# 1. Functional Description

The RC210xx is a small-form factor, fully integrated, low-power, high-performance frequency synthesizer providing excellent PCIe and Ethernet phase jitter, while covering a wide range of output frequencies up to 650MHz. It can simultaneously provide low phase jitter non-spreading clocks for Ethernet and storage applications, while providing spread-spectrum PCIe Gen6 clocks.

The following sections provide an overview of the RC210xx.

## 1.1 Power-Up, Configuration, and Serial Interfaces

The RC210xx can be powered up and configured in three ways:

- From internal non-volatile memory using OTP user configurations (UserCfgs)
- From its slave serial interface
- From an external I2C EEPROM

The power-up sequence loads one of up to 27 *internal* UserCfgs from OTP. This configuration can be selected via external GPIO pins or by programming a field to select the default configuration to load. This is useful when external GPIO are not used to select the UserCfg at power-up. After the device is powered up, the slave serial interface can be used to select preprogrammed UserCfgs or load entirely new UserCfgs stored outside the device.

The RC210xx supports three slave serial interfaces: I2C, SPI, SMBUS, and one serial master interface (I2C).

These interfaces share the same pins so only one is available at a time. The I2C master interface that is used to load UserCfgs from an external I2C EEPROM is only active after loading an OTP UserCfg that indicates a further load from external I2C EEPROM. An external master (I2C, SPI, SMBUS) can be used to access internal registers. If the slave serial port is configured as SPI then loading from external EEPROM is not available.

## 1.2 Input Clocks

The RC210xx supports one crystal/reference input and up to two differential or four single-ended clock inputs.

### 1.2.1 Crystal/Reference Input

The crystal input supports crystal frequencies of 8MHz to 80MHz. It has programmable internal load capacitors to support crystals with CL = 6pF to 12pF. Internal crystal variants of RC210xx support a trim value in OTP that can be set during ATE to compensate for initial frequency offset of the internal crystal. The crystal input supports being overdriven with a clipped sine-wave TCXO with 0.8VPP signal.

If an external square wave clock is used to drive the XIN\_REFIN pin, the default is amplitude limit is 1.2V. If [sel\\_ib\\_xo](#) is set to 0 and [xo\\_ib\\_cmos\\_sel](#) is set to 1 amplitude limitations are determined by the VDDX supply rail.

The crystal input can be overdriven with differential or single-ended inputs with proper external terminations. The supported frequency range is same as reference clock inputs:

- 1kHz to 650MHz in differential mode
- 1kHz to 200MHz in single-ended mode

An available LOS monitor detects the loss of signal on crystal input.

### 1.2.2 Clock Inputs

There are two differential clock inputs that support LVDS, HCSL, or single-ended CMOS logic levels without external terminations. LVPECL or CML clock inputs can be supported with external terminations and/or AC coupling. Internal terminations are available for both HCSL and LVDS logic levels. Additionally, HCSL input terminations support both 100ohm and 85ohm operating environments.

If the [cmos\\_sel](#) register bit is set to single-ended type, the differential inputs turn into two single-ended inputs. CLKIN0 drives clkin0 internally, CLKIN0b drives clkin1 internally. CLKIN1 drives clkin2 internally, and CLKIN1b

drives `clk3` internally. If set to differential type, `CLKIN0/CLKIN0b` pair drives `clk0`, while `CLKIN1/CLKIN1b` pair drives `clk2`. Internal biasing is available for AC-coupled applications. The two clock inputs can be left floating when unused. An available LOS monitor detects the loss of signal on crystal input. The LOS status is stored in register bits and can also be steered to a GPIO pin.

## 1.3 APLL

The APLL is fractional LC-VCO based PLL with an operating range from 9.5GHz to 10.7GHz. Any of the available input clocks can be selected to drive the APLL, and the input clock can be frequency doubled for increased performance. The APLL is temperature compensated for the utmost frequency stability. For synchronous, deterministic requirements, the APLL also supports ZDB mode where `CLKIN0` is used for the feedback input.

### 1.3.1 APLL Lock Detector

The APLL lock detector indicates whether the APLL is locked to a functioning crystal or reference input by monitoring the phase errors. Lock status can be sent on to a GPIO pin and register [apll\\_lock\\_sts](#). The falling edge of [apll\\_lock\\_sts](#) sets [apll\\_lol](#) event sticky bit. The [apll\\_lol](#) event also increments a 7-bit loss of lock counter that starts from power on. The counter values represents the total number of loss of lock since power on and can be read back from register [apll\\_lol\\_cnt](#).

## 1.4 Output Dividers

The RC210xx provides four integer and three fractional output dividers.

### 1.4.1 Integer Output Dividers

All four IODs are identical and use a 25-bit divider to provide output frequencies from 1kHz to 650MHz derived from the VCO clock. Changing IOD values results in an immediate change to the new frequency. Glitch-less squelch and release of the IOD clock is supported with an [iod\\_squelch](#) bit. When enabled, this mimics a gapped clock behavior when an IOD frequency is changed.

### 1.4.2 Fractional Output Dividers

There are three fractional output dividers (FOD). Each FOD can divide down the VCO clock to provide frequencies of 1kHz to 650MHz. Each FOD is implemented in two stages. The first stage is an 8-bit fractional divider with Digital Control Delay (DCD) correction followed by a divide-by-2. The DCD FOD allows a divide down of the VCO clock from 30MHz to 657MHz. The FOD's second stage divider is a 17-bit integer divider with minimum divide ratio of 4. This allows output frequencies lower than 30MHz. For output frequencies above 30MHz, this second-stage divider may be bypassed.

#### 1.4.2.1 Spread-Spectrum Clocking (SSC)

FOD0 and FOD1 support spread-spectrum clocking.

If spreading is enabled by setting [ssc\\_en](#) to 1, the spread-spectrum engine generates a triangular frequency modulation on to FOD's divider ratio. The modulation amplitude is programmable in [ssc\\_ampl](#) register fields. The modulation can be programmed to either down spread or center spread in register [ssc\\_mode](#). The peak-to-peak amplitude is two times of [ssc\\_ampl](#) for center spreading, and one [ssc\\_ampl](#) for down spreading. The supported modulation frequency is from 30kHz to 63kHz. It can be set by programming register [ssc\\_step](#) based on the equations provided in the register description.

When turning off spread, it stops when the current spreading cycle's modulation returns to zero.

If FOD0 and FOD1 SSC are programmed to the same modulation frequency, the register bit [ssc\\_share](#) can be set to 1 to ensure that SSC for FOD0 and FOD1 are in phase. The modulation amplitude and mode (down or center spread) can be set differently. The spread engine of FOD0 will act as the master for the spread engine of FOD1 with respect to synchronization. The zero crossing of the spread triangles is where the synchronization occurs. If the center spread is used on FOD0, then the zero crossing of the upwards frequency ramp of the triangle is the synchronization point. When [ssc\\_share](#) is set to 1, then FOD1 [ssc\\_en](#) must be set to 1 before FOD0 [ssc\\_en](#) is set

to 1 since FOD1 SSC will start when FOD0 [ssc\\_en](#) is set to 1. This restriction does not apply when loading the device configuration from OTP/EEPROM on startup, but does apply if dynamically changing these settings later through a dynamic configuration load from the OTP/EEPROM, or by writing registers from the serial interface.

The minimum output frequency that can be spread is 33MHz. A spreading output clock meets the PCIe Gen1 to Gen6 standard at 100MHz.

#### 1.4.2.2 Sync and Phase Adjustment

Each FOD can adjust its output clock phase with a step size of 1/4 VCO period up to about  $\pm 20$ ns. The amount of phase adjustment is programmed in register [fod\\_phase](#). The adjustment can be of either positive or negative directions. The phase adjustment can be applied immediately if the [fod\\_ph\\_adj\\_now](#) bit is set to 1, and/or it will be applied after each time the divider is synchronized if [fod\\_ph\\_adj\\_post\\_sync](#) is set to 1.

IOD phase adjustment is same as, or maybe mimics, FOD phase adjustment but with a step size of one VCO period. The amount of phase adjustment is programmed in register [iod\\_phase](#). The phase adjustment can be applied immediately if the [iod\\_ph\\_adj\\_now](#) bit is set to 1, and/or it will be applied after each time the divider is synchronized if [iod\\_ph\\_adj\\_post\\_sync](#) is set to 1.

There are two sync groups, group0 and group1. An FOD or IOD can be assigned to either group or none by [fod\\_sync\\_group](#) or [iod\\_sync\\_group](#), respectively. The dividers in the same group can be re-synchronized together after any one of them is re-programmed by writing 1 to [od\\_grp0\\_sync](#) or [od\\_grp1\\_sync](#). To disable all clock outputs sourced from the dividers belonging to sync group 0 or 1 prior to re-programming until re-synchronization completes, first write 1 to [clr\\_grp0\\_oe](#) or [clr\\_grp1\\_oe](#). If no divider exists in neither group then it will not re-synchronize.

Upon power-up, after OTP has been loaded and VCO calibration completes and APLL gets locked, a sync pulse is generated automatically to all dividers including FODs, IODs, that are assigned to sync group 0 or 1.

A sync pulse can also be initiated by writing 1 to register [divider\\_sync](#) to synchronize all dividers assigned to group 0 and 1, or [od\\_grp0\\_sync](#) and [od\\_grp1\\_sync](#) can be used to synchronize only the dividers assigned to each group.

Writing the [apl\\_reinit](#) bit causes the power-up sequence to restart from the VCO calibration step, which will synchronize the dividers after the APLL locks.

#### 1.4.2.3 Numerically Controlled Oscillator (NCO) Mode

In NCO mode, each FOD can adjust its output clock frequency with a step size of  $1/2^{34}$  or 58.21ppt, and is based on incrementing the numerator while holding the 34-b denominator at a fixed value. This frequency change at the output clock is gradual and without glitches.

## 1.5 Clock Outputs

The RC210xx supports up to 12 differential or 24 single-ended clock outputs, or any combination of differential and single-ended clock outputs. Each differential clock output can be programmed as two single-ended clock outputs.

### 1.5.1 Output Types

Differential outputs can be set to 85ohm HCSL, 100ohm HCSL, or LVDS. The HCSL outputs types are low-power push-pull HCSL (LPHCSL) with integrated terminations. They do not require external terminations to drive standard HCSL inputs, such as those found in PCIe applications. HCSL outputs have programmable output swing and HCSL outputs also have two slew rate settings (2V/ns to 4V/ns and 3V/ns to 5V/ns). LVDS outputs require only a 100ohm resistor between the true and complement inputs of the clock input being driven. Both LVDS and HCSL provide output swing levels that are compatible with LVPECL and CML with external AC coupling.

If set to single-ended mode, the output pair can drive both pins. If both pins are enabled, they can be in phase or inverted phase. The single-ended outputs support CMOS swings of 1.8V, 2.5V, or 3.3V as determined by their VDDO voltage.

## 1.5.2 Output Banks

The RC210xx maps the internal and external frequency sources to output banks that can be programmed in register [output\\_bank\\_src](#), according to the following table. There are up to 12 clock outputs arranged in seven output banks. Each bank sits on its own VDDO (each VDDO also supplies an IOD or FOD as listed below).

Table 1. Output Bank Source Mapping

output_bank_src	Bank 0	Bank 1	Bank 2	Bank 3	Bank 4	Bank 5	Bank 6
	OUT0	OUT1	OUT[2:3]	OUT[4:7]	OUT[8:9]	OUT10	OUT11
0x0	IOD0		N/A		CLKIN1		
0x1	IOD1			N/A		XIN_REFIN	N/A
0x2	N/A				IOD2		
0x3	N/A					IOD3	
0x4	FOD0				N/A		
0x5	FOD1						
0x6	N/A			FOD2			
0x7	N/A				CLKIN0		

## 1.6 Output Enable Control

During the power-up sequence, the clock output drivers are tri-stated until the power supplies have stabilized, then both OUTx and OUTxb are held low. After the OTP configuration load completes, the clock output drivers can be enabled or held disabled until the APLL lock according to the setting of [out\\_startup](#). This behavior can be overridden by setting [out\\_dis\\_group](#) to 0x7.

After power-up, the clock output driver is then enabled, either by setting the corresponding [out\\_dis](#) register bit or by the designated OE pin, if assigned to an OE group. The output driver is enabled when both the register bit and the OE pin are active. If configured in CMOS mode, OUTx and OUTxb can be enabled or disabled individually through [out\\_prog3](#) and [out\\_prog2](#).

There are five OE groups, each output driver can optionally be assigned to a OE group in register [out\\_dis\\_group](#). A GPI or GPIO pin can be assigned as OE pin to a OE group in register [gpi\\_func](#) or [gpio\\_func](#) or can also be assigned as a global OE (GOE) pin with the [goe](#) register bit.

## 2. Serial Interfaces

The RC210xx can be configured in three ways:

- From internal non-volatile memory using OTP user configurations
- From its slave serial interface and program by a master device
- From an external I2C EEPROM. The device will become master at power-up and load data from I2C EEPROM.

The RC210xx supports three slave serial interfaces: I2C, SPI, and SMBUS. The interface type is selected by the [ssi\\_enable](#) (0x0026[1:0]) register field. If OTP is not programmed, the device powers up in I2C 1-byte offset mode. These serial interfaces share the same pins so only one is available at a time. The I2C master interface that is used to load User Configurations from an external I2C EEPROM is only active after loading an OTP Configuration with EEPROM function enable. An external master (I2C, SPI, SMBUS) can be used to access internal registers after power-up and the configuration load process is completed.

### 2.1 1-Byte and 2-Byte Offset Mode

The RC210xx has a 912-byte register memory space. It also separates as four pages, and each page is 256 bytes.

The RC210xx supports 1-byte and 2-byte offset mode for all three slave serial interfaces, I2C, SPI, and SMBUS. The user can choose to operate as 1-byte or 2-byte offset mode, and can be configured through register [ssi\\_addr\\_size](#) (0x0026[2]) register field which defaults as 1-byte offset mode. These offsets are used in conjunction with the page register to access registers internal to the device. Because the I2C protocol already includes a read/write bit with the Dev Addr, all bits of the 1-byte or 2-byte offset field can be used to address internal registers.

- The 1-byte offset mode – It also called page mode where part of the address offset is provided in each transaction and another part comes from an internal page register in each serial port. For an I2C 1-byte offset mode operation example, see [Figure 1](#).
- The 2-Byte offset mode – Use two byte as the serial port providing the full offset address within each burst. For an I2C 2-byte offset mode operation example, see [Figure 2](#).

### 3. I2C Slave

The I2C slave protocol complies with the *I2C Specification*, version UM10204 Rev.6, 4 April 2014. The SCL\_SCLK and SDA\_nCS pins are 3.3V tolerant. The Dev Addr shown in the [Figure 1](#) represents the I2C bus address that the device will respond to. This 7-bit value in the i2c\_addr register field defaults to 0x09 if not programmed via the OTP load.

#### 3.1 1-Byte Offset Mode

In 1-byte mode, the lower 8 bits of the register offset address originate from the Offset Addr byte and the upper 8 bits come from the page register. The page register can be accessed at any time using an offset byte value of 0xFD. Write to 0 for page0, 1 for page1, 2 for page2, and 3 for page3.

Sequential 8-bit Read

Sequential 8-bit Write

☒ From master to slave    S=Start    A=Acknowledge    P=Stop  
☐ From slave to master    Sr=Repeated start     $\bar{A}$ =Non-acknowledge

Figure 1. I2C 1-Byte Offset Mode Slave Sequencing

#### 3.2 2-Byte Offset Mode

In 2-byte mode, the full 16-bit register address can be obtained from the Offset Addr bytes, so the page register does not need to be set up. The MSB offset address is the page number and the LSB address is the register address.

Sequential 16-bit Read

Sequential 16-bit Write

☐ From slave to master    Sr=Repeated start     $\bar{A}$ =Non-acknowledge

Figure 2. I2C 2-Byte Offset Mode Slave Sequencing

**Note:** All serial port configuration will take effect after the write cycle is completed.

## 4. SPI Slave

This device supports 4-wire or 3-wire SPI operation as a selectable protocol on the serial port. The 3-wire or 4-wire mode is selected by the `spi_3wire` register bit. In 4-wire mode, there are separate data in and data out signals (SDI and SDO, respectively). In 3-wire mode, the SDIO signal is used as a single, bidirectional data signal.

Figure 3 shows the sequencing of address and data on the serial port in both 3-wire and 4-wire SPI mode. 4-wire SPI mode is the default. The R/W bit is high for read cycles and low for write cycles.

SPI Read Sequence\*

SPI Write Sequence\*

\* See the timing diagrams for exact timing relationships.

Figure 3. SPI Sequencing Diagram

SPI operation can be configured for the following settings through register fields: 1-byte or 2-byte offset addressing (`ssi_addr_size`).

In 1-byte operation, the 16-bit register address is formed by using the 7 bits of address supplied in the SPI access and taking the upper 9 bits from the page register. The page register is accessed using an offset address of 0xFD. For an 1-byte offset operation example, see [Example of I2C 1-Byte Offset Mode Programming](#).

In 2-byte operation, the 16-bit register address is formed by using the 15 bits of address supplied in the SPI access and taking the upper 1-bit from the page register. For an 2-byte offset operation example, see also [Example of I2C 2-Byte Offset Mode Programming](#).

- Data sampling on falling or rising edge of SCLK (`spi_clk_sel`)
- Output (read) data positioning relative to active SCLK edge (`spi_del_out`)

**Note:** SPI burst mode operation is required to ensure data integrity of multi-byte registers. When accessing a multi-byte register, all data bytes must be written or read in a single SPI burst access. Bursts can be of greater length if desired but must not extend beyond the end of the register page. An internal address pointer is incremented automatically as each data byte is written or read.

The SPI interface operating at 10MHz supports a DCO update rate of approximately 200k updates per second.

