

## Description

The 5P49V60 is a programmable clock generator intended for automotive applications. Configurations may be stored in on-chip One-Time Programmable (OTP) memory or changed using I<sup>2</sup>C interface. This is Renesas' sixth generation of programmable clock technology (VersaClock 6E).

The frequencies are generated from a single reference clock. The reference clock can come from one of the two redundant clock inputs. A glitchless manual switchover function allows one of the redundant clocks to be selected during normal operation.

Two select pins allow up to four different configurations to be programmed and accessible using processor GPIOs or bootstrapping. The different selections may be used for different operating modes (full function, partial function, partial power-down), regional standards (US, Japan, Europe) or system production margin testing. The device may be configured to use one of two I<sup>2</sup>C addresses to allow multiple devices to be used in a system.

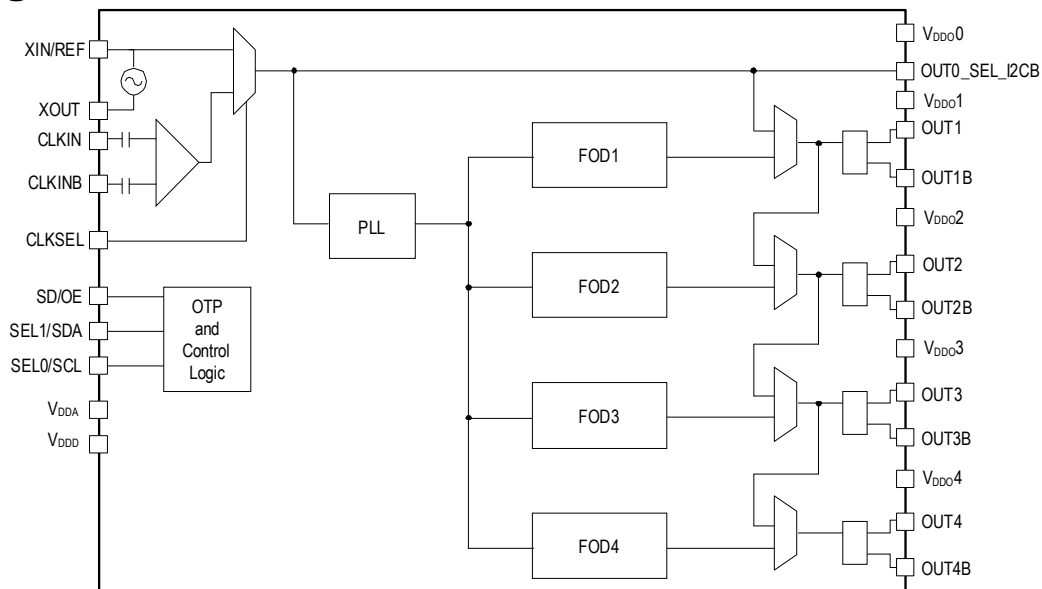

## Typical Applications

- Automotive infotainment
- Dashboard systems
- PCI Express 1.0 / 2.0 / 3.0 / 4.0 (with spread spectrum)
- Audio/Video applications
- Camera applications
- Active antennas
- In-vehicle networking

## Features

- Flexible 1.8V, 2.5V, 3.3V power-rails
- High-performance, low phase noise PLL, < 0.5ps RMS typical phase jitter on outputs
- Four banks of internal OTP memory
  - In-system or factory programmable
  - 2 select pins accessible with processor GPIOs or bootstrapping
- I<sup>2</sup>C serial programming interface
  - 0xD0 or 0xD4 I<sup>2</sup>C address options allows multiple devices configured in a same system
- Reference LVCMOS output clock
- Four universal output pairs individually configurable:
  - Differential (LVPECL, LVDS or HCSL)
  - 2 single-ended (2 LVCMOS in-phase or 180 degrees out of phase)
  - I/O V<sub>DD</sub>s can be mixed and matched, supporting 1.8V (LVDS and LVCMOS), 2.5V, or 3.3V
- Output frequency ranges:
  - LVCMOS clock outputs: 1MHz to 200MHz
  - LVDS, LVPECL, HCSL differential clock outputs: 1MHz to 350MHz
- Redundant clock inputs with manual switchover
- Programmable output enable or power-down mode
- 4 × 4 mm 24-VFQFPN wettable flank package
- AEC-Q100 qualified
- -40° to +105°C (Grade 2) temperature operation

## Pin Descriptions

Table 1. Pin Descriptions

| Number | Name             | Type   |                    | Description  |
|--------|------------------|--------|--------------------|--|
| 1      | CLKIN            | Input  | Internal Pull-down | Differential clock input. Weak 100kΩ internal pull-down.   |
| 2      | CLKINB           | Input  | Internal Pull-down | Complementary differential clock input. Weak 100kΩ internal pull-down.   |
| 3      | XOUT             | Output |                    | Crystal oscillator interface output.   |
| 4      | XIN/REF          | Input  |                    | Crystal oscillator interface input, or single-ended LVCMOS clock input. Ensure that the input voltage is between 500mV and 1.2V. Refer to the section <a href="#">Driving XIN/REF with a CMOS Driver</a> . |
| 5      | V <sub>DDA</sub> | Power  |                    | Analog functions power supply pin. Connect to 1.8V to 3.3V. V <sub>DDA</sub> and V <sub>DD</sub> should have the same voltage applied.   |
| 6      | CLKSEL           | Input  | Internal Pull-down | Input clock select. Selects the active input reference source in manual switchover mode.<br>0 = XIN/REF, XOUT (default).<br>1 = CLKIN, CLKINB.<br>See <a href="#">Table 19</a> for more details.           |
| 7      | SD/OE            | Input  | Internal Pull-down | Enables/disables the outputs (OE) or powers down the chip (SD).  |
| 8      | SEL1/SDA         | Input  | Internal Pull-down | Configuration select pin, or I <sup>2</sup> C SDA input as selected by OUT0_SEL_I2CB. Weak internal pull-down resistor.  |
| 9      | SEL0/SCL         | Input  | Internal Pull-down | Configuration select pin, or I <sup>2</sup> C SCL input as selected by OUT0_SEL_I2CB. Weak internal pull-down resistor.  |

