

ISL15100

Single Port, PLC Differential Line Driver

FN8577

Rev 0.00

September 19, 2013

The ISL15100 is a single port differential line driver developed for Power Line Communication (PLC) applications. The device is designed to drive heavy line loads while maintaining the high level of linearity required in OFDM PLC modem links. With 15.5dBm of total transmit signal power into 100Ω line load, the driver achieves -43dB average MTPR distortion across the output spectrum up to 86MHz.

The ISL15100 has two bias current control pins (C0, C1) to allow for four power settings (disable, low, medium, high). In disable mode, the line driver outputs maintain a high impedance in the presence of high receive signal amplitude, so it doesn't affect TDM receive signal integrity.

The ISL15100 is available in the thermally-enhanced 16 Ld QFN and is specified for operation over the full -40°C to +85°C ambient temperature range.

Features

- Single differential driver
- 100MHz Broadband PLC G.hn, EOC, HomePlug AV2
- Control pins for enable/disable and supply current selection
- High output impedance when disabled for TDM operation
- -43dBc average MTPR distortion at full line power
- Single +12V or bipolar ±6V nominal supplies
- High surge current handling capability

Applications

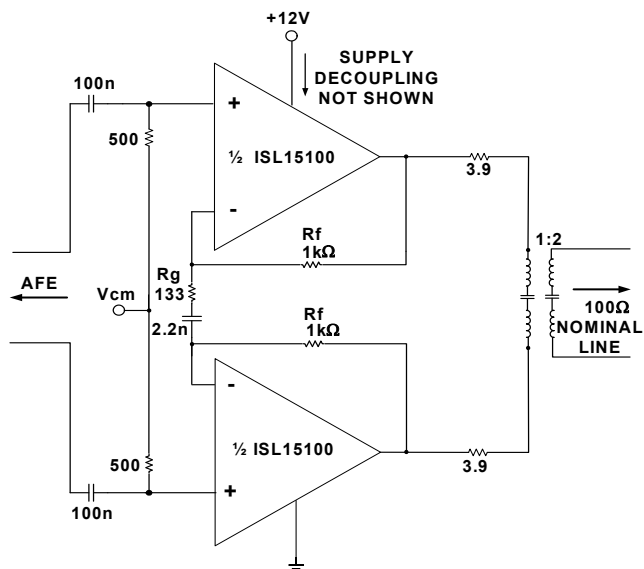

- Power Line Communication differential driver
- Pin compatible upgrade to ISL1571IRZ

### NOTES:

- Please refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), please see device information page for [ISL15100](#). For more information on MSL please see tech brief [TB363](#).

## Pin Configuration

\*EXPOSED THERMAL PAD CONNECTS TO MOST NEGATIVE SUPPLY

## Pin Descriptions

PIN NUMBER	PIN NAME	FUNCTION
EP	THERMAL PAD	Connect to the Most Negative Supply
1	NC	No Internal Connection
2	INA-	Amplifier A Inverting Input
3	INA+	Amplifier A Non-Inverting Input
4	GND	Ground
5	NC	No Internal Connection
6	NC	No Internal Connection
7	VS-	Negative Supply Voltage (-6V for split supplies, GND for single supply operation)
8	CO	Digital Control Pin
9	C1	Digital Control Pin
10	INB+	Amplifier B Non-Inverting Input
11	INB-	Amplifier B Inverting Input
12	NC	No Internal Connection
13	OUTB	Amplifier B Output
14	VS+	Positive Supply Voltage (+6V for split supplies, +12V for single supply operation)
15	NC	No Internal Connection
16	OUTA	Amplifier A Output

## C0, C1 Truth Table

C1	C0	FUNCTION
0	0	High Bias Setting
0	1	Medium Bias Setting
1	0	Low Bias Setting
1	1	Outputs Disabled (Power Down)

**Absolute Maximum Ratings** ( $T_A = +25^\circ\text{C}$ )

$V_S+$ Voltage to $V_S-$ or GND	-0.3V to +13.3V
INA+, INB+ Voltage	GND to $V_S+$
$C_0, C_1$ Voltage to GND	-0.3V to $V_S+$
Current into any Input	8mA
Continuous Output Current for Long Term Reliability	50mA
Latch-up (Tested per JESD78D, Class II)	100mA
<b>ESD Rating</b>	
Human Body Model (Tested per JESD22-A114F)	4kV
Charge Device Model (Tested per JESD22-C101E)	1.5kV
Machine Model (Tested per JESD22-A115C)	300V

**Thermal Information**

Thermal Resistance (Typical)	$\theta_{JA}$ ( $^\circ\text{C}/\text{W}$ )	$\theta_{JC}$ ( $^\circ\text{C}/\text{W}$ )
16 Ld QFN Package (Notes 4, 5)	53	16.5
Maximum Junction Temperature (Plastic Package)	+150 $^\circ\text{C}$	
Storage Temperature Range	-40 $^\circ\text{C}$ to +150 $^\circ\text{C}$	
Pb-Free Reflow Profile	see link below <a href="http://www.intersil.com/pbfree/Pb-FreeReflow.asp">http://www.intersil.com/pbfree/Pb-FreeReflow.asp</a>	

**Operating Conditions**

Ambient Temperature Range	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
Junction Temperature Range	-40 $^\circ\text{C}$ to +150 $^\circ\text{C}$

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

**NOTES:**

- $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief [TB379](#).
- For  $\theta_{JC}$ , the "case temp" location is the center of the exposed metal pad on the package underside.

