# **General Description**

The 844S012I-01 is an optimized PCIe, sRIO and Gigabit Ethernet Frequency Synthesizer. The 844S012I-01 uses a 25MHz parallel resonant crystal to generate 33.33MHz - 200MHz clock signals, replacing solutions requiring multiple oscillator and fanout buffer solution. The device supports  $\pm 0.25\%$  center-spread, and -0.6% down-spread clocking with two spread select pins (SSC[1:0]). The VCO operates at frequency of 2GHz. The device has three output banks: Bank A with two LVDS outputs, 100MHz – 250MHz; Bank B with seven 33.33MHz – 200MHz LVCMOS/ LVTTL outputs; and Bank C with one 33.33MHz – 200MHz LVCMOS/LVTTL output.

All Banks A, B and C have their own dedicated frequency select pins and can be independently set for the frequencies mentioned above. The low jitter characteristic of the 844S012I-01 makes it an ideal clock source for PCIe, sRIO and Gigabit Ethernet applications. Designed for networking and industrial applications, the 844S012I-01 can also drive the high-speed clock inputs of communication processors, DSPs, switches and bridges.

## Features

- Two differential LVDS outputs (Bank A), configurable for PCIe (100MHz or 250MHz) and sRIO (100MHz or 125MHz) clock signals
- Eight LVCMOS/LVTTL outputs (Bank B/C), 18Ω typical output impedance
- Two REF\_OUT LVCMOS/LVTTL clock outputs 23Ω typical output impedance
- Selectable crystal oscillator interface, 25MHz, 18pF parallel resonant crystal or one LVCMOS/LVTTL single-ended reference clock input
- Supports the following output frequencies: LVDS Bank A: 100MHz, 125MHz, 200MHz and 250MHz LVCMOS/LVTTL Bank B/C: 33.33MHz, 50MHz, 66.67MHz, 100MHz, 125MHz, 133.33MHz, 166.67MHz and 200MHz
- VCO: 2GHz
- Spread spectrum clock: ±0.25% center-spread, and -0.6% down-spread
- PLL bypass and output enable
- RMS period jitter: 23ps (maximum), QB outputs
- Full 3.3V supply voltage
- -40°C to 85°C ambient operating temperature
- Available in a lead-free (RoHS 6) compliant package