**Table 1. Pin Descriptions (Cont.)**

| Number | Name              | Type             |                       | Description  |
|--------|-------------------|------------------|-----------------------|--|
| 10     | V <sub>DDO4</sub> | Power            |                       | Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT4/OUT4B.  |
| 11     | OUT4              | Output           |                       | Output clock 4. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 12     | OUT4B             | Output           |                       | Complementary output clock 4. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 13     | OUT3B             | Output           |                       | Complementary output clock 3. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 14     | OUT3              | Output           |                       | Output clock 3. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 15     | V <sub>DDO3</sub> | Power            |                       | Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT3/OUT3B.  |
| 16     | OUT2B             | Output           |                       | Complementary output clock 2. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 17     | OUT2              | Output           |                       | Output clock 2. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 18     | V <sub>DDO2</sub> | Power            |                       | Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT2/OUT2B.  |
| 19     | OUT1B             | Output           |                       | Complementary output clock 1. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 20     | OUT1              | Output           |                       | Output clock 1. Refer to the <a href="#">Output Drivers</a> section for more details.  |
| 21     | V <sub>DDO1</sub> | Power            |                       | Output power supply. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT1/OUT1B.  |
| 22     | V <sub>DDD</sub>  | Power            |                       | Digital functions power supply pin. Connect to 1.8 to 3.3V. V <sub>DDA</sub> and V <sub>DDD</sub> should have the same voltage applied.  |
| 23     | V <sub>DDO0</sub> | Power            |                       | Power supply pin for OUT0_SEL_I2CB. Connect to 1.8 to 3.3V. Sets output voltage levels for OUT0.   |
| 24     | OUT0_SEL_I2CB     | Input/<br>Output | Internal<br>Pull-down | Latched input/LVCMOS output. At power-up, the voltage at the pin OUT0_SEL_I2CB is latched by the part and used to select the state of pins 8 and 9. If a weak pull-up (10kΩ) is placed on OUT0_SEL_I2CB, pins 8 and 9 will be configured as hardware select pins, SEL1 and SEL0. If a weak pull-down (10kΩ) is placed on OUT0_SEL_I2CB or it is left floating, pins 8 and 9 will act as the SDA and SCL pins of an I <sup>2</sup> C interface. After power-up, the pin acts as an LVCMOS reference output. |
| 25     | GND               | GND              |                       | Connect to ground pad.   |

## Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the 5P49V60 at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Table 2. Absolute Maximum Ratings**

| Item  | Rating                           |
|---|----------------------------------|
| Supply Voltage, $V_{DDA}$ , $V_{DDD}$ , $V_{DDO}$ | 3.465V.                          |
| XIN/REF Input                                     | 1.2V.                            |
| CLKIN, CLKINB Input                               | $V_{DDO0}$ , 1.2V voltage swing. |
| I <sup>2</sup> C Loading Current                  | 10mA.                            |
| Storage Temperature, $T_{STG}$                    | -65°C to 150°C.                  |
| ESD Human Body Model                              | 2000V.                           |

## Thermal Characteristics

**Table 3. Thermal Characteristics**

| Symbol        | Parameter   | Value | Units |
|---------------|---|-------|-------|
| $\theta_{JA}$ | Theta $J_A$ . Junction to air thermal impedance (0mps).   | 42    | °C/W  |
| $\theta_{JB}$ | Theta $J_B$ . Junction to board thermal impedance (0mps). | 2.35  | °C/W  |
| $\theta_{JC}$ | Theta $J_C$ . Junction to case thermal impedance (0mps).  | 41.8  | °C/W  |

## Recommended Operating Conditions

**Table 4. Recommended Operating Conditions**

| Symbol     | Parameter   | Minimum | Typical | Maximum | Units |
|------------|---|---------|---------|---------|-------|
| $V_{DDOX}$ | Power supply voltage for supporting 1.8V outputs.   | 1.71    | 1.8     | 1.89    | V     |
|            | Power supply voltage for supporting 2.5V outputs.   | 2.375   | 2.5     | 2.625   | V     |
|            | Power supply voltage for supporting 3.3V outputs.   | 3.135   | 3.3     | 3.465   | V     |
| $V_{DDD}$  | Power supply voltage for core logic functions.  | 1.71    |         | 3.465   | V     |
| $V_{DDA}$  | Analog power supply voltage. Use filtered analog power supply.                                      | 1.71    |         | 3.465   | V     |
| $T_A$      | Operating temperature (Grade 2), ambient.   | -40     |         | 105     | °C    |
| $C_L$      | Maximum load capacitance (3.3V LVCMOS only).  |         |         | 15      | pF    |
| $t_{PU}$   | Power-up time for all $V_{DD}S$ to reach minimum specified voltage (power ramps must be monotonic). | 0.05    |         | 5       | ms    |

## Electrical Characteristics

**Table 5. Current Consumption**

$V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V \pm 5\%, 2.5V \pm 5\%, 1.8V \pm 5\%$ ,  $T_A = -40^\circ C$  to  $+105^\circ C$  unless stated otherwise.

