

## Features

- Logic & Mixed Signal Circuits
- Highly Versatile Macrocells
- 1.8 V ( $\pm 5\%$ ) to 5 V ( $\pm 10\%$ )  $V_{DD}$
- 1.8 V ( $\pm 5\%$ ) to 5 V ( $\pm 10\%$ )  $V_{DD2}$  ( $V_{DD2} \leq V_{DD}$ )
- Operating Temperature Range:  $-40\text{ }^{\circ}\text{C}$  to  $85\text{ }^{\circ}\text{C}$
- RoHS Compliant / Halogen-Free
- Pb-Free 12-pin STQFN: 1.6 x 1.6 x 0.55 mm, 0.4 mm pitch

## Applications

- Personal Computers and Servers
- PC Peripherals
- Consumer Electronics
- Data Communications Equipment
- Handheld and Portable Electronics

## Block Diagram

## 1.0 Overview

The SLG46121 provides a small, low power component for commonly used mixed-signal functions. The user creates their circuit design by programming the one time Non-Volatile Memory (NVM) to configure the interconnect logic, the I/O Pins and the macrocells of the SLG46121. This highly versatile device allows a wide variety of mixed-signal functions to be designed within a very small, low power single integrated circuit.

The additional power supply ( $V_{DD2}$ ) on the SLG46121 provides the ability to interface two independent voltage domains within the same design. Users can configure pins, dedicated to each power supply, as inputs, outputs, or both (controlled dynamically by internal logic) to both  $V_{DD}$  and  $V_{DD2}$  voltage domains. Using the available macrocells designers can implement mixed-signal functions bridging both domains or simply pass through level-translation in both High to Low and Low to High directions.

The macrocells in the device include the following:

- Two Analog Comparators (ACMP)
- Voltage References (Vref)
- Five Combinatorial Look Up Tables (LUTs)
  - One 2-bit LUTs
  - Four 3-bit LUTs
- Twelve Combination Function Macrocell
  - Four Selectable DFF/Latch or 2-bit LUTs
  - Four Selectable DFF/Latch or 3-bit LUTs
  - One Selectable Pipe Delay or 3-bit LUT
    - Pipe Delay – 8 stage / 2 output, one 1 stage fixed output
  - Two Selectable Counter/Delay or 4-bit LUT
  - One Programmable Delay / Deglitch Filter
- Two Counter / Delay Generators (CNT/DLY)
  - One 8-bit counter/delay
  - One 14-bit counter/delay with external clock/reset
- Eight D Flip-Flop / Latches (DFF) (Part of Combination Function Macrocell)
- Additional Logic Function - 1 Inverter
- Pipe Delay – 8 stage/2 output (Part of Combination Function Macrocell)
- One Bandgap
- RC Oscillator (RC OSC)
- Power On Reset (POR)

## 2.0 Pin Description

### 2.1 Functional Pin Description

| Pin # | Pin Name         | Function                                               |
|-------|------------------|--------------------------------------------------------|
| 1     | V <sub>DD</sub>  | Power Supply (PIN 2, 3, 4, 5, 6)                       |
| 2     | GPI              | General Purpose Input                                  |
| 3     | GPIO             | General Purpose I/O or Analog Comparator 0 (+)         |
| 4     | GPIO             | General Purpose I/O or Analog Comparator 0 (-)         |
| 5     | GPIO             | General Purpose I/O                                    |
| 6     | GPIO             | General Purpose I/O or Analog Comparator 1 (+) with OE |
| 7     | GND              | Ground                                                 |
| 8     | GPIO             | General Purpose I/O                                    |
| 9     | GPIO             | General Purpose I/O                                    |
| 10    | GPIO             | General Purpose I/O with OE and Vref output            |
| 11    | V <sub>DD2</sub> | Power Supply (PIN 8, 9, 10, 12)                        |
| 12    | GPIO             | General Purpose I/O or External Clock Input            |

### 3.0 User Programmability

Non-volatile memory (NVM) is used to configure the SLG46121's connection matrix routing and macrocells. The NVM is One-Time-Programmable (OTP). However, Renesas's GreenPAK development tools can be used to configure the connection matrix and macrocells, without programming the NVM, to allow on-chip emulation. This configuration will remain active on the device as long as it remains powered and can be re-written as needed to facilitate rapid design changes.

When a design is ready for in-circuit testing, the same GreenPAK development tools can be used to program the NVM and create samples for small quantity builds. Once the NVM is programmed, the device will retain this configuration for the duration of its lifetime.

Once the design is finalized, the design file can be forwarded to Renesas to integrate into the production process.

