

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

ITRON is an abbreviation of Industrial TRON.

The export of these products from Japan is regulated by the Japanese government. The export of some or all of these products may be prohibited without governmental license. To export or re-export some or all of these products from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

License not needed : μ PD178F124GF-3B9, 178F124GC-8BT
The customer must judge the need for license : μ PD178022GF-xxx-3B9, 178022GC-xxx-8BT, 178023GF-xxx-3B9,
 μ PD178023GC-xxx-8BT, 178024GF-xxx-3B9, 178024GC-xxx-8BT

Purchase of NEC I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

• **The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.**

- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.
- NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.
- Descriptions of circuits, software, and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software, and information in the design of the customer's equipment shall be done under the full responsibility of the customer. NEC Corporation assumes no responsibility for any losses incurred by the customer or third parties arising from the use of these circuits, software, and information.
- While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.
- NEC devices are classified into the following three quality grades:
"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Major Revisions in This Edition

Page	Description
Throughout	Deletion of μ PD178124 Subseries (μ PD178122, 178123, 178124)
	Provision of UART0 function for all products of the μ PD178024 Subseries (μ PD178022, 178023, 178024, 178F124)
	Deletion of EEPROM TM from μ PD178F124
p.26, 33, 237-244	Change of the number of interrupt sources (Addition of INTSER0, INTSR0, INTST0 in μ PD178022, 178023, 178024, and deletion of INTEE from μ PD178F124)
p.28	Correction of pin configuration of 80-pin plastic QFP (GF-3B9 type)
p.29	Correction of pin configuration of 80-pin plastic QFP (GC-8BT type)
p.34, 285, 290, 293, 297	Change of power-ON clear voltage in STOP mode to 2.2 V
p.35, 38, 83, 93	Correction of Port 4 (P40-P47) so that a pull-up resistor can be connected to this port's pins in both input and output modes
p.41, 42	Correction of I/O Circuit types of P76/SDA0, P77/SCL0
p.62	Correction of POCS register so that it is set by a 1-bit or 8-bit memory manipulation instruction
p.64	Correction of IMS, IXS register so that it is set by an 8-bit memory manipulation instruction
p.140	Correction of PFM3 register so that it is set by a 1-bit or 8-bit memory manipulation instruction

The mark ★ shows the major revised points.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

PREFACE

Readers This manual has been prepared for user engineers who want to understand the functions of the μ PD178024 subseries and design and develop its application systems and programs.

Purpose This manual is intended for users to understand the functions described in the Organization below.

Organization The μ PD178024 subseries manual is separated into two parts: this manual and the instruction edition (common to the 78K/0 series).

- | | |
|---|---|
| <ul style="list-style-type: none">• Pin functions• Internal block functions• Interrupt• Other on-chip peripheral functions | <ul style="list-style-type: none">• CPU functions• Instruction set• Explanation of each instruction |
|---|---|

How to Read This Manual Before reading this manual, you should have general knowledge of electric and logic circuits and microcomputers.

- When you want to understand the functions in general:
 - Read this manual in the order of the contents.
- To know the μ PD178024 subseries instruction function in detail:
 - Refer to the **78K/0 series User's Manual -Instructions (U12326E)**
- How to interpret the register format:
 - For the circled bit number, the bit name is defined as a reserved word in DF178124 and RA78K0, and in CC78K0, already defined in the header file named sfrbit.h.
- To know the electrical specifications of the μ PD178024 subseries:
 - Refer to separately available Data Sheet.

Conventions	Data representation weight	:	High digits on the left and low digits on the right
	Active low representations	:	$\overline{\text{xxx}}$ (line over the pin and signal names)
	Note	:	Description of Note in the text.
	Caution	:	Information requiring particular attention
	Remark	:	Additional explanatory material
	Numeral representations	:	Binary ... xxxxB Decimal ... xxxxD Hexadecimal ... xxxxH

Related Documents

The related documents indicated in this publication may include preliminary versions. However, preliminary versions are not marked as such.

CHAPTER 1 OUTLINE

1.1 Features

- On-chip ROM and RAM

Part Number \ Item	Program Memory		Data Memory	
			Internal high-speed RAM	EEPROM
μ PD178022	ROM	16 Kbytes	512 bytes	–
μ PD178023		24 Kbytes	1024 bytes	
μ PD178024		32 Kbytes		
μ PD178F124	Flash memory	32 Kbytes		

- Instruction set suitable for system control
 - Bit processing across entire address space
 - Multiplication/division instructions
- General-purpose I/O ports: 62 pins
- Hardware for PLL frequency synthesizer
 - Dual modulus prescaler (160 MHz MAX.)
 - Programmable divider
 - Phase comparator
 - Charge pump
- Frequency counter
- 8-bit resolution A/D converter: 6 channels
- ★ Serial interface: clocked 3 channels
 - I²C bus mode^{Note} : 1 channel
 - 3-wire serial I/O mode : 1 channel
- ★ UART mode : 1 channel

Note When using the I²C bus mode (including when this mode is implemented by software without using the internal hardware), consult NEC when you place an order for mask.

- Timer: 4 channels
 - Basic timer (timer carry FF): 1 channel
 - 8-bit timer/event counter : 2 channels
 - Watchdog timer : 1 channel
- Buzzer output
- ★ • Vectored interrupt

Part Number \ Item	Non-Maskable Interrupt ^{Note}	Maskable Interrupt ^{Note}		Software Interrupt
		External	Internal	
μ PD178022, 178023, 178024, μ PD178F124	1 source	5 sources	11 sources	1 source

Note Either a non-maskable interrupt or maskable interrupt (internal) can be selected as the interrupt source of the watchdog timer (INTWDT).

- Test input : 1 pin
- Instruction cycle : 0.45/0.89/1.78/3.56/7.11 μ s (with 4.5-MHz crystal resonator)
- Supply voltage : $V_{DD} = 4.5$ to 5.5 V (with CPU, PLL operating)
 $V_{DD} = 3.5$ to 5.5 V (with CPU operating)
- Power-ON clear circuit

1.2 Applications

Car stereo

★ 1.3 Ordering Information

Part Number	Package
μ PD178022GF-xxx-3B9	80-pin plastic QFP (14 × 20 mm, 0.8-mm pitch)
μ PD178022GC-xxx-8BT	80-pin plastic QFP (14 × 14 mm, 0.65-mm pitch)
μ PD178023GF-xxx-3B9	80-pin plastic QFP (14 × 20 mm, 0.8-mm pitch)
μ PD178023GC-xxx-8BT	80-pin plastic QFP (14 × 14 mm, 0.65-mm pitch)
μ PD178024GF-xxx-3B9	80-pin plastic QFP (14 × 20 mm, 0.8-mm pitch)
μ PD178024GC-xxx-8BT	80-pin plastic QFP (14 × 14 mm, 0.65-mm pitch)
μ PD178F124GF-3B9	80-pin plastic QFP (14 × 20 mm, 0.8-mm pitch)
μ PD178F124GC-8BT	80-pin plastic QFP (14 × 14 mm, 0.65-mm pitch)

Remark xxx indicates ROM code suffix. When using I²C bus mode, Exx is the ROM code suffix.

1.4 Pin Configuration (Top View)

- ★ • 80-pin plastic QFP (14 × 20 mm, 0.8-mm pitch)
 μPD178022GF-xxx-3B9, 178023GF-xxx-3B9, 178024GF-xxx-3B9
 μPD178F124GF-3B9

★

• 80-pin plastic QFP (14 × 14 mm, 0.65-mm pitch)

μPD178022GC-xxx-8BT, 178023GC-xxx-8BT, 178024GC-xxx-8BT

μPD178F124GC-8BT

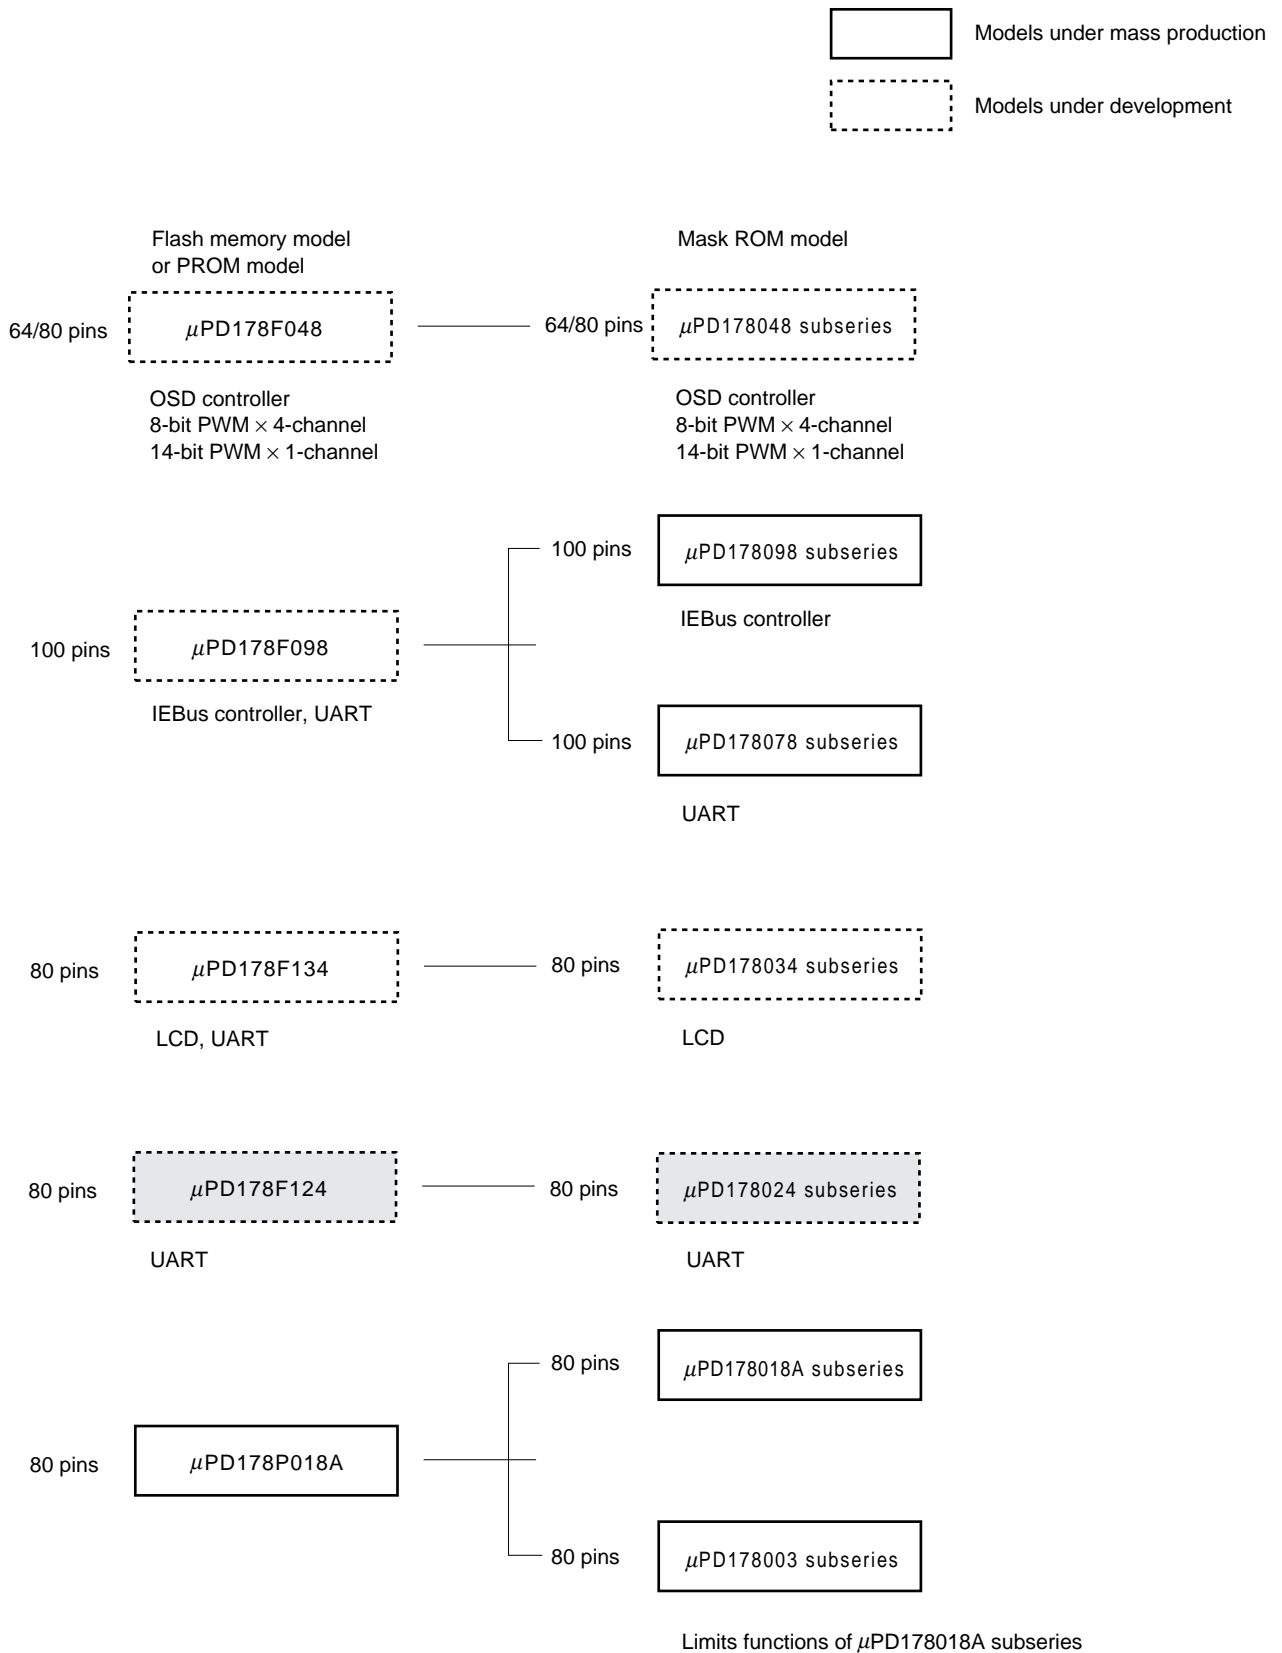

- Cautions**
1. Directly connect the IC (Internally Connected) pin and V_{PP} pin to GND.
 2. Keep the voltage at V_{DD}PORT and V_{DD}PLL same as that at the V_{DD} pin.
 3. Keep the voltage at GNDPORT and GNDPLL same as that at GND.
 4. Connect each of the REGOSC and REGCPU pins to GND via a 0.1-μF capacitor.

Remark (): μPD178F124 only

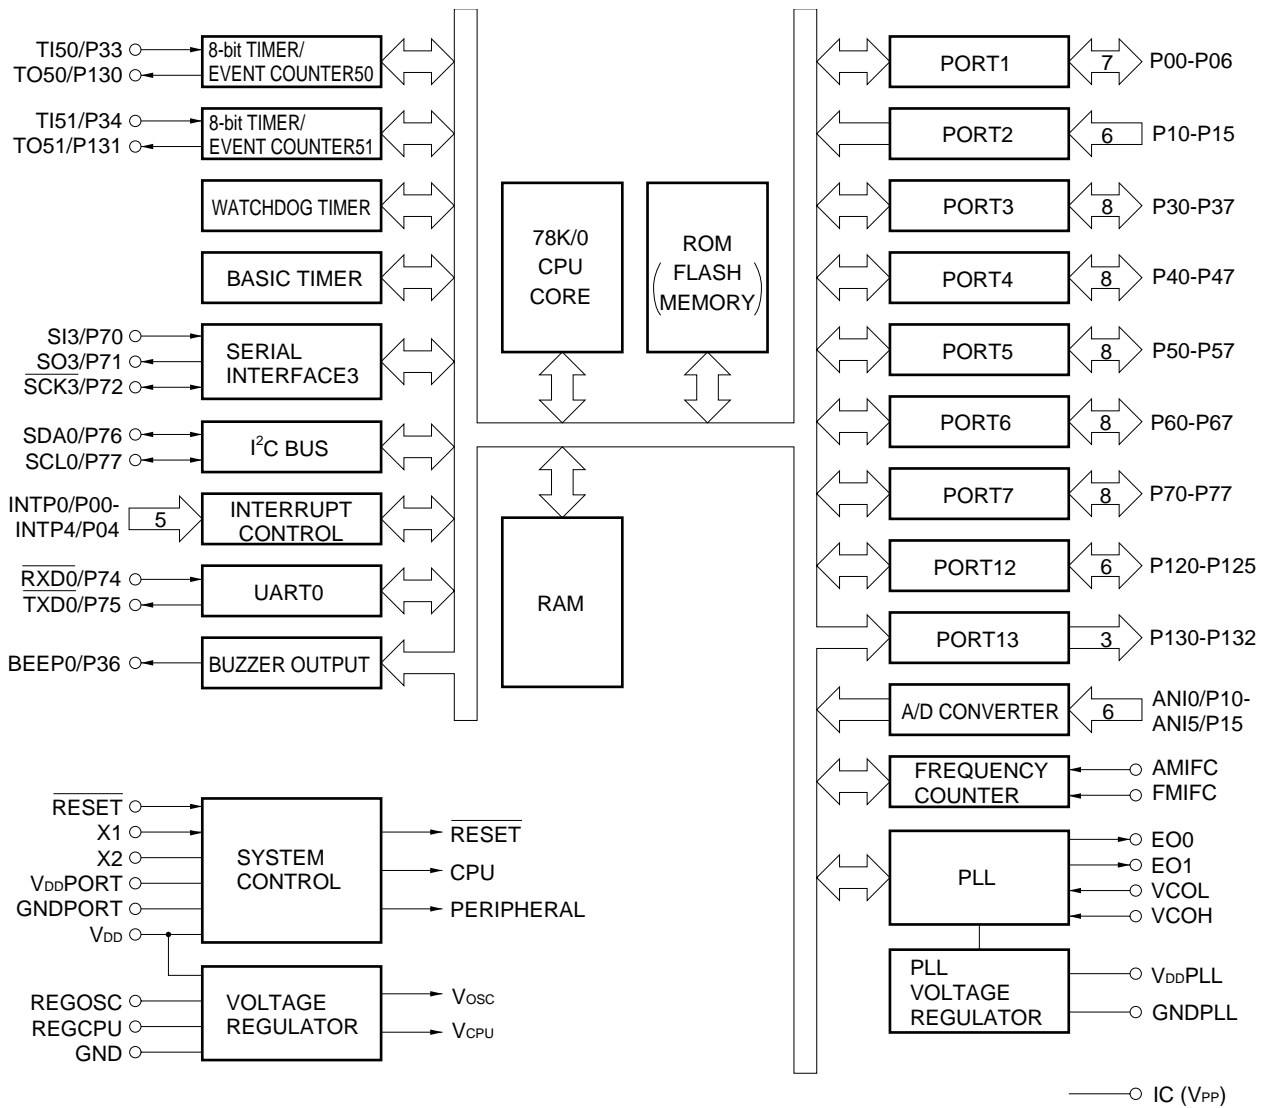

Pin Name				
AMIFC	: AM intermediate frequency counter	P120-P125	: Port 12	
	input	P130-P132	: Port 13	
ANI0-ANI5	: A/D converter input	REGCPU	: Regulator for CPU power supply	
★ BEEP0	: Buzzer output	REGOSC	: Regulator for oscillator	
EO0, EO1	: Error out output	$\overline{\text{RESET}}$: Reset input	
FMIFC	: FM intermediate frequency counter	$\overline{\text{RXD0}}$: Serial (UART0) data input	
	input	$\overline{\text{SCK3}}$: Serial (SIO3) clock input/output	
GND	: Ground	SCL0	: Serial (IIC0) clock input/output	
GNDPLL	: PLL ground	SDA0	: Serial (IIC0) data input/output

Package	<ul style="list-style-type: none"> • 80-pin plastic QFP (14 × 20 mm, 0.8-mm pitch) • 80-pin plastic QFP (14 × 14 mm, 0.65-mm pitch) 			

★

Note For details, refer to **CHAPTER 18 RESET FUNCTION**.

CHAPTER 2 PIN FUNCTION

2.1 Pin Function List

(1) Port pins

Pin Name	I/O	Function	At Reset	Shared by:
P00-P04	I/O	Port 0. 7-bit I/O port. Can be set in input or output mode in 1-bit units.	Input	INTP0-INTP4
P05, P06				—
P10-P15	Input	Port 1. 6-bit input port.	Input	ANI0-ANI5
P30-P32	I/O	Port 3. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	Input	—
P33				TI50
P34				TI51
P35				—
P36				BEEP0
P37				—
P40-47				I/O
P50-P57	I/O	Port 5. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	Input	—
P60-P67	I/O	Port 6. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	Input	—
P70	I/O	Port 7. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	Input	SI3
P71				SO3
P72				SCK3
P73				—
P74				RXD0
P75				TXD0
P76				SDA0
P77				SCL0
P120-P125	I/O	Port 12. 6-bit I/O port. Can be set in input or output mode in 1-bit units.	Input	—
P130	Output	Port 13. 3-bit output port. N-ch open-drain output port (12 V withstand)	Low-level output	TO50
P131				TO51
P132				—

★

(2) Pins other than port pins

Pin Name	I/O	Function	At Reset	Shared by:	
INTP0-INTP4	Input	External maskable interrupt input whose valid edge (rising edge, falling edge, or both rising and falling edges) can be specified.	Input	P00-P04	
SI3	Input	Serial data input to serial interface.	Input	P70	
SO3	Output	Serial data output from serial interface.	Input	P71	
SDA0	I/O	Serial data input/output to/from serial interface.	N-ch open drain I/O	Input	P76
SCK3	I/O	Serial clock input/output to/from serial interface.	Input	P72	
SCL0			N-ch open drain I/O	P77	
★ RXD0	Input	Serial data input to asynchronous serial interface (UART0).	Input	P74	
★ TXD0	Output	Serial data output from asynchronous serial interface (UART0).		P75	
TI50	Input	External count clock input to 8-bit timer (TM50).	Input	P34	
TI51		External count clock input to 8-bit timer (TM51).		P35	
TO50	Output	8-bit timer (TM50) output.	Low-level output	P130	
TO51		8-bit timer (TM51) output.		P131	
BEEP0	Output	Buzzer output.	Input	P36	
ANI0-ANI5	Input	Analog input to A/D converter.	Input	P10-P15	
EO0, EO1	Output	Error out output from charge pump of PLL frequency synthesizer.	–	–	
VCOL	Input	Inputs local oscillation frequency of PLL (in HF and MF modes).	–	–	
VCOH		Inputs local oscillation frequency of PLL (in VHF mode).			
AMIFC	Input	Input to AM intermediate frequency counter.	Input	–	
FMIFC		Input to FM or AM intermediate frequency counter.			
RESET	Input	System reset input.	–	–	
X1	Input	Connection of crystal resonator for system clock oscillation.	–	–	
X2	–		–	–	
REGOSC	–	Regulator for oscillator. Connect this pin to GND via 0.1- μ F capacitor.	–	–	
REGCPU	–	Regulator for CPU power supply. Connect this pin to GND via 0.1- μ F capacitor.	–	–	
V _{DD}	–	Positive power supply.	–	–	
GND	–	Ground.	–	–	
V _{DD} PORT	–	Port power supply.	–	–	
GNDPORT	–	Port ground.	–	–	
V _{DD} PLL ^{Note 1}	–	PLL positive power supply.	–	–	
GNDPLL ^{Note 1}	–	PLL ground.	–	–	
IC	–	Internally connected. Directly connect this pin to GND.			
V _{PP} ^{Note 2}	–	Pin to apply high voltage at program writing/verifying. Directly connect this pin to GND in normal operating mode.	–	–	

Notes 1. Connect a capacitor of about 1000 pF between the V_{DD}PLL and GNDPLL pins.

2. μ PD178F124 only.

2.2 Description of Pin Functions

2.2.1 P00 to P06 (Port 0)

These are 7-bit input/output ports. Besides serving as input/output ports, they function as an external interrupt input. The following operating modes can be specified bit-wise.

(1) Port mode

Function as 7-bit input/output ports. Can be specified for input or output ports bit-wise with a port mode register 0 (PM0).

(2) Control mode

These ports function as an external interrupt input pin (INTP0-INTP4).

These are external interrupt input pins which can specify valid edges (rising edge, falling edge, and both rising and falling edges).

2.2.2 P10 to P15 (Port 1)

These are 6-bit input ports. Besides serving as input ports, they function as an A/D converter analog input. The following operating modes can be specified bit-wise.

(1) Port mode

These ports function as 6-bit input ports.

(2) Control mode

These ports function as A/D converter analog input pins (ANI0-ANI5).

2.2.3 P30 to P37 (Port 3)

These are 8-bit input/output ports. Beside serving as input/output ports, they function as timer input and buzzer output. Which function is selected can be specified by the peripheral function sharing register 3 (PF3).

The following operating modes can be specified bit-wise.

(1) Port mode

These ports function as 8-bit input/output ports. They can be specified bit-wise as input or output ports with port mode register 3 (PM3).

(2) Control mode

These ports function as timer input (TI50, T51) and buzzer output (BEEP0).

(a) TI50, TI51

Pins for external clock input to the 8-bit timer/event counter.

(b) BEEP0

Buzzer output pin.

2.2.4 P40 to P47 (Port 4)

These are 8-bit input/output ports.

They can be specified in 8-bit units for input or output ports by using the port mode register 4 (PM4).

- ★ Internal pull-up resistors can be specified by pull-up resistor option register 4 (PU4). Interrupt function by key input is provided.

2.2.5 P50 to P57 (Port 5)

These are 8-bit input/output ports.

They can be specified bit-wise as input/output ports with port mode register 5 (PM5).

2.2.6 P60 to P67 (Port 6)

These are 8-bit input/output ports.

They can be specified bit wise as input or output ports with port mode register 6 (PM6).

2.2.7 P70 to P77 (Port 7)

These pins constitute an 8-bit input/output port. In addition to port pins, these pins are also used to input/output serial interface data, clock, and asynchronous serial interface data.

These pins can be set in the following operation modes in 1-bit units.

(1) Port mode

These pins function as an 8-bit I/O port. They can be specified in 1-bit units as input or output ports with port mode register 7 (PM7).

(2) Control mode

These pins function as serial interface data input/output, clock input/output, and asynchronous serial interface data input/output pins.

(a) SI3, SO3, SDA0^{Note}

Serial data input/output pins of the serial interface.

(b) $\overline{\text{SCK3}}$, $\overline{\text{SCL0}}$ ^{Note}

Serial clock input/output pins of the serial interface.

★ **(c) $\overline{\text{RXD0}}$, $\overline{\text{TXD0}}$**

Serial data input/output pins of asynchronous serial interface.

Note For the I²C bus mode.

2.2.8 P120 to P125 (Port 12)

These pins constitute a 6-bit I/O port.

This port can be specified in 1-bit units as the input or output mode with port mode register 12 (PM12).

2.2.9 P130 to P132 (Port 13)

These are 3-bit output ports. They are N-ch open drain ports with a 12-V withstand voltage. Besides serving as output port, they are used for timer output.

The following operating modes can be specified bit-wise.

(1) Port mode

These ports function as 3-bit output port.

(2) Control mode

These ports function as output for 8-bit timer/event counter.

TO50, TO51

These pins are output for 8-bit timer/event counter.

2.2.10 EO0, EO1

These are the output pins of the charge pump of the PLL frequency synthesizer.

They output the result of phase comparison between the frequency divided by the programmable divider of the local oscillation input (VCOL and VCOH pins) and the reference frequency.

2.2.11 VCOL, VCOH

These pins input the local oscillation frequency (VCO) of the PLL.

Because signals are input to these pins via an AC amplifier, cut the DC component of the input signals by using a capacitor.

- VCOL
 - HF, MF input
 - This pin becomes active when the HF or MF mode is selected in software. Otherwise, the pin is in the status set by bit 2 (VCOLDMD) of the PLL mode select register (PLLMD). If VCOLDMD is reset to 0 (to connect a pull-down resistor), however, the VCOL pin does not become active even if the HF or MF mode is selected. In this case, set VCOLDMD to 1 (high-impedance state).
- VCOH
 - VHF input
 - This pin becomes active when the FM mode is selected in software. Otherwise, the pin is in the status set by bit 3 (VCOHDMD) of the PLL mode select register (PLLMD). If VCOHDMD is reset to 0 (to connect a pull-down resistor), however, the VCOL pin does not become active even if the FM mode is selected. In this case, set VCOHDMD to 1 (high-impedance state).

2.2.12 AMIFC

Input pin of the AM intermediate frequency counter.

2.2.13 FMIFC

Input pin of the FM intermediate frequency counter or AM intermediate frequency counter.

2.2.14 $\overline{\text{RESET}}$

This is a low-level active system reset input pin.

2.2.15 X1, X2

Crystal resonator connect pins for system clock oscillation.

2.2.16 REGOSC

Regulator pin for oscillator. Connect to GND via a 0.1- μ F capacitor.

2.2.17 REGCPU

Regulator pin for CPU power supply. Connect to GND via a 0.1- μ F capacitor.

2.2.18 V_{DD}

Positive power supply pin.

2.2.19 GND

Ground potential pin.

2.2.20 V_{DD}PORT

Positive power supply pin for port.

2.2.21 GNDPORT

Ground potential pin for port.

2.2.22 V_{DD}PLL

Positive power supply pin for PLL.

2.2.23 GNDPLL

Ground potential pin for PLL.

2.2.24 V_{PP} (μ PD178F124 only)

This pin applies a high voltage when the flash memory programming mode is set or when a program is written or verified.

In the normal operation mode, directly connect this pin to GND.

2.2.25 IC (Mask ROM version only)

The IC (Internally Connected) pin is provided to set the test mode to check the μ PD178024 subseries at delivery. Connect it directly to the GND pin with the shortest possible wire in the normal operating mode.

When a potential difference is produced between the IC pin and GND pin because the wiring between those two pins is too long or an external noise is input to the IC pin, the user's program may not run normally.

- **Connect IC pin to GND pin directly.**

2.3 I/O Circuits of Pins and Recommended Connections of Unused Pins

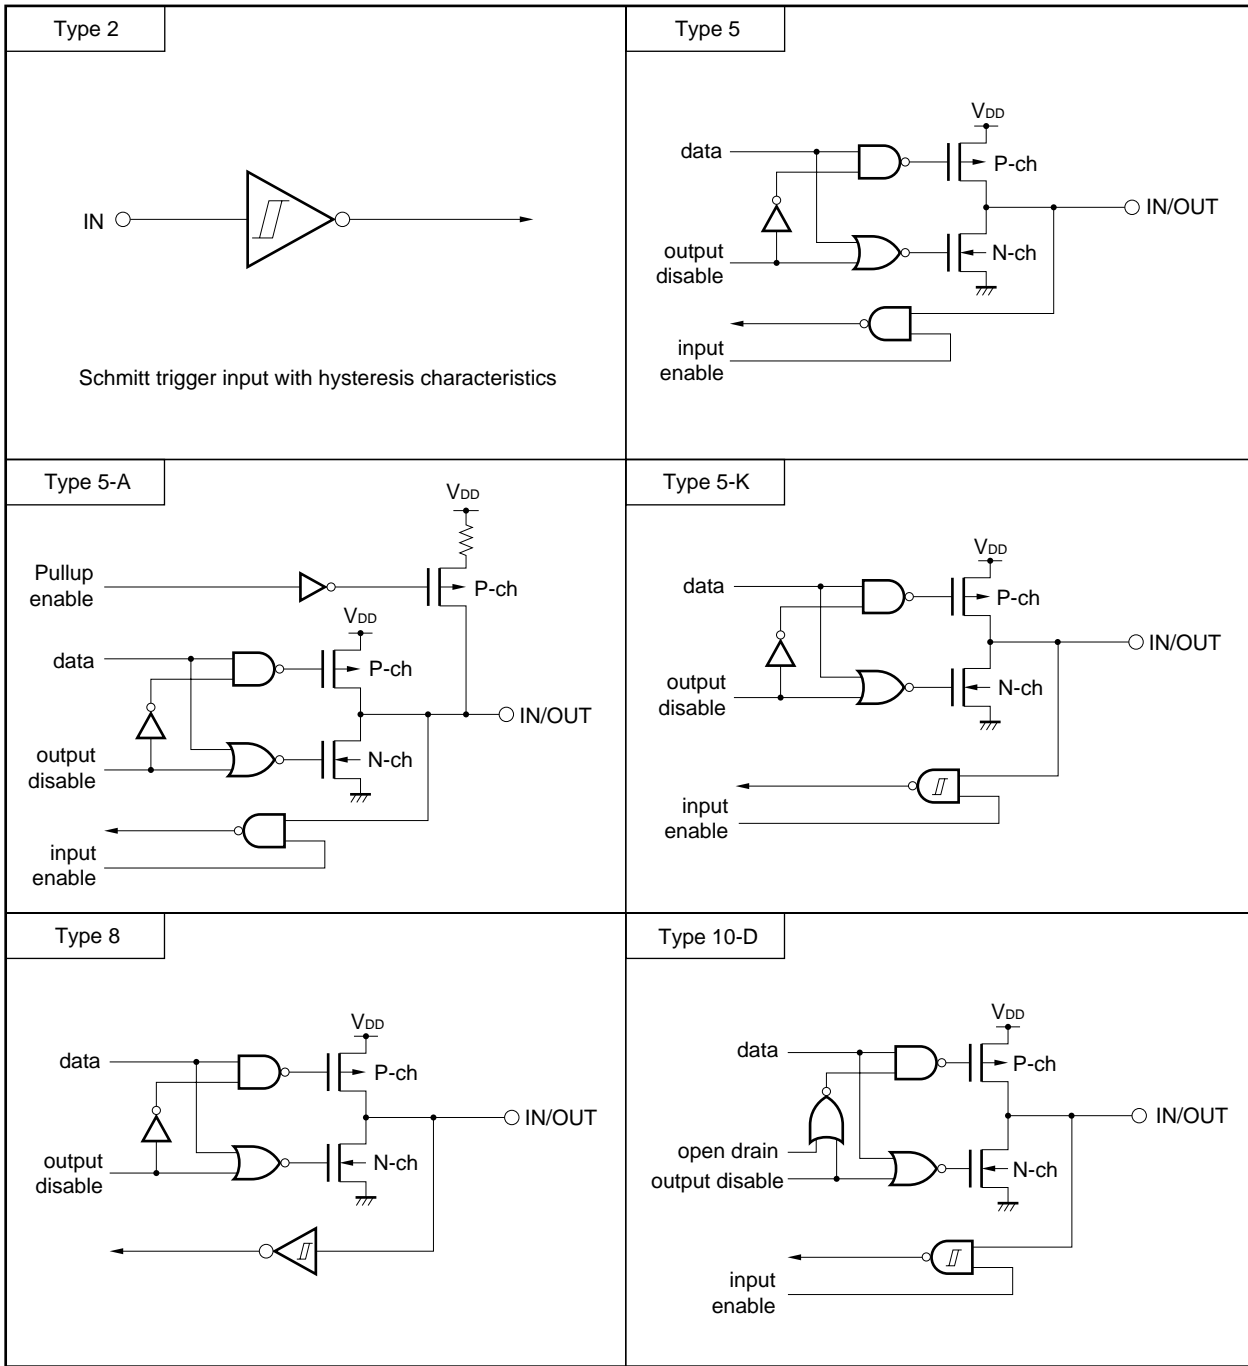

Table 2-1 shows the types of the I/O circuits of the respective pins and the recommended connections of the pins when they are not used. For the configuration of the I/O circuit of each pin, refer to Figure 2-1.

Table 2-1. I/O Circuit Type of Each Pin and Recommended Connections of Unused Pins

Pin Name	I/O Circuit Type	I/O	Recommended Connection of Unused Pin
P00/INTP0-P04/INTP4 P05, P06	8	I/O	Set these pins in general-purpose input mode in software, and connect each of them to V _{DD} , V _{DD} PORT, GND, or GNDPORT via resistor.
P10/ANI0-P15/ANI5	25	Input	Connect each of them to V _{DD} , V _{DD} PORT, GND, or GNDPORT via resistor.
P30-P32	5	I/O	Set these pins in general-purpose input mode in software, and output low-level signal. Leave unconnected.
P33/TI50	5-K		
P34/TI51			
P35	5		
P36/BEEP0			
P37			
P40-P47	5-A		
P50-P57	5		Set these pins in general-purpose input mode in software, and connect each of them to V _{DD} , V _{DD} PORT, GND, or GNDPORT via resistor.
P60-P67	5		Set these pins in general-purpose input mode in software, and output low-level signal. Leave unconnected.
P70/SI3	5-K		Set these pins in general-purpose input mode in software, and connect each of them to V _{DD} , V _{DD} PORT, GND, or GNDPORT via resistor.
P71/SO3	5		
P72/SCK3	5-K		
P73	5		
P74/RXD0	5-K		
P75/TXD0	5		
P76/SDA0	10-D		
P77/SCL0			
P120-P125	5		
P130/TO50 P131/TO51 P132	19	Output	
EO0, EO1	DTS-EO1		Leave unconnected.
VCOL, VCOH AMIFC, FMIFC	DTS-AMP	Input	Disable PLL in software and select pull-down.
			Set these pins in general-purpose input port mode in software and connect each of them to V _{DD} , V _{DD} PORT, GND, or GNDPORT via resistor.
REGOSC, REGCPU	–	–	Connect these pins to GND via 0.1-μF capacitor.
RESET	2	Input	–
V _{DD} PLL GNDPLL IC (Mask ROM model) V _{PP} (μPD178F124 only)	–	–	Connect this pin to V _{DD} . Directly connect these pins to GND or GNDPORT.

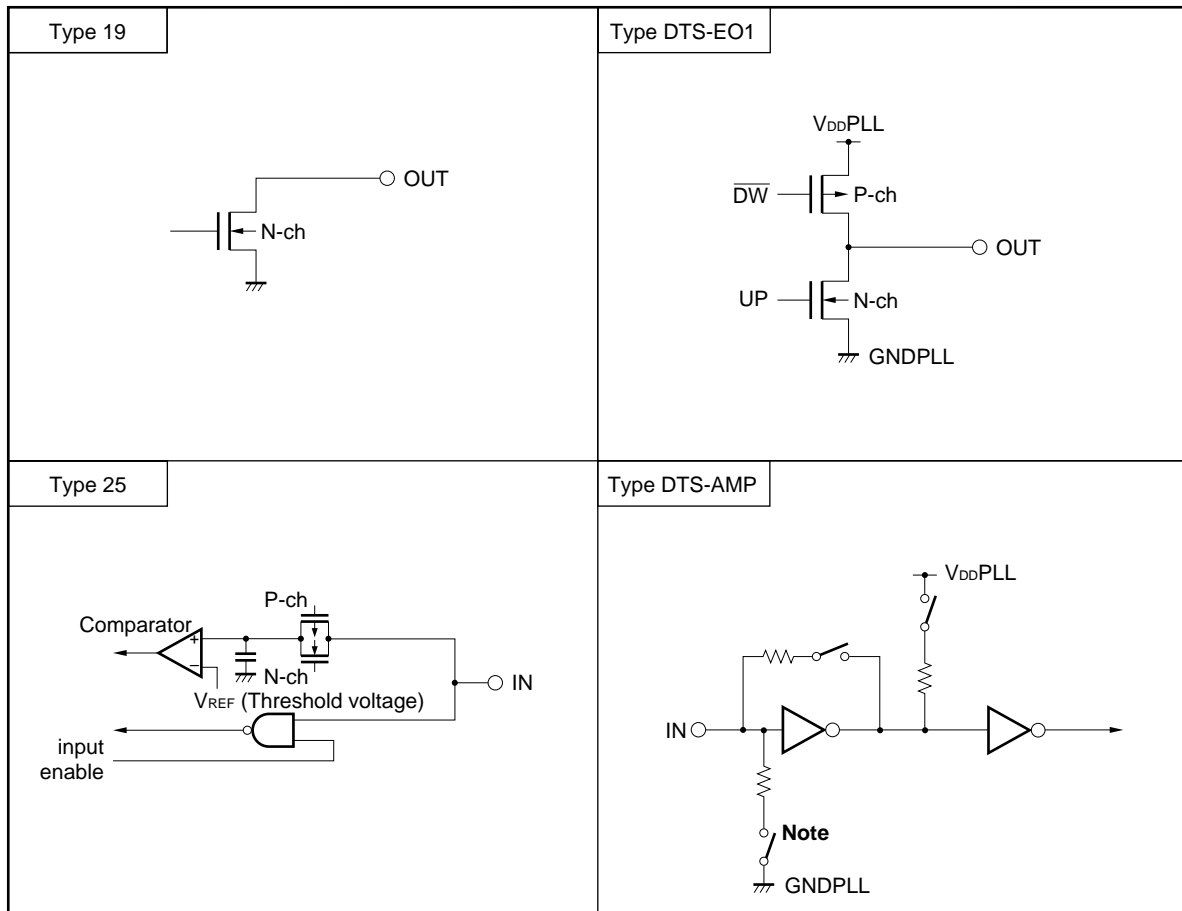

★
★
★

Figure 2-1. I/O Circuits of Respective Pins (1/2)

Remark V_{DD} and GND are the positive power supply and ground pins for all port pins. Take V_{DD} and GND as V_{DDPORT} and $GNDPORT$.

Figure 2-1. I/O Circuits of Respective Pins (2/2)

Note This switch is selectable in software only for the VCOL and VCOH pins.

Remark V_{DD} and GND are the positive power supply and ground pins for all port pins. Take V_{DD} and GND as V_{DDPORT} and $GNDPORT$.

[MEMO]

CHAPTER 3 CPU ARCHITECTURE

3.1 Memory Spaces

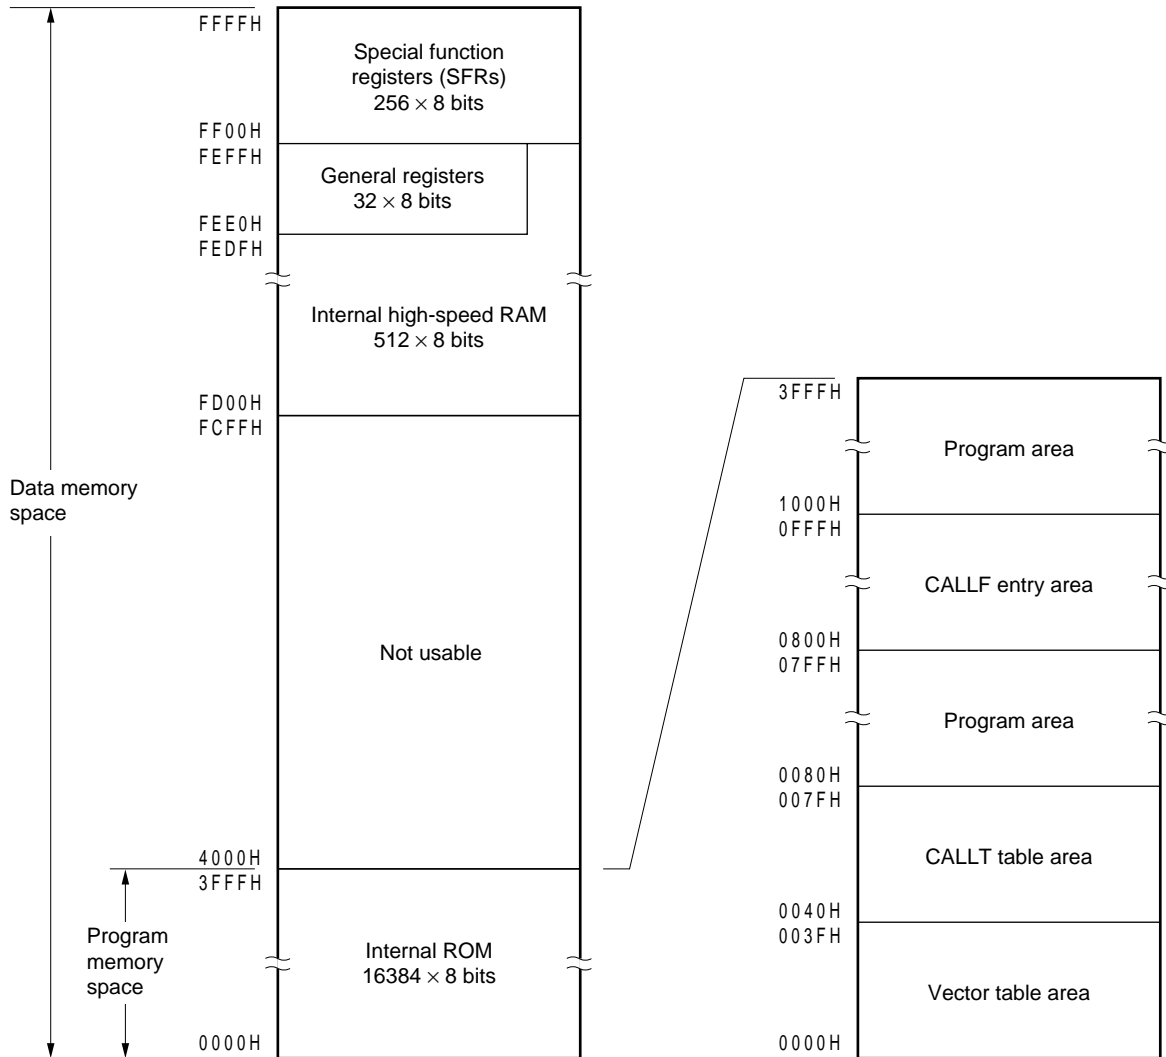

The initial value of the memory size select register (IMS) is CFH . The following values must be set to the registers of each model.

Part Number	IMS
μPD178022	44H
μPD178023	C6H
μPD178024	C8H
μPD178F124	Value equivalent to mask ROM model

(1) μ PD178022

Set the value of the memory size select register (IMS) to 44H (the initial value is CFH).

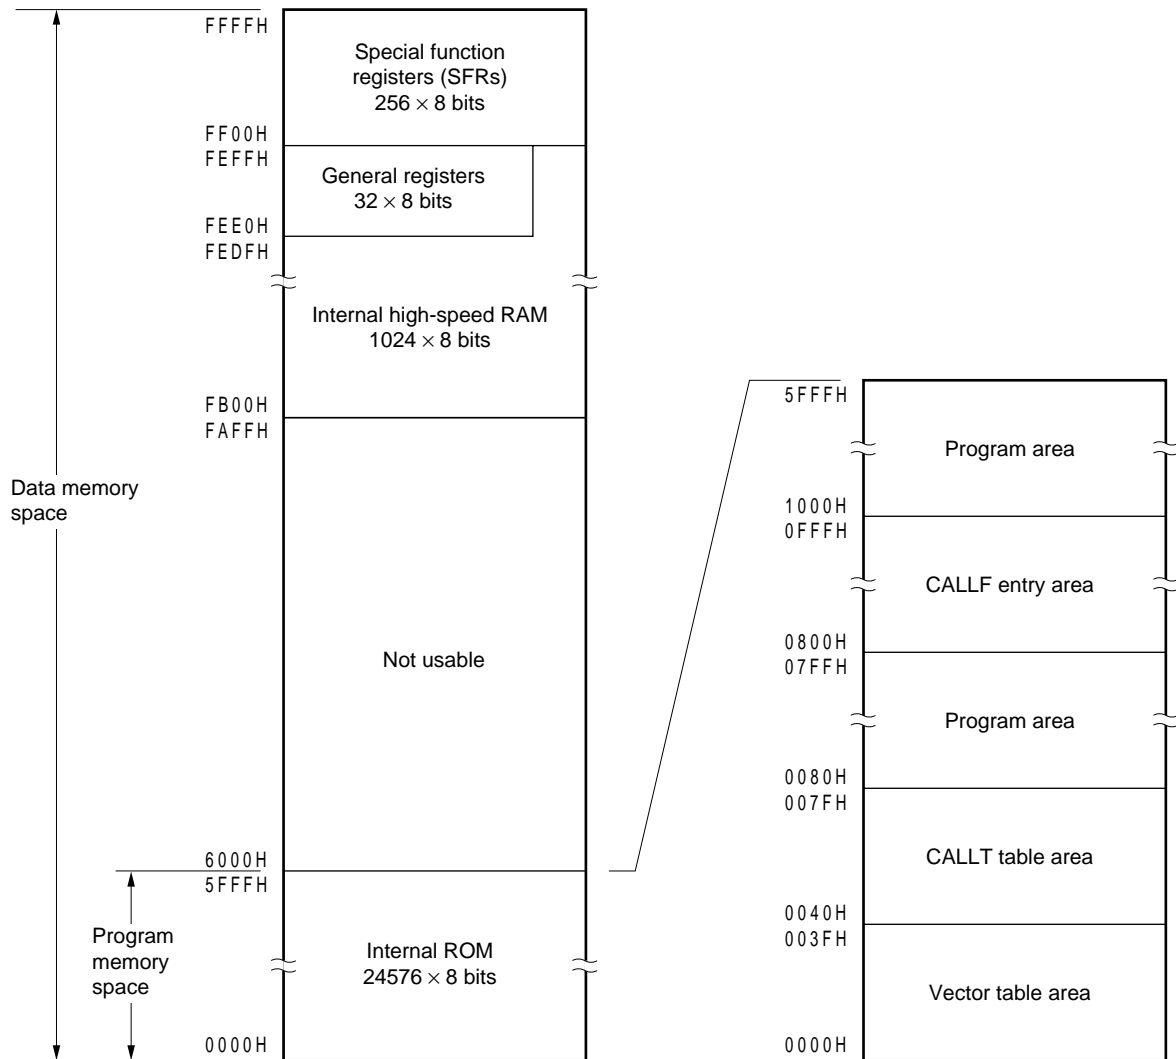

Figure 3-1. Memory Map (μ PD178022)

(2) μ PD178023

Set the value of the memory size select register (IMS) to C6H (the initial value is CFH).

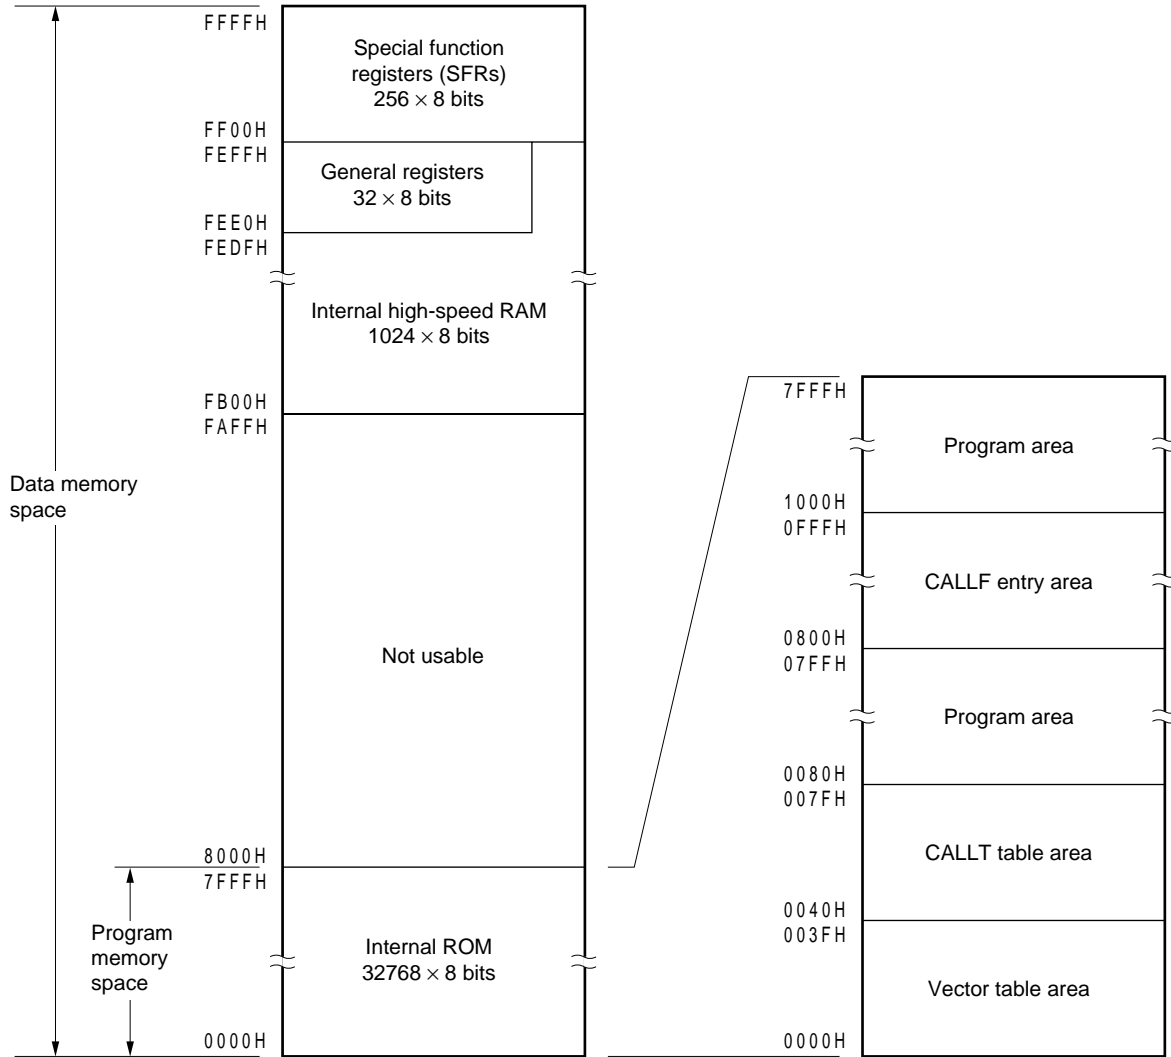

Figure 3-2. Memory Map (μ PD178023)

(3) μ PD178024

Set the value of the memory size select register (IMS) to C8H (the initial value is CFH).

Figure 3-3. Memory Map (μ PD178024)

(4) μ PD178F124

Set the value of the memory size select register (IMS) to the value corresponding to that of the mask ROM models (the initial value is CFH).

★

Figure 3-4. Memory Map (μ PD178F124)

3.1.1 Internal program memory space

Programs and table data are stored in internal program memory space, and are usually addressed by the program counter (PC).

The μ PD178024 subseries have an internal ROM (or flash memory) as shown in the following table.

Table 3-1. Internal Memory Capacities

Model	Structure	Capacity
μ PD178022	Mask ROM	16384 \times 8 bits (0000H-3FFFH)
μ PD178023		24576 \times 8 bits (0000F-5FFFH)
μ PD178024		32768 \times 8 bits (0000H-7FFFH)
μ PD178F124	Flash memory	

The following areas are assigned to the internal program memory space.

(1) Vector table area

The 64-byte area 0000H to 003FH is reserved as a vector table area. The reset input and program start addresses for branch upon generation of each interrupt request are stored in the vector table area. Of the 16-bit address, low-order 8 bits are stored at even addresses and high-order 8 bits are stored at odd addresses.

Table 3-2. Vector Table

Vector Table Address	Interrupt Request
0004H	INTWDT
0006H	INTP0
0008H	INTP1
000AH	INTP2
000CH	INTP3
000EH	INTP4
0010H	INTKY
0012H	INTIIC0
0014H	INTBTM0
0016H	INTAD3
★ 0018H ^{Note}	—
001AH	INTCSI3
001CH	INTTM50
001EH	INTTM51
★ 0020H	INTSER0
★ 0022H	INTSR0
★ 0024H	INTST0
003EH	BRK

Note There are no interrupt sources corresponding to vector addresses 0018H.

(2) CALLT instruction table area

The 64-byte area 0040H to 007FH can store the subroutine entry address of a 1-byte call instruction (CALLT).

(3) CALLF instruction entry area

The area 0800H to 0FFFH can perform a direct subroutine call with a 2-byte call instruction (CALLF).

3.1.2 Internal data memory space

The μ PD178024 subseries units incorporate the following RAMs.

(1) Internal high-speed RAM

The μ PD178022 have an internal high-speed RAM structure of 512×8 bits, and the μ PD178023, 178024, and 178F124 have a RAM structure of 1024×8 bits.

In this area, four banks of general registers, each bank consisting of eight 8-bit registers, are allocated in the 32-byte area FEE0H to FEFFH.

The internal high-speed RAM can also be used as a stack memory area.

3.1.3 Special Function Register (SFR) area

An on-chip peripheral hardware special function register (SFR) is allocated in the area FF00H to FFFFH. (Refer to **Table 3-4 Special Function Registers**).

Caution Do not access addresses where the SFR is not assigned.

3.1.4 Data memory addressing

Addressing refers to the method of specifying the address of the instruction to be executed next or the address of the register or memory relevant to the execution of instructions.

The address of an instruction to be executed next is addressed by the program counter (PC) (for details, refer to **3.3 Instruction Address Addressing**).

Several addressing modes are provided for addressing the memory relevant to the execution of instructions for the μ PD178024 subseries, based on operability and other considerations. For areas containing data memory in particular, special addressing methods designed for the functions of special function registers (SFR) and general-purpose registers are available for use. Data memory addressing is illustrated in Figures 3-5 to 3-8. For the details of each addressing mode, refer to **3.4 Operand Address Addressing**.

Figure 3-5. Data Memory Addressing (μ PD178022)

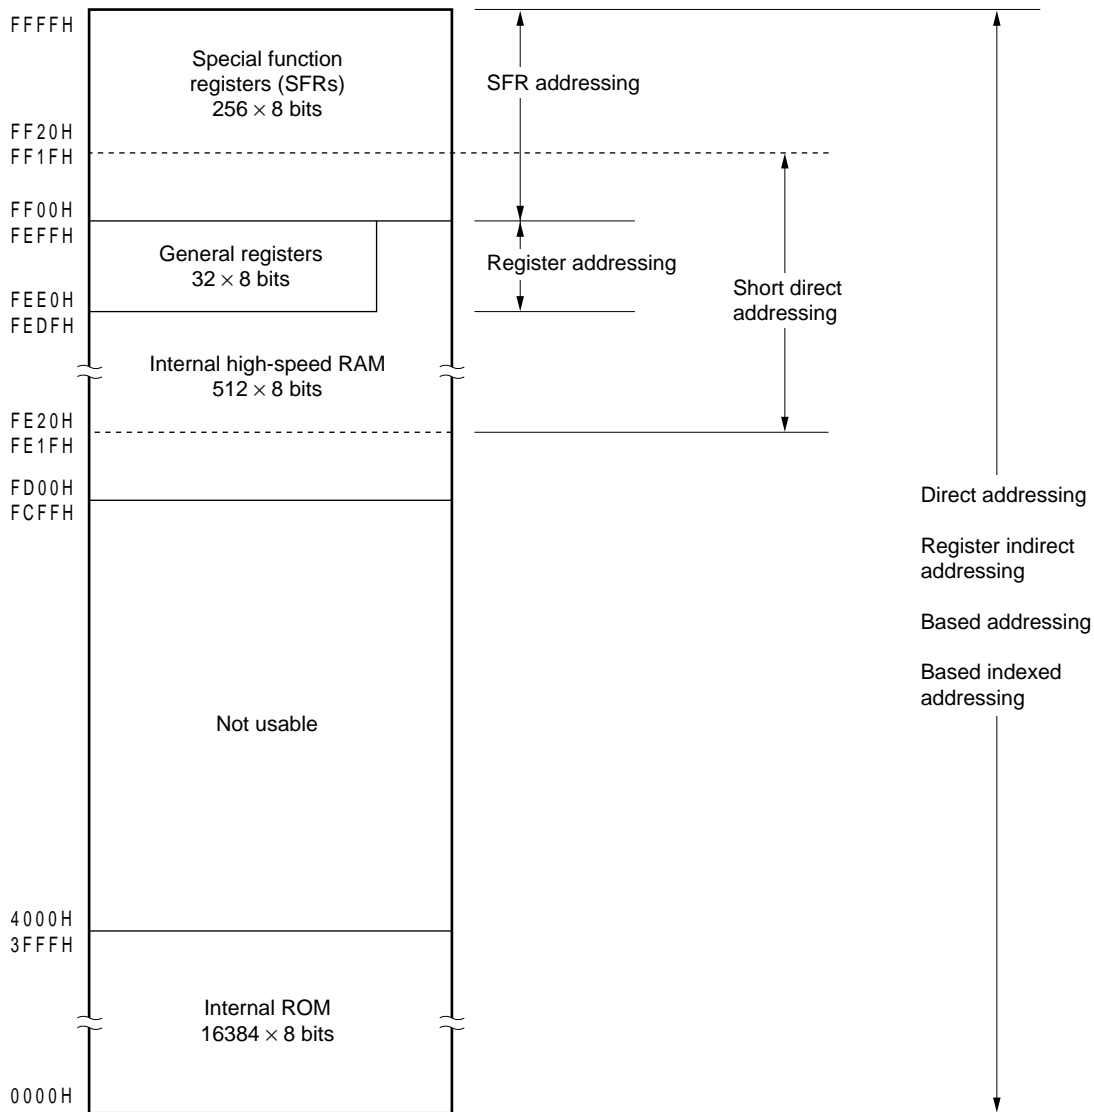

Figure 3-6. Data Memory Addressing (μ PD178023)

Figure 3-7. Data Memory Addressing (μ PD178024)

★

Figure 3-8. Data Memory Addressing (μ PD178F124)

3.2 Processor Registers

The μ PD178024 subseries units incorporate the following processor registers.

