

SCI (Asynchronous) Data Transfer Using DTC

R01AN0947EJ0102 Rev.1.02 Jan. 19, 2012

### Introduction

This application note presents an overview of using the data transfer controller (DTC) and serial communication interface (SCI) of the SH7216 to perform asynchronous serial data transfer.

Note that although the sample tasks and applications presented in this application note have been verified to work as intended, they should be checked in the actual operating environment before being put into actual use.

### **Target Device**

SH7216

### Contents

1.	Introduction	2
2.	Description of Sample Application	3
3	Reference Documents	20
<b>U</b> .		0

### 1. Introduction

### 1.1 Specifications

The sample program performs serial transmission and reception by using the DTC to transfer data between the serial communication interface (SCI) and the on-chip RAM.

- SCI channel 1 is used.
- The communication format is 8-bit fixed data.
- For transmission, the DTC is activated by a transmit data empty interrupt request and transfers data consisting of a character string from the on-chip RAM to the transmit data register (SCTDR).
- For reception, the DTC is activated by a receive data full interrupt request and transfers the received data to the onchip RAM.
- Operation stops when transmission or reception of 32 bytes of data has completed.

### 1.2 Functions Used

- Serial communication interface (SCI), channel 1
- Data transfer controller (DTC)

### 1.3 Applicable Conditions

MCU	SH7216
Operating frequency	Internal clock: 200 MHz
	Bus clock: 50 MHz
	Peripheral clock: 50 MHz
Integrated development environment	Renesas Electronics High-performance Embedded Workshop, Ver. 4.06.00
C compiler	Renesas Electronics SuperH RISC Engine Family
	C/C++ Compiler Package, Ver. 9.03.00, Release 00
Compile options	High-performance Embedded Workshop default settings
	(-cpu=sh2afpu -pic=1 -object="\$(CONFIGDIR)¥\$(FILELEAF).obj"
	-debug -gbr=auto -chgincpath -errorpath -global_volatile=0
	-opt_range=all -infinite_loop=0 -del_vacant_loop=0
	-struct_alloc=1 -nologo)

### 2. Description of Sample Application

The sample application uses the transmit data empty interrupt (TXI) and receive data full interrupt (RXI) of the SCI as activation sources for the DTC. It performs asynchronous serial data transmission and reception, using the normal transfer mode to transfer data.

### 2.1 Operation of Functions Used

### 2.1.1 Serial Communication Interface (SCI)

In the SCI's asynchronous mode, each transmitted or received character begins with a start bit (indicating start of communication) and ends with a stop bit (indicating end of communication). Serial communication is synchronized one character at a time. The transmitter and receiver blocks of each channel are independent, so transmission and reception can take place simultaneously. Both the transmitter and receiver blocks have a double-buffered structure, enabling high-speed continuous serial data transmission and reception.

In asynchronous serial communication, the communication line is normally held in the mark (high-level) state. The SCI monitors the line and starts serial communication when the line goes to the space (low-level) state, indicating a start bit.

One serial character consists of a start bit (low-level), data (LSB first, meaning starting with the lowest or least significant bit), parity bit (high- or low-level), and stop bit (high-level), in that order.

For details of the SCI, see the Serial Communication Interface (SCI) section in the SH7216 Group Hardware Manual.

Table 1 shows an outline of asynchronous communication. Figure 1 is a block diagram of the SCI.

Item	Description			
Channels	4 channels (SCI_0, SCI_1, SCI_2, SCI_4)			
Clock source	Internal clock: Pφ, Pφ/4, Pφ/16, Pφ/64 (Pφ: peripheral clock)			
	External clock: SCK pin clock input			
Data format	Transfer data length: 7 or 8 bits			
	Data sequence: Selectable between LSB-first and MSB-first			
Baud rate	When internal clock selected: 110 bps to 1.5625 Mbps ( $P\phi = 50$ MHz operation)			
	When external clock selected: Max. 781,250 bps			
	$(P\phi = 50 \text{ MHz}, \text{ external clock input} = 15.0000 \text{ MHz})$			
Error detection Framing error, parity error, overrun error, and break detection				
Interrupt requests	Transmit data empty interrupt (TXI)			
	Receive data full interrupt (RXI)			
	Receive error interrupt (ERI)			
	Transmit end interrupt (TEI)			
Clock source	Selectable between internal clock and external clock			
	When internal clock selected:			
	The SCI operates using the baud rate generator clock, and a clock with a			
	frequency 16 times the bit rate can be output.			
	When external clock selected:			
	A clock with a frequency 16 times the bit rate must be input.			
	(The internal baud rate generator is not used.)			