| Symbol         | Parameter                    | Conditions  | Minimum | Typical | Maximum | Units |
|----------------|------------------------------|---|---------|---------|---------|-------|
| $I_{DDCORE}^1$ | Core Supply Current          | 100MHz on all outputs, 25MHz REFCLK (3.3V)            |         | 32      | 42      | mA    |
|                |                              | 100MHz on all outputs, 25MHz REFCLK (2.5V)            |         | 32      | 42      |       |
|                |                              | 100MHz on all outputs, 25MHz REFCLK (1.8V)            |         | 31      | 42      |       |
| $I_{DDOx}$     | Output Buffer Supply Current | LVPECL, 350MHz, 3.3V $V_{DDOx}$ .                     |         | 48      | 63      | mA    |
|                |                              | LVPECL, 350MHz, 2.5V $V_{DDOx}$ .                     |         | 41      | 54      | mA    |
|                |                              | LVDS, 350MHz, 3.3V $V_{DDOx}$ .                       |         | 26      | 32      | mA    |
|                |                              | LVDS, 350MHz, 2.5V $V_{DDOx}$ (same setting as 3.3V). |         | 25      | 30      | mA    |
|                |                              | LVDS, 350MHz, 1.8V $V_{DDOx}$ .                       |         | 23      | 27      | mA    |
|                |                              | HCSL, 250MHz, 3.3V $V_{DDOx}^2$ .                     |         | 39      | 48      | mA    |
|                |                              | HCSL, 250MHz, 2.5V $V_{DDOx}^2$ .                     |         | 37      | 46      | mA    |
|                |                              | LVC MOS, 50MHz, 3.3V, $V_{DDOx}^{2,3}$ .              |         | 23      | 27      | mA    |
|                |                              | LVC MOS, 50MHz, 2.5V, $V_{DDOx}^{2,3}$ .              |         | 20      | 24      | mA    |
|                |                              | LVC MOS, 50MHz, 1.8V, $V_{DDOx}^{2,3}$ .              |         | 18      | 21      | mA    |
|                |                              | LVC MOS, 200MHz, 3.3V $V_{DDOx}^{2,3}$ .              |         | 45      | 58      | mA    |
|                |                              | LVC MOS, 200MHz, 2.5V $V_{DDOx}^{2,3}$ .              |         | 34      | 45      | mA    |
|                |                              | LVC MOS, 200MHz, 1.8V $V_{DDOx}^{2,3}$ .              |         | 24      | 33      | mA    |
| $I_{DDPD}$     | Power Down Current           | SD asserted, I <sup>2</sup> C programming (3.3V).     |         | 10      | 12      | mA    |
|                |                              | SD asserted, I <sup>2</sup> C programming (2.5V).     |         | 10      | 12      |       |
|                |                              | SD asserted, I <sup>2</sup> C programming (1.8V).     |         | 10      | 12      |       |

<sup>1</sup>  $I_{DDCORE} = I_{DDA} + I_{DDD}$ , no loads.

<sup>2</sup> Measured into a 5" 50Ω trace with 2pF load.

<sup>3</sup> Single CMOS driver active.

**Table 6. AC Timing Characteristics**

$V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V \pm 5\%, 2.5V \pm 5\%, 1.8V \pm 5\%$ ,  $T_A = -40^\circ C$  to  $+105^\circ C$  unless stated otherwise.

| Symbol              | Parameter         | Conditions   | Minimum | Typical | Maximum | Units |
|---------------------|-------------------|--|---------|---------|---------|-------|
| $f_{IN}^1$          | Input Frequency   | Input frequency limit (crystal).   | 8       |         | 40      | MHz   |
|                     |                   | Input frequency limit (CLKIN,CLKINB).  | 1       |         | 350     | MHz   |
|                     |                   | Input frequency limit (single-ended over XIN).   | 1       |         | 200     | MHz   |
| $f_{OUT}^2$         | Output Frequency  | Single-ended clock output limit (LVCMOS).  | 1       |         | 200     | MHz   |
|                     |                   | Differential clock output limit (LVPECL/LVDS/HCSL).  | 1       |         | 350     |       |
| $t_{DC}^3$          | Output Duty Cycle | Measured at $V_{DD}/2$ , all outputs except reference output, $V_{DDOX} = 2.5V$ or $3.3V$ .              | 45      | 50      | 55      | %     |
|                     |                   | Measured at $V_{DD}/2$ , all outputs except reference output, $V_{DDOX} = 1.8V$ .                        | 40      | 50      | 60      | %     |
|                     |                   | Measured at $V_{DD}/2$ , reference output OUT0 (5MHz–150.1MHz) with 50% duty cycle input.                | 40      | 50      | 60      | %     |
|                     |                   | Measured at $V_{DD}/2$ , reference output OUT0 (150.1MHz–200MHz) with 50% duty cycle input.              | 30      | 50      | 70      | %     |
| $t_{SKEW}$          | Output Skew       | Skew between the same frequencies, with outputs using the same driver format and phase delay set to 0ns. |         | 75      |         | ps    |
| $t_{STARTUP}^{4,5}$ | Startup Time      | Measured after all $V_{DD}$ s have risen above 90% of their target value <sup>6</sup> .                  |         |         | 30      | ms    |
|                     |                   | PLL lock time from shutdown mode.  |         | 3       | 4       | ms    |

<sup>1</sup> Practical lower frequency is determined by loop filter settings.

<sup>2</sup> A slew rate of 2.75V/ns or greater should be selected for output frequencies of 100MHz or higher.

<sup>3</sup> Duty cycle is only guaranteed at maximum slew rate settings.

<sup>4</sup> Actual PLL lock time depends on the loop configuration.

<sup>5</sup> Includes loading the configuration bits from EPROM to PLL registers. It does not include EPROM programming/write time.

<sup>6</sup> Power-up with temperature calibration enabled; contact Renesas if shorter lock-time is required in system.