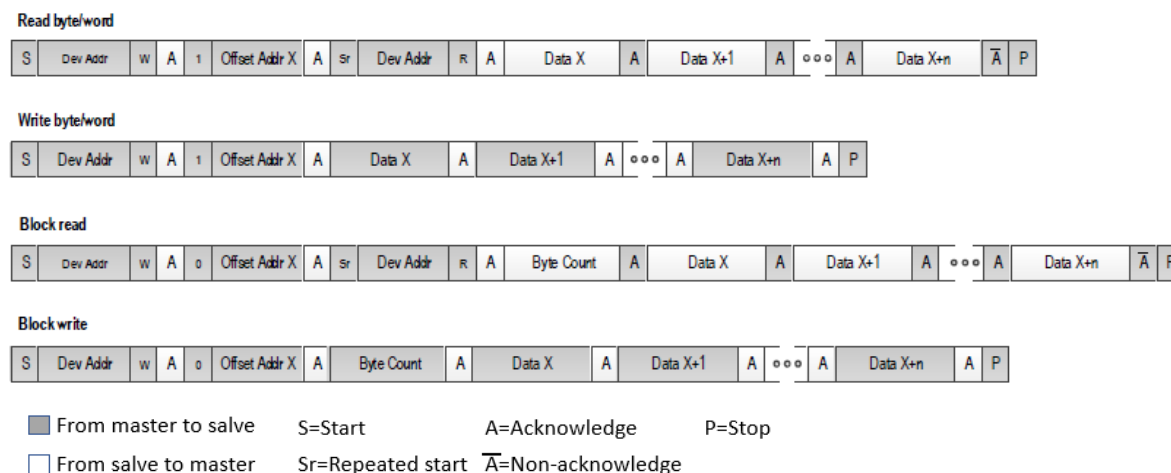

## 5. SMBus Slave

This device supports a standard SMBus v2.0 and v3.1 compliant interface operating at 100kHz, 400kHz, and 1MHz. The SCL\_SCLK and SDA\_nCS pins are 3.3V tolerant.

The SMBus interface supports block write and byte write modes. SMBus only supports 7-bit sub-addresses and the ssi\_addr\_size setting is ignored. A writeable page register selects the upper address bits.

The SMBus slave protocol of the RC210xx complies with the SMBus v2.0 and v3.1 standard.

In the following description, SCL refers to the SCL\_SCLK pin and SDA refers to the SDA\_nCS pin. [Figure 4](#) shows the sequence of states on the SMBus SDA signal for the supported modes of operation.

**Figure 4. I2C Slave Timing Diagram**

The Dev Addr shown in the figure represents the SMBus address that the device will respond to. This 7-bit value in the i2c\_addr register field defaults to 0x09 if not programmed via the OTP load.

In SMBus, the MSB of the offset address is used to determine whether Block mode is selected, and means the address space is only 128 locations. The internal 16-bit register address is formed by using the 7 bits of address supplied in the SMBus access and taking the upper 9 bits from the page register. The page register is accessed using an offset address of 0xFD.

Read byte/word and Write byte/word are essentially the same as the reads and writes in I2C mode. The main difference is in that when this mode is selected, the MSB of the offset address to read is set to 1. Block read and Block write modes are selected when the MSB of the offset address is set to 0. In block mode, the byte count is always the first value of the data phase. The byte count is stored in the byte count register field and defaults to 0x8.

*Note:* Same as for I2C, external to the scope of the SMBus-specific logic, burst mode operation is required to ensure data integrity of multi-byte registers. When accessing a multi-byte register, all data bytes must be written or read in a single SMBus burst access. Bursts can be of greater length if desired, but must not extend the end of the register page (Offset Addr 0x7F). An internal address pointer is incremented automatically as each data byte is written or read.

### 5.1 SMBus 1-Byte/2-Byte Offset Mode Programming Examples

In 1-byte operation, same as I2C 1-byte offset mode operation. For an 1-byte offset operation example, see [Example of I2C 1-Byte Offset Mode Programming](#).

In 2-byte operation, same as I2C 2-byte offset mode operation. For an 2-byte offset operation example, see also [Example of I2C 2-Byte Offset Mode Programming](#).

## 6. Example of Programming Process

The following two examples show how to use the rbs setting file register value and the customer's own I2C master to program the RC210xx:

- The I2C 1-byte offset mode programming with page number for more than 256 register offset addresses.
- The I2C 2-byte offset mode programming will use the most significant offset byte for the page number. It also applies to SMBus and SPI.

There are four steps to program the RC210xx:

1. Program all register values to the device.
2. Complete a VCO calibration for the new setting.  
*Note:* This step applies only if the VCO frequency will change.
3. Complete an output divider sync up.
4. Change synchronous serial bus setting. The setting is effective after the write cycle is completed. If no change on synchronous serial bus change, then skip this step.

### 6.1 Getting Register Value from rbs Setting File

The register values of a configuration can be exported from the RICBox GUI when the configuration file is loaded, or it can be retrieved from an rbs file by running a Python script on the configuration file. The register map file is a text file that can be integrated into the user's software (i.e., a head file or a data array), and it will list all of the register values at the beginning of the file (see the following example).

Offset Number	Binary Value	Hex Value	Offset Number
00	00110011	33	00
01	00010000	10	01
02	00000000	00	02
03	00000000	00	03
04	00100010	22	04
05	00000001	01	05
06	10101001	A9	06
07	00000000	00	07
08	00101010	2A	08

### 6.2 Example of I2C 1-Byte Offset Mode Programming

#### //Step 1 – Program register value

```
write 0x9 fd 00 // Change page number to page 0.
write 0x9 02 data(0x0002 to 0x0019)
write 0x9 28 data(0x0028 to 0x00F7) // Skip register 0x20 to 0x27, the synchronous
serial bus setting at the end.
write 0x9 fd 01 //Change page number to 1:
write 0x9 00 data(0x0100 to 0x01FA)
write 0x9 fd 02 //Change page number to 2:
write 0x9 00 data(0x0200 to 0x02FB)
write 0x9 fd 03 //Change page number to 3:
write 0x9 00 data(0x0300 to 0x031F)
write 0x9 fd 01 //Change page number to 1
```

**//Step 2 – VCO re-calibration**

```

write 0x9 3c 20 // Dummy write, delay
write 0x9 3c A0 // Apl1 re-calibrate
write 0x9 3c 20 // Dummy write, wait for the re-calibrate.
// If the master has wait function, then it can be replay by wait
// command. (Wait about 400us)

write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write
write 0x9 3c 20 // Dummy write

```

**//Step 3 – Output divider sync up**

```

write 0x9 fd 00 //Change page number to 0
write 0x9 11 30
write 0x9 11 32 // output divider sync up
write 0x9 11 30

```

**//Step 4 – Synchronous serial bus setting**

```

write 0x9 00 20 data(0x0020 to 0x0027) //change synchronous serial bus setting. It
will be affected after the write cycle completed.

```

**6.3 Example of I2C 2-Byte Offset Mode Programming****//Step 1 Program register value**

```

write 0x9 00 02 data(0x0002 to 0x0019) // burst write //Skip register 0x0020 to
0x0027.
write 0x9 00 28 data(0x0028 to 0x00F7) // burst write
write 0x9 01 00 data(0x0100 to 0x01FA) // burst write
write 0x9 02 00 data(0x0200 to 0x01FB) // burst write
write 0x9 03 00 data(0x0300 to 0x031F) // burst write

```

**//Step 2 VCO re-calibration**

```

write 0x9 01 3c 20 // Dummy write, delay
write 0x9 01 3c 20
write 0x9 01 3c A0 // Apl1 re-calibrate. Change register 0x013C from 20 to A0 to
re-calibrate
write 0x9 01 3c 20 // Dummy write, wait for the re-calibrate.
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write

```

```
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
write 0x9 01 3c 20 // Dummy write
```

### //Step 3 Output divider sync up

```
write 0x9 00 11 30
write 0x9 00 11 32 // divider sync up
write 0x9 00 11 30
```

### //Step 4 Synchronous serial bus setting

```
write 0x9 00 20 data(0x0020 to 0x0027) //change synchronous serial bus setting. It
will be affected after the write cycle completed.
```

## 7. Example of Changing Output Frequency

Changing an output frequency does not require all registers to be programmed. Changing an output frequency can be implemented by changing either or both of the following:

- VCO frequency of the APLL
- Output divider

Output dividers include integer output dividers (IODs) and fractional output dividers (FODs). Modifying only the output dividers will result in a glitchless frequency change when the last byte of output divider value is updated by an I2C block write event. The frequency change is instantaneous; one clock cycle is still the old frequency and the next clock cycle is the new frequency. Re-calibration is not required; however, if the VCO frequency is modified, it will trigger a VCO calibration. The resulting output frequency will not be glitchless.

APLL VCO frequency is determined by input clock frequency and the 27-bit Feedback divider. The VCO frequency range is between 9.5GHz and 10.7GHz. With VCO frequency in the range of 9.5GHz to 10.7GHz, the RC210xx supports an output frequency range of 1KHz to 650MHz by choosing a proper output divider value. If the desired output frequency is in an integer relationship with VCO frequency, an IOD is used; otherwise, an FOD is used. FOD provides a frequency resolution up to 1ppt (1 per trillion). There are four IODs (IOD0-3) and three FODs (FOD0-2).

*Note:* If the input frequency or VCO frequency is changed, then re-calibration is required. All changes made through I2C will be temporary. When power is cycled, the original configuration is loaded from OTP memory.

### 7.1 Output Frequency Calculation

The following formulas provide a method to calculate the desired output frequency. With output frequency determined, we then select an output divider to get the VCO frequency, which must be within 9.5GHz to 10.7GHz.

- Output Frequency = VCO Frequency / Output Divider
- VCO Frequency = Input Frequency \* Doubler \* (apll\_fb\_div\_int + (apll\_fb\_div\_frac / 2 ^ 27))

*Note:* If the doubler is enabled, the Doubler=2. If the doubler is disabled, the Doubler = 1.

The VCO feedback divider consists of a 10-bit integer and a 27-bit fractional portion. The offset addresses of the feedback divider register are as follows:

- FB\_INT\_DIV[9:8] = 0x125[1:0]
- FB\_INT\_DIV[7:0] = 0x124[7:0]

- FB\_FRAC\_DIV[26:24] = 0x123[2:0]
- FB\_FRAC\_DIV[23:16] = 0x122[7:0]
- FB\_FRAC\_DIV[15:8] = 0x121[7:0]
- FB\_FRAC\_DIV[7:0] = 0x120[7:0]

With a crystal frequency of 60MHz, in order to make a VCO frequency of 10GHz:

- Program the following registers will make VCO frequency = 10GHz:

- 0x125[1:0] = 0x0
- 0x124[7:0] = 0x53
- 0x123[2:0] = 0x02
- 0x122[7:0] = 0xAA
- 0x121[7:0] = 0xAA
- 0x120[7:0] = 0xAB

Each Integer Output Divider (IOD) is 25 bits with valid values between 14 and 33,554,431 ( $= 2^{25} - 1$ ). A value smaller than 14 causes the output frequency to increase above its maximum 650MHz and the biggest value makes an output frequency below the minimum 1KHz.

- IOD0[24] = Register 0x1C3[0]
- IOD0[23:16] = Register 0x1C2[7:0]
- IOD0[15:8] = Register 0x1C1[7:0]
- IOD0[7:0] = Register 0x1C0[7:0]

In addition, the other three IODs are taking up the register ranges listed below:

- IOD1[24:0] are in registers 0x1C8, 0x1C9, 0x1CA and 0x1CB.
- IOD2[24:0] are in registers 0x1D0, 0x1D1, 0x1D2 and 0x1D3.
- IOD3[24:0] are in registers 0x1D8, 0x1D9, 0x1DA and 0x1DB.

**Example:** To make OUT0 = 100MHz by change IOD0 to 100 (VCO frequency = 10GHz)

Output Frequency = VCO Frequency / Output Divider

$$100\text{MHz} = 10\text{GHz} / 100$$

Programming the following registers will change the output to 100MHz. Assuming the VCO is 10GHz.

- Register 0x1C0[7:0] value 0x64
- Register 0x1C1[7:0] value 0x00
- Register 0x1C2[7:0] value 0x00
- Register 0x1C3[0] value 0x0

## 7.4 Fractional Output Dividers

The fractional output divider consists of a 9-bit 1<sup>st</sup> integer, a 17-bit 2<sup>nd</sup> integer, and a 34-bit fractional portion. Together, it can provide a frequency resolution better than 1ppt. The 1<sup>st</sup> integer covers values up to 511 and is always used. The 2<sup>nd</sup> integer can cover values up to 131,071 and is used for output frequencies below 33MHz. The formula for the total divider value is as follows:

- $F_{\text{OUT}} > 33\text{MHz}$ :  $\text{FOD} = 1^{\text{st}} \text{ Integer} + \text{Fraction}$
- $F_{\text{OUT}} < 33\text{MHz}$ :  $\text{FOD} = (1^{\text{st}} \text{ Integer} + \text{Fraction}) \times 2 \times 2^{\text{nd}} \text{ Integer}$

For output frequencies above 33MHz, where the 2<sup>nd</sup> Integer is not used, the 2<sup>nd</sup> Integer value is set to 1. This causes the 2<sup>nd</sup> Integer and its additional  $\times 2$  to be bypassed. Both integer and fractional registers are as follows.

1<sup>st</sup> Integer:

- FOD0 1<sup>st</sup> Integer [8] = Register 0x1E1[0]
- FOD0 1<sup>st</sup> Integer [7:0] = Register 0x1E0[7:0]

2<sup>nd</sup> Integer:

- FOD0 2<sup>nd</sup> Integer [16:15] = Register 0x1E3[1:0]
- FOD0 2<sup>nd</sup> Integer [14:7] = Register 0x1E2[7:0]
- FOD0 2<sup>nd</sup> Integer [6:0] = Register 0x1E1[7:1]

Fractional:

- FOD0 Fractional [33:30] = Register 0x1E7[3:0]
- FOD0 Fractional [29:22] = Register 0x1E6[7:0]
- FOD0 Fractional [21:14] = Register 0x1E5[7:0]
- FOD0 Fractional [13:6] = Register 0x1E4[7:0]
- FOD0 Fractional [5:0] = Register 0x1E3[7:2]

In addition, FOD1 values are carried by registers 0x1F0 to 0x1F7, and FOD2 is carried by registers in 0x200 to 0x207. For more information, see [Register Offsets](#).

**Example:** Setting OUT0 = 156.25MHz by programming FOD0 = 64 (VCO frequency = 10GHz)

Output Frequency = VCO Frequency / Output Divider

$$156.25\text{MHz} = 10\text{GHz} / 64$$

Program the following registers will change the output to 156.25MHz

- FOD0 Integer Register programming:
  - Register 0x1E0[7:0] value 0x40
  - Register 0x1E1[7:0] value 0x00

- Register 0x1E2[7:0] value 0x00
- Register 0x1E3[1:0] value 0x00
- FOD0 Fractional register programming:
  - Register 0x1E3[7:2] value 0x00
  - Register 0x1E4[6:0] value 0x00
  - Register 0x1E5[6:0] value 0x00
  - Register 0x1E6[6:0] value 0x00
  - Register 0x1E7[3:0] value 0x00

## 8. Example of Device Programming with the Driver

For PC or Linux users, they can also leverage the RC210xx Python driver to program the device. The driver will take care of the programming process.

The requirement: Install RICBox and the VC7 plug-in file, or install Python 3.9 and the VC7 driver.

### 8.1 Example of Python Code

Save the following code to “VC7\_Config\_Builder.py”

```
import rbcore
from r_drv_vc7.device_abstraction.config_builder import *
from r_drv_vc7.device_abstraction.versaclock7 import Versaclock7
from rbcore.io.ftdi import FtdiI2cSettings
## Create VC7 device. (VC7_Family, Version)
vc7 = Versaclock7( Versaclock7.create_device(r'RC21012B', 'B'))
## Connect FTDI device, I2C address = 0x9
vc7.connect(FtdiI2cSettings(index='0', address=0x09))
## Program VC7
vc7.program_settings_file(r'RC21012B065_config0.rbs')
```

### 8.2 Example of DOS Batch File

The RICBox VC7 plug-in file comes with the Python 3.9 environment. The following example shows the RICBox environment path. Save the following command to batch file so that it can execute the Python code.

```
Echo off
Echo Start!
C:\Users\%username%\AppData\Roaming\RICBox\venvs\VersaClock7-x64\Scripts\python
VC7_Config_Builder.py
pause
```

## 9. Register Organization

### 9.1 Overview

Register sizes are denoted as:

- byte: 8-bit
- hword: 16-bit
- word: 32-bit
- dword: 64-bit

Register types are defined in the following table.

**Table 2. Register Type Definition**

Type Indicator	Definition
R/W1C	Read/Write 1 to Clear
R/W1S	Read/Write 1 to Set
RO	Read-only
RW	Read/Write
WO	Write-only

### 9.2 Register Block Offsets

**Table 3. Register Block Offsets**

Block Offset	Block Name	Address Table	Registers
0x000	GLOBAL	<a href="#">Global Addresses</a>	<a href="#">Global Registers</a>
0x020	SSI	<a href="#">SSI Addresses</a>	<a href="#">SSI Registers</a>
0x02C	XO	<a href="#">Crystal Addresses</a>	<a href="#">XO Register</a>
0x030 += 0x004	CLKIN[0:1]	<a href="#">Clock Input Addresses</a>	<a href="#">CLKIN Register</a>
0x050 += 0x010	LOSMON[0:4]	<a href="#">LOS Monitor Addresses</a>	<a href="#">LOSMON Registers</a>
0x120	APLL	<a href="#">APLL Addresses</a>	<a href="#">APLL Registers</a>
0x1C0 += 0x008	IOD[0:3]	<a href="#">IOD Addresses</a>	<a href="#">IOD Registers</a>
0x1E0 += 0x010	FOD[0:2]	<a href="#">FOD Addresses</a>	<a href="#">FOD Registers</a>

0x26f	OUT[11]	ODRV_CNFG[1]	RW	0x00

## 10.10 BANK Block

Table 27. BANK Block Physical Register Addresses

Address	Block Name	Register	Type	Default
0x280	BANK[0]	OUT_BANK_CNFG	RW	0x05
0x284	BANK[1]	OUT_BANK_CNFG	RW	0x05
0x288	BANK[2]	OUT_BANK_CNFG	RW	0x05
0x28c	BANK[3]	OUT_BANK_CNFG	RW	0x05
0x290	BANK[4]	OUT_BANK_CNFG	RW	0x05
0x294	BANK[5]	OUT_BANK_CNFG	RW	0x05
0x298	BANK[6]	OUT_BANK_CNFG	RW	0x05

## 10.11 GPI Block

Table 28. GPI Block Physical Register Addresses

Address	Block Name	Register	Type	Default
0x29c	GPI[0]	GPI_CNFG[0]	RW	0x7f
0x29d	GPI[0]	GPI_CNFG[1]	RW	0x00
0x29e	GPI[0]	GPI_STS	RO	0x00
0x2a0	GPI[1]	GPI_CNFG[0]	RW	0x7f
0x2a1	GPI[1]	GPI_CNFG[1]	RW	0x00
0x2a2	GPI[1]	GPI_STS	RO	0x00
0x2a4	GPI[2]	GPI_CNFG[0]	RW	0x7f
0x2a5	GPI[2]	GPI_CNFG[1]	RW	0x00
0x2a6	GPI[2]	GPI_STS	RO	0x00
0x2a8	GPI[3]	GPI_CNFG[0]	RW	0x7f
0x2a9	GPI[3]	GPI_CNFG[1]	RW	0x00
0x2aa	GPI[3]	GPI_STS	RO	0x00

## 10.12 GPIO Block

Table 29. GPIO Block Physical Register Addresses

Address	Block Name	Register	Type	Default
0x2ac	GPIO[0]	GPIO_CNFG[0]	RW	0x90
0x2ad	GPIO[0]	GPIO_CNFG[1]	RW	0x04
0x2ae	GPIO[0]	GPIO_STS	RO	0x00
0x2b0	GPIO[1]	GPIO_CNFG[0]	RW	0x90
0x2b1	GPIO[1]	GPIO_CNFG[1]	RW	0x04
0x2b2	GPIO[1]	GPIO_STS	RO	0x00
0x2b4	GPIO[2]	GPIO_CNFG[0]	RW	0x90

Table 29. GPIO Block Physical Register Addresses (Cont.)

