the function of Filtering and Interrupt.

TOE has flags for each filter conditions. When they match filter configurations of CSFR1*, each flag is set.

CSFR00 controls the action (discard or transmit) for the frames which are configured that Filtering is Enable. The filter condition relationship between “Match/Unmatch” and “Discard/Transmit” is configured by CSFR00.true_false.

The Enable/Disable configuration for discarding frame is controllable in a lump by CSFR00.sby_mode [1:0].

The flag status of each filter’s conditions is indicated to CSFR20 and outputted as interrupt. And the mask control for each interrupt is configured by CSFR21.

TOE has flags of each filter’s conditions for Filtering and Interrupt. The set condition of flags for each function is same. But clear condition is different. (The flags for Filtering are cleared at the top of frame. The flags for Interrupt are cleared by write access to the interrupt status registers.) And TOE also has Interrupt Flag which indicates the Received Frame was transmitted from TOE to DMAC without discarding by filtering conditions.

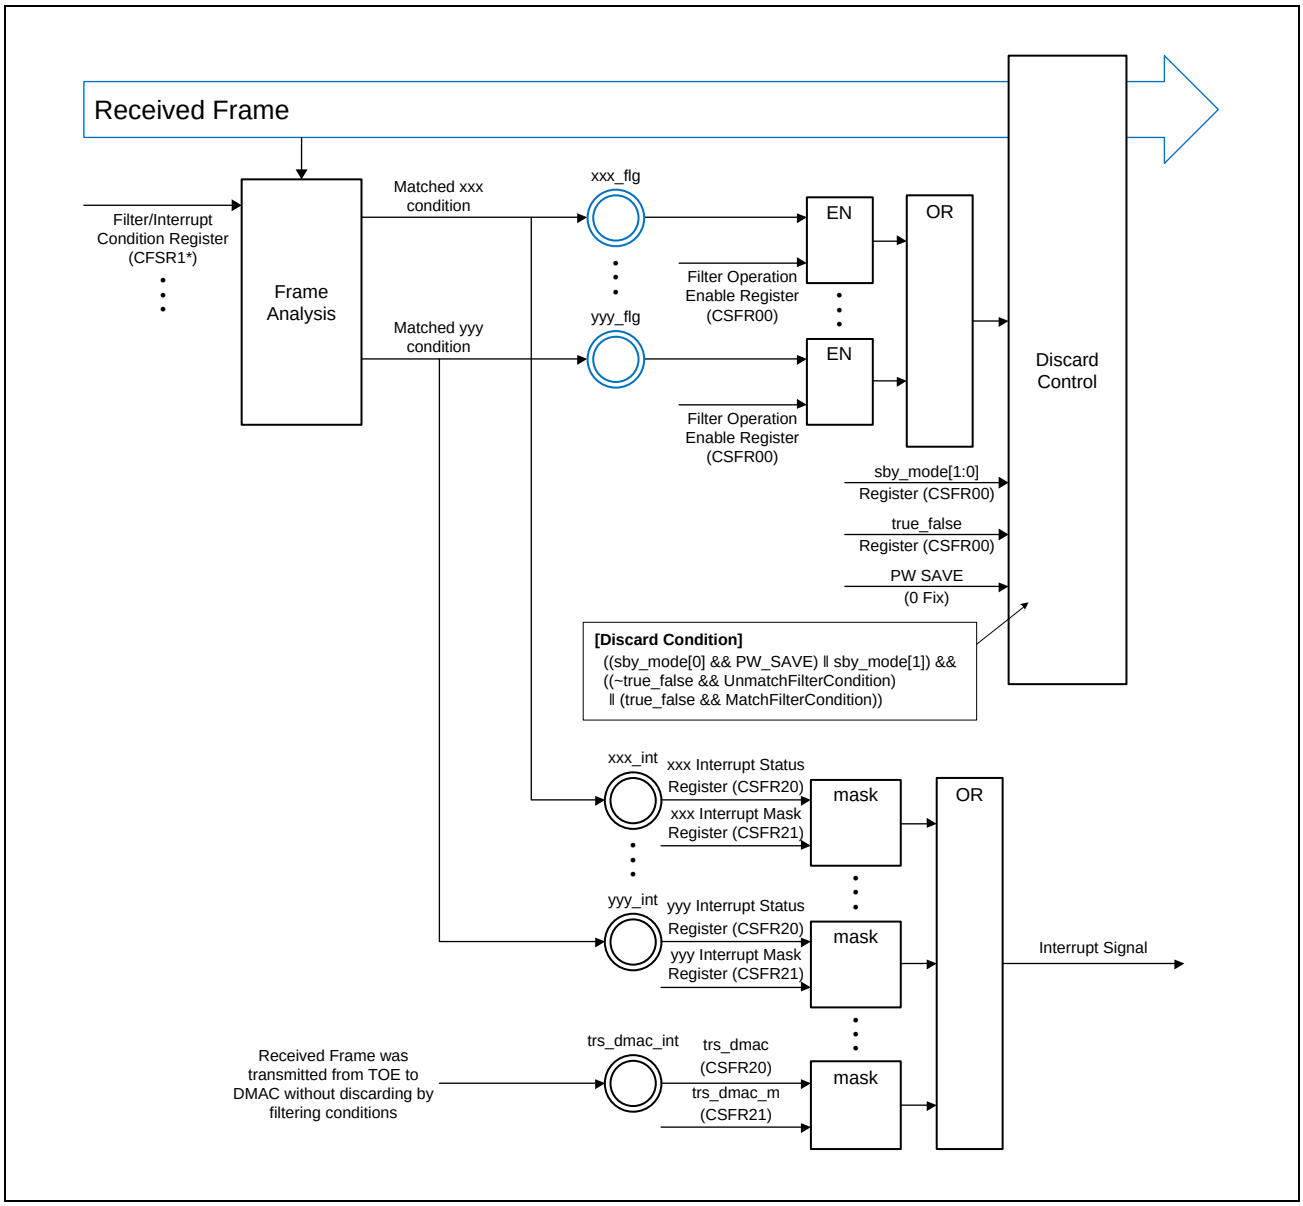

Figure 30.41 Overview of Filtering and Interrupt

### 30.5.8 Auto Response

TOE has following automatic responding functions.

- When TOE received ARP request for Local Station, it transmits ARP reply automatically.
- When TOE received Neighbor Solicitation for Local Station, it transmits Neighbor Advertisement automatically.

TOE also has following interrupt functions for updating ARP Table/Cache or responding function by software.

- When TOE received ARP request for Local Station, it asserts interrupt and indicates packet's information to registers. (CSFR4*)
- When TOE received Neighbor Solicitation for Local Station, it asserts interrupt and indicates packet's information to registers. (CSFR4*)

#### 30.5.8.1 Auto Response Function for ARP REQ

**Table 30.18** is operations for ARP request. See **Figure 30.38** for about the Frame Analysis Flow of ARP REQ.

Table 30.18 Operation after Received ARP REQ

| | General Operation | | TOE Operation | | |
|---|---|---|---|---|---|
| ARP REQ | Transmit ARP REPLY | Update Table | REPLY FIFO | REG FIFO | Remarks Column |
| ARP for Other Station (SourceIP ≠ DestinationIP) | × | × | × | × | ARP REQ for Other Station |
| ARP for Local Station (SourceIP ≠ DestinationIP) | ✓ | ✓ | ✓ | ✓ | Operation of ARP for Local Station |
| GARP for Other Station (SourceIP = DestinationIP) | × | ✓ | × | ✓ | Request of updating ARP Table |
| GARP for Local Station (SourceIP = DestinationIP) | ✓ | × | ✓ | × | Response for IP Duplicate Detection |

GARP:

REQ which Source IP Address and Destination IP Address are same.

REPLY FIFO:

It stores SourceIP/MAC Address to FIFO and transmits ARP REPLY by Hardware.
The information in this FIFO is cleared after TOE sends ARP REPLY.

REG FIFO:

It stores SourceIP/MAC Address + GARP identification to FIFO and asserts interrupt.
Software is expected to check registers (CSFR4*) and update ARP Table.
The information in this FIFO is cleared by writing "1" to CSRF40.arp_ns. At that time if this FIFO has next information, CSRF40.arp_ns is asserted again and CSFR4* are updated to next information.

Storing to REPLY FIFO and REG FIFO is controlled by followings.

Use followings for Enable/Disable Configuration in a lump.

CSFR00.reply_fifo_en
.reg_fifo_en

Use followings for Enable/Disable Configuration of individually

CSFR30.arp_self_reply_en
.garp_self_reply_en
.arp_self_int_en
.garp_other_int_en
.garp_self_int_en

When CSFR00.arp_ns_abt_en = “1”, the ARP frame which was stored to REPLY FIFO or REG FIFO is not transferred to DMAC. It is discarded (aborted).

REPLY FIFO and REG FIFO is used as shared FIFO for the function of “Auto Response for Neighbor Solicitation” which is indicated in the chapter of 4.8.2. And the FIFO capacity is for 8 frames.

If TOE received ARP REQ when FIFO was full, its information is not stored to FIFO and the interrupt is asserted to notify the status of by reg_fifo_full or reply_fifo_full. If one-FIFO is already full and TOE receives ARP REQ which is stored to both FIFO, its information is not stored to both FIFO.

Table 30.19 Operation after Received Neighbor Solicitation

| | General Operation | | TOE Operation | | |
|---|---|---|---|---|---|
| Neighbor Solicitations | Transmit Neighbor Advertisements | Update Cache | REPLY FIFO | REG FIFO | Remarks Column |
| Multicast for Local Station<br>Option Type = 1<br>(SourceIP ≠ All 0) | ✓ | ✓ | ✓ | ✓ | — |
| Unicast for Local Station<br>Option Type = 1<br>(SourceIP ≠ All 0) | ✓ | ✓ | ✓ | ✓ | — |
| Unicast for Local Station<br>Option Type ≠ 1 or Nothing<br>(SourceIP ≠ All 0) | ✓ | × | × | ✓ | Transmission of Neighbor Advertisements is executed by software via REG_FIFO. |
| IP Duplicate Detection for Local Station<br>Option Type ≠ 1 or Nothing<br>(SourceIP = All 0) | ✓ | × | ✓ | × | Response for IP Duplicate Detection |
| Other | × | × | × | × | Invalid |

REPLY FIFO:

It stores SourceIP/MAC Address + multicast/unicast identification to FIFO and transmits Neighbor Advertisements by Hardware.

The information in this FIFO is cleared after TOE sends Neighbor Advertisements.

REG FIFO:

It stores SourceIP/MAC Address + multicast/unicast identification + OptionType to FIFO and asserts interrupt to CPU. Software is expected handling followings by interrupt status (CSFR4*).

- Updating cache.
- In the case of Unicast for Local Station(Option Type ≠ 1 or Nothing), transmits Neighbor Advertisements after checking Source MAC Address by referencing cache or Neighbor search.

The information in this FIFO is cleared by writing “1” to CSRF40.arp_ns. At that time, if this FIFO has next information, CSRF40.arp_ns is asserted again and CSFR4* are updated to next information.

TOE does not support anycast address. If anycast address is set to CSFR02_i register, TOE behaves same action the case of received unicast address. But the Random Delay Function for responding Neighbor Advertisement which is be defined in RFC2461 is not supported.

Storing to REPLY FIFO and REG FIFO is controlled by followings.

Use followings for Enable/Disable Configuration in a lump.

CSFR00.reply_fifo_en

.reg_fifo_en

Use followings for Enable/Disable Configuration of individually

CSFR30.ns_mul_reply_en

.ns_uni_reply_en

.ns_dup_reply_en

.ns_mul_int_en

.ns_uni_int_en

.ns_uni_nopt_int_en

.ns_dup_int_en

When CSFR00.arp_ns_abt_en = “1”, the Neighbor Solicitation frame which was stored to REPLY FIFO or REG FIFO is not transferred to DMAC. It is discarded (aborted).

REPLY FIFO and REG FIFO is used as shared FIFO for the function of “Auto Response for ARP REQ” which is indicated in the chapter of 4.8.1. And the FIFO capacity is for 8 frames.

If TOE received Neighbor Solicitation when FIFO was full, its information is not stored to FIFO and the interrupt is asserted to notify the status of by reg_fifo_full or reply_fifo_full. If one-FIFO is already full and TOE receives Neighbor Solicitations which is stored to both FIFO, its information is not stored to both FIFO.

### 30.5.9 Flow Control

Flow control conforming to the IEEE802.3x is possible during full-duplex operation. There are two methods of transmitting PAUSE frames that are used in flow control as given below.

To use this function, configure CCC.FCE and RCR.RFCL of DMAC.

(1) Auto transmission of PAUSE frame (See bit 16 in CXR20)

A PAUSE frame is automatically transmitted by E-MAC when DMAC notifies that the condition of Reception FIFO reached at Critical Level. The value set in the CXR71 parameter settings register is used as the timer value included in the PAUSE frame. After transmitting a PAUSE frame, if the “Reception FIFO Critical Level Notification” from DMAC is not negated by the time that is indicated in the Timer value, the PAUSE frame is sent again. The number of times of transmitting a PAUSE frame can be set from 1 to 65535 in the CXR81 register, and once the upper limit of the transmission count is reached (value set in CXR81), the PAUSE frame is not transmitted thereafter.

However, if the “Reception FIFO Critical Level Notification” from DMAC is negated, the transmission count counter is reset when the next “Reception FIFO Critical Level Notification” from DMAC is asserted and PAUSE frame transmission begins. It is also possible to not define the transmission count upper limit (transmitting for infinite times).

(2) Manual transmission of PAUSE frame (See CXR72)

The PAUSE frame can be transmitted by software instruction. PAUSE frame transmission is started by setting the Timer value in the CXR72 register. In this case, PAUSE frame is transmitted once only (one frame).

(3) PAUSE Timer value (See bits 19 and 20 in CXR20)

Control can be enabled or disabled for the PAUSE frames having PAUSE Timer value 0

a) Operation during transmission
If control is enabled and the “Reception FIFO Critical Level Notification” from DMAC is negated within the time indicated by the Timer value, the PAUSE frame with Timer value 0 is transmitted.
If control is disabled, the PAUSE frame with Timer value 0 is not transmitted.

b) Operation during reception
If control is enabled, a PAUSE frame with Timer value 0 is received and frame transmission waiting is cancelled.
If control is disabled, a PAUSE frame with Timer value 0 is received and the PAUSE frame is discarded.

(4) PAUSE frame reception (See the bit 17 in CXR20)

When a PAUSE frame is received, the next frame transmission is in wait mode till the time which is considered Timer value of PAUSE frame elapses. The transmission of the frame that is being transmitted continues. In addition, the PAUSE frame reception count is counted (See CXR80).

### 30.5.10 Low Power Idle (LPI)

E-MAC supports the function of Low Power Idle for 1 Gbps/100 Mbps transfer rate. Since LPI function for 10Mbps is not defined in standard*1, E-MAC also does not support.

**Note 1.** Specifically, Standard of 10 BASE-Te whose voltage is lower than 10 BASE-T was defined. But a basic specification except about voltage (such as the rule of Code or Media Access Control Operation) is same as 10 BASE-T. (10 BASE-Te is supported by the cable of Cat5 or more)

(1) Output function of Low Power Idle Code (LPI Code)

When E-MAC does not receive any transmission request during over certain period, E-MAC outputs transmission LPI Code to PHY for notifying request to change into Low Power Mode. If E-MAC receives a transmission request (not includes the request for PAUSE frame) while outputting transmission LPI Code, E-MAC changes output Code from transmission LPI Code to Normal Idle Code. Then E-MAC resumes to transmit Frames after waiting certain period (WakeUp time of PHY).

The following time is configurable by register.
- The time from E-MAC does not receive any transmission request to E-MAC starts outputting transmission LPI Code.
- The time from E-MAC received transmission request to E-MAC starts outputting Normal Idle Code.

(2) Receive function of Low Power Idle Code (LPI Code)

When PHY receives a changing request into Low Power Mode from Link Partner, PHY starts outputting reception LPI Code to E-MAC. If E-MAC receives reception LPI Code, E-MAC does not send this Code to TOE. E-MAC outputs Normal Status to TOE same as receiving Normal Idle Code.

(3) Stop function of transmission clock (Only RGMII Mode)

When RGMII interface is used, E-MAC can stop the RGMII transmission clock (TXC) during outputting transmission LPI Code. This function is configurable by register. But the case of MII interface is used, to stop MII transmission clock (TX_CLK) which PHY outputs is prohibited.

(4) Handling function for stopping reception clock (Both RGMII and MII Mode)

E-MAC can accept to stop RGMII and MII reception clock (RXC/RX_CLK) while receiving reception LPI Code. To stop RGMII and MII reception clock (RXC/RX_CLK) is configurable by register of PHY. (See the datasheet of PHY)

[Simplified Full Duplex Mode]

E-MAC supports Simplified Full Duplex Mode which is used for Low Power Idle Function.

In the Full Duplex Mode, when E-MAC receives transmission request from Upper Module (such as DMAC), E-MAC starts transmitting frames without care of PHY status.

But in the Simplified Full Duplex Mode, E-MAC cares the PHY status and does not transmit any frames to PHY during both PHY status is Low Power Idle and PHY is changing status from Low Power Idle to Normal.

To use E-MAC as Simplified Full Duplex Mode, set ‘1’ to DMP bit and LPM bit of CXR20 register after checking Link Partner supports Low Power Idle Mode by Auto Negotiation*2.

**Note 2.** Check PHY and Link Partner support Low Power Idle Mode before setting E-MAC as Low Power Idle Mode. And for the function of Low Power Idle Mode, registers area of PHY was expanded. Therefore, to use Low Power Idle Mode, software has to be changed for the function of accessing PHY registers, PHY Auto Negotiation and initial setting of E-MAC.

### 30.5.11 Control of Reference Clock for Ethernet

Gigabit Ethernet Interface IP has a function to notify the status that whether Gigabit Ethernet Interface needs Reference Clock for Ethernet “clk_miitx_gtx_refclk” or not by “ref_clk_stop_en”. And this condition also is notified to CPU by interrupt signal “pif_int_n” (Case of interrupt is indicated on TIS.RCSRF and ISS.RCSRM).

This function is only enabled when the configurations of Gigabit Ethernet Interface are matched following all conditions.

- RGMII is selected as PHY IF.
- This function is enabled by register configuration. (CCC.ERCS = 1)
- E-MAC is configured as LowPowerMode. (CXR20.LPM = 1), Duplex = Full and TransmitSpeed = 1000 M/100 Mbps.

**Figure 30.42** is a block diagram of this function.

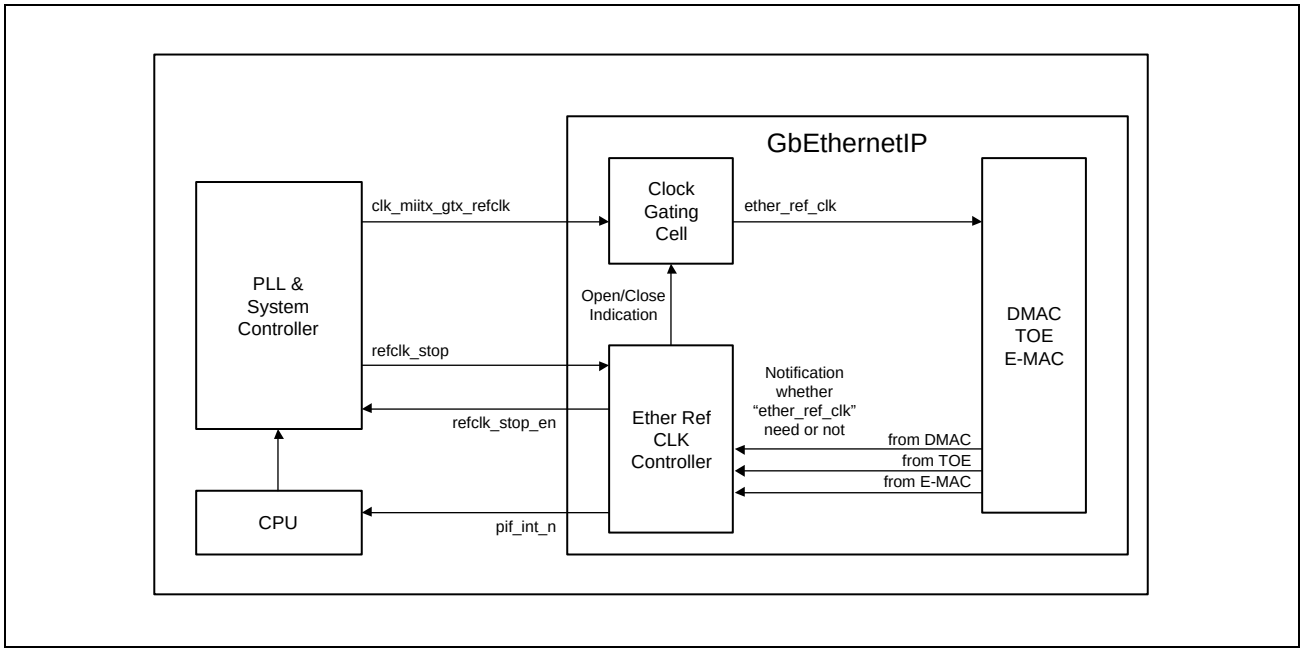

Figure 30.42 Block Diagram

As showing **Figure 30.42**, Gigabit Ethernet Interface has an “Ether Ref CLK Controller” which controls “ref_clk_stop_en”, “pif_int_n” and Open/Close Operation of Internal Clock Gating Cell for “clk_miitx_gtx_refclk”.

The state of Open/Close Operation of Internal Clock Gating Cell is indicated on CSR.RCSI.

NOTE

Whenever “pif_int_n” is asserted by this function, CPU has to instruct PLL & System Controller to stop “clk_miitx_gtx_refclk”.

### 30.5.11.1 Stop Procedure of Reference Clock for Ethernet

Stop procedure of “clk_miitx_gtx_refclk” is executed by following steps.

1. When DMAC and TOE do not have any Transmission Frames, they do not need “clk_miitx_gtx_refclk” anymore. So, they notify that status to Ether Ref CLK Controller.
2. After outputting Transmission LPI Code during configured time at LPTXG(M)TH4, E-MAC does not need “clk_miitx_gtx_refclk” anymore, So, it notifies that status to Ether Ref CLK Controller.
3. When Ether Ref CLK Controller is received the status that all of DMAC/TOE/E-MAC don’t need “clk_miitx_gtx_refclk” any more, it asserts “ref_clk_stop_en” to notify about this condition to ETH_PLL & System Controller. Then Gigabit Ethernet Interface closes an internal Clock Gating Cell for “clk_miitx_gtx_refclk” and asserts “pif_int_n” to indicate this condition to CPU.
4. CPU instructs ETH_PLL & System Controller to stop “clk_miitx_gtx_refclk” and writes “0” to TIS.RCSRF to clears “pif_int_n”.
5. After PLL is stopped completely, ETH_PLL & System Controller asserts “ref_clk_stop” notifying PLL status to Ether Ref CLK Controller.

**Figure 30.43** is a sequence of stopping “clk_miitx_gtx_refclk”.

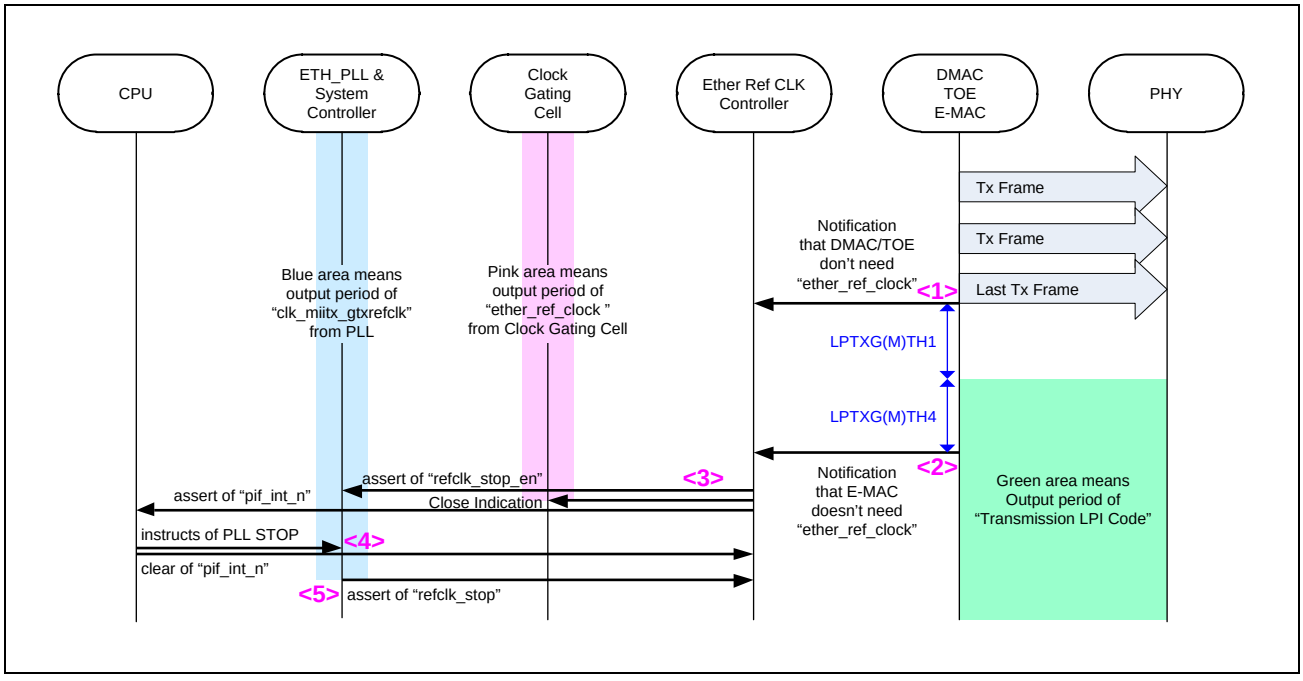

Figure 30.43 Sequence of stopping “clk_miitx_gtx_refclk”

### 30.5.11.2 Resume Procedure of Reference Clock for Ethernet

Resume procedure of “clk_miitx_gtx_refclk” is executed by following steps.

Case1: Gigabit Ethernet Interface receives indication from CPU restarting transmission operation.

1. CPU indicates restarting transmitting operation to DMAC.
2. DMAC fetches a new transmission descriptor and gets a Transmission Frame from external Memory. Then, it notifies to Ether Ref CLK Controller that it needs “clk_miitx_gtx_refclk” for transmitting operation.
3. After Ether Ref CLK Controller is notified from DMAC that DMAC needs “clk_miitx_gtx_refclk”, it de-asserts “ref_clk_stop_en” to notify ETH_PLL & System Controller that Gigabit Ethernet Interface needs restart of PLL.
4. ETH_PLL & System Controller tries to restart PLL. After “clk_miitx_gtx_refclk” is resumed completely, it de-asserts “ref_clk_stop” to notify Ether Ref CLK Controller about PLL status.
5. By the change of “ref_clk_stop” from assert to de-assert, Ether Ref CLK Controller opens the internal Clock Gating Cell for ”clk_miitx_gtx_refclk”.
6. Since providing clock is resumed, Transmitting Function of DMAC/TOE/E-MAC is also resumed. Then, E-MAC outputs a Transmission Frame to PHY after outputting IDLE Code during the time which is configured at LPTXG(M)TH3 register.

**Figure 30.44** is a sequence of resuming “clk_miitx_gtx_refclk” of Case1.

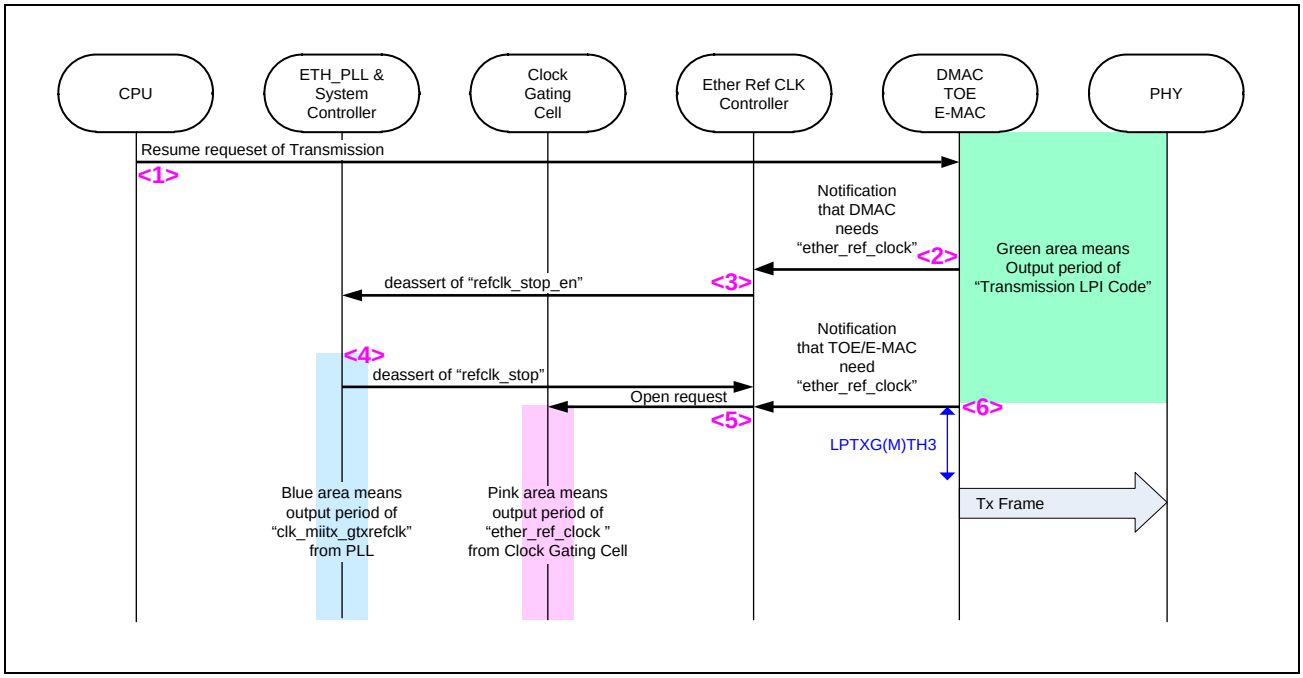

Figure 30.44 Sequence of resuming “clk_miitx_gtx_refclk” of Case1

Case2: Gigabit Ethernet Interface receives a frame which needs to Automatic Response by H/W.

For about the function of Automatic Response by H/W, see 4.8.

1. Received a frame which needs to Automatic Response by H/W from PHY.
2. After received the frame, TOE notifies to Ether Ref CLK Controller that it needs “clk_miitx_gtx_refclk” for transmitting operation.
3. After Ether Ref CLK Controller is notified from TOE that TOE needs “clk_miitx_gtx_refclk”, it deasserts “ref_clk_stop_en” to notify ETH_PLL & System Controller that Gigabit Ethernet Interface needs restart of PLL.
4. ETH_PLL & System Controller tries to restart PLL. After “clk_miitx_gtx_refclk” is resumed completely, it de-asserts “ref_clk_stop” to notify Ether Ref CLK Controller about PLL status.
5. By the change of “ref_clk_stop” from assert to de-assert, Ether Ref CLK Controller opens the internal Clock Gating Cell for ”clk_miitx_gtx_refclk”.
6. Since providing clock is resumed, Transmitting Function of DMAC/TOE/E-MAC is also resumed. Then, E-MAC outputs an Automatic Response Frame to PHY after outputting IDLE Code during the time which is configured at LPTXG(M)TH3 register.

**Figure 30.45** is a sequence of resuming “clk_miitx_gtx_refclk” of Case2.

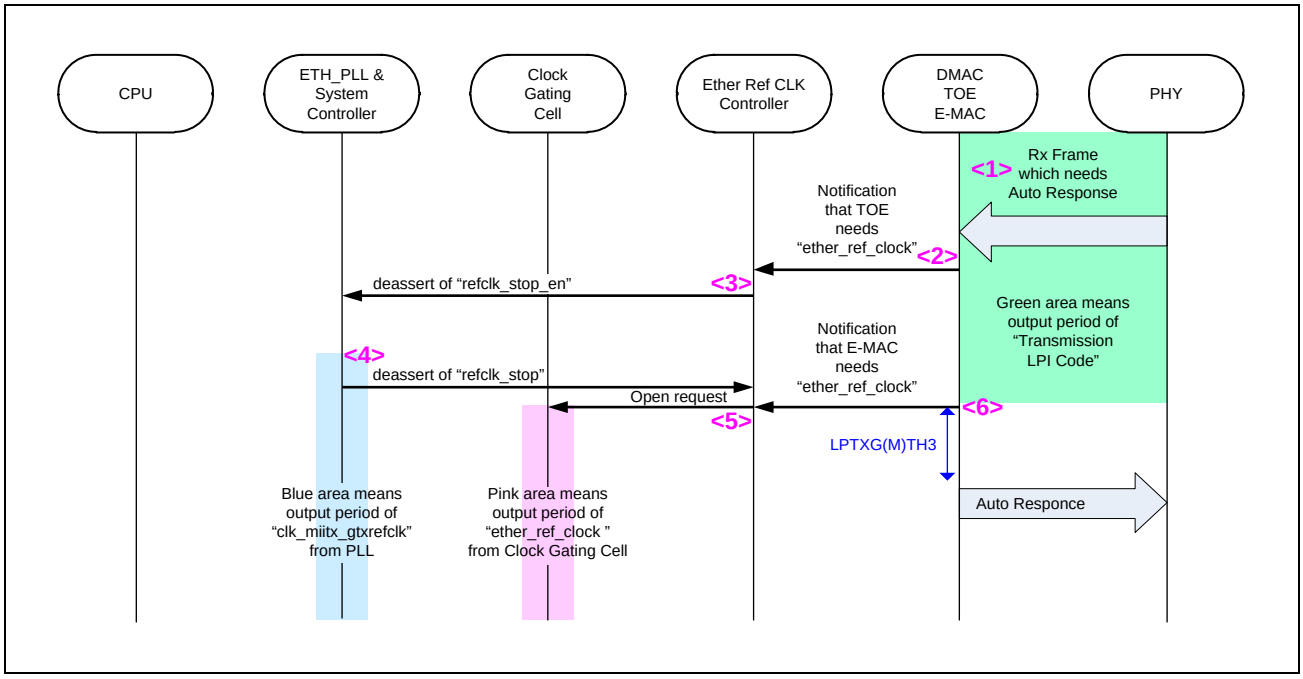

Figure 30.45 Sequence of resuming “clk_miitx_gtx_refclk” of Case2

## 30.5.12 Interrupts

The DMAC related interrupts include descriptor interrupts, error interrupts, reception interrupts and transmission interrupts. The states of a DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt summary bit in the error interrupt status register (EIS.QFS). This reduces the load on the CPU.

### 30.5.12.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupts in the receive interrupt status register 0 (RIS0.FRF)
- Descriptor processed interrupts in the receive interrupt status register 3 (RIS3.RDPF)
- Frame transmitted interrupts in the transmit interrupt status register (TIS.FTF)
- Descriptor processed interrupts in the transmit interrupt status register (TIS.TDPF)
- Descriptor processed interrupts in the descriptor interrupt status register (DIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt flag bits in the interrupt summary status register (ISS.DPMi) or the Reception FIFO warning interrupt summary bit (ISS.RFWM).

### 30.5.12.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Queue error interrupt in the error interrupt status register (EIS.QEF)
- E-MAC and TOE transmission/reception error interrupts in the error interrupt status register (EIS.MTEF, EIS.MREF, EIS.MFFF, EIS.MFFF2)
- Reception FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupts in the receive interrupt status register 2 (RIS2.QFF0)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.EM, ISS.MFWM2, ISS.MFUM2).

#### 30.5.12.3 Other Management Interrupts

The other management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

- Reception FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

- MAC Status FIFO/FIFO2 Warning Flag (TIS.MFWF/TIS.MFWF2)
- MAC status FIFO/FIFO2 Updated Flag (TIS.MFUF/TIS.MFUF2)
- Reference Clock Stop Req Flag (TIS.RCSRF)

The general error interrupt state can be checked by reading the Reception FIFO warning error interrupt status bit in the interrupt summary status register (ISS.RFWM).

#### 30.5.12.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

- PAUSE Frame Retry Interrupt in the E-MAC status register (CXR21.PFRI)
- PHY Interrupt in the E-MAC status register (CXR21.PHYI)
- LINK Interrupt in the E-MAC status register (CXR21.LINKI)
- False Carrier Interrupt in the E-MAC status register (CXR21.FCI)

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MM).

#### 30.5.12.5 TOE Interrupt

The TOE interrupt is issued when the TOE interrupt source is generated.

- Wake Up interrupt in the TOE register (CSFR20)
- ARPREQ/Neighbor Solicitation Receive interrupt in the TOE register (CSFR40, CSFR42_*, CSFR43_*)

### 30.5.12.6 Interrupt

**Table 30.20**, **Table 30.21**, and **Table 30.22** shows interrupt for each interrupt status bit. Interrupts of DMAC and E-MAC are merged into the “pif_int_n” of output port. TOE has two independent output ports “int_fil_n” and “int_arp_ns_n”.

Table 30.20 Interrupt of DMAC

| Interrupt trigger | Interrupt flag bit | Interrupt enable bit | Interrupt (Output port) |
|---|---|---|---|
| The descriptor in a reception or transmit queue has been processed where DESCR.DIE is i | DIS.DPFi (i = 1 to 15) | DIC.DPEi = 1 | pif_int_n |
| In receive queue a frame is stored, and data is available to be processed by CPU. | RIS0.FRF | RIC0.FRE = 1 | |
| The descriptor in reception queue has been processed where DESCR.DIE is 0001b. | RIS3.RDPF | RIC3.RDPE = 1 & CIE.CRIE = 1 | |
| The descriptor in transmit queue has been processed where DESCR.DIE is 0001b. | TIS.TDPF | TIC.TDPE = 1 & CIE.CTIE = 1 | |
| A frame is transmitted from transmit queue. | TIS.FTF | TIC.FTE = 1 | |
| An error has been detected while processing receive or transmit queue. | EIS.QEF | EIC.QEE = 1 | |
| The E-MAC has detected a fault during transmission. | EIS.MTEF | EIC.MTEE = 1 | |
| The E-MAC has detected a fault during reception. | EIS.MREF | EIC.MREE = 1 | |
| The MAC status FIFO2 is full. | EIS.MFFF2 | EIC.MFFE2 = 1 | |
| The MAC status FIFO is full. | EIS.MFFF | EIC.MFFE = 1 | |
| A received frame was not completely stored in the Reception FIFO. | RIS2.RFFF | RIC2.RFFE = 1 | |
| No sufficient space in receive queue to store completely a received frame. | RIS2.QFF0 | RIC2.QFE = 1 | |
| The Reception FIFO has reached warning level. | RIS1.RFWF | RIC1.RFWE = 1 | |
| The MAC status FIFO has been reached warning level. | TIS.MFWF | TIC.MFWE = 1 | |
| The MAC status FIFO has been updated. | TIS.MFUF | TIC.MFUE = 1 | |
| The MAC status FIFO2 has been reached warning level. | TIS.MFWF2 | TIC.MFWE2 = 1 | |
| The MAC status FIFO2 has been updated. | TIS.MFUF2 | TIC.MFUE2 = 1 | |
| Reference Clock Stop Request has been notified | TIS.RCSRF | TIC.RCSRE = 1 | |

Table 30.21 Interrupt of E-MAC

| Interrupt trigger | Interrupt flag bit | Interrupt enable bit | Interrupt (Output port) |
|---|---|---|---|
| PAUSE Frame Retry reached to threshold. | CXR21.PFRI | CXR22.PFRIM | pif_int_n |
| PHY Interrupt is detected. | CXR21.PHYI | CXR22.PHYIM | |
| LINK status change is detected. | CXR21.LINKI | CXR22.LINKIM | |
| False Carrier is detected. | CXR21.FCI | CXR22.FCIM | |

Table 30.22 Interrupt of TOE

| Interrupt trigger | Interrupt flag bit | Interrupt mask bit | Interrupt main enable bit | Interrupt (Output port) |
|---|---|---|---|---|
| Transmit Rx Frame to DMAC | CSFR20.trs_dmac | CSFR21. trs_dmac_m | — | int_fil_n |
| Reception of IEEE Length Frames. | CSFR20.ieee_len | CSFR21. ieee_len_m | — | |
| Reception of Invalid Neighbor Solicitations. | CSFR20.ns_dis | CSFR21.ns_dis_m | — | |
| Reception of IP Duplicate Detection Neighbor Solicitations. | CSFR20.ns_dup | CSFR21.ns_dup_m | — | |
| Reception of unicast Neighbor Solicitations. (Except “Option Type=1” or No “Option Type”) | CSFR20.ns_uni_nopt | CSFR21.ns_uni_nopt_m | — | |
| Reception of unicast Neighbor Solicitations. (“Option Type=1”) | CSFR20.ns_uni | CSFR21.ns_uni_m | — | |
| Reception of multicast Neighbor Solicitations. | CSFR20.ns_mul | CSFR21.ns_mul_m | — | |
| Reception of Un-analyzable Frames. | CSFR20.ana_stp | CSFR21.ana_stp_m | — | |
| Reception of Un-analyzable IPv6 Protocol No. | CSFR20.v6_ana_protocol | CSFR21.v6_ana_protocol_m | — | |
| Reception of ARP (Except ARP REQ). | CSFR20.arp_noreq | CSFR21.arp_noreq_m | — | |
| Reception of GARP REQ for Local Station. | CSFR20.garp_self | CSFR21.garp_self_m | — | |
| Reception of GARP REQ for Other Station. | CSFR20.garp_other | CSFR21.garp_other_m | — | |
| Reception of ARP REQ for Local Station. | CSFR20.arp_self | CSFR21.arp_self_m | — | |
| Reception of ARP REQ for Other Station. | CSFR20.arp_other | CSFR21.arp_other_m | — | |
| Match of IPv6 UDP Port No. | CSFR20.v6_udp_pt | CSFR21.v6_udp_pt_m | — | |
| Match of IPv4 UDP Port No. | CSFR20.v4_udp_pt | CSFR21.v4_udp_pt_m | — | |
| Match of IPv6 Protocol No. | CSFR20.v6_protocol | CSFR21.v6_protocol_m | — | |
| Match of IPv4 Protocol No. | CSFR20.v4_protocol | CSFR21.v4_protocol_m | — | |
| Match of Ether Type. | CSFR20.type | CSFR21.type_m | — | |
| Match of Multicast MAC DA. | CSFR20.mac_da_mul | CSFR21.mac_da_mul_m | — | |
| Match of Broadcast MAC DA. | CSFR20.mac_da_bro | CSFR21.mac_da_bro_m | — | |
| Match of Unicast MAC DA. | CSFR20.mac_da_uni | CSFR21.mac_da_uni_m | — | |
| REPLY_FIFO is full. | CSFR40.reply_fifo_full | CSFR41.reply_fifo_full_m | CSFR00.reply_fifo enable & at least one CSFR30.xx_reply_en | int_arp_ns_n |
| REG_FIFO is full. | CSFR40.reg_fifo_full | CSFR41.reg_fifo_full_m | CSFR00.reg_fifo_en & at least one CSFR30.xx_int_en | |
| Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO. | CSFR40.arp_ns | CSFR41.arp_ns_m | CSFR00.reg_fifo_en & at least one CSFR30.xx_int_en | |

## 30.5.13 Configuration Procedure

The following are Configuration Procedures. The meaning of “X” in Write Value, set the appropriate value to each bit for your system.

### 30.5.13.1 Set Up Procedure

Check the Configuration of Other Station by using Auto Negotiation Function of PHY before setting Transfer Rate (1 Gbps/100 Mbps/10 Mbps), Duplex Mode (Half or Full), Low Power Mode and Flow Control to E-MAC registers.

| Action | | Address | Write Value | Description |
|---|---|---|---|---|
| Hardware Reset | | | | |
| ↓ | | | | |
| DMAC.CSR | Read | H’00C | — | Check the read value is same as “H’00000001” (Reset Mode). |
| ↓ | | | | |
| DMAC.CCC | Write | H’000 | H’00000001 | Set “Config Mode” |
| ↓ | | | | |
| DMAC.CSR | Read | H’00C | — | Check the read value is same as “H’00000002” (Config Mode). |
| ↓ | | | | |
| E-MAC Initial Configuration (Not necessary to change other E-MAC registers) | | | | |
| E-MAC.CXR35 | Write | H’540 | H’XXXXXXXX | Set the appropriate value for your system. And wait the double of your configuration value to this register. |
| E-MAC.CXR31 | Write | H’530 | H’0000000X | Set the appropriate value for your system. (Only if In-Band Status of RGMII will be used) |
| E-MAC.CXR2C | Write | H’52C | H’0000000X | Set the appropriate value for your system. |
| E-MAC.CXR2A | Write | H’508 | H’00002000 | Set Max Frame size as 8KB. |
| E-MAC.CXR71 | Write | H’554 | H’0000XXXX | Set the appropriate value for your system. (Only if Flow Control Function will be used) |
| E-MAC.CXR24 | Write | H’5C0 | H’XXXXXXXX | Set the appropriate value for your system. |
| E-MAC.CXR25 | Write | H’5C8 | H’0000XXXX | Set the appropriate value for your system. |
| E-MAC.CXR21 | Write | H’510 | H’0000001F | Clear all Interrupt. |
| E-MAC.CXR22 | Write | H’518 | H’0000000X | Set the appropriate value for your system. |
| E-MAC.CXR2D | Write | H’5B0 | H’000000X0 | Set the appropriate value for your system. (Only if In-Band Status of RGMII will not be used) |
| E-MAC.CXR2G | Write | H’5BC | H’0000000X | Set the appropriate value for your system. (Only if Software LINK will not be used) |
| ↓ | | | | |
| TOE Initial Configuration (Not necessary to change other TOE registers). | | | | |
| TOE.CSR1 | Write | H’804 | H’0XX000XX | Set the appropriate value for your system. |
| TOE.CSR2 | Write | H’808 | H’0XX000XX | Set the appropriate value for your system. |
| TOE.CSFR01 | Write | H’844 | H’XXXXXXXX | Set the appropriate value for your system. |
| TOE.CSFR02_i | Write | H’848+4*i | H’XXXXXXXX | Set the appropriate value for your system. (i = 0 to 3) |
| TOE.CSFR03_U | Write | H’858 | H’0000XXXX | Set the appropriate value for your system. |
| TOE.CSFR03_L | Write | H’85C | H’XXXXXXXX | Set the appropriate value for your system. |
| TOE.CSFR10_i | Write | H’870+4*i | H’XXXXXXXX | Set the appropriate value for your system. (i = 0 to 3) |
| TOE.CSFR10 | Write | H’880 | H’000000XX | Set the appropriate value for your system. |
| TOE.CSFR11_i | Write | H’884+4*i | H’XXXXXXXX | Set the appropriate value for your system. (i = 0 to 3) |
| TOE.CSFR11 | Write | H’894 | H’00000XXXX | Set the appropriate value for your system. |
| TOE.CSFR12_i | Write | H’898+4*i | H’XXXXXXXX | Set the appropriate value for your system. (i = 0 to 11) |
| TOE.CSFR12 | Write | H’8C8 | H’00XXXXXX | Set the appropriate value for your system. |
| TOE.CSFR13_U | Write | H’8CC | H’0000XXXX | Set the appropriate value for your system. |
| TOE.CSFR13_L | Write | H’8D0 | H’XXXXXXXX | Set the appropriate value for your system. |
| TOE.CSFR14_U | Write | H’8D4 | H’0000XXXX | Set the appropriate value for your system. |
| TOE.CSFR14_L | Write | H’8D8 | H’XXXXXXXX | Set the appropriate value for your system. |
| TOE.CSFR15_U_i | Write | H’8DC+8*i | H’0000XXXX | Set the appropriate value for your system. (i = 0 to 19) |
| TOE.CSFR15_L_i | Write | H’8E0+8*i | H’XXXXXXXX | Set the appropriate value for your system. (i = 0 to 19) |
| TOE.CSFR15 | Write | H’97C | H’XX0XXXXX | Set the appropriate value for your system. |
| TOE.CSFR20 | Write | H’9A0 | H’000FFFFF | Clear all Interrupt. |
| TOE.CSFR21 | Write | H’9A4 | H’000XXXXX | Set the appropriate value for your system. |

| Action | | Address | Write Value | Description |
|---|---|---|---|---|
| TOE.CSFR30 | Write | H'9B0 | H'000XXXXX | Set the appropriate value for your system. |
| TOE.CSFR31 | Write | H'9B4 | H'XX0XXXXX | Set the appropriate value for your system. |
| TOE.CSFR00 | Write | H'840 | H'10XXXXXX | Enable the appropriate Filter Function for your system. Disable of Auto Response Function. |
| ↓ | | | | |
| DMAC Initial Configuration (Not necessary to change other DMAC registers). | | | | |
| DMAC.DBAT | Write | H'004 | H'XXXXXXXX | Set the appropriate value for your system. |
| DMAC.RCR | Write | H'090 | H'XXXX000X | Set the appropriate value for your system. |
| DMAC.RTC | Write | H'0B4 | H'00002000 | Set Max Reception Frame size as 8 KB. |
| DMAC.CIE | Write | H'384 | H'00000X0X | Set the appropriate value for your system. |
| DMAC.DIE | Write | H'450 | H'0000XXXX | Set the appropriate value for your system. |
| DMAC.EIE | Write | H'458 | H'00000X0X | Set the appropriate value for your system. |
| DMAC.RIE0 | Write | H'460 | H'0000000X | Set the appropriate value for your system. |
| DMAC.RIE1 | Write | H'468 | H'X0000000 | Set the appropriate value for your system. |
| DMAC.RIE2 | Write | H'470 | H'X000000X | Set the appropriate value for your system. |
| DMAC.TIE | Write | H'478 | H'000XXX0X | Set the appropriate value for your system. |
| DMAC.RIE3 | Write | H'488 | H'0000000X | Set the appropriate value for your system. |
| ↓ | | | | |
| DMAC.CCC | Write | H'000 | H'0X0X0002 | Set bit [1:0] = "10b" (Operation Mode) and bit25 (FCE)/bit18 (ERCS) = "the appropriate value for your system". |
| ↓ | | | | |
| TOE.CSR0 | Write | H'800 | H'00000030 | Set TPE and RPE = "1" and TOE FIFO=2 KB. |
| ↓ | | | | |
| E-MAC.CXR20 | Write | H'500 | H'0XXXXXXX | Set the appropriate value for your system. (The following are example) |
| | | | H'02030061 | Rx CRC PassThrough, PAUSE, TPE and RPE = '1', Half Duplex (for 100 Mbps/10 Mbps), Promiscuous. |
| | | | H'02030063 | Rx CRC PassThrough, PAUSE, TPE/RPE = '1', Full Duplex (for 10 Mbps), Promiscuous. |
| | | | H'02030073 | Rx CRC PassThrough, PAUSE, TPE/RPE = '1', Simplified Full Duplex (for 1 Gbps/100 Mbps), Promiscuous. |
| ↓ | | | | |
| DMAC.TCCR | Write | H'304 | H'000X0001 | Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system". |

### 30.5.13.2 System Mode Change Procedure (Normal -> Network Standby)

| Action | | Address | Write Value | Description |
|---|---|---|---|---|
| DMAC.TCCR | Read | H'304 | — | Wait until bit0 (TSRQ) will be "0". |
| ↓ | | | | |
| DMAC.CSR | Read | H'00C | — | Wait until bit16 (TPO) and bit20 (RPO) will be "0". |
| ↓ | | | | |
| DMAC.CCC | Write | H'000 | H'0X0X0202 | Set bit9 (RDFD) = "1" to stop fetch of Rx Descriptor. Not necessary to change other bits. |
| ↓ | | | | |
| DMAC.CSR | Read | H'00C | | Wait until bit9 (RDFDM) will be "1" and re-check bit20 (RPO) is "0".*1 |
| ↓ | | | | |
| TOE Configuration to enable Auto Response Function (Not necessary to change other registers) | | | | |
| TOE.CSFR40 | Write | H'9C0 | H'00000007 | Clear all Interrupt. |
| TOE.CSFR41 | Write | H'9C4 | H'0000000X | Set the appropriate value for your system. |
| TOE.CSFR00 | Write | H'840 | H'1XXXXXXX | Enable of the appropriate Auto Response Function for your system. Not necessary to change Filter Function. |
| ↓ | | | | |
| Change System Mode from "Normal" to "Network Standby". | | | | |
| ↓ | | | | |
| Set Tx Descriptor and Tx Frame at Internal SRAM | | | | |
| ↓ | | | | |
| DMAC.DBAT | Write | H'004 | H'XXXXXXXX | Set the appropriate value for your system. |
| ↓ | | | | |
| DMAC.DLR | Write | H'008 | H'003FFFFF | Set bit0 and bit4 = "1" loading DBAT to Tx and Rx queue. |
| ↓ | | | | |

| Action | | Address | Write Value | Description |
|---|---|---|---|---|
| DMAC.TCCR | Write | H'304 | H'000X0001 | Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system". |

Note 1. If bit9 (RDFDM) is "0" and bit20 (RPO) is "0", wait bit9 (RDFDM) will be "1" without accessing other registers.
If bit9 (RDFDM) is "1" and bit20 (RPO) is "0", the DMA transfer and fetch of Rx Descriptor have stopped.
So go to next step.
If bit9 (RDFDM) is "0" and bit20 (RPO) is "1", wait bit9 (RDFDM) will be "1" without accessing other registers.
If bit9 (RDFDM) is "1" and bit20 (RPO) is "1", the Reception Frame was stored to Reception FIFO.
So software has to cancel changing System mode. Set DMAC.CCC. bit9 (RDFD) = "0" immediately to resume fetch of Rx Descriptor.

