Bit Position	Bit Name	Function
31 to 17	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
16	RIEPA	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPA bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPA bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPA bit is 1.
15 to 12	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
11	RIETOL	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RITOL bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RITOL bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RITOL bit is 1.
10	RIETOF	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RITOF bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RITOF bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RITOF bit is 1.
9	RIETON	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RITON bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RITON bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RITON bit is 1.
8	RIEDT	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIDT bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIDT bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIDT bit is 1.
7	RIEET	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIET bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIET bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIET bit is 1.
6	RIEFT	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIFT bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIFT bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIFT bit is 1.
5	RIEST	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIST bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIST bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIST bit is 1.
4	RIEFR	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIFR bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIFR bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIFR bit is 1.
3	RIESR	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RISR bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RISR bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RISR bit is 1.

Table 29.88 RHSIFnRXICIE Register Contents (2/2)

Bit Position	Bit Name	Function
2	RIEPSTP	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPSTP bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSTP bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSTP bit is 1.
1	RIEPSRT	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPSRT bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSRT bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSRT bit is 1.
0	RIEPG	This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPG bit. 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPG bit is 1. 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPG bit is 1.

29.5.3 Operation

29.5.3.1 Initial Settings

(1) Clocks generated by CLKGEN and transfer mode

The CLKGEN generates the clock for data transmission/reception. **Table 29.89** below shows the correspondence between the clocks to be generated and the transfer mode. The switching between master mode and slave mode, the transfer mode, and the baud rate for fast transfer mode are specified by setting the registers.

During operation in slave mode, the transfer mode can be switched between fast and slow by the ICLC command transmitted from the master.

Table 29.89 Clocks Generated by CLKGEN

Data Transfer Modes	Operation Modes	Clock Sources	Sampling Clock	Baud Rate
			Frequency	
Fast Speed mode	Master/slave	Internal PLL	320, 160, 80 MHz	320, 160, 80 M Baud
Slow Speed mode	Master	System clock	20 MHz	5 M Baud
	Slave	External clock	10, 20 MHz	

(2) L1 settings

- (1) Master/slave setting
Specify the master or slave operation by setting the RHSIFnMDCR.MST register. When the master operation is specified, also specify the frequency of the clock to be output to communication device by setting the RHSIFnMDCR.CLKSEL.
- (2) Flow control setting
Specify the automatic flow control setting by setting the RHSIFnMDCR.CTSEN register.
- (3) RxD enable setting
Enable or disable RxD reception by setting the RHSIFnTXRXCR.RXEN register.
- (4) TxD enable setting
Enable or disable TxD transmission by setting the RHSIFnTXRXCR.TXEN.
- (5) Interrupt enable setting
Enable or disable interrupts by setting the RHSIFn*IE registers for L2 and L1, respectively.
- (6) Transmission/reception speed setting for fast transfer mode
Specify the transmission/reception speed (baud rate) by setting the RHSIFnSPCR.FMBR register.
- (7) Transfer mode setting for transmission/reception
Specify the transfer speed mode for transmission and reception by setting the RHSIFnSPCR.TXSP and RHSIFnSPCR.RXSP registers, respectively.
- (8) Procedure for releasing CLKGEN standby
After power-on reset release, the PLL in the CLKGEN is in the standby (OFF) state. It is necessary to release the PLL from the standby state (ON) to perform data transmission/reception in fast transfer mode. When switching from PLL OFF to PLL ON, be sure to release the standby state of the PLL by using the procedures of steps (a) to (e) described below.
If data transmission/reception is performed in fast transfer mode without following the procedure, the baud rate is unstable and normal operation may not be achieved.
 - (a) Insert waits by software so that the external reference clock (RHSIF0_REFCLK) becomes stable 1 μ s before the PLL is released from the standby state (indicated by step (d) below).
During master operation, however, no wait is required because the internal clock is used as the reference clock for PLL at this time.
 - (b) Set the following registers as required.
RHSIFnMDCR.MST
RHSIFnMDCR.CLKSEL
RHSIFnSPCR.FMBR
RHSIFnSPCR.TXSP
RHSIFnSPCR.RXSP
Be sure to update these registers when the PLL is in the standby state.
 - (c) Insert waits for at least 1 μ s by software.
 - (d) Clear the RHSIFnPCR.PLLSTBY bit to "0". The PLL released from the standby starts running.
 - (e) Insert waits for at least $t_{RHPLLCT}$ μ s by software until the PLL locks up. For details of PLL locked time, refer to *the RH850/E2x-FCC2 Electrical Characteristics, User's Manual: Hardware*.

Note: When switching from PLL ON to PLL OFF, set the RHSIFnPCR.PLLSTBY bit to "1" first to set the PLL in standby state, and then change the registers described in step (b) above. If setting values of these registers are changed while the PLL is running, the PLL may not operate normally.

Figure 29.30 below shows a timing chart for the procedure of steps (a) to (e) above.

Figure 29.30 Timing Chart for Releasing CLKGEN from Reset State

29.5.3.2 ICLC Command Control Method

(1) Basic operation: ICLC command issuance

An ICLC command can be issued from the master to a slave. An ICLC command request is transmitted by firmware. Transmit a request by accessing the register and check the response by using an interrupt as trigger.

Figure 29.31 below shows the procedure flow for issuing an ICLC command.

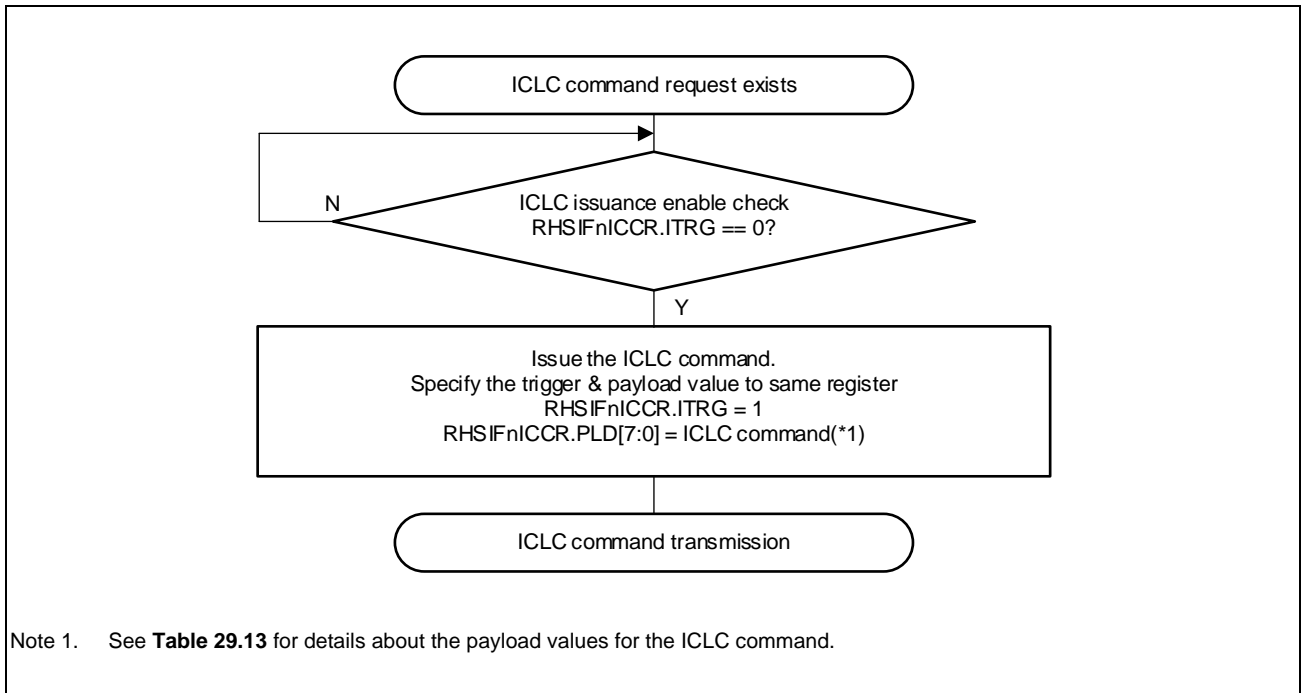

Figure 29.31 Procedure Flow for Issuing ICLC Command

For details about the ICLC commands supported by this product, see **Table 29.13, List of ICLC Command**.

(2) Basic operation: Interrupt

Figure 29.32 below shows the procedure flow for processing an interrupt, using transmission completion interrupt as example.

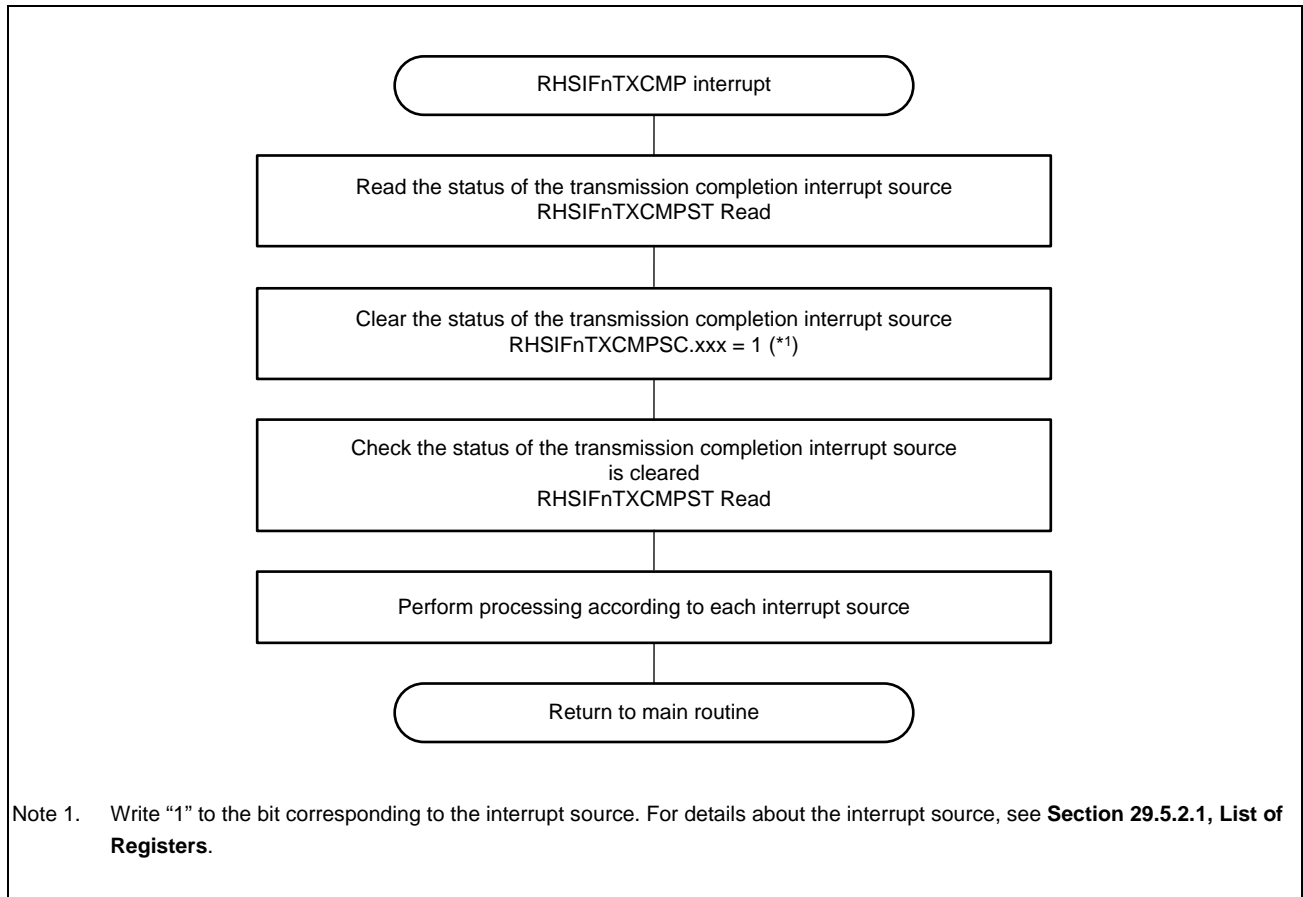

Figure 29.32 Procedure Flow for Processing Transmission Completion Interrupt

The processing is similar to the other interrupts. See **Table 29.90** below for the status registers, status clear registers and interrupt enable registers for the other interrupts.

Table 29.90 List of Interrupt Related Registers

Interrupt	Status Register	Status Clear Register	Interrupt Enable Register
RHSIFnTXCMP	RHSIFnTXCMPST	RHSIFnTXCMPSC	RHSIFnTXCMPIE
RHSIFnTXERR	RHSIFnTXERRST	RHSIFnTXERRSC	RHSIFnTXERRIE
RHSIFnRXCMP	RHSIFnRXCMPST	RHSIFnRXCMPSC	RHSIFnRXCMPIE
RHSIFnRXERR	RHSIFnRXERRST	RHSIFnRXERRSC	RHSIFnRXERRIE
RHSIFnRXICLC	RHSIFnRXICST	RHSIFnRXICSC	RHSIFnRXICIE

(3) Basic operation: Execution of ICLC “PING” command

Figure 29.33 below shows a flow for transmitting an ICLC “PING” command and receiving an ICLC “PING Answer”. The ICLC “PING Answer” can automatically be transmitted without firmware.

After completion of transmission, the device waits for a response from the link partner. The following five cases can be considered according to the responding state of the link partner and whether there is a frame error.

- (a) When the device operates as the master and the link partner sends back an ICLC “PING Answer” (normal case)
 - When the device completes transmission of a PING command, a transmission completion interrupt is generated.
 - Wait until the device receives the ICLC “PING Answer”.
 - When the device receives the “PING Answer”, a reception completion interrupt and an ICLC reception interrupt are generated.
- (b) Transmission errors when the device operates as the master
 - If an error occurs after the device transmits an ICLC “PING” command, a transmission error interrupt is generated.
- (c) Reception errors when the device operates as the master
 - If an error occurs after the device receives the ICLC “PING Answer”, a reception error interrupt is generated.
- (d) Reception errors when the device operates as a slave
 - If an error occurs after the device receives the ICLC “PING” command, a reception error interrupt is generated.
- (e) Transmission errors when the device operates as a slave
 - If an error occurs after the device transmits an ICLC “PING Answer”, a transmission error interrupt is generated.

Figure 29.33 Flow for ICLC “PING” Command Execution

For the ICLC commands other than “PING”, the processing is the same except the slave does not send back an ICLC “PING Answer”.

29.5.3.3 Changing Communication Speed Using ICLC Commands

(1) Changing from slow transfer mode to fast transfer mode

Figure 29.34 to **Figure 29.40** show the procedure for changing the communication speed (transfer mode) from slow transfer mode to fast transfer mode.

For fast transfer mode, the transfer rate (baud rate) can be selected from 320, 160 and 80 M Baud. Be sure to specify the transfer rate in advance, by setting the RHSIFnSPCR register.

Also, be sure to enable transmission for the master.

(a) Enable transmission for the RX link slave.

Transmit the ICLC “Enable Slave interface transmitter” command.

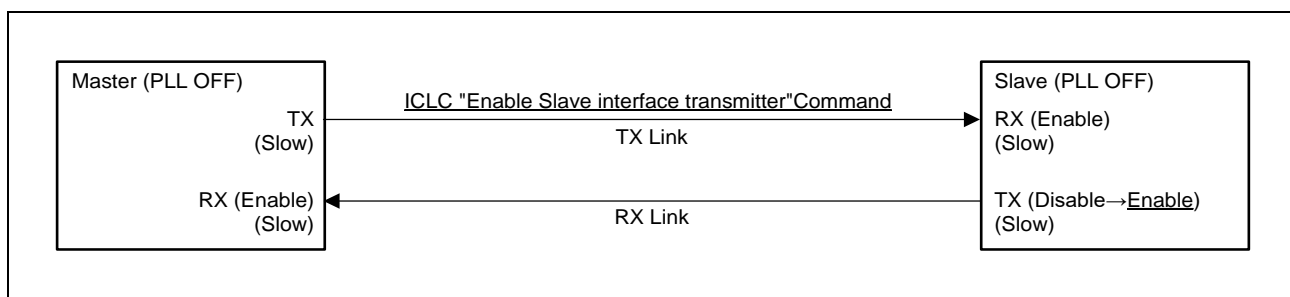

Figure 29.34 Enabling Transmission for RX Link Slave

(b) Start operation of the PLL in slave

Transmit the ICLC “Slave interface PLL start” command. Refer to **(8), Procedure for releasing CLKGEN standby** in **Section 29.5.3.1(2), L1 setting** of **Section 29.5.3.1, Initial Setting** for details.

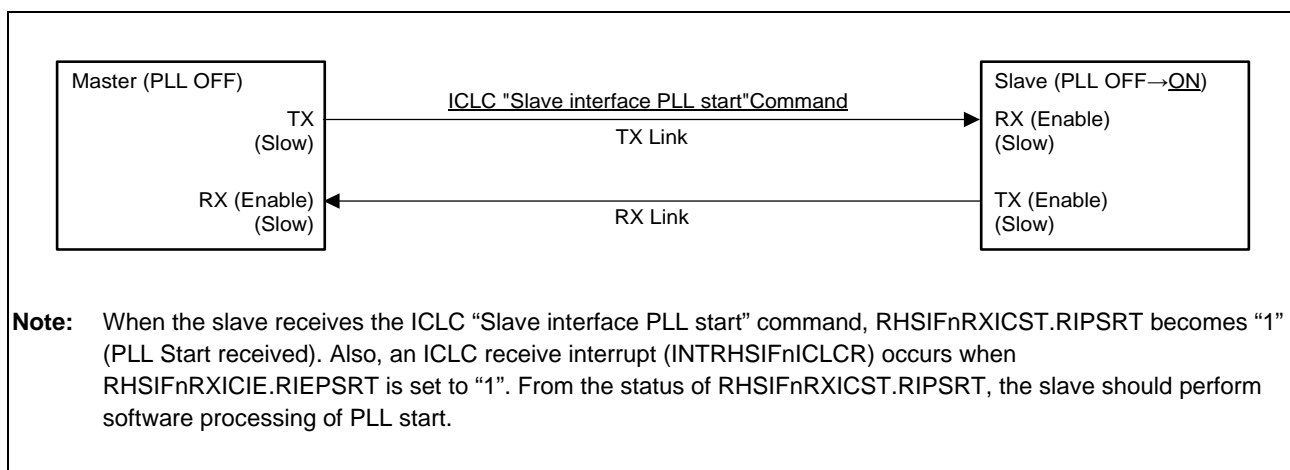

Figure 29.35 Starting Operation of PLL in Slave

(c) Set the transmission speed mode for Rx link slave to fast mode

Transmit the ICLC “Select Fast Speed mode for transfers from the Slave interface to the Master interface” command.

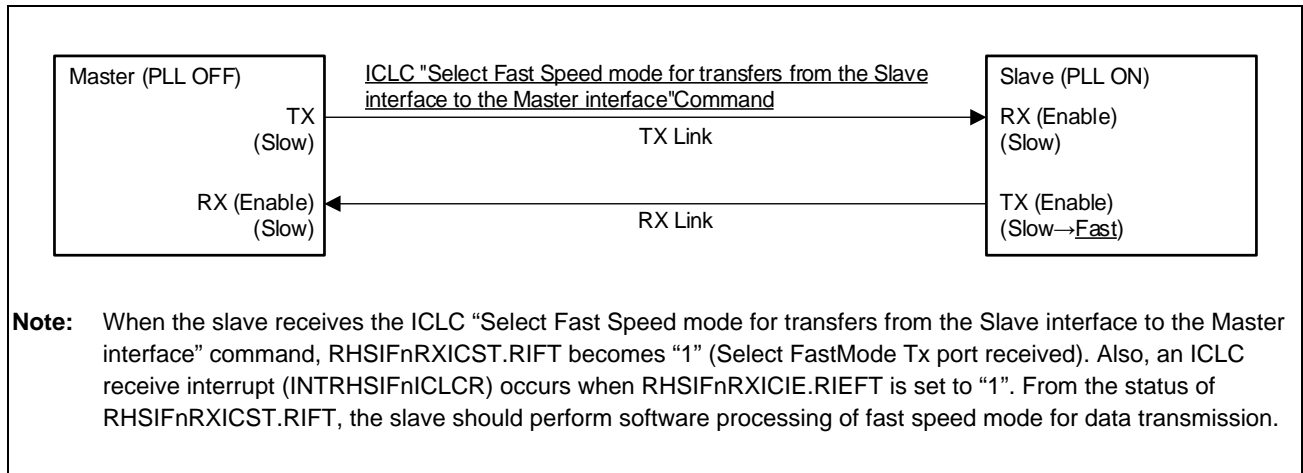

Figure 29.36 Setting Transmission Speed Mode for Slave to Fast

(d) Set the reception speed mode for Tx link slave to fast mode

Transmit the ICLC “Select Fast Speed mode for transfers from the Master interface to the Slave interface” command.

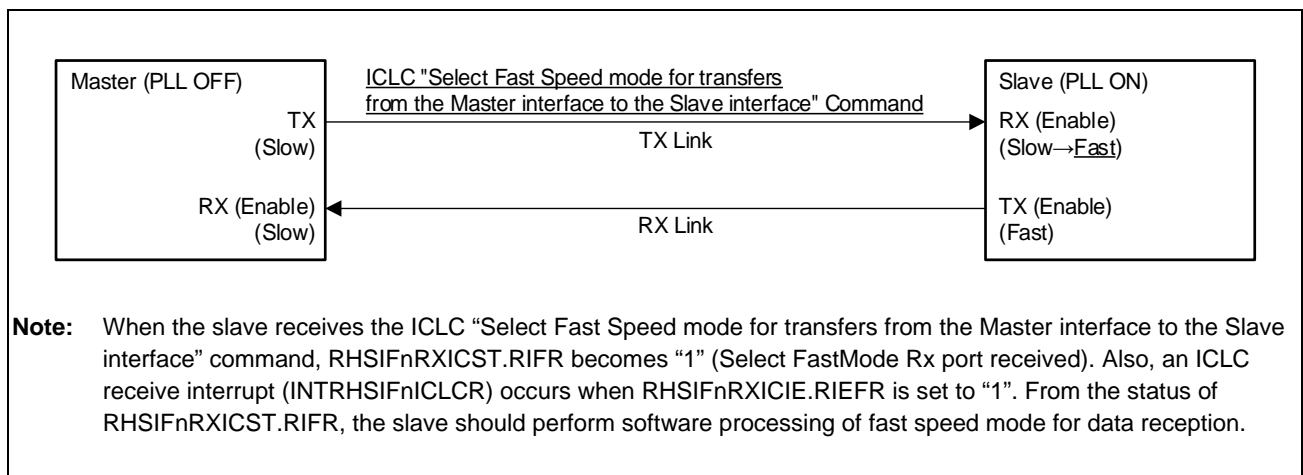

Figure 29.37 Setting Reception Speed for Slave to Fast

(e) Start operation of the PLL in master

Release the PLL from the standby state and start operation of the PLL by setting the APB registers. Refer to **(8)**, **Procedure for releasing CLKGEN standby** in **Section 29.5.3.1(2)**, **L1 setting** of **Section 29.5.3.1**, **Initial Setting** for details.

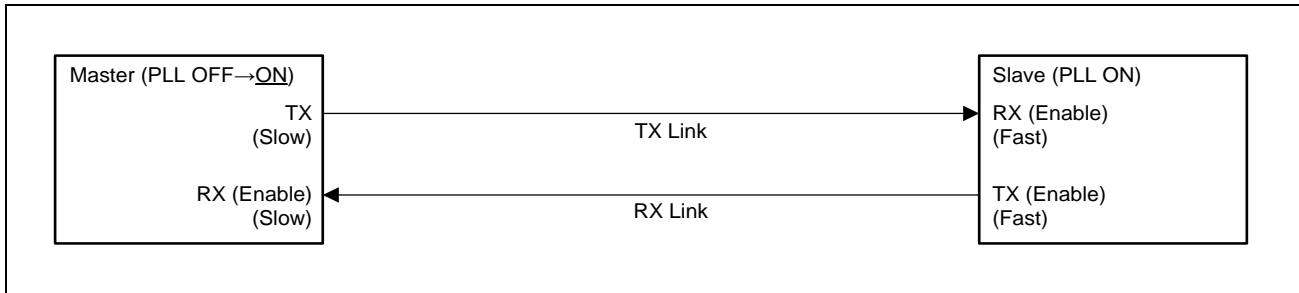

Figure 29.38 Starting Operation of PLL in Master

(f) Set the reception speed mode for Rx link and the transmission speed mode for Tx link of master to fast mode

Set the Rx and Tx speed modes to fast mode by setting RHSIFnSPCR.TXSP to "1" and RHSIFnSPCR.RXSP to "1".

Figure 29.39 Setting Rx and Tx Speed Modes for Master to Fast

(g) Check the link establishment

Transmit the ICLC "PING" command and make sure that a "PING ANSWER" is sent back.

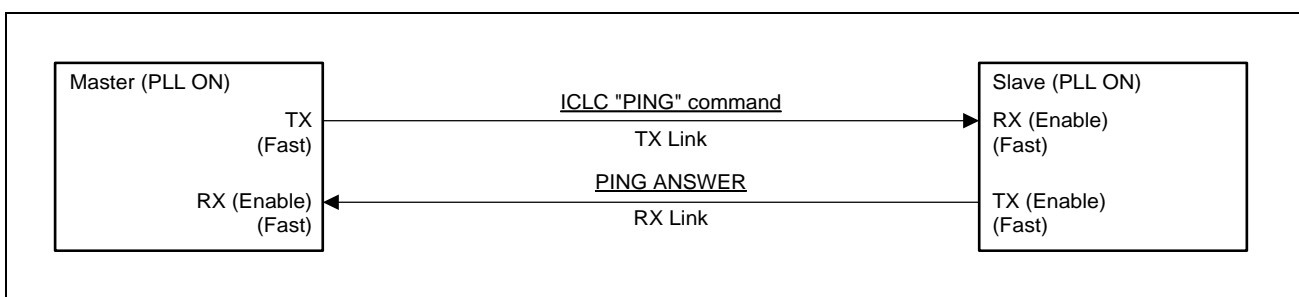

Figure 29.40 Checking Link Establishment

(2) Changing from fast transfer mode to slow transfer mode

Figure 29.41 to **Figure 29.47** show the procedure for changing the communication speed (transfer mode) from fast transfer mode to slow transfer mode.

Be sure to enable transmission for the master in advance

(a) Enable transmission for the RX link slave

Transmit the ICLC “Enable Slave interface transmitter” from the master to slave.

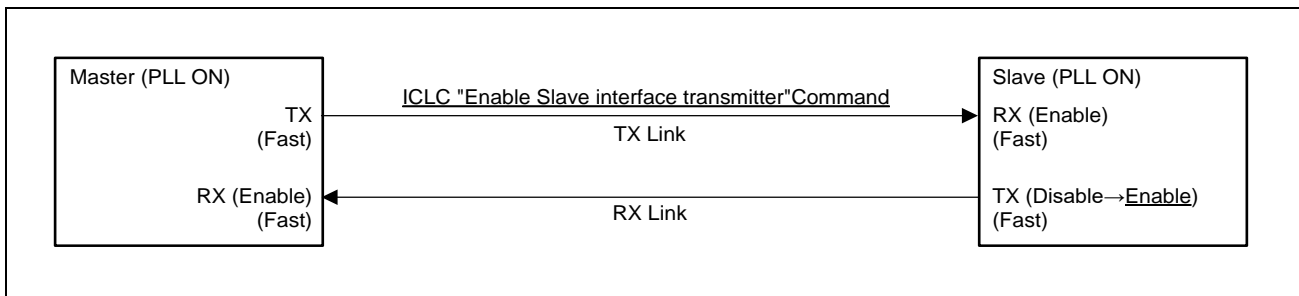

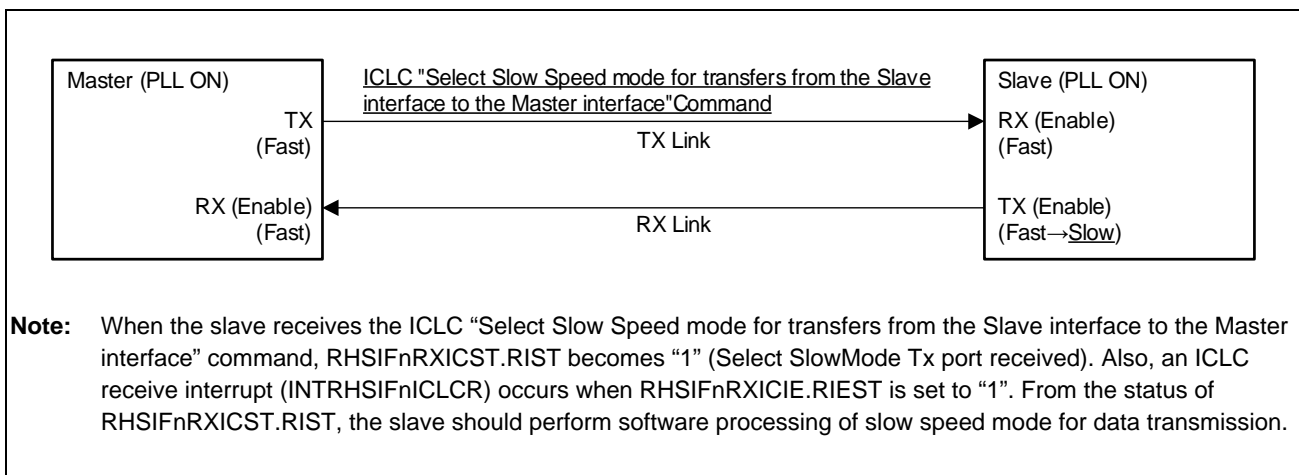

Figure 29.41 Enabling Transmission for RX Link Slave

(b) Set the transmission speed mode for slave to slow mode

Transmit the ICLC “Select Slow Speed mode for transfers from the Slave interface to the Master interface” command from the master to slave.

Note: When the slave receives the ICLC “Select Slow Speed mode for transfers from the Slave interface to the Master interface” command, RHSIFnRXICST.RIST becomes “1” (Select SlowMode Tx port received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIEST is set to “1”. From the status of RHSIFnRXICST.RIST, the slave should perform software processing of slow speed mode for data transmission.

Figure 29.42 Setting Transmission Speed Mode for Slave to Slow

(c) Set the reception speed mode for slave to slow mode

Transmit the ICLC “Select Slow Speed mode for transfers from the Master interface to the Slave interface” command from the master to slave.

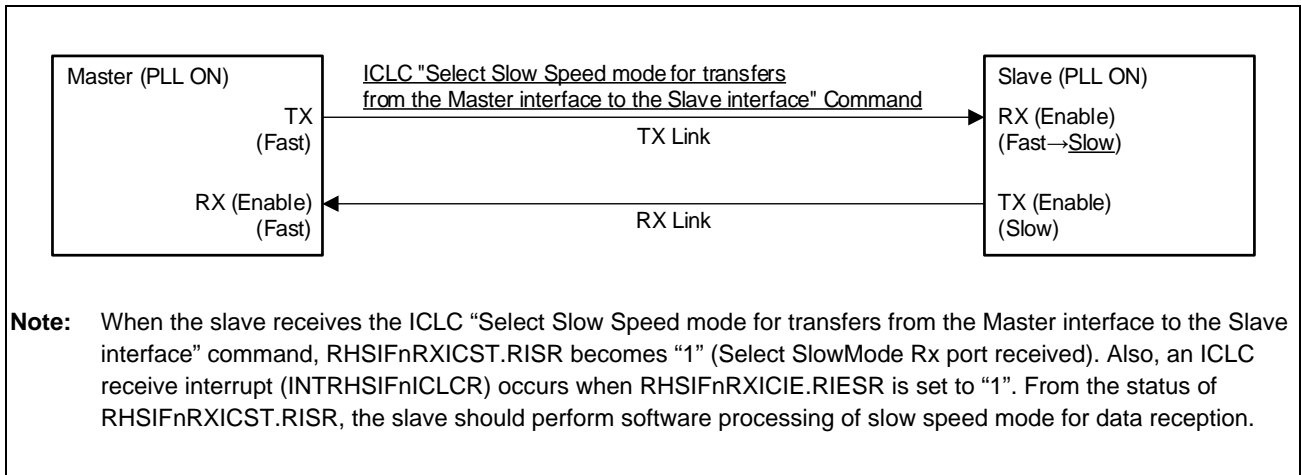

Figure 29.43 Setting Reception Speed for Slave to Slow

(d) Set the reception and transmission speed modes for master to slow mode

Set the Rx and Tx speed modes to slow by setting RHSIFnSPCR.RXSP to “0” and RHSIFnSPCR.TXSP to “0”.

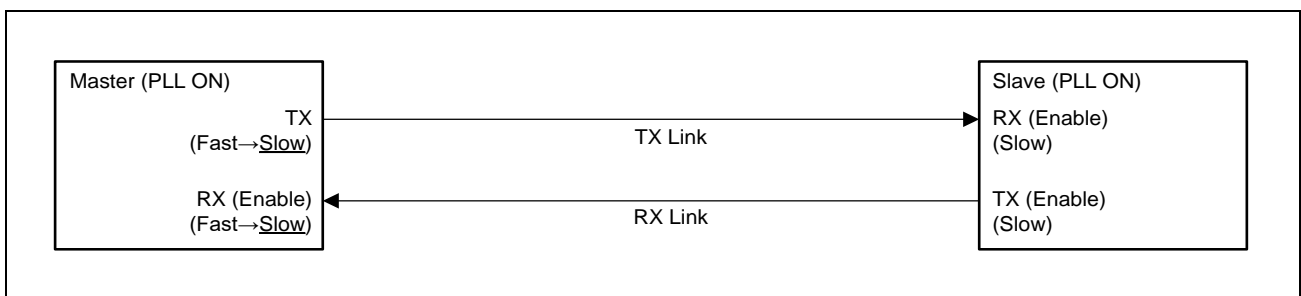

Figure 29.44 Setting Rx and Tx Speed Modes for Master to Slow

- (e) Stop the operation of the PLL in slave
 Transmit the ICLC “Slave interface PLL stop” command.

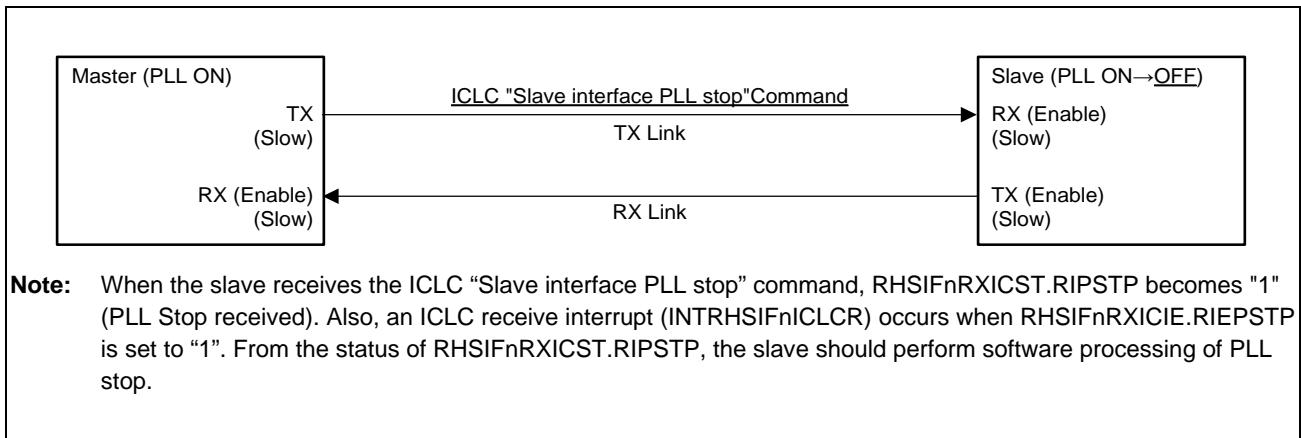

Figure 29.45 Stopping Operation of PLL in Slave

- (f) Stop the operation of the PLL in master
 Set RHSIFnPCR.PLLSTBY to “1” to stop the PLL operation in master.

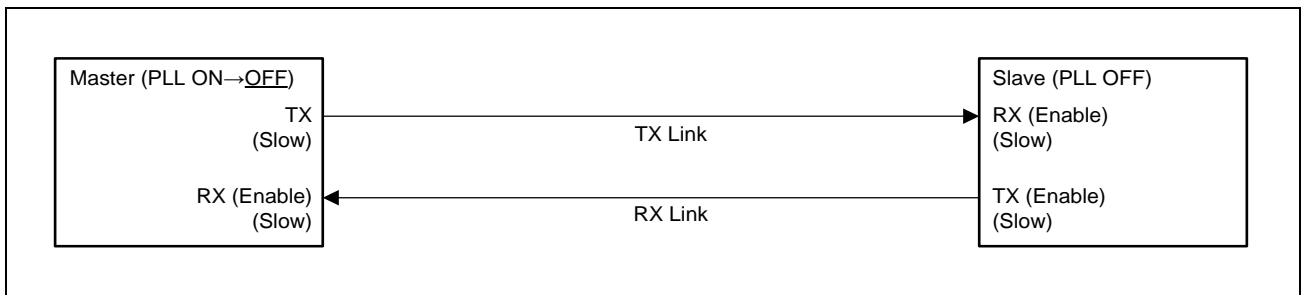

Figure 29.46 Stopping PLL Operation in Master

- (g) Check the link establishment
 Transmit the ICLC “PING” command from the master to slave, and make sure that a “PING ANSWER” is sent back.

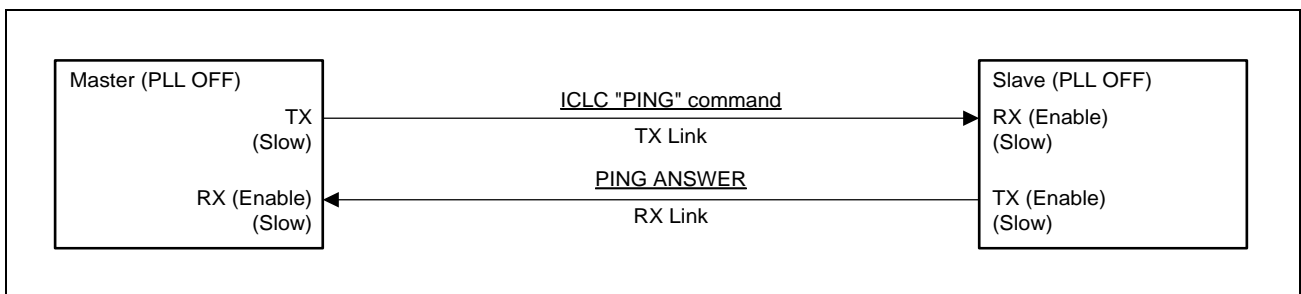

Figure 29.47 Checking Link Establishment

29.5.3.4 Transiting Slave State Using ICLC Commands

When the device is operating as a slave, the state transitions according to the ICLC command that is received as follows.

(1) Transmission enabled/disabled state

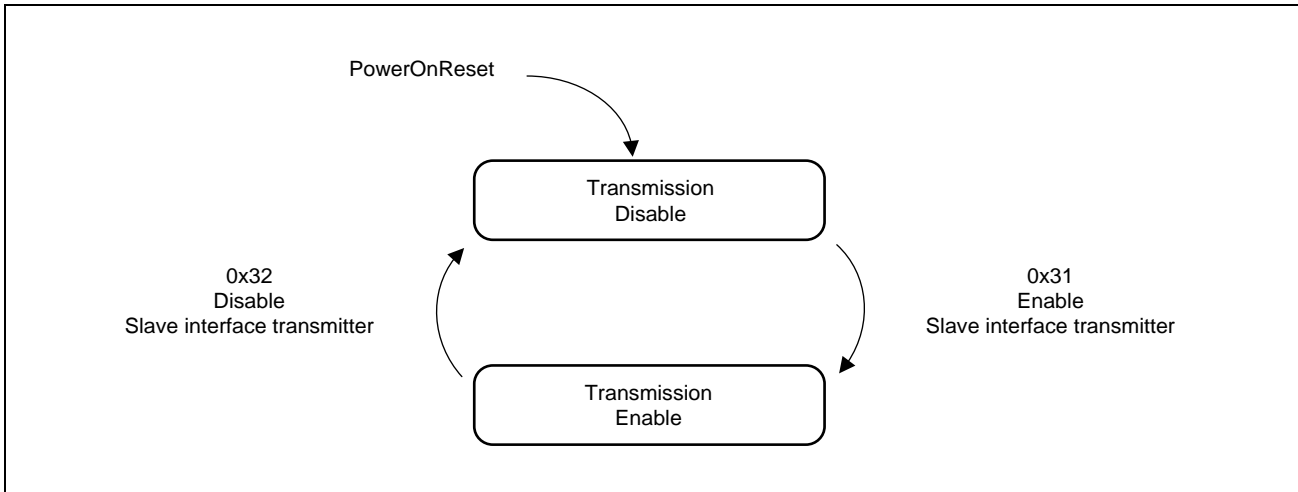

Figure 29.48 Transition between Transmission Enabled and Disabled States

(2) Tx Speed Mode Slow/Fast

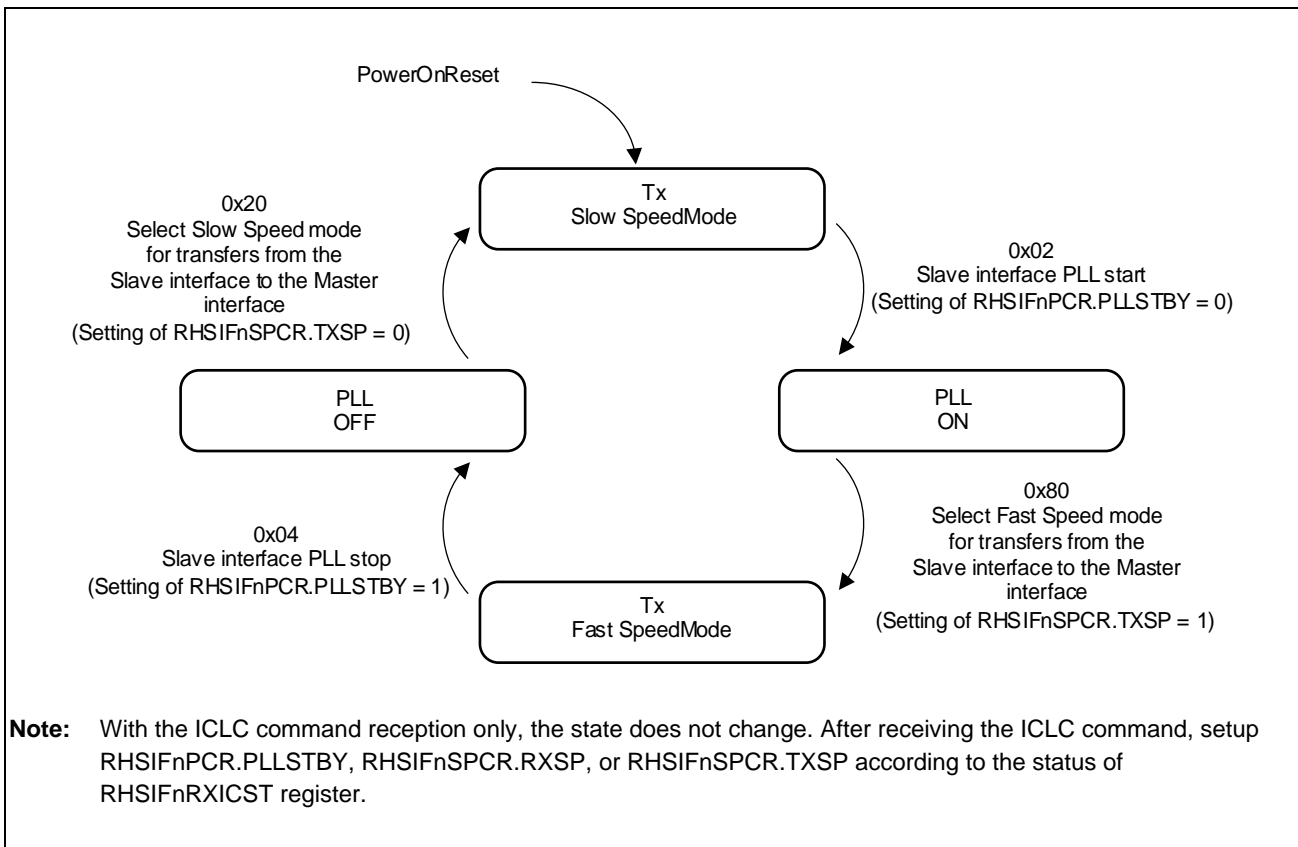

Figure 29.49 Transition between Tx Speed Modes Slow and Fast

(3) Rx Speed Mode Slow / Fast

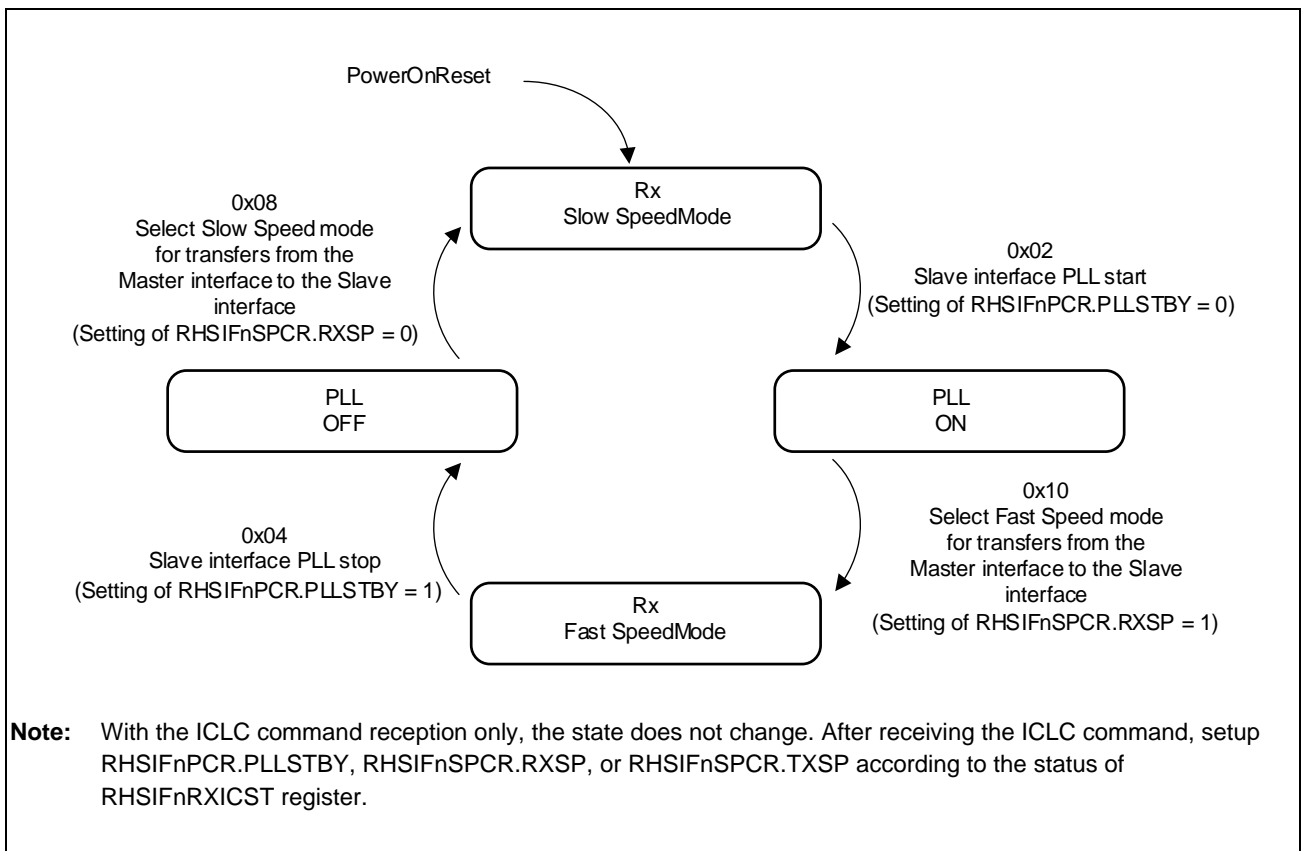

Figure 29.50 Transition between the Slow and Fast RX Speed Modes

(4) Test Mode

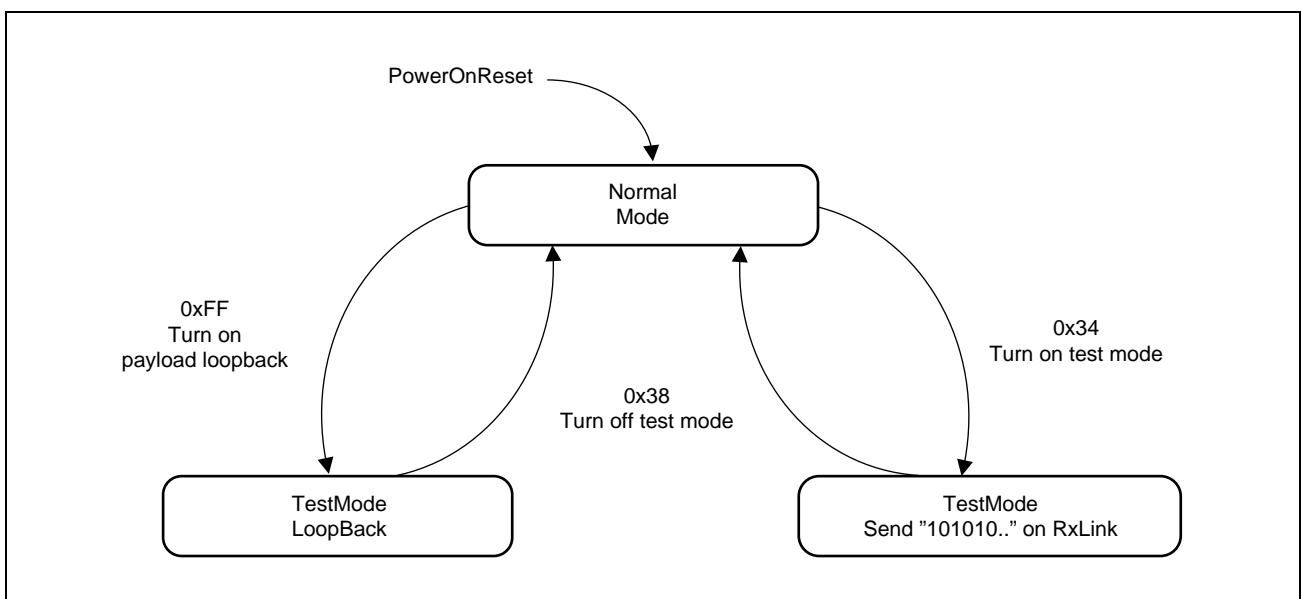

Figure 29.51 Transition between Test Modes

29.5.3.5 CTS Commands

(1) For Flow Control by CTS

The automatic flow control is enabled after PowerOnReset.

The automatic flow control is disabled by the RHSIFnMDCR.CTSEN = 0.

(a) When the Automatic Flow Control is Enabled

(i) Link partner is not ready

Link partner: Transmits a frame with a CTS value = 0.

This Product: Receives a frame and reflects the CTS value to RHSIFnL1SR.RCTS.

This Product: Suppresses the next frame transmission.

Link partner: Transmits a frame with a CTS value = 1 after becoming receivable.

This Product: Receives a frame and reflects the CTS value to RHSIFnL1SR.RCTS.

This Product: Resumes the transmission of the next frame.

(ii) This product is not ready

This Product: When RxDIFIFO is full, transmits a CTS command frame of CTS value = 0.

This Product: When RxDIFIFO is not full, transmits a CTS command frame with a CTS value = 1.

Caution: Do not write '0' to RHSIFnMDCR.CTSV while Automatic Flow Control is enabled.

(b) When the Automatic Flow Control is Disabled

By using the following register, it is possible to control the flow manually.

(i) reception status of Link partner

RHSIFnL1SR.RCTS

(ii) reception status of This Product

RHSIFnL1SR.RFFUL

RHSIFnMDCR.CTSV

(2) Basic Operation: CTS Command Issuance

A CTS command request is transmitted by firmware. Transmit a request by accessing the register.

Figure 29.52 below shows the procedure flow for issuing a CTS command.

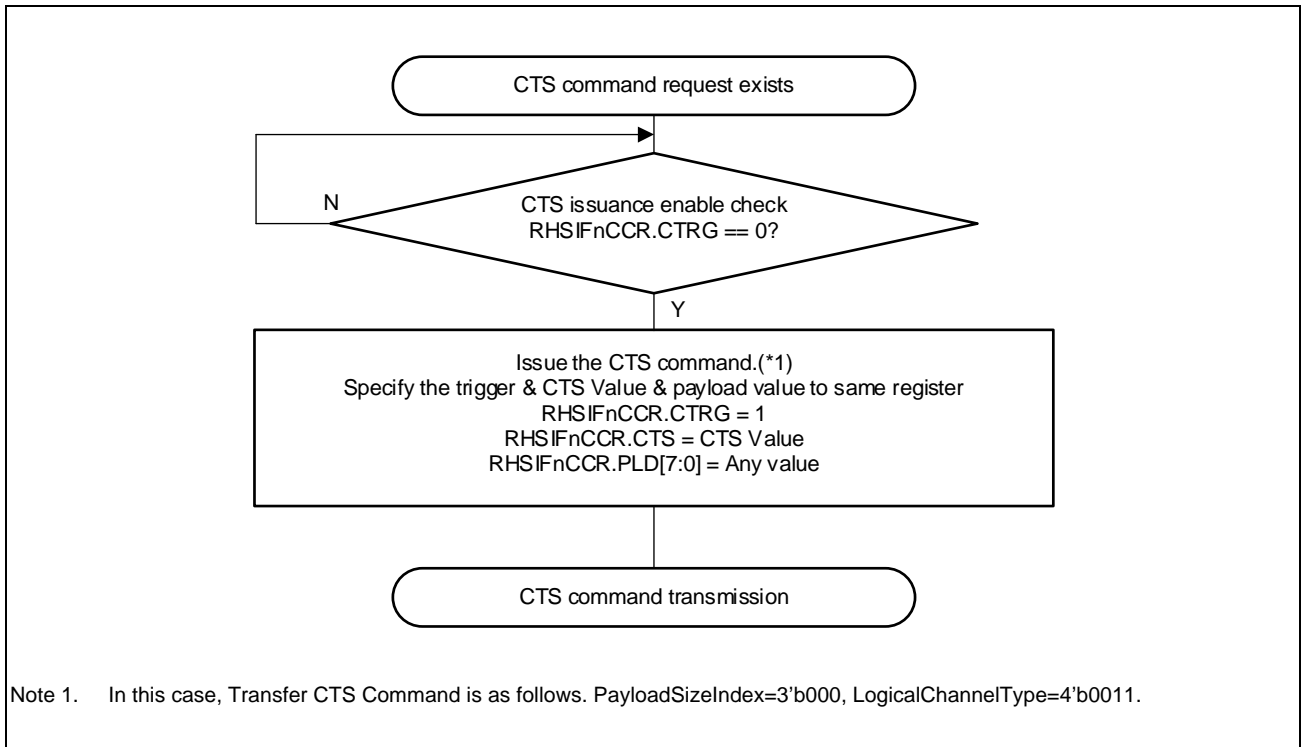

Figure 29.52 Procedure Flow for Issuing CTS Command

29.5.3.6 Sleep Mode

(1) Transitioning to Sleep Mode for the Link Partner

If an L2 frame, ICLC command, or CTS command is transmitted after RHSIFnSMCR.SLP is set to “1”, the L1 END bit continues to transmit “1”. This makes the Link Partner to transit to sleep mode.

(2) Recovering from Sleep Mode

This device does not support sleep mode when receiving.

RHSIF communication has no issues if RHSIF receives the sleep mode restoration condition specified by the communication protocol standard shown below.

- In fast transfer mode: Zero-level signal of 8-bit rate or more
- In slow transfer mode: Zero-level signal of 1-bit rate or more

29.5.4 Interrupt Specification

29.5.4.1 Interrupt Source List

The tables below list the error interrupt sources detected in L1.

Table 29.91 Transmission Completion Interrupt

No.	Register		Description
	Register Name	Bit Name	
1	RHSIFnTXCMP	TCL2	Transmission frame L2 completion interrupt
2		TCCT	Transmission frame CTS completion interrupt
3		TCIC	Transmission frame ICLC completion interrupt

Table 29.92 Transmission Error Interrupts

No.	Register		Description
	Register Name	Bit Name	
1	RHSIFnTXERRST	TERSZ	This bit indicates the status of payload size error of transmission.
2		TERSZI5	Transmission frame L1 header payload code error (undefined code 0x5 detected)
3		TERSZI4	Transmission frame L1 header payload code error (undefined code 0x4 detected)
4		TERCTF	Transmission frame L1 header channel type code error (undefined code 0xF detected)
5		TERCTE	Transmission frame L1 header channel type code error (undefined code 0xE detected)
6		TERCTD	Transmission frame L1 header channel type code error (undefined code 0xD detected)
7		TERCTC	Transmission frame L1 header channel type code error (undefined code 0xC detected)
8		TERCTB	Transmission frame L1 header channel type code error (undefined code 0xB detected)
9		TERCTA	Transmission frame L1 header channel type code error (undefined code 0xA detected)
10		TERCT9	Transmission frame L1 header channel type code error (undefined code 0x9 detected)
11		TERCT8	Transmission frame L1 header channel type code error (undefined code 0x8 detected)
12		TERCT2	Transmission frame L1 header channel type code error (undefined code 0x2 detected)
13		TERCT1	Transmission frame L1 header channel type code error (undefined code 0x1 detected)

Table 29.93 Reception Completion Interrupt

No.	Register		Description
	Register Name	Bit Name	
1	RHSIFnRXCMPST	RCL2	Reception frame L2 completion interrupt
2		RCCT	Reception frame CTS completion interrupt
3		RCIC	Reception frame ICLC completion interrupt

Table 29.94 Reception Error Interrupts

No.	Register		Description
	Register Name	Bit Name	
1	RHSIFnRXERRST	RERSZ	This bit indicates the status of payload size error of reception.
2		RERSZI5	Reception frame L1 header payload code error (undefined code 0x5 detected)
3		RERSZI4	Reception frame L1 header payload code error (undefined code 0x4 detected)
4		RERCTF	Reception frame L1 header channel type code error (undefined code 0xF detected)
5		RERCTE	Reception frame L1 header channel type code error (undefined code 0xE detected)
6		RERCTD	Reception frame L1 header channel type code error (undefined code 0xD detected)
7		RERCTC	Reception frame L1 header channel type code error (undefined code 0xC detected)
8		RERCTB	Reception frame L1 header channel type code error (undefined code 0xB detected)
9		RERCTA	Reception frame L1 header channel type code error (undefined code 0xA detected)
10		RERCT9	Reception frame L1 header channel type code error (undefined code 0x9 detected)
11		RERCT8	Reception frame L1 header channel type code error (undefined code 0x8 detected)
12		RERCT2	Reception frame L1 header channel type code error (undefined code 0x2 detected)
13		RERCT1	Reception frame L1 header channel type code error (undefined code 0x1 detected)
14		RERIPV	Reception ICLC command undefined error.

Table 29.95 ICLC Reception Completion Interrupt

No.	Register		Description
	Register Name	Bit Name	
1	RHSIFnRXICST	RIPA	Reception of PING answer frame
2		RITOL	Reception of Turn on payload loopback frame
3		RITOF	Reception of Turn off test mode frame
4		RITON	Reception of Turn on test mode frame
5		RIDT	Reception of Disable Slave interface transmitter frame
6		RIET	Reception of Enable Slave interface transmitter frame
7		RIFT	Reception of Select Fast Speed mode for transfers from the Slave interface to the Master interface frame
8		RIST	Reception of Select Slow Speed mode for transfers from the Slave interface to the Master interface frame
9		RIFR	Reception of Select Fast Speed mode for transfers from the Master interface to the Slave interface frame
10		RISR	Reception of Select Slow Speed mode for transfers from the Master interface to the Slave interface frame
11		RIPSTP	Reception of Slave interface PLL stop
12		RIPSRT	Reception of Slave interface PLL start
13		RIPG	Reception of PING frame

29.5.4.2 Error Detect Conditions

The tables below list the error detect conditions.

Table 29.96 The combination of Transmission Payload size index and Transmission Logical channel type

			Logical Channel Type						
			ICLC*2	CTS*2	L2Frame				
			b0000	b0011	b0100	b0101	b0110	b0111	others*3
Payload_Size_Index	8 bit	b000	TCIC	TCCT	TERSZ	TERSZ	TERSZ	TERSZ	TERSZ
	32 bit	b001	TCIC	— *1	TCL2	TCL2	TCL2	TCL2	TERSZ
	64 bit	b010	— *1	— *1	TCL2	TCL2	TCL2	TCL2	TERSZ
	96 bit	b011	— *1	— *1	TCL2	TCL2	TCL2	TCL2	TERSZ
	Not used	b100	— *1	— *1	TERSZI4	TERSZI4	TERSZI4	TERSZI4	TERSZ TERSZI4*4
		b101	— *1	— *1	TERSZI5	TERSZI5	TERSZI5	TERSZI5	TERSZ TERSZI5*4
	160 bit	b110	— *1	— *1	TCL2	TCL2	TCL2	TCL2	TERSZ
	288 bit	b111	— *1	— *1	TCL2	TCL2	TCL2	TCL2	TERSZ

Note 1. These conditions will not occur.

Note 2. In L1 Frame, error bits are generated only when Logical Channel Type is b0000(ICLC) or b0011(CTS).

Note 3. In L2 Frame, the generated error bit is always TERSZ when the Logical Channel Type is other than b01xx.

Note 4. Either TERSZI4 or TERSZI5 is simultaneously generated with TERSZ according to the Payload Size Index value.

Table 29.97 The combination of Reception Payload size index and Reception Logical channel type (1 of 2)

			Logical_Channel_Type							
			ICLC	Reserved		CTS	L2Frame			
			b0000	b0001	b0010	b0011	b0100	b0101	b0110	b0111
Payload_Size_Index	8 bit	b000	RCIC	RERCT1	RERCT2	RCCT	RERSZ	RERSZ	RERSZ	RERSZ
	32 bit	b001	RCIC RERSZ	RERCT1	RERCT2	RCCT	RCL2	RCL2	RCL2	RCL2
	64 bit	b010	RERSZ	RERCT1	RERCT2	RCCT	RCL2	RCL2	RCL2	RCL2
	96 bit	b011	RERSZ	RERCT1	RERCT2	RCCT	RCL2	RCL2	RCL2	RCL2
	Not used	b100	RERSZI4	RERCT1 RERSZI4*1	RERCT2 RERSZI4*1	RERSZI4	RERSZI4	RERSZI4	RERSZI4	RERSZI4
		b101	RERSZI5	RERCT1 RERSZI5*1	RERCT2 RERSZI5*1	RERSZI5	RERSZI5	RERSZI5	RERSZI5	RERSZI5
	160 bit	b110	RERSZ	RERCT1	RERCT2	RCCT	RCL2	RCL2	RCL2	RCL2
	288 bit	b111	RERSZ	RERCT1	RERCT2	RCCT	RCL2	RCL2	RCL2	RCL2

Note 1. Either RERSZI4 or RERSZI5 is simultaneously generated with RERCT1 or RERCT2 according to the Payload Size Index value.

Table 29.98 The combination of Reception Payload size index and Reception Logical channel type (2 of 2)

			Logical_Channel_Type							
			Reserved							
			b1000	b1001	b1010	b1011	b1100	b1101	b1110	b1111
Payload_Size_Index	8bit	b000	RERCT8	RERCT9	RERCTA	RERCTB	RERCTC	RERCTD	RERCTE	RERCTF
	32bit	b001	RERCT8	RERCT9	RERCTA	RERCTB	RERCTC	RERCTD	RERCTE	RERCTF
	64bit	b010	RERCT8	RERCT9	RERCTA	RERCTB	RERCTC	RERCTD	RERCTE	RERCTF
	96bit	b011	RERCT8	RERCT9	RERCTA	RERCTB	RERCTC	RERCTD	RERCTE	RERCTF
	Not used	b100	RERCT8 RERSZI4*1	RERCT9 RERSZI4*1	RERCTA RERSZI4*1	RERCTB RERSZI4*1	RERCTC RERSZI4*1	RERCTD RERSZI4*1	RERCTE RERSZI4*1	RERCTF RERSZI4*1
		b101	RERCT8 RERSZI5*1	RERCT9 RERSZI5*1	RERCTA RERSZI5*1	RERCTB RERSZI5*1	RERCTC RERSZI5*1	RERCTD RERSZI5*1	RERCTE RERSZI5*1	RERCTF RERSZI5*1
	160bit	b110	RERCT8	RERCT9	RERCTA	RERCTB	RERCTC	RERCTD	RERCTE	RERCTF
	288bit	b111	RERCT8	RERCT9	RERCTA	RERCTB	RERCTC	RERCTD	RERCTE	RERCTF

Note 1. Either RERSZI4 or RERSZI5 is simultaneously generated with RERCT8~RERCTF according to the Payload Size Index value.

29.5.4.3 Operation Upon Error Occurrence

The operations upon error occurrence in L1 consist only of the following.

- Assertion of error interrupt
- Indication of error interrupt status by register

29.5.5 Debug

Table 29.99 List of Debug Function

Purpose	Item	Content	APB Register	
Debug	ICLC(0x34)	Turn on test mode (Send 101010.. Txline data rate)	RHSIFnTMDCR.CKTMSEL	
	Loopback	TxD->RxD	RHSIFnTMDCR.TXLPBK	
	Sent Frame information	Last sent frame information display	L1 frame	RHSIFnLTXFRMRL1.TL1E
				RHSIFnLTXFRMRL1.TL1P
				RHSIFnLTXFRMRL1.TL1H
			L2 frame	RHSIFnLTXFRMRL2.T2L2H
				RHSIFnLTXFRMRL2.T2L1H
				Received frame information
	RHSIFnLRXFRMRL1.RL1P			
	RHSIFnLRXFRMRL1.RL1H			
	L2 frame	RHSIFnLRXFRMRL2.R2L2H		
		RHSIFnLRXFRMRL2.R2L1H		

29.5.6 Usage Note

29.5.6.1 About Fast Mode of Slave

A fast mode of Slave (It's sampled using a reference clock.) recommends following correspondence because there is a possibility that BER (the bit error rate) deteriorates by influence of a jitter.

- Use Slave's fast mode only when sending / receiving various ICLC commands (during communication establishment).
- After confirming the establishment of communication by the PING command of ICLC when communicating by a fast mode, begin to change to Master (sampling by MOSC) and communicate from $t_{RHPLLCT}$ μ s later (PLL locked time of a clock change). For details of PLL locked time, refer to *the RH850/E2x-FCC2 Electrical Characteristics, User's Manual: Hardware*.

Section 30 Window Watchdog Timer (WDTB)

30.1 Features of WDTB

30.1.1 Units and Channels

This microcontroller has the following number of WDTB units.

Each WDTB unit has one channel interface.

Table 30.1 Number of Units (For E2x-FCC2)

Product Name	RH850/E2x-FCC2	
	468 Pins	373 Pins
Number of Units	6	
Name	WDTBn (n = 0 to 5)	

Table 30.2 Number of Units (For E2UH)

Product Name	RH850/E2UH	
	468 Pins	373 Pins
Number of Units	6	
Name	WDTBn (n = 0 to 5)	

Table 30.3 Number of Units (For E2H)

Product Name	RH850/E2H	
	468 Pins	373 Pins
Number of Units	4	
Name	WDTBn (n = 0 to 3)	

Meaning of n

Throughout this section, the individual units of a window watchdog timer are identified by the index “n” (n = 0 to 5), for example, WDTBnWDTE for the WDTBn enable register.

30.1.2 Register Base Addresses

All WDTBn register addresses are given as address offsets from the individual base address <WDTBn_base>.

Table 30.4 shows the register base address of each WDTBn.

Table 30.4 Register Base Addresses of WDTBn

Base Address Name	Base Address	Bus Group
<WDTB0_base>	FFED 0000 _H	Peripheral Group 2L
<WDTB1_base>	FFED 1000 _H	Peripheral Group 2L
<WDTB2_base>	FFED 2000 _H	Peripheral Group 2L
<WDTB3_base>	FFED 3000 _H	Peripheral Group 2L
<WDTB4_base>	FFED 4000 _H	Peripheral Group 2L
<WDTB5_base>	FFED 5000 _H	Peripheral Group 2L

30.1.3 Clock Supply

The window watchdog timer uses WDTBTCKI and PCLK as a clock input.

Table 30.5 Clock Supply of WDTB

Unit Name	Unit Clock Name	Clock Supply Name
WDTBn	WDTBTCKI	CLK_WDT* ¹
	PCLK	CLK_LSB* ²

Note 1. CLK_WDT is a 250 kHz clock selectable from CLK_MOSC or CLK_IOSC.

Note 2. CLK_LSB is a 40 MHz clock. For details on the clock, see **Section 15, Clock Controller**.

30.1.4 Interrupt Requests

WDTBn interrupt requests are listed in the following table.

Table 30.6 Interrupt Requests

Interrupt Symbol Name	Unit Interrupt Signal	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
INTWDTB0TIT	WDTBnTIT (n = 0)	WDTB0 interrupt	CPU0-22	—	—
INTWDTB1TIT	WDTBnTIT (n = 1)	WDTB1 interrupt	CPU1-22	—	—
INTWDTB2TIT	WDTBnTIT (n = 2)	WDTB2 interrupt	CPU2-22	—	—
INTWDTB3TIT	WDTBnTIT (n = 3)	WDTB3 interrupt	CPU3-22	—	—
INTWDTB4TIT	WDTBnTIT (n = 4)	WDTB4 interrupt	CPU4-22	—	—
INTWDTB5TIT	WDTBnTIT (n = 5)	WDTB5 interrupt	CPU5-22	—	—

30.1.5 Reset Sources

WDTBn reset source are listed in the following table. WDTBn is initialized by these reset sources.

Table 30.7 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
WDTBn	All registers	✓	✓	✓	✓	—	—

30.1.6 Correspondence of WDTB and CPU

Table 30.8 Correspondence of WDTB and CPU

WDTBn	CPU Unit
WDTB0	CPU0
WDTB1	CPU1
WDTB2	CPU2
WDTB3	CPU3
WDTB4	CPU4
WDTB5	CPU5

30.2 Overview

30.2.1 Functional Overview

The WDTB has the following functions:

- WDTB counter start function by software.
- Default start function (WDTB0 only)
 - Selection of the operating mode after release from reset using the option byte.
 - Starting/stopping of the counter after WDTB is reset, enabling/disabling of interrupt requests, selection of the window-open period and the overflow interval time.
- Interrupt request signals
 - The interrupt request output timing can be set using a register.
- Window function
 - The period during which writing to the WDTB trigger register is valid (window-open period) can be set. Writing to the WDTB trigger register outside the window-open period causes an error.
 - The window open period can be set using a register.
- WDTB error detection
 - When an error is detected, the WDTBnTRES signal indicates the error to the ECM.
For details on WDTB error detection, see **Section 30.4.3, WDTB Error Detection**.
- Selectable counter clock for internal clock or external clock by option byte.
 - External clock is CLK_MOSC, and internal clock is CLK_IOSC.
For details on the clock, see **Section 15, Clock Controller**.

30.2.2 Block Diagram

Figure 30.1 shows the main components of WDTB.

Figure 30.1 Block Diagram of WDTB

30.3 Registers

WDTB is controlled and operated by the following registers.

30.3.1 List of Registers

The following shows the list of registers and the memory address of WDTBn.

For the base addresses, see **Table 30.4**.

The actual address can be obtained by adding the offset shown in the table to this base address.

Table 30.9 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection
WDTBn	WDTB Enable Register	WDTBnWDTE	<WDTBn_base> + 0000 _H	8	—
	WDTB Mode Register	WDTBnMD	<WDTBn_base> + 000C _H	8	—
	WDTB Window Open Start Register	WDTBnWOST	<WDTBn_base> + 0010 _H	16	—
	WDTB Interrupt Output Timing Setting Register	WDTBnWIS	<WDTBn_base> + 0014 _H	16	—

30.3.2 Detail of Registers

30.3.2.1 WDTBnWDTE — WDTB Enable Register

This register is the WDTB start control and trigger register.

Writing AC_H to this register generates a WDTB trigger and starts or restarts the WDTB counter.

Please refer to **Section 30.4.2, WDTB Trigger** for details.

The value that can be written in this register is only AC_H .

Value after reset: (1) WDTB0

This value depends on the set value of OPBT0.

The value after reset depends on the setting of the OPWDRUN bit.

The initial state of the OPWDRUN bit at shipment is $OPWDRUN = 0_B$.

Therefore, the register value after reset of WDTB0 at shipment is $2C_H$.

(2) WDTBn ($n = 1$ to 5)

The register value after reset is also $2C_H$.

Bit	7	6	5	4	3	2	1	0
	WDTBnRUN[7:0]							
Value after reset	0	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.10 WDTBnWDTE Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTBnRUN[7:0]	The WDTB trigger is generated by writing fixed start code (AC_H), and start/restart of the WDTB counter is controlled. An error occurs when values other than AC_H are written. After it starts, WDTB counter cannot be stopped.

The values after reset of the WDTB0RUN[7] bit, which differ according to the start-up option, are indicated in the following table.

Table 30.11 WDTB0RUN[7] Value After Reset

Start-up Options	WDTB0RUN[7] Value after Reset
OPWDRUN	
1	1
0	0

30.3.2.2 WDTBnMD — WDTB Mode Register

This register specifies the overflow interval time, enabling or disabling of the interrupt, window-open function mode selection, and the window-open period.

Value after reset: (1) WDTB0

This value depends on a set value of the OPBT0.

The value after reset depends on the setting of OPWDWMS bit, OPWDOVF[2:0] bits, OPWDINT bit, and OPWDWS[1:0] bits.

The value of OPWDWMS bit is set to 0_B; the values of OPWDOVF[2:0] bits, OPWDINT bit and OPWDWS[1:0] bits are set to 1_B because the initial state of WDTB0 set by the option byte at shipment is the same as that of WDTBn (n = 1 to 5).

Therefore, the register value after reset of WDTB0 at shipment is 7F_H.

(2) WDTBn (n = 1 to 5)

The value after reset is 7F_H.

Bit	7	6	5	4	3	2	1	0
	WDTBnWMS	WDTBnOVF[2:0]			WDTBnWIE	—	WDTBnWS[1:0]	
Value after reset	0	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Table 30.12 WDTBnMD Register Contents (1/2)

Bit Position	Bit Name	Function																																				
7	WDTBnWMS	Window Open function mode selection 0: Window size of Window Open function is set by WDTBnWS[1:0]. WDTBnTIT outputs when the counter reaches 75% of the overflow interval time defined by WDTBnMD.WDTBnOVF[2:0]. 1: Window size of Window Open function is set by WDTBnWOST register. WDTBnTIT outputs when WDTBnWIS matches WDTB counter.																																				
6 to 4	WDTBnOVF[2:0]	These bits select the overflow interval time. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>WDTBn OVF2</th> <th>WDTBn OVF1</th> <th>WDTBn OVF0</th> <th>Overflow Interval Time</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>2⁹ / WDTBTCKI</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>2¹⁰ / WDTBTCKI</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>2¹¹ / WDTBTCKI</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>2¹² / WDTBTCKI</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>2¹³ / WDTBTCKI</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>2¹⁴ / WDTBTCKI</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>2¹⁵ / WDTBTCKI</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>2¹⁶ / WDTBTCKI</td> </tr> </tbody> </table>	WDTBn OVF2	WDTBn OVF1	WDTBn OVF0	Overflow Interval Time	0	0	0	2 ⁹ / WDTBTCKI	0	0	1	2 ¹⁰ / WDTBTCKI	0	1	0	2 ¹¹ / WDTBTCKI	0	1	1	2 ¹² / WDTBTCKI	1	0	0	2 ¹³ / WDTBTCKI	1	0	1	2 ¹⁴ / WDTBTCKI	1	1	0	2 ¹⁵ / WDTBTCKI	1	1	1	2 ¹⁶ / WDTBTCKI

1	0	75%															
1	1	100%															

NOTE**WDTBnMD register update timing**

- Default start mode: The WDTBnMD register cannot be updated after any reset.
- Software trigger start mode: The WDTBnMD register can be updated only once before the first write to the trigger register.

The WDTBnWS[1:0] setting is applied after the first trigger.

30.3.2.3 WDTBnWOST — WDTB Window Open Start Register

This register configures the start time of the open-window period.

Value after reset: (1) WDTB0

This value depends on the set value of OPBT0.

The value after reset depends on the settings of the OPWDWOST[15:0] bits.

The values of the OPWDWOST[15:0] bits are set to 0010_H because the initial state of WDTB0 set by the Option byte at shipment is the same as that of WDTBn (n = 1 to 5).

Therefore, the register value after reset of WDTB0 at shipment is 0010_H.

(2) WDTBn (n = 1 to 5)

The register value after reset is also 0010_H.

Table 30.13 WDTBnWOST Register Contents

Bit position	Bit name	Function
15 to 0	WDTBnWOST[15:0]	If WDTBnMD.WDTBnWMS = 1, this register is enabled. When WDTB counter value ≥ WDTBnWOST, WDTB is inside the window-open period.

NOTE

WDTBnWOST register update timing

- Default start mode: WDTBnWOST register cannot be updated after any reset.
- Software trigger start mode: WDTBnWOST register can be updated only once before first WDTB trigger.

The WDTBnWOST register must be set to a value greater than 0010_H (when WDTBnMD.WDTBnWMS = 1).
The WDTBnWOST register setting is applied after the first trigger.

30.3.2.4 WDTBnWIS — WDTB Interrupt Output Timing Setting Register

This register configures the timing of WDTB interrupt (WDTBnTIT) generation.

Value after reset: (1) WDTB0

This value depends on a set value of OPBT1.

The value after reset depends on the settings of the OPWDWWIS[15:0] bits.

The values of the OPWDWWIS[15:0] bits are set to 0000_H because the initial state of WDTB0 set by the option byte at shipment is the same as that of WDTBn (n = 1 to 5).

Therefore, the register value after reset of WDTB0 at shipment is 0000_H.

(2) WDTBn (n = 1 to 5)

The register value after reset is also 0000_H.

Table 30.14 WDTBnWIS Register Contents

Bit position	Bit name	Function
15 to 0	WDTBnWIS[15:0]	If WDTBnMD.WDTBnWMS = 1 and WDTBnMD.WDTBnWIE = 1, this register is enabled. When WDTB counter value = WDTBnWIS[15:0], interrupt request WDTBnTIT is generated.

NOTE

WDTBnWIS register update timing

- Default start mode: The WDTBnWIS register cannot be updated after any reset.
- Software trigger start mode: The WDTBnWIS register can be updated only once before the first WDTB trigger.

CAUTION

The register value after reset is 0000_H.

When using this register, it must be set to a value greater than 0001_H.

30.4 Operation

30.4.1 WDTB after Reset Release

30.4.1.1 Start Modes

The WDTB provides two modes for the counter start after release from the reset state:

- Software trigger start mode (for all WDTB)

The counter value remains 0000_H after reset release

The counter is started with the first WDTB trigger.

- Default start mode (only for WDTB0)

The counter starts automatically after release from the reset state. However, default start mode is disabled in serial programming mode even if OPWDRUN is set to 1_B for the start-up options.

WDTB other than WDTB0 are fixed to software trigger start mode, and cannot be set by the option byte.

30.4.1.2 Start Mode Selection (Only for WDTB0)

The start mode can be selected by the start-up options.

Table 30.15 shows the selection of the start mode.

Table 30.15 Start Modes

Start-up Option	Start Mode
OPWDRUN	
0	Software trigger
1	Default

30.4.1.3 WDTB Settings after Reset Release

The following table shows the settings of WDTB after reset release.

Table 30.16 Setting of WDTB after Reset Release

Function	Setting after WDTB0 is Reset	Setting after WDTB other than WDTB0 is Reset
Start mode	Specified by the start-up option.	Software trigger mode
Overflow interval time	Specified by the start-up option.	2 ¹⁶ / WDTBTCKI
Interrupt mode	Specified by the start-up option.	Interrupt disabled
Window-open period	Specified by the start-up option.	100%
Window open function mode selection	Specified by the start-up option.	Window size of Window Open function is set by WDTBnMD.WDTBnWS[1:0] and interrupt is generated when the counter reaches 75% of the overflow interval time defined by WDTBnMD.WDTBnOVF[2:0].
Counter value of window open start	Specified by the start-up option.	0010 _H
Counter value of WDTB interrupt output timing	Specified by the start-up option.*1	0000 _H *1

Note 1. When using this register, it must be set to a value greater than 0001_H.

For details on the option bytes, see **Section 43, Flash Memory**.

Change WDTB settings

In default start mode, WDTB cannot be changed after any reset.

In software trigger start mode, WDTB can be changed only once before the first WDTB trigger.

30.4.1.4 Default Start Mode Timing (Only for WDTB0)

Figure 30.2 shows the timing of the default start mode.

Figure 30.2 Timing Diagram of WDTB Start in Default Start Mode

The timing chart of **Figure 30.2** shows the following behaviors:

- (1) In default start mode, the WDTB counter starts after release from the reset state. The overflow interval time after release from the reset state is set by start-up options.

Example: overflow interval time after release from the reset state

$$= 2^{16} / \text{WDTBTCKI} (\text{OPWDOVF}[2:0] = 111_{\text{B}})$$

In default start mode, after reset release, the WDTBnMD register cannot be changed because WDTBnRUN = 1.

- (2) Write to the WDTB trigger register before the WDTB counter overflows.
The WDTB counter restarts with the WDTB trigger.

30.4.1.5 Software Trigger Start Mode Timing (Common to all WDTB)

Figure 30.3 shows the timing of the software trigger start mode and the change to the WDTB setting.

Figure 30.3 Timing Diagram of WDTB Start in Software Trigger Start Mode

The timing diagram in **Figure 30.3** shows the following:

- (1) After release from the reset state, the counter remains 0000_H until the first WDTB trigger. The overflow interval time is set by using the start-up options, but it does not have any effect.
- (2) WDTBnMD is set before the first WDTB trigger. However, the settings are not applied immediately.
- (3) The WDTB counter starts at the first WDTB trigger. The overflow interval time and other settings specified in WDTBnMD are applied.

30.4.2 WDTB Trigger

The WDTB trigger is generated in WDTB enable register (WDTBnWDTE) by writing the specific value that is called a start code.

The WDTB trigger has the following functions:

- Starting the WDTB counter in software trigger start mode
- Restarting the WDTB counter
- Setting the WDTB mode specified by the WDTBnMD register in software trigger start mode (only for the first WDTB trigger after release from the reset state).
Only the WDTBnWS[1:0] setting by WDTBnMD register in default start mode.

The WDTB can be triggered by writing a fixed activation code to the trigger register.

Table 30.17 Trigger Register and Activation Code

Type of Activation Code	Trigger Register	Activation Code
Fixed	WDTBnWDTE	AC _H

30.4.3 WDTB Error Detection

The WDTB detects an overflow of the WDTB counter and illegal operations as an error.

The conditions for error detection are:

- WDTB counter overflow
- Wrong activation code is written to the WDTB trigger register
- Writing to the trigger register outside the window-open period
- Illegal update of WDTBnMD, WDTBnWOST and WDTBnWIS registers

The following table describes illegal updates of WDTBnMD, WDTBnWOST and WDTBnWIS registers.

Table 30.18 Condition of WDTB Error Detection

Start Mode	Condition			Error Detection
	WDTBnRUN	Register Write First or Second	Write Value	
Default	0	This condition does not happen.		
	1	—	Same	Not Detect
		—	Another	Detect
Software Trigger	0	First	Same	Not Detect
			Another	Not Detect
		Second	Same	Not Detect
			Another	Detect
	1	—	Same	Not Detect
		—	Another	Detect

30.4.3.1 WDTB Error Mode

When an error is detected, it is notified to the ECM by the WDTBnTRES signal.

Figure 30.4 shows the generation of a reset when the counter overflows when the default start mode has been selected.

Figure 30.4 Timing Diagram of WDTB Internal Reset Generation

The timing diagram of **Figure 30.4** shows the following:

- (1) After reset is released, the WDTB counter is started in the default start mode. The overflow interval time after reset is released is set by the start-up option.
- (2) The counter restarts with the WDTB trigger.
- (3) The error is detected when the counter overflows.

Errors are notified to the ECM by the WDTBnTRES signal. The counter value does not change until internal reset is generated.

- (4) The WDTB counter stops until the counter is cleared when an internal reset is generated by a factor such as ECM, and reset is released.

30.4.4 WDTB Interrupt Output

When the WDTB counter reaches 75% of the overflow interval time and WDTBnWMS = 0, interrupt request WDTBnTIT is generated.

When the WDTB counter = WDTBnWIS and WDTBnWMS = 1, an interrupt request WDTBnTIT is generated.

This function can be selected by the WDTBnMD.WDTBnWIE register.

Figure 30.5 and **Figure 30.6** show the generation of the interrupt request under the following condition:

- The default start mode is selected.
- Interrupt request is enabled after the first WDTB trigger is generated.
- WDTB Overflow interval time: $2^{16} / \text{WDTBTCKI}$

• When WDTBnWMS = 0:

Figure 30.5 Timing Diagram of WDTB Interrupt Request Signals (WDTBnWMS = 0)

- (1) After reset is released, the WDTB counter is started in the default start mode. The overflow interval time after reset is released is set by the start-up option.
- (2) The counter restarts with the WDTB trigger.
- (3) When the WDTB counter reaches 75% of the overflow interval time, interrupt request WDTBnTIT is generated.
- (4) The counter restarts with the WDTB trigger.
- (5) When the WDTB counter reaches 75% of the overflow interval time, interrupt request WDTBnTIT is generated.
- (6) An error is detected when the counter overflows.
The error is notified to the ECM by the WDTBnTRES signal. The counter value does not change until an internal reset is generated.

• When WDTBnWMS = 1:

Figure 30.6 Timing Diagram of WDTB Interrupt Request Signals (WDTBnWMS = 1)

- (1) After reset is released, the WDTB counter is started in the default start mode. The overflow interval time after reset is released is set by the start-up option.
- (2) The counter restarts with the WDTB trigger.
- (3) When the WDTB counter value = WDTBnWIS[15:0], interrupt request WDTBnTIT is generated.
- (4) The counter restarts with the WDTB trigger.
- (5) When the WDTB counter value = WDTBnWIS[15:0], interrupt request WDTBnTIT is generated.
- (6) An error is detected when the counter overflows.
The error is notified to the ECM by the WDTBnTRES signal. The counter value does not change until an internal reset is generated.

30.4.5 Window Function

The period when a WDTB trigger is valid (window-open period) can be set. If the window-open period is set to a value less than 100%, an error occurs when the WDTB trigger is generated outside of the window-open period.

The window-open period after reset release is 100%. The period is set to the value configured by the WDTBnMD.WDTBnWS[1:0] or the WDTBnWOST register setting after the first WDTB trigger is generated.

Figure 30.7 and **Figure 30.8** show the window function operation under the following conditions.

- The default start mode is selected.
- 25% window-open period is effective after the first WDTB trigger (WDTBnWS[1:0] = 00_B).
- WDTB Overflow interval time: $2^{16} / \text{WDTBTCKI}$

• When WDTBnWMS = 0:

Figure 30.7 Timing Diagram of WDTB Window Function

- (1) In default start mode, the WDTB counter starts after reset is released.
The overflow interval time after reset is released is set by the start-up option.
- (2) The WDTBnMD.WDTBnWS[1:0] setting is applied at the WDTB trigger.
- (3) The WDTB counter restarts at the WDTB trigger during the window-open period.
- (4) An error is detected at the WDTB trigger during the window-close period and then the WDTBnTRES signal indicates the error the ECM.
The counter value remains unchanged until a System reset is performed.
- (5) If an internal reset occurs due to the ECM or some other sources, the counter is cleared and stops until release from the reset state.

• When WDTBnWMS = 1:

Figure 30.8 Timing Diagram of WDTB Window Function

- (1) In default start mode, the WDTB counter starts after reset is released.
The overflow interval time after reset is released is set by the start-up option.
- (2) The WDTBnWOST register setting is applied at the WDTB trigger.
- (3) The WDTB counter restarts at the WDTB trigger during the window-open period.
- (4) An error is detected at the WDTB trigger during the window-close period and then the WDTBnTRES signal indicates the error the ECM.
The counter value remains unchanged until a System reset is performed.
- (5) If an internal reset occurs due to the ECM or some other source, the counter is cleared and stops until release from the reset state.

Section 31 OS Timer (OSTM)

31.1 Features of OSTM

31.1.1 Number of Units

This microcontroller has the following number of OSTM units.

Each OSTM unit has one channel interface.

Table 31.1 Number of Units (For E2x-FCC2)

Product Name	RH850/E2x-FCC2	
	468 Pins	373 Pins
Number of Units	7	
Name	OSTMn (n = 0 to 6)	

Table 31.2 Number of Units (For E2UH)

Product Name	RH850/E2UH	
	468 Pins	373 Pins
Number of Units	7	
Name	OSTMn (n = 0 to 6)	

Table 31.3 Number of Units (For E2H)

Product Name	RH850/E2H	
	468 Pins	373 Pins
Number of Units	5	
Name	OSTMn (n = 0 to 4)	

Meaning of n

Throughout this section, the individual units of the OS timer are identified by the index “n” (n = 0 to 6), for example, OSTMnTO for the OS timer n output register.

31.1.2 Register Base Addresses

All OS timer register addresses are given as address offsets from the individual base addresses <OSTMn_base>.

The register base address of each OSTMn is listed in the following table.

Table 31.4 Register Base Addresses

Base Address Name	Base Address	Bus Group
<OSTM0_base>	FFEC 0000 _H	Peripheral Group 2L
<OSTM1_base>	FFEC 1000 _H	Peripheral Group 2L
<OSTM2_base>	FFEC 2000 _H	Peripheral Group 2L
<OSTM3_base>	FFEC 3000 _H	Peripheral Group 2L
<OSTM4_base>	FFEC 4000 _H	Peripheral Group 2L
<OSTM5_base>	FFEC 5000 _H	Peripheral Group 2L
<OSTM6_base>	FFEC 6000 _H	Peripheral Group 2L

31.1.3 Clock Supply

Table 31.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
OSTMn	PCLK	CLK_LSB
	Register access clock	CLK_LSB

31.1.4 Interrupts Requests

The OS timers can generate the following interrupt requests.

Table 31.6 OSTMn Interrupt Requests

Interrupt Symbol Name	Unit Interrupt Signal	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
INTOSTM0TINT	OSTMnTINT (n = 0)	OSTM0 interrupt	18	group0-201	group1-109
INTOSTM1TINT	OSTMnTINT (n = 1)	OSTM1 interrupt	CPU0-19	group0-202	group1-110
INTOSTM2TINT	OSTMnTINT (n = 2)	OSTM2 interrupt	CPU1-19	group0-203	group1-111
INTOSTM3TINT	OSTMnTINT (n = 3)	OSTM3 interrupt	CPU2-19	group0-204	group1-112
INTOSTM4TINT	OSTMnTINT (n = 4)	OSTM4 interrupt	CPU3-19	group0-205	group1-113
INTOSTM5TINT	OSTMnTINT (n = 5)	OSTM5 interrupt	CPU4-19	group0-220	group1-126
INTOSTM6TINT	OSTMnTINT (n = 6)	OSTM6 interrupt	CPU5-19	group0-221	group1-127

31.1.5 Reset Sources

OSTM reset sources are listed in the following table.

Table 31.7 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
OSTMn	All registers	✓	✓	✓	✓	—	—

31.1.6 Correspondence of OSTM and CPU

Table 31.8 Correspondence of OSTM and CPU

OSTMn	CPU Unit
OSTM0*1	all CPUs
OSTM1	CPU0
OSTM2	CPU1
OSTM3	CPU2
OSTM4	CPU3
OSTM5	CPU4
OSTM6	CPU5

Note 1. The global timer can be accessed from all CPU units.

