
RX671 Group, RX65N/RX651 Group

Differences Between the RX671 Group and the RX65N Group

Summary

This application note is intended as a reference to points of difference between the peripheral functions, I/O registers, and pin functions of the RX671 Group and RX65N Group, as well as a guide to key points to consider when migrating between the two groups.

Unless specifically otherwise noted, the information in this application note applies to the 145-pin package version of the RX671 Group and the 177-pin package version of the RX65N Group as the maximum specifications. To confirm details of differences in the specifications of the electrical characteristics, usage notes, and setting procedures, refer to the User's Manual: Hardware of the products in question.

1. Comparison of Built-In Functions of RX671 Group and RX65N Group

A comparison of the built-in functions of the RX671 Group and RX65N Group is provided below. For details of the functions, see section 2, Comparative Overview of Specifications and section 5, Reference Documents.

Table 1.1 is a comparison of built-in functions of RX671 Group and RX65N Group.

Table 1.1 Comparison of Built-In Functions of RX671 Group and RX65N Group

Function	RX65N		RX671
	Code Flash 1.0 MB or less	Code Flash more than 1.5 MB	
CPU		●

2. Comparative Overview of Specifications

This section presents a comparative overview of specifications, including registers.

In the comparative overview, **red text** indicates functions which are included only in one of the MCU groups and also functions for which the specifications differ between the two groups.

In the register comparison, **red text** indicates differences in specifications for registers that are included in both groups and **black text** indicates registers which are included only in one of the MCU groups. Differences in register specifications are not listed.

2.1 CPU

Table 2.1 is a comparative overview of CPU, and Table 2.2 is a comparison of CPU registers.

Table 2.1 Comparative Overview of CPU

Item	RX65N	RX671
CPU	<ul style="list-style-type: none"> • Maximum operating frequency: 120 MHz • 32-bit RX CPU (RXv2) • Minimum instruction execution time: One instruction per state (system clock cycle) • Address space: 4 GB, linear • Register set of the CPU <ul style="list-style-type: none"> — General purpose: Sixteen 32-bit registers — Control: Ten 32-bit registers — Accumulator: Two 72-bit register • Basic instructions: 75 • Floating-point instructions: 11 • DSP instructions: 23 • Addressing modes: 11 • Data arrangement <ul style="list-style-type: none"> — Instructions: Little endian — Data: Selectable between little endian or big endian • On-chip 32-bit multiplier: 32 × 32 → 64 bits • On-chip divider: 32 / 32 → 32 bits • Barrel shifter: 32 bits 	<ul style="list-style-type: none"> • Maximum operating frequency: 120 MHz • 32-bit RX CPU (RXv3) • Minimum instruction execution time: One instruction per state (system clock cycle) • Address space: 4 GB, linear • Register set of the CPU <ul style="list-style-type: none"> — General purpose: Sixteen 32-bit registers — Control: Ten 32-bit registers — Accumulator: Two 72-bit registers • Basic instructions: 77 • Single-precision floating point instructions: 11 • DSP instructions: 23 • Instructions for register bank save function: 2 • Addressing modes: 11 • Data arrangement <ul style="list-style-type: none"> — Instructions: Little endian — Data: Selectable between little endian or big endian • On-chip 32-bit multiplier: 32 × 32 → 64 bits • On-chip divider: 32 / 32 → 32 bits • Barrel shifter: 32 bits
FPU	<ul style="list-style-type: none"> • Single-precision floating point (32 bits) • Data types and floating-point exceptions conform to IEEE 754 standard 	<ul style="list-style-type: none"> • Single-precision floating-point (32 bits) • Data types and floating-point exceptions conform to IEEE 754 standard

Item	RX65N	RX671
Double-precision floating point coprocessor	—	<ul style="list-style-type: none"> • Double-precision floating-point register set — Double-precision floating-point data registers: 64-bit × 16 — Double-precision floating-point control registers: 32-bit × 4 • Double-precision floating-point processing instructions: 21 • Function for notifying the interrupt controller of double-precision floating-point exceptions
Register bank save function	—	<ul style="list-style-type: none"> • Fast collective saving and restoration of the values of CPU registers • 16 save register banks

