

To our customers,

---

## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1<sup>st</sup>, 2010  
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

**Windows is either a registered trademark or a trademark of Microsoft Corporation in the United States and/or other countries.**

- **The information in this document is current as of September, 2002. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
  - No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
  - NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
  - Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
  - While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
  - NEC semiconductor products are classified into the following three quality grades:
    - "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
    - "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
    - "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
    - "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
- The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
- (Note)
- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
  - (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).

# Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

## PREFACE

**Target Readers** This manual is for users who design and develop  $\mu$ PD77016 Family application systems.

$\mu$ PD77016 Family is the generic name for the  $\mu$ PD7701x family ( $\mu$ PD77015, 77016, 77017, 77018, 77018A, 77019), the  $\mu$ PD77111 Family ( $\mu$ PD77110, 77111, 77112, 77113A, 77114, 77115) and the  $\mu$ PD77210 Family ( $\mu$ PD77210, 77213). However, this manual is for  $\mu$ PD77110, 77113A, 77114, and 77115 devices.

**Purpose** The purpose of this manual is to help users understand the supporting middleware when designing and developing  $\mu$ PD77016 Family application systems.

**Organization** This manual consists of the following contents.

**CHAPTER 1 OVERVIEW**  
**CHAPTER 2 LIBRARY SPECIFICATIONS**  
**CHAPTER 3 INSTALLATION**  
**CHAPTER 4 SYSTEM EXAMPLES**  
**APPENDIX SAMPLE PROGRAM SOURCE**

**How to Read This Manual** It is assumed that the reader of this manual has general knowledge in the fields of electrical engineering, logic circuits, microcontrollers, and the C language.

To learn about  $\mu$ PD77111 Family hardware functions

→ Refer to  **$\mu$ PD77111 Family User's Manual Architecture**.

To learn about  $\mu$ PD77016 Family hardware functions

→ Refer to  **$\mu$ PD77016 Family User's Manual Instruction**.

**Conventions**

Data significance:	Higher digits on the left and lower digits on the right
Active low representation:	$\overline{XXX}$ (overscore over pin or signal name)
<b>Note:</b>	Footnote for item marked with <b>Note</b> in the text
<b>Caution:</b>	Information requiring particular attention
<b>Remark:</b>	Supplementary information
Numerical representation:	Binary ... XXXX or 0bXXXX
	Decimal ... XXXX
	Hexadecimal ... 0xXXXX

**Related Documents** The related documents listed below may include preliminary versions. However, preliminary versions are not marked as such.

**Documents Related to Devices**

# CHAPTER 1 OVERVIEW

## 1.1 Middleware

Middleware is the name given to a group of software that has been tuned so that it draws out the maximum performance of the processor and enables processing that is conventionally performed by hardware to be performed by software.

The concept of middleware was introduced with the development of a new high-speed processor, the DSP, in order to facilitate operation of the environments integrated in the system.

By providing appropriate speech codec and image data compression/decompression-type middleware, NEC is offering users the kind of technology essential in the realization of a multimedia system for the  $\mu$ PD77016 Family, and is continuing its promotion of system development.

$\mu$ SAP77016-B07 is middleware that provides MP3 decoding functions.

## 1.2 MP3 Audio Decoder

In this manual, audio signal encoding and decoding methods MPEG-1 Audio Layer-3 and MPEG-2 Audio Layer-3 LSF (Low Sampling Frequency) are called MP3. The relevant standards for these are ISO/IEC 11172-3 and ISO/IEC 13818-3.

$\mu$ SAP77016-B07 complies with this decoding method. The compressed data is data that encodes a digital signal converted to 16-bit linear PCM data after sampling an analog signal at frequencies shown in Table 1-1.

**Table 1-1. Sampling Frequencies**

MPEG-1 Audio Layer-3 [Hz]	MPEG-2 Audio Layer-3 LSF [Hz]
44100	22050
48000	24000
32000	16000

### 1.2.1 Decoder outline

Figure 1-1 is a sample configuration of decoding using  $\mu$ SAP77016-B07.

**Figure 1-1. Sample Configuration of Decoding**

**(1) MP3 Encode Data**

MP3 Encode Data is data sampled at frequencies shown in Table 1-1 (16-bit linear PCM data) and encoded at a fixed bit rate from Table 1-2 or a variable bit rate.

**Table 1-2. Bit Rates**

MPEG-1 Audio Layer-3 [kbps]	MPEG-2 Audio Layer-3 LSF [kbps]
32	8
40	16
48	24
56	32
64	40
80	48
96	56
112	64
128	80
160	96
192	112
224	128
256	144
320	160

**(2) Decoder**

The decoder reads input data, performs decoding, and outputs 16-bit linear PCM data.

$\mu$ SAP77016-B07 decodes and outputs a maximum of two channels.

Finally, it performs CRC processing as error compensation.

**(3) DAC**

The DAC converts 16-bit linear PCM data to an analog signal.

The DAC must operate at the sampling frequency attached to the encoded data.

If the sampling frequency of the encoded data differs from the DAC, separate frequency conversion software (such as a rate converter) is needed.

### 1.3 Product Overview

#### 1.3.1 Features

- (1) Employs ISO/IEC standardized MP3 decoder algorithm
- (2) Bit rate can be fixed bit rate of Table 1-2 or variable bit rate
- (3) Input data is 16-bit linear PCM data sampled at frequencies shown in Table 1-1 and encoded at a fixed bit rate from Table 1-2 or a variable bit rate
- (4) Output data is 16-bit linear PCM data of the same frequency as the input data sampling frequency
- (5) 1152 samples/frame/channel (MPEG1), 576 samples/frame/channel (MPEG2), decoding
- (6) Provides CRC as error compensation
- (7) Does not handle free format
- (8) Supports 2-channel decoding

#### 1.3.2 Functions

**(1) Decompression processing**

Decompression processing converts compressed data to one frame of 16-bit linear PCM data.

**(2) Error compensation**

CRC is performed as error compensation processing.

#### 1.3.3 Operating environment

**(1) Operable DSPs:**

$\mu$ PD77110, 77113A, 77114, 77115

**(2) Required memory size:**

$\mu$ SAP77016-B07 requires memory sizes shown in the following table.

**Table 1-3. Required Memory Sizes**

Memory	Type		Size [Kwords]
Instruction memory	-		6.4
X memory	RAM	Scratch area	2.3
		Static area	2.2
	ROM		1.7
Y memory	RAM	Scratch area	0.6
		Static area	3.7
	ROM		5.4

**Caution** One word of instruction memory is 32 bits.  
 One word of X memory or Y memory is 16 bits.

A scratch area is a memory area that can be discarded when  $\mu$ SAP77016-B07 is not operating. The user can use scratch areas when  $\mu$ SAP77016-B07 is not operating.