## **Pin Assignment**

# **Block Diagram**

# Table 1. Pin Descriptions

Number	Name	Туре		Description	
1	V <sub>DDO_REF</sub>	Power		Output supply pin for REF_OUT outputs.	
2, 3	REF_OUT0, REF_OUT1	Output		Single-ended reference clock outputs. $23\Omega$ typical output impedance. LVCMOS/LVTTL interface levels.	
4, 5, 15, 27, 34, 35, 36, 40, 46, 50, 54	GND	Power		Power supply ground.	
6	REF_IN	Input	Pulldown	Single-ended reference clock input. LVCMOS/LVTTL interface levels.	
7, 14, 28, 29	V <sub>DD</sub>	Power		Core supply pins.	
8	REF_SEL	Input	Pulldown	Reference select pin. When HIGH selects REF_IN. When LOW, selects crystal. See Table 3E. LVCMOS/LVTTL interface levels.	
9, 10	XTAL_IN XTAL_OUT	Input		Crystal oscillator interface. XTAL_IN is the input, XTAL_OUT is the output.	
11	BYPASS	Input	Pulldown	PLL bypass. When HIGH, bypasses PLL. When LOW, selects PLL. See Table 3J. LVCMOS/LVTTL interface levels	
12	REF_OE	Input	Pulldown	Active HIGH REF_OUT enable/disable pin. See Table 3F. LVCMOS/LVTTL interface levels.	
13	nMR	Input	Pullup	Active LOW Master Reset. When logic LOW, the internal dividers are reset. When logic HIGH, the internal dividers are enabled. This device requires a reset signal after powerup. See Table 3G. LVCMOS/LVTTL interface levels.	
16, 17	SSC1, SSC0	Input	Pullup	SSC control pins. See Table 3D. LVCMOS/LVTTL interface levels.	
18, 19, 20	F_SELB2, F_SELB1, F_SELB0	Input	Pulldown	Frequency select pins for QBx outputs. See Table 3B. LVCMOS/LVTTL interface levels.	
21, 22, 23	F_SELC2, F_SELC1, F_SELC0	Input	Pulldown	Frequency select pins for QC output. See Table 3C. LVCMOS/LVTTL interface levels.	
24, 25	F_SELA1, F_SELA0	Input	Pulldown	Frequency select pins for QAx, nQAx outputs. See Table 3A. LVCMOS/LVTTL interface levels.	
26	QA_OE	Input	Pullup	Output enable pin for Bank A outputs. See Table 3H. LVCMOS/LVTTL interface levels.	
30, 31 32, 33	nQA1, QA1 nQA0, QA0	Output		Differential Bank A clock output pairs. LVDS interface levels.	
37, 38	V <sub>DDA</sub>	Power		Analog supply pins.	
39	QBC_OE	Input	Pullup	Output enable pin for Bank B and Bank C outputs. See Table 3I. LVCMOS/LVTTL Interface levels.	
41	QC	Output		Single-ended Bank C clock output. LVCMOS/LVTTL interface levels. $18\Omega$ typical output impedance.	
42	V <sub>DDOC</sub>	Power		Output supply pin for QC LVCMOS output.	
43, 48, 52, 56	V <sub>DDOB</sub>	Power		Output supply pins for QBx LVCMOS outputs.	
44, 45, 47, 49, 51, 53, 55	QB0, QB1, QB2, QB3, QB4, QB5, QB6	Output		Single-ended Bank B clock outputs. LVCMOS/LVTTL interface levels. $18\Omega$ typical output impedance.	

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

	,	QB[0:6], QC	Output Frequency > 66.67MHz	45		55	%

NOTE: QBx, QC LVCMOS outputs are characterized up to 125MHz.

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Defined as skew within a bank of outputs at the same supply voltage and with equal load conditions.

NOTE 2: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 3: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at V<sub>DDOB</sub>/2.

## **Recommendations for Unused Input and Output Pins**

### Inputs:

### **LVCMOS Control Pins**

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A  $1k\Omega$  resistor can be used.

#### **Crystal Inputs**

For applications not requiring the use of the crystal oscillator input, both XTAL\_IN and XTAL\_OUT can be left floating. Though not required, but for additional protection, a  $1k\Omega$  resistor can be tied from XTAL\_IN to ground.

#### **REF\_IN Input**

For applications not requiring the use of the reference clock, it can be left floating. Though not required, but for additional protection, a  $1k\Omega$  resistor can be tied from the REF\_IN to ground.

### Outputs:

#### **LVCMOS Outputs**

All unused LVCMOS output can be left floating. We recommend that there is no trace attached.

#### LVDS Outputs

All unused LVDS outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## **Power Supply Filtering Technique**

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 844S012I-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{DD}$ ,  $V_{DDA}$ ,  $V_{DDOB}$  and  $V_{DDO}$  should be individually connected to the power supply plane through vias, and 0.01µF bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic  $V_{DD}$  pin and also shows that  $V_{DDA}$  requires that an additional 10 $\Omega$  resistor along with a 10µF bypass capacitor be connected to the  $V_{DDA}$  pin.

Figure 1. Power Supply Filtering

## **VFQFN EPAD Thermal Release Path**

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 2*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as "heat pipes". The number of vias (i.e. "heat pipes") are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor's Thermally/ Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 2. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

## **Crystal Input Interface**

The 844S012I-01 has been characterized with 18pF parallel resonant crystals. The capacitor values shown in *Figure 3* below

Figure 3. Crystal Input Interface

## Overdriving the XTAL Interface

The XTAL\_IN input can accept a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 4A*. The XTAL\_OUT pin can be left floating. The maximum amplitude of the input signal should not exceed 2V and the input edge rate can be as slow as 10ns. This configuration requires that the output impedance of the driver (Ro) plus the series resistance (Rs) equals the transmission line impedance. In addition,

were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error.

matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most  $50\Omega$  applications, R1 and R2 can be  $100\Omega$ . This can also be accomplished by removing R1 and making R2  $50\Omega$ . By overdriving the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.