### 30.5.13.3 System Mode Change Procedure (Network Standby -> Normal)

| Action | | Address | Write Value | Description |
|---|---|---|---|---|
| TOE.CSFR00 | Write | H'840 | H'10XXXXXX | Disable of the Auto Response Function. Not necessary to change Filter Function. |
| ↓ | | | | |
| DMAC.TCCR | Read | H'304 | — | Wait until bit0 (TSRQ) will be "0". |
| ↓ | | | | |
| DMAC.CSR | Read | H'00C | — | Wait until bit16 (TPO) will be "0". |
| ↓ | | | | |
| Change System Mode from "Network Standby" to "Normal". | | | | |
| ↓ | | | | |
| Set Rx/Tx Descriptor and Tx Frame at External SDRAM. | | | | |
| ↓ | | | | |
| DMAC.DBAT | Write | H'004 | H'XXXXXXXX | Set the appropriate value for your system. |
| ↓ | | | | |
| DMAC.DLR | Write | H'008 | H'003FFFFF | load DBAT to Tx and Rx queue. |
| ↓ | | | | |
| DMAC.CCC | Write | H'000 | H'0X0X0002 | Set "bit9 (RDFD) = 0" to start Rx DMA Transfer for Rx Frame. Not necessary to change other bits. |
| ↓ | | | | |
| DMAC.TCCR | Write | H'304 | H'000X0001 | Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system". |

### 30.5.13.4 Stop Procedure

| Action | | Address | Write Value | Description |
|---|---|---|---|---|
| Make “EOS” in the Tx Descriptor chain and wait until it is used. (Wait the interrupt of DIS.DPFi of this EOS Descriptor.) | | | | |
| ↓ | | | | |
| E-MAC.CXR20 | Write | H’500 | H’0XXXXXXX | Set bit6 (RPE) = “0” to stop Rx Function of E-MAC. Not necessary to change other bits. |
| ↓ | | | | |
| Wait following time depending on the Transfer speed mode. (Waiting time that the last Rx Frame is stored to Reception FIFO and the last Tx Frame is transmitted to PHY)<br>• 1 Gbps : Wait 70 µs • 100 Mbps : Wait 700 µs • 10 Mbps : Wait 7 ms | | | | |
| ↓ | | | | |
| DMAC.CSR | Read | H’00C | — | Wait until bit20 (RPO) will be “0” (Wait Reception FIFO will be empty) |
| ↓ | | | | |
| DMAC.CCC | Write | H’000 | H’0X0X0102 | Set bit8 (DTSR) = “1” to stop URAM access. Not necessary to change other bits. |
| ↓ | | | | |
| DMAC.CSR | Read | H’00C | — | Wait until bit8 (DTS) will be “1” (URAM access is stopping) |
| ↓ | | | | |
| TOE.CSR0 | Write | H’800 | H’00000000 | Set bit5 (RPE) = “0” and bit4 (TPE) = “0” to stop Rx and Tx Function of TOE. Not necessary to change other bits. |
| ↓ | | | | |
| TOE.CSR0 | Read | H’800 | — | Wait until bit5 (RPE) and bit4 (TPE) will be “0” |
| ↓ | | | | |
| E-MAC.CXR20 | Write | H’500 | H’0XXXXXXX | Set bit5 (TPE) = “0” to stop Tx Function of E-MAC. Not necessary to change other bits. |
| ↓ | | | | |
| E-MAC.CXR20 | Read | H’500 | — | Wait until bit6 (RPE) and bit5 (TPE) will be “0” |
| ↓ | | | | |
| DMAC.CCC | Write | H’000 | H’0X0X0001 | Set bit [1:0] = “01b” (Config Mode) and bit8 (DTSR) = “0” |

**Note:** If the system needs software reset, set DMAC.CCC bit [1:0] = “00b” to be RESET Mode after “Stop Procedure” and retry “Set up Procedure”.

### 30.5.14 Connection to PHY-LSI

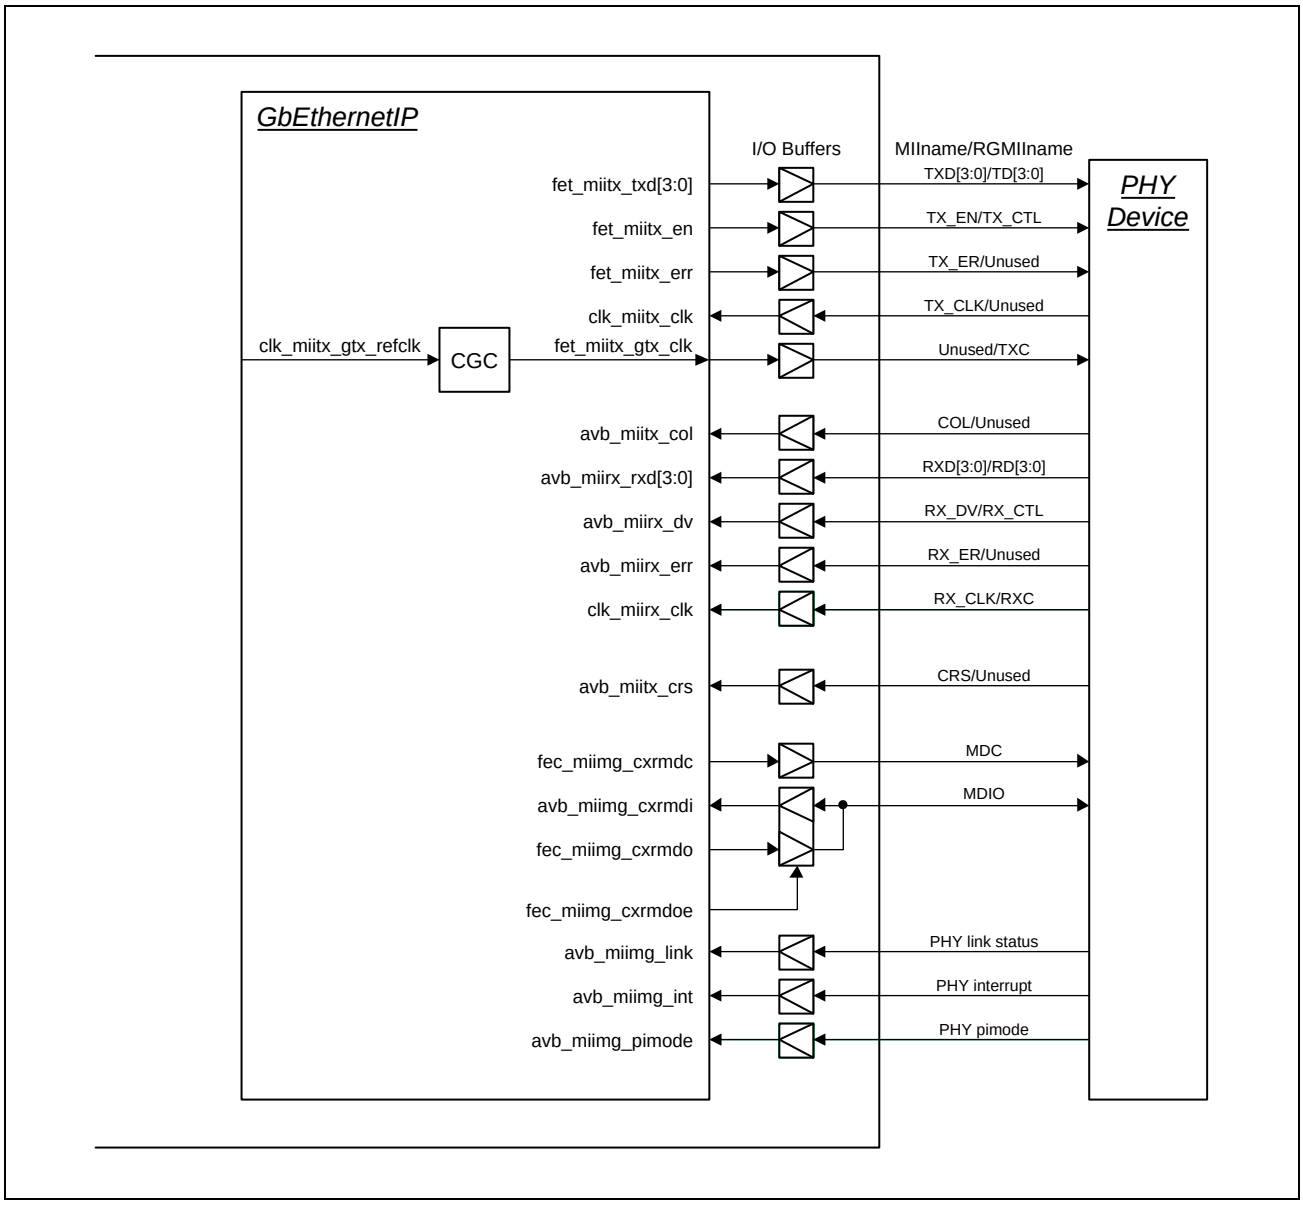

Figure 30.46 Connection to PHY-LSI

### 30.5.14.1 RGMII Frame Transmission/Reception Timing

Each RGMII frame transmission/reception timing is shown in **Figure 30.47** and **Figure 30.48**.

### 30.5.14.2 MII Frame Reception Timing

Each MII frame transmission/reception timing is shown in **Figure 30.49** and **Figure 30.50**.

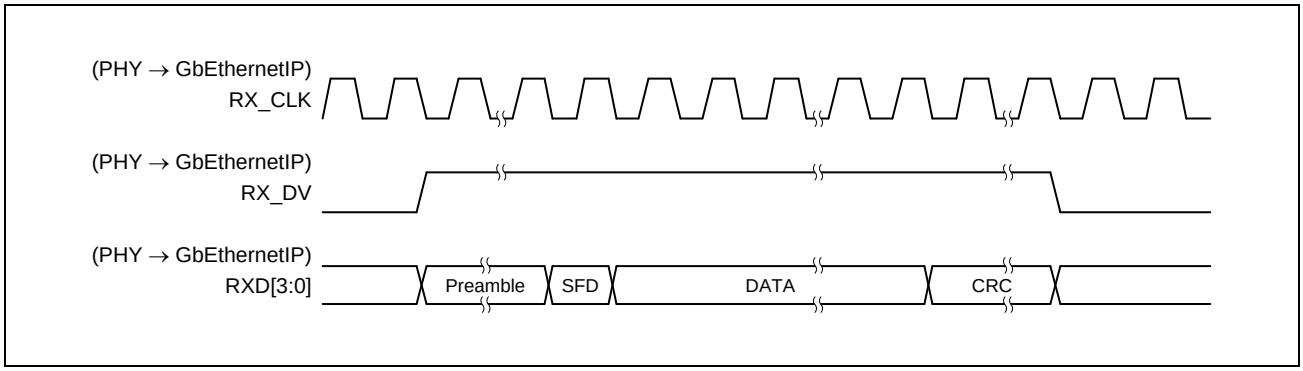

Figure 30.49 Normal Frame Reception Time Chart (MII)

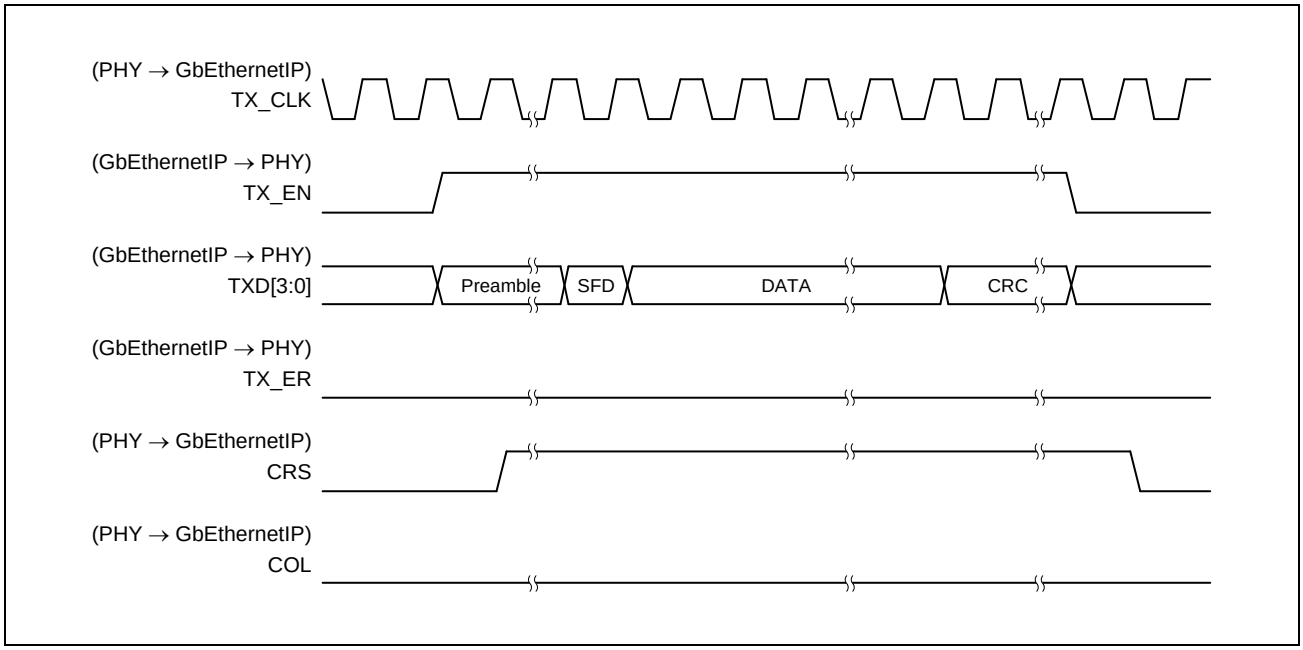

Figure 30.50 Normal Frame Transmission Time Chart (MII)

### 30.5.14.3 Accessing PHY Registers

There are two methods to access the PHY register: using the E-MAC-MDIOC block and using the CXR23 register.

Which access method to be used can be set using the MDIOMOD register.

#### (1) PHY Register Access Method (using MDIOC)

To access the PHY register from MDIOC, the SEL_MDIO bit in MDIOMOD register must be set to 0.

The following commands can be used for indirect access using MDIOC.

Table 30.23 List of MDIOC Commands

| Command | OP code | Address | Data | Description |
|---|---|---|---|---|
| WRITE | “01” | A [9:0] | D [15:0] | Write PHY register |
| READ | “10” | A [9:0] | D [15:0] | Read PHY register |

**PHY Register Write Access Procedure (Using MDIOC)**

The write access procedure for PHY register is given below.

(1) Read MDIOSTS register and confirm that BSY bit = 0.

(2) Set PHY address as (A [9:5]) and register address as (A [4:0]) in MDIOADR register.

(3) Set write data in MDIODAT register.

(4) Set OP field of MDIOCMD register to “01”.
{Here, the hardware sets BSY bit in MDIOSTS register to 1.}

(5) Read MDIOSTS register and wait till BSY bit = 0. After BSY becomes 0, write access is complete.
{After write access to PHY register completes, the BSY bit in MDIOSTS register is cleared to 0 by hardware.}

**PHY Register Read Access Procedure (Using MDIOC)**

The read access procedure for PHY Register is given below.

(1) Read MDIOSTS register and confirm that BSY bit = 0.

(2) Set PHY address as (A [9:5]) and register address as (A [4:0]) in MDIOADR register.

(3) Set OP field of MDIOCMD register to “10”.
{Here, the hardware sets BSY bit in MDIOSTS register to 1.}

(4) Read MDIOSTS register and wait till BSY bit = 0.
{After read access from PHY register completes and read data becomes available in MDIODAT register, hardware clears BSY bit in MDIOSTS register is cleared to 0 by hardware.}

(5) When the BSY bit in MDIOSTS register is cleared to 0, read data is acquired from MDIODAT register and access is complete.

### (2) PHY Register Access Method (Using CXR23)

To access PHY register using CXR23 register, SEL_MDIO bit of MDIOMOD register must be set to 1. (The initial value can be used as is.)

PHY access using CXR23 is done by controlling High and Low of MDC and MDIO signals for every cycle. The relationship between CXR23 register access and MDC and MDIO signals is shown below.

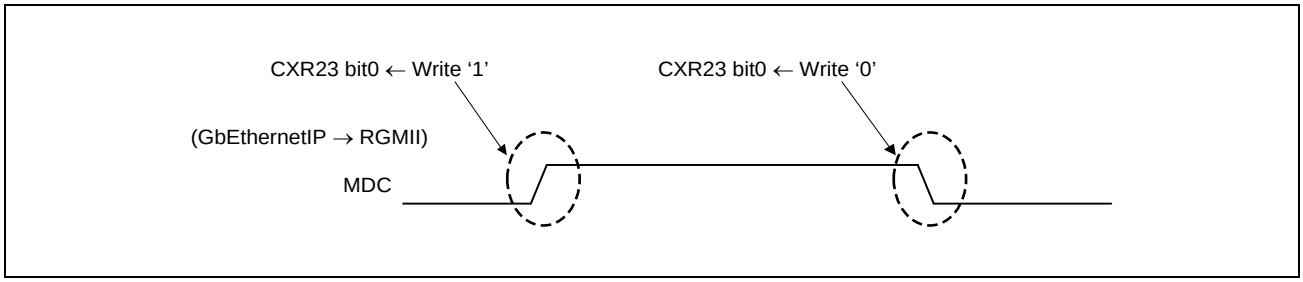

Figure 30.51 Relationship between CXR23 Write and MDC signal

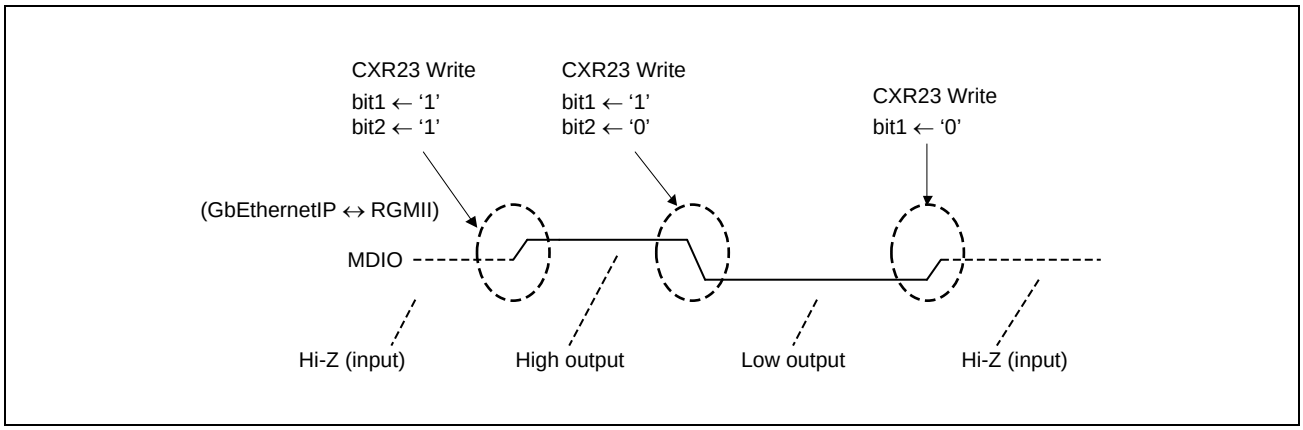

Figure 30.52 Relationship between CXR23 Write and MDIO (output) signal

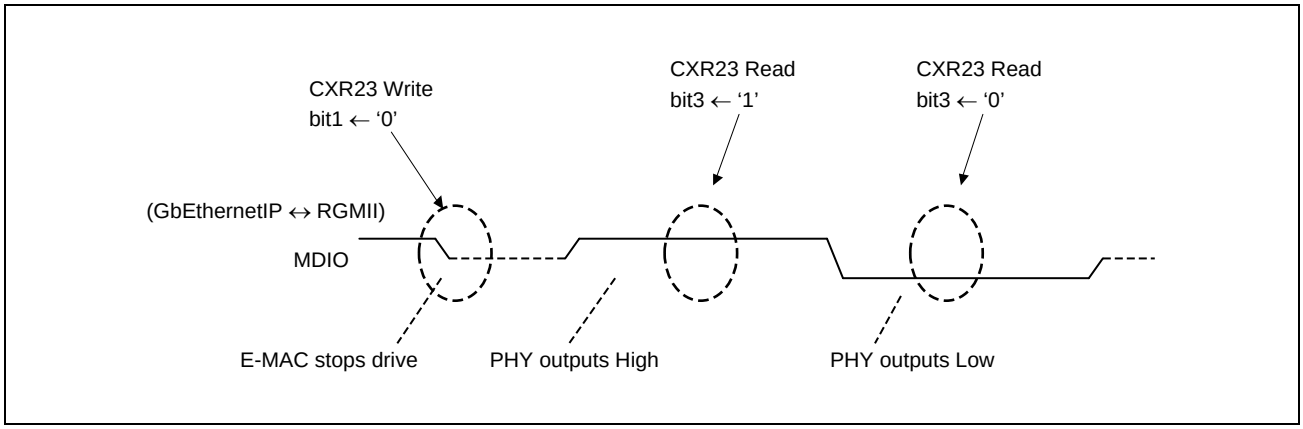

Figure 30.53 Relationship between MDIO input and CXR23 Read Values

### PHY Register Write Access Procedure (Using CXR23)

To write PHY chip register, control MDC and MDIO signals based on the format given below.

(1) PHY Write Access Format

Table 30.24 PHY Write Access Format

| # | Field name | I/O | Details | Remarks |
|---|---|---|---|---|
| 1 | Preamble | Output | 1 = 32 bits | Preamble |
| 2 | ST | Output | “01” | Start |
| 3 | Op Code (Write) | Output | “01” | Operation code for write |
| 4 | PHY Address | Output | 5 bit | PHY address (See data sheet of PHY LSI) |
| 5 | Reg Address | Output | 5 bit | Register address (See data sheet of PHY LSI) |
| 6 | Turn Around | Output | “10” | Turnaround |
| 7 | Data (Write) | Output | 16 bit | Write data |
| 8 | IDLE | — | — | Idle status |

(2) PHY Register Write Access Time chart

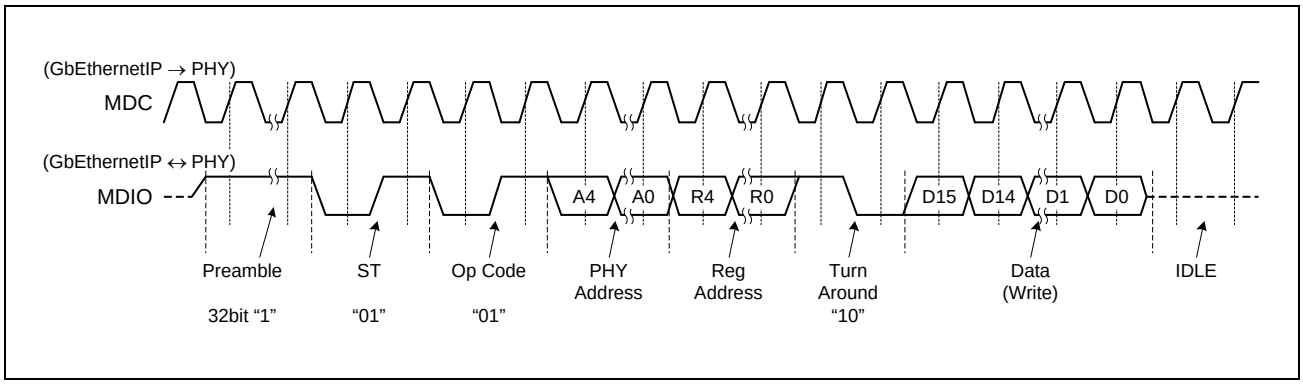

Figure 30.54 PHY Register Write Access Time Chart

(3) PHY Register Write Access Procedure

Table 30.25 PHY Register Write Access Procedure (1/2)

| # | CXR23 bit 3 | CXR23 bit 2 | CXR23 bit 1 | CXR23 bit 0 | CXR23 access | Description |
|---|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | Initial state | IDLE |
| 1 | 0 | 1 | 1 | 1 | CXR23 WRITE | Start of Write access (MDC rise) |
| 2 | 0 | 1 | 1 | 0 | CXR23 WRITE | (MDC fall) |
| 3 | 0 | 1 | 1 | 1 | CXR23 WRITE | Preamble1 |
| 4 | 0 | 1 | 1 | 0 | CXR23 WRITE | |
| 5 | 0 | 1 | 1 | 1 | CXR23 WRITE | Preamble2 |
| 6 | 0 | 1 | 1 | 0 | CXR23 WRITE | |
| 7 | 0 | 1 | 1 | 1 | CXR23 WRITE | Preamble3 |
| 8 | 0 | 1 | 1 | 0 | CXR23 WRITE | |
| — | — | — | — | — | — | Repeat |
| 64 | 0 | 1 | 1 | 0 | CXR23 WRITE | |
| 65 | 0 | 1 | 1 | 1 | CXR23 WRITE | Preamble32 |
| 66 | 0 | 0 | 1 | 0 | CXR23 WRITE | |
| 67 | 0 | 0 | 1 | 1 | CXR23 WRITE | ST |
| 68 | 0 | 1 | 1 | 0 | CXR23 WRITE | |
| 69 | 0 | 1 | 1 | 1 | CXR23 WRITE | ST |

| 121 | 0 | 0 | 0 | 1 | CXR23 WRITE | IDLE |
| 122 | 0 | 0 | 0 | 0 | CXR23 WRITE | IDLE End of write access |

### PHY Register Read Access Procedure (Using CXR23)

To read from the PHY chip registers, control MDC and MDIO signals in the format given below

(1) PHY Read Access Format

Table 30.26 PHY Read Access Format

| # | Field name | I/O | Details | Remarks |
|---|---|---|---|---|
| 1 | Preamble | Output | 1 = 32 bits | Preamble |
| 2 | ST | Output | “01” | Start |
| 3 | Op Code (read) | Output | “10” | Operation code for read |
| 4 | PHY Address | Output | 5 bit | PHY address (See data sheet of PHY LSI) |
| 5 | Reg Address | Output | 5 bit | Register address (See data sheet of PHY LSI) |
| 6 | Turn Around | Input | “Z0” | Turnaround (input/output switching) |
| 7 | Data (Read) | Input | 16 bit | Read data |
| 8 | IDLE | — | — | Idle state |

(2) PHY Register Read Access Time Chart

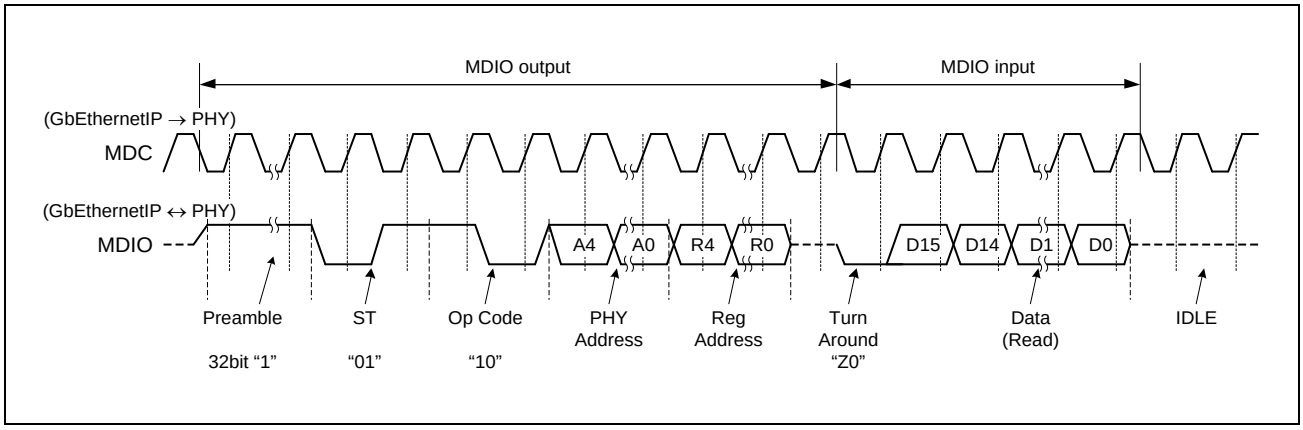

Figure 30.55 PHY Register Read Access Time Chart

(3) PHY Register Read Access Procedure

Table 30.27 PHY Register Read Access Procedure (1/2)

| # | CXR23 bit 3 | CXR23 bit 2 | CXR23 bit 1 | CXR23 bit 0 | CXR23 access | Description |
|---|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | Initial state | IDLE |
| 1 | 0 | 1 | 1 | 1 | CXR23 WRITE | Start of write access (MDC rise) |
| 2 | 0 | 1 | 1 | 0 | CXR23 WRITE | (MDC fall) |
| 3 | 0 | 1 | 1 | 1 | CXR23 WRITE | Preamble1 |
| 4 | 0 | 1 | 1 | 0 | CXR23 WRITE | |

# 31. A/D Converter

## 31.1 Features

This LSI has a successive approximation A/D converter with a 12-bit accuracy. Up to two analog input channels can be selected.

### ■ Resolution

12 bits

### ■ Two input channels

### ■ Input voltage range

0 V to 1.8 V

### ■ Minimum conversion time

1.0 µs per channel (when A/D conversion clock ADIVCLK is 20 MHz)

### ■ Four data registers

The A/D conversion result is stored in a 32-bit data register corresponding to each channel.

### ■ Sample-and-hold function

### ■ Trigger mode

- Software trigger mode and hardware trigger mode are available.
- Software trigger mode to start A/D conversion by software
- Hardware trigger mode to start A/D conversion by an asynchronous trigger or synchronous trigger
  - Asynchronous trigger using an external pin (ADC_TRG) as the activation source
  - Synchronous trigger using the multi-function timer pulse unit 3 (MTU3a) or general-purpose

### ■ Operating mode

- Select mode and scan mode are available.
- Select mode to convert the specified single analog input channel
  - 1-buffer mode or 4-buffer mode can be specified for storing the A/D conversion result.
  - In 4-buffer mode, A/D conversion proceeds four times for the selected analog input and the A/D conversion results are stored in four registers.
- Scan mode to convert the analog inputs of arbitrarily selected channels in ascending order of channel number
  - 1-buffer mode can be specified for storing the A/D conversion result.

### ■ Conversion mode

- Single mode and repeat mode are available.
- Single mode to proceed A/D conversion only once
- Repeat mode to repeatedly proceed A/D conversion

### ■ A single interrupt source

- An A/D conversion end interrupt (INTAD) can be generated on completion of A/D conversion.
  - In the select mode with 1-buffer mode selected, an A/D conversion end interrupt is generated on completion of a single conversion.
  - In the select mode with 4-buffer mode selected, an A/D conversion end interrupt is generated on completion of four rounds of conversion.
  - In scan mode, an A/D conversion end interrupt is generated on completion of scanning of all the selected channels.

**Table 31.1** shows the outline of the functions of the A/D converter.

Table 31.1 Functions of A/D Converter

| Item | | | | Source |
|---|---|---|---|---|
| Analog Input Channel | | | | ADC_CH0, ADC_CH1 |
| Conditions for starting A/D conversion | Software | Software trigger | | (Enabled by software) |
| | Asynchronous trigger | External trigger*1 | Trigger input pin | ADC_TRG |
| | Synchronous trigger | Trigger from MTU3a | Compare match with or input capture to MTU0.TGRA | TRGA0N |
| | | | Compare match with or input capture to MTU1.TGRA | TRGA1N |
| | | | Compare match with or input capture to MTU2.TGRA | TRGA2N |
| | | | Compare match with or input capture to MTU3.TGRA | TRGA3N |
| | | | Compare match with or input capture to MTU4.TGRA or underflow of MTU4.TCNT in complementary PWM mode | TRGA4N |
| | | | Compare match with or input capture to MTU6.TGRA | TRGA6N |
| | | | Compare match with or input capture to MTU7.TGRA or underflow of MTU7.TCNT in complementary PWM mode | TRGA7N |
| | | | Compare match with MTU0.TGRE | TRG0N |
| | | | Compare match between MTU4.TADCORA and MTU4.TCNT | TRG4AN |
| | | | Compare match between MTU4.TADCORB and MTU4.TCNT | TRG4BN |
| | | | Compare match between MTU4.TADCORA and MTU4.TCNT or compare match between MTU4.TADCORB and MTU4.TCNT | TRG4AN or TRG4BN |
| | | | Compare match between MTU4.TADCORA and MTU4.TCNT and compare match between MTU4.TADCORB and MTU4.TCNT (when interrupt skipping function 2 is used) | TRG4ABN |
| | | | Compare match between MTU7.TADCORA and MTU7.TCNT | TRG7AN |
| | | | Compare match between MTU7.TADCORB and MTU7.TCNT | TRG7BN |
| | | | Compare match between MTU7.TADCORA and MTU7.TCNT or compare match between MTU7.TADCORB and MTU7.TCNT compare match | TRG7AN or TRG7BN |
| | | | Compare match between MTU7.TADCORA and MTU7.TCNT and compare match between MTU7.TADCORB and MTU7.TCNT (when interrupt skipping function 2 is used) | TRG7ABN |
| Interrupt | | | | INTAD |

Note 1. To set ADC_TRG as the trigger for starting A/D conversion, set the general-purpose I/O function. For details, see **Section 41, General Purpose Input Output Port**.

**Table 31.2** lists the I/O pins used in the A/D converter.

Table 31.2 I/O Pins of A/D Converter

| Pin Name | I/O | Name | Function |
|---|---|---|---|
| ADC_CH0, ADC_CH1 | Input | Analog input pins | Analog input pins |
| ADC_TRG | Input | A/D conversion trigger input | External trigger input pin for starting A/D conversion |
| ADC_AVDD18 | Input | Analog power supply voltage | A/D converter power supply pin |
| VSS | Input | Analog ground | A/D converter ground pin |

## 31.2 List of Registers

**Table 31.3** shows the register list of this module.

The base address is as follows.

Base address: H'0_1005_9000 (Cortex-A55 Address Space)
Base address: H'4005_9000 (Cortex-M33 Address Space Non-Secure)
Base address: H'5005_9000 (Cortex-M33 Address Space Secure)

Table 31.3 List of Registers of A/D Converter

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| A/D converter mode register 0 | ADM0 | R/W | H'0000 | H'0 | 32 |
| A/D converter mode register 1 | ADM1 | R/W | H'0000 | H'4 | 32 |
| A/D converter mode register 2 | ADM2 | R/W | H'0000 | H'8 | 32 |
| A/D converter mode register 3 | ADM3 | R/W | H'0000 | H'C | 32 |
| Reserved | — | R | H'0000 | H'10 – 1F | 32 |
| A/D converter interrupt control register | ADINT | R/W | H'0000 | H'20 | 32 |
| A/D converter status register | ADSTS | R/W | H'0000 | H'24 | 32 |
| A/D converter clock division setting register | ADIVC | R/W | H'0000 | H'28 | 32 |
| A/D converter external trigger pin filter control register | ADFIL | R/W | H'0000 | H'2C | 32 |
| A/D conversion result register 0 | ADCR0 | R | H'0000 | H'30 | 32 |
| A/D conversion result register 1 | ADCR1 | R | H'0000 | H'34 | 32 |
| A/D conversion result register 2 | ADCR2 | R | H'0000 | H'38 | 32 |
| A/D conversion result register 3 | ADCR3 | R | H'0000 | H'3C | 32 |
| Reserved | — | R | H'0000 | H'40 – 6C | 32 |
| Renesas reserved area*1 | — | R/W | Undefined | H'70 – 7F | 32 |

**Note:** When writing successively to the same register, the notes in **Section 31.5.2, Timing Restrictions**, need to be observed.

Note 1. Writing to a Renesas reserved area is prohibited.

# 31.3 Register Descriptions

## 31.3.1 A/D Converter Mode Register 0 (ADM0)

The ADM0 is a 32-bit register that controls A/D conversion and the power-saving mode of the A/D converter, and also executes a software reset. This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SRESB | — | — | — | — | — | — | — | — | — | — | — | — | PWDWNB | ADBSY | ADCE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 15 | SRESB | 0 | R/W | Issues a software reset to the A/D converter. Circuits (e.g. registers) other than those of the A/D converter will not be reset. To release the A/D converter from the reset state, write 1 to this bit.<br>0: A/D converter is reset.<br>1: A/D converter is released from the reset state.<br>The A/D converter enters the power-saving mode when this bit is used to execute a reset. |
| 14 to 3 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 2 | PWDWNB | 0 | R/W | Specifies the A/D converter to enter or exit the power-saving mode.<br>0: Power-saving mode<br>1: Normal mode |
| 1 | ADBSY | 0 | R | Indicates the status of the A/D converter.<br>This bit is read-only. Writing to this bit is ignored.<br>0: A/D converter is stopped.<br>1: A/D converter is busy.<br>For operation of the ADBSY bit, see **Figure 31.1**. |
| 0 | ADCE | 0 | R/W | Stops or enables the A/D converter.<br>0: A/D converter is stopped.<br>1: A/D converter is enabled.<br>When 0 is written to the ADCE bit, the A/D converter stops operating. For operation of the ADCE bit at reading, see **Figure 31.1**. |

**Note:** Notes regarding the ADM0 register are given on the next page.

NOTES

1. To enable A/D conversion operation using the ADCE bit, first switch from PWDWNB = 0 (power-saving mode) to PWDWNB = 1 (normal mode) and then wait for a period equal to or longer than the stabilization wait time before setting the ADCE bit to 1. The stabilization wait time is 1 µs.
2. To make a transition to the power-saving mode using the PWDWNB bit, first stop operation of the A/D converter (ADCE = 0) and then confirm that A/D conversion is completed (ADBSY = 0) before setting the PWDWNB bit to 0.

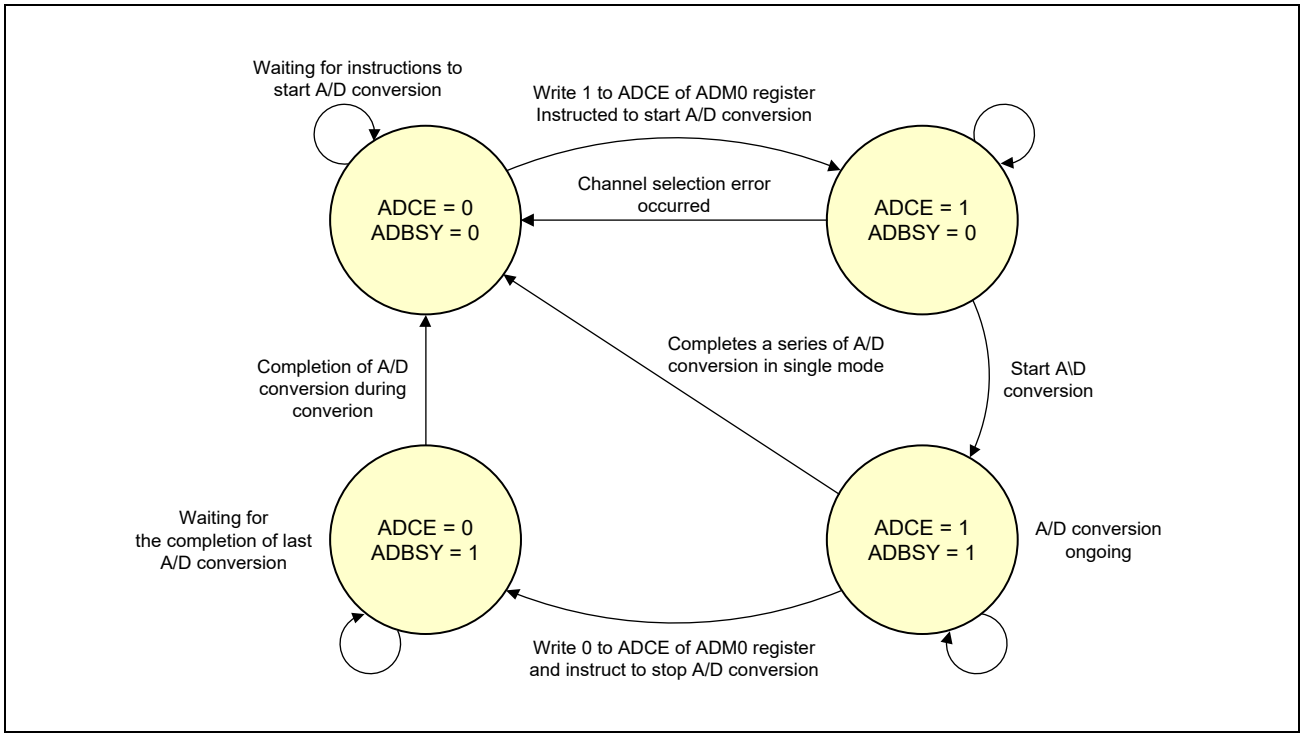

Figure 31.1 State Transitions of ADCE Bit and ADBSY Bit

### 31.3.2 A/D Converter Mode Register 1 (ADM1)

The ADM1 is a 32-bit register that controls A/D conversion and sets the mode for a hardware trigger. This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | TRGEN5 | TRGEN4 | TRGEN3 | TRGEN2 | TRGEN1 | TRGEN0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | EGA1 | EGA0 | — | — | — | — | — | — | — | BS | RPS | MS | TRGIN | TRG |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 22 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 21 to 16 | TRGEN[5:0] | All 0 | R/W | These bits select the hardware trigger pin.<br>For details, see **Table 31.4**. |
| 15, 14 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 13, 12 | EGA[1:0] | 00 | R/W | These bits select the valid edge of the trigger pin. |

| EGA1 | EGA0 | Valid Edge |
|---|---|---|
| 0 | 0 | Hardware trigger is invalid |
| 0 | 1 | Falling edge |
| 1 | 0 | Rising edge |
| 1 | 1 | Both edges |

*Note*: When the EGA[1:0] bits are set to 00 in hardware trigger mode, a trigger from the trigger pin will be ignored. When a trigger pin of the MTU3a is used, the falling edge is always valid and the setting of the EGA[1:0] bits (01b, 10b, or 11b) will be ignored. When the external trigger pin (ADC_TRG) is used, the valid edge is set by the EGA[1:0] bits.

| | | | | |
|---|---|---|---|---|
| 11 to 5 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 4 | BS | 0 | R/W | Selects the buffer mode (valid in select mode).<br>0: 1-buffer mode<br>1: 4-buffer mode<br>4-buffer mode is prohibited in scan mode. |
| 3 | RPS | 0 | R/W | Selects the repeat number.<br>0: Single<br>1: Repeat |
| 2 | MS | 0 | R/W | Selects the operating mode.<br>0: Scan mode<br>1: Select mode |
| 1 | TRGIN | 0 | R/W | Selects the trigger input mode.<br>0: Auto mode<br>1: Step mode |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | TRG | 0 | R/W | Sets the trigger mode.<br>0: Software trigger mode*1<br>1: Hardware trigger mode |

Note 1. Set the EGA[1:0] bits to 00 when using software trigger mode.

Table 31.4 TRGEN[5:0] Bits and Trigger Source

| Module | Source | Description | TRGEN[5:0] Bits | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | 5 | 4 | 3 | 2 | 1 | 0 |
| External pin | ADC_TRG | External trigger input | 0 | 0 | 0 | 0 | 0 | 0 |
| MTU | TRGA0N | Compare match with or input capture to MTU0.TGRA | 0 | 0 | 0 | 0 | 0 | 1 |
| | TRGA1N | Compare match with or input capture to MTU1.TGRA | 0 | 0 | 0 | 0 | 1 | 0 |
| | TRGA2N | Compare match with or input capture to MTU2.TGRA | 0 | 0 | 0 | 0 | 1 | 1 |
| | TRGA3N | Compare match with or input capture to MTU3.TGRA | 0 | 0 | 0 | 1 | 0 | 0 |
| | TRGA4N | Compare match with or input capture to MTU4.TGRA or underflow (trough) of MTU4.TCNT in complementary PWM mode | 0 | 0 | 0 | 1 | 0 | 1 |
| | TRGA6N | Compare match with or input capture to MTU6.TGRA | 0 | 0 | 0 | 1 | 1 | 0 |
| | TRGA7N | Compare match with or input capture to MTU7.TGRA or underflow (trough) of MTU7.TCNT in complementary PWM mode | 0 | 0 | 0 | 1 | 1 | 1 |
| | TRG0N | Compare match with MTU0.TGRE | 0 | 0 | 1 | 0 | 0 | 0 |
| | TRG4AN | Compare match between MTU4.TADCORA and MTU4.TCNT | 0 | 0 | 1 | 0 | 0 | 1 |
| | TRG4BN | Compare match between MTU4.TADCORB and MTU4.TCNT | 0 | 0 | 1 | 0 | 1 | 0 |
| | TRG4AN or TRG4BN | Compare match between MTU4.TADCORA and MTU4.TCNT or compare match between MTU4.TADCORB and MTU4.TCNT | 0 | 0 | 1 | 0 | 1 | 1 |
| | TRG4ABN | Compare match between MTU4.TADCORA and MTU4.TCNT and compare match between MTU4.TADCORB and MTU4.TCNT (when interrupt skipping function 2 is used) | 0 | 0 | 1 | 1 | 0 | 0 |
| | TRG7AN | Compare match between MTU7.TADCORA and MTU7.TCNT | 0 | 0 | 1 | 1 | 0 | 1 |
| | TRG7BN | Compare match between MTU7.TADCORB and MTU7.TCNT | 0 | 0 | 1 | 1 | 1 | 0 |
| | TRG7AN or TRG7BN | Compare match between MTU7.TADCORA and MTU7.TCNT or compare match between MTU7.TADCORB and MTU7.TCNT | 0 | 0 | 1 | 1 | 1 | 1 |
| | TRG7ABN | Compare match between MTU7.TADCORA and MTU7.TCNT and compare match between MTU7.TADCORB and MTU7.TCNT (when interrupt skipping function 2 is used) | 0 | 1 | 0 | 0 | 0 | 0 |

### 31.3.3 A/D Converter Mode Register 2 (ADM2)

The ADM2 is a 32-bit register that specifies the analog input channels to be used in A/D conversion. This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CHSEL 1 | CHSEL 0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 7 to 2 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 1, 0 | CHSEL[1:0] | All 0 | R/W | These bits select the A/D analog input channel n (n = 0, 1).<br>0: Analog input channel n is not subjected to conversion.<br>1: Analog input channel n is subjected to conversion. |

Note 1. Select only one channel in select mode.

Note 2. If more than one channel is selected in select mode, a channel select error occurs.

### 31.3.4 A/D Converter Mode Register 3 (ADM3)

The ADM3 is a 32-bit register that sets the sampling period of the A/D converter. Be sure to set this register before starting the A/D converter. This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ADIL7 | ADIL6 | ADIL5 | ADIL4 | ADIL3 | ADIL2 | ADIL1 | ADIL0 | ADCMP7 | ADCMP6 | ADCMP5 | ADCMP4 | ADCMP3 | ADCMP2 | ADCMP1 | ADCMP0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ADSMP15 | ADSMP14 | ADSMP13 | ADSMP12 | ADSMP11 | ADSMP10 | ADSMP9 | ADSMP8 | ADSMP7 | ADSMP6 | ADSMP5 | ADSMP4 | ADSMP3 | ADSMP2 | ADSMP1 | ADSMP0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | ADIL[7:0] | All 0 | R/W | These bits should be set to H'00. |
| 23 to 16 | ADCMP[7:0] | All 0 | R/W | These bits should be set to H'0E. |
| 15 to 0 | ADSMP[15:0] | All 0 | R/W | These bits set the sampling period (unit: ADIVCLK cycle).<br>A value from H'06 (6 T) to H'AF0 (2800 T) can be set.<br>T stands for the cycle of ADIVCLK (20 MHz). |

**Note:** The ADIL[7:0] bits should be set to H'00 and the ADCMP[7:0] bits should be set to H'0E. If they are set to other values, normal operation cannot be guaranteed.

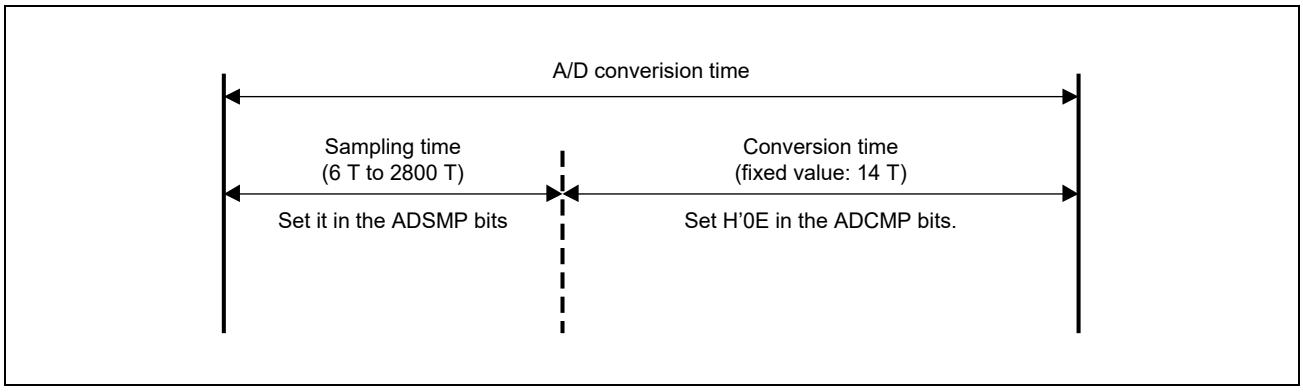

Figure 31.2 Correspondence between ADM3 Register and A/D Conversion Time

NOTE

ADIVCLK is a clock obtained by dividing the frequency of ADC_ADCLK(TSUϕ) with the ADIVC register setting.

### 31.3.5 A/D Converter Interrupt Control Register (ADINT)

The ADINT is a 32-bit register that controls interrupts. This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | INTS | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CSEEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | INTEN3 | INTEN2 | INTEN1 | INTEN0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | INTS | 0 | R/W | Selects the attribute of the interrupt (INTAD) signal.<br>0: Pulse signal<br>1: Reserved<br>This bit should be set to 0. |
| 30 to 17 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 16 | CSEEN | 0 | R/W | Enables or disables the A/D conversion channel select error interrupt.<br>0: Interrupt output is disabled.<br>1: Interrupt output is enabled. |
| 15 to 8 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 7 to 4 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 3 to 0 | INTEN[3:0] | All 0 | R/W | These bits enable or disable the conversion end interrupt of channel n (n = 0 to 3).<br>0: Interrupt output is disabled.<br>1: Interrupt output is enabled.<br>INTEN3-2 is used only in 4-buffer mode. |

The interrupt signal is specified as a pulse and that pulse is output at any of the following timing:

1. An A/D conversion request is detected while the ADM2 register has caused an A/D conversion channel select error
2. Completion of conversion on the channel for which interrupt output has been enabled in the ADINT register
3. An A/D conversion request is detected while 4-buffer mode has been specified in scan mode

### 31.3.6 A/D Converter Status Register (ADSTS)

The ADSTS is a 32-bit register that controls the state of the A/D converter. This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Note 1. When an interrupt source is generated simultaneously with clearing of the interrupt source, clearing is ignored and the respective bit remains set to 1.

### 31.3.7 A/D Converter Clock Division Setting Register (ADIVC)

The ADIVC is a 32-bit register that sets the frequency division ratio for dividing the frequency of ADC_ADCLK(TSUϕ) and supplying a clock to the A/D converter. ADIVCLK is a clock obtained by dividing the frequency of ADC_ADCLK(TSUϕ).

This register can be read from and written to in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 31.3.9 A/D Conversion Result Registers 3 to 0 (ADCR3 to ADCR0)

The ADCR3 to ADCR0 are 32-bit registers that hold the A/D conversion results. The A/D converter has four 32-bit registers. These registers are read from in 32-bit units.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | AD11 | AD10 | AD9 | AD8 | AD7 | AD6 | AD5 | AD4 | AD3 | AD2 | AD1 | AD0 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>When read, the initial value is read. The written value will be ignored. |
| 11 to 0 | AD[11:0] | All 0 | R | These bits hold the A/D conversion results. |

| Analog Input Channel | ADCR3 to ADCR0 Registers | |
|---|---|---|
| | Select Mode with 1-Buffer Mode Selected or Scan Mode | Select Mode with 4-Buffer Mode Selected |
| 0 | ADCR0 | ADCR3 to ADCR0 |
| 1 | ADCR1 | |
| 2 | — | |
| 3 | — | |

The following formula indicates the relationship between the analog input voltage that is input to analog input pins (ADC_CH1, ADC_CH0) and the A/D conversion results (A/D conversion result registers (ADCR3 to ADCR0)).

$$\mathrm{ADCR} = \mathrm{INT}\left[\frac{\mathrm{Vin}}{\mathrm{ADC_AVREF}} \times 2^{\mathrm{d}} \times 0.5\right]$$

or

$$(\mathrm{ADCR} - 0.5) \times \frac{\mathrm{ADC_AVREF}}{2^{\mathrm{d}}} \leq \mathrm{Vin} < (\mathrm{ADCR} + 0.5) \times \frac{\mathrm{ADC_AVREF}}{2^{\mathrm{d}}}$$

| | |
|---|---|
| INT[ ]: | Function that returns the integer portion of the value enclosed in [ ] |
| Vin: | Analog input voltage |
| ADC_AVREF: | Voltage of power supply pin(ADC_AVDD18) for the analog unit |
| ADCR: | Value of A/D conversion result registers (ADCR3 to ADCR0) |
| d: | Resolution of A/D converter (d = 12 in this LSI) |

The relationship between the analog input voltage and A/D conversion result is shown in the figure below.