However, caution is required when using these areas. Since  $\mu$ SAP77016-B07 will use these areas again when it operates, if a user has set information in scratch areas, the set information cannot be guaranteed.

Refer to **Table 1-4** if using scratch areas.

**Table 1-4. Scratch Areas**

Memory	Public Symbol Name	Size [words]
X memory	lib_Scratch_x	2304
Y memory	lib_Scratch_y	576

Scratch areas are reserved by the user and set using the mp3\_InitDec function. Specification of align/at is not necessary when declaring lib\_Scratch\_x or lib\_Scratch\_y.

A static area is a memory area that cannot be discarded even when  $\mu$ SAP77016-B07 is not operating. A user cannot use a static area.

Besides these, input data buffers and output buffers are needed.

In the sample program described later, 1442 words are used as an input data buffer and 2304 words as two output buffers, for a total of three buffers.

Although it is possible to increase the size of the input data buffer, do not decrease it or it may affect operations.

The output buffer size cannot be changed. However, the number of buffers can be changed.

**(3) Required D/A specs**

D/A 2 ch, 16-bit resolution, sampling frequency shown in Table 1-1

**(4) Software tools (Windows™ version)**

**Table 1-5. Software Tools**

Relevant DSP	Software Tools
$\mu$ PD77016 Family	DSP tools WB77016 (Workbench) HSM77016 (High-speed simulator)

1.3.4 Performance

Table 1-6 shows the MIPS values that are necessary in order to execute decompression processing for one frame in real time.

Table 1-6. MIPS Needed in One Frame Decompression Processing

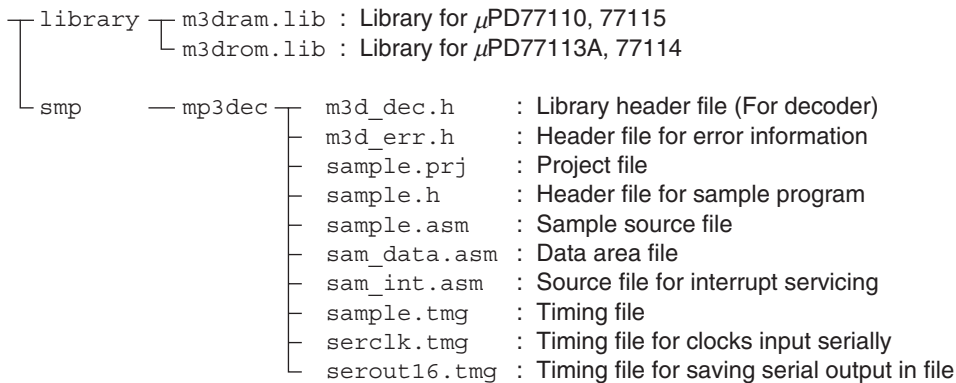

Conditions		DSP: $\mu$ PD77110 (Operating frequency 75 MHz, 75 MIPS)		
Decompression	Sampling frequency	32 kHz [MIPS]	44.1 kHz [MIPS]	48 kHz [MIPS]
	Logical <sup>Note 1</sup> maximum MIPS value	Approx. 26	Approx. 35	Approx. 37
	Measured <sup>Note 2</sup> maximum MIPS value	22.6	31.1	33.9
	Measured <sup>Note 2</sup> average MIPS value	19.2	26.4	28.7
CRC	Logical <sup>Note 1</sup> value	0.4	0.5	0.5

**Notes 1.** Logical means that the value is calculated by taking the maximum number of cycles for the number of loops, number of repeats, and algorithm processing route in a program.

**2.** Measured means that the value was measured by actually executing  $\mu$ SAP77016-B07 on a real machine using a bit rate of 320 kbps and stereo (2-channel) encoded data.

1.3.5 Directory configuration

The directory configuration of  $\mu$ SAP77016-B07 is shown below.

A summary of each directory is shown below.

(1) library

This directory contains library files.

(2) smp --- mp3dec

This directory contains sample program source files and header files.

It also provides timing files described later.

## 1.4 Compressed Data Format

For details of the compressed data format, refer to standards (ISO/IEC 11172-3, JIS X 4323).

$\mu$ SAP77016-B07 specifications conform to standards. However,  $\mu$ SAP77016-B07 is not in compliance with free format on a bitrate\_index of '0000'.

Figure 1-2 shows the format structure of compressed data.

Figure 1-2. Compressed Data Format

### 1.4.1 Header

Headers contain information such as the sampling frequency, bit rate, and mode for synchronizing.

Table 1-7. Details of Header Section

Information	Number of Bits Used	Value
Frame sync word	12	'1111 1111 1111': Fixed value
ID	1	'1': MPEG-1 '0': MPEG-2
Layer	2	'11': Layer1/'10': Layer2/'01': Layer3
Protection bit	1	'0': Has CRC '1': No CRC
Bit rate	4	Refer to <b>Table 1-8 Relationship of Bit Values to Bit Rates.</b>
Sampling frequency	2	Refer to <b>Table 1-9 Relationship of Bit Values to Sampling Frequencies.</b>
Padding bit	1	'1': 1 byte is added to frame <sup>Note 1</sup> '0': 1 byte not added to frame
Private bit	1	Not used
Mode	2	'00': stereo '10': dual_channel '01': joint_stereo '11': single_channel
Mode extension	2	'00': is_off, ms_off '10': is_off, ms_on '01': is_on, ms_off '11': is_on, ms_on <sup>Note 2</sup>
Copyright	1	'0': no copyright '1': copyright protected
Original/copy distinction	1	'0': copy '1': original
Emphasis	2	'00': no emphasis '10': reserved '01': 50/15 $\mu$ s '11': CCITT J.17

**Notes 1.** For a sampling frequency of 44.1 kHz, 1 byte is added to adjust frame ends.

**2.** "is" designates intensity stereo and "ms" MS stereo.

**Table 1-8. Relationship of Bit Values to Bit Rates**

Value	MPEG-1 Audio Layer-3 [kbps]	MPEG-2 Audio Layer-3 LSF [kbps]
'0000'	Free format <sup>Note</sup>	
'0001'	32	8
'0010'	40	16
'0011'	48	24
'0100'	56	32
'0101'	64	40
'0110'	80	48

### 1.4.2 CRC

There are two bytes of information that follow the header only when the header protection bit indicates that CRC is in effect. If it is not in effect, the two bytes of information do not exist.

**1.4.3 Side information**

Side information includes information such as the starting position of audio data in a frame and the decoding method as information needed in decoding audio data.

The size of side information is shown in Table 1-10.