Figure 1. Steps to create a custom Renesas GreenPAK device

## 4.0 Ordering Information

| Part Number | Type                                    |
|-------------|-----------------------------------------|
| SLG46121V   | 12-pin STQFN                            |
| SLG46121VTR | 12-pin STQFN - Tape and Reel (3k units) |

*Note 1: Use SLG46121V to order. Shipments are automatically in Tape and Reel.*

*Note 2: "TR" suffix is no longer used. It is a legacy naming convention shown here only for informational purposes.*

## 5.0 Electrical Specifications

### 5.1 Absolute Maximum Conditions

| Parameter                                   |                | Min.      | Max.            | Unit |
|---------------------------------------------|----------------|-----------|-----------------|------|
| Supply Voltage on $V_{DD}$ relative to GND  |                | -0.5      | 7               | V    |
| Supply Voltage on $V_{DD2}$ relative to GND |                | -0.5      | $V_{DD} + 0.5$  | V    |
| DC Input Voltage                            | Pins 2,3,4,5,6 | GND - 0.5 | $V_{DD} + 0.5$  | V    |
|                                             | Pins 8,9,10,12 |           | $V_{DD2} + 0.5$ |      |
| Maximum Average or DC Current (Through pin) | Push-Pull 1x   | --        | 12              | mA   |
|                                             | Push-Pull 2x   | --        | 17              |      |
|                                             | OD 1x          | --        | 18              |      |
|                                             | OD 2x          | --        | 28              |      |
| Current at Input Pin                        |                | -1.0      | 1.0             | mA   |
| Storage Temperature Range                   |                | -65       | 150             | °C   |
| Junction Temperature                        |                | --        | 150             | °C   |
| ESD Protection (Human Body Model)           |                | 2000      | --              | V    |
| ESD Protection (Charged Device Model)       |                | 500       | --              | V    |
| Moisture Sensitivity Level                  |                | 1         |                 |      |

### 5.2 Electrical Characteristics (1.8 V $\pm 5\%$ $V_{DD}$ )

| Symbol     | Parameter                                        | Condition/Note                                                                              | Min.  | Typ.  | Max.     | Unit    |
|------------|--------------------------------------------------|---------------------------------------------------------------------------------------------|-------|-------|----------|---------|
| $V_{DD}$   | Supply Voltage                                   | $V_{DD2} \leq V_{DD}$                                                                       | 1.71  | 1.80  | 1.89     | V       |
| $I_Q$      | Quiescent Current                                | Static Inputs and Outputs (when ACMP, Vref and RC OSC are powered down and non-operational) | --    | 0.5   | --       | $\mu A$ |
| $T_A$      | Operating Temperature                            |                                                                                             | -40   | 25    | 85       | °C      |
| $V_{ACMP}$ | ACMP Input Voltage Range                         | Positive Input                                                                              | 0     | --    | $V_{DD}$ |         |
|            |                                                  | Negative Input                                                                              | 0     | --    | 1.1      |         |

Note 1: DC or average current through any pin should not exceed value given in Absolute Maximum Conditions.  
Note 2: The GreenPAK's power rails are divided in two sides. Pins 2, 3, 4, 5 and 6 are connected to one side, pins 8, 9, 10 and 12 to another.

## 5.3 Electrical Characteristics (3.3 V $\pm 10\%$ V<sub>DD</sub>)

Note 1: DC or average current through any pin should not exceed value given in Absolute Maximum Conditions.

Note 2: The GreenPAK's power rails are divided in two sides. Pins 2, 3, 4, 5 and 6 are connected to one side, pins 8, 9, 10 and 12 to another.

## 5.4 Electrical Characteristics (5 V $\pm 10\%$ $V_{\text{DD}}$ )

Note 1: DC or average current through any pin should not exceed value given in Absolute Maximum Conditions.

Note 2: The GreenPAK's power rails are divided in two sides. Pins 2, 3, 4, 5 and 6 are connected to one side, pins 8, 9, 10 and 12 to another.

## 5.11 Expected Delays and Widths

**Table 4. Expected Delays and Widths for Programmable Delay (typical).**

| Symbol | Parameter     | Note                                                    | V <sub>DD</sub> /V <sub>DD2</sub> =<br>1.8 V | V <sub>DD</sub> /V <sub>DD2</sub> =<br>3.3 V | V <sub>DD</sub> /V <sub>DD2</sub> =<br>5.0 V | Unit |
|--------|---------------|---------------------------------------------------------|----------------------------------------------|----------------------------------------------|----------------------------------------------|------|
| time1  | Width, 1 cell | PDLY mode:(any)edge detect, edge detect output          | 256.7                                        | 120.8                                        | 110                                          | ns   |
| time1  | Width, 2 cell | PDLY mode:(any)edge detect, edge detect output          | 564.4                                        | 262.7                                        | 225                                          | ns   |
| time1  | Width, 3 cell | PDLY mode:(any)edge detect, edge detect output          | 873.5                                        | 405                                          | 340                                          | ns   |
| time1  | Width, 4 cell | PDLY mode:(any)edge detect, edge detect output          | 11.82.3                                      | 547.5                                        | 450                                          | ns   |
| time2  | Delay, 1 cell | PDLY mode:(any)edge detect, edge detect output          | 48.2                                         | 20                                           | 14                                           | ns   |
| time2  | Delay, 2 cell | PDLY mode:(any)edge detect, edge detect output          | 48.2                                         | 20.1                                         | 14                                           | ns   |
| time2  | Delay, 3 cell | PDLY mode:(any)edge detect, edge detect output          | 48.2                                         | 20.1                                         | 14                                           | ns   |
| time2  | Delay, 4 cell | PDLY mode:(any)edge detect, edge detect output          | 48.3                                         | 20.1                                         | 14                                           | ns   |
| time1  | Delay, 1 cell | PDLY mode: both edge delay (shared macrocell inputs)    | 357.9                                        | 162.2                                        | 110                                          | ns   |
| time1  | Delay, 2 cell | PDLY mode: both edge delay (shared macrocell inputs)    | 666.1                                        | 304.3                                        | 220                                          | ns   |
| time1  | Delay, 3 cell | PDLY mode: both edge delay (shared macrocell inputs)    | 974.7                                        | 446.3                                        | 335                                          | ns   |
| time1  | Delay, 4 cell | PDLY mode: both edge delay (shared macrocell inputs)    | 1283.8                                       | 588.8                                        | 450                                          | ns   |
| time1  | Width         | CNT3/DLY3 Rising Edge Detect (shared macrocell inputs)  | 136.6                                        | 73.4                                         | 140                                          | ns   |
| time1  | Width         | CNT3/DLY3 Falling Edge Detect (shared macrocell inputs) | 130.6                                        | 71                                           | 140                                          | ns   |
| time1  | Width         | CNT3/DLY3 Both Edge Detect (shared macrocell inputs)    | 133.05                                       | 72                                           | 140                                          | ns   |