Address	Block Name	Register	Type	Default
0x2b5	GPIO[2]	GPIO_CNFG[1]	RW	0x04
0x2b6	GPIO[2]	GPIO_STS	RO	0x00
0x2b8	GPIO[3]	GPIO_CNFG[0]	RW	0x90
0x2b9	GPIO[3]	GPIO_CNFG[1]	RW	0x04
0x2ba	GPIO[3]	GPIO_STS	RO	0x00
0x2bc	GPIO[4]	GPIO_CNFG[0]	RW	0x90
0x2bd	GPIO[4]	GPIO_CNFG[1]	RW	0x04
0x2be	GPIO[4]	GPIO_STS	RO	0x00

## 10.13 SSC Block

Table 30. SSC Block Physical Register Addresses

Address	Block Name	Register	Type	Default
0x300	SSC[0]	SSC_CNFG[0]	RW	0x8c
0x301	SSC[0]	SSC_CNFG[1]	RW	0x2b
0x302	SSC[0]	SSC_CNFG[2]	RW	0x51
0x303	SSC[0]	SSC_CNFG[3]	RW	0x00
0x304	SSC[1]	SSC_CNFG[0]	RW	0x8c
0x305	SSC[1]	SSC_CNFG[1]	RW	0x2b
0x306	SSC[1]	SSC_CNFG[2]	RW	0x51
0x307	SSC[1]	SSC_CNFG[3]	RW	0x00

## 10.14 INT Block

Table 31. INT Block Physical Register Addresses

Address	Block Name	Register	Type	Default
0x308	INT	SCRATCH0[0]	RW	0x00
0x309	INT	SCRATCH0[1]	RW	0x00
0x30a	INT	SCRATCH0[2]	RW	0x00
0x30b	INT	SCRATCH0[3]	RW	0x00
0x30c	INT	INT_EN[0]	RW	0x00
0x30d	INT	INT_EN[1]	RW	0x00
0x30e	INT	INT_EN[2]	RW	0x00
0x30f	INT	INT_EN[3]	RW	0x00
0x310	INT	INT_STS[0]	RO	0x00
0x311	INT	INT_STS[1]	RO	0x00

Table 31. INT Block Physical Register Addresses (Cont.)

Address	Block Name	Register	Type	Default
0x312	INT	INT_STS[2]	RO	0x00
0x313	INT	INT_STS[3]	RO	0x00

## 11. Register Descriptions

### 11.1 Global Registers

Table 32. VENDOR\_ID - Vendor ID

Bit Field	Field Name	Type	Default Value	Description
15:12	dev_id_type	RO	0x1	Device ID Block Type. A value of 0x1 indicates that this register is followed by a 16-bit Device ID register and an 16-bit Device Revision register, and a 16-bit Device Programming register.
11	reserved	RO	0x0	Reserved.
10:0	vendor_id	RO	0x33	Vendor ID. Renesas/IDT JEDEC ID.

Table 33. DEVICE\_ID - Device ID

Bit Field	Field Name	Type	Default Value	Description
15:0	device_id	RW	0x0	Device ID. For default value refer to Product Identification. This field is writeable so it can be configured from OTP.

Table 34. DEVICE\_REV - Device Revision

Bit Field	Field Name	Type	Default Value	Description
15:0	device_revision	RO	0x0443	Device Revision. Decode as follows: <ul style="list-style-type: none"> <li>0x0111 = First silicon; not released.</li> <li>0x0333 = Rev A</li> <li>0x0443 = Rev B</li> </ul>

Table 35. DEVICE\_PGM - Device Programming

Bit Field	Field Name	Type	Default Value	Description
15:0	dash_code	RW	0x0	Dash Code. Decimal value assigned by IDT to identify the user configuration loaded in OTP at the factory. This field is write-able and is configured from the OTP common configuration programmed at the factory. <ul style="list-style-type: none"> <li>0x0 = No user configuration has been programmed at the factory</li> </ul>

Table 36. DEVICE\_CNFG - Device Configuration

Bit Field	Field Name	Type	Default Value	Description
31	reserved	RO	0x0	Reserved.
30:24	reserved	RW	0x0	Reserved.
30	float_vddo6	RW	0x0	Float VDDO6 Supply. <ul style="list-style-type: none"> <li>Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider IOD3 and output driver 11 in the VDDO6 domain. 0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO6 pin floats</li> </ul>
29	float_vddo5	RW	0x0	Float VDDO5 Supply. Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider IOD2 and output driver 10 in the VDDO5 domain. <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO5 pin floats</li> </ul>
28	float_vddo4	RW	0x0	Float VDDO4 Supply. Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider FOD2 and output drivers 8/9 in the VDDO4 domain. <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO4 pin floats</li> </ul>
27	float_vddo3	RW	0x0	Float VDDO3 Supply. Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider FOD1 and output drivers 4/5/6/7 in the VDDO3 domain. <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO3 pin floats</li> </ul>
26	float_vddo2	RW	0x0	Float VDDO2 Supply. Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider FOD0 and output drivers 2/3 in the VDDO2 domain. <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO2 pin floats</li> </ul>
25	float_vddo1	RW	0x0	Float VDDO1 Supply. Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider IOD1 and output driver 1 in the VDDO1 domain. <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO1 pin floats</li> </ul>
24	float_vddo0	RW	0x0	Float VDDO0 Supply. Controls Iref and Ibias to the output divider LDO, output bank LDO, output divider IOD0 and output driver 0 in the VDDO0 domain. <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDO0 pin floats</li> </ul>
23	reserved	RW	0x0	Reserved.

Table 36. DEVICE\_CNFG - Device Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
22	dyn_csel_deb	RW	0x0	Dynamic CSEL De-bounce Interval. The input value across GPI/GPIO pins configured as Dynamic CSEL must be stable for this number of system clock cycles before it takes effect. <ul style="list-style-type: none"> <li>0x0 = 8 system clock cycles (133ns)</li> <li>0x1 = 256 system clock cycles (4.2us)</li> </ul>
21:20	reserved	RW	0x1	reserved.
19:16	sync_dis_wait	RW	0x2	Divider Synchronization Output Clock Disable Wait Time. During the divider synchronization procedure, after de-asserting the output enable to the affected output drivers, the control logic waits for this period of time before stopping the clocks and synchronizing the dividers. If enabled, this must be set longer than the period of the slowest output clock, and longer than the SSC modulation interval. <ul style="list-style-type: none"> <li>0x0 = 1us</li> <li>0x1 = 2us</li> <li>0x2 = 4us</li> <li>0x3 = 8us</li> <li>0x4 = 16us</li> <li>0x5 = 32us</li> <li>0x6 = 64us</li> <li>0x7 = 128us</li> <li>0x8 = 256us</li> <li>0x9 = 512us</li> <li>0xA = 1024us</li> <li>0xB = 2048us</li> <li>0xC = 4096us</li> </ul>
15:12	pwrndn_sel	RW	0xF	PWRGD/PWRDN# Pin Select. Selects the pin used as PWRGD/PWRDN#, or disables the functionality. If a pin is selected, the device waits for that pin to be high before loading the OTP/EEPROM UserCfg. That pin may also be assigned as a 2-level Dynamic CSEL pin with <a href="#">gpio_func</a> and <a href="#">gpio_type</a> , and polarity inversion must be disabled ( <a href="#">gpio_pol</a> ). This setting must be programmed by the OTP/EEPROM common configuration in order to take effect during the power-up sequence. <ul style="list-style-type: none"> <li>0x0 = GPIO0</li> <li>0x1 = GPIO1</li> <li>0x2 = GPIO2</li> <li>0x3 = GPIO3</li> <li>0x4 = GPIO4</li> <li>0x5 = GPIO</li> <li>0x6 = GPI1</li> <li>0x7 = GPI2</li> <li>0x8 = GPI3</li> <li>0xF: No pin selected, associated functionality disabled</li> </ul>
11:6	reserved	RW	0x0	Reserved.

Table 36. DEVICE\_CNFG - Device Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
11	float_vddr3	RW	0x0	Float VDDR3 Supply. Controls Iref and Ibias to the Input Buffer LDO and IB2 in the VDDR3 domain (bonded to VDDR in the current 48 and 40 pin package variants). <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDR3 pin floats</li> </ul>
10	float_vddr2	RW	0x0	Float VDDR2 Supply. Controls Iref and Ibias to the Input Buffer LDO and IB1 in the VDDR2 domain (bonded to VDDR in the current 48 and 40 pin package variants). <ul style="list-style-type: none"> <li>0x0 = Reference currents enabled</li> <li>0x1 = Reference currents disabled, must be set when the VDDR2 pin floats</li> </ul>
9:6	reserved	RW	0x0	Reserved.
5:4	static_csel2	RW	0x2	Static Configuration Select Bit 2. Selects the GPIO pin or fixed value used for static configuration select bit index 2. This setting must be programmed by the OTP/EEPROM common configuration in order to take effect during the power-up sequence. <ul style="list-style-type: none"> <li>0x0 = No pin selected, treated as Low (tri-level)</li> <li>0x1 = No pin selected, treated as Mid (tri-level)</li> <li>0x2 = GPIO2 (tri-level)</li> <li>0x3 = No pin selected, treated as High (tri-level)</li> </ul>
3:2	static_csel1	RW	0x2	Static Configuration Select Bit 1. Selects the GPIO pin or fixed value used for static configuration select bit index 1. This setting must be programmed by the OTP/EEPROM common configuration in order to take effect during the power-up sequence. <ul style="list-style-type: none"> <li>0x0 = No pin selected, treated as Low (tri-level)</li> <li>0x1 = No pin selected, treated as Mid (tri-level)</li> <li>0x2 = GPIO1 (tri-level)</li> <li>0x3 = No pin selected, treated as High (tri-level)</li> </ul>
1:0	static_csel0	RW	0x2	Static Configuration Select Bit 0. Selects the GPIO pin or fixed value used for static configuration select bit index 0. This setting must be programmed by the OTP/EEPROM common configuration in order to take effect during the power-up sequence. <ul style="list-style-type: none"> <li>0x0 = No pin selected, treated as Low (tri-level)</li> <li>0x1 = No pin selected, treated as Mid (tri-level)</li> <li>0x2 = GPIO0 (tri-level)</li> <li>0x3 = No pin selected, treated as High (tri-level)</li> </ul>

Table 37. PWR\_CTL - Power Control

Bit Field	Field Name	Type	Default Value	Description
7:1	reserved	RO	0x0	Reserved.
0	pd_restoreb	RW	0x1	<p>Power Down Restore (Active Low). Controls the device behavior when PWRGD/PWRDN# falls to enter power down. If pd_restoreb is set to 0, it will be reset back to 1 by the reset sequence.</p> <ul style="list-style-type: none"> <li>0x0 = Full power-on-reset. The falling edge of the PWRGD/PWRDN# pin resets the device, including configuration registers, to the initial power-on-reset state. The startup sequence is executed. It will wait for the rising edge of the PWRGD/PWRDN# pin to re-latch static CSEL inputs and load the corresponding user configuration, as on initial power-up.</li> <li>0x1 = Quick power down and power up sequence. The falling and subsequent rising edge of the PWRGD/PWRDN# pin trigger dynamic configuration loads which program the device to enter the powered down and powered up states, respectively. The startup sequence is not executed, and static CSEL inputs are not re-latched.</li> </ul>

Table 38. REG\_LOCK - Configuration Register Lock

Bit Field	Field Name	Type	Default Value	Description
7:0	reg_lock_key	RW	0x0	<p>Configuration Register Lock Key. Writing this field with 0xCB sets the <a href="#">config_reg_ro</a> bit to 1. Writing this field with 0x34 clears the <a href="#">config_reg_ro</a> bit to 0.</p>

Table 39. INIT\_SYNC - Initialization and Synchronization Register

Bit Field	Field Name	Type	Default Value	Description
7	clr_grp1_oe	RW1S	0x0	<p>Clear Reset Sequencer Sync Group 1 Output Enable. Writing this bit to 1 clears the sync group 1 output enable from the reset sequencer. The reset sequencer will set it back to 1 after the next group 1 divider synchronization completes. This affects all outputs in banks that select a divider assigned to sync group 1. Self-cleared immediately. Must not be set to 1 at the same time as any of <a href="#">divider_sync</a>, <a href="#">od_grp0_sync</a> and <a href="#">od_grp1_sync</a> are set to 1.</p>
6	clr_grp0_oe	RW1S	0x0	<p>Clear Reset Sequencer Sync Group 0 Output Enable. Writing this bit to 1 clears the sync group 0 output enable from the reset sequencer. The reset sequencer will set it back to 1 after the next group 0 divider synchronization completes. This affects all outputs in banks that select a divider assigned to sync group 0. Self-cleared immediately. Must not be set to 1 at the same time as any of <a href="#">divider_sync</a>, <a href="#">od_grp0_sync</a> and <a href="#">od_grp1_sync</a> are set to 1.</p>
5	id_global_setb	RW	0x1	<p>Input Dividers Common Set. When cleared, all input dividers are held in set mode (bit is active low). This allows set and release of all dividers at roughly the same time.</p>
4	goe	RW	0x1	<p>Output Global OE. This bit allows manual CSR control of the global output OE.</p>

Table 39. INIT\_SYNC - Initialization and Synchronization Register

Bit Field	Field Name	Type	Default Value	Description
3	od_grp1_sync	RW1S	0x0	Divider Group 1 Sync Trigger. Write 1 to trigger synchronization of output dividers in group 1 as defined in <a href="#">iod_sync_group</a> and <a href="#">fod_sync_group</a> . The affected output clocks will be squelched for approximately the <a href="#">sync_dis_wait</a> duration. Self-cleared immediately.
2	od_grp0_sync	RW1S	0x0	Divider Group 0 Sync Trigger. Write 1 to trigger synchronization of output dividers in group 0 as defined in <a href="#">iod_sync_group</a> and <a href="#">fod_sync_group</a> . The affected output clocks will be squelched for approximately the <a href="#">sync_dis_wait</a> duration. Self-cleared immediately.
1	divider_sync	RW1S	0x0	Divider Synchronization. Write 1 to trigger synchronization of output dividers in groups 0 and 1 as defined in <a href="#">iod_sync_group</a> and <a href="#">fod_sync_group</a> . The affected output clocks will be squelched for approximately the <a href="#">sync_dis_wait</a> duration. Self-cleared immediately.
0	apll_reinit	RW1S	0x0	APLL Reinitialization. Writing this bit to 1 re-starts the startup sequence from the VCO calibration step, including divider synchronization. Self-cleared immediately.

Table 40. SW\_RESET - Software Reset Register

Bit Field	Field Name	Type	Default Value	Description
15:12	reserved	RO	0x0	Reserved.
11	out_rst	RW	0x0	Output Driver Reset. This bit resets and disables all output drivers. Reset assertion acts asynchronously and can cause output glitches or runt pulses. Reset assertion acts synchronously.
10	config_rst	RW	0x0	Configuration Reset. Writing this bit to 1 resets the digital logic including the registers and re-starts the startup sequence at the bias calibration, if the device is not already executing the startup sequence (during the startup sequence, writes to this bit are masked). This bit can be set to 1 by the first write in a static OTP/EEPROM User Configuration in order to revert the CSRs to their default values. The static CSEL pins are not latched. If written from a User Configuration, that same User Configuration is loaded during the startup sequence. If written from the serial port, the User Configuration to load during the startup sequence is determined by the originally latched CSEL pins, as on device power-up. If written from the serial port, the reset is triggered after the serial port write transaction completes. Self-cleared by the reset.
9	dig_sw_rst	RW	0x0	Digital Logic Software Reset. Writing this bit to 1 resets all digital logic including the registers and re-starts the startup sequence at the latching of the static CSEL pins. The reset is triggered after the serial port write transaction completes. Self-cleared by the reset.
8	otp_sw_rst	RW	0x0	Configuration Loader Software Reset. The configuration loader logic is held in reset while this bit is set to 1. This bit must not be set through the OTP/EEPROM configuration, otherwise the part will become unresponsive.

Table 40. SW\_RESET - Software Reset Register (Cont.)