**Table 1-10. Size of Side Information**

	MPEG-1 Audio Layer-3 [byte]	MPEG-2 Audio Layer-3 LSF [byte]
Monaural	17	9
Stereo	32	17

**1.4.4 Audio data**

This is data related to an audio sample. The starting position of the audio data is set in the side information. Audio data can start in the same frame as the side information that shows the position of the audio data or it can start in a preceding frame.

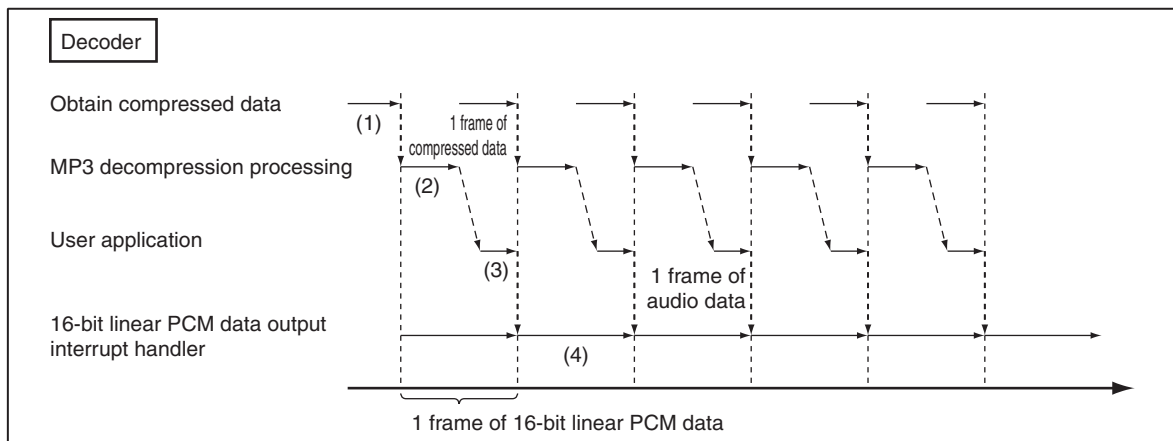

Moreover, the starting position of audio data is not limited to one frame before. It also can start two frames before. Refer to **ISO/IEC 11172-3** for details about audio data.

**1.4.5 Additional data**

This is a segment in which data that the user can define is loaded. This data sometimes does not exist in a frame.  $\mu$ SAP77016-B07 does not perform any processing on this data. It does not even read it.

**1.5 Timing Diagram**

**Figure 1-3. Decoder Timing Diagram**

- (1) Read 1 frame of compressed data and pass it to decompression processing.
- (2) Convert 1 frame of compressed data to 1 frame of decompressed data.
- (3) Buffer decompressed data. Besides this, perform application processing such as rate conversion.
- (4) Perform D/A conversion of 1 frame of 16-bit linear PCM data.

## CHAPTER 2 LIBRARY SPECIFICATIONS

### 2.1 Library Overview

$\mu$ SAP77016-B07 provides the following five functions.

**Table 2-1. List of Library Functions**

Function Name	Function
mp3_InitDec	Initialize decompression processing
mp3_Dec	Decompression processing
mp3_GetVersion	Obtain version information
mp3_GetStatus	Obtain status information
mp3_GetErrorStatus	Obtain error information

## 2.2 Function Specifications

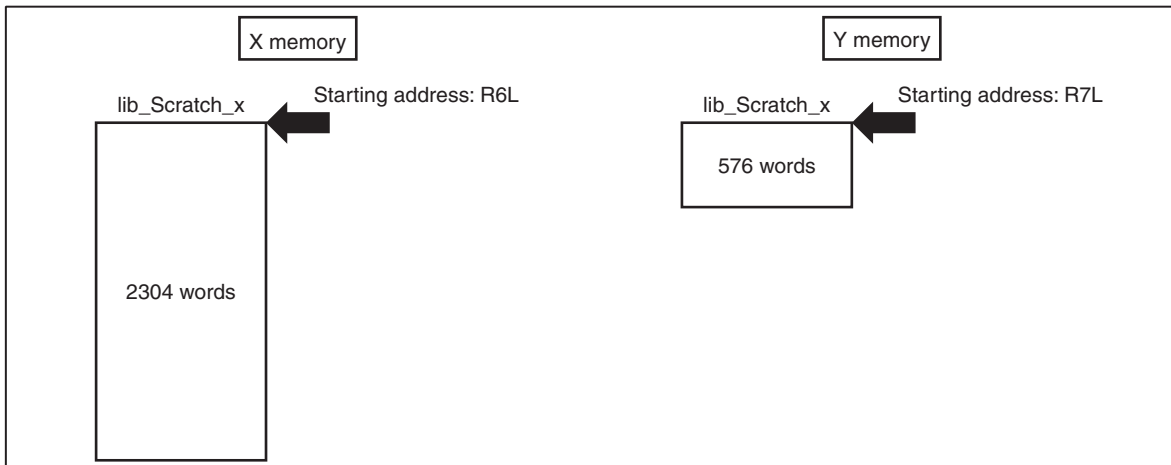

Specifications when calling each library function are shown below.

### 2.2.1 mp3\_InitDec function

<b>[Classification]</b>	MP3 decoder initialization processing
<b>[Function name]</b>	mp3_InitDec
<b>[Summary of function]</b>	Initializes RAM areas and sets parameters used by $\mu$ SAP77016-B07
<b>[Format]</b>	call mp3_InitDec
<b>[Arguments]</b>	R0            Length of input MP3 data (bytes) R1 to R5    Reserved R6L         Starting address of lib_Scratch_x R7L         Starting address of lib_Scratch_y
<b>[Return value]</b>	None
<b>[Function]</b>	Set the sub-band filter, IMDCT, reverse quantization, stereo, CRC, and main processing parameters and initialize RAM areas used by the MP3 decoder.
<b>[Registers used]</b>	R0, R6, R7, DP0, DP4
<b>[Hardware resourcement]</b>	
	Maximum stack level            2
	Maximum loop stack level      0
	Maximum number of repeats    576
	Maximum number of cycles     4636

**Caution** The mp3\_InitDec function initializes only RAM areas that the MP3 decoder uses. Initialization of user-defined RAM areas (such as I/O buffers) should be performed in a user program. In addition, the user should reserve lib\_Scratch\_x and lib\_Scratch\_y areas in advance.