3.2.1 Control registers

The control registers control the program sequence, statuses and stack memory. The control registers consist of a program counter (PC), a program status word (PSW) and a stack pointer (SP).

(1) Program counter (PC)

The program counter is a 16-bit register which holds the address information of the next program to be executed.

In normal operation, the PC is automatically incremented according to the number of bytes of the instruction to be fetched. When a branch instruction is executed, immediate data and register contents are set.

Reset input sets the reset vector table values at addresses 0000H and 0001H to the program counter.

Figure 3-9. Configuration of Program Counter

(2) Program status word (PSW)

The program status word is an 8-bit register consisting of various flags to be set/reset by instruction execution. Program status word contents are automatically stacked upon interrupt request generation or PUSH PSW instruction execution and are automatically restored upon execution of the RETB, RETI and POP PSW instructions. Reset input sets the PSW to 02H.

Figure 3-10. Configuration of Program Status Word

(a) Interrupt enable flag (IE)

This flag controls the interrupt request acknowledge operations of the CPU.

When IE = 0, all the interrupts are disabled (DI) except the non-maskable interrupt.

When IE = 1, the interrupts are enabled (EI). At this time, the acknowledging of interrupts is controlled by the in-service priority flag (ISP), the interrupt mask flag corresponding to each interrupt, and the interrupt priority specification flag.

The IE is reset to (0) upon DI instruction execution or interrupt acknowledgement and is set to (1) upon EI instruction execution.

(b) Zero flag (Z)

When the operation result is zero, this flag is set (1). It is reset (0) in all other cases.

(c) Register bank select flags (RBS0 and RBS1)

These are 2-bit flags to select one of the four register banks.

In these flags, the 2-bit information which indicates the register bank selected by SEL RBn instruction execution is stored.

(d) Auxiliary carry flag (AC)

If the operation result has a carry from bit 3 or a borrow at bit 3, this flag is set (1). It is reset (0) in all other cases.

(e) In-service priority flag (ISP)

This flag manages the priority of acknowledgeable maskable vectored interrupts.

When ISP = 0, acknowledging the vectored interrupt requests to which a low priority is assigned by the priority specification flag registers (PR0L, PR0H, PR1L) (refer to **14.3 (3) Priority specification flag registers (PR0L, PR0H, PR1L)**) is disabled. Whether an interrupt request is actually accepted depends on the status of the interrupt enable flag (IE).

(f) Carry flag (CY)

This flag stores overflow and underflow upon add/subtract instruction execution. It stores the shift-out value upon rotate instruction execution and functions as a bit accumulator during bit manipulation instruction execution.

(3) Stack pointer (SP)

This is a 16-bit register to hold the start address of the memory stack area. Only the internal high-speed RAM area (FD00H-FEFFFH for μ PD178022, FB00H-FEFFFH for μ PD178023, 178024, and 178F124) can be set as the stack area.

Figure 3-11. Configuration of Stack Pointer

The SP is decremented ahead of write (save) to the stack memory and is incremented after read (restored) from the stack memory.

Each stack operation saves/restores data as shown in Figures 3-12 and 3-13.

Caution Since reset input makes SP contents undefined, be sure to initialize the SP before instruction execution.

Figure 3-12. Data to be Saved to Stack Memory

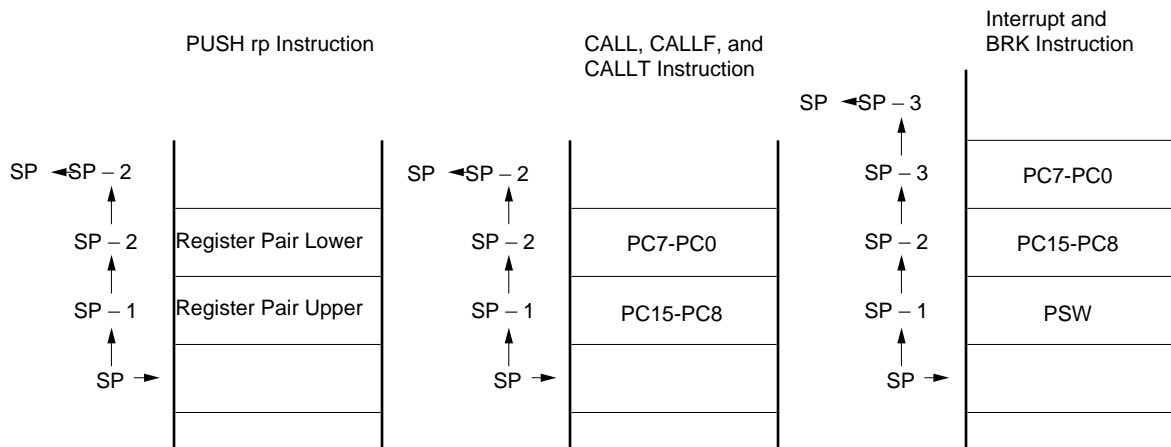

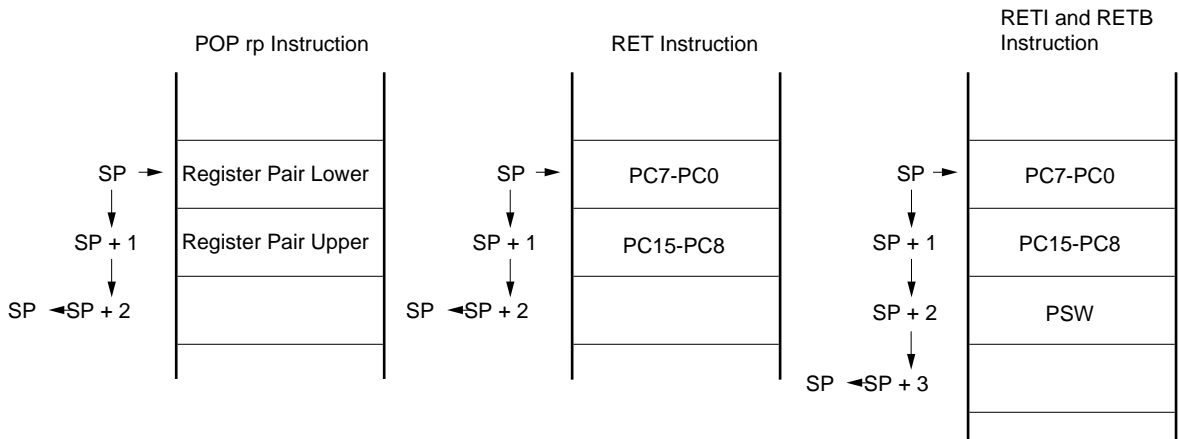

Figure 3-13. Data to be Restored from Stack Memory

3.2.2 General registers

A general register is mapped at particular addresses (FEE0H to FEFFH) of the data memory. It consists of 4 banks, each bank consisting of eight 8-bit registers (X, A, C, B, E, D, L and H).

Each register can also be used as an 8-bit register. Two 8-bit registers can be used in pairs as a 16-bit register (AX, BC, DE and HL).

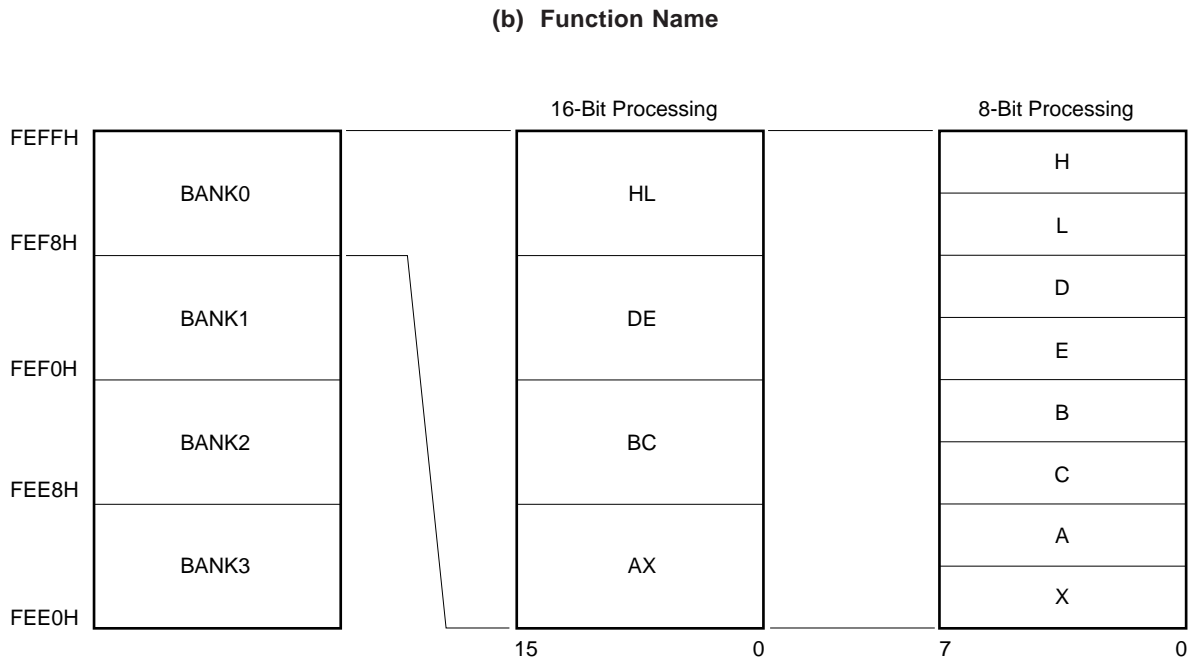

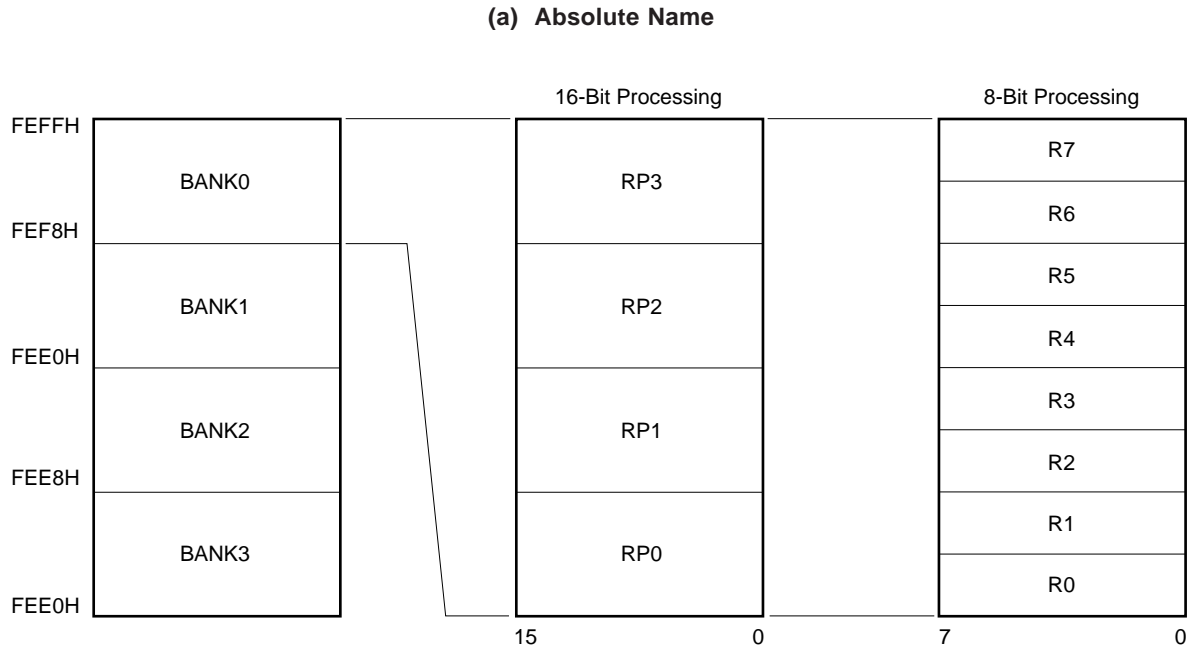

They can be written in terms of function names (X, A, C, B, E, D, L, H, AX, BC, DE and HL) and absolute names (R0 to R7 and RP0 to RP3).

Register banks to be used for instruction execution are set with the CPU control instruction (SEL RBn). Because of the 4-register bank configuration, an efficient program can be created by switching between a register for normal processing and a register for interrupt for each bank.

Table 3-3. Absolute Address of General-Purpose Registers

Bank	Register		Absolute Address	Bank	Register		Absolute Address
	Function name	Absolute name			Function name	Absolute name	
BANK0	H	R7	F E F F H	BANK2	H	R7	F E E F H
	L	R6	F E F E H		L	R6	F E E E H
	D	R5	F E F D H		D	R5	F E E D H
	E	R4	F E F C H		E	R4	F E E C H
	B	R3	F E F B H		B	R3	F E E B H
	C	R2	F E F A H		C	R2	F E E A H

Figure 3-14. Configuration of General Register

3.2.3 Special Function Registers (SFR)

Unlike a general register, each special function register has special functions.

It is allocated in the FF00H to FFFFH area.

The special function register can be manipulated like the general register, with the operation, transfer and bit manipulation instructions. Manipulatable bit units, 1, 8 and 16, depend on the special function register type.

Each manipulation bit unit can be specified as follows.

- **1-bit manipulation**

Use the symbol reserved in the assembler for the 1-bit manipulation instruction operand (sfr.bit).

This manipulation can also be specified with an address.

- **8-bit manipulation**

Use the symbol reserved in the assembler for the 8-bit manipulation instruction operand (sfr).

This manipulation can also be specified with an address.

- **16-bit manipulation**

Use the symbol reserved in the assembler for the 16-bit manipulation instruction operand (sfrp).

When addressing an address, use an even address.

Table 3-4 gives a list of special function registers. The meaning of items in the table is as follows.

- **Symbol**

This is a symbol to indicate an address of the special function register.

These symbols are reserved for the DF178124 and RA78K0, and defined by header file sfrbit.h for the CC78K0.

They can be written as instruction operands when the RA78K0, ID78K0, or ID78K0-NS is used.

- **R/W**

Indicates whether the corresponding special function register can be read or written.

R/W : Read/write enable

R : Read only

R&Reset : Read only (reset to 0 when read)

W : Write only

- **Bit units for manipulation**

○ indicates manipulatable bit units 1, 8, and 16. – indicates the bit units that cannot be manipulated.

- **At reset**

Indicates each register status upon reset. The values of special function registers whose addresses are not shown in the table are undefined at reset.

Table 3-4. Special Function Registers (1/3)

Address	Special Function Register (SFR) Name	Symbol	R/W	Bit Units for Manipulation			At Reset
				1 bit	8 bits	16 bits	
FF00H	Port 0	P0	R/W	○	○	—	00H
FF01H	Port 1	P1	R	○	○	—	
FF03H	Port 3	P3	R/W	○	○	—

FF13H	Analog input channel specification register 3	ADS3		—	○	—	
FF15H	Power-fail comparison threshold value register 3	PFT3		—	○	—	
FF16H	Power-fail comparison mode register 3	PFM3		○	○	—	
FF1AH	IIC shift register 0	IIC0		—	○	—	
★ FF1BH	POC status register	POCS	R&Reset	○	○	—	Retained ^{Note 2}
FF20H	Port mode register 0	PM0	R/W	○	○	—	FFH
FF23H	Port mode register 3	PM3		○	○	—	
FF24H	Port mode register 4	PM4		○	○	—	
FF25H	Port mode register 5	PM5		○	○	—	
FF26H	Port mode register 6	PM6		○	○	—	
FF27H	Port mode register 7	PM7		○	○	—	
FF2CH	Port mode register 12	PM12		○	○	—	
FF34H	Pull-up resistor option register 4	PU4		○	○	—	
FF41H	BEEP clock select register 0	BEEPCL0	○	○	—		
FF42H	Watchdog timer clock select register	WDCS	○	○	—		
FF43H	IIC transfer select register 0	IICCL0	○	○	—		
FF48H	External interrupt rising edge enable register	EGP	○	○	—		
FF49H	External interrupt falling edge enable register	EGN	○	○	—		
★ FF5AH	Asynchronous serial interface mode register 0	ASIM0	○	○	—		
★ FF5BH	Asynchronous serial interface status register 0	ASIS0	R	—	○	—	
★ FF5CH	Baud rate generator control register 0	BRGC0	R/W	—	○	—	

Notes 1. This register can be accessed only in 8-bit units. When ADCR3 is read, the value of FF11H is read.

2. The value of this register is 03H only at reset by power-ON clear. This register is not reset by the RESET pin or watchdog timer.

Caution Do not access the addresses to which no SFR is assigned.

Table 3-4. Special Function Registers (2/3)

Address	Special Function Register (SFR) Name		Symbol		R/W	Bit Units for Manipulation			At Reset
						1 bit	8 bits	16 bits	
★ FF5DH	Transmit shift register 0		TXS0		W	—	○	—	FFH
	Receive buffer register 0		RXB0		R	—	○	—

FFAFH				IFCRH					—

Notes 1. Undefined by power-on clear reset only.

2. Though the initial value of the DTS system clock select register (DTSCCK) is 00H, be sure to set this register to 01H before using it.

Caution Do not access the addresses to which no SFR is assigned.

Table 3-4. Special Function Registers (3/3)

Address	Special Function Register (SFR) Name	Symbol		R/W	Bit Units for Manipulation			At Reset
					1 bit	8 bits	16 bits	
FFD0H FFDFH	External access area ^{Note 1}			R/W	○	○	—	Undefined
FFE0H	Interrupt request flag register 0L	IF0	IF0L		○	○	○	00H
FFE1H	Interrupt request flag register 0H		IF0H		○	○		
★ FFE2H	Interrupt request flag register 1L	IF1L			○	○	—	
FFE4H	Interrupt mask flag register 0L	MK0	MK0L		○	○	○	FFH
FFE5H	Interrupt mask flag register 0H		MK0H		○	○		
★ FFE6H	Interrupt mask flag register 1L	MK1L			○	○	—	
FFE8H	Priority specification flag register 0L	PR0	PR0L		○	○	○	FFH
FFE9H	Priority specification flag register 0H		PR0H		○	○		
★ FFEAH	Priority specification flag register 1L	PR1L			○	○	—	
★ FFF0H	Memory size select register	IMS			—	○	—	CFH ^{Note 2}
★ FFF4H	Internal extension RAM size select register	IXS			—	○	—	0CH ^{Note 3}
FFF9H	Watchdog timer mode register	WDTM			○	○	—	00H
FFFAH	Oscillation stabilization time select register	OSTS			○	○	—	04H
FFFBH	Processor clock control register	PCC			○	○	—	

- Notes**
- The external access area cannot be accessed by means of SFR addressing. Use direct addressing to access this area.
 - The initial value of the memory size select register (IMS) is CFH. Set the values of these registers of each model as follows:

Part Number	IMS
μPD178022	44H
μPD178023	C6H
μPD178024	C8H
μPD178F124	Value equivalent to mask ROM model

- Do not assign a value other than the value at reset to the internal extension RAM size select register (IXS).

Caution Do not access the addresses to which no SFR is assigned.

3.3 Instruction Address Addressing

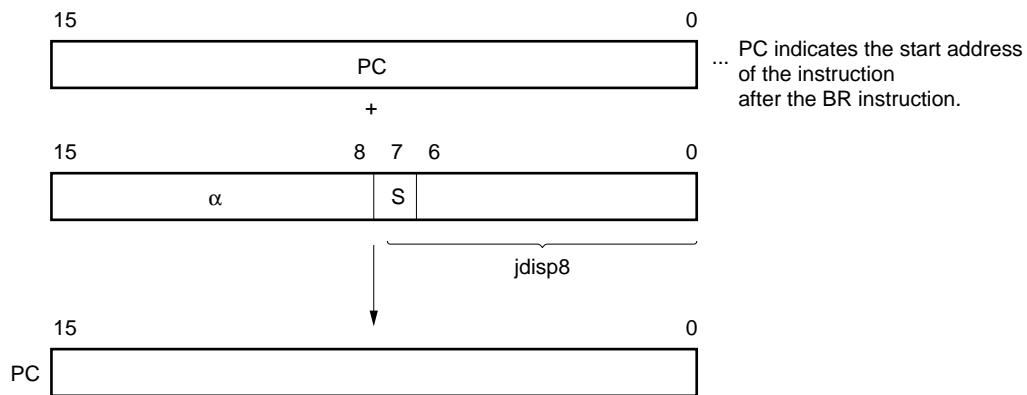

An instruction address is determined by program counter (PC) contents, and the contents is normally incremented (+1 for each byte) automatically according to the number of bytes of an instruction to be fetched each time another instruction is executed. When a branch instruction is executed, the branch destination information is set to the PC and branched by the following addressing. (For details of instructions, refer to **78K/0 User's Manual -Instruction (U12326E)**).

3.3.1 Relative addressing

[Function]

The value obtained by adding 8-bit immediate data (displacement value: $jdisp8$) of an instruction code to the start address of the following instruction is transferred to the program counter (PC) and branched. The displacement value is treated as signed two's complement data (–128 to +127) and bit 7 becomes a sign bit. That is, using relative addressing, the program branches in the range –128 to +127 relative to the first address of the next instruction. This function is carried out when the BR \$addr16 instruction or a conditional branch instruction is executed.

[Illustration]

When $S = 0$, all bits of α are 0.
 When $S = 1$, all bits of α are 1.

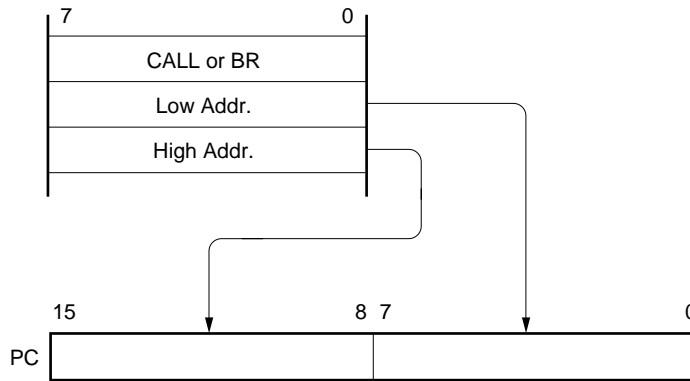

3.3.2 Immediate addressing

[Function]

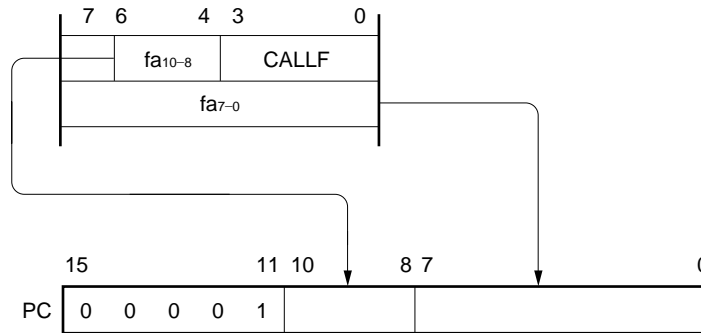

Immediate data in the instruction word is transferred to the program counter (PC) and branched. This function is carried out when the CALL !addr16 or BR !addr16 or CALLF !addr11 instruction is executed. The CALL !addr16 and BR !addr16 instructions can be used to branch to any location in the memory. The CALLF !addr11 instruction is used to branch to the area between 0800H through 0FFFH.

[Illustration]

In the case of CALL !addr16 and BR !addr16 instructions

In the case of CALLF !addr11 instruction

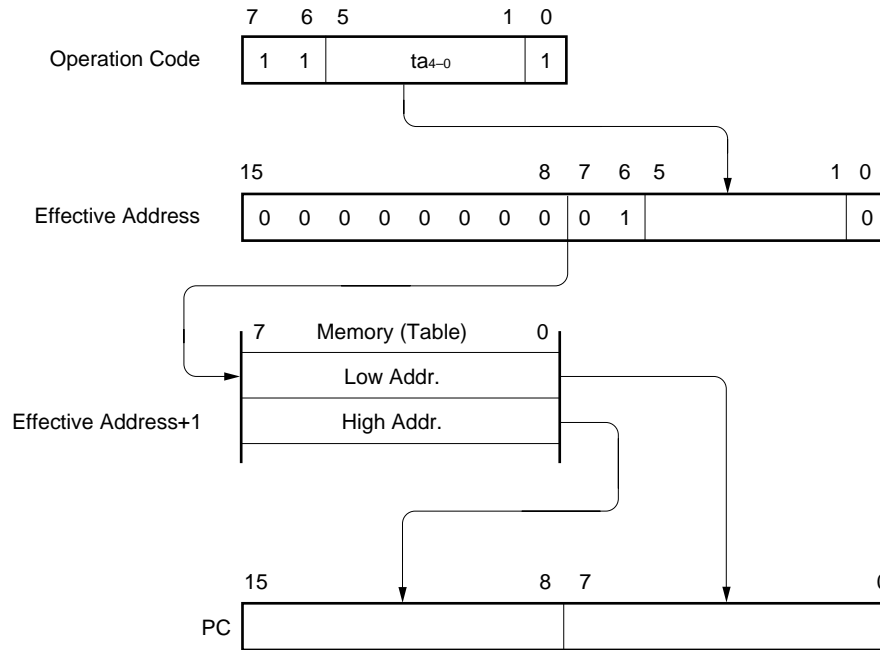

3.3.3 Table indirect addressing

[Function]

Table contents (branch destination address) of the particular location to be addressed by bits 1 to 5 of the immediate data of an operation code are transferred to the program counter (PC) and branched.

This addressing is used when the CALLT [addr5] instruction is executed. This instruction references an address stored in the memory table between 40H through 7FH, and can be used to branch to any location in the memory.

[Illustration]

3.3.4 Register addressing

[Function]

Register pair (AX) contents to be specified with an instruction word are transferred to the program counter (PC) and branched.

This function is carried out when the BR AX instruction is executed.

[Illustration]

3.4 Operand Address Addressing

The following various methods are available to specify the register and memory (addressing) which undergo manipulation during instruction execution.

3.4.1 Implied addressing

[Function]

The register which functions as an accumulator (A and AX) in the general register is automatically addressed (implied). Of the μ PD178024 subseries instruction words, the following instructions employ implied addressing.

Instruction	Register To Be Specified by Implied Addressing
MULU	A register for multiplicand and AX register for product storage
DIVUW	AX register for dividend and quotient storage
ADJBA/ADJBS	A register for storage of numeric values which become decimal correction targets
ROR4/ROL4	A register for storage of digit data which undergoes digit rotation

[Operand format]

Because implied addressing can be automatically employed with an instruction, no particular operand format is necessary.

[Example]

In the case of MULU X

With an 8-bit \times 8-bit multiply instruction, the product of A register and X register is stored in AX. In this example, the A and AX registers are specified by implied addressing.

3.4.2 Register addressing

[Function]

This addressing mode is used to access a general-purpose register as an operand. The register to be accessed is specified by the register bank select flags (RBS0 and RBS1) and the register specification code (Rn and RPn) in the operation code.

Register addressing is carried out when an instruction with the following operand format is executed. When an 8-bit register is specified, one of the eight registers is specified with 3 bits in the operation code.

[Operand format]

Symbol	Description
r	X, A, C, B, E, D, L, H
rp	AX, BC, DE, HL

'r' and 'rp' can be written with function names (X, A, C, B, E, D, L, H, AX, BC, DE and HL) as well as absolute names (R0 to R7 and RP0 to RP3).

[Example]

MOV A, C; when selecting C register as r

INCW DE; when selecting DE register pair as rp

3.4.3 Direct addressing

[Function]

The memory with immediate data in an instruction word is directly addressed.

[Operand format]

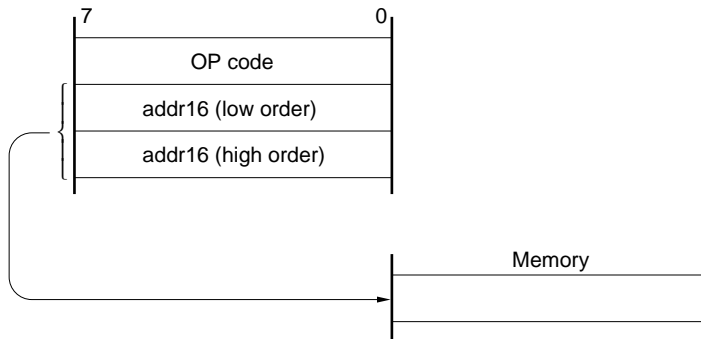

Symbol	Description
addr16	Label or 16-bit immediate data

[Example]

MOV A, !0FE00H; when setting !addr16 to FE00H

[Illustration]

3.4.4 Short direct addressing

[Function]

The memory to be manipulated in the fixed space is directly addressed with 8-bit data in an instruction word. This addressing is applied to the fixed 256-byte space FE20H to FF1FH. An internal RAM and a special-function register (SFR) are mapped at FE20H to FEFFH and FF00H to FF1FH, respectively.

The SFR area (FF00H to FF1FH) where short direct addressing is applied is one part of all the SFR areas. In this area, ports which are frequently accessed in a program and a compare register and a capture register of the timer/event counter are mapped and these SFRs can be manipulated with a small number of bytes and clocks. When 8-bit immediate data is at 20H to FFH, bit 8 of an effective address is set to 0. When it is at 00H to 1FH, bit 8 is set to 1. Refer to [Illustration] below.

[Operand format]

Symbol	Description
saddr	Label of FE20H to FF1FH immediate data
saddrp	Label of FE20H to FF1FH immediate data (even address only)

[Example]

MOV 0FE30H, #50H; when setting saddr to FE30H and immediate data to 50H

[Illustration]

When 8-bit immediate data is 20H to FFH, α = 0

When 8-bit immediate data is 00H to 1FH, α = 1

3.4.5 Special Function Register (SFR) addressing

[Function]

The memory-mapped special function register (SFR) is addressed with 8-bit immediate data in an instruction word.

This addressing is applied to the 240-byte spaces FF00H to FFCFH and FFE0H to FFFFH. However, the SFR mapped at FF00H to FF1FH can be accessed with short direct addressing.

[Operand format]

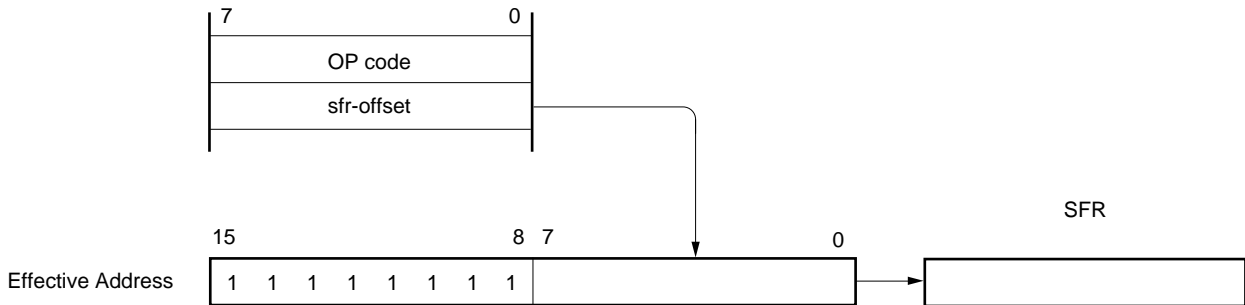

Symbol	Description
sfr	Special function register name
sfrp	16-bit manipulatable special function register name (even address only)

[Example]

MOV PM0, A; when selecting PM0 (FF20H) as sfr

[Illustration]

3.4.6 Register indirect addressing

[Function]

This addressing is used to address the memory to be manipulated by using the contents of the register pair specified by the register pair code in an instruction word as the operand address. The register pair specified is in the register bank specified by the register bank select flags (RBS0 and RBS1). This addressing can be used for the entire memory space.

[Operand format]

Symbol	Description
—	[DE], [HL]

[Example]

MOV A, [DE]; when selecting [DE] as register pair

Operation code 1 0 0 0 0 1 0 1

[Illustration]

3.4.7 Based addressing

[Function]

This addressing mode is used to address a memory location specified by the result of adding the 8-bit immediate data to the contents of the HL register pair which is used as a base register. The HL register pair accessed is the register in the register bank specified by the register bank select flags (RBS0 and RBS1). Addition is performed by expanding the offset data as a positive number to 16 bits. A carry from the 16th bit is ignored. This addressing can be carried out for all the memory spaces.

[Operand format]

Symbol	Description
—	[HL + byte]

[Example]

MOV A, [HL + 10H]; when setting byte to 10H

Operation code

1 0 1 0 1 1 1 0

0 0 0 1 0 0 0 0

3.4.8 Based indexed addressing

[Function]

This addressing mode is used to address a memory location specified by the result of adding the contents of the B or C register specified in the instruction word to the contents of the HL register pair which is used as a base register. The HL, B, and C registers accessed are the registers in the register bank specified by the register bank select flags (RBS0 and RBS1).

Addition is performed by expanding the offset data as a positive number to 16 bits. A carry from the 16th bit is ignored. This addressing can be carried out for all the memory spaces.

[Operand format]

Symbol	Description
—	[HL + B], [HL + C]

[Example]

In the case of MOV A, [HL + B]

Operation code

1 0 1 0 1 0 1 1

3.4.9 Stack addressing

[Function]

The stack area is indirectly addressed with the stack pointer (SP) contents.

This addressing method is automatically employed when the PUSH, POP, subroutine call and RETURN instructions are executed or the register is saved/restored upon generation of an interrupt request.

Stack addressing enables to address the internal high-speed RAM area only.

[Example]

In the case of PUSH DE

Operation code

1 0 1 1 0 1 0 1

CHAPTER 4 PORT FUNCTIONS

4.1 Functions of Port

The μ PD178024 subseries units incorporate six input ports, three output ports and 53 input/output ports. Figure 4-1 shows the port configuration. Every port is capable of 1-bit and 8-bit manipulations and can carry out considerably varied control operations. Besides port functions, the ports can also serve as on-chip hardware input/output pins.

Figure 4-1. Port Types

Table 4-1. Port Function

Pin Name	I/O	Function	Shared by:
P00-P04	I/O	Port 0. 7-bit I/O port. Can be set in input or output mode in 1-bit units.	INTP0-INTP4
P05, P06			–
P10-P15	Input	Port 1. 6-bit input port.	ANI0-ANI5
P30-P32	I/O	Port 3. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	–
P33			TI50
P34			TI51
P35			–
P36			BEEP0
P37			–
P40-47	I/O	Port 4. 8-bit I/O port. Can be set in input or output mode in 1-bit units. Internal pull-up resistors can be specified in software. Interrupt function by key input is provided.	–
P50-P57	I/O	Port 5. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	–
P60-P67	I/O	Port 6. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	–
P70	I/O	Port 7. 8-bit I/O port. Can be set in input or output mode in 1-bit units.	SI3
P71			SO3

★

★

★

4.2 Configuration of Port

A port consists of the following hardware:

Table 4-2. Configuration of Port

Item	Configuration
Control register	Port mode register (PMm: m = 0, 3-7, 12)
Port	Total: 62 ports (6 inputs, 3 outputs, 53 I/Os)

4.2.1 Port 0

Port 0 is a 7-bit input/output port with output latch. P00 to P06 pins can specify the input mode/output mode in 1-bit units with the port mode register 0 (PM0).

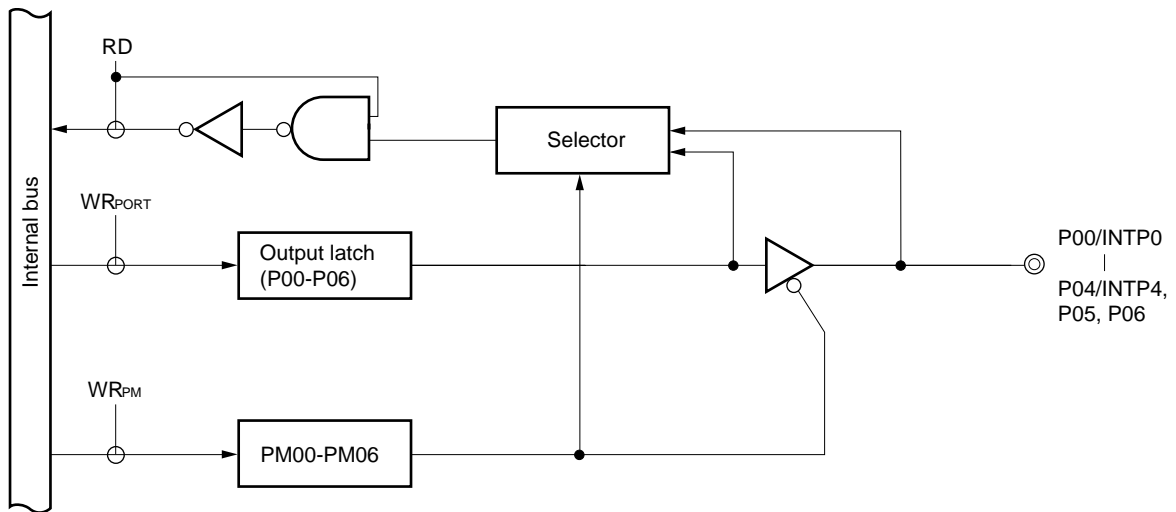

Alternate functions include external interrupt request input.

Reset input sets port 0 to the input mode.

Figure 4-2 shows the block diagram of port 0.

Caution Because port 0 also serves for external interrupt request input, when the port function output mode is specified and the output level is changed, the interrupt request flag is set. Thus, when the output mode is used, set the interrupt mask flag to 1.

Figure 4-2. Block Diagram of P00 to P06

PM : Port mode register
 RD : Port 0 read signal
 WR : Port 0 write signal

4.2.2 Port 1

Port 1 is a 6-bit input port.

Alternate functions include an A/D converter analog input.

Figure 4-3 shows the block diagram of port 1.

Figure 4-3. Block Diagram of P10 to P15

RD : Port 1 read signal

4.2.3 Port 3

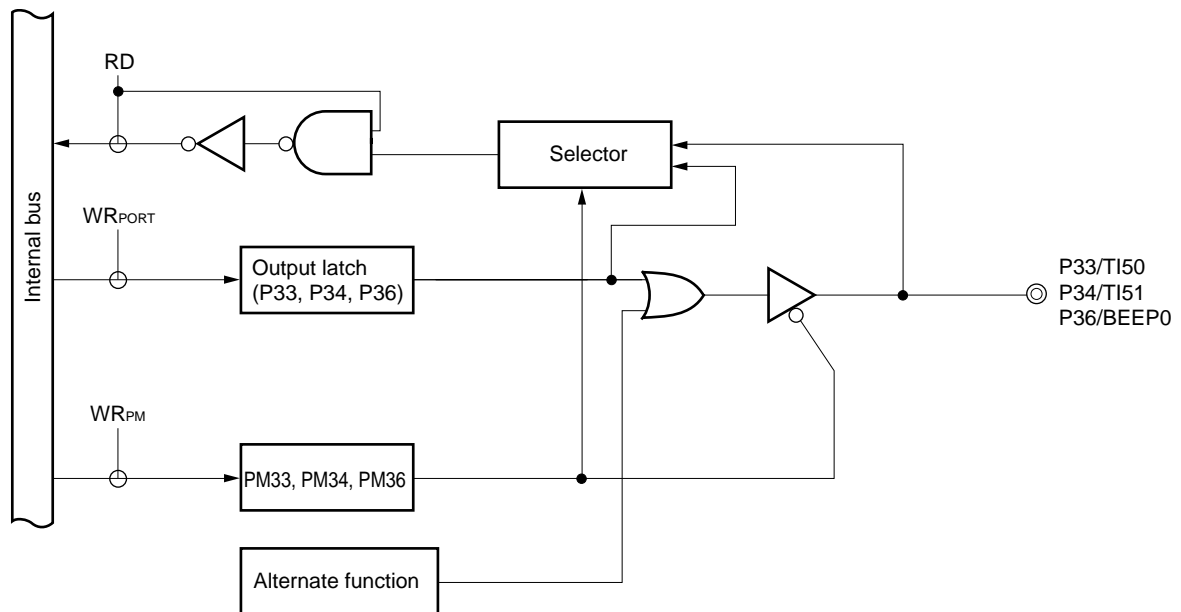

Port 3 is an 8-bit input/output port with output latch. P30 to P37 pins can specify the input mode/output mode in 1-bit units with the port mode register 3 (PM3).

Alternate functions include timer input and buzzer output.

Reset input sets port 3 to the input mode.

Figures 4-4 and 4-5 show the block diagrams of port 3.

Figure 4-4. Block Diagram of P33, P34, and P36

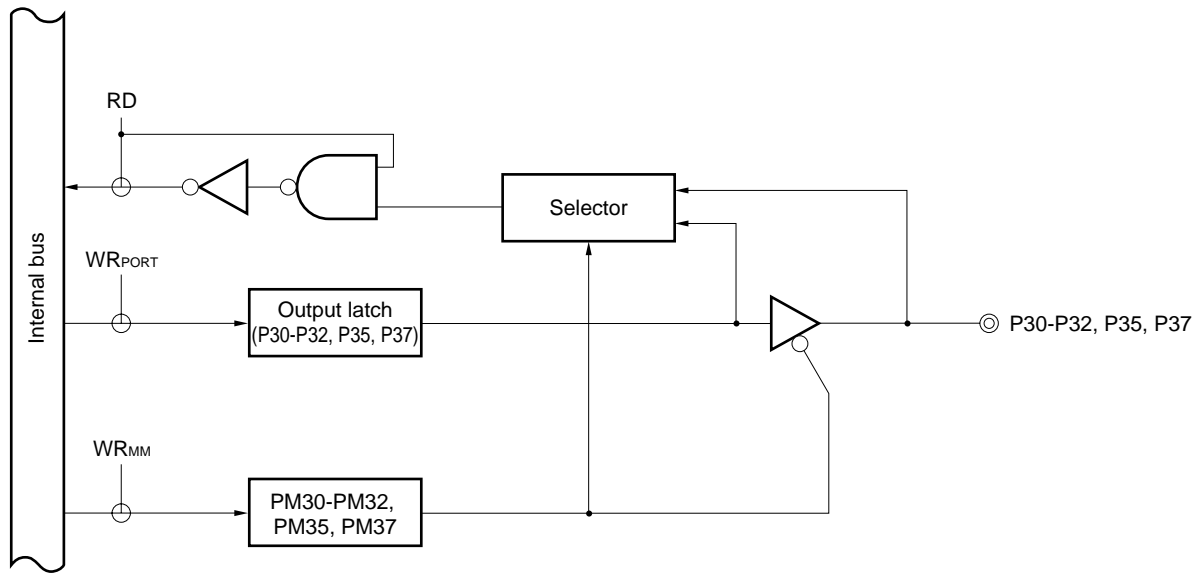

PM : Port mode register

RD : Port 3 read signal

WR : Port 3 write signal

Figure 4-5. Block Diagram of P30-P32, P35, and P37

PM : Port mode register
 RD : Port 3 read signal
 WR : Port 3 write signal

4.2.4 Port 4

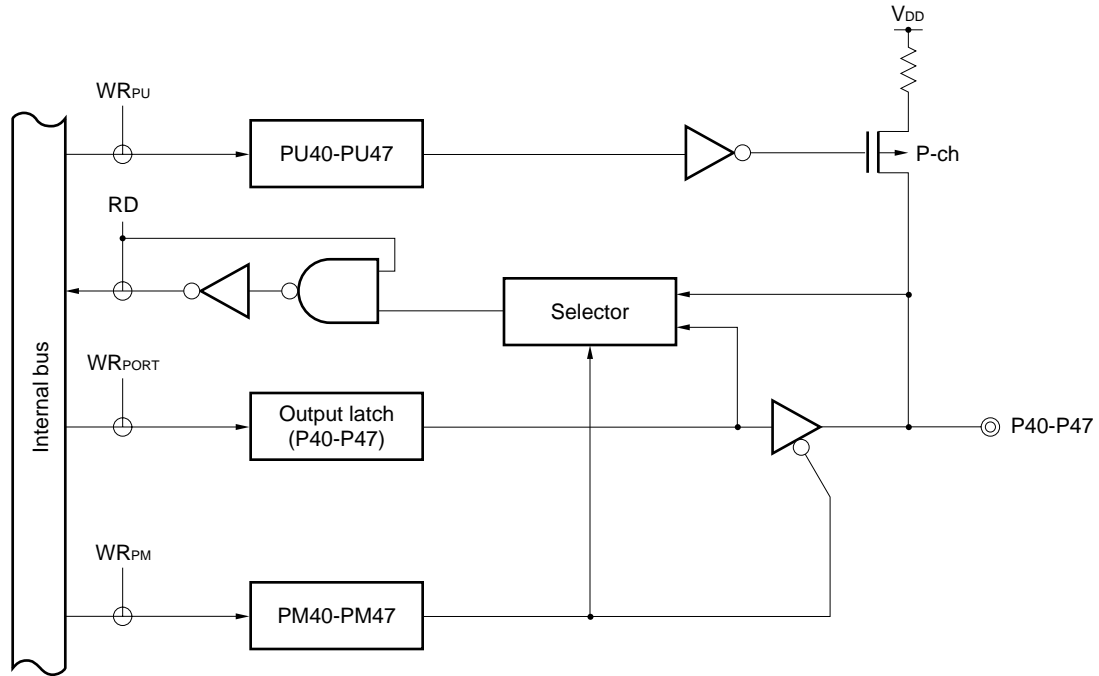

★ Port 4 is an 8-bit input/output port with output latch. The P40 to P47 pins can specify the input mode/output mode in 1-bit units with port mode register 4 (PM4). A pull-up resistor can be connected to them in 1-bit units with pull-up resistor option register 4 (PU4).

The interrupt request flag (KYIF) can be set to 1 by detecting key inputs. When using this function, be sure to set MEM register to 01H.

$\overline{\text{RESET}}$ input sets port 4 to input mode.

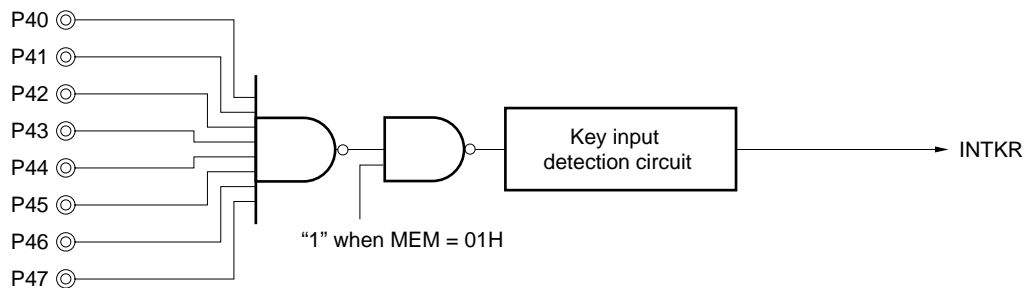

Figures 4-6 and 4-7 show a block diagram of port 4 and block diagram of the key input detection circuit, respectively.

★ **Figure 4-6. Block Diagram of P40 to P47**

PU : Pull-up resistor option register
 PM : Port mode register
 RD : Port 4 read signal
 WR : Port 4 write signal

Figure 4-7. Block Diagram of Key Input Detection Circuit

Caution This register is valid only when MEM register is set to 01H.

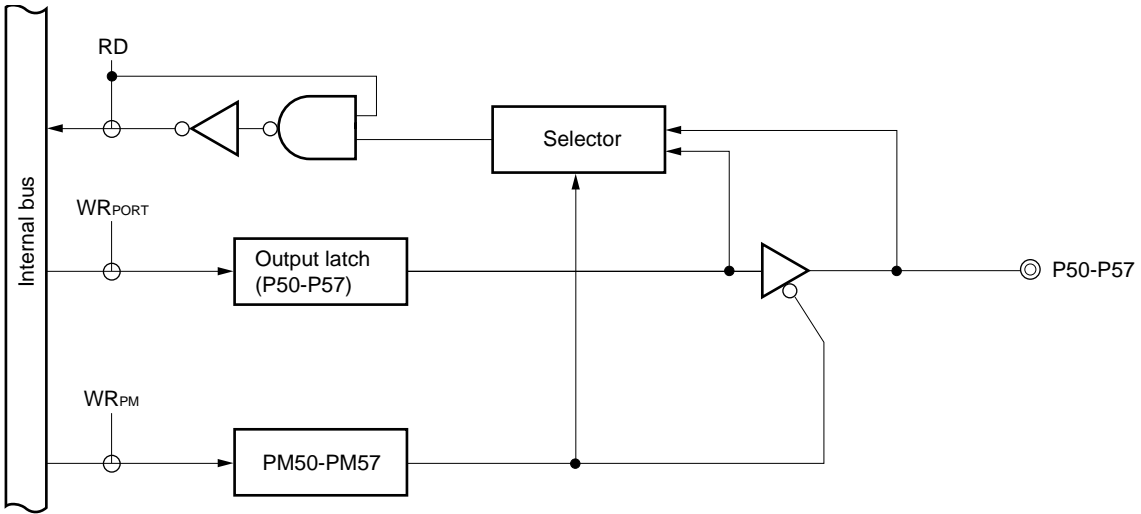

4.2.5 Port 5

Port 5 is an 8-bit input/output port with output latch. P50 to P57 pins can specify the input mode/output mode in 1-bit units with the port mode register 5 (PM5).

Reset input sets port 5 to the input mode.

Figure 4-8 shows the block diagram of port 5.

Figure 4-8. Block Diagram of P50 to P57

PM : Port mode register
 RD : Port 5 read signal
 WR : Port 5 write signal

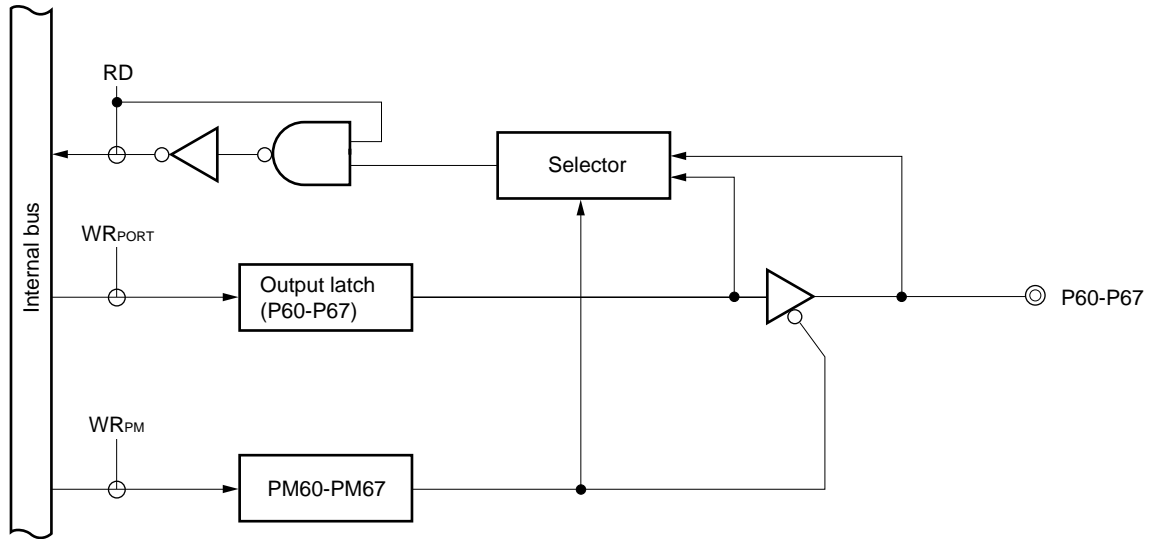

4.2.6 Port 6

Port 6 is an 8-bit input/output port with output latch. P60 to P67 pins can specify the input mode/output mode in 1-bit units with the port mode register 6 (PM6).

Reset input sets port 6 to the input mode.

Figure 4-9 shows the block diagram of port 6.

Figure 4-9. Block Diagram of P60 to P67

PM : Port mode register
 RD : Port 6 read signal
 WR : Port 6 write signal

4.2.7 Port 7

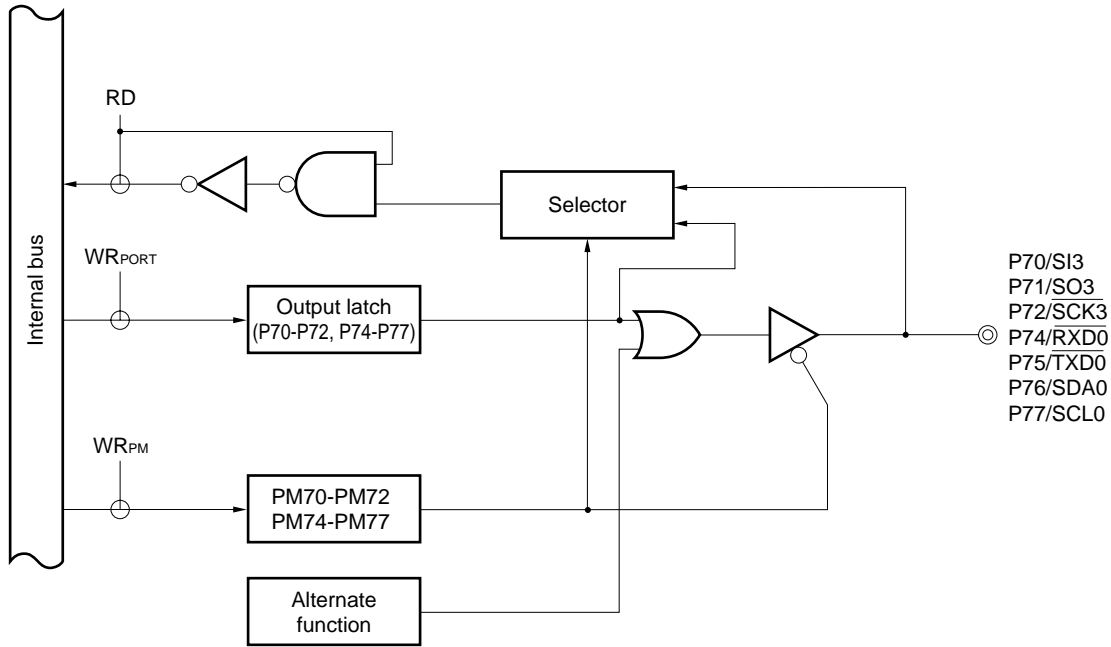

This is an 8-bit input/output port with an output latch. Pins P70 through P77 can be set in the input or output mode in 1-bit units by using port mode register 7 (PM7).

- ★ This port is also multiplexed with serial interface data input/output, clock input/output, and asynchronous interface data input/output pins.

Reset input sets port 7 to the input mode.

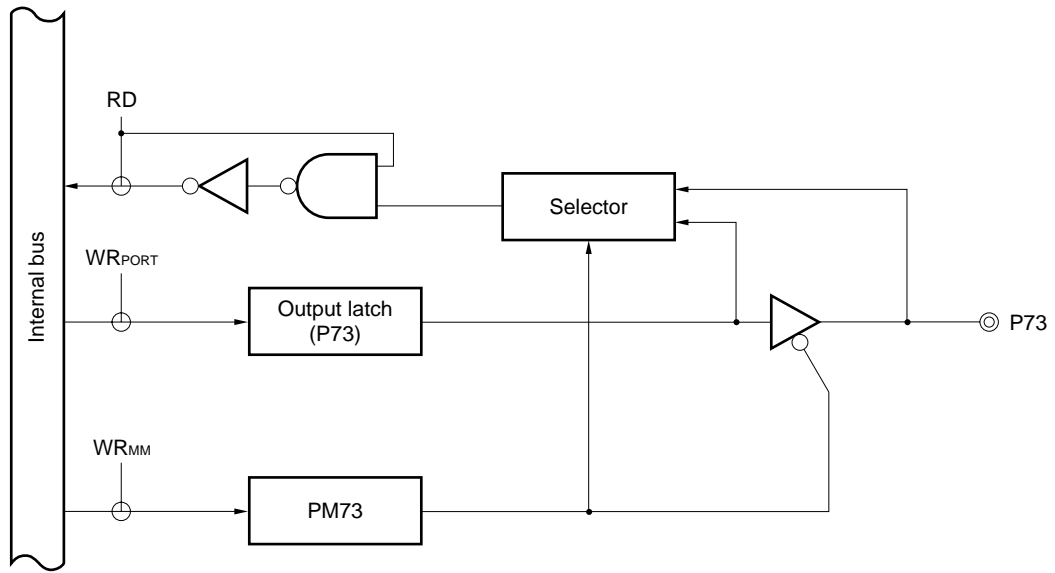

Figures 4-10 and 4-11 show the block diagrams of port 7.

Figure 4-10. Block Diagram of P70 to P72, P74 to P77

PM : Port mode register
 RD : Port 7 read signal
 WR : Port 7 write signal

Figure 4-11. Block Diagram of P73

PM : Port mode register
 RD : Port 7 read signal
 WR : Port 7 write signal

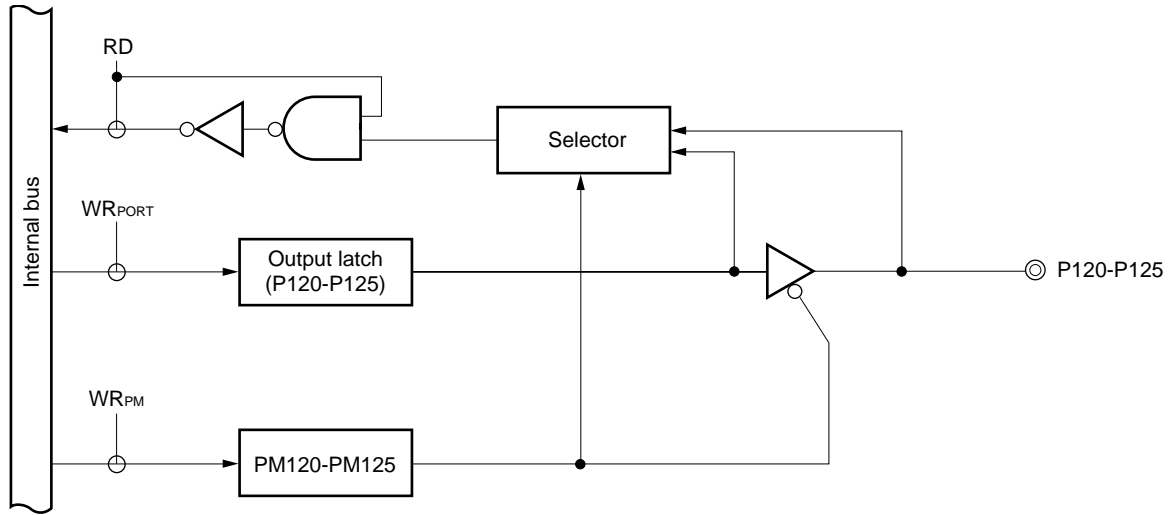

4.2.8 Port 12

Port 12 is a 6-bit input/output port with output latch. P120 to P125 pins can specify the input mode/output mode in 1-bit units with the port mode register 12 (PM12).

Reset input sets port 12 to the input mode.

Figure 4-12 shows the block diagram of port 12.

