  - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware[1].

Note

1. The software SSL Pin is required when using the SPI (r_sci_spi) driver.
2. When using software SSL, the pin must be configured as "Output mode (Initial High)" in the pin configuration editor in addition to being configured in the "stacks" tab.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_SetEvent
- R_BLE_GAP_Init
- R_BLE_GAP_StopAdv
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_SetAdvParam
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_SetDbInst
- R_BLE_GATTS_Init
- R_BLE_GATTS_GetAttr

- R_BLE_GATTS_SetAttr
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTC_Init
- R_BLE_GATTC_RegisterCb
- R_BLE_VS_SetBdAddr
- R_BLE_VS_SetTxPower

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the e² studio Configurator is 4.57 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
```

```
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
     {
           g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_ON:
     {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
           g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
           g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_OFF:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
      }
 case BLE_GAP_EVENT_CONN_IND:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
      }
     {
 /* Do nothing. */
 break;
        }
 default:
 break;
    }
}
```

```

BLE_ABS_SPP Firmware Update Example

This is a basic example of performing a firmware update.

```
void ble_abs_firmware_update_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
    err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
    assert(FSP_SUCCESS == err);
 /* Complete the firmware update (This function blocks until the procedure has
completed). */
    ble_status_t status = R_BLE_VS_UpdateModuleFirmware(g_firmware_image,
g_firmware_image_size);
    assert(BLE_SUCCESS == status);
```

```
 /* Close the module. */
    err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
    assert(FSP_SUCCESS == err);
 /* The RYZ012 is now using the updated firmware. Call open to re-initialize the
module using the new firmware. */
}
```

BLE_ABS_SPP Firmware Update Asynchronous Example

This is an example of performing a firmware update using the asynchronous API.

```
volatile uint32_t g_firmware_update_complete = 0;
void vs_cb (uint16_t type, ble_status_t result, st_ble_vs_evt_data_t * p_data)
{
 FSP_PARAMETER_NOT_USED(p_data);
 if (BLE_SUCCESS != result)
    {
 /* Stop the firmware update process if there was an error. */
 return;
    }
 static uint16_t index = 0;
 switch (type)
    {
 /* The response to the START_FW_UPDATE command was received (Fall through to send
the next data frame). */
 case BLE_VS_EVENT_START_FW_UPDATE_COMP:
 /* The response to the SEND_FW_DATA command was received. */
 case BLE_VS_EVENT_SEND_FW_DATA_COMP:
     {
 if (BLE_VS_EVENT_START_FW_UPDATE_COMP == index)
     {
                index = 0;
        }
           uint16_t length          = 0;
           uint8_t * p_firmware_data = NULL;
```

```
 /*
  * Get next firmware data frame.
  * Note that app_data_frame_get() is an application defined function.
  */
            app_data_frame_get(index, &p_firmware_data, &length);
 if (length > 0)
      {
 /* Send the firmware data frame. */

Detailed Description

Middleware to implement a generic communications interface over LWIP. This module implements the Communications Middleware Interface.

Overview

The RM_COMMS_SOCKET module implements COMMS API for LWIP interface.

Features

The implementation of the LWIP communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS
- Socket connection detection mode

Configuration

Build Time Configurations for rm_comms_socket

The following build time configurations are defined in fsp_cfg/rm_comms_socket_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > Socket Communication Device (rm_comms_socket)

This module can be added to the Stacks tab via New Stack > Networking > Socket Communication Device (rm_comms_socket).

Configuration	Options	Default	Description
RTOS			
Recursive Write Mutex	• Do Not Use • Use	Use	Lock device for writing in using RTOS.
Recursive Read Mutex	• Do Not Use • Use	Use	Lock device for reading in using RTOS.
Mutex Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for recursive mutex operation in using RTOS.
Write Semaphore	• Do Not Use • Use	Use	Block writing in using RTOS.
Read Semaphore	• Do Not Use • Use	Use	Block reading in using RTOS.
Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Name	Name must be a valid C symbol	g_comms_socket0	Module name.
Socket type	TCP	TCP	
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided.
Server Port	Value must be a non-negative integer	9010	TCP port ranges from 1 to 63556

Usage Notes

Limitations

- If DHCP is enabled, user have to find board's IP address via DHCP server, mDNS, etc.
- UDP socket is not supported.
- RM_COMMS_SOCKET_WriteRead API is not implemented.

Examples

Basic Example

This is a basic example of minimal use of LWIP communications implementation in an application.

```
void rm_comms_socket_example () {
 /* This step: Initialize pin setting (of MCU device) */
 /* TODO code */
    rm_comms_socket_extended_cfg_t * p_extend = (rm_comms_socket_extended_cfg_t *)
g_comms_socket_port_cfg.p_extend;
 struct netif comms_socket_netif;
 /* Following code are lwIP setup process. */
    lwip_init();
 /* Initialize netif before open rm_comms_socket. */
    netif_add(&comms_socket_netif,
              RM_COMMS_SOCKET_EXAMPLE_IP_ADDR,
              RM_COMMS_SOCKET_EXAMPLE_NETMASK,
              RM_COMMS_SOCKET_EXAMPLE_GW,
              p_extend->p_lwip_ether,
 rm_lwip_ether_init,
              netif_input);
    netif_set_default(&comms_socket_netif);
    netif_set_up(&comms_socket_netif);
    netif_set_link_up(&comms_socket_netif);
 /* Init the rm_comms_socket */
 RM_COMMS_SOCKET_Open(&g_comms_socket_port_ctrl, &g_comms_socket_port_cfg);
 /* Waiting few milliseconds for socket ready to be used */
 R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MILLISECONDS);
 /* Set callback function */
 RM_COMMS_SOCKET_CallbackSet(&g_comms_socket_port_ctrl, tcp_callback,
g_comms_socket_port_cfg.p_context);
```

```
 /* This step: Client start to creating the socket and send connect command to Server
(MCU device) */
 /* TODO code */
 /* Waiting for connection to be established. */
    LWIP_TEST_WAIT_TIMEOUT(true == connected, LWIP_TEST_MAXIMUM_WAITING_TIME);
 /* Tries 3 times loop to receive/send data from/to client */
 for (uint16_t tries = 1; tries < 3; tries++)
    {
 /* This step: Server (MCU device) starts to receive data */
 RM_COMMS_SOCKET_Read(&g_comms_socket_port_ctrl, rx_tcp_data, BUFFER_SIZE);
 /* This step: Client starts to send the data to Server (MCU device) */
 /* TODO code */
 /* Wait for receiving data, RX complete flag will be indicated in callback function
*/

           tx_complete = true;
break;
     }
case RM_COMMS_EVENT_OPERATION_COMPLETE:
     {
           connected = true;
break;
     }
   }
}
```

Data Structures

struct	rm_comms_socket_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_socket_instance_ctrl_t

struct rm_comms_socket_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.
rm_comms_cfg_t const *	p_cfg

	Middleware configuration.
rm_comms_socket_extended_cfg_t *	p_extend
	Pointer to device specific settings (lower level configuration structure)
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a socket_event_t occurs.
void *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_SOCKET_Open()

fsp_err_t RM_COMMS_SOCKET_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the SOCKET Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	SOCKET Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ABORTED	Module is not successfully open.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_UNSUPPORTED	Socket type is not supported.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_Close()

fsp_err_t RM_COMMS_SOCKET_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SOCKET Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Socket type is not supported.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_CallbackSet()

fsp_err_t RM_COMMS_SOCKET_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context*)

Updates the SOCKET Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_SOCKET_Read()

fsp_err_t RM_COMMS_SOCKET_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the SOCKET bus. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_ENABLED	Operation is disabled when there is no TCP connection.
FSP_ERR_NOT_OPEN	Module is not open.

Note

Do not call this API in Interrupt function when enabling mutex or semaphore

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_Write()

fsp_err_t RM_COMMS_SOCKET_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the SOCKET bus. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_WRITE_FAILED	No bytes were transferred.
FSP_ERR_NOT_ENABLED	Operation is disabled when there is no active TCP connection.
FSP_ERR_NOT_OPEN	Module is not open.

Note

Do not call this API in Interrupt function when enabling mutex or semaphore

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_WriteRead()

fsp_err_t RM_COMMS_SOCKET_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs simultaneous read and write. Implements rm_comms_api_t::writeRead..

Return values

FSP_SUCCESS	Transfer was started successfully.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Read bytes and write bytes are not the same.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

fsp_err_t	RM_WIFI_DA16XXX_GenericAtSendRcv (char const *const at_string, char *const response_buffer, uint32_t length)

Detailed Description

Wifi and Socket implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module currently supplies an implementation for using the DA16XXX module in two different configurations.

The first is for the FreeRTOS WiFi interface, where the network stack is located on the MCU using a socket interface, and the DA16XXX Wi-Fi module provides a connection to the internet. This configuration requires FreeRTOS to be used.

The second configuration is for use with the DA16XXX on-chip MQTT and HTTP client modules, where the network stack is located on the DA16XXX module. In this configuration, this Middleware driver supports FreeRTOS as well as Baremetal (Microsoft Azure support expected in future release).

DA16XXX is a low power Wi-Fi networking SoC that delivers a dramatic breakthrough in battery life even for devices that are continuously connected to the Wi-Fi network. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the DA16XXX Web Site

The DA16XXX module supports the following modules:

- DA16200
- DA16600 (currently Wi-Fi features only)

Features

The WiFi Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports TCP client sockets.
- Drive supports 1 UART for interfacing with the DA16XXX module.

Configuration

Build Time Configurations for rm_wifi_da16xxx

The following build time configurations are defined in fsp_cfg/rm_wifi_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Enable DA16600 Support	• Enabled • Disabled	Disabled	Enabled if using the DA16600 module
Check Minimum SDK Version	• Disabled • Enabled	Enabled	Enable or disable comparing the current DA16XXX module's SDK version to the minimum required

Number of supported socket instances (not used with on-chip APIs)	1	1	Enable number of socket instances
Size of RX buffer for socket (not used with on-chip APIs)	Manual Entry	8192	
Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi DA16XXX Framework Driver (rm_wifi_da16xxx)

Configuration	Options	Default	Description
Country code in ISO 3166-1 alpha-2 standard	Manual Entry	US	
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
SNTP Timezone UTC Offset in Hours	Refer to the RA Configuration tool for available options.	0	Value in hours from 12 to -12

Note: It is suggested that when using the DA16XXX module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

- When the DA16XXX Wi-Fi configures the UART baud rate on the DA16XXX module based on the user settings in the UART driver configuration properties, the UART Baud rate settings will be stored in the NVM memory of the DA16XXX. After reboot, the DA16XXX comes up with the previously updated UART baud rate settings.
- When using the DA16600 Pmod module, make sure that the SDK has been updated to the latest version that supports AT commands. The default SDK that comes from the factory doesn't support the AT command interface, which will cause the WIFI_On() API to fail. This is not required for the DA16200 Pmod module.

Limitations

- WiFi AP connections do not currently support WEP security.
- The default UART baud rate supported by v3.2.1 Wi-Fi SDK is 115200 and v3.2.4 Wi-Fi SDK is 230400. User needs to explicitly configure the default UART baud settings in the UART driver configurator properties based on the version of Wi-Fi SDK used in their testing.
- This driver is configured to support the following baud rates only: 115200, 230400, 460800, and 921600. These values are defined by the uart_baud_rates[] array and UART_BAUD_MAX_CNT found in the transport layer files.
- In v3.2.1 Wi-Fi SDK, the daylight savings time setting is disabled by default. The user needs to mandatorily set the following parameters such as minutes = 0, daylight savings to disable when calling RM_WIFI_DA16XXX_SntpTimeZoneSet() API.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the da16xxx module firmware. The rm_wifi_da16xxx_connect() function will return an error if a comma is detected.
- Wi-Fi AP Scanning is currently limited to max of 10 Access Points.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = "password",
       .ucSSID                     = "access_point_ssid",
```

```
      .xPassword.xWPA.ucLength = 8,
      .ucSSIDLength            = 17,
      .xSecurity               = eWiFiSecurityWPA2,
   };
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
   memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
   wifi_err = WIFI_GetIPInfo(&ipInfo);
   assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
   uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
   wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
   assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE (64)
/*
```

```
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                    = "access_point_ssid",
       .ucSSIDLength              = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                 = 0,
       .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
 WIFI_Disconnect();
```

```
 /* Change the IP address of the server */
 RM_WIFI_DA16XXX_SntpServerIpAddressSet((uint8_t *) ip_address_sntp_server_valid);
 /* Change the timezone to PST with daylight saving enabled */
 RM_WIFI_DA16XXX_SntpTimeZoneSet(-8, 0, WIFI_DA16XXX_SNTP_DAYLIGHT_SAVINGS_DISABLE);
 /* Connect back to the access point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the Access Point and shutdown the WIFI module*/
 WIFI_Disconnect();
 WIFI_Off();
}
```

Data Structures

Data Structure Documentation

◆ wifi_da16xxx_cfg_t

struct wifi_da16xxx_cfg_t		
User configuration structure, used in open function		
Data Fields		
at_transport_da16xxx_instance_t	p_transport_instance	

const *		
const uint32_t	num_sockets	Number of sockets to initialize.
const uint8_t *	country_code	Country code defined in ISO3166-1 alpha-2 standard.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_utc_offset_in_hours	Timezone offset in secs (-43200 - 43200)
void *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ da16xxx_socket_t

struct da16xxx_socket_t		
DA16XXX Wifi internal socket instance structure		
Data Fields		
uint8_t	remote_ipaddr[4]	Remote IP address.
int	remote_port	Remote Port.
int	socket_recv_data_len	Data length of incoming socket data.
int	socket_type	Socket type (TCP Server | TCP Client | UDP)
uint32_t	socket_status	Current socket status.
uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.
da16xxx_recv_state	socket_recv_state	Incoming Socket data header information.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_DA16XXX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.

◆ wifi_da16xxx_instance_ctrl_t

struct wifi_da16xxx_instance_ctrl_t

WIFI_DA16XXX private control block. DO NOT MODIFY.

Data Fields		
wifi_da16xxx_cfg_t const *	p_wifi_da16xxx_cfg	Pointer to initial configurations.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_socket	Current Socket index for AT commands.
uint32_t	open	Flag to indicate if wifi instance has been initialized.
uint8_t	is_sntp_enabled	Flag to indicate Enable/Disable of SNTP Client.
uint8_t	cmd_tx_buff[WIFI_DA16XXX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_DA16XXX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.
uint8_t	curr_gateway[4]	Current GAteway of module.
da16xxx_socket_t	sockets[WIFI_DA16XXX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ wifi_da16xxx_sntp_enable_t

enum wifi_da16xxx_sntp_enable_t

DA16XXX WiFi module enable/disable for SNTP

◆ da16xxx_socket_status_t

enum da16xxx_socket_status_t

DA16XXX Wifi socket status types

◆ da16xxx_socket_rw

enum da16xxx_socket_rw

DA16XXX socket shutdown channels

◆ da16xxx_recv_state

enum da16xxx_recv_state
DA16XXX socket receive state

◆ wifi_da16xxx_sntp_daylight_savings_enable_t

enum wifi_da16xxx_sntp_daylight_savings_enable_t
DA16XXX WiFi module enable/disable for SNTP Daylight

Function Documentation

◆ RM_WIFI_DA16XXX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_DA16XXX_SntpServerIpAddressSet (uint8_t * *p_server_ip_addr*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_server_ip_addr	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_ASSERTION	The parameter p_server_ip_addr is NULL.

Update the SNTP Server IP Address

◆ RM_WIFI_DA16XXX_SntpEnableSet()

fsp_err_t RM_WIFI_DA16XXX_SntpEnableSet (wifi_da16xxx_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Flag to indicate enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_DA16XXX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_DA16XXX_SntpTimeZoneSet (int *utc_offset_in_hours*, uint32_t *minutes*, wifi_da16xxx_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	utc_offset_in_hours	Timezone in UTC offset in hours
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

◆ RM_WIFI_DA16XXX_LocalTimeGet()

fsp_err_t RM_WIFI_DA16XXX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: YYYY-MM-DD,HOUR:MIN:SECS

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_DA16XXX_GenericAtSendRcv()

fsp_err_t RM_WIFI_DA16XXX_GenericAtSendRcv (char const *const *at_string*, char *const *response_buffer*, uint32_t *length*)

Sends any AT command compatible with the DA16XXX module. Provide optional buffer to receive the response.

Parameters

[in]	at_string	Input AT command string from the user.
[in]	response_buffer	Optional buffer for receiving the response.
[in]	length	Size of optional buffer.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input was not a valid AT command.

Send a generic AT command to the DA16XXX and optionally receive a response

	minutes, wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable)

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the FreeRTOS WiFi interface and AzureRTOS NetxDuo WiFi interface using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: Wifi API.

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the Silex Web Site

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Number of supported socket instances	Refer to the RA Configuration tool for available options.	1	Enable number of socket instances
Size of RX buffer for socket	Manual Entry	4096	

Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi Onchip Silex Driver using UART (rm_wifi_onchip_silex)

Configuration	Options	Default	Description
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
SNTP Timezone Offset from UTC Hours	Must be between 12 and -12 hours	0	Value in hours from 12 to -12
SNTP Timezone Offset from UTC Minutes	Must be between 0 and 59 minutes	0	Value in minutes from 0 to 59
Use Daylight Savings Time	• Enabled • Disabled	Disabled	Specify if daytime savings should be used for local time calulation

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The rm_wifi_onchip_silex_connect() function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call WIFI_Scan(), WIFI_Ping(), WIFI_GetMAC(), or WIFI_GetIPInfo(). Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
```

```
      .xPassword.xWPA.cPassphrase = "password",
      .ucSSID                     = "access_point_ssid",
      .xPassword.xWPA.ucLength = 8,
      .ucSSIDLength            = 17,
      .xSecurity               = eWiFiSecurityWPA2,
   };
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);

/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                    = "access_point_ssid",
       .ucSSIDLength              = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                 = 0,
       .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
```

```
 /* Get the local time string */
 RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */

Data Structure Documentation

◆ wifi_onchip_silex_cfg_t

struct wifi_onchip_silex_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uint32_t	num_sockets	Number of sockets to initialize.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.
const uart_instance_t *	uart_instances[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const wifi_onchip_silex_sntp_enable_t	sntp_enabled	Enable/Disable the SNTP Client.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_timezone_offset_from_utc_hours	Timezone offset from UTC in (+/-) hours.
const uint32_t	sntp_timezone_offset_from_utc_minutes	Timezone offset from UTC in minutes.
const wifi_onchip_silex_sntp_daylight_savings_enable_t	sntp_timezone_use_daylight_savings	Enable/Disable use of daylight saving time.
void *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ ulpgn_socket_t

struct ulpgn_socket_t		
Silex ULPGN Wifi internal socket instance structure		
Data Fields		
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.
uint32_t	socket_status	Current socket status.

uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.

◆ wifi_onchip_silex_instance_ctrl_t

struct wifi_onchip_silex_instance_ctrl_t		
WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if wifi instance has been initialized.
wifi_onchip_silex_cfg_t const *	p_wifi_onchip_silex_cfg	Pointer to initial configurations.
bsp_io_port_pin_t	reset_pin	Wifi module reset pin.
uint32_t	num_uarts	number of UARTS currently used for communication with module
uint32_t	tx_data_size	Size of the data to send.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_cmd_port	Current UART instance index for AT commands.
uint32_t	curr_data_port	Current UART instance index for data.
uint8_t	cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	at_cmd_mode	Current command mode.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.

uint8_t	curr_gateway[4]	Current GAteway of module.
SemaphoreHandle_t	tx_sem	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem	Receive binary semaphore handle.
uint8_t	last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH]	Tailing buffer used for command parser.
uart_instance_t *	uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART instance objects.
SemaphoreHandle_t	uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART transmission end binary semaphore.
ulpgn_socket_t	sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ sx_ulpgn_socket_status_t

enum sx_ulpgn_socket_status_t
Silex ULPGN Wifi socket status types

◆ sx_ulpgn_socket_rw

enum sx_ulpgn_socket_rw
Silex socket shutdown channels

◆ wifi_onchip_silex_sntp_enable_t

enum wifi_onchip_silex_sntp_enable_t
Silex WiFi module enable/disable for SNTP

◆ wifi_onchip_silex_sntp_daylight_savings_enable_t

enum wifi_onchip_silex_sntp_daylight_savings_enable_t
Silex WiFi module enable/disable for SNTP

Function Documentation

◆ rm_wifi_onchip_silex_open()

fsp_err_t rm_wifi_onchip_silex_open (wifi_onchip_silex_cfg_t const *const *p_cfg*)

Opens and configures the WIFI_ONCHIP_SILEX Middleware module.

Parameters

[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_OUT_OF_MEMORY	There is no more heap memory available.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ rm_wifi_onchip_silex_close()

fsp_err_t rm_wifi_onchip_silex_close ( )

Disables WIFI_ONCHIP_SILEX.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX closed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_wifi_onchip_silex_disconnect()

fsp_err_t rm_wifi_onchip_silex_disconnect ( )

Disconnects from connected AP.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX disconnected successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_wifi_onchip_silex_socket_connected()

fsp_err_t rm_wifi_onchip_silex_socket_connected (fsp_err_t * *p_status*)

Check if a specific socket instance is connected.

Parameters

[out]	p_status	Pointer to integer holding the socket connection status.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_status is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

◆ rm_wifi_onchip_silex_network_info_get()

fsp_err_t rm_wifi_onchip_silex_network_info_get (uint32_t * *p_ip_addr*, uint32_t * *p_subnet_mask*, uint32_t * *p_gateway*)

Return the network information for the connection to the access point.

Parameters

[out]	p_ip_addr	Pointer to integer holding the IP address.
[out]	p_subnet_mask	Pointer to integer holding the subnet mask.
[out]	p_gateway	Pointer to integer holding the gateway.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	A parameter pointer is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_AP_NOT_CONNECTED	No connection to access point has happened.

◆ rm_wifi_onchip_silex_connect()

fsp_err_t rm_wifi_onchip_silex_connect (const char * *p_ssid*, WIFISecurity_t *security*, const char * *p_passphrase*)

Connects to the specified Wifi Access Point.

Parameters

[in]	p_ssid	Pointer to SSID of Wifi Access Point.
[in]	security	Security type to use for connection.
[in]	p_passphrase	Pointer to the passphrase to use for connection.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ssid or p_passphrase is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	No commas are accepted in the SSID or Passphrase.

◆ rm_wifi_onchip_silex_mac_addr_get()

fsp_err_t rm_wifi_onchip_silex_mac_addr_get (uint8_t * *p_macaddr*)

Get MAC address.

Parameters

[out]	p_macaddr	Pointer array to hold mac address.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_macaddr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_scan()

fsp_err_t rm_wifi_onchip_silex_scan (WIFIScanResult_t * *p_results*, uint32_t *maxNetworks*)

Get the information about local Wifi Access Points.

Parameters

[out]	p_results	Pointer to a structure array holding scanned Access Points.
[in]	maxNetworks	Size of the structure array for holding APs.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_results or p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_ping()

fsp_err_t rm_wifi_onchip_silex_ping (uint8_t * *p_ip_addr*, uint32_t *count*, uint32_t *interval_ms*)

Ping an IP address on the network.

Parameters

[in]	p_ip_addr	Pointer to IP address array.
[in]	count	Number of pings to attempt.
[in]	interval_ms	Interval between ping attempts.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_ip_addr_get()

fsp_err_t rm_wifi_onchip_silex_ip_addr_get (uint32_t * *p_ip_addr*)

Get the assigned module IP address.

Parameters

[out]	p_ip_addr	Pointer an array to hold the IP address.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_avail_socket_get()

fsp_err_t rm_wifi_onchip_silex_avail_socket_get (uint32_t * *p_socket_id*)

Get the next available socket ID.

Parameters

[out]	p_socket_id	Pointer to an integer to hold the socket ID.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_socket_id is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_FAILED	Error occurred in the execution of this function

◆ rm_wifi_onchip_silex_socket_status_get()

fsp_err_t rm_wifi_onchip_silex_socket_status_get (uint32_t *socket_no*, uint32_t * *p_socket_status*)

Get the socket status.

Parameters

[in]	socket_no	Socket ID number.
[out]	p_socket_status	Pointer to an integer to hold the socket status

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl or p_socket_status is NULL. The value of socket_no is greater than/equal num_creatable_sockets.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_tcp_shutdown()

int32_t rm_wifi_onchip_silex_tcp_shutdown (uint32_t *socket_no*, uint32_t *shutdown_channels*)

Shutdown portion of a socket

Parameters

[in]	socket_no	Socket ID number.
[in]	shutdown_channels	Specify if read or write channel is shutdown for socket

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL. The value of socket_no is greater than/equal num_creatable_sockets.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_socket_create()

fsp_err_t rm_wifi_onchip_silex_socket_create (uint32_t *socket_no*, uint32_t *type*, uint32_t *ipversion*)

Create a new socket instance.

Parameters

[in]	socket_no	Socket ID number.
[in]	type	Socket type.
[in]	ipversion	Socket IP type.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_tcp_connect()

fsp_err_t rm_wifi_onchip_silex_tcp_connect (uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*)

Connect to a specific IP and Port using socket.

Parameters

[in]	socket_no	Socket ID number.
[in]	ipaddr	IP address for socket connection.
[in]	port	Port number for socket connection.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_udp_connect()

fsp_err_t rm_wifi_onchip_silex_udp_connect (uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*, uint32_t *type*)

Connect to a specific IP and Port using UDP socket.

Parameters

[in]	socket_no	Socket ID number.
[in]	ipaddr	IP address for socket connection. 0 if type is server.
[in]	port	Port number for socket connection.
[in]	type	Type of UDP connection. Can be client or server.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_send()

int32_t rm_wifi_onchip_silex_send (uint32_t *socket_no*, const uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Send data over TCP to a server.

Parameters

[in]	socket_no	Socket ID number.
[in]	p_data	Pointer to data to send.
[in]	length	Length of data to send.
[in]	timeout_ms	Timeout to wait for transmit end event

Return values

FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl or parameter p_data is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_recv()

int32_t rm_wifi_onchip_silex_recv (uint32_t *socket_no*, uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Receive data over TCP from a server.

Parameters

[in]	socket_no	Socket ID number.
[out]	p_data	Pointer to data received from socket.
[in]	length	Length of data array used for receive.
[in]	timeout_ms	Timeout to wait for data to be received from socket.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	The p_instance_ctrl or parameter p_data is NULL.

◆ rm_wifi_onchip_silex_socket_disconnect()

fsp_err_t rm_wifi_onchip_silex_socket_disconnect (uint32_t *socket_no*)

Disconnect a specific socket connection.

Parameters

[in]	socket_no	Socket ID to disconnect

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	Bad parameter value was passed into function.

◆ rm_wifi_onchip_silex_dns_query()

fsp_err_t rm_wifi_onchip_silex_dns_query (const char * *p_textstring*, uint8_t * *p_ip_addr*)

Initiate a DNS lookup for a given URL.

Parameters

[in]	p_textstring	Pointer to array holding URL to query from DNS.
[out]	p_ip_addr	Pointer to IP address returned from look up.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl, p_textstring, p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	The URL passed in is to long.

◆ RM_WIFI_ONCHIP_SILEX_EpochTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * *p_utc_time*)

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

[out]	p_utc_time	Returns the epoch time in seconds.

Return values

FSP_SUCCESS	Successfully retrieved the system time from module.
FSP_ERR_ASSERTION	The parameter utc_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ RM_WIFI_ONCHIP_SILEX_LocalTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_ONCHIP_SILEX_SntpEnableSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet (wifi_onchip_silex_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Can be set to enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * *p_ip_address*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_ip_address	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_ASSERTION	The parameter p_ip_address or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Update the SNTP Server IP Address

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet (int32_t *hours*, uint32_t *minutes*, wifi_onchip_silex_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	hours	Number of hours (+/-) used for timezone offset from GMT.
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

5.2.12.34 lwIP Baremetal Porting Layer (rm_lwip_sys_baremetal)

Modules » Networking

Overview

This module provides system timer feature for baremetal.

Please refer to the lwIP documentation for further details.

Features

This porting layer includes the following features.

- Timer
- Critical sections
- Compiler/Platform abstraction.

5.2.12.35 lwIP Ethernet Driver (rm_lwip_ether)

Modules » Networking

Functions

err_t	rm_lwip_ether_init (struct netif *p_netif)
void	rm_lwip_ether_callback (ether_callback_args_t *p_args)

Detailed Description

Overview

This module provides a lwIP driver that is implemented using the Ethernet Interface.

Please refer to the lwIP documentation for further details.

Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- UDP (User Datagram Protocol) including experimental UDP-lite extensions
- TCP (Transmission Control Protocol) with congestion control, RTT estimation fast recovery/fast retransmit and sending SACKs
- raw/native API for enhanced performance
- Link status callback

Configuration

Configurations for Networking > lwIP Wrapper to r_ether (rm_lwip_ether)

Configuration	Options	Default	Description
RTOS			
RX thread stacksize	Must be a positive integer	1024	Stack size of RX thread.
RX thread priority	Must be a positive integer	4	Priority of RX thread.
Name	Name must be a valid C symbol	g_lwip_ether0	Module name.
MTU	Must be an integer from 576 to 1500	1500	MTU size.
Netif flags	• UP • BROADCAST	• BROADCAST • ETHARP	Flags representing the capabilities of the

	• LINK_UP • ETHARP • ETHERNET • IGMP • MLD6		Ethernet device
Zero-copy mode	• Disable • Enable	Disable	Enable or disable zero-copy mode.
RX buffer pool size	Must be a positive integer	10	Buffer pool size for zero-copy RX.
Link check interval	Must be a positive integer	100	Interval for checking link status.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the lwIP Ether Driver in an application.

```
#include "lwip/tcp.h"
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/ip4.h"
#define LWIP_EXAMPLE_PORT_NUMBER 9000
/* TCP callback functions. */

Function Documentation

◆ rm_lwip_ether_init()

err_t rm_lwip_ether_init (struct netif * *p_netif*)
Initialize ethernet hardware and lwIP network interface. This function is passed to netif_add()

◆ rm_lwip_ether_callback()

void rm_lwip_ether_callback (ether_callback_args_t * *p_args*)
Callback of Ethernet interrupt subroutine. This function is set to ethernet driver callback by configurator.

5.2.12.36 lwIP FreeRTOS Porting Layer (rm_lwip_sys_freertos)

Modules » Networking

Overview

This module provides a lwIP porting layer for FreeRTOS.

Please refer to the lwIP documentation for further details.

Features

This porting layer includes the following features.

- Compiler/Platform abstraction.

All other features of FreeRTOS porting layer are provided by the lwIP library.

5.2.12.37 lwIP HTTP Server

Modules » Networking

This module provides the lwIP HTTP Server integration documentation.

Overview

The LwIP HTTP Server library can be used to respond HTTP request. The documentation for the library can be found at the following link: lwIPServer.

Features

The LwIP HTTP Server:

- Can respond from HTTP GET and POST requests.
- Supports Server-Side Includes (SSI) and Common Gateway Interface (CGI).
- Can set up TLS connection handling (HTTPS).

Configuration

Build Time Configurations for Source

The following build time configurations are defined in lwip/lwip/apps/httpd_opts.h:

Configuration	Options	Default	Description
LwIP HTTPD CGI (old style)	• Enabled • Disabled	Disabled	Enable CGI support (old style). Use this CGI type e.g. to execute specific actions and return a page that does not depend on the CGI parameters.
LwIP HTTPD CGI SSI (new style)	• Enabled • Disabled	Disabled	Enable CGI support with SSI feature (new style). Use this CGI handler if you want CGI information passed on to SSI.

LwIP HTTPD SSI	• Enabled • Disabled	Disabled	Enable SSI support (Server-Side-Includes).
LwIP HTTPD SSI Raw	• Enabled • Disabled	Disabled	Enable to implement an SSI tag handler callback that gets a const char* to the tag (instead of an index into a pre-registered array of known tags).
LwIP HTTPD SSI By File Extension	• Overridden • Enabled • Disabled	Enabled	enable/disable or override the file SSI tag scan function. You need to provide an external function to perform the check: u8_t http_uri_is_ssi(struct fs_file *file, const char *uri)
LwIP HTTPD SSI Extension	Manual Entry	".shtml", ".shtm", ".ssi", ".xml", ".json"	List of file extensions handled as SSI files. Only used if LWIP_HTTPD_SSI_BY_FILE_EXTENSION != 0.
LwIP HTTPD Support POST	• Enabled • Disabled	Disabled	Set this to 1 to support HTTP POST.
LwIP HTTPD Maximum CGI Parameters	Must be a non zero positive interger.	16	The maximum number of parameters that the CGI handler can be sent.
LwIP HTTPD SSI Multipart	• Enabled • Disabled	Disabled	SSI handler function is called with 2 more arguments to handle string too long to be inserted at once
LwIP HTTPD Maximum Tag Name Length	Must be a non zero positive interger.	8	The maximum length of the string comprising the SSI tag name. The longer tags are ignored.
LwIP HTTPD Maximum Tag Insert Length	Must be a non zero positive interger.	192	The maximum length of string that can be returned to replace any given tag.
LwIP HTTPD POST Manual WND	• Enabled • Disabled	Disabled	Enable configurating POST window response for HTTP server
HTTPD Server Agent	Manual Entry	lwIP/" LWIP_VERSION_STRING	This string is passed in the HTTP header as

		" (http://savannah.nongnu.org/projects/lwip)	'Server: HTTPD_SERVER_AGENT'.
LwIP HTTPD Dynamic Headers	• Enabled • Disabled	Disabled	Set this to 1 if you want to include code that creates HTTP headers at runtime. Else use static header created by the makefsdata tool.
HTTPD Debug	• Disabled • Enabled	Disabled	Configure debug for HTTPD file send timing
HTTPD Use Mem Pool	• Enabled • Disabled	Disabled	Set this to 1 to allocate http_state instead of using heap.If enabled, define MEMP_NUM_PARALLEL_HTTPD_CONNS (and MEMP_NUM_PARALLEL_HTTPD_SSI_CONNS for SSI) to set the size of the pool(s).
HTTPD Server Port	Must be an interger in range 0-65535.	80	The http server port for HTTPD to use
HTTPD Server Port HTTPS	Must be an interger in range 0-65535.	443	The https server port for HTTPD to use
HTTPD Enable HTTPS	• Enabled • Disabled	Disabled	Enable https support.
HTTPD Maximum Retries	Must be a positive integer.	4	Maximum retries before the connection is aborted/closed.
HTTPD Poll Interval	Must be a non zero positive interger.	4	How long the Server will keep the connection. The poll delay is X*500ms.
HTTPD TCP Priority	Must be an interger in range 1-127.	1	Priority for tcp pcbs created by HTTPD 1 by default range from 1-127.
LwIP HTTPD Timing	• Enabled • Disabled	Disabled	Set this to 1 to enable timing each file sent.
HTTPD Debug Timing	• Disabled • Enabled	Disabled	Set this to 1 to enable timing each file sent.
LwIP HTTPD Support Extstatus	• Enabled • Disabled	Disabled	Set this to one to show error pages when parsing request fail. Else simply close the connection

LwIP HTTPD Support V09	• Enabled • Disabled	Enabled	Set this to 0 to drop support for HTTP/0.9 clients (to save some bytes).
LwIP HTTPD Support 11 Keepalive	• Enabled • Disabled	Disabled	Set this to 1 to enable HTTP/1.1 persistent connections.
LwIP HTTPD Support Requestlist	• Enabled • Disabled	Enabled	Set this to 1 to support HTTP request coming in in multiple packets/pbufs.
LwIP HTTPD Request Queuelen	Must be a non zero positive interger.	5	Number of rx pbufs to enqueue to parse an incoming request.
LwIP HTTPD Request Bufsize	Must be a non zero positive interger.	LWIP_HTTPD_MAX_REQ_LENGTH	Number of (TCP payload-) bytes (in pbufs) to enqueue to parse and incoming request.
LwIP HTTPD Maximum Request Length	Must be a non zero positive interger.	LWIP_MIN(1023, (LWIP_HTTPD_REQ_QUEUELEN * PBUF_POOL_BUFSIZE))	Defines the maximum length of a HTTP request line.
LwIP HTTPD Maximum Request URI Length	Must be a positive interger.	63	This is the size of a static buffer used when URIs end with '/'.
LwIP HTTPD POST Maximum Response URI Length	Must be a non zero positive interger.	63	Maximum length of the filename to send as response to a POST request.
LwIP HTTPD SSI Include Tag	• Enabled • Disabled	Enabled	Set this to 0 to not send the SSI tag.
LwIP HTTPD Abort On Close Memory Error	• Enabled • Disabled	Disabled	Set this to 1 to call tcp_abort when tcp_close fails with memory error.
LwIP HTTPD Kill Old On Connections Exceeded	• Enabled • Disabled	Disabled	Set this to 1 to kill the oldest connection.
LwIP HTTPD Omit Header For Extensionless URI	• Enabled • Disabled	Disabled	Set this to 1 to send URIs without extension without headers.
HTTPD Limit Sending To 2mss	• Enabled • Disabled	Enabled	By default, the httpd is limited to send 2*pcb->mss.
HTTPD Maximum Write Length	The name function must be a valid C symbol	altcp_mss	Define this to a function that returns the maximum amount

			of data to enqueue. The function have this signature: u16_t fn(struct altcp_pcb* pcb);.
LwIP HTTPD Custom Files	• Enabled • Disabled	Disabled	Set this to 1 and provide the functions: - int fs_open_custom(struct fs_file *file, const char *name) Called first for every opened file to allow opening files that are not included in fsdata(_custom).c - void fs_close_custom(struct fs_file *file) Called to free resources allocated by fs_open_custom().
LwIP HTTPD Dynamic File Read	• Enabled • Disabled	Disabled	Set this to 1 to support fs_read(). Else only one-block files are supported, and the contents must be ready after fs_open().
LwIP HTTPD File State	• Enabled • Disabled	Disabled	Set this to 1 to include an application stateargument per file that is opened.
LwIP HTTPD File Extension	• Enabled • Disabled	Disabled	Set this to 1 to add the pextension field to the fs_file structure.New code should use LWIP_ HTTPD_FILE_STATE instead.
HTTPD Precalculated Checksum	• Enabled • Disabled	Disabled	Support asynchronous read operations.
LwIP HTTPD FS Async Read	• Enabled • Disabled	Disabled	Set this to 1 to add the pextension field.
HTTPD Fsdata File	Manual Entry	fsdata_sample.c	Provide source name file of FS custom data. This data file will be included by fs.c file
HTTP Is Data Volatile	• Allow Copy and More • Allow Copy • Undefined	Allow Copy	Determines if HTTP data should be copied into the TCP buffer before transmission.

			Allow Copy: data will be copied into memory belonging to the stack. Allow Copy and More: Notify to TCP that data will be copied into memory belonging to the stack and additional data will follow in subsequent TCP transmissions.
LwIP HTTPD Use Default Template	• Enabled FSdata Generator • Disabled FSdata Generator	Enabled FSdata Generator	Set this to 1 to when intent to use the default template from the generator

Usage Notes

Limitations

- In normal mode, the user must select the "HTTP Is Data Volatile" option as Allow Copy mode (TCP_WRITE_FLAG_COPY) in the FSP Configurator properties to ensure tcp_write() functions correctly.
- When using the Server-Side Includes (SSI) mode or the Common Gateway Interface (CGI) mode, make sure that the "HTTP Is Data Volatile" option is set to Allow Copy and More mode (TCP_WRITE_FLAG_COPY | TCP_WRITE_FLAG_MORE) in the FSP Configurator properties to work properly.

How to use fsdata file

There are two ways to use fsdata file as follows:

1. Use the available fsdata_sample.c file

When the stack "LwIP HTTP Server" is added, by default it includes the stack "LwIP HTTP Server FS" which is the sample file provided in the LwIP HTTP Server library repository, and the fsdata_sample.c file is generated at the src/fsdata/ path.

2. Generate new fsdata.c file using makefsdata script

In case, creating a new fsdata.c file by makefsdata script, follow these detailed steps:

Note

Reffer to this link readme.txt for an introduction by the author about the makefsdata scripts.

- ***Setup Environment***
  1. *Make sure Perl is installed on your development environment to ensure the required script runs.*
- ***Convert Server Contents to C Source Code***
  1. *Create a new folder. (the created folder can be placed outside the project workspace).*
  2. *Copy the "makefsdata" folder from the LwIP HTTP Server library repository into the created folder.*
  3. *Inside the created folder, create a new subfolder named "fs" (the name "fs" is mandatory).*
  4. *Place the files to be converted into the "fs" folder.*
  5. *Open a terminal on Linux or Git Bash/Windows Command Prompt on Windows. (if Cygwin*

is installed) and navigate to the created folder.
6. *Type the command "perl makefsdata".*
7. *The new "fsdata.c" file will be generated in the created folder.*

- ***Configure the Generated File***
  1. *Remove the the stack "LwIP HTTP Server FS".*
  2. *Add an "include guard" to prevent multiple inclusions in the new file "fsdata.c".*
  3. *Include the headers "lwip/apps/fs.h" and "lwip/def.h" in the new file "fsdata.c".*
  4. *Copy only the new file "fsdata.c" into the project workspace.*
  5. *In the FSP Configurator properties, set the "HTTPD Fsdata File" option to the new file "fsdata.c".*

Examples

Basic Example

This is a basic example of minimal use of the LwIP HTTP Server APIs in an application.

```
#if HTTPD_ENABLE_HTTPS
 #include "lwip/altcp_tls.h"

5.2.12.38 lwIP MQTT

Modules » Networking

This module provides the lwIP MQTT integration documentation.

Overview

The lwIP MQTT library can connect to a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: lwIPMQTT.

Features

- MQTT connections to MQTT broker
- Support set up TLS connection handling with one-way server authentication or two-way server/client authentication
- The version of MQTT protocol supported in lwIP is 3.1.1. Details of the MQTT protocol can be found at: mqtt-v3.1.1

Examples

Basic Example

This is a basic example of minimal use of the lwIP MQTT APIs in an application.

```
#if LWIP_ALTCP && LWIP_ALTCP_TLS

fsp_err_t	R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
  - Deep Software Standby mode (On supported MCUs)
  - Deep Sleep (On supported MCUs)
  - Software Standby mode
  - Sleep mode
  - Snooze mode (On supported MCUs)
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.

- Supports disabling and enabling the MCU's other hardware peripherals

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Standby Limit	• Enabled • Disabled	Disabled	If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call.

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_lpm0	Module name.
Low Power Mode	MCU Specific Options		Power mode to be entered.
Output port state in standby and deep standby	MCU Specific Options		Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins.
Supply of SOSC clock to peripheral function in standby	MCU Specific Options		If enabled, SOSC clock is provided to peripheral functions in Software Standby and Snooze modes.
Startup speed of the HOCO in Standby and Snooze modes	MCU Specific Options		If enabled, the HOCO enters high-speed startup mode, shortening standby release time, and snooze transition time.

Flash mode in sleep or snooze	MCU Specific Options	Select flash mode in sleep mode or in snooze mode.

Deep Sleep and Standby Options

Deep Sleep and Standby Options > Snooze Options (Not available on every MCU)

Snooze Request Source	MCU Specific Options	Select the event that will enter snooze.
Snooze End Sources	MCU Specific Options	Enable wake from snooze from these sources.
DTC state in Snooze Mode	MCU Specific Options	Enable wake from snooze from this source.
Snooze Cancel Source	MCU Specific Options	Select an interrupt source to cancel snooze.
Wake Sources	MCU Specific Options	Enable wake from deep sleep and standby from these Sources.
Wake Sources 2	MCU Specific Options	Enable wake from deep sleep and standby from these Sources.

RAM Retention Control (Not available on every MCU)

RAM retention in Standby mode	MCU Specific Options	Select the memory regions that are retained in standby mode.
TCM retention in Deep Sleep and Standby modes	MCU Specific Options	Select if Tightly Coupled Memory (TCM) is retained in deep sleep and standby modes.
Standby RAM retention in Standby and Deep Standby modes	MCU Specific Options	Select if Standby RAM is retained in standby and deep standby modes.

Oscillator LDO Control (Not available on every MCU)

PLL1 LDO State in standby mode	MCU Specific Options	Select the state PLL1 LDO state in standby mode.
PLL2 LDO State in standby mode	MCU Specific Options	Select the state PLL2 LDO state in standby mode.
HOCO LDO State in	MCU Specific Options	Select the state HOCO

standby mode		LDO state in standby mode.
Deep Standby Options (Not available on every MCU)		
I/O Port Retention	MCU Specific Options	Select the state of the IO Pins after exiting deep standby mode.
Power-Supply Control	MCU Specific Options	Select the state of the internal power supply in deep standby mode.
Cancel Sources	MCU Specific Options	Enable wake from deep standby using these sources.
Cancel Edges	MCU Specific Options	Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge.
Soft Start Mode	MCU Specific Options	The soft start setting affects the inrush current, and wake-up time when waking from deep standby mode (See the MCU user manual for more information).

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

Deep Sleep Mode

Deep sleep mode is similar to sleep mode with the exception that DTC and DMAC are stopped, access to TCM memory is not available, and only a subset of interrupts are available for waking the CPU.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the R_LPM_IoKeepClear API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

- On RA8, there are delays inserted before and after switching to a lower power mode based on BSP configuration options and current CPUCLK speed. These delays do not disable interrupts for the entire delay as required by the RA8 Hardware Manual. Interrupts should be disabled by the application when possible before sleeping to meet the requirements, or the control of interrupts and the delay should be managed by the user to ensure the requirement is fully met.

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
 fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
 fsp_err_t err;
#ifdef R_SYSTEM_RSTSR0_DPSRSTF_Msk
 /* Check the Deep Software Standby Reset Flag. If it is set, then the MCU is exiting
  * Deep Software Standby mode. */
 if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
    {
 /* Clear the IOKEEP bit to allow I/O Port use.
  * Note that this function should be called before opening the LPM driver. */
       err = R_LPM_IoKeepClear(&g_lpm_ctrl);
     assert(FSP_SUCCESS == err);
    }
#endif
```

```
    err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Add user code here. */
 /* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
 /* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
  * Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	lpm_instance_ctrl_t

Data Structure Documentation

◆ lpm_instance_ctrl_t

struct lpm_instance_ctrl_t
LPM private control block. DO NOT MODIFY. Initialization occurs when R_LPM_Open() is called.

Function Documentation

◆ R_LPM_Open()

fsp_err_t R_LPM_Open (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Perform any necessary initialization

Return values

FSP_SUCCESS	LPM instance opened
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_ALREADY_OPEN	LPM instance is already open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerReconfigure()

fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

FSP_SUCCESS	Low power mode successfully applied
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerModeEnter()

fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const *p_api_ctrl*)

Enter low power mode (sleep/deep sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_INVALID_MODE	One of the following: • HOCO was not system clock when using snooze mode with SCI0/RXD0. • HOCO was not stable when using snooze mode with SCI0/RXD0. • MOCO was running when using snooze mode with SCI0/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCI0/RXD0. • PLL was running when using snooze mode with SCI0/RXD0. • Unable to disable ocillator stop detect when using standby or deep standby.

◆ R_LPM_IoKeepClear()

fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const *p_api_ctrl*)

Clear the IOKEEP bit after deep software standby

Return values

FSP_SUCCESS	DPSBYCR_b.IOKEEP bit cleared Successfully.
FSP_ERR_UNSUPPORTED	Deep standby mode not supported on this MCU.

◆ R_LPM_Close()

fsp_err_t R_LPM_Close (lpm_ctrl_t *const *p_api_ctrl*)
Close the LPM Instance **Return values** FSP_SUCCESS — LPM driver closed FSP_ERR_NOT_OPEN — LPM instance is not open FSP_ERR_ASSERTION — Null Pointer

5.2.14 RTOS

Modules

Detailed Description

RTOS Modules.

Modules

	Azure RTOS ThreadX Port (rm_threadx_port) ThreadX port for RA MCUs.
	FreeRTOS Port (rm_freertos_port) FreeRTOS port for RA MCUs.

5.2.14.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

Overview

Note

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at https://docs.microsoft.com/en-us/azure/rtos/threadx/ for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration

Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

Configuration	Options	Default	Description
General			
Custom tx_user.h	Manual Entry		Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Error Checking	• Enabled • Disabled	Enabled	The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined.
Max Priorities	Value must be a multiple of 32 and in range 32 to 1024 or empty	32	Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32.
Minimum Stack	Value must be greater than 0 or empty	200	Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error.
Stack Filling	• Enabled • Disabled	Enabled	Determine is stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each

			thread's stack. This is used by debuggers with ThreadX-awareness and by the ThreadX run-time stack checking feature.
Preemption Threshold	• Enabled • Disabled	Disabled	Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.
Notify Callbacks	• Enabled • Disabled	Disabled	Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.
Inline Thread Resume Suspend	• Enabled • Disabled	Disabled	Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.
Not Interruptable	• Enabled • Disabled	Disabled	Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.
IAR Library Support	• Enabled • Disabled	Disabled	Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option

			--threaded_lib. In the IAR IDE, this can be enabled in Project > Options > General Options > Library Configuration > Enable thread support in library.
BSD Support	• Enabled • Disabled	Disabled	Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD.
FileX Pointer	• Enabled • Disabled	Enabled	Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block.
Timer			
Timer Ticks Per Second	Value must be greater than 0 or empty	100	Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms.
Timer Thread Stack Size	Value must be greater than 0 or empty	1024	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer Thread Priority	Value must be a positive integer or empty	0	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer Process In ISR	• Enabled • Disabled	Enabled	Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system

			timer thread or directly in the timer ISR. When disabled, the timer thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.
Reactivate Inline	• Enabled • Disabled	Disabled	Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size.
Timer	• Enabled • Disabled	Enabled	Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.
Trace			
Event Trace	• Enabled • Disabled	Disabled	Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.
Trace Buffer Name	Name must be a valid C symbol	g_tx_trace_buffer	Name of trace buffer symbol, only used if Event Trace is enabled.
Memory section for Trace Buffer	Manual Entry	.bss	Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled.

			To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and open it with Azure RTOS TraceX.
Trace Buffer Size	Value must be greater than 0	65536	Trace buffer size in bytes, only used if Event Trace is enabled
Trace Buffer Number of Registries	Value must be greater than 0	30	Number of registries available to TraceX, only used if Event Trace is enabled
Performance			
Block Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers block pool performance information.
Byte Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers byte pool performance information.
Event Flags Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers event flags performance information.
Mutex Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers mutex performance information.
Queue Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers queue performance information.
Semaphore Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers semaphore performance information.
Thread Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers thread performance information.
Timer Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers timer performance information.

RA		
Hardware Thread Stack Monitoring	MCU Specific Options	Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.
Interrupts		
SysTick Interrupt Priority	MCU Specific Options	Select the Systick interrupt priority.
Maximum Interrupt Priority	MCU Specific Options	The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See Low Power Modes (r_lpm) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt

priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx_thread_secure_stack_allocate).

The secure context can be freed by deleting the thread or calling tx_thread_secure_stack_free.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
```

```
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_UNINIT_SECTION_PREFIX ".ram_noinit");
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
```

```
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the thread to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling tx_thread_secure_stack_allocate before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
 /* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
  * to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
  * This function can be called when the thread is created or in the thread before an
non-secure callable function is
  * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
```

```
    rm_threadx_port_nsc_function();
}
```

5.2.14.2 FreeRTOS Port (rm_freertos_port)

Modules » RTOS

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at https://www.freertos.org/Documentation for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Note

The FreeRTOS Port and libraries use printf by default when logging is enabled. printf requires a heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes)).

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

Configuration	Options	Default	Description
General			
Custom FreeRTOSConfig.h	Manual Entry		Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Use Preemption	• Enabled • Disabled	Enabled	Set to Enabled to use the preemptive RTOS scheduler, or Disabled

			to use the cooperative RTOS scheduler.
Use Port Optimised Task Selection	• Enabled • Disabled	Disabled	Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port. The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all FreeRTOS ports. Is completely written in C, making it less efficient than a port specific method. Does not impose a limit on the maximum number of available priorities. A port specific method: Is not available for all ports. Is used when Use Port Optimized Task Selection is Enabled. Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written. Is more efficient than the generic method. Typically imposes a limit of 32 on the maximum number of available priorities.
Use Tickless Idle	• Enabled • Disabled	Disabled	Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the

			tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.
Cpu Clock Hz	Manual Entry	SystemCoreClock	Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals.
Tick Rate Hz	Value must be greater than 0	1000	The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required. More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the

			'time slice' given to each task.
Max Priorities	Must be an integer and greater than 0	5	The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application.
Minimal Stack Size	Must be an integer and greater than 0	128	The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).
Max Task Name Len	Must be an integer and greater than 0	16	The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.
Use 16-bit Ticks	Disabled	Disabled	Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the

			RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as an unsigned 32bit type. Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.
Idle Should Yield	• Enabled • Disabled	Enabled	This parameter controls the behaviour of tasks at the idle priority. It only has an effect if: The preemptive scheduler is being used. The application creates tasks that run at the idle priority. If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be

allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case. When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

			This situation can be avoided by: If appropriate, using an idle hook in place of separate tasks at the idle priority. Creating all application tasks at a priority greater than the idle priority. Setting Idle Should Yield to Disabled. Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.
Use Task Notifications	• Enabled • Disabled	Enabled	Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build. Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build. Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.
Task Notification Array Entries	Must be an integer and greater than 0	1	Set the Task Notifications Array

			Entries to enter the size of array needed
Use Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.
Use Recursive Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.
Use Counting Semaphores	• Enabled • Disabled	Enabled	Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.
Queue Registry Size	Value must be positive integer greater than or equal to 0	10	The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI. It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry

			Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for vQueueAddToRegistry( ) and vQueueUnregisterQueue() for more information.
Use Queue Sets	• Enabled • Disabled	Disabled	Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality.
Use Time Slicing	• Enabled • Disabled	Disabled	If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.
Use Newlib Reentrant	• Enabled • Disabled	Disabled	If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for

			each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.
Enable Backward Compatibility	• Enabled • Disabled	Disabled	The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.
Num Thread Local Storage Pointers	Value must be positive integer greater than or equal to 0	5	Sets the number of indexes in each task's thread local storage array.
Stack Depth Type	Manual Entry	uint32_t	Sets the type used to

			specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type UBaseType_t, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify the type to use.
Message Buffer Length Type	Manual Entry	size_t	FreeRTOS Message buffers use variables of type Message Buffer Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller.
Library Max Syscall Interrupt Priority	MCU Specific Options		The highest interrupt priority that can be used by any interrupt service routine that

makes calls to interrupt safe FreeRTOS API functions. DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS! (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting configMAX_SYSCALL_INTERRUPT_PRIORITY above (that is, at a higher priority level) than configKERNEL_INTERRUPT_PRIORITY. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the

disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above configMAX_SYSCALL_INTERRUPT_PRIORITY and therefore never be delayed by the RTOS kernel execution.

A special note for Arm Cortex-M users: Please read the page dedicated to interrupt priority settings on Arm Cortex-M devices. As a minimum, remember that Arm Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above config MAX_SYSCALL_INTERRUPT_PRIORITY.

The lowest priority on a Arm Cortex-M core is in fact 255 - however different Arm Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest

			priority you can specify is 15 - and the highest priority you can specify is 0.
Assert	Manual Entry	assert(x)	The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT() defined. The example definition (shown at the top of the file and replicated below) calls vAssertCalled(), passing in the file name and line number of the triggering configASSERT() call (__FILE__ and __LINE__ are standard macros provided by most compilers). This is just for demonstration as vAssertCalled() is not a FreeRTOS function, configASSERT() can be defined to take whatever action the application writer deems appropriate. It is normal to define configASSERT() in such a way that it will prevent the application from executing any further. This if for two reasons; stopping the application at the point

of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining configASSERT() will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the configASSERT() definition in FreeRTOSConfig.h.

/* Define configASSERT() to call vAssertCalled() if the assertion fails. The assertion
has failed if the value of the parameter passed into configASSERT() equals zero. */
#define configASSERT((x)) if((x) == 0) vAssertCalled(__FILE__, __LINE__)
If running FreeRTOS under the control of a debugger, then configASSERT() can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed.

			/* Define configASSERT() to disable interrupts and sit in a loop. */ #define configASSERT((x)) if((x) == 0) { taskDISABLE_INTERRUPTS(); for(;;); }
Include Application Defined Privileged Functions	• Enabled • Disabled	Disabled	Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes. Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can

			be encapsulated in a privileged function using the following code:
			
			void MPU_debug_printf(const char *pcMessage)
			{
			/* State the privilege level of the processor when the function was called. */
			BaseType_t xRunningPrivileged = prvRaisePrivilege();
			
			/* Call the library function, which now has access to all RAM. */
			debug_printf(pcMessage);
			
			/* Reset the processor privilege level to its original value. */
			portRESET_PRIVILEGE(xRunningPrivileged);
			}
			This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Hooks			
Use Idle Hook	• Enabled • Disabled	Enabled	Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook.
Use Malloc Failed Hook	• Enabled • Disabled	Disabled	The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are

			implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed. If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Dosab;ed then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below. void vApplicationMalloc FailedHook(void);
Use Daemon Task Startup Hook	• Enabled • Disabled	Disabled	If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task

			(also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function. void void vApplicationDaemonTaskStartupHook(void);
Use Tick Hook	• Enabled • Disabled	Disabled	Set to Enabled if you wish to use an tick hook, or Disabled to omit an tick hook.
Check For Stack Overflow	• Enabled • Disabled	Disabled	The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable the RA hardware stack monitor instead.
Stats			
Use Trace Facility	• Enabled • Disabled	Disabled	Set to Enabled if you wish to include additional structure members and functions to assist with execution visualisation and tracing.
Use Stats Formatting Functions	• Enabled • Disabled	Disabled	Set Use Trace Facility and Use Stats Formatting Functions to Enabled to include the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStates() from the build.
Generate Run Time Stats	• Enabled • Disabled	Disabled	The Run Time Stats page describes the use of this parameter.
Memory Allocation			

Clear Memory on Free	• Enabled • Disabled	Disabled	If set to 1, then blocks of memory allocated using pvPortMalloc() will be cleared when freed using vPortFree()
Support Static Allocation	• Enabled • Disabled	Enabled	If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer. If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap. If Support Static Allocation is left undefined it will default to 0. If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplication GetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use Timers is Enabled) vAp plicationGetTimerTask Memory() to provide memory for use by the RTOS Daemon/Timer Service task. Examples are provided below. /* Support Static Allocation is Enabled, so the application must provide an implementation of vAp plicationGetIdleTaskMe mory() to provide the memory that is used by the Idle task. */ void vApplicationGetIdl eTaskMemory(StaticTask_t **ppxIdleT

```
askTCBBuffer,<br>
StackType_t **ppxIdleT
askStackBuffer,<br>
uint32_t
*pulIdleTaskStackSize )
{
/* If the buffers to be
provided to the Idle
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */

			*pulTimerTaskStackSize = configTIMER_TASK_STACK_DEPTH;
			}
			
			Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.
			
			See the Static Vs Dynamic Memory Allocation page for more information.

Support Dynamic Allocation	• Enabled • Disabled	Disabled	If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer. See the Static Vs Dynamic Memory Allocation page for more information.
Total Heap Size	Value must be positive integer greater than or equal to 0	1024	The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the

			application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details.
Application Allocated Heap	• Enabled • Disabled	Disabled	By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory. If heap_1.c, heap_2.c or heap_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8_t array with the exact name and dimension as shown below. The array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation. uint8_t ucHeap[configTOTAL_HEAP_SIZE];
Timers			
Use Timers	• Enabled • Disabled	Enabled	Set to Enabled to include software timer functionality, or Disabled to omit software timer functionality. See the

			FreeRTOS software timers page for a full description.
Timer Task Priority	Value must be positive integer greater than or equal to 0	3	Sets the priority of the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Timer Queue Length	Value must be a non-negative integer	10	Sets the length of the software timer command queue. See the FreeRTOS software timers page for a full description.
Timer Task Stack Depth	Value must be a non-negative integer	128	Sets the stack depth allocated to the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Optional Functions			
vTaskPrioritySet() Function	• Enabled • Disabled	Enabled	Include vTaskPrioritySet() function in build
uxTaskPriorityGet() Function	• Enabled • Disabled	Enabled	Include uxTaskPriorityGet() function in build

Logging Level	• LOG_NONE • LOG_ERROR • LOG_WARN • LOG_INFO • LOG_DEBUG	LOG_NONE	Set the logging level

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define configRECORD_STACK_HIGH_ADDRESS as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes WFI() when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes WFI(), the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using portALLOCATE_SECURE_CONTEXT).

The secure context can be freed by deleting the thread or using the portCLEAN_UP_TCB(pxTCB) macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
```

```
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_UNINIT_SECTION_PREFIX ".ram_noinit");
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
```

```
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the task to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
 /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
```

```
  * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

5.2.15 Security

Modules

Detailed Description

Security Modules.

Modules

	AWS Device Provisioning AWS Device Provisioning example software.
	Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto) Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.
	Mbed Crypto H/W Acceleration (rm_psa_crypto) Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.
	Ocrypto (rm_ocrypto_port) Ocrypto software only crypto on RA2E1.
	Renesas Secure IP (r_rsip_e11a_protected_cavp) Driver for the CAVP Certified Renesas Secure IP (RSIP-E11A) on RA MPUs.
	Renesas Secure IP (r_rsip_e51a_protected_cavp) Driver for the CAVP Certified Renesas Secure IP (RSIP-E51A) on RA MPUs.

	Renesas Secure IP (r_rsip_protected) Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.
	SCE Protected Mode Driver for the Secure Crypto Engine (SCE9) on RA MCUs.
	Secure Crypto Engine (r_sce_protected_cavp) Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.
	Secure Key Injection (r_rsip_key_injection) Driver for the Secure Key Injection on RA MCUs.
	Secure Key Injection (r_sce_key_injection) Driver for the Secure Key Injection on RA MCUs.
	TinyCrypt H/W Acceleration (rm_tinycrypt_port) AES128 Hardware acceleration for TinyCrypt on the RA2 family.

5.2.15.1 AWS Device Provisioning

Modules » Security

AWS Device Provisioning example software.

Overview

Terminology

The terminology defined below will be used in the following sections.

Term	Description
Service Provider	Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure.
Device Manufacturer	Entity that provides the MCU, for example,

	Renesas.
OEM	Entity that uses the MCU to create a product.
Customer	End user of OEM product.

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the X.509 format which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between service providers. There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality .Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an example of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal

rm_aws_pkcs11_pal_littlefs module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (aws_dev_mode_key_provisioning.c) exposes:

1. vAlternateKeyProvisioning()

This function requires that the device credentials be provided in PEM format. Using this example function as is in production is not recommended.

Note **vDevModeKeyProvisioning()** is no longer supported.

Credentials can be created as follows: *Create your own CA and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example Register your CA with AWS.

- Use AWS to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```
#define keyCLIENT_CERTIFICATE_PEM \

params.pucClientCertificate);
    params.pucJITPCertificate       = NULL;
    params.ulJITPCertificateLength   = 0;
    vAlternateKeyProvisioning(&params);
}
```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

5.2.15.2 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

Modules » Security

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Overview

Please refer to the NetXDuo - NetX Crypto documentation for further details.

HW Overview

Note

1. Only block cipher unit is HW accelerated
2. Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated
3. Signature verification only

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.
Maximum RSA Modulus size (bits)	• 1024 • 2048 • 3072 • 4096	4096	

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Hardware Acceleration			
Hardware Acceleration > Hash			
SHA256/224	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT.
SHA512/384	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA512_ALT.
Hardware Acceleration > Cipher			
AES	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT
Hardware Acceleration > Public Key Cryptography (PKC)			
Hardware Acceleration > Public Key Cryptography (PKC) > ECC			
ECC	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_M

			ETHODS_ECC_ALT
ECDSA Scratch Buffer Size (Bytes)	Value must be a non-negative integer	3016	Sets value of NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE
ECDH Scratch Buffer Size (Bytes)	Value must be a non-negative integer	2464	Sets value of NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE
Hardware Acceleration > Public Key Cryptography (PKC) > RSA			
RSA	MCU Specific Options		Enables/Disables RSA HW support
RSA 1024 (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_1024_ALT to allow HW support
RSA 2048 (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT to allow HW support
RSA 3072 Verify/Encryption (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT to allow HW support
RSA 4096 Verify/Encryption (HW)	MCU Specific Options		Enables RSA NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT to allow HW support
RSA Scratch Buffer Size (Bytes)	MCU Specific Options		Sets value of NX_CRYPTO_RSA_SCRATCH_BUFFER_SIZE
TRNG	• Enabled • Disabled	Enabled	Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT.
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require

setting up the heap as 'rand' implementation calls 'malloc'.

SHA Configuration

To enable hardware acceleration for the SHA256/224 or SHA384/512 calculation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT or NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA512_ALT must be defined in the configuration file. By default SHA is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1 and SECP256R1, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be must be defined in the configuration file:

Configuration Macro	Feature / Operation
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_1024_ALT	Signature Generation / Signature Verification (Encryption / Decryption)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT	Signature Generation / Signature Verification (Encryption / Decryption)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT	Signature Verification (Encryption Only)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT	Signature Verification (Encryption Only)

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

_nx_crypto_initialize() must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer Azure RTOS NetX Crypto API description for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the _nx_crypto_method_aes_operation must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in Using Advanced Encryption Standard (AES) Counter Mode With IPsec Encapsulating Security Payload (ESP) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to _nx_crypto_method_aes_operation through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the _nx_crypto_method_aes_operation during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE and NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE macros for ECDSA and ECDH respectively.

Operation	Key Format
ECDSA Signature	Plain private key; Wrapped private key
ECDSA Signature-Verify	Uncompressed public key
Key Generation using ECDSA operation API	Wrapped private key; Uncompressed public key
ECDH private key import	Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key)
ECDH public key export	Uncompressed public key

ECDH setup	Uncompressed public key
ECDH shared secret calculate	Uncompressed public key
Key Generation using ECDH operation API	Wrapped private key; Uncompressed public key

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under RFC5480
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral.

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during _nx_crypto_method_rsa_init API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_rsa_operation API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of _nx_crypto_method_pkcs1_v1_5_init are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_pkcs1_v1_5_operation API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Software Implementation

The plaintext data passed in to the RSA encryption API must be 4-byte aligned. If it is not aligned then when the resultant encrypted data is decrypted using the decryption API, the unaligned data will be endian-swapped. For instance, if {0x01, 0x02,0x03, 0x04, 0x05} is passed as input data for encryption, when decrypted, the result will be {0x01, 0x02, 0x03, 0x04, 0x00, 0x00, 0x00, 0x05}. Note that this alignment of input data need not be taken care while using Hardware accelerated RSA.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is eanbled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */

   err = nx_crypto_initialize();
```

```
    assert(NX_CRYPTO_SUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTO_METHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void netx_secure_crypto_sha256_example (void)
{

ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPTO_METHOD crypto_method_ecdh;
/*Private key 59137e38152350b195c9718d39673d519838055ad908dd4757152fd8255c09bf */

Functions

int	mbedtls_platform_setup (mbedtls_platform_context *ctx)
void	mbedtls_platform_teardown (mbedtls_platform_context *ctx)
fsp_err_t	RM_PSA_CRYPTO_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes, uint32_t *p_num_gen_bytes) Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer. More...

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the mbedTLS version 3.6.2 which conforms to the PSA Crypto API 1.0 specification. Consult the Arm documentation at https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface for further information. *FSP 3.0 onward adopts a change by Arm where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.*

HW Overview

Crypto Peripheral version	Devices
RSIP-E51A	RA8M1, RA8D1, RA8T1
RSIP-E50D	RA8P1

	RSA-4096	–	–	–	–	–	(1)	–	–	Yes	Yes
	Key generation - plaintext	–	–	–	–	Yes	–	–	–	–	–
	Key generation - wrapped	–	–	–	–	Yes	(2)	–	–	(3)	(3)

Note

1. Signature verification only
2. RSA-1024 and RSA-2048 only
3. RSA-2048, RSA-3072, RSA-4096 only

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

Configuration	Options	Default	Description
Hardware Acceleration			
Hardware Acceleration > Key Format			
AES	MCU Specific Options		Select AES key formats used
ECC	MCU Specific Options		Select ECC key formats used
RSA	MCU Specific Options		Select RSA key formats used
Hardware Acceleration > Hash			
SHA256/224	MCU Specific Options		Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT.
SHA512/384	MCU Specific Options		Defines MBEDTLS_SHA512_ALT and MBEDTLS_SHA512_PROCESS_ALT.
SHA3_224/256/384/512	MCU Specific Options		Defines MBEDTLS_SHA3_ALT and MBEDTLS_SHA3_PROCESS_ALT.
Hardware Acceleration > Cipher			
AES	MCU Specific Options		Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT
Hardware Acceleration > Public Key Cryptography (PKC)			
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072			
Key Generation	MCU Specific Options		Enables RSA 3072 Key Generation.
Signing	MCU Specific Options		Enables RSA 3072 Key Signing.
Verification	MCU Specific Options		Enables RSA 3072

			Verify.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096			
Key Generation	MCU Specific Options		Enables RSA 4096 Key Generation.
Signing	MCU Specific Options		Enables RSA 4096 Key Signing.
Verification	MCU Specific Options		Enables RSA 4096 Verify.
ECC	MCU Specific Options		Defines MBEDTLS_ECP_ALT
ECDSA	MCU Specific Options		Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT
ECDH	MCU Specific Options		Defines MBEDTLS_ECDH_ALT
RSA 1024	MCU Specific Options		Defines MBEDTLS_RSA_1024_ALT. RSA 1024 Key Generation, Signing and Verification are also enabled.
RSA 2048	MCU Specific Options		Defines MBEDTLS_RSA_ALT. RSA 2048 Key Generation, Signing and Verification are also enabled.
TRNG	Enabled	Enabled	Defines MBEDTLS_ENTROPY_HARDWARE_ALT.
Crypto Engine Initialization	Enabled	Enabled	MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT
Platform			
Platform > Alternate			
MBEDTLS_PLATFORM_SETBUF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SETBUF_ALT
MBEDTLS_PLATFORM_EXIT_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_EXIT_ALT
MBEDTLS_PLATFORM_TIME_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_ALT
MBEDTLS_PLATFORM_FPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_FPRINTF_ALT
MBEDTLS_PLATFORM_PRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_PRINTF_ALT

MBEDTLS_PLATFORM_SNPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SNPRINTF_ALT
MBEDTLS_PLATFORM_VSNPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_VSNPRINTF_ALT
MBEDTLS_PLATFORM_NV_SEED_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_ALT
MBEDTLS_PLATFORM_MS_TIME_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_MS_TIME_ALT
MBEDTLS_PLATFORM_ZEROIZE_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_ZEROIZE_ALT
MBEDTLS_PLATFORM_GMTIME_R_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_GMTIME_R_ALT
MBEDTLS_HAVE_ASM	• Define • Undefine	Undefine	MBEDTLS_HAVE_ASM
MBEDTLS_NO_UDBL_DIVISION	• Define • Undefine	Undefine	MBEDTLS_NO_UDBL_DIVISION
MBEDTLS_NO_64BIT_MULTIPLICATION	• Define • Undefine	Undefine	MBEDTLS_NO_64BIT_MULTIPLICATION
MBEDTLS_HAVE_SSE2	• Define • Undefine	Undefine	MBEDTLS_HAVE_SSE2
MBEDTLS_HAVE_TIME	• Define • Undefine	Undefine	MBEDTLS_HAVE_TIME
MBEDTLS_HAVE_TIME_DATE	• Define • Undefine	Undefine	MBEDTLS_HAVE_TIME_DATE
MBEDTLS_PLATFORM_MEMORY	• Define • Undefine	Define	MBEDTLS_PLATFORM_MEMORY
MBEDTLS_PLATFORM_NO_STD_FUNCTIONS	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NO_STD_FUNCTIONS
MBEDTLS_TIMING_ALT	• Define • Undefine	Undefine	MBEDTLS_TIMING_ALT
MBEDTLS_NO_PLATFORM_ENTROPY	• Define • Undefine	Define	MBEDTLS_NO_PLATFORM_ENTROPY
MBEDTLS_ENTROPY_C	• Define • Undefine	Define	MBEDTLS_ENTROPY_C
MBEDTLS_PLATFORM_C	• Define • Undefine	Define	MBEDTLS_PLATFORM_C
MBEDTLS_PLATFORM_STD_CALLOC	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_CALLOC
MBEDTLS_PLATFORM_STD_CALLOC value	Manual Entry	calloc	MBEDTLS_PLATFORM_STD_CALLOC value
MBEDTLS_PLATFORM_STD_FREE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_FREE

MBEDTLS_PLATFORM_STD_FREE value	Manual Entry	free	MBEDTLS_PLATFORM_STD_FREE value
MBEDTLS_PLATFORM_STD_SETBUF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_SETBUF
MBEDTLS_PLATFORM_STD_SETBUF value	Manual Entry	setbuf	MBEDTLS_PLATFORM_STD_SETBUF value
MBEDTLS_PLATFORM_STD_EXIT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_EXIT
MBEDTLS_PLATFORM_STD_EXIT value	Manual Entry	exit	MBEDTLS_PLATFORM_STD_EXIT value
MBEDTLS_PLATFORM_STD_TIME	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_TIME
MBEDTLS_PLATFORM_STD_TIME value	Manual Entry	time	MBEDTLS_PLATFORM_STD_TIME value
MBEDTLS_PLATFORM_STD_FPRINTF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_FPRINTF
MBEDTLS_PLATFORM_STD_FPRINTF value	Manual Entry	fprintf	MBEDTLS_PLATFORM_STD_FPRINTF value
MBEDTLS_PLATFORM_STD_PRINTF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_PRINTF
MBEDTLS_PLATFORM_STD_PRINTF value	Manual Entry	printf	MBEDTLS_PLATFORM_STD_PRINTF value
MBEDTLS_PLATFORM_STD_SNPRINTF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_SNPRINTF
MBEDTLS_PLATFORM_STD_SNPRINTF value	Manual Entry	snprintf	MBEDTLS_PLATFORM_STD_SNPRINTF value
MBEDTLS_PLATFORM_STD_EXIT_SUCCESS	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_EXIT_SUCCESS
MBEDTLS_PLATFORM_STD_EXIT_SUCCESS value	Manual Entry	0	MBEDTLS_PLATFORM_STD_EXIT_SUCCESS value
MBEDTLS_PLATFORM_STD_EXIT_FAILURE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_EXIT_FAILURE
MBEDTLS_PLATFORM_STD_EXIT_FAILURE value	Manual Entry	1	MBEDTLS_PLATFORM_STD_EXIT_FAILURE value
MBEDTLS_PLATFORM_STD_NV_SEED_READ	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_NV_SEED_READ
MBEDTLS_PLATFORM_STD_NV_SEED_READ value	Manual Entry	mbedtls_platform_std_nv_seed_read	MBEDTLS_PLATFORM_STD_NV_SEED_READ value
MBEDTLS_PLATFORM_STD_NV_SEED_WRITE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_NV_SEED_WRITE

MBEDTLS_PLATFORM_STD_NV_SEED_WRITE value	Manual Entry	mbedtls_platform_std_nv_seed_write	MBEDTLS_PLATFORM_STD_NV_SEED_WRITE value
MBEDTLS_PLATFORM_STD_NV_SEED_FILE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_NV_SEED_FILE
MBEDTLS_PLATFORM_STD_NV_SEED_FILE value	Manual Entry		MBEDTLS_PLATFORM_STD_NV_SEED_FILE value
MBEDTLS_PLATFORM_CALLOC_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_CALLOC_MACRO
MBEDTLS_PLATFORM_CALLOC_MACRO value	Manual Entry	calloc	MBEDTLS_PLATFORM_CALLOC_MACRO value
MBEDTLS_PLATFORM_FREE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_FREE_MACRO
MBEDTLS_PLATFORM_FREE_MACRO value	Manual Entry	free	MBEDTLS_PLATFORM_FREE_MACRO value
MBEDTLS_PLATFORM_EXIT_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_EXIT_MACRO
MBEDTLS_PLATFORM_EXIT_MACRO value	Manual Entry	exit	MBEDTLS_PLATFORM_EXIT_MACRO value
MBEDTLS_PLATFORM_SETBUF_MACRO	• Define • Undefine	Define	MBEDTLS_PLATFORM_SETBUF_MACRO
MBEDTLS_PLATFORM_SETBUF_MACRO value	Manual Entry	dummy_setbuf	MBEDTLS_PLATFORM_SETBUF_MACRO value
MBEDTLS_PLATFORM_TIME_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_MACRO
MBEDTLS_PLATFORM_TIME_MACRO value	Manual Entry	time	MBEDTLS_PLATFORM_TIME_MACRO value
MBEDTLS_PLATFORM_TIME_TYPE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_TYPE_MACRO
MBEDTLS_PLATFORM_TIME_TYPE_MACRO value	Manual Entry	time_t	MBEDTLS_PLATFORM_TIME_TYPE_MACRO value
MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO
MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO value	Manual Entry	int64_t	MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO value
MBEDTLS_PRINTF_MS_TIME	• Define • Undefine	Undefine	MBEDTLS_PRINTF_MS_TIME
MBEDTLS_PRINTF_MS_TIME value	Manual Entry	PRId64	MBEDTLS_PRINTF_MS_TIME value
MBEDTLS_PLATFORM_F	• Define	Undefine	MBEDTLS_PLATFORM_F

PRINTF_MACRO	• Undefine		PRINTF_MACRO
MBEDTLS_PLATFORM_FPRINTF_MACRO value	Manual Entry	fprintf	MBEDTLS_PLATFORM_FPRINTF_MACRO value
MBEDTLS_PLATFORM_PRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_PRINTF_MACRO
MBEDTLS_PLATFORM_PRINTF_MACRO value	Manual Entry	printf	MBEDTLS_PLATFORM_PRINTF_MACRO value
MBEDTLS_PLATFORM_SNPRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SNPRINTF_MACRO
MBEDTLS_PLATFORM_SNPRINTF_MACRO value	Manual Entry	snprintf	MBEDTLS_PLATFORM_SNPRINTF_MACRO value
MBEDTLS_PLATFORM_VSNPRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_VSNPRINTF_MACRO
MBEDTLS_PLATFORM_VSNPRINTF_MACRO value	Manual Entry	vsnprintf	MBEDTLS_PLATFORM_VSNPRINTF_MACRO value
MBEDTLS_PLATFORM_NV_SEED_READ_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_READ_MACRO
MBEDTLS_PLATFORM_NV_SEED_READ_MACRO value	Manual Entry	mbedtls_platform_std_nv_seed_read	MBEDTLS_PLATFORM_NV_SEED_READ_MACRO value
MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO
MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO value	Manual Entry	mbedtls_platform_std_nv_seed_write	MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO value
General			
MBEDTLS_PSA_CRYPTO_DRIVERS	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_DRIVERS
MBEDTLS_DEPRECATED_WARNING	• Define • Undefine	Undefine	MBEDTLS_DEPRECATED_WARNING
MBEDTLS_DEPRECATED_REMOVED	• Define • Undefine	Define	MBEDTLS_DEPRECATED_REMOVED
MBEDTLS_CHECK_RETURN_WARNING	• Define • Undefine	Undefine	MBEDTLS_CHECK_RETURN_WARNING
MBEDTLS_ERROR_STRERROR_DUMMY	• Define • Undefine	Define	MBEDTLS_ERROR_STRERROR_DUMMY
MBEDTLS_MEMORY_DEBUG	• Define • Undefine	Undefine	MBEDTLS_MEMORY_DEBUG
MBEDTLS_MEMORY_BACKTRACE	• Define • Undefine	Undefine	MBEDTLS_MEMORY_BACKTRACE
MBEDTLS_PSA_CRYPTO	• Define	Undefine	MBEDTLS_PSA_CRYPTO

_CLIENT	• Undefine		_CLIENT
MBEDTLS_PSA_CRYPTO_SPM	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_SPM
MBEDTLS_PSA_KEY_STORE_DYNAMIC	• Define • Undefine	Undefine	MBEDTLS_PSA_KEY_STORE_DYNAMIC
MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS	• Define • Undefine	Undefine	MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS
MBEDTLS_SELF_TEST	• Define • Undefine	Undefine	MBEDTLS_SELF_TEST
MBEDTLS_THREADING_ALT	• Define • Undefine	Define	MBEDTLS_THREADING_ALT
MBEDTLS_THREADING_PTHREAD	• Define • Undefine	Undefine	MBEDTLS_THREADING_PTHREAD
MBEDTLS_USE_PSA_CRYPTO	Undefine	Undefine	MBEDTLS_USE_PSA_CRYPTO
MBEDTLS_VERSION_FEATURES	• Define • Undefine	Define	MBEDTLS_VERSION_FEATURES
MBEDTLS_ERROR_C	• Define • Undefine	Define	MBEDTLS_ERROR_C
MBEDTLS_MEMORY_BUFFER_ALLOC_C	• Define • Undefine	Undefine	MBEDTLS_MEMORY_BUFFER_ALLOC_C
MBEDTLS_PSA_CRYPTO_C	• Define • Undefine	Define	MBEDTLS_PSA_CRYPTO_C
MBEDTLS_PSA_CRYPTO_SE_C	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_SE_C
MBEDTLS_THREADING_C	• Define • Undefine	Define	MBEDTLS_THREADING_C
MBEDTLS_TIMING_C	• Define • Undefine	Undefine	MBEDTLS_TIMING_C
MBEDTLS_VERSION_C	• Define • Undefine	Define	MBEDTLS_VERSION_C
MBEDTLS_MEMORY_ALIGN_MULTIPLE	• Define • Undefine	Undefine	MBEDTLS_MEMORY_ALIGN_MULTIPLE
MBEDTLS_MEMORY_ALIGN_MULTIPLE value	Manual Entry	4	MBEDTLS_MEMORY_ALIGN_MULTIPLE value
MBEDTLS_CHECK_RETURN	• Define • Undefine	Define	MBEDTLS_CHECK_RETURN
MBEDTLS_IGNORE_RETURN	• Define • Undefine	Undefine	MBEDTLS_IGNORE_RETURN
MBEDTLS_PSA_CRYPTO_CONFIG	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_CONFIG

Cipher

Cipher > Alternate			
MBEDTLS_ARIA_ALT	• Define • Undefine	Undefine	MBEDTLS_ARIA_ALT
MBEDTLS_CAMELLIA_ALT	• Define • Undefine	Undefine	MBEDTLS_CAMELLIA_ALT
MBEDTLS_CCM_ALT	MCU Specific Options		MBEDTLS_CCM_ALT
MBEDTLS_CHACHA20_ALT	• Define • Undefine	Undefine	MBEDTLS_CHACHA20_ALT
MBEDTLS_CHACHAPOLY_ALT	• Define • Undefine	Undefine	MBEDTLS_CHACHAPOLY_ALT
MBEDTLS_CMAC_ALT	MCU Specific Options		MBEDTLS_CMAC_ALT
MBEDTLS_DES_ALT	• Define • Undefine	Undefine	MBEDTLS_DES_ALT
MBEDTLS_GCM_ALT	MCU Specific Options		MBEDTLS_GCM_ALT
MBEDTLS_NIST_KW_ALT	• Define • Undefine	Undefine	MBEDTLS_NIST_KW_ALT
MBEDTLS_DES_SETKEY_ALT	• Define • Undefine	Undefine	MBEDTLS_DES_SETKEY_ALT
MBEDTLS_DES_CRYPT_ECB_ALT	• Define • Undefine	Undefine	MBEDTLS_DES_CRYPT_ECB_ALT
MBEDTLS_DES3_CRYPT_ECB_ALT	• Define • Undefine	Undefine	MBEDTLS_DES3_CRYPT_ECB_ALT
Cipher > AES			
MBEDTLS_AES_ROM_TABLES	• Define • Undefine	Undefine	MBEDTLS_AES_ROM_TABLES
MBEDTLS_AES_FEWER_TABLES	• Define • Undefine	Undefine	MBEDTLS_AES_FEWER_TABLES
MBEDTLS_AES_ONLY_128_BIT_KEY_LENGTH	• Define • Undefine	Undefine	MBEDTLS_AES_ONLY_128_BIT_KEY_LENGTH
MBEDTLS_CAMELLIA_SMALL_MEMORY	• Define • Undefine	Undefine	MBEDTLS_CAMELLIA_SMALL_MEMORY
MBEDTLS_CIPHER_MODE_CBC	• Define • Undefine	Define	MBEDTLS_CIPHER_MODE_CBC
MBEDTLS_CIPHER_MODE_CFB	• Define • Undefine	Define	MBEDTLS_CIPHER_MODE_CFB
MBEDTLS_CIPHER_MODE_CTR	• Define • Undefine	Define	MBEDTLS_CIPHER_MODE_CTR
MBEDTLS_CIPHER_MODE_OFB	• Define • Undefine	Undefine	MBEDTLS_CIPHER_MODE_OFB
MBEDTLS_CIPHER_MODE_XTS	• Define • Undefine	Undefine	MBEDTLS_CIPHER_MODE_XTS

MBEDTLS_CIPHER_NULL_CIPHER	• Define • Undefine	Undefine	MBEDTLS_CIPHER_NULL_CIPHER
MBEDTLS_CIPHER_PADDING_PKCS7	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_PKCS7
MBEDTLS_CIPHER_PADDING_ONE_AND_ZEROS	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_ONE_AND_ZEROS
MBEDTLS_CIPHER_PADDING_ZEROS_AND_LEN	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_ZEROS_AND_LEN
MBEDTLS_CIPHER_PADDING_ZEROS	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_ZEROS
MBEDTLS_AES_C	Define	Define	MBEDTLS_AES_C
MBEDTLS_BLOCK_CIPHER_NO_DECRYPT	• Define • Undefine	Undefine	MBEDTLS_BLOCK_CIPHER_NO_DECRYPT
MBEDTLS_CAMELLIA_C	• Define • Undefine	Undefine	MBEDTLS_CAMELLIA_C
MBEDTLS_ARIA_C	• Define • Undefine	Undefine	MBEDTLS_ARIA_C
MBEDTLS_CCM_C	• Define • Undefine	Define	MBEDTLS_CCM_C
MBEDTLS_CHACHA20_C	• Define • Undefine	Undefine	MBEDTLS_CHACHA20_C
MBEDTLS_CHACHAPOLY_C	• Define • Undefine	Undefine	MBEDTLS_CHACHAPOLY_C
MBEDTLS_CIPHER_C	• Define • Undefine	Define	MBEDTLS_CIPHER_C
MBEDTLS_DES_C	• Define • Undefine	Undefine	MBEDTLS_DES_C
MBEDTLS_GCM_C	• Define • Undefine	Define	MBEDTLS_GCM_C
MBEDTLS_GCM_LARGE_TABLE	• Define • Undefine	Undefine	MBEDTLS_GCM_LARGE_TABLE
MBEDTLS_NIST_KW_C	• Define • Undefine	Undefine	MBEDTLS_NIST_KW_C

Public Key Cryptography (PKC)

Public Key Cryptography (PKC) > DHM

Public Key Cryptography (PKC) > DHM > Alternate

MBEDTLS_DHM_ALT	• Define • Undefine	Undefine	MBEDTLS_DHM_ALT
MBEDTLS_DHM_C	• Define • Undefine	Undefine	MBEDTLS_DHM_C

Public Key Cryptography (PKC) > ECC

Public Key Cryptography (PKC) > ECC > Alternate

MBEDTLS_ECJPAKE_ALT	• Define • Undefine	Undefine	MBEDTLS_ECJPAKE_ALT
MBEDTLS_ECDSA_GEN KEY_ALT	• Define • Undefine	Undefine	MBEDTLS_ECDSA_GEN KEY_ALT
MBEDTLS_ECP_INTERN AL_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_INTERN AL_ALT
MBEDTLS_ECP_RANDO MIZE_JAC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_RANDO MIZE_JAC_ALT
MBEDTLS_ECP_ADD_MI XED_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_ADD_MI XED_ALT
MBEDTLS_ECP_DOUBLE _JAC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_DOUBLE _JAC_ALT
MBEDTLS_ECP_NORMA LIZE_JAC_MANY_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_NORMA LIZE_JAC_MANY_ALT
MBEDTLS_ECP_NORMA LIZE_JAC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_NORMA LIZE_JAC_ALT
MBEDTLS_ECP_DOUBLE _ADD_MXZ_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_DOUBLE _ADD_MXZ_ALT
MBEDTLS_ECP_RANDO MIZE_MXZ_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_RANDO MIZE_MXZ_ALT
MBEDTLS_ECP_NORMA LIZE_MXZ_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_NORMA LIZE_MXZ_ALT

Public Key Cryptography (PKC) > ECC > Curves

MBEDTLS_ECP_DP_SEC P192R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P192R1_ENABLED
MBEDTLS_ECP_DP_SEC P224R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P224R1_ENABLED
MBEDTLS_ECP_DP_SEC P256R1_ENABLED	• Define • Undefine	Define	MBEDTLS_ECP_DP_SEC P256R1_ENABLED
MBEDTLS_ECP_DP_SEC P384R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P384R1_ENABLED
MBEDTLS_ECP_DP_SEC P521R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P521R1_ENABLED
MBEDTLS_ECP_DP_SEC P192K1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P192K1_ENABLED
MBEDTLS_ECP_DP_SEC P224K1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P224K1_ENABLED
MBEDTLS_ECP_DP_SEC P256K1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SEC P256K1_ENABLED
MBEDTLS_ECP_DP_BP2	• Define	Undefine	MBEDTLS_ECP_DP_BP2

56R1_ENABLED	• Undefine		56R1_ENABLED
MBEDTLS_ECP_DP_BP384R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_BP384R1_ENABLED
MBEDTLS_ECP_DP_BP512R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_BP512R1_ENABLED
MBEDTLS_ECP_DP_CURVE25519_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_CURVE25519_ENABLED
MBEDTLS_ECP_DP_CURVE448_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_CURVE448_ENABLED
MBEDTLS_ECDH_GEN_PUBLIC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECDH_GEN_PUBLIC_ALT
MBEDTLS_ECDH_COMPUTE_SHARED_ALT	• Define • Undefine	Undefine	MBEDTLS_ECDH_COMPUTE_SHARED_ALT
MBEDTLS_ECP_NO_FALLBACK	• Define • Undefine	Undefine	MBEDTLS_ECP_NO_FALLBACK
MBEDTLS_ECP_NIST_OPTIM	• Define • Undefine	Undefine	MBEDTLS_ECP_NIST_OPTIM
MBEDTLS_ECP_RESTARTABLE	• Define • Undefine	Undefine	MBEDTLS_ECP_RESTARTABLE
MBEDTLS_ECDSA_DETERMINISTIC	• Define • Undefine	Undefine	MBEDTLS_ECDSA_DETERMINISTIC
MBEDTLS_PK_PARSE_EC_COMPRESSED	• Define • Undefine	Undefine	MBEDTLS_PK_PARSE_EC_COMPRESSED
MBEDTLS_PK_PARSE_EC_EXTENDED	• Define • Undefine	Undefine	MBEDTLS_PK_PARSE_EC_EXTENDED
MBEDTLS_ECDH_C	• Define • Undefine	Undefine	MBEDTLS_ECDH_C
MBEDTLS_ECDSA_C	• Define • Undefine	Define	MBEDTLS_ECDSA_C
MBEDTLS_ECP_C	• Define • Undefine	Define	MBEDTLS_ECP_C
MBEDTLS_ECJPAKE_C	• Define • Undefine	Undefine	MBEDTLS_ECJPAKE_C
MBEDTLS_ECP_WINDOW_SIZE	• Define • Undefine	Undefine	MBEDTLS_ECP_WINDOW_SIZE
MBEDTLS_ECP_WINDOW_SIZE value	Manual Entry	6	MBEDTLS_ECP_WINDOW_SIZE value
MBEDTLS_ECP_FIXED_POINT_OPTIM	• Define • Undefine	Undefine	MBEDTLS_ECP_FIXED_POINT_OPTIM
MBEDTLS_ECP_FIXED_POINT_OPTIM value	Manual Entry	1	MBEDTLS_ECP_FIXED_POINT_OPTIM value
MBEDTLS_ECDH_VARIA	• Define	Undefine	MBEDTLS_ECDH_VARIA

NT_EVEREST_ENABLED	• Undefine		NT_EVEREST_ENABLED
Public Key Cryptography (PKC) > RSA			
MBEDTLS_PK_RSA_ALT_SUPPORT	• Define • Undefine	Undefine	MBEDTLS_PK_RSA_ALT_SUPPORT
MBEDTLS_RSA_NO_CRT	• Define • Undefine	Define	MBEDTLS_RSA_NO_CRT
MBEDTLS_RSA_C	• Define • Undefine	Define	MBEDTLS_RSA_C
MBEDTLS_RSA_GEN_KEY_MIN_BITS	• Define • Undefine	Undefine	MBEDTLS_RSA_GEN_KEY_MIN_BITS
MBEDTLS_RSA_GEN_KEY_MIN_BITS value	Manual Entry	1024	MBEDTLS_RSA_GEN_KEY_MIN_BITS value
MBEDTLS_GENPRIME	• Define • Undefine	Define	MBEDTLS_GENPRIME
MBEDTLS_PKCS1_V15	• Define • Undefine	Define	MBEDTLS_PKCS1_V15
MBEDTLS_PKCS1_V21	• Define • Undefine	Define	MBEDTLS_PKCS1_V21
MBEDTLS_ASN1_PARSE_C	• Define • Undefine	Define	MBEDTLS_ASN1_PARSE_C
MBEDTLS_ASN1_WRITE_C	• Define • Undefine	Define	MBEDTLS_ASN1_WRITE_C
MBEDTLS_BASE64_C	• Define • Undefine	Define	MBEDTLS_BASE64_C
MBEDTLS_BIGNUM_C	• Define • Undefine	Define	MBEDTLS_BIGNUM_C
MBEDTLS_LMS_C	• Define • Undefine	Define	MBEDTLS_LMS_C
MBEDTLS_LMS_PRIVATE	• Define • Undefine	Undefine	MBEDTLS_LMS_PRIVATE
MBEDTLS_OID_C	• Define • Undefine	Define	MBEDTLS_OID_C
MBEDTLS_PEM_PARSE_C	• Define • Undefine	Define	MBEDTLS_PEM_PARSE_C
MBEDTLS_PEM_WRITE_C	• Define • Undefine	Define	MBEDTLS_PEM_WRITE_C
MBEDTLS_PK_C	• Define • Undefine	Define	MBEDTLS_PK_C
MBEDTLS_PK_PARSE_C	• Define • Undefine	Define	MBEDTLS_PK_PARSE_C
MBEDTLS_PK_WRITE_C	• Define • Undefine	Define	MBEDTLS_PK_WRITE_C

MBEDTLS_PKCS5_C	• Define • Undefine	Define	MBEDTLS_PKCS5_C
MBEDTLS_PKCS7_C	• Define • Undefine	Undefine	MBEDTLS_PKCS7_C
MBEDTLS_PKCS12_C	• Define • Undefine	Define	MBEDTLS_PKCS12_C
MBEDTLS_MPI_WINDOW_SIZE	• Define • Undefine	Undefine	MBEDTLS_MPI_WINDOW_SIZE

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

Note

Only AES XTS 128 is currently supported. RA2 devices support acceleration for ECB part alone, while other devices support full AES XTS hardware acceleration.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro MBEDTLS_ECP_ALT must be defined in the configuration file. For ECDSA, the macros MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine MBEDTLS_ECP_C, MBEDTLS_ECDSA_C and MBEDTLS_ECDH_C. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro MBEDTLS_RSA_ALT must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS_RSA_C, MBEDTLS_PK_C, MBEDTLS_PK_PARSE_C, MBEDTLS_PK_WRITE_C. This can be done using the RA Configuration editor.