## 5.12 Typical Pulse Width Performance

Table 5. Typical Pulse Width Performance.

| Parameter            | $V_{DD}/V_{DD2} = 1.8\text{ V}$ | $V_{DD}/V_{DD2} = 3.3\text{ V}$ | $V_{DD}/V_{DD2} = 5.0\text{ V}$ | Unit |
|----------------------|---------------------------------|---------------------------------|---------------------------------|------|
| Filtered Pulse Width | < 150                           | < 55                            | < 35                            | ns   |

## 6.0 Summary of Macrocell Function

### 6.1 I/O Pins

- Digital Input (low voltage or normal voltage, with or without Schmitt Trigger)
- Open Drain NMOS and Open Drain PMOS Outputs
- Push Pull Outputs
- Analog I/O
- 10 k $\Omega$ /100 k $\Omega$ /1 M $\Omega$  pull-up/pull-down resistors

### 6.2 Connection Matrix

- Digital matrix for circuit connections based on user design

### 6.3 Analog Comparators (2 total)

- Selectable hysteresis 0 mV/25 mV/50 mV/200 mV and selectable gain 1x/0.5x/0.33x/0.25x

### 6.4 Voltage Reference

- Used for references on Analog Comparators
- Can also be driven to external pins

### 6.5 Combinational Logic Look Up Tables (LUTs – 5 total)

- One 2-bit Lookup Tables
- Four 3-bit Lookup Tables

### 6.6 Combination Function Macrocells (12 total)

- Four Selectable DFF/Latches or 2-bit LUTs
- Four Selectable DFF/Latches or 3-bit LUTs
- One Selectable Pipe Delay or 3-bit LUT
- Two Selectable CNT/DLYs or 4-bit LUTs
- One Programmable Delay or Deglitch Filter

### 6.7 Delays/Counters (2 total)

- One 8-bit delay/counter with external clock/reset: Range 1-255 clock cycles
- One 14-bit delay/counter with external clock: Range 1-16383 clock cycles

### 6.8 Pipe Delay (Part of Combination Function Macrocell)

- 8 stage / 2 output
- Two 1-8 stage selectable outputs
- One 1 stage fixed output

### 6.9 Additional Logic Functions (Part of Combination Function Macrocell)

- One Deglitch filter macrocell
- One Programmable Delay
  - 163 ns / 305 ns / 446 ns / 588 ns @ 3.3 V
  - Includes Edge Detection function

**6.10 Additional Logic Function**

- One Inverter

**6.11 RC Oscillator**

- 25 kHz and 2 MHz selectable frequency
- First Stage Clock pre=divider (4): OSC/1, OSC/2, OSC/4, and OSC/8
- Second stage divider control with two outputs, OUT0 and OUT1 (8): selectable (OSC/1, OSC/2, OSC/3, OSC/4, OSC/8, OSC/12, OSC/24, or OSC/64)

**6.12 Power On Reset (POR)**

## 7.0 I/O Pins

The SLG46121 has a total of 9 multi-function I/O pins which can function as either a user defined Input or Output, as well as serving as a special function (such as outputting the voltage reference). Refer to Section 2.0 Pin Description for pin definitions.

All of the 9 user defined I/O pins on the SLG46121, except Pin 2 can serve as both digital input and digital output. Pin 2 can only serve as a digital input pin.

The high side of the user selectable push-pull or open-drain pin output structures for each GPIO is connected to either  $V_{DD}$  or  $V_{DD2}$ . This allows for the appropriate voltage level output compatible with each voltage domain. The level shifters are located in lower power IO PADs (pins 8, 9, 10 and 12) powered from  $V_{DD2}$ . All configuration registers of the SLG46121 are powered from  $V_{DD}$ , so it is possible to maintain the configuration information even after  $V_{DD2}$  was turned off, discharged and turned back on again.

Pins 2, 3, 4, 5 and 6 are powered  $V_{DD}$  and pins 8, 9, 10 and 12 are powered from  $V_{DD2}$ . All internal macrocells are powered from  $V_{DD}$ . Voltage on  $V_{DD2}$  Pin must be less or equal voltage on  $V_{DD}$  Pin.

In case  $V_{DD2}$  floating and any Pin powered from  $V_{DD2}$  is configured as input, ESD pin protection diodes must be considered when applying an input signal to the pin. This will cause a significant current leakage.

In case  $V_{DD2}$  floating and any Pin powered from  $V_{DD2}$  is configured as Output, the pin will behave as NMOS Open Drain.