Figure 4A. General Diagram for LVCMOS Driver to XTAL Input Interface

Figure 4B. General Diagram for LVPECL Driver to XTAL Input Interface

## **LVDS Driver Termination**

A general LVDS interface is shown in *Figure 4*. Standard termination for LVDS type output structure requires both a 100 $\Omega$  parallel resistor at the receiver and a 100 $\Omega$  differential transmission line environment. In order to avoid any transmission line reflection issues, the 100 $\Omega$ resistor must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source. The standard termination schematic as shown in Figure 4 can be used with either type of output structure. If using a non-standard termination, it is recommended to contact IDT and confirm if the output is a current source or a voltage source type structure. In addition, since these outputs are LVDS compatible, the input receivers amplitude and common mode input range should be verified for compatibility with the output.

Figure 4. Typical LVDS Driver Termination

## Schematic Example

*Figure 6* shows an example of 844S012I-01 application schematic. In this example, the device is operated at  $V_{DD} = V_{DDOB} = V_{DDOC} = V_{DDO\_REF} = 3.3V$ . The 18pF parallel resonant 25MHz crystal is used. The C1 and C2 = 18pF and are recommended for frequency accuracy. For different board layouts, the C1 and C2 may be slightly adjusted for optimizing frequency accuracy. Two examples of LVDS terminations and one example of an LVCMOS termination are shown in this schematic. The decoupling capacitors should be located as close as possible to the power pin.

Figure 6. 844S012I-01 Schematic Example

## **Spread Spectrum**

Spread-spectrum clocking is a frequency modulation technique for EMI reduction. When spread-spectrum is enabled, a 32kHz triangle waveform is used with 0.6% down-spread (+0.0% / -0.6%) from the nominal output frequency. An example of a triangle frequency modulation profile is shown in *Figure 7A* below. The ramp profile can be expressed as:

- € Fnom = Nominal Clock Frequency in Spread Off mode
- € Fm = Nominal Modulation Frequency (30kHz)
- €  $\delta$  = Modulation Factor (0.6% down spread)

$$(1 - \delta)$$
Fnom + 2Fm ×  $\delta$  × Fnom × t when 0 < t <  $\frac{1}{2$ Fm},  
 $(1 - \delta)$ Fnom - 2Fm ×  $\delta$  × Fnom × t when  $\frac{1}{2$ Fm} < t <  $\frac{1}{Fm}$ 

The 844S012I-01 triangle modulation frequency deviation will not exceed 0.7% down-spread from the nominal clock frequency (+0.0% / -0.6%). An example of the amount of down spread relative to the nominal clock frequency can be seen in the frequency domain, as shown in *Figure 7B*. The ratio of this width to the fundamental frequency is typically 0.4%, and will not exceed 0.7%. The resulting spectral reduction will be greater than 5dB, as shown in *Figure 7B*. It is important to note the 844S012I-01 5dB minimum spectral reduction is the component-specific EMI reduction, and will not necessarily be the same as the system EMI reduction.

## **Power Considerations**

This section provides information on power dissipation and junction temperature for the ICS44S012I. Equations and example calculations are also provided.

