## 1.1 Notes on Testing with a Physical Layer Clock

PTS with SyncE Assistance test uses a SyncE clock from the test equipment as an additional clock source. In both cases, a DPLL (configured for ITU-T G.8262 EEC1) is locked to the SyncE source and is connected to the PTP DPLL via the combo bus. For FTS there is no filter on the combo bus connection. For PTS with SyncE Assistance there is a 3mHz filter on the combo bus connection.

Synced software is used to manage the SyncE clock based on the QL level from the test equipment for tests required a physical layer clock. A category 1 (QL-PRTC) SyncE source from the test equipment is connected to the SyncE input on Clock Matrix and is qualified before PTP (PCM4L/PTP4I) is started.

## 1.2 Notes on Single Path Operation

When operating in single path mode, only the Sync packets from the master are used for timing. This results in an unknown floor delay. In PTS mode a floor delay is manually entered by the user in the PCM4L Json file:

```
"floorDelayEstimateSeconds": 0.000008800,
```

The test description contains the floor delay estimate used in each case. The floor delay estimate changes depending on the PDV pattern being tested as well as the inherent delay in the measurement device.

PDV noise cases “With BC’s Normal Stability” and “With BC’s High Stability” were omitted as they are not applicable to the Single Path use case.

## Notes on Testing with SyncE Assistance

SyncE from the Calnex measurement equipment (Paragon Neo and Paragon X) is used as the physical layer assistance for each test in this report. The quality level of the SyncE level is manually set greater than or equal to the quality level threshold in the PCM4LJson configuration file.

```
"physicalPllClockCategory": 1,  
"physicalPllClockCategoryThreshold": 1,
```

The SyncE recovered clock is an input to a DPLL channel running in DPLL Mode with the G.8262 EEC1 preset. The output from this DPLL is filtered (3mHz filter bandwidth) and used as a combo source for the PTP DPLL.