It is not recommended to connect  $V_{DD2}$  to the GND.

### 7.1 Input Modes

Each I/O pin can be configured as a digital input pin with/without buffered Schmitt Trigger, or can also be configured as a low voltage digital input. Pins 3, 4, and 6 can also be configured to serve as analog inputs to the on-chip comparators.

### 7.2 Output Modes

Pins 3, 4, 5, 6, 8, 9, 10, and 12 can all be configured as digital output pins.

### 7.3 Pull Up/Down Resistors

All I/O pins have the option for user selectable resistors connected to the input structure. The selectable values on these resistors are 10 k $\Omega$ , 100 k $\Omega$  and 1 M $\Omega$ . In the case of Pin 2, the resistors are fixed to a pull-down configuration. In the case of all other I/O pins, the internal resistors can be configured as either pull-up or pull-downs.

## 7.4 I/O Register Settings

### 7.4.1 PIN 2 Register Settings

**Table 6. PIN 2 Register Settings**

| Signal Function                          | Register Bit Address | Register Definition                                                                                                                  |

## 8.0 Connection Matrix

The Connection Matrix in the SLG46121 is used to create the internal routing for internal functions of the device once it is programmed. The registers are programmed from the one-time NVM cell during Test Mode Operation. All of the connection points for each logic cell within the SLG46121 have a specific digital bit code assigned to it that is either set to active “High” or inactive “Low” based on the design that is created. Once the 768 register bits within the SLG46121 are programmed a fully custom circuit will be created.

The Connection Matrix has 40 inputs and 64 outputs. Each of the 40 inputs to the Connection Matrix is hard-wired to a particular source macrocell, including I/O pins, LUTs, analog comparators, other digital resources and  $V_{DD}$  and  $V_{SS}$ . The input to a digital macrocell uses a 6-bit register to select one of these 40 input lines.

For a complete list of the SLG46121’s register table, see Section 17.0 Appendix A - SLG46121 Register Definition.

| Matrix Input Signal Functions | N         |                            |                            |                            |                       |

## 9.0 Combinatorial Logic

Combinatorial logic is supported via five Lookup Tables (LUTs) within the SLG46121. There is one 2-bit LUT and four 3-bit LUTs. The device also includes 11 Combination Function Macrocells that can be used as LUTs. For more details, please see Section 10.0 Combination Function Macrocells.

Inputs/Outputs for the four LUTs are configured from the connection matrix with specific logic functions being defined by the state of NVM bits. The outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

### 9.1 2-Bit LUT

The one 2-bit LUT takes in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. ...

Figure 9. 2-bit LUT

Table 17. 2-bit LUT4 Truth Table.

| IN1 | IN0 | OUT          |
|-----|-----|--------------|
| 0   | 0   | reg <412>reg |
| 0   | 1   | reg <413>reg |
| 1   | 0   | reg <414>reg |
| 1   | 1   | reg <415>reg |

Each 2-bit LUT uses a 4-bit register signal to define their output functions;

*2-Bit LUT4 is defined by reg <415:412>*

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the two 2-bit LUT logic cells.

Table 18. 2-bit LUT Standard Digital Functions.

| Function | MSB |   |   | LSB |
|----------|-----|---|---|-----|
| AND-2    | 1   | 0 | 0 | 0   |
| NAND-2   | 0   | 1 | 1 | 1   |
| OR-2     | 1   | 1 | 1 | 0   |
| NOR-2    | 0   | 0 | 0 | 1   |
| XOR-2    | 0   | 1 | 1 | 0   |
| XNOR-2   | 1   | 0 | 0 | 1   |

## 9.2 3-Bit LUT

The four 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix.

Figure 10. 3-bit LUTs

Table 19. 3-bit LUT4 Truth Table.

| IN2 | IN1 | IN0 | OUT       |
|-----|-----|-----|-----------|

| XNOR-3   | 0   | 1 | 1 | 0 | 1 | 0 | 0 | 1   |

## 10.0 Combination Function Macrocells

The SLG46121 has twelve combination function macrocells that can serve more than one logic or timing function. In eleven of these cases, they can serve as a Look Up Table (LUT), or as another logic or timing function. In the last case, it can serve as either a programmable delay or deglitch filter. See the list below for the functions that can be implemented in these macrocells.

- Four macrocells that can serve as either 2-bit LUTs or as D Flip Flops
- Four macrocells that can serve as either 3-bit LUTs or as D Flip Flops
- One macrocell that can serve as either 3-bit LUT or as Pipe Delay
- Two macrocells that can serve as either 4-bit LUTs or as 8-Bit Counter / Delays
- One macrocell that can serve as either a Programmable Delay or as a Deglitch Filter

Inputs/Outputs for the eleven combination function macrocells are configured from the connection matrix with specific logic functions being defined by the state of NVM bits.

When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

When used as a D Flip Flop / Latch, the source and destination of the inputs and outputs for the DFF/Latches are configured from the connection matrix. All DFF/Latch macrocells have user selection for initial state, and all have the option to connect both the Q and Q Bar outputs to the connection matrix. The macrocells DFF4, DFF5, DFF6 and DFF7 have an additional input from the matrix that can serve as a nSet or nReset function to the macrocell.