31.2 Overview

31.2.1 Function Overview

- OSTM has two operating modes.
 - Interval timer mode
 - Free-run compare mode
- Simultaneous starting of multiple units of the OS timer (timer synchronization of PIC1)
- Interrupt and sDMA/DTS notification when counting by the counter is started, restarted, or ends
- Notifying the ECM of errors when an OSTMn (n = other than 0) interrupt occurs
- Generation of output waveform from the $\overline{\text{ERROROUT_M}}$ and $\overline{\text{ERROROUT_C}}$ pins with the OSTM0TTOUT signal of OSTM0 when ECM is in dynamic mode
- Counter start and restart of OSTM can be performed by software.
- The counter value at counter operation start can be set by software.
- Interrupt request of OSTM will be notified to the corresponding CPU.
 - Interrupt request of OSTM0 assigned to all CPUs
 - Interrupt request of OSTM1 assigned to CPU0
 - Interrupt request of OSTM2 assigned to CPU1
 - Interrupt request of OSTM3 assigned to CPU2
 - Interrupt request of OSTM4 assigned to CPU3
 - Interrupt request of OSTM5 assigned to CPU4
 - Interrupt request of OSTM6 assigned to CPU5
- Module standby can be set for each unit (see **Section 16, Standby Controller**, for details).

31.2.2 Block Diagram

The following block diagram shows the main components of OSTMn.

Figure 31.1 Block Diagram of OSTMn

31.2.3 Output Modes (only for OSTM0)

The OSTMn has the following output modes. The mode is selected by the setting of the OSTMnTOE.OSTMnTOE bit.

- Software control mode (the OSTMnTOE.OSTMnTOE bit is 0): The value set in the OSTMnTO.OSTMnTO bit is output to OSTMnTTOUT.
- Timer-output toggling mode (the OSTMnTOE.OSTMnTOE bit is 1): The OSTMnTTOUT output is toggled each time an OSTMnTINT request is generated.

Both output modes are illustrated in the following figure.

Figure 31.2 Timing Diagram of Output Modes

The above timing diagram shows the following operations.

- In software control mode, the level of the OSTMnTTOUT output changes in accordance with the value set in the OSTMnTO.OSTMnTO bit.
- In timer-output toggling mode, the value of the OSTMnTO.OSTMnTO bit and level of the OSTMnTTOUT output are toggled each time an OSTMnTINT interrupt request is generated.

31.2.4 Interrupt Requests (OSTMnTINT)

An OSTMnTINT interrupt request is generated whenever the counter reaches 0000 0000_H (in interval timer mode) or matches the comparison value (in free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

Since OSTMnTINT triggers toggling of the OSTMnTTOUT output in timer output toggling mode (OSTMnTOE.OSTMnTOE is 1), the setting of the OSTMnCTL.OSTMnMD0 bit also affects the output (OSTMnTTOUT).

Figure 31.3 Generating an Interrupt when Counting Starts (Interval Timer Mode)

31.3 Registers

The OS timers are controlled and operated by the following registers.

31.3.1 List of Registers

The list of OSTMn registers and the memory addresses are as follows.

For the base addresses, see **Table 31.4**.

Table 31.9 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection
OSTMn	OSTM Compare Register	OSTMnCMP	<OSTMn_base> + 00 _H	32	—
	OSTM Counter Register	OSTMnCNT	<OSTMn_base> + 04 _H	32	—
	OSTM Output Register	OSTMnTO	<OSTMn_base> + 08 _H	8	—
	OSTM Output Enable Register	OSTMnTOE	<OSTMn_base> + 0C _H	8	—
	OSTM Count Enable Status Register	OSTMnTE	<OSTMn_base> + 10 _H	8	—
	OSTM Count Start Trigger Register	OSTMnTS	<OSTMn_base> + 14 _H	8	—
	OSTM Count Stop Trigger Register	OSTMnTT	<OSTMn_base> + 18 _H	8	—
	OSTM Control Register	OSTMnCTL	<OSTMn_base> + 20 _H	8	—

31.3.2 Detail of Registers

31.3.2.1 OSTMnCMP — OSTM Compare Register

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.10 OSTMnCMP Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP[31:0]	In interval timer mode: Start value of the down-counter In free-run compare mode: Value for comparison

31.3.2.2 OSTMnCNT — OSTM Counter Register

This register indicates the counter value of the timer.

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.11 OSTMnCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT[31:0]	32-bit counter value

Table 31.12 lists the correspondence between the OSTM operating mode, counting direction, and start value.

The start value indicates the value to be read after the operating mode is changed.

Table 31.12 Correspondence between Operating Mode, Counting Direction and Start Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Start Value*2
Interval timer mode	0*1	Down count	FFFF FFFF _H
Free-run compare mode	1	Up count	0000 0000 _H

Note 1. Value after reset

Note 2. The start value is the value that is read after the operating mode has been changed following reset input.

When OSTMnTE.OSTMnTE = 0 (counter stop status), the OSTMnCNT register can be written.

When the operation mode of the counter is changed with OSTMnCTL.OSTMnMD2 = 1, write any value to the OSTMnCNT register before the counter operation starts.

31.3.2.3 OSTMnTO — OSTM Output Register

The OSTM output register is used to specify and read the level of OSTMnTTOUT output signals. The setting of this register is only valid in OSTM0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTO
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 31.13 OSTMnTO Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is read. When writing, write the value after reset.
0	OSTMnTO	This bit specifies/reads the level of OSTMnTTOUT output signals. 0: Low level 1: High level

31.3.2.4 OSTMnTOE — OSTM Output Enable Register

The OSTM output enable register specifies OSTMnTTOUT output mode. The setting of this register is only valid in OSTM0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 31.14 OSTMnTOE Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is read. When writing, write the value after reset.
0	OSTMnTOE	This bit specifies the OSTMnTTOUT output mode. 0: Software control mode: The level corresponding to the setting of OSTMnTO.OSTMnTO is output to OSTMnTTOUT. 1: Timer-output toggling mode: OSTMnTTOUT output is toggled whenever an OSTMnTINT interrupt request is generated.

31.3.2.5 OSTMnTE — OSTM Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.15 OSTMnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is read.
0	OSTMnTE	This bit indicates whether the counter is enabled or disabled. 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1, or to the OSTMnTSST signal (when timer synchronization of PIC1 is in use) becoming 1. This bit is reset to 0 when the OSTMnTT.OSTMnTT bit is set to 1.

NOTE

When OSTMnTS.OSTMnTE = 0, the counter retains its value.

If the counter is restarted when OSTMnCTL.OSTMnMD2 = 0,

- It restarts counting down from the value in the OSTMnCMP register in interval timer mode.
- It restarts counting up from the counter value 0000 0000_H in free-run compare mode.

If OSTMnCTL.OSTMnMD2 = 1, the counter is not initialized.

31.3.2.6 OSTMnTS — OSTM Count Start Trigger Register

This register starts the counter.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 31.16 OSTMnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing, write the value after reset.
0	OSTMnTS	This bit starts the counter. 0: This setting is invalid. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

31.3.2.7 OSTMnTT — OSTM Count Stop Trigger Register

This register stops the counter.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 31.17 OSTMnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing, write the value after reset.
0	OSTMnTT	Stops the counter. 0: This setting is invalid. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

31.3.2.8 OSTMnCTL — OSTM Control Register

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	OSTMnIE	—	—	—	—	OSTMnMD2	OSTMnMD1	OSTMnMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Table 31.18 OSTMnCTL Register Contents

Bit Position	Bit Name	Function
7	OSTMnIE	OSTM Interrupt enable This bit is the enable bit of the OSTM Interrupt (OSTMnTINT) 0: OSTMn interrupt request is disabled. 1: OSTMn interrupt request is enabled.
6 to 3	—	Reserved When read, the value after reset is read. When writing, write the value after reset.
2	OSTMnMD2	Control of the counter operation at counter operation start This bit controls the counter operation at counter operation start regardless of whether the counter currently is disabled or enabled (OSTMnTE.OSTMnTE = 0 to 1). 0: OSTMnCNT is loaded at counter operation start The following describes the value of the counter at counter operation start. – Interval timer mode: The OSTMnCMP[31:0] value is loaded to OSTMnCNT[31:0] at counter start. – Free-run compare mode: The value of 0000 0000 _H is loaded to OSTMnCNT[31:0] at counter operation start. 1: OSTMnCNT is not loaded at counter operation start
1	OSTMnMD1	Specifies the operating mode for the counter. 0: Interval timer mode 1: Free-run compare mode
0	OSTMnMD0	Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts. 0: Disables the interrupts when counting starts. 1: Enables the interrupts when counting starts.

31.4 Operation

Each OS timer is a 32-bit timer/counter.

The settings for the operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

31.4.1 Starting and Stopping OSTM

The OS timer is started and stopped as follows.

Starting the timer

Figure 31.4 shows the flow of starting the counter of OSTM_n. For details on the operations of the timer in interval timer mode and free-run timer mode in a given step of the figure, see the descriptions in **Section 31.4.2, Interval Timer Mode**, and **Section 31.4.3, Free-Run Compare Mode**.

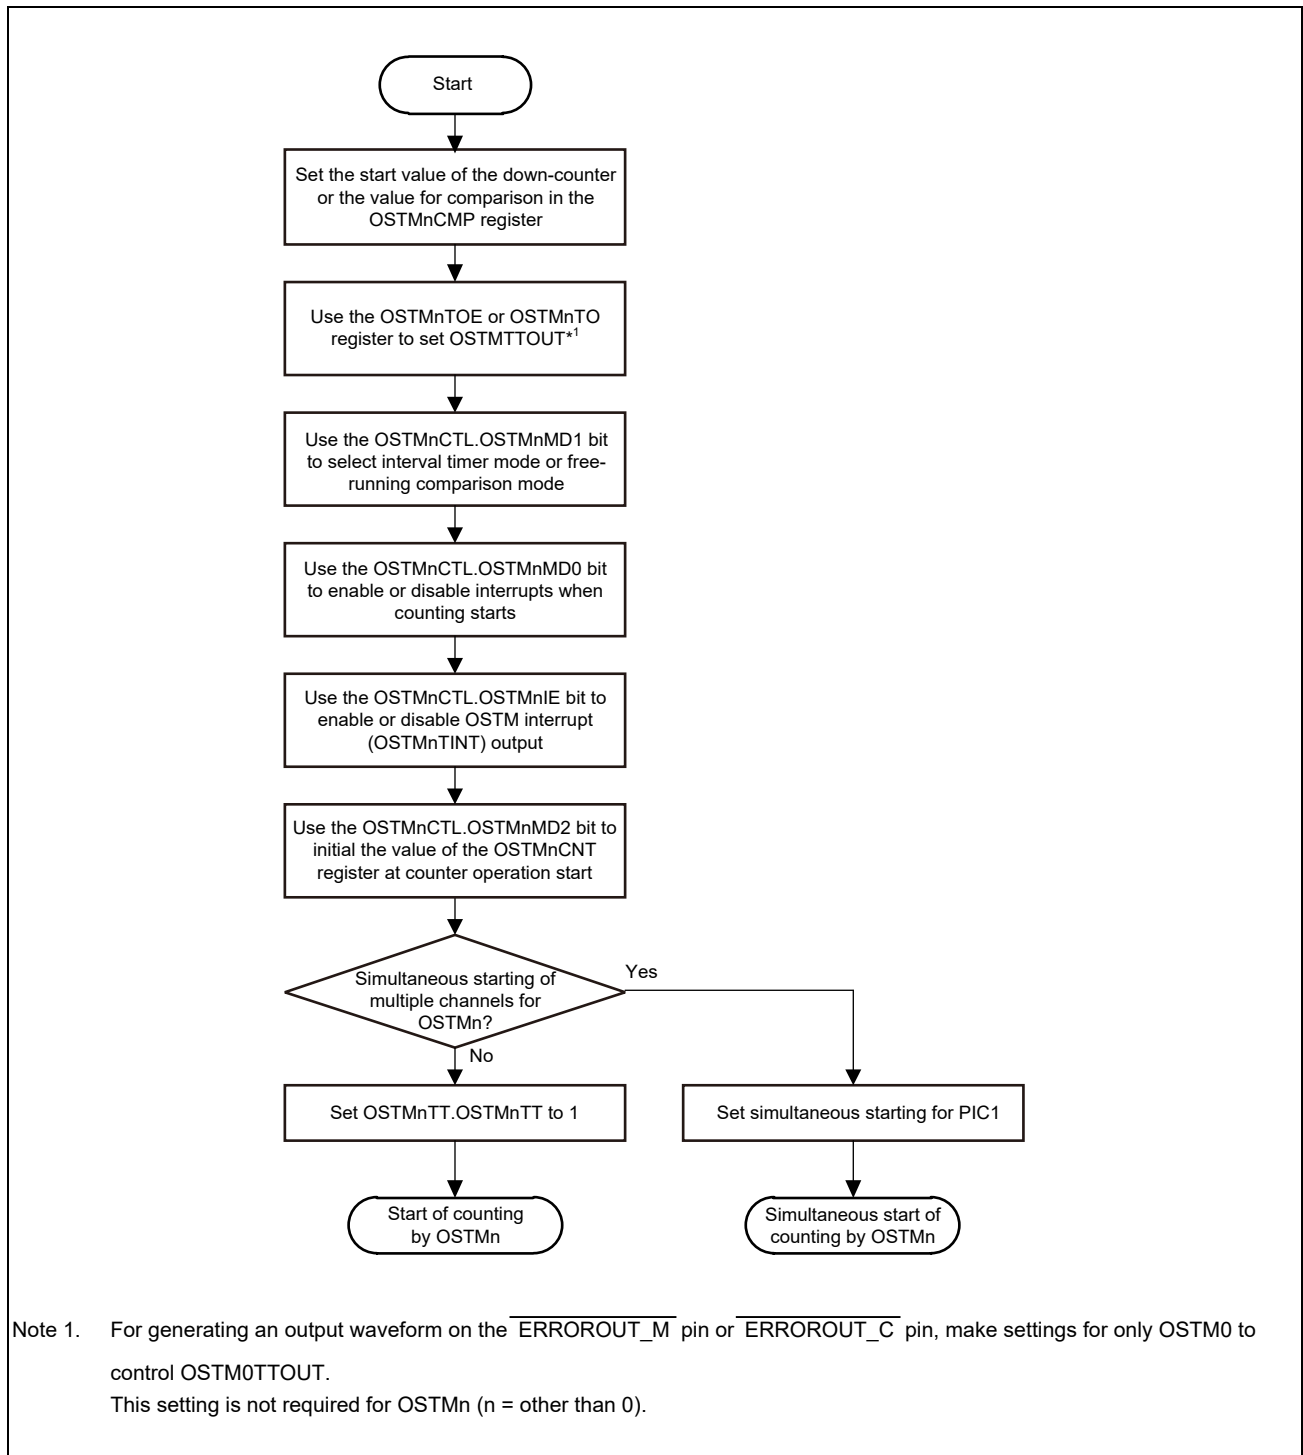

Figure 31.4 Flow of Starting the OS Timer

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer and clears the OSTMnTE.OSTMnTE status flag bit.

Timer Synchronization (PIC1)

The OSTMnTSST signal can be used to start multiple timers at the same time. For detailed connections, refer to **Section 35, Peripheral Interconnection (PIC)**.

31.4.2 Interval Timer Mode

Select the interval timer mode when an OS timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

31.4.2.1 Basic Operation in Interval Timer Mode

The interval timer mode is set when count mode selection bit OSTMnMD1 is set to “0”. In the interval timer mode, the OSTM can be used as the reference timer generating the OSTMnTINT interrupt at fixed intervals. Upon occurrence of an interrupt, OSTMnTTOUT performs a toggle operation and outputs a square wave. The periods of OSTMnTINT and OSTMnTTOUT are as follows.

- OSTMnTINT generation cycle = Count-clock cycle × (OSTMnCMP + 1)
- OSTMnTTOUT output cycle = OSTMnTINT generation period × 2

OSTMnCMP can be rewritten at any timing, and if it is rewritten during OSTMnCNT operation (OSTMnTE = 1), OSTMnCNT reloads the new OSTMnCMP value upon the next 0000 0000_H match detection, and the count operation continues. Then, when “1” is written to OSTMnTT to clear OSTMnTE to “0”, the counter and OSTMnTO stops operation while holding their values as they are.

When OSTMnMD2 = 0, OSTMnCMP[31:0] value is stored to OSTMnCNT at counter operation start.

When OSTMnMD2 = 1, OSTMnCMP[31:0] value is not stored to OSTMnCNT at counter operation start.

Figure 31.5 Timing Diagram of OSTMn in Interval Timer Mode (OSTMnMD2 = 0)

The timing diagram above shows the following:

- (1) The counter starts counting when OSTMnTS.OSTMnTS = 1 or OSTMnTSST = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting-down from the value of OSTMnCMP. If OSTMnCTL.OSTMnMD0 is 1,

OSTMnTINT interrupt requests are generated at the start of counting and the OSTMnTTOUT signal is toggled. The OSTMnCNT register indicates the counter value.

- (2) When the counter reaches 0000 0000_H, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled. The counter loads the new start value from OSTMnCMP and continues counting down.
- (3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
- (4) When counting is restarted (OSTMnTS.OSTMnTS = 1, or OSTMnTSST = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Figure 31.6 Timing Diagram of OSTMn in Interval Timer Mode (OSTMnMD2 = 1)

The timing diagram above shows the following:

- (1) The counter starts counting when OSTMnTS.OSTMnTS = 1 or OSTMnTSST = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting-down from the value written to OSTMnCNT.
If OSTMnCTL.OSTMnMD0 is 1, OSTMnTINT interrupt requests are generated at the start of counting and the OSTMnTTOUT signal is toggled. The OSTMnCNT register contains the current value as the counter.
- (2) When the counter reaches 0000 0000_H, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled. The counter loads the new start value from OSTMnCMP and continues counting down.
- (3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
- (4) When counting is restarted (OSTMnTS.OSTMnTS = 1, or OSTMnTSST = 1), the counter keeps the value when it was stopped and starts counting down.

31.4.2.2 Operation when OSTMnCMP = 0000 0000_H

When OSTMnCMP = 0000 0000_H, the OS timer behaves as follows.

- If the counter is enabled, the OSTMnTINT interrupt request will always be set to 1. However, the timer (OSTMnTTOUT) output signal can still be used. Timer (OSTMnTTOUT) output using timer output toggling mode results in OSTMnTTOUT being toggled at every cycle of the count clock.

The following figure shows the operation of OSTMn when OSTMnCMP = 0000 0000_H, the counter start interrupt is enabled (OSTMnCTL.OSTMnMD0 = 1), and the timer is in timer output toggling mode, where OSTMnTTOUT is toggled (OSTMnTOE.OSTMnTOE = 1).

Figure 31.7 Timing Diagram when OSTMnCMP = 0000 0000_H in Interval Timer Mode

The timing diagram above shows the following operations:

- (1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000_H is retained in OSTMnCNT.
- (2) While the OSTMnTINT interrupt request signal is continuously asserted, OSTMnTTOUT is toggled (in **Figure 31.7**, OSTMnTINT is fixed to the high level because PCLK is selected as the count clock).
- (3) After the counter stops, the OSTMnTINT interrupt request signal is deasserted and the output level of the OSTMnTTOUT signal is maintained.

When an interrupt is prohibited when the counter starts, 1 clock cycle of the count clock is not generated at the start timing of the counter.

31.4.2.3 Forced Restart Operation in Interval Timer Mode

Forced restart operation is performed by writing “1” to the OSTMnTS count start register during the count operation (OSTMnTE = 1) in the interval timer mode. At this time, the OSTMnCNT counter immediately reloads the OSTMnCMP compare register and the count operation continues.

CAUTION

If the OSTMnTS.OSTMnTS bit for a desired channel is set to 1 while simultaneous starting of multiple channels of the timer is in progress, the individual channels are forcibly restarted, so synchronous operation between the channels is not guaranteed.

If simultaneous starting of PIC1 is used while multiple channels of the timer start individually, the timers set for simultaneous starting are forcibly restarted at the same time.

Forced restart operation is performed regardless of the value of OSTMnCTL.OSTMnMD2.

Figure 31.8 Forced Restart Operation in Interval Timer Mode

The operations shown in the above timing diagram are as follows.

- (1) The counter is started and stopped as described under **Figure 31.5** or **Figure 31.6**.
- (2) Setting OSTMnTS.OSTMnTS = 1 or OSTMnTSST = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMnTINT interrupt request is generated when counting starts and the OSTMnTTOUT signal is toggled.

31.4.3 Free-Run Compare Mode

31.4.3.1 Basic Operation in Free-Run Compare Mode

The free-run compare mode is set when count mode selection bit OSTMnMD1 is set to “1”. In the free-run compare mode, the OSTMnTINT interrupt is output when the value of the OSTMnCMP compare register and the count value match. OSTMnTTOUT performs a toggle operation.

When OSTMnMD2 = 0, OSTMnCNT[31:0] is cleared to 0000 0000_H at counter operation start.

When OSTMnMD2 = 1, OSTMnCNT is not cleared at counter operation start.

Figure 31.9 Timing Diagram of OSTMn in Free-Run Compare Mode (OSTMnMD2 = 0)

The timing diagram above shows the following:

- (1) The counter starts counting when OSTMnTS.OSTMnTS = 1, or when OSTMnTSST = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 0000_H to FFFF FFFF_H. The OSTMnCNT register indicates the counter value. When the OSTMnCTL.OSTMnMD0 set to 1, the interrupt request OSTMnTINT is generated when the counting starts.
- (2) When the current counter value matches the value in the OSTMnCMP register, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled.
- (3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
- (4) When restarting the counter by setting OSTMnTS.OSTMnTS=1, the counter starts from 0000 0000_H.

The OSTMnTINT and OSTMnTTOUT occurrence timing in the free-run compare mode may not be a constant period depending on the usage conditions. This occurs at count start and when OSTMnCMP is rewritten during the count operation. This is explained using **Figure 31.9**.

Table 31.19 Timing of OSTMnTINT Generation

Old value for comparison	New value for comparison	Counter value at time of rewriting	Period of OSTMnTINT Generation	Label in timing diagram
Counter starts			$(A + 1) \times \text{count clock period}$	(1)
A	A	No rewriting	$(\text{FFFF FFFF}_H + 1) \times \text{count clock period}$	(2)
B	$C > B$	$B < \text{counter value} < C$	$(C - B) \times \text{count clock period}$	(3)
C	$D < C$	Counter value $> D, C$	$(\text{FFFF FFFF}_H - C + D + 1) \times \text{count clock period}$	(4)

Even during the count operation, OSTMnCMP rewrite is immediately reflected, and OSTMnCNT match judgment is executed. When “1” is written to OSTMnTT to set OSTMnTE = 0, the counter and OSTMnTO stop operation while holding their values.

Figure 31.10 Timing Diagram of OSTMn in Free-Run Compare Mode (OSTMnMD2 = 1)

The timing diagram above shows the following:

- (1) The counter starts counting when OSTMnTS.OSTMnTS = 1, or when OSTMnTSST = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter starts count up to FFFF FFFF_H from the value written to the OSTMnCNT register. The OSTMnCNT register is the counter, so it contains the current value. When the OSTMnCTL.OSTMnMD0 set to 1, the OSTMnTINT interrupt request is generated when counting starts.
- (2) When the current counter value matches the value in the OSTMnCMP register, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled.

- (3) When the counter is stopped ($OSTMnTT.OSTMnTT = 1$), the $OSTMnTE.OSTMnTE$ bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
- (4) Counting by the counter restarts from the value at which counting stopped when $OSTMnTS.OSTMnTS = 1$, or when $OSTMnTSST = 1$.

31.4.3.2 Operation when $OSTMnCMP = 0000\ 0000_H$

The following figure shows the operation of $OSTMn$ when $OSTMnCMP = 0000\ 0000_H$, counter-start interrupts are enabled ($OSTMnCTL.OSTMnMD0 = 1$) and the timer is in timer output toggling mode, where $OSTMnTTOUT$ is toggled ($OSTMnTOE.OSTMnTOE = 1$).

Figure 31.11 Timing Diagram when $OSTMnCMP = 0000\ 0000_H$ in Free-Run Compare Mode

The timing diagram above shows the following operations.

- (1) Once the counter starts, it counts up from $0000\ 0000_H$ to $FFFF\ FFFF_H$.
- (2) An $OSTMnTINT$ interrupt request is generated when counting starts and the $OSTMnTTOUT$ signal is toggled.
- (3) If the current counter value matches $OSTMnCMP$, the interrupt request $OSTMnTINT$ is generated. If $OSTMnCMP = 0000\ 0000_H$ as shown above, $OSTMnTINT$ is generated over two clock cycles and the $OSTMnTTOUT$ signal is toggled.
- (4) For every $(FFFF\ FFFF_H + 1)$ clock cycles, the $OSTMnTINT$ interrupt request signal is asserted and the $OSTMnTTOUT$ signal is toggled.

When an interrupt is prohibited when the counter starts, 1 clock cycle of the count clock is not generated at the start timing of the counter.

31.4.3.3 Forced Restart Operation in Free-Run Compare Mode

In the free-run compare mode, forced restart operation is not performed even when “1” is written to OSTMnTS during the count operation (OSTMnTS = 1). The OSTMnCNT counter continues counting at this time.

Forced restart operation is performed regardless of the value of OSTMnCTL.OSTMnMD2.

Section 32 ATU-V

32.1 Features of ATU-V

32.1.1 Units and Channels

This microcontroller has the following number of ATU-V units.

Table 32.1 Number of Units (1/3)

Product Name	RH850/E2x-FCC2	
	468 Pins	373 Pins
Number of Units	1	1

Table 32.5 Interrupt Requests (6/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID00	INTATUDSLID00	OCR1D0_0 compare match interrupt	140	—	—	Selected by ATU_INTSEL_D00[2:0] bits of ATUINTELD0 register.
		OCR2D0_0 compare match interrupt				
		1shot pulse ON D0_0 occurrence interrupt				
		1shot pulse OFF D0_0 occurrence interrupt				
		UDID0_0 down-counter underflow interrupt				
INTATUDSLID01	INTATUDSLID01	OCR1D0_1 compare match interrupt	141	—	—	Selected by ATU_INTSEL_D01[2:0] bits of ATUINTELD0 register.
		OCR2D0_1 compare match interrupt				
		1shot pulse ON D0_1 occurrence interrupt				
		1shot pulse OFF D0_1 occurrence interrupt				
		UDID0_1 down-counter underflow interrupt				
INTATUDSLID02	INTATUDSLID02	OCR1D0_2 compare match interrupt	142	—	—	Selected by ATU_INTSEL_D02[2:0] bits of ATUINTELD0 register.
		OCR2D0_2 compare match interrupt				
		1shot pulse ON D0_2 occurrence interrupt				
		1shot pulse OFF D0_2 occurrence interrupt				
		UDID0_2 down-counter underflow interrupt				
INTATUDSLID03	INTATUDSLID03	OCR1D0_3 compare match interrupt	143	—	—	Selected by ATU_INTSEL_D03[2:0] bits of ATUINTELD0 register.
		OCR2D0_3 compare match interrupt				
		1shot pulse ON D0_3 occurrence interrupt				
		1shot pulse OFF D0_3 occurrence interrupt				
		UDID0_3 down-counter underflow interrupt				
INTATUDSLID10	INTATUDSLID10	OCR1D1_0 compare match interrupt	144	—	—	Selected by ATU_INTSEL_D10[2:0] bits of ATUINTELD0 register.
		OCR2D1_0 compare match interrupt				
		1shot pulse ON D1_0 occurrence interrupt				
		1shot pulse OFF D1_0 occurrence interrupt				
		UDID1_0 down-counter underflow interrupt				
INTATUDSLID11	INTATUDSLID11	OCR1D1_1 compare match interrupt	145	—	—	Selected by ATU_INTSEL_D11[2:0] bits of ATUINTELD0 register.
		OCR2D1_1 compare match interrupt				
		1shot pulse ON D1_1 occurrence interrupt				
		1shot pulse OFF D1_1 occurrence interrupt				
		UDID1_1 down-counter underflow interrupt				
INTATUDSLID12	INTATUDSLID12	OCR1D1_2 compare match interrupt	146	—	—	Selected by ATU_INTSEL_D12[2:0] bits of ATUINTELD0 register.
		OCR2D1_2 compare match interrupt				
		1shot pulse ON D1_2 occurrence interrupt				
		1shot pulse OFF D1_2 occurrence interrupt				
		UDID1_2 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (7/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID13	INTATUDSLID13	OCR1D1_3 compare match interrupt	147	—	—	Selected by ATU_INTSEL_D13[2:0] bits of ATUINTELD0 register.
		OCR2D1_3 compare match interrupt				
		1shot pulse ON D1_3 occurrence interrupt				
		1shot pulse OFF D1_3 occurrence interrupt				
		UDID1_3 down-counter underflow interrupt				
INTATUDSLID20	INTATUDSLID20	OCR1D2_0 compare match interrupt	148	—	—	Selected by ATU_INTSEL_D20[2:0] bits of ATUINTELD1 register.
		OCR2D2_0 compare match interrupt				
		1shot pulse ON D2_0 occurrence interrupt				
		1shot pulse OFF D2_0 occurrence interrupt				
		UDID2_0 down-counter underflow interrupt				
INTATUDSLID21	INTATUDSLID21	OCR1D2_1 compare match interrupt	149	—	—	Selected by ATU_INTSEL_D21[2:0] bits of ATUINTELD1 register.
		OCR2D2_1 compare match interrupt				
		1shot pulse ON D2_1 occurrence interrupt				
		1shot pulse OFF D2_1 occurrence interrupt				
		UDID2_1 down-counter underflow interrupt				
INTATUDSLID22	INTATUDSLID22	OCR1D2_2 compare match interrupt	150	—	—	Selected by ATU_INTSEL_D22[2:0] bits of ATUINTELD1 register.
		OCR2D2_2 compare match interrupt				
		1shot pulse ON D2_2 occurrence interrupt				
		1shot pulse OFF D2_2 occurrence interrupt				
		UDID2_2 down-counter underflow interrupt				
INTATUDSLID23	INTATUDSLID23	OCR1D2_3 compare match interrupt	151	—	—	Selected by ATU_INTSEL_D23[2:0] bits of ATUINTELD1 register.
		OCR2D2_3 compare match interrupt				
		1shot pulse ON D2_3 occurrence interrupt				
		1shot pulse OFF D2_3 occurrence interrupt				
		UDID2_3 down-counter underflow interrupt				
INTATUDSLID30	INTATUDSLID30	OCR1D3_0 compare match interrupt	152	—	—	Selected by ATU_INTSEL_D30[2:0] bits of ATUINTELD1 register.
		OCR2D3_0 compare match interrupt				
		1shot pulse ON D3_0 occurrence interrupt				
		1shot pulse OFF D3_0 occurrence interrupt				
		UDID3_0 down-counter underflow interrupt				
INTATUDSLID31	INTATUDSLID31	OCR1D3_1 compare match interrupt	153	—	—	Selected by ATU_INTSEL_D31[2:0] bits of ATUINTELD1 register.
		OCR2D3_1 compare match interrupt				
		1shot pulse ON D3_1 occurrence interrupt				
		1shot pulse OFF D3_1 occurrence interrupt				
		UDID3_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (8/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID32	INTATUDSLID32	OCR1D3_2 compare match interrupt	154	—	—	Selected by ATU_INTSEL_D32[2:0] bits of ATUINTELD1 register.
		OCR2D3_2 compare match interrupt				
		1shot pulse ON D3_2 occurrence interrupt				
		1shot pulse OFF D3_2 occurrence interrupt				
		UDID3_2 down-counter underflow interrupt				
INTATUDSLID33	INTATUDSLID33	OCR1D3_3 compare match interrupt	155	—	—	Selected by ATU_INTSEL_D33[2:0] bits of ATUINTELD1 register.
		OCR2D3_3 compare match interrupt				
		1shot pulse ON D3_3 occurrence interrupt				
		1shot pulse OFF D3_3 occurrence interrupt				
		UDID3_3 down-counter underflow interrupt				
INTATUDSLID40	INTATUDSLID40	OCR1D4_0 compare match interrupt	156	—	—	Selected by ATU_INTSEL_D40[2:0] bits of ATUINTELD2 register.
		OCR2D4_0 compare match interrupt				
		1shot pulse ON D4_0 occurrence interrupt				
		1shot pulse OFF D4_0 occurrence interrupt				
		UDID4_0 down-counter underflow interrupt				
INTATUDSLID41	INTATUDSLID41	OCR1D4_1 compare match interrupt	157	—	—	Selected by ATU_INTSEL_D41[2:0] bits of ATUINTELD2 register.
		OCR2D4_1 compare match interrupt				
		1shot pulse ON D4_1 occurrence interrupt				
		1shot pulse OFF D4_1 occurrence interrupt				
		UDID4_1 down-counter underflow interrupt				
INTATUDSLID42	INTATUDSLID42	OCR1D4_2 compare match interrupt	158	—	—	Selected by ATU_INTSEL_D42[2:0] bits of ATUINTELD2 register.
		OCR2D4_2 compare match interrupt				
		1shot pulse ON D4_2 occurrence interrupt				
		1shot pulse OFF D4_2 occurrence interrupt				
		UDID4_2 down-counter underflow interrupt				
INTATUDSLID43	INTATUDSLID43	OCR1D4_3 compare match interrupt	159	—	—	Selected by ATU_INTSEL_D43[2:0] bits of ATUINTELD2 register.
		OCR2D4_3 compare match interrupt				
		1shot pulse ON D4_3 occurrence interrupt				
		1shot pulse OFF D4_3 occurrence interrupt				
		UDID4_3 down-counter underflow interrupt				
INTATUDSLID50	INTATUDSLID50	OCR1D5_0 compare match interrupt	160	—	—	Selected by ATU_INTSEL_D50[2:0] bits of ATUINTELD2 register.
		OCR2D5_0 compare match interrupt				
		1shot pulse ON D5_0 occurrence interrupt				
		1shot pulse OFF D5_0 occurrence interrupt				
		UDID5_0 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (9/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID51	INTATUDSLID51	OCR1D5_1 compare match interrupt	161	—	—	Selected by ATU_INTSEL_D51[2:0] bits of ATUINTSELD2 register.
		OCR2D5_1 compare match interrupt				
		1shot pulse ON D5_1 occurrence interrupt				
		1shot pulse OFF D5_1 occurrence interrupt				
		UDID5_1 down-counter underflow interrupt				
INTATUDSLID52	INTATUDSLID52	OCR1D5_2 compare match interrupt	162	—	—	Selected by ATU_INTSEL_D52[2:0] bits of ATUINTSELD2 register.
		OCR2D5_2 compare match interrupt				
		1shot pulse ON D5_2 occurrence interrupt				
		1shot pulse OFF D5_2 occurrence interrupt				
		UDID5_2 down-counter underflow interrupt				
INTATUDSLID53	INTATUDSLID53	OCR1D5_3 compare match interrupt	163	—	—	Selected by ATU_INTSEL_D53[2:0] bits of ATUINTSELD2 register.
		OCR2D5_3 compare match interrupt				
		1shot pulse ON D5_3 occurrence interrupt				
		1shot pulse OFF D5_3 occurrence interrupt				
		UDID5_3 down-counter underflow interrupt				
INTATUDSLID60	INTATUDSLID60	OCR1D6_0 compare match interrupt	164	—	—	Selected by ATU_INTSEL_D60[2:0] bits of ATUINTSELD3 register.
		OCR2D6_0 compare match interrupt				
		1shot pulse ON D6_0 occurrence interrupt				
		1shot pulse OFF D6_0 occurrence interrupt				
		UDID6_0 down-counter underflow interrupt				
INTATUDSLID61	INTATUDSLID61	OCR1D6_1 compare match interrupt	165	—	—	Selected by ATU_INTSEL_D61[2:0] bits of ATUINTSELD3 register.
		OCR2D6_1 compare match interrupt				
		1shot pulse ON D6_1 occurrence interrupt				
		1shot pulse OFF D6_1 occurrence interrupt				
		UDID6_1 down-counter underflow interrupt				
INTATUDSLID62	INTATUDSLID62	OCR1D6_2 compare match interrupt	166	—	—	Selected by ATU_INTSEL_D62[2:0] bits of ATUINTSELD3 register.
		OCR2D6_2 compare match interrupt				
		1shot pulse ON D6_2 occurrence interrupt				
		1shot pulse OFF D6_2 occurrence interrupt				
		UDID6_2 down-counter underflow interrupt				
INTATUDSLID63	INTATUDSLID63	OCR1D6_3 compare match interrupt	167	—	—	Selected by ATU_INTSEL_D63[2:0] bits of ATUINTSELD3 register.
		OCR2D6_3 compare match interrupt				
		1shot pulse ON D6_3 occurrence interrupt				
		1shot pulse OFF D6_3 occurrence interrupt				
		UDID6_3 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (10/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID70	INTATUDSLID70	OCR1D7_0 compare match interrupt	168	—	—	Selected by ATU_INTSEL_D70[2:0] bits of ATUINTELD3 register.
		OCR2D7_0 compare match interrupt				
		1shot pulse ON D7_0 occurrence interrupt				
		1shot pulse OFF D7_0 occurrence interrupt				
		UDID7_0 down-counter underflow interrupt				
INTATUDSLID71	INTATUDSLID71	OCR1D7_1 compare match interrupt	169	—	—	Selected by ATU_INTSEL_D71[2:0] bits of ATUINTELD3 register.
		OCR2D7_1 compare match interrupt				
		1shot pulse ON D7_1 occurrence interrupt				
		1shot pulse OFF D7_1 occurrence interrupt				
		UDID7_1 down-counter underflow interrupt				
INTATUDSLID72	INTATUDSLID72	OCR1D7_2 compare match interrupt	170	—	—	Selected by ATU_INTSEL_D72[2:0] bits of ATUINTELD3 register.
		OCR2D7_2 compare match interrupt				
		1shot pulse ON D7_2 occurrence interrupt				
		1shot pulse OFF D7_2 occurrence interrupt				
		UDID7_2 down-counter underflow interrupt				
INTATUDSLID73	INTATUDSLID73	OCR1D7_3 compare match interrupt	171	—	—	Selected by ATU_INTSEL_D73[2:0] bits of ATUINTELD3 register.
		OCR2D7_3 compare match interrupt				
		1shot pulse ON D7_3 occurrence interrupt				
		1shot pulse OFF D7_3 occurrence interrupt				
		UDID7_3 down-counter underflow interrupt				
INTATUDSLID80	INTATUDSLID80	OCR1D8_0 compare match interrupt	172	—	—	Selected by ATU_INTSEL_D80[2:0] bits of ATUINTELD4 register.
		OCR2D8_0 compare match interrupt				
		1shot pulse ON D8_0 occurrence interrupt				
		1shot pulse OFF D8_0 occurrence interrupt				
		UDID8_0 down-counter underflow interrupt				
INTATUDSLID81	INTATUDSLID81	OCR1D8_1 compare match interrupt	173	—	—	Selected by ATU_INTSEL_D81[2:0] bits of ATUINTELD4 register.
		OCR2D8_1 compare match interrupt				
		1shot pulse ON D8_1 occurrence interrupt				
		1shot pulse OFF D8_1 occurrence interrupt				
		UDID8_1 down-counter underflow interrupt				
INTATUDSLID82	INTATUDSLID82	OCR1D8_2 compare match interrupt	174	—	—	Selected by ATU_INTSEL_D82[2:0] bits of ATUINTELD4 register.
		OCR2D8_2 compare match interrupt				
		1shot pulse ON D8_2 occurrence interrupt				
		1shot pulse OFF D8_2 occurrence interrupt				
		UDID8_2 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (11/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID83	INTATUDSLID83	OCR1D8_3 compare match interrupt	175	—	—	Selected by ATU_INTSEL_D83[2:0] bits of ATUINTSELD4 register.
		OCR2D8_3 compare match interrupt				
		1shot pulse ON D8_3 occurrence interrupt				
		1shot pulse OFF D8_3 occurrence interrupt				
		UDID8_3 down-counter underflow interrupt				
INTATUDSLID90	INTATUDSLID90	OCR1D9_0 compare match interrupt	524	—	—	Selected by ATU_INTSEL_D90[2:0] bits of ATUINTSELD4 register.
		OCR2D9_0 compare match interrupt				
		1shot pulse ON D9_0 occurrence interrupt				
		1shot pulse OFF D9_0 occurrence interrupt				
		UDID9_0 down-counter underflow interrupt				
INTATUDSLID91	INTATUDSLID91	OCR1D9_1 compare match interrupt	525	—	—	Selected by ATU_INTSEL_D91[2:0] bits of ATUINTSELD4 register.
		OCR2D9_1 compare match interrupt				
		1shot pulse ON D9_1 occurrence interrupt				
		1shot pulse OFF D9_1 occurrence interrupt				
		UDID9_1 down-counter underflow interrupt				
INTATUDSLID92	INTATUDSLID92	OCR1D9_2 compare match interrupt	526	—	—	Selected by ATU_INTSEL_D92[2:0] bits of ATUINTSELD4 register.
		OCR2D9_2 compare match interrupt				
		1shot pulse ON D9_2 occurrence interrupt				
		1shot pulse OFF D9_2 occurrence interrupt				
		UDID9_2 down-counter underflow interrupt				
INTATUDSLID93	INTATUDSLID93	OCR1D9_3 compare match interrupt	527	—	—	Selected by ATU_INTSEL_D93[2:0] bits of ATUINTSELD4 register.
		OCR2D9_3 compare match interrupt				
		1shot pulse ON D9_3 occurrence interrupt				
		1shot pulse OFF D9_3 occurrence interrupt				
		UDID9_3 down-counter underflow interrupt				
INTATUDSLID100	INTATUDSLID100	OCR1D10_0 compare match interrupt	528	—	—	Selected by ATU_INTSEL_D100[2:0] bits of ATUINTSELD5 register.
		OCR2D10_0 compare match interrupt				
		1shot pulse ON D10_0 occurrence interrupt				
		1shot pulse OFF D10_0 occurrence interrupt				
		UDID10_0 down-counter underflow interrupt				
INTATUDSLID101	INTATUDSLID101	OCR1D10_1 compare match interrupt	529	—	—	Selected by ATU_INTSEL_D101[2:0] bits of ATUINTSELD5 register.
		OCR2D10_1 compare match interrupt				
		1shot pulse ON D10_1 occurrence interrupt				
		1shot pulse OFF D10_1 occurrence interrupt				
		UDID10_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (12/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID102	INTATUDSLID102	OCR1D10_2 compare match interrupt	530	—	—	Selected by ATU_INTSEL_D102[2:0] bits of ATUINTSELD5 register.
		OCR2D10_2 compare match interrupt				
		1shot pulse ON D10_2 occurrence interrupt				
		1shot pulse OFF D10_2 occurrence interrupt				
		UDID10_2 down-counter underflow interrupt				
INTATUDSLID103	INTATUDSLID103	OCR1D10_3 compare match interrupt	531	—	—	Selected by ATU_INTSEL_D103[2:0] bits of ATUINTSELD5 register.
		OCR2D10_3 compare match interrupt				
		1shot pulse ON D10_3 occurrence interrupt				
		1shot pulse OFF D10_3 occurrence interrupt				
		UDID10_3 down-counter underflow interrupt				
INTATUDSLID110	INTATUDSLID110	OCR1D11_0 compare match interrupt	532	—	—	Selected by ATU_INTSEL_D110[2:0] bits of ATUINTSELD5 register.
		OCR2D11_0 compare match interrupt				
		1shot pulse ON D11_0 occurrence interrupt				
		1shot pulse OFF D11_0 occurrence interrupt				
		UDID11_0 down-counter underflow interrupt				
INTATUDSLID111	INTATUDSLID111	OCR1D11_1 compare match interrupt	533	—	—	Selected by ATU_INTSEL_D111[2:0] bits of ATUINTSELD5 register.
		OCR2D11_1 compare match interrupt				
		1shot pulse ON D11_1 occurrence interrupt				
		1shot pulse OFF D11_1 occurrence interrupt				
		UDID11_1 down-counter underflow interrupt				
INTATUDSLID112	INTATUDSLID112	OCR1D11_2 compare match interrupt	534	—	—	Selected by ATU_INTSEL_D112[2:0] bits of ATUINTSELD5 register.
		OCR2D11_2 compare match interrupt				
		1shot pulse ON D11_2 occurrence interrupt				
		1shot pulse OFF D11_2 occurrence interrupt				
		UDID11_2 down-counter underflow interrupt				
INTATUDSLID113	INTATUDSLID113	OCR1D11_3 compare match interrupt	535	—	—	Selected by ATU_INTSEL_D113[2:0] bits of ATUINTSELD5 register.
		OCR2D11_3 compare match interrupt				
		1shot pulse ON D11_3 occurrence interrupt				
		1shot pulse OFF D11_3 occurrence interrupt				
		UDID11_3 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (13/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID120	INTATUDSLID120	OCR1D12_0 compare match interrupt	536	—	—	Selected by ATU_INTSEL_D120[2:0] bits of ATUINTSELD6 register.
		OCR2D12_0 compare match interrupt				
		1shot pulse ON D12_0 occurrence interrupt				
		1shot pulse OFF D12_0 occurrence interrupt				
		UDID12_0 down-counter underflow interrupt				
INTATUDSLID121	INTATUDSLID121	OCR1D12_1 compare match interrupt	537	—	—	Selected by ATU_INTSEL_D121[2:0] bits of ATUINTSELD6 register.
		OCR2D12_1 compare match interrupt				
		1shot pulse ON D12_1 occurrence interrupt				
		1shot pulse OFF D12_1 occurrence interrupt				
		UDID12_1 down-counter underflow interrupt				
INTATUDSLID122	INTATUDSLID122	OCR1D12_2 compare match interrupt	538	—	—	Selected by ATU_INTSEL_D122[2:0] bits of ATUINTSELD6 register.
		OCR2D12_2 compare match interrupt				
		1shot pulse ON D12_2 occurrence interrupt				
		1shot pulse OFF D12_2 occurrence interrupt				
		UDID12_2 down-counter underflow interrupt				
INTATUDSLID123	INTATUDSLID123	OCR1D12_3 compare match interrupt	539	—	—	Selected by ATU_INTSEL_D123[2:0] bits of ATUINTSELD6 register.
		OCR2D12_3 compare match interrupt				
		1shot pulse ON D12_3 occurrence interrupt				
		1shot pulse OFF D12_3 occurrence interrupt				
		UDID12_3 down-counter underflow interrupt				
INTATUDSLID130	INTATUDSLID130	OCR1D13_0 compare match interrupt	540	—	—	Selected by ATU_INTSEL_D130[2:0] bits of ATUINTSELD6 register.
		OCR2D13_0 compare match interrupt				
		1shot pulse ON D13_0 occurrence interrupt				
		1shot pulse OFF D13_0 occurrence interrupt				
		UDID13_0 down-counter underflow interrupt				
INTATUDSLID131	INTATUDSLID131	OCR1D13_1 compare match interrupt	541	—	—	Selected by ATU_INTSEL_D131[2:0] bits of ATUINTSELD6 register.
		OCR2D13_1 compare match interrupt				
		1shot pulse ON D13_1 occurrence interrupt				
		1shot pulse OFF D13_1 occurrence interrupt				
		UDID13_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (14/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUDSLID132	INTATUDSLID132	OCR1D13_2 compare match interrupt	542	—	—	Selected by ATU_INTSEL_D132[2:0] bits of ATUINTSELD6 register.
		OCR2D13_2 compare match interrupt				
		1shot pulse ON D13_2 occurrence interrupt				
		1shot pulse OFF D13_2 occurrence interrupt				
		UDID13_2 down-counter underflow interrupt				
INTATUDSLID133	INTATUDSLID133	OCR1D13_3 compare match interrupt	543	—	—	Selected by ATU_INTSEL_D133[2:0] bits of ATUINTSELD6 register.
		OCR2D13_3 compare match interrupt				
		1shot pulse ON D13_3 occurrence interrupt				
		1shot pulse OFF D13_3 occurrence interrupt				
		UDID13_3 down-counter underflow interrupt				
INTATUDSLID140	INTATUDSLID140	OCR1D14_0 compare match interrupt	544	—	—	Selected by ATU_INTSEL_D140[2:0] bits of ATUINTSELD7 register.
		OCR2D14_0 compare match interrupt				
		1shot pulse ON D14_0 occurrence interrupt				
		1shot pulse OFF D14_0 occurrence interrupt				
		UDID14_0 down-counter underflow interrupt				
INTATUDSLID141	INTATUDSLID141	OCR1D14_1 compare match interrupt	545	—	—	Selected by ATU_INTSEL_D141[2:0] bits of ATUINTSELD7 register.
		OCR2D14_1 compare match interrupt				
		1shot pulse ON D14_1 occurrence interrupt				
		1shot pulse OFF D14_1 occurrence interrupt				
		UDID14_1 down-counter underflow interrupt				
INTATUDSLID142	INTATUDSLID142	OCR1D14_2 compare match interrupt	546	—	—	Selected by ATU_INTSEL_D142[2:0] bits of ATUINTSELD7 register.
		OCR2D14_2 compare match interrupt				
		1shot pulse ON D14_2 occurrence interrupt				
		1shot pulse OFF D14_2 occurrence interrupt				
		UDID14_2 down-counter underflow interrupt

		ICRB0 input capture interrupt				
INTATUBSLDB2	INTATUBSLDB2	OCRB0 compare match interrupt	—	group1-48, group1-176	group2- 48, group2-112	Selected by ATU_DMASEL_B2[3:0] bits of ATUDMASELB register.
		OCRB1 compare match interrupt				
		OCRB6 compare match interrupt				
		OCRB10 compare match interrupt				
		OCRB11 compare match interrupt				
		OCRB12 compare match interrupt				
		Comparison between TCNTB6M and ICRB6 condition match interrupt				
		AND/OR condition of CMFB6 and CMFB6M condition match interrupt				
		ICRB0 input capture interrupt				
INTATUBSLDB3	INTATUBSLDB3	OCRB0 compare match interrupt	—	group1-49, group1-177	group2- 49, group2-113	Selected by ATU_DMASEL_B3[3:0] bits of ATUDMASELB register.
		OCRB1 compare match interrupt				
		OCRB6 compare match interrupt				
		OCRB10 compare match interrupt				
		OCRB11 compare match interrupt				
		OCRB12 compare match interrupt				
		Comparison between TCNTB6M and ICRB6 condition match interrupt				
		AND/OR condition of CMFB6 and CMFB6M condition match interrupt				
		ICRB0 input capture interrupt				
INTATUCDSLDCD0	INTATUCDSLDCD0	GRC0_0 input capture/compare match interrupt	—	group1-64, group1-192	group3-0, group3-64	Selected by ATU_DMASEL_CD00[2:0] bits of ATUDMASELCD0 register.
		OCRC0_0 input capture/compare match interrupt				
		OCR1D8_0 compare match interrupt				
		OCR2D8_0 compare match interrupt				
		1shot pulse ON D8_0 occurrence interrupt				
		1shot pulse OFF D8_0 occurrence interrupt				
		UDID8_0 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (19/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD1	INTATUCDSLDCD1	GRC0_1 input capture/compare match interrupt	—	group1-65, group1-193	group3-1, group3-65	Selected by ATU_DMASEL_CD01[2:0] bits of ATUDMASELCD0 register.
		OCRC0_1 input capture/compare match interrupt				
		OCR1D8_1 compare match interrupt				
		OCR2D8_1 compare match interrupt				
		1shot pulse ON D8_1 occurrence interrupt				
		1shot pulse OFF D8_1 occurrence interrupt				
		UDID8_1 down-counter underflow interrupt				
INTATUCDSLDCD2	INTATUCDSLDCD2	GRC0_2 input capture/compare match interrupt	—	group1-66, group1-194	group3-2, group3-66	Selected by ATU_DMASEL_CD02[2:0] bits of ATUDMASELCD0 register.
		OCRC0_2 input capture/compare match interrupt				
		OCR1D8_2 compare match interrupt				
		OCR2D8_2 compare match interrupt				
		1shot pulse ON D8_2 occurrence interrupt				
		1shot pulse OFF D8_2 occurrence interrupt				
		UDID8_2 down-counter underflow interrupt				
INTATUCDSLDCD3	INTATUCDSLDCD3	GRC0_3 input capture/compare match interrupt	—	group1-67, group1-195	group3-3, group3-67	Selected by ATU_DMASEL_CD03[2:0] bits of ATUDMASELCD0 register.
		OCRC0_3 input capture/compare match interrupt				
		OCR1D8_3 compare match interrupt				
		OCR2D8_3 compare match interrupt				
		1shot pulse ON D8_3 occurrence interrupt				
		1shot pulse OFF D8_3 occurrence interrupt				
		UDID8_3 down-counter underflow interrupt				
INTATUCDSLDCD4	INTATUCDSLDCD4	GRC1_0 input capture/compare match interrupt	—	group1-68, group1-196	group3-4, group3-68	Selected by ATU_DMASEL_CD04[2:0] bits of ATUDMASELCD0 register.
		OCRC1_0 input capture/compare match interrupt				
		OCR1D9_0 compare match interrupt				
		OCR2D9_0 compare match interrupt				
		1shot pulse ON D9_0 occurrence interrupt				
		1shot pulse OFF D9_0 occurrence interrupt				
		UDID9_0 down-counter underflow interrupt				
INTATUCDSLDCD5	INTATUCDSLDCD5	GRC1_1 input capture/compare match interrupt	—	group1-69, group1-197	group3-5, group3-69	Selected by ATU_DMASEL_CD05[2:0] bits of ATUDMASELCD0 register.
		OCRC1_1 input capture/compare match interrupt				
		OCR1D9_1 compare match interrupt				
		OCR2D9_1 compare match interrupt				
		1shot pulse ON D9_1 occurrence interrupt				
		1shot pulse OFF D9_1 occurrence interrupt				
		UDID9_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (20/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD6	INTATUCDSLDCD6	GRC1_2 input capture/compare match interrupt	—	group1-70, group1-198	group3-6, group3-70	Selected by ATU_DMASEL_CD06[2:0] bits of ATUDMASELCD0 register.
		OCRC1_2 input capture/compare match interrupt				
		OCR1D9_2 compare match interrupt				
		OCR2D9_2 compare match interrupt				
		1shot pulse ON D9_2 occurrence interrupt				
		1shot pulse OFF D9_2 occurrence interrupt				
		UDID9_2 down-counter underflow interrupt				
INTATUCDSLDCD7	INTATUCDSLDCD7	GRC1_3 input capture/compare match interrupt	—	group1-71, group1-199	group3-7, group3-71	Selected by ATU_DMASEL_CD07[2:0] bits of ATUDMASELCD0 register.
		OCRC1_3 input capture/compare match interrupt				
		OCR1D9_3 compare match interrupt				
		OCR2D9_3 compare match interrupt				
		1shot pulse ON D9_3 occurrence interrupt				
		1shot pulse OFF D9_3 occurrence interrupt				
		UDID9_3 down-counter underflow interrupt				
INTATUCDSLDCD8	INTATUCDSLDCD8	GRC2_0 input capture/compare match interrupt	—	group1-72, group1-200	group3-8, group3-72	Selected by ATU_DMASEL_CD08[2:0] bits of ATUDMASELCD1 register.
		OCRC2_0 input capture/compare match interrupt				
		OCR1D10_0 compare match interrupt				
		OCR2D10_0 compare match interrupt				
		1shot pulse ON D10_0 occurrence interrupt				
		1shot pulse OFF D10_0 occurrence interrupt				
		UDID10_0 down-counter underflow interrupt				
INTATUCDSLDCD9	INTATUCDSLDCD9	GRC2_1 input capture/compare match interrupt	—	group1-73, group1-201	group3-9, group3-73	Selected by ATU_DMASEL_CD09[2:0] bits of ATUDMASELCD1 register.
		OCRC2_1 input capture/compare match interrupt				
		OCR1D10_1 compare match interrupt				
		OCR2D10_1 compare match interrupt				
		1shot pulse ON D10_1 occurrence interrupt				
		1shot pulse OFF D10_1 occurrence interrupt				
		UDID10_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (21/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD10	INTATUCDSLDCD10	GRC2_2 input capture/compare match interrupt	—	group1-74, group1-202	group3-10, group3-74	Selected by ATU_DMASEL_CD10[2:0] bits of ATUDMASELCD1 register.
		OCRC2_2 input capture/compare match interrupt				
		OCR1D10_2 compare match interrupt				
		OCR2D10_2 compare match interrupt				
		1shot pulse ON D10_2 occurrence interrupt				
		1shot pulse OFF D10_2 occurrence interrupt				
		UDID10_2 down-counter underflow interrupt				
INTATUCDSLDCD11	INTATUCDSLDCD11	GRC2_3 input capture/compare match interrupt	—	group1-75, group1-203	group3-11, group3-75	Selected by ATU_DMASEL_CD11[2:0] bits of ATUDMASELCD1 register.
		OCRC2_3 input capture/compare match interrupt				
		OCR1D10_3 compare match interrupt				
		OCR2D10_3 compare match interrupt				
		1shot pulse ON D10_3 occurrence interrupt				
		1shot pulse OFF D10_3 occurrence interrupt				
		UDID10_3 down-counter underflow interrupt				
INTATUCDSLDCD12	INTATUCDSLDCD12	GRC3_0 input capture/compare match interrupt	—	group1-76, group1-204	group3-12, group3-76	Selected by ATU_DMASEL_CD12[2:0] bits of ATUDMASELCD1 register.
		OCRC3_0 input capture/compare match interrupt				
		OCR1D11_0 compare match interrupt				
		OCR2D11_0 compare match interrupt				
		1shot pulse ON D11_0 occurrence interrupt				
		1shot pulse OFF D11_0 occurrence interrupt				
		UDID11_0 down-counter underflow interrupt				
INTATUCDSLDCD13	INTATUCDSLDCD13	GRC3_1 input capture/compare match interrupt	—	group1-77, group1-205	group3-13, group3-77	Selected by ATU_DMASEL_CD13[2:0] bits of ATUDMASELCD1 register.
		OCRC3_1 input capture/compare match interrupt				
		OCR1D11_1 compare match interrupt				
		OCR2D11_1 compare match interrupt				
		1shot pulse ON D11_1 occurrence interrupt				
		1shot pulse OFF D11_1 occurrence interrupt				
		UDID11_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (22/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD14	INTATUCDSLDCD14	GRC3_2 input capture/compare match interrupt	—	group1-78, group1-206	group3-14, group3-78	Selected by ATU_DMASEL_CD14[2:0] bits of ATUDMASELCD1 register.
		OCRC3_2 input capture/compare match interrupt				
		OCR1D11_2 compare match interrupt				
		OCR2D11_2 compare match interrupt

		1shot pulse OFF D14_0 occurrence interrupt				
		UDID14_0 down-counter underflow interrupt				
INTATUCDSLDCD25	INTATUCDSLDCD25	GRC6_1 input capture/compare match interrupt	—	group1-89, group1-217	group3-25, group3-89	Selected by ATU_DMASEL_CD25[2:0] bits of ATUDMASELCD3 register.
		OCRC6_1 input capture/compare match interrupt				
		OCR1D14_1 compare match interrupt				
		OCR2D14_1 compare match interrupt				
		1shot pulse ON D14_1 occurrence interrupt				
		1shot pulse OFF D14_1 occurrence interrupt				
		UDID14_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (25/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD26	INTATUCDSLDCD26	GRC6_2 input capture/compare match interrupt	—	group1-90, group1-218	group3-26, group3-90	Selected by ATU_DMASEL_CD26[2:0] bits of ATUDMASELCD3 register.
		OCRC6_2 input capture/compare match interrupt				
		OCR1D14_2 compare match interrupt				
		OCR2D14_2 compare match interrupt				
		1shot pulse ON D14_2 occurrence interrupt				
		1shot pulse OFF D14_2 occurrence interrupt				
		UDID14_2 down-counter underflow interrupt				
INTATUCDSLDCD27	INTATUCDSLDCD27	GRC6_3 input capture/compare match interrupt	—	group1-91, group1-219	group3-27, group3-91	Selected by ATU_DMASEL_CD27[2:0] bits of ATUDMASELCD3 register.
		OCRC6_3 input capture/compare match interrupt				
		OCR1D14_3 compare match interrupt				
		OCR2D14_3 compare match interrupt				
		1shot pulse ON D14_3 occurrence interrupt				
		1shot pulse OFF D14_3 occurrence interrupt				
		UDID14_3 down-counter underflow interrupt				
INTATUCDSLDCD28	INTATUCDSLDCD28	GRC7_0 input capture/compare match interrupt	—	group1-92, group1-220	group3-28, group3-92	Selected by ATU_DMASEL_CD28[2:0] bits of ATUDMASELCD3 register.
		OCRC7_0 input capture/compare match interrupt				
INTATUCDSLDCD29	INTATUCDSLDCD29	GRC7_1 input capture/compare match interrupt	—	group1-93, group1-221	group3-29, group3-93	Selected by ATU_DMASEL_CD29[2:0] bits of ATUDMASELCD3 register.
		OCRC7_1 input capture/compare match interrupt				
INTATUCDSLDCD30	INTATUCDSLDCD30	GRC7_2 input capture/compare match interrupt	—	group1-94, group1-222	group3-30, group3-94	Selected by ATU_DMASEL_CD30[2:0] bits of ATUDMASELCD3 register.
		OCRC7_2 input capture/compare match interrupt				
INTATUCDSLDCD31	INTATUCDSLDCD31	GRC7_3 input capture/compare match interrupt	—	group1-95, group1-223	group3-31, group3-95	Selected by ATU_DMASEL_CD31[2:0] bits of ATUDMASELCD3 register.
		OCRC7_3 input capture/compare match interrupt				
INTATUCDSLDCD32	INTATUCDSLDCD32	GRC8_0 input capture/compare match interrupt	—	group1-96, group1-224	group3-32, group3-96	Selected by ATU_DMASEL_CD32[2:0] bits of ATUDMASELCD4 register.
		OCRC8_0 input capture/compare match interrupt				
		OCR1D0_0 compare match interrupt				
		OCR2D0_0 compare match interrupt				
		1shot pulse ON D0_0 occurrence interrupt				
		1shot pulse OFF D0_0 occurrence interrupt				
		UDID0_0 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (26/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD33	INTATUCDSLDCD33	GRC8_1 input capture/compare match interrupt	—	group1-97, group1-225	group3-33, group3-97	Selected by ATU_DMASEL_CD33[2:0] bits of ATUDMASELCD4 register.
		OCRC8_1 input capture/compare match interrupt				
		OCR1D0_1 compare match interrupt				
		OCR2D0_1 compare match interrupt				
		1shot pulse ON D0_1 occurrence interrupt				
		1shot pulse OFF D0_1 occurrence interrupt				
		UDID0_1 down-counter underflow interrupt				
INTATUCDSLDCD34	INTATUCDSLDCD34	GRC8_2 input capture/compare match interrupt	—	group1-98, group1-226	group3-34, group3-98	Selected by ATU_DMASEL_CD34[2:0] bits of ATUDMASELCD4 register.
		OCRC8_2 input capture/compare match interrupt				
		OCR1D0_2 compare match interrupt				
		OCR2D0_2 compare match interrupt				
		1shot pulse ON D0_2 occurrence interrupt				
		1shot pulse OFF D0_2 occurrence interrupt				
		UDID0_2 down-counter underflow interrupt				
INTATUCDSLDCD35	INTATUCDSLDCD35	GRC8_3 input capture/compare match interrupt	—	group1-99, group1-227	group3-35, group3-99	Selected by ATU_DMASEL_CD35[2:0] bits of ATUDMASELCD4 register.
		OCRC8_3 input capture/compare match interrupt				
		OCR1D0_3 compare match interrupt				
		OCR2D0_3 compare match interrupt				
		1shot pulse ON D0_3 occurrence interrupt				
		1shot pulse OFF D0_3 occurrence interrupt				
		UDID0_3 down-counter underflow interrupt				
INTATUCDSLDCD36	INTATUCDSLDCD36	GRC9_0 input capture/compare match interrupt	—	group1-100, group1-228	group3-36, group3-100	Selected by ATU_DMASEL_CD36[2:0] bits of ATUDMASELCD4 register.
		OCRC9_0 input capture/compare match interrupt				
		OCR1D1_0 compare match interrupt				
		OCR2D1_0 compare match interrupt				
		1shot pulse ON D1_0 occurrence interrupt				
		1shot pulse OFF D1_0 occurrence interrupt				
		UDID1_0 down-counter underflow interrupt				
INTATUCDSLDCD37	INTATUCDSLDCD37	GRC9_1 input capture/compare match interrupt	—	group1-101, group1-229	group3-37, group3-101	Selected by ATU_DMASEL_CD37[2:0] bits of ATUDMASELCD4 register.
		OCRC9_1 input capture/compare match interrupt				
		OCR1D1_1 compare match interrupt				
		OCR2D1_1 compare match interrupt				
		1shot pulse ON D1_1 occurrence interrupt				
		1shot pulse OFF D1_1 occurrence interrupt				
		UDID1_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (27/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD38	INTATUCDSLDCD38	GRC9_2 input capture/compare match interrupt	—	group1-102, group1-230	group3-38, group3-102	Selected by ATU_DMASEL_CD38[2:0] bits of ATUDMASELCD4 register.
		OCRC9_2 input capture/compare match interrupt				
		OCR1D1_2 compare match interrupt				
		OCR2D1_2 compare match interrupt				
		1shot pulse ON D1_2 occurrence interrupt				
		1shot pulse OFF D1_2 occurrence interrupt				
		UDID1_2 down-counter underflow interrupt				
INTATUCDSLDCD39	INTATUCDSLDCD39	GRC9_3 input capture/compare match interrupt	—	group1-103, group1-231	group3-39, group3-103	Selected by ATU_DMASEL_CD39[2:0] bits of ATUDMASELCD4 register.
		OCRC9_3 input capture/compare match interrupt				
		OCR1D1_3 compare match interrupt				
		OCR2D1_3 compare match interrupt				
		1shot pulse ON D1_3 occurrence interrupt				
		1shot pulse OFF D1_3 occurrence interrupt				
		UDID1_3 down-counter underflow interrupt				
INTATUCDSLDCD40	INTATUCDSLDCD40	GRC10_0 input capture/compare match interrupt	—	group1-104, group1-232	group3-40, group3-104	Selected by ATU_DMASEL_CD40[2:0] bits of ATUDMASELCD5 register.
		OCRC10_0 input capture/compare match interrupt				
		OCR1D2_0 compare match interrupt				
		OCR2D2_0 compare match interrupt				
		1shot pulse ON D2_0 occurrence interrupt				
		1shot pulse OFF D2_0 occurrence interrupt				
		UDID2_0 down-counter underflow interrupt				
INTATUCDSLDCD41	INTATUCDSLDCD41	GRC10_1 input capture/compare match interrupt	—	group1-105, group1-233	group3-41, group3-105	Selected by ATU_DMASEL_CD41[2:0] bits of ATUDMASELCD5 register.
		OCRC10_1 input capture/compare match interrupt				
		OCR1D2_1 compare match interrupt				
		OCR2D2_1 compare match interrupt				
		1shot pulse ON D2_1 occurrence interrupt				
		1shot pulse OFF D2_1 occurrence interrupt				
		UDID2_1 down-counter underflow interrupt				
INTATUCDSLDCD42	INTATUCDSLDCD42	GRC10_2 input capture/compare match interrupt	—	group1-106, group1-234	group3-42, group3-106	Selected by ATU_DMASEL_CD42[2:0] bits of ATUDMASELCD5 register.
		OCRC10_2 input capture/compare match interrupt				
		OCR1D2_2 compare match interrupt				
		OCR2D2_2 compare match interrupt				
		1shot pulse ON D2_2 occurrence interrupt				
		1shot pulse OFF D2_2 occurrence interrupt				
		UDID2_2 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (28/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD43	INTATUCDSLDCD43	GRC10_3 input capture/compare match interrupt	—	group1-107, group1-235	group3-43, group3-107	Selected by ATU_DMASEL_CD43[2:0] bits of ATUDMASELCD5 register.
		OCRC10_3 input capture/compare match interrupt				
		OCR1D2_3 compare match interrupt				
		OCR2D2_3 compare match interrupt				
		1shot pulse ON D2_3 occurrence interrupt				
		1shot pulse OFF D2_3 occurrence interrupt				
		UDID2_3 down-counter underflow interrupt				
INTATUCDSLDCD44	INTATUCDSLDCD44	GRC11_0 input capture/compare match interrupt	—	group1-108, group1-236	group3-44, group3-108	Selected by ATU_DMASEL_CD44[2:0] bits of ATUDMASELCD5 register.
		OCRC11_0 input capture/compare match interrupt				
		OCR1D3_0 compare match interrupt				
		OCR2D3_0 compare match interrupt				
		1shot pulse ON D3_0 occurrence interrupt				
		1shot pulse OFF D3_0 occurrence interrupt				
		UDID3_0 down-counter underflow interrupt				
INTATUCDSLDCD45	INTATUCDSLDCD45	GRC11_1 input capture/compare match interrupt	—	group1-109, group1-237	group3-45, group3-109	Selected by ATU_DMASEL_CD45[2:0] bits of ATUDMASELCD5 register.
		OCRC11_1 input capture/compare match interrupt				
		OCR1D3_1 compare match interrupt				
		OCR2D3_1 compare match interrupt				
		1shot pulse ON D3_1 occurrence interrupt				
		1shot pulse OFF D3_1 occurrence interrupt				
		UDID3_1 down-counter underflow interrupt				
INTATUCDSLDCD46	INTATUCDSLDCD46	GRC11_2 input capture/compare match interrupt	—	group1-110, group1-238	group3-46, group3-110	Selected by ATU_DMASEL_CD46[2:0] bits of ATUDMASELCD5 register.
		OCRC11_2 input capture/compare match interrupt				
		OCR1D3_2 compare match interrupt				
		OCR2D3_2 compare match interrupt				
		1shot pulse ON D3_2 occurrence interrupt				
		1shot pulse OFF D3_2 occurrence interrupt				
		UDID3_2 down-counter underflow interrupt				
INTATUCDSLDCD47	INTATUCDSLDCD47	GRC11_3 input capture/compare match interrupt	—	group1-111, group1-239	group3-47, group3-111	Selected by ATU_DMASEL_CD47[2:0] bits of ATUDMASELCD5 register.
		OCRC11_3 input capture/compare match interrupt				
		OCR1D3_3 compare match interrupt				
		OCR2D3_3 compare match interrupt				
		1shot pulse ON D3_3 occurrence interrupt				
		1shot pulse OFF D3_3 occurrence interrupt				
		UDID3_3 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (29/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD48	INTATUCDSLDCD48	GRC12_0 input capture/compare match interrupt	—	group1-112, group1-240	group3-48, group3-112	Selected by ATU_DMASEL_CD48[2:0] bits of ATUDMASELCD6 register.
		OCRC12_0 input capture/compare match interrupt				
		OCR1D4_0 compare match interrupt				
		OCR2D4_0 compare match interrupt				
		1shot pulse ON D4_0 occurrence interrupt				
		1shot pulse OFF D4_0 occurrence interrupt				
		UDID4_0 down-counter underflow interrupt				
INTATUCDSLDCD49	INTATUCDSLDCD49	GRC12_1 input capture/compare match interrupt	—	group1-113, group1-241	group3-49, group3-113	Selected by ATU_DMASEL_CD49[2:0] bits of ATUDMASELCD6 register.
		OCRC12_1 input capture/compare match interrupt				
		OCR1D4_1 compare match interrupt				
		OCR2D4_1 compare match interrupt				
		1shot pulse ON D4_1 occurrence interrupt				
		1shot pulse OFF D4_1 occurrence interrupt

		1shot pulse OFF D5_1 occurrence interrupt				
		UDID5_1 down-counter underflow interrupt				
INTATUCDSLDCD54	INTATUCDSLDCD54	GRC13_2 input capture/compare match interrupt	—	group1-118, group1-246	group3-54, group3-118	Selected by ATU_DMASEL_CD54[2:0] bits of ATUDMASELCD6 register.
		OCRC13_2 input capture/compare match interrupt				
		OCR1D5_2 compare match interrupt				
		OCR2D5_2 compare match interrupt				
		1shot pulse ON D5_2 occurrence interrupt				
		1shot pulse OFF D5_2 occurrence interrupt				
		UDID5_2 down-counter underflow interrupt				
INTATUCDSLDCD55	INTATUCDSLDCD55	GRC13_3 input capture/compare match interrupt	—	group1-119, group1-247	group3-55, group3-119	Selected by ATU_DMASEL_CD55[2:0] bits of ATUDMASELCD6 register.
		OCRC13_3 input capture/compare match interrupt				
		OCR1D5_3 compare match interrupt				
		OCR2D5_3 compare match interrupt				
		1shot pulse ON D5_3 occurrence interrupt				
		1shot pulse OFF D5_3 occurrence interrupt				
		UDID5_3 down-counter underflow interrupt				
INTATUCDSLDCD56	INTATUCDSLDCD56	OCR1D6_0 compare match interrupt	—	group1-120, group1-248	group3-56, group3-120	Selected by ATU_DMASEL_CD56[2:0] bits of ATUDMASELCD7 register.
		OCR2D6_0 compare match interrupt				
		1shot pulse ON D6_0 occurrence interrupt				
		1shot pulse OFF D6_0 occurrence interrupt				
		UDID6_0 down-counter underflow interrupt				
INTATUCDSLDCD57	INTATUCDSLDCD57	OCR1D6_1 compare match interrupt	—	group1-121, group1-249	group3-57, group3-121	Selected by ATU_DMASEL_CD57[2:0] bits of ATUDMASELCD7 register.
		OCR2D6_1 compare match interrupt				
		1shot pulse ON D6_1 occurrence interrupt				
		1shot pulse OFF D6_1 occurrence interrupt				
		UDID6_1 down-counter underflow interrupt				

Table 32.5 Interrupt Requests (31/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUCDSLDCD58	INTATUCDSLDCD58	OCR1D6_2 compare match interrupt	—	group1-122, group1-250	group3-58, group3-122	Selected by ATU_DMASEL_CD58[2:0] bits of ATUDMASELCD7 register.
		OCR2D6_2 compare match interrupt				
		1shot pulse ON D6_2 occurrence interrupt				
		1shot pulse OFF D6_2 occurrence interrupt				
		UDID6_2 down-counter underflow interrupt				
INTATUCDSLDCD59	INTATUCDSLDCD59	OCR1D6_3 compare match interrupt	—	group1-123, group1-251	group3-59, group3-123	Selected by ATU_DMASEL_CD59[2:0] bits of ATUDMASELCD7 register.
		OCR2D6_3 compare match interrupt				
		1shot pulse ON D6_3 occurrence interrupt				
		1shot pulse OFF D6_3 occurrence interrupt				
		UDID6_3 down-counter underflow interrupt				
INTATUCDSLDCD60	INTATUCDSLDCD60	OCR1D7_0 compare match interrupt	—	group1-124, group1-252	group3-60, group3-124	Selected by ATU_DMASEL_CD60[2:0] bits of ATUDMASELCD7 register.
		OCR2D7_0 compare match interrupt				
		1shot pulse ON D7_0 occurrence interrupt				
		1shot pulse OFF D7_0 occurrence interrupt				
		UDID7_0 down-counter underflow interrupt				
INTATUCDSLDCD61	INTATUCDSLDCD61	OCR1D7_1 compare match interrupt	—	group1-125, group1-253	group3-61, group3-125	Selected by ATU_DMASEL_CD61[2:0] bits of ATUDMASELCD7 register.
		OCR2D7_1 compare match interrupt				
		1shot pulse ON D7_1 occurrence interrupt				
		1shot pulse OFF D7_1 occurrence interrupt				
		UDID7_1 down-counter underflow interrupt				
INTATUCDSLDCD62	INTATUCDSLDCD62	OCR1D7_2 compare match interrupt	—	group1-126, group1-254	group3-62, group3-126	Selected by ATU_DMASEL_CD62[2:0] bits of ATUDMASELCD7 register.
		OCR2D7_2 compare match interrupt				
		1shot pulse ON D7_2 occurrence interrupt				
		1shot pulse OFF D7_2 occurrence interrupt				
		UDID7_2 down-counter underflow interrupt				
INTATUCDSLDCD63	INTATUCDSLDCD63	OCR1D7_3 compare match interrupt	—	group1-127, group1-255	group3-63, group3-127	Selected by ATU_DMASEL_CD63[2:0] bits of ATUDMASELCD7 register.
		OCR2D7_3 compare match interrupt				
		1shot pulse ON D7_3 occurrence interrupt				
		1shot pulse OFF D7_3 occurrence interrupt				
		UDID7_3 down-counter underflow interrupt				
INTATUESLDE0	INTATUESLDE0	CYLRE0_0 cycle compare match interrupt/DTRE0_0 duty compare match interrupt	—	group1-0, group1-128	group2-0, group2-64	Selected by ATU_DMASEL_E0[1:0] bits of ATUDMASELE register.
		CYLRE0_1 cycle compare match interrupt/DTRE0_1 duty compare match interrupt				
		CYLRE0_2 cycle compare match interrupt/DTRE0_2 duty compare match interrupt				
		CYLRE0_3 cycle compare match interrupt/DTRE0_3 duty compare match interrupt				

Table 32.5 Interrupt Requests (32/33)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Note.
INTATUESLDE1	INTATUESLDE1	CYLRE1_0 cycle compare match interrupt/DTRE1_0 duty compare match interrupt	—	group1-1, group1-129	group2-1, group2-65	Selected by ATU_DMASEL_E1[1:0] bits of ATUDMASELE register.
		CYLRE1_1 cycle compare match interrupt/DTRE1_1 duty compare match interrupt				
		CYLRE1_2 cycle compare match interrupt/DTRE1_2 duty compare match interrupt				
		CYLRE1_3 cycle compare match interrupt/DTRE1_3 duty compare match interrupt				
INTATUESLDE2	INTATUESLDE2	CYLRE2_0 cycle compare match interrupt/DTRE2_0 duty compare match interrupt	—	group1-2, group1-130	group2-2, group2-66	Selected by ATU_DMASEL_E2[1:0] bits of ATUDMASELE register.
		CYLRE2_1 cycle compare match interrupt/DTRE2_1 duty compare match interrupt

Symbol	I/O	Number of Bits	Function
TOE00 - 03 to TOE90 - 93	Output	40	Output pins for PWM signals of timer E (one each for channels 0 to 3 in sub blocks E0 to E9)

Timer F

Table 32.12 External Input/Output Signals Timer F

RH850/E2x-FCC2, E2UH, E2H			
Symbol	I/O	Number of Bits	Function
TIF0A to TIF2A TIF3 to TIF19	Input	20	Input pins for event signals for sub blocks F0 to F19 of timer F TIF0A to TIF2A: Input pins for sub blocks F0 to F2 TIF3 to TIF19: Input pins for sub blocks F3 to F19
TIF0B to TIF2B	Input	3	Input pins for event signals for subblocks F0 to F2 of timer F

Timer G

Not provided

32.2 Overview

The ATU-V has the following features.

- ATU-V consists of 7 timer blocks (timer A to timer G), prescalers, and a controller. The timer blocks have different functions and each can operate independently; timer blocks can also be linked via the clock bus. Each timer block consists of one or more timer subblocks, and each subblock has one or more channels. The Numbers of subblocks/channels are shown in “**Table 32.13, Block Configuration**”, please refer.
 - Timer A has a free run counter, and can capture by an assertion of the external event inputs.
 - Timer B can generate a multiplied-and-corrected clock signal based on an external event input. It can also supply the generated signal to other timers.
 - Timer C is a general-purpose timer, input capture or output compare is selectable.
 - Timer D can output one-shot pulses.
 - Timer E is a PWM output timer.
 - Timer F can be used as a measurement timer for external inputs. 7 operation modes are available.
 - Timer G has a counter and can use as an interval timer.
- Equipped with a function to output pulses to A/D and DFE
- On-chip 4-channel prescaler provided, which generates four types of clocks by dividing on-chip peripheral clock (PCLK) by 1/1 to 1/1024
- Each channel for a timer can select a count source from among four divided clocks generated by prescaler, two external clocks, and angle clock generated by timer B.
- Pin output values of timers C, D, and E can be selected by the RHSB cross bar and then output as data to the RHSB.

<<Timer A>>

Timer A has a 32-bit free-run counter and SB_A 32-bit input capture registers. Its features are shown below.

- Detection by rising edges, falling edges, or both edges
- Activating the DMAC at the capture timing
- Noise canceling function for each external input pin with maximum length of 0.21 s or noise cancelling function using the angle clock
- Selectable noise canceling mode per channel
- The level of each external input pin can be read.
- A capture interrupt request and a counter overflow interrupt request can be generated.
- Signals after noise cancellation can be sent to external input pins of timer F.

<<Timer B>>

Timer B consists of three subblocks: an edge-interval measuring block, frequency-multiplied clock generator, and frequency-multiplied clock signal corrector.

Edge-Interval Measuring Block

The edge-interval measuring block is provided with a 32-bit input edge-interval measuring timer, three output compare and input capture registers, six edge-interval time measured value recording registers, seven edge-interval time measured value history registers, 8-bit event counter, and output compare register. This provides the following operations:

- Capture by edges of external event input (rising edge, falling edge, or both edges are selectable)
- Capture by event compare match of external event input
- Automatic event counter clear by event compare match
- Capture interrupt and compare match interrupt (edge-interval compare match, event compare match)
- Captures event counter values individually by detection of SB_A external event inputs from timer A.
- Generates reference data for down-count values used in the frequency-multiplied clock generator, from 24 sequencer states.

Frequency-Multiplied Clock Generator

The frequency-multiplied clock generator is provided with 24-bit reloadable counter, reload register, 20-bit multiplied clock counter, 26-bit multiplied clock counter, capture register, and output compare register. This provides the following operations:

- Reloadable counting of values captured by edge-interval measuring block with arbitrary number (1 to 4095)
- Reloadable down-count values can be modified by event compare match of the edge-interval measuring block.
- Internal clock generated by the underflow of reloadable counter can be used as input of 20-bit multiplied clock counter and 26-bit multiplied clock counter.
- The 20-bit multiplied clock counter value can be captured by an edge input of external input event.
- An interrupt request for compare match between 20-bit multiplied clock counter and output compare register and an interrupt request for compare match between 26-bit multiplied clock counter and capture register can be generated.

Frequency-Multiplied Clock Signal Corrector

Frequency-multiplied clock signal corrector is provided with 20-bit correcting event counter, 20-bit correcting multiplied clock counter, 20-bit multiplied-and-corrected clock generating counter, and correcting counter clearing register. This provides the following operations:

- Frequency-multiplied correcting clock that serves as the count source for other timers can be generated based on the read count in frequency-multiplied clock generator.
- The counter of timer D can be cleared by compare match (enabling or disabling this function selectable) between multiplied-and-corrected clock generating counter and correcting counter clearing register.
- The correcting event counter can be automatically cleared at the event compare match timing due to an external input event of the edge-interval measuring block.

<<Timer C>>

Timer C consists of SB_C subblocks that have the same functions. Each subblock is provided with a 32-bit counter, four 32-bit general registers, four 32-bit compare match registers, four range comparison value setting registers, four 32-bit general mirror registers, four 32-bit output comparison mirror registers, and a 32-bit upper-limit value setting register. This provides the following operations:

- Choice of rising edge, falling edge, or both edge sensing as the edge of input capture trigger signal.
- When timer C is used for input capture, capturing is possible at the timing of event output 1, 2A, and 2B from timer A.
- Noise canceling function for each external input pin with maximum length of 0.21 s or noise cancelling function using the angle clock
- Selectable noise canceling mode per subblock or channel
- 1, 0, toggle, or one-shot pulse waveform can be output by a compare match.
- Three PWM waveforms can be output for each subblock in PWM mode.
- Input capture/compare match interrupt and overflow interrupt can be generated. Input capture/compare match interrupts activate DMAC.
- One-shot pulse mode is possible for output.
- Upper-limit value setting function for 32-bit counters
- The range compare value setting register enables the range compare function for compare match output by compare match register.

<<Timer D>>

Timer D consists of SB_D subblocks that have the same function. Each subblock is provided with two 32-bit counters, an offset base register, an output value register, and an output setting register, and four channels. Each channel is provided with two 32-bit output compare registers, two range comparison value setting registers, two input capture registers, a 32-bit down-counter for outputting one-shot pulse, and two 32-bit upper-limit value setting registers. This provides the following operations:

- Enables to start down-counter by software. One-shot pulse can also be generated.
- Compare match in compare match register can be used as the start trigger for down-counter. One-shot pulse with offset can also be generated.
- Compare match in compare match register can stop down-counter and forcibly cut off one-shot pulse output.
- Compare match in compare match register can be output.
- Compare match range can be set by the range comparison value setting register (range compare function).
- Compare match in compare match register can be used as a trigger for capturing the count value into input capture register.
- Counter value can be captured triggered by timer A.
- Provided with counter clearing function from timer B
- Generation of $8 \times SB_D$ compare match interrupts, $2 \times SB_D$ counter overflow interrupts, and $4 \times SB_D$ underflow interrupts. The $4 \times SB_D$ underflow interrupts correspond to DMAC activation.
- Output waveform can be inverted.
- The value set in the output value register can be output from each pin by the output setting register.

- Upper-limit value setting function for 32-bit counters
- The MIN guard function which guarantees the MIN width for the “the MIN width of ON waveform”, “the MIN width of the OFF waveform”, and “ON to next ON” is loaded to the output waveform.

<<Timer E>>

Timer E consists of SB_E subblocks that have the same function. Each subblock consists of four channels. Each channel is provided with a 24-bit counter, a 24-bit duty cycle setting register, a 24-bit cycle setting register, a 24-bit duty cycle reload register, and a 24-bit cycle reload register. This provides the following operations:

- PWM output with programmable cycle time and duty cycle ranging from 0 to 100% is possible by setting the cycle setting register and duty cycle setting register.
- The duty mode can be switched between on-state and off-state by setting the output control register.
- Values in duty cycle reload register and cycle reload register can be transferred to duty cycle setting register and cycle setting register at every cycle, respectively. The reload function can be enabled or disabled.
- Writing 00000_H to the counter can forcibly finish the current PWM cycle and start another PWM cycle.
- PWM output can be blocked by shutoff input.
- $4 \times 2 \times SB_E$ interrupt requests can be output for cycle match and duty match. Also, SB_E DMAC activation requests can be output by cycle match in channel 0 of each subblock.
- Compare match between $TCNTE_{xy}$ and $CYLRE_{xy}$ can forcibly be generated by setting the forced compare match bit.

<<Timer F>>

Timer F consists of SB_F subblocks. Each subblock is provided with two 32-bit counters, a 16-bit counter, three 32-bit general registers, a 16-bit general register, three 32-bit backup registers, and input processing block. This provides the following operations:

- Detection level can be selected from rising edge, falling edge or both edges
- TIA00 to TIA0SB_A-1 signals of timer A after noise cancellation can be used as external input signals.
- Noise canceling function for each external input pin with maximum length of 0.21 s or noise cancelling function using the angle clock
- Selectable noise canceling mode per subblock or channel
- Seven operation modes: edge counting in a specified period, effective edge input interval counting, measurement of time during high/low input, measurement of PWM input waveform timing, rotation speed/pulse measurement (subblocks 3 to SB_F-1), up/down count (subblocks 0 to 2), and four-time multiplication event count (subblocks 0 to 2).
- Activates DMAC by input capture interrupt request
- Generates an interrupt upon overflow, underflow, or capturing.
- A interrupt request can be generated on compare match in specified-period edge count mode, effective edge input interval measurement mode, input high/low level measurement mode, PWM input waveform measurement mode, up/down count mode, and four-time multiplication event count mode.

<<Timer G>>

Timer G consists of SB_G subblocks that have the same function. Each channel is provided with a 32-bit timer counter and compare match register. This provides the following operations:

- An event can be output by using compare match as a trigger, which is used as A/D activation/interrupt request trigger.
- Activates DMAC by compare match interrupt request

32.2.1 Configuration of ATU-V

ATU-V is a macro for engine control that operates by using multiple timer block in combination.

ATU-V consists of seven timer blocks from timer A to timer G, prescalers, and a common controller unit. The timer blocks have different functions and each can operate independently; timer blocks can also be linked via the clock bus. Each timer block consists of one or more timer subblocks that have the same function, and each subblock has one or more channels (see **Table 32.13, Block Configuration**).

Table 32.13 Block Configuration

Access size of the ATU-V registers are shown below.

Common Controller Registers

Module Name	Register Name	Symbol	Access Size
ATU5CTRL	ATU Master Enable Register	ATUENR	8
	Clock Bus Control Register	CBCNT	8
	Noise Cancellation Mode Register	NCMR	8

Prescaler Registers

Module Name	Register Name	Symbol	Access Size
ATU5CTRL	Prescaler Registers x	PSCRx	16

DMA/AD Requests Automatic Switching Registers

Module Name	Register Name	Symbol	Access Size
ATU5CTRL	Trigger Status Register DMA0	TRGSRDMA0	8
	Trigger Select Register DMA00	TRGSELDMA00	8
	Trigger Select Register DMA01	TRGSELDMA01	8
	Trigger Select Register AD	TRGSELAD	8
	Trigger Status Register DMA1	TRGSRDMA1	8
	Trigger Select Register DMA10	TRGSELDMA10	8
	Trigger Select Register DMA11	TRGSELDMA11	8

Timer A Registers

Module Name	Register Name	Symbol	Access Size
ATU5A	Timer Control Register 1A	TCR1A	8
	Timer Control Register 2A	TCR2A	8, 16
	Timer Control Register 2AS1	TCR2AS1	8
	Timer Control Register 2AS2	TCR2AS2	8
	Timer Control Register 3A	TCR3A	8, 16
	Timer Control Register 4A	TCR4A	8, 16
	Timer Control Register 5A	TCR5A	8
	Noise Cancellation Mode Channel Register 1A	NCMCR1A	8
	Noise Cancellation Mode Channel Register 2A	NCMCR2A	8
	Timer I/O Control Register 1	TIOR1A	8, 16
	Timer I/O Control Register 2	TIOR2A	8, 16, 32
	Timer Interrupt Enable Register A	TIERA	8, 16
	Timer Status Register A	TSRA	8, 16
	Timer Status Clear Register A	TSCRA	8, 16
	Input Capture Registers Ax	ICRAx	32
	Input Capture Registers A2x	ICRA2x	32
	Free-Running Counter A	TCNTA	32
	Timer Input Signal Level Register	TILRA	8
	Noise Canceler Counters Ax	NCNTAx	16
	Noise Cancel Registers Ax	NCRAx	16

Timer B Registers (1/2)

Module Name	Register Name	Symbol	Access Size
ATU5B	Timer Control Register B	TCRB	8
	Timer Control Register BS1	TCRBS1	8
	Timer Control Register BS2	TCRBS2	8
	Timer I/O Control Register B	TIORB	8
	Timer Status Register B	TSRB	8, 16
	Timer Status Clear Register B	TSCRB	8, 16
	Timer Interrupt Control Register B	TICRB	8
	Timer Interrupt Enable Register B	TIERB	8, 16
	Channel Select Register B	CHSELBR	8
	Multiplied-and-Corrected Clock Generating Counter B4 Control Register	TCNT4CRB	8
	Edge Interval Measuring Counter B0	TCNTB0	32
	Edge Interval Measuring Counter B0S1	TCNTB0S1	32
	Edge Interval Measuring Counter B0S2	TCNTB0S2	32
	Input Capture Register B0	ICRB0	32
	Input Capture Register B0	DICRB0	32
	Mirror Input Capture Register B0	MIICRB0	32
	Input Capture Register B0S1	ICRB0S1	32
	Input Capture Register B0S2	ICRB0S2	32
	Record Registers B1 to B6	RECRB1 to RECRB6	32
	Record Registers B1	DRECRB1	32
	Record Backup Register B0 to B6	RBURB0 to RBURB6	32
	Input Capture Registers B30 to B37	ICRB30 to ICRB37	8
	Output Compare Register B0	OCRB0	32
	Output Compare Register B0S1	OCRB0S1	32
	Output Compare Register B0S2	OCRB0S2	32
	Event Counter B1	TCNTB1	8
	Event Counter B1S1	TCNTB1S1	8
	Event Counter B1S2	TCNTB1S2	8
	Output Compare Register B1	OCRB1	8
	Output Compare Register B1S1	OCRB1S1	8
	Output Compare Register B1S2	OCRB1S2	8

32.3 Common Controller

32.3.1 Overview of Operation

The common controller controls the ATU-V module as a whole. For example, it enables and disables the prescalers and timer counters for timers A to G and controls the clock bus.

