

ISL70419SEH

Single Event Effects Testing

AN1944 Rev 0.00 July 17, 2014

## Introduction

The intense heavy ion environment encountered in space applications can cause a variety of transient and destructive effects in analog circuits, including single-event latch-up (SEL), single-event transients (SET) and single-event burnout (SEB). These effects can lead to system-level failures including disruption and permanent damage. For predictable and reliable system operation, these components have to be formally designed and fabricated for SEE hardness, followed by detailed SEE testing to validate the design. This report discusses the results of SEE testing of Intersil's ISL70419SEH.

## **Product Description**

The ISL70419SEH contains four very high precision amplifiers featuring the perfect combination of low noise vs power consumption. These devices are fabricated in a 40V advanced bonded wafer SOI process using deep trench isolation, resulting in a fully isolated structure. This choice of process technology results in latch-up free performance, whether by electrical or single event caused. These devices were also designed for enhance single event transient response resulting in fast SET recovery.

A super-beta NPN input stage with input bias current cancellation provides low input bias current, low input offset voltage, low input noise voltage, and low 1/f noise corner frequency. These amplifiers also feature high open loop gain for excellent CMRR and THD+N performance. A complementary bipolar output stage enables high capacitive load drive without external compensation.

These amplifier are designed to operate over a wide supply range of 4.5V to 36V. Applications for these amplifiers include precision active filters, low noise front ends, loop filters, data acquisition and charge amplifiers.

The combination of high precision, low noise, low power and radiation tolerance provide the user with outstanding value and flexibility relative to similar competitive parts.

The part is packaged in a 14 lead hermetic ceramic flat pack and operates over the extended temperature range of -55°C to +125°C. A summary of key full temperature range and radiation specifications follow:

•	Input Offset Voltage	<b>11</b> 0µV, max.
•	Offset Voltage Drift	. $1\mu\text{V}/^{\circ}\text{C},$ max.
•	Input Offset Current	<b>1</b> 0nA, max.
•	Input Bias Current	<b>1</b> 5nA, max.
•	Supply Current/Amplifier	. 0.75mA, max.
•	Gain Bandwidth Product	1.5MHz. tvp.

# **Key SEE Test Results**

- · SOI process results in single event latch-up immunity
- No SEB up to 36V supply, LET = 86.4MeV cm<sup>2</sup>/mg
- Ultra fast recovery time from SET: < 10 µs

# **SEE Test Objective**

The objective of SEE testing of the ISL70419SEH were to evaluate its susceptibility to destructive events induced by single event effects, such as single event burnout and to determine its SET behavior.

# **SEE Test Facility**

Testing was performed at the Texas A&M University (TAMU) Cyclotron Institute heavy ion facility. This facility is coupled to a K500 super-conducting cyclotron, which is capable of generating a wide range of test particles with the various energy, flux and fluence levels needed for advanced radiation testing.

### **SEE Test Procedure**

The part was tested for single event burnout, using Au ions at  $0^{\circ}$ C incidence (LET = 86.4MeV  $\cdot$  cm<sup>2</sup>/mg) with a case temperature of +125  $^{\circ}$ C, and single event transient characterized using Ar, Kr, Ag and Pr ions with a case temperature of +25  $^{\circ}$ C.

The device under test (DUT) was mounted in the beam line and irradiated with heavy ions of the appropriate species. The parts were assembled in 14 lead dual in-line packages with the metal lid removed for beam exposure. The beam was directed onto the exposed die and the beam flux, beam fluence and errors in the device outputs were measured.

The tests were controlled remotely from the control room. All input power was supplied from portable power supplies connected via cable to the DUT. The supply currents were monitored along with the device outputs. All currents were measured with digital ammeters, while all the output waveforms were monitored on a digital oscilloscope for ease of identifying the different types of SEE, displayed by the part. Events were captured by triggering on changes in the output.

#### **Cross Section Calculation**

#### where:

- CS is the SET cross section (cm<sup>2</sup>), expressed as a function of the heavy ion LET
- LET is the linear energy transfer in MeV·cm<sup>2</sup>/mg, corrected according to the incident angle, if any
- · N is the total number of SET events
- F is fluence in particles/cm<sup>2</sup>

A value of 1/F is the assumed cross section when no event is observed

## **Single Event Burnout Results**

The first testing sequence looked at destructive effects due to burnout. A burnout condition is indicated by a permanent change in the device supply current after application of the beam. If the increased current can be reset by cycling power, it is termed a latch-up. No burnout was observed using Au ions at 0° up a supply voltage of ±18V. Testing was performed on four parts at  $T_C = +125$  °C. All parts commenced testing with  $V_S = \pm 18V$  and on subsequent tests V<sub>S</sub> voltage was increased by 2V until failure. All test runs were run to a fluence of  $2.5 \times 10^6 / \text{cm}^2$ . A power supply applied a DC voltage of 200mV to the non-inverting inputs of the amplifiers during the test. Functionality of all outputs were verified after exposure. IDD and IEE were recorded pre and post exposure and summed up. A 5% change in total supply current indicates permanent damage to the op amp. Test results demonstrated that all parts passed with  $V_S = \pm 18V$  however, failed when the supply voltage was increased to  $V_S = \pm 19V$ . Test data for  $V_S = \pm 18V$  and  $V_S = \pm 19V$  is shown in <u>Tables 1</u> and <u>2</u>, respectively.