The operation of the D Flip-Flop and Latch will follow the functional descriptions below:

DFF: CLK is rising edge triggered, then  $Q = D$ ; otherwise Q will not change

Latch: if CLK = 0, then  $Q = D$

### 10.1 2-Bit LUT or D Flip Flop Macrocells

There are four macrocells that can serve as either 2-bit LUTs or as D Flip Flops. When used to implement LUT functions, the 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the two input signals from the connection matrix go to the data (d) and clock (clk) inputs for the Flip Flop, with the output going back to the connection matrix.

| 0   | 0   | reg <408> |
| 0   | 1   | reg <409> |
| 1   | 0   | reg <410> |
| 1   | 1   | reg <411> |

Each Macrocell, when programmed for a LUT function, uses a 4-bit register to define their output function:

*2-Bit LUT0 is defined by reg <399:396>*

*2-Bit LUT1 is defined by reg <403:400>*

*2-Bit LUT2 is defined by reg <407:404>*

*2-Bit LUT3 is defined by reg <411:408>*

## 10.1.2 2-Bit LUT or D Flip Flop Macrocells Used as D Flip Flop Register Settings

**Table 28. DFF0 Register Settings**

| Signal Function              | Register Bit Address | Register Definition                  |
|------------------------------|----------------------|--------------------------------------|
| DFF0 or Latch select         | reg <396>            | 0: DFF function<br>1: Latch function |
| DFF0 output select           | reg <397>            | 0: Q output<br>1: nQ output          |
| DFF0 initial polarity select | reg <398>            | 0: Low<br>1: High                    |

## 10.2 3-Bit LUT or D Flip Flop with Set/Reset Macrocells

There are four macrocells that can serve as either 3-bit LUTs or as D Flip Flops. When used to implement LUT functions, the 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the three input signals from the connection matrix go to the data (d) and clock (clk) and Set/Reset (nRST/nSET) inputs for the Flip Flop, with the output going back to the connection matrix.

### 10.3 3-Bit LUT or Pipe Delay Macrocell

There is one macrocell that can serve as either a 3-bit LUT or as a Pipe Delay.

When used to implement LUT functions, the 3-bit LUT take in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix.

When used as an 8-stage pipe delay, there are three inputs signals from the matrix, Input (IN), Clock (CLK) and Reset (nRESET). The pipe delay macrocell is built from 8 D Flip-Flop logic cells that provide three register shifted options, two of which are user selectable. The DFF cells are tied in series where the output (Q) of each delay cell goes to the next DFF cell. The first delay option (1 PIPE OUT) is fixed at the output of the first flip-flop stage. The other two outputs (OUT0 and OUT1) provide user selectable options for 1 to 8 stages of delay.

The overall time of the delay is based on the clock used in the SLG46121 design. Each DFF cell has a time delay of the inverse of the clock time (either external clock or the RC Oscillator within the SLG46121). The sum of the number of DFF cells used will be the total time delay of the Pipe Delay logic cell.

Figure 19. 3-bit LUT4 or Pipe Delay

## 10.3.1 3-Bit LUT or Pipe Delay Macrocells Used as 3-Bit LUTs

**Table 40. 3-bit LUT8 Truth Table.**

| IN2 | IN1 | IN0 | OUT       |
|-----|-----|-----|-----------|
| 0   | 0   | 0   | reg <488> |
| 0   | 0   | 1   | reg <489> |
| 0   | 1   | 0   | reg <490> |
| 0   | 1   | 1   | reg <491> |
| 1   | 0   | 0   | reg <492> |
| 1   | 0   | 1   | reg <493> |
| 1   | 1   | 0   | reg <494> |
| 1   | 1   | 1   | reg <495> |

Each Macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

*3-Bit LUT8 is defined by reg <495:488>*

## 10.3.2 3-Bit LUT or Pipe Delay Macrocells Used as Pipe Delay Register Settings

**Table 41. Pipe Delay Register Settings**

| Signal Function                    | Register Bit Address | Register Definition        |
|------------------------------------|----------------------|----------------------------|
| OUT0 select                        | reg <490:488>        | data (pipe number)         |
| OUT1 select                        | reg <493:491>        | data (pipe number)         |
| Unused if Pipe Delay selected      | reg <495:494>        | Unused                     |
| LUT3_8 or pipe delay output select | reg <500>            | 0: LUT3_8<br>1: pipe delay |

#### 10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells

There are two macrocells that can serve as either a 4-bit LUT or as a Counter / Delay. When used to implement LUT functions, the 4-bit LUT takes in four input signals from the connection matrix and produces a single output, which goes back into the connection matrix. When used to implement 8-Bit Counter / Delay function, two of the four input signals from the connection matrix go to the external clock (ext\_clk) and reset (DLY\_n/CNT\_Reset) for the counter/delay, with the output going back to the connection matrix.