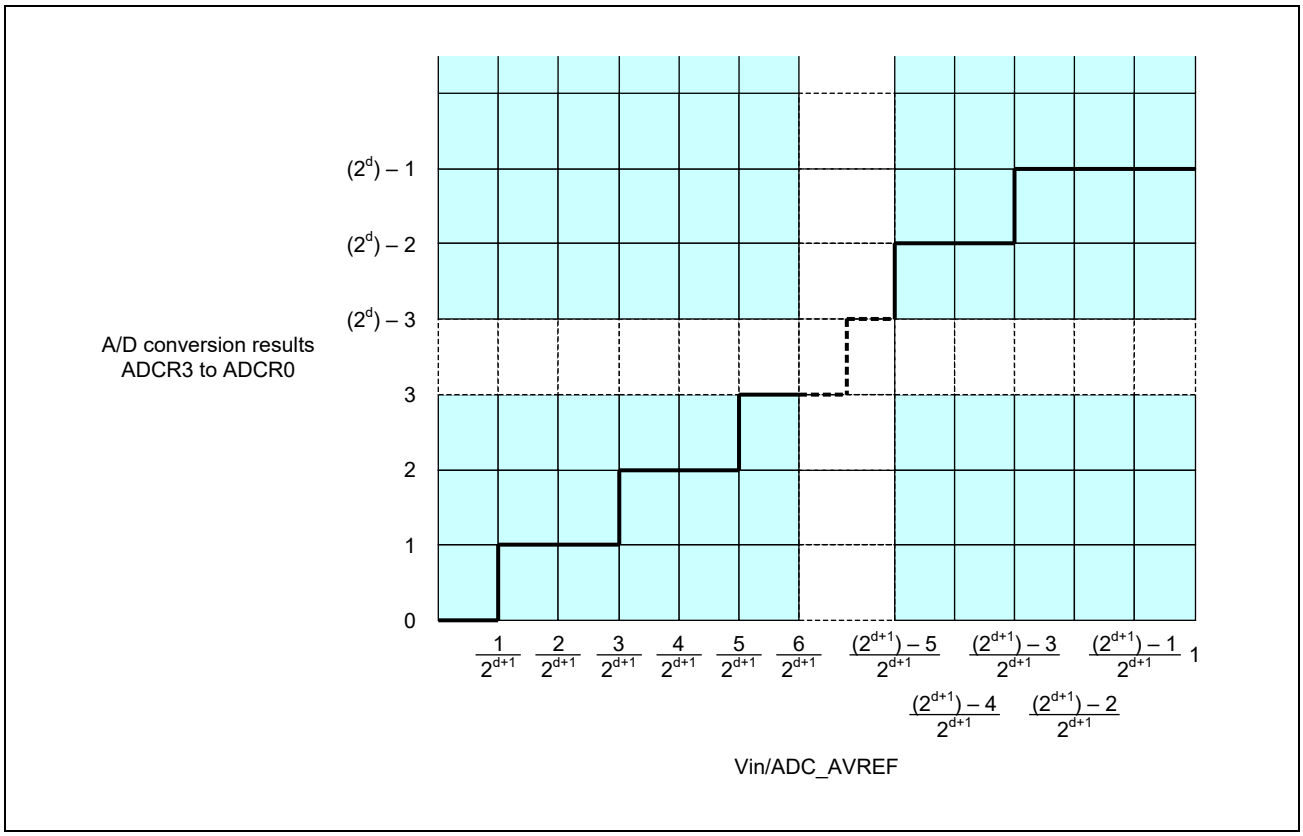

Figure 31.3 Relationship between Analog Input Voltage and A/D Conversion Result

# 31.4 Operation

## 31.4.1 Types of A/D Conversion Modes

The following A/D conversion modes can be specified. A/D conversion modes can be set in the ADM1 register.

Table 31.5 A/D Conversion Modes

| Trigger Mode | Trigger Input Mode | Operating Mode | Conversion Count | Buffer Count | Operation | Example of A/D Conversion for Reference |
|---|---|---|---|---|---|---|
| Software trigger | — | Select | Single | 1 buffer | Selected 1 channel × 1-time conversion | **Section 31.4.4.1, Example of A/D Conversion in Select Mode with Single Mode Selected** |
| | | | | 4 buffers | Selected 1 channel × 4-time conversion | — |
| | | | Repeat | 1 buffer | (Selected 1 channel × 1-time conversion) × repeated | **Section 31.4.4.2, Example of A/D Conversion in Select Mode with Repeat Mode Selected** |
| | | | | 4 buffers | (Selected 1 channel × 4-time conversion) × repeated | **Section 31.4.4.3, Example of A/D Conversion in 4-Buffer Mode** |
| | | Scan | Single | 1 buffer | All selected channels × 1-time conversion | **Section 31.4.4.4, Example of A/D Conversion in Scan Mode with Single Mode Selected** |
| | | | | 4 buffers | (Setting prohibited) | |
| | | | Repeat | 1 buffer | (All selected channels × 1-time conversion) × repeated | **Section 31.4.4.5, Example of A/D Conversion in Scan Mode with Repeat Mode Selected** |
| | | | | 4 buffers | (Setting prohibited) | |
| Hardware trigger | Auto (started with a single trigger input) | Select | Single | 1 buffer | Selected 1 channel × 1-time conversion | — |
| | | | | 4 buffers | Selected 1 channel × 4-time conversion | — |
| | | | Repeat | 1 buffer | (Selected 1 channel × 1-time conversion) × repeated | — |
| | | | | 4 buffers | (Selected 1 channel × 4-time conversion) × repeated | — |
| | | Scan | Single | 1 buffer | All selected channels × 1-time conversion | **Section 31.4.4.6, Example of A/D Conversion in Auto Mode** |
| | | | | 4 buffers | (Setting prohibited) | |
| | | | Repeat | 1 buffer | (All selected channels × 1-time conversion) × repeated | — |
| | | | | 4 buffers | (Setting prohibited) | |
| | Step (conversion proceeds at every trigger input) | Select | Single | 1 buffer | Selected 1 channel × 1-time conversion | — |
| | | | | 4 buffers | Selected 1 channel × 4-time conversion | — |
| | | | Repeat | 1 buffer | (Selected 1 channel × 1-time conversion) × repeated | — |
| | | | | 4 buffers | (Selected 1 channel × 4-time conversion) × repeated | — |
| | | Scan | Single | 1 buffer | All selected channels × 1-time conversion | **Section 31.4.4.7, Example of A/D Conversion in Step Mode** |
| | | | | 4 buffers | (Setting prohibited) | |
| | | | Repeat | 1 buffer | (All selected channels × 1-time conversion) × repeated | — |
| | | | | 4 buffers | (Setting prohibited) | |

**Note:** When 4-buffer mode is set in scan mode, a channel select error occurs.

#### 31.4.1.1 Trigger Modes

Software trigger mode and hardware trigger mode are the two types of trigger modes in which the trigger is the timing for starting the A/D conversion processing. These trigger modes can be set by the TRG bit in the ADM1 register.

##### (1) Software Trigger Mode

In software trigger mode, A/D conversion is started for the input of the ADC_CH1, ADC_CH0 pins by setting the ADCE bit in the ADM0 register to 1. The ADBSY bit in the ADM0 register is 1 while the converter is operating.

The hardware trigger is invalid when software trigger mode is set. Set the EGA[1:0] bits in the ADM1 register to 00 when using software trigger mode. When a hardware trigger is input, A/D conversion is not started and the TRGS bit in the ADSTS register retains 0.

##### (2) Hardware Trigger Mode

There are two triggers in hardware trigger mode: asynchronous trigger using the ADC_TRG pin as the activation source and synchronous trigger using the multi-function timer pulse unit 3 (MTU3a) as the activation source.

The valid edge of the selected hardware trigger can be set by the EGA[1:0] bits in the ADM1 register.

When the ADCE bit in the ADM0 register is set to 1, the A/D converter enters a standby state for a hardware trigger after 250 ns as passed and will start conversion operation upon detection of a valid edge. The ADBSY bit in the ADM0 register remains to be 1 during conversion operation.

The status of the TRGS bit in the ADSTS register can be cleared by writing 1 to the TRGS bit.

In hardware trigger mode, the available trigger input modes are auto mode and step mode. The trigger input mode can be set in the TRGIN bit in the ADM1 register.

###### (a) Auto mode

When a hardware trigger is input once, A/D conversion is repeated automatically for the conversion count in accordance with the specified conversion settings.

###### (b) Step mode

A/D conversion proceeds every time a hardware trigger is input. For example, if select mode, single mode, and 4-buffer mode are selected, conversion finishes when a hardware trigger has been input four times.

#### 31.4.1.2 Operating mode

There are two operating modes: select mode and scan mode. The select mode has 1-buffer mode and 4-buffer mode as sub-modes. These modes can be set in the BS and MS bits in the ADM1 register.

##### (1) Select Mode

A/D conversion proceeds for the analog input specified in the CHSEL[1:0] bits in the ADM2 register. The A/D conversion results are stored in the ADCR3 to ADCR0 registers corresponding to the ADC_CH1, ADC_CH0 pins. In select mode, 1-buffer mode or 4-buffer mode can be used as the method for storing the A/D conversion results.

Only one channel is selectable for A/D conversion in select mode.

If more than one analog input channel is selected in select mode, a channel select error occurs.

###### (a) 1-buffer mode

A/D conversion proceeds only once for the analog input specified in the ADM2 register and the conversion result is stored in the ADCR3 to ADCR0 registers corresponding to the ADC_CH1, ADC_CH0 pins.

The ADC_CH1, ADC_CH0 pins correspond with the ADCR3 to ADCR0 registers on a one-on-one basis. If interrupt output is enabled in the INTEN[3:0] bits in the ADINT register for the channels on which A/D conversion proceeds, an A/D conversion end interrupt (INTAD) occurs on completion of a single conversion.

This mode is usable for reading the result of a single conversion.

###### (b) 4-buffer mode

A/D conversion proceeds four times for the analog input specified in the ADM2 register and the conversion results are stored ADCR3 to ADCR0 registers. See **Table 31.7** for the correspondence between the analog inputs and A/D conversion result registers.

If interrupt output is enabled in the INTEN[3:0] bits in the ADINT register for the channels corresponding to the ADCR3 to ADCR0 registers where the A/D conversion result is to be stored in 1-buffer mode, an A/D conversion end interrupt (INTAD) occurs when the A/D conversion result is stored in the ADCR3 to ADCR0 registers. For example, to generate an interrupt on the fourth A/D conversion when ADC_CH0 is selected, set the INTEN3 bit in the ADINT register to 1.

See **Table 31.6** for the relationship between the setting of the ADINT register and the output of an A/D conversion end interrupt in 4-buffer mode.

This mode is usable for obtaining the average of the A/D conversion results.

Table 31.6 ADINT Setting and Generation of A/D Conversion End Interrupt in 4-Buffer Mode

| Channel for A/D Conversion | ADINT Register Setting | | A/D Conversion End Interrupt |
|---|---|---|---|
| 1 channel is selected from ADC_CH1, ADC_CH0 | INTEN[0] | 1: Interrupt is enabled | An interrupt is output on completion of A/D conversion on channel 0. |
| | | 0: Interrupt is disabled | No interrupt is output on completion of A/D conversion on channel 0. |
| | INTEN[1] | 1: Interrupt is enabled | An interrupt is output on completion of A/D conversion on channel 1. |
| | | 0: Interrupt is disabled | No interrupt is output on completion of A/D conversion on channel 1. |
| | INTEN[2] | 1: Interrupt is enabled | An interrupt is output on completion of third A/D conversion (used only in 4-buffer mode). |
| | | 0: Interrupt is disabled | No interrupt is output on completion of A/D conversion. |
| | INTEN[3] | 1: Interrupt is enabled | An interrupt is output on completion of fourth A/D conversion (used only in 4-buffer mode). |
| | | 0: Interrupt is disabled | No interrupt is output on completion of A/D conversion. |

Table 31.7 Correspondence between Analog Inputs and A/D Conversion Result Registers in 4-Buffer Mode

| Analog Input | A/D Conversion Result Register |
|---|---|
| 1 channel is selected from ADC_CH1, ADC_CH0 | ADCR0 (first time) |
| | ADCR1 (second time) |
| | ADCR2 (third time) |
| | ADCR3 (fourth time) |

#### (2) Scan Mode

A/D conversion proceeds for the analog inputs of channels selected in the ADM2 register, in ascending order of channel number. The A/D conversion results are stored in the ADCR3 to ADCR0 registers corresponding to the analog inputs. If interrupt output is enabled in the INTEN[3:0] bits in the ADINT register for the channels on which A/D conversion proceeds, an A/D conversion end interrupt (INTAD) occurs when A/D conversion on the relevant channel finishes.

This mode is usable for constantly monitoring multiple analog signals.

In scan mode, only 1-buffer mode can be specified. If 4-buffer mode is specified in scan mode, a channel select error occurs.

### 31.4.1.3 Conversion Mode

Single mode and repeat mode are available. Use the RPS bit in the ADM1 register to set the conversion mode.

#### (1) Single Mode

When A/D conversion for the number of times of the conversion count finishes, the ADCE bit in the ADM0 register is automatically cleared to 0. For the number of times of conversion, see the description of operation in **Table 31.5**.

#### (2) Repeat Mode

When 1 is written to the ADCE bit in the ADM0 register, A/D conversion repeatedly proceeds in the A/D conversion mode specified in the ADM1 register. Immediately after 0 is written to the ADCE bit in the ADM0 register, A/D conversion is finished.

For the number of times of conversion, see the description of operation in **Table 31.5**.

### 31.4.2 Interrupt Functions

**Table 31.8** lists the interrupt sources of the A/D converter and the conditions for generating them and the methods for confirming and clearing the interrupt sources.

The INTS bit in the ADINT register is used to set the operation for outputting an interrupt request of the INTAD.

Table 31.8 List of Interrupt Functions

| Interrupt Source | Condition for Generation | Enabling Interrupt<br>ADINT Register | Confirming Interrupt Source<br>ADSTS Register*1 | Method for Clearing Interrupt Source<br>ADSTS Register |
|---|---|---|---|---|
| A/D conversion end | When A/D conversion on the specified channel is completed | INTEN[3:0]*2 | INTST[3:0] | Write 1 to the bits that were 1 when the register was read. |
| A/D conversion channel select error | • When all of the CHSEL[1:0] bits in the ADM2 register were 0 at the start of A/D conversion*3<br>• When multiple analog input channels are selected in select mode*3<br>• When 4-buffer mode is specified in scan mode*3 | CSEEN | CSEST | Write 1 to the CSEST bit. |

Note 1. If an interrupt source is generated regardless of the settings of the INTEN[3:0] and CSEEN bits in the ADINT register, the bit corresponding to the interrupt source is set to 1 in the ADSTS register.

Note 2. The A/D conversion end interrupt can be enabled or disabled individually for each channel.

Note 3. When an A/D conversion channel select error occurs, the ADCE bit in the ADM0 register becomes 0 and A/D conversion operation is stopped.

### 31.4.3 Procedures of A/D Conversion

Follow the procedures given below for A/D conversion.

(1) Procedure for starting A/D conversion

After the A/D converter is released from the software reset state, use the ADM3 to ADM0 registers*[1] to select the analog input channels on which A/D conversion proceeds and specify the trigger mode (software trigger or hardware trigger), operating mode (select or scan), etc.

Setting the ADCE bit in the ADM0 register to 1 will start A/D conversion in software trigger mode, whereas the A/D converter will enter a standby state for a trigger*[2] in hardware trigger mode.

*Note 1.* Set the ADM3 to ADM0 registers when conversion by the A/D converter is stopped (ADBSY bit in the ADM0 register is 0).

*Note 2.* If the ADCE bit in the ADM0 register is set to 1 in hardware trigger mode, a transition is made to a trigger standby state. A/D conversion is started (ADBSY bit in ADM0 register is 1) by a hardware trigger signal and the A/D converter returns to the trigger standby state (ADBSY bit in ADM0 register is 0) on completion of A/D conversion.

A/D conversion operation is enabled.

After the A/D converter makes a transition from power-saving mode to normal mode, a period as long as the stabilization wait time is required. The stabilization wait time is 1 µs.

After the stabilization wait time has passed, set the ADCE bit in the ADM0 register to 1.

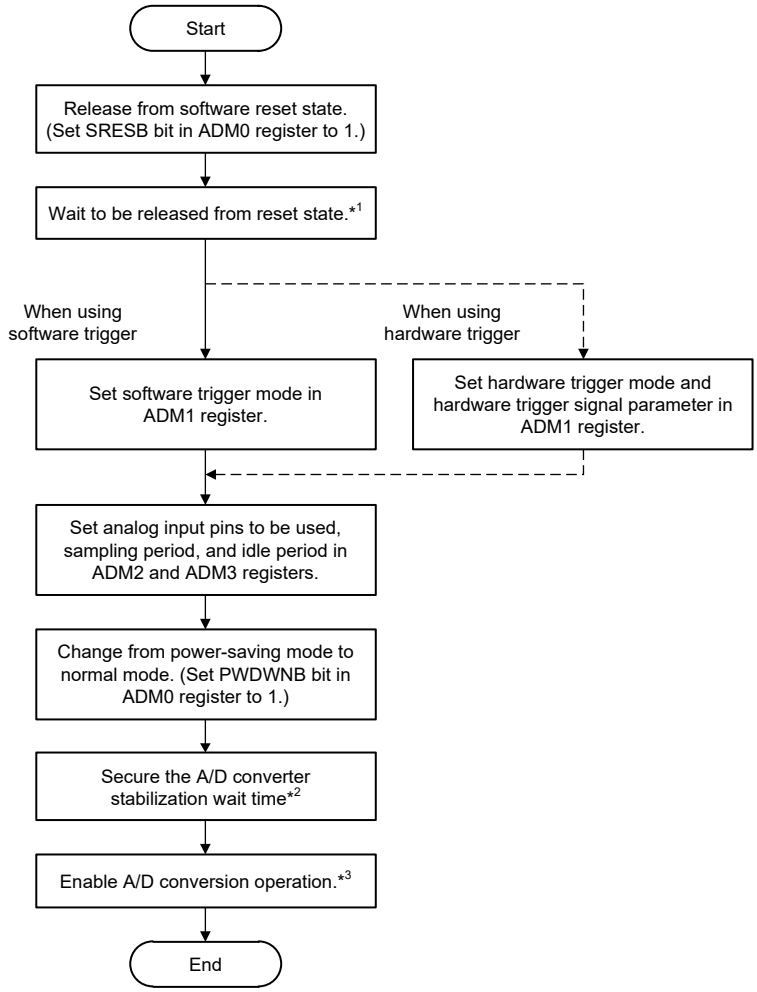
In software trigger mode, setting the ADCE bit to 1 starts A/D conversion.

In hardware trigger mode, setting the ADCE bit to 1 makes the A/D converter enter a standby state for a hardware trigger after 250 ns has passed, and conversion operation is started upon detection of a valid edge.

(2) When A/D conversion is finished, the A/D conversion results are stored in the ADCR3 to ADCR0 registers. Also, an A/D conversion end interrupt (INTAD) occurs on completion of A/D conversion on the channels specified in the INTEN[3:0] bits in the ADINT register.

### 31.4.3.1 Procedure for Starting A/D Conversion

Use the following flowchart to start A/D conversion.



Note 1. The time waiting for the A/D converter to be released from the reset state is 2 × ADC_ADCLK(TSUϕ).

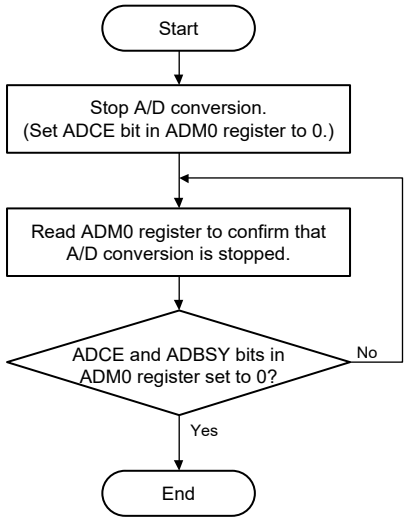
Note 2. The stabilization wait time is 1 µs.

Note 3. In software trigger mode, A/D conversion is started by setting the ADCE bit to 1.
In hardware trigger mode, after the ADCE bit is set to 1, A/D conversion is started upon detection of a valid edge.

Figure 31.4 Procedure for Starting A/D Conversion

### 31.4.3.2 Procedure for Stopping A/D Conversion

Use the following flowchart to stop A/D conversion.

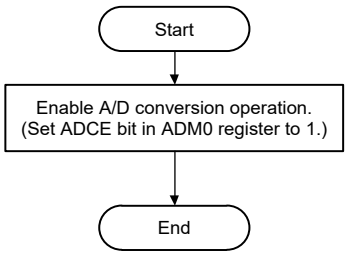


**Note:** For details on the operation for stopping conversion by writing 0 to the ADCE bit, see **Table 31.10**.

Figure 31.5 Procedure for Stopping A/D Conversion

### 31.4.3.3 Procedure for Stopping and Restarting A/D Conversion

Use the following flowchart to restart A/D conversion after it has been stopped with the procedure for stopping A/D conversion.



**Note:** For details on the operation for restarting conversion, see **Table 31.10**.

Figure 31.6 Procedure for Stopping and Restarting A/D Conversion

### 31.4.3.4 Procedure for Entering Power-saving Mode

Use the following flowchart to make a transition to the power-saving mode.

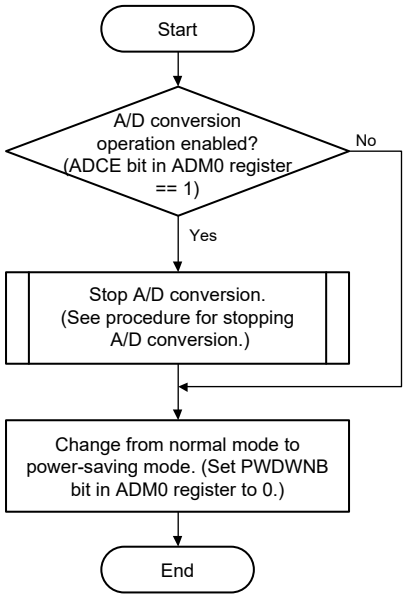


Figure 31.7 Procedure for Entering Power-Saving Mode

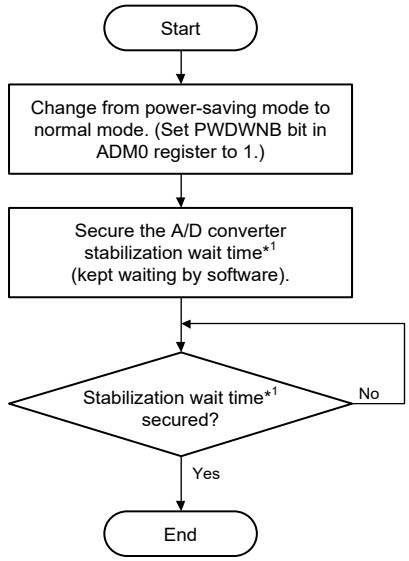
### 31.4.3.5 Procedure for Releasing from Power-saving Mode

Use the following flowchart to release the A/D converter from the power-saving mode.



Note 1. The stabilization wait time is 1 µs.

Figure 31.8 Procedure for Releasing from Power-Saving Mode

#### 31.4.3.6 Procedure for a Software Reset

Use the following flowchart to execute a software reset.

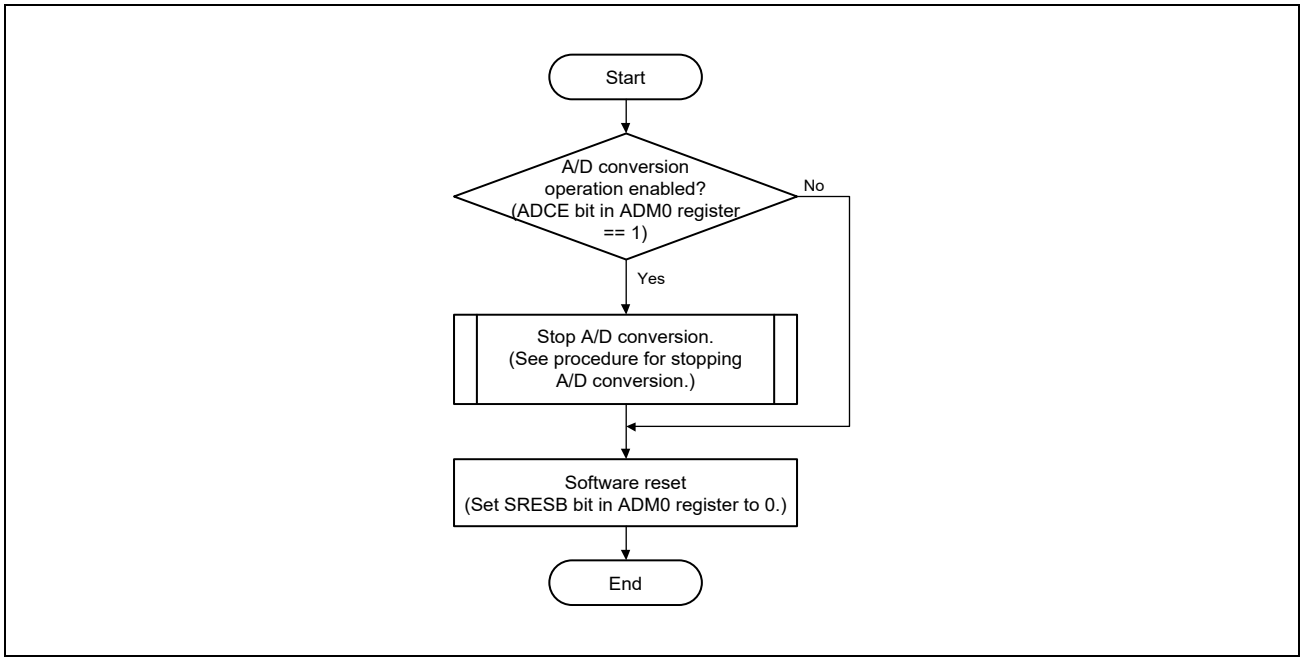


Figure 31.9 Procedure for a Software Reset

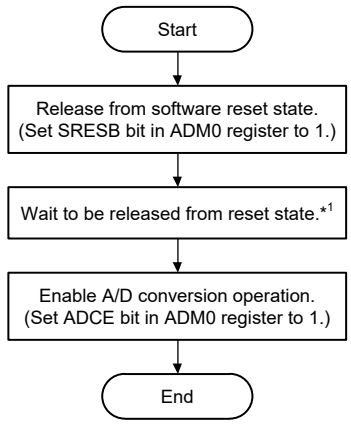
### 31.4.3.7 Procedure for Restarting A/D Conversion after a Software Reset

Use the following flowchart to start A/D conversion, then execute a software reset with the procedure for a software reset, and finally restart A/D conversion.



Note 1. The time waiting for the A/D converter to be released from the reset state is 2 × ADC_ADCLK(TSUϕ).

Figure 31.10 Procedure for Restarting A/D Conversion after a Software Reset

#### 31.4.3.8 Procedure for Interrupt Processing

Use the flowchart in **Figure 31.11** to process an interrupt request that was output by the A/D converter.

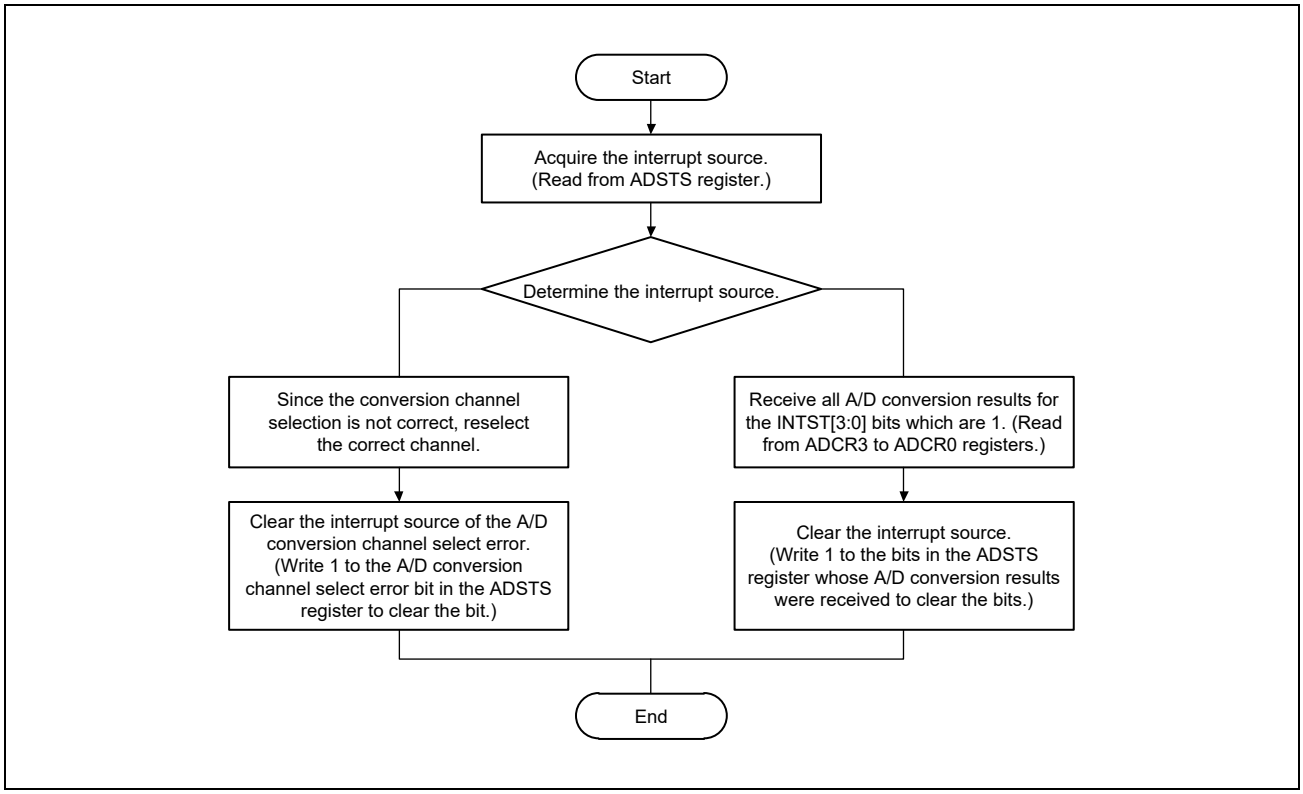


Figure 31.11 Procedure for Interrupt Processing

### 31.4.4 Examples of A/D Conversion

This section gives examples of A/D conversion.

1) Example of A/D conversion in select mode with single mode selected
2) Example of A/D conversion in select mode with repeat mode selected
3) Example of A/D conversion in 4-buffer mode
4) Example of A/D conversion in scan mode with single mode selected
5) Example of A/D conversion in scan mode with repeat mode selected
6) Example of A/D conversion in auto mode
7) Example of A/D conversion in step mode

Note to confirm the differences between modes shown below because not all possible combinations are included in this manual.

- For the differences between 1-buffer mode and 4-buffer mode, refer to 1) and 3).
- For the differences between single mode and repeat mode, refer to 1) and 2).
- For the differences between select mode and scan mode, refer to 1) and 4) or 2) and 5)
- For the differences between auto mode and step mode, refer to 6) and 7)
- For the differences between software trigger mode and hardware trigger mode, refer to 4) and 6).

### 31.4.4.1 Example of A/D Conversion in Select Mode with Single Mode Selected

**Figure 31.12** shows an example of A/D conversion with software trigger mode, select mode, single mode and 1-buffer mode are selected. In the example in **Figure 31.12**, conversion proceeds with the analog input changed from ADC_CH0, ADC_CH1.

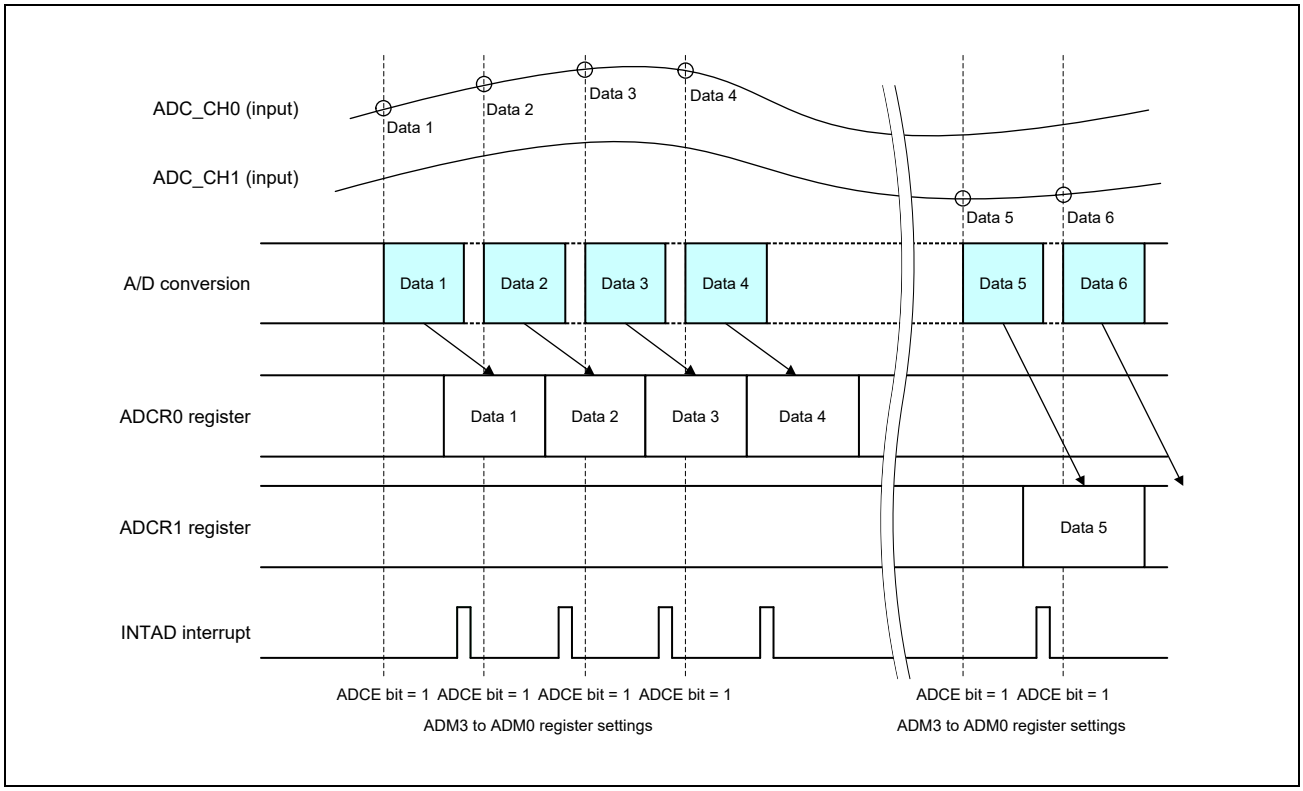

Figure 31.12 Example of A/D Conversion in Select Mode with Single Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, single mode, and 1-buffer mode are selected, and analog input pin ADC_CH0 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 0 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result is stored in the ADCR0 register).
9. An INTAD interrupt occurs.
10. Steps 7 to 9 above are repeated.
11. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.
12. In the ADM3 to ADM0 registers, software trigger mode, select mode, single mode, and 1-buffer mode are selected, and analog input pin ADC_CH1 is set.

13. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
14. A/D conversion proceeds on ADC_CH1 (A/D conversion result is stored in the ADCR1 register).
15. An INTAD interrupt occurs.
16. Steps 13 to 15 above are repeated.

**Note 1.** The stabilization wait time is 1 μs.

### 31.4.4.2 Example of A/D Conversion in Select Mode with Repeat Mode Selected

**Figure 31.13** shows an example of A/D conversion with software trigger mode, select mode, repeat mode, and 1-buffer mode are selected. In the example in **Figure 31.13**, conversion proceeds with the analog input changed from ADC_CH0, ADC_CH1.

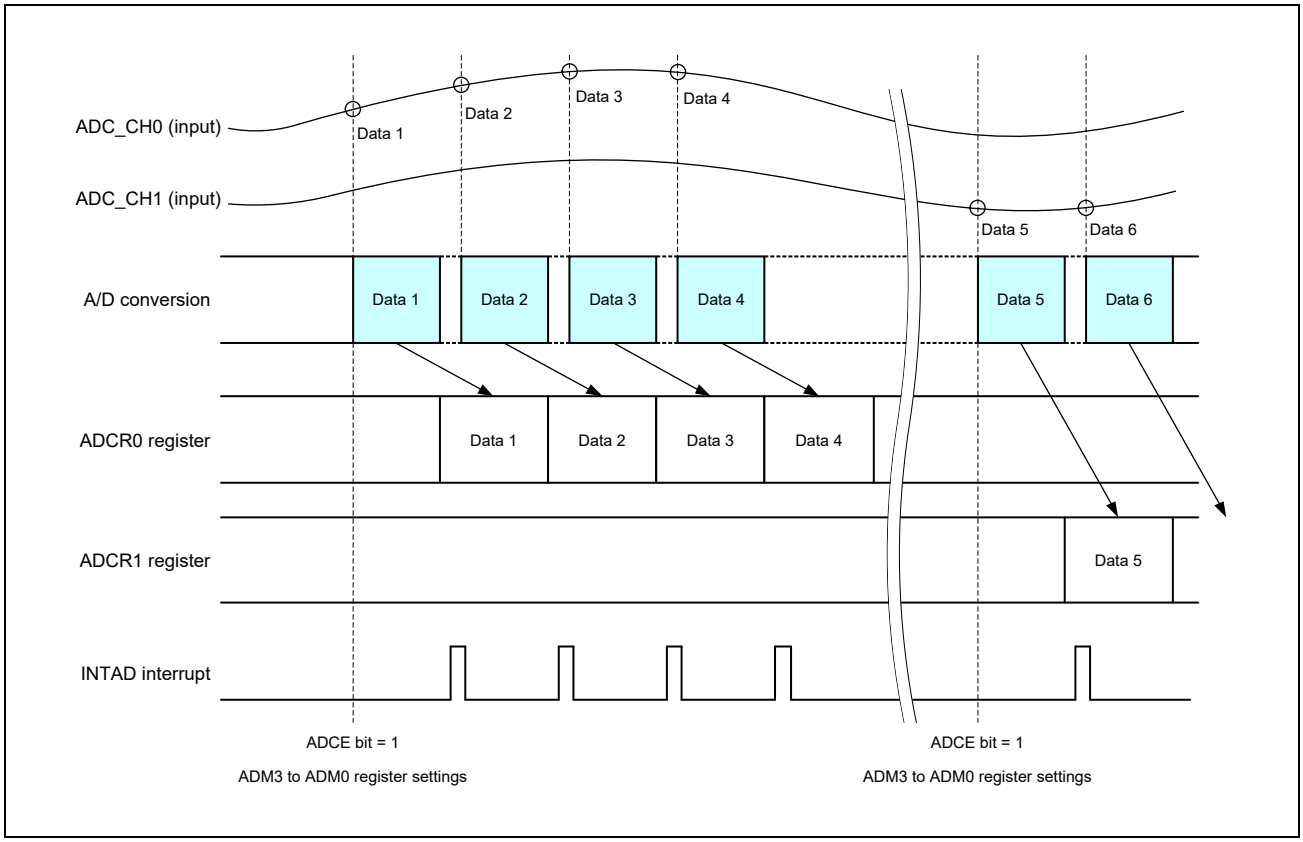

Figure 31.13 Example of A/D Conversion in Select Mode with Repeat Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 1-buffer mode are selected, and analog input pin ADC_CH0 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 0 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result is stored in the ADCR0 register).
9. An INTAD interrupt occurs.
10. Steps 8 and 9 above are repeated automatically.
11. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.

12. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, 1-buffer mode are selected, and analog input pin ADC_CH1 is set.
13. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
14. A/D conversion proceeds on ADC_CH1 (A/D conversion result is stored in the ADCR1 register).
15. An INTAD interrupt occurs.
16. Steps 14 and 15 above are repeated.

**Note 1.** The stabilization wait time is 1 μs.

### 31.4.4.3 Example of A/D Conversion in 4-Buffer Mode

**Figure 31.14** shows an example of A/D conversion with software trigger mode, select mode, repeat mode, and 4-buffer mode are selected. In the example in **Figure 31.14**, conversion proceeds with ADC_CH0 selected.

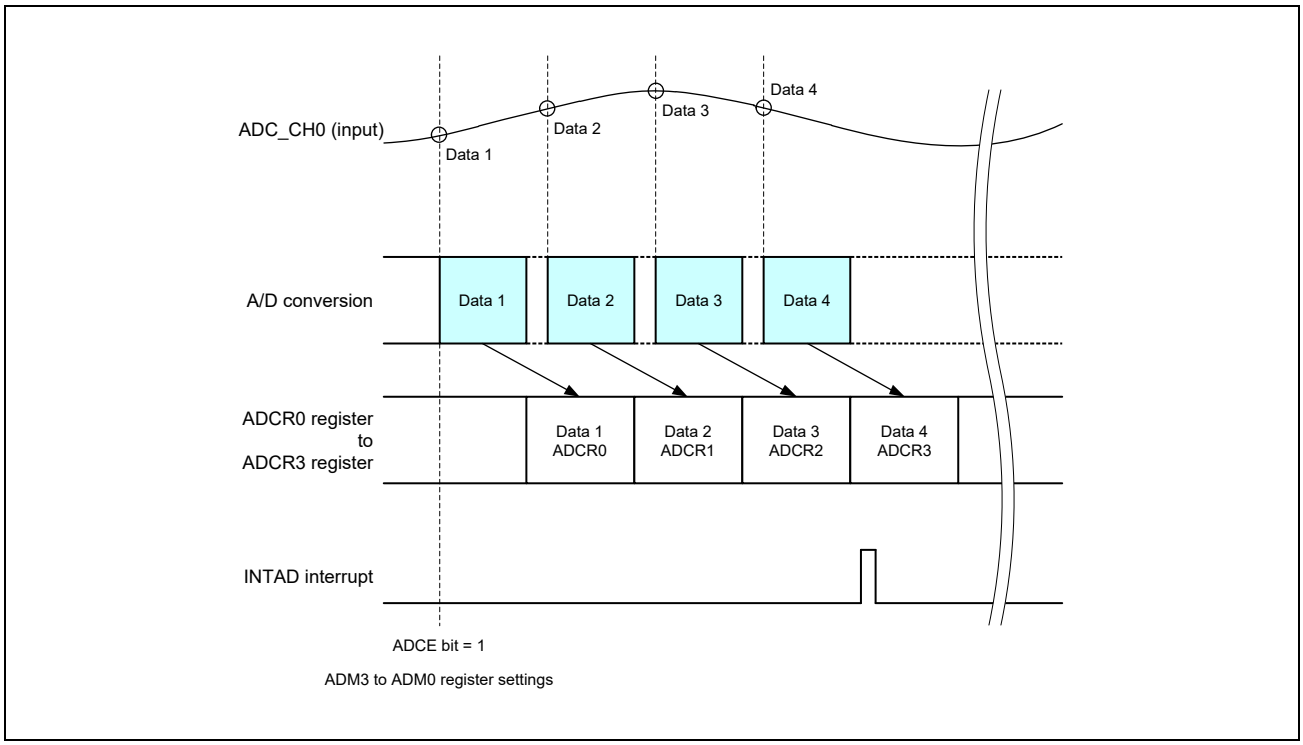

Figure 31.14 Example of A/D Conversion in 4-Buffer Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 4-buffer mode are selected, and analog input pin ADC_CH0 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 3) is stored in the ADCR2 register).
11. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 4) is stored in the ADCR3 register).
12. An INTAD interrupt occurs.
13. Steps 8 to 12 above are repeated automatically.
14. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.

**Note 1.** The stabilization wait time is 1 µs.

#### 31.4.4.4 Example of A/D Conversion in Scan Mode with Single Mode Selected

**Figure 31.15** shows an example of A/D conversion with software trigger mode, scan mode, and single mode are selected. In the example in **Figure 31.15**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

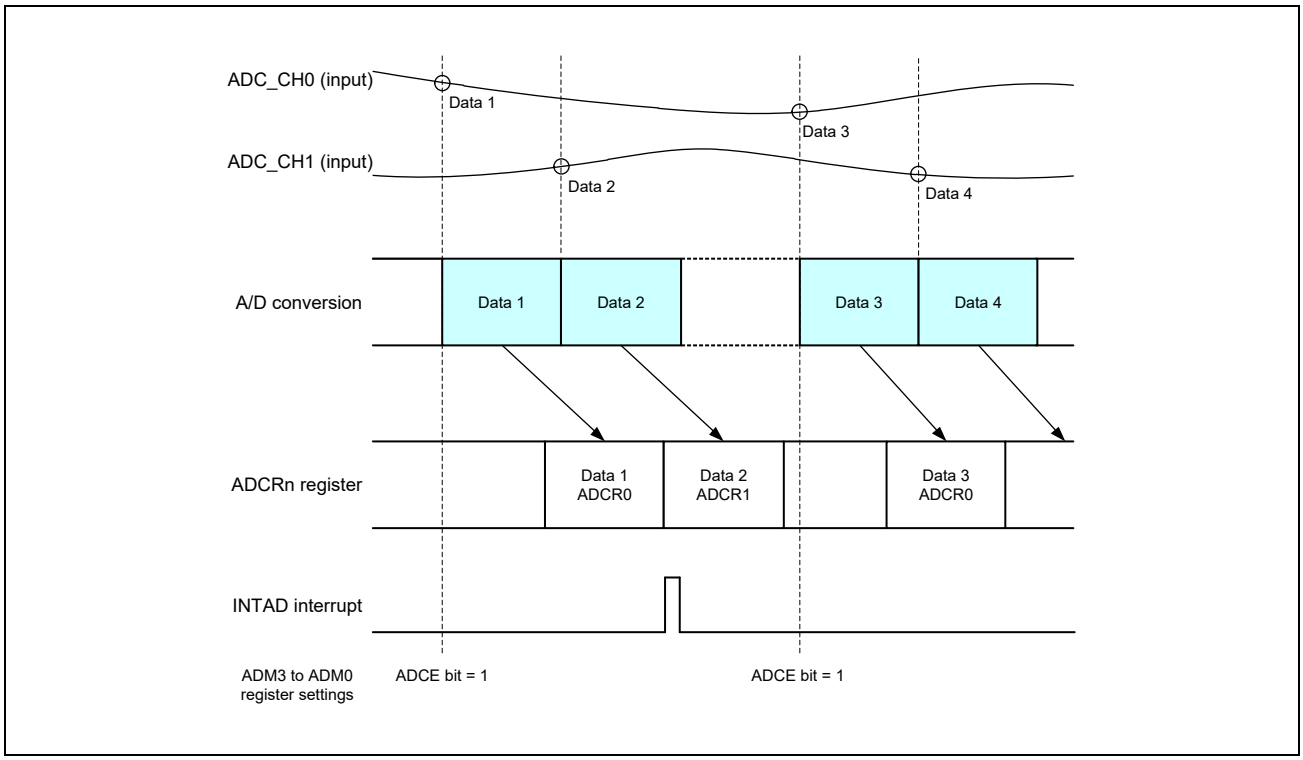

Figure 31.15 Example of A/D Conversion in Scan Mode with Single Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, scan mode, and single mode are selected, and analog input pins ADC_CH1, ADC_CH0 are set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. An INTAD interrupt occurs.
11. Steps 7 to 10 above are repeated.

**Note 1.** The stabilization wait time is 1 µs.

### 31.4.4.5 Example of A/D Conversion in Scan Mode with Repeat Mode Selected

**Figure 31.16** shows an example of A/D conversion with software trigger mode, scan mode, and repeat mode are selected. In the example in **Figure 31.16**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

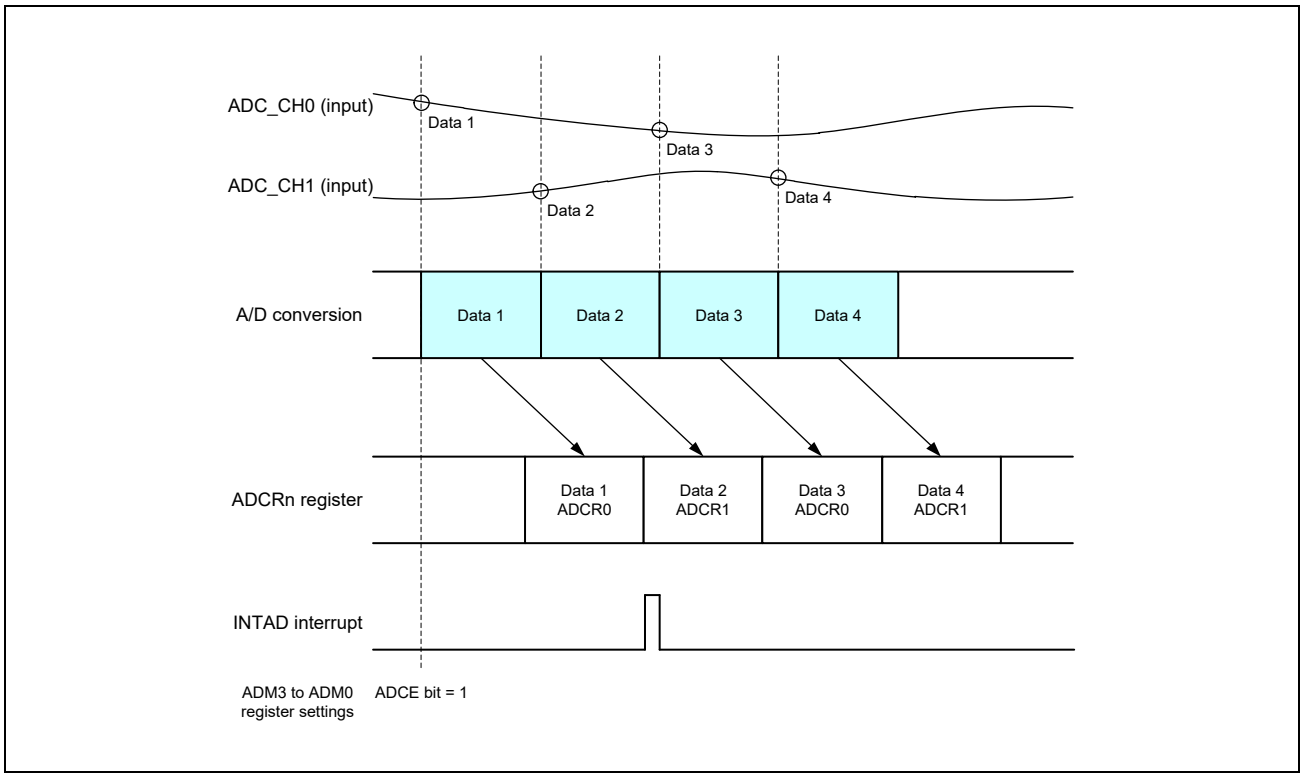

Figure 31.16 Example of A/D Conversion in Scan Mode with Repeat Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, scan mode, and repeat mode are selected and analog input pins ADC_CH1, ADC_CH0 are set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. An INTAD interrupt occurs.
11. Steps 8 to 10 above are repeated automatically.