Figure 4-12. Block Diagram of P120 to P125

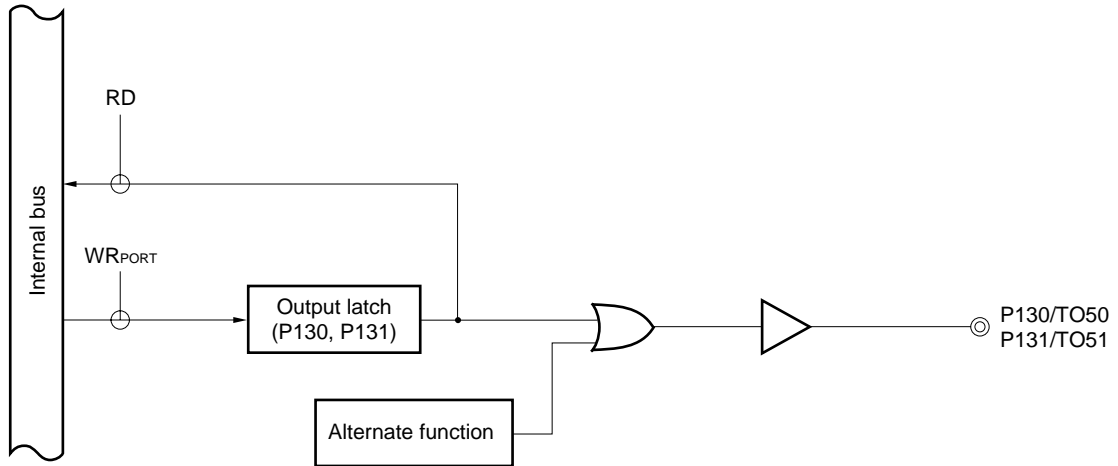

- PM : Port mode register
- RD : Port 12 read signal
- WR : Port 12 write signal

4.2.9 Port 13

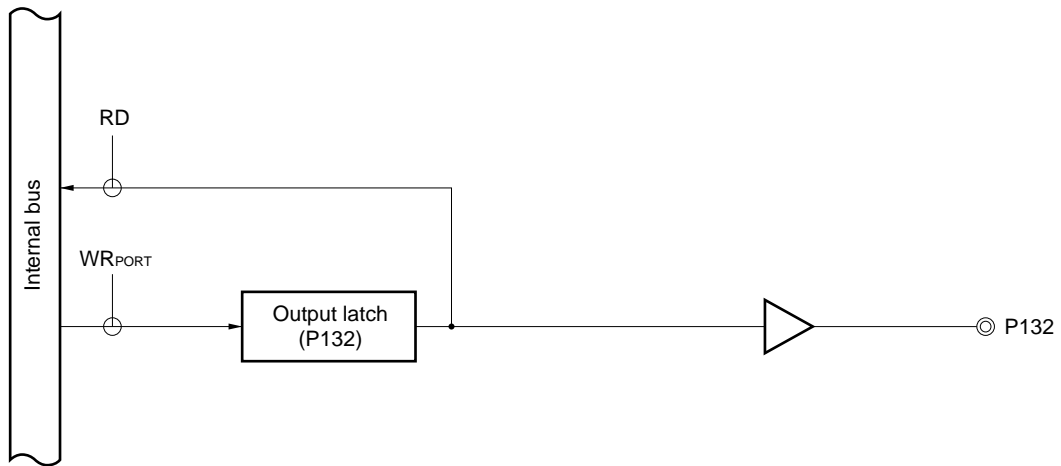

This is a 3-bit N-ch open-drain output port with an output latch.
 The pins of this port are also used as timer output pins.
 These pins are set in the general-purpose output port mode at reset.
 The port 13 block diagram is shown in Figures 4-13 and 4-14.

Figure 4-13. Block Diagram of P130 and P131

RD : Port 13 read signal
 WR : Port 13 write signal

Figure 4-14. Block Diagram of P132

RD : Port 13 read signal
 WR : Port 13 write signal

4.3 Port Function Control Registers

The following two types of registers control the ports.

- Port mode registers (PM0, PM3 to PM7, PM12)
- Pull-up resistor option register (PU4)

(1) Port mode registers (PM0, PM3 to PM7, PM12)

These registers are used to set port input/output in 1-bit units.

PM0 and PM3 to PM7, and PM12 are independently set with a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets registers to FFH.

When using a port pin as a shared function pin, set the values of port mode registers and output latch as shown in Table 4-3.

- Cautions**
1. P10 to P17 are input-only pins, and P100 to P132 are output-only pins.
 2. As port 0 has an alternate function as an external interrupt input, when the port function output mode is specified and the output level is changed, the interrupt request flag is set. When the output mode is used, therefore, the interrupt mask flag should be set to 1 beforehand.

Table 4-3. Port Mode Register and Output Latch Settings When Using Alternate Functions

Pin Name	Alternate Functions		PM _{xx}	P _{xx}
	Name	Input/Output		
P00-P04	INTP0-INTP4	Input	1	×
P10-P15	ANI0-ANI5	Input	1	×

(2) Pull-up resistor option register 4 (PU4)

This register is used to specify the use of the internal pull-up resistors of port 4. Even if the use of the pull-up resistor is specified for a particular bit in PU4, the pull-up resistor can only be used.

PU4 can be set with a 1-bit or 8-bit memory manipulation instruction.

Reset sets PU4 to 00H.

0	Internal pull-up resistor not used
1	Internal pull-up resistor used

4.4 Port Function Operations

Port operations differ depending on whether the input or output mode is set, as shown below.

4.4.1 Writing to input/output port

(1) Output mode

A value is written to the output latch by a transfer instruction, and the output latch contents are output from the pin.

Once data is written to the output latch, it is retained until data is written to the output latch again.

(2) Input mode

A value is written to the output latch by a transfer instruction, but since the output buffer is OFF, the pin status does not change.

Once data is written to the output latch, it is retained until data is written to the output latch again.

Caution In the case of 1-bit memory manipulation instruction, although a single bit is manipulated the port is accessed as an 8-bit unit. Therefore, on a port with a mixture of input and output pins, the output latch contents for pins specified as input are undefined except for the manipulated bit.

4.4.2 Reading from input/output port

(1) Output mode

The output latch contents are read by a transfer instruction. The output latch contents do not change.

(2) Input mode

The pin status is read by a transfer instruction. The output latch contents do not change.

4.4.3 Operations on input/output port

(1) Output mode

An operation is performed on the output latch contents, and the result is written to the output latch. The output latch contents are output from the pins.

Once data is written to the output latch, it is retained until data is written to the output latch again.

(2) Input mode

The output latch contents are undefined, but since the output buffer is OFF, the pin status does not change.

Caution In the case of 1-bit memory manipulation instruction, although a single bit is manipulated the port is accessed as an 8-bit unit. Therefore, on a port with a mixture of input and output pins, the output latch contents for pins specified as input are undefined, even for bits other than the manipulated bit.

CHAPTER 5 CLOCK GENERATOR

5.1 Functions of Clock Generator

The clock generator generates the clock to be supplied to the CPU and peripheral hardware. This system clock oscillator is connected to 4.5-MHz crystal resonator. At this time, set bit 0 (DTSCK0) of the DTS system clock select register (DTSCK) to 1. Set the DTSC0 flag after power application and reset by the $\overline{\text{RESET}}$ pin, and before using the basic timer, buzzer output control circuit, PLL frequency synthesizer, and frequency counter.

Oscillation can be stopped by executing the STOP instruction.

Figure 5-1. Format of DTS System Clock Select Register (DTSCK)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
DTSCK	0	0	0	0	0	0	0	DTSCK0	FFAAH	00H	R/W

DTSCK0	Selects System Clock
1	4.5 MHz
0	Setting prohibited

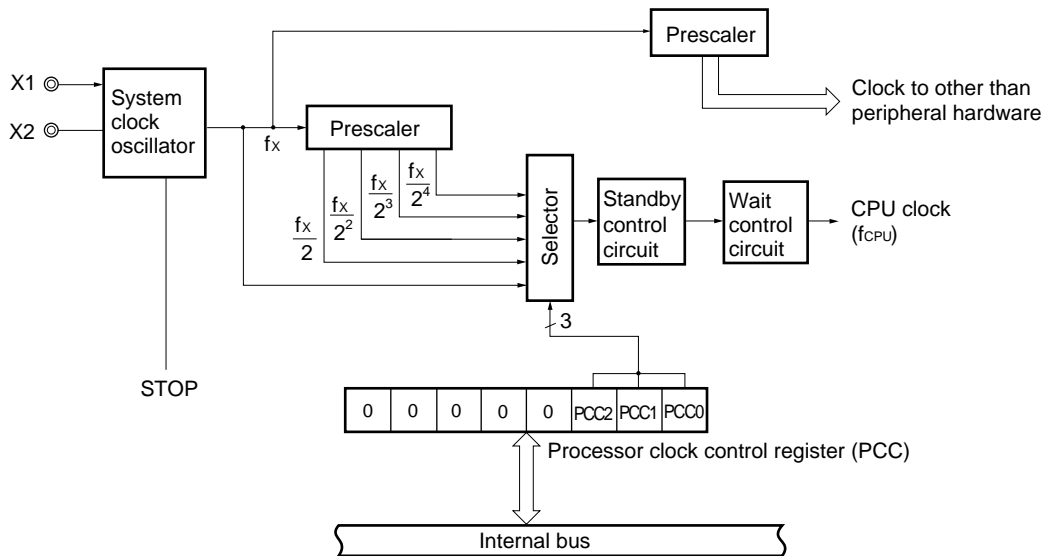

5.2 Configuration of Clock Generator

The clock generator consists of the following hardware.

Table 5-1. Configuration of Clock Generator

Item	Configuration
Control register	Processor clock control register (PCC)
Oscillator	System clock oscillator

Figure 5-2. Block Diagram of Clock Generator

5.3 Clock Generator Control Register

The clock generator is controlled by the processor clock control register (PCC).

The PCC sets CPU clock.

The PCC is set with a 1-bit or 8-bit memory manipulation instruction.

Reset input sets the PCC to 04H.

Figure 5-3. Format of Processor Clock Control Register (PCC)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
PCC	0	0	0	0	0	PCC2	PCC1	PCC0	FFFBH	04H	R/W ^{Note}
R/W	PCC2	PCC1	PCC0	CPU Clock (f_{CPU}) Selection							
	0	0	0	f_x (0.45 μ s)							
	0	0	1	$f_x/2$ (0.89 μ s)							
	0	1	0	$f_x/2^2$ (1.78 μ s)							
	0	1	1	$f_x/2^3$ (3.56 μ s)							
	1	0	0	$f_x/2^4$ (7.11 μ s)							
	Other than above			Setting prohibited							

Note Bits 3 to 7 are Read Only.

Remarks 1. f_x : System clock oscillation frequency

2. () : Minimum instruction execution time: $2/f_{CPU}$ at $f_x = 4.5$ MHz operation

5.4 System Clock Oscillator

5.4.1 System clock oscillator

The system clock oscillator oscillates with a crystal resonator (4.5 MHz TYP.) connected to the X1 and X2 pins. Figure 5-4 shows an external circuit of the system clock oscillator.

Figure 5-4. External Circuit of System Clock Oscillator

Caution When using a system clock oscillator, carry out wiring in the broken line area in Figure 5-4 to prevent any effects from wiring capacities.

- Minimize the wiring length.
- Do not allow wiring to intersect with other signal conductors. Do not allow wiring to come near changing high current.
- Set the potential of the grounding position of the oscillator capacitor to that of GND. Do not ground to any ground pattern where high current is present.
- Do not fetch signals from the oscillator.

Figure 5-5 shows examples of resonator having bad connection.

Figure 5-5. Examples of Resonator with Bad Connection (1/2)

(a) Wiring of connection circuits is too long

(b) Signal conductors intersect each other

(c) Changing high current is too near a signal conductor

(d) Current flows through the grounding line of the oscillator (potential at points A, B, and C fluctuate)

Figure 5-5. Examples of Resonator with Bad Connection (2/2)

(e) Signals are fetched

5.4.2 Scaler

The scaler divides the system clock oscillator output (f_x) and generates various clocks.

5.5 Clock Generator Operations

The clock generator generates the following various types of clocks and controls the CPU operating mode including the standby mode.

- System clock f_x
- CPU clock f_{CPU}
- Clock to peripheral hardware

The following clock generator functions and operations are determined with the processor clock control register (PCC).

- Upon generation of $\overline{\text{RESET}}$ signal, the lowest speed mode of the system clock ($7.11 \mu\text{s}$ when operated at 4.5 MHz) is selected ($\text{PCC} = 04\text{H}$). System clock oscillation stops while low level is applied to $\overline{\text{RESET}}$ pin.
- One of the five CPU clock types ($0.45, 0.89, 1.78, 3.56, 7.11 \mu\text{s}$ at 4.5 MHz) can be selected by setting the PCC and OSMS.
- Two standby modes, the STOP and HALT modes, are available.
- The system clock is divided and supplied to the peripheral hardware. The peripheral hardware also stops if the system clock is stopped.

5.6 Changing System Clock and CPU Clock Settings

5.6.1 Time required for switchover between system clock and CPU clock

The system clock and CPU clock can be switched over by means of bits 0 to 2 (PCC0 to PCC2) of the processor clock control register (PCC).

The actual switchover operation is not performed directly after writing to the PCC, but operation continues on the pre-switchover clock for several instructions (refer to **Table 5-2**).

Table 5-2. Maximum Time Required for CPU Clock Switchover

Set Values before Switchover			Set Values After Switchover														
PCC2	PCC1	PCC0	PCC2	PCC1	PCC0	PCC2	PCC1	PCC0	PCC2	PCC1	PCC0	PCC2	PCC1	PCC0	PCC2	PCC1	PCC0
			0	0	0	0	0	1	0	1	0	0	1	1	1	0	0
0	0	0	/			16 instructions			16 instructions			16 instructions			16 instructions		
0	0	1				8 instructions			8 instructions			8 instructions			8 instructions		
0	1	0				4 instructions			4 instructions			4 instructions			4 instructions		
0	1	1				2 instructions			2 instructions			2 instructions			2 instructions		
1	0	0				1 instruction			1 instruction			1 instruction			1 instruction		

Remark One instruction is the minimum instruction execution time with the pre-switchover CPU clock.

CHAPTER 6 8-BIT TIMERS/EVENT COUNTERS

6.1 Functions of 8-Bit Timers/Event Counters

The 8-bit timers/event counters (TM50 and TM51) have the following two modes:

- Mode in which an 8-bit timer/event counter is used alone (single mode)
- Mode in which the two timers/event counters are cascaded (cascade mode with a resolution of 16 bits)

These two modes are explained below.

(1) Mode in which an 8-bit timer/event counter is used alone (single mode)

It operates as an 8-bit timer/event counter.

In this mode, the following functions can be used:

- Interval timer
- External event counter
- Square wave output
- PWM output

(2) Mode in which the two timers/event counters are cascaded (cascade mode with a resolution of 16 bits)

By connecting the two 8-bit timers/event counters in cascade, they operate as a 16-bit timer/event counter.

In this mode, the following functions can be used:

- Interval timer with 16-bit resolution
- External event counter with 16-bit resolution
- Square wave output with 16-bit resolution

Figures 6-1 and 6-2 show the block diagrams of the 8-bit timers/event counters.

Figure 6-1. Block Diagram of 8-Bit Timer/Event Counter 50

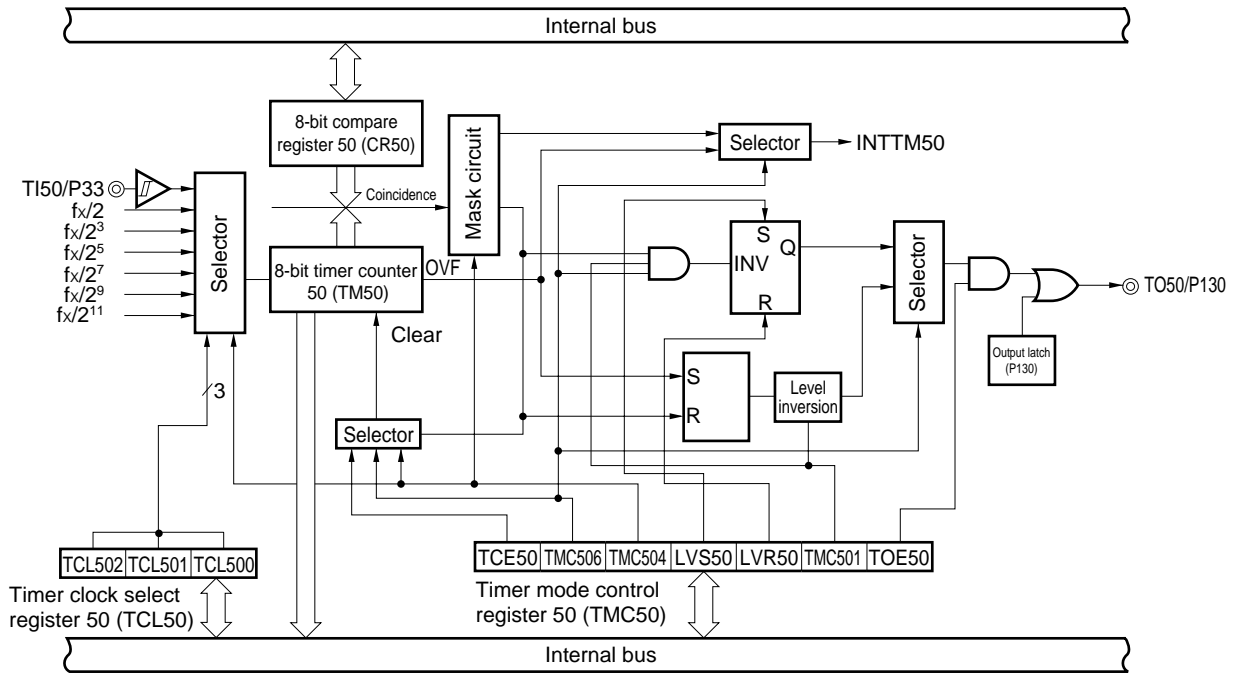

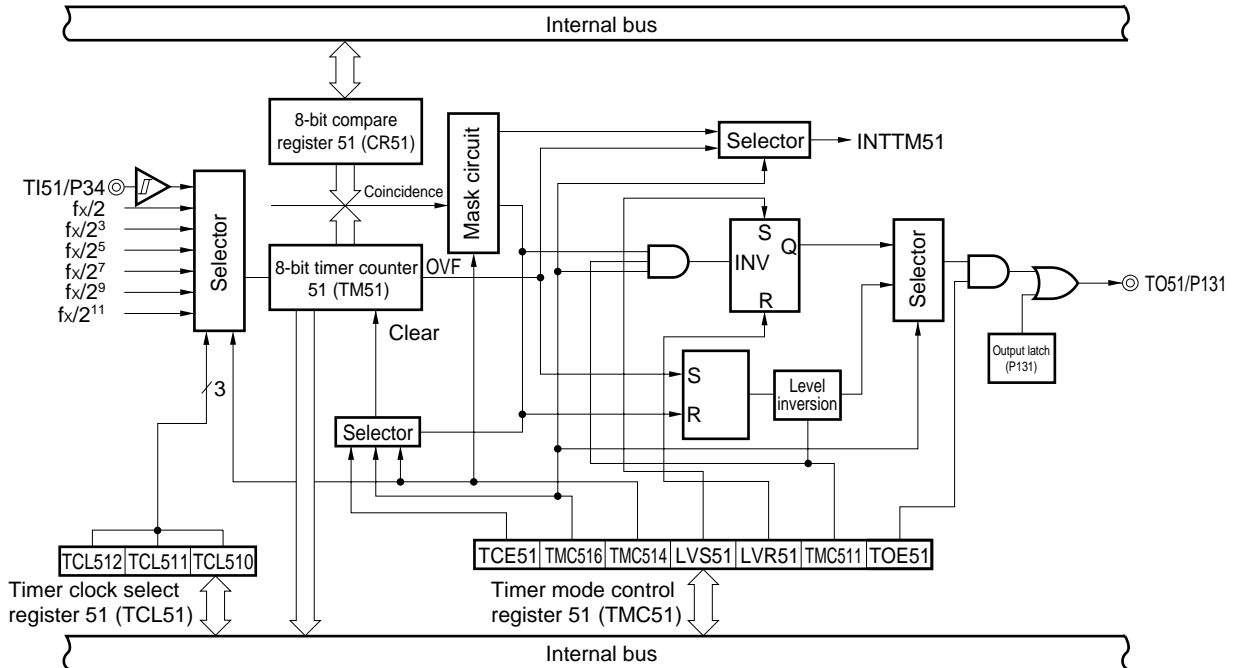

Figure 6-2. Block Diagram of 8-Bit Timer/Event Counter 51

6.2 Configuration of 8-Bit Timers/Event Counters

The 8-bit timers/event counters consist of the following hardware:

Table 6-1. Configuration of 8-Bit Timers/Event Counters

Item	Configuration
Timer register	8-bit timer counters 50 and 51 (TM50 and TM51)
Register	8-bit compare registers 50 and 51 (CR50 and CR51)
Timer output	2 lines (TO50 and TO51)
Control register	<ul style="list-style-type: none"> • Timer clock select registers 50 and 51 (TCL50 and TCL51) • 8-bit timer mode control registers 50 and 51 (TMC50 and TMC51)

(1) 8-bit timer counters 50 and 51 (TM50 and TM51)

TM50 and TM51 are 8-bit read-only registers that count the count pulses.

The counter is incremented at the rising edge of the count clock.

TM50 and TM51 can be cascaded and used as a 16-bit timer.

When TM50 and TM51 are cascaded and used as a 16-bit timer, its value can be used by using a 16-bit memory manipulation instruction. However, because TM50 and TM51 are connected with the internal 8-bit bus, each of them is read at a time. Therefore, read the value of TM50 and TM51 when used as a 16-bit timer two times for comparison, taking a change in the value during counting into consideration.

If the count value is read while the timer is operating, stop input of the count clock, and read the count value at that point. The count value is cleared to 00H in the following cases:

- <1> $\overline{\text{RESET}}$ input
- <2> Clearing TCE5n
- <3> Coincidence between TM5n and CR5n in mode in which the timer is cleared and started on coincidence between TM5n and CR5n

Caution When TM50 and TM51 are cascaded, the value of the timer is cleared to 00H even if the least significant bit (TCE50) of the timer mode control register 50 (TMC50) is cleared.

Remark n = 0, 1

(2) 8-bit compare registers 50 and 51 (CR50 and CR51)

The values set to CR50 and CR51 are always compared with the values of 8-bit timer counters 50 and 51 (TM50 and TM51). When the value of a compare register coincides with the count value of the corresponding counter, an interrupt request (INTTM50 or INTTM51) is generated (in a mode other than PWM mode).

If TM50 and TM51 are cascaded and used as a 16-bit timer, CR50 and CR51 operate together as a 16-bit compare register. Therefore, a 16-bit counter value and a 16-bit compare register value are compared, and when the two values coincide, an interrupt request (INTTM50) is generated. At this time, interrupt request INTTM51 is also generated. Therefore, mask INTTM51 when using TM50 and TM51 in the cascade mode.

Caution When TM0 and TM51 are cascaded, be sure to write data to the timers after stopping the timer operation.

6.3 Registers Controlling 8-Bit Timers/Event Counters

The following two types of registers control the 8-bit timers/event counters 50 and 51.

- Timer clock select registers 50 and 51 (TCL50 and TCL51)
- 8-bit timer mode control registers 50 and 51 (TMC50 and TMC51)

(1) Timer clock select registers 50 and 51 (TCL50 and TCL51)

These registers select the count clocks of the 8-bit timers/event counters 50 and 51 (TM50 and TM51) and the valid edge of TI50 and TI51 inputs.

TCL50 and TCL51 are set by using an 8-bit memory manipulation instruction.

At reset, the values of these registers are initialized to 00H.

Figure 6-3. Format of Timer Clock Select Register 50 (TCL50)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
TCL50	0	0	0	0	0	TCL502	TCL501	TCL500	FF84H	00H	R/W

TCL502	TCL501	TCL500	Selects Count Clock
0	0	0	Falling edge of TI50
0	0	1	Rising edge of TI50
0	1	0	$f_x/2$ (2.25 MHz)
0	1	1	$f_x/2^3$ (563 kHz)
1	0	0	$f_x/2^5$ (141 kHz)
1	0	1	$f_x/2^7$ (35.2 kHz)
1	1	0	$f_x/2^9$ (8.79 kHz)
1	1	1	$f_x/2^{11}$ (2.20 kHz)

- Cautions**
1. Before changing the data of TCL50, be sure to stop the timer operation.
 2. Be sure to reset bits 3 through 7 to “0”.

- Remarks**
1. In the cascade mode, the setting of bits TCL500 through TCL502 of the low-order timer (TM50) is valid.
 2. f_x : System clock oscillation frequency
 3. (): $f_x = 4.5$ MHz

Figure 6-4. Format of Timer Clock Select Register 51 (TCL51)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
TCL51	0	0	0	0	0	TCL512	TCL511	TCL510	FF87H	00H	R/W

TCL512	TCL511	TCL510	Selects Count Clock
0	0	0	Falling edge of TI51
0	0	1	Rising edge of TI51
0	1	0	$f_x/2$ (2.25 MHz)
0	1	1	$f_x/2^3$ (563 kHz)
1	0	0	$f_x/2^5$ (141 kHz)
1	0	1	$f_x/2^7$ (35.2 kHz)
1	1	0	$f_x/2^9$ (8.79 kHz)
1	1	1	$f_x/2^{11}$ (2.20 kHz)

- Cautions**
1. Before changing the data of TCL51, be sure to stop the timer operation.
 2. Be sure to reset bits 3 through 7 to “0”.

- Remarks**
1. In the cascade mode, the setting of bits TCL510 through TCL512 is invalid.
 2. f_x : System clock oscillation frequency
 3. (): $f_x = 4.5$ MHz

(2) 8-bit timer mode control registers 50 and 51 (TMC50 and TMC51)

TMC50 and TMC51 are registers that are used for the following:

- <1> Controlling count operation of 8-bit timer counters 50 and 51 (TM50 and TM51)
- <2> Selecting operation mode of 8-bit timer counters 50 and 51 (TM50 and TM51)
- <3> Selecting single mode or cascade mode
- <4> Setting status of timer output F/F (flip-flop)
- <5> Controlling timer F/F or selecting active level in PWM (free-running) mode
- <6> Controlling timer output

TMC50 and TMC51 can be set by using a 1-bit or 8-bit memory manipulation instruction. They are cleared to 00H at reset.

Figures 6-5 and 6-6 show the formats of TMC50 and TMC51.

Figure 6-5. Format of 8-Bit Timer Mode Control Register 50 (TMC50)

Symbol	<7>	6	5	4	<3>	<2>	1	<0>	Address	At reset	R/W

TMC516	Selects Operating Mode of TM51
0	Mode of clearing and starting TM51 on coincidence between TM51 and CR51
1	PWM (free-running) mode

TMC514	Selects Single Mode or Cascade Mode
0	Single mode
1	Cascade mode (connected to low-order timer (TM50))

LVS51	LVR51	Setting Status of Timer Output F/F
0	0	Not affected
0	1	Resets timer output F/F to 0
1	0	Sets timer output F/F to 1
1	1	Setting prohibited

TMC511	Other Than PWM Mode (TMC516 = 0)	PWM Mode (TMC516 = 1)
	Controls timer F/F	Selects active level
0	Disables inversion operation	High active
1	Enables inversion operation	Low active

TOE51	Controls Timer Output
0	Disables output (port mode)
1	Enables output

- Remarks**
1. The PWM output becomes inactive when TCE51 = 0 in the PWM mode.
 2. LVS51 and LVR51 are 0 when read after data has been set.

6.4 Operations of 8-Bit Timers/Event Counters

6.4.1 Operation as interval timer (8-bit)

The 8-bit timer/event counter operates as an interval timer that repeatedly generates an interrupt request at the interval specified by the count value set in advance in 8-bit compare register 5n (CRn).

When the count value of 8-bit timer counter 5n (TM5n) coincides with the value set in CR5n, the value of TM5n is cleared to 0. TM5n continues counting and an interrupt request signal (INTTM5n) is generated.

The count clock of TM5n can be selected by using bits 0 through 2 (TCL5n0 through TCL5n2) of the timer clock select register 5n (TCL5n).

For the operation if the value of the compare register is changed while the timer count operation, refer to **(2)** in

6.5 Notes on 8-Bit Timers/Event Counters.

[Setting]

<1> Set each register.

- TCL5n : Select a count clock.
- CR5n : Compare value
- TMC5n : Select a mode in which TM5n is cleared and started on coincidence between TM5n and CR5n (TMC5n = 0000xx0B: x = don't care).

<2> The count operation is started when TEC5n is set to 1.

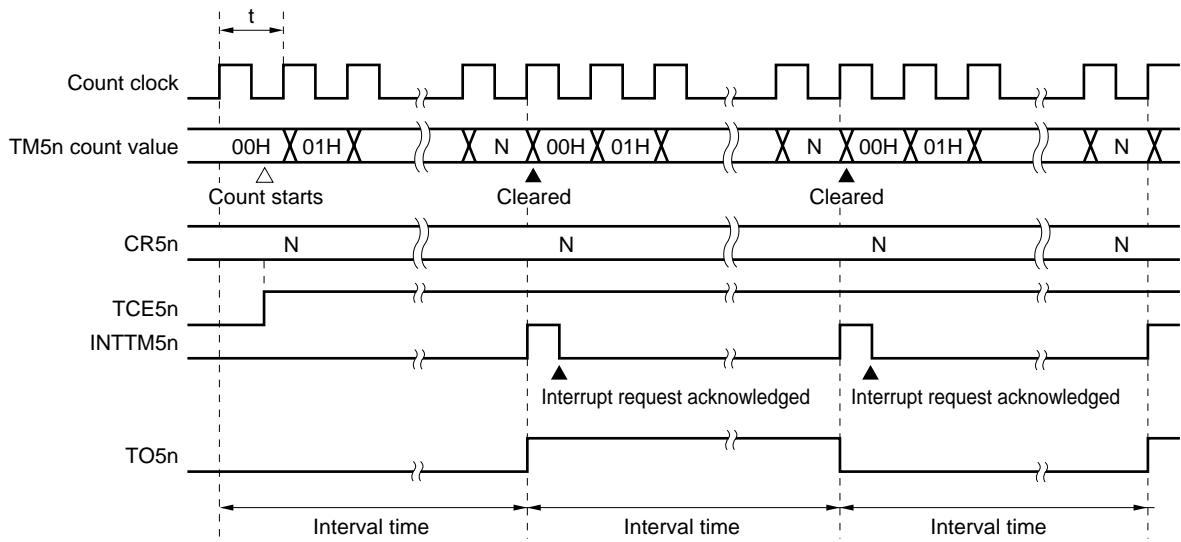

<3> INTTM5n is generated if the values of TM5n and CR5n coincide (TM5n is cleared to 00H).

<4> After that, INTTM5n is repeatedly generated at fixed intervals. To stop the count operation, clear TCE5n to 0.

Remark n = 0 or 1

Figure 6-7. Timing of Interval Timer Operation (1/3)

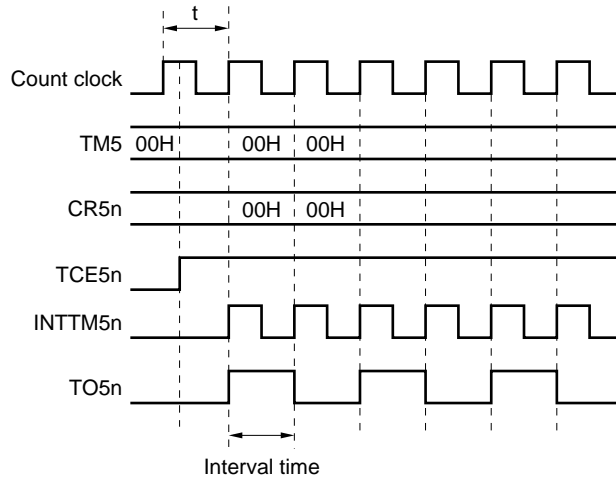

(a) Basic operation

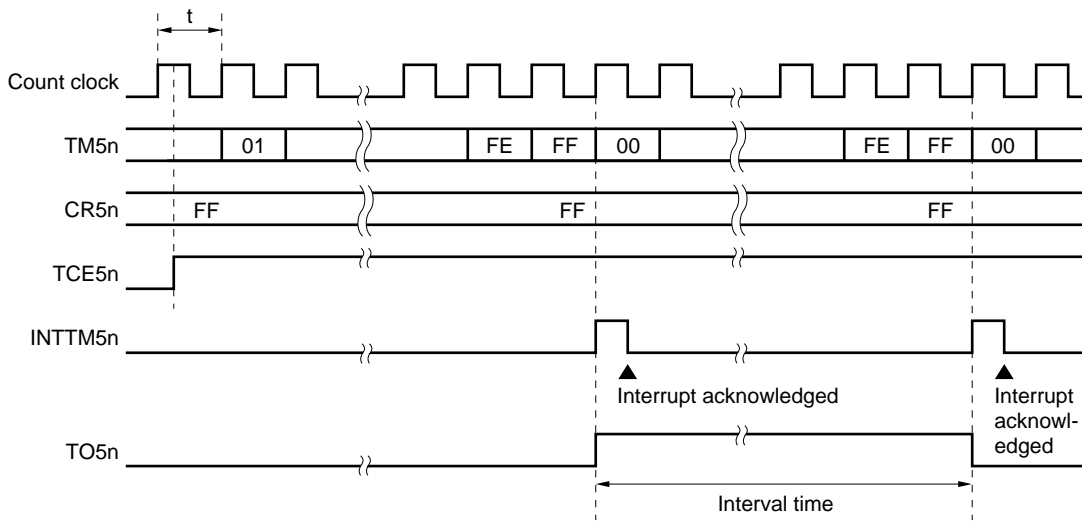

- Remarks**
- Interval time = $(N + 1) \times t$; $N = 00H$ to FFH
 - $n = 0$ or 1

Figure 6-7. Timing of Interval Timer Operation (2/3)

(b) When CR5n = 00H

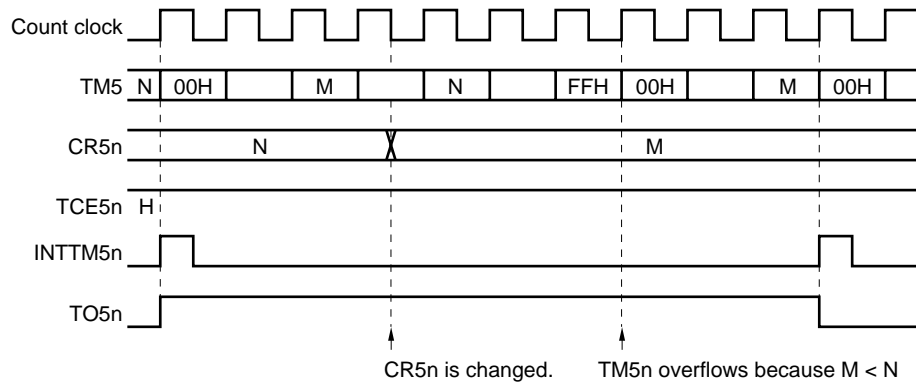

(c) When CR5n = FFH

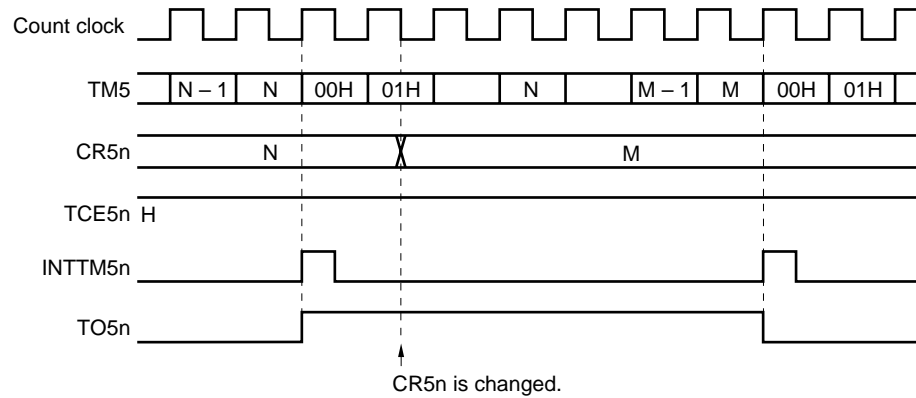

n = 0 or 1

Figure 6-7. Timing of Interval Timer Operation (3/3)

(d) Operation when CR5n is changed ($M < N$)

(e) Operation when CR5n is changed ($M > N$)

n = 0 or 1

6.4.2 Operation as external event counter

The external event counter counts the number of clock pulses input from an external source to TI5n pin with 8-bit timer counter 5n (TM5n).

Each time the valid edge specified by timer clock select register 5n (TCL5n) has been input to TI5n, the value of TM5n is incremented. As the valid edge, either the rising or falling edge can be selected.

When the count value of TM5n coincides with the value of 8-bit compare register 5n (CR5n), TM5n is cleared to 0, and an interrupt request signal (INTTM5n) is generated.

After that, each time the value of TM5n coincides with the value of CR5n, INTTM5n is generated.

[Setting]

<1> Set each register.

- TCL5n : Select the valid edge of TI5n input.
- CR5n : Compare value
- TMC5n : Select a mode in which TM5n is cleared and started on coincidence between TM5n and CR5n.

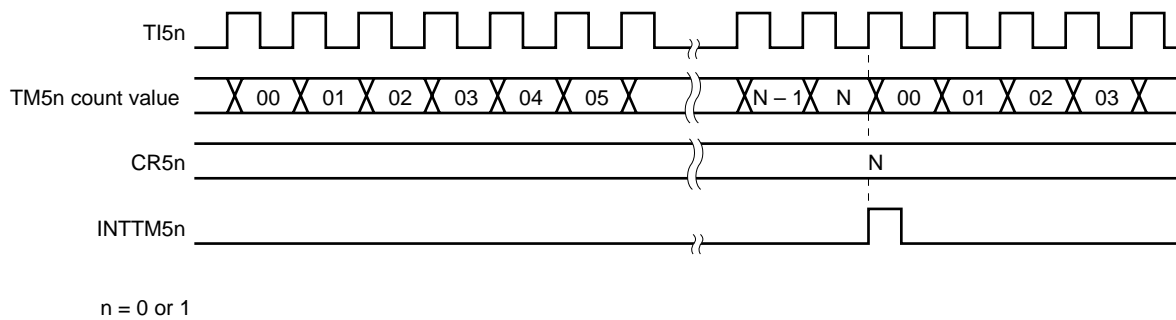

<2> The count operation is started when TEC5n is set to 1.

<3> INTTM5n is generated if the values of TM5n and CR5n coincide (TM5n is cleared to 00H).

<4> After that, INTTM5n is generated each time the value of TM5n coincides with the value of CR5n. To stop the count operation, clear TCE5n to 0.

Remark n = 0 or 1

Figure 6-8. Operation Timing of External Event Counter (with rising edge specified)

6.4.3 Square wave output operation (8-bit resolution)

The 8-bit timer/event counter TM5n can be used to output a square wave with any frequency at time interval specified by the value set in advance in 8-bit compare register 5n (CR5n).

When bit 0 (TOE5n) of 8-bit timer mode control register 5n (TMC5n) is set to 1, the output status of TO5n is inverted at the interval specified by the count value set in advance to CR5n. In this way, a square wave (duty factor = 50%) of any frequency can be output.

[Setting]

<1> Set each register.

- Reset the port latch and port mode register to "0".
- TCL5n : Select a count clock.
- CR5n : Compare value
- TMC5n : Mode in which TM5n is cleared and started on coincidence between TM5n and CR5n

LVS5n	LVR5n	Sets Status of Timer Output F/F
1	0	High-level output
0	1	Low-level output

Enable inverting the timer F/F.

Enable the timer output → TOE5n = 1.

<2> When TCE5n is set to 1, the count operation is started.

<3> When the value of TM5n coincides with the value of CR5n, the timer output F/F is inverted.

In addition, INTTM5n is generated, and TM5n is cleared to 00H.

<4> After that, the timer output F/F is inverted at fixed intervals, and a square wave is output from TO5n.

Remark n = 0 or 1

Figure 6-9. Timing of Square Output Operation

Note The initial value of TO5n output can be set by using bits 2 and 3 (LVR5n and LVS5n) of 8-bit timer mode control register 5n (TMC5n).

Remark n = 0 or 1

6.4.4 8-bit PWM output operation

The 8-bit timer/event counter can be used for PWM output when bit 6 (TMC5n6) of 8-bit timer mode control register 5n (TMC5n) is set to "1".

The pulse with a duty factor determined by the value set in 8-bit compare register 5n (CR5n) is output from TO5n.

Set the active level width of the PWM pulse to CR5n. The active level is selected by bit 1 (TMC5n1) of TMC5n.

The count clock can be selected by bits 0 through 2 (TCL5n0 through TCL5n2) of timer clock select register n (TCL5n).

PWM output can be enabled or disabled by bit 0 (TOE5n) of TMC5n.

Caution The value of CR5n can be rewritten only one in one cycle in the PWM mode.

Remark n = 0 or 1

(1) Basic operation of PWM output

[Setting]

- <1> Set port latches (P130 and P131) to "0".
- <2> Select an active level width by using the 8-bit compare register (CR5n).
- <3> Select a count clock by using the timer clock select register 5n (TCL5n).
- <4> Select an active level by using bit 1 (TMC5n1) of TMC5n.
- <5> When bit 7 (TCE5n) of TMC5n is set to "1", the count operation is started.
To stop the count operation, reset TCE5n to "0".

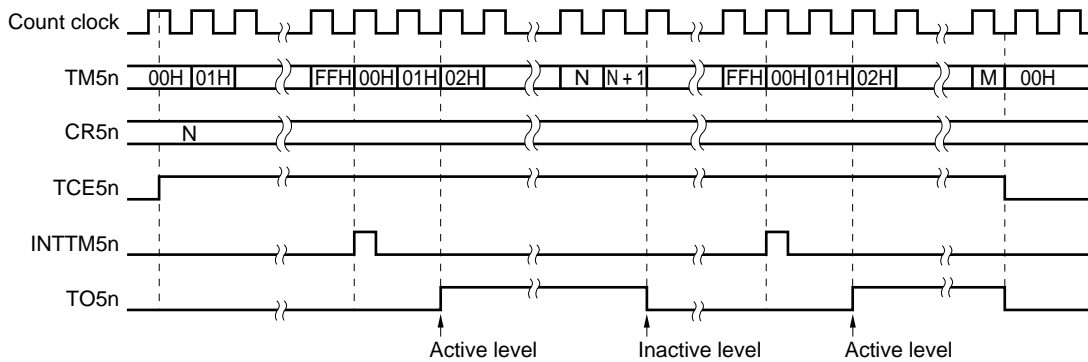

[Operation of PWM output]

- <1> When the count operation is started, the PWM output (output from TO5n) remains inactive until an overflow occurs.
- <2> When an overflow occurs, the active level set in step <1> above is output. This active level is output until the value of CR5n coincides with the count value of 8-bit timer counter 5n (TM5n).
- <3> The PWM output remains inactive after CR5n and the count value of TM5n have coincided, until an overflow occurs again.
- <4> After that, <2> and <3> are repeated until the count operation is stopped.
- <5> When the count operation is stopped because TCE5n is cleared to 0, the PWM output becomes inactive.

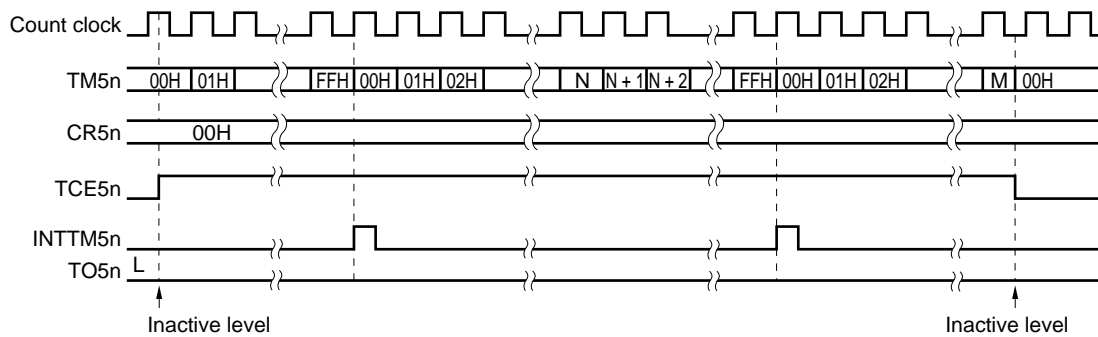

Remark n = 0 or 1

Figure 6-10. Operation Timing of PWM Output

(a) Basic operation (when active level = H)

(b) When CR5n = 0

(c) When CR5n = FFH

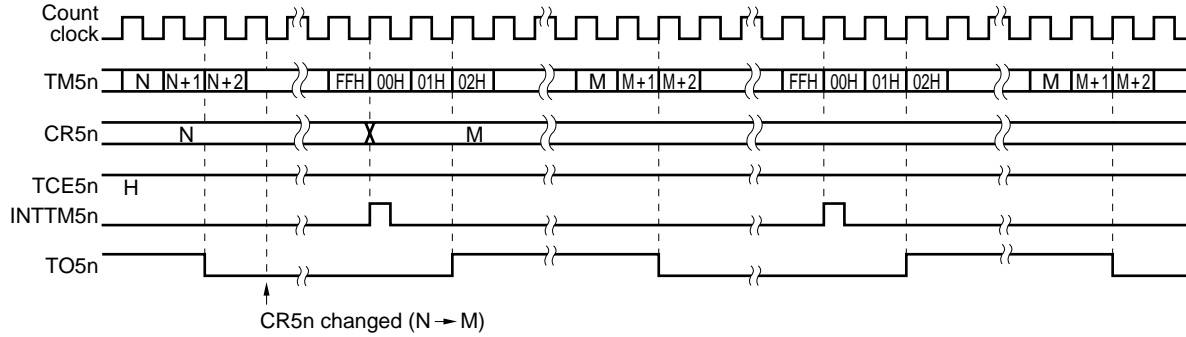

n = 0 or 1

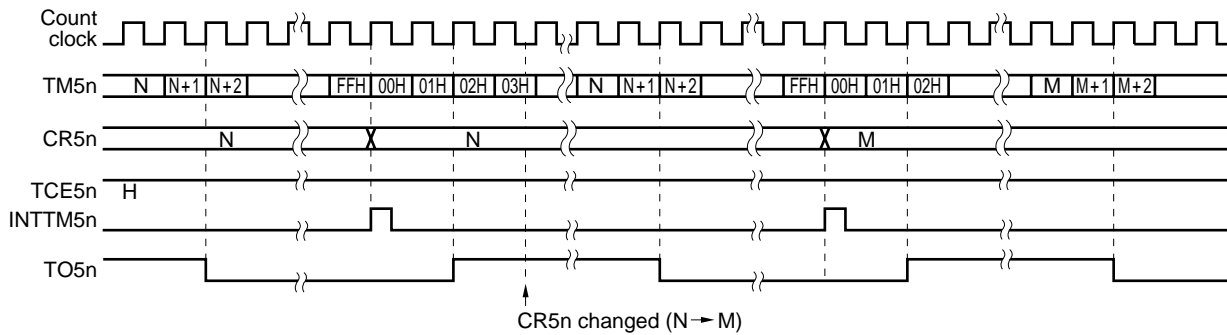

(2) Operation when CR5n is changed

Figure 6-11. Timing of Operation When CR5n Is Changed

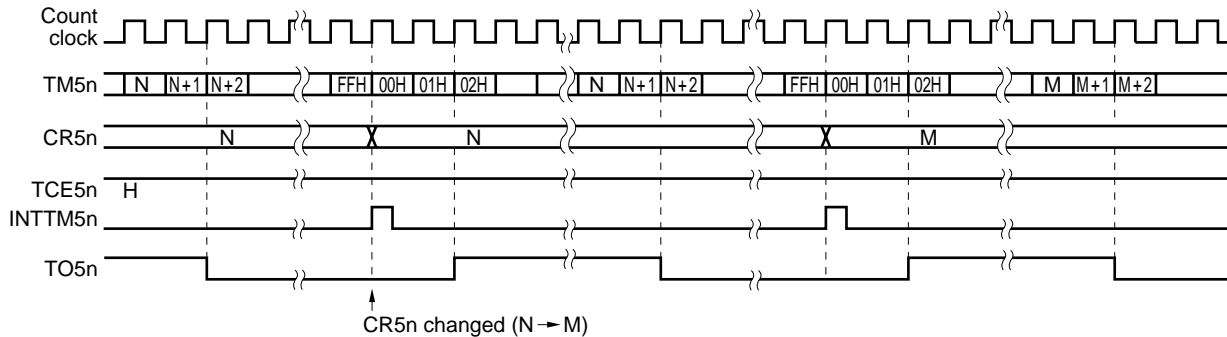

(a) If value of CR5n is changed from N to M before overflow of TM5n

(b) If value of CR5n is changed from N to M after overflow of TM5n

(c) If value of CR5n is changed from N to M for duration of 2 clocks immediately after overflow of TM5n

n = 0 or 1

Caution The value of CR5n can be changed only once in one cycle in the PWM mode.

6.4.5 As interval timer operation (16-bit)

The 8-bit timers/event counters are used together in a 16-bit timer/counter mode when bit 4 (TMC514) of the 8-bit timer mode control register 51 (TM51) is set to "1".

In this mode, the 8-bit timers/event counters are used as a 16-bit interval timer that repeatedly generates an interrupt request at intervals specified by the count value set in advance in the 8-bit compare registers (CR50 and CR51).

At this time, CR50 serves as the low-order 8 bits of the 16-bit compare register, and CR51 serves as the high-order 8 bits.

[Setting]

<1> Set each register.

- TCL50 : Select a count clock for TM50.
The count clock for TM51, which is cascaded, does not have to be set.
- CR50 and CR51 : Compare values (Each compare value can be set in a range of 00H to FFH.)
- TMC50 and TMC51 : Select a mode in which the interval timer is cleared and started on coincidence between TM50 and CR50 (or between TM51 and CR51).

$$\left(\begin{array}{l} \text{TM50} \rightarrow \text{TMC50} = 0000\text{xxx}0\text{B } \times: \text{ don't care} \\ \text{TM51} \rightarrow \text{TMC51} = 0001\text{xxx}0\text{B } \times: \text{ don't care} \end{array} \right)$$

<2> The count operation is started by setting TCE51 of TMC51 to 1 first, and then TCE50 of TMC50 to 1.

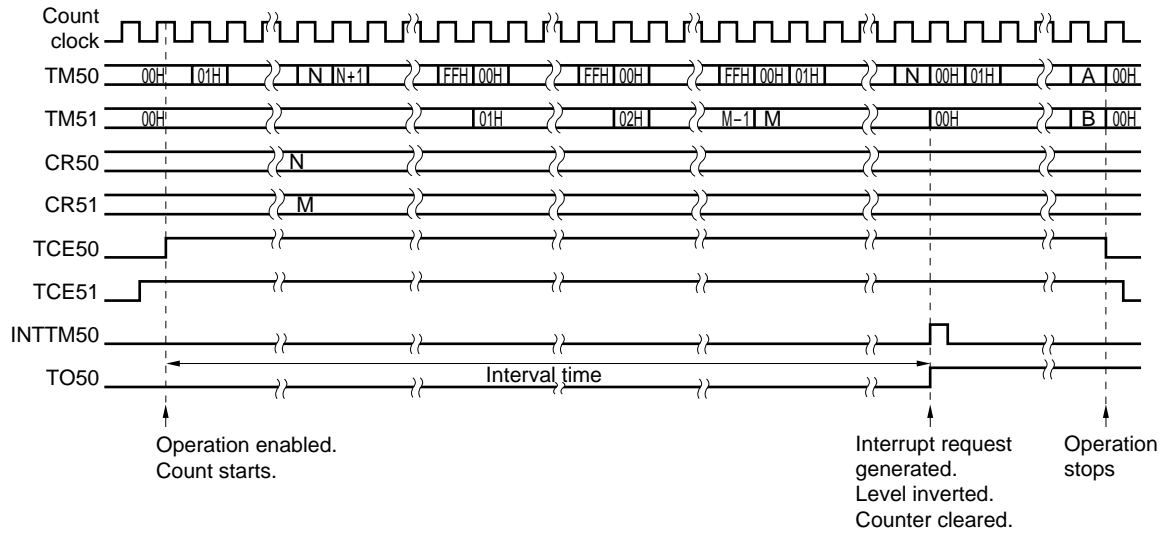

<3> If the value of cascaded timer TM50 coincides with the value of CR50, INTTM50 of TM50 is generated (TM50 and TM51 are cleared to 00H).

<4> After that, INTTM50 is repeatedly generated at fixed intervals.

- Cautions**
1. Be sure to set the compare registers (CR50 and CR51) after stopping the timer operation.
 2. Even if the 8-bit timers/counters are cascaded, INTTM51 of TM51 is generated when the count value of TM51 coincides with CR51. Be sure to mask TM51 to disable this interrupt.
 3. Set TCE50 and TCE51 in the order of TM51 and TM50.
 4. Counting can be restarted or stopped by setting or resetting only TCE50 of TM50 to 1 or 0.

Figure 6-12 shows a timing example in the 16-bit cascade mode.

Figure 6-12. 16-Bit Cascade Mode

6.5 Notes on 8-Bit Timers/Event Counters

(1) Error on starting timer

An error of up to 1 clock occurs after the timer has been started until a coincidence signal is generated. This is because 8-bit timer counter 5n (TM5n) is started asynchronously with the count pulse.

Figure 6-13. Start Timing of 8-Bit Timer Counter

n = 0 or 1

(2) Operation after changing compare register during timer count operation

If a new value of 8-bit compare register 5n (CR5n) is less than the value of 8-bit timer counter 5n (TM5n), counting continues, TM5n overflows and starts counting from 0. If the new value of CR5n (M) is less than the old value (N), therefore, it is necessary to restart the timer after changing CR5n.

Figure 6-14. Timing after Changing Compare Register Value during Timer Count Operation

Caution Be sure to clear TCE5n to 0 to set the STOP status, except when TI5n input is selected.

Remarks 1. $N > X > M$

2. $n = 0$ or 1

(3) Reading TM5n (n = 0 or 1) during timer operation

When TM5n is read during operation, the count clock is temporarily stopped. Therefore, select a count clock with a high/low level longer than two cycles of the CPU clock. For example, when the CPU clock (f_{CPU}) is f_x , the count clock to be selected should be $f_x/4$ or less in order that TM5n can be read.

Remark $n = 0$ or 1

[MEMO]

CHAPTER 7 BASIC TIMER

The basic timer is used for time management during program execution.

7.1 Function of Basic Timer

The basic timer generates an interrupt request signal (INTBTM0) at time intervals of 100 ms.

7.2 Configuration of Basic Timer

Figure 7-1. Block Diagram of Basic Timer

Caution Use the basic timer after setting bit 0 of the DTS system clock select register (DETSCK) to 1 after power application, and after reset by the $\overline{\text{RESET}}$ pin (refer to 5.1 Functions of Clock Generator). The first interrupt request signal (INTBTM0) after the DTSC0 flag has been set is generated within 100 to 140 ms. The second signal and those that follow are generated at intervals of 100 ms.

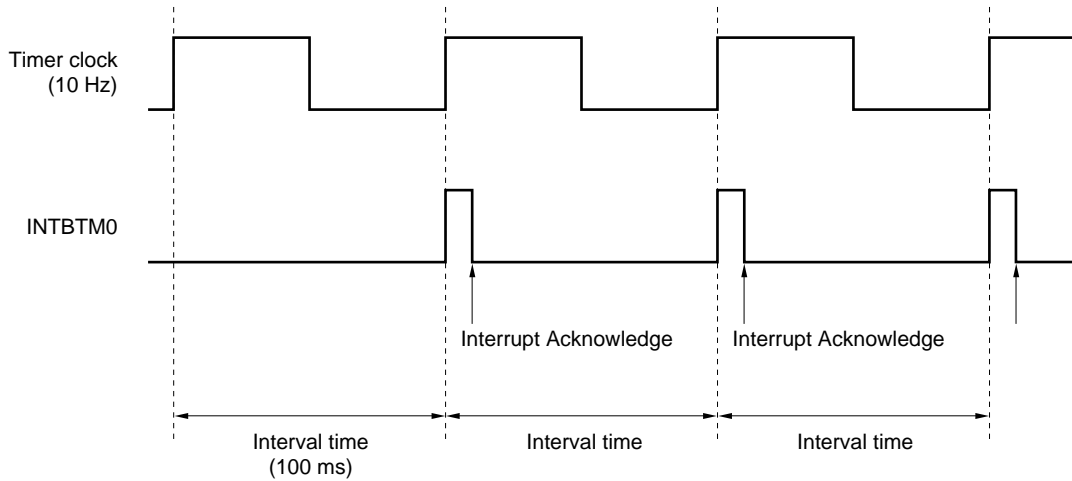

7.3 Operation of Basic Timer

An example of the operation of the basic timer is shown below.

In this example, the basic timer operates as an interval timer that repeatedly generates an interrupt at time intervals of 100 ms. Interrupt request signal (INTBTM0) is generated every 100 ms.

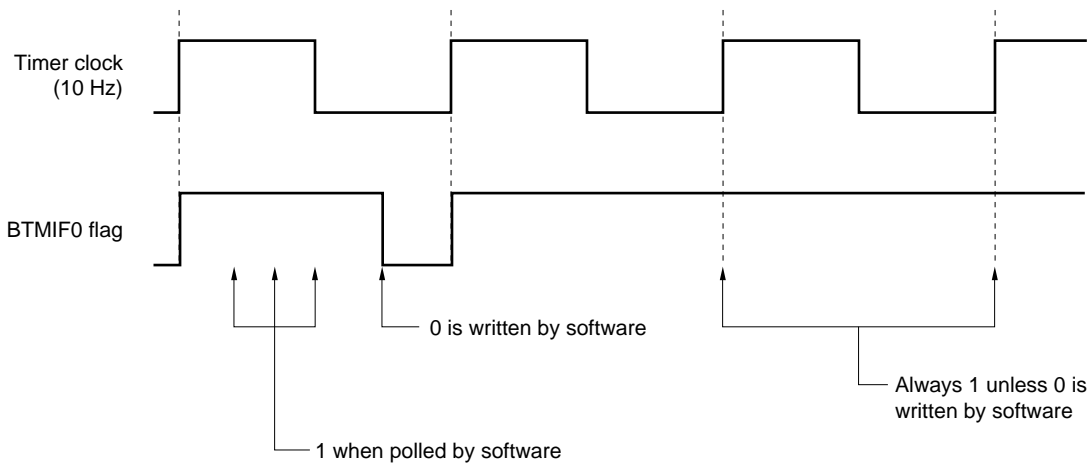

The timer clock frequency is 10 Hz.

Figure 7-2. Operation Timing of Basic Timer

By polling the interrupt request flag (BTMIF0) of this basic timer by software, time management can be carried out. Note that BTMIF0 is not a Read & Reset flag.

Figure 7-3. Operating Timing to Poll BTMIF0 Flag

For the registers controlling the basic timer, refer to **CHAPTER 14 INTERRUPT FUNCTIONS**.

CHAPTER 8 WATCHDOG TIMER

8.1 Functions of Watchdog Timer

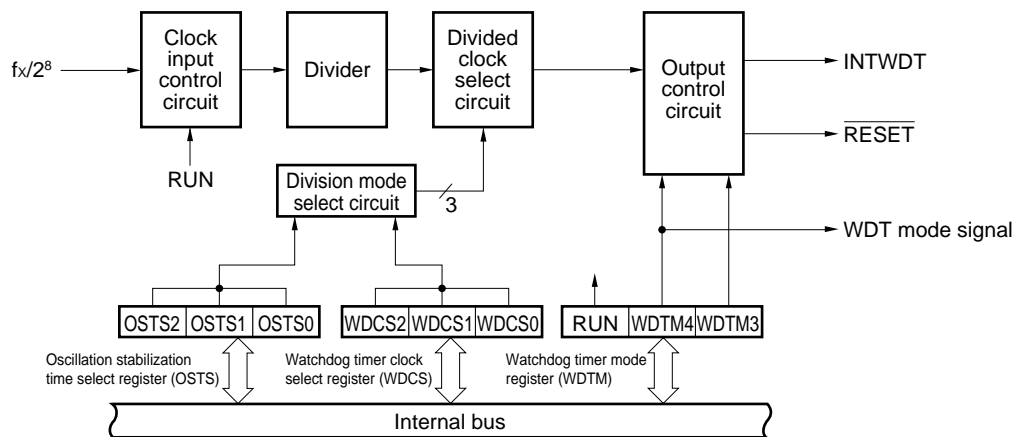

The watchdog timer has the following functions.

- Watchdog timer
- Interval timer
- Selecting oscillation stabilization time

Caution Select the watchdog timer mode or the interval timer mode with the watchdog timer mode register (WDTM). (The watchdog timer and interval timer cannot be used simultaneously.)

Figure 8-1 shows a block diagram.

Figure 8-1. Block Diagram of Watchdog Timer

(1) Watchdog timer mode

An inadvertent program loop is detected. Upon detection of the inadvertent program loop, a non-maskable interrupt request or reset can be generated.

Table 8-1. Watchdog Timer Inadvertent Program Loop Detection Times

Inadvertent Program Loop Detection Time
$2^{12}/f_x$ (910 μ s)
$2^{13}/f_x$ (1.82 ms)
$2^{14}/f_x$ (3.64 ms)
$2^{15}/f_x$ (7.28 ms)
$2^{16}/f_x$ (14.6 ms)
$2^{17}/f_x$ (29.1 ms)
$2^{18}/f_x$ (58.3 ms)
$2^{20}/f_x$ (233 ms)

Remarks 1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5$ MHz

(2) Interval timer mode

Interrupt requests are generated at the preset time intervals.