# **Single Event Transient Results**

#### **Test Setup**

A a simplified schematic of the configuration of each op amp on board used during testing is shown in Figure 1.

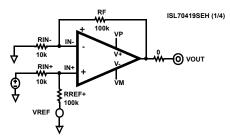

FIGURE 1. ISL70419SEH SEE TEST SCHEMATIC

Each operational amplifier was set up in a non-inverting operation with G = 10V/V. The IN- inputs were grounded and the input signal was applied to the IN+ pin. The reference input was also grounded. All the outputs were fed into a summer op amp which was out of the beam line. The output of the summer amp was used to trigger the scope, while channels 1 through 4 of the scope capture changes on the output of op amp A, B, C, and D of each device. The complete board schematic and silk screen of the board are included in Appendix A.

Biasing used for SET test runs was  $V_S = \pm 5V$  and  $\pm 15V$ . Similar to SEL/B testing, a DC voltage of 200mV was applied to the non-inverting inputs of the amplifiers. Signals from the switch board in the control room were connected to four LECROY oscilloscopes to capture SETs on devices 5, 6, 7 and 8. Summary of the scope settings are as follows:

#### TRIGGER CONNECTIONS

- · Scope 1 is set to capture Device 5
- · Scope 2 is set to capture Device 6
- · Scope 3 is set to capture Device 7
- · Scope 4 is set to capture Device 8

#### CHANNEL CONNECTION ON ALL SCOPES FOR $V_S = \pm 5V$

- CH1 = OUTA 1V/div, CH2 = OUTB 1V/div
- CH3 = OUTC 1V/div, CH4 = OUTD 1V/div
- External trigger connected to output of summer amplifier

# CHANNEL CONNECTION ON ALL SCOPES FOR $V_S = \pm 15V$

- CH1 = OUTA 2V/div, CH2 = OUTB 2V/div
- CH3 = OUTC 2V/div, CH4 = OUTD 2V/div
- · External trigger connected to output of summer amplifier

Events are recorded when movement on output during beam exposure exceeds the definition of a SET. For the ISL70419SEH a SET is a transient that exceeds the set window trigger of  $\pm 200$ mV for  $V_S = \pm 5V$  and for  $V_S = \pm 15V$ .

#### **Cross Section Results**

One approach to characterize the SET response of an integrated circuit is to represent the data on a LET threshold plot. Figure 2 shows the overall cross section of the four devices tested versus the LET level, for  $V_S=\pm5V$  and  $\pm15V$ . It can be noted that the cross section is independent of the supply voltage. Data from Figure 2 is represented in Table 3. Figures 3 and 4 show the LET threshold plot of each device independently for  $V_S=\pm5V$  and  $\pm15V$ . The graphs also show that there is no part-to-part sensitivity as the graphs lie almost directly on top of each other. Complete data for Figures 3 and 4 are available in Appendix A.

### **Single Event Transient Response**

The ISL70419SEH was designed for single event transient (SET) mitigation with a goal of recovering from an SET in  $10\mu s$  or less. Figures 5 through 16 plot the SET duration outside the  $\pm 200mV$  window versus the extreme deviation for the various devices tested and channels. This data is representative of the typical response of the ISL70419SEH and provides a quick way of categorizing the SET by magnitude and duration. All captured SET had durations of equal or less than  $10\mu s$  outside of the  $\pm 200mV$  window about the nominal amplifier output of 2V.

There are both positive and negative deviation on most of the captures, while the rest of the transients were either only positive or negative. Figures 17 through 28 are the composite plots of the scatter plots shown in Figures 5 through 16.

LET =  $59.2 \text{MeV} \cdot \text{cm}^2/\text{mg}$ 

LET =  $28 \text{MeV} \cdot \text{cm}^2/\text{mg}$ 

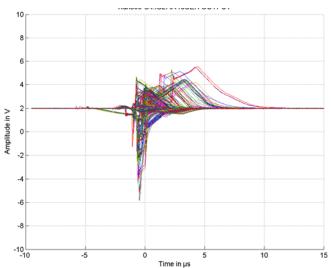

FIGURE 26. DEVICE 8, CHANNEL D, RUN 308,  $V_S = \pm 15V$ , LET =  $59.2 \text{MeV} \cdot \text{cm}^2/\text{mg}$ 