Table 2.2 Comparison of CPU Registers

Register	Bit	RX65N	RX671
DR0 to DR15	—	—	Double-precision floating-point data registers
DPSW	—	—	Double-precision floating-point status word
DCMR	—	—	Double-precision floating-point comparison result register
DECNT	—	—	Double-precision floating-point exception handling control register
DEPC	—	—	Double-precision floating-point exception program counter

2.2 Address Space

Figure 2.1 is a comparative memory map of single-chip mode, Figure 2.2 is a comparative memory map of on-chip ROM enabled extended mode, and Figure 2.3 is a comparative memory map of on-chip ROM disabled extended mode.

	Main clock oscillator	Operation possible	Operation possible
	Sub-clock oscillator	Operation possible	Operation possible
	High-speed on-chip oscillator	Stopped	Stopped
	Low-speed on-chip oscillator	Stopped	Stopped
	IWDT-dedicated on-chip oscillator	Stopped (undefined)	Stopped (undefined)
	PLL	Stopped	Stopped
	CPU	Stopped (undefined)	Stopped (undefined)
	RAM and expansion RAM: RX65N RAM: RX671	Stopped (undefined)	Stopped (undefined)
	Standby RAM	Stopped (retained/undefined)	Stopped (retained/undefined)
	Flash memory	Stopped (retained)	Stopped (retained)
	USB 2.0 Host/Function module (USBb)	Stopped (retained/undefined)	Stopped (retained/undefined)
	Watchdog timer (WDTA)	Stopped (undefined)	Stopped (undefined)
	Independent watchdog timer (IWDT)	Stopped (undefined)	Stopped (undefined)
	Realtime clock (RTC)	Operation possible	Operation possible
	8-bit timer (unit 0, unit 1) (TMR)	Stopped (undefined)	Stopped (undefined)
	Port output enable (POE)	Stopped (undefined)	Stopped (undefined)
	Remote control signal receiver (REMC)	—	Operation possible
Voltage detection circuit (LVDA)	Operation possible	Operation possible	
Power-on reset circuit	Operation	Operation	
Other peripheral modules	Stopped (undefined)	Stopped (undefined)	
I/O ports	Retained	Retained	

Notes: “Operation possible” means that whether the state is operating or stopped is controlled by the control register setting.

“Stopped (retained)” means that internal register values are retained and internal operations are suspended.

“Stopped (undefined)” means that internal register values are undefined and power is not supplied to the internal circuit.

1. If POE interrupts are enabled and a POE interrupt source occurs while the chip is in all-module clock stop mode, return from all-module clock stop mode does not occur but the state of the interrupt source flag is retained. If a different source initiates return from all-module clock stop mode in this state, the POE interrupt is generated after the return.

Table 2.7 Comparison of Low Power Consumption Registers

Register	Bit	RX65N	RX671
MSTPCRA	MSTPA19	12-bit D/A converter module stop bit	—
MSTPCRB	MSTPB15	Ethernet controller and Ethernet controller DMA controller (channel 0) modules stop bit	—

Transfer data	Single data	Bit length: 8, 16, 32 bits	Bit length: 8, 16, 32 bits
	Block size	Number of data: 1 to 1,024	Number of data: 1 to 1,024
Transfer modes	Normal transfer mode	<ul style="list-style-type: none"> • One data transfer per DMA transfer request • Setting in which total number of data transfers is not specified (free running mode) is available. 	<ul style="list-style-type: none"> • One data transfer per DMA transfer request • Setting in which total number of data transfers is not specified (free running mode) is available.
	Repeat transfer mode	<ul style="list-style-type: none"> • One data transfer per DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. • Maximum settable repeat size: 1,024 data 	<ul style="list-style-type: none"> • One data transfer per DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. • Maximum settable repeat size: 1,024 data
	Block transfer mode	<ul style="list-style-type: none"> • One block data transfer per DMA transfer request • Maximum settable block size: 1,024 data 	<ul style="list-style-type: none"> • One block data transfer per DMA transfer request • Maximum settable block size: 1,024 data
Selective functions	Extended repeat area function	<ul style="list-style-type: none"> • Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed • Area of 2 bytes to 128 MB separately settable as extended repeat area for transfer source or destination 	<ul style="list-style-type: none"> • Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed • Area of 2 bytes to 128 MB separately settable as extended repeat area for transfer source or destination