Table 8-2. Interval Times

Interval Time
$2^{12} / f_x$ (910 μ s)
$2^{13}/f_x$ (1.82 ms)
$2^{14}/f_x$ (3.64 ms)
$2^{15}/f_x$ (7.28 ms)
$2^{16}/f_x$ (14.6 ms)
$2^{17}/f_x$ (29.1 ms)
$2^{18}/f_x$ (58.3 ms)
$2^{20}/f_x$ (233 ms)

Remarks 1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5$ MHz

8.2 Configuration of Watchdog Timer

The watchdog timer consists of the following hardware.

Table 8-3. Configuration of Watchdog Timer

Item	Configuration
Control register	Watchdog timer clock select register (WDCS) Watchdog timer mode register (WDTM) Oscillation stabilization time select register (OSTS)

8.3 Watchdog Timer Control Registers

The following three types of registers are used to control the watchdog timer.

- Watchdog timer clock select register (WDCS)
- Watchdog timer mode register (WDTM)
- Oscillation stabilization time select register (OSTS)

(1) Watchdog timer clock select register (WDCS)

This register sets the watchdog timer and overflow time of the interval timer.

WDCS is set with a 1-bit or 8-bit memory manipulation instruction.

Reset input sets WDCS to 00H.

Figure 8-2. Format of Watchdog Timer Clock Select Register (WDCS)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
WDCS	0	0	0	0	0	WDCS2	WDCS1	WDCS0	FF42H	00H	R/W

WDCS2	WDCS1	WDCS0	Watchdog Timer/Interval Timer Overflow Time
0	0	0	$2^{12}/f_x$ (910 μ s)
0	0	1	$2^{13}/f_x$ (1.82 ms)
0	1	0	$2^{14}/f_x$ (3.64 ms)
0	1	1	$2^{15}/f_x$ (7.28 ms)
1	0	0	$2^{16}/f_x$ (14.6 ms)
1	0	1	$2^{17}/f_x$ (29.1 ms)
1	1	0	$2^{18}/f_x$ (58.3 ms)
1	1	1	$2^{20}/f_x$ (233 ms)

- Remarks**
1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5$ MHz

(2) Watchdog timer mode register (WDTM)

This register sets the watchdog timer operating mode and enables/disables counting. WDTM is set with a 1-bit or 8-bit memory manipulation instruction. Reset input sets WDTM to 00H.

Figure 8-3. Format of Watchdog Timer Mode Register (WDTM)

Symbol	<7>	6	5	4	3	2	1	0	Address	At reset	R/W
WDTM	RUN	0	0	WDTM4	WDTM3	0	0	0	FFF9H	00H	R/W

RUN	Watchdog Timer Operating Mode Selection ^{Note 1}
0	Count stop
1	Counter is cleared and counting starts.

WDTM4	WDTM3	Watchdog Timer Operating Mode Selection ^{Note 2}
0	×	Interval timer mode ^{Note 3} (Maskable interrupt occurs upon generation of an overflow.)
1	0	Watchdog timer mode 1 (Non-maskable interrupt occurs upon generation of an overflow.)
1	1	Watchdog timer mode 2 (Reset operation is activated upon generation of an overflow.)

- Notes**
- Once set to 1, RUN cannot be cleared to 0 by software. Therefore, use $\overline{\text{RESET}}$ input to clear RUN to 0.
 - WDTM starts interval timer operation at a time RUN is set to 1.
 - Once set to 1, WDTM3 and WDTM4 cannot be cleared to 0 by software.

Caution When 1 is set in RUN so that the watchdog timer is cleared, the actual overflow time is up to 0.5 % shorter than the time set by timer clock select register (WDCS).

Remark ×: don't care

(3) Oscillation stabilization time select register (OSTS)

This register is used to select the time required for oscillation to stabilize after the $\overline{\text{RESET}}$ signal has been input or the STOP mode has been released.

This register is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is set to 04H at reset. To release the STOP mode by $\overline{\text{RESET}}$ input, therefore, it takes $2^{17}/f_x$ to release the STOP mode.

Figure 8-4. Format of Oscillation Stabilization Time Select Register (OSTS)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
OSTS	0	0	0	0	0	OSTS2	OSTS1	OSTS0	FFFAH	04H	R/W

OSTS2	OSTS1	OSTS0	Selects Oscillation Stabilization Time
0	0	0	$2^{12}/f_x$ (910 μs)
0	0	1	$2^{14}/f_x$ (3.64 ms)
0	1	0	$2^{15}/f_x$ (7.28 ms)
0	1	1	$2^{16}/f_x$ (14.6 ms)
1	0	0	$2^{17}/f_x$ (29.1 ms)
Others			Setting prohibited

Remarks 1. f_x : System clock oscillation frequency

2. (): $f_x = 4.5 \text{ MHz}$

8.4 Operations of Watchdog Timer

8.4.1 Watchdog timer operation

When bit 4 (WDTM4) of the watchdog timer mode register (WDTM) is set to 1, the watchdog timer is operated to detect any inadvertent program loop.

The watchdog timer count clock (inadvertent program loop detection time interval) can be selected with bits 0 to 2 (WDCS0 to WDCS2) of the timer clock select register 2 (WDCS). Watchdog timer starts count operation by setting bit 7 (RUN) of WDTM to 1. After the watchdog timer starts count operation, set RUN to 1 within the set inadvertent program loop time interval.

The watchdog timer can be cleared and counting is started by setting RUN to 1. If RUN is not set to 1 and the inadvertent program loop detection time is past, system reset or a non-maskable interrupt request is generated according to the WDTM bit 3 (WDTM3) value.

The watchdog timer continues operating in the HALT mode but it stops in the STOP mode. Thus, set RUN to 1 before the STOP mode is set, clear the watchdog timer and then execute the STOP instruction.

Caution The actual inadvertent program loop detection time may be shorter than the set time by a maximum of 0.5 %.

Table 8-4. Watchdog Timer Inadvertent Program Loop Detection Time

Inadvertent Program Loop Detection Time
$2^{12}/f_x$ (910 μ s)
$2^{13}/f_x$ (1.82 ms)
$2^{14}/f_x$ (3.64 ms)
$2^{15}/f_x$ (7.28 ms)
$2^{16}/f_x$ (14.6 ms)
$2^{17}/f_x$ (29.1 ms)
$2^{18}/f_x$ (58.3 ms)
$2^{20}/f_x$ (233 ms)

- Remarks**
1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5$ MHz

8.4.2 Interval timer operation

The watchdog timer operates as an interval timer which generates interrupt requests repeatedly at an interval of the preset count value when bit 3 (WDTM3) and bit 4 (WDTM4) of the watchdog timer mode register (WDTM) is set to 1 and 0, respectively.

A count clock (interval time) can be selected by using bits 0 through 2 (WDCS0 through WDCS2) of the watchdog timer clock select register (WDCS). By setting bit 7 (RUN) of WDTM to 1, the watchdog timer starts operating as an interval timer.

When the watchdog timer operated as interval timer, the interrupt mask flag (WDTMK) and priority specification flag (WDTPR) are validated and the maskable request interrupt (INTWDT) can be generated. Among maskable interrupt requests, the INTWDT default has the highest priority.

The interval timer continues operating in the HALT mode but it stops in STOP mode. Thus, set RUN to 1 before the STOP mode is set, clear the interval timer and then execute the STOP instruction.

- Cautions**
1. Once bit 4 (WDTM4) of WDTM is set to 1 (with the watchdog timer mode selected), the interval timer mode is not set unless **RESET** is input.
 2. The interval time just after setting with WDTM may be shorter than the set time by a maximum of 0.5 %.

Table 8-5. Interval Timer Interval Time

Interval Time
$2^{12}/f_x$ (910 μ s)
$2^{13}/f_x$ (1.82 ms)
$2^{14}/f_x$ (3.64 ms)
$2^{15}/f_x$ (7.28 ms)
$2^{16}/f_x$ (14.6 ms)
$2^{17}/f_x$ (29.1 ms)
$2^{18}/f_x$ (58.3 ms)
$2^{20}/f_x$ (233 ms)

- Remarks**
1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5$ MHz

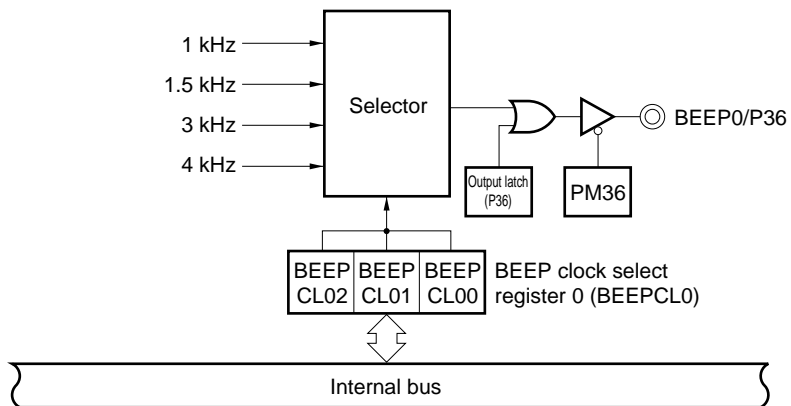

CHAPTER 9 BUZZER OUTPUT CONTROL CIRCUIT

9.1 Functions of Buzzer Output Control Circuit

The buzzer output control circuit outputs a square wave of the buzzer frequency selected by the BEEP clock select register 0 (BEEPCL0) from the BEEP0/P36 pin.

Figure 9-1 shows the block diagram of BEEP0.

Figure 9-1. Block Diagram of Buzzer Output Control Circuit

9.2 Configuration of Buzzer Output Control Circuit

The buzzer output control circuit consists of the following hardware:

Table 9-1. Configuration of Buzzer Output Control Circuit

Item	Configuration
Control register	BEEP clock select register 0 (BEEPCL0)

9.3 Registers Controlling Buzzer Output Circuit

The buzzer output control circuit is controlled by the following register:

- BEEP clock select register 0 (BEEPCL0)

(1) BEEP clock select register 0 (BEEPCL0)

This register selects the frequency of buzzer output.

BEEPCL0 is set by using a 1-bit or 8-bit memory manipulation instruction.

This register is initialized to 00H at reset.

Figure 9-2. Format of BEEP Clock Select Register 0 (BEEPCL0)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
BEEP CL0	0	0	0	0	0	BEEP CL02	BEEP CL01	BEEP CL00	FF41H	00H	R/W

BEEP CL02	BEEP CL01	BEEP CL00	Selects Frequency of BEEP0 Output
0	×	×	Disables buzzer output (port function)
1	0	0	1 kHz
0	0	1	3 kHz
1	1	0	4 kHz
1	1	1	1.5 kHz

Caution The selected clock may not be correctly output during the period of 1 cycle immediately after the output clock has been changed.

9.4 Operation of Buzzer Output Control Circuit

The buzzer frequency is output in the following procedure:

- <1> Select a buzzer output clock by using bits 0 through 2 (BEEPCL00 through BEEPCL02) of the BEEP clock select register 0 (BEEPCL0).
- <2> Reset the output latch of P36 to 0.
- <3> Reset bit 6 (PM36) of the port mode register 3 to 0 (set the output mode).

CHAPTER 10 A/D CONVERTER

10.1 Functions of A/D Converter

The A/D converter converts an analog input into a digital value. It consists of 6 channels (ANI0 to ANI5) with an 8-bit resolution.

The conversion method is based on successive approximation and the conversion result is held in the 8-bit A/D conversion result register 3 (ADCR3).

Conversion is started by setting the A/D converter mode register 3.

Select one channel of analog input from ANI0 to ANI5 and carry out A/D conversion.

When A/D conversion is completed, the next A/D conversion is started immediately. Each time an A/D conversion operation ends, an interrupt request (INTAD) is generated.

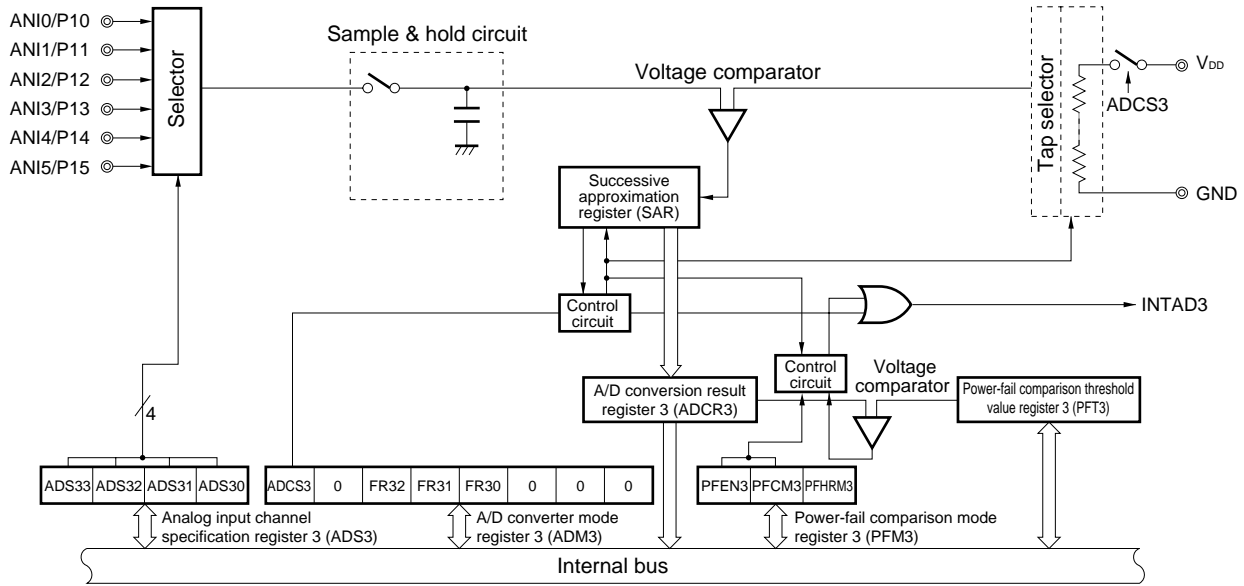

10.2 Configuration of A/D Converter

The A/D converter consists of the following hardware.

Table 10-1. Configuration of A/D Converter

Item	Configuration
Analog input	6 channels (ANI0 to ANI5)
Control register	A/D converter mode register 3 (ADM3) Analog input channel specification register 3 (ADS3) Power-fail comparison mode register 3 (PFM3)
Register	Successive approximation register (SAR) A/D conversion result register 3 (ADCR3) Power-fail comparison threshold value register 3 (PFT3)

Figure 10-1. Block Diagram of A/D Converter

(1) Successive approximation register (SAR)

This register compares the analog input voltage value to the voltage tap (compare voltage) value applied from the series resistor string and holds the result from the most significant bit (MSB).

When up to the least significant bit (LSB) is set (termination of A/D conversion), the SAR contents are transferred to the A/D conversion result register.

(2) A/D conversion result register 3 (ADCR3)

This register is an 8-bit register to store the A/D conversion result. Each time A/D conversion terminates, the conversion result is loaded from the successive approximation register (SAR).

ADCR is read with an 8-bit memory manipulation instruction.

Reset input makes ADCR undefined.

Caution When data is written to the A/D converter mode register (ADM3) and analog input channel specification register 3 (ADS3), the contents of ADCR3 can be undefined. Read the result of conversion after conversion has been completed and before writing data to ADM3 and ADS3. Otherwise, the correct conversion result may not be read.

(3) Power-fail comparison threshold value register 3 (PFT3)

This register sets a threshold value to be compared with the value of the A/D conversion result register 3 (ADCR3).

PFT3 is read or written by using an 8-bit memory manipulation instruction.

(4) Sample & hold circuit

The sample & hold circuit samples each analog input signal sequentially applied from the input circuit and sends it to the voltage comparator. This circuit holds the sampled analog input voltage value during A/D conversion.

(5) Voltage comparator

The voltage comparator compares the analog input to the series resistor string output voltage.

(6) Resistor string

The resistor string is connected between V_{DD} and GND, and generates a voltage to be compared to the analog input.

(7) ANI0 to ANI5 pins

These are 6-channel analog input pins to input analog signals to undergo A/D conversion to the A/D converter.

Cautions

1. Use ANI0 to ANI5 input voltages within the specified range. If a voltage higher than V_{DD} or lower than GND is applied (even if within the absolute maximum ratings), the converted value of the corresponding channel becomes indeterminate and may adversely affect the converted values of other channels.

2. The analog input pins (ANI0 through ANI5) are multiplexed with input port pins (P10 through P15). When one of ANI0 through ANI5 is selected for A/D conversion, do not execute an input instruction to port 1; otherwise, the conversion resolution may drop. If a digital pulse is applied to the pin adjacent to the pin executing A/D conversion, the A/D conversion value may not be obtained as expected due to coupling noise. Do not apply a pulse to the pin adjacent to the pin executing A/D conversion.

10.3 Registers Controlling A/D Converter

The following three types of registers control the A/D converter:

- A/D converter mode register 3 (ADM3)
- Analog input channel specification register 3 (ADS3)
- Power-fail comparison mode register 3 (PFM3)

(1) A/D converter mode register 3 (ADM3)

This register selects the conversion time of the analog input to be converted and starts or stops the conversion operation.

ADM3 is set by using a 1-bit or 8-bit memory manipulation instruction.

This register is reset to 00H at reset.

Figure 10-2. Format of A/D Converter Mode Register 3 (ADM3)

Symbol	<7>	6	5	4	3	2	1	0	Address	At reset	R/W
ADM3	ADCS3	0	FR32	FR31	FR30	0	0	0	FF12H	00H	R/W

ADCS3	Controls A/D Conversion Operation
0	Stops conversion operation
1	Enables conversion operation

FR32	FR31	FR30	Selects Conversion Time
0	0	0	288/f _x (64.0 μs)
0	0	1	240/f _x (53.3 μs)
0	1	0	192/f _x (42.7 μs)
1	0	0	144/f _x (32.0 μs)
1	0	1	120/f _x (26.7 μs)
1	1	0	96/f _x (21.3 μs)
Others			Setting prohibited

- Cautions**
1. The conversion result is undefined immediately after bit 7 (ADCS3) has been set to “1”.
 2. To change the data of bits 3 through 5 (FR30 through FR32), stop the A/D conversion operation.

- Remarks**
1. f_x: System clock oscillation frequency
 2. (): f_x = 4.5 MHz

(2) Analog input channel specification register 3 (ADS3)

This register specifies the input channel of the analog voltage to be converted.

ADS3 is set by using an 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Figure 10-3. Format of Analog Input Channel Specification Register 3 (ADS3)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
ADS3	0	0	0	0	ADS33	ADS32	ADS31	ADS30	FF13H	00H	R/W

ADS33	ADS32	ADS31	ADS30	Specifies Analog Input Channel
0	0	0	0	ANI0
0	0	0	1	ANI1
0	0	1	0	ANI2
0	0	1	1	ANI3
0	1	0	0	ANI4
0	1	0	1	ANI5
Others				Setting prohibited

(3) Power-fail comparison mode register 3 (PFM3)

- ★ PFM3 is set by using a 1-bit or 8-bit memory manipulation instruction.
The value of this register is initialized to 00H at reset.

Figure 10-4. Format of Power-Fail Comparison Mode Register 3 (PFM3)

Symbol	<7>	<6>	<5>	4	3	2	1	0	Address	At reset	R/W
PFM3	PFEN3	PFCM3	PFHRM3	0	0	0	0	0	FF16H	00H	R/W

PFEN3	Enables or Disables Power-fail Comparison
0	Disables power-fail comparison
1	Enables power-fail comparison

PFCM3	Selects Power-fail Comparison Mode
0	Generates interrupt request (INTAD) when $ADCR3 \geq PFT$
1	Generates interrupt request (INTAD) when $ADCR3 < PFT$

Note PFHRM3	Selects Power-fail HALT Repeat Mode
0	Disables power-fail HALT repeat mode
1	Enables power-fail HALT repeat mode

Note When bit 5 (PFHRM3) is set to 1, power-fail comparison manipulation is enabled in the HALT mode in which A/D conversion is repeated until an interrupt request (INTAD) is generated (this bit is reset to 0 when INTAD is generated).

10.4 Operations of A/D Converter

10.4.1 Basic operations of A/D converter

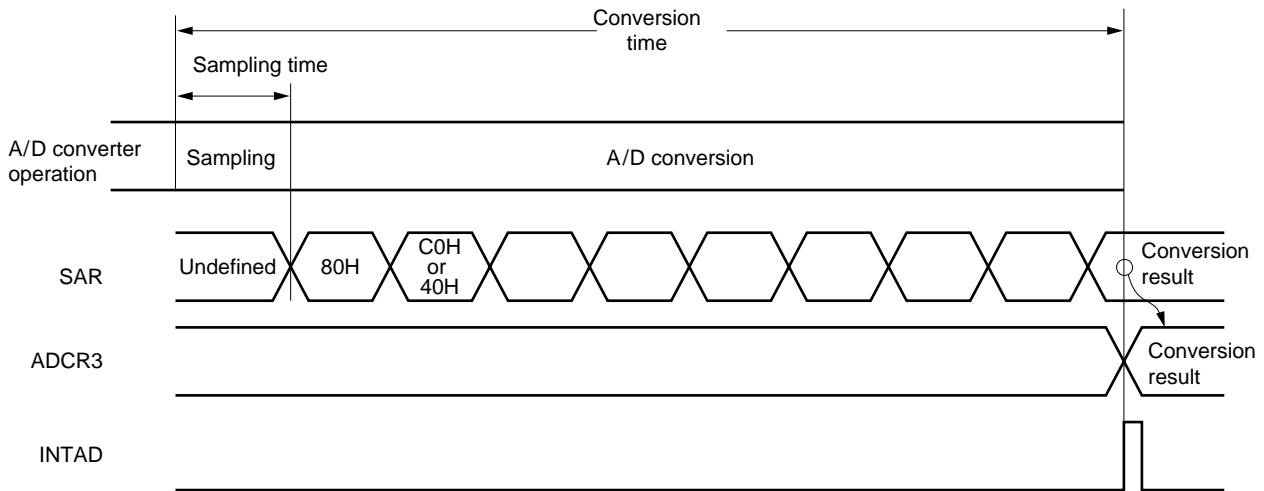

- (1) Select one channel for A/D conversion with A/D converter analog input channel specification register 3 (ADS3).
- (2) Sample the voltage input to the selected analog input channel with the sample & hold circuit.
- (3) Sampling for the specified period of time sets the sample & hold circuit to the hold state so that the circuit holds the input analog voltage until termination of A/D conversion.
- (4) Bit 7 of the successive approximation register (SAR) is set and the tap selector sets the series resistor string voltage tap to $(1/2) V_{DD}$.
- (5) The voltage difference between the series resistor string voltage tap and analog input is compared with a voltage comparator. If the analog input is greater than $(1/2) V_{DD}$, the MSB of SAR remains set. If the input is smaller than $(1/2) V_{DD}$, the MSB is reset.
- (6) Next, bit 6 of SAR is automatically set and the operation proceeds to the next comparison. In this case, the series resistor string voltage tap is selected according to the preset value of bit 7 as described below.
 - Bit 7 = 1 : $(3/4) V_{DD}$
 - Bit 7 = 0 : $(1/4) V_{DD}$

The voltage tap and analog input voltage are compared and bit 6 of SAR is manipulated with the result as follows.

- Analog input voltage \geq Voltage tap : Bit 6 = 1
 - Analog input voltage $<$ Voltage tap : Bit 6 = 0
- (7) Comparison of this sort continues up to bit 0 of SAR.
 - (8) Upon completion of the comparison of 8 bits, any effective digital resultant value remains in SAR and the resultant value is transferred to and latched in the A/D conversion result register 3 (ADCR3).
At the same time, the A/D conversion termination interrupt request (INTAD) can also be generated.

Caution The value immediately after A/D conversion has been started may not satisfy the ratings.

Figure 10-5. A/D Converter Basic Operation

A/D conversion operations are performed continuously until the bit 7 (ADCS3) of the ADM is reset (0) by software. If a write to the ADM3 or ADS3 is performed during an A/D conversion operation, the conversion operation is initialized, and if the ADCS3 bit is set (1), conversion starts again from the beginning. After reset input, the value of ADCR3 is undefined.

10.4.2 Input voltage and conversion results

The relation between the analog input voltage input to the analog input pins (ANI0 to ANI5) and the A/D conversion result (the value stored in A/D conversion result register 3 (ADCR3) is shown by the following expression.

$$ADCR3 = \text{INT} \left(\frac{V_{IN}}{V_{DD}} \times 256 + 0.5 \right)$$

or

$$(ADCR3 - 0.5) \times \frac{V_{DD}}{256} \leq V_{IN} < (ADCR3 + 0.5) \times \frac{V_{DD}}{256}$$

Where, INT () : Function which returns integer parts of value in parentheses.

V_{IN} : Analog input voltage

V_{DD} : V_{DD} pin voltage

ADCR3 : A/D conversion result register 3 (ADCR3) value

Figure 10-6 shows the relation between the analog input voltage and the A/D conversion result.

Figure 10-6. Relations between Analog Input Voltage and A/D Conversion Result

10.4.3 A/D converter operating mode

The A/D converter has the following two modes:

- **A/D conversion operation mode:** In this mode, the voltage applied to the analog input pin selected from ANI0 through ANI5 is converted into a digital signal. The result of the A/D conversion is stored in the A/D conversion result register 3 (ADCR3), and at the same time, an interrupt request signal (INTAD) is generated.
- **Power-fail comparison mode :** The digital value resulting from A/D conversion is compared with the value assigned to the power-fail comparison threshold value register 3 (PFT3) is compared. If the result of the comparison coincides with the condition set by bit 6 (PFCM3) of the power-fail comparison mode register 3 (PFM3), an interrupt request signal (INTAD) is generated.

(1) A/D conversion operation mode

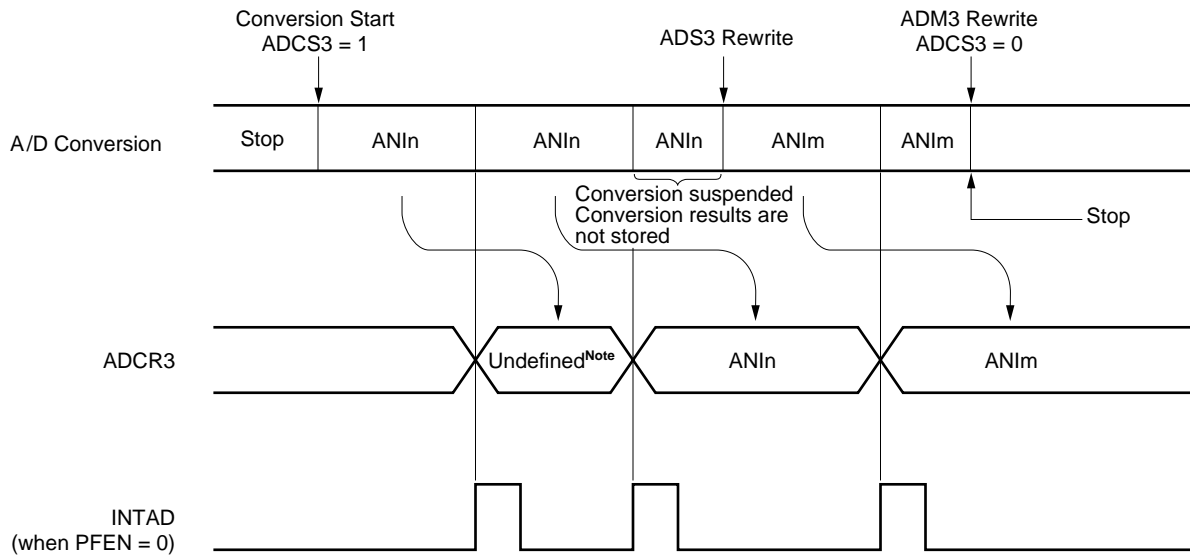

When bit 7 (ADCS3) of A/D converter mode register 3 (ADM3) is set to 1, the A/D conversion starts on the voltage applied to the analog input pins specified with bits 0 to 3 (ADS30 to ADS33) of ADS3.

Upon termination of the A/D conversion, the conversion result is stored in the A/D conversion result register 3 (ADCR3) and the interrupt request signal (INTAD) is generated. After one A/D conversion operation is started and terminated, the next A/D conversion operation starts immediately. The A/D conversion operation continues repeatedly until new data is written to ADM3.

If data is written to ADCS3 again during A/D conversion, the converter suspends its A/D conversion operation and starts A/D conversion on the newly written data.

If data with ADCS3 set to 0 is written to ADM3 during A/D conversion, the A/D conversion operation stops immediately.

Figure 10-7. A/D Conversion Operation

- Remarks**
1. $n = 0, 1, \dots, 5$
 2. $m = 0, 1, \dots, 5$

Note The conversion result is illegal immediately after bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) has been set to 1 (to enable conversion).

Caution Reset bit 5 (PFHRM3) of the power-fail comparison mode register 3 (PFM3) to 0.

(2) Power-fail comparison mode

In the power-fail comparison mode, the digital value converted from analog input is compared in units of 8 bits.

If the result of the comparison coincides with the condition set by bit 6 (PFCM3) of the power-fail comparison mode register 3 (PFM3), an interrupt request (INTAD) is generated.

Moreover, the power-fail comparison mode can be used in the HALT mode. At this time, the HALT mode can be released by generating the interrupt request signal (INTAD) as a result of comparison (however, the A/D operation must be executed before the HALT instruction is executed).

To set the power-fail comparison mode, set bit 7 (PEEN3) of PFM3 to 1, set bit 6 (PFCM3) to the generation condition of INTAD, and assign the threshold value to be compared with the value of the A/D conversion result register 3 (ADCR3) to the power-fail comparison threshold value register 3 (PFT3).

By setting bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) to 1, the voltage applied to the analog input pin specified by ADS3 is converted into a digital signal. When the A/D conversion has been completed, the result of the conversion is stored in ADCR3. This conversion result is compared with the value set in PFT3 and if the result of the comparison coincides with the condition set by bit 6 (PFCM3) of PFM3, an interrupt request signal (INTAD) is generated.

Figure 10-8. Power-Fail Comparison Threshold Value Register 3 (PFT3)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
PFT3	PFT37	PFT36	PFT35	PFT34	PFT33	PFT32	PFT31	PFT30	FF15H	00H	R/W

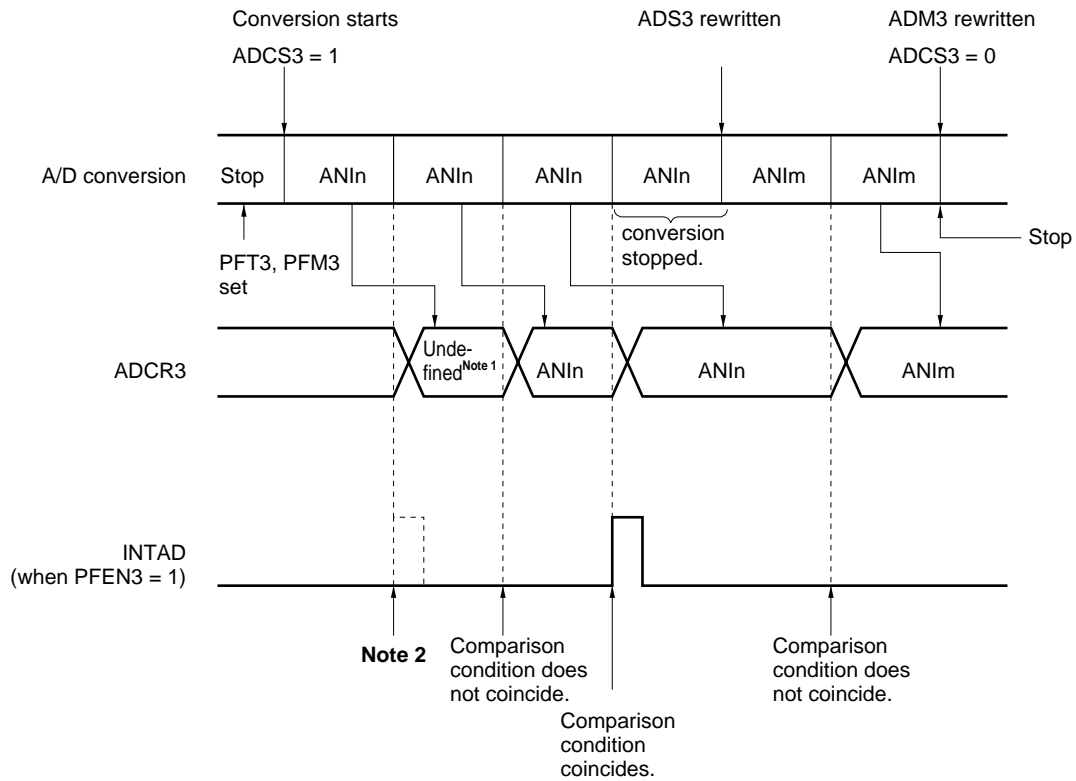

Remark Bit 7 (PFT37) is the MSB, and bit 0 (PFT30) is the LSB.

For the setting value, refer to **10.4.2 Input voltage and conversion results**.

- Cautions**
- 1. In the power-fail comparison mode, the first result (A/D conversion result and interrupt request (INTAD)) of the A/D conversion (started by setting bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) to 1) is not correct.**
 - 2. When executing A/D conversion in the HALT mode using the power-fail HALT repeat mode, clear the interrupt request flag (ADIF) after the first conversion has been completed immediately after bit 7 (ADCS3) of ADM3 has been set to 1, and bit 5 (PFHRM3) of the power-fail comparison mode register 3 (PFM3) has been set to 1, before executing the HALT instruction.**
 - 3. To set the power-fail comparison mode in the HALT mode, be sure to set bit 5 (PFHRM3) of PFM3 to 1 before executing the HALT instruction. Otherwise, comparison cannot be performed correctly because the conversion result in the HALT mode is not stored in the A/D conversion result register 3 (ADCR3). If bit 5 (PFHRM3) of PFM3 is set in the normal operating mode (other than HALT Mode), the A/D conversion is not performed correctly. Therefore, be sure to clear this bit to 0 in the normal mode.**

Figure 10-9. A/D Conversion Operation in Power-Fail Comparison Mode (1/3)

(1) In normal mode (other than HALT mode)

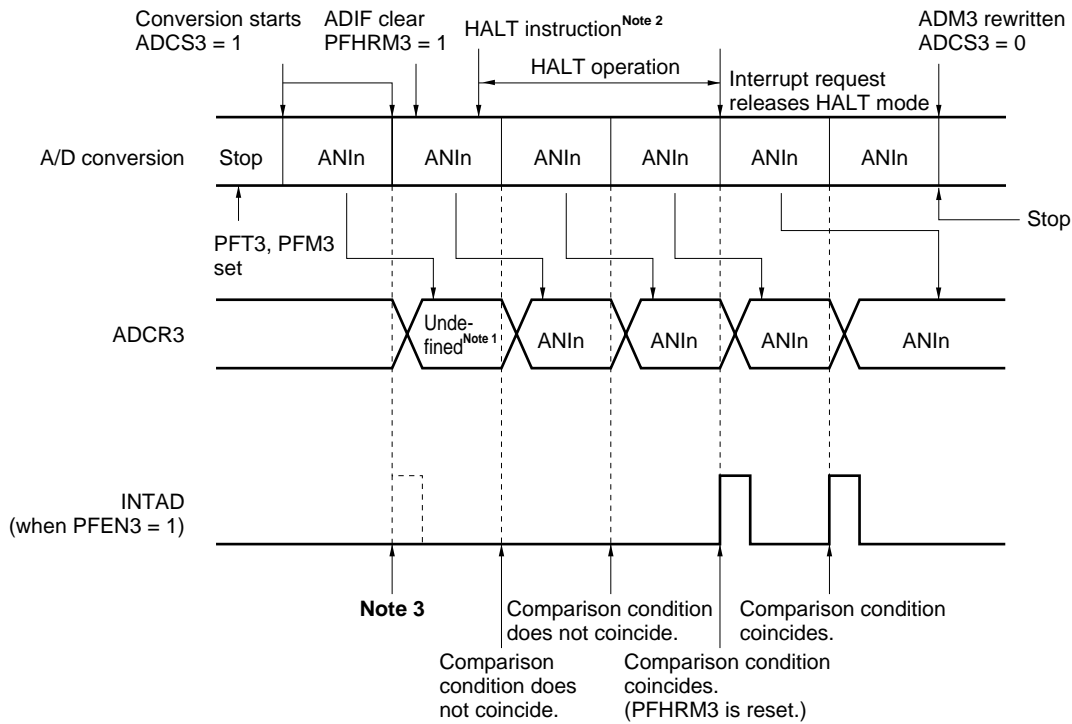

- Notes**
1. The conversion data is undefined immediately after bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) is set to 1 (to start conversion).
 2. The first result of the A/D conversion (A/D conversion result and interrupt request) is not correct. Do not use this result because there is a possibility that it will be determined that the comparison condition has coincided even if it has not.

Caution Set the power-fail comparison threshold value register 3 (PFT3) and power-fail comparison mode register 3 (PFM3) before starting conversion. Be sure to reset bit 5 (PFHRM3) of PFM3 to 0 (to disable HALT repeat mode setting).

Remark n = 0, 1, ... 5
m = 0, 1, ... 5

Figure 10-9. A/D Conversion Operation in Power-Fail Comparison Mode (2/3)

(2) In HALT repeat mode (when generation of interrupt (INTAD) is used to release HALT mode)

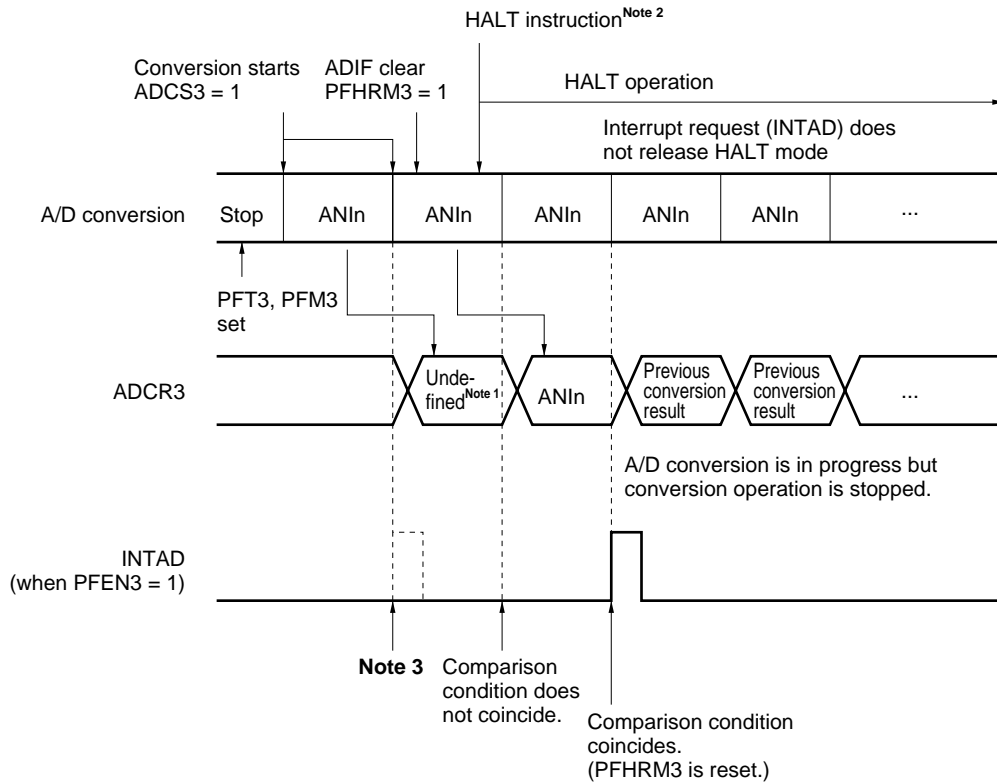

- Notes**
1. The conversion data is undefined immediately after bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) is set to 1 (to start conversion).
 2. When executing A/D conversion in the HALT mode by using the power-fail comparison mode, clear the interrupt request flag (ADIF) after the first conversion has been completed immediately after bit 7 (ADCS3) of ADM3 has been set to 1, and bit 5 (PFHRM3) of the power-fail comparison mode register 3 (PFM3) has been set to 1, before executing the HALT instruction.
 3. The first result of the A/D conversion (A/D conversion result and interrupt request) is not correct. Do not use this result because there is a possibility that it will be determined that the comparison condition has coincided even if it has not.

Caution Be sure to set bit 5 (PFHRM3) of PFM3 to 1 (to enable the HALT repeat mode setting).

Remark n = 0, 1, ... 5

Figure 10-9. A/D Conversion Operation in Power-Fail Comparison Mode (3/3)

(3) In HALT repeat mode (when generation of interrupt (INTAD) is not used to release HALT mode)

- Notes**
1. The conversion data is undefined immediately after bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) is set to 1 (to start conversion).
 2. When executing A/D conversion in the HALT mode by using the power-fail HALT repeat mode, clear the interrupt request flag (ADIF) after the first conversion has been completed immediately after bit 7 (ADCS3) of ADM3 has been set to 1, and bit 5 (PFHRM3) of the power-fail comparison mode register 3 (PFM3) has been set to 1, before executing the HALT instruction.
 3. The first result of the A/D conversion (A/D conversion result and interrupt request) is not correct. Do not use this result because there is a possibility that it will be determined that the comparison condition has coincided even if it has not.

Caution Be sure to set bit 5 (PFHRM3) of PFM3 to 1 (to enable the HALT repeat mode setting).

Remark n = 0, 1, ... 5

10.5 Notes on A/D Converter

(1) Current consumption in standby mode

The A/D converter is stopped in the standby mode. At this time, the current consumption can be reduced by stopping the conversion operation (by resetting bit 7 (ADCS3) of the A/D converter mode register 3 (ADM3) to 0).

Figure 10-10 shows how to reduce the current consumption in the standby mode.

Figure 10-10. Example of Reducing Current Consumption in Standby Mode

(2) Input range of ANI0 to ANI5

The input voltages of ANI0 to ANI5 should be within the specification range. In particular, if a voltage above V_{DD} or below GND is input (even if within the absolute maximum rating range), the conversion value for that channel will be indeterminate. The conversion values of the other channels may also be affected.

(3) Conflicting operations

- <1> Conflict between writing A/D conversion result register 3 (ADCR3) on completion of conversion and reading ADCR3 by an instruction
Reading ADCR3 takes precedence. After ADCR3 has been read, a new conversion result is written to ADCR3.
- <2> Conflict between writing ADCR3 on completion of conversion and writing A/D converter mode register 3 (ADM3) or writing analog input channel specification register 3 (ADS3)
Writing ADM3 or ADS3 takes precedence. ADCR3 is not written. Nor is the conversion completion interrupt request signal (INTAD) generated.

(4) ANI0 to ANI5

The analog input pins ANI0 to ANI5 also function as input port (P10 to P15) pins.

When A/D conversion is performed with any of pins ANI0 to ANI5 selected, be sure not to execute a PORT1 input instruction while conversion is in progress, as this may reduce the conversion resolution.

Also, if digital pulses are applied to a pin adjacent to the pin in the process of A/D conversion, the expected A/D conversion value may not be obtainable due to coupling noise. Therefore, avoid applying pulses to pins adjacent to the pin undergoing A/D conversion.

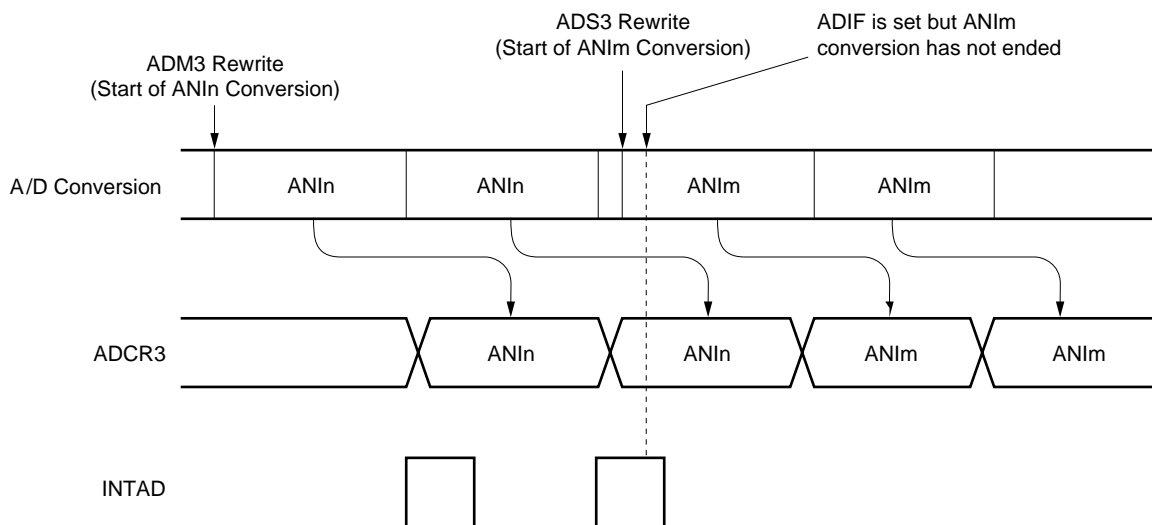

(5) Interrupt request flag (ADIF)

The interrupt request flag (ADIF) is not cleared even if the analog input channel specification register 3 (ADS3) is changed.

Caution is therefore required since, if a change of analog input pin is performed during A/D conversion, the A/D conversion result and conversion end interrupt request flag for the pre-change analog input may be set just before the ADS3 rewrite, and when ADIF is read immediately after the ADM rewrite, ADIF may be set despite the fact that the A/D conversion for the post-change analog input has not ended.

When the A/D conversion is stopped and then resumed, clear the ADIF before it is resumed.

Figure 10-11. A/D Conversion End Interrupt Request Generation Timing

- Remarks**
1. $n = 0, 1, \dots, 5$
 2. $m = 0, 1, \dots, 5$

(6) Conversion result immediately after starting A/D conversion

The first A/D conversion result value is undefined immediately after the A/D conversion operation has been started. Poll the A/D conversion completion interrupt request (INTAD) and discard the first conversion result.

(7) Reading A/D conversion result register 3 (ADCR3)

If data is written to the A/D converter mode register 3 (ADM3) and analog input channel specification register 3 (ADS3), the contents of ADCR3 can be undefined. Read the conversion value before writing ADM3 and ADS3 after the conversion operation has been completed. Otherwise, the correct conversion result may not be read.

[MEMO]

CHAPTER 11 SERIAL INTERFACE (IIC0)

11.1 Function of Serial Interface (IIC0)

The serial interface (IIC0) has the following two modes:

(1) Operation stop mode

This mode is used when serial transfer is not performed. It can therefore be used to reduce power consumption.

(2) I²C bus mode (multimaster supported)

This mode is used for 8-bit data transfers with several devices via two lines: a serial clock line (SCL0) and a serial data bus line (SDA0).

This mode complies with the I²C bus format and can output “start condition”, “data”, and “stop condition” data segments when transmitting via the serial data bus. These data segments are automatically detected by hardware during reception.

Since SCL0 and SDA0 are open-drain outputs, the IIC0 requires pull-up resistors for the serial clock line (SCL0) and the serial data bus line (SDA0).

Figure 11-1 shows the block diagram of the serial interface (IIC0).

Figure 11-1. Block Diagram of Serial Interface (IIC0)

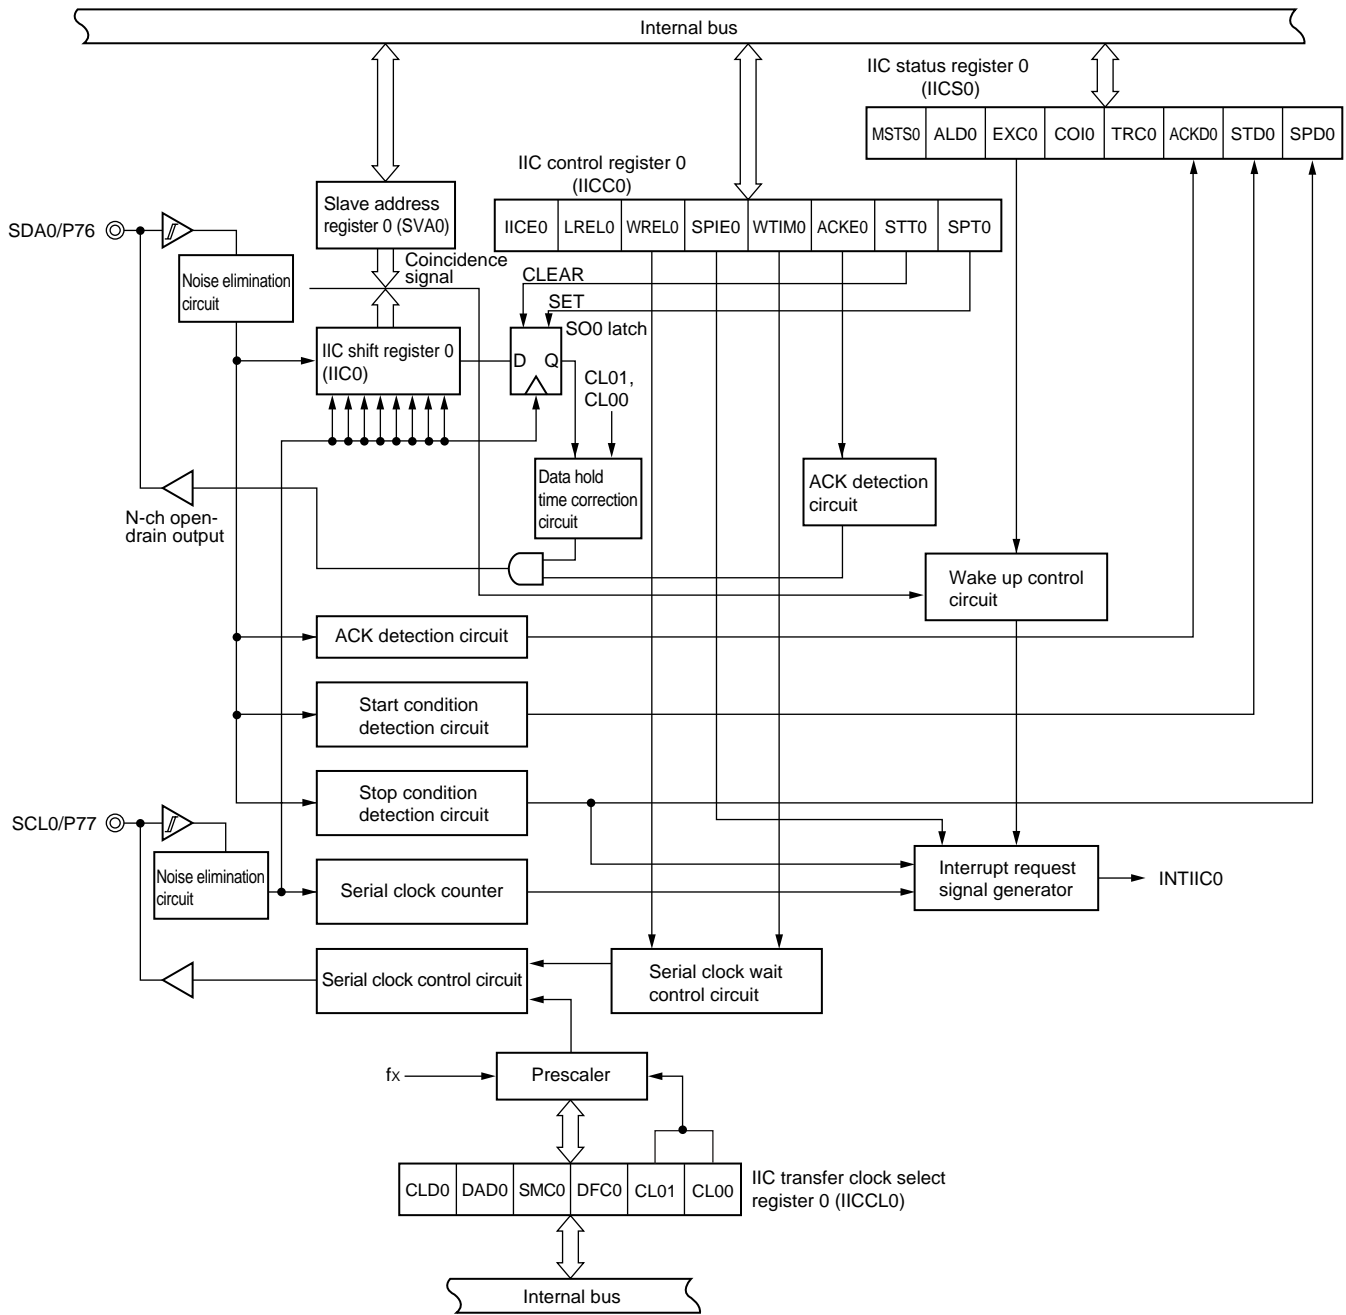

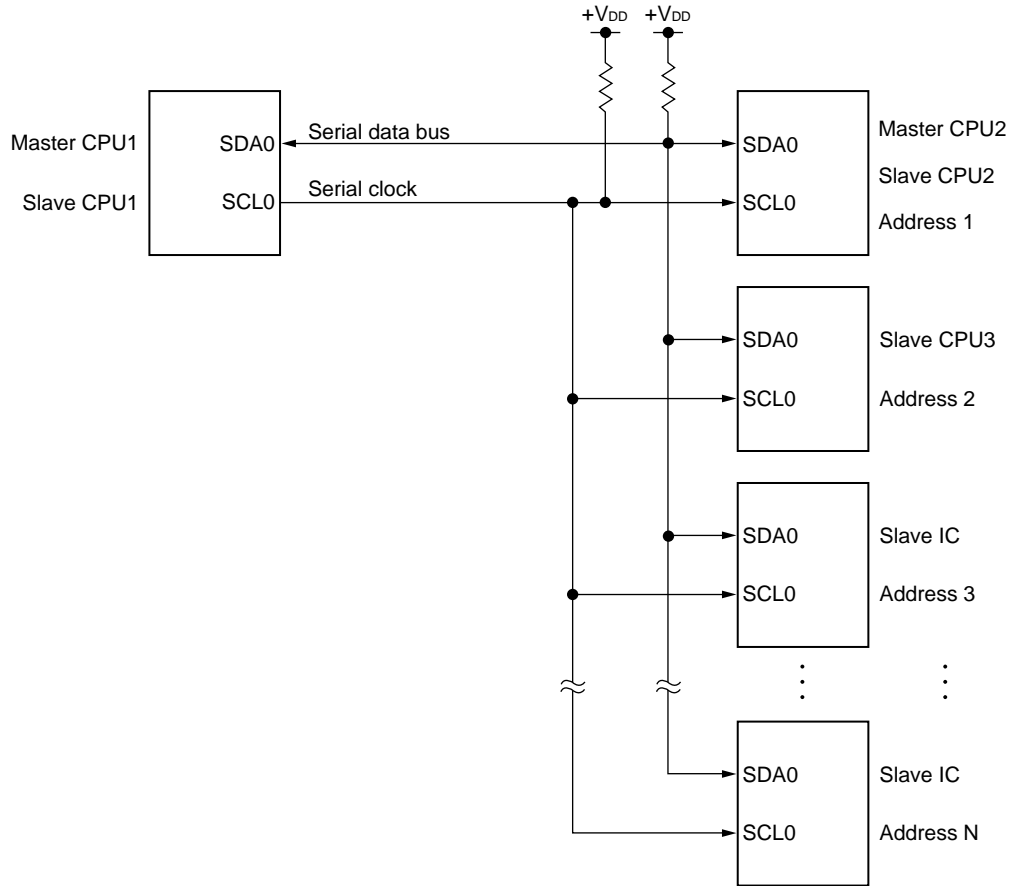

Figure 11-2 shows a serial bus configuration example.

Figure 11-2. Serial Bus Configuration Example Using I²C Bus

11.2 Configuration of Serial Interface (IIC0)

The serial interface (IIC0) consists of the following hardware.

Table 11-1. Configuration of Serial Interface (IIC0)

Item	Configuration
Registers	IIC shift register 0 (IIC0) Slave address register 0 (SVA0)
Control registers	IIC control register 0 (IICC0) IIC status register 0 (IICS0) IIC transfer clock select register 0 (IICCL0)

(1) IIC shift register 0 (IIC0)

IIC0 is used to convert 8-bit serial data to 8-bit parallel data and to convert 8-bit parallel data to 8-bit serial data.

IIC0 can be used for both transmission and reception.

Write and read operations to IIC0 are used to control the actual transmit and receive operations.

IIC0 is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets the IIC0 00H.

(2) Slave address register 0 (SVA0)

This register sets local addresses when in slave mode.

SVA0 is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input makes SVA0 undefined.

(3) SO0 latch

The SO0 latch is used to retain the SDA0 pin's output level.

This can be controlled directly in software.

(4) Wake-up control circuit

This circuit generates an interrupt request when the address received by this register matches the address value set to the slave address register 0 (SVA0) or when an extension code is received.

(5) Clock selector

This selects the sampling clock to be used.

(6) Serial clock counter

This counter counts the serial clocks that are output or input during transmit/receive operations and is used to verify that 8-bit data was sent or received.

(7) Interrupt request signal generator

This circuit controls the generation of interrupt request signals (INTIIC0).

An I²C interrupt request is generated following either of two triggers.

- Eighth or ninth clock of the serial clock (set by WTIM0 bit) **Note**
- Interrupt request generated when a stop condition is detected (set by SPIE0 bit) **Note**

Note WTIM0 bit : bit 3 of the IIC control register 0 (IICC0)

SPIE0 bit : bit 4 of the IIC control register 0 (IICC0)

(8) Serial clock control circuit

During master mode, this circuit generates the clock output via the SCL0 pin from a sampling clock.

(9) Serial clock wait control circuit

This circuit controls the wait timing.

(10) ACK output circuit, stop condition detection circuit, start condition detection circuit, and ACK detection circuit

These circuits are used to output and detect various control signals.

(11) Data hold time correction circuit

This circuit generates the hold time for data corresponding to the falling edge of the serial clock.

11.3 Registers Controlling Serial Interface (IIC0)

The following registers control the serial interface (IIC0):

- IIC control register 0 (IICC0)
- IIC status register 0 (IICS0)
- IIC transfer clock select register 0 (IICCL0)

The following registers are also used.

- IIC shift register 0 (IIC0)
- Slave address register 0 (SVA0)

(1) IIC control register 0 (IICC0)

This register is used to enable/disable I²C operations, set wait timing, and set other I²C operations.

IICC0 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets IICC0 to 00H.

Caution In I²C bus mode, set the port mode register (PM_{xx}) as follows. Set the output latch to 0.

- Set P76 (SDA0) to output mode (PM76 = 0)
- Set P77 (SCL0) to output mode (PM77 = 0)

Figure 11-3. Format of IIC Control Register 0 (IICC0) (1/3)

Note This flag's signal is invalid when IICE0 = 0.

Figure 11-3. Format of IIC Control Register 0 (IICC0) (2/3)

WTIM0	Control of Wait and Interrupt Request Generation
0	Interrupt request is generated at the eighth clock's falling edge. Master mode : After output of eight clocks, clock output is set to low level and wait is set. Slave mode : After input of eight clocks, the clock is set to low level and wait is set for master device.
1	Interrupt request is generated at the ninth clock's falling edge. Master mode : After output of nine clocks, clock output is set to low level and wait is set. Slave mode : After input of nine clocks, the clock is set to low level and wait is set for master device.
This bit's setting is invalid during an address transfer and is valid after the transfer is completed. When in master mode, a wait is inserted at the falling edge of the ninth clock during address transfers. For a slave device that has received a local address, a wait is inserted at the falling edge of the ninth clock after an ACK signal is issued. When the slave device has received an extension code, a wait is inserted at the falling edge of the eighth clock.	
Condition for clearing (WTIM0 = 0) Note	
<ul style="list-style-type: none"> • Cleared by instruction • When RESET is input 	
Condition for setting (WTIM0 = 1)	
<ul style="list-style-type: none"> • Set by instruction 	

ACKE0	Acknowledge Control
0	Disable acknowledge.
1	Enable acknowledge. During the ninth clock period, the SDA0 line is set to low level. However, the ACK is invalid during address transfers and is valid when EXC0 = 1.
Condition for clearing (ACKE0 = 0) Note	
<ul style="list-style-type: none"> • Cleared by instruction • When RESET is input 	
Condition for setting (ACKE0 = 1)	
<ul style="list-style-type: none"> • Set by instruction 	

STT0	Start Condition Trigger
0	Does not generate a start condition.
1	When bus is released (during STOP mode): Generates a start condition (for starting as master). The SDA0 line is changed from high level to low level and then the start condition is generated. Next, after the rated amount of time has elapsed, SCL0 is changed to low level. When bus is not used: This trigger functions as a start condition reserve flag. When set, it releases the bus and then automatically generates a start condition. Wait status (during master mode): Generates a restart condition after wait is released.
Cautions concerning set timing	
<ul style="list-style-type: none"> • For master reception : Cannot be set during transfer. Can be set only at the waiting period when ACKE0 has been set to 0 and slave has been notified of final reception. • For master transmission : A start condition may not be generated normally during the ACK period. Therefore, set it during the waiting period. • Cannot be set at the same time as SPT0 	
Condition for clearing (STT0 = 0) Note	
<ul style="list-style-type: none"> • Cleared by instruction • Cleared by loss in arbitration • Cleared after start condition is generated by master device • When LREL0 = 1 • When RESET is input 	
Condition for setting (STT0 = 1)	
<ul style="list-style-type: none"> • Set by instruction 	

Note This flag's signal is invalid when IICE0 = 0.