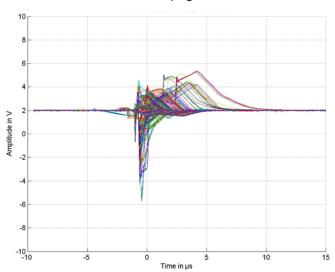

FIGURE 28. DEVICE 8, CHANNEL B, RUN 308,  $V_S = \pm 15V$ , LET =  $59.2 \text{MeV} \cdot \text{cm}^2/\text{mg}$ 

There is correlation to the duration of the SET with respect to the linear energy transfer. Lower LET values e.g.  $8.5 \text{MeV} \cdot \text{cm}^2/\text{mg}$  had the quicker response times returning the SET window of  $\pm 200 \text{mV}$ . As the LET increases so does the recovery time until it saturates at LET =  $43 \text{MeV} \cdot \text{cm}^2/\text{mg}$ . The same correlation is found on the extreme voltage deviation versus LET. Reviewing Figures 5 through  $\underline{16}$  shows that lower LET have a smaller deviation than the SETs caused by higher LET values.

Another interesting note is the correlation of channel-to-channel common SET occurrences at higher LET values. For example on run 305, which is tested with LET =  $59.2 \text{MeV} \cdot \text{cm}^2/\text{mg}$ , roughly 75% of the SET were common on all channels. For run 101, which is tested with LET =  $8.5 \text{MeV} \cdot \text{cm}^2/\text{mg}$ , 0% of the SET were common to all four channels. This correlation start to occur when the LET =  $28 \text{MeV} \cdot \text{cm}^2/\text{mg}$ . An explanation of the commonality is that a device or circuit which is common to all amplifiers is being upset. For example the ESD clamps which are common to all four amplifiers within the IC, could be susceptible at higher LET and causing SETs on the output of all four channels. Figures 29 and 30 are SETs of Channel 1 (OUT A) and Channel 2 (OUT B) of device 5 in run 201. These events occurred simultaneously on all four channels.

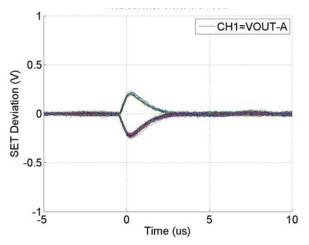

FIGURE 29. CHANNEL 1 COMPOSITE PLOT OF COMMON SETS

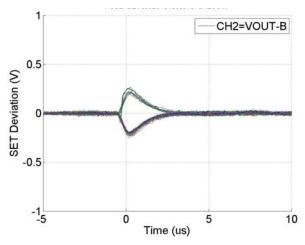

FIGURE 30. CHANNEL 2 COMPOSITE PLOT OF COMMON SETS

## **Summary**

### **Single Event Burnout**

No single event burnout (SEB) was observed for the device up to an LET of  $86.4 \text{MeV} \cdot \text{cm}^2/\text{mg}$  (+125 °C) at a maximum voltage supply of  $V_S = \pm$  18V. This gives 20% margin on the recommended supply voltage of  $V_S = \pm$  15V. Since the operational amplifier has no internal ground reference, the 36V supply range can be partitioned as desired, for example have a single supply where the  $V^+$  pin can be tied to 36V and the  $V^-$  pin tied to ground (0V).

It is also not surprising that since the process is an SOI process, there was no latch-up observed on the device.

#### **Single Event Transient**

Based on the results presented, the ISL70419SEH op amp offers advantages over the competitors part by having better SET performance yet keeping the high accuracy of a precision op amp. The length of worst case SETs can be 6µs for devices with  $V_S = \pm 5V$  and 10µs for devices with  $V_S = \pm 15V$ . This part does not experience the long recovery time (>100µs) during a single event transient seen on other competitor op amps in a comparator application. This may be explained by the higher drive capability of the ISL70419SEH and its ability to drive highly capacitive loads. Magnitude of the deviation for  $V_S = \pm 5V$  was to 1V below the rail in the positive direction and 1V above the rail in the negative direction, limited by the VOH and VOL specifications of the amplifier. For amplifiers supplied with a  $V_S = \pm 15V$ , the transient excursions were much larger, however they do not extend to the expected VOH or VOL levels of ±13.5V. All the transients observed were 8.5V deviations or less with all the larger transient occurring in the negative direction. Recovery time of the transients were less than or equal to 10µs.

Overall, the ISL70419SEH is very well behaved in a heavy ion environment. In space flight applications, the ISL70419SEH should not require filtering or other types of SET mitigation techniques. The ISL70419SEH offers a competitive advantage over other rad hard op amps by offering the following:

- · No single event burnout up to ±36V
- · SOI process for latch-up immunity
- · Fast recovery from single event transients

# **Appendix A**

Appendix A includes the data from Figures 3 and 4 in tabular format, complete test schematic, and board silk screen images.

#### Notice

- 1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system, Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information
- 2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application
- 3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
- Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
  - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc. Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or

- 6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified
- 7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
- e contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or
- 10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
- 11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