**Electrical Specifications**  $V_S+ = +12\text{V}$ ,  $V_S- = \text{GND} = 0\text{V}$ , see Figure 3, Full Bias ( $C_0 = C_1 = 0\text{V}$ ),  $T_A = +25^\circ\text{C}$ , unless otherwise specified.

$C_0$ , $C_1$ Logic Low Voltage	$V_{INL}$	Pin 4 at GND, logic reference pin	-0.3	0	0.8	V

## NOTES:

- Compliance to data sheet limits is assured by one or more methods: production test, characterization and/or design.
- Positive currents flow out of the pin.

## Applications Information

### Product Description

The ISL15100 is a differential operational amplifier designed for line driving in power line communications (PLC). It is a low distortion, current mode feedback amplifier that draws moderately low supply current. Due to the current feedback architecture, the ISL15100 closed-loop -3dB bandwidth is dependent on the value of the feedback resistor. The desired bandwidth is selected by choosing the feedback resistor,  $R_F$ , and then the gain is set by picking the gain resistor,  $R_G$ .

### Feedback Resistor Values

The ISL15100 has been designed and specified with  $R_F = 1k\Omega$  for  $A_V = +16$ . As is the case with all current feedback amplifiers, wider bandwidth at the expense of slight peaking, can be obtained by reducing the value of the feedback resistor. Inversely, larger values of the feedback resistor will cause rolloff to occur at a lower frequency.

### Quiescent Current vs Temperature

The ISL15100 was designed to have the quiescent current increase with temperature, which maintains good distortion performance at high temperatures.

### Supply Voltage Range

The ISL15100 operates with bipolar supply voltages from  $\pm 4.0V$  to  $\pm 6.6V$  ( $\pm 6.65V$  maximum). Optimum bandwidth, slew rate, and video characteristics are obtained at higher supply voltages.

### Single Supply Operation

If a single supply is desired, values from  $+8.0V$  to  $+13.2V$  ( $+13.3V$  maximum) can be used as long as the input common mode range is not exceeded. When using a single supply, be sure to either:

1. DC bias the inputs at an appropriate common mode voltage and AC-couple the signal.
2. Ensure the driving signal is within the common mode range of the ISL15100.

### Multi-Tone Power Ratio (MTPR)

G.hn PLC uses OFDM modulation to digitally encode data for communication. A carrier spacing of  $24.41kHz$  is used in power lines, and  $48.82kHz$  is used in phone lines.

In multi-tone signaling, linearity is shown in the MTPR measurement. MTPR measures the difference in power of a carrier tone vs. a missing tone.

FIGURE 4. PLC SIGNAL TONES WITH 25kHz SPACING

Figure 4 shows ISL15100's MTPR performance for a narrow frequency span.

### Disable Linearity

Unlike DSL, communication in PLC systems is half duplex meaning only one device can transmit at a time. When the line driver is not transmitting, it is disabled and the receiver is enabled. Figure 5 shows the shared transmit and receive signal path of two ends. When Txa is transmitting, optimal MTPR is achieved if Txb is removed. Since Txb cannot be removed, the best MTPR occurs if the line driver is a very high impedance when disabled.

$R_{BM}$  are resistors to limit fault currents, and to provide a driving impedance to the transformer, thus setting its frequency span.  $R_{BM}$  is typically low in value ( $<10\Omega$ ).

FIGURE 5. Tx AND Rx SIGNAL PATH. CASE1:[Txa: ON, Rxa: OFF, Txb: OFF, Rxb: ON]. CASE2:[Txa: OFF, Rxa: ON, Txb: ON, Rxb: OFF]

### PC Board Design Recommendation

To minimize parasitic capacitance in the ISL15100 design, consider laying out short output traces. Also, select low capacitance protection devices, and use line transformers with low interwinding capacitance in the signal path.

The supply decoupling capacitors must be close to the supply pins to minimize parasitic inductance in the supply paths. High frequency load currents are pulled through these capacitors, so placement of the 0.1µF capacitors close to the supply pin(s) improves dynamic performance. The higher value 4.7µF capacitors provide low frequency decoupling, so they can be placed farther from the supply pins.

The ISL15100's thermal pad (EP) should be connected to VS- (ground in single supply applications). For good thermal control, include a thermal pad in the layout footprint, as shown in the "Typical Recommended Land Pattern" on the "Package Outline Drawing" page. Adding vias to this thermal pad helps dissipate heat away from the package. The ISL15100 evaluation board uses four 10mil (hole size) vias with 20mil diameter pads.

### Thermal Resistance and Power Dissipation

Thermal resistance for junction to ambient, T<sub>JA</sub>, is +53°C/W. The power dissipation at 12V supply is 600mW. The ambient temperature allowed given the maximum junction temperature of +150°C is:

$$T_A = T_J - \theta_{JA} \times P_d \tag{EQ. 1}$$

$$T_A = +150^\circ\text{C} - 53^\circ(\text{C}/\text{W}) * 600\text{mW} = +118^\circ\text{C}$$