Bit Field	Field Name	Type	Default Value	Description
7	oc_ssc_sw_rst	RW	0x0	Over-Clock and Spread-Spectrum Engine Software Reset. The over-clocking engine and both spread-spectrum blocks are held in reset while this bit is set to 1.
6	tdc_apll_dig_sw_rst	RW	0x0	TDC APLL Digital Logic Reset. The TDC APLL digital logic is held in reset while this bit is set to 1. While re-programming the TDC APLL CSRs after device start-up, tdc_apll_dig_sw_rst must be set to 1.
5	reserved	RW	0x0	Reserved
4	clkmon4_sw_rst	RW	0x0	CLKMON4 Software Reset. The Clock Monitor 4 is held in reset while this bit is set to 1. While re-programming the refin LOS monitor CSRs after device start-up, clkmon4_sw_rst must be set to 1.
3	clkmon3_sw_rst	RW	0x0	CLKMON3 Software Reset. The Clock Monitor 3 is held in reset while this bit is set to 1. While re-programming the clkin3 LOS or Frequency monitor CSRs after device start-up, clkmon3_sw_rst must be set to 1.
2	clkmon2_sw_rst	RW	0x0	CLKMON2 Software Reset. The Clock Monitor 2 is held in reset while this bit is set to 1. While re-programming the clkin2 LOS or Frequency monitor CSRs after device start-up, clkmon2_sw_rst must be set to 1.
1	clkmon1_sw_rst	RW	0x0	CLKMON1 Software Reset. The Clock Monitor 1 is held in reset while this bit is set to 1. While re-programming the clkin1 LOS or Frequency monitor CSRs after device start-up, clkmon1_sw_rst must be set to 1.
0	clkmon0_sw_rst	RW	0x0	CLKMON0 Software Reset. The Clock Monitor 0 is held in reset while this bit is set to 1. While re-programming the clkin0 LOS or Frequency monitor CSRs after device start-up, clkmon0_sw_rst must be set to 1.

Table 41. CLOCK\_GATE - Clock Gate Register

Bit Field	Field Name	Type	Default Value	Description
15:7	reserved	RO	0x0	Reserved.
6	reserved	RW	0x0	Reserved.
5	clkmon4_cg	RW	0x0	CLKMON4 Clock Gate. The Clock Monitor 4 is clock gated while this bit is set to 1.
4	clkmon3_cg	RW	0x0	CLKMON3 Clock Gate. The Clock Monitor 3 is clock gated while this bit is set to 1.
3	clkmon2_cg	RW	0x0	CLKMON2 Clock Gate. The Clock Monitor 2 is clock gated while this bit is set to 1.
2	clkmon1_cg	RW	0x0	CLKMON1 Clock Gate. The Clock Monitor 1 is clock gated while this bit is set to 1.

Table 41. CLOCK\_GATE - Clock Gate Register (Cont.)

Bit Field	Field Name	Type	Default Value	Description
1	clkmon0_cg	RW	0x0	CLKMON0 Clock Gate. The Clock Monitor 0 is clock gated while this bit is set to 1.
0	otp_cg	RW	0x0	OTP Logic Clock Gate. The OTP interface logic is clock gated while this bit is set to 1. The user must set this bit to 0 to access the OTP. This bit must not be set through the OTP config, otherwise the part will become unresponsive.

Table 42. MISC\_CNFG - Miscellaneous Configuration

Bit Field	Field Name	Type	Default Value	Description
15:11	Reserved	RW	0x20	Reserved.
10	losmon_clkse1	RW	0x0	LOS Monitor Measuring Clock Select. Selects the measuring clock for the LOS monitor blocks. <ul style="list-style-type: none"> <li>0x0 = quad system clock (nominally 240 MHz)</li> <li>0x1 = TDC ring oscillator frequency divided by 2 (nominally 432MHz).</li> </ul>
9:8	fanout_buf_mod e1	RW	0x0	CLKIN1 Fan-out Buffer Mode. Configures the device to operate in fan-out buffer mode from CLKIN1. Independent from the CLKIN0 <a href="#">fanout_buf_mode</a> setting. <ul style="list-style-type: none"> <li>0x0 = CLKIN1 Fan-out buffer mode disabled or Manual fan-out buffer mode, output banks select their clock sources according to <a href="#">output_bank_src</a>. <a href="#">fanout_clkmode1</a> reads back as 0.</li> <li>0x1 = Automatic fan-out buffer mode. In banks where <a href="#">bank_fanout_mode</a> is set to 2 (not available on Bank 6), output bank clock source selection is based on CLKIN1 LOS and is latched at the rising edge of PERST1#. The selected mode can be read in <a href="#">fanout_clkmode1</a>.</li> <li>0x3 = Manual fan-out buffer mode, CLKIN1 fans out to output clocks in banks where <a href="#">bank_fanout_mode</a> is set to 2. <a href="#">fanout_clkmode1</a> reads back as 1.</li> </ul>
7:6	out_startup	RW	0x0	Output Disable on Startup until PLL locks. Controls whether the clock output drivers are disabled until the APLL locks during the startup sequence. When output_startup is not set to 0x2, individual output clocks may be configured to ignore APLL lock status by setting their <a href="#">out_dis_group</a> to 0x7. <ul style="list-style-type: none"> <li>0x0 = Clock output drivers are disabled until APLL lock asserts</li> <li>0x1 = Reserved</li> <li>0x2 = Clock output drivers are not disabled by APLL lock status</li> <li>0x3 = Reserved</li> </ul>
5	ssc_share	RW	0x0	Spectrum Spreading Phase Share. When two SSC engines have the same modulation frequency, setting this bit to 1 will align the phase of FOD1 SSC to FOD0 SSC. For restrictions on enabling the SSCs when <a href="#">ssc_share</a> is set to 1, see <a href="#">ssc_en</a> .

Table 42. MISC\_CNFG - Miscellaneous Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
4:3	fanout_buf_mode	RW	0x0	<p>CLKIN0 Fan-out Buffer Mode.</p> <p>Configures the device to operate in fan-out buffer mode from CLKIN0. Independent from the CLKIN1 <a href="#">fanout_buf_mode1</a> setting.</p> <ul style="list-style-type: none"> <li>0x0 = CLKIN0 Fan-out buffer mode disabled or Manual fan-out buffer mode, output banks select their clock sources according to <a href="#">output_bank_src</a>. <a href="#">fanout_clkmode</a> reads back as 0.</li> <li>0x1 = Automatic fan-out buffer mode. Table 44. DEVICE\_STS - Device Status

Bit Field	Field Name	Type	Default Value	Description
15	fanout_clkmode1	RO	0x0	CLKIN1 Fanout Clock Mode. Set to 1 when CLKIN1 fanout buffer mode is enabled ( <a href="#">fanout_buf_mode1</a> is not set to 0x0) and CLKIN1 is passed to the output clocks.
14	fanout_clkmode	RO	0x0	CLKIN0 Fanout Clock Mode. Set to 1 when CLKIN0 fanout buffer mode is enabled ( <a href="#">fanout_buf_mode</a> is not set to 0x0) and CLKIN0 is passed to the output clocks.
13:10	reserved	RO	0x0	Reserved.
9	device_ready	RO	0x0	Device Ready. Set to 1 when the configuration load (OTP and/or EEPROM) completes during the startup sequence. Cleared during a dynamic configuration load.
8	config_reg_ro	RO	0x0	Configuration Register Read-only Status. When this bit is 1, writes to configuration registers are ignored. Writes to bits of type RW1C, <a href="#">reg_lock_key</a> and certain RW and RW1S bits are not ignored. Use the <a href="#">reg_lock_key</a> field to set/clear this bit.
7	otp_detect_se	RO	0x0	OTP Loader Detected Single-Ended Mode. When high, indicates that the OTP loader detected that the OTP image is configured for single-ended mode.
6	eeeprom_config_valid	RO	0x0	Valid EEPROM User Configuration Loaded. Indicates that the user configuration in <a href="#">config_loaded</a> was successfully loaded from EEPROM. Only valid when <a href="#">device_ready</a> is 1.
5	otp_config_valid	RO	0x0	Valid OTP User Configuration Loaded. Indicates that the user configuration in <a href="#">config_loaded</a> was successfully loaded from OTP. Only valid when <a href="#">device_ready</a> is 1.
4:0	config_loaded	RO	0x0	User Configuration Loaded. Indicates the user configuration loaded from OTP/EEPROM on start-up or a dynamic configuration load. Note that on startup, the common configuration is always loaded prior to the user configuration. Only valid when <a href="#">device_ready</a> is 1.

## 11.2 SSI Registers

Table 45. SPI\_CNFG - SPI Configuration

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3	spi_del_out	RW	0x0	SDO Delay. <ul style="list-style-type: none"> <li>0x0 = SDO is driven on opposite SCLK edge than the sampling edge</li> <li>0x1 = SDO is delayed one half cycle of SCLK</li> </ul>
2	reserved	RO	0x0	Reserved.

Table 45. SPI\_CNFG - SPI Configuration

Bit Field	Field Name	Type	Default Value	Description
1	spi_clk_sel	RW	0x0	SDI Sampling Edge Selection. <ul style="list-style-type: none"> <li>0x0 = SDI is sampled on rising SCLK edge</li> <li>0x1 = SDI is sampled on falling SCLK edge</li> </ul>
0	spi_3wire	RW	0x0	Select SPI 3 or 4-wire Mode. <ul style="list-style-type: none"> <li>0x0 = Normal 4-wire SPI. Data is received on the GPI/GPIO pin assigned as SDI, and transmitted on the GPIO pin assigned as SDO.</li> <li>0x1 = 3-wire SPI. Data is received and transmitted on the GPIO pin assigned as SDIO.</li> </ul>

Table 46. I2C\_FLTR\_CNFG - I2C Filter Configuration

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3:0	i2c_spike_filtr	RW	0x1	I2C/SMBus Digital Spike Filter Duration. Controls the duration of the digital spike filters on the SCL and SDA inputs, specified in number of system clock cycles (16.7ns). 0 disables filtering.

Table 47. I2C\_TIMING\_CNFG - I2C Timing Configuration

Bit Field	Field Name	Type	Default Value	Description
7:4	i2c_sda_high_hold	RW	0x2	I2C/SMBus Transmit One Bit Delay. Delays transmission of 1 value by this number of 133ns periods (8 system clock cycles).
3:0	i2c_sda_low_hold	RW	0x2	I2C/SMBus Transmit Zero Bit Delay. Delays transmission of 0 value by this number of 133ns periods (8 system clock cycles).

Table 48. I2C\_ADDR\_CNFG - I2C Address Configuration

Bit Field	Field Name	Type	Default Value	Description
7	reserved	RO	0x0	Reserved.
6:0	i2c_addr	RW	0x09	I2C Device Address. Sets I2C or SMBus device address that the SSI will acknowledge and accept accesses on.

Table 49. BYTE\_CNT - Byte Count

Bit Field	Field Name	Type	Default Value	Description
7:6	reserved	RO	0x0	Reserved.
5:0	bc	RW	0x08	Byte Count. Defines how many bytes are in an SMBus block transaction. This register is modified by the SMBus interface logic when a block transaction is processed.

Table 50. SMB\_CTL - SMBus Control

Bit Field	Field Name	Type	Default Value	Description
7	reserved	RO	0x0	Reserved.
6	smb_d_to_en	RW	0x1	SMBus Data Timeout Enable. Enables the SMBus data timeout check. When this bit is set to 1, the clock timeout must also be enabled ( <code>smb_to_cnt</code> is not 0). When a data timeout is detected, the <code>smb_d_to</code> bit is set to 1.
5	smb_to_en	RW	0x1	Reserved.
4:0	smb_to_cnt	RW	0x19	SMBus Timeout Duration. Sets the clock and data timeout duration in milliseconds. When this field is set to 0, the clock timeout is disabled and <code>smb_d_to_en</code> must also be set to 0 to disable the data timeout. When a clock timeout is detected, the <code>smb_to</code> bit is set to 1.

Table 51. SSI\_GLOBAL\_CNFG - SSI Global Configuration

Bit Field	Field Name	Type	Default Value	Description
7:5	reserved	RO	0x0	Reserved.
4:3	sda_sdi_drv	RW	0x0	I2C/SMBus Drive Strength. Selects the output driver slew rate of the SDA_nCS and SCL_SCLK pins when the serial slave interface is configured for I2C/SMBus mode (higher settings means higher drive strength). This setting does not affect the internal timing. As an I2C/SMBus slave, the external I2C/SMBus master must provide the appropriate SCL frequency and other timing requirements according to the selected speed. <ul style="list-style-type: none"> <li>0x0 = 1.8V Standard mode (100 kHz) or 2.5V/3.3V standard (100kHz) and Fast mode (400kHz)</li> <li>0x1 = 1.8V Fast mode (400 kHz)</li> <li>0x2 = Reserved</li> <li>0x3 = 1.8V/2.5V/3.3V Fast mode plus (1MHz)</li> </ul>
2	ssi_addr_size	RW	0x0	SSI Address Size. Sets the number of bytes expected when providing a CSR address. Upper address bits are taken from the SSI's page register to create a full 32-bit CSR address. <ul style="list-style-type: none"> <li>0x0 = 1-byte address</li> <li>0x1 = 2-byte address</li> </ul>
1:0	ssi_enable	RW	0x1	SSI Mode. <ul style="list-style-type: none"> <li>0x0 = SSI is disabled</li> <li>0x1 = SSI is in I2C mode</li> <li>0x2 = SSI is in SPI mode</li> <li>0x3 = SSI is in SMBus mode</li> </ul>

Table 52. SSI\_STS - Serial Port Status

Bit Field	Field Name	Type	Default Value	Description
7:2	reserved	RO	0x0	Reserved.
1	smb_d_to	RW1C	0x0	SMBus Data Timeout. Set when the SMBus interface detects a data timeout.
0	smb_to	RW1C	0x0	SMBus Clock Timeout. Set when the SMBus interface detects a clock timeout.

## 11.3 XO Register

Table 53. XO\_CNFG - Crystal Configuration

Bit Field	Field Name	Type	Default Value	Description
31:30	reserved	RO	0x0	Reserved.
29	xo_ib_h_div_setb	RW	0x1	XO / Input Buffer High-Frequency Divider Set. When cleared, the XO/IB high frequency divider is held in set mode (bit is active low). Unless this divider is bypassed ( <a href="#">xo_ib_h_div</a> = 0), clearing this bit will halt the <a href="#">refin_div</a> clock.
28:24	xo_ib_h_div	RW	0x0	XO / Input Buffer High-Frequency Divide Ratio. Divide by 2 to 31. Bypass if set to 0. 1 is reserved.
23:22	en_gain	RW	0x1	XO Gain Boosting Control. Selects the number of gain boosting amplifiers enabled during startup. <ul style="list-style-type: none"> <li>0x0 = Gain boosting amplifiers are disabled</li> <li>0x1 = One parallel amplifier is enabled</li> <li>0x2 = Two parallel amplifiers are enabled</li> <li>0x3 = All three parallel amplifiers are enabled</li> </ul>
21:16	en_cap_x2	RW	0x28	XO Capacitance at X2 Terminal. Controls the internal tuning capacitance applied at the XOUT_REFINb terminal integrated crystal. The capacitance rises monotonically in steps of 0.42pF from 0pF to 26.8pF as the control setting increases from 0x00 to the maximum of 0x3F. This must be set to 0 when <a href="#">sel_ib_xo</a> is set to 0.
15	reserved	RO	0x0	Reserved.
14	xo_buff_dis	RW	0x0	XO Buffer Disable. Forces the XO buffer to the core logic to be disabled. This setting is intended for debug purposes only. <ul style="list-style-type: none"> <li>0x0 = XO buffer enable is controlled by the hardware. It is enabled during the startup sequence and remains enabled until the device is power cycled.</li> <li>0x1 = XO buffer is disabled</li> </ul>
13:8	en_cap_x1	RW	0x28	XO Capacitance at X1 Terminal. Controls the internal tuning capacitance applied at the XIN_REFIN terminal integrated crystal. The capacitance rises monotonically in steps of 0.42pF from 0pF to 26.8pF as the control setting increases from 0x00 to the maximum of 0x3F. This must be set to 0 when <a href="#">sel_ib_xo</a> is set to 0.
7	reserved	RO	0x0	Reserved.
6:4	xo_res	RW	0x4	XO Resistor Configuration. Series resistance array control for limiting driving power level.
3	xo_ib_en_dc_bias	RW	0x0	Input Buffer Internal DC Bias Enable. When the input buffer clock input signal is AC-coupled external to the device, the internal DC bias voltage must be enabled. <ul style="list-style-type: none"> <li>0x0 = Internal DC bias is disabled (input signal is DC-coupled)</li> <li>0x1 = Internal DC bias is enabled (input signal is AC-coupled)</li> </ul>
2	sel_ib_xo	RW	0x1	XO / Input Buffer Select. Selects the mode of the XO / Input Buffer. <ul style="list-style-type: none"> <li>0x0 = Input buffer</li> <li>0x1 = XO</li> </ul>

Table 53. XO\_CNFG - Crystal Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
1	xo_ib_cmos_sel	RW	0x0	Input Buffer CMOS / Differential Select. Configures the input buffer for single-ended CMOS or differential input signal. <ul style="list-style-type: none"> <li>0x0 = Differential input is selected</li> <li>0x1 = CMOS input is selected</li> </ul>
0	xo_ib_p_n_diff_sel	RW	0x1	Input Buffer PMOS / NMOS Select. Configures the input buffer according to the common mode voltage of the provided input signal. <ul style="list-style-type: none"> <li>0x0 = PMOS input pair is enabled (low common mode voltage)</li> <li>0x1 = NMOS input pair is enabled (higher common mode voltage)</li> </ul>

## 11.4 CLKIN Register

Table 54. CLKIN\_CNFG - Clock Input Pad Configuration

Bit Field	Field Name	Type	Default Value	Description
15	h_div_setb	RW	0x1	Reference Clock High-Frequency Divider Set. When cleared, the corresponding reference clock high-frequency divider is held in set mode (bit is active low). Unless this divider is bypassed ( <b>h_div</b> = 0), clearing this bit will halt the <b>clkln0_div/clkln2_div</b> clock.
14:10	h_div	RW	0x0	Reference Clock High-Frequency Divide Ratio. Divide by 2 to 31. Bypass if set to 0. 1 is reserved.
9	trim_term	RW	0x0	Reference Clock Input Pad Termination Trim. Selects the HCSL and LVDS termination resistance to ground / across the inputs for modes to: <ul style="list-style-type: none"> <li>0x0 = 50Ω / 100Ω</li> <li>0x1 = 42.5Ω / 85Ω</li> </ul>
8	en_lvpecl	RW	0x0	Reference Clock Input Pad LVPECL Termination Enable. Enables compatible termination when the reference clock input signal is LVPECL. <ul style="list-style-type: none"> <li>0x0 = LVPECL input termination is disabled</li> <li>0x1 = LVPECL input termination is enabled</li> </ul>
7	en_lvds	RW	0x0	Reference Clock Input Pad LVDS Termination Enable. Enables compatible termination when the reference clock input signal is LVDS. <ul style="list-style-type: none"> <li>0x0 = LVDS input termination is disabled</li> <li>0x1 = LVDS input termination is enabled</li> </ul>
6	en_hcsl	RW	0x0	Reference Clock Input Pad HCSL Termination Enable. Enables compatible termination when the reference clock input signal is HCSL. <ul style="list-style-type: none"> <li>0x0 = HCSL input termination is disabled</li> <li>0x1 = HCSL input termination is enabled</li> </ul>
5	en_cml	RW	0x0	Reference Clock Input Pad CML Termination Enable. Enables compatible termination when the reference clock input signal is CML. <ul style="list-style-type: none"> <li>0x0 = CML input termination is disabled</li> <li>0x1 = CML input termination is enabled</li> </ul>

Table 54. CLKIN\_CNFG - Clock Input Pad Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
4	en_dc_bias	RW	0x0	Reference Clock Input Pad Internal DC Bias Enable. When the reference clock input signal is AC-coupled external to the device, the internal DC bias voltage must be enabled. <ul style="list-style-type: none"> <li>0x0 = Internal DC bias is disabled (input signal is DC-coupled)</li> <li>0x1 = Internal DC bias is enabled (input signal is AC-coupled)</li> </ul>
3	en_inbuff	RW	0x0	Reference Clock Input Pad Enable. The reference clock input pad must be enabled to allow the clock to be used by the device, and should be left disabled if unused. To fully power down the input pad, en_inbuff, en_dc_bias, en_cml, en_hcsl, en_lvds, and en_lvpecl all must be set to 0. <ul style="list-style-type: none"> <li>0x0 = Input pad is disabled</li> <li>0x1 = Input pad is enabled</li> </ul>
2:1	cmos_sel	RW	0x0	Reference Clock Input Pad CMOS / Differential Select. Configures the reference clock input pad for two single-ended CMOS or differential input signal. <ul style="list-style-type: none"> <li>0x0 = Differential input is selected</li> <li>0x1 = Single CMOS input is selected on positive pin</li> <li>0x2 = Single CMOS input is selected on negative pin</li> <li>0x3 = Dual CMOS inputs are selected</li> </ul>
0	p_n_diff_sel	RW	0x1	Reference Clock Input Pad PMOS / NMOS Select. Configures the reference clock input pad according to the common mode voltage of the provided input signal. <ul style="list-style-type: none"> <li>0x0 = PMOS input pair is enabled (low common mode voltage)</li> <li>0x1 = NMOS input pair is enabled (higher common mode voltage)</li> </ul>

## 11.5 LOSMON Registers

Note that before reprogramming a Loss of Signal Monitor, the corresponding [clkmon0\\_sw\\_rst](#), [clkmon1\\_sw\\_rst](#), [clkmon2\\_sw\\_rst](#), [clkmon3\\_sw\\_rst](#), or [clkmon4\\_sw\\_rst](#) bit should be set. Once programming is done, it should then be cleared.