Figure 11-3. Format of IIC Control Register 0 (IICC0) (3/3)

SPT0	Stop Condition Trigger				
0	Stop condition is not generated.				
1	Stop condition is generated (termination of master device's transfer). After the SDA0 line goes to low level, either set the SCL0 line to high level or wait until it goes to high level. Next, after the rated amount of time has elapsed, the SDA0 line changes from low level to high level and a stop condition is generated.				
<p>Cautions concerning set timing</p> <ul style="list-style-type: none"> For master reception : Cannot be set during transfer. Can be set only at the waiting period when ACKE0 has been set to 0 and slave has been notified of final reception. For master transmission: A stop condition cannot be generated normally during the ACK0 period. Therefore, set it during the waiting period. Cannot be set at the same time as STT0. SPT0 can be set only when in master mode. Note 1 When WTIM0 has been set to 0, if SPT0 is set during the wait period that follows output of eight clocks, note that a stop condition will be generated during the high level period of the ninth clock. When a ninth clock must be output, WTIM0 should be changed from 0 to 1 during the wait period following output of eight clocks, and SPT0 should be set during the wait period that follows output of the ninth clock. 					
<table border="1"> <thead> <tr> <th>Condition for clearing (SPT0 = 0) Note 2</th> <th>Condition for setting (SPT0 = 1)</th> </tr> </thead> <tbody> <tr> <td> <ul style="list-style-type: none"> Cleared by instruction Cleared by loss in arbitration Automatically cleared after stop condition is detected When $\overline{\text{LREL0}} = 1$ When $\overline{\text{RESET}}$ is input </td> <td> <ul style="list-style-type: none"> Set by instruction </td> </tr> </tbody> </table>		Condition for clearing (SPT0 = 0) Note 2	Condition for setting (SPT0 = 1)	<ul style="list-style-type: none"> Cleared by instruction Cleared by loss in arbitration Automatically cleared after stop condition is detected When $\overline{\text{LREL0}} = 1$ When $\overline{\text{RESET}}$ is input 	<ul style="list-style-type: none"> Set by instruction

DFC0	Control of Digital Filter Operation ^{Note}
0	Digital filter OFF
1	Digital filter ON

CL01	CL00	Selection of Transfer Rate	
		Standard mode	High-speed mode
0	0	$f_x/44$ (51.1 kHz)	$f_x/24$ (93.8 kHz)
0	1	$f_x/86$ (26.2 kHz)	
1	0	$f_x/86$ (52.3 kHz)	$f_x/24$ (187.5 kHz)
1	1	Setting prohibited	

Note The digital filter can be used when in high-speed mode. Response time is slower when the digital filter is used.

Caution Stop serial transfer once before rewriting CL01 and CL00 to other than the same value.

- Remarks**
1. IICE0: Bit 7 of IIC control register 0 (IICC0)
 2. f_x : System clock oscillation frequency
 3. Figures in parentheses are for operation with $f_x = 4.5$ MHz.

(4) I²C shift register 0 (IIC0)

This register is used for serial transmission/reception (shift operations) that are synchronized with the serial clock. It can be read from or written to in 8-bit units, but data should not be written to IIC0 during a data transfer.

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
IIC0									FF1AH	Undefined	R/W

(5) Slave address register 0 (SVA0)

This register holds the I²C's slave addresses. It can be read from or written to in 8-bit units, but bit 0 is fixed to "0".

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
SVA0								0	FF62H	Undefined	R/W

11.4 Functions of I²C Bus Mode

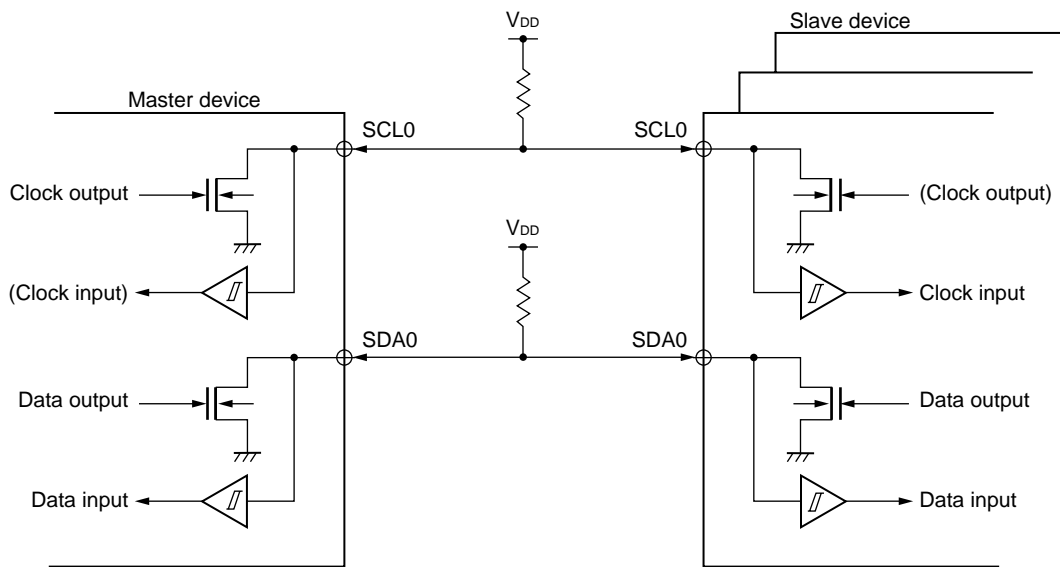

11.4.1 Pin configuration

The serial clock pin (SCL0) and serial data bus pin (SDA0) are configured as follows.

- (1) SCL0 This pin is used for serial clock input and output.
This pin is an N-ch open-drain output for both master and slave devices. Input is Schmitt input.
- (2) SDA0 This pin is used for serial data input and output.
This pin is an N-ch open-drain output for both master and slave devices. Input is Schmitt input.

Since outputs from the serial clock line and the serial data bus line are N-ch open drain outputs, an external pull-up resistor is required.

Figure 11-6. Pin Configuration

11.5 I²C Bus Definitions and Control Methods

The following section describes the I²C bus's serial data communication format and the signals used by the I²C bus. Figure 11-7 shows the transfer timing for the "start condition", "data", and "stop condition" output via the I²C bus's serial data bus.

Figure 11-7. I²C Bus's Serial Data Transfer Timing

The master device outputs the start condition, slave address, and stop condition.

The acknowledge signal ($\overline{\text{ACK}}$) can be output by either the master or slave device (normally, it is output by the device that receives 8-bit data).

The serial clock (SCL0) is continuously output by the master device. However, in the slave device, the SCL0's low level period can be extended and a wait can be inserted.

11.5.1 Start conditions

A start condition is met when the SCL0 pin is at high level and the SDA0 pin changes from high level to low level. The start conditions for the SCL0 pin and SDA0 pin are signals that the master device outputs to the slave device when starting a serial transfer. The slave device includes hardware for detecting start conditions.

Figure 11-8. Start Conditions

A start condition is output when the IIC control register 0 (IICC0)'s bit 1 (STT0) is set (to "1") after a stop condition has been detected (SPD0: Bit 0 = 1 in the IIC status register 0 (IICS0)). When a start condition is detected, IICS0's bit 1 (STD0) is set (to "1").

11.5.2 Addresses

The address is defined by the 7 bits of data that follow the start condition.

An address is a 7-bit data segment that is output in order to select one of the slave devices that are connected to the master device via bus lines. Therefore, each slave device connected via the bus lines must have a unique address.

The slave devices include hardware that detects the start condition and checks whether or not the 7-bit address data matches the data values stored in the slave address register 0 (SVA0). If the address data matches the SVA0 values, the slave device is selected and communicates with the master device until the master device transmits a start condition or stop condition.

Figure 11-9. Address

Note INTIIC0 is not issued if data other than a local address or extension code is received during slave device operation.

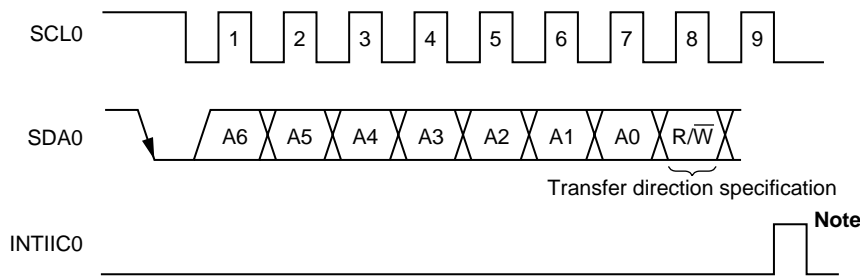

The slave address and the eighth bit, which specifies the transfer direction as described in **11.5.3 Transfer direction specification** below, are together written to the IIC shift register 0 (IIC0) and are then output. Received addresses are written to IIC0.

The slave address is assigned to the high-order 7 bits of IIC0.

11.5.3 Transfer direction specification

In addition to the 7-bit address data, the master device sends 1 bit that specifies the transfer direction. When this transfer direction specification bit has a value of "0", it indicates that the master device is transmitting data to a slave device. When the transfer direction specification bit has a value of "1", it indicates that the master device is receiving data from a slave device.

Figure 11-10. Transfer Direction Specification

Note INTIIC0 is not issued if data other than a local address or extension code is received during slave device operation.

11.5.4 Acknowledge ($\overline{\text{ACK}}$) signal

The acknowledge ($\overline{\text{ACK}}$) signal is used by the transmitting and receiving devices to confirm serial data reception.

The receiving device returns one $\overline{\text{ACK}}$ signal for each 8 bits of data it receives. The transmitting device normally receives an $\overline{\text{ACK}}$ signal after transmitting 8 bits of data. However, when the master device is the receiving device, it does not output an $\overline{\text{ACK}}$ signal after receiving the final data to be transmitted. The transmitting device detects whether or not an $\overline{\text{ACK}}$ signal is returned after it transmits 8 bits of data. When an $\overline{\text{ACK}}$ signal is returned, the reception is judged as normal and processing continues. If the slave device does not return an $\overline{\text{ACK}}$ signal, the master device outputs either a stop condition or a restart condition and then stops the current transmission. Failure to return an $\overline{\text{ACK}}$ signal may be caused by the following two factors.

- <1> Reception was not performed normally.
- <2> The final data was received.

When the receiving device sets the SDA0 line to low level during the ninth clock, the $\overline{\text{ACK}}$ signal becomes active (normal receive response).

When bit 2 (ACKE0) of the IIC control register 0 (IICC0) is set to 1, automatic $\overline{\text{ACK}}$ signal generation is enabled.

Transmission of the eighth bit following the 7 address data bits causes bit 3 (TRC0) of the IIC status register 0 (IICS0) to be set. When this TRC0 bit's value is "0", it indicates receive mode. Therefore, ACEK0 should be set to "1".

When the slave device is receiving (when TRC0 = 0), if the slave device does not need to receive any more data after receiving several bytes, setting ACEK0 to "0" will prevent the master device from starting transmission of the subsequent data.

Similarly, when the master device is receiving (when TRC0 = 0) and the subsequent data is not needed and when either a restart condition or a stop condition should therefore be output, setting ACEK0 to "0" will prevent the $\overline{\text{ACK}}$ signal from being returned. This prevents the MSB data from being output via the SDA line (i.e., stops transmission) during transmission from the slave device.

Figure 11-11. $\overline{\text{ACK}}$ Signal

When the local address is received, an $\overline{\text{ACK}}$ signal is automatically output in sync with the falling edge of the SCL's eighth clock regardless of the ACEK0 value. No $\overline{\text{ACK}}$ signal is output if the received address is not a local address.

The $\overline{\text{ACK}}$ signal output method during data reception is based on the wait timing setting, as described below.

- When 8-clock wait is selected : $\overline{\text{ACK}}$ signal is output when ACEK0 is set to "1" before wait cancellation.
- When 9-clock wait is selected : $\overline{\text{ACK}}$ signal is automatically output at the falling edge of the SCL0's eighth clock if ACEK0 has already been set to "1".

11.5.5 Stop condition

When the SCL0 pin is at high level, changing the SDA0 pin from low level to high level generates a stop condition.

A stop condition is a signal that the master device outputs to the slave device when serial transfer has been completed. The slave device includes hardware that detects stop conditions.

Figure 11-12. Stop Condition

A stop condition is generated when bit 0 (SPT0) of the IIC control register 0 (IICC0) is set (to "1"). When the stop condition is detected, bit 0 (SPD0) of the IIC status register 0 (IICS0) is set (to "1") and INTIIC0 is generated when bit 4 (SPIE0) of IICC0 is set (to "1").

11.5.6 Wait signal ($\overline{\text{WAIT}}$)

The wait signal ($\overline{\text{WAIT}}$) is used to notify the communication partner that a device (master or slave) is preparing to transmit or receive data (i.e., is in a wait state).

Setting the SCL0 pin to low level notifies the communication partner of the wait status. When wait status has been canceled for both the master and slave devices, the next data transfer can begin.

Figure 11-13. Wait Signal (1/2)

(1) When master device has a nine-clock wait and slave device has an eight-clock wait (master transmits, slave receives, and $\text{ACKE0} = 1$)

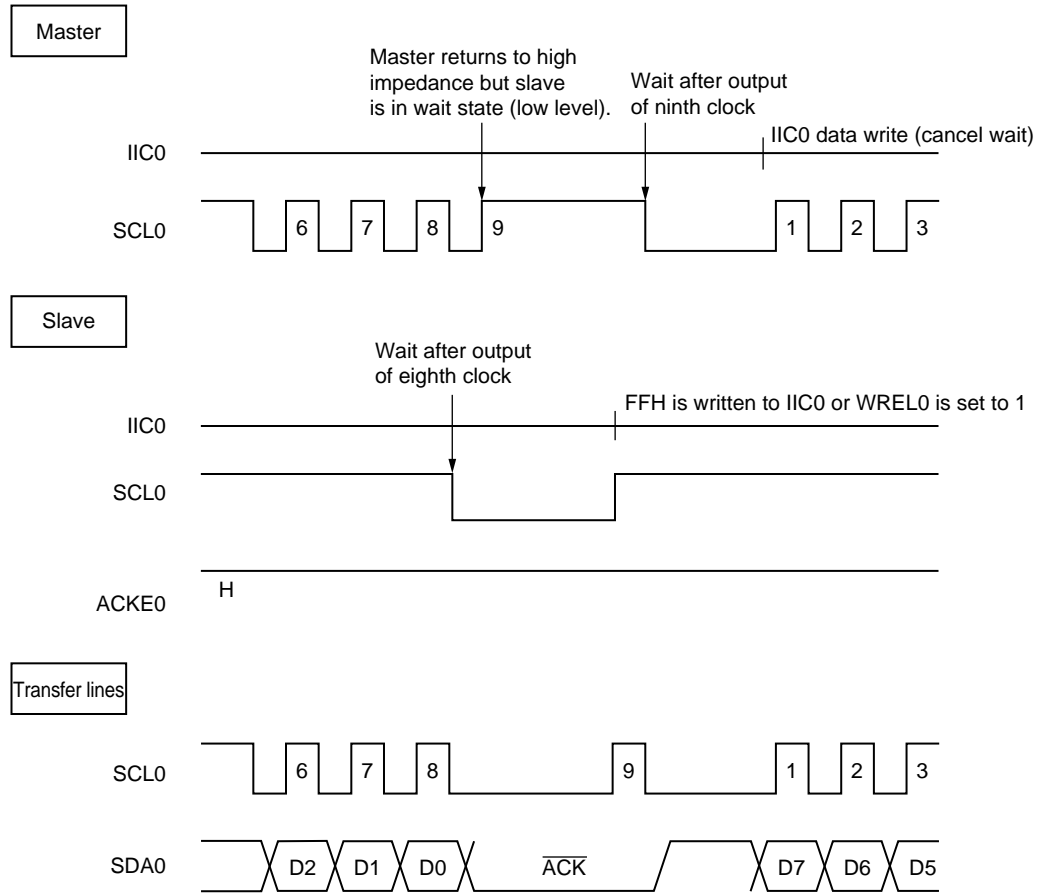

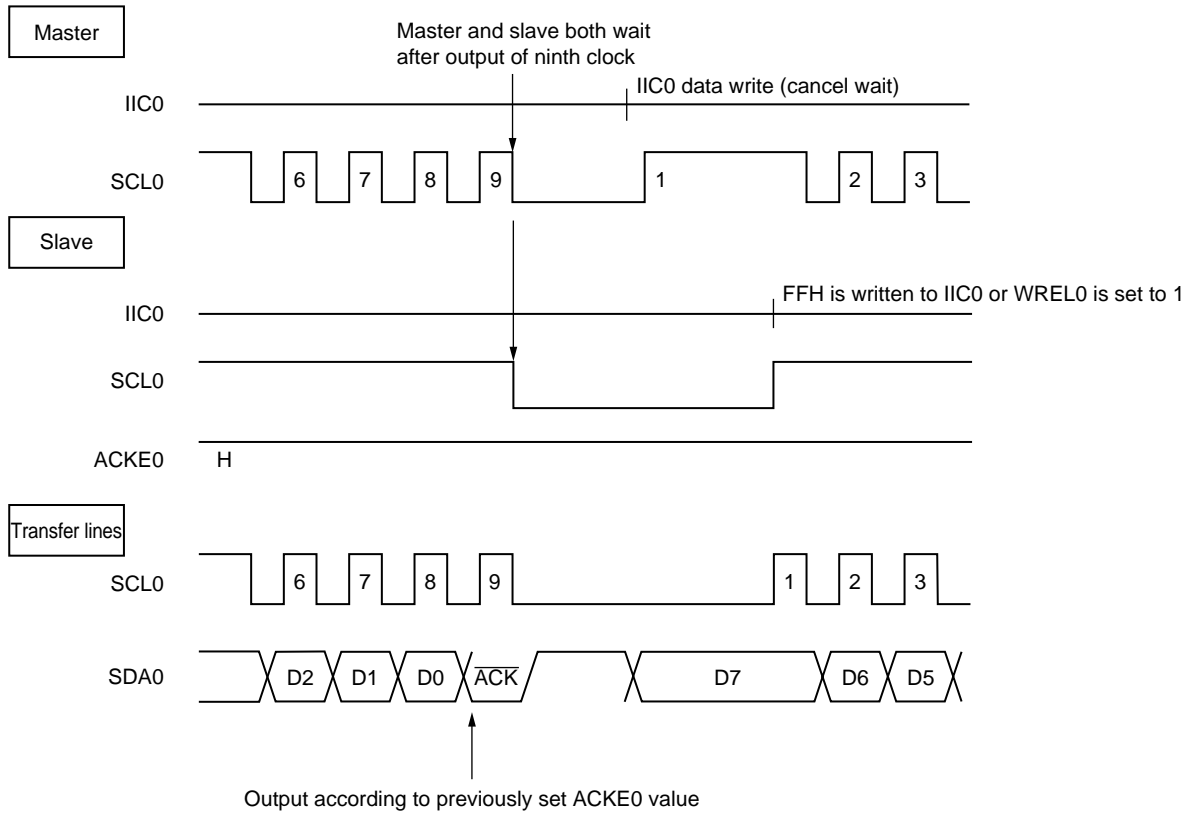

Figure 11-13. Wait Signal (2/2)

(2) When master and slave devices both have a nine-clock wait (master device transmits, slave receives, and ACKE0 = 1)

Remark ACKE0 : Bit 2 of IIC control register (IICC0)
 WREL0 : Bit 5 of IIC control register (IICC0)

A wait may be automatically generated depending on the setting for bit 3 (WTIM0) of the IIC control register 0 (IICC0).

Normally, when bit 5 (WREL0) of IICC0 is set to "1" or when FFH is written to the IIC shift register 0 (IIC0), the wait status is canceled and the transmitting side write data to IIC0 to cancel the wait status.

The master device can also cancel the wait status via either of the following methods.

- By setting bit 1 (STT0) of IICC0 to "1"
- By setting bit 0 (SPT0) of IICC0 to "1"

11.5.7 I²C interrupt requests (INTIIC0)

The INTIIC0 interrupt request timing and the IIC status register 0 (IICS0) settings corresponding to that timing are described below.

(1) Master device operation

(a) Start ~ Address ~ Data ~ Data ~ Stop (normal transmission/reception)

11.5.8 Interrupt request (INTIIC0) generation timing and wait control

The setting of bit 3 (WTIM0) in the IIC control register 0 (IICC0) determines the timing by which INTIIC0 is generated and the corresponding wait control, as shown in Table 11-2.

Table 11-2. INTIIC0 Timing and Wait Control

WTIM	During Slave Device Operation			During Master Device Operation		
	Address	Data reception	Data transmission	Address	Data reception	Data transmission
0	9 Notes 1, 2	8 Note 2	8 Note 2	9	8	8
1	9 Notes 1, 2	9 Note 2	9 Note 2	9	9	9

Notes 1. The slave device's INTIIC0 signal and wait period occurs at the falling edge of the ninth clock only when there is a match with the address set to the slave address register 0 (SVA0).

At this point, $\overline{\text{ACK}}$ is output regardless of the value set to IICC0's bit 2 (ACKE0). For a slave device that has received an extension code, INTIIC0 occurs at the falling edge of the eighth clock.

2. If the received address does not match the contents of the slave address register 0 (SVA0), neither INTIIC0 nor a wait occurs.

Remark The numbers in the table indicate the number of the serial clock's clock signals. Interrupt requests and wait control are both synchronized with the falling edge of these clock signals.

(1) During address transmission/reception

- Slave device operation : Interrupt and wait timing are determined regardless of the WTIM0 bit.
- Master device operation: Interrupt and wait timing occur at the falling edge of the ninth clock regardless of the WTIM0 bit.

(2) During data reception

- Master/slave device operation: Interrupt and wait timing are determined according to the WTIM0 bit.

(3) During data transmission

- Master/slave device operation: Interrupt and wait timing are determined according to the WTIM0 bit.

(4) Wait cancellation method

The four wait cancellation methods are as follows.

- By setting bit 5 (WREL0) of IIC control register 0 (IICC0) to "1"
- By writing to the IIC shift register 0 (IIC0)
- By setting a start condition (setting bit 1 (STT0) of IIC control register 0 (IICC0) to "1")
- By setting a stop condition (setting IICC0's bit 0 (SPT0) to "1")

When 8-clock wait has been selected (WTIM0 = 0), the output level of $\overline{\text{ACK}}$ must be determined prior to wait cancellation.

(5) Stop condition detection

INTIIC0 is generated when a stop condition is detected.

11.5.9 Address match detection method

When in I²C bus mode, the master device can select a particular slave device by transmitting the corresponding slave address.

Address match can be detected automatically by hardware. An interrupt frequency (INTIIC0) occurs when a local address has been set to the slave address register 0 (SVA0) and when the address set to SVA0 matches the slave address sent by the master device, or when an extension code has been received.

11.5.10 Error detection

During I²C bus mode, the status of the serial data bus (SDA0) during data transmission is captured by the IIC shift register 0 (IIC0) of the transmitting device, so the IIC0 data prior to transmission can be compared with the transmitted IIC0 data to enable detection of transmission errors. A transmission error is judged as having occurred when the compared data values do not match.

11.5.11 Extension code

- (1) When the high-order 4 bits of the receive address are either “0000” or “1111”, the extension code flag (EXC0) is set for extension code reception and an interrupt request (INTIIC0) is issued at the falling edge of the eighth clock. The local address stored in the slave address register 0 (SVA0) is not affected.
- (2) If “111110xx” is set to SVA0 by a 10-bit address transfer and “111110xx” is transferred from the master device, the results are as follows. Note that INTIIC0 occurs at the falling edge of the eighth clock.
 - High-order four bits of data match: EXC0 = 1 **Note**
 - Seven bits of data match: COI0 = 1 **Note**

Note EXC0 : Bit 5 of IIC status register 0 (IICS0)
 COI0 : Bit 4 of IIC status register 0 (IICS0)

- (3) Since the processing after the interrupt request occurs differs according to the data that follows the extension code, such processing is performed by software.
 For example, after the extension code is received, if you do not wish to operate the target device as a slave device, you can set bit 6 (LREL0) of the IIC control register 0 (IICC0) to “1” to set the standby mode for the next communication operation.

Table 11-3. Extension Code Bit Definitions

Slave Address	R/W Bit	Description
0000 000	0	General call address
0000 000	1	Start byte
0000 001	×	CBUS address
0000 010	×	Address that is reserved for different bus format
1111 0xx	×	10-bit slave address specification

11.5.12 Arbitration

When several master devices simultaneously output a start condition (when STT0 is set to 1 before STD0 is set to 1^{Note}), communication among the master devices is performed as the number of clocks are adjusted until the data differs. This kind of operation is called arbitration.

When one of the master devices loses in arbitration, an arbitration loss flag (ALD0) in the IIC status register 0 (IICS0) is set via the timing by which the arbitration loss occurred, and the SCL0 and SDA0 lines are both set for high impedance, which releases the bus.

The arbitration loss is detected based on the timing of the next interrupt request (the eighth or ninth clock, when a stop condition is detected, etc.) and the ALD0 = 1 setting that has been made by software.

For details of interrupt request timing, refer to **11.5.7 I²C interrupt requests (INTIIC0)**.

Note STD0 : Bit 1 of IIC status register (IICS0)

STT0 : Bit 1 of IIC control register (IICC0)

Figure 11-14. Arbitration Timing Example

Table 11-4. Status during Arbitration and Interrupt Request Generation Timing

Status during Arbitration	Interrupt Request Generation Timing
During address transmission	At falling edge of eighth or ninth clock following byte transfer Note 1
Read/write data after address transmission	
During extension code transmission	
Read/write data after extension code transmission	
During data transmission	
During $\overline{\text{ACK}}$ signal transfer period after data transmission	
When restart condition is detected during data transfer	
When stop condition is detected during data transfer	When stop condition is output (when SPIE0 = 1) Note 2
When data is at low level while attempting to output a restart condition	At falling edge of eighth or ninth clock following byte transfer Note 1
When stop condition is detected while attempting to output a restart condition	When stop condition is output (when SPIE0 = 1) Note 2
When data is at low level while attempting to output a stop condition	At falling edge of eighth or ninth clock following byte transfer Note 1
When SCL0 is at low level while attempting to output a restart condition	

- Notes**
1. When WTIM0 (bit 3 of the IIC control register 0 (IICC0)) = 1, an interrupt request occurs at the falling edge of the ninth clock. When WTIM0 = 0 and the extension code's slave address is received, an interrupt request occurs at the falling edge of the eighth clock.
 2. When there is a chance that arbitration will occur, set SPIE0 = 1 for master device operation.

Remark SPIE0 : Bit 5 of the IIC control register 0 (IICC0)

11.5.13 Wake up function

The I²C bus slave function is a function that generates an interrupt request (INTIIC0) when a local address and extension code have been received.

This function makes processing more efficient by preventing unnecessary interrupt requests from occurring when addresses do not match.

When a start condition is detected, wake-up standby mode is set. This wake-up standby mode is in effect while addresses are transmitted due to the possibility that an arbitration loss may change the master device (which has output a start condition) to a slave device.

However, when a stop condition is detected, bit 5 (SPIE0) of the IIC control register 0 (IICC0) is set regardless of the wake up function, and this determines whether interrupt requests are enabled or prohibited.

11.5.14 Communication reservation

To start master device communications when not currently using a bus, a communication reservation can be made to enable transmission of a start condition when the bus is released. There are two modes under which the bus is not used.

- When arbitration results in neither master nor slave operation
- When an extension code is received and slave operation is disabled (\overline{ACK} is not returned and the bus was released when bit 6 (LRELO) of the IIC control register 0 (IICC0) was set to "1").

If bit 1 (STT0) of IICC0 is set while the bus is not used (after a stop condition is detected), a start condition is automatically generated and wait status is set.

When the bus release is detected (when a stop condition is detected), writing to the IIC shift register 0 (IIC0) causes the master's address transfer to start. At this point, IICC0's bit 4 (SPIE0) should be set.

When STT0 has been set, the operation mode (as start condition or as communication reservation) is determined according to the bus status.

- If the bus has been released a start condition is generated
- If the bus has not been released (standby mode) communication reservation

Check whether the communication reservation operates or not with MST0 (bit 7 of the IIC status register 0 (IICS0)) after SST0 is set and a wait time elapses.

Wait periods, which should be set via software, are listed in Table 11-5. These wait periods can be set via the settings for bits 3, 1, and 0 (SMC0, CL01, and CL00) in the IIC clock select register 0 (IICCL0).

Table 11-5. Wait Periods

SMC0	CL01	CL00	Wait Time
0	0	0	26 clocks \times 1/fx
0	0	1	46 clocks \times 1/fx
0	1	0	92 clocks \times 1/fx
0	1	1	Setting prohibited
1	0	0	16 clocks \times 1/fx
1	0	1	
1	1	0	32 clocks \times 1/fx
1	1	1	Setting prohibited

Remark fx: System oscillation frequency

Figure 11-5 shows communication reservation timing.

Figure 11-15. Communication Reservation Timing

Remark IIC0 : IIC shift register 0
 STT0 : Bit 1 of IIC control register 0 (IICC0)
 STD0 : Bit 1 of IIC status register 0 (IICS0)
 SPD0 : Bit 0 of IIC status register 0 (IICS0)

Communication reservations are accepted via the following timing. After bit 1 (STD0) of the IIC status register 0 (IICS0) is set to "1", a communication reservation can be made by setting bit 1 (STT0) of the IIC control register 0 (IICC0) to "1" before a stop condition is detected.

Figure 11-16. Timing for Accepting Communication Reservations

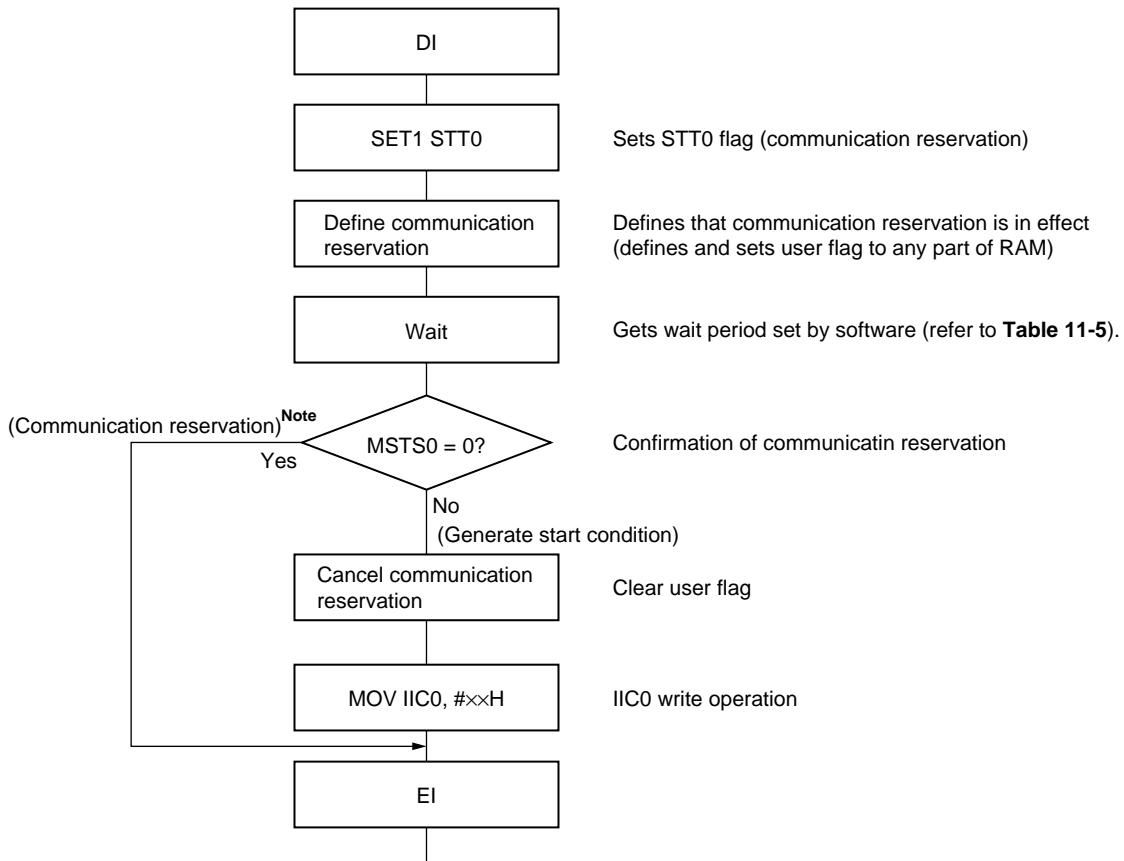

Figure 11-17 shows the communication reservation protocol.

Figure 11-17. Communication Reservation Protocol

Note The communication reservation operation executes a write to the IIC shift register 0 (IIC0) when a stop condition interrupt request occurs.

Remark STT0 : Bit 1 of IIC control register 0 (IICC0)
 MSTS0 : Bit 7 of IIC status register 0 (IICS0)
 IIC0 : IIC shift register 0

11.5.15 Other cautions

After a reset, when changing from a mode in which no stop condition has been detected (the bus has not been released) to a master device communication mode, first generate a stop condition to release the bus, then perform master device communication.

When using multiple masters, it is not possible to perform master device communication when the bus has not been released (when a stop condition has not been detected).

Use the following sequence for generating a stop condition.

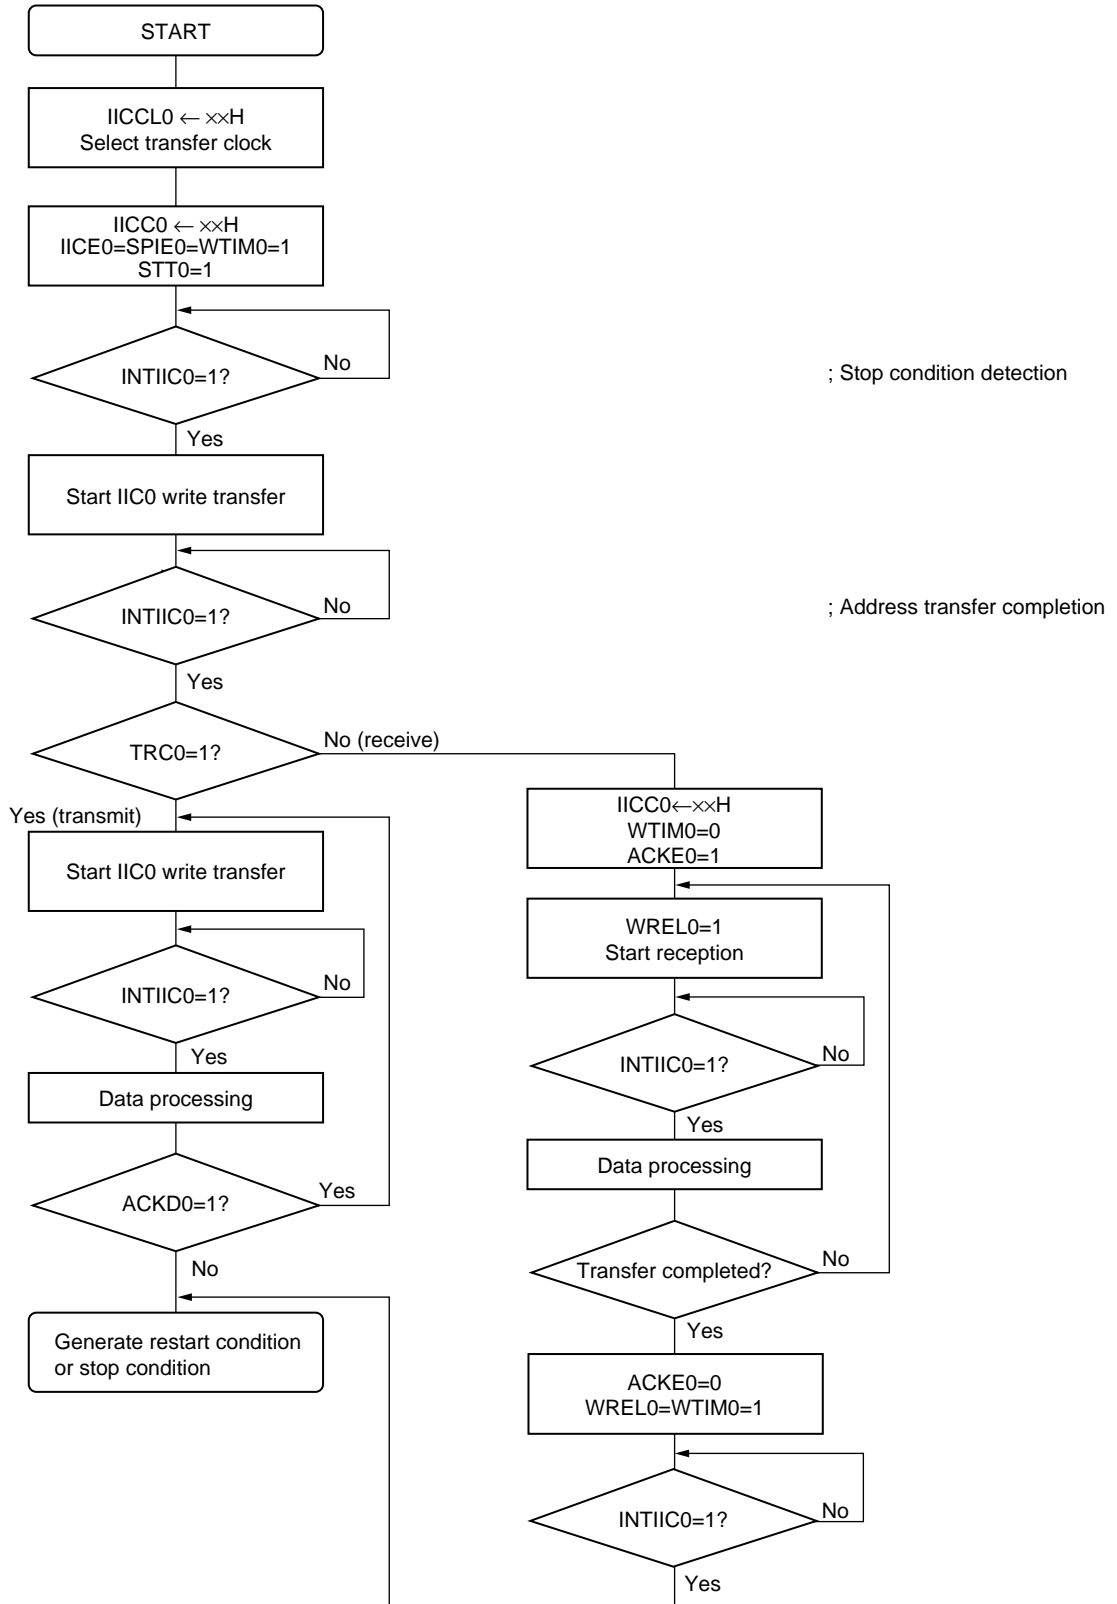

- (a) Set IIC transfer clock select register (IICCL0).
- (b) Set bit 7 (IICE0) of the IIC control register 0 (IICC0).
- (c) Set bit 0 of IICC0.

11.5.16 Communication operations

(1) Master operations

The following is a flow chart of the master operations.

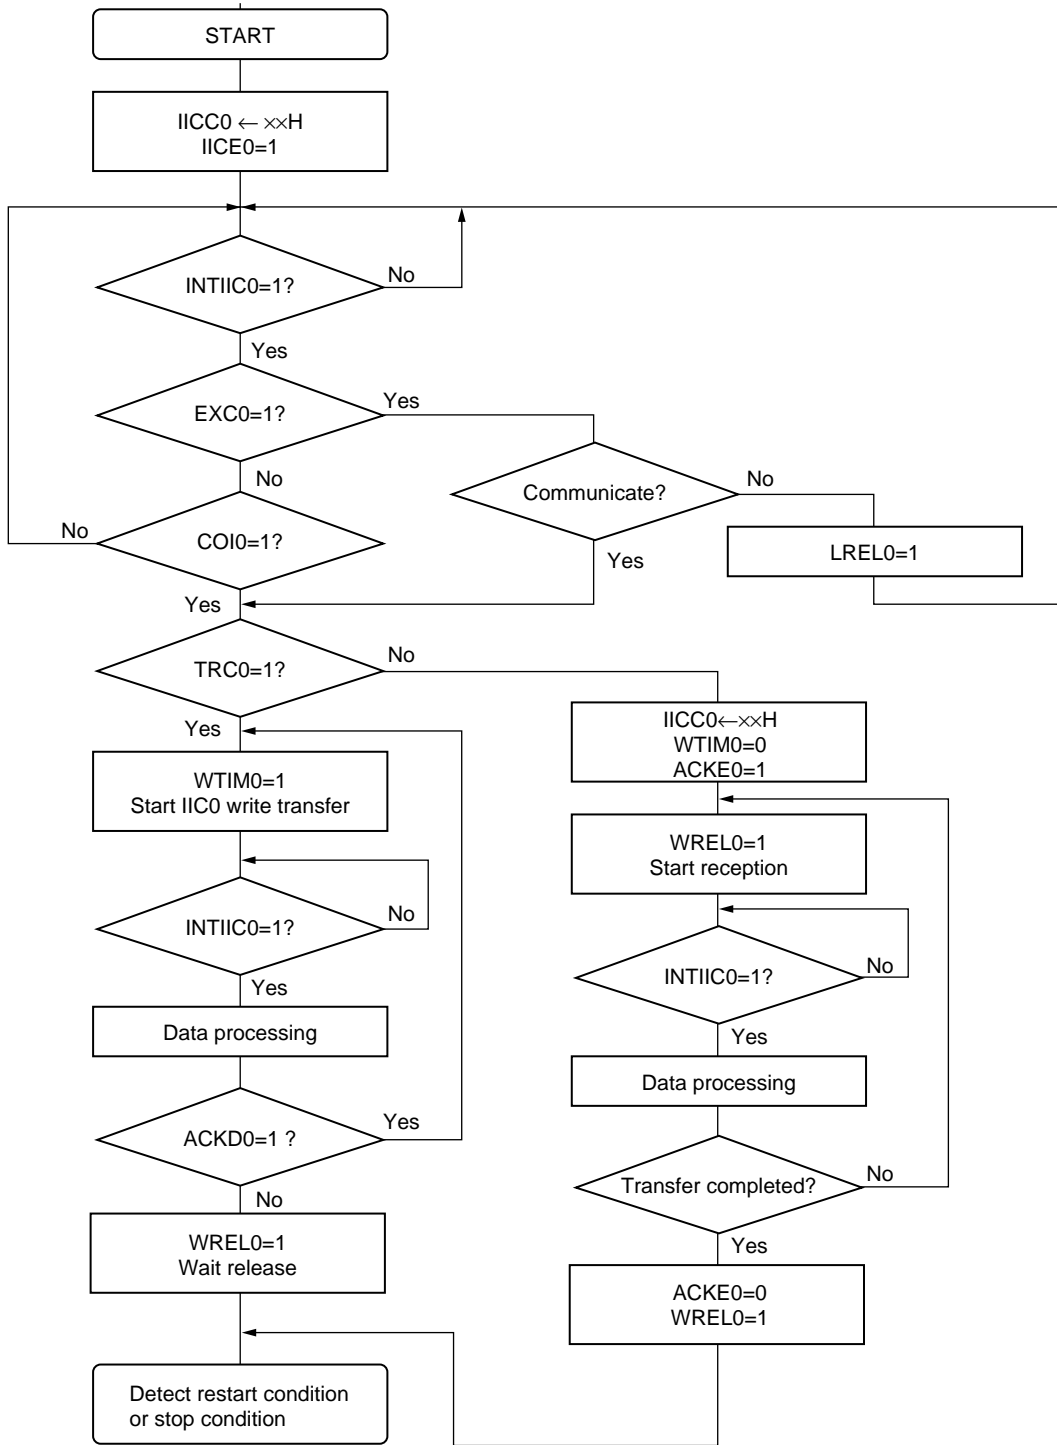

Figure 11-18. Flow Chart of Master Operation

(2) Slave operation

An example of slave operation is shown below.

Figure 11-19. Slave Operation Flow Chart

11.6 Timing Charts

When using the I²C bus mode, the master device outputs an address via the serial bus to select one of several slave devices as its communication partner.

After outputting the slave address, the master device transmits the TRC0 bit (bit 3 of the IIC status register 0 (IICS0)) that specifies the data transfer direction and then starts serial communication with the slave device.

Figures 11-20 and 11-21 show timing charts of the data communication.

The IIC bus shift register 0 (IIC0)'s shift operation is synchronized with the falling edge of the serial clock (SCL0). The transmit data is transferred to the SO0 latch and is output (MSB first) via the SDA0 pin.

Data input via the SDA0 pin is captured into IIC0 at the rising edge of SCL0.

[MEMO]

CHAPTER 12 SERIAL INTERFACE (SIO3)

12.1 Function of Serial Interface (SIO3)

The serial interface (SIO3) has the following two modes:

(1) Operation stop mode

This mode is used when serial transfer is not performed. For details, refer to 12.4.1.

(2) 3-wire serial I/O mode (MSB first)

In this mode, 8-bit data is transferred by using three lines: serial clock ($\overline{\text{SCK3}}$), serial output (SO3), and serial input (SI3).

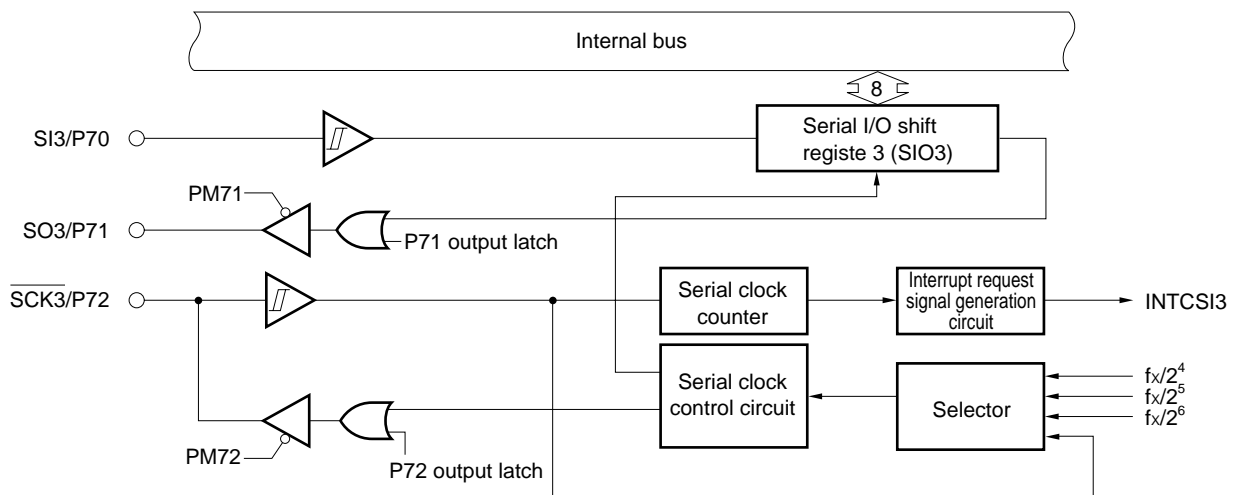

Because transmission and reception can be executed simultaneously in this mode, the processing time of data transfer can be shortened.

The first bit of the 8-bit data to be transferred is the MSB.

The 3-wire serial I/O mode is useful for connecting a peripheral I/O or display controller with a clocked serial interface. For details, refer to 12.4.2.

Figure 12-1 shows the block diagram of the serial interface (SIO3).

Figure 12-1. Block Diagram of Serial Interface (SIO3)

12.2 Configuration of Serial Interface (SIO3)

The serial interface (SIO3) consists of the following hardware:

Table 12-1. Configuration of Serial Interface (SIO3)

Item	Configuration
Register	Serial I/O shift register 3 (SIO3)
Control register	Serial operating mode register 3 (CSIM3)

(1) Serial I/O shift register 3 (SIO3)

This 8-bit register converts parallel data into serial data and transmits or receives the serial data (shift operation) in synchronization with a serial clock.

SIO3 is set by using an 8-bit memory manipulation instruction.

Serial operation is started by writing or reading data to or from SIO3 when bit 7 (CSIE3) of the serial operating mode register 3 (CSIM3) is 1.

Data written to SIO3 is output to a serial output line (SO3) for transmission.

Data is read to SIO3 from a serial input line (SI3) for reception.

The value of this register is undefined at reset.

Caution Do not execute access other than that for transfer starting trigger to SIO3 during transfer operation (the read operation disabled when MODE0 = 0, and the write operation is disabled when MODE0 = 1).

12.3 Register Controlling Serial Interface (SIO3)

The following register controls the serial interface (SIO3):

- **Serial operating mode register 3 (CSIM3)**

(1) Serial operating mode register 3 (CSIM3)

This register selects the serial clock of SIO3 and an operating mode, and enables or disables the operation. CSIM3 is set by using a 1-bit or 8-bit memory manipulation instruction. The value of this register is initialized to 00H at reset.

Figure 12-2. Format of Serial Operating Mode Register 3 (CSIM3)

Symbol	<7>	6	5	4	3	2	1	0	Address	At reset	R/W
CSIM3	CSIE3	0	0	0	0	MODE	SCL31	SCL30	FF6FH	00H	R/W

CSIE3	Enables/Disables SIO3 Operation		
	Shift register operation	Serial counter	Port
0	Disables operation	Cleared	Port function ^{Note 1}
1	Enables operation	Enables counter operation	Serial function + port function ^{Note 2}

MODE	Transfer Operating Mode Flag		
	Operating mode	Transfer start trigger	SO3 output
0	Transmit or transmit/receive mode	SIO3 write	Serial output
1	Receive only mode	SIO3 read	Fixed to low level ^{Note 3}

SCL31	SCL30	Selects Clock
0	0	External clock input to $\overline{SCK3}$
0	1	$f_x/2^4$ (281 kHz)
1	0	$f_x/2^5$ (141 kHz)
1	1	$f_x/2^6$ (70.3 kHz)

- Notes**
1. The SI3, SO3, and $\overline{SCK3}$ pins can be used as port pins when CSIE3 = 0 (when SIO3 operation is stopped).
 2. When CSIE3 = 1 (when SIO3 operation is enabled), the SI3 pin can be used as a port pin if only the transmission function is used, and the SO3 pin can be used as a port pin in the receive mode.
 3. This pin can be used as a port pin (P71).

Caution Set the port mode register (PM_{xx}) as follows in the 3-wire serial I/O mode.

Reset the output latch to 0.

- When serial clock is output (master transmission or master reception)
Set P72 ($\overline{\text{SCK3}}$) in the output mode (PM72 = 0).
- When serial clock is input (slave transmission or slave reception)
Set P72 in the input mode (PM72 = 1).
- In transmit or transmit/receive mode
Set P71 (SO3) in the output mode (PM71 = 0).
- In receive mode
Set P70 (SI3) in the input mode (PM70 = 1).

Remarks 1. fx: System clock oscillation frequency

2. (): fx = 4.5 MHz

12.4 Operation of Serial Interface (SIO3)

This section explains the two modes of the serial interface (SIO3).

12.4.1 Operation stop mode

In this mode, serial transfer is not performed.

The P70/SI3, P71/SO3, and P72/ $\overline{\text{SCK3}}$ pins can be used as ordinary I/O port pins.

(1) Register setting

The operation stop mode is set by using the serial operating mode register 3 (CSIM3).

CSIM3 is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Symbol	<7>	6	5	4	3	2	1	0	Address	At reset	R/W
CSIM3	CSIE3	0	0	0	0	MODE	SCL31	SCL30	FF6FH	00H	R/W

CSIE3	Enables/Disables SIO3 Operation		
	Shift register operation	Serial counter	Port
0	Disables operation	Cleared	Port function ^{Note 1}
1	Enables operation	Enables count operation	Serial function + port function ^{Note 2}

- Notes**
1. The SI3, SO3, and $\overline{\text{SCK3}}$ pins can be used as port pins when CSIE3 = 0 (when SIO3 operation is stopped).
 2. When CSIE3 = 1 (when SIO3 operation is enabled), the SI3 pin can be used as a port pin if only the transmission function is used, and the SO3 pin as a port pin in the receive mode.

12.4.2 3-wire serial I/O mode

The 3-wire serial I/O mode is useful for connecting a peripheral I/O or display controller equipped with a clocked serial interface.

In this mode, communication is executed by using three lines: serial clock ($\overline{\text{SCK3}}$), serial output (SO3), and serial input (SI3).

(1) Register setting

The 3-wire serial I/O mode is set by using the serial operating mode register 3 (CSIM3).

This register is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Symbol	<7>	6	5	4	3	2	1	0	Address	At reset	R/W
CSIM3	CSIE3	0	0	0	0	MODE	SCL31	SCL30	FF6FH	00H	R/W

CSIE3	Enables/Disables SIO3 Operation		
	Shift register operation	Serial counter	Port
0	Disables operation	Cleared	Port function ^{Note 1}
1	Enables operation	Enables counter operation	Serial function + port function ^{Note 2}

MODE	Transfer Operation Mode Flag		
	Operating mode	Transfer start trigger	SO3 output
0	Transmit or transmit/receive mode	SIO3 write	Serial output
1	Receive-only mode	SIO3 read	Fixed to low level ^{Note 3}

SCL31	SCL30	Selects Clock
0	0	External clock input to $\overline{\text{SCK3}}$
0	1	$f_x/2^4$ (281 kHz)
1	0	$f_x/2^5$ (141 kHz)
1	1	$f_x/2^6$ (70.3 kHz)

- Notes**
1. The SI3, SO3, and $\overline{\text{SCK3}}$ pins can be used as port pins when CSIE3 = 0 (when SIO3 operation is stopped).
 2. When CSIE3 = 1 (when SIO3 operation is enabled), the SI3 pin can be used as a port pin if only the transmission function is used, and the SO3 pin can be used as a port pin in the receive mode.
 3. This pin can be used as a port pin (P71).

Caution Set the port mode register (PM_{xx}) as follows in the 3-wire serial I/O mode.

Reset the output latch to 0.

- When serial clock is output (master transmission or master reception)
Set P72 ($\overline{\text{SCK3}}$) in the output mode (PM72 = 0).
- When serial clock is input (slave transmission or slave reception)
Set P72 in the input mode (PM72 = 1).
- In transmit or transmit/receive mode
Set P71 (SO3) in the output mode (PM71 = 0).
- In receive mode
Set P70 (SI3) in the input mode (PM70 = 1).

- Remarks**
1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5$ MHz

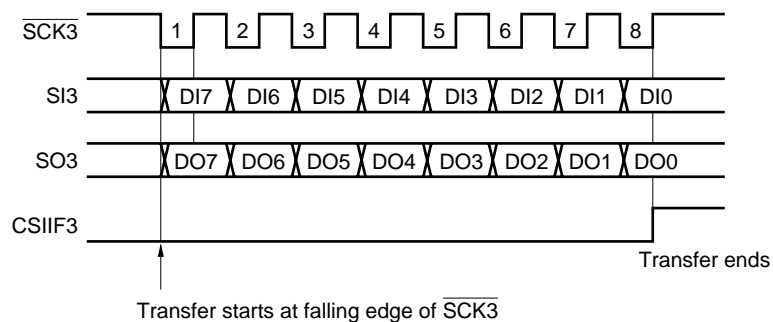

(2) Communication operation

In the 3-wire serial I/O mode, data is transmitted or received in 8-bit units. Data is transmitted or received in synchronization with the serial clock.

The shift operation of the serial I/O shift register 3 (SIO3) is performed at the falling edge of the serial clock ($\overline{SCK3}$). The transmit data is retained to SO3 and is output from the SO3 pin. The receive data input to the SI3 pin is latched to SIO3 at the falling edge of the serial clock.

When 8-bit data has been transferred, the operation of SIO3 is automatically stopped, and an interrupt request flag (CSIF3) is set.

Figure 12-3. Timing in 3-Wire Serial I/O Mode

(3) Starting transfer

Serial transfer is started by writing (or reading) the transfer data to the serial I/O shift register 3 (SIO3) when the following conditions are satisfied:

- Operation control bit of SIO3 (bit 7 (CSIE3) of serial operation mode register 3 (CSIM3)) = 1
- If the internal serial clock is stopped or $\overline{SCK3}$ is high after transfer of 8-bit serial data
- Transmit/receive mode
 - Transfer is started if SIO3 is written when bit 7 (CSIE3) of CSIM3 = 1, and bit 2 (MODE) = 0
- Receive mode
 - Transfer is started if SIO3 is read when bit 7 (CSIE3) of CSIM3 = 1, and bit 2 (MODE) = 1

Caution Serial transfer is not started even if 1 is written to CSIE3 after data is written to SIO3.

On completion of transfer of the 8-bit data, serial transfer is automatically stopped, and an interrupt request flag (CSIF3) is set.

[MEMO]

CHAPTER 13 SERIAL INTERFACE (UART0)

13.1 Function of Serial Interface (UART0)

The serial interface (UART0) has the following two modes:

(1) Operation stop mode

In this mode, serial transfer is not performed.

For details, refer to 13.4.1.

(2) Asynchronous serial interface (UART) mode

This mode is used to transmit or receive 1-byte data following a start bit. Full duplex operation can be executed in this mode.

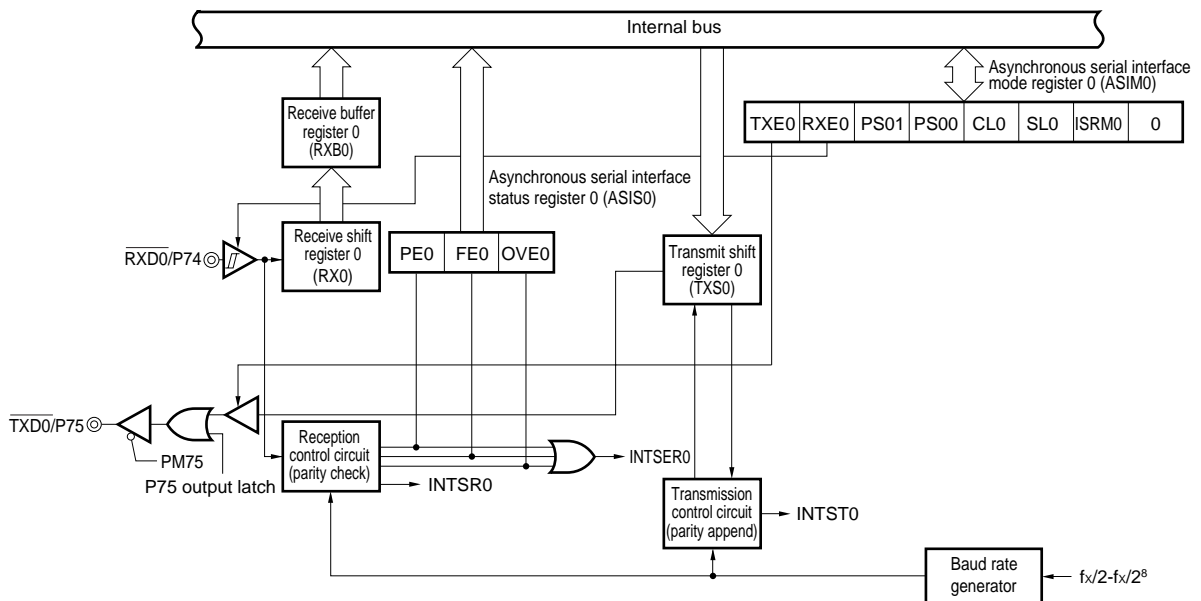

Because a UART-dedicated baud rate generator is provided, communication can be executed at a wide range of baud rates.

Moreover, MIDI standard baud rate (31.25 kbps) can be also generated by using the UART-dedicated baud rate generator.

For details, refer to 13.4.2.

Figure 13-1 shows the block diagram of the serial interface (UART0).

Figure 13-1. Block Diagram of Serial Interface (UART0)

13.2 Configuration of Serial Interface (UART0)

The serial interface (UART0) consists of the following hardware:

Table 13-1. Configuration of Serial Interface (UART0)

Item	Configuration
Register	Transmit shift register 0 (TXS0) Receive shift register 0 (RX0) Receive buffer register 0 (RXB0)
Control register	Asynchronous serial interface mode register 0 (ASIM0) Asynchronous serial interface status register 0 (ASIS0) Baud rate generator control register 0 (BRGC0)

(1) Transmit shift register 0 (TXS0)

This register stores transmit data. The data written to TXS0 is transmitted as serial data.