Figure 2-1. Scratch Area Memory Image

## 2.2.2 mp3\_Dec function

<b>[Classification]</b>	MP3 decoder processing														
<b>[Function name]</b>	mp3_Dec														
<b>[Summary of function]</b>	Expands specified compressed data to one frame of audio data.														
<b>[Format]</b>	call mp3_Dec														
<b>[Arguments]</b>	<table> <tr> <td>R0</td> <td>0: Decode 1: Skip 1 frame of decoding</td> </tr> <tr> <td>R7</td> <td>Set the read order of identical addresses at the input buffer (user-defined) read pointer (<b>Figure 2-2</b>) 0: Use from higher byte of address indicated by DP2 1: Use from lower byte of address indicated by DP2</td> </tr> <tr> <td>DP2</td> <td>Set the input buffer (user-defined) read pointer (<b>Figure 2-2</b>)</td> </tr> <tr> <td>DP3</td> <td>Set the input buffer (user-defined) write pointer (<b>Figure 2-2</b>)</td> </tr> <tr> <td>DP4</td> <td>Set to output data buffer (user-defined) pointer</td> </tr> <tr> <td>DMX</td> <td>Set to size of input buffer (user-defined) – 1</td> </tr> <tr> <td>DMY</td> <td>Set to size of output buffer (user-defined) – 1</td> </tr> </table>	R0	0: Decode 1: Skip 1 frame of decoding	R7	Set the read order of identical addresses at the input buffer (user-defined) read pointer ( <b>Figure 2-2</b> ) 0: Use from higher byte of address indicated by DP2 1: Use from lower byte of address indicated by DP2	DP2	Set the input buffer (user-defined) read pointer ( <b>Figure 2-2</b> )	DP3	Set the input buffer (user-defined) write pointer ( <b>Figure 2-2</b> )	DP4	Set to output data buffer (user-defined) pointer	DMX	Set to size of input buffer (user-defined) – 1	DMY	Set to size of output buffer (user-defined) – 1
R0	0: Decode 1: Skip 1 frame of decoding														
R7	Set the read order of identical addresses at the input buffer (user-defined) read pointer ( <b>Figure 2-2</b> ) 0: Use from higher byte of address indicated by DP2 1: Use from lower byte of address indicated by DP2														
DP2	Set the input buffer (user-defined) read pointer ( <b>Figure 2-2</b> )														
DP3	Set the input buffer (user-defined) write pointer ( <b>Figure 2-2</b> )														
DP4	Set to output data buffer (user-defined) pointer														
DMX	Set to size of input buffer (user-defined) – 1														
DMY	Set to size of output buffer (user-defined) – 1														
<b>[Return value]</b>	<table> <tr> <td>DP2</td> <td>Returns input buffer (user-defined) read pointer (<b>Figure 2-2</b>) Used in next decoding</td> </tr> <tr> <td>R7</td> <td>Returns higher byte if input buffer (user-defined) read pointer (<b>Figure 2-2</b>) is 0 and lower byte if it is 1 Used in next decoding</td> </tr> </table>	DP2	Returns input buffer (user-defined) read pointer ( <b>Figure 2-2</b> ) Used in next decoding	R7	Returns higher byte if input buffer (user-defined) read pointer ( <b>Figure 2-2</b> ) is 0 and lower byte if it is 1 Used in next decoding										
DP2	Returns input buffer (user-defined) read pointer ( <b>Figure 2-2</b> ) Used in next decoding														
R7	Returns higher byte if input buffer (user-defined) read pointer ( <b>Figure 2-2</b> ) is 0 and lower byte if it is 1 Used in next decoding														
<b>[Function]</b>	<p>mp3_Dec takes the address shown in DP2 and R7 as the start of input data and performs decompression on compressed data until just before the address specified in DP3. Normally, the arguments DP2 and R7 use the return values of DP2 and R7 from the previous decoding.</p> <p>The sample program in the Appendix has a two-frame output buffer. This is so that while mp3_Dec outputs one frame, another frame of data can be output to the D/A. The compressed data is a stream of bit units.</p>														
<b>[Registers used]</b>	R0, R1, R2, R3, R4, R5, R6, R7 DP0, DP1, DP2, DP3, DP4, DP5, DP6, DP7 DN0, DN1, DN2, DN3, DN4, DN5, DN6, DN7, DMX, DMY														
<b>[Hardware resourcement]</b>	<table> <tr> <td>Maximum stack level</td> <td>5</td> </tr> <tr> <td>Maximum loop stack level</td> <td>3</td> </tr> <tr> <td>Maximum number of repeats</td> <td>256</td> </tr> <tr> <td>Maximum MIPS value</td> <td>37 MIPS (If there is no error encoding) 37.5 MIPS (If there is error encoding)</td> </tr> </table>	Maximum stack level	5	Maximum loop stack level	3	Maximum number of repeats	256	Maximum MIPS value	37 MIPS (If there is no error encoding) 37.5 MIPS (If there is error encoding)						
Maximum stack level	5														
Maximum loop stack level	3														
Maximum number of repeats	256														
Maximum MIPS value	37 MIPS (If there is no error encoding) 37.5 MIPS (If there is error encoding)														

(1) User-defined input buffer

Figure 2-2. User-Defined Input Buffer

(2) User-defined output buffer

Granule: Internal processing unit of MP3 decoder. Normally, two granules are decoded within one frame. However, one granule is decoded within one frame if LSF.