**Table 7. Input Characteristics**

$V_{DDA}$ ,  $V_{DDD}$ ,  $V_{DDO0}$  = 3.3V ±5%, 2.5V ±5%, 1.8V ±5%,  $T_A$  = -40°C to +105°C unless stated otherwise.

| Symbol    | Parameter            | Conditions  | Minimum              | Typical | Maximum              | Units |

| $T_F$           | LVDS fall time 80%–20%  |         | 300     |         | ps    |

**Table 11. Electrical Characteristics – LVPECL Outputs**

$V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V \pm 5\%, 2.5V \pm 5\%, T_A = -40^\circ C$  to  $+105^\circ C$  unless stated otherwise.

| Symbol      | Parameter  | Minimum          | Typical | Maximum          | Units |
|-------------|--|------------------|---------|------------------|-------|
| $V_{OH}$    | Output Voltage High, Terminated through $50\Omega$ tied to $V_{DD} - 2V$ | $V_{DDO} - 1.19$ |         | $V_{DDO} - 0.69$ | V     |
| $V_{OL}$    | Output Voltage Low, Terminated through $50\Omega$ tied to $V_{DD} - 2V$  | $V_{DDO} - 1.94$ |         | $V_{DDO} - 1.4$  | V     |
| $V_{SWING}$ | Peak-to-Peak Output Voltage Swing  | 0.55             |         | 0.993            | V     |
| $T_R$       | LVPECL rise time 20%–80%   |                  | 400     |                  | ps    |
| $T_F$       | LVPECL fall time 80%–20%   |                  | 400     |                  | ps    |

**Table 12. Electrical Characteristics – HCSL Outputs <sup>1</sup>**

$V_{DDA}, V_{DDD}, V_{DDO0} = 3.3V \pm 5\%, 2.5V \pm 5\%, T_A = -40^\circ C$  to  $+105^\circ C$  unless stated otherwise.

| Symbol             | Parameter                  | Conditions   | Minimum | Typical | Maximum | Units |
|--------------------|----------------------------|--|---------|---------|---------|-------|
| dV/dt              | Slew Rate                  | Scope averaging on <sup>2,3</sup> .  | 1       |         | 4       | V/ns  |
| $\Delta V/dt$      | Slew Rate Matching         | Scope averaging on <sup>3</sup> .  |         |         | 20      | %     |
| $V_{MAX}$          | Maximum Voltage            | Measurement on single-ended signal using absolute value (scope averaging off). |         |         | 1150    | mV    |
| $V_{MIN}$          | Minimum Voltage            |  | -300    |         |         | mV    |
| $V_{SWING}$        | Voltage Swing              | Scope averaging off <sup>2,6</sup> .   | 300     |         |         | mV    |
| $V_{CROSS}$        | Crossing Voltage Value     | Scope averaging off <sup>4,6</sup> .   | 250     |         | 550     | mV    |
| $\Delta V_{CROSS}$ | Crossing Voltage Variation | Scope averaging off <sup>5</sup> .   |         |         | 140     | mV    |

<sup>1</sup> Guaranteed by design and characterization. Not 100% tested in production.

<sup>2</sup> Measured from differential waveform.

<sup>3</sup> Slew rate is measured through the  $V_{SWING}$  voltage range centered around differential 0V. This results in a  $\pm 150mV$  window around differential 0V.

<sup>4</sup>  $V_{CROSS}$  is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>5</sup> The total variation of all  $V_{CROSS}$  measurements in any particular system. Note that this is a subset of  $V_{CROSS}$  min/max ( $V_{CROSS}$  absolute) allowed. The intent is to limit  $V_{CROSS}$  induced modulation by setting  $\Delta V_{CROSS}$  to be smaller than  $V_{CROSS}$  absolute.

<sup>6</sup> Measured from single-ended waveform.

**Table 13. Spread Spectrum Generation Specifications**

| Symbol       | Parameter        | Conditions   | Minimum                     | Typical | Maximum | Units       |
|--------------|------------------|--|-----------------------------|---------|---------|-------------|
| $f_{SSOUT}$  | Spread Frequency | Output frequency range for spread spectrum.          | 5                           |         | 300     | MHz         |
| $f_{MOD}$    | Mod Frequency    | Modulation frequency.                                | 30 to 63                    |         |         | kHz         |
| $f_{SPREAD}$ | Spread Value     | Amount of spread value (programmable)–center spread. | $\pm 0.25\%$ to $\pm 2.5\%$ |         |         | % $f_{OUT}$ |
|              |                  | Amount of spread value (programmable)–down spread.   | -0.5% to -5%                |         |         |             |

## I<sup>2</sup>C Bus Characteristics

**Table 14. I<sup>2</sup>C Bus DC Characteristics**

3.3V ±5% only.

| Symbol           | Parameter             | Conditions                         | Minimum                 | Typical | Maximum                | Units |
|------------------|-----------------------|------------------------------------|-------------------------|---------|------------------------|-------|

<sup>1</sup> Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup> Based on PCIe Base Specification Rev 4.0 version 1.0. See <http://www.pcisig.com> for latest specifications.

<sup>3</sup> Sample size of at least 100K cycles. This figure extrapolates to 108ps pk-pk at 1M cycles for a BER of  $1^{-12}$ .

<sup>4</sup> According to the PCIe Base Specification Rev4.0 version 1.0, the jitter transfer functions and corresponding jitter limits are not defined for the IR clock architecture. Widely accepted industry limits using widely accepted industry filters are used to populate this table. There are no accepted filters or limits for IR clock architectures at PCIe Gen1 or Gen4 data rates.

<sup>5</sup> IR (Independent Reference) is the new name for Separate Reference Independent Spread (SRIS) and Separate Reference no Spread (SRNS) PCIe clock architectures.

## Features and Functional Blocks

### Device Startup and Power-On-Reset

The device has an internal power-up reset (POR) circuit. All  $V_{DD^S}$  must be connected to desired supply voltage to trigger POR.

User can define specific default configurations through internal One-Time-Programmable (OTP) memory. Either customer or factory can program the default configuration. Please refer to [VersaClock 6E Family Register Descriptions and Programming Guide](#) for details or contact Renesas if a specific factory-programmed default configuration is required.

Device will identify which of the 2 modes to operate in by the state of  $OUT0\_SEL\_I2CB$  pin at POR. Both of the modes default configurations can be programmed as stated above.

