

ISL1557IRZ-EVAL

The ISL1557IRZ-EVAL evaluation board is designed to provide a quick and easy method for evaluating the [ISL1557](#). The ISL1557 is a high-speed current feedback differential amplifier used in a single port Power Line Communication (PLC) application.

Features

- Drives up to 750mA from a +12V supply
- Full, medium, low, and disable power settings

Specifications

This board is optimized for the following operating conditions:

- Nominal Supply Voltage = $\pm 6V$ or $+12V$
- Bias Voltages at pins Bias 0 and Bias 1:
 $V_{IH(min)} = 2V, V_{IL(max)} = 0.8V$
- Signal Bandwidth: 35kHz to 190MHz

1. Functional Description

1.1 Gain Setting

The ISL1557IRZ evaluation board is set to a gain of 5V/V. The gain can be adjusted by changing RCG.

$$(EQ. 1) \quad A_V = 1 + \frac{RFA}{0.5 \times RCG}$$

1.2 Operating Conditions

The ISL1557IRZ operates on a nominal supply of $\pm 6V$ or $+12V$. The C0 and C1 control pins bias the operating supply current of the ISL1557IRZ. [Table 1](#) summarizes the four power modes and the typical supply current for each mode. The minimum voltage to set C0 and C1 pins high is 2V and the maximum voltage to set C0 and C1 pins low is 0.8V.

Table 1. Operating Power Modes

Power Modes	C0	C1	Supply Current per Port
Full Power	0	0	30mA
Medium Power	1	0	22mA
Low Power	0	1	12mA
Disable	1	1	1.2mA

1.3 Evaluation Set Up

1. Connect +12V to +VS pin and ground to -VS and GND pin.
2. Turn on the power supply and the quiescent supply current in full power mode for the two amplifiers should read 30mA.
3. Apply a 1MHz differential sine wave signal from -0.25V to +0.25V ($0.5V_{P-P}$) to INA and INB. $1V_{P-P}$ differential across INA-INB.
4. With an oscilloscope, probe OUTA (Pin 16) or OUTB (Pin 13) with a high impedance ($10M\Omega$) probe and verify correct output voltage. Each output has $\pm 1.25V$ ($2.5V_{P-P}$). $5V_{P-P}$ differential across Pin 16 and Pin 13.