Table 55. LOSMON\_WINDOW - LOS Monitor Window Configuration

Bit Field	Field Name	Type	Default Value	Description
15:12	reserved	RO	0x0	Reserved.
11:8	los_cnt_thresh	RW	0x0	Loss-of-Signal Counter Threshold. While the Loss-of-Signal counter ( <a href="#">los_cnt</a> ) exceeds this threshold, the <a href="#">los_lmt_evt</a> bit is set.
7	reserved	RO	0x0	Reserved.
6	reserved	RW	0x0	Reserved.
5	los_fail_mask	RW	0x0	LOS Monitor Failure Mask. Masks the LOS monitor status contribution to <a href="#">ref_invalid</a> . <ul style="list-style-type: none"> <li>0x0 = <a href="#">los_sts</a> contributes to <a href="#">ref_invalid</a></li> <li>0x1 = <a href="#">los_sts</a> does not contribute to <a href="#">ref_invalid</a></li> </ul>

Table 55. LOSMON\_WINDOW - LOS Monitor Window Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
4:0	los_div_ratio	RW	0x0	<p>LOS Monitor Divide Ratio.</p> <p>This divide ratio must be set such that the monitored clock nominal frequency divided by <a href="#">los_div_ratio</a> is less than 1/8 of the measuring clock frequency (see <a href="#">losmon_clkssel</a>) to achieve 25% accuracy. One period of the divided clock is the monitoring window duration. A value of 0 or 1 means divide by 1.</p>

Table 56. LOSMON\_NOMINAL - LOS Monitor Nominal Number Configuration

Bit Field	Field Name	Type	Default Value	Description
15:0	los_nom_num	RW	0x0	<p>LOS Monitor Nominal Cycle Count.</p> <p>Sets the expected number of measuring clock periods (see <a href="#">losmon_clkssel</a>) within one monitor window. Set to 0x0 to disable the LOS monitor. Disabling the monitor will cause the <a href="#">los_sts</a> bit to be asserted, therefore the <a href="#">los_fail_mask</a> bit should also be set when this field is written to 0x0.</p>

Table 57. LOSMON\_THRESH - LOS Monitor Threshold Configuration

Bit Field	Field Name	Type	Default Value	Description
31	reserved	RO	0x0	Reserved.
30:16	los_acc_margin	RW	0x0	<p>LOS Monitor Accept Threshold.</p> <p>An accepted clock monitoring window occurs when the final monitor counter value is within <a href="#">los_nom_num</a> <math>\pm</math> <a href="#">los_acc_margin</a>.</p>
15	reserved	RO	0x0	Reserved.
14:0	los_rej_margin	RW	0x0	<p>LOS Monitor Reject Threshold.</p> <p>A rejected clock monitoring window occurs when the final monitor counter value is outside of <a href="#">los_nom_num</a> <math>\pm</math> <a href="#">los_rej_margin</a>.</p>

Table 58. LOSMON\_QUAL - LOS Monitor Qualify Counter Configuration

Bit Field	Field Name	Type	Default Value	Description
7:4	los_good_times	RW	0x4	<p>LOS Monitor Qualification Count.</p> <p>If this number of consecutive accepted clock LOS monitoring windows occur without a rejected window, then the clock is qualified and <a href="#">los_sts</a> is set to 0. A value of 0 is reserved.</p>
3:0	los_fail_times	RW	0x4	<p>LOS Monitor Disqualification Count.</p> <p>If this number of rejected clock LOS monitoring windows occur without qualifying the clock, then the clock is disqualified and <a href="#">los_sts</a> is set to 1. A value of 0 is reserved.</p>

Table 59. LOSMON\_STS - LOS Monitor Status

Bit Field	Field Name	Type	Default Value	Description
7:2	reserved	RO	0x0	Reserved.
1	ref_invalid	RO	0x1	Reference Clock Invalid Status. Indicates whether this reference clock is currently considered to be invalid. This occurs if the clock is disqualified by one or more of the Loss-of-Signal and Frequency monitors. <ul style="list-style-type: none"> <li>0x0 = Clock is valid</li> <li>0x1 = Clock is invalid</li> </ul>
0	los_sts	RO	0x1	Loss-of-Signal Status. Current value of the LOS status from the clock monitor: <ul style="list-style-type: none"> <li>0x0 = Clock meets the monitoring criteria</li> <li>0x1 = Loss-of-signal detected</li> </ul>

Table 60. LOSMON\_EVENT - LOS Monitor Event Status

Bit Field	Field Name	Type	Default Value	Description
7:2	reserved	RO	0x0	Reserved.
1	los_lmt_evt	RW1C	0x0	Loss-of-Signal Counter Threshold Exceeded Status. Set while the Loss-of-Signal counter ( <a href="#">los_cnt</a> ) exceeds the threshold set in <a href="#">los_cnt_thresh</a> . This bit cannot be cleared by software while the condition persists. <ul style="list-style-type: none"> <li>0x0 = Loss-of-signal counter has not exceeded the threshold since the last time the bit was cleared</li> <li>0x1 = Loss-of-signal counter exceeded the threshold since the last time the bit was cleared</li> </ul>
0	los_evt	RW1C	0x1	Loss-of-Signal Event Status. Set while the clock monitor asserts LOS. This bit cannot be cleared by software while the LOS condition persists. This bit is set when the block comes out of reset and needs to be cleared after proper programming. <ul style="list-style-type: none"> <li>0x0 = Loss-of-signal not detected since the last time the bit was cleared</li> <li>0x1 = Loss-of-signal detected since the last time the bit was cleared</li> </ul>

Table 61. LOSMON\_CNT - LOS Monitor Count

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3:0	los_cnt	RW	0x0	Loss-of-Signal Failure Counter. This counter increments each time the clock monitor asserts LOS and saturates at 0xF. It is cleared by writing 0x0 to it, and can be preset by writing the desired value. Preset can be used either as a debug tool or to cause a threshold alarm to happen sooner. This register can only be written if the block is not clock gated ( <a href="#">clkmon0_cg:clkmon4_cg</a> ) or held in reset ( <a href="#">clkmon0_sw_rst:clkmon4_sw_rst</a> ).

## 11.6 FREQMON Registers

Note that before reprogramming a Frequency Monitor, the corresponding `clkmon0_sw_rst`, `clkmon1_sw_rst`, `clkmon2_sw_rst`, or `clkmon3_sw_rst` bit should be set. Once programming is done, it should then be cleared.

**Table 62. FREQMON\_WINDOW - Frequency Monitor Window Configuration**

Bit Field	Field Name	Type	Default Value	Description
31	freq_fail_mask	RW	0x0	Frequency Monitor Failure Mask. Masks the frequency monitor status contribution to <code>ref_invalid</code> . <ul style="list-style-type: none"> <li>0x0 = <code>freq_sts</code> contributes to <code>ref_invalid</code></li> <li>0x1 = <code>freq_sts</code> does not contribute to <code>ref_invalid</code></li> </ul>
30:28	reserved	RO	0x0	Reserved.
27:0	freq_div_ratio	RW	0x0	Frequency Monitor Divide Ratio. This divide ratio must be set such that the monitored clock nominal frequency divided by <code>freq_div_ratio</code> is as close as possible to 2.5Hz, creating a 0.4s monitoring window. A value of 0 or 1 means divide by 1.

**Table 63. FREQMON\_NOMINAL - Frequency Monitor Nominal Number Configuration**

Bit Field	Field Name	Type	Default Value	Description
31:27	reserved	RO	0x0	Reserved.
26:0	freq_nom_num	RW	0x0	Frequency Monitor Nominal Cycle Count. Sets the expected number of clock periods of the TDC ring oscillator frequency divided by 4 (nominally 216MHz) within one monitor window. Set to 0x0 to disable the frequency monitor. Disabling the monitor will cause the <code>freq_sts</code> bit to be asserted, therefore the <code>freq_fail_mask</code> bit should also be set when this field is written to 0x0.

**Table 64. FREQMON\_THRESH - Frequency Monitor Threshold Configuration**

Bit Field	Field Name	Type	Default Value	Description
63:59	reserved	RO	0x0	Reserved.
58:32	freq_acc_margin	RW	0x0	Frequency Monitor Accept Threshold. An accepted clock monitoring window occurs when the final monitor counter value is within <code>freq_nom_num ± freq_acc_margin</code> . One accepted window qualifies the clock and <code>freq_sts</code> is set to 0.
31:27	reserved	RO	0x0	Reserved.
26:0	freq_rej_margin	RW	0x0	Frequency Monitor Reject Threshold. A rejected clock monitoring window occurs when the final monitor counter value is outside of <code>freq_nom_num ± freq_rej_margin</code> . One rejected window disqualifies the clock and <code>freq_sts</code> is set to 1.

**Table 65. FREQMON\_STS - Frequency Monitor Status**

Bit Field	Field Name	Type	Default Value	Description
7:1	reserved	RO	0x0	Reserved.
0	freq_sts	RO	0x1	Frequency Monitor Status. Current value of the qualification status from the frequency monitor: <ul style="list-style-type: none"> <li>0x0 = Clock meets the monitoring criteria, clock qualified</li> <li>0x1 = Failure detected, clock disqualified</li> </ul>

Table 66. FREQMON\_EVENT - Frequency Monitor Event Status

Bit Field	Field Name	Type	Default Value	Description
7:1	reserved	RO	0x0	Reserved.
0	freq_evt	RW1C	0x1	<p>Frequency Monitor Event Status.</p> <p>Set while the frequency monitor disqualifies the clock. This bit cannot be cleared by software while the disqualified condition persists. This bit is set when the block comes out of reset and needs to be cleared after proper programming.</p> <ul style="list-style-type: none"> <li>0x0 = Frequency monitor has not disqualified the clock since the last time the bit was cleared</li> <li>0x1 = Frequency monitor has disqualified the clock since the last time the bit was cleared</li> </ul>

Table 67. FREQMON\_OFFSET - Frequency Monitor Frequency Offset Status

Bit Field	Field Name	Type	Default Value	Description
31:28	reserved	RO	0x0	Reserved.
27:0	freq_offset_sts	RO	0x7FFFFFFF	<p>Frequency Count Status.</p> <p>Cycle count measured by the frequency monitor, updated at the end of each monitoring window. The count saturates to 0x7FF_FFFF when it reaches <code>freq_nom_num*2</code>, which typically indicates that the monitored clock is not toggling, or is less than half the expected nominal frequency. It may be converted to ppm as follows:</p> <p>ppm offset = <math>1e6 * (\text{freq\_nom\_num} - \text{freq\_offset\_sts}) / \text{freq\_offset\_sts}</math></p>

## 11.7 TDC APLL Registers

Note that before reprogramming the TDC APLL registers, the `tdc_apll_dig_sw_rst` bit should be set. Once programming is done, it should then be cleared.

Table 68. TDC\_APLL\_CNFG - TDC APLL Configuration

Bit Field	Field Name	Type	Default Value	Description
15	tdc_en	RW	0x0	<p>TDC Enable.</p> <p>Controls whether the TDC is enabled. Must be enabled when enabling a reference clock LOS monitor when <code>losmon_clkssel</code> is set to 1, and when enabling a reference clock frequency monitor.</p>
14	reserved	RO	0x0	Reserved.
13:9	tdc_kp_coef	RW	0xF	<p>TDC APLL Proportional Filter Coefficient (Kp).</p> <p>The filter output is (up/down) * <math>2^{Kp}</math> + integrator.</p>
8:4	tdc_ki_coef	RW	0x4	<p>TDC APLL Integral Filter Coefficient (Ki).</p> <p>The integrator is (up/down) * <math>2^{Ki}</math> + integrator.</p>

Table 68. TDC\_APLL\_CNFG - TDC APLL Configuration

Bit Field	Field Name	Type	Default Value	Description
3:2	tdc_fast_lock	RW	0x2	TDC APLL Fast Lock Mode. Controls the TDC APLL lock speed by increasing the effective Ki values while the input up/down is railed. <ul style="list-style-type: none"> <li>0x0 = Normal lock. Ki as programmed.</li> <li>0x1 = Ki increased by 2</li> <li>0x2 = Ki increased by 4</li> <li>0x3 = Ki increased by 6</li> </ul>
1:0	tdc_dac_sdm_order	RW	0x2	TDC APLL DAC SDM (Sigma Delta Modulator) Order. Selects the order of the SDM controlling the DAC for the TDC APLL. <ul style="list-style-type: none"> <li>0x0 = No accumulation</li> <li>0x1 = 1st order</li> <li>0x2 = 2nd order</li> <li>0x3 = Reserved</li> </ul>

Table 69. TDC\_FB\_DIV\_FRAC - TDC APLL Feedback Divider Fraction Configuration

Bit Field	Field Name	Type	Default Value	Description
15:0	tdc_fb_div_frac	RW	0x2800	TDC APLL Feedback Divider Fraction. Fraction of the TDC APLL feedback divider. The fraction is calculated as follows: $\text{tdc\_fb\_div\_frac}/2^{16}$ .

Table 70. TDC\_FB\_DIV\_INT - TDC APLL Feedback Divider Integer Configuration

Bit Field	Field Name	Type	Default Value	Description
7:0	tdc_fb_div_int	RW	0x24	TDC APLL Feedback Divider Integer. Integer portion of the TDC APLL feedback divider.

Table 71. TDC\_FB\_SDM\_CNFG - TDC APLL Feedback SDM Configuration

Bit Field	Field Name	Type	Default Value	Description
7	tdc_fb_sdm_en	RW	0x1	TDC APLL Feedback SDM Enable. Enables the SDM controlling the TDC APLL feedback divider. <ul style="list-style-type: none"> <li>0x0 = SDM disabled, constant integer division by <a href="#">tdc_fb_div_int</a></li> <li>0x1 = SDM enabled, MMD mode</li> </ul>
6:2	reserved	RO	0x0	Reserved.
1:0	tdc_fb_sdm_order	RW	0x1	TDC APLL Feedback SDM Order. Selects the order of the SDM controlling the feedback divider for the TDC APLL. <ul style="list-style-type: none"> <li>0x0 = Integer</li> <li>0x1 = 1st order</li> <li>0x2 = 2nd order</li> <li>0x3 = 3rd order</li> </ul>

Table 72. TDC\_REF\_DIV\_CNFG - TDC APLL Reference Divider Configuration

Bit Field	Field Name	Type	Default Value	Description
7:3	reserved	RO	0x0	Reserved.
2:0	tdc_ref_div_cnfg	RW	0x1	<p>TDC Reference Divider Control.</p> <p>Controls the divide ratio of the TDC reference (either XO input or reference clock input, selected by <a href="#">apll_ref_sel</a>). This field should be programmed such that the reference to the TDC APLL is between 10MHz and 30MHz.</p> <ul style="list-style-type: none"> <li>0x0 = Bypass divider</li> <li>0x1 = Divide by 2</li> <li>0x2 = Divide by 4</li> <li>0x3 = Divide by 8</li> <li>0x4 = Divide by 16</li> </ul>

Table 73. TDC\_FILTER\_STS - TDC APLL Filter Status

Bit Field	Field Name	Type	Default Value	Description
15:0	tdc_filter_status	RO	0x0	<p>TDC Loop Filter Status.</p> <p>Provides the TDC loop filter output value. It is a signed 16-bit number.</p>

## 11.8 APLL Registers

Table 74. APLL\_FB\_DIV\_FRAC - APLL Feedback Divider Fraction Configuration

Bit Field	Field Name	Type	Default Value	Description
31:27	reserved	RO	0x0	Reserved.
26:0	apll_fb_div_frac	RW	0x0	<p>APLL Feedback Divider Fraction.</p> <p>APLL feedback divider numerator value. The denominator is a fixed value of <math>2^{27}</math>.</p>

Table 83. APLL\_STS - APLL Status

Bit Field	Field Name	Type	Default Value	Description
7:1	reserved	RO	0x0	Reserved.
0	apll_lock_sts	RO	0x0	APLL Lock Status. Set to 1 when the APLL is locked to its reference. <ul style="list-style-type: none"> <li>0x0 = Unlocked</li> <li>0x1 = Locked</li> </ul>

Table 84. APLL\_EVENT - APLL Event Status

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3	apll_rail_high_evt	RW1C	0x0	APLL Rail High Event. Set to 1 when the APLL lock detects a rail high status. Once asserted, this bit will remain asserted until cleared by a write of '1' to this bit position.
2	apll_rail_low_evt	RW1C	0x0	APLL Rail Low Event. Set to 1 when the APLL lock detects a rail low status. Once asserted, this bit will remain asserted until cleared by a write of '1' to this bit position.
1	apll_lol_lmt	RW1C	0x0	APLL Loss-of-Lock Counter Threshold Exceeded Status. Set while the APLL Loss-of-Lock counter ( <a href="#">apll_lol_cnt</a> ) exceeds the threshold set in <a href="#">apll_lol_cnt_thresh</a> . This bit cannot be cleared by software while the condition persists. <ul style="list-style-type: none"> <li>0x0 = Loss-of-lock counter has not exceeded the threshold since the last time the bit was cleared</li> <li>0x1 = Loss-of-lock counter exceeded the threshold since the last time the bit was cleared</li> </ul>
0	apll_lol	RW1C	0x0	APLL Loss-of-lock Event. Set to 1 when the APLL lock status transitions from locked to unlocked.