**Note 1.** The stabilization wait time is 1 µs.

### 31.4.4.6 Example of A/D Conversion in Auto Mode

**Figure 31.17** shows an example of A/D conversion with hardware trigger mode, auto mode, scan mode, and single mode are selected. In the example in **Figure 31.17**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

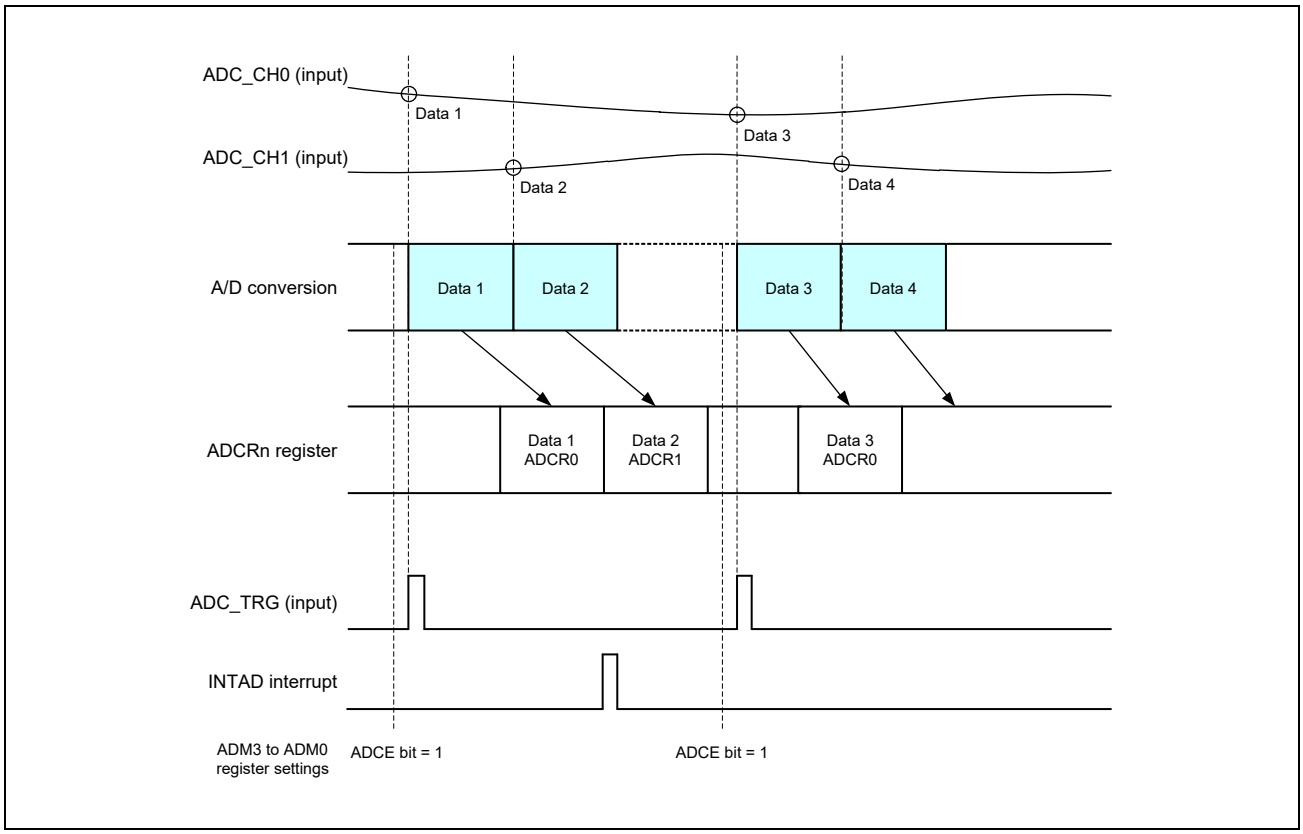

Figure 31.17 Example of A/D Conversion in Auto Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, hardware trigger mode, auto mode, scan mode, and single mode are selected, and analog input pins ADC_CH1, ADC_CH0 are set, the trigger of the ADC_TRG pin is enabled, and rising-edge detection of the hardware trigger is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
10. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
11. An INTAD interrupt occurs.

12. Steps 7 to 11 above are repeated.

**Note 1.** The stabilization wait time is 1 µs.

### 31.4.4.7 Example of A/D Conversion in Step Mode

**Figure 31.18** shows an example of A/D conversion with hardware trigger mode, step mode, scan mode, and single mode are selected. In the example in **Figure 31.18**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

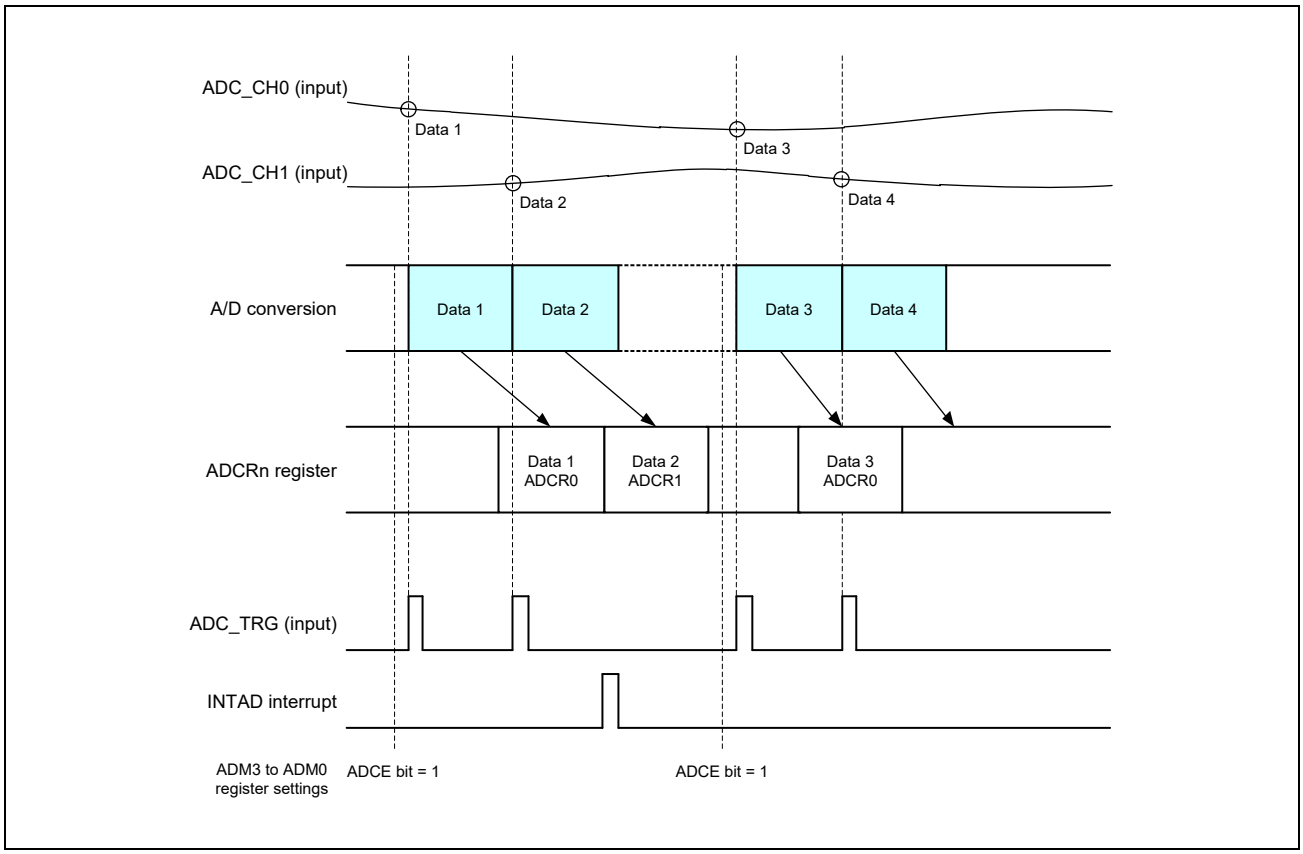

Figure 31.18 Example of A/D Conversion in Step Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, hardware trigger mode, step mode, scan mode, and single mode are selected, analog input pins ADC_CH1, ADC_CH0 are set, the trigger of the ADC_TRG pin is enabled, and rising-edge detection of the hardware trigger is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1.
8. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
10. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).

11. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
12. An INTAD interrupt occurs.
13. Steps 7 to 12 above are repeated.

**Note 1.** The stabilization wait time is 1 µs.

## 31.5 Notes

### 31.5.1 Interval of Hardware Trigger

The interval (interval of input time) of a trigger in hardware trigger mode must be longer than the A/D conversion time. For the A/D conversion time, see **Section 31.3.4, A/D Converter Mode Register 3 (ADM3)**.

### 31.5.2 Timing Restrictions

This A/D converter has restrictions on the timing interval, which are caused by the asynchronism countermeasure circuit. The restrictions shown in **Table 31.9** need to be met. If an access is made in a period shorter than this interval, the register values on the ADC_PCLK(P0ϕ) side are not reflected in the registers on the ADC_ADCLK(TSUϕ) side because the notification of register update does not reach the ADC_ADCLK(TSUϕ) side.

Table 31.9 Restrictions on Timing Interval

| Condition | Restriction |
|---|---|
| Writing to the same register successively | (Interval of write access) ≥ (6 × ADC_PCLK(P0ϕ) + 6 × ADC_ADCLK(TSUϕ)) |
| Interval of A/D conversion | (A/D conversion time) ≥ (6 × ADC_PCLK(P0ϕ) + 6 × ADC_ADCLK(TSUϕ)) |

**Note:** For the A/D conversion time, see **Figure 31.2**.

### 31.5.3 Restrictions on ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) Cycles

The ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) cycles need to satisfy the relation in the following formula.

$$\frac{\text{ADC_ADCLK(TSU}\phi\text{)} \leq \text{(A/D conversion time)}}{6 - \text{ADC_PCLK(P0}\phi\text{)}}$$

**Note:** For the A/D conversion time, see **Figure 31.2**.

### 31.5.4 Operation when Stopping or Restarting A/D Conversion

When 0 is written to the ADCE bit in the ADM0 register, the A/D converter stops A/D conversion. A/D conversion is restarted by writing 0 to the ADCE bit in the ADM0 register once and then writing 1 to the same bit. Even though there was an instruction to stop A/D conversion, A/D conversion may not stop immediately. **Table 31.10** shows the operation for stopping conversion and also the operation for restarting conversion after it has been stopped.

Table 31.10 Operation when Stopping or Restarting A/D Conversion with the ADCE Bit

| A/D Conversion Modes | | | | | Timing for Stopping Conversion when Stop is Instructed with ADCE = 0 | Operation for Restarting Conversion |
|---|---|---|---|---|---|---|
| Trigger | | Operating Mode | Conversion Count | Buffer Count | | |
| Mode | Input | | | | | |
| Software | — | Select | Single | 1 | Stopped on completion of 1-time conversion. | Conversion proceeds on the channel selected in the ADM2 register. |
| | | | | 4 | Stopped on completion of conversion in which there was an instruction to stop in the middle of 4-time conversion. | Same as above |
| | | | Repeat | 1 | Stopped on completion of 1-time conversion. | Same as above |
| | | | | 4 | Stopped on completion of conversion in which there was an instruction to stop in the middle of 4-time conversion. | Same as above |
| | | Scan | Single | 1 | Stopped on completion of conversion in which there was an instruction to stop in the middle of scanning. | Conversion proceeds from the smallest channel number selected in the ADM2 register. |
| | | | | 4 | (Setting prohibited) | (Setting prohibited) |
| | | | Repeat | 1 | Stopped on completion of conversion in which there was an instruction to stop in the middle of scanning. | Conversion proceeds from the smallest channel number selected in the ADM2 register. |
| | | | | 4 | (Setting prohibited) | (Setting prohibited) |
| Hardware | Auto mode | Select | Single | 1 | Same as software trigger mode | Same as software trigger mode |
| | | | | 4 | Same as above | Same as above |
| | | | Repeat | 1 | Same as above | Same as above |
| | | | | 4 | Same as above | Same as above |
| | | Scan | Single | 1 | Same as above | Same as above |
| | | | | 4 | Same as above | Same as above |
| | | | Repeat | 1 | Same as above | Same as above |
| | | | | 4 | Same as above | Same as above |
| | Step mode | Select | Single | 1 | Same as software trigger mode | Same as software trigger mode |
| | | | | 4 | Same as above | Same as above |
| | | | Repeat | 1 | Same as above | Same as above |
| | | | | 4 | Same as above | Same as above |
| | | Scan | Single | 1 | Same as above | Same as above |
| | | | | 4 | Same as above | Same as above |
| | | | Repeat | 1 | Same as above | Same as above |
| | | | | 4 | Same as above | Same as above |

# 32. USB2.0

This LSI includes 1 channel USB2.0 OTG/DRD(Host/Function) interface and 1 channel USB2.0 Host interface.

This section describes the overview of USB2.0 and USB2.0 PHY control.

The detail function of USB2.0 Host controller and the common function both Host module and Function module are described in **Section 32A, USB 2.0 Host Module**.

The detail function of USB2.0 Function controller is described in **Section 32B, USB 2.0 Function Module**.

## 32.1 Features

This interface complies the following specifications.

- Universal Serial Bus Specification Revision 2.0
- On-The-Go and Embedded Host Supplement to the USB Revision 2.0 Specification Revision 2.0 plus errata and ecn*1
- Enhanced Host Controller Interface (EHCI) Specification for Universal Serial Bus Revision 1.0
- EHCI v1.1 Addendum*2
- Open Host Controller Interface (OHCI) Specification for USB Release 1.0a
- Battery Charging Specification Revision 1.2*3

**Note 1.** Session Request Protocol(SRP) and Host Negotiation Protocol(HNP) are not supported.
**Note 2.** Some EHCI v1.1 feature are not supported. (Refer to **Section 32A, USB 2.0 Host Module** for detail)
**Note 3.** DCP (Dedicated Charging Port) is not supported as downstream port.

### 32.1.1 Ch0: USB2.0 OTG/DRD(Host/Function) interface

The following table shows features of this interface.

Table 32.1 Ch0: USB2.0 OTG/DRD(Host/Function) interface features

| Function | Description |
|---|---|
| Host mode | • Support mode: High-Speed(480Mbps)/Full-Speed(12Mbps)/Low-Speed(1.5Mbps)<br>• Support Isochronous/Interrupt/Control/Bulk transfer modes<br>• Support Isochroous/Interrupt high bandwidth transfer |
| Function mode | • Support mode: High-Speed(480Mbps)/Full-Speed(12Mbps)<br>• Isochronous/Interrupt/Control/Bulk transfer<br>• Up to 10 ch PIPE (includes default control PIPE) |
| Other functions | • OTG function (Rev2.0)<br>• Battery Charging function<br>• DRD(Dual-Role-Device) function (Static switch between Host and Function) |

### 32.1.2 Ch1: USB2.0 HOST interface

The following table shows features of this interface.

Table 32.2 Ch1: USB2.0 Host interface function features

| Features | Description |
|---|---|
| Host mode | • Support mode: High-Speed(480Mbps)/Full-Speed(12Mbps)/Low-Speed(1.5Mbps)<br>• Support Isochronous/Interrupt/Control/Bulk transfer modes<br>• Support Isochroous/Interrupt high bandwidth transfer |
| Other function | • Battery Charging function |

### 32.1.3 Block Diagram

The block diagram of USB interface is as follows.

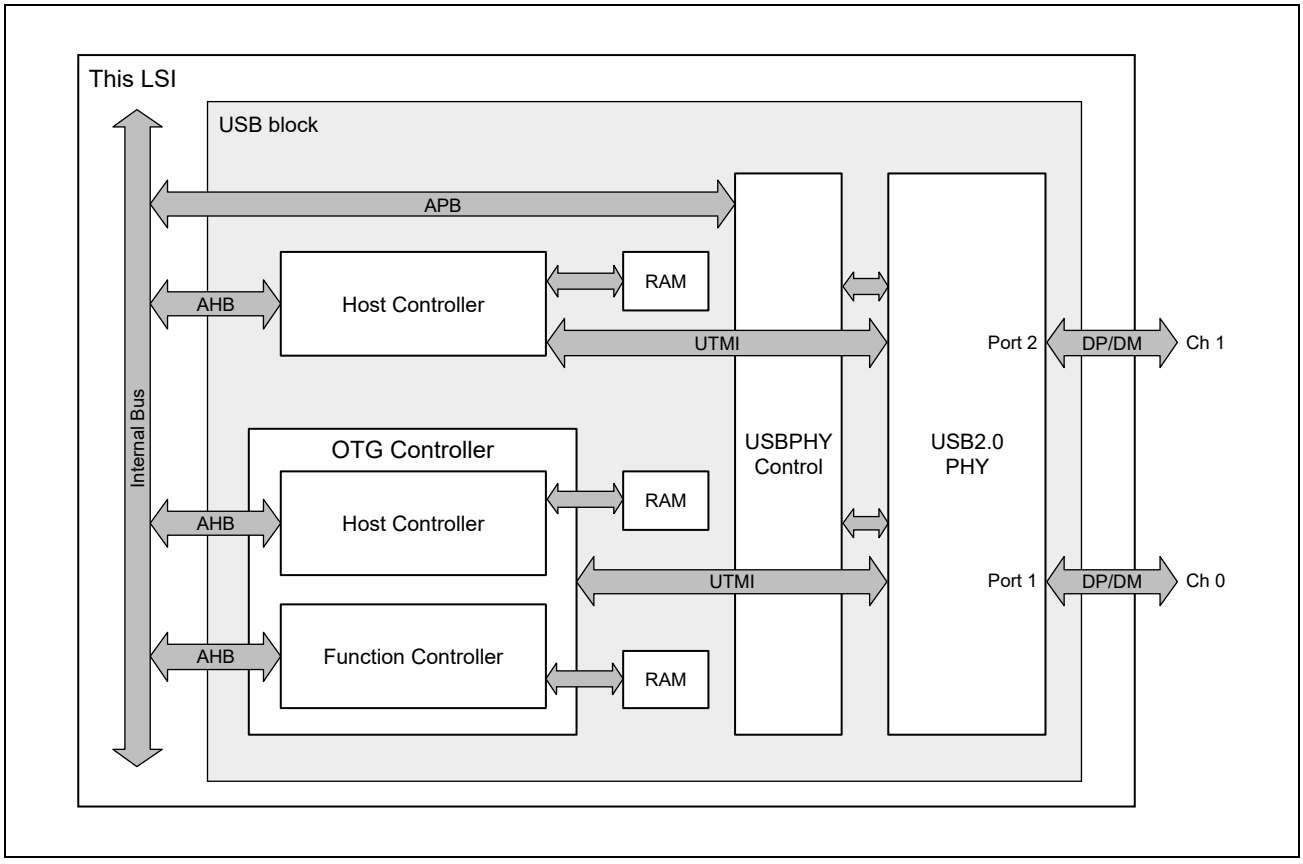

Figure 32.1 USB interface block diagram

### 32.1.4 External signal pins

The following table shows external signal pins for USB block.

Table 32.3 External signal pins

| Name | I/O | Description | Active Level | Initial value | Handling in not used |
|---|---|---|---|---|---|
| USB0_DP | — | USB data pin Data+ (Ch0) | — | — | Open*1 |
| USB0_DM | — | USB data pin Data- (Ch0) | — | — | Open*1 |
| USB0_OVRCUR | I | Over current detection input (Ch0) | L | — | Pull-Up |
| USB0_VBUSEN | O | VBUS output enable (Ch0) | H | 0b | Open |
| USB0_VBUSIN | I | Peripheral VBUS input (Ch0) | H | — | Pull-Down |
| USB0_OTG_EXICEN | O | External power IC control (Ch0) | H | 0b | Open |
| USB0_OTG_ID | I | OTG ID input (Ch0) | — | — | Pull-Down |
| USB1_DP | — | USB data pin Data+ (Ch1) | — | — | Open*1 |
| USB1_DM | — | USB data pin Data- (Ch1) | — | — | Open*1 |
| USB1_OVRCUR | I | Over current detection input (Ch1) | L | — | Pull-Up |
| USB1_VBUSEN | O | VBUS output enable (Ch1) | H | 0b | Open |

Note 1. When it is not used permanently, connect to GND via a resistor of 10kΩ.

### 32.1.5 Power and GND pins

The following table shows Power and GND pins for USB block.

Table 32.4 Power and GND pins

| Name | Description |
|---|---|
| USB_VDD18 | Internal Regulator Power (1.8V), HS receiver power (1.8V) |
| USB_VDD33 | IO power (3.3V) |
| USB_RREF | Reference voltage |
| VSS | GND |

### 32.1.6 Interrupt

The following table shows interrupt list for USB block.

Table 32.5 USB interrupt

| Name | Description | Active Level | Type |
|---|---|---|---|
| U2H0_INT | USB2.0 Host AHB Interrupt (Ch0) | H | Level-Sensitive |
| U2H0_OHCI_INT | USB2.0 Host OHCI Interrupt (Ch0) | H | Level-Sensitive |
| U2H0_EHCI_INT | USB2.0 Host EHCI Interrupt (Ch0) | H | Level-Sensitive |
| U2H0_WAKEON_INT | USB2.0 Host EHCI Wakeup Interrupt (Ch0) | H | Level-Sensitive |
| U2H0_OBINT | USB2.0 Host OTG and Battery Charging Interrupt (Ch0) | H | Level-Sensitive |
| U2H1_INT | USB2.0 Host AHB Interrupt (Ch1) | H | Level-Sensitive |
| U2H1_OHCI_INT | USB2.0 Host OHCI Interrupt (Ch1) | H | Level-Sensitive |
| U2H1_EHCI_INT | USB2.0 Host EHCI Interrupt (Ch1) | H | Level-Sensitive |
| U2H1_WAKEON_INT | USB2.0 Host EHCI Wakeup Interrupt (Ch1) | H | Level-Sensitive |
| U2H1_OBINT | USB2.0 Host OTG and Battery Charging Interrupt (Ch1) | H | Level-Sensitive |
| U2P_IXL_INT | USB2.0 Function controller Interrupt (Ch0) | H | Edge-Triggered |
| U2P_INT_DMA[1:0] | USB2.0 Function controller DMA transaction complete interrupt (Ch0) | H | Level-Sensitive |
| U2P_INT_DMAERR | USB2.0 Function controller DMA error response interrupt (Ch0) | H | Level-Sensitive |

## 32.2 Register Configuration

### 32.2.1 Host controller Register

Refer to the **Section 32A, USB 2.0 Host Module**.

### 32.2.2 Function controller Register

Refer to the **Section 32B, USB 2.0 Function Module**.

### 32.2.3 USBPHY Control Register

USBPHY Control Register mainly controls reset and power down of the USB/PHY.

Base Address: H'0_11C4_0000 (Cortex-A55 Address Space)

Base Address: H'41C4_0000 (Cortex-M33 Address Space Non-Secure)

Base Address: H'51C4_0000 (Cortex-M33 Address Space Secure)

The following table shows USBPHY Control Register list.

Prohibit to write undefined area.

Table 32.6 USBPHY Control Register List

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---|---|---|---|---|
| Reset register | RESET | R/W | H'0000_0133 | H'000 | 32 |
| Clock control register | UCLKCTL | R/W | H'0340_0303 | H'018 | 32 |
| Direct power down setting register | UDIRPD | R/W | H'0000_0000 | H'01C | 32 |
| VBUSEN control register | VBENCTL | R/W | H'0000_0000 | H'03C | 32 |
| Connection control register | CON_CTRL | R/W | H'0000_0000 | H'020 | 32 |
| Clock status register | CLK_STAT | R | H'0000_0000 | H'104 | 32 |

# 32.3 Register Descriptions

## 32.3.1 Reset register (RESET)

This register controls USB/PHY reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | sel_pll reset | — | — | — | pllreset | — | — | sel_p2 reset | sel_p1 reset | — | — | phyrst_2 | phyrst_1 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R/W | R | R | R | R/W | R | R | R/W | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 13 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 12 | sel_pllreset | 0 | R/W | Select USB/PHY PLL reset<br>1: register (by bit8: pllreset)<br>0: control by host controller (Ch0) |
| 11 to 9 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 8 | pllreset | 1 | R/W | PLL reset<br>1: PLL reset<br>0: deassert PLL reset |

| 4 | sel_connect | 0 | R/W | Select USB connection notification control<br>1: register (controlled by bit0: connect_1 and bit1: connect_2)<br>0: Control by host controller |
| 3, 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | connect_2 | 0 | R/W | Notice of USB connection (port2)<br>Used to notify UTM + core of USB connection status<br>0: USB not connected (single end receiver disabled)<br>1: USB not connected (single end receiver enabled) |
| 0 | connect_1 | 0 | R/W | Notice of USB connection (port1)<br>Used to notify UTM + core of USB connection status<br>0: USB not connected (single end receiver disabled)<br>1: USB not connected (single end receiver enabled) |

### 32.3.6 Clock status register (CLK_STAT)

This register shows USB/PHY clock status.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | frclk60 lock | frclk48 lock | phy lock | — | — | pllllock_ 2 | pllllock_ 1 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 7 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 6 | frclk60_lock | 0 | R | FRCLK60 LOCK status<br>0: UNLOCK<br>1: LOCK |
| 5 | frclk48_lock | 0 | R | FRCLK48 LOCK status<br>0: UNLOCK<br>1: LOCK |
| 4 | phylock | 0 | R | PHY PLL LOCK Status (Transceiver)<br>0: UNLOCK<br>1: LOCK |
| 3, 2 | — | All 0 | R | Reserved<br>Whenever it is read, 0 is read. The written value will be ignored. |
| 1 | pllllock_2 | 0 | R | PLL LOCK status (port2)<br>0: UNLOCK<br>1: LOCK |
| 0 | pllllock_1 | 0 | R | PLL LOCK status (port1)<br>0: UNLOCK<br>1: LOCK |

## 32.4 Operation

### 32.4.1 USB/PHY Initialization

In the initial state, the reset of USB/PHY Port1 and Port2 is controlled by the register in the USBPHY Control Register, and the reset is asserted, so the control is switched to controller by the following initialization.

Also, in the initial state, the USB/PHY PLL Reset is controlled by the Host Controller in the OTG Controller, but it needs to be switched to controlled by the USBPHY Control Register.

- **Initialization when starting only Port1 of USB/PHY (when Port2 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1022 to release the reset.

  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released.

  Port1 of USB/PHY is controlled by Host Controller, and Port2 is reset by USBPHY Control Register.)

- **Initialization when starting only Port2 of USB/PHY (when Port1 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1011 to release the reset.

  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released.

  USB/PHY Port1 is reset by USBPHY Control Register, and port2 is controlled by Host Controller.)

- **Initialization when starting both Port1 and Port2 of USB/PHY**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1000 to release the reset.

  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released.

  USB/PHY Port1 is controlled by the Host Controller, and Port2 is controlled by the Host Controller.)

The common setting sequence both Host mode and Function mode including USB/PHY initialization is described in **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.

## 32.4.2 Handling of permanently unused pin

Take the following measures when USB interface is not used permanently.

### 32.4.2.1 USB/PHY related pins

- When both Port1 and Port2 are unused

Take the following measures for the USB pins and power supply.

- Connect the USB0_DP/DM and USB1_DP/DM to GND via a resistor of 10kΩ.
- Set the RREF to Open.
- Connect USB_VDD18 to a 1.8V power supply. However, there is no need to separate the digital and analog power supplies.
- Connect USB_VDD33 to GND.
- Connect VSS to GND.

Also, perform the following control with software.

- Set the direct power down (via UDIRPD register). See **Section 32.4.3, Direct power down (DIRPD)** for more information.

- When either Port1 or Port2 is unused

Supply all power.

Since USB_VDD18 / USB_VDD33 are common to 2 Port PHY, it is necessary to supply power even when one of the ports is not in use.

Make the following settings for unused port.

- Apply Port reset:
  - Apply reset to unused USB/PHY port by controlling the Reset register (RESET).
  - Set sel_p1reset=1 and phyrst_1=1 when USB/PHY Port1 is unused.
  - Set sel_p2reset=1 and phyrst_2=1 when USB/PHY Port2 is unused.

- Power down setting:
  - Set power down setting to unused USB/PHY port by controlling the Clock control register (UCLKCTL).
  - Set sel_suspendm=1 and suspendm_1=0 when USB/PHY Port1 is unused.
  - Set sel_suspendm=1 and suspendm_2=0 when USB/PHY Port2 is unused.

- Single-ended receiver stop:
  - Stop single-ended receiver of unused USB/PHY port by controlling the Connection control register (CON_CTRL).
  - Set sel_connect=1 and connect_1=0 when USB/PHY Port1 is unused.
  - Set sel_connect=1 and connect_2=0 when USB/PHY Port2 is unused.

#### 32.4.2.2 Handling of USB controller related pins

- When Host controller is unused

The USB0_VBUSEN pin leaves open and fix the USB0_OVRCUR pin to 1 when USB/PHY port1 is unused.

The USB1_VBUSEN pin leaves open and fix the USB1_OVRCUR pin to 1 when USB/PHY port2 is unused.

- Function controller is unused

Fix the USB0_VBUSIN pin to 0 when USB/PHY port1 is unused.

### 32.4.3 Direct power down (DIRPD)

By directly controlling the power down signal of the USB/PHY with the USBPHY Control register, the USB/PHY can be put into a low power state regardless of the state of the controller.

When set to the direct power down state, all USB/PHY functions including the PLL will be stopped. Direct power down can only be used when the USB/PHY is unused (means both ports are unused).

Follow the procedure below to switch to / return to the direct power down mode.

For details on the USBPHY Control Register reset register and direct power down setting register used in the procedure below, refer to **Section 32.3.1, Reset register (RESET)** and **Section 32.3.3, Direct power down setting register (UDIRPD)**, respectively.

#### 32.4.3.1 Enter to Direct power down mode

Follow the steps below to switch to direct power down mode.

(1) USB operation stop

Stop the operation of USB.

(2) Assert the direct power down signal.

It is asserted by setting H'0000_0010 in the direct power-down setting register (UDIRPD) and then setting H'0000_0011.

There are no timing restrictions when transitioning to direct power down. Immediately after setting, it shifts to power down mode.

#### 32.4.3.2 Resume from Direct power down mode

Follow the steps below to recover from the direct power down mode.

(1) Assert a USB/PHY PLL reset.

The PLL reset is asserted by setting 1 to sel_pllreset bit of the Reset register (RESET) and then setting 1 to pllreset bit.

The reset period should be 1µs or more.

(2) De-assert direct power down signal

Negate the direct power down signal after continuing to assert the PLL reset for more than 1us. It is negated by setting H'0000_0010 in the direct power down setting register (UDIRPD) and then setting H'0000_0000.

After negating the direct power down signal, keep asserting the PLL reset for at least 1µs.

(3) De-assert USB/PHY PLL reset

After negating the direct power down signal, continue to assert the PLL reset for 1us or more, and then negate the PLL reset.

The PLL reset is negated by clearing the pllreset bit in the reset register (RESET) and then clearing the sel_pllreset.

The timing chart when returning from the direct putter down is shown below.

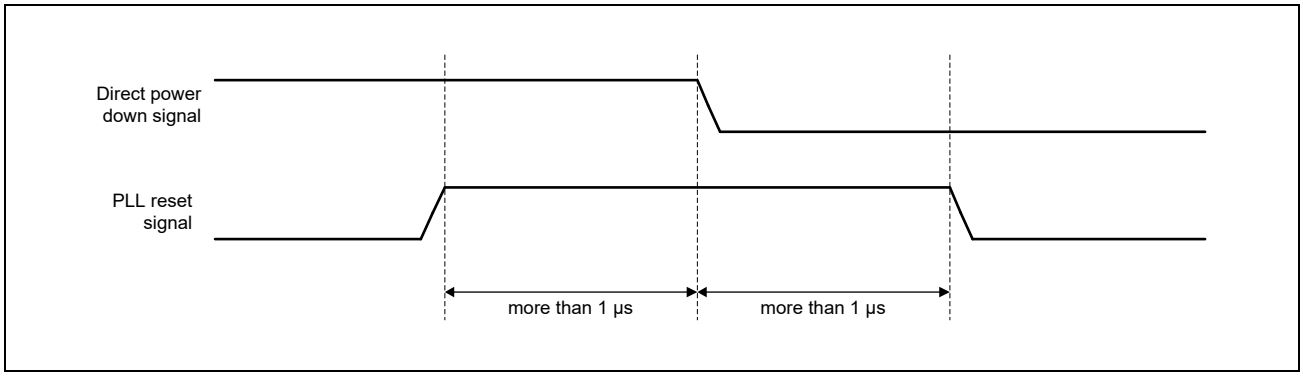

Figure 32.2 Resume from Direct power down mode

## 32.5 Usage Notes

### 32.5.1 Precautions in power down mode

When USB interface is unused, it can be set to power-down mode by register setting. For the setting, refer to **Section 32.3.3, Direct power down setting register (UDIRPD)**.

The precautions for power down mode are as follows.

- Once enter to power down, do not access the interface.
- Move to the power-down state after the USB is in unused state. If USB interface moves power-down state while it is operating, current may continue to flow to the USB side and it may damage device.

# 32A. USB 2.0 Host Module

## 32A.1 Overview

### 32A.1.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

### 32A.1.2 Features

This module has the following features:

| Function | Description |
|---|---|
| Host function | • Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers<br>• Compliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0a<br>• Compliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1 |
| Other functions | • Battery charging (compliant with Battery Charging Specification Revision 1.2)*2<br>• Dual-role-device function (static switching between the USB host and USB peripheral functions) |

Note 1. Some functions (specifications) are not supported.

Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected. This LSI does not support DCP (Dedicated Charging Port) as a Downstream Port.

### 32A.1.2.1 EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.

Note, however, that this module supports only the functions marked with a circle "✓" in the table below.

| Function Name | Support |
|---|---|
| Per-Port Change Events | ✓ |
| Shorter Periodic Frame List | ✓ |
| Hardware Prefetching | — |
| Link Power Management (LPM) | ✓ |

Of the three features to support, the registers associated with "Per-Port Change Events" and "Shorter Periodic Frame List" are listed below. For more information on each register, refer to the appropriate register specification of the **Section 32A.2, Register Descriptions**.

With regard to "Link Power Management (LPM)", it is described in **Section 32A.1.2.2, Link Power Management (LPM) function**.

Table 32A.1 Per-Port Change Events

| Relevant register | Relevant bit | | Attribute | Function |
|---|---|---|---|---|
| HCCPARAMS (offset: H'108) | bit 18 | Per-Port Change Event Capability | R | This bit indicates to support this function.<br>This bit is fixed to 1b. |
| USBCMD (offset: H'120) | bit 15 | Per-Port Change Events Enable | R/W | Per-Port event notification setting.<br>Writing 1b to this bit enables the Per-Port event notification function. |
| USBSTS (offset: H'124) | bit 16 | Port-1 Change Detect | R/W(1) | If a port-1 change event is detected, 1b is written to this bit. |
| USBINTR (offset: H'128) | bit 16 | Port-1 Change Event Enable | R/W | Enable/Disable setting of the above "port-1 Change Detect" field.<br>To reflect the port event on the above field for the port, set corresponding bit to 1b. |

Table 32A.2 Shorter Periodic Frame List

| Relevant register | Relevant bit | | Attribute | Function |
|---|---|---|---|---|
| HCCPARAMS (offset: H'108) | bit 19 | 32-Frame Periodic List Capability | R | This bit indicates to support this function.<br>This bit is fixed to 1b. |
| USBCMD (offset: H'120) | bit[3:2] | Frame List Size | R/W | This bit determines the Frame List Size.<br>To determine 32-frames, set this field 11b. |

### 32A.1.2.2 Link Power Management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).

When the peripheral device which supports LPM function is connected to this module, the device can be moved to suspend state faster than conventional by using LPM function.

*In using LPM function: 8 to 10 µs

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in **Section 32A.2, Register Descriptions**.

| Relevant register | Relevant bit | | Attribute | Function |
|---|---|---|---|---|
| HCCPARAMS (offset: H’108) | bit 17 | Link Power Management Capability | R | This bit indicates to support this function.<br>This bit is fixed to 1b. |
| USBCMD (offset: H’120) | bit[27:24] | Host-Initiated Resume Duration | R/W | The minimum duration time of K-state drive in resume from LPM state. |
| PORTSC1 (offset: H’164) | bit[31:25] | Device Address [7:0] | R/W | The device address of the destination of LPM Token. In using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token. |
| | bit[24:23] | Suspend Status [1:0] | R | The device response to LPM Token. |
| | bit 9 | Suspend using L1 | R/W | In using LPM function, set this bit 1b. |
| | bit 7 | Suspend | R/W | When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = H’000”. |
| PORT_LPM_CTR1 (offset: H’320) | bit[7:4] | NYET_RETRY_CNT_P1[3:0] | R/W | The number of retry for NYET response of device in LPM transaction. |
| | bit 3 | REMOTEWAKE_EN_P1 | R/W | Setting of LPM RemoteWakeup permission.<br>0b: permitted (default)<br>1b: not permitted |
| | bit 2 | SLEEP_INT_EN_P1 | R/W | In LPM transaction, setting to generate an interrupt or not when received a response other than ACK.<br>0b: not to generate an interrupt (default)<br>1b: to generate an interrupt |
| | bit 1 | RETRY_ENABLE_NYET_P1 | R/W | In LPM transaction, setting to the host behavior when received NYET response from the device.<br>0b: not to Retry (default)<br>1b: to Retry |
| | bit 0 | HIRD_SEL_P1 | R/W | Setting the duration time of the K-state drive, in resume of LPM state. |

### 32A.1.2.3 OTG function

Detects changing of the USB0_OTG_ID pin by U2H0_OBINT interrupt and switches the Host/Function role. Confirm the IDCHG_STA bit of **Section 32A.2.4.5(2), OTG-BC Interrupt Status Register** and the IDMON bit of **Section 32A.2.4.5(5), Line Control Port 1 Register**.

Host/Function role switching is performed by the OTG_PERI bit of **Section 32A.2.4.5(1), Common Control Register**.

| OTG_PERI bit |
|---|
| 0 : Host mode |
| 1 : Function mode (Only CH0 can be set) |

### 32A.1.2.4 Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module. The detail of the UCOM register, refer to **Section 32A.2.4.5, UCOM Register**.

### 32A.1.2.5 Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.

The detail of the register, refer to **Section 32A.2.4.4(6), Suspend Control Register**.

[Relevant register]

Suspend Control Register (offset: H'308)

[Functional specification]

| Function | | Relevant bit | |
|---|---|---|---|
| [1] | Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register | bit 31 | SUSPENDM_ENABLE |
| [2] | Function to forcibly assert USBPHY SUSPENDM | bit 0 | GLOBAL_SUSPENDM_P1 |

### 32A.1.3 Support of USB-Related Specifications

| USB-Related Specification or Function | | | Support |
|---|---|---|---|
| Host function | High Speed | Bulk IN/OUT transfer | ✓ |
| | | Control IN/OUT transfer | ✓ |
| | | Isochronous IN/OUT transfer | ✓ |
| | | Isochronous Highband transfer | ✓ |
| | | Interrupt IN/OUT transfer | ✓ |
| | Full Speed | Bulk IN/OUT transfer | ✓ |
| | | Control IN/OUT transfer | ✓ |
| | | Isochronous IN/OUT transfer | ✓ |
| | | Interrupt IN/OUT transfer | ✓ |
| | Low Speed | Control IN/OUT transfer | ✓ |
| | | Interrupt IN/OUTtransfer | ✓ |
| | No. of hub connection stages | HS: 5 stages | ✓ |
| | | FS: 5 stages | ✓ |
| | Support of EHCI V1.1 | Hardware Prefetching | × |
| | | Link Power Management | ✓ |
| | | Per-Port Change Events | ✓ |
| | | Shorter Periodic Frame List | ✓ |
| Battery-charging function (hereafter called the “BC function”) | | | ✓ |
| Dual role device * Function to statically switch between the host and peripheral modes | | | ✓ |

**Remarks:** ✓: support
×: no support

# 32A.2 Register Descriptions

## 32A.2.1 Register Attributes

Table 32A.3 Register Attributes

| Register Attribute | Description |
|---|---|
| R/W | Register bits can be read and written. |
| R/W(1) | Register bits can be read. A clear bit may be set by writing “1”; writing 0 to R/W(1) bits has no effect. |
| R/W(0) | Register bits can be read. A clear bit may be set by writing “0”; writing 1 to R/W(0) bits has no effect. |
| R | Register bits can only be read. |
| W | Register bits can only be written. |
| Reserved | Reserved bits are Read Only field. |

## 32A.2.2 Base Address

Table 32A.4 Base Addresses for Each Channel of the USB Host Module

| Channel | Base Address | |
|---|---|---|
| 0 | H’0_11C5_0000 | (Cortex-A55 Address Space) |
| | H’41C5_0000 | (Cortex-M33 Address Space Non-Secure) |
| | H’51C5_0000 | (Cortex-M33 Address Space Secure) |
| 1 | H’0_11C7_0000 | (Cortex-A55 Address Space) |
| | H’41C7_0000 | (Cortex-M33 Address Space Non-Secure) |
| | H’51C7_0000 | (Cortex-M33 Address Space Secure) |

### 32A.2.3 Register Overview

| Register Name | Abbreviated Name | R/W | Initial Value | Offset Address | Access Size | Remarks |
|---|---|---|---|---|---|---|
| HcRevision | HcRevision | R | H'0000_0000 | H'000 | 32 | OHCI Operation Registers |
| HcControl | HcControl | R/W | H'0000_0000 | H'004 | 32 | |
| HcCommandStatus | HcCommandStatus | R/W | H'0000_0000 | H'008 | 32 | |
| HcInterruptStatus | HcInterruptStatus | R/W | H'0000_0000 | H'00C | 32 | |
| HcInterruptEnable | HcInterruptEnable | R/W | H'0000_0000 | H'010 | 32 | |
| HcInterruptDisable | HcInterruptDisable | R/W | H'0000_0000 | H'014 | 32 | |
| HcHCCA | HcHCCA | R/W | H'0000_0000 | H'018 | 32 | |
| HcPeriodCurrentED | HcPeriodCurrentED | R | H'0000_0000 | H'01C | 32 | |
| HcControlHeadED | HcControlHeadED | R/W | H'0000_0000 | H'020 | 32 | |
| HcControlCurrentED | HcControlCurrentED | R/W | H'0000_0000 | H'024 | 32 | |
| HcBulkHeadED | HcBulkHeadED | R/W | H'0000_0000 | H'028 | 32 | |
| HcBulkCurrentED | HcBulkCurrentED | R/W | H'0000_0000 | H'02C | 32 | |
| HcDoneHead | HcDoneHead | R | H'0000_0000 | H'030 | 32 | |
| HcFmInterval | HcFmInterval | R/W | H'0000_2EDF | H'034 | 32 | |
| HcFmRemaining | HcFmRemaining | R | H'0000_2EDF | H'038 | 32 | |
| HcFmNumber | HcFmNumber | R | H'0000_0000 | H'03C | 32 | |
| HcPeriodicStart | HcPeriodicStart | R/W | H'0000_0000 | H'040 | 32 | |
| HcLSThreshold | HcLSThreshold | R/W | H'0000_0628 | H'044 | 32 | |
| HcRhDescriptorA | HcRhDescriptorA | R/W | H'0F00_0901 | H'048 | 32 | |
| HcRhDescriptorB | HcRhDescriptorB | R/W | H'0002_0000 | H'04C | 32 | |
| HcRhStatus | HcRhStatus | R/W | H'0000_0000 | H'050 | 32 | |
| HcRhPortStatus1 | HcRhPortStatus1 | R/W | H'0000_0000 | H'054 | 32 | |
| HCIVERSION / CAPLENGTH | CAPL_VERSION | R | H'0110_0020 | H'100 | 32 | EHCI Capability Registers |
| HCSPARAMS | HCSPARAMS | R | H'0000_1191 | H'104 | 32 | |
| HCCPARAMS | HCCPARAMS | R | H'000E_0006 | H'108 | 32 | |
| HCSP_PORTROUTE | HCSP_PORTROUTE | R | H'0000_0000 | H'10C | 32 | |
| USBCMD | USBCMD | R/W | H'0008_0B00 | H'120 | 32 | EHCI Operation Registers |
| USBSTS | USBSTS | R/W | H'0000_1000 | H'124 | 32 | |
| USBINTR | USBINTR | R/W | H'0000_0000 | H'128 | 32 | |
| FRINDEX | FRINDEX | R/W | H'0000_0000 | H'12C | 32 | |
| CTRLDSSEGMENT | CTRLDSSEGMENT | R | H'0000_0000 | H'130 | 32 | |
| PERIODICLISTBASE | PERIODICLISTBASE | R/W | H'0000_0000 | H'134 | 32 | |
| ASYNCLISTADDR | ASYNCLISTADDR | R/W | H'0000_0000 | H'138 | 32 | |
| CONFIGFLAG | CONFIGFLAG | R/W | H'0000_0000 | H'160 | 32 | |
| PORTSC1 | PORTSC1 | R/W | H'0000_2000 | H'164 | 32 | |
| INT_ENABLE | INT_ENABLE | R/W | H'0000_0000 | H'200 | 32 | AHB Registers |
| INT_STATUS | INT_STATUS | R/W | H'0000_0000 | H'204 | 32 | |
| AHB_BUS_CTR | AHB_BUS_CTR | R/W | H'0000_0000 | H'208 | 32 | |
| USBCTR | USBCTR | R/W | H'0000_0002 | H'20C | 32 | |

| Register Name | Abbreviated Name | R/W | Initial Value | Offset Address | Access Size | Remarks |
|---|---|---|---|---|---|---|
| Register Enable/Clock Gating Control | REGEN_CG_CTRL | R/W | H'0000_0000 | H'304 | 32 | Core Defined Registers |
| Suspend Control | SPD_CTRL | R/W | H'0000_0000 | H'308 | 32 | |
| Suspend/Resume Timer Setting | SPD_RSM_TIMSET | R/W | H'01F4_03E8 | H'30C | 32 | |
| Overcurrent Detection/Sleep Timer Setting | OC_SLP_TIMSET | R/W | H'0C83_0D40 | H'310 | 32 | |
| SBRN/FLADJ/PORTWAKECAP | SBRN_FLADJ_PW | R/W | H'0003_2020 | H'314 | 32 | |
| PORT_LPM_CTRL1 | PORT_LPM_CTRL1 | R/W | H'0000_0000 | H'320 | 32 | |
| Common Control | COMMCTRL | R/W | H'8000_0000 | H'800 | 32 | OTG/BC Module Control Register |
| OTG-BC Interrupt Status | OBINTSTA | R/W | H'0000_0001 | H'804 | 32 | OTG/BC Interrupt Status Register |
| OTG-BC Interrupt Enable | OBINTEN | R/W | H'0000_0000 | H'808 | 32 | OTG/BC Interrupt Enable Register |
| VBUS Control | VBCTRL | R/W | H'0001_0000 | H'80C | 32 | OTG VBUS Control Register |
| Line Control Port 1 | LINECTRL1 | R/W | H'0000_0000 | H'810 | 32 | OTG USB Bus Control Register (Port 1) |
| BC Control Port 1 | BCCTRL1 | R/W | H'0300_0000 | H'820 | 32 | Battery Charging Control Register (Port 1) |

## 32A.2.4 Description of Registers

### 32A.2.4.1 OHCI Operational Register

#### (1) HcRevision Register

Abbreviated name of register: HcRevision

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | Revision | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 7 to 0 | Revision | All 0 | R | This field indicates the version of HCI specifications implemented in this host controller module.<br>Because this module conforms to OHCI standard 1.0a, H’10 is indicated. |

### (2) HcControl Register

Abbreviated name of register: HcControl

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | RWC | — | HCFS | | BLE | CLE | IE | PLE | CBSR | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 10 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 9 | RWC | 0 | R/W | Remote Wakeup Connected<br>This bit indicates whether the host controller supports remote wakeup signaling.<br>Software should set this bit to 1b in the initialization sequence if it is required to support remote wakeup.<br>Note that this bit can be initialized at hardware reset only.<br>0b: The remote wakeup is not supported.<br>1b: The remote wakeup is supported |
| 8 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 7, 6 | HCFS | All 0 | R/W | Host Controller Functional State<br>This field indicates the operating state of the host controller.<br>00b: USB Reset<br>01b: USB Resume 10b: USB Operational<br>11b: USB Suspend<br>When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary.<br>This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume.<br>Note that the reset value of this field differs between hardware reset and software reset.<br>Hardware reset: 00b (USB Reset)<br>Software reset: 11b (USB Suspend) |
| 5 | BLE | 0 | R/W | BulkList Enable<br>This bit sets whether the bulk list processing is performed for the next frame. The setting value of this bit is enabled from the next frame.<br>When you correct the bulk list, this bit must be 0b.<br>0b: The processing of the Bulk list is disabled.<br>1b: The processing of the Bulk list is enabled |
| 4 | CLE | 0 | R/W | ControlList Enable<br>This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame.<br>When you correct the control list, this bit must be 0b.<br>0b: The processing of the Control list is disabled.<br>1b: The processing of the Control list is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | IE | 0 | R/W | Isochronous Enable<br>This bit sets whether the isochronous ED processing is performed. The setting value of this bit is enabled from the next frame.<br>If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing.<br>1b: The processing of the isochronous ED is continued.<br>0b: The periodic list processing is stopped, and the bulk/control list processing is started.<br><br>0b: The processing of the isochronous ED is disabled.<br>1b: The processing of the isochronous ED is enabled. |
| 2 | PLE | 0 | R/W | Periodic List Enable<br>This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame.<br>The host controller module checks this bit before starting the periodic list processing.<br>0b: The processing of the periodic list is disabled.<br>1b: The processing of the periodic list is enabled. |
| 1, 0 | CBSR | All 0 | R/W | Control Bulk Service Ratio<br>This field defines the service ratio of the control transfer and bulk transfer.<br>When the periodic list is processed, the service ratio defined in this field is used for transfer. |

| CBSR | No. of Control EDs Over Bulk EDs Served |
|---|---|
| 00b | 1 : 1 |
| 01b | 2 : 1 |
| 10b | 3 : 1 |
| 11b | 4 : 1 |

### (3) HcCommandStatus Register

Abbreviated name of register: HcCommandStatus

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SOC | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | BLF | CLF | HCR |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 17, 16 | SOC | All 0 | R | Scheduling Overrun Count<br>This field counts the number of scheduling overrun.<br>This field is initialized to 00b, and is counted up every time scheduling overrun is detected.<br>After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected. |
| 15 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 2 | BLF | 0 | R/W | BulkList Filled<br>This bit indicates whether TD exists in the bulk list.<br>To add TD to ED in the bulk list, set this bit to 1b.<br>The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b.<br>When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b.<br>However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops.<br>To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit.<br>0b: TD does not exist in the bulk list.<br>1b: TD exists in the bulk list. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | CLF | 0 | R/W | ControlList Filled<br>This bit indicates whether TD exists in the control list.<br>To add TD to ED in the control list, set this bit to 1b.<br>The host controller checks this bit when it starts processing of the head ED in the control list.<br>If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b.<br>When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b.<br>However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops.<br>To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit.<br>0b: TD does not exist in the control list.<br>1b: TD exists in the control list. |
| 0 | HCR | 0 | W | Host Controller Reset<br>This bit is used to start OHCI software reset for the host controller.<br>When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized.<br>When the software reset finishes, the host controller clears this bit to 0b. |

### (4) HcInterruptStatus Register

Abbreviated name of register: HcInterruptStatus

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RHSC | FNO | UE | RD | SF | WDH | SO |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 7 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 6 | RHSC | 0 | R/W | Root Hub Status Change<br>Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed.<br>When the Root Hub status is changed, the host controller sets this bit to 1b.<br>Writing 1b to this bit clears the interrupt.<br>0b: The status of root hub has not changed.<br>1b: The status of root hub has changed. |
| 5 | FNO | 0 | R/W | Frame Number Overflow<br>Interrupt bit that indicates that the MSB in the FrameNumber (FN) field of the HcFmNumber register has changed.<br>When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated.<br>Writing this bit to 1b clears the interrupt.<br>0b: The overflow of frame number has not occurred.<br>1b: The overflow of frame number has occurred. |
| 4 | UE | 0 | R/W | Unrecoverable Error<br>Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected.<br>Writing this bit to 1b clears the interrupt.<br>0b: The unrecoverable error has not occurred.<br>1b: The unrecoverable error has occurred. |
| 3 | RD | 0 | R/W | Resume Detected<br>Interrupt bit that indicates that Resume has been detected.<br>When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b.<br>This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume.<br>Writing this bit to 1b clears the interrupt.<br>0b: The host controller has not detected resume signaling (RemoteWakeup).<br>1b: The host controller has detected resume signaling (RemoteWakeup). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | SF | 0 | R/W | Start of Frame<br>Interrupt bit that indicates that Hcca Frame Number was updated when each frame started.<br>The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b.<br>Writing this bit to 1b clears the interrupt.<br>0b: The host controller has not started new frame.<br>1b: The host controller has started new frame. |
| 1 | WDH | 0 | R/W | Writeback DoneHead<br>Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccDoneHead.<br>The host controller sets this bit to 1b immediately after it updates HccaDoneHead.<br>Note that HccaDoneHead is not updated until this bit is cleared.<br>Writing this bit to 1b clears the interrupt.<br>This bit must be cleared only after the contents of HccaDoneHead are saved.<br>0b: The write back to HccaDoneHead has not occurred.<br>1b: The write back to HccaDoneHead has occurred. |
| 0 | SO | 0 | R/W | Scheduling Overrun<br>Interrupt bit that indicates that overrun of the USB schedule occurred.<br>When USB scheduling overrun occurs, the host controller updates HccaFrameNumberl, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented.<br>Writing this bit to 1b clears the interrupt.<br>0b: The scheduling overrun has not occurred.<br>1b: The scheduling overrun has occurred. |