Clock Bus

The clock bus consists of six signal lines used to distribute the clock signals for counting (counter enabling signals) to the timer channels. The timer counters on each of the channels run in synchronization with the internal peripheral clock (PCLK), and the signals on the clock bus functions as the counter enabling signal for these timer counters.

The following table shows the signals that can be input on the clock bus.

Bit Number of Clock Bus	Input Signals
5	Output signal from timer B (angle clock) or external input clock B (TCLKB)
4	External input clock A (TCLKA)
3	Output signal from prescaler 3
2	Output signal from prescaler 2
1	Output signal from prescaler 1
0	Output signal from prescaler 0

32.3.2 Registers Related to Common Controller

32.3.2.1 ATUENR — ATU Master Enable Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TGE	TFE	TEE	TDE	TCE	TBE	TAE	PSCE
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.14 ATUENR Register Contents

Bit Position	Bit Name	Function
7	TGE	Timer G enable bit 0: Timer G counter operation disabled 1: Timer G counter operation enabled
6	TFE	Timer F enable bit 0: Timer F counter operation disabled 1: Timer F counter operation enabled
5	TEE	Timer E enable bit 0: Timer E counter operation disabled 1: Timer E counter operation enabled
4	TDE	Timer D enable bit 0: Timer D counter operation disabled 1: Timer D counter operation enabled
3	TCE	Timer C enable bit 0: Timer C counter operation disabled 1: Timer C counter operation enabled
2	TBE	Timer B enable bit 0: Timer B counter operation disabled 1: Timer B counter operation enabled
1	TAE	Timer A enable bit 0: Timer A counter operation disabled 1: Timer A counter operation enabled
0	PSCE	Prescaler enable bit 0: Prescaler counter operation disabled 1: Prescaler counter operation enabled

ATUENR is an 8-bit readable/writable register. This register is used to enable and disable the prescalers and the individual blocks in ATU-V. Setting an enable bit to 1 enables the corresponding block. Clearing the bit to 0 disables the corresponding block. Even when the enable bit is cleared to 0, the registers of these blocks remain accessible.

Timers can be synchronized by simultaneously setting multiple bits to 1.

Timer A Enable Bit (TAE)

Enables and disables counter operation of timer A.

When this bit is set to “1”, the timer A counter starts working. When this bit is cleared to “0”, the timer A counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Timer B Enable Bit (TBE)

Enables and disables counter operation of timer B.

When this bit is set to “1”, the timer B counter starts working. When this bit is cleared to “0”, the timer B counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Timer C Enable Bit (TCE)

Enables and disables counter operation of timer C.

When this bit is set to “1”, the timer C counter starts working. When this bit is cleared to “0”, the timer C counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TCE bit is set of the corresponding bit in the timer C start register is not set to “1”.

Timer D Enable Bit (TDE)

Enables and disables counter operation of timer D.

When this bit is set to “1”, the timer D counter starts working. When this bit is cleared to “0”, the timer D counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TDE bit is set of the corresponding bit in the timer D start register is not set to “1”.

Timer E Enable Bit (TEE)

Enables and disables counter operation of timer E.

When this bit is set to “1”, the timer E counter starts working. When this bit is cleared to “0”, the timer E counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TEE bit is set of the corresponding bit in the timer E start register is not set to “1”.

Timer F Enable Bit (TFE)

Enables and disables counter operation of timer F.

When this bit is set to “1”, the timer F counter starts working. When this bit is cleared to “0”, the timer F counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TFE bit is set of the corresponding bit in the timer F start register is not set to “1”.

Timer G Enable Bit (TGE)

Enables and disables counter operation of timer G.

When this bit is set to “1”, the timer G counter starts working. When this bit is cleared to “0”, the timer G counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TGE bit is set of the corresponding bit in the timer G start register is not set to “1”.

Prescaler Enable Bit (PSCE)

Enables and disables counter operation of the prescaler.

When this bit is set to “1”, the prescaler counter starts working. When this bit is cleared to “0”, the prescaler counter stops working. When the counter is disabled, its value is retained. When this bit is set to “1” again, the counter resumes counting from the retained value.

CAUTION

Timer operation setting should be done before starting.

Also, be sure to observe the cautions when using registers to be operated after startup.

32.3.2.2 CBCNT — Clock Bus Control Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	CB4EG[1:0]		—	CB5SEL	CB5EG[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 32.15 CBCNT Register Contents

Bit Position	Bit Name	Function
7, 6	—	These bits are not used. Fix these bits to 0.
5, 4	CB4EG[1:0]	Clock bus 4 edge select bits These bits specify the edge sense for external input clock (TCLKA) to be output on signal line 4 of the clock bus. 00: Neither edge of the external clock is sensed. 01: Rising edges of the external clock are sensed. 10: Falling edges of the external clock are sensed. 11: Both rising and falling edges of the external clock are sensed.
3	—	These bits are not used. Fix these bits to 0.
2	CB5SEL	Clock bus 5 source select bit This bit specifies the clock to be output on signal line 5 of the clock bus. 0: External clock B (TCLKB) 1: Angle clock output by timer B
1, 0	CB5EG[1:0]	Clock bus 5 edge select bits These bits specify the edge sense for external input clock to be output on signal line 5 of the clock bus when CB5S is cleared to "0". 00: Neither edge of the external clock is sensed. 01: Rising edges of the external clock are sensed. 10: Falling edges of the external clock are sensed. 11: Both rising and falling edges of the external clock are sensed.

CBCNT is an 8-bit readable/writable register that selects the source of the clock signal to be supplied on the signal lines of the clock bus and the effective edge of the external clock signal.

Clock Bus 4 Edge Select Bits (CB4EG[1:0])

These bits select the edge sense for externally input clock A (TCLKA). The clock signal is output on signal line 4 of the clock bus. Counters for which signal line 4 of the clock bus has been selected as the source for counting count on the edge selected by these bits.

Clock Bus 5 Source Select Bit (CB5SEL)

This bit selects the source of the clock to be output on signal line 5 of the clock bus.

Clock Bus 5 Edge Select Bits (CB5EG[1:0])

These bits select the edge sense for external input clock B (TCLKB). The clock signal is output on signal line 5 of the clock bus. Counters for which signal line 5 of the clock bus has been selected as the source for counting count on the edge selected by these bits.

The setting of these bits is only valid when the TCLKB signal is selected as the source for line 5 of the clock bus. When the angle clock is selected as the source for line 5 of the clock bus, the setting of these bits is ignored.

32.3.2.3 NCMR — Noise Cancellation Mode Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NCCSEL	—	—	NCMSEL	—	NCMF	NCMC	NCMA
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R/W	R	R/W	R/W	R/W

Table 32.16 NCMR Register Contents

Bit Position	Bit Name	Function
7	NCCSEL	Noise canceler counter clock select bit This bit selects the clock for counting by the noise cancelers. 0: Internal peripheral clock (PCLK) divided by 128 is used as the counter clock 1: Internal peripheral clock (PCLK) is used as the counter clock
6, 5	—	These bits are not used. Fix these bits to 0.
4	NCMSEL	Noise cancellation mode select bit This bit selects minimum time-at-level cancellation mode or level accumulation cancellation mode. 0: Minimum time-at-level cancellation mode 1: Level accumulation cancellation mode
3	—	This bit is not used. Fix this bit to 0.
2	NCMF	Timer F noise cancellation mode bit This bit specifies the operating mode of the timer F noise canceler. 0: Premature-transition cancellation mode 1: Minimum time-at-level cancellation mode (when NCMSEL = 0) 1: Level accumulation cancellation mode (when NCMSEL = 1)
1	NCMC	Timer C noise cancellation mode bit This bit specifies the operating mode of the timer C noise canceler. 0: Premature-transition cancellation mode 1: Minimum time-at-level cancellation mode (when NCMSEL = 0) 1: Level accumulation cancellation mode (when NCMSEL = 1)
0	NCMA	Timer A noise cancellation mode bit This bit specifies the operating mode of the timer A noise canceler. 0: Premature-transition cancellation mode 1: Minimum time-at-level cancellation mode (when NCMSEL = 0) 1: Level accumulation cancellation mode (when NCMSEL = 1)

NCMR is an 8-bit readable/writable register that selects the operating mode and clock to drive the counter for of the noise canceler in each of timers A, C, and F.

In premature-transition cancellation mode, after an input signal level change is detected, any input signal level change in the specified period is ignored. This mode regards a signal level change in the specified period as noise after the first level change is detected.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

The period is set by noise canceler registers in each of the applicable blocks (i.e. in timers A, C, and F) and is counted by a noise canceler counter.

To disable noise cancellation mode from premature-transition/minimum time-at-level cancellation mode, do so after the value of the counter (timer A: NCNTA0 to 6; timer C: NCNTC00 to NCNTC03, NCNTC10 to NCNTC13, NCNTC20 to NCNTC23, NCNTC30 to NCNTC33, NCNTC40 to NCNTC43, NCNTC50 to 53, NCNTC60 to 63, NCNTC70 to 73; timer F: NCNTFA0 to 15, NCNTFB0 to 2) held in each timer becomes 0000_H.

Outline of noise canceling operation (example of TIA00 input signal of timer A) is shown in **Figure 32.1** (in premature-transition cancellation mode), **Figure 32.2** (in minimum time-at-level cancellation mode), and **Figure 32.3** (in level accumulation cancellation mode).

Each timer (A, C, and F) detects the edge of a signal that has passed through the noise canceler. **Figure 32.1**, **Figure 32.2**, and **Figure 32.3** show an example of detecting the rising edge of a signal that has passed through the noise canceler.

Noise Canceler Counter Clock Select Bit (NCCSEL)

Selects the clock for counting by the noise cancelers. Either of the internal peripheral clock (PCLK) divided by 128 or the internal peripheral clock can be selected. The default setting is the clock divided by 128. The same counter clock must be used for all timers other than timer A. In the case of timer A, the clock signal on signal line 5 of the clock bus is also available. For setting the counter clock, see the description of the TIOR2A register in timer A.

Noise Cancellation Mode Select Bit (NCMSEL)

Noise cancellation mode when each noise cancellation mode bit (NCMA, NCMC, or NCMF) is set to “1” can be set to minimum time-at-level cancellation mode or level accumulation cancellation mode.

Timer F Noise Cancellation Mode Bit (NCMF)

Selects the noise cancellation mode for timer F. This bit cannot be used to specify the operating mode for each channel of timer F individually.

To specify the operation mode for each channel of timer F individually, set this bit to “0” and then set noise cancellation mode channel registers 1F (NCMCR1F) and 2F (NCMCR2F).

Timer C Noise Cancellation Mode Bit (NCMC)

Selects the noise cancellation mode for timer C. This bit cannot be used to specify the operating mode for each channel of timer C individually.

To specify the operation mode for each channel of timer C individually, set this bit to “0” and then set noise cancellation mode channel registers 1C (NCMCR1C) and 2C (NCMCR2C).

Timer A Noise Cancellation Mode Bit (NCMA)

Selects the noise cancellation mode for timer A. This bit cannot be used to specify the operating mode for each channel of timer A individually.

To specify the operation mode for each channel of timer A individually, set this bit to “0” and then set noise cancellation mode channel registers 1A (NCMCR1A) and 2C (NCMCR2A).

The tables below show the truth table for settings that determine the noise cancellation mode.

<<Timer A>>

Settings that Determine Noise Cancellation Modes for Timer A

Channel Enable	Filter Mode		Channel Register		Mode of Cancellation	Unit of Filtering
	TIOR2A. NCEAx	NCMR. NCMA	NCMR. NCMSEL	NCMCR1A. NCM1Ax		
0	—	—	—	—	Filter invalid	—
1	0	(-)	0	(-)	Premature-transition	Individual channel/ All channels
1	0	(-)	1	0	Minimum time-at-level	Individual channel
1	0	(-)	1	1	Level accumulation	Individual channel
1	1	(0)	—	—	Minimum time-at-level	All channels
1	1	1	—	—	Level accumulation	All channels

Note 1: x = SB_A-1, 0**Note 2:** The noise canceller enable bit (NCEAx) can be set for each channel.**Methods of Setting Noise Cancellation for Timer A when the Unit of Filtering is Individual Channel (precondition: channel enable = 1)**

- Settings for individual channels:

After setting the noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) to “0”, set any noise cancellation mode channel setting bit (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) of timer A to “1”.

- Settings for all channels:

Set the noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) to “1”, or set all noise cancellation mode channel setting bits (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) to “0”.

<<Timer C>>

Settings that Determine Noise Cancellation Modes for Timer C

Channel Enable	Filter Mode		Channel Register		Mode of Cancellation	Unit of Filtering
	NCCRCx. NCECxy	NCMR. NCMC	NCMR. NCMSEL	NCMCR1C. NCM1Cx		
0	—	—	—	—	Filter invalid	—
1	0	(-)	0	(-)	Premature-transition	Individual subblock/ All subblocks
1	0	(-)	1	0	Minimum time-at-level	Individual subblock
1	0	(-)	1	1	Level accumulation	Individual subblock
1	1	(0)	—	—	Minimum time-at-level	All subblocks
1	1	1	—	—	Level accumulation	All subblocks

Note 1: x = SB_C-1, 0 (subblock), y = 3 to 0 (channel)**Note 2:** The noise canceller enable bit (NCECxy) can be set for each channel.

Methods of Setting Noise Cancellation for Timer C when the Unit of Filtering is Individual Subblock (precondition: channel enable = 1)

Only timer C is set in units of subblock. Each subblock of timer C consists of four channels.

- Settings for individual channels:

After setting the noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) to “0”, set any noise cancellation mode channel setting bit (NCM1Cx) in noise cancellation mode channel register 1C (NCMCR1C) of timer C to “1”.

- Settings for all channels:

Set the noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) to “1”, or set all noise cancellation mode channel setting bits (NCM1Cx) in noise cancellation mode channel register 1C (NCMCR1C) to “0”.

<<Timer F>>

Settings that Determine Noise Cancellation Modes for Timer F

Channel Enable TCCR _F . NCEF _x	Filter Mode		Channel Register		Mode of Cancellation	Unit of Filtering
	NCMR. NCMF	NCMR. NCMSEL	NCMCR1F. NCM1F _x	NCMCR2F. NCM2F _x		
0	—	—	—	—	Filter invalid	—
1	0	(-)	0	(-)	Premature-transition	Individual channel/ All channels
1	0	(-)	1	0	Minimum time-at-level	Individual channel
1	0	(-)	1	1	Level accumulation	Individual channel
1	1	(0)	—	—	Minimum time-at-level	All channels
1	1	1	—	—	Level accumulation	All channels

Note 1: $x = SB_F - 1, 0$

Note 2: The noise canceller enable bit (NCEF_x) can be set for each channel.

Methods of Setting Noise Cancellation for Timer F when the Unit of Filtering is Individual Channel (precondition: channel enable = 1)

- Settings for individual channels:

After setting the noise cancellation mode bit (NCMF) in the noise cancellation mode register (NCMR) to “0”, set any noise cancellation mode channel setting bit (NCM1F_x) in noise cancellation mode channel register 1F (NCMCR1F) of timer F to “1”.

- Settings for all channels:

Set the noise cancellation mode bit (NCMF) in the noise cancellation mode register (NCMR) to “1”, or set all noise cancellation mode channel setting bits (NCM1F_x) in noise cancellation mode channel register 1F (NCMCR1F) to “0”.

The figures below show an overview of the timing of operations for noise cancellation in the respective modes. Detailed descriptions and timing charts of operations in the respective modes follow that. Since these figures and descriptions are provided for the case of timer A, be sure to replace the registers, bits, and input pin for timers C and F by referring to the following table.

List of Registers, Bits, and Input Pins of Timers Related to Noise Canceller

	Timer A	Timer C	Timer F
Common units			
Noise cancel mode register (NCMR register bit name →)	NCMA	NCMC	NCMF
	NCMSEL	NCMSEL	NCMSEL
Each timer			
Noise cancellation mode channel register (register name →)	NCMCR1A	NCMCR1C	NCMCR1F
	NCMCR2A	NCMCR2C	NCMCR2F
Noise canceller enable bit (register name, bit name →)	TIOR2A. NCEAx	NCCRCx. NCECxy	NCCRF. NCEFx
Noise cancellation counter (register name →)	NCNTAx	NCNTCxy	NCNTFAx NCNTFBx
Noise cancellation register (register name →)	NCRAx	NCRCxy	NCRFAx NCRFBx

Note: x indicates the number of subblocks of each timer; y indicates the number of channels of each timer.

Note: This figure is schematic and does not show accurate timing.

Figure 32.1 Outline of Noise Canceling Operation in Premature-Transition Cancellation Mode

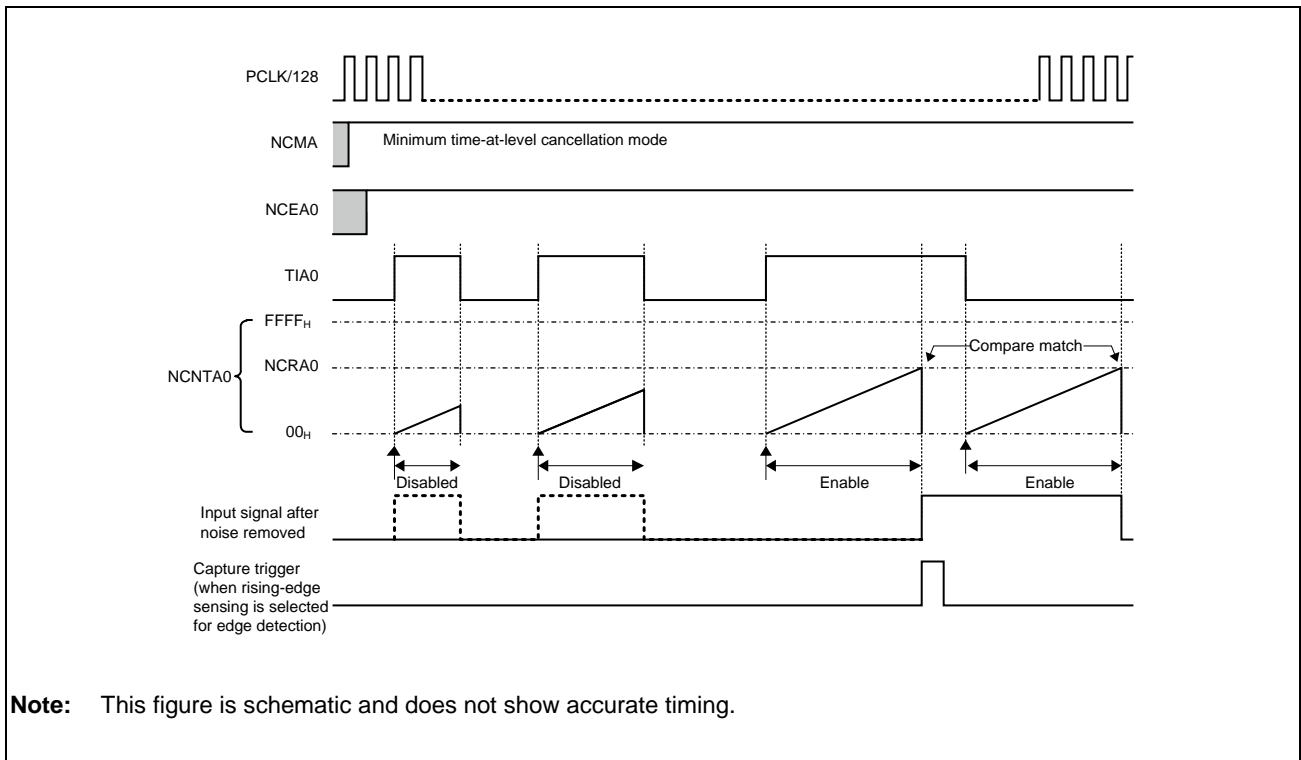

Figure 32.2 Outline of Noise Canceling Operation in Minimum Time-at-Level Cancellation Mode

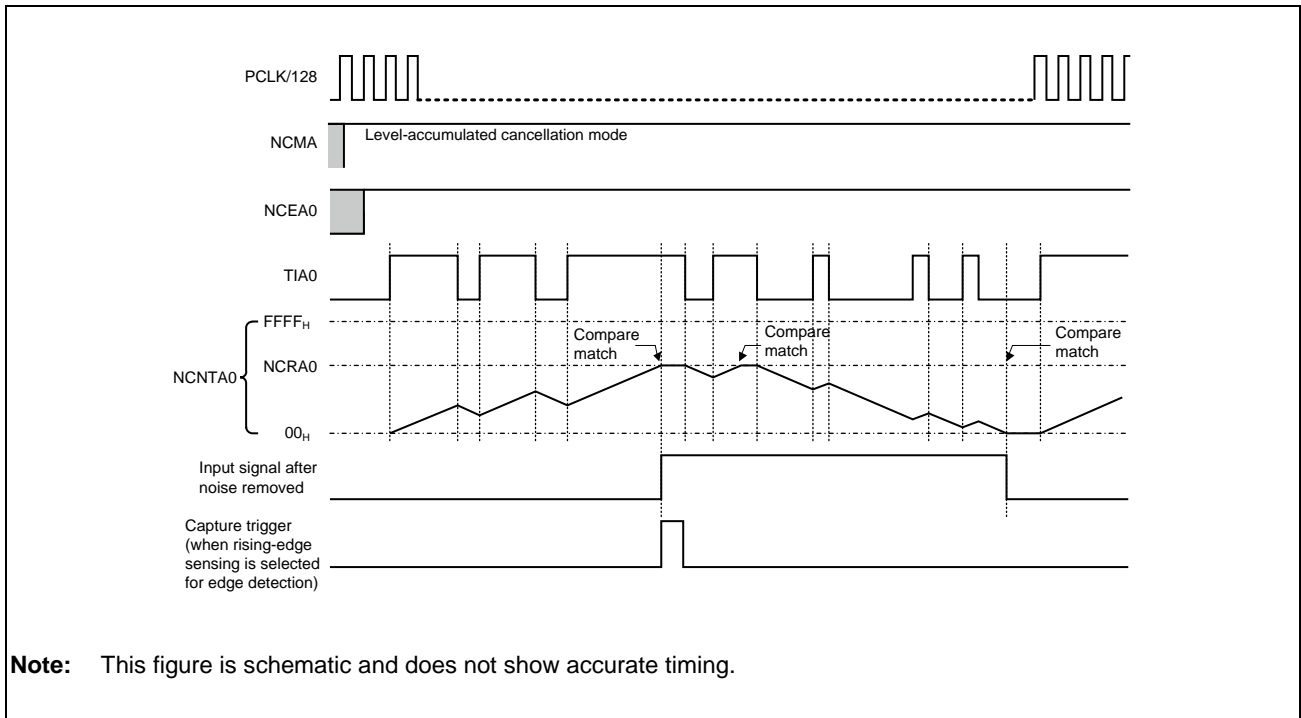

Figure 32.3 Outline of Noise Canceling Operation in Level Accumulation Cancellation Mode

32.3.2.4 Description of Operations for Noise Cancellation

The noise canceller has three operating modes: minimum time-at-level cancellation mode, premature-transition cancellation mode, and level- accumulative cancellation mode. Either of these modes can be selected by setting the noise cancellation mode register (NCMR) of the common controller unit, the noise cancellation mode channel register 1A (NCMCR1A) of timer A, and noise cancellation mode channel register 2A (NCMCR2A) of timer A.

Figure 32.4 shows an example of operations for noise cancellation in premature-transition cancellation mode and **Figure 32.6** shows an example of operations for noise cancellation in minimum time-at-level cancellation mode. These figures show an example in which TIA00 input is used and the edge deletion level is the rising.

In premature-transition cancellation mode, the noise cancellation counter (NCNTAx) starts counting in response to a change in the level of the input signal as a trigger. At the same time as counting starts, changes in the level of the input signal are output as the signal after noise cancellation.

Counting continues until the count value matches the value set in the noise cancellation register (NCRAx). All changes in the level of the input signal are ignored during the counting and are not output as the signal after noise cancellation.

When the count value matches the value set in the noise cancellation register, the level of the input signal at that time is output as the signal after noise cancellation. Note that the signal after noise cancellation changes upon compare match if the input level at the start of counting (after transition) differs from that upon compare match. **Figure 32.5** shows difference in noise cancellation processing between two input waveforms in premature-transition cancellation mode.

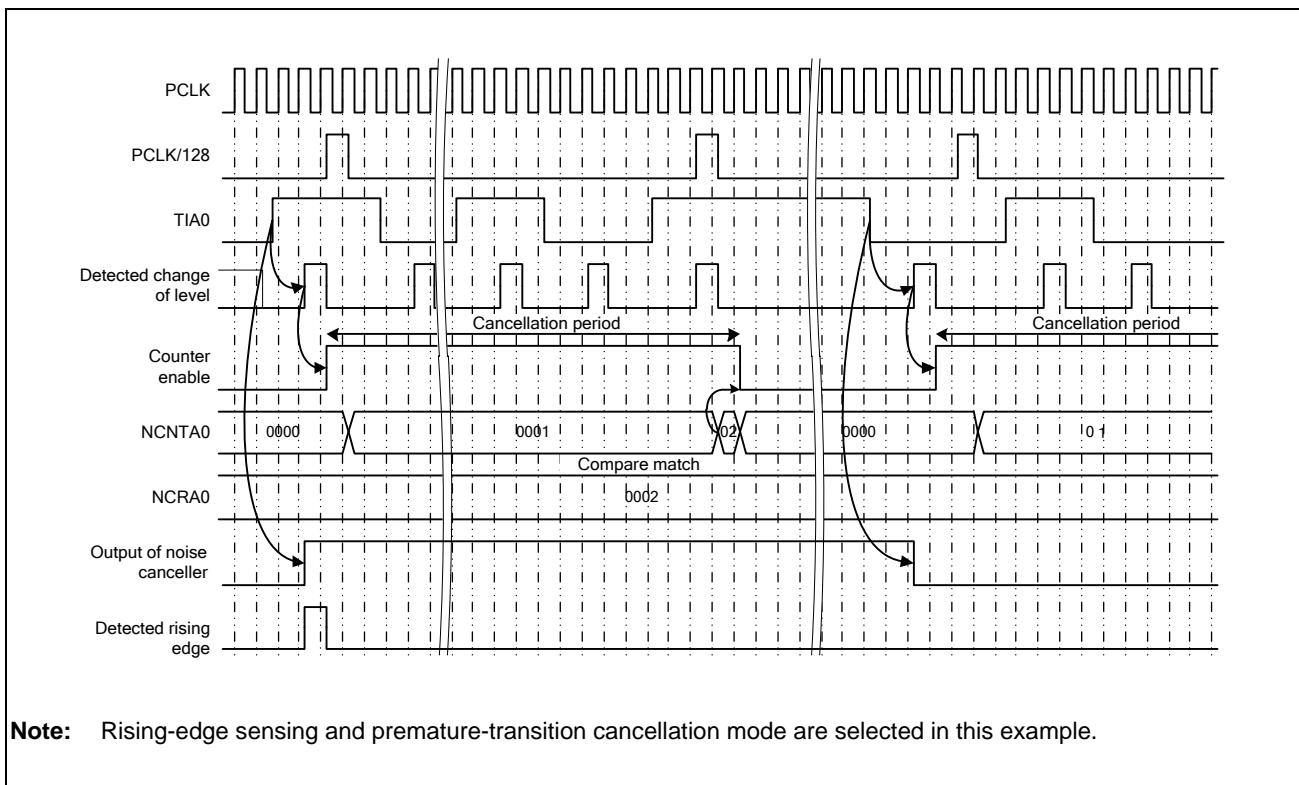

Figure 32.4 Example of Noise Cancellation in Premature-Transition Cancellation Mode

Figure 32.5 Example of Noise Cancellation for Two Types of Waveforms
(in Premature-Transition Cancellation Mode)

In minimum time-at-level cancellation mode, the noise cancellation counter (NCNTAx) starts counting in response to a change in the level of the input signal as a trigger. Counting continues until the count value matches the value set in the noise cancellation register (NCRAx) or until the level of the input signal changes.

When the count value matches the value set in the noise cancellation register, any change in the level of the input signal after the start of counting is output as the signal after noise cancellation. If the level of the input signal changes before the count value and the value of the noise cancellation register match, the changes in the level from that when counting started are deemed to be noise, and are not output as the signal after noise cancellation.

Figure 32.7 shows an example of operations for noise cancellation in level accumulation cancellation mode. This figure shows an example in which TIA00 input is used and the edge deletion level is the rising.

In level accumulation cancellation mode, noise cancellation counter (NCNTAx) counts up or down according to the level of the input signal. If the counter is counting up, the counting operation continues until the count value matches the value set in the noise cancellation register (NCNTAx). If the counter is counting down, the counting operation continues until the count value matches 0000H.

The noise canceller output is updated upon compare match. If the count value matches the NCRAx value during counting-up operation, the noise canceller output value is updated to “1”. If the counter value matches 0000H during counting-down operation, the noise canceller output value is updated to “0”.

Figure 32.6 Example of Noise Cancellation in Minimum Time-at-Level Cancellation Mode

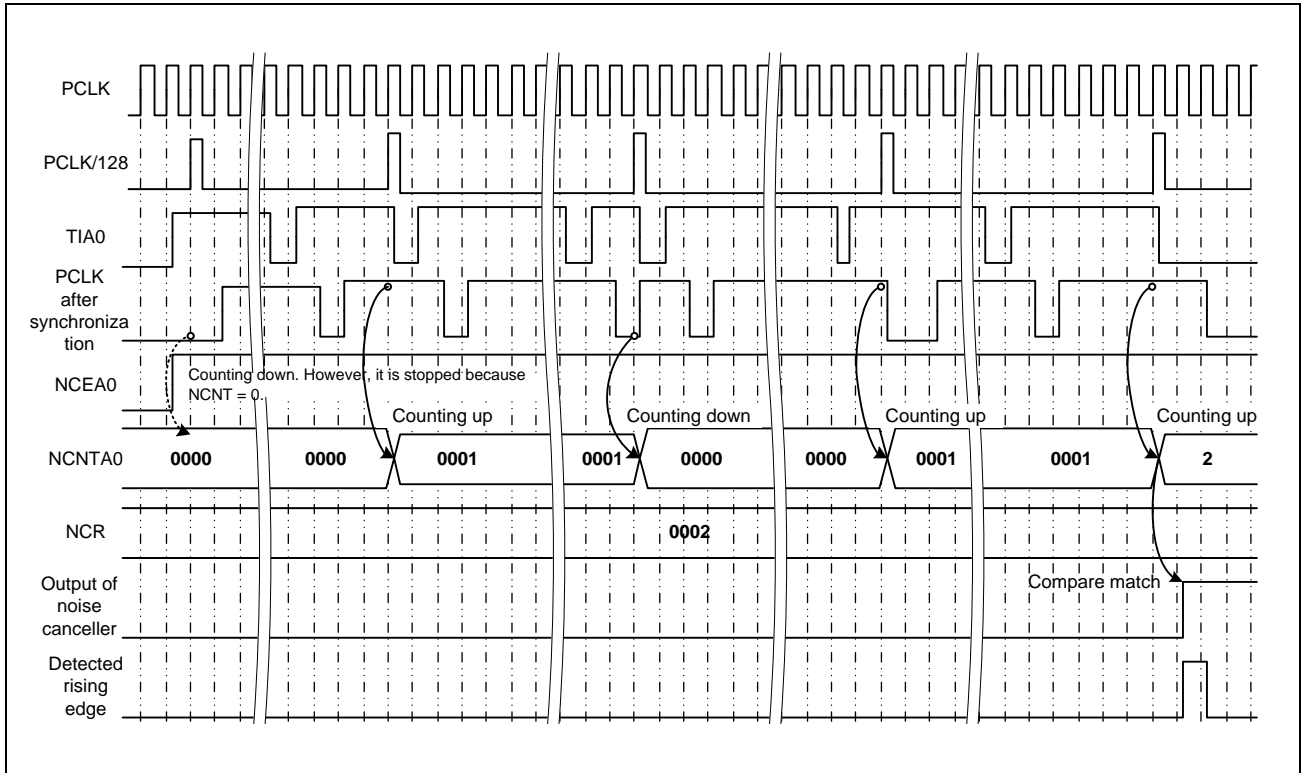

Figure 32.7 Example of Noise Cancellation in Level Accumulation Cancellation Mode

32.4 Prescaler

32.4.1 Overview of Operation

ATU-V includes general prescalers of four channels and a prescaler for the noise-canceler clock.

Each general prescaler are implemented as 10-bit down-counters, in which the prescaled clock signals are generated by frequency-dividing the internal peripheral clock (PCLK) by N ($1 \leq N \leq 1024$). The generated clock signals are supplied to the individual timers via the clock bus. The prescalers for each channel operate independently.

The prescaler for the noise-canceler clock is implemented as a 7-bit down-counter. It generates a clock signal by frequency-dividing the peripheral clock (PCLK) by 128. The clock signal thus generated is supplied to the noise cancelers of timers A, C, and F.

Whether to generate a noise canceler clock by frequency-dividing the peripheral clock frequency by 1 or 128 can be selected by the NCCSEL bit in NCMR of the common controller. No other division ratios are available.

The down-counters of the prescalers are initialized to 0000_H after reset.

32.4.2 Registers Related to Prescaler

32.4.2.1 PSCRx — Prescaler Registers x

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PSCx[9:0]									
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.17 PSCRx Register Contents

Bit Position	Bit Name	Function
15 to 10	—	This bit is not used. Fix this bit to 0.
9 to 0	PSCx[9:0]	Division ratio bits These bits specify the division ratio for the corresponding prescaler.

Note: x = 0 to 3

Prescaler registers are 16-bit readable/writable registers, each of which holds a division ratio for one of the four prescalers.

When the value in prescaler register x is changed, the prescaler updates the value on its underflow. The setting range is from 000_H to 3FF_H.

The division ratio is obtained from the following expression.

$$\text{Division ratio of prescaler} = \frac{1}{\text{PSCx}[9:0] + 1} \quad (\text{setting range: } 1/1 \text{ to } 1/1024)$$

A duty ratio of 50% is not guaranteed for the clock output by the prescaler. The level of the PCLK is high during one-cycle period only, and is low during the other periods.

32.4.3 Details of Operation

32.4.3.1 Starting Prescalers

The prescalers start operating when the PSCE bit in the ATU master enable register is set to 1 and generates a clock with a frequency given by the division ratio in the PSCx bits. While a prescaler is operating, the high level is output for one cycle of the PCLK clock each time the corresponding prescaler counter underflows.

When the setting in the PSCx bits is changed during operation, the division ratio of the output clock is updated on the first subsequent counter underflow.

Figure 32.8 Starting Prescaler

32.4.3.2 Stopping and Restarting Operation

The prescaler stops operating when the PSCE bit in the ATU master enable register is cleared to “0”. The clock signal retains the low level while the prescaler is stopped.

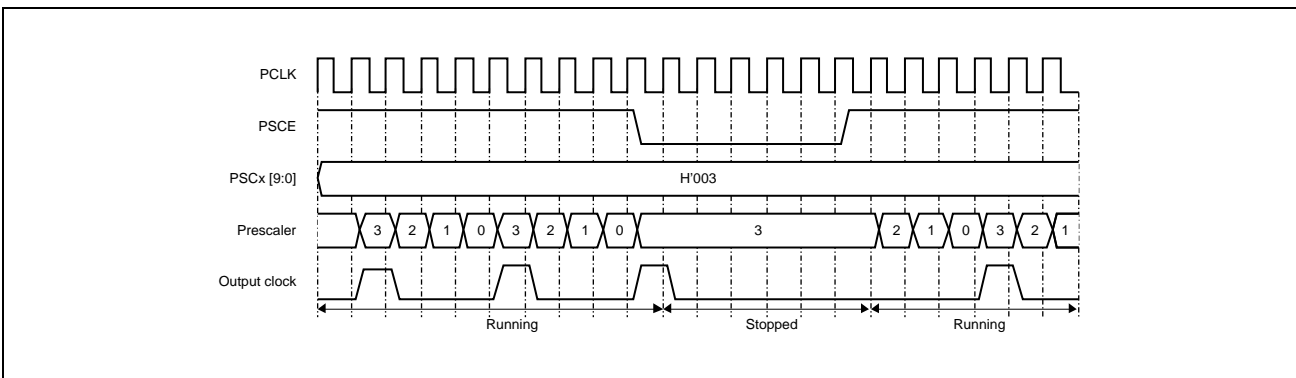

Figure 32.9 Stopping Prescaler

32.5 Timer A

32.5.1 Overview of Operation

Timer A integrates a 32-bit free-running counter A (TCNTA) and SB_A 32-bit input capture registers (ICRA0 to ICRASB_A-1). TCNTA is a free-running up counter. An interrupt request can be output when the counter overflows.

SB_A input capture registers A0 to ASB_A-1 (ICRA0 to ICRASB_A-1) capture the value of free-running counter A (TCNTA) on an assertion of the corresponding external input signal (TIA00 to TIA0SB_A-1). The rising edge, falling edge, or both edges can be selected as the trigger for capture. The detection edge is selected by timer I/O control register 1 (TIOR1A). An interrupt request can be issued at the same timing as capturing.

Noise on the external input signals can be removed by the noise canceler. The pin level of these external signal input pins (TIA00 to TIA0SB_A-1) after noise cancellation can be read. Input pin (TIA00 to TIA0SB_A-1) signals after noise cancellation can be output as input signals to timer F. Some input pin signals can be output to timer B, C or D as event signals after noise has been removed and their edges have been extracted. One of TIA00 to TIA0SB_A-1 can be output to timer B as an event signal (event output 1_0, 1_1, or 1_2). SB_A event signals TIA00 to TIA0SB_A-1 are output (event outputs 1B to 1I) to timer B to be used as the capture trigger of the event counter B1 (TCNTB1). One of SB_A event signals TIA00 to TIA0SB_A-1 is output (event output 2A and 2B) to timer D0 to DSB_D-1 respectively to be used as the capture trigger of timer offset base registers OSBRD0 to OSBRDSB_D-1. The signals of these event outputs 1_0, 1_1, 1_2, and event outputs 2A and 2B can be used as the input capture trigger of timer C.

Figure 32.10 shows a block diagram of timer A.

Figure 32.10 Block Diagram of Timer A Configuration

TCR1A is an 8-bit readable/writable register that sets the event output generated from external input signals (TIA00 to TIA02) and the counter clock.

TCR1A is initialized to 00_H after reset.

Event Output 2A Select (EVOSEL2A)

Selects either of the externally input signals TIA01 and TIA02 (after the noise cancellation and edge detection) to be output as the event output 2A signal. Timers C0 to CSB_C-1 and timers D0 to DSB_D-1 can use the event output 2A signal as a capture trigger.

Event Output 2B Select (EVOSEL2B)

Selects either of the externally input signals TIA01 and TIA02 (after the noise cancellation and edge detection) to be output as the event output 2B signal. Timers C0 to CSB_C-1 and timers D0 to DSB_D-1 can use the event output 2B signal as a capture trigger.

Event Output 1_0 Select (EVOSEL1)

Selects either of the externally input signals TIA02 to TIA00 (after the noise cancellation and edge detection) to be output to timers B and C as the event output 1_0 signal. Furthermore, input edge combinations of TIA00 and TIA01, TIA00 and TIA02, TIA01 and TIA02, and TIA00, TIA01, and TIA02 can be output together to timer B as the event output 1_0.

Clock Select A (CKSELA)

These bits select the signal on one of clock-bus lines 0 to 5 as the clock signal for counting. The signals on lines 0 to 3 have been frequency-divided by prescalers 0 to 3, respectively. Clock-bus line 4 supplies external clock input A (TCLKA). Clock-bus line 5 supplies external input clock B (TCLKB) or the multiplied-and-corrected clock output by timer B according to the setting of the clock bus control register.

Be sure to stop timer A before selecting the counter clock.

CAUTION

The edge of an external input clock is detected before it is output on a clock bus. When using external input clock A or B, select the edge to be detected by setting the edge select bit in the clock bus control register (CBCNT).

32.5.2.2 TCR2A — Timer Control Register 2A

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.19 TCR2A Register Contents

Bit Position	Bit Name	Function
15	EVOSELE1E	Event output 1_0 extension select enable 0: Event output 1_0 extension selection is disabled. 1: Event output 1_0 extension selection is enabled.
14-SB _A	—	These bits are not used. Fixe these bits to “0”.
bSB _A -1 to 0	EVOSELE1	Event output 1_0 extension select register These bits select the combination of inputs (TIA0x) to be output as an event. 0: TIA0x input edge is not output. 1: TIA0x input edge is output. Example: For b0 b0 = 0: TIA00 input edge is not output. b0 = 1: TIA00 input edge is output.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

Event Output 1_0 Extension Select Enable (EVOSELE1E)

Event output 1_0 extension select enable (EVOSELE1E) is an 8-bit/16-bit readable/writable register to enable or disable the event output 1_0 extension selection.

EVOSELE1E is initialized to 0_B after reset.

Event Output 1_0 Extension Select Register (EVOSELE1)

Event output 1_0 extension select register (EVOSELE1) is an 8-bit/16-bit readable/writable register to set event output 1_0 of external input edge TIA0x when EVOSELE1E is enabled.

EVOSELE1 is initialized to 00_H after reset.

Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output to timer B or timer C as event 1_0 according to the setting of this register.

When this function is enabled, event output selection specified by TCR1A is disabled.

32.5.2.3 TCR2AS1 — Timer Control Register 2AS1

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Example: For b0 b0 = 0: TIA00 input edge is not output. b0 = 1: TIA00 input edge is output.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

Event Output 1_1 Extension Select Register (EVOSELE1S1)

Event output 1_1 extension select register (EVOSELE1S1) is an 8-bit readable/writable register to set event output 1_1 of external input edge TIA0x.

EVOSELE1S1 is initialized to 00_H after reset.

Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output to timer B as event 1_1 according to the setting of this register.

32.5.2.4 TCR2AS2 — Timer Control Register 2AS2

Example: For b0 b0 = 0: TIA00 input edge is not output. b0 = 1: TIA00 input edge is output.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

Event Output 1_2 Extension Select Register (EVOSELE1S2)

Event output 1_2 extension select register (EVOSELE1S2) is an 8-bit readable/writable register to set event output 1_2 of external input edge TIA0x.

EVOSELE1S2 is initialized to 00_H after reset.

Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output to timer B as event 1_2 according to the setting of this register.

32.5.2.5 TCR3A — Timer Control Register 3A

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15	EVOSELE2AE	Event output 2A extension select enable 0: Event output 2A extension selection is disabled. 1: Event output 2A extension selection is enabled.
14-SB _A	—	These bits are not used. Fixe these bits to “0”.
SB _A -1 to 0	EVOSELE2A	Event output 2A extension select register These bits select the combination of inputs (TIA0x) to be output as an event. 0: TIA0x input edge is not output. 1: TIA0x input edge is output. Example: For b0 b0 = 0: TIA00 input edge is not output. b0 = 1: TIA00 input edge is output.

Note 1: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

Event Output 2A Extension Select Enable (EVOSELE2AE)

Event output 2A extension select enable (EVOSELE2AE) is an 8-bit/16-bit readable/writable register to enable or disable the event output 2A extension selection.

EVOSELE2AE is initialized to 0_B after reset.

Event Output 2A Extension Select Register (EVOSELE2A)

Event output 2A extension select register (EVOSELE2A) is an 8-bit/16-bit readable/writable register to set event output 2A of external input edge TIA0x when EVOSELE2AE is enabled.

EVOSELE2A is initialized to 00_H after reset.

Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output as event 2A according to the setting of this register. Timers C0 to CSB_C-1 and timers D0 to DSB_D-1 can use this event 2A signal as the capture trigger.

When this function is enabled, event output selection specified by TCR1A is disabled.

32.5.2.6 TCR4A — Timer Control Register 4A

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15	EVOSELE2BE	Event output 2B extension select enable 0: Event output 2B extension selection is disabled. 1: Event output 2B extension selection is enabled.
14-SB _A	—	These bits are not used. Fixe these bits to “0”.
SB _A -1 to 0	EVOSELE2B	Event output 2B extension select register These bits select the combination of inputs (TIA0x) to be output as an event. 0: TIA0x input edge is not output. 1: TIA0x input edge is output. Example: For b0 b0 = 0: TIA00 input edge is not output. b0 = 1: TIA00 input edge is output.

Note 1: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

Event Output 2B Extension Select Enable (EVOSELE2BE)

Event output 2B extension select enable (EVOSELE2BE) is an 8-bit/16-bit readable/writable register to enable or disable the event output 2B extension selection.

EVOSELE2BE is initialized to 0_B after reset.

Event Output 2B Extension Select Register (EVOSELE2B)

Event output 2B extension select register (EVOSELE2B) is an 8-bit/16-bit readable/writable register to set event output 2B of external input edge TIA0x when EVOSELE2BE is enabled.

EVOSELE2B is initialized to 00_H after reset.

Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output as event 2B according to the setting of this register. Timers C0 to CSB_C-1 and timers D0 to DSB_D-1 can use this event 2B signal as the capture trigger.

When this function is enabled, event output selection specified by TCR1A is disabled.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.25 NCMCR1A Register Contents

Bit Position	Bit Name	Function
SB _A -1 to 0	NCM1Ax	Noise cancellation mode bit of channel x Specify the operating mode of noise canceler in channel x. 0: Premature-transition cancellation mode 1: Minimum time-at-level cancellation mode (When NCMA = 0 and NCM2Ax = 0) 1: Level accumulation cancellation mode (When NCMA = 0 and NCM2Ax = 1)

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

NCMCR1A is an 8-bit readable/writable register that selects the operation mode of noise canceler for channel unit.

In premature-transition cancellation mode, after an input signal level change is detected, any input signal level change in the specified period is ignored. This mode regards a signal level change in the specified period as noise after the first level change is detected.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.

To disable noise cancellation mode from premature-transition cancellation mode or minimum time-at-level cancellation mode, do so after the value of the counter (NCNTAx) held in each timer becomes 0000_H.

For details of operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

Noise Cancellation Mode Bit of Channel x (NCM1Ax)

Specify the operating mode of noise canceler in channel x.

CAUTION

This register is only effective when the NCMA bit of the noise cancellation mode register (NCMR) in the common control unit is "0". Furthermore, when the corresponding channel bit (NCM1Ax) in this register is set to "1", the mode can be set to premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode according to the state of the corresponding channel bit in the noise cancellation mode channel register 2A (NCMCR2A).

32.5.2.9 NCMCR2A — Noise Cancellation Mode Channel Register 2A

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NCM2A[SB _A -1:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.26 NCMCR2A Register Contents

Bit Position	Bit Name	Function
SB _A -1 to 0	NCM2Ax	Noise cancellation mode bit of channel x Specify the operating mode of noise canceler in channel x. 0: Minimum time-at-level cancellation mode (When NCMA = 0 and NCM1Ax = 1) 1: Level accumulation cancellation mode (When NCMA = 0 and NCM1Ax = 1)

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

NCMCR2A is an 8-bit readable/writable register that selects the operation mode of noise canceler for channel unit.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.

For details on the operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

Noise Cancellation Mode Bit 2 of Channel x (NCM2Ax)

Specify the operating mode of noise canceler in channel x.

CAUTION

This register is only effective when the NCMA bit of the noise cancellation mode register (NCMR) in the common control unit is "0" and the noise cancellation mode bit of the corresponding channel (NCM1Ax) in the noise cancellation mode channel register 1A of timer A (NCMCR1A) is "1".

32.5.2.10 TIOR1A — Timer I/O Control Register 1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IOA7[1:0]		IOA6[1:0]		IOA5[1:0]		IOA4[1:0]		IOA3[1:0]		IOA2[1:0]		IOA1[1:0]		IOA0[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.27 TIOR1A Register Contents

Bit Position	Bit Name	Function
SB _A -1 to 0	IOAx	I/O control Ax 00: TIA0x input capturing is prohibited 01: TCNTA is captured in ICRAx at the rising edge of TIA0x. 10: TCNTA is captured in ICRAx at the falling edge of TIA0x. 11: TCNTA is captured in ICRAx at both the rising and falling edges of TIA0x.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Timer I/O control register 1 (TIOR1A) is used to select the edge of event outputs 2A, 2B, 1_0, and 1B to 1H.

This is a 16-bit readable/writable register that sets the edge of external input (TIA0x) to be detected.

TIOR1A is initialized to 0000_H after reset.

I/O Control Ax (IOAx)

These bits select the edge of external inputs (TIA00 to TIA0SB_A-1) that is to be detected as a trigger for input capture. When these bits are set to “00”, input capturing is not performed. When the bit is set to “01”, “10” or “11”, the contents of free-running counter A (TCNTA) are transferred to input capture register A0 to ASB_A-1 (ICRA0 to ICRASB_A-1) on detection of the selected edge from one of the external inputs.

Edge detection is synchronized with the PCLK clock. Make sure that the cycle of the external input signal is at least twice the cycle of the PCLK clock. Otherwise, edge detection is not performed correctly.

Edge detection is performed for signals that have passed through the noise canceler. When the noise canceler is disabled, edge detection is performed for the external inputs (TIA00 to TIA0SB_A-1). When the noise canceler is enabled, edge detection is performed for the signals after noise cancellation.

The edge detection signals of TIA00 to TIA0SB_A-1 are directly output to event outputs 1B to 1H. TIA00 corresponds to event output 1B, TIA01 to event output 1C, TIA02 to event output 1D, TIA03 to event output 1E, TIA04 to event output 1F, TIA05 to event output 1G, TIA06 to event output 1H, and TIA07 to event output 1I, respectively.

Furthermore, the signal detected by the valid edge is output to other timer modules by setting the event output 1_0, event output 2A, and event output 2B select bits (EVOSEL1, EVOSEL2A, and EVOSEL2B) in TCR1A, the event output 1_0 extension select bits (EVOSELE1) in TCR2A, the event output 2A extension select bits (EVOSELE2A) in TCR3A, and the event output 2B extension select bits (EVOSELE2B) in TCR4A. (Signals to be output after edge detection are generated in positive logic.)

32.5.2.11 TIOR2A — Timer I/O Control Register 2

Table 32.28 TIOR2A Register Contents

Bit Position	Bit Name	Function
31 to 24	—	These bits are not used. Fixe these bits to “0”.
23 to 16	NCKGA _x	Noise canceler clock select G Ax 0: The clock selected by NCKAx is selected as the count source clock of NCNTAx. 1: Noise canceler count clock (AGCK1) is selected as the count source clock of NCNTAx
15 to 8	NCKAx	Noise canceler clock select Ax 0: Noise canceler count clock (PCLK or PCLK/128) is selected as the count source clock of NCNTAx. 1: Clock-bus line 5 is selected as the count source clock of NCNTAx.
7 to 0	NCEAx	Noise canceler enable Ax 0: Noise cancellation function for TIA0x is disabled. 1: Noise cancellation function for TIA0x is enabled.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1.

Timer I/O control register 2 (TIOR2A) is an 8-bit/16-bit/32-bit readable/writable register that selects the noise canceler clock and enables and disables the noise cancelers for external input signals (TIA0x).

TIOR2A is initialized to 0000 0000_H after reset.

Noise Canceler Clock Select G Ax (NCKGA0 to x)

These bits select the count source clock of noise canceler counters Ax (NCNTAx).

The noise canceler count clock selected by the noise canceler clock select bits (NCKAx) or AGCK1 can be selected as the count source clock.

Noise Canceler Clock Select Ax (NCKAx)

These bits select the count source clock of noise canceler counter Ax (NCNTAx).

The noise canceler count clock or the signal on clock-bus line 5 can be selected as the count source clock. Either the PCLK clock frequency divided by 128 or the PCKL clock can be selected as the noise canceler count clock by setting the NCCSEL bit of the common controller.

Noise Canceler Enable Ax (NCEAx)

These bits enable and disable the noise cancelers for external input signal TIA0x.

When a level change of the external input signal TIA0x is detected while this bit is set to “1”, it is processed in premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode depending on the setting in the noise cancellation mode register (NCMR) of the common controller, noise cancellation mode channel register 1A (NCMCR1A) of timer A, and noise cancellation mode channel register 2A (NCMCR2A) of timer A.

In premature-transition cancellation mode, when a level change of the external input signal is detected, the change is output as the signal whose noise is removed and the corresponding noise canceler counter Ax (NCNTAx) starts counting up. Subsequent level changes are masked until the value in the counter reaches the value in the noise canceler register Ax (NCRAx). This compare match occurs, the level of the external input signal at that time is output as the signal after noise cancellation.

When these bits are cleared to “0” while NCNTAx is being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes of TIA0x are also masked over this period.

In minimum time-at-level cancellation mode, when a level change of the external input signal is detected, the corresponding noise canceler counter Ax (NCNTAx) starts counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register Ax (NCRAx), the previously accepted level change is output as the signal after noise cancellation upon compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes are treated as noise. Therefore, the noise canceler assumes that the levels of external input signals have not changed and does not change the signal after cancellation.

When these bits are cleared to “0” while NCNTAx is being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the external input signal is detected.

In level accumulation cancellation mode, the corresponding noise canceler counter Ax (NCNTAx) increments or decrements according to the input signal level. NCNTAx increments (up-counting) when the input signal level is high, and decrements (down-counting) when the input signal level is low. Up-counting continues until NCNTAx reaches the value set in the noise canceler register Ax (NCRAx). Down-counting continues until NCNTAx reaches 00_H.

When a compare match with NCRAx occurs during up-counting, the noise canceler output is updated to “1”. When a compare match with 00_H occurs during down-counting, the noise canceler output is updated to “0”.

In minimum time-at-level cancellation mode and premature-transition cancellation mode, level changes are always detected by PCLK regardless of the selected noise-canceler clock. In level accumulation cancellation mode, input level sampling is performed by the clock selected by the noise canceler clock select bit Ax (NCKAx).

For details of operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

32.5.2.12 TIERA — Timer Interrupt Enable Register A

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVEA	—	—	—	—	—	—	—	ICIEA[7:0]

Table 32.29 TIERA Register Contents

Bit Position	Bit Name	Function
15	OVEA	Overflow interrupt enable 0: Interrupt request due to TCNTA overflow is disabled. 1: Interrupt request due to TCNTA overflow is enabled.
14 to 8	—	These bits are not used. Fixe these bits to “0”.
7 to 0	ICIEAx	Input capture interrupt enable 0: Interrupt request due to input capture x is disabled. 1: Interrupt request due to input capture x is enabled.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Timer interrupt enable register A (TIERA) is 8-bit/16-bit readable/writable registers used to set interrupt requests due to comparison in overflow and input capture.

32.5.2.13 TSRA — Timer Status Register A

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVFA	—	—	—	—	—	—	—	ICFA[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.30 TSRA Register Contents

Bit Position	Bit Name	Function
15	OVFA	Overflow flag A 0: Indicates that TCNTA has not overflowed 1: Indicates that TCNTA has overflowed
14 to 8	—	These bits are not used. Fixe these bits to “0”.
7 to 0	ICFA _x	Input capture flag A _x 0: No input capture has occurred. 1: Input capture has occurred

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Timer status register A (TSRA) is an 8-bit/16-bit read-only register that indicates occurrence of overflow of the free-running counter A (TCNTA) and input capture of input capture registers A_x (ICRA_x).

These status flags indicate occurrence of an interrupt request, and can be cleared to “0” by setting the corresponding bit in timer status clear register A (TSCRA). If an interrupt source takes effect when one of these flags is set to “1”, an interrupt request is issued again. An interrupt request is issued even if flag clearing by the corresponding timer status clear register conflicts with flag setting by an interrupt source.

TSRA is initialized to 0000_H after reset.

Overflow Flag A (OVFA)

This bit indicates whether free-running counter A (TCNTA) has overflowed. This flag indicates that an overflow occurred in TCNTA when this bit is read as “1”. This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition
When TCNTA overflows (from FFFF FFFF_H to 0000 0000_H)
- Clearing (to 0) condition
When “1” is written to OVFA in timer status clear register A (TSCRA)

Input Capture Flag A_x (ICFA_x)

These bits indicate whether the value in free-running counter A (TCNTA) has been captured by input capture register A_x (ICRA_x). When one of these bits is read as “1”, the value in TCNTA has been stored in the corresponding ICRA_x.

These bits cannot be set to 1 or 0 by software.

- Setting (to 1) condition
When the value of TCNTA is transferred to ICRA_x on assertion of the input capture signal TIA0_x
- Clearing (to 0) condition
When “1” is written to ICFA_x in timer status clear register A (TSCRA)

32.5.2.14 TSCRA — Timer Status Clear Register A

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVFCA	—	—	—	—	—	—	—	ICFCA[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 32.31 TSCRA Register Contents

Bit Position	Bit Name	Function
15	OVFCA	Overflow flag clear A enable 0: Disabled (default) 1: OVFA in the timer status register A (TSRA) is cleared to 0.
14 to 8	—	These bits are not used. Fixe these bits to “0”.
7 to 0	ICFCAx	Input capture flag clear Ax enable 0: Disabled (default) 1: ICFAX in the timer status register A (TSRA) is cleared to 0

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

TSCRA is an 8-bit/16-bit readable/writable register that sets clearing of flags at occurrence of an overflow or input capture.

When TSCRA is read, “0” is always returned.

TSCRA is initialized to 0000_H after reset.

Overflow Flag Clear A Enable (OVFCA)

Writing “1” to this bit while overflow flag A (OVFA) in the timer status register A (TSRA) is set to “1” clears OVFA to “0”. When this bit is read, “0” is always returned.

Input Capture Flag Clear Ax Enable (ICFCAx)

Writing “1” to this bit while input capture flag Ax (ICFAX) in the timer status register A (TSRA) is set to “1” clears ICFAX to “0”. When this bit is read, “0” is always returned.

32.5.2.15 ICRAx — Input Capture Registers Ax

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.32 ICRAx Register Contents

Bit Position	Bit Name	Function
31 to 0	ICAx	Input capture Ax These bits store 32-bit input capture value.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Input capture registers Ax (ICRAx) are 32-bit read-only registers dedicated to input capture. No value can be written to these registers.

These input capture-dedicated registers detect an external input capture signal (TIA0x) and store the free-running counter A (TCNTA) value. At this time, the corresponding bit in the timer status register A (TSRA) is set to “1”.

The detection edge for the input capture signal is set by the I/O control bits in the timer I/O control register 1 (TIOR1A).

ICRAx can be read only in 32-bit units. Do not read these registers in 16-bit or 8-bit units.

ICRAx is initialized to 0000 0000_H after reset.

32.5.2.16 ICRA2x — Input Capture Registers A2x

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.33 ICRA2x Register Contents

Bit Position	Bit Name	Function
31 to 0	ICA2x	Input capture A2x These bits store 32-bit input capture value.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Input capture registers A2x (ICRA2x) are 32-bit read-only registers dedicated to input capture. No value can be written to these registers.

These input capture-dedicated registers detect an external input capture signal (TIA00 to TIA0SB_A-1) and store the values of timer D counters (TCNT1D0, TCNT2D0). At this time, the corresponding bit in the timer status register A (TSRA) is set to “1”. Whether to store the value of TCNT1D0 or TCNT2D0 is determined by setting the ICRA2SEL bit in the timer control register 5A (TCR5A).

The detection edge for the input capture signal is set by the I/O control bits in the timer I/O control register 1 (TIOR1A).

ICRA2x can be read only in 32-bit units. Do not read these registers in 16-bit or 8-bit units.

ICRA2x is initialized to 0000 0000_H after reset.

32.5.2.17 TCNTA — Free-Running Counter A

Value after reset: 0000 0000_H

Table 32.34 TCNTA Register Contents

Bit Position	Bit Name	Function
31 to 0	CNTA	Timer count A These bits store the counter value in 32-bit units.

TCNTA is a 32-bit readable/writable register that counts on the signal output by the prescaler via the clock bus, external input clock signal, or multiplied-and-corrected signal output by timer B.

TCNTA starts counting up when the TAE bit in the ATU master enable register (ATUENR) is set to “1”. The clock input to the counter is selected by setting the clock select A bit (CKSELA) in timer control register 1A (TCR1A).

When TCNTA overflows (FFFF FFFF_H to 0000 0000_H), an overflow interrupt is issued and the overflow flag (OVFA) in timer status register A (TSRA) is set to “1”.

TCNTA can be read and written only in 32-bit units. Do not read or write TCNTA in 16-bit or 8-bit units.

TCNTA is initialized to 0000 0000_H after reset.

32.5.2.18 TILRA — Timer Input Signal Level Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
SB _A -1 to 0	TIAL0x	Input signal level read Register only for reading the TIA0x pin level

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

The timer input signal level register (TILRA) is an 8-bit read-only register that can read external input (TIA0x) pin levels after noise cancellation.

TILRA can be read only in 8-bit units.

TILRA is initialized to 00_H after reset.

32.5.2.19 NCNTAx — Noise Canceler Counters Ax

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.36 NCNTAx Register Contents

Bit Position	Bit Name	Function
15 to 0	NCNTAx	Noise canceler count Ax These bits store a 16-bit count value.

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Noise canceler counters Ax (NCNTAx) are 16-bit readable/writable registers.

In premature-transition cancellation mode or minimum time-at-level cancellation mode, NCNTAx starts counting up by an assertion of external input signals (TIA0x) as a trigger when the noise canceler function is enabled by the noise canceler enable bit (NCEAx) in timer I/O control register 2 (TIOR2A). In level accumulation cancellation mode, NCNTAx performs up-counting or down-counting according to the external input level. The count clock for the noise cancelers or the signal on clock-bus line 5 can be selected as the count source by setting the noise canceler clock select bits (NCKAx) in TIOR2A.

NCNTAx is initialized to 00_H after reset.

The noise cancellation mode can be selected from premature-transition cancellation mode, minimum time-at-level cancellation mode, and the level accumulation cancellation mode, by setting the noise cancellation mode select bit (NCMSEL) and the timer A noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) of the common controller, the noise cancellation mode bits (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) of timer A, and the noise cancellation mode bits (NCM2Ax) in noise cancellation mode channel register 2A (NCMCR2A) of timer A.

- Premature-transition cancellation mode

If a level change on pin TIA0x is detected when the NCEAx bit is “1” and NCNTAx is stopped, NCNTAx starts counting up. The counter is cleared to 0000_H and stopped on the first edge of the PCLK after the counter value matches the value in noise canceler register Ax (NCRAx).

NCNTAx is incremented regardless of the TAE bit in the ATU master enable register (ATUENR).

The level change at the start of counting is output as the signal after noise cancellation and its edge is to be detected. However, since subsequent level changes are masked until the counter value matches the value in NCRAx, the signal after noise cancellation does not change. When the values in the counter and NCRAx match, the input signal level at that time is output as the signal after noise cancellation.

When NCEAx bits are cleared to “0” while the counter is being incremented, counting continues until the values in the counter and NCRAx match. The subsequent level changes are also masked over this period.

- Minimum time-at-level cancellation mode

If a level change on pin TIA0x is detected when the NCEAx bit is “1” and NCNTAx is stopped, NCNTAx starts counting up. If subsequent level change is detected or the values in the counter and the noise canceler register Ax (NCRAx) match, the counter is cleared to 0000_H and stopped on the next PCLK cycle.

NCNTAx is incremented regardless of the TAE bit in the ATU master enable register (ATUENR).

The signal after noise cancellation changes only upon compare match between the counter and NCRAx in synchronization with the level change at the start of counting. When the counter is stopped before the compare match with NCRAx, level changes at the start and stop of counting are masked and the signal after noise cancellation does not change.

When the NCEAx bit is cleared during the counter operation, counting continues until compare match or a level change on the pin is detected.

- Level accumulation cancellation mode

When the NCEAx bit is set to “1”, NCNTAx performs up-counting or down-counting depending on the input signal level. NCNTAx performs up-counting when the input level is high, and if the counter value matches the value of the noise cancel register Ax (NCRAx), the up-counting stops at the next PCLK cycle. NCNTAx performs down-counting when the input level is low, and if the counter value reaches 0000_H, the down-counting stops at the next PCLK cycle.

Counting of NCNTAx is performed regardless of the setting of the TAE bit of the ATU master enable register (ATUENR).

If an up-count results in a compare match of NCRAx, the noise canceler output is updated to “1”. If a down-count results in a compare match with 0000_H, the noise canceler output is updated to “0”.

If the NCEAx bit is cleared during counting operation, the noise cancel counter stops counting, and the value is changed from the noise canceler output to the current input signal level. Note that clearing the NCEAx bit in level accumulation cancellation mode might cause an edge detection due to this value change.

For details of operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

32.5.2.20 NCRAx — Noise Cancel Registers Ax

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCTAx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.37 NCRAx Register Contents

Bit Position	Bit Name	Function
15 to 0	NCTAx	Noise cancellation time Ax These bits store the TIA0x noise cancellation time (16-bit compare value)

Note: x = 0 to SB_A-1: Corresponding to channels 0 to SB_A-1

Noise cancel registers Ax (NCRAx) are 16-bit readable/writable registers that set the upper limit value of the noise cancel counters Ax (NCNTAx). When the PCLK cycle divided by 128 is selected as the noise cancel clock, setting FFFF_H to this register can cancel noise for maximum of 0.21 second period (when PCLK = 40 MHz).

The noise cancellation mode can be selected from premature-transition cancellation mode, minimum time-at-level cancellation mode, and the level accumulation cancellation mode, by setting the noise cancellation mode select bit (NCMSEL) and the timer A noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) of the common controller, the noise cancellation mode bits (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) of timer A, and the noise cancellation mode bits (NCM2Ax) in noise cancellation mode channel register 2A (NCMCR2A) of timer A.

- Premature-transition cancellation mode

While NCNTAx counting is in progress, level changes of succeeding input signals are masked. Values of NCNTAx and NCRAx are always compared. If a compare match occurs, the NCNTAx counter value is cleared, the counting is stopped, and the input signal mask is released at the next PCLK cycle.

- Minimum time-at-level cancellation mode

While NCNTAx counting is in progress, the noise canceler processing is waited for. Values of NCNTAx and NCRAx are always compared. If a compare match occurs, the NCNTAx counter value is cleared, the counting is stopped, and the noise canceler starts to output the input signal after noise cancellation at the next PCLK cycle.

- Level accumulation cancellation mode

When NCNTAx is performing up-counting, values of NCNTAx and NCRAx are compared. When a compare match occurs, the up-counting of NCNTAx stops at the next PCLK cycle. When NCNTAx is performing down-counting, NCNTAx is compared with 0000_H.

NCRAx is initialized to 0000_H after reset.

For details of operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

32.5.3 Details of Operation

32.5.3.1 Operation of Noise Canceler

For details of operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

32.5.3.2 Operation of Free-Running Counter

Free-running counter A (TCNTA) starts counting up by setting the TAE bit in ATU master enable register (ATUENR) to “1”. When TCNTA overflows (FFFF FFFF_H to 0000 0000_H), the OVFA bit in timer status register A (TSRA) is set to “1”. An interrupt request is issued to the CPU at this time. After overflow, TCNTA continues counting up from 0000 0000_H.

If the TAE bit in ATU master enable register (AUTENR) is cleared to “0” when TCNTA is operating, TCNTA stops counting while retaining the value at that time. By setting the TAE bit to “1” again, TCNTA resumes counting from the value when it is stopped.

TCNTA can be written during operation and writing takes priority over counting. After that, TCNTA resumes counting from the written value. The write access is completed in two cycles of the PCLK clock, regardless of the count source.

CAUTION

The prescalers run independently of the setting of the TAE bit and are not initialized when the TCNTA starts counting. Therefore, the time from when the TAE bit is set to when TCNTA starts counting may be less than the cycle of the selected count source clock (resolution), being undetermined due to hardware factors.

Figure 32.11 shows an example of free-running counter A (TCNTA) operation.

Figure 32.11 Example of Free-Running Counter A (TCNTA) Operation: Overflow Timing

32.5.3.3 Input Capture

Input capture is performed by input capture register Ax (ICRAx) when input capture is enabled in bits IOAx in timer I/O control register 1 (TIOR1A). ICRAx capture the value in free-running counter A (TCNTA) by detecting the edge of external input signals (TIA0x).

Noise on the external input signals can be removed by the noise cancelers. TCNTA starts counting up by setting the TAE bit in ATU master enable register (ATUENR). When the valid edge of the signal corresponding to ICRA is detected, the corresponding bit in timer status register A (TSRA) is set to “1” and the value in TCNTA is transferred to ICRA. The detection edge can be selected from rising edge, falling edge, or both rising and falling edges. It is also possible to output an interrupt request to the CPU upon input capture.

When input capture and writing to free-running counter A (TCNTA) occur simultaneously, the counter value before the write is captured.

Figure 32.12 shows an example of input capture when the edges to be sensed are rising edges for TIA00, falling edges for TIA01, and both edges for TIA02

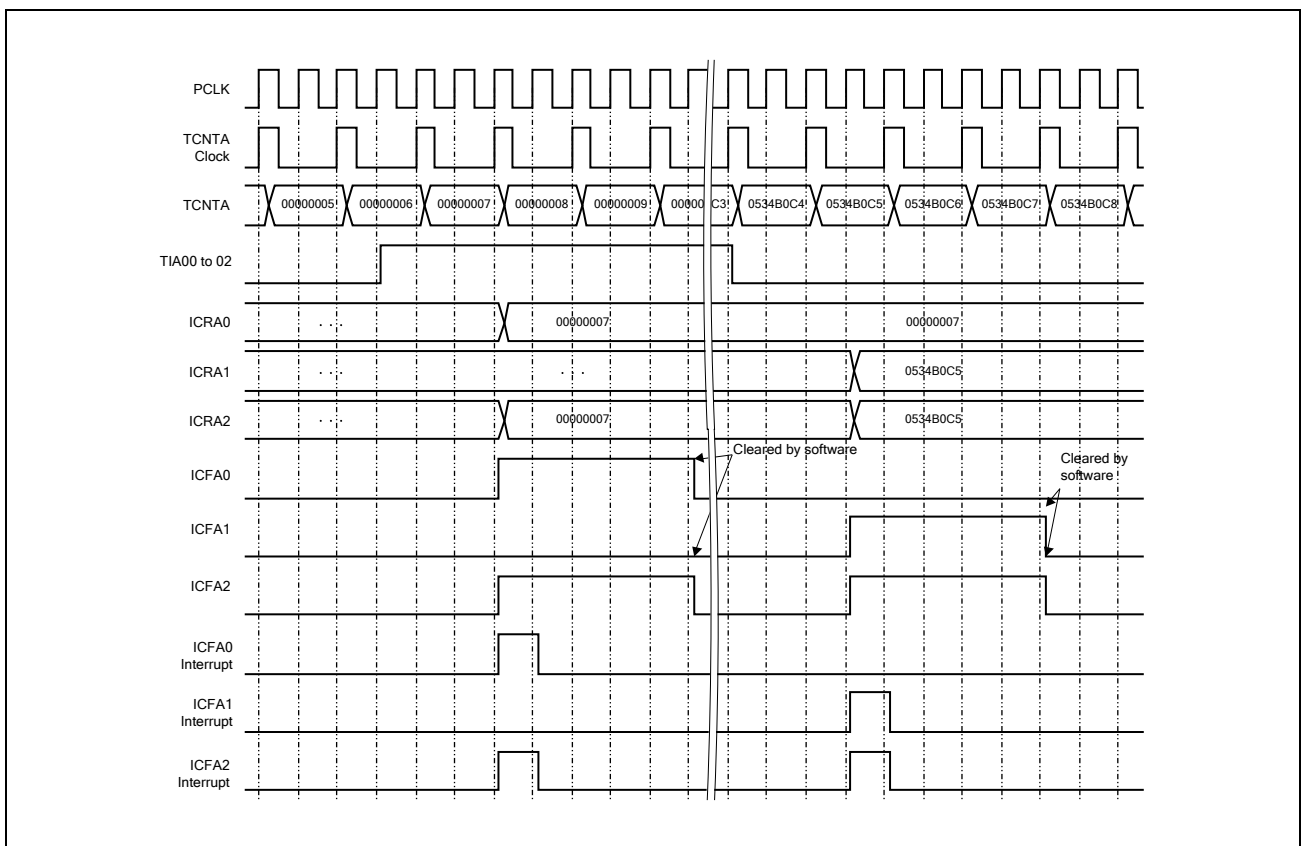

Figure 32.12 Example of Input Capture of Timer A

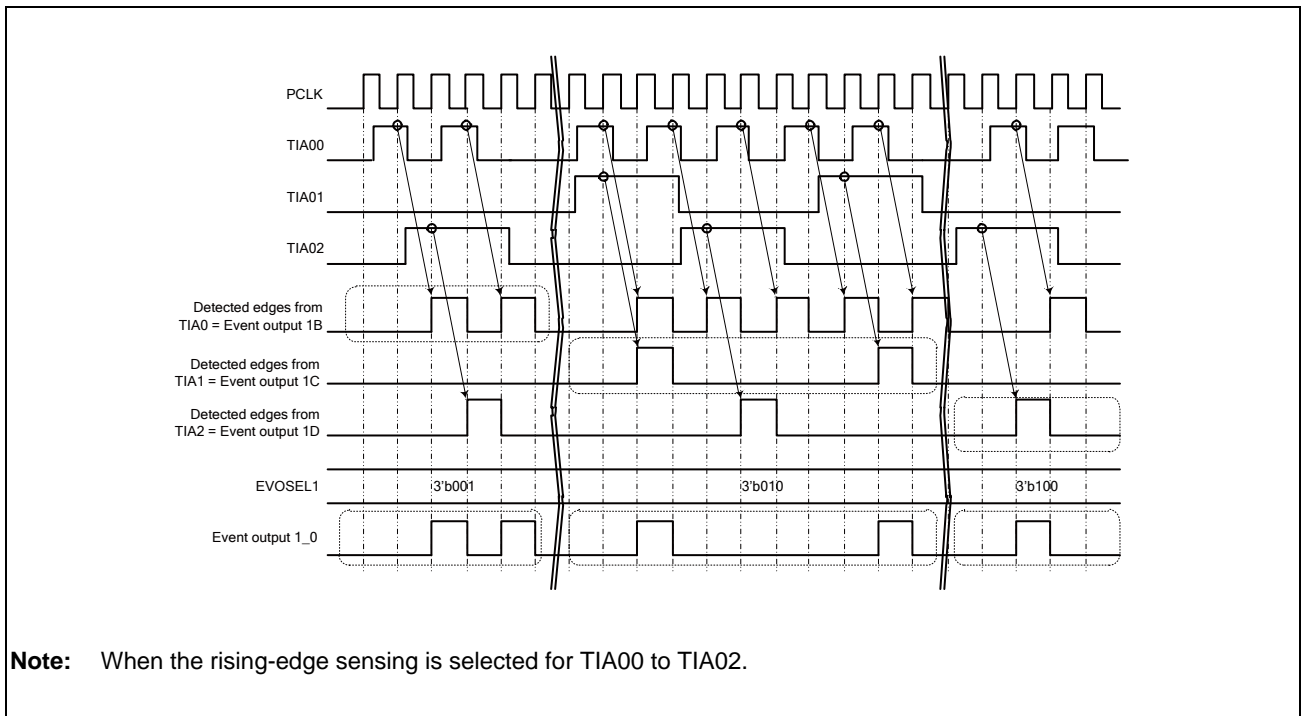

Figure 32.13 Example of TIA00 to TIA02 Event Output

By setting the EVOSEL1 bit in timer control register 1A (TCR1A), any of external input signals TIA02 to TIA00 after edge detection and noise cancellation can be output to timers B and C as an event (event output 1_0).

Furthermore, either TIA01 or TIA02 or a combination of them (after edge detection and noise cancellation) can be output to timers C and D as an event (event outputs 2A and 2B) by setting the EVOSEL2A and EVOSEL2B bits. In addition, any one of external input pins TIA0x or a combination of them (after edge detection and noise cancellation) can be output to timers B and C as an event (event output 1_0) by setting the EVOSELE1E and EVOSELE1 bits in timer control register 2A (TCR2A). Any one of external input pins TIAs or a combination of them (after edge detection and noise cancellation) can be output to timers C and D as an event (event outputs 2A and 2B) by setting the EVOSELE2AE and EVOSELE2A bits in timer control register 3A (TCR3A) and the EVOSELE2BE and EVOSELE2B bits in timer control register 4A (TCR4A).

Figure 32.13 shows an example of event output operation in case EVOSEL1 is set to 001_B (TIA00 input edge output), 010_B (TIA01 input edge output), and 100_B (TIA02 input edge output).

32.5.3.4 Pin Level Capture Operation

Levels of the external input pins (TIA0x) after noise cancellation can be read from the timer input signal level register (TILRA). **Figure 32.14** shows an example of operation of the TILRA register when signals are input to TIA0x.

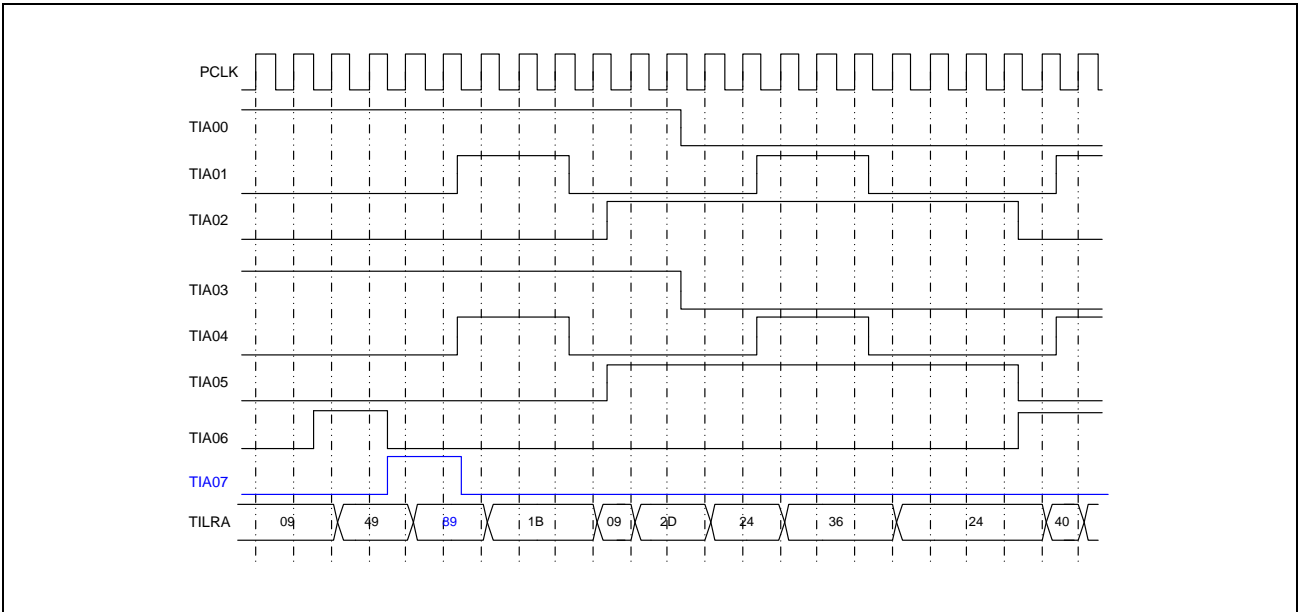

Figure 32.14 Example of TILRA Capture Operation

32.6 Timer B

32.6.1 Overview of Operation

Timer B generates a multiplied-and-corrected clock signal based on an external-event input and supplies the generated signal to other timers. Timer B consists of an edge-interval measuring block, frequency-multiplying clock generator, and corrector for the frequency-multiplied clock signal.

Edge-Interval Measuring Block

The edge-interval measuring block measures the intervals between edges of external-event signals 1_0 input via timer A (TCNTB0, ICRB0). Interrupt requests can be issued for the CPU in response to matches between edge interval measuring counter (TCNTB0) and output compare register B0 (OCRB0). TCNTB0 can also be captured in ICRB2 via ICRB1 on matches between event counter B1 (TCNTB1) that uses an external event input 1_0 as the count source and output compare register B1 (OCRB1). This provides a way to measure the intervals between multiple event inputs. Although TCNTB0 is cleared every event input 1_0, ICRB1 keeps a running total of the TCNTB0 value. ICRB2 latches the running totals on compare matches of the event counter. Furthermore, it is also possible to set the value of the event counter B1 (TCNTB1) that uses an external event input 1_0 as a count source to 01_H by the CLRBI bit (TCNTB1 clear bit) in the timer control register B (TCRB) at the next external event input timing after an event compare match with OCRB10. Furthermore, up to seven capture values (ICRB0) can be retained in record registers B1 to B6 (RECRB1 to RECRB6) at the external input event timing. Values retained in ICRB0 and RECRB1 to RECRB6 can be backed up in record backup registers B0 to B6 (RBURB0 to RBURB6) on event compare match between the event counter B1 (TCNTB1) and OCRB12.

For event counter (TCNB1), 24 compare registers (OCRB20 to OCRB 43) are provided for sequencer control. The sequencer transits to 24 states upon compare match between event counter (TCNTB1 and compare register (OCRB20 to OCRB 43). When the sequencer has transited, it generates a correction value for generating a frequency-multiplied clock by calculating the correction formula that uses the captured value (ICRB0) and Record Registers B1 to 6 (RECRB1 to RECRB 6).

In the edge-interval measuring block, the event counter B1 (TCNTB1) value is captured for the event counter B1 (TCNTB1) at occurrence of any of seven external event input signals 1B to 1I that are input via timer A (ICRB30 to ICRB37). The event counter B1 (TCNTB1) is not cleared at occurrence of any of external event input signals 1B to 1I.

The edge-interval measuring block consists of three channels. Edge-interval blocks 0 to 3 operate based on the external event signals 1_0, 1_1, and 1_2 input via timer A, respectively.

Table 32.38 below shows the events that correspond to each channel of the edge-interval measuring block and the registers provided for each channel.

What external-event and register value of the channel is used for other blocks can be selected by channel select register B (CHSELBR).

Table 32.38 Edge-Interval Measuring Blocks

	Edge-interval block 0	Edge-interval block 1	Edge-interval block 2
Corresponding event	External event 1_0	External event 1_1	External event 1_2
Register	TCNTB0	TCNTB0S1	TCNTB0S2
	ICRB0	ICRB0S1	ICRB0S2
	OCRB0	OCRB0S1	OCRB0S2
	TCNTB1	TCNTB1S1	TCNTB1S2
	OCRB1	OCRB1S1	OCRB1S2
	OCRB10	OCRB10S1	OCRB10S2
	OCRB11	OCRB11S1	OCRB11S2
	OCRB12	OCRB12S1	OCRB12S2
	ICRB1	ICRB1S1	ICRB1S2
	ICRB2	ICRB2S1	ICRB2S2

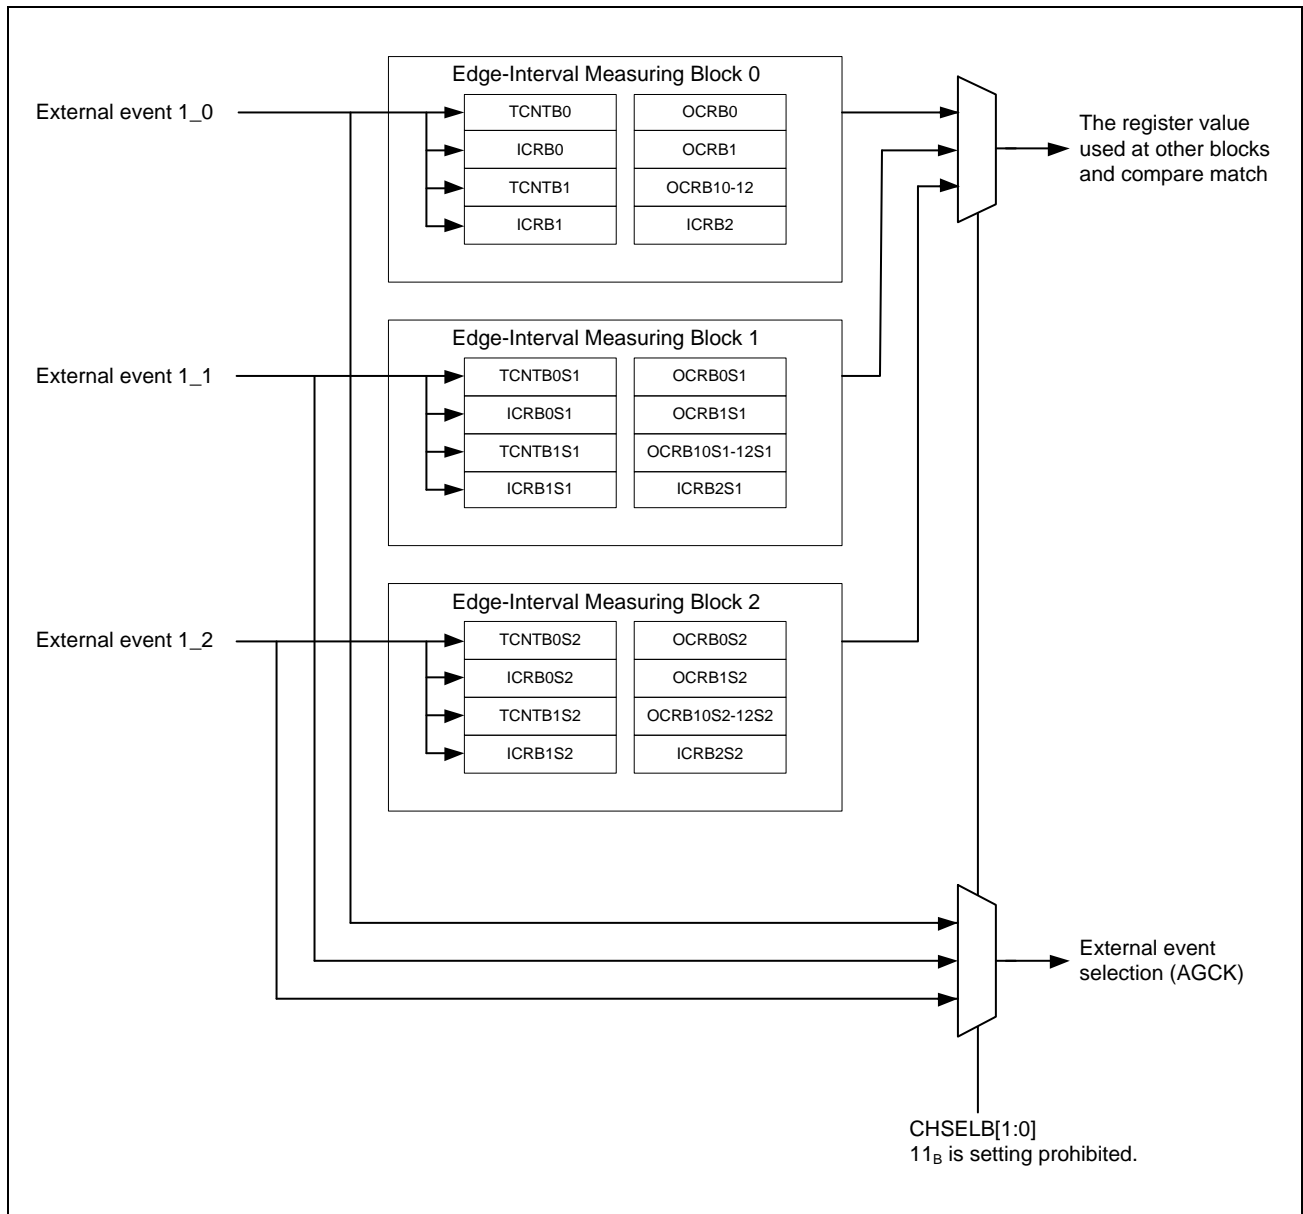

Figure 32.15 Timer B Edge-Interval Measuring Blocks 0 to 2

NOTE

The output event selection (AGCK) is selected from output event 1_0, 1_1 and 1_2 in CHSELB[1:0]. When CHSELB [1:0] is 00B, output event 1_0 is selected. When CHSELB [1:0] is 01B, output event 1_1 is selected. When CHSELB [1:0] is 10B, output event 1_2 is selected.

Frequency-Multiplied Clock Generator

The frequency-multiplied clock generator generates a clock signal obtained by frequency-multiplying an external-event selection (AGCK) input signal by a value from 1 to 4095.

In the edge-interval measuring block, down-counting (TCNTB2) with reload (RLDB) is performed for the capture value (ICRB0) in the input edge-interval measuring counter B0 (TCNTB0) or the corrected value calculated through sequencer control. Down-counting is performed by the set division ratio value specified in the PIMR select register. In addition to PIMR1, a division ratio value of PIMR2 can be selected by an event compare match between the event counter B1 (TCNTB1) in the edge-interval measuring block and OCRB11. When the down counter underflows, the multiplied clock (AGCK1) signal is asserted. (The multiplied clock is supplied as the count clock source for the noise canceler of timer A.)

TCNTB6 is a measuring counter using the multiplied clock as a source clock, and an interrupt request to the CPU can be output due to the compare match with OCRB6. ICRB6 is a capture register, and this TCNTB6 value is captured when an external event selection (AGCK) input occurs.

TCNTB6M is a measuring counter using the multiplied clock as a source clock. The up-count value can be set within a range from 0 to less than 4 in units of 1/64. When an external event selection (AGCK) input occurs, the TCNTB6M value is compared with the ICRB6 value. When the TCNTB6M value is smaller than the ICRB6 value, an interrupt request to the CPU can be output.

Frequency-Multiplied Clock Signal Corrector

The multiplied clock signal (AGCK1) needs to be corrected when two consecutive edge intervals differ significantly, since the earlier interval is referred to in calculating the multiplier for the current interval. The frequency-multiplied clock signal corrector generates a multiplied-and-corrected clock signal (AGCKM) by using three correcting counters (TCNTB3 to TCNTB5) and correcting counter clearing register B (TCCLR B). Output of the clock signal thus produced on clock-bus line 5 can be selected by using the clock-bus control register (CBCNT). Other timers can then use this clock as a source for counting. For the automatic up-counting function that continues counting until the multiplied-and-corrected clock generating counter B5 (TCNTB5) value matches the correcting counter clear register B (TCCLR B) value when the multiplied-and-corrected clock (AGCKM) is generated, whether to enable or disable this function is selectable. Furthermore, the correcting counter (TCNTB3) can be automatically cleared by the CLR B3 bit (TCNTB3 clear bit) in the timer control register B (TCRB) at the timing of an event compare match between the event counter B1 (TCNTB1) in the edge-interval measuring block and OCRB10 or between the correcting event counter B3 (TCNTB3) and OCRB8.

Figure 32.16 is a block diagram of timer B.

Figure 32.16 Block Diagram of Timer B

CAUTION

The edge-interval measuring block consists of three channels. The channel to be used is selected by channel select register B (CHSELBR). See **Table 32.38** for the registers provided for each channel.

32.6.2 Timer B Control Registers

32.6.2.1 TCRB — Timer Control Register B

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIMRSEL	CLRB3	CLRB1	CLRB3SEL[1:0]		CLRB1SEL	CKSELB[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.39 TCRB Register Contents

Bit Position	Bit Name	Function
7	PIMRSEL	PIMR select 0: PIMR1 is always selected. 1: PIMR2 is selected instead of PIMR1 while TCNTB1 and OCRB11 match.
6	CLRB3	TCNTB3 clear 0: TCNTB3 is not cleared. 1: TCNTB3 is cleared.
5	CLRB1	TCNTB1 clear select 0: TCNTB1 is not cleared. 1: TCNTB1 is cleared.
4, 3	CLRB3SEL	TCNTB3 clear select 00: Compare match between TCNTB1 and OCRB10 is used to clear TCNTB3 01: Compare match between TCNTB6 and OCRB6 is used to clear TCNTB3 10: Compare match between TCNTB3 and OCRB8 is used to clear TCNTB3 11: Setting prohibited
2	CLRB1SEL	TCNTB1 clear select 0: Compare match between TCNTB1 and OCRB10 is used to clear TCNTB1 1: Compare match between TCNTB6 and OCRB6 is used to clear TCNTB1
1, 0	CKSELB	Clock select B 00: Clock-bus line 0 is selected for count source 01: Clock-bus line 1 is selected for count source 10: Clock-bus line 2 is selected for count source 11: Clock-bus line 3 is selected for count source

TCRB is an 8-bit readable/writable register that allows you to select a count source for the input edge interval measuring counter B0 (TCNTB0) and the reload counter B2 (TCNTB2), select whether to clear the TCNTB1 and TCNTB3 values at a compare match between TCNTB1 and OCRB10 or a compare match between TCNTB6 and OCRB6, and to select a pulse interval multiplier.