Item		RX65N (DMACAa)	RX671 (DMACAb)
Interrupt request	Transfer end interrupt	<ul style="list-style-type: none"> Generated when the specified number of transfers is completed in normal transfer mode Generated when the specified repeat count of transfers is completed in repeat transfer mode Generated when the specified block count of transfers is completed in block transfer mode 	<ul style="list-style-type: none"> Generated when the specified number of transfers is completed in normal transfer mode Generated when the specified repeat count of transfers is completed in repeat transfer mode Generated when the specified block count of transfers is completed in block transfer mode
	Transfer escape end interrupt	Generated when the repeat size of data transfer is completed or the extended repeat area overflows.	Generated when the repeat size of data transfer is completed or the extended repeat area overflows.
Event link function		Event link request generated after one data transfer (or after one block transfer in case of block transfer operation).	Event link request generated after one data transfer (or after one block transfer in case of block transfer operation).
Low power consumption function		Module stop state can be set.	Module stop state can be set.

Table 2.20 Comparison of DMA Controller Registers

Register	Bit	RX65N (DMACAa)	RX671 (DMACAb)
DMSAR	—	DMA source address register Specifies the start address of the transfer source. 00000000h to 0FFFFFFFh (256 MB) F0000000h to FFFFFFFFh (256 MB)	DMA source address register Specifies the start address of the transfer source. 00000000h to FFFFFFFFh (4 GB)
DMDAR	—	DMA destination address register Specifies the start address of the transfer destination. 00000000h to 0FFFFFFFh (256 MB) F0000000h to FFFFFFFFh (256 MB)	DMA destination address register Specifies the start address of the transfer destination. 00000000h to FFFFFFFFh (4 GB)

2.12 Event Link Controller

Table 2.21 is a comparative overview of the event link controllers, Table 2.22 is a comparison of event link controller registers, Table 2.23 lists correspondences between ELSRn registers and peripheral modules, and Table 2.24 shows correspondences between values set in ELSRn.ELS[7:0] and event signal names and numbers.

Table 2.21 Comparative Overview of Event Link Controllers

Item	RX65N (ELC)	RX671 (ELC)
Event link function	<ul style="list-style-type: none"> 82 event signals can be directly connected to modules. Operation of timer modules while inputting an event signal can be selected. Event linkage operation is possible on ports B and E. <ul style="list-style-type: none"> Single port*1: Event link operation can be enabled on a single port corresponding to the specified bit. Port group*1: Among the eight I/O ports, event link operation can be enabled for a group of ports corresponding to multiple specified bits. 	<ul style="list-style-type: none"> 99 event signals can be directly interconnected to modules. Operation of timer modules while inputting an event signal can be selected. Event linkage operation is possible on ports B and E. <ul style="list-style-type: none"> Single port*1: Event link operation can be specified on a single port. Port group*1: Event linkage operation can be specified by grouping multiple designated ports among up to eight ports.
Low power consumption function	Ability to specify module stop state	Ability to transition to module stop state

Note: 1. An event is generated when the corresponding input signal on a single port or port group set to input changes.

Table 2.22 Comparison of Event Link Controller Registers

Register	Bit	RX65N (ELC)	RX671 (ELC)
ELSRn	—	Event link setting register n (n = 0, 3, 4, 7, 10 to 13, 15, 16, 18 to 28, 33, 35 to 38, and 45)	Event link setting register n (n = 0, 3, 4, 7, 10 to 15, 18 to 28, 33, 35 to 38, and 45)
	ELS[7:0]	Event link select bits 00h: Event output to the corresponding peripheral module is disabled. 01h to BDh: Specifies the number of the event signal to be linked. Settings other than the above are prohibited.	Event link select bits 00h: Event signal output to the corresponding peripheral module is disabled. 01h to DFh: Specifies the number of the event signal to be linked. Settings other than the above are prohibited.