### (5) HcInterruptEnable Register

Abbreviated name of register: HcInterruptEnable

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MIE | OCE | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RHSCE | FNOE | UEE | RDE | SFE | WDHE | SOE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | MIE | 0 | R/W | Master Interrupt Enable<br>This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled.<br>If this bit is set to 0b, all OHCI interrupts are masked.<br>To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b.<br>0b: All interrupts are disabled.<br>1b: Interrupts that are set to 1b are enabled. |
| 30 | OCE | 0 | R/W | OC (Ownership Change) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange).<br>To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b.<br>0b: OC (OwnershipChange) interrupt is disabled.<br>1b: OC (OwnershipChange) interrupt is enabled. |
| 29 to 7 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 6 | RHSCE | 0 | R/W | RHSC (RootHub Status Change) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes RHSC (RootHub Status Change).<br>To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b.<br>0b: RHSC (RootHub Status Change) interrupt is disabled.<br>1b: RHSC (RootHub Status Change) interrupt is enabled. |
| 5 | FNOE | 0 | R/W | FNO (Frame Number Overflow) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow).<br>To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b.<br>0b: FNO (Frame Number Overflow) interrupt is disabled.<br>1b: FNO (Frame Number Overflow) interrupt is enabled. |
| 4 | UEE | 0 | R/W | UE (Unrecoverable Error) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error).<br>To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b.<br>0b: UE (Unrecoverable Error) interrupt is disabled.<br>1b: UE (Unrecoverable Error) interrupt is enabled. |
| 3 | RDE | 0 | R/W | RD (Resume Detect) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes RD (Resume Detect).<br>To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b.<br>0b: RD (Resume Detect) interrupt is disabled.<br>1b: RD (Resume Detect) interrupt is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 2 | SFE | 0 | R/W | SF (Start of Frame) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes SF (Start of Frame).<br>To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b.<br>0b: SF (Start of Frame) interrupt is disabled.<br>1b: SF (Start of Frame) interrupt is enabled. |
| 1 | WDHE | 0 | R/W | WDH (Writeback DoneHead) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead).<br>To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b.<br>0b: WDH (Writeback DoneHead) interrupt is disabled.<br>1b: WDH (Writeback DoneHead) interrupt is enabled. |
| 0 | SOE | 0 | R/W | SO (Scheduling Overrun) Interrupt Enable bit.<br>If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun).<br>To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b.<br>0b: SO (Scheduling Overrun) interrupt is disabled.<br>1b: SO (Scheduling Overrun) interrupt is enabled. |

### (6) HcInterruptDisable Register

Abbreviated name of register: HcInterruptDisable

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MID | OCD | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W(1) | R/W(1) | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

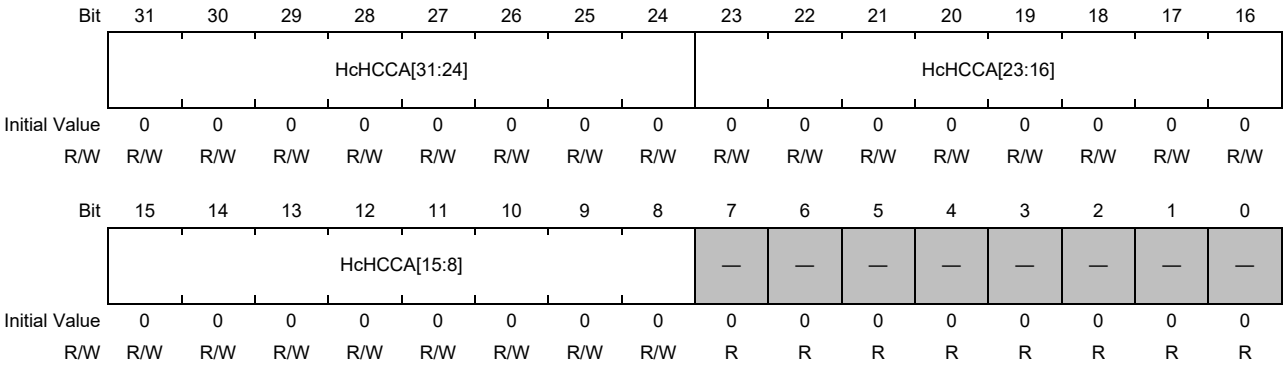
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | RHSCD | FNOD | UED | RDD | SFD | WDHD | SOD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W(1) | R/W(1) | R/W(1) | R/W(1) | R/W(1) | R/W(1) | R/W(1) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | MID | 0 | R/W (1) | Master Interrupt Disable<br>This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled.<br>If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked.<br>Writing 0b to this bit is ignored. |
| 30 | OCD | 0 | R/W (1) | OC (Ownership Change) Interrupt Disable bit.<br>If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |
| 29 to 7 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 6 | RHSCD | 0 | R/W (1) | RHSC (RootHub Status Change) Interrupt Disable bit.<br>If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (RootHub Status Change) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |
| 5 | FNOD | 0 | R/W (1) | FNO (Frame Number Overflow) Interrupt Disable bit.<br>If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |
| 4 | UED | 0 | R/W (1) | UE (Unrecoverable Error) Interrupt Disable bit.<br>If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |
| 3 | RDD | 0 | R/W (1) | RD (Resume Detected) Interrupt Disable bit.<br>If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |
| 2 | SFD | 0 | R/W (1) | SF (Start of Frame) Interrupt Disable bit.<br>If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |
| 1 | WDHD | 0 | R/W (1) | WDH (Writeback DoneHead) Interrupt Disable bit.<br>If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | SOD | 0 | R/W (1) | SO (Scheduling Overrun) Interrupt Disable bit.<br>If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source.<br>Writing 0b to this bit is ignored. |

### (7) HcHCCA Register

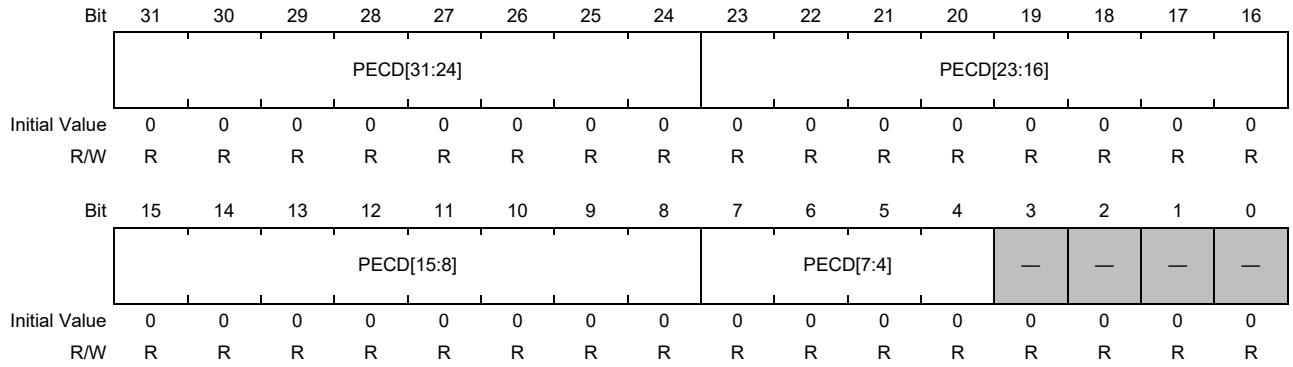
Abbreviated name of register: HcHCCA



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | HcHCCA | All 0 | R/W | This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area.<br>This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field. |
| 7 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (8) HcPeriodicCurrentED Register

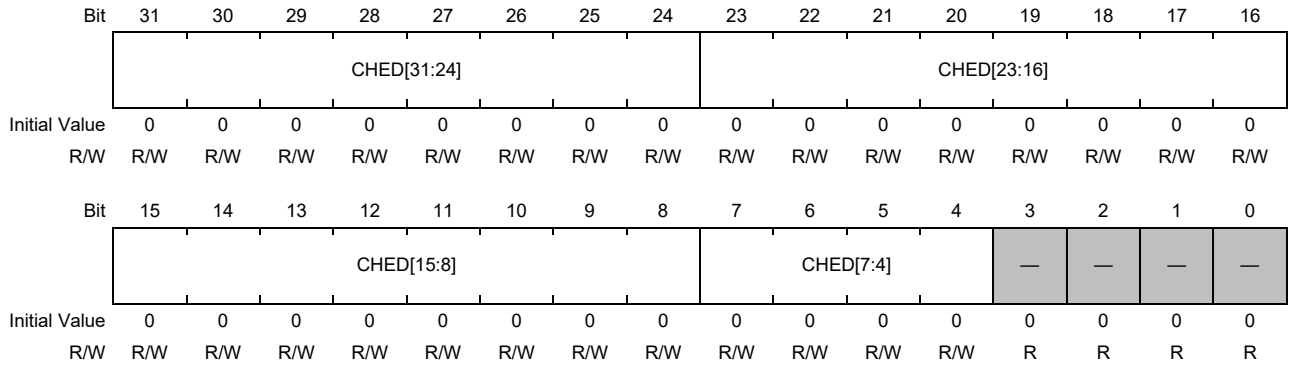
Abbreviated name of register: HcPeriodCurrentED



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | PECD | All 0 | R | Period Current ED<br>This pointer indicates the physical address of ED in the periodic list that is currently processed.<br>The host controller updates this pointer when the list processing of the periodic ED finishes. |
| 3 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (9) HcControlHeadED Register

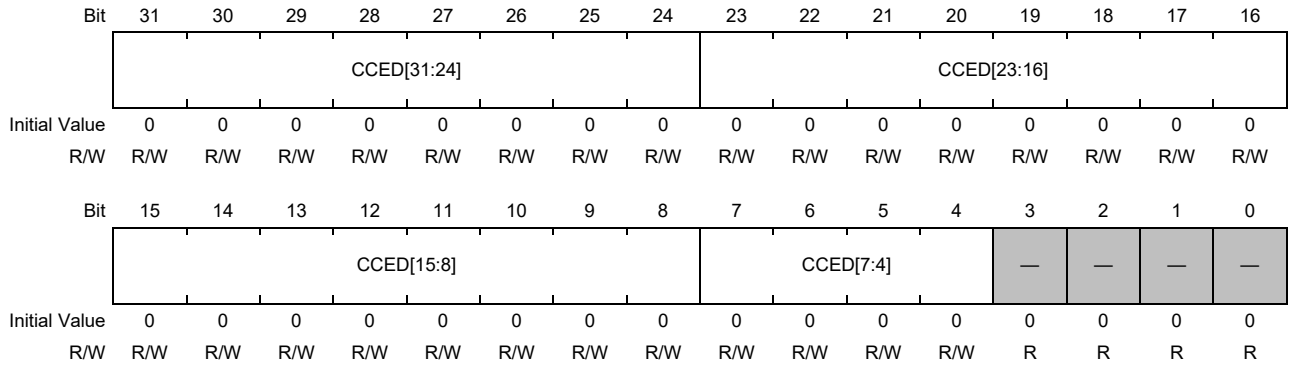
Abbreviated name of register: HcControlHeadED



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | CHED | All 0 | R/W | Control Head ED<br>This field specifies the physical address of the head ED of the control list.<br>These bits must be set for control transfer before the CLE bit of the HcControl register is set.<br>The host controller starts processing of the control list from the HcBulkHeadED pointer. |
| 3 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (10) HcControlCurrentED Register

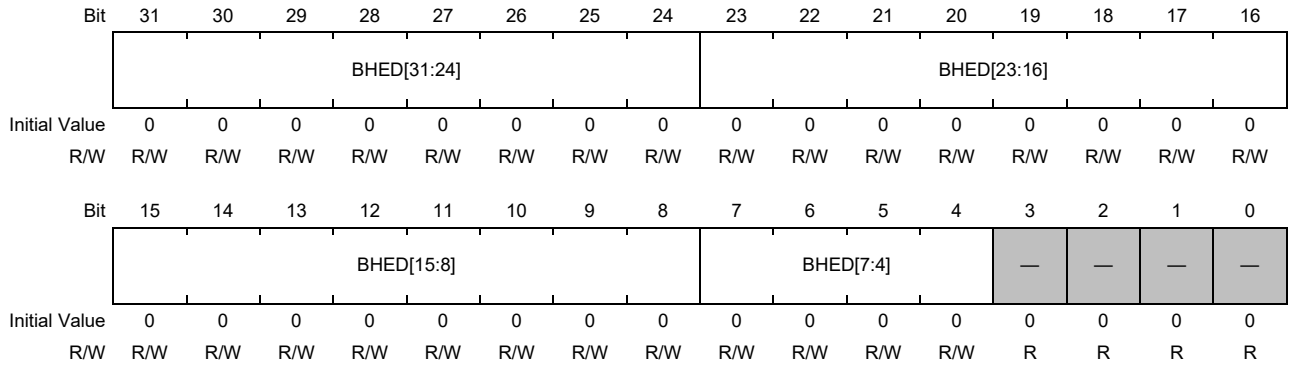
Abbreviated name of register: HcControlCurrentED



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | CCED | All 0 | R/W | Control Current ED<br>This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED.<br>The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed.<br>Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the control list. |
| 3 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (11) HcBulkHeadED Register

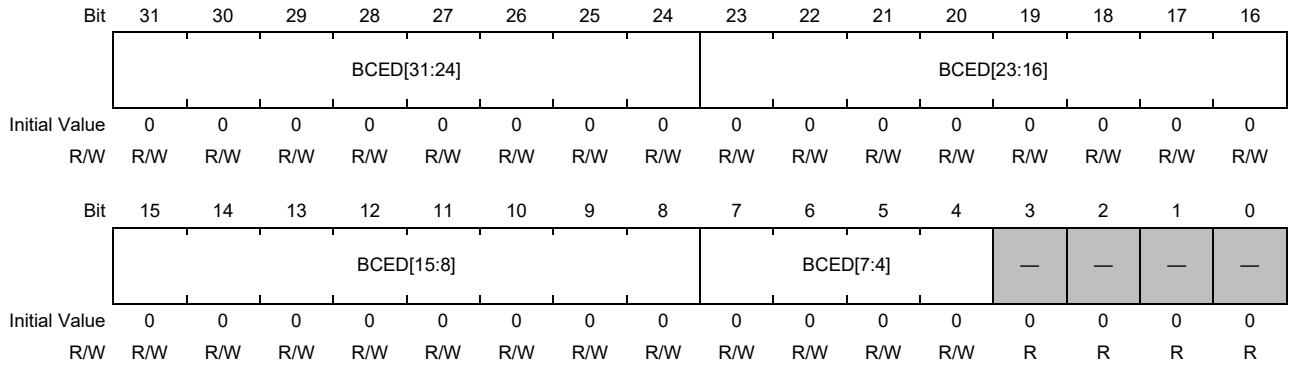
Abbreviated name of register: HcBulkHeadED



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | BHED | All 0 | R/W | BulkHead ED<br>This field specifies the physical address of the head ED of the bulk list.<br>This field must be set for bulk transfer before the BLE bit of the HcControl register is set.<br>The host controller starts the processing of the control list from the HcBulkHeadED pointer. |
| 3 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (12) HcBulkCurrentED Register

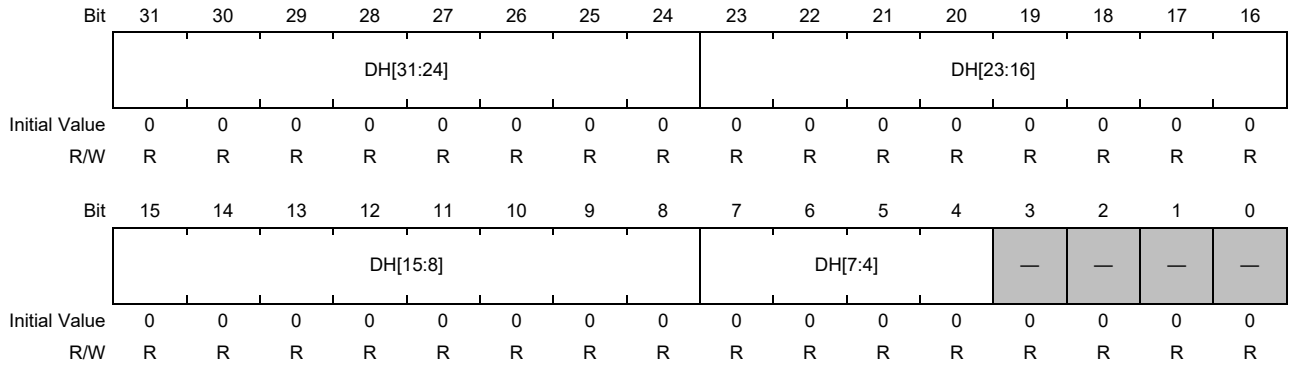
Abbreviated name of register: HcBulkCurrentED



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | BCED | All 0 | R/W | Bulk Current ED<br>This pointer indicates the physical address of the ED that is currently processed in the bulk list. After the current ED processing finishes, this pointer proceeds to the next ED.<br>The host controller continues the list processing until the end of the frame. When the end of the bulk list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcBulkHeadED field are copied to the HcBulklCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed.<br>Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the bulk list. |
| 3 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (13) HcDoneHead Register

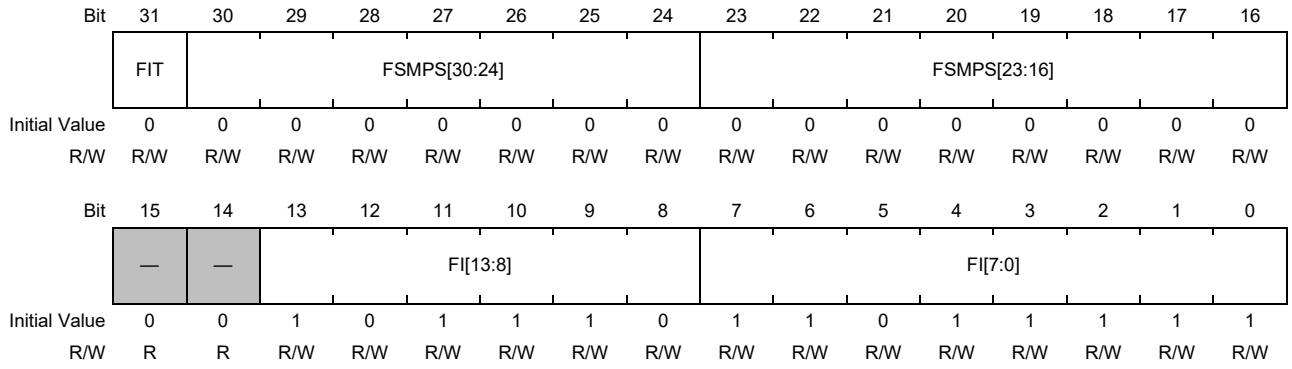
Abbreviated name of register: HcDoneHead



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 4 | DH | All 0 | R | Done Head<br>This field indicates the physical address of the HcDoneHead of the host controller.<br>The physical address of the TD that lately finished and is added to the Done queue.<br>After the TD processing finishes, the host controller writes the contents of the HcDoneHead to the NextTD field of the TD.<br>At the same time, the host controller overwrites the contents of HcDoneHead with the TD address.<br>After the host controller writes the contents of this register into HCCA, it sets 0b to this register.<br>Then, the WritebackDoneHead bit of the HcInterruptStatus register is set to 1b. |
| 3 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (14) HcFmInterval Register

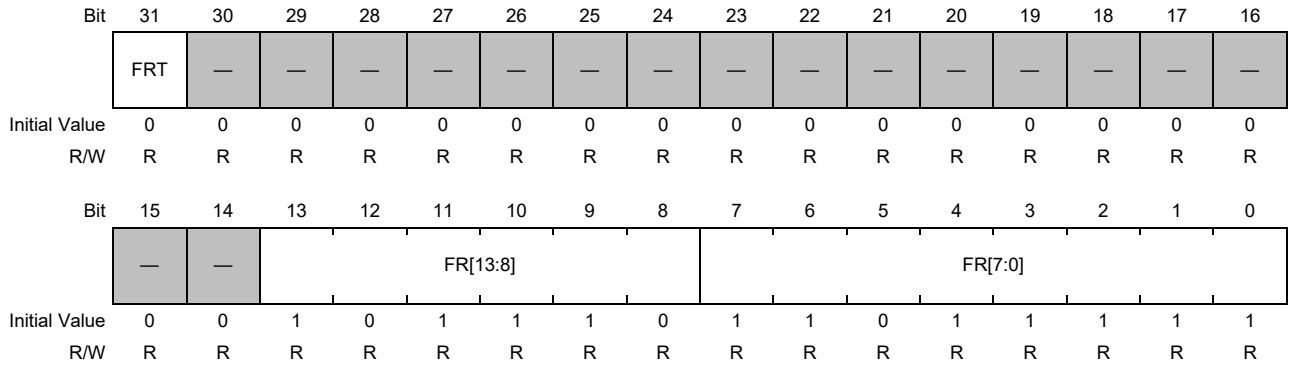
Register abbreviation: HcFmInterval



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | FIT | 0 | R/W | Frame Interval Toggle<br>This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register.<br>By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register. |
| 30 to 16 | FSMPS | All 0 | R/W | FS Largest Data Packet<br>This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun.<br>The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred.<br>This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field.<br>*Note*: The maximum setting value for this field is H'2778. Do not set any value that is larger than H'2778. |
| 15, 14 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 13 to 0 | FI | H'2EDF | R/W | Frame Interval<br>This field is used to set the length of the frame (bit time) used for Full Speed.<br>Set the value of this field to "H'2EDF" so that 1 frame (= 1 ms) of USB standard is satisfied. |

### (15) HcFmRemaining Register

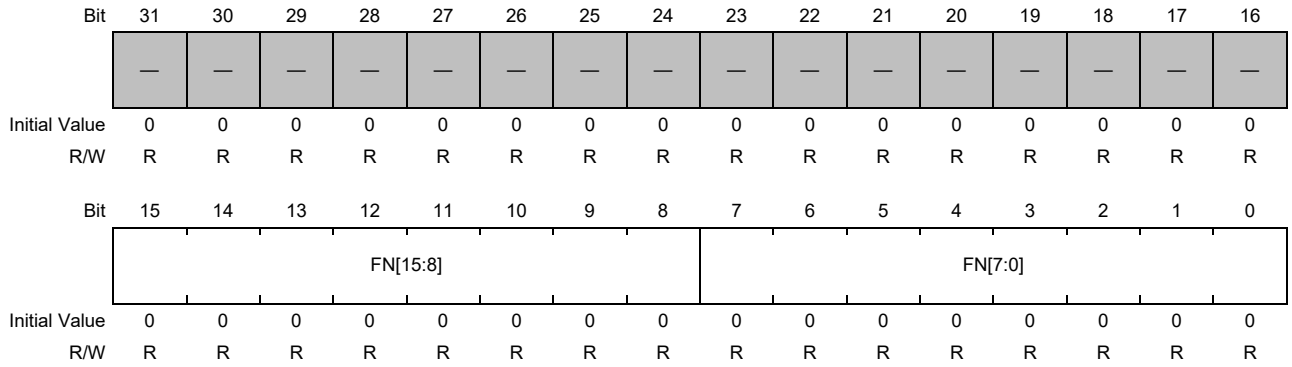
Register abbreviation: HcFmRemaining



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | FRT | 0 | R | Frame Remaining Toggle<br>This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to H'0000, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field. |
| 30 to 14 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 13 to 0 | FR | H'2EDF | R | Frame Remaining<br>This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes H'0000, the value of FI (Frame Interval) of the HcFmInterval register is loaded.<br>When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF. |

### (16) HcFmNumber Register

Register abbreviation: HcFmNumber



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 15 to 0 | FN | All 0 | R | Frame Number<br>This field indicates the number of passed frames.<br>When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to H'FFFF, the value is rolled over to H'0000. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame.<br>After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register. |

### (17) HcPeriodicStart Register

Register abbreviation: HcPeriodicStart

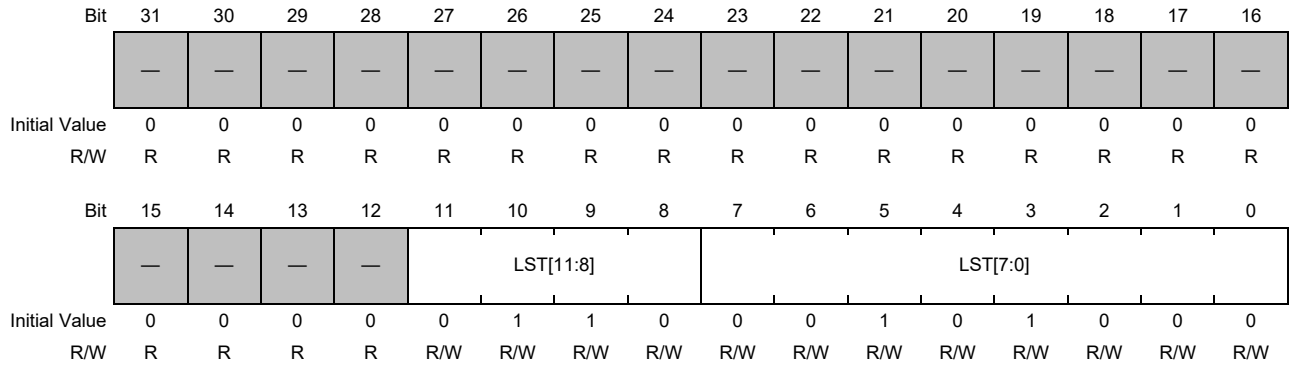
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | PS[13:8] | | | | | | PS[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 13 to 0 | PS | All 0 | R/W | Periodic Start<br>This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register.<br>The recommended value is H'2A2F.<br>When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing.<br>Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing. |

### (18) HcLSThreshold Register

Register abbreviation: HcLSThreshold



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 11 to 0 | LST | H'628 | R/W | LS Threshold<br>This field indicates the threshold value of whether transfer is available for the remaining time of the LS transfer frame.<br>If the value of the FR field of the FmRemaining register is larger than the value set to this field, the host controller can start LS transfer. |

### (19) HcRhDescriptorA Register

Register abbreviation: HcRhDescriptorA

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | POTPGT | | | | | | | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | NOCP | OCPM | DT | NPS | PSM | NDP | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R/W | R/W | R | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | POTPGT | H'0F | R/W | PowerOn To PowerGood Time<br>This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port.<br>The unit of time is 2 ms. Therefore, the wait time is POTPGT × 2 ms. |
| 23 to 13 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 12 | NOCP | 0 | R/W | No OverCurrent Protection<br>This bit sets whether the overcurrent function of the root hub is supported.<br>If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit.<br>0b: The overcurrent state is supported.<br>1b: The overcurrent state is not supported.<br>If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see **Section 32A.9.1, Host/Peripheral Common Setting Sequence**. |
| 11 | OCPM | 1 | R/W | OverCurrent Protection Mode<br>This bit sets how to report the overcurrent state of the root hub.<br>If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit.<br>This bit is valid only when the NOCP (NoOverCurrent Protection) bit is cleared (0b).<br>0b: The overcurrent state is collectively reported for all ports.<br>1b: The overcurrent state is reported for each port. |
| 10 | DT | 0 | R | Device Type<br>This bit indicates that the root hub is not a composite device.<br>This bit is always 0b because the root hub is not allowed to be a composite device. |
| 9 | NPS | 0 | R/W | No Power Switching<br>This bit sets how to control the port power.<br>If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port.<br>0b: The port power can be switched between on and off.<br>1b: The power is always on while the host controller is running. |
| 8 | PSM | 1 | R/W | Power Switching Mode<br>This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b.<br>0b: The power of all ports is collectively controlled.<br>1b: The power of ports is controlled for each port.<br>If the PPCM (PortPower Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 7 to 0 | NDP | H'01 | R | Number Downstream Ports<br>This field indicates the number of downstream ports supported by the root hub. |

### (20) HcRhDescriptorB Register

Register abbreviation: HcRhDescriptorB

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PPCM | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DR | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 17 | PPCM | 1 | R/W | PortPower Control Mask<br>This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set.<br>If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control.<br>If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control.<br>If the PSM bit is 0b, this bit is ignored. |
| 16 to 2 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 1 | DR | 0 | R/W | Device Removable<br>This bit indicates whether each port of the root hub is removable.<br>If this bit is 0b, the connected device is removable.<br>If this bit is 1b, the connected device is not removable. |
| 0 | — | 0 | R | Reserved<br>The write value should always be 0. |

### (21) HcRhStatus Register

Register abbreviation: HcRhStatus

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 21 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 20 | PRSC | 0 | R/W (1) | Port Reset Status Change<br>This bit indicates that port reset (bus reset) has finished.<br>The host controller sets this bit when 10 ms port reset (bus reset) finishes.<br>0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed.<br>1b: Port reset has finished. |
| 19 | OCIC | 0 | R/W (1) | Port OverCurrent Indicator Change<br>This bit is set when the overcurrent state of the port is detected.<br>This bit is set when the host controller changed the POCI bit value.<br>This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b).<br>If this bit is set to 1b, this bit is cleared.<br>Writing 0b to this bit has no effect.<br>0b: The overcurrent state has not changed.<br>1b: The overcurrent state has changed (POCI bit changed). |
| 18 | PSSC | 0 | R/W (1) | Port Suspend Status Change<br>This bit indicates that the Resume sequence finished.<br>This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay.<br>If this bit is set to 1b, this bit is cleared.<br>Writing 0b to this bit has no effect.<br>If the PRSC (Port Reset Status Change) bit is set, this bit is cleared.<br>0b: The Resume sequence has not finished.<br>1b: The Resume sequence has finished. |
| 17 | PESC | 0 | R/W (1) | Port Enable Status Change<br>This bit indicates that the PES (Port Enable Status) bit was changed.<br>If a hardware event clears the PES bit, this bit is set to 1b.<br>If this bit is set to 1b, this bit is cleared.<br>Writing 0b to this bit has no effect.<br>0b: The PES (Port Enable Status) bit has not changed.<br>1b: The PES (Port Enable Status) bit has changed. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 16 | CSC | 0 | R/W (1) | Connect Status Change<br>This bit indicates that the CCS (Current Connect Status) bit was changed.<br>If the Connect/Disconnect event occurs, this bit is set to 1b.<br>If this bit is set to 1b, this bit is cleared.<br>Writing 0b to this bit has no effect.<br>If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation.<br>0b: The CCS (Current Connect Status) bit has not changed.<br>1b: The CCS (Current Connect Status) bit has changed. |
| 15 to 10 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 9 | LSDA | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Low Speed Device Attached<br>This bit indicates the speed of the device connected to the port.<br>This bit is valid only when the CCS (Current Connect Status) bit is set.<br>0b: Full Speed device is connected.<br>1b: Low Speed device is connected.<br>[Write] Clear Port Power<br>This bit is used to turn off the power of the port when the port is power controlled.<br>Writing 1b to this bit turns off the port power.<br>Writing 0b to this bit has no effect. |
| 8 | PPS | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Port Power Status<br>This bit indicates the power status of the port.<br>This bit is cleared when the overcurrent is detected.<br>0b: Port power is off.<br>1b: Port power is on.<br>[Write] Set Port Power<br>This bit is used to turn on the power of the port when the port is power controlled.<br>Writing 1b to this bit turns on the port power.<br>Writing 0b has no effect. |
| 7 to 5 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 4 | PRS | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Port Reset Status<br>This bit indicates the port reset (bus reset) status.<br>When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set.<br>0b: Not during port reset<br>1b: During port reset<br>[Write] Set Port Reset<br>This bit is used to issue a port reset (bus reset) to the downstream port.<br>Writing 1b to this bit starts 10 ms of port reset.<br>Writing 0b to this bit has no effect.<br>If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b.<br>This is performed to report to ports to which no device is connected, that port reset was performed. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | POCI | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Port OverCurrent Indicator<br>This bit indicates that the downstream port is in the overcurrent status.<br>This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b).<br>On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b.<br>0b: The port is in normal status.<br>1b: The port is in overcurrent status.<br>[Write] Clear Suspend Status<br>This bit is used to finish the Suspend status and start the Resume sequence.<br>Writing 1b to this bit starts the Resume sequence.<br>Writing 0b has no effect.<br>The Resume sequence starts only when PSS (Port Suspend Status) is set. |
| 2 | PSS | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Port Suspend Status<br>This bit indicates that the port status is in Suspend or Resume sequence.<br>0b: The port is not in Suspend status.<br>1b: The port is in Suspend status.<br>When the CCS bit is cleared (when no device is connected), this bit cannot be set.<br>This bit is cleared under the following conditions:<br>• When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set<br>• When the port reset finished, and the PRSC (Port Reset Status Change) bit is set<br>• When the host controller is in the USB Resume state<br>[Write] Set Port Suspend<br>This bit is used to change the port status to Suspend.<br>Writing 1b to this bit changes the status to Suspend.<br>Writing 0b to this bit has no effect.<br>If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b.<br>This is performed to report to the ports to which no device is connected that the Suspend command was issued. |
| 1 | PES | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Port Enable Status<br>This bit indicates whether the port status is Enable or Disable.<br>If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (PortEnableStatusChange) bit is set.<br>When the CCS bit is cleared (when no device is connected), this bit cannot be set.<br>This bit is set “when port reset finished and the PRSC bit is set” or “when the port status becomes Suspend and the PRSC bit is set”.<br>0b: The port status is Disable.<br>1b: The port status is Enable.<br>[Write] Set Port Enable<br>This bit is used to set the PES bit.<br>Writing 1b to this bit changes the port status to Enable.<br>Writing 0b to this bit has no effect.<br>If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b.<br>This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | CCS | 0 | R/W | The meaning of this bit differs depending on whether the operation is read or write.<br>[Read] Current Connect Status<br>The current connection status of the downstream port is applied to this bit.<br>0b: No device is connected.<br>1b: A device is connected.<br>[Write] Clear Port Enable<br>This bit is used to clear the PES (Port Enable Status) bit.<br>Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect. |

### 32A.2.4.2 EHCI Controller Capability Register

#### (1) HCIVERSION/CAPLENGTH Register

Register abbreviation: CAPL_VERSION

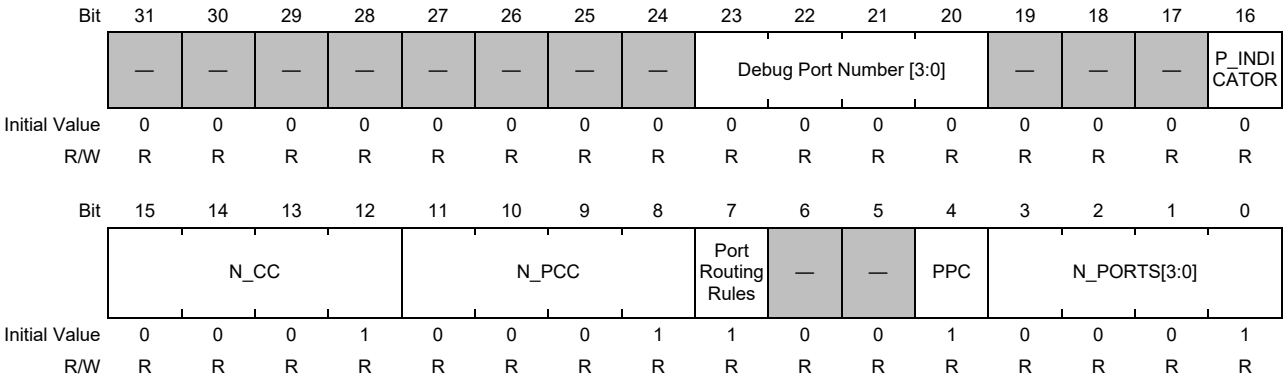
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Interface Version Number[15:8] | | | | | | | | Interface Version Number[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | Capability Registers Length[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | Interface Version Number | H'0110 | R | This field indicates the EHCI version supported by the host controller.<br>H'0110 is indicated because this host controller supports EHCI Rev1.1. |
| 15 to 8 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 7 to 0 | Capability Registers Length | H'20 | R | This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register.<br>H'20 is indicated because the EHCI Operation register of this module starts from H'20. |

### (2) HCSPARAMS Register

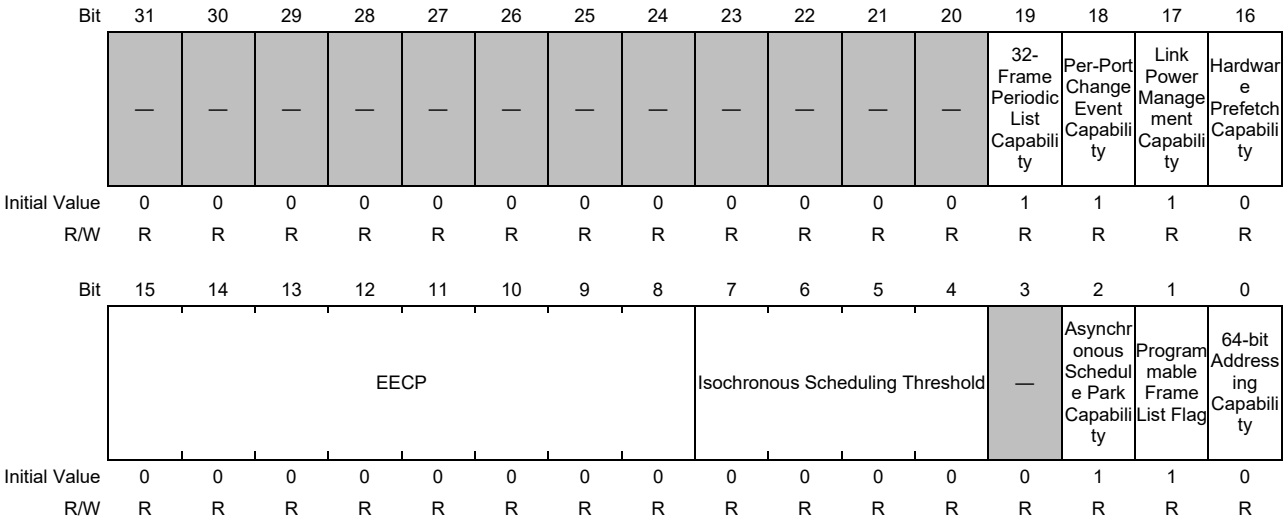
Register abbreviation: HCSPARAMS



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 23 to 20 | Debug Port Number | All 0 | R | This field indicates that the host controller port is a debug port.<br>0000b is indicated because this module does not have a debug port. |
| 19 to 17 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 16 | P_INDICATOR | 0 | R | Port Indicators<br>This bit indicates whether the host controller supports port indicator control.<br>0b is indicated because this module does not support port indicator control. |
| 15 to 12 | N_CC | H'1 | R | Number of Companion Controller<br>This field indicates the number of OHCI host controllers implemented in this module.<br>H'1 is indicated because this module has one OHCI host controller. |
| 11 to 8 | N_PCC | H'1 | R | Number of Ports per Companion Controller<br>This field indicates the number of ports supported by an OHCI host controller.<br>The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field. |
| 7 | Port Routing Rules | 1 | R | This bit indicates how individual ports are mapped to the OHCI host controller.<br>This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method. |
| 6, 5 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 4 | PPC | 1 | R | Port Power Control<br>This bit indicates how the port power of this module is controlled.<br>0b: The port power is always on.<br>1b: The PP bit of the PORTSC register controls the port power. |
| 3 to 0 | N_PORTS | H'1 | R | This field indicates the number of physical downstream ports used by this module.<br>0001b: 1 Port |

### (3) HCCPARAMS Register

Register abbreviation: HCCPARAMS

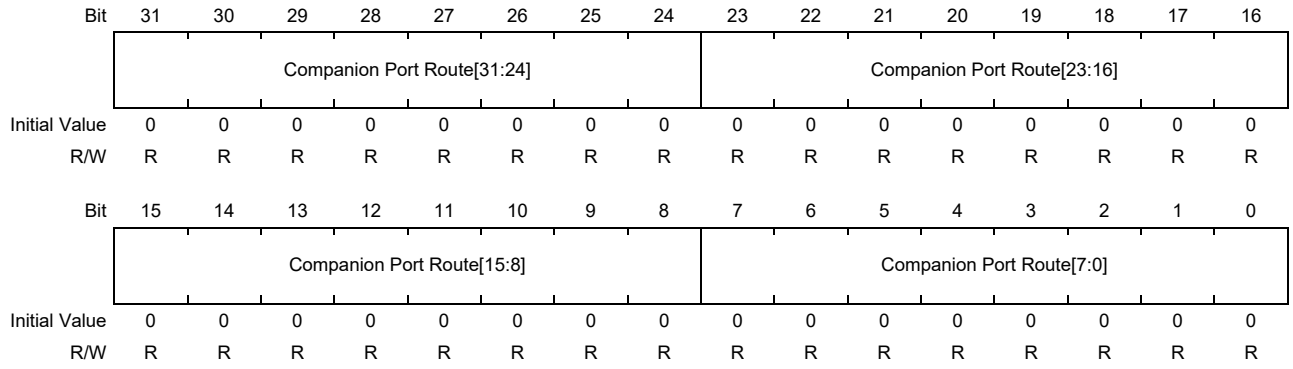


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 19 | 32-Frame Periodic List Capability | 1 | R | This bit indicates 1b because this module supports 32-Frame Periodic List defined in EHCI V1.1.<br>This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32-Frame Periodic List. |
| 18 | Per-Port Change Event Capability | 1 | R | This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1.<br>This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register.<br>If this bit is 0b, the corresponding fields of the above registers are treated as Reserved. |
| 17 | Link Power Management Capability | 1 | R | This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1.<br>This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register.<br>If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved. |
| 16 | Hardware Prefetch Capability | 0 | R | This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1. |
| 15 to 8 | EECP | All 0 | R | This field indicates the offset address of the EHCI Extend Capabilities Registers.<br>This field indicates H'00 because this module does not use EHCI Extend Capabilities Registers. |
| 7 to 4 | Isochronous Scheduling Threshold | All 0 | R | This field indicates H'0 because this module does not support caches with isochronous data structure for the entire frame. |
| 3 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 2 | Asynchronous Schedule Park Capability | 1 | R | This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule.<br>This bit indicates 1b because this module supports the above function. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1 | Programmable Frame List Flag | 1 | R | This bit indicates the setting for the available frame list size.<br>This bit indicates 1b for this module.<br>If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable. |
| 0 | 64-bit addressing Capability | 0 | R | This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer).<br>This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported. |

### (4) HCSP-PORTROUTE Register

Register abbreviation: HCSP_PORTROUTE



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | Companion Port Route[31:0] | All 0 | R | This field indicates the ports controlled by the OHCI host controller.<br>This field indicates 0b for this module because this module has one OHCI host controller. |

### 32A.2.4.3 HCI Operational Register

#### (1) USBCMD Register

Register abbreviation: USBCMD

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | Host-Initiated Resume Duration | | | | Interrupt Threshold Control | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Per-Port Change Events Enable | — | — | — | Asynchronous Schedule Park Mode Enable | — | Asynchronous Schedule Park Mode Count | | — | Interrupt on Async Advance Doorbell | Asynchronous Schedule Enable | Periodic Schedule Enable | Frame List Size | | HCRESET | RS |
| Initial Value | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R/W | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 28 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 27 to 24 | Host-Initiated Resume Duration | All 0 | R/W | This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state.<br>The value in this field is sent to the connected device that has the LPM function via the HIDR field in the bmAttributes field of the LPM token.<br>The encoded value of this field is defined as the name of the HIRD field in the LPM Token.<br>Specifically, H'0 means 50 µs, and if the value is incremented by 1, 75 µs is incremented. For example, H'1 means 125 µs, and H'4 means 1175 µs. |
| 23 to 16 | Interrupt Threshold Control | H'08 | R, R/W | This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed.<br>Value / Maximum Interrupt Interval<br>H'00 Reserved<br>H'01 1 micro-frame<br>H'02 2 micro-frames<br>H'04 4 micro-frames<br>H'08 8 micro-frames (default, equals to 1 ms)<br>H'10 16 micro-frames (2 ms)<br>H'20 32 micro-frames (4 ms)<br>H'40 64 micro-frames (8 ms)<br>Do not set H'00 to this field while the Halted bit is 0b. |
| 15 | Per-Port Change Events Enable | 0 | R/W | This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register.<br>0b: The event report function of the ports is disabled.<br>1b: The event report function of the ports is enabled. |
| 14 to 12 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 11 | Asynchronous Schedule Park Mode Enable | 1 | R/W | This bit enables or disables the Asynchronous Schedule Park mode.<br>0b: The Park mode is disabled.<br>1b: The Park mode is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 10 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 9, 8 | Asynchronous Schedule Park Mode Count | 11b | R/W | This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule.<br>The valid value range is H'1 to H'3.<br>This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b.<br>Do not set H'0 to this field. |
| 7 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 6 | Interrupt on Async Advance Doorbell | 0 | R/W | This bit is used as the doorbell.<br>In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b.<br>After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b.<br>If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing.<br>If the asynchronous schedule is disabled, do not write 1b to this bit. |
| 5 | Asynchronous Schedule Enable | 0 | R/W | This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing.<br>0b: The asynchronous list processing is skipped.<br>1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing. |
| 4 | Periodic Schedule Enable | 0 | R/W | This bit sets whether the host controller proceeds or skips the periodic list processing.<br>0b: The periodic list processing is skipped.<br>1b: Use the PERIODICLISTBASE register to proceed the periodic list processing. |
| 3, 2 | Frame List Size | 0 | R/W | This field specifies the frame list size.<br>The setting value of this field determines the size of the Frame List Current index of the FRINDEX register.<br>Value: 00b — the number of frames in Frame List: 1024 frames (default)<br>01b: 512 frames<br>10b: 256 frames<br>11b: 32 frames |
| 1 | HCRESET | 0 | W | Host Controller Reset<br>This bit is used to initialize the EHCI circuit of the host controller.<br>If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports.<br>Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI.<br>Software must be reset to return the host controller to the operational state.<br>When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit. |
| 0 | RS | 0 | R/W | Run/Stop<br>This bit is used to run or stop the EHCI host controller.<br>If this bit is set to 1b, the host controller starts operation.<br>As long as this bit is set to 1b, the host controller continues running.<br>If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status.<br>If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit. |

### (2) USBSTS Register

Register abbreviation: USBSTS

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | Port-1 Change Detect |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W(1) |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Asynchronous Schedule Status | Periodic Schedule Status | Reclamation | HCHalted | — | — | — | — | — | — | Interrupt on Async Advance | Host System Error | Frame List Rollover | Port Change Detect | USBERRINT | USBINT |
| Initial Value | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W(1) | R/W(1) | R/W(1) | R/W(1) | R/W(1) | R/W(1) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 16 | Port-1Change Detect | 0 | R/W (1) | If this bit is set to 1b, it indicates that a change in the port status was detected.<br>This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b. |
| 15 | Asynchronous Schedule Status | 0 | R | This bit indicates the current status of the asynchronous schedule.<br>0b: The asynchronous schedule is disabled.<br>1b: The asynchronous schedule is enabled.<br>If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b). |
| 14 | Periodic Schedule Status | 0 | R | This bit indicates the current status of the periodic schedule.<br>0b: The periodic schedule is disabled.<br>1b: The periodic schedule is enabled.<br>If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b). |
| 13 | Reclamation | 0 | R | This bit is used to detect an empty asynchronous schedule.<br>If this bit is 1b, the asynchronous schedule is empty.<br>After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b.<br>Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b.<br>If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode. |
| 12 | HCHalted | 1 | R | If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b.<br>If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit.<br>0b: The EHCI host controller is running.<br>1b: The EHCI host controller is stopped. |
| 11 to 6 | — | All 0 | R | Reserved<br>The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 5 | Interrupt on Async Advance | 0 | R/W (1) | This bit indicates the Async Advance Interrupt status.<br>After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit.<br>If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit.<br>If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect.<br>0b: Async Advance Interrupt not occurred.<br>1b: Async Advance Interrupt status is detected. |
| 4 | Host System Error | 0 | R/W (1) | This bit is set to 1b if a serious error occurs in the host controller.<br>If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.<br>0b: No system error occurred.<br>1b: A system error occurred. |
| 3 | Frame List Rollover | 0 | R/W (1) | If a frame list rollover occurs, the host controller sets this bit to 1b.<br>Specifically, when the Frame Index field of the FRINDEX register is returned to H'000 from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register.<br>For example, if the Frame List Size is 1024 frame, rollover occurs every time FRIMDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles.<br>If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles.<br>Writing 1b to this bit can clears this bit. Writing 0b to this bit has no effect.<br>0b: The frame list is not returned to H'000.<br>1b: The frame list is returned to H'000 (rollover occurred). |
| 2 | Port Change Detect | 0 | R/W (1) | This bit indicates that the port status has changed.<br>Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b:<br>• Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0 to 1.<br>• A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0 to 1.<br>• The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0 to 1.<br>• J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0 to 1.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. |
| 1 | USBERRINT | 0 | R/W (1) | USB Error Interrupt<br>This bit indicates that a USB transaction finished with an error.<br>When a USB transaction finishes with an error, the host controller sets this bit to 1b.<br>If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.<br>0b: USB transaction is normal.<br>1b: USB transaction finished with an error. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | USBINT | 0 | R/W (1) | USB Interrupt<br>This bit indicates that a USB transfer has finished.<br>The host controller sets this bit to 1b if one of the following conditions is satisfied:<br>● A USB transfer has finished.<br>● A short packet is received.<br>Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.<br>0b: A USB transfer has not finished.<br>1b: A USB transfer has finished. |

### (3) USBINTR Register

Register abbreviation: USBINTR

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | Port-1 Change Event Enable |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

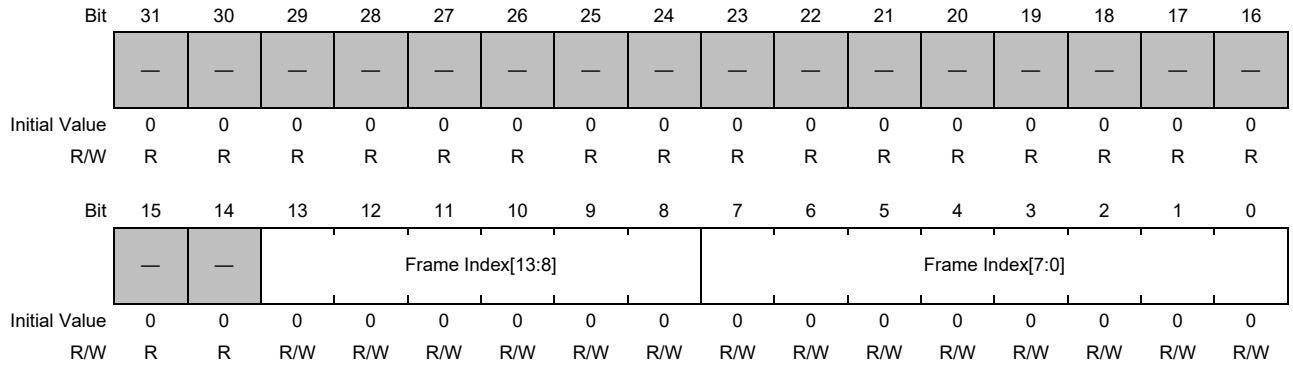
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | Interrupt on Async Advance Enable | Host System Error Enable | Frame List Rollover Enable | Port Change Detect Enable | USB Error Interrupt Enable | USB Interrupt Enable |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 17 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 16 | Port-1 Change EventEnable | 0 | R/W | If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt. |
| 15 to 6 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 5 | Interrupt on Async Advance Enable | 0 | R/W | This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled.<br>If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing.<br>0b: Disabled.<br>1b: Enabled (an interrupt occurs via the IAA bit). |
| 4 | Host System Error Enable | 0 | R/W | This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing.<br>0b: Disabled.<br>1b: Enabled (an interrupt occurs via the HSE bit). |
| 3 | Frame List Rollover Enable | 0 | R/W | This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled.<br>If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing.<br>0b: Disabled.<br>1b: Enabled (an interrupt occurs via the FLR bit). |
| 2 | Port Change Detect Enable | 0 | R/W | This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled.<br>If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing.<br>0b: Disabled.<br>1b: Enabled (an interrupt occurs via the PCD bit). |
| 1 | USB Error Interrupt Enable | 0 | R/W | This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing.<br>0b: Disabled.<br>1b: Enabled (an interrupt occurs via the USBERRINT bit). |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | USB Interrupt Enable | 0 | R/W | This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled.<br>If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing.<br>0b: Disabled.<br>1b: Enabled (an interrupt occurs via the USBINT bit). |

### (4) FRINDEX Register

Register abbreviation: FRINDEX



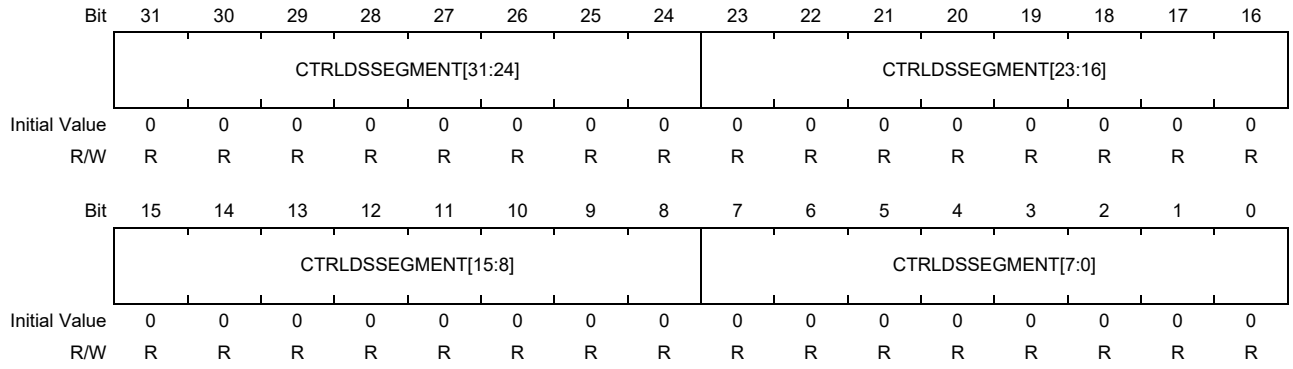
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 14 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 13 to 0 | Frame Index[13:0] | All 0 | R/W | This field is used by the host controller to add an index to the periodic frame list. The value in this field is incremented at the end of a micro frame.<br>Bit [N:3] of this field is used as the Frame List Current index. This means that, before the next index arrives, the current frame list is accessed 8 times. The value for N is determined, as follows, by the setting value of bit [3:2] (Frame List Size field) of the USBCMD register. |

| Frame List Size | Number of Frames | N |
|---|---|---|
| 00b | 1024 | 12 |
| 01b | 512 | 11 |
| 10b | 256 | 10 |
| 11b | 32 | 12 |

Access this register only when the host controller is in stop status (bit 12 [HCHalted] = 1b). The setting value of this field is applied to the SOF frame number of the SOF token.

