### 2. Errata

#### 2.1 4.2.8.2 R\_RSIP\_RFC3394\_KeyUnwrap, Description

Correct:

This API unwraps a key with an RFC3394-compliant algorithm.

It unwraps `p_rfc3394_wrapped_target_key` with the key specified in `p_wrapped_kek`. The unwrapped key is output to `p_wrapped_target_key` in the wrapped key format. **For type field of `p_wrapped_target_key`, specify the value defined in Table 2-4\*. The available value is AES128bit key or AES256bit key.**

For `p_ctrl`, specify the pointer to the management structure used in the `R_RSIP_Open()` function.

Note: Table 2-4 is described in section 2.9 in the Application Note.

Incorrect:

It unwraps `p_rfc3394_wrapped_target_key` with the key specified in `p_wrapped_kek`. The unwrapped key is output to `p_wrapped_target_key` in the wrapped key format. **For `key_type`, specify the type of key to be unwrapped.**