- Software Mode (I<sup>2</sup>C):**  $OUT0\_SEL\_I2CB$  is low at POR. I<sup>2</sup>C interface will be open to users for in-system programming, overriding device default configurations at any time.
- Hardware Select Mode:**  $OUT0\_SEL\_I2CB$  is high at POR. Device has been programmed to load OTP at power-up ( $REG0[7] = 1$ ). The device will load internal registers according to [Table 18](#).

Internal OTP memory can support up to 4 configurations, selectable by  $SEL0/SEL1$  pins.

At POR, logic levels at  $SEL0$  and  $SEL1$  pins must be settled, resulting the selected configuration to be loaded at power up.

After the first 10ms of operation, the levels of the  $SELx$  pins can be changed, either to low or to the same level as  $V_{DD^D}/V_{DDA}$ . The  $SELx$  pins must be driven with a digital signal of < 300ns rise/fall time and only a single pin can be changed at a time. After a pin level change, the device must not be interrupted for at least 1ms so that the new values have time to load and take effect.

**Table 18. Power-up Behavior**

| $OUT0\_SEL\_I2CB$ at POR | $SEL1$ | $SEL0$ | I <sup>2</sup> C Access | $REG0:7$ | Config                    |
|--------------------------|--------|--------|-------------------------|----------|---------------------------|
| 1                        | 0      | 0      | No                      | 0        | 0                         |
| 1                        | 0      | 1      | No                      | 0        | 1                         |
| 1                        | 1      | 0      | No                      | 0        | 2                         |
| 1                        | 1      | 1      | No                      | 0        | 3                         |
| 0                        | X      | X      | Yes                     | 1        | I <sup>2</sup> C defaults |
| 0                        | X      | X      | Yes                     | 0        | 0                         |

### Reference Clock and Selection

The device supports up to two clock inputs.

- Crystal input, can be driven by a single-ended clock.
- Clock input (CLKIN, CLKINB), a fully differential input that only accepts a reference clock. A single-ended clock can also drive it on CLKIN.

**Figure 7. Clock Input Diagram, Internal Logic**

### Manual Switchover

The CLKSEL pin selects the input clock between either XTAL/REF or (CLKIN, CLKINB). CLKSEL polarity can be changed by I<sup>2</sup>C programming (Byte 0x13[1]) as shown in the table below.

0 = XIN/REF, XOUT (default); 1 = CLKIN, CLKINB.

**Table 19. Input Clock Select**

| PRIMSRC (Register 0x13[1]) | CLKSEL | Source        |
|----------------------------|--------|---------------|
| 0                          | 0      | XIN/REF       |
| 0                          | 1      | CLKIN, CLKINB |
| 1                          | 0      | CLKIN, CLKINB |
| 1                          | 1      | XIN/REF       |

When  $SM[1:0]$  is "0x", the redundant inputs are in manual switchover mode. In this mode, CLKSEL pin is used to switch between the primary and secondary clock sources. The PRIMSRC bit determines the primary and secondary clock source setting. During the switchover, no glitches will occur at the output of the device, although there may be frequency and phase drift, depending on the exact phase and frequency relationship between the primary and secondary clocks.

## Internal Crystal Oscillator (XIN/REF)

### Choosing Crystals

A crystal manufacturer will calibrate its crystals to the nominal frequency with a certain load capacitance value. When the oscillator load capacitance matches the crystal load capacitance, the oscillation frequency will be accurate. When the oscillator load capacitance is lower than the crystal load capacitance, the oscillation frequency will be higher than nominal and vice versa so for an accurate oscillation frequency you need to make sure to match the oscillator load capacitance with the crystal load capacitance.

### Tuning the Crystal Load Capacitor

Cs1 and Cs2 are stray capacitances at each crystal pin and typical values are between 1pF and 3pF.

Ce1 and Ce2 are additional external capacitors, increasing the load capacitance reduces the oscillator gain so please consult the factory when adding Ce1 and/or Ce2 to avoid crystal startup issues. Ci1 and Ci2 are integrated programmable load capacitors, one at XIN and one at XOUT. Ci1 and Ci2.

The value of each capacitor is composed of a fixed capacitance amount plus a variable capacitance amount set with the XTAL[5:0] register.

**Table 21. Recommended Crystal Characteristics**

| Parameter                                      | Minimum     | Typical | Maximum | Units    |
|--|-------------|---------|---------|----------|
| Mode of Oscillation                            | Fundamental |         |         |          |
| Frequency                                      | 8           | 25      | 40      | MHz      |
| Equivalent Series Resistance (ESR)             |             | 10      | 100     | $\Omega$ |
| Shunt Capacitance                              |             |         | 7       | pF       |
| Load Capacitance ( $C_L$ ) at $\leq 25$ MHz    | 6           | 8       | 12      | pF       |
| Load Capacitance ( $C_L$ ) $> 25$ MHz to 40MHz | 6           |         | 8       | pF       |
| Maximum Crystal Drive Level                    |             |         | 100     | $\mu$ W  |

Ci1 and Ci2 are commonly programmed to be the same value. Adjustment of the crystal tuning capacitors allows maximum flexibility to accommodate crystals from various manufacturers. The range of tuning capacitor values available are in accordance with the following table.

Ci1/Ci2 starts at 9pF with setting 000000b and can be increased up to 25pF with setting 111111b. The step per bit is 0.5pF.