Post Quantum Cryptography (PQC) Configuration

ML-KEM Configuration

To enable software only PQC ML-KEM key generation, encapsulation, and decapsulation operations, the macro MBEDTLS_MLKEM_ALT must be defined in the configuration file. By default, PQC ML-KEM is disabled as the PQC stack is optional. This can be done using the RA Configuration editor.

ML-DSA Configuration

By default, PQC ML-DSA is disabled as it is not yet supported. MBEDTLS_MLDSA_ALT shows up in the RA Configuration Editor but with the only option of being disabled.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA_KEY_TYPE_AES_WRAPPED or PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve) or PSA_KEY_TYPE_RSA_KEY_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS_FS_IO,

MBEDTLS_PSA_CRYPTO_STORAGE_C, and MBEDTLS_PSA_ITS_FILE_C. The key lifetime must also be specified as PSA_KEY_LIFETIME_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa_set_key_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
   {
/* Set the id to a positive integer. */
      psa_set_key_id(&attributes, (psa_key_id_t) 5);
   }
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|MBEDTLS_CHECK_PARAMS) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_ENTROPY_HARDWARE_ALT must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

mbedtls_platform_setup() must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

Algorithm	Required Heap (bytes)
SHA256/224	None
AES	0x200
Hardware ECC	0x400
Software ECC	0x1800
RSA	0x1500

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

Limitations

- Only little endian mode is supported.

Stdio Buffering

The MBEDTLS_PLATFORM_SETBUF_MACRO was introduced in mbedTLS 3.2.1 to prevent stdio read/write functions from buffering stream data to reduce the likelihood of key leakage by setting the buffer argument in setbuf() to NULL. FSP uses a dummy_setbuf() function in rm_psa_crypto.c to prevent build errors; since FSP uses LittleFS by default (where the usage of a buffer is mandatory) this function does not perform any action. Setting the cache size in LittleFS to the minimum supported by the Data Flash (4) can minimize but not remove the likelihood of key data leakage. The dummy function can be replaced with a user-defined function by defining a different value for MBEDTLS_PLATFORM_SETBUF_MACRO_value in the FSP configurator.

Post Quantum Cryptography (PQC)

ML-DSA

- ML-DSA not yet supported. See ML-DSA Configuration.

ML-KEM

- Only ML-KEM-512 and ML-KEM-768 supported. ML-KEM-1024 not supported.
- Key derivation not supported.
- ASN.1 encoding not implemented. Keys are currently implemented in raw bytes.
- The data format for import and export of the key pair is the concatenation of the two seed values: d || z

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the psa_key_agreement() function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable

will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

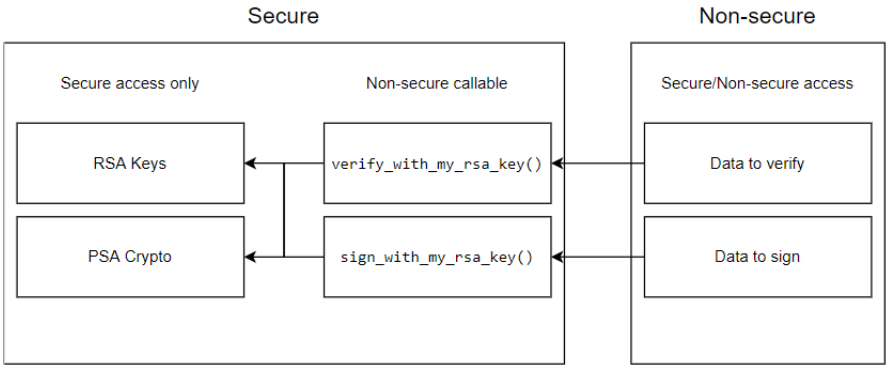

Figure 327: PSA Crypto Non-secure callable example

- Secure project
  - During secure project boot-up, psa_crypto_init() is called.
  - The RSA private key is programmed into secure flash either at the factory or by calling psa_generate_key() in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
  - psa_import_key()/psa_open_key() are called with the resultant handle held in secure RAM.
  - The Non-secure callable section contains the following **user-defined** functions
  - verify_with_my_rsa_key(input_signature, input_hash, verification_result)
  - The implementation of this function in secure region will call psa_verify_hash() and return the result via verification_result.
  - sign_with_my_rsa_key(input_hash, output_signature)
  - The implementation of this function in secure region will call psa_sign_hash() and return the signature via output_signature.

- Non-secure project
  - Calls verify_with_my_rsa_key() to verify a signature. The implementation will use the public key that is present in the secure project.
  - Calls sign_with_my_rsa_key() to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void psa_crypto_sha256_example (void)
{
    psa_algorithm_t      alg               = PSA_ALG_SHA_256;
    psa_hash_operation_t operation         = {0};
 size_t               expected_hash_len = PSA_HASH_LENGTH(alg);
    uint8_t              actual_hash[PSA_HASH_MAX_SIZE];
 size_t               actual_hash_len;
 mbedtls_platform_context ctx = {0};
 /* Setup the platform; initialize the SCE and the TRNG */
 if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
    {
 /* Platform initialization failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_setup(&operation, alg))
    {
 /* Hash setup failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_update(&operation, NIST_SHA256ShortMsgLen200,
```

```
sizeof(NIST_SHA256ShortMsgLen200)))
    {
 /* Hash calculation failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_finish(&operation, &actual_hash[0], sizeof
(actual_hash), &actual_hash_len))
    {
 /* Reading calculated hash failed */
       debugger_break();
    }
 else if (0 != memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],
actual_hash_len))
    {
 /* Hash compare of calculated value with expected value failed */
       debugger_break();
    }
 else if (0 != memcmp(&expected_hash_len, &actual_hash_len, sizeof
(expected_hash_len)))
    {
 /* Hash size compare of calculated value with expected value failed */
       debugger_break();
    }
 else
    {
 /* SHA256 calculation succeeded */
       debugger_break();
    }
 /* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
 mbedtls_platform_teardown(&ctx);
}
```

AES Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
static psa_status_t cipher_operation (psa_cipher_operation_t * operation,
 const uint8_t          * input,
 size_t                   input_size,
 size_t                   part_size,
                                  uint8_t                * output,
 size_t                   output_size,
 size_t                * output_len)
{
    psa_status_t status;
 size_t       bytes_to_write = 0;
 size_t       bytes_written = 0;
 size_t       len            = 0;
    *output_len = 0;
 while (bytes_written != input_size)
    {
       bytes_to_write = (input_size - bytes_written > part_size ?
                         part_size :
                         input_size - bytes_written);
       status = psa_cipher_update(operation,
                                  input + bytes_written,

 else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
   {
 /* MAC verification failed */
       debugger_break();
   }
 else
   {
 /* All the operations succeeded for MAC verification */
```

```
    }
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.
 * It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.
 * It then re-imports that key, and performs signing and verification operations. */

Migrating to MbedTLS 3.6.0

MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS macro is disabled by default to handle shared memory in a secure manner. Note that this increases heap memory usage and code size. The macro can be enabled if all buffers passed to any PSA function reside in memory that is accessible only to the PSA function during its execution or if it possible otherwise for the user to conclude that the user buffers passed into PSA are secure from modification. Refer to https://github.com/Mbed-TLS/mbedtls-docs/blob/main/security-advisories/mbedtls-security-advisory-2024-03.md for more details.

psa_import_key() now only accepts RSA keys in the PSA standard formats. Applications that need other formats like: PKCS#8, SubjectPublicKey, PEM can call mbedtls_pk_parse_{public,}key() followed by mbedtls_pk_import_into_psa().

Function Documentation

◆ mbedtls_platform_setup()

int mbedtls_platform_setup (mbedtls_platform_context * *ctx*)

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};
/* Setup the platform; initialize the SCE and the TRNG */
if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

Return values

0	Initialization was successful.
MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED	SCE Initialization error.

◆ mbedtls_platform_teardown()

void mbedtls_platform_teardown (mbedtls_platform_context * *ctx*)

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the mbedtls_platform_setup() function, but currently is only a placeholder function.

Example:

```
/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);
```

Return values

N/A	

◆ RM_PSA_CRYPTO_TRNG_Read()

fsp_err_t RM_PSA_CRYPTO_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*, uint32_t * *p_num_gen_bytes*)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

5.2.15.4 Ocrypto (rm_ocrypto_port)

fsp_err_t	RM_OCRYPTO_PORT_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes) Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer. More...

Detailed Description

Ocrypto software only crypto on RA2E1.

Overview

Ocrypto is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP only on RA2E1.

Note

The Ocrypto port module does not provide any crypto interfaces to the user. See Ocrypto Licensed Functions.

Hardware Overview

Limited to RA2E1 only.

Features

For features supported by the software-only version, refer to the Ocrypto documentation.

Configuration

Build Time Configurations for rm_ocrypto_trng_port

The following build time configurations are defined in fsp_cfg/rm_ocrypto_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration for the AES-EBC, CBC, and CTR operations, choose Ocrypto (H/W Accelerated) from the stack options. Be sure to initialize the hardware

Usage Notes

Hardware Initialization

Invoke RM_OCRYPTO_PORT_Init() to initialize the hardware before using Ocrypto if the TRNG or if H/W Acceleration is to be used.

Random Number Generation

Use the RM_OCRYPTO_PORT_TRNG_Read() function to obtain random data from the TRNG hardware. If purely random data is sufficient for the application, then RM_OCRYPTO_PORT_TRNG_Read() can be used directly instead.

Memory Usage

Ocrypto does not use dynamic allocation so there is no heap requirement.

A minimum stack of 0x800 is required to use Ocrypto.

Side Channel Safety Statement

See Ocrypto Side Channel Safety Statement.

Function Overview

Limitations

Usage with RA2E1

Ocrypto can only be used on RA2E1.

Ocrypto

Ocrypto does provide any API to generate keys. It is the responsibility of the caller to provide generated keys.

AES Reentrancy

Use the S/W only stack if AES reentrancy is required in your application.

Examples

Ocrypto Library Examples

For examples of how to use Ocrypto APIs, see Ocrypto test code under ra/oberon/ocrypto/tests/. These tests are not meant to be built or run in FSP and have been compiled out by the macro OCRYPTO_REFERENCE_TEST_CODE_DOES_NOT_BUILD by default.

TRNG Example

This is an example on using Ocrypto to generate a random number

```
#define TEST_SECRET_KEY_SIZE 32U
#define TEST_PUBLIC_KEY_SIZE 64U
void ocrypto_trng_example (void)
{
 fsp_err_t status       = FSP_SUCCESS;
    uint8_t   ecdsa_msg[3] = "abc";
```

```
    uint8_t   secret_key[TEST_SECRET_KEY_SIZE];
    uint8_t   session_key[TEST_SECRET_KEY_SIZE];
    uint8_t   ecdsa_public_key[TEST_PUBLIC_KEY_SIZE];
    uint8_t   signature[TEST_PUBLIC_KEY_SIZE];
 /* Setup the platform; initialize the crypto engine. */
    status = RM_OCRYPTO_PORT_Init();
 if (FSP_SUCCESS != status)
    {
       assert(0);
    }
 /* Read random data from the TRNG to use as secret key. */
    status = RM_OCRYPTO_PORT_TRNG_Read(secret_key, sizeof(secret_key));
 if (FSP_SUCCESS != status)
    {
       assert(0);
    }
 if (0 != ocrypto_ecdsa_p256_public_key(ecdsa_public_key, secret_key))
    {
       assert(0);
    }
 /* Read random data from the TRNG to use as session key */
    status = RM_OCRYPTO_PORT_TRNG_Read(session_key, sizeof(session_key));
 if (FSP_SUCCESS != status)
    {
       assert(0);
    }
 if (0 != ocrypto_ecdsa_p256_sign(signature, ecdsa_msg, sizeof(ecdsa_msg),
secret_key, session_key))
    {
       assert(0);
    }
 if (0 != ocrypto_ecdsa_p256_verify(signature, ecdsa_msg, sizeof(ecdsa_msg),
ecdsa_public_key))
    {
```

```
      assert(0);
   }
/* Operation successful. */
while (1)
   {
      ;
   }
}
```

Function Documentation

◆ RM_OCRYPTO_PORT_Init()

fsp_err_t RM_OCRYPTO_PORT_Init ( )

Initialize the SCE.

Return values

FSP_SUCCESS	SCE initialized successfully

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_OCRYPTO_PORT_TRNG_Read()

fsp_err_t RM_OCRYPTO_PORT_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*)

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Parameters

[out]	p_rngbuf	Pointer to buffer to store generated random number
[in]	num_req_bytes	How many bytes of random numbers to generate

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

5.2.15.5 Renesas Secure IP (r_rsip_e11a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E11A) on RA MPUs.

Version

v2.0.0

The version that appears on the Components tab of the FSP Configuration editor is v2.0.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v6.0.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v6.0.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides RSIP-E11A CAVP Certified functions.

HW Overview

RSIP-E11A Protected Mode CAVP certification has been obtained using the RA4L1 as the target processor.

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - CTR 128/256bit
      - GCM 128/256bit

        - CCM 128/256bit
    - Asymmetric Encryption/Decryption
        - ECC
            - ECDSA
                - secp256r1
    - Key Agreement
        - ECDH
            - secp256r1
    - Key Derivation
        - Key Derivation Function (KDF) using SHA
            - SHA-256bit
        - Key Import by derived keying material
        - IV output by derived keying material
    - Public Key Infrastructure (PKI)
        - Certificate Verification
            - ECDSA
                - secp256r1
        - Key Import from Certificate
            - ECC
                - secp256r1
    - Hash Functions
        - SHA-2
            - SHA-224/256
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA224/256bit
    - AES-CMAC 128/256bit
- Key Manage
    - Key Support
        - AES 128/256bit
        - ECC
            - secp256r1
        - HMAC-SHA224/256bit
- Random Number Generate

Supported algorithms

The following algorithms are available on each devices.

- RSIP-E11A: RA4L1

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E11A
RSIP_KEY_TYPE_AES_128	Supported
RSIP_KEY_TYPE_AES_192	Not Supported
RSIP_KEY_TYPE_AES_256	Supported
RSIP_KEY_TYPE_XTS_AES_128	Not Supported
RSIP_KEY_TYPE_XTS_AES_256	Not Supported
RSIP_KEY_TYPE_HMAC_SHA224	Supported
RSIP_KEY_TYPE_HMAC_SHA256	Supported

RSIP_KEY_TYPE_HMAC_SHA384	Not Supported
RSIP_KEY_TYPE_HMAC_SHA512	Not Supported

Asymmetric Key

Key pair type (rsip_key_pair_type_t)	Public key type (rsip_key_type_t)	Private key type (rsip_key_type_t)	RSIP-E11A
RSIP_KEY_PAIR_TYPE_ECC_SECP256R1	RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP384R1	RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP521R1	RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP256K1	RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP256R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP384R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP512R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_RSA_2048	RSIP_KEY_TYPE_RSA_2048_PUBLIC	RSIP_KEY_TYPE_RSA_2048_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_RSA_3072	RSIP_KEY_TYPE_RSA_3072_PUBLIC	RSIP_KEY_TYPE_RSA_3072_PRIVATE	Not Supported
RSIP_KEY_PAIR_TYPE_RSA_4096	RSIP_KEY_TYPE_RSA_4096_PUBLIC	RSIP_KEY_TYPE_RSA_4096_PRIVATE	Not Supported

AES Block Cipher Mode of Operation

Cipher mode (rsip_aes_cipher_mode_t)	RSIP-E11A
RSIP_AES_CIPHER_MODE_ECB_ENC	Supported
RSIP_AES_CIPHER_MODE_ECB_DEC	Supported
RSIP_AES_CIPHER_MODE_CBC_ENC	Supported
RSIP_AES_CIPHER_MODE_CBC_DEC	Supported
RSIP_AES_CIPHER_MODE_CTR	Supported
RSIP_AES_CIPHER_MODE_XTS_ENC	Not Supported
RSIP_AES_CIPHER_MODE_XTS_DEC	Not Supported

AEAD mode (rsip_aes_aead_mode_t)	RSIP-E11A

RSIP_AES_AEAD_MODE_GCM_ENC	Supported
RSIP_AES_AEAD_MODE_GCM_DEC	Supported
RSIP_AES_AEAD_MODE_CCM_ENC	Supported
RSIP_AES_AEAD_MODE_CCM_DEC	Supported

MAC mode (rsip_aes_mac_mode_t)	RSIP-E11A
RSIP_AES_MAC_MODE_CMAC	Supported

Configuration

Build Time Configurations for r_rsip_e11a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	Enabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

ECC BRAINPOOLP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP-E11A Protected Mode (CAVP Certified)

This module can be added to the Stacks tab via New Stack > Security > RSIP-E11A Protected Mode (CAVP Certified).

Configuration	Options	Default	Description

General			
Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E11A Protected Mode (CAVP Certified).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_SHA	Computing KDF SHA.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part

operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
```

```
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define GCM_BLOCK_LEN (16)
#define GCM_TEXT_LEN (31)
#define GCM_NONCE_LEN (12)
#define GCM_AAD_LEN (8)

5.2.15.6 Renesas Secure IP (r_rsip_e51a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E51A) on RA MPUs.

Version

v1.5.0

The version that appears on the Components tab of the FSP Configuration editor is v1.5.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v5.8.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v5.8.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides RSIP-E51A CAVP Certified functions.

HW Overview

RSIP-E51A Protected Mode CAVP certification has been obtained using the RA8M1 as the target processor.

Crypto Peripheral version	Devices
RSIP-E51A	RA8M1, RA8D1, RA8T1

Features

The RSIP module supports for the following features.

- Cryptography
    - Symmetric Encryption/Decryption
        - AES
            - ECB 128/256bit
            - CBC 128/256bit
            - CTR 128/256bit
            - GCM 128/256bit
            - CCM 128/256bit
            - XTS 128/256bit
    - Asymmetric Encryption/Decryption
        - RSA
            - RSAES-PKCS1-V1_5 2048/3072/4096bit
            - RSAES-OAEP 2048/3072/4096bit
            - RSASSA-PKCS1-V1_5 2048/3072/4096bit
            - RSASSA-PSS 2048/3072/4096bit
        - ECC
            - ECDSA
                - secp256r1/secp384r1/secp521r1
                - secp256k1
                - brainpool P256r1/P384r1/P512r1
            - ECDH
                - secp256r1/secp384r1/secp521r1
    - Hash Functions
        - SHA-2
            - SHA-256/384/512
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA256/384/512bit
    - AES-CMAC 128/256bit
- Key Manage
    - Key Support
        - AES 128/256bit
        - RSA 2048/3072/4096bit
        - ECC
            - secp256r1/secp384r1/secp521r1
            - secp256k1
            - brainpool P256r1/P384r1/P512r1
        - HMAC-SHA256/384/512bit
- Random Number Generate

Supported algorithms

The following algorithms are available on each devices.

- RSIP-E51A: RA8M1, RA8D1, RA8T1

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E51A
RSIP_KEY_TYPE_AES_128	Supported
RSIP_KEY_TYPE_AES_256	Supported
RSIP_KEY_TYPE_XTS_AES_128	Supported
RSIP_KEY_TYPE_XTS_AES_256	Supported

RSIP_KEY_TYPE_HMAC_SHA224	Not Supported
RSIP_KEY_TYPE_HMAC_SHA256	Supported
RSIP_KEY_TYPE_HMAC_SHA384	Supported
RSIP_KEY_TYPE_HMAC_SHA512	Supported

Asymmetric Key

Key pair type (rsip_key_pair_type_t)	Public key type (rsip_key_type_t)	Private key type (rsip_key_type_t)	RSIP-E51A
RSIP_KEY_PAIR_TYPE_ECC_SECP256R1	RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP384R1	RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP521R1	RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP256K1	RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP256R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP384R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP512R1	RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_RSA_2048	RSIP_KEY_TYPE_RSA_2048_PUBLIC	RSIP_KEY_TYPE_RSA_2048_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_RSA_3072	RSIP_KEY_TYPE_RSA_3072_PUBLIC	RSIP_KEY_TYPE_RSA_3072_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_RSA_4096	RSIP_KEY_TYPE_RSA_4096_PUBLIC	RSIP_KEY_TYPE_RSA_4096_PRIVATE	Supported

AES Block Cipher Mode of Operation

Cipher mode (rsip_aes_cipher_mode_t)	RSIP-E51A
RSIP_AES_CIPHER_MODE_ECB_ENC	Supported
RSIP_AES_CIPHER_MODE_ECB_DEC	Supported
RSIP_AES_CIPHER_MODE_CBC_ENC	Supported
RSIP_AES_CIPHER_MODE_CBC_DEC	Supported
RSIP_AES_CIPHER_MODE_CTR	Supported
RSIP_AES_CIPHER_MODE_XTS_ENC	Supported

RSIP_AES_CIPHER_MODE_XTS_DEC	Supported

AEAD mode (rsip_aes_aead_mode_t)	RSIP-E51A
RSIP_AES_AEAD_MODE_GCM_ENC	Supported
RSIP_AES_AEAD_MODE_GCM_DEC	Supported
RSIP_AES_AEAD_MODE_CCM_ENC	Supported
RSIP_AES_AEAD_MODE_CCM_DEC	Supported

MAC mode (rsip_aes_mac_mode_t)	RSIP-E51A
RSIP_AES_MAC_MODE_CMAC	Supported

Hash Function

Hash Function (rsip_hash_type_t)	RSIP-E51A
RSIP_HASH_TYPE_SHA224	Not Supported
RSIP_HASH_TYPE_SHA256	Supported
RSIP_HASH_TYPE_SHA384	Supported
RSIP_HASH_TYPE_SHA512	Supported

Configuration

Build Time Configurations for r_rsip_e51a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	Enabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP-E51A Protected Mode (CAVP Certified)

This module can be added to the Stacks tab via New Stack > Security > RSIP-E51A Protected Mode (CAVP Certified).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E51A Protected Mode (CAVP Certified).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).

STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */
```

```
uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);

Detailed Description

Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.

Overview

This module provides RSIP functions in protected mode.

HW Overview

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1
RSIP-E31A	RA4C1
RSIP-E51A	RA8M1, RA8D1, RA8T1
RSIP-E50D	RA8P1, RA8T2

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/192/256bit
      - CBC 128/192/256bit
      - CTR 128/192/256bit
      - GCM 128/192/256bit
      - CCM 128/192/256bit
      - XTS 128/256bit
    - ChaCha

        - ChaCha20
    - Asymmetric Encryption/Decryption
        - RSA
            - RSAES-PKCS1-V1_5 2048/3072/4096bit
            - RSAES-OAEP 2048/3072/4096bit
            - RSASSA-PKCS1-V1_5 2048/3072/4096bit
            - RSASSA-PSS 2048/3072/4096bit
        - ECC
            - ECDSA
                - secp256r1/secp384r1/secp521r1
                - secp256k1
                - brainpool P256r1/P384r1/P512r1
            - EdDSA
                - Ed25519
    - Key Agreement
        - ECDH
            - secp256r1/secp384r1/secp521r1
            - brainpool P256r1/P384r1
    - Key Derivation
        - Key Derivation Function (KDF) using SHA
            - SHA-256/384bit
        - Key Derivation Function (KDF) using HMAC
            - HMAC-SHA256/384/512bit
        - Key Import by derived keying material
        - IV output by derived keying material
    - Public Key Infrastructure (PKI)
        - Certificate Verification
            - ECDSA
                - secp256r1/secp384r1/secp521r1
                - brainpool P256r1/P384r1
        - Key Import from Certificate
            - ECC
                - secp256r1/secp384r1/secp521r1
                - brainpool P256r1/P384r1
    - Hash Functions
        - SHA-2
            - SHA-224, 256, 384, 512, 512/224, 512/256
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA224/256/384/512bit
    - AES-CMAC 128/192/256bit
- Key Manage
    - Key Support
        - AES 128/192/256bit
        - RSA 2048/3072/4096bit
        - ECC
            - secp256r1/secp384r1/secp521r1
            - secp256k1
            - brainpool P256r1/P384r1/P512r1
        - HMAC-SHA224/256/384/512bit
- Random Number Generate
- Secure boot for FSBL
    - Manifest verification and MAC generation (Refer to Application Note R11AN0774.)

Supported algorithms

The following algorithms are available on each devices.

- RSIP-E11A: RA4L1
- RSIP-E31A: RA4C1
- RSIP-E51A: RA8M1, RA8D1, RA8T1
- RSIP-E50D: RA8P1, RA8T2

Symmetric Key

Configuration

Build Time Configurations for r_rsip_e11a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
SHA-512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e31a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses

			only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
HMAC_SHA224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e51a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled	Enabled	If the application uses

	• Disabled		only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e50d_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP Protected Mode (r_rsip_protected).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_CHACHA	Computing ChaCha.
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_SHA	Computing KDF SHA.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
```

```
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
```

```
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define GCM_BLOCK_LEN (16)
#define GCM_TEXT_LEN (31)
#define GCM_NONCE_LEN (12)
#define GCM_AAD_LEN (8)
#define GCM_TAG_LEN (8)
void r_rsip_example_gcm ()
{
```

```
 fsp_err_t            err;
 static const uint8_t plain[GCM_TEXT_LEN] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e,
    };
 static const uint8_t aad[GCM_AAD_LEN] BSP_ALIGN_VARIABLE(4) =
    {
       0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07
    };
    uint8_t nonce[GCM_BLOCK_LEN] BSP_ALIGN_VARIABLE(4)                = {0};
    uint8_t tag[GCM_BLOCK_LEN] BSP_ALIGN_VARIABLE(4)                   = {0};
    uint8_t cipher_calculated[GCM_BLOCK_LEN * 2] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t plain_calculated[GCM_BLOCK_LEN * 2] BSP_ALIGN_VARIABLE(4) = {0};
    uint32_t input_length      = 0;
    uint32_t output_length    = 0;
    uint32_t input_length_tmp = 0;
    uint32_t output_length_tmp = 0;
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);

Verified certificate information

◆ rsip_wrapped_secret_t

struct rsip_wrapped_secret_t
Wrapped ECDH secret structure for ECDH and KDF APIs.

◆ rsip_instance_ctrl_t

struct rsip_instance_ctrl_t
RSIP private control block. DO NOT MODIFY. Initialization occurs when R_RSIP_Open() is called.

Macro Definition Documentation

◆ RSIP_BYTE_SIZE_PLAIN_KEY

#define RSIP_BYTE_SIZE_PLAIN_KEY (key_type)
Returns the plain key size formatted for RSIP driver of the key type.

◆ RSIP_BYTE_SIZE_ENCRYPTED_KEY

#define RSIP_BYTE_SIZE_ENCRYPTED_KEY (key_type)
Returns the encrypted key size of the key type.

◆ RSIP_BYTE_SIZE_WRAPPED_KEY

#define RSIP_BYTE_SIZE_WRAPPED_KEY (key_type)
Returns the wrapped key size of the key type.

Enumeration Type Documentation

◆ rsip_byte_size_wrapped_key_t

enum rsip_byte_size_wrapped_key_t	
Byte size of wrapped key	
Enumerator	
RSIP_BYTE_SIZE_WRAPPED_KEY_AES_128	AES-128.
RSIP_BYTE_SIZE_WRAPPED_KEY_AES_192	AES-192.
RSIP_BYTE_SIZE_WRAPPED_KEY_AES_256	AES-256.
RSIP_BYTE_SIZE_WRAPPED_KEY_XTS_AES_128	XTS-AES-128.
RSIP_BYTE_SIZE_WRAPPED_KEY_XTS_AES_256	XTS-AES-256.
RSIP_BYTE_SIZE_WRAPPED_KEY_CHACHA20	ChaCha20.
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP256R1_PUBLIC	secp256r1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP384R1_PUBLIC	secp384r1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP521R1_PUBLIC	secp521r1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP256K1_PUBLIC	secp256k1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_BRAINPOOLP256R1_PUBLIC	brainpoolP256r1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_BRAINPOOLP384R1_PUBLIC	brainpoolP384r1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_BRAINPOOLP512R1_PUBLIC	brainpoolP512r1 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_EDWARDS25519_PUBLIC	edwards25519 public key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP256R1_PRIVATE	secp256r1 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP384R1_PRIVATE	secp384r1 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP521R1_PRIVATE	secp521r1 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_SECP256K1_PRIVATE	secp256k1 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_BRAINPOOLP256R1_PRIVATE	brainpoolP256r1 private key

RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_BRAINPOOLP384R1_PRIVATE	brainpoolP384r1 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_BRAINPOOLP512R1_PRIVATE	brainpoolP512r1 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_ECC_EDWARDS25519_PRIVATE	edwards25519 private key
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_1024_PUBLIC	RSA-1024 public key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_2048_PUBLIC	RSA-2048 public key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_3072_PUBLIC	RSA-3072 public key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_4096_PUBLIC	RSA-4096 public key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_1024_PRIVATE	RSA-1024 private key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_2048_PRIVATE	RSA-2048 private key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_3072_PRIVATE	RSA-3072 private key.
RSIP_BYTE_SIZE_WRAPPED_KEY_RSA_4096_PRIVATE	RSA-4096 private key.
RSIP_BYTE_SIZE_WRAPPED_KEY_HMAC_SHA1	HMAC-SHA1.
RSIP_BYTE_SIZE_WRAPPED_KEY_HMAC_SHA224	HMAC-SHA224.
RSIP_BYTE_SIZE_WRAPPED_KEY_HMAC_SHA256	HMAC-SHA256.
RSIP_BYTE_SIZE_WRAPPED_KEY_HMAC_SHA384	HMAC-SHA384.
RSIP_BYTE_SIZE_WRAPPED_KEY_HMAC_SHA512	HMAC-SHA512.
RSIP_BYTE_SIZE_WRAPPED_KEY_KDF_HMAC_SHA256	KDF HMAC-SHA256.
RSIP_BYTE_SIZE_WRAPPED_KEY_KDF_HMAC_SHA384	KDF HMAC-SHA384.
RSIP_BYTE_SIZE_WRAPPED_KEY_KDF_HMAC_SHA512	KDF HMAC-SHA512.
RSIP_BYTE_SIZE_WRAPPED_KEY_KUK	Key Update Key (KUK)

◆ rsip_byte_size_encrypted_key_t

enum rsip_byte_size_encrypted_key_t	
Byte size of encrypted key	
Enumerator	
RSIP_BYTE_SIZE_ENCRYPTED_KEY_AES_128	AES-128.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_AES_192	AES-192.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_AES_256	AES-256.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_XTS_AES_128	XTS-AES-128.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_XTS_AES_256	XTS-AES-256.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_CHACHA20	ChaCha20.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP256R1_PUBLIC	secp256r1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP384R1_PUBLIC	secp384r1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP521R1_PUBLIC	secp521r1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP256K1_PUBLIC	secp256k1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_BRAINPOOLP256R1_PUBLIC	brainpoolP256r1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_BRAINPOOLP384R1_PUBLIC	brainpoolP384r1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_BRAINPOOLP512R1_PUBLIC	brainpoolP512r1 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_EDWARDS25519_PUBLIC	edwards25519 public key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP256R1_PRIVATE	secp256r1 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP384R1_PRIVATE	secp384r1 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP521R1_PRIVATE	secp521r1 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_SECP256K1_PRIVATE	secp256k1 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_BRAINPO	brainpoolP256r1 private key

OLP256R1_PRIVATE	
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_BRAINPOOLP384R1_PRIVATE	brainpoolP384r1 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_BRAINPOOLP512R1_PRIVATE	brainpoolP512r1 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_ECC_EDWARDS25519_PRIVATE	edwards25519 private key
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_1024_PUBLIC	RSA-1024 public key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_2048_PUBLIC	RSA-2048 public key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_3072_PUBLIC	RSA-3072 public key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_4096_PUBLIC	RSA-4096 public key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_1024_PRIVATE	RSA-1024 private key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_2048_PRIVATE	RSA-2048 private key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_3072_PRIVATE	RSA-3072 private key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_RSA_4096_PRIVATE	RSA-4096 private key.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_HMAC_SHA1	HMAC-SHA1.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_HMAC_SHA224	HMAC-SHA224.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_HMAC_SHA256	HMAC-SHA256.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_HMAC_SHA384	HMAC-SHA384.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_HMAC_SHA512	HMAC-SHA512.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_KDF_HMAC_SHA256	KDF HMAC-SHA256.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_KDF_HMAC_SHA384	KDF HMAC-SHA384.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_KDF_HMAC_SHA512	KDF HMAC-SHA512.
RSIP_BYTE_SIZE_ENCRYPTED_KEY_KUK	Key Update Key (KUK)

◆ rsip_byte_size_wrapped_dkm_t

enum rsip_byte_size_wrapped_dkm_t	
Byte size of wrapped key	
Enumerator	
RSIP_BYTE_SIZE_WRAPPED_DKM_HEADER	Header.
RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA256	A block of SHA-256.
RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA384	A block of SHA-384.
RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA512	A block of SHA-384.

Function Documentation

◆ R_RSIP_Open()

fsp_err_t R_RSIP_Open (rsip_ctrl_t *const *p_ctrl*, rsip_cfg_t const *const *p_cfg*)

Enables use of Renesas Secure IP functionality.

Implements rsip_api_t::open.

State transition

This API can only be executed in **STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Internal key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Hardware initialization is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption or hardware fault is detected.

Note

This version does not have an optional feature to disable TRNG initialization.

◆ R_RSIP_Close()

fsp_err_t R_RSIP_Close (rsip_ctrl_t *const *p_ctrl*)

Disables use of Renesas Secure IP functionality.

Implements rsip_api_t::close.

State transition

This API can be executed in **except STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_INITIAL
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RandomNumberGenerate()

fsp_err_t R_RSIP_RandomNumberGenerate (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_random*)

Generates a 128-bit random number.

Implements rsip_api_t::randomNumberGenerate.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyGenerate()

fsp_err_t R_RSIP_KeyGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t *const *p_wrapped_key*)

Generates a wrapped symmetric key from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyGenerate.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256
- RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyPairGenerate()

fsp_err_t R_RSIP_KeyPairGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t *const *p_wrapped_public_key*, rsip_wrapped_key_t *const *p_wrapped_private_key*)

Generates a wrapped asymmetric key pair from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyPairGenerate.

Conditions

Argument p_wrapped_public_key->type must be one of the following:

- RSIP_KEY_TYPE_ECC_*_PUBLIC
- RSIP_KEY_TYPE_RSA_*_PUBLIC Argument p_wrapped_private_key->type must be one of the following:
- RSIP_KEY_TYPE_ECC_*_PRIVATE
- RSIP_KEY_TYPE_RSA_*_PRIVATE Here, p_wrapped_public_key->type and p_wrapped_private_key->type must match. For example, if p_wrapped_public_key->type is RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC, then p_wrapped_public_key->type must be RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_EncryptedKeyWrap()

fsp_err_t R_RSIP_EncryptedKeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_key_update_key*, void const *const *p_initial_vector*, void const *const *p_encrypted_key*, rsip_wrapped_key_t *const *p_wrapped_key*)

Decrypts an encrypted user key with Key Update Key (KUK) and wrap it with the Hardware Unique Key (HUK).

Implements rsip_api_t::encryptedKeyWrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input KUK is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyWrap()

fsp_err_t R_RSIP_RFC3394_KeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_wrapped_key_t const *const *p_wrapped_target_key*, uint8_t *const *p_rfc3394_wrapped_target_key*)

This function provides Key Wrap algorithm compliant with RFC3394. Using p_wrapped_kek to wrap p_wrapped_target_key, and output the result to p_rfc3394_wrapped_target_key.

Implements rsip_api_t::rfc3394_KeyWrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Conditions

- Key type of p_wrapped_kek must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256
- Key type of p_wrapped_target_key must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyUnwrap()

fsp_err_t R_RSIP_RFC3394_KeyUnwrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, uint8_t const *const *p_rfc3394_wrapped_target_key*, rsip_wrapped_key_t *const *p_wrapped_target_key*)

This function provides Key Unwrap algorithm compliant with RFC3394. Using p_wrapped_kek to unwrap p_rfc3394_wrapped_target_key, and output the result to p_wrapped_target_key.

Implements rsip_api_t::rfc3394_KeyUnwrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Conditions

- Key type of p_wrapped_kek must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256
- The third argument key_type represents the key type of p_rfc3394_wrapped_target_key must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PublicKeyExport()

fsp_err_t R_RSIP_PublicKeyExport (rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t *const *p_raw_public_key*)

Exports public key parameters from a wrapped key.

Implements rsip_api_t::publicKeyExport.

Relative position of each elements in p_raw_public_key is shown in below:

- ECC (RSIP_KEY_TYPE_ECC_*) : Qx placed first and Qy placed after that.

bit length	Qx	Qy
256	0	32
384	0	48
512	0	64
521	0	66

- RSA (RSIP_KEY_TYPE_RSA_*) : n placed first and e placed after that.

modulus	n	e
1024	0	128
2048	0	256
3072	0	384
4096	0	512

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_Cipher_Init()

fsp_err_t R_RSIP_AES_Cipher_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_cipher_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_initial_vector*)

Starts AES cipher operation in confidentiality mode (ECB/CBC/CTR) or XTS mode.

Implements rsip_api_t::aesCipherInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_192, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256

Argument mode must be the following:

- AES key
  - RSIP_AES_CIPHER_MODE_ECB_ENC, RSIP_AES_CIPHER_MODE_ECB_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC, RSIP_AES_CIPHER_MODE_CBC_DEC
  - RSIP_AES_CIPHER_MODE_CTR
- XTS-AES key
  - RSIP_AES_CIPHER_MODE_XTS_ENC, RSIP_AES_CIPHER_MODE_XTS_DEC

Argument p_initial_vector must be the following:

- [ECB] Not used
- [CBC] Raw initial vector
- [CTR] Raw nonce
- [XTS] Raw initial vector

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_Cipher_Update()

fsp_err_t R_RSIP_AES_Cipher_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint8_t *const *p_output*, uint32_t const *length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesCipherUpdate.

Conditions

Argument length must be the following:

- [ECB][CBC][CTR] 0 or a multiple of 16.
- [XTS] 0 or greater than or equal to 16.

Output length

Output length to p_output is length.

State transition

This API can only be executed in **STATE_AES**, and does not cause any state transitions.

In XTS mode, if once an integer other than 0 or a multiple of 16 is input, this API can no longer be called.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_Cipher_Finish()

fsp_err_t R_RSIP_AES_Cipher_Finish (rsip_ctrl_t *const *p_ctrl*)

Finishes AES operation.

Implements rsip_api_t::aesCipherFinish.

State transition

This API can only be executed in **STATE_AES**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Init()

fsp_err_t R_RSIP_AES_AEAD_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_aead_mode_t *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length*)

Starts AES AEAD function.

Implements rsip_api_t::aesAeadInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_192

- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

Argument nonce_length must be the following:

- [GCM] Any length is accepted, but 12 bytes is generally recommended.
- [CCM] 7 to 13 bytes.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_AEAD
Others	No change

The next callable API functions in STATE_AES_AEAD are as below.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_LengthsSet()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	nonce_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_LengthsSet()

fsp_err_t R_RSIP_AES_AEAD_LengthsSet (rsip_ctrl_t *const *p_ctrl*, uint32_t const *total_aad_length*, uint32_t const *total_text_length*, uint32_t const *tag_length*)

Sets text and tag lengths for CCM mode.

Implements rsip_api_t::aesAeadLengthsSet.

Conditions

Argument total_aad_length must be equal to the length of AAD and must be 110 or less.

Argument total_test_length must be equal to the length of the plaintext or ciphertext.

Argument tag_length must be 4, 6, 8, 10, 12, 14, or 16.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

The next callable API functions in STATE_AES_AEAD are as below.

- [CCM] R_RSIP_AES_AEAD_AADUpdate()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, this API must NOT be called. If called, FSP_ERR_INVALID_STATE will be returned. AAD length and text length are indeterminate and output tag length is fixed to 16 bytes.

◆ R_RSIP_AES_AEAD_AADUpdate()

fsp_err_t R_RSIP_AES_AEAD_AADUpdate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length*)

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::aesAeadAadUpdate.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_AADUpdate() (AAD input is not completed), R_RSIP_AES_AEAD_Update() (AAD input is completed)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	aad_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

◆ R_RSIP_AES_AEAD_Update()

fsp_err_t R_RSIP_AES_AEAD_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesAeadUpdate.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 16 bytes.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_Update() (text input is not completed), R_RSIP_AES_AEAD_Finish() (text input is completed, encryption), R_RSIP_AES_AEAD_Verify() (text input is completed, decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, if this API is skipped, GMAC will be calculated. For detailed usage, refer to example code.

◆ R_RSIP_AES_AEAD_Finish()

fsp_err_t R_RSIP_AES_AEAD_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag*)

Finalizes an AES AEAD encryption.

Implements rsip_api_t::aesAeadFinish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag as below.

- [GCM] 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Verify()

fsp_err_t R_RSIP_AES_AEAD_Verify (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length*)

Finalizes an AES AEAD decryption.

If there is 16-byte fractional data indicated by the total data length of the value of p_cipher that was input by R_RSIP_AES_GCM_DecryptUpdate(), this API will output the result of decrypting that fractional data to p_cipher. Here, the portion that does not reach 16 bytes will be padded with zeros.

Implements rsip_api_t::aesAeadVerify.

Conditions

Argument tag_length must be as below.

- [GCM] 1 to 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	tag_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_Init()

fsp_err_t R_RSIP_AES_MAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_mac_mode_t const *mode*, rsip_wrapped_key_t const *const p_wrapped_key*)

Starts an AES MAC operation.

Implements rsip_api_t::aesMacInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_192
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_MAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

To calculate AES-GMAC, please use not R_RSIP_MAC_*() but R_RSIP_AEAD_*(). For detailed usage, refer to example code.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_MAC_Update()

fsp_err_t R_RSIP_AES_MAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::aesMacUpdate.

Inside this function, the data that is input by the user is buffered until the input value of p_message exceeds 16 bytes. If the input value, p_message, is not a multiple of 16 bytes, it will be padded within the function.

State transition

This API can only be executed in **STATE_AES_MAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_AES_MAC_SignFinish()

fsp_err_t R_RSIP_AES_MAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs AES MAC.

Implements rsip_api_t::aesMacSignFinish.

Output length

Output length to p_mac is 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_VerifyFinish()

fsp_err_t R_RSIP_AES_MAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies AES MAC.

Implements rsip_api_t::aesMacVerifyFinish.

Conditions

Argument mac_length must be as below.

- [CMAC] 2 to 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Init()

fsp_err_t R_RSIP_ChaCha20_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *counter*)

Prepares a ChaCha20 function.

Implements rsip_api_t::chacha20Init.

Conditions

Key type of p_wrapped_key must be RSIP_KEY_TYPE_CHACHA20.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_CHACHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Update()

fsp_err_t R_RSIP_ChaCha20_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::chacha20Update.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 64 bytes.

State transition

This API can only be executed in **RSIP_STATE_CHACHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_ChaCha20_Finish()

fsp_err_t R_RSIP_ChaCha20_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Finalize ChaCha20 operation.

Implements rsip_api_t::chacha20Finish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **RSIP_STATE_CHACHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDSA_Sign()

fsp_err_t R_RSIP_ECDSA_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Generates an ECDSA signature.

Implements rsip_api_t::ecdsaSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature generation is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_ECDSA_Verify()

fsp_err_t R_RSIP_ECDSA_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies an ECDSA signature.

Implements rsip_api_t::ecdsaVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_PKI_ECDSA_CertVerify()

fsp_err_t R_RSIP_PKI_ECDSA_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a public key certificate with ECDSA.

Implements rsip_api_t::pkiEcdsaCertVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PureEdDSA_Sign()

fsp_err_t R_RSIP_PureEdDSA_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_message*, uint64_t const *message_length*, uint8_t *const *p_signature*)

Generates an EdDSA signature.

Implements rsip_api_t::eddsaSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_EDWARDS25519_PRIVATE

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_EDWARDS25519_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_PureEdDSA_Verify()

fsp_err_t R_RSIP_PureEdDSA_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_message*, uint64_t const *message_length*, uint8_t const *const *p_signature*)

Verifies an EdDSA signature.

Implements rsip_api_t::eddsaVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_EDWARDS25519_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_ECDH_KeyAgree()

fsp_err_t R_RSIP_ECDH_KeyAgree (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret*)

Computes ECDH secret with wrapped private key and wrapped public key.

Implements rsip_api_t::ecdhKeyAgree.

Conditions

Key type of p_wrapped_private_key and p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDH_PlainKeyAgree()

fsp_err_t R_RSIP_ECDH_PlainKeyAgree (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_plain_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret*)

Computes ECDH secret with wrapped private key and plain public key.

Implements rsip_api_t::ecdhPlainKeyAgree.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

For secp521r1 operation, the length of the argument p_plain_public_key must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	public_key Qx (521 bit)	zero padding (7 bit)	public_key Qy (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

Unauthenticated public key of Diffie–Hellman key exchange generally carry the risk of man-in-the-middle (MITM) attack. Please use R_RSIP_ECDH_KeyAgree() or implement signature verification whenever possible.

◆ R_RSIP_KDF_SHA_Init()

fsp_err_t R_RSIP_KDF_SHA_Init (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*)

Prepares a SHA generation.

Implements rsip_api_t::kdfShaInit.

Conditions

Argument hash_type must be one of the following:
- RSIP_HASH_TYPE_SHA256
- RSIP_HASH_TYPE_SHA384

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

◆ R_RSIP_KDF_SHA_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_SHA_ECDHSecretUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*)

Inputs wrapped ECDH secret as a message. Input the messages required to perform the SHA operation using this API and R_RSIP_KDF_SHA_Update() in the desired order.

Implements rsip_api_t::kdfShaEcdhSecretUpdate.

Conditions

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree(). This API can only be called if there is no previous message input, or if a 4-byte message has been input using R_RSIP_KDF_SHA_Update(). This API cannot be called multiple times in a process of performing SHA operation.

State transition

This API can only be executed in **STATE_KDF_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Update()

fsp_err_t R_RSIP_KDF_SHA_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message. Input the messages required to perform the SHA operation using this API and R_RSIP_KDF_SHA_ECDHSecretUpdate() in the desired order.

Implements rsip_api_t::kdfShaUpdate.

State transition

This API can only be executed in **STATE_KDF_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	Input message_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

For RSIP-E11A, the total message length that can be input is the block size of the SHA algorithm used.

◆ R_RSIP_KDF_SHA_Finish()

fsp_err_t R_RSIP_KDF_SHA_Finish (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t *const *p_wrapped_dkm*)

Finalizes a SHA operation and generate DKM (Derived Keying Material).

Implements rsip_api_t::kdfShaFinish.

State transition

This API can only be executed in **STATE_KDF_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Suspend()

fsp_err_t R_RSIP_KDF_SHA_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_sha_handle_t *const *p_handle*)

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfShaSuspend.

State transition

This API can only be executed in **STATE_KDF_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Resume()

fsp_err_t R_RSIP_KDF_SHA_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_sha_handle_t const *const *p_handle*)

Resumes SHA operation suspended by R_RSIP_KDF_SHA_Suspend().

Implements rsip_api_t::kdfShaResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_HMAC_DKMKeyImport()

fsp_err_t R_RSIP_KDF_HMAC_DKMKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, uint32_t const *key_length*, rsip_wrapped_key_t *const *p_wrapped_key*)

Converts wrapped MAC to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfHmacDkmKeyImport.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_KDF_HMAC_SHA256
- RSIP_KEY_TYPE_KDF_HMAC_SHA384
- RSIP_KEY_TYPE_KDF_HMAC_SHA512

The argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish().

Argument kdf_data_length depends on key type.

- 32 to 64 (RSIP_KEY_TYPE_KDF_HMAC_SHA256)
- 48 to 64 (RSIP_KEY_TYPE_KDF_HMAC_SHA384)
- 64 (RSIP_KEY_TYPE_KDF_HMAC_SHA512)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_ECDHSecretKeyImport()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*, rsip_wrapped_key_t *const *p_wrapped_key*)

Converts wrapped ECDH secret to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfHmacEcdhSecretKeyImport.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_KDF_HMAC_SHA256
- RSIP_KEY_TYPE_KDF_HMAC_SHA384
- RSIP_KEY_TYPE_KDF_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Init()

fsp_err_t R_RSIP_KDF_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Prepares a HMAC generation.

Implements rsip_api_t::kdfHmacInit.

Conditions

Argument p_wrapped_key must be one of the following:
- Output data p_wrapped_key from R_RSIP_KDF_ECDHSecretKeyImport().
- Key type of p_wrapped_key is RSIP_KEY_TYPE_HMAC_*.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

◆ R_RSIP_KDF_HMAC_DKMUpdate()

fsp_err_t R_RSIP_KDF_HMAC_DKMUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*)

Inputs wrapped Derived Keying Material (DKM) as a message.

Implements rsip_api_t::kdfHmacDkmUpdate.

Conditions

The argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_HMAC_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*)

Inputs wrapped ECDH secret as a message.

Implements rsip_api_t::kdfHmacEcdhSecretUpdate.

Conditions

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree().

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Update()

fsp_err_t R_RSIP_KDF_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::kdfHmacUpdate.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_SignFinish()

fsp_err_t R_RSIP_KDF_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t *const *p_wrapped_dkm*)

Finalizes a HMAC generation.

Implements rsip_api_t::kdfHmacSignFinish.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Suspend()

fsp_err_t R_RSIP_KDF_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfHmacSuspend.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Resume()

fsp_err_t R_RSIP_KDF_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_KDF_HMAC_Suspend().

Implements rsip_api_t::kdfHmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_DKMConcatenate()

fsp_err_t R_RSIP_KDF_DKMConcatenate (rsip_wrapped_dkm_t *const *p_wrapped_dkm1*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm2*, uint32_t const *wrapped_dkm1_buffer_length*)

Concatenates two wrapped derived keying materials (DKMs).

DKM1 || DKM2 is output to p_wrapped_dkm1.

Implements rsip_api_t::kdfDkmConcatenate.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.

◆ R_RSIP_KDF_DerivedKeyImport()

fsp_err_t R_RSIP_KDF_DerivedKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, uint32_t const *position*, rsip_wrapped_key_t *const *p_wrapped_key*)

Outputs a wrapped key from KDF output.

Implements rsip_api_t::kdfDerivedKeyImport.

Conditions

Argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_MACConcatenate(). Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_DerivedIVWrap()

fsp_err_t R_RSIP_KDF_DerivedIVWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, rsip_initial_vector_type_t const *initial_vector_type*, uint32_t const *position*, uint8_t const *const *p_tls_sequence_num*, uint8_t *const *p_wrapped_initial_vector*)

Outputs a initial vector from KDF output.

Implements rsip_api_t::kdfDerivedIvWrap

Conditions

Argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_MACConcatenate(). Argument initial_vector_type must be one of the following:

- RSIP_INITIAL_VECTOR_TYPE_AES_16_BYTE

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_OTF_Init()

fsp_err_t R_RSIP_OTF_Init (rsip_ctrl_t *const *p_ctrl*, rsip_otf_channel_t const *channel*, rsip_wrapped_key_t *const *p_wrapped_key*, uint8_t const *const *p_seed*)

Initialize on-the-fly decryption on RSIP. Implements rsip_api_t::otfInit.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled or selected channel is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms

Attention

This function is only part of on-the-fly decryption activation process and intended to be called from a higher level FSP module. Even if a user calls this function directly, the feature will not be enabled.

◆ R_RSIP_PKI_VerifiedCertInfoExport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoExport (rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t *const *p_verified_cert_info*)

Exports verified certificate information stored in this driver.

The certificate is last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), R_RSIP_PKI_RSASSA_PSS_CertVerify(), or R_RSIP_PKI_VerifiedCertInfoImport().

Implements rsip_api_t::pkiVerifiedCertInfoExport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.

◆ R_RSIP_PKI_VerifiedCertInfoImport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoImport (rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t const *const *p_verified_cert_info*)

Imports verified certificate information.

Implements rsip_api_t::pkiVerifiedCertInfoImport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.

◆ R_RSIP_PKI_CertKeyImport()

fsp_err_t R_RSIP_PKI_CertKeyImport (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_cert*, uint32_t const *cert_length*, uint8_t const *const *p_key_param1*, uint32_t const *key_param1_length*, uint8_t const *const *p_key_param2*, uint32_t const *key_param2_length*, rsip_hash_type_t const *hash_function*, rsip_wrapped_key_t *const *p_wrapped_public_key*)

Wraps the public key in the verified public key certificate.

Implements rsip_api_t::pkiCertKeyImport.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

- *Argument p_cert must correspond to the signature of the last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), or R_RSIP_PKI_RSASSA_PSS_CertVerify().*
- *For arguments p_key_param1 and p_key_param2, specify an address inside the certificate. Addresses outside the certificate are invalid.*

Section Supported Algorithms

◆ R_RSIP_RSA_Encrypt()

fsp_err_t R_RSIP_RSA_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint8_t *const *p_cipher*)

Encrypts plaintext with raw RSA.

Implements rsip_api_t::rsaEncrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSAEP/RSAVP1). It should be used in conjunction with any padding scheme.

See also

Section Supported Algorithms.

◆ R_RSIP_RSA_Decrypt()

fsp_err_t R_RSIP_RSA_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*)

Decrypts ciphertext with raw RSA.

Implements rsip_api_t::rsaDecrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSADP/RSASP1). It should be used in conjunction with any padding scheme.

◆ R_RSIP_RSAES_PKCS1_V1_5_Encrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Encrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length) and k (modulus length) must meet the following condition.

- mLen <= k - 11

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSAES_PKCS1_V1_5_Decrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Decrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

plain_buffer_length must be greater than or equal to mLen(plaintext length).

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.2.2 Step 1.

Section Supported Algorithms.

◆ R_RSIP_RSAES_OAEP_Encrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepEncrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length), hLen (hash length of hash_function), and k (modulus length) must meet the following condition.

- mLen <= k - 2 hLen - 2

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_RSAES_OAEP_Decrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts ciphertext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepDecrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

hLen (hash length of hash_function) and k (modulus length) must meet the following condition.

- k >= 2 hLen + 2

plain_buffer_length must be greater than or equal to mLen(plaintext length).

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.1.2 Step 1.

See also

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Sign()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Signs message with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Sign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Verify()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Verify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PSS_Sign()

fsp_err_t R_RSIP_RSASSA_PSS_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t *const

p_signature)

Signs message with RSASSA-PSS.

Implements rsip_api_t::rsassaPssSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PSS_Verify()

fsp_err_t R_RSIP_RSASSA_PSS_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PSS. Implements rsip_api_t::rsassaPssVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify()

fsp_err_t R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a certificate with RSASSA-PKCS1-v1_5.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_wrapped_public_key	Pointer to wrapped key of RSA public key.
[in]	hash_function	Hash function in EMSA-PKCS1-v1_5.
[in]	p_hash	Pointer to input hash.
[in]	p_signature	Pointer to input signature.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PKI_RSASSA_PSS_CertVerify()

fsp_err_t R_RSIP_PKI_RSASSA_PSS_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a certificate with RSASSA-PSS.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_wrapped_public_key	Pointer to wrapped key of RSA public key.
[in]	hash_function	Hash function in EMSA-PSS-VERIFY.
[in]	mask_generation_function	Mask generation function in EMSA-PSS-VERIFY.
[in]	salt_length	Salt length. RSIP_RSA_SALT_LENGTH_AUTO, RSIP_RSA_SALT_LENGTH_HASH, RSIP_RSA_SALT_LENGTH_MAX, 0, or positive integers can be set, where salt_length <= emLen - hLen - 2 (emLen is the same as the key length and hLen is the hash length).
[in]	p_hash	Pointer to input hash.
[in]	p_signature	Pointer to input signature.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLI	A resource conflict occurred because a

CT	hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Compute()

fsp_err_t R_RSIP_SHA_Compute (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_digest*)

Generates SHA message digest. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaCompute.

Conditions

See R_RSIP_SHA_Init().

Output length

See R_RSIP_SHA_Finish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

See also

Section Supported Algorithms.

◆ R_RSIP_SHA_Init()

fsp_err_t R_RSIP_SHA_Init (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*)

Starts SHA operation.

Implements rsip_api_t::shaInit.

Conditions

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

See also

Section Supported Algorithms.

◆ R_RSIP_SHA_Update()

fsp_err_t R_RSIP_SHA_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs SHA message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaUpdate.

State transition

This API can only be executed in **STATE_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Finish()

fsp_err_t R_RSIP_SHA_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_digest*)

Outputs SHA message digest.

Implements rsip_api_t::shaFinish.

Output length

Output length to p_digest depends on hash_function.

- 28 (RSIP_HASH_TYPE_SHA224, RSIP_HASH_TYPE_SHA512_224)
- 32 (RSIP_HASH_TYPE_SHA256, RSIP_HASH_TYPE_SHA512_256)
- 48 (RSIP_HASH_TYPE_SHA384)
- 64 (RSIP_HASH_TYPE_SHA512)

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Suspend()

fsp_err_t R_RSIP_SHA_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t *const *p_handle*)

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::shaSuspend.

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Resume()

fsp_err_t R_RSIP_SHA_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t const *const *p_handle*)

Resumes SHA operation suspended by R_RSIP_SHA_Suspend().

Implements rsip_api_t::shaResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_HMAC_Compute()

fsp_err_t R_RSIP_HMAC_Compute (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_mac*)

Generates HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacCompute.

Conditions

See R_RSIP_HMAC_Init().

Output length

See R_RSIP_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_HMAC_Verify()

fsp_err_t R_RSIP_HMAC_Verify (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacVerify.

Conditions

See R_RSIP_HMAC_Init() and R_RSIP_HMAC_VerifyFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Init()

fsp_err_t R_RSIP_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Starts HMAC operation.

Implements rsip_api_t::hmacInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_HMAC_SHA224
- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.

◆ R_RSIP_HMAC_Update()

fsp_err_t R_RSIP_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs HMAC message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacUpdate.

State transition

This API can only be executed in **STATE_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_SignFinish()

fsp_err_t R_RSIP_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs HMAC.

Implements rsip_api_t::hmacSignFinish.

Output length

Output length to p_mac depends on key type of p_wrapped_key.

- 28 (RSIP_KEY_TYPE_HMAC_SHA224)
- 32 (RSIP_KEY_TYPE_HMAC_SHA256)
- 48 (RSIP_KEY_TYPE_HMAC_SHA384)
- 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_VerifyFinish()

fsp_err_t R_RSIP_HMAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC.

Implements rsip_api_t::hmacVerifyFinish.

Conditions

Argument mac_length depends on key type of p_wrapped_key. Usually the longest length is recommended.

- 4 to 28 (RSIP_KEY_TYPE_HMAC_SHA224)
- 4 to 32 (RSIP_KEY_TYPE_HMAC_SHA256)
- 4 to 48 (RSIP_KEY_TYPE_HMAC_SHA384)
- 4 to 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
FSP_ERR_INVALID_SIZE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Suspend()

fsp_err_t R_RSIP_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::hmacSuspend.

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Resume()

fsp_err_t R_RSIP_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_HMAC_Suspend().

Implements rsip_api_t::hmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_FSBL_OEM_BL_Digest_Generate()

fsp_err_t R_RSIP_FSBL_OEM_BL_Digest_Generate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key_cert*, uint32_t const *key_cert_max_length*, uint8_t const *const *p_code_cert*, uint32_t const *code_cert_max_length*, uint32_t *const *p_mac*)

Verifies a Manifest signature and outputs the MAC of image and code certificate. The hash algorithm only supports HMAC-SHA256. The signature algorithm only supports ECDSA secp256r1.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Note

If this API returns FSP_ERR_SB_LOWER_IMAGE_VERSION or FSP_ERR_SB_CRYPTO_AUTH_FAIL, RSIP stops working. In this case, RSIP can be resumed by executing R_RSIP_Close() and R_RSIP_Open() in that order.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_key_cert	Pointer to key certificate.
[in]	key_cert_max_length	Maximum length of key certificate.
[in]	p_code_cert	Pointer to key code certificate.

[in]	code_cert_max_length	Maximum length of code certificate.
[out]	p_mac	Pointer to output MAC. It is output in TLV format and consists of a 4-byte Type-Length and a 32-byte Value.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_SB_INTERNAL_FAIL	An internal failure.
FSP_ERR_SB_INVALID_ARG	An invalid argument was entered.
FSP_ERR_SB_UNSUPPORTED_FUNCTION	Unsupported function executed.
FSP_ERR_SB_INVALID_ALIGNMENT	Data entered with incorrect alignment.
FSP_ERR_SB_SAME_IMAGE_VERSION	An image of the same version as the current version is input. (verification completed successfully)
FSP_ERR_SB_LOWER_IMAGE_VERSION	Image version lower than the current image version is installed.
FSP_ERR_SB_MANI_INVALID_MAGIC	An invalid magic number is set.
FSP_ERR_SB_MANI_UNSUPPORTED_VERSION	Unsupported version is set.
FSP_ERR_SB_MANI_OUT_OF_RANGE_LEN	Out of range TLV Length is set.
FSP_ERR_SB_MANI_TLV_FIELD_ERR	Missing required TLV field.
FSP_ERR_SB_MANI_TLV_INVALID_LEN	The length exceeding the end of the manifest is specified in length of the TLV field.
FSP_ERR_SB_MANI_INVALID_IMAGE_LEN	An invalid image length is set.
FSP_ERR_SB_MANI_MISMATCH_SIGN_ALGORITHM	There is a wrong combination of signature algorithms.
FSP_ERR_SB_MANI_UNSUPPORTED_ALGORITHM	An algorithm was specified that the manifest does not support.
FSP_ERR_SB_CRYPTO_FAIL	Cryptographic processing failure.
FSP_ERR_SB_CRYPTO_AUTH_FAIL	Verification failed.
FSP_ERR_SB_CRYPTO_PARAM_ERR	Parameter error.
FSP_ERR_SB_CRYPTO_RESOURCE_CONFLICT	CryptoIP is in use.
FSP_ERR_UNSUPPORTED	This API is not supported on this device.

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1

    - HMAC-SHA256bit
- TRNG
- TLS
    - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t *message, uint8_t* digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
```

```
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
```

```
};
void r_sce_example_ecc ()
{
 sce_ecc_wrapped_pair_key_t wrapped_pair_key;
 sce_ecdsa_byte_data_t      message_hash =
    {
       0
    };
 sce_ecdsa_byte_data_t signature;
    uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
 fsp_err_t             return_code;
    message_hash.data_length = sizeof(ecc256_data_msg);
    message_hash.pdata       = (uint8_t *) ecc256_data_msg;
    signature.pdata          = out_data;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random pair key */
 R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
 /* Generate a Signature */
 R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
 /* Verify Signature and Public wrapped key */
    return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 if (FSP_SUCCESS != return_code)
    {
 while (1)
     {
 /* Verify Fail */
       }
    }
 else
```

```
    {
 while (1)
      {
 /* Verify Success */
       }
    }
}
```

RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,

     {
/* plain_dec and plain are the same (correct) */
      }
   }
}
```

HASH Example

This is an example of calculating the SHA256 hash.

```
uint8_t message[] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
0x0d, 0x0e, 0x0f,
    0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,
0x1d, 0x1e, 0x1f,
};
uint8_t hash[] =
{
    0x63, 0x0d, 0xcd, 0x29, 0x66, 0xc4, 0x33, 0x66, 0x91, 0x12, 0x54, 0x48, 0xbb,
0xb2, 0x5b, 0x4f,
    0xf4, 0x12, 0xa4, 0x9c, 0x73, 0x2d, 0xb2, 0xc8, 0xab, 0xc1, 0xb8, 0x58, 0x1b,
0xd7, 0x10, 0xdd
```

```
};
void r_sce_example_hash ()
{
 sce_sha_md5_handle_t handle;
    uint8_t             digest[HW_SCE_SHA256_HASH_LENGTH_BYTE_SIZE] = {0};
    uint32_t             digest_length = 0;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Encrypt a message text */
 R_SCE_SHA256_Init(&handle);
 R_SCE_SHA256_Update(&handle, &message, HW_SCE_SHA256_HASH_LENGTH_BYTE_SIZE);
 R_SCE_SHA256_Final(&handle, &digest, &digest_length);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare digest and hash */
 if (0 != memcmp(digest, hash, digest_length))
    {
 while (1)
     {
 /* digest and hash are different (incorrect) */
      }
    }
 else

     {
 /* digest and hash are the same (correct) */
      }
    }
}
```

Data Structures

struct	sce_instance_ctrl_t

Data Structure Documentation

◆ sce_instance_ctrl_t

struct sce_instance_ctrl_t
SCE private control block. DO NOT MODIFY. Initialization occurs when R_SCE_Open() is called.

Function Documentation

◆ R_SCE_Open()

fsp_err_t R_SCE_Open (sce_ctrl_t *const *p_ctrl*, sce_cfg_t const *const *p_cfg*)

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

fsp_err_t R_SCE_Close (sce_ctrl_t *const *p_ctrl*)

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

fsp_err_t R_SCE_AES256_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate (sce_rsa1024_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate (sce_rsa2048_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp192r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp224r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp256r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp384r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RandomNumberGenerate()

fsp_err_t R_SCE_RandomNumberGenerate (uint32_t * *random*)

This API can generate 4 words random number.

Parameters

[in,out]	random	Stores 4words (16 bytes) random data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

fsp_err_t R_SCE_AES128_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyWrap()

fsp_err_t R_SCE_AES256_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES128_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptInit()

fsp_err_t R_SCE_AES128ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_EncryptUpdate() function and R_SCE_AES128ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

fsp_err_t R_SCE_AES128ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptFinal()

fsp_err_t R_SCE_AES128ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

fsp_err_t R_SCE_AES128ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptUpdate()

fsp_err_t R_SCE_AES128ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptFinal()

fsp_err_t R_SCE_AES128ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptInit()

fsp_err_t R_SCE_AES256ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256ECB_EncryptUpdate() function and R_SCE_AES256ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

fsp_err_t R_SCE_AES256ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptFinal()

fsp_err_t R_SCE_AES256ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

fsp_err_t R_SCE_AES256ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

fsp_err_t R_SCE_AES256ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptFinal()

fsp_err_t R_SCE_AES256ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

fsp_err_t R_SCE_AES128CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

fsp_err_t R_SCE_AES128CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptFinal()

fsp_err_t R_SCE_AES128CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

fsp_err_t R_SCE_AES128CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

fsp_err_t R_SCE_AES128CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptFinal()

fsp_err_t R_SCE_AES128CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

fsp_err_t R_SCE_AES256CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptUpdate()

fsp_err_t R_SCE_AES256CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptFinal()

fsp_err_t R_SCE_AES256CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

fsp_err_t R_SCE_AES256CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptUpdate()

fsp_err_t R_SCE_AES256CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptFinal()

fsp_err_t R_SCE_AES256CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

fsp_err_t R_SCE_AES128GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_EncryptUpdate() function and R_SCE_AES128GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

fsp_err_t R_SCE_AES128GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

fsp_err_t R_SCE_AES128GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

fsp_err_t R_SCE_AES128GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_DecryptUpdate() function and R_SCE_AES128GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

fsp_err_t R_SCE_AES128GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptFinal()

fsp_err_t R_SCE_AES128GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES128GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES128GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

fsp_err_t R_SCE_AES256GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_EncryptUpdate() function and R_SCE_AES256GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

fsp_err_t R_SCE_AES256GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

fsp_err_t R_SCE_AES256GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

fsp_err_t R_SCE_AES256GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_DecryptUpdate() function and R_SCE_AES256GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

fsp_err_t R_SCE_AES256GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

fsp_err_t R_SCE_AES256GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES256GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES256GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

fsp_err_t R_SCE_AES128CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

fsp_err_t R_SCE_AES128CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES128CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

fsp_err_t R_SCE_AES128CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES128CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes128CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

fsp_err_t R_SCE_AES128CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_DecryptUpdate() and R_SCE_AES128CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

fsp_err_t R_SCE_AES128CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES128CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptFinal()

fsp_err_t R_SCE_AES128CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES128GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes128CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

fsp_err_t R_SCE_AES256CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

fsp_err_t R_SCE_AES256CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES256CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

fsp_err_t R_SCE_AES256CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES256CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes256CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

fsp_err_t R_SCE_AES256CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

fsp_err_t R_SCE_AES256CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES256CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptFinal()

fsp_err_t R_SCE_AES256CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES256GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes256CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateInit()

fsp_err_t R_SCE_AES128CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CMAC_GenerateUpdate() function and R_SCE_AES128CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES128CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateFinal()

fsp_err_t R_SCE_AES128CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES128CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

fsp_err_t R_SCE_AES128CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES128CMAC_VerifyUpdate() function and R_SCE_AES128CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES128CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

fsp_err_t R_SCE_AES128CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES128CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

fsp_err_t R_SCE_AES256CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CMAC_GenerateUpdate() function and R_SCE_AES256CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES256CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateFinal()

fsp_err_t R_SCE_AES256CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES256CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

fsp_err_t R_SCE_AES256CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES256CMAC_VerifyUpdate() function and R_SCE_AES256CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES256CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyFinal()

fsp_err_t R_SCE_AES256CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES256CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Init()

fsp_err_t R_SCE_SHA256_Init (sce_sha_md5_handle_t * *handle*)

The R_SCE_SHA256_Init() function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_SHA256_Update() function and R_SCE_SHA256_Final() function.

Parameters

[in,out]	handle	SHA handler (work area)

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

fsp_err_t R_SCE_SHA256_Update (sce_sha_md5_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

fsp_err_t R_SCE_SHA256_Final (sce_sha_md5_handle_t * *handle*, uint8_t * *digest*, uint32_t * *digest_length*)

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hasha data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

fsp_err_t R_SCE_SHA256HMAC_GenerateInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_GenerateUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

fsp_err_t R_SCE_SHA256HMAC_GenerateFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_SHA256HMAC_GenerateFinal() function uses the handle specified by the first argument handle and writes the calculation result to the second argument mac.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

fsp_err_t R_SCE_SHA256HMAC_VerifyInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyUpdate()

fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_VerifyUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyFinal()

fsp_err_t R_SCE_SHA256HMAC_VerifyFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_SHA256HMAC_VerifyFinal() function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value

		• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the

		data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 2048-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS3072_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pda

		ta : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS4096_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS4096_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Data length (byte units)

[in]	wrapped_key	Input wrapped key of secp192r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp224r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash

		value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp384r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp192r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)

[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp224r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of

		secp256r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)

[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp384r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

fsp_err_t R_SCE_ECDH_secp256r1_Init (sce_ecdh_handle_t * *handle*, uint32_t *key_type*, uint32_t *use_key_id*)

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, uint8_t * *public_key*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeySign() function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to public_key and the private key is output to wrapped_key.

If ECDH is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the public key input as ecc_public_wrapped_key is output to public_key and nothing is output to wrapped_key.

The succeeding function R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses the first argument, handle, as an argument. R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area) When using key_id, input handle->key_id after running R_SCE_ECDH_secp256r1_Init().
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using key_id, key_id (8-bit) || public key (512-bit) || 0 padding (24-bit)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) || signature s (256 bits)" • signature->data_leng

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, uint8_t * *public_key_data*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature (sce_ecdh_handle_t * *handle*, uint8_t * *public_key_data*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().
R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in,out]	wrapped_key	wrapped key of public_key_data

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*)

The R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, ecc_public_wrapped_key, the public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify(). When key_type of R_SCE_ECDH_secp256r1_Init() is 0, input as the third argument, ecc_private_wrapped_key, the private wrapped key generated from a random number by R_SCE_ECDH_secp256r1_PublicKeySign(), and when key_type is other than 0, input the private wrapped key that forms a pair with the second argument of R_SCE_ECDH_secp256r1_PublicKeySign(). The subsequent R_SCE_ECDH_secp256r1_KeyDerivation() function uses shared_secret_wrapped_key as key material for outputting the wrapped key.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify()
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation (sce_ecdh_handle_t * *handle*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*, uint32_t *key_type*, uint32_t *kdf_type*, uint8_t * *other_info*, uint32_t *other_info_length*, sce_hmac_sha_wrapped_key_t * *salt_wrapped_key*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_KeyDerivation() function uses the shared secret "Z (shared_secret_index)" calculated by the R_SCE_ECDH_secp256r1_SharedSecretCalculate() function as the key material to derive the wrapped key specified by the third argument, key_type. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, kdf_type. When SHA-256 HMAC is specified, the wrapped key output by the R_SCE_SHA256HMAC_EncryptedKeyWrap() function is specified as the seventh argument, salt_wrapped_key. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, other_info. A wrapped key corresponding to key_type is output as the eighth argument, wrapped_key. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: R_SCE_SHA256HMAC_GenerateInit() function and R_SCE_SHA256HMAC_VerifyInit() function

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by R_SCE_ECDH_secp256r1_SharedSecretCalculate
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID || PartyUInfo || PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when kdf_type is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to key_type. When the value of key_type is 2, an SHA256-HMAC wrapped key is output. wrapped_key can be specified by casting the start address of the area

		reserved beforehand by the sce_hmac_sha_wrapped_key_t type with the (sce_aes_wrapped_key_t*) type.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall (uint8_t * *encrypted_provisioning_key*, uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_tls_ca_certification_public_wrapped_key_t * *wrapped_key*)

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint8_t * *ephemeral_ecdh_public_key*)

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateVerify()

fsp_err_t R_SCE_TLS_RootCertificateVerify (uint32_t *public_key_type*, uint8_t * *certificate*, uint32_t *certificate_length*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint8_t * *signature*, uint32_t * *encrypted_root_public_key*)

Verify root CA certificate.

Parameters

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

fsp_err_t R_SCE_TLS_CertificateVerify (uint32_t *public_key_type*, uint32_t * *encrypted_input_public_key*, uint8_t * *certificate*, uint32_t *certificate_length*, uint8_t * *signature*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint32_t * *encrypted_output_public_key*)

Verify server certificate and intermediate certificate.

Parameters

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * *encrypted_public_key*, uint32_t * *sce_pre_master_secret*, uint8_t * *encrypted_pre_master_secret*)

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[out]	sce_pre_master_secret	pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

fsp_err_t R_SCE_TLS_MasterSecretGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_pre_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint32_t * *sce_master_secret*)

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value with SCE-specific conversion.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

fsp_err_t R_SCE_TLS_SessionKeyGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *nonce_explicit*, sce_hmac_sha_wrapped_key_t * *client_mac_wrapped_key*, sce_hmac_sha_wrapped_key_t * *server_mac_wrapped_key*, sce_aes_wrapped_key_t * *client_crypto_wrapped_key*, sce_aes_wrapped_key_t * *server_crypto_wrapped_key*, uint8_t * *client_initial_vector*, uint8_t * *server_initial_vector*)

Output various key information.

Parameters

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

fsp_err_t R_SCE_TLS_VerifyDataGenerate (uint32_t *select_verify_data*, uint32_t * *sce_master_secret*, uint8_t * *hand_shake_hash*, uint8_t * *verify_data*)

Generate verify data.

Parameters

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ServerKeyExchangeVerify()

fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify (uint32_t *public_key_type*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *server_ephemeral_ecdh_public_key*, uint8_t * *server_key_exchange_signature*, uint32_t * *encrypted_public_key*, uint32_t * *encrypted_ephemeral_ecdh_public_key*)

Retrives ECDH public key.

Parameters

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange sigunature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 (uint32_t * *encrypted_public_key*, sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

5.2.15.9 Secure Crypto Engine (r_sce_protected_cavp)

Modules » Security

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

Version

v1.1.0

The version that appears on the Components tab of the FSP Configuration editor is v1.1.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Secure Crypto Engine (r_sce_protected) of FSP v5.5.0.

For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v5.5.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides SCE CAVP Certified functions.

HW Overview

SCE9 Protected Mode CAVP certification has been obtained using the RA6M4 as the target processor.

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS

- SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
```

```
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
```

```
sce_ecc_wrapped_pair_key_t wrapped_pair_key;
sce_ecdsa_byte_data_t      message_hash =
   {
      0
   };
sce_ecdsa_byte_data_t signature;
   uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
fsp_err_t             return_code;
   message_hash.data_length = sizeof(ecc256_data_msg);
   message_hash.pdata       = (uint8_t *) ecc256_data_msg;
   signature.pdata          = out_data;
/* SCE power on */
R_SCE_Open(&sce_ctrl, &sce_cfg);
/* Generate a random pair key */
R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
/* Generate a Signature */
R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
/* Verify Signature and Public wrapped key */
   return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
/* SCE power off */
R_SCE_Close(&sce_ctrl);
if (FSP_SUCCESS != return_code)
   {
while (1)
     {
/* Verify Fail */
      }
   }
else
   {
while (1)
     {
```

```
 /* Verify Success */
       }
    }
}
```

RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides RSIP functions in PSA Crypto.