When the data length is specified to be 7 bits, bits 0 through 6 of the data written to TXS0 are transferred as transmit data. By writing data to TXS0, the transmission operation is started.

TXS0 is written by using an 8-bit memory manipulation instruction, but it cannot be read.

At reset, the value of this register is set to FFH.

Caution Do not write data to TXS0 during transmission operation.

Because TXS0 and the receive buffer register 0 (RXB0) are assigned to the same address, if this address is read, the value of RXB0 is read.

(2) Receive shift register 0 (RX0)

This register converts the serial data input to the $\overline{\text{RXD0}}$ pin into parallel data. When 1 byte of data has been received, the receive data is transferred to the receive buffer register 0 (RXB0).

RX0 cannot be directly manipulated in software.

(3) Receive buffer register 0 (RXB0)

This register holds receive data. Each time 1 byte of data has been received, new receive data is transferred from the receive shift register 0 (RX0).

If the data length is specified to be 7 bits, the receive data is transferred to bits 0 through of RXB0, and the MSB of RXB0 is always 0.

RXB0 can be read by using an 8-bit memory manipulation instruction, but it cannot be written.

The value of this register is set to FFH at reset.

Caution Because RXB0 and the transmit shift register 0 (TXS0) are assigned to the same address, if data is written to this address, the value is written to TXS0.

(4) Transmission control circuit

This circuit controls the transmission operation by appending a start bit, parity bit, and stop bit to the data written to the transmit shift register 0 (TXS0) according to the contents of the asynchronous serial interface mode register 0 (ASIM0).

(5) Reception control circuit

This circuit controls the reception operation according to the contents of the asynchronous serial interface mode register 0 (ASIM0). It also checks for errors such as a parity error during reception and, if an error is detected, writes a value identifying the error to the asynchronous serial interface status register 0 (ASIS0).

13.3 Registers Controlling Serial Interface (UART0)

The following three registers control the serial interface (UART0):

- Asynchronous serial interface mode register 0 (ASIM0)
- Asynchronous serial interface status register 0 (ASIS0)
- Baud rate generator control register 0 (BRGC0)

(1) Asynchronous serial interface mode register 0 (ASIM0)

This 8-bit register controls the serial transfer operation of the serial interface (UART0).

ASIM0 is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Figure 13-2 shows the format of ASIM0.

Figure 13-2. Format of Asynchronous Serial Interface Mode Register 0 (ASIM0)

Symbol	<7>	<6>	5	4	3	2	1	0	Address	At reset	R/W
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	0 ^{Note}	FF5AH	00H	R/W

TXE0	RXE0	Operating Mode	Function of $\overline{\text{RXD0}}$ /P74 Pin	Function of $\overline{\text{TXD0}}$ /P75 Pin

0	1	UART mode (reception only)	Serial function ($\overline{\text{RXD0}}$)	
1	0	UART mode (transmission only)	Port function (P74)	Serial function ($\overline{\text{TXD0}}$)
1	1	UART Mode (transmission/reception)	Serial function ($\overline{\text{RXD0}}$)	

PS01	PS00	Specifies Parity Bit
0	0	No parity
0	1	Always appends 0 parity during transmission. Does not check parity during reception (parity error does not occur).
1	0	Odd parity
1	1	Even parity

CL0	Specifies Character Length
0	7 bits
1	8 bits

SL0	Specifies Stop Bit Length of Transmit Data
0	1 bit
1	2 bits

ISRM0	Controls Reception Completion Interrupt in Case of Error
0	Generates reception completion interrupt request in case of error
1	Does not generate reception completion interrupt request in case of error

Note Be sure to reset bit 0 of ASIM0 to “0”.

Cautions 1. Before changing the operating mode, stop the serial transmission/reception operation.

2. Set the port mode registers (PM_{xx}) as follows in the UART mode.

Reset the output latch to 0.

- During reception

- Set P74 ($\overline{\text{RXD0}}$) in the input mode (PM74 = 1).

- During transmission

- Set P75 ($\overline{\text{TXD0}}$) in the output mode (PM75 = 0).

- During transmission/reception

- Set P74 in the input mode and P75 in the output mode.

(2) Asynchronous serial interface status register 0 (ASIS0)

This register indicates the type of error when a reception error occurs in the UART mode.

ASIS0 is set by using an 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Figure 13-3. Format of Asynchronous Serial Interface Register 0 (ASIS0)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
ASIS0	0	0	0	0	0	PE0	FE0	OVE0	FF5BH	00H	R

PE0	Parity Error Flag
0	No parity error
1	Parity error occurred (if parity of transmit data did not coincide).

FE0	Framing Error Flag
0	No framing error
1	Framing error occurred ^{Note 1} (if stop bit was not detected).

OVE0	Overrun Error Flag
0	No overrun error
1	Overrun error occurred ^{Note 2} (if next reception operation was completed before data was read from receive buffer register).

Notes 1. Even when the stop bit length is set to 2 bits by bit 2 (SL0) of the asynchronous serial interface mode register 0 (ASIM0), only 1 stop bit is detected during reception.

2. Be sure to read the receive buffer register 0 (RXB0) if an overrun error has occurred.
The overrun error persistently occurs each time data has been received, until RXB0 is read.

(3) Baud rate generator control register 0 (BRGC0)

This register sets the serial clock of the serial interface.

BRGC0 is set by using an 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Figure 13-4 shows the format of BRGC0.

Figure 13-4. Format of Baud Rate Generator Control Register 0 (BRGC0)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
BRGC0	0	TPS02	TPS01	TPS00	MDL03	MDL02	MDL01	MDL00	FF5CH	00H	R/W

TPS02	TPS01	TPS00	Selects Source Clock of 5-bit Counter	n
0	0	0	$f_x/2$ (2.25 MHz)	1
0	0	1	$f_x/2^2$ (1.13 MHz)	2
0	1	0	$f_x/2^3$ (563 kHz)	3
0	1	1	$f_x/2^4$ (281 kHz)	4
1	0	0	$f_x/2^5$ (141 kHz)	5
1	0	1	$f_x/2^6$ (70.3 kHz)	6
1	1	0	$f_x/2^7$ (35.2 kHz)	7
1	1	1	$f_x/2^8$ (17.6 kHz)	8

MDL03	MDL02	MDL01	MDL00	Selects Input Clock of Baud Rate Generator	k
0	0	0	0	$f_{sck}/16$	0
0	0	0	1	$f_{sck}/17$	1
0	0	1	0	$f_{sck}/18$	2
0	0	1	1	$f_{sck}/19$	3
0	1	0	0	$f_{sck}/20$	4
0	1	0	1	$f_{sck}/21$	5
0	1	1	0	$f_{sck}/22$	6
0	1	1	1	$f_{sck}/23$	7
1	0	0	0	$f_{sck}/24$	8
1	0	0	1	$f_{sck}/25$	9
1	0	1	0	$f_{sck}/26$	10
1	0	1	1	$f_{sck}/27$	11
1	1	0	0	$f_{sck}/28$	12
1	1	0	1	$f_{sck}/29$	13
1	1	1	0	$f_{sck}/30$	14
1	1	1	1	Setting prohibited	—

Caution If data is written to BRGC0 during communication, the output of the baud rate generator is disturbed and communication cannot be executed normally. Therefore, do not write BRGC0 during communication.

Remark f_{sck} : Source clock of 5-bit counter
 n : Value set by TPS00 through TPS02 ($1 \leq n \leq 8$)
 k : Value set by MDL00 through MDL03 ($0 \leq k \leq 14$)
 $()$: $f_x = 4.5$ MHz

13.4 Operation of Serial Interface (UART0)

This section explains the two modes of the serial interface (UART0).

13.4.1 Operation stop mode

In this mode, serial transfer is not performed, and the pins used for the serial interface can be used as ordinary port pins.

(1) Register setting

The operation stop mode is set by the asynchronous serial interface mode register 0 (ASIM0).

ASIM0 is set by a 1-bit or 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Symbol	<7>	<6>	5	4	3	2	1	0	Address	At reset	R/W
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	0 ^{Note}	FF5AH	00H	R/W

TXE0	RXE0	Operating Mode	Function of $\overline{\text{RXD0}}$ /P74 Pin	Function of $\overline{\text{TXD0}}$ /P75 Pin
0	0	Stops operation	Port function (P74)	Port function (P75)
0	1	UART mode (reception only)	Serial function ($\overline{\text{RXD0}}$)	
1	0	UART mode (transmission only)	Port function (P74)	Serial function ($\overline{\text{TXD0}}$)
1	1	UART mode (transmission/reception)	Serial function ($\overline{\text{RXD0}}$)	

Note Be sure to reset bit 0 of ASIM0 to “0”.

Caution Before changing the operating mode, stop the serial transmission/reception operation.

13.4.2 Asynchronous serial interface (UART) mode

This mode is used to transmit or receive 1-byte data following a start bit. Full duplex operation can be executed in this mode.

Because a UART-dedicated baud rate generator is provided, communication can be executed at a wide range of baud rates.

Moreover, the baud rate of the MIDI standard (31.25 kbps) can be also generated by using the UART-dedicated baud rate generator.

(1) Register setting

The UART mode is set by the asynchronous serial interface mode register 0 (ASIM0), asynchronous serial interface status register 0 (ASIS0), and baud rate generator control register 0 (BRGC0).

(a) Asynchronous serial interface mode register 0 (ASIM0)

ASIM0 is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Symbol	<7>	<6>	5	4	3	2	1	0	Address	At reset	R/W
ASIM0	TXE0	RXE0	PS01	PS00	CL0	SL0	ISRM0	0 ^{Note}	FF5AH	00H	R/W

TXE0	RXE0	Operating Mode	Function of $\overline{\text{RXD0}}$ /P74 Pin	Function of $\overline{\text{TXD0}}$ /P75 Pin
0	0	Stops operation	Port function (P74)	Port function (P75)
0	1	UART mode (reception only)	Serial function ($\overline{\text{RXD0}}$)	Serial function ($\overline{\text{TXD0}}$)
1	0	UART mode (transmission only)	Port function (P74)	
1	1	UART mode (transmission/reception)	Serial function ($\overline{\text{RXD0}}$)	

PS01	PS00	Specifies Parity Bit
0	0	No parity
0	1	Always appends 0 parity during transmission. Does not check parity during reception (parity error does not occur).
1	0	Odd parity
1	1	Even parity

CL0	Specifies Character Length
0	7 bits
1	8 bits

SL0	Specifies Stop Bit Length of Transmit Data
0	1 bit
1	2 bits

ISRM0	Controls Reception Completion Interrupt in Case of Error
0	Generates reception completion interrupt request in case of error
1	Does not generate reception completion interrupt request in case of error

Note Be sure to reset bit 0 of ASIM0 to "0".

Cautions 1. Before changing the operating mode, stop the serial transmission/reception operation.

2. Set the port mode registers (PM_{xx}) as follows in the UART mode.

Reset the output latch to 0.

- During reception
Set P74 ($\overline{\text{RXD0}}$) in the input mode (PM74 = 1).
- During transmission
Set P75 ($\overline{\text{TXD0}}$) in the output mode (PM75 = 0).
- During transmission/reception
Set P74 in the input mode and P75 in the output mode.

(b) Asynchronous serial interface status register 0 (ASIS0)

ASIS0 is set by using an 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
ASIS0	0	0	0	0	0	PE0	FE0	OVE0	FF5BH	00H	R

PE0	Parity Error Flag
0	No parity error
1	Parity error occurred (if parity of transmit data did not coincide).

FE0	Framing Error Flag
0	No framing error
1	Framing error occurred ^{Note 1} (if stop bit was not detected).

OVE0	Overrun Error Flag
0	No overrun error
1	Overrun error occurred ^{Note 2} (if next reception operation was completed before data was read from receive buffer register 0 (RXB0)).

- Notes**
1. Even when the stop bit length is set to 2 bits by bit 2 (SL0) of the asynchronous serial interface mode register 0 (ASIM0), only 1 stop bit is detected during reception.
 2. Be sure to read the receive buffer register 0 (RXB0) if an overrun error has occurred. The overrun error persistently occurs each time data has been received, until RXB0 is read.

(c) Baud rate generator control register 0 (BRGC0)

BRGC0 is set by using an 8-bit memory manipulation instruction.

The value of this register is initialized to 00H at reset.

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
BRGC0	0	TPS02	TPS01	TPS00	MDL03	MDL02	MDL01	MDL00	FF5CH	00H	R/W

TPS02	TPS01	TPS00	Selects Source Clock of 5-bit Counter	n
0	0	0	$f_x/2$ (2.25 MHz)	1
0	0	1	$f_x/2^2$ (1.13 MHz)	2
0	1	0	$f_x/2^3$ (563 kHz)	3
0	1	1	$f_x/2^4$ (281 kHz)	4
1	0	0	$f_x/2^5$ (141 kHz)	5
1	0	1	$f_x/2^6$ (70.3 kHz)	6
1	1	0	$f_x/2^7$ (35.2 kHz)	7
1	1	1	$f_x/2^8$ (17.6 kHz)	8

MDL03	MDL02	MDL01	MDL00	Selects Input Clock of Baud Rate Generator	k
0	0	0	0	$f_{sck}/16$	0
0	0	0	1	$f_{sck}/17$	1
0	0	1	0	$f_{sck}/18$	2
0	0	1	1	$f_{sck}/19$	3
0	1	0	0	$f_{sck}/20$	4
0	1	0	1	$f_{sck}/21$	5
0	1	1	0	$f_{sck}/22$	6
0	1	1	1	$f_{sck}/23$	7
1	0	0	0	$f_{sck}/24$	8
1	0	0	1	$f_{sck}/25$	9
1	0	1	0	$f_{sck}/26$	10
1	0	1	1	$f_{sck}/27$	11
1	1	0	0	$f_{sck}/28$	12
1	1	0	1	$f_{sck}/29$	13
1	1	1	0	$f_{sck}/30$	14
1	1	1	1	Setting prohibited	—

Caution If data is written to BRGC0 during communication, the output of the baud rate generator is disturbed and communication cannot be executed normally. Therefore, do not write BRGC0 during communication.

Remarks

1. f_{sck} : Source clock of 5-bit counter
 n : Value set by TPS00 through TPS02 ($1 \leq n \leq 8$)
 k : Value set by MDL00 through MDL03 ($0 \leq k \leq 14$)
2. () : $f_x = 4.5$ MHz

The transmit/receive clock for the generated baud rate is the system clock divided.

- Generation of transmit/receive clock for baud rate with system clock

The transmit/receive clock is generated by dividing the system clock. The baud rate generated from the system clock can be calculated by the following expression:

$$[\text{Baud rate}] = \frac{f_x}{2^{n+1} (k + 16)} \text{ [bps]}$$

f_x : System clock oscillation frequency

n : Value set by TPS00 through TPS02 ($1 \leq n \leq 8$)

For details, refer to **Table 13-2**.

k : Value set by MDL00 through MDL03 ($0 \leq k \leq 14$)

Table 13-2 shows the relation between the source clock of the 5-bit counter allocated to bits 4 through 6 (TPS00 through TPS02) of BRGC0 and the value of n .

Table 13-2. Relation between Source Clock of 5-Bit Counter and Value n

TPS02	TPS01	TPS00	Selects Source Clock of 5-bit Counter	n
0	0	0	$f_x/2$	1
0	0	1	$f_x/2^2$	2
0	1	0	$f_x/2^3$	3
0	1	1	$f_x/2^4$	4
1	0	0	$f_x/2^5$	5
1	0	1	$f_x/2^6$	6
1	1	0	$f_x/2^7$	7
1	1	1	$f_x/2^8$	8

Remark f_x : System clock oscillation frequency

- Permissible error range of baud rate

The permissible range of the baud rate depends on the number of bits in one frame and the division ratio of the counter $[1/(16 + k)]$.

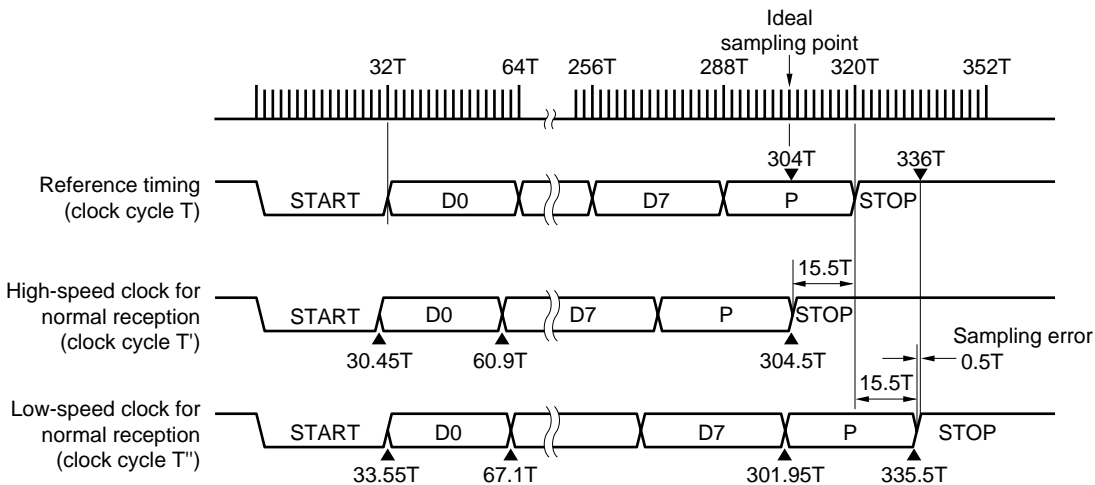

Table 13-3 shows the relation between the system clock and baud rate, and Figure 13-5 shows an example of permissible error.

Table 13-3. Relation between System Clock and Baud Rate

Baud Rate [bps]	$f_x = 4.5 \text{ MHz}$	
	BRGC0	Error (%)
300	7DH	1.02
600	6DH	1.02
1200	5DH	1.02
2400	4DH	1.02
4800	3DH	1.02
9600	2DH	1.02
19200	1DH	1.02
31250	12H	0.0
38400	0DH	1.02

Remark Baud rate = $f_x / \{2^{n+1} \times (k + 16)\}$
 f_x : System clock oscillation frequency
 n : Value set by TPS00 through TPS02 ($1 \leq n \leq 8$)
 k : Value set by MDL00 through MDL03 ($0 \leq k \leq 14$)

Figure 13-5. Permissible Error of Baud Rate with Sampling Error Considered (k = 0)

Remark T: Source clock cycle of 5-bit counter

$$\text{Permissible baud rate error (where } k = 0) = \frac{\pm 15.5}{320} \times 100 = 4.8438 (\%)$$

(2) Basic operation**(a) Data format**

Figure 13-6 shows the format of transmit/receive data.

Figure 13-6. Format of Transmit/Receive Data of Asynchronous Serial Interface

One data frame consists of the following bits:

- Start bit 1 bit
- Character bits 7 or 8 bits
- Parity bit..... Even parity/odd parity/0 parity/no parity
- Stop bit 1 or 2 bits

The character bit length, parity, and stop bit length of one data frame are selected by the asynchronous serial interface mode register 0 (ASIM0).

If the character bit length is specified to be 7 bits, only the low-order 7 bits (bits 0 through 6) are valid. The most significant bit (bit 7) is ignored during transmission, and it is “0” during reception.

The serial transfer rate is set by ASIM0 and baud rate generator control register 0 (BGRC0).

If a receive error occurs in the serial data, the error can be identified by reading the status of the asynchronous serial interface status register 0 (ASIS0).

(b) Type and operation of parity

A parity bit is used to detect a bit error in the communication data. Usually, the same type of parity bit is used both at the transmitter and receiver sides. With even parity or odd parity, an error of 1 bit (or odd numbers of errors) can be detected. Errors cannot be detected when 0 parity or no parity is specified.

(i) Even parity**• During transmission**

The parity bit is set so that the number of bits in the transmit data, plus the parity bit, that are “1” is even. The value of the parity bit is as follows:

If the number of bits in transmit data that are “1” is odd: 1

If the number of bits in transmit data that are “1” is even: 0

• During reception

The number of bits in the receive data, including the parity bit, that are “1” are counted. If the number of bits is odd, a parity error occurs.

(ii) Odd parity**• During transmission**

The parity bit is set so that the number of bits in the transmit data, plus the parity bit, that are “1” is odd. The value of the parity bit is as follows:

If the number of bits in transmit data that are “1” is odd: 0

If the number of bits in transmit data that are “1” is even: 1

• During reception

The number of bits in the receive data, including the parity bit, that are “1” are counted. If the number of bits is even, a parity error occurs.

(iii) 0 parity

The parity bit is cleared to “0” during transmission, regardless of the transmit data.

The parity bit is not checked during reception. Therefore, a parity error does not occur regardless of whether the parity bit is “0” or “1”.

(iv) No parity

A parity bit is not appended to the transmit data.

During reception, data is received assuming that it has no parity bit. Because no parity bit is used, parity errors do not occur.

(c) Transmission

The transmission operation is started when transmit data is written to the transmit shift register 0 (TXS0). The start bit, parity bit, and stop bit are automatically appended.

When the data in TXS0 is shifted out and TXS0 becomes empty as a result of starting transmission, a transmission completion interrupt request (INTST0) is generated.

Figure 13-7 shows the timing of the transmission completion interrupt.

Figure 13-7. Generation Timing of Transmission Completion Interrupt Request of Asynchronous Serial Interface

(i) Stop bit length: 1**(ii) Stop bit length: 2**

Caution Do not change the contents of the asynchronous serial interface mode register 0 (ASIM0) during transmission. If the contents of the ASIM0 register are changed during transmission, the transmission may not be performed any more (it can be returned to the normal status by reset).

Whether transmission is in progress can be checked by software, by using the transmission completion interrupt request (INTST0) or the interrupt request flag (STIF0) that is set by INTST0.

(d) Reception

Reception is enabled when bit 6 (RXE0) of the asynchronous serial interface mode register 0 (ASIM0) is set to 1, and then the input to the $\overline{\text{RXD0}}$ pin is sampled.

The $\overline{\text{RXD0}}$ pin is sampled with the serial clock specified by ASIM0.

When the $\overline{\text{RXD0}}$ pin goes low, the 5-bit counter of the baud rate generator starts counting. When a time of half the set baud rate has elapsed, the start timing signal of data sampling is output. If the $\overline{\text{RXD0}}$ pin is sampled with this start timing signal again and is found to be low level, the pin level is recognized as a start bit. The 5-bit counter is initialized, counting is started, and the data is sampled. If character data, a parity bit, and 1 stop bit are detected after the start bit, reception of the one frame of data is completed. When reception of one frame of data has been completed, the receive data in the shift register is transferred to the receive buffer register 0 (RXB0), and a reception completion interrupt request (INTSR0) is generated.

Even if an error occurs, the receive data is transferred if an error occurs in RXB0. If bit 1 (ISRM0) of ASIM0 is cleared to 0 when the error occurs, INTSR0 is generated (refer to **Figure 13-9**).

INTSR0 is not generated if the ISRM0 bit is set to 1.

If the RXE0 bit is reset to 0 during reception, the reception is immediately stopped. At this time, the contents of RXB0 and ASIS0 are not affected, nor are INTSR0 and INTSER0 generated.

Figure 13-8 shows the timing of generating the reception completion interrupt request of the asynchronous serial interface.

Figure 13-8. Timing of Generation of Reception Completion Interrupt of Asynchronous Serial Interface

Caution Be sure to read the receive buffer register 0 (RXB0) even if a reception error occurs. Otherwise, an overrun error occurs when the next data is received, and the reception error status persists as a result.

(e) Reception error

Three types of error, parity error, framing error, and overrun error, may occur during reception. If the error flag in the asynchronous serial interface status register 0 (ASIS0) is set as a result of receiving data, the reception error interrupt request (INTSER0) is generated. This interrupt occurs before the reception completion interrupt request (INTSR0). Table 13-4 shows the causes of the reception error.

Which error has occurred during reception can be identified by reading the contents of ASIS0 in reception error processing (INTSER0) (refer to **Table 13-4** and **Figure 13-9**).

The contents of ASIS0 are reset when the receive buffer register 0 (RXB0) is read or the next data is received (if an error occurs in the next data, the corresponding error flag is set).

Table 13-4. Causes of Reception Errors

Reception Errors	Causes	Value of ASIS0
Parity error	Parity specified for transmission does not coincide with parity of receive data.	04H
Framing error	Stop bit is not detected.	02H
Overrun error	Reception is completed at next data before data is read from receive buffer register 0.	01H

Figure 13-9. Reception Error Timing

Note If a reception error occurs while the ISRM0 bit is set to 1, INTSR0 does not occur.

Cautions 1. The contents of the asynchronous serial interface status register 0 (ASIS0) are reset to 0 when the receive buffer register 0 (RXB0) is read or the next data is received. To identify the error, be sure to read ASIS0 before reading RXB0.

2. Be sure to read the RXB0 even if a reception error occurs. Otherwise, an overrun error occurs when the next data is received, and the reception error status persists as a result.

[MEMO]

CHAPTER 14 INTERRUPT FUNCTIONS

14.1 Interrupt Function Types

The following three types of interrupt functions are used.

(1) Non-maskable interrupt

This interrupt is acknowledged unconditionally even if interrupt is disabled. It does not undergo interrupt priority control and is given top priority over all other interrupt requests.

It generates a standby release signal.

One interrupt source from the watchdog timer is incorporated as a non-maskable interrupt.

(2) Maskable interrupts

These interrupts undergo mask control. Maskable interrupts can be divided into a high interrupt priority group and a low interrupt priority group by setting the priority specification flag register (PR).

Multiple high priority interrupts can be applied to low priority interrupts. If two or more interrupts with the same priority are simultaneously generated, each interrupt has a predetermined priority (refer to **Table 14-1**).

A standby release signal is generated.

Maskable interrupts are provided for each product as follows:

- μ PD178022, 178023, 178024, 178F124 Internal: 11, external: 5

(3) Software interrupt

This is a vectored interrupt to be generated by executing the BRK instruction. It is acknowledged even in a disabled state. The software interrupt does not undergo interrupt priority control.

14.2 Interrupt Sources and Configuration

The μ PD178022, 178023, 178024, and 178F124 have a total of 17 sources (refer to **Table 14-1**).

Remark As the interrupt source of the watchdog timer (INTWDT), either a non-maskable interrupt or a maskable interrupt (internal) can be selected.

★

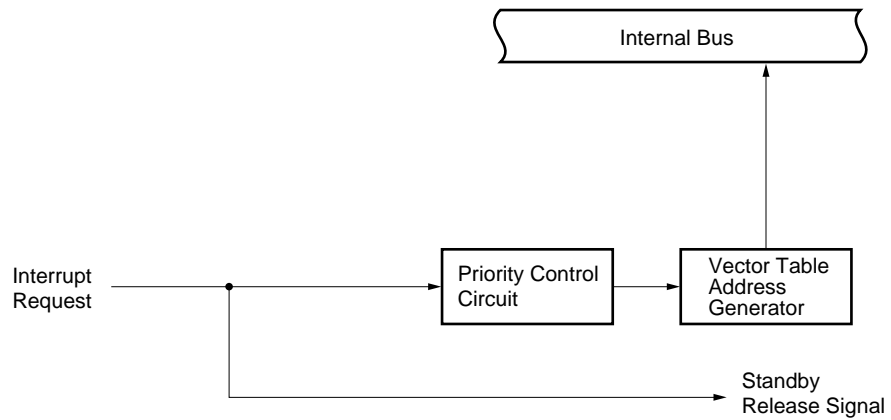

Table 14-1. Interrupt Sources

Interrupt Type	Default Priority ^{Note 1}	Interrupt Source		Internal/External	Vector Table Address	Basic Configuration Type ^{Note 2}	
		Name	Trigger				
Non-maskable	–	INTWDT	Overflow of watchdog timer (when watchdog timer mode 1 is selected)	Internal	0004H	(A)	
Maskable	0	INTWDT	Overflow of watchdog timer (when interval timer mode is selected)			External	0006H 0008H 000AH 000CH 000EH
	1	INTP0	Pin input edge detection	(C)			
	2	INTP1					
	3	INTP2					
	4	INTP3					
	5	INTP4					
	6	INTKY	Detection of key input of port 4		Internal	0010H 0012H 0014H 0016H	(B)
	7	INTIIC0	End of transfer by serial interface IIC0				
	8	INTBTM0	Generation of basic timer match signal				
	9	INTAD3	End of conversion by A/D converter				
	10	–	–	–	0018H ^{Note 3}	–	
		11	INTCSI3	End of transfer by serial interface SIO3	Internal	001AH 001CH 001EH 0020H 0022H 0024H	(B)
		12	INTTM50	Generation of coincidence signal of 8-bit timer/event counter 50			
		13	INTTM51	Generation of coincidence signal of 8-bit timer/event counter 51			
		14	INTSER0	Reception error of serial interface UART0			
		15	INTSR0	End of reception by serial interface UART0			
16		INTST0	End of transmission by serial interface UART0				
Software	–	BRK	Execution of BRK instruction	–	003EH	(D)	

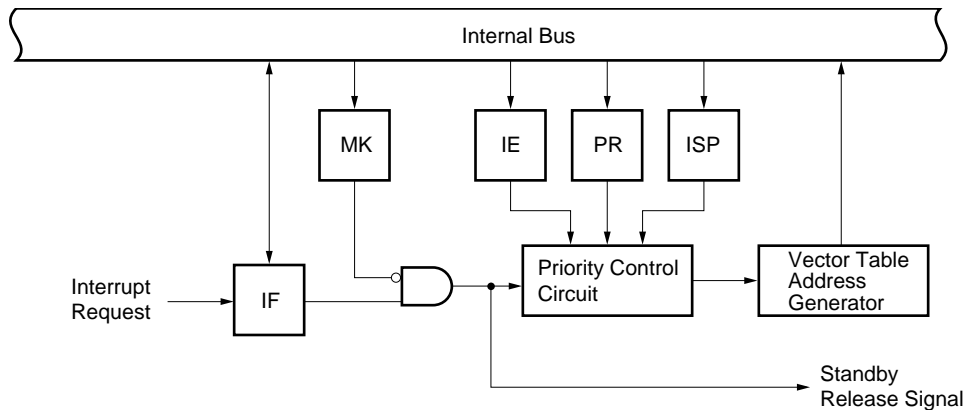

- Notes**
1. If two or more maskable interrupts occur at the same time, they are acknowledged or kept pending according to their default priorities. The default priority 0 is the highest, while 16 is the lowest.
 2. (A) to (D) under the heading Basic Configuration Type corresponds to (A) to (D) in Figure 14-1.
 3. There are no interrupt sources corresponding to vector addresses 0018H.

Figure 14-1. Basic Configuration of Interrupt Function (1/2)

(A) Internal non-maskable interrupt

(B) Internal maskable interrupt

(C) External maskable interrupt

Figure 14-1. Basic Configuration of Interrupt Function (2/2)

(D) Software interrupt

Remark

- IF : Interrupt request flag
- IE : Interrupt enable flag
- ISP : Inservice priority flag
- MK : Interrupt mask flag
- PR : Priority specification flag

14.3 Interrupt Function Control Registers

The following six types of registers are used to control the interrupt functions.

- Interrupt request flag register (IF0L, IF0H, IF1L)
- Interrupt mask flag register (MK0L, MK0H, MK1L)
- Priority specification flag register (PR0L, PR0H, PR1L)
- External interrupt rising edge enable register (EGP)
- External interrupt falling edge enable register (EGN)
- Program status word (PSW)

Table 14-2 gives a listing of interrupt request flags, interrupt mask flags, and priority specification flags corresponding to interrupt request sources.

★

Table 14-2. Various Flags Corresponding to Interrupt Request Sources

Interrupt Source	Interrupt Request Flag		Interrupt Mask Flag		Priority Specification Flag	
	Flag	Register	Flag	Register	Flag	Register
INTWDT	WDTIF	IF0L	WDTMK	MK0L	WDTPR	PR0L
INTP0	PIF0		PMK0		PPR0	
INTP1	PIF1		PMK1		PPR1	
INTP2	PIF2		PMK2		PPR2	
INTP3	PIF3		PMK3		PPR3	
INTP4	PIF4		PMK4		PPR4

INTTM51	TMIF51		TMMK51		TMPR51	
INTSER0	SERIF0		SERMK0		SERPR0	
INTSR0	SRIF0		SRMK0		SRPR0	
INTST0	STIF0		IF1L		STMK0	

(1) Interrupt request flag registers (IF0L, IF0H, IF1L)

The interrupt request flags are set to 1 when the corresponding interrupt request is generated or an instruction is executed. They are cleared to 0 when an instruction is executed upon acknowledgment of an interrupt request or upon application of reset input.

IF0L, IF0H and IF1L are set with a 1-bit or 8-bit memory manipulation instruction. If IF0L and IF0H are used as a 16-bit register IF0, use a 16-bit memory manipulation instruction for the setting.

Reset input sets these registers to 00H.

Figure 14-2. Format of Interrupt Request Flag Register (IF0L, IF0H, IF1L)

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>	Address	At reset	R/W
IF0L	IICIF0	KYIF	PIF4	PIF3	PIF2	PIF1	PIF0	WDTIF	FFE0H	00H	R/W
★ IF0H	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>	FFE1H	00H	R/W
	SRIF0	SERIF0	TMIF51	TMIF50	CSIF3	0	ADIF	BTMIF0			
★ IF1L	7	6	5	4	3	2	1	<0>	FFE2H	00H	R/W
	0	0	0	0	0	0	0	STIF0			

xxIDx	Interrupt Request Flag
0	No interrupt request signal
1	Interrupt request signal is generated; Interrupt request state

- Cautions**
- 1. TMIF4 flag is R/W enabled only when a watchdog timer is used as an interval timer. If a watchdog timer is used in watchdog timer mode 1, set TMIF4 flag to 0.**
 - 2. To operate the timers, serial interface, and A/D converter after the standby mode has been released, clear the interrupt request flag, because the interrupt request flag may be set by noise.**

(2) Interrupt mask flag registers (MK0L, MK0H, MK1L)

The interrupt mask flags are used to enable/disable the corresponding maskable interrupt service and to set standby clear enable/disable.

MK0L, MK0H and MK1L are set with a 1-bit or 8-bit memory manipulation instruction. If MK0L and MK0H are used as a 16-bit register MK0, use a 16-bit memory manipulation instruction for the setting.

Reset input sets these registers to FFH.

Figure 14-3. Format of Interrupt Mask Flag Register (MK0L, MK0H, MK1L)

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>	Address	At reset	R/W
MK0L	IICMK0	KYMK	PMK4	PMK3	PMK2	PMK1	PMK0	WDTMK	FFE4H	FFH	R/W
★ MK0H	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>			
	SRMK0	SERMK0	TMMK51	TMMK50	CSIMK3	1	ADMK	BTMMK0	FFE5H	FFH	R/W
★ MK1L	7	6	5	4	3	2	1	<0>			
	1	1	1	1	1	1	1	STMK0	FFE6H	FFH	R/W

××MK×	Interrupt Service Control
0	Interrupt servicing enabled
1	Interrupt servicing disabled

- Cautions**
1. If WDTMK flag is read when a watchdog timer is used in watchdog timer mode 1, MK0 value becomes undefined.
 2. Because port 0 has a dual function as the external interrupt request input, when the output level is changed by specifying the output mode of the port function, an interrupt request flag is set. Therefore, 1 should be set in the interrupt mask flag before using the output mode.

(3) Priority specification flag registers (PR0L, PR0H, PR1L)

The priority specification flags are used to set the corresponding maskable interrupt priority orders. PR0L, PR0H and PR1L are set with a 1-bit or 8-bit memory manipulation instruction. If PR0L and PR0H are used as a 16-bit register PR0, use a 16-bit memory manipulation instruction for the setting. Reset input sets these registers to FFH.

Figure 14-4. Format of Priority Specification Flag Register (PR0L, PR0H, PR1L)

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>	Address	At reset	R/W
PR0L	IICPR0	KYPR	PPR4	PPR3	PPR2	PPR1	PPR0	WDTPR	FFF8H	FFH	R/W
★ PR0H	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>			
	SRPR0	SERPR0	TMPR51	TMPR50	CSIPR3	1	ADPR	BTMPR0	FFE9H	FFH	R/W
	7	6	5	4	3	2	1	<0>			
★ PR1L	1	1	1	1	1	1	1	STPR0	FFEAH	FFH	R/W

xxPRx	Priority Level Selection
0	High priority level
1	Low priority level

Caution When a watchdog timer is used in watchdog timer mode 1, set WDTPR flag to 1.

(4) External interrupt rising edge enable register (EGP), external interrupt falling edge enable register (EGN)

These registers set the valid edge for INTP0 to INTP4.

EGP and EGN are set with a 1-bit or 8-bit memory manipulation instructions.

Reset input sets these registers to 00H.

Figure 14-5. Format of External Interrupt Rising Edge Enable Register (EGP) and External Interrupt Falling Edge Enable Register (EGN)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
EGP	0	0	0	EGP4	EGP3	EGP2	EGP1	EGP0	FF48H	00H	R/W
EGN	7	6	5	4	3	2	1	0	FF49H	00H	R/W

EGPn	EGNn	INTPn Pin Valid Edge Selection (n = 0-4)
0	0	Interrupt prohibited
0	1	Falling edge
1	0	Rising edge
1	1	Both falling and rising edges

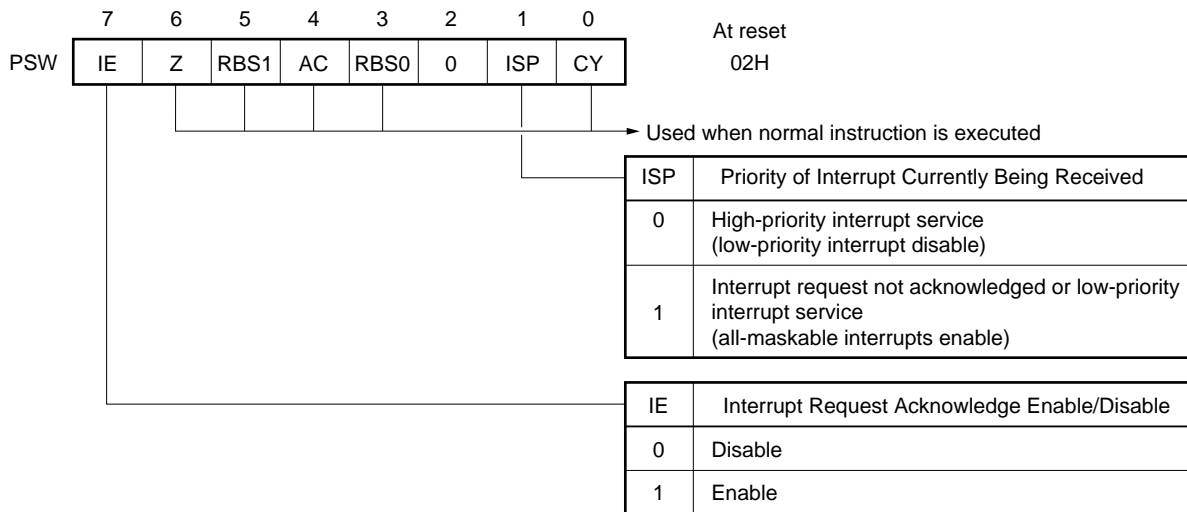

(5) Program status word (PSW)

The program status word is a register to hold the instruction execution result and the current status for interrupt request. The IE flag to set maskable interrupt enable/disable and the ISP flag to control nesting interrupt are mapped.

Besides 8-bit unit read/write, this register can carry out operations with a bit manipulation instruction and dedicated instructions (EI and DI). When a vectored interrupt request is acknowledged, if the BRK instruction is executed, the contents of PSW are automatically saved into a stack and the IE flag is reset to 0. If a maskable interrupt request is acknowledged contents of the priority specification flag of the acknowledged interrupt are transferred to the ISP flag. The acknowledged interrupt is also saved into the stack with the PUSH PSW instruction. It is restored from the stack with the RETI, RETB, and POP PSW instructions.

Reset input sets PSW to 02H.

Figure 14-6. Configuration of Program Status Word (PSW)

14.4 Interrupt Service Operations

14.4.1 Non-maskable interrupt request acknowledge operation

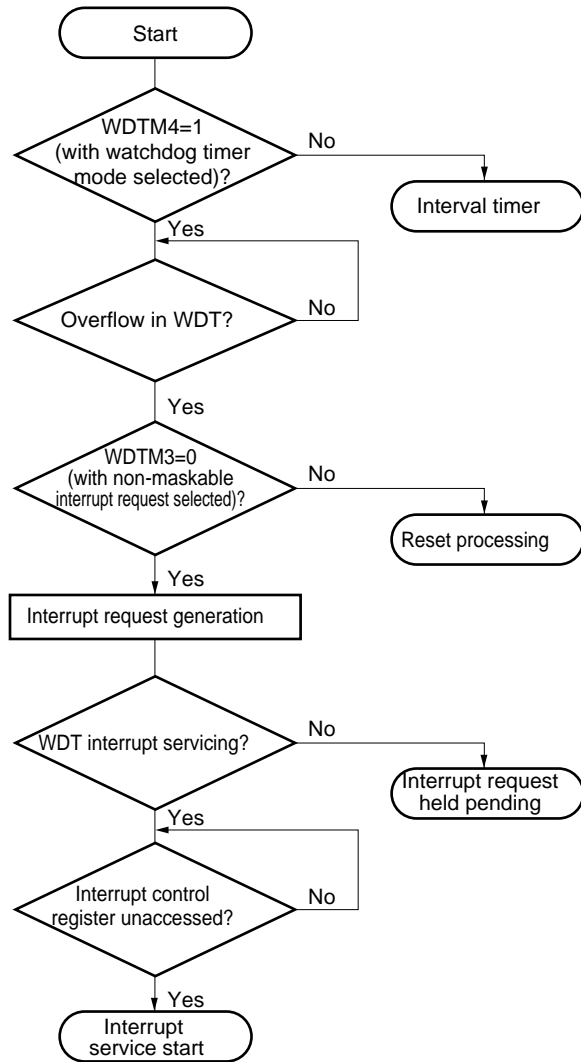

A non-maskable interrupt request is unconditionally acknowledged even if in an interrupt request acknowledge disable state. It does not undergo interrupt priority control and has highest priority over all other interrupts.

If a non-maskable interrupt request is acknowledged, the acknowledged interrupt is saved in the stacks, the program status word (PSW) and the program counter (PC), in that order, the IE and ISP flags are reset to 0, and the vector table contents are loaded into PC and branched.

A new non-maskable interrupt request generated during execution of a non-maskable interrupt servicing program is acknowledged after the current execution of the non-maskable interrupt servicing program is terminated (following RETI instruction execution) and one main routine instruction is executed. If a new non-maskable interrupt request is generated twice or more during non-maskable interrupt service program execution, only one non-maskable interrupt request is acknowledged after termination of the non-maskable interrupt service program execution.

Figure 14-7 shows the flowchart from generation of the non-maskable interrupt request to acknowledging it. Figure 14-8 shows the timing of acknowledging the non-maskable interrupt request, and Figure 14-9 shows the operation performed if a more than one non-maskable interrupt request occurs.

Figure 14-7. Flowchart from Generation of Non-Maskable Interrupt Request to Acknowledge

WDTM : Watchdog timer mode register
 WDT : Watchdog timer

Figure 14-8. Non-Maskable Interrupt Request Acknowledge Timing

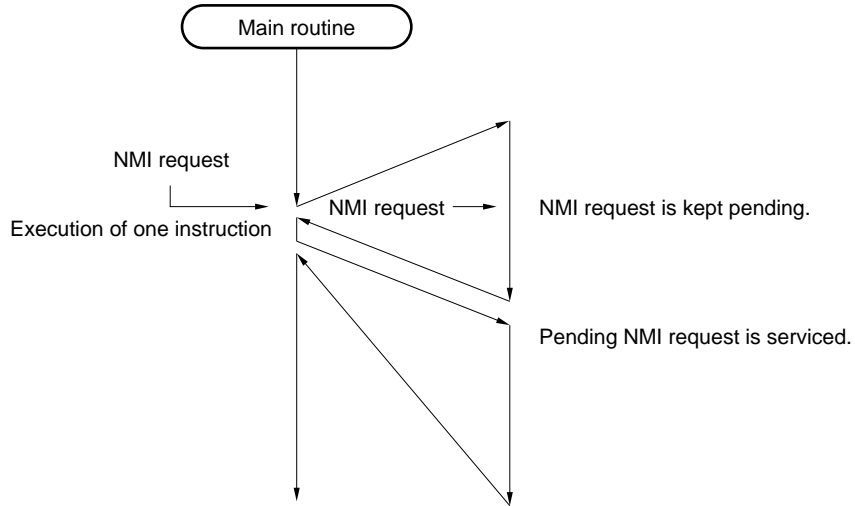

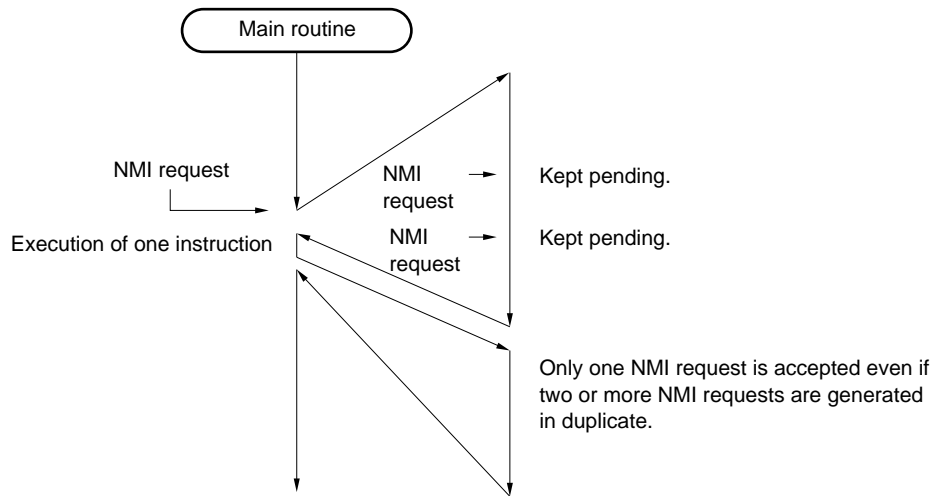

Figure 14-9. Non-Maskable Interrupt Request Acknowledge Operation

(a) If a new non-maskable interrupt request is generated during non-maskable interrupt service program execution

(b) If two non-maskable interrupt requests are generated during non-maskable interrupt service program execution

14.4.2 Maskable interrupt request acknowledge operation

A maskable interrupt request becomes acknowledgeable when an interrupt request flag is set to 1 and the mask (MK) flag of the interrupt request is cleared to 0. A vectored interrupt request is acknowledged in an interrupt enable state (with IE flag set to 1). However, a low-priority interrupt request is not acknowledged during high-priority interrupt service (with ISP flag reset to 0).

Wait times maskable interrupt request generation to interrupt request service are as follows.

For the interrupt acknowledge timing, refer to **Figures 14-11** and **14-12**.

Table 14-3. Times from Maskable Interrupt Request Generation to Interrupt Service

	Minimum Time	Maximum Time Note
When $\times\times PR\times = 0$	7 clocks	32 clocks
When $\times\times PR\times = 1$	8 clocks	33 clocks

Note If an interrupt request is generated just before a divide instruction, the wait time is maximized.

Remark 1 clock : $\frac{1}{f_{CPU}}$ (f_{CPU} : CPU clock)

If two or more maskable interrupt requests are generated simultaneously, the request specified for higher priority with the priority specification flag is acknowledged first. Two or more requests specified for the same priority by the priority specification flag, the default priorities apply.

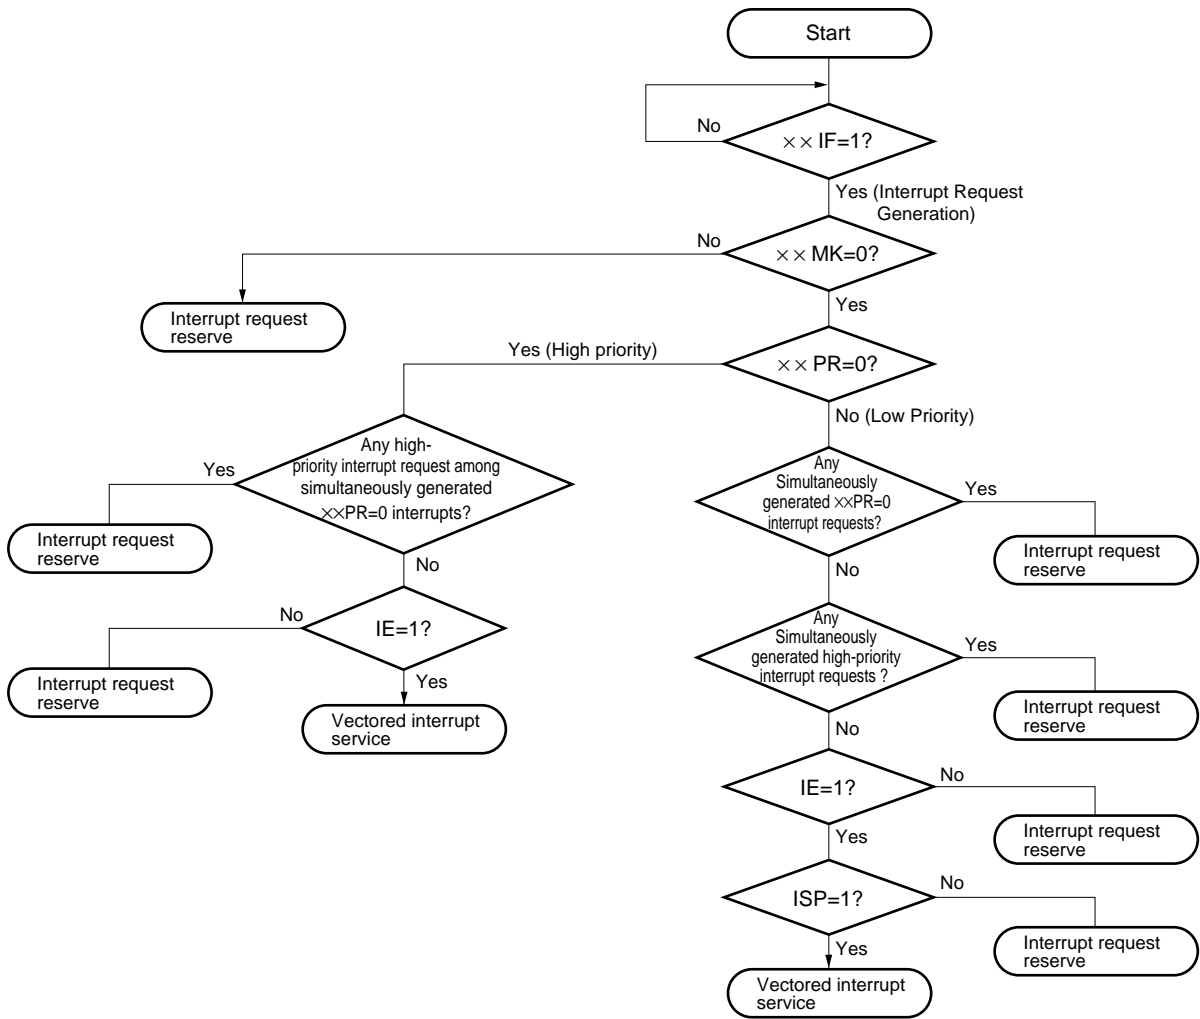

Any reserved interrupt requests are acknowledged when they become acknowledgeable.

Figure 14-10 shows interrupt request acknowledge algorithms.

If a maskable interrupt request is acknowledged, the acknowledged interrupt request is saved in the stacks, the program status word (PSW) and the program counter (PC), in that order, the IE flag is reset to 0, and the acknowledged interrupt priority specification flag contents are transferred to the ISP flag. Further, the vector table data determined for each interrupt request is loaded into PC and branched.

Return from the interrupt is possible with the RETI instruction.

Figure 14-10. Interrupt Request Acknowledge Processing Algorithm

xxIF : Interrupt request flag

xxMK : Interrupt mask flag

xxPR : Priority specification flag

IE : Flag controlling acknowledging maskable interrupt request (1 = enable, 0 = disable)

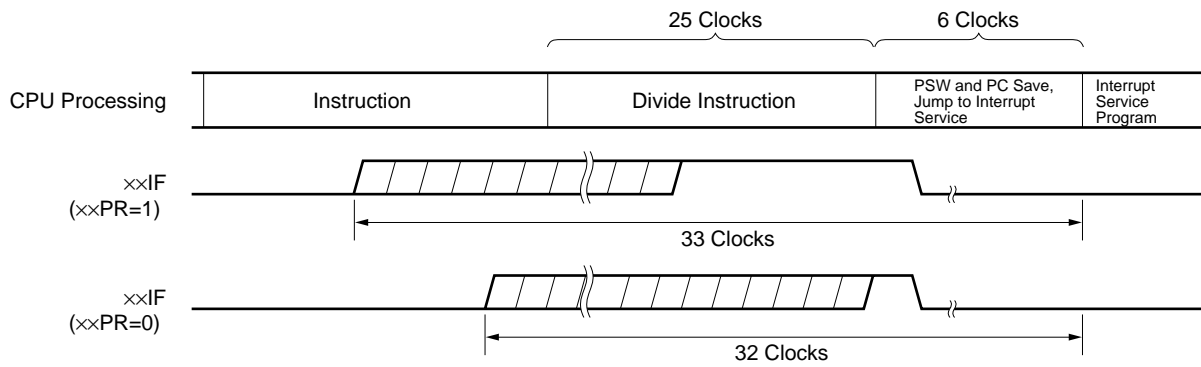

ISP : Flag indicating priority of interrupt currently serviced (0 = interrupt with high priority serviced, 1 = interrupt request is not acknowledged, or interrupt with low priority serviced)

Figure 14-11. Interrupt Request Acknowledge Timing (Minimum Time)

Remark 1 clock: $\frac{1}{f_{CPU}}$ (f_{CPU} : CPU clock)

Figure 14-12. Interrupt Request Acknowledge Timing (Maximum Time)

Remark 1 clock: $\frac{1}{f_{CPU}}$ (f_{CPU} : CPU clock)

14.4.3 Software interrupt request acknowledge operation

A software interrupt request is acknowledged by BRK instruction execution. Software interrupt cannot be disabled.

If a software interrupt request is acknowledged, it is saved in the stacks, the program status word (PSW) and program counter (PC), in that order, the IE flag is reset to 0 and the contents of the vector tables (003EH and 003FH) are loaded into PC and branched.

Return from the software interrupt is possible with the RETB instruction.

Caution Do not use the RETI instruction for returning from the software interrupt.

14.4.4 Nesting interrupt

Accepting another interrupt request while an interrupt is being serviced is called nesting interrupts.

Nesting does not take place unless the interrupts (except the non-maskable interrupt) are enabled to be acknowledged (IE = 1). Accepting another interrupt request is disabled (IE = 0) when one interrupt has been acknowledged. Therefore, to enable nesting, the EI flag must be set to 1 during interrupt servicing, to enable the another interrupt.

Nesting interrupts may not occur even when the interrupts are enabled. This is controlled by the priorities of the interrupts. Although two types of priorities, default priority and programmable priority, may be assigned to an interrupt, nesting is controlled by using the programmable priority.

If an interrupt with the same level of priority as or the higher priority than the interrupt currently serviced occurs, that interrupt can be acknowledged and nested. If an interrupt with a priority lower than that of the currently serviced interrupt occurs, that interrupt cannot be acknowledged and nested.

An interrupt that is not acknowledged and nested because it is disabled or it has a low priority is kept pending. This interrupt is acknowledged after servicing of the current interrupt has been completed and one instruction of the main routine has been executed.

Nesting is not enabled while the non-maskable interrupt is being serviced.

Table 14-4 shows the interrupts that can be nested, and Figure 14-13 shows an example of nesting.

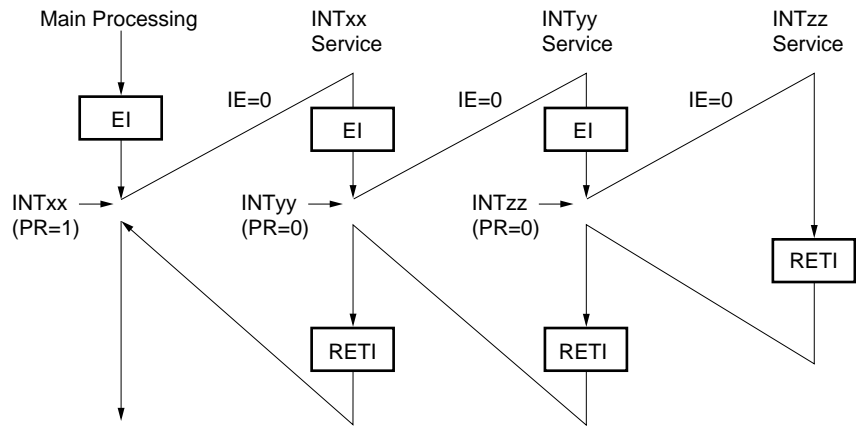

Table 14-4. Interrupt Request Enabled for Nesting Interrupt during Interrupt Service

Nesting Interrupt Request Interrupt being serviced		Non-maskable Interrupt Request	Maskable Interrupt Request			
			PR = 0		PR = 1	
			IE=1	IE=0	IE=1	IE=0
Non-maskable interrupt		D	D	D	D	D
Maskable interrupt	ISP = 0	E	E	D	D	D
	ISP = 1	E	E	D	E	D
Software interrupt servicing		E	E	D	E	D

- Remarks**
1. E : Nesting interrupt enable
 2. D : Nesting interrupt disable
 3. ISP and IE are the flags contained in PSW
 - ISP = 0 : An interrupt with higher priority is being serviced
 - ISP = 1 : An interrupt request is not accepted or an interrupt with lower priority is being serviced
 - IE = 0 : Interrupt request acknowledge is disabled
 - IE = 1 : Interrupt request acknowledge is enabled
 4. PR is a flag contained in PR0L and PR0R.
 - PR = 0 : Higher priority level
 - PR = 1 : Lower priority level

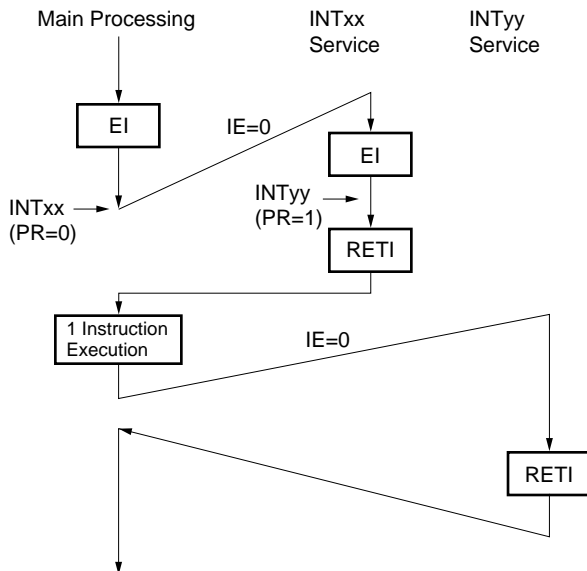

Figure 14-13. Nesting Interrupt Example (1/2)

Example 1. Example where nesting takes place two times

Two interrupt requests, INTyy and INTzz, are acknowledged while interrupt INTxx is serviced, and nesting takes place. Before each interrupt request is acknowledged, the EI instruction is always executed, and the interrupt is enabled.

Example 2. Example where nesting does not take place because of priority control

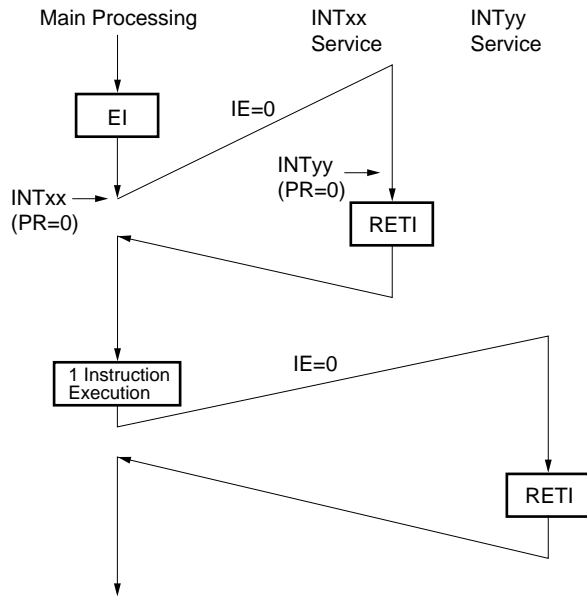

Interrupt request INTyy that is generated while interrupt INTxx is being serviced is not acknowledged because its priority is lower than that of INTxx, and therefore, nesting does not take place. INTyy request is kept pending, and is acknowledged after one instruction of the main routine has been executed.