Table 2.23 Correspondence between ELSRn Registers and Peripheral Modules

Register	RX65N (ELC)	RX671 (ELC)
ELSR0	MTU0	MTU0
ELSR3	MTU3	MTU3
ELSR4	MTU4	MTU4

Table 2.30 Comparison of I/O Port Registers

Register	Bit	RX65N	RX671
PDR	B0 to B7	Pm0 to Pm7 I/O select bits (m = 0 to 9, A to G, J)	Pm0 to Pm7 I/O select bits (m = 0 to 9, A to F, H, J)
PODR	B0 to B7	Pm0 to Pm7 output data store bits (m = 0 to 9, A to G, J)	Pm0 to Pm7 output data store bits (m = 0 to 9, A to F, H, J)
PIDR	B0 to B7	Pm0 to Pm7 bits (m = 0 to 9, A to G, J)	Pm0 to Pm7 bits (m = 0 to 9, A to F, H, J)
PMR	B0 to B7	Pm0 to Pm7 pin mode control bits (m = 0 to 9, A to G, J)	Pm0 to Pm7 pin mode control bits (m = 0 to 9, A to F, H, J)
ODR0	B0	Pm0 output type select bit (m = 0 to 9, A to G, J)	Pm0 output type select bit (m = 0 to 9, A to E, H, J)
	B2	Pm1 output type select bit (m = 0 to 9, A to G, J)	Pm1 output type select bit (m = 0 to 9, A to E, H, J)
	B3	PE1 output type select bit (m = 0 to 9, A to G, J)	PE1 output type select bit (m = 0 to 9, A to E, H, J)
	B4	Pm2 output type select bit (m = 0 to 9, A to G, J)	Pm2 output type select bit (m = 0 to 9, A to E, H, J)
	B6	Pm3 output type select bit (m = 0 to 9, A to G, J)	Pm3 output type select bit (m = 0 to 9, A to E, H, J)
ODR1	B0	Pm4 output type select bit (m = 0 to 9, A to G, J)	Pm4 output type select bit (m = 0 to 8, A to F, J)
	B2	Pm5 output type select bit (m = 0 to 9, A to G, J)	Pm5 output type select bit (m = 0 to 8, A to F, J)
	B4	Pm6 output type select bit (m = 0 to 9, A to G, J)	Pm6 output type select bit (m = 0 to 8, A to F, J)
	B6	Pm7 output type select bit (m = 0 to 9, A to G, J)	Pm7 output type select bit (m = 0 to 8, A to F, J)
PCR	B0 to B7	Pm0 to Pm7 input pull-up resistor control bits (m = 0 to 9, A to G, J)	Pm0 to Pm7 input pull-up resistor control bits (m = 0 to 9, A to F, H, J)
DSCR	B0 to B7	Pm0 to Pm7 drive capacity control bits (m = 0 to 2, 5, 7 to 9, A to E, G, J)	Pm0 to Pm7 drive capacity control bits (m = 0 to 2, 5, 7 to 9, A to E, H)
DSCR2	B0 to B7	Pm0 to Pm7 drive capacity control bits 2 (m = 0 to 3, 5, 7 to 9, A to E, G, J)	Pm0 to Pm7 drive capacity control bits 2 (m = 0 to 3, 5, 7 to 9, A to E, H)

2.14 Multi-Function Pin Controller

Table 2.31 is a comparison of the assignments of multiplexed pins, and Table 2.32 to Table 2.49 are comparisons of multi-function pin controller registers.