HW Overview

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1
RSIP-E31A	RA4C1
RSIP-E51A	RA8M1, RA8D1, RA8T1
RSIP-E50D	RA8P1

Features

The RSIP Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used RSIP. Please refer to the following for details.

Key Support

AES Key Injection

Crypto Peripheral version	128 bit	192 bit	256 bit
RSIP-E11A	Support	No support	Support
RSIP-E31A	Support	No support	Support
RSIP-E51A	Support	Support	Support
RSIP-E50D	Support	Support	Support

AES XTS Key Injection

Crypto Peripheral version	128 bit XTS	256 bit XTS
RSIP-E11A	No support	No support
RSIP-E31A	Support	Support
RSIP-E51A	Support	Support
RSIP-E50D	Support	Support

ChaCha20 Key Injection

Crypto Peripheral version	ChaCha20
RSIP-E11A	No support
RSIP-E31A	No support
RSIP-E51A	No support
RSIP-E50D	Support

RSA Key Injection

Crypto Peripheral version	2048 bit	3072 bit	4096 bit
RSIP-E11A	No support	No support	No support
RSIP-E31A	No support	No support	No support
RSIP-E51A	Support	Support	Support
RSIP-E50D	Support	Support	Support

ECC Key Injection

Crypto Peripheral version	secp256r1	secp384r1	secp521r1	secp256k1	brainpoolP256r1	brainpoolP384r1	brainpoolP512r1	Ed25519
RSIP-	Support	No	No	Support	Support	No	No	No

E11A		support	support			support	support	support
RSIP-E31A	Support	Support	No support	Support	Support	Support	No support	Support
RSIP-E51A	Support	Support	Support	Support	Support	Support	Support	Support
RSIP-E50D	Support	Support	Support	Support	Support	Support	Support	Support

HMAC Key Injection

Crypto Peripheral version	SHA224	SHA256	SHA384	SHA512	SHA512/224	SHA512/256
RSIP-E11A	Support	Support	No support	No support	No support	No support
RSIP-E31A	No support	Support	Support	Support	Support	Support
RSIP-E51A	Support	Support	Support	Support	Support	Support
RSIP-E50D	Support	Support	Support	Support	Support	Support

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

RSIP Key Umport for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires RSIP Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injectin for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to injection and update secure keys, refer to the Application Note R11AN0496.

Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Enumerations

enum rsip_key_type_t

Enumeration Type Documentation

◆ rsip_key_type_t

enum rsip_key_type_t	
Enumerator	
RSIP_KEY_TYPE_INVALID	Invalid key.

Function Documentation

◆ R_RSIP_AES128_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 128-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES192_InitialKeyWrap()

fsp_err_t R_RSIP_AES192_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 192-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES256_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES128_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_XTS_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 128-bit AES-XTS key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	128-bit AES-XTS wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES256_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_XTS_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit AES-XTS key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit AES-XTS wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ChaCha20_InitialKeyWrap()

fsp_err_t R_RSIP_ChaCha20_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_chacha20_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ChaCha20-Poly-1305 key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ChaCha20 wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA2048_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa2048_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 2048-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	2048-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA3072_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA3072_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa3072_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 3072-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	3072-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA4096_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA4096_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa4096_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 4096-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	4096-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 521-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	521-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP384r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP512r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP512r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 512-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit Edwards curve ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA224_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 224-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	224-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA384_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA384_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_224_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512/224-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512/224-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512/256-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512/256-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides SCE functions in PSA Crypto.

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M5, RA6M4, RA4M3, RA4M2
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
SCE5B	RA6T2

Features

The SCE Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used SCE. Please refer to the following for details.

- Key Support
  - AES 128/256bit

Crypto Peripheral version	128 bit	192 bit	256 bit
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only

SCE7	Support	Support	Support
SCE5	Support	No support	Support
SCE5B	InitialKeyWrap Only	No support	InitialKeyWrap Only

- RSA 2048/3072/4096bit

Crypto Peripheral version	2048 bit	3072 bit (public)	4096 bit (public)
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only
SCE7	Support	No support	No support
SCE5	No support	No support	No support
SCE5B	No support	No support	No support

- ECC secp256r1/secp256k1/secp384r1

Crypto Peripheral version	secp256r1	secp256k1	secp384r1	secp256r1 Brainpool	secp384r1 Brainpool
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only
SCE7	Support	Support	Support	Support	Support
SCE5	No support	No support	No support	No support	No support
SCE5B	No support	No support	No support	No support	No support

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

SCE Key Injection for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires SCE Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injection for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to import and update secure keys, refer to the Application Note R11AN0496.
(*1)

Crypto Peripheral version	String displayed in the Stacks tab
SCE9	SCE Compatibility Mode
SCE7	SCE7
SCE5	SCE5
SCE5B	SCE5B

Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Function Documentation

◆ R_SCE_AES128_InitialKeyWrap()

fsp_err_t R_SCE_AES128_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 128-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_InitialKeyWrap()

fsp_err_t R_SCE_AES192_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 192-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_InitialKeyWrap()

fsp_err_t R_SCE_AES256_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_KeyUpdateKeyWrap()

fsp_err_t R_SCE_KeyUpdateKeyWrap (const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_key_update_key_t *const *key_update_key*)

This API generates a key update key which is used for functions of the key updating.

Parameters

[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	key_update_key	Key update key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_EncryptedKeyWrap()

fsp_err_t R_SCE_AES192_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 192-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key*)

This API generates 2048-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa3072_public_wrapped_key_t *const *wrapped_key*)

This API generates 3072-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	3072-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa4096_public_wrapped_key_t *const *wrapped_key*)

This API generates 4096-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	4096-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key*)

This API generates 2048-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key*)

This API wraps 2048-bit RSA key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key*)

This API wraps 2048-bit RSA key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	364-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	364-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.
- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Overview

Note

The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst for further information.

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

Hardware Overview

Crypto Peripheral version	Devices
AES Engine	RA2A1, RA2E1, RA2L1

Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
  - Keybits - 128, 192, 256
  - ECB, CBC, CTR, CCM, GCM and CMAC modes -TRNG

Configuration

Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

Usage Notes

Hardware Initialization

Invoke RM_TINCYRYPT_PORT_Init () to initialize the hardware before using Tinycrypt if either

hardware acceleration or the TRNG is to be used.

Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in rm_tinycrypt_port must be used to seed these modules. When using CTR-PRNG or HMAC-PRNG, use the RM_TINCYRYPT_PORT_TRNG_Read() function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then RM_TINCYRYPT_PORT_TRNG_Read() can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the default_CSPRNG() function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement default_CSPRNG() if using ECC signature generation (ECDSA) or key derivation (ECDH).

AES-128 Usage

The AES ECB mode implementation is provided in aes_encrypt.decrypt.c. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

Usage with RA2A2

On the RA2A2, the TinyCrypt API has been expanded to support GCM mode operation. Key lengths of 128, 192 and 256 are supported. GCM mode operation is not supported on other MCUs in hardware or software in the TinyCrypt API.

Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

Limitations

Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function default_CSPRNG() must be implemented in the user code.

TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

Examples

AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE
#define TC_OUTPUT_CIPHERTEXT_SIZE (TC_INPUT_PLAINTEXT_SIZE + TF_AES_IV_SIZE)

Function Documentation

◆ RM_TINCYRYPT_PORT_Init()

fsp_err_t RM_TINCYRYPT_PORT_Init ( )
Initialize the SCE.

◆ RM_TINCYRYPT_PORT_TRNG_Read()

fsp_err_t RM_TINCYRYPT_PORT_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*)
Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ default_CSPRNG()

int default_CSPRNG (uint8_t * *dest*, unsigned int *size*)
Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt.

Return values

TC_CRYPTO_SUCCESS	Random number generation successful
TC_CRYPTO_FAIL	Random number generation failed.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- RM_TINCYRYPT_PORT_TRNG_Read

5.2.16 Sensor

Modules

Detailed Description

Sensor Modules.

Modules

	FS3000 Flow Sensor (rm_fs3000) [Deprecated] Middleware to implement the FS3000 sensor interface. This module implements the FSXXXX Middleware Interface.
	HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated] Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.
	HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated] Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.
	RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated] Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.
	RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated] Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.
	RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated] Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.
	ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated] Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

Detailed Description

Middleware to implement the FS3000 sensor interface. This module implements the FSXXXX Middleware Interface.

Overview

FS3000 is EOL.

Features

The FS3000 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Limitations

- I2C Master (r_sau_i2c) is not supported. FS3000 needs clock stretching, but is not supported by SAU I2C.

Configuration

Build Time Configurations for rm_fs3000

The following build time configurations are defined in fsp_cfg/rm_fs3000_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Device Type	FS3000-1005	FS3000-1005	Select FS3000 device used.

Configurations for Sensor > FS3000 Flow Sensor (rm_fs3000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > FS3000 Flow Sensor (rm_fs3000) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fs3000_sensor0	Module name.
Callback	Name must be a valid C symbol	fs3000_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

FS3000 datasheet is here.
If ADC data is invalid, it is needed to read ADC data from FS3000 again. The module only supports FS3000-1005.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS3000 interface expects a bus instance to be opened before opening any FS3000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of FS3000 sensor implementation in an application.

```
void rm_fs3000_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
```

```
 rm_fsxxxx_raw_data_t fs3000_raw_data;
 rm_fsxxxx_data_t    fs3000_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_fs3000_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
```

```
      *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
           xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
 #endif
    }
#endif
    err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 while (true)
    {
 do
     {
           g_flag = 0;
 /* Read ADC Data from FS3000 */
 RM_FS3000_Read(&g_fs3000_ctrl, &fs3000_raw_data);
 while (0 == g_flag)
     {
 /* Wait callback */
     }
 /* Calculate Flow value from ADC data */
           err = RM_FS3000_DataCalculate(&g_fs3000_ctrl, &fs3000_raw_data,
&fs3000_data);
 if (FSP_SUCCESS == err)
     {
               calculated_flag = 1;
     }
 else if (FSP_ERR_SENSOR_INVALID_DATA == err) /* Checksum error */
     {
               calculated_flag = 0;
     }
 else
     {
     handle_error(err);
```

```
      }
      } while (0 == calculated_flag);
 /* Wait 125 milliseconds. See table 4 on the page 7 of the datasheet. */
 R_BSP_SoftwareDelay(FS3000_DELAY_125, BSP_DELAY_UNITS_MILLISECONDS);
    }
}
```

Data Structures

struct	rm_fs3000_instance_ctrl_t

Data Structure Documentation

◆ rm_fs3000_instance_ctrl_t

struct rm_fs3000_instance_ctrl_t	
FS3000 Control Block	
Data Fields	
uint32_t	open
	Open flag.
rm_fsxxxx_cfg_t const *	p_cfg
	Pointer to FS3000 Configuration.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ RM_FS3000_Open()

fsp_err_t RM_FS3000_Open (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_cfg_t const *const *p_cfg*)

Opens and configures the FS3000 Middle module. Implements rm_fsxxxx_api_t::open.

Example:

```
    err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
```

Return values

FSP_SUCCESS	FS3000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_FS3000_Close()

fsp_err_t RM_FS3000_Close (rm_fsxxxx_ctrl_t *const *p_api_ctrl*)

Disables specified FS3000 control block. Implements rm_fsxxxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS3000_Read()

fsp_err_t RM_FS3000_Read (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*)

Reads ADC data from FS3000. Implements rm_fsxxxx_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS3000_DataCalculate()

fsp_err_t RM_FS3000_DataCalculate (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*, rm_fsxxxx_data_t *const *p_fs3000_data*)
Calculates flow [m/sec] from ADC data. Implements rm_fsxxxx_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

5.2.16.2 HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated]

Modules » Sensor

Functions

fsp_err_t	RM_HS300X_Open (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_cfg_t const *const p_cfg) Opens and configures the HS300X Middle module. Implements rm_hs300x_api_t::open. More...
fsp_err_t	RM_HS300X_Close (rm_hs300x_ctrl_t *const p_api_ctrl) Disables specified HS300X control block. Implements rm_hs300x_api_t::close. More...
fsp_err_t	RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const p_api_ctrl) This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements rm_hs300x_api_t::measurementStart. More...
fsp_err_t	RM_HS300X_Read (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data) Reads ADC data from HS300X. Implements rm_hs300x_api_t::read. More...

fsp_err_t	RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data, rm_hs300x_data_t *const p_hs300x_data) Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements rm_hs300x_api_t::dataCalculate. More...
fsp_err_t	RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const p_api_ctrl) This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements rm_hs300x_api_t::programmingModeEnter. More...
fsp_err_t	RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_data_type_t const data_type, rm_hs300x_resolution_t const resolution) This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements rm_hs300x_api_t::resolutionChange. More...
fsp_err_t	RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const p_sensor_id) This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements rm_hs300x_api_t::sensorIdGet. More...
fsp_err_t	RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const p_api_ctrl) This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements rm_hs300x_api_t::programmingModeExit. More...

Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.

Overview

HS300x is EOL.

Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

Configuration

Build Time Configurations for rm_hs300x

The following build time configurations are defined in fsp_cfg/rm_hs300x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Data type	• Both humidity and temperature • Humidity only	Both humidity and temperature	Select Getting humidity only and both humidity and temperature.
Programming Mode	• ON • OFF	OFF	If selected the programming mode can be entered.

Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hs300x_sensor0	Module name.
Callback	Name must be a valid C symbol	hs300x_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS300x datasheet is here.
If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)

	Buffer for I2C communications.

Function Documentation

◆ RM_HS300X_Open()

fsp_err_t RM_HS300X_Open (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_cfg_t const *const *p_cfg*)

Opens and configures the HS300X Middle module. Implements rm_hs300x_api_t::open.

Example:

```
    err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

Return values

FSP_SUCCESS	HS300X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_HS300X_Close()

fsp_err_t RM_HS300X_Close (rm_hs300x_ctrl_t *const *p_api_ctrl*)

Disables specified HS300X control block. Implements rm_hs300x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_MeasurementStart()

fsp_err_t RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements rm_hs300x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_Read()

fsp_err_t RM_HS300X_Read (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS300X. Implements rm_hs300x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_DataCalculate()

fsp_err_t RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*, rm_hs300x_data_t *const *p_hs300x_data*)

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements rm_hs300x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

◆ RM_HS300X_ProgrammingModeEnter()

fsp_err_t RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements rm_hs300x_api_t::programmingModeEnter.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ResolutionChange()

fsp_err_t RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_data_type_t const *data_type*, rm_hs300x_resolution_t const *resolution*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements rm_hs300x_api_t::resolutionChange.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_SensorIdGet()

fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_sensor_id*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements rm_hs300x_api_t::sensorIdGet.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ProgrammingModeExit()

fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements rm_hs300x_api_t::programmingModeExit.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

Detailed Description

Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.

Overview

HS400x is EOL.

Features

The HS400X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Selecting one shot or a periodic measurement
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data

Limitations

- Alert feature is not supported. It will be supported in the future.
- I2C Master (r_sau_i2c) is not supported in Hold measurement. Hold measurement needs clock stretching, but is not supported by SAU I2C.

Notifications

The minimum frequency for the SCL clock in Hold measurement is 200kHz. Please configure I2C_MASTER_RATE_FAST or I2C_MASTER_RATE_FASTPLUS to "Rate" in I2C Master (r_iic_master) or I2C Master (r_sci_i2c).

Configuration

Build Time Configurations for rm_hs400x

The following build time configurations are defined in fsp_cfg/rm_hs400x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Measurement Type	• Hold Measurement • No-Hold Measurement • Periodic Measurement	No-Hold Measurement	Select measurement type.
Data type	• Both humidity and temperature • Temperature only	Both humidity and temperature	Select getting temperature only or both humidity and temperature.

Configurations for Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hs400x_sensor0	Module name.
Temperature Resolution	• 8-bit • 10-bit • 12-bit • 14-bit	14-bit	Set resolution of temperature.
Humidity Resolution	• 8-bit • 10-bit • 12-bit • 14-bit	14-bit	Set resolution of humidity.
Frequency for Periodic Measurement	• 0.4Hz • 1Hz • 2Hz	1Hz	Set frequency for periodic measurement.
Comms I2C Callback	Name must be a valid	hs400x_comms_i2c_cal	A user COMMS I2C

	C symbol	lback	callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS400x datasheet is here.
This module supports three measurement type :

- Hold measurement
- No-Hold measurement
- Periodic measurement

Hold and no-hold measurements also support measuring temperature data only. However, a periodic measurement only supports measuring both humidity and temperature data.

Hold Measurement

A hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired hold measurement command.
2. Change the direction of communication by sending a start bit, the HS400x I2C address, and a read bit. The SCL line is held low by the sensor during the measurement process, which prevents the master from initiating any communications with other slaves on the bus.
3. Once the requested measurement is completed by the HS400x series sensor, the SCL line is released and the chip waits for the SCL clock signal to send the results. The sensor will then transmit the requested measurement data on the bus for the master to capture.

No-Hold Measurement

A no-hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired no-hold measurement command.
2. To read the result from the HS400x series sensor, the master has to send the chip its I2C address and a read bit. If the measurement is completed and the result is ready, the chip will send an ACK bit and starts to send the result over the bus. If the measurement is still in progress, the chip will send a NACK bit and the master will need to try to read the result again.

Periodic Measurement

The HS400x sensors can also be configured to measure at regular intervals without user intervention. In this mode, the user can read the latest relative humidity / temperature data by issuing a data fetch sequence, which consists of sending the HS400x I2C address with a read bit. The sensor will then send the latest measurement result over the I2C bus.
When the periodic measurement mode is active, the only commands the chip will respond to are the data fetch command, and a command to stop the periodic measurements. The command to stop periodic measurements is issued by sending the I2C address with a write bit, followed by the command 0x30. Sequence to Stop Periodic Measurements. Once the periodic measurements have been stopped, the chip returns to sleep and is ready to accept all valid I2C commands.

Bus Initialization

The HS400X interface expects a I2C bus instance to be opened before opening any I2C device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with RM_HS400X_Open().

From measurement start to data acquisition

After normal completion, start the each measurement.

Hold Measurement

In hold measurement, the HS400x series sensor holds the SCL line low during the measurement and releases the SCL line when the measurement is complete.

1. Call RM_HS400X_Read(). This function will start a measurement and read the ADC data.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

No-Hold Measurement

In no-hold measurement, the HS400x series sensor does not hold the SCL line low, and the master is free to initiate communication with other slaves while the chip is performing the measurement.

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_Read(). This function will read the ADC data.
4. If the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. User should call RM_HS400X_Read() again. If the measurement is completed, RM_HS400X_EVENT_SUCCESS is received in callback.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

Periodic Measurement

In periodic measurement, the HS400x sensors measure at regular intervals without user intervention. If a periodic measurement is running, the resolution and the frequency cannot be changed. please stop the periodic measurement with RM_HS400X_MeasurementStop().

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement. If the function is called once, a second call is not required.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.

3. Wait for frequency for periodic measurement.
4. Call RM_HS400X_Read(). This function will read the ADC data.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

Examples

Basic Example

This is a basic examples of minimal use of HS400X sensor implementation in an application.

```
void rm_hs400x_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_hs400x_raw_data_t hs400x_raw_data;
 rm_hs400x_data_t     hs400x_data;
 bool                 measurement_complete = false;
 bool                 calculated           = false;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =

	Flag for stop of periodic measurement.
volatile bool	no_hold_measurement_read
	Flag for data read of No-Hold measurement.
uint8_t	write_buf [18]
	Buffer for data write.
void(*	p_comms_callback)(rm_hs400x_callback_args_t *p_args)
	I2C Communications callback.

Function Documentation

◆ RM_HS400X_Open()

fsp_err_t RM_HS400X_Open (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_cfg_t const *const *p_cfg*)

Opens and configures the HS400X middleware module. Implements rm_hs400x_api_t::open.

Example:

```
err = RM_HS400X_Open(&g_hs400x_ctrl, &g_hs400x_cfg);
```

Return values

FSP_SUCCESS	HS400X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_HS400X_Close()

fsp_err_t RM_HS400X_Close (rm_hs400x_ctrl_t *const *p_api_ctrl*)

Disables specified HS400X control block. Implements rm_hs400x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS400X_MeasurementStart()

fsp_err_t RM_HS400X_MeasurementStart (rm_hs400x_ctrl_t *const *p_api_ctrl*)

This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call RM_HS400X_Read() without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_UNSUPPORTED	Hold measurement is unsupported.

◆ RM_HS400X_MeasurementStop()

fsp_err_t RM_HS400X_MeasurementStop (rm_hs400x_ctrl_t *const *p_api_ctrl*)

Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_UNSUPPORTED	Hold and No-Hold measurement are unsupported.

◆ RM_HS400X_Read()

fsp_err_t RM_HS400X_Read (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements rm_hs400x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS400X_DataCalculate()

fsp_err_t RM_HS400X_DataCalculate (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*, rm_hs400x_data_t *const *p_hs400x_data*)

Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements rm_hs400x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

fsp_err_t	RM_RRH46410_Read (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data) This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read. More...
fsp_err_t	RM_RRH46410_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_2nd_data_t *const p_rrh46410_data) This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate. More...
fsp_err_t	RM_RRH46410_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_pbaq_data_t *const p_rrh46410_data) This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::pbaqDataCalculate. More...
fsp_err_t	RM_RRH46410_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const p_api_ctrl, float temperature, float humidity) This function should be called before Read. Humidity measurements

	are needed for ambient compensation. temperature is not supported. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet. More...

Detailed Description

Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

RRH46410 is EOL.

This module provides an API for configuring and controlling the RRH46410 sensor module (ZMOD4410 + MCU).

I2C communication with the RRH46410 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH46410 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Input current humidity for best performance.
- Receive status for wait until the measurement is done. This will also be signaled by an interrupt
- Get the measruement results from the sensor module
- Different from ZMOD sensors, no libraries are needed.

Configuration

Build Time Configurations for rm_rrh46410

The following build time configurations are defined in fsp_cfg/rm_rrh46410_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Operation Mode	• IAQ 2nd Gen and Rel IAQ • IAQ 2nd Gen ULP and Rel IAQ ULP • Public Building AQ Standard (PBAQ)	IAQ 2nd Gen and Rel IAQ	Select operation mode.

Configurations for Sensor > RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh46410_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	rrh46410_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	rrh46410_irq_callback	A user IRQ callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH46410 datasheet is here.
The RRH46410 has three modes of operation.
The RRH46410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Operation mode	Description	Data
IAQ 2nd Generation and Relative IAQ	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs). Lightweight algorithm reacts to air quality changes and outputs a relative IAQ	IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ
IAQ 2nd Generation Ultra Low Power and Relative IAQ Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This operation mode offers a much lower power consumption.	IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ
Public Building AQ Standard (PBAQ)	For highly accurate and consistent sensor readings to fulfill public building standards.	TVOC[mg/m^3], EtOH[ppm]

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH46410 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - Get Product ID
    - Get Tracking Number
    - Set Operation Mode -> Sensor cleaning
    - Config GPIO
    - Get GPIO
    - Set GPIO
    - Clear GPIO
    - Read Flash Shadow
    - Write Flash Shadow
    - Write Flash
    - Reset

Notifications

- The RRH46410 sensor module needs a reset before operation; please input a reset signal to the RES_N pin (active low).
- The RRH46410 sensor module needs some time (e.g. 1s) for self initialization after power-on and reset.

Bus Initialization

The RRH46410 interface expects a bus instance to be opened before opening any RRH46410 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH46410_Open().

From measurement start to data acquisition

After normal completion, start the measurement with RM_RRH46410_MeasurementStart(). An endless loop continuously checks the status of the RRH46410 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
2. Call RM_RRH46410_Read(). This function will read the measurement results.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_RRH46410_Read(). This function will read the measurement results.
2. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user

should wait some time and then call RM_RRH46410_Read() again.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

Examples

Basic Example

These are basic examples of minimal use of RRH46410 sensor implementation in an application.

IAQ 2nd Gen.

```
void rm_rrh46410_iaq_2nd_gen_basic_example (void)
{
 fsp_err_t                  err = FSP_SUCCESS;

	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

Function Documentation

◆ RM_RRH46410_Open()

fsp_err_t RM_RRH46410_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)

Opens and configures the RRH46410 sensor module. Implements rm_zmod4xxx_api_t::open.

Return values

FSP_SUCCESS	RRH46410 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Close()

fsp_err_t RM_RRH46410_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_zmod4xxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH46410_MeasurementStart()

fsp_err_t RM_RRH46410_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_MeasurementStop()

fsp_err_t RM_RRH46410_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Read()

fsp_err_t RM_RRH46410_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Iaq2ndGenDataCalculate()

fsp_err_t RM_RRH46410_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_rrh46410_data*)

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Unsupported operation mode.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_RRH46410_PbaqDataCalculate()

fsp_err_t RM_RRH46410_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_rrh46410_data*)

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Unsupported operation mode.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_RRH46410_TemperatureAndHumiditySet()

fsp_err_t RM_RRH46410_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)
This function should be called before Read. Humidity measurements are needed for ambient compensation. temperature is not supported. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully humidity is set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

Detailed Description

Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.

Overview

RRH47000 is EOL.

This module provides an API for configuring and controlling the RRH47000 sensor module.

I2C communication with the RRH47000 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH47000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Get the measruement results from the sensor module

Configuration

Build Time Configurations for rm_rrh47000

The following build time configurations are defined in fsp_cfg/rm_rrh47000_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

• Disabled		included in the build.

Configurations for Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh47000_sensor0	Module name.
Automatic Baseline Correction (ABC)	• Enable all • Enable only ABC • Enable only fast ABC • Disable all	Enable all	Set Automatic Baseline Correction (ABC).
Correction cycle period [days]	Value must be 1 or more	7	Set correction cycle period. Min = 1 and Max = 30.
CO2 baseline value [ppm]	Value must be 400 or more	400	Set CO2 baseline value. Min = 400 and Max = 1500.
Comms I2C Callback	Name must be a valid C symbol	rrh47000_comms_i2c_callback	A user COMMS I2C callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH47000 datasheet is here.
The RRH47000 sensor module uses nondispersive infrared (NDIR) technology to accurately measure CO2 in a compact package size while ensuring competitive pricing. An integrated relative humidity and temperature sensor enables calibration and compensation of the NDIR sensor for precise operation in different environments. Sensors for carbon dioxide (CO2, not estimated), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

- This module supports I2C only (not support UART).
- The RRH47000 sensor module needs a minimum of 3 seconds to initiate communication via I²C after power-on.
- The RRH47000 sensor module supports a clock frequency ranging from 10kHz to 100kHz.

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH47000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
  - Start CO2 Correction
  - Get Serial Number

Bus Initialization

The RRH47000 interface expects a bus instance to be opened before opening any RRH47000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH47000_Open().

From measurement start to data acquisition

An endless loop continuously checks the status of the RRH47000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH47000_Read() and read the measurement data.
2. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
3. Call RM_RRH47000_DataCalculate().

Examples

Basic Example

These are basic examples of minimal use of RRH47000 sensor implementation in an application.

```
void rm_rrh47000_basic_example (void)
{
 fsp_err_t                err = FSP_SUCCESS;

◆ rm_rrh47000_abc_t

enum rm_rrh47000_abc_t	
RRH47000 Automatic Baseline Correction (ABC) setting.	
Enumerator	
RM_RRH47000_ABC_ENABLE_ALL	Enable all.
RM_RRH47000_ABC_ENABLE_ONLY_ABC	Enable only ABC (automatic baseline correction)
RM_RRH47000_ABC_ENABLE_ONLY_FAST_ABC	Enable only fast ABC (fast automatic baseline correction)
RM_RRH47000_ABC_DISABLE_ALL	Disable all.

Function Documentation

◆ RM_RRH47000_Open()

fsp_err_t RM_RRH47000_Open (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg*)

Opens and configures the RRH47000 sensor module. Implements rm_air_sensor_api_t::open.

Return values

FSP_SUCCESS	RRH47000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_DATA	Checksum error occurs.

◆ RM_RRH47000_Close()

fsp_err_t RM_RRH47000_Close (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH47000_Read()

fsp_err_t RM_RRH47000_Read (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. Implements rm_air_sensor_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH47000_DataCalculate()

fsp_err_t RM_RRH47000_DataCalculate (rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh47000_data*)

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_SENSOR_INVALID_DATA	Checksum error occurs.

◆ RM_RRH47000_FirmwareVersionGet()

fsp_err_t RM_RRH47000_FirmwareVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get firmware version. Firmware version will be set "ascii_code" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_INVALID_POINTER	Pointer is NULL.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH47000_StatusCheck()

fsp_err_t RM_RRH47000_StatusCheck (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

StatusCheck API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_RRH47000_AlgorithmVersionGet()

fsp_err_t RM_RRH47000_AlgorithmVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

AlgorithmVersionGet API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.

Overview

RRH62000 is EOL.

This module provides an API for configuring and controlling the RRH62000 sensor module.

I2C communication with the RRH62000 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH62000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Receive status for wait until the measurement is done.
- Get the measruement results from the sensor module

Configuration

Build Time Configurations for rm_rrh62000

The following build time configurations are defined in fsp_cfg/rm_rrh62000_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh62000_sensor0	Module name.
Number of moving average [times]	Value must be 1 or more	10	Set number of moving average. Min = 1 and Max = 60.
Fan speed control [%]	Value must be 60 or more	86	Set fan speed control. Min = 60 and Max = 100.
Comms I2C Callback	Name must be a valid C symbol	rrh62000_comms_i2c_callback	A user COMMS I2C callback function can

be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH62000 datasheet is here.
When using the sensor for the first time, allow up to 48 hours for re-hydration of the humidity sensor in ambient air and for TVOC sensor conditioning. This will allow the module to take optimal readings.
The RRH62000 is an integrated sensor module for the measurement of critical air quality parameters. Sensors for particulate matter (PM), total volatile organic compounds (TVOC), estimation of carbon dioxide (eCO2) optional nitrogen dioxide (NO2), optional ozone (O3), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

- After turning on the module for the first time, the sensor will automatically start in ZMOD sensor cleaning mode for 1 minute. Do not cut power to the sensor during this period.
- Interval time needs to be at least 1s after power-on or reset.
- I2C-master access interval for RRH62000 must be longer than 1s.
- This module supports I2C only (not support UART).

Limitations

- r_iic_master on RA8 series MCU is not supported.
- I2C Master (r_sau_i2c) is not supported. RRH62000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - SLEEP
    - CLEAN
    - TINTC_H
    - TINTC_L
    - TCLEAN
    - RMOX
    - UID

Bus Initialization

The RRH62000 interface expects a bus instance to be opened before opening any RRH62000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH62000_Open().

From measurement start to data acquisition

An endless loop continuously checks the status of the RRH62000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH62000_StatusCheck(). This function will execute a status check over I2C.
2. If RM_AIR_SENSOR_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time (min=1s) and then call RM_RRH62000_StatusCheck() again.
3. Wait until RM_AIR_SENSOR_EVENT_MEASUREMENT_COMPLETE is received.
4. Call RM_RRH62000_Read() and read the measurement data.
5. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
6. Call RM_RRH62000_DataCalculate().

Examples

Basic Example

These are basic examples of minimal use of RRH62000 sensor implementation in an application.

```
void rm_rrh62000_basic_example (void)
{
 fsp_err_t                err = FSP_SUCCESS;
 rm_air_sensor_raw_data_t raw_data;
 rm_air_sensor_data_t    rrh62000_data;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)
g_rrh62000_cfg.p_comms_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {

Function Documentation

◆ RM_RRH62000_Open()

fsp_err_t RM_RRH62000_Open (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg*)

Opens and configures the RRH62000 sensor module. If ZMOD cleaning is not complete, this function will take at least 1 minute. Implements rm_air_sensor_api_t::open.

Return values

FSP_SUCCESS	RRH62000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_NOT_INITIALIZED	ZMOD cleaning is not complete.

◆ RM_RRH62000_Close()

fsp_err_t RM_RRH62000_Close (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH62000_StatusCheck()

fsp_err_t RM_RRH62000_StatusCheck (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_RRH62000_Read()

fsp_err_t RM_RRH62000_Read (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_air_sensor_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH62000_DataCalculate()

fsp_err_t RM_RRH62000_DataCalculate (rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh62000_data*)

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_RRH62000_FirmwareVersionGet()

fsp_err_t RM_RRH62000_FirmwareVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get firmware version. Firmware version does not use "patch" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH62000_AlgorithmVersionGet()

fsp_err_t RM_RRH62000_AlgorithmVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get algorithm version. Implements rm_air_sensor_api_t::algorithmVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck. More...

Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

ZMOD4410, ZMOD4450 and ZMOD4510 are EOL.

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4450
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the rm_comms_i2c module.

Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement

- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

Configuration

Build Time Configurations for rm_zmod4xxx

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_zmod4xxx_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	zmod4xxx_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	zmod4xxx_irq_callback	A user IRQ callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

ZMOD4410 datasheet is here.
The ZMOD4410 has five modes of operation.
The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Method	Description
IAQ 1st Generation Continuous	Measurement of UBA levels for IAQ and eCO2, provides continuous data

IAQ 1st Generation Low Power	Measurement of UBA levels for IAQ and eCO2, fixed sampling interval of 6 seconds
IAQ 2nd Generation	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs)
IAQ 2nd Generation Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. This method offers a much lower power consumption
Relative IAQ	Lightweight algorithm reacts to air quality changes and outputs a relative IAQ
Relative IAQ Ultra Low Power	Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This method offers a much lower power consumption
Public Building AQ Standard (PBAQ)	For highly accurate and consistent sensor readings to fulfill public building standards.
Sulfur-based Odor Discrimination	The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell

ZMOD4450 datasheet is here.
The ZMOD4450 has one modes of operation.
The response time for a gas stimulation is always within a few seconds, depending on the gas and its concentration. An active or direct airflow onto the sensor module is not necessary since diffusion of ambient gas does not limit the sensor module response time. The ZMOD4450 will respond to typical refrigeration gases immediate upon start-up; however, a conditioning period of 48 hours in a refrigeration environment is recommended to improve stability and get maximum performance, as the module algorithm is able to learn about the refrigeration environment over time.

Method	Description
RAQ	Control signal based on Refrigerator Air Quality Changes

ZMOD4510 datasheet is here.
The ZMOD4510 has two modes of operation.
For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.
For NO2 O3 operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
For Compensation for oxidizing gases ULP option operation a response to ozone will be seen after a warmup time of 30 min.
For Compensation for oxidizing gases option operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Method	Description
OAQ 2nd Generation	Selective Ozone featuring Ultra-Low Power
NO2 O3	Selective nitrogen dioxide and ozone firmware
Compensation for oxidizing gases option	Measurement of compensation data for IAQ 2nd

	Gen, PBAQ
Compensation for oxidizing gases option ULP	Measurement of compensation data for IAQ 2nd Gen Ultra-Low Power

A library corresponding to each of these modes is required.
The **Compensation for oxidizing gases option** mode can be used with the **IAQ 2nd Generation** mode and the **Public Building AQ Standard (PBAQ)** mode.
The **Compensation for oxidizing gases option ULP** mode can be used with the **IAQ 2nd Generation Ultra Low Power** mode.
By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

The ZMOD4xxx sensor needs a reset before operation; please input a reset signal to the RES_N pin (active low).

Program flow for OAQ 2nd gen is changed in FSP v4.0.0. Please refer to the programming manual [R36US0004EU] and the application note[R01AN5899].
R01AN5899 : https://www.renesas.com/document/apn/zmod4xxx-sample-application
R36US0004EU : https://www.renesas.com/document/mat/zmod4510-programming-manual-read-me

Limitations

- The following modes are currently not supported for dev_assist.
  - Compensation
  - Compensation ULP

Bus Initialization

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_ZMOD4XXX_Open(). One channel of timer is required to measure the waiting time at initialization.

From measurement start to data acquisition

After normal completion, start the measurement with RM_ZMOD4XXX_MeasurementStart(). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
3. Call RM_ZMOD4XXX_Read(). This function will read the ADC data.
4. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
5. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
3. Call RM_ZMOD4XXX_StatusCheck(). This function will execute a status check over I2C.
4. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time and then call RM_ZMOD4XXX_StatusCheck() again.
5. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
6. Call RM_ZMOD4XXX_Read() and read the ADC data.
7. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
8. Call the DataCalculate API according to the mode.

Checking device error for IAQ 2nd Gen.

1. Call RM_ZMOD4XXX_DeviceErrorCheck(). This function will execute a device error check over I2C.
2. If any device error occurs, RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET or RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT are received in callback. If no device error, RM_ZMOD4XXX_EVENT_SUCCESS is received in callback.

Examples

Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)
{
 fsp_err_t                  err = FSP_SUCCESS;
 rm_zmod4xxx_raw_data_t    raw_data;
 rm_zmod4xxx_iaq_1st_data_t zmod4410_data;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)

Data Structures

struct	rm_zmod4xxx_compensation_info_t

struct	rm_zmod4xxx_init_process_params_t
struct	rm_zmod4xxx_instance_ctrl_t

Enumerations

enum	rm_zmod4xxx_lib_type_t

Data Structure Documentation

◆ rm_zmod4xxx_compensation_info_t

struct rm_zmod4xxx_compensation_info_t		
ZMOD4XXX compensation info		
Data Fields		
rm_zmod4xxx_cfg_t const *	p_compensation_sensor_cfg	Pointer to configuration structure of compensation sensor.
rm_zmod4xxx_raw_data_t *	p_raw_data	Pointer to compensation sensor raw data.

◆ rm_zmod4xxx_init_process_params_t

struct rm_zmod4xxx_init_process_params_t		
ZMOD4XXX initialization process block		
Data Fields		
volatile uint32_t	delay_ms	Delay milliseconds.
volatile bool	communication_finished	Communication flag for blocking.
volatile bool	measurement_finished	IRQ flag.
volatile rm_zmod4xxx_event_t	event	Callback event.

◆ rm_zmod4xxx_instance_ctrl_t

struct rm_zmod4xxx_instance_ctrl_t	
ZMOD4XXX control block	
Data Fields	
uint32_t	open
	Open flag.
uint8_t	buf [RM_ZMOD4XXX_MAX_I2C_BUF_SIZE]
	Buffer for I2C communications.

uint8_t	register_address
	Register address to access.
rm_zmod4xxx_status_params_t	status
	Status parameter.
volatile bool	dev_err_check
	Flag for checking device error.
volatile rm_zmod4xxx_event_t	event
	Callback event.
rm_zmod4xxx_init_process_params_t	init_process_params
	For the initialization process.
rm_zmod4xxx_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
rm_zmod4xxx_lib_extended_cfg_t *	p_zmod4xxx_lib
	Pointer of ZMOD4XXX Lib extended configuration.
void const *	p_zmod4510_device

	Pointer of ZMOD4510 device.
rm_zmod4xxx_raw_data_t *	p_zmod4510_raw_data
	Raw data of ZMOD4510 device for calculating compensation data.
void const *	p_irq_instance
	Pointer to IRQ instance.
void *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

Enumeration Type Documentation

◆ rm_zmod4xxx_lib_type_t

enum rm_zmod4xxx_lib_type_t
ZMOD4XXX Library type

Function Documentation

◆ RM_ZMOD4XXX_Open()

fsp_err_t RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements rm_zmod4xxx_api_t::open.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Unsupport product ID.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Close()

fsp_err_t RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor. Implements rm_zmod4xxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_ZMOD4XXX_MeasurementStart()

fsp_err_t RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_MeasurementStop()

fsp_err_t RM_ZMOD4XXX_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_StatusCheck()

fsp_err_t RM_ZMOD4XXX_StatusCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_zmod4xxx_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Read()

fsp_err_t RM_ZMOD4XXX_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_ZMOD4XXX_Iaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_1st_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq1stGenDataCalculate .

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Iaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_SulfurOdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_sulfur_odor_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::sulfurOdorDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_RaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_raq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::raqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_RellaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RellaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_rel_iaq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::rellaqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_PbaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_No2O3DataCalculate()

fsp_err_t RM_ZMOD4XXX_No2O3DataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_no2_o3_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::no2O3DataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter or library internal error occurred.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_SENSOR_IN_STABILIZATION	Module is stabilizing.
FSP_ERR_SENSOR_INVALID_DATA	Sensor probably damaged. Algorithm results may be incorrect.

◆ RM_ZMOD4XXX_CompensationInfoSet()

fsp_err_t RM_ZMOD4XXX_CompensationInfoSet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_compensation_info_t const *const *p_compensation_info*)

This function should be called when setting the compensation info from ZMOD4510 device for the ZMOD4410 device and when the ZMOD4510 for oxidizing gas correction option is enabled. After reading the raw data from the ZMOD4510 device, set the compensation info for the ZMOD4410 to begin calculating the compensation data.

Return values

FSP_SUCCESS	Successfully compensation info are set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter or library internal error occurred.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Operation mode is not supported.

◆ RM_ZMOD4XXX_TemperatureAndHumiditySet()

fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_DeviceErrorCheck()

fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

5.2.17 Storage

Modules

Detailed Description

Storage Modules.

Modules

Block Media Custom Implementation (rm_block_media_user)

	Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.
	Block Media RAM (rm_block_media_ram) Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.
	Block Media SD/MMC (rm_block_media_sdmmc) Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.
	Block Media SPI Flash (rm_block_media_spi) Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.
	Block Media USB (rm_block_media_usb) Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.
	FileX I/O (rm_filex_block_media) Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.
	FileX I/O (rm_filex_levelx_nor) Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.
	Flash (r_flash_hp) Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.
	Flash (r_flash_lp) Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.
	FreeRTOS+FAT Port for RA (rm_freertos_plus_fat) Middleware for the FAT File System control on RA MCUs.

	LevelX NOR Port (rm_levelx_nor_spi) Middleware for using Azure RTOS LevelX on NOR SPI memory.
	LittleFS on Flash (rm_littlefs_flash) Middleware for the LittleFS File System control on RA MCUs.
	LittleFS on SPI Flash (rm_littlefs_spi_flash) Middleware for the LittleFS File System control on RA MCUs using external SPI Flash.
	MRAM (r_mram) Driver for the MRAM memory on RA MCUs. This module implements the Flash Interface.
	OSPI Flash (r_ospi) Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	OSPI Flash (r_ospi_b) Driver for the OSPI_B peripheral on RA MCUs. This module implements the SPI Flash Interface.
	QSPI (r_qspi) Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	SD/MMC (r_sdhi) Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.
	Virtual EEPROM on Flash (rm_vee_flash) Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

5.2.17.1 Block Media Custom Implementation (rm_block_media_user)

Modules » Storage

Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.

Overview

Features

This module is for using Block media with user-selected media.

Configuration

Block Media User has no output config settings.
The user is required to create the config settings etc. in the application.
The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =
{
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write    = RM_BLOCK_MEDIA_RAM_Write,
    .erase    = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close    = RM_BLOCK_MEDIA_RAM_Close,
};
extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);
const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };
rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

Note

If you use block_media_user, you need to create a function that matches the media you are using.
In the above example, this is the function with RM_BLOCK_MEDIA_.
Register the created function in rm_block_media_api_t.
The registered rm_block_media_api_t is registered in p_api, which is a member of rm_block_media_instance_t.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

Please refer to USB PMSC (r_usb_pmsc) for the PMSC application given as an example.

5.2.17.2 Block Media RAM (rm_block_media_ram)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)
fsp_err_t	RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest_address, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src_address, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_StatusGet (rm_block_media_ctrl_t *const p_api_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.

Overview

Features

- This module is for using RAM as a media area.
- Supports using any read/write section of the address space as the media area.

Note

When using an external RAM as the media area (like SDRAM or OctaRAM), it must be initialized before calling RM_BLOCK_MEDIA_RAM_Open().
When using PMSC driver in combination with this module, the API of this module is called from the PMSC driver.

Configuration

Build Time Configurations for rm_block_media_ram

The following build time configurations are defined in fsp_cfg/rm_block_media_ram_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
RAM Media Size	Please enter the RAM media size.	65536	Enter a RAM media size of 20K bytes or more.
Memory Storage Section	Manual Entry	.bss	This is the section of memory that will be used for the backing storage. Must be a valid Linker section. ('.bss', '.sdram', '.OSPI_DEVICE_0_RAM', etc). For AC6 preface any section with '.bss' e.g. '.bss.sdram'
Format during mediaInit	• Enabled • Disabled	Enabled	If disabled RAM must be formatted with filex_media_format before calling filex_media_open.

Configurations for Storage > Block Media RAM Implementation (rm_block_media_ram)

This module can be added to the Stacks tab via New Stack > Storage > Block Media RAM Implementation (rm_block_media_ram).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Note

Specify RAM media size of 20 Kbytes or more. This module cannot be used with an MCU that cannot allocate at least 20 Kbytes of RAM as media area.
When using AC6 it is recommended to start section names with ".bss" (ex. ".bss.sdram") to prevent unnecessarily large binaries. This tells AC6 to create ZI sections rather than initialized sections.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the RAM block media implementation in an application.

```
#define RM_BLOCK_MEDIA_RAM_BLOCK_SIZE (512U)
uint8_t g_dest[RM_BLOCK_MEDIA_RAM_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_RAM_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
rm_block_media_status_t status;
void rm_block_media_ram_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_RAM_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_RAM driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_RAM_Open(&g_rm_block_media0_ctrl,
```

```
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* When enabled, format RAM as FAT file system. */
    err = RM_BLOCK_MEDIA_RAM_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Get the RM_BLOCK_MEDIA_RAM driver status. */
    err = RM_BLOCK_MEDIA_RAM_StatusGet(&g_rm_block_media0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 if (true == status.initialized)
    {
 /* Write a block of data to block 3 of the RAM memory. */
       err = RM_BLOCK_MEDIA_RAM_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
      assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the RAM memory. */
       err = RM_BLOCK_MEDIA_RAM_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
      assert(FSP_SUCCESS == err);
    }
 else
    {
 /* Close the RM_BLOCK_MEDIA_RAM driver. */
 RM_BLOCK_MEDIA_RAM_Close(&g_rm_block_media0_ctrl);
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_RAM_Open()

fsp_err_t RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the RAM media area.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Read()

fsp_err_t RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from RAM media.

Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Write()

fsp_err_t RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to RAM media.

Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Erase()

fsp_err_t RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of RAM media.

Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status.

Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_RAM_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_RAM_Close()

fsp_err_t RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes the module.

Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.

Overview

Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_sdmmc

The following build time configurations are defined in driver/rm_block_media_sdmmc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media SD/MMC (rm_block_media_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm_block_media_sdmmc). Non-secure callable guard functions can be generated for this module by

right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)
uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void rm_block_media_sdmmc_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SDMMC driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SDMMC_Open()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::open

◆ RM_BLOCK_MEDIA_SDMMC_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::mediaInit

◆ RM_BLOCK_MEDIA_SDMMC_Read()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements rm_block_media_api_t::read().

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::read

◆ RM_BLOCK_MEDIA_SDMMC_Write()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements rm_block_media_api_t::write().

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::write

◆ RM_BLOCK_MEDIA_SDMMC_Erase()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an SD card or eMMC device. Implements rm_block_media_api_t::erase().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::erase
- sdmmc_api_t::statusGet

◆ RM_BLOCK_MEDIA_SDMMC_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_BLOCK_MEDIA_SDMMC_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SDMMC_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SDMMC_Close()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close (rm_block_media_ctrl_t *const *p_ctrl*)
Closes an open SD/MMC device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

5.2.17.4 Block Media SPI Flash (rm_block_media_spi)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)

fsp_err_t	RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void *const p_context, rm_block_media_callback_args_t *const p_callback_memory)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks)

Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.

Overview

Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

Note

By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.

Configuration

Build Time Configurations for rm_block_media_spi

The following build time configurations are defined in driver/rm_block_media_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build

Configurations for Storage > Block Media SPI Flash (rm_block_media_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm_block_media_spi).

Configuration	Options	Default	Description
Module Instance Name	Name must be a valid C symbol	g_rm_block_media0	Module name
Block size (bytes)	Manual Entry	4096	Specify the size of a block in bytes.
Block count	Minimum block count is 1, maximum is defined by hardware and software design.	8192	Number of blocks available for use by this driver instance.
Base Address	Manual Entry	0	Base address offset (bytes) for instance memory region.
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be

provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

Developers should be aware of the following limitations when using RM_BLOCK_MEDIA_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

Examples

Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)
uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Non-Blocking Example

This is a basic example of using the optional SPI callback to implement non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
```

```
}
/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
 * been blocked by the lower level SPI driver busy indication.
 */
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
 /* Process operation complete. */
    }
 else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
    {
 rm_block_media_status_t status;
 rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
      assert(FSP_SUCCESS == err);
 if (true == status.busy)
      {
 /* Run waiting tasks */
            vTaskSuspend(xTaskGetCurrentTaskHandle());
      }
    }
 else
    {
       assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
 /* Process Read, Write, or Erase error. */
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SPI_Open()

fsp_err_t RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements rm_block_media_api_t::open.

Return values

FSP_SUCCESS	Block media for SPI framework is successfully opened.
FSP_ERR_ASSERTION	One of the input parameters or their data references may be null.
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::open

◆ RM_BLOCK_MEDIA_SPI_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SPI_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the Block Media SPI Flash device.

Implements rm_block_media_api_t::mediaInit.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SPI_Read()

fsp_err_t RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::read.

Return values

FSP_SUCCESS	SPI data read successfully
FSP_ERR_ASSERTION	p_ctrl or p_dest is NULL, or num_blocks is zero
FSP_ERR_NOT_OPEN	Block Media SPI module is not yet open
FSP_ERR_INVALID_ADDRESS	Invalid address range for read operation
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

◆ RM_BLOCK_MEDIA_SPI_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status.

Implements rm_block_media_api_t::statusGet.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::statusGet

◆ RM_BLOCK_MEDIA_SPI_Write()

fsp_err_t RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Writes provided data to a number of blocks of spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::write.

Return values

FSP_SUCCESS	Flash write finished successfully.
FSP_ERR_ASSERTION	p_ctrl or p_src is NULL. Or num_blocks is zero.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::write

◆ RM_BLOCK_MEDIA_SPI_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. API not supported.

Implements rm_block_media_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	API not supported by RM_BLOCK_MEDIA_SPI.

◆ RM_BLOCK_MEDIA_SPI_Close()

fsp_err_t RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes the Block Media SPI device. Implements rm_block_media_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	One of the following parameters may be null: p_ctrl.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- spi_flash_api_t::close

◆ RM_BLOCK_MEDIA_SPI_Erase()

fsp_err_t RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *start_block*, uint32_t const *num_blocks*)

This function erases blocks of the SPI device. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::erase.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- spi_flash_api_t::erase
- spi_flash_api_t::statusGet

5.2.17.5 Block Media USB (rm_block_media_usb)

Detailed Description

Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.

Overview

Features

The USB implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from a USB mass storage device
- Callback called when device insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_usb

The following build time configurations are defined in driver/rm_block_media_usb_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media USB (rm_block_media_usb)

This module can be added to the Stacks tab via New Stack > Storage > Block Media USB (rm_block_media_usb). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be

			provided. If this callback function is provided, it will be called when a device is attached or removed.
Pointer to user context	Name must be a valid C symbol	NULL	A user context can be provided. If this context is provided, it will be passed to callback function when a device is attached or removed.

Note

RM_BLOCK_MEDIA_USB_MediaInit function must be called after receiving the insert event notification.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the USB mass storage block media implementation in an application.

```
#define RM_BLOCK_MEDIA_USB_BLOCK_SIZE (512)
volatile bool g_usb_inserted = false;
uint8_t       g_dest[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t       g_src[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_usb_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_USB_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_USB driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_USB_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!g_usb_inserted)
    {
 /* Wait for a card insertion interrupt. */
    }
 /* Initialize the mass storage device. This should not be done until the device is
plugged in and initialized. */
    err = RM_BLOCK_MEDIA_USB_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Device Insertion

This is an example of using a callback to determine when a mass storage device is plugged in and enumerated.

```
/* The callback is called when a media insertion event occurs. */
void rm_block_media_usb_media_insertion_example_callback
(rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED == p_args->event)
    {
       g_usb_inserted = true;
    }
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED == p_args->event)
    {
       g_usb_inserted = false;
    }
```

```
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_USB_Open()

fsp_err_t RM_BLOCK_MEDIA_USB_Open (rm_block_media_ctrl_t *const *p_ctrl*,
rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the USB device.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_USB_Read()

fsp_err_t RM_BLOCK_MEDIA_USB_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an USB device. Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Write()

fsp_err_t RM_BLOCK_MEDIA_USB_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an USB device. Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Erase()

fsp_err_t RM_BLOCK_MEDIA_USB_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an USB device. Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet (rm_block_media_ctrl_t *const *p_api_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Note

This function is currently unsupported for Block Media over USB.

Return values

FSP_ERR_UNSUPPORTED	CallbackSet is not currently supported for Block Media over USB.

◆ RM_BLOCK_MEDIA_USB_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_USB_Close()

fsp_err_t RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes an open USB device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

Features

The FileX Block Media module supports the following features:

- Callbacks for insertion and removal for removable devices.
- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for rm_filex_block_media

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_block_media_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (rm_filex_block_media)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_block_media_0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_block_media_0_callback	A user callback function can be provided. If this callback function is provided, it will be called when media is inserted or removed. It will also be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
Partition Number	• 0 • 1 • 2 • 3	0	The partition to use for partitioned media. This partition will only be used if a Master Boot Record with partition table exists at block 0 of the media, otherwise the FileX FAT boot record should exist or be formatted to block 0.

Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

Configuration	Options	Default	Description
Common			
Max Long Name Len	Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty		Specifies the maximum file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Max Last Name Len	Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.

Max Sector Cache	Value must be an integer greater than 0 and power of 2 or empty		Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2.
Fat Map Size	Value must be an integer greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Max Fat Cache	Value must be an integer greater than 0 and power of 2 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading			
Update Rate (Seconds)	Value must be an integer greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
No Timer	• Enabled • Disabled (default)	Disabled (default)	Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Single Thread	• Enabled • Disabled (default)	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from

			one thread.
Standalone	• Enabled • Disabled (default)	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features			
Don't Update Open Files	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX does not update already opened files.
Media Search Cache	• Enabled (default) • Disabled	Enabled (default)	When disabled, the file search cache optimization is disabled.
Direct Data Read Cache Fill	• Enabled (default) • Disabled	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Media Statistics	• Enabled (default) • Disabled	Enabled (default)	When disabled, gathering of media statistics is disabled.
Single Open Legacy	• Enabled • Disabled (default)	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Rename Path Inherit	• Enabled • Disabled (default)	Disabled (default)	When enabled, renaming inherits path information.
No Local Path	• Enabled • Disabled (default)	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
64-bit LBA	• Enabled • Disabled (default)	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Cache	• Enabled (default) • Disabled	Enabled (default)	Enables or disables the cache, default is enabled.
File Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables file close, default is enabled.
Fast Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables fast open, default is enabled.
Force Memory Operation	• Enabled (default)	Enabled (default)	Enables or disables force memory

	• Disabled		operation, default is enabled.
Build Options	• Enabled (default) • Disabled	Enabled (default)	Enables or disables build options, default is enabled.
One Line Function	• Enabled (default) • Disabled	Enabled (default)	Enables or disables one line function, default is enabled.
FAT Entry Refresh	• Enabled (default) • Disabled	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Consecutive Detect	• Enabled (default) • Disabled	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Enable exFAT	• Enabled • Disabled (default)	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant			
Fault Tolerant Service	• Enabled • Disabled (default)	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA.
Fault Tolerant Data	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps

			limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant Boot Index	Value must be an integer greater than or equal to 116 and less than or equal to 119		Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.
Error Checking	• Enabled (default) • Disabled	Enabled (default)	

Configurations for Storage > Azure RTOS FileX on Block Media

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on Block Media.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a maximum of 11 characters	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.
Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an	0	Number of sectors hidden before this

	integer		media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	65536	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Bytes per Sector	Bytes per Sector must be multiple of 32	512	Number of bytes per sector, which is typically 512. FileX requires this to be a multiple of 32. When using a Renesas provided block media implementation, bytes per sector can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal

to the size of one sector.

Usage Notes

Pending during Read/Write

The FileX Block Media driver provides a number of events in the user callback to handle waiting or pending while it is doing blocking operations. The events received in the callback will differ depending on the lower level block media driver in use.

If the lower level block media driver is rm_block_media_spi (SPI blocks on read/write operations):

- The user will receive RM_BLOCK_MEDIA_EVENT_POLL_STATUS in the user callback while the lower level driver is polling for the read/write operation to be complete. The user can choose to do a thread sleep or software delay upon receiving this event in the callback.
- Once the operation is complete no other callbacks will be received.

If the lower level block media driver is rm_block_media_sdmmc (SDMMC is interrupt based, the FileX Block Media driver will still block while waiting for interrupts from SDMMC):

- The user will receive RM_BLOCK_MEDIA_EVENT_WAIT in the user callback when the FileX Block Media driver begins waiting for an interrupt event from SDMMC. This is sent from a thread context. The user can choose to pend on a semaphore, sleep the thread, or do a software delay upon receiving this event in the callback. The FileX Block Media driver thread will block until an interrupt is received.
- Once an SDMMC interrupt is received the user will receive RM_BLOCK_MEDIA_EVENT_WAIT_END in the user callback. This is sent from an interrupt context. The user can choose to give a semaphore on this event or do nothing.
- If SDMMC is busy on a long erase after receiving the interrupt the FileX Block Media driver will send RM_BLOCK_MEDIA_EVENT_POLL_STATUS to the user callback and proceed to do a blocking poll on SDMMC status. The user can choose to do a thread sleep or software delay upon receiving this event in the callback. This event will not be received by the user on typical operations by FileX.

Partitioned Media

When using fx_format to format a partition the number of hidden sectors should match the starting block number of the partition and the total number of sectors should be equal to the number of sectors in the partition.

Unused User Callback Events

Certain events are defined in rm_block_media_event_t but not returned by the FileX Block Media user callback:

- RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE: This event is handled internally and operation success is indicated by FileX API calls returning FX_SUCCESS.
- RM_BLOCK_MEDIA_EVENT_ERROR: This event is handled internally and operation failure will be indicated by an error return code from FileX API calls.

Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the FileX instance should be erased using the lower

level flash API prior to usage. Otherwise, FileX open operation may fail when fx_media_open( ) is called.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS (1073741824)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_block_media_instance_t g_filex_block_media0;
extern rm_filex_block_media_instance_ctrl_t g_filex_block_media0_ctrl;
extern rm_filex_block_media_cfg_t g_filex_block_media0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_block_media_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize FileX */
    fx_system_initialize();
```

```
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                              &g_filex_block_media0,
                              g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
 /* Create a file */
    fx_err = fx_file_create(&g_fx_media0, RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME);
    handle_fx_error(fx_err);
 /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
 /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
 /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
&actual_size_read);
    handle_fx_error(fx_err);
    assert(sizeof(g_file_data) == actual_size_read);
 /* Close the file. */
```

```
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_filex_block_media_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
```

```
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Pend Example

This shows how to use the I/O driver callback with ThreadX in order to wait/pend for operations to complete.

```
TX_SEMAPHORE g_operation_wait_semaphore;
/* Callback called by FileX block media I/O driver needs to pend on operation. */
void rm_filex_block_media_test_callback_pend (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT)
    {
 /* Interrupt has not happened for operation, get semaphore to wait for it. This will
be called from the FileX I/O driver thread. */
       tx_semaphore_get(&g_operation_wait_semaphore, TX_WAIT_FOREVER);
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT_END)
    {
 /* Interrupt has occurred for operation, post semaphore so that wait will end. This
will be called from an interrupt context. */
       tx_semaphore_put(&g_operation_wait_semaphore);
```

```
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_POLL_STATUS)
    {
 /* Interrupt has been received from block media device but operation is still
ongoing. The FileX I/O driver will wait on the driver busy status.
  * This event can be used to put the thread to sleep while waiting. This will be
called from the FileX I/O driver thread. */
       tx_thread_sleep(1);
    }
}
void rm_filex_block_media_callback_pend_example (void)
{
 /* Create semaphore for driver use */
    tx_semaphore_create(&g_operation_wait_semaphore, "operation_wait_semaphore", 0);
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
```

```
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
volatile uint32_t g_rm_filex_block_media_insertion_events = 0;
volatile uint32_t g_rm_filex_block_media_removal_events = 0;
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_filex_block_media_test_callback (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED)
    {
       g_rm_filex_block_media_insertion_events++;
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED)
    {
       g_rm_filex_block_media_removal_events++;
    }
}
void rm_filex_block_media_media_insertion_example (void)
{
```

```
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
 while (0U == g_rm_filex_block_media_insertion_events)
    {
 /* Wait for media insertion. */
    }
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                             &g_filex_block_media0,
                             g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
}
```

Using FileX with Custom Block Media Implementations

When using a Custom Block Media implementation with rm_filex_block_media the custom implementation must call rm_filex_block_media_memory_callback upon the completion of a read/write operation. This callback should be called with an event of RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE and p_context of rm_filex_block_media_instance_ctrl_t *. The following example shows how this should be done in the context of a demo RAM block media read function.

```
#define EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR (0x20004AFE)
#define EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES (512)
/* Example implementation of rm_block_media_api_t::read(), user should define custom
block media RAM implementation. */
fsp_err_t RM_BLOCK_MEDIA_CUSTOM_RAM_Read (rm_block_media_ctrl_t * const p_ctrl,
                                          uint8_t * const
               p_dest_address,
```

```
                                       uint32_t const
block_address,
                                       uint32_t const                num_blocks)
{
 FSP_PARAMETER_NOT_USED(p_ctrl);
    memcpy(p_dest_address,
          (void *) (EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR + (block_address *
EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES)),
          (EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES * num_blocks));
 /* Notify FileX port of operation complete through calling the callback, this is
required for custom block media/FileX port integration */
 rm_block_media_callback_args_t args;
    args.event    = RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE;
    args.p_context = &g_filex_block_media0_ctrl;
    rm_filex_block_media_memory_callback(&args);
 return FSP_SUCCESS;
}
```

Data Structures

struct	rm_filex_block_media_instance_ctrl_t

Data Structure Documentation

◆ rm_filex_block_media_instance_ctrl_t

struct rm_filex_block_media_instance_ctrl_t
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_BLOCK_MEDIA_Open is called.

Function Documentation

◆ RM_FILEX_BLOCK_MEDIA_Open()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Open (rm_filex_block_media_ctrl_t *const *p_ctrl*, rm_filex_block_media_cfg_t const *const *p_cfg*)

The file system relies on the media to be formatted prior to creating directories and files The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. Initializes callback and configuration for FileX Block Media interface. Call this before calling any FileX functions.

Implements rm_filex_block_media_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_Close()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Close (rm_filex_block_media_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_filex_block_media_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_BlockDriver()

void RM_FILEX_BLOCK_MEDIA_BlockDriver (FX_MEDIA * *p_fx_media*)

Access Block Media device functions open, close, read, write and control.

The RM_FILEX_BLOCK_MEDIA_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the FSP Block Media Interface. Uses block media driver for accesses.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

None	

Returns

Nothing, but updates FileX media control block.

5.2.17.7 FileX I/O (rm_filex_levelx_nor)

Modules » Storage

Functions

void	RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA *p_fx_media) Access LevelX NOR device functions open, close, read, write and control. More...

Detailed Description

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

Features

The FileX LevelX NOR module supports the following features:

- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for rm_filex_levelx_nor

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_levelx_nor_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (rm_filex_levelx_nor)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_levelx_nor0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_levelx_nor_0_callback	A user callback function can be provided. If this callback function is provided, it will be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
LevelX NOR Name (String)	Manual Entry	g_rm_filex_levelx_nor_0	String name to be input into LevelX API.

Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

Configuration	Options	Default	Description
Common			
Max Long Name Len	Value must be an		Specifies the maximum

	integer greater than or equal to 13 and less than or equal to 256, or empty	file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Max Last Name Len	Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty	This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Max Sector Cache	Value must be an integer greater than 0 and power of 2 or empty	Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2.
Fat Map Size	Value must be an integer greater than 0 or empty	Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Max Fat Cache	Value must be an integer greater than 0 and power of 2 or empty	Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading		
Update Rate (Seconds)	Value must be an integer greater than 0 or empty	Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10

			seconds.
No Timer	• Enabled • Disabled (default)	Disabled (default)	Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Single Thread	• Enabled • Disabled (default)	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Standalone	• Enabled • Disabled (default)	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features			
Don't Update Open Files	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX does not update already opened files.
Media Search Cache	• Enabled (default) • Disabled	Enabled (default)	When disabled, the file search cache optimization is disabled.
Direct Data Read Cache Fill	• Enabled (default) • Disabled	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Media Statistics	• Enabled (default) • Disabled	Enabled (default)	When disabled, gathering of media statistics is disabled.
Single Open Legacy	• Enabled • Disabled (default)	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Rename Path Inherit	• Enabled • Disabled (default)	Disabled (default)	When enabled, renaming inherits path information.
No Local Path	• Enabled • Disabled (default)	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
64-bit LBA	• Enabled • Disabled	Disabled (default)	When enabled, 64-bits sector addresses are

	(default)		used in I/O driver.
Cache	• Enabled (default) • Disabled	Enabled (default)	Enables or disables the cache, default is enabled.
File Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables file close, default is enabled.
Fast Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables fast open, default is enabled.
Force Memory Operation	• Enabled (default) • Disabled	Enabled (default)	Enables or disables force memory operation, default is enabled.
Build Options	• Enabled (default) • Disabled	Enabled (default)	Enables or disables build options, default is enabled.
One Line Function	• Enabled (default) • Disabled	Enabled (default)	Enables or disables one line function, default is enabled.
FAT Entry Refresh	• Enabled (default) • Disabled	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Consecutive Detect	• Enabled (default) • Disabled	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Enable exFAT	• Enabled • Disabled (default)	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant			
Fault Tolerant Service	• Enabled • Disabled (default)	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA.
Fault Tolerant Data	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this

			feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant Boot Index	Value must be an integer greater than or equal to 116 and less than or equal to 119		Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.
Error Checking	• Enabled (default) • Disabled	Enabled (default)	

Configurations for Storage > Azure RTOS FileX on LevelX NOR

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on LevelX NOR.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a maximum of 11 characters	Volume 1	Volume name string, which is a maximum of 11 characters.

Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.
Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	57337	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

Usage Notes

Pending during Write/Erase

If the underlying LevelX NOR driver performs a blocking operation that requires waiting to complete (such as a long write/erase on NOR SPI), a callback can be provided to provide a way to wait with an OS-specific thread wait. This callback will also pass up block erase events.

Partitioned Media

Partitioned media is not supported directly by the FileX LevelX NOR port.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_levelx_nor_instance_t g_filex_levelx_nor0;
extern rm_filex_levelx_nor_instance_ctrl_t g_filex_levelx_nor0_ctrl;
extern rm_filex_levelx_nor_cfg_t g_filex_levelx_nor0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_levelx_nor_example (void)
{
 /* Initialize FileX */
```

```
    fx_system_initialize();
 /* Initialize LevelX */
    lx_nor_flash_initialize();
 /* Open the media. This assumes the flash is already formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_LEVELX_NOR_DeviceDriver,
                             &g_filex_levelx_nor0,
                             g_fx_media0_memory,
 sizeof(g_fx_media0_memory));

    handle_fx_error(fx_err);
 /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
 /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
 /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
&actual_size_read);
    handle_fx_error(fx_err);
```

```
    assert(sizeof(g_file_data) == actual_size_read);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE (4096)
void rm_filex_levelx_nor_format_example (void)
{
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE)
    {
       err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE);
```

```
     assert(FSP_SUCCESS == err);
      status.write_in_progress = true;
 while (status.write_in_progress)
     {
           err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
     assert(FSP_SUCCESS == err);
      }
   }
   err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
   assert(FSP_SUCCESS == err);
 /* Format the media */
   UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Wait Example

This shows how to use the I/O driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by FileX block media I/O driver needs to wait on operation. */
void rm_filex_levelx_nor_test_callback_wait (rm_filex_levelx_nor_callback_args_t *
p_args)
{
 if (p_args->event & RM_FILEX_LEVELX_NOR_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
void rm_filex_levelx_nor_callback_wait_example (void)
{
 /* Format the media */
    UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,          // Total sectors
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,    // Sectors per cluster
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Data Structures

struct	rm_filex_levelx_nor_cfg_t
struct	rm_filex_levelx_nor_instance_ctrl_t
struct	rm_filex_levelx_nor_instance_t

Macros

#define	VOID

Enumerations

enum	rm_filex_levelx_nor_event_t

Data Structure Documentation

◆ rm_filex_levelx_nor_callback_args_t

struct rm_filex_levelx_nor_callback_args_t		
Callback function parameter data		
Data Fields		
rm_filex_levelx_nor_event_t	event	The event can be used to identify what caused the callback.

void *	p_context	Placeholder for user data.

◆ rm_filex_levelx_nor_cfg_t

struct rm_filex_levelx_nor_cfg_t	
FileX LevelX configuration	
Data Fields	
UINT(*	nor_driver_initialize)(LX_NOR_FLASH *)
	Pointer to the initialization function.
LX_NOR_FLASH *	p_nor_flash
	NOR Flash instance.
CHAR *	p_nor_flash_name
	NOR Flash instance name.
fsp_err_t(*	close)()
	Pointer to underlying driver close.
void(*	p_callback)(rm_filex_levelx_nor_callback_args_t *p_args)
	Pointer to callback function.
void *	p_context
	Placeholder for user data.

◆ rm_filex_levelx_nor_instance_ctrl_t

struct rm_filex_levelx_nor_instance_ctrl_t		
FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_LEVELX_NOR_Open is called.		
Data Fields		
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to instance configuration.

◆ rm_filex_levelx_nor_instance_t

struct rm_filex_levelx_nor_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
rm_filex_levelx_nor_instance_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.

Macro Definition Documentation

◆ VOID

#define VOID
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file.

Enumeration Type Documentation

◆ rm_filex_levelx_nor_event_t

enum rm_filex_levelx_nor_event_t	
Options for the callback events.	
Enumerator	
RM_FILEX_LEVELX_NOR_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_FILEX_LEVELX_NOR_DeviceDriver()

void RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA * *p_fx_media*)

Access LevelX NOR device functions open, close, read, write and control.

The RM_FILEX_LEVELX_NOR_DeviceDriver function is called from the FileX file system driver and issues requests to a LevelX NOR device through the LevelX API.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

None	

Returns

Nothing, but updates FileX media control block.

5.2.17.8 Flash (r_flash_hp)

Detailed Description

Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and

ROM flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The R_FLASH_HP module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank-checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for ROM Flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.
- Anti-rollback counter support (select MCUs).
- Blocking writing of user lockable data flash option setting memory area (select MCUs).

Configuration

Build Time Configurations for r_flash_hp

The following build time configurations are defined in fsp_cfg/r_flash_hp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming Enable	• Enabled • Disabled	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming Enable	• Enabled • Disabled	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

Configurations for Storage > Flash (r_flash_hp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_hp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background	• Enabled	Enabled	Enabling allows Flash

Operation	• Disabled		API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.
Flash Error Interrupt Priority	MCU Specific Options		Select the flash error interrupt priority.

Clock Configuration

Flash uses FCLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_hp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO (Background Operation) mode, you can still access the user ROM, RAM and external memory. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Data flash BGO is not supported during anti-rollback counter operations or writes to the user lockable area.

Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to

RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Flash Clock (FCLK)

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Anti Rollback Counter

Anti-rollback counters are available on select MCUs and can be used to prevent or limit firmware downgrade. The counters can only be incremented and never decremented or reset, even with an external programming tool.

Note

> ***The OEM bootloader anti-rollback counter is protected by the security engine and cannot be incremented past the version number specified in the code certificate. This counter works with the First Stage Bootloader (FSBL) set to enabled. For more information, read the 'Secure Boot' section in the 'Security Features' chapter of the user manual of the target MCU and refer to Application Note R11AN0774.***

Anti-Rollback Counter Configuration Setting

When anti-rollback counters are used for one or more non-secure applications, the Anti-Rollback Counter Configuration Setting for ARC_NSEC (ARCCS) must be configured as either a single line (1xn bits) or multi-line counter (mxn bits). Single line is suitable when there is only one non-secure application using the anti-rollback counter. Multi-line is suitable when there are multiple non-secure applications. Before the counter is configured, it can't be used.

This configuration setting is permanent and must be performed with an external programming tool such as Renesas Flash Programmer (RFP). It cannot be configured in e2 studio.

The secure application and OEM bootloader anti-rollback counters do not require any initial configuration.

Anti-Rollback Counter Lock Setting

Select MCUs have the ability to permanently lock the anti-rollback counters using the Anti-Rollback Counter Lock Setting (ARCLS). It cannot be set with e2 studio, but if needed, it can be configured with an external programming tool such as Renesas Flash Programmer (RFP). **Once the lock protection is applied to a counter, the counter value can never be incremented again.** It is still possible to read the value of a locked counter.

Anti-Rollback Counter Recovery from Power Loss or other Counter Increment Error

If an error is returned by R_FLASH_HP_AntiRollbackCounterIncrement or power loss occurs during increment command processing, a successful call to R_FLASH_HP_AntiRollbackCounterRefresh is required before reading or incrementing the counter again. Otherwise, the counter flash may be in an invalid state.

User Lockable Area

The user lockable area of the data flash configuration area neither requires nor supports erase before rewriting.

Locked sections of the user lockable area cannot be rewritten.

If lockable area is available on the MCU, start address, end address, and write size can be read at runtime in the second element of the data flash block information array (p_info->data_flash.p_block_array[1]) returned by R_FLASH_HP_InfoGet.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Viewing flash contents in e2 studio

By default, the contents of data flash and code flash are cached by e^2 studio. This means that during a debug session, modifications to these memory regions will not be observed by e^2 studio. When debugging applications using e^2 studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified flash contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

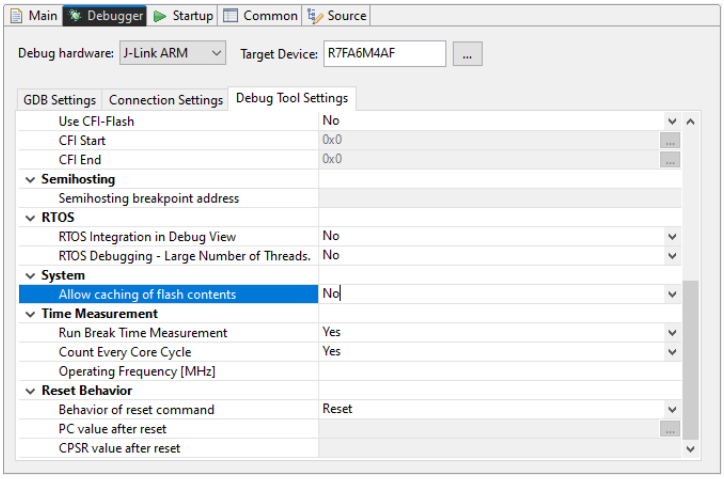

Figure 328: Debug Configuration

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is

still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased data flash blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.
- Runtime locking of the user lockable area is not currently supported. The area can be locked by an external programming tool. Do not write to locked areas of user lockable area.

Examples

High-Performance Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 64 B: 0x40100000 - 0x4010003F */
#define FLASH_CF_BLOCK_8 0x00010000  /* 32 KB: 0x00010000 - 0x00017FFF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_HP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void r_flash_hp_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
```

```
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_8, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
```

High-Performance Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
```

```
    .irq            = BSP_VECTOR_FLASH_HP_FRDYI_ISR,
};
void r_flash_hp_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
```

```
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

High-Performance Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void r_flash_hp_bankswap_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x00200000. */
 /* Swap the block at address 0 with the one at 0x00200000 after the next restart.
  * The application at 0x00200000 must be written there by application code. */
    err = R_FLASH_HP_BankSwap(&g_flash_ctrl);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Handle any pre-reset operations here */
 /* Reset the MCU to swap to the other bank */
    __NVIC_SystemReset();
}
```

High-Performance Anti-Rollback Counter Basic Example

This example demonstrates basic usage of the anti-rollback counter functions.

```
void r_flash_hp_anti_rollback_counter_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    uint32_t current_count;
 /* Read the current counter value for the secure application */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_SEC,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the OEM bootloader */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_OEMBL,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the non-secure application if counter is
configured as 1xn bits */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for 4 non-secure applications if counter is
configured as mxn bits */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App 0
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_1,
&current_count); // NSEC App 1
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_2,
&current_count); // NSEC App 2
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_3,
&current_count); // NSEC App 3
    assert(FSP_SUCCESS == err);
 /* Increment the counter value for the secure application. Caution: The increment
```

```
cannot be reversed. */
    err = R_FLASH_HP_AntiRollbackCounterIncrement(&g_flash_ctrl, FLASH_ARC_SEC);
 /* If error occurred during increment, refresh the counter flash to ensure a valid
state */
 if (FSP_SUCCESS != err)
    {
       err = R_FLASH_HP_AntiRollbackCounterRefresh(&g_flash_ctrl, FLASH_ARC_SEC);
      assert(FSP_SUCCESS == err);
    }
    assert(FSP_SUCCESS == err);
}
```

High-Performance User Lockable Area Basic Example

This example demonstrates writing the user lockable area.

```
void r_flash_hp_user_lockable_area_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 flash_info_t flash_info;
    err = R_FLASH_HP_InfoGet(&g_flash_ctrl, &flash_info);
    assert(FSP_SUCCESS == err);
    assert(flash_info.data_flash.num_regions >= 2);
 flash_block_info_t const * const p_user_area_info =
&flash_info.data_flash.p_block_array[1];
 /* Select initial value to write to the lockable area */
    uint32_t update_complete_flag = 0;
 /* Set parameters for writing update_complete_flag to start of lockable area */
    uint32_t const flash_address    = p_user_area_info->block_section_st_addr;
    uint32_t const write_size_bytes = sizeof(update_complete_flag);
 /* Ensure write size is a multiple of the programming size */
    uint32_t const programming_size_bytes = p_user_area_info->block_size_write;
    assert(write_size_bytes % programming_size_bytes == 0);
```

```
 /* Write data to the beginning of User Lockable Area 0 */
    err = R_FLASH_HP_UserLockableAreaWrite(&g_flash_ctrl,
                                           (uint32_t) &update_complete_flag,
                                           flash_address,
                                           write_size_bytes);
    assert(FSP_SUCCESS == err);
 /* Confirm the data was written */
    assert(0 == memcmp(&update_complete_flag, (uint8_t *) flash_address,
write_size_bytes));
 /* Select new value to write to the lockable area */
    update_complete_flag = 1;
 /* Write new data to the beginning of User Lockable Area 0 */
    err = R_FLASH_HP_UserLockableAreaWrite(&g_flash_ctrl,
                                           (uint32_t) &update_complete_flag,
                                           flash_address,
                                           write_size_bytes);
    assert(FSP_SUCCESS == err);
 /* Confirm the data was written */
    assert(0 == memcmp(&update_complete_flag, (uint8_t *) flash_address,
write_size_bytes));
}
```

Data Structures

struct	flash_hp_instance_ctrl_t

Enumerations

enum	flash_bgo_operation_t

Data Structure Documentation

◆ flash_hp_instance_ctrl_t

struct flash_hp_instance_ctrl_t	
Flash HP instance control block. DO NOT INITIALIZE.	
Data Fields	
uint32_t	opened
	To check whether api has been opened or not.

flash_bgo_operation_t	current_operation
	Operation in progress, for example, FLASH_OPERATION_CF_ERASE.