**Table 20. XTAL[5:0] Tuning Capacitor**

| Parameter | Bits | Step (pF) | Minimum (pF) | Maximum (pF) |
|-----------|------|-----------|--------------|--------------|
| XTAL      | 6    | 0.5       | 9            | 25           |

You can write the following equation for this capacitance:

$$C_i = 9\text{pF} + 0.5\text{pF} \times \text{XTAL}[5:0]$$

$$C_{XIN} = C_{i1} + C_{s1} + C_{e1}$$

$$C_{XOUT} = C_{i2} + C_{s2} + C_{e2}$$

The final load capacitance of the crystal:

$$C_L = C_{XIN} \times C_{XOUT} / (C_{XIN} + C_{XOUT})$$

It is recommended to set the same value for capacitors the same at each crystal pin, meaning:

$$C_{XIN} = C_{XOUT}$$

**Example 1:** The crystal load capacitance is specified as 8pF and the stray capacitance at each crystal pin is Cs = 1.5pF. Assuming equal capacitance value at XIN and XOUT, the equation is as follows:

$$8\text{pF} = (9\text{pF} + 0.5\text{pF} \times \text{XTAL}[5:0] + 1.5\text{pF}) / 2$$

$$\text{So, XTAL}[5:0] = 11 \text{ (decimal)}.$$

**Example 2:** The crystal load capacitance is specified as 12pF and the stray capacitance Cs is unknown. Footprints for external capacitors Ce are added and a worst case Cs of 5pF is used. For now we use Cs + Ce = 5pF and the right value for Ce can be determined later to make 5pF together with Cs.

$$12\text{pF} = (9\text{pF} + 0.5\text{pF} \times \text{XTAL}[5:0] + 5\text{pF}) / 2$$

$$\text{So, XTAL}[5:0] = 20 \text{ (decimal)}.$$

## Programmable Loop Filter

**Table 22. Loop Filter**

The device PLL loop bandwidth range depends on the input reference frequency (Fref).

| Input Reference Frequency (MHz) | Loop Bandwidth Minimum (kHz) | Loop Bandwidth Maximum (kHz) |
|---------------------------------|------------------------------|------------------------------|
| 1                               | 40                           | 126                          |
| 350                             | 300                          | 1000                         |

### Fractional Output Dividers (FOD)

The device has 4 fractional output dividers (FOD). Each of the FODs are comprised of a 12-bit integer counter, and a 24-bit fractional counter. The output divider can operate in integer divide only mode for improved performance, or utilize the fractional counters to generate a clock frequency accurate to 50ppb.

FOD has the following features:

#### Individual Spread Spectrum Modulation

The output clock frequencies can be modulated to spread energy across a broader range of frequencies, lowering system EMI.

Each divider has individual spread ability. Spread modulation independent of output frequency, a triangle wave modulation between 30kHz and 63kHz.

Spread spectrum can be applied to any output clock, any clock frequency, and any spread amount from  $\pm 0.25\%$  to  $\pm 2.5\%$  center-spread and  $-0.5\%$  to  $-5\%$  down-spread.

#### Bypass Mode

Bypass mode (divide by 1) to allow the output to behave as a buffered copy from the input or another FOD.

#### Dividers Alignment

Each output divider block has a synchronizing pulse to provide startup alignment between outputs dividers. This allows alignment of outputs for low skew performance.

When the device is at hardware select mode, outputs will be automatically aligned at POR. The same synchronization reset is also triggered when switching between configurations with the SEL0/1 pins. This ensures that the outputs remain aligned in every configuration.

When using software mode I<sup>2</sup>C to reprogram an output divider during operation, alignment can be lost. Alignment can be restored by manually triggering the reset through I<sup>2</sup>C.

The outputs are aligned on the falling edges of each output by default. Rising edge alignment can also be achieved by utilizing the programmable skew feature to delay the faster clock by 180 degrees. The programmable skew feature also allows for fine tuning of the alignment.

### Programmable Skew

The device has the ability to skew outputs by quadrature values. The skew on each output can be adjusted from 0 to 360 degrees. Skew is adjusted in units equal to 1/32 of the VCO period. So, for 100MHz output and a 2500MHz VCO, you can select how many 12.5ps units you want added to your skew (resulting in units of 0.45 degrees). For example, 0, 0.45, 0.90, 1.35, 1.80, and so on. The granularity of the skew adjustment is always dependent on the VCO period and the output period.

### Output Drivers

The device output drivers support the following features individually:

- 2.5V or 3.3V voltage level for HCSL/LVPECL operation
- 1.8V, 2.5V or 3.3V voltage levels for CMOS/LVDS operation
- CMOS supports 4 operating modes:
  - CMOSD: OUTx and OUTxB 180 degrees out of phase
  - CMOSX2: OUTx and OUTxB phase-aligned
  - CMOS1: only OUTx pin is on
  - CMOS2: only OUTxB pin is on

When a given output is configured to at CMOSD or CMOSX2, then all previously described configuration and control apply equally to both pins.

- Independent output enable/disabled by register bits. When disabled, an output can be either in a logic 1 state or Hi-Z.

The following options are used to disable outputs:

1. Output turned off by I<sup>2</sup>C.
2. Output turned off by SD/OE pin.
3. Output unused, which means is turned off regardless of OE pin status.

### SD/OE Pin Function

SD/OE pin can be programmed as following functions:

1. OE output enable (low active).
2. OE output enable (high active).
  - a. **Note:** In this mode, toggling the OE input from low level to high level is mandatory to activate outputs. This should occur after the device has started up and the PLL has reached lock status. Please refer to [VersaClock 6E Family Register Descriptions and Programming Guide](#), chapter “Shutdown Function”, for details.
3. Global shutdown (low active).
4. Global shutdown (high active).

Output behavior when disabled is also programmable. User will have the option to choose output driver behavior when it's off:

1. OUTx pin high, OUTxB pin low. (Controlled by SD/OE pin).
2. OUTx/OUTxB Hi-Z (Controlled by SD/OE pin).
3. OUTx pin high, OUTxB pin low. (Configured through I<sup>2</sup>C).
4. OUTx/OUTxB Hi-Z (Configured by I<sup>2</sup>C).

The user has the option to disable the output with either I<sup>2</sup>C or SD/OE pin. Refer to [VersaClock 6E Family Register Descriptions and Programming Guide](#) for details.

### I<sup>2</sup>C Operation

The device acts as a slave device on the I<sup>2</sup>C bus using one of the two I<sup>2</sup>C addresses (0xD0 or 0xD4) to allow multiple devices to be used in the system. The interface accepts byte-oriented block write and block read operations.