In the following comparison of the assignments of multiplexed pins, **light blue text** designates pins that exist on the RX671 Group only and **orange text** pins that exist on the RX65N Group only. A circle (○) indicates that a function is assigned, a cross (×) that the pin does not exist or that no function is assigned, and grayed out items mean that the function is not implemented. A filled circle (●) indicates cases where all pins are present among pin functions where there is a difference in the pins present on the RX671 Group and RX65N Group.

Table 2.31 Comparison of Multiplexed Pin Assignments

Module/ Function	Pin Function	Port Allocation	RX65N			RX671		
			145-/ 144- Pin	100- Pin	64- Pin	145-/ 144- Pin	100- Pin	64- Pin

Notes: 1. For these pin functions, ensure that the corresponding pin is set as general input (PORTm.PDR.Bn and PORTm.PMR.Bn bits cleared to 0).

2. Not supported on products with a code flash memory capacity of 1 MB or less.
3. Not present on the 145-pin TFLGA product.
4. Supported on the 145-pin TFLGA product only.
5. Supported on the 64-pin TFBGA product only.
6. Simple SPI mode is not supported.

SPCR2	SPPE	Parity enable bit 0: No transmit data parity bit appended No parity checking is performed on receive data. 1: A transmit data parity bit is appended. Parity checking is performed on receive data.	Parity enable bit 0: No transmit data parity bit appended No parity checking is performed on receive data. 1: A transmit data parity bit is appended, and parity checking is performed on receive data (when SPCR.TXMD = 0). A parity bit is appended to transmit data, but no parity checking is performed on receive data (when SPCR.TXMD = 1).
SPDCR2	DINV	—	Transfer data invert bit
SPCR3	—	—	RSPI control register 3

2.20 Quad Serial Peripheral Interface/Quad SPI Memory Interface

Table 2.59 is a comparative overview of the quad serial peripheral interface and quad SPI memory interface, and Table 2.60 is a comparison of quad serial peripheral interface and quad SPI memory interface registers.

Table 2.59 Comparative Overview of Quad Serial Peripheral Interface and Quad SPI Memory Interface

Item	RX65N (QSPI)	RX671 (QSPIX)
Channels	1 channel	1 channel
SPI	<ul style="list-style-type: none"> Ability to communicate with serial flash memory using single-, dual-, or quad-SPI operation Ability to configure SPI modes 0 to 4 	<ul style="list-style-type: none"> Support for extended SPI, dual-SPI, and quad-SPI protocols Ability to configure SPI modes 0 and 3 Ability to select address width of 8, 16, 24, or 32 bits
Timing adjustment function	—	Ability to implement configurations supporting a variety of serial flash specifications
Memory mapped mode	—	<ul style="list-style-type: none"> Support for read, fast read, fast read dual output, fast read dual I/O, fast read quad output, and fast read quad I/O instructions Ability to substitute instruction codes Ability to adjust dummy cycle count Prefetch function Polling processing SPI bus cycle extension function
Indirect access mode	—	Flexible support using software control for various serial flash instructions/functions, including erase, write, ID read, and power down control
Interrupt sources	<ul style="list-style-type: none"> Receive buffer full interrupt Transmit buffer empty interrupt QSSL negate interrupt 	<ul style="list-style-type: none"> Error interrupt
Module stop function	Ability to transition to module stop state	Ability to reduce power consumption by enabling module stop state

Table 2.60 Comparison of Quad Serial Peripheral Interface and Quad SPI Memory Interface Registers

Register	Bit	RX65N (QSPI)	RX671 (QSPIX)
SPCR	—	QSPI control register	—
SSLP	—	QSPI slave select polarity register	—
SPPCR	—	QSPI pin control register	—
SPSR	—	QSPI status register	SPI status register
		SPSR is a 16-bit register.	SPSR is a 32-bit register.
		Initial value after a reset differs.	
	SPSSLF	QSSL negate flag	—
	SPTEF	Transmit buffer empty flag	—
	TREND	Transmit end flag	—
	SPRFF	Receive buffer full flag	—
	BUSY	—	Bus busy flag
ROMAE	—	ROM access error flag	