Enumeration Type Documentation

◆ flash_bgo_operation_t

enum flash_bgo_operation_t

Possible Flash operation states

Function Documentation

◆ R_FLASH_HP_Open()

fsp_err_t R_FLASH_HP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initializes the high performance flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

Example:

```
/* Open the flash hp instance. */
fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ALREADY_OPEN	The flash control block is already open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.

◆ R_FLASH_HP_Write()

fsp_err_t R_FLASH_HP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Writes to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_Erase()

fsp_err_t R_FLASH_HP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erases the specified Code or Data Flash blocks. Implements flash_api_t::erase by the block_erase_address.

Note

Code flash may contain blocks of different sizes. When erasing code flash it is important to take this into consideration to prevent erasing a larger address space than desired.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified. If the address is in code flash then code flash programming must be enabled.
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_BlankCheck()

fsp_err_t R_FLASH_HP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Performs a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blank check operation completed with result in p_blank_check_result, or blank check started and in-progess (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.

◆ R_FLASH_HP_StatusGet()

fsp_err_t R_FLASH_HP_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the FLASH peripheral for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	FLASH peripheral is ready to use.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The Flash API is not Open.

◆ R_FLASH_HP_IdCodeSet()

fsp_err_t R_FLASH_HP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Implements flash_api_t::idCodeSet.

Return values

FSP_SUCCESS	ID Code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_AccessWindowSet()

fsp_err_t R_FLASH_HP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block –> last block inclusive. Anything outside this range of Code Flash is then write protected.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear().

Implements flash_api_t::accessWindowSet.

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_AccessWindowClear()

fsp_err_t R_FLASH_HP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements flash_api_t::accessWindowClear.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_Reset()

fsp_err_t R_FLASH_HP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_StartUpAreaSelect()

fsp_err_t R_FLASH_HP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements flash_api_t::startupAreaSelect.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_BankSwap()

fsp_err_t R_FLASH_HP_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Swaps the flash bank located at address 0x00000000 and address 0x00200000. This can only be done when in dual bank mode. Dual bank mode can be enabled in the FSP Configuration Tool under BSP Properties. After a bank swap is done the MCU will need to be reset for the changes to take place. flash_api_t::bankSwap.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_INVALID_MODE	Cannot switch banks while flash is in Linear mode.
FSP_ERR_WRITE_FAILED	Flash write operation failed.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_HP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_FCLK	FCLK is not within the acceptable range.

◆ R_FLASH_HP_InfoGet()

fsp_err_t R_FLASH_HP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

◆ R_FLASH_HP_Close()

fsp_err_t R_FLASH_HP_Close (flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

◆ R_FLASH_HP_CallbackSet()

fsp_err_t R_FLASH_HP_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements flash_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_FLASH_HP_AntiRollbackCounterIncrement()

fsp_err_t R_FLASH_HP_AntiRollbackCounterIncrement (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Increments the selected anti-rollback counter.

Warning

If this function returns an error code other than FSP_SUCCESS, or power loss occurs during a call to this function, call R_FLASH_HP_AntiRollbackCounterRefresh to ensure the counter flash is in a valid state following the error.

Note

The counter is read internally before increment.

Implements flash_api_t::antiRollbackCounterIncrement

Return values

FSP_SUCCESS	Counter incremented successfully
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_api_ctrl
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_OVERFLOW	The counter cannot be incremented because it is already at its max value
FSP_ERR_PE_FAILURE	Failed to enter or exit Data Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command
FSP_ERR_UNSUPPORTED	Data flash programming is not enabled or selected anti-rollback counter is not supported on this MCU

◆ R_FLASH_HP_AntiRollbackCounterRefresh()

fsp_err_t R_FLASH_HP_AntiRollbackCounterRefresh (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Refreshes the selected anti-rollback counter flash area to ensure the flash is in a valid state even if an error occurred during counter increment processing.

This function must be called if errors or power failure occurred during counter increment.

Power failure can be detected by the application code by management of user-defined non-voltile flags during counter increment.

Until a refresh completes successfully, the value of the anti-rollback counter cannot be guaranteed and should not be read.

Implements flash_api_t::antiRollbackCounterRefresh

Return values

FSP_SUCCESS	Counter refreshed successfully
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_PE_FAILURE	Failed to enter or exit Data Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command
FSP_ERR_UNSUPPORTED	Data flash programming is not enabled or Anti-Rollback counter is not supported on this MCU

◆ R_FLASH_HP_AntiRollbackCounterRead()

fsp_err_t R_FLASH_HP_AntiRollbackCounterRead (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count*)

Reads the selected anti-rollback counter and returns the number of counter bits set.

Implements flash_api_t::antiRollbackCounterRead

Return values

FSP_SUCCESS	Counter read successfully into p_count
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_api_ctrl or p_count
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_PE_FAILURE	Failed to enter or exit Data Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command
FSP_ERR_UNSUPPORTED	Data flash programming is not enabled or Anti-Rollback counter is not supported on this MCU

◆ R_FLASH_HP_UserLockableAreaWrite()

fsp_err_t R_FLASH_HP_UserLockableAreaWrite (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Write to the user lockable area in flash

Implements flash_api_t::userLockableAreaWrite

Note

BGO is not supported for user lockable area flash operations.

Return values

FSP_SUCCESS	Operation successful.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

Detailed Description

Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and code flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The Low-Power Flash HAL module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for code flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

Configuration

Build Time Configurations for r_flash_lp

The following build time configurations are defined in fsp_cfg/r_flash_lp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming	• Enabled • Disabled	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Code Flash Background Operation Support With Bank Programming	MCU Specific Options		Enables execution from the startup code flash bank while programming the other code flash bank.
Data Flash Programming	• Enabled • Disabled	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.
Data Flash Background Operation Support	• Enabled • Disabled	Enabled	Controls whether or not Data Flash Background

			Operation support is included in the build. Disabling reduces the amount of ROM used by the API.
Instant Bank Swap (No Reset Required)	MCU Specific Options		Calls to R_FLASH_LP_BankSwap will immediately swap banks without requiring a reset.

Configurations for Storage > Flash (r_flash_lp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_lp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	• Enabled • Disabled	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.

Clock Configuration

Flash either uses FCLK or ICLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_lp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO, the code flash, RAM and external memory can still be accessed. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Code Flash Precautions

Modifying code flash has limitations requiring some of the flash code to reside in RAM. The use of Bank Programming can limit these requirements but some still exist.

Code flash cannot be accessed while writing, erasing or blank checking code flash unless Bank Programming is supported. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash or flash settings all supporting code must reside in RAM. This is only done when code flash programming is enabled.

When Bank Programming is disabled or not supported a code flash write, erase or blank check operation will not return before the operation has completed.

By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation other thank a Bank Programming operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must ensure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Bank Programming Precautions

Bank programming is supported on select MCUs. When enabled Bank1 can be programmed while executing out of Bank0, decreasing the RAM used by the flash driver. When this mode is enabled only Bank1 can be modified.

Flash Clock Source

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Viewing flash contents in e2 studio

By default, the contents of data flash and code flash are cached by e^2 studio. This means that during a debug session, modifications to these memory regions will not be observed by e^2 studio. When debugging applications using e^2 studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified flash contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

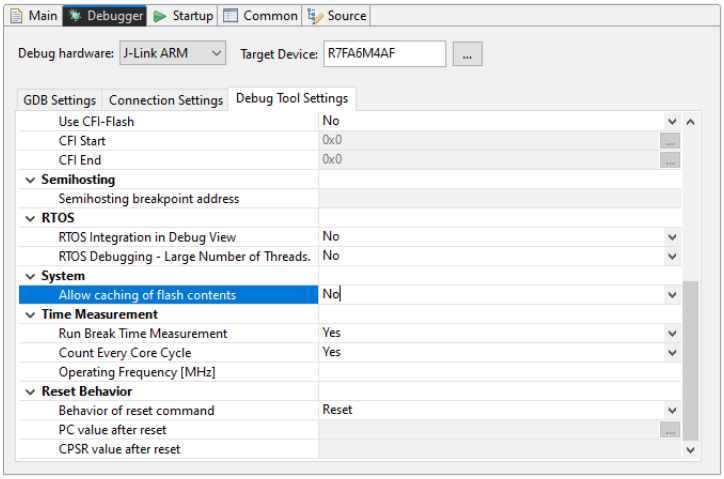

Figure 329: Debug Configuration

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

Examples

Low-Power Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 1 KB: 0x40100000 - 0x401003FF */
#define FLASH_CF_BLOCK_10 0x00005000  /* 2 KB: 0x00005000 - 0x000057FF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_LP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
```

```
void R_FLASH_LP_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_10, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

```
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
```

Low-Power Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
    .irq            = BSP_VECTOR_FLASH_LP_FRDYI_ISR,
};
void R_FLASH_LP_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
```

```
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* When Bank Programming is enabled the code flash P/E operations are also non
blocking. */
    interrupt_called = false;
 /* Erase the first block of the flash bank not configured as the startup bank. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, (BSP_FEATURE_FLASH_CODE_FLASH_START +
BSP_ROM_SIZE_BYTES) / 2, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
```

```
        ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

Low-Power Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void R_FLASH_LP_bankswap_example (void)
{
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x0004_0000. */
 /* Swap the bank at address 0 with the one at 0x0004_0000 after the next restart.
  * The application at 0x0004_0000 must be written there by application code. */
    err = R_FLASH_LP_BankSwap(&g_flash_ctrl);
 /* When using Instant Bank Swap the MCU will now have the banks swapped. */
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Handle any pre-reset operations here */
 /* When using Bank Swap with Reset the MCU must be reset to swap to the other bank
*/
    __NVIC_SystemReset();
}
```

Data Structures

struct	flash_lp_instance_ctrl_t

Data Structure Documentation

◆ flash_lp_instance_ctrl_t

struct flash_lp_instance_ctrl_t
Flash instance control block. DO NOT INITIALIZE. Initialization occurs when R_FLASH_LP_Open() is called.

Function Documentation

◆ R_FLASH_LP_Open()

fsp_err_t R_FLASH_LP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initialize the Low Power flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations.

Example:

```
/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Note

Providing a callback function in the supplied p_cfg->callback field automatically configures the Flash for Data Flash to operate in non-blocking background operation (BGO) mode.

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	NULL provided for p_ctrl, p_cfg or p_callback if BGO is enabled.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
FSP_ERR_ALREADY_OPEN	Flash Open() has already been called.
FSP_ERR_TIMEOUT	Failed to exit P/E mode after configuring flash.
FSP_ERR_INVALID_STATE	The system is not running from the required clock or the required clock is not running and stable.

◆ R_FLASH_LP_Write()

fsp_err_t R_FLASH_LP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Write to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.

◆ R_FLASH_LP_Erase()

fsp_err_t R_FLASH_LP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erase the specified Code or Data Flash blocks. Implements flash_api_t::erase.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.

◆ R_FLASH_LP_BlankCheck()

fsp_err_t R_FLASH_LP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Perform a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_BLANK_CHECK_FAILED	An error occurred during blank checking.

◆ R_FLASH_LP_StatusGet()

fsp_err_t R_FLASH_LP_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the FLASH for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	Flash is ready and available to accept commands.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_AccessWindowSet()

fsp_err_t R_FLASH_LP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory. Implements flash_api_t::accessWindowSet .

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block (inclusive) –> last block (exclusive). Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_LP_AccessWindowClear().

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Parameters

	p_api_ctrl	The p api control
[in]	start_addr	The start address
[in]	end_addr	The end address

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_AccessWindowClear()

fsp_err_t R_FLASH_LP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is configured in the Code Flash. Implements flash_api_t::accessWindowClear. On successful return from this call all Code Flash is writable.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_IdCodeSet()

fsp_err_t R_FLASH_LP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Write the ID code provided to the id code registers. Implements flash_api_t::idCodeSet.

Return values

FSP_SUCCESS	ID code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for completion of extra command.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_Reset()

fsp_err_t R_FLASH_LP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_StartUpAreaSelect()

fsp_err_t R_FLASH_LP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Select which block is used as the startup area block. Implements flash_api_t::startupAreaSelect.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled. Cannot set FLASH_STARTUP_AREA_BTFLG when the temporary flag is false.

◆ R_FLASH_LP_BankSwap()

fsp_err_t R_FLASH_LP_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Swap the Code Flash bank to update new program. Implement flash_api_t::bankSwap.

Swap the flash bank located at address 0x00000000 and address 0x00040000. After a bank swap is done the MCU will need to be reset for the changes to take place unless instant swap is enabled.

To use this API, Code Flash Programming in the FSP Configuration Tool under Stack Properties must be enabled.

Note

This function only available on MCUs which support bank swap feature.
When active bank is bank 1, startup program protection function is invalid.

Parameters

[in]	p_api_ctrl	The api control instance.

Return values

FSP_SUCCESS	Banks were swapped.
FSP_ERR_UNSUPPORTED	Module does not support Bank Swap.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_IN_USE	Extra area is being used by other command.

◆ R_FLASH_LP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_FCLK	Invalid flash clock source frequency.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.

◆ R_FLASH_LP_InfoGet()

fsp_err_t R_FLASH_LP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.
FSP_ERR_NOT_OPEN	The flash is not open.

◆ R_FLASH_LP_Close()

fsp_err_t R_FLASH_LP_Close (flash_ctrl_t *const *p_api_ctrl*)

Release any resources that were allocated by the Flash API. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_IN_USE	The flash is currently in P/E mode.

◆ R_FLASH_LP_CallbackSet()

fsp_err_t R_FLASH_LP_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Stub function Implements flash_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_AntiRollbackCounterIncrement()

fsp_err_t R_FLASH_LP_AntiRollbackCounterIncrement (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Stub function Implements flash_api_t::antiRollbackCounterIncrement.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_AntiRollbackCounterRefresh()

fsp_err_t R_FLASH_LP_AntiRollbackCounterRefresh (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Stub function Implements flash_api_t::antiRollbackCounterRefresh.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_AntiRollbackCounterRead()

fsp_err_t R_FLASH_LP_AntiRollbackCounterRead (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count*)

Stub function Implements flash_api_t::antiRollbackCounterRead.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

◆ R_FLASH_LP_UserLockableAreaWrite()

fsp_err_t R_FLASH_LP_UserLockableAreaWrite (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Stub function Implements flash_api_t::userLockableAreaWrite.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

Detailed Description

Middleware for the FAT File System control on RA MCUs.

Overview

This module provides the hardware port layer for FreeRTOS+FAT file system. After initializing this module, refer to the FreeRTOS+FAT API reference to use the file system: https://www.freertos.org/FreeRTOS-Plus/FreeRTOS_Plus_FAT/index.html

Features

The FreeRTOS+FAT port module supports the following features:

- Callbacks for insertion and removal for removable devices.
- Helper function to initialize FF_Disk_t
- Blocking read and write port functions that use FreeRTOS task notification to pend if FreeRTOS is used
- FreeRTOS is optional

Configuration

Build Time Configurations for rm_freertos_plus_fat

The following build time configurations are defined in fsp_cfg/middleware/rm_freertos_plus_fat_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_freertos_plus_fat0	Module name.
Total Number of Sectors	Must be a non-negative integer	31293440	Enter the total number of sectors on the device. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit().
Sector Size (bytes)	Must be a power of 2 multiple of 512	512	Select the sector size. Must match the underlying media sector size and at least 512. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit().
Cache Size (bytes)	Must be a power of 2 multiple of 512	1024	Select the cache size. Must be a multiple of the sector size and at least 2 times the sector size.
Partition Number	Must be a non-negative integer	0	Select the partition number for this disk.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Usage Notes

Pending during Read/Write

If the underlying driver supports non-blocking operations, the FreeRTOS+FAT port pends the active

FreeRTOS task during read and write operations so other tasks can run in the background.

If FreeRTOS is not used, the FreeRTOS+FAT port spins in a while loop waiting for read and write operations to complete.

FreeRTOS+FAT without FreeRTOS

To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.

Also, update the Malloc function to malloc and the Free function to free in the Common configurations.

Examples

Basic Example

This is a basic example of FreeRTOS+FAT in an application.

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER (0)
extern rm_freertos_plus_fat_instance_ctrl_t g_freertos_plus_fat0_ctrl;
extern const rm_freertos_plus_fat_cfg_t g_freertos_plus_fat0_cfg;
extern rm_freertos_plus_fat_disk_cfg_t g_rm_freertos_plus_fat_disk_cfg;
extern uint8_t g_file_data[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_freertos_plus_fat_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
```

```
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_freertos_plus_fat_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Try to mount the disk. If the disk is not formatted, mount will fail. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
 if (FF_isERR((uint32_t) ff_err))
    {
 /* The disk is likely not formatted. Partition and format the disk, then mount
again. */
       FF_PartitionParameters_t partition_params;
       partition_params.ulSectorCount   =
g_rm_freertos_plus_fat_disk_cfg.device.sector_count;
       partition_params.ulHiddenSectors = 1;
       partition_params.ulInterSpace    = 0;
       memset(partition_params.xSizes, 0, sizeof(partition_params.xSizes));
       partition_params.xSizes[RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER] =
```

```
            (BaseType_t) partition_params.ulSectorCount - 1;
       partition_params.xPrimaryCount = 1;
       partition_params.eSizeType    = eSizeIsSectors;
       ff_err = FF_Partition(&disk, &partition_params);
      handle_ff_error(ff_err);
       ff_err = FF_Format(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER,
pdFALSE, pdFALSE);
      handle_ff_error(ff_err);
       ff_err = FF_Mount(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
      handle_ff_error(ff_err);
    }
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
#if 2 == BSP_CFG_RTOS
static EventGroupHandle_t xUSBEventGroupHandle = NULL;
#else
volatile uint32_t g_rm_freertos_plus_fat_insertion_events = 0;
volatile uint32_t g_rm_freertos_plus_fat_removal_events = 0;
#endif
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_freertos_plus_fat_test_callback (rm_freertos_plus_fat_callback_args_t *
p_args)
{
#if 2 == BSP_CFG_RTOS
 /* Post an event if FreeRTOS is available. */
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    xEventGroupSetBitsFromISR(xUSBEventGroupHandle, p_args->event,
&xHigherPriorityTaskWoken);
    portYIELD_FROM_ISR(xHigherPriorityTaskWoken);
#else
 /* If FreeRTOS is not used, set a global flag. */
```

```
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED)
    {
       g_rm_freertos_plus_fat_insertion_events++;
    }
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_REMOVED)
    {
       g_rm_freertos_plus_fat_removal_events++;
    }
#endif
}
void rm_freertos_plus_fat_media_insertion_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
    TEST_ASSERT_NOT_EQUAL(NULL, xUSBEventGroupHandle);
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
                                                       pdTRUE,
                                                       pdFALSE,
                                                       portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
```

```
 /* Wait for media insertion. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
}
```

Media Insertion Example for USB

This shows how to use the callback to read and write to USB media.

```
void rm_freertos_plus_fat_usb_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for the USB media to be attached. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
```

```
                                                    pdTRUE,
                                                    pdFALSE,
                                                    portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
 /* Wait for the USB media to be attached. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
```

```
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Data Structures

struct	rm_freertos_plus_fat_instance_ctrl_t

Data Structure Documentation

◆ rm_freertos_plus_fat_instance_ctrl_t

struct rm_freertos_plus_fat_instance_ctrl_t
FreeRTOS plus FAT private control block. DO NOT MODIFY. Initialization occurs when RM_FREERTOS_PLUS_FAT_Open is called.

Function Documentation

◆ RM_FREERTOS_PLUS_FAT_Open()

fsp_err_t RM_FREERTOS_PLUS_FAT_Open (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_cfg_t const *const *p_cfg*)

Initializes lower layer media device.

Implements rm_freertos_plus_fat_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_OUT_OF_MEMORY	Not enough memory to create semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::open

◆ RM_FREERTOS_PLUS_FAT_MediaInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_MediaInit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_device_t *const *p_device*)

Initializes the media device. This function blocks until all identification and configuration commands are complete.

Implements rm_freertos_plus_fat_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::mediaInit
- rm_block_media_api_t::infoGet

◆ RM_FREERTOS_PLUS_FAT_DiskInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskInit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_disk_cfg_t const *const *p_disk_cfg*, FF_Disk_t *const *p_disk*)

Initializes a FreeRTOS+FAT disk structure. This function calls FF_CreateIOManger.

Implements rm_freertos_plus_fat_api_t::diskInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.
FSP_ERR_INTERNAL	Call to FF_CreateIOManger failed.

◆ RM_FREERTOS_PLUS_FAT_DiskDeinit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskDeinit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*)

Deinitializes a FreeRTOS+FAT disk structure. This function calls FF_DeleteIOManger.

Implements rm_freertos_plus_fat_api_t::diskDeinit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

◆ RM_FREERTOS_PLUS_FAT_InfoGet()

fsp_err_t RM_FREERTOS_PLUS_FAT_InfoGet (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*, rm_freertos_plus_fat_info_t *const *p_info*)

Get partition information. This function can only be called after rm_freertos_plus_fat_api_t::diskInit() .

Implements rm_freertos_plus_fat_api_t::infoGet().

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_NOT_FOUND	The value of p_iomanager is NULL.

◆ RM_FREERTOS_PLUS_FAT_Close()

fsp_err_t RM_FREERTOS_PLUS_FAT_Close (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_freertos_plus_fat_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::close

Detailed Description

Middleware for using Azure RTOS LevelX on NOR SPI memory.

Overview

This module provides the hardware port layer for LevelX on NOR SPI flash memory. Setup for this module is done solely through calling LevelX APIs. Please refer to the LevelX API reference: https://docs.microsoft.com/en-us/azure/rtos/levelx/

Configuration

Build Time Configurations for rm_levelx_nor_spi

The following build time configurations are defined in fsp_cfg/middleware/rm_levelx_nor_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the

			build.
Page Buffer Size (bytes)	Size should be greater than zero	256	When direct read is enabled in LevelX a situation can occur where the driver has to write to SPI memory with the source locaiton also being within the SPI memory address range. In this situation the driver needs a buffer that is at least the same size as a page in order to temporarily store data to write out.

Configurations for Storage > LevelX NOR Port (rm_levelx_nor_spi)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_levelx_nor_spi0	Module name.
Memory Start Address Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LevelX memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LevelX Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

Build Time Configurations for lx

The following build time configurations are defined in fsp_cfg/azure/lx/lx_user.h:

Configuration	Options	Default	Description
NOR			
Direct Read	• Enabled (default) • Disabled	Enabled (default)	When enabled, this option bypasses the NOR flash driver read routine in favor or

			reading the NOR memory directly, resulting in a significant performance increase.
Free Sector Data Verify	• Enabled • Disabled (default)	Disabled (default)	When enabled, this causes the LevelX NOR instance open logic to verify free NOR sectors are all ones.
Extended Cache	• Enabled (default) • Disabled	Enabled (default)	Enables the extended NOR cache.
Extended Cache Size	Manual Entry		If not set this value defaults to 8, which represents a maximum of 8 sectors that can be cached in a NOR instance.
Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 16 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
NAND			
Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 128 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
Flash Direct Mapping Cache	• Enabled • Disabled (default)	Disabled (default)	When enabled, this creates a direct mapping cache, such that there are no cache misses. It also required that LX_NAND_SECTOR_MAPPING_CACHE_SIZE represents the exact number of total pages in your flash device.

Thread Safe	• Enabled • Disabled (default)	Disabled (default)	When enabled, this makes LevelX thread-safe by using a ThreadX mutex object throughout the API.
Standalone Mode	• Enabled • Disabled (default)	Disabled (default)	When enabled, allows LevelX to be used in standalone mode (without Azure RTOS).

Usage Notes

Pending during Erase/Write

The LevelX NOR SPI driver is blocking on all SPI operations and will poll device status for operation completion on Writes and Erases. A callback can be provided by the user to wait with an OS-specific thread wait in these instances.

Closing the driver

When lx_nor_flash_close is called to close the LevelX instance it does not call any services within the LevelX NOR SPI driver to close out the driver instance. The user should call the generated close function (i.e. g_rm_levelx_nor_spi0_close) in order to close out the driver instance.

Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the LevelX instance should be erased using the lower level flash API prior to usage. Otherwise, LevelX API may fail on lx_nor_flash_open due to any areas in flash memory that have been written/set.

Examples

Basic Example

This is a basic example of using the LevelX NOR SPI driver with the LevelX API in an application.

```
#define RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE (512)
#define RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE (0xA5)
#define RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE (4096)
extern rm_levelx_nor_spi_instance_ctrl_t g_levelx_nor_spi0_ctrl;
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
extern LX_NOR_FLASH g_lx_nor_flash0;
void rm_levelx_nor_spi_example (void)
{
    uint8_t               read_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    uint8_t               write_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
```

```
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
    memset(write_buffer, RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE, sizeof
(write_buffer));
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE)
    {
       err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE);
      assert(FSP_SUCCESS == err);
       status.write_in_progress = true;
 while (status.write_in_progress)
      {
           err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
      assert(FSP_SUCCESS == err);
       }
    }
    err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize LevelX */
    lx_nor_flash_initialize();
    UINT lx_err = lx_nor_flash_open(&g_lx_nor_flash0, "LX_NOR_SPI_EXAMPLE",
g_levelx_nor_spi0_initialize);
    handle_lx_error(lx_err);
```

```
 /* Write test value to sector 0 then read back to verify */
    lx_err = lx_nor_flash_sector_write(&g_lx_nor_flash0, 0, write_buffer);
    handle_lx_error(lx_err);
    lx_err = lx_nor_flash_sector_read(&g_lx_nor_flash0, 0, read_buffer);
    handle_lx_error(lx_err);
    assert(0 == memcmp(read_buffer, write_buffer, sizeof(read_buffer)));
}
```

Callback Wait Example

This shows how to use the LevelX NOR SPI driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by LevelX NOR SPI driver needs to wait on operation. */
void rm_levelx_nor_spi_callback_wait_example (rm_levelx_nor_spi_callback_args_t *
p_args)
{
 if (p_args->event & RM_LEVELX_NOR_SPI_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
```

Data Structures

struct	rm_levelx_nor_spi_callback_args_t
struct	rm_levelx_nor_spi_cfg_t
struct	rm_levelx_nor_spi_instance_ctrl_t

Enumerations

enum	rm_levelx_nor_spi_event_t

Data Structure Documentation

◆ rm_levelx_nor_spi_callback_args_t

struct rm_levelx_nor_spi_callback_args_t
RM_LEVELX_NOR_SPI callback arguments definitions

Data Fields		
rm_levelx_nor_spi_event_t	event	LevelX NOR driver callback event.
void *	p_context	Placeholder for user data.

◆ rm_levelx_nor_spi_cfg_t

struct rm_levelx_nor_spi_cfg_t	
SF_EL_LX_NOR Config Block Type	
Data Fields	
spi_flash_instance_t const *	p_lower_lvl
	Lower level memory pointer.
LX_NOR_FLASH *	p_lx_nor_flash
	Pointer to the LevelX nor flash instance.
uint32_t	base_address
	Base address of memory mapped region.
uint32_t	address_offset
	Offset to use subset of available flash size if desired.
uint32_t	size
	Size of the partitioned region.
uint32_t	poll_status_count
	Number of times to poll for operation complete status before returning an error.
void *	p_context
	Placeholder for user data. Passed to the user callback.

void(*	p_callback)(rm_levelx_nor_spi_callback_args_t *p_args)
	Callback function.

◆ rm_levelx_nor_spi_instance_ctrl_t

struct rm_levelx_nor_spi_instance_ctrl_t		
SF_EL_LX_NOR Control Block Type		
Data Fields		
rm_levelx_nor_spi_cfg_t const *	p_cfg	Pointer to instance configuration.
uint32_t	start_address	Start address of partition to use within memory mapped region.
uint32_t	minimum_erase_size	Minimum erase size of SPI memory.
uint8_t	page_buffer[RM_LEVELX_NOR_SPI_CFG_BUFFER_SIZE]	Page buffer for situations when writing to SPI memory from a source within SPI memory.
uint32_t	open	Used to determine if module is initialized.

Enumeration Type Documentation

◆ rm_levelx_nor_spi_event_t

enum rm_levelx_nor_spi_event_t	
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events.	
Enumerator	
RM_LEVELX_NOR_SPI_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_LEVELX_NOR_SPI_Open()

fsp_err_t RM_LEVELX_NOR_SPI_Open (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, rm_levelx_nor_spi_cfg_t const *const *p_cfg*)

Initializes LevelX NOR SPI port read/write and control.

Calls lower level SPI memory functions.

Parameters

[in,out]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_cfg	Configuration for LevelX NOR SPI port.

Return values

FSP_SUCCESS	LevelX NOR driver is successfully opened.
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver is already in OPEN state.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:open

◆ RM_LEVELX_NOR_SPI_Read()

fsp_err_t RM_LEVELX_NOR_SPI_Read (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_dest*, ULONG *word_count*)

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in,out]	p_dest	Specifies where to place the sector contents.
[in]	word_count	Specifies how many 32-bit words to read.

Return values

FSP_SUCCESS	LevelX NOR flash sector read successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_dest is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for reading.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Write()

fsp_err_t RM_LEVELX_NOR_SPI_Write (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_src*, ULONG *word_count*)

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in]	p_src	Specifies the source of the write.
[in]	word_count	Specifies how many 32-bit words to write.

Return values

FSP_SUCCESS	LevelX NOR flash sector write successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_src is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for writing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.
FSP_ERR_WRITE_FAILED	Verification of Write operation failed.
FSP_ERR_INVALID_ADDRESS	Write address or size falls outside of flash memory range.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:write

◆ RM_LEVELX_NOR_SPI_BlockErase()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErase (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*, ULONG *erase_count*)

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which NOR block to erase.
[in]	erase_count	Provided for diagnostic purposes(currently unused).

Return values

FSP_SUCCESS	LevelX NOR flash block erase successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for erasing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:erase

◆ RM_LEVELX_NOR_SPI_BlockErasedVerify()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErasedVerify (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*)

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which block to verify that it is erased.

Return values

FSP_SUCCESS	LevelX flash block erase verification successful.
FSP_ERR_ASSERTION	p_ctrl or lower level driver is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for verifying.
FSP_ERR_NOT_ERASED	The block is not erased properly.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Close()

fsp_err_t RM_LEVELX_NOR_SPI_Close (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*)

LevelX NOR driver close service.

This is responsible for closing the driver properly.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.

Return values

FSP_SUCCESS	LevelX flash is available and is now open for read, write, and control access.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for closing.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:close

5.2.17.12 LittleFS on Flash (rm_littlefs_flash)

Modules » Storage

Functions

fsp_err_t	RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg)
fsp_err_t	RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the LittleFS File System control on RA MCUs.

Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

Configuration

Build Time Configurations for rm_littlefs_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > LittleFS on Flash (rm_littlefs_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All program operations will be a multiple of this value.

Memory Start Address	Manual Entry	BSP_FEATURE_FLASH_DATA_FLASH_START	Start address of the memory allocated for the LittleFS Volume.
Block Size (bytes)	Must be a multiple of 64	128	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Count	Manual Entry	(BSP_DATA_FLASH_SIZE_BYTES/128)	Number of erasable blocks on the device.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number

			of blocks found during an allocation pass. The lookahead buffer is stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.

Common LittleFS Configuration

Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

Configuration	Options	Default	Description
Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	• Enabled • Disabled	Disabled	Enables thread safety in LittleFS.
Read Only	• Enabled • Disabled	Disabled	Enables Read Only mode in LittleFS.
Use Malloc	• Enabled • Disabled	Enabled	Configures the use of malloc by LittleFS.
Use Assert	• Enabled • Disabled	Enabled	Configures the use of assert by LittleFS.
Debug Messages	• Enabled • Disabled	Disabled	Configures debug messages.
Warning Messages	• Enabled • Disabled	Disabled	Configures warning messages.
Error Messages	• Enabled • Disabled	Disabled	Configures error messages.
Trace Messages	• Enabled • Disabled	Disabled	Configures trace messages.
Intrinsics	• Enabled • Disabled	Enabled	Configures intrinsic functions such as __builtin_clz.
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The rm_littlefs instance name to use with the STDIO wrapper.

Usage Notes

Memory Address

LittleFS requrires a section of non volatile memory to store data. It is recommended to use Data Flash when available. In other cases, such as MRAM, a section of memory should be reserved in the Memories Tab using an RA Solution project. The address of this memory section must be entered in the rm_littlefs_flash configuration. If the memory is not reserved in the RA Solution it is possible unrelated data will be linked in this section and will cause conflicts at runtime.

Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the data flash erase size of the MCU. It must be greater than 104 bytes which is the minimum block size of a LittleFS block. For information about data flash erase sizes refer to the "Specifications of the code flash memory and data flash memory" table of the "Flash Memory" chapter's "Overview" section.

Examples

Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
 fsp_err_t err = RM_LITTLEFS_FLASH_Open(&g_rm_littlefs_flash0_ctrl,
&g_rm_littlefs_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
```

```
 int lfs_err = lfs_format(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /**********************************************************************************
***********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  **********************************************************************************
*********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_WRONLY |
LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
```

```
/* Apply butter to toast 10 times. */
for (uint32_t i = 0; i < 10; i++)
   {
      lfs_err = lfs_file_write(&g_rm_littlefs_flash0_lfs, &file, contents, len);
if (lfs_err < 0)
     {
     handle_lfs_error(lfs_err);
      }
   }
/* Close the file. */
   lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);

/* Unmount the filesystem. */
   lfs_err = lfs_unmount(&g_rm_littlefs_flash0_lfs);
   handle_lfs_error(lfs_err);
/* Remount the filesystem. */
   lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
   handle_lfs_error(lfs_err);
/* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
   lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY,
&g_file_cfg);
   handle_lfs_error(lfs_err);
#else
   lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY);
   handle_lfs_error(lfs_err);
#endif
   handle_lfs_error(lfs_err);
/* Verify the toast is buttered the correct amount. */
for (uint32_t i = 0; i < 10; i++)
   {
      lfs_err = lfs_file_read(&g_rm_littlefs_flash0_lfs, &file, buffer, len);
if (lfs_err < 0)
     {
```

```
      handle_lfs_error(lfs_err);
       }
       assert(0 == memcmp(buffer, contents, len));
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
}
```

Function Documentation

◆ RM_LITTLEFS_FLASH_Open()

fsp_err_t RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg*)

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- flash_api_t::open

◆ RM_LITTLEFS_FLASH_Close()

fsp_err_t RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- flash_api_t::close

5.2.17.13 LittleFS on SPI Flash (rm_littlefs_spi_flash)

Modules » Storage

Functions

fsp_err_t	RM_LITTLEFS_SPI_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg)
fsp_err_t	RM_LITTLEFS_SPI_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the LittleFS File System control on RA MCUs using external SPI Flash.

Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

Configuration

Build Time Configurations for rm_littlefs_spi_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_spi_flash_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > LittleFS on SPI Flash (rm_littlefs_spi_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Delay Callback	Name must be a valid C symbol	g_rm_littlefs_spi_flash0_callback	Optional delay callback for custom delay while waiting for the flash erase/write operation to complete.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All program operations will be a multiple of this value.
Block Size (bytes)	Must be a multiple of 64	4096	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a

			portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The lookahead buffer is stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.
Memory Start Address Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LittleFS memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LittleFS Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

Common LittleFS Configuration

Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

Configuration	Options	Default	Description

Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	• Enabled • Disabled	Disabled	Enables thread safety in LittleFS.
Read Only	• Enabled • Disabled	Disabled	Enables Read Only mode in LittleFS.
Use Malloc	• Enabled • Disabled	Enabled	Configures the use of malloc by LittleFS.
Use Assert	• Enabled • Disabled	Enabled	Configures the use of assert by LittleFS.
Debug Messages	• Enabled • Disabled	Disabled	Configures debug messages.
Warning Messages	• Enabled • Disabled	Disabled	Configures warning messages.
Error Messages	• Enabled • Disabled	Disabled	Configures error messages.
Trace Messages	• Enabled • Disabled	Disabled	Configures trace messages.
Intrinsics	• Enabled • Disabled	Enabled	Configures intrinsic functions such as __builtin_clz.
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The rm_littlefs instance name to use with the STDIO wrapper.

Usage Notes

Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the sector erase size of the SPI Flash. It must be greater than 104 bytes which is the minimum block size of a LittleFS block.

Examples

Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_spi_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
 fsp_err_t err = RM_LITTLEFS_SPI_FLASH_Open(&g_rm_littlefs_spi_flash0_ctrl,
&g_rm_littlefs_spi_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
 int lfs_err = lfs_format(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_spi_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /*************************************************************************
**********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
```

```
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  ********************************************************************************
*********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_spi_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_spi_flash0_lfs, &file, path, LFS_O_WRONLY
| LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
 /* Apply butter to toast 10 times. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_write(&g_rm_littlefs_spi_flash0_lfs, &file, contents, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_spi_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
 /* Unmount the filesystem. */
    lfs_err = lfs_unmount(&g_rm_littlefs_spi_flash0_lfs);
```

```
    handle_lfs_error(lfs_err);
 /* Remount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_spi_flash0_lfs, &file, path,
LFS_O_RDONLY, &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_spi_flash0_lfs, &file, path,
LFS_O_RDONLY);
    handle_lfs_error(lfs_err);
#endif
    handle_lfs_error(lfs_err);
 /* Verify the toast is buttered the correct amount. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_read(&g_rm_littlefs_spi_flash0_lfs, &file, buffer, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
       assert(0 == memcmp(buffer, contents, len));
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_spi_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
}
```

Function Documentation

◆ RM_LITTLEFS_SPI_FLASH_Open()

fsp_err_t RM_LITTLEFS_SPI_FLASH_Open (rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg*)

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- spi_flash_api_t::open

◆ RM_LITTLEFS_SPI_FLASH_Close()

fsp_err_t RM_LITTLEFS_SPI_FLASH_Close (rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- spi_flash_api_t::close

Detailed Description

Driver for the MRAM memory on RA MCUs. This module implements the Flash Interface.

Overview

The MRAM HAL module APIs allow an application to write and erase MRAM areas that reside within the MCU. The amount of MRAM memory available varies across MCU parts.

Features

The R_MRAM module has the following key features:

- Blocking writing and erasing of MRAM.
- Boot block-swapping.
- Anti-rollback counter support (select MCUs).

Configuration

Build Time Configurations for r_mram

The following build time configurations are defined in fsp_cfg/r_mram_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > MRAM (r_mram)

This module can be added to the Stacks tab via New Stack > Storage > MRAM (r_mram). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_mram0	Module name.

Clock Configuration

MRAM uses MRAM bus clock for Code MRAM and MRAM clock for Extra MRAM.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Code MRAM Precautions

Code MRAM cannot be accessed while writing or erasing code MRAM. In order to support modifying code MRAM all supporting code must reside in RAM. Code MRAM operation will not return before the operation has completed. By default, the vector table resides in the code MRAM. If an interrupt occurs during the code MRAM operation, then code MRAM will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code MRAM operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must ensure that if in a multi-threaded environment, threads running from code MRAM cannot become active while a code MRAM operation is in progress.

Erase condsiderations

The erase API was designed with flash blocks in mind. The Erase API provides a mechanism for quickly overwriting blocks of data at a single time. The block size is determined by the MRAM Unit of Programming size.

Anti Rollback Counter

Anti-rollback counters are available on select MCUs and can be used to prevent or limit firmware downgrade. The counters can only be incremented and never decremented or reset, even with an external programming tool.

Note

> ***The OEM bootloader anti-rollback counter is protected by the security engine and cannot be incremented past the version number specified in the code certificate. This counter works with the First Stage Bootloader (FSBL) set to enabled. For more information, read the 'Secure Boot' section in the 'Security Features' chapter of the user manual of the target MCU and refer to Application Note R11AN0774.***

Anti-Rollback Counter Configuration Setting

When anti-rollback counters are used for one or more non-secure applications, the Anti-Rollback Counter Configuration Setting for ARC_NSEC (ARCCS) must be configured as either a single line (1xn bits) or multi-line counter (mxn bits). Single line is suitable when there is only one non-secure application using the anti-rollback counter. Multi-line is suitable when there are multiple non-secure applications. Before the counter is configured, it can't be used.

This configuration setting is permanent and must be performed with an external programming tool such as Renesas Flash Programmer (RFP). It cannot be configured in e2 studio.

The secure application and OEM bootloader anti-rollback counters do not require any initial configuration.

Anti-Rollback Counter Lock Setting

Select MCUs have the ability to permanently lock the anti-rollback counters using the Anti-Rollback Counter Lock Setting (ARCLS). It cannot be set with e2 studio, but if needed, it can be configured with an external programming tool such as Renesas Flash Programmer (RFP). **Once the lock protection is applied to a counter, the counter value can never be incremented again.** It is still possible to read the value of a locked counter.

Viewing MRAM contents in e2 studio

By default, the contents of code MRAM are cached by e^2 studio. This means that during a debug session, modifications to these memory regions will not be observed by e^2 studio. When debugging applications using e^2 studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified MRAM contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

Examples

MRAM Basic Example

This is a basic example of writing to MRAM.

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
void r_mram_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the MRAM instance. */
 fsp_err_t err = R_MRAM_Open(&g_mram_ctrl, &g_mram_cfg);
    assert(FSP_SUCCESS == err);
 /* Disable interrupts to prevent vector table access while MRAM is programming. */
    __disable_irq();
 /* Write 32 bytes to an area of MRAM. */
    err = R_MRAM_Write(&g_mram_ctrl, (uint32_t) g_src, MRAM_WRITE_ADDRESS,
MRAM_EXAMPLE_WRITE_SIZE);
 /* Enable interrupts after MRAM operations are complete. */
    __enable_irq();
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) MRAM_WRITE_ADDRESS,
MRAM_EXAMPLE_WRITE_SIZE));
}
```

Anti-Rollback Counter Basic Example

This example demonstrates basic usage of the anti-rollback counter functions.

```
void r_mram_anti_rollback_counter_example (void)
{
 /* Open the MRAM instance. */
 fsp_err_t err = R_MRAM_Open(&g_mram_ctrl, &g_mram_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    uint32_t current_count;
 /* Read the current counter value for the secure application */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_SEC,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the OEM bootloader */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_OEMBL,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the non-secure application if counter is
configured as 1xn bits */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for 4 non-secure applications if counter is
configured as mxn bits */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App 0
    err |= R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_1,
&current_count); // NSEC App 1
    err |= R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_2,
&current_count); // NSEC App 2
    err |= R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_3,
&current_count); // NSEC App 3
    assert(FSP_SUCCESS == err);
 /* Increment the counter value for the secure application. Caution: The increment
cannot be reversed. */
```

```
    err = R_MRAM_AntiRollbackCounterIncrement(&g_mram_ctrl, FLASH_ARC_SEC);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	mram_instance_ctrl_t

Data Structure Documentation

◆ mram_instance_ctrl_t

struct mram_instance_ctrl_t
MRAM instance control block. DO NOT INITIALIZE.

Function Documentation

◆ R_MRAM_Open()

fsp_err_t R_MRAM_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initializes the MRAM peripheral. Implements flash_api_t::open.

The Open function initializes the MRAM.

Example:

```
/* Open the MRAM instance. */
fsp_err_t err = R_MRAM_Open(&g_mram_ctrl, &g_mram_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ALREADY_OPEN	The MRAM control block is already open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the MRAM interrupts are not supported.

◆ R_MRAM_Write()

fsp_err_t R_MRAM_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *mram_address*, uint32_t const *num_bytes*)

Writes to the specified MRAM memory area. Implements flash_api_t::write.

Example:

```
/* Disable interrupts to prevent vector table access while MRAM is programming. */
   __disable_irq();
/* Write 32 bytes to an area of MRAM. */
   err = R_MRAM_Write(&g_mram_ctrl, (uint32_t) g_src, MRAM_WRITE_ADDRESS,
MRAM_EXAMPLE_WRITE_SIZE);
/* Enable interrupts after MRAM operations are complete. */
   __enable_irq();
```

Return values

FSP_SUCCESS	Operation successful.
FSP_ERR_IN_USE	The MRAM peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The MRAM API is not Open.
FSP_ERR_CMD_LOCKED	MRAM Application Command Interface is in locked state
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested MRAM area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for write operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was invalid
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_MRAM_Erase()

fsp_err_t R_MRAM_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erases the specified MRAM blocks. Implements flash_api_t::erase by the block_erase_address.

Example:

```
/* Disable interrupts to prevent vector table access while MRAM is programming. */
   __disable_irq();
/* Erase 10 programmable units of MRAM */
fsp_err_t err = R_MRAM_Erase(&g_mram_ctrl, MRAM_ERASE_ADDRESS, 10);
/* Enable interrupts after MRAM operations are complete. */
   __enable_irq();
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified.
FSP_ERR_IN_USE	Other MRAM operation in progress, or API not initialized
FSP_ERR_CMD_LOCKED	MRAM Application Command Interface is in locked state
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The MRAM API is not Open.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.
FSP_ERR_TIMEOUT	Timed out waiting for the MACI to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_MRAM_BlankCheck()

fsp_err_t R_MRAM_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Stub function Implements flash_api_t::blankCheck.

Return values

FSP_ERR_UNSUPPORTED	Blank Check is not supported on this MCU.

◆ R_MRAM_StatusGet()

fsp_err_t R_MRAM_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the MRAM peripheral for its status. Implements flash_api_t::statusGet.

Return values

FSP_SUCCESS	MRAM peripheral is ready to use.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The MRAM API is not Open.

◆ R_MRAM_IdCodeSet()

fsp_err_t R_MRAM_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Stub function Implements flash_api_t::idCodeSet.

Return values

FSP_ERR_UNSUPPORTED	ID Code is not supported on this MCU.

◆ R_MRAM_AccessWindowSet()

fsp_err_t R_MRAM_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Stub function Implements flash_api_t::accessWindowSet.

Return values

FSP_ERR_UNSUPPORTED	Access window is not supported on this MCU.

◆ R_MRAM_AccessWindowClear()

fsp_err_t R_MRAM_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Stub function Implements flash_api_t::accessWindowClear.

Return values

FSP_ERR_UNSUPPORTED	Access window is not supported on this MCU.

◆ R_MRAM_Reset()

fsp_err_t R_MRAM_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the MRAM peripheral. Implements flash_api_t::reset.

No attempt is made to check if the MRAM is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	MRAM circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the MACI to become ready.
FSP_ERR_CMD_LOCKED	MRAM Application Command Interface is in locked state

◆ R_MRAM_StartUpAreaSelect()

fsp_err_t R_MRAM_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Implements flash_api_t::startupAreaSelect.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	MRAM peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit MRAM P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the MACI to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	MRAM Application Command Interface is in locked state

◆ R_MRAM_BankSwap()

fsp_err_t R_MRAM_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Stub function flash_api_t::bankSwap.

Return values

FSP_ERR_UNSUPPORTED	Bank Swap is not supported on this MCU.

◆ R_MRAM_UpdateFlashClockFreq()

fsp_err_t R_MRAM_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the MRAM module that the system clock has changed. Implements flash_api_t::updateFlashClockFreq.

This should be the case if the application has changed the system clock.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	MRAM is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	MRAM API has not yet been opened.

◆ R_MRAM_InfoGet()

fsp_err_t R_MRAM_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the MRAM regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

◆ R_MRAM_Close()

fsp_err_t R_MRAM_Close (flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent MRAM operations. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

◆ R_MRAM_CallbackSet()

fsp_err_t R_MRAM_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Stub function Implements flash_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	Interrupt driven operation is not supported on this MCU.

◆ R_MRAM_AntiRollbackCounterIncrement()

fsp_err_t R_MRAM_AntiRollbackCounterIncrement (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Increments the selected anti-rollback counter.

Note

The counter is read internally before increment.

Implements flash_api_t::antiRollbackCounterIncrement

Return values

FSP_SUCCESS	Counter incremented successfully
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_api_ctrl
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_OVERFLOW	The counter cannot be incremented because it is already at its max value
FSP_ERR_PE_FAILURE	Failed to enter or exit MRAM P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the MACI to become ready.
FSP_ERR_CMD_LOCKED	MRAM Application Command Interface is in locked state
FSP_ERR_UNSUPPORTED	Selected anti-rollback counter is not supported on this MCU

◆ R_MRAM_AntiRollbackCounterRefresh()

fsp_err_t R_MRAM_AntiRollbackCounterRefresh (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*)

Stub function Implements flash_api_t::antiRollbackCounterRefresh

Return values

FSP_ERR_UNSUPPORTED	Anti-Rollback counter refresh is not supported on this MCU

◆ R_MRAM_AntiRollbackCounterRead()

fsp_err_t R_MRAM_AntiRollbackCounterRead (flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count*)

Reads the selected anti-rollback counter and returns the number of counter bits set.

Implements flash_api_t::antiRollbackCounterRead

Return values

FSP_SUCCESS	Counter read successfully into p_count
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_api_ctrl or p_count
FSP_ERR_NOT_ENABLED	The specified counter has not been configured (configuration is only required for ARC_NSEC)
FSP_ERR_PE_FAILURE	Failed to enter or exit MRAM P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the MACI to become ready.
FSP_ERR_CMD_LOCKED	MRAM Application Command Interface is in locked state

◆ R_MRAM_UserLockableAreaWrite()

fsp_err_t R_MRAM_UserLockableAreaWrite (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *mram_address*, uint32_t const *num_bytes*)

Stub function Implements flash_api_t::userLockableAreaWrite

Return values

FSP_ERR_UNSUPPORTED	User Lockable Area is not supported on this MCU

fsp_err_t	R_OSPI_Close (spi_flash_ctrl_t *const p_ctrl)

Detailed Description

Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

The OSPI peripheral interfaces with an external OctaFlash and/or OctaRAM chip(s) to perform data I/O Operations. When both OctaFlash and OctaRAM devices are interfaced, they must be connected to their own chip-select lines. The devices cannot share a single chip-select line.

Features

The OSPI driver has the following key features to support the **OctaFlash** device:

- Perform data I/O Operation in both SPI and OPI modes
- Can be configured with OctaFlash device on either of the 2 channels
- Memory mapped read access to the OctaFlash
- Programming the OctaFlash device using single continuous write
- Erasing the OctaFlash device

- Sending device specific commands and reading back responses
- Entering and exiting XIP (Single Continuous Read) mode
- 3 byte addressing for SPI
- 4 byte addressing for SPI and OPI
- Auto-calibration for OPI mode (SOPI and DOPI)

The OSPI driver has the following key features to support the **OctaRAM** device:

- Perform data I/O Operation in DOPI mode
- Can be configured with OctaRAM device on either of the 2 channels
- Memory mapped read amd write access to the OctaRAM using single continuous mode
- Sending device specific commands and reading back responses
- Auto-calibration for DOPI mode
- Uninitialized global variables or buffers can be allocated in the OSPI RAM address space.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OctaFlash.

Note

For OctaFlash, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.

Configuration

OSPI Flash:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.

Configurations for Storage > OSPI Flash (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r_ospi).

Configuration	Options	Default	Description
General			
General > Single Continuous Mode			
Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the read idle time.

Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the write idle time.
Name	Name must be a valid C symbol	g_ospi0	Module name.
Channel	Channel should be 0 or 1	0	Specify the OSPI chip select line to use.
Flash Size	Must be an integer greater than 0 with maximum configurable value of 0x3FFFFFFF	0x04000000	Specify the OctaFlash size in bytes.
SPI Protocol	• SPI • Single data rate OPI • Dual data rate OPI	SPI	Select the initial SPI protocol. SPI protocol can be changed on the OctaFlash using R_OSPI_DirectTransfer( ).
Address Bytes	• 3 • 4	4	Select the number of address bytes.
OPI Mode			
OPI Mode > Auto-Calibration			
Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
OPI Mode > Command Definitions			
Page Program Command	Must be a 16-bit OSPI Page Program Command under OPI Mode|Command Definitions	0x12ED	The command to program a page in OPI mode.
Read Command	Must be a 16-bit OSPI Read Command under OPI Mode|Command Definitions	0xEC13	The command to read in SOPI mode (8READ).
Dual Read Command	Must be a 16-bit OSPI Dual Read Command under OPI Mode|Command Definitions	0xEE11	The command to read in DOPI mode (8DTRD).

Write Enable Command	Must be a 16-bit OSPI Write Enable Command under OPI Mode|Command Definitions	0x06F9	The command to enable write in OPI mode.
Status Command	Must be a 16-bit OSPI Status Command under OPI Mode|Command Definitions	0x05FA	The command to query the status of a write or erase command in OPI mode.
OPI Mode > OM_DQS Enable Counter			
SOPI	Must be an integer between 0 and 255	9	OM_DQS enable counter for memory access. Setting for SOPI mode.
DOPI	Must be an integer between 0 and 255	6	OM_DQS enable counter for memory access. Setting for DOPI mode.
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 0 and 255	10	Memory read dummy cycles
Status Read Dummy Cycles	Must be an integer between 0 and 255	4	Status read dummy cycles
DOPI Byte Order	• Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2	Byte0, Byte1, Byte2, Byte3	Byte order on the external bus
SPI Mode			
SPI Mode > Command Definitions			
Page Program Command	Must be a 8-bit OSPI Page Program Command under SPI Mode|Command Definitions	0x12	The command to program a page in SPI mode.
Read Command	Must be a 8-bit OSPI Read Command under SPI Mode|Command Definitions	0x13	The command to read in SPI mode.
Write Enable Command	Must be a 16-bit OSPI Write Enable Command under SPI Mode|Command Definitions	0x06	The command to enable write in SPI mode.
Status Command	Must be a 16-bit OSPI Status Command under	0x05	The command to query the status of a write or

	SPI Mode|Command Definitions		erase command in SPI mode.
Common Command Definitions			
Sector Erase Command	Must be a value greater than or equal to 0	0x21DE	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Block Erase Command	Must be a value greater than or equal to 0	0xDC23	The command to erase a block. Set Block Erase Size to 0 if unused.
Chip Erase Command	Must be a value greater than or equal to 0	0xC738	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Write Enable Bit	Must be an integer between 0 and 7	1	Which bit contains the write enable status returned from the Write Enable Command.
Sector Erase Size	Must be an integer greater than or equal to 0 and less than 4294967296	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Block Erase Size	Must be an integer greater than or equal to 0 and less than 4294967296	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Chip Select Timing Setting			
Memory Mapped Read Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped read command execution interval setting in OCTACLK units
Memory Mapped Write Command Interval	• 2 • 5 • 7 • 9 • 11 • 13	2	Memory mapped write command execution interval setting in OCTACLK units

	• 15 • 17		
Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Command execution interval setting in OCTACLK units
Memory Mapped Read Pull-up Timing	• 5 SPI/SOPI • 6 SPI/SOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	5 SPI/SOPI	Memory mapped read signal pull-up timing setting in OCTACLK units
Memory Mapped Write Pull-up Timing	• 2 SPI/SOPI, 1.5 DOPI • 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI • 6 SPI/SOPI, 5.5 DOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	2 SPI/SOPI, 1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Pull-up Timing	• 5 SPI/SOPI • 6 SPI/SOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	5 SPI/SOPI	Signal pull-up timing setting in OCTACLK units
Memory Mapped Read Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Memory Mapped Write Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5	3 SPI/SOPI, 2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK

	DOPI • 5 SPI/SOPI, 4.5 DOPI		units
Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Signal pull-down timing setting in OCTACLK units

Note

The user is expected to modify the command definitions based on the OctaFlash chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for OPI mode based on Macronix OctaFlash MX25LM51245G.

OSPI RAM:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.

Configurations for Storage > OSPI RAM (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI RAM (r_ospi).

Configuration	Options	Default	Description
General			
General > Single Continuous Mode			
Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the read idle time.
Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the write idle time.
Name	Name must be a valid C symbol	g_ospi_ram0	Module name.
Channel	Channel should be 0 or 1 [Channel 0 recommended]	0	Specify the OSPI chip select line to use.

RAM Size	Must be an integer greater than 0 with maximum configurable value of 0x00800000	0x00800000	Specify the OctaRam size in bytes.
SPI Protocol	Dual data rate OPI	Dual data rate OPI	Select the initial SPI protocol. OctaRAM only supports DOPI mode.
Address Bytes	4	4	Select the number of address bytes. OctaRAM only supports 4 byte addresses in DOPI mode.
Auto-Calibration			
Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
Command Definitions			
Memory Read Command	Must be a 16-bit OSPI Dual Read Command under Command Definitions	0xA000	The command to read in DOPI mode.
Memory Write Command	Must be a 16-bit OSPI Write Command under Command Definitions	0x2000	The command to write in DOPI mode.
OM_DQS Enable Counter			
DOPI	Must be an integer between 0 and 255	3	OM_DQS enable counter for memory access. Setting for DOPI mode.
Chip Select Timing Setting			
Memory Mapped Read Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped read command execution interval setting in OCTACLK units
Memory Mapped Write Command Interval	• 2 • 5 • 7	2	Memory mapped write command execution interval setting in

	• 9 • 11 • 13 • 15 • 17		OCTACLK units
Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Command execution interval setting in OCTACLK units
Memory Mapped Read Pull-up Timing	• 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	6.5 DOPI	Memory mapped read signal pull-up timing setting in OCTACLK units
Memory Mapped Write Pull-up Timing	• 1.5 DOPI • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI • 5.5 DOPI • 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Pull-up Timing	• 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	6.5 DOPI	Signal pull-up timing setting in OCTACLK units
Memory Mapped Read Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Memory Mapped Write Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Signal pull-down timing setting in OCTACLK units
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 0 and 255	4	Memory read dummy cycles
Memory Write Dummy Cycles	Must be an integer between 0 and 255	4	Memory write dummy cycles
DOPI Byte Order	• Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0,	Byte1, Byte0, Byte3, Byte2	Byte order on the external bus

	Byte3, Byte2		
Chip Select Maximum Low Time (us)	Must be an integer between 0 to 511	4	Chip Select Maximum Low Time (tCSM).

Clock Configuration

PCLKA is the Octal-SPI bus interface, and PCLKB is used to set OSPI registers.

The signals to the OSPI device are derived from OCTACLK. The OMSCLK signal is OCTACLK / 2. Data can be output at the OCTACLK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTACLK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTACLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with IOPORT_CFG_DRIVE_HS_HIGH.
Chip Select pins should be configured with at least IOPORT_CFG_DRIVE_MEDIUM.

Usage Notes

Usage Notes for OctaFlash support

Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer Transfer (r_dmac).

OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling R_OSPI_Open() with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using R_OSPI_SpiProtocolSet() API. The appropriate preamble pattern can be written to the desired address using the R_OSPI_Write() API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling R_OSPI_Open().

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using R_OSPI_SpiProtocolSet(), please select latencies required for DOPI before calling R_OSPI_Open().

OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

Usage Notes for OctaRAM support

OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call R_OSPI_Open() without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. R_OSPI_AutoCalibrate() should be then called to perform auto-calibration.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

Limitations

Developers should be aware of the following limitations when using the OSPI driver:

OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).

- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an OMSCLK greater than 50MHz.

Examples

OSPI Flash:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi0_cs1 section to flash it during programming. */
const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi0_cs1") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .ospi0_cs1 section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".ospi0_cs1_code")
__attribute__((noinline));
void r_ospi_example_function (void)
{
 /* Add code here. */
}
void r_ospi_basic_example (void)
{
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Change SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);
 /* After R_OSPI_Open() and any required device specific intiialization, functions in
the OSPI flash can be called. */
    r_ospi_example_function();
}
```

Reading Status Register Example (R_OSPI_DirectTransfer)

This is an example of using R_OSPI_DirectWrite followed by R_OSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_direct_example (void)
{
 spi_flash_direct_transfer_t ospi_test_direct_transfer =
    {
       .command       = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
       .address       = 0U,
       .data          = 0U,
       .command_length = 1U,
       .address_length = 0U,
       .data_length    = 0U,
       .dummy_cycles   = 0U
    };
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* Write Enable */
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
 /* Read Status Register */
    ospi_test_direct_transfer.command    = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
    ospi_test_direct_transfer.data_length = 1U;
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Check if Write Enable is set */
 if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
    {
       __BKPT(0);
    }
```

```
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_Write, R_OSPI_SpiProtocolSet)

This is an example of using R_OSPI_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```
#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
0xF7, 0x00, 0xF7
};
void ospi_example_wait_until_wip (void)
{
 fsp_err_t          err = FSP_SUCCESS;
 spi_flash_status_t status;
    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
 while ((status.write_in_progress) && (--timeout))
    {
       err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 if (0 == timeout)
    {
      assert(FSP_SUCCESS == err);
    }
}
void r_ospi_auto_calibrate_example (void)
{
 /* Open the OSPI instance. */
 /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

```
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
 /* Wait until write has been completed */
    ospi_example_wait_until_wip();
 /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
```

Octaclk Update Example (R_OSPI_SpiProtocolSet)

This is an example of using R_BSP_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R_OSPI_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
 /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

OSPI RAM:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
```

```
/* Place uninitialized data buffers in the ospi0_cs1_noinit section.
 * Use ospi0_cs1_noinit section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi0_cs1_noinit");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi0_cs1_noinit");
void r_ospi_ram_basic_example (void)
{
 /* Open the OSPI instancee.
  * Ensure valid setting of the 'Data latching delay' field in the configurator.
  * To successfully perform OSPI RAM reads this value must not be 0.
  */
 fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read from or written to directly from the OSPI RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_AutoCalibrate)

This is an example of using R_OSPI_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```
#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
```

```
 /* OctaRAM Configuration Register (cr) read and write command definition */
 spi_flash_direct_transfer_t read_cr =
    {
       .command       = 0xC000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
 /* Dummy Cycles set to the default value specified in the OctaRAM device
Configuration Register */
       .dummy_cycles   = 5U
    };
 spi_flash_direct_transfer_t write_cr =
    {
       .command       = 0x4000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
       .dummy_cycles   = 0U
    };
 /* Read OctaRAM device Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
    uint16_t config_reg = (uint16_t) (((uint16_t) (read_cr.data) &
~OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK) |
                                      ((uint16_t)
(OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING <<
                                                        OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENC
Y_COUNTER_POS) &
                                         OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MA
```

```
SK));
 /* Write Configuration Register */
    write_cr.data = (uint32_t) config_reg;
    err          = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &write_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
    read_cr.data = 0;
 /* Set Dummy Clocks to value configured above (4 Clocks) */
    read_cr.dummy_cycles = 4U;
 /* Read Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Confirm the intended Configuration Register value */
    assert(config_reg == (uint16_t) (read_cr.data & UINT16_MAX));
 volatile uint32_t * ram_addr = (uint32_t *) OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS;
 /* Write the auto-calibration preamble pattern for DOPI mode as specified by the
Hardware Manual */
    ram_addr[0] = 0xFFFF0000;          // NOLINT(readability-magic-numbers)
    ram_addr[1] = 0x0800FF00;          // NOLINT(readability-magic-numbers)
    ram_addr[2] = 0xFF0000F7;          // NOLINT(readability-magic-numbers)
    ram_addr[3] = 0x00F708F7;          // NOLINT(readability-magic-numbers)
    err = R_OSPI_AutoCalibrate(&g_ospi_ram0_ctrl);
    assert(FSP_SUCCESS == err);
 /* After Auto-calibration data can be read from or written to directly from the OSPI
RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

Data Structures

struct	ospi_instance_ctrl_t

Enumerations

enum	ospi_device_number_t

enum	ospi_device_type_t

enum	ospi_command_cs_pulldown_clocks_t
enum	ospi_dopi_byte_order_t

Data Structure Documentation

◆ ospi_instance_ctrl_t

struct ospi_instance_ctrl_t
Instance control block. DO NOT INITIALIZE. Initialization occurs when spi_flash_api_t::open is called

Enumeration Type Documentation

◆ ospi_device_number_t

enum ospi_device_number_t	
Enumerator	
OSPI_DEVICE_NUMBER_0	Device connected to Chip-Select 0.
OSPI_DEVICE_NUMBER_1	Device connected to Chip-Select 1.

◆ ospi_device_type_t

enum ospi_device_type_t	
Enumerator	
OSPI_DEVICE_FLASH	Device Memory type OctaFlash.
OSPI_DEVICE_RAM	Device Memory type OctaRAM.

◆ ospi_command_cs_pullup_clocks_t

enum ospi_command_cs_pullup_clocks_t	
Enumerator	
OSPI_COMMAND_CS_PULLUP_CLOCKS_2	1.5 clocks DOPI mode; 2 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_3	2.5 clocks DOPI mode; 3 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_4	3.5 clocks DOPI mode; 4 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_5	4.5 clocks DOPI mode; 5 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_6	5.5 clocks DOPI mode; 6 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_7	6.5 clocks DOPI mode; 7 Clocks all other modes
OSPI_COMMAND_CS_PULLUP_CLOCKS_8	7.5 clocks DOPI mode; 8 Clocks all other modes
OSPI_COMMAND_CS_PULLUP_CLOCKS_9	8.5 clocks DOPI mode; 9 Clocks all other modes

◆ ospi_command_cs_pulldown_clocks_t

enum ospi_command_cs_pulldown_clocks_t	
Enumerator	
OSPI_COMMAND_CS_PULLDOWN_CLOCKS_3	2.5 clocks DOPI mode; 3 Clocks all other modes
OSPI_COMMAND_CS_PULLDOWN_CLOCKS_4	3.5 clocks DOPI mode; 4 Clocks all other modes
OSPI_COMMAND_CS_PULLDOWN_CLOCKS_5	4.5 clocks DOPI mode; 5 Clocks all other modes

◆ ospi_dopi_byte_order_t

enum ospi_dopi_byte_order_t	
Enumerator	
OSPI_DOPI_BYTE_ORDER_0123	DOPI byte order byte 0, byte 1, byte 2, byte 3.
OSPI_DOPI_BYTE_ORDER_1032	DOPI byte order byte 1, byte 0, byte 3, byte 2.

Function Documentation

◆ R_OSPI_Open()

fsp_err_t R_OSPI_Open (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements spi_flash_api_t::open.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_ctrl.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to open the driver with an invalid SPI protocol for OctaRAM.

◆ R_OSPI_DirectWrite()

fsp_err_t R_OSPI_DirectWrite (spi_flash_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_DirectTransfer

Implements spi_flash_api_t::directWrite.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_DirectRead()

fsp_err_t R_OSPI_DirectRead (spi_flash_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_DirectTransfer.

Implements spi_flash_api_t::directRead.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_DirectTransfer()

fsp_err_t R_OSPI_DirectTransfer (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements spi_flash_api_t::directTransfer.

Example:

```
/* Write Enable */
   err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_XipEnter()

fsp_err_t R_OSPI_XipEnter (spi_flash_ctrl_t *const *p_ctrl*)

Enters Single Continuous Read/Write mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_XipExit()

fsp_err_t R_OSPI_XipExit (spi_flash_ctrl_t *const *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_Write()

fsp_err_t R_OSPI_Write (spi_flash_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Example:

```
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_INVALID_SIZE	Write operation crosses page-boundary.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ R_OSPI_Erase()

fsp_err_t R_OSPI_Erase (spi_flash_ctrl_t *const *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, byte_count doesn't match an erase size defined in spi_flash_cfg_t, or byte_count is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ R_OSPI_StatusGet()

fsp_err_t R_OSPI_StatusGet (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Example:

```
      err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_BankSet()

fsp_err_t R_OSPI_BankSet (spi_flash_ctrl_t *const *p_ctrl*, uint32_t *bank*)

Selects the bank to access.

Implements spi_flash_api_t::bankSet.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_SpiProtocolSet()

fsp_err_t R_OSPI_SpiProtocolSet (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to set an invalid SPI protocol for OctaRAM.

◆ R_OSPI_AutoCalibrate()

fsp_err_t R_OSPI_AutoCalibrate (spi_flash_ctrl_t *const *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern.

Note

The preamble pattern must be written to the configured address before calling this API. Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaFlash.

◆ R_OSPI_Close()

fsp_err_t R_OSPI_Close (spi_flash_ctrl_t *const *p_ctrl*)
Close the OSPI driver module. Implements spi_flash_api_t::close. **Return values** FSP_SUCCESS — Configuration was successful. FSP_ERR_ASSERTION — p_instance_ctrl is NULL. FSP_ERR_NOT_OPEN — Driver is not opened.

Detailed Description

Driver for the OSPI_B peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

The OSPI_B peripheral supports xSPI (or OSPI) compatible external memory devices, and it interfaces with these devices to perform data I/O Operations. The OSPI_B peripheral does not support addressable devices, so all connected memory devices must be connected to an individual chip-select pin. Please note that this document will reference the xSPI protocol to which OSPI is a subset. The OSPI_B peripheral is compatible with a variety of xSPI protocol operating modes.

Features

The OSPI_B driver has the following key features to support the **xSPI** device:

- Perform data I/O Operation
- Direct memory-mapped access to the xSPI device memory up to 256 MB.
- Can be configured with xSPI devices on either of the 2 channels
- Programming the xSPI device using combination write (up to 64 bytes)
- Erasing the xSPI device
- Sending device specific commands and reading back responses of up to 8 bytes
- 1- and 2-byte addressing intended for row-column memories
- 3 byte addressing
- 4 byte addressing
- Auto-calibration
- Decryption-on-the-fly
- Support for standard SPI frames, xSPI Protocol 1.0, xSPI Protocol 2.0, and xSPI Protocol 2.0 Extended frames.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OSPI_B.
- Optional (build-time) XiP support for entering/exiting XiP mode of the target device.
- Optional (build-time) Data-strobe (DS) auto-calibration support for target devices using the

DS signal.
- Optional (build-time) Decryption on the fly (DOTF)
- Optional (build-time) Support for memory which use row-column addressing.

Note

For OSPI_B, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.

Configuration

OSPI_B Flash:

Build Time Configurations for r_ospi_b

The following build time configurations are defined in fsp_cfg/r_ospi_b_cfg.h:

Configuration	Options	Default	Description
Memory-mapping Support			
Prefetch Function	• Enable • Disable	Enable	Enable prefetch function on memory-mapped reads.
Combination Function	Refer to the RA Configuration tool for available options.	64 Bytes	Enable combination function on memory-mapped writes.
XiP Support	• Enable • Disable	Disable	Enable the use of XiP enter and exit codes.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.
Autocalibration Support	• Enable • Disable	Disable	Enable DS autocalibration for dual-data-rate modes.
DOTF Support	• Enable (Protected Mode) • Enable (Compatibility Mode) • Disable	Disable	Enable DOTF support for the OSPI module.
Row Addressing Support	• Enable • Disable	Disable	Enable support for xSPI devices which utilize row-column addressing of the memory array.

Configurations for Storage > OSPI (r_ospi_b)

This module can be added to the Stacks tab via New Stack > Storage > OSPI (r_ospi_b).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ospi0	Module name.
Unit	MCU Specific Options		Specify the OSPI peripheral to use.
Chip Select	• CS0 • CS1	CS1	Specify the OSPI chip select line to use.
Write Status Bit	• b0 • b1 • b2 • b3 • b4 • b5 • b6 • b7	b0	Which bit contains the write in progress status returned from the Write Status Command.
Write Enable Bit	• b0 • b1 • b2 • b3 • b4 • b5 • b6 • b7	b1	Which bit contains the write enable status returned from the Write Enable Command.
DS Auto-calibration Pattern Address	Must be a valid pointer address	0	Address to the auto-calibration pattern in the target flash memory's address space.
Command Sets			
Command Sets > Custom Table			
Table Pointer	Must be a vaild C symbol		Specify the custom command set table (ospi_b_xspi_command_set_t[]) to use. If provided, all other command set settings are ignored.
Table Length	Length must be an integer greater than or equal to zero.	0	Length of the custom command set table.
Command Sets > Erase Sizes			
Sector Erase	Erase size must be an	4096	Size of the memory

	integer greater-than or equal-to zero and less than 4,294,967,296 (0xFFFF_FFFF).		region erased by Sector Erase
Block Erase	Erase size must be an integer greater-than or equal-to zero and less than 4,294,967,296 (0xFFFF_FFFF).	262144	Size of the memory region erased by Block Erase
Command Sets > Initial Mode			
Command Sets > Initial Mode > Read			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x13	Read command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Read commands. Set to 0 to disable dummy cycles.
Command Sets > Initial Mode > Program			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x12	Program command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Program commands. Set to 0 to disable dummy cycles.
Command Sets > Initial Mode > Row Load			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x00	Row Load command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Row Load commands. Set to 0 to disable dummy cycles.
Command Sets > Initial Mode > Row Store			
Command Code	Command codes must be positive and fit in the selected command	0x00	Row Store command code. Set to 0x00 to disable.

	byte length.		
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Row Store commands. Set to 0 to disable dummy cycles.
Command Sets > Initial Mode > Write Enable			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x06	Write Enable command code. Set to 0x00 to disable.
Command Sets > Initial Mode > Status Read			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x05	Status Read command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Status Read commands. Set to 0 to disable dummy cycles.
Command Sets > Initial Mode > Sector Erase			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x21	Sector Erase command code. Set to 0x00 to disable.
Command Sets > Initial Mode > Block Erase			
Command Code	Command codes must be positive and fit in the selected command byte length.	0xDC	Block Erase command code. Set to 0x00 to disable.
Command Sets > Initial Mode > Chip Erase			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x60	Chip Erase command code. Set to 0x00 to disable.
Protocol Mode	• SPI (1S-1S-1S) • DSPI (1S-2S-2S) • DSPI (2S-2S-2S) • QSPI (1S-4S-4S) • QSPI (4S-4S-4S) • QSPI (4S-4D-4D) • Dual data rate OPI (8D-8D-8D)	SPI (1S-1S-1S)	Signal protocol mode to use for this command set.

Frame Format	• Standard • xSPI Profile 1.0 • xSPI Profile 2.0 • xSPI Profile 2.0 Extended	Standard	Frame format to use with this command set.
Latency Mode	• Fixed • Variable (DQS)	Fixed	Latency mode to use with this command set.
Address Length	• 1 byte • 2 bytes • 3 bytes • 4 bytes	3 bytes	Number of bytes used to address data in a memory page or row.
Address MSB Mask	Address mask must be between 0x00 and 0xFF.	0xF0	Mask of bits to zero for the most-significant byte of the address stage during memory-mapped operations
Command Code Length	• 1 byte • 2 bytes	1 byte	
Status Register Address Length	• No address • 1 byte • 2 bytes • 3 bytes • 4 bytes	No address	Number of bytes used for addressing the status register.
Status Register Address	Status register address must be between 0x00 and 0xFFFF_FFFF, inclusive.	0x00	Address of the status register that reports Write-in-Progress and Write-Enable flags.
Command Sets > High-speed Mode			
Command Sets > High-speed Mode > Read			
Command Code	Command codes must be positive and fit in the selected command byte length.	0xEEEE	Read command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	20	Dummy cycles to use between the address and data phase for Read commands. Set to 0 to disable dummy cycles.
Command Sets > High-speed Mode > Program			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x1212	Program command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer	0	Dummy cycles to use between the address

	between 0 and 31.		and data phase for Program commands. Set to 0 to disable dummy cycles.
Command Sets > High-speed Mode > Row Load			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x00	Row Load command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Row Load commands. Set to 0 to disable dummy cycles.
Command Sets > High-speed Mode > Row Store			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x00	Row Store command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	0	Dummy cycles to use between the address and data phase for Row Store commands. Set to 0 to disable dummy cycles.
Command Sets > High-speed Mode > Write Enable			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x0606	Write Enable command code. Set to 0x00 to disable.
Command Sets > High-speed Mode > Status Read			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x0505	Status Read command code. Set to 0x00 to disable.
Dummy Cycles	Dummy cycle counts must be an integer between 0 and 31.	3	Dummy cycles to use between the address and data phase for Status Read commands. Set to 0 to disable dummy cycles.
Command Sets > High-speed Mode > Sector Erase			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x2121	Sector Erase command code. Set to 0x00 to disable.

Command Sets > High-speed Mode > Block Erase			
Command Code	Command codes must be positive and fit in the selected command byte length.	0xDCDC	Block Erase command code. Set to 0x00 to disable.
Command Sets > High-speed Mode > Chip Erase			
Command Code	Command codes must be positive and fit in the selected command byte length.	0x6060	Chip Erase command code. Set to 0x00 to disable.
Protocol Mode	• SPI (1S-1S-1S) • DSPI (1S-2S-2S) • DSPI (2S-2S-2S) • QSPI (1S-4S-4S) • QSPI (4S-4S-4S) • QSPI (4S-4D-4D) • Dual data rate OPI (8D-8D-8D)	Dual data rate OPI (8D-8D-8D)	Signal protocol mode to use for this command set.
Frame Format	• Standard • xSPI Profile 1.0 • xSPI Profile 2.0 • xSPI Profile 2.0 Extended	xSPI Profile 1.0	Frame format to use with this command set.
Latency Mode	• Fixed • Variable (DQS)	Fixed	Latency mode to use with this command set.
Address Length	• 1 byte • 2 bytes • 3 bytes • 4 bytes	4 bytes	Number of bytes used to address data in a memory page or row.
Address MSB Mask	Address mask must be between 0x00 and 0xFF.	0xF0	Mask of bits to zero for the most-significant byte of the address stage during memory-mapped operations
Command Code Length	• 1 byte • 2 bytes	2 bytes	
Status Register Address Length	• No address • 1 byte • 2 bytes • 3 bytes • 4 bytes	4 bytes	Number of bytes used for addressing the status register.
Status Register Address	Status register address must be between 0x00 and 0xFFFF_FFFF, inclusive.	0x00	Address of the status register that reports Write-in-Progress and Write-Enable flags.
Timing Settings			

Timing Settings > Chip Select			
Command Interval	Refer to the RA Configuration tool for available options.	2 cycles	Minimum clock cycles between two consecutive xSPI frames (CS idle time).
Pull-up Timing	• No Extension • 1 Cycle	No Extension	Signal pull-up timing (CS asserting extension) setting in OCTACLK units
Pull-down Timing	• No Extension • 1 Cycle	No Extension	Signal pull-down timing (CS negating extension) setting in OCTACLK units
Timing Settings > SDR			
Drive Timing	• Drive 1/2 cycle before CK • Drive at CK	Drive 1/2 cycle before CK	Data signal timing relative to the rising-edge of the CK signal.
CK Sampling Edge	• Falling edge • Rising edge	Falling edge	Selects the clock edge to sample the data signal.
Sampling Delay	• None • 1 cycle • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles	None	Number of cycles to delay before sampling the data signal.
Timing Settings > DDR			
Sampling Window Extension	• None • 1 cycle • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles	None	Number of cycles to extending the data sampling window in DDR mode.
DS Latching Delay	Refer to the RA Configuration tool for available options.	Auto-calibrate	Number of delay cells for the data strobe signal. This value must be set to zero if auto-calibration is used.
XiP Mode			
XiP Enter Code	Must be an integer between 0 and 255	0	XiP enter code.
XiP Exit Code	Must be an integer between 0 and 255	0	XiP exit code.

DOTF			
Name	Name must be a valid C symbol	g_ospi_dotf	DOTF Configuration name.
AES Key	Name must be a valid C symbol	g_ospi_dotf_key	Name of Key variable.
AES IV	Name must be a valid C symbol	g_ospi_dotf_iv	Name of IV variable
AES Key Length	MCU Specific Options		Select AES key length
Key Format	MCU Specific Options		Select key format
Decryption start address	Value must be an integer between 0x80000000 and 0x9FFFF000	0x90000000	OSPI decryption start address
Decryption end address	Value must be an integer between 0x80000FFF and 0x9FFFFFFF	0x90001FFF	OSPI decryption end address
Row Addressing			
Row Address Length	• No address • 1 byte • 2 bytes • 3 bytes • 4 bytes	No address	Number of bytes used for addressing the row index.

Note

The user is expected to modify the command definitions based on the xSPI chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for DOPI mode based on Infineon S28HS256.

Clock Configuration

The signals to the xSPI target device are derived from OCTACLK. OCTACLK must be set to twice the desired OMSCLK signal frequency. This allows data to be latched on either clock edge for Dual-Data-Rate modes (4S-4D-4D or 8D-8D-8D).

Please refer to the Hardware User Manual for the clocks which control the OSPI_B registers. These along with OCTACLK can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTACLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O

- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with IOPORT_CFG_DRIVE_HS_HIGH.
Chip Select pins should be configured with at least IOPORT_CFG_DRIVE_MEDIUM.

Usage Notes

Usage Notes for xSPI support

After R_OSPI_B_Open() completes successfully, the xSPI device contents are mapped to the appropriate external memory regions for each OSPI_B unit. For example, on the RA8M1, R_OSPI_B0 maps the CS0 device to address 0x80000000 and the CS1 device to address 0x90000000. After opening, the addresses can be accessed like on-chip flash.

Bank CS0 and CS1 support up to 256 MB of address space each depending on the platform.

Auto-calibration

If support is enabled, auto-calibration procedures are triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling R_OSPI_B_Open() when using a data strobe (DS) mode or changing the SPI protocol to a DS mode using the R_OSPI_B_SpiProtocolSet() API. The appropriate preamble pattern can be written to the desired address using the R_OSPI_B_Write() API while in simple SPI mode (recommended), or a non-DS mode. Ensure that the same address is passed through the configurator. If the xSPI device is already in a DS mode, the preamble pattern must be programmed using the debugger before calling R_OSPI_B_Open().

The preamble pattern is expected to be { 0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08, 0xF7, 0x00, 0xF7 }.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using R_OSPI_B_SpiProtocolSet(), please select latencies required for DOPI before calling R_OSPI_B_Open().

XiP Support

OSPI_B supports eXecute in Place (XiP) modes of operation. This can be used for read-only memory-mapped accesses to reduce overall read latency by skipping the command sequence in the xSPI transaction. Separate XiP enter and exit codes may be specified for either attached target device. Upon calling R_OSPI_B_XipEnter(), the associated memory region for the target device is switched to read-only mode and the enter code sent to the device. Calling R_OSPI_B_XipExit() will transmit the exit code and transition the memory region back to read-write access.

Only one flash device should be used after entering XiP mode. Once entered, XiP codes will be transmitted to all attached devices.

xSPI Commands

Command sets and erase commands may be specified individually for each supported protocol mode. By default, the configurator only supports an alternative command set for "High-Speed Mode" (DOPI 8D-8D-8D) mode. The command sets cannot be changed during run-time, but the appropriate command set will be selected when changing protocol modes. If a command set is not found, an FSP_ERR_INVALID_MODE error code will be returned.

If custom DOPI erase commands are not specified, ensure the erase commands are the appropriate 2-byte DOPI commands. The lower byte will be used for 1-byte command protocols.

DOTF Support

Decryption-On-The-Fly is configurable for OSPI Flash and is disabled from the build by default.