Address bytes (2 bytes) specify the register address of the byte position of the first register to write or read.

Data bytes (registers) are accessed in sequential order from the lowest to the highest byte (most significant bit first).

Read and write block transfers can be stopped after any complete byte transfer. During a write operation, data will not be moved into the registers until the STOP bit is received, at which point, all data received in the block write will be written simultaneously.

For full electrical I<sup>2</sup>C compliance, use external pull-up resistors for SDATA and SCLK.

Figure 9. Application Circuit Example

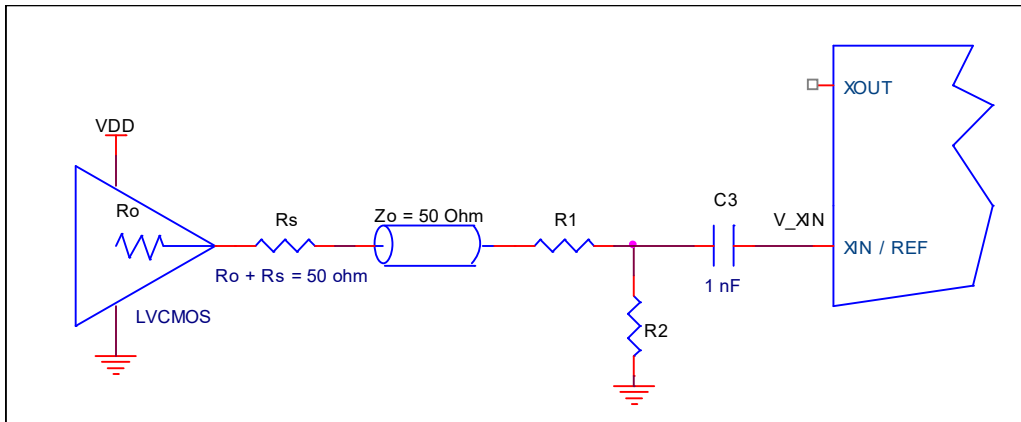

## Input – Driving the XIN/REF or CLKIN

### Driving XIN/REF with a CMOS Driver

In some cases, it is encouraged to have XIN/REF driven by a clock input for reasons like better SNR, multiple input select with device CLKIN, etc. The XIN/REF pin requires an input amplitude between 500mV and 1.2V. The clock slew rate should be at least 0.2V/ns ( $\geq 0.2V/ns$ ).

The XIN/REF input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The XOUT pin can be left floating.

**Figure 10. Overdriving XIN with a CMOS Driver**

**Table 23. Nominal Voltage Divider Values for Overdriving XIN with Single-ended Driver**

| LVCMOS Diver $V_{DD}$ | $R_o + R_s$ | $R_1$ | $R_2$ | $V_{XIN}$ (peak) | $R_o + R_s + R_1 + R_2$ |
|-----------------------|-------------|-------|-------|------------------|-------------------------|
| 3.3                   | 50.0        | 130   | 75    | 0.97             | 255                     |
| 2.5                   | 50.0        | 100   | 100   | 1.00             | 250                     |
| 1.8                   | 50.0        | 62    | 130   | 0.97             | 242                     |

### Driving XIN with an LVPECL Driver

Figure 11 shows an example of the interface diagram for a +3.3V LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XIN/REF input. It is recommended that all components in the schematics be placed in the layout; though some components might not be used, they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input. If the driver is 2.5V LVPECL, the only change necessary is to use the appropriate value of  $R_3$ .

**Figure 11. Overdriving XIN with an LVPECL Driver**

### Wiring the CLKIN Pin to Accept Single-ended Inputs

CLKIN cannot take a signal larger than 1.2V pk-pk due to the 1.2V regulated input inside. However, it is internally AC coupled so it is able to accept both LVDS and LVPECL input signals.

Occasionally, it is desired to have CLKIN to take CMOS levels. Below is an example showing how this can be achieved.

This configuration has three properties:

1. Total output impedance of  $R_o$  and  $R_s$  matches the 50Ω transmission line impedance.
2.  $V_{rx}$  voltage is generated at the CLKIN which maintains the LVCMOS driver voltage level across the transmission line for best S/N.
3.  $R_1$ – $R_2$  voltage divider values ensure that  $V_{rx}$  p-p at CLKIN is less than the maximum value of 1.2V.

**Figure 12. Recommended Schematic for Driving CLKIN with LVCMOS Driver**

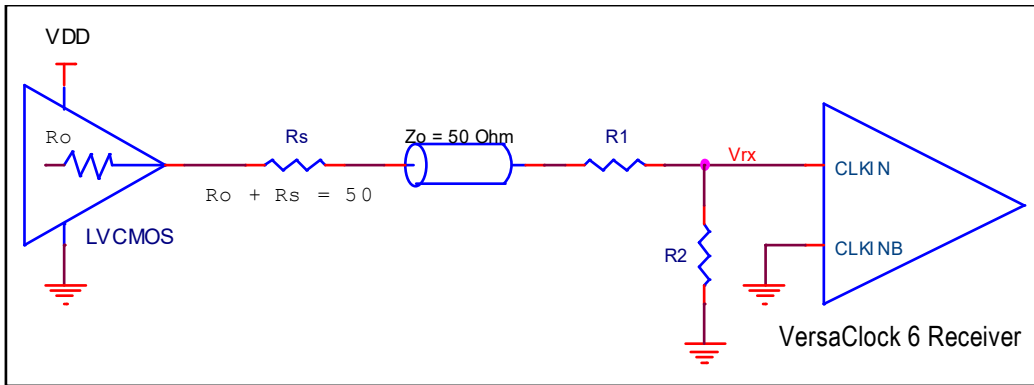

Table 24 shows resistor values that ensure the maximum drive level for the CLKIN port is not exceeded for all combinations of 5% tolerance on the driver  $V_{DD}$ ,  $V_{DD00}$  and 5% resistor tolerances. The values of the resistors can be adjusted to reduce the loading for slower and weaker LVCMOS driver by increasing the impedance of the  $R_1$ – $R_2$  divider. To better assist this assessment, the total load ( $R_o + R_s + R_1 + R_2$ ) on the driver is included in the table.