Table 85. APLL\_LOL\_CNT - APLL Loss-of-Lock Counter

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3:0	apll_lol_cnt	RW	0x0	APLL Loss-of-Lock Counter. This counter increments each time the APLL lock status de-asserts, and saturates at 0xF. It is cleared by writing it to 0x0, and may be preset by writing the desired value.

Table 86. ANA\_SPARE\_CNFG - Analog Spare Configuration

Bit Field	Field Name	Type	Default Value	Description
15	regulator_dis	RW	0x0	Regulator Disable. This field can disable the following regulators: LD_XO_IB, LDO_IB1, LDO_IB2, LDO_DIG, LDO_CP, LDO_VCO, DIG_LDO_DIV, DIG_LDO_FOD. <ul style="list-style-type: none"> <li>0x0 = Regulators listed above are enabled.</li> <li>0x1 = Regulators listed above are disabled.</li> </ul>
14	ana_spare	RW	0x0	Reserved
13	sense_mode_sel	RW	0x0	One-shot VDDO Sensing. Provides one-shot VDDO sensing for system clock gating function controlled by sysclk_gate_start and sysclk_gate_bypass. Should be left at 0x0.
12	sysclk_gate_bypass	RW	0x0	System Clock Gating Bypass. Setting this bit to 1 in the last byte of the COMMON OTP will bypass the above function in sysclk_gate_start or sysclk_gate_start may be set to 1.
11	sysclk_gate_start	RW	0x0	System Clock Start. Setting this bit to 1 in the last byte of the COMMON OTP config will allow the part to wait to load the USER OTP config until all VDDO that are not programmed as float_vddo* in DEVICE_CNFG are present.
10	BNK6_pwrssel	RW	0x0	Bank6 Regulator Select. This bit controls whether to enable or bypass the 1.8V regulator in the output driver. <ul style="list-style-type: none"> <li>0x0 = Used when VDDO = 2.5V or 3.3V. Enables the 1.8V voltage regulator.</li> <li>0x1 = Used when VDDO = 1.8V to bypass the 1.8V regulator.</li> </ul>
9	BNK5_pwrssel	RW	0x0	Bank5 Regulator Select. Bit Field	Field Name	Type	Default Value	Description
5	BNK1_pwrssel	RW	0x0	Bank1 Regulator Select. This bit controls whether to enable or bypass the 1.8V regulator in the output driver. <ul style="list-style-type: none"> <li>0x0 = Used when VDDO = 2.5V or 3.3V. Enables the 1.8V voltage regulator.</li> <li>0x1 = Used when VDDO = 1.8V to bypass the 1.8V regulator.</li> </ul>
4	BNK0_pwrssel	RW	0x0	Bank0 Regulator Select. This bit controls whether to enable or bypass the 1.8V regulator in the output driver. <ul style="list-style-type: none"> <li>0x0 = Used when VDDO = 2.5V or 3.3V. Enables the 1.8V voltage regulator.</li> <li>0x1 = Used when VDDO = 1.8V to bypass the 1.8V regulator.</li> </ul>
3:0	bg_trim	RW	0x0	Bandgap Trim. PTAT current trimming for bandgap Vbg voltage.

Table 87. ANA\_SPARE\_STS - Analog Spare Status

Bit Field	Field Name	Type	Default Value	Description
15:0	ana_spare_sts	RO	0x00	Reserved

## 11.9 IOD Registers

Table 88. IOD\_INT\_CNFG - IOD Integer Ratio Configuration

Bit Field	Field Name	Type	Default Value	Description
31	iod_pd	RW	0x0	Integer Output Divider Power Down. Powers down the integer output divider by turning off the regulator. If this bit is set to 1, <a href="#">iod_rst</a> must also be set to 1. When clearing this bit, <a href="#">iod_rst</a> must remain set and then it can be cleared afterwards. <ul style="list-style-type: none"> <li>0x0 = Divider is powered up</li> <li>0x1 = Divider is powered down</li> </ul>
30	iod_dis	RW	0x0	Integer Output Divider Disable. Disables the integer output divider. If this bit is set to 1, <a href="#">iod_rst</a> must also be set to 1. When clearing this bit, <a href="#">iod_rst</a> must remain set and then it can be cleared afterwards. <ul style="list-style-type: none"> <li>0x0 = Divider enabled</li> <li>0x1 = Divider disabled</li> </ul>
29	iod_rst	RW	0x0	Integer Output Divider Reset. Resets the integer output divider. <ul style="list-style-type: none"> <li>0x0 = Divider reset de-asserted</li> <li>0x1 = Divider reset asserted</li> </ul>
28	iod_squelch	RW	0x0	Integer Output Divider Squelch. Synchronously squelches and releases the IOD output clock. <ul style="list-style-type: none"> <li>0x0 = IOD output is not squelched</li> <li>0x1 = IOD output is squelched</li> </ul>

Table 88. IOD\_INT\_CNFG - IOD Integer Ratio Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
27:25	reserved	RO	0x0	Reserved.
24:0	iod_int	RW	0x64	Integer Output Divider Ratio Integer output divider ratio. The minimum value is 14. This register is atomic. When the most significant byte (bit [24]) is written, the new value is applied to the IOD.

Table 89. IOD\_PHASE\_CNFG - IOD Phase Configuration

Bit Field	Field Name	Type	Default Value	Description
15	iod_ph_adj_now	RW1S	0x0	Integer Output Divider Phase Adjustment Now. When this bit is written from 0 to 1, the phase adjustment in <a href="#">iod_phase</a> is applied to the divider. This bit self-clears when the adjust completes.
14	iod_ph_adj_post_sync	RW	0x0	Integer Output Divider Phase Adjustment After Synchronization. When this bit is set to 1, the phase adjustment in <a href="#">iod_phase</a> is applied to the divider whenever the divider is synchronized.
13:11	reserved	RO	0x0	Reserved.
10:9	iod_sync_group	RW	0x0	Integer Output Divider Sync Group. Sets the sync group that this divider belongs to <ul style="list-style-type: none"> <li>▪ 0x0 = Group0</li> <li>▪ 0x1 = Group1</li> <li>▪ 0x2 = None</li> <li>▪ 0x3 = None</li> </ul>
8:0	iod_phase	RW	0x0	Integer Output Divider Phase Configuration. Signed 2's complementary value sets the phase, a positive value means lag from 0 phase, a negative value means lead from 0 phase, in steps of one VCO period. The available range is $\pm 0\sim 255$ steps (approximately $\pm 0\sim 20$ ns). This register is atomic. When the most significant byte (bit [8]) is written, the new value is applied to the IOD according to <a href="#">iod_ph_adj_now</a> and <a href="#">iod_ph_adj_post_sync</a> .

## 11.10 FOD Registers

Table 90. FOD\_INT\_CNFG - FOD Integer Configuration

Bit Field	Field Name	Type	Default Value	Description
63	fod_pd	RW	0x0	Fractional Output Divider Power Down. Powers down the fractional output divider by turning off the regulator. If this bit is set to 1, <a href="#">fod_rst</a> must also be set to 1. When clearing this bit, <a href="#">fod_rst</a> must remain set and then it can be cleared afterwards. <ul style="list-style-type: none"> <li>0x0 = Divider is powered up</li> <li>0x1 = Divider is powered down</li> </ul>
62	fod_dis	RW	0x0	Fractional Output Divider Disable. Disables the fractional output divider. If this bit is set to 1, <a href="#">fod_rst</a> must also be set to 1. When clearing this bit, <a href="#">fod_rst</a> must remain set and then it can be cleared afterwards. <ul style="list-style-type: none"> <li>0x0 = Divider enabled</li> <li>0x1 = Divider disabled</li> </ul>
61	fod_rst	RW	0x0	Fractional Output Divider Reset. Resets the fractional output divider. <ul style="list-style-type: none"> <li>0x0 = Divider reset de-asserted</li> <li>0x1 = Divider reset asserted</li> </ul>
60	fod_acc_reset	RW	0x0	Fractional Output Divider Accumulator Reset. Resets the FOD SDM accumulator. <ul style="list-style-type: none"> <li>0x0 = Accumulator reset de-asserted</li> <li>0x1 = Accumulator reset asserted</li> </ul>
59:26	fod_frac	RW	0x0	Fractional Output Divider Ratio Fraction Portion. Denominator is fixed to $2^{34}$ . This register field is part of an atomic group consisting of <a href="#">fod_1st_int</a> and <a href="#">fod_frac</a> . When the most significant byte (bits [33:30]) of <a href="#">fod_frac</a> is written, the value of all these fields are applied to the FOD. <i>Note:</i> When an FOD has spread-spectrum <a href="#">fod_frac</a> [5:0] <i>must</i> be set to 0x0.
25:9	fod_2nd_int	RW	0x0	Fractional Output Divider Ratio 2nd Integer Portion. Half integer divide ratio of second stage. The actual divide ratio is ( <a href="#">fod_2nd_int</a> * 2). A setting of 1 is invalid: the minimum divide ratio is 4. Set to 0 to bypass the second stage.
8:0	fod_1st_int	RW	0x64	Fractional Output Divider Ratio 1st Integer Portion. Integer divide ratio of first stage (MMD). The first stage divides the VCO clock down to a range of 33MHz to 650MHz, giving a minimum divide ratio of 9.5GHz / 650MHz = 14.61 and maximum divide ratio of 10.7GHz / 33MHz = 324.25 If the first stage frequency is less than 70MHz, the <a href="#">fod_slow_freq_en</a> bit must be set to 1. This register field is part of an atomic group consisting of <a href="#">fod_1st_int</a> and <a href="#">fod_frac</a> . When the most significant byte (bits [33:30]) of <a href="#">fod_frac</a> is written, the value of all these fields are applied to the FOD. <i>Note:</i> Refer to <a href="#">fod_frac</a> for details about serial bus writes to this register field and automatic updates performed by the over-clocking engine.

Table 91. FOD\_PHASE\_CNFG - FOD Phase Configuration

Bit Field	Field Name	Type	Default Value	Description
15	fod_ph_adj_now	RW1S	0x0	Fraction Output Divider Phase Adjustment Now. When this bit is written from 0 to 1, the phase adjustment in <a href="#">fod_phase</a> is applied to the divider. This bit self-clears when the adjust completes.
14	fod_ph_adj_post_sync	RW	0x1	Fraction Output Divider Phase Adjustment After Synchronization. When this bit is set to 1, the phase adjustment in <a href="#">fod_phase</a> is applied to the divider whenever the divider is synchronized.
13	fod_slow_freq_en	RW	0x0	FOD Slow Frequency Enable. Must be set to 1 when the MMD (first stage) frequency is under 70MHz.
12	reserved	RO	0x0	Reserved.
11:10	fod_sync_group	RW	0x0	Fraction Output Divider Sync Group. Sets the sync group that this divider belongs to: <ul style="list-style-type: none"> <li>0x0 = Group0</li> <li>0x1 = Group1</li> <li>0x2 = None</li> <li>0x3 = None</li> </ul>
9:0	fod_phase	RW	0x3F0	Fraction Output Divider Phase Configuration. Signed 2's complementary value sets the phase. A positive value means lag from 0 phase, and a negative value means lead from 0 phase, in steps of 1/4 VCO period. The default value of -16 (decimal), or -4.0 VCO periods, approximately aligns the FOD output clock with the IOD output clock, when the FOD is configured with an integer divide ratio. This register is atomic. When the most significant byte (bits [9:8]) is written, the new value is applied to the FOD according to <a href="#">fod_ph_adj_now</a> and <a href="#">fod_ph_adj_post_sync</a> .

## 11.11 SSC Register

Table 92. SSC\_CNFG - Spectrum Spreading Configuration

Bit Field	Field Name	Type	Default Value	Description
31	ssc_en	RW	0x0	<p>Spread-Spectrum Clocking Enable.</p> <p>Enable spread spectrum. The spread configuration is determined by the other register fields in this register.</p> <ul style="list-style-type: none"> <li>0x0 = SSC disabled</li> <li>0x1 = SSC enabled</li> </ul> <p>If the FOD0 and FOD1 SSC modulation frequencies are the same, the FOD1 SSC phase can be aligned to FOD0 SSC by setting <a href="#">ssc_share</a> to 1.</p> <p><i>Note:</i> When <a href="#">ssc_share</a> is set to 1, then FOD1 <a href="#">ssc_en</a> must be set to 1 before FOD0 <a href="#">ssc_en</a> is set to 1 since FOD1 SSC will start when FOD0 <a href="#">ssc_en</a> is set to 1. This restriction does not apply when loading the device configuration from OTP/EEPROM on startup, but does apply if dynamically changing these settings later through a dynamic configuration load from the OTP/EEPROM, or by writing registers from the serial interface.</p>
30	ssc_mode	RW	0x0	<p>Spectrum Spreading Mode.</p> <ul style="list-style-type: none"> <li>0x0 = Down spreading</li> <li>0x1 = Center spreading</li> </ul>
29:24	reserved	RO	0x0	Reserved.
23:16	ssc_ampl	RW	0x51	<p>Spectrum Spreading Amplitude.</p> <p>Sets the positive and negative spreading amplitude. For down spread, <a href="#">ssc_ampl</a> is only used for the negative limit and the positive limit is internally set to 0. For center spread, the peak-to-peak spread amplitude is twice the specified amplitude (for a 1% peak-to-peak center spread, define <a href="#">ssc_ampl</a> as 0.5%).</p> $\text{ssc\_ampl} = \text{spread\_percentage} / 100 * 2^{14}$ <p>For example, for 1% spread, set <a href="#">ssc_ampl</a> to <math>0.01 * 2^{14} = 163</math> decimal, or 0xA3.</p> <p>The default value corresponds to a 0.5% down spread at 31.5kHz.</p>
15:0	ssc_step	RW	0x2B8C	<p>Spectrum Spreading Step Size.</p> <p>Set ramp step size to get the target modulation rate.</p> <p>For down spread:</p> <ul style="list-style-type: none"> <li><math>\text{ssc\_step} = \text{ssc\_ampl} * 2^{16} * \text{ssc\_freq} / 15\text{MHz}</math></li> </ul> <p>For center spread:</p> <ul style="list-style-type: none"> <li><math>\text{ssc\_step} = 2 * \text{ssc\_ampl} * 2^{16} * \text{ssc\_freq} / 15\text{MHz}</math></li> </ul> <p>where:</p> <p><a href="#">ssc_freq</a> is the target modulation rate from 30kHz to 63kHz</p> <p>15MHz is the system clock divided by 4, assuming the system clock is 60MHz</p> <p><i>Example 1.</i> For a 32kHz 1% down spread:</p> <p><a href="#">ssc_ampl</a> = 163</p> <p><math>\text{ssc\_step} = 163 * 2^{16} * 32\text{kHz} / 15\text{MHz} = 0x5905</math></p> <p><i>Example 2.</i> For a 32kHz <math>\pm 0.5\%</math> center spread:</p> <p><a href="#">ssc_ampl</a> = 81</p> <p><math>\text{ssc\_step} = 2 * 81 * 2^{16} * 32\text{kHz} / 15\text{MHz} = 0x5879</math></p> <p>The default value corresponds to a 0.5% down spread at 31.5kHz.</p>

## 11.12 BANK Register

Table 93. OUT\_BANK\_CNFG - Output Bank Configuration

Bit Field	Field Name	Type	Default Value	Description
7:6	reserved	RO	0x0	Reserved.
5	bank_pd	RW	0x0	<p>Output Bank Power Down.</p> <p>Powers down the output bank by turning off the regulator. When a bank is powered down, all output driver(s) in that bank should also be powered down by setting their <a href="#">out_pd</a> bit(s) to 1.</p> <ul style="list-style-type: none"> <li>0x0 = Bank is powered up</li> <li>0x1 = Bank is powered down</li> </ul>
4:3	bank_fanout_mode	RW	0x0	<p>Output Bank Fan-out Buffer Mode.</p> <p>Configures the bank selection for fanout buffer mode. Only available on banks 4, 5, and 6.</p> <p>The device must be configured for fanout buffer mode by <a href="#">fanout_buf_mode</a> (CLKIN0) / <a href="#">fanout_buf_mode1</a> (CLKIN1) for this setting to take effect.</p> <ul style="list-style-type: none"> <li>0x0 = Normal operation mode. The output bank source clock is selected by <a href="#">output_bank_src</a>.</li> <li>0x1 = CLKIN0 Fan-out buffer mode. When <a href="#">fanout_clkmode</a> is 1, the output bank selects CLKIN0. When <a href="#">fanout_clkmode</a> is 0, the output bank source clock is selected by <a href="#">output_bank_src</a>.</li> <li>0x2 = CLKIN1 Fan-out buffer mode. When <a href="#">fanout_clkmode1</a> is 1, the output bank selects CLKIN1. When <a href="#">fanout_clkmode1</a> is 0, the output bank source clock is selected by <a href="#">output_bank_src</a>.</li> </ul>
2:0	output_bank_src	RW	0x5	<p>Output Bank Source.</p> <p>Sets the clock source of each output bank, in conjunction with <a href="#">bank_fanout_mode</a>. Some configurations can be reserved based on <a href="#">Output Bank Source Mapping</a> table. The bits in <a href="#">BANK_MUX_CLK_EN - Bank Mux Clock Enable</a> must be set appropriately to enable only the selected source for each bank.</p> <ul style="list-style-type: none"> <li>0x0 = IOD0 for Banks 0, 1 / <a href="#">clk2_div</a> (CLKIN1) for Banks 4, 5, 6</li> <li>0x1 = IOD1 for Banks 0, 1, 2 / <a href="#">refin_div</a> (XIN_REF) for Bank 5</li> <li>0x2 = IOD2 for Banks 4, 5, 6</li> <li>0x3 = IOD3 for Banks 5, 6</li> <li>0x4 = FOD0 for Banks 0, 1, 2, 3</li> <li>0x5 = FOD1</li> <li>0x6 = FOD2 for Banks 3, 4, 5, 6</li> <li>0x7 = <a href="#">clk0_div</a> (CLKIN0) for Banks 4, 5, 6</li> </ul>