Sample: Smallest unit of 16-bit linear PCM data output

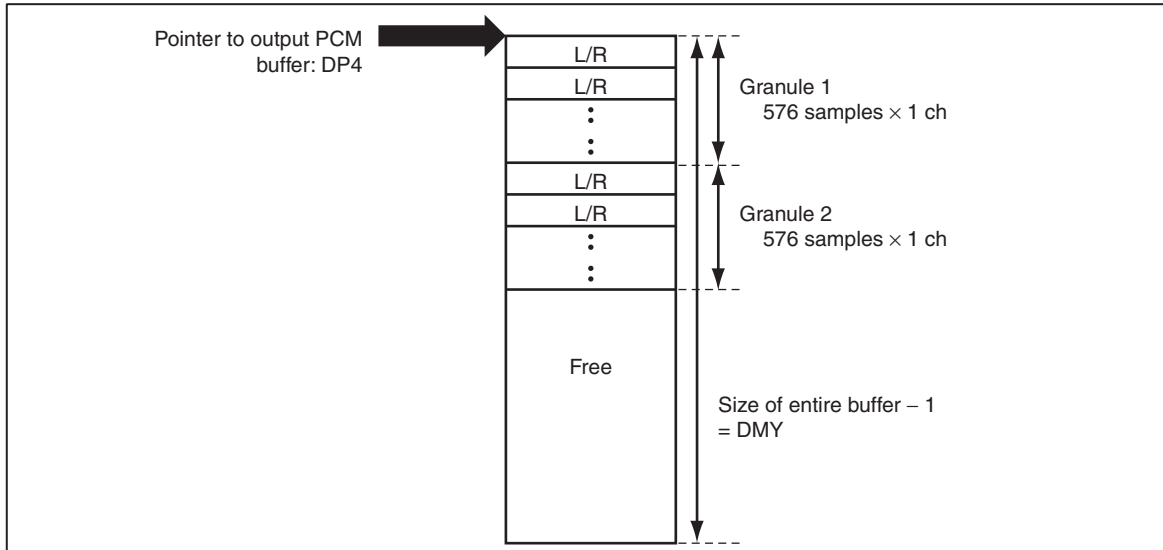

(i) For stereo channel

Figure 2-3. User-Defined Output Buffer for Stereo Channel

(ii) For single channel

Figure 2-4. User-Defined Output Buffer for Single Channel

(iii) For LSF and stereo channel

Figure 2-5. User-Defined Output Buffer for LSF and Stereo Channel

(iv) For LSF and single channel

Figure 2-6. User-Defined Output Buffer for LSF and Single Channel

### 2.2.3 mp3\_GetVersion function

<b>[Classification]</b>	Version information acquisition
<b>[Function name]</b>	mp3_GetVersion
<b>[Summary of function]</b>	Returns the version of the library.
<b>[Format]</b>	call mp3_GetVersion
<b>[Arguments]</b>	None
<b>[Return value]</b>	R0H        Major version number R0L        Minor version number
<b>[Function]</b>	Return the version number of the $\mu$ SAP77016-B07 library in a 32-bit value. Version when R0 = 0x00'0x0001'0x0100: V1.01
<b>[Registers used]</b>	R0
<b>[Hardware resourcement]</b>	
	Maximum stack level        0
	Maximum loop stack level    0
	Maximum number of repeats   0
	Maximum number of cycles    6

### 2.2.4 mp3\_GetStatus function

<b>[Classification]</b>	Status information acquisition										
<b>[Function name]</b>	mp3_GetStatus										
<b>[Summary of function]</b>	Obtains the status of the MP3 decoder. Information from the decoding performed just before this function was called is returned as the status.										
<b>[Format]</b>	call mp3_GetStatus										
<b>[Arguments]</b>	None										
<b>[Return value]</b>	<table> <tr> <td>R0</td> <td>0: MPEG-2 Audio Layer-3 LSF Other: MPEG-1 Audio Layer-3</td> </tr> <tr> <td>R1</td> <td>0: Monaural Other: Stereo</td> </tr> <tr> <td>R2</td> <td>Index value of sampling frequency (<b>Table 2-2</b>)</td> </tr> <tr> <td>R3</td> <td>0: Normal decoding Other: Skip 1 frame of decoding</td> </tr> <tr> <td>R4</td> <td>Index value of bit rate (<b>Table 2-3</b>)</td> </tr> </table>	R0	0: MPEG-2 Audio Layer-3 LSF Other: MPEG-1 Audio Layer-3	R1	0: Monaural Other: Stereo	R2	Index value of sampling frequency ( <b>Table 2-2</b> )	R3	0: Normal decoding Other: Skip 1 frame of decoding	R4	Index value of bit rate ( <b>Table 2-3</b> )
R0	0: MPEG-2 Audio Layer-3 LSF Other: MPEG-1 Audio Layer-3										
R1	0: Monaural Other: Stereo										
R2	Index value of sampling frequency ( <b>Table 2-2</b> )										
R3	0: Normal decoding Other: Skip 1 frame of decoding										
R4	Index value of bit rate ( <b>Table 2-3</b> )										
<b>[Function]</b>	Obtain status information and set registers.										
<b>[Registers used]</b>	R0, R1, R2, R3, R4										
<b>[Hardware resourcement]</b>	<table> <tr> <td>Maximum stack level</td> <td>0</td> </tr> <tr> <td>Maximum loop stack level</td> <td>0</td> </tr> <tr> <td>Maximum number of repeats</td> <td>0</td> </tr> <tr> <td>Maximum number of cycles</td> <td>15</td> </tr> </table>	Maximum stack level	0	Maximum loop stack level	0	Maximum number of repeats	0	Maximum number of cycles	15		
Maximum stack level	0										
Maximum loop stack level	0										
Maximum number of repeats	0										
Maximum number of cycles	15										

**Table 2-2. Frequencies of mp3\_GetStatus() Return Value R2**

Value of R2	MPEG-1 Audio Layer-3 [Hz]	MPEG-2 Audio Layer-3 LSF [Hz]
0x00	44100	22050
0x01	48000	24000
0x02	32000	16000

**Table 2-3. Bit Rates of mp3\_GetStatus() Return Value R4**

Value of R4	MPEG-1 Audio Layer-3 [kbps]	MPEG-2 Audio Layer-3 LSF [kbps]
0x00	Free format <sup>Note</sup>	
0x01	32	8
0x02	40	16
0x03	48	24
0x04	56	32
0x05	64	40
0x06	80	48
0x07	96	56
0x08	112	64
0x09	128	80
0x0a	160	96
0x0b	192	112
0x0c	224	128
0x0d	256	144
0x0e	320	160

**Note** Not supported by  $\mu$ SAP77016-B07

2.2.5 mp3\_GetErrorStatus function

[Classification] Error information acquisition

[Function name] mp3\_GetErrorStatus

[Summary of function] Obtain MP3 decoder error information.

[Format] call mp3\_GetErrorStatus

[Arguments] None

[Return value] R0L Error status  
R1L Skip size (number of bytes)

[Function] Obtain the error information of the MP3 decoder using R0L and R1L. Use this function after calling the mp3\_Dec function.

- The following values are returned for R0L as error information.

Name	Value	Contents	
MP3_DEC_NO_ERROR	0x0000	Normal	Resumable
MP3_DEC_CRC_ERROR	0x0001	CRC error	Resumable
MP3_DEC_HEADER_FOUND_ERROR	0x0002	Header detection error	Resumable
MP3_DEC_BITSTREAM_ERROR	0x0003	Bit stream abnormality <ul style="list-style-type: none"> <li>The size of bit stream in the input buffer is zero.</li> <li>No data found at the point which "main_data_begin" in the bit stream indicates. The bit stream is abnormal.</li> </ul>	Resumable

★

- (i) CRC error  
This is a CRC error. At this time, DP2 and R7 (read pointer) have been moved to the position next to the end of the frame that is to be decoded.
  - (ii) Header detection error  
Either the file is not an mp3 file or the file may have been corrupted. The user should suspend decoding or continue by filling the input buffer with the bit stream up to where the mp3\_Dec function detected a header.
  - (iii) Bit stream abnormality  
Either the bit stream needed in decoding is inadequate or the bit stream is abnormal. The user must fill the bit stream. Set the read pointer and write pointer to appropriate values and execute the mp3\_Dec function again.
- Skip size of return value  
This is the size skipped from the read pointer until the next frame header when the frame header is detected. If the read pointer does not indicate the frame header, the value skipped is returned as the byte size.

