Notes on Operation at High Temperatures

R01AN3398EJ0100

Rev.1.00

Aug. 09, 2016

Outline

The range of operating temperature for the EC-1 is $T_j = -40$ to 125°C . That is, operation of the devices within this range is guaranteed. However, the quality and reliability of semiconductor devices are greatly influenced by the environment of use. In other words, products with the same quality may be less reliable in harsh environments, and more reliable when the usage environment is less harsh. Even when used within the maximum ratings, if a device is used under extremely stringent conditions equivalent to lifetime tests, wear-out-like failures may result.

This document gives notes on the operating environment when a product of the EC-1 is used in high-temperature ($T_j = 110$ to 125°C) applications.

1. Relationship between Actual Usage Environment and Reliability for the EC-1

1.1 Concept of Microcontroller Reliability

When using an EC-1 microcontroller, follow the advice given below to ensure the reliability of the device.

The reliability of semiconductor devices is represented by the failure rate curve (called the “bathtub curve”). The curve can be divided into the three following regions: (1) infant mortality, failures which occur within a relatively short time after a device starts to be used, (2) normal-life failures, random failures which occur over longer periods of time, and (3) wear-out failures (service life), which occur with the passage of time reaching the essential end-of-life for the device. For details on the bathtub curve, refer to the Semiconductor Reliability Handbook (R51ZZ0001EJ0100).

Of these failures, wear-out failures are strongly dependent on the temperature environment in which the semiconductor device is used. Derating is an important measure to consider in reducing the average time until wear-out failure of an EC-1.

1.2 Derating

Derating is defined under JIS Z 8115 as the systematic reduction of load for the sake of improved reliability.

The quality and reliability of semiconductor devices are greatly influenced by the environment of use. In other words, products with the same quality may be less reliable in harsh environments, and more reliable when the usage environment is less harsh. Even when used within the maximum ratings, if a device is used under extremely stringent conditions equivalent to lifetime tests, wear-out-like failures may result. Hence the concept of derating is extremely important.

Derating is applied to product groups, such as discrete devices and power ICs, that require adjustment of the operating conditions, such as ambient temperature, junction temperature, voltage, current, and power, which are mutually related. This is because in addition to having wide usage condition ranges these products have the property that even if they are operated within the corresponding usage range (e.g. voltage), concern for the junction temperature will be required due to the relationships between characteristics such as the power generated, ambient temperature, and heat sink used.

For details on the derating, refer to section 5.2.3, Derating, in the Semiconductor Reliability Handbook (R51ZZ0001EJ0100).

This application note describes temperature profiles assumed for typical high-temperature (110 to 125°C) applications and gives examples of derating to suit products of the EC-1.

2. Thermal Design

In general, the junction temperature of a semiconductor device affects its lifetime, and high enough temperatures may lead to its destruction. Therefore, the junction temperature (T_j) should be specified for any LSI with large power consumption, so that thermal design can be applied such that it operates below the maximum allowable temperature.

If the temperature of the environment where a device is used approaches or exceeds the maximum allowable temperature specified for the junction temperature (T_j), estimate the junction temperature of the device by as accurate a method as is possible. The point of calculating T_j for the device in actual usage is to check it is operating below the maximum operating temperature given in the electrical characteristics. If the estimated result exceeds the maximum, reconsider the parts layout, board configuration, and power consumption.

The junction temperature cannot be measured directly, so it must be estimated from power consumption and thermal characteristics parameters. There are several methods of estimation, and the accuracy varies with the method. This application note describes an example of thermal design.

2.1 Example of Thermal Design

2.1.1 Calculation from the Temperature at the Top-Center of the Package (T_t)

Measure the temperature at the center of the top of the package (T_t) in the usage environment, and use the following formula to estimate the junction temperature (T_j).

$$T_j = T_t + T\beta$$

T_j : Junction temperature

T_t : Temperature at the center of the top of the package

$T\beta$: Temperature correction value (Table 2.1)

Table 2.1 Temperature Correction Value ($T\beta$)

Printed Circuit Board	$T\beta$ (°C)
4-layer (see EIA/JEDEC STANDART 51-7)	13
6-layer (This is the above 4-layer board plus two extra layers. In addition, 36 via holes run from the top surface to the back surface and connected only to the second layer are added.)	12

Even if sufficient margin is determined in the initial investigation, make sure that T_j is within the range listed in Table 3.1 by measuring T_t . If T_j exceeds the value listed in Table 3.1, reconsider the parts layout, board configuration, and power consumption.

- (1) Points for caution in measuring T_t
 - Measurement by a thermocouple

In using a thermocouple to measure the temperature accurately, take care in selecting the thermocouple used and mounting it on the objective of measurement. Notes and recommendations are as follows.

- Use a thermocouple with wire having as narrow a diameter as is possible to obtain good thermal conduction

(recommendation: 150 μm or less).

- We recommend a thermocouple of the K-type. Thermocouples of the T-type have larger heat dissipation, raising the possibility of measuring a falsely low temperature.
- Heat-resistant resin tape or a heat-resistant resin for affixing the thermocouple is recommended.
- The thermocouple should be firmly affixed to the objective of measurement ("floating" will lead to errors in measurement).

- Measuring point

Measure T_t at the center of the top of the package after confirming that the temperature has reached the steady state.