Register	Bit	RX65N (QSPI)	RX671 (QSPIX)
SPDR	—	QSPI data register Writing to this register is accomplished by writing to the transmit buffer (SPTXB), and reading from this register is accomplished by reading from the receive buffer (SPRXB). This register can be accessed in byte, word, or longword units.	SPI data register Reads and writes to this register are converted into SPI bus cycles. When the AMOD bit is set to 1, this register can only be accessed in indirect access mode. In memory mapped mode, accesses to this register are ignored.
SPSCR	—	QSPI sequence control register	—
SPSSR	—	QSPI sequence status register	—
SPBR	—	QSPI bit rate register	—
SPDCR	TXDMY	Dummy data transmit enable bit	—
	DCYC[3:0]	—	Dummy cycle count setting bits
	XIPS	—	XIP status flag
	XIPE	—	XIP enable bit
	MODE[7:0]	—	Mode data bits
SPCKD	—	QSPI clock delay register	—
SSLND	—	QSPI slave select negate delay register	—
SPND	—	QSPI next access delay register	—
SPCMDn	—	QSPI command register n (n = 0 to 3)	—
SPBFCR	—	QSPI buffer control register	—
SPBDCR	—	QSP buffer data count setting register	—
SPBMULn	—	QSPI transfer data length multiple setting register n (n = 0 to 3)	—
SPMR0	—	—	Mode register 0
SPSSCR	—	—	Slave select signal control register
SPOCR	—	—	Operating clock control register
SPPFSR	—	—	Prefetch status register
SPMR1	—	—	Mode register 1
SPSR	—	—	SPI status register
SPRIR	—	—	Independent read instruction setting register
SPAMR	—	—	Address mode register
SPMR2	—	—	Mode register 2
SPPCR	—	—	Port control register
SPUAR	—	—	Upper-bit address register

2.21 Boundary Scan

Table 2.61 is a comparative overview of the boundary scan functions, and Table 2.62 is a comparison of boundary scan registers.

Table 2.61 Comparative Overview of Boundary Scan Functions

Item	RX65N	RX671
Boundary scan enable/disable	Boundary scan is enabled when the RES# pin and the BSCANP pin are driven high and the EMLE pin is driven low.	Boundary scan is enabled when the RES# pin and the BSCANP pin are driven high and the EMLE pin is driven low.
Dedicated boundary scan pins	The following pins are used exclusively by the JTAG when the boundary scan function is enabled: TDO, TCK, TDI, TMS, and TRST# 177-pin TFLGA and 176-pin LFBGA products: PF0, PF1, PF2, PF3, and PF4 145-pin TFLGA and 64-pin TFBGA products: P26, P27, P30, P31, and P34	The following pins are used exclusively by the JTAG when the boundary scan function is enabled: TDO, TCK, TDI, TMS, and TRST# 145-pin TFLGA and 64-pin TFBGA products: P26, P27, P30, P31, and P34
Six test modes	<ul style="list-style-type: none"> • BYPASS mode • EXTEST mode • SAMPLE/PRELOAD mode • CLAMP mode • HIGHZ mode • IDCODE mode 	<ul style="list-style-type: none"> • BYPASS mode • EXTEST mode • SAMPLE/PRELOAD mode • CLAMP mode • HIGHZ mode • IDCODE mode

2.27 Packages

As indicated in Table 2.72, there are discrepancies in the package drawing codes and availability of some package types, and this should be borne in mind at the board design stage.

Table 2.72 Comparison of Packages

Package Type	Renesas Code	
	RX65N	RX671
177-pin TFLGA	○	×
176-pin LFBGA	○	×
176-pin LFQFP	○	×
145-pin TFLGA	PTLG0145KA-A	PTLG0145 J C-A, PTLG0145 K B-A
100-pin TFLGA	PTLG0100JA-A	PTLG0100 J B-A
48-pin HWQFN	×	○

○: Package available (Renesas code omitted); ×: Package not available

3. Comparison of Pin Functions

This section presents a comparative description of pin functions as well as a comparison of the pins for the power supply, clocks, and system control. Items that exist only on one group are indicated by **blue text**. Items that exist on both groups with different specifications are indicated by **red text**. **Black text** indicates there is no differences in the item’s specifications between groups.