### (5) CTRLDSSEGMENT Register

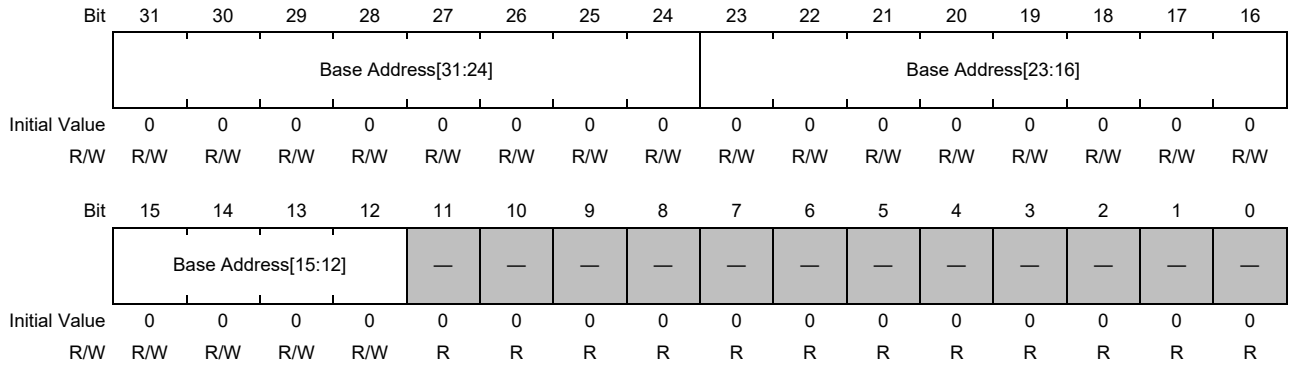
Register abbreviation: CTRLDSSEGMENT



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CTRLDSSEGMENT | All 0 | R | This register is not used because this module does not support 64-bit address method.<br>Therefore, HCD must not access this register. |

### (6) PERIODICLISTBASE Register

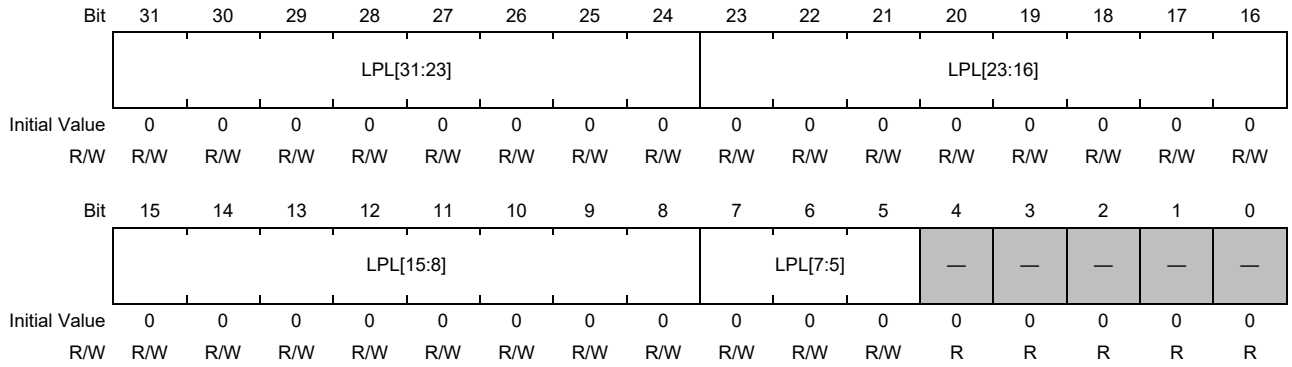
Register abbreviation: PERIODICLISTBASE



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 12 | Base Address | All 0 | R/W | This field indicates the head address of the periodic frame list on the system memory.<br>The host controller loads the contents of this register before starting the list processing.<br>The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register.<br>Align the address of the periodic frame list by 4 Kbyte.<br>Normal operation is not guaranteed if any of these bits are changed during operation. |
| 11 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (7) ASYNCLISTADDR Register

Register abbreviation: ASYNCLISTADDR



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | LPL | All 0 | R/W | Link Pointer Low<br>This field indicates the address (on the system memory) of the Asynchronous Queue Head to be processed next time.<br>Align the address of Asynchronous Queue Head by 32 byte. |
| 4 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (8) CONFIGFLAG Register

Register abbreviation: CONFIGFLAG

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CF |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 0 | CF | 0 | R/W | Configuration Flag<br>This bit controls which of OHCI or EHCI is routed by the port routing control circuit by default.<br>At the end of the host controller configuration, this bit is set to 1b.<br>0b: The port routing control circuit routes each port to the OHCI host controller by default.<br>1b: The port routing control circuit routes each port to the EHCI host controller by default. |

### (9) PORTSC1Register

Register abbreviation: PORTSC1

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Device Address | | | | | | | Suspend Status[1] | Suspend Status[0] | WKOC_E | WKDSCNNT_E | WKCNNT_E | Port Test Control | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | Port Owner | PP | Line Status | | Suspend using L1 | Port Reset | Suspend | Force Port Resume | Over current Active Change | Over-current Active | Port Enabled /Disabled Change | Port Enabled /Disabled | Connect Status Change | Current Connect Status |
| Initial Value | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W(1) | R | R/W(1) | R/W | R/W(1) | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 25 | Device Address | All 0 | R/W | This field indicates the USB device address (7 bits) of the device connected to the down port.<br>This address is used when the LPM Token is sent.<br>If the value of this filed is H'00, it means that no device that needs to use this field has been connected. |
| 24, 23 | Suspend Status | All 0 | R | This field indicates the response from the connected device to the LPM Token (L1 transition request).<br>00b: The device succeeded transition to the L1 state (ACK received from the device).<br>01b: The device has not changed to the L1 state (NYET received from the device).<br>10b: The device does not support the L1 state transition (STALL received from the device).<br>11b: Other response (for example, Timeout error)<br>Change this field only when the Suspend bit is 0b. |
| 22 | WKOC_E | 0 | R/W | Wake on Overcurrent Enable<br>By writing 1b to this bit, the overcurrent state can be detected as an EHCI Wakeup event.<br>If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b. |
| 21 | WKDSCNNT_E | 0 | R/W | Wake on Disconnect Enable<br>By writing 1b to this bit, device disconnection can be detected as an EHCI Wakeup event.<br>If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b. |
| 20 | WKCNNT_E | 0 | R/W | Wake on Connect Enable<br>By writing 1b to this bit, device connection can be detected as an EHCI Wakeup event.<br>If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b. |

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>

<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>9</td><td>Suspend using L1</td><td>0</td><td>R/W</td><td>Suspend using L1 (LPM) control bit.<br>If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state.<br>Writing to this bit is possible only when the Suspend bit (bit 7) is 0b.<br>0b: Suspend using L2<br>1b: Suspend using L1 (LPM)<br>If this bit is 1b and the Device Address field is other than H’0000, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state.<br>If this bit is 0b, the host controller operates as L2 Suspend.</td></tr>
<tr><td>8</td><td>Port Reset</td><td>0</td><td>R/W</td><td>This bit indicates the reset status of the port.<br>0b: The port is not being reset.<br>1b: The port is being reset.<br>If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete.<br>If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b.<br>If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b.<br>Note: Even if 1b is written to this bit, the bus reset sequence does not start.<br>• PP (Port Power) bit = 0b<br>• Port Owner bit = 1b<br>• Current Connect Status bit = 0b</td></tr>
<tr><td>7</td><td>Suspend</td><td>0</td><td>R/W</td><td>This bit indicates the Suspend control and status of the port.<br>This bit and bit 2 (Port Enabled/Disabled bit) indicate the following port status.
<table>
<tr><th>Port Enabled</th><th>Suspend</th><th>Port Status</th></tr>
<tr><td>0b</td><td>—</td><td>Disable</td></tr>
<tr><td>1b</td><td>0b</td><td>Enable</td></tr>
<tr><td></td><td>1b</td><td>Suspend</td></tr>
</table>
To change the port state to L1 or L2 Suspend, set this bit to 1b.<br>Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit.<br>In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes.<br>Writing 0b to this bit has no effect.<br>This bit can be set to 1b only when all the following conditions are satisfied: “PP (Port Power) bit = 1b”, “Port Owner bit = 0b”, and “Current Connect Status bit = 1b”. If any of the following conditions is satisfied, the host controller clears this bit:<br>• “Resume is complete” is detected.<br>• The PR bit is set to 1b when PR (Port Reset) bit is 0b.<br>• The port owner is 1b (OHCI).<br>• The PP (Port Power) bit is set to 0b.<br>• The Port Enabled/Disabled bit is set to 0b.</td></tr>
</table>

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 6 | Force Port Resume | 0 | R/W | This bit indicates that the Resume state of the port is detected.<br>0b: Resume signal is not detected or output.<br>1b: Resume (K-state) is detected or output.<br>When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b.<br>If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus.<br>For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b.<br>On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register.<br>If the Port Power (PP) bit is 0b, this bit becomes 0b. |
| 5 | Over-current Change | 0 | R/W (1) | This bit indicates that bit 4 (Over-current Active bit) has changed.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.<br>0b: Over-current Active bit has not changed.<br>1b: Over-current Active bit has changed. |
| 4 | Over-current Active | 0 | R | This bit indicates the overcurrent status of the port.<br>If the host controller detects overcurrent, it disables the port, and set this bit to 1b.<br>After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b.<br>0b: The port is not in overcurrent state.<br>1b: The port is in overcurrent state. |
| 3 | Port Enable/ Disable Change | 0 | R/W (1) | This bit indicates that the host controller detected frame babble.<br>If the Host Controller detects frame babble, it disables the port and sets this bit to 1b.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b.<br>0b: Frame babble has not occurred.<br>1b: Frame babble is detected. |
| 2 | Port Enabled/ Disabled | 0 | R/W | This bit indicates the Enable/Disable status of the port.<br>The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b.<br>If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit.<br>If the port is disabled, data transfer to the downstream port is blocked except for port reset.<br>If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b.<br>If the Port Power (PP) bit is 0b, this bit becomes 0b.<br>0b: The port is disabled.<br>1b: The port is enabled. |
| 1 | Connect Status Change | 0 | R/W (1) | This bit indicates that bit 0 (Current Connect Status bit) has changed.<br>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.<br>If the Port Power (PP) bit is 0b, this bit becomes 0b.<br>0b: The Current Connect Status bit has no change.<br>1b: The Current Connect Status bit has changed. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | Current Connect Status | 0 | R | This bit indicates the connection status of the port.<br>If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected.<br>On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b.<br>If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b.<br>0b: No device is connected to the port.<br>1b: A device is connected to the port. |

### 32A.2.4.4 AHB Bridge Register

#### (1) INT_ENABLE Register

Abbreviated name of register: INT_ENABLE

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | WAKEON_INTEN | UCOM_INTEN | USBH_INTBEN | USBH_INTAEN | AHB_INTEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 4 | WAKEON_INTEN | 0 | R/W | This bit enables or disables bit 4 (WAKEON_INT) of the INT_STATUS register.<br>0b: disable<br>1b: enable |
| 3 | UCOM_INTEN | 0 | R/W | This bit enables or disables bit 3 (UCOM_INT) of the INT_STATUS register.<br>0b: disable<br>1b: enable |
| 2 | USBH_INTBEN | 0 | R/W | This bit enables or disables bit 2 (USBH_INTB) of the INT_STATUS register.<br>0b: disable<br>1b: enable |
| 1 | USBH_INTAEN | 0 | R/W | This bit enables or disables bit 1 (USBH_INTA) of the INT_STATUS register.<br>0b: disable<br>1b: enable |
| 0 | AHB_INTEN | 0 | R/W | This bit enables or disables bit 0 (AHB_INT) of the INT_STATUS register.<br>0b: disable<br>1b: enable |

### (2) INT_STATUS Register

Abbreviated name of register: INT_STATUS

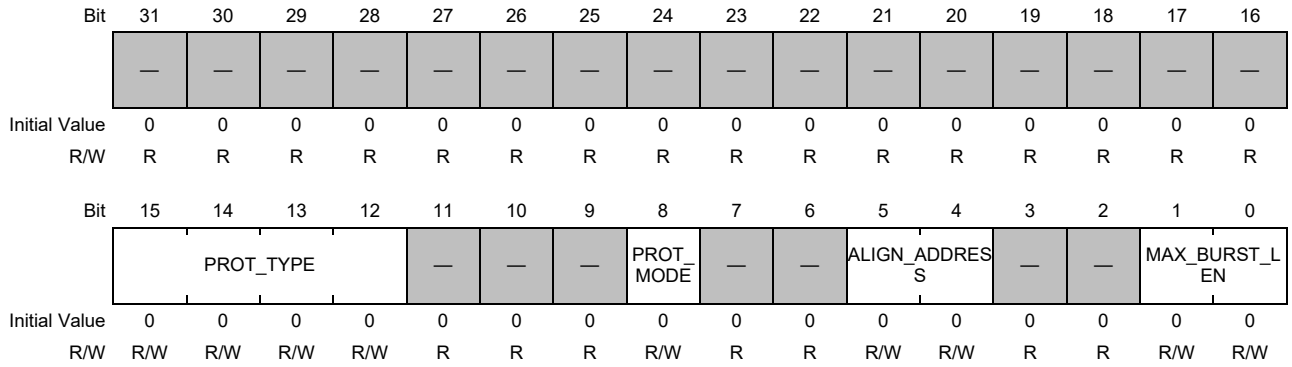
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | WAKEON_INT | UCOM_INT | USBH_INTB | USBH_INTA | AHB_INT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W(1) | R | R | R | R/W(1) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 5 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 4 | WAKEON_INT | 0 | R/W (1) | This bit indicates the state of WAKEON interrupt from the HOST module.<br>Writing 1b to this bit can clear this bit.<br>0b: No WAKEON interrupt<br>1b: WAKEON interrupt |
| 3 | UCOM_INT | 0 | R | This bit indicates the state of interrupt from the UCOM register.<br>To clear the interrupt, use the UCOM2 Register.<br>0b: No UCOM register interrupt<br>1b: UCOM register interrupt |
| 2 | USBH_INTB | 0 | R | This bit indicates the state of EHCI interrupt.<br>To clear the interrupt, use the USBSTS Register (of the EHCI Operational Register).<br>0b: No INTB interrupt<br>1b: INTB interrupt |
| 1 | USBH_INTA | 0 | R | This bit indicates the state of OHCI interrupt.<br>To clear the interrupt, use the HcInterruptStatus Register (of the OHCI Operational Register).<br>0b: No INTA interrupt<br>1b: INTA interrupt |
| 0 | AHB_INT | 0 | R/W (1) | This bit indicates that a BUS Master error occurred.<br>Writing 1b to this bit can clear this bit.<br>0b: No bus error occurred.<br>1b: A bus error occurred. |

### (3) AHB_BUS_CTR Register

Abbreviated name of register: AHB_BUS_CTR



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 15 to 12 | PROT_TYPE | All 0 | R/W | This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request.<br>bit 15 0b: Cache disabled.<br>1b: Cache enabled.<br>bit 14 0b: Buffer disabled.<br>1b: Buffer enabled.<br>bit 13 0b: User access<br>1b: Privileged access<br>bit 12 0b: Operation code<br>1b: Data |
| 11 to 9 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 8 | PROT_MODE | 0 | R/W | This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request.<br>0b: The value of PROT_TYPE is output as MHPROT [3:0].<br>1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed. |
| 7, 6 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 5, 4 | ALIGN_ADDRESS | All 0 | R/W | This field sets the address boundary used when the BUS Master interface issues a burst transfer.<br>00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary.<br>01b: A burst transfer is issued so that not to exceed 64-byte boundary.<br>10b: A burst transfer is issued so that not to exceed 32-byte boundary.<br>(The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.)<br>11b: A burst transfer is issued so that not to exceed16 byte boundary.<br>(The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.) |
| 3,2 | — | All 0 | R | Reserved<br>The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 1, 0 | MAX_BURST_LEN | All 0 | R/W | This field selects the maximum burst length used when the BUS Master interface issues a transfer request.<br>00b: INCR16<br>01b: INCR8<br>10b: INCR4<br>11b: SINGLE |

### (4) USBCTR Register

Abbreviated name of register: USBCTR

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | DIRPD | PLL_RST | USBH_RST |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 3 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 2 | DIRPD | 0 | R/W | USBPHY Standby Mode Control<br>0b: USBPHY normal operating mode<br>1b: USBPHY standby mode<br>*Note*: When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module.<br>Only set it to 1 when the USB module is not in use.<br>In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 µs before the transition. |
| 1 | PLL_RST | 1 | R/W | This bit controls resetting of the USBPHY module.<br>0b: The USBPHY reset is released.<br>1b: The USBPHY module is reset. |
| 0 | USBH_RST | 0 | W | Software reset to this module.<br>Setting this bit to 1b resets this module entirely.<br>This bit is always read as 0b.<br>*Note*: Set this bit only when the BUS Master interface of this module is not running.<br>Access to this module becomes valid 10 CLK (internal bus clock [P1ϕ]) after this bit is written.<br>0b: Nothing occurs.<br>1b: Reset is issued to this module. |

### (5) Register Enable/Clock Gating Control Register

Abbreviated name of register: REGEN_CG_CTRL

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NONUSE_CLK_MSK | — | HOST_CLK_MSK | PERI_CLK_MSK | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | NONUSE_CLK_MSK | 0 | R/W | This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register.<br>0b: Do not mask the clock.<br>1b: Mask the clock.<br>For details, see **Section 32A.3.1.2, Specifications of NONUSE_CLK_MSK operation**. |
| 30 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 29 | HOST_CLK_MSK | 0 | R/W | This bit is used to forcibly mask clock supply to the host controller.<br>0b: Do not mask the clock supply.<br>1b: Mask the clock supply.<br>For details, see **Section 32A.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**. |
| 28 | PERI_CLK_MSK | 0 | R/W | This bit is used to forcibly mask the clock supply to the peripheral controller.<br>0b: Do not mask the clock supply.<br>1b: Mask the clock supply.<br>For details, see **Section 32A.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**. |
| 27 to 24 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 23 to 0 | — | All 0 | R | Reserved<br>The write value should always be 0. |

### (6) Suspend Control Register

Abbreviated name of register: SPD_CTRL

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SUSPENDM_ENABLE | SLEEPM_ENABLE | — | — | — | — | — | — | WKCNNT_ENABLE | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R |

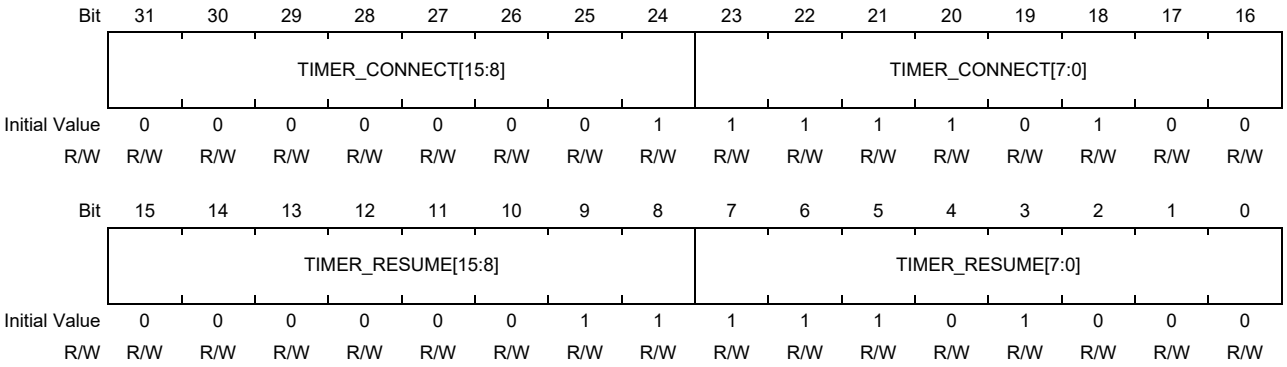
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GLOBAL_SUSPENDM_P1 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | SUSPENDM_ENABLE | 0 | R/W | The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b).<br>This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode.<br>If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status.<br>[This function is valid for the following OHCI/EHCI Operational registers]<br>EHCI: bit [7] (Suspend bit) of the PORTSC1 register<br>OHCI: bit [2] (PSS bit) of the HcRhPortStatus register<br>OHCI: bit [7:6] (HCFS field) of the HcControl register |
| 30 | SLEEPM_ENABLE | 0 | R/W | The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b).<br>This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.)<br>This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b.<br>[This function is valid for the following OHCI/EHCI Operational register]<br>EHCI: bit [7] (Suspend bit) of the PORTSC1 register |
| 29 to 24 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 23 | WKCNNT_ENABLE | 0 | R/W | The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b).<br>If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released.<br>This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b.<br>*Note*: To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEPM_ENABLE bit (bit 30), as the general rule, set this bit to 1b.<br>If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs. |
| 22 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | GLOBAL_SUSPENDM_P1 | 0 | R/W | The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register.<br>This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped).<br>If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller.<br>*Note*:<br>– Do not set this bit to 1b during data transfer. We recommend that you set this bit to 1b after “stopping the EHCI/OHCI list processing” and “placing the port in the disabled status”.<br>– If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b. |

### (7) Suspend/Resume Timer Setting Register

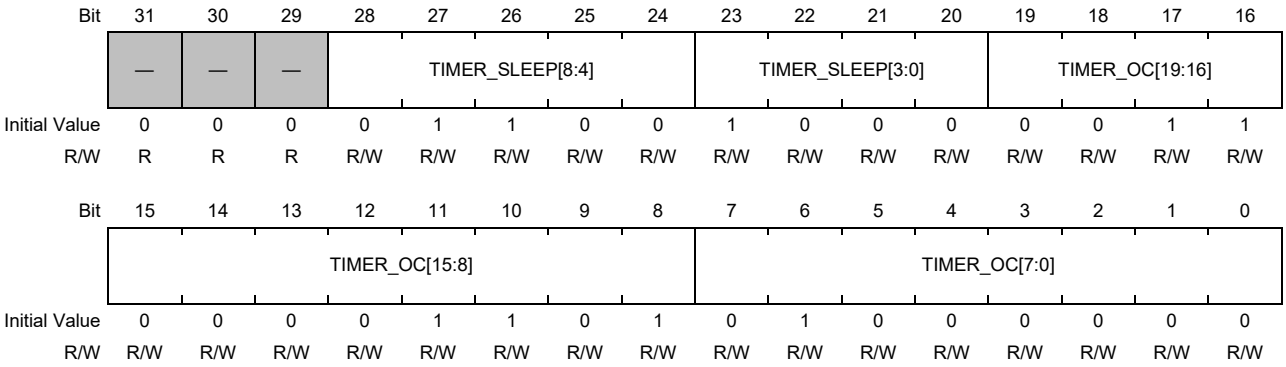
Abbreviated name of register: SPD_RSM_TIMSET



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TIMER_CONNECT[15:0] | H'01F4 | R/W | This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b.<br>When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (P1ϕ).<br>According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 2.5 μs.<br>1 bit = 1 cycle (μs)<br>(Setting guideline)<br>For 100 MHz: At least H'FA |
| 15 to 0 | TIMER_RESUME[15:0] | H'03E8 | R/W | This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b.<br>When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ).<br>According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 5 μs.<br>1 bit = 1 cycle (μs)<br>(Setting guideline)<br>For 100 MHz: At least H'1F4 |

### (8) Overcurrent Detection/Sleep Timer Setting Register

Abbreviated name of register: OC_SLP_TIMSET



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 29 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 28 to 20 | TIMER_SLEEP[8:0] | H'0C8 | R/W | This field indicates the timer value used by USBPHY when the SLEEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated).<br>When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ).<br>According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes 1 µs.<br>1 bit = 1 cycle (µs)<br>(Setting guideline)<br>For 100 MHz: H'064 |
| 19 to 0 | TIMER_OC[19:0] | H'30D40 | R/W | This field indicates the timer value used for overcurrent detection.<br>If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred.<br>According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (µs).<br>(Setting guideline)<br>For 100 MHz and 1 ms: At least H'1_86A0 |

### (9) SBRN_FLADJ_PORTWAKECAP Register

Abbreviated name of register: SBRN_FLADJ_PW

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | PORTWAKECAP[15:8] | | | | | | | | PORTWAKECAP[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FLADJ[7:0] | | | | | | | | SBRN[7:0] | | | | | | | |
| Initial Value | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | PORTWAKECAP[15:0] | H'0003 | R/W | This field is used to mask the ports (of the connected device) that are used for Wakeup event.<br>Operation on this field has no effect on the operation of the HOST module. |
| 15 to 8 | FLADJ[7:0] | H'20 | R,<br>R/W | This field adjusts the length of one micro frame by 16HS bit time unit.<br>The initial value indicates H'20 (60000d HS bit time). |
| 7 to 0 | SBRN[7:0] | H'20 | R | This field indicates the Serial Bus Release Number.<br>The fixed value "H'20" is indicated. |

### (10) PORT_LPM_CTR1 Register

Abbreviated name of register: PORT_LPM_CTRL1

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | NYET_RETRY_CNT_P1[3:0] | | | | REMOTEWAKE_EN_P1 | SLEEP_INT_EN_P1 | RETRY_ENABLE_NYET_P1 | HIRD_SEL_P1 |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 8 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 7 to 4 | NYET_RETRY_CNT_P1[3:0] | All 0 | R/W | This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b.<br>0000b: No retry.<br>0001b to 1111b: Retries the set number of times. (MAX: 15 retries) |
| 3 | REMOTEWAKE_EN_P1 | 0 | R/W | This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token.<br>0b: RemoteWakeup is supported.<br>1b: RemoteWakeup is not supported. |
| 2 | SLEEP_INT_EN_P1 | 0 | R/W | This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction.<br>The Per-Port Change interrupt can occur.<br>0b: No interrupt occurs.<br>1b: An interrupt occurs. |
| 1 | RETRY_ENABLE_NYET_P1 | 0 | R/W | This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction.<br>0b: No retry.<br>1b: Retries are made. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | HIRD_SEL_P1 | 0 | R/W | This bit sets the time for K drive for when recovered from the Sleep state.<br>Based on the setting values of this bit and EHCI USBCMD Register bit [27:24], the K drive time is determined as follows. |

| USBCMD Register | HIRD_SEL_P1 (Setting value of this bit) | |
|---|---|---|
| bit [27:24] | 0b | 1 |
| 0000b | 75 µs | 50 µs |
| 0001b | 100 µs | 125 µs |
| 0010b | 150 µs | 200 µs |
| 0011b | 250 µs | 275 µs |
| 0100b | 350 µs | 350 µs |
| 0101b | 450 µs | 425 µs |
| 0110b | 950 µs | 500 µs |
| 0111b | 1950 µs | 575 µs |
| 1000b | 2950 µs | 650 µs |
| 1001b | 3950 µs | 725 µs |
| 1010b | 4950 µs | 800 µs |
| 1011b | 5950 µs | 875 µs |
| 1100b | 6950 µs | 950 µs |
| 1101b | 7950 µs | 1025 µs |
| 1110b | 8950 µs | 1100 µs |
| 1111b | 9950 µs | 1175 µs |

### 32A.2.4.5 UCOM Register

#### (1) Common Control Register

Abbreviated name of register: COMMCTRL

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OTG_PERI | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | OTG_PERI | 1 | R/W | This bit specifies whether this module is set to the host mode or function mode.<br>0b: Host mode<br>1b: Function mode (Only CH0 can be set) |
| 30 to 0 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. |

### (2) OTG-BC Interrupt Status Register

Abbreviated name of register: OBINTSTA

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DPMONCHG_STA | DMMONCHG_STA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W(1) | R/W(1) |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CHGDETCHG1_STA | — | PDDETCHG1_STA | — | — | OCINT_STA | IDCHG_STA |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R/W(1) | R | R/W(1) | R | R | R/W(1) | R/W(1) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved The write value should always be 0. |
| 17 | DPMONCHG_STA | 0 | R/W (1) | This bit is set if the DPMON bit of the LINECTRL1 register has changed.<br>0b: The DPMON bit of the LINECTRL1 register has not changed.<br>1b: The DPMON bit of the LINECTRL1 register has changed. |
| 16 | DMMONCHG_STA | 0 | R/W (1) | This bit is set if the DMMON bit of the LINECTRL1 register has changed.<br>0b: The DMMON bit of the LINECTRL1 register has not changed.<br>1b: The DMMON bit of the LINECTRL1 register has changed. |
| 15 to 7 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 6 | CHGDETCHG1_STA | 0 | R/W (1) | This bit is set if the CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.<br>0b: The CHGDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b<br>1b: The CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. |
| 5 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 4 | PDDETCHG1_STA | 0 | R/W (1) | This bit is set if the PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.<br>0b: The PDDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b.<br>1b: The PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. |
| 3 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 2 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 1 | OCINT_STA | 0 | R/W (1) | This bit is set if the OVRCUR pin is asserted.<br>0b: The OVRCUR pin is not asserted (and remains 1b).<br>1b: The OVRCUR pin is asserted (and became 0b). |
| 0 | IDCHG_STA | 1 | R/W (1) | This bit is set if the input value from the OTG_ID pin has changed.<br>0b: There is no change in the OTG_ID pin.<br>1b: There is a change in the OTG_ID pin.<br>*Note*: The initial value is 1. Before using this bit, clear the status. |

### (3) OTG-BC Interrupt Enable Register

Abbreviated name of register: OBINTEN

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DPMONCHG_EN | DMMONCHG_EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | CHGDETCHG1_EN | — | PDDETCHG1_EN | — | — | OCINT_EN | IDCHG_EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 18 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 17 | DPMONCHG_EN | 0 | R/W | DPMONCHG_STA bit interrupt enable<br>0b: Interrupt via the DPMONCHG_STA bit is disabled.<br>1b: Interrupt via the DPMONCHG_STA bit is enabled. |
| 16 | DMMONCHG_EN | 0 | R/W | DMMONCHG_STA bit interrupt enable<br>0b: Interrupt via the DMMONCHG_STA bit is disabled.<br>1b: Interrupt via the DMMONCHG_STA bit is enabled. |
| 15 to 7 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 6 | CHGDETCHG1_EN | 0 | R/W | CHGDETCHG1_STA bit interrupt enable<br>0b: Interrupt via the CHGDETCHG1_STA bit is disabled.<br>1b: Interrupt via the CHGDETCHG1_STA bit is enabled. |
| 5 | — | 0 | R | Reserved<br>The write value should always be 0. |
| 4 | PDDETCHG1_EN | 0 | R/W | PDDETCHG1_STA bit interrupt enable<br>0b: Interrupt via the PDDETCHG1_STA bit is disabled.<br>1b: Interrupt via the PDDETCHG1_STA bit is enabled. |
| 3 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 2 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 1 | OCINT_EN | 0 | R/W | OCINT_STA bit interrupt enable<br>0b: Interrupt via the OCINT_STA bit is disabled.<br>1b: Interrupt via the OCINT_STA bit is enabled. |
| 0 | IDCHG_EN | 0 | R/W | IDCHG_STA bit interrupt enable<br>0b: Interrupt via the IDCHG_STA bit is disabled.<br>1b: Interrupt via the IDCHG_STA bit is enabled. |

### (4) VBUS Control Register

Abbreviated name of register: VBCTRL

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | VGPUO | — | — | — | VBOUT |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31, 30 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 29 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. |
| 28 to 22 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. |
| 21 | — | 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. |
| 20 to 17 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 16 | — | 1 | R | Reserved<br>The write value should always be 1. |
| 15 to 5 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. |
| 4 | VGPUO | 0 | R/W | The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin.<br>This bit is used, for example, for control of the external power IC. |
| 3 to 1 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 0 | VBOUT | 0 | R/W | This bit is one of the VBUSEN control bits.<br>This bit is used to assert VBUS by controlling the external power IC.<br>0b: VBUS output disable<br>1b: VBUS output enable<br>If overcurrent occurs, this bit is automatically cleared to 0. |

### (5) Line Control Port 1 Register

Abbreviated name of register: LINECTRL1

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | DPRPU_EN | DP_RPU | DPRPD_EN | DP_RPD | DMRPD_EN | DM_RPD |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | DPMON | DMMON | — | IDMON |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 26 | — | All 0 | R | Reserved |
| 25, 24 | — | All 0 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value.<br>Operation is not guaranteed if a value other than the initial value is written. |
| 23, 22 | — | All 0 | R | Reserved |
| 21 | DPRPU_EN | 0 | R/W | This bit enables the DP_RPU (bit 20) setting for pullup control of D+ in port 1.<br>0: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is disabled.<br>1: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is enabled. |
| 20 | DP_RPU | 0 | R/W | This bit controls pullup of D+ in port 1.<br>This control is enabled only when DPRPU_EN (bit 21) = 1.<br>Note that if this bit is cleared to 0 when DPRPU_EN (bit 21) = 1,<br>D+ is in the floating state while no device drives the USB bus.<br>Note also that setting DPRPD_EN (bit 19) and DP_RPD (bit 18) to enabled is prohibited while this bit is set to enabled - that is, enabling both pullup and pulldown of D+ together is prohibited.<br>0: Pullup of D+ in port 1 is disabled.<br>1: Pullup of D+ in port 1 is enabled. |
| 19 | DPRPD_EN | 0 | R/W | This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resister.<br>0b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is disabled.<br>1b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is enabled. |
| 18 | DP_RPD | 0 | R/W | This bit controls USB bus (DP) 15 kΩ Pulldown resister when DPRPD_EN (bit 19) = 1b.<br>0b: DP-side 15 kΩ Pulldown resister is OFF.<br>1b: DP-side 15 kΩ Pulldown resister is ON. |
| 17 | DMRPD_EN | 0 | R/W | This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resister.<br>0b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is disabled.<br>1b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is enabled. |
| 16 | DM_RPD | 0 | R/W | This bit controls USB bus (DM) 15 kΩ Pulldown resister when DMRPD_EN (bit 17) = 1b.<br>0b: DM-side 15 kΩ Pulldown resister is OFF.<br>1b: DM-side 15 kΩ Pulldown register is ON. |
| 15 to 4 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 3 | DPMON | 0 | R | This bit indicates the value of USB bus DP. |
| 2 | DMMON | 0 | R | This bit indicates the value of USB bus DM. |
| 1 | — | 0 | R | Reserved<br>The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | IDMON | 0 | R | This bit indicates the value of the OTG_ID pin. |

### (6) BC Control Port 1 Register

Abbreviated name of register: BCCTRL1

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PDDETSTS | CHGDETSTS | — | — | DCPMODE | VDMSRCE | IDPSINKE | VDPSRCE | IDMSINKE | IDPSRCE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 10 | — | H'00_C000 | R | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. |
| 9 | PDDETSTS | 0 | R | This bit indicates the USBPHY Portable Device Detect signal state. |
| 8 | CHGDETSTS | 0 | R | This bit indicates the USBPHY Charging Downstream Port Detect signal state. |
| 7, 6 | — | All 0 | R | Reserved<br>The write value should always be 0. |
| 5 | DCPMODE | 0 | R/W | If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b. |
| 4 | VDMSRCE | 0 | R/W | This bit controls the USBPHY built-in VDM_SRC circuit.<br>If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven. |
| 3 | IDPSINKE | 0 | R/W | This bit controls the USBPHY built-in Portable Device Detect circuit.<br>If this bit is set to 1b, Portable Device detection is enabled. |
| 2 | VDPSRCE | 0 | R/W | This bit controls the USBPHY built-in VDP_SRC circuit.<br>If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven. |
| 1 | IDMSINKE | 0 | R/W | This bit controls the USBPHY built-in Charging Downstream Port Detect circuit.<br>If this bit is set to 1b, Charging Downstream Port detection is enabled. |
| 0 | IDPSRCE | 0 | R/W | This bit controls the USBPHY built-in IDP_SRC circuit.<br>If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven. |

# 32A.3 Clock Signals

## 32A.3.1 Clock Gating Specifications

### 32A.3.1.1 Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.

Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the “circuits that do not require clock supply temporarily.”

The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]

Register Enable/Clock Gating Control Register (offset:H’304)

[Functional specification]

| bit | Symbol | Functional specification |
|---|---|---|
| 31 | NONUSE_CLK_MSK | Gating clocks for unused host controller or peripheral controller. |
| 29 | HOST_CLK_MSK | Gating clocks for host controller. |
| 28 | PERI_CLK_MSK | Gating clocks for peripheral controller. |

### 32A.3.1.2 Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.

This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: H’800).

| Clock Gating Register Setting | | | Host/Peripheral Switching Setting | Gating Target | |
|---|---|---|---|---|---|
| | | | Register | | |
| NONUSE_CLK_MSK | HOST_CLK_MSK | PERI_CLK_MSK | OTG_PERI | Host Controller | Function Controller |
| 1 | 0 | 0 | 0 | | ✓ |
| | | | 1 | ✓ | |

[Note on using the NONUSE_CLK_MSK bit]

If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.

If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

### 32A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.

The following table shows the operating specifications of this function.

| Clock Gating Register Setting | | | Host/Peripheral Switching Setting | Gating Target | |
|---|---|---|---|---|---|
| | | | Register | | |
| NONUSE_CLK_MSK | HOST_CLK_MSK | PERI_CLK_MSK | OTG_PERI | Host Controller | Function Controller |
| 0 | 1 | 0 | — | ✓ | |
| | 0 | 1 | — | | ✓ |
| | 1 | 1 | 0 | ✓ | ✓ |

**Note:** If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set t0 1b, the effect of clock gating becomes logical OR of each bit.

## 32A.4 Interrupt Sources

### 32A.4.1 Interrupt Signals

This module has the five interrupt signals listed below.

| Interrupt Source Name | Interrupt Type | Pulse/ Level | Active Level |
|---|---|---|---|
| U2H_INT | BUS Master interrupt signal.<br>This signal is asserted when a bus error occurs in the BUS Master.<br>Interrupt control is performed by the AHB Bridge Register. | Level | H |
| U2H_OHCI_INT | OHCI interrupt signal<br>This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected.<br>Interrupt control is performed by the OHCI Operational Register. | Level | H |
| U2H_EHCI_INT | EHCI interrupt signal.<br>This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected.<br>Interrupt control is performed by the EHCI Operational Register. | Level | H |
| U2H_WAKEON_INT | EHCI Wakeup interrupt signal.<br>This signal is asserted by an EHCI Wakeup event.<br>Interrupt control is performed by the EHCI Operational Register. | Level | H |
| U2H_OBINT | OTG/Battery Charging interrupt signal.<br>This signal is asserted by OTG or Battery Charging related event.<br>Interrupt control is performed by the UCOM2 Register. | Level | H |

### 32A.4.2 Interrupt Sources and Control

#### 32A.4.2.1 U2H_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[0] (AHB_INTEN)

[Interrupt source]

A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H'204) bit[0] (AHB_INT)

### 32A.4.2.2 U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset:H'010) bit[31], bit[6:0]*[1]

**Note 1.** Enable the bit required as the assertion source.

[Interrupt source]

| Interrupt Source | | Registers That Require Interrupt Enable Setting | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | HcInterruptEnable | | | | | | |
| | | USBH_INTAEN | bit [31] MIE | bit [6] RHSCE | bit [5] FNOE | bit [3] ROE | bit [2] SFE | bit [1] WDHE | bit [0] SOE |
| 1 | Device connection is detected. | ✓ | ✓ | ✓ | | | | | |
| 2 | Device disconnection is detected. | ✓ | ✓ | ✓ | | | | | |
| 3 | Port power is OFF (excluding overcurrent detection). | ✓ | ✓ | ✓ | | | | | |
| 4 | Babble error is detected during a USB transfer. | ✓ | ✓ | ✓ | | | | | |
| 5 | Resume is complete. | ✓ | ✓ | ✓ | | | | | |
| 6 | Overcurrent is detected. | ✓ | ✓ | ✓ | | | | | |
| 7 | Bus reset is complete. | ✓ | ✓ | ✓ | | | | | |
| 8 | When the HcRhDescritorB Register DR bit is 1b, OHCI becomes "USB Operational" (HCFS[1:0] bit = 10b) or "USB Suspend" (HCFS[1:0] bit = 11b). | ✓ | ✓ | ✓ | | | | | |
| 9 | When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register. | ✓ | ✓ | ✓ | | | | | |
| 10 | When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register. | ✓ | ✓ | ✓ | | | | | |
| 11 | When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register. | ✓ | ✓ | ✓ | | | | | |
| 12 | When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register. | ✓ | ✓ | ✓ | | | | | |
| 13 | When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register. | ✓ | ✓ | ✓ | | | | | |
| 14 | When no device is connected (CCS bit = 1b), the port power is turned off. | ✓ | ✓ | ✓ | | | | | |
| 15 | The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed. | ✓ | ✓ | | ✓ | | | | |
| 16 | RemoteWakeup signal (Resume signal) is detected from a device. | ✓ | ✓ | | | ✓ | | | |
| 17 | HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.) | ✓ | ✓ | | | | ✓ | | |
| 18 | A transfer finishes (including an error), and the host module updated HccaDoneHead. | ✓ | ✓ | | | | | ✓ | |
| 19 | USB schedule overrun occurred for the frame. | ✓ | ✓ | | | | | | ✓ |

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset:H'00C) bit[6:0]

### 32A.4.2.3 U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset:H'128) bit[16], bit[5:0]*1

**Note 1.** Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset:H'120) bit[15], bit[6]

[Interrupt source]

| Interrupt Source | | Registers That Require Interrupt Enable Setting | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | USBCMD | | USBINTR | | | | | |
| | | | bit [15] | bit [6] | bit [16] | bit [5] | bit [3] | bit [2] | bit [1] | bit [0] |
| | | USBH_INTBEN | Per-Port Change Event | Doorbell | Port-1 Change Event | Async Advance | Frame List Rollover | Port Change Detect | USB ERRINT | USB INT |
| [1] | Device connection is detected. | ✓ | | | | | | ✓ | | |
| [2] | Device disconnection is detected. | ✓ | | | | | | ✓ | | |
| [3] | Overcurrent is detected. | ✓ | | | | | | ✓ | | |
| [4] | RemoteWakeup signal (Resume Signal) is detected from a device. | ✓ | | | | | | | | |
| [5] | Babble status of the USB bus is detected. | ✓ | | | | | | ✓ | | |
| [6] | USB transfer with "qTD IOC = 1b" normally finishes. | ✓ | | | | | | | | ✓ |
| [7] | Short packet is received. | ✓ | | | | | | | | ✓ |
| [8] | USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.) | ✓ | | | | | | | ✓ | |
| [9] | The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b. | ✓ | | ✓ | | ✓ | | | | |
| [10] | The FRINDEX Register FrameIndex bit returned from the maximum value to H'000 (rollover detected). | ✓ | | | | | ✓ | | | |
| [11] | The Port Change Detect event (interrupt source 1 to 5) was detected. | ✓ | ✓ | | ✓ | | | | | |

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset:H'124) bit[16], bit[5:0]

#### 32A.4.2.4 U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[4] (WAKEON_INTEN)

EHCI Operational Register PORTSC[1:2] Register (offset:H'164/H'168) bit[22:20]*[1]

**Note 1.** Enable the bit required as the assertion source.

[Interrupt source]

| Interrupt Source | | Registers That Require Interrupt Enable Setting | | | |
|---|---|---|---|---|---|
| | | | PORTSC | | |
| | | WAKEON_INTEN | bit [22] WKOC_E | bit [21] WKDSCNNT_E | bit [20] WKCNNT_E |
| 1 | Device connection is detected. | ✓ | | | ✓ |
| 2 | Device disconnection is detected. | ✓ | | ✓ | |
| 3 | Overcurrent is detected. | ✓ | ✓ | | |
| 4 | RemoteWakeup signal (Resume Signal) is detected from a device. | ✓ | | | |

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H'204) bit[4] (WAKEON_INT)

### 32A.4.2.5 U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset:H'808) bit[17:16], bit[6], bit[4], bit[1:0]*[1]

**Note 1.** Enable the bit required as the assertion source.

[Interrupt source]

| | | Registers That Require Interrupt Enable Setting | | |
|---|---|---|---|---|
| | | | OTG-BC Interrupt Enable | |
| | | | bit [17] | bit [16] |
| | Interrupt Source | UCOM_INTEN | DPMONCHG_EN | DMMONCHG_EN |
| 1 | The DP pin has changed. | ✓ | ✓ | |
| 2 | The DM pin has changed. | ✓ | | ✓ |

| | | Registers That Require Interrupt Enable Setting | | |
|---|---|---|---|---|
| | | | OTG-BC Interrupt Enable | |
| | | | bit [6] | bit [4] |
| | Interrupt Source | UCOM_INTEN | CHGDETCHG1_EN | PDDETCHG1_EN |
| 1 | The portable device detection signal has changed. | ✓ | | ✓ |
| 2 | The charging port detection signal has changed. | ✓ | ✓ | |

| | | Registers That Require Interrupt Enable Setting | | |
|---|---|---|---|---|
| | | | OTG-BC Interrupt Enable | |
| | | | bit [1] | bit [0] |
| | Interrupt Source | UCOM_INTEN | OCINT_EN | IDCHG_EN |
| 1 | Overcurrent is detected. (The change of the OVRCUR pin from 1 to 0b is detected.) | ✓ | ✓ | |
| 2 | The OTG_ID pin has changed. | ✓ | | ✓ |

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset:H'804) bit[17:16], bit[6], bit[4], bit[1:0]

### 32A.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

## 32A.5 Power-Saving Function

This module controls power consumption by using the following two methods:

1. Controlling the SUSPENDM/SLEEPM pin of USBPHY
2. Using clock gating to stop the clock to the host controller or peripheral controller.

### 32A.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USBPHY:

- Reducing the power consumption by the USBPHY
- Reducing the power consumption by the host core by stopping the clocks from the USBPHY

As described at **Section 32A.1.2.5, Suspend extension function**, by default, the SUSPENDM and SLEEPM pins of the USBPHY are not asserted even when EHCI and OHCI are put into the Suspended state.

See **Section 32A.2.4.4(6), Suspend Control Register** and control the relevant registers appropriately.

### 32A.5.2 Controlling the Clock-Gating Function

See **Section 32A.2.4.4(5), Register Enable/Clock Gating Control Register** and **Section 32A.3.1, Clock Gating Specifications**, then control the relevant registers appropriately.

# 32A.6 Battery Charging

## 32A.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.

Charging ports can be generally classified by function as described below.

| Type | Function |
|---|---|
| CDP<br>(Charging Downstream Port) | Downstream port that can supply power in compliance with the Battery Charging Specification.<br>This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host). |
| DCP<br>(Dedicated Charging Port) | Port that provides only power supply function in compliance with the Battery Charging Specification.<br>This type of charging port does not operate as the usual host. |
| SDP<br>(Standard Downstream Port) | Standard Downstream Port that is not compliant with the Battery Charging Specification.<br>This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host. |

## 32A.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.

# 32A.7 Bus Master

## 32A.7.1 Functional specifications of the bus master

### 32A.7.1.1 Supported bus master functions

| Function as the BUS MASTER | Status |
|---|---|
| Residual burst after an error response is received | The transfer is not stopped. |
| 1 Kbyte boundary processing | The fixed length burst (INCRx) across 1 Kbyte boundary is not performed. |

### 32A.7.1.2 Issuing requests for different types of bus transfer

| MHTRANS[1:0] | MHSIZE[2:0] | MHWRITE | MHBURST[2:0] | Reply | Remarks |
|---|---|---|---|---|---|
| IDLE (00b) | — | — | — | — | — |
| BUSY (01b) | — | — | — | — | Not issued. |
| NONSEQ (10b) | 32-bit (010b) | WRITE | SINGLE<br>INCR4<br>INCR8<br>INCR16 | OKAY/ERROR | 32-bit transfer is issued.<br>A response error is reported by an interrupt, and the transfer is not stopped. |
| | | READ | | | |
| | 8-bit (000b)<br>16-bit (001b) | WRITE | SINGLE | OKAY/ERROR | 8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt. |
| | other than the above | — | — | — | Not issued. |
| SEQ (11b) | 32-bit (010b) | WRITE | INCR4<br>INCR8<br>INCR16 | OKAY/ERROR | 32-bit transfer is issued.<br>A response error is reported by an interrupt, and the transfer is not stopped. |
| | | READ | | OKAY/ERROR | |
| | other than the above | — | — | — | Not issued. |

### 32A.7.1.3 Supported responses

| Response type | Response | Remarks |
|---|---|---|
| OKAY | Enable | Supported. |
| ERROR | Enable | A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed. |

### 32A.7.1.4 Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: H'208).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

#### 32A.7.1.5 Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: H’208). The maximum burst length is common to reading and writing.

#### 32A.7.1.6 Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: H’208).

### 32A.7.1.7 Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

| ALIGN_ADDRESS Setting | Fixed length Start Address of INCR Burst | | |
|---|---|---|---|
| | INCR4 | INCR8 | INCR16 |
| 00b<br>(Aligned at the 1-Kbyte boundary) | MHADDR[9:0] = H'000<br>H'004<br>H'008<br>H'00C<br>H'010<br>:<br>H'3D0<br>H'3D4<br>H'3D8<br>H'3DC<br>H'3E0<br>H'3E4<br>H'3E8<br>H'3EC<br>H'3F0 | MHADDR[9:0] = H'000<br>H'004<br>H'008<br>H'00C<br>H'010<br>:<br>H'3C8<br>H'3CC<br>H'3D0<br>H'3D4<br>H'3D8<br>H'3DC<br>H'3E0 | MHADDR[9:0] = H'000<br>H'004<br>H'008<br>H'00C<br>H'010<br>:<br>H'3B8<br>H'3BC<br>H'3C0 |
| 01b<br>(Aligned at the 16-byte boundary) | MHADDR[3:0] = H'0 | -- (Not issued) | -- (Not issued) |
| 10b<br>(Aligned at the 32-byte boundary) | MHADDR[4:0] = H'00<br>H'04<br>H'08<br>H'0C<br>H'10 | MHADDR[4:0] = H'00 | -- (Not issued) |
| 11b<br>(Aligned at the 64-byte boundary) | MHADDR[5:0] = H'00<br>H'04<br>H'08<br>H'0C<br>H'10<br>H'14<br>H'18<br>H'1C<br>H'20<br>H'24<br>H'28<br>H'2C<br>H'30 | MHADDR[5:0] = H'00<br>H'04<br>H'08<br>H'0C<br>H'10<br>H'14<br>H'18<br>H'1C<br>H'20 | MHADDR[5:0] = H'00 |

# 32A.8 Overcurrent Control and VBUS Control

## 32A.8.1 OVRCUR/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

| This module pin | Input/Output | Level | Description |
|---|---|---|---|
| OVRCURI | Input | L | Overcurrent status was detected. |
| | | H | Overcurrent status was not detected. |
| VBUSEN | Output | L | Port Power (VBUS) OFF |
| | | H | Port Power (VBUS) ON |

## 32A.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCUR pin remains asserted (0b) for a set period.

The period over which assertion of the OVRCUR pin is required (“overcurrent detection time”) can be set in the following register.

| Register | Overcurrent detection/sleep timer setting register (offset: H’310) |
|---|---|
| Bits | TIMER_OC[19:0] |
| Initial value | H’3_0D40 |

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (P1ϕ) cycle.

Therefore, set the value of the above register at initial configuration, considering “the internal bus clock (P1ϕ) frequency to be used” and “the overcurrent detection time you want to specify”.

### 32A.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the VBUSEN control (VBENCTL) register in USBPHY Control.

Refer to **Section 32.3.4, VBUSEN control register (VBENCTL)**.

When using as Function, VBUSEN should be 0.

| Situation | | Register | | bit |
|---|---|---|---|---|
| EHCI control | | PORTSC1 (offset: H'164) | | bit 12 (PP) |
| OHCI control | Global control*1 | ON setting | HcRhStatus Register (offset: H'050) | bit 16 (Set Global Power) |
| | | OFF setting | | bit 0 (Clear Port Status) |
| | Selective control*2 | ON setting | HcRhPortStatus1 Register (offset: H'054) | bit 8 (Set Port Power) |
| | | OFF setting | | bit 9 (Clear Port Power) |

Note 1. Global control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 0b
or
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 0b

Note 2. Selective control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCUR pin's status.