- Measurement by thermography (thermal camera)

In order to measure the temperature accurately, set the emissivity of the objective of measurement by thermography. Though the emissivity of a board's surface is approximately 0.8 to 0.9, the value is generally smaller for metal surfaces. (Measurements from a metal surface will be lower than the actual temperature if measurement is with a setting in the 0.8 to 0.9 range.) If the emissivity is unknown, spray the surface with black spray and set the emissivity of the black spray to obtain an accurate measurement of the temperature.

Also, note that anything between the thermal camera and the objective of measurement (even a transparent acrylic plate) will lead to incorrect results of measurement. (With a transparent acrylic plate, the camera will measure the temperature of the plate.)

Temperature measurement with thermography is sometimes difficult because of how the objective of measurement is placed. However, because knowledge of the temperature distribution is useful, we recommend using a thermocouple.

3. Examples of Derating in Typical High-Temperature Applications

Table 3.1 lists expected temperature profiles and the corresponding recommended temperature profiles for derating of EC-1 products in typical high-temperature applications.

The target packages are BGA-196, and the package codes are PLBG0196GA-B. For the specific target products, refer to the EC-1 User's Manual: Hardware. Derating is assumed to be for 10 years.

Choose an example close to your usage conditions. If there is no suitable example in the list, please contact a Renesas sales representative.

Table 3.1 Typical High-Temperature (110 to 125°C) Applications

Example	Application	Assumed Temperature Profiles	Recommended Temperature Profiles for Derating			
			Case 1		Case 2	
1	Industrial motors, power tools, power conditioners (running around-the-clock: example 1)	Continuous use T _j max = 110°C	-40°C*1 ≤ T _j ≤ 110°C		100%	-
2	Industrial motors (running around-the-clock: example 2)	Continuous use at higher temperature T _j max = 115°C	-40°C*1 ≤ T _j ≤ 100°C	34%	-40°C*1 ≤ T _j ≤ 105°C	50%
			100°C ≤ T _j ≤ 115°C	66%	105°C ≤ T _j ≤ 115°C	50%
3	Industrial motors (running around-the-clock: example 3)	Continuous use at higher temperature T _j max = 120°C	-40°C*1 ≤ T _j ≤ 100°C	50%	-40°C*1 ≤ T _j ≤ 105°C	67%
			100°C ≤ T _j ≤ 120°C	50%	105°C ≤ T _j ≤ 120°C	33%
4	Industrial motors (running around-the-clock: example 4)	Continuous use at higher temperature T _j max = 120°C	-40°C*1 ≤ T _j ≤ 100°C	5%	-40°C*1 ≤ T _j ≤ 100°C	10%
			100°C ≤ T _j ≤ 110°C	90%	100°C ≤ T _j ≤ 110°C	80%
			110°C ≤ T _j ≤ 120°C	5%	110°C ≤ T _j ≤ 120°C	10%
5	Industrial motors (running around-the-clock: example 5)	Continuous use at higher temperature T _j max = 120°C	-40°C*1 ≤ T _j ≤ 100°C	35%	-40°C*1 ≤ T _j ≤ 100°C	37%
			100°C ≤ T _j ≤ 115°C	60%	100°C ≤ T _j ≤ 115°C	53%
			115°C ≤ T _j ≤ 120°C	5%	115°C ≤ T _j ≤ 120°C	10%
6	Industrial motors (running around-the-clock: example 6)	Continuous use at higher temperature T _j max = 120°C	-40°C*1 ≤ T _j ≤ 100°C	15%	-40°C*1 ≤ T _j ≤ 100°C	39%
			100°C ≤ T _j ≤ 110°C	70%	100°C ≤ T _j ≤ 115°C	46%
			110°C ≤ T _j ≤ 120°C	15%	110°C ≤ T _j ≤ 120°C	15%
7	Industrial motors (running around-the-clock: example 7)	Continuous use at higher temperature T _j max = 125°C	-40°C*1 ≤ T _j ≤ 100°C	60%	-40°C*1 ≤ T _j ≤ 105°C	75%
			100°C ≤ T _j ≤ 125°C	40%	105°C ≤ T _j ≤ 125°C	25%
8	Industrial motors (running around-the-clock: example 8)	Continuous use at higher temperature T _j max = 125°C	-40°C*1 ≤ T _j ≤ 100°C	8%	-40°C*1 ≤ T _j ≤ 100°C	15%
			100°C ≤ T _j ≤ 110°C	87%	100°C ≤ T _j ≤ 110°C	75%
			110°C ≤ T _j ≤ 125°C	5%	110°C ≤ T _j ≤ 125°C	10%
9	Industrial motors (running around-the-clock: example 9)	Continuous use at higher temperature T _j max = 125°C	-40°C*1 ≤ T _j ≤ 100°C	37%	-40°C*1 ≤ T _j ≤ 100°C	40%
			100°C ≤ T _j ≤ 115°C	58%	100°C ≤ T _j ≤ 115°C	50%
			115°C ≤ T _j ≤ 125°C	5%	115°C ≤ T _j ≤ 125°C	10%
10	Industrial motors (running around-the-clock: example 10)	Continuous use at higher temperature T _j max = 125°C	-40°C*1 ≤ T _j ≤ 100°C	23%	-40°C*1 ≤ T _j ≤ 100°C	44%
			100°C ≤ T _j ≤ 110°C	62%	100°C ≤ T _j ≤ 115°C	41%
			110°C ≤ T _j ≤ 125°C	15%	115°C ≤ T _j ≤ 125°C	15%

Note 1. The ambient temperature (T_a) should be no less than -40°C in a low-temperature environment.

General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

- The characteristics of an MPU or MCU in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.
Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