PR = 0 : High-priority level

PR = 1 : Low-priority level

IE = 0 : Acknowledging interrupt request is disabled.

Figure 14-13. Nesting Interrupt Example (2/2)

Example 3. Example where nesting does not take place because interrupts are not enabled

Because interrupts are not enabled (EI instruction is not issued) in interrupt processing INTxx, interrupt request INTyy is not acknowledged, and nesting does not take place. INTyy request is kept pending, and is acknowledged after one instruction of the main routine has been executed.

PR = 0 : High priority level

IE = 0 : Acknowledging interrupts is disabled.

14.4.5 Pending interrupt requests

Even if an interrupt request is generated, the following instructions keep it pending.

- MOV PSW, #byte
- MOV A, PSW
- MOV PSW, A
- MOV1 PSW.bit, CY
- MOV1/AND1/OR1/XOR1 CY, PSW.bit
- SET1/CLR1 PSW.bit
- RETB
- RETI
- PUSH PSW
- POP PSW
- BT/BF/BTCLR PSW.bit, \$addr16
- EI
- DI
- Instructions manipulating IF0L, IF0H, IF1L, MK0L, MK0H, MK1L, PR0L, PR0H, PR1L, EGP, and EGN registers

Caution Because the IE flag is cleared to 0 by the software interrupt (caused by execution of the BRK instruction), a maskable interrupt request is not acknowledged even if it occurs while the BRK instruction is executed. However, the non-maskable interrupt is acknowledged.

Figure 14-14. Pending Interrupt Request

- Remarks**
1. Instruction N: Instruction that keeps interrupt request pending
 2. Instruction M: Instruction that does not keep interrupt request pending
 3. Operation of xxIF is not affected by value of xxPR.

[MEMO]

CHAPTER 15 PLL FREQUENCY SYNTHESIZER

15.1 Function of PLL Frequency Synthesizer

The PLL (Phase Locked Loop) frequency synthesizer is used to lock the frequency in the MF (Middle Frequency), HF (High Frequency), and VHF (Very High Frequency) ranges to a specific frequency by means of phase difference comparison.

The PLL frequency synthesizer divides the frequency of the signal input from the VCOL or VCOH pin by using a programmable divider, and outputs the phase difference between the frequency of this signal and reference frequency from the EO0 and EO1 pin.

The following two types of input pins and five frequency division modes are used.

(1) Direct division (MF) mode

The VCOL pin is used.

The VCOH pin is set in the status specified by bit 3 (VCOHDMD) of the PLL mode select register (PLLMD).

(2) Pulse swallow (HF) mode

The VCOL pin is used.

The VCOH pin is set in the status specified by bit 3 (VCOHDMD) of PLLMD.

(3) Pulse swallow (VHF) mode

The VCOH pin is used.

The VCOL pin is set in the status specified by bit 2 (VCOLDMD) of PLLMD.

(4) VCOL and VCOH pin disable

The VCOL and VCOH pins are set in the status specified by bits 2 (VCOLDMD) and 3 (VCOHDMD) of PLLMD. At this time, the phase comparator, reference frequency generator, and charge pump operate.

(5) PLL disable

The PLL disabled status is set by the PLL reference mode register (PLLRF).

The VCOH and VCOL pins are set in the status specified by bits 2 (VCOLDMD) and 3 (VCOHDMD) of PLLMD.

The EO0 and EO1 pins go into a high-impedance state.

At this time, all the internal PLL operations are stopped.

These division modes are selected by using the PLL mode select register (PLLMD).

The division value (N value) is set to the programmable divider by using the PLL data register. Frequency division in each of the above modes is carried out according to the value (N value) set to the programmable divider.

Table 15-1 shows the division modes, input pins used (VCOL pin or VCOH pin), and the value that can be set to the programmable divider.

Table 15-1. Division Mode, Input Pin, and Division Value

Division Mode	Pin Used	Value That Can Be Set
Direct division (MF)	VCOL	32 to $2^{12}-1$
Pulse swallow (HF)	VCOL	1024 to $2^{17}-1$
Pulse swallow (VHF)	VCOH	1024 to $2^{17}-1$

Caution For the frequencies that can be actually input, and input amplitude, refer to Electrical Specifications in Data Sheet.

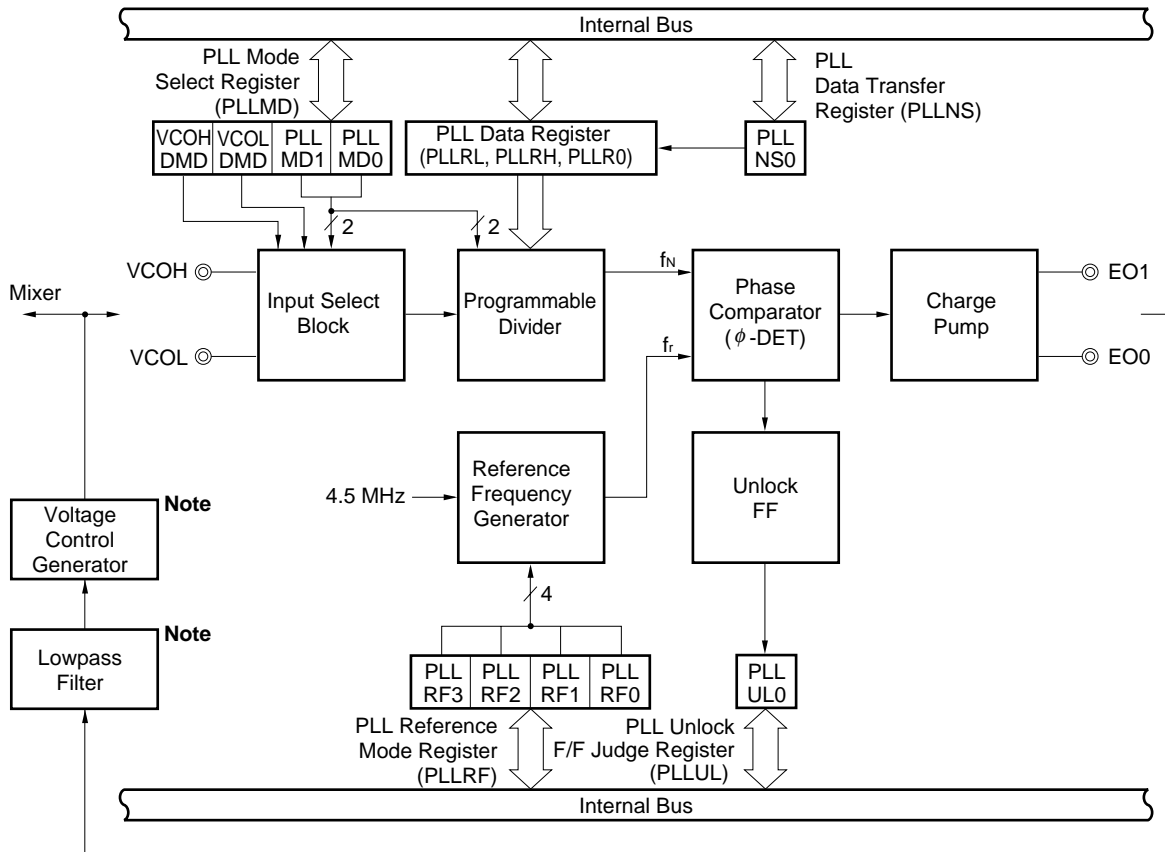

15.2 Configuration of PLL Frequency Synthesizer

The PLL frequency synthesizer consists of the following hardware units.

Table 15-2. Configuration of PLL Frequency Synthesizer

Item	Configuration
Data register	PLL data register L (PLLRL) PLL data register H (PLLRH) PLL data register 0 (PLLRO)
Control register	PLL mode select register (PLLMD) PLL reference mode register (PLLRF) PLL unlock F/F judge register (PLLUL) PLL data transfer register (PLLNS)

Figure 15-1. Block Diagram of PLL Frequency Synthesizer

Note External circuit

(1) PLL data register L (PLLRL), PLL data register H (PLLRH), and PLL data register 0 (PLLRO)

These registers set the division value of the PLL frequency synthesizer. The division value of the PLL frequency synthesizer is made up of 17 bits. The high-order 16 bits of this value are set by the PLL data register L (PLLRL) and PLL data register H (PLLRH). The high-order 16 bits can also be set by the PLL data register (PLLRO).

The least significant bit is set by bit 7 (PLLSCN) of the PLL data register 0 (PLLRO).

The contents of these registers are undefined at reset. These registers hold the current values in the STOP and HALT modes.

(2) Input select block

The input select block consists of the VCOL and VCOH pins, and input amplifiers of the respective pins.

(3) Programmable divider

The programmable divider consists of two modulus prescalers, a programmable counter (12 bits), a swallow counter (5 bits), and a division mode select switch.

(4) Reference frequency generator

The reference frequency generator consists of a divider that generates the reference frequency f_r of the PLL frequency synthesizer, and a multiplexer.

(5) Phase comparator

The phase comparator (ϕ -DET) compares the phase of the divided frequency output f_n of the programmable divider with that of the reference frequency output f_r of the reference frequency generator, and outputs an up request signal (\overline{UP}) and down request signal (\overline{DW}).

(6) Unlock F/F

The unlock F/F detects the unlock status of the PLL frequency synthesizer from the up request signal (\overline{UP}) and down request signal (\overline{DW}) of the phase comparator (ϕ -DET).

(7) Charge pump

The charge pump outputs the result of the output of the phase comparator from the error out pins (EO0 and EO1 pins).

15.3 Registers Controlling PLL Frequency Synthesizer

The PLL frequency synthesizer is controlled by the following four registers.

- PLL mode select register (PLLMD)
- PLL reference mode register (PLLRF)
- PLL unlock F/F judge register (PLLUL)
- PLL data transfer register (PLLNS)

(1) PLL mode select register (PLLMD)

This register selects the input pin and division mode of the PLL frequency synthesizer.

PLLMD is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is set to 00H at reset.

In the STOP mode, only bits 3 and 2 (VCOHDMD and VCOLDMD) retain the previous value. Bits 1 and 0 (PLLMD1 and PLLMD0) are reset to 0.

In the HALT mode, it holds the value immediately before the HALT mode was set.

Figure 15-2. Format of PLL Mode Select Register (PLLMD)

Symbol	7	6	5	4	<3>	<2>	<1>	<0>	Address	At reset	R/W
PLLMD	0	0	0	0	VCOHDMD	VCOLDMD	PLLMD1	PLLMD0	FFA0H	00H	R/W

VCOH DMD	Selects Disable Status of VCOH Pin
0	Connected to pull-down resistor.
1	High-impedance status

VCOL DMD	Selects Disable Status of VCOL Pin
0	Connected to pull-down resistor.
1	High-impedance status

PLLMD1	PLLMD0	Selects Division Mode of PLL Frequency Synthesizer and VCO Input Pin
0	0	Disables VCOL and VCOH pins ^{Note}
0	1	Direct division (VCOL pin and MF mode)
1	0	Pulse swallow (VCOH pin and VHF mode)
1	1	Pulse swallow (VCOL pin and HF mode)

Note This does not mean that the PLL is disabled. The VCOH and VCOL pins become the status specified by bit 3 (VCOHDMD) and bit 2 (VCOLDMD). The EO0 and EO1 pin go low.

Remark Bits 4 through 7 are fixed to 0 by hardware.

(2) PLL reference mode register (PLLRF)

This register selects the reference frequency f_r of the PLL frequency synthesizer and sets the disabled status of the PLL frequency synthesizer.

PLLRF is set by using 1-bit or 8-bit memory manipulation instruction.

The value of this register is set to 0FH at reset and in the STOP mode.

In the HALT mode, it holds the value immediately before the HALT mode was set.

Figure 15-3. Format of PLL Reference Mode Register (PLLRF)

Symbol	7	6	5	4	<3>	<2>	<1>	<0>	Address	At reset	R/W
PLLRF	0	0	0	0	PLLRF3	PLLRF2	PLLRF1	PLLRF0	FFA1H	0FH	R/W

PLLRF3	PLLRF2	PLLRF1	PLLRF0	Sets Reference Frequency f_r of PLL Frequency Synthesizer
0	0	0	0	50 kHz
0	0	0	1	25 kHz
0	0	1	0	12.5 kHz
0	0	1	1	9 kHz
0	1	0	0	1 kHz
0	1	0	1	3 kHz
0	1	1	0	10 kHz
0	1	1	1	Setting prohibited
1	×	×	×	PLL disable ^{Note}

Note When PLL disable is selected, the status of the VCOL, VCOH, EO0, and EO1 pins are as follows:

VCOH, VCOL pins: Status specified by bit 3 (VCOHDMD) and bit 2 (VCOLDMD) of the PLL mode select register (PLLMD).

EO0, EO1 pins : High-impedance state

Remark Bits 4 through 7 are fixed to 0 by hardware.

×: don't care

(3) PLL unlock F/F judge register (PLLUL)

This register detects whether the PLL frequency synthesizer is in the unlock status.

Because this register is an R&RESET register, it is reset to 0 after it has been read.

At reset, the value of this register is set to 0xH^{Note 1}.

In the STOP and HALT modes, this register holds the value immediately before the STOP or HALT mode was set.

Figure 15-4. Format of PLL Unlock F/F Judge Register (PLLUL)

Symbol	7	6	5	4	3	2	1	<0>	Address	At reset	R/W
PLLUL	0	0	0	0	0	0	0	PLLUL0	FFA2H	0xH ^{Note 1}	R ^{Note 2}

PLLUL0	Detects Status of Unlock F/F
0	Unlock F/F = 0: PLL lock status
1	Unlock F/F = 1: PLL unlock status

Notes 1. The value of bit 0 (PLLUL0) at reset differs depending on the type of reset that has been executed (refer to the table below).

2. Bit 0 (PLLUL0) is R&Reset.

		7	6	5	4	3	2	1	0
At reset	Power-ON clear	0	0	0	0	0	0	0	Undefined
	Watchdog timer								Retained
	RESET input								Retained
STOP mode									Retained
HALT mode		↓	↓	↓	↓	↓	↓	↓	Retained

Remark Bits 1 through 7 are fixed to 0 by hardware.

(4) PLL data transfer register (PLLNS)

This register transfers the values of the PLL data registers (PLLRL, PLLRH, and PLLR0) to the programmable counter and swallow counter.

The value of this register is 00H at reset and in the STOP mode.

In the HALT mode, this register holds the previous value immediately before the HALT mode is set.

Figure 15-5. Format of PLL Data Transfer Register (PLLNS)

Symbol	7	6	5	4	3	2	1	<0>	Address	At reset	R/W
PLLNS	0	0	0	0	0	0	0	PLLNS0	FFA3H	00H	W

PLLNS0	Transfers Value of PLL Data Register to Programmable Counter and Swallow Counter
0	Does not transfer
1	Transfers

Remark Bits 0 through 7 are fixed to 0 by hardware.

15.4 Operation of PLL Frequency Synthesizer

15.4.1 Operation of each block of PLL frequency synthesizer

(1) Operation of input select block and programmable divider

The input select block and programmable divider select the input pin and division mode of the PLL frequency synthesizer and divide the frequency in the selected division mode, according to the setting of the PLL mode select register (PLLMD).

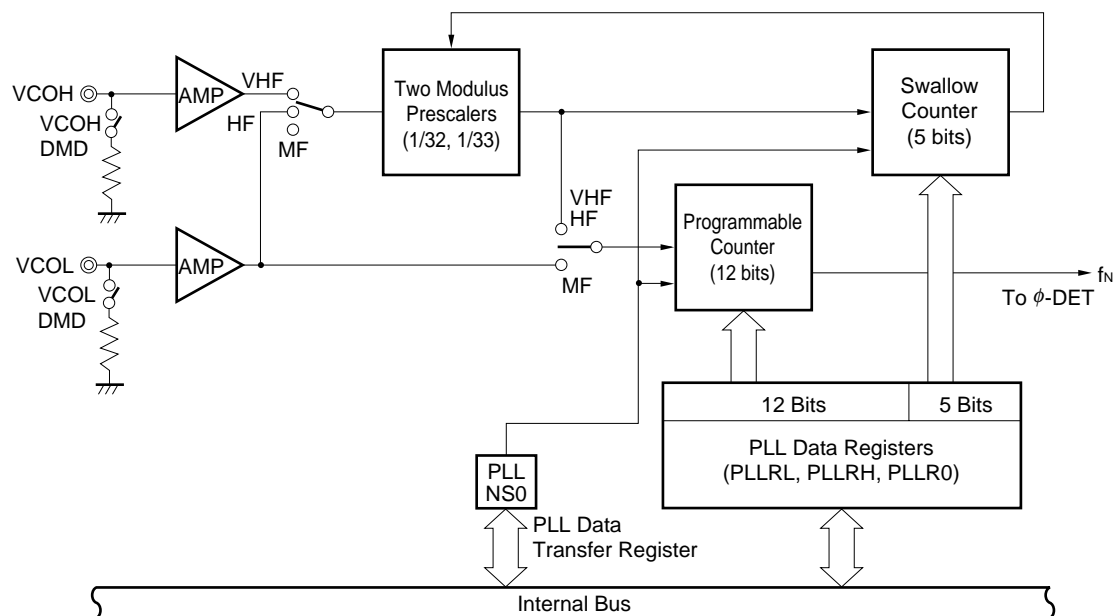

The programmable counter (12 bits) and pulse swallow counter (5 bits) are binary counters.

The division value (N value) is set to the programmable counter and swallow counter by the PLL data registers (PLLRL, PLLRH, and PLLR0).

When the N value has been transferred to the programmable counter and swallow counter, frequency division is performed in the selected division mode according to the status of bit 0 (PLLNS0) of the PLL data transfer register.

Figure 15-6 shows the configuration of the input select block and programmable divider.

Figure 15-6. Configuration of Input Select Block and Programmable Divider

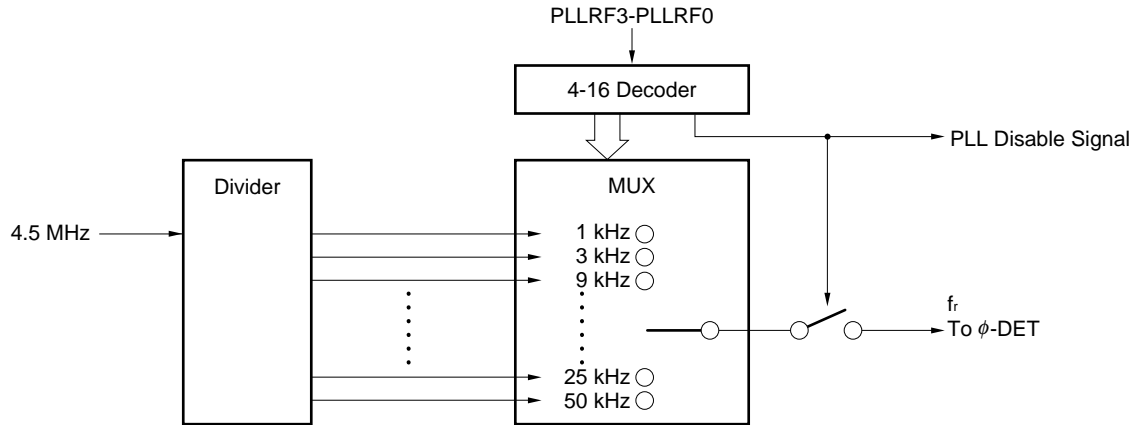

(2) Operation of reference frequency generator

The reference frequency generator divides the 4.5 MHz output of the crystal oscillator and generates seven types of reference frequency f_r for the PLL frequency synthesizer.

Reference frequency f_r is selected by the PLL reference mode register (PLLRF).

Figure 15-7 shows the configuration of the reference frequency generator.

Figure 15-7. Configuration of Reference Frequency Generator

(3) Operation of phase comparator (ϕ -DET)

Figure 15-8 shows the configuration of the phase comparator (ϕ -DET), charge pump, and unlock F/F. The phase comparator (ϕ -DET) compares the phase of the divided frequency f_N of the programmable divider with that of the reference frequency f_r of the reference frequency generator, and outputs an up request signal, \overline{UP} , or a down request signal, \overline{DW} .

If the divided frequency f_N is lower than the reference frequency f_r , the up request signal is output. If f_N is higher than f_r , the down request signal is output.

Figure 15-9 shows the relation among reference frequency f_r , divided frequency f_N , up request signal \overline{UP} , and down request signal \overline{DW} .

When the PLL is disabled, neither the up nor the down request signal is output.

The up and down request signals are input to the charge pump and unlock F/F.

Figure 15-8. Configuration of Phase Comparator, Charge Pump, and Unlock F/F

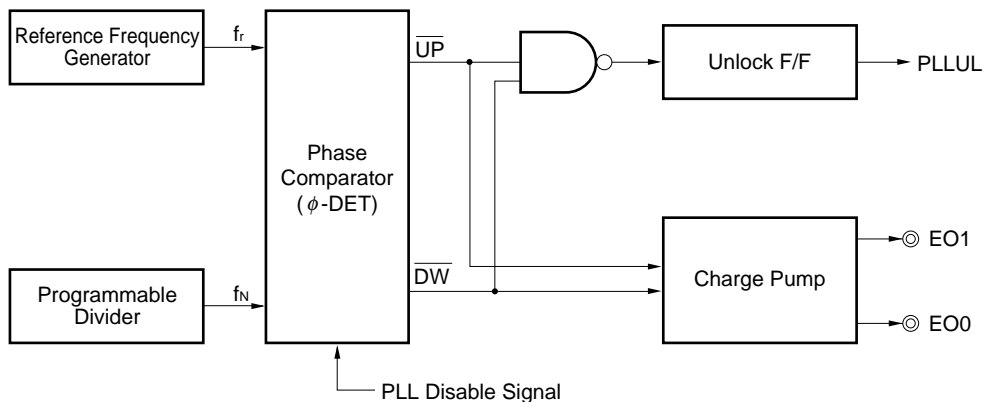

Figure 15-9. Relationship between f_r , f_N , \overline{UP} , and \overline{DW}

(a) If f_N advances f_r in phase

(b) If f_N advances f_r in phase

(c) If f_N and f_r are in phase

(d) If f_N is lower than f_r

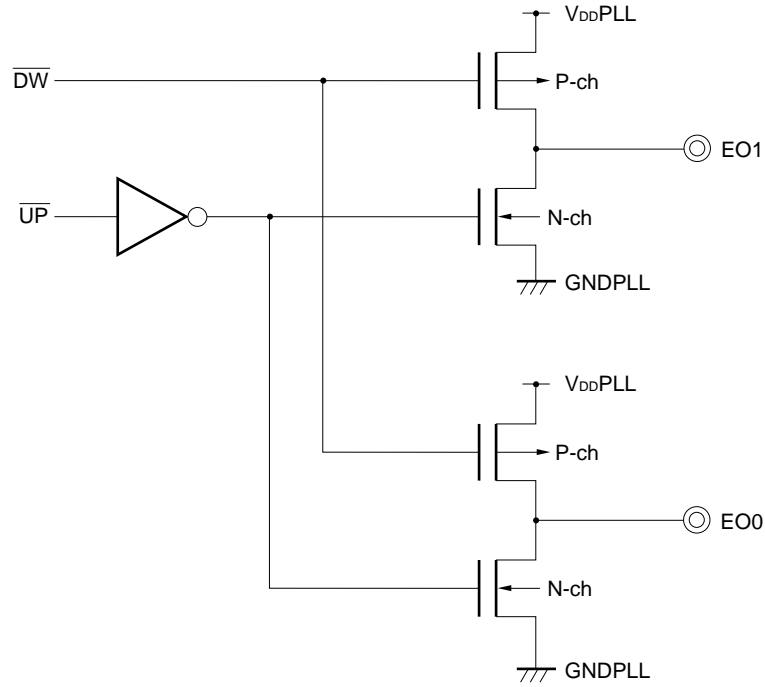

(4) Operation of charge pump

The charge pump outputs the result of the up request (\overline{UP}) or down request (\overline{DW}) signal from the phase comparator (ϕ -DET) from the error out pins (EO0 and EO1 pins). Table 15-3 shows the output signals. The EO0 pin is of voltage-driven type, and EO1 pin is of current-driven type. Figure 15-10 shows the configuration of the error out pins.

Table 15-3. Error Out Output Signal

Relationship between Divided Frequency f_N and Reference Frequency f_r	Error Out Output Signal
When $f_r > f_N$	Low level
When $f_r < f_N$	High level
When $f_r = f_N$	Floating (high impedance)

Figure 15-10. Configuration of Error Out Pins

(5) Operation of unlock F/F

The unlock F/F detects the unlock status of the PLL frequency synthesizer.

It detects the unlock status of the PLL frequency synthesizer from the up request signal \overline{UP} and down request signal \overline{DW} of the phase comparator (ϕ -DET).

Because either of the up request or down request signal outputs a low level in the unlock status, the unlock status can be detected by using this low-level signal.

The status of the unlock F/F is detected by bit 0 (PLLUL0) of the PLL unlock F/F judge register (PLLUL).

The unlock F/F is set at the cycle of reference frequency f_r selected at that time.

The PLL unlock F/F judge register is reset when its contents have been read.

To read the PLLUL, therefore, it must be read at a cycle longer than the cycle ($1/f_r$) of the reference frequency.

15.4.2 Operation to set N value of PLL frequency synthesizer

The division value (N value) is set to the programmable counter (12 bits) and swallow counter (5 bits) by the PLL data registers (PLLRL, PLLRH, and PLLR0).

When the N value has been transferred to the programmable counter and swallow counter by bit 0 (PLLNS0) of the PLL data transfer register (PLLNS), frequency division is carried out in the selected division mode.

Examples of setting the N value in the respective division modes (MF, HF, and VHF) are shown below.

(1) Direct division mode (MF)**(a) Calculating division value N (value set to PLL data register)**

$$N = \frac{f_{V_{COL}}}{f_r}$$

where, $f_{V_{COL}}$: input frequency of V_{COL} pin
 f_r : reference frequency

(b) Example of setting PLL data register

An example of setting the PLL data register to receive broadcasting stations in the following MW band is shown below.

Receive frequency : 1422 kHz (MW band)

Reference frequency : 9 kHz

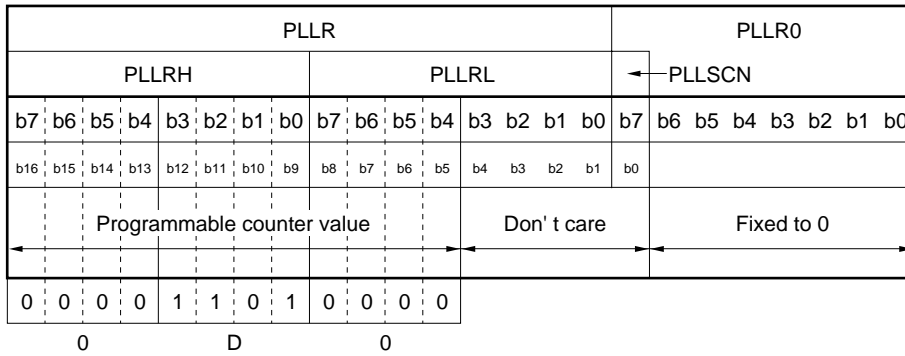

Intermediate frequency : 450 kHz

Division value N is calculated as follows:

$$N = \frac{f_{V_{COL}}}{f_r} = \frac{1422 + 450}{9} = 208 \text{ (decimal)}$$

$$= 0D0H \text{ (hexadecimal)}$$

Data is set to the PLL data registers (PLLRL and PLLRH) as follows:

After setting the above PLL data registers (PLLRL and PLLRH), data must be transferred to the programmable counter by setting bit 0 (PLLNS0) of the PLL data transfer register (PLLNS).

(2) Pulse swallow mode (HF)

(a) Calculating division value N (value set to PLL data register)

$$N = \frac{f_{V_{COL}}}{f_r}$$

where, $f_{V_{COL}}$: input frequency of V_{COL} pin
 f_r : reference frequency

(b) Example of setting PLL data register

An example of setting the PLL data register to receive broadcasting stations in the following SW band is shown below.

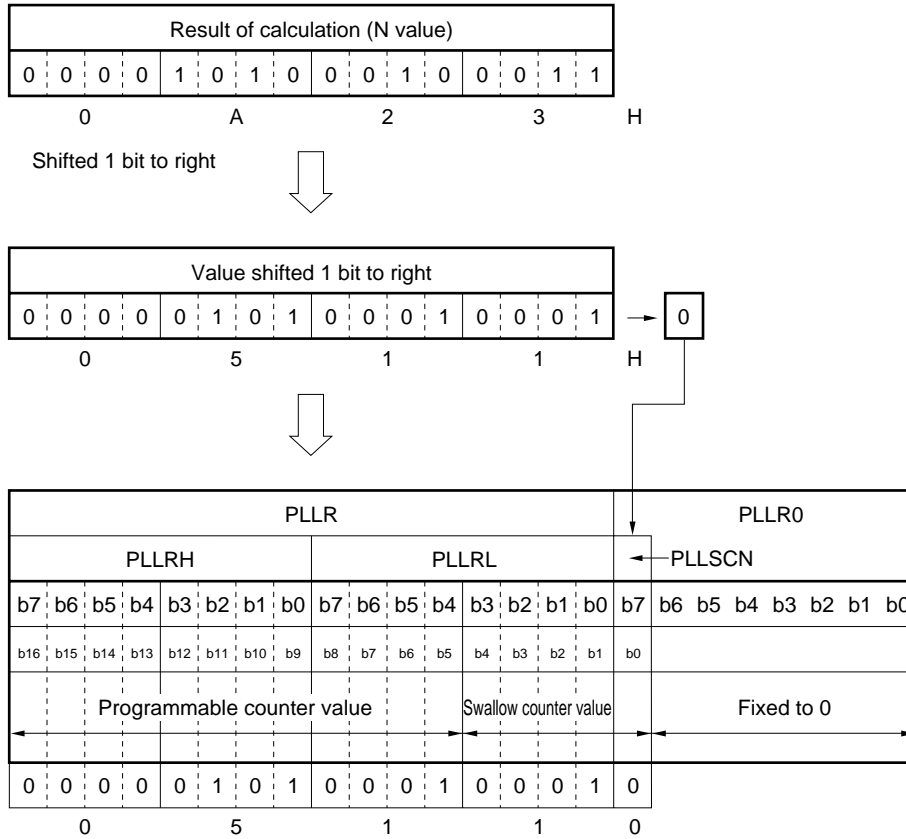

- Receive frequency : 25.50 MHz (SW band)
- Reference frequency : 10 kHz
- Intermediate frequency : 450 kHz

Division value N is calculated as follows:

$$N = \frac{f_{V_{COL}}}{f_r} = \frac{25500 + 450}{10} = 2595 \text{ (decimal)}$$

$$= 0A23H \text{ (hexadecimal)}$$

Because the least significant bit of the division value N must be set to bit 7 (PLLSCN) of the PLL data register 0 (PLLRO), data must be set by shifting the result of the above calculation 1 bit to the right. Data is set to the PLL data registers (PLLRL and PLLRH) as follows:

After setting the above PLL data registers (PLLRL and PLLRH), data must be transferred to the programmable counter and swallow counter by setting bit 0 (PLLNS0) of the PLL data transfer register (PLLNS).

In this example, a value of half the N value is set to the high-order 16 bits of the PLL data register (PLLRL) by shifting the N value resulting from calculation 1 bit to the right.

If the N value is calculated as follows with the least significant bit of the N value in PLLSCN fixed to 0, the result of the calculation (N_{PLLRL}) can be set to the PLL data register (PLLRL) as is.

If the calculation result is set in this way, however, the input frequency (f_{COL}) is 2 × f_r (reference frequency) of the set value N_{PLLRL}.

$$N_{PLLRL} = \frac{f_{COL}}{2f_r}$$

(3) Pulse swallow mode (VHF)

(a) Calculating division value N (value set to PLL data register)

$$N = \frac{f_{VCOH}}{f_r}$$

where, f_{VCOH} : input frequency of VCOH pin
 f_r : reference frequency

(b) Example of setting PLL data register

An example of setting the PLL data register to receive broadcasting stations in the following FM band is shown below.

- Receive frequency : 100.0 MHz (FM band)
- Reference frequency : 50 kHz
- Intermediate frequency : +10.7 MHz

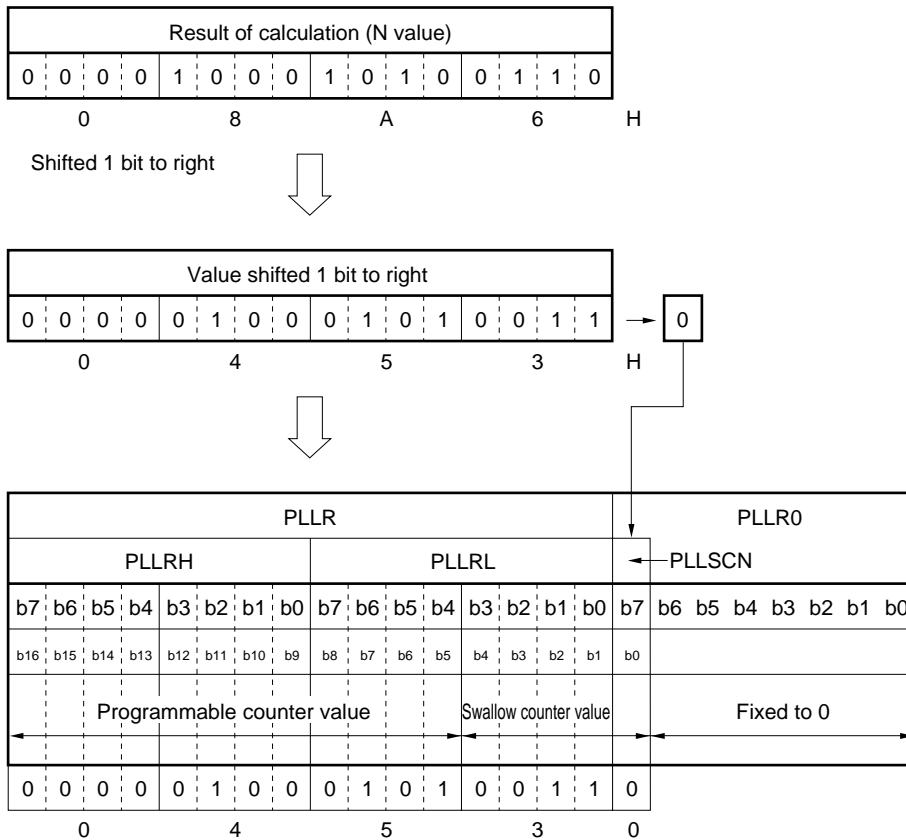

Division value N is calculated as follows:

$$N = \frac{f_{VCOH}}{f_r} = \frac{100.0 + 10.7}{0.05} = 2214 \text{ (decimal)}$$

$$= 08A6H \text{ (hexadecimal)}$$

Because the least significant bit of the division value N must be set to the PLL data register 0 (PLLRO), data must be set by shifting the value calculated by the above expression 1 bit to the right.

Data is set to the PLL data registers (PLLRL and PLLRH) as follows:

After setting the above PLL data registers (PLLR and PLLR0), data must be transferred to the programmable counter and swallow counter by setting bit 0 (PLLNS0) of the PLL data transfer register (PLLNS).

In this example, a value of half the N value is set to the high-order 16 bits of the PLL data register (PLLR) by shifting the N value resulting from calculation 1 bit to the right.

If the N value is calculated as follows with the least significant bit of the N value in PLLSCN fixed to 0, the result of the calculation (N_{PLLR}) can be set to the PLL data register (PLLR) as is.

If the calculation result is set in this way, however, the input frequency (f_{VCOH}) is $2 \times f_r$ (reference frequency) of the set value N_{PLLR} .

$$N_{\text{PLLR}} = \frac{f_{\text{VCOH}}}{2f_r}$$

15.5 PLL Disable Status

The PLL frequency synthesizer can be stopped (PLL disabled status) by performing any of the following settings while the PLL frequency synthesizer is operating.

- Setting value of bit 3 (PLLR3) of the PLL reference mode register (PLLRF) to 1 to set PLL disabled status
- Setting STOP mode with the STOP instruction
- Setting reset status with the reset function

The following table shows the operation of each block and the status of each register in the PLL disabled status.

Table 15-4. Operation of Each Block and Register Status in PLL Disabled Status

Block/Register	Status in PLL Disabled Status
VCOL and VCOH pins	Status set in bit 3 (VCOHDMD) and bit 2 (VCOLDMD) of PLLMD
Programmable divider	Division stops
Reference frequency generator	Output stops
Phase comparator	Output stops
EO0 and EO1 pin	High impedance
PLL mode select register	Retains value on execution of write instruction
PLL data register	
PLL unlock F/F judge register	

15.6 Notes on PLL Frequency Synthesizer

- **Notes on using PLL frequency synthesizer**

Because the input pins (VCOL and VCOH pins) of the PLL frequency synthesizer are provided with an AC amplifier, cut the DC component of the input signal by connecting a capacitor to the input pins in series. The potential of the selected input pin is intermediate (about $1/2V_{DD}$). The input pin not selected becomes the status set in bit 3 (VCOHDMD) and bit 2 (VCOLDMD) of the PLL mode select register (PLLMD). For the frequencies that can be actually input and input amplitude, refer to Electrical Characteristics in Data Sheet.

CHAPTER 16 FREQUENCY COUNTER

16.1 Function of Frequency Counter

The frequency counter counts the intermediate frequency (IF) of a tuner.

It counts the intermediate frequency input to the FMIFC or AMIFC pin for a specific time (1 ms, 4 ms, 8 ms, or open) with a 16-bit counter. The count value of the frequency counter is stored to the IF counter register.

For the range of the frequency that can be input to the FMIFC and AMIFC pins, refer to Electrical Characteristics in Data Sheet.

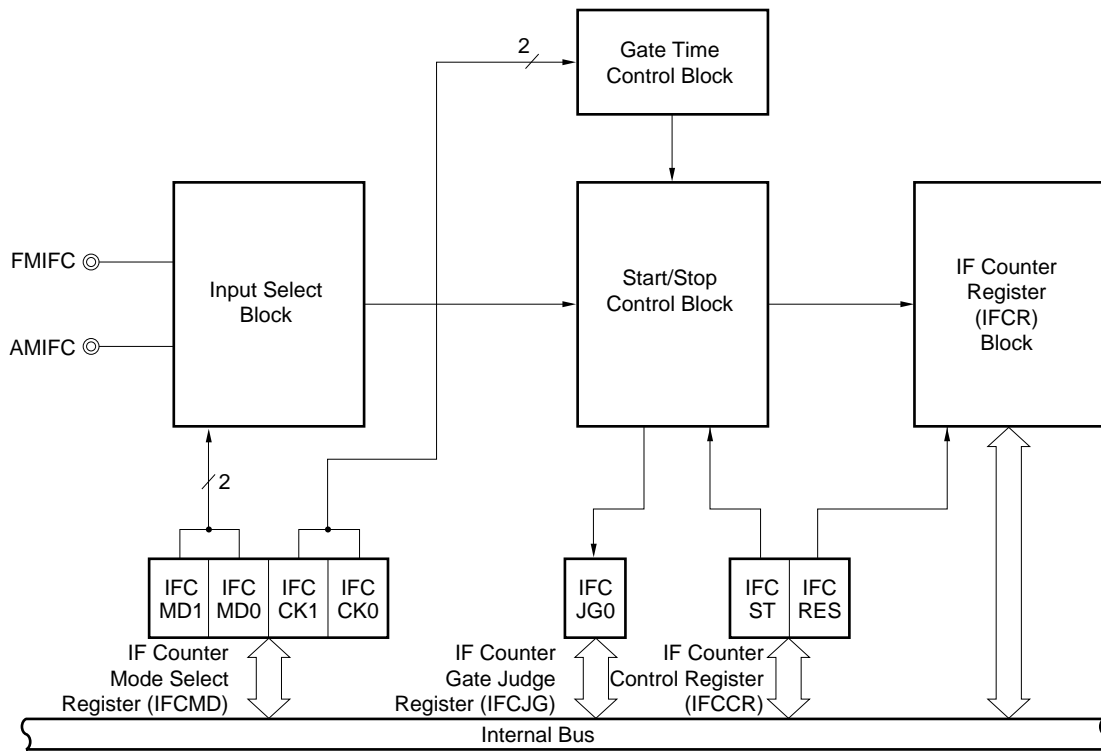

16.2 Configuration of Frequency Counter

The frequency counter consists of the following hardware units.

Table 16-1. Configuration of Frequency Counter

Item	Configuration
Counter register	IF counter register (IFC)
Control register	IF counter mode select register (IFCMD) IF counter control register (IFCR) IF counter gate judge register (IFCJG)

Figure 16-1. Block Diagram of Frequency Counter

**(1) IF counter input select block**

The IF counter input select block selects the pin to be used from the FMIFC and AMIFC pins, and a count mode.

(2) Gate time control block

The gate time control block sets a gate time (count time).

(3) Start/stop control block

The start/stop control block starts counting by the IF counter register and detects the end of counting.

(4) IF counter register block

The IF counter register block is a 16-bit register that counts up the frequency input in the set gate time. The count value is stored to the IF counter register (IFCR). When the count value reaches FFFFH, the IF counter register holds FFFFH at the next input, and stops counting. The value of this register is reset to 0000H at reset or in the STOP mode. In the HALT mode, it holds the current count value.

16.3 Registers Controlling Frequency Counter

The frequency counter is controlled by the following three registers.

- IF counter mode select register (IFCMD)
- IF counter control register (IFCCR)
- IF counter gate judge register (IFCJG)

(1) IF counter mode select register (IFCMD)

This register selects the input pin of the frequency counter, and selects a mode and gate time (count time).

This register is set by using a 1-bit or 8-bit memory manipulation instruction.

The value of this register is reset to 00H at reset or in the STOP mode.

In the HALT mode, this register holds the value immediately before the HALT mode is set.

Figure 16-2. Format of IF Counter Mode Select Register (IFCMD)

Symbol	7	6	5	4	<3>	<2>	<1>	<0>	Address	At reset	R/W
IFCMD	0	0	0	0	IFCMD1	IFCMD0	IFCCK1	IFCCK0	FFA9H	00H	R/W

IFCMD1	IFCMD0	Selects Frequency Counter Pin and Mode
0	0	Disables FMIFC AMIFC pins ^{Note}
0	1	AMIFC pin, AMIF count mode
1	0	FMIFC pin, FMIF count mode
1	1	FMIFC pin, AMIF count mode

IFCCK1	IFCCK0	Selects Gate Time
0	0	1 ms
0	1	4 ms
1	0	8 ms
1	1	Open

Note The FMIFC and AMFIC pins are high-impedance state.

Remark Bits 4 through 7 are fixed to 0 by hardware.

(2) IF counter control register (IFCCR)

This register starts counting by the IF counter register and clears the IF counter register. IFCCR is set by using a 1-bit or 8-bit memory manipulation instruction. The value of this register is reset to 00H at reset and in the STOP mode. In the HALT mode, this register holds the value immediately before the HALT mode is set.

Figure 16-3. Format of IF Counter Control Register (IFCCR)

Symbol	7	6	5	4	3	2	<1>	<0>	Address	At reset	R/W
IFCCR	0	0	0	0	0	0	IFCST	IFCRES	FFACH	00H	W

IFCST	Starts IF Counter Register	
0	Nothing is affected	
1	Starts counting	
IFCRES	Clears Data of IF Counter Register	
0	Nothing is affected	
1	Clears data of IF counter register	

Remark Bits 2 through 7 are fixed to 0 by hardware.

(3) IF counter gate judge register (IFCJG)

This register detects opening/closing of the gate of the frequency counter. The value of this register is reset to 00H at reset and in the STOP mode. In the HALT mode, this register holds the value immediately before the HALT mode is set.

Figure 16-4. Format of IF Counter Gate Judge Register (IFCJG)

Symbol	7	6	5	4	3	2	1	<0>	Address	At reset	R/W
IFCJG	0	0	0	0	0	0	0	IFCJG0	FFABH	00H	R

IFCJG0	Detects Opening/Closing of Gate of Frequency Counter	
0	Gate is closed	
1	<ul style="list-style-type: none"> • If gate time is set to other than open Status until gate is closed after IFCST has been set to 1 • If gate time is set to open Status where gate is open as soon as it has been set to be opened 	

Remark Bits 1 through 7 are fixed to 0 by hardware.

Caution IFCJG0 remains set even if the IF counter register overflows and stops counting, until the set gate time expires.

16.4 Operation of Frequency Counter

- (1) Select an input pin, mode, and gate time by using the IF counter mode select register (IFCMD).
Figure 16-5 shows a block that selects an input pin and mode.
- (2) Set bit 0 (IFCRES) of the IF counter control register (IFCCR) to 1, and clears the data of the IF counter register.
- (3) Set bit 1 (IFCST) of the IF counter control register (IFCCR) to 1.
- (4) The gate is opened only for the set gate time since a 1-kHz internal signal has risen after IFCST was set. If the gate time is set to be opened, the gate is opened as soon as it has been specified to be opened. Bit 0 (IFCJG0) of the IF counter gate judge register (IFCJG) is automatically set to 1 as soon as IFCST has been set to 1.
When the gate time has expired, bit 0 (IFCJG0) of the IF counter gate judge register (IFCJG) is automatically cleared to 0. If it is specified that the gate be open, however, IFCJG0 is not automatically cleared. In this case, set a gate time. Figure 16-6 shows the gate timing of the frequency counter.
- (5) While the gate opens the frequency input to the selected FMIFC or AMIFC pin, the IF counter register counts the frequency.
If the FMIFC pin is used in the FMIF count mode, however, the input frequency is divided by half before it is counted.

The relationship between count value x (decimal), input frequencies (f_{FMIFC} and f_{AMIFC}), and gate time (T_{GATE}) is shown below.

- FMIF count mode (FMIFC pin)

$$f_{FMIFC} = \frac{x}{T_{GATE}} \times 2 \text{ (kHz)}$$

- AMIF count mode (FMIFC or AMIFC pin)

$$f_{AMIFC} = \frac{x}{T_{GATE}} \text{ (kHz)}$$

Figure 16-5. Block Diagram of Input Pin and Mode Selection

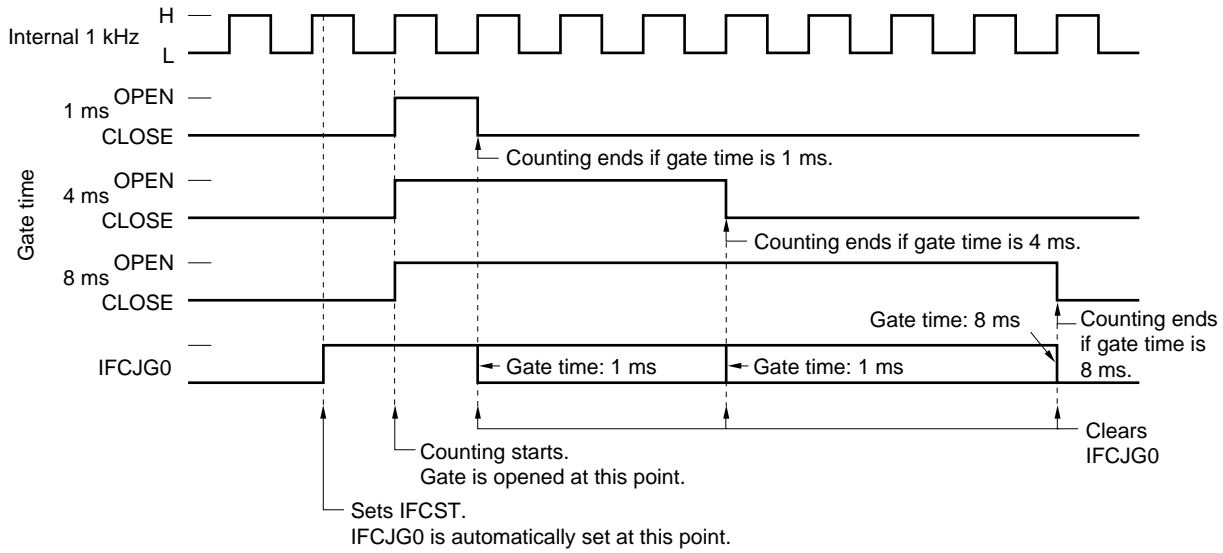

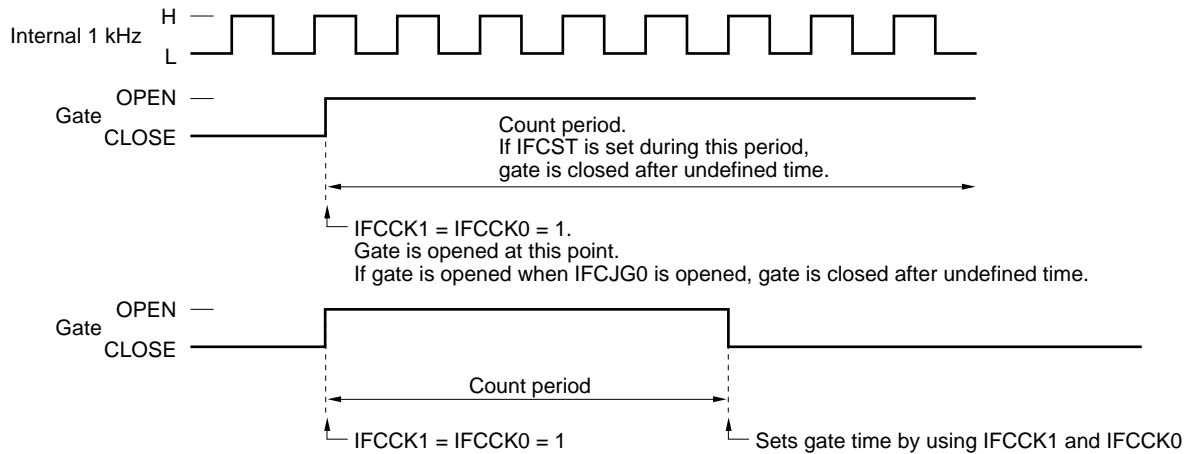

Figure 16-6. Gate Timing of Frequency Counter

(a) If gate time is set to 1, 4, or 8 ms

(b) If gate is set to be open

Caution If counting is started by using IFCST while this gate is open, the gate is closed after undefined time. To open the gate, therefore, do not set IFCST to 1.

Remark IFCST : Bit 1 of IF counter control register (IFCCR)
 IFCJG0 : Bit 0 of IF counter gate judge register (IFJG)
 IFCCK1, 0 : Bit 1 and 0 of IF counter mode select register (IFCMD)

16.5 Notes on Frequency Counter

(1) Notes on using frequency counter

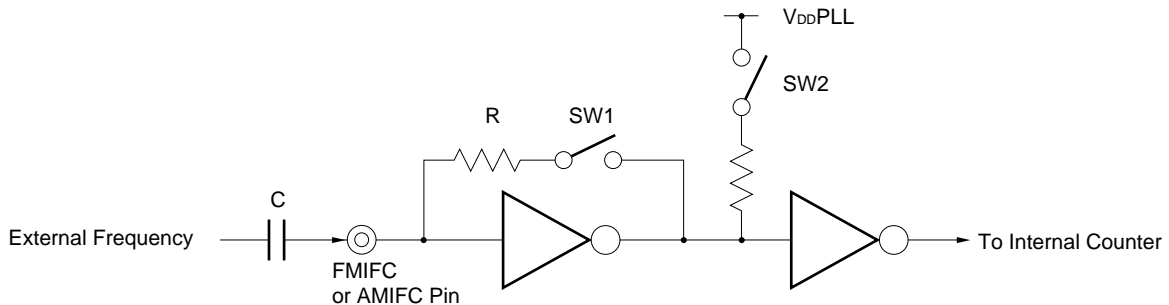

Because signals are input to the frequency counter from an input pin (FMIFC or AMIFC pin) with an AC amplifier as shown in Figure 16-7, cut the DC component of the input signals by using capacitor C.

If the FMIFC or AMIFC pin is selected by the IF counter mode select register, switch SW1 turns ON, and switch SW2 turns OFF. As a result, the voltage on the pin is about $1/2V_{DD}$.

Unless the voltage has risen to a sufficient intermediate level at this time, counting may not be performed normally because the AC amplifier is not in the normal operating range.

Therefore, make sure that sufficient wait time elapses after a pin has been selected and before counting is started (IFCST = 1).

Figure 16-7. Frequency Counter Input Pin Circuit

(2) Notes in HALT mode

The FMIFC and AMIFC pins hold the status immediately before the HALT status was set.

To release the HALT mode by using the interrupt of the frequency counter at this time, the following point must be noted.

The gate will not be opened if the HALT instruction is executed after counting has been started by IFCST before the gate is actually opened.

Therefore, wait for at least 1 ms before executing the HALT instruction.

Figure 16-8. Gate Status When HALT Instruction Is Executed

(3) Error of frequency counter

The error of the frequency counter includes an error of gate time and a count error.

(1) Error of gate time

The gate time of the frequency counter is created by dividing 4.5 MHz.

Therefore, if 4.5 MHz is shifted "+x" ppm, the gate time is also shifted "-x" ppm.

(2) Count error

The frequency counter counts the frequency at the rising edge of the input signal.

If a high level is input to the pin when the gate is opened, therefore, one excess pulse is counted. When the gate is closed, however, counting is not affected by the status of the pin.

Therefore, the count error is "maximum + 1".

17.1 Standby Function and Configuration

17.1.1 Standby function

The standby function is designed to decrease power consumption of the system. The following two modes are available.

(1) HALT mode

HALT instruction execution sets the HALT mode. The HALT mode is intended to stop the CPU operation clock. System clock oscillator continues oscillation. In this mode, current consumption cannot be decreased as in the STOP mode. The HALT mode is valid to restart immediately upon interrupt request and to carry out intermittent operations such as in watch applications.

Although the CPU stops operating, the peripheral functions can operate. To lower the current consumption, therefore, stop all unnecessary circuits before executing the HALT instruction.

(2) STOP mode

STOP instruction execution sets the STOP mode. In the STOP mode, the system clock oscillator stops and the whole system stops. CPU current consumption can be considerably decreased.

★ Data memory low-voltage hold (down to $V_{DD} = 2.2$ V) is possible. Thus, the STOP mode is effective to hold data memory contents with ultra-low current consumption.

★ If the supply voltage drops below 2.2 V, the system is reset by means of power-ON clear reset. For reset, refer to **CHAPTER 18 RESET FUNCTION**.

Because this mode can be cleared upon interrupt request, it enables intermittent operations to be carried out. However, because a wait time is necessary to secure an oscillation stabilization time after the STOP mode is cleared, select the HALT mode if it is necessary to start processing immediately upon interrupt request. All the functions stop operating.

Some registers of the PLL frequency synthesizer and frequency counter are reset, but the other functions are stopped with their current status retained.

Cautions 1. When proceeding to the STOP mode, be sure to stop the peripheral hardware operation and execute the STOP instruction.

2. The following sequence is recommended for power consumption reduction of the A/D converter: first clear bit 7 (ADCS3) of ADM3 to 0 to stop the A/D conversion operation. Then execute the HALT or STOP instruction.

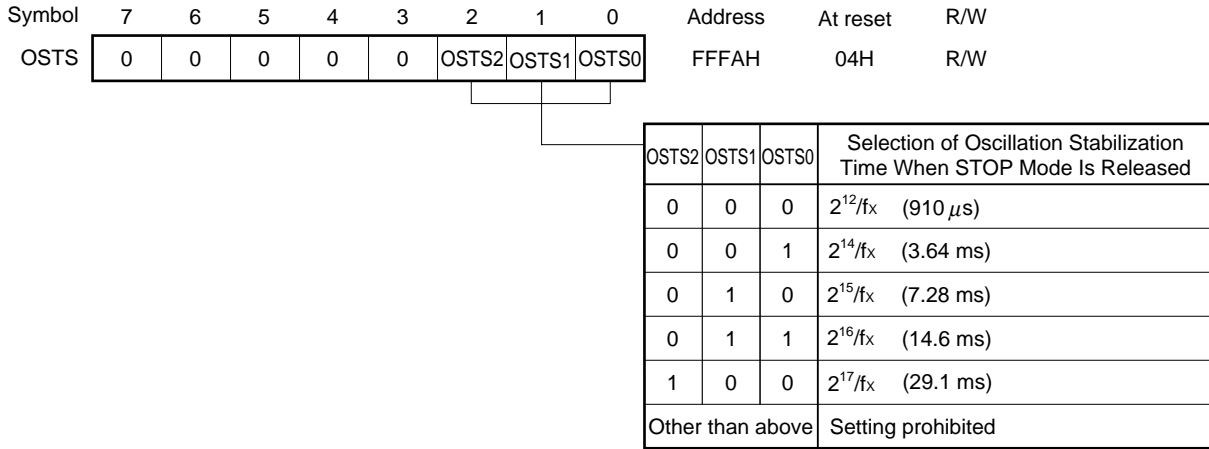

17.1.2 Standby function control register

A wait time after the STOP mode is cleared upon interrupt request till the oscillation stabilizes is controlled with the oscillation stabilization time select register (OSTS).

OSTS is set with an 8-bit memory manipulation instruction.

Reset input sets OSTS to 04H.

Figure 17-1. Format of Oscillation Stabilization Time Select Register (OSTS)

Remark f_x : System clock oscillation frequency
 () : $f_x = 4.5\text{MHz}$

Caution The wait time when the STOP mode is released does not include the time required for the clock oscillation to start after the STOP mode has been released (see “a” in the figure below), regardless of whether the mode has been released by the $\overline{\text{RESET}}$ signal or an interrupt request.

17.2 Operations of Standby Function

17.2.1 HALT mode

(1) HALT mode set and operating status

The HALT mode is set by executing the HALT instruction.

The operating status in the HALT mode is described below.

Table 17-1. HALT Mode Operating Status

Item	Status
Clock generation circuit	Can oscillate system clock. Stops clock supply to CPU.
CPU	Stops operating.
Port	Holds status before HALT mode is set.
8-bit timer/event counter	Holds operation before HALT mode is set and can operate.
Basic timer	
Watchdog timer	
Buzzer output control circuit	
A/D converter	Retains operation performed when HALT mode is set. However, comparison cannot be performed correctly in A/D conversion operation mode. In power-fail comparison mode, operation is as follows depending on setting of bit 5 (PFHRM3) of power-fail comparison mode register 3 (PFM3): <ul style="list-style-type: none"> • PFHRM3 = 0: Comparison cannot be performed normally. • PFHRM3: Power-fail comparison operation can be performed.
Serial interface (IIC0, SIO3, UART0)	Retains operation performed when HALT mode is set and can operate.
External interrupt	Hold operation before HALT mode is set and can operate.
PLL frequency synthesizer	
Frequency counter	Retains operation performed before HALT mode is set. However, operation is not performed correctly though it is continued.
Power-ON clear circuit	Reset when voltage of less than 3.5 V is detected.

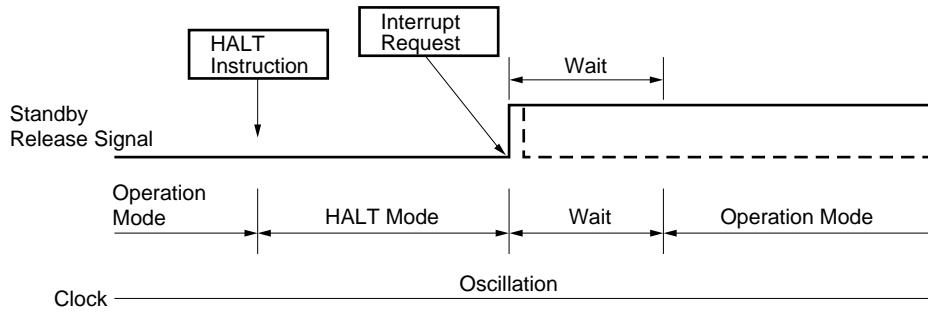

(2) HALT mode release

The HALT mode can be released with the following three types of sources.

(a) Release upon unmasked interrupt request

When an unmasked interrupt request is generated, the HALT mode is released. If interrupt acknowledge is enabled, vectored interrupt service is carried out. If disabled, the next address instruction is executed.

Figure 17-2. HALT Mode Release upon Interrupt Generation

Remarks 1. The broken line indicates the case when the interrupt request which has released the standby status is acknowledged.