TCRB can be read and written in 8-bit units.

TCRB is initialized to 00_H after reset.

Clock Select B (CKSELB)

These bits select the clock driving TCNTB0 and TCNTB2 from clock-bus lines 0 to 3, which are clock signals divided by prescalers 0 to 3. The counters are incremented on the rising edge of the selected clock.

To select the clock, stop timer B operation.

Pulse Interval Multiplier Select (PIMRSEL)

By setting the PIMRSEL bit to 1 while TCNTB1 matches OCRB11, PIMR2 is selected for down-count values to be loaded to reload register B (RLDB) or for down-count values of TCNT2B. In other cases, PIMR1 is selected. However, PIMR1 is always used for adding the TCNTB3 value.

While the PIMRSEL bit is 0, PIMR1 is always used.

TCNTB1 Clear (CLRB1)

Setting the TCNTB1 clear bit (CLRB1) to 1 clears the TCNTB1 value at the timing of the first event input after a compare match between TCNTB1 and OCRB10 or between TCNTB6 and OCRB6 for the CLRB1SEL setting condition.

TCNTB3 Clear (CLRB3)

Setting the TCNTB3 clear bit (CLRB3) to 1 clears the TCNTB3 value in synchronization with the first PCLK after a compare match between TCNTB1 and OCRB10, between TCNTB6 and OCRB6, or between TCNTB3 and OCRB8 for the CLRB3SEL setting condition.

TCNTB1 Clear Select (CLRB1SEL)

Setting the TCNTB1 clear select bit (CLRB1SEL) sets the TCNTB1 clearing condition. When CLRB1SEL is 0, TCNTB1 can be cleared on compare match between TCNTB1 and OCRB10. When CLRB1SEL is 1, TCNTB1 can be cleared on compare match between TCNTB6 and OCRB6.

TCNTB3 Clear Select (CLRB3SEL)

Setting the TCNTB1 clear select bit (CLRB3SEL) sets TCNTB3 clearing condition. When CLRB3SEL is 00, TCNTB3 can be cleared on compare match between TCNTB1 and OCRB10. When CLRB3SEL is 01, TCNTB3 can be cleared on compare match between TCNTB6 and OCRB6. When CLRB3SEL is 10, TCNTB3 can be cleared on compare match between TCNTB3 and OCRB8.

32.6.2.2 TCRBS1 — Timer Control Register BS1

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	CLRB1S1	—	—	CLRB1SELS1	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R/W	R	R

Table 32.40 TCRBS1 Register Contents

Bit Position	Bit Name	Function
7, 6	—	These bits are not used. Fix these bits to “0”.
5	CLRB1S1	TCNTB1S1 clear 0: TCNTB1S1 is not cleared. 1: TCNTB1S1 is cleared.
4, 3	—	These bits are not used. Fix these bits to “0”.
2	CLRB1SELS1	TCNTB1S1 clear select 0: Compare match between TCNTB1S1 and OCRB10S1 is used to clear TCNTB1S1. 1: Compare match between TCNTB6 and OCRB6 is used to clear TCNTB1S1.
1, 0	—	These bits are not used. Fix these bits to “0”.

TCRBS1 is an 8-bit readable/writable register that allows you to select whether or not to clear TCNTB1S1 upon compare match between TCNTB1S1 and OCRB10S1 or compare match between TCNTB6 and OCRB6.

TCRBS1 can be read and written in 8-bit units.

TCRBS1 is initialized to 00_H after reset.

TCNTB1S1 Clear (CLRB1S1)

Setting the TCNTB1S1 clear bit (CLRB1S1) to 1 clears the TCNTB1S1 value at the timing of the first event input after a compare match between TCNTB1S1 and OCRB10S1 or between TCNTB6 and OCRB6 for the CLRB1SELS1 setting condition.

TCNTB1S1 Clear Select (CLRB1SELS1)

Setting the TCNTB1S1 clear select bit (CLRB1SELS1) sets the TCNTB1S1 clearing condition. When CLRB1SELS1 is 0, TCNTB1S1 can be cleared on compare match between TCNTB1S1 and OCRB10S1. When CLRB1SELS1 is 1, TCNTB1S1 can be cleared on compare match between TCNTB6 and OCRB6.

32.6.2.3 TCRBS2 — Timer Control Register BS2

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	CLRB1S2	—	—	CLRB1SELS2	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R/W	R	R

Table 32.41 TCRBS2 Register Contents

Bit Position	Bit Name	Function
7, 6	—	These bits are not used. Fix these bits to “0”.
5	CLRB1S2	TCNTB1S2 clear 0: TCNTB1S2 is not cleared. 1: TCNTB1S2 is cleared.
4, 3	—	These bits are not used. Fix these bits to “0”.
2	CLRB1SELS2	TCNTB1S2 clear select 0: Compare match between TCNTB1S2 and OCRB10S2 is used to clear TCNTB1S2. 1: Compare match between TCNTB6 and OCRB6 is used to clear TCNTB1S2
1, 0	—	These bits are not used. Fix these bits to “0”.

TCRBS2 is an 8-bit readable/writable register that allows you to select whether or not to clear TCNTB1S2 upon compare match between TCNTB1S2 and OCRB10S2 or compare match between TCNTB6 and OCRB6.

TCRBS2 can be read and written in 8-bit units.

TCRBS2 is initialized to 00_H after reset.

TCNTB1S2 Clear (CLRB1S2)

Setting the TCNTB1S2 clear bit (CLRB1S2) to 1 clears the TCNTB1S2 value at the timing of the first event input after a compare match between TCNTB1S2 and OCRB10S2 or between TCNTB6 and OCRB6 for the CLRB1SELS2 setting condition.

TCNTB1S2 Clear Select (CLRB1SELS2)

Setting the TCNTB1S2 clear select bit (CLRB1SELS2) sets the TCNTB1S2 clearing condition. When CLRB1SELS2 is 0, TCNTB1S2 can be cleared on compare match between TCNTB1S2 and OCRB10S2. When CLRB1SELS2 is 1, TCNTB1S2 can be cleared on compare match between TCNTB6 and OCRB6.

32.6.2.4 TIORB — Timer I/O Control Register B

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDSEL	CTCNTB5	EVCNTB	LDEN	CCS	—	—	IOB6
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W

Table 32.42 TIORB Register Contents

Bit Position	Bit Name	Function
7	LDSEL	Loading Data Select 0: ICRB0 value is used to calculate the data to be loaded to TCNTB2 and RLDB. 1: LDB value is used to calculate the data to be loaded to TCNTB2 and RLDB
6	CTCNTB5	Count Control B5 0: TCNTB5 count operation is enabled. 1: TCNTB5 count operation is disabled.
5	EVCNTB	Event Control B 0: External event input 1_0, 1_1, 1_2 is disabled. 1: External event input 1_0, 1_1, 1_2 is enabled.
4	LDEN	Load Enable 0: TCNTB2 and RLDB are updated on ICEB0 input capture. 1: TCNTB2 and RLDB are not updated on ICEB0 input capture.
3	CCS	Counter Correction Select 0: TCNTB4 is in operation when TCNTB3 = TCNTB4 1: [When CU4SEL bit is 0] TCNTB4 is stopped when TCNTB3 = TCNTB4 [When CU4SEL bit is 1] TCNTB4 is stopped when TCNTB3 = TCNTB4 - 1
2, 1	—	These bits are not used. Fix these bits to "0".
0	IOB6	I/O Control B6 0: Compare match between TCNTB6 and OCB6 is disabled. 1: Compare match between TCNTB6 and OCB6 is enabled.

TIORB is an 8-bit readable/writable register that selects the source of the frequency-multiplied clock and enables and disables the externally input signals, loading data, and correcting frequency multiplied clock. TIORB also controls multiplied-and-corrected clock generating counter B5 (TCNTB5) and output compare register B6 (OCRB6).

TIORB can be read and written in 8-bit units.

TIORB is initialized to 00_H after reset.

Loading Data Select (LDSEL)

Selects the register to be loaded to reloadable counter B2 (TCNTB2) and to be used for calculating data to be loaded to reload register B (RLDB) from ICRB0 or LDB.

Count Control B5 (CTCNTB5)

Selects whether the multiplied-and-corrected clock generating counter B5 (TCNTB5) is enabled or stopped.

Setting this bit to 1 stops TCNTB5 and the multiplied-and-corrected clock to be output to other timers. Even if the counter is stopped, it is not cleared. Clearing this bit to 0 resumes TCNTB5 and multiplied- and-corrected clock.

Event Control B (EVCNTB)

Disables and enables the externally input 1_0, 1_1, 1_2 events. Clearing this bit to 0 disables the input. Setting this bit to 1 enables the input with which input capture or generating the multiplied-and-corrected clock signal.

Load Enable (LDEN)

Selects whether to update the input capture register B0 (ICRB0) value, the reload counter B2 (TCNTB2) value, and the reload register B (RLDB) value at the input capture of the input edge interval measuring counter B0 (TCNTB0).

Counter Correction Select (CCS)

Selects whether or not correcting multiplied clock counter B4 (TCNTB4) is stopped when $TCNTB3 = TCNTB4$ ($CU4SEL = 0$) or $TCNTB3 = TCNTB4 - 1$ ($CU4SEL = 1$).

I/O Control B6 (IOB6)

Enables and disables compare match between TCNTB6 and OCRB6. When this bit is cleared to 0, compare match between TCNTB6 and OCRB6 is disabled. When it is set to 1, compare match between TCNTB6 and OCRB6 is enabled. At this time, an interrupt request is output to the CPU at a compare match.

CAUTION

When setting "1" to the CU4SEL bit of TCNT4CRB, be sure to set "1" to the CCS bit.

32.6.2.5 TSRB — Timer Status Register B

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CMFB6 E	CMFB6 M	—	CMFB1 2	CMFB1 1	CMFB1 0	CMFB6	CMFB1	ICFB0	CMFB0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.43 TSRB Register Contents

Bit Position	Bit Name	Function
15-10	—	These bits are not used. Fix these bits to “0”.
9	CMFB6E	Compare Match Flag B6E 0: Function is not selected or no compare match has occurred. 1: A compare match has occurred under the condition set for IREGB6E in TICRB.
8	CMFB6M	Compare Match Flag B6M 0: The TCNTB6M value is the ICRB6 value or larger. 1: When the TCNTB6M value is smaller than ICRB6, the next event input occurs
7	—	This bit is not used. Fixe this bit to “0”.
6	CMFB12	Compare Match Flag B12 0: No compare match has occurred. 1: Compare match has occurred.
5	CMFB11	Compare Match Flag B11 0: No compare match has occurred. 1: Compare match has occurred.
4	CMFB10	Compare Match Flag B10 0: No compare match has occurred. 1: Compare match has occurred.
3	CMFB6	Compare Match Flag B6 0: No compare match has occurred. 1: Compare match has occurred.
2	CMFB1	Compare Match Flag B1 0: No compare match has occurred. 1: Compare match has occurred.
1	ICFB0	Input Capture Flag B0 0: No input capture has occurred 1: Input capture has occurred
0	CMFB0	Compare Match Flag B0 0: No compare match has occurred. 1: Compare match has occurred.

The timer status register B (TSRB) is an 8-bit or 16-bit read-only register that indicates occurrence of input capture and compare match.

These status flags indicate occurrence of an interrupt request, and can be cleared to 0 by setting the corresponding bit in timer status clear register B (TSCRB). When an interrupt source occurs while one of these flags is set to 1, an interrupt request is generated again.

Even if flag clear by the corresponding timer status clear register conflicts with flag setting due to occurrence of an interrupt source, an interrupt request is generated.

NOTE

If an interrupt source is generated while the CMFB6 flag is set, the interrupt request is not generated.

TSRB can be read in 8-bit or 16-bit units only.

TSRB is initialized to 0000_H after reset.

Compare Match Flag B6E (CMFB6E)

This status flag indicates that both (or one of) CMFB6 and CMFB6M flags have been set by the setting for IREGB6E in the timer interrupt control register B (TICRB). When 1 is read from this flag, it shows that both (or one of) CMFB6 and CMFB6M flags have been set. This flag cannot be set to 1 or 0 by the software.

- Setting (to 1) condition

When a CMFB6E interrupt request has occurred by the setting of IREGB6E in the timer interrupt control register B (TICRB). For details, see the description of the setting for IREGB6E in TICRB.

- Clearing (to 0) condition

Writing 1 to CMFCB6E in timer status clear register B (TSCRB)

Compare Match Flag B6M (CMFB6M)

This status flag indicates that the multiplied clock counter B6M (TCNTB6M) value was smaller than the input capture register B6 (ICRB6) value at the external input event timing. When 1 is read from this flag, the TCNTB6M value is not larger than the ICRB6 value and the next event input has occurred. This flag cannot be set to 1 or 0 by the software.

- Setting (to 1) condition

When the TCNTB6M count value does not exceed the ICRB6 value and the next event input has occurred

- Clearing (to 0) condition

Writing 1 to CMFCB6M in timer status clear register B (TSCRB)

Compare Match Flag B12 (CMFB12)

This status flag indicates occurrence of a compare match of output compare register B12 (OCRB12) or output compare register B12S1 (OCRB12S1) or output compare register B12S2 (OCRB12S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB12. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1) condition

CHSELB	Setting (to 1) conditions
00	When the TCNTB1 count value matches the OCRB12 value and the next PCLK has occurred
01	When the TCNTB1S1 count value matches the OCRB12S1 value and the next PCLK has occurred
10	When the TCNTB1S2 count value matches the OCRB12S2 value and the next PCLK has occurred
11 (Prohibited)	—

- Clearing (to 0) condition

Writing 1 to CMFCB12 in timer status clear register B (TSCRB)

Compare Match Flag B11 (CMFB11)

This status flag indicates occurrence of a compare match of output compare register B11 (OCRB11) or output compare register B11S1 (OCRB11S1) or output compare register B11S2 (OCRB11S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB11. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1) condition

CHSELB	Setting (to 1) conditions
00	When the TCNTB1 count value matches the OCRB11 value and the next PCLK has occurred
01	When the TCNTB1S1 count value matches the OCRB11S1 value and the next PCLK has occurred
10	When the TCNTB1S2 count value matches the OCRB11S2 value and the next PCLK has occurred
11 (Prohibited)	—

- Clearing (to 0) condition

Writing 1 to CMFCB11 in timer status clear register B (TSCRB)

Compare Match Flag B10 (CMFB10)

This status flag indicates occurrence of a compare match of output compare register B10 (OCRB10) or output compare register B10S1 (OCRB10S1) or output compare register B10S2 (OCRB10S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB10. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1) condition

CHSELB	Setting (to 1) conditions
00	When the TCNTB1 count value matches the OCRB10 value and the next PCLK has occurred
01	When the TCNTB1S1 count value matches the OCRB10S1 value and the next PCLK has occurred
10	When the TCNTB1S2 count value matches the OCRB10S2 value and the next PCLK has occurred
11 (Prohibited)	—

- Clearing (to 0) condition

Writing 1 to CMFCB10 in timer status clear register B (TSCRB)

Compare Match Flag B6 (CMFB6)

This status flag indicates occurrence of a compare match of output compare register B6 (OCRB6). When 1 is read from this flag, it shows that a compare match has occurred in CMFB6. This flag cannot be set to 1 or 0 by the software.

This flag is automatically cleared to 0 at an OCRB7 compare match only when IREGB6 in TICRB is set to 10.

- Setting (to 1) condition

When the TCNTB6 count value matches the OCRB6 value and the next AGCK1 has occurred with compare match enabled by the IOB6 bit in timer I/O control register B (TIORB)

- Clearing (to 0) condition

- Writing 1 to CMFCB6 in timer status clear register B (TSCRB)
- Automatically cleared to 0 at an OCRB7 compare match when IREGB6 = 10.

Compare Match Flag B1 (CMFB1)

This status flag indicates occurrence of a compare match of output compare register B1 (OCRB1), output compare register B1S1 (OCRB1S1), output compare register B1S2 (OCRB1S2). When 1 is read from this flag, this indicates that a compare match has occurred in CMFB1. This flag cannot be set to 1 or 0 by the software.

The compare match for which this status flag is set is specified by the channel select bit (CHSELB).

- Setting (to 1) condition

CHSELB	Setting (to 1) conditions
00	When the TCNTB1 count value matches the OCRB1 value and the next PCLK has occurred
01	When the TCNTB1S1 count value matches the OCRB1S1 value and the next PCLK has occurred
10	When the TCNTB1S2 count value matches the OCRB1S2 value and the next PCLK has occurred
11 (Prohibited)	—

- Clearing (to 0) condition

Writing 1 to CMFCB1 in timer status clear register B (TSCR B)

Input Capture Flag B0 (ICFB0)

This status flag indicates occurrence of an input capture of input capture register B0 (ICRB0), input capture register B0S1 (ICRB0S1), or input capture register B0S2 (ICRB0S2). When 1 is read from this flag, it shows that an input capture has occurred in ICRB0, ICRB0S1, or ICRB0S2. This flag cannot be set to 1 or 0 by the software.

The input capture to set this flag is selected by channel select bit (CHSELB).

- Setting (to 1) condition

CHSELB	Setting (to 1) conditions
00	When the TCNTB0 value has been transferred to ICRB0 at an input capture trigger due to an external event 1_0
01	When the TCNTB0 value has been transferred to ICRB0 at an input capture trigger due to an external event 1_1
10	When the TCNTB0 value has been transferred to ICRB0 at an input capture trigger due to an external event 1_0
11 (Prohibited)	—

- Clearing (to 0) condition

Writing 1 to ICFCB0 in timer status clear register B (TSCR B)

Compare Match Flag B0 (CMFB0)

This status flag indicates occurrence of a compare match of output compare register B0 (OCRB0) or output compare register B0S1 (OCRB0S1) or output compare register B0S2 (OCRB0S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB0. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1) condition

CHSELB	Setting (to 1) conditions
00	When the TCNTB0 count value matches the OCRB0 value and the next clock set by the prescaler has occurred
01	When the TCNTB0 count value matches the OCRB0S1 value and the next clock set by the prescaler has occurred
10	When the TCNTB0 count value matches the OCRB0S2 value and the next clock set by the prescaler has occurred
11 (Prohibited)	—

- Clearing (to 0) condition

Writing 1 to CMFCB0 in the timer status clear register B (TSCRB)

32.6.2.6 TSCRB — Timer Status Clear Register B

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CMFCB 6E	CMFCB 6M	—	CMFCB 12	CMFCB 11	CMFCB 10	CMFCB 6	CMFCB 1	ICFCB0	CMFCB 0

R/W	R	R	R	R	R	R	W	W	R	W	W	W	W	W	W	W

Table 32.44 TSCRB Register Contents

Bit Position	Bit Name	Function
15 to 10	—	These bits are not used. Fix these bits to “0”.
9	CMFCB6E	Compare Match Flag Clear B6E Enable 0: Disabled (Default) 1: CMFB6E in timer status register B (TSRB) is cleared to 0.
8	CMFCB6M	Compare Match Flag Clear B6M Enable 0: Disabled (Default) 1: CMFB6M in timer status register B (TSRB) is cleared to 0.
7	—	This bit is not used. Fix this bit to “0”.
6	CMFCB12	Compare Match Flag Clear B12 Enable 0: Disabled (Default) 1: CMFB12 in timer status register B (TSRB) is cleared to 0.
5	CMFCB11	Compare Match Flag Clear B11 Enable 0: Disabled (Default) 1: CMFB11 in timer status register B (TSRB) is cleared to 0.
4	CMFCB10	Compare Match Flag Clear B10 Enable 0: Disabled (Default) 1: CMFB10 in timer status register B (TSRB) is cleared to 0.
3	CMFCB6	Compare Match Flag Clear B6 Enable 0: Disabled (Default) 1: CMFB6 in timer status register B (TSRB) is cleared to 0.
2	CMFCB1	Compare Match Flag Clear B1 Enable 0: Disabled (Default) 1: CMFB1 in timer status register B (TSRB) is cleared to 0.
1	ICFCB0	Input Capture Flag Clear B0 Enable 0: Disabled (Default) 1: ICFB0 in timer status register B (TSRB) is cleared to 0.
0	CMFCB0	Compare Match Flag Clear B0 Enable 0: Disabled (Default) 1: CMFB0 in timer status register B (TSRB) is cleared to 0.

The timer status clear register B (TSCRB) is an 8-bit or 16-bit readable/writable register to set clearing of flags at occurrence of an input capture or compare match.

TSCRB can be read and written in 16-bit units. When read, “0” is always returned.

TSCRB is initialized to 0000_H after reset.

Compare Match Flag Clear B6E Enable (CMFCB6E)

Writing 1 to this bit while the compare match flag B6E (CMFB6E) in timer status register B (TSRB) is set to 1 clears CMFB6E to 0. This bit is always read as 0.

Compare Match Flag Clear B6M Enable (CMFCB6M)

Writing 1 to this bit while the compare match flag B6M (CMFB6M) in timer status register B (TSRB) is set to 1 clears CMFB6M to 0. This bit is always read as 0.

Compare Match Flag Clear B12 Enable (CMFCB12)

Writing 1 to this bit while the compare match flag B12 (CMFB12) in timer status register B (TSRB) is set to 1 clears CMFB12 to 0. This bit is always read as 0.

Compare Match Flag Clear B11 Enable (CMFCB11)

Writing 1 to this bit while the compare match flag B11 (CMFB11) in timer status register B (TSRB) is set to 1 clears CMFB11 to 0. This bit is always read as 0.

Compare Match Flag Clear B10 Enable (CMFCB10)

Writing 1 to this bit while the compare match flag B10 (CMFB10) in timer status register B (TSRB) is set to 1 clears CMFB10 to 0. This bit is always read as 0.

Compare Match Flag Clear B6 Enable (CMFCB6)

Writing 1 to this bit while the compare match flag B6 (CMFB6) in timer status register B (TSRB) is set to 1 clears CMFB6 to 0. This bit is always read as 0.

Compare Match Flag Clear B1 Enable (CMFCB1)

Writing 1 to this bit while the compare match flag B1 (CMFB1) in timer status register B (TSRB) is set to 1 clears CMFB1 to 0. This bit is always read as 0.

Input Capture Flag Clear B0 Enable (ICFCB0)

Writing 1 to this bit while the input capture flag B0 (ICFB0) in timer status register B (TSRB) is set to 1 clears ICFB0 to 0. This bit is always read as 0.

Compare Match Flag Clear B0 Enable (CMFCB0)

Writing 1 to this bit while the compare match flag B0 (CMFB0) in timer status register B (TSRB) is set to 1 clears CMFB0 to 0. This bit is always read as 0.

32.6.2.7 TICRB — Timer Interrupt Control Register B

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	IREGB6E[1:0]		IREGB6[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 32.45 TICRB Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. Fix these bits to “0”.
3, 2	IREGB6E	Interrupt Enable Edge B6E 00: No interrupt request is output. 01: An interrupt request is output when CMFB6 is enabled and then CMFB6M is enabled or when CMFB6M is enabled and then CMFB6 is enabled (AND condition). 10: An interrupt request is output when CMFB6 or CMFB6M is enabled (OR condition) 11: Setting prohibited
1, 0	IREGB6	Interrupt Enable Edge B6 00: An interrupt request is output when CMFB6 is enabled 01: An interrupt request is output at the next external event selection (AGCK) input timing after CMFB6 is enabled. 10: An interrupt request is output at the second external event selection (AGCK) input timing after CMFB6 is enabled. However, no interrupt request is output if compare match B7 occurs before the second external event selection (AGCK) is input. 11: Setting prohibited

The timer interrupt control register B (TICRB) is an 8-bit readable/writable register to control the compare match interrupt request output timing.

TICRB can be read and written in 8-bit units.

TICRB is initialized to 00_H after reset.

Interrupt Enable Edge B6E (IREGB6E)

These bits select conditions for CMFB6E interrupt request output of TSRB. Operation of these bits is disabled if these bits are set to 00.

While these bits are set to 01, an interrupt request is output at the external event selection (AGCK) input timing at the time when CMFB6M is enabled while a CMFB6 interrupt by the IREGB6 setting is present or at the timing of a CMFB6 interrupt request by the IREGB6 setting with CMFB6M enabled (AND condition). If CMFB6 is cleared even after a CMFB6 interrupt has occurred, no CMFB6E interrupt request is output even while CMFB6M is enabled. Otherwise, if CMFB6M is cleared even while CMFB6M is enabled, a CMFB6 interrupt request by the IREGB6 setting occurs but no CMFB6E interrupt request is output.

While these bits are set to 10, an interrupt request is output when a CMFB6 interrupt by the IREGB6 setting occurs or when CMFB6M is enabled (OR condition). Note that, if the CMFB6 interrupt request timing by the IREGB6 setting differs from the CMFB6M interrupt request timing, respective interrupt requests occur.

However, if the CMFB6 interrupt request timing matches the CMFB6M interrupt request timing, an interrupt request occurs once.

Do not modify these bits while the counter is working or the CMFB6 or CMFB6M bit in TSRB is set to 1. If these bits are modified, this register does not function correctly.

Interrupt Enable Edge B6 (IREGB6)

These bits select CMFB6 interrupt request output timing of TSRB. While these bits are set to 00, a CMFB6 interrupt request is output when CMFB6 is enabled. While these bits are set to 01, an interrupt request is output at the first external event selection (AGCK) input timing after CMFB6 is enabled.

While these bits are set to 10, an interrupt request is output at the second external event selection (AGCK) input timing after CMFB6 is enabled. However, if compare match B7 occurs during the period of waiting for the second external event selection (AGCK) input, CMFB6 is automatically cleared and no interrupt request is output even if the second external event selection (AGCK) is input.

Do not modify these bits while the counter is working or the CMFB6 bit in TSRB is set to 1. If these bits are modified, this register does not function correctly.

32.6.2.8 TIERB — Timer Interrupt Enable Register B

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.46 TIERB Register Contents

Bit Position	Bit Name	Function
15 to 10	—	These bits are not used. Fix these bits to “0”.
9	CMFB6EIE	Compare Match B6E Interrupt Enable 0: Interrupt request by CMFB6E is disabled. 1: Interrupt request by CMFB6E is enabled.
8	CMFB6MIE	Compare Match B6M Interrupt Enable 0: Interrupt request by CMFB6M is disabled. 1: Interrupt request by CMFB6M is enabled.
7	—	This bit is not used. Fix this bit to “0”.
6	CMFB12IE	Compare Match B12 Interrupt Enable 0: Interrupt request by CMFB12 is disabled. 1: Interrupt request by CMFB12 is enabled.
5	CMFB11IE	Compare Match B11 Interrupt Enable 0: Interrupt request by CMFB11 is disabled. 1: Interrupt request by CMFB11 is enabled.
4	CMFB10IE	Compare Match B10 Interrupt Enable 0: Interrupt request by CMFB10 is disabled. 1: Interrupt request by CMFB10 is enabled.
3	CMFB6IE	Compare Match B6 Interrupt Enable 0: Interrupt request by CMFB6 is disabled. 1: Interrupt request by CMFB6 is enabled.
2	CMFB1IE	Compare Match B1 Interrupt Enable 0: Interrupt request by CMFB1 is disabled. 1: Interrupt request by CMFB1 is enabled.
1	ICFB0IE	Input Capture B0 Interrupt Enable 0: Interrupt request by ICFB0 is disabled. 1: Interrupt request by ICFB0 is enabled.
0	CMFB0IE	Compare Match B0 Interrupt Enable 0: Interrupt request by CMFB0 is disabled. 1: Interrupt request by CMFB0 is enabled.

The timer interrupt enable register B (TIERB) is an 8-bit or 16-bit readable/writable register that enables or disables interrupt requests corresponding to the status flags of timer status register B.

TIERB is initialized to 0000_H after reset.

32.6.2.9 CHSELBR — Channel Select Register B

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CHSELB[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.47 CHSELBR Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. When these bits are read, “0” is returned. When writing, write “0”.
1, 0	CHSELB[1:0]	Timer B Channel Select 00: Edge-interval measuring block 0 is selected. 01: Edge-interval measuring block 1 is selected. 10: Edge-interval measuring block 2 is selected. 11: Setting prohibited (Edge-interval measuring block 0 is selected, as same as 00 is specified.)

The channel select register B (CHSELBR) is an 8-bit readable/writable register.

CHSELBR is initialized to 00_H after reset.

Channel Select (CHSELB)

Select the counter to be compared with OCRB20 to OCRB43 for compare match, the output of the edge-interval measuring block to be used in frequency-multiplied clock generator, the source for setting input capture flag B0 (ICFB0), compare match flag B0 (CMFB0), compare match flag B1 (CMFB1), compare match flag B10 (CMFB10), compare match flag B11 (CMFB11) and compare match flag B12 (CMFB12).

32.6.2.10 TCNT4CRB — Multiplied-and-Corrected Clock Generating Counter B4 Control Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CU4SEL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.48 TCNT4CRB Register Contents

Bit Position	Bit Name	Function
7 to 1	—	These bits are not used. When these bits are read, “0” is returned. When writing, write “0”.
0	CU4SEL	TCNTB4 count up setting. 0: TCNTB4 is stopped when TCNTB3 = TCNTB4. The clear value of TCNTB5 is H'00001000. (ATU-IV movement) 1: TCNTB4 is stopped when (TCNTB3 - 1) = TCNTB4. The clear value of TCNTB5 is H'00000000.

The Multiplied-and-Corrected clock generating counter B4 control register (TCNT4CRB) is an 8-bit readable/writable register.

TCNT4CRB is initialized to 00_H after reset.

TCNTB4 count up setting (CU4SEL)

This bit can select the count up conditions of Multiplied-and-Corrected Clock Counter B4 (TCNTB4) and the clear value of Multiplied-and-Corrected Clock Generating Counter B5 (TCNTB5).

CAUTION

When setting “1” to the CU4SEL bit of TCNT4CRB, be sure to set “1” to the CCS bit of Timer I/O Control Register B (TIORB).

32.6.2.11 TCNTB0 — Edge Interval Measuring Counter B0

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNTB0[31:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.49 TCNTB0 Register Contents

Bit Position	Bit Name	Function
31 to 0	CNTB0	Edge Interval Count These bits store 32-bit counter value.

TCNTB0 is a 32-bit readable/writable register that functions as a counter driven by the clock selected in the clock select bit B (CKSELB) of timer control register B (TCRB). TCNTB0 is cleared to 0000 0001_H on input capture by external input event 1_0.

TCNTB0 is started when the timer B enable bit (TBE) in ATU master enable register (ATUENR) is set to 1. Clearing the TBE bit to 0 stops the counting but the counter value is not cleared.

TCNTB0 can be read and written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

TCNTB0 is initialized to 0000 0001_H after reset.

Table 32.52 ICRB0 / DICRB0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ICB0	Input Capture B0 These bits store 32-bit captured value.

ICRB0 is a 32-bit read-only register that is loaded with the value in TCNTB0 when external input event 1_0 is detected. At this time, ICFB0 in timer status register B (TSRB) is set to 1.

When the timer B channel select bits (CHSELB[1:0]) are set to “00”, an interrupt request can be output to the CPU at this ICRB0 input capture timing. TCNTB0 is cleared to 0000 0001_H.

ICRB0 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

ICRB0 is initialized to 0000 0000_H after reset.

The read value of ICRB0 and DICRB0 is select by the set value of CHSELB[1:0], and when CHSELB[1:0] are set to “00”, the value of ICRB0 (edge-interval measuring block) is read. When CHSELB[1:0] are set to “01”, the value of ICRB0S1 (edge-interval measuring block 1) is read, and when CHSELB[1:0] are set to “10”, the value of ICRB0S2 (edge-interval measuring block 2) is read. The read value of MIICRB0 is always that of input capture register B0 (ICRB0).

Table 32.55 RECRB1 to RECRB6 / DRECRB1 Register Contents

Bit Position	Bit Name	Function
31 to 0	RECRB1 to 6	Record Register B1 to B6 These bits store 32-bit event capture value.

Record registers B1 to B6 (RECRB1 to RECRB6) are 32-bit registers that capture the ICRB0, ICRB0S1 or ICRB0S2 value at the timing of external event selection (AGCK) input (event 1 input). Which register RECRB1 captures is selected with the channel select bit (CHSELB).

CHSELB	Captured register RECRB1
00	ICRB0
01	ICRB0S1
10	ICRB0S2
11 (Prohibited)	—

Each time an external event selection (AGCK) is input, the ICRB0, ICRB0S1, ICRB0S2 value is captured by shifting the ICRB0 value to RECRB1, the RECRB1 value to RECRB2, and the RECRB2 value to RECRB3. Thus up to seven past TCNT0B, TCNT0BS1 or TCNT0BS2 values can be retained in ICRB0 and RECRB1 to RECRB6.

RECRB1 to RECRB6 can be read or written in 32-bit units only.

RECRB1 to RECRB6 are used as the calculation value for correction formula in sequencer control.

To initialize these registers, write 0000 0000_H to them.

RECRB1 to RECRB6 are initialized to 0000 0000_H after reset.

A mirror register DRECRB1 is provided to RECRB1. The contents in RECRB1 and DRECRB1 are the same.

Table 32.56 RBURB0 to RBURB6 Register Contents

Bit Position	Bit Name	Function
31 to 0	RBURB0-6	Record Backup Registers B0 to B6 These bits store 32-bit event capture backup value.

Record backup registers B0 to B6 (RBURB0 to RBURB6) are 32-bit registers that back up values of ICRB0 and RECRB1 to RECRB6 in this register at the timing of event compare match between “event counter B1 (TCNTB1) and OCRB12” or “event counter B1S1 (TCNTB1) and OCRB12S1” or “event counter B1S2 and OCRB12S2”.

Which register RBURB0 captures is selected with the channel select bit (CHSELB).

CHSELB	RBURB0 backup factor	Register of a backup target
00	Compare match of TCNTB1 and OCRB12	ICRB0
01	Compare match of TCNTB1S1 and OCRB12S1	ICRB0S1
10	Compare match of TCNTB1S2 and OCRB12S2	ICRB0S2
11 (Prohibited)	—	—

The ICRB0 value is retained in RBURB0, the RECRB1 value in RBURB1, the RECRB2 value in RBURB2, the RECRB3 value in RBURB3, the RECRB4 value in RBURB4, the RECRB5 value in RBURB5, and the RECRB6 value is retained in RBURB6 by compare match genesis timing of OCRB12, OCRB12S1 or OCRB12S2.

RBURB0 to RBURB6 can be read or written in 32-bit units only.

RBURB0 to RBURB6 are initialized to 0000 0000_H after reset.

32.6.2.19 ICRB30 to ICRB37 — Input Capture Registers B30 to B37

Value after reset: 00_H

Table 32.57 ICRB30 to ICRB37 Register Contents

Bit Position	Bit Name	Function
7 to 0	ICRB30 to ICRB37	Input Capture Registers B30 to B37 These bits store 8-bit event capture value.

Input capture registers B30 to B37 (ICRB30 to ICRB37) are 8-bit read-only registers. The event counter B1 (TCNTB1) value is captured at occurrence of any of seven external event inputs 1B to 1I that are input via timer A (ICRB30 to ICRB37). The event counter B1 (TCNTB1) is not cleared at occurrence of any of external event inputs 1B to 1I.

Which register ICRB30-37 captures is selected with the channel select bit (CHSELB).

CHSELB	Register of a backup target
00	TCNTB1
01	TCNTB1S1
10	TCNTB1S2
11 (Prohibited)	—

ICRB30 to ICRB37 can be read in 8-bit units only.

ICRB30 to ICRB37 are initialized to 00_H after reset.

32.6.2.20 OCRB0 — Output Compare Register B0

Table 32.61 TCNTB1 Register Contents

Bit Position	Bit Name	Function
7 to 0	CNTB1	Event Count B1 These bits store 8-bit counter value.

The event counter B1 (TCNTB1) is an 8-bit readable/writable register that counts external event 1_0. According to the setting for the CLRB1 and CLRB1SEL bits in the timer control register B (TCRB), the TCNTB1 value can be cleared to 01_H at the next event input timing after a compare match between TCNTB1 and OCRB10 or between TCNTB6 and OCRB6 occurs.

Unless count operation is enabled by the TBE bit in the ATU master enable register (ATUENR), count operation is not performed even if an external event 1_0 is input.

TCNTB1 can be read or written in 8-bit units only.

TCNTB1 can be written only when TSECRB.EVSEQENB is “0”. Writing to TCNTB1 when TSECRB.EVSEQENB is “1” is prohibited.

TCNTB1 is initialized to 00_H after reset.

32.6.2.24 TCNTB1S1 — Event Counter B1S1

Value after reset: 00_H

Table 32.62 TCNTB1S1 Register Contents

Bit Position	Bit Name	Function
7 to 0	CNTB1S1	Event Count B1S1 These bits store 8-bit counter value.

The event counter B1S1 (TCNTB1S1) is an 8-bit readable/writable register that counts external event 1_1. According to the setting for the CLRBS1 and CLRBS1SELS1 bits in the timer control register B (TCRB), the TCNTB1S1 value can be cleared to 01_H at the next event input timing after a compare match between TCNTB1S1 and OCRB10 or between TCNTB6 and OCRB6 occurs.

Unless count operation is enabled by the TBE bit in the ATU master enable register (ATUENR), count operation is not performed even if an external event 1_1 is input.

TCNTB1S1 can be read or written in 8-bit units only.

TCNTB1S1 can be written only when TSECRB.EVSEQENB is “0”. Writing to TCNTB1S1 when TSECRB.EVSEQENB is “1” is prohibited.

TCNTB1S1 is initialized to 00_H after reset.

32.6.2.25 TCNTB1S2 — Event Counter B1S2

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CNTB1S2[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.63 TCNTB1S2 Register Contents

Bit Position	Bit Name	Function
7 to 0	CNTB1S2	Event Count B1S2 These bits store 8-bit counter value.

The event counter B1S2 (TCNTB1S2) is an 8-bit readable/writable register that counts external event 1_2. According to the setting for the CLRB1S2 and CLRB1SELS2 bits in the timer control register B (TCRB), the TCNTB1S2 value can be cleared to 01_H at the next event input timing after a compare match between TCNTB1S2 and OCRB10 or between TCNTB6 and OCRB6 occurs.

Unless count operation is enabled by the TBE bit in the ATU master enable register (ATUENR), count operation is not performed even if an external event 1_2 is input.

TCNTB1S2 can be read or written in 8-bit units only.

TCNTB1S2 can be written only when TSECRB.EVSEQENB is “0”. Writing to TCNTB1S2 when TSECRB.EVSEQENB is “1” is prohibited.

TCNTB1S2 is initialized to 00_H after reset.

32.6.2.26 OCRB1 — Output Compare Register B1

Value after reset: FF_H

Table 32.64 OCRB1 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB1	Output Compare B1 These bits store 8-bit data to be compared with TCNTB1.

The output compare register B1 (OCRB1) is an 8-bit readable/writable register that is constantly compared with the event counter B1 (TCNTB1). When the timer B channel select bits (CHSELB[1:0]) are set to “00” and the OCRB1 value matches the TCNTB1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB1 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

The input capture register B1 (ICRB1) value is transferred to input capture register B2 (ICRB2) and ICRB1 is cleared at this compare match timing.

OCRB1 can be read or written in 8-bit units only.

OCRB1 is initialized to FF_H after reset.

32.6.2.27 OCRB1S1 — Output Compare Register B1S1

Value after reset: FF_H

Table 32.67 OCRB10 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB10	Output Compare B10 These bits store 8-bit data to be compared with TCNTB1.

The output compare register B10 (OCRB10) is an 8-bit readable/writable register that is constantly compared with the event counter B1 (TCNTB1). When the timer B channel select bits (CHSELB[1:0]) are set to “00” and the OCRB10 value matches the TCNTB1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB10 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

According to the setting for the CLRB1 and CLRB1SEL bits in timer control register B (TCRB), the TCNTB1 value can be cleared to 01_H at the next event input timing after this compare match occurs. Furthermore, according to the setting for the CLRB3 and CLRB3SEL bits in timer control register B (TCRB), the TCNTB3 value can be cleared to 0000 0000_H at the next PCLK timing after this compare match occurs.

OCRB10 can be read or written in 8-bit units only.

OCRB10 is initialized to FF_H after reset.

32.6.2.30 OCRB10S1 — Output Compare Register B10S1

Value after reset: FF_H

Table 32.69 OCRB10S2 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB10S2	Output Compare B10S2 These bits store 8-bit data to be compared with TCNTB1S2.

The output compare register B10S2 (OCRB10S2) is an 8-bit readable/writable register that is constantly compared with the event counter B1S2 (TCNTB1S2). When the timer B channel select bits (CHSELB[1:0]) are set to “10” and the OCRB10S2 value matches the TCNTB1S2 value, an interrupt request due to this compare match can be output to the CPU and the CMFB10 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

According to the setting for the CLRB1S2 and CLRB1SELS2 bits in timer control register BS2 (TCRBS2), the TCNTB1S2 value can be cleared to 01_H at the next event input timing after this compare match occurs.

OCRB10S2 can be read or written in 8-bit units only.

OCRB10S2 is initialized to FF_H after reset.

32.6.2.32 OCRB11 — Output Compare Register B11

Value after reset: FF_H

Table 32.70 OCRB11 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB11	Output Compare B11 These bits store 8-bit data to be compared.

The output compare register B11 (OCRB11) is an 8-bit readable/writable register. According to the setting for the PIMRSEL bit in timer control register B (TCRB), when the timer B channel select bits (CHSELB[1:0]) are set to “00”, this register can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 during a compare match between TCNTB1 and OCRB11. PIMR1 is always used for up-count values of TCNTB3.

When the timer B channel select bits (CHSELB[1:0]) are set to “00” and the TCNTB1 value matches the OCRB11 value, an interrupt request due to this compare match can be output to the CPU and the CMFB11 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB11 can be read or written in 8-bit units only.

OCRB11 is initialized to FF_H after reset.

32.6.2.33 OCRB11S1 — Output Compare Register B11S1

Value after reset: FF_H

Table 32.71 OCRB11S1 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB11S1	Output Compare B11S1 These bits store 8-bit data to be compared.

The output compare register B11S1 (OCRB11S1) is an 8-bit readable/writable register. According to the setting for the PIMRSEL bit in timer control register B (TCRB), when the timer B channel select bits (CHSELB[1:0]) are set to “01”, this register can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 during a compare match between TCNTB1S1 and OCRB11S1. PIMR1 is always used for up-count values of TCNTB3.

When the timer B channel select bits (CHSELB[1:0]) are set to “01” and the TCNTB1S1 value matches the OCRB11S1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB11S1 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB11S1 can be read or written in 8-bit units only.

OCRB11S1 is initialized to FF_H after reset.

32.6.2.34 OCRB11S2 — Output Compare Register B11S2

Value after reset: FF_H

Table 32.72 OCRB11S2 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB11S2	Output Compare B11S2 These bits store 8-bit data to be compared.

The output compare register B11S2 (OCRB11S2) is an 8-bit readable/writable register. According to the setting for the PIMRSEL bit in timer control register B (TCRB), when the timer B channel select bits (CHSELB[1:0]) are set to “10”, this register can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 during a compare match between TCNTB1S2 and OCRB11S2. PIMR1 is always used for up-count values of TCNTB3.

When the timer B channel select bits (CHSELB[1:0]) are set to “10” and the TCNTB1S2 value matches the OCRB11S2 value, an interrupt request due to this compare match can be output to the CPU and the CMFB11S2 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB11S2 can be read or written in 8-bit units only.

OCRB11S2 is initialized to FF_H after reset.

Table 32.81 ICRB2S2 Register Contents

Bit Position	Bit Name	Function
31 to 0	ICB2S2	Input Capture B2S2 These bits store 32-bit input capture value.

ICRB2S2 is a 32-bit read-only register. ICRB1S2 keeps a running total of the value in input capture register B1S2 (ICRB1S2) on compare match between event counter B1S2 (TCNTB1S2) and output compare register B1S2 (OCRB1S2).

ICRB2S2 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.

ICRB2S2 is initialized to 0000 0000_H after reset.

32.6.2.44 LDB — Load Register B

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.82 LDB Register Contents

Bit Position	Bit Name	Function
31 to 24	—	These bits are not used. Fix these bits to “0”.
23 to 0	LDVAL	Load Value These bits store 24-bit data to be loaded to TCNTB2 and RLDB.

LDB is a 32-bit readable/writable register that is mapped to the lower-order 24 bits on a 32-bit boundary. The lower 24 bits are available.

When the LDSEL bit in timer I/O control register B (TIORB) is set to 1, the value in this register is loaded to reloadable counter B2 (TCNTB2) and reload register B (RLDB).

LDB can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

LDB is initialized to 0000 0000_H after reset.

32.6.2.45 RLDB — Reload Register B

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.83 RLDB Register Contents

Bit Position	Bit Name	Function
31 to 8	RLDVAL	Reload Value These bits store 24-bit reload value.
7 to 0	—	These bits are not used. Fix these bits to “0”.

RLDB is a 32-bit readable/writable register that is aligned with a longword boundary. The upper 24 bits are available.

This register is updated when the externally input event selection (AGCK) is detected while the LDEN bit in timer I/O control register B (TIORB) is cleared to 0.

The value in input capture register B0 (ICRB0)*¹ or load register B (LDB) minus the value in the PIMR bits in PIM is used for updating. According to the setting for the PIMRSEL bit in timer control register B (TCRB) and a compare match between TCNTB1 and OCRB11*², PIMR2 is used as the PIMR value. In other cases, PIMR1 is used as the PIMR value. ICRB0*¹ or LDB is set by the LDSEL bit in TIORB. For subtraction on ICRB0*¹ and PIMR, the lower 24 bits of ICRB0*¹ and PIM which is zero-extended.

The value in this register is added to the value in TCNTB2 on the first counter clock after the value in bits reload count B2 (CNTB2) is equal to or less than the value in the pulse interval multiplier register (PIM).

RLDB can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

RLDB is initialized to 0000 0000_H after reset.

Initial setting is required for RLDB before starting timer B counter operation. For details, see **Section 32.6.3, Details of Operation**.

Note 1. CHSELB is used for ICRB0 at 00_B, and CHSELB is used for ICRB0S1 at 01_B, and CHSELB is used for ICRB0S2 at 10_B.

Note 2. CHSELB moves at 00_B for a compare match of TCNTB1 and OCRB11, and CHSELB moves at 01_B for a compare match of TCNTB1S1 and OCRB11S1, and CHSELB moves at 10_B for a compare match of TCNTB1S2 and OCRB11S2.

32.6.2.46 TCNTB2 — Reloadable Counter B2

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 32.84 TCNTB2 Register Contents

Bit Position	Bit Name	Function
31 to 8	CNTB2	Reload Counter B2 These bits store 24-bit reload counter value.
7 to 0	—	These bits are not used. Fix these bits to "0".

TCNTB2 is a down counter mapped to 24 bits in a 32-bit readable and writable register and functions as a counter driven by the clock selected by the clock selection B bits (CKSELB0 to CKSELB2) in timer control register B (TCRB). Each decrementation by the value set in the pulse interval multiplier register (PIMR). According to the setting for the PIMRSEL bit in timer control register B (TCRB) and in response to a compare match between TCNTB1 and OCRB11*¹, PIMR2 is used as the PIMR value. In other cases, PIMR1 is used as the PIMR value.

When the TBE bit in ATU master enable register (ATUENR) is set to 1, counting is not performed. Even if the TBE bit is cleared to 0, this counter is not cleared.

The TCNTB2 value is updated when the externally input event selection (AGCK) is detected while the LEDN bit in timer I/O control register B (TIORB) is cleared to 0.

The value in input capture register B0 (ICRB0)*² or load register B (LDB) is used for updating. ICRB0*² or LDB can be set by the LDSEL bit in TIORB.

The value in reload register B (RLDB) is added to the value stored in this counter on the first counter clock cycle after the value in this counter is equal to or less than the value in PIM. The frequency-multiplied clock (AGCK1) is output as a train of single pulses equal in width to the cycle of the PCLK clock on reloading.

TCNTB2 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

TCNTB2 is initialized to 0000 0000_H after reset.

Initial setting is required for TCNTB2 before starting timer B counter operation. For details, see **Section 32.6.3, Details of Operation**.

Note 1. CHSELB uses PIMR2 by a compare match of TCNTB1 and OCRB11 at 00_B, the compare match by which CHSELB is TCNTB1S1 and OCRB11S1 at 01_B, the compare match of TCNTB1S2 and OCRB11S2 at 10_B.

Note 2. CHSELB uses ICRB0 as renewal data at 00_B. When CHSELB is 01_B, ICRB0S1 is used, and CHSELB uses ICRB0S2 as renewal data at 10_B.

32.6.2.47 PIMR1 — Pulse Interval Multiplier Register 1

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PIM1[11:0]

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.85 PIMR1 Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. Fix these bits to “0”.
11 to 0	PIM1	Pulse Interval Multiplier 1 These bits set the multiplication ratio for the frequency-multiplied clock. The settable value ranges from 1 to 4095.

PIMR1 is a 16-bit readable/writable register that sets the multiplication ratio of the externally input event for generation of the frequency-multiplied clock.

The settable value ranges from 1 (001_H) to 4095 (FFF_H). Do not set the PIM bits to 000_H. If the PIM bits are set to 000_H, operation cannot be guaranteed.

The value in this register is used in various registers: as the step size in decrementation of reloadable counter B2 (TCNTB2); for calculation of the value to be input to reload register B (RLDB); and for calculation of the value to be input to corrected event counter B3 (TCNTB3). However, when a compare match between TCNTB1 and OCRB11*¹ occurs with the PIMRSEL bit in timer control register B (TCRB) set to 1, PIMR2 is used to calculate the TCNTB2 down-count value and the RLDB input value. PIMR1 is always used to calculate the TCNTB3 input value

PIMR1 can be read or written in 16-bit units only. Do not write or read 8-bit data for this register.

PIMR1 is initialized to 0001_H after reset.

Note 1. CHSELB uses PIMR2 by a compare match of TCNTB1 and OCRB11 at 00_B, the compare match by which CHSELB is TCNTB1S1 and OCRB11S1 at 01_B, the compare match of TCNTB1S2 and OCRB11S2 at 10_B.

32.6.2.48 PIMR2 — Pulse Interval Multiplier Register 2

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PIM2[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.86 PIMR2 Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. Fix these bits to “0”.
11 to 0	PIM2	Pulse Interval Multiplier 2 These bits set the multiplication ratio for the frequency-multiplied clock. The settable value ranges from 1 to 4095.

The pulse interval multiplier register 2 (PIMR2) is a 16-bit readable/writable register that is mapped to the lower 12 bits. PIMR2 sets the multiplication ratio of the frequency-multiplied clock when tooth is missing.

The settable value ranges from 1 (001_H) to 4095 (FFF_H). Do not set the PIM2 bits to 000_H. If the PIM2 bits are set to 000_H, operation cannot be guaranteed.

By setting the PIMRSEL bit in timer control register B (TCRB), the reload counter B2 (TCNTB2) performs down-counting with the set PIMR2 value (PIM2) (not with the PIMR1 value) while the TCNTB1 value is equal to the OCRB11 value*¹. The PIMR2 value is also used to calculate the reload register B (RLDB) input value, but is not used to calculate the correction event counter B3 (TCNTB3) input value. The multiplication ratio of the frequency-multiplied clock at missing tooth is corrected by setting a value of (N (number of missing teeth) + 1) times for the PIMR1 value. When the number of missing teeth is 2, for example, a value of (PIMR1 value × 3) is set for PIMR2.

PIMR2 can be read or written in 16-bit units only. Do not write or read 8-bit data for this register.

PIMR2 is initialized to 0001_H after reset.

Note 1. CHSELB uses PIMR2 by a compare match of TCNTB1 and OCRB11 at 00_B, the compare match by which CHSELB is TCNTB1S1 and OCRB11S1 at 01_B, the compare match of TCNTB1S2 and OCRB11S2 at 10_B.

32.6.2.49 TCNTB6 — Multiplied Clock Counter B6

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.87 TCNTB6 Register Contents

Bit Position	Bit Name	Function
31 to 12	CNTB6	Frequency-Multiplied Clock Count B6 These bit store 20-bit counter value driven by the frequency-multiplied clock.
11 to 0	—	These bits are not used. Fix these bits to “0”.

The multiplied clock counter B6 (TCNTB6) is a 20-bit up-counter mapped in the 32-bit readable/ writable register. TCNTB6 performs up-counting on the frequency-multiplied clock (AGCK1). This counter is cleared to 00000_H when the external input event selection (AGCK) is detected.

When the TBE bit in ATU master enable register (ATUENR) is set to 1, counting is not performed. Even if the TBE bit is cleared to 0 and counting up is stopped, the counter value is not cleared.

TCNTB6 can be read or written in 32-bit units only. Do not write or read 16-bit data for this register.

TCNTB6 is initialized to 0000 0000_H after reset.

32.6.2.50 ICRB6 — Input Capture Register B6

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.88 ICRB6 Register Contents

Bit Position	Bit Name	Function
31 to 12	ICB6	Input Capture B6 These bits store 20-bit input capture value.
11 to 0	—	These bits are not used. Fix these bits to “0”.

The input capture register B6 (ICRB6) is a 32-bit read-only register that is mapped to upper 20 bits. No value can be written to this register.

When an external event selection (AGCK) input is detected, ICRB6 stores the TCNTB6 value at the next clock (PCLK) timing. The value stored in ICRB6 is compared with the TCNTB6M value at the next external event selection input timing. When the ICRB6 value is larger than the TCNTB6M value, an interrupt request can be output.

ICRB6 can be read in 32-bit units only.

ICRB6 is initialized to 0000 0000_H after reset.

32.6.2.51 RARB6 — Multiplication Setting Register B6

Value after reset: 40_H

Bit	7	6	5	4	3	2	1	0

Table 32.89 RARB6 Register Contents

Bit Position	Bit Name	Function
7 to 0	RARB6	Multiplication Setting Register B6 These bits set the TCNTB6M count value.

The multiplication setting register B6 (RARB6) is an 8-bit readable/writable register to set an up-count value of the frequency-multiplied clock counter B6M (TCNTB6M). RARB6 handles the lower 6 bits as fixed point. A multiplication of 1 to 3.984375 can be set with a resolution of 1/64.

RARB6 can be read or written in 8-bit units only.

RARB6 is initialized to 40_H after reset.

32.6.2.52 TCNTB6M — Frequency-Multiplied Clock Counter B6M

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Table 32.90 TCNTB6M Register Contents

Bit Position	Bit Name	Function
31 to 6	CNTB6M	Frequency-Multiplied Clock Count B6M 26-bit frequency-multiplied clock count value
5 to 0	—	These bits are not used. Fix these bits to “0”.

The frequency-multiplied clock counter B6M (TCNTB6M) is a 32-bit readable/writable register (up-counter) that is mapped to upper 26 bits. TCNTB6M performs count-up operation with a count value of multiplication that is set in multiplication setting register B6 (RARB6) for the frequency-multiplied clock (AGCK1). TCNTB6M handles the lower 6 bits (b11 to b6) as fixed point, and can count within a range of 1 to 1048575.984375 with a resolution of 1/64. Each time an external event selection (AGCK) is input, the TCNTB6M value is compared with the ICRB6 value. When ICRB6 is larger than TCNTB6M, an interrupt request can be output. TCNTB6M is initialized to 0000 0000_H at the first clock (PCLK) timing after occurrence of an external event selection input.

Setting the TBE bit in the ATU master enable register (ATUENR) to 1 starts counting of this counter. Clearing the TBE bit to 0 stops counting but the counter value is not cleared.

TCNTB6M can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

TCNTB6M is initialized to 0000 0000_H after reset.

32.6.2.53 OCRB6 — Output Compare Register B6

Value after reset: FFFF F000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OCB6[31:16]

Table 32.91 OCRB6 Register Contents

Bit Position	Bit Name	Function
31 to 12	OCB6	Output Compare B6 These bits store 20-bit data to be compared
11 to 0	—	These bits are not used. Fix these bits to "0".

OCRB6 is a 32-bit readable/writable register in which output compare B6 (OCB6) is mapped to upper 20 bits in 32 bits. Whether to perform compare match between multiplied-clock counter B6 and OCRB6 can be selected by the IOB6 setting of timer I/O control register B (TIORB).

The OCRB6 value is compared with the TCNTB6 value. When input of the frequency-multiplied clock signal (AGCK1) leads to the values matching, a missing tooth detection trigger is generated, which leads to setting of the CMFB6 bit in timer status register B (TSRB) to 1 and can also cause the output of an interrupt request for the CPU.

According to the setting for the CLRB1 and CLRB1SEL bits in the timer control register B (TCRB) and this compare match occurrence, the TCNTB1, TCNT1S1 and TCNT1S2 value can be cleared to 01_H at the next event input timing. Furthermore, according to the setting for the CLRB3 and CLRB3SEL bits in the timer control register B (TCRB) and this compare match occurrence, the TCNTB3 value can be cleared to 0000 0000_H at the next PCLK timing.

OCRB6 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

OCRB6 is initialized to FFFF F000_H after reset.

32.6.2.54 OCRB7 — Output Compare Register B7

Value after reset: FFFF F000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.92 OCRB7 Register Contents

Bit Position	Bit Name	Function
31 to 12	OCB7	Output Compare B7 These bit store 20-bit data to be compared.
11 to 0	—	These bits are not used. Fix these bits to “0”.

OCRB7 is a 32-bit readable/writable register in which output compare B7 (OCB7) is mapped to upper 20 bits in 32 bits.

The OCRB7 value is compared with the TCNTB6 value. When the frequency-multiplied clock (AGCK1) is input with these values matching, a compare match occurs. When the IREGB6 bits in timer interrupt control register B (TICRB) are set to 10, the CMFB6 bit in timer status register B (TSRB) is cleared to 0 at an occurrence of this compare match.

There is no status flag or interrupt request that indicates occurrence of a compare match of OCRB7.

OCRB7 can be read or written in 32-bit units only. Do not write or read 16-bit data for this register.

OCRB7 is initialized to FFFF F000_H after reset.

32.6.2.55 OCRB20 to OCRB43 — Output Compare Registers B20 to 43

Value after reset: FF_H

Bit	7	6	5	4	3	2	1	0

Table 32.93 OCRB20 to OCRB43 Register Contents

Bit Position	Bit Name	Function
7 to 0	OCB20 to OCB43	Output Compare B20 to B43 These bits store 8-bit value to be compared.

The output compare registers B20 to B43 (OCRB20 to OCRB43) are 8-bit readable/writable register.

During timer B operation, one of OCRB20 to OCRB43 that is selected by the sequencer is constantly compared with TCNTB1, and if its value matches the TCNTB1 value, the sequencer transits at the next external event selection (AGCK).

There is no status flag or interrupt request that indicates occurrence of a compare match of OCRB20 to OCRB43.

OCRB20 to OCR43 can be read or written in 8-bit units only.

OCRB20 to OCRB43 are initialized to FF_H after reset.

The register that is compared with TCNTB1*¹ functions as following according to the status of the sequencer.

If the sequencer status bit (SEQB) in the timer sequencer register (TSEQRB) is “x”, the output compare register OCRB (20 + x – 1) is compared with TCNTB1 (x = 1 to 24).

While the sequencer is running, it is prohibited to rewrite the compare registers corresponding to the sequence numbers enabled by the timer sequencer enable bits TSEQNEN[23:0].

Compare register/Compare match	Transition of sequencer
OCRB20 compare match	The sequencer transits at the first external event selection (AGCK) after compare match. Example: State 0 → State 1
:	
OCRB43 compare match	

Note 1. When CHSELB is 00_B, TCNTB1 counter compares, and when CHSELB is 01_B, TCNTB1S1 counter compares, and when CHSELB is 10_B, TCNTB1S2 counter compares.

32.6.2.56 TSEQCRB — Timer Sequencer Control Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	EVSEQENB
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.94 TSEQCRB Register Contents

Bit Position	Bit Name	Function
7 to 1	—	These bits are not used. Fix these bits to “0”.
0	EVSEQENB	Event Input Cycle Correction Sequencer Enable 0: Sequencer operation is disabled. Correction is not performed. 1: Sequencer operation is enabled.

The timer sequencer control register (TSEQRB) is an 8-bit readable/writable register.

The ECSEQENB bit enables the sequencer operation for correcting the timer B event input cycle. If ECSEQENB is changed from 1 to 0, the sequencer inside is initialized after next external event selection (AGCK) input timing.

TSEQRB can be read or written in 8-bit units only.

TSEQRB is initialized to 00_H after reset.

32.6.2.57 TSEQRB — Timer Sequencer Register

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	FONS	—	—	SEQB[4:0]				
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.95 TSEQRB Register Contents

Bit Position	Bit Name	Function
7	FONS	Correction Formula Enable Status 0: Correction is disabled. 1: Correction is enabled.
6, 5	—	These bits are not used. Fix these bits to “0”.
4 to 0	SEQB	Sequencer Status 00000: The sequencer is in State 0. : 11000: The sequencer is in State 24.

The timer sequencer register (TSEQRB) is an 8-bit read-only register that generates AGCK cycle according to the sequencer state.

TSEQRB can be read or written in 8-bit units only.

TSEQRB is initialized to 00_H after reset.

32.6.2.58 TSEQENB0 to TSEQENB2 — Timer Sequencer Enable Registers 0 to 2

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSEQNENB15-8								TSEQNENB7-0							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.96 TSEQENB0 to TSEQENB2 Register Contents

Bit Position	Bit Name	Function
31 to 24	—	These bits are not used. Fix these bits to “0”.
23 to 16	TSEQNENB x (x = 23 to 16)	Sequencer Enable 0: Do not transit to the target sequencer state. 1: Transit to the target sequencer state and perform correction.
15 to 8	TSEQNENB x (x = 15 to 8)	Sequencer Enable 0: Do not transit to the target sequencer state. 1: Transit to the target sequencer state and perform correction.
7 to 0	TSEQNENB x (x = 7 to 0)	Sequencer Enable 0: Do not transit to the target sequencer state. 1: Transit to the target sequencer state and perform correction.

Timer sequencer enable registers 0 to 2 (TSEQENB0 to TSEQENB2) are 8-bit readable/writable registers that control transition of the sequencer to the state upon detection of a compare match between TCNTB1*¹ and OCRB20 to OCRB43.

TSEQENB0 to TSEQENB2 can be read or written in 8-bit units only.

TSEQENB0 to TSEQENB2 are initialized to 00_H after reset.

Note 1. When CHSELB is 00_B, TCNTB1 counter compares, and when CHSELB is 01_B, TCNTB1S1 counter compares, and when CHSELB is 10_B, TCNTB1S2 counter compares.

32.6.2.59 TEPCFB0 to TEPCFB23 — Timer Event Cycle Correction Formula Definition Registers B0 to 23

Table 32.98 TCNTB3 Register Contents

Bit Position	Bit Name	Function
31 to 12	CNTB3	Correction Event Counter B3 20-bit event counter value
11 to 0	—	These bits are not used. Fix these bits to “0”.

Correction event counter B3 (TCNTB3) is a 20-bit up-counter that is mapped a 32-bit readable/writable register.

When ex external event selection (AGCK) is input, TCNTB3 transfers the counter value to correction counter B4 (TCNTB4) and then starts up counting using the value of pulse interval multiplier register 1 (PIMR1). The value of pulse interval multiplier register 2 (PIMR2) is not used for up-counting of TCNTB3.

TCNTB3 does not perform counting if the TBE bit of ATU master enable register (ATUENR) is not set to “1”. The counter value is not cleared if TBE is cleared to “0”.

According to the setting for the CLRB3 and CLRB3SEL bits in the timer control register B (TCRB), the TCNTB3 value can be cleared to 0000 0000_H at the next PCLK timing after a compare match*¹ between TCNTB1 and OCRB10 or between TCNTB6 and OCRB6 occurs.

TCNTB3 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

TCNTB3 is initialized to 0000 0000_H after reset.

Note 1. CHSELB uses by compare match of TCNTB1 and OCRB11 at 00_B, the compare match by which CHSELB is TCNTB1S1 and OCRB10S1 at 01_B, the compare match of TCNTB1S2 and OCRB10S2 at 10_B.

32.6.2.61 OCRB8 — Output Compare Register B8

Value after reset: FFFF F000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.99 OCRB8 Register Contents

Bit Position	Bit Name	Function
31 to 12	OCB8	Output Compare B8 These bits store 20-bit value to be compared with TCNTB3.
11 to 0	—	These bits are not used. Fix these bits to “0”.

Output Compare Register B8 (OCRB8) is a 32-bit readable/writable register in which output compare B8 (OCB8) bits are mapped to the upper 20 bits.

The OCRB8 value is compared with the TCNTB3 value. When TCNTB3 clear (due to a compare match between OCRB8 and TCNTB3) is enabled by bit 4 and bit 3 in the timer control register B (TCRB), the TCNTB3 value is cleared to 0 at the first PCLK timing after a compare match between the OCRB8 value and the TCNTB3 value. OCRB8 has no compare match status flag or interrupt

OCRB8 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

OCRB8 is initialized to FFFF F000_H after reset.

32.6.2.62 TEPCFENB0 to TEPCFENB2 — Timer Event Cycle Correction Enable Registers 0 to 2

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.100 TEPCFENB0 to TEPCFENB2 TEPCFENB0 to TEPCFENB2

Bit Position	Bit Name	Function
31 to 24	—	These bits are not used. Fix these bits to “0”.
23 to 16	FONx	Event Input Cycle Correction Formula x Correction Enable 0: The correction formula is disabled in sequencer state x. (AGCK1 multiplication cycle is calculated using the ICRB0 value only.) 1: The correction formula is enabled in sequencer state x.
15 to 8	FONx	Event Input Cycle Correction Formula x Correction Enable 0: The correction formula is disabled in sequencer state x. (AGCK1 multiplication cycle is calculated using the ICRB0 value only.) 1: The correction formula is enabled in sequencer state x.
7 to 0	FONx	Event Input Cycle Correction Formula x Correction Enable 0: The correction formula is disabled in sequencer state x. (AGCK1 multiplication cycle is calculated using the ICRB0 value only.) 1: The correction formula is enabled in sequencer state x.

Timer event cycle correction enable registers 0 to 2 (TEPCFENB0 to TEPCFENB2) are 8-bit readable/writable registers. TEPCFENB0 to TEPCFENB2 enables and disables the correction formula that is set by the TEPCFBx and TEPCOEFFBx registers in sequencer state x indicated by the TSEQRB register (x = 0 to 23).

TEPCFENB0 to TEPCFENB2 can be read or written in 8-bit units only.

TEPCFENB0 to TEPCFENB2 are initialized to 00_H after reset.

32.6.2.63 TEPCVALRB0 — Timer Event Input Cycle Correction Result Retention Register

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.101 TEPCVALRB0 Register Contents

Bit Position	Bit Name	Function
31-0	TEPCVALB0	Timer Event Input Cycle Correction Result Retention 0 These bits store 32-bit timer event input cycle correction result.

The timer event input cycle correction result retention register (TEPCVALRB0) is a 32-bit read-only register. TEPCVALRB0 captures the ICRB0 register value*¹ that is corrected according to the setting in timer event cycle correction formula definition registers B0 to B23 (TEPCFB0 to TEPCFB23) and timer event cycle correction formula enable register B0 to B2 (TEPCFENB0 to TEPCFENB2).

TEPCVALRB0 can be read in 32-bit units only.

TEPCVALRB0 is initialized to 0000 0000_H after reset.

Note 1. CHSELB revises ICRB0 register value at 00_B. CHSELB revises ICRB0S1 register value at 01_B also CHSELB revises ICRB0S2 register value at 10_B.

32.6.2.64 TEPCRECRB1 — Timer Event Input Cycle Correction Result Log Register

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.102 TEPCRECRB1 Register Contents

Bit Position	Bit Name	Function
31 to 0	TEPCRECRB1	Timer Event Input Cycle Correction Log 1 These bits store 32-bit event captured value.

The timer event input cycle correction result log register (TEPCRECRB1) is a 32-bit read-only register that captures the TEPCVALRB0 register value when a timer B external event selection (AGCK) is input.

TEPCRECRB1 can be read in 32-bit units only.

TEPCRECRB1 is initialized to 0000 0000_H after reset.

32.6.2.65 TCNTB4 — Multiplied-and-Corrected Clock Counter B4

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNTB4[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNTB4[15:12]				—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.103 TCNTB4 Register Contents

Bit Position	Bit Name	Function
31 to 12	CNTB4	Multiplied-and-Corrected Clock Counter B4 These bits store 20-bit frequency-multiplied clock count value.
11 to 0	—	These bits are not used. Fix these bits to “0”.

The multiplied-and-corrected clock counter B4 (TCNTB4) is a 20-bit up-counter mapped in the 32-bit readable/writable register.

The value in TCNTB3 is loaded to this counter when the externally input event selection (AGCK) is detected.

This up-counter is driven by the frequency-multiplied clock (AGCK1) output by reload counter B2 (TCNTB2) and is cleared to 00000_H when the externally input event selection is detected while CNTB3 = 00000_H.

When the values in this counter and TCNTB3 match with the CCS bit in timer I/O control register B (TIORB) set to 1, counting is stopped*1. When the CCS bit is set to 0, counting is continued.

When the TBE bit in ATU master enable register (ATUENR) is set to 1, counting is not performed. Even if the TBE bit is cleared to 0 and counting is stopped, the counter value is not cleared.

TCNTB4 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

TCNTB4 is initialized to 0000 0000_H after reset.

Note 1. When CU4SEL is 0, and then count up to the value of TCNTB3 matches TCNTB4. When CU4SEL is 1, and then count up to the value of “TCNTB3 - 1” matches TCNTB4.

32.6.2.66 TCNTB5 — Multiplied-and-Corrected Clock Generating Counter B5

Value after reset: 0000 1000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNTB5[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNTB5[15:12]				—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.104 TCNTB5 Register Contents

Bit Position	Bit Name	Function
31 to 12	CNTB5	Multiplied-and-Corrected Clock Generation Count B5 These bit store 20-bit multiplied-and-corrected clock count value.
11 to 0	—	These bits are not used. Fix these bits to “0”.

The multiplied-and-corrected clock generating counter B5 (TCNTB5) is a 20-bit up-counter mapped in the 32-bit readable/writable register.

This counter is enabled by the TBE bit in ATU master enable register (ATUENR) and the count control B5 bit (CTCNTB5). Incrementation of this counter is driven by the PCLK as long as the counter value is less than the value in multiplied-and-corrected clock counter B4 (TCNTB4).

Incrementation is stopped when the counter value matches the value in correcting counter clearing register (TCCLRB).

The value in this counter is corrected and cleared when the externally input event selection (AGCK) is detected while CNTB3 = 0000_H. The value for the clearing depends on the counter value.

- When TCNTB5 = TCCLRB

This counter is cleared. The corrected counter clear flag register B (TCCLFRB) retains 0.

- When TCNTB5 ≠ TCCLRB

The TCCLFB bit of correction counter clear flag register (TCCLFRB) is set to “1”, and TCNTB5 continues counting automatically. When the counter value reaches the value in TCCLRB, TCNTB5 is cleared and the TCCLFB bit is cleared to “0”.

The clear value of TCNTB5 is different depending on setting of the CU4SEL bit of “Multiplied-and-Corrected Clock Generating Counter B4 Control Register (TCNT4CRB)”.

When the CU4SEL bit is set to “0”, the value is cleared to 0000 1000_H.

When the CU4SEL bit is set to “1”, the value is cleared to 0000 0000_H.

Every incrementation of this counter, a single pulse of the multiplied-and-corrected clock (AGCKM) is output. The clock can be output on clock-bus line 5 by setting the CB5SEL bit in clock bus control register (CBCNT) to 1. The output of the clock is temporarily stopped by altering the setting in bit CTCNTB5 in the TIORB during counting.

TCNTB5 can be read or written in 32-bit units only. Do not write or read 16-bit data for this register.

TCNTB5 is initialized to 0000 1000_H after reset.

Initial setting is required for TCNTB5 (make the contents of TCNTB5 and TCCLR5 the same) before starting timer B counter operation. For details, see **Section 32.6.3, Details of Operation**.

32.6.2.67 TCCLFRB — Correcting Counter Clear Flag Register B

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCCLFB
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.105 TCCLFRB Register Contents

Bit Position	Bit Name	Function
7 to 1	—	These bits are not used. Fix these bits to “0”.
0	TCCLFB	Correcting Counter Clear Flag B 0: TCNTB5 is not automatically counting up. (Default) 1: TCNTB5 is automatically counting up until it matches the TCCLR B value.

The correcting counter clear flag register B (TCCLFRB) is an 8-bit read-only register that indicates whether the function of correcting TCNTB5 (the automatic up-counting function that continues counting until TCNTB5 = TCCLR B) is enabled or disabled.

TCCLFRB can be read in 8-bit units only.

TCCLFRB is initialized to 00_H after reset.

Correcting Counter Clear Flag B (TCCLFB)

This status flag shows that the function of correcting TCNTB5 is enabled and the automatic up-counting function continues until TCNTB5 = TCCLR B. When 1 is read from this flag, it shows that TCNTB5 is automatically up-counting until TCNTB5 = TCCLR B. This flag cannot be set to 1 or 0 by the software.

- Setting (to 1) conditions
 - When an external event selection is input with TCNTB3 = 0000_H and TCNTB5 ≠ TCCLR B while TCNTB5 is automatically up-counting until it reaches the TCCLR B value
- Clearing (to 0) condition
 - When TCNTB5 value has reached the TCCLR B value after counting with the TCCLFB bit set to 1, the TCNTB5 value has matched the TCCLR B value, and TCNTB5 has been cleared*¹

Note 1. CU4SEL clears TCNTB5 in 0000 1000_H at 0. CU4SEL clears TCNTB5 in 0000 0000_H at 1.

32.6.2.68 TCCLRB — Correcting Counter Clearing Register B

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.106 TCCLRB Register Contents

Bit Position	Bit Name	Function
31 to 12	CCLRB	Correcting Counter Clear B These bits store 20-bit correcting counter clear value.
11 to 0	—	These bits are not used. Fix these bits to “0”.

The correcting counter clearing register B (TCCLRB) is a 32-bit readable/writable register mapped to upper 20 bits in 32 bits.

TCCLRB is constantly compared with TCNTB5. When they match, TCNTB5 is stopped and a counter clearing trigger is output to timer D. TCNT1Dx and TCNT2Dx in timer D are separately cleared by setting the corresponding counter clearing enable bit in timer control register Dx (TCRDx).

TCCLRB can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.

TCCLRB is initialized to 0000 0000_H after reset.

32.6.3 Details of Operation

32.6.3.1 Edge Interval Measuring Function and Edge Input Stopping Function

For timer B, input-capture and compare-match operations are unconditionally performed with 32-bit input capture register B0 (ICRB0) and 32-bit output compare register B0 (OCRB0), respectively.

These registers are connected to input edge-interval measuring counter B0 (TCNTB0).

Operation of timer B is started by setting the TBE bit in the ATU master enable register (ATUENR).

ICRB0 captures the TCNTB0 value when an external-event 1_0 is input via timer A. At the same time, TCNTB0 is set to 0000 0001_H. An interrupt request can be output to the CPU at this capture timing*¹. This enables measurement of the time of edge-to-edge interval.

The value captured in ICRB0*¹ is transferred to the frequency-multiplied clock generating block to be used as an input value to the reload counter B2 (TCNTB2) and the reload register B (RLDB).

Furthermore, up to six captured values (ICRB0*¹) can be retained in the record registers B1 to B6 (RECRB1 to RECRB6) at the external input event selection (AGCK) timing. Values retained in ICRB0*¹ and RECRB1 to RECRB6 are backed up in the record backup registers B0 to B6 (RBURB0 to RBURB6) at the timing of B12 (OCRB12) event compare match*² between TCNTB1 and the output compare register B12 (OCRB12).

When TCNTB0 reaches the value set in OCRB0, an interrupt request due to this compare match can be output*³. This interrupt indicates that active edge input has stopped for at least time equivalent to the setting in OCRB0.

- Note 1.** CHSELB [1:0] outputs interrupt by capture timing of ICRB0 at 00_B, and a flag (IMFB0) is set. CHSELB [1:0] outputs interrupt by capture timing of ICRB0S1 at 01_B, and a flag (IMFB0) is set. CHSELB [1:0] outputs interrupt by capture timing of ICRB0S2 at 10_B, and a flag (IMFB0) is set.
- Note 2.** CHSELB [1:0] is a compare match of TCNTB1 and OCRB12 at 00_B, and it's backup in RBURB0-6. CHSELB [1:0] is a compare match of TCNTB1 and OCRB12S1 at 01_B, and it's backup in RBURB0-6. CHSELB [1:0] is a compare match of TCNTB1 and OCRB12S2 at 10_B, and it's backup in RBURB0-6.
- Note 3.** CHSELB [1:0] is a compare match of TCNTB0 and OCRB0 and outputs interrupt at 00_B, and a flag (CMFB0) is set. CHSELB [1:0] is a compare match of TCNTB0S1 and OCRB0S1 and outputs interrupt at 01_B, and a flag (CMFB0) is set. CHSELB [1:0] is a compare match of TCNTB0S2 and OCRB0S2 and outputs interrupt at 10_B, and a flag (CMFB0) is set.

Figure 32.18 shows input-capture and compare-match operation of TCNTB0 at CHSELB[1:0] = 00_B.

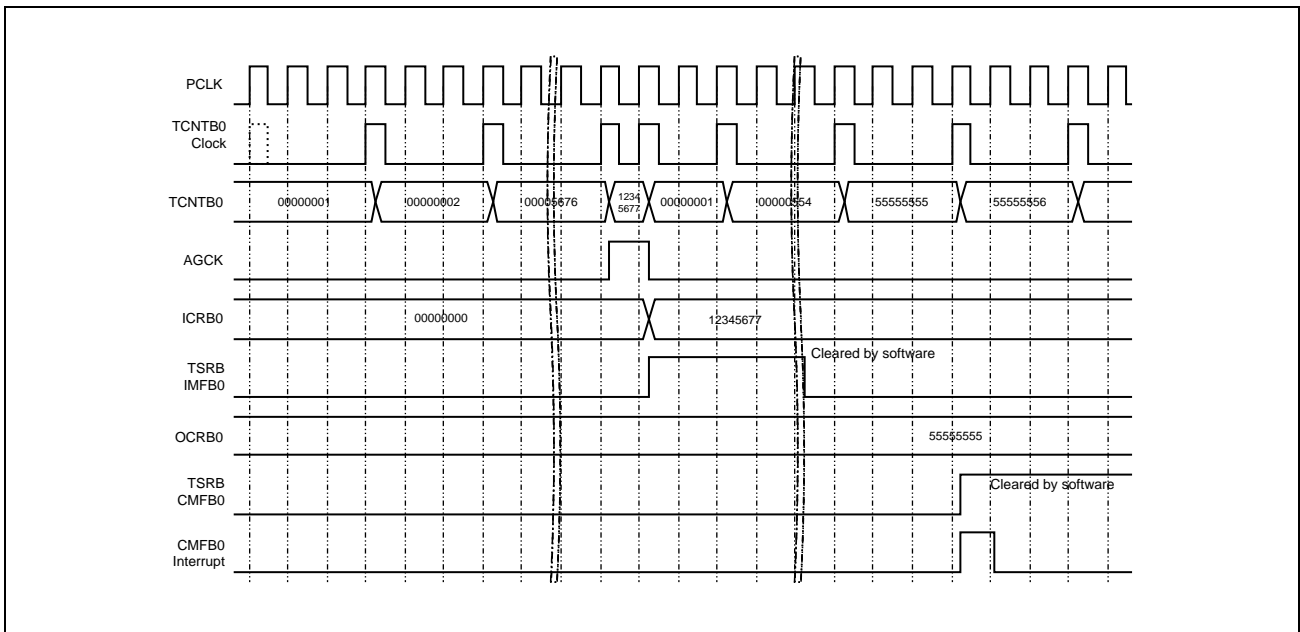

Figure 32.18 Input-Capture and Compare-Match Operation of TCNTB0 at CHSELB[1:0] = 00_B

Event counter B1 (TCNTB1) counts the input of signals indicating external events 1_0. When a predetermined value is set in output compare register B1 (OCRB1) and TCNTB1 reaches that value, a compare-match occurs. When a value is set in output compare register B10 (OCRB10) by the setting of the TCNTB1 clear setting bit (CLRB1) in the timer control register B (TCRB), TCNTB1 can be cleared at the first event input timing after an event compare match between TCNTB1 and OCRB10. Furthermore, by the setting of the TCNTB3 clear setting bit (CLRB3SEL) in the timer control register B (TCRB), TCNTB3 can be cleared at a compare match between TCNTB1 and OCRB10*¹. Input capture register B2 (ICRB2) can capture input capture register B1 (ICRB1) at the timing of a compare match between TCNTB1 and OCRB1. This compare match*² makes it possible to output an interrupt request to the CPU, allowing detection of edge input stop of external event. In addition, event counter B1 (TCNTB1) has a function for compare match with output compare register B11 (OCRB11). When the pulse interval multiplier select bit (PIMRSELR) is set to 1, TCNTB1 can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 at a compare match between TCNTB1 and OCRB11*³. When the TCNTB1 value matches the OCRB11 value, an interrupt request due to this compare match*³ can be output to the CPU.

The external event signal 1_0 drives the capturing of TCNTB0 values in ICRB1. Moreover, latching of ICRB1 in ICRB2 on matches between TCNTB1 and OCRB1 can also be selected. This enables the measurement of multiple edge-to-edge intervals.

Registers ICRB30 to ICRB37 capture the TCNTB1*⁴ value by using the external event input 1B to 1I as a trigger. ICRB30 corresponds to external event input 1B and ICRB31 to ICRB37 correspond to respective external event input 1C to 1I.

- Note 1.** When CHSELB [1:0] is 00_B, TCNTB3 can be cleared by a compare match of TCNTB1 and OCRB10. When CHSELB [1:0] is 01_B, TCNTB3 can be cleared by a compare match of TCNTB1S1 and OCRB10S1. When CHSELB [1:0] is 10_B, TCNTB3 can be cleared by a compare match of TCNTB1S2 and OCRB10S2.
- Note 2.** When CHSELB [1:0] is 00_B, interrupt request can be output by a comparing match of TCNTB1 and OCRB1. When CHSELB [1:0] is 01_B, interrupt request can be output by a comparing match of TCNTB1S1 and OCRB1S1. When CHSELB [1:0] is 10_B, interrupt request can be output by a comparing match of TCNTB1S2 and OCRB1S2.
- Note 3.** When CHSELB [1:0] is 00_B, PIMR2 can be used by a compare match of TCNTB1 and OCRB11, and interrupt request can be output. When CHSELB [1:0] is 01_B, PIMR2 can be used by a compare match of TCNTB1S1 and OCRB11S1, and interrupt request can be output. When CHSELB [1:0] is 10_B, PIMR2 can be used by a compare match of TCNTB1S2 and OCRB11S2, and interrupt request can be output.
- Note 4.** When CHSELB [1:0] is 00_B, the value of TCNTB1 can be captured in ICRB30-37. When CHSELB [1:0] is 01_B, the value of TCNTB1S1 can be captured in ICRB30-37. When CHSELB [1:0] is 10_B, the value of TCNTB1S2 can be captured in ICRB30-37.

Figure 32.19 shows compare-match operation of TCNTB1 and capture operation of ICRB1 and ICRB2 at CHSELB[1:0] = 00_B, and **Figure 32.20** shows capture operation of TCNTB1 and ICRB3x.

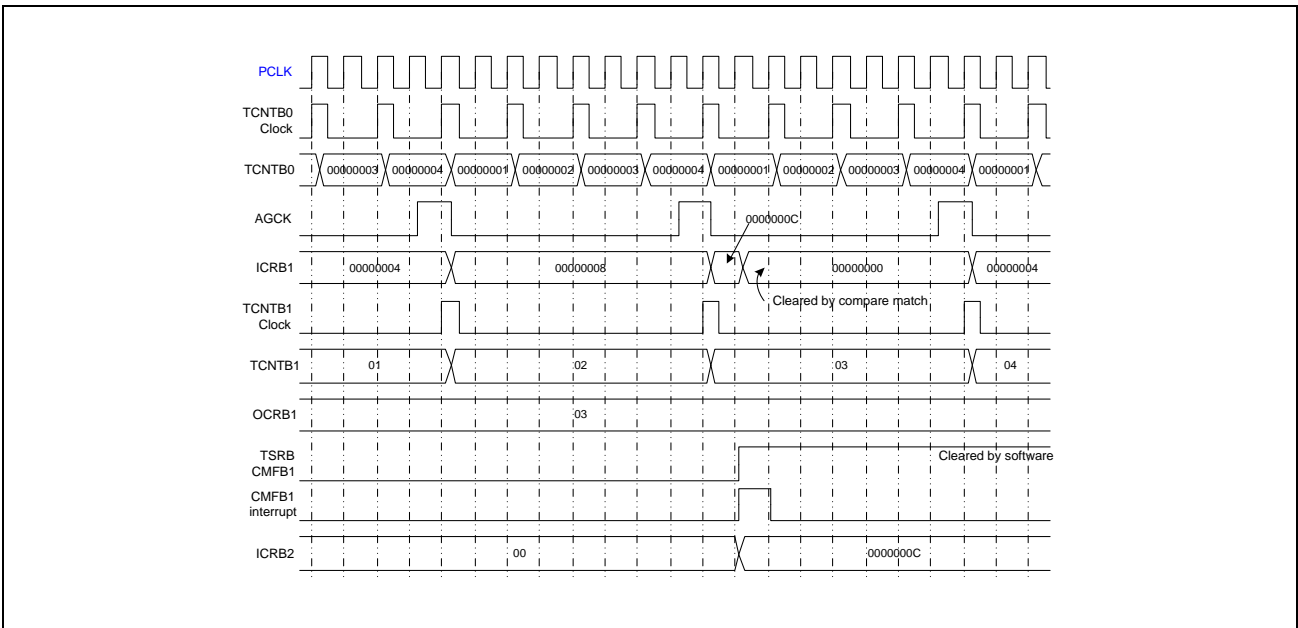

Figure 32.19 Compare-Match Operation of TCNTB1 and Capture Operation of ICRB1 and ICRB2 at CHSELB[1:0] = 00_B

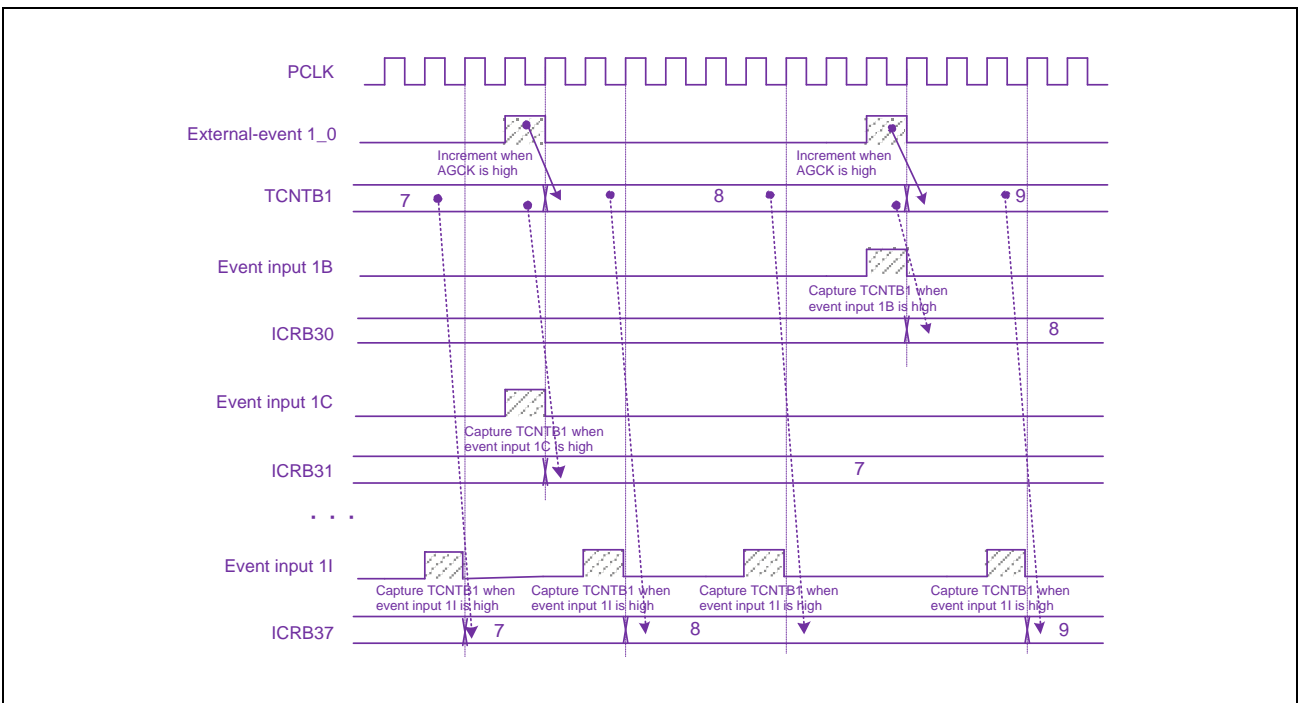

Figure 32.20 Count Operation of TCNTB1 and Capture Operation of ICRB3x at CHSELB[1:0] = 00_B

Upon detection of a compare match between event counter B1 (TCNTB1)*¹ and output compare register (OCRB20 to OCRB43), the state of the sequencer that control correction for edge interval measurement values is determined. The condition for transiting to the corresponding sequencer state upon compare match between TCNTB1*¹ and OCRB20 to OCRB43 is controlled by the SEQEN23 to SEQEN0 bits. IF the same value is set for OCRB20 to OCRB43, the transition caused by a compare match with upper OCRB (OCRB43 < OCRB42 < ... < OCRB21 < OCRB20) takes priority. According to the TEPCFB20 to TEPCFB43 set values for the sequencer state after transition, the correction value is calculated and the result is saved in timer event input cycle correction result retention register (TEPCVALRB0). The TEPCVALRB0 value is saved into timer event input cycle correction result log register (TEPCRECRB1) at the external event selection (AGCK) detection timing. The value of ICRB0*² or TEPCVALRB0 is supplied to the frequency-multiplied clock generator, according to the EVSEQENB bit setting.

Note 1. When CHSELB [1:0] is 00_B, a comparing match with TCNTB1 is put into effect. When CHSELB [1:0] is 01_B, a comparing match with TCNTB1S1 is put into effect. When CHSELB [1:0] is 10_B, a comparing match with TCNTB1S2 is put into effect.

Note 2. When CHSELB [1:0] is 00_B, the value of ICRB0 is communicated to frequency-multiplying clock generator. When CHSELB [1:0] is 01_B, the value of ICRB0S1 is communicated to frequency-multiplying clock generator. When CHSELB [1:0] is 10_B, the value of ICRB0S2 is communicated to frequency-multiplying clock generator.

Figure 32.21 Operation upon Compare Match between TCNTB1 and OCRB20-43 and Sequencer State Transition at CHSELB[1:0] = 00_B

NOTE

TCNTB1 and ICRB0 are used by sequencer control of the figure above because CHSELB [1:0] is 00_B but TCNTB1S1 and ICRB0S1 use the time when CHSELB [1:0] is 01_B and TCNTB2S2 and ICRB2S2 use the time when CHSELB [1:0] is 10_B.