Specify the settings as necessary (for example, your system needs that VBUS is always ON).

| EHCI Operational | OHCI Operational | | | | |
|---|---|---|---|---|---|
| HCSPARAMS (offset: H'104) | HcRhDescriptorA (offset: H'048) | | | HcRhDescriptorB (offset: H'04C) | Pin Operation |
| PPC (bit 4) | NOCP (bit 12) | NPS (bit 9) | PSM (bit 8) | PPCM[1] (bit 17) | When the OVRCUR pin is asserted (0b) |
| 0 | — | — | — | — | Fixed to 1b |
| — | 1 | — | — | — | Fixed to 1b |

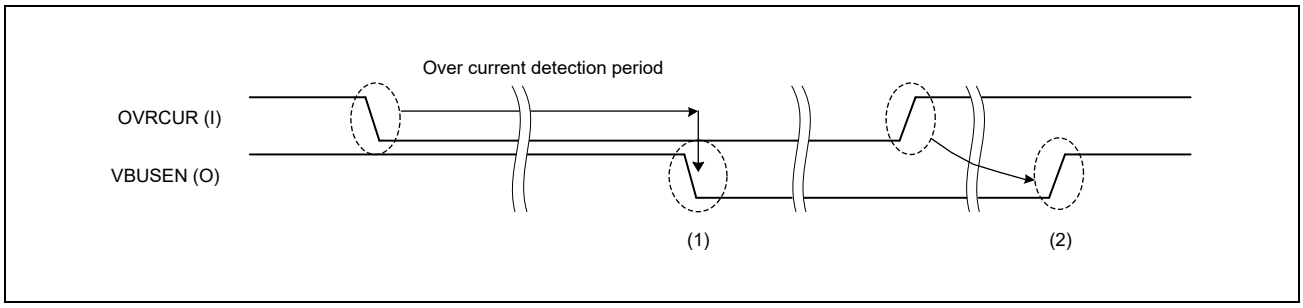
| | | | | 1 | |

### 32A.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCUR and VBUSEN pins signals at overcurrent detection and recovery.

Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see **Section 32A.8.3, Port Power (VBUS) control specifications**) have not been made.



1. When the OVRCUR pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).
2. After the overcurrent status has been resolved, and de-assertion of the OVRCUR pin (1b) is confirmed, 1b is written to the Port Power bit described in **Section 32A.8.3, Port Power (VBUS) control specifications** to turn on the Port Power (Vbus).

NOTE

Before the Port Power bit is set by firmware, be sure to check that the OVRCUR pin has been deasserted.

## 32A.9 Procedure for Setting this Module

### 32A.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

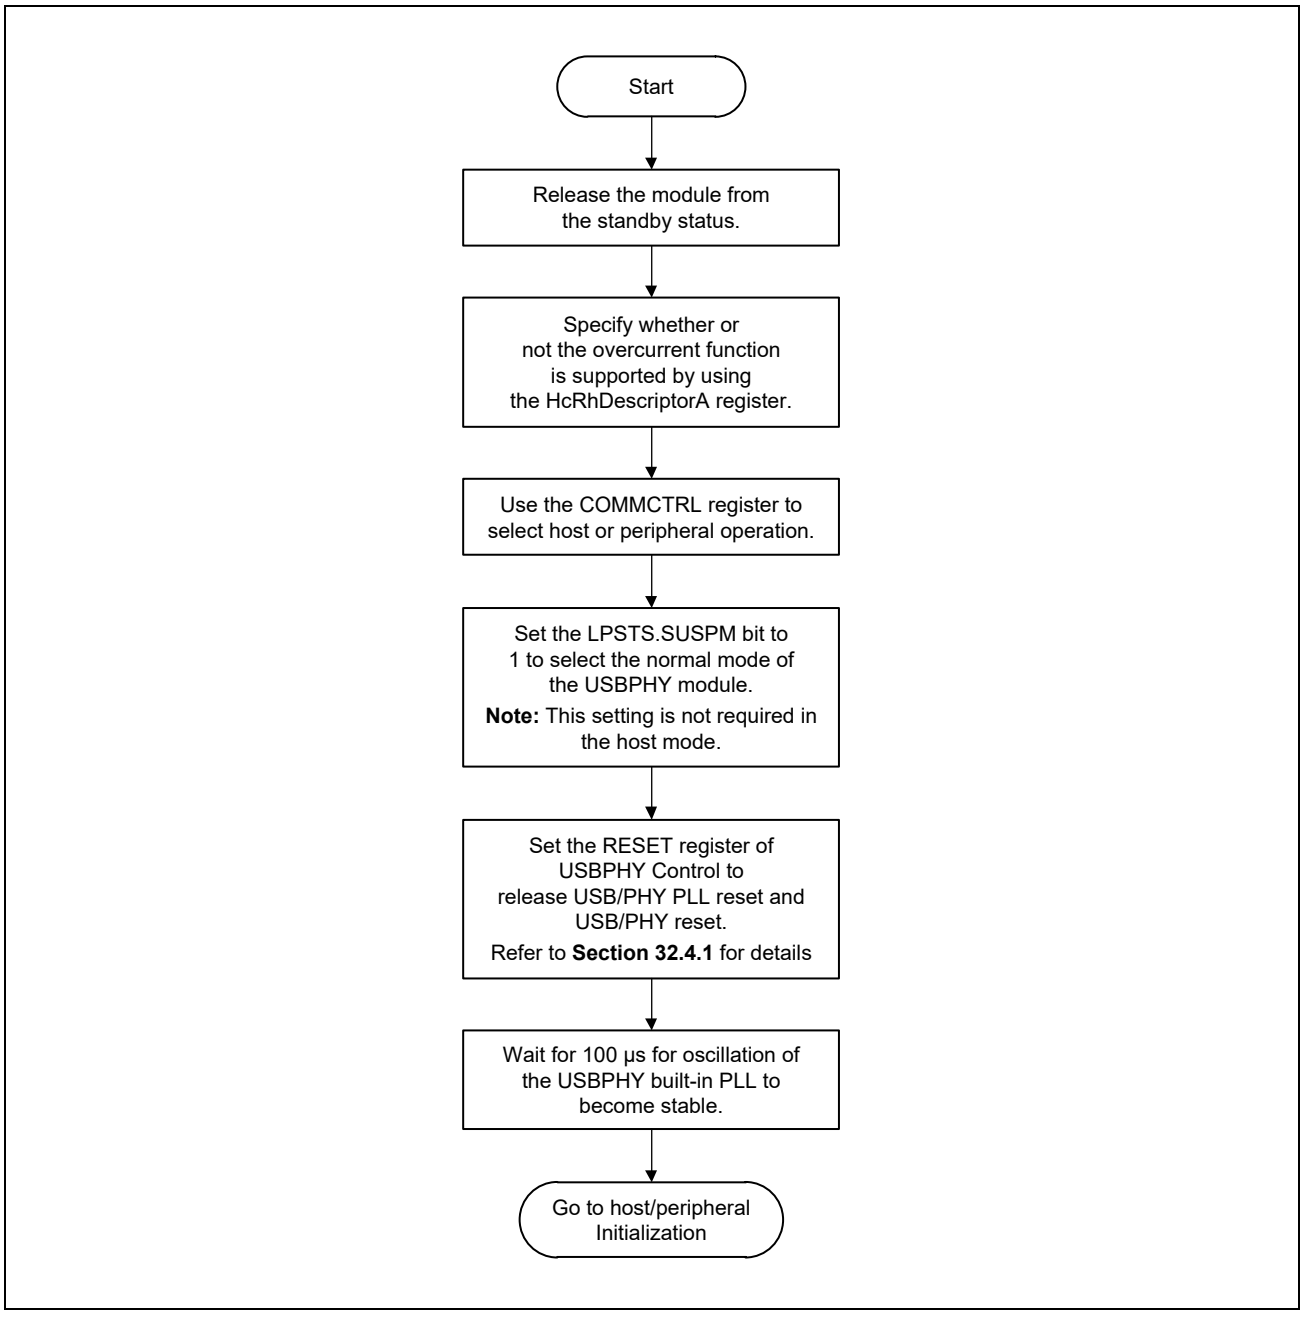


Figure 32A.1 Sequence Common to Both Host and Peripheral Modes

### 32A.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

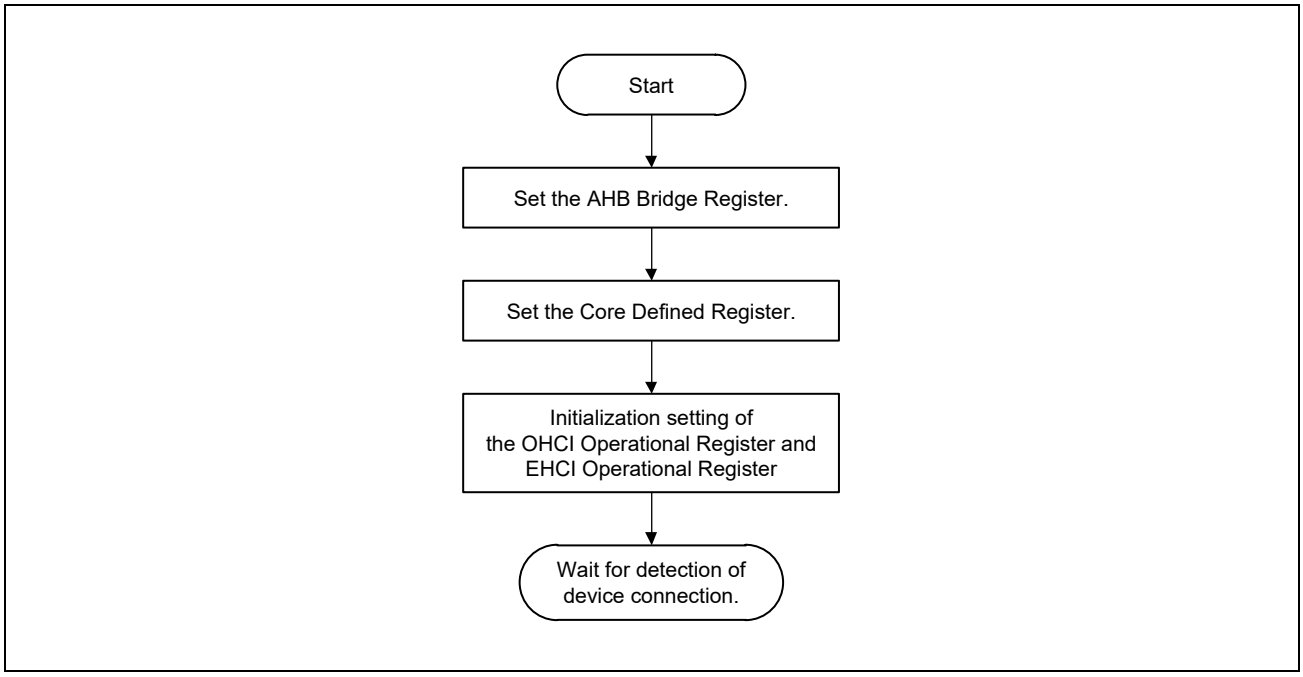

Figure 32A.2 Initialization Sequence

### 32A.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: H'120) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: H'008) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

# 32B. USB 2.0 Function Module

## 32B.1 Overview

### 32B.1.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This chapter describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see **Section 32A, USB 2.0 Host Module**.

This module is a universal serial bus (USB) controller that has peripheral functions.

This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 10 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

### 32B.1.2 Features

#### 32B.1.2.1 Peripheral controller supporting high-speed USB

(1) On-chip peripheral USB controller

#### 32B.1.2.2 Support of all types of USB transfer

(1) Supporting all types of USB transfer, including isochronous transfer

(2) Control transfer

(3) Bulk transfer

(4) Interrupt transfer (high-bandwidth transfers not supported)

(5) Isochronous transfer (high-bandwidth transfers not supported)

#### 32B.1.2.3 Bus interface

(1) Includes a two-channel DMA interface

#### 32B.1.2.4 Pipe configuration

(1) 8 Kbytes of buffer memory for USB communications for each channel

(2) Up to 10 pipes (including the default control pipe) selectable for each channel

(3) Programmable pipe configuration

(4) Any endpoint number assignable to pipes other than pipe 0

Table 32B.1 Pipe Settings

| PIPE | Transfer Type | Double buffer | Continuous transfer mode | Buffer size |
|---|---|---|---|---|
| PIPE0 | Control | — | — | Fixed to 64 bytes/<br>256 bytes (CNTMD = 1) |
| PIPE1 | Iso/Bulk | ✓ | ✓ (Bulk only) | Up to 2 Kbytes |
| PIPE2 | Iso/Bulk | ✓ | ✓ (Bulk only) | Up to 2 Kbytes |
| PIPE3 | Bulk | ✓ | ✓ | Up to 2 Kbytes |
| PIPE4 | Bulk | ✓ | ✓ | Up to 2 Kbytes |
| PIPE5 | Bulk | ✓ | ✓ | Up to 2 Kbytes |
| PIPE6 | Int | — | — | Fixed to 64 bytes |
| PIPE7 | Int | — | — | Fixed to 64 bytes |
| PIPE8 | Int | — | — | Fixed to 64 bytes |
| PIPE9 | Int | — | — | Fixed to 64 bytes |

#### 32B.1.2.5 Features of peripheral functions

(1) Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)

(2) Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake

(3) Control transfer stage monitoring function

(4) Device state monitoring function

(5) Automatic response to SET_ADDRESS request

(6) NAK response interrupt (NRDY)

(7) SOF interpolation

#### 32B.1.2.6 Features of DMA transfer

DMA transaction mode: Fetching in both register and link modes are supported.

Interrupt: Level is supported.

Transfer size: A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination.

Skip (scatter/gather) function: The access size and skip size can be specified separately for the transfer source and destination.

Suspend function: A running DMA transaction can be suspended temporarily.

Interval function: The interval of DMA transfers can be specified to control the bus occupancy.

#### 32B.1.2.7 Other functions

(1) Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)

(2) Transfer ending function using a transaction counter

(3) SOF pulse output function

(4) BRDY interrupt event notification timing change function (BFRE)

(5) Function (SHTNAK) to set NAK in the response PID when transfer ends

(6) Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

## 32B.1.3 Overview of Functions

### 32B.1.3.1 Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

#### (1) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

##### (a) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

##### (b) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

### 32B.1.3.2 USB event

This module notifies the event in USB operation by issuing an interrupt.

You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

### 32B.1.3.3 USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:

(1) One pipe dedicated to control transfer

(2) Four pipes dedicated to interrupt transfer

(3) Three pipes dedicated to bulk transfer

(4) Two pipes selectively used for bulk or isochronous transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

### 32B.1.3.4 SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

## 32B.1.4 Restriction matter and Notes

### 32B.1.4.1 Restriction matter

#### (1) Restrictions on the USB specifications

It's no support About below of USB 2.0 specification

- HighBandWidth transfer is no support

#### (2) Restrictions on DMA Master

- DAD = 1 (destination address fixed) and can not use skip transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use skip transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- DAD = 1 (destination address fixed), and can not use the beat unalign transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use beat unalign transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- When REQD =1, SBE = 1 (sweep mode) and compulsion discharge function can not use.

### 32B.1.4.2 Notes

#### (1) DMA transfer and passing problem of interrupt signal in DMA Master construction.

##### (a) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

##### (b) Plan to avoid

A plan to avoid the above problem is indicated below.

Plan to avoid 1) HPROT is set as non bufferable.

According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

#### (2) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

## 32B.2 Registers

How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset “Power on Reset” indicates the initial state at power-on reset.
The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.
Significant points regarding reset operation are indicated in notes.
“—” indicates that a user’s setting is retained without this module operation having been performed. “X” indicates that the value is undefined.

(4) Access condition: The condition to be met when this module accesses the register for an operation.

R: Reading only
W: Writing only
R/W: Reading or writing
R(0): 0-reading only
W(1): 1-writing only

(5) Name: Bit symbol and bit name

(6) Function: Description of functions.

**<Example of description>**

| (1) Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | A bit | B bit | C bit | — | — | — | — | — | — | — | — | — | — | — | — |
| (2) Initial Value | X | 0 | 0 | 0 | | | | | | | | | | | | |
| R/W | X | 0 | — | — | | | | | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | | | Nothing is assigned. Fix this bit to 0. |
| 14 | A bit | | R/W | AAA enable<br>0: Disables operation<br>1: Enables operation |
| 13 | B bit | | R | BBB operation<br>0: Outputs low-level signal<br>1: Outputs high-level signal |
| 12 | C bit | | R(0)/ W(1) | CCC control<br>0: .....<br>1: ..... |
| | (5) | | (4) | (6) |

### 32B.2.1 Base Address

Table 32B.2 Base addresses for each channel of the USB function module

| Channel number | Base address |
|---|---|
| 0 | H'0_11C6_0000 (Cortex-A55 Address Space) |
| | H'41C6_0000 (Cortex-M33 Address Space Non-Secure) |
| | H'51C6_0000 (Cortex-M33 Address Space Secure) |

### 32B.2.2 List of Registers

**Table 32B.3** lists the registers of this module.

Table 32B.3 List of Registers (1/3)

| Offset Address | Symbol | Name | Access unit |
|---|---|---|---|
| 000 | SYSCFG0 | System Configuration Control Register 0 | 16-bit |
| 002 | SYSCFG1 | System Configuration Control Register 1 | 16-bit |

## 32B.2.3 System Configuration Control Registers

### 32B.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: H'000>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CNEN | HSE | — | DRPD | DPRPU | — | — | — | USBE |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 9 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 8 | CNEN | 0 | R/W | This bit prohibits or enables single-ended receiver operation.<br>0: Single-ended receiver operation prohibited<br>1: Single-ended receiver operation enabled |
| 7 | HSE | 0 | R/W | This bit prohibits or enables High-Speed operation.<br>0: High-Speed operation prohibited (Full-Speed)<br>1: High-Speed operation enable (The controller detects the communication speed.) |
| 6 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 5 | DRPD | 1 | R/W | D+/D- line resistor control<br>Set this bit to 0 to use this module.<br>For details, see Control of USB Data Bus Resistors. |
| 4 | DPRPU | 0 | R/W | D+ line resistor control<br>This bit prohibits or enables D+ line pull-up for the peripheral controller function.<br>For details, see Control of USB Data Bus Resistors.<br>0: Pull Up prohibited<br>1: Pull Up enabled |
| 3 to 1 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 0 | USBE | 0 | R/W | USB block operation prohibited<br>This bit prohibits or enables USB block operation.<br>0: USB block operation prohibited<br>1: USB block operation enabled |

**Note:** Data can be written to and read from this register even while the UTMI+PHY clock is stopped. However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function takes effect after the oscillation of UTMI+PHY clock starts.

#### (1) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.

Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

### (2) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

- When the HSE bit is 0, this module performs a full-speed operation.
- When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

### (3) D+/D- line resistor control (DRPD or DPRPU) bit

**Table 32B.4** shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 32B.4 Control of USB Data Bus Resistors

| Setting | | Control of USB Data Bus Resistors | | |
|---|---|---|---|---|
| DRPD | DPRPU | D- Line | D+ Line | Remarks |
| 0 | 0 | Open | Open | |
| 0 | 1 | Open | Pull-Up | Specify the settings as shown in the left. |
| 1 | 0 | Pull-Down | Pull-Down | Initial state (When power on reset is canceled) |
| 1 | 1 | Pull-Down | Pull-Up | Setting prohibited |

#### (a) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V. Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

### (4) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.

When this bit is changed from 1 to 0, this module initializes the bits shown in **Table 32B.5**.

Table 32B.5 Register Bits That Are Initialized by Writing 0 to the USBE Bit

| Register Name | Bit Name |
|---|---|
| SYSSTS0 | LNST |
| DVSTCTR0 | RHST |
| INTSTS0 | DVSQ |
| USBADDR | USBADDR |
| USBREQ | bRequest<br>bmRequestType |
| USBVAL | wValue |
| USBINDX | wIndex |
| USBLENG | wLength |

**Note:** Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

### 32B.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: H'002>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | BWAIT | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 12 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 11 to 8 | — | H'F | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 7, 6 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 5 to 0 | BWAIT | H'0F | R/W | CPU bus access wait specification<br>These bits specify the number of wait cycles for the access to this module.<br>000000: 0 wait cycles (2 access cycles)<br>:<br>000010: 2 wait cycles (4 access cycles)<br>:<br>000100: 4 wait cycles (6 access cycles)<br>:<br>001111: 15 wait cycles (17 access cycles) (default)<br>:<br>111111: 63 wait cycles (65 access cycles) |

#### (1) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.

The following restriction is placed on the cycle of the access to the registers at address H'04 or after of this module: Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock (P1ϕ) frequency.

The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:

MBW = 10 (32-bit access width): Max 60 MBytes/sec
MBW = 01 (16-bit access width): Max 30 MBytes/sec
MBW = 00 (8-bit access width): Max 15 MBytes/sec

## 32B.2.4 System Configuration Status

### 32B.2.4.1 System Configuration Status Register (SYSSTS0) <Address: H'004>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LNST | |
| Initial Value | — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 2 | — | See above | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 1, 0 | LNST | All 0 | R | USB Line status monitor<br>The USB line status is displayed.<br>*Note*: See the detailed description. |

#### (1) Line status monitor (LNST) bits

**Table 32B.6** shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 32B.6 Line Status of USB Data Bus

| LNST [1] | LNST [0] | Full-Speed operation | High-Speed operation | Chirp operation |
|---|---|---|---|---|
| 0 | 0 | SE0 | Squelch | Squelch |
| 0 | 1 | J State | Unsquelch | Chirp J |
| 1 | 0 | K State | Invalid | Chirp K |
| 1 | 1 | SE1 | Invalid | Invalid |

**Note:** Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
Squelch: SE0 or idle state
Unsquelch: High-speed J or high-speed K state
Chirp J: Chirp J State
Chirp K: Chirp K State

## 32B.2.5 USB Signal Control Registers

### 32B.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: H'008>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | WKUP | — | — | — | — | — | RHST | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | 0 | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R/W(1) | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R/W | Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 14 to 9 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 8 | WKUP | 0 | R/W<br>(1) | Remote wakeup output<br>This bit prohibits or enables Remote wakeup (resume signal output).<br>0: Remote wakeup signal is not output.<br>1: Remote wakeup signal is output. |
| 7 to 3 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 2 to 0 | RHST | All 0 | R | Reset handshake<br>This bit indicates the reset handshake status.<br>*Note*: See the detailed description. |

#### (1) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.

This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.

The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.

When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 µs, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

### (2) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. **Table 32B.7** lists the results of reset handshake.

Table 32B.7 Reset Handshake Status

| Bus State | Value of RHST Bit |
|---|---|
| Powered or disconnected state | 000 |
| Reset handshake in process | 100 |
| Full-speed connection | 010 |
| High-speed connection | 011 |

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

## 32B.2.6 Test Mode Register

### 32B.2.6.1 USB Test Mode Register [TESTMODE] <Address: H'00C>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | UTST | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 14 | — | 0 | R/W | Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 13, 12 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 11 | — | 0 | R/W | Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 10 to 4 | — | H'10 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 3 to 0 | UTST | All 0 | R/W | Test mode<br>See the detailed description. |

#### (1) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.

**Table 32B.8** lists the test modes of this module.

Table 32B.8 List of test mode operation

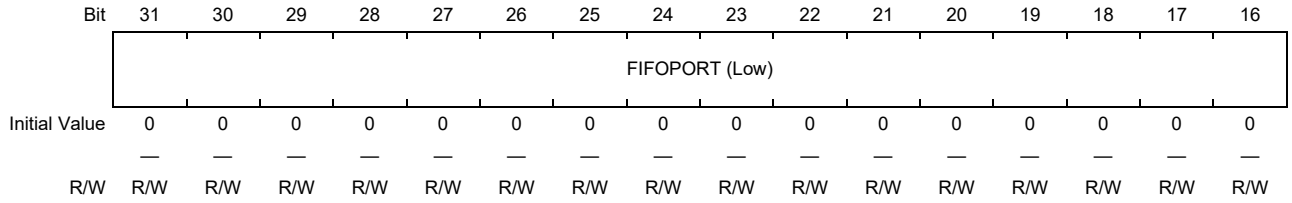
| Test mode | Value of UTST Bits |
|---|---|
| Normal operation | 0000 |
| Test_J | 0001 |
| Test_K | 0010 |
| Test_SE0_NAK | 0011 |
| Test_Packet | 0100 |
| Test_Force_Enable | — |
| Reserved | 0101 to 0111 |

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication. When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.

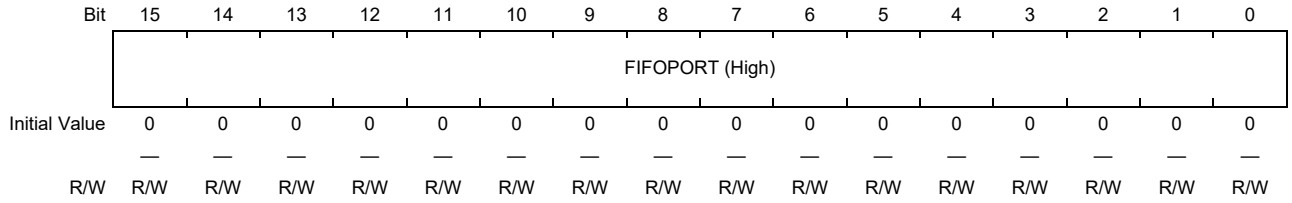
To perform a normal USB communication after setting a test mode, perform Power on reset.

## 32B.2.7 FIFO Port Registers

### 32B.2.7.1 CFIFO Port Register [CFIFO] <Address: H'014>



### 32B.2.7.2 CFIFO Port Register [CFIFO] <Address: H'016>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | FIFOPORT | All 0 | R/W | FIFO port<br>These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer. |

#### (1) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

1. The CFIFO port must be used to access the FIFO buffer through the DCP.
2. When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
3. The registers configured for a FIFO port do not affect any other FIFO ports.
4. The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

### (2) FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).

The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in **Table 32B.9** to **Table 32B.11**.

Table 32B.9 Endian Operation in 32-Bit Access (When MBW = 10)

| BIGEND | b31 to b24 | b23 to b16 | b15 to b8 | b7 to b0 |
|---|---|---|---|---|
| 0 | N + 3 address | N + 2 address | N + 1 address | N + 0 address |
| 1 | N + 0 address | N + 1 address | N + 2 address | N + 3 address |

Table 32B.10 Endian Operation in 16-Bit Access (When MBW = 01)

| BIGEND | b31 to b24 | b23 to b16 | b15 to b8 | b7 to b0 |
|---|---|---|---|---|
| 0 | Writing: invalid<br>Reading: prohibited*1 | | even-numbered address | odd-numbered address |
| 1 | even-numbered address | odd-numbered address | Writing: invalid<br>Reading: prohibited*1 | |

Table 32B.11 Endian Operation in 8-Bit Access (When MBW = 00)

| BIGEND | b31 to b24 | b23 to b16 | b15 to b8 | b7 to b0 |
|---|---|---|---|---|
| 0 | Writing: invalid<br>Reading: prohibited*1 | | | Writing: valid<br>Reading: valid |
| 1 | Writing: valid<br>Reading: valid | Writing: invalid<br>Reading: prohibited*1 | | |

Note 1. Reading words or bytes from an invalid register is prohibited.

### 32B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H'020>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RCNT | REW | — | — | MBW | | — | BIGEND | — | — | ISEL | — | CURPIPE | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R(0)/W | R | R | R/W | R/W | R | R/W | R | R | R/W | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | RCNT | 0 | R/W | Read count mode<br>This bit specifies DTLN read mode for the CFIFOCTR register.<br>0: Clears the DTLN bits when all received data is read.<br>1: Decrements the value of the DTLN bits each time received data is read. |
| 14 | REW | 0 | R(0)/W | Buffer pointer rewind<br>Set this bit to 1 to rewind the buffer pointer.<br>0: Does not rewind the buffer pointer.<br>1: Rewinds the buffer pointer. |
| 13, 12 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 11, 10 | MBW | All 0 | R/W | CFIFO port access bit width<br>This bit specifies the bit width for access to the CFIFO port.<br>00: 8-bit width<br>01: 16-bit width<br>10: 32-bit width<br>11: Setting prohibited |
| 9 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 8 | BIGEND | 0 | R/W | FIFO port byte endian control<br>This bit specifies the byte endian of the CFIFO port.<br>0: Little endian<br>1: Big endian |
| 7, 6 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 5 | ISEL | 0 | R/W | FIFO port access direction with DCP selected<br>This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits.<br>0: Selects reading of buffer memory.<br>1: Selects writing of buffer memory. |
| 4 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 3 to 0 | CURPIPE | All 0 | R/W | FIFO port access pipe specification<br>This bit specifies the pipe number used for accessing the CFIFO port.<br>0000: DCP<br>0001: PIPE1<br>0010: PIPE2<br>↓<br>1000: PIPE8<br>1001: PIPE9<br>↓<br>1110: PIPE14<br>1111: PIPE15 |

#### (1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

#### (2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

#### (3) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.

If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.

Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.

For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.

When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.

Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

#### (4) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.

For details see **Section 32B.2.7.2(1), FIFO port control bits (for FIFOPORT)**.

#### (5) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

Set this bit simultaneously with setting of the CURPIPE bits.

### (6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

### 32B.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address:H'028>
### D1FIFO Port Select Register [D1FIFOSEL] <Address:H'02C>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 9 to 4 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 3 to 0 | CURPIPE | All 0 | R/W | FIFO port access pipe specification<br>0000: No specification<br>0001: PIPE1<br>0010: PIPE2<br>↓<br>1000: PIPE8<br>1001: PIPE9 |

#### (1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the DxFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the DxFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

#### (2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

#### (3) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the “BCLR = 1” processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.

Always clears this bit when you use this module with the BRDYM bit set.

#### (4) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.

When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits. When changing the value of the CURPIPE bits, change the value always after clearing this bit.

#### (5) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port. For details, see **Section 32B.2.7.3(3), CFIFO port access bit width (MBW) bits**.

#### (6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

| 13 | FRDY | 0 | R | FIFO port ready<br>This bit indicates whether the FIFO port can be accessed.<br>0: The FIFO port cannot be accessed.<br>1: The FIFO port can be accessed. |
| 12 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 11 to 0 | DTLN | All 0 | R | Receive data length<br>These bits indicate the length of receive data. |

#### (1) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases descried below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

(1) To send short packets, set this bit when data writing ends.

(2) To send zero length packets, set this bit before writing data to the FIFO buffer.

(3) Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.

When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.

Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit. Do not set this bit when the specified pipe is in the receiving direction.

### (2) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.

Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and the both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to “NAK”.

When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

### (3) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.

In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

(1) A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.

(2) A short packet has been received and data reading has ended while the BFRE bit is 1.

### (4) Receive data length (DTLN) bits

These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

(1) When the RCNT bit is 0:
This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.

(2) When the RCNT bit is 1:
This module decrements the value of these bits each time the CPU reads data.
(The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.

When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.

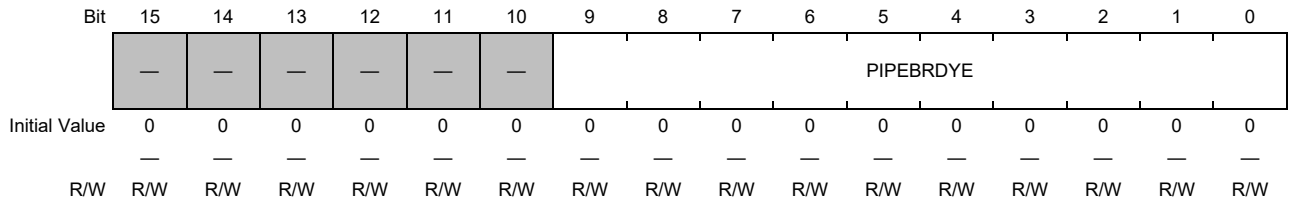
## 32B.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB)

### 32B.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: H'030>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | VBSE | RSME | SOFE | DVSE | CTRE | BEMPE | NRDYE | BRDYE | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | VBSE | 0 | R/W | VBUS Interrupt Enable<br>This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 14 | RSME | 0 | R/W | Frame number update interrupt enable<br>Resume interrupt enable<br>This bit prohibits or enables a USB interrupt when a RESM interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 13 | SOFE | 0 | R/W | This bit prohibits or enables a USB interrupt when a SOF interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 12 | DVSE | 0 | R/W | Device state transition interrupt enable<br>This bit prohibits or enables a USB interrupt when a DVST interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 11 | CTRE | 0 | R/W | Control transfer stage transition interrupt enable<br>This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 10 | BEMPE | 0 | R/W | Buffer empty interrupt enable<br>This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 9 | NRDYE | 0 | R/W | Buffer not ready response interrupt enable<br>This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 8 | BRDYE | 0 | R/W | Buffer ready interrupt enable<br>This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |
| 7 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

### 32B.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: H'036>



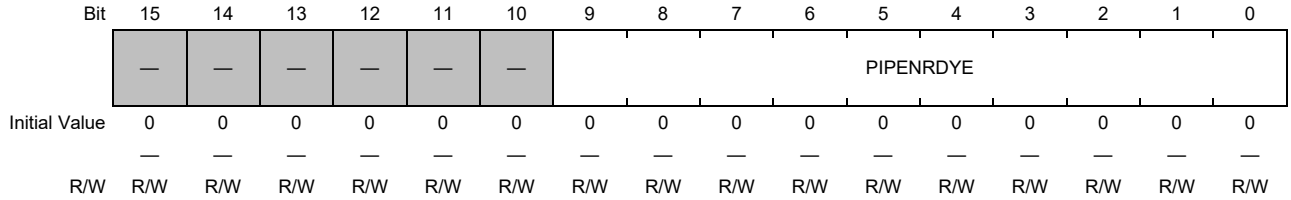
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R/W | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 to 0 | PIPEBRDYE | All 0 | R/W | Pipe BRDY interrupt enable<br>These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |

#### (1) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

### 32B.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: H'038>



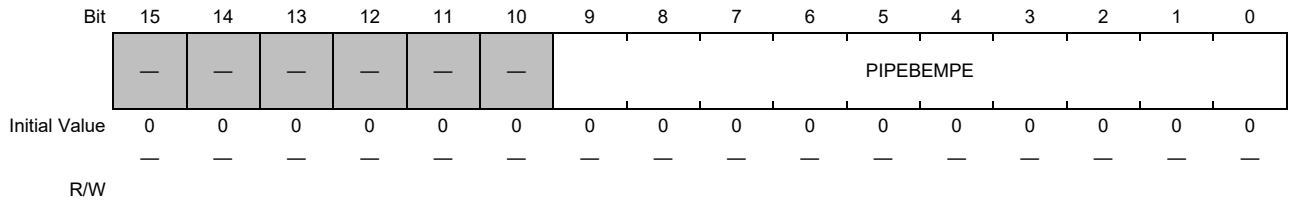
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R/W | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 to 0 | PIPENRDYE | All 0 | R/W | Pipe NRDY interrupt enable<br>These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected.<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |

#### (1) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

### 32B.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: H'03A>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R/W | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 to 0 | PIPEBEMPE | All 0 | R/W | Pipe BEMP interrupt enable<br>These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected<br>0: Interrupt output prohibited<br>1: Interrupt output enabled |

**Note:** Bit numbers correspond to pipe numbers.

#### (1) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

## 32B.2.9 SOF Control Register

### 32B.2.9.1 SOF Pin Configuration Register [SOFCFG] <Address: H'03C>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 3, 2 | SOFM | All 0 | R/W | SOF function setting<br>These bits are used to select SOF pulse output mode.<br>00: SOF output disabled<br>01: SOF output in units of 1 ms<br>10: µSOF output in units of 125 µs<br>11: Reserved |
| 1, 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

## 32B.2.10 Interrupt Status

### 32B.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: H'040>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | VBINT | RESM | SOFR | DVST | CTRT | BEMP | NRDY | BRDY | VBSTS | DVSQ | | | VALID | CTSQ | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | 1 | — | — | — | — | — | 0 | 0 | 1 | — | — | — | — |
| R/W | R/W(0) | R/W(0) | R/W(0) | R/W(0) | R/W(0) | R | R | R | R | R | R | R | R/W(0) | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | VBINT | 0 | R/W(0) | Change detection interrupt status<br>This bit indicates the VBUS change detection interrupt status.<br>0: No VBUS interrupt is generated.<br>1: A VBUS interrupt is generated. |
| 14 | RESM | 0 | R/W(0) | Resume interrupt status<br>This bit indicates the resume detection interrupt status.<br>0: No resume interrupt is generated.<br>1: A resume interrupt is generated. |
| 13 | SOFR | 0 | R/W(0) | Frame number update interrupt status<br>This bit indicates the frame number update interrupt status.<br>0: No SOF interrupt is generated.<br>1: A SOF interrupt is generated. |
| 12 | DVST | 0 | R/W(0) | Device state transition interrupt status<br>This bit indicates the device state transition interrupt.<br>0: No device state transition interrupt is generated.<br>1: A device state transition interrupt is generated. |
| 11 | CTRT | 0 | R/W(0) | Control transfer stage transition interrupt status<br>This bit indicates the status of a control transfer stage transition interrupt.<br>0: No control transfer stage transition interrupt is generated.<br>1: A control transfer stage transition interrupt is generated. |
| 10 | BEMP | 0 | R | BEMP interrupt status<br>This bit indicates the BEMP interrupt status.<br>0: No BEMP interrupt is generated.<br>1: A BEMP interrupt is generated. |
| 9 | NRDY | 0 | R | NRDY interrupt status<br>This bit indicates the NRDY interrupt status.<br>0: No NRDY interrupt is generated.<br>1: An NRDY interrupt is generated. |
| 8 | BRDY | 0 | R | BRDY interrupt status<br>This bit indicates the BRDY interrupt status.<br>0: No BRDY interrupt is generated.<br>1: A BRDY interrupt is generated. |
| 7 | VBSTS | 0 | R | VBUS input status<br>This bit indicates the VBUS pin input status.<br>0: The VBUS pin is at the low level.<br>1: The VBUS pin is at the high level. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 6 to 4 | DVSQ | All 0 | R | Device state<br>These bits indicate the device state.<br>000: Powered state<br>001: Default state<br>010: Address state<br>011: Configured state<br>1xx: Suspended state |
| 3 | VALID | 0 | R/W(0) | USB request reception<br>This bit indicates whether USB request reception is detected.<br>0: Not detected<br>1: A setup packet is received. |
| 2 to 0 | CTSQ | All 0 | R | Control transfer stage<br>These bits indicate the control transfer stage.<br>000: Idle or setup stage<br>001: Control reading data stage<br>010: Control reading status stage<br>011: Control writing data stage<br>100: Control writing status stage<br>101: Control writing (No Data) status stage<br>110: Control transfer sequence error<br>111: Reserved |

**Note:** When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 to only the bit to be cleared and 1 to other bits. Do not write 0 to any status bit that is currently 0.

**Note:** This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

### (1) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

### (2) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XX) and detects a falling edge of the signal at the DP pin.

### (3) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:

This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)

This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

### (4) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

#### (5) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.

When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

#### (6) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).

For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.

This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.

Cannot clear this bit even by writing 0.

#### (7) Buffer not-ready interrupt status (NRDY) bit

This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).

For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.

This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.

Software cannot clear this bit even by writing 0.

#### (8) Buffer ready interrupt status (BRDY) bit

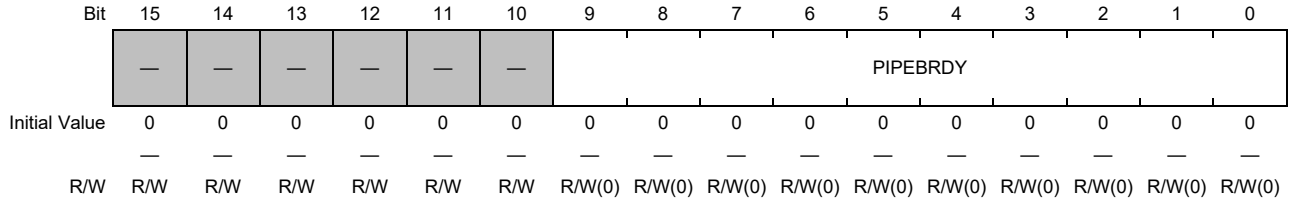
This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).

For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.

This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.

Software cannot clear this bit even by writing 0.

### 32B.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: H'046>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R/W | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 to 0 | PIPEBRDY | All 0 | R/W(0) | Pipe BRDY interrupt status<br>These bits indicate the BRDY interrupt status of each pipe.<br>0: No interrupt is generated.<br>1: An interrupt is generated. |

**Note:** Bit numbers correspond to pipe numbers.

**Note:** To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0, write 0 to only the bit to be cleared and 1 to other bit.

**Note:** When the BRDYM bit is 0, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

#### (1) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

##### (a) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.

Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction

(a) When the DIR bit changes from 0 to 1

(b) When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.

(c) When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.

(d) When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.

(e) When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction

(a) When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
No request trigger is generated for the transaction that involves a data PID mismatch.
In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
In that case, the request trigger is generated even if the FIFO buffer has a free space.

(b) When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes.

Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

### (b) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:

1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to “0” by writing “0” to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.

If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

### (c) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.

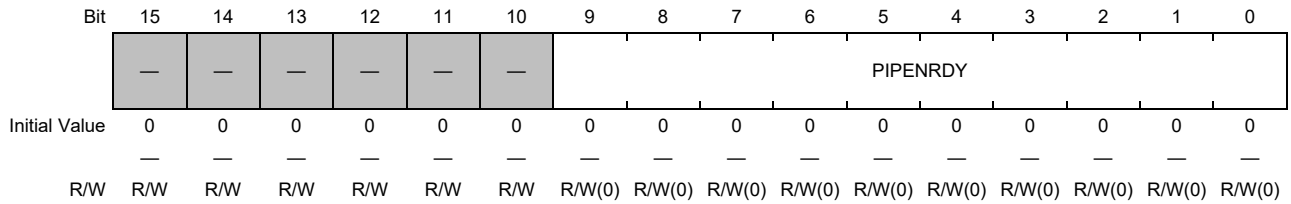
(a) For the pipe in the sending direction
This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.
The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.

(b) For the pipe in the receiving direction
This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).
If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

### 32B.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: H'048>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R/W | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 to 0 | PIPENRDY | All 0 | R/W(0) | Pipe NRDY interrupt status<br>These bits indicate the NRDY interrupt status of each pipe.<br>0: No interrupt is generated.<br>1: An interrupt is generated. |

**Note:** Bit numbers correspond to pipe numbers.

**Note:** To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

#### (1) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal NRDY interrupt request for individual pipes under the conditions described below. This module does not issue any interrupt request at the status stage of a control transfer.

##### (a) For the pipe in the sending direction

(1) When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data
When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero- length packet, and sets the OVRN bit.

##### (b) For the pipe in the receiving direction

(1) When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.
If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.
Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).
This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.

(2) When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

(3) When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame
When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

### 32B.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: H'04A>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | PIPEBEMP | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) | — R/W(0) |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R/W | Reserved<br>When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written. |
| 9 to 0 | PIPEBEMP | All 0 | R/W(0) | Pipe BEMP interrupt status<br>These bits indicate the BEMP interrupt status of each pipe.<br>0: No interrupt is generated.<br>1: An interrupt is generated. |

**Note:** Bit numbers correspond to pipe numbers.

**Note:** To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

#### (1) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

1. When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty
   In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends

(b) When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit

(c) During an IN transfer (sending zero-length packets) at the status stage of a control transfer

2. For the pipe in the receiving direction
   When the data larger than the specified maximum packet size has been received normally
   In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).
   Then, this module returns a STALL packet.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When a CRC or bit stuff error has been detected in the received data

(b) When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.

Writing 1 to this bit causes no effect.

## 32B.2.11 Frame Number Registers (FRMNUM, UFRMNUM)

### 32B.2.11.1 Frame Number Register [FRMNUM] <Address: H'04C>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OVRN | CRCE | — | — | — | FRNM | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R/W(0) | R/W(0) | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | OVRN | 0 | R/W(0) | Overrun/underrun detection status<br>This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer.<br>0: No error<br>1: An error occurred. |
| 14 | CRCE | 0 | R/W(0) | CRC error detection status<br>This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer.<br>0: No error<br>1: An error occurred. |
| 13 to 11 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 10 to 0 | FRNM | All 0 | R | Frame number<br>These bits indicate the latest frame number. |

**Note:** The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

#### (1) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.

When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see **Section 32B.2.10.3(1), Pipe NRDY interrupt status (PIPENRDY) bit**.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write H'40.

When the peripheral controller function is selected

This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

#### (2) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.

Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write H'80.

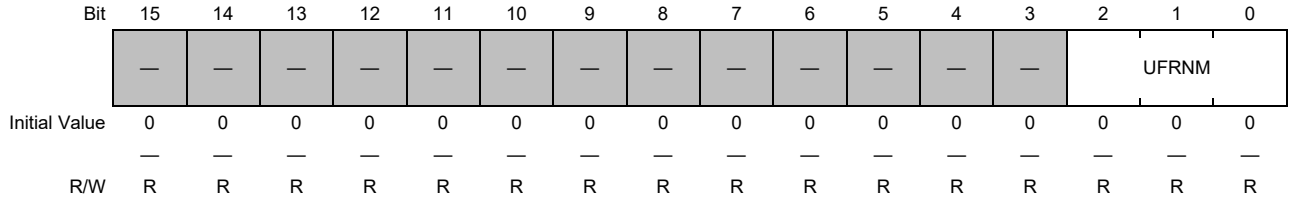
When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see **Section 32B.2.10.3(1), Pipe NRDY interrupt status (PIPENRDY) bit**.

#### (3) Frame number (FRNM) bits

This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.

When reading these bits, read them twice and check for consistency.

### 32B.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: H’04E>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 14 to 3 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 2 to 0 | UFRNM | All 0 | R | Micro frame<br>These bits indicate the micro frame number. |

#### (1) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes H’00 to these bits.

When reading these bits, read them twice and check for consistency.

## 32B.2.12 USB Address

### 32B.2.12.1 USB Address Register [USBADDR] <Address: H'050>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | USBADDR | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 11 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 10 to 8 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 7 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 6 to 0 | USBADDR | All 0 | R | USB address<br>These bits indicate the USB address allocated by the host. |

#### (1) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.

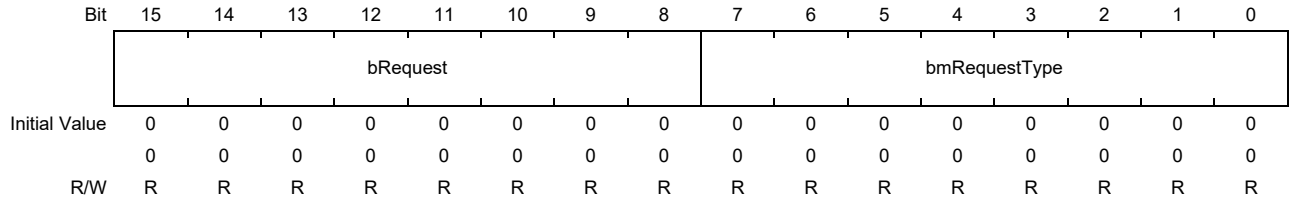
When this module detects a USB bus reset, this module writes H'00 to these bits.

## 32B.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.

These registers store the values set in the received USB requests.

### 32B.2.13.1 USB Request Type Register [USBREQ] <Address: H'054>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | bRequest | All 0 | R | Request<br>Value of USBRequestbRequest |
| 7 to 0 | bmRequestType | All 0 | R | Request type<br>Value of USBRequestbmRequestType |

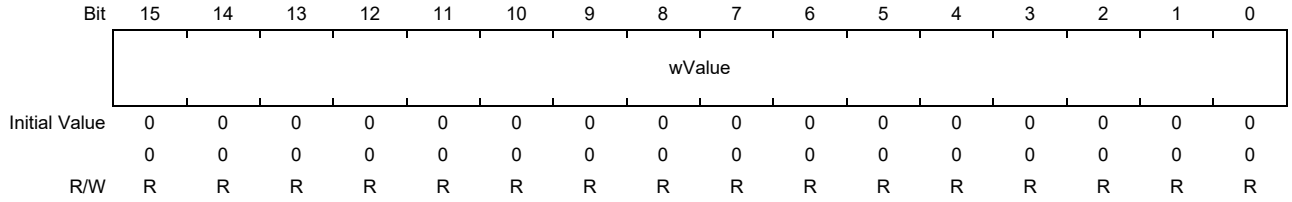
#### (1) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

#### (2) USB request type (bRmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

### 32B.2.13.2 USB Request Value Register [USBVAL] <Address: H'056>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 0 | wValue | All 0 | R | Value<br>Value of the wValue field in a USB request |

#### (1) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.

These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

### 32B.2.13.3 USB Request Index Register [USBINDX] <Address: H'058>

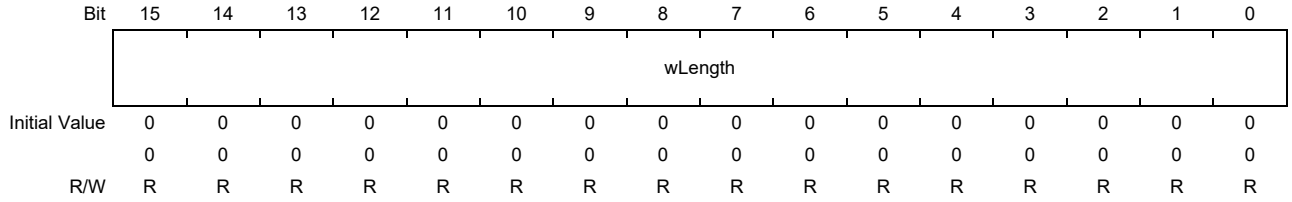
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 0 | wIndex | All 0 | R | Index<br>Value of the wIndex field in a USB request |

#### (1) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.

These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

### 32B.2.13.4 USB Request Length Register [USBLENG] <Address: H'05A>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 0 | wLength | All 0 | R | Length<br>Value of the wLength field in a USB request |

#### (1) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.

These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

## 32B.2.14 DCP Configuration

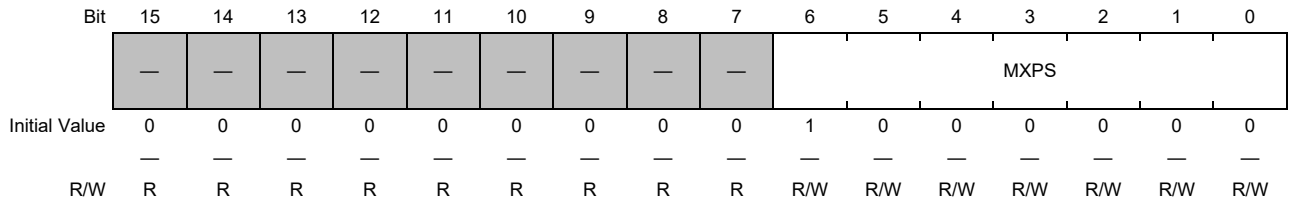
When performing a data communication by a control transfer, use the default control pipe (DCP).

### 32B.2.14.1 DCP Configuration Register [DCPCFG] <Address: H'05C>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | CNTMD | SHTNAK | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | — | — | — | — | — | — | — | R/W | R/W | — | — | — | — | — | — | — |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 9 | — | All 0 | | Nothing is assigned to these bits. Fix these bits to 0. |
| 8 | CNTMD | 0 | R/W | Continuous transfer mode<br>This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode.<br>0: Non-continuous transfer mode<br>1: Continuous transfer mode |
| 7 | SHTNAK | 0 | R/W | Pipe disable at transfer end<br>When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends.<br>0: Continues the pipe when the transfer ends<br>1: Disables the pipe when the transfer ends |
| 6 to 0 | — | All 0 | | Nothing is assigned to these bits. Fix these bits to 0. |

### 32B.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: H'05E>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 7 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 6 to 0 | MXPS | H'40 | R/W | Maximum packet size<br>These bits specify the maximum data payload size (maximum packet size) for the DCP. |

#### (1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.

The default is H'40 (64 bytes).

The value of the MXPS bits must conform to the USB Specification.

Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits. If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

### 32B.2.14.3 DCP Control Register [DCPCTR] <Address: H'060>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BSTS | — | — | — | — | — | — | SQCLR | SQSET | SQMON | PBUSY | — | — | CCPL | PID | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R(0)/W(1) | R(0)/W(1) | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | BSTS | 0 | R | Buffer status<br>This bit indicates the accessibility status of the DCP FIFO buffer.<br>0: Buffer access is not possible.<br>1: Buffer access is possible. |
| 14 to 9 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 8 | SQCLR | 0 | R(0)/W(1) | Toggle bit clear<br>This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer.<br>0: Writing disabled<br>1: DATA0 specified |
| 7 | SQSET | 0 | R(0)/W(1) | Toggle bit set<br>This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer.<br>0: Writing disabled<br>1: DATA1 specified |
| 6 | SQMON | 0 | R | Sequence toggle bit monitor<br>This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer.<br>0: DATA0<br>1: DATA1 |
| 5 | PBUSY | 0 | R | Pipe busy<br>This bit indicates whether the specified pipe is being used in the USB bus.<br>0: The specified pipe is not used in the USB bus.<br>1: The specified pipe is being used in the USB bus. |
| 4 to 3 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 2 | CCPL | 0 | R/W | Control transfer end enable<br>Setting this bit permits the status stage of the control transfer to end.<br>0: Does not permit the control transfer to end.<br>1: Permits the control transfer to end. |
| 1, 0 | PID | All 0 | R/W | Response PID<br>These bits control responses from this module in control transfer.<br>00: NAK response<br>01: BUF response (according to the buffer status)<br>10: STALL response<br>11: STALL response |

#### (1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

1. When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
2. When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

#### (2) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

#### (3) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

#### (4) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module. When a transaction ends normally, this module toggles this bit.