## 11.13 OUT Registers

Table 94. ODRV\_EN - Output Driver Enable

Bit Field	Field Name	Type	Default Value	Description
7	out_pd	RW	0x0	Output Driver Power Down. Powers down the output clock driver. <ul style="list-style-type: none"> <li>0x0 = Output driver is powered up</li> <li>0x1 = Output driver is powered down</li> </ul>
6	out_oe_mode	RW	0x0	Output Driver OE Mode. Controls whether the output enable acts synchronously or asynchronously with respect to the output divider clock. Must be set to asynchronous mode when outputting SYSREF. <ul style="list-style-type: none"> <li>0x0 = OE is synchronized to the divider clock. Enabling and disabling the output clock is glitchless. OE transitions take effect after 1 divider clock cycle.</li> <li>0x1 = OE is asynchronous to the divider clock. OE transitions while the divider clock is toggling can result in glitches/runt pulses.</li> </ul>
5:3	out_dis_group	RW	0x0	Output Driver OE Group Select and Global Output Enable Exclusion. Sets which OE group this driver is in, and if not assigned to a group, can also exclude global output enables from applying to the clock. <ul style="list-style-type: none"> <li>0x0 = Group0</li> <li>0x1 = Group1</li> <li>0x2 = Group2</li> <li>0x3 = Group3</li> <li>0x4 = Group4</li> <li>0x5 = None</li> <li>0x7 = None, and exclude global output enables</li> </ul> When set to 0x7, allows the output clock to be enabled regardless of: <ul style="list-style-type: none"> <li>APLL lock status (equivalent to <a href="#">out_startup</a> set to 2)</li> <li><a href="#">goe</a> register bit</li> <li>GOE pin, if one is assigned with <a href="#">gpi_func/gpio_func</a></li> </ul> The output clock can still be disabled by the <a href="#">out_dis</a> register bit. This setting is intended to allow an output clock to run freely following the configuration load so that it can be used as an external APLL feedback clock. In that application, if the output clock's divider is resynchronized after the startup sequence completes, the output clock will stop running for less than 1us and then the APLL will re-align the feedback clock to the reference clock.
2:1	out_dis_state	RW	0x3	OUT Driver Disabled State. Controls the state of OUTx / OUTxb when the output driver is disabled. <ul style="list-style-type: none"> <li>0x0 = Held High / Low</li> <li>0x1 = Held Low / High</li> <li>0x2 = Held Hi-Z / Hi-Z</li> <li>0x3 = Held Low / Low (except LVDS mode is held High / Low)</li> </ul>
0	out_dis	RW	0x0	OUTx and/or OUTxb Driver Disable. Forces both OUTx and OUTxb Drivers to be disabled if in differential mode or forces OUT Driver to be disabled if in CMOS mode. For more information, see <a href="#">Output Enable Control</a> . <ul style="list-style-type: none"> <li>0x0 = OUTx and/or OUTxb Driver is enabled if not disabled by other means</li> <li>0x1 = OUTx and/or OUTxb Driver is disabled</li> </ul>

Table 95. ODRV\_CNFG - Output Driver Configuration

Bit Field	Field Name	Type	Default Value	Description
15	out_prog7	RW	0x0	Output Driver Programmability Bit 7. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: reserved / flip output polarity / flip output polarity
14	out_prog6	RW	0x0	Output Driver Programmability Bit 6. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: reserved / reserved / reserved
13	out_prog5	RW	0x0	Output Driver Programmability Bit 5. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: reserved / cross point lower / cross point tune
12	out_prog4	RW	0x0	Output Driver Programmability Bit 4. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: reserved / cross point increase for double termination / cross point tune
11	out_prog3	RW	0x0	Output Driver Programmability Bit 3. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: tristate OUTx / driver impedance -5% / cross point tune
10	out_prog2	RW	0x0	Output Driver Programmability Bit 2. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: tristate OUTxb / driver impedance +5% / cross point tune
9	out_prog1	RW	0x0	Output Driver Programmability Bit 1. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: flip OUTx polarity / amplitude -10% / amplitude -10%
8	out_prog0	RW	0x0	Output Driver Programmability Bit 0. When set to 1, controls the output driver as follows according to CMOS mode / LPHCSL mode / LVDS mode: flip OUTxb polarity / amplitude +5% / amplitude +5%
7	reserved	RO	0x0	Reserved.
6	out_lpamp	RW	0x0	Output Driver LPHCSL Amplitude Control. Controls the amplitude of the output driver when LPHCSL mode is selected. <ul style="list-style-type: none"> <li>0x0 = 800mV</li> <li>0x1 = 900mV</li> </ul>
5	out_lpsr	RW	0x1	Output Driver LPHCSL Slew Rate Control. Controls the slew rate of the output driver when LPHCSL mode is selected. Based on 5" transmission line simulation condition. Slew rates are measured from -150mV to +150mV from crossing point. <ul style="list-style-type: none"> <li>0x0 = Slow, 2-4 V/ns</li> <li>0x1 = Fast, &gt; 4 V/ns</li> </ul>

Table 95. ODRV\_CNFG - Output Driver Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
4	out_lpimp	RW	0x1	Output Driver LPHCSL Impedance Control. Controls the output impedance of the output driver when LPHCSL mode is selected. <ul style="list-style-type: none"> <li>0x0 = 85Ω</li> <li>0x1 = 100Ω</li> </ul>
3:2	out_cmdrv	RW	0x3	Output Driver CMOS Slew Rate Control. Controls the slew rate of the output driver (in V/ns) when CMOS mode is selected, according to the supply voltage level of 3.3V / 2.5V / 1.8V: <ul style="list-style-type: none"> <li>0x0 = 4.2 / 2.7 / 1.8</li> <li>0x1 = 2.2 / 1.5 / 1.8</li> <li>0x2 = 2.2 / 1.5 / 1.8</li> <li>0x3 = 3.4 / 2.0 / 1.9</li> </ul>
1:0	out_mode	RW	0x0	Output Driver Type. Selects the output driver type. <ul style="list-style-type: none"> <li>0x0 = LPHCSL</li> <li>0x1 = LVDS</li> <li>0x2 = LVDS</li> <li>0x3 = CMOS</li> </ul>

## 11.14 GPI Registers

Table 96. GPI\_CNFG - GPI Configuration

Bit Field	Field Name	Type	Default Value	Description
15:10	reserved	RO	0x0	Reserved.
9	gpi_pol	RW	0x0	GPI Polarity Sets the pin polarity. This bit is ignored if <a href="#">gpi_func</a> configures the pin as a reference clock input. <ul style="list-style-type: none"> <li>0x0 = Normal sense. Pin functions denoted with a # are active low, others are active high.</li> <li>0x1 = Inverted sense. Pin functions denoted with a # are active high, others are active low.</li> </ul>
8	gpi_pullup	RW	0x0	GPI Pull-up Enable Sets the internal pull-up mode. This bit is ignored and the internal pull-down is enabled if <a href="#">gpi_func</a> configures the pin as a reference clock input. <ul style="list-style-type: none"> <li>0x0 = Pull-up disabled</li> <li>0x1 = Pull-up enabled</li> </ul>

Table 96. GPI\_CNFG - GPI Configuration

Bit Field	Field Name	Type	Default Value	Description
7	gpi_pulldn	RW	0x0	<p>GPI Pull-down Enable.</p> <p>Sets the internal pull-up or pull-down modes. This bit is ignored and the internal pull-down is enabled if <a href="#">gpi_func</a> configures the pin as a reference clock input.</p> <ul style="list-style-type: none"> <li>0x0 = Pull-down disabled</li> <li>0x1 = Pull-down enabled</li> </ul>
6:0	gpi_func	RW	0x7F	<p>GPI Functions.</p> <p>Sets the general purpose input function.</p> <ul style="list-style-type: none"> <li>0x0 = OE[0], input, enable output drivers in OE group 0</li> <li>0x1 = OE[1], input, enable output drivers in OE group 1</li> <li>0x2 = OE[2], input, enable output drivers in OE group 2</li> <li>0x3 = OE[3], input, enable output drivers in OE group 3</li> <li>0x4 = OE[4], input, enable output drivers in OE group 4</li> <li>0x5 = PERST#, input, latches CLKIN0 fanout buffer mode clock selection on active edge</li> <li>0x6 = GOE, input, enable all output drivers</li> <li>0x9 = PERST1#, input, latches XO/IB fanout buffer mode clock selection on active edge</li> <li>0xA = Reserved</li> <li>0xE = SDI, input (SPI 4-wire mode)</li> <li>0xF = SYSREF_IN</li> <li>0x10 = GPI, input, input status allowed read back via SSI</li> <li>0x7F = GPI function disabled, pin used as reference clock input</li> </ul>

Table 97. GPI\_STS - GPI Status

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3:0	gpi_sts	RO	0x0	<p>GPI Status.</p> <p>Indicates the status of the GPIO/1/2/3 pins without latching and without applying optional polarity inversion (<a href="#">gpi_pol</a>). If a pin is configured to be a reference clock input (see <a href="#">gpi_func</a>), the status reads back as 0.</p> <p>Bit [3] = GPI3 status            Bit [2] = GPI2 status            Bit [1] = GPI1 status            Bit [0] = GPIO status</p>

## 11.15 GPIO Registers

Table 98. GPIO\_CNFG - GPIO Configuration

Bit Field	Field Name	Type	Default Value	Description
15	reserved	RO	0x0	Reserved.
14:13	gpo_drv	RW	0x0	GPO Drive Strength. Applies to the pad when configured as an output ( <a href="#">gpio_type</a> is 0x0 or 0x2). Drive strength increases as this setting increases.
12	gpo_ctrl	RW	0x0	GPO Output Control Signal Value. Sets the value to drive the GPO pin when configured as a general purpose output.
11:10	gpio_type	RW	0x1	GPIO Type. Sets the direction and type following reset. <ul style="list-style-type: none"> <li>0x0 = Output (driven high/low), or bidirectional if configured as SDIO by <a href="#">gpio_func</a></li> <li>0x1 = Input (2-level)</li> <li>0x2 = Output (open-drain)</li> <li>0x3 = Input (tri-level). Only valid for GPIO0/1/2 when set to GPI mode or Dynamic CSEL; reserved for GPIO3/4.</li> </ul>
9	gpio_pol	RW	0x0	GPIO Polarity. Sets the pin polarity. This bit is ignored if <a href="#">gpio_func</a> configures the pin as a tri-level Dynamic CSEL, GPO, or test clock output. <ul style="list-style-type: none"> <li>0x0 = Normal sense. Pin functions denoted with a # are active low, others are active high.</li> <li>0x1 = Inverted sense. Pin functions denoted with a # are active high, others are active low.</li> </ul>
8	gpio_pullup	RW	0x0	GPIO Pull-up Enable. Sets the internal pull-up mode. <ul style="list-style-type: none"> <li>0x0 = Pull-up disabled</li> <li>0x1 = Pull-up enabled</li> </ul>
7	gpio_pulldn	RW	0x1	GPIO Pull-down Enable. Sets the internal pull-down mode. <ul style="list-style-type: none"> <li>0x0 = Pull-down disabled</li> <li>0x1 = Pull-down enabled</li> </ul>

Table 98. GPIO\_CNFG - GPIO Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
6:0	gpio_func	RW	0x10	<p>GPIO Functions.</p> <p>Sets the general purpose input/output function. Refer to <a href="#">pwrdrn_sel</a> for PWRGD/PWRDN# assignment.</p> <p>0x0 = OE[0], input, enable output drivers in OE group 0</p> <p>0x1 = OE[1], input, enable output drivers in OE group 1</p> <p>0x2 = OE[2], input, enable output drivers in OE group 2</p> <p>0x3 = OE[3], input, enable output drivers in OE group 3</p> <p>0x4 = OE[4], input, enable output drivers in OE group 4</p> <p>0x5 = PERST#, input, latches CLKIN0 fanout buffer mode clock selection on active edge</p> <p>0x6 = GOE, input, enable all output drivers</p> <p>0x9 = PERST1#, input, latches CLKIN1 fanout buffer mode clock selection on active edge</p> <p>0xE = SDI, input (SPI 4-wire mode)</p> <p>0xF = SYSREF_IN, input</p> <p>0x10 = GPI, input, input status allowed read back via SSI</p> <p>0x11 = Dynamic CSEL, input, dynamic configuration control. Only valid for GPIO0/1/2. May be tri-level or 2-level.</p> <p>0x1C = INT, output</p> <p>0x1D = GPO, output, to control external functions such as LEDs. The output value is set in <a href="#">gpo_ctrl</a>.</p> <p>0x1E = SDO, output (SPI 4-wire mode) or SDIO, bidirectional (SPI-3-wire mode; <a href="#">gpio_type</a> must be set to 0, and is internally controlled as 0 or 1 by the SPI logic).</p> <p>0x20 = clkIn0 <a href="#">los_sts</a>, output</p> <p>0x21 = clkIn1 <a href="#">los_sts</a>, output</p> <p>0x22 = clkIn2 <a href="#">los_sts</a>, output</p> <p>0x23 = clkIn3 <a href="#">los_sts</a>, output</p> <p>0x24 = refin <a href="#">los_sts</a>, output</p> <p>0x25 = <a href="#">apll_lock_sts</a>, output</p> <p>0x28 = clkIn0 <a href="#">los_evt</a>, output</p> <p>0x29 = clkIn1 <a href="#">los_evt</a>, output</p> <p>0x2A = clkIn2 <a href="#">los_evt</a>, output</p> <p>0x2B = clkIn3 <a href="#">los_evt</a>, output</p> <p>0x2C = refin <a href="#">los_evt</a>, output</p> <p>0x2D = <a href="#">apll_lol</a>, output</p> <p>0x30 = clkIn0 <a href="#">los_lmt_evt</a>, output</p> <p>0x31 = clkIn1 <a href="#">los_lmt_evt</a>, output</p> <p>0x32 = clkIn2 <a href="#">los_lmt_evt</a>, output</p> <p>0x33 = clkIn3 <a href="#">los_lmt_evt</a>, output</p> <p>0x34 = refin <a href="#">los_lmt_evt</a>, output</p> <p>0x35 = <a href="#">apll_lol_lmt</a>, output</p> <p>0x37 = CLKMODE (<a href="#">fanout_clkmode</a>), output</p> <p>0x38 = <a href="#">device_ready</a>, output</p> <p>0x39 = CLKMODE1 (<a href="#">fanout_buf_mode1</a>), output</p>

Table 99. GPIO\_STS - GPIO Status

Bit Field	Field Name	Type	Default Value	Description
7:0	gpio_sts	RO	0x0	<p>GPIO Status.</p> <p>Indicates the status of the GPIO0/1/2/3/4 pins without latching and without applying optional polarity inversion (<a href="#">gpio_pol</a>).</p> <p>For GPIO0/1/2, the possible encodings are:</p> <ul style="list-style-type: none"> <li>0x0 = Tri-level low, 2-level low</li> <li>0x1 = Tri-level mid, 2-level unused</li> <li>0x2 = Unused</li> <li>0x3 = Tri-level high, 2-level high</li> </ul> <p>Bit [7] = GPIO4 status            Bit [6] = GPIO3 status            Bits [5:4] = GPIO2 status            Bits [3:2] = GPIO1 status            Bits [1:0] = GPIO0 status</p>

## 11.16 EEPROM Registers

Table 100. EEPROM\_CNFG - EEPROM Load Configuration

Bit Field	Field Name	Type	Default Value	Description
63:56	reserved	RO	0x0	Reserved.
55:44	eeeprom_fall	RW	0x96	<p>EEPROM Falling Edge Time.</p> <p>Cycle number (counting down from <a href="#">eeeprom_cycle</a>) at which the SCL falling edge occurs. The default value is for a 60MHz clock and must be scaled according to the actual system clock frequency.</p>
43:32	eeeprom_rise	RW	0x1C2	<p>EEPROM Rising Edge Time.</p> <p>Cycle number (counting down from <a href="#">eeeprom_cycle</a>) at which the SCL rising edge occurs. The default value is for a 60MHz clock and must be scaled according to the actual system clock frequency.</p>
31:20	eeeprom_cycle	RW	0x258	<p>EEPROM Cycle Time.</p> <p>Number of system clock cycles in one SCL period when running at 100kHz. The default value is for a 60MHz clock and must be scaled according to the actual system clock frequency.</p>
19:15	reserved	RO	0x0	Reserved.
14:13	eeeprom_i2c_drv	RW	0x0	<p>I2C/SMBus Drive Strength.</p> <p>Selects the output driver slew rate of the SDA_nCS and SCL_SCLK pins when the internal I2C master is active. (higher settings means higher drive strength). This setting does not affect the internal timing, refer to <a href="#">eeeprom_i2c_speed</a>.</p> <p>0x0 = 1.8V Standard mode (100 kHz) or 2.5V/3.3V standard (100kHz) and Fast mode (400kHz)</p> <ul style="list-style-type: none"> <li>0x1 = 1.8V Fast mode (400 kHz)</li> <li>0x2 = Reserved</li> <li>0x3 = 1.8V/2.5V/3.3V Fast mode plus (1 MHz)</li> </ul>

Table 100. EEPROM\_CNFG - EEPROM Load Configuration (Cont.)