#### Table 1 Outline of Clock Synchronous Communication

Figure 1 SCI Block Diagram

### 2.1.2 Data Transfer Controller (DTC)

Three transfer modes are supported: normal, repeat, and block. Data transfer can be performed using a number of channels specified by the user by storing transfer information in the data area. When the DTC is activated, it reads the transfer information from the data area, performs the data transfer, and then writes back the transfer information after the data transfer completes.

The transfer information is allocated in the data area.

For details of the DTC, see the Data Transfer Controller (DTC) section in the *SH7216 Group Hardware Manual* (rej09b0543).

Table 2 shows an overview of the DTC, and figure 2 is a block diagram of the DTC.

Item	Description
Transfer modes	Normal transfer mode, repeat transfer mode, block transfer mode
Transfer count	Normal transfer mode: 1 to 65,536
	Repeat transfer mode: 1 to 256
	Block transfer mode: 1 to 65,536
Data size	Selectable among byte, word, and longword
CPU interrupt requests	An interrupt request can be sent to the CPU after a single data transfer
	completes.
	An interrupt request can be sent to the CPU after the specified number of data
	transfers complete.
Activation sources	External pin, A/D, CMT, USB, MTU2, MTU2S, IIC3, SSU, SCI, SCIF
Other	Support for chain transfer
	(multiple data transfers triggered by a single activation source)
	Transfer information read skip mode setting
	Module stop mode setting
	Short address mode setting
	Selectable among three bus release timing settings
	Selectable among two DTC activation priority settings

#### Table 2DTC Overview

Figure 2 DTC Block Diagram

#### (a) DTC Transfer Information Allocation

The transfer information is allocated within the data area. Use 4n as the transfer information start address. When an address other than 4n is specified, the bottom two bits are ignored when accessing the data area ([1:0] = B'00). Figure 3 illustrates the allocation of transfer information in the data area. Exclusively in cases when all transfer sources and transfer destinations for DTC transfers are located in the on-chip RAM and on-chip peripheral modules, the short address mode may be selected by setting to 1 the DTSA bit in the bus function extending register (BSCEHR).\*<sup>1</sup>

Normally, reading the transfer information requires processing of 4 longwords, but this can be reduced to 3 longwords and the DTC activation time reduced by selecting short address mode.

Note: 1. See 9.4.8 Bus Function Extending Register (BSCEHR) in the Bus State Controller (BSC) section in the *SH7216 Group Hardware Manual* (rej09b0543).

Figure 3 Allocation of Transfer Information in Data Area

#### (b) DTC Vector Table Allocation

- The DTC vector table is allocated in the RAM, so the address to be used as the vector base is set in the DTC vector base address register (DTCVBR).
- The start address of the transfer information is stored at the address pointed to by the DTC vector address offset.

For each activation source, the DTC reads the transfer information start address from the vector table and then reads the transfer information at that start address.

Figure 4 shows the correspondence between the DTC vector table and transfer information.

Table 3 lists the correspondences between the interrupt sources, DTC vector addresses, and DTCE Bits.

Figure 4 Correspondences between DTC Vector Table and Transfer Information

Origin of Activation Source	Activation Source	Vector Number	DTC Vector Address Offset	DTCE <sup>*1</sup>

Note: 1. DTCE bits with no corresponding interrupt are reserved. Always write 0 to these bits.

### 2.2 Sample Program Operation

Table 4 lists the DTC transfer conditions and table 5 the SCI settings for the sample program.

Figure 5 shows a transfer information memory map and figure 6 illustrates transmit and receive operation.

#### Table 4 DTC Transfer Conditions

Condition	SCI Transmit Side DTC Transfer Condition (TXI1)	SCI Receive Side DTC Transfer Condition (RXI1)	
Transfer mode	Normal mode	Normal mode	
Transfer count	32	32	
Transfer size	Byte	Byte	
DTC vector table	Allocated at H'FFF90000 (on-chip RAM)	Allocated at H'FFF90000 (on-chip RAM)	
Transfer source	On-chip RAM	Receive data register (SCRDR_1)	
Transfer destination Transmit data register (SCTDR_1)		On-chip RAM	
Transfer source addressing mode	SAR incremented after transfer	SAR fixed after transfer	
Transfer destination addressing mode	DAR fixed after transfer	DAR incremented after transfer	
Activation source TXI1 of SCI1		RXI1 of SCI1	
Interrupt handling Interrupt to CPU after specified number of data transfers complete enabled		Interrupt to CPU after specified number of data transfers complete enabled	

