## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

## **M16C/26**

### **Using Timer B for Pulse Period/Width Measurements**

---

#### **1.0 Abstract**

The following article introduces and shows how to use Timer B of the M16C/26 (M30262) Flash microcontroller (MCU) for pulse period/width measurements. A sample program written for the MSV30262-SKP, with an accelerometer, shows how to use this Timer B function.

#### **2.0 Introduction**

The Renesas M16C/26 is a 16-bit MCU based on the M16C/60 CPU core and has multiple peripheral functions. It has 8 16-bit timers which can be broken into 5 Timer A's and 3 Timer B's. Only Timer B can be used for pulse period/width measurements.

Pulse period/width measurement can be used in applications where in pulse or duty cycles need to be measured. It can be used to measure sensor outputs or verify time periods and duty cycle.

For the demo, pulse outputs from the ADI ADXL210 accelerometer were measured. Using these measurements, acceleration, tilt, or vibration can also be calculated. The demo was written to run on the MSV30262-SKP board with an ADXL210EB evaluation board connected to Timer B0, B1 input pins.

#### **3.0 Timer B**

The M16C/26 has three Timer B's, which are all 16-bit timers. The three modes of operations of Timer B are: Timer Mode, Event Counter Mode, and Pulse Period/Pulse Width Measurement Mode. The first two modes are standard timer operations and also exist in the 5 Timer A's. These two modes are discussed in other application notes and are not mentioned in this document. The focus of this document is how to use the third mode, Pulse Period/Pulse Width Measurement Mode. A block diagram of Timer B is shown in Figure 1. Register used in pulse period/width measurement is shown in Figure 2.