Bit Field	Field Name	Type	Default Value	Description
12	eeeprom_ext_ad dr	RW	0x0	EEPROM Extended Address Enable. Allows extended 10-bit addressing with a 1-byte I2C address, if supported by the EEPROM. <ul style="list-style-type: none"> <li>0x0 = The address is sent outside of the device address.</li> <li>0x1 = Address bits 10:8 are sent in bits 2:0 of the device address, and address bits 7:0 are sent in the 1-byte address.</li> </ul> <a href="#">eeeprom_addr_size</a> must be set to 0.
11	eeeprom_addr_si ze	RW	0x1	EEPROM Address Size. Number of address bytes sent to the EEPROM during a read. 0x0 = 1-byte address 0x1 = 2-byte address
10:7	eeeprom_length	RW	0x4	EEPROM Size. Selects the number of bytes in the EEPROM for storing configurations. <ul style="list-style-type: none"> <li>0x0 = 128B</li> <li>0x1 = 256B</li> <li>0x2 = 512B</li> <li>0x3 = 1KB</li> <li>0x4 = 2KB</li> <li>0x5 = 4KB</li> <li>0x6 = 8KB</li> <li>0x7 = 16KB</li> <li>0x8 = 32KB</li> <li>0x9 = 64KB</li> </ul>
6	eeeprom_load_en	RW	0x0	EEPROM Load Enable. Enables loading of the common and/or user configurations from an external EEPROM device. The device loads configurations in the following order: OTP common, EEPROM common (if <a href="#">eeeprom_load_en</a> is set to 1), OTP user, and EEPROM user (if <a href="#">eeeprom_load_en</a> is set to 1). This bit may be programmed in the OTP common and/or user configurations to control whether the device attempts to load the common and/or user configurations from EEPROM. <i>Warning:</i> If the SDA pin is held low or floating when the I2C master attempts to read the EEPROM, the I2C master will wait indefinitely until SDA becomes high before beginning the read request. <ul style="list-style-type: none"> <li>0x0 = Disabled</li> <li>0x1 = Enabled</li> </ul>
5:4	eeeprom_i2c_spe ed	RW	0x0	EEPROM I2C Speed. Selects the I2C master speed for EEPROM load. When the speed is 400kHz or 1MHz, <a href="#">eeeprom_fall</a> , <a href="#">eeeprom_rise</a> and <a href="#">eeeprom_cycle</a> are internally divided by 4 or 10 respectively to achieve the faster timing. The pad drive strength ( <a href="#">eeeprom_i2c_drv</a> ) should also be set according to the speed. <ul style="list-style-type: none"> <li>0x0 = 100kHz</li> <li>0x1 = 400kHz</li> <li>0x2 = 1MHz</li> <li>0x3 = Reserved</li> </ul>
3:0	eeeprom_retry_c ount	RW	0x4	EEPROM Load Retry Count. Number of times to attempt to load EEPROM. If <a href="#">eeeprom_bad</a> or load failed (CRC error) after this number of attempts, the <a href="#">eeeprom_load_fail</a> status bit is set.

Table 101. EEPROM\_ADDR - EEPROM Address Configuration

Bit Field	Field Name	Type	Default Value	Description
7	reserved	RO	0x0	Reserved.
6:0	eeeprom_addr	RW	0x50	EEPROM Device Address. Sets the I2C device address of the EEPROM to load.

Table 102. EEPROM\_EVENT - EEPROM Load Event Status

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3	eeeprom_bad	RW1C	0x0	EEPROM Not Detected. When high, indicates the EEPROM did not acknowledge a read access during device startup or a dynamic configuration load. In this case, <a href="#">eeeprom_load_fail</a> is not set. If EEPROM load is disabled ( <a href="#">eeeprom_load_en</a> is set to 0), then VC7 will not attempt to read the EEPROM and this bit cannot be set. Cleared by writing it to 1.
2	eeeprom_config_empty	RW1C	0x0	EEPROM Load of Empty Configuration. When high, indicates the EEPROM load attempted to load a configuration that did not select any blocks, during device startup or a dynamic configuration load. Cleared by writing it to 1.
1	eeeprom_load_fail	RW1C	0x0	EEPROM Load Failure. When high, indicates the EEPROM load failed during device startup or a dynamic configuration load. This bit is not set if the EEPROM does not respond ( <a href="#">eeeprom_bad</a> is set instead). Cleared by writing it to 1.
0	eeeprom_crc_err	RW1C	0x0	EEPROM Load CRC Error. When high, indicates the EEPROM load encountered one or more CRC errors during device startup or a dynamic configuration load. Cleared by writing it to 1.

Table 103. EEPROM\_ERR\_CNT - EEPROM CRC Error Count

Bit Field	Field Name	Type	Default Value	Description
7:4	reserved	RO	0x0	Reserved.
3:0	eeeprom_crc_err_cnt	RW	0x0	EEPROM CRC Error Counter. This counter increments each time the loader detects a CRC error while reading the EEPROM, and saturates at 0xF. It is cleared by writing it to 0x0, and may be preset by writing the desired value. Preset may be used as a debug tool. This register can only be written if the block is not clock gated ( <a href="#">otp_cg</a> ) or held in reset ( <a href="#">otp_sw_rst</a> ).

Table 104. OTP\_VPPLMT - OTP VPP Monitor Limit

Bit Field	Field Name	Type	Default Value	Description
15:14	reserved	RO	0x0	Reserved.
13:0	vpplmt	RW	0x3D0	OTP VPP Monitor Limit. Number of VPP monitor clock cycles before the VPP monitor issues an error ( <a href="#">vpp_error</a> ). Counted in multiples of 1024 us. The default value is approximately 1 second.

Table 105. OTP\_EVENT - OTP Event Status

Bit Field	Field Name	Type	Default Value	Description
7	manual_rdy	RW1C	0x0	Manual Ready Indicator. When high, indicates a manual request (including Program Assist) completed. Cleared by writing it to 1.
6	status_latched	RW1C	0x0	OTP Latched Status. Latched value of the OTP STATUS pin. Can be cleared by writing 1 to it. If STATUS is still high when clearing is attempted, this bit will immediately be set to 1 again.
5	vpp_error	RW1C	0x0	OTP VPP Error. This error bit signals that the VPP monitor has detected that the OTP internal charge pump was enabled for longer than the time defined in the <a href="#">vpplmt</a> field. This bit gets cleared by writing one to it. It cannot be cleared unless the internal condition has gone away (i.e., VPP_MON has been de-asserted).
4	reserved	RO	0x0	Reserved.
3	pgm_assist_fail	RW1C	0x0	Program Assist Failure. When high, indicates that the Program Assist sequence failed to program one or more bits in the OTP word.
2	otp_config_empty	RW1C	0x0	OTP Load of Empty Configuration. When high, indicates the OTP load attempted to load a configuration that did not select any blocks. Cleared by writing it to 1.
1	otp_load_fail	RW1C	0x0	OTP Load Failure. When high, indicates the OTP load failed during device startup or a dynamic configuration load. Cleared by writing it to 1.
0	otp_crc_err	RW1C	0x0	OTP Load CRC Error. When high, indicates the OTP load encountered one or more CRC errors during device startup or a dynamic configuration load. Cleared by writing it to 1.

## 11.17 INT Registers

Table 106. SCRATCH0 - Software Scratch Register 0

Bit Field	Field Name	Type	Default Value	Description
31:0	scratch0	RW	0x0	<p>Scratch Register and Power-down Controls.</p> <p>For arbitrary software use.</p> <p>In VC7A+, bits[3:0] have the following function:</p> <ul style="list-style-type: none"> <li>scratch0[3]: System clock divider disable override; When high, this bit overrides the normal enable pin of the system clock divider and forces it to be low (disabled). This bit should only be set when the digital core is running on the RC oscillator clock.</li> <li>scratch0[2]: APLL feedback divider disable override; When high, this bit overrides the normal enable pin of the APLL feedback divider and forces it to be low (disabled).</li> <li>scratch0[1]: System clock divider reset; When high, this bit resets the system clock divider. This bit should only be set when the digital core is running on the RC oscillator clock.</li> <li>scratch0[0]: System clock select; When high, this bit cleanly switches the digital core system clock to the RC oscillator clock. This bit should only be set once the RC oscillator has been enabled (by programming the <code>por_osc_sel</code> field to 0x3) once it is cleanly toggling. To switch the digital core back to the VCO clock, this bit must be written back to zero, but only once the VCO has been properly enabled (see <code>vco_dis</code>) and after the system clock divider has been reset (by writing to one and then zero bit[1] of this register).</li> </ul>

Table 107. INT\_EN - Interrupt Enable

Bit Field	Field Name	Type	Default Value	Description
31	device_int_en	RW	0x0	<p>Device Interrupt Enable.</p> <p>Overall device interrupt enable. When this field is set to 1, the device interrupt is asserted while <a href="#">device_int_sts</a> is 1.</p>
30	reserved	RO	0x0	Reserved.
29	load_fail_int_en	RW	0x0	<p>Configuration Loader Failure Interrupt Enable.</p> <p>When this field is set to 1, the <a href="#">load_fail_int_sts</a> bit contributes to the device interrupt</p>
28	load_err_int_en	RW	0x0	<p>Configuration Loader Error Interrupt Enable.</p> <p>When this field is set to 1, the <a href="#">load_err_int_sts</a> bit contributes to the device interrupt</p>
27	otp_manual_rdy_int_en	RW	0x0	<p>OTP Manual Request Ready Interrupt Enable.</p> <p>When this field is set to 1, the <a href="#">otp_manual_rdy_int_sts</a> bit contributes to the device interrupt</p>
26	reserved	RO	0x0	Reserved.
25	los4_lmt_int_en	RW	0x0	<p>REFIN Monitor LOS Threshold Exceeded Interrupt Enable.</p> <p>When this field is set to 1, the <a href="#">los4_lmt_int_sts</a> bit contributes to the device interrupt</p>
24	los3_lmt_int_en	RW	0x0	<p>CLKIN3 Monitor LOS Threshold Exceeded Interrupt Enable.</p> <p>When this field is set to 1, the <a href="#">los3_lmt_int_sts</a> bit contributes to the device interrupt</p>
23	los2_lmt_int_en	RW	0x0	<p>CLKIN2 Monitor LOS Threshold Exceeded Interrupt Enable.</p> <p>When this field is set to 1, the <a href="#">los2_lmt_int_sts</a> bit contributes to the device interrupt</p>

Table 107. INT\_EN - Interrupt Enable (Cont.)

Bit Field	Field Name	Type	Default Value	Description
22	los1_lmt_int_en	RW	0x0	CLKIN1 Monitor LOS Threshold Exceeded Interrupt Enable. When this field is set to 1, the <a href="#">los1_lmt_int_sts</a> bit contributes to the device interrupt
21	los0_lmt_int_en	RW	0x0	CLKIN0 Monitor LOS Threshold Exceeded Interrupt Enable. When this field is set to 1, the <a href="#">los0_lmt_int_sts</a> bit contributes to the device interrupt
20	reserved	RO	0x0	Reserved.
19	apll_lol_lmt_int_en	RW	0x0	APLL Loss-of-lock Threshold Exceeded Interrupt Enable. When this field is set to 1, the <a href="#">apll_lol_lmt_int_sts</a> bit contributes to the device interrupt
18	reserved	RO	0x0	Reserved.
17	freq3_int_en	RW	0x0	CLKIN3 Frequency Monitor Interrupt Enable. When this field is set to 1, the <a href="#">freq3_int_sts</a> bit contributes to the device interrupt
16	freq2_int_en	RW	0x0	CLKIN2 Frequency Monitor Interrupt Enable. When this field is set to 1, the <a href="#">freq2_int_sts</a> bit contributes to the device interrupt
15	freq1_int_en	RW	0x0	CLKIN1 Frequency Monitor Interrupt Enable. When this field is set to 1, the <a href="#">freq1_int_sts</a> bit contributes to the device interrupt
14	freq0_int_en	RW	0x0	CLKIN0 Frequency Monitor Interrupt Enable. When this field is set to 1, the <a href="#">freq0_int_sts</a> bit contributes to the device interrupt.
13:9	reserved	RO	0x0	Reserved.
8	los4_int_en	RW	0x0	REFIN Monitor Loss-of-Signal interrupt Enable. When this field is set to 1, the <a href="#">los4_int_sts</a> bit contributes to the device interrupt
7	los3_int_en	RW	0x0	CLKIN3 Monitor Loss-of-Signal Interrupt Enable. When this field is set to 1, the <a href="#">los3_int_sts</a> bit contributes to the device interrupt
6	los2_int_en	RW	0x0	CLKIN2 Monitor Loss-of-Signal Interrupt Enable. When this field is set to 1, the <a href="#">los2_int_sts</a> bit contributes to the device interrupt
5	los1_int_en	RW	0x0	CLKIN1 Monitor Loss-of-Signal Interrupt Enable. When this field is set to 1, the <a href="#">los1_int_sts</a> bit contributes to the device interrupt
4	los0_int_en	RW	0x0	CLKIN0 Monitor Loss-of-Signal Interrupt Enable. When this field is set to 1, the <a href="#">los0_int_sts</a> bit contributes to the device interrupt.
3:1	reserved	RO	0x0	Reserved.
0	apll_lol_int_en	RW	0x0	APLL Loss-of-Lock Interrupt Enable. When this field is set to 1, the <a href="#">apll_lol_int_sts</a> bit contributes to the device interrupt.

Table 108. INT\_STS - Interrupt Status

Bit Field	Field Name	Type	Default Value	Description
31	device_int_sts	RO	0x0	Device Interrupt Status. Overall device interrupt status. This bit is the OR of all the other interrupt status bits in this register after masking by their respective interrupt enable bits in the <a href="#">INT_EN - Interrupt Enable</a> register. This bit is masked by <a href="#">device_int_en</a> . The resulting signal can be output on the assigned GPIO pin.
30	reserved	RO	0x0	Reserved.
29	load_fail_int_sts	RO	0x0	Configuration Loader Failure Interrupt Status. The logical OR of the <a href="#">otp_load_fail</a> and <a href="#">eeprom_load_fail</a> event bits
28	load_err_int_sts	RO	0x0	Configuration Loader Error Interrupt Status. The logical OR of the <a href="#">otp_crc_err</a> and <a href="#">eeprom_crc_err</a> event bits
27	otp_manual_rdy_int_sts	RO	0x0	OTP Manual Request Ready Interrupt Status. Mirrors the OTP <a href="#">manual_rdy</a> event bit
26	reserved	RO	0x0	Reserved.
25	los4_lmt_int_sts	RO	0x0	REFIN Monitor LOS Threshold Exceeded Interrupt Status. Mirrors the REFIN <a href="#">los_lmt_evt</a> event bit
24	los3_lmt_int_sts	RO	0x0	CLKIN3 Monitor LOS Threshold Exceeded Interrupt Status. Mirrors the CLKIN3 <a href="#">los_lmt_evt</a> event bit
23	los2_lmt_int_sts	RO	0x0	CLKIN2 Monitor LOS Threshold Exceeded Interrupt Status. Mirrors the CLKIN2 <a href="#">los_lmt_evt</a> event bit
22	los1_lmt_int_sts	RO	0x0	CLKIN1 Monitor LOS Threshold Exceeded Interrupt Status. Mirrors the CLKIN1 <a href="#">los_lmt_evt</a> event bit
21	los0_lmt_int_sts	RO	0x0	CLKIN0 Monitor LOS Threshold Exceeded Interrupt Status. Mirrors the CLKIN0 <a href="#">los_lmt_evt</a> event bit
20	reserved	RO	0x0	Reserved.
19	apll_lol_lmt_int_sts	RO	0x0	APLL Loss-of-lock Threshold Exceeded Interrupt Status. Mirrors the <a href="#">apll_lol_lmt</a> event bit
18	reserved	RO	0x0	Reserved.
17	freq3_int_sts	RO	0x0	CLKIN3 Frequency Monitor Interrupt Status. Mirrors the CLKIN3 <a href="#">freq_evt</a> event bit
16	freq2_int_sts	RO	0x0	CLKIN2 Frequency Monitor Interrupt Status. Mirrors the CLKIN2 <a href="#">freq_evt</a> event bit
15	freq1_int_sts	RO	0x0	CLKIN1 Frequency Monitor Interrupt Status. Mirrors the CLKIN1 <a href="#">freq_evt</a> event bit
14	freq0_int_sts	RO	0x0	CLKIN0 Frequency Monitor Interrupt Status. Mirrors the CLKIN0 <a href="#">freq_evt</a> event bit
13:9	reserved	RO	0x0	Reserved.
8	los4_int_sts	RO	0x0	REFIN Monitor Loss-of-Signal Interrupt Status. Mirrors the REFIN <a href="#">los_evt</a> event bit
7	los3_int_sts	RO	0x0	CLKIN3 Monitor Loss-of-Signal Interrupt Status. Mirrors the CLKIN3 <a href="#">los_evt</a> event bit
6	los2_int_sts	RO	0x0	CLKIN2 Monitor Loss-of-Signal Interrupt Status. Mirrors the CLKIN2 <a href="#">los_evt</a> event bit

Table 108. INT\_STS - Interrupt Status (Cont.)

Bit Field	Field Name	Type	Default Value	Description
5	los1_int_sts	RO	0x0	CLKIN1 Monitor Loss-of-Signal Interrupt Status. Mirrors the CLKIN1 <a href="#">los_evt</a> event bit
4	los0_int_sts	RO	0x0	CLKIN0 Monitor Loss-of-Signal Interrupt Status. Mirrors the CLKIN0 <a href="#">los_evt</a> event bit
3:1	reserved	RO	0x0	Reserved.
0	apll_lol_int_sts	RO	0x0	APLL Loss-of-lock Interrupt Status. Mirrors the <a href="#">apll_lol</a> event bit

## 12. Revision History

Revision	Date	Description
1.01	Aug 14, 2023	<ul style="list-style-type: none"> <li>Updated part number references to RC210xx</li> <li>Updated device_revision in <a href="#">Table 34</a> (DEVICE_REV)</li> <li>Updated the description of en_cap_x2 and en_cap_x1 in <a href="#">Table 53</a> (XO_CNFG)</li> <li>Added <a href="#">Table 86</a> (ANA_SPARE_CNFG) and <a href="#">Table 87</a> (ANA_SPARE_STS)</li> </ul>
1.00	Oct 26, 2022	Initial release.