Using the DOTF feature requires first creating the encrypted blob on the PC and then configuring the DOTF module with the appropriate parameters to allow decryption of the blob once it is programmed into OSPI. Use the Security Key Management Tool (https://www.renesas.com/us/en/software-tool/security-key-management-tool) to create the encrypted blob.

Example: To encrypt a 4096 byte area in a input srec file from 0x90000000 to 0x90000FFF using a 128 AES encryption key FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF and IV 00000000000000000000000000000000 use SKMT with the following arguments:

```
skmt.exe /encdotf /keytype "AES-128" /enckey "FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"
/nonce "00000000000000000000000000000000" /startaddr "90000000" /endaddr "90000FFF"
/prg "input.srec" /incplain /output "encrypted_output.srec"
```

The values for key, iv and decryption area start and end addresses that were used to create the blob using SKMT must be set in the DOTF configuration in FSP.

Make sure that the Key and IV passed into DOTF configuration are 4 byte aligned. This can be done using a compiler alignment attribute as shown below:

```
uint8_t aes_key[] __attribute__((aligned(4))) =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
0x0d, 0x0e, 0x0f,
    0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,
0x1d, 0x1e, 0x1f
};
```

Supported Key Formats

- When the Compatibility Mode stack is added for the crypto engine, the user can provide either a wrapped or plaintext AES key to the DOTF module.

- When the Protected Mode stack is used, only wrapped keys are supported.

When configuring the DOTF options, make sure that the key format is specified.

Note

For a detailed description of the Crypto Engine operating modes, refer to Application Note R11AN0498.

Limitations

Developers should be aware of the following limitations when using the OSPI_B driver:

OSPI_B

- The R_OSPI_B driver expects memory devices to have uniform sector sizes. If a design requires using a memory with non-uniform sectors, the end-user application must appropriately manage sectors.
- Prefetch and combination support for memory-mapped access is applied globally to all slave devices per OSPI_B unit.
- Combination writes are limited to a maximum of 64 bytes. The user should verify the write has completed before attempting to write more bytes.
- Writing to the memory-mapped regions with the CPU is restricted to 64-bit accesses with 8-byte destination alignments. This restriction is not applicable to other bus masters (e.g. DTC or DMAC).
- When using Arm LLVM ensure any read-only (const) data used with R_OSPI_B_Write() is word (4-byte) aligned if the DMAC is not being used. If parameter checking is enabled, the source pointer alignment will be verified for calls to R_OSPI_B_Write().
- Take care to restrict concurrent accesses of the OSPI memory area. Collisions on the bus can occur if other bus masters attempt to write to the OSPI memory area while another master is reading the OSPI memory area.
- When using 8D-8D-8D mode, care should be taken to access on even-aligned addresses. Problems may occur if odd address alignment is used. This restriction applies to all bus masters using OSPI_B.
- DOTF: AES-192 is not supported when the Protected Mode stack is used.
- When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.
- Memories which use row-column addressing must be managed by the end-user application to ensure the appropriate memory row is loaded and stored.

Examples

OSPI Flash:

The following definitions are used across various example snippets below.

```
#define OSPI_B_COMMAND_WRITE_ENABLE_SPI_MODE (0x06U)
#define OSPI_B_COMMAND_WRITE_DISABLE_SPI_MODE (0x04U)
#define OSPI_B_COMMAND_READ_STATUS_SPI_MODE (0x05U)
#define OSPI_B_COMMAND_READ_REGISTER_SPI_MODE (0x65U)
#define OSPI_B_COMMAND_READ_QSPI_MODE (0x0BU)
#define OSPI_B_COMMAND_PROGRAM_QSPI_MODE (0x12U)
```

```
#define OSPI_B_COMMAND_WRITE_ENABLE_QSPI_MODE (0x06U)
#define OSPI_B_COMMAND_STATUS_QSPI_MODE (0x05U)
#define OSPI_B_COMMAND_BLOCK_ERASE_DOPI_MODE (0x21DEU)
#define OSPI_B_COMMAND_SECTOR_ERASE_DOPI_MODE (0xDC23U)
#define OSPI_B_COMMAND_CHIP_ERASE_DOPI_MODE (0x609FU)
#define OSPI_B_COMMAND_READ_DOPI_MODE (0xEE11U)
#define OSPI_B_COMMAND_PROGRAM_DOPI_MODE (0x12EDU)
#define OSPI_B_COMMAND_WRITE_ENABLE_DOPI_MODE (0x06F9U)
#define OSPI_B_COMMAND_STATUS_DOPI_MODE (0x05FAU)
#define OSPI_B_WEN_BIT_MASK (0x02U)
#define OSPI_B_WIP_BIT_MASK (0x01U)
#define OSPI_B_BLOCK_ERASE_SIZE (4096U)
#define OSPI_B_SECTOR_ERASE_SIZE (262144U)
#define OSPI_B_EXAMPLE_DESTINATION_ADDRESS ((void *) 0x90000000U) /* Device on CS1 */
```

```
static void ospi_b_change_mode (spi_flash_protocol_t new_protocol)
{
 /* Step 1. Identify current device configuration and reconfigure as needed... */
 /* Step 2. Update clocks... */
 /* Step 3. Transition driver to the new protocol. */
 fsp_err_t err = R_OSPI_B_SpiProtocolSet(&g_ospi0_ctrl, new_protocol);
    assert(FSP_SUCCESS == err);
 /* Step 4. Verify mode change... */
}
```

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_B_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_B_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi_flash section to flash it during programming. */
const uint8_t g_src[OSPI_B_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi0_cs1") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .ospi0_cs1_code section to flash it during programming. */
```

```
void r_ospi_b_example_function(void) BSP_PLACE_IN_SECTION(".ospi0_cs1_code")
__attribute__((noinline));
void r_ospi_b_example_function (void)
{
 /* Add code here. */
}
void r_ospi_b_basic_example (void)
{
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_B_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Change SPI to DOPI mode */
    ospi_b_change_mode(SPI_FLASH_PROTOCOL_8D_8D_8D);
 /* After R_OSPI_B_Open() and any required device specific initialization, data can
be read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_B_EXAMPLE_DATA_LENGTH);
 /* After R_OSPI_B_Open() and any required device specific initialization, functions
in the OSPI flash can be called. */
    r_ospi_b_example_function();
}
```

Reading Status Register Example (R_OSPI_B_DirectTransfer)

This is an example of using R_OSPI_B_DirectWrite followed by R_OSPI_B_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_B_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_b_direct_example (void)
{
 spi_flash_direct_transfer_t ospi_b_test_direct_transfer =
    {
       .command       = OSPI_B_COMMAND_READ_STATUS_SPI_MODE,
       .address       = 0U,
       .data          = 0U,
       .command_length = 1U,
```

```
       .address_length = 0U,
       .data_length    = 0U,
       .dummy_cycles   = 0U
   };
 /* Open the OSPI instance. */

Auto-calibration Example (R_OSPI_B_DirectTransfer, R_OSPI_B_Write, R_OSPI_B_SpiProtocolSet)

This is an example of using R_OSPI_B_SpiProtocolSet to change the operating mode from SPI to DOPI and allow the driver to initiate auto-calibration.

```
#define OSPI_B_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_B_EXAMPLE_PREAMBLE_ADDRESS (0x90000000U) /* Device connected to CS1 */
const uint8_t g_preamble_bytes[OSPI_B_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
0xF7, 0x00, 0xF7
```

```
};
static void ospi_b_wait_until_wip (void)
{
 fsp_err_t          err = FSP_SUCCESS;
 spi_flash_status_t status;
    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
 while ((status.write_in_progress) && (--timeout))
    {
       err = R_OSPI_B_StatusGet(&g_ospi0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 if (0 == timeout)
    {
      assert(FSP_SUCCESS == err);
    }
}
void r_ospi_b_auto_calibrate_example (void)
{
 /* Open the OSPI instance. */
 /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
 fsp_err_t err = R_OSPI_B_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_B_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_B_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_B_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
 /* Wait until write has been completed */
    ospi_b_wait_until_wip();
 /* Change from SPI to DOPI mode */
    ospi_b_change_mode(SPI_FLASH_PROTOCOL_8D_8D_8D);
}
```

OctaClk Update Example (R_OSPI_B_SpiProtocolSet)

This is an example of using R_BSP_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R_OSPI_B_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
/*
 * Changes the OCTACLK divider; assumes PLL2 is being used as the source for OCTACLK.
 * @param divider New clock divider to switch to.
 */
static void ospi_b_change_omclk (bsp_clocks_octaclk_div_t divider)
{
 /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = divider;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

Using a Custom xSPI Command Set Example

This is an example of using custom command sets for 8D-8D-8D and 4S-4S-4S protocol modes.

```
/* Custom two-byte erase commands. */
spi_flash_erase_command_t g_2B_erase_commands[] =
{
    {.command = OSPI_B_COMMAND_BLOCK_ERASE_DOPI_MODE, .size = OSPI_B_BLOCK_ERASE_SIZE
},
    {.command = OSPI_B_COMMAND_SECTOR_ERASE_DOPI_MODE, .size =
OSPI_B_SECTOR_ERASE_SIZE     },
    {.command = OSPI_B_COMMAND_CHIP_ERASE_DOPI_MODE, .size =
SPI_FLASH_ERASE_SIZE_CHIP_ERASE},
};
ospi_b_table_t g_2B_erase_table =
{
    .p_table = g_2B_erase_commands,
    .length = (uint8_t) (sizeof(g_2B_erase_commands) / sizeof
```

```
(g_2B_erase_commands[0])),
};
/* Custom command sets. */
ospi_b_xspi_command_set_t g_command_sets[] =
{
 /* 8D-8D-8D example with inverted lower command byte. */
    {
        .protocol             = SPI_FLASH_PROTOCOL_8D_8D_8D,
        .command_bytes       = OSPI_B_COMMAND_BYTES_2,
        .read_command         = OSPI_B_COMMAND_READ_DOPI_MODE,
        .program_command      = OSPI_B_COMMAND_PROGRAM_DOPI_MODE,
        .write_enable_command = OSPI_B_COMMAND_WRITE_ENABLE_DOPI_MODE,
        .status_command       = OSPI_B_COMMAND_STATUS_DOPI_MODE,
        .read_dummy_cycles    = 20U,
        .program_dummy_cycles = 0U,
        .status_dummy_cycles = 3U,
        .p_erase_commands    = &g_2B_erase_table
    },
 /* 4S-4S-4S example with different .read_command and dummy cycles. */
    {
        .protocol             = SPI_FLASH_PROTOCOL_4S_4S_4S,
        .command_bytes       = OSPI_B_COMMAND_BYTES_1,

Data Structure Documentation

◆ ospi_b_table_t

struct ospi_b_table_t		
Simple array length table structure.		
Data Fields		
void *	p_table	Pointer to the table array.
uint8_t	length	Number of entries in the table.

◆ ospi_b_timing_setting_t

struct ospi_b_timing_setting_t		
Fixed timing configuration for bus signals.		
Data Fields		
ospi_b_command_interval_clocks_t	command_to_command_interval	Interval between 2 consecutive commands.
ospi_b_command_cs_pullup_clocks_t	cs_pullup_lag	Duration to de-assert CS line after the last command.
ospi_b_command_cs_pulldown_clocks_t	cs_pulldown_lead	Duration to assert CS line before the first command.
ospi_b_sdr_drive_timing_t	sdr_drive_timing	Data signal timing relative to the rising-edge of the CK signal.
ospi_b_ck_edge_t	sdr_sampling_edge	Selects the clock edge to sample the data signal.
ospi_b_sdr_sampling_delay_t	sdr_sampling_delay	Number of cycles to delay before sampling the data signal.
ospi_b_ddr_sampling_extension_t	ddr_sampling_extension	Number of cycles to extending the data sampling window in DDR mode.

◆ ospi_b_xspi_command_set_t

struct ospi_b_xspi_command_set_t		
Command set used for a protocol mode.		
Data Fields		
spi_flash_protocol_t	protocol	Protocol mode associated with this command set.
ospi_b_frame_format_t	frame_format	Frame format to use for this command set.
ospi_b_latency_mode_t	latency_mode	Configurable or variable latency, only valid for OSPI_B_FRAME_FORMAT_XSPI_PROFILE_2 and OSPI_B_FRAME_FORMAT_XSPI_PROFILE_2_EXTENDED.

ospi_b_command_bytes_t	command_bytes	Number of command bytes for each command code.
spi_flash_address_bytes_t	address_bytes	Number of bytes used during the address phase.
uint16_t	read_command	Read command.
uint16_t	program_command	Memory program/write command.
uint16_t	write_enable_command	Command to enable write or erase, set to 0x00 to ignore.
uint16_t	status_command	Command to read the write status, set to 0x00 to ignore.
uint16_t	row_load_command	Load a page into the device's internal buffer, set to 0x00 to ignore.
uint16_t	row_store_command	Stores the device's internal buffer to the memory page, set to 0x00 to ignore.
uint8_t	read_dummy_cycles	Dummy cycles to be inserted for read commands.
uint8_t	program_dummy_cycles	Dummy cycles to be inserted for page program commands.
uint8_t	status_dummy_cycles	Dummy cycles to be inserted for status read commands.
uint8_t	row_load_dummy_cycles	Dummy cycles to be inserted for the page load command.
uint8_t	row_store_dummy_cycles	Dummy cycles to be inserted for the page store command.
uint8_t	address_msb_mask	Mask of bits to zero when using memory-mapped operations; only applies to the most-significant byte.
bool	status_needs_address	Indicates that reading the status register requires an address stage.
uint32_t	status_address	Address to use for reading the status register with "busy" and "write-enable" flags.
spi_flash_address_bytes_t	status_address_bytes	Number of bytes used for status register addressing.
ospi_b_table_t const *	p_erase_commands	List of all erase commands and associated sizes.

◆ ospi_b_dotf_cfg_t

struct ospi_b_dotf_cfg_t
This structure is used to hold all the DOTF related configuration.

◆ ospi_b_extended_cfg_t

struct ospi_b_extended_cfg_t		
OSPI_B Extended configuration.		
Data Fields		
uint8_t	ospi_b_unit	The OSPI_B unit corresponding to the selected channel.
ospi_b_device_number_t	channel	Device number to be used for memory device.
ospi_b_timing_setting_t const *	p_timing_settings	Fixed protocol timing settings.
ospi_b_table_t const *	p_xspi_command_set	Additional protocol command sets; if additional protocol commands set are not used set this to NULL.
ospi_b_ds_timing_delay_t	data_latch_delay_clocks	Delay after assertion of the DS signal where data should be latched.
uint8_t *	p_autocalibration_preamble_pattern_addr	OctaFlash memory address holding the preamble pattern.
transfer_instance_t const *	p_lower_lvl_transfer	DMA Transfer instance used for data transmission.

◆ ospi_b_instance_ctrl_t

struct ospi_b_instance_ctrl_t		
Instance control block. DO NOT INITIALIZE. Initialization occurs when spi_flash_api_t::open is called		
Data Fields		
spi_flash_cfg_t const *	p_cfg	Pointer to initial configuration.
uint32_t	open	Whether or not driver is open.
spi_flash_protocol_t	spi_protocol	Current OSPI protocol selected.
ospi_b_device_number_t	channel	Device number to be used for memory device.
uint8_t	ospi_b_unit	OSPI_B instance number.
ospi_b_xspi_command_set_t const *	p_cmd_set	Command set for the active protocol mode.
R_XSPI0_Type *	p_reg	Address for the OSPI peripheral associated with this channel.

Macro Definition Documentation

◆ OSPI_B_MAX_WRITE_ENABLE_POLLING_LOOPS

#define OSPI_B_MAX_WRITE_ENABLE_POLLING_LOOPS
Maximum number of status polling checks after enabling memory writes.

Enumeration Type Documentation

◆ ospi_b_device_number_t

enum ospi_b_device_number_t	
OSPI Flash chip select	
Enumerator	
OSPI_B_DEVICE_NUMBER_0	Device connected to Chip-Select 0.
OSPI_B_DEVICE_NUMBER_1	Device connected to Chip-Select 1.

◆ ospi_b_command_bytes_t

enum ospi_b_command_bytes_t	
OSPI flash number of command code bytes.	
Enumerator	
OSPI_B_COMMAND_BYTES_1	Command codes are 1 byte long.
OSPI_B_COMMAND_BYTES_2	Command codes are 2 bytes long.

◆ ospi_b_command_interval_clocks_t

enum ospi_b_command_interval_clocks_t	
OSPI frame to frame interval	
Enumerator	
OSPI_B_COMMAND_INTERVAL_CLOCKS_1	1 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_2	2 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_3	3 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_4	4 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_5	5 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_6	6 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_7	7 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_8	8 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_9	9 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_10	10 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_11	11 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_12	12 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_13	13 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_14	14 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_15	15 interval clocks
OSPI_B_COMMAND_INTERVAL_CLOCKS_16	16 interval clocks

◆ ospi_b_command_cs_pullup_clocks_t

enum ospi_b_command_cs_pullup_clocks_t	
OSPI chip select de-assertion duration	
Enumerator	
OSPI_B_COMMAND_CS_PULLUP_CLOCKS_NO_EXTENSION	CS asserting No extension.
OSPI_B_COMMAND_CS_PULLUP_CLOCKS_1	CS asserting Extend 1 cycle.

◆ ospi_b_command_cs_pulldown_clocks_t

enum ospi_b_command_cs_pulldown_clocks_t	
OSPI chip select assertion duration	
Enumerator	
OSPI_B_COMMAND_CS_PULLDOWN_CLOCKS_NO_EXTENSION	CS negating No extension.
OSPI_B_COMMAND_CS_PULLDOWN_CLOCKS_1	CS negating Extend 1 cycle.

◆ ospi_b_ds_timing_delay_t

enum ospi_b_ds_timing_delay_t	
OSPI data strobe delay.	
Enumerator	
OSPI_B_DS_TIMING_DELAY_NONE	Sample without delay.
OSPI_B_DS_TIMING_DELAY_1	Delay sampling by 1 clock cell.
OSPI_B_DS_TIMING_DELAY_2	Delay sampling by 2 clock cells.
OSPI_B_DS_TIMING_DELAY_3	Delay sampling by 3 clock cells.
OSPI_B_DS_TIMING_DELAY_4	Delay sampling by 4 clock cells.
OSPI_B_DS_TIMING_DELAY_5	Delay sampling by 5 clock cells.
OSPI_B_DS_TIMING_DELAY_6	Delay sampling by 6 clock cells.
OSPI_B_DS_TIMING_DELAY_7	Delay sampling by 7 clock cells.
OSPI_B_DS_TIMING_DELAY_8	

	Delay sampling by 8 clock cells.
OSPI_B_DS_TIMING_DELAY_9	Delay sampling by 9 clock cells.
OSPI_B_DS_TIMING_DELAY_10	Delay sampling by 10 clock cells.
OSPI_B_DS_TIMING_DELAY_11	Delay sampling by 11 clock cells.
OSPI_B_DS_TIMING_DELAY_12	Delay sampling by 12 clock cells.
OSPI_B_DS_TIMING_DELAY_13	Delay sampling by 13 clock cells.
OSPI_B_DS_TIMING_DELAY_14	Delay sampling by 14 clock cells.
OSPI_B_DS_TIMING_DELAY_15	Delay sampling by 15 clock cells.
OSPI_B_DS_TIMING_DELAY_16	Delay sampling by 16 clock cells.
OSPI_B_DS_TIMING_DELAY_17	Delay sampling by 17 clock cells.
OSPI_B_DS_TIMING_DELAY_18	Delay sampling by 18 clock cells.
OSPI_B_DS_TIMING_DELAY_19	Delay sampling by 19 clock cells.
OSPI_B_DS_TIMING_DELAY_20	Delay sampling by 20 clock cells.
OSPI_B_DS_TIMING_DELAY_21	Delay sampling by 21 clock cells.
OSPI_B_DS_TIMING_DELAY_22	Delay sampling by 22 clock cells.
OSPI_B_DS_TIMING_DELAY_23	Delay sampling by 23 clock cells.
OSPI_B_DS_TIMING_DELAY_24	Delay sampling by 24 clock cells.
OSPI_B_DS_TIMING_DELAY_25	Delay sampling by 25 clock cells.
OSPI_B_DS_TIMING_DELAY_26	Delay sampling by 26 clock cells.
OSPI_B_DS_TIMING_DELAY_27	Delay sampling by 27 clock cells.
OSPI_B_DS_TIMING_DELAY_28	Delay sampling by 28 clock cells.
OSPI_B_DS_TIMING_DELAY_29	Delay sampling by 29 clock cells.
OSPI_B_DS_TIMING_DELAY_30	Delay sampling by 30 clock cells.
OSPI_B_DS_TIMING_DELAY_31	Delay sampling by 31 clock cells.

◆ ospi_b_sdr_drive_timing_t

enum ospi_b_sdr_drive_timing_t	
OSPI SDR signal drive timing.	
Enumerator	
OSPI_B_SDR_DRIVE_TIMING_BEFORE_CK	SDR is asserted 1/2 cycle before the rising-edge of CK.
OSPI_B_SDR_DRIVE_TIMING_AT_CK	SDR is asserted at the rising-edge of CK.

◆ ospi_b_ck_edge_t

enum ospi_b_ck_edge_t	
Clock edge useed to sample data in SDR mode.	
Enumerator	
OSPI_B_CK_EDGE_FALLING	Falling-edge of CK signal.
OSPI_B_CK_EDGE_RISING	Rising-edge of CK signal.

◆ ospi_b_sdr_sampling_delay_t

enum ospi_b_sdr_sampling_delay_t	
SDR sampling window delay.	
Enumerator	
OSPI_B_SDR_SAMPLING_DELAY_NONE	No sampling delay.
OSPI_B_SDR_SAMPLING_DELAY_1	Delay sampling by 1 cycle.
OSPI_B_SDR_SAMPLING_DELAY_2	Delay sampling by 2 cycles.
OSPI_B_SDR_SAMPLING_DELAY_3	Delay sampling by 3 cycles.
OSPI_B_SDR_SAMPLING_DELAY_4	Delay sampling by 4 cycles.
OSPI_B_SDR_SAMPLING_DELAY_5	Delay sampling by 5 cycles.
OSPI_B_SDR_SAMPLING_DELAY_6	Delay sampling by 6 cycles.
OSPI_B_SDR_SAMPLING_DELAY_7	Delay sampling by 7 cycles.

◆ ospi_b_ddr_sampling_extension_t

enum ospi_b_ddr_sampling_extension_t	
DDR sampling window extension.	
Enumerator	
OSPI_B_DDR_SAMPLING_EXTENSION_NONE	No sampling extension.
OSPI_B_DDR_SAMPLING_EXTENSION_1	Sampling extended by 1 cycle.
OSPI_B_DDR_SAMPLING_EXTENSION_2	Sampling extended by 2 cycles.
OSPI_B_DDR_SAMPLING_EXTENSION_3	Sampling extended by 3 cycles.
OSPI_B_DDR_SAMPLING_EXTENSION_4	Sampling extended by 4 cycles.
OSPI_B_DDR_SAMPLING_EXTENSION_5	Sampling extended by 5 cycles.
OSPI_B_DDR_SAMPLING_EXTENSION_6	Sampling extended by 6 cycles.
OSPI_B_DDR_SAMPLING_EXTENSION_7	Sampling extended by 7 cycles.

◆ ospi_b_frame_format_t

enum ospi_b_frame_format_t	
Format of data frames used for communicating with the target device.	
Enumerator	
OSPI_B_FRAME_FORMAT_STANDARD	Standard frame with command, address, and data phases.
OSPI_B_FRAME_FORMAT_XSPI_PROFILE_1	JEDEC XSPI 8D-8D-8D Profile 1.0 frame.
OSPI_B_FRAME_FORMAT_XSPI_PROFILE_2	JEDEC XSPI 8D-8D-8D Profile 2.0 frame.
OSPI_B_FRAME_FORMAT_XSPI_PROFILE_2_EXTENDED	JEDEC XSPI 8D-8D-8D Profile 2.0 extended 6-byte command-address frame, used with HyperRAM.

◆ ospi_b_latency_mode_t

enum ospi_b_latency_mode_t	
Variable or fixed latency selection for flash devices which can notify the host of requiring additional time.	
Enumerator	
OSPI_B_LATENCY_MODE_FIXED	Latency is fixed to the number of dummy cycles for the command.
OSPI_B_LATENCY_MODE_VARIABLE	The flash target signifies additional latency (2x dummy cycles) by asserting the DQS line during the address phase.

◆ ospi_b_prefetch_function_t

enum ospi_b_prefetch_function_t	
Prefetch function settings	
Enumerator	
OSPI_B_PREFETCH_FUNCTION_DISABLE	Prefetch function disable.
OSPI_B_PREFETCH_FUNCTION_ENABLE	Prefetch function enable.

◆ ospi_b_combination_function_t

enum ospi_b_combination_function_t	
Combination function settings	
Enumerator	
OSPI_B_COMBINATION_FUNCTION_DISABLE	Combination function disable.
OSPI_B_COMBINATION_FUNCTION_4BYTE	Combine up to 4 bytes.
OSPI_B_COMBINATION_FUNCTION_8BYTE	Combine up to 8 bytes.
OSPI_B_COMBINATION_FUNCTION_12BYTE	Combine up to 12 bytes.
OSPI_B_COMBINATION_FUNCTION_16BYTE	Combine up to 16 bytes.
OSPI_B_COMBINATION_FUNCTION_20BYTE	Combine up to 20 bytes.
OSPI_B_COMBINATION_FUNCTION_24BYTE	Combine up to 24 bytes.
OSPI_B_COMBINATION_FUNCTION_28BYTE	Combine up to 28 bytes.
OSPI_B_COMBINATION_FUNCTION_32BYTE	Combine up to 32 bytes.
OSPI_B_COMBINATION_FUNCTION_36BYTE	Combine up to 36 bytes.
OSPI_B_COMBINATION_FUNCTION_40BYTE	Combine up to 40 bytes.
OSPI_B_COMBINATION_FUNCTION_44BYTE	Combine up to 44 bytes.
OSPI_B_COMBINATION_FUNCTION_48BYTE	Combine up to 48 bytes.
OSPI_B_COMBINATION_FUNCTION_52BYTE	Combine up to 52 bytes.
OSPI_B_COMBINATION_FUNCTION_56BYTE	Combine up to 56 bytes.
OSPI_B_COMBINATION_FUNCTION_60BYTE	Combine up to 60 bytes.
OSPI_B_COMBINATION_FUNCTION_64BYTE	Combine up to 64 bytes.
OSPI_B_COMBINATION_FUNCTION_2BYTE	Combine up to 2 bytes.

◆ ospi_b_dotf_aes_key_length_words_t

enum ospi_b_dotf_aes_key_length_words_t
OSPI DOTF AES Key Lengths.

◆ ospi_b_dotf_aes_key_type_t

enum ospi_b_dotf_aes_key_type_t
PSPI DOTF AES Type.

◆ ospi_b_dotf_key_format_t

enum ospi_b_dotf_key_format_t
OSPI DOTF key Type.

Function Documentation

◆ R_OSPI_B_Open()

fsp_err_t R_OSPI_B_Open (spi_flash_ctrl_t *const *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the xSPI device. After the driver is open, the xSPI device can be accessed like internal flash memory.

Implements spi_flash_api_t::open.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_ctrl.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.

◆ R_OSPI_B_DirectWrite()

fsp_err_t R_OSPI_B_DirectWrite (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_B_DirectTransfer

Implements spi_flash_api_t::directWrite.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_B_DirectRead()

fsp_err_t R_OSPI_B_DirectRead (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_B_DirectTransfer.

Implements spi_flash_api_t::directRead.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_B_DirectTransfer()

fsp_err_t R_OSPI_B_DirectTransfer (spi_flash_ctrl_t * *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash.

Implements spi_flash_api_t::directTransfer.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_B_XipEnter()

fsp_err_t R_OSPI_B_XipEnter (spi_flash_ctrl_t * *p_ctrl*)

Enters XIP (execute in place) mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	XiP mode was entered successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	XiP support is not enabled.

◆ R_OSPI_B_XipExit()

fsp_err_t R_OSPI_B_XipExit (spi_flash_ctrl_t * *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	XiP mode was entered successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	XiP support is not enabled.

◆ R_OSPI_B_Write()

fsp_err_t R_OSPI_B_Write (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_SIZE	Insufficient space remaining in page or write length is not a multiple of CPU access size when not using the DMAC.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_INVALID_ADDRESS	Destination or source is not aligned to CPU access alignment when not using the DMAC.

◆ R_OSPI_B_Erase()

fsp_err_t R_OSPI_B_Erase (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, byte_count doesn't match an erase size defined in spi_flash_cfg_t, or byte_count is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ R_OSPI_B_StatusGet()

fsp_err_t R_OSPI_B_StatusGet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_B_BankSet()

fsp_err_t R_OSPI_B_BankSet (spi_flash_ctrl_t * *p_ctrl*, uint32_t *bank*)

Selects the bank to access. Use ospi_b_bank_select_t as the bank value.

Implements spi_flash_api_t::bankSet.

Return values

FSP_ERR_UNSUPPORTED	This function is unsupported.

◆ R_OSPI_B_SpiProtocolSet()

fsp_err_t R_OSPI_B_SpiProtocolSet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MPU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.

◆ R_OSPI_B_Close()

fsp_err_t R_OSPI_B_Close (spi_flash_ctrl_t * *p_ctrl*)

Close the OSPI driver module.

Implements spi_flash_api_t::close.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_B_AutoCalibrate()

fsp_err_t R_OSPI_B_AutoCalibrate (spi_flash_ctrl_t *const *p_ctrl*)

AutoCalibrate the OSPI_B DS signal.

Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_SUCCESS	Autocalibration completed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	Autocalibration support is not enabled.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.

◆ R_OSPI_B_RowLoad()

fsp_err_t R_OSPI_B_RowLoad (spi_flash_ctrl_t *const *p_ctrl*, uint32_t *row_index*)

Loads a row into the page buffer on devices which support row addressing.

Parameters

[in]	p_ctrl	Pointer to a driver handle.
	row_index	Index of the row in the OSPI device.

Return values

FSP_SUCCESS	Page transaction succeeded.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.
FSP_ERR_NOT_OPEN	Driver has not been opened.
FSP_ERR_UNSUPPORTED	Row addressing support is not enabled
FSP_ERR_DEVICE_BUSY	On going asynchronous operation or the device in in XiP mode.

◆ R_OSPI_B_RowStore()

fsp_err_t R_OSPI_B_RowStore (spi_flash_ctrl_t *const *p_ctrl*, uint32_t *row_index*)

Stores (programs) the page buffer to a row on devices which support row addressing.

Parameters

[in]	p_ctrl	Pointer to a driver handle.
	row_index	Index of the row in the OSPI device.

Return values

FSP_SUCCESS	Page transaction succeeded.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.
FSP_ERR_NOT_OPEN	Driver has not been opened.
FSP_ERR_UNSUPPORTED	Row addressing support is not enabled
FSP_ERR_DEVICE_BUSY	On going asynchronous operation or the device in in XiP mode.

◆ R_OSPI_B_DOTF_Configure()

fsp_err_t R_OSPI_B_DOTF_Configure (spi_flash_ctrl_t *const *p_ctrl*, ospi_b_dotf_cfg_t *const *p_dotf_cfg*)

Configure DOTF

Parameters

[in]	p_ctrl	Pointer to OSPI specific control structure
[in]	p_dotf_cfg	Pointer to DOTF configuration structure

Return values

FSP_SUCCESS	DOTF enabled successfully
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Key initialization failed.
FSP_ERR_CRYPTO_SCE_FAIL	Key wrapping failed.
FSP_ERR_INVALID_ARGUMENT	Invalid key type argument.
FSP_ERR_UNSUPPORTED	DOTF support is not enabled

fsp_err_t	R_QSPI_BankSet (spi_flash_ctrl_t *p_ctrl, uint32_t bank)
fsp_err_t	R_QSPI_SpiProtocolSet (spi_flash_ctrl_t *p_ctrl, spi_flash_protocol_t spi_protocol)
fsp_err_t	R_QSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)
fsp_err_t	R_QSPI_Close (spi_flash_ctrl_t *p_ctrl)

Detailed Description

Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

Features

The QSPI driver has the following key features:

- Memory mapped read access to the QSPI flash
- Programming the QSPI flash device
- Erasing the QSPI flash device
- Sending device specific commands and reading back responses
- Entering and exiting QPI mode
- Entering and exiting XIP mode
- 3 or 4 byte addressing

Configuration

Build Time Configurations for r_qspi

The following build time configurations are defined in driver/r_qspi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Support Multiple Line Program in Extended SPI Mode	• Enabled • Disabled	Disabled	If selected code for programming on multiple lines in extended SPI mode is

included in the build.

Configurations for Storage > QSPI (r_qspi)

This module can be added to the Stacks tab via New Stack > Storage > QSPI (r_qspi).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_qspi0	Module name.
SPI Protocol	• Extended SPI • QPI	Extended SPI	Select the initial SPI protocol. SPI protocol can be changed in R_QSPI_Direct().
Address Bytes	• 3 • 4 • 4 with 4-byte read code	3	Select the number of address bytes. Selecting '4 with 4-byte read code' converts the default read code determined in Read Mode to the 4-byte version. If 4-byte mode is selected without using 4-byte commands, the application must issue the EN4B command using R_QSPI_Direct().
Read Mode	• Standard Read • Fast Read • Fast Read Dual Output • Fast Read Dual I/O • Fast Read Quad Output • Fast Read Quad I/O	Fast Read Quad I/O	Select the read mode for memory mapped access.
Dummy Clocks for Fast Read	Refer to the RA Configuration tool for available options.	Default	Select the number of dummy clocks for fast read operations. Default is 6 clocks for Fast Read Quad I/O, 4 clocks for Fast Read Dual I/O, and 8 clocks for other fast read instructions including Fast Read Quad Output, Fast Read Dual Output, and Fast Read

Page Size Bytes	Must be an integer greater than 0	256	The maximum number of bytes allowed for a single write.
Command Definitions			
Page Program Command	Must be an 8-bit QSPI Page Program Command under Command Definitions	0x02	The command to program a page. If 'Support Multiple Line Program in Extended SPI Mode' is Enabled, this command must use the same number of data lines as the selected read mode.
Page Program Address Lines	• 1 • 2 • 4	1	Select the number of lines to use for the address bytes during write operations. This can be determined by referencing the datasheet for the external QSPI. It should either be 1 or match the number of data lines used for memory mapped fast read operations.
Write Enable Command	Must be an 8-bit QSPI Write Enable Command under Command Definitions	0x06	The command to enable write.
Status Command	Must be an 8-bit QSPI Status Command under Command Definitions	0x05	The command to query the status of a write or erase command.
Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Sector Erase Command	Must be an 8-bit QSPI Sector Erase Command under Command Definitions	0x20	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Block Erase Command	Must be an 8-bit QSPI Block Erase Command under Command	0xD8	The command to erase a block. Set Block Erase Size to 0 if

	Definitions		unused.
Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Block Erase 32KB Command	Must be an 8-bit QSPI Block Erase 32KB Command under Command Definitions	0x52	The command to erase a 32KB block. Set Block Erase Size to 0 if unused.
Block Erase 32KB Size	Must be an integer greater than or equal to 0	32768	The block erase 32KB size. Set Block Erase 32KB Size to 0 if Block Erase 32KB is not supported.
Chip Erase Command	Must be an 8-bit QSPI Chip Erase Command under Command Definitions	0xC7	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
XIP Enter M7-M0	Must be an 8-bit QSPI XIP Enter M7-M0 command under Command Definitions	0x20	How to set M7-M0 to enter XIP mode.
XIP Exit M7-M0	Must be an 8-bit QSPI XIP Exit M7-M0 command under Command Definitions	0xFF	How to set M7-M0 exit XIP mode.
Bus Timing			
QSPKCLK Divisor	MCU Specific Options		Select the divisor to apply to PCLK to get QSPCLK.
Minimum QSSL Deselect Cycles	Refer to the RA Configuration tool for available options.	4 QSPCLK	Define the minimum number of QSPCLK cycles for QSSL to remain high between operations.

Clock Configuration

The QSPI clock is derived from PCLKA.

Pin Configuration

The following pins are available to connect to an external QSPI device:

- QSPCLK: QSPI clock output
- QSSL: QSPI slave select
- QIO0: Data 0 I/O
- QIO1: Data 1 I/O
- QIO2: Data 2 I/O

- QIO3: Data 3 I/O

Note

It is recommended to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

QSPI Memory Mapped Access

After R_QSPI_Open() completes successfully, the QSPI flash device contents are mapped to address 0x60000000 and can be read like on-chip flash.

Limitations

Developers should be aware of the following limitations when using the QSPI driver:

- Only P305-P310 are currently supported by the J-Link driver to flash the QSPI.
- The default J-Link downloader requires the device to be in extended SPI mode (not QPI mode).

Examples

Basic Example

This is a basic example of minimal use of the QSPI in an application.

```
#define QSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[QSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .qspi_flash section to flash it during programming. */
const uint8_t g_src[QSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".qspi_flash") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .qspi_flash_code section to flash it during programming. */
void r_qspi_example_function(void) BSP_PLACE_IN_SECTION(".qspi_flash_code")
__attribute__((noinline));
void r_qspi_example_function (void)
{
 /* Add code here. */
}
void r_qspi_basic_example (void)
{
 /* Open the QSPI instance. */
 fsp_err_t err = R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
    assert(FSP_SUCCESS == err);
```

```
 /* (Optional) Send device specific initialization commands. */
    r_qspi_example_init();
 /* After R_QSPI_Open() and any required device specific intiialization, data can be
read directly from the QSPI flash. */
    memcpy(&g_dest[0], &g_src[0], QSPI_EXAMPLE_DATA_LENGTH);
 /* After R_QSPI_Open() and any required device specific intiialization, functions in
the QSPI flash can be called. */
    r_qspi_example_function();
}
```

Initialization Command Structure Example

This is an example of the types of commands that can be used to initialize the QSPI.

```
#define QSPI_COMMAND_WRITE_ENABLE (0x06U)
#define QSPI_COMMAND_WRITE_STATUS_REGISTER (0x01U)
#define QSPI_COMMAND_ENTER_QPI_MODE (0x38U)
#define QSPI_EXAMPLE_STATUS_REGISTER_1 (0x40)
#define QSPI_EXAMPLE_STATUS_REGISTER_2 (0x00)
static void r_qspi_example_init (void)
{
 /* Write status registers */
 /* Write one byte to enable writing to the status register, then deassert QSSL. */
    uint8_t   data[4];
 fsp_err_t err;
    data[0] = QSPI_COMMAND_WRITE_ENABLE;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
 /* Write 3 bytes, including the write status register command followed by values for
both status registers. In the
  * status registers, set QE to 1 and other bits to their default setting. After all
data is written, deassert the
  * QSSL line. */
    data[0] = QSPI_COMMAND_WRITE_STATUS_REGISTER;
    data[1] = QSPI_EXAMPLE_STATUS_REGISTER_1;
```

```
    data[2] = QSPI_EXAMPLE_STATUS_REGISTER_2;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 3, false);
    assert(FSP_SUCCESS == err);
 /* Wait for status register to update. */
 spi_flash_status_t status;
 do
    {
       (void) R_QSPI_StatusGet(&g_qspi0_ctrl, &status);
    } while (true == status.write_in_progress);
 /* Write one byte to enter QSPI mode, then deassert QSSL. After entering QPI mode on
the device, change the SPI
  * protocol to QPI mode on the MCU peripheral. */
    data[0] = QSPI_COMMAND_ENTER_QPI_MODE;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
    (void) R_QSPI_SpiProtocolSet(&g_qspi0_ctrl, SPI_FLASH_PROTOCOL_QPI);
}
```

Reading Status Register Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define QSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_qspi_direct_example (void)
{
 /* Read a status register. */
 /* Write one byte to read the status register. Do not deassert QSSL. */
    uint8_t   data;
 fsp_err_t err;
    data = QSPI_COMMAND_READ_STATUS_REGISTER;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data, 1, true);
    assert(FSP_SUCCESS == err);
 /* Read one byte. After all data is read, deassert the QSSL line. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data, 1);
```

```
    assert(FSP_SUCCESS == err);
 /* Status register contents are available in variable 'data'. */
}
```

Querying Device Size Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to query the device size.

```
#define QSPI_EXAMPLE_COMMAND_READ_ID (0x9F)
#define QSPI_EXAMPLE_COMMAND_READ_SFDP (0x5A)
void r_qspi_size_example (void)
{
 /* Many QSPI devices support more than one way to query the device size. Consult the
datasheet for your
  * QSPI device to determine which of these methods are supported (if any). */
    uint32_t device_size_bytes;
 fsp_err_t err;
#ifdef QSPI_EXAMPLE_COMMAND_READ_ID
 /* This example shows how to get the device size by reading the manufacturer ID. */
    uint8_t data[4];
    data[0] = QSPI_EXAMPLE_COMMAND_READ_ID;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, true);
    assert(FSP_SUCCESS == err);
 /* Read 3 bytes. The third byte often represents the size of the QSPI, where the
size of the QSPI = 2 ^ N. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data[0], 3);
    assert(FSP_SUCCESS == err);
    device_size_bytes = 1U << data[2];
 FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
#ifdef QSPI_EXAMPLE_COMMAND_READ_SFDP
 /* Read the JEDEC SFDP header to locate the JEDEC flash parameters table. Reference
JESD216 "Serial Flash
  * Discoverable Parameters (SFDP)". */
```

```
 /* Send the standard 0x5A command followed by 3 address bytes (SFDP header is at
address 0). */
    uint8_t buffer[16];
    memset(&buffer[0], 0, sizeof(buffer));
    buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
    err       = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
    assert(FSP_SUCCESS == err);
 /* Read out 16 bytes (1 dummy byte followed by 15 data bytes). */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 16);
    assert(FSP_SUCCESS == err);
 /* Read the JEDEC flash parameters to locate the memory size. */
 /* Send the standard 0x5A command followed by 3 address bytes (located in big endian
order at offset 0xC-0xE).
  * These bytes are accessed at 0xD-0xF because the first byte read is a dummy byte.
*/
    buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
    buffer[1] = buffer[0xF];
    buffer[2] = buffer[0xE];
    buffer[3] = buffer[0xD];
    err       = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
    assert(FSP_SUCCESS == err);
 /* Read out 9 bytes (1 dummy byte followed by 8 data bytes). */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 9);
    assert(FSP_SUCCESS == err);
 /* Read the memory density (located in big endian order at offset 0x4-0x7). These
bytes are accessed at 0x5-0x8
  * because the first byte read is a dummy byte. */
    uint32_t memory_density = (uint32_t) ((buffer[8] << 24) | (buffer[7] << 16) |
(buffer[6] << 8) | buffer[5]);
 if ((1U << 31) & memory_density)
    {
 /* For densities 4 gigabits and above, bit-31 is set to 1b. The field 30:0 defines
'N' where the density is
  * computed as 2^N bits (N must be >= 32). This code subtracts 3 from N to divide by
```

```
8 to get the size in
  * bytes instead of bits. */
       device_size_bytes = 1U << ((memory_density & ~(1U << 31)) - 3U);
    }
 else
    {
 /* For densities 2 gigabits or less, bit-31 is set to 0b. The field 30:0 defines the
size in bits. This
  * code divides the memory density by 8 to get the size in bytes instead of bits. */
       device_size_bytes = (memory_density / 8) + 1;
    }
 FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
}
```

Data Structures

struct	qspi_instance_ctrl_t

Enumerations

enum	qspi_qssl_min_high_level_t
enum	qspi_qspclk_div_t

Data Structure Documentation

◆ qspi_instance_ctrl_t

struct qspi_instance_ctrl_t
Instance control block. DO NOT INITIALIZE. Initialization occurs when spi_flash_api_t::open is called

Enumeration Type Documentation

◆ qspi_qssl_min_high_level_t

enum qspi_qssl_min_high_level_t	
Enumerator	
QSPI_QSSL_MIN_HIGH_LEVEL_1_QSPCLK	QSSL deselected for at least 1 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_2_QSPCLK	QSSL deselected for at least 2 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_3_QSPCLK	QSSL deselected for at least 3 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_4_QSPCLK	QSSL deselected for at least 4 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_5_QSPCLK	QSSL deselected for at least 5 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_6_QSPCLK	QSSL deselected for at least 6 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_7_QSPCLK	QSSL deselected for at least 7 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_8_QSPCLK	QSSL deselected for at least 8 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_9_QSPCLK	QSSL deselected for at least 9 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_10_QSPCLK	QSSL deselected for at least 10 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_11_QSPCLK	QSSL deselected for at least 11 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_12_QSPCLK	QSSL deselected for at least 12 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_13_QSPCLK	QSSL deselected for at least 13 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_14_QSPCLK	QSSL deselected for at least 14 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_15_QSPCLK	QSSL deselected for at least 15 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_16_QSPCLK	QSSL deselected for at least 16 QSPCLK.

◆ qspi_qspclk_div_t

enum qspi_qspclk_div_t	
Enumerator	
QSPI_QSPCLK_DIV_2	QSPCLK = PCLK / 2.
QSPI_QSPCLK_DIV_3	QSPCLK = PCLK / 3.
QSPI_QSPCLK_DIV_4	QSPCLK = PCLK / 4.
QSPI_QSPCLK_DIV_5	QSPCLK = PCLK / 5.
QSPI_QSPCLK_DIV_6	QSPCLK = PCLK / 6.

QSPI_QSPCLK_DIV_28	

	QSPCLK = PCLK / 28.
QSPI_QSPCLK_DIV_30	QSPCLK = PCLK / 30.
QSPI_QSPCLK_DIV_32	QSPCLK = PCLK / 32.
QSPI_QSPCLK_DIV_34	QSPCLK = PCLK / 34.
QSPI_QSPCLK_DIV_36	QSPCLK = PCLK / 36.
QSPI_QSPCLK_DIV_38	QSPCLK = PCLK / 38.
QSPI_QSPCLK_DIV_40	QSPCLK = PCLK / 40.
QSPI_QSPCLK_DIV_42	QSPCLK = PCLK / 42.
QSPI_QSPCLK_DIV_44	QSPCLK = PCLK / 44.
QSPI_QSPCLK_DIV_46	QSPCLK = PCLK / 46.
QSPI_QSPCLK_DIV_48	QSPCLK = PCLK / 48.

Function Documentation

◆ R_QSPI_Open()

fsp_err_t R_QSPI_Open (spi_flash_ctrl_t * *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the QSPI driver module. After the driver is open, the QSPI can be accessed like internal flash memory starting at address 0x60000000.

Implements spi_flash_api_t::open.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_instance_ctrl.

◆ R_QSPI_DirectWrite()

fsp_err_t R_QSPI_DirectWrite (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the QSPI.

Implements spi_flash_api_t::directWrite.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_DirectRead()

fsp_err_t R_QSPI_DirectRead (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the QSPI. This API can only be called after R_QSPI_DirectWrite with read_after_write set to true.

Implements spi_flash_api_t::directRead.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function must be called after R_QSPI_DirectWrite with read_after_write set to true.

◆ R_QSPI_DirectTransfer()

fsp_err_t R_QSPI_DirectTransfer (spi_flash_ctrl_t * *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash/OctaRAM device. Unsupported by QSPI.

Implements spi_flash_api_t::directTransfer.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI.

◆ R_QSPI_XipEnter()

fsp_err_t R_QSPI_XipEnter (spi_flash_ctrl_t * *p_ctrl*)

Enters XIP (execute in place) mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_XipExit()

fsp_err_t R_QSPI_XipExit (spi_flash_ctrl_t * *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_Write()

fsp_err_t R_QSPI_Write (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_Erase()

fsp_err_t R_QSPI_Erase (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, or byte_count doesn't match an erase size defined in spi_flash_cfg_t, or device is in XIP mode.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_StatusGet()

fsp_err_t R_QSPI_StatusGet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.

◆ R_QSPI_BankSet()

fsp_err_t R_QSPI_BankSet (spi_flash_ctrl_t * *p_ctrl*, uint32_t *bank*)

Selects the bank to access. A bank is a 64MB sliding access window into the QSPI device flash memory space. To access chip address 0x4000000, select bank 1, then read from internal flash address 0x60000000. To access chip address 0x8001000, select bank 2, then read from internal flash address 0x60001000.

This function is not required for memory devices less than or equal to 512 Mb (64MB).

Implements spi_flash_api_t::bankSet.

Return values

FSP_SUCCESS	Bank successfully selected.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_SpiProtocolSet()

fsp_err_t R_QSPI_SpiProtocolSet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid SPI protocol requested.

◆ R_QSPI_AutoCalibrate()

fsp_err_t R_QSPI_AutoCalibrate (spi_flash_ctrl_t * *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern. Unsupported by QSPI. Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI

◆ R_QSPI_Close()

fsp_err_t R_QSPI_Close (spi_flash_ctrl_t * *p_ctrl*)

Close the QSPI driver module.

Implements spi_flash_api_t::close.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

Detailed Description

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.

Overview

Features

- Supports the following memory devices: SDSC (SD Standard Capacity), SDHC (SD High Capacity), SDXC (SD Extended Capacity) and eMMC (embedded Multi Media Card)
    - Supports reading, writing and erasing SD memory devices
    - Supports 1, 4 or 8-bit data bus (8-bit bus is supported for eMMC only)
    - Supports detection of device write protection (SD cards only)
    - Supports high speed mode
- Automatically configures the clock to the maximum clock rate supported by both host (MCU) and device
- Supports hardware acceleration using DMAC or DTC
- Supports callback notification when an operation completes or an error occurs

Configuration

Build Time Configurations for r_sdhi

The following build time configurations are defined in fsp_cfg/r_sdhi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Access Support	• Disabled • Enabled	Enabled	If enabled, code for supporting buffers that are not aligned on a 4-byte boundary is included in the build. Only disable this if all buffers passed to the driver are 4-byte aligned.
SD Support	• Disabled • Enabled	Enabled	If selected code for SD card support is included in the build.
eMMC Support	• Disabled • Enabled	Disabled	If selected code for eMMC device support is included in the build.

Configurations for Storage > SD/MMC (r_sdhi)

This module can be added to the Stacks tab via New Stack > Storage > SD/MMC (r_sdhi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_sdmmc0	Module name.

Channel	Value must be a non-negative integer	0	Select the channel.
Bus Width	MCU Specific Options		Select the bus width.
Card Detection	• Not Used • CD Pin	CD Pin	Select the card detection method.
Write Protection	• Not Used • WP Pin	WP Pin	Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Access Interrupt Priority	MCU Specific Options		Select the access interrupt priority.
Card Interrupt Priority	MCU Specific Options		Select the card interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Interrupt Configurations:

The following interrupts are required to use the r_sdhi module:

Using SD/MMC with DTC:

- Access Interrupt
- DTC Interrupt

Using SD/MMC with DMAC:

- Access Interrupt
- DMAC Interrupt (in DMAC instance)

The Card interrupt is optional and only available on MCU packages that have the SDnCD pin (n = channel number).

Clock Configuration

The SDMMC MCU peripheral (SDHI) uses the PCLKA for its clock source. The SDMMC driver selects the optimal built-in divider based on the PCLKA frequency and the maximum clock rate allowed by the device obtained at media initialization.

Pin Configuration

The SDMMC driver supports the following pins (n = channel number):

- SDnCLK
- SDnCMD
- SDnDAT0
- SDnDAT1
- SDnDAT2
- SDnDAT3
- SDnDAT4 (not available on all MCUs)
- SDnDAT5 (not available on all MCUs)
- SDnDAT6 (not available on all MCUs)
- SDnDAT7 (not available on all MCUs)
- SDnCD (not available on all MCUs)
- SDnWP

The drive capacity for each pin should be set to "Medium" or "High" for most hardware designs. This can be configured in the **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection -> Ports.

Usage Notes

Card Detection

When Card Detection is configured to "CD Pin" in the RA Configuration editor, interrupt flags are cleared and card detection is enabled during R_SDHI_Open().

R_SDHI_StatusGet() can be called to retrieve the current status of the card (including whether a card is present). If the Card Interrupt Priority is enabled, a callback is called when a card is inserted or removed.

If a card is removed and reinserted, R_SDHI_MediaInit() must be called before reading from the card or writing to the card.

Note

R_SDHI_StatusGet() should be used to initially determine the card state after opening the interface.

DMA Request Interrupt Priority

When data transfers are not 4-byte aligned or not a multiple of 4 bytes, a software copy of the block size (up to 512 bytes) is done in the DMA Request interrupt. This blocks all other interrupts that are a lower or equal priority to the access interrupt until the software copy is complete.

Timing Notes for R_SDHI_MediaInit

The R_SDHI_MediaInit() API completes the entire device identification and configuration process. This involves several command-response cycles at a bus width of 1 bit and a bus speed of 400 kHz or less.

Limitations

Developers should be aware of the following limitations when using the SDHI:

Blocking Calls

The following functions block execution until the response is received for at least one command:

- R_SDHI_MediaInit
- R_SDHI_Erase

Once the function returns the status of the operation can be determined via R_SDHI_StatusGet or through receipt of a callback.

Note

Due to the variability in clocking configurations it is recommended to determine blocking delays experimentally on the target system.

Data Alignment and Size

Data transfers should be 4-byte aligned and a multiple of 4 bytes in size whenever possible. This recommendation applies to the read(), write(), readIoExt(), and writeIoExt() APIs. When data transfers are 4-byte aligned and a multiple of 4-bytes, the r_sdhi driver is zero copy and takes full advantage of hardware acceleration by the DMAC or DTC. When data transfers are not 4-byte aligned or not a multiple of 4 bytes an extra CPU interrupt is required for each block transferred and a software copy is used to move data to the destination buffer.

Examples

Basic Example

This is a basic example of minimal use of the r_sdhi in an application.

```
uint8_t g_dest[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void r_sdhi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < SDHI_MAX_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the SDHI driver. */
 fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    assert(FSP_SUCCESS == err);
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
```

```
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
 /* Wait for transfer. */
    }
    err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
 /* Wait for transfer. */
    }
}
/* The callback is called when a transfer completes. */
void r_sdhi_example_callback (sdmmc_callback_args_t * p_args)
{
 if (SDMMC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = 1;
    }
}
```

Card Detection Example

This is an example of using SDHI when the card may not be plugged in. The card detection interrupt must be enabled to use this example.

```
bool g_card_inserted = false;
void r_sdhi_card_detect_example (void)
{
```

```
/* Open the SDHI driver. This enables the card detection interrupt. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Check if card is inserted. */
sdmmc_status_t status;
   err = R_SDHI_StatusGet(&g_sdmmc0_ctrl, &status);
   assert(FSP_SUCCESS == err);
if (!status.card_inserted)
   {
while (!g_card_inserted)
     {
/* Wait for a card insertion interrupt. */
     }
   }
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card after card insertion is detected. */
   err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
   assert(FSP_SUCCESS == err);
}
/* The callback is called when a card detection event occurs if the card detection
interrupt is enabled. */
void r_sdhi_card_detect_example_callback (sdmmc_callback_args_t * p_args)
{
if (SDMMC_EVENT_CARD_INSERTED == p_args->event)
   {
      g_card_inserted = true;
   }
if (SDMMC_EVENT_CARD_REMOVED == p_args->event)
   {
```

```
        g_card_inserted = false;
    }
}
```

Function Documentation

◆ R_SDHI_Open()

fsp_err_t R_SDHI_Open (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_cfg_t const *const *p_cfg*)

Opens the driver. Resets SDHI, and enables card detection interrupts if card detection is enabled. R_SDHI_MediaInit must be called after this function before any other functions can be used.

Implements sdmmc_api_t::open().

Example:

```
/* Open the SDHI driver. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
```

Return values

FSP_SUCCESS	Module is now open.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
FSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU.

◆ R_SDHI_MediaInit()

fsp_err_t R_SDHI_MediaInit (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_device_t *const *p_device*)

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements sdmmc_api_t::mediaInit().

Example:

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
```

Return values

FSP_SUCCESS	Module is now ready for read/write access.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_INIT_FAILED	Device was not identified as an SD card or eMMC device.
FSP_ERR_RESPONSE	Device responded with an error.
FSP_ERR_TIMEOUT	Device did not respond.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_Read()

fsp_err_t R_SDHI_Read (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements sdmmc_api_t::read().

A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the read data is available.

Example:

```
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
```

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.

◆ R_SDHI_Write()

fsp_err_t R_SDHI_Write (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements sdmmc_api_t::write().

A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the all data has been written and the device is no longer holding DAT0 low to indicate it is busy.

Example:

```
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
```

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ R_SDHI_ReadIo()

fsp_err_t R_SDHI_ReadIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*)

The Read function reads a one byte register from an SDIO card. Implements sdmmc_api_t::readIo().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_WriteIo()

fsp_err_t R_SDHI_WriteIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*, sdmmc_io_write_mode_t const *read_after_write*)

Writes a one byte register to an SDIO card. Implements sdmmc_api_t::writeIo().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_ReadIoExt()

fsp_err_t R_SDHI_ReadIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *function*, uint32_t const *address*, uint32_t *const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Reads data from an SDIO card function. Implements sdmmc_api_t::readIoExt().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_WriteIoExt()

fsp_err_t R_SDHI_WriteIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *function*, uint32_t const *address*, uint32_t const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Writes data to an SDIO card function. Implements sdmmc_api_t::writeIoExt().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_IoIntEnable()

fsp_err_t R_SDHI_IoIntEnable (sdmmc_ctrl_t *const *p_api_ctrl*, bool *enable*)

Enables or disables the SDIO Interrupt. Implements sdmmc_api_t::ioIntEnable().

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	SDIO is not supported.

◆ R_SDHI_StatusGet()

fsp_err_t R_SDHI_StatusGet (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_status_t *const *p_status*)

Provides driver status. Implements sdmmc_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

◆ R_SDHI_Erase()

fsp_err_t R_SDHI_Erase (sdmmc_ctrl_t *const *p_api_ctrl*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Erases sectors of an SD card or eMMC device. Implements sdmmc_api_t::erase().

This function blocks until the erase command is sent. Poll the status to determine when erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	A required pointer is NULL or an argument is invalid.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_RESPONSE	Device responded with an error.
FSP_ERR_TIMEOUT	Device did not respond.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_CallbackSet()

fsp_err_t R_SDHI_CallbackSet (sdmmc_ctrl_t *const *p_api_ctrl*, void(*)(sdmmc_callback_args_t *) *p_callback*, void *const *p_context*, sdmmc_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements sdmmc_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SDHI_Close()

fsp_err_t R_SDHI_Close (sdmmc_ctrl_t *const *p_api_ctrl*)
Closes an open SD/MMC device. Implements sdmmc_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

fsp_err_t RM_VEE_FLASH_Close (rm_vee_ctrl_t *const p_api_ctrl)

Detailed Description

Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

Overview

This VEE module emulates basic EEPROM capabilities. Support is provided for reading and writing both common records and reference data (originally programmed during product assembly or test). A count of the number of segments erased throughout the lifetime of the application is maintained and can be accessed at any time. Wear leveling is handled automatically by the driver.

Features

- Writing and reading user defined records of any length to data flash.
- Wear leveling is handled automatically.
- Reference data such as calibration data programmed at assembly or test time is preserved.
- Reference data can be updated at run time.
- Fault resilient design.

Data Flash Segmentation

Wear leveling is handled by changing the location in the data flash where a record is stored every time that it is updated. This change in physical location of the record is transparent to the user. Any time an update for a specific record ID is written, it is written to the next unused location in data flash and its location is stored in RAM for quick look-up later. When required, only the most recent version of these records is automatically copied to the next blank segment in data flash. The data flash area is divided into a number of equal-size segments. There is only one segment active at a time. A segment contains two areas- the record area (which is the vast majority of the segment) and the reference data area which contains optional data typically programmed during assembly or final test. Records and updated reference data are written to this segment until one of the two areas becomes full. The record area must be able to hold at least one of every record ID possible and still have space left over for record updates.

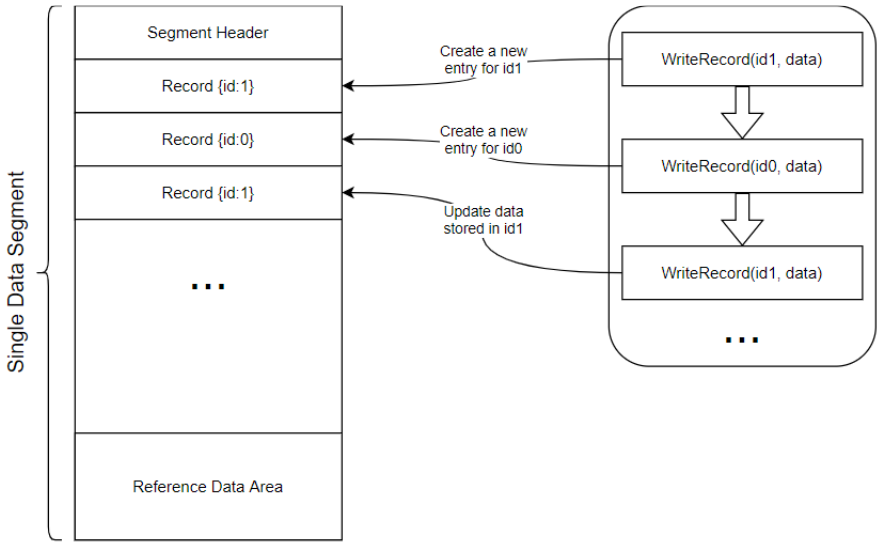

Figure 330: Segment Data Format

When a segment does not have sufficient space for additional records or updated reference data, a Refresh occurs. This process copies the most recent record for each ID as well as the latest version of reference data (if any) to the next segment. The very first time VEE runs on an MCU, it marks the last segment as active whether there is reference data configured or not. The end of VEE data flash area is used to provide an easily identified physical flash address that can be used while programming reference data without requiring Virtual EEPROM middleware.

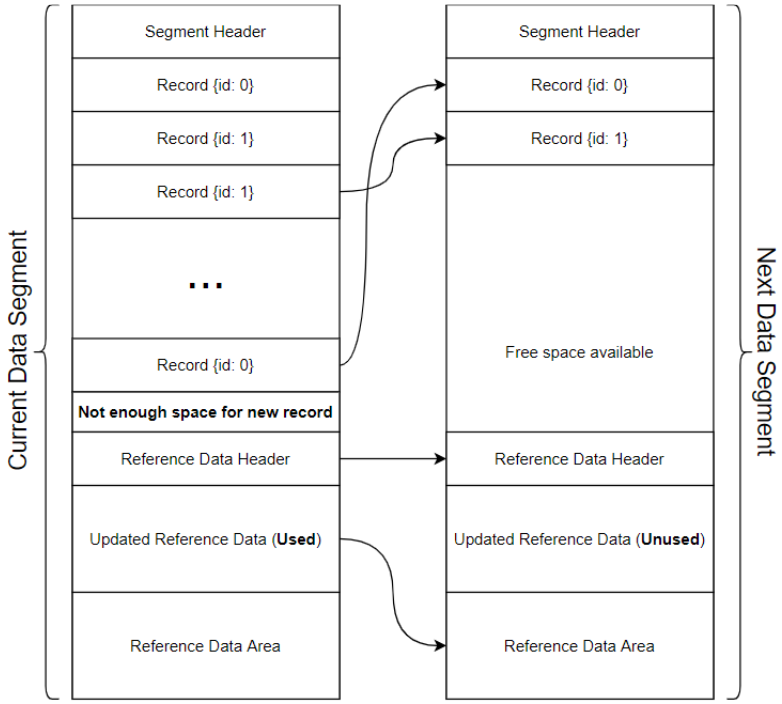

Figure 331: Refresh Operation

Record Format

Each record begins with a header that contains the record size, followed by the data, and the trailer.

The trailer contains a validation code which is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the record data passed to the driver. Padding is added between the end of user data and the trailer to ensure the trailer is aligned properly.

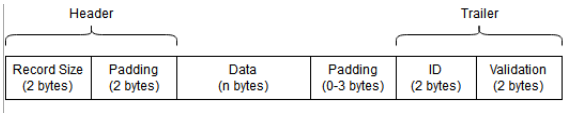

Figure 332: Record Format

Reference Data Area

VEE can be configured for the presence of reference data. The original programmed reference data must be located at the end of the VEE data flash area. An area of equal size is reserved below this in case updated reference data becomes available later. Below that is a header which indicates whether the update area has been written to.

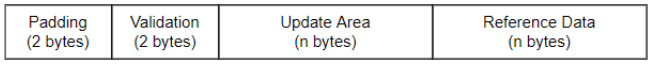

Figure 333: Reference Data Area Format

Just as with records, the validation code is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the updated reference data passed to the driver.

Fault Tolerance

The Virtual EEPROM has a fault tolerant design. If for any reason an operation fails before it is completed the next time the module is opened a refresh will occur. Any corrupted data will be discarded.

Configuration

Build Time Configurations for rm_vee_flash

The following build time configurations are defined in fsp_cfg/rm_vee_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Data Support	• Enabled • Disabled	Disabled	Support writing reference data to the end of the segment.
Refresh Buffer Size	Value must be an integer greater than 0 and a multiple of 4 bytes.	32	The size of the internal buffer used to copying data from one flash segment to another

			during a refresh operation. This is required because data flash to data flash transfers are not supported by the hardware.

Configurations for Storage > Virtual EEPROM on Flash (rm_vee_flash)

This module can be added to the Stacks tab via New Stack > Storage > Virtual EEPROM on Flash (rm_vee_flash). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_vee0	Module name.
Record Max ID	Value must be an integer.	16	Set this value to the highest record ID in use.
Number of Segments	Value must be an integer.	2	Set value to number of segments desired in data flash (minimum 2). The fewer the segments, the fewer refreshes occur, but the longer refreshes take to complete (erase time).
Start Address	Manual Entry	BSP_FEATURE_FLASH_DATA_FLASH_START	Start address of the flash area used by Virtual EEPROM.
Total Size	Manual Entry	BSP_DATA_FLASH_SIZE_BYTES	The total size (In bytes) of the flash area used by Virtual EEPROM.
Reference Data Size	Value must be an integer.	0	The size of the reference area (In bytes) used by Virtual EEPROM.
Callback	Name must be a valid C symbol	vee_callback	A user callback function can be provided. If this callback function is provided, it will be called from the flash interrupt service routine (ISR).

Clock Configuration

There is no clock configuration for the RM_VEE_FLASH module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

A refresh buffer is required to copy data between segments. Data flash cannot be simultaneously read from and written to. Data will be temporarily copied into RAM during refresh operations.

Examples

Basic Example

This is a basic example of minimal use of the RM_VEE_FLASH module in an application.

```
volatile bool callback_called = false;
/* Record ID to use for storing pressure data. */
#define ID_PRESSURE (0U)
/* Example data structure. */
typedef struct st_pressure
{
    uint32_t timestamp;
    uint16_t low;
    uint16_t average;
    uint16_t high;
} pressure_t;
void rm_vee_example ()
{
 /* Open the Virtual EEPROM Module. */
 fsp_err_t err = RM_VEE_FLASH_Open(&g_vee_ctrl, &g_vee_cfg);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Read pressure data from external sensor. */
    pressure_t pressure_data;
    get_pressure_data(&pressure_data);
 /* Write the pressure data to a Virtual EEPROM Record. */
```

```
    err = RM_VEE_FLASH_RecordWrite(&g_vee_ctrl, ID_PRESSURE, (uint8_t *)
&pressure_data, sizeof(pressure_t));
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Wait for the Virtual EEPROM callback to indicate it finished writing data. */
 while (false == callback_called)
    {
       ;
    }
 /* Get a pointer to the record that is stored in data flash. */
    uint32_t    length;
    pressure_t * p_pressure_data;
    err = RM_VEE_FLASH_RecordPtrGet(&g_vee_ctrl, ID_PRESSURE, (uint8_t **)
&p_pressure_data, &length);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Close the Virtual EEPROM Module. */
    err = RM_VEE_FLASH_Close(&g_vee_ctrl);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
}
void rm_vee_tests_callback (rm_vee_callback_args_t * p_args)
{
    callback_called = true;
 FSP_PARAMETER_NOT_USED(p_args);
}
```

Data Structures

struct	rm_vee_flash_cfg_t

struct rm_vee_flash_instance_ctrl_t

Data Structure Documentation

◆ rm_vee_flash_cfg_t

struct rm_vee_flash_cfg_t		
User configuration structure, used in open function		
Data Fields		
flash_instance_t const *	p_flash	Pointer to a flash instance.

◆ rm_vee_flash_instance_ctrl_t

struct rm_vee_flash_instance_ctrl_t
Instance control block. This is private to the FSP and should not be used or modified by the application.

Function Documentation

◆ RM_VEE_FLASH_Open()

fsp_err_t RM_VEE_FLASH_Open (rm_vee_ctrl_t *const *p_api_ctrl*, rm_vee_cfg_t const *const *p_cfg*)

Open the RM_VEE_FLASH driver module

Implements rm_vee_api_t::open

Initializes the driver's internal structures and opens the Flash driver. The Flash driver must be closed prior to opening VEE. The error code FSP_SUCCESS_RECOVERY indicates that VEE detected corrupted data; most likely due to a power loss during a data flash write or erase. In these cases, an automatic internal Refresh is performed and the partially written data is lost.

Return values

FSP_SUCCESS	Successful. FSP_SUCCESS_RECOVERY changed to FSP_SUCCESS
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_ALREADY_OPEN	This function has already been called.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Interrupts disabled outside of VEE
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.
FSP_ERR_INVALID_ARGUMENT	The supplied configuration is invalid.

◆ RM_VEE_FLASH_RecordWrite()

fsp_err_t RM_VEE_FLASH_RecordWrite (rm_vee_ctrl_t *const *p_api_ctrl*, uint32_t const *rec_id*, uint8_t const *const *p_rec_data*, uint32_t const *num_bytes*)

Writes a record to data flash.

Implements rm_vee_api_t::recordWrite

This function writes num_bytes of data pointed to by p_rec_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes. This includes exiting the calling function when the data buffer is a local variable (stack may be used by another function and corrupt the data buffer contents).

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_ARGUMENT	An argument contains an illegal value.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_RefDataWrite()

fsp_err_t RM_VEE_FLASH_RefDataWrite (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_ref_data*)

Writes new Reference data to the reference update area.

Implements rm_vee_api_t::refDataWrite

This function writes VEE_CFG_REF_DATA_SIZE bytes pointed to by p_ref_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes.

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_RecordPtrGet()

fsp_err_t RM_VEE_FLASH_RecordPtrGet (rm_vee_ctrl_t *const *p_api_ctrl*, uint32_t const *rec_id*, uint8_t **const *pp_rec_data*, uint32_t *const *p_num_bytes*)

Gets a pointer to the most recent record data.

Implements rm_vee_api_t::recordPtrGet

This function sets the argument pointer to the most recent version of the record data in flash. Flash cannot be accessed for reading and writing at the same time. Therefore, reading the data at p_ref_data must be completed prior to initiating any type of Flash write.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	p_ref_data is NULL.
FSP_ERR_INVALID_ARGUMENT	Record data not configured.
FSP_ERR_NOT_FOUND	The record associated with the requested ID could not be found.

◆ RM_VEE_FLASH_RefDataPtrGet()

fsp_err_t RM_VEE_FLASH_RefDataPtrGet (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t **const *pp_ref_data*)

Gets a pointer to the most recent reference data.

Implements rm_vee_api_t::recordPtrGet

This function sets the argument pointer to the most recent version of the reference data in flash. Flash cannot be accessed for reading and writing at the same time.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_FOUND	No reference data was found.

◆ RM_VEE_FLASH_Refresh()

fsp_err_t RM_VEE_FLASH_Refresh (rm_vee_ctrl_t *const *p_api_ctrl*)

Manually start a refresh operation

Implements rm_vee_api_t::refresh

This function is used to start a segment Refresh at any time. The Refresh process by default occurs automatically when no more record or reference data space is available and a Write is requested. However, the app may desire to force a refresh when it knows it is running low on space and large amounts of data are about to be recorded.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_Format()

fsp_err_t RM_VEE_FLASH_Format (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_ref_data*)

Start a manual format operation.

Implements rm_vee_api_t::format

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_CallbackSet()

fsp_err_t RM_VEE_FLASH_CallbackSet (rm_vee_ctrl_t *const *p_api_ctrl*, void(*)(rm_vee_callback_args_t *) *p_callback*, void *const *p_context*, rm_vee_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure.

Implements rm_vee_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_VEE_FLASH_StatusGet()

fsp_err_t RM_VEE_FLASH_StatusGet (rm_vee_ctrl_t *const *p_api_ctrl*, rm_vee_status_t *const *p_status*)

Get the current status of the driver.

Implements rm_vee_api_t::statusGet

This command is typically used to verify that the last Write or Refresh command has completed before attempting to perform another API call.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

◆ RM_VEE_FLASH_Close()

fsp_err_t RM_VEE_FLASH_Close (rm_vee_ctrl_t *const *p_api_ctrl*)

Closes the Flash driver and VEE driver.

Implements rm_vee_api_t::close

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

5.2.18 System

Modules

Detailed Description

System Modules.

Modules

Clock Generation Circuit (r_cgc)

Driver for the CGC peripheral on RA MCUs. This module implements the CGC Interface.

	Event Link Controller (r_elc) Driver for the ELC peripheral on RA MCUs. This module implements the ELC Interface.
	I/O Port (r_ioport) Driver for the I/O Ports peripheral on RA MCUs. This module implements the I/O Port Interface.
	Inter-Processor Communication (r_ipc) Driver for the IPC peripheral on RA MCUs. This module implements the IPC Interface.

5.2.18.1 Clock Generation Circuit (r_cgc)

Modules » System

Functions

fsp_err_t	R_CGC_Open (cgc_ctrl_t *const p_ctrl, cgc_cfg_t const *const p_cfg)

fsp_err_t	R_CGC_Close (cgc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CGC peripheral on RA MCUs. This module implements the CGC Interface.

Note

This module is not required for the initial clock configuration. Initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor. The initial clock settings are applied by the BSP during the startup process before main.

Overview

Features

The CGC module supports runtime modifications of clock settings. Key features include the following:

- Supports changing the system clock source to any of the following options (provided they are supported on the MCU):
  - High-speed on-chip oscillator (HOCO)
  - Middle-speed on-chip oscillator (MOCO)
  - Low-speed on-chip oscillator (LOCO)
  - Main oscillator (external resonator or external clock input frequency)
  - Sub-clock oscillator (external resonator)
  - PLL/PLL2 (not available on all MCUs)
- When the system core clock frequency changes, the following things are updated:
  - The CMSIS standard global variable SystemCoreClock is updated to reflect the new clock frequency.
  - Wait states for ROM and RAM are adjusted to the minimum supported value for the new clock frequency.
  - The operating power control mode is updated to the minimum supported value for the new clock settings.
- Supports starting or stopping any of the system clock sources
- Supports changing dividers for the internal clocks
- Supports the oscillation stop detection feature

Internal Clocks

The RA microcontrollers have up to seven internal clocks. Not all internal clocks exist on all MCUs. Each clock domain has its own divider that can be updated in R_CGC_SystemClockSet(). The dividers are subject to constraints described in the footnote of the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual.

The internal clocks include:

- System clock (ICLK): core clock used for CPU, flash, internal SRAM, DTC, and DMAC
- PCLKA/PCLKB/PCLKC/PCLKD: Peripheral clocks, refer to the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual to see which peripherals are controlled by which clocks.
- FCLK: Clock source for reading data flash and for programming/erasure of both code and

data flash.
- BCLK: External bus clock

Configuration

Note

*The initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor.*
There is a configuration to enable the HOCO on reset in the OFS1 settings on the BSP tab.
The following clock related settings are configurable in the RA Common section on the BSP tab:
- *Main Oscillator Wait Time*
- *Main Oscillator Clock Source (external oscillator or crystal/resonator)*
- *Subclock Populated*
- *Subclock Drive*
- *Subclock Stabilization Time (ms)*

The default stabilization times are determined based on development boards provided by Renesas, but are generally valid for most designs. Depending on the target board hardware configuration and requirements these values may need to be adjusted for reliability or startup speed.

Build Time Configurations for r_cgc

The following build time configurations are defined in fsp_cfg/r_cgc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Clock Generation Circuit (r_cgc)

This module can be added to the Stacks tab via New Stack > System > Clock Generation Circuit (r_cgc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Sub Clock Oscillation Stop Detection Settings			
Enable sub clock oscillator stop detection via the SOSC_STOP interrupt	• Enabled • Disabled	Disabled	Oscillation Stop Detection for Sub Clock enabled.
Sub Clock Oscillation Stop Detection Time	Manual Entry	0	These bits specify the oscillation stop detection time. It is detected that oscillation has stopped when oscillation has been stopped for (A-2) to (A+1) clock cycles, where A refers to the time specified by these bits. Oscillation stop detection time = Low-

			speed on-chip oscillator clock (LOCO) cycle x ((value of OSDCCMP) + 1).
Sub Clock Oscillation Stop Detection Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the Sub Clock Oscillation Stop Detection interrupt.
Main Oscillation Stop Detection Settings			
Enable main clock oscillator stop detection via the MOSC_STOP interrupt	• Enabled • Disabled	Disabled	Oscillation Stop Detection for Main Clock enabled.
Main Oscillation Stop Detection Time	Manual Entry	0	These bits specify the oscillation stop detection time. It is detected that oscillation has stopped when oscillation has been stopped for (A - 2) to (A + 1) clock cycles, where A refers to the time specified by these bits. Oscillation stop detection time = High speed on-chip oscillator clock (HOCO) cycle x ((value of OSDCCMP) + 1).
Main Oscillation Stop Detection Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the Main Oscillation Stop Detection interrupt.
Oscillator Stop Detection Settings			
Clock Switch Enable for Oscillation Stop Detected of SDADCCLK	• Enabled • Disabled	Disabled	The OSTDCSE bit specifies the source clock of the 24-bit Sigma-delta A/D Converter Clock switched to HOCO when oscillation stop detected.
Name	Name must be a valid C symbol	g_cgc0	Module name.
Enable main oscillator stop detection via the NMI interrupt	• Enabled • Disabled	Enabled	Oscillation Stop Detection for System Clock enabled.

Oscillation Stop Detection Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if oscillation stop detection for System Clock/Main Oscillation/Sub Clock Oscillation is used. If this callback function is provided, it is called from the NMI handler if the main oscillator stops.

Clock Configuration

This module is used to configure the system clocks. There are no module specific clock configurations required to use it.

Pin Configuration

The CGC module controls the output of the CLOCKOUT signal.

If an external oscillator is used the XTAL and EXTAL pins must be configured accordingly. When running from an on chip oscillator there is no requirement for the main clock external oscillator. In this case, the XTAL and EXTAL pins can be set to a different function in the RA Configuration editor.

The functionality of the subclock external oscillator pins XCIN and XCOUT is fixed.

Usage Notes

Oscillation Stop Detection

CGC driver supports following oscillation stop detection function.

NMI Interrupt

The CGC driver uses the NMI for oscillation stop detection of the main oscillator after R_CGC_OscStopDetectEnable is called. The NMI is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during R_CGC_Open() is called.

Main Oscillator Stop Detection Interrupt

A main clock oscillation stop detection interrupt (MOSTD_STOP) is generated when the Oscillation Stop Detection for Main Clock is enabled. The main oscillation stop detection interrupt is a maskable interrupt. When the MOSTD_STOP is triggered, the callback function registered during R_CGC_Open() is called.

Subclk Oscillator Stop Detection Interrupt

A sub clock oscillation stop detection interrupt (SOSC_STOP) is generated when the Oscillation Stop Detection for Sub Clock is enabled. The sub clock oscillation stop detection interrupt is a maskable interrupt. When the SOSC_STOP is triggered, the callback function registered during R_CGC_Open() is called.

ADC Clock Switching

When Clock Switch Enable for Oscillation Stop Detected is set.

- When MOSC stop is detected when MOSC is selected for SDADCCLK, SDADCCLK is switched to HOCO.
- When SOSC stop is detected when PLL is selected for SDADCCLK, SDADCCLK is switched to HOCO.

Starting or Stopping the Subclock

If the Subclock Populated property is set to Populated on the BSP configuration tab, then the subclock is started in the BSP startup routine. Otherwise, it is stopped in the BSP startup routine. Starting and stopping the subclock at runtime is not recommended since the stabilization requirements typically negate the negligible power savings.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take up to several seconds to stabilize. RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. In this case the default wait time is 1000ms (1 second). When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation. Because there is no hardware stabilization status bit for the subclock R_CGC_ClockCheck cannot be used to optimize this wait.

Changing the subclock state during R_CGC_ClocksCfg() is not supported.

Low Power Operation

If "Use Low Voltage Mode" is enabled in the BSP MCU specific properties (not available on all MCUs), the MCU is always in low voltage mode and no other power modes are considered. The following conditions must be met for the MCU to run in low voltage mode:

- Requires HOCO to be running, so HOCO cannot be stopped in low voltage mode
- Requires PLL to be stopped, so PLL APIs are not available in low voltage mode
- Requires ICLK <= 4 MHz
- If oscillation stop detection is used, dividers of 1 or 2 cannot be used for any clock

If "Use Low Voltage Mode" is not enabled, the MCU applies the lowest power mode by searching through the following list in order and applying the first power mode that is supported under the current conditions:

- Subosc-speed mode (lowest power)
  - Requires system clock to be LOCO or subclock
  - Requires MOCO, HOCO, main oscillator, and PLL (if present) to be stopped
  - Requires ICLK and FCLK dividers to be 1
- Low-speed mode
  - Requires PLL to be stopped
  - Requires ICLK <= 1 MHz
  - If oscillation stop detection is used, dividers of 1, 2, 4, or 8 cannot be used for any clock
- Middle-speed mode (not supported on all MCUs)
  - Requires ICLK <= 8 MHz
- High-speed mode
  - Default mode if no other operating mode is supported

Refer to the section "Function for Lower Operating Power Consumption" in the "Low Power Modes" chapter of the hardware manual for MCU specific information about operating power control modes.

Note

The DCDC regulator (if present) is only available in Middle- and High-speed modes. The BSP will automatically switch between DCDC and LDO when switching between compatible and incompatible modes if the DCDC regulator is in use. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

When low voltage mode is not used, the following functions adjust the operating power control mode to ensure it remains within the hardware specification and to ensure the MCU is running at the optimal operating power control mode:

- R_CGC_ClockStart()
- R_CGC_ClockStop()
- R_CGC_SystemClockSet()
- R_CGC_OscStopDetectEnable()
- R_CGC_OscStopDetectDisable()

Note

FSP APIs, including these APIs, are not thread safe. These APIs and any other user code that modifies the operating power control mode must not be allowed to interrupt each other. Proper care must be taken during application design if these APIs are used in threads or interrupts to ensure this constraint is met.

No action is required by the user of these APIs. This section is provided for informational purposes only.