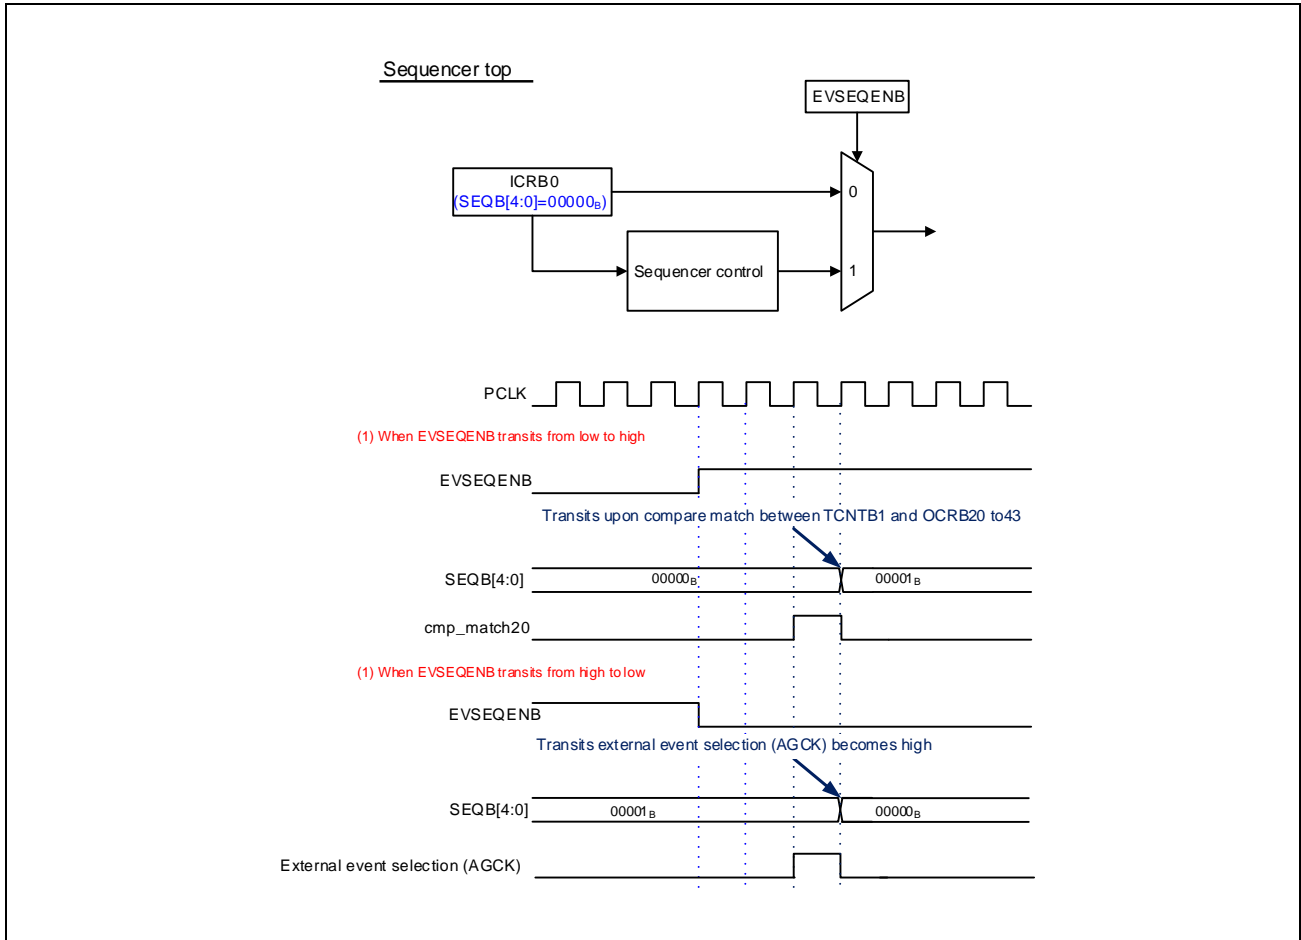

Figure 32.22 Switching between ICRB0 and TEPVALRB0 by EVSEQENB at CHSELB[1:0] = 00_b

NOTE

ICRB0 is used by control of the figure above because CHSELB [1:0] is 00_b but ICRB0S1 is used by the time when CHSELB [1:0] is 01_b and ICRBS2 is used by the time when CHSELB [1:0] is 10_b.

Figure 32.23 Operation of Compare Match between TCNTB1 and OCRB20-43 and Sequencer Control at CHSELB[1:0] = 00_B

32.6.3.2 Frequency-Multiplied Clock Generator

The frequency-multiplied clock generator generates a clock signal (AGCK1) for use within timer B. The cycle of this clock signal is obtained by dividing the intervals between selected transitions of the external-event selection (AGCK) input by the value in the pulse interval multiplier register (PIMR1 or PIMR2).

When the LDEN bit in the TIORB is 0, On the selected transition of the external-event selection (AGCK) input signal, the lower 24 bits of the value captured in ICRB0*¹ of the edge-interval measuring block are transferred to 24-bit reloadable counter B2 (TCNTB2). At the same time, the value transferred to TCNTB2 minus the value in PIMR (PIM1 or PIM2) is transferred to 24-bit reload register B (RLDB). When the LDEN bit in the TIORB is 1, the values of TCNTB2 and RLDB are not updated on ICRB0*¹ input capture.

When the LDSEL bit in timer I/O control register B (TIORB) is set to 1, the value in load register B (LDB) instead of that in ICRB0*¹ can be transferred to TCNTB2 and RLDB. When the pulse interval multiplier select bit (PIMRSELR) is set to 1, the above operation is performed using the PIMR2 value instead of PIMR1 value while TCNTB1 matches OCB11*².

24-bit reloadable counter B2 (TCNTB2) is driven to count down by the clock selected by the CKSELB bits in timer control register B (TCRB). Each decrementation is by the value set in PIMR (TCNTB2- = PIM). When the value in the down counter is less than or equal to that of the PIM bits, RLDB is automatically read out into TCNTB2 and added to the count value (TCNTB2 + the RLDB value), and which again starts to count down. A single pulse of the multiplied clock signal (AGCK1) is output in synchronization with the reloading of TCNTB2. The pulse width is equal to the cycle of the PCLK.

Compare match operation by frequency-multiplied clock (AGCK1) can be performed by using 20-bit output compare register B6 (OCRB6) and 20-bit frequency-multiplied clock counter B6 (TCNTB6).

Incrementation of TCNTB6 on the assertion of AGCK1 is unconditional. The values in TCNTB6 and output compare register B6 (OCRB6) are tested for matches, and an interrupt request will be generated to the CPU when the values match. The IREGB6 bits in TICRB can be set so that the interrupt is generated on the match, on the first AGCK pulse (external event) after the match, or on the second AGCK pulse (external event) after the match.

When an external event selection input (AGCK) is detected, ICRB6 stores the TCNTB6 value at the next clock (PCLK) timing. The frequency-multiplied clock counter B6M (TCNTB6M) performs count-up operation with a count value of multiplication that is set in multiplication setting register B6 (RARB6) for the frequency-multiplied clock (AGCK1). Each time an external event selection (AGCK) is input, the TCNTB6M value is compared with the ICRB6 value. When the ICRB6 value is larger than the TCNTB6M value as a result of comparison, an interrupt request can be output.

Since AGCK1 is generated with reference to the previous edge-to-edge interval, if two consecutive edge intervals differ significantly, the clock will not be generated correctly. To correct this error, AGCK1 is corrected by the frequency-multiplied clock signal corrector, whose description is provided in the next section, and is to be converted into AGCKM.

Figure 32.24 and **Figure 32.25** show counting operations with reloading and output of the frequency-multiplied clock and **Figure 32.26** and **Figure 32.27** show the generation of interrupt requests on matches between TCNTB6 and CMFB6, enabled or disabled by the setting in IREG. **Figure 32.28** shows the Switching Timing of PIMR1 and PIMR2. **Figure 32.29** shows comparison of TCNTB6M and ICRB6 operations and interrupt request output.

Note 1. When CHSELB [1:0] is 00_B, ICRB0 is used. When CHSELB [1:0] is 01_B, ICRB0S1 is used. When CHSELB [1:0] is 10_B, ICRB0S2 is used.

Note 2. When CHSELB [1:0] is 00_B, PIMR2 is used by a compare match of TCNTB1 and OCB11. When CHSELB [1:0] is 01_B, PIMR2 is used by a compare match of TCNTB1S1 and OCB11S1. When CHSELB [1:0] is 10_B, PIMR2 is used by a compare match of TCNTB1S2 and OCB11S2.

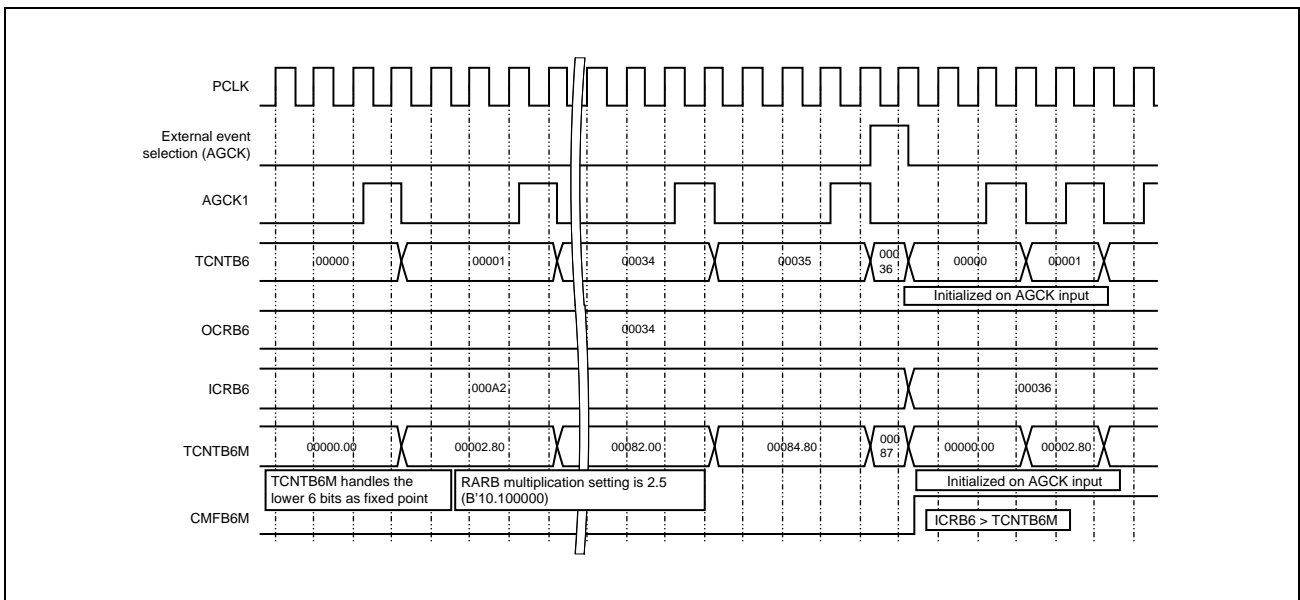

Figure 32.29 Example of Operations of TCNTB6M and ICRB6

32.6.3.3 Frequency-Multiplied Clock Signal Corrector

The frequency-multiplied clock signal which is generated by dividing the intervals between external event selection (AGCK) inputs by the multiplication ratio set in the PIM bits in PIMR can be corrected by using 20-bit correcting event counter B3 (TCNTB3), 20-bit multiplied-and-corrected clock counter B4 (TCNTB4), 20-bit multiplied-and-corrected clock generating counter B5 (TCNTB5), and correcting counter clearing register B (TCCLR B).

TCNTB3 is a 20-bit up-counter that is driven by the external event selection (AGCK) input. On the selected transition of the external event selection (AGCK) signal, the value in TCNTB3 is transferred to TCNTB4, after which TCNTB3 is incremented by the value in the PIM bits ($TCNTB3+ = PIM$). According to the setting for the CLR B3SEL bit (TCNTB3 clear select bit) in the timer control register B (TCRB), TCNTB3 can be cleared by a compare match between TCNTB1 and OCRB10*¹, between TCNTB6 and OCRB6, or between TCNTB3 and OCRB8.

TCNTB4 is a 20-bit up-counter that is driven by the multiplied clock signal (AGCK1). TCNTB3 is loaded to TCNTB4 with the external event selection (AGCK) input as a trigger, and incrementation of TCNTB4 is driven by the AGCK1 input.

The counter correcting select bit (CCS) in TIORB controls counting by TCNTB4. When CU4SEL is set to "0", movement or a stop of TCNTB4 up count can be select at $TCNTB3 = TCNTB4$, and when CU4SEL is set to "1", movement or a stop of TCNTB4 up count can be select at $(TCNTB3-1) = TCNTB4$.

TCNTB5 is a 20-bit up-counter that is driven by the PCLK clock, meaning that it operates at a high speed. TCNTB5 is constantly compared with TCNTB4 and is incremented as long as its value is lower than that in TCNTB4. Each time TCNTB5 is actually incremented, it produces a single pulse whose width is equal to one cycle of the PCLK clock. Pulse of the peripheral clock signal, namely the multiplied-and -corrected clock signal (AGCKM), for which output on clock-bus line 5 can be selected by bit CB5SEL in the clock bus control register (CBCNT). The AGCKM signal is then available on clock-bus line 5 as a source to drive counting by other timers.

As state above, TCNTB5 is not incremented when its value is greater that in TCNTB4 (for example, after TCNTB3 has been loaded to TCNTB4), TCNTB5 can also be disabled by the count control B5 (CTCNTB5) bit in timer I/O control register B (TIORB). This halts the output of the AGCKM signal.

As long as its value is lower than TCNTB4, TCNTB5 is incremented until it reaches the value in correcting counter clearing register B (TCCLR B). This function allows you to check the automatic up- count status by using correcting counter clear flag register B (TCCLFRB). Incrementation of TCNTB5 then stops, regardless of the relation between its value and that of TCNTB4. In addition, timer counters 1Dx and 2Dx of timer D (TCNT1Dx and TCNT2Dx) can be separately cleared by this match as a trigger when the corresponding counter clearing enable bit (C1CEDx/C2CEDx) in timer control register Dx (TCRDx) is set to 1.

TCNTB4 is unconditionally cleared to 0000 0000_H when a pulse of the external-event selection signal (AGCK) is input while $TCNTB3 = 0000\ 0000_{H}$. TCNTB5 is unconditionally set to 0000 1000_H at CU4SEL = 0, or cleared to 0000 0000_H at CU4SEL = 1 when a pulse of the external-event selection signal (AGCK) is input while $TCNTB3 = 0000\ 0000_{H}$.

However, when TCNTB5 has not reached TCCLR B, TCNTB5 is incremented until it reaches TCCLR B. After that, it is set to 0000 1000_H.

Figure 32.30 shows operations of TCNTB3 and TCNTB4, **Figure 32.31** shows operation when TCNTB5 is being started up, **Figure 32.32** shows TCNTB5 operation with correction at the end of a cycle.

Note 1. When CHSELB [1:0] is 00_B, TCNTB3 can be cleared by a comparing match of TCNTB1 and OCRB10. When CHSELB [1:0] is 01_B, TCNTB3 can be cleared by a comparing match of TCNTB1S1 and OCRB10S1. When CHSELB [1:0] is 10_B, TCNTB3 can be cleared by a comparing match of TCNTB1S2 and OCRB10S2.

32.7 Timer C

32.7.1 Overview of Operation

The timer C block is a general-purpose timer consisting of SB_C subblocks having the same function. Each subblock consists of four channels.

Each timer C subblock can achieve the following functions.

- Input capture and output compare matches
- Choice of rising edge, falling edge, or both edge sensing as the edge of input capture trigger signal
- Capturing at the timing of event output 1_0, 2A, or 2B from timer A when used as input capture
- Output of a waveform on compare match. Choice of a logical one, a logical zero, a toggled output, or a one-shot pulse output by setting a register
- Output of an interrupt request on capture or compare match
- Output of an interrupt request on timer counter overflow
- Clearing counter (TCNTCx) on compare match (two types)
 - The counter can be cleared on compare match of GRCx0 in PWM mode (not supported by GRCx1 to GRCx3)
 - When the counter upper-limit setting function is used in any mode other than PWM mode, the counter can be cleared on compare match of CUCRCx.
- Output of forced compare match by setting the forced compare match bit
- There is noise cancellation of at most 0.21 sec or a noise cancellation function by the angle clock in each input terminal.
- A noise cancellation mode setting by the subblock/channel unit is possible.
- High/Low/toggle corrugated output is possible by a comparing match.
- The range comparison can be used for compare match output by the compare match register by setting the range comparison value setting register.

Timer C subblock consists of a 32-bit counter (TCNTCx), four 32-bit general registers (GRCxy), four 32-bit output compare registers (OCRCxy), a 32-bit counter upper-limit setting compare register (CUCRCx), four range comparison value setting registers (RCRCxy), four 32-bit general mirror registers (GMRCxy), and controller. The general registers (GRCxy) can be used for input capture/compare match operations and input capture trigger input and output compare output signals (TIOCxy) are available.

The initial output value on the TIOCxy pin is 0 for output compare operation. During operation, the previous state is reflected. An input/output mode of a TIOCxy terminal is selectable by setting of TIORCx.IOCxy.

Figure 32.37 Block Diagram of Timer C Subblock

32.7.2 Registers Related to Timer C

32.7.2.1 TSTRC — Timer Start Register C

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.107 TSTRC Register Contents

Bit Position	Bit Name	Function
15 to SB _C	—	These bits are not used. Fix these bits to “0”.
SB _C -1 to 0	STRC _x	Counter C _x start 0: TCNTC _x is disabled 1: TCNTC _x is enabled

Note: Start bits are provided for subblocks C0 to CSB_C-1 respectively.

TSTRC is an 8-bit or a 16-bit readable/writable register that enables and disables timer counter (TCNTC_x) in SB_C subblocks C_x ($x = 0$ to SB_C-1). When the both the STRC bits in this register and the TCE bit in ATU master enable register (ATUENR) are set to 1, counting is enabled.

TSTRC is initialized to 00_H after reset.

Counter C_x Start (STRC_x)

These bits enable and disable timer counter C_x (TCNTC_x) in a subblock.

When bit STRC_x is cleared to 0, TCNTC_x is stopped. While TCNTC_x is stopped, the previous counter value is retained and TCNTC_x is resumed from the value when this bit is set to 1 again.

Even if the counter C_x start bit is set to 1, counting does not start unless the timer C_x master enable bit in the ATU master enable register (ATUENR) is set to 1.

CAUTION

The prescalers run independently of the setting of the STRC_x bit and are not initialized at the start of TCNTC_x. Therefore, during the time between the activation and the start of actual count operation by the above counter, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

32.7.2.2 NCCRCx — Noise Canceler Control Register Cx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NCKCx3	NCKCx2	NCKCx1	NCKCx0	NCECx3	NCECx2	NCECx1	NCECx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1

Table 32.108 NCCRCx Register Contents

Bit Position	Bit Name	Function
7 to 4	NCKCxy	Noise canceler clock select These bits select the count source clock for noise canceler counter Cxy (NCNTCxy).
3 to 0	NCECxy	Noise canceler enable Cxy These bits set the TIOCxy input noise canceling function.

Note: x = 0 to SB_C-1, y = 0, 1, 2, 3

The noise canceler control register Cx (NCCRCx) is an 8-bit readable/writable register. The noise cancellation is performed on the input capture trigger signal input from pin TIOCxy in subblock Cx by setting this register. Three modes are available in noise cancellation and can be switched by the NCMC bit in the noise cancel mode register (NCMR). Noise canceler count clock or clock bus 5 can be selected as the count source by the noise canceler clock select bits (NCKCxy) in this register.

NCCRCx is initialized to 00_H after reset.

Noise Canceler Clock Select (NCKCxy)

These bits select the count source clock of noise canceler counter Cx (NCNTCx).

NCKCxy	Function
0	Noise canceler count clock (PCLK or PCLK/128) is selected as the count source clock of NCNTCx (Default)
1	Clock bus 5 is selected as the count source clock of NCNTCx

Note: x = 0 to SB_C-1, y = 0, 1, 2, 3

Selects the count source clock for noise cancellation counters C4 to C0 (NCNTC4 to NCNTC0).

Noise canceler count clock or clock bus 5 is selectable as the count source clock. As the noise canceler count clock, a clock of PCLK or PCLK/128 can be selected by the NCCSEL bit in the common control unit.

Noise canceler Enable Cxy (NCECxy)

These bits enable or disable the noise canceling function for input/output pins TIOCx0 to Cx3 of subblock Cx.

NCECxy	Function
0	The TIOCxy input noise canceling function is disabled (Default)
1	The TIOCxy input noise canceling function is enabled.

Note: x = 0 to SB_C-1, y = 0, 1, 2, 3

When a change in input signal level from TIOC_{xy} is detected with these bits set to 1, processing for premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode starts according to the settings of the noise cancellation mode register (NCMR) and the noise canceler clock select bit (NCKC) in the common control unit.

- In premature-transition cancellation mode

When a level change of the externally input signal is detected, the change is output as the signal whose noise is removed and the corresponding noise canceler counter C_{xy} (NCNTC_{xy}) is started for counting up. Subsequent level changes are masked until the value in the counter reaches the value in the noise canceler register C_{xy} (NCRC_{xy}). The level of the externally input signal is output on this compare match.

When these bits are cleared to 0 while the counter (NCNTC_{xy}) is being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes are also masked over this period.

- In minimum time-at-level cancellation mode

When a level change of the externally input signal is detected, the corresponding noise canceler counter C_{xy} (NCNTC_{xy}) is started for counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register C_{xy} (NCRC_{xy}), the previously accepted level change is output as the signal whose noise is removed on compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes are treated as noise. Therefore the signal whose noise is removed is not changed.

When these bits are cleared to 0 while the counter (NCNTC_{xy}) is being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the externally input signal is detected.

- In level accumulation cancellation mode

The corresponding noise canceler counter C_{xy} (NCNTC_{xy}) is started for counting up or down according to the input signal level (high level: up-count, low level: down-count). Up-count continues until the noise canceler counter value matches the noise canceler register C_{xy} (NCRC_{xy}) value. Down-count continues until the noise canceler counter value reaches 0000_H. When a compare match (NCRC_{xy}) occurs during up-counting, the noise canceler output is updated to 1. When a compare match (0000_H) occurs during down-counting, the noise canceler output is updated to 0.

In minimum time-at-level cancellation mode and premature-transition cancellation mode, clock PCLK is always used to detect input signal level changes regardless of the selected noise canceler clock. In level accumulation cancellation mode, the clock selected by the noise canceler clock select C_{xy} bits (NCKC_{xy}) is used for sampling the input level.

For details of operations for noise cancellation, see **Figure 32.1**, **Figure 32.2**, and **Figure 32.3**.

32.7.2.3 TCRCx — Timer Control Registers Cx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FOCMC _{x3}	FOCMC _{x2}	FOCMC _{x1}	FOCMC _{x0}	—	—	CLRCS ELC _x	CLRC _x	FCMC _{x3}	FCMC _{x2}	FCMC _{x1}	FCMC _{x0}	PWM _{x0}	CKSEL _{Cx} [2:0]		
Value after reset	0*1	0*1	0*1	0*1	0	0	0	0	0*1	0*1	0*1	0*1	0	0	0	0
R/W	W	W	W	W	R	R	R/W	R/W	W	W	W	W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1, corresponding to subblocks C0 to CSB_C-1

Note 1. Value 0 cannot be written. The value is not retained when 1 is written. These bits are always read as 0.

Table 32.109 TCRCx Register Contents

Bit Position	Bit Name	Function
15 to 12	FOCMC _{xy}	Forced output compare match C _{xy} Forced compare match is performed by output compare register (OCRC _{xy}). ^{*1}
11 to 10	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
9	CLRCS ELC _x	TCNTC _x clear timing select bit C _x Select the timing for clearing TCNTC _x . 0: Clear in sync with PCLK (equivalent to ATU-IV) 1: Clear in sync with the count clock
8	CLRC _x	TCNTC _x clear C _x Enable and disable clearing of the timer counters.
7 to 4	FCMC _{xy}	Forced compare match C _{xy} Forced compare match is performed by general register (GRC _{xy}). ^{*1}
3	PWM _{x0}	PWM mode Whether to operate subblock C _x in PWM mode is selected.
2 to 0	CKSEL _{Cx} [2:0]	Clock select bits The count clock is selected from clock bus 0 to 5.

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.

y = 0, 1, 2, 3: Corresponding to general registers C_{x0}, C_{x1}, C_{x2}, and C_{x3}.

Note 1. Do not use forced compare match in input capture mode.

The timer control registers C_x (TCRC_x) are 8-bit/16-bit readable/writable registers that select the counter clock for subblocks C0 to CSB_C-1, set operating mode, set forced compare matches, and enable/ disable clearing of timer counters.

Even if the respective “Forced output compare match C_{xy}(FOCMC_{xy})” and “Forced compare match C_{xy}(FCMC_{xy})” are made effective when using “Output Compare Registers C_{xy}(OCRC_{xy})” and “Timer General Registers C_{xy}(GRC_{xy})” as a capture register, a forced compare matches doesn’t occur.

TCNTCx Clock Select (CKSELCx[2:0])

These bits select the counter clock of subblock Cx. Counters (TCNTCx) in subblock Cx are driven by the clock selected in these bits.

CKSELCx			Function	
0	0	0	Counters are driven by clock-bus line 0	(Default)
0	0	1	Counters are driven by clock-bus line 1	
0	1	0	Counters are driven by clock-bus line 2	
0	1	1	Counters are driven by clock-bus line 3	
1	0	0	Counters are driven by clock-bus line 4	
1	0	1	Counters are driven by clock-bus line 5	
1	1	0	Setting prohibited	
1	1	1	Setting prohibited	

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.

PWM Mode (PWMx0)

Setting this bit to 1 makes subblock Cx operate in PWM mode. In PWM mode, TCNTCx is cleared on compare match between TCNTCx and general register Cx0 (GRCx0). The setting of this bit is valid when GRCx0 functions as a compare match register.

When general register GRCxm (m = 1 to 3) functions as a compare match register, aIOCx0 setting value in the TIORCx is output to its output pins (TIOCx1, TIOCx2, TIOCx3) at the timing of clearing of the TCNTCx.

PWM output from pins TIOCx1 to TIOCx3 is enabled by setting a PWM cycle in GRCx0 and setting a duty cycle in GRCx1 to GRCx3.

CAUTION

To make the subblock operate in PWM mode, further settings are also required.

Select the compare match (IOCxy[3:0] = 0001_B or 0010_B) by the IOCxy bits in timer I/O control register C (TIORCx) for GRCx0 and GRCx1 to GRCx3 (for PWM output). The active polarity of PWM can be specified by the IOCxy[1:0] bits.

PWMx0	Function	
0	0: Subblock Cx does not operate in PWM mode	(Default)
1	1: Subblock Cx operates in PWM mode	

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.

When TCNTCx matches GRCx0 while this bit is set to 1, the counter is cleared to 0000 0000_H. However, when clearing the counter on compare match and incrementation occur simultaneously, TCNTCx is set to 0000 0001_H. This occurs when TCNTCx is driven by the clock whose frequency is equal to the PCLK clock.

In PWM mode, do not set from GRCx0 to GRCx3 to 0000 0000_H. If GRCx0 is set to 0000 0000_H, note that compare match occurs at illegal cycles.

Forced Compare Match Cxy (FCMCxy)

Setting these bits to 1 generates forced compare match when a general register Cxy (GRCxy) is used for compare match. Refer to **Figure 32.44**, **Figure 32.45**, **Figure 32.46**, and **Figure 32.47** as a use example.

FCMCxy	Function
0	No forced compare match is disabled on general register (GRCxy) (Default)
1	Forced compare match generated on general register (GRCxy)

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.
y = 0, 1, 2, 3: Corresponding to general registers Cx0, Cx1, Cx2, and Cx3.

When GRCxy is used as a comparing register at a comparing match mode (TIORCx.IOCxy [3:2] = 00_B), Setting the FCMCxy bit to 1 sets the IMFCxy bit (compare match flag) in TSRCx (timer status register Cx) to 1 and outputs a compare match interrupt to the CPU. Even when the IMFCxy bit is set to 1, a compare match interrupt is output. Furthermore, TIOCxy output data also changes as in the case of compare match. This operation is performed only once when the FCMCxy bit is set to 1. Writing 0 to these bits is disabled. If 1 is written to these bits, data is not retained. These bits are always read as 0.

Even if a forced compare match is established effectively, then a forced compare match doesn't generate an input capture mode (TIORCx.IOCxy [3:2] = 01_B or 11_B). A one shot pulse mode (TIORCx.IOCxy [3:2] = 10_B), then FCMCxy setting becomes effective after GRCxy setting with a one shot pulse mode programming procedure. Even if FCMCxy is made effective before GRCxy setting without following a one shot pulse mode programming procedure, a forced compare match doesn't occur. The change of state of TSRCx in the back writing in became effective where to FCMCxy is same as the time of a compare match mode.

The FCMCxy bit can be established only by the following condition.

Mode	TIORCx.IOCxy				TCRCx.PWMx0*1	The setting propriety of the FCMCxy bit
	[3]	[2]	[1]	[0]		
Compare match mode	0	0	0	0	0	Setting prohibited
	0	0	0	1	0	Possible to establish
					1	Setting prohibited
	0	0	1	0	0	Possible to establish
				1	Setting prohibited	
	0	0	1	1	0	Possible to establish
Input capture mode	0	1	0/1	0/1	0	Setting prohibited
One shot pulse mode	1	0	0/1	0/1	0	Possible to establish
Input capture mode	1	1	0/1	0/1	0	Setting prohibited

Note 1. TCRCx.PWMx0 can set only at TIORCx.IOCxy = 0001_B or 0010_B.

TCNTCx Clear Cx (CLRCx)

When the TCNTCx clear bit is set to 1, the TCNTCx is cleared in synchronization with PCLK after occurrence of a compare match between timer counter Cx (TCNTCx) and counter upper limit value setting compare register (CUCRCx) or in synchronization with count clock input (according to the setting of CLRCSELx).

CLRCx	Function	
0	CUCRCx compare match is not used to clear TCNTCx.	(Default)
1	CUCRCx compare match is used to clear TCNTCx	

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. Supports timer counter Cx.

The upper limit value setting function can be enabled (CLRCx = 1) in other than PWM mode (PWMx0 = 0).

If the upper limit value setting function (CLRCx = 1) is used in PWM mode (PWMx0 = 1), timer counter Cx (TCNTCx) is cleared in a cycle other than PWM cycle, so the PWM output may become an unintended waveform.

The upper limit value of the counter is different depending on setting. Refer to the following table.

PWMx0	CLRCx	The upper limit value of the TCNTCx counter
1	0	(Setting prohibited) The value of GRCx0 (PWM cycle)
0	0	FFFF_FFFF _H
0	1	The value of CUCRCx (When the writing in value to CUCRCx is smaller than TCNTCx, it'll be FFFF_FFFF _H .)

TCNTCx Clear Timing Select Cx (CLRCSELCx)

Select the timing for clearing timer counter Cx (TCNTCx) after occurrence of a compare match between timer counter Cx (TCNTCx) and counter upper limit value setting compare register (CUCRCx).

CLRCSELCx	Function	
0	Clear in sync with PCLK (equivalent to ATU-IV)	(Default)
1	Clear in sync with count clock	

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1 of timer counter Cx

CLRCSELCx can be set at all except for a PWM mode (PWMx0 = 0).

When comparing match occurrence with Timer Counter Cx(TCNTCx) and Counter Upper-Limit Setting Compare Registers Cx(CUCRCx) and a count up of TCNTCx occurred at the same time in case of CLRCSELx = 0, TCNTCx is cleared by 0000 0001_H. When a count up isn't simultaneous with a compare match, timer counter Cx (TCNTCx) is cleared by 0000 0000_H. Timer counter Cx (TCNTCx) doesn't depend on division ratio of a count clock in case of CLRCSELCx = 1, and is cleared in 0.

PWMx0	The setting propriety of CLRCSELCx
0	It's possible to set it as 0 or 1.
1	Setting prohibited (The PWM cycle is prohibited to collapse)

Forced Output Compare Match Cxy (FOCMCxy)

When the output compare register (OCRCxy) is used as a compare match register, a compare match is forcibly generated by setting FOCMCxy to 1. Refer to **Figure 32.44**, **Figure 32.45**, **Figure 32.46**, and **Figure 32.47** as a use example.

FOCMCxy	Function
0	Forced compare match is disabled for the output compare register (OCRCxy). (Default)
1	Forced compare match is generated in the output compare register (OCRCxy).

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.
y = 0, 1, 2, 3: Corresponding to output compare registers Cx0 to Cx3.

When OCRCxy is used as a compare register by a compare match mode (TIORCx.IOCxy [3:2] = 00_B) and an input capture mode (TIORCx.IOCxy [3:2] = 01_B or 11_B), setting the FOCMCxy bit to 1 sets the OCMFCxy bit (compare match flag) in TSRCx (timer status register Cx) to 1 and outputs a compare match interrupt to the CPU. Even when the OCMFCxy bit is 1, a compare match interrupt is generated and the output from TIOCxy changes as when a compare match occurs. This operation is performed only once when 1 is written to this bit. Writing 0 is disabled. If 1 is written to this bit, data is not retained. This bit is always read as 0.

Even if a forced compare match is established effectively when using OCRCxy as a capture register by an input capture mode (TIORCx.IOCxy [3:2] = 01_B or 11_B), a forced compare match doesn't occur. A one shot pulse mode (TIORCx.IOCxy [3:2] = 10_B), then FOCMCxy setting becomes effective after GRCxy setting with a one shot pulse mode programming procedure. Even if FOCMCxy is made effective before GRCxy setting without following a one shot pulse mode programming procedure, it becomes invalid.

Even if FOCMCxy is also made effective before GRCxy setting after a one shot pulsed output, it becomes invalid.

The change of state of after TSRCx writing in to FOCMCxy became effective where is same as a compare match mode and the time of an input capture.

The FOCMCxy bit can be established only by the following condition.

Mode	TIORDCx.IOCxy				TCRCx.PWMx0*1	The setting propriety of the FOCMCxy bit
	[3]	[2]	[1]	[0]		
Compare match mode	0	0	0	0	0	Possible to establish
	0	0	0	1	0	Possible to establish
					1	Setting prohibited
	0	0	1	0	0	Possible to establish
					1	Setting prohibited
Input capture mode	0	0	1	1	0	Possible to establish
	0	1	0	0	0	Possible to establish
	0	1	0	1	0	Setting prohibited
	0	1	1	0	0	Setting prohibited
One shot pulse mode	0	1	1	1	0	Possible to establish
	1	0	0/1	0/1	0	Possible to establish
	1	1	0/1	0/1	0	Possible to establish

Note 1. TCRCx.PWMx0 can set only at TIORC.IOCxy = 0001_B or 0010_B

32.7.2.4 TSRCx — Timer Status Registers Cx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OCMFC _{x3}	OCMFC _{x2}	OCMFC _{x1}	OCMFC _{x0}	—	—	—	OVFCx	IMFCx3	IMFCx2	IMFCx1	IMFCx0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_C-1, corresponding to subblocks C0 to CSB_C-1

Table 32.110 TSRCx Register Contents

Bit Position	Bit Name	Function
15-12	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
11 to 8	OCMFC _{xy}	Output compare match/input capture flag C _{xy} 1: Input capture or compare match with OCRC _{xy} has occurred. 0: Input capture or compare match with OCRC _{xy} has not occurred. (Default)
7 to 3	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
4	OVFC _x	Overflow flag C _x 1: An overflow has occurred. 0: No overflow has occurred.
3 to 0	IMFC _{xy}	Input capture/compare match flag C _{xy} 1: Input capture and compare match by the GRC _{xy} register have occurred. 0: No input capture or compare match by the GRC _{xy} register has occurred.

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Timer status registers C_x (TSRC_x) are 8-bit/16-bit read-only registers that indicate occurrence of overflow of timer counter (TCNTC_x) in subblocks C_x (x = 0 to SB_C-1), occurrence of input capture or compare match of general registers (GRC_{xy}, y = 0 to 3), and occurrence of output compare match or input capture in output compare/input capture registers (OCRC_{xy}, y = 0 to 3).

These status flags indicate occurrence of an interrupt request. These flags can be cleared by setting corresponding bits in the timer status clear register (TSCRC_x). If an interrupt source occurs with one of these flags set to 1, an interrupt request is generated again. Even when clearing a flag by using the corresponding timer status clear register conflicts with setting the flag due to occurrence of an interrupt source, an interrupt request is generated.

TSRC_x is initialized to 0000_H after reset.

Output Compare Match/Input Capture Flag Cxy (OCMFCxy)

This status flag indicates occurrence of a compare match of the compare register xy (OCRCxy). This flag cannot be set to 1 or 0 by the software. Setting and clearing conditions are described below.

OCMFCxy	Function	
0	[Clearing condition in compare match mode, input capture mode, or one-shot pulse mode] Writing 1 to OCMFCCxy in timer status clear register C (TSCRC).	(Default)
1	[Setting conditions in compare match mode/input capture mode (IOCxy[3:0] is other than 0101 _B , 0110 _B) <ul style="list-style-type: none"> When the TCNTCx value is equal to the OCRCxy value Writing 1 to FOCMCxy (forced output compare match bit) in TCRcx When all except for 00_H is in the established state in Range Comparison Value Setting Register 1Cx (RCR1Cx), and TCNTCx is in the range set in RCR1Cx at the time of writing in OCRCxy. [Setting conditions in input capture mode] <ul style="list-style-type: none"> When the falling edge of TIOCxy is detected when IOCxy[3:0] = 0101_B When the rising edge of TIOCxy is detected when IOCxy[3:0] = 0110_B [Setting conditions in one-shot pulse mode] <ul style="list-style-type: none"> When the TCNTCx value is equal to the OCRCxy value after writing in GRCxy. Writing 1 to FOCMCxy (forced output compare match bit) in TCRcx after writing in GRCxy. When after writing in a GRCxy register in the state as which all except for 00_H is set by Range Comparison Value Setting Register 1Cx (RCR1Cx), TCNTCx writes in OCRCxy, and is in the range set in RCR1Cx. 	

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The next output compare processing is enabled even when the output compare match flag xy (OCMFCxy) is 1 (the flag is not cleared). At this time, 1 is overwritten to OCMFCxy.

Even if the output compare match status is cleared while the TCNTCx and OCMFCxy values are equal after an output compare match is detected, no status is set newly.

The value of TCNTCx, OCRCxy is in the identical state, and even if output comparing match status is cleared, status isn't set newly. Because the rising edge which is at the time of comparing match signal detection is detected and status is being set.

Overflow Flag Cx (OVFCx)

Indicates whether or not TCNTCx has overflowed. This flag cannot be set to 1 or 0 by software.

OVFCx	Function	
0	[Clearing condition] Writing 1 to OVFCx in timer status clear register C (TSCRC)	(Default)
1	[Setting condition] <ul style="list-style-type: none"> When the TCNTCx value overflows (FFFF FFFF_H to 0000 0000_H) When the counter is cleared with the upper-limit setting function enabled 	

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.

The overflow flag is set to 1 when the up-count clock is input with TCNTCx set to FFFF FFFF_H or at the next PCLK (when CLRCSELcx = 0) and at the next count (when CLRCSELcx = 1) clock after the counter value matches the upper-limit setting register value with the upper-limit setting function enabled. When writing 0000 0000_H to TCNTCx or TCNTCx is started from 0000 0000_H, this bit is not set to 1.

When writing to TCNTCx at the same time as incrementation while it is FFFF FFFF_H, this bit is set to 1. However, TCNTCx is started from the written value.

Input Capture/Compare Match Flag Cxy (IMFCxy)

These bits indicate whether or not input capture and compare match between general register (GRCxy) and TCNTCx has occurred. This flag cannot be set to 1 or 0 by software. Setting and clearing conditions are shown below.

IMFCxy	Function
0	[Clearing conditions in compare match mode, input capture mode, or one-shot pulse mode] (Default) Writing 1 to IMFCCxy in timer status clear register C (TSCRC)
1	It's set by the condition besides the TIORCx.IOCxy[1:0] = 00 _B . [Setting condition in input capture mode] (when TIORCx.IOCxy[3:2] = 01 _B or 11 _B) <ul style="list-style-type: none"> ● When the rising edge of TIOCxy is detected when IOCxy[3:0] = 0101_B ● When the falling edge of TIOCxy is detected when IOCxy[3:0] = 0110_B ● When the both edge of TIOCxy is detected when IOCxy[3:0] = 0111_B when edge detection. <ul style="list-style-type: none"> ● When Event1_0 from Timer A is detected when IOCxy[3:0] = 1101_B ● When Event2A from Timer A is detected when IOCxy[3:0] = 1110_B ● When Event2B from Timer A is detected when IOCxy[3:0] = 1111_B [Setting conditions in output compare mode] (when TIORCx.IOCxy[3:2] = 00 _B) <ul style="list-style-type: none"> ● When GRCxy functions as a compare match register and the values in TCNTCx and GRCxy match ● When the forced compare match bit (FCMCxy) in TCRCx is set to 1 ● When all except for 00_H is in the established state in "Range Comparison Value Setting Register 2Cx(RCR2Cx)", and TCNTCx is in the range set in RCR2Cx at the time of writing in GRCxy. [Setting conditions in one-shot pulse output mode] (when TIORCx.IOCxy[3:2] = 10 _B) <ul style="list-style-type: none"> ● When the TCNTCx value is equal to the GRCxy after (or at the same time when) a compare match of OCRCxy is generated while one-shot pulse is output ● When the forced compare match bit (FCMCxy) in TCRCx is set to 1 after (or at the same time when) a compare match of OCRCxy is generated while one-shot pulse is output ● When TCNTCx writes in GRCxy during a one shot pulsed output in the state as which all except for 00_H is set by RCR2Cx, and TCNTCx is in the range set in RCR2Cx.

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Even if these bits are set to 1 meaning that the flag has not been cleared, another input capture or output compare signal can be input. A value of 1 is written to these bits.

Even if the compare match flag is cleared to 0 while TCNTCx and GRCxy after the compare match is detected, these bits are not set to 1.

The value of TCNTCx and GRCxy is in the identical state because rising edge of a comparing match signal is detected and status is being set, and even if input capture comparing match status is cleared, status isn't set newly.

32.7.2.5 TSCRCx — Timer Status Clear Register Cx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OCMFC Cx3	OCMFC Cx2	OCMFC Cx1	OCMFC Cx0	—	—	—	OVFCC x	IMFCCx 3	IMFCCx 2	IMFCCx 1	IMFCCx 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W	R	R	R	W	W	W	W	W

Note: x = 0 to SB_C-1, corresponding to subblocks C0 to CSB_C-1

Table 32.111 TSCRCx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. Fix these bits to 0.
11 to 8	OCMFCCxy	Output compare match flag clear Cxy enable 0: Disabled (Default) 1: OCMFCxy in timer status register Cx (TSCRCx) is cleared to 0.
7 to 5	—	These bits are not used. Fix these bits to 0.
4	OVFCCx	Overflow flag clear Cx enable 0: Disabled (Default) 1: OVFCx in timer status register C (TSCRCx) is cleared to 0.
3 to 0	IMFCCxy	Input capture flag clear Cxy enable 0: Disabled (Default) 1: IMFCxy in timer status register C (TSCRCx) is cleared to 0.

Note: x = 0 to SB_C-1, corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3, corresponding to channels 0 to 3.

TSCRCx is an 8-bit/16-bit readable/writable register to set clearing of flags at occurrence of an overflow or input capture or compare match. This register is always read as 0.

TSCRCx is initialized to 0000_H after reset.

Output Compare Match Flag Clear Cxy enable (OCMFCCxy)

Writing 1 to this register while the compare match flag (OCMFCxy) in the timer status register (TSCRCx) is set to 1 clears OCMFCCxy to 0. This bit is always read as 0.

Overflow Flag Clear C enable (OVFCCx)

Writing 1 to this bit while overflow flag C (OVFCx) in the timer status register C (TSCRCx) is set to 1 clears OVFCx to 0. This bit is always read as 0.

Input Capture Flag Clear Cxy Enable (IMFCCxy)

Writing 1 to this bit while input capture flag Cxy (IMFCxy) in the timer status register x (TSCRCx) is set to 1 clears IMFCCxy to 0. This bit is always read as 0.

32.7.2.6 TIORCx — Timer I/O Control Registers Cx

Value after reset: 0000_H

6				1	1						0	
7	Input capture mode ^{*3}	0	1	0	0	0	Cmp ^{*5}	x	* It's used as an input terminal. * An output factor is state retention.	The capture function, being effective and when detecting an edge of a chosen TIOC, TCNTCx is captured. When a comparing match of OCRC is effective, it's compared with TCNTCx.		
8				0	1						Cap (TIOC↓)	Cap (TIOC↑)
9				1	0						Cap (TIOC↑)	Cap (TIOC↓)
10				1	1						Cmp	Cap (TIOC↑↓)
11	One-shot pulse mode	1	0	0	0	0	Cmp	Cmp	0 output (active high)	It's used for initialization of an output terminal. But, the output of a one shot pulse is impossible. A TIOC does state maintenance of a forced compare match until it's established. The level established in IOCxy is output from a TIOC after forced compare match setting. ^{*1}		
12				0	1						1 output (active low)	
13				1	0						One shot output (active high)	0 is output from TIOCxy output until compare match occurrence at the OCRCxy register. 1 is output from TIOCxy output from compare match occurrence at the OCRCxy register to compare match occurrence at the GRCxy register. 0 is output from TIOCxy output by compare match occurrence at the GRCxy register. ^{*2}
14				1	1						One shot output (active low)	1 is output from TIOCxy output until compare match occurrence at the OCRCxy register. 0 is output from TIOCxy output from compare match occurrence at the OCRCxy register to compare match occurrence at the GRCxy register. 1 is output from TIOCxy output by compare match occurrence at the GRCxy register. ^{*2}
15	Input capture mode	1	1	0	0	0	Cmp ^{*5}	x	* It's used as an input terminal. * An output factor is state retention.	The capture function, being effective and when detecting chosen Event, TCNTCx is captured. When a compare match of OCRC is effective, it's compared with TCNTCx.		
16				0	1						Cap (Event1)	
17				1	0						Cap (Event2A)	
18				1	1						Cap (Event2B)	

Note: x = 0 to SB_C-1, y = 0, 1, 2, 3.

Cmp: It can be used as a compare match register.^{*4}

Cap: It can be used as a capture register. () indicates a capture trigger.

x: don't use

- Note 1. If a compare match by OCRCxy and a compare match by GRCxy occur at the same time, the compare match by GRCxy takes precedence.
- Note 2. Before selecting one-shot pulse mode (IOCxy[3:2] = 10_B), set the PWMX0 bit to 0.
It is prohibited to set PWMX0 bit to 1.
(The circuit operates in PWM mode.)
- Note 3. Output operation of a one shot pulse is permitted by write to GRCxy. Set OCRCxy before writing in to GRCxy. The value of TCNTCx and OCRCxy is to be identical, and the active level is output. Set OCRCxy, GRCxy so that an OCRCxy compare match may occur or occur at the same time first than a GRCxy compare match after GRCxy writing in at the time of one shot pulsed output movement.
- Note 4. A range compare match by RCR1Cx, and RCR2Cx and a range compare match by FCMCxy and FOCCMCxy are also included.
- Note 5. A compare match of TCNTCx and OCRC doesn't influence output of a TIOC by a mode except for a one shot pulse mode. When interrupt occurred to the time of a comparing match, that notifies outside of a comparing match's occurring.

The IOCxy[3:2] bits are used to set operating mode (compare match mode, input capture mode, or one-shot pulse mode). Change operating mode (IOCxy[3:2]) while the counter is not working.

Disable compare match and input capture (by setting IOCxy[1:0] to 00_B) before switching output mode for compare match mode (IOCxy[3:2] = 00_B) or switching edge detection/trigger for input capture mode (IOCxy[3:2] = 01_B or 11_B).

Change operating mode to one-shot pulse mode (IOCxy[3:2] = 10_B) and change active polarity (IOCxy[1:0]) in one-shot pulse mode (IOCxy[3:2] = 10_B) while the counter is not working.

When one-shot pulse mode (IOCxy[3:2] = 10_B) is used, initialize the external pins (TIOCxy) by forced compare match Cxy (FCMCxy) after operating mode is set, and then start counting.

When IOCxy[3:2] = x1_B and the mode setting is for input-capture, output operations do not proceed (the existing level on TIOCxy is retained).

The condition of the register who can establish it is different in each mode, so confirm each register condition to refer to the following table and establish it by TIORCx.IOCxy and TCRCx.PWMx0.

No.	mode	IOCxy				TCRCx	TCRCx	CLRCx	OCRCx	GRCx	CUCR	RCR1C	RCR2C	The upper limit value of TCNTCx												
		[3]	[2]	[1]	[0]

Note: x = 0 to SB_C-1, corresponding to subblocks C0 to CSB_C-1)

Timer counter C_x (TCNTCx) is 32-bit readable/writable registers driven by the input clock. These counters can be read from and written to while they are being run.

Timer counter C_x (TCNTCx) is started for counting by setting the bit in timer start register (TSTRC) to 1. The clock signal is selected by the clock select bits (CKSEL) in timer control register (TCRCx). A timer overflow causes an overflow interrupt request to be output to the CPU. TCNTCx is initialized to 0000 0000_H after reset.

The upper limit value of timer counter C_x (TCNTCx)

PWMx0	CLRCx	Upper limit value of timer counter C _x (TCNTCx)
1	0/1	GRCx0
0	0	FFFF_FFFF _H
0	1	CUCRCx*1

Note 1. When the writing in value to CUCRC is smaller than TCNTCx, it'll be FFFF_FFFF_H.

32.7.2.8 GRCxy — Timer General Registers Cxy

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

These timer general registers Cxy (GRCxy) are 32-bit readable/writable registers that function as the input capture register or output compare register. These functions are switched by setting timer I/O control register Cx (TIORCx).

- Operation in input capture mode

When GRCxy is used as an input capture register, it detects an external input capture signal, stores the TCNTCx value, and outputs an input capture interrupt request to the CPU. At this time, the IMFCxy bit in timer status register x (TSRCx) is set to 1. The edge to be detected is selected by the corresponding TIORCx.

Input capture is performed even if the counter is stopped (the TCE bit in ATUENR is cleared to 0 or the STRCx bit in TSTRC is cleared to 0). The value in the counter stopped is loaded to GRCxy.

- Operation in compare match mode

When GRCxy is used as an output compare register, the values in GRCxy and the timer counter (TCNTCx) are constantly compared. When these values match, TIOCx output is changed according to the method (0 output, 1 output, or toggle output) specified in TIORCx, a compare match interrupt request is output to the CPU. At this time, the IMFCxy bit in the timer status register (TSRCx) is set to 1. Initially, logical zero is output on the TIOCx pin (immediately after a reset or output compare modes are switched). During operation, the previous value is output. If these registers function as the output compare register for one-shot pulse output, one-shot pulse output starts by writing to GRCxy. Set OCRCxy before writing to GRCxy.

TCNTCx value is captured in GRCx at the time of range compare match occurrence by RCR2Cx. Regarding the range compare function, refer to **Section 32.7.3.6 Range Compare Function**.

- Operation in one-shot pulse mode

When GRCxy is used as an output compare register for one-shot pulse output, one-shot pulse output starts when a value is written to GRCxy. Be sure to set OCRCxy before writing to GRCxy.

The values in GRCxy and timer counter (TCNTCx) are compared after a compare match with OCRCxy is detected (or when GRCxy = OCRCxy).

Compare match of GRCxy inactivates one-shot pulse (compare match with OCRCxy activates one-shot pulse) and the IMFC bit in the timer status register (TSRCx) is set to 1. TCNTCx value is captured in GRCx at the time of range compare match occurrence by RCR2Cx. Regarding the range compare function, refer to **Section 32.7.3.6, Range Compare Function**.

Once the one-shot pulse is output, another output is not performed until new value is set to GRCxy. Also, the IMFC bit in the timer status register (TSRCx) is not changed.

When these registers are used as output compare registers for compare match or one-shot pulse output, if CLRCSELC_x bit is set to 0 and the counter upper-limit setting function (see **Section 32.7.3.5, Counter Upper-Limit Setting Function**) is used, and moreover either clock-bus line 5 or a prescaler division ratio as 1/1 is selected for the count clock, the timer counter counts between 1 and the value of CUCRC_x and the counter value may not become 0000 0000_H. Therefore, do not set these registers to 0000 0000_H in such cases.

GRC_{xy} is initialized to FFFF FFFF_H after reset.

32.7.2.9 NCNTCxy — Noise Canceler Counters Cxy

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCNTCxy[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.113 NCNTCxy Register Contents

Bit Position	Bit Name	Function
15 to 0	NCNTCxy	Noise cancel count Cxy These bits store an 16-bit count value

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Noise Canceler counters Cxy (NCNTCx0 to x3) are 16-bit readable/writable registers. NCNTCx0 to x3 are started by the external input pins (TIOCx0 to TIOCx3) as triggers when the noise canceler is enabled by the noise cancel enable bit (NCECx0 to x3) in timer I/O control register Cx (TIORCx). In level accumulation cancellation mode, these counters increment or decrement according to the external input level. Up-count or down-count after operation start is performed in synchronization with the noise canceler count clock or clock bus 5 supplied from the prescaler.

NCNTCxy continues counting regardless of the settings in the timer C enable bit (TCE) in ATU master enable register (ATUENR) and in TSTRC (regardless of the TCNTCx).

NCNTCxy operates in one of three modes (premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode) according to the settings of the noise cancellation mode select bit (NCMSEL) and the timer C noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) in the common control unit.

- In premature-transition cancellation mode

When a level change of the externally input signal (TIOCxxy) is detected while bit NCECxxy is set to 1 and NCNTCxy is stopped, NCNTCxy is started for counting up. This counter is cleared to 0000_H and stopped on the first edge of the PCLK after the value in NCNTCxy matches the value in noise cancel register (NCRCxy).

NCNTCxy is incremented regardless of the timer C enable bit (TCE) in ATU master enable register (ATUENR).

The first change is output as the signal whose noise is removed and the edge is to be extracted. Subsequent level changes are masked until the value in the counter reaches the value in the noise cancel register (NCRCxy). The level of the externally input signal is output on this compare match.

When the NCECxxy bit is cleared to 0 while the counter (NCRCxy) is being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes are also masked over this period.

- In minimum time-at-level cancellation mode

When a level change of the externally input signal (TIOC_{xy}) is detected while the NCEC_{xy} bit is set to 1 and NCNT_{xy} is stopped, NCNT_{xy} is started for counting up. This counter is cleared to 0000_H and stopped on the first edge of the PCLK after the value in NCNT_{xy} matches the value in noise cancel registers (NCRC_{xy}) or after the level of the externally input signal (TIOC_{xy}) is changed.

NCNT_{xy} is incremented regardless of the timer C enable bit (TCE) in ATU master enable register (ATUENR).

When a level change of the externally input signal is detected, the corresponding noise canceler counter (NCNT_{xy}) is started for counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register (NCRC_{xy}), the previously accepted level change is output as the signal whose noise is removed on compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes is treated as noise. Therefore the signal whose noise is removed is not changed.

When the NCEC_{xy} bits are cleared to 0 while the counter (NCNT_{xy}) is being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the externally input signal is detected.

- In level accumulation cancellation mode

When the NCEC_{xy} bit is 1, NCNT_{xy} increments or decrements according to the input signal level. While the input level is high, NCNT_{xy} increments. When the counter value matches the noise cancel register (NCRC_{xy}) value, up-counting stops on the next PCLK. While the input level is low, NCNT_{xy} decrements. When the counter value reaches 0000_H, down-counting stops on the next PCLK.

NCNT_{xy} counts regardless of the timer C enable bit (TCE) value in the ATU master enable register (ATUENR).

When the counter value matches the NCRC_{xy} value during up-counting, the noise canceler output is updated to 1.

When the counter value reaches 0000_H during down-counting, the noise canceler output is updated to 0.

When the NCEC_{xy} bit is cleared during counting, the noise canceler counter stops working and the value changes from the noise canceler output to the input signal level at that time. For this reason, note that when clearing the NCEC_{xy} bit in level accumulation cancellation mode, edge detection may be made at this changeover.

NCNT_{xy} is initialized to 0000_H after reset.

32.7.2.10 NCRCxy — Noise Canceler Registers Cxy

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCRCxy[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.114 NCRCxy Register Contents

Bit Position	Bit Name	Function
15 to 0	NCRCxy	Noise Canceling Time Cxy TIOCxy noise canceling period (16-bit comparison value)

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Noise cancel registers Cxy (NCSCx0 to Cx3) are 16-bit readable/writable registers that are provided in each subblock and set the upper limitations of noise cancel counters Cxy (NCNTCx0 to Cx3).

When PCLK/128 clock is selected as a noise canceler clock, noise with maximum length of 0.21 s (at PCLK = 40 MHz) can be canceled when this register is set to FFFF_H.

NCSCx0 to NCSCx3 operate in one of three modes (premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode) according to the settings of the noise cancellation mode select bit (NCMSEL) and the timer C noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCRM) in the common control unit.

- In premature-transition cancellation mode

While NCNTCxxy is in count operation, the level change of the subsequent input signal is masked. Values in NCNTCxxy and NCRCxy are always compared. If a compare match occurs, the value in NCNTCxxy is cleared on the next PCLK, the count operation is stopped, and the masking of the input signal is canceled.

- In minimum time-at-level cancellation mode

While NCNTCxxy is in count operation, noise canceler processing waiting state is entered. Values in NCNTCxxy and NCRCxy are always compared. If a compare match occurs, the value in NCNTCxxy is cleared on the next PCLK, the count operation is stopped, and at the same time the noise canceler outputs the input signal that has passed through the noise canceling processing.

- In level accumulation cancellation mode

While NCNTCxxy is counting up, the NCNTCxxy value is compared with the NCRCxy value. When a compare match occurs, NCNTCxxy stops up-counting on the next PCLK. While NCNTCxxy is counting down, the NCNTCxxy value is compared with 0000_H.

NCRCx0 to NCRCx3 can be read and written only in 16-bit units.

NCRCx0 to NCRCx3 are initialized to 0000_H after reset.

32.7.2.11 OCRCxy — Output Compare Registers Cxy

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OCRCxy[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OCRCxy[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Output compare registers Cxy (OCRCxy) are 32-bit readable/writable registers that function as an output compare register. These registers are used as a compare register in modes other than one-shot pulse mode.

- Operation in input capture mode:

When GRCxy is used as an input capture register, it detects an external input capture signal, stores the TCNTCx value, and outputs an input capture interrupt request to the CPU. At this time, the IMFCxy bit in timer status register x (TSRCx) is set to 1. The edge to be detected is selected by the corresponding TIORCx.

Input capture is performed even if the counter is stopped (the TCE bit in ATUENR is cleared to 0 or the STRCx bit in TSTRC is cleared to 0). The value in the counter stopped is loaded to GRCxy.

- Operation in compare match mode:

The values in OCRCxy and timer counter (TCNTCx) are always compared. When these values match, a compare match interrupt request is outputs to the CPU. At this time, the OCMFC bit in the timer status register (TSRCx) is set to 1. TCNTCx value is captured in OCRCx at the time of range compare match occurrence by RCR1Cx. Regarding the range compare function, refer to **Section 32.7.3.6, Range Compare Function**.

- Operation in one-shot pulse mode:

When GRCxy is used as an output compare register for one-shot pulse output, one-shot pulse output starts when a value is written to GRCxy. Be sure to set OCRCxy before writing to GRCxy.

When one-shot pulse output starts, the values in OCRCxy and timer counter (TCNTCx) are compared.

Compare match with OCRCxy activates one-shot pulse (compare match with GRCxy inactivates one-shot pulse) and the OCMFCxy bit in the timer status register (TSRCx) is set to 1. TCNTCx value is captured in OCRCx at the time of range compare match occurrence by RCR1Cx. Regarding the range compare function, refer to **Section 32.7.3.6, Range Compare Function**.

Once the one-shot pulse is output, another output is not performed until new value is set to GRCxy. Also, the OCMFCxy bit in the timer status register (TSRCx) is not changed. When these registers are used as output compare registers for compare match or one-shot pulse output, if the counter upper-limit setting function (see **Section 32.7.3.5, Counter Upper-Limit Setting Function**) is in use with clock-bus line 5, or with a division ratio of 1/1 selected for the prescaler, the timer counter counts between 1 and the value of CUCRCx and the counter value never reaches 0000 0000_H. Therefore, do not set these registers to 0000 0000_H in such cases.

OCRCxy is initialized to FFFF FFFF_H after reset.

32.7.2.12 OCMRCxy — Output Compare Mirror Registers Cxy

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OCMRCxy[31:16]																
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OCMRCxy[15:0]																
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SBc-1: Corresponding to subblocks C0 to CSBc-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The output compare mirror registers Cxy (OCMRCxy) are 32-bit read-only registers that have a function mirroring the output compare registers Cxy (OCRCxy) for DMA transfer. Writing to this register is prohibited.

The mirroring function is provided to DMA-transfer the value captured to OCRCxy or GRCxy in input capture mode. During DMA transfer, read the values in OCMRCxy and GMRCxy consecutively in this order.

32.7.2.13 GMRCxy — Timer General Mirror Registers Cxy

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GMRCxy[31:16]																
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GMRCxy[15:0]																
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer general mirror registers Cxy (GMRCxy) are 32-bit read-only registers that have a function mirroring the timer general registers Cxy (GRCxy) for DMA transfer. Writing to this register is prohibited.

The mirroring function is provided to DMA-transfer the value captured to OCRCxy or GRCxy in input capture mode. During DMA transfer, read the values in OCMRCxy and GMRCxy consecutively in this order.

32.7.2.14 TIERCx — Timer Interrupt Enable Registers Cx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OCRCE _{x3}	OCRCE _{x2}	OCRCE _{x1}	OCRCE _{x0}	—	—	—	OVCE _x	GRCE _{x3}	GRCE _{x2}	GRCE _{x1}	GRCE _{x0}
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1

Table 32.115 TIERCx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. Fix these bits to 0.
11 to 8	OCRCE _{xy}	OCRC interrupt enable xy Interrupt request due to comparison and capture by OCRCE _{xy} 0: Interrupt request due to comparison and capture by OCRCE _{xy} is disabled. 1: Interrupt request due to comparison and capture by OCRCE _{xy} is enabled.
7 to 5	—	These bits are not used. Fix these bits to 0.
4	OVCE _x	Overflow interrupt enable x 0: Interrupt request due to overflow is disabled. 1: Interrupt request due to overflow is enabled.
3 to 0	GRCE _{xy}	GRC interrupt enable xy 0: Interrupt request due to comparison and capture by GRCE _{xy} is disabled. 1: Interrupt request due to comparison and capture by GRCE _{xy} is enabled.

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Timer interrupt enable registers C_x (TIERCx) are 8-bit/16-bit readable/writable registers used to set interrupt requests due to comparison in subblocks C0 to CSB_C-1.

Interrupt request C_{xy} due to comparison (OCRCE_{xy})

An interrupt is generated on compare match by the output compare register (OCRC_{xy}).

Interrupt request C_{xy} due to overflow (OVCE_x)

An interrupt is generated upon occurrence of an overflow.

Interrupt request C_{xy} due to comparison and capture (GRCE_{xy})

An interrupt is generated on compare match or capture operation by the general register GRC_{xy}.

32.7.2.15 CUCRCx — Counter Upper-Limit Setting Compare Registers Cx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CUCRCx[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CUCRCx[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1

Counter upper-limit value compare registers C_x (CUCRC_x) are 32-bit readable/writable registers that has a function to be compared with the TCNTC_x counter. Compare match between this register and the TCNTC_x counter is enabled by setting the TCNTC_x clear bit C_x (CLRC_x) in the timer control register (TCRC_x) to 1. The TCNTC_x counter is cleared to 0000 0000_H on compare match between the TCNTC_x counter and counter upper-limit setting compare register (CUCRC_x).

If this compare match occurs at the same time as counting up by the timer counter C_x (TCNTC_x), the timer counter C_x (TCNTC_x) is cleared to 0000 0001_H.

The OVFC_x bit in timer status register C (TSRC_x) is set to 1 and an overflow interrupt is output on compare match between the TCNTC_x counter and counter upper-limit setting compare register C_x (CUCRC_x).

Establish “CUCRC_x ≥ GRC_{xy}” by occurrence condition of a compare match of GRC_{xy} by Counter Upper-Limit Setting Compare Registers C_x(CUCRC_x) when GRC_{xy} is used as a comparing register at CLRC_x = 1.

When not establishing it, an expectancy wave-shaped isn't output from an output terminal TIOC.

Do not set CUCRC_x to 0000 0000_H. If 0000 0000_H is set, a compare match may occur at an unintended timing.

CAUTION

The upper limit value setting function can be enabled (CLRC_x = 1) in other than PWM mode (PWM_{x0} = 0).

32.7.2.16 RCR1Cx — Range Comparison Value Setting Register 1Cx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RCR1Cx[4:0]				
Value after reset	0*1	0*1	0*1	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1

Note 1. These bits are not used. Fix these bits to "0".

The range comparison value setting registers 1Cx (RCR1Cx) are 8-bit readable/writable registers.

This register can enable / disable range compare function and set range value. Regarding the range compare function, refer to **Section 32.7.3.6, Range Compare Function**.

RCR1Cx is initialized to 00_H after reset.

32.7.2.17 RCR2Cx — Range Comparison Value Setting Register 2Cx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RCR2Cx[4:0]				
Value after reset	0*1	0*1	0*1	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_C-1: Corresponding to subblocks C0 to CSB_C-1

Note 1. These bits are not used. Fix these bits to "0".

The range comparison value setting registers 2Cx (RCR2Cx) are 8-bit readable/writable registers. This register can enable / disable range compare function and set range value. Regarding the range compare function, refer to **Section 32.7.3.6, Range Compare Function**.

RCR2Cx is initialized to 00_H after reset.

The following table shows ranges that can be set as range comparison values (power of 2 (excluded only when RCR1Cx and RCR2Cx are 0)).

RCR1Cx[4:0], RCR2Cx[4:0]	Selectable Range	Remarks
00000	None	Range comparison is invalid (Default)
00001	2^1-1	—
00010	2^2-1	—
00011	2^3-1	—

11100	$2^{28}-1$	—
11101	$2^{29}-1$	—
11110	$2^{30}-1$	—
11111	$2^{31}-1$	—

32.7.2.18 NCMCR1C — Noise Cancellation Mode Channel Register 1C

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	NCM1C 13	NCM1C 12	NCM1C 11	NCM1C 10	NCM1C 9	NCM1C 8	NCM1C 7	NCM1C 6	NCM1C 5	NCM1C 4	NCM1C 3	NCM1C 2	NCM1C 1	NCM1C 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.116 NCMCR1C Register Contents

Bit Position	Bit Name	Function
15 to SB _c	—	These bits are not used. Fix these bits to “0”.
SB _c -1 to 0	NCM1C _x	Subblock x all channels noise cancellation mode This bit specifies the operating mode of all the noise cancellers in subblock x. 0: Premature-transition cancellation mode 1: Minimum time-at-level cancellation mode (When NCMC = 0 and NCM2C _x = 0) 1: Level accumulation cancellation mode (When NCMC = 0 and NCM2C _x = 1)

Note: x = 0 to SB_c-1. Corresponding to subblocks C0 to CSB_c-1.

The noise cancellation mode channel register 1C is an 8-bit or a 16-bit readable/writable register used to select an operating mode of noise canceler in each channel. However, the setting of this register applies to all channels in the corresponding subblock and the setting cannot be made for the individual channels.

Premature-transition cancellation mode detects a change in input signal level, and then ignores changes in input signal level within the specified time period. Changes in input signal level within the specified time period after the first level change are regarded as noise in this mode.

Level accumulation cancellation mode accumulates input signal levels and regards that the input level has reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise cancellation register in each channel, and the noise cancellation counter measures the time.

Subblock x All Channels Noise Cancellation Mode (NCM1C_x)

This bit specifies the operating mode of all the noise cancellers in subblock x.

CAUTION

This register is only effective when the NCMC bit of the noise cancellation mode register (NCMR) in the common control unit is “0”. Furthermore, when the corresponding channel bit (NCM1C_x) in this register is set to “1”, the mode can be set to premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode according to the state of the corresponding channel bit in the noise cancellation mode channel register 2C (NCMCR2C).

Note: x indicates 0 to SB_c-1.

32.7.2.19 NCMCR2C — Noise Cancellation Mode Channel Register 2C

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	NCM2C 13	NCM2C 12	NCM2C 11	NCM2C 10	NCM2C 9	NCM2C 8	NCM2C 7	NCM2C 6	NCM2C 5	NCM2C 4	NCM2C 3	NCM2C 2	NCM2C 1	NCM2C 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.117 NCMCR2C Register Contents

Bit Position	Bit Name	Function
15 to SB _C	—	These bits are not used. Fix these bits to “0”.
SB _C -1 to 0	NCM2C _x	Subblock x all channels noise cancellation mode This bit specifies the operating mode of all the noise cancellers in subblock x. 0: Minimum time-at-level cancellation mode (When NCMC = 0 and NCM1C _x = 1) 1: Level accumulation cancellation mode (When NCMC = 0 and NCM1C _x = 1)

Note: x = 0 to SB_C-1. Corresponding to subblocks C0 to CSB_C-1.

The noise cancellation mode channel register 2C is an 8-bit or a 16-bit readable/writable register used to select an operating mode of noise canceler in each channel. However, the setting of this register applies to all channels in the corresponding subblock and the setting cannot be made for the individual channels.

Level accumulation cancellation mode accumulates input signal levels and regards that the input level has reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise cancellation register in each channel, and the noise cancellation counter measures the time.

Subblock x All Channels Noise Cancellation Mode 2 (NCM2C_x)

This bit specifies the operating mode of all the noise cancellers in subblock x.

CAUTION

This register is only effective when the NCMC bit of the noise cancellation mode register (NCMR) in the common control unit is “0” and the corresponding channel bit (NCM1C_x) in noise cancellation mode channel register 1C (NCMCR1C) is “1”.

Note: x indicates 0 to SB_C-1.

32.7.3 Details of Operation

32.7.3.1 Input Capture Mode (Input Capture Function)

Timer general registers Cxy (GRCxy) and output compare registers Cxy (OCRCxy) perform input capture when an edge is input from the corresponding external pin (TIOCxy) or an event output (event 1, 2A, or 2B) from timer A is input by setting input capture in timer I/O control registers (TIORCx).

The timer counter (TCNTCx) starts up-counting by setting the timer start register (TSTRx). When an edge of the corresponding external pin of GRCxy and OCRCxy is input or an event output from timer A used as a capture timing signal of GRCx is input, the corresponding bit (IMFCxy/OCMFCxy) in the timer status register (TSRC) is set to 1 and the counter value is transferred to GRCxy and OCRCxy. After a changed edge of TIOCxy has been extracted and then two internal operating clock (PCLK) cycles have passed, the interrupt output changes. Input capture flags (IMFCxy/OCMFCxy bits in TSRCx) can be cleared by writing 1 to the corresponding clear bit in the timer status clear register (TSCRCx).

An edge to be input can be selected from rising edge, falling edge, and both edges according to the setting of the IOC bit in the TIORCx register.

Furthermore, an interrupt request can be output to the CPU at the input capture timing.

The value in timer counter Cx (TCNTCx) is cleared when its value matches the value of counter upper limit value setting compare register Cx (CUCRCx) while the CLRCx bit in timer control register Cx (TCRCx) is set to enabled. But, when the writing in value to CUCRC is smaller than TCNTCx, it'll be FFFF_FFFF_H.

Figure 32.38 shows an operation example of input capture in subblock C0. TIOC00 is captured at active high, and TIOC01 is captured at active low.

Input capture is performed even if TCNTCx is stopped (when the TCE bit in ATUENR or bit STRCx is cleared to 0). The counter value of the TCNTCx stopped is captured in GRCxy and OCRCxy.

TIORC.IOCxy				TCRCx	TCRC.	TCRC.	OCRCxy	GRCxy	CUCRCx	RCR1Cx	RCR2Cx	The upper limit value of TCNTCx	
[3]	[2]	[1]	[0]	PWMx0	CLRCx	CLRCSELCx							
0	1	0	0	0 *(1 setting prohibited)	0/1		Cmp	x	0/1	○	x	[When TCRC.CLRCx = 0] FFFF_FFFF _H	
		0	1				Cap(TIOC↓)	Cap(TIOC↑)					x
		1	0				Cap(TIOC↑)	Cap(TIOC↓)					x
		1	1				Cmp	Cap(TIOC↑↓)					○
1	1	0	0				Cmp	x		○		[When TCRC.CLRCx = 1] CUCRCx or FFFF_FFFF _H	
		0	1				Cap	(Event Output 1)					
		1	0				Cap	(Event Output 2A)					
		1	1				Cap	(Event Output 2B)					

Note: Cmp: It can be used as a compare match.

Cap: It can be used as a capture. () indicates a capture trigger.

○: Setting possible, x: Setting prohibited

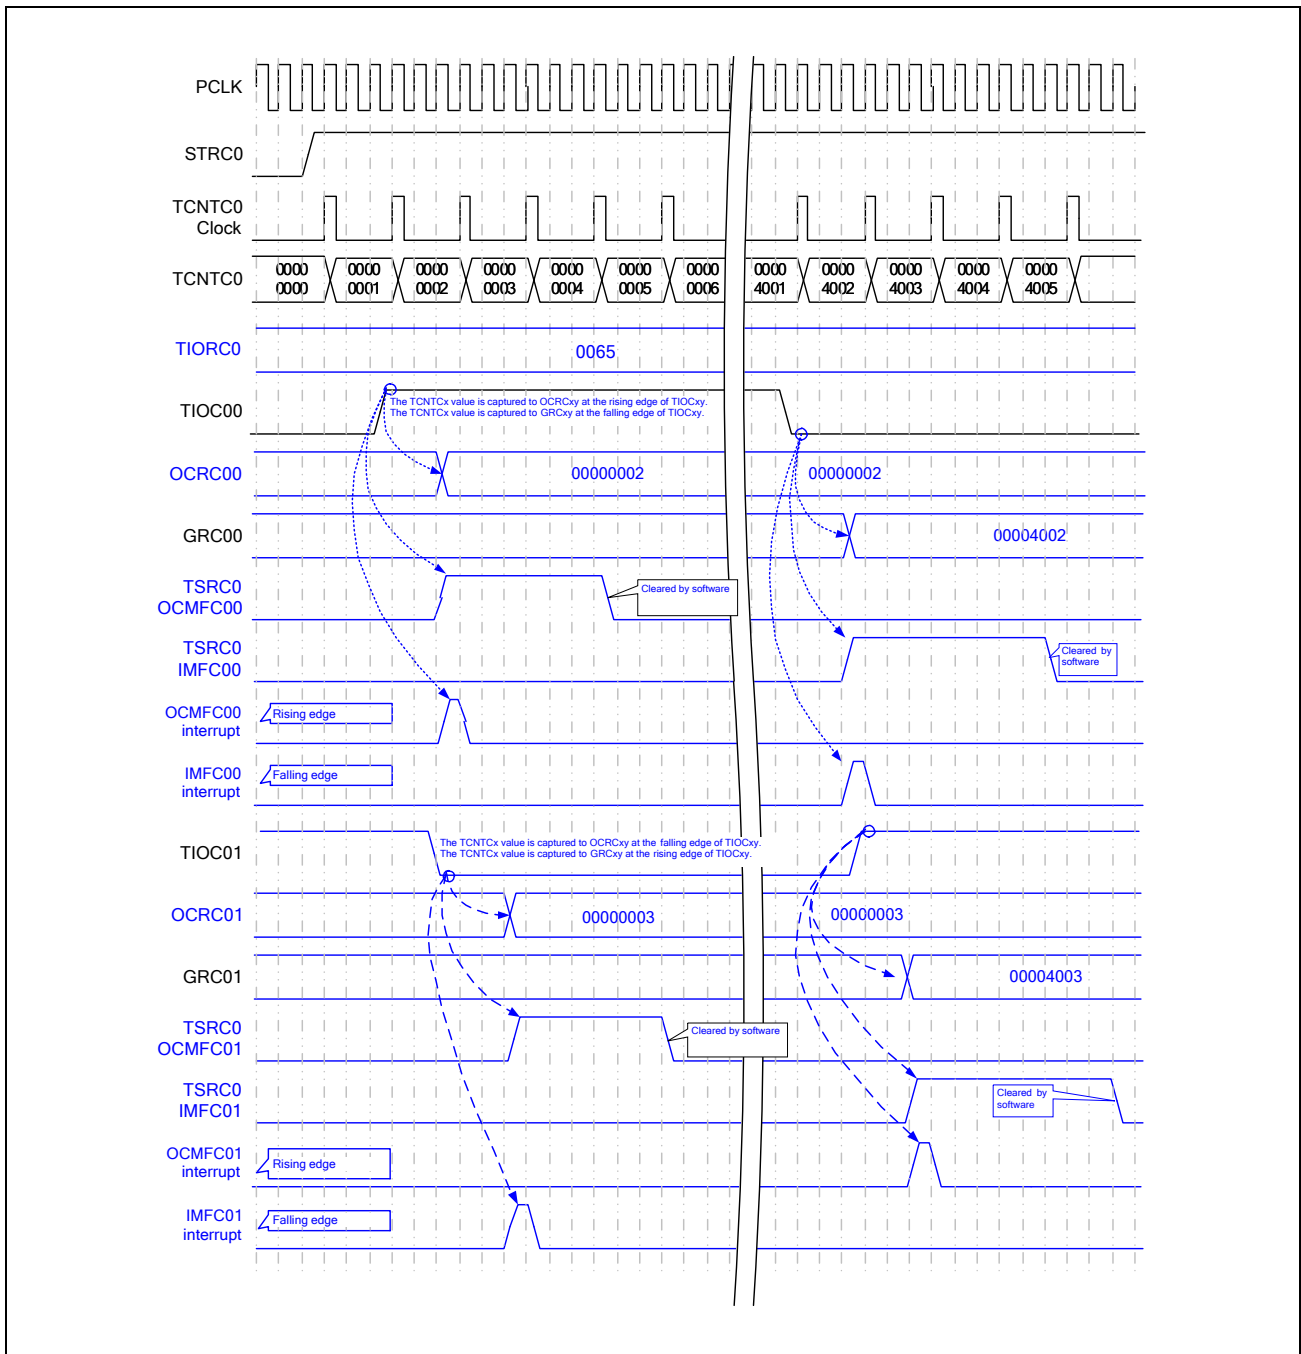

Figure 32.38 Operation Example of Input Capture

32.7.3.2 Compare Match Mode (Compare Match Function)

The following table can be set as a compare match mode. The PWM function explains the explanation at the time of on/off below.

TIORC.IOCxy				TCRCx.	TCRC.	TCRC.	OCRCxy	GRCxy	CUCRCx	RCR1Cx	RCR2Cx	The upper limit value of TCNTCx	
[3]	[2]	[1]	[0]	PWMx0	CLRCx	CLRCSELCx							
0	1	0	0	0	0/1		Cmp	x	o	o	x	[When TCRC.PWMx0 = 1] GRCx0	
				0	1	0		0/1	Cmp [When PWMx0 = 1] • GRCx0	o	o	o	[When TCRC.CLRCx = 0] FFFF_FFFF _H
				1	0 *(1 setting prohibited)			x		x	x	[When TCRC.CLRCx = 1] CUCRCx or FFFF_FFFF _H	
		1	0	0	0/1			PWM cycle • GRCx1-3 duty ratio	o	o	o		
				1	0 *(1 setting prohibited)				x	x	x		
				0	0/1				o	o	o		

Note: Cmp: It can be used as a compare match.

o: Setting possible, x: Setting prohibited

General registers (GRCxy) of timer C output compare match from the corresponding external pin (TIOCxy) by setting compare match operation in timer I/O control registers (TIORCx). A comparing match by Output Compare Registers Cxy (OCRCxy) isn't precocious in relation to output control of the outside terminal (TIOCxy).

Timer counter (TCNTCx) is started for counting up by setting a bit in timer start register (TSTRC) to 1. Set the value in GRCxy before starting the counter. When the values in GRCxy and TCNTCx match, a bit corresponding to GRCxy in timer status register (TSRCx) is set and a waveform is output on external pin TIOCxy.

The compare match flag is set and the signal level on pin TIOCxy is changed on the first edge of the PCLK immediately after compare match between GRCxy and TCNTCx. Compare match flags (IMFCxy bits in TSRCx) can be cleared to 0 by writing 1 to the corresponding clear bit in the timer status clear register (TSCRCx).

A logical one, a logical zero, or a toggled output can be selected for the signal to be output on pin TIOCxy.

An interrupt request can be output to the CPU at occurrence of a compare match.

When PWM mode is disabled (TCRCx.PWMx0 = 0) and the CLRCx bit of timer control register Cx (TCRCx) is enabled, timer counter (TCNTCx) is cleared if its value matches the value of counter upper limit value setting compare register Cx (CUCRCx).

Figure 32.39 shows an operation example of compare match. In this example, a toggled output on GRC00, a logical one output on GRC01, and a logical zero output on GRC02 are externally output. A value of 004004 is set for GRC0y, which changes the TIOC0y output on the next PCLK after compare match with the TCNTC0 value.

Output compare registers Cxy (OCRCxy) is compared with timer counter (TCNTCx), and if they match, the OCMFCxy bit in timer status register (TSRCx) corresponding to OCRCxy is set.

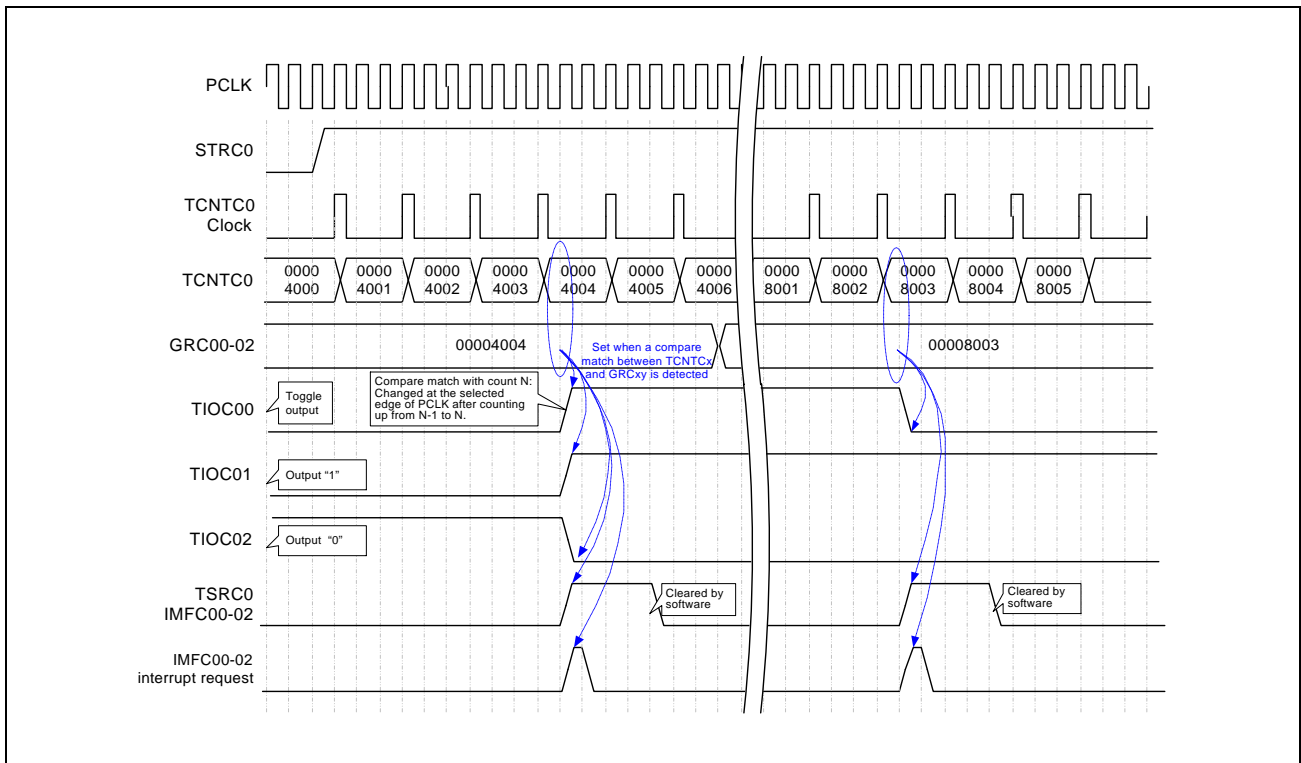

Figure 32.39 Operation Example of Compare Match

By setting a forced compare match bit (FCMC_{xy}) in timer control register (TCRC_x), compare match can be generated even if TCNTC_x has not matched GRC_{xy}. The compare match flag and the signal level on pin TIOC_{xy} are changed on the first edge of the PCLK after bit FCMFC_{xy} is set to 1.

Compare match is detected by GRC_{xy} when any of the following occurs.

- When the values in TCNTC_x and GRC_{xy} match (forced compare match is OFF)
- When the forced compare match bit (bit FCMC_{xy} in TCRC_x) is changed from 0 to 1
- When TCNTC_x sets the value besides 00_H as RCR2C_x, and it's in the range set as RCR2C_x at the time of writing in GRC_{xy}.

Compare match is detected by OCRC_{xy} when any of the following occurs.

- When the values in TCNTC_x and OCRC_{xy} match (forced compare match is OFF)
- When the forced compare match bit (bit FOCMC_{xy} in TCRC_x) is changed from 0 to 1
- When TCNTC_x sets the value besides 00_H as RCR1C_x, and it's in the range set as RCR1C_x at the time of writing in GRC_{xy}.

The compare match flag and the signal level on pin TIOC_{xy} is changed on the first edge of the PCLK after bit FCMC_{xy} is set to 1. Make sure that the compare match operation is selected by bits IOC_{xy}[2:0] in TIORC_x before starting operation. At the moment TCNTC_x and GRC_{xy} are set to the same value, or when the forced compare match bit is set to "1", compare match is not detected at the moment when compare match is enabled.

Compare match is detected regardless of the counter operating state. Even if the counter is stopped, compare match occurs when the condition is satisfied.

When the compare match status flag is cleared before GRC_{xy} and TCNTC_x are changed (such as before counting while the counter has been stopped), the compare match is not detected.

32.7.3.3 PWM Function

Setting bit PWMx in timer control register C (TCRCx) to 1 makes channels 1 to 3 in each subblock function as PWM timers with the same frequency. In PWM mode, GRCx0 as a cycle setting register and GRCx1 to GRCx3 as duty cycle setting registers are used. External pins TIOCx1 to TIOCx3 corresponding GRCx1 to GRCx3 are used to output PWM signals. To use them as PWM signal outputs, select the compare match operation by bits IOCxy in TIORCx as well as setting bit PWMx so that GRCn0 to GRCn3 function as compare match registers.

Timer counter (TCNTCx) is started by setting timer start register (TSTRC). When the value in TCNTCx reaches the value in the cycle setting register (GRCx0), compare match occurs and the bit in timer status register C (TSRCx) is set to 1. At this time, TCNTCx is cleared and a signal is output on external pins TIOCx1 to TIOCx3 according to bit IOCx0 in PWM mode. The output signal levels on pin TIOCx0 depend on bit IOCx0.

When the value in TCNTCx reaches the value in the duty cycle setting register (GRCx1 to GRCx3), the bit in timer status register C (TSRCx) is set to 1 and a signal is output on external pins TIOCx1 to TIOCx3 according to bits IOCx1 to IOCx3.

When the same value is set in the cycle and duty cycle setting registers, priority is given to bit IOCx0 corresponding to the cycle setting register.

Figure 32.40 shows an operation example of block C0 in PWM mode.

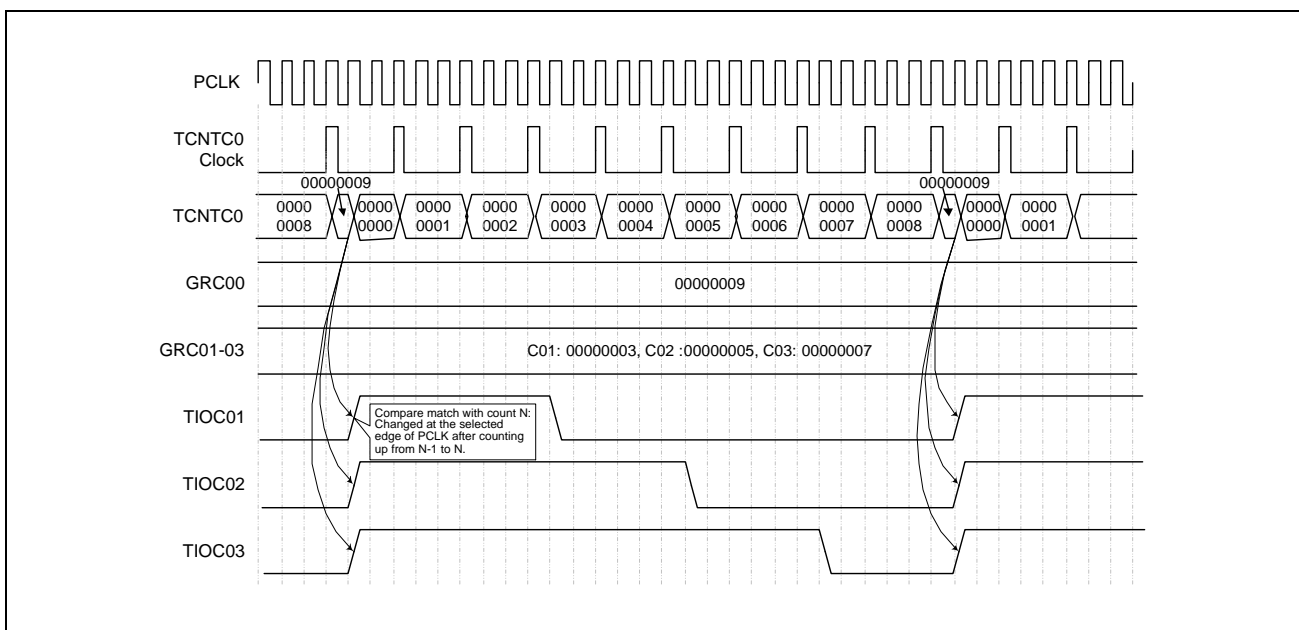

Figure 32.40 Operation Example of PWM Mode

The settings to obtain the above waveforms are IOC00 = 10 (for the output of 1 on TIOC00) and IOC01, 02, 03 = 01 or 11 (for the output of 0 on or inversion of TIOC01, 02, 03).

CAUTION

Operation will not be correct for PWM output with a duty cycle of 0%. Do not set GRCxy to 0, since the output will not be as expected in this case (in the case of frequency division by one, operation becomes the same as with a duty cycle of 100%, and in the case of division by two, pulses of one cycle of PCLK will be generated).

