

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

 Known bugs in this release (3)

SuperH RISC engine C/C++ compiler Ver.7 Known bug in this release (3)

The known bug in Ver.7.0B, Ver.7.0.03 and Ver.7.0.04 of the compiler is described below. Instances of this bug in the program can be found using the checker on the URL below.

<http://www.hitachisemiconductor.com/sic/jsp/japan/eng/products/mpumcu/tool/download/caution7002.html>

1. Illegal stack access

[Contents]

When an address of a parameter passed on a register is referred to, a data on the stack may be superseded illegally.

[Example]

```
extern void er();
extern char f2(char *a);
void f(char a) {
    char c;
    a++;                // updates the variable which is a parameter on a register
    do {
        c=f2(&a);      // refers to an address of a parameter on a register
        if (c) er();
        else return;
    } while(c);
}
```

```
_f:
    MOV.L    R13,@-R15
    MOV.L    R14,@-R15
    STS.L    PR,@-R15
    ADD      #-4,R15
    MOV      R4,R0
    ADD      #1,R0
    MOV.B    R0,@(3,R15) ; updates the variable "a"
    MOV.L    R4,@R15 ; the variable "a" is superseded illegally
    MOV.L    L14+2,R13 ; _f2
    :
```

[Condition]

This problem may occur when all of the following conditions are satisfied.

- (1) The optimize=1 option is specified.
- (2) A parameter on a register exists.
- (3) An address of this parameter is referred to in a function.
- (4) An assignment to this parameter exists before reference to the address.
- (5) Copying a parameter on a register into the stack is moved after assignment to the parameter to the parameter by the optimization of instruction scheduling.

[How to avoid the bug]

The bug can be avoided with either method of the following.

- (1) Specify the optimize=0 option.
- (2) Modify the source program as shown in the example below.

[Example]

```
void f(char a) {
    char c;
    char temp=a;          // A parameter "a" assigns to a local variable "temp"
    temp++;              // Updates "temp"
    do {
        c=f2(&temp);     // Refers to an address of "temp"
        if (c) er();
        else return;
    } while(c);
}
```
