Off-Line Digital Green-Mode Quasi-Resonant PWM Controller

1 Description

The iW1602 is a high performance AC/DC power supply controller that uses digital control technology to build peak current mode PWM flyback power supplies. The device operates in quasi-resonant mode to provide high efficiency and includes a number of key built-in protection features while minimizing the external component count, simplifying EMI design and lowering the total bill of material cost. The iW1602 removes the need for secondary feedback circuit while achieving excellent line and load regulation. It also eliminates the need for loop compensation components while maintaining stability over all operating conditions. Pulse-by-pulse waveform analysis allows for a loop response that is much faster than traditional solutions, resulting in improved dynamic load response. The built-in power limit function enables optimized transformer design in universal off-line applications and allows for a wide input voltage range.

Dialog's innovative proprietary technology ensures that power supplies built with the iW1602 can achieve both the highest average active efficiency and low no-load power consumption, and have fast dynamic load response in a compact form factor in typical 5V, 2A, 10W applications. The iW1602 has unique user-configurable light-load operation modes to allow optimization of the system cost and performance according to the application requirements of dynamic load response and no-load power consumption.