*Note: Counters initialize with counter data=0 after POR.*

## 10.4.1 4-Bit LUT or 8-Bit Counter / Delay Macrocell Used as 4-Bit LUTs

**Table 42. 4-bit LUT0 Truth Table.**

| IN3 | IN2 | IN1 | IN0 | OUT       |
|-----|-----|-----|-----|-----------|
| 0   | 0   | 0   | 0   | reg <501> |
| 0   | 0   | 0   | 1   | reg <502> |
| 0   | 0   | 1   | 0   | reg <503> |
| 0   | 0   | 1   | 1   | reg <504> |
| 0   | 1   | 0   | 0   | reg <505> |
| 0   | 1   | 0   | 1   | reg <506> |
| 0   | 1   | 1   | 0   | reg <507> |
| 0   | 1   | 1   | 1   | reg <508> |
| 1   | 0   | 0   | 0   | reg <509> |
| 1   | 0   | 0   | 1   | reg <510> |
| 1   | 0   | 1   | 0   | reg <511> |
| 1   | 0   | 1   | 1   | reg <512> |
| 1   | 1   | 0   | 0   | reg <513> |
| 1   | 1   | 0   | 1   | reg <514> |
| 1   | 1   | 1   | 0   | reg <515> |
| 1   | 1   | 1   | 1   | reg <516> |

**Table 43. 4-bit LUT1 Truth Table.**

| IN3 | IN2 | IN1 | IN0 | OUT       |
|-----|-----|-----|-----|-----------|
| 0   | 0   | 0   | 0   | reg <518> |
| 0   | 0   | 0   | 1   | reg <519> |
| 0   | 0   | 1   | 0   | reg <520> |
| 0   | 0   | 1   | 1   | reg <521> |
| 0   | 1   | 0   | 0   | reg <522> |
| 0   | 1   | 0   | 1   | reg <523> |
| 0   | 1   | 1   | 0   | reg <524> |
| 0   | 1   | 1   | 1   | reg <525> |
| 1   | 0   | 0   | 0   | reg <526> |
| 1   | 0   | 0   | 1   | reg <527> |
| 1   | 0   | 1   | 0   | reg <528> |
| 1   | 0   | 1   | 1   | reg <529> |
| 1   | 1   | 0   | 0   | reg <530> |
| 1   | 1   | 0   | 1   | reg <531> |
| 1   | 1   | 1   | 0   | reg <532> |
| 1   | 1   | 1   | 1   | reg <533> |

Each Macrocell, when programmed for a LUT function, uses a 16-bit register to define their output function:

*4-Bit LUT0 is defined by reg <516:501>*

*4-Bit LUT1 is defined by reg <533:518>*

**Table 44. 4-bit LUT Standard Digital Functions.**

## 10.5 Programmable Delay / Edge Detector

The SLG46121 has a programmable time delay logic cell available that can generate a delay that is selectable from one of four timings (time1) configured in the GreenPAK Designer. The programmable time delay cell can generate one of four different delay patterns, rising edge detection, falling edge detection, both edge detection and both edge delay. These four patterns can be further modified with the addition of delayed edge detection, which adds an extra unit of delay as well as glitch rejection during the delay period. See the timing diagrams below for further information.

*Note: The input signal must be longer than the delay, otherwise it will be filtered out.*

Figure 22. Programmable Delay

## 10.6 Programmable Delay Timing Diagram - Edge Detector Output

Figure 23. Edge Detector Output

Figure 24. Delayed Edge Detector Output

Note: For delays and widths refer to *Table 4*.

## 10.6.1 Programmable Delay Register Settings

**Table 47. Programmable Delay Register Settings**

### 10.7 Deglitch Filter

The SLG46121 has an additional logic function that is connected directly to the Connection Matrix inputs and outputs. There is one deglitch filter.

Figure 25. Deglitch Filter

## 11.0 Analog Comparators (ACMP)

There are two Analog Comparator (ACMP) macrocells in the SLG46120. In order for the ACMP cells to be used in a GreenPAK design, the power up signals (ACMP0\_pdb and ACMP1\_pdb) need to be active. By connecting to signals coming from the Connection Matrix, it is possible to have each ACMP be on continuously, off continuously, or switched on periodically based on a digital signal coming from the Connection Matrix. When ACMP is powered down, output is low.

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage before connection to the analog comparator. Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by way of the external sources.

Each of the ACMP cells has a selection for the bandwidth of the input signal, which can be used to save power when low bandwidth signals are input into the analog comparator. And if input frequency > 200 kHz, the output will retain its previous value. Each cell also has a hysteresis selection, to offer hysteresis of 0 mV, 25 mV, 50 mV or 200 mV.

During powerup, the ACMP output will remain low, and then become valid 110  $\mu$ s (max) after POR signal goes high, see Figure 26. .

*Note: Applies to first time power ON.*

*Note: Regulator and Charge Pump set to automatic ON/OFF.*

Figure 26. Maximum Power On Delay vs.  $V_{DD}$ .

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage (1X, 0.5X, 0.33X, 0.25X) before connection to the analog comparator. The Gain divider is unbuffered and consists of 250 K $\Omega$  (typ.) resistors, see Table 48. For gain divider accuracy refer to Table 49. IN- voltage range: 0 - 1.2 V. Can use Vref selection  $V_{DD}/4$  and  $V_{DD}/3$  to maintain this input range.

Table 48. Gain Divider Input Resistance (typ.).

| Gain             | 1X   | 0.5X | 0.33X | 0.25X |
|------------------|------|------|-------|-------|
| Input Resistance | 100M | 1M   | 0.75M | 1M    |

**Table 49. Gain Divider Accuracy.**

| Gain     | 0.5X   | 0.33X  | 0.25X   |
|----------|--------|--------|---------|
| Accuracy | ±0.6 % | ±0.9 % | ±0.28 % |

Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by the external reference/source. Internal Vref accuracy is optimized near 1000 mV selection.