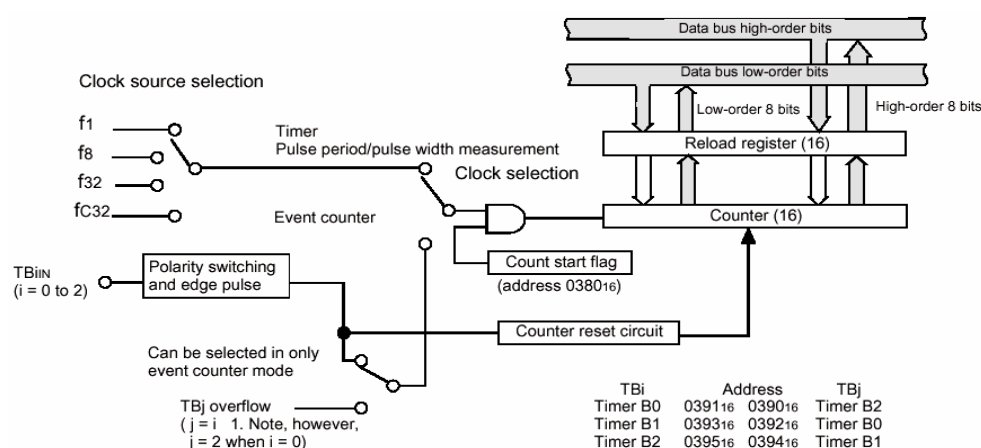

Figure 1 M16C/26 Timer B Block Diagram

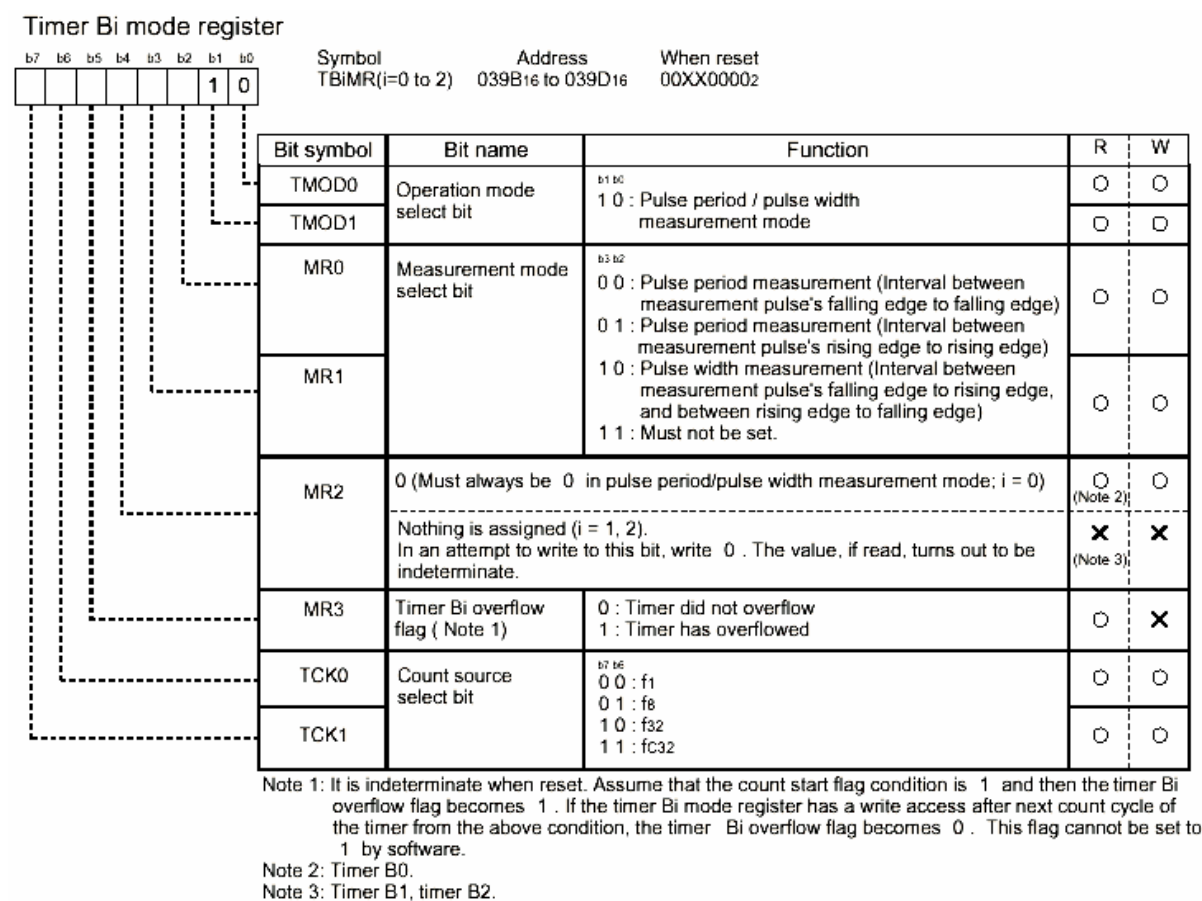

Figure 2 Timer B Mode Register in Pulse Period/Width Measurement Mode

### 3.1 Measurement Modes

There are three modes in which a pulse can be measured: falling edge-to-falling edge, rising edge-to-rising edge, or rising edge-to-falling edge/falling edge-to-rising edge. The mode can be selected by setting bits 2 and 3 (MR0, MR1) of the Timer B Mode register.

In the demo, two modes are used: rising edge-to-rising edge and rising edge-to-falling edge/falling edge-to-rising edge. The rising edge-to-rising edge mode is used to measure one total cycle (period),  $t_2$ . The rising edge-to-falling edge/falling edge-to-rising edge mode is used to measure the 'On' time,  $t_1$ , of the accelerometer. When measuring the 'On' time of the accelerometer, the port pin where the pulse is connected is polled to determine if the measurement should be used or discarded. The port pin is polled after the measurement is taken (i.e. a Timer B interrupt has occurred). If the port pin is low, then the rising edge-to-falling edge ('On' time) is measured is used. If the port pin is high (i.e. falling edge-to-rising edge), the measurement is discarded.

### 3.2 Count Source

There are four count sources to choose from:  $f_1$ ,  $f_8$ ,  $f_{32}$ , or  $fc_{32}$ .  $f_1$ ,  $f_8$ , and  $f_{32}$  are clocks derived from the main clock input,  $X_{in}$ .  $f_1$  is the frequency of the main clock,  $f_8$  is  $f_1$  divided by 8, and  $f_{32}$  is  $f_1$  divided 32. On the other hand,  $fc_{32}$  is a clock derived from the subclock input.  $fc_{32}$  is the frequency of the subclock,  $fc$ , divided by 32. On the MSV30262 Board,  $f_1$  is 20MHz ( $f_8=2.5$ MHz,  $f_{32}=625$ KHz) and  $fc$  is 32.768KHz ( $fc_{32}=1024$ Hz).

The importance of the count source is that, it determines the sampling rate of the measurement. For example, if the pulse you need to measure is 1.5ms and you sample it every 1ms, you will miss the width by 0.5ms. If we sample the pulse with every 0.1ms (100us), the pulse measurement will be close to 1.5ms. Figure 3 shows how the sampling clock affects the accuracy of the pulse measurement. As can be seen on the figure, using a faster sampling clock rate makes a more accurate pulse width measurement.