3.1 144-Pin LQFP Package

Table 3.1 is a comparative listing of the pin functions of 144-pin LQFP package products.

- Notes: 1. Valid only on products with a code flash memory capacity of 2 MB or 1.5 MB.
 2. P53, which is multiplexed as the BCLK pin, cannot be used as an I/O port when the external bus is enabled.

3.2 100-Pin TFLGA Package

Table 3.2 is a comparative listing of the pin functions of 100-pin TFLGA package products.

- Notes: 1. Valid only on products with a code flash memory capacity of 2 MB or 1.5 MB.
 2. P53, which is multiplexed as the BCLK pin, cannot be used as an I/O port when the external bus is enabled.

3.3 100-Pin LFQFP Package

Table 3.3 is a comparative listing of the pin functions of 100-pin LFQFP package products.

Notes: 1. Valid only on products with a code flash memory capacity of 2 MB or 1.5 MB.

2. P53, which is multiplexed as the BCLK pin, cannot be used as an I/O port when the external bus is enabled.

3.4 64-Pin TFBGA Package

Table 3.4 is a comparative listing of the pin functions of 64-pin TFBGA package products.

4. Notes on Migration

This section presents important information regarding differences between the RX671 Group and RX65N Group.

4.1, Notes on Functional Design, presents information regarding the software.

4.1 Notes on Functional Design

Some software that runs on the RX65N Group is compatible with the RX671 Group. Nevertheless, appropriate caution must be exercised due to differences in aspects such as operation timing and electrical characteristics.

Software-related considerations regarding function settings that differ between the RX671 Group and RX65N Group are as follows:

For differences between modules and functions, refer to 2, Comparative Overview of Specifications. For further information, refer to the User's Manual: Hardware of each MCU group, listed in 5, Reference Documents.

4.1.1 Running RAM Self-Diagnostics on Register Save Banks

On the RX671 Group the register save banks are configured in the RAM. The register save banks are buffered, so writing to a bank with the SAVE instruction and then reading from the same bank with the RSTR instruction immediately afterwards may result in data being read from the buffer rather than from the RAM memory cells. When running RAM self-diagnostics on a register save bank, follow the steps below to ensure that the previously written data is read from the RAM rather than from the buffer.

- (1) Use the SAVE instruction to write data to the bank on which self-diagnostics will be run.
- (2) Use the SAVE instruction to write data to a bank other than that written to in step (1).
- (3) Use the RSTR instruction to read data from the bank written to in step (1).

4.1.2 Setting Number of Flash Memory Access Wait States

On the RX65N Group it is necessary to modify the ROMWT register in order to set the MCU's system clock (ICLK) to a frequency higher than 50 MHz, but on the RX671 Group modification of the ROMWT register is needed only when setting ICLK to a frequency higher than 60 MHz.

4.1.3 Note on RX671 Group 48-Pin Package Products

On the RX671 Group the sub-clock and RTC cannot be used on 48-pin package products. After a cold start the state of the sub-clock control circuit is unstable, so do not fail to set these bits following a cold start. For details, refer to RX671 Group User's Manual: Hardware, listed in 5, Reference Documents.

4.1.4 Current Flow to VBATT Pin

On the RX671 Group, when the VCC voltage rises to $V_{BATT} + 0.6$ V or higher while operating in battery backup mode, a current flows from the VCC pin, via a parasitic diode in the power switch on the VCC side, to the VBATT pin. If this presents a problem, insert a low-dropout diode between the backup power supply and the VBATT pin.

4.1.5 Port Direction Register (PDR) Initialization

The method for initializing the PDR register differs even on products with the same pin count.

4.1.6 Quad Serial Peripheral Interface/Quad SPI Memory Interface

The quad SPI memory interface registers on the RX671 Group incorporate significant changes compared to the quad serial peripheral interface registers on the RX65N Group. This results in a reduction in software compatibility.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