2. Wait time will be as follows:

- When vectored interrupt service is carried out: 8 to 9 clocks
- When vectored interrupt service is not carried out: 2 to 3 clocks

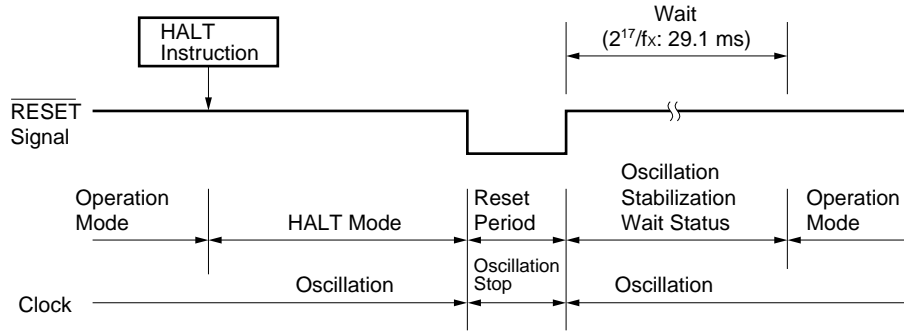

(b) Release upon non-maskable interrupt request

When a non-maskable interrupt is generated, the HALT mode is released and vectored interrupt service is carried out whether interrupt acknowledge is enabled or disabled.

(c) Release by $\overline{\text{RESET}}$ input

If a $\overline{\text{RESET}}$ signal is input, the HALT mode is released. As is the case with normal reset operation, a program is executed after branch to the reset vector address.

Figure 17-3. HALT Mode Release by $\overline{\text{RESET}}$ Input

- Remarks**
1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5 \text{ MHz}$

Table 17-2. Operation after HALT Mode Release

Release Source	MK _{xx}	PR _{xx}	IE	ISP	Operation
Maskable interrupt request	0	0	0	×	Next address instruction execution
	0	0	1	×	Interrupt service execution
	0	1	0	1	Next address instruction execution
	0	1	×	0	Interrupt service execution
	0	1	1	1	
	1	×	×	×	HALT mode hold
Non-maskable interrupt request	–	–	×	×	Interrupt service execution
$\overline{\text{RESET}}$ input	–	–	×	×	Reset processing

Remark ×: Don't care

17.2.2 STOP mode

(1) STOP mode set and operating status

The STOP mode is set by executing the STOP instruction.

- Cautions**
1. When the STOP mode is set, the X1 pin is pulled down by GND, and the X2 pin is internally pulled up by V_{DD} to minimize the leakage current at the crystal oscillator block.
 2. Because the interrupt request signal is used to clear the standby mode, if there is an interrupt source with the interrupt request flag set and the interrupt mask flag reset, the standby mode is immediately released if set. Thus, the STOP mode is reset to the HALT mode immediately after execution of the STOP instruction. After the wait set using the oscillation stabilization time select register (OSTS), the operation mode is set.

The operating status in the STOP mode is described below.

Table 17-3. STOP Mode Operating Status

Item	Status
Clock generation circuit	Can oscillate system clock. Stops clock supply to CPU.
CPU	Stops operating.
Port	Holds status before HALT mode is set.
8-bit timer/event counter	Operation stops and cannot operate.
Basic timer	
Watchdog timer	
Buzzer output control circuit	
A/D converter	
Serial interface (IIC0, SIO3, UART0)	
External interrupt	
PLL frequency synthesizer	Operation stops and cannot operate.
Frequency counter	
★ Power-ON clear circuit	RESET generated when detecting 2.2 V or less.

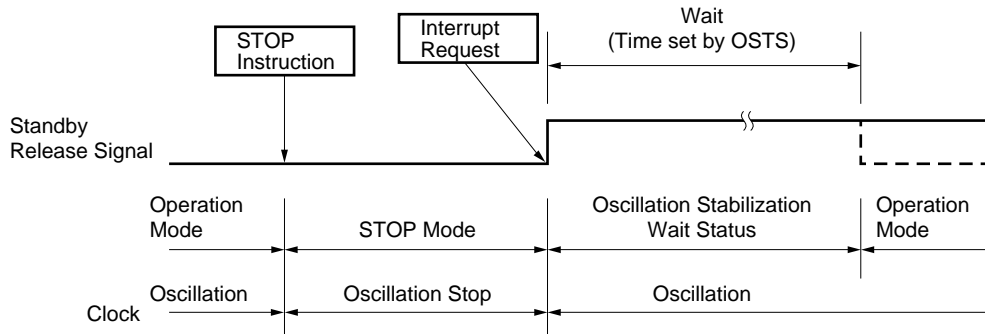

(2) STOP mode release

The STOP mode can be released with the following two types of sources.

(a) Release by unmasked interrupt request

When an unmasked interrupt request is generated, the STOP mode is released. If interrupt request acknowledge is enabled after the lapse of oscillation stabilization time, vectored interrupt service is carried out. If interrupt request acknowledge is disabled, the next address instruction is executed.

Figure 17-4. STOP Mode Release by Interrupt Request Generation

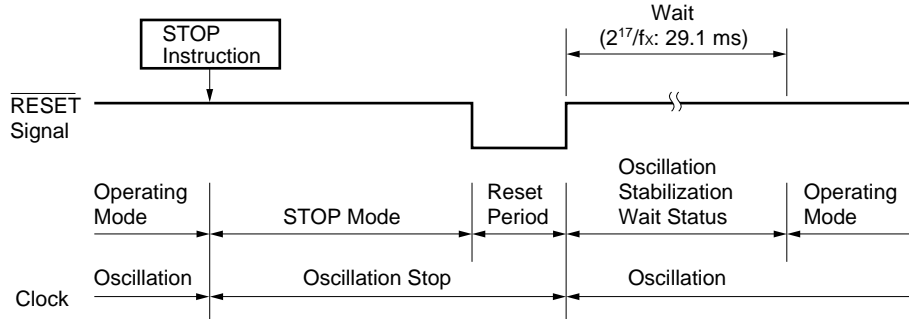

Remark The broken line indicates the case when the interrupt request which has released the standby status is acknowledged.

(b) Release by $\overline{\text{RESET}}$ input

If a $\overline{\text{RESET}}$ signal is input, the STOP mode is released, and after the lapse of oscillation stabilization time, reset operation is carried out.

Figure 17-5. Release by STOP Mode $\overline{\text{RESET}}$ Input

- Remarks**
1. f_x : System clock oscillation frequency
 2. (): $f_x = 4.5 \text{ MHz}$

Table 17-4. Operation after STOP Mode Release

Release Source	MK $\times\times$	PR $\times\times$	IE	ISP	Operation
Maskable interrupt request	0	0	0	×	Next address instruction execution
	0	0	1	×	Interrupt service execution
	0	1	0	1	Next address instruction execution
	0	1	×	0	
	0	1	1	1	Interrupt service execution
	1	×	×	×	STOP mode hold
$\overline{\text{RESET}}$ input	—	—	×	×	Reset processing

Remark ×: Don't care

CHAPTER 18 RESET FUNCTION

18.1 Reset Function

The following three operations are available to generate the reset signal.

- (1) External reset input with $\overline{\text{RESET}}$ pin
- (2) Internal reset by inadvertent program loop time detection watchdog timer
- (3) Internal reset by power-ON clear (POC)

(1) External reset input by $\overline{\text{RESET}}$ pin

When a low level is input to the $\overline{\text{RESET}}$ pin, the device is reset, and each hardware unit enters the status shown in Table 18-1. While the reset signal is input and during the oscillation stabilization time immediately after the $\overline{\text{RESET}}$ signal has been deasserted, each pin goes into a high-impedance state (however, the P130 through P132 pins go low, VCOH and VCOL pin are pulled down).

The $\overline{\text{RESET}}$ signal is deasserted when a high level is input to the $\overline{\text{RESET}}$ pin, and the program execution is started after the oscillation stabilization time ($2^{17}/f_x$) has elapsed.

(2) Internal reset by inadvertent program loop time detection of watchdog timer

Reset is effected and each hardware unit enters the status shown in Table 18-1 when the watchdog timer overflow. While reset is effected and during the oscillation stabilization time immediately after the effect of reset has been cleared, each pin goes into a high-impedance state (however, the P130 through P132 pins go low, VCOH and VCOL pin are pulled down).

Reset by the watchdog timer is cleared immediately after reset has been effected, and the program execution is started after the oscillation stabilization time ($2^{17}/f_x$) has elapsed.

(3) Internal reset by power-ON clear (POC)

Reset is effected by means of power-ON clear under the following conditions:

- If supply voltage is less than $3.5 V^{\text{Note}}$ on power application
- If supply voltage drops to less than $2.2 V^{\text{Note}}$ in STOP mode
- If supply voltage drops to less than $3.5 V^{\text{Note}}$ (including HALT mode)

When these reset conditions of power-ON clear are satisfied, reset is effected, and each hardware unit enters the status shown in Table 18-1. While the reset signal is input and during the oscillation stabilization time immediately after the reset signal has been deasserted, each pin goes into a high-impedance state (the P130 through P132 pins go low, however).

Reset by power-ON clear is cleared if the supply voltage rises beyond a specific level, and the program execution is started after the oscillation stabilization time ($2^{17}/f_x$) has elapsed.

Note These voltage values are maximum values. Actually, reset is effected at a voltage lower than these.

- Cautions**
1. For an external reset, input a low level for 10 μs or more to the $\overline{\text{RESET}}$ pin.
 2. During reset input, system clock oscillation remains stopped.
 3. When the STOP mode is cleared by $\overline{\text{RESET}}$ input, the STOP mode register contents are held during reset input. However, the I/O port pin becomes high-impedance. Output dedicated port pin (P130 to P132) becomes low level regardless of the previous status.

Figure 18-1. Reset Function Block Diagram

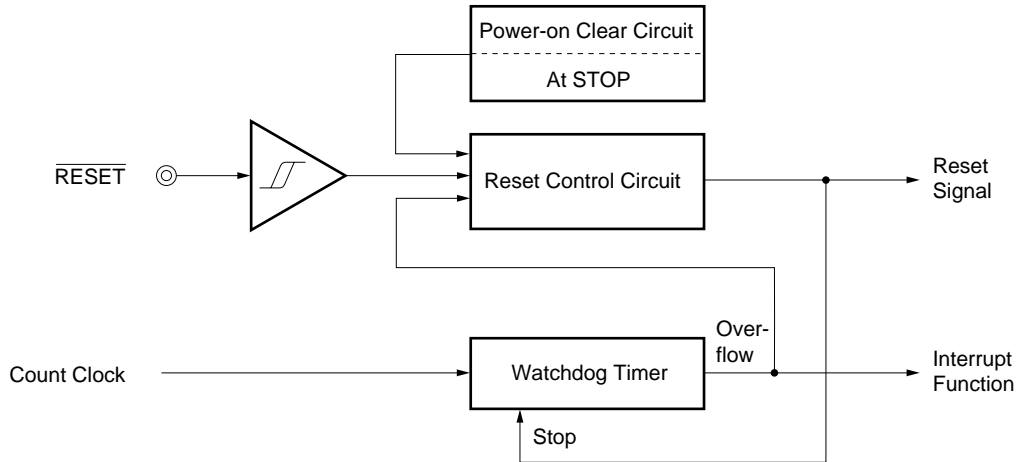

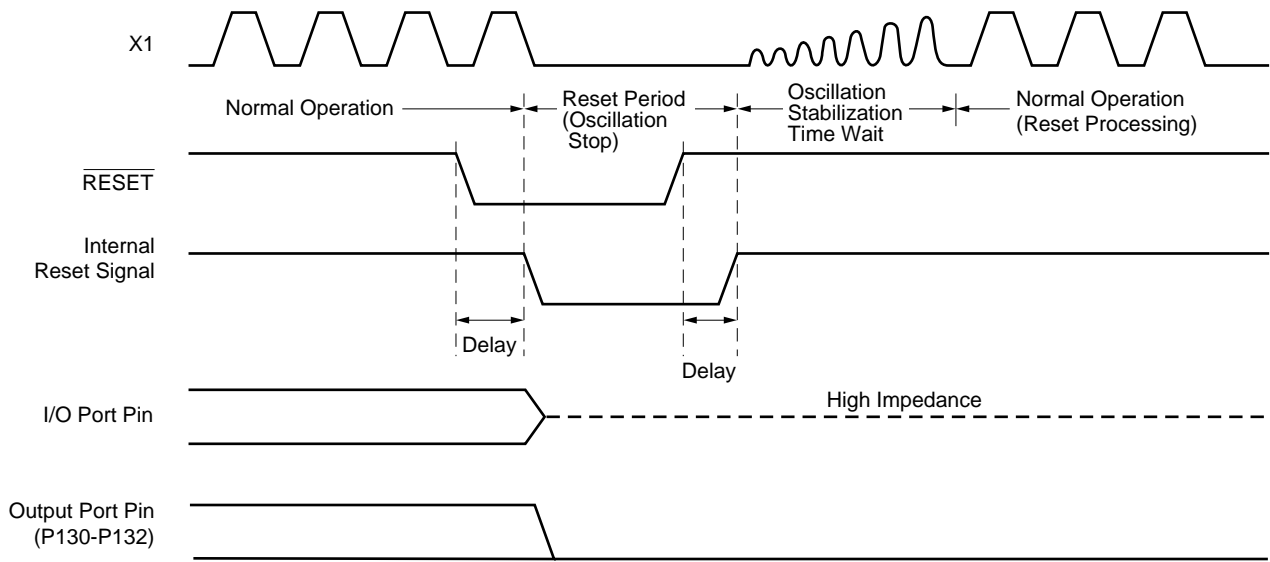

Figure 18-2. Timing of Reset by $\overline{\text{RESET}}$ Input

(c) In normal operating mode (including HALT mode)

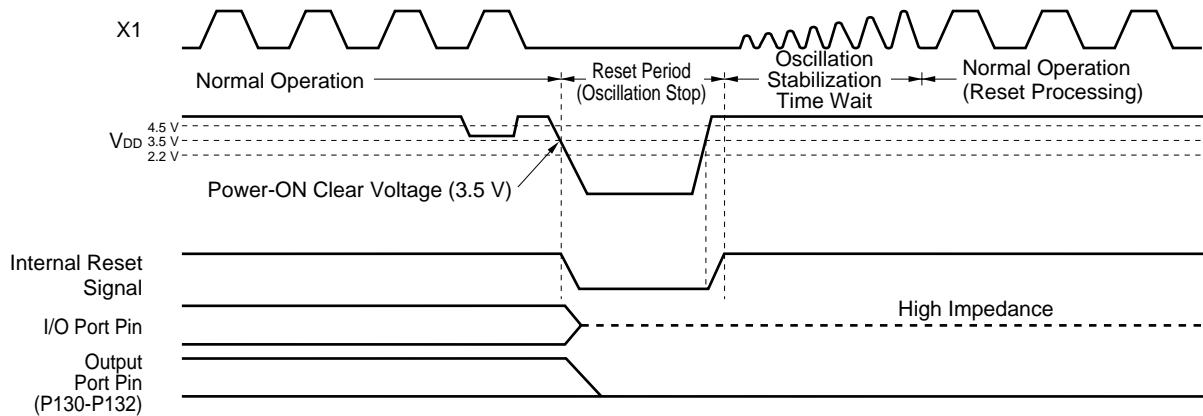

Table 18-1. Hardware Status after Reset (1/2)

Hardware		Status after Reset
Program counter (PC) ^{Note 1}		Contents of reset vector table (0000H, 0001H) are set.
Stack pointer (SP)		Undefined
Program status word (PSW)		Undefined
RAM	Data memory	Undefined ^{Note 2}
	General-purpose register	Undefined ^{Note 2}
Port (output latch)	Ports 0, 1, 3-7, 12, 13 (P0, P1, P3-P7, P12, P13)	00H
Port mode registers (PM0, PM3-PM7, PM12)		FFH
Pull-up resistor option register 4 (PU4)		00H
Processor clock control register (PCC)		04H
Oscillation stabilization time select register (OSTS)		04H
DTS system clock select register (DTSCK)		00H ^{Note 3}
Memory size select register (IMS)		CFH ^{Note 4}
Internal extension RAM size select register (IXS)		0CH ^{Note 5}
8-bit timer/event counter	Counters 50, 51 (TM50, TM51)	00H
	Compare registers 50, 51 (CR50, CR51)	Undefined
	Clock select registers 50, 51 (TCL50, TCL51)	00H
	Mode control registers 50, 51 (TMC50, TMC51)	00H
Watchdog timer	Clock select register (WDCS)	00H
	Mode register (WDTM)	00H
Buzzer output control circuit	BEEP clock select register 0 (BEEPCL0)	00H

- Notes**
1. During reset input or oscillation stabilization time wait, only the PC contents among the hardware statuses become undefined. All other hardware statuses remains unchanged after reset.
 2. The status before reset is retained even after reset in the standby mode.
 3. Though the initial value is 00H, be sure to set it to 01H before using.
 4. The initial value is CFH. Set the following value to this register depending on the model:
 μ PD178022 : 44H
 μ PD178023 : C6H
 μ PD178024 : C8H
 μ PD178F124: Value corresponding to mask ROM
 5. Do not assign a value other than 0CH.

Table 18-1. Hardware Status after Reset (2/2)

Hardware			Status after Reset
Serial interface	IIC	IIC shift register 0 (IIC0)	Undefined
		Slave address register 0 (SVA0)	Undefined
		IIC transfer clock select register 0 (IICCL0)	00H
		IIC status register 0 (IICSO)	00H
		IIC control register 0 (IICC0)	00H
	SIO3	Shift register 3 (SIO3)	Undefined
		Operating mode register 3 (CSIM3)	00H
	UART0	Asynchronous serial interface mode register 0 (ASIM0)	00H

	Mask flag registers (MK0L, MK0H, and MK1L)	FFH	
	Priority specification flag registers (PR0L, PR0H, and PR1L)	FFH	
	External interrupt rising edge enable register (EGP)	00H	
	External interrupt falling edge enable register (EGN)	00H	
PLL frequency synthesizer	PLL mode select register (PLLMD)	00H	
	PLL reference mode register (PLLRF)	0FH	
	PLL unlock F/F judge register (PLLUL)	Retained ^{Note 1}	
	PLL data registers (PLLRH, PLLRL, and PLLR0)	Undefined	
	PLL data transfer register (PLLNS)	00H	
Frequency counter	IF counter mode select register (IFCMD)	00H	
	IF counter gate judge register (IFCJG)	00H	
	IF counter control register (IFCCR)	00H	
	IF counter register (IFCR)	0000H	
Power-ON clear	POC status register (POCS)	Retained ^{Note 2}	

Notes 1. Undefined only at power-ON clear reset

2. 03H only at power-ON clear reset

18.2 Power Failure Detection Function

If reset is effected by means of power-ON clear, bit 0 (POCM) of the POC status register (POCS) is set to 1. If reset is effected by the $\overline{\text{RESET}}$ pin or the watchdog timer, however, POCM holds the previous status.

A power failure status can be detected by detecting this POCM after reset by power-ON clear has been cleared (after program execution has been started from address 0000H).

Figure 18-5. Format of POC Status Register (POCS)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
POCS	0	0	0	0	0	0	VM45	POCM	FF1BH	Retained ^{Note}	R&Reset

POCM	Detects Power-ON Clear Occurrence Status
0	Power-ON clear does not occur
1 ^{Note}	Reset is effected by power-ON clear

Note The value of this register is set to 03H only when reset is effected through power-ON clearing. It is not reset by the $\overline{\text{RESET}}$ pin or watchdog timer.

Remark The values of the special function registers, other than POCS and PLLUL, at power-ON clear are the same as the values following a reset by the $\overline{\text{RESET}}$ pin or watchdog timer.

18.3 4.5-V Voltage Detection Function

This function is used to detect a voltage drop on the V_{DD} pin below 4.5 V ($4.5\text{ V} \pm 0.3\text{ V}$). If the voltage on the V_{DD} pin drops below 4.5 V ($4.5\text{ V} \pm 0.3\text{ V}$), bit 1 (VM45) of the POC status register (POCS) is set.

Note, however, that this 4.5-V voltage detection function does not cause internal reset.

Figure 18-6. Format of POC Status Register (POCS)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
POCS	0	0	0	0	0	0	VM45	POCM	FF1BH	Retained ^{Note}	R&Reset

VM45	Detects Voltage Level of V_{DD} Pin
0	Does not detect if V_{DD} pin is less than 4.5 V ($4.3 \pm 0.3\text{ V}$)
1	Detects if V_{DD} pin is less than 4.5 V ($4.3 \pm 0.3\text{ V}$)

Note The value of this register is set to 03H only at power-ON clear reset, and is not reset by the $\overline{\text{RESET}}$ pin and watchdog timer.

Remark The values of the special function registers, other than POCS and PLLUL, at power-ON clear are the same as the values following a reset by the $\overline{\text{RESET}}$ pin or watchdog timer.

[MEMO]

CHAPTER 19 μ PD178F124

The μ PD178F124 is provided with a flash memory to/from which data can be rewritten/erased with the device mounted on a printed circuit board. The differences between the flash memory model (μ PD178F124) and mask ROM models (μ PD178022, 178023, and 178024) are shown in Table 19-1.

★

Table 19-1. Differences between μ PD178F124 and Mask ROM Models

Item		μ PD178F124	μ PD178022, 178023, 178024
Internal memory	ROM structure	Flash memory	Mask ROM
	ROM capacity	32K bytes	μ PD178022 : 16K bytes μ PD178023 : 24K bytes μ PD178024 : 32K bytes
Internal ROM capacity selected by memory size select register (IMS)		Equivalent to mask ROM model	μ PD178022 : 44H μ PD178023 : C6H μ PD178024 : C8H
IC pin		Not provided	Provided
V_{PP} pin		Provided	Not provided
Electrical specifications, recommended soldering conditions		These may differ between flash memory model and mask ROM model.	

19.1 Memory Size Select Register (IMS)

The internal memory capacity of the μ PD178F124 can be changed using the memory size select register (IMS). By using this register, the memory of the μ PD178F124 can be mapped in the same manner as a mask ROM model with a different internal memory capacity.

Use an 8-bit memory manipulation instruction to set the IMS.

This register is set to CFH at reset.

Be sure to set 44H, C6H, or C8H to the IMS.

Figure 19-1. Format of Memory Size Select Register (IMS)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
IMS	RAM2	RAM1	RAM0	0	ROM3	ROM2	ROM1	ROM0	FFF0H	CFH	R/W

RAM2	RAM1	RAM0	Selects Internal High-speed RAM Capacity		
0	1	0	512 bytes		
1	1	0	1024 bytes		
Others			Setting prohibited		

RAM3	RAM2	RAM1	RAM0	Selects Internal ROM Capacity		
0	1	0	0	16K bytes		
0	1	1	0	24K bytes		
1	0	0	0	32K bytes		
Others				Setting prohibited		

Table 19-2 shows the setting of IMS to perform the same memory mapping as that of a mask ROM model.

Table 19-2. Set Value of Memory Size Select Register

Targeted Model	Set Value of IMS
μ PD178022	44H
μ PD178023	C6H
μ PD178024	C8H

19.2 Internal Extension RAM Size Select Register (IXS)

The internal extension RAM capacity of the μ PD178F124 can be changed using the internal extension RAM size select register (IXS). By using this register, the memory of the μ PD178F124 can be mapped in the same manner as a mask ROM model with a different internal extension RAM capacity.

Use an 8-bit memory manipulation instruction to set the IXS.

This register is set to 0CH at reset.

Caution Do not assign a value other than that the value at reset.

Figure 19-2. Format of Internal Extension RAM Size Select Register (IXS)

Symbol	7	6	5	4	3	2	1	0	Address	At reset	R/W
IXS	0	0	0	IXRAM4	IXRAM3	IXRAM2	IXRAM1	IXRAM0	FFF4H	0CH	R/W

IXRAM4	IXRAM3	IXRAM2	IXRAM1	IXRAM0	Selects Internal Extension RAM Capacity
0	1	1	0	0	0 byte
Others					Setting prohibited

Table 19-3 shows the setting of IXS to perform the same memory mapping as that of a mask ROM model.

Table 19-3. Set Value of Internal Extension RAM Size Select Register

Targeted Model	Set Value of IXS
μ PD178022, 178023, 178024	0CH

19.3 Flash Memory Programming

The program memory provided in the μ PD178F124 is flash memory.

The flash memory can be written on-board, i.e., with the μ PD178F124 mounted on the target system. To do so, connect a dedicated flash programmer (Flashpro III (Part number: FL-PR3, PG-FP3)) to the host machine and target system.

Remark FL-PR3 and PG-FP3 are products of Naito Densai Machida Mfg. Co., Ltd.

19.3.1 Selecting communication mode

The flash memory is written by using Flashpro III and by means of serial communication. Select a communication mode from those listed in Table 19-4. To select a communication mode, the format shown in Figure 19-3 is used. Each communication mode is selected depending on the number of V_{PP} pulses shown in Table 19-4.

Table 19-4. Communication Modes

Communication Mode	Pins Used	Number of V_{PP} Pulses
3-wire serial I/O (SIO3)	SI3/P70 SO3/P71 $\overline{\text{SCK3/P72}}$	0
IIC0	SDA0/P76 SCL0/P77	4
UART0	$\overline{\text{RXD0/P74}}$ $\overline{\text{TXD0/P75}}$	8

Caution Be sure to select a communication mode by the number of V_{PP} pulses shown in Table 19-4.

Figure 19-3. Format of Communication Mode Selection

19.3.2 Flash memory programming function

An operation such as writing the flash memory is performed when a command or data is transmitted/received in the selected communication mode. The major flash memory programming functions are listed in Table 19-5.

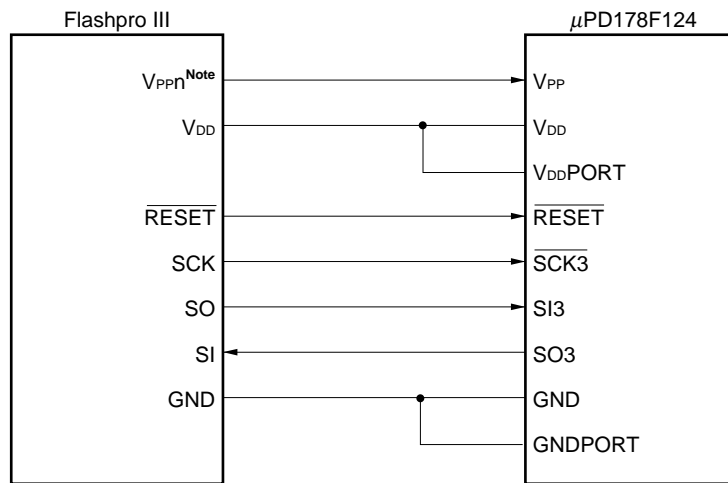

Table 19-5. Functions of Major Flash Memory Programming

Function	Description
Batch erase	Erases all memory contents.
Batch blank check	Checks erased status of entire memory.
Data write	Writes data to flash memory starting from write start address and based on number of data (bytes) to be written).
Batch verify	Compares all contents of memory with input data.

19.3.3 Connecting Flashpro III

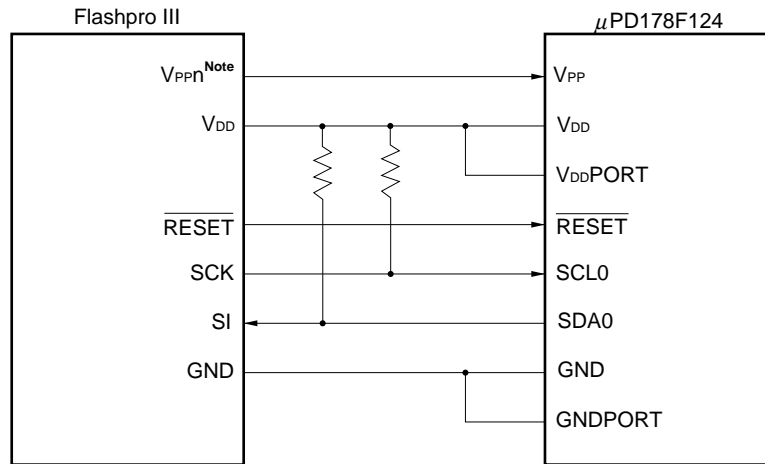

Connection with Flashpro III differs depending on the communication mode (3-wire serial I/O, IIC0, or UART0). Figures 19-4 through 19-6 show the connection in the respective modes.

Figure 19-4. Connection of Flashpro III in 3-Wire Serial I/O Mode

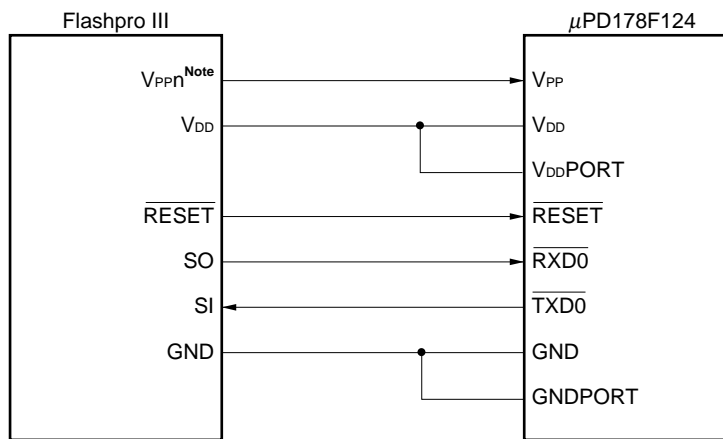

Note n = 1, 2

Figure 19-5. Connection of Flashpro III in IIC0 Mode

Note n = 1, 2

Figure 19-6. Connection of Flashpro III in UART0 Mode

Note n = 1, 2

19.3.4 Example settings for Flashpro III (PG-FP3)

When writing data to flash memory using Flashpro III (PG-FP3), use the following settings:

- <1> Load parameter file.
- <2> Select the serial mode and serial clock using the type command.
- <3> An example of the settings for PG-FP3 is shown in Table 19-6.

Table 19-6. Example settings for Flashpro III (PG-FP3)

Communication Mode	Setting of Flashpro III		Number of V _{PP} pulses ^{Note 1}
3-wire serial I/O (SIO3)	COMM PORT	SIO ch-0	0
	CPU CLK	On Target Board	
		In Flashpro	
	On Target Board	4.1943 MHz	
	SIO CLK	1.0 MHz	
	In Flashpro	4.0 MHz	
SIO CLK		1.0 MHz	
IIC0	COMM PORT	IIC ch-0	4
	SLAVE ADDRESS	08H to 77H	
	CPU CLK	On Target Board	
		In Flashpro	
IIC CLK	1 to 400 kHz		
UART0	COMM PORT	UART ch-0	8
	CPU CLK	On Target Board	
		On Target Board	
	UART BPS	9600 bps ^{Note 2}	

- Notes**
- Number of V_{PP} pulse supplied by Flashpro III (PG-FP3) when serial mode is initialized. This determines the pin used for the communication.
 - Select from 9600 bps, 19200 bps, 38400 bps, and 76800 bps.

Remark

- COMM PORT : Selection of serial port
- SIO CLK : Selection of serial clock frequency
- CPU CLK : Selection of CPU clock source to be input

[MEMO]

CHAPTER 20 INSTRUCTION SET

This chapter describes each instruction set of the μ PD178024 subseries as list table. For details of its operation and operation code, refer to the separate document **78K/0 series User's Manual—Instruction (U12326E)**.

20.1 Conventions

20.1.1 Operand symbols and description

Operands are written in “Operand” column of each instruction in accordance with the description of the instruction operand symbols (refer to the assembler specifications for detail). When there are two or more descriptions, select one of them. Alphabetic letters in capitals and symbols, #, !, \$ and [] are key words and must be written as they are. Each symbol has the following meaning.

- # : Immediate data specification
- ! : Absolute address specification
- \$: Relative address specification
- [] : Indirect address specification

In the case of immediate data, write an appropriate numeric value or a label. When using a label, be sure to write the #, !, \$, and [] symbols.

For operand register symbols, r and rp, either function names (X, A, C, etc.) or absolute names (names in parentheses in the table below, R0, R1, R2, etc.) can be used.

Table 20-1. Operand Symbols and Descriptions

Symbol	Description
r	X (R0), A (R1), C (R2), B (R3), E (R4), D (R5), L (R6), H (R7),
rp	AX (RP0), BC (RP1), DE (RP2), HL (RP3)
sfr	Special-function register symbol ^{Note}
sfrp	Special-function register symbol (16-bit manipulatable register even addresses only) ^{Note}
saddr	FE20H-FF1FH Immediate data or labels
saddrp	FE20H-FF1FH Immediate data or labels (even address only)
addr16	0000H-FFFFH Immediate data or labels (Only even addresses for 16-bit data transfer instructions)
addr11	0800H-0FFFH Immediate data or labels
addr5	0040H-007FH Immediate data or labels (even address only)
word	16-bit immediate data or label
byte	8-bit immediate data or label
bit	3-bit immediate data or label
RBn	RB0 to RB3

Note Addresses from FFD0H to FFDFH cannot be accessed with these operands.

Remark For special function register symbols, refer to **Table 3-4 Special Function Registers**.

20.1.2 Description of “operation” column

A	: A register; 8-bit accumulator
X	: X register
B	: B register
C	: C register
D	: D register
E	: E register
H	: H register
L	: L register
AX	: AX register pair; 16-bit accumulator
BC	: BC register pair
DE	: DE register pair
HL	: HL register pair
PC	: Program counter
SP	: Stack pointer
PSW	: Program status word
CY	: Carry flag
AC	: Auxiliary carry flag
Z	: Zero flag
RBS	: Register bank select flag
IE	: Interrupt request enable flag
NMIS	: Non-maskable interrupt servicing flag
()	: Memory contents indicated by address or register contents in parentheses
x _H , x _L	: High-order 8 bits and low-order 8 bits of 16-bit register
∧	: Logical product (AND)
∨	: Logical sum (OR)
⊕	: Exclusive logical sum (exclusive OR)
—	: Inverted data
addr16	: 16-bit immediate data or label
jdisp8	: Signed 8-bit data (displacement value)

20.1.3 Description of “flag operation” column

(Blank)	: Not affected
0	: Cleared to 0
1	: Set to 1
×	: Set/cleared according to the result
R	: Previously saved value is restored

20.2 Operation List

Instruction Group	Mnemonic	Operands	Byte	Clock		Operation	Flag

CY	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1			SET1 CLR1 NOT1

(4) Call/instructions/branch instructions

CALL, CALLF, CALLT, BR, BC, BNC, BZ, BNZ, BT, BF, BTCLR, DBNZ

2nd Operand 1st Operand	AX	!addr16	!addr11	[addr5]	\$addr16
Basic instruction	BR	CALL BR	CALLF	CALLT	BR BC BNC BZ BNZ
Compound instruction					BT BF BTCLR DBNZ

(5) Other instructions

ADJBA, ADJBS, BRK, RET, RETI, RETB, SEL, NOP, EI, DI, HALT, STOP

[MEMO]

APPENDIX A DEVELOPMENT TOOLS

The following development tools are available for the development of systems which employ the μ PD178024 subseries. Figure A-1 shows the configuration example of the tools.

- **Support for PC98-NX series**

Unless otherwise specified, products compatible with IBM PC/AT™ computers are compatible with PC98-NX series computers. When using PC98-NX series computers, refer to the description for IBM PC/AT computers.

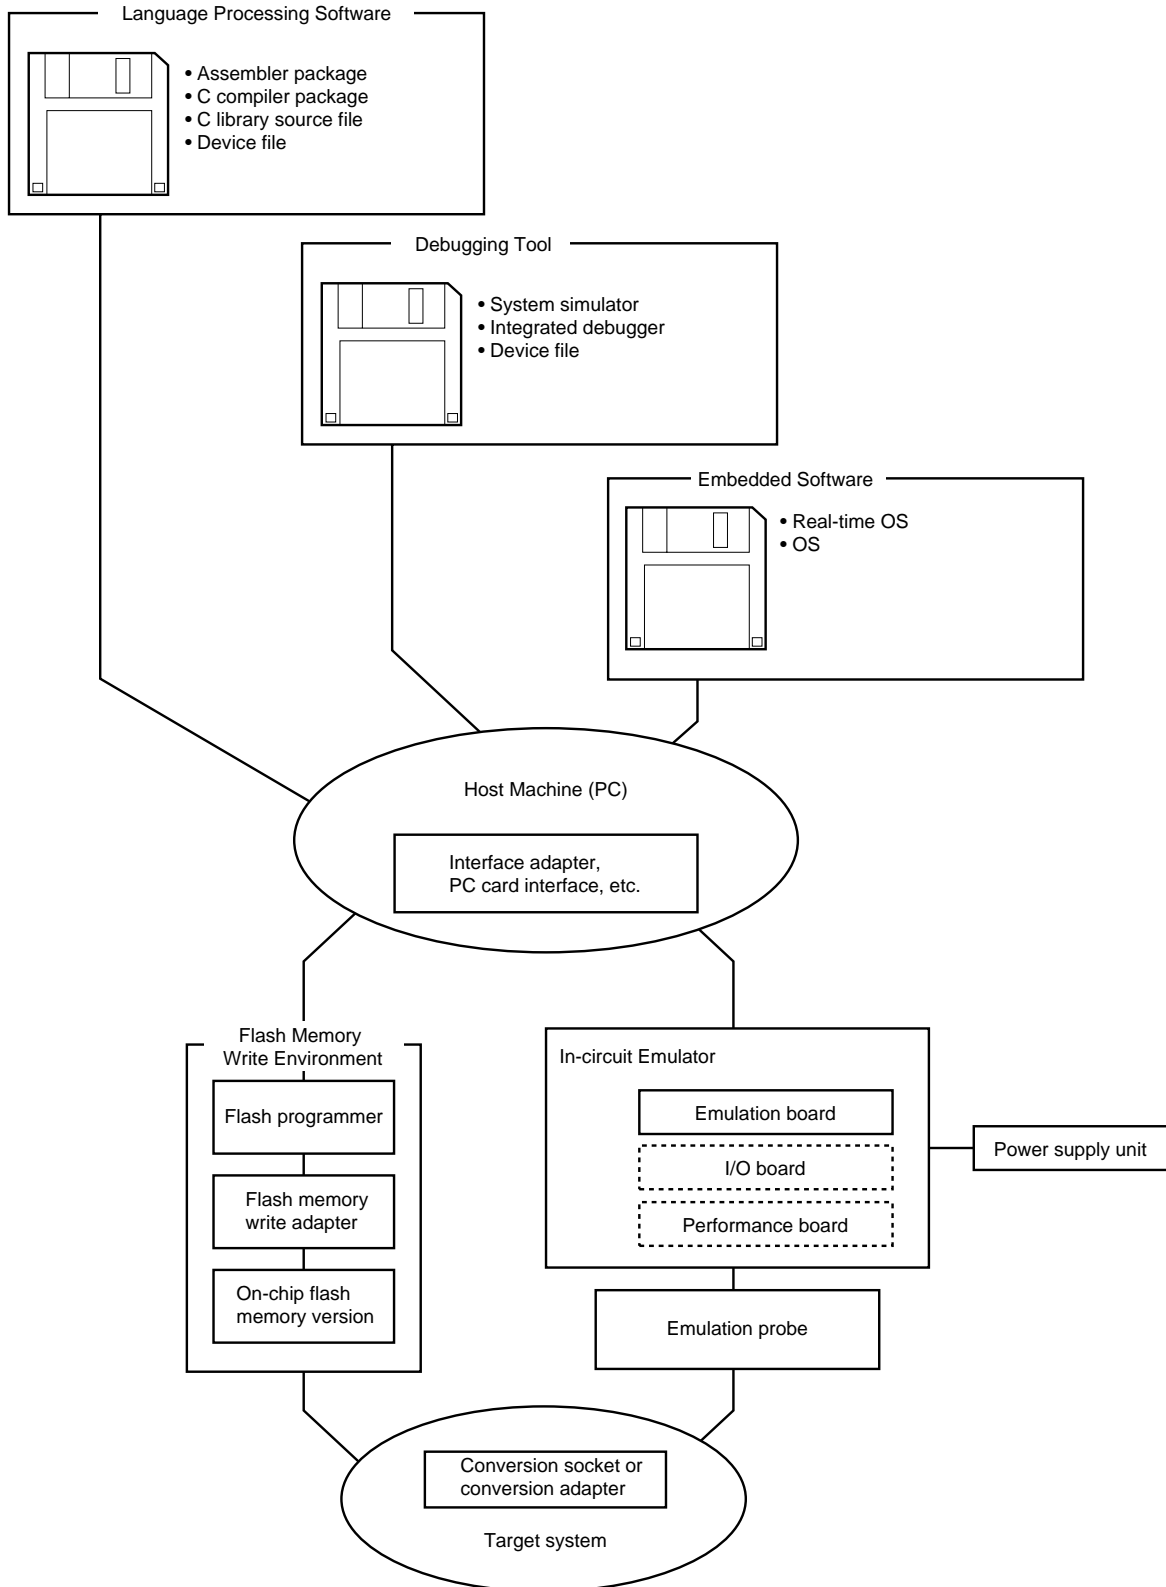

- **Windows**

Unless otherwise specified, "Windows" means the following OSs.

- Windows 3.1
- Windows95
- WindowsNT™ Ver 4.0

Figure A-1. Configuration of Development Tool (1/2)

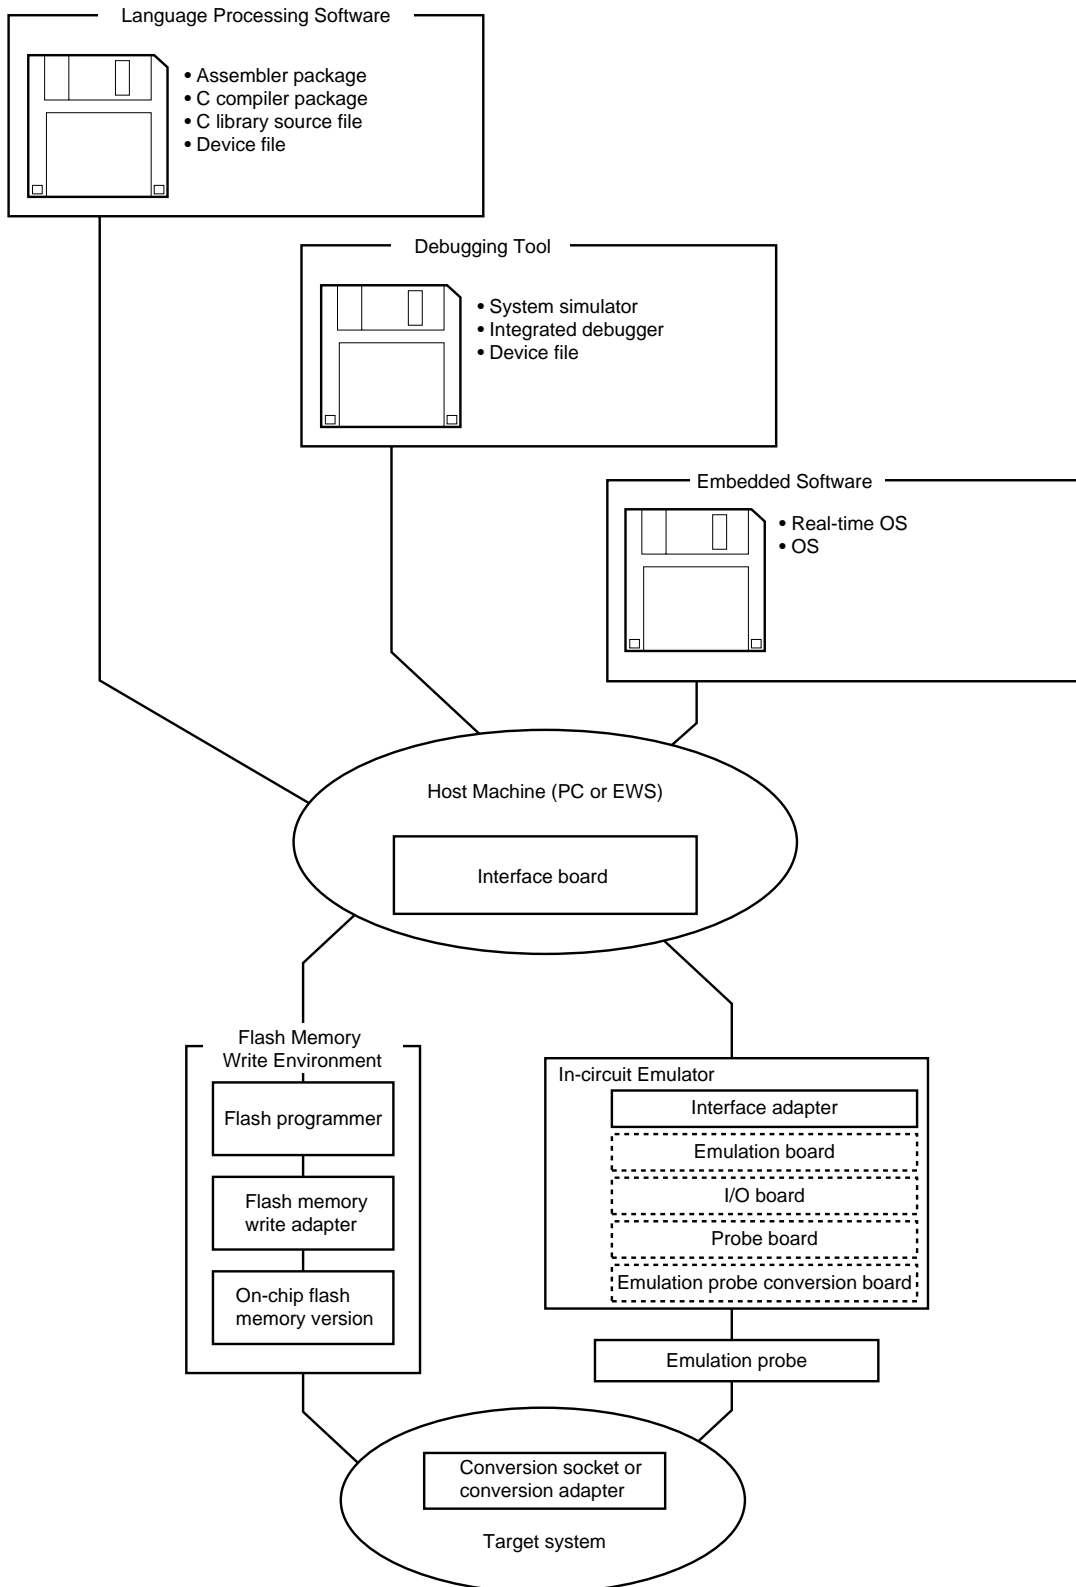

(1) When using the in-circuit emulator IE-78K0-NS

Remark Items in broken-line boxes differ according to the development environment. Refer to **A.3.1. Hardware**.

Figure A-1. Configuration of Development Tool (2/2)

(2) When using the in-circuit emulator IE-78001-R-A

Remark Items in broken line boxes differ according to the development environment. Refer to **A.3.1. Hardware**.

A.1 Language Processing Software

<p>RA78K0 Assembler Package</p>	<p>This assembler converts programs written in mnemonics into an object codes executable with a microcontroller. Further, this assembler is provided with functions capable of automatically creating symbol tables and branch instruction optimization. This assembler should be used in combination with an optical device file (DF178124). <Precaution when using RA78K0 in PC environment> This assembler package is a DOS-based application. It can also be used in Windows, however, by using the Project Manager (included in assembler package) on Windows.</p> <p>Part Number: μSxxxxRA78K0</p>
<p>CC78K0 C Compiler Package</p>	<p>This compiler converts programs written in C language into object codes executable with a microcontroller. This compiler should be used in combination with an optical assembler package and device file. <Precaution when using CC78K0 in PC environment> This C compiler package is a DOS-based application. It can also be used in Windows, however, by using the Project Manager (included in assembler package) on Windows.</p> <p>Part Number: μSxxxxCC78K0</p>
<p>DF178124^{Note} Device File</p>	<p>This file contains information peculiar to the device. This device file should be used in combination with an optical tool (RA78K0, CC78K0, SM78K0, ID78K0-NS, and ID78K0). Corresponding OS and host machine differ depending on the tool used.</p> <p>Part Number: μSxxxxDF178124</p>
<p>CC78K0-L C Library Source File</p>	<p>This is a source file of functions configuring the object library included in the C compiler package. This file is required to match the object library included in C compiler package to the user's specifications. It does not depend on the operating environment because it is a source file.</p> <p>Part Number: μSxxxxCC78K0-L</p>

Note The DF178124 can be used in common with the RA78K0, CC78K0, SM78K0, ID78K0-NS, and ID78K0.

Remark xxxx in the part number differs depending on the host machine and OS used.

A.2 Flash Memory Writing Tools

Flashpro III (Part number: FL-PR3, PG-FP3) Flash Programmer	Flash programmer dedicated to microcontrollers with on-chip flash memory.
FA-80GF FA-80GC Flash Memory Writing Adapter	Flash memory writing adapter used connected to the Flashpro III. <ul style="list-style-type: none"> • FA-80GF : 80-pin plastic QFP (GF-3B9 type) • FA-80GC : 80-pin plastic QFP (GC-8BT type)
Flashpro III controller	Control program that runs on a PC. This is supplied with Flashpro III.

Remark Flashpro III, FA-80GF, and FA-80GC are products of Naito Densai Machida Mfg. Co., Ltd.
 Phone: (044) 822-3813 Naito Densai Machida Mfg. Co., Ltd.

A.3 Debugging Tools

A.3.1 Hardware (1/2)

(1) When using the in-circuit emulator IE-78K0-NS

IE-78K0-NS In-circuit Emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using a 78K/0 Series product. It corresponds to integrated debugger (ID78K0-NS). This emulator should be used in combination with power supply unit, emulation probe, and interface adapter which is required to connect this emulator to the host machine.
IE-70000-MC-PS-B Power Supply Unit	This adapter is used for supplying power from a receptacle of 100-V to 240-V AC.
★ IE-78K0-NS-PA ^{Note} Performance board	This board is used for extending the IE-78K0-NS functions, and is used connected to the IE-78K0-NS. With the addition of this board, the addition of a coverage function, enhancement of tracer and timer functions, and other such debugging function enhancements are possible.
IE-70000-98-IF-C Interface Adapter	This adapter is required when using the PC-9800 series computer (except notebook type) as the IE-78K0-NS host machine (C bus compatible).
IE-70000-CD-IF-A PC Card Interface	This is PC card and interface cable required when using the notebook-type computer as the IE-78K0-NS host machine (PCMCIA socket compatible).
IE-70000-PC-IF-C Interface Adapter	This adapter is required when using the IBM PC compatible computers as the IE-78K0-NS host machine (ISA bus compatible).
IE-70000-PCI-IF Interface Adapter	This adapter is required when using a PC with a PCI bus as the IE-78K0-NS host machine.
★ IE-178134-NS-EM1 ^{Note} Emulation Board	This board emulates the operations of the peripheral hardware peculiar to a device. It should be used in combination with an in-circuit emulator.
NP-80GF Emulation Probe	This probe is used to connect the in-circuit emulator to the target system and is designed for 80-pin plastic QFP (GF-3B9 type).
EV-9200G-80 Conversion Socket (Refer to Figures A-2, A-3)	This conversion socket connects the NP-80GF to the target system board designed to mount an 80-pin plastic QFP (GF-3B9 type).
NP-80GC Emulation Probe	This probe is used to connect the in-circuit emulator to the target system and is designed for 80-pin plastic QFP (GC-8BT type).
EV-9200GC-80 Conversion Socket (Refer to Figures A-4, A-5)	This conversion socket connects the NP-80GC to the target system board designed to mount an 80-pin plastic QFP (GC-8BT type).

Note Under development

- Remarks 1.** NP-80GF and NP-80GC are products of Naito Densai Machida Mfg. Co., Ltd.
Phone: (044) 822-3813 Naito Densai Machida Mfg. Co., Ltd.
- 2.** EV-9200G-80 and EV-9200GC-80 are sold in five units.

A.3.1 Hardware (2/2)

(2) When using the in-circuit emulator IE-78001-R-A

IE-78001-R-A In-circuit Emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using a 78K/0 Series product. It corresponds to integrated debugger (ID78K0). This emulator should be used in combination with emulation probe and interface adapter, which is required to connect this emulator to the host machine.
IE-70000-98-IF-C Interface Adapter	This adapter is required when using the PC-9800 series computer (except notebook type) as the IE-78001-R-A host machine (C bus compatible).
IE-70000-PC-IF-C Interface Adapter	This adapter is required when using the IBM PC/AT compatible computers as the IE-78001-R-A host machine (ISA bus compatible).
IE-70000-PCI-IF Interface Adapter	This adapter is required when using a PC with a PCI bus as the IE-78001-R-A host machine.
IE-78000-R-SV3 Interface Adapter	This is adapter and cable required when using an EWS computer as the IE-78001-R-A host machine, and is used connected to the board in the IE-78000-R-A. As Ethernet™, 10Base-5 is supported. With the other method, a commercially available conversion adapter is necessary.
★ IE-178134-NS-EM1 ^{Note} Emulation Board	This board emulates the operations of the peripheral hardware peculiar to a device. It should be used in combination with an in-circuit emulator and emulation conversion board.
IE-78K0-R-EX1 Emulation Probe Conversion Board	This board is required when using the IE-178134-NS-EM1 on the IE-78001-R-A.
EP-78130GF-R Emulation Probe	This probe is used to connect the in-circuit emulator to the target system and is designed for 80-pin plastic QFP (GF-3B9 type).
EV-9200G-80 Conversion Socket (Refer to Figures A-2, A-3)	This conversion socket connects the EP-78130GF-R to the target system board designed to mount an 80-pin plastic QFP (GF-3B9 type).
EP-78230GC-R Emulation Probe	This probe is used to connect the in-circuit emulator to the target system and is designed for 80-pin plastic QFP (GC-8BT type).
EV-9200GC-80 Conversion Socket (Refer to Figures A-4, A-5)	This conversion socket connects the EP-78230GC-R to the target system board designed to mount an 80-pin plastic QFP (GC-8BT type).

Note Under development

Remark EV-9200G-80 and EV-9200GC-80 are sold in five units.

A.3.2 Software (1/2)

SM78K0 System Simulator	This system simulator is used to perform debugging at C source level or assembler level while simulating the operation of the target system on a host machine. This simulator runs on Windows. Use of the SM78K0 allows the execution of application logical testing and performance testing on an independent basis from hardware development without having to use an in-circuit emulator, thereby providing higher development efficiency and software quality. The SM78K0 should be used in combination with the optical device file (DF178124). Part Number: μ SxxxxSM78K0
----------------------------	---

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxSM78K0

xxxx	Host Machine	OS	Supply Medium
AA13	PC-9800 series	Windows (Japanese version)	3.5-inch 2HD FD
AB13	IBM PC/AT compatibles	Windows (Japanese version)	3.5-inch 2HC FD
BB13		Windows (English version)	

A.3.2 Software (2/2)

ID78K0-NS Integrated Debugger (supporting in-circuit emulator IE-78K0-NS)	This debugger is a control program to debug 78K/0 Series microcontrollers. It adopts a graphical user interface, which is equivalent visually and operationally to Windows or OSF/Motif™. It also has an enhanced debugging function for C language programs, and thus trace results can be displayed on screen in C-language level by using the windows integration function which links a trace result with its source program, disassembled display, and memory display. In addition, by incorporating function modules such as task debugger and system performance analyzer, the efficiency of debugging programs, which run on real-time OSs can be improved. It should be used in combination with the optional device file.
ID78K0 Integrated Debugger (supporting in-circuit emulator IE-78001-R-A)	
Part Number: μ SxxxxID78K0-NS, μ SxxxxID78K0	

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxID78K0-NS

xxxx	Host Machine	OS	Supply Medium

A.4 System Upgrade from Former In-circuit Emulator for 78K/0 Series to IE-78001-R-A

If you already have a former in-circuit emulator for 78K/0 Series microcontrollers (IE-78000-R or IE-78000-R-A), that in-circuit emulator can operate as an equivalent to the IE-78001-R-A by replacing its internal break board with the IE-78001-R-BK (under development).

Table A-1. System Upgrade Method from Former In-circuit Emulator for 78K/0 Series to the IE-78001-R-A

In-circuit Emulator Owned	In-circuit Emulator Cabinet System Upgrade ^{Note}	Board To Be Purchased
IE-78000-R	Required	IE-78001-R-BK
IE-78000-R-A	Not required	

Note For upgrading a cabinet, send your in-circuit emulator to NEC.

APPENDIX B EMBEDDED SOFTWARE

For efficient development and maintenance of the μ PD178024 subseries, the following embedded products are available.

Real-Time OS (1/2)

RX78K/0 Real-time OS	<p>RX 78K/0 is a real-time OS conforming to the μITRON specifications. Tool (configurator) for generating nucleus of RX78K/0 and plural information tables is supplied. Used in combination with an optional assembler package (RA78K/0) and device file (DF178124).</p> <p><Precaution when using RX78K/0 in PC environment> The real-time OS is a DOS-based application. It should be used in the DOS Prompt when using in Windows.</p> <hr/> <p>Part number: μSxxxxRX78013-$\Delta\Delta\Delta\Delta$</p>
-------------------------	--

Caution When purchasing the RX78K/0, fill in the purchase application form in advance and sign the user agreement.

Remark xxxx and $\Delta\Delta\Delta\Delta$ in the part number differ depending on the host machine and OS used.

μ SxxxxRX78013- $\Delta\Delta\Delta\Delta$

$\Delta\Delta\Delta\Delta$	Product Outline	Maximum Number for Use in Mass Production
001	Evaluation object	Do not use for mass-produced product.
100K	Mass-production object	0.1 million units
001M		1 million units
010M		10 million units
S01	Source program	Source program for mass-produced object

xxxx	Host Machine	OS	Supply Medium
AA13	PC-9800 series	Windows (Japanese version) ^{Note}	3.5-inch 2HD FD
AB13	IBM PC/AT compatibles	Windows (Japanese version) ^{Note}	3.5-inch 2HC FD
BB13		Windows (English version) ^{Note}	
3P16	HP9000 series 700	HP-UX (Rel. 10.10)	DAT (DDS)
3K13	SPARCstation	SunOS (Rel. 4.1.4),	3.5-inch 2HC FD
3K15		Solaris (Rel. 2.5.1)	1/4-inch CGMT
3R13	NEWS (RISC)	NEWS-OS (Rel. 6.1)	3.5-inch 2HC FD

Note Can also be operated in DOS environment.

Real-Time OS (2/2)

MX78K0 OS	<p>MX78K0 is an OS for μTRON specification subsets. A nucleus for the MX78K0 is also included as a companion product.</p> <p>This manages tasks, events, and time. In the task management, determining the task execution order and switching from task to the next task are performed.</p> <p><Precaution when using MX78K0 in PC environment></p> <p>The MX78K0 is a DOS-based application. It should be used in the DOS Prompt when using in Windows.</p>
	<p>Part number: μSxxxxMX78K0-$\Delta\Delta\Delta$</p>

Remark xxxx and $\Delta\Delta\Delta$ in the part number differ depending on the host machine and OS used.

μ SxxxxMX78K0- $\Delta\Delta\Delta$

$\Delta\Delta\Delta$	Product Outline	Maximum Number for Use in Mass Production
001	Evaluation object	Use in preproduction stages.
xx	Mass-production object	Use in mass production stages.
S01	Source program	Only the users who purchased mass-production objects are allowed to purchase this program.

xxxx	Host Machine	OS	Supply Medium
AA13	PC-9800 series	Windows (Japanese version) ^{Note}	3.5-inch 2HD FD
AB13	IBM PC/AT compatibles	Windows (Japanese version) ^{Note}	3.5-inch 2HC FD
BB13		Windows (English version) ^{Note}

APPENDIX D REVISION HISTORY

Here is the revision history of this manual. “Chapter” indicates the chapter of the previous edition.

Edition	Revision from Previous Edition	Chapter
Second edition	Deletion of μ PD178124 Subseries (μ PD178122, 178123, 178124)	Throughout
	Provision of UART0 function for all products of the μ PD178024 Subseries (μ PD178022, 178023, 178024, 178F124)	
	Deletion of EEPROM from μ PD178F124	
	Change of the number of interrupt sources (Addition of INTSER0, INTSR0, INTST0 in μ PD178022, 178023, 178024, and deletion of INTEE from μ PD178F124)	Chapter 1 OUTLINE, Chapter 14 INTERRUPT FUNCTIONS
	Correction of pin configuration of 80-pin plastic QFP (GF-3B9 type)	Chapter 1 OUTLINE,
	Correction of pin configuration of 80-pin plastic QFP (GC-8BT type)	
	Change of power-ON clear voltage in STOP mode to 2.2 V	Chapter 1 OUTLINE, Chapter 18 RESET FUNCTION
	Correction of Port 4 (P40-P47) so that a pull-up resistor can be connected to this port's pins in both input and output modes	Chapter 2 PIN FUNCTION, Chapter 4 PORT FUNCTIONS
	Correction of I/O Circuit types of P76/SDA0, P77/SCL0	Chapter 2 PIN FUNCTION
	Correction of POCS register so that it is set by a 1-bit or 8-bit memory manipulation instruction	Chapter 3 CPU ARCHITECTURE
	Correction of IMS, IXS register so that it is set by an 8-bit memory manipulation instruction	
	Correction of PFM3 register so that it is set by a 1-bit or 8-bit memory manipulation instruction	Chapter 10 A/D CONVERTER