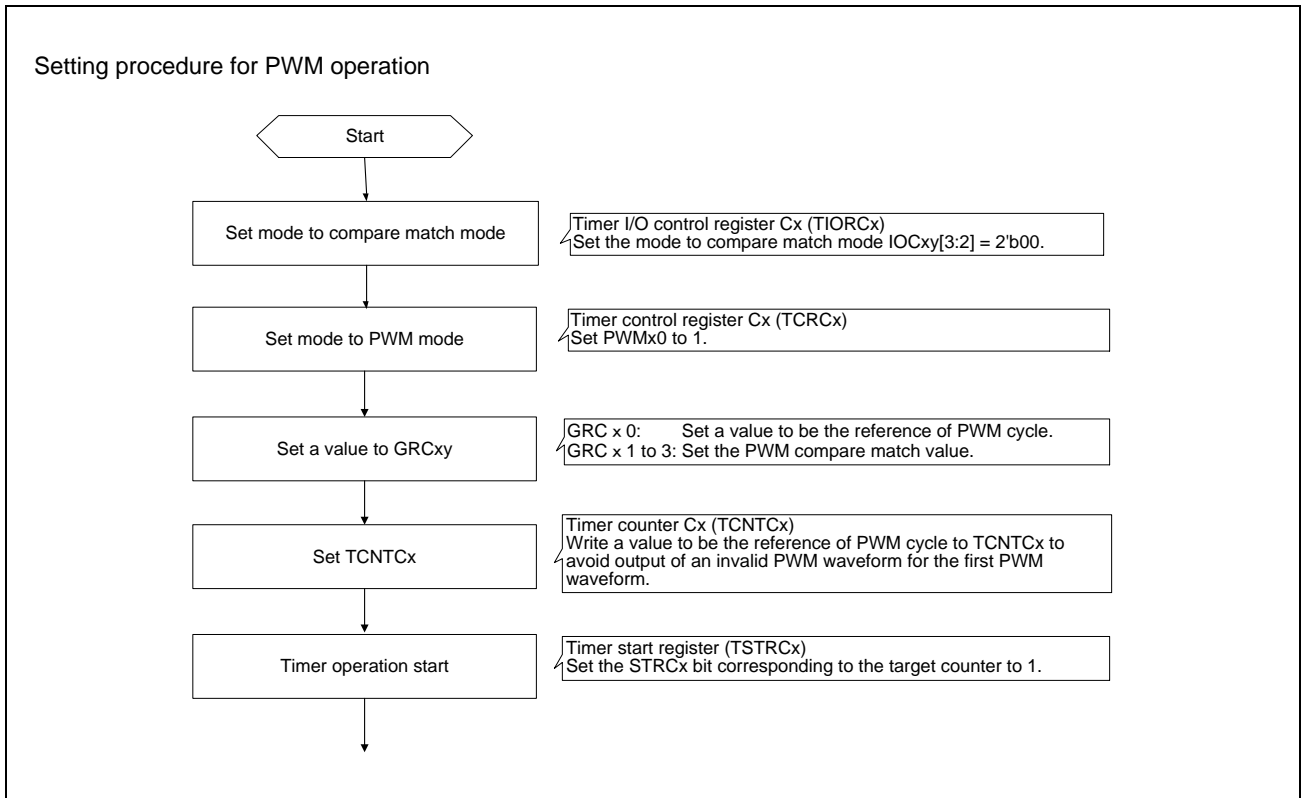

Figure 32.41 PWM Operation Setting Procedure

32.7.3.4 One-Shot Pulse Mode (One-Shot Pulse Function)

By setting the PWMx0 bits in timer control register Cx (TCRCx) to 0_B and setting the IOCxy[3:2] bits in timer I/O control register Cx (TIORXCx) to 10_B, one-shot pulses are output from the corresponding external pin (TIOCxy).

Setting the timer start register (TSTRC) starts up-count of the timer counter (TCNTCx).

In one-shot pulse mode, a one-shot pulse is output at a trigger of write access to the GRCxy register.

After the write access to the GRCxy register, a compare match interrupt is output on compare match between timer counter Cx (TCNTCx) and OCRCxy register, set the external pin (TIOCxy) to active level, a compare match interrupt is output on compare match between timer counter Cx (TCNTCx) and GRCxy register, and then reset the external pin (TIOCxy) to inactive level. When a single one-shot pulse output has been completed after an access to the GRCxy register, no interrupt occurs until the next write access to the GRCxy register is made and the external pin (TIOCxy) retains inactive level.

When one-shot pulse mode (IOCxy[3:2] = 10_B) is used, initialize the external pin (TIOCxy) by forced compare match Cxy (FCMCxy) after operating mode is set, and then start counting.

If one-shot pulse mode is activated without initializing the external pin (TIOCxy) to inactive level, output level becomes unstable.

To cancel one-shot pulse mode after a value is written to the GRCxy register, write 1 to forced compare match Cxy (FCMCxy) and forced output compare match Cxy (FOCMCxy) simultaneously.

TIORC.IOCxy				TCRCx.	TCRC.	TCRC.						
[3]	[2]	[1]	[0]	PWMx0	CLRCx	CLRCSELCx	OCRCxy	GRCxy	CUCRCx	RCR1Cx	RCR2Cx	The upper limit value of TCNTCx
1	0	0	0	0 *(1 setting prohibited)	0/1		x	x	0/1	x	x	[When TCRC.CLRCx = 0] FFFF_FFFF _H
		0	1				Cmp	Cmp		o	o	[When TCRC.CLRCx = 1] CUCRCx or FFFF_FFFF _H
		1	0									
		1	1									

Note: Cmp: It can be used as a compare match Cap: It can be used as a capture
o: Setting possible, x: Setting prohibited

Figure 32.42 shows an example of one-shot pulse mode operation in block C0.

Figure 32.42 One-Shot Pulse Mode Operation

NOTE

The active width of one-shot pulse can be obtained from the following formula.

- $GRC_{xy} = OCR_{Cxy}$:
One-shot pulse (active) width = 0
- $GRC_{xy} > OCR_{Cxy}$:
One-shot pulse (active) width = $GRC_{xy}[31:0] - OCR_{Cxy}[31:0]$
- $GRC_{xy} < OCR_{Cxy}$:
 - Upper-limit setting function is off
One-shot pulse (active) width = $(FFFF\ FFFF_H - OCR_{Cxy}[31:0]) + (GRC_{xy}[31:0] + 1)$
 - Upper-limit setting function is on
One-shot pulse (active) width = $(CUCRC_x - OCR_{Cxy}[31:0]) + GRC_{xy}[31:0]$

To output a one-shot pulse in the second and subsequent cycles, be sure to confirm that the previously set one-shot pulse output has been completed, and then set GRCxy and OCRCxy in the second and subsequent cycles. If the GRCxy or OCRCxy register value is modified before the one-shot pulse output has been completed, the modified value is reflected to the ongoing one-shot-pulse output.

32.7.3.5 Counter Upper-Limit Setting Function

The timer counter (TCNTCx) upper-limit value in each subblock can be changed by the counter upper-limit setting compare register Cxy (CUCRCx) to perform interval operation. To enable the counter upper-limit setting function, set the CLRCx bit in the timer control register C (TCRCx) to 1.

Figure 32.48 shows an example of operation with the counter upper-limit setting function of block C0 enabled.

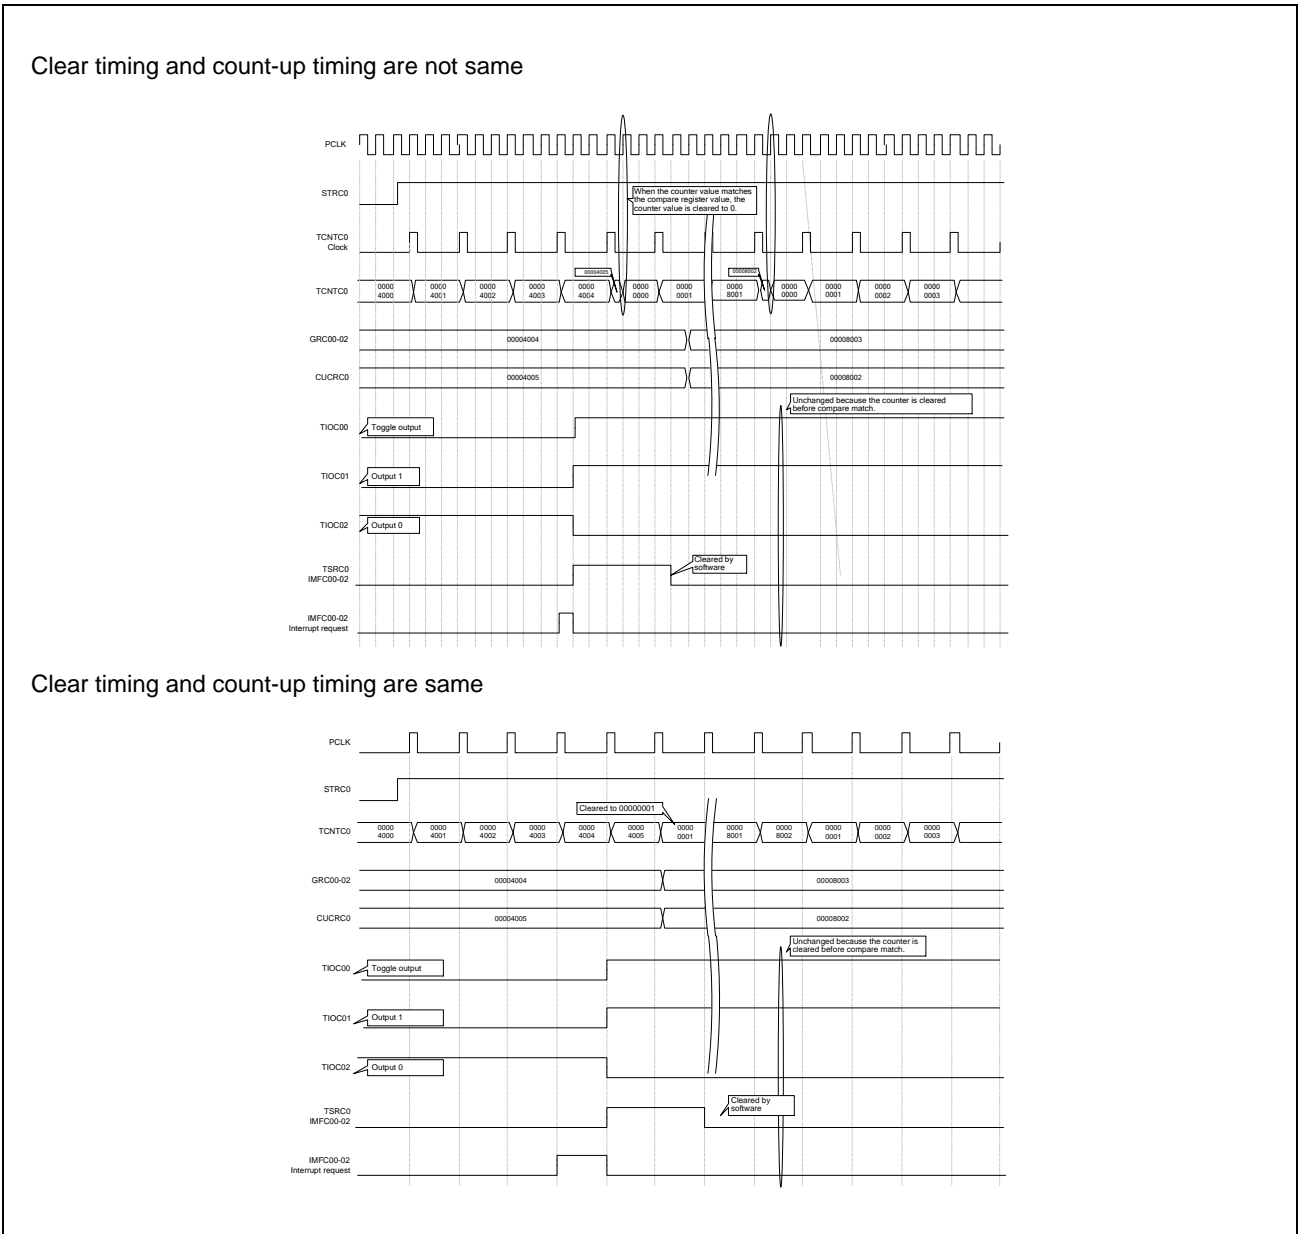

Figure 32.48 Example of Upper-Limit Setting Function Operation

Figure 32.49 One-Shot Pulse Output Cancellation Timing Chart

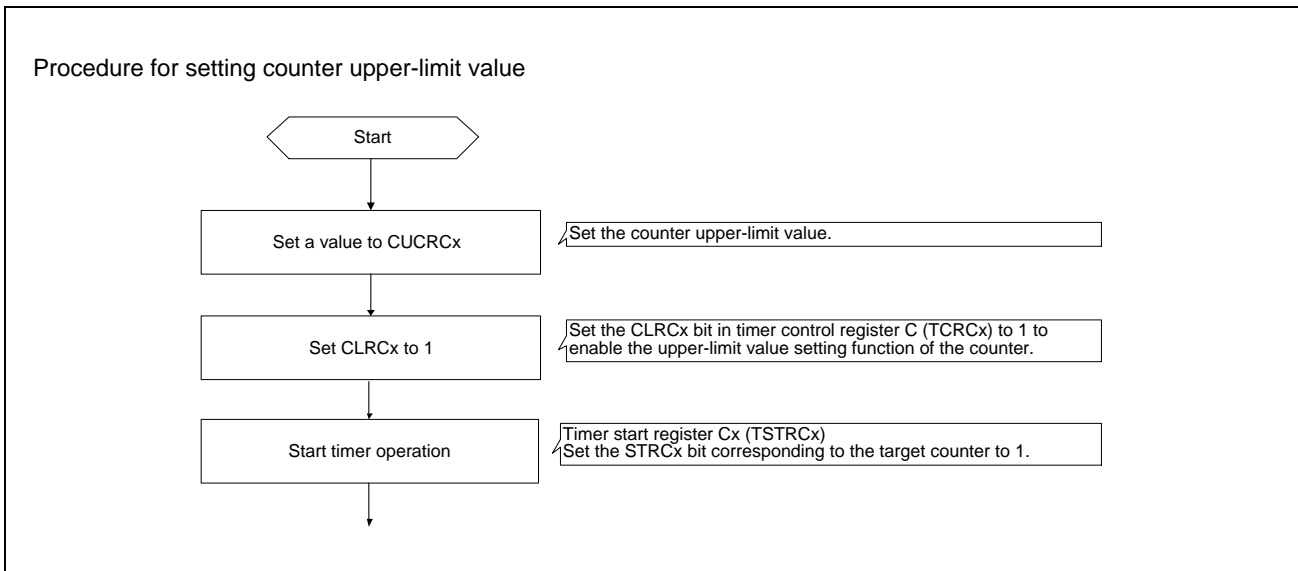

Figure 32.50 Counter Upper-Limit Setting Function Setting Procedure

32.7.3.6 Range Compare Function

(1) Range compare function

The range compare function generates a compare match when the counter value (TCNTCx) is within the set compare range when writing to “output compare register (OCRCxy) and timer general register Cxy (GRCxy)”. When using “PWM mode (PWMx0 = 1)” or “TIORCx.IOCxy setting OCRCxy, GRCxy as the capture register”, the range compare function is prohibited. The range compare function is enabled when setting other than 00H to the range compare value setting register (RCR1Cx or RCR2Cx).

The range compare value setting register 1Cx (RCR1Cx) and the range compare value setting register 2Cx (RCR2Cx) correspond to the output compare register (OCRCxy) and timer general register Cxy (GRCxy), respectively.

Range of OCRCxy, GRCxy Judge the range of compare match using the following values.

OCRCxy Range Compare Match

- Write value of OCRCxy
- Value of TCNTCx
- Range value set in RCR1Cx
- TCNTCx upper limit value (FFFFFFFF_H [TCRCx.CLRCx = 0] or CUCRCx setting value [TCRCx.CLRCx = 1])

GRCxy Range Compare Match

- Write value of GRCxy
- Value of TCNTCx
- Range value set in RCR2Cx
- TCNTCx upper limit value (FFFFFFFF_H [TCRCx.CLRCx = 0] or CUCRCx setting value [TCRCx.CLRCx = 1])

Figure 32.51, **Figure 32.52** show the operation diagram of OCRCxy range compare match.

Also, OCRCxy and GRCxy capture the counter value (TCNTCx) when a compare match is generated by the range compare function. **Figure 32.53** shows the capture operation when range compare match occurs.

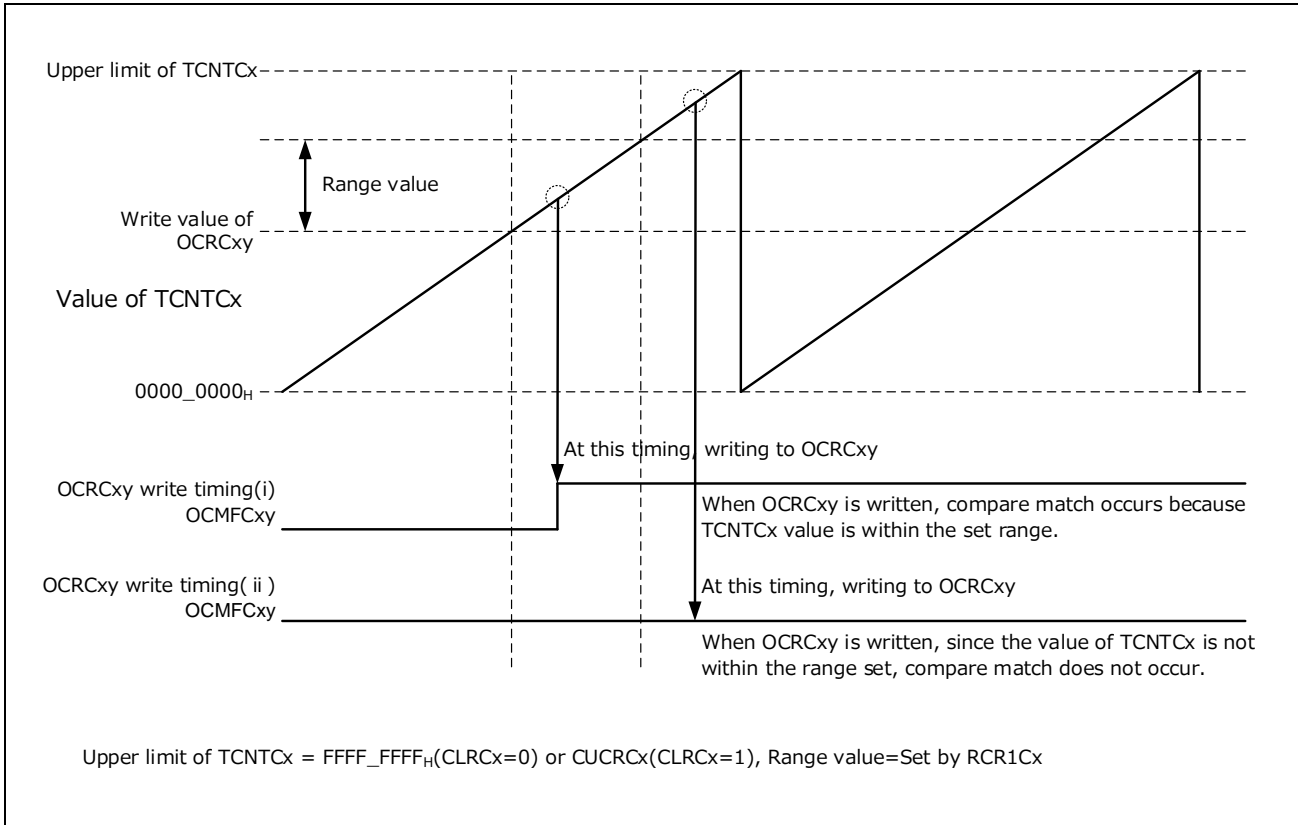

Figure 32.51 Operation of the Range Comparison Function(1)

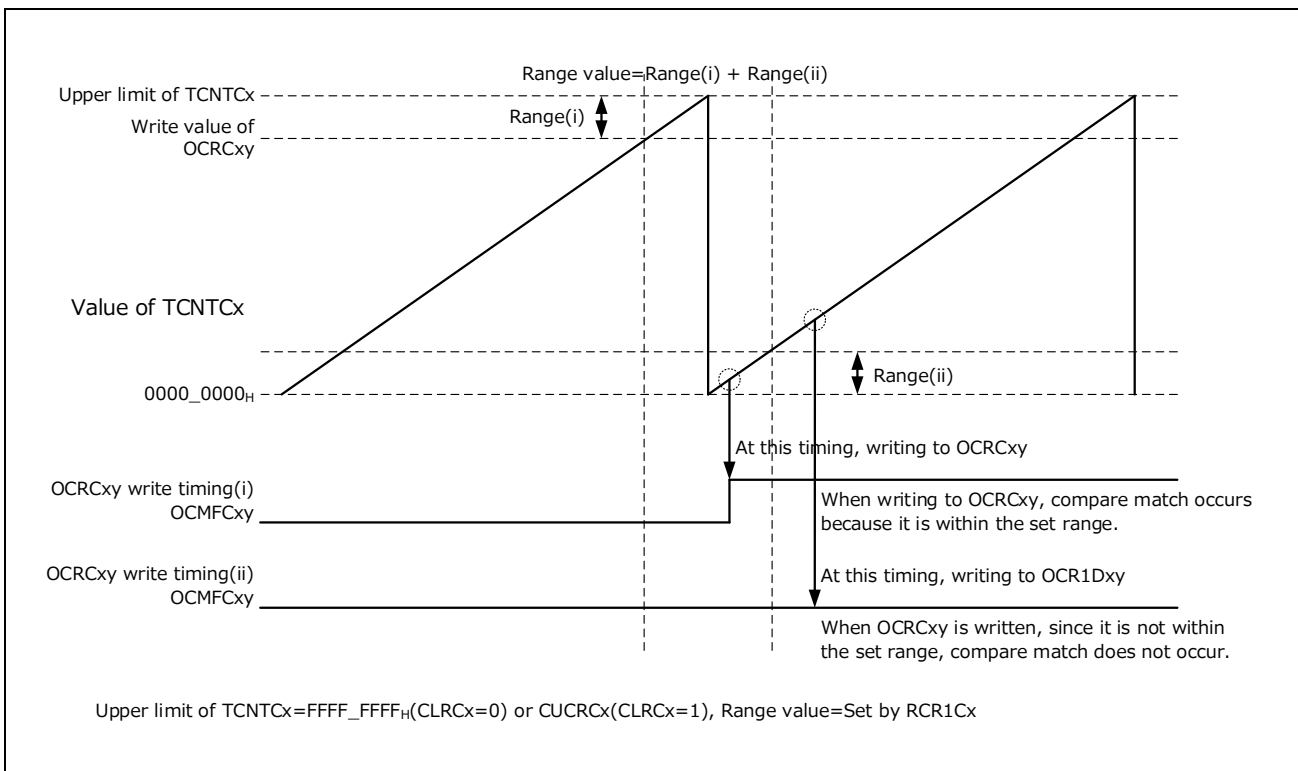

Figure 32.52 Operation of the Range Comparison Function(2)

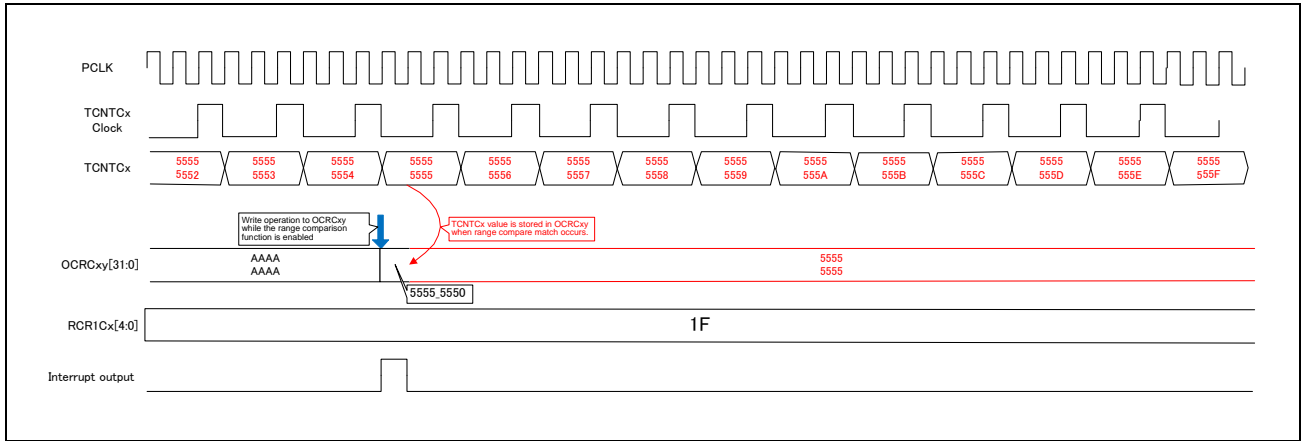

Figure 32.53 Range Compare Counter Value Capturing Operation

OCRCxy range compare match occurs when the condition of **Table 32.118** is satisfied when writing to OCRCxy by setting the range compare function to valid (except for 00_H in RCR1Cx).

Table 32.118 OCRCxy Range Compare Match Generation Condition

	Range condition	Range compare match generation condition in OCRCxy
Condition 1	When the set compare range is less than or equal to the TCNTCx upper limit value. OCRCxy + Range value set in RCR1Cx ≤ TCNTCx upper limit value.	OCRCxy ≤ TCNTCx value ≤ Range value set for OCRCxy + RCR1Cx
Condition 2	When the set compare range exceeds the TCNTCx upper limit value. TCNTCx upper limit < Range value set for OCRCxy + RCR1Cx	Range(i): OCRCxy ≤ TCNTCx value ≤ TCNTCx upper limit value or Range(ii): 00000000 ≤ TCNTCx value ≤ OCRCxy + Range value set for RCR 1Cx + TCNTCx upper limit value

Note 1. "Condition 1 When a set comparing area is below the TCNTCx upper limit value.", The range condition shown in the **Figure 32.51**.

Note 2. "Condition 2 When a set comparing area exceeds TCNTCx.", The range condition shown in the **Figure 32.52**.

Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in **Figure 32.52**.

GRCxy range compare match occurs if the condition of **Table 32.119** is satisfied when writing to GRCxy by setting the range compare function to valid (except for H'00 in RCR2Cx).

Table 32.119 GRCxy Range Compare Match Generation Condition

	Range condition	Range compare match generation condition in GRCxy
Condition 1	When the set compare range is less than or equal to the TCNTCx upper limit value. Range value set for GRCxy + RCR2Cx ≤ TCNTCx upper limit value	GRCxy ≤ TCNTCx value ≤ Range value set for GRCxy + RCR2Cx
Condition 2	When the set compare range exceeds the TCNTCx upper limit value TCNTCx upper limit value < Range value set for GRCxy + RCR2Cx	Range(i): GRCxy ≤ TCNTCx value ≤ TCNTCx upper limit value or Range(ii): 00000000 _H ≤ TCNTCx value ≤ Range value set for GRCxy + RCR2Cx - TCNTCx upper limit value

Note 1. "Condition 1 When a set comparing area is below the TCNTCx upper limit value.", The range condition shown in the **Figure 32.51**.

Note 2. "Condition 2 When a set comparing area exceeds TCNTCx.", The range condition shown in the **Figure 32.52**.

Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in **Figure 32.52**.

The table below shows the setting example when the range compare function is used and the counter value at which the range compare match occurs.

No.1, No.3 are examples of the condition “When the set compare range is less than or equal to the TCNTCx upper limit value”, and No.2, No.4 are examples of the condition “When the set compare range exceeds the TCNTCx upper limit value”.

Table 32.120 Range Compare Function Register Setting Example

No.	CLRCx setting value	CUCRCx setting value	The write value of OCRCxy or GRCxy	Set value (range value) of range compare value setting register (RCR1Cx, RCR1Cx)	When writing to the compare register (OCRCxy, GRCxy), the value of the counter where range compare match occurs
1	0	—	FFFF0000 _H	12 (range value: FFF _H)	FFFF0000 _H to FFFF0FFF _H *1
2	0	—	FFFF0000 _H	18 (range value: 3FFFF _H)	FFFF0000 _H to FFFFFFFF _H 00000000 _H to 00030000 _H *2
3	1	00000FFF _H	00000E00 _H	6 (range value: 3F _H)	00000E00 _H to 00000E3F _H *3
4	1	00000FFF _H	00000E00 _H	10 (range value: 3FF _H)	00000E00 _H to 00000FFF _H 00000000 _H to 00000200 _H *4

Note 1. FFFF0000_H to (FFFF0000_H + 2¹² -1)

Note 2. 00000000_H to (FFFF0000_H + 2¹⁸ -1 – FFFFFFFF_H)

Note 3. 00000E00_H to (00000E00_H + 2⁶ -1)

Note 4. 00000000_H to (00000E00_H + 2¹⁰ -1 – 00000FFF_H)

32.8 Timer D

32.8.1 Overview of Operation

The timer D block is a one-shot pulse output timer that consists of SB_D subblocks. Each subblock has four channels.

Timer D has the following functions.

- A compare match between the counter and output compare register is generated. Compare match A by compare match of TCNT1Dx (or TCNT2Dx) and OCR1Dx and compare match B by compare match of TCNT2Dx (or TCNT1Dx) and OCR2Dx are generated respectively.
- Down counter is started on compare match A or B of the output compare register or writing to the counter start bit in the down-counter start register. A one-shot pulse with an offset can be output.
- The output waveform can be forcibly shutoff regardless of the down-counter value by compare match B of the compare match register. If compare match A or counter start bit writing occurs concurrently with compare match B, output shutoff takes precedence.
- The input capture register enables to capture the TCNT2Dx (or TCNT1Dx) value using compare match A as a trigger and the TCNT1Dx (or TCNT2Dx) value using compare match B as a trigger.
- Pulse indicating that compare match A or B can be output.
- Interrupt requests can be output on compare matches A and B ($8 \times SB_D$ lines supported).
- Range compare function by the compare match register is enabled according to the range comparison value setting register.
- The counters (TCNT1Dx and TCNT2Dx) can be cleared upon compare match.
 - When the upper limit setting of TCNT1Dx is valid, the counters can be cleared upon compare match with CUCR1Dx.
 - When the upper limit setting of TCNT2Dx is valid, the counters can be cleared upon compare match with CUCR2Dx.
- Interrupt requests ($2 \times SB_D$ in total) can be output on counter overflow: SB_D outputs from TCNT1Dx and SB_D outputs from TCNT2Dx.
- Interrupt requests can be output on down-counter underflow ($4 \times SB_D$ lines supported).
- Offset base register can capture the counter value by a trigger signal from timer A and a PH notification trigger from DFE
- Clearing TCNT1Dx and TCNT2Dx is possible by a clear signal issued from timer B.
- The value configured in the output value register can be output from pins according to the output select register.

Figure 32.54 Block Diagram of Timer D

Figure 32.54 is a block diagram of timer D. Components of timer D subblock Dx include two range compare setting registers (RCR1Dx and RCR2Dx), two 32-bit timer counters (TCNT1Dx and TCNT2Dx), one offset base register (OSBRDx), one output value register (ORDx), one output select register (OSELRDx), SB_D compare match registers (OCR1Dxy and OCR2Dxy), two counter upper-limit setting registers (CUCR1Dx and CUCR2Dx), four timer down-counters Dxy (DCNTDxy), SB_D input capture registers (ICR1Dxy and ICR2Dxy), and a controller. Each channel includes two output pins; TODxyA for compare match output and TODxyB for one-shot pulse output. (Output pins are supported by subblocks D0 to DSB_{D-1}.)

TODxyA and TODxyB are output a level of 0 as a default.

When compare match A or B is detected, a pulse is output as an interrupt request.

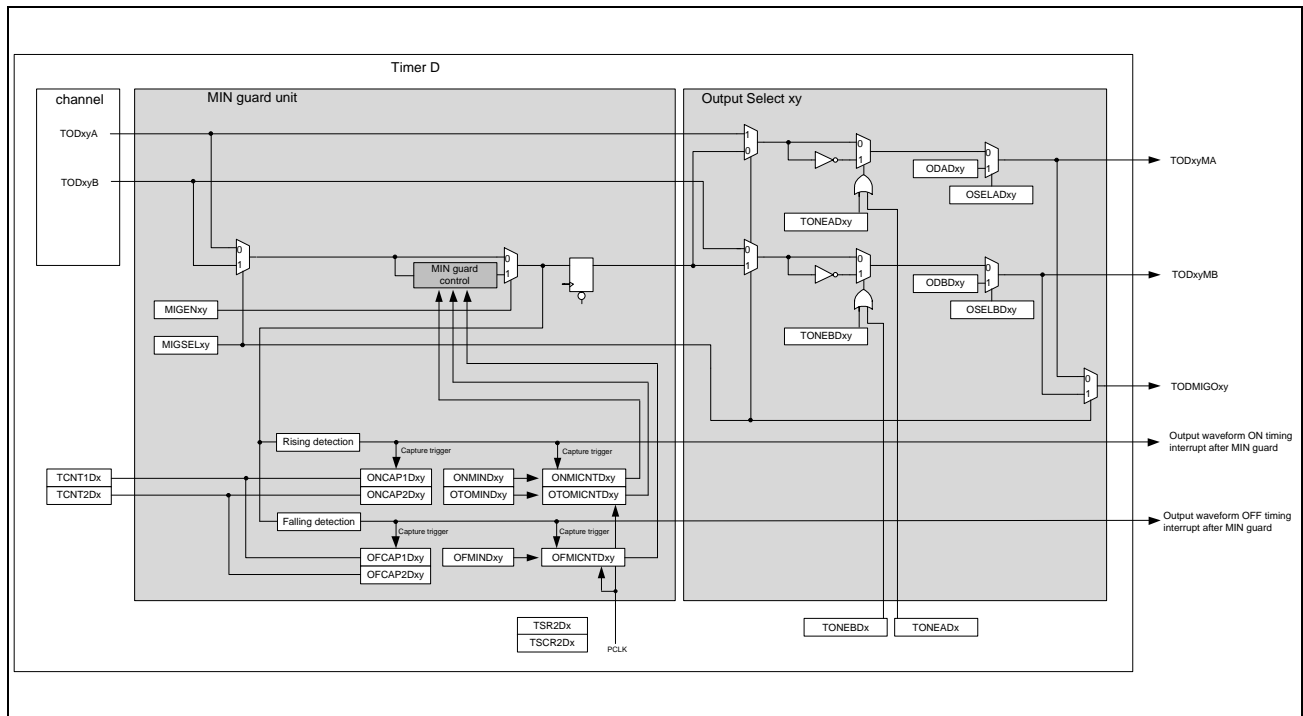

Figure 32.55 Timer D Channel xy MIN Guard Unit Connection Diagram

Figure 32.55 shows the block diagram of the timer D MIN guard unit.

The MIN guard unit is connected to each channel of timer D, and it is possible to add MIN guard function to TODxyA (compare match output) or TODxyB (one shot pulse output) and it can output as TODxyMA, TODxyMB and TODMIGOxy.

It is also possible to output an interrupt request at the ON timing and OFF timing of the output waveform after the MIN guard to the output that selected the MIN guard function, and capture the values of TCNT1Dxy and TCNT2Dxy at the timing of interrupt output.

Figure 32.56 Common Input Capture Register

Figure 32.56 is a common input capture select register. A common input capture register (CICRD0-7) is prepared 8, and stocks the value of TCNT1D0 in subblock 0 or TCNT2D0 at the time of PH renewal notice trigger 0-7 occurrence from DFE.

Transmission of DFE to timer trigger

Timer D trigger of compare match A (TODxyA) and compare match B (TODxyB) can be used as a timer trigger source for DFE. **Table 32.121** shows pairs of DFE's timer trigger (compare A0/B0 to A19/B19 from the Timer) and compare match A / compare match B.

Table 32.121 Timer D to DFE Timer Trigger Pair Table (1/2)

Table 32.122 TSTRD Register Contents

Bit Position	Bit Name	Function
15 to SB _D	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
SB _D -1 to 0	STRD _x	Counter Dx Start 0: TCNT1D _x , TCNT2D _x , and DCNTD _{xy} are disabled 1: TCNT1D _x , TCNT2D _x , and DCNTD _{xy} are enabled Example: For b0 0: TCNT1D0, TCNT2D0, and DCNTD0y are disabled 1: TCNT1D0, TCNT2D0, and DCNTD0y are enabled

Note: A start bit is provided for each subblock D0 to DSB_D-1. (y = 0, 1, 2, 3: Corresponding to Dx0 to Dx3.)

Timer start register (TSTRD) is an 8-bit/16-bit readable/writable register. This register is set to enable or disable two timer counters (TCNT1D_x and TCNT2D_x) and down counters (DCNTD_{xy}) in SB_D subblocks Dx (x = 0 to SB_D-1). When the counter Dx start bit and the TDE bit in the ATU master enable register (ATUENR) are both set to 1, the counters are started.

TSTRD is initialized to 0000_H after reset.

Counter Dx Start Bit (STRD_x)

These bits enable and disable timer counters 1D_x and 2D_x (TCNT1D_x, TCNT2D_x) and down counters (DCNTD_{xy}).

When this bit is cleared to 0, TCNT1D_x, TCNT2D_x, and DCNTD_{xy} stop operation. The counter value is retained while the counter is stopped. When this bit is set to 1 again, the counter is restarted from the value. Note, however, that the counter is cleared if a clear upon match with the upper limit value setting register occurs while operation is stopped. When the count clear signal is input from timer B, the counter is cleared when restarting operation at C1CED_x in TCRD_x or the C2CED_x bit is effective.

Even if the counter D start bit is set to 1, counting does not start unless the timer D enable bit (TDE) is set to 1 by the ATU master enable register (ATUENR).

CAUTION

The prescalers run independently of the setting of the STRD_x bit and are not initialized at the start of TCNT1D_x and TCNT2D_x. Therefore, during the time between the activation and the start of actual count operation by the above counters, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

Table 32.123 TCRDx Register Contents

Bit Position	Bit Name	Function
15	—	This bit is not used. When this bit is read, “0” is always returned. When writing, always write “0”.
14	OBRED _x	Timer Offset Base Register Enable Enables and disables input capture to the offset base register.
13	C2CED _x	Counter 2 Clear Enable Enables and disables a timer counter 2 clearing request from timer B.
12	C1CED _x	Counter 1 Clear Enable Enables and disables a timer counter 1 clearing request from timer B.
11	CLR2D _x	TCNT2D _x Clear Setting Enables and disables clearing the timer counter at CUCR2D _x and TCNT2D _x are identical.
10 to 8	CKSEL2D _x [2:0]	TCNT2D _x Clock Select These bits select the TCNT2D _x counting-up clock from clock-bus lines 0 to 5.
7	CLR1D _x	TCNT1D _x Clear Setting Enables and disables clearing the timer counter at CUCR1D _x and TCNT1D _x are identical.
6 to 4	CKSEL1D _x [2:0]	TCNT1D _x Clock Select These bits select the TCNT1D _x counting-up clock from clock-bus lines 0 to 5.
3	—	This bit is not used. When this bit is read, “0” is always returned. When writing, always write “0”.
2 to 0	DCSELD _x [2:0]	DCNTD _{xy} Clock Select These bits select the DCNTD _{xy} counting-down clock from clock-bus lines 0 to 5.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Timer control registers Dx (TCRDx) are 8-bit or 16-bit readable/writable registers that select the counter clocks in subblock Dx for 32-bit timer counter 1 (TCNT1D_x), 32-bit timer counter 2 (TCNT2D_x), and 32-bit timer down counter (DCNTD_{xy}) from clock-bus lines 0 to 5. These registers also enable and disable capture of the timer offset base register, counter clearing requests from timer B for TCNT1D_x and TCNT2D_x, and clearing timer counters 1D (TCNT1D_x) and 2D (TCNT2D_x).

Offset Base Register Enable (OBREDx)

This register enables and disables input capture to offset base register (OSBRDx). When this bit is set to 1, the value in TCNT1Dx is captured by OSBRDx in the PCLK cycles following cycles in which the input signal selected by the TICTSELDx register is asserted. When the pulse width of the event 2A or 2B signal from timer A exceeds one cycle of the PCLK, the counter value is captured every clock cycle.

OBREDx	Function	
0	Input capture by OSBRDx is enabled	(Default)
1	Input capture by OSBRDx is disabled	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Counter 2 Clear Enable (C2CEDx)

Enables and disables clearing the counter value in TCNT2Dx by timer B.

When an edge of the counter clearing signal output from timer B is detected while this bit is set to 1, TCNT2Dx is cleared (0000 0000_H) in the following timing.

When the rising edge of the clearing signal is detected in the cycle in which TCNT2Dx is counted up, the counter is cleared on the counting up timing. When the rising edge of the clearing signal is detected in other than the TCNT2Dx counting-up cycle, the counter is cleared on the first counting up timing after edge detection. In other words, the request for clearing remains in place from the rising edge of the counter-clearing signal from timer B until completion of the first clock cycle to drive counting up. Even if C2CEDx is changed to 0 during this period of retention, and even if timer D is disabled and the clock is stopped, the request for clearing remains in place.

The counter clearing signal is ignored with this bit set to the initial value.

C2CEDx	Function	
0	TCNT2Dx clearing signal from timer B is disabled	(Default)
1	TCNT2Dx clearing signal from timer B is enabled	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1.

Counter 1 Clear Enable (C1CEDx)

Enables and disables clearing the value in TCNT1Dx by timer B.

When an edge of the counter clearing signal output from timer B is detected while this bit is set to 1, TCNT1Dx is cleared (0000 0000_H) in the following timing.

When the rising edge of the clearing signal is detected in the cycle in which TCNT1Dx is counted up, the counter is cleared on the counting up timing. When the rising edge of the clearing signal is detected in other than the TCNT1Dx counting-up cycle, the counter is cleared on the first counting up timing after edge detection. In other words, the clear request is held from the rising of the counter clear signal from timer B to the first count-up clock. The clear request is held during this period, even if C1CEDx is set to "0" or if timer D is disabled and the clock is stopped.

The counter clearing signal is ignored with this bit set to the initial value.

C1CEDx	Function	
0	TCNT1Dx clearing signal from timer B is disabled	(Default)
1	TCNT1Dx clearing signal from timer B is enabled	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

TCNT2Dx Clear 2Dx (CLR2Dx)

Setting the TCNT2Dx clear 2Dx bit to 1 clears (0000 0000_H) the TCNT2Dx value at the first clock after a compare match between timer counter 2Dx (TCNT2D) and counter upper-limit setting compare register 2Dx (CUCR2Dx). During count operation, a compare match occurs and continues counting even after it is cleared.

CLR2Dx	Function	
0	CUCR2Dx compare match is not used to clear the TCNT2Dx value.	(Default)
1	CUCR2Dx compare match is used to clear the TCNT2Dx value.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

TCNT2Dx Clock Select (CKSEL2Dx[2:0])

These bits select the TCNT2Dx counting-up clock.

CKSEL2Dx			Function
[2]	[1]	[0]	
0	0	0	Incrementation of TCNT2Dx is driven by clock-bus line 0. (Default)
0	0	1	Incrementation of TCNT2Dx is driven by clock-bus line 1.
0	1	0	Incrementation of TCNT2Dx is driven by clock-bus line 2.
0	1	1	Incrementation of TCNT2Dx is driven by clock-bus line 3.
1	0	0	Incrementation of TCNT2Dx is driven by clock-bus line 4.
1	0	1	Incrementation of TCNT2Dx is driven by clock-bus line 5.
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

TCNT1Dx Clear 1Dx (CLR1Dx)

The TCNT1Dx value is cleared to 0000 0000_H by setting the TCNT1Dx clear 1Dx bit to 1 at the first clock after a compare match between timer counter 1Dx (TCNT1Dx) and counter upper-limit setting compare register 1Dx (CUCR1Dx). During count operation, a compare match occurs and continues counting even after it is cleared.

CLR1Dx	Function	
0	CUCR1Dx compare match is not used to clear the TCNT1Dx value.	(Default)
1	CUCR1Dx compare match is used to clear the TCNT1Dx value.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

TCNT1Dx Clock Select (CKSEL1Dx[2:0])

These bits select the TCNT1Dx counting-up clock.

CKSEL1Dx			Function
[2]	[1]	[0]	
0	0	0	Incrementation of TCNT1Dx is driven by clock-bus line 0. (Default)
0	0	1	Incrementation of TCNT1Dx is driven by clock-bus line 1.
0	1	0	Incrementation of TCNT1Dx is driven by clock-bus line 2.
0	1	1	Incrementation of TCNT1Dx is driven by clock-bus line 3.
1	0	0	Incrementation of TCNT1Dx is driven by clock-bus line 4.
1	0	1	Incrementation of TCNT1Dx is driven by clock-bus line 5.
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

DCNTDxy Clock Select (DCSEL Dx[2:0])

These bits select the clock signal to drive counting down by the 32-bit down counter (DCNTDxy) of the Dx sub-block.

DCSEL Dx			Function
[2]	[1]	[0]	
0	0	0	Decrementation of DCNTDxy is driven by clock-bus line 0. (Default)
0	0	1	Decrementation of DCNTDxy is driven by clock-bus line 1.
0	1	0	Decrementation of DCNTDxy is driven by clock-bus line 2.
0	1	1	Decrementation of DCNTDxy is driven by clock-bus line 3.
1	0	0	Decrementation of DCNTDxy is driven by clock-bus line 4.
1	0	1	Decrementation of DCNTDxy is driven by clock-bus line 5.
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Note 1: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Note 2: y = 0, 1, 2, 3: Corresponding to channels 0 to 3 in subblock Dx. Channels 0 to 3 of a subblock share a common counter clock.

Output of one-shot pulse (TODxyB) is synchronized with the clock selected in these bits.

32.8.2.3 TCCRLRDx — Timer Compare Control Register Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLRSE L2Dx	CLRSE L1Dx	CMPSE L2Dx3	CMPSE L2Dx2	CMPSE L2Dx1	CMPSE L2Dx0	CMPSE L1Dx3	CMPSE L1Dx2	CMPSE L1Dx1	CMPSE L1Dx0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.124 TCCRLRDx Register Contents

Bit Position	Bit Name	Function
15 to 10	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
9	CLRSEL2Dx	TCNT2Dx clear timing select bit Select the timing for clearing TCNT2Dx. 0: Clear in sync with PCLK (equivalent to ATU-IV) 1: Clear in sync with the count clock
8	CLRSEL1Dx	TCNT1Dx clear timing select bit Select the timing for clearing TCNT1Dx. 0: Clear in sync with PCLK (equivalent to ATU-IV) 1: Clear in sync with the count clock
7 to 4	CMPSEL2Dxy	Compare match B select bit Select the timer counter to be compared with OCR2Dxy. (Select counter B) 0: Compare with TCNT2Dx 1: Compare with TCNT1Dx
3 to 0	CMPSEL1Dxy	Compare match A select bit Select the timer counter to be compared with OCR1Dxy. (Select counter A) 0: Compare with TCNT1Dx 1: Compare with TCNT2Dx

Note: x = 0 to SB_b-1: Corresponding to subblocks D0 to DSB_b-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer compare control register Dx (TCCRLRDx) is an 8-bit/16-bit readable/writable register.

This register specifies the timing for clearing the timer counters 1Dx/2Dx (TCNT1Dx and TCNT2Dx) and the timer counters (TCNT1Dx and TCNT2Dx) to be compared with the output compare registers 1Dxy/2Dxy (OCR1Dxy and OCR2Dxy).

TCCRLRDx is initialized to 0000_H after reset.

TCNT2Dx Clear Timing Select Bit (CLRSEL2Dx)

Selects the timing for clearing the timer counter 2Dx (TCNT2Dx) after occurrence of compare match between the timer counter 2Dx (TCNT2Dx) and the counter upper limit value setting compare register (CUCR2Dx).

CLRSEL2Dx	Function	
0	Clear in sync with PCLK (equivalent to ATU-IV)	(Default)
1	Clear in sync with the count clock	

Note: x = 0 to SB_D-1. Corresponding to subblocks D0 to DSB_D-1.

If CLRSEL2Dx = 0, the cleared value of the timer counter 2Dx (TCNT2Dx) after occurrence of compare match between TCNT2Dx and the counter upper limit value setting compare register (CUCR2Dx) may differ. TCNT2Dx is cleared to 0 when the division ratio of the count clock is 2 or greater, while it is cleared to 1 when the division ratio is 1. If CLRSEL2Dx = 1, TCNT2Dx is cleared to 0 when spite of the division ratio of the count clock is 1.

TCNT1Dx Clear Timing Select Bit (CLRSEL1Dx)

Selects the timing for clearing the timer counter 1Dx (TCNT1Dx) after occurrence of compare match between the timer counter 1Dx (TCNT1Dx) and the counter upper limit value setting compare register (CUCR1Dx).

CLRSEL1Dx	Function	
0	Clear in sync with PCLK (equivalent to ATU-IV)	(Default)
1	Clear in sync with the count clock	

Note: x = 0 to SB_D-1. Corresponding to subblocks D0 to DSB_D-1.

If CLRSEL1Dx = 0, the cleared value of the timer counter 1Dx (TCNT1Dx) after occurrence of compare match between TCNT1Dx and the counter upper limit value setting compare register (CUCR1Dx) may differ. TCNT1Dx is cleared to 0 when the division ratio of the count clock is 2 or greater, while it is cleared to 1 when the division ratio is 1. If CLRSEL1Dx = 1, TCNT1Dx is cleared to 0 when spite of the division ratio of the count clock is 1.

Compare Match B Select Bit (CMPSEL2Dxy)

Selects the timer counter (TCNT1Dx or TCNT2Dx) to be compared with the output compare register 2Dxy (OCR2Dxy).

CMPSEL2Dxy	Function	
0	Compare with TCNT2Dx	(Default)
1	Compare with TCNT1Dx	

Note: x = 0 to SB_D-1. Corresponding to subblocks D0 to DSB_D-1.

Compare Match A Select Bit (CMPSEL1Dxy)

Selects the timer counter (TCNT1Dx or TCNT2Dx) to be compared with the output compare register 1Dx (OCR1Dx).

CMPSEL1Dxy	Function	
0	Compare with TCNT1Dx	(Default)
1	Compare with TCNT2Dx	

Note: x = 0 to SB_D-1. Corresponding to subblocks D0 to DSB_D-1.

32.8.2.4 TIOR1Dx — Timer I/O Control Registers 1Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSSDx3[1:0]		OSSDx2[1:0]		OSSDx1[1:0]		OSSDx0[1:0]		IOADx3[1:0]		IOADx2[1:0]		IOADx1[1:0]		IOADx0[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.125 TIOR1Dx Register Contents

Bit Position	Bit Name	Function
15 to 8	OSSDx3-Dx0	Compare match output source select These bits select the output level on the compare match output pin (TODxyA). The output is controlled by compare match A, compare match B, or both matches.
7 to 0	IOADx3-IOADx0	I/O control A These bits select the function of the output compare register (OCR1Dxy) on compare match A.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The timer I/O control registers 1Dx (TIOR1Dx) are 8-bit/16-bit readable/writable registers.

TIOR1Dx selects the source of compare match output (TODxyA), enable and disable compare match of OCRDxy, and set the output level on pin TODxA on compare match A.

TIOR1Dx is initialized to 0000_H after reset.

Compare Match Output Source Select (OSSDxy[1:0])

OSSDxy		Function
[1]	[0]	
0	0	No TODxyA pin output (Default)
0	1	Output level on TODxyA depends on the I/O control bit A on compare match A
1	0	Output level on TODxyA depends on the I/O control bit B on compare match B
1	1	Output level on TODxyA depends on the I/O control bit A or B on compare match A respectively

Note: x = 0 to SB_D-1, y = 0, 1, 2, 3

These bits select the output level on the compare match output pin (TODxyA). The output is controlled by compare match A, compare match B, or both matches.

Either of compare matches A and B is used as a start/stop trigger of timer down counter D (DCNTDxy), and the other one is used as a trigger of compare match output. In addition, both of compare matches A and B are used to control the output, with one as a trigger of an assertion of the output and the other as a trigger of a negation of the output, enabling a one-shot pulse to be output from pin TODxyA.

When both matches are used as a trigger of the output and they occur at the same time, priority is given to compare match B and the output level depends on the IOBxy bit in TIOR2Dx.

A level of 0 is output on TODxyA as a default. While these bits are set to “00”, the output level on TODxyA is not changed even if compare match A or B occurs.

I/O Control A (IOADxy[1:0])

IOADxy		Function
[1]	[0]	
0	0	Compare match A is disabled (Default)
0	1	Output level on compare match A is 0
1	0	Output level on compare match A is 1
1	1	Output level on compare match A is toggled

Note: x = 0 to SB_D-1, y = 0, 1, 2, 3

These bits select the function of the output compare register (OCR1Dxy). When these bits are set to 00B, compare match between OCR1Dxy and timer counter (TCNT1Dx or TCNT2Dx) is not performed. Otherwise, the compare match is performed. An interrupt request is issued on compare match.

When a compare match occurs, if the compare match A is selected as the output source by the compare match output source select bit (OSSDxy) or by the timer compare match control register (TCMPED) and timer I/O control register (TIORDx), the compare match output value set by IOADxy is output to the TODxyA pin (in subblocks D0 to DSB_D-1). See the tables below for correspondence between the I/O control bit A (IOADxy), timer compare match control register (TCMPED), and timer I/O control register (TIORDx).

<<TCMPED and TIORDx when TIOR1Dx is written>>

Written to:		Applied to:		Operation
TIOR1Dx.IOADxy[1:0]		TCMPED.CMPE1Dx	TIORDx.IO1Dxy[1:0]	
00		0	Value held	Compare match is disabled
01		1	01	Output level on compare match is 0
10		1	10	Output level on compare match is 1
11		1	11	Output level on compare match is toggled

<<TIOR1Dx when TCMPED or TIORDx is written>>

Written to:		Applied to:		Operation
TCMPED.CMPE1Dx	TIORDx.IO1Dxy[1:0]	TIOR1Dx.IOADxy[1:0]		
0	Xx *1	00		Compare match is disabled
1	00 *2	11		Output level on compare match is toggled
1	01	01		Output level on compare match is 0
1	10	10		Output level on compare match is 1
1	11	11		Output level on compare match is toggled

Note 1. The written value is held. "11" is returned when read.

Note 2. If "00" is attempted to be written, the writing in value is "00", but the read value is "11".

32.8.2.5 TIOR2Dx — Timer I/O Control Register 2Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	IOBDx3[2:0]			—	IOBDx2[2:0]			—	IOBDx1[2:0]			—	IOBDx0[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Table 32.126 TIOR2Dx Register Contents

Bit Position	Bit Name	Function
15, 11, 7, 3	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
14-12, 10-8, 6-4, 2-0	IOBDx3-IOBDx0	I/O control B Sets permission/prohibition of the output compare register (OCR2Dxy), and the compare match B output value.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer I/O control register 2Dx (TIOR2Dx) is an 8-bit/16-bit readable/writable register.

This register can function as capture or output compare registers (OCR2Dxy). TIOR2Dx also enables and disables compare match and set the output level on pin TODxA on compare match.

TIOR2Dx is initialized to 0000_H after reset.

I/O Control B (IOBDxy[2:0])

IOBDxy			Function
[2]	[1]	[0]	
0	0	0	Selects compare match output of OCR2Dxy. Compare match B is disabled (Default)
0	0	1	Output level on compare match B is 0
0	1	0	Output level on compare match B is 1
0	1	1	Output level on compare match B is toggled
1	0	0	Setting prohibited Setting prohibited
1	0	1	Setting prohibited
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Note: x = 0 to SB_D-1, y = 0, 1, 2, 3

These bits enable and disable of compare match of the output compare register 2Dxy (OCR2Dxy) and select the TODxA pin output value on the compare match B.

When TIOR2Dx is used as the compare match register (IOBDxy[2] = 0) and the IOBDxy[1:0] bits are set to 00B, compare match between GRDxy and timer counter (TCNT1Dx or TCNT2Dx) is not performed. Otherwise, the compare match is performed. At this time, an interrupt request is issued to CPU by compare match.

When a compare match occurs, if the compare match B is selected as the output source by the compare match output source select bit (OSSDxy), the compare match output value set by IOBDxy or by the timer compare match control register (TCMPED) and the timer I/O control register (TIORDx) is output to the TODxyA pin. See the tables below for correspondence between the I/O control bit B (IOBDxy), timer compare match control register (TCMPED), and timer I/O control register (TIORDx).

<<TCMPED and TIORDx when TIOR2Dx is written>>

Written to:	Applied to:		Operation
TIOR2Dx.IOBDxy[2:0]	TCMPED.CMPE2Dx	TIORDx.IO2Dxy[1:0]	
000	0	Value held	Compare match is disabled
001	1	01	Output level on compare match is 0
010	1	10	Output level on compare match is 1
011	1	11	Output level on compare match is toggled
1xx *1	0	Value held	Compare match is disabled

Note 1. "1xx" Indicates 100, 101, 110, 111.

<<TIOR2Dx when TCMPED or TIORDx is written>>

Written to:		Applied to:		Operation
TCMPED.CMPE2Dx	TIORDx.IO2Dxy[1:0]	TIOR2Dx.IOBDxy[2:0]		
0	xx *1	000		Compare match is disabled
1	00 *2	011		Output level on compare match is toggled
1	01	001		Output level on compare match is 0
1	10	010		Output level on compare match is 1
1	11	011		Output level on compare match is toggled

Note 1. The written value is held. If "00" is attempted to be written, "11" is returned when read.

Note 2. If "00" is attempted to be written, the writing in value is "00", but the read value is "11".

32.8.2.6 TCMPEd_x — Timer Compare Match Control Register D_x

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CMPE2D _x 3	CMPE2D _x 2	CMPE2D _x 1	CMPE2D _x 0	CMPE1D _x 3	CMPE1D _x 2	CMPE1D _x 1	CMPE1D _x 0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.127 TCMPEd_x Register Contents

Bit Position	Bit Name	Function
7 to 4	CMPE2D _x 3-D _x 0	Select counter B compare match control bit Controls compare match with Select counter B 0: Disable compare match 1: Enable compare match
3 to 0	CMPE1D _x 3-D _x 0	Select counter A compare match control bit Controls compare match with Select counter A 0: Disable compare match 1: Enable compare match

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer compare match control register D_x (TCMPED_x) is an 8-bit readable/writable register.

This register controls the compare match with TCNT1D_x and TCNT2D_x. The output compare register selected by TCCRLRD_x.CMPSEL1D_{xy} and TCCRLRD_x.CMPSEL2D_{xy} will be compared. The setting in this register is reflected to the TIOR1D_x and TIOR2D_x registers. The setting in the TIOR1D_x and TIOR2D_x registers is reflected to this register. For details about how the setting is reflected, see the description about the I/O control bit A (IOAD_{xy}[1:0]) of the timer I/O control register 1D_x (TIOR1D_x) and the I/O control bit B (IOBD_{xy}[2:0]) of the timer I/O control register 2D_x (TIOR2D_x).

TCMPED_x is initialized to 00_H after reset.

32.8.2.7 TIORDx — Timer I/O Control Register Dx

Value after reset: FFFF_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IO2Dx3[1:0]		IO2Dx2[1:0]		IO2Dx1[1:0]		IO2Dx0[1:0]		IO1Dx3[1:0]		IO1Dx2[1:0]		IO1Dx1[1:0]		IO1Dx0[1:0]

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.128 TIORDx Register Contents

Bit Position	Bit Name	Function
15 to 8	IO2Dx3 to Dx0	TCNT2D compare match output value Controls the TCNT2Dx compare match output 00: Setting prohibited 01: Output 0 10: Output 1 11: Toggle output
7 to 0	IO1Dx3-Dx0	TCNT1D compare match output value Controls the TCNT1Dx compare match output 00: Setting prohibited 01: Output 0 10: Output 1 11: Toggle output

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer I/O control register Dx (TIORDx) is an 8-bit/16-bit readable/writable register.

This register control the TCNT1Dx and TCNT2Dx compare match output values. The setting of this register is valid when compare match is enabled by the TCMPEd_x register. When compare match is enabled by the TCMPEd_x register, the setting in this register is reflected to the TIOR1Dx and TIOR2Dx registers. The setting in the TIOR1Dx and TIOR2Dx registers is reflected to this register. For details about how the setting is reflected, see the description about the I/O control bit A (IOADxy[1:0]) of the timer I/O control register 1Dx (TIOR1Dx) and the I/O control bit B (IOBDxy[2:0]) of the timer I/O control register 2Dx (TIOR2Dx).

TIORDx is initialized to FFFF_H after reset.

32.8.2.8 OSELRDx — Output Select Register Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	OSELBDx3	OSELBDx2	OSELBDx1	OSELBDx0	OSELADx3	OSELADx2	OSELADx1	OSELADx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.129 OSELRDx Register Contents

Bit Position	Bit Name	Function
7 to 4	OSELBDxy	Output selection B 0: TODxyB provides normal output. 1: TODxyB provides the value of the output value register.
3 to 0	OSELADxy	Output selection A 0: TODxyA provides normal output. 1: TODxyA provides the value of the output value register.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The output selection register Dx (OSELRDx) is an 8-bit readable/writable register.

It determines whether to output the value of output value register from the pins (TODxyA and TODxyB).

OSELRDx is initialized to 00_H after reset.

Output Selection Bits A (B) xy (OSEL A (B) Dxy)

Writing 1 to this bit outputs the value of the output value register to TODxyA (or TODxyB) pin. Setting of the timer I/O control register D (TIOR1Dx and TIOR2Dx), setting of the timer output control register D (TOCRDx), or one-shot pulse output by the timer down-counter Dxy has no effect on the output value.

When this bit is set to 0, the TODxyA pin outputs according to the settings of the timer I/O control register D (TIOR1Dx and TIOR2Dx), and settings of the one-shot pulse output by the timer output control register D (TOCRDx).

A glitch may be generated if a change in normal output on TODxyA (or TODxyB) coincides with the setting of this bit. Do not write a new value to the bit if the counter value is in the vicinity of that which leads to a match in comparison.

32.8.2.9 ODRDx — Output Value Register Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ODBDx3	ODBDx2	ODBDx1	ODBDx0	ODADx3	ODADx2	ODADx1	ODADx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.130 ODRDx Register Contents

Bit Position	Bit Name	Function
7 to 4	ODBDxy	Output value B Sets the value to be output to TODxyB.
3 to 0	ODADxy	Output value A Sets the value to be output to TODxyA.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The output value register Dx (ODRDx) is an 8-bit readable/writable register.

When a bit of the output selection register Dx (OSELRDx) is set to 1, the corresponding ODRDx value is issued from respective pins (TODxyA and TODxyB).

ODRDx is initialized to 00_H after reset.

32.8.2.10 DSTRD_x — Down Counter Start Register D_x

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	DSTD _{x3}	DSTD _{x2}	DSTD _{x1}	DSTD _{x0}
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Note: $x = 0$ to SB_D-1 : Corresponding to subblocks D0 to DSB_D-1

Table 32.131 DSTRD_x Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
3 to 0	DSTD _{xy} *1	Down Counter Start 0: No operation 1: Timer down counters (DCNTD _{x3} -D _{x0}) are started

Note 1. Value 0 cannot be written. The value is not retained when 1 is written. These bits are always read as 0.

Note: $x = 0$ to SB_D-1 : Corresponding to subblocks D0 to DSB_D-1. $y = 0, 1, 2, 3$: Corresponding to channels 0 to 3.

The down counter starting register D_x (DSTRD_x) is an 8-bit writable register.

This register has a start bit for the down counter. Writing “1” to a bit starts down counting of the corresponding timer.

DSTRD_x is initialized to 00_H after reset.

Down Counter Start D_{xy} (DSTD_{xy})

Setting these bits to 1 makes timer down counter D_{xy} (DCNTD_{xy}) start. The setting in these bits is always valid and regardless of the start trigger setting in the down counter control register. When compare match B and writing 1 to these bits occurs at the same time if the down counter is set so that it is stopped on compare match B (compare match A or B), compare match B (compare match A or B) takes priority and the down counter is not started.

When DCNTD_{xy} = 0000 0000_H, writing 1 to these bits has no effect. The DSFD_{xy} bit in the down counter status register 1D_x (DSR1D_x) is retained to “1” until the next down counter clock is input. See the description about DSR1D_x described later.

32.8.2.11 DSR1Dx — Down Counter Status Registers 1Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	DWFDx3	DWFDx2	DWFDx1	DWFDx0	DSFDx3	DSFDx2	DSFDx1	DSFDx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.132 DSR1Dx Register Contents

Bit Position	Bit Name	Function
7 to 4	DWFDxy	Down count wait flag 0: Down count compare match start wait status has not occurred. 1: Down count compare match start wait status has occurred.
3 to 0	DSFDxy	Down counter status flag 0: Down counter is disabled 1: Down counter is enabled

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The down count status register 1Dx (DSR1Dx) is an 8-bit read-only register. This register has a flag that indicates the status of the timer down counter (DCNTDxy).

DSR1Dx is initialized to 00_H after reset.

Down Count Wait Flag Dxy (DWFDxy)

These bits are flags that indicate whether timer down count Dxy (DCNTDxy) is in the count start wait status. This flag is valid only when compare match A and B is set for the count start trigger by TRGSELDxy bits in the down counter control register (DCRDx) at DCRDx.TRGSELDxy[3:0] = 0110_B. This flag is not set to 1 in other settings.

When compare match A and B is set as a count start trigger and DWFDxy is 0, if compare match A or compare match B occurs, DWFDxy is set to 1. When a compare match (compare match B if DWFDxy is set to 1 on compare match A) of a source different from setting DWFDxy to 1 occurs, it is recognized as a count start trigger and down-counting starts. At this time, the DWFDxy value is cleared to 0.

Even when a compare match of the same source as setting DWFDxy to 1 occurs, the DWFDxy value remains 1 and is not recognized as a count start trigger.

If compare match A and compare match B occur simultaneously, it is immediately recognized as a count start trigger. Therefore, this flag does not enter the down count wait status and DWFDxy is not set to 1.

This flag is read-only flag and cannot be set to 1 or cleared to 0 by the software.

- Setting (to 1) condition

When compare match A or compare match B has occurred while TRGSELDxy in the down counter control register Dx (DCRDx) is 0110_B

- Clearing (to 0) condition

- When DWFDxy is set to 1 on compare match A and compare match B has occurred while DWFDxy is 1
- When DWFDxy is set to 1 on compare match B and compare match A has occurred while DWFDxy is 1
- Writing 1 to DWFDxy in the down count status clear register (DSCRDX)

Down counter status flag Dxy (DSFDxy)

These bits indicate enabling/disabling of timer down counter Dxy (DCNTDxy). When these bits are read as 1, the counter operation is enabled. If the TDE bit of ATUENR is 1 and the STRDx bit of TSTRD is 1, the counter is running. When these bits are read as 0, the counter operation is disabled, so counting cannot be in progress.

This flag is a read-only flag; it cannot be set to 1 or cleared to 0 by software.

When the set/clear condition competed, 0 clear condition is given priority, and DSFDxy will be 0.

- Setting (to 1) condition
 - When writing 1 to the down count start bit in the down count starting register (DSTRDx)
 - When the condition set as the down counter start trigger is satisfied (compare-match A, compare-match B, compare-match A or B, compare-match A and B)
- Clearing (to 0) condition
 - When the down counter is stopped by underflow
 - When the condition to stop the down counter (compare match B, compare-match A or B)

These flags are set regardless of the settings of the TDE bit in ATUENR and the STRDx bit in TSTRD. Accordingly, if the TDE bit and the STRDn bit are not set to enable counting, the down counter is not actually running even if these bits indicate that counting is enabled. Clearing proceeds in synchronization with the down-count clock.

CAUTION

When the value of down counter DCNTDxy is 0000 0000_H, a trigger to start counting down by the counter being produced by writing 1 to DSTDxy, the bit that starts counting down by the counter, or by a match in compare-match A or B occurring, counting down will not start, although the value of the above counting down status flag (DSFDxy) becomes "1" over the period where the clock input to the down counter is "0". The value of DSFDxy returns to "0" when the clock input to the down counter becomes "1". If a start trigger is issued through the down-counting start bit or by compare-match A, B over the period where the clock input to the down counter is "1", the value of DSFDxy will remain "0".

32.8.2.12 DSR2Dx — Down Count Status Register 2Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	DWRFDx3[1:0]		DWRFDx2[1:0]		DWRFDx1[1:0]		DWRFDx0[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.133 DSR2Dx Register Contents

Bit Position	Bit Name	Function
7 to 0	DWRFDxy[1:0]	00: No compare match 01: Down-counting starts on compare match A. 10: Down-counting starts on compare match B. 11: Down-counting starts on simultaneous compare match A and compare match B.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Down count status registers 2Dx (DSR2Dx) are 8-bit read-only registers.

The DWRFDxy register is a flag that indicates the condition for starting count operation of the timer down counter (DCNTDxy).

The status is updated when the timer down counter (DCNTDxy) starts counting.

When the down count start condition is “A and B”, the down count start (compare match occurring later) condition is retained in the status register. When down-counting is started by the down count start register Dx (DSTRDx), the status register keeps retaining the previous value.

DSR2Dx is initialized to 00_H after reset.

- The condition of the renewal

When a start factor of the down count set as DCRDx.TRGSELDxy (besides setting prohibited) occurred, it's renewed. Further, the condition of DCRDx.TRGSELDxy that DWRFDxy = 11_B is set is only when comparing match A,B occurred at the same time when establishing one of 0110_B, 1010_B and 1011_B.

When writing 1 in DWRFCDxy of a down count status clear register (DSCRDx), it'll be 00_B.

- The condition of the state maintenance

When a down count has been begun by DSTRDx, the state is maintained.

The state is maintained in DSR1Dx.DSFDxy = 1 (A down count is moving.)

When DCRDx.TRGSELDxy is set as setting prohibited, the previous value is maintained.

32.8.2.13 DSCR_{Dx} — Down Count Status Clear Register Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	DWFCD _{x3}	DWFCD _{x2}	DWFCD _{x1}	DWFCD _{x0}	DWRFCD _{x3}	DWRFCD _{x2}	DWRFCD _{x1}	DWRFCD _{x0}
Value after reset	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.134 DSCR_{Dx} Register Contents

Bit Position	Bit Name	Function
7 to 4	DWFCD _{xy}	Down count wait flag clear enable 0: Disabled (Default) 1: DWFD _{xy} in the down count status register 1 (DSR1D _x) is cleared to 0.
3 to 0	DWRFCD _{xy}	Down count wait Record flag clear enable 0: Disabled (Default) 1: DWRFD _{xy} in the down count status register 2 (DSR2D _x) is cleared to 0.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The down count status clear register (DSCR_{Dx}) is an 8-bit readable/writable register that sets clearing of the flag for the down count status registers (DSR1D_x and DSR2D_x).

DSCR_{Dx} is initialized to 00_H after reset.

Down Count Wait Flag Clear Enable Dxy (DWFCD_{xy})

These bits set clearing the flag that is set by occurrence of down count wait of the down count status register (DSR1D_x).

Setting each of these bits to 1 clears the down count wait flag (DWFD_{xy}) in the down count status register (DSR1D_x). These bits are always read as 0.

When DWFD_{xy} in down counter status registers 1D_x (DSR1D_x) sets “1” as this bit in case of 1, the down count WAIT status is cleared.

When “1” is set as this bit before compare match A occurs, and compare match B occurs, it’s cleared that compare match A occurred.

It’ll be similar movement until compare match B occurs, and compare match A occurs.

Down Count Wait Record Flag Clear Enable Dxy (DWRFCD_{xy})

These bits set clearing of the flag that is set by occurrence of down count wait of the down count status register (DSR2D_x).

Setting each of these bits to 1 clears the down count wait record flag (DWRFD_{xy}) in the down count status register (DSR2D_x). These bits are always read as 0.

32.8.2.14 DCRDx — Down Counter Control Registers Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	TRGSELDx3				TRGSELDx2				TRGSELDx1				TRGSELDx0				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.135 DCRDx Register Contents

Bit Position	Bit Name	Function
15-12, 11-8	TRGSELDx3-Dx0	Down Counter Start/Stop Trigger Select
7-4, 3-0		Compare match A and compare match B can be set as the start or stop condition for counting of the timer down counter (DCNTDxy).

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Down counter control registers (DCRDx) are 8-bit/16-bit readable/writable registers.

DCRDx starts the timer down counter (DCNTDxy). Besides the down count start by DSTRDx and the down count stop condition when DCNTDx counted a down, and it was 0000_0000_H, Compare match A, compare match B, compare match A or B, or compare match A and B can be set as a starting or stopping trigger of timer down counters (DCNTDxy).

DCRDx is initialized to 0000_H after reset.

To change the TRGSELDx bit, stop the counter. Otherwise operation cannot be guaranteed.

Down Counter Start/Stop Trigger Select Dxy (TRGSELDxy)

TRGSELDxy				Function		
[3]	[2]	[1]	[0]	Counter start trigger	Counter stop trigger	
0	0	0	0	No trigger	No trigger	(Default)
0	0	0	1	No trigger	Compare match B	
0	0	1	0	Compare match A	No trigger	
0	0	1	1	Compare match A	Compare match B	
0	1	0	0	Compare match B	No trigger	
0	1	0	1	Setting prohibited		
0	1	1	0	Compare match A and B	No trigger	
0	1	1	1	Setting prohibited		
1	0	0	0	No trigger	No trigger	
1	0	0	1	No trigger	Compare match A or B	
1	0	1	0	Compare match A or B	No trigger	
1	0	1	1	Compare match A or B	Compare match A or B	
1	1	0	0	Setting prohibited		
1	1	0	1	Setting prohibited		
1	1	1	0	Setting prohibited		
1	1	1	1	Setting prohibited		

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3. “No trigger” of a count start shows a down count start by DSTRDx, and DCNTDxy counts a down, and “No trigger” of a count stop shows the case which became 0000_0000_H. These factors are relevant to everything’s condition besides the setting prohibited.

Besides the down count start by DSTRDx and the down count stop condition when DCNTDx counted a down, and it was 0000_0000_H, the trigger source to start and stop the timer down counter (DCNTDxy) can be selected by these TRGSELDxy bits. Compare-match A, compare-match B, compare-match A or B, or compare-match A and B can be set as a count start trigger. When it's "No trigger", a down count is begun by DSTRDx. Compare match A and B starts down-counting when both compare match A and compare match B are satisfied. (Simultaneous occurrence of compare match A and compare match B is not necessary.)

Compare-match B, compare-match A or B, or compare-match A and B can be set as a count stop trigger. DCNTDxy counts a down in case of "No trigger", and when it was 0000_0000_H, a trigger of a count stop occurs.

If the source of down counter start trigger and the source of down counter stop trigger occur simultaneously, the down counting is stopped.

A signal from compare-match A or B acts as a stop-trigger and as a start-trigger for counting when the setting of TRGSELDxy is 1011_B. Specifically, a trigger generated while down counting is stopped acts as a start trigger and a trigger generated while down counting is in progress acts as a stop trigger. It can be judged in DSR1Dx.DSFDxy whether a down count is moving.

CAUTION

When an underflow and compare match A occur simultaneously while TRGSELDxy is 1010_B, an underflow interrupt is not generated and the underflow flag is not set to 1. When a count start trigger and a compare match A occur simultaneously when the timer downcounter Dxy (DCNTDxy) stops with 0000_0000_H while TRGSELDxy is 1010_B, an underflow interrupt is not generated and the underflow flag is not set to 1.

In this case, to execute software processing for underflow occurrence, write the underflow interrupt flag to 1 (EICn.EIRFn = 1) only when the down counter is stopped (DSR1Dx.DSFDxy = 0) and the underflow interrupt flag of the interrupt controller is 0 (EICn.EIRFn = 0).

32.8.2.15 TSRD_x — Timer Status Registers D_x

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OVF2D _x	OVF1D _x	UDFD _{x3}	UDFD _{x2}	UDFD _{x1}	UDFD _{x0}	CMFAD _{x3}	CMFAD _{x2}	CMFAD _{x1}	CMFAD _{x0}	CMFBD _{x3}	CMFBD _{x2}	CMFBD _{x1}	CMFBD _{x0}
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.136 TSRD_x Register Contents

Bit Position	Bit Name	Function
15, 14	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
13	OVF2D _x	Overflow flag 2D _x 0: TCNT2D _x has not overflowed 1: TCNT2D _x has overflowed
12	OVF1D _x	Overflow flag 1D _x 0: TCNT1D _x has not overflowed 1: TCNT1D _x has overflowed
11 to 8	UDFD _{x3} to UDFD _{x0}	Underflow flag D _{x3} to D _{x0} 0: DCNTD _{xy} has not underflowed 1: DCNTD _{xy} has underflowed
7 to 4	CMFAD _{x3} to CMFAD _{x0}	Compare match A flag D _{x3} to D _{x0} 0: Compare match A has not occurred 1: Compare match A has occurred
3 to 0	CMFBD _{x3} to CMFBD _{x0}	Compare match B flag D _{x3} to D _{x0} 0: Compare match B has not occurred 1: Compare match B has occurred

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The timer status register (TSRD_x) is an 8-bit/16-bit read-only register. This register indicates overflow of two timer counters (TCNT2D_x and TCNT1D_x) of subblock D_x (x = 0 to SB_D-1), underflow of the timer down counters (DCNTD_{xy}) of channels 0 to 3, and compare match of the output compare registers (OCR1_{xy} and OCR2D_{xy}). If an interrupt source takes effect when this flag is set, an interrupt request is made again. An interrupt request is made even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source.

Overflow flags 2 and 1 as well as underflow flags and compare match flags A and B can be cleared by setting the corresponding bits of the timer status clear register (TSCRD_x).

TSRD_x is initialized to 0000_H after reset.

Overflow Flag 2Dx (OVF2Dx)

OVF2Dx	Function	
0	[Clearing condition] When 1 is written to the OVFC2Dx bit of the timer status clear register (TSCR Dx).	(Default)
1	[Setting condition] When TCNT2Dx overflowed (from FFFF FFFF _H to 0000 0000 _H) When the counter is cleared with the upper-limit setting function enabled	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Indicates whether or not timer counter 2Dx (TCNT2Dx) has overflowed. If the reading value of this flag is 1, it means that an overflow in TCNT2Dx has occurred. This flag cannot be set to 1.

The overflow flag is set when the count-up clock is input while TCNT2Dx is FFFF FFFF_H or at the first edge of the PCLK after the counter value matches the upper-limit setting register value with the upper-limit setting function enabled. Writing 0000 0000_H to TCNT2Dx or starting TCNT2Dx from an initial value of 0000 0000_H has no effect on this bit.

When writing to TCNT2Dx at the same time as incrementation while it is FFFF FFFF_H, this bit is set to 1. However, TCNT2Dx is updated with the written value, but not 0000 0000_H.

When an assertion of counter clearing signal from timer B and overflow due to count up occur, overflow does not occur. Simultaneous occurrence of counter clearing by timer B and counter clearing with the upper-limit setting function enabled is detected as an overflow.

Overflow Flag 1Dx (OVF1Dx)

OVF1Dx	Function	
0	[Clearing condition] When 1 is written to the OVFC1Dx bit of the timer status clear register (TSCR Dx).	(Default)
1	[Setting condition] When TCNT1Dx overflowed (from FFFF FFFF _H to 0000 0000 _H) When the counter is cleared with the upper-limit setting function enabled	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Indicates whether or not timer counter 1Dx (TCNT1Dx) has overflowed. If the reading value of this flag is 1, it means that an overflow in TCNT1Dx has occurred. This flag cannot be set to 1.

The overflow flag is set when the count-up clock is input while TCNT1Dx is FFFF FFFF_H or at the first edge of the PCLK after the counter value matches the upper-limit setting register value with the upper-limit setting function enabled. Writing 0000 0000_H to TCNT1Dx or starting TCNT1Dx from an initial value of 0000 0000_H has no effect on this bit.

When writing to TCNT1Dn at the same time as incrementation while it is FFFF FFFF_H, this bit is set to 1. However, TCNT1Dx is updated with the written value, but not 0000 0000_H.

When an assertion of counter clearing signal from timer B and an overflow by counting up occur simultaneously, the overflow is not detected. Simultaneous occurrence of counter clearing by timer B and counter clearing with the upper-limit setting function enabled is detected as an overflow.

Underflow Flag Dxy (UDFDxy)

UDFDxy	Function	
0	[Clearing condition] When 1 is written to the UDFCDxy bit of the timer status clear register (TSCRDX).	(Default)
1	[Setting condition] When DCNTDxy underflowed (decremented while DCNTDxy = 0000 0000 _H)	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

This flag is a status flag that indicates underflow of subblock Dx and down counter Dxy of channel y. If the reading value of this flag is 1, it means that DCNTDxy had an underflow. This flag cannot be set to 1.

This bit is set to 1 when DCNTDxy is to be decremented while it is 0000 0000_H. DCNTDxy holds 0000 0000_H on underflow. Writing FFFF FFFF_H to DCNTDxy has no effect on these bits.

These bits are initialized to 0 after reset. Although DCNTDxy is initialized to 0000 0000_H, these flags do not indicate underflow because DCNTDxy has not started. For details on control of DCNTDxy, see descriptions of timer D down counters.

Compare Match A Flag Dxy (CMFADxy)

CMFADxy	Function	
0	[Clearing condition] When 1 is written to the CMFCADxy bit of the timer status clear register (TSCRDX).	(Default)
1	[Setting condition] The thing set as all except for 00 _B (comparing match A permission) does a set of TIOR1Dx.IOADxy in the following case by the precondition. <ul style="list-style-type: none"> • When the value of the select counter A (TCNT1Dx or TCNT2Dx) is match with OCR1Dxy. • All except for 00_H is set as the range comparing value setting register 1Dx (RCR1Dx), and when writing in OCR1Dxy, when selection counter A (TCNT1Dx or TCNT2Dx) is in the range set in RCR1Dx. 	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

CMFADxy is a status flag that indicates occurrence of a compare match in the output compare register (OCR1Dxy) of channel y in subblock Dx. If the reading value of this flag is 1, it means that a compare match occurs between select counter A (TCNT1Dx or TCNT2Dx) and OCR1Dxy or it's meant that it was in the area select counter A (TCNT1Dx or TCNT2Dx) set as the time of write in RCR1Dx or OCR1Dxy. This flag cannot be set to 1.

When operation of compare match between OCRDxy and select counter A (TCNT1Dx or TCNT2Dx) is enabled by the setting in timer I/O control register 1 (TIOR1Dx), compare match operation is performed regardless of the state of select counter A (TCNT1Dx or TCNT2Dx). Or when select counter A (TCNT1Dx or TCNT2Dx) is in the area set in RCR1Dx at the time of write in OCR1Dxy, a compare match A flag is set by the following PCLK cycle. These bits are set to 1 on the first edge of the PCLK after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCR1Dxy match. Even if these compare match flags are cleared to 0 by software while TCNT1Dx = OCR1Dxy after the compare match is detected, these bits are not set to 1 again.

If select counter A (TCNT1Dx or TCNT2Dx) matches OCR1Dxy again before the status flag is cleared, the compare match A is detected and the status flag is rewritten with 1.

Compare match B flag Dxy (CMFBDxy)

CMFBDxy	Function	
0	[Clearing condition] When 1 is written to the CMFCBDxy bit of the timer status clear register (TSCRDX).	(Default)
1	[Setting condition] The thing set as all except for 00 _B (comparing match B permission) does a set of TIOR2Dx.IOADxy in the following case by the precondition. <ul style="list-style-type: none"> • When the value of the select counter B (TCNT1Dx or TCNT2Dx) is match with OCR1Dxy. • All except for 00H is set as the range comparing value setting register 2Dx (RCR2Dx), and when writing in OCR2Dxy, when selection counter B (TCNT1Dx or TCNT2Dx) is in the range set in RCR2Dx. 	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

CMFBDxy is a status flag that indicates occurrence of a compare match in the output compare B register (OCBRDxy) of channel y in subblock Dx. If the reading value of this flag is 1, it means that a compare match occurs between select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy or it's meant that it was in the area select counter B (TCNT1Dx or TCNT2Dx) set as the time of write in RCR2Dx or OCR2Dxy. This flag cannot be set to 1.

When operation of compare match between OCR2Dxy and select counter B (TCNT1Dx or TCNT2Dx) is enabled by the setting in timer I/O control register 2 (TIOR2Dx), compare match operation is performed regardless of the state of select counter B (TCNT1Dx or TCNT2Dx). Or when select counter B (TCNT1Dx or TCNT2Dx) is in the area set in RCR2Dx at the time of write in OCR2Dxy, a compare match B flag is set by the following PCLK cycle. These bits are set to 1 on the first edge of the PCLK after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCR2Dxy match. Even if these compare match flags are cleared to 0 by software while TCNT2Dx = OCR2Dxy after the compare match B is detected, these bits are not set to 1 again.

If select counter B (TCNT1Dx or TCNT2Dx) matches OCR2Dxy again before the status flag is cleared, the compare match B is detected and the status flag is rewritten with 1.

32.8.2.16 TSCRDx — Timer Status Clear Register Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OVFC2 Dx	OVFC1 Dx	UDFCD x3	UDFCD x2	UDFCD x1	UDFCD x0	CMFCA Dx3	CMFCA Dx2	CMFCA Dx1	CMFCA Dx0	CMFCB Dx3	CMFCB Dx2	CMFCB Dx1	CMFCB Dx0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.137 TSCRDx Register Contents

Bit Position	Bit Name	Function
15, 14	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
13	OVFC2Dx	Overflow flag clear enable 2Dx 0: Disabled (Default) 1: Clears OVFC2Dx of timer status register D (TSRDx) to 0.
12	OVFC1Dx	Overflow flag clear enable 1Dx 0: Disabled (Default) 1: Clears OVFC1Dx of timer status register D (TSRDx) to 0.
11 to 8	UDFCDx3 to UDFCDx0	Underflow flag clear enable Dx3 to Dx0 0: Disabled (Default) 1: Clears UDFCDx3-UDFCDx0 of timer status register D (TSRDx) to 0.
7 to 4	CMFCA Dx3 to CMFCA Dx0	Compare match A flag clear enable Dx3 to Dx0 0: Disabled (Default) 1: Clears CMFCA Dx3-CMFCA Dx0 of timer status register D (TSRDx) to 0.
3 to 0	CMFCB Dx3 to CMFCB Dx0	Compare match B flag clear enable Dx3 to Dx0 0: Disabled (Default) 1: Clears CMFCB Dx3-CMFCB Dx0 of timer status register D (TSRDx) to 0.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The timer status clear register (TSCRDx) is an 8-bit/16-bit writable register. This register specifies the flag clearing at the time of overflow of two 32-bit up-counters (TCNT2Dx and TCNT1Dx), compare match and the output compare register (OCR1Dxy), and compare match and the output compare register (OCR2Dxy).

TSCRDx is initialized to 0000_H after reset.

Overflow Flag Clear Enable 2Dx (OVFC2Dx)

This bit specifies flag clearing at the time of overflow of the timer counter 2Dx (TCNT2Dx).

Setting this bit enables clearing of the overflow flag 2 (OVF2Dx) of the timer status register (TSRDx). This bit is always read as 0.

OVFC2Dx	Function	
0	Disabled	(Default)
1	Clears OVF2Dx to 0.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Overflow Flag Clear Enable 1Dx (OVFC1Dx)

This bit specifies flag clearing at the time of overflow of the timer counter 1Dx (TCNT1Dx).

Setting this bit enables clearing of overflow flag 1 (OVF1Dx) of the timer status register (TSRDx). This bit is always read as 0.

OVFC1Dx	Function	
0	Disabled	(Default)
1	Clears OVF1Dx to 0.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Underflow Flag Clear Enable Dxy (UDFCDxy)

This bit specifies flag clearing at the time of underflow of the timer down counter Dxy (DCNTDxy).

Setting this bit enables clearing of the underflow flag (UDFDxy) of the timer status register (TSRDx). This bit is always read as 0.

UDFCDxy	Function	
0	Disabled	(Default)
1	Clears UDFDxy to 0.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Compare Match A Flag Clear Enable Dxy (CMFCADxy)

This flag specifies flag clearing at the time of compare match of the output compare register (OCR1Dxy).

Setting this bit enables clearing of the compare match A flag (CMFADxy) of the timer status register (TSRDx). This bit is always read as 0.

CMFCADxy	Function	
0	Disabled	(Default)
1	Clears CMFADxy to 0.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Compare Match B Flag Clear Enable Dxy (CMFCBDxy)

This flag specifies flag clearing at the time of compare match of the output compare register (OCR2Dxy).

Setting this bit enables clearing of the compare match B flag (CMFBDxy) of the timer status register (TSRDx). This bit is always read as 0.

CMEBDxy	Function	
0	Disabled	(Default)
1	Clears CMFBDxy to 0.	

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

32.8.2.17 TOCRDx — Timer Output Control Registers Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TONEBDx	TONEADx
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.138 TOCRDx Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
1	TONEBDx	Output inversion select TODxyB 0: Output level is not inverted 1: Output level is inverted
0	TONEADx	Output inversion select TODxyA 0: Output level is not inverted 1: Output level is inverted

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer output control register Dx (TOCRDx) is an 8-bit readable/writable register. This register specifies whether to invert signals of the output pins TODxyA and TODxyB of each subblock Dx.

This register is initialized to 00_H after reset.

Output Inversion Select Dx (TONEBDx, TONEADx)

Specifies whether to invert the output from TODxy and TODxyA.

TONEBDx	Function
0	Normal output from the output pin (TODxyB) (Default)
1	Inverted output from the output pin (TODxyB)

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

TONEADx	Function
0	Normal output from the output pin (TODxyA) (Default)
1	Inverted output from the output pin (TODxyA)

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Signals on pins TODxyA and TODxyB are inverted on the first edge of the PCLK after the output inversion select Dx bit is set to 1.

This function is not affected by the operating state of timer counters 1Dx and 2Dx (TCNT1Dx, TCNT2Dx).

Output levels on pins TODxyA and TODxyB are initialized to a level of 0 (when TONEADx = 0 and TONEBDx = 0).

A glitch may be generated if a change in normal output on TODxyA (or TODxyB) coincides with the setting of this bit. Do not write a new value to the bit if the counter value is in the vicinity of that which leads to a match in comparison.

32.8.2.18 TOCCRDx — Timer Output Channel Control Registers Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TONEBDx3	TONEBDx2	TONEBDx1	TONEBDx0	TONEADx3	TONEADx2	TONEADx1	TONEADx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.139 TOCCRDx Register Contents

Bit Position	Bit Name	Function
7 to 4	TONEBDxy	Channel output inversion select TODxyB 0: The signal on channel y is output from ODxyB as is (without inversion). 1: The signal on channel y is inverted to be output from ODxyB.
3 to 0	TONEADxy	Channel output inversion select TODxyA 0: The signal on channel y is output from ODxyA as is (without inversion). 1: The signal on channel y is inverted to be output from ODxyA.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer output channel control register Dx (TOCCRDx) is an 8-bit readable/writable register that specifies whether to invert the signal on each channel before outputting to the TODxyA and TODxyB output pins of each subblock Dx.

This register is initialized to 00_H after reset.

Channel Output Inversion Select Dx (TONEBDx, TONEADx)

Specifies whether to invert the signal on the channel before outputting to TODxyB and TODxyA.

TONEBDxy	Function
0	The signal on channel y is output to TODxyB as is. (Default)
1	The signal on channel y is inverted to be output to TODxyB.

TONEADxy	Function
0	The signal on channel y is output to TODxyA as is. (Default)
1	The signal on channel y is inverted to be output to TODxyA.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

When the channel output inversion select Dx bit is changed, it is reflected to the logical output of TODxyB and TODxyA in the next PCLK cycle. The logical output of TODxyB and TODxyA is controlled by the timer output control register Dx (TOCRDx) and timer output channel control register Dx (TOCCRDx). The operation status (running or stopping) of the timer counters 1Dx and 2Dx (TCNT1Dx and TCNT2Dx) does not affect the switching of output inversion.

Setting for subblock	Setting for channel	Pulse output inversion
TOCRDx (0: Normal, 1: inversion)	TOCCRDx (0: Normal, 1: Inversion)	
Normal output	Normal output	Normal output
	Inversion output	Inversion output
Inversion output	Normal output	
	Inversion output	

32.8.2.19 OSBRD_x — Timer Offset Base Registers D_x

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OSBRD _x [31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OSBRD _x [15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Timer offset base registers D_x (OSBRD_x) are 32-bit read-only registers that are used only for input capture. The timer counter 1D_x (TCNT1D_x) value is captured and stored by a trigger signal from timer A and PH update notification triggers 0 to 1 from DFE. The trigger signal from timer A is selectable from TIA00 to TIA0SB_A-1, and the external input signals TID0 and TID1 are selectable with the timer input capture trigger select register (TICTSEL_{Dx}). For details, see the description of the timer control registers 1A, 3A, and 4A (TCR1A, TCR3A, TCR4A) and the timer input capture trigger select register (TICTSEL_{Dx}).

This register is initialized to 0000 0000_H after reset.

32.8.2.20 TICTSELDx — Timer Input Capture Trigger Select Register Dx

Value after reset: 0xH

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TIDSELDx[1:0]	
Value after reset	0	0	0	0	0	0	0	*1
R/W	R	R	R	R	R	R	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Note 1. The value varies depending on the channel to maintain compatibility with the traditional products.

x = 0 to 2: 0

x = 3 to 9: 1

The timer input capture trigger select register Dx (TICTSELDx) is an 8-bit readable/writable register. This register is used to select event 2A or 2B from timer A and external input signals PH update notification trigger 0 and PH update notification trigger 1 from the DFE, and to capture the TCNT1Dx counter value in the OSBRDx register.