Examples

Basic Example

This is a basic example of minimal use of the CGC in an application.

```
void cgc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Change the system clock to LOCO for power saving. */
 /* Start the LOCO. */
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
    assert(FSP_SUCCESS == err);
 /* Wait for the LOCO stabilization wait time.
  *
```

```
  * NOTE: The MOCO, LOCO and subclock do not have stabilization status bits, so any
stabilization time must be
  * performed via a software wait when starting these oscillators. For all other
oscillators, R_CGC_ClockCheck can
  * be used to verify stabilization status.
  */
 R_BSP_SoftwareDelay(BSP_FEATURE_CGC_LOCO_STABILIZATION_MAX_US,
BSP_DELAY_UNITS_MICROSECONDS);
 /* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
 cgc_divider_cfg_t dividers =
    {
#if !BSP_FEATURE_CGC_REGISTER_SET_B
 /* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
 /* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
 /* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
 /* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
#else
       .moco_divider = CGC_SYS_CLOCK_DIV_2,
       .hoco_divider = CGC_SYS_CLOCK_DIV_1,
       .mosc_divider = CGC_SYS_CLOCK_DIV_4,
#endif
    };
 /* Switch the system clock to LOCO. */
    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
```

```
    assert(FSP_SUCCESS == err);
}
```

Configuring Multiple Clocks

This example demonstrates switching to a new source clock and stopping the previous source clock in a single function call using R_CGC_ClocksCfg().

```
void cgc_clocks_cfg_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Change the system clock to PLL running from the main oscillator. */
 /* Assuming the system clock is MOCO, switch to HOCO. */
 cgc_clocks_cfg_t clocks_cfg;
#if !BSP_FEATURE_CGC_REGISTER_SET_B
    clocks_cfg.system_clock                    = CGC_CLOCK_PLL;
    clocks_cfg.pll_state                       = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.pll_cfg.source_clock            = CGC_CLOCK_MAIN_OSC; // unused
    clocks_cfg.pll_cfg.multiplier              = CGC_PLL_MUL_10_0;   // unused
    clocks_cfg.pll_cfg.divider                 = CGC_PLL_DIV_2;      // unused
    clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
    clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
#else
    clocks_cfg.system_clock            = CGC_CLOCK_HOCO;
    clocks_cfg.divider_cfg.moco_divider = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.hoco_divider = CGC_SYS_CLOCK_DIV_2;
```

```
    clocks_cfg.divider_cfg.mosc_divider = CGC_SYS_CLOCK_DIV_1;
#endif
    clocks_cfg.mainosc_state = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.hoco_state    = CGC_CLOCK_CHANGE_START;
    clocks_cfg.moco_state    = CGC_CLOCK_CHANGE_STOP;
    clocks_cfg.loco_state    = CGC_CLOCK_CHANGE_NONE;
    err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
    assert(FSP_SUCCESS == err);
#if BSP_FEATURE_CGC_HAS_PLL
 /* Assuming the system clock is HOCO, switch to PLL running from main oscillator and
stop MOCO. */
    clocks_cfg.system_clock                    = CGC_CLOCK_PLL;
    clocks_cfg.pll_state                       = CGC_CLOCK_CHANGE_START;
    clocks_cfg.pll_cfg.source_clock            = CGC_CLOCK_MAIN_OSC;
    clocks_cfg.pll_cfg.multiplier              = (cgc_pll_mul_t) BSP_CFG_PLL_MUL;
    clocks_cfg.pll_cfg.divider                 = (cgc_pll_div_t) BSP_CFG_PLL_DIV;
    clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
    clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.mainosc_state                   = CGC_CLOCK_CHANGE_START;
    clocks_cfg.hoco_state                      = CGC_CLOCK_CHANGE_STOP;
    clocks_cfg.moco_state                      = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.loco_state                      = CGC_CLOCK_CHANGE_NONE;
    err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
    assert(FSP_SUCCESS == err);
#endif
}
```

Oscillation Stop Detection

This example demonstrates registering a callback for oscillation stop detection of the main oscillator.

```
/* Example callback called when oscillation stop is detected. */
void oscillation_stop_callback (cgc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) If the MCU was running on the main oscillator, the MCU is now running
on MOCO. Switch clocks if
  * desired. This example shows switching to HOCO. */
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
    assert(FSP_SUCCESS == err);
 do
    {
 /* Wait for HOCO to stabilize. */
       err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
    } while (FSP_SUCCESS != err);
 cgc_divider_cfg_t dividers =
    {
#if !BSP_FEATURE_CGC_REGISTER_SET_B
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4,
#else
       .moco_divider = CGC_SYS_CLOCK_DIV_2,
       .hoco_divider = CGC_SYS_CLOCK_DIV_1,
       .mosc_divider = CGC_SYS_CLOCK_DIV_4,
#endif
    };
    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_HOCO, &dividers);
    assert(FSP_SUCCESS == err);
#if BSP_FEATURE_CGC_HAS_PLL
```

```
/* (Optional) If the MCU was running on the PLL, the PLL is now in free-running
mode. Switch clocks if
 * desired. This example shows switching to the PLL running on HOCO. */
   err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
   assert(FSP_SUCCESS == err);
do
   {
/* Wait for HOCO to stabilize. */
      err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
   } while (FSP_SUCCESS != err);
cgc_pll_cfg_t pll_cfg =
   {
      .source_clock = CGC_CLOCK_HOCO,
      .multiplier   = (cgc_pll_mul_t) BSP_CFG_PLL_MUL,
      .divider      = (cgc_pll_div_t) BSP_CFG_PLL_DIV,
   };
   err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_PLL, &pll_cfg);
   assert(FSP_SUCCESS == err);
do
   {
/* Wait for PLL to stabilize. */
      err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_PLL);
   } while (FSP_SUCCESS != err);

    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	cgc_instance_ctrl_t

Data Structure Documentation

◆ cgc_instance_ctrl_t

struct cgc_instance_ctrl_t

CGC private control block. DO NOT MODIFY. Initialization occurs when R_CGC_Open() is called.

Data Fields

void *	p_context

Field Documentation

◆ p_context

void* cgc_instance_ctrl_t::p_context

Placeholder for user data. Passed to the user callback in cgc_callback_args_t.

Function Documentation

◆ R_CGC_Open()

fsp_err_t R_CGC_Open (cgc_ctrl_t *const *p_ctrl*, cgc_cfg_t const *const *p_cfg*)

Initialize the CGC API. Implements cgc_api_t::open.

Example:

```
/* Initializes the CGC module. */
   err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
```

Return values

FSP_SUCCESS	CGC successfully initialized.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_CGC_ClocksCfg()

fsp_err_t R_CGC_ClocksCfg (cgc_ctrl_t *const *p_ctrl*, cgc_clocks_cfg_t const *const *p_clock_cfg*)

Reconfigures all main system clocks. This API can be used for any of the following purposes:

- start or stop clocks
- change the system clock source
- configure the PLL/PLL2 multiplication and division ratios when starting the PLL
- configure the division ratios when starting the HOCO/MOCO/MOSC
- change the system dividers

If the requested system clock source has a stabilization flag, this function blocks waiting for the stabilization flag of the requested system clock source to be set. If the requested system clock source was just started and it has no stabilization flag, this function blocks for the stabilization time required by the requested system clock source according to the Electrical Characteristics section of the hardware manual. If the requested system clock source has no stabilization flag and it is already running, it is assumed to be stable and this function will not block. If the requested system clock is the subclock, the subclock must be stable prior to calling this function.

The internal dividers (cgc_clocks_cfg_t::divider_cfg) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of table "Specifications of the clock generation circuit for the internal clocks" in the CGC section of the relevant hardware manual.
- RA2A1: see footnotes of table "Clock generation circuit specifications for the internal clocks" in the CGC section of the relevant hardware manual.

Do not attempt to stop the requested clock source or the source of a PLL if the PLL will be running after this operation completes.

Implements cgc_api_t::clocksCfg.

Example:

```
/* Assuming the system clock is MOCO, switch to HOCO. */
cgc_clocks_cfg_t clocks_cfg;
#if !BSP_FEATURE_CGC_REGISTER_SET_B
    clocks_cfg.system_clock                     = CGC_CLOCK_PLL;
    clocks_cfg.pll_state                        = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.pll_cfg.source_clock             = CGC_CLOCK_MAIN_OSC; // unused
    clocks_cfg.pll_cfg.multiplier               = CGC_PLL_MUL_10_0;   // unused
    clocks_cfg.pll_cfg.divider                  = CGC_PLL_DIV_2;      // unused
    clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
    clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
```

```
    clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
#else
    clocks_cfg.system_clock             = CGC_CLOCK_HOCO;
    clocks_cfg.divider_cfg.moco_divider = CGC_SYS_CLOCK_DIV_4;
    clocks_cfg.divider_cfg.hoco_divider = CGC_SYS_CLOCK_DIV_2;
    clocks_cfg.divider_cfg.mosc_divider = CGC_SYS_CLOCK_DIV_1;
#endif
    clocks_cfg.mainosc_state = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.hoco_state    = CGC_CLOCK_CHANGE_START;
    clocks_cfg.moco_state    = CGC_CLOCK_CHANGE_STOP;
    clocks_cfg.loco_state    = CGC_CLOCK_CHANGE_NONE;
    err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock configuration applied successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_NOT_STABILIZED	PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ R_CGC_ClockStart()

fsp_err_t R_CGC_ClockStart (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*, cgc_pll_cfg_t const *const *p_pll_cfg*)

Start the specified clock if it is not currently active. The PLL configuration cannot be changed while the PLL is running. Implements cgc_api_t::clockStart.

The PLL source clock must be operating and stable prior to starting the PLL.

Example:

```
/* Start the LOCO. */
   err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock initialized successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	The clock source is not stabilized after being turned off or PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ R_CGC_ClockStop()

fsp_err_t R_CGC_ClockStop (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*)

Stop the specified clock if it is active. Implements cgc_api_t::clockStop.

Do not attempt to stop the current system clock source. Do not attempt to stop the source clock of a PLL if the PLL is running.

Return values

FSP_SUCCESS	Clock stopped successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_OSC_STOP_DET_ENABLED	Attempt to stop MOCO when Oscillation stop is enabled.
FSP_ERR_NOT_STABILIZED	Clock not stabilized after starting.

◆ R_CGC_SystemClockSet()

fsp_err_t R_CGC_SystemClockSet (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*, cgc_divider_cfg_t const *const *p_divider_cfg*)

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD, BCLK, and FCLK. Implements cgc_api_t::systemClockSet.

The requested clock source must be running and stable prior to calling this function. The internal dividers are subject to constraints described in the hardware manual table "Specifications of the Clock Generation Circuit for the internal clocks".

The internal dividers (p_divider_cfg) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes "Specifications of the clock generation circuit for the internal clocks" in the CGC section of the relevant hardware manual.
- RA2A1: see footnotes "Clock generation circuit specifications for the internal clocks" in the CGC section of the relevant hardware manual.

This function also updates the RAM and ROM wait states, the operating power control mode, and the SystemCoreClock CMSIS global variable.

Example:

```
/* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
cgc_divider_cfg_t dividers =
   {
```

```
#if !BSP_FEATURE_CGC_REGISTER_SET_B
 /* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
 /* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
 /* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
 /* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
#else
       .moco_divider = CGC_SYS_CLOCK_DIV_2,
       .hoco_divider = CGC_SYS_CLOCK_DIV_1,
       .mosc_divider = CGC_SYS_CLOCK_DIV_4,
#endif
    };
 /* Switch the system clock to LOCO. */
    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
FSP_ERR_NOT_STABILIZED	The clock source has not stabilized

◆ R_CGC_SystemClockGet()

fsp_err_t R_CGC_SystemClockGet (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *const *p_clock_source*, cgc_divider_cfg_t *const *p_divider_cfg*)

Return the current system clock source and configuration. Implements cgc_api_t::systemClockGet.

Return values

FSP_SUCCESS	Parameters returned successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CGC_ClockCheck()

fsp_err_t R_CGC_ClockCheck (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*)

Check the specified clock for stability. Implements cgc_api_t::clockCheck.

Return values

FSP_SUCCESS	Clock is running and stable.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	Clock not stabilized.
FSP_ERR_CLOCK_INACTIVE	Clock not turned on.

◆ R_CGC_OscStopDetectEnable()

fsp_err_t R_CGC_OscStopDetectEnable (cgc_ctrl_t *const *p_ctrl*)

Enable the oscillation stop detection for the main clock. Implements cgc_api_t::oscStopDetectEnable.

The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

Example:

```
/* Enable oscillation stop detection. The main oscillator must be running at this
point. */
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_LOW_VOLTAGE_MODE	Settings not allowed in low voltage mode.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_OscStopDetectDisable()

fsp_err_t R_CGC_OscStopDetectDisable (cgc_ctrl_t *const *p_ctrl*)

Disable the oscillation stop detection for the main clock. Implements cgc_api_t::oscStopDetectDisable.

Example:

```
/* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
    err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
    __WFI();
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_OscStopStatusClear()

fsp_err_t R_CGC_OscStopStatusClear (cgc_ctrl_t *const *p_ctrl*)

Clear the Oscillation Stop Detection Status register. This register is not cleared automatically if the stopped clock is restarted. Implements cgc_api_t::oscStopStatusClear.

After clearing the status, oscillation stop detection is no longer enabled.

This register cannot be cleared while the main oscillator is the system clock or the PLL source clock.

Example:

```
/* (Optional) Clear the error flag. Only clear this flag after switching the MCU clock source away from the main
 * oscillator and if the main oscillator is stable again. */
  err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
  assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	Main oscillator must be running to clear the oscillation stop detection flag.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.
FSP_ERR_INVALID_HW_CONDITION	Oscillation stop status was not cleared. Check preconditions and try again.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_CallbackSet()

fsp_err_t R_CGC_CallbackSet (cgc_ctrl_t *const *p_api_ctrl*, void(*)(cgc_callback_args_t *) *p_callback*, void *const *p_context*, cgc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements cgc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.
FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CGC_Close()

fsp_err_t R_CGC_Close (cgc_ctrl_t *const *p_ctrl*)

Closes the CGC module. Implements cgc_api_t::close.

Return values

FSP_SUCCESS	The module is successfully closed.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

5.2.18.2 Event Link Controller (r_elc)

Modules » System

Functions

fsp_err_t	R_ELC_Open (elc_ctrl_t *const p_ctrl, elc_cfg_t const *const p_cfg)
fsp_err_t	R_ELC_Close (elc_ctrl_t *const p_ctrl)
fsp_err_t	R_ELC_SoftwareEventGenerate (elc_ctrl_t *const p_ctrl, elc_software_event_t event_number)
fsp_err_t	R_ELC_LinkSet (elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral,

	elc_event_t signal)

fsp_err_t	R_ELC_Enable (elc_ctrl_t *const p_ctrl)
fsp_err_t	R_ELC_Disable (elc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the ELC peripheral on RA MCUs. This module implements the ELC Interface.

Overview

The event link controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect (link) them to different modules, allowing direct cooperation between the modules without central processing unit (CPU) intervention. The conceptual diagram below illustrates a potential setup where a pin interrupt triggers a timer which later triggers an ADC conversion and CTSU scan, while at the same time a serial communication interrupt automatically starts a data transfer. These tasks would be automatically handled without the need for polling or interrupt management.

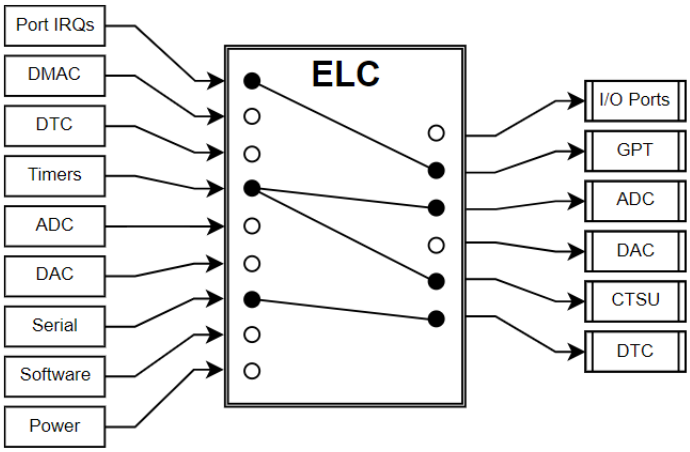

Figure 334: Event Link Controller Conceptual Diagram

In essence, the ELC is an array of multiplexers to route a wide variety of interrupt signals to a subset of peripheral functions. Events are linked by setting the multiplexer for the desired function to the desired signal (through R_ELC_LinkSet). The diagram below illustrates one peripheral output of the ELC. In this example, a conversion start is triggered for ADC0 Group A when the GPT0 counter overflows:

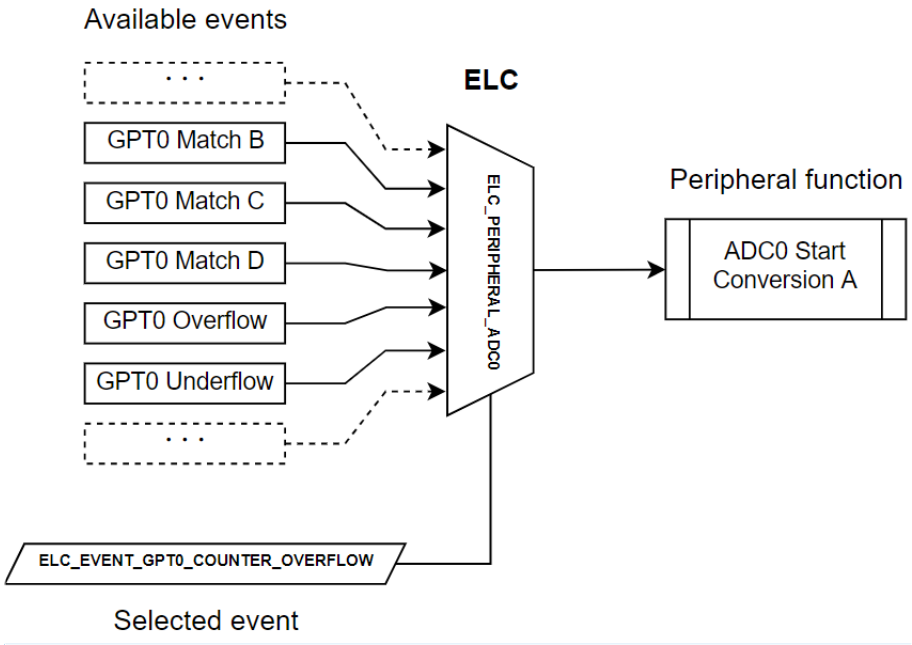

Figure 335: ELC Example

Features

The ELC HAL module can perform the following functions:

- Initialize the ELC to a pre-defined set of links
- Create an event link between two blocks
- Break an event link between two blocks
- Generate one of two software events that interrupt the CPU
- Globally enable or disable event links

A variety of functions can be activated via events, including:

- General-purpose timer (GPT) control
- ADC and DAC conversion start
- Synchronized I/O port output (ports 1-4 only)
- Capacitive touch unit (CTSU) measurement activation

Note

The available sources and peripherals may differ between devices. A full list of selectable peripherals and events is available in the User's Manual for your device.
Some peripherals have specific settings related to ELC event generation and/or reception. Details on how to enable event functionality for each peripheral are located in the usage notes for the related module(s) as well as in the User's Manual for your device.

Configuration

Note

Event links will be automatically generated based on the selections made in module properties. To view the currently linked events check the Event Links tab in the RA Configuration editor.
Calling R_ELC_Open followed by R_ELC_Enable will automatically link all events shown in the Event Links tab.

To manually link an event to a peripheral at runtime perform the following steps:

1. Configure the operation of the destination peripheral (including any configuration necessary to receive events)
2. Use R_ELC_LinkSet to set the desired event link to the peripheral
3. Use R_ELC_Enable to enable transmission of event signals
4. Configure the signaling module to output the desired event (typically an interrupt)

To disable the event, either use R_ELC_LinkBreak to clear the link for a specific event or R_ELC_Disable to globally disable event linking.

Note

The ELC module needs no pin, clocking or interrupt configuration; it is merely a mechanism to connect signals between peripherals. However, when linking I/O Ports via the ELC the relevant I/O pins need to be configured as inputs or outputs.

Build Time Configurations for r_elc

The following build time configurations are defined in fsp_cfg/r_elc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Event Link Controller (r_elc)

This module can be added to the Stacks tab via New Stack > System > Event Link Controller (r_elc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	ELC instance name must be g_elc to match elc_cfg_t data structure created in elc_data.c	g_elc	Module name. Fixed to g_elc.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the ELC:

- To link events it is necessary for the ELC and the related modules to be enabled. The ELC cannot operate if the related modules are in the module stop state or the MCU is in a low power consumption mode for which the module is stopped.
- If two modules are linked across clock domains there may be a 1 to 2 cycle delay between event signaling and reception. The delay timing is based on the frequency of the slowest clock.

Examples

Basic Example

Below is a basic example of minimal use of event linking in an application.

```
/* This struct is automatically generated based on the events configured by
peripherals in the RA Configuration editor. */
static const elc_cfg_t g_elc_cfg =
{
#if (BSP_CFG_MCU_PART_SERIES == 0)
    .link[ELC_PERIPHERAL_TAU01]   = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_TAU0_TMI01
#else
    .link[ELC_PERIPHERAL_GPT_A]   = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_GPT4_COUNTER_OVERFLOW
#endif
};
void elc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Create or modify a link between a peripheral function and an event source. */
#if (BSP_CFG_MCU_PART_SERIES == 0)
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_AD, ELC_EVENT_TAU0_TMI01);
#else
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
#endif
    assert(FSP_SUCCESS == err);
 /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Software-Generated Events

This example demonstrates how to use a software-generated event to signal a peripheral. This can be useful when the desired event source is not supported by the ELC hardware.

```
/* Interrupt handler for peripheral event not supported by the ELC */
void peripheral_isr (void)
{
 fsp_err_t err;
 /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
}
void elc_software_event (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Link ADC0 conversion start to software event 0. */
#if (BSP_CFG_MCU_PART_SERIES == 0)
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_AD,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
#else
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
#endif
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application code here. */
    }
}
```

Data Structures

struct	elc_instance_ctrl_t

Data Structure Documentation

◆ elc_instance_ctrl_t

struct elc_instance_ctrl_t
ELC private control block. DO NOT MODIFY. Initialization occurs when R_ELC_Open() is called.

Function Documentation

◆ R_ELC_Open()

fsp_err_t R_ELC_Open (elc_ctrl_t *const *p_ctrl*, elc_cfg_t const *const *p_cfg*)

Initialize all the links in the Event Link Controller. Implements elc_api_t::open

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set or clear an individual link use R_ELC_LinkSet and R_ELC_LinkBreak respectively.

Example:

```
/* Initializes the software and sets the links defined in the control structure. */
   err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl or p_cfg was NULL
FSP_ERR_ALREADY_OPEN	The module is currently open

◆ R_ELC_Close()

fsp_err_t R_ELC_Close (elc_ctrl_t *const *p_ctrl*)

Globally disable ELC linking. Implements elc_api_t::close

Return values

FSP_SUCCESS	The ELC was successfully disabled
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_SoftwareEventGenerate()

fsp_err_t R_ELC_SoftwareEventGenerate (elc_ctrl_t *const *p_ctrl*, elc_software_event_t *event_number*)

Generate a software event in the Event Link Controller. Implements elc_api_t::softwareEventGenerate

Example:

```
/* Generate an event signal through software to the linked peripheral. */
   err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	Invalid event number or p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_LinkSet()

fsp_err_t R_ELC_LinkSet (elc_ctrl_t *const *p_ctrl*, elc_peripheral_t *peripheral*, elc_event_t *signal*)

Create a single event link. Implements elc_api_t::linkSet

Example:

```
 /* Create or modify a link between a peripheral function and an event source. */
#if (BSP_CFG_MCU_PART_SERIES == 0)
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_AD, ELC_EVENT_TAU0_TMI01);
#else
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
#endif
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_LinkBreak()

fsp_err_t R_ELC_LinkBreak (elc_ctrl_t *const *p_ctrl*, elc_peripheral_t *peripheral*)

Break an event link. Implements elc_api_t::linkBreak

Return values

FSP_SUCCESS	Event link broken
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_Enable()

fsp_err_t R_ELC_Enable (elc_ctrl_t *const *p_ctrl*)

Enable the operation of the Event Link Controller. Implements elc_api_t::enable

Return values

FSP_SUCCESS	ELC enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_Disable()

fsp_err_t R_ELC_Disable (elc_ctrl_t *const *p_ctrl*)

Disable the operation of the Event Link Controller. Implements elc_api_t::disable

Return values

FSP_SUCCESS	ELC disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

fsp_err_t	R_IOPORT_PortWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t value, ioport_size_t mask)
fsp_err_t	R_IOPORT_PinWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t level)
fsp_err_t	R_IOPORT_PortDirectionSet (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t direction_values, ioport_size_t mask)
fsp_err_t	R_IOPORT_PortEventInputRead (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t *p_event_data)
fsp_err_t	R_IOPORT_PinEventInputRead (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t *p_pin_event)
fsp_err_t	R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t event_data, ioport_size_t mask_value)
fsp_err_t	R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t pin_value)

Detailed Description

Driver for the I/O Ports peripheral on RA MCUs. This module implements the I/O Port Interface.

Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

Features

The IOPORT HAL module can configure the following pin settings:

- Pin direction
- Default output state
- Pull-up
- NMOS/PMOS
- Drive strength
- Event edge trigger (falling, rising or both)
- Whether the pin is to be used as an IRQ pin
- Whether the pin is to be used as an analog pin
- Peripheral connection

The module also provides the following functionality:

- Read/write GPIO pins/ports
- Sets event output data
- Reads event input data
- Controlled Current Drive (CCD)

Configuration

The I/O PORT HAL module must be configured by the user for the desired operation. The operating state of an I/O pin can be set via the RA Configuration tool. When the project is built a pin configuration file is created. The BSP will automatically configure the MCU IO ports accordingly at startup using the same API functions mentioned in this document.

Build Time Configurations for r_ioport

The following build time configurations are defined in fsp_cfg/r_ioport_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
CCD Support	MCU Specific Options		Enable support for CCD (Controlled Current Drive) port pins.

Configurations for System > I/O Port (r_ioport)

This module can be added to the Stacks tab via New Stack > System > I/O Port (r_ioport).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ioport	Module name.
1st Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 1st port
2nd Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 2nd port
3rd Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 3rd port

4th Port ELC Trigger Source	MCU Specific Options		ELC source that will trigger the 4th port
Pin Configuration Name	Name must be a valid C symbol	g_bsp_pin_cfg	Name for pin configuration structure

Clock Configuration

The I/O PORT HAL module does not require a specific clock configuration.

Pin Configuration

The IOPORT module is used for configuring pins.

Usage Notes

Port Group Function for ELC

Depending on pin configuration, the IOPORT module can perform automatic reads and writes on 4 ports (RA2 and RA0 series support 2 ports only, see the table of ELC triggers below) on receipt of an ELC event.

ELC triggers	RA6T2	RA2XX, RA0XX	All others
1st Port	Port B	Port 1	Port 1
2nd Port	Port C	Port 2	Port 2
3rd Port	Port D	NA	Port 3
4th Port	Port E	NA	Port 4

When an event is received by a port, the state of the input pins on the port is saved in a hardware register. Simultaneously, the state of output pins on the port is set or cleared based on settings configured by the user. The functions R_IOPORT_PinEventInputRead and R_IOPORT_PortEventInputRead allow reading the last event input state of a pin or port, and event-triggered pin output can be configured through R_IOPORT_PinEventOutputWrite and R_IOPORT_PortEventOutputWrite.

In addition, each pin on these ports can be configured to trigger an ELC event on rising, falling or both edges. This event can be used to activate other modules when the pin changes state.

Note

The number of ELC-aware ports vary across MCUs. Refer to the Hardware User's Manual for your device for more details.

Examples

Basic Example

This is a basic example of minimal use of the IOPORT in an application.

```
void basic_example ()
{
```

```
 bsp_io_level_t readLevel;
 fsp_err_t      err;
 /* Initialize the IOPORT module and configure the pins
  * Note: The default pin configuration name in the RA Configuration tool is
g_bsp_pin_cfg */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Call R_IOPORT_PinsCfg if the configuration was not part of initial configurations
made in open */
    err = R_IOPORT_PinsCfg(&g_ioport_ctrl, &g_runtime_pin_cfg);
    assert(FSP_SUCCESS == err);
 /* Set Pin 00 of Port 06 to High */
    err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, BSP_IO_LEVEL_HIGH
);
    assert(FSP_SUCCESS == err);
 /* Read Pin 00 of Port 06*/
    err = R_IOPORT_PinRead(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, &readLevel);
    assert(FSP_SUCCESS == err);
}
```

Blinky Example

This example uses IOPORT to configure and toggle a pin to blink an LED.

```
void blinky_example ()
{
 fsp_err_t err;
 /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure Pin as output
  * Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
```

```
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00,
IOPORT_CFG_PORT_DIRECTION_OUTPUT);
    assert(FSP_SUCCESS == err);
 bsp_io_level_t level = BSP_IO_LEVEL_LOW;
 while (1)
    {
 /* Determine the next state of the LEDs */
 if (BSP_IO_LEVEL_LOW == level)
      {
            level = BSP_IO_LEVEL_HIGH;
       }
 else
      {
            level = BSP_IO_LEVEL_LOW;
       }
 /* Update LED on RA6M3-PK */
       err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, level);
      assert(FSP_SUCCESS == err);
 /* Delay */
 R_BSP_SoftwareDelay(100, BSP_DELAY_UNITS_MILLISECONDS); // NOLINT
    }
}
```

ELC Example

This is an example of using IOPORT with ELC events. The ELC event system allows the captured data to be stored when it occurs and then read back at a later time.

```
static elc_instance_ctrl_t g_elc_ctrl;
static elc_cfg_t g_elc_cfg;
void ioport_elc_example ()
{
 bsp_io_level_t eventValue;
 fsp_err_t      err;
 /* Initializes the software and sets the links defined in the control structure. */
```

```
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, (elc_peripheral_t) ELC_PERIPHERAL_IOPORT2,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    assert(FSP_SUCCESS == err);
 /* Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
IOPORT_CFG_PORT_DIRECTION_INPUT);
    assert(FSP_SUCCESS == err);
 /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 /* Read Pin Event Input. The data(BSP_IO_LEVEL_HIGH/ BSP_IO_LEVEL_LOW) from
BSP_IO_PORT_02_PIN_00 is read into the
  * EIDR bit */
    err = R_IOPORT_PinEventInputRead(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
&eventValue);
    assert(FSP_SUCCESS == err);
}
```

IOPORT_PERIPHERAL_ETHER_MII	Pin will function as an Ethernet MMI peripheral pin
IOPORT_PERIPHERAL_GPT4	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_ETHER_RMII	Pin will function as an Ethernet RMMI peripheral pin
IOPORT_PERIPHERAL_PDC	Pin will function as a PDC peripheral pin
IOPORT_PERIPHERAL_LCD_GRAPHICS	Pin will function as a graphics LCD peripheral pin
IOPORT_PERIPHERAL_CAC	Pin will function as a CAC peripheral pin
IOPORT_PERIPHERAL_TRACE	Pin will function as a debug trace peripheral pin
IOPORT_PERIPHERAL_OSPI	Pin will function as a OSPI peripheral pin
IOPORT_PERIPHERAL_CEC	Pin will function as a CEC peripheral pin
IOPORT_PERIPHERAL_PGAOUT0	Pin will function as a PGAOUT peripheral pin
IOPORT_PERIPHERAL_PGAOUT1	Pin will function as a PGAOUT peripheral pin

IOPORT_PERIPHERAL_ULPT	Pin will function as a ULPT peripheral pin
IOPORT_PERIPHERAL_MIPI	Pin will function as a MIPI DSI peripheral pin
IOPORT_PERIPHERAL_ETHER_RGMII	Pin will function as a RGMII peripheral pin
IOPORT_PERIPHERAL_ESC	Pin will function as a ETHERNET slave controller peripheral pin
IOPORT_PERIPHERAL_PDM	Pin will function as a PDM peripheral pin
IOPORT_PERIPHERAL_DSMIF	Pin will function as a DSMIF peripheral pin
IOPORT_PERIPHERAL_IO	Pin will functions as an IO pin
IOPORT_PERIPHERAL_DEBUG	Pin will function as a DEBUG pin
IOPORT_PERIPHERAL_AGT	Pin will function as an AGT peripheral pin
IOPORT_PERIPHERAL_AGTW	Pin will function as an AGT peripheral pin
IOPORT_PERIPHERAL_AGT1	Pin will function as an AGT peripheral pin
IOPORT_PERIPHERAL_GPT0	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_GPT1	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_SCI0_2_4_6_8	Pin will function as an SCI peripheral pin
IOPORT_PERIPHERAL_SCI1_3_5_7_9	Pin will function as an SCI peripheral pin
IOPORT_PERIPHERAL_SPI	Pin will function as a SPI peripheral pin
IOPORT_PERIPHERAL_IIC	Pin will function as a IIC peripheral pin
IOPORT_PERIPHERAL_KEY	Pin will function as a KEY peripheral pin
IOPORT_PERIPHERAL_CLKOUT_COMP_RTC	Pin will function as a clock/comparator/RTC peripheral pin
IOPORT_PERIPHERAL_CAC_AD	Pin will function as a CAC/ADC peripheral pin
IOPORT_PERIPHERAL_BUS	Pin will function as a BUS peripheral pin
IOPORT_PERIPHERAL_CTSU	Pin will function as a CTSU peripheral pin
IOPORT_PERIPHERAL_ACMPHS	Pin will function as a CMPHS peripheral pin

IOPORT_PERIPHERAL_LCDC	Pin will function as a segment LCD peripheral pin
IOPORT_PERIPHERAL_DE_SCI0_2_4_6_8	Pin will function as an SCI peripheral DEn pin
IOPORT_PERIPHERAL_DE_SCI1_3_5_7_9	Pin will function as an SCI DEn peripheral pin
IOPORT_PERIPHERAL_DALI	Pin will function as a DALI peripheral pin
IOPORT_PERIPHERAL_CEU	Pin will function as a CEU peripheral pin
IOPORT_PERIPHERAL_CAN	Pin will function as a CAN peripheral pin
IOPORT_PERIPHERAL_QSPI	Pin will function as a QSPI peripheral pin
IOPORT_PERIPHERAL_SSI	Pin will function as an SSI peripheral pin
IOPORT_PERIPHERAL_USB_FS	Pin will function as a USB full speed peripheral pin
IOPORT_PERIPHERAL_USB_HS	Pin will function as a USB high speed peripheral pin
IOPORT_PERIPHERAL_GPT2	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_SDHI_MMC	Pin will function as an SD/MMC peripheral pin
IOPORT_PERIPHERAL_GPT3	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_ETHER_MII	Pin will function as an Ethernet MMI peripheral pin
IOPORT_PERIPHERAL_GPT4	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_GPT5	Pin will function as a GPT peripheral pin
IOPORT_PERIPHERAL_ETHER_RMII	Pin will function as an Ethernet RMMI peripheral pin
IOPORT_PERIPHERAL_PDC	Pin will function as a PDC peripheral pin
IOPORT_PERIPHERAL_LCD_GRAPHICS	Pin will function as a graphics LCD peripheral pin
IOPORT_PERIPHERAL_CAC	Pin will function as a CAC peripheral pin
IOPORT_PERIPHERAL_TRACE	Pin will function as a debug trace peripheral pin

IOPORT_PERIPHERAL_OSPI	Pin will function as a OSPI peripheral pin
IOPORT_PERIPHERAL_CEC	Pin will function as a CEC peripheral pin
IOPORT_PERIPHERAL_PGAOUT0	Pin will function as a PGAOUT peripheral pin
IOPORT_PERIPHERAL_PGAOUT1	Pin will function as a PGAOUT peripheral pin
IOPORT_PERIPHERAL_ULPT	Pin will function as a ULPT peripheral pin
IOPORT_PERIPHERAL_MIPI	Pin will function as a MIPI DSI peripheral pin
IOPORT_PERIPHERAL_UARTA	Pin will function as an UARTA peripheral pin

◆ ioport_cfg_options_t

enum ioport_cfg_options_t	
Options to configure pin functions	
Enumerator	
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.

IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.

IOPORT_CFG_PMOS_ENABLE	Enables the pin's PMOS open-drain output.
IOPORT_CFG_DRIVE_MID	Sets pin drive output to medium.
IOPORT_CFG_DRIVE_HS_HIGH	Sets pin drive output to high along with supporting high speed.
IOPORT_CFG_DRIVE_MID_IIC	Sets pin to drive output needed for IIC on a 20mA port.
IOPORT_CFG_DRIVE_HIGH	Sets pin drive output to high.
IOPORT_CFG_EVENT_RISING_EDGE	Sets pin event trigger to rising edge.
IOPORT_CFG_EVENT_FALLING_EDGE	Sets pin event trigger to falling edge.
IOPORT_CFG_EVENT_BOTH_EDGES	Sets pin event trigger to both edges.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.

◆ ioport_output_current_t

enum ioport_output_current_t	
Output current settings for CCD pins	
Enumerator	
IOPORT_OUTPUT_CURRENT_HI_Z	High-impedance state.
IOPORT_OUTPUT_CURRENT_2_MA	2 mA output current
IOPORT_OUTPUT_CURRENT_5_MA	5 mA output current
IOPORT_OUTPUT_CURRENT_10_MA	10 mA output current
IOPORT_OUTPUT_CURRENT_15_MA	15 mA output current
IOPORT_OUTPUT_CURRENT_DISABLE	Disables output current control.

Function Documentation

◆ R_IOPORT_Open()

fsp_err_t R_IOPORT_Open (ioport_ctrl_t *const *p_ctrl*, const ioport_cfg_t * *p_cfg*)

Initializes internal driver data, then calls pin configuration function to configure pins.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Pin configurations is invalid.

◆ R_IOPORT_Close()

fsp_err_t R_IOPORT_Close (ioport_ctrl_t *const *p_ctrl*)

Resets IOPORT registers. Implements ioport_api_t::close

Return values

FSP_SUCCESS	The IOPORT was successfully uninitialized
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_IOPORT_PinsCfg()

fsp_err_t R_IOPORT_PinsCfg (ioport_ctrl_t *const *p_ctrl*, const ioport_cfg_t * *p_cfg*)

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements ioport_api_t::pinsCfg.

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the Pins tab of the RA Configuration editor or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and testing.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

◆ R_IOPORT_PinCfg()

fsp_err_t R_IOPORT_PinCfg (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, uint32_t *cfg*)

Configures the settings of a pin. Implements ioport_api_t::pinCfg.

Return values

FSP_SUCCESS	Pin configured
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.

◆ R_IOPORT_PinRead()

fsp_err_t R_IOPORT_PinRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t * *p_pin_value*)

Reads the level on a pin. Implements ioport_api_t::pinRead.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different pins.

◆ R_IOPORT_PortRead()

fsp_err_t R_IOPORT_PortRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t * *p_port_value*)

Reads the value on an IO port. Implements ioport_api_t::portRead.

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

Return values

FSP_SUCCESS	Port read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortWrite()

fsp_err_t R_IOPORT_PortWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *value*, ioport_size_t *mask*)

Writes to multiple pins on a port. Implements ioport_api_t::portWrite.

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. For example, value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

Return values

FSP_SUCCESS	Port written to
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.

◆ R_IOPORT_PinWrite()

fsp_err_t R_IOPORT_PinWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t *level*)

Sets a pin's output either high or low. Implements ioport_api_t::pinWrite.

Return values

FSP_SUCCESS	Pin written to
FSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.

◆ R_IOPORT_PortDirectionSet()

fsp_err_t R_IOPORT_PortDirectionSet (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *direction_values*, ioport_size_t *mask*)

Sets the direction of individual pins on a port. Implements ioport_api_t::portDirectionSet().

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

Return values

FSP_SUCCESS	Port direction updated
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortEventInputRead()

fsp_err_t R_IOPORT_PortEventInputRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t * *p_event_data*)

Reads the value of the event input data. Implements ioport_api_t::portEventInputRead().

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Port read
FSP_ERR_INVALID_ARGUMENT	Port not a valid ELC port
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_UNSUPPORTED	Function not supported.

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinEventInputRead()

fsp_err_t R_IOPORT_PinEventInputRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t * *p_pin_event*)

Reads the value of the event input data of a specific pin. Implements ioport_api_t::pinEventInputRead.

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_INVALID_ARGUMENT	Port is not valid ELC PORT.
FSP_ERR_UNSUPPORTED	Function not supported.

Note

This function is re-entrant.

◆ R_IOPORT_PortEventOutputWrite()

fsp_err_t R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *event_data*, ioport_size_t *mask_value*)

This function writes the set and reset event output data for a port. Implements ioport_api_t::portEventOutputWrite.

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Return values

FSP_SUCCESS	Port event data written
FSP_ERR_INVALID_ARGUMENT	Port or Mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinEventOutputWrite()

fsp_err_t R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t *pin_value*)

This function writes the event output data value to a pin. Implements ioport_api_t::pinEventOutputWrite.

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

Return values

FSP_SUCCESS	Pin event data written
FSP_ERR_INVALID_ARGUMENT	Port or Pin or value not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

5.2.18.4 Inter-Processor Communication (r_ipc)

Modules » System

Functions

fsp_err_t	R_IPC_Open (ipc_ctrl_t *const p_api_ctrl, ipc_cfg_t const *const p_cfg)
fsp_err_t	R_IPC_MessageSend (ipc_ctrl_t *const p_api_ctrl, uint32_t message)
fsp_err_t	R_IPC_EventGenerate (ipc_ctrl_t *const p_api_ctrl, ipc_generate_event_t event)
fsp_err_t	R_IPC_CallbackSet (ipc_ctrl_t *const p_api_ctrl, void(*p_callback)(ipc_callback_args_t *), void *const p_context, ipc_callback_args_t *const p_callback_memory)
fsp_err_t	R_IPC_Close (ipc_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the IPC peripheral on RA MCUs. This module implements the IPC Interface.

Overview

The IPC HAL module supports communication across processors via maskable interrupts and one-way message FIFOs.

Note

IPC semaphores and NMI are handled through BSP APIs. See Inter-Processor Communication (IPC) Support.

Features

- Send and receive messages through IPC FIFOs
- Trigger or receive maskable interrupts with multiple event bits settable per interrupt

Configuration

Build Time Configurations for r_ipc

The following build time configurations are defined in fsp_cfg/r_ipc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > IPC (r_ipc)

This module can be added to the Stacks tab via New Stack > System > IPC (r_ipc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ipc0	Module name.
Channel	MCU Specific Options		Select the IPC channel.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided when the IPC interrupt is enabled. It will be called from the interrupt service routine (ISR).
Interrupt Priority	MCU Specific Options		Select the IPC interrupt priority. An interrupt is only required for receiving messages and events from the opposing core.

Interrupt Configuration

- In order to receive messages, the interrupt must be enabled and a callback must be supplied. If an IPC instance is only being used to send messages or generate events the interrupt doesn't have to be enabled.

Usage Notes

IPC maskable interrupts and FIFOs share the same interrupt so the IPC driver handles configuration of both similarly:

- The IPC driver will choose which IPC registers to use based on the selected core and channel.
- An interrupt and callback is only required when the IPC instance is being used to receive.
    - When receiving a callback should be used to process any received messages/interrupts.
- The channels across cores should always match up for IPC instances. For example, in order to communicate from Core 0 to Core 1 over channel 0:
    - Core 0 should have an IPC instance configured opened on channel 0
    - Core 1 should have an IPC instance configured opened on channel 0

IPC Maskable Interrupt Events

Each IPC channel can set multiple "event" bits in a single maskable interrupt. This should be done through ipc_api_t::eventGenerate.

Examples

Basic IPC Messaging Example

The following example demonstrates sending a simple message from Core 0 to Core 1 via IPC.

Core 0 Application

```
#define IPC_SEND_MESSAGE 0xABCD
void r_ipc_basic_messaging_core0_example (void)
{
 /* Open an IPC instance on the core 0 application configured to send a message to
core 1.
  * @ref ipc_cfg_t::direction should be set to IPC_DIRECTION_SEND.
  * @ref ipc_cfg_t::channel should match for IPC instances on both cores.
  */
 fsp_err_t err = R_IPC_Open(&g_ipc0_ctrl, &g_ipc0_cfg);
    assert(FSP_SUCCESS == err);
 /* Send IPC_SEND_MESSAGE to core 1. */
    err = R_IPC_MessageSend(&g_ipc0_ctrl, IPC_SEND_MESSAGE);
    assert(FSP_SUCCESS == err);
}
```

Core 1 Application

```
void r_ipc_basic_messaging_core1_example (void)
{
 /* Open an IPC instance on the core 1 application configured to receive messages.
  * @ref ipc_cfg_t::direction should be set to IPC_DIRECTION_RECEIVE.
  * @ref ipc_cfg_t::channel should match for IPC instances on both cores.
  */
 fsp_err_t err = R_IPC_Open(&g_ipc0_ctrl, &g_ipc0_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for message from callback */
 while (!g_callback_called)
    {
       ;
    }
 /* Message will be in g_last_message_received */
    (void) g_last_message_received;
}
void ipc_message_example_callback (ipc_callback_args_t * p_args)
{
```

```
 /* Check for message received event */
 if (IPC_EVENT_MESSAGE_RECEIVED & p_args->event)
    {
       g_callback_called       = true;
       g_last_message_received = p_args->message;
    }
}
```

Basic IPC Interrupt Event Example

The following example demonstrates triggering an event via maskable interrupt from Core 0 to Core 1.

Core 0 Application

```
void r_ipc_basic_interrupt_event_core0_example (void)
{
 /* Open an IPC instance on the core 0 application configured to send to core 1.
  * @ref ipc_cfg_t::direction should be set to IPC_DIRECTION_SEND.
  * @ref ipc_cfg_t::channel should match for IPC instances on both cores.
  */
 fsp_err_t err = R_IPC_Open(&g_ipc0_ctrl, &g_ipc0_cfg);
    assert(FSP_SUCCESS == err);
 /* Trigger interrupt on core 1 with event 0 bit set. */
    err = R_IPC_EventGenerate(&g_ipc0_ctrl, IPC_GENERATE_EVENT_IRQ0);
    assert(FSP_SUCCESS == err);
}
```

Core 1 Application

```
void r_ipc_basic_interrupt_event_core1_example (void)
{
 /* Open an IPC instance on the core 1 application configured to receive.
  * @ref ipc_cfg_t::direction should be set to IPC_DIRECTION_RECEIVE.
  * @ref ipc_cfg_t::channel should match for IPC instances on both cores.
  */
 fsp_err_t err = R_IPC_Open(&g_ipc0_ctrl, &g_ipc0_cfg);
```

```
    assert(FSP_SUCCESS == err);
 /* Wait for event */
 while (!g_event0_triggered)
    {
       ;
    }
}
void ipc_event_example_callback (ipc_callback_args_t * p_args)
{
 /* Check for message received event */
 if (IPC_EVENT_IRQ0 & p_args->event)
    {
       g_event0_triggered = true;
    }
}
```

Function Documentation

◆ R_IPC_Open()

fsp_err_t R_IPC_Open (ipc_ctrl_t *const *p_api_ctrl*, ipc_cfg_t const *const *p_cfg*)

Configures the IPC driver channel based on the input configuration.

Implements ipc_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to IPC control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_IPC_MessageSend()

fsp_err_t R_IPC_MessageSend (ipc_ctrl_t *const *p_api_ctrl*, uint32_t *message*)

Sends a message over the configured IPC channel.

Implements ipc_api_t::messageSend.

Return values

FSP_SUCCESS	Message written to FIFO successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INSUFFICIENT_SPACE	IPC channel FIFO is full

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_IPC_EventGenerate()

fsp_err_t R_IPC_EventGenerate (ipc_ctrl_t *const *p_api_ctrl*, ipc_generate_event_t *event*)

Triggers an interrupt with the specified event bit set over the configured IPC channel.

Implements ipc_api_t::eventGenerate.

Return values

FSP_SUCCESS	Event request set successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_IPC_CallbackSet()

fsp_err_t R_IPC_CallbackSet (ipc_ctrl_t *const *p_api_ctrl*, void(*)(ipc_callback_args_t *) *p_callback*, void *const *p_context*, ipc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure.

Implements ipc_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	Pointer to IPC control block or callback is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_IPC_Close()

fsp_err_t R_IPC_Close (ipc_ctrl_t *const *p_api_ctrl*)

Closes the IPC driver.

Implements ipc_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to IPC control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

5.2.19 Timers

Modules

Detailed Description

Timers Modules.

Modules

	Independent Channel, 16-bit and 8-bit timer (r_tau) Driver for the TAU peripheral on RA MCUs. This module implements the Timer Interface.
	Port Output Enable for GPT (r_poeg) Driver for the POEG peripheral on RA MCUs. This module implements the POEG Interface.
	Realtime Clock (r_rtc) Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.
	Realtime Clock (r_rtc_c) Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.
	Three-Phase PWM (r_gpt_three_phase) Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the Three-Phase Interface.
	Timer, 32-bit Interval Timer (r_tml) Driver for the TML peripherals on RA MCUs. This module implements the Timer Interface.
	Timer, General PWM (r_gpt) Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the Timer Interface.
	Timer, Low-Power (r_agt) Driver for the AGT and AGTW peripheral on RA MCUs. This module implements the Timer Interface.
	Timer, Simultaneous Channel (r_tau_pwm) Driver for the TAU_PWM peripheral on RA MCUs. This module implements the Timer Interface.

	Timer, Ultra Low-Power (r_ulpt) Driver for the ULPT peripheral on RA MCUs. This module implements the Timer Interface.

5.2.19.1 Independent Channel, 16-bit and 8-bit timer (r_tau)

fsp_err_t	R_TAU_LinMeasurementFuncSwitch (timer_ctrl_t *const p_ctrl, tau_function_t func)

Detailed Description

Driver for the TAU peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The TAU module has the following features:

- Supports Function Interval Timer, Square Wave Output, External Event Counter, Divider Function, Input Pulse Interval Measurement, Delay Counter, Input Signal High- or Low-Level Width Measurement.
- Configurable clock source and external sources input to TImn
- Configurable period (counts per timer cycle).
- Supports operation clocks: CK00, CK01, CK02, and CK03.
- Supports noise filter on input source.
- Supports 16-bit and 8-bit timers.
- Supports the runtime reconfiguration of the period.
- Signal can be output to a pin.
- Supports counting based on an external signal to TImn
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value. Below table illustrates the channels and their corresponding supported features.

Channel	Interval Timer	Square Wave Output	External Event Counter	Divider	Input Pulse Interval Measurement	Delay Counter	Measure High-Low Level Pulse Width	8-bit timer operation	Operation clocks	Input signals	Output signals
TAU00	✓	✓	✓	✓	✓	✓	✓		CK00, CK01	TI00, ELC	TO00
TAU01	✓	✓	✓		✓	✓	✓	✓	CK00, CK01, CK02, CK03	TI01, ELC	TO01
TAU02	✓	✓	✓		✓	✓	✓		CK00, CK01	TI02	TO02
TAU03	✓	✓	✓		✓	✓	✓	✓	CK00, CK01, CK02, CK03	TI03	TO03
TAU04	✓	✓	✓		✓	✓	✓		CK00, CK01	TI04	TO04
TAU05	✓	✓	✓		✓	✓	✓		CK00, CK01	TI05, MOCO,	TO05

								LOCO, FSUB		
TAU06	✓	✓	✓		✓	✓	✓	CK00, CK01	TI06	TO06
TAU07	✓	✓	✓		✓	✓	✓	CK00, CK01	TI07, RXD2	TO07

Configuration

Build Time Configurations for r_tau

The following build time configurations are defined in fsp_cfg/r_tau_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Interrupt Support	• Disabled • Enabled	Enabled	Enable support for interrupts
Pin Output Support	• Disabled • Enabled	Disabled	Enable output for either square wave or divider output
Pin Input Support	• Disabled • Enabled	Disabled	Enable input for pulse width measurement, level width measurement, pulse/edge counting or divider functions.
Extra Input Mode Support	• Disabled • Enabled	Disabled	Enable support for event counting, system clock count sources and input noise filtering when Pin Input Support is enabled.
8-Bit Mode Support	• Disabled • Enabled	Disabled	Enable support for 8-bit timer modes (only available on channels 1 and 3).

Configurations for Timers > Timer, Independent Channel, 16-bit and 8-bit Timer Operation (r_tau)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Independent Channel, 16-bit and 8-bit Timer Operation (r_tau).

Configuration	Options	Default	Description

General

Name	Name must be a valid C symbol	g_timer0	Module name.
Channel	Channel number must be a non-negative integer	0	Physical hardware channel.
Function	• Interval Timer • Square Wave Output • External Event Counter • Divider • Input Pulse Interval Measurement • Measure Low Level Pulse Width • Measure High Level Pulse Width • Delay Counter	Interval Timer	Function selection. Note: The calculation of the input pulse function and the high-low level pulse width measurement function is implemented using interrupts. ISR's must be enabled for these functions even if callback is unused.
Bit Timer Mode	• 16-bit timer • Higher 8-bit timer • Lower 8-bit timer • Higher and Lower 8-bit timer	16-bit timer	Specify the 16 or 8-bit timer mode
Operation Clock	• CK00 • CK01 • CK02 • CK03	CK00	Specify the selection of operation clock
Period	Value must be a non-negative integer	0x10000	Specify the timer period based on the selected units. When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest divisor (fastest timer tick). When Pulse width measurement or high-low level pulse width measurement is enabled, this period is always generated as zero.. The period

			should be set maximally 0x100 when lower 8-bit mode or higher and lower 8-bit mode is enabled. When 'Input->Trigger Edge' is set to 'Trigger Edge Rising' or 'Trigger Edge Falling', this period can be maximally set to 0x20000 when using the divider function. If the requested period cannot be achieved, the settings with the largest possible period, that does not exceed the requested period, are used. The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Period (Higher 8-bit timer)	Value must be a non-negative integer	0x100	Specify the higher 8-bit timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x100 results in the maximum period at the lowest divisor (fastest timer tick). This setting is only applicable in interval timer function with higher 8bit mode or higher and lower 8bit mode. If the requested period cannot be achieved, the settings with the largest possible period that is less than or

			equal to the requested period are used. The theoretical calculated period is printed in a comment in the tau_extended_cfg_t structure.
Period Unit (Higher 8-bit timer)	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Input			
Input Source	MCU Specific Options		Input source, applies in input pulse width measurement function, high-low level pulse width measurement function, external event count function, and divider function.
Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	Select the trigger edge. Applies in input pulse width measurement function, high-low level pulse width measurement function, external event count function, and divider function.
Input Filter	• Disabled • Enabled	Disabled	Input filter, applies in input pulse width measurement function, high-low level pulse width measurement function, external event count function, and divider function.
Output			
Initial Output	• Disabled • Start Level High • Start Level Low	Disabled	Initial output, applies in divider function and square wave.
Interrupts			
Setting of starting count and interrupt	• Timer interrupt is not generated when counting	Timer interrupt is not generated when counting is started/Start trigger is	Specify OPIRQ bit setting

	is started/Start trigger is invalid during counting operation. • Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.	invalid during counting operation.	
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Interrupt Priority	MCU Specific Options		Timer interrupt priority.
Higher 8-bit Interrupt Priority	MCU Specific Options		Timer higher 8-bit interrupt priority.

Clock Configuration

The TAU clock is based on the peripheral module clock (PCLKB) which is equal to the system clock (ICLK).

Each TAU channel has certain operation clocks selections, these can be set with the **General>Operation Clock** property in the module configuration. When the operation clock of a channel is set to CK00, CK01, CK02, or CK03, the TAU module provides divisor values for each of those clocks. These divisors may be set in the **Clocks** tab. As such, setting a divisor in the **Clocks** tab affects all TAU channels that use that CK0x clock as an input. Adjusting these settings determines the frequency range achievable by a TAU channel. If a desired frequency is not achievable, the divider in the **Clocks** tab may be adjusted. The clock dividers cannot be adjusted at runtime.

Pin Configuration

This module should use the TOmn pins as output pins for Square Wave Output, Divider Function

For input source, the input signal must be applied to External Event Counter, Divider, Input Pulse Interval Measurement, Delay Counter, and Measure High-Low Level Pulse Width Function

Timer Period

The RA Configuration editor will automatically calculate the period count value based on the selected period time, units, operation clock (set by **General>Operation Clock** property in the module configuration), and clock divisor value (set in **Clocks** tab).

When the selected unit is "Raw counts", the maximum and minimum allowed period setting varies depending on the selected clock source:

Clock divisor	Minimum period (counts)	Maximum period (counts)
ICLK/1	0x00002	0x10000
All other divisors	0x00001	0x10000

Note

If ICLK (undivided) is selected as the operation clock (CK00, CK01) and TDR0n is set to 0x0000 (n = 0 to 7), interrupt requests output from timer array units cannot be used. For this reason When Clock Source is ICLK, Minimum period (counts) is 0x00002

Clock divisor	Minimum Higher 8-bit period (counts)	Maximum Higher 8-bit period (counts)
All divisors	0x001	0x100

Note

Though the TAU is a 16-bit timer, because the period interrupt occurs when the counter underflow, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Interval Timer Function

This function can be used as a reference timer to generate TAU0_TMI0n (timer interrupt) at fixed intervals. The interrupt generation period can be calculated by the following expression.

- Generation period of TAU0_TMI0n (timer interrupt) = Period of count clock × (Set value of TDR0n + 1)

The Interval Timer Function can operate as the higher/lower 8-bits mode.

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", an interrupt is generated immediately after R_TAU_Start() function is called and timer output also changed.

Square Wave Output Function

This function can use TO0n to perform a toggle operation as soon as TAU0_TMI0n has been generated, and outputs a square wave with a duty factor of 50%.

The period and frequency for outputting a square wave from TO0n can be calculated by the following expressions.

- Period of square wave output from TO0n = Period of count clock × (Set value of TDR0n + 1) × 2
- Frequency of square wave output from TO0n = Frequency of count clock / {(Set value of TDR0n + 1) × 2}

The Square Wave Output Function can operate as the lower 8-bits mode.

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", an interrupt is generated immediately after R_TAU_Start() function is called and output pin is also changed.

External Event Counter Function

The timer array unit can be used as an external event counter that counts the number of times the valid input edge (external event) is detected in the TI0n pin. When a specified count value is reached, the event counter generates an interrupt. The specified number of counts can be calculated by the following expression.

- Specified number of counts = Set value of TDR0n + 1

Instead of using the TI0n pin input, a channel specified for the External Event Counter Function can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

The External Event Counter Function can operate as the lower 8-bits mode.

Delay Counter Function

It is possible to start counting down when the valid edge of the TI0n pin input is detected (an external event), and then generate TAU0_TMI0n (a timer interrupt) after any specified interval. The interrupt generation period can be calculated by the following expression. Generation period of TAU0_TMI0n (timer interrupt) = Period of count clock × (Set value of TDR0n + 1)

Instead of using the TI0n pin input, a channel specified for the Delay Counter Function can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

The Delay Counter Function can operate as the lower 8-bits mode.

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", a start trigger is valid during counting operation.

Divider Function

The timer array unit can be used as a frequency divider that divides a clock input to the TI00 pin and outputs the result from the TO00 pin. The divided clock frequency output from TO00 can be calculated by the following expression. When rising edge/falling edge is selected:

- Divided clock frequency = Input clock frequency / {(Set value of TDR00 + 1) × 2} When both edges are selected:
- Divided clock frequency ≈ Input clock frequency / (Set value of TDR00 + 1)

When "Interrupts > Setting of starting count and interrupt" is "Timer interrupt is generated when counting is started/Start trigger is valid during counting operation.", an interrupt is generated immediately after first input signal is detected and output pin is also changed.

Input Pulse Interval Measurement Function

The count value can be captured at the TI0n valid edge and the interval of the pulse input to TI0n can be measured. The pulse interval can be calculated by the following expression.

- TI0n input pulse interval = Period of count clock × ((0x10000 × TSR0n.OVF) + (Captured value of TDR0n + 1))

Instead of using the TI0n pin input, a channel specified for the Input Pulse Interval Measurement can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", "Input signal of the RXD2 pin", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

High-Low Level Pulse Width Measurement

By starting counting at one edge of the TI0n pin input and capturing the number of counts at another edge, the signal width (high-level width or low-level width) of TI0n can be measured. The signal width of TI0n can be calculated by the following expression.

- Signal width of TI0n input = Period of count clock × ((0x10000 × TSR0n.OVF) + (Captured value of TDR0n + 1))

Instead of using the TI0n pin input, a channel specified for the High-Low Level Pulse Width Function can also use the signal as "Middle-speed on-chip oscillator (MOCO)", "Low-speed on-chip oscillator (LOCO)", "Subsystem clock (FSUB)", "Input signal of the RXD2 pin", and ELC event which selected in **Input>Input Source** property as its input source to drive counting.

Triggering ELC Events with TAU

The TAU timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Limitations

- When using pin input a delay of 2 TAU input clocks (ICLK/CK0*) is required between R_TAU_Open() and R_TAU_Start(). When using the noise filter, a delay of 4 clocks is required instead. See in hardware manual: TAU > Timer Input (TI0n) Control > Cautions on Channel Input Operation.
- When using High-Low Level Pulse Width Measurement function, the counter can not be reset by invoking R_TAU_Reset().

Examples

TAU Basic Example

This is a basic example of minimal use of the TAU in an application.

```
void tau_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
```

```
}
```

TAU Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
uint32_t g_counter_underflow = 0U;
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
       g_counter_underflow++;
    }
 if (TIMER_EVENT_HIGHER_8BIT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

TAU 16-bit or 8-bit mode Example

To use the TAU as 16-bit or 8-bit mode, select Bit Mode Timer.

```
void tau_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
```

```
    (void) R_TAU_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer0_ctrl, &status);
}
```

```
void tau_higher_8bit_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_higher_8bit_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_TAU_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU Input Capture Example

This is an example of using the TAU to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint32_t g_captured_time = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CAPTURE_EDGE == p_args->event)
    {
 /* Process capture from TAUIO. */
       g_captured_time = p_args->capture;
    }
```

```
}
void tau_input_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer_input_capture_ctrl, &g_timer_input_capture_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_TAU_Enable(&g_timer_input_capture_ctrl);
 /* (Optional) Disable captures. */
    (void) R_TAU_Disable(&g_timer_input_capture_ctrl);
}
```

TAU Period Update Example

This is an example of updating the period.

```
#define TAU_EXAMPLE_MSEC_PER_SEC (1000)
#define TAU_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tau_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer0_ctrl);
 /* Get operation clock frequency
  * - Use the R_TAU_InfoGet function (it accounts for the clock source and divider of
operation clock ).
  */
 timer_info_t info;
```

```
    (void) R_TAU_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / iclk_freq_hz. A cast to uint32_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) ((timer_freq_hz * TAU_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_TAU_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

TAU Square Wave Output Function Example

This is an example of configuration for Square Wave Output Function.

```
/* This example shows how configure squarewave output function. */
void tau_squarewave_output_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_squarewave_ctrl, &g_timer_squarewave_cfg);
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_Start(&g_timer_squarewave_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_squarewave_ctrl, &status);
}
```

TAU External Event Counter Function Example

This is an example of configuration for External Event Counter Function.

```
/* This example shows how to configure the external event counter function. */
void tau_external_event_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_external_event_ctrl, &g_timer_external_event_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable external event counter */
    (void) R_TAU_Enable(&g_timer_external_event_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_external_event_ctrl, &status);
}
```

TAU Divider Function Example

This is an example of configuration for Divider Function.

```
/* This example shows how configure divider function. */
void tau_divider_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_divider_ctrl, &g_timer_divider_cfg);
    assert(FSP_SUCCESS == err);
 /* Start the divider. */
    (void) R_TAU_Start(&g_timer_divider_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_divider_ctrl, &status);
}
```

TAU Delay Counter Function Example

This is an example of configuration for Delay Counter Function.

```
/* This example shows how configure delay counter function. */
void tau_delay_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers. */
    err = R_TAU_Open(&g_timer_delay_counter_ctrl, &g_timer_delay_counter_cfg);
    assert(FSP_SUCCESS == err);
 /* Start Delay Counter. */
    (void) R_TAU_Enable(&g_timer_delay_counter_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_StatusGet(&g_timer_delay_counter_ctrl, &status);
}
```

Data Structures

struct	tau_instance_ctrl_t
struct	tau_extended_cfg_t

Enumerations

enum	tau_function_t
enum	tau_bit_mode_t
enum	tau_operation_ck_t
enum	tau_trigger_edge_t
enum	tau_interrupt_opirq_bit_t
enum	tau_input_source_t
enum	tau_pin_output_cfg_t
enum	tau_input_noise_filter_t

Data Structure Documentation

◆ tau_instance_ctrl_t

struct tau_instance_ctrl_t

Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ tau_extended_cfg_t

struct tau_extended_cfg_t		
Optional TAU extension data structure.		
Data Fields		
tau_interrupt_opirq_bit_t	opirq: 1	Setting of starting count and interrupt.
tau_function_t	tau_func	Setting of Function for TAU.
tau_bit_mode_t	bit_mode	Setting of 16-bit timer or 8-bit timer.
tau_pin_output_cfg_t	initial_output	Setting of Function for TAU.
tau_input_source_t	input_source	
tau_input_noise_filter_t	tau_filter	Input filter for TAU.
tau_trigger_edge_t	trigger_edge	Trigger edge to start pulse period measurement or count external event.
tau_operation_ck_t	operation_clock	
uint16_t	period_higher_8bit_counts	Period in raw higher 8 bit timer counts.
uint8_t	higher_8bit_cycle_end_ipl	Cycle higher 8-bit end interrupt priority.
IRQn_Type	higher_8bit_cycle_end_irq	Cycle higher 8-bit end interrupt.

Enumeration Type Documentation

◆ tau_function_t

enum tau_function_t	
Timer function	
Enumerator	
TAU_FUNCTION_INTERVAL	Interval Timer Function.
TAU_FUNCTION_SQUARE_WAVE	Square Wave Function.
TAU_FUNCTION_EXTERNAL_EVENT_COUNT	External Event Count Function.
TAU_FUNCTION_DIVIDER	Divider Function.
TAU_FUNCTION_INPUT_PULSE_INTERVAL_MEASUREMENT	Input Pulse Interval Function.
TAU_FUNCTION_LOW_LEVEL_WIDTH_MEASUREMENT	Low Level Width Measure Function.
TAU_FUNCTION_HIGH_LEVEL_WIDTH_MEASUREMENT	High Level Width Measure Function.
TAU_FUNCTION_DELAY_COUNT	Delay Count Function.

◆ tau_bit_mode_t

enum tau_bit_mode_t	
Timer bit mode	
Enumerator	
TAU_BIT_MODE_16BIT	16-Bit Timer Mode
TAU_BIT_MODE_HIGHER_8BIT	Higher 8-bit Timer Mode.
TAU_BIT_MODE_LOWER_8BIT	Lower 8-bit Timer Mode.
TAU_BIT_MODE_HIGHER_LOWER_8BIT	Lower and Higher 8-bit Timer Mode.

◆ tau_operation_ck_t

enum tau_operation_ck_t
Timer operation clock.

◆ tau_trigger_edge_t

enum tau_trigger_edge_t	
Trigger edge for pulse period measurement mode, high-low measurement, divider, delay counter and event counting mode.	
Enumerator	
TAU_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
TAU_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
TAU_TRIGGER_EDGE_BOTH	Events are counted on both edges (pulse period mode and high-low measurement)

◆ tau_interrupt_opirq_bit_t

enum tau_interrupt_opirq_bit_t
Interrupt and starting Count Mode

◆ tau_input_source_t

enum tau_input_source_t	
Input source	
Enumerator	
TAU_INPUT_SOURCE_TI_PIN	Timer Input Source is input pin.
TAU_INPUT_SOURCE_ELC	ELC Timer Input Source.
TAU_INPUT_SOURCE_RXD2_PIN	Timer Input Source is RXD2 pin.
TAU_INPUT_SOURCE_MOCO	Timer Input Source is MOCO.
TAU_INPUT_SOURCE_LOCO	Timer Input Source is LOCO.
TAU_INPUT_SOURCE_FSUB	Timer Input Source is FSUB.
TAU_INPUT_SOURCE_NONE	No Timer Input Source.

◆ tau_pin_output_cfg_t

enum tau_pin_output_cfg_t	
Level of TAU pin	
Enumerator	
TAU_PIN_OUTPUT_CFG_START_LEVEL_LOW	Pin level low.
TAU_PIN_OUTPUT_CFG_START_LEVEL_HIGH	Pin level high.
TAU_PIN_OUTPUT_CFG_DISABLED	Not used as output pin.

◆ tau_input_noise_filter_t

enum tau_input_noise_filter_t	
Input filter, applies TAU in high-low measurement, pulse width measurement, delay counter, divider, or event counter mode.	
Enumerator	
TAU_INPUT_NOISE_FILTER_DISABLE	Disable noise filter.
TAU_INPUT_NOISE_FILTER_ENABLE	Enable noise filter.

Function Documentation

◆ R_TAU_Open()

fsp_err_t R_TAU_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

The TAU implementation of the general timer can accept a tau_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_TAU_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_IRQ_BSP_DISABLED	Timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback
FSP_ERR_INVALID_MODE	Invalid configuration for p_extend.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TAU_Stop()

fsp_err_t R_TAU_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_TAU_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Start()

fsp_err_t R_TAU_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_TAU_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Reset()

fsp_err_t R_TAU_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Input Pulse Function is reset counter value to 0. Implements timer_api_t::reset.

Note

This function can not reset the counter when counter is stopped, and function High/Low Measurement Function is used.

Return values

FSP_SUCCESS	The counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Enable()

fsp_err_t R_TAU_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_TAU_Enable(&g_timer_input_capture_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_Disable()

fsp_err_t R_TAU_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Note

The timer could be running after R_TAU_Disable(). To ensure it is stopped, call R_TAU_Stop().

Example:

```
/* (Optional) Disable captures. */
   (void) R_TAU_Disable(&g_timer_input_capture_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PeriodSet()

fsp_err_t R_TAU_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter underflow. If the timer is stopped, this function resets the counter and updates the period. This Function is not supported for Input pulse Function, High-Low Measurement Function. Implements timer_api_t::periodSet.

Note

if timer mode is Lower and Higher 8-bit Timer Mode, the last 8 bits are the lower 8-bits of the timer, and the subsequent 8 bits are the higher 8-bits of the timer

Example:

```
/* Get operation clock frequency
 * - Use the R_TAU_InfoGet function (it accounts for the clock source and divider of operation clock ).
 */
timer_info_t info;
   (void) R_TAU_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
/* Calculate the desired period based on the current clock. Note that this calculation could overflow if the
 * desired period is larger than UINT32_MAX / iclk_freq_hz. A cast to uint32_t is used to prevent this. */
   uint32_t period_counts =
      (uint32_t) ((timer_freq_hz * TAU_EXAMPLE_DESIRED_PERIOD_MSEC) / TAU_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. This will return an error if parameter checking is enabled and the calculated
 * period is larger than UINT16_MAX. */
   err = R_TAU_PeriodSet(&g_timer0_ctrl, period_counts);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or period is invalid range.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_UNSUPPORTED	Unsupported for Input pulse Function, High-Low Measurement Function

◆ R_TAU_CompareMatchSet()

fsp_err_t R_TAU_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	TAU compare match is not supported.

◆ R_TAU_DutyCycleSet()

fsp_err_t R_TAU_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

timer_api_t::dutyCycleSet is not supported on the R_TAU Independent channels.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_TAU_InfoGet()

fsp_err_t R_TAU_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
timer_info_t info;
   (void) R_TAU_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_StatusGet()

fsp_err_t R_TAU_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_TAU_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_CallbackSet()

fsp_err_t R_TAU_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_TAU_Close()

fsp_err_t R_TAU_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_LinMeasurementFuncSwitch()

fsp_err_t R_TAU_LinMeasurementFuncSwitch (timer_ctrl_t *const *p_ctrl*, tau_function_t *func*)

This function is provided for the SAU LIN driver to support switching between low level measurement and input pulse measurement functions during LIN reception. It is not intended to be called directly by application code.

Parameters

[in]	p_ctrl	Pointer to TAU control structure
[in]	func	Measurement functions (TAU_FUNCTION_LOW_LEVEL_WIDTH_MEASUREMENT, TAU_FUNCTION_INPUT_PULSE_INTERVAL_MEASUREMENT)

Return values

FSP_SUCCESS	Switching was successful and measurement has started.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid input function.

5.2.19.2 Port Output Enable for GPT (r_poeg)

Modules » Timers

Functions

fsp_err_t	R_POEG_Open (poeg_ctrl_t *const p_ctrl, poeg_cfg_t const *const p_cfg)

fsp_err_t	R_POEG_Close (poeg_ctrl_t *const p_ctrl)

Detailed Description

Driver for the POEG peripheral on RA MCUs. This module implements the POEG Interface.

Overview

The POEG module can be used to configure events to disable GPT GTIOC output pins.

Features

The POEG module has the following features:

- Supports disabling GPT output pins based on GTETRG input pin level.
- Supports disabling GPT output pins based on comparator crossing events (configurable in the Comparator, High-Speed (r_acmphs) driver).
- Supports disabling GPT output pins when GTIOC pins are the same level (configurable in the Timer, General PWM (r_gpt) driver).
- Supports disabling GPT output pins when main oscillator stop is detected.
- Supports disabling GPT output pins by software API.
- Supports notifying the application when GPT output pins are disabled by POEG.
- Supports resetting POEG status.

Configuration

Build Time Configurations for r_poeg

The following build time configurations are defined in fsp_cfg/r_poeg_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Port Output Enable for GPT (r_poeg)

This module can be added to the Stacks tab via New Stack > Timers > Port Output Enable for GPT (r_poeg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_poeg0	Module name.
Channel	Must be a valid POEG channel	0	Specify the hardware channel.
Trigger	MCU Specific Options		Select the trigger

			sources that will enable POEG. Software disable is always supported. This configuration can only be set once after reset. It cannot be modified after the initial setting.
Input			
GTETRG Polarity	• Active High • Active Low	Active High	Select the polarity of the GTETRG pin. Only applicable if GTETRG pin is selected under Trigger.
GTETRG Noise Filter	• Disabled • PCLKB/1 • PCLKB/8 • PCLKB/32 • PCLKB/128	Disabled	Configure the noise filter for the GTETRG pin. Only applicable if GTETRG pin is selected under Trigger.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) when GPT output pins are disabled by POEG.
Interrupt Priority	MCU Specific Options		Select the POEG interrupt priority.

Clock Configuration

The POEG clock is based on the PCLKB frequency.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, or GTETRGD as an input signal to disable GPT output pins.

Usage Notes

POEG GTETRG Pin and Channel

The POEG channel number corresponds to the GTETRG input pin that can be used with the channel. GTETRGA must be used with POEG channel 0, GTETRGB must be used with POEG channel 1, etc.

Limitations

The user should be aware of the following limitations when using POEG:

- The POEG trigger source can only be set once per channel. Modifying the POEG trigger source after it is set is not allowed by the hardware.
- The POEG cannot be disabled using this API. The interrupt is disabled in R_POEG_Close(), but the POEG will still disable the GPT output pins if a trigger is detected even if the module is closed.

Examples

POEG Basic Example

This is a basic example of minimal use of the POEG in an application.

```
void poeg_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the POEG. */
    err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

POEG Callback Example

This is an example of a using the POEG callback to restore GPT output operation.

```
/* Example callback called when POEG disables GPT output pins. */
void poeg_callback (poeg_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 /* (Optional) Determine the cause of the POEG event. */
 poeg_status_t status;
    (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
 /* Correct the cause of the POEG event before resetting POEG. */
 /* Reset the POEG before exiting the callback. */
    (void) R_POEG_Reset(&g_poeg0_ctrl);
 /* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
  * again. */
```

```
do
   {
     (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
   } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
 /* Alternatively, if the POEG cannot be reset, disable the POEG interrupt to prevent
it from firing continuously.
  * Update the 0 in the macro below to match the POEG channel number. */
   NVIC_DisableIRQ(VECTOR_NUMBER_POEG0_EVENT);
}
```

Data Structures

struct	poeg_instance_ctrl_t

Data Structure Documentation

◆ poeg_instance_ctrl_t

struct poeg_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when poeg_api_t::open is called.

Function Documentation

◆ R_POEG_Open()

fsp_err_t R_POEG_Open (poeg_ctrl_t *const *p_ctrl*, poeg_cfg_t const *const *p_cfg*)

Initializes the POEG module and applies configurations. Implements poeg_api_t::open.

Note

The poeg_cfg_t::trigger setting can only be configured once after reset. Reopening with a different trigger configuration is not possible.

Example:

```
/* Initializes the POEG. */
   err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	poeg_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_POEG_OutputDisable()

fsp_err_t R_POEG_OutputDisable (poeg_ctrl_t *const *p_ctrl*)

Disables GPT output pins. Implements poeg_api_t::outputDisable.

Return values

FSP_SUCCESS	GPT output pins successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_Reset()

fsp_err_t R_POEG_Reset (poeg_ctrl_t *const *p_ctrl*)

Resets status flags. Implements poeg_api_t::reset.

Note

Status flags are only reset if the original POEG trigger is resolved. Check the status using R_POEG_StatusGet after calling this function to verify the status is cleared.

Example:

```
/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
   (void) R_POEG_Reset(&g_poeg0_ctrl);
/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
 * again. */
do
   {
     (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
   } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
```

Return values

FSP_SUCCESS	Function attempted to clear status flags.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_StatusGet()

fsp_err_t R_POEG_StatusGet (poeg_ctrl_t *const *p_ctrl*, poeg_status_t *const *p_status*)

Get current POEG status and store it in provided pointer p_status. Implements poeg_api_t::statusGet.

Example:

```
/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;
   (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current POEG state stored successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_CallbackSet()

fsp_err_t R_POEG_CallbackSet (poeg_ctrl_t *const *p_ctrl*, void(*)(poeg_callback_args_t *) *p_callback*, void *const *p_context*, poeg_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements poeg_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_POEG_Close()

fsp_err_t R_POEG_Close (poeg_ctrl_t *const *p_ctrl*)
Disables POEG interrupt. Implements poeg_api_t::close. ***Note*** *This function does not disable the POEG.* **Return values**

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC time and date get and set.
- RTC time and date alarm get and set.
- RTC alarm and periodic event notification.
- RTC time capture.

The RTC HAL module supports three different interrupt types:

- An alarm interrupt generated on a match of any combination of year, month, day, day of the week, hour, minute or second
- A periodic interrupt generated every 2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, or 1/256 second(s)
- A carry interrupt is used internally when reading time from the RTC calender to get accurant time readings.
  Note
  See "Reading 64-Hz Counter and Time" in the RTC section of the relevant hardware manual for more details.
  A user-defined callback function can be registered (in the rtc_api_t::open API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure (rtc_callback_args_t) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for calendarTimeSet and calendarAlarmSet APIs. If "Parameter Checking" is enabled, the 'day of the week' field is automatically calculated and updated by the driver for the provided date. When using the calendarAlarmSet API, only the fields which have their corresponding match flag set are written to the registers. Other register fields are reset to default value.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused

by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initiliazing the driver. Application must make calls to the error adjustment APIs for desired adjustment. See "Time Error Adjustment Function" in the RTC section of the relevant hardware manual for more details on this feature.

Configuration

Build Time Configurations for r_rtc

The following build time configurations are defined in fsp_cfg/r_rtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Set Source Clock in Open	• Enabled • Disabled	Enabled	If enabled RTC source clock is initialized in R_RTC_Open. If disabled, R_RTC_ClockSourceSet must be called to set the RTC source clock. Disable if user wants to control the setting of RTC source clock after warm start.

Configurations for Timers > Realtime Clock (r_rtc)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Clock Source	MCU Specific Options		Select the RTC clock source.
Frequency Comparison Value (LOCO)	Value must be a positive integer between 7 and 511	255	Frequency comparison value when using LOCO

Automatic Adjustment Mode	• Enabled • Disabled	Enabled	Enable/ Disable the Error Adjustment mode
Automatic Adjustment Period	• 10 Seconds • 1 Minute • NONE	10 Seconds	Select the Error Adjustment Period for Automatic Adjustment
Adjustment Type (Plus-Minus)	• NONE • Addition • Subtraction	NONE	Select the Error Adjustment type
Error Adjustment Value	Manual Entry	0	Specify the Adjustment Value (the number of sub-clock cycles) from the prescaler
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Alarm Interrupt Priority	MCU Specific Options		Select the alarm interrupt priority.
Period Interrupt Priority	MCU Specific Options		Select the period interrupt priority.
Carry Interrupt Priority	MCU Specific Options		Select the carry interrupt priority.

Note

See "Frequency Register (RFRH/RFRL)" in the RTC section of the relevant hardware manual for more details

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources:

- LOCO (Low Speed On-Chip Oscillator) with less accuracy
- Sub-clock oscillator with increased accuracy

Users have to select the right source for their application. LOCO is the default during configuration when it is available.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Carry interrupt priority must be set to avoid incorrect time returned from calendarTimeGet API during roll-over.
- Even when only running in Periodic Interrupt mode R_RTC_CalendarTimeSet must be called successfully to start the RTC.
- In case of warm start or a hard reset (when VBATT powers RTC in case of power loss), user might not want to reinitialize the clock source after reset. In this case, disable the Set Source Clock in Open property for RTC and call R_RTC_ClockSourceSet() only when RTC clock source needs to be set. Application should check for the reset type and should accordingly call the R_RTC_ClockSourceSet().

Limitations

Developers should be aware of the following limitations when using the RTC:

- R_RTC operates in 24-hour mode.
- Binary-count mode is not supported.
- The R_RTC_CalendarTimeGet() cannot be used from an interrupt that has higher priority than the carry interrupt. Also, it must not be called with interrupts disabled globally, as this API internally uses carry interrupt for its processing. API may return incorrect time if this is done.
- Time capture input pins should be configured prior to opening RTC.
- When multiple events are detected, the capture time for the first event is retained. Time capture value must be got and reset status bit for the next capture when having event input.

VRTC-Domain

VRTC-domain provides power supply to SOSC and RTC on devices with IRTC:

- In case VRTC-domain is invalid, SOSC and RTC will be in undetermined state. Any operation related to RTC and sub-clock should be avoided.
- When VRTC-domain becomes valid again, application is responsible to reinitialize SOSC and RTC. Sub-clock initialization can be done by calling R_BSP_SubclockInitialize().
- BSP provides R_BSP_SubclockStatusGet() to check the status of VRTC domain. But, it is recommended to use LVD to monitor VRTC domain change. Please refer to Low/Programmable Voltage Detection (r_lvd) module for more details.

Time Capture

The RTC is capable of storing the month, day, hour, minute and second when detecting an edge of a signal on a time capture event input pin. On RA parts up to three capture channels can be configured.

- Use R_RTC_TimeCaptureSet to configure the detection source and noise filter for each capture channel.
- Use R_RTC_TimeCaptureGet to check the latest capture. If no capture has been triggered the function will return FSP_ERR_INVALID_STATE.
- Even when the supply of power from the VCC power supply pin is stopped and VRTC power is being supplied, the time capture function of the time capture event input pins (RTCICn) can be used.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
void rtc_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* Set the calendar time */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Get the calendar time */
```

```
 R_RTC_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Clock Source Set Example

This is an example of how to handle call to set the RTC clock.

```
void rtc_clock_source_set_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* This condition can differ based on use case. */
 if (R_SYSTEM->RSTSR0 == 1)
    {
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    }
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_periodic_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_alarm_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
```

```
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
 R_RTC_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
 /* Wait for the Alarm interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```
void rtc_erroradj_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
 R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
 /* Modify Error Adjustment after RTC is running */
    err = R_RTC_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
    assert(FSP_SUCCESS == err);
}
```

RTC with VRTC-domain example

This is an example of calling RTC API on devices with VRTC-domain.