#### 1. Power Dissipation.

The total power dissipation for the ICS44S012I is the sum of the core power plus the power dissipation in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

The maximum current at  $85^{\circ}$  is as follows:  $I_{DD_{MAX}} = 260mA$   $I_{DDA_{MAX}} = 18mA$  $I_{DDO_{MAX}} = 2mA$ 

#### **Core and LVDS Output Power Dissipation**

• Power (core, LVDS) = V<sub>DD\_MAX</sub> \* (I<sub>DD</sub> + I<sub>DDA</sub> + I<sub>DDO</sub>) = 3.465V \* (260mA + 18mA + 2mA) = **970.20mW** 

#### LVCMOS Output Power Dissipation

- Dynamic Power Dissipation at 200MHz, (QB, QC)
   Power (200MHz) = C<sub>PD</sub> \* Frequency \* (V<sub>DDO</sub>)<sup>2</sup> = 19pF \* 200MHz \* (3.465V)<sup>2</sup> = 45mW per output
   Total Power (200MHz) = 45mW \* 8 = 360mW
- Dynamic Power Dissipation at 25MHz Power (25MHz) =  $C_{PD}$  \* Frequency \*  $(V_{DDO})^2$  = 19pF \* 25MHz \* (3.465V)<sup>2</sup> = **5.6mW per output** Total Power (25MHz) = **5.6mW \* 2 = 11.2mW**

#### **Total Power Dissipation**

- Total Power
  - = Power (core, LVDS) + Total Power (200MHz) + Total Power (25MHz)
  - = 970.20mW + 360mW + 11.2mW
  - = 1,341.4mW

#### 2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, Tj, to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for Tj is as follows: Tj =  $\theta_{JA}$  \* Pd\_total + T<sub>A</sub>

Tj = Junction Temperature

 $\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

Pd\_total = Total Device Power Dissipation (example calculation is in section 1 above)

T<sub>A</sub> = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 27.5°C/W per Table 7 below.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:

85°C + 1.341W \* 27.5°C/W = 121.9°C. This is below the limit of 125°C.

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

#### Table 7. Thermal Resistance $\theta_{JA}$ for 56 Lead VFQFN, Forced Convection

Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	31.4°C/W	27.5°C/W	24.6°C/W

# **Reliability Information**

Table 8.  $\theta_{\text{JA}}$  vs. Air Flow Table for a 56 Lead VFQFN

	$\theta_{\text{JA}}$ vs. Air Flow		
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	31.4°C/W	27.5°C/W	24.6°C/W

## **Transistor Count**

The transistor count for 844S012I-01 is: 11,509

# Package Outline and Package Dimensions

There are 3 methods of indicating pin 1 corner at the back of the VFQFN package are:

- 1. Type A: Chamfer on the paddle (near pin 1)
- 2. Type B: Dummy pad between pin 1 and N.
- 3. Type C: Mouse bite on the paddle (near pin 1)

#### Table 9. Package Dimensions

SPEC NON_JEDEC: VLLD-2/-5 All Dimensions in Millimeters			
Symbol	Minimum	Maximum	
Ν	5	6	
Α	0.80	1.00	
A1	0	0.05	
A3	0.25 Ref.		
b	0.18	0.30	
N <sub>D</sub> & N <sub>E</sub>	1	4	
D&E	8.00	Basic	
D2	4.35	4.65	
E2	5.05	5.35	
е	0.50 Basic		
L	0.30	0.50	

Reference Document: JEDEC Publication 95, MO-220

NOTE: The following package mechanical drawing is a generic drawing that applies to any pin count VFQFN package. This drawing is not intended to convey the actual pin count or pin layout of this device. The pin count and pinout are shown on the front page. The package dimensions are in Table 9.

# **Ordering Information**

### Table 10. Ordering Information

Part/Order Number	Marking	Package	Shipping Packaging	Temperature
844S012BKI-01LF	ICS4S012BI01L	"Lead-Free" 56 Lead VFQFN	Tray	-40°C to +85°C
844S012BKI-01LFT	ICS4S012BI01L	"Lead-Free" 56 Lead VFQFN	Tape & Reel	-40°C to +85°C

# **Revision History**

Revision Date	Description of Change	
January 5, 2016	<ul> <li>General Description - removed the ICS chip.</li> <li>Removed ICS from the part number.</li> <li>Ordering Information - removed 1000 from Tape and Reel and the LF note below the table.</li> <li>Updated the header and footer.</li> </ul>