Table 32.140 TICTSELDx Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. Fix these bits to "0".
1, 0	TIDSELDx[1:0]	00: Event 2A 01: Event 2B 10: PH update notification trigger 0 from the DFE 11: PH update notification trigger 1 from the DFE

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

32.8.2.21 TCNT1Dx — Timer Counter 1Dx

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCNT1Dx[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNT1Dx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Timer counters 1Dx (TCNT1Dx) are 32-bit readable/writable registers.

TCNT1Dx is driven by the clock selected in the CKSEL1Dx[2:0] bits in timer control register (TCRDx). These counters are started by setting the bit in timer start register (TSTRD) to 1.

When overflow interrupt request is permitted (TIER1Dx.OV1EDx = 1), an overflow interrupt request can be issued to CPU when the timer overflows.

The overflow flag OV1Dx of the timer status register (TSRDx) is set to 1.

When a clear request from timer B made TCRD.C1CEDx effective, and occurred, TCNT1Dx is cleared by 0000_0000_H. But, when competing with writing in to TCNT1Dx, writing in of TCNT1Dx is given priority.

This register is initialized to 0000 0000_H after reset.

- The upper limit value of timer counter 1Dx (TCNT1Dx)

TCRDx.CLR1Dx	The upper limit value of TCNT1Dx
0	FFFF_FFFF _H
1	CUCR1Dx When the writing in value to CUCR1Dx is smaller than TCNT1Dx, it'll be FFFF_FFFF _H .

- The clear value of TCNT1Dx after reaching the upper limit value

TCRDx.CLR1Dx	TCCR1Dx.CLRSEL1Dx	The count clock chosen in TCRDx.CKSEL1Dx	The clear value of TCNT1Dx
0	0/1	1	0000_0000 _H
1	0	0	0000_0000 _H
		1	0000_0001 _H
1	1	0	State maintenance (=CUCR1Dx value)
		1	0000_0000 _H

32.8.2.22 TCNT2Dx — Timer Counter 2Dx

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCNT2Dx[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNT2Dx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Timer counters 2Dx (TCNT2Dx) are 32-bit readable/writable registers.

TCNT2Dx is driven by the clock selected in the CKSEL2Dx[2:0] bits in timer control register Dx (TCRDx). These counters are started by setting the bit in timer start register (TSTRD) to 1.

When overflow interrupt request is permitted (TIER1Dx.OV2EDx = 1), an overflow interrupt request can be issued to CPU when the timer overflows.

The overflow flag OVF2Dx of the timer status register (TSRDx) is set to 1.

When a clear request from timer B made TCRD.C2CEDx effective, and occurred, TCNT2Dx is cleared by 0000_0000_H. But, when competing with writing in to TCNT2Dx, writing in of TCNT2Dx is given priority.

This register is initialized to 0000 0000_H after reset.

- The upper limit value of timer counter 2Dx (TCNT2Dx)

TCRDx.CLR2Dx	The upper limit value of TCNT2Dx
0	FFFF_FFFF _H
1	CUCR2Dx When the writing in value to CUCR2Dx is smaller than TCNT2Dx, it'll be FFFF_FFFF _H .

- The clear value of TCNT2Dx after reaching the upper limit value

TCRDx.CLR2Dx	TCCR2Dx.CLRSEL2Dx	The count clock chosen in TCRDx.CKSEL2Dx	The clear value of TCNT2Dx
0	0/1	1	0000_0000 _H
1	0	0	0000_0000 _H
		1	0000_0001 _H
1	1	0	State maintenance (=CUCR2Dx value)
		1	0000_0000 _H

32.8.2.23 CUCR1D_x — Counter Upper-Limit Setting Compare Register 1D_x

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CUCR1D _x [31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CUCR1D _x [15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The counter upper-limit setting compare register (CUCR1D_x) is a 32-bit readable/writable register that has a function for comparison with the TCNT1D_x counter. Compare match between this register and the TCNT1D_x counter is enabled by setting the TCNT1D_x clear setting bit 1D_x (CLR1D_x) in the timer control register (TCRD_x) to 1. The TCNT1D_x counter value is cleared to 0000 0000_H or 0000 0001_H on compare match between the TCNT1D_x counter and counter upper-limit setting compare register (CUCR1D_x). The clear timing differs depending on TCCRLRD_x.CLRSEL1D_x. When TCCRLRD_x.CLRSEL1D_x = 0, clearing occurs without synchronization with the count clock, and when TCCRLRD_x.CLRSEL1D_x = 1, it clears in synchronization with the count clock. For the clear value and clear timing of TCNT1D_x, refer to the description of TCNT1D_x.

The OVF1D_x bit in timer status register D (TSRD_x) is set to 1 and an overflow interrupt is output on compare match between the TCNT1D_x counter and counter upper-limit setting compare register (CUCR1D_x).

The output width of overflow interrupt is one clock width of PCLK.

Do not set CUCR1D_x to 0000 0000_H. If 0000 0000_H is set, a compare match may occur at an unintended timing.

32.8.2.24 CUCR2Dx — Counter Upper-Limit Setting Compare Register 2Dx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CUCR2Dx[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The counter upper-limit setting compare register (CUCR2D_x) is a 32-bit readable/writable register that has a function for comparison with the TCNT2D_x counter. Compare match between this register and the TCNT2D_x counter is enabled by setting the TCNT2D_x clear setting bit 2D_x (CLR2D_x) in the timer control register (TCRD_x) to 1. The TCNT2D_x counter value is cleared to 0000 0000_H or 0000 0001_H on compare match between the TCNT2D_x counter and counter upper-limit setting compare register (CUCR2D_x). The clear timing differs depending on TCCRLRD_x.CLRSEL2D_x. When TCCRLRD_x.CLRSEL2D_x = 0, clearing occurs without synchronization with the count clock, and when TCCRLRD_x.CLRSEL2D_x = 1, it clears in synchronization with the count clock. For the clear value and clear timing of TCNT2D_x, refer to the description of TCNT2D_x.

The OVF2D_x bit in timer status register D (TSRD_x) is set to 1 and an overflow interrupt is output on compare match between the TCNT2D_x counter and counter upper-limit setting compare register (CUCR2D_x).

The output width of overflow interrupt is one clock width of PCLK.

Do not set CUCR2D_x to 0000 0000_H. If 0000 0000_H is set, a compare match may occur at an unintended timing.

32.8.2.25 OCR1Dxy — Output Compare Registers 1Dxy

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OC1Dxy[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OC1Dxy[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_b-1: Corresponding to subblocks D0 to DSB_b-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The output compare registers (OCR1D_{xy}) are 32-bit readable/writable registers. OCR1D_{xy} is constantly compared with the select counter A (TCNT1D_x or TCNT2D_x). When compare match operation is selected by bit IOAD_{xy} in TIOR1D_x, the compare match A flag (CMFAD_{xy}) in TSRD_x is set to 1 on the first edge of the PCLK after the values in select counter A (TCNT1D_x or TCNT2D_x) and OCR1D_{xy} match. When compare match A is selected by an output source select bit, a signal is output to pin TOD_{xy}A on compare match.

When compare match A is selected as a down counter starting trigger by the TRGSELD_{xy} bit in DCRD_{xy}, DCNTD_{xy} is ready to be counted down on compare match A.

When the down counter (DCNTD_{xy}) is ready, it is started in synchronization with the down counter clock. At this time, a one-shot pulse can be output on pin TOD_{xy}B. If compare match A and down-counter stop trigger are output at the same time, output is disabled without any pulse.

When TCNT1D_x overflows to change from FFFF FFFF_H to 0000 0000_H and OCRD_{xy} is set to 0000 0000_H, compare match is detected. If the counter upper-limit setting function (see **Section 32.8.3.2 Counter Upper-Limit Setting Function**) is in use with clock-bus line 5 or 6, or with a division ratio of 1/1 selected for the prescaler, the timer counter counts between 1 and the value of CUCR1D_x and the counter value never reaches 0000 0000_H. Therefore, do not set these registers to 0000 0000_H in such cases.

An interrupt can be issued to CPU by a compare match A detection.

When the range compare function is enabled, the select counter A (TCNT1D_x or TCNT2D_x) value at the compare match timing is stored in OCR1D_{xy}. Regarding the range compare function, see **Section 32.8.3.1 Range Comparison Function**.

This register is initialized to FFFF FFFF_H after reset.

32.8.2.26 RCR1Dx — Range Comparison Value Setting Register 1Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RC1Dx[4:0]				
Value after reset	0*1	0*1	0*1	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Note 1. These bits are not used. Fix these bits to "0".

The range comparison value setting register 1Dx (RCR1Dx) is an 8-bit readable/writable register. This register can enable/disable range compare function and set range value. Regarding the range compare function, see **Section 32.8.3.1 Range Comparison Function**.

RCR1Dx is initialized to 00_H after reset.

The following table shows ranges that can be set as range comparison values (power of 2 (excluded only when RCR1Dx is 0)).

RCR1Dx[4:0]	Selectable Range	Remarks
00000	None	Range comparison disable (Default)

11100	$2^{28}-1$	—
11101	$2^{29}-1$	—
11110	$2^{30}-1$	—
11111	$2^{31}-1$	—

32.8.2.27 OCR2Dxy — Output Compare Registers 2Dxy

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OC2Dxy[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OC2Dxy[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_b-1: Corresponding to subblocks D0 to DSB_b-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The output compare registers (OCR2Dxy) are 32-bit readable/writable registers. OCR2Dxy is always compared with select counter B (TCNT1Dx or TCNT2Dx), and if the IOBDxy bit of the TIOR2Dx register permits compare match, a match of select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy values is detected. If the OSSDxy bit specifies compare match B as the output source, the compare match is output to the TODxyA pin at the next PCLK cycle.

When compare match B is selected as a down counter starting trigger by the TRGSELDxy bit in DCRDx, DCNTDxy is ready to be counted down on compare match B.

When the down counter (DCNTDxy) is ready, it is started in synchronization with the down counter clock. At this time, a one-shot pulse can be output on pin TODxyB. If compare match A and down-counter stop trigger are output at the same time, output is disabled without any pulse.

If the TRGSELDxy bit of DCRDx specifies compare match B as the down count stop trigger, detection of compare match B disables down counting. At the next down-counting clock cycle, the down counter is cleared to 0 and TODxyB output (one-shot pulse) is negated.

When select counter B (TCNT1Dx or TCNT2Dx) overflows to change from FFFF FFFF_H to 0000 0000_H and OCR2Dxy is set to 0000 0000_H, compare match is detected.

If the counter upper-limit setting function (see **Section 32.8.3.2 Counter Upper-Limit Setting Function**) is in use with clock-bus line 5 or 6, or with a division ratio of 1/1 selected for the prescaler, the timer counter counts between 1 and the value of CUCR2Dx and the counter value never reaches 0000 0000_H. Therefore, do not set these registers to 0000 0000_H in such cases.

An interrupt can be issued to CPU by compare match B detection.

When the range compare function is enabled, the select counter B value at the compare match timing is stored in OCR2Dxy. Regarding the range compare function, see **Section 32.8.3.1 Range Comparison Function**.

This register is initialized to FFFF FFFF_H after reset.

32.8.2.28 RCR2Dx — Range Comparison Value Setting Register 2Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

32.8.2.29 ICR1Dxy — Input Capture Register 1Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IC1Dxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IC1Dxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_b-1: Corresponding to subblocks D0 to DSB_b-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The input capture register 1Dxy (ICR1Dxy) is a 32-bit read-only register, and its initial value is 0000 0000_H. This register captures the counter value of select counter A (TCNT1Dx or TCNT2Dx) into ICR1Dxy triggered by compare match B.

ICR1Dxy is initialized to 0000 0000_H after reset.

32.8.2.30 ICR2Dxy — Input capture register 2Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IC2Dxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IC2Dxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_b-1: Corresponding to subblocks D0 to DSB_b-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The input capture register 2Dxy (ICR2Dxy) is a 32-bit read-only register, and its initial value is 0000 0000_H. This register captures the counter value of select counter B (TCNT1Dx or TCNT2Dx) in ICR2Dxy triggered by compare match A.

ICR2Dxy is initialized to 0000 0000_H after reset.

32.8.2.31 DCNTDxy — Timer Down Counters Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNTDxy[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_b-1: Corresponding to subblocks D0 to DSB_b-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Timer down counters (DCNTDxy) are 32-bit readable/writable registers.

DCNTDxy is driven by the clock selected in the DCSELDx[2:0] bits in timer control register D (TCRDx).

While the down counter is enabled, it is decremented every input of the down counter clock. Counting can be stopped by an underflow of DCNTDxy, detection of compare match B, or detection of compare match A or B. When the decrementing is stopped by an underflow, a down counter underflow interrupt request and a DMA transfer request can be issued.

Decrementation is enabled; on the first edge of the PCLK (the same as compare match A) after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCRDxy match; on the first edge of the PCLK (the same as compare match B) after the values in select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy match; on the first edge of the PCLK after the DSTDxy bit is set to 1. Decrementation is enabled until DCNTDxy underflows or until the first edge of the PCLK (the same as compare match A) after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCR2Dxy or the first edge of the PCLK (the same as compare match B) after the values in select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy match. The down counter is decremented every input of the down counter clock while it is enabled.

Once DCNTDxy is enabled, it remains enabled until DCNTDxy underflow, compare match B, or compare match A or B (if selected as a count stop trigger) is detected. While it is enabled, another counter starting trigger or writing 1 to DSTDxy bit has no effect on the enabled state of the counter.

When compare match B or compare match A or B (if selected as a count stop trigger) is detected, the counter is stopped on the first edge of the down counter clock and then cleared to 0000 0000_H. If a down count start trigger (compare match A or writing 1 to DSTDxy) and a down count stop trigger (compare match B) are detected at the same time, the count stop trigger takes priority. The counter is not decremented and no signal on pin TODxyB is output.

Moreover, When no down counter clock is input during the time between enabled state due to compare match A or writing 1 to DSTDxy and counter stop state due to compare match B, the counter stops without performing down-count. The counter stops down-counting in the down-count stop state regardless of that the DCNTDxy value is 0000 0000_H.

A request to stop counting down is retained until the next input of the clock signal to drive counting. Accordingly, after a request to stop counting is issued, a trigger to start counting will not be accepted until the next input of the clock signal to drive counting.

If a value other than 0000 0000_H is set in DCNTDxy after decrementation is terminated by underflow, the counter is not decremented until the counter stopping source is activated. When the DCNTDxy value is 0000 0000_H and the down-

count clock is not input at the beginning of down-counting, only flags in the down count status register 2Dx (DSR2Dx) are updated without performing down-counting. A count down stop interrupt (due to DCNTDxy = 0000 0000_H) is generated at the next down-count clock. The down-count status flag Dxy (DSFDxy) in the down count status register 1Dx (DSR1Dx) retains 1 until an interrupt occurs.

This register is initialized to 0000 0000_H after reset.

32.8.2.32 TIER1Dx — Timer Interrupt Enable Register 1Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OV2EDx	OV1EDx
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.141 TIER1Dx Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
1	OV2EDx	Overflow 2 interrupt enable Dx Specifies enable/disable of interrupt requests issued by overflow of TCNT2Dx. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
0	OV1EDx	Overflow 1 interrupt enable Dx Specifies enable/disable of interrupt requests issued by overflow of TCNT1Dx. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The timer interrupt enable register 1Dx (TIER1Dx) is an 8-bit readable/writable register. This register enables and disables interrupt requests triggered by overflow of TCNT2Dx and TCNT1Dx.

TIER1Dx is initialized to 00_H after reset.

32.8.2.33 TIER2Dx — Timer Interrupt Enable Register 2Dx

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	UNDED x3	UNDED x2	UNDED x1	UNDED x0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.142 TIER2Dx Register Contents

Bit Position	Bit Name	Function
31 to 20	—	These bits are not used. Fixe these bits to "0".
19 to 16	UNDEDxy	Underflow interrupt enable Dx Specifies enable/disable of interrupt requests issued by underflow of DCNTDxy. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
15 to 12	—	These bits are not used. Fixe these bits to "0".
11 to 8	CMPBEDxy	Compare match B interrupt enable Dxy Specifies enable/disable of interrupt requests issued by compare match B. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
7 to 4	—	These bits are not used. Fixe these bits to "0".
3 to 0	CMPAEDxy	Compare match A interrupt enable Dxy Specifies enable/disable of interrupt requests issued by compare match A. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer interrupt enable register 2Dx (TIER2Dx) is an 8-bit readable/writable register. UNDEDxy register controls enable/disable of interrupts triggered by underflow of DCNTDxy. CMPBEDxy, CMPAEDxy register enables and disables interrupt requests upon compare match A between the counter (TCNT1Dx or TCNT2Dx) set by the CMPSEL1Dxy bit in the timer compare control register Dx (TCCRLRDx) and OCR1Dxy, and compare match B between the counter (TCNT1Dx or TCNT2Dx) set by the CMPSEL1Dxy bit in the timer compare control register Dx (TCCRLRDx) and OCR2Dxy.

TIER2Dx is initialized to 0000 0000_H after reset.

32.8.2.34 TIER3Dx — Timer Interrupt Enable Register 3Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	FEIEDx ₃	FEIEDx ₂	FEIEDx ₁	FEIEDx ₀	—	—	—	—	REIEDx ₃	REIEDx ₂	REIEDx ₁	REIEDx ₀
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.143 TIER3Dx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. Fixe these bits to "0".
11 to 8	FEIEDxy	OFF timing of the output waveform after MIN guard interrupt enable Dxy Specifies enable/disable of interrupt requests issued by off timing of the output waveform after MIN guard interrupt enable Dxy. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
7 to 4	—	These bits are not used. Fixe these bits to "0".
3 to 0	REIEDxy	ON timing of the output waveform after MIN guard interrupt enable Dxy Specifies enable/disable of interrupt requests issued by on timing of the output waveform after MIN guard interrupt enable Dxy. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.)

The timer interrupt enable register 3Dx (TIER3Dx) is an 8-bit/16-bit readable/writable register. This register controls enable/disable of interrupts triggered by on/off timing of the output waveform after MIN guard interrupt enable Dxy.

TIER3Dx is initialized to 0000_H after reset.

32.8.2.35 MIGCRD_x — MIN Guard Control Register D_x

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	MIGEND _x 3	MIGEND _x 2	MIGEND _x 1	MIGEND _x 0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.144 MIGCRD_x Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. Fixe these bits to “0”.
3 to 0	MIGEND _{xy}	MIN Guard function Enable D _{xy} 0: MIN Guard is disabled. 1: MIN Guard is enabled.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

MIN Guard control register D_x (MIGCRD_x) is an 8-bit readable/writable register. This register controls enable/disable of min guard function by one shot pulse output TOD_{xy}A/TOD_{xy}B.

MIGCRD_x is initialized to 00_H after reset.

MIN Guard function Enable D_{xy} (MIGEND_{xy})

The MIN guard function enable in OFMIND_{xy}, ONMIND_{xy}, OTOMIND_{xy} can be added to one shot pulsed output TOD_{xy}A or TOD_{xy}B by writing “1” in this bit.

When changing this bit to 0 from 1, a counter register for MIN guard (OFMICNTD_{xy}, ONMICNTD_{xy}, OTOMICNTD_{xy}) is cleared in 00000000_H and the function of the MIN guard is suspended.(A generated one shot pulse is output directly.)

32.8.2.36 MIGSELDx — MIN Guard Pulse Select Register Dx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	MIGSELx3	MIGSELx2	MIGSELx1	MIGSELx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

Table 32.145 MIGSELDx Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
3 to 0	MIGSELxy	MIN Guard pulse selected. 0: MIN Guard function is added to TODxyA output. 1: MIN Guard function is added to TODxyB output.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.)

MIN Guard pulse select register Dx (MIGSELDx) is an 8-bit readable/writable register. This register select the one shot pulse output (TODxyA/TODxyB) to which the MIN guard function.

MIGSELDx is initialized to 00_H after reset.

MIN Guard pulse selected (MIGSELDxy)

This bits select the one shot pulse output (TODxyA/TODxyB) to which the MIN guard function.

MIN guard is added to TODxyA at 0 setting and min guard is added to TODxyB at 1 setting in OFMINDxy, ONMINDxy, OTOMINDxy.

32.8.2.37 OFMIND_{xy} —Pulse Output Off Minimum Width Setting Register D_{xy}

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFMIND _{xy} [31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFMIND _{xy} [15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The pulse output off minimum width setting register D_{xy} (OFMIND_{xy}) is a 32-bit readable/writable register. When an enable the MIN guard function (MIGEND_{xy} = 1), the smallest width of the off period can be set as TOD_{xy}A or TOD_{xy}B. If a pulse whose OFF period is shorter than the width set by this register is generated, it is automatically corrected to satisfy the set minimum width.

32.8.2.38 ONMIND_{xy} —Pulse Output On Minimum Width Setting Register D_{xy}

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ONMIND _{xy} [31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ONMIND _{xy} [15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The pulse output on minimum width setting register D_{xy} (ONMIND_{xy}) is a 32-bit readable/writable register. When an enable the MIN guard function (MIGEND_{xy} = 1), the smallest width of the on period can be set as TOD_{xy}A or TOD_{xy}B. If a pulse whose ON period is shorter than the width set by this register is generated, it is automatically corrected to satisfy the set minimum width.

32.8.2.39 OTOMINDxy —Pulse Output On-to-On Minimum Width Setting Register Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OTOMINDxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OTOMINDxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The pulse output on-to-on minimum width setting register Dxy (ONMINDxy) is a 32-bit readable/writable register that specifies the minimum width of the TODxyB (one-shot pulse output) between a change from OFF to ON and the next change from OFF to ON period in pulse type 2 mode. If a pulse whose ON-to-ON period is shorter than the width set by this register is generated, it is automatically corrected to satisfy the set minimum width.

32.8.2.40 OFMICNTDxy —Pulse Output Off Minimum Width Measurement Counter Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OFMICNTDxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OFMICNTDxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The pulse output off minimum width measurement counter Dxy (OFMICNTDxy) is a 32-bit readable register that measures the pulse OFF period for correction to secure the minimum width of the pulse OFF period.

32.8.2.41 ONMICNTDxy —Pulse Output On Minimum Width Measurement Counter Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ONMICNTDxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ONMICNTDxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The pulse output on minimum width measurement counter Dxy (ONMICNTDxy) is a 32-bit readable register that measures the pulse ON period for correction to secure the minimum width of the pulse ON period.

32.8.2.42 OTOMICNTDxy —Pulse Output On-to-On Minimum Width Measurement Counter Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OTOMICNTDxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OTOMICNTDxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The pulse output on-to-on minimum width measurement counter Dxy (OTOMICNTDxy) is a 32-bit readable register that measures the pulse ON-to-ON period for correction to secure the minimum width of the pulse ON-to-ON period.

32.8.2.43 ONCAP1Dxy — Input Capture Register ONCAP1Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ONCAP1Dxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ONCAP1Dxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The input capture register ONCAP1Dxy (ONCAP1Dxy) is a 32-bit read-only register, and its initial value is 0000 0000_H. This register captures the value of TCNT1Dx0 when TODxyB (pulse output) changes from OFF to ON in min guard function.

ONCAP1Dxy is initialized to 0000 0000_H after reset.

32.8.2.44 ONCAP2Dxy — Input Capture Register ONCAP2Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ONCAP2Dxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ONCAP2Dxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The input capture register ONCAP2Dxy (ONCAP2Dxy) is a 32-bit read-only register, and its initial value is 0000 0000_H. This register captures the value of TCNT2Dx0 when TODxyB (pulse output) changes from OFF to ON in min guard function.

ONCAP2Dxy is initialized to 0000 0000_H after reset.

32.8.2.45 OFCAP1Dxy — Input Capture Register OFCAP1Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OFCAP1Dxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OFCAP1Dxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The input capture register OFCAP1Dxy (OFCAP1Dxy) is a 32-bit read-only register, and its initial value is 0000 0000_H. This register captures the value of TCNT1Dx0 when TODxyB (pulse output) changes from ON to OFF in min guard function.

OFCAP1Dxy is initialized to 0000 0000_H after reset.

32.8.2.46 OFCAP2Dxy — Input Capture Register OFCAP2Dxy

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OFCAP2Dxy[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OFCAP2Dxy[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The input capture register OFCAP2Dxy (OFCAP2Dxy) is a 32-bit read-only register, and its initial value is 0000 0000_H. This register captures the value of TCNT2Dx0 when TODxyB (pulse output) changes from ON to OFF in min guard function.

OFCAP2Dxy is initialized to 0000 0000_H after reset.

32.8.2.47 TSR2Dx — Timer Status Register 2Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	FEFDx3	FEFDx2	FEFDx1	FEFDx0	—	—	—	—	REFDx3	REFDx2	REFDx1	REFDx0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.146 TSR2Dx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
11 to 8	FEFDx3 to FEFDx0	Output pulse after MIN guard OFF flag Dx3 to Dx0 0: Output pulse after MIN guard has not changed from ON to OFF 1: Output pulse after MIN guard has changed from ON to OFF
7 to 4	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
3 to 0	REFDx3 to REFDx0	Output pulse after MIN guard ON flag Dx3 to Dx0 0: Output pulse after MIN guard has not changed from OFF to ON 1: Output pulse after MIN guard has changed from OFF to ON

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1

The timer status register 2 (TSR2D_x) is an 8-bit/16-bit read-only register. This register indicates the change of the output pulse in subblock D_x (x = 0 to SB_D-1) after MIN guard, from ON to OFF or OFF to ON.

If an interrupt source takes effect when this flag is set, an interrupt request is made again. An interrupt request is made even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source.

The flags can be cleared by setting the corresponding bits of the timer status clear register 2 (TSCR2D_x).

TSR2D_x is initialized to 0000_H after reset.

Output pulse after MIN guard OFF flag Dxy (FEFDxy)

FEFDxy	Function
0	[Clearing condition] When 1 is written to the FEFDxy bit of the timer status clear register 2 (TSCR2D _x). (Default)
1	[Setting condition] When the output pulse after MIN guard has changed from ON to OFF

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1 y = 0, 1, 2, 3: Corresponding to channels 0 to 3

Output pulse after MIN guard ON flag Dxy (REFDxy)

REFDxy	Function
0	[Clearing condition] When 1 is written to the REFDxy bit of the timer status clear register 2 (TSCR2D _x). (Default)
1	[Setting condition] When the output pulse after MIN guard has changed from OFF to ON

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1 y = 0, 1, 2, 3: Corresponding to channels 0 to 3

32.8.2.48 TSCR2Dx — Timer Status Clear Register 2Dx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	FEFCD x3	FEFCD x2	FEFCD x1	FEFCD x0	—	—	—	—	REFCD x3	REFCD x2	REFCD x1	REFCD x0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W	R	R	R	R	W	W	W	W

Table 32.147 TSCR2Dx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
11 to 8	FEFCDx3 to FEFCDx0	Output pulse after MIN guard OFF flag clear enable Dx3 to Dx0 0: Disabled (Default) 1: Clears FEFCDx3-FEFCDx0 of timer status register 2D (TSR2Dx) to 0.
7 to 4	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
3 to 0	REFCDx3 to REFCDx0	Output pulse after MIN guard ON flag clear enable Dx3 to Dx0 0: Disabled (Default) 1: Clears REFCDx3-REFCDx0 of timer status register 2D (TSR2Dx) to 0.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1.

The timer status clear register 2Dx (TSCR2Dx) is an 8-bit/16-bit readable/writable register. This register clears the flags that indicate the change of output pulse after MIN guard (from ON to OFF or vice versa).

TSCR2Dx is initialized to 0000_H after reset.

Output pulse after MIN guard OFF flag clear enable 2Dxy (FEFCDxy)

This bit clears the flags that indicate the change of output pulse after MIN guard from ON to OFF.

Setting this bit enables clearing of the output pulse after MIN guard OFF flag (FEFCDxy) of the timer status register 2Dx (TSR2Dx). When these bits are read, “0” is always returned.

FEFCDxy	Function
0	Disabled (Default)
1	Clears FEFCDxy to 0.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1 y = 0, 1, 2, 3: Corresponding to channels 0 to 3

Output pulse after MIN guard ON flag clear enable 2Dxy (REFCDxy)

This bit clears the flags that indicate the change of output pulse after MIN guard from OFF to ON.

Setting this bit enables clearing of the output pulse after MIN guard ON flag (REFCDxy) of the timer status register 2Dx (TSR2Dx). When these bits are read, “0” is always returned.

REFCDxy	Function
0	Disabled (Default)
1	Clears REFCDxy to 0.

Note: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1 y = 0, 1, 2, 3: Corresponding to channels 0 to 3

32.8.2.49 CCAPSELD — Common Input Capture Select Register D

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CCAPSEL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.148 CCAPSELD Register Contents

Bit Position	Bit Name	Function
7 to 1	—	These bits are not used. When these bits are read, “0” is always returned. When writing, always write “0”.
0	CCAPSEL	Common input capture select. 0: The value of the TCNT1D0 is stocked in CICRD0-7 1: The value of the TCNT2D0 is stocked in CICRD0-7

Common input capture select register D (CCAPSELD) is an 8-bit readable/writable register.

When a PH renewal notice trigger occurred, Its select which to stock in Common input capture registerD0-7, Timer Counter 1D0 (TCNT1D0) or Timer Counter 2D0 (TCNT2D0).

CCAPSELD is initialized to 00_H after reset.

32.8.2.50 CICRD0-7 — Common Input Capture Register D0-7

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CICRD0-7[31:16]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CICRD0-7[15:0]																
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

The common input capture register D0-7 (CICRD0-7) is a 32-bit read-only register, and its initial value is 0000 0000_H.

The value of the timer counter (If CCAPSEL = 0 then TCNT1D0, CCAPSEL = 1 then TCNT2D0) is stocked by PH renewal notice trigger 0~7 from DFE.

CICRD_x is assigned to “PH renewal notice trigger x”. (x = 0-7)

CICRD0-7 is initialized to 0000 0000_H after reset.

32.8.3 Details of Operation

Timer D consists of SB_D subblocks. Each block has two range compare setting registers (RCR1D_x and RCR2D_x), two 32-bit up-counters (TCNT1D_x and TCNT2D_x), one offset base register (OSBRD_x), one output value register (ODRD_x), one output select register (OSELRD_x), and four channels described below. Each channel consists of the output compare register (OCR1D_{xy}) to which select counter A (TCNT1D_x or TCNT2D_x) is compared, the output compare register (OCR2D_{xy}) to which select counter B (TCNT1D_x or TCNT2D_x) is compared, one down-counter D_{xy} (DCNTD_{xy}), two upper-limit setting registers (CUCR1D_x and CUCR2D_x) for two counters, and two input capture registers (ICR1D_{xy} and ICR2D_{xy}).

One-shot pulse can be output from timer D. By using compare match A, compare match B, compare match A or B, (or compare match A and B), 1 writing in to DSTRD_x.DSTD_{xy} as a start trigger of a down-counter, one-shot pulse with an offset can also be output.

Setting the TDE bit in ATUENR and bit STRD_x in timer start register (TSTRD) to 1 makes two up-counters (TCNT1D_x and TCNT2D_x) in subblock D_x start operation. Also, this becomes a request for counting down by the down counter to start.

The down-counter is started by any of five sources; setting the DSTD_{xy} bit in the down count start register (DSTRD) to 1, compare match A, compare match B, compare match A or B, and compare match A and B that are set by the TRGSEL_{Dxy} bit in the down counter control register (DCRD). When any of these triggers occurs, DCNTD_{xy} driven by the down counter clock is started. But, during off-Min guard and during OTO-Min guard or DCNTD_{xy} doesn't begin down count movement at 0000_0000_H.

The down counter is stopped on an underflow of the down counter and compare match B or A or B selected by bit TRGSEL_{xy}. When an underflow occurs (during down-counting when the counter value is 0000 0000_H), the value of the down counter (DCNTD_{xy}) is immediately cleared to 0000 0000_H and the down-counting is terminated. When a compare match B or compare match A or B occurs, the same operation is performed in synchronization with the next down-count clock.

For compare match A between TCNT1D_x (or TCNT2D_x) and OCR1D_{xy} and compare match B between TCNT2D_x (or TCNT1D_x) and OCR2D_{xy} are set to 1 on the first edge of the PCLK after the compare match. A compare match interrupt request is issued to CPU triggered by the compare match. According to the settings of range comparison value setting registers (RCR1D_x and RCR2D_x), enable the range compare function, compare match A can be generated if it is within the range set by select counter A when writing to OCR1D_{xy}, compare match B can be generated if it is within the range set by select counter B when writing to OCR2D_{xy}. Furthermore, the counter value of select counter B is captured into ICR2D_{xy} triggered by compare match A and the counter value of select counter A is captured into ICR1D_{xy} triggered by compare match B. The CMFAD_{xy} and CMFBD_{xy} bits in TSRD_x are set to 1 in synchronization with PCLK in the occurrence of compare match.

A signal on pin TOD_{xy}A is output when the output source selected in the OSSD_{xy} bit in timer I/O control register 1D (TIOR1D_x) is activated. For example, assume that compare match A is selected. A signal level set by the IOA_{xy} bit is output on pin TOD_{xy}A on the first edge of the PCLK after the compare match between select counter A and OCR1D_{xy}.

Output of the one-shot pulse is synchronized with the down counter clock in a way similar to the down counter operation. The five counter starting sources are synchronized with the PCLK, a signal on pin TOD_{xy}B is output on the first edge of the down counter clock after the source is activated. Underflow of the down counter, which is a counter stopping source, is synchronized with the down counter clock and compare match B and compare match A or B is synchronized with the PCLK. As to negation timing, the TOD_{xy}B signal is negated in synchronization with underflow and on the first edge of the down counter clock after the compare match B or A or B.

Output Pin	Assertion Timing	Negation Timing	Initial Value
TODxyB	On the first edge of the down counter clock after the counter starting source is activated	On the first edge of the down counter clock after compare match B or on DCNTDxy underflow	0 (inverted depending on TOCRDx)

Note 1: x = 0 to SB_D-1: Corresponding to subblocks D0 to DSB_D-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Note 2: If an assertion and a negation occur simultaneously, the negation takes priority.

The initial values output on pins TODxyA and TODxyB are 0. However, the output level can be inverted by setting timer output control register (TOCRDx). Setting bit TONEADx to 1 makes pin TODxyA in subblock Dx inverted and setting bit TONEBDx to 1 makes pin TODxyB in subblock Dx inverted. By setting the output select register Dx (OSELRDx), the value of the corresponding output value register Dx (ODRDx) can be output to pins (TODxyA and TODxyB).

To set the clocks for TCNT1Dx, TCNT2Dx, or DCNTDxy or values in registers such as DCNTDxy, OCR1Dxy, and OCR2Dxy while TCNT1Dx or TCNT2Dx is in operation, note that the value to be set may lead to malfunction. For example, while setting the compare match value, the counter value may exceed the value to be set.

Figure 32.57 shows an operation example of one-shot pulse output for channel 0 in subblock D0.

Figure 32.57 Operation Example of One-Shot Pulse Output (1) - Counting Started on Compare Match A and Stopped on Compare Match B -

Figure 32.57 shows operations of the down counter when the counter is started on compare match A and is stopped on compare match B. It also shows the assertion and negation of a one-shot pulse. Compare match A as the counter starting trigger and compare match B as the counter stopping trigger are set by the TRGSEL00 bits in DCRD0. Both matches are selected as the source of the output signal by the OSSD00 bits in TIOR1D0 and output levels are set by the IOAD00 and IOBD00 bits. A logical one for compare match A and a logical zero for compare match A are selected.

When the timer start register (TSTRD) is set to 1, TCNT1D0 and TCNT2D0 start counting up immediately after the next count clocks for TCNT1D0 and TCNT2D0, respectively. If TCNT1D0 coincides with the output compare register (OCR1D00), compare match A occurs at the next PCLK cycle. At this time, the counter value of TCNT2Dx is captured in ICR2Dxy. In addition, a compare match interrupt request is issued to CPU triggered by compare match A. The compare match A status flag (CMFAD00) is set to 1. At the same time, TOD00A outputs 1 and the down count status flag (DSFD00) is also set to 1, entering the down counter enabled state. This down count enabled state continues until

detection of compare match B or under flow of DCNTD00. Input of the down counter clock during this state decrements DCNTD00. TOD00B outputs 1 from the time of the first down counter clock input.

If TCNT2D0 coincides with the output compare register (OCR2D00), compare match B occurs at the next PCLK cycle. At this time, the counter value of TCNT1Dx is captured into ICR1Dxy. In addition, a compare match interrupt request is issued to CPU triggered by compare match B. The compare match B flag (CMFBD00) is set to 1. At this time, a level of 0 is output on pin TOD00A. The down counter is cleared and a one-shot pulse (TOD00B) is terminated.

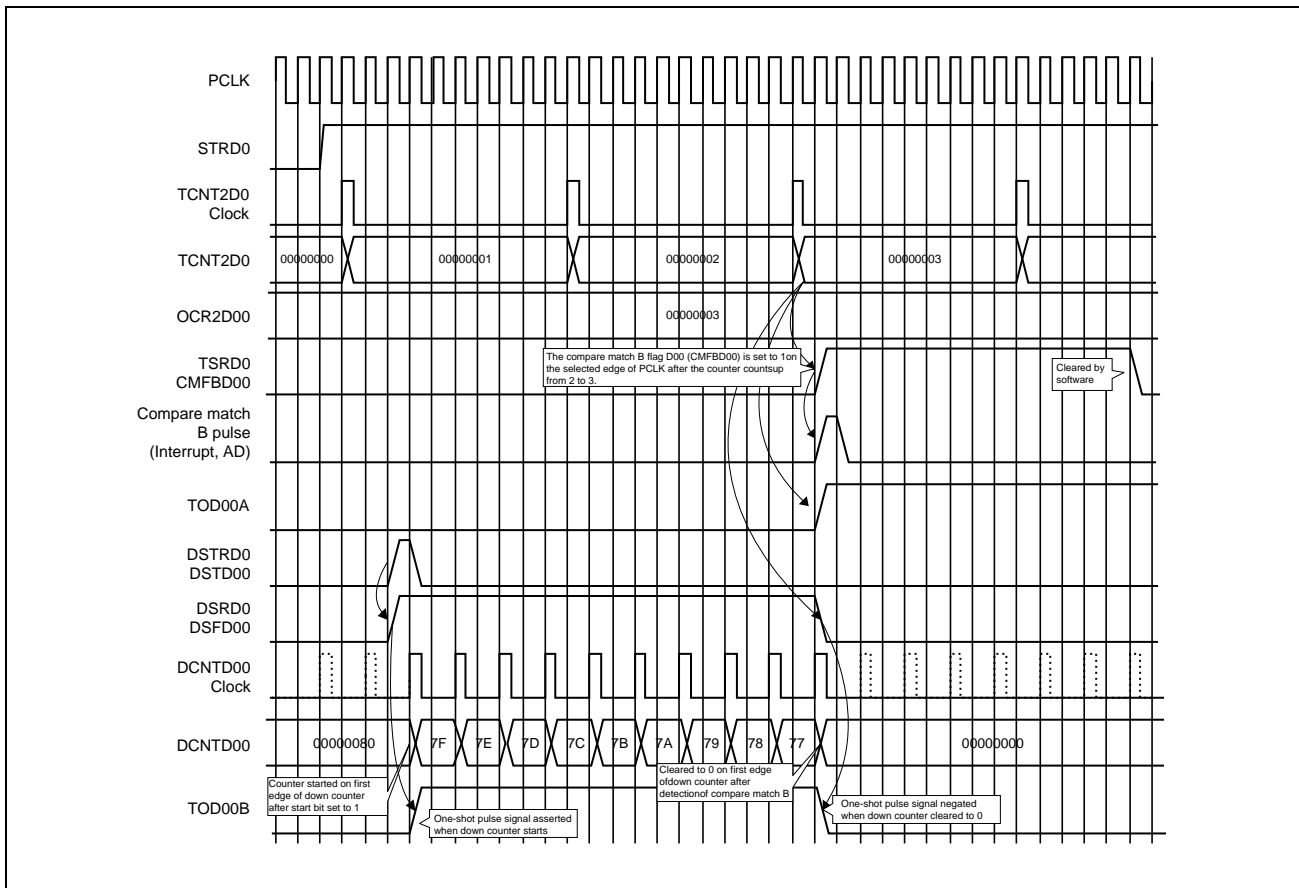

Figure 32.58 Operation Example of One-Shot Pulse Output (2) - Counting Started by Writing 1 to Counter Starting Bit and Stopped on Compare Match B -

Figure 32.58 shows an operation example when the down counter is started by writing 1 to the down counter starting bit. In this example, the counter starting trigger is not selected and compare match B is selected as the counter stopping trigger (TRGSELD00 in DCRD0). The source of the output signal is compare match B (OSSD00 in TIOR1D0) and logical one is output (IOBD00 in TIOR1D0).

Figure 32.59 shows an operation example of a one-shot pulse output for channel 0 in subblock D0.

Setting the DSTD00 bit in the down counter starting register (DSTRD0) sets the down counter status flag (DSFD00) to 1. This makes the down counter ready for counting down. DCNTD00 is started on the first edge of the down counter clock after DSFD00 is set to 1. At this time, a level of 1 is output on pin TOD00B.

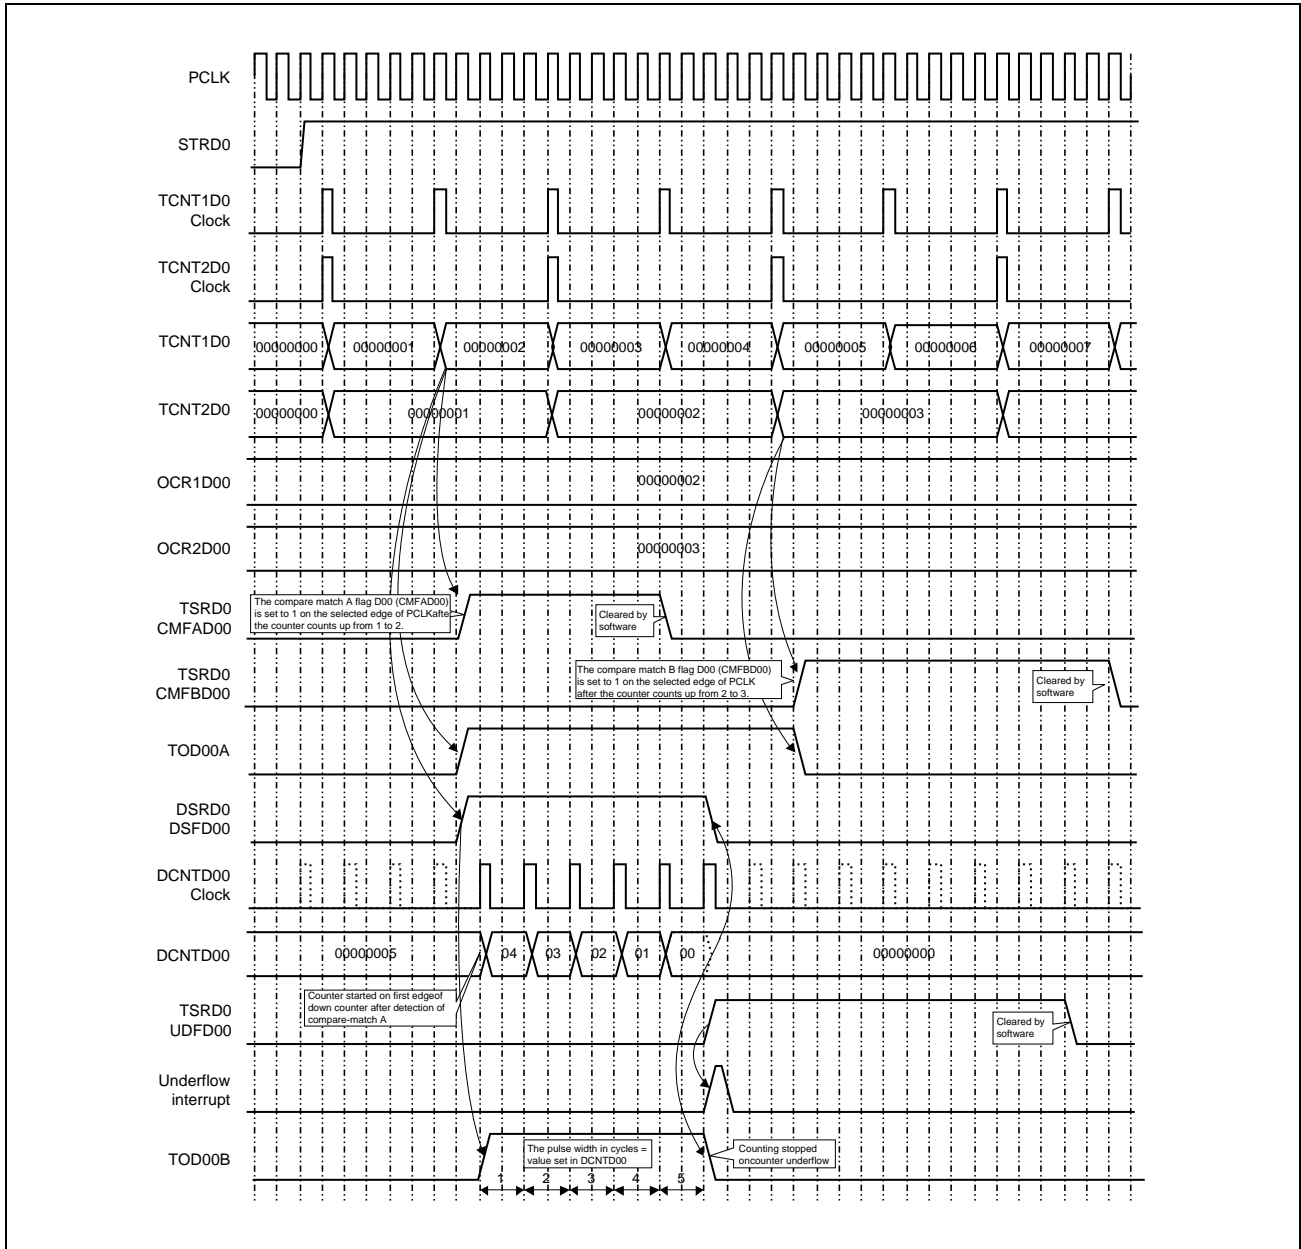

Figure 32.59 Operation Example of One-Shot Pulse Output (3) – Underflow Occurs -

Figure 32.59 shows an operation example when a one-shot pulse is terminated on underflow. In this example, compare match A as the counter starting trigger is selected and the counter stopping trigger is not selected (TRGSEL0 in DCRD0). Both compare matches A and B as the source of the output signal (OSSD0 in TIOR1D0) are selected. Output levels of 1 for compare match A (IOAD0) and 0 for compare match B (IOBD0) are selected. Underflow is detected and the underflow flag (UDFD0) in TSRD0 is set on the first edge of the down counter clock after the value in timer down counter Dxy (DCNTD0) is 00 0000_H. At the same time, the one-shot pulse output is terminated. The width of the pulse output on pin TOD00B is equal to the value set in DCNTD0 before counting down.

32.8.3.1 Range Comparison Function

(1) Range compare function

The range compare function is a function to generate a compare match when the counter value (TCNT1Dx, TCNT2Dx) is within the compare range set when outputting to the output compare register (OCR1Dxy, OCR2Dxy). The range compare function is valid when other than 00_H is set in the range compare value setting register (RCR1Dx or RCR2Dx). Range compare match A and B correspond to compare match A and B, respectively. Range Compare range of compare match A, B is judged by using the following values.

Range compare match A

- Write value of OCR1Dxy
- Value of select counter A
- Range value for select counter A
- Upper limit value of select counter A

Range compare match B

- Write value of OCR2Dxy
- Value of select counter B
- Range value for select counter B
- Upper limit value of select counter B

Figure 32.60 and **Figure 32.61** show the operation diagram of range compare match.

Also, OCR1Dxy and OCR2Dxy capture counter values (TCNT1Dx, TCNT2Dx) when a compare match is generated by the range compare function.

Figure 32.62 shows the capture operation when range compare match occurs.

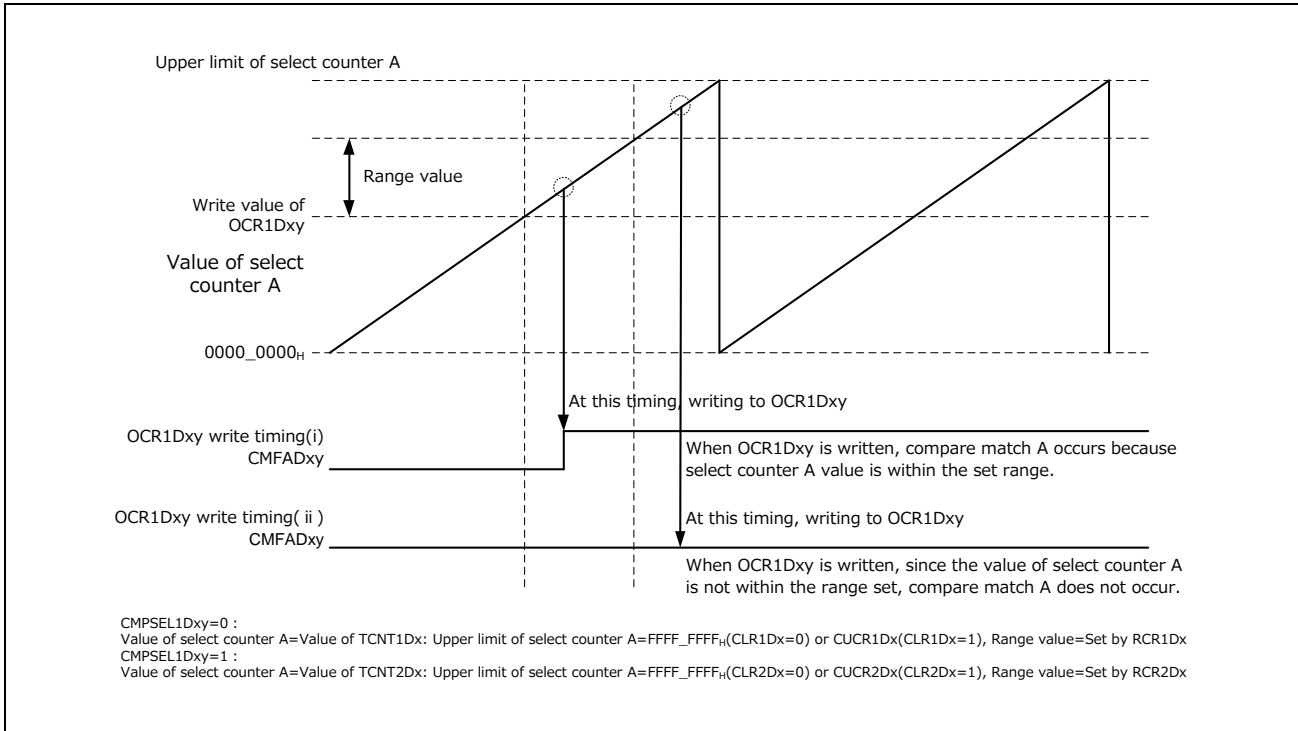

Figure 32.60 Operation of the Range Comparison Function(1)

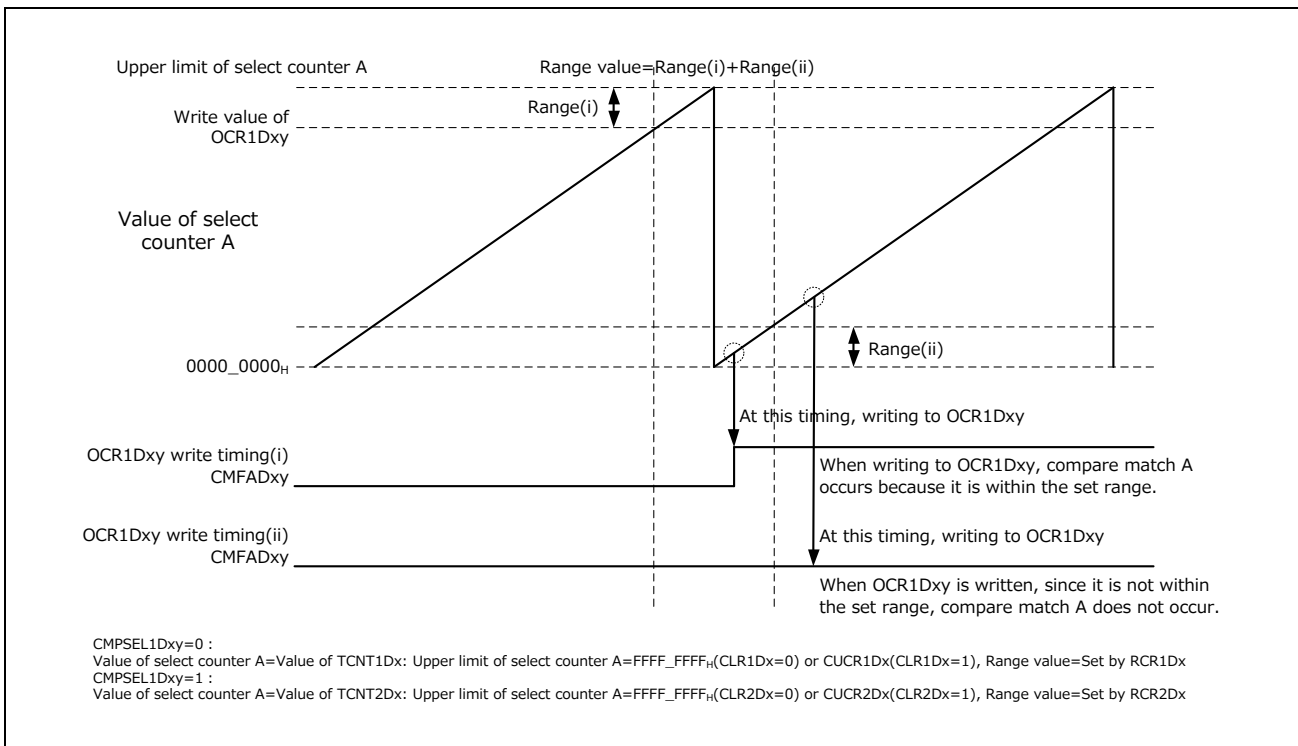

Figure 32.61 Operation of the Range Comparison Function(2)

Figure 32.62 Range Compare Counter Value Capturing Operation

Range compare match A occurs if the condition of **Table 32.149** is satisfied when the range compare function is enabled (other than 00_H for the range value for select counter A) and writing to OCR1Dxy is performed.

Table 32.149 Range Compare Match A Generation Condition

	Range condition	Range compare match A generation condition
Condition 1	When the set compare range is lower than select counter A upper limit OCR1Dxy + Range value for select counter A ≤ Upper limit value of select counter A	OCR1Dxy ≤ Value of select counter A ≤ OCR1Dxy + Range value for select counter A
Condition 2	When the set compare range exceeds select counter A upper limit Upper limit value of select counter A < OCR1Dxy + Range value for select counter A	Range(i) : OCR1Dxy ≤ Value of select counter A ≤ Upper limit value of select counter A or Range(ii) : 00000000 ≤ Value of select counter A ≤ OCR1Dxy + Range value for select counter A – Upper limit value of select counter A

Note 1. “Condition 1 When the set compare range is lower than select counter A upper limit”, The range condition shown in the **Figure 32.60**.

Note 2. “Condition 2 When the set compare range exceeds select counter A”, The range condition shown in the **Figure 32.61**.

Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in **Figure 32.61**.

Table 32.150 lists the registers used to determine the compare range of “Range compare match A”.

Table 32.150 Register Used in Range Judgment of Compare Match A

Configuration			Used registers			
CMPSEL1Dxy	CLR1Dx	CLR2Dx	Value of select counter A	Set value for select counter A	Upper limit value of select counter A	Output compare register
0	0	—	TCNT1Dx	RCR1Dx	FFFFFFF _H	OCR1Dxy
0	1	—			CUCR1Dx	
1	—	0	TCNT2Dx	RCR2Dx	FFFFFFF _H	
1	—	1			CUCR2Dx	

Note 1. “—” indicates that the setting has no effect.

Range compare match B occurs if the condition of **Table 32.151** is satisfied when the range compare function is enabled (other than 00_H for the range value for select counter B) and writing to OCR2Dxy is performed.

Table 32.151 Range Compare Match B Generation Condition

	Range condition	Range compare match B generation condition
Condition 1	When the set compare range is lower than select counter B upper limit OCR2Dxy + Range value for select counter B ≤ Upper limit value of select counter B	OCR2Dxy ≤ Value of select counter B ≤ OCR2Dxy + Range value for select counter B
Condition 2	When the set compare range exceeds select counter B upper limit Upper limit value of select counter B < OCR2Dxy + Range value for select counter B	Range(i) : OCR2Dxy ≤ Value of select counter B ≤ Upper limit value of select counter B or Range(ii) : 00000000 ≤ Value of select counter B ≤ OCR2Dxy + Range value for select counter B – Upper limit value of select counter B

Note 1. “Condition 1 When the set compare range is lower than select counter B upper limit”, The range condition shown in the **Figure 32.60**.

Note 2. “Condition 2 When the set compare range exceeds select counter B”, The range condition shown in the **Figure 32.61**.

Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in **Figure 32.61**.

Table 32.152 lists the registers used to determine the compare range of “Range compare match B”.

Table 32.152 Register Used in Range Judgment of Compare Match B

Configuration			Used registers			
CMPSEL2Dxy	CLR2Dx	CLR1Dx	Value of select counter B	Set value for select counter B	Upper limit value of select counter B	Output compare register
0	0	—	TCNT2Dx	RCR2Dx	FFFFFFF _H	OCR2Dxy
0	1	—			CUCR2Dx	
1	—	0	TCNT1Dx	RCR1Dx	FFFFFFF _H	
1	—	1			CUCR1Dx	

Note 1. “—” indicates that the setting has no effect.

The table below shows the setting example when the range compare function is used and the counter value at which the range compare match occurs.

No.1, No.3 are examples of the condition “When the set compare range is less than or equal to the select counter A/B upper limit value”, and No.2, No.4 are examples of the condition “When the set compare range exceeds the select counter A/B upper limit value”.

Table 32.153 Range Compare Function Register Setting Example

No.	CLR1Dx or CLR2Dx bit value	Counter upper limit setting compare register (CUCR1Dx, CUCR2Dx)	The write value of the output compare register (OCR1Dxy, OCR2Dxy)	Set value (range value) of range compare value setting register (RCR1Dx, RCR2Dx)	When writing to the output compare register (OCR1Dxy, OCR2Dxy), the value of the counter where range compare match occurs
0	0	—	FFFF0000 _H	12 (range value: FFF _H)	FFFF0000 _H to FFFF0FFF _H *1
1	0	—	FFFF0000 _H	18 (range value: 3FFFF _H)	FFFF0000 _H to FFFFFFFF _H 00000000 _H to 00030000 _H *2
2	1	00000FFF _H	00000E00 _H	6 (range value: 3F _H)	00000E00 _H to 00000E3F _H *3
3	1	00000FFF _H	00000E00 _H	10 (range value: 3FF _H)	00000E00 _H to 00000FFF _H 00000000 _H to 00000200 _H *4

Note 1. FFFF0000_H to (FFFF0000_H + 2¹² -1)

Note 2. 00000000_H to (FFFF0000_H + 2¹⁸ -1 – FFFFFFFF_H)

Note 3. 00000E00_H to (00000E00_H + 2⁶ -1)

Note 4. 00000000_H to (00000E00_H + 2¹⁰ -1 – 00000FFF_H)

32.8.3.2 Counter Upper-Limit Setting Function

According to the setting for the counter upper-limit setting compare register 1 (CUCR1Dx), the upper-limit value of the timer counter (TCNT1Dx) in each subblock can be modified to change the one-shot pulse cycle. To enable the counter upper-limit setting function, the CLR1Dx bit in the timer control register D (TCRDx) must be set to 1.

According to the setting for the counter upper-limit setting compare register 2 (CUCR2Dx), the upper-limit value of the timer counter (TCNT2Dx) in each subblock can be modified to change the one-shot pulse cycle. To enable the counter upper-limit setting function, the CLR2Dx bit in the timer control register D (TCRDx) must be set to 1.

Figure 32.63 shows an example of operation when the counter upper-limit setting function in block D0 is enabled.

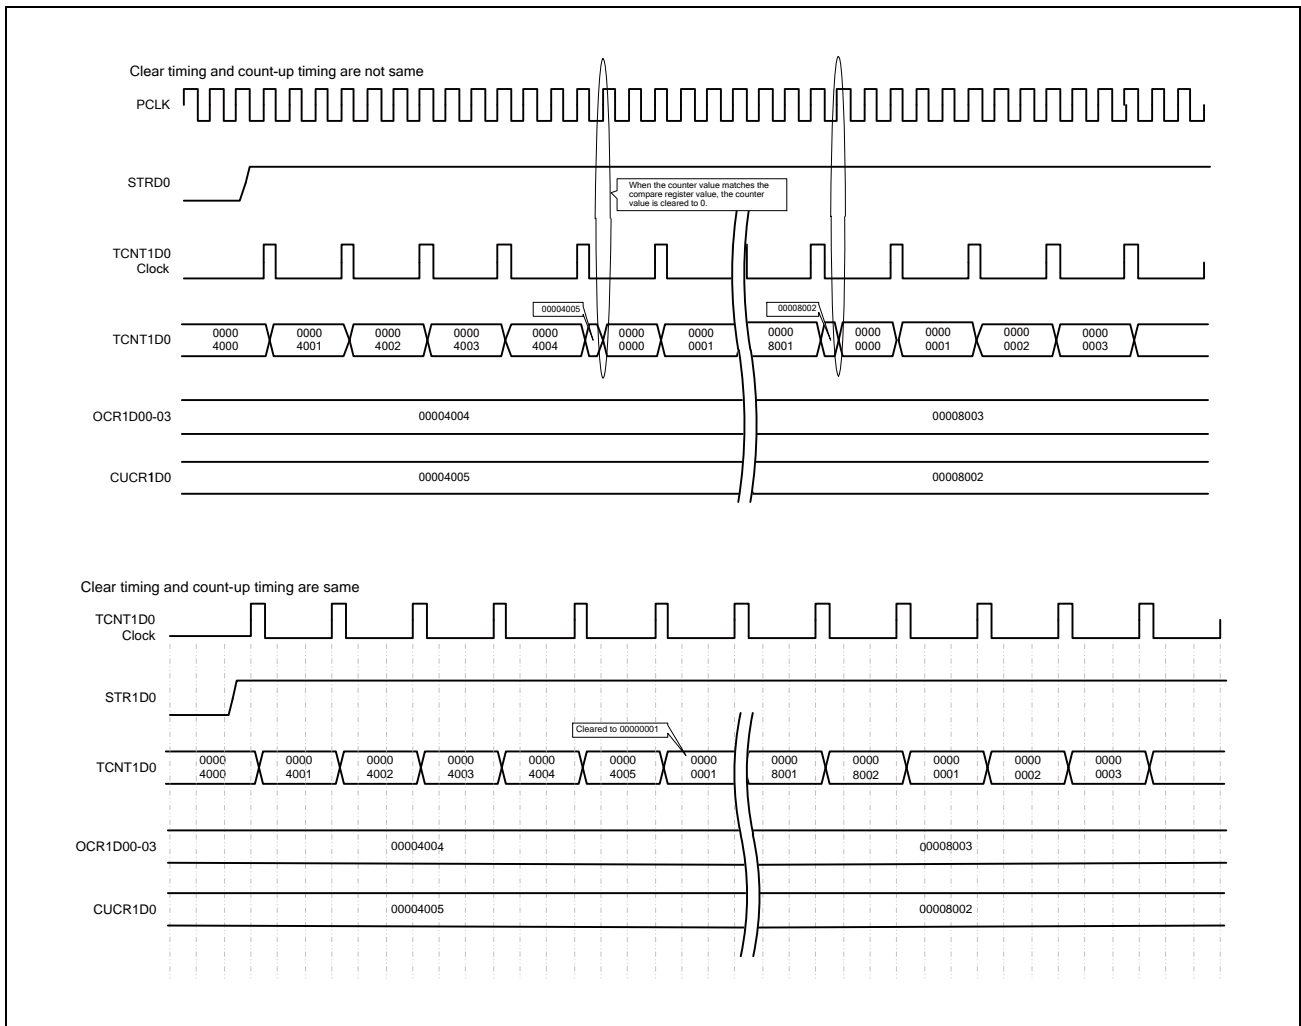

Figure 32.63 Operation of the Counter Upper-Limit Setting Function

Figure 32.64 Counter Upper-Limit Function Setting Procedure

32.8.3.3 Capture Function

The input capture registers 1Dxy (ICR1Dxy) and 2Dxy (ICR2Dxy) capture the values counted by timer counters 1Dx (TCNT1Dx) and 2Dx (TCNT2Dx) in response to the compare match B and compare match A triggers, respectively. Capture proceeds on the rising edges of the pulses produced by matches.

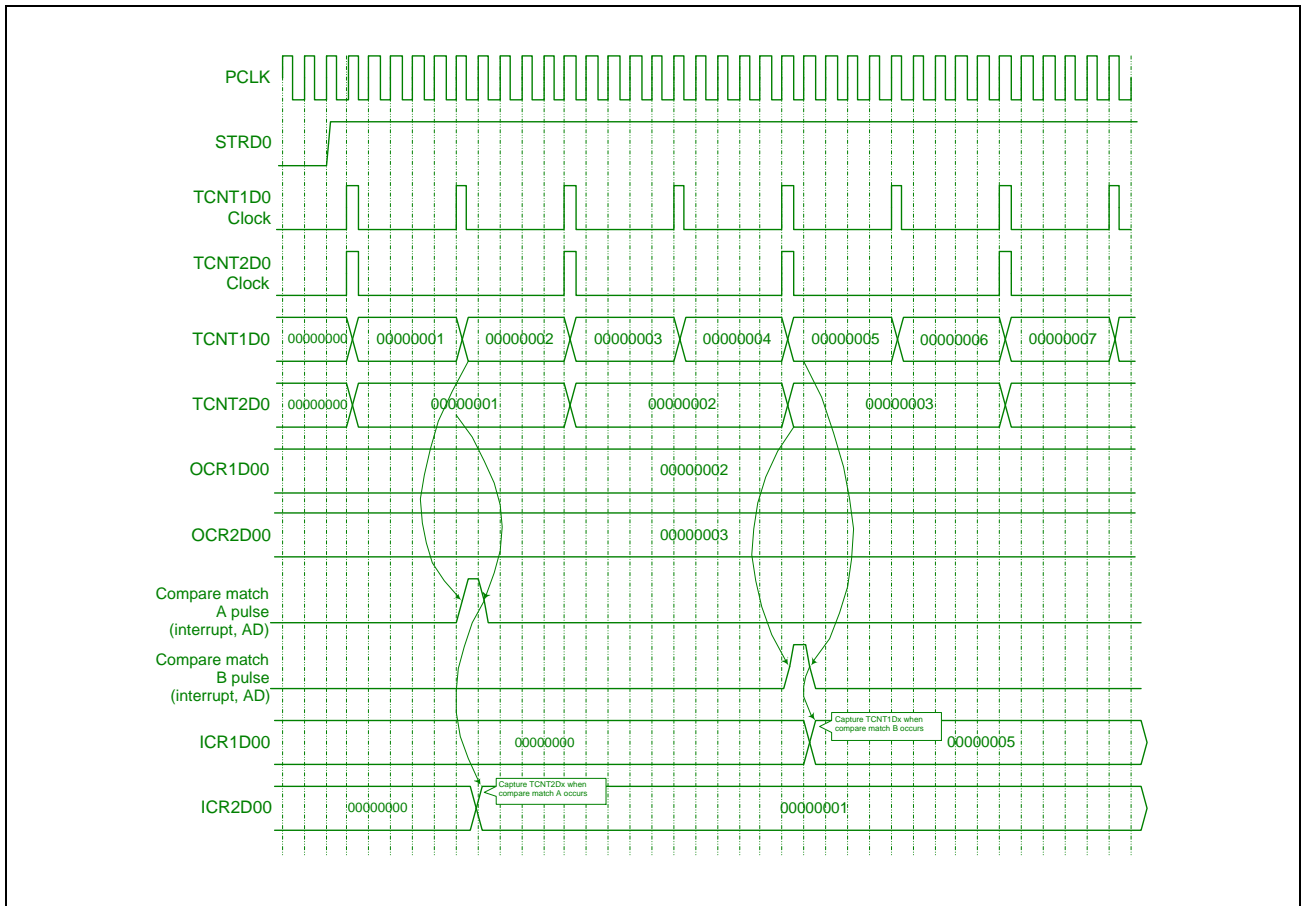

Figure 32.65 Capture Operation

32.8.3.4 MIN Guard Function

The MIN guard unit is connected to each channel of timer D, and it is possible to add MIN guard function to TODxyA (compare match output) or TODxyB (one shot pulse output).

Figure 32.66 shows the basic operation of the MIN guard function.

When the waveform selected from TODxyA, TODxyB changes from OFF to ON, ONMINDxy setting value is loaded to ONMICNTDxy and ON width of the selected waveform is guarded with ONMICNTDxy.

Similarly, when the waveform selected from TODxyA and TODxyB changes from ON to OFF, the setting value of OFMINDxy is loaded into OFMICNTDxy, and the setting value of OTOMINDxy is loaded into OTOMICNTDxy at the timing when it switches from OFF to ON, and the selected waveform Guard the OFF width and ON to ON width.

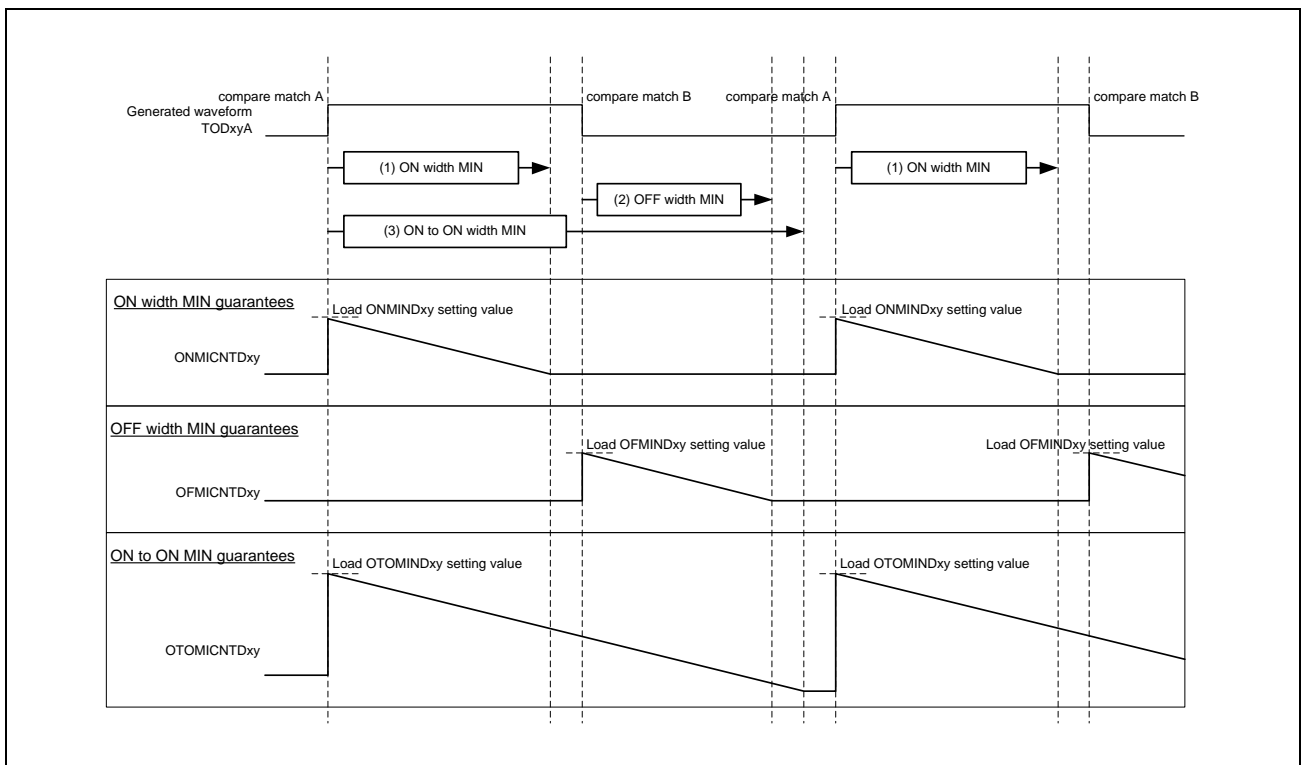

Figure 32.66 Basic Operation of the MIN Guard Function

Figure 32.67 shows the output waveform when MIN guard correction of ON width is performed for TODxyA, TODxyB.

At the timing from OFF to ON, ONMINDxy setting value is loaded into ONMICNTDxy and start down counting.

If the generated waveform (TODxyA or TODxyB) turns OFF before ONMICNTDxy becomes 0, the MIN guard correction is performed and the waveform after MIN guard (TODxyMA or TODxyMB) continues to be ON. After that, OFF waveform is output when ONMICNDxy becomes 0.

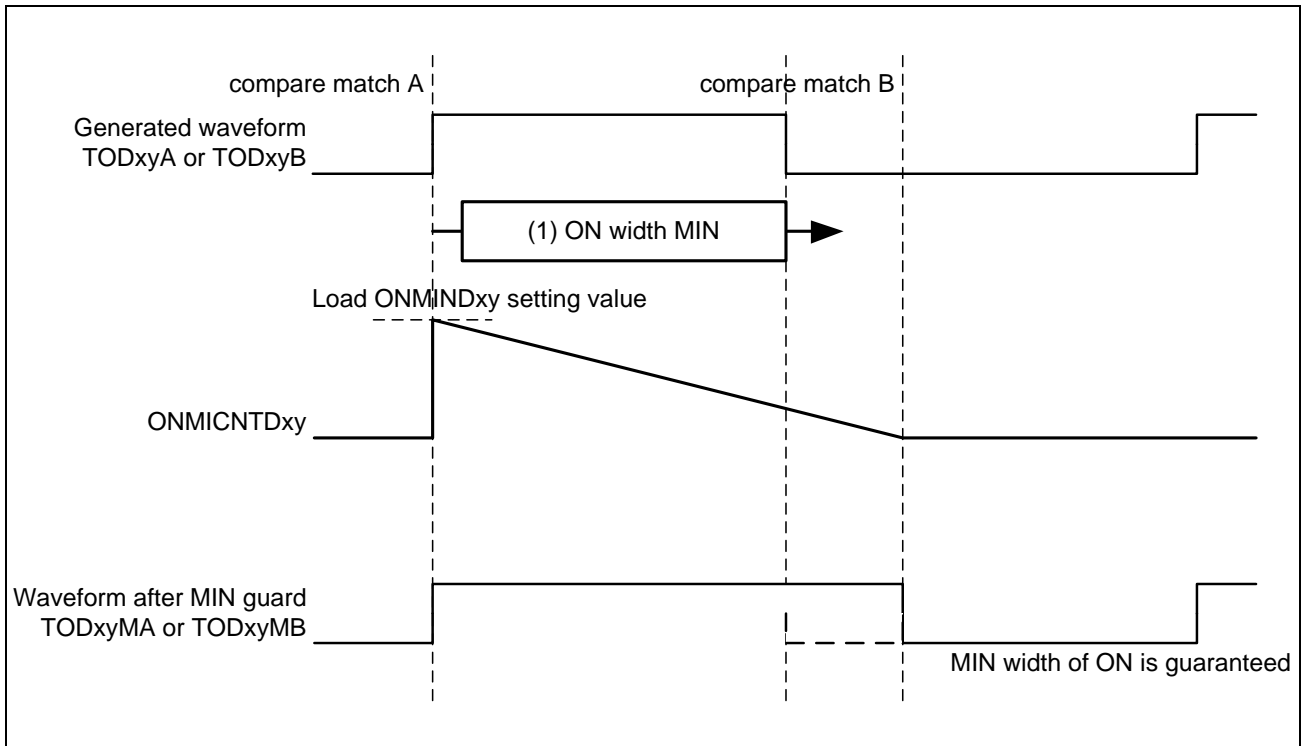

Figure 32.67 MIN Guard Function ON Width MIN Correction Operation Diagram

Figure 32.68 shows the output waveform when MIN guard correction of OFF width is performed for TODxyA. At the timing from ON to OFF, load OFMINDxy setting value into OFMICNTDxy and start down counting.

If the generated waveform (TODxyA) turns ON before OFMICNTDxy becomes 0, the MIN guard correction is performed, and the waveform after the MIN guard (TODxyMA) continues to be OFF.

After that, the ON waveform is output at the timing when OFMICNDxy becomes 0.

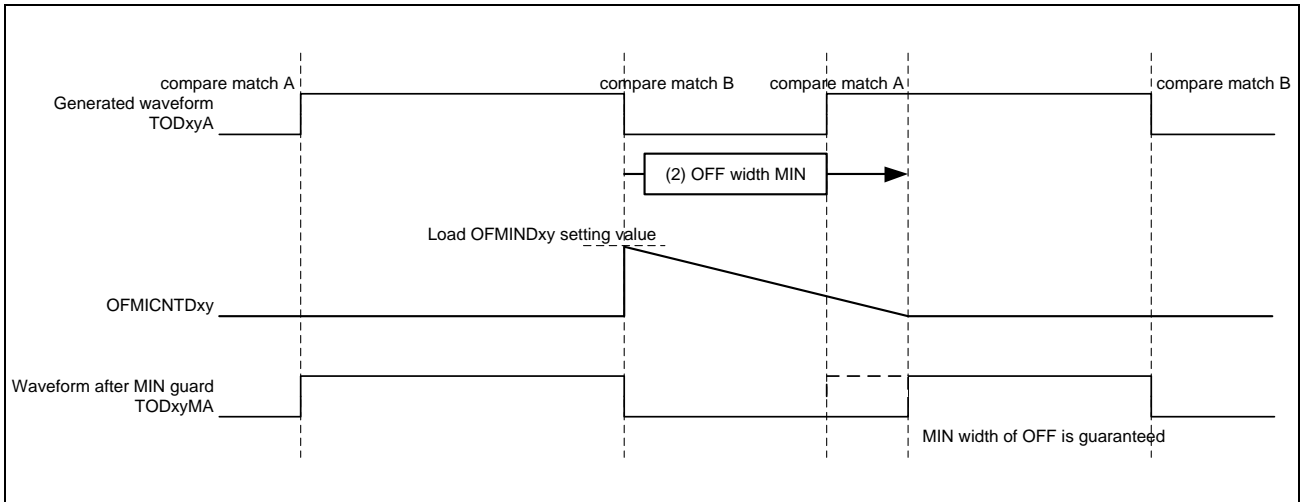

Figure 32.68 MIN Guard Function OFF Width MIN Correction Operation Diagram (TODxyA Correction)

Figure 32.69 shows the output waveform when MIN guard correction of OFF width is performed for TODxyB.

In the correction operation for TODxyB, the downcounter DCNTDxy starts down-counting at the OFF to ON timing of the OFF width MIN correction waveform and guarantees the Max value of the ON width of the output waveform.

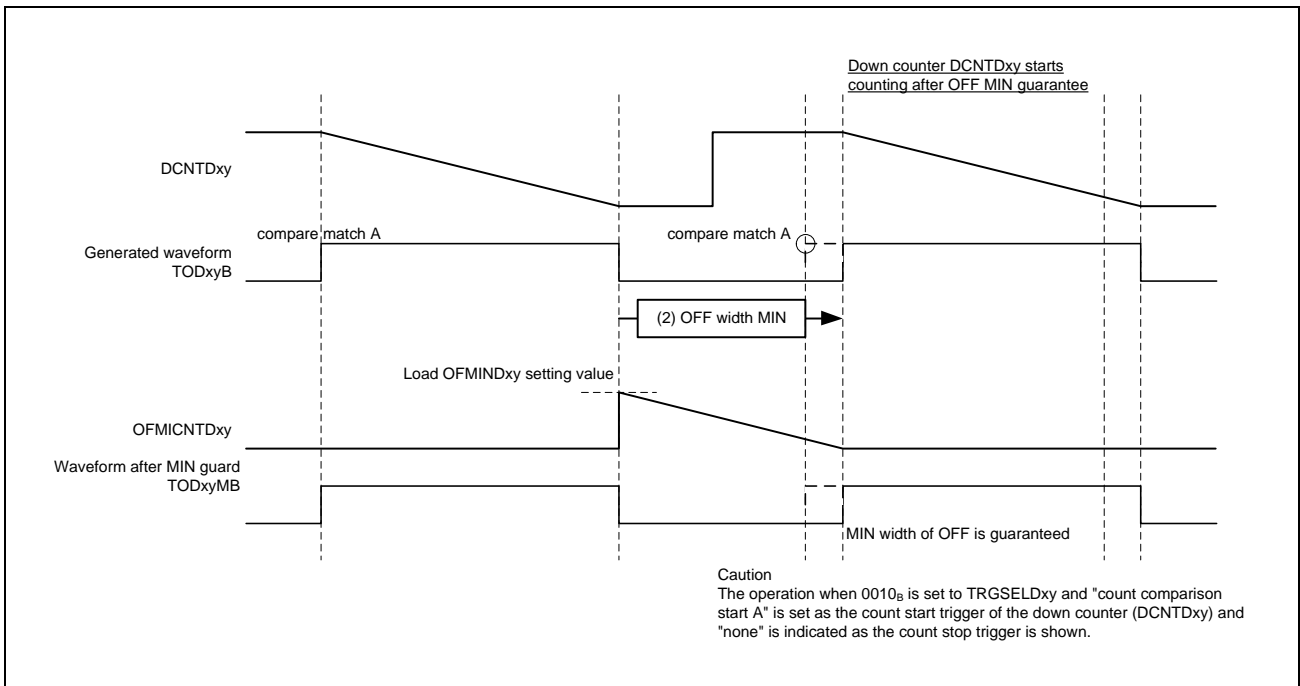

Figure 32.69 MIN Guard Function OFF Width MIN Correction Operation Diagram (TODxyB Correction)

Figure 32.70 shows the output waveform when MIN guard correction with ON to ON width is performed on TODxyA.

At the timing from OFF to ON, load the OTOMINDxy setting value into OTOMICNTDxy and start down counting.

If the generated waveform (TODxyA) turns ON before OTOMICNTDxy becomes 0, the MIN guard correction is performed, and the waveform after MIN guard (TODxyMA) continues to be OFF. After that, the ON waveform is output at the timing when OTOMICNDxy becomes 0.

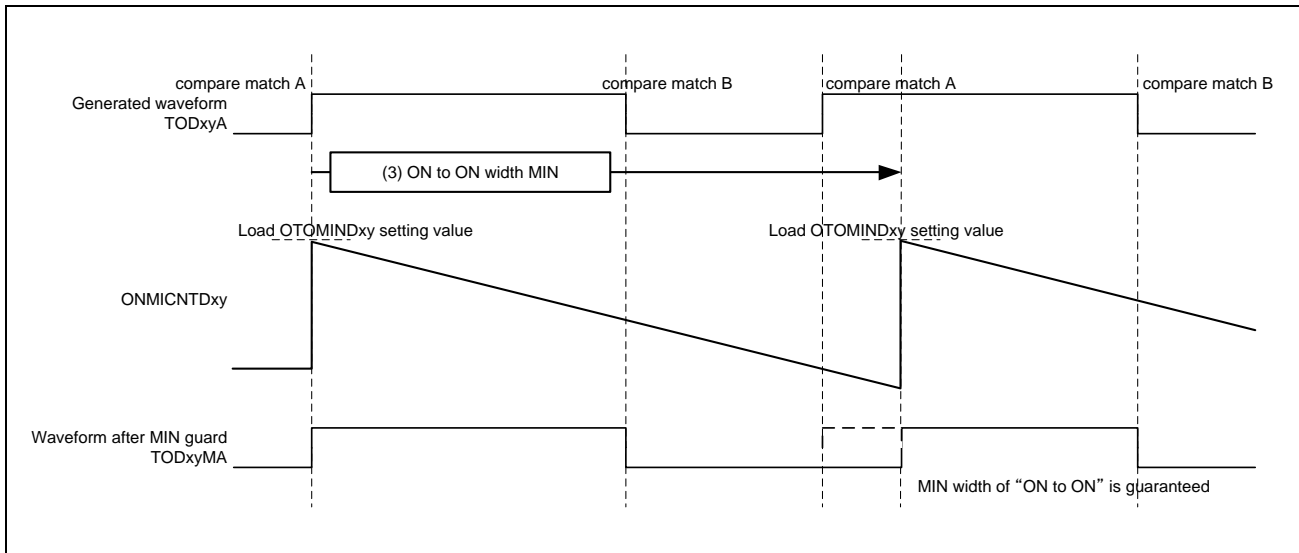

Figure 32.70 MIN Guard Function ON to ON Width MIN Correction Operation Diagram (TODxyA Correction)

Figure 32.71 shows the output waveform when MIN guard correction with ON to ON width is performed on TODxyB.

In the correction operation for TODxyB, the downcounter DCNTDxy starts down-counting at the timing from OFF to ON of the ON to ON width MIN correction waveform and guarantees the Max value of the ON width of the output waveform.

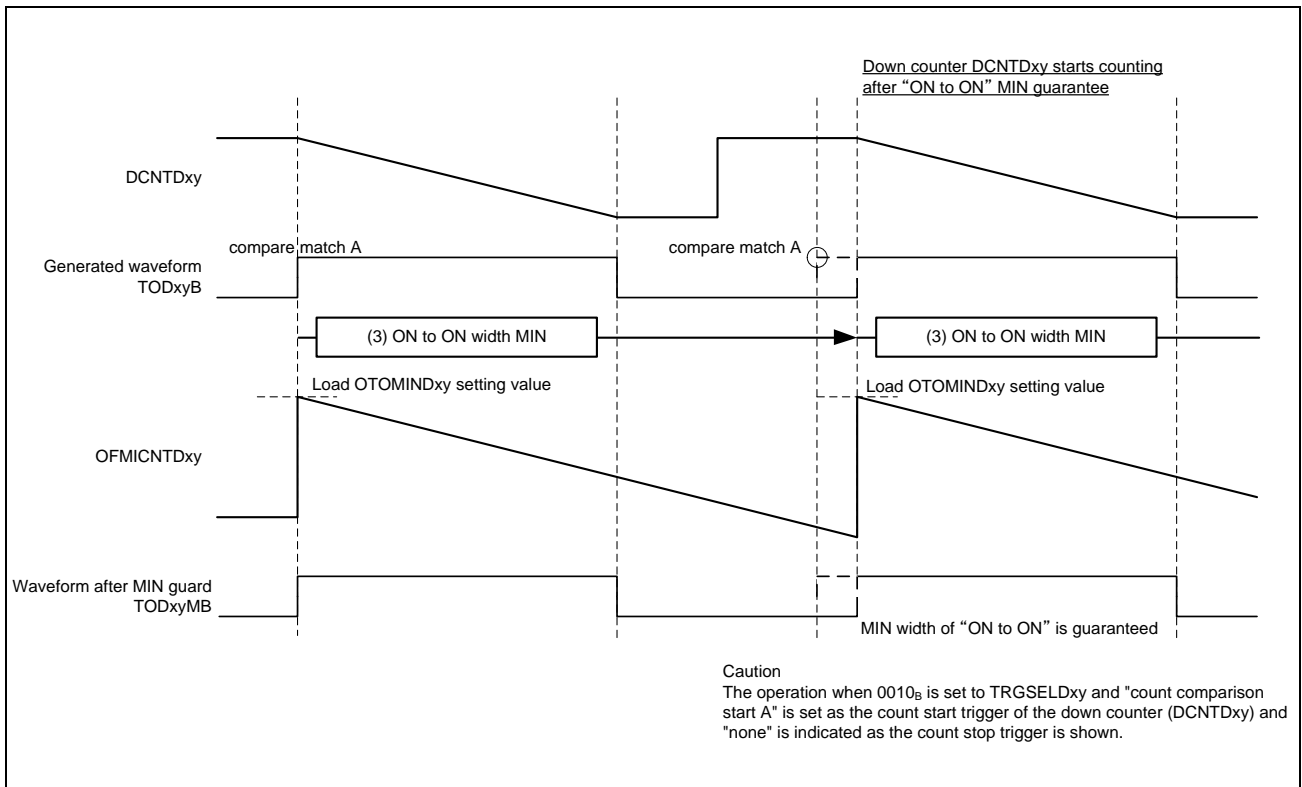

Figure 32.71 MIN Guard Function ON to ON Width MIN Correction Operation Diagram (TODxyB Correction)

Figure 32.72 shows the output waveform when MIN guard correction of ON width and MIN guard correction of OFF width are performed for TODxyA and TODxyB.

Each compensation counter loads the setting value from OFF to ON or ON to OFF timing of the output waveform after MIN guard.

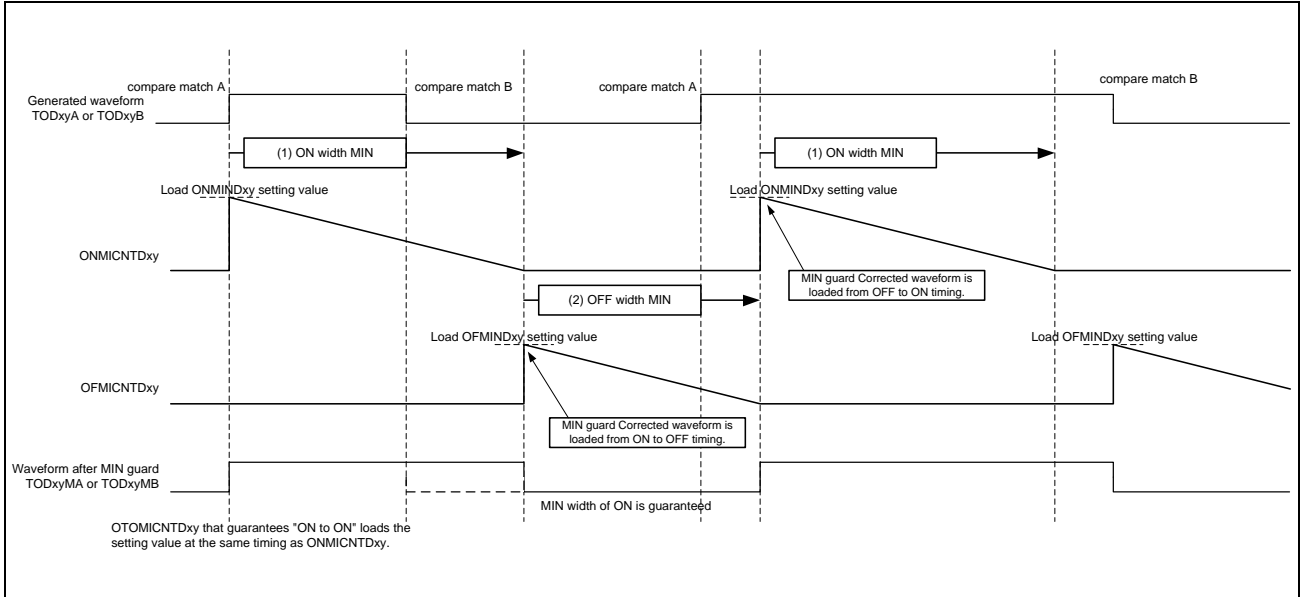

Figure 32.72 MIN Guard Function ON Width, OFF Width MIN Correction Operation Diagram

Figure 32.73 shows the output waveform when MIN guard correction of OFF width and MIN guard correction of ON to ON width are performed for TODxyA.

Both corrections are always valid because MIN guard correction of OFF width and MIN guard correction of ON to ON width individually perform correction.