★

Figure 2-7. Skip Size of Read Pointer

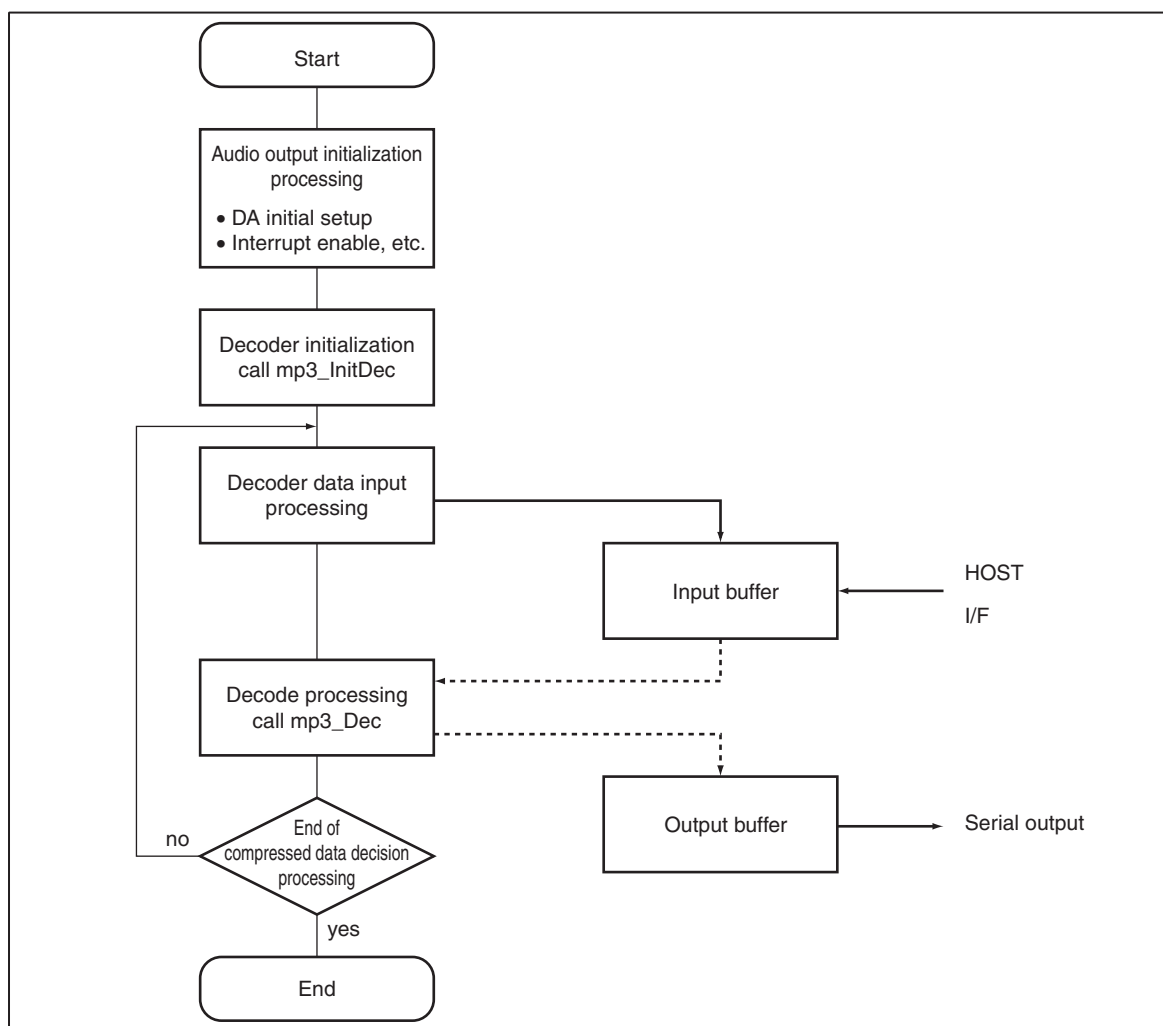

<b>[Registers used]</b>	R0, R1
<b>[Hardware resourcement]</b>	
Maximum stack level	0
Maximum loop stack level	0
Maximum number of repeats	0
Maximum number of cycles	5

### 2.3 Application Processing Flow

Figure 2-8 shows an example of the processing of an application that uses the MP3 decoder.

**Figure 2-8. Application Processing Flow (Decoder)**

The audio data I/O processing section of the interrupt handler is processing that depends on the hardware of the target system. Consequently, the user should design it to suit the target system.