**Table 24. Nominal Voltage Divider Values for Overdriving CLKIN with Single-ended Driver**

| LVC MOS Diver $V_{DD}$ | $R_o + R_s$ | $R_1$ | $R_2$ | $V_{rx}$ (peak) | $R_o + R_s + R_1 + R_2$ |
|------------------------|-------------|-------|-------|-----------------|-------------------------|
| 3.3                    | 50.0        | 130   | 75    | 0.97            | 255                     |
| 2.5                    | 50.0        | 100   | 100   | 1.00            | 250                     |
| 1.8                    | 50.0        | 62    | 130   | 0.97            | 242                     |

### Driving CLKIN with Differential Clock

CLKIN/CLKINB will accept DC coupled HCSL/LVPECL/LVDS signals.

**Figure 13. CLKIN, CLKINB Input Driven by an HCSL Driver**

## Output – Single-ended or Differential Clock Terminations

### LVDS Termination

For a general LVDS interface, the recommended value for the termination impedance ( $Z_T$ ) is between  $90\Omega$  and  $132\Omega$ . The actual value should be selected to match the differential impedance ( $Z_0$ ) of your transmission line. A typical point-to-point LVDS design uses a  $100\Omega$  parallel resistor at the receiver and a  $100\Omega$  differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. The standard termination schematic as shown in figure [Standard Termination](#) or the termination of figure [Optional Termination](#) can be used, which uses a center tap capacitance to help filter common mode noise. The capacitor value should be approximately  $50\text{pF}$ . In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the Renesas LVDS output. If using a non-standard termination, it is recommended to contact Renesas and confirm that the termination will function as intended. For example, the LVDS outputs cannot be AC coupled by placing capacitors between the LVDS outputs and the  $100\Omega$  shunt load. If AC coupling is required, the coupling caps must be placed between the  $100\Omega$  shunt termination and the receiver. In this manner, the termination of the LVDS output remains DC coupled.

**Figure 14. Standard and Optional Terminations**

### LVPECL Termination

The clock layout topology shown below is a typical termination for LVPECL outputs.

The differential outputs generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion.

For  $V_{DD0} = 2.5V$ , the  $V_{DD0} - 2V$  is very close to ground level. The R3 in 2.5V LVPECL output termination can be eliminated and the termination is shown in Figure 17, 2.5V LVPECL Output Termination.

**Figure 15. 3.3V LVPECL Output Termination (1)**

**Figure 16. 3.3V LVPECL Output Termination (2)**

**Figure 17. 2.5V LVPECL Output Termination**

**Figure 18. 2.5V LVPECL Driver Termination (1)**

**Figure 19. 2.5V LVPECL Driver Termination (2)**

**HCSL Termination**

HCSL termination scheme applies to both 3.3V and 2.5V  $V_{DDO}$ .

**Figure 20. HCSL Receiver Terminated**

**Figure 21. HCSL Source Terminated**

### LVC MOS Termination

Each output pair can be configured as a standalone CMOS or dual-CMOS output driver. Example of CMOSD driver termination is shown below.

- CMOS1 – Single CMOS active on OUTx pin.
- CMOS2 – Single CMOS active on OUTxB pin.
- CMOSD – Dual CMOS outputs active on both OUTx and OUTxB pins, 180 degrees out of phase.
- CMOSX2 – Dual CMOS outputs active on both OUTx and OUTxB pins, in-phase.

**Figure 22. LVC MOS Termination**

### Package Outline Drawings

The [package outline drawings](#) are appended at the end of this document. The package information is the most current data available.

### Marking Diagram

- Line 1: truncated part number.
- Line 2: “ddd” denotes dash code.
- Line 3:
  - “YWW” is the last digit of the year and week that the part was assembled.
  - “\*\*” denotes sequential lot number.
  - “\$” denotes mark code.

### Ordering Information

| Orderable Part Number | Package  | Carrier Type | Temperature    |
|-----------------------|--|--------------|----------------|
| 5P49V60AdddNLG2       | 4 × 4 mm, 0.5mm pitch 24-VFQFPN Wettable Flank | Tray         | -40° to +105°C |
| 5P49V60AAdddNLG28     | 4 × 4 mm, 0.5mm pitch 24-VFQFPN Wettable Flank | Reel         | -40° to +105°C |

<sup>1</sup> “ddd” denotes factory programmed configurations based on required settings. Contact factory for factory programming.

## Revision History

| Revision Date     | Description of Change   |
|-------------------|---|
| March 16, 2021    | Updated the figure <a href="#">Overdriving XIN with an LVPECL Driver</a>  |
| January 26, 2021  | <ul style="list-style-type: none"> <li>▪ Updated links to all VersaClock 6E Family Register Descriptions and Programming Guide references.</li> <li>▪ Added note and document link in section <a href="#">SD/OE Pin Function</a> under item 2.</li> </ul> |
| December 10, 2020 | Updated text for clock slew rate values in the section “Driving XIN/REF with a CMOS Driver”.  |
| September 4, 2020 | <ul style="list-style-type: none"> <li>▪ Updated pin 4 description.</li> <li>▪ Updated VIH minimum value.</li> <li>▪ Updated the section <a href="#">Driving XIN/REF with a CMOS Driver</a>.</li> </ul>   |
| August 20, 2020   | Updated the slew rate terminology in section <a href="#">Driving XIN/REF with a CMOS Driver</a> .   |
| October 14, 2019  | Added PCIe Gen4 to Typical Applications.  |
| March 8, 2019     | Updated package outline drawings.   |
| February 22, 2019 | Updated marking diagram.  |
| July 12, 2018     | Initial release.  |

4. Numbers in ( ) are for references only.
5. Wettable flank (step cut).

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