*Note: Power supply control options have influence on the ACMP operation.*

*Note: Any ACMP powered on enables the BandGap internal circuit as well. An analog voltage will appear on Vref (even when the Force BandGap option is set as Disabled).*

Analog comparators have the following configurable options:

- Hysteresis: Input signal hysteresis options are Disable, 25 mV, 50 mV, 200 mV.
- Low Bandwidth: Enable, Disable;
- IN+ Gain: 1X, 0.5X, 0.33X, 0.25X;
- IN+ source:
  - ACMP0 IN+ options are PIN 3,  $V_{DD}$ ;
  - ACMP1 IN+ options are PIN 6, ACMP0 IN+;
- IN- source:
  - ACMP0 IN- options are 24 internal reference sources (50 mV – 1200 mV) and  $V_{DD}/3$ ,  $V_{DD}/4$ , PIN 4;
  - PWR UP=0 – ACMP is powered down; PWR UP=1 – ACMP is powered up.

All ACMPs can have a common negative input. This can be achieved by configuring ACMP0 PIN 4 analog I/O connection.

## 12.0 Counters/Delay Generators (CNT/DLY)

There are two configurable counters/delay generators in the SLG46121. CNT/DLY0 is 14-bit and CNT/DLY2 is 8-bit. For flexibility, each of these macrocells has a large selection of internal and external clock sources, as well as the option to chain from the output of the previous (N-1) CNT/DLY macrocell, to implement longer count / delay circuits.

One of the counter/delay generator macrocells (CNT/DLY1) has two inputs from the connection matrix, one for Delay Input/Reset Input (Delay\_In/Reset\_In), and one for an external counter/clock source.

Note that there are also two Combination Function Macrocells that can implemented as either 4-bit LUTs or 8-bit counter / delays, For more information please see Section 10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells.

## 13.0 Voltage Reference (VREF)

### 13.1 Voltage Reference Overview

The SLG46121 has a Voltage Reference Macrocell to provide references to the four analog comparators. This macrocell can supply a user selection of fixed voltage references,  $/3$  and  $/4$  reference off of the  $V_{DD}$  power supply to the device, and externally supplied voltage references from Pin 4. The macrocell also has the option to output reference voltages on pins 10. See table below for the available selections for each analog comparator. Also see *Figure 45.* below, which shows the reference output structure.

### 13.2 VREF Selection Table

**Table 55. VREF Selection Table.**

| SEL<4:0> | CMP0_VREF        | CMP1_VREF        |
|----------|------------------|------------------|
| 11010    | ext. Vref (PIN4) | ext. Vref (PIN4) |
| 11001    | $V_{DD} / 4$     | $V_{DD} / 4$     |
| 11000    | $V_{DD} / 3$     | $V_{DD} / 3$     |

## 14.0 RC Oscillator (RC Osc)

### 14.1 RC Oscillator Overview

The SLG46121 has two internal RC oscillators, one that runs at 25 kHz and one that runs at 2 MHz. When using the chip internal RC OSC, a choice is available to “Force Power On”, meaning that the RC OSC will always run, or “Auto Power On”, meaning that the RC OSC will have an associated startup and settling time associated with it (offset). Figure 46. and Figure 47. show maximum power on delay vs.  $V_{DD}$ .

Note: RC OSC power setting: “Auto Power On”.

Figure 46. Maximum Power On Delay vs.  $V_{DD}$ , RC OSC = 2 MHz.

Figure 47. Maximum Power On Delay vs.  $V_{DD}$ , RC OSC = 25 kHz.

The user can select one of these fundamental frequencies for the RC OSC Macrocell, or the fundamental frequency can also come from an external clock input (Pin 12). There are two divider stages that allow the user flexibility for introducing clock signals on various Connection Matrix Input lines. The first stage divider (also known as the clock pre-divider) allows the selection of /1, /2, /4 or /8 divide down frequency from the fundamental. There are two second stage divider controls (OUT0 and OUT1). Each has its own input of one frequency from the first stage divider, and outputs two different frequencies on Connection Matrix Input lines <30>, and <31>. See *Figure 48.* below for details of the frequencies for each of these two Connection Matrix Inputs.

If PWR DOWN input of oscillator is LOW, the oscillator will be turned on. If PWR DOWN input of oscillator is HIGH the oscillator will be turned off. The PWR DOWN signal has the highest priority.

## 14.2 RC OSC Block Diagram

Figure 48. RC OSC Block Diagram

## 15.0 Additional Logic Functions

The SLG46121 has one additional logic function that is connected directly to the Connection Matrix inputs and outputs. There is one inverter which can switch the polarity of any Connection Matrix signal.

### 15.1 INV\_0 Gate

Figure 49. INV\_0 Gate

## 16.0 Power On Reset (POR)

The SLG46121 has a power-on reset (POR) macrocell to ensure correct device initialization and operation of all macrocells in the device. The purpose of the POR circuit is to have consistent behavior and predictable results when the  $V_{DD}$  power is first ramping to the device, and also while the  $V_{DD}$  is falling during power-down. To accomplish this goal, the POR drives a defined sequence of internal events that trigger changes to the states of different macrocells inside the device, and finally to the state of the I/O pins. This application note is created to explain the whole process of POR operation and GreenPAK chip behavior during the time while it is powering up and powering down.