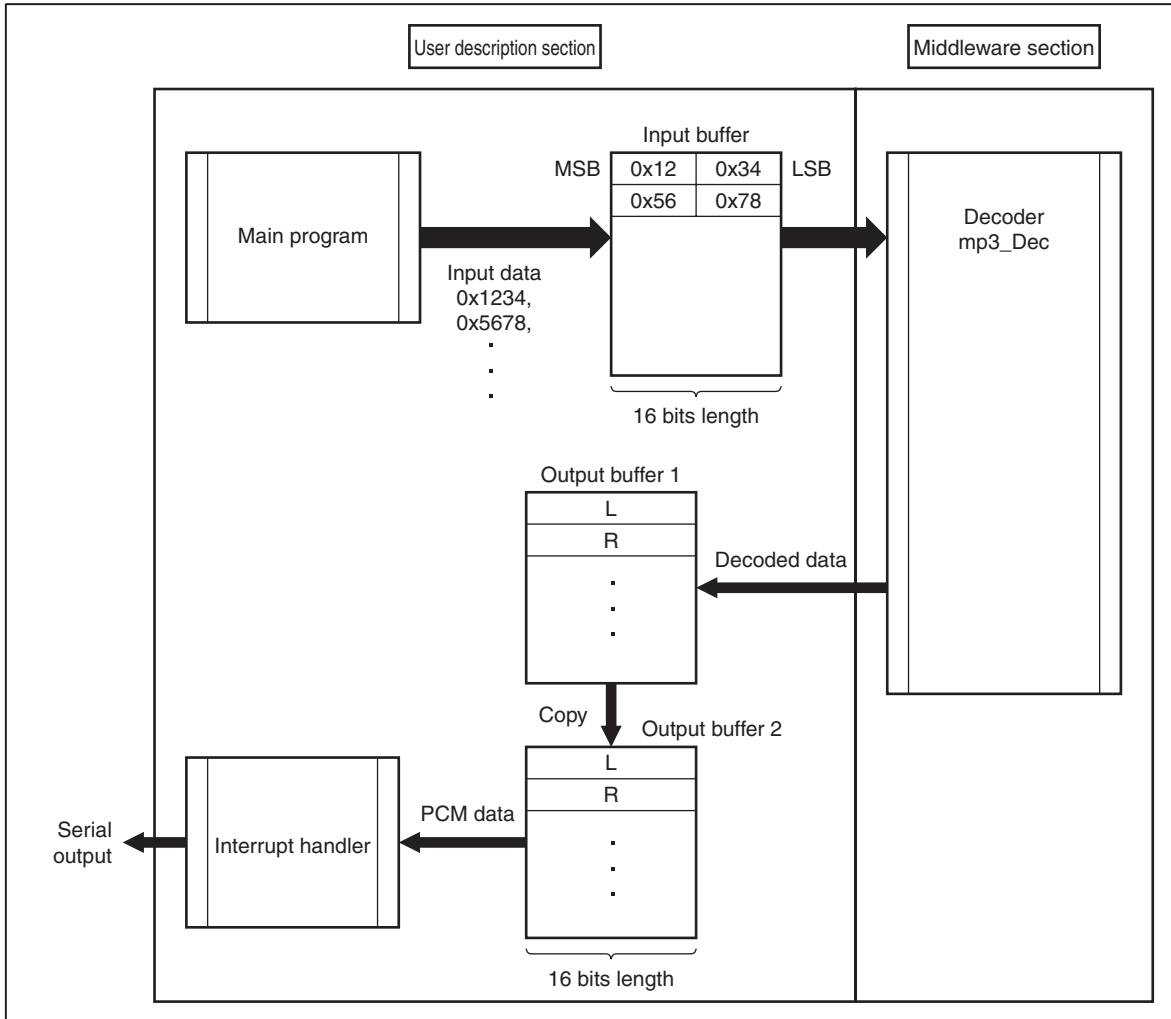

2.3.1 Data flow

Figure 2-9 shows an example of the data flow when decoding.

Data in the input buffer must be set in order from MSB to LSB.

For example, place the data 0x1234, 0x5678, ... in the order 0x12, 0x34, 0x56, 0x78, ....

Figure 2-9. Sample Data Flow

## CHAPTER 3 INSTALLATION

### 3.1 Installation Procedure

The  $\mu$ SAP77016-B07 (MP3 decoder middleware) is supplied on a 3.5-inch floppy disk (1.44 MB). The procedure for installing the  $\mu$ SAP77016-B07 in the host machine is outlined below.

- (1) Set the floppy disk in the floppy disk drive and copy the files to the directory where software tools are used (e.g. C:\DSPTools).

The following is an example of when files are copied from the A drive to the C drive.

```
A:\>xcopy /s *.* c:\DSPTools<CR>
```

- (2) Confirm that the files have been copied. Refer to **1.3.5 Directory configuration** for details on the directories.

```
A:\>dir c:\DSPTools<CR>
```

### 3.2 Sample Program Creation Procedure

A sample program is stored in the smp directory.

The sample program operates on HSM77016 (high-speed simulator) Ver. 2.32 or later. Using the timing files described later makes it possible to simulate data I/O. Refer to **CHAPTER 4 SYSTEM EXAMPLE** regarding timing files.

The following is an explanation of how to build the MP3 decoder middleware sample program.

- (1) Start up the WB77016 (workbench).
- (2) Open the sample.prj project file.

Example Specify sample.prj with the Open Project command on the Project menu.

- (3) Execute Build and confirm that sample.Ink has been created.

Example The sample.Ink file can be created by selecting the Build All command from the Make menu.

- (4) Start up the HSM77016 (high-speed simulator).
- (5) Open the sample.Ink file.

Example Specify sample.Ink with the Open command on the File menu.

- (6) Open timing files (sample.tmg, serclk.tmg, serot16.tmg).

serclk.tmg and serot16.tmg are files provided by HSM77016 (high-speed simulator) in Example.

Example Specify sample.tmg with the Open command on the File menu.

### 3.3 Symbol Naming Regulations

The symbols used in this library are named according to the following regulations.

Classification	Regulation
Function name, variable name	mp3_xxxx
Macro, constant name	mp3_XXXX
Section name	__MP3_XXXX (Two leading underscores)

### 3.4 Sample Program Processing Flow

Figures 3-1 and 3-2 show the processing of a sample program that uses the MP3 decoder.