**Figure 3 Sampling Clock & Measurement Accuracy**

You might be thinking that we should use the fastest sampling clock so we can get the most accurate measurement. We have to remember that the timer must be able to handle the count without overflowing when we used a faster sampling clock. For example, in the demo, the total cycle of the pulse is about 4ms. f1, f8, and f32 can be used as the sampling clock (but not fc32). Timer B is a 16-bit counter, if we used f1, the total count will be  $20\text{MHz} \times 4\text{ms}$  which will be equal to 80,000. This count is beyond the 16-bit counter range (65,536). And so, f8 was used for the demo.

```
/* Initialize Timer B0 for t2 measurement */
tb0mr = 0x46;           // f8, measure rising-to-rising edges,
                        // pulse period measurement mode
```

#### List 1 Timer B Mode Register Initialization for Pulse Period Measurement

```
/* now that we have t2, let's set switch both timers to measure t1, rising-
to-falling edges (or falling-to-rising edges) */
tb0mr = 0x4A;           // f8, measure rising-to-rising edge, PM mode
tb1mr = 0x4A;           // f8, measure rising-to-rising edge, PM mode
```

#### List 2 Timer B Mode Register Initialization for Pulse Width Measurement

### 3.3 Interrupts

When taking pulse period/width measurements, interrupts occur after the period or pulse has been measured and is dependent on the mode selected. If using rising edge-to-rising edge mode, the interrupt is generated during the first rising edge of the count source (sampling clock) after the second rising edge of the pulse is detected. If using rising edge-to-falling edge/falling edge-to-rising edge mode, the interrupt is generated on the next rising edge of the count source for every rising or falling edge of the pulse.

### 4.0 Pulse Period/Width Measurement Demo Program

The demo program was written to run on the MSV30262-SKP board with Analog Device's ADXL210EB Evaluation Board connected to the M16C/26's Timer B input pins. The 'On' time period of the dual axis accelerometer is shown on the LCD. The LCD display is updated every 2 seconds. X-axis PM, in milliseconds (ms), is shown on the upper line while the Y-axis PM is displayed on the lower line of the LCD. Tilting the board sideways, X- or Y-axis, will change the pulse period displayed. Further modifications of the program will allow acceleration, tilt, vibration, or duty cycle measurements.

If you have an MSV30262-SKP, a copy of the source files can be found under the C:\MTOOL\MSV30262-SKP\Sample\_Code\PulsMsmt folder after MSV30262-SKP software installation. The program was compiled using the KNC30 Compiler, which also came with the MSV30262-SKP. It can be modified to suit a user application.

## 5.0 Conclusion

Pulse Period/Width Measurement mode on the M16C/26 MCU allows a simple method of measuring pulse periods or duty cycles. It can be used in applications where time periods, duty cycles, etc., needs to be measured.

    prc2 = 0;          // Write protect P9

    /* Initialize brd_mode to PWM initialization */
    brd_mode = INIT;

    /* measure t2, the width of one cycle, on both timers. t2 is used for calculation */
    get_t2();

    /* set our brd_mode to running */
    brd_mode = RUNNING;
}

/*****
Name:          get_t2
Parameters:     none
Returns:        none
Description:    Gets the width of one cycle, t2, and stores it in memory to be used
                for calculation later.
*****/

```

t2 is measured using timer B0 as it is the same for both X and Y channels (see ADXL210 datasheet for details). Timer B0 is initialized to measure rising edge to rising edge. By doing this, we will be able to measure one cycle (T2), which will be used for later calculation.

f8 is used because it provides high resolution for measuring our pulses (about 5ms cycles). f1 is too high that our 16-bit counter will always time out. f32/fc32 can be used but may not provide enough resolution.

After measuring t2, the timers are reconfigured for measuring t1, i.e. measure rising edge to falling edge.

While the app is running, it is called to compensate for error due to temperature.

```

*****
void get_t2(void){
    char second_t2 = 0;                // indicator for second measurement of t2.
                                        // 1st irq is indeterminate so we have to wait
                                        // for the second one

    /* disable interrupts before we change timer configuration */
    asm("FCLR I");                    // disable interrupts
    tb0ic = 0;                        // disable timer B0 irq
    tb1ic = 0;                        // disable timer B1 irq
    asm("FSET I");                    // enable interrupts

/*****
Name:          tb0_int
Parameters:    None
Returns:       None
Description:    This is the Timer B0, Y-axis, interrupt routine. During PWM
                initialization, it is used to measure t2, period of one total cycle.
                It is called every rising edge.

                When the app is already running, it is used to measure t1 ('ON'
                portion of the total cycle for the Y-axis). It is called every
                rising or falling edge.

                According to ADXL210 datasheet, 'ON' time t1 is time the pulse is
                in a high/Vcc state. We added a condition (p9_0 == 0) so that only
                measurements between rising-and-falling edges are taken but not
                falling-and-rising edges.

                No need to initialize timer B0 count register, tb0, because it is
                re-initialized after an effective edge.