### 16.1 General Operation

The SLG46121 is guaranteed to be powered down and nonoperational when the  $V_{DD}$  voltage (voltage on PIN1) is less than 0.6 V, but not less than -0.6 V. Another essential condition for the chip to be powered down is that no voltage higher (see Note 1) than the  $V_{DD}$  voltage is applied to any other PIN. For example, if  $V_{DD}$  voltage is 0.3 V, applying a voltage higher than 0.3 V to any other PIN is incorrect, and can lead to incorrect or unexpected device behavior.

*Note 1. There is a 0.6 V margin due to forward drop voltage of the ESD protection diodes.*

To start the POR sequence in the SLG46121, the voltage applied on the  $V_{DD}$  should be higher than the Power\_ON threshold (see Note 2). The full operational  $V_{DD}$  range for the SLG46121 is 1.71 V – 5.5 V (1.8 V  $\pm$  10 % - 5 V  $\pm$  10 %). This means that the  $V_{DD}$  voltage must ramp up to the operational voltage value, but the POR sequence will start earlier, as soon as the  $V_{DD}$  voltage rises to the Power\_ON threshold. After the POR sequence has started, the SLG46121 will have a typical period of time to go through all the steps in the sequence (noted in the datasheet for that device), and will be ready and completely operational after the POR sequence is complete.

*Note 2. The Power\_ON threshold can vary by PVT, but typically it is 1.6 V.*

To power down the chip the  $V_{DD}$  voltage should be lower than the operational and to guarantee that chip is powered down it should be less than 0.6 V.

All PINs are in high impedance state when the chip is powered down and while the POR sequence is taking place. The last step in the POR sequence releases the I/O structures from the high impedance state, at which time the device is operational. The pin configuration at this point in time is defined by the design programmed into the chip. Also as it was mentioned before the voltage on PINs can't be bigger than the  $V_{DD}$ , this rule also applies to the case when the chip is powered on.

Note that  $V_{DD2}$  has no influence on POR sequence, all internal macrocells are powered from  $V_{DD}$ . It means,  $V_{DD2}$  can be switched on/off while  $V_{DD}$  is on. If voltage on  $V_{DD2}$  appears after the POR sequence, pins 8, 9, 10, 12 become available when  $V_{DD2}$  reaches 0.6 V.

For proper power up sequence, make sure  $V_{DD2}$  will not exceed  $V_{DD}$  at any point during startup.

For normal operation  $V_{DD}$  should not be switched off while  $V_{DD2}$  is on, due to  $V_{DD2} \leq V_{DD}$ , see section 5.0 Electrical Specifications.

## 16.2 POR Sequence

The POR system generates a sequence of signals that enable certain macrocells. The sequence is shown in *Figure 50*.

Figure 50. POR sequence

As can be seen from *Figure 50*, after the  $V_{DD}$  has started ramping up and crosses the Power\_ON threshold, first, the on-chip NVM memory is reset. Next the chip reads the data from NVM, and transfers this information to SRAM registers that serve to configure each macrocell, and the Connection Matrix which routes signals between macrocells. The third stage causes the reset of the input pins, and then to enable them. After that, the LUTs are reset and become active. After LUTs the Delay cells, RC OSC, DFFs, Latches and Pipe Delay are initialized. Only after all macrocells are initialized internal POR signal (POR macrocell output) goes from LOW to HIGH. The last portion of the device to be initialized are the output PINs, which transition from high impedance to active at this point.

The typical time that takes to complete the POR sequence varies by device type in the GreenPAK family. It also depends on many environmental factors, such as: slew rate,  $V_{DD}$  value, temperature and even will vary from chip to chip (process influence).

### 16.3 Macrocells Output States During POR Sequence

To have a full picture of SLG46121 operation during powering and POR sequence, review the overview the macrocell output states during the POR sequence (*Figure 51.* describes the output signals states).

First, before the NVM has been reset, all macrocells have their output set to logic LOW (except the output PINs which are in high impedance state). Before the NVM is ready, all macrocell outputs are unpredictable (except the output PINs). On the next step, some of the macrocells start initialization: input pins output state becomes LOW; LUTs also output LOW. Only P DLY macrocell configured as edge detector becomes active at this time. After that input PINs are enabled. Next, only LUTs are configured. Next, all other macrocells are initialized. After macrocells are initialized, internal POR matrix signal switches from LOW to HIGH. The last are output PINs that become active and determined by the input signals.

**RoHS Compliance**

Renesas Electronics Corporation's suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.

## IMPORTANT NOTICE AND DISCLAIMER

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES ("RENESAS") PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD-PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for developers who are designing with Renesas products. You are solely responsible for (1) selecting the appropriate products for your application, (2) designing, validating, and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. Renesas grants you permission to use these resources only to develop an application that uses Renesas products. Other reproduction or use of these resources is strictly prohibited. No license is granted to any other Renesas intellectual property or to any third-party intellectual property. Renesas disclaims responsibility for, and you will fully indemnify Renesas and its representatives against, any claims, damages, costs, losses, or liabilities arising from your use of these resources. Renesas' products are provided only subject to Renesas' Terms and Conditions of Sale or other applicable terms agreed to in writing. No use of any Renesas resources expands or otherwise alters any applicable warranties or warranty disclaimers for these products.