This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).

This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

### (5) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

### (6) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.

In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.

When a new SETUP packet is received, this module changes this bit from 1 to 0.

When the VALID bit is 1, software cannot set this bit.

### (7) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

1. This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
2. When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
3. This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
4. This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

## 32B.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI)

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

### 32B.2.15.1 Pipe Window Select Register [PIPESEL] <Address: H'064>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | PIPESEL | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 4 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 3 to 0 | PIPESEL | All 0 | R/W | Pipe window select<br>These bits specify a pipe for registers at addresses H'68 to H'6E.<br>0000: No selection<br>0001: PIPE1<br>0010: PIPE2<br>0011: PIPE3<br>0100: PIPE4<br>0101: PIPE5<br>0110: PIPE6<br>0111: PIPE7<br>1000: PIPE8<br>1001: PIPE9 |

**Note:** When the PIPESEL bits are 0000, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000, writing to the registers at addresses H'68 to H'6E is ignored.

#### (1) Pipe Window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses H'68 to H'6E. After a pipe is selected by these bits, the values set in the areas at addresses H'68 to H'6E are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses H'68 to H'6E. Then, writing to the areas at addresses H'68 to H'6E is ignored.

### 32B.2.15.2 Pipe Configuration Register [PIPECFG] <Address: H'068>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TYPE | | — | — | — | BFRE | DBLB | CNTMD | SHTNAK | — | — | DIR | EPNUM | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15, 14 | TYPE | All 0 | R/W | Transfer type<br>These bits specify the transfer type of the pipe specified in the PIPESEL bit.<br>00: The pipe cannot be used.<br>01: Bulk transfer<br>10: Interrupt transfer<br>11: Isochronous transfer |
| 13 to 11 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 10 | BFRE | 0 | R/W | BRDY interrupt operation specification<br>This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe.<br>0: A BRDY interrupt is notified when data is sent or received.<br>1: A BRDY interrupt is notified when reading of data is completed. |
| 9 | DBLB | 0 | R/W | Double-buffer mode<br>This bit specifies a single or double FIFO buffer to be used by the specified pipe.<br>0: Single buffer<br>1: Double buffer |
| 8 | CNTMD | 0 | R/W | Continuous transfer mode<br>This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode.<br>0: Non-continuous transfer mode<br>1: Continuous transfer mode |
| 7 | SHTNAK | 0 | R/W | Pipe disable at transfer end<br>When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends.<br>0: Continues the pipe when the transfer ends.<br>1: Disables the pipe when the transfer ends. |
| 6, 5 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 4 | DIR | 0 | R/W | Transfer direction<br>This bit specifies the transfer direction of the specified pipe.<br>0: Receiving direction<br>1: Sending direction |
| 3 to 0 | EPNUM | All 0 | R/W | Endpoint number<br>These bits specify the endpoint number of the specified pipe. |

### (1) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.

**Table 32B.12** lists pipes and the transfer types specifiable in these bits.

Table 32B.12 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

| Selected Pipe | TYPE Bits | USB Transfer Type |
|---|---|---|
| PIPE1 or PIPE2 | 01 or 11 | Bulk or isochronous transfer |
| PIPE3 to PIPE5 | 01 | Bulk transfer |
| PIPE6 to PIPE9 | 10 | Interrupt transfer |

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

The value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

### (2) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.

If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.

For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

### (3) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

### (4) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5, and the transfer type of the selected pipe is bulk transfer.

This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in **Table 32B.13**.

Table 32B.13 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer According to the Value of the CNTMD Bit

| CNTMD Bit Setting Value | How to Determine Whether Reading or Sending is Enabled |
|---|---|
| 0 | Condition for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"):<br>This module receives one packet |
| | Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"):<br>Either of the following conditions (1) and (2) is met:<br>(1) Data for the maximum packet size is written to the FIFO buffer.<br>(2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. |
| 1 | Conditions for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"):<br>(1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes ((BUFSIZE + 1) * 64).<br>(2) This module receives a short packet other than a zero-length packet.<br>(3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data.<br>(4) Packets are received as many times as the value of the transaction counter set for the selected pipe. |
| | Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"):<br>One of the following conditions (1) to (3) is met:<br>(1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe.<br>(2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.<br>(3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing. |

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

### (5) PIPE disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 and is in the receiving direction.

When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

(1) This module has normally received short packet data (including zero-length packets).

(2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

### (6) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

### (7) Endpoint number (EPNUM) bits

These bits are used to specify the endpoint number of the endpoint of a selected pipe. Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting "EPNUM = 000" [the selected pipe is not used] can be duplicated for multiple pipes.)

### 32B.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: H'06A>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | BUFSIZE | | | | | — | — | BUFNMB | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | — R | — R/W | — R/W | — R/W | — R/W | — R/W | — R | — R | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W | — R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 14 to 10 | BUFSIZE | All 0 | R/W | Buffer size<br>These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit.<br>H'00: 64 bytes<br>H'01: 128 bytes<br>...<br>(H'1F: 2 Kbytes) |
| 9, 8 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 7 to 0 | BUFNMB | All 0 | R/W | Buffer number<br>These bits specify the FIFO buffer number of the specified pipe.<br>(H'4 to H'7F) |

**Note:** Changing values of these register bits for a selected pipe must be done when sets the PID of the selected pipe to NAK, and specifies no pipe in the CURPIPE bits.

**Note:** If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the values of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

#### (1) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe. Specify the FIFO buffer size in units of blocks. One block has 64 bytes.

When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

The following value can be specified in these bits:

(1) Any value from H'0 to H'1F when the selected pipe is PIPE1 to PIPE5.

(2) H'0 only when the selected pipe is PIPE6 to PIPE9.

In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

### (2) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe. This module allocates the following blocks of FIFO buffer to the selected pipe:

Block with block number “BUFNMB” to the block with block number “BUFNMB + (BUFSIZE + 1) × (DBLB + 1) - 1”

The value of these bits must be H’04 to H’7F. Note, however, that the following rules must be observed: Value " H’00" is exclusively used for DCP.

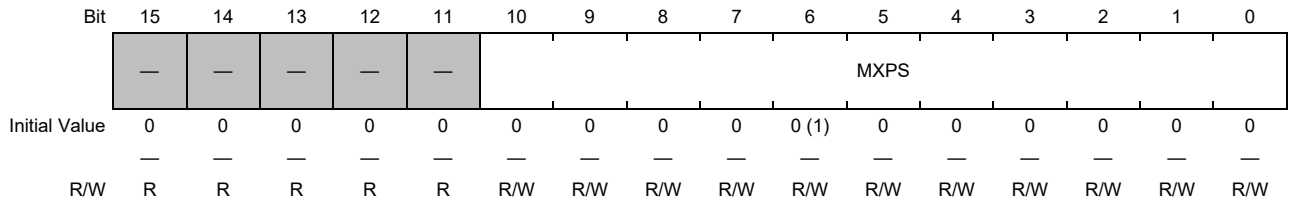
Value “H’04” is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’04 in the BUFNMB bits for PIPE6.

Value “H’05” is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’05 in the BUFNMB bits for PIPE7.

Value “H’06” is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’06 in the BUFNMB bits for PIPE8.

Value “H’07” is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’07 in the BUFNMB bits for PIPE9.

### 32B.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: H'06C>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 11 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 10 to 0 | MXPS | *Note | R/W | Maximum packet size<br>These bits specify the maximum data payload size (maximum packet size) for the specified pipe.<br>For PIPE6 to PIPE8, a value from H'1 to H'40 (bytes) can be set. |

**Note:** The initial value of the MXPS bits is H'00 when no pipe is specified in the PIPESEL bits in the PIPESEL register or H'40 when a pipe is specified in the PIPESEL bits.

#### (1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.

The initial value of these bits is H'40 (64 bytes).

- For PIPE1 and PIPE2, a value from H'1 (1 byte) to H'400 (1024 bytes) can be specified.
- For PIPE3 to PIPE5, H'8 (8 bytes), H'10 (16 bytes), H'20 (32 bytes), H'40 (64 bytes), or H'200 (512 bytes) can be specified. (Bits [2:0] are excluded.)
- For PIPE6 to PIPE9, a value from H'1 (1 byte) to H'40 (64 bytes) can be specified.

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

### 32B.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: H'06E>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | IFIS | — | — | — | — | — | — | — | — | — | IITV | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 13 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 12 | IFIS | 0 | R/W | Isochronous IN buffer flush<br>This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer.<br>0: Does not perform a buffer flush.<br>1: Performs a buffer flush. |
| 11 to 3 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 2 to 0 | IITV | All 0 | R/W | These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2. |

#### (1) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.

In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.

This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token hag to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

#### (2) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.

For PIPE3 to PIPE5 these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5.

You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

### (a) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.

This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.

When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

(a) When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

| (Micro) frame | SOF | SOF | SOF | OUT | DATA0 | SOF | OUT | DATA0 |
|---|---|---|---|---|---|---|---|---|
| Setting of PID bits | NAK | NAK | BUF | | | BUF | | |
| Whether token reception is expected<br>(0: reception expected<br>—: non-reception expected) | — | — | 0 | | | 0 | | |
| Start of interval counting | | | ↑ | | | | | |

Figure 32B.1 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 0

(b) When IITV is not 0: Interval counting starts at the end of the first normal reception of data packet after the PID of the selected pipe is changed to BUF.

| (Micro) frame | SOF | SOF | SOF | OUT | DATA0 | SOF | SOF | OUT | DATA0 | SOF | SOF | OUT | DATA0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Setting of PID bits | NAK | BUF | BUF | | | BUF | BUF | | | BUF | BUF | | |
| Whether token reception is expected<br>(0: reception expected<br>—: non-reception expected) | — | — | 0 | | | — | 0 | | | — | 0 | | |
| Start of interval counting | | | ↑ | | | | | | | | | | |

Figure 32B.2 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

### (b) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.

This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.

This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:

(1) This module is reset (then, also the IITV bits are cleared).

(2) The ACLRM bit is set.

(3) This module detects a USB bus reset.

## 32B.2.16 Pipe Control Registers (PIPExCTR)

### 32B.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: H'070>
### PIPE2 Control Register [PIPE2CTR] <Address: H'072>

### (1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 32B.14 BSTS Bit Operations

| DIR bit Setting Value | BFRE bit Setting Value | DCLRM bit Setting Value | Meaning of the BSTS Bit |
|---|---|---|---|
| 0 | 0 | 0 | This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished. |
| | | 1 | Setting prohibited |
| | 1 | 0 | This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished. |
| | | 1 | This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished. |
| 1 | 0 | 0 | This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished. |
| | | 1 | Setting prohibited |
| | 1 | 0 | Setting prohibited |
| | | 1 | Setting prohibited |

### (2) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

### (3) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.

When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.
   Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA- PID).
   This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

### (4) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

**Table 32B.15** shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

**Table 32B.16** shows the cases that require this processing.

Table 32B.15 Buffer Contents This Core Clears When the ACLRM Bit is Set

| No. | Contents to be Cleared by Setting the ACLRM Bit |
|---|---|
| (1) | Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared) |
| (2) | If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared. |

Table 32B.16 Cases Requiring the ACLRM Bit to be Set

| No. | Cases when Data Clear is Required |
|---|---|
| (1) | The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared. |
| (2) | The interval count value needs to be reset. |
| (3) | The value of the BFRE bit is changed. |
| (4) | The value of the DBLB bit is changed. |
| (5) | Forced termination of the transaction count function is performed. |

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

#### (5) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

#### (6) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

#### (7) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

### (8) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

### (9) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.

The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting muse be changed to BUF. For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see **Table 32B.17**.

If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check, that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

1. When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
2. When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
3. If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits. To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.

To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits. To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 32B.17 Core Operations Depending on the PID Setting

| PID bit Setting Value | Transfer Type (TYPE Bit Setting Value) | Transfer Direction (DIR Bit Setting Value) | Operation of This Core |
|---|---|---|---|
| 00 (NAK) | Bulk ("TYPE = 01"), or Interrupt ("TYPE = 10") | Independent of the setting value | Sends a NAK response for a token from the USB host. |
| | Isochronous ("TYPE = 11") | Receiving direction ("DIR = 0") | Does not respond to a token from the USB host. |
| | | Sending direction ("DIR = 1") | Sends a zero-length packet for a token from the USB host. |
| 01 (BUF) | Bulk ("TYPE = 01") | Receiving direction ("DIR = 0") | For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response.<br>For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response. |
| | Interrupt ("TYPE = 10") | Receiving direction ("DIR = 0") | For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response. |
| | Bulk ("TYPE = 01") or Interrupt ("TYPE = 10") | Sending direction ("DIR = 1") | If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response. |
| | Isochronous ("TYPE = 11") | Receiving direction ("DIR = 0") | For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data. |
| | | Sending direction ("DIR = 1") | If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet. |
| 10 (STALL) or 11 (STALL) | Bulk ("TYPE = 01") or Interrupt ("TYPE = 10") | Independent of the setting value | Sends a STALL response for a token from the USB host. |
| | Isochronous ("TYPE = 11") | Independent of the setting value | Does not respond to a token from the USB host. |

### 32B.2.16.2 PIPE6 Control Register [PIPE6CTR] <Address: H'07A>
### PIPE7 Control Register [PIPE7CTR] <Address: H'07C>

#### (1) Buffer status (BSTS) bit

See **Section 32B.2.16.1(2), Transmit buffer monitor (INBUFM) bit**.

#### (2) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

**Table 32B.18** shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

**Table 32B.19** shows the cases that require this processing.

Table 32B.18 Buffer Contents This Core Clears when the ACLRM Bit is Set

| No. | Contents Cleared by ACLRM Bit Operation |
|---|---|
| (1) | All contents of the FIFO buffer allocated to the selected pipe |

Table 32B.19 Cases Requiring the ACLRM Bit to be Set

| No. | Contents Cleared by ACLRM Bit Operation |
|---|---|
| (1) | When clearing contents of the FIFO buffer allocated to the selected pipe |
| (2) | When resetting the interval counter |
| (3) | When the value of the BFRE bit is changed |
| (4) | When the transaction count function is terminated forcibly |

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

#### (3) Sequence toggle bit clear (SQCLR) bit

See **Section 32B.2.16.1(5), Sequence toggle bit clear (SQCLR) bit**.

#### (4) Sequence toggle bit set (SQSET) bit

See **Section 32B.2.16.1(6), Sequence toggle bit set (SQSET) bit**.

#### (5) Sequence toggle bit monitor (SQMON) bit

See **Section 32B.2.16.1(7), Sequence toggle bit monitor (SQMON) bit**.

#### (6) Pipe busy (PBUSY) bit

See **Section 32B.2.16.1(8), Pipe busy (PBUSY) bit**.

#### (7) Response PID (PID) bits

See **Section 32B.2.16.1(9), Response PID (PID) bits**.

## 32B.2.17 Transaction Counters (PIPExTRE)

### 32B.2.17.1 PIPE1 Transaction Counter Enable Register [PIPE1TRE] <Address: H'090>
### PIPE2 Transaction Counter Enable Register [PIPE2TRE] <Address: H'094>
### PIPE3 Transaction Counter Enable Register [PIPE3TRE] <Address: H'098>
### PIPE4 Transaction Counter Enable Register [PIPE4TRE] <Address: H'09C>
### PIPE5 Transaction Counter Enable Register [PIPE5TRE] <Address: H'0A0>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | TRENB | TRCLR | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R/W | R(0)/W(1) | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 10 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 9 | TRENB | 0 | R/W | Transactio n counter enable<br>This bit enables or disables the transaction counter.<br>0: Disables the transaction counter.<br>1: Enables the transaction counter. |
| 8 | TRCLR | 0 | R(0)/W(1) | Transactio n counter clear<br>This bit clears the transaction counter to 0. To clear the counter, write 1 to this bit.<br>0: Invalid<br>1: Clears the current transaction counter. |
| 7 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

**Note:** Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is NAK. If you change the value of a bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of the bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

### (1) Transaction counter enable (TRENB) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.

For the pipe in the sending direction, write 0 to this bit (TRENB bit). When not using the transaction count function, write 0 to this bit.

When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

### (2) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

### 32B.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: H'092>
### PIPE2 Transaction Counter Register [PIPE2TRN] <Address: H'096>
### PIPE3 Transaction Counter Register [PIPE3TRN] <Address: H'09A>
### PIPE4 Transaction Counter Register [PIPE4TRN] <Address: H'09E>
### PIPE5 Transaction Counter Register [PIPE5TRN] <Address: H'0A2>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TRNCNT | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 0 | TRNCNT | All 0 | R/W | When writing:<br>Specifies the total number of packets to be received by the pertinent pipe (number of transactions).<br>When reading:<br>Indicates the specified number of transactions if TRENB is 0.<br>Indicates the number of the currently counted transaction if TRENB is 1. |

#### (1) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in **Section 32B.2.17.1(1), Transaction counter enable (TRENB) bit**.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions (a) to (c):

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is not equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions (a) to (c) are met:

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is equal to "current count + 1. "

(c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions (a) and (b) are met:

(a) The TRENB bit is 1.

(b) A short packet has been received.

(3) The following condition is met:

(a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits). When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENB bit is 0.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENB bit.

## 32B.2.18 Low Power Control Register

### 32B.2.18.1 Low Power Control Register [LPCTRL] <Address: H'100>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | HWUPM | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 8 | — | All 0 | R | Reserved<br>Nothing is assigned to these bits. Fix these bits to 0. |
| 7 | HWUPM | 0 | R/W | 0: Resumes the PHY from the low-power mode while the internal bus clock (P1ϕ) is operating.<br>1: Enables resume from the low-power mode while the internal bus clock (P1ϕ) is stopped. |
| 6 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

#### (1) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (P1ϕ) is stopped.

0: Disables resumption while the internal bus clock (P1ϕ) is stopped.

1: Enables resumption while the internal bus clock (P1ϕ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (P1ϕ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (P1ϕ) is stopped, set both this bit and the L1EXTMD bit.

## 32B.2.19 Low Power Status Register

### 32B.2.19.1 Low Power Status Register [LPSTS] <Address: H'102>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | SUSPM | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 14 | SUSPM | 0 | R/W | USBPHY Suspend M control<br>This bit controls the Suspend M signal to the USBPHY.<br>0: USBPHY suspend mode<br>1: USBPHY normal mode |
| 13 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

#### (1) USBPHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USBPHY. By default, the value of this bit is 0 and the USBPHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in **Table 32B.20**.

Table 32B.20 Registers That Allow Writing when the SUSPM Bit is 0

| Address | Register Name |
|---|---|
| H'000 | SYSCFG0 |
| H'002 | BUSWAIT |
| H'100 | LPCTRL |
| H'102 | SUSPMODE |

Note that the values written to the SYSCFG0 register while the USBPHY clock is stopped (SUSPM = 0) will be applied after the USBPHY clock starts (SUSPM = 1).

When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

## 32B.2.20 PHY Function Control Register

### 32B.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: H'104>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 14 | SusMon | 0 | R | This bit allows reading of the status of the Suspend M signal. |
| 13 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

#### (1) SusMon

SuspendM monitor bit (read only)

The status of the Suspend M signal can be read.

## 32B.2.21 PHY_OTG Control Register (PHYOTGCTR)

### 32B.2.21.1 PHY_OTG Control Register [PHYOTGCTR] <Address: H'10A>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | DmPuDwn | DpPuDwn | — | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 11 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 10 | DmPuDwn | 1 | R | Dm Pulldown monitor bit |
| 9 | DpPuDwn | 1 | R | Dp Pulldown monitor bit |
| 8 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

#### (1) DmPuDwn

DmPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DM side is disabled.

1: 15-kΩ Pulldown resistor control on the DM side is enabled.

#### (2) DpPuDwn

DpPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DP side is disabled.

1: 15-kΩ Pulldown resistor control on the DP side is enabled.

## 32B.2.22 Peripheral L1 Control Register 1 (PL1CTRL)

### 32B.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: H'144>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | L1EXTMD | — | — | HIRDTHR[3:0] | | | | DVSQ[3:0] | | | | L1NEGOMD | L1RESPMD[1:0] | | L1RESPEN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 14 | L1EXTMD | 0 | R/W | USBPHY control mode on resumption from the L1 state<br>This bit controls the USBPHY resume operation on resumption from the L1 state.<br>0: Does not set the Suspend M bit when the Host K signal is received.<br>1: Sets the Suspend M bit when the Host K signal is received |
| 13, 12 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 11 to 8 | HIRDTHR[3:0] | All 0 | R/W | L1 response negotiation threshold<br>HIRD threshold to be used for the L1NEGOMD bit<br>The format is the same as the HIRD field of the HL1CTRL register. |
| 7 | DVSQ[3] | 0 | R | DVSQ extension bit<br>This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state.<br>0000b: Powered state<br>0001b: Default state<br>0010b: Address state<br>0011b: Configured state<br>01xxb: Suspended state<br>10xxb: L1 state |
| 6 to 4 | DVSQ[2:0] | All 0 | R | These bits mirror the DVSQ[2:0] bits in INTSTS0. |
| 3 | L1NEGOMD | 0 | R/W | L1 response negotiation control<br>This bit sets the negotiation function using for the HIRD value.<br>0: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits.<br>In other cases (including same values), an NYET response is returned.<br>1: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits.<br>In other cases (including same values), an NYET response is returned.<br>This bit is valid only when the value of the L1RESPMD[1:0] bit is 11b. |
| 2, 1 | L1RESPMD[1:0] | All 0 | R/W | L1 response mode<br>These bits specify how to respond to an LPM token.<br>00b: NYET<br>01b: ACK<br>10b: STALL<br>11b: Response according to the value of the L1NEGOMD bit |
| 0 | L1RESPEN | 0 | R/W | L1 response enable<br>This bit enables an L1 response.<br>0: Does not support LPM.<br>1: Supports LPM. |

#### (1) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USBPHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.

1: Sets the SuspendM bit when this module is resumed from the L1 state.

NOTES

1. The Host K period lasts a minimum of 50 µs. Therefore, the USBPHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
2. For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.
3. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

#### (2) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit.

The format of the value is the same as that of the HIRD field in the HL1CTRL register.

#### (3) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.

0000b: Powered state

0001b: Default state

0010b: Address state

0011b: Configured state

01xxb: Suspended state

10xxb: L1 state

#### (4) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

#### (5) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.

0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 11b.

#### (6) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module responds to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.

00b: NYET

01b: ACK

10b: STALL

11b: Response according to the value of L1NEGOMD bit

#### (7) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

## 32B.2.23 Peripheral L1 Control Register 2

### 32B.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: H'146>

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | RWEMON | HIRDMON[3:0] | | | | — | — | — | — | — | — | — | — |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 15 to 13 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |
| 12 | RWEMON | 0 | R/W | This bit reflects the value of the RWE bit in the LPM token received last. |
| 11 to 8 | HIRDMON[3:0] | All 0 | R/W | These bits reflect the value of the HIRD field in the LPM token received last. |
| 7 to 0 | — | All 0 | R | Nothing is assigned to these bits. Fix these bits to 0. |

#### (1) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.

This bit reflects the value of the RWE bit in the LPM token received last.

#### (2) HIRD value monitor (HIRDMON) bits

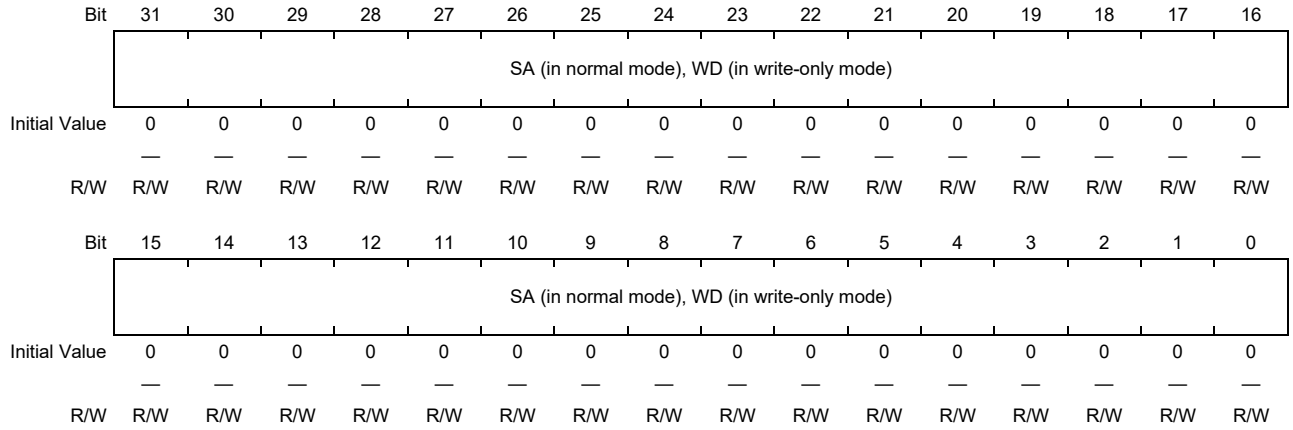
These bits are referenced to monitor the value of the HIRD field in a received LPM token.

These bits reflect the value of the HIRD field in the LPM token received last.

# 32B.3 Next Register Set

## 32B.3.1 Next Source Address Register n

### 32B.3.1.1 Next0 Source Address Register ch0 [N0SA_0] <Address: H'400>
### Next1 Source Address Register ch0 [N1SA_0] <Address: H'40C>
### Next0 Source Address Register ch1 [N0SA_1] <Address: H'440>
### Next1 Source Address Register ch1 [N1SA_1] <Address: H'44C>

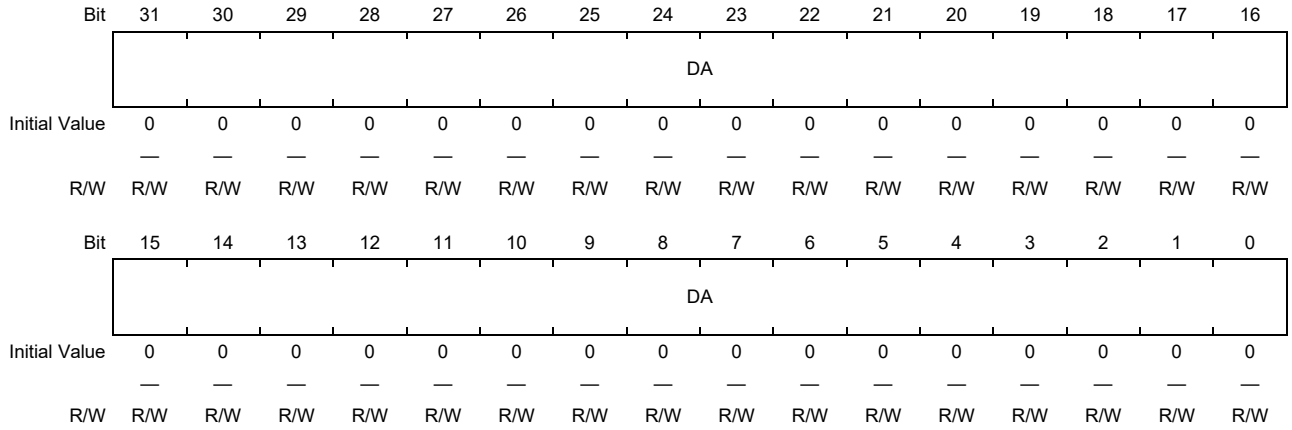


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | SA (in normal mode) | All 0 | R/W | Source Address<br>These bits specify the start address of the DMA transfer source. |
| | WD (in write-only mode) | All 0 | R/W | Write Data<br>These bits specify the write data in write-only mode. |

**Note:** In a transfer in link mode, the data in the N0SA_n register is overwritten with descriptor read data.

## 32B.3.2 Next Destination Address Register n

### 32B.3.2.1 Next0 Destination Address Register ch0 [N0DA_0] <Address: H'404>
### Next1 Destination Address Register ch0 [N1DA_0] <Address: H'410>
### Next0 Destination Address Register ch1 [N0DA_1] <Address: H'444>
### Next1 Destination Address Register ch1 [N1DA_1] <Address: H'450>

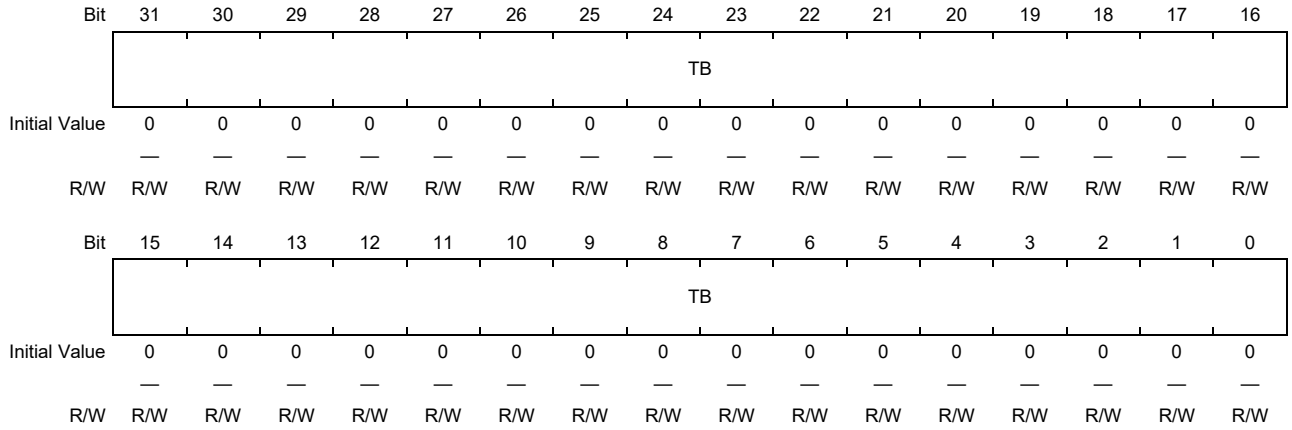


| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | DA | All 0 | R/W | Destination Address<br>These bits specify the start address of the DMA transfer destination. |

**Note:** In a transfer in link mode, the data in the N0DA_n register is overwritten with descriptor read data.

## 32B.3.3 Next Transaction Byte Register n

### 32B.3.3.1 Next0 Transaction Byte Register ch0 [N0TB_0] <Address: H'408>
### Next1 Transaction Byte Register ch0 [N1TB_0] <Address: H'414>
### Next0 Transaction Byte Register ch1 [N0TB_1] <Address: H'448>
### Next1 Transaction Byte Register ch1 [N1TB_1] <Address: H'454>



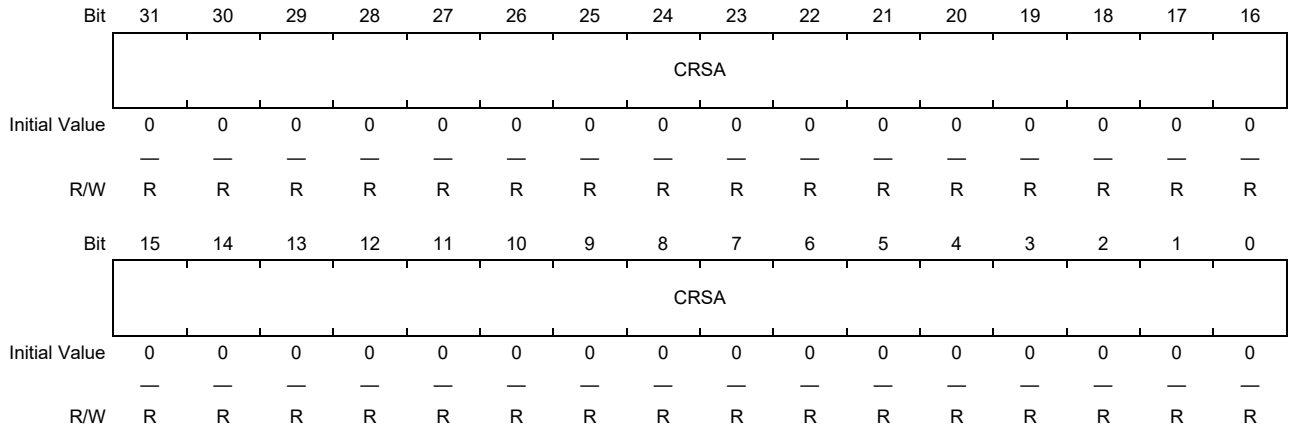
| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | TB | All 0 | R/W | Transaction Byte<br>These bits specify the total number of transfer bytes.<br>*Note*: Do not start a DMA transaction with 0 set in these bits. |

**Note:** The N0TB_n register is overwritten by the descriptor read data during link mode transfer.

# 32B.4 Current Register Set

## 32B.4.1 Current Source Address Register

### 32B.4.1.1 Current Source Address Register ch0 [CRSA_0] <Address: H'418>
### Current Source Address Register ch1 [CRSA_1] <Address: H'458>



| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRSA | All 0 | R | Current Source Address Register<br>This register indicates the read address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the SAD bit in the CHCFG_n register is 1, the value of this register is fixed. When the WONLY bit in the CHCFG_n register is 1, the value of this register is undefined.)<br>The initial value of this register is loaded from the following register:<br>In register mode:<br>A transfer source address is loaded from the Next0/1 Register Set.<br>In link mode:<br>A transfer source address is loaded from the descriptor. (The descriptor read data is input to the N0SA_n register, and is loaded into the CRSA_n register when a transfer starts.)<br>The value of this register is incremented when a read transfer ends.<br>Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.) |

## 32B.4.2 Current Destination Address Register

### 32B.4.2.1 Current Destination Address Register ch0 [CRDA_0] <Address: H'41C>
### Current Destination Address Register ch1 [CRDA_1] <Address: H'45C>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRDA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRDA | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRDA | All 0 | R | Current Destination Address Register<br>This register indicates the write address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the DAD bit in the CHCFG_n register is 1, the value of this register is fixed.)<br>The initial value of this register is loaded from the following register:<br>In register mode:<br>A transfer destination address is loaded from the Next0/1 Register Set.<br>In link mode:<br>A transfer destination address is loaded from the descriptor. (The descriptor read data is input to the N0DA_n register, and is loaded into the CRDA_n register when a transfer starts.)<br>The value of this register is incremented when a write transfer ends.<br>Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.) |

## 32B.4.3 Current Transaction Byte Register

### 32B.4.3.1 Current Transaction Byte Register ch0 [CRTB_0] <Address: H'420>
### Current Transaction Byte Register ch1 [CRTB_1] <Address: H'460>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRTB | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CRTB | | | | | | | | | | | | | | | |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | CRTB | All 0 | R | Current Transaction Byte Register<br>This register indicates the remaining number of transfer bytes in the ongoing DMA transaction.<br>The value of this register is decremented automatically while the DMA transaction is in process.<br>The initial value of this register is loaded from the following register:<br>In register mode:<br>The number of transfer bytes is loaded from the Next0/1 Register Set.<br>In link mode:<br>The number of transfer bytes is loaded from the descriptor. (The descriptor read data is input to the N0TB_n register, and is loaded into the CRTB_n register when a transfer starts.)<br>The value of this register is decremented when a write transfer ends.<br>Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.) |

# 32B.5 Channel Register Set

## 32B.5.1 Channel Status Register n

### 32B.5.1.1 Channel Status Register ch0 [CHSTAT_0] <Address: H'424>
### Channel Status Register ch1 [CHSTAT_1] <Address: H'464>

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DNUM | | | | | | | | — | — | — | — | — | SWPRQ | DMARQM | INTM |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MODE | DER | DW | DL | SR | TC | END | ER | SUS | TACT | RQST | EN |
| Initial Value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 24 | DNUM | All 0 | R | Data Number<br>These bits indicate the amount of valid data in the buffer.<br>The indicated amount of data is the amount of the data that was read from the source but has not yet been written to the destination. (Unit: byte)<br>Incrementing condition:<br>• A DMA read transfer ends.<br>Decrementing condition:<br>• A DMA write transfer ends.<br>Clearing conditions:<br>• A condition for clearing the EN bit is met.<br>• "1" is written to the SWRST bit in the CHCTRL_n register. |
| 23 to 19 | — | All 0 | R | Reserved area. Write 0 to these bits. When these bits are read, 0 is read. |
| 18 | SWPRQ | 0 | R | Sweep Request<br>This bit indicates the state of sweep request.<br>This bit indicates the state of software sweep request (which has been activated by the SETSSWPRQ bit in the CHCTRL_n register).<br>1: The sweep request signal has been asserted.<br>0: The sweep request signal has not been asserted.<br>Setting condition:<br>• The SETSSWPRQ bit in the CHCTRL_n register is asserted.<br>Clearing conditions:<br>• The buffer becomes empty because of sweep.<br>• "1" is written to the CLRHSWPRQM bit in the CHCTRL_n register.<br>• "1" is written to the SWRST bit in the CHCTRL_n register. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 17 | DMARQM | 0 | R | DMAREQ Mask<br>This bit indicates the state of temporary masking of the DMA transfer request from the USB control.<br>1: The request is temporarily masked.<br>0: The request is released from temporary masking.<br>Setting condition:<br>● The SETDMARQM bit in the CHCTRL_n register is set.<br>Clearing conditions:<br>● “1” is written to the CLRDMARQM bit in the CHCTRL_n register.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. |
| 16 | INTM | 0 | R | Interrupt Mask<br>This bit indicates the state of temporary masking of the output from the USBFDMAmn interrupt.<br>1: The output is temporarily masked.<br>0: The output is released from temporary masking.<br>Setting condition:<br>● “1” is written to the SETINTM bit in the CHCTRL_n register.<br>Clearing conditions:<br>● “1” is written to the CLRINTM bit in the CHCTRL_n register.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. |
| 15 to 12 | — | All 0 | R | Reserved area. Write 0 to these bits. When these bits are read, 0 is read. |
| 11 | MODE | 0 | R | DMA Mode<br>This bit indicates the DMA mode. The indicated value is the value of the DMS bit in the CHCFG_n register.<br>0: Register mode<br>1: Link mode |
| 10 | DER | 0 | R | Descriptor Error<br>This bit indicates whether the data read from the descriptor is invalid (LV = 0) (regardless of the value of the DIM bit in the CHCFG_n register).<br>0: No descriptor error has occurred.<br>1: A descriptor error has occurred.<br>Setting condition:<br>● In link mode, when the DRRP bit in the CHCFG_n register is 0, the LV bit value read from the descriptor is 0.<br>Clearing conditions:<br>● “1” is written to the CLRDER bit in the CHCTRL_n register.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. |
| 9 | DW | 0 | R | Descriptor WriteBack<br>This bit indicates whether data is being written back to the descriptor. If a bus error occurs during write-back to the descriptor, this bit retains 1.<br>0: Status other than write-back to the header in link mode<br>1: (When the ER bit in the CHSTAT_n register is 0)<br>Data is being written back to the header in link mode.<br>(When the ER bit in the CHSTAT_n register is 1)<br>A bus error has occurred during write-back to the header in link mode.<br>Setting condition:<br>● Write-back to the header is started in link mode.<br>Clearing conditions:<br>● Write-back to the header in link mode ends with an OK response.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 8 | DL | 0 | R | Descriptor Load<br>This bit indicates whether data is being read from the descriptor. If a bus error occurs during descriptor reading, this bit retains 1.<br>0: Status other than descriptor reading<br>1: (When the ER bit is 0)<br>Descriptor reading is in process in link mode.<br>(When the ER bit is 1)<br>A bus error has occurred during descriptor reading in link mode.<br>Setting condition:<br>● Descriptor reading is started in link mode.<br>Clearing conditions:<br>● Descriptor reading in link mode ends with an OK response.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit. |
| 7 | SR | 0 | R | Selected Register Set<br>In register mode, this bit indicates the register set that is selected.<br>0: Next0 Register Set<br>1: Next1 Register Set<br>Setting condition:<br>● The RSEL bit in the CHCFG_n register is set.<br>Clearing condition:<br>● The RSEL bit in the CHCFG_n register is cleared. |
| 6 | TC | 0 | R | Terminal Count<br>This status bit indicates whether the DMA transaction has ended. This bit is set only when the TCM bit in the CHCFG_n register is 0.<br>0: The DMA transfer has not ended.<br>1: The DMA transfer has ended.<br>Setting conditions:<br>● In register mode, transfer of the total number of transfer bytes specified in the CRTB bits ends.<br>● In link mode, when the WBD bit in the header of the descriptor is 1, transfer of the total number of transfer bytes specified in the CRTB bits ends.<br>● In link mode, when the WBD bit in the header of the descriptor is 0, write-back to the descriptor ends.<br>Clearing conditions:<br>● “1” is written to the CLRTC bit in the CHCTRL_n register.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. |
| 5 | END | 0 | R | USBFDMAmn Interrupted<br>This bit indicates whether the DMA transaction has ended and an USBFDMAmn interrupt has occurred.<br>0: The DMA transfer has not ended.<br>1: The DMA transfer has ended.<br>Setting conditions:<br>● The condition for setting the TC bit is met, and the DEM bit in the CHCFG_n register is 0.<br>● In link mode, when the descriptor is read, the LV bit in the header is 0, and the DRRP and DIM bits in the CHCFG_n register are 0.<br>Clearing conditions:<br>● “1” is written to the CLREND bit in the CHCTRL_n register.<br>● “1” is written to the SWRST bit in the CHCTRL_n register. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 4 | ER | 0 | R | Error<br>This bit indicates whether an error response has been received and a DMAERR interrupt has occurred during the DMA transfer.<br>0: No error response has been received.<br>1: An error response has been received.<br>Setting condition:<br>● An error response is received in a bus cycle.<br>Clearing condition:<br>● “1” is written to the SWRST bit in the CHCTRL_n register. |
| 3 | SUS | 0 | R | Suspend<br>This bit indicates whether the channel is suspended. For details, see **Section 32B.9.13.8(2), Suspension**.<br>0: Channel_n is not suspended.<br>1: Channel_n is suspended.<br>Setting condition:<br>● “1” is written to the SETSUS bit in the CHCTRL_n register during the DMA transfer using channel_n, and, thereby, the inside of the channel is suspended.<br>Clearing conditions:<br>● “1” is written to the CLRSUS bit in the CHCTRL_n register.<br>● “1” is written to the CLREN bit in the CHCTRL_n register.<br>● A condition for clearing the EN bit in the CHSTAT_n register. |
| 2 | TACT | 0 | R | Transaction Active<br>This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see **Section 32B.9.13.8, Transfer state**.<br>0: The DMA in channel_n is stopped.<br>1: The DMA in channel_n is operating.<br>Setting condition:<br>● “1” is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request).<br>Clearing condition:<br>● The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended). |
| 1 | RQST | 0 | R | Request<br>This bit indicates whether a transfer request has been received.<br>0: No DMA transfer request has been received.<br>1: A DMA transfer request has been received.<br>Setting conditions:<br>● “1” is written to the STG bit in the CHCTRL_n register.<br>● A DMA transfer request is received from the USB control.<br>Clearing conditions:<br>● “1” is written to the SWRST bit in the CHCTRL_n register.<br>● “1” is written to the CLRRQ bit in the CHCTRL_n register.<br>● In single transfer mode (the TM bit in the CHCFG_n register is 0), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register<br>● In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0).<br>● In link mode, the DMA transfer of the last descriptor (LE = 1) ends.<br>● In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0).<br>● In link mode, when the DEM bit in the CHCFG_n register is 0, a DMA transaction ends.<br>● The master interface receives a bus error signal. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 0 | EN | 0 | R | Enable<br>This bit indicates whether the operation of DMA channel n is enabled or stopped.<br>0: Operation is stopped.<br>1: Operation is enabled.<br>Setting conditions:<br>• “1” is written to the SETEN bit in the CHCTRL_n register.<br>Clearing conditions:<br>• “1” is written to the SWRST bit in the CHCTRL_n register.<br>• “1” is written to the CLREN bit in the CHCTRL_n register.<br>• An error response is received during transfer.<br>• In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0).<br>• In link mode, DMA transfer of the last descriptor (the LE bit is 1) ends (if the WBD bit is 0, write- back to the descriptor ends).<br>• In link mode, reading of a descriptor is stopped (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). |

Note 1. When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.

Note 2. To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see **Section 32B.9.13.8(3), Transfer suspension**.)

Note 3. If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that takes effect cannot be identified. Therefore, design the system so that only one type of transfer requests is used.

Note 4. When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

## 32B.5.2 Channel Control Register n

### 32B.5.2.1 Channel Control Register ch0 [CHCTRL_0] <Address: H'428>
### Channel Control Register ch1 [CHCTRL_1] <Address: H'468>

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 to 20 | — | All 0 | R | Reserved area. Write 0 to these bits. When these bits are read, 0 is read |
| 19 | CLRDMARQM | 0 | R/W | Clear DMAREQ Mask<br>Writing 1 to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1 to this bit also clears the DMARQM bit in the CHSTATn register.<br>When this bit is read, 0 is read.<br>1: Releases the DNA transfer requests from masking set by using the SETDMARQM bit.<br>0: Has no effect on operation. |
| 18 | SETDMARQM | 0 | R/W | SET DMAREQ Mask<br>Writing 1 to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1 to this bit also sets the DMARQM bit in the CHSTATn register.<br>When this bit is read, 0 is read.<br>1: Masks the DMA transfer requests from the USB control.<br>0: Has no effect on operation. |
| 17 | CLRINTM | 0 | R/W | Clear Interrupt Mask<br>Writing 1 to this bit releases the USBFDMAmn interrupt from masking. Writing 1 to this bit also clears the INTM bit in the CHSTATn register.<br>Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1 activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0.)<br>When this bit is read, 0 is read.<br>1: Releases the pin output from masking set by using the SETINTM bit.<br>0: Has no effect on operation. |
| 16 | SETINTM | 0 | R/W | SETINTMSet Interrupt Mask<br>Writing 1 to this bit temporarily masks the USBFDMAmn interrupt. Writing 1 to this bit also sets the INTM bit in the CHSTATn register.<br>When this bit is read, 0 is read.<br>1: Masks the USBFDMAmn interrupt.<br>0: Has no effect on operation. |
| 15 | — | 0 | R | Reserved area. Write 0 to this bit. When this bit is read, 0 is read. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 14 | SETSSWPRQ | 0 | R/W | Set Software Sweep Request<br>Writing 1 to this bit sweeps out the data stored in the buffer to the destination (see **Section 32B.9.13.3(1), Forced software sweeping request**).<br>When this bit is read, 0 is read.<br>1: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination.<br>0: Has no effect on operation.<br>If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used. |
| 13 | — | 0 | R | Reserved area. Write 0 to this bit. When this bit is read, 0 is read. |
| 12 | SETREN | 0 | R/W | Set Register Set Enable<br>Writing 1 to this bit sets the REN bit in the CHCFG_n register.<br>When this bit is read, 0 is read.<br>1: Sets the REN bit in the CHCFG_n register.<br>0: Has no effect on operation. |
| 11, 10 | — | All 0 | R | Reserved area. Write 0 to these bits. When these bits are read, 0 is read. |
| 9 | CLRSUS | 0 | R/W | Clear Suspend<br>Writing 1 to this bit when the SUS bit in the CHSTAT_n register is 1 releases the ongoing DMA transfer from the suspended state.<br>When this bit is read, 0 is read.<br>1: Releases the ongoing DMA transfer from the suspended state.<br>0: Has no effect on operation. |
| 8 | SETSUS | 0 | R/W | Set Suspend<br>Writing 1 to this bit when the EN bit in the CHSTAT_n register is 1 suspends the ongoing DMA transfer.<br>When this bit is read, 0 is read.<br>1: Suspends the ongoing DMA transfer.<br>0: Has no effect on operation. |
| 7 | CLRDER | 0 | R/W | Clear DER<br>Writing 1 to this bit clears the DER bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt.<br>When this bit is read, 0 is read.<br>1: Clears the DER bit.<br>0: Has no effect on operation. |
| 6 | CLRTC | 0 | R/W | Clear TC<br>Writing 1 to this bit clears the TC bit in the CHSTAT_n register.<br>When this bit is read, 0 is read.<br>1: Clears the TC bit.<br>0: Has no effect on operation. |
| 5 | CLREND | 0 | R/W | Clear End<br>Writing 1 to this bit clears the END bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt.<br>When this bit is read, 0 is read.<br>1: Clears the END bit.<br>0: Has no effect on operation. |
| 4 | CLRRQ | 0 | R/W | Clear Request<br>Writing 1 to this bit clears the RQST bit in the CHSTAT_n register.<br>When this bit is read, 0 is read.<br>1: Clears the RQST bit in the CHSTAT_n register.<br>0: Has no effect on operation. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 3 | SWRST | 0 | R/W | Software Reset<br>Writing 1 to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0.<br>When this bit is read, 0 is read.<br>1: Clears individual bits in the CHSTAT_n register.<br>0: Has no effect on operation. |
| 2 | STG | 0 | R/W | Software Trigger<br>Writing 1 to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority.<br>When this bit is read, 0 is read.<br>1: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register).<br>0: Has no effect on operation. |
| 1 | CLREN | 0 | R/W | Clear Enable<br>Writing 1 to this bit clears the EN bit in the CHSTAT_n register (for details, see **Section 32B.9.13.8(3) Transfer suspension**).<br>When this bit is read, 0 is read.<br>1: Disables DMA transfers (clears the EN bit in the CHSTAT_n register).<br>0: Has no effect on operation. |
| 0 | SETEN | 0 | R/W | Set Enable<br>Writing 1 to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start.<br>When this bit is read, 0 is read.<br>1: Enables DMA transfers (sets the EN bit in the CHSTAT_n register).<br>0: Has no effect on operation. |

**Note:** Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

## 32B.5.3 Channel Configuration Register

### 32B.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: H'42C>
### Channel Configuration Register ch1 [CHCFG_1] <Address: H'46C>

| R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 31 | DMS | 0 | R/W | DMA Mode Select<br>This bit specifies the DMA mode to be used.<br>0: Register mode (default)<br>1: Link mode |
| 30 | REN | 0 | R/W | Register Set Enable<br>This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode.<br>0: Does not perform the DMA transaction successively.<br>1: Performs the DMA transaction successively.<br>Setting conditions:<br>• "1" is written to this bit.<br>• "1" is written to the SETREN bit in the CHCTRL_n register.<br>Clearing conditions:<br>• "0" is written to this bit.<br>• The REN bit is 1, and a DMA transaction ends.<br>To re-set the REN bit during a transaction, we recommend you to use the SETREN bit in the CHCTRL_n register. |
| 29 | RSW | 0 | R/W | Register Select Switch<br>This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode.<br>0: Does not invert the RSEL bit after a DMA transaction ends. (Default)<br>1: Inverts the RSEL bit after a DMA transaction ends. |
| 28 | RSEL | 0 | R/W | Register Set Select<br>This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode.<br>When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction.<br>0: Uses the Next0 Register Set. (Default)<br>1: Uses the Next1 Register Set.<br>Transition condition:<br>A DMA transaction ends with the RSW bit set. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---|---|---|---|---|
| 27 | SBE | 0 | R/W | Sweep Buffer Enable<br>This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction.<br>The sweep mode can be used only when the REQD bit is 0.<br>0: Stops transfer without sweeping out the buffer. (Default)<br>1: Stops transfer after sweeping out the buffer. |
| 26 | DIM | 0 | R/W | Descriptor Interrupt Mask<br>This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0.<br>0: Does not mask the USBFDMAmn interrupt. (Default)<br>1: Mask the USBFDMAmn interrupt. |
| 25 | TCM | 0 | R/W | DMATC Mask<br>This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control.<br>When this bit is 1 at the time the DMATC signal is to be output, the DMATC signal is not asserted.<br>Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically.<br>Use this bit when you control DMA transfers by software.<br>0: Does not mask the DMATC signal. (Default)<br>1: Masks the DMATC signal.<br>Clearing condition:<br>A DMA transaction ends with the TCM bit set. |
| 24 | DEM | 0 | R/W | USBFDMAmn Mask<br>When this bit is 1 at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared.<br>0: Does not mask the USBFDMAmn interrupt. (Default)<br>1: Masks the USBFDMAmn interrupt.<br>Clearing condition:<br>A DMA transaction ends with the DEM bit set. |
| 23 | WONLY | 0 | R/W | Write Only Mode<br>This bit is used to switch the transfer operation mode to the write-only mode (see **Section 32B.9.12.2, Write only mode**).<br>0: Normal operation (default)<br>1: Write-only mode |
| 22 | — | 0 | R | Nothing is assigned to this bit. Fix this bit to 0. |
| 21 | DAD | 0 | R/W | Destination Address Direction<br>This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1 (fixed) to this bit.<br>0: Incrementing (default)<br>1: Fixed<br>When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit. |