```
#if BSP_FEATURE_RTC_IS_IRTC
void rtc_vrtc_domain_checking_example ()
{
 fsp_err_t       err       = FSP_SUCCESS;
 static uint32_t rtc_opened = 0;
```

```
 while (1)
    {
       err = R_BSP_SubclockStatusGet();
 if (FSP_SUCCESS != err)
     {
 /* RTC API should not be called. */
 /* Try to initialize SOSC. */
           err = R_BSP_SubclockInitialize();
 if (FSP_SUCCESS == err)
     {
 /* Delay for sub-clock oscillation stabilization time */
 R_BSP_SoftwareDelay(BSP_CLOCK_CFG_SUBCLOCK_STABILIZATION_MS,
BSP_DELAY_UNITS_MILLISECONDS);
     }
     }
 else
     {
 /* VRTC-domain reset will not initialize RTC registers. */
 if (0 == rtc_opened)
     {
               err       = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
               rtc_opened = (FSP_SUCCESS == err) ? 1 : 0;
     }
 /* Other RTC API can be called if needed. */
     }
    }
}
#endif
```

RTC Time Capture example

This is an example of calling Time Capture API on RTC with Independent Power Supply.

```
void rtc_irtc_time_capture_example ()
{
```

```
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure a GPIO pin to trigger the Time Capture pin */
 R_BSP_PinCfg(RTC_TIME_CAPTURE_TRIGGER_CHANNEL_0, (uint32_t) BSP_IO_DIRECTION_OUTPUT
);
 /* Preset trigger pin */
 R_BSP_PinWrite(RTC_TIME_CAPTURE_TRIGGER_CHANNEL_0, BSP_IO_LEVEL_LOW);
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set time capture configuration for the provided channel when RTC is running */
    err = R_RTC_TimeCaptureSet(&g_rtc0_ctrl, &g_rtc_time_capture);
    assert(FSP_SUCCESS == err);
 /* Update trigger pin */
 R_BSP_PinWrite(RTC_TIME_CAPTURE_TRIGGER_CHANNEL_0, BSP_IO_LEVEL_HIGH);
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Get the time capture for the provided channel */
    err = R_RTC_TimeCaptureGet(&g_rtc0_ctrl, &g_rtc_time_capture);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rtc_extended_cfg_t
struct	rtc_instance_ctrl_t

Data Structure Documentation

◆ rtc_extended_cfg_t

struct rtc_extended_cfg_t

RTC extend configuration		
Data Fields		
uint8_t	alarm1_ipl	Alarm 1 interrupt priority.
IRQn_Type	alarm1_irq	Alarm 1 interrupt vector.

◆ rtc_instance_ctrl_t

struct rtc_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.
volatile bool	carry_isr_triggered
	Was the carry isr triggered.

Function Documentation

◆ R_RTC_Open()

fsp_err_t R_RTC_Open (rtc_ctrl_t *const *p_ctrl*, rtc_cfg_t const *const *p_cfg*)

Opens and configures the RTC driver module. Implements rtc_api_t::open. Configuration includes clock source, and interrupt callback function.

Example:

```
/* Open the RTC module */
   err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_Close()

fsp_err_t R_RTC_Close (rtc_ctrl_t *const *p_ctrl*)

Close the RTC driver. Implements rtc_api_t::close

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ R_RTC_ClockSourceSet()

fsp_err_t R_RTC_ClockSourceSet (rtc_ctrl_t *const *p_ctrl*)

Sets the RTC clock source. Implements rtc_api_t::clockSourceSet.

Example:

```
/* This condition can differ based on use case. */
if (R_SYSTEM->RSTSR0 == 1)
   {
/* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
R_RTC_ClockSourceSet(&g_rtc0_ctrl);
   }
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid clock source.

◆ R_RTC_CalendarTimeSet()

fsp_err_t R_RTC_CalendarTimeSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Set the calendar time.

Implements rtc_api_t::calendarTimeSet.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_CalendarTimeGet()

fsp_err_t R_RTC_CalendarTimeGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements rtc_api_t::calendarTimeGet

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_CalendarAlarmSet()

fsp_err_t R_RTC_CalendarAlarmSet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Set the calendar alarm time.

Implements rtc_api_t::calendarAlarmSet.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_CalendarAlarmGet()

fsp_err_t R_RTC_CalendarAlarmGet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Get the calendar alarm time.

Implements rtc_api_t::calendarAlarmGet

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_PeriodicIrqRateSet()

fsp_err_t R_RTC_PeriodicIrqRateSet (rtc_ctrl_t *const *p_ctrl*, rtc_periodic_irq_select_t const *rate*)

Set the periodic interrupt rate and enable periodic interrupt.

Implements rtc_api_t::periodicIrqRateSet

Note

To start the RTC R_RTC_CalendarTimeSet must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_InfoGet()

fsp_err_t R_RTC_InfoGet (rtc_ctrl_t *const *p_ctrl*, rtc_info_t *const *p_rtc_info*)

Set RTC clock source and running status information ad store it in provided pointer p_rtc_info

Implements rtc_api_t::infoGet

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_ErrorAdjustmentSet()

fsp_err_t R_RTC_ErrorAdjustmentSet (rtc_ctrl_t *const *p_ctrl*, rtc_error_adjustment_cfg_t const *const *err_adj_cfg*)

This function sets time error adjustment

Implements rtc_api_t::errorAdjustmentSet

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_UNSUPPORTED	The clock source is not sub-clock.
FSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.

◆ R_RTC_CallbackSet()

fsp_err_t R_RTC_CallbackSet (rtc_ctrl_t *const *p_ctrl*, void(*)(rtc_callback_args_t *) *p_callback*, void *const *p_context*, rtc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements rtc_api_t::callbackSet

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_RTC_TimeCaptureSet()

fsp_err_t R_RTC_TimeCaptureSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Set time capture configuration for the provided channel.

Implements rtc_api_t::timeCaptureSet

Note

Updating capture settings requires significant software delay. Timing considerations should be carefully considered when calling this function.

Return values

FSP_SUCCESS	Setting for Time capture was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_CHANNEL	Invalid input channel set.
FSP_ERR_UNSUPPORTED	Hardware not support this feature.

◆ R_RTC_TimeCaptureGet()

fsp_err_t R_RTC_TimeCaptureGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Get time capture value of the provided channel.

Implements rtc_api_t::timeCaptureGet

Return values

FSP_SUCCESS	Get time capture successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_CHANNEL	Invalid input channel get.
FSP_ERR_INVALID_STATE	Invalid operation state.
FSP_ERR_UNSUPPORTED	Hardware not support this feature.

fsp_err_t	R_RTC_C_TimeCaptureGet (rtc_ctrl_t *const p_ctrl, rtc_time_capture_t *const p_time_capture)

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC_C time and date get and set.
- RTC_C time and date alarm get and set.
- RTC_C alarm and periodic event notification.

The RTC HAL module supports two different interrupt types:

- An alarm interrupt generated on a match of any combination of minute, hour and day of the week.
- A periodic interrupt generated every 1 month, 1 day, 1 hour, 1 minute, 1 second and 1/2 second.

A user-defined callback function can be registered (in the rtc_api_t::open API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure (rtc_callback_args_t) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for calendarTimeSet and calendarAlarmSet APIs. When using the calendarAlarmSet API, minute, hour and day of the week are written to the related registers.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the

clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initializing the driver. Application must make calls to the error adjustment api's for desired adjustment.

Configuration

Build Time Configurations for r_rtc_c

The following build time configurations are defined in fsp_cfg/r_rtc_c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Realtime Clock (r_rtc_c)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc_c).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Operation clock	• FSXP • SOSC/256 (128 Hz)	FSXP	Select the RTC operation clock. If using 'SOSC/256' as the source for RTCCLK, the FSXP source cannot be LOCO in Clock tab.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority	MCU Specific Options		Select the period or alarm interrupt priority.

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources(setting in clock page):

- Sub-Clock: SOSC (32.768 kHz)
- SOSC/256 (128 Hz)
- LOCO (32.768 kHz)

Users have to select the right source for their application. Sub-Clock is the default during configuration when it is available.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning
The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Even when only running in Periodic Interrupt mode R_RTC_C_CalendarTimeSet must be called successfully to start the RTC.

Limitations

Developers should be aware of the following limitations when using the RTC_C:

- R_RTC_C operates in 24-hour mode.
- If using 'SOSC/256' as the source for RTC operation clock, the FSXP source cannot be LOCO in Clock tab.
- Time error correction function can only proceed when the setting of the RTCC0.RTC128EN bit is 0.
- Alarm clock interrupt can work under LOCO clock source, but it is unstable. Please use alarm clock interrupt function under other clocks.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC_C in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
```

```
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
void rtc_c_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the calendar time */
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Get the calendar time */
 R_RTC_C_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Calendar Time Set example

This is an example of setting calendar time in RTC_C.

Warning

The weekday must be set correctly even when parameter checking is disabled.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_calendar_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
 /* tm_wday value must be set correctly */
```

```
    .tm_wday = 5,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
void rtc_c_calendar_time_set_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the calendar time and date */
    err = R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_calendar_time);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_c_periodic_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* R_RTC_C_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_C_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
```

```
 /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_c_alarm_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
    err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 R_RTC_C_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
 /* Wait for the Alarm interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```
void rtc_c_erroradj_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
 R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 R_RTC_C_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Modify Error Adjustment after RTC is running */
    err = R_RTC_C_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
```

```
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rtc_c_extended_cfg
struct	rtc_c_instance_ctrl_t

Enumerations

enum	rtc_c_subclock_division_t

Data Structure Documentation

◆ rtc_c_extended_cfg

struct rtc_c_extended_cfg		
RTC extended configuration		
Data Fields		
rtc_c_subclock_division_t	clock_source_div	The sub clock division value.

◆ rtc_c_instance_ctrl_t

struct rtc_c_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.

Enumeration Type Documentation

◆ rtc_c_subclock_division_t

enum rtc_c_subclock_division_t	
RTC sub_clock division	
Enumerator	
RTC_CLOCK_SOURCE_SUBCLOCK_DIV_BY_1	Using sub_clock for rct_c clock.
RTC_CLOCK_SOURCE_SUBCLOCK_DIV_BY_256	Using (sub_clock / 256) for rct_c clock.

Function Documentation

◆ R_RTC_C_Open()

fsp_err_t R_RTC_C_Open (rtc_ctrl_t *const *p_ctrl*, rtc_cfg_t const *const *p_cfg*)

Opens and configures the RTC driver module. Implements rtc_api_t::open. Configuration includes clock source, and interrupt callback function.

R_RTC_Open should be called to manipulate the RTC instead of setting register directly.

Example:

```
/* Open the RTC module */
   err = R_RTC_C_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_UNSUPPORTED	Invalid clock source.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_MODE	Subsystem clock should use SOSC before setting realtime clock to SOSC/256.
FSP_ERR_ASSERTION	Invalid time parameter field.

◆ R_RTC_C_Close()

fsp_err_t R_RTC_C_Close (rtc_ctrl_t *const *p_ctrl*)

Close the RTC driver. Implements rtc_api_t::close

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ R_RTC_C_ClockSourceSet()

fsp_err_t R_RTC_C_ClockSourceSet (rtc_ctrl_t *const *p_ctrl*)

Setting clock source is not supported on the RTC_C.

Return values

FSP_ERR_UNSUPPORTED	Please set clock source in clock page.

◆ R_RTC_C_CalendarTimeSet()

fsp_err_t R_RTC_C_CalendarTimeSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Set the calendar time.

Implements rtc_api_t::calendarTimeSet.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter field.

◆ R_RTC_C_CalendarTimeGet()

fsp_err_t R_RTC_C_CalendarTimeGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements rtc_api_t::calendarTimeGet

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_C_CalendarAlarmSet()

fsp_err_t R_RTC_C_CalendarAlarmSet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Set the calendar alarm time. For the p_alarm, only minutes, hours and weekdays are valid. Minutes 0 to 59. Hours 0 to 23. Weekdays 0 to 127.

Implements rtc_api_t::calendarAlarmSet.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	Interrupt must be enabled to use the alarm.

◆ R_RTC_C_CalendarAlarmGet()

fsp_err_t R_RTC_C_CalendarAlarmGet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Get the calendar alarm time. For the p_alarm, only minutes, hours and weekdays will be got.

Implements rtc_api_t::calendarAlarmGet

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_C_PeriodicIrqRateSet()

fsp_err_t R_RTC_C_PeriodicIrqRateSet (rtc_ctrl_t *const *p_ctrl*, rtc_periodic_irq_select_t const *rate*)

Set the periodic interrupt rate and enable periodic interrupt.

Implements rtc_api_t::periodicIrqRateSet

Note

To start the RTC R_RTC_C_CalendarTimeSet must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_C_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_C_InfoGet()

fsp_err_t R_RTC_C_InfoGet (rtc_ctrl_t *const *p_ctrl*, rtc_info_t *const *p_rtc_info*)

Get RTC_C running status information ad store it in provided pointer p_rtc_info

Implements rtc_api_t::infoGet

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Realtime clock module is stopped.

◆ R_RTC_C_ErrorAdjustmentSet()

fsp_err_t R_RTC_C_ErrorAdjustmentSet (rtc_ctrl_t *const *p_ctrl*, rtc_error_adjustment_cfg_t const *const *err_adj_cfg*)

This function sets time error adjustment

Implements rtc_api_t::errorAdjustmentSet

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_INVALID_ARGUMENT	Not under sub-clock or invalid error adjustment value.

◆ R_RTC_C_CallbackSet()

fsp_err_t R_RTC_C_CallbackSet (rtc_ctrl_t *const *p_ctrl*, void(*)(rtc_callback_args_t *) *p_callback*, void *const *p_context*, rtc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements rtc_api_t::callbackSet

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_RTC_C_TimeCaptureSet()

fsp_err_t R_RTC_C_TimeCaptureSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Capture is not supported on the RTC_C.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_RTC_C_TimeCaptureGet()

fsp_err_t R_RTC_C_TimeCaptureGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_capture_t *const *p_time_capture*)

Capture is not supported on the RTC_C.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

5.2.19.5 Three-Phase PWM (r_gpt_three_phase)

fsp_err_t	R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const p_ctrl, three_phase_duty_cycle_t *const p_duty_cycle)
fsp_err_t	R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const p_ctrl, void(*p_callback)(timer_callback_args_t *), void *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const p_ctrl)

Detailed Description

Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the Three-Phase Interface.

Overview

The General PWM Timer (GPT) Three-Phase driver provides basic functionality for synchronously starting and stopping three PWM channels for use in 3-phase motor control applications. A function is additionally provided to allow setting duty cycle values for all three channels, optionally with double-buffering.

Features

The GPT Three-Phase driver provides the following functions:

- Synchronize configuration of three GPT channels
- Synchronously start, stop and reset all three GPT channels
- Set duty cycle on all three channels with one function

Configuration

Build Time Configurations for r_gpt_three_phase

The following build time configurations are defined in fsp_cfg/r_gpt_three_phase_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Three-Phase PWM (r_gpt_three_phase)

This module can be added to the Stacks tab via New Stack > Timers > Three-Phase PWM (r_gpt_three_phase). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_three_phase0	Module name.
Mode	• Triangle-Wave Symmetric PWM • Triangle-Wave Asymmetric PWM • Triangle-Wave Asymmetric PWM (Mode 3)	Triangle-Wave Symmetric PWM	Mode selection. Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough. Triangle-Wave Asymmetric PWM: Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.
Period	Value must be a non-negative integer less than or equal to 0x40000000000	15	Specify the timer period in units selected below. Setting the period to 0x100000000 raw counts results in the maximum period. Set the period to 0x100000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x40000000000, which will use a divider of 1024 with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period

			that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated timer_cfg_t structures for each timer.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Kilohertz	Unit of the period specified above
GPT U-Channel	Value must be an integer greater than or equal to 0	0	Specify the GPT channel for U signal output.
GPT V-Channel	Value must be an integer greater than or equal to 0	1	Specify the GPT channel for V signal output.
GPT W-Channel	Value must be an integer greater than or equal to 0	2	Specify the GPT channel for W signal output.
Callback Channel	• U-Channel • V-Channel • W-Channel	U-Channel	Specify the GPT channel to set a callback for when using R_GPT_THREE_PHASE_CallbackSet.
Buffer Mode	• Single Buffer • Double Buffer	Single Buffer	When Double Buffer is selected the 'duty_buffer' array in three_phase_duty_cycle_t is used as a buffer for the 'duty' array. This allows setting the duty cycle for the next two crest/trough events in asymmetric mode with only one call to R_GPT_THREE_PHASE_DutyCycleSet.
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.

Extra Features

Extra Features > Dead Time

Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during up counting. This value also applies during down counting for the GPT32 and GPT16 variants.
Dead Time Count Down (Raw Counts) (GPTE/GPTEH only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting. This value only applies to the GPT32E and GPT32EH variants.

Clock Configuration

Please refer to the Timer, General PWM (r_gpt) section for more information.

Pin Configuration

Please refer to the Timer, General PWM (r_gpt) section for more information.

Usage Notes

Warning

Be sure the GTIOCA/B stop level and dead time values are set appropriately for your application before attempting to drive a motor. Failure to do so may result in damage to the motor drive circuitry and/or the motor itself if the timer is stopped by software.

Initial Setup

The following should be configured once the GPT Three-Phase module has been added to a project:

1. Set "Pin Output Support" in one of the GPT submodules to "Enabled with Extra Features"
2. Configure common settings in the GPT Three-Phase module properties
3. Set the crest and trough interrupt priority and callback function in **one** of the three GPT submodules (if desired)
4. Set the "Extra Features -> Output Disable" settings in each GPT submodule as needed for your application

Note

Because all three modules are operated synchronously with the same period interrupts only need to be enabled in one of the three GPT modules.

Buffer Modes

There are two buffering modes available for duty cycle values - single- and double-buffered. In single buffer mode only the values specified in the duty array element of three_phase_duty_cycle_t are used by R_GPT_THREE_PHASE_DutyCycleSet. At the next trough or crest event the output duty cycle will be internally updated to the set values.

In double buffer mode the duty_buffer array values are used as buffer values for the duty elements. Once passed to R_GPT_THREE_PHASE_DutyCycleSet, the next trough or crest event will update the output duty cycle to the values specified in duty as before. However, at the following crest or trough event the output duty cycle will be updated to the values in duty_buffer. This allows the duty cycle for both sides of an asymmetric PWM waveform to be set at only one trough or crest event per period instead of at every event.

Examples

GPT Three-Phase Basic Example

This is a basic example of minimal use of the GPT Three-Phase module in an application. The duty cycle is updated at every timer trough with the previously loaded buffer value, then the duty cycle buffer is reloaded in the trough interrupt callback.

```
void gpt_callback (timer_callback_args_t * p_args)
{
 fsp_err_t                err;
 three_phase_duty_cycle_t duty_cycle;
 if (TIMER_EVENT_TROUGH == p_args->event)
    {
 /* Update duty cycle values (example) */
       duty_cycle.duty[THREE_PHASE_CHANNEL_U] =
get_duty_counts(THREE_PHASE_CHANNEL_U);
       duty_cycle.duty[THREE_PHASE_CHANNEL_V] =
get_duty_counts(THREE_PHASE_CHANNEL_V);
       duty_cycle.duty[THREE_PHASE_CHANNEL_W] =
get_duty_counts(THREE_PHASE_CHANNEL_W);
 /* Update duty cycle values */
       err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
       assert(FSP_SUCCESS == err);
    }
 else
    {
 /* Handle crest event. */
    }
}
void gpt_three_phase_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;
/* Initializes the module. */
   err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Start the timer. */
   (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
}
```

Data Structures

struct	gpt_three_phase_instance_ctrl_t

Data Structure Documentation

◆ gpt_three_phase_instance_ctrl_t

struct gpt_three_phase_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when three_phase_api_t::open is called.

Function Documentation

◆ R_GPT_THREE_PHASE_Open()

fsp_err_t R_GPT_THREE_PHASE_Open (three_phase_ctrl_t *const *p_ctrl*, three_phase_cfg_t const *const *p_cfg*)

Initializes the 3-phase timer module (and associated timers) and applies configurations. Implements three_phase_api_t::open.

Example:

```
/* Initializes the module. */
   err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_GPT_THREE_PHASE_Stop()

fsp_err_t R_GPT_THREE_PHASE_Stop (three_phase_ctrl_t *const *p_ctrl*)

Stops all timers synchronously. Implements three_phase_api_t::stop.

Return values

FSP_SUCCESS	Timers successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_Start()

fsp_err_t R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const *p_ctrl*)

Starts all timers synchronously. Implements three_phase_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
```

Return values

FSP_SUCCESS	Timers successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_Reset()

fsp_err_t R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const *p_ctrl*)

Resets the counter values to 0. Implements three_phase_api_t::reset.

Return values

FSP_SUCCESS	Counters were reset successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_DutyCycleSet()

fsp_err_t R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const *p_ctrl*, three_phase_duty_cycle_t *const *p_duty_cycle*)

Sets duty cycle for all three timers. Implements three_phase_api_t::dutyCycleSet.

In symmetric PWM mode duty cycle values are reflected after the next trough. In asymmetric PWM mode values are reflected at the next trough OR crest, whichever comes first.

When double-buffering is enabled the values in three_phase_duty_cycle_t::duty_buffer are set to the double-buffer registers. When values are reflected the first time the single buffer values (three_phase_duty_cycle_t::duty) are used. On the second reflection the duty_buffer values are used. In asymmetric PWM mode this enables both count-up and count-down PWM values to be set at trough (or crest) exclusively.

Note

It is recommended to call this function in a high-priority callback to ensure that it is not interrupted and that no GPT events occur during setting that would result in a duty cycle buffer load operation.

Example:

```
/* Update duty cycle values */
      err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
      assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	One or more duty cycle count values was outside the range 0..(period - 1).

◆ R_GPT_THREE_PHASE_CallbackSet()

fsp_err_t R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const *p_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback for the GPT U-channel with the option to provide memory for the callback argument structure. Implements three_phase_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_GPT_THREE_PHASE_Close()

fsp_err_t R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const *p_ctrl*)

Stops counters, disables output pins, and clears internal driver data. Implements three_phase_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

Detailed Description

Driver for the TML peripherals on RA MCUs. This module implements the Timer Interface.

Overview

The TML module can be used to count or count input events. TML operates with the HOCO, MOCO, MOSC, LOCO/SOSC clock or the event input from the ELC, which is asynchronous to CPU operation.

Features

The TML module has the following features:

- Supports 8-bit counter mode: 4 independent channels (Channel 0,Channel 1,Channel 2 and Channel 3).
- Supports 16-bit counter mode: 2 independent channels (Channel 0 and Channel 2).
- Supports 32-bit counter mode: 1 channel (channel 0).
- Supports 16-bit capture mode: 1 channel (channel 0).
- Supports count source of HOCO, MOCO, MOSC, LOCO/SOSC clock or ELC events.
- Configurable period (counts per timer cycle).
- Supports runtime reconfiguration of period.
- Supports capture-start by external sources from ELC events.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status.

Selecting a Timer

RA MCUs have different timer peripherals: the General PWM Timer (GPT), the 32-bit Interval Timer (TML), Timer Array Unit (TAU), and the Asynchronous General Purpose Timer (AGT). Some MCUs have multiple timer modules. When selecting between them, consider these factors:

	GPT	TML	AGT	TAU
Low Power Modes	The GPT can operate in sleep mode.	The TML can operate in all low power modes.	The AGT can operate in all low power modes.	The TAU can not operate in all low power modes.
Available Channels	The number of GPT channels is device specific. Currently supported MCUs have at least 7 GPT channels.	Currently supported MCUs have 4 TML channels.	Currently supported MCUs have 2 AGT channels.	Currently supported MCUs have 8 TAU channels.
Timer Resolution	Currently	The TML timers	The AGT timers	The TAU timers

	supported MCUs have at least one 32-bit GPT timer.	are 32-bit/16-bit/8-bit timers.	are 16-bit timers.	are 16-bit/8-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The TML runs off MOSC, LOCO/SOSC, HOCO, MOCO with a configurable divider up to 128 or ELC events.	The AGT runs off PCLKB, LOCO, or subclock.	The TAU runs off PCLK with a configurable divider up to 32768

Configuration

Build Time Configurations for r_tml

The following build time configurations are defined in fsp_cfg/r_tml_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Critical Section Guarding	• Enabled • Disabled	Disabled	Enable critical section guarding around peripheral configuration updates. This should be enabled if multiple instances of the R_TML module are being used.
16-bit Capture Mode Support	• Disabled • Enabled	Disabled	Controls whether 16-bit capture mode support is included in the build. This setting applies globally to all r_tml_instances. If 16-bit capture mode is not used by any instance, disable this setting to reduce ROM usage.
Enable Single Channel	• Disabled • Enabled	Disabled	Enable single channel to reduce code size. Assumes channel 0.
Interrupt Support	• Disabled • Enabled	Disabled	Enable support for interrupts.

Configurations for Timers > 32-bit Interval Timer (r_tml)

This module can be added to the Stacks tab via New Stack > Timers > 32-bit Interval Timer (r_tml).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Mode	• 8-bit Counter Mode • 16-bit Counter Mode • 32-bit Counter Mode • 16-bit Capture Mode	16-bit Counter Mode	Selection of Operating mode.
Channel Selection	Channel number must exist on this MCU	0	Specify the hardware channel.
ELC event	MCU Specific Options		Select the elc event.
Counter Mode Settings			
Period	Value must be positive integer	0x10000	Specify the timer period in units selected below. Set the period to 0x100 (8-bit) or 0x10000 (16-bit) or 0x100000000 (32-bit) raw counts for a free running timer. Since the maxmimum divider is 128... the raw counts period can be set up to the (max count+1)*128. [0x8000 (8-bit) or 0x800000 (16-bit), or 0x8000000000 (32-bit)].
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above. When the Counter Clock Source is the ELC, only Raw Counts can be selected here.
Capture Mode Settings			
Capture Mode Settings > 16-Bit Counter Input Settings (when Capture source = Interrupt on compare match with ITLCMP01)			
Period	Value must be positive	0x10000	Specify the timer

	integer		period in units selected below. Set the period to 0x10000 raw counts in the maximum period of 16-bit capture.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above. When the Capture Clock Source is the ELC, only Raw Counts can be selected here.
Capture Trigger	MCU Specific Options		Selection of capture trigger.
Capture Clock Divider	• fITL0 • fITL0/2 • fITL0/4 • fITL0/8 • fITL0/16 • fITL0/32 • fITL0/64 • fITL0/128	fITL0	Configure FDIV0 for the counter clock in 16-bit Capture Mode.
Counter Status	• Retained after the completion of capturing • Cleared after the completion of capturing	Retained after the completion of capturing	Selection of the 16-bit counter (ITL000 + ITL001) clearing after capturing.
Interrupt			
Callback function	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers
Priority	MCU Specific Options		Select the interrupt priority.

Clock Configuration

The TML operating clock is based on the HOCO, MOCO, MOSC, or LOCO/SOSC. The operating frequency will be based on the source chosen and the divider selected. You can set the clock frequencies using the **Clocks** tab of the RA Configuration editor or change the clock divider for the capture mode channel by **Capture Mode Settings->Capture Clock Divider**.

Note

The TML channels may be alternatively configured to use an event input from the ELC as a count clock in case no frequency/duration can be input, only "Raw Counts".

Pin Configuration

Usage Notes

Maximum Period

In capture mode, the clock divider for the capture channel has to be selected in **Capture Mode Settings->Capture Clock Divider**. If ITLCMP01 is the capture trigger input, the clock divider for channels 2 + 3 is not available.

When no capture mode is active, the RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x8000000000/0x800000/0x8000 on a 32-bit/16-bit/8-bit timer. This will configure the timer with the maximum period and a count clock divisor of 128.

Note

When an event input from ELC is used as an operation clock, the automatic calculation of the period count value and source clock divider is not available.

Updating Period

The period is updated after calling R_TML_PeriodSet().

Note

The period is only updated when the counter is stopped.
When using the API to set the period counts, the maximum timer_cfg_t::period_counts for 8-bit and 16-bit modes are 0x100 and 0x10000, respectively. To set the the maximum count for 32-bit mode, set the timer_cfg_t::period_counts to 0 (as 0x10000000 is outside the 32-bit range).
In the 16-bit capture mode, if the interrupt on compare match with ITLCMP01 is used as trigger source, the period counts of the 16-bit timer channels 2 + 3 can be changed at run-time.

Capture mode

When the 16-bit capture mode is to be used for channels 0 and 1, the counter value is stored in interval timer capture register 00 (ITLCAP00) in response to the selected capture trigger.

Note

*When Channels 0 and 1 are in capture mode, Channels 2 and 3 can be used to trigger the capture when ITLCMP01 is the capture trigger. In this case the counter setup for Channels 2 and 3 are in **Capture Mode Settings->16-Bit Counter Input Settings**. If ITLCMP01 is not the capture trigger input, Channels 2 and 3 may be setup as an independent instance of 16-bit Counter channel.*
When a capture trigger is generated when the timer is not running, the previous counter value of the capture channel is still copied to the Interval Timer Capture Register (ITLCAP00).
*The **Common->16-bit Capture Mode Support** property in the module configuration must be enabled to use the capture operation.*

Controlling TML with ELC Events

The TML timer can be configured to start count down or trigger capture when an ELC event occurs.

Note

The configurable ELC TML sources are shared by all TML channels.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with TML

The TML timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

TML Basic Example

This is a basic example of minimal use of the TML in an application.

```
void tml_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TML_Start(&g_timer0_ctrl);
}
```

TML Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

TML Counter Example

This is an example of 8/16/32-bit Counter.

```
void tml_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TML_Start(&g_timer0_ctrl);
 /* Read the current state. Counter value is in status.state. */
 timer_status_t status;
    (void) R_TML_StatusGet(&g_timer0_ctrl, &status);
 /* (Optional) Enable the mask for the interrupt flag. */
    (void) R_TML_Disable(&g_timer0_ctrl);
 /* (Optional) Disable the mask to use the interrupt. */
    (void) R_TML_Enable(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_TML_Stop(&g_timer0_ctrl);
}
```

TML Capture Example

This is an example of using the TML to capture the counter value of configured channel.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CAPTURE_EDGE == p_args->event)
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
```

```
      (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
      uint32_t period = info.period_counts;
      g_captured_time    = (period * g_capture_overflows) + p_args->capture;
      g_capture_overflows = 0U;
   }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
   {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
      g_capture_overflows++;
   }
}
void tml_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
   err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
 /* There are 4 ways to trigger the capture:
  * - Use software trigger by set the ITLCC0.CAPR bit to 1 directly after call start
  * - Use ELC event and wait for valid input
  * - Use LOCO/SOSC clock and wait for valid edge
  * - Use interrupt on compare match with ITLCPM01
  *
  * This example uses the last option.
  */
   (void) R_TML_Start(&g_timer0_ctrl);
}
```

TML Period Update Example

This an example of updating the period.

```
#define TML_EXAMPLE_MSEC_PER_SEC (1000)
```

```
#define TML_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tml_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Get the source clock frequency (in Hz) */
 timer_info_t info;
    (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint64_t is used to prevent
this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * TML_EXAMPLE_DESIRED_PERIOD_MSEC) /
TML_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_TML_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TML_Start(&g_timer0_ctrl);
}
```

Data Structures

Data Structure Documentation

◆ tml_extended_cfg_t

struct tml_extended_cfg_t		
User configuration structure, used in open function		
Data Fields		
tml_capture_trigger_t	capture_trigger	Select the capture source for capture channel.
tml_counter_status_t	counter_status	Status of 16-bit counter (ITL000 + ITL001) after completion of capturing.

◆ tml_instance_ctrl_t

struct tml_instance_ctrl_t	
TML instance control block.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
const timer_cfg_t *	p_cfg
	Pointer to the configuration block.
uint8_t	channel_mask
	Mask value of channel used.
void(*	p_callback)(timer_callback_args_t *)
	Pointer to callback that is called when a timer event occurs.
void *	p_context
	Pointer to context to be passed into callback function.

Enumeration Type Documentation

◆ tml_clock_t

enum tml_clock_t	
Enumeration for TML FITL0, FITL1 clock source	
Enumerator	
TML_CLOCK_HOCO	HOCO.
TML_CLOCK_MOCO	MOCO.
TML_CLOCK_MOSC	MOSC.
TML_CLOCK_LOCO_SOSC	SOSC.
TML_CLOCK_ELC_EVENT	Event input from the ELC.

◆ tml_capture_trigger_t

enum tml_capture_trigger_t	
Enumeration for TML FITL2 capture trigger source	
Enumerator	
TML_CAPTURE_TRIGGER_SOFTWARE	Software trigger.
TML_CAPTURE_TRIGGER_ITLCMP01	Interrupt on compare match with ITLCMP01.
TML_CAPTURE_TRIGGER_LOCO_SOSC	LOCO/SOSC (rising edge)
TML_CAPTURE_TRIGGER_EVENT_ELC	Event input from ELC (rising edge)

◆ tml_counter_status_t

enum tml_counter_status_t	
Enumeration for status of 16-bit counter (ITL000 + ITL001) after completion of capturing	
Enumerator	
TML_COUNTER_STATUS_RETAINED_AFTER_CAPTURING	16-bit counter (ITL000 + ITL001) is retained after the completion of capturing
TML_COUNTER_STATUS_CLEARED_AFTER_CAPTURING	16-bit counter (ITL000 + ITL001) is cleared after the completion of capturing

Function Documentation

◆ R_TML_Open()

fsp_err_t R_TML_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

TML hardware does not support one-shot functionality natively. If one shot mode is desired, the user code should stop the timer after the timer expires the first time in an ISR after the requested period has elapsed.

The TML implementation of the general timer can accept a tml_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_TML_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.
FSP_ERR_INVALID_CHANNEL	Selected channel is invalid
FSP_ERR_INVALID_MODE	The mode requested in the p_cfg parameter is incorrect. It must be the same for all instances.
FSP_ERR_IN_USE	Channel is running

◆ R_TML_Stop()

fsp_err_t R_TML_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the counter and disable the capture. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_TML_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Start()

fsp_err_t R_TML_Start (timer_ctrl_t *const *p_ctrl*)

Starts the counter and enable the capture. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_TML_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Reset()

fsp_err_t R_TML_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to 0. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Enable()

fsp_err_t R_TML_Enable (timer_ctrl_t *const *p_ctrl*)

Enable the interrupt generation from the selected channel timer_api_t::enable.

Example:

```
/* (Optional) Disable the mask to use the interrupt. */
   (void) R_TML_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_Disable()

fsp_err_t R_TML_Disable (timer_ctrl_t *const *p_ctrl*)

Disable the interrupt generation for this timer. Implements timer_api_t::disable.

Note

The timer could be stop after R_TML_Disable().

Example:

```
/* (Optional) Enable the mask for the interrupt flag. */
   (void) R_TML_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_PeriodSet()

fsp_err_t R_TML_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. Only set this value when all timers are stop. Implements timer_api_t::periodSet.

Example:

```
/* Get the source clock frequency (in Hz) */
timer_info_t info;
   (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
/* Calculate the desired period based on the current clock. Note that this calculation could overflow if the
 * desired period is larger than UINT32_MAX. A cast to uint64_t is used to prevent this. */
   uint32_t period_counts =
      (uint32_t) (((uint64_t) timer_freq_hz * TML_EXAMPLE_DESIRED_PERIOD_MSEC) / TML_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. */
   err = R_TML_PeriodSet(&g_timer0_ctrl, period_counts);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	Channel is running

◆ R_TML_DutyCycleSet()

fsp_err_t R_TML_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

timer_api_t::dutyCycleSet is not supported on the TML.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_TML_CompareMatchSet()

fsp_err_t R_TML_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

timer_api_t::compareMatchSet is not supported on the TML.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_TML_InfoGet()

fsp_err_t R_TML_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer configuration information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_TML_InfoGet(&g_timer0_ctrl, &info);
      uint32_t period = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TML_StatusGet()

fsp_err_t R_TML_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current state. Counter value is in status.state. */
timer_status_t status;
   (void) R_TML_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_TML_CallbackSet()

fsp_err_t R_TML_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_TML_Close()

fsp_err_t R_TML_Close (timer_ctrl_t *const *p_ctrl*)
Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — p_ctrl was NULL. FSP_ERR_NOT_OPEN — The instance is not opened. FSP_ERR_IP_CHANNEL_NOT_PRESENT — The channel requested in the p_cfg parameter is not available on this device. FSP_ERR_IN_USE — Channel is running

Detailed Description

Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the Timer Interface.

Overview

The GPT module can be used to count events, measure external input signals, generate a periodic interrupt, or output a periodic or PWM signal to a GTIOC pin.

This module supports the GPT peripherals GPT32EH, GPT32E, GPT32, and GPT16. GPT16 is a 16-bit timer. The other peripherals (GPT32EH, GPT32E, and GPT32) are 32-bit timers. The 32-bit timers are all treated the same in this module from the API perspective.

Features

The GPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Supports count source of PCLK, GTETRG pins, GTIOC pins, or ELC events.
- Supports debounce filter on GTIOC pins.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Supports runtime reconfiguration of period.

- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports runtime reconfiguration of compare match value.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Supports start, stop, clear, count up, count down, and capture by external sources from GTETRG pins, GTIOC pins, or ELC events.
- Supports symmetric and asymmetric PWM waveform generation.
- Supports One shot synchronous pulse waveform generation.
- Supports automatic addition of dead time.
- Supports generating ELC events to start an ADC scan at a compare match value (see Event Link Controller (r_elc)) and updating the compare match value.
- Supports linking with a POEG channel to automatically disable GPT output when an error condition is detected.
- Supports setting the counter value while the timer is stopped.
- Supports enabling and disabling output pins.
- Supports skipping up to seven overflow/underflow (crest/trough) interrupts at a time
- Supports generating custom PWM waveforms by configuring the pin's output level at each compare match and cycle end.
- Supports GTIOCnA and GTIOCnB input/output polarity control.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes.
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock.

Configuration

Build Time Configurations for r_gpt

The following build time configurations are defined in fsp_cfg/r_gpt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

	• Enabled • Disabled		parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled • Enabled with Extra Features	Disabled	Enables or disables support for outputting PWM waveforms on GTIOCx pins. The "Enabled with Extra Features" option enables support for Triangle wave modes and also enables the features located in the "Extra Features" section of each module instance.
Write Protect Enable	• Enabled • Disabled	Disabled	If selected write protection is applied to all GPT channels.

Configurations for Timers > Timer, General PWM (r_gpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, General PWM (r_gpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
General > Compare Match			
General > Compare Match > Compare Match A			
Status	• Enabled • Disabled	Disabled	
Compare match value	Value must be a non-negative integer less than or equal to 0x40000000000	0	Specify the compare match A value in units that selected in Period Unit section.
General > Compare Match > Compare Match B			
Status	• Enabled • Disabled	Disabled	
Compare match value	Value must be a non-negative integer less than or equal to 0x40000000000	0	Specify the compare match B value in units that selected in Period Unit section.
Name	Name must be a valid C symbol	g_timer0	Module name.
Channel	Enter the supported Channel number	0	Specify the hardware channel.

Mode	• Periodic • One-Shot • One-Shot Pulse • Saw-wave PWM • Triangle-wave PWM (symmetric, Mode 1) • Triangle-wave PWM (asymmetric, Mode 2) • Triangle-wave PWM (asymmetric, Mode 3)	Periodic	Mode selection. Periodic: Generates periodic interrupts or square waves. One-shot: Generate a single interrupt or a pulse wave. Note: One-shot mode is implemented in software. ISRs must be enabled for one-shot even if callback is unused. One-Shot Pulse: Counter performs saw-wave operation with fixed buffer operation. Saw-wave PWM: Generates basic saw-wave PWM waveforms. Triangle-wave PWM (symmetric, Mode 1): Generates symmetric PWM waveforms with duty cycle determined by compare match set with 32-bit transfer during a crest event and updated at the next trough with single or double buffer operation. Triangle-wave PWM (asymmetric, Mode 2): Generates asymmetric PWM waveforms with duty cycle determined by compare match set with 32-bit transfer during a crest/trough event and updated at the next trough/crest. Triangle-wave PWM (asymmetric, Mode 3): Generates PWM waveforms with duty cycle determined by compare match set with 64-bit transfer during a crest interrupt and updated at the next trough with fixed buffer operation.
Period	Value must be a non-	0x10000	Specify the timer

	negative integer less than or equal to 0x40000000000		period in units selected below. Set the period to 0x100000000 (32-bit) or 0x10000 (16-bit) raw counts for a free running timer or an input capture configuration. The period can be set up to 0x40000000000 (32-bit) or 0x4000000 (16-bit) which will use a divider of 1024 with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Output			
Output > Custom Waveform			
Output > Custom Waveform > GTIOA			
Initial Output Level	• Pin Level Low • Pin Level High	Pin Level Low	Set the initial output level of GTIOCxA.
Cycle End Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxA at cycle end.
Compare Match Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxA at compare match.
Retain Output Level at	• Disabled	Disabled	Retain the current

Count Stop	• Enabled		GTIOxA output level when counting is stopped.
Output > Custom Waveform > GTIOB			
Initial Output Level	• Pin Level Low • Pin Level High	Pin Level Low	Set the initial output level of GTIOCxB.
Cycle End Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxB at cycle end.
Compare Match Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxB at compare match.
Retain Output Level at Count Stop	• Disabled • Enabled	Disabled	Retain the current GTIOxB output level when counting is stopped.
Custom Waveform Enable	• Disabled • Enabled	Disabled	Enable custom waveform configuration.
Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
GTIOCA Output Enabled	• True • False	False	Enable the output of GTIOCA on a pin.
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
GTIOCB Output Enabled	• True • False	False	Enable the output of GTIOCB on a pin.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Input			
Count Up Source	MCU Specific Options		Select external source that will increment the counter. If any count up source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Count Down Source	MCU Specific Options		Select external source

			that will decrement the counter. If any count down source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Start Source	MCU Specific Options		Select external source that will start the timer. For pulse width measurement, set the Start Source and the Clear Source to the trigger edge (the edge to start the measurement), and set the Stop Source and Capture Source (either A or B) to the opposite edge (the edge to stop the measurement). For pulse period measurement, set the Start Source, the Clear Source, and the Capture Source (either A or B) to the trigger edge (the edge to start the measurement).
Stop Source	MCU Specific Options		Select external source that will stop the timer.
Clear Source	MCU Specific Options		Select external source that will clear the timer.
Capture A Source	MCU Specific Options		Select external source that will trigger a capture A event.
Capture B Source	MCU Specific Options		Select external source that will trigger a capture B event.
Noise Filter A Sampling Clock Select	• No Filter • Filter PCLKD / 1 • Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64	No Filter	Select the input filter for GTIOCA.
Noise Filter B Sampling Clock Select	• No Filter • Filter PCLKD / 1	No Filter	Select the input filter for GTIOCB.

	• Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64		
Pin Polarity			
GTIOCnA Polarity	• Normal • Inverted	Normal	Input/output polarity control for GTIOCnA pin.
GTIOCnB Polarity	• Normal • Inverted	Normal	Input/output polarity control for GTIOCnB pin.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the timer period elapses
Overflow/Crest Interrupt Priority	MCU Specific Options		Select the overflow interrupt priority. This is the crest interrupt for triangle-wave PWM.
Capture/Compare match A Interrupt Priority	MCU Specific Options		Select the interrupt priority for Capture/Compare match A.
Capture/Compare match B Interrupt Priority	MCU Specific Options		Select the interrupt priority for Capture/Compare match B.
Underflow/Trough Interrupt Priority	MCU Specific Options		Select the interrupt priority for the trough interrupt (triangle-wave PWM only).
Extra Features			
Extra Features > Output Disable			
POEG Link	MCU Specific Options		Select which POEG to link this GPT channel to.
Output Disable POEG Trigger	• Dead Time Error • GTIOCA and		Select which errors send an output disable trigger to POEG. Dead

	GTIOCB High Level • GTIOCA and GTIOCB Low Level		time error is only available GPT channels that have GTINTAD.GRPDTE.
GTIOCA Disable Setting	• Disable Prohibited • Set Hi Z • Level Low • Level High	Disable Prohibited	Select the disable setting for GTIOCA.
GTIOCB Disable Setting	• Disable Prohibited • Set Hi Z • Level Low • Level High	Disable Prohibited	Select the disable setting for GTIOCB.
Extra Features > ADC Trigger			
Start Event Trigger (Channels with GTINTAD only)	• Trigger Event A/D Converter Start Request A During Up Counting • Trigger Event A/D Converter Start Request A During Down Counting • Trigger Event A/D Converter Start Request B During Up Counting • Trigger Event A/D Converter Start Request B During Down Counting		Select which A/D converter start request interrupts to generate and at which point in the cycle to generate them.
ADC A Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG A event.
ADC B Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG B event.
Extra Features > Dead Time (Value range varies with Channel)			
Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable	0	Select the dead time to apply during up counting. This value

	value of 4294967295 (0xffffffff).		also applies during down counting for channels that do not have GTDVD. The dead time count up value can be set up to 0xffffffff (32-bit) or 0xffff (16-bit).
Dead Time Count Down (Raw Counts) (Channels with GTDVD only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting. The dead time count down value can be set up to 0xffffffff (32-bit) or 0xffff (16-bit).
Extra Features > Interrupt Skipping (Channels with GTITC only)			
Interrupt to Count	• None • Overflow and Underflow (sawtooth) • Crest (triangle) • Trough (triangle)	None	Select the count source for interrupt skipping. The interrupt skip counter increments after each source event. All crest/overflow and trough/underflow interrupts are skipped when the interrupt skip counter is non-zero.
Interrupt Skip Count	• 0 • 1 • 2 • 3 • 4 • 5 • 6 • 7	0	Select the number of interrupts to skip.
Skip ADC Events	• None • ADC A Compare Match • ADC B Compare Match • ADC A and B Compare Match	None	Select ADC events to suppress when the interrupt skip count is not zero.
Extra Features	• Enabled • Disabled	Disabled	Select whether to enable extra features on this channel.

Clock Configuration

The GPT clock is based on the PCLKD frequency. You can set the PCLKD frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, GTETRGD, GTIOCA and GTIOCB pins as count sources.

This module can use GTIOCA and GTIOCB pins as output pins for periodic or PWM signals.

This module can use GTIOCA and GTIOCB as input pins to measure input signals.

Usage Notes

Maximum Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x40000000000 on a 32-bit timer or 0x4000000 on a 16-bit timer. This will configure the timer with the maximum period and a count clock divisor of 1024.

Note

16-bit channels inherently have a reduced maximum period compared to 32-bit channels. When setting period values of hundreds of milliseconds or more on 16-bit channels be sure to check the generated output to confirm the actual configured value as it will clip much earlier than 32-bit channels. In general, it is recommended to use a lower-power timer like AGT or RTC if long hardware delays are required.

Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter overflow after calling R_GPT_PeriodSet() or R_GPT_DutyCycleSet(). To force them to update before the next counter overflow, call R_GPT_Reset() while the counter is running.

Note

When manually changing the timer period counts the maximum value for a 32-bit GPT is 0x100000000. This number overflows the 32-bit value for timer_cfg_t::period_counts. To configure the timer for the maximum period, set timer_cfg_t::period_counts to 0.
When changing the period and duty cycle at the same time when Parameter Checking is enabled, call R_GPT_PeriodSet first followed by R_GPT_DutyCycleSet to ensure input validation is performed correctly.

One-Shot Mode

The GPT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the Transfer (r_dtc).

One-Shot Mode Output

The output waveform in one-shot mode is one PCLKD cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

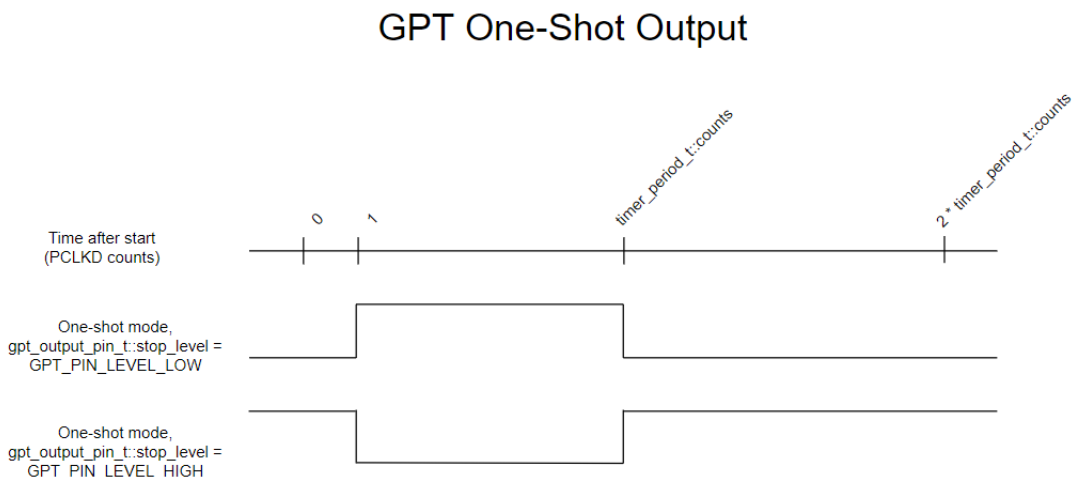

Figure 336: GPT One-Shot Output

One-Shot Pulse Mode

The one-shot pulse mode is an asymmetric PWM mode that provides more control over the rising and falling edges of the output. The user provides a period and initial output level and controls the signal by specifying compare match values for the leading and trailing edges each period.

Note

Despite its name, the One-Shot Pulse Mode operates continuously and does not stop after the first period.

One-Shot Pulse Mode Output

Examples of PWM signals that can be generated by this module are shown below. The leading and trailing edge match values can be modified using R_GPT_DutyCycleSet() in the overflow interrupt.

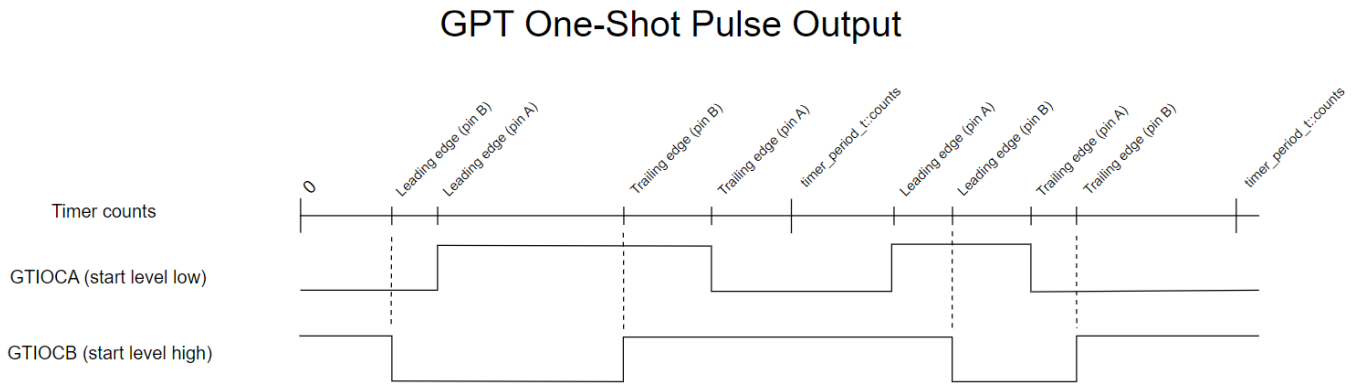

Figure 337: GPT One-Shot Pulse Output (without dead time)

If dead time is enabled only match values for GTIOCnA need to be set; the match values for GTIOCnB will be automatically configured in hardware.

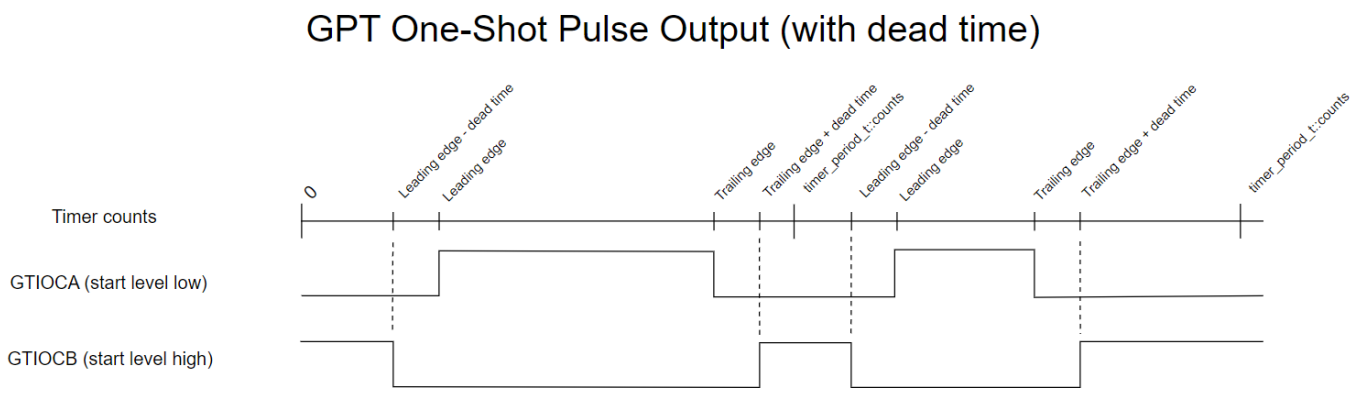

Figure 338: GPT One-Shot Pulse Output (with dead time)

Periodic Output

The GTIOC pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square wave (from rising edge to rising edge) matches the period of the GPT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

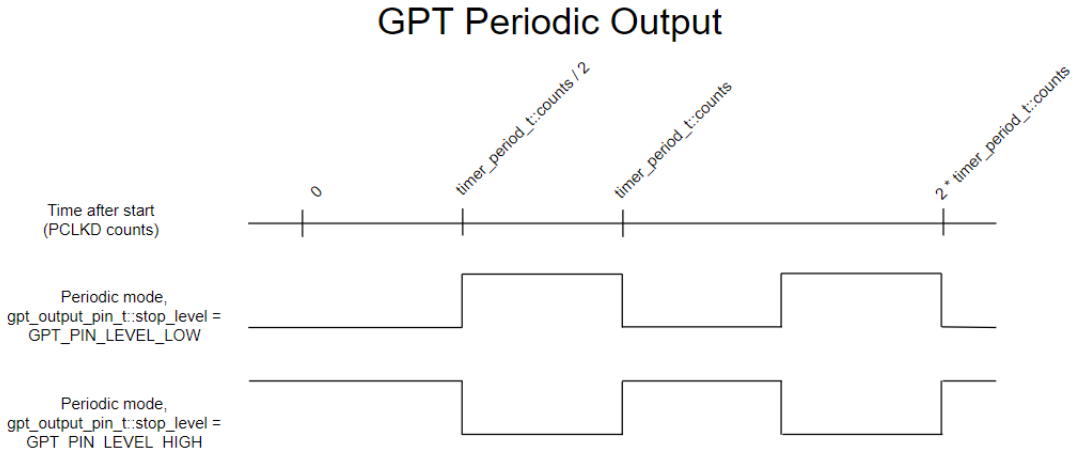

Figure 339: GPT Periodic Output

PWM Output

The PWM output signal is high at the beginning of the cycle and low at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

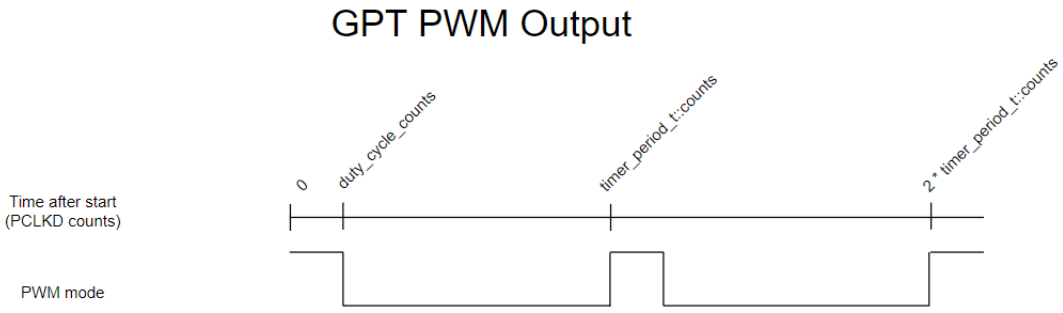

Figure 340: GPT PWM Output

Triangle-Wave PWM Output

Examples of PWM signals that can be generated by this module are shown below. The duty_cycle_counts can be modified using R_GPT_DutyCycleSet() in the crest interrupt and updated at the following trough for symmetric PWM or modified in both the crest/trough interrupts and updated at the following trough/crest for asymmetric PWM.

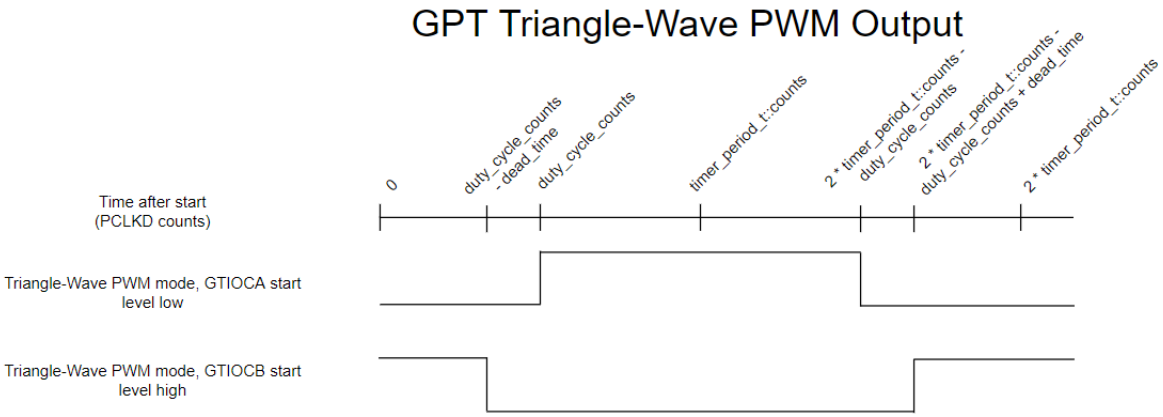

Figure 341: GPT Triangle-Wave PWM Output

PWM Output Delay Circuit

On select MCUs, an additional PWM output delay circuit can be configured in order to fine tune the rising and falling edge delays in increments of 1/32 times the period of the GPT core clock. The PWM output delay function must be configured prior to initializing the GPT channels using R_GPT_PwmOutputDelayInitialize.

Note

1. In Saw-wave PWM mode, the output delay setting cannot be changed while the capture compare setting (GTCCRn) is greater than or equal the period setting (GTPR) - 2.
2. In Triangle PWM modes, the output delay setting cannot be changed while the counter is counting down, and the capture compare setting (GTCCRn) is less than or equal to 2.
3. When the PWM Output Delay Circuit is enabled, the PWM signal is delayed by 3 GPT core clock cycles.
4. When the GPTCLK is used as the GPT core clock, the following delay is required between writes to the rising or falling edge output delay setting for a given pin: Write_Interval[ns] = Period_of_PCLKA [ns] × 6 + Period_of_GPTCLK [ns] × 4).

Event Counting

Event counting can be done by selecting up or down counting sources from GTETRG pins, ELC events, or GTIOC pins. In event counting mode, the GPT counter is not affected by PCLKD.

Note

In event counting mode, the application must call R_GPT_Start() to enable event counting. The counter will not change after calling R_GPT_Start() until an event occurs.

Pulse Measurement

If the capture edge occurs before the start edge in pulse measurement, the first capture is invalid (0).

Controlling GPT with GTETRG Edges

The GPT timer can be configured to stop, start, clear, count up, or count down when a GTETRG rising or falling edge occurs.

Note

The GTETRG pins are shared by all GPT channels.
GTETRG pins require POEG to be on (example code for this is provided in GPT Free Running Counter Example).
If input filtering is required on the GTETRG pins, that must also be handled outside this module.

Controlling GPT with ELC Events

The GPT timer can be configured to stop, start, clear, count up, or count down when an ELC event occurs.

Note

The configurable ELC GPT sources are shared by all GPT channels.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with GPT

The GPT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Enabling External Sources for Start, Stop, Clear, or Capture

R_GPT_Enable() must be called when external sources are used for start, stop, clear, or capture.

Interrupt Skipping

When an interrupt skipping source is selected a hardware counter will increment each time the selected event occurs. Each interrupt past the first (up to the specified skip count) will be suppressed. If ADC events are selected for skipping they will also be suppressed except during the timer period leading to the selected interrupt skipping event (see below diagram).

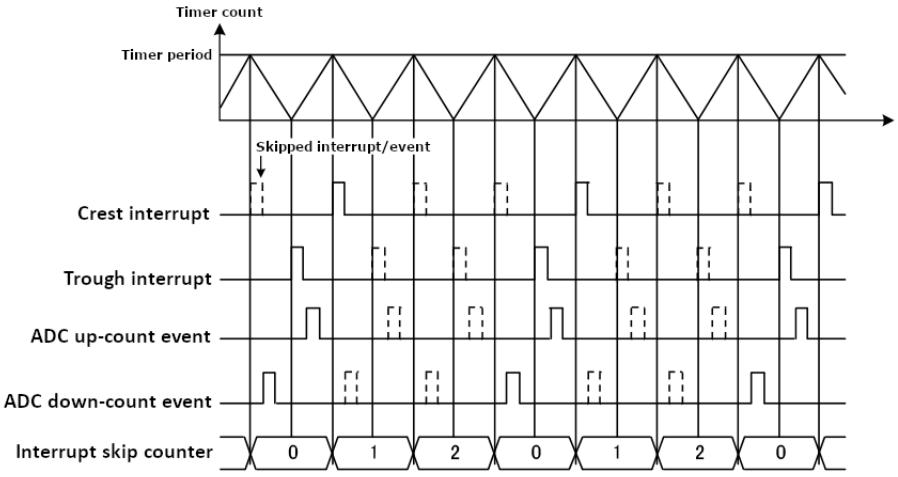

Figure 342: Crest interrupt skipping in triangle-wave PWM modes (skip count 2)

Complementary Output

By using the Custom Waveform option the output pins can be made to output complementary waveforms. To ensure these waveforms stay in sync, the duty cycle for both pins can be set simultaneously by calling R_GPT_DutyCycleSet once with a pin parameter of GPT_IO_PIN_GTIOCA_AND_GTIOCB.

Note

The pin level for 0% and 100% duty cycle is determined by the Cycle End Output Level in normal PWM mode and the Initial Output Level in triangle PWM modes. 100% duty will output the configured level and 0% will output the opposite. Do not use Pin Level Toggle or Pin Level Retain for the Cycle End Output Level if normal PWM waveforms are desired.

Examples

GPT Basic Example

This is a basic example of minimal use of the GPT in an application.

```
void gpt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
}
```

GPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

GPT Free Running Counter Example

To use the GPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void gpt_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) If event count mode is used to count edges on a GTETRG pin, POEG must
be started to use GTETRG.
  * Reference Note 1 of Table "GPT functions" in the relevant hardware manual. */
 R_BSP_MODULE_START(FSP_IP_POEG, 0U);
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_GPT_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
```

```
 timer_status_t status;
    (void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
}
```

GPT Input Capture Example

This is an example of using the GPT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if ((TIMER_EVENT_CAPTURE_A == p_args->event) || (TIMER_EVENT_CAPTURE_B ==
p_args->event))
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
       (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
       uint64_t period = info.period_counts;
 /* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
  * timer_info_t::period_counts. */
 if (0U == period)
     {
           period = UINT32_MAX + 1U;
     }
       g_captured_time    = (period * g_capture_overflows) + p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
       g_capture_overflows++;
```

```
    }
}
void gpt_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_GPT_Enable(&g_timer0_ctrl);
 /* (Optional) Disable captures. */
    (void) R_GPT_Disable(&g_timer0_ctrl);
}
```

GPT Period Update Example

This an example of updating the period.

```
#define GPT_EXAMPLE_MSEC_PER_SEC (1000)
#define GPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void gpt_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
  * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
  * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
```

```
  * - Use the R_GPT_InfoGet function (it accounts for the divider).
  * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
  * by timer_cfg_t::source_div.
  *
  * This example uses the 3rd option (R_FSP_SystemClockHzGet).
  */
    uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

GPT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define GPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void gpt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
  * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
prevent this. The cast is
  * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
       (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                   GPT_EXAMPLE_MAX_PERCENT);
 /* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
}
```

GPT A/D Converter Start Request Example

This is an example of using the GPT to start the ADC at a configurable A/D converter compare match value.

```
#if ((1U << GPT_EXAMPLE_CHANNEL) & (BSP_FEATURE_GPT_GPTE_CHANNEL_MASK |
BSP_FEATURE_GPT_GPTEH_CHANNEL_MASK | \
  BSP_FEATURE_GPT_AD_DIRECT_START_CHANNEL_MASK))
/* This example shows how to configure the GPT to generate an A/D start request at an
A/D start request compare
 * match value. This example can only be used with GPTE or GPTEH variants. */
void gpt_adc_start_request_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 #if ((BSP_FEATURE_GPT_GPTE_SUPPORTED | BSP_FEATURE_GPT_GPTEH_SUPPORTED) &&
```

```
!BSP_FEATURE_GPT_AD_DIRECT_START_SUPPORTED)
 /* Initialize and configure the ELC. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the ELC to start a scan on ADC unit 0 when GPT channel 0. Note: This is
typically configured in
  * g_elc_cfg and already set during R_ELC_Open. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0, ELC_EVENT_GPT0_AD_TRIG_A);
    assert(FSP_SUCCESS == err);
 /* Globally enable ELC events. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
 #else  /* BSP_FEATURE_GPT_AD_DIRECT_START_SUPPORTED */
 /* Do not configure AD ELC trigger for devices with GPT ADC direct-start support */
 #endif
 /* Initialize the ADC to start a scan based on an GPT compare-match event trigger.
Set adc_cfg_t::trigger to
  * ADC_TRIGGER_SYNC_ELC. */
    err = p_adc_api->open(&g_adc0_ctrl, &g_adc0_cfg);
    assert(FSP_SUCCESS == err);
    err = p_adc_api->scanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable synchronous triggers by calling R_ADC_ScanStart(). */
    (void) p_adc_api->scanStart(&g_adc0_ctrl);
 /* Initializes the GPT module. Configure gpt_extended_pwm_cfg_t::adc_trigger to set
when the A/D start request
  * is generated. Set gpt_extended_pwm_cfg_t::adc_a_compare_match to set the desired
compare match value. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start the timer. A/D converter start request events are generated each time the
counter is equal to the
  * A/D start request compare match value. */
    (void) R_GPT_Start(&g_timer0_ctrl);
```

```
}
#endif
```

GPT One-Shot Pulse Mode Example

This example demonstrates the configuration and use of one-shot pulse mode with GPT timer.

```
/* Example callback called when timer overflows. */
void gpt_overflow_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
       g_timer_cycle_end_counter++;
 /* Use R_GPT_DutyCycleSet() API to set new values for each cycle.
  * - Use GPT_IO_PIN_ONE_SHOT_LEADING_EDGE to set the leading edge transition match
value (GTCCRC or GTCCRE register).
  * - Use GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE to set the trailing edge transition match
value (GTCCRD or GTCCRF register).
  */
    }
}
/* GTIOCA (configured for active-high) first and second pulse will be:
 * - 1/2 period, offset by 3/8 period
 * - 1/4 period, offset by 1/4 period */
#define GPT_ONE_SHOT_EXAMPLE_FIRST_EDGE_PIN_A ((g_timer0_cfg.period_counts * 3) / 8)
#define GPT_ONE_SHOT_EXAMPLE_SECOND_EDGE_PIN_A ((g_timer0_cfg.period_counts * 7) / 8)
#define GPT_ONE_SHOT_EXAMPLE_THIRD_EDGE_PIN_A ((g_timer0_cfg.period_counts * 1) / 4)
#define GPT_ONE_SHOT_EXAMPLE_FOURTH_EDGE_PIN_A ((g_timer0_cfg.period_counts * 2) / 4)
/* GTIOCB (configured for active-low) first and second pulse will be:
 * - 1/2 period, offset by 1/4 period
 * - 1/4 period, offset by 1/2 period */
#define GPT_ONE_SHOT_EXAMPLE_FIRST_EDGE_PIN_B ((g_timer0_cfg.period_counts * 1) / 4)

 /* Wait for the one-shot pulse output to complete then stop GPT
  *
  * Notes:
  * - FSP driver does not currently support automatically stopping one-shot pulse. If
GPT is not stopped the last waveform timing will be repeated indefinitely.
  * - Some (more recent) MCUs added a new register (GTPC) that could be used to
automatically stop GPT after a set number of periods. Software driver support for
```

```
this is scheduled to be added in the future.
  * - The last transition edge timings will continue to be used indefinitely until
the user application stops GPT operation. */
 while (g_timer_cycle_end_counter < 2)
    {
 /* Wait for one-shot pulse output to complete (two pulses) */
    }
 /* (Optional) Stop the timer. */
    err = R_GPT_Stop(&g_timer0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

GPT Compare Match Set Example

This example demonstrates the configuration and use of compare match with GPT timer.

```
/* Example callback called when compare match occurs. */
void gpt_compare_match_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_COMPARE_A == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
#define GPT_COMPARE_MATCH_EXAMPLE_VALUE (0x2000U)
void gpt_compare_match_set_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the compare match value (GPT_COMPARE_MATCH_EXAMPLE_VALUE). This value must be
less than or equal to period value. */
    err = R_GPT_CompareMatchSet(&g_timer0_ctrl, GPT_COMPARE_MATCH_EXAMPLE_VALUE,
```

```
TIMER_COMPARE_MATCH_A);
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_GPT_Stop(&g_timer0_ctrl);
}
```

Data Structure Documentation

◆ gpt_output_pin_t

struct gpt_output_pin_t		
Configurations for output pins.		
Data Fields		
bool	output_enabled	Set to true to enable output, false to disable output.
gpt_pin_level_t	stop_level	Select a stop level from gpt_pin_level_t.

◆ gpt_gtior_setting_t

struct gpt_gtior_setting_t
Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.

◆ gpt_instance_ctrl_t

struct gpt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ gpt_extended_pwm_cfg_t

struct gpt_extended_pwm_cfg_t		
GPT extension for advanced PWM features.		
Data Fields		
uint8_t	trough_ipl	Trough interrupt priority.
IRQn_Type	trough_irq	Trough interrupt.
gpt_poeg_link_t	poeg_link	Select which POEG channel controls output disable for this GPT channel.
gpt_output_disable_t	output_disable	Select which trigger sources request output disable from POEG.
gpt_adc_trigger_t	adc_trigger	Select trigger sources to start A/D conversion.

uint32_t	dead_time_count_up	Set a dead time value for counting up.
uint32_t	dead_time_count_down	Set a dead time value for counting down (available on GPT32E and GPT32EH only)
uint32_t	adc_a_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_A.
uint32_t	adc_b_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_B.
gpt_interrupt_skip_source_t	interrupt_skip_source	Interrupt source to count for interrupt skipping.
gpt_interrupt_skip_count_t	interrupt_skip_count	Number of interrupts to skip between events.
gpt_interrupt_skip_adc_t	interrupt_skip_adc	ADC events to skip when interrupt skipping is enabled.
gpt_gtioc_disable_t	gtioca_disable_setting	Select how to configure GTIOCA when output is disabled.
gpt_gtioc_disable_t	gtiocb_disable_setting	Select how to configure GTIOCB when output is disabled.

◆ gpt_extended_cfg_t

struct gpt_extended_cfg_t		
GPT extension configures the output pins for GPT.		
Data Fields		
gpt_output_pin_t	gtioca	Configuration for GPT I/O pin A.
gpt_output_pin_t	gtiocb	Configuration for GPT I/O pin B.
gpt_source_t	start_source	Event sources that trigger the timer to start.
gpt_source_t	stop_source	Event sources that trigger the timer to stop.
gpt_source_t	clear_source	Event sources that trigger the timer to clear.
gpt_source_t	capture_a_source	Event sources that trigger capture of GTIOCA.
gpt_source_t	capture_b_source	Event sources that trigger capture of GTIOCB.
gpt_source_t	count_up_source	Event sources that trigger a

		single up count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_source_t	count_down_source	Event sources that trigger a single down count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_capture_filter_t	capture_filter_gtioca	
gpt_capture_filter_t	capture_filter_gtiocb	
uint8_t	capture_a_ipl	Capture A interrupt priority.
uint8_t	capture_b_ipl	Capture B interrupt priority.
IRQn_Type	capture_a_irq	Capture A interrupt.
IRQn_Type	capture_b_irq	Capture B interrupt.
uint32_t	compare_match_value[2]	Storing compare match value for channels.
uint8_t	compare_match_status	Storing the compare match register status.
gpt_extended_pwm_cfg_t const *	p_pwm_cfg	Advanced PWM features, optional.
gpt_gtior_setting_t	gtior_setting	Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.
gpt_gtioc_polarity_t	gtioca_polarity	Polarity control for GTIOCxA input/output pin.
gpt_gtioc_polarity_t	gtiocb_polarity	Polarity control for GTIOCxB input/output pin.

Enumeration Type Documentation

◆ gpt_io_pin_t

enum gpt_io_pin_t	
Input/Output pins, used to select which duty cycle to update in R_GPT_DutyCycleSet().	
Enumerator	
GPT_IO_PIN_GTIOCA	GTIOCA.
GPT_IO_PIN_GTIOCB	GTIOCB.
GPT_IO_PIN_GTIOCA_AND_GTIOCB	GTIOCA and GTIOCB.
GPT_IO_PIN_TROUGH	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_CREST	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_ONE_SHOT_LEADING_EDGE	Used in R_GPT_DutyCycleSet to set GTCCRC and GTCCRE registers when One-Shot Pulse mode is selected.
GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE	Used in R_GPT_DutyCycleSet to set GTCCRD and GTCCRF registers when One-Shot Pulse mode is selected.

◆ gpt_buffer_force_push

enum gpt_buffer_force_push	
Forced buffer push operation used in One-Sot Pulse mode with R_GPT_DutyCycleSet().	
Enumerator	
GPT_BUFFER_FORCE_PUSH	Used in R_GPT_DutyCycleSet to force push the data from GTCCRn registers to temporary buffer A or B when One-Shot Pulse mode is selected.

◆ gpt_pin_level_t

enum gpt_pin_level_t	
Level of GPT pin	
Enumerator	
GPT_PIN_LEVEL_LOW	Pin level low.
GPT_PIN_LEVEL_HIGH	Pin level high.

◆ gpt_source_t

enum gpt_source_t	
Sources can be used to start the timer, stop the timer, count up, or count down. These enumerations represent a bitmask. Multiple sources can be ORed together.	
Enumerator	
GPT_SOURCE_NONE	No active event sources.
GPT_SOURCE_GTETRGA_RISING	Action performed on GTETRGA rising edge.
GPT_SOURCE_GTETRGA_FALLING	Action performed on GTETRGA falling edge.
GPT_SOURCE_GTETRGB_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGB_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTETRGC_RISING	Action performed on GTETRGC rising edge.
GPT_SOURCE_GTETRGC_FALLING	Action performed on GTETRGC falling edge.
GPT_SOURCE_GTETRGD_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGD_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input rises while GTIOCB is low.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input rises while GTIOCB is high.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input falls while GTIOCB is low.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input falls while GTIOCB is high.

GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.
GPT_SOURCE_GPT_A	Action performed on ELC GPTA event.
GPT_SOURCE_GPT_B	Action performed on ELC GPTB event.
GPT_SOURCE_GPT_C	Action performed on ELC GPTC event.
GPT_SOURCE_GPT_D	Action performed on ELC GPTD event.
GPT_SOURCE_GPT_E	Action performed on ELC GPTE event.
GPT_SOURCE_GPT_F	Action performed on ELC GPTF event.
GPT_SOURCE_GPT_G	Action performed on ELC GPTG event.
GPT_SOURCE_GPT_H	Action performed on ELC GPTH event.

◆ gpt_capture_filter_t

enum gpt_capture_filter_t

Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.

Enumerator	
GPT_CAPTURE_FILTER_NONE	None - no filtering.
GPT_CAPTURE_FILTER_PCLKD_DIV_1	PCLK/1 - fast sampling.
GPT_CAPTURE_FILTER_PCLKD_DIV_4	PCLK/4.
GPT_CAPTURE_FILTER_PCLKD_DIV_16	PCLK/16.
GPT_CAPTURE_FILTER_PCLKD_DIV_64	PCLK/64 - slow sampling.

◆ gpt_adc_trigger_t

enum gpt_adc_trigger_t	
Trigger options to start A/D conversion.	
Enumerator	
GPT_ADC_TRIGGER_NONE	None - no output disable request.
GPT_ADC_TRIGGER_UP_COUNT_START_ADC_A	Request A/D conversion from ADC unit 0 at up counting compare match of gpt_extended_pwm_cfg_t::adc_a_compare_match.
GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_A	Request A/D conversion from ADC unit 0 at down counting compare match of gpt_extended_pwm_cfg_t::adc_a_compare_match.
GPT_ADC_TRIGGER_UP_COUNT_START_ADC_B	Request A/D conversion from ADC unit 1 at up counting compare match of gpt_extended_pwm_cfg_t::adc_b_compare_match.
GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_B	Request A/D conversion from ADC unit 1 at down counting compare match of gpt_extended_pwm_cfg_t::adc_b_compare_match.

◆ gpt_poeg_link_t

enum gpt_poeg_link_t	
POEG channel to link to this channel.	
Enumerator	
GPT_POEG_LINK_POEG0	Link this GPT channel to POEG channel 0 (GTETRGA)
GPT_POEG_LINK_POEG1	Link this GPT channel to POEG channel 1 (GTETRGB)
GPT_POEG_LINK_POEG2	Link this GPT channel to POEG channel 2 (GTETRGC)
GPT_POEG_LINK_POEG3	Link this GPT channel to POEG channel 3 (GTETRGD)

◆ gpt_output_disable_t

enum gpt_output_disable_t	
Select trigger to send output disable request to POEG.	
Enumerator	
GPT_OUTPUT_DISABLE_NONE	None - no output disable request.
GPT_OUTPUT_DISABLE_DEAD_TIME_ERROR	Request output disable if a dead time error occurs.
GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_HIGH	Request output disable if GTIOCA and GTIOCB are high at the same time.
GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_LOW	Request output disable if GTIOCA and GTIOCB are low at the same time.

◆ gpt_gtioc_disable_t

enum gpt_gtioc_disable_t	
Disable level options for GTIOC pins.	
Enumerator	
GPT_GTIOC_DISABLE_PROHIBITED	Do not allow output disable.
GPT_GTIOC_DISABLE_SET_HI_Z	Set GTIOC to high impedance when output is disabled.
GPT_GTIOC_DISABLE_LEVEL_LOW	Set GTIOC level low when output is disabled.
GPT_GTIOC_DISABLE_LEVEL_HIGH	Set GTIOC level high when output is disabled.

◆ gpt_adc_compare_match_t

enum gpt_adc_compare_match_t	
Trigger options to start A/D conversion.	
Enumerator	
GPT_ADC_COMPARE_MATCH_ADC_A	Set A/D conversion start request value for GPT A/D converter start request A.
GPT_ADC_COMPARE_MATCH_ADC_B	Set A/D conversion start request value for GPT A/D converter start request B.

◆ gpt_interrupt_skip_source_t

enum gpt_interrupt_skip_source_t	
Interrupt skipping modes	
Enumerator	
GPT_INTERRUPT_SKIP_SOURCE_NONE	Do not skip interrupts.
GPT_INTERRUPT_SKIP_SOURCE_OVERFLOW_UNDERFLOW	Count and skip overflow and underflow interrupts.
GPT_INTERRUPT_SKIP_SOURCE_CREST	Count crest interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t. When the interrupt does fire, the trough interrupt fires before the crest interrupt.
GPT_INTERRUPT_SKIP_SOURCE_TROUGH	Count trough interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t. When the interrupt does fire, the crest interrupt fires before the trough interrupt.

◆ gpt_interrupt_skip_count_t

enum gpt_interrupt_skip_count_t	
Number of interrupts to skip between events	
Enumerator	
GPT_INTERRUPT_SKIP_COUNT_0	Do not skip interrupts.
GPT_INTERRUPT_SKIP_COUNT_1	Skip one interrupt.
GPT_INTERRUPT_SKIP_COUNT_2	Skip two interrupts.
GPT_INTERRUPT_SKIP_COUNT_3	Skip three interrupts.
GPT_INTERRUPT_SKIP_COUNT_4	Skip four interrupts.
GPT_INTERRUPT_SKIP_COUNT_5	Skip five interrupts.
GPT_INTERRUPT_SKIP_COUNT_6	Skip six interrupts.
GPT_INTERRUPT_SKIP_COUNT_7	Skip seven interrupts.

◆ gpt_interrupt_skip_adc_t

enum gpt_interrupt_skip_adc_t	
ADC events to skip during interrupt skipping	
Enumerator	
GPT_INTERRUPT_SKIP_ADC_NONE	Do not skip ADC events.
GPT_INTERRUPT_SKIP_ADC_A	Skip ADC A events.
GPT_INTERRUPT_SKIP_ADC_B	Skip ADC B events.
GPT_INTERRUPT_SKIP_ADC_A_AND_B	Skip ADC A and B events.

◆ gpt_pwm_output_delay_setting_t

enum gpt_pwm_output_delay_setting_t	
Delay setting for the PWM Delay Generation Circuit (PDG).	
Enumerator	
GPT_PWM_OUTPUT_DELAY_SETTING_0_32	Delay is not applied.
GPT_PWM_OUTPUT_DELAY_SETTING_1_32	Delay of 1 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_2_32	Delay of 2 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_3_32	Delay of 3 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_4_32	Delay of 4 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_5_32	Delay of 5 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_6_32	Delay of 6 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_7_32	Delay of 7 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_8_32	Delay of 8 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_9_32	Delay of 9 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_10_32	Delay of 10 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_11_32	Delay of 11 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_12_32	Delay of 12 / 32 GTCLK period applied.

GPT_PWM_OUTPUT_DELAY_SETTING_13_32	Delay of 13 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_14_32	Delay of 14 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_15_32	Delay of 15 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_16_32	Delay of 16 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_17_32	Delay of 17 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_18_32	Delay of 18 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_19_32	Delay of 19 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_20_32	Delay of 20 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_21_32	Delay of 21 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_22_32	Delay of 22 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_23_32	Delay of 23 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_24_32	Delay of 24 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_25_32	Delay of 25 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_26_32	Delay of 26 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_27_32	Delay of 27 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_28_32	Delay of 28 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_29_32	Delay of 29 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_30_32	Delay of 30 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_31_32	Delay of 31 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_BYPASS	Bypass the PWM Output Delay Circuit.

◆ gpt_pwm_output_delay_edge_t

enum gpt_pwm_output_delay_edge_t	
Select which PWM Output Delay setting to apply.	
Enumerator	
GPT_PWM_OUTPUT_DELAY_EDGE_RISING	Configure the PWM Output Delay setting for rising edge.
GPT_PWM_OUTPUT_DELAY_EDGE_FALLING	Configure the PWM Output Delay setting for falling edge.

◆ gpt_gtioc_polarity_t

enum gpt_gtioc_polarity_t	
Polarity inversion control for GTIOCnA/B pins.	
Enumerator	
GPT_GTIOC_POLARITY_NORMAL	GPTIOCnA/B pin polarity is not changed.
GPT_GTIOC_POLARITY_INVERTED	GPTIOCnA/B pin polarity is inverted.

Function Documentation

◆ R_GPT_Open()

fsp_err_t R_GPT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a gpt_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	timer_cfg_t::mode is TIMER_MODE_ONE_SHOT or timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_INVALID_MODE	Triangle wave PWM is only supported if GPT_CFG_OUTPUT_SUPPORT_ENABLE is 2. Selected channel does not support external count sources. External and event count sources not are available in this mode.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_GPT_Stop()

fsp_err_t R_GPT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_GPT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Start()

fsp_err_t R_GPT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_GPT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Reset()

fsp_err_t R_GPT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to 0. Implements timer_api_t::reset.

Note

This function also updates to the new period if no counter overflow has occurred since the last call to R_GPT_PeriodSet().

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Enable()

fsp_err_t R_GPT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_GPT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Disable()

fsp_err_t R_GPT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Note

The timer could be running after R_GPT_Disable(). To ensure it is stopped, call R_GPT_Stop().

Example:

```
/* (Optional) Disable captures. */
   (void) R_GPT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PeriodSet()

fsp_err_t R_GPT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
 /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
  * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
  * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
  * - Use the R_GPT_InfoGet function (it accounts for the divider).
  * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
  * by timer_cfg_t::source_div.
  *
```

```
  * This example uses the 3rd option (R_FSP_SystemClockHzGet).
  */
    uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_DutyCycleSet()

fsp_err_t R_GPT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Sets duty cycle on requested pin. Implements timer_api_t::dutyCycleSet.