#### Table 5 SCI Settings

Channel	CH1		
Communication mode	Asynchronous mode		
Interrupts	Transmit data empty interrupt (TXI)		
	Receive data full interrupt (RXI), receive error interrupt (ERI)		
Communication speed	19,200 bps (Ρφ = 50 MHz)		
Data length	8-bit data (fixed)		
Stop bits	1 stop bit		
Parity	None		
Bit order	LSB-first transmission		

Figure 5 Transfer Information Memory Map

Figure 6 Operation

### 2.3 Setting Procedure for Functions Used

The procedure for making initial settings for the functions used by the sample program is described below.

Figure 7 shows the processing sequence of the sample program, figure 8 shows the setting sequence for canceling module standby, figure 9 shows the setting sequence for the pin configuration controller, figure 10 shows part 1 of the DTC initialization sequence, figure 11 shows part 2 of the DTC initialization sequence, figure 12 shows the initial setting sequence for transmission and reception in asynchronous mode. Figure 13 shows the processing sequence of the asynchronous mode transmit interrupt handler, figure 14 shows the processing sequence of the asynchronous mode receive interrupt handler, and figure 15 shows the processing sequence of the receive error interrupt handler. For details on the settings of each register, see the *SH7216 Group Hardware Manual*.

### 2.4 Register Settings for Sample Program

#### 2.4.1 Clock Pulse Generator (CPG)

Table 6 lists the clock pulse generator settings.

### Table 6 Clock Pulse Generator Settings

Register	Address	Setting value	Description
Frequency control	H'FFFE0010	H'0303	STC[2:0] = Β'011: ×1/8 (Βφ)
register (FRQCR)			IFC[2:0] = B'000: ×1/4 (Ιφ)
			PFC[2:0] = Β'011: ×1/8 (Ρφ)

#### 2.4.2 Power-Down Mode

Table 7 lists the standby control register (STBCR) settings.

#### Table 7 Standby Control Register Settings

Register	Address	Setting value	Description
Standby control	H'FFFE0018	H'00	Clear MSTP4 to 0: DTC operates (initial value)
register 2 (STBCR2)			Other bits: Initial values
Standby control	H'FFFE0418	H'BF	Clear MSTP56 to 0: SCI1 operates
register 5 (STBCR5)			Other bits: Initial values

### 2.4.3 Interrupt Controller (INTC)

Table 8 lists the interrupt priority register (IPR) settings.

#### Table 8 Interrupt Priority Register Settings

Register	Address	Setting value	Description
Interrupt priority register 16 (IPR16)	H'FFFE0C14	H'0F00	Set SCI1 interrupt level to 15 (bits 11 to 8).

### 2.4.4 Data Transfer Controller (DTC)

Table 9 lists the DTC register settings used in the sample program.

#### Table 9 DTC Register Settings

Register	Address	Setting value	Description
DTC control register	H'FFFFCC90	H'00	RRS = 0: No transfer information read skip
(DTCCR)			RCHNE = 0: Chain transfer after repeat transfer disabled
			ERR = 0: No interrupt request
DTC vector base register (DTCVBR)	H'FFFFCC94	H'FFF90000	DTC vector base address setting

#### DTC transfer information settings with TXI1 of SCI1 as interrupt source

Register	Address	Setting value	Description
DTC mode register A	H'FFF90800	H'08	MD[1:0] = B'00: Normal transfer mode
(MRA)			Sz[1:0] = B'00: Byte transfer size
			SM[1:0] = B'10: SAR incremented after transfer
DTC mode register B	H'FFF90801	H'00	CHNE = 0: Chain transfer disabled
(MRB)			CHNS = 0: No effect because chain transfer
			disabled
			DISEL = 0: Interrupt request to CPU after specified number of transfers complete
			DTS = 0: No effect because normal transfer mode disabled
			DM[1:0] = B'00: Fixed at DAR
DTC source address	H'FFF90804		Transfer source address setting
register (SAR)			Start address of data table (TR_DATA[]) allocated in on-chip flash memory
DTC destination	H'FFF90808	SCTDR_1	Transfer destination address setting
address register (DAR)			Transmit data register (SCTDR)
DTC transfer count	H'FFF9080C	H'20	Transfer count setting
register A (CRA)			32
DTC transfer count register B (CRB)	H'FFF9080E	H'00	No effect because normal transfer mode disabled
DTC enable register	H'FFFE6008	H'1000	Selection of interrupt source to activate DTC
E (DTCERE)			TXI1 of SCI1 (DTCERE12)