**Figure 3-1. Sample Program Processing Flow (1)**

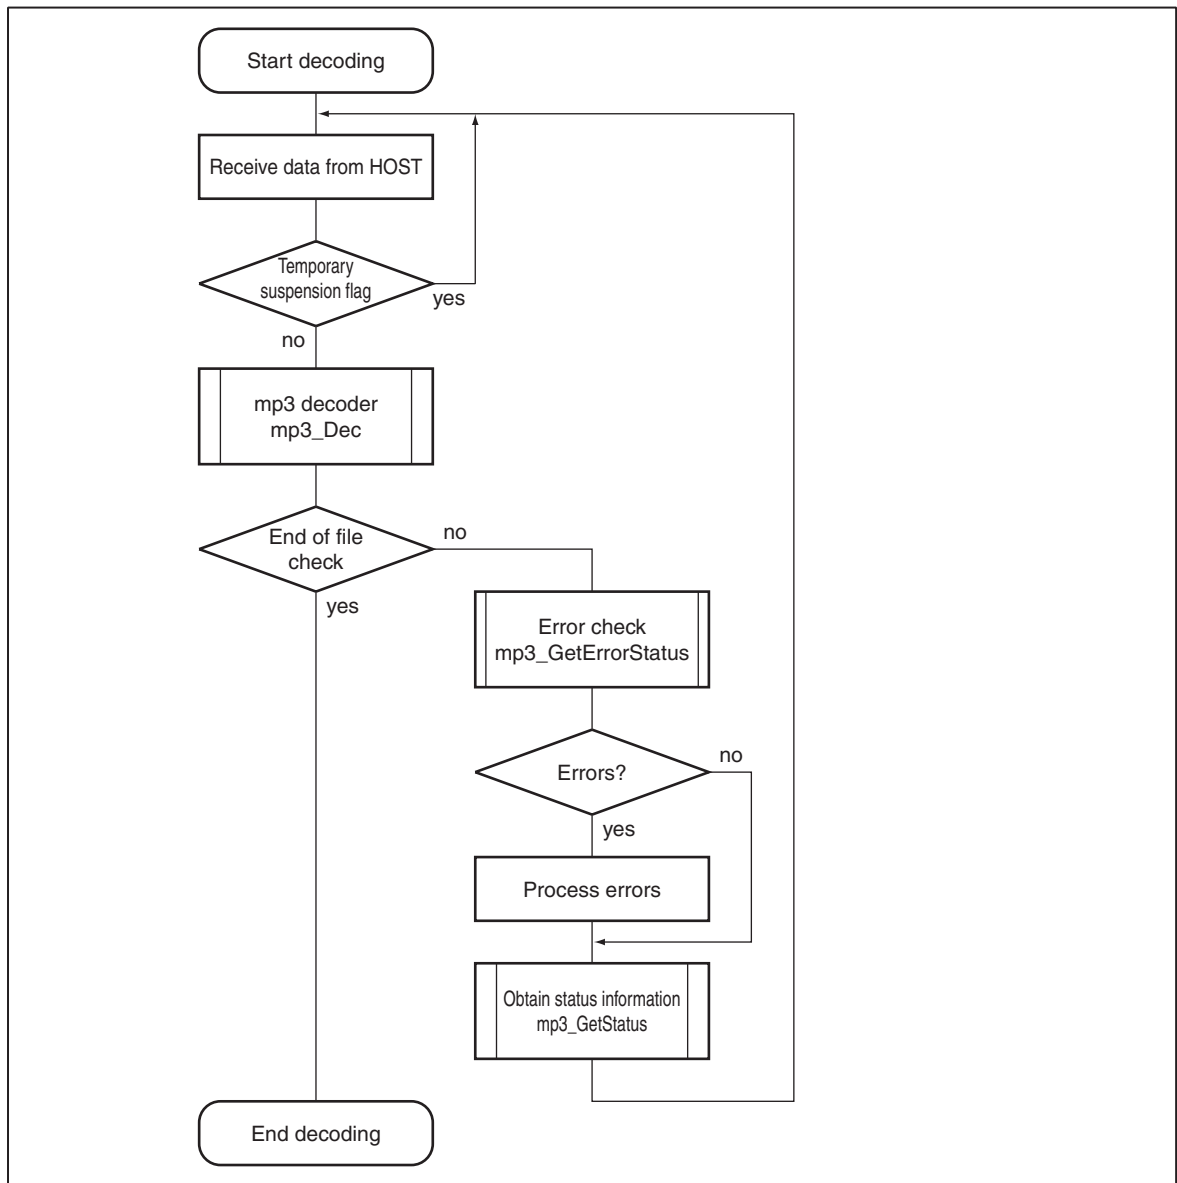

Figure 3-2. Sample Program Processing Flow (2)

## CHAPTER 4 SYSTEM EXAMPLE

### 4.1 Simulation Environment Using Timing Files

An example in which an audio decoding decompression-processing simulator and timing files are used is shown below. Encoded data is input, and then output frame by frame after each frame has undergone compression/decompression processing.

#### [Software environment]

- High-speed simulator: HSM77016 Ver. 2.32 or later
- Sample program: sample.Ink (created in 3.2 Sample Program Creation Procedure)
- Timing file: sample.tmg

### 4.2 Operation

<1> Start up the HSM77016 (High-speed simulator)

<2> Open sample.Ink created in 3.2 Sample Program Creation Procedure.

Example Specify sample.Ink with Open command on the File menu.

<3> Open the timing files (sample.tmg, serclk.tmg, serot16.tmg).

serclk.tmg and serot16.tmg are files provided by HSM77016 (high-speed simulator) in Example.

Example Specify sample.tmg with Open command on the File menu.

<4> Make the wait settings.

Example Set waits to the DWTR/IWTR registers in the setting windows opened by selecting Periphery Register on the Window menu.

<5> Execute with Run.

(a) Timing file sample.tmg

HSM77016 (high-speed simulator) provides a function for simulating external I/O using a timing file.

(b) Data file input (16-bit data)

Data is input from a file via the host interface. An example of the description format is shown below.

- Preparation

```

local data                ; Compressed data storage variable
local size                ; MP3 file size (bytes)

set DEBUG_ID = 1          ; select target
open input "mp3data.dat"  ; File name of MP3 file converted to text data
set size = 888058         ; MP3 file size (size of binary file in bytes)

```

- Input processing (16-bit data)

(1/2)

```

        set pin hcs = 1          ; terminate any write access, which might
        set pin hwr = 1          ; be active
        set pin hrd = 1          ;
; send MP3 file size
        wait cond pin hwe == 0    ; wait till write is allowed
        wait cond pin hcs == 1    ; and no read is in progress
        set pin hcs = 0          ; perform the access...
        set port ha = 0          ; select higher byte of HDT
        set pin hwr = 0          ; start input
        set port hd = (size>>16)&0xFF ; input low byte to host port
        wait 100ns                ; access duration
        set pin hwr = 1          ; end output
        set pin hcs = 1          ; terminate first access...
        wait 5ns                  ; delay
        set port ha = 1          ; select higher byte of HDT
        wait 5ns                  ; delay
        set pin hcs = 0          ; performe second access...
        set pin hwr = 0          ; start output
        set port hd = (size>>24)&0xFF ; input high byte to host port
        wait 100ns                ; access duration
        set pin hwr = 1          ; end input
        set pin hcs = 1          ; end access

        wait 1                    ;

        wait cond pin hwe == 0    ; wait till write is allowed
        wait cond pin hcs == 1    ; and no read is in progress
        set pin hcs = 0          ; perform the access...
        set port ha = 0          ; select higher byte of HDT
        set pin hwr = 0          ; start input
        set port hd = (size>>0)&0xFF ; input low byte to host port
        wait 100ns                ; access duration
        set pin hcs = 1          ; terminate first access...
        set pin hwr = 1          ; end output
        wait 5ns                  ; delay
        set port ha = 1          ; select higher byte of HDT
        wait 5ns                  ; delay
        set pin hcs = 0          ; performe second access...
        set pin hwr = 0          ; start output
        set port hd = (size>>8)&0xFF ; input high byte to host port
        wait 100ns                ; access duration
        set pin hwr = 1          ; end input
        set pin hcs = 1          ; end access

do
    exit size<=0 ;
    wait cond pin hwe == 0        ; wait till write is allowed
    wait cond pin hcs == 1        ; and no read is in progress
    set pin hcs = 0              ; perform the access...
    set port ha = 0              ; select higher byte of HDT
    set pin hwr = 0              ; start input
    input data                    ; input host data to temp variable

```

```

    set port hd = data&0xFF          ; input low byte to host port
    wait 100ns                       ; access duration
    set pin hcs = 1                   ; terminate first access...
    set pin hwr = 1                   ; end output
    wait 5ns                          ; delay
    set port ha = 1                   ; select higher byte of HDT
    wait 5ns                          ; delay
    set pin hwr = 0                   ; start output
    set pin hcs = 0                   ; performe second access...
    set port hd = (data>>8)&0xFF      ; input high byte to host port
    wait 100ns                       ; access duration
    set pin hwr = 1                   ; end input
    set pin hcs = 1                   ; end access
    set size = size-2                 ;
enddo

close input

wait cond (reg ip & 0xffff)==(mp3_mon_input_bs_finish & 0xffff)

```

mp3\_mon\_input\_bs\_finish is a label name that is defined at the beginning of the sample program source.

- **Termination**

```

Break                               ; Terminate
end

```