Duty cycle is updated in the buffer register. The updated duty cycle is reflected after the next cycle end (counter overflow).

Example:

```
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
  * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
```

```
prevent this. The cast is
  * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
       (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                   GPT_EXAMPLE_MAX_PERCENT);
 /* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use gpt_io_pin_t to select GPT_IO_PIN_GTIOCA or GPT_IO_PIN_GTIOCB

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of gpt_io_pin_t
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is larger than period.
FSP_ERR_INVALID_MODE	GPT_IO_PIN_TROUGH, and GPT_IO_PIN_CREST settings are invalid in the this mode.
FSP_ERR_UNSUPPORTED	GPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_GPT_CompareMatchSet()

fsp_err_t R_GPT_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Set value for compare match feature. Implements timer_api_t::compareMatchSet.

Note

This API should be used when timer is stop counting. And shall not be used along with PWM operation.

Example:

```
 /* Set the compare match value (GPT_COMPARE_MATCH_EXAMPLE_VALUE). This value must be
less than or equal to period value. */
    err = R_GPT_CompareMatchSet(&g_timer0_ctrl, GPT_COMPARE_MATCH_EXAMPLE_VALUE,
TIMER_COMPARE_MATCH_A);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Set the compare match value successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_NOT_ENABLED	Requested compare channel is disabled.

◆ R_GPT_InfoGet()

fsp_err_t R_GPT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
      uint64_t period = info.period_counts;
/* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
 * timer_info_t::period_counts. */
if (0U == period)
    {
          period = UINT32_MAX + 1U;
    }
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_StatusGet()

fsp_err_t R_GPT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_CounterSet()

fsp_err_t R_GPT_CounterSet (timer_ctrl_t *const *p_ctrl*, uint32_t *counter*)

Set counter value.

Note

Do not call this API while the counter is counting. The counter value can only be updated while the counter is stopped.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	The timer is running. Stop the timer before calling this function.

◆ R_GPT_OutputEnable()

fsp_err_t R_GPT_OutputEnable (timer_ctrl_t *const *p_ctrl*, gpt_io_pin_t *pin*)

Enable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is enabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_OutputDisable()

fsp_err_t R_GPT_OutputDisable (timer_ctrl_t *const *p_ctrl*, gpt_io_pin_t *pin*)

Disable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is disabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_AdcTriggerSet()

fsp_err_t R_GPT_AdcTriggerSet (timer_ctrl_t *const *p_ctrl*, gpt_adc_compare_match_t *which_compare_match*, uint32_t *compare_match_value*)

Set A/D converter start request compare match value.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PwmOutputDelaySet()

fsp_err_t R_GPT_PwmOutputDelaySet (timer_ctrl_t *const *p_ctrl*, gpt_pwm_output_delay_edge_t *edge*, gpt_pwm_output_delay_setting_t *delay_setting*, uint32_t const *pin*)

Set the Output Delay setting for the PWM output pin.

Return values

FSP_SUCCESS	The output delay was set.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_NOT_INITIALIZED	The PWM Output Delay Circuit has not been initialized.
FSP_ERR_INVALID_STATE	The PWM Output Delay setting cannot be updated in the current state.
FSP_ERR_UNSUPPORTED	This feature is not supported on this MCU.

◆ R_GPT_CallbackSet()

fsp_err_t R_GPT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_GPT_Close()

fsp_err_t R_GPT_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PwmOutputDelayInitialize()

fsp_err_t R_GPT_PwmOutputDelayInitialize ( )

Initialize the PWM Delay Generation Circuit (PDG). This function must be called before calling R_GPT_PwmOutputDelaySet.

Note

This function will delay for 20 microseconds.

Return values

FSP_SUCCESS	Initialization sequence completed successfully.
FSP_ERR_INVALID_STATE	The source clock frequnecy is out of the required range for the PDG.
FSP_ERR_UNSUPPORTED	This feature is not supported.

Detailed Description

Driver for the AGT and AGTW peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The AGT module has the following features:

- Supports 16- and 32-bit timers via the AGT and AGTW peripherals, respectively.
- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, including PCLKB, LOCO, SUBCLK, and external sources input to AGTIO.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to AGTIO.
- Supports debounce filter on AGTIO pins.
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have at least 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers can be 16-bit or 32-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.

Configuration

Build Time Configurations for r_agt

The following build time configurations are defined in fsp_cfg/r_agt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	• Disabled • Enabled	Disabled	Enable input support to use pulse width measurement mode, pulse period measurement mode, or input from P402, P403, P404, or AGTIO.

Configurations for Timers > Timer, Low-Power (r_agt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Low-Power (r_agt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Counter Bit Width	MCU Specific Options		Counter register bit width (16-bit or 32-bit))
Channel	Channel number must be a non-negative integer	0	Physical hardware channel.
Mode	• Periodic • One-Shot • PWM	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
Period	Value must be non-negative	0x10000	Specify the timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x100000000 (32-bit) or 0x10000 (16-bit) results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x100000000 (32-bit) or 0x10000 (16-bit) for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x800000000 (32-bit) or 0x80000 (16-bit) when counting from PCLKB or 0x8000000000 (32-bit) or 0x800000 (16-bit) when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum

			period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Count Source	MCU Specific Options		AGT counter clock source. NOTE: The divisor is calculated automatically based on the selected period. See agt_clock_t documentation for details.
Output			
Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
AGTOA Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTOA output.
AGTOB Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTOB output.
AGTO Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTO output.
Input			
Measurement Mode	• Measure Disabled • Measure Low Level Pulse Width • Measure High Level Pulse	Measure Disabled	Select if the AGT should be used to measure pulse width or pulse period. In high level pulse width measurement mode, the AGT counts when

	Width • Measure Pulse Period		AGTIO is high and starts counting immediately in the middle of a pulse if AGTIO is high when R_AGT_Start() is called. In low level pulse width measurement mode, the AGT counts when AGTIO is low and could start counting in the middle of a pulse if AGTIO is low when R_AGT_Start() is called.
Input Filter	• No Filter • Filter sampled at PCLKB • Filter sampled at PCLKB / 8 • Filter sampled at PCLKB / 32	No Filter	Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Enable Pin	• Enable Pin Not Used • Enable Pin Active Low • Enable Pin Active High	Enable Pin Not Used	Select active edge for the AGTEE pin if used. Only applies if the count source is P402, P403 or AGTIO.
Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	Select the trigger edge. Applies if measurement mode is pulse period, or if the count source is P402, P403, or AGTIO. Do not select Trigger Edge Both with pulse period measurement.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

When using the AGT module on devices with both AGT and AGTW peripherals, the channel numbers used with the AGT driver are combined between both peripherals; AGTW channels are listed first followed by AGT. For example, on the RA2A2 there are 2 AGTW channels and 8 AGT channels. These correspond to channels 0-1 for AGTW0-AGTW1 and 2-9 for AGT0-AGT7.

Clock Configuration

The AGT clock is based on the PCLKB, LOCO, or Subclock frequency. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use the AGTOA and AGTOB pins as output pins for periodic, one-shot, or PWM signals.

For input capture, the input signal must be applied to the AGTIOn pin.

For event counting, the AGTEEn enable pin is optional.

Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	16-bit Timer Maximum period (counts)	32-bit Timer Maximum period (counts)
LOCO/Subclock	0x800000	0x8000000000
PCLKB	0x80000	0x800000000
All other sources	0x10000	0x100000000

Note

The period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).
When using a 32-bit channel (AGTW), a special period count value of 0 is used to obtain an actual period register value of 0xFFFFFFFF.

Usage Notes

Starting and Stopping the AGT

After starting or stopping the timer, AGT registers cannot be accessed until the AGT state is updated after 3 AGTCLK cycles. If another AGT function is called before the 3 AGTCLK period elapses, the function spins waiting for the AGT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of AGTCLK, which is derived from timer_cfg_t::source_div and agt_extended_cfg_t::count_source.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

Low Power Modes

The AGT1 (channel 1 only) can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

One-Shot Mode

The AGT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the Transfer (r_dtc).

One-Shot Mode Output

The output waveform in one-shot mode is one AGT clock cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

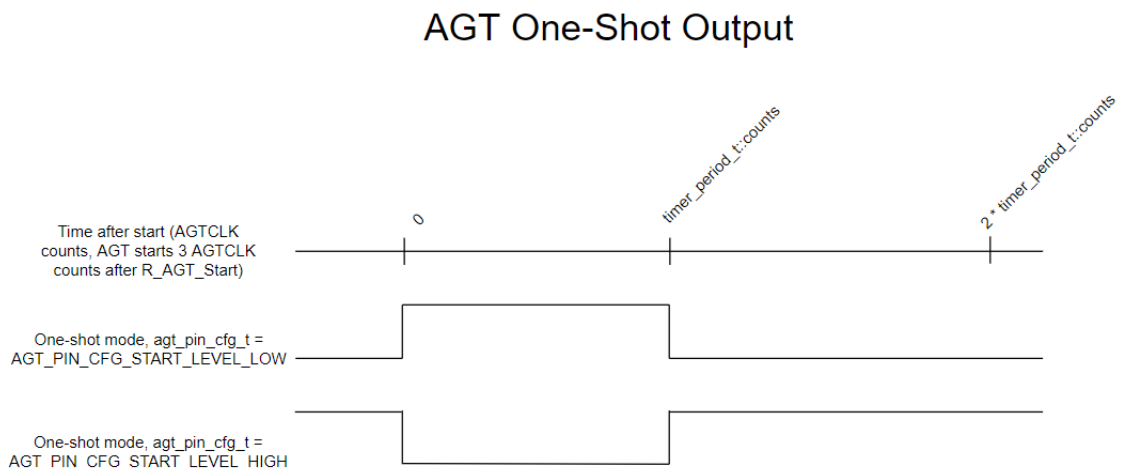

Figure 343: AGT One-Shot Output

Periodic Output

The AGTOA or AGTOB pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square (from rising edge to rising edge) matches the period of the AGT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

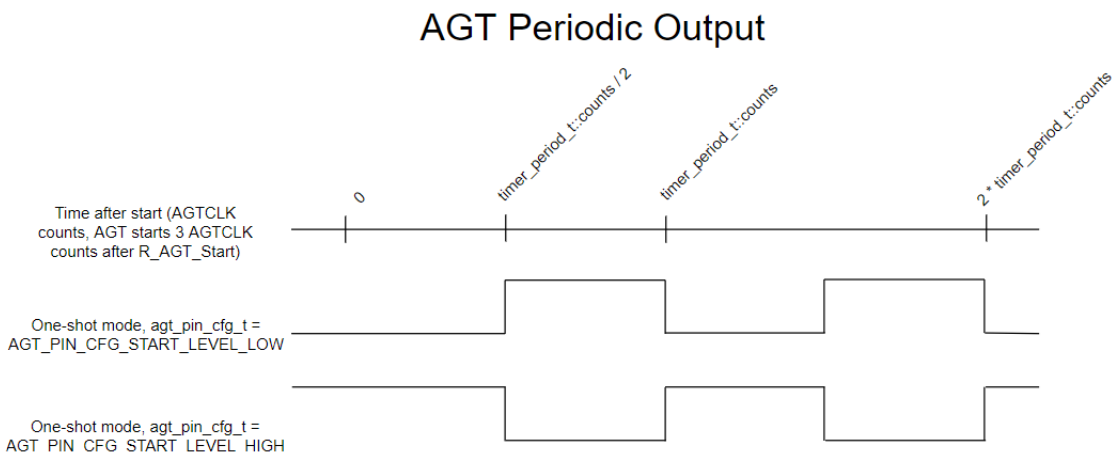

Figure 344: AGT Periodic Output

PWM Output

This module does not support in phase PWM output. The PWM output signal is low at the beginning of the cycle and high at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

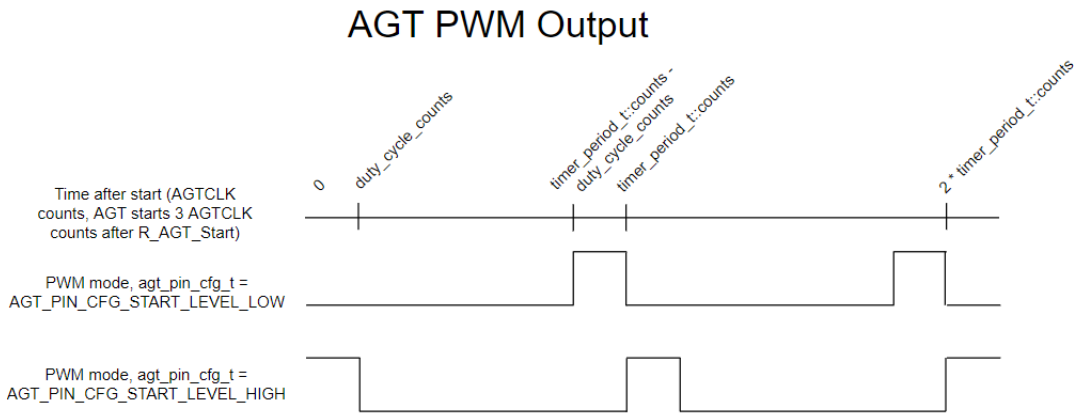

Figure 345: AGT PWM Output

Triggering ELC Events with AGT

The AGT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

AGT Basic Example

This is a basic example of minimal use of the AGT in an application.

```
void agt_basic_example (void)
```

```
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
}
```

AGT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

AGT Free Running Counter Example

To use the AGT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void agt_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_AGT_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
}
```

AGT Input Capture Example

This is an example of using the AGT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CAPTURE_A == p_args->event)
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
       (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
       uint32_t period = info.period_counts;
 /* Process capture from AGTIO. */
       g_captured_time    = ((uint64_t) period * g_capture_overflows) +
p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
       g_capture_overflows++;
    }
```

```
}
void agt_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_AGT_Enable(&g_timer0_ctrl);
 /* (Optional) Disable captures. */
    (void) R_AGT_Disable(&g_timer0_ctrl);
}
```

AGT Period Update Example

This an example of updating the period.

```
#define AGT_EXAMPLE_MSEC_PER_SEC (1000)
#define AGT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void agt_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
  * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
  * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
  * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
```

```
  * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
  * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
  * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
  * by timer_cfg_t::source_div.
  *
  * This example uses the last option (R_FSP_SystemClockHzGet).
  */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

AGT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define AGT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void agt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                 AGT_EXAMPLE_MAX_PERCENT;
 /* Set the calculated duty cycle. */
    err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
    assert(FSP_SUCCESS == err);
}
```

AGT Cascaded Timers Example

This an example of using underflow from an even AGT channel as the count source for the next channel (in this case, AGT0 and AGT1).

```
/* This example shows how use cascaded timers. The count source for AGT channel 1 is
set to AGT0 underflow. */
void agt_cascaded_timers_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers in any order. */
    err = R_AGT_Open(&g_timer_channel0_ctrl, &g_timer_channel0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_AGT_Open(&g_timer_channel1_ctrl, &g_timer_channel1_cfg);
    assert(FSP_SUCCESS == err);
 /* Start AGT channel 1 first. */
```

```
    (void) R_AGT_Start(&g_timer_channel1_ctrl);
    (void) R_AGT_Start(&g_timer_channel0_ctrl);
 /* (Optional) Stop AGT channel 0 first. */
    (void) R_AGT_Stop(&g_timer_channel0_ctrl);
    (void) R_AGT_Stop(&g_timer_channel1_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer_channel1_ctrl, &status);
}
```

Data Structures

struct	agt_instance_ctrl_t
struct	agt_extended_cfg_t

Enumerations

enum	agt_clock_t
enum	agt_measure_t

enum	agt_counter_bit_width_t

Data Structure Documentation

◆ agt_instance_ctrl_t

struct agt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ agt_extended_cfg_t

struct agt_extended_cfg_t
Optional AGT extension data structure.

Data Fields		
agt_clock_t	count_source	AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_CLOCK_FSUB.
union agt_extended_cfg_t	__unnamed__	
agt_pin_cfg_t	agto: 3	Configure AGTO pin. *Note* *AGTIO polarity is opposite AGTO*
agt_measure_t	measurement_mode	Measurement mode.
agt_agtio_filter_t	agtio_filter	Input filter for AGTIO.
agt_enable_pin_t	enable_pin	Enable pin (event counting only)
agt_trigger_edge_t	trigger_edge	Trigger edge to start pulse period measurement or count external event.
agt_counter_bit_width_t	counter_bit_width	Counter bit width.

Enumeration Type Documentation

◆ agt_clock_t

enum agt_clock_t	
Count source	
Enumerator	
AGT_CLOCK_PCLKB	PCLKB count source, division by 1, 2, or 8 allowed.
AGT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_AGT_UNDERFLOW	Underflow event signal from next lowest AGT channel, division must be 1.
AGT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_P402	Counts events on P402, events are counted in deep software standby mode.
AGT_CLOCK_P403	Counts events on P403, events are counted in deep software standby mode.
AGT_CLOCK_P404	Counts events on P404, events are counted in deep software standby mode.
AGT_CLOCK_AGTIO	Counts events on AGTIOn, events are not counted in software standby modes.

◆ agt_measure_t

enum agt_measure_t	
Enable pin for event counting mode.	
Enumerator	
AGT_MEASURE_DISABLED	AGT used as a counter.
AGT_MEASURE_PULSE_WIDTH_LOW_LEVEL	AGT used to measure low level pulse width.
AGT_MEASURE_PULSE_WIDTH_HIGH_LEVEL	AGT used to measure high level pulse width.
AGT_MEASURE_PULSE_PERIOD	AGT used to measure pulse period.

◆ agt_agtio_filter_t

enum agt_agtio_filter_t	
Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
AGT_AGTIO_FILTER_NONE	No filter.
AGT_AGTIO_FILTER_PCLKB	Filter at PCLKB.
AGT_AGTIO_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
AGT_AGTIO_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

◆ agt_enable_pin_t

enum agt_enable_pin_t	
Enable pin for event counting mode.	
Enumerator	
AGT_ENABLE_PIN_NOT_USED	AGTEE/AGTWEE is not used.
AGT_ENABLE_PIN_ACTIVE_LOW	Events are only counted when AGTEE/AGTWEE is low.
AGT_ENABLE_PIN_ACTIVE_HIGH	Events are only counted when AGTEE/AGTWEE is high.

◆ agt_trigger_edge_t

enum agt_trigger_edge_t	
Trigger edge for pulse period measurement mode and event counting mode.	
Enumerator	
AGT_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
AGT_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
AGT_TRIGGER_EDGE_BOTH	Events are counted on both edges (n/a for pulse period mode)

◆ agt_output_pin_t

enum agt_output_pin_t	
Output pins, used to select which duty cycle to update in R_AGT_DutyCycleSet().	
Enumerator	
AGT_OUTPUT_PIN_AGTOA	AGTOA.
AGT_OUTPUT_PIN_AGTOB	AGTOB.

◆ agt_pin_cfg_t

enum agt_pin_cfg_t	
Level of AGT pin	
Enumerator	
AGT_PIN_CFG_DISABLED	Not used as output pin.
AGT_PIN_CFG_START_LEVEL_LOW	Pin level low.
AGT_PIN_CFG_START_LEVEL_HIGH	Pin level high.

◆ agt_counter_bit_width_t

enum agt_counter_bit_width_t	
Counter type to determine regsiter size	
Enumerator	
AGT_COUNTER_BIT_WIDTH_DEFAULT	Legacy.
AGT_COUNTER_BIT_WIDTH_16	AGT.
AGT_COUNTER_BIT_WIDTH_32	AGTW.

Function Documentation

◆ R_AGT_Open()

fsp_err_t R_AGT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the AGT module instance. Implements timer_api_t::open.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional agt_extended_cfg_t extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
   err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_AGT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on AGT.

◆ R_AGT_Start()

fsp_err_t R_AGT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_AGT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Stop()

fsp_err_t R_AGT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_AGT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Reset()

fsp_err_t R_AGT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Enable()

fsp_err_t R_AGT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_AGT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_AGT_Disable()

fsp_err_t R_AGT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Example:

```
/* (Optional) Disable captures. */
   (void) R_AGT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_AGT_PeriodSet()

fsp_err_t R_AGT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.
Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
 * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
 * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
 * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
 * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
 * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
 * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
 * by timer_cfg_t::source_div.
 *
```

```
  * This example uses the last option (R_FSP_SystemClockHzGet).
  */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_DutyCycleSet()

fsp_err_t R_AGT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements timer_api_t::dutyCycleSet.

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
   uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                AGT_EXAMPLE_MAX_PERCENT;
/* Set the calculated duty cycle. */
   err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not AGT_AGTO_AGTOA or AGT_AGTO_AGTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	AGT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_AGT_CompareMatchSet()

fsp_err_t R_AGT_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	AGT compare match is not supported.

◆ R_AGT_InfoGet()

fsp_err_t R_AGT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Gets timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
      uint32_t period = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_StatusGet()

fsp_err_t R_AGT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current state and counter value stores them in p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_CallbackSet()

fsp_err_t R_AGT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_AGT_Close()

fsp_err_t R_AGT_Close (timer_ctrl_t *const *p_ctrl*)
Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements timer_api_t::close. **Return values** FSP_SUCCESS — Timer closed. FSP_ERR_ASSERTION — p_ctrl is NULL. FSP_ERR_NOT_OPEN — The instance control structure is not opened.

5.2.19.9 Timer, Simultaneous Channel (r_tau_pwm)

fsp_err_t	R_TAU_PWM_StatusGet (timer_ctrl_t *const p_ctrl, timer_status_t *const p_status)

fsp_err_t	R_TAU_PWM_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_TAU_PWM_Close (timer_ctrl_t *const p_ctrl)

Detailed Description

Driver for the TAU_PWM peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The TAU_PWM module has the following features:

- Supports simultaneous channel operation functions: one-shot pulse output, PWM output and multiple PWM output.
- Configurable clock source (CK00, CK01).
- Build-time configuration of clock divider
- Configurable period (counts per timer cycle).
- Configurable trigger source (TImn input) for one-shot pulse output
- Supports noise filter on input source in one-shot pulse output mode (always enabled)
- Supports runtime reconfiguration of period/delay, pulse width or duty cycle percent.
- Signal can be output to a pin.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Build-time availability of multi-slave mode for PWM outputs

Configuration

Build Time Configurations for r_tau_pwm

The following build time configurations are defined in fsp_cfg/r_tau_pwm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
One-shot Pulse Output Mode Support	• Disabled • Enabled	Disabled	Controls whether one-shot pulse output mode support is included in the build. This setting applies globally to all r_tau_pwm_instances. If one shot mode is not used by any instance, disable this setting to

			reduce ROM usage.
PWM Output Mode Support	• Disabled • Enabled	Enabled	Controls whether PWM mode support is included in the build. This setting applies globally to all r_tau_pwm_instances. If PWM mode is not used by any instance, disable this setting to reduce ROM usage.
Multi-Slave	• Disabled • Enabled	Disabled	Enable support for multiple slaves

Configurations for Timers > Timer, Simultaneous Channel Operation (r_tau_pwm)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Simultaneous Channel Operation (r_tau_pwm).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Operation Clock	• CK00 • CK01	CK00	Select the operation clock
Mode	• One-shot pulse output • PWM output	PWM output	Mode selection.
Master Channel	Channel number must be even.	0	Select the TAU master channel. When two or more master channels are to be used, slave channels with a master channel between them may not be set.
Period	Value must be a non-negative integer	0x10000	Specify the timer period based on the selected unit. In One-shot pulse output mode this value corresponds to the delay time. When the unit is set to 'Raw Counts', setting the period to 0x10000/0x10001 results in the maximum period for PWM Output function/One-shot pulse output function

			at the lowest divisor (fastest timer tick). The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Input (One-shot pulse)			
Trigger Source	MCU Specific Options		Select the trigger source for master channel.
Detect Edge	• Falling Edge • Rising Edge • Both Edges	Falling Edge	Select the detect edge.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If provided, the callback function is called from the interrupt service routine (ISR) each time the timer period elapses in PWM mode, and when the timer delay elapses in one-shot mode. If the optional slave channel interrupt is enabled, the callback is also called when the signal switches state during the PWM cycle in PWM mode, and when the pulse output is complete in one-shot mode.
Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Configurations for Timers > TAU PWM Channel Configuration (r_tau_pwm)

Configuration	Options	Default	Description
General			

Channel	Value must be between 0 and 7.	1	Specify the slave channel.
Output			
Output Level	• Start Level Low • Start Level High	Start Level Low	Output level of TAU slave channel.
Output Polarity	• Active-high • Active-low	Active-high	Output polarity of TAU slave channel.
One-Shot Pulse Width	Value must be a non-negative integer	0xffff	Specify the pulse width based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0xffff results in the maximum period at the lowest divisor (fastest timer tick).
One-Shot Pulse Width Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
PWM Duty Cycle Percent	Value must be a non-negative integer between 0 and 100	50	Specify the duty cycle percent for output pulse of slave channel.
Interrupts			
Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Clock Configuration

The TAU PWM clock is based on the peripheral module clock (PCLKB) which is equal to the system clock (ICLK).

Each TAU PWM channel has certain operation clocks selections, these can be set with the **General>Operation Clock** property in the module configuration. When the operation clock of a channel is set to CK00, or CK01, the TAU_PWM module provides divisor values for each of those clocks. These divisors may be set in the **Clocks** tab. As such, setting a divisor in the **Clocks** tab affects all TAU PWM and TAU channels that use that CK0x clock as an input. Adjusting these settings determines the frequency range achievable by a TAU_PWM channel. If a desired frequency is not achievable, the divider in the **Clocks** tab may be adjusted. The clock dividers cannot be adjusted at runtime.

Pin Configuration

This module can use the TOmn pins as output pins for One-shot and PWM signals.

This module can use the TImn pin as the input pin for One-shot signals.

Timer Period And Duty Cycle

The RA Configuration editor will automatically calculate the period/pulse width/duty cycle percent based on the selected period time, units, clock source, clock divider and mode.

When the selected unit is "Raw counts", the maximum and minimum allowed period/pulse width/duty cycle setting are presented by the following tables:

In One-shot pulse output mode:

Clock divider	Minimum period (counts)	Maximum period (counts)	Minimum pulse width (counts)	Maximum pulse width (counts)
PCLK/1	0x00003	0x10001	0x0001	0xffff
PCLK/2 to PCLK/32768	0x00002	0x10000	0x0000	0xffff

In PWM output mode:

Clock divider	Minimum period (counts)	Maximum period (counts)	Minimum duty cycle (%)	Maximum duty cycle (%)
PCLK/1	0x00002	0x10001	0	100
PCLK/2 to PCLK/32768	0x00001	0x10000	0	100

Note

If PCLK (undivided) is selected as the operation clock (CK00, CK01) and TDR0n is set to 0x0000 (n = 0 to 7), interrupt requests output from timer array units cannot be used. So, when PCLK is undivided, the minimum period must be plus one.
Because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason, all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter underflow after calling R_TAU_PWM_PeriodSet() or R_TAU_PWM_DutyCycleSet().

One-Shot Pulse Output Mode

By using two channels as a set, a one-shot pulse having any delay pulse width can be generated from the signal input to the TI0n pin.

The delay time is counted by the master channel, and the pulse width is counted by the slave channel.

PWM Output

Two channels can be used as a set to generate a pulse of any period and duty factor (duty cycle). By extending the PWM function and using multiple slave channels, many PWM waveforms with different

duty values can be output.

When multiple slaves are to be connected to a single master, the build time option for multiple slaves needs to be set.

Note

When two or more master channels are to be used, slave channels with a master channel between them may not be set. For example, if channels 0 and 4 are set as master channels, channels 1 to 3 can be set as the slave channels of master channel 0, channels 5 to 7 cannot be set as the slave channels of master channel 0.

The period is counted by the master channel, and the duty cycle is counted by the slave channel.

Controlling TAU_PWM with ELC Events

The TAU_PWM timer can be configured to trigger the timer counter when an ELC event occurs.

Note

Triggering the timer using ELC events is supported only when master channel is set to 0 and mode is set to One-shot pulse output.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with TAU_PWM

The TAU_PWM timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Note

Only event signals from channel 00 to 03 are available.

Limitations

- None

Examples

TAU_PWM Basic Example

This is a basic example of minimal use of the TAU PWM (in PWM Output mode) in an application.

```
void tau_pwm_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
```

```
}
```

TAU_PWM Callback Example

This is an example of a timer callback.

Note

The callback function always called after the period time (in PWM output mode) or delay time (in One-shot pulse output mode) has expired. Additionally, it can be optionally called after the duty cycle (in PWM output mode) or pulse width (in One-shot pulse output mode) has expired by enabling the slave channel's interrupt.

```
uint32_t g_timer_master_cycle_end_counter = 0;
uint32_t g_timer_slave_cycle_end_counter = 0;
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_MASTER_CYCLE_END == p_args->event)
    {
       g_timer_master_cycle_end_counter++;
    }
 if (TIMER_EVENT_SLAVE_CYCLE_END == p_args->event)
    {
       g_timer_slave_cycle_end_counter++;
    }
}
```

TAU_PWM One-Shot Pulse Output Mode Example

TAU_PWM One-Shot Pulse Output Mode Example - Software Trigger

This example demonstrates the configuration and use of One-shot pulse output mode with TAU_PWM timer when using the software trigger.

```
void tau_pwm_one_shot_software_trigger_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_one_shot_software_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Enable triggering (including by software). */
   (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
   g_timer_master_cycle_end_counter = 0;
   g_timer_slave_cycle_end_counter = 0;
   (void) R_TAU_PWM_Start(&g_timer0_ctrl);
   uint32_t timeout = TIMER_TEST_WAVEFORM_TIMEOUT;
while (((timeout--) > 0) && (0 == g_timer_slave_cycle_end_counter))
   {
/* Wait for one shot pulse output to complete */
   }
/* Ensure exactly one slave interrupt and one master interrupt have occurred. */
   assert(1 == g_timer_master_cycle_end_counter);
   assert(1 == g_timer_slave_cycle_end_counter);
   g_timer_master_cycle_end_counter = 0;
   g_timer_slave_cycle_end_counter = 0;
/* Start trigger by software. */
   (void) R_TAU_PWM_Start(&g_timer0_ctrl);
   timeout = TIMER_TEST_WAVEFORM_TIMEOUT;
while (((timeout--) > 0) && (0 == g_timer_slave_cycle_end_counter))
   {
/* Wait for one shot pulse output to complete */
   }
/* Ensure exactly one slave interrupt and one master interrupt have occurred. */
   assert(1 == g_timer_master_cycle_end_counter);
   assert(1 == g_timer_slave_cycle_end_counter);
/* Stop timer and disable the software trigger. */
   (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU_PWM One-Shot Pulse Output Mode Example - Pin Input Trigger

This example demonstrates the configuration and use of One-shot pulse output mode with TAU_PWM timer when using an external pin input trigger.

```
void tau_pwm_one_shot_pin_input_trigger_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_one_shot_input_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the input trigger. */
    (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Wait for trigger source from the input pin */
 /* Disable the input trigger. */
    (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU_PWM PWM Output Mode Example

This example demonstrates the configuration and use of PWM output mode with TAU_PWM timer.

```
void tau_pwm_multiple_pwm_output_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_pwm_output_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
```

```
    (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

TAU_PWM Period Update Example

This an example of updating the period.

```
#define TAU_PWM_EXAMPLE_MSEC_PER_SEC (1000)
#define TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tau_pwm_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz) */
 timer_info_t info;
    (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint32_t is used to prevent
this. */
    uint32_t period_counts =
       (uint32_t) ((timer_freq_hz * TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_PWM_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
```

```
  * period is larger than UINT16_MAX. */
    err = R_TAU_PWM_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

TAU_PWM Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define TAU_PWM_EXAMPLE_MSEC_PER_SEC (1000)
#define TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void tau_pwm_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz) */
 timer_info_t info;
    (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
    uint32_t timer_freq_hz = info.clock_frequency;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint32_t is used to prevent
this. */
    uint32_t period_counts =
       (uint32_t) ((timer_freq_hz * TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_PWM_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
```

```
    err = R_TAU_PWM_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

ELC Example

This is an example of using TAU_PWM with ELC events.

```
/* This example shows how to use ELC event to trigger the timer counters. */
void tau_pwm_elc_event_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_elc_event_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the elc event trigger. */
    (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
    (void) R_TAU_PWM_Start(&g_timer0_ctrl);
 /* Wait for ELC event */
 /* Disable the elc event trigger. */
    (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
}
```

Data Structures

struct	tau_pwm_channel_cfg_t
struct	tau_pwm_extended_cfg_t
struct	tau_pwm_instance_ctrl_t

Enumerations

enum	tau_pwm_operation_clock_t
enum	tau_pwm_source_t

enum	tau_pwm_detect_edge_t
enum	tau_pwm_output_level_t
enum	tau_pwm_output_polarity_t
enum	tau_pwm_io_pin_t

Data Structure Documentation

◆ tau_pwm_channel_cfg_t

struct tau_pwm_channel_cfg_t		
TAU_PWM per channel configuration.		
Data Fields		
uint8_t	channel	Slave Channel Number (1..7)
uint16_t	duty_cycle_counts	One-shot: Pulse_width_counts; PWM: Duty_cycle_counts.
tau_pwm_output_level_t	output_level	Setting of output level for TAU.
tau_pwm_output_polarity_t	output_polarity	Setting of output polarity for TAU.
uint8_t	cycle_end_ipl	TAU slave channel IPL.
IRQn_Type	cycle_end_irq	TAU slave channel IRQ.

◆ tau_pwm_extended_cfg_t

struct tau_pwm_extended_cfg_t		
Extended configuration structure for TAU_PWM		
Data Fields		
tau_pwm_operation_clock_t	operation_clock	Setting of operation clock for master and slave channels.
tau_pwm_source_t	trigger_source	Trigger source for master channel.
tau_pwm_detect_edge_t	detect_edge	Trigger edge to start pulse period measurement.
tau_pwm_channel_cfg_t const *	p_slave_channel_cfgs[TAU_PWM_MAX_NUM_SLAVE_CHANNELS]	Configuration for each slave channel, at least 1 slave channel is required.

◆ tau_pwm_instance_ctrl_t

struct tau_pwm_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

Enumeration Type Documentation

◆ tau_pwm_operation_clock_t

enum tau_pwm_operation_clock_t	
Operation clock.	
Enumerator	
TAU_PWM_OPERATION_CLOCK_CK00	Operation Clock CK00.
TAU_PWM_OPERATION_CLOCK_CK01	Operation CLock CK01.

◆ tau_pwm_source_t

enum tau_pwm_source_t	
Trigger Source	
Enumerator	
TAU_PWM_SOURCE_PIN_INPUT	Use TI0n pin input as trigger source.
TAU_PWM_SOURCE_ELC_EVENT	Use ELC events as trigger source.

◆ tau_pwm_detect_edge_t

enum tau_pwm_detect_edge_t	
TI0n pin input edge	
Enumerator	
TAU_PWM_DETECT_EDGE_FALLING	Detects falling edge.
TAU_PWM_DETECT_EDGE_RISING	Detects rising edge.
TAU_PWM_DETECT_EDGES_BOTH	Detects both edges.

◆ tau_pwm_output_level_t

enum tau_pwm_output_level_t	
Level of TAU pin	
Enumerator	
TAU_PWM_OUTPUT_LEVEL_LOW	Pin level low.
TAU_PWM_OUTPUT_LEVEL_HIGH	Pin level high.

◆ tau_pwm_output_polarity_t

enum tau_pwm_output_polarity_t	
Timer output polarity	
Enumerator	
TAU_PWM_OUTPUT_POLARITY_ACTIVE_HIGH	Positive logic output (active-high)
TAU_PWM_OUTPUT_POLARITY_ACTIVE_LOW	Negative logic output (active-low)

◆ tau_pwm_io_pin_t

enum tau_pwm_io_pin_t	
Input/Output pins, used to select which duty cycle to update in R_TAU_PWM_DutyCycleSet().	
Enumerator	
TAU_PWM_IO_PIN_CHANNEL_0	I/O pin of channel 0.
TAU_PWM_IO_PIN_CHANNEL_1	I/O pin of channel 1.
TAU_PWM_IO_PIN_CHANNEL_2	I/O pin of channel 2.
TAU_PWM_IO_PIN_CHANNEL_3	I/O pin of channel 3.
TAU_PWM_IO_PIN_CHANNEL_4	I/O pin of channel 4.
TAU_PWM_IO_PIN_CHANNEL_5	I/O pin of channel 5.
TAU_PWM_IO_PIN_CHANNEL_6	I/O pin of channel 6.
TAU_PWM_IO_PIN_CHANNEL_7	I/O pin of channel 7.

Function Documentation

◆ R_TAU_PWM_Open()

fsp_err_t R_TAU_PWM_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

The TAU_PWM implementation of the timer requires a tau_pwm_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_TAU_PWM_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	A required input pointer is NULL, the source divider/period/duty cycle counts or number of slave channels is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	ISR of master channel must be enabled
FSP_ERR_INVALID_MODE	Invalid configuration option provided for selected timer mode
FSP_ERR_INVALID_CHANNEL	The master/slave channel selected is not available on this device, slave channel number must be greater than master channel number.

◆ R_TAU_PWM_Stop()

fsp_err_t R_TAU_PWM_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_TAU_PWM_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_Start()

fsp_err_t R_TAU_PWM_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer (pwm mode) or triggers the one-shot pulse output by software (one-shot mode). Implements timer_api_t::start.

Note

In one-shot mode, this function is supported only after the timer has been placed into the start trigger detection wait state by calling timer_api_t::enable

Example:

```
/* Start the timer. */
   (void) R_TAU_PWM_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_NOT_ENABLED	In One-shot mode, timer must be enabled first.

◆ R_TAU_PWM_Reset()

fsp_err_t R_TAU_PWM_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the current period and duty cycle. Implements timer_api_t::reset.

Note

If the timer is stopped when calling this function, the timer counter is not reset. The counter will be reset one cycle after the timer is next started (or restarted), since it takes one cycle to reload the initial count when starting the timer.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_Enable()

fsp_err_t R_TAU_PWM_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event inputs that can start the counter and enables the software trigger. After a successful call to this function, the timer is placed into the trigger detection wait state. Implements timer_api_t::enable.

Example:

```
/* Enable triggering (including by software). */
   (void) R_TAU_PWM_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_MODE	The mode is invalid, only called in TIMER_MODE_ONE_SHOT mode.
FSP_ERR_UNSUPPORTED	Unsupported when one shot mode support is disabled

◆ R_TAU_PWM_PeriodSet()

fsp_err_t R_TAU_PWM_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter underflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

Example:

```
/* Get the source clock frequency (in Hz) */
timer_info_t info;
   (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
   uint32_t timer_freq_hz = info.clock_frequency;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX. A cast to uint32_t is used to prevent
this. */
   uint32_t period_counts =
      (uint32_t) ((timer_freq_hz * TAU_PWM_EXAMPLE_DESIRED_PERIOD_MSEC) /
TAU_PWM_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
   err = R_TAU_PWM_PeriodSet(&g_timer0_ctrl, period_counts);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Period counts is out of range.

◆ R_TAU_PWM_CompareMatchSet()

fsp_err_t R_TAU_PWM_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	TAU PWM compare match is not supported.

◆ R_TAU_PWM_DutyCycleSet()

fsp_err_t R_TAU_PWM_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Sets duty cycle on requested pin. Implements timer_api_t::dutyCycleSet.

Duty cycle is updated in the timer data register. The updated duty cycle is reflected after the next cycle end (counter underflow).

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
   uint16_t duty_cycle_counts = (uint16_t) ((current_period_counts *
TAU_PWM_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                          TAU_PWM_EXAMPLE_MAX_PERCENT);
/* Set the calculated duty cycle. */
   err = R_TAU_PWM_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, 1);
   assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use tau_pwm_io_pin_t to select the target slave channel

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of tau_pwm_io_pin_t.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is out of range or larger than period.

◆ R_TAU_PWM_InfoGet()

fsp_err_t R_TAU_PWM_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_TAU_PWM_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, frequency written to caller's structure successfully
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_StatusGet()

fsp_err_t R_TAU_PWM_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current timer state and master channel counter value and stores them in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_TAU_PWM_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value retrieved successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_CallbackSet()

fsp_err_t R_TAU_PWM_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	p_ctrl or p_callback was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_TAU_PWM_Close()

fsp_err_t R_TAU_PWM_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

fsp_err_t	R_ULPT_StatusGet (timer_ctrl_t *const p_ctrl, timer_status_t *const p_status)
fsp_err_t	R_ULPT_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_ULPT_Close (timer_ctrl_t *const p_ctrl)

Detailed Description

Driver for the ULPT peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The ULPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, LOCO, SUBCLK, and external sources input to ULPTEVIn.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to ULPTEVIn.
- Supports debounce filter on ULPTEVIn pins.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

Selecting a Timer

RA MCUs can have multiple timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer, and the Ultra Low Power Timer (ULPT). When selecting between them, consider these factors:

	GPT	AGT	ULPT

Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).	The ULPT can operate in all low power up to DSTBYs (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.	The number of ULPT channels is device specific, 2 is common.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.	The ULPT timers are 32-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.	The ULPT runs off PCLKB. LOCO, or subclock are count sources with a configurable divider up to 128.

Configuration

Build Time Configurations for r_ulpt

The following build time configurations are defined in fsp_cfg/r_ulpt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	• Disabled • Enabled (Required when Count Source is EVI on any channel)	Disabled	Enable input support to use ULPTEVin as count source

Configurations for Timers > Timer, Ultra-Low-Power (r_ulpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Ultra-Low-Power (r_ulpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_timer0	Module name.
Channel	Channel number does not exist	0	Physical hardware channel.
Mode	• Periodic • One-Shot • PWM	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
Period	Value must be non-negative	0x10000	Specify the timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x10000 for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x80000 when counting from PCLKB or 0x800000 when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a

			comment in the timer_cfg_t structure.
Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Count Source	• LOCO • SUBCLOCK • EVI (Requires Pin Input Support-Enabled)	LOCO	ULPT count source. NOTE: The divisor is calculated automatically based on the selected period. See ulpt_count_source_t documentation for details.
Output			
Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
ULPTOA Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure Match ULPTOA output.
ULPTOB Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure Match ULPTOB output.
ULPTO Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure Pulse ULPTO output.
Input			
Input Filter	• No Filter • Filter sampled at PCLKB • Filter sampled at PCLKB / 8 • Filter sampled at PCLKB / 32	No Filter	ULPTEVIn filter. Only applies if the count source is ULPTEVIn, event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Enable Pin	• Enable Function Ignored • Enable Function Low • Enable Function High • Enable Function	Enable Function Ignored	ULPTEEn enable edge. Only applies if the count source is ULPTEVIn, event counter mode

	Start • Enable Function Restart		
Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	ULPTEVIn trigger edge. Applies Only applies if the count source is ULPTEVIn, event counter mode.
Event Edge	• Event Edge Rising • Event Edge Falling • Event Edge Both	Event Edge Rising	Select the ULPTEVin edge. Applies if count input is ULPTEVin.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Clock Configuration

The ULPT subsystem is driven by the PCLKB, but countdown is driven LOCO, Subclock, or event input. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use the ULPTO, ULPTOA and ULPTOB pins as output pins for periodic, one-shot, or PWM signals.

For event counting, the input clocking signal must be applied to the ULPTEVIn pin.

Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	Maximum period (counts)
LOCO/Subclock	0xFFFFFFFF

All other sources	0xFFFFFFFF

Note

Though the ULPT is a 32-bit timer, because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Starting and Stopping the ULPT

After starting or stopping the timer, ULPT registers cannot be accessed until the ULPT state is updated after 3 ULPTCLK cycles. If another ULPT function is called before the 3 ULPTCLK period elapses, the function spins waiting for the ULPT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of ULPTCLK, which is derived from timer_cfg_t::source_div and ulpt_extended_cfg_t::count_source.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running ULPT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

Low Power Modes

The ULPT can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

One-Shot Mode

The ULPT timer does support one-shot mode natively. The interrupt with put the module in the stop state. The callback is only called once in this case. If needed the timer needs to be re-started via the driver call.

Periodic Output

The ULPTO toggles each time the counter underflows.

Examples of periodic signals that can be generated by this module are shown below:

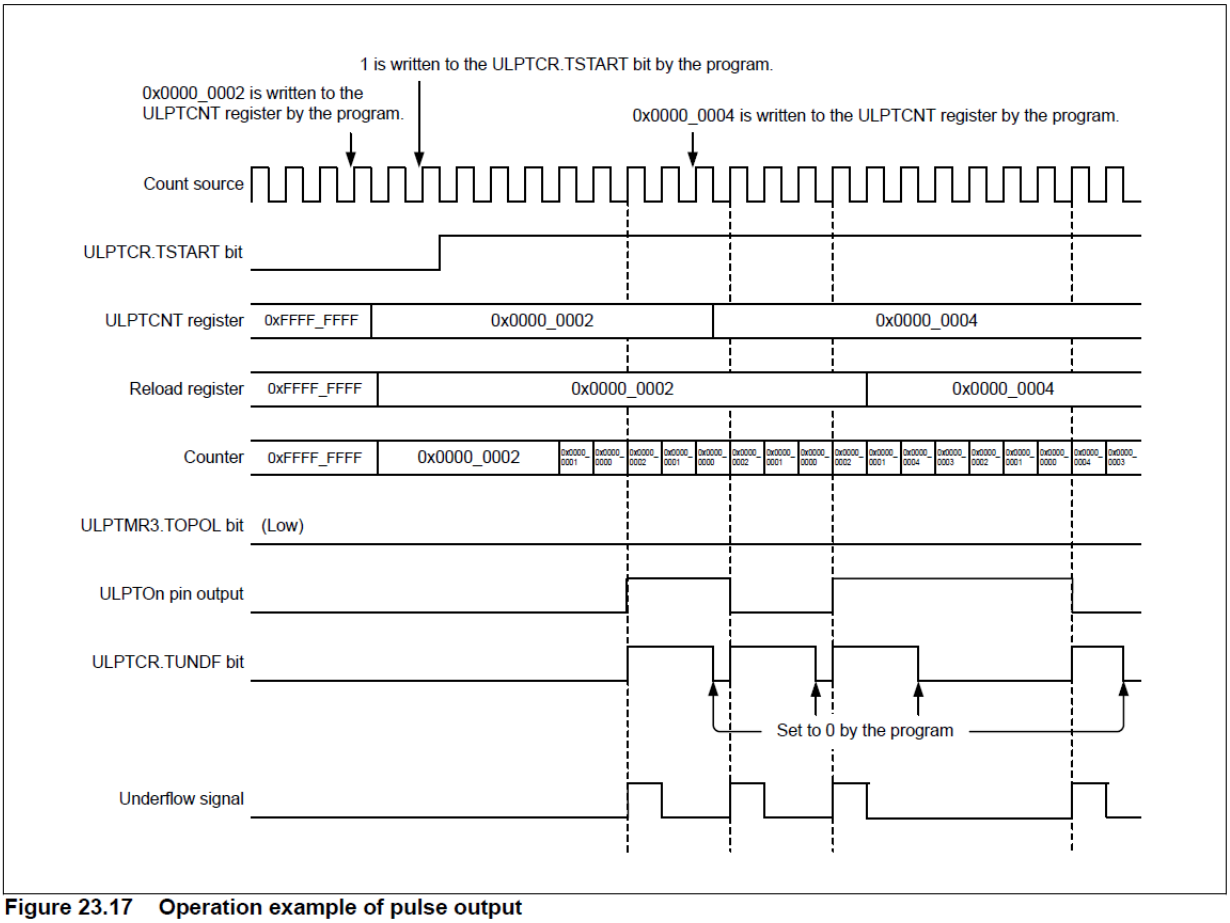

Figure 23.17 Operation example of pulse output

Figure 346: ULPT Periodic Output

PWM Output

The ULPTOA or ULPTOB pin toggles each time the compare match timer matches the down counter. It also toggles once the underflow occurs in periodic mode. for example setting the ULPT counter to 0x1000, and compare match A to half (0x800) will created a 50% duty cycle output on ULPTOA. Setting ULPTB to a quarter of that (0x400) will create a 25% duty cycle wave. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

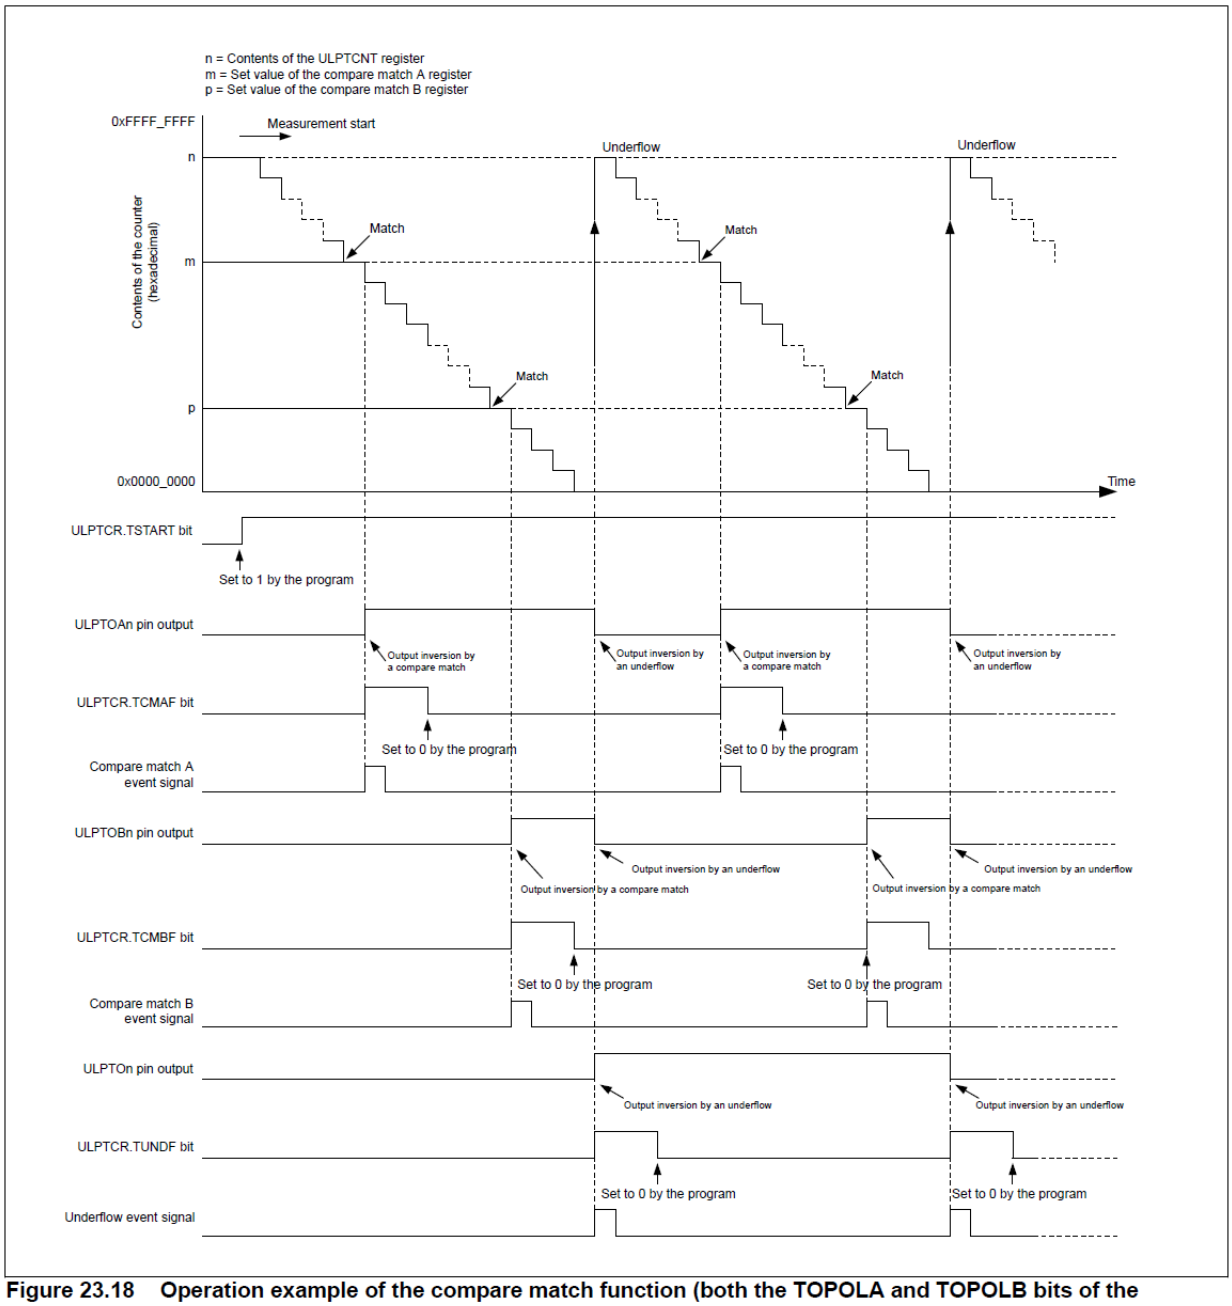

Figure 23.18 Operation example of the compare match function (both the TOPOLA and TOPOLB bits of the ULPTCMSR register are set to 0)

Figure 347: ULPT Periodic Output

Triggering ELC Events with ULPT

The ULPT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

ULPT Basic Example

This is a basic example of minimal use of the ULPT in an application.

```
void ulpt_basic_example (void)
{
 fsp_err_t      err = FSP_SUCCESS;
 timer_status_t status;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
    (void) R_ULPT_StatusGet(&g_timer0_ctrl, &status);
}
```

ULPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

ULPT Free Running Counter Example

To use the ULPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF.

```
void ulpt_counter_example (void)
{
 fsp_err_t      err = FSP_SUCCESS;
```

```
 timer_status_t status;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. This will set the counter back to max */
    (void) R_ULPT_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
    (void) R_ULPT_StatusGet(&g_timer0_ctrl, &status);
}
```

ULPT Period Update Example

This an example of updating the period.

```
#define ULPT_EXAMPLE_MSEC_PER_SEC (1000)
#define ULPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void ulpt_period_calculation_example (void)
{
 fsp_err_t    err = FSP_SUCCESS;
 timer_info_t ulptInfo;
    uint32_t    timer_freq_hz = 0;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
    err = R_ULPT_Enable(&g_timer0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Get the source clock frequency (in Hz).
  * - Use the R_ULPT_InfoGet function (it accounts for the clock source and divider).
```

```
*/
 if (R_ULPT_InfoGet(&g_timer0_ctrl, &ulptInfo) == FSP_SUCCESS)
    {
       timer_freq_hz = ulptInfo.clock_frequency;
    }
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * ULPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
ULPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_ULPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
    err = R_ULPT_Disable(&g_timer0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

ULPT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define ULPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define ULPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void ulpt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Start the timer. */
    (void) R_ULPT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_ULPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
ULPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                 ULPT_EXAMPLE_MAX_PERCENT;
 /* Set the calculated duty cycle. */
    err = R_ULPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts,
ULPT_OUTPUT_PIN_ULPTOA);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	ulpt_instance_ctrl_t
struct	ulpt_extended_cfg_t

Enumerations

enum	ulpt_clock_t
enum	ulpt_enable_function_t

Data Structure Documentation

◆ ulpt_instance_ctrl_t

struct ulpt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ ulpt_extended_cfg_t

struct ulpt_extended_cfg_t		
Optional ULPT extension data structure.		
Data Fields		
ulpt_clock_t	count_source	ULPT channel clock source.
ulpt_ulptevi_filter_t	ulptevi_filter	Input filter for ULTPEVI.
ulpt_enable_function_t	enable_function	Counter function when ULPTEE is valid.
ulpt_trigger_edge_t	trigger_edge	Enable trigger edge (start and restart functions only).
ulpt_event_pin_t	event_pin	Event pin (event counting only).
ulpt_pulse_pin_cfg_t	ulpto	Pulse output pin.
union ulpt_extended_cfg_t	__unnamed__	

Enumeration Type Documentation

◆ ulpt_clock_t

enum ulpt_clock_t	
Count source.	
Enumerator	
ULPT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, 128.
ULPT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, 128.
ULPT_CLOCK_ULPTEVI	Counts external events on ULPTEVI.

◆ ulpt_enable_function_t

enum ulpt_enable_function_t	
Counter mode for event enable.	
Enumerator	
ULPT_ENABLE_FUNCTION_IGNORED	Always count external events, ignore ULPTEE.
ULPT_ENABLE_FUNCTION_ENABLE_LOW	Event counting is enabled while ULPTEE is low (event counting only).
ULPT_ENABLE_FUNCTION_ENABLE_HIGH	Event counting is enabled while ULPTEE is high (event counting only).
ULPT_ENABLE_FUNCTION_START	Counting is started after ULPTEE.
ULPT_ENABLE_FUNCTION_RESTART	Counting is restarted after ULPTEE.

◆ ulpt_trigger_edge_t

enum ulpt_trigger_edge_t	
Enable signal trigger edge for start and restart functions.	
Enumerator	
ULPT_TRIGGER_EDGE_RISING	Timer enable function occurs on the rising edge of ULPTEE.
ULPT_TRIGGER_EDGE_FALLING	Timer enable function occurs on the falling edge of ULPTEE.
ULPT_TRIGGER_EDGE_BOTH	Timer enable function occurs on any edge of ULPTEE.

◆ ulpt_event_pin_t

enum ulpt_event_pin_t	
Event signal pin.	
Enumerator	
ULPT_EVENT_PIN_RISING	Event count occurs on the rising edge.
ULPT_EVENT_PIN_FALLING	Event count occurs on the falling edge.
ULPT_EVENT_PIN_BOTH	Event count occurs on both edges.

◆ ulpt_output_pin_t

enum ulpt_output_pin_t	
Output pins, used to select which duty cycle to update in R_ULPT_DutyCycleSet().	
Enumerator	
ULPT_OUTPUT_PIN_ULPTOA	Compare match A output.
ULPT_OUTPUT_PIN_ULPTOB	Compare match B output.

◆ ulpt_pulse_pin_cfg_t

enum ulpt_pulse_pin_cfg_t	
ULPTO pulse output pin.	
Enumerator	
ULPT_PULSE_PIN_CFG_DISABLED	Output pin disabled.
ULPT_PULSE_PIN_CFG_ENABLED_START_LEVEL_LOW	Output pin Enabled Start Low.
ULPT_PULSE_PIN_CFG_ENABLED_START_LEVEL_HIGH	Output pin enabled Start Hig.

◆ ulpt_match_pin_cfg_t

enum ulpt_match_pin_cfg_t	
ULPT match output pin.	
Enumerator	
ULPT_MATCH_PIN_CFG_DISABLED	Match output disabled.
ULPT_MATCH_PIN_CFG_START_LEVEL_LOW	Match output enabled, starts low.
ULPT_MATCH_PIN_CFG_START_LEVEL_HIGH	Match output enabled, starts high.

◆ ulpt_ulptevi_filter_t

enum ulpt_ulptevi_filter_t	
Input filter, applied to ULPTEVI in event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
ULPT_ULPTEVI_FILTER_NONE	No filter.
ULPT_ULPTEVI_FILTER_PCLKB	Filter at PCLKB.
ULPT_ULPTEVI_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
ULPT_ULPTEVI_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

Function Documentation

◆ R_ULPT_Open()

fsp_err_t R_ULPT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the ULPT module instance. Implements timer_api_t::open.

The ULPT implementation of the general timer can accept an optional ulpt_extended_cfg_t extension parameter. For ULPT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock LOCO is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
   err = R_ULPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_ULPT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on ULPT.

◆ R_ULPT_Start()

fsp_err_t R_ULPT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_ULPT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_Stop()

fsp_err_t R_ULPT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. This will set the counter back to max */
   (void) R_ULPT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_Reset()

fsp_err_t R_ULPT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_Enable()

fsp_err_t R_ULPT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
err = R_ULPT_Enable(&g_timer0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_ULPT_Disable()

fsp_err_t R_ULPT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Example:

```
err = R_ULPT_Disable(&g_timer0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_ULPT_PeriodSet()

fsp_err_t R_ULPT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.
Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
 * period is larger than UINT16_MAX. */
  err = R_ULPT_PeriodSet(&g_timer0_ctrl, period_counts);
  assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_DutyCycleSet()

fsp_err_t R_ULPT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements timer_api_t::dutyCycleSet.

Example:

```
/* Set the calculated duty cycle. */
   err = R_ULPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts,
ULPT_OUTPUT_PIN_ULPTOA);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not ULPT_ULPTO_ULPTOA or ULPT_ULPTO_ULPTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	ULPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_ULPT_CompareMatchSet()

fsp_err_t R_ULPT_CompareMatchSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *compare_match_value*, timer_compare_match_t const *match_channel*)

Placeholder for unsupported compareMatch function. Implements timer_api_t::compareMatchSet.

Return values

FSP_ERR_UNSUPPORTED	ULPT compare match is not supported.

◆ R_ULPT_InfoGet()

fsp_err_t R_ULPT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Gets timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* Get the source clock frequency (in Hz).
 * - Use the R_ULPT_InfoGet function (it accounts for the clock source and divider).
*/
if (R_ULPT_InfoGet(&g_timer0_ctrl, &ulptInfo) == FSP_SUCCESS)
   {
      timer_freq_hz = ulptInfo.clock_frequency;
   }
```

Return values

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_StatusGet()

fsp_err_t R_ULPT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current state and counter value stores them in p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
   (void) R_ULPT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_ULPT_CallbackSet()

fsp_err_t R_ULPT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_ULPT_Close()

fsp_err_t R_ULPT_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Timer closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

5.2.20 Transfer

Modules

Detailed Description

Transfer Modules.

Modules

	Transfer (r_dmac) Driver for the DMAC peripheral on RA MCUs. This module implements

	the Transfer Interface.
	Transfer (r_dtc) Driver for the DTC peripheral on RA MCUs. This module implements the Transfer Interface.

fsp_err_t	R_DMAC_Close (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DMAC peripheral on RA MCUs. This module implements the Transfer Interface.

Overview

The Direct Memory Access Controller (DMAC) transfers data from one memory location to another without using the CPU.

Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
  - Repeat-Block transfer (Not available on all MCUs)
- Address increment, decrement, fixed, or offset modes
- Triggered by ELC events
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dmac

The following build time configurations are defined in fsp_cfg/r_dmac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Transfer > Transfer (r_dmac)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dmac).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Mode	MCU Specific Options		Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of

			Blocks; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	• 1 Byte • 2 Bytes • 4 Bytes	2 Bytes	Select the transfer size.
Destination Address Mode	• Fixed • Offset addition • Incremented • Decremented	Fixed	Select the address mode for the destination.
Source Address Mode	• Fixed • Offset addition • Incremented • Decremented	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	• Destination • Source	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Number of Transfers	Value must be a non-negative integer	1	Specify the number of transfers for repeat and normal mode or block size for repeat-block transfer mode.
Number of Blocks (Valid only in Repeat,Block or Repeat-Block Mode)	Value must be a non-negative integer	0	Specify the number of blocks to transfer in Repeat,Block or Repeat-Block mode.
Activation Source	MCU Specific Options		Select the DMAC transfer start event. If no ELC event is chosen then software start can be used.
Callback	Name must be a valid C symbol	NULL	A user callback that is called at the end of the transfer.
Transfer End Interrupt Priority	MCU Specific Options		Select the transfer end interrupt priority.
Interrupt Frequency	• Interrupt after all transfers have completed • Interrupt after each block, or	Interrupt after all transfers have completed	Select to have interrupt after each transfer or after last transfer.

	repeat size is transferred		
Offset value (Valid only when address mode is \'Offset\')	Value must be a 24 bit signed integer.	1	Offset value is added to the address after each transfer.
Source Buffer Size	Value must be a non-negative integer with a maximum configurable value of 65535.	1	Specify the size of whole source buffer (valid only for Repeat-Block transfer mode with source address update mode other than offset addition).

Clock Configuration

The DMAC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build, or by using the CGC module at run-time.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Source and Destination Configuration

R_DMAC_Reset() API function should be called to set the source and destination before starting transfer operation.

Transfer Modes

The DMAC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transferred every time the configured ELC event is received by the DMAC channel. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment, decrement, or add an offset to the next data unit after each transfer. A 16-bit counter decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the ELC event and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,1024]. When the transfer counter reaches 0, the counter is reset to its configured value, the repeat area (source or destination address) resets to its starting address and the block count remaining will decrement by 1. When the block count reaches 0, transfers will no longer be triggered by the ELC event and the CPU may be interrupted to signal that all transfers have finished.
- **Block Mode** - In block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.
- **Repeat-Block Mode** - In repeat-block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can be configured to a 16 bit number. If the destination address mode is offset mode,

maximum configurable number of blocks is 0xFFFF for block size(length) of one with data transfer size as byte,0x7FFF for block size of one with data transfer size as half word and 0x3FFF for block size of one with data size as word. After each block transfer the source address and the destination address will be incremented or decremented to the next block address. In case of offset address mode for source address, the source address size is the total size of source buffer after which the source area is rolled over, block size can be smaller than the source buffer size.For source address mode as offset mode, the maximum configurable source buffer size is 0xFFFF for transfer data size of a byte,0x7FFF for transfer data size of half word and 0x3FFF for transfer data size of word. Repeat-block mode can be used to implement single ring buffer to multiple ring buffer transfer type design.

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever • Max repeat size is 256 x 4 bytes	• Configurable number of repeats • Max repeat size is 1024 x 4 bytes
Block Mode	• Max block size is 256 x 4 bytes	• Max block size is 1024 x 4 bytes
Channels	• One instance per interrupt	• MCU specific (8 channels or less)
Chained Transfers	• Supported	• Not Supported
Software Trigger	• Must use the software ELC event	• Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	• Not supported	• Supported

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Repeat-block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	N/A	N/A
TRANSFER_IRQ_END	N/A	Interrupt after last block

Additional Considerations

- The DTC requires a moderate amount of RAM (one transfer_info_t struct per open instance + DTC_VECTOR_TABLE_SIZE).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.

Offset Address Mode

When the source or destination mode is configured to offset mode, a configurable offset is added to the source or destination pointer after each transfer. The offset is a signed 24 bit number.

Examples

Basic Example

This is a basic example of minimal use of the DMAC in an application. In this case, one or more events have been routed to the DMAC for handling so it only needs to be enabled to start accepting transfers.

```
void dmac_minimal_example (void)
{
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the DMAC so that it responds to transfer requests. */
```

```
    err = R_DMAC_Enable(&g_transfer_ctrl);
    assert(FSP_SUCCESS == err);
}
```

CRC32 Example

In this example the DMAC is used to feed the CRC peripheral to perform a CRC32 operation.

```
volatile bool g_transfer_complete = false;
void dmac_callback (dmac_callback_args_t * cb_data)
{
 FSP_PARAMETER_NOT_USED(cb_data);
    g_transfer_complete = true;
}
void dmac_crc_example (void)
{
    uint8_t p_src[TRANSFER_LENGTH];
 /* Initialize p_src to [ABC..OP] */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       p_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Set transfer source address to p_src */
    g_transfer_cfg.p_info->p_src = (void *) p_src;
 /* Set transfer destination address to the CRC data input register */
    g_transfer_cfg.p_info->p_dest = (void *) &R_CRC->CRCDIR;
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable DMAC transfers. */
    (void) R_DMAC_Enable(&g_transfer_ctrl);
 /* Open the CRC module. */
    err = R_CRC_Open(&g_crc_ctrl, &g_crc_cfg);

   crc32 ^= CRC32_FINAL_XOR_VALUE;
/* Verify that the CRC32 is calculated correctly. */
/* CRC32("ABCD...NOP") = 0xE0E8FF4D. */
const uint32_t expected_crc32 = 0xE0E8FF4D;
if (expected_crc32 != crc32)
   {
/* Handle any CRC errors. This function should be defined by the user. */
      handle_crc_error();
   }
}
```

Data Structures

struct	dmac_instance_ctrl_t
struct	dmac_extended_cfg_t

Macros

#define	DMAC_MAX_NORMAL_TRANSFER_LENGTH
#define	DMAC_MAX_REPEAT_TRANSFER_LENGTH
#define	DMAC_MAX_BLOCK_TRANSFER_LENGTH
#define	DMAC_MAX_REPEAT_COUNT
#define	DMAC_MAX_BLOCK_COUNT

Data Structure Documentation

◆ dmac_instance_ctrl_t

struct dmac_instance_ctrl_t
Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

◆ dmac_extended_cfg_t

struct dmac_extended_cfg_t	
DMAC transfer configuration extension. This extension is required.	
Data Fields	
uint8_t	channel
	Channel number, does not apply to all HAL drivers.
IRQn_Type	irq
	DMAC interrupt number.
uint8_t	ipl
	DMAC interrupt priority.
int32_t	offset
	Offset value used with transfer_addr_mode_t::TRANSFER_ADDR_MODE_OFFSET.
uint16_t	src_buffer_size
elc_event_t	activation_source
void(*	p_callback)(dmac_callback_args_t *cb_data)
void *	p_context

Field Documentation

◆ src_buffer_size

uint16_t dmac_extended_cfg_t::src_buffer_size

Source ring buffer size for TRANSFER_MODE_REPEAT_BLOCK.

◆ activation_source

elc_event_t dmac_extended_cfg_t::activation_source

Select which event will trigger the transfer.

Note

Select ELC_EVENT_NONE for software activation in order to use softwareStart and softwareStart to trigger transfers.

◆ p_callback

void(* dmac_extended_cfg_t::p_callback) (dmac_callback_args_t *cb_data)

Callback for transfer end interrupt.

◆ p_context

void* dmac_extended_cfg_t::p_context

Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

Macro Definition Documentation

◆ DMAC_MAX_NORMAL_TRANSFER_LENGTH

#define DMAC_MAX_NORMAL_TRANSFER_LENGTH

Max configurable number of transfers in TRANSFER_MODE_NORMAL.

◆ DMAC_MAX_REPEAT_TRANSFER_LENGTH

#define DMAC_MAX_REPEAT_TRANSFER_LENGTH

Max number of transfers per repeat for TRANSFER_MODE_REPEAT.

◆ DMAC_MAX_BLOCK_TRANSFER_LENGTH

#define DMAC_MAX_BLOCK_TRANSFER_LENGTH

Max number of transfers per block in TRANSFER_MODE_BLOCK

◆ DMAC_MAX_REPEAT_COUNT

#define DMAC_MAX_REPEAT_COUNT
Max configurable number of repeats to transfer in TRANSFER_MODE_REPEAT

◆ DMAC_MAX_BLOCK_COUNT

#define DMAC_MAX_BLOCK_COUNT
Max configurable number of blocks to transfer in TRANSFER_MODE_BLOCK

Function Documentation

◆ R_DMAC_Open()

fsp_err_t R_DMAC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Configure a DMAC channel.

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The configured channel is invalid.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ R_DMAC_Reconfigure()

fsp_err_t R_DMAC_Reconfigure (transfer_ctrl_t *const *p_api_ctrl*, transfer_info_t * *p_info*)

Reconfigure the transfer with new transfer info.

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Reset()

fsp_err_t R_DMAC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers.

Return values

FSP_SUCCESS	Transfer reset successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_SoftwareStart()

fsp_err_t R_DMAC_SoftwareStart (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

If the mode is TRANSFER_START_MODE_SINGLE initiate a single transfer with software. If the mode is TRANSFER_START_MODE_REPEAT continue triggering transfers until all of the transfers are completed.

Return values

FSP_SUCCESS	Transfer started written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
FSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

◆ R_DMAC_SoftwareStop()

fsp_err_t R_DMAC_SoftwareStop (transfer_ctrl_t *const *p_api_ctrl*)

Stop software transfers if they were started with TRANSFER_START_MODE_REPEAT.

Return values

FSP_SUCCESS	Transfer stopped written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Enable()

fsp_err_t R_DMAC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfers for the configured activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Disable()

fsp_err_t R_DMAC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfers so that they are no longer triggered by the activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_InfoGet()

fsp_err_t R_DMAC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_info*)

Set driver specific information in provided pointer.

Return values

FSP_SUCCESS	Information has been written to p_info.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DMAC_Reload()

fsp_err_t R_DMAC_Reload (transfer_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *num_transfers*)

To update next transfer information without interruption during transfer.

Return values

FSP_ERR_UNSUPPORTED	This feature is not supported.

◆ R_DMAC_CallbackSet()

fsp_err_t R_DMAC_CallbackSet (transfer_ctrl_t *const *p_api_ctrl*, void(*)(dmac_callback_args_t *) *p_callback*, void *const *p_context*, dmac_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_DMAC_Close()

fsp_err_t R_DMAC_Close (transfer_ctrl_t *const *p_api_ctrl*)
Disable transfer and clean up internal data. Implements transfer_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — An input parameter is invalid. FSP_ERR_NOT_OPEN — Handle is not initialized. Call R_DMAC_Open to initialize the control block.

5.2.20.2 Transfer (r_dtc)

Modules » Transfer

Functions

fsp_err_t	R_DTC_Open (transfer_ctrl_t *const p_api_ctrl, transfer_cfg_t const *const p_cfg)

fsp_err_t	R_DTC_CallbackSet (transfer_ctrl_t *const p_api_ctrl, void(*p_callback)(transfer_callback_args_t *), void *const p_context, transfer_callback_args_t *const p_callback_memory)

fsp_err_t R_DTC_Close (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DTC peripheral on RA MCUs. This module implements the Transfer Interface.

Overview

The Data Transfer Controller (DTC) transfers data from one memory location to another without using the CPU.

The DTC uses a RAM based vector table. Each entry in the vector table corresponds to an entry in the ISR vector table. When the DTC is triggered by an interrupt, it reads the DTC vector table, fetches the transfer information, and then executes the transfer. After the transfer is executed, the DTC writes the updated transfer info back to the location pointed to by the DTC vector table.

Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
- Chain transfers
- Address increment, decrement or fixed modes
- Can be triggered by any event that has reserved a slot in the interrupt vector table.
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dtc

The following build time configurations are defined in fsp_cfg/r_dtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Linker section to keep DTC vector table	Manual Entry	.fsp_dtc_vector_table	Section to place the DTC vector table.

Configurations for Transfer > Transfer (r_dtc)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dtc).

Configuration	Options	Default	Description
Name	Name must be a valid	g_transfer0	Module name.

	C symbol		
Mode	• Normal • Repeat • Block	Normal	Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers. Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer repeats until stopped. Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	• 1 Byte • 2 Bytes • 4 Bytes	2 Bytes	Select the transfer size.
Destination Address Mode	• Fixed • Incremented • Decremented	Fixed	Select the address mode for the destination.
Source Address Mode	• Fixed • Incremented • Decremented	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	• Destination • Source	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Interrupt Frequency	• After all transfers have completed • After each transfer	After all transfers have completed	Select to have interrupt after each transfer or after last transfer.
Number of Transfers	Value must be a non-negative integer	0	Specify the number of transfers.
Number of Blocks (Valid only in Block Mode)	Must be a valid non-negative integer with a maximum configurable value of 65536. Applicable only in Block Mode.	0	Specify the number of blocks to transfer in Block mode.

Number of Transfer Descriptors	Value must be a non-negative integer	1	Specify the number of transfer descriptors. Users have to initialize descriptors if its value is greater than 1.
Activation Source	MCU Specific Options		Select the DTC transfer start event.

Clock Configuration

The DTC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build or by using the CGC module at runtime.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Source and Destination Configuration

R_DTC_Reset() API function should be called to set the Source and Destination address before starting the transfer operation.

Transfer Modes

The DTC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transferred every time an interrupt is received by the DTC. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment or decrement to the next data unit after each transfer. A 16-bit counter (length) decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the interrupt source and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,256]. When the tranfer counter reaches 0, the counter is reset to its configured value and the repeat area (source or destination address) resets to its starting address and transfers will still be triggered by the interrupt.
- **Block Mode** - In block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,256]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.

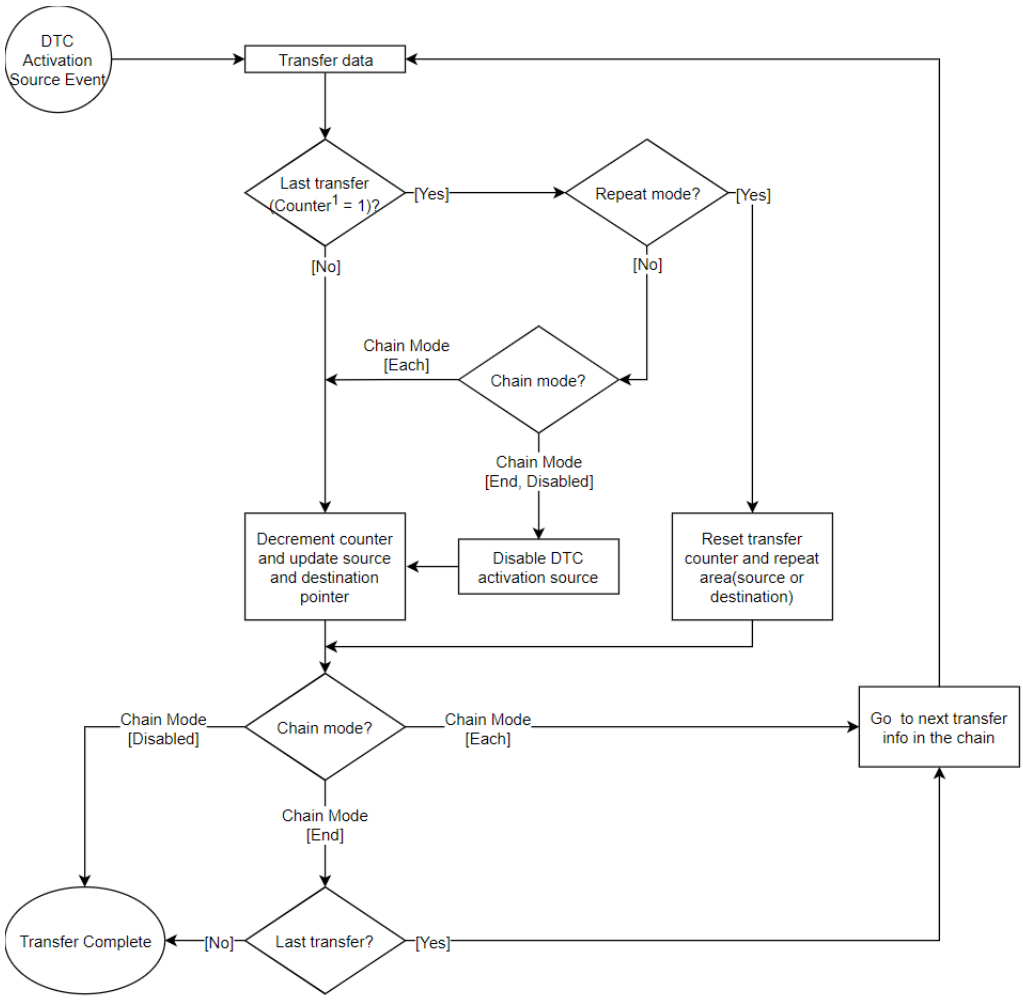
Note

The source and destination address of the transfer must be aligned to the configured data unit.

Chaining Transfers

Multiple transfers can be configured for the same interrupt source by specifying an array of transfer_info_t structs instead of just passing a pointer to one. In this configuration, every transfer_info_t struct must be configured for a chain mode except for the last one. There are two types of chain mode; CHAIN_MODE_EACH and CHAIN_MODE_END. If a transfer is configured in

CHAIN_MODE_EACH then it triggers the next transfer in the chain after it completes each transfer. If a transfer is configured in CHAIN_MODE_END then it triggers the next transfer in the chain after it completes its last transfer.



1. **Counter** refers to transfer_info_t::**length** in normal and repeat mode and transfer_info_t::**num_blocks** in block mode.

Figure 348: DTC Transfer Flowchart

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever • Max repeat size is 256 x 4 bytes	• Configurable number of repeats • Max repeat size is 1024 x 4 bytes
Block Mode	• Max block size is 256 x 4 bytes	• Max block size is 1024 x 4 bytes
Channels	• One instance per interrupt	• MCU specific (8 channels or less)

Chained Transfers	• Supported	• Not Supported
Software Trigger	• Must use the software ELC event	• Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	• Not supported	• Supported

Additional Considerations

- The DTC requires a moderate amount of RAM (one transfer_info_t struct per open instance + DTC_VECTOR_TABLE_SIZE).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.
- The DTC interrupts the CPU using the activation source's IRQ. Each DMAC channel has its own IRQ.
- The necessary alignment of the transfer_info_t structs depends on the underlying MCU. The DTC_TRANSFER_INFO_ALIGNMENT macro is supplied to align the structs as necessary.

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

- **Normal Mode**

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

- **Repeat Mode**

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

- **Block Mode**

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Note

DTC_VECTOR_TABLE_SIZE = (ICU_NVIC_IRQ_SOURCES x 4) Bytes

Peripheral Interrupts and DTC

When an interrupt is configured to trigger DTC transfers, the peripheral ISR will trigger on the following conditions:

- Each transfer completed (transfer_info_t::irq = TRANSFER_IRQ_EACH)
- Last transfer completed (transfer_info_t::irq = TRANSFER_IRQ_END)

For example, if SCI1_RXI is configured to trigger DTC transfers and a SCI1_RXI event occurs, the interrupt will not fire until the DTC transfer is completed. If the DTC transfer_info_t::irq is configured to only interrupt on the last transfer, then no RXI interrupts will occur until the last transfer is completed.

Note

1. The DTC activation source must be enabled in the NVIC in order to trigger DTC transfers (Modules that are designed to integrate the R_DTC module will automatically handle this).
2. The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

Low Power Modes

DTCST must be set to 0 before transitioning to any of the following:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode

Note

1. R_LPM Module stops the DTC before entering deep software standby mode and software standby without snooze mode transition.
2. For more information see "Snooze Control Interface" and "Module-Stop Function" in the DTC section of the relevant hardware manual.

Limitations

Developers should be aware of the following limitations when using the DTC:

- If the DTC is configured to service many different activation sources, the system could run in to performance issues due to memory contention. To address this issue, it is recommended that the DTC vector table and transfer information be moved to their own dedicated memory area (Ex: SRAM0, SRAM1, SRAMHS). This allows memory accesses from different BUS Masters (CPU, DTC, DMAC, EDMAC and Graphics IPs) to occur in parallel.

Examples

Basic Example

This is a basic example of minimal use of the DTC in an application.

```
void dtc_minimal_example (void)

```

```
{
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the DTC to handle incoming transfer requests. */