#### DTC transfer information settings with RXI1 of SCI1 as interrupt source

Register	Address	Setting value	Description
DTC mode register A	H'FFF90810	H'00	MD[1:0] = B'00: Normal transfer mode
(MRA)			Sz[1:0] = B'00: Byte transfer size
			SM[1:0] = B'10: SAR fixed after transfer
DTC mode register B	H'FFF90811	H'80	CHNE = 0: Chain transfer disabled
(MRB)			CHNS = 0: No effect because chain transfer disabled
			DISEL = 0: Interrupt request to CPU after specified number of transfers complete
			DTS = 0: No effect because normal transfer mode disabled
			DM[1:0] = B'00: Incremented at DAR
DTC source address	H'FFF90814	SCRDR_1	Transfer source address setting
register (SAR)			Receive data register (SCRDR)
DTC destination	H'FFF90818	—	Transfer destination address setting
address register			Start address of buffer area allocated in on-chip
(DAR)			RAM (DTC_RX_ADD)
DTC transfer count	H'FFF9081C	H'20	Transfer count setting
register A (CRA)			32
DTC transfer count register B (CRB)	H'FFF9081E	H'00	No effect because normal transfer mode disabled
DTC enable register	H'FFFE6008	H'2000	Selection of interrupt source to activate DTC
E (DTCERE)			RXI1 of SCI1 (DTCERE13)

### 2.4.5 Serial Communication Interface 1 (SCI1)

Table 10 lists the SCI (channel 1) register settings used in the sample program.

### Table 10 SCI1 (Channel 1) Register Settings

Register	Address	Setting value	Description
Serial mode register	H'FFFF8800	H'00	C/A = 0: Asynchronous mode
(SCSMR_1)			CHR = 0: 8-bit data
			PE = 0: Add parity bit, disable checking
			STOP = 0: 1 stop bit
			CKS[1:0] = B'00: P
Bit rate register	H'FFFF8802	D'40	Asynchronous mode
(SCBRR_1)			Bit rate: 19,200 (bps)
Serial control	H'FFFF8804	H'00	Initial settings
register (SCSCR_1)			TIE = 0: Transmit data empty interrupt (TXI) requests disabled
			RIE = 0: Receive data full interrupt (RXI) requests
			and receive error interrupt (ERI) requests disabled
			TE = 0: Transmit operation disabled
			RE = 0: Receive operation disabled
		H'F4	When making settings
			asynchronous mode
			CEK[1:0] = B'00: Internal clock/SCK pin set as
			input pin
		H'F0	When transmit/receive enabled
			TIE = 1: Transmit data empty interrupt (TXI) requests enabled
			RIE = 1: Receive data full interrupt (RXI) requests
			and receive error interrupt (ERI) requests enabled
			TE = 1: Transmit operation enabled
			RE = 1: Receive operation enabled
Serial status register	H'FFFF8808	H'84	Initial settings
(SCSSR_1)			TDRE = 1: Transmit data register empty flag
			TEND = 1: Transmit end flag
		H'04	When making settings
			Clear TDRE flag.

### General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

- 1. Handling of Unused Pins
  - Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.
    - The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.
- 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

 The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses Access to reserved addresses is prohibited.

The reserved addresses are provided for the possible future expansion of functions. Do not access
these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.
- 5. Differences between Products

Before changing from one product to another, i.e. to one with a different type number, confirm that the change will not lead to problems.

— The characteristics of MPU/MCU in the same group but having different type numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different type numbers, implement a system-evaluation test for each of the products.

	Notice
1.	All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas
	Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information with a Renesas Electronics sales office.
2	be disclosed by Renesas Electronics such as that disclosed through our website. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or
2.	technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics products or
	others.
3.	You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4.	Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for
	the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the
6	use of these circuits, software, or information. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and
5.	regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to
	the development of weapons of mass destruction. Renease Electronics protection and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is
	prohibited under any applicable domestic or foreign laws or regulations.
6.	Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics
	assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7.	Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specifie". The recommended applications for each Renesas Electronics product
	depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics.
	Lection product with any application categorized as Optime material in provide an international contract of the material contract of the
	use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics.
	The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
	"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools;
	personal electronic equipment; and industrial robots.
	"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
	"Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical
8.	implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