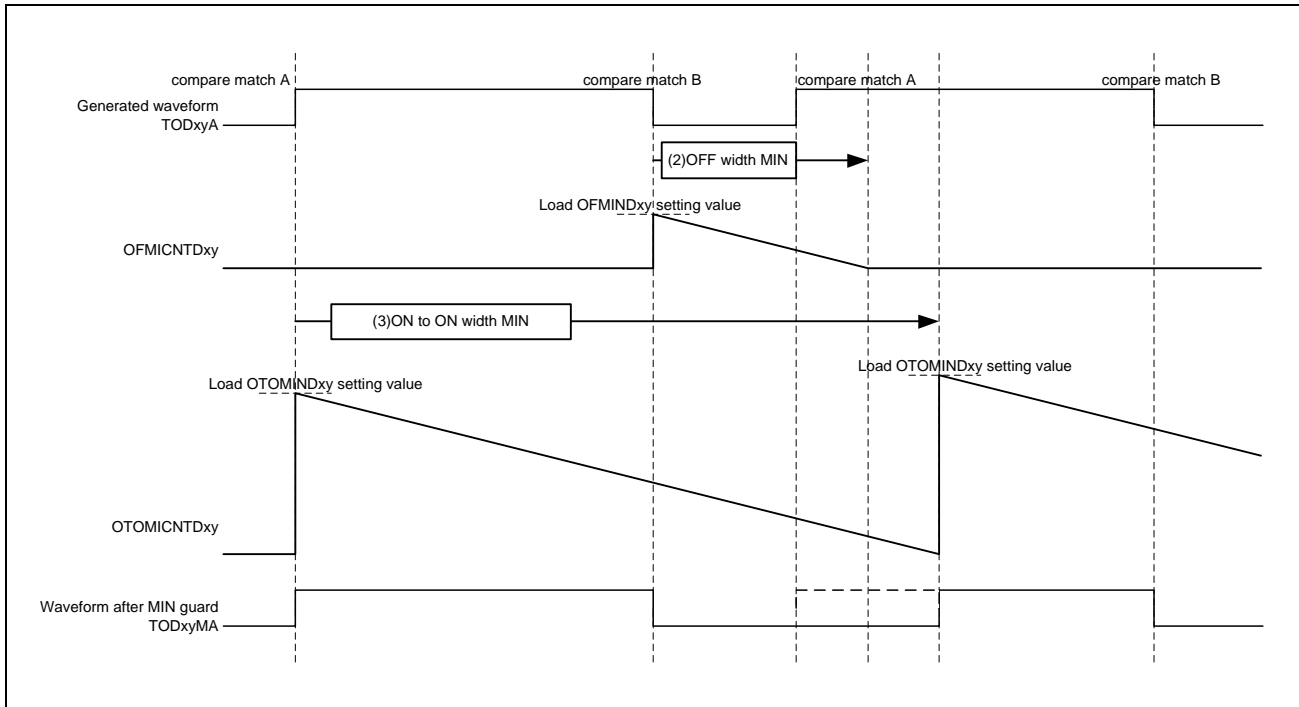

Figure 32.73 MIN guard function OFF width, ON to ON width MIN correction operation diagram

Caution

For the above operation, the MIN guard correction setting OTOMINDxy of the ON to ON width has no substantial meaning unless this set the sum of ON width MIN guard correction ONMINDxy and OFF width MIN guard correction.

Figure 32.74 shows the operation when ONMINDxy is changed during operation.

ONMICNDxy has a down counter configuration, and when setting value is changed during operation, the new setting value is loaded into ONMICNTDxy at the timing when the output waveform after the next MIN guard turns from OFF to ON.

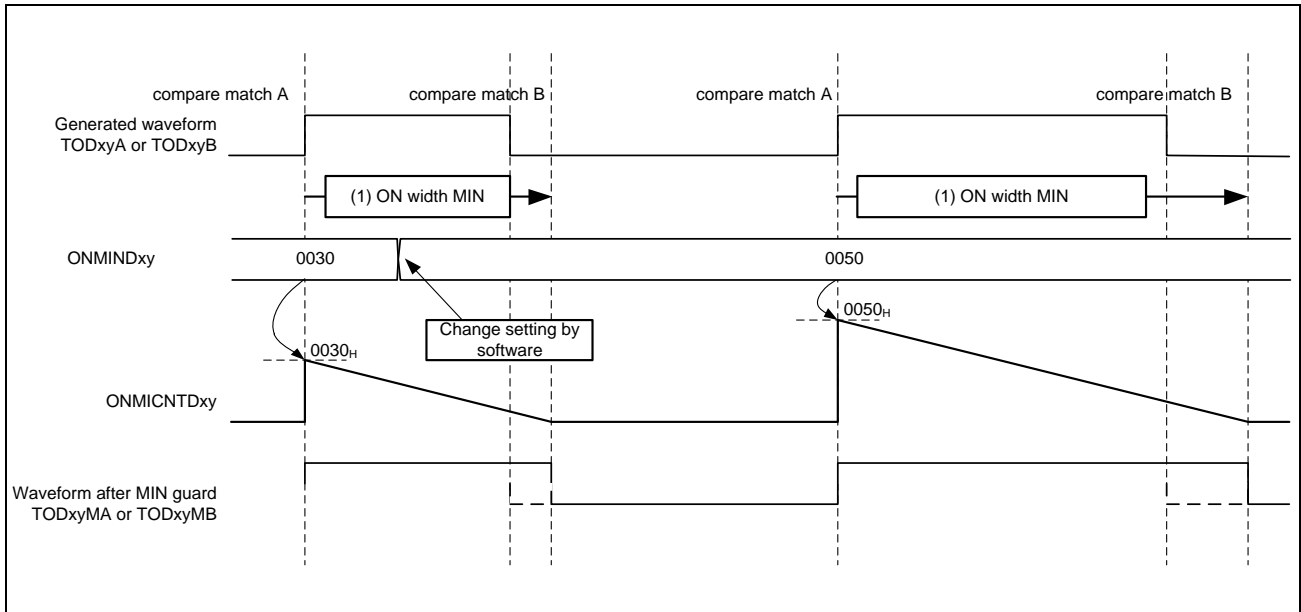

Figure 32.74 Change Setting while MIN Guard Function is Running

Figure 32.75 shows the operation when the generated waveform is turned from OFF to ON again while ON width is being corrected.

The MIN guard function does not hold the number of pulses input during the ON - MIN guard, so even if a waveform is input multiple times during the ON - MIN guard, it will be output as one pulse.

Figure 32.75 MIN Guard Regeneration of Correcting Waveform

Figure 32.76 shows the detailed timing when MIN guard correction is applied to TOD00A.

Interrupts are output from TOD00MA OFF to ON and ON to OFF timing after MIN guard correction, and the values of TCNT1D0 and TCNT2D0 are captured to ONCAP1D00, ONCAP2D00, OFCAP1D00, and OFCAP2D00.

Figure 32.76 Detailed Timing Diagram of MIN Guard Function

32.9 Timer E

32.9.1 Overview of Operation

The timer E block is a PWM output timer that consists of SB_E timer E subblocks.

Timer E subblocks realize the following features:

- Output of waveform with a duty cycle of 0 to 100% by setting cycle-setting register and duty cycle setting register
- The values of the cycle-setting and duty-cycle-setting registers are updated every PWM cycle. The values in the cycle reload register and duty cycle reload register are reloaded as update data. The reloading function can be enabled and disabled.
- Writing 00000000_H to the counter can forcibly end PWM cycle.
- The shutoff input pins (POEx) shut off the PWM output. (They can also be used as the timer F input pins.) This feature is supported by subblocks E0 to E5. Other subblocks does not support this feature.
- On-state duty and off-state duty modes available
- Interrupt requests can be issued on cycle match (compare match between cycle-setting register and timer counter), that is, interrupts are issued every cycle.
- Compare matches of the duty cycle setting register generate interrupt requests periodically.
- Compare matches between TCNTExy and CYLRExy can be generated forcibly by setting the forced compare match trigger register.

A timer E subblock Ex consists of 4 channels. Components of each channel include a 24-bit up counter (TCNTExy), a 24-bit cycle-setting register (CYLRExy), a 24-bit duty-cycle-setting register (DTRExy), a 24-bit cycle reload register (CRLDExy), a 24-bit duty-reload register (DRLDExy), and a controller.

Subblocks E0 to E5 have a shutoff input pin (POEx), and each channel of each subblock has a PWM output pin (TOExy). (The default value of TOExy: 0)

POEx can also be used as TIF0A to TIF2A and TIF0B to TIF2B of timer F. For timer E, signals of TIF0A to TIF2A and TIF0B to TIF2B that have been processed by a noise canceler are used, which means that their noise canceler feature can be used. To use the noise canceler for the shutoff input signal of the PWM output shutoff feature, the timer F noise canceler setting is necessary as well as the timer E setting. For more about the setting, see **Section 32.10, Timer F**.

Table 32.154 shows the correspondence between TIF0A/B to TIF2A/B and POEx.

Table 32.154 Correspondence between Timer F Primary Inputs and Timer E Shutoff Inputs

Timer F Primary Inputs	Timer E Shutoff Inputs
TIF0A	POE0
TIF1A	POE1
TIF2A	POE2
TIF0B	POE3
TIF1B	POE4
TIF2B	POE5

Be noted that the timer F measurement signals become the shutoff input signals when TIF0A/B to TIF2A/B are used as POEx inputs and the corresponding timer F subblocks are operated simultaneously.

Figure 32.77 shows a block diagram of timer E.

Figure 32.77 Block Diagram of Timer E Subblock

32.9.2 Registers Related to Timer E

32.9.2.1 TSTRE — Timer Start Register E

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	STRE9	STRE8	STRE7	STRE6	STRE5	STRE4	STRE3	STRE2	STRE1	STRE0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.155 TSTRE Register Contents

Bit Position	Bit Name	Function
15-SB _E	—	These bits are not used. When read, "0" is always returned. When writing, always write 0.
SB _E -1 to 0	STRE _x	Subblock Ex Start 0: Subblock Ex is disabled 1: Subblock Ex is enabled

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

TSTRE controls subblocks E0 to ESB_E-1.

The timer E counters run when the timer E enable bit (TEE) in the ATU master enable register (ATUENR), timer start register E (TSTRE), and subblock starting register E (SSTRE) must be set.

TSTRE is initialized to 0000_H after reset.

CAUTION

To synchronize timer operation for all channels in the subblock, as well as an SSTRE_x register, use the TSTRE register to enable or disable operation for each subblock.

32.9.2.2 SBRLNE — Subblock Reload Enable Register E

Value after reset: 03FF_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SBRLDEN9	SBRLDEN8	SBRLDEN7	SBRLDEN6	SBRLDEN5	SBRLDEN4	SBRLDEN3	SBRLDEN2	SBRLDEN1	SBRLDEN0
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.156 SBRLNE Register Contents

Bit Position	Bit Name	Function
15-SB _E	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
SB _E -1 to 0	SBRLDEN _{Ex}	Subblock Ex reload enable 0: The reload function for subblock Ex is disabled. 1: The reload function for subblock Ex is enabled.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

The subblock reload enable register E (SBRLNE) is an 8-bit/16-bit readable/writable register enables and disables the reload function. The reload function is enabled when both the SBRLDEN_{Ex} and RLDEN_{Exy} bits are set to “1”, and is disabled in the other settings.

SBRLNE is initialized to 03FF_H after reset.

Subblock Ex Reload Enable Bit (SBRLDEN_{Ex})

When the SBRLDEN_{Ex} and RLDEN_{Exy} bits are set to “1” to enable the reload function, the values of the cycle reload register (CRLDE_{Exy}) and the duty reload register (DRLDE_{Exy}) are transferred to the cycle-setting register and duty cycle setting register, respectively, upon a cycle match between the timer counter (TCNTE_{Exy}) and the cycle-setting register (CYLRE_{Exy}).

32.9.2.3 SSTREx — Subblock Starting Registers Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SSTREx3	SSTREx2	SSTREx1	SSTREx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.157 SSTREx Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, "0" is always returned. When writing, always write 0.
3	SSTREx3	Counter Ex3 start 0: Counter of channel 3 in subblock Ex is disabled 1: Counter of channel 3 in subblock Ex is enabled
2	SSTREx2	Counter Ex2 start 0: Counter of channel 2 in subblock Ex is disabled 1: Counter of channel 2 in subblock Ex is enabled
1	SSTREx1	Counter Ex1 start 0: Counter of channel 1 in subblock Ex is disabled 1: Counter of channel 1 in subblock Ex is enabled
0	SSTREx0	Counter Ex0 start 0: Counter of channel 0 in subblock Ex is disabled 1: Counter of channel 0 in subblock Ex is enabled

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

The subblock starting registers Ex (SSTREx) are 8-bit readable/writable registers. These registers control stop/start of timer counters of 4 channels of each subblock. This control is effective only for subblocks enabled by the timer start register (TSTRE).

SSTREx are initialized to 00_H after reset.

Counter Exy Start Bit (SSTRExy)

Enables and disables timer counter Exy (TCNTExy).

SSTRExy	Function
0	Counting of TCNTExy is disabled. (Default)
1	Counting of TCNTExy is enabled.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

When this bit is cleared to 0, TCNTExy is disabled. TCNTExy retains the previous value while it is stopped. When this bit is set to 1 again, TCNTExy is resumed from the retained value.

Even if the counter Exy start bit is set to 1, counting does not start unless the enable bit of timer E is set to 1 by the ATU master enable register (ATUENR).

CAUTION

The prescalers run independently of the setting of the SSTRExy bit and are not initialized when TCNTExy starts counting. Therefore, during the time between the activation and the start of actual count operation by the above counter, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

32.9.2.4 PSCREx — Prescaler Registers Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PSCE _x [2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.158 PSCREx Register Contents

Bit Position	Bit Name	Function
7 to 3	—	These bits are not used. Fix these bits to 0.
2 to 0	PSCE _x [2:0]	Division ratio These bits set the division ratio of the prescaler.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Prescaler registers Ex are 8-bit readable/writable registers.

Each subblock of timer E has one prescaler Ex that divides the frequency of the clock supplied via the clock bus. The register sets the division ratio of the prescaler Ex.

When the value in prescaler register Ex (PSCRE) is changed, the prescaler Ex updates the value on its underflow. Timer counter Exy (TCNTE_{xy}) (y = 0 to 3) in the same subblock is driven by the clock output from prescaler Ex.

The settable value in prescaler register Ex (PSCRE) ranges from 0_H to 7_H. The division ratio is given below.

$$\text{Division ratio of prescaler} = \frac{1}{\text{PSCE}_{x[2:0]} + 1} \quad (\text{setting range: } 1/1 \text{ to } 1/8)$$

A duty cycle of 50% for the prescaler Ex output clock is not guaranteed. The high level width is equal to the cycle of the PCLK and a low level is output in the remaining cycle of the prescaler E output clock.

Prescaler Ex runs when the TEE bit in the ATU master enable register (ATUENR) and the subblock Ex start bit (STRE_x) in timer start register E (TSTRE) are both set to 1.

32.9.2.5 PSCCRExy — Prescaler Channel Registers Exy

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PSCCExy[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3

Table 32.159 PSCCRExy Register Contents

Bit Position	Bit Name	Function
7 to 0	PSCCExy[7:0]	Division Ratio These bits set the division ratio of the prescaler.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Prescaler channel registers Exy are 8-bit readable/writable registers.

Each channel of timer E has one prescaler Exy that divides the frequency of the clock supplied via the clock bus. The register sets the division ratio of the prescaler Exy.

When the value in prescaler channel register Exy is changed, the prescaler Exy updates the value on its underflow. Timer counter E (TCNTExy) (y = 0 to 3) in the same channel is driven by the clock output from prescaler Exy.

The settable value in prescaler channel register Exy ranges from 00_H to FF_H. The division ratio is given below.

$$\text{Division ratio of prescaler} = \frac{1}{\text{PSCCExy}[7:0] + 1} \quad (\text{setting range: } 1/1 \text{ to } 1/256)$$

A duty cycle of 50% for the prescaler Exy output clock is not guaranteed. The high level width is equal to the cycle of the PCLK and a low level is output in the remaining cycle of the prescaler E output clock.

Prescaler Exy runs when the TEE bit in the ATU master enable register (ATUENR) and the subblock Ex start bit (STREx) in timer start register E (TSTRE) are both set to 1. The setting of the counter Exy start bit (SSTRExy) in the subblock start register Ex (SSTREx) does not affect operation of the prescaler Exy.

32.9.2.6 TCREx — Timer Control Register Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PSCSEL	—	—	—	—	CKSELEx[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.160 TCREx Register Contents

Bit Position	Bit Name	Function
7	PSCSEL	Prescaler select 0: Select the prescaler registers Ex (PSCREx: 3-bit settings for subblock units). 1: Selects the prescaler channel registers Exy (PSCCRExy: 8 bit settings for channel units).
6 to 3	—	These bits are not used. When read, "0" is always returned. When writing, always write 0.
2 to 0	CKSELEx[2:0]	TCNTExy clock select These bits select the counter clock of prescaler E from clock-bus lines 0 to 5.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Timer control registers Ex (TCREx) are 8-bit readable/writable registers that select the counter clock of prescaler E from clock-bus lines 0 to 5. 24-bit up counter (TCNTExy) is driven by the clock output from prescaler E.

Prescaler Select (PSCSEL)

The prescaler can be selected in subblock units or in channel units. This selection makes a difference in the range of division ratios that can be selected for the prescaler.

Subblock Ex Clock Select (CKSELEx[2:0])

The subblock Ex clock select (CKSELEx) selects the count source of the prescaler of subblock Ex.

CKSELEx			Function
[2]	[1]	[0]	
0	0	0	Clock-bus line 0 is selected as counter clock of prescaler E (Default)
0	0	1	Clock-bus line 1 is selected as counter clock of prescaler E
0	1	0	Clock-bus line 2 is selected as counter clock of prescaler E
0	1	1	Clock-bus line 3 is selected as counter clock of prescaler E
1	0	0	Clock-bus line 4 is selected as counter clock of prescaler E
1	0	1	Clock-bus line 5 is selected as counter clock of prescaler E
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

32.9.2.7 RLDCREx — Reload Control Registers Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	RLDENEx3	RLDENEx2	RLDENEx1	RLDENEx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.161 RLDCREx Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3 to 0	RLDENEx3 to RLDENEx0	Reload enable Ex3 to Ex0 0: Reload function on cycle match is disabled. 1: Reload function on cycle match is enabled.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Reload control registers Ex (RLDCREx) are 8-bit readable/writable registers. RLDENExy enables and disables the reload function. The reload function is enabled when both the SBRLDENEx and RLDENExy bits are set to “1”, and is disabled in the other settings.

RLDCREx is initialized to 00_H after reset.

Reload Enable Bit (RLDENExy)

When the SBRLDENEx and RLDENExy bits are set to “1” to enable the reload function, the values of the cycle reload register Exy(CRLDExy) and the duty reload register Exy(DRLDExy) are transferred to the cycle-setting register and duty cycle setting register, respectively, upon a cycle match between the timer counter Exy(TCNTExy) and the cycle-setting register Exy(CYLRExy).

32.9.2.8 POECREx — Output Shutoff Control Register Ex

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POECRKEY[7:0]							—	—	—	POE POLx	POE ENx3	POE ENx2	POE ENx1	POE ENx0	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	R	R	R	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1 (MAX:5): Corresponding to subblocks E0 to ESB_E-1

Note 1. Values written to the write key code are not retained.

Table 32.162 POECREx Register Contents

Bit Position	Bit Name	Function
15 to 8	POECRKEY[7:0] Write key code	9C _H : Values of POEEN _{xy} and POEPOL _x can be changed. Other than 9C _H : Values of POEEN _{xy} and POEPOL _x cannot be changed.
7 to 5	—	These bits are not used. When read, "0" is always returned. When writing, always write 0.
4	POEPOL _x	Shutoff input active level selection 0: Shutoff input is active low. 1: Shutoff input is active high.
3	POEEN _{x3}	Output shutoff enable/disable
2	POEEN _{x2}	0: Output shutoff is disabled.
1	POEEN _{x1}	1: Output shutoff is enabled.
0	POEEN _{x0}	

Note: x = 0 to SB_E-1 (MAX:5): Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Output shutoff control register Ex (POECRE_x) is a 16-bit readable/writable register. To write a value to this register, the data to be written must be provided and the write key code must be set in bits 15 to 8. This feature is not supported for subblocks 6 to 8 because there is no POE₆ to POE₈ inputs.

POECRE_x is initialized to 0000_H after reset.

Write Key Code (POECRKEY)

This code controls the write permission for bits POEEN_{xy} (y = 0 to 3) and POEPOL_x. Setting is required to bits 15 to 8 as well as the data to be written to bits POEEN_{xy} (y = 0 to 3) and POEPOL_x. Data written to these bits is not retained; Value 00_H is always returned when being read.

Shutoff Input Active Level Selection (POEPOL_x)

Controls the active level of the shutoff input (POE_x). The setting of this bit applies to all channels of the subblock.

Output Shutoff Enable/Disable (POEEN_{xy})

Controls disable/enable of the output shutoff feature. This bit can be set for each channel.

For details of the output shutoff feature, see **Figure 32.81** in **Section 32.9.3, Details of Operation**.

32.9.2.9 SOLVLE_x — Output Shutoff Level Setting Register Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWMSLV _{x3}	PWMSLV _{x2}	PWMSLV _{x1}	PWMSLV _{x0}
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1 (MAX:5): Corresponding to subblocks E0 to ESB_E-1

Table 32.163 SOLVLE_x Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, "0" is always returned. When writing, always write 0.
3	PWMSLV _{x3}	Output level H/L selection
2	PWMSLV _{x2}	0: The low level is output to TOE _x y when output is shutoff.
1	PWMSLV _{x1}	1: The high level is output to TOE _x y when output is shutoff.
0	PWMSLV _{x0}	

Note: x = 0 to SB_E-1 (MAX:5): Corresponding to subblocks E0 to ESB_E-1

The output shutoff level setting register Ex (SOLVLE_x) is an 8-bit readable/writable register.

SOLVLE_x is initialized to 00_H after reset.

Output Level H/L Selection (PWMSLV_{xy})

This bit specifies the output level of TOE_xy in the output shutoff state.

32.9.2.10 TSREx — Timer Status Registers Ex

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DMFEx ₃	DMFEx ₂	DMFEx ₁	DMFEx ₀	OVFEx ₃	OVFEx ₂	OVFEx ₁	OVFEx ₀	CMFEx ₃	CMFEx ₂	CMFEx ₁	CMFEx ₀
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.164 TSREx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
11 to 8	DMFEx ₃ to DMFEx ₀	Duty match flags Ex ₃ to Ex ₀ 0: No duty match has occurred. 1: A Duty match has occurred.
7 to 4	OVFEx ₃ to OVFEx ₀	Overflow flags Ex ₃ to Ex ₀ 0: Counter E has not overflowed 1: Counter E has overflowed
3 to 0	CMFEx ₃ to CMFEx ₀	Cycle match flags Ex ₃ to Ex ₀ 0: Cycle match has not occurred 1: Cycle match has occurred

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

The timer status register Ex (TSREx) is an 8-bit or a 16-bit read-only register. In subblocks E0 to E8, these registers indicate occurrence of compare match (cycle match) of cycle-setting registers (CYLRE_{xy}) and timer counters (TCNTE_{xy}), compare match (duty match) of duty cycle setting registers (DTRE_{xy}) and timer counters (TCNTE_{xy}), and overflow of TCNTE_{xy}.

The overflow flag is the status flag for indicating the occurrence of overflow. It does not generate interrupts. The cycle match flag and the duty match flag are status flags for requesting interrupts. Interrupts can be issued by setting the corresponding bits of the TIEREx register. When interrupt is permitted at the TIEREx register, setting the corresponding flags issues interrupt requests. Setting a bit of the timer status clear register Ex (TSCREx) clears the corresponding flag. When set and clear competed, clear is given priority to. Also, by setting the corresponding bit of the TIEREx register, it is possible to generate a sDMA / DTS transfer request. If a duty match (or cycle match) occurs again while the duty match flag DMFEx_{xy} (or the cycle match flag CMFEx_{xy}) is set, a transfer request to sDMA / DTS can not be generated. To generate a transfer request to sDMA / DTS, it is necessary to clear the flag by “CPU interrupt processing” or “sDMA / DTS chain transfer”.

TSREx is initialized to 0000_H after reset.

Duty Match Flag Ex_{xy} (DMFEx_{xy})

DMFEx _{xy}	Function
0	[Clearing condition] When 1 is written to the DMFCE _{xy} bit of the timer status clear register Ex (TSCREx). (Default)
1	[Setting condition] When the counter clock is input in the condition where the timer counter Ex _{xy} (TCNTE _{xy}) value coincides with the duty cycle setting register Ex _{xy} (DTRE _{xy}) value.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

This flag cannot be set to 1 or 0 by software. The next duty match can be processed even if DMFExy is 1 (even if the flag is not cleared). In this case, 1 is rewritten to these bits. However, an interrupt request or sDMA / DTS transfer request can be realized only when DMFExy is 0 (only when the flag is cleared).

Cycle Match Flag Exy (CMFExy)

CMFExyl	Function	
0	[Clearing conditions] When 1 is written to the CMFCExy bit of the timer status clear register Ex (TSCREx).	(Default)
1	[Setting condition 1] When timer counter Exy (TCNTExy) is incremented while it is the same value as cycle-setting register Exy (CYLRExy) [Setting condition 2] When a compulsion cycle match (1 write to FCMTxy) occurred.	

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

These bits cannot be set to 1 or 0 by software. Even if these bits are 1, meaning that the flag has not been cleared, the next cycle match can be input. In this case, 1 is rewritten to these bits. However, an interrupt request or sDMA / DTS transfer request can be realized only when CMFExy is 0 (only when the flag is cleared).

Overflow Flag Exy (OVFExy)

OVFExy	Function	
0	[Clearing conditions] When 1 is written to the OVFCExy bit of the timer status clear register Ex (TSCREx).	(Default)
1	[Setting condition] When the 24 higher-order bits of timer counter Exy (TCNTExy) value changes from FFFF FF _H to 0000 00 _H .	

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

These bits are set to 1 when timer counter Exy (TCNTExy) overflows. This flag cannot be set to 1 or 0 by software.

Overflow occurs when the 24 higher-order bits of timer counter Exy is incremented while it is FFFF FF_H. Writing 0000 00_H to the timer counter Exy has no effect on these bits.

When writing a value to the timer counter and incrementation occur simultaneously while the counter is FFFF FF_H, the overflow flag is set to 1 but the counter value is changed to the written value instead of 0000 00_H.

As to cycle match, since the counter is cleared to 0000 01_H, overflow will not occur. However, it may occur when the value in the cycle-setting register is changed during counter in operation.

When overflow and cycle match occur simultaneously, overflow is not detected (the counter is incremented while it is FFFF FF_H and CYLREx is FFFF FF_H). In this case, only the processing upon detection of cycle match is performed. If counter value is 0000 01_H and the reload function is enabled, cycle reload or duty-cycle reload is performed. When overflow and duty match occur simultaneously, the same operation is performed because a cycle match occurs with duty cycle of 100%.

32.9.2.11 TSCREx — Timer Status Clear Registers Ex

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W	W	W	W	W	W	W	W	W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.165 TSCREx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. When read, “0” is always returned. When writing, always write “0”.
11 to 8	DMFCE _{xy}	Duty match flag clear enable Ex _y 0: Disabled (Default) 1: Clears DMFCE _{xy} of timer status register Ex (TSREx) to 0.
7 to 3	OVFCE _{xy}	Overflow flag clear enable Ex _y 0: Disabled (Default) 1: Clears OVFCE _{xy} of timer status register Ex (TSREx) to 0.
3 to 0	CMFCE _{xy}	Cycle match flag clear enable Ex _y 0: Disabled (Default) 1: Clears CMFCE _{xy} of timer status register Ex (TSREx) to 0.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

The timer status clear registers Ex (TSCREx) are 8-bit or a 16-bit readable/writable registers. When read, “0” is always returned. TSCREx specifies flag clearing in the events of overflow of timer counters Ex_y (TCNTE_{xy}), cycle match of TCNTE_{xy} and cycle-setting registers Ex_y (CYLRE_{xy}), and duty match of TCNTE_{xy} and duty cycle setting registers Ex_y (DTRE_{xy}).

TSCREx is readable/writable in 16-bit units. When read, “0” is always returned.

TSCREx is initialized to 0000_H after reset.

Duty Match Flag Clear Enable Ex_y (DMFCE_{xy})

This flag specifies flag clearing at the time of duty match of TCNTE_{xy} and the duty cycle setting register Ex_y (DTRE_{xy}).

Setting this bit enables clearing of the duty match flag Ex_y (DMFCE_{xy}) of the timer status register Ex (TSREx). When this bit is read, “0” is always returned.

DMFCE _{xy}	Function
0	Disabled (Default)
1	Clears DMFCE _{xy} of timer status register Ex (TSREx) to 0.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Overflow Flag Clear Enable Exy (OVFCExy)

This bit specifies flag clearing at the time of overflow of the timer counter Ex (TCNTExy).

Setting this bit enables clearing of the overflow flag Exy (OVFExy) of the timer status register Ex (TSREx). When this bit is read, “0” is always returned.

OVFCExy	Function	
0	Disabled	(Default)
1	Clears OVFExy of timer status register E (TSREx) to 0.	

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Cycle Match Flag Clear Enable Exy (CMFCExy)

This flag specifies flag clearing at the time of cycle match of TCNTExy and the cycle-setting register Exy (CYLRExy).

Setting this bit enables clearing of the cycle match flag Exy (CMFExy) of the timer status register Ex (TSREx). When this bit is read, “0” is always returned.

CMFCExy	Function	
0	Disabled	(Default)
1	Clears CMFExy of timer status register Ex (TSREx) to 0.	

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

32.9.2.12 TIEREx — Timer Interrupt Enable Registers Ex

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DMEEEx ₃	DMEEEx ₂	DMEEEx ₁	DMEEEx ₀	—	—	—	—	CMEEEx ₃	CMEEEx ₂	CMEEEx ₁	CMEEEx ₀
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.166 TIEREx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
11 to 8	DMEEEx ₃ to DMEEEx ₀	Duty match interrupt enable Ex ₃ to Ex ₀ Specifies enable/disable of interrupt requests issued by duty match flags DMFEx _y .
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3 to 0	CMEEEx ₃ to CMEEEx ₀	Cycle match interrupt enable Ex ₃ to Ex ₀ Specifies enable/disable of interrupt requests issued by cycle match flags CMFEx _y .

The timer interrupt enable registers Ex (TIEREx) are 8-bit or a 16-bit readable/writable registers. TIEREx controls enable/disable of interrupts triggered by compare match (cycle match) of the cycle-setting register (CYLREx_y) and TCNTEx_y and compare match (duty match) of the duty cycle setting register (DTREx_y) and TCNTEx_y.

TIEREx is initialized to 0000_H after reset.

Duty Match Interrupt Enable Ex_y (DMEEEx_y)

This flag specifies enable/disable of interrupt requests triggered by duty match of DTREx_y.

Setting this bit enables interrupts issued by the duty match flag Ex (DMFEx_y) of the timer status register (TSREx).

DMEEEx _y	Function
0	Interrupts by DMFEx _y are disabled. (Default)
1	Interrupts by DMFEx _y are enabled.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Cycle Match Interrupt Enable Ex_y (CMEEEx_y)

This flag specifies enable/disable of interrupt requests triggered by cycle matches of CYLREx_y.

A cycle match flag (CMFEx_y) of the timer status register (TSREx) can be output as an interrupt by setting this bit.

CMEEEx _y	Function
0	Interrupts by CMFEx _y are disabled. (Default)
1	Interrupts by CMFEx _y are enabled.

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

CAUTION

Interrupt requests by cycle match Ex (CMFExy) and duty match Exy (DMFExy) of timer subblock Ex are issued as the logical sum of CMFExy and DMFExy. Whether the interrupt request is triggered by a cycle match or a duty match of the counter can be determined by referencing TSREx. Clear the corresponding interrupt request flag of TSREx when processing the interrupt.

32.9.2.13 TOCREx — Timer Output Control Registers Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TONEEx3	TONEEx2	TONEEx1	TONEEx0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1

Table 32.167 TOCREx Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3 to 0	TONEExy	TOExy output inversion select Inversion setting of the TOExy output signal (on-state duty/off-state duty selection)

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Timer output control registers Ex (TOCREx) are 8-bit readable/writable registers that select whether or not a signal on the output pin TOExy in each subblock Ex is inverted.

TOCREx is initialized to 00_H after reset.

TOExy Output Inversion Select (TONEExy)

These bits select whether to invert the PWM output signal from TOExy.

TONEExy	Function
0	Normal output from the output pin (TOExy) (Default)
1	Inverted output from the output pin (TOExy)

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

When the on-state duty/off-state duty setting of TOCREEx is changed, the TOExy output is inverted immediately after the change of the register setting by the next clock cycle (PCLK). The operating state of the timer counter (TCNTExy) has no effect on the mode switching.

The initial level on the PWM output pin is “0” (TONEExy = 0).

32.9.2.14 FCTRGE_x — Forced Compare Match Trigger Registers Ex

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FCMT _{x3}	FCMT _{x2}	FCMT _{x1}	FCMT _{x0}
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Note: $x = 0$ to SB_E-1 : Corresponding to subblocks E0 to ESB_E-1

Table 32.168 FCTRGE_x Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3 to 0	FCMT _{xy}	Forced cycle match trigger 0: disable (initial value) 1: Forcibly generate a cycle match between TCNT _{Exy} and CYLRE _{xy} .

Note: $x = 0$ to SB_E-1 : Corresponding to subblocks E0 to ESB_E-1

The forced compare match trigger registers Ex (FCTRGE_x) are 8-bit writable registers. When FCTRGE_x is read, “0” is always returned. FCTRGE_x is used to specify whether to generate a cycle match between TCNT_{Exy} and CYLRE_{xy} of each subblock forcibly.

FCTRGE_x is initialized to 00_H after reset.

CAUTION

This bit can be set to “1” only when the operation of the timer counter Exy (TCNT_{Exy}) is stopped. (When any bit of TEE, STRE_x, or SSTRE_{xy} is 0).

32.9.2.15 TCNTExy — Timer Counters Exy

Value after reset: 0000 0100_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCNTExy															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNTExy								—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	1	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Note 1. These bits are not used. Fix these bits to "0".

Timer counters Exy (TCNTExy) are 32-bit readable/writable registers allocated in channel y of subblock Ex. These registers are started by setting the TEE bit in the ATU master enable register (ATUENR), the subblock Ex start bit (STREx) in the timer start register (TSTRE), and the counter Exy start bit (SSTRExy) in subblock starting register (SSTREx). When the 8 lower-order bits are read, 0 is always read.

The counter clock is selected by the TCNTEx clock select bits (CKSELEx[2:0]) in timer control register Ex (TCREx), prescaler register (PSCREx) and prescaler channel registers Exy (PSCCRExy) of timer E.

When a cycle match with the cycle register Exy (CYLRExy) occurs, or when a cycle match between TCNTExy and CYLRExy is forced generated by setting the forced compare match trigger register Ex (FCTRGEx), The 24 higher-order bits of TCNTExy is initialized to 0000 01_H. For example, when the 24 higher-order bit value of the cycle-setting register is N and the counter value is to be incremented from N to N + 1, the counter value is changed to 1. This enables counting from 1 to N and PWM pulses with the cycle time of N is produced.

These counters can count from 0000 01_H to FFFF FF_H (when the 24 higher-order bit value of the cycle-setting register is FFFF FF_H).

When writing 0000 00_H to these counters, a PWM cycle is terminated and a new PWM cycle is started from 0000 01_H in the next clock cycle. While the counter value holds 0000 00_H, when TONEExy = 0, the PWM output retains the previous value and outputs a level of 1 at the beginning of the new cycle. When the PWM cycle is terminated before duty match, the duty cycle for that PWM cycle is 100% (1 is always output), that is, a level of 0 will not be output between PWM cycles. For details on writing 0000 00_H to these counters, see **Figure 32.79** and **Figure 32.80**.

When TCNTExy or CYLRExy is rewritten during the counter in operation, a cycle match may not occur even if the value of the counter reaches FFFF FF_H. In this case, the counter value is changed from FFFF FF_H to 0000 00_H in the next counter clock cycle. A PWM cycle is terminated in a way similar to writing 0000 00_H. The counter value is incremented to 0000 01_H and a new PWM cycle is started. When the reload function is enabled, reloading of the cycle or duty cycle is also performed.

TCNTExy is initialized to 0000 0100_H after reset.

32.9.2.16 CYLRE_{xy} — Cycle-Setting Registers Exy

Value after reset: FFFF FF00_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CYLRE _{xy}															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CYLRE _{xy}								—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	1	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Note 1. These bits are not used. Fix these bits to "0".

CYLRE_{xy} are 32-bit readable/writable registers that store the cycle of PWM. The settable 24 higher-order bit value of the ranges from 0000 01_H to FFFF FF_H. When the 8 lower-order bits are read, 0 is always read.

The value in CYLRE_{xy} is constantly compared with the value in the timer counter Exy (TCNTE_{xy}). When they match, TCNTE_{xy} is cleared to 0000 01_H. A compare match between CYLRE_{xy} and TCNTE_{xy} can be generated forcibly by setting the FCTRGE_x register. When the SBRLDEN_x bit in the subblock reload enable register E (SBRLENE) and the RLDEN_{Exy} bit in the reload control register Ex (RLDCRE_x) are set to 1, the values in the cycle reload register Exy (CRLDE_{xy}) and duty reload register Exy (DRLDE_{xy}) are transferred to cycle-setting register Exy (CYLRE_{xy}) and duty cycle setting register Exy (DTRE_{xy}), respectively. Writing 0000 00_H to the 24 higher-order bits of TCNTE_{xy} can forcibly end PWM cycle and start the same reloading as above at the next clock cycle. Interrupt request to CPU can be made by a compare match (cycle match) of the cycle-setting register.

To rewrite to CYLRE_{xy} during TCNTE_{xy} in operation, note that the value to be set may lead to malfunction. When TCNTE_{xy} in operation is rewritten, a cycle match between TCNTE_{xy} and DTRE_{xy} may not be detected and TCNTE_{xy} continues to be incremented even if the counter value exceeds the value in CYLRE_{xy}. In this case, unwanted PWM waveforms are output.

CYLRE_{xy} is initialized to FFFF FF00_H after reset.

32.9.2.17 DTRExy — Duty Cycle Setting Registers Exy

Value after reset: FFFF FF00_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DTRExy															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DTRExy								—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	1	0*1	0*1	0*1	0*1	0*1	0*1	0*1	0*1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Note 1. These bits are not used. Fix these bits to "0".

DTRExy are 32-bit readable/writable registers that store the duty cycle of PWM. The settable 24 higher-order bit value of ranges from 0000 00_H to FFFF FF_H. When the 8 lower-order bits are read, 0 is always read.

The value in DTRExy is constantly compared with the value in timer counter Exy (TCNTExy). When they match, the output level on the pin for the corresponding channel becomes 0. When the values in CYLRExy and TCNTExy match while the SBRLDENEx bit in the subblock reload enable register E (SBRLENE) and the RLDENExy bit of the reload control register Ex (RLDCREx) are set to 1, the value in DRLDExy is reloaded to DTRExy. Writing 0000 00_H to TCNTExy can forcibly end PWM cycle and start the same reloading as above at the next clock cycle.

The settable value in DTRExy ranges from 0 to the value in CYLRExy. When 0 is set, the duty cycle is 0% and the same value as CYLRExy is set, the duty cycle is 100%. Do not set DTRExy to a value greater than CYLRExy.

To rewrite to DTRExy during TCNTExy in operation, note that the value to be set may lead to malfunction. When TCNTExy in operation is rewritten, a duty match may not be detected. In this case, unwanted PWM waveforms may be output.

DTRExy is initialized to FFFF FF00_H after reset.

32.9.2.18 CRLDE_{xy} — Cycle Reload Registers Exy

Value after reset: FFFF FF00_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRLDE _{xy}															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRLDE _{xy}								—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	1	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}	0 ^{*1}
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Note 1. These bits are not used. Fix these bits to "0".

Cycle reload registers xy (CRLDE_{xy}) are 32-bit readable/writable register, and can be set to 0000 01_H to FFFF FF_H as the cycle of PWM outputs. When the 8 lower-order bits are read, 0 is always read.

When the reload function is enabled (when the SBRLDEN_{Ex} bit in the subblock reload enable register (SBRLNE) and the RLDE_{Nxy} bit in the reload control register (RLDCRE_{Ex}) are set to "1"), the value in this register is transferred to the cycle-setting register Exy (CYLRE_{xy}) on cycle match. Writing 0000 00_H to TCNT_{Exy} can forcibly end PWM cycle and start the same reloading as above at the next clock cycle.

CRLDE_{xy} is initialized to FFFF FF00_H after reset.

32.9.2.19 DRLDE_{xy} — Duty Reload Registers E_{xy}

Value after reset: FFFF FF00_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DRLDE _{xy}															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRLDE _{xy}								—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	1	0*1	0*1	0*1	0*1	0*1	0*1	0*1	0*1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_E-1: Corresponding to subblocks E0 to ESB_E-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3.

Note 1. These bits are not used. Fix these bits to “0”.

Duty reload registers E_{xy} (DRLDE_{xy}) are a 32-bit readable/writable register, and can be set to 0000 00_H to FFFF FF_H as the duty cycle. When the 8 lower-order bits are read, 0 is always read.

When the reload function is enabled (when the SBRLDEN_{Ex} bit in the subblock reload enable register (SBRLNE) and the RLDEN_{xy} bit in the reload control register (RLDCRE_{Ex}) are set to “1”), the value in this register is transferred to the duty cycle setting register E_{xy} (DTRE_{xy}) on cycle match. Writing 0000 00_H to TCNT_{E_{xy}} can forcibly end PWM cycle and start the same reloading as above at the next clock cycle.

DRLDE_{xy} is initialized to FFFF FF00_H after reset.

32.9.3 Details of Operation

Timer E consists of 24-bit timer counter E_{xy} (TCNTE_{xy}), 24-bit cycle-setting register E_{xy} (CYLRE_{xy}), 24-bit duty cycle setting register E_{xy} (DTRE_{xy}), 24-bit cycle reload register E_{xy} (CRLDE_{xy}), and 24-bit duty reload register E_{xy} (DRLDE_{xy}). Timer E can be used as a PWM timer.

TCNTE_{xy} starts counting up when a channel is selected by subblock starting register (SSTRE_{xy}) after a subblock is selected by timer start register (TSTRE). When TONEE_{xy} = 0, a logical zero level is output on pin TOE_{xy} on the first edge of the counter clock after TCNTE_{xy} matches duty cycle setting register E_{xy} (DTRE_{xy}), or a logical one level is output on pin TOE_{xy} on the first edge the counter clock after TCNTE_{xy} matches cycle-setting register E_{xy} (CYLRE_{xy}). After a match with the cycle-setting register, cycle match occurs, the counter is set to 0000 01_H on the next counter clock edge and starts counting up again. A compare match between TCNTE_{xy} and the cycle match register E_{xy} (CYLRE_{xy}) can be generated forcibly by setting the forced compare match trigger register Ex (FCTRGE_x).

Subsequently, duty match and cycle match are repeated, producing a PWM output on pin TOE_{xy}.

However, external output level retains the default value of “0” for one cycle which is from starting up the counter to the first cycle match. In addition, when a forced cycle match is generated by the FCTRGE_x register while the counter is stopped, the inactive level is output when the duty is 0%, and the active level is output when the duty is not 0%.

For duty determination, when the reload function is enabled (SBRLDEN_{Ex} = 1 and RLDEN_{Ex} = 1), it judges whether the duty of the timer E is set to 0% by the duty reload register E_{xy} (DRLDE_{xy}). When the reload function is disabled (SBRLDEN_{Ex} = 0 or RLDEN_{Ex} = 0), it judges by the duty register E_{xy} (DTRE_{xy}).

The settable PWM cycle ranges from 0000 01_H to FFFF FF_H. The settable duty cycle ranges from 0% to 100%. The values set in the cycle-setting register and duty cycle setting register are used as the cycle width and duty cycle width, respectively. When the duty cycle setting register is set to 0000_H, the output level is 0 and remains unchanged (when TONEE_{xy} = 0, duty cycle = 0%). When the values in duty cycle setting register and cycle-setting register are the same, the output level is 1 and remains unchanged (when TONEE_{xy} = 1, duty cycle = 100%). The value in duty cycle setting register must be equal to or less than the value in cycle-setting register.

An interrupt request can be generated per cycle by a compare match (cycle match) of the cycle-setting register.

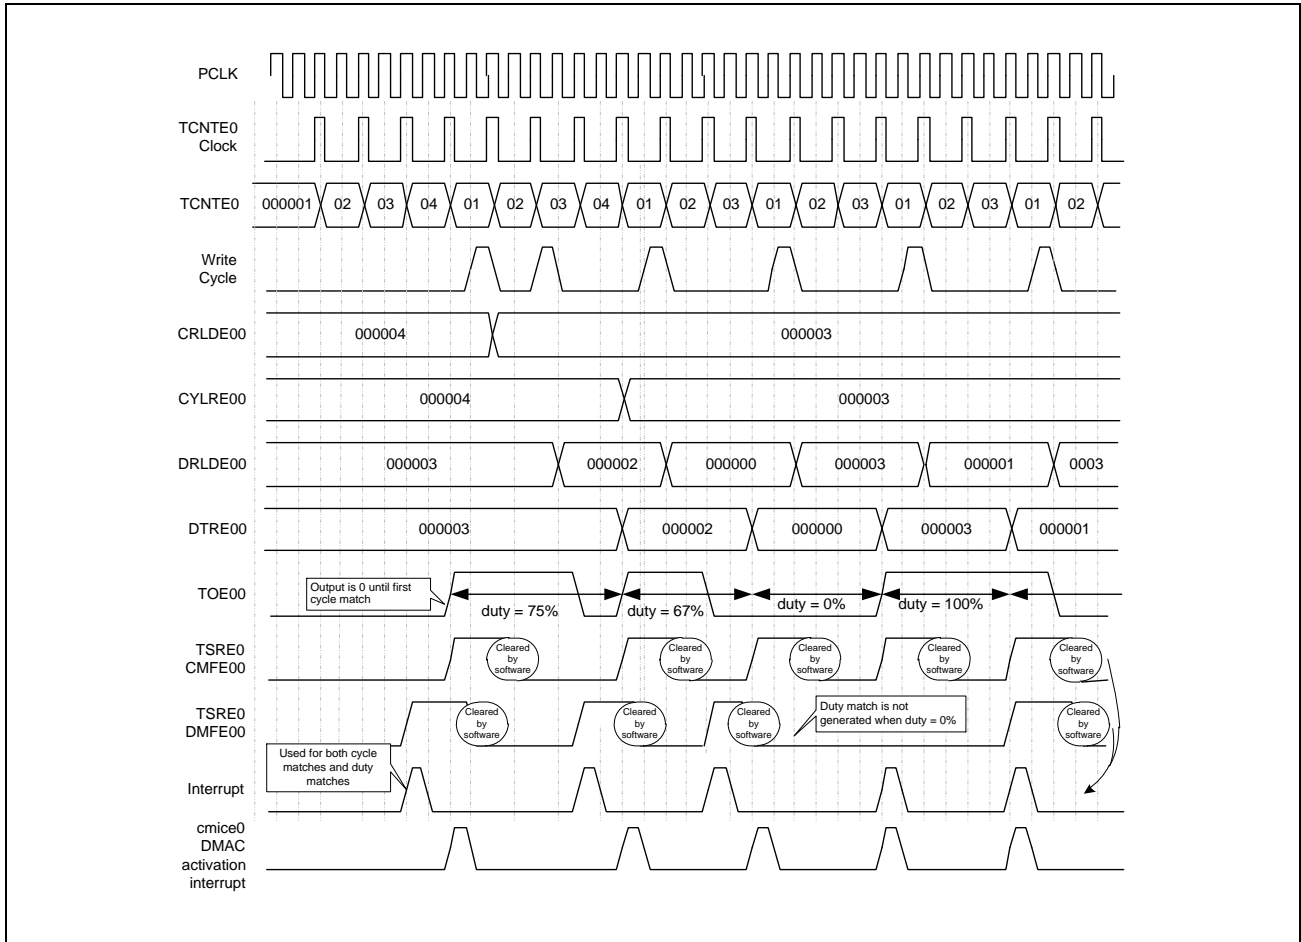

Figure 32.78 Operation of PWM (1)

The duty cycle setting and cycle-setting registers have respective reload registers. When the values in the up-counter and cycle-setting register match, the values in the duty cycle reload and cycle reload registers are loaded to the duty cycle setting and cycle-setting registers, respectively. The loaded data is updated in the next PWM cycle after loading. The reload function is enabled and disabled by the SBRLDEN_x bit in the subblock reload enable register (SBRLENE) and reload enable bit (RLDEN_{Ex}) in the reload control register (RLDCRE_x).

In timer E, a PWM output cycle is terminated by writing 0000 00_H to the counter (TCNTE_x). The counter is changed from 0000 00_H to 0000 01_H on the next counter clock and the counter is restarted. When the counter value is changed, the values in the duty cycle reload and cycle reload registers are loaded to the duty cycle setting and cycle-setting registers, respectively.

Figure 32.78 shows the operation of the PWM timer of channel 0, block E0, in which the duty cycle is changed from 75% to 67%, 0%, and to 100% in every cycle.

Figure 32.79 shows the PWM output cycle terminated by writing 0000 00_H to the counter and the counter restarted.

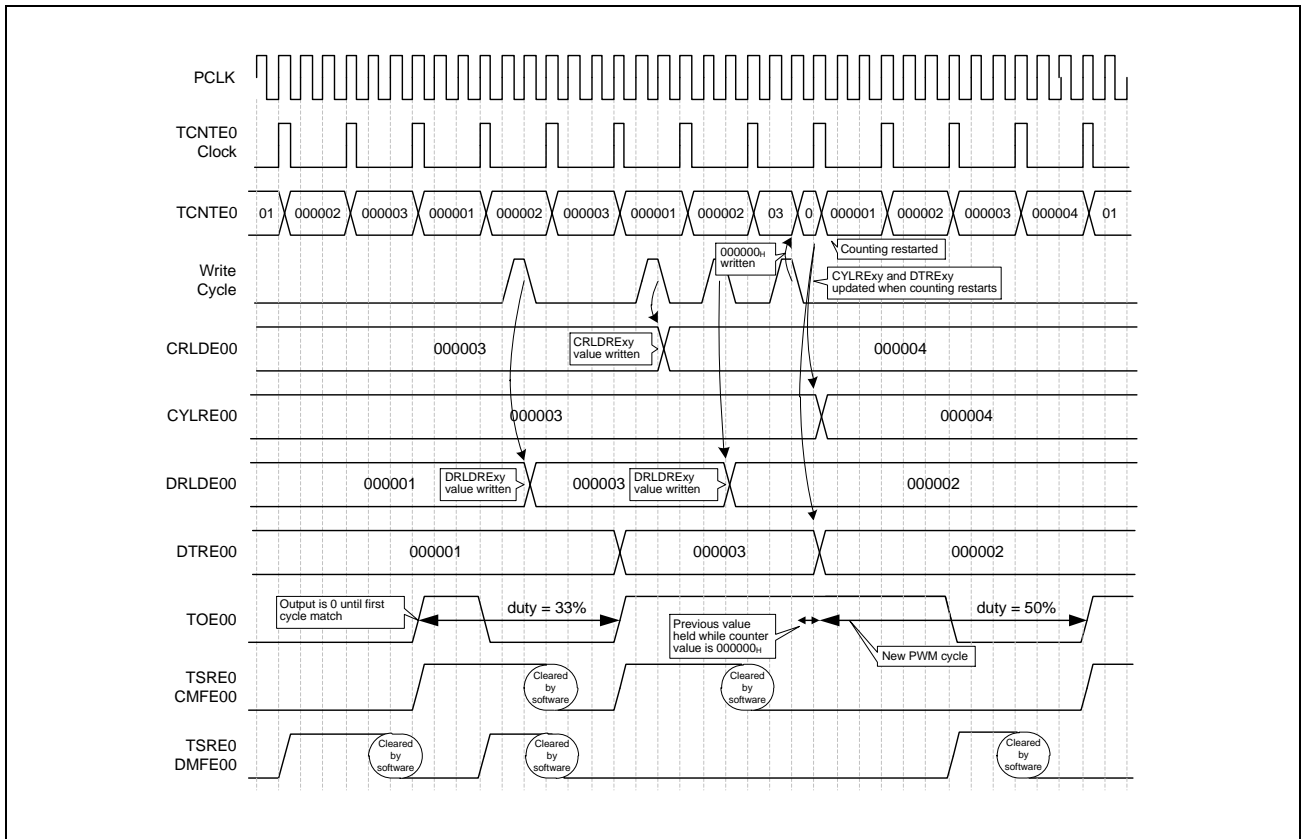

Figure 32.79 Operation of PWM (2)

Writing 0000 00_H to the 24 higher-order bits of the counter changes the 24 higher-order bits values of the counter to 0000 00_H. The output waveform (TOE00) does not change. If the reload function is enabled, an input of counter clock after writing 0000 00_H transfers the values of the cycle reload register and the duty reload register to the cycle-setting register and the duty cycle setting register, respectively. At the same time, counting starts and PWM output also starts.

A waveform is output in off-state duty (active-low output) mode when the off-state duty mode is selected by setting the corresponding bit in the timer output control register Ex (TOCREx). The output waveform on pin TOExy is inverted on the next PCLK cycle after setting.

Figure 32.80 shows an example of a waveform when switching on- and off-state duty modes. By selecting the off-state duty mode before the counter is started, the initial output level on the PWM output pin TOE00 is 1. After the counter started until the first cycle match, the level on pin TOE00 retains 1. On the following cycle match and duty match, the output levels are alternated. When the PWM cycle is forcibly terminated by writing 0000 00_H to the 24 higher-order bits of the counter, TOE00 retains the previous value. At the timing in which the 24 higher-order bits of the counter is incremented to 0000 01_H, a new PWM cycle is started.

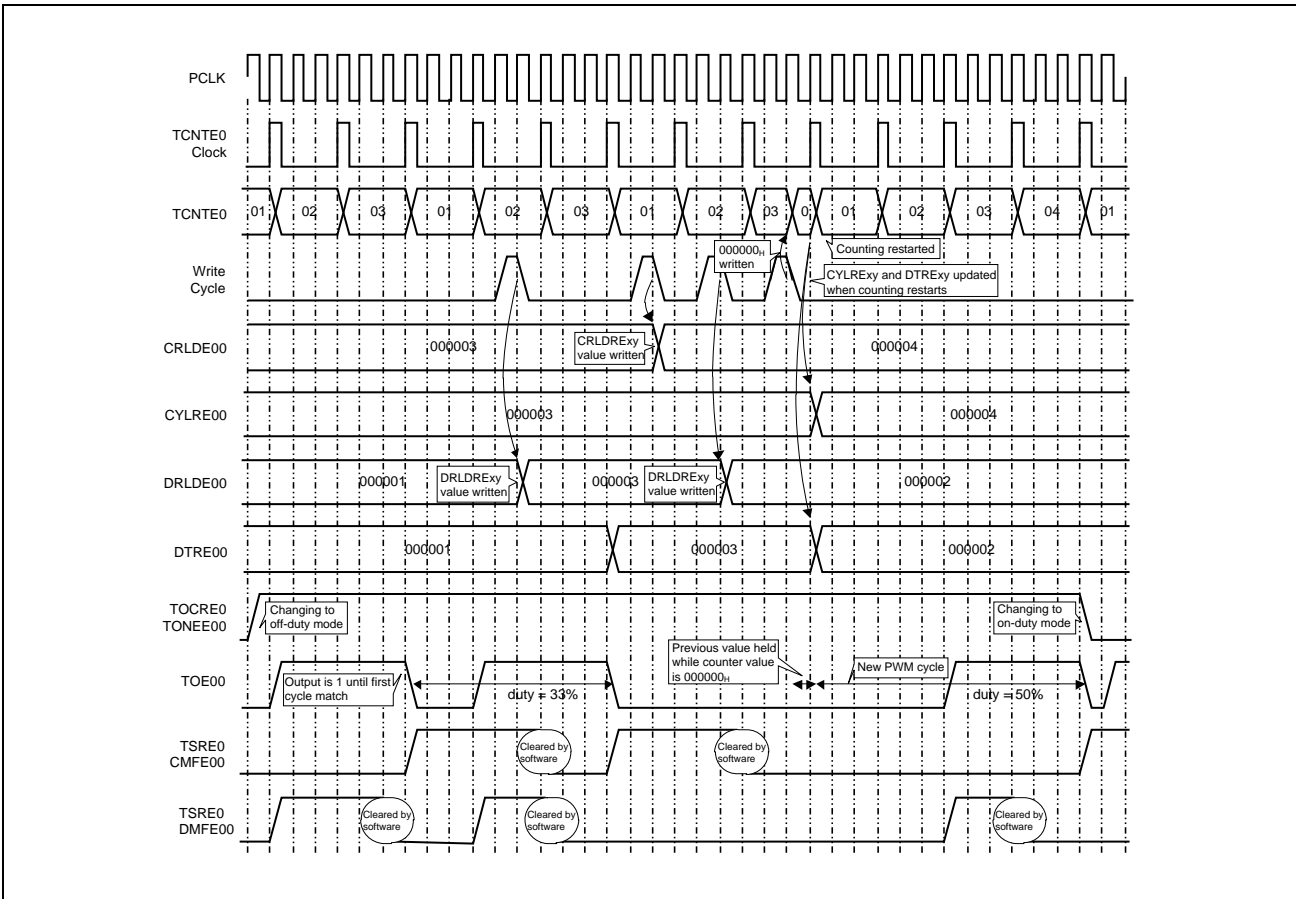

Figure 32.80 Operation of PWM (3)

Figure 32.81 illustrates the output waveform when PWM output is shutoff. PWM output is shutoff if the output shutoff enable/disable selection bit (POEEN_{xy}) of the output shutoff control register Ex (POECRE_{Ex}) is enabled and shutoff input (POE_{Ex}) is enabled during a duty period (between a cycle match in the previous PWM cycle to a duty match). POE_{Ex} being enabled during non-duty period does not trigger a shutoff. During an output shutoff period, the signal is output to TOE_{xy} at the level specified by the output level H/L selection bit (PWMSLV_{xy}) of the output shutoff setting register Ex (SOLVLE_{Ex}). This output level is not affected by the inversion setting (on-state/off-state duty) of the corresponding bit of the timer output control register (TOCRE_{Ex}).

The state of output shutoff is released if POE_{Ex} is disabled at the time of a cycle match. The state of PWM output being shutoff continues to the next cycle match if POE_{Ex} is in the enabled state at the above-mentioned timing.

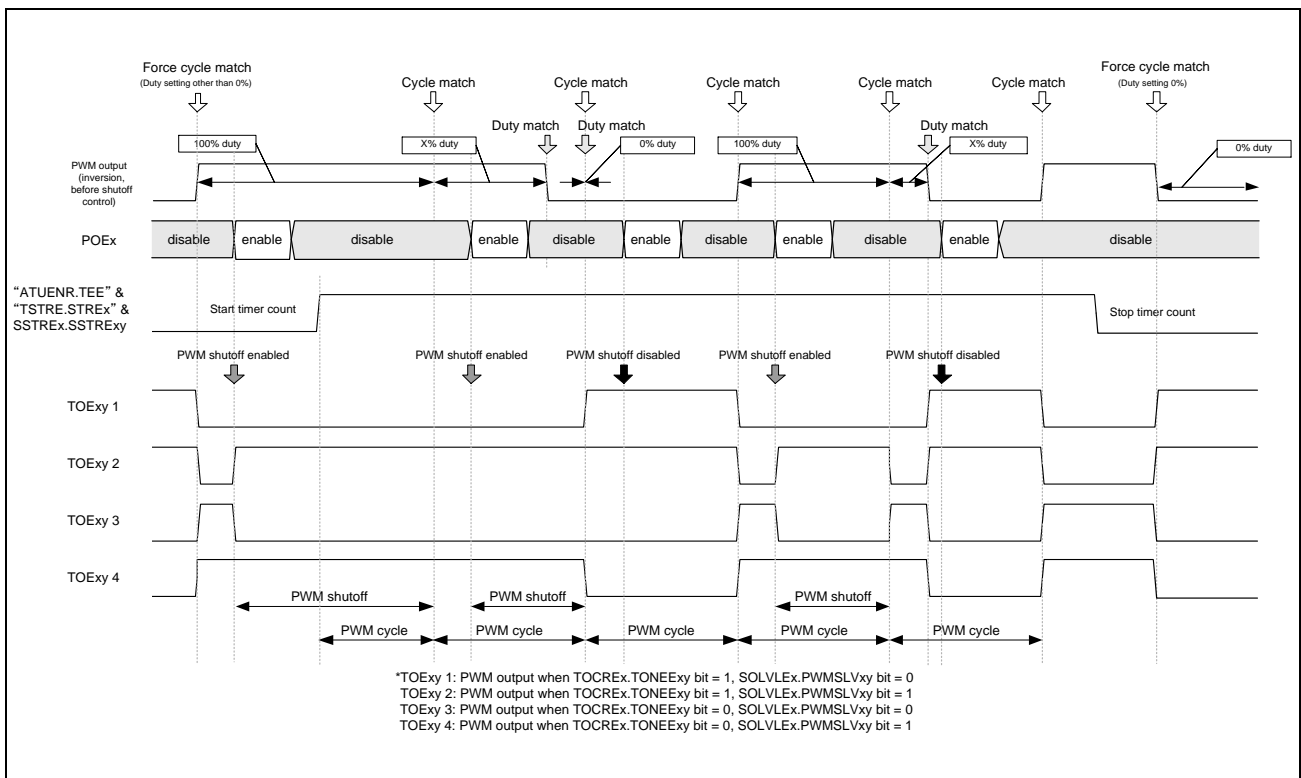

Figure 32.81 Example of PWM Output Shutoff

• Supplementary note:

The shutdown state continues until the next cycle match, even if POE_{Ex} is temporarily enabled or disabled within the duty period. When the setting is for a duty cycle of 100% (except when it becomes 0% due to reloading), the shutdown state can newly be set by enabling POE_{Ex}, even at the time of a cycle match. Shutdown or release from shutdown is in accord with POE_{Ex} for forced ending of the PWM cycle when the counter is 0000 00_H, if the setting is not for a duty cycle of 0% (including it becoming 0% due to reloading). After POE_{Ex} has been disabled, only a request for release from shutdown is accepted if the setting is for a duty cycle of 0% (including it becoming 0% due to reloading).

32.10 Timer F

32.10.1 Overview of Operation

The timer F block consists of SG_F timer F subblocks.

Timer F subblocks realize the following functions:

- Edge counting in a specified period:
Counts the number of edges input to the external input pin (TIFxA)
- Effective edge interval counting:
Measures time until a specified number of edges is input to the external pin (TIFxA).
- Measurement of time during high/low input levels:
Measures a total amount of time when a high or low level is input to the external input pin (TIFxA). The duration of measurement is designated as the number of pulses input to the external pin.
- Measurement of PWM input waveform timing:
Measures the off-duty period and cycle time of the PWM waveform input to the external pin (TIFxA). The duration of measurement is designated as the number of PWM cycles input to the external pin.
- Rotation speed/pulse measurement (for the subblock 3 to SB_F-1 only):
Every time an edge is input to the external pin (TIFxA), the following values are retained edge count, time stamp at edge input, edge input interval (cycle), and high/low input level immediately before input.
- Up/down event count (for subblocks 0 to 2 only):
TIFxA of the two external pins (TIFxA, TIFxB) is used to count as the count source. TIFxB switches between up-counting and down-counting.
- Four-time multiplication event count (for subblocks 0 to 2 only):
Counting operation is executed using two external input pins (TIFxA, TIFxB) as the count sources. Signals in the pins switch between up-counting and down-counting.

Input signals from the external input pins TIFxA and TIFxB can be subject to the noise cancellation function using the input cancellation function. Noise-canceled signals from TIA00 to TIA0SB_A-1 of timer A can be used instead of external signal input pin TIFxA.

Inputs of TIF0A to TIF2A and TIF0B and TIF2B can also be used as inputs (shutoff inputs) for POE0 to POE5 of timer E. For the correspondence between TIFxA/B and POE_x, see **Table 32.154** of timer E.

Note that, if any of TIF0A to TIF2A and TIF0B to TIF2B is used as a shutoff input of timer E, the shutoff input becomes the measurement target of the corresponding timer F subblock.

Configuration

Figure 32.82 is a block diagram of timer F. Components of a timer F subblock include two external outputs (TIFxA and TIFxB), two 32-bit counters (ECNTAFx and ECNTCFx), three 32-bit general registers (GRAFx, GRCFx, and GRDFx), three 32-bit backup registers (BGRAFx*¹, BGRCFx, and BGRDFx*²), 16-bit up/down counters (ENCTBFx), 16-bit general registers (GRBFx), an input processor (edge detection and noise canceler), and a controller.

Figure 32.82 Block Diagram of Timer F Subblock

Note 1. The BGRAFx register is provided for subblocks 3 to SB_F-1 only.

Note 2. The BGRDFx register is provided for subblocks 3 to SB_F-1 only.

Interrupt request

The timer F can output two types of interrupts totaling $SB_F \times 2$ interrupts.

- OVF_{Fx} interrupt requests (SB_F interrupts ($0 \leq x \leq SB_F-1$)): An interrupt is output when one of the three counters (ECNTAF_x, ECNTBF_x, ECNTCF_x) in the subblock F_x has overflowed or underflowed (only in ECNTBF_x). They can also be used as compare match interrupts in PWM input waveform measurement mode and “rotation speed/pulse measurement” mode. To which counter the interrupt belongs can be known by referring to the timer status register F (ISRF). This request is received by the INTC block and the designated processing is performed.
- ICF_{Fx} interrupt requests (SB_F interrupts ($0 \leq x \leq SB_F-1$)): The interrupt is output when a count value capturing in the timer subblock F_x occurs. This request is received by INTC and performs designated processing by interrupt request.

32.10.2 Registers Related to Timer F

32.10.2.1 TSTRF — Timer Start Register F

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	STRF 19	STRF 18	STRF 17	STRF 16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRF 15	STRF 14	STRF 13	STRF 12	STRF 11	STRF 10	STRF 9	STRF 8	STRF 7	STRF 6	STRF 5	STRF 4	STRF 3	STRF 2	STRF 1	STRF 0

Table 32.169 TSTRF Register Contents

Bit Position	Bit Name	Function
31 to SB _F	—	These bits are not used. When read, "0" is always returned. When writing, always write 0.
SB _F -1 to 0	STRF _x	Timer F start 0: Stops counting of ECNTAF _x , ECNTBF _x , and ECNTCF _x . 1: Permits counting of ECNTAF _x , ECNTBF _x , and ECNTCF _x .

Note: x indicates the subblock number (channel number) of 0 to SB_F-1.

TSTRF is an 8-bit/16-bit/32-bit readable/writable register that specifies whether to operate or stop each subblock (timer F0 to FSB_F-1) in the timer F.

Count operation is not executed unless TFE bit in ATU master enable register (ATUENR) is enabled even if the start bit in timer F is set to enable the count operation.

TSTRF is initialized to 0000 0000_H after reset.

Counter F Start (STRF_x)

These bits specify whether to operate or stop two time counters (ECNTAF_x, ECNTCF_x) in subblocks (F0 to FSB_F-1) of timer F and event counter (ECNTBF_x).

When this bit is cleared to 0, ECNTAF_x, ECNTBF_x, and ECNTCF_x stop operation. Counter value is retained at stop state. When this bit is set to 1 once again, the operation starts at the retained value.

Count operation is not executed unless TFE bit in ATU master enable register (ATUENR) is enabled even if the start bit in timer F is set enable the count operation.

CAUTION

The prescalers run independently of the setting of the STRF_x bit and are not initialized at the start of counter. Therefore, during the time between the activation and the start of actual count operation by the above counter, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

32.10.2.2 NCMCR1F — Noise Cancellation Mode Channel Register 1F

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.170 NCMCR1F Register Contents

Bit Position	Bit Name	Function
31 to SB _F	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
SB _F -1 to 0	NCM1F _x	Channel x Noise Cancel Mode Specify the operating mode of noise canceler in channel x. 0: Premature-transition cancellation mode 1: Minimum time-at-level cancellation mode (when NCMF = 0 and NCM2F _x = 0) 1: Level accumulation cancellation mode (when NCMF = 0 and NCM2F _x = 1)

Note: x indicates the subblock number (channel number) of 0 to SB_F-1.

NCMCR1F is an 8-bit/16-bit/32-bit readable/writable register that selects the operation mode of noise canceler for each channel unit.

In premature-transition cancellation mode, after an input signal level change is detected, any input signal level change in the specified period is ignored. This mode regards a signal level change in the specified period as noise after the first level change is detected.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.

Noise Cancellation Mode Bit of Channel x (NCM1Fx)

Specify the operation mode of noise canceller in channel x.

CAUTION

This register is only effective when the NCMF bit of the noise cancellation mode register (NCMR) in the common control unit is "0". Furthermore, when the corresponding channel bit (NCM1Fx) in this register is set to "1", the mode can be set to premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode according to the state of the corresponding channel bit in the noise cancellation mode channel register 2F (NCMCR2F).

Note: x indicates 0 to SB_F-1.

32.10.2.3 NCMCR2F — Noise Cancellation Mode Channel Register 2F

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	NCM2F 19	NCM2F 18	NCM2F 17	NCM2F 16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCM2F 15	NCM2F 14	NCM2F 13	NCM2F 12	NCM2F 11	NCM2F 10	NCM2F 9	NCM2F 8	NCM2F 7	NCM2F 6	NCM2F 5	NCM2F 4	NCM2F 3	NCM2F 2	NCM2F 1	NCM2F 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.171 NCMCR2F Register Contents

Bit Position	Bit Name	Function
31 to SB _F	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
SB _F -1 to 0	NCM2F _x	Specify the operating mode of noise canceler in channel x. 0: Minimum time-at-level cancellation mode (when NCMF = 0 and NCM1F _x = 1) 1: Level accumulation cancellation mode (when NCMF = 0 and NCM1F _x = 1)

Note: x indicates the subblock number (channel number) of 0 to SB_F-1.

Noise cancel mode channel register 2F is an 8-bit/16-bit/32-bit readable/writable register that selects the operation mode of the noise canceler for each channel.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.

Noise Cancellation Mode Bit 2 of Channel x (NCM2F_x)

Specify the operation mode of noise canceller in channel x.

CAUTION

This register is only effective when the NCMF bit of the noise cancellation mode register (NCMR) in the common control unit is “0”. The channel mode when the corresponding bit (NCM2F_x) of this register is set to 1 can be set to the minimum time-at-level cancellation mode or the level accumulation cancellation mode depending on the setting of the corresponding bit of the noise cancel mode channel register 1F (NCMCR1F).

Note: x indicates 0 to SB_F-1.

32.10.2.4 NCCRF — Noise Canceller Control Register F

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.172 NCCRF Register Contents

Bit Position	Bit Name	Function
31 to SB _F	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
SB _F -1 to 0	NCEFx	Noise canceler enable Fx 0: The noise cancellation is disabled for TIFxA and TIFxB. 1: The noise cancellation is enabled for TIFxA and TIFxB.

Note: x indicates the subblock number (channel number) of 0 to SB_F-1.

The noise canceler control register F (NCCRF) is an 8-bit/16-bit/32-bit readable/writable register that specifies enable/disable of the noise cancellation function of each subblock (timer F0 to timer FSB_F-1) of timer F.

NCCRF is initialized to 0000 0000_H after reset.

Noise Canceller Enable Fx (NCEFx)

Specify to enable/disable the noise canceller in each subblock. Regarding the subblocks 2 to 0, each subblock has noise cancellers TIFxA and TIFxB but enabling/disabling these cancellers cannot be specified independently. Setting the NCEFx bit to 1 enables each noise canceller in TIFxA and TIFxB.

When a level change of the external input signal TIFxA or TIFxB is detected while this bit is set to “1”, it is processed in premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode depending on the setting in the noise cancel mode register (NCMR) of common controller, noise cancel mode channel register 1F (NCMCR1F) of timer F, and noise cancel mode channel register 2F (NCMCR2F) of timer F.

In premature-transition cancellation mode, when a level change of the input signal is detected, the change is output as the signal whose noise is removed and the corresponding noise canceler counter (NCNTFA0 to NCNTFASB_F-1, NCNTFB0 to NCNTFB2) starts counting up. Subsequent level changes are masked until the value in the counter reaches the value in the noise canceler register (NCRFA0 to NCRFASB_F-1 and NCRFB2 to NCRFB0). When this compare match occurs, the level of the input signal at that time is output as the signal after noise cancellation.

When these bits are cleared to “0” while NCNTFAx and NCNTFBx are being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes of TIFAx and TIFBx are also masked over this period.

In minimum time-at-level cancellation mode, when a level change of the external input signal is detected, the corresponding noise canceler counter (NCNTFA0 to NCNTFASB_{F-1}, NCNTFB0 to NCNTFB2) starts counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register (NCRFA0 to NCRFASB_{F-1} and NCRFB2 to NCRFB0), the previously accepted level change is output as the signal after noise cancellation upon compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes are treated as noise. Therefore, the noise canceler assumes that the levels of external input signals have not changed and does not change the signal after cancellation.

When these bits are cleared to “0” while NCNTFA_x and NCNTFB_x are being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the input signal is detected.

In level accumulation cancellation mode, the corresponding noise canceler counter (NCNTFA0 to NCNTFASB_{F-1}, NCNTFB0 to NCNTFB2) increments or decrements according to the input signal level. The noise canceler counter increments (up-counting) when the input signal level is high, and decrements (down-counting) when the input signal level is low. Up-counting continues until the noise canceler counter reaches the value set in the noise canceler register (NCRFA0 to NCRFASB_{F-1} and NCRFB2 to NCRFB0). Down-counting continues until NCNTA_x reaches 00_H.

When a compare match (with NCRFA0 to NCRFASB_{F-1} and NCRFB2 to NCRFB0) occurs during up-counting, the noise canceler output is updated to “1”. When a compare match (with 0000_H) occurs during down-counting, the noise canceler output is updated to “0”.

In minimum time-at-level cancellation mode and premature-transition cancellation mode, level changes are always detected by PCLK regardless of the selected noise-canceler clock. In level accumulation cancellation mode, input level sampling is performed by the noise canceler clock (PCLK or PCLK/128).

For details of operations for noise cancellation, see **Figure 32.1**, **Figure 32.2**, and **Figure 32.3**.

32.10.2.5 PVFCRF — Private Function Control Register F

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PVFCRKEY[7:0]								—	—	—	—	—	—	GRDF CMEN	BKCR WEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R	R	R	R	R	R	R/W

Note 1. Values written to the write key code are not retained.

Table 32.173 PVFCRF Register Contents

Bit Position	Bit Name	Function
15 to 8	PVFCRKEY[7:0]	Write key code C9 _H : GRDFCMEN and BKCRWEN values can be changed. Other than C9 _H : GRDFCMEN and BKCRWEN values cannot be changed.
7 to 2	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
1	GRDFCMEN	GRDFx compare match enable 0: GRDFx compare match function is disabled in PWM input waveform measurement mode. 1: GRDFx compare match function is enabled in PWM input waveform measurement mode.
0	BKCRWEN	Backup control register Fx write enable 0: The BKCRFx register is not writable. 1: The BKCRFx register is writable.

Note: x indicates the subblock number (channel number) of 0 to SB_F-1.

The private function control register F (PVFCRF) is a 16-bit readable/writable register. To write a value to this register, write key code setting is required to bits 15 to 8 as well as the data to be written.

PVFCRF is initialized to 0000_H after reset.

Write Key Code (PVFCRKEY)

This code controls the write permission for bits GRDFCMEN and BKCRWEN. Setting is required to bits 15 to 8 as well as the data to be written to bits GRDFCMEN and BKCRWEN. Data written to this bit is not retained; Value 00_H is always returned when being read.

GRDFx Compare Match Enable (GRDFCMEN)

Controls enable/disable of the compare match between time measurement counter CFx (ECNTCFx) and general register DFx (GRDFx). This bit takes effect in PWM input waveform mode, and is ignored in other modes. (GRDFx compare match function is disabled.)

The setting of this bit is applied to all subblocks of timer F. Subblock-individual setting is not possible.

Backup Control Register Fx Write Enable (BKCRWEN)

Controls write permission to the backup control register Fx (BKCRFx).

The setting of this bit is applied to all subblocks of timer F. Subblock-individual setting is not possible.

32.10.2.6 TCR1Fx — Timer Control Registers 1Fx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSELF _x [2:0]			MDF _x [2:0]			EGSELF _x [1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.174 TCR1Fx Register Contents

Bit Position	Bit Name	Function
7 to 5	CKSELF _x [2:0]	Clock select Fx Specify the clock sources for the time counters (ECNTAF _x , ECNTCF _x). 000: Clock bus 0 001: Clock bus 1 010: Clock bus 2 011: Clock bus 3 100: Clock bus 4 101: Clock bus 5 110: Setting prohibited 111: Setting prohibited
4 to 2	MDF _x [2:0]	Timer operation mode Fx Specify the operation mode for the corresponding subblocks Fx. 000: Edge counting in a specified period 001: Effective edge interval counting 010: Measurement of time during high/low input levels 011: Setting prohibited 100: Measurement of PWM input waveform timing 101: Rotation speed/pulse measurement 110: Up/down event count 111: Four-time multiplication event count
1, 0	EGSELF _x [1:0]	Edge select Fx Specify the edge sense mode of TIF _x A input or TIA00 to TIA0SB _A -1 input. 00: Edge detection disabled 01: Rising edge 10: Falling edge 11: Both edges

Note: x indicates an integer from 0 to SB_F-1.

Timer control register Fx (TCR1Fx) is an 8-bit readable/writable register that specifies the operation mode of the subblocks F0 to FSB_F-1.

TCR1Fx is initialized to 00_H after reset.

Clock Select Fx (CKSELFx)

Specify the clock sources for the two time counters (ECNTAFx, ECNTCFx) in the subblocks F0 to FSB_F-1.

Setting these bits to a value from “000” to “101” selects the corresponding clock bus (0 to 5) as the clock source. Do not specify “110” and “111”. If specified, the operation is not guaranteed.

Timer Operation Mode Fx (MDFx)

Specify the operation mode for the timer subblocks F0 to FSB_F-1. There are seven modes: up/down event count, four-time multiplication event count, edge counting in a specified period, effective edge interval counting, measurement of time during high/low input levels, measurement of PWM input waveform timing, and rotation speed/pulse measurement.

Do not set rotation speed/pulse measurement for subblocks other than subblocks 3 to SB_F-1.

Edge Select Fx (EGSELFx)

Specifies the event input (TIFxA) of timer subblocks F0 to FSB_F-1 and the edge sense mode of pin inputs (TIA00 to TIA0SB_A-1) from timer A.

Edge detection is done for signals that have passed through the noise canceller. Therefore, edge detection is done to the external input (TIFxA, TIFxB) if the noise cancellation function is disabled, and to signals after noise cancel if the noise cancellation function is enabled.

While measurement of time during high/low input levels is specified, when this bit selects the falling edge, measurement of time during high level is specified. When this bit selects the rising edge, measurement of time during low level is specified. Do not select both edges.

While measurement of PWM input waveform timing and rotation speed/pulse measurement are specified, when this bit selects the rising edge, the period between the two rising edges is regarded as the PWM cycle and the low level period is regarded as the off-duty period. If the falling edge is selected, the period between the two falling edges is regarded as the PWM cycle and the high-level period is regarded as the off-duty period. Do not select both edges.

When up/down event count mode and four-time multiplication event count mode are specified, be sure to designate both the rising and falling edges. If otherwise selected, the operation is not guaranteed.

CAUTION

The TIFxB pin is only available in up/down event count and four-time multiplication event count mode. TIFxB operates always detecting both the rising and falling edges. In the other modes, TIFxB does not detect edges.

32.10.2.7 TCR2F_x — Timer Control Registers 2F_x

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	EISELEF _x	—	—	—	—	EISELF _x [2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.175 TCR2F_x Register Contents

Bit Position	Bit Name	Function
7	EISELEF _x	Event input selection enable F _x Selects the event input. 0: Selects TIF _x A. 1: Selects the signal processed by noise cancellation of TIA.
6 to 3	—	These bits are not used. Fix these bits to 0.
2 to 0	EISELF _x	Event input selection F _x Selects the TIA signal when the signal processed by noise cancellation of TIA is selected by EISELEF _x . 000: Selects the signal of TIA00 of timer A processed by noise canceling. 001: Selects the signal of TIA01 of timer A processed by noise canceling. 010: Selects the signal of TIA02 of timer A processed by noise canceling. 011: Selects the signal of TIA03 of timer A processed by noise canceling. 100: Selects the signal of TIA04 of timer A processed by noise canceling. 101: Selects the signal of TIA05 of timer A processed by noise canceling. 110: Selects the signal of TIA06 of timer A processed by noise canceling. 111: Selects the signal of TIA07 of timer A processed by noise canceling.

Note: x indicates an integer from 0 to SB_F-1.

The timer control register 2F_x (TCR2F_x) is an 8-bit readable/writable register that specifies the event input of each subblock (timer F0 to timer FSB_F-1) of timer F.

TCR2F0 to TCR2FSB_F-1 are initialized to 00_H after reset.

Event Input Selection Enable F_x (EISELEF_x)

Selects an event input for each subblock (timer F0 to timer FSB_F-1) included in timer F.

By setting this bit, noise-canceled signals from TIA00 to TIA0SB_A-1 of timer A can be used as the event input instead of external input pin TIF_xA.

Event Input Selection F_x (EISELF_x)

When EISELEF_x is set to 1, noise-canceled signal TIA00 to TIA0SB_A-1 of timer A can be selected as the event input for each subblock (timer F0 to timer FSB_F-1) included in timer F.

32.10.2.8 TIERFx — Timer Interrupt Enable Registers Fx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	OVECFx	OVEBFx	OVEAFx	ICIEFx
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.176 TIERFx Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3	OVECFx	Overflow interrupt enable CFx 0: Interrupt by OVFCFx disabled 1: Interrupt by OVFCFx enabled
2	OVEBFx	Overflow interrupt enable BFx 0: Interrupt by OVFBFx disabled 1: Interrupt by OVFBFx enabled
1	OVEAFx	Overflow interrupt enable AFx 0: Interrupt by OVFAFx disabled 1: Interrupt by OVFAFx enabled
0	ICIEFx	Input capture interrupt enable Fx 0: Interrupt by ICFFx disabled 1: Interrupt by ICFFx enabled

Note: x indicates an integer from 0 to SB_F-1.

Timer interrupt enable registers Fx (TIERF0 to TIERFSB_F-1) are 8-bit readable/writable registers that specify whether to enable or disable the interrupt corresponding to the timer status register Fx (TSRFx).

TIERF0 to TIERFSB_F-1 are initialized to 00_H after reset.

Overflow Interrupt Enable CFx (OVECFx)

Specifies whether to enable or disable interrupt requests of the state (OVFCFx) corresponding to overflow of timer measurement counter Cx (ECNTCFx) (when it is in PWM input waveform measurement mode and the GRDFCMEN bit of the PVFCRF register is 0), corresponding to compare match of ECNTCFx and GRDFx (when it is in PWM input waveform measurement mode and the GRDFCMEN bit of the PVFCRF register is 1), or corresponding to compare match of ECNTCFx and GRBFx (rotation speed/pulse measurement mode).^{*1}

Overflow Interrupt Enable BFx (OVEBFx)

Specifies whether to enable or disable the interrupt of the state (OVFBFx) corresponding to the overflow/underflow of the event counter x (ECNTBFx).^{*1}

Overflow Interrupt Enable AFx (OVEAFx)

Specifies whether to enable or disable the interrupt of the state (OVFAFx) corresponding to the overflow of the time measurement counter Ax (ECNTAFx).^{*1}

Input Capture Interrupt Enable Fx (ICIEFx)

Specifies whether to enable or disable the interrupt of the state (ICFFx) corresponding to the input capture or compare match detection status in subblock Fx (F0 to FSB_F-1).*1

Note 1. The overflow of interrupt of the timer subblock Fx is requested as the logical sum of the interrupts OVFAFx, OVFBFx, and OVFCFx, by referring to TSRFx, which counter generated the interrupt by overflow or underflow can be known. Clear the corresponding interrupt request flag of TSRFx when processing the interrupt.

32.10.2.9 BKCRFx — Backup Control Register Fx

Value after reset: 00_H

[Subblocks F00 to F02]

Bit	7	6	5	4	3	2	1	0
	—	—	BKENC _{Fx}	—	—	—	ARSWC _{Fx}	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W* ¹	R	R	R	R/W* ¹	R

Note: x = 0 to SB_{F-1}: Corresponding to subblocks F0 to FSB_{F-1}

[Subblocks F03 to FSB_{F-1}]

Bit	7	6	5	4	3	2	1	0
	—	BKENA _{Fx}	BKENC _{Fx}	BKEND _{Fx}	—	ARSWA _{Fx}	ARSWC _{Fx}	ARSWD _{Fx}
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W* ¹	R/W* ¹	R/W* ¹	R	R/W* ¹	R/W* ¹	R/W* ¹

Note: x = 0 to SB_{F-1}: Corresponding to subblocks F0 to FSB_{F-1}

Note 1. Writing to this register is permitted only when the BKCRWEN bit of the PVFCRF register is 1.

Table 32.177 BKCRFx Register Contents

Bit Position	Bit Name	Function
7	—	This bit is not used. When read, “0” is always returned. When writing, always write 0.
6	BKENA _{Fx} * ¹	Backup enable A Saving GRA _{Fx} in BGRA _{Fx} when CDR _{Fx} is read 0: Not saved 1: Saved
5	BKENC _{Fx}	Backup enable C Saving GR _{Cx} in BGR _{Cx} when CDR _{Fx} is read 0: Not saved 1: Saved
4	BKEND _{Fx} * ¹	Backup enable D Saving GR _{Dx} in BGR _{Dx} when CDR _{Fx} is read 0: Not saved 1: Saved
3	—	This bit is not used. When read, “0” is always returned. When writing, always write 0.
2	ARSWA _{Fx} * ¹	Mapping to access register switching A To FFE6 5054 _H + (40 _H × x) 0: GRA _{Fx} is mapped. 1: BGRA _{Fx} is mapped.
1	ARSWC _{Fx}	Mapping to access register switching C To FFE6 5064 _H + (40 _H × x) 0: GR _{Cx} is mapped. 1: BGR _{Cx} is mapped.
0	ARSWD _{Fx} * ¹	Mapping to access register switching D To FFE6 5068 _H + (40 _H × x) 0: GR _{Dx} is mapped. 1: BGR _{Dx} is mapped.

Note 1. BKENA_{Fx}, BKEND_{Fx}, ARSWA_{Fx}, and ARSWD_{Fx} exist only in subblocks F03 to FSB_{F-1}. They are not deployed in F00 to F02. When these bits are read, “0” is always returned. When writing, write “0”.

Note: x indicates an integer from 0 to SB_{F-1}.

The backup control register Fx (BKCRF00 to BKCRFSB_{F-1}) is an 8-bit readable/writable register. Writing to BKCRF00 to BKCRFSB_{F-1} is permitted only when the BKCRWEN bit of the private function control register F (PVFCRF) is 1.

BKCRF00 to BKCRFSB_{F-1} are initialized to 00_H after reset.

Backup Enable Bits A, C, and D (BKENAF_x, BKENC_{Fx}, BKEND_{Fx})

These bits permit or prohibit value saving of GRAF_x to BGRAF_x, GRCF_x to BGRCF_x, and GRDF_x to BGRDF_x when capture output register Fx (CDRF_x) is read.

Access Register Switching Bits A, C, and D (ARSWAF_x, ARSWC_{Fx}, ARSWD_{Fx})

These bits specify whether BGRAF_x is mapped instead of GRAF_x to address FFE6 5054_H + (40_H × x), whether BGRCF_x is mapped instead of GRCF_x to address FFE6 5064_H + (40_H × x), and whether BGRDF_x is mapped instead of GRDF_x to address FFE6 5068_H + (40_H × x).

CAUTION

Setting of this register always takes effect regardless of the operation mode. Value saving and mapping change are performed even for registers that do not operate in some operation mode.

32.10.2.10 TSRFx — Timer Status Registers Fx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	OVFCFx	OVFBFx	OVFAFx	ICFFx
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.178 TSRFx Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3	OVFCFx	Overflow flag CFx 0: No overflow in ECNTCFx 1: ECNTCFx overflows
2	OVFBFx	Overflow flag BFx 0: No overflow or underflow in ECNTBFx 1: ECNTBFx overflows or underflows
1	OVFAFx	Overflow flag AFx 0: No overflow in ECNTAFx 1: ECNTAFx overflows
0	ICFFx	Input capture flag Fx 0: Input capture is not detected in the subblock Fx 1: Input capture in subblock Fx detected

Note: x indicates an integer from 0 to SB_F-1.

Timer status registers Fx (TSRF0 to TSRF_{SB_F-1}) are 8-bit readable registers that indicate overflows in the time counters A and C, overflow or underflow in the event counter, and input capture occurrence.

This flag is a status flag that indicates occurrence of an interrupt request. For overflow flags AFx, BFx, and CFx (OVFAx, OVFBx, and OVFCx), interrupt requests can be issued by setting the TIERFx register. Setting a bit of the timer status clear register Fx (TSCRFx) clears the corresponding flag.

For input capture flag Fx (ICFFx), an interrupt request is made again if an interrupt source takes effect while this flag is set. An interrupt request is made even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source.

For overflow flags, an interrupt request is issued when the corresponding flag is set by setting the corresponding bit of timer interrupt enable register Fx (TIERFx).

TSRF0 to TSRF_{SB_F-1} are initialized to 00_H after reset.

Overflow/Compare Match Flag CFx (OVFCFx)

Values of this flag indicate different conditions depending on the operation mode and the setting of the GRDFx compare match enable bit (GRDFCMEN) of the private function control register (PVFCRF). When the PWM input waveform measurement mode is set, value 0 of the GRDFCMEN bit makes this flag indicate an overflow of time measurement counter Cx (ECNTCFx), and value 1 of the GRDFCMEN bit makes this flag indicate a compare match of ECNTCFx and GRDFx. In “rotation speed/pulse measurement” mode, this flag indicates a compare match of ECNTCFx and GRBFx regardless of the GRDFCMEN bit setting.

This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition
(Measurement of PWM input waveform timing mode)
[GRDFCMEN = 0]
When the value of ECNTCFx has overflown (FFFF FFFF_H to 0000 0000_H)
[GRDFCMEN = 1]
When the values of ECNTCFx and GRDFx coincide.
(Rotation speed/pulse measurement mode)
When ECNTCFx and GRDFx (the value of zero extension to the 16 lower-order bits) coincide
- Clearing (to 0) condition
When 1 is written to OVFCF_x of the timer status clear register Fx (TSCRF_x).

Overflow Flag BF_x (OVFBF_x)

By this flag, overflow or underflow of the event counter F_x (ECNTBF_x) can be monitored. This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition
When ECNTBF_x overflows (FFFF_H to 0000_H) or underflows (0000_H to FFFF_H)
- Clearing (to 0) condition
When 1 is written to OVFCBF_x of the timer status clear register Fx (TSCRF_x).

Overflow Flag AF_x (OVFAF_x)

By this flag, overflow of the time counter AF_x (ECNTAF_x) can be monitored. This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition
When ECNTAF_x overflows (FFFF FFFF_H to 0000 0000_H)
- Clearing (to 0) condition
When 1 is written to OVFCAF_x of the timer status clear register Fx (TSCRF_x).

Input Capture/Compare Match Flag F_x (ICFF_x)

By this bit, the detection state of input capture and compare match in the subblock F_x (F₀ to FSB_F-1) can be monitored. This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition
When input capture is detected in subblock F_x
- Clearing (to 0) condition
When 1 is written to ICFCF_x of the timer status clear register Fx (TSCRF_x)

32.10.2.11 TSCRF_x — Timer Status Clear Register F_x

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	OVFCCF _x	OVFCBF _x	OVFAF _x	ICFCF _x
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.179 TSCRF_x Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. When read, “0” is always returned. When writing, always write 0.
3	OVFCCF _x	Overflow flag clear FC enable 0: Disabled (Default) 1: Clears OVFCF _x of timer status register F (TSRF _x) to 0.
2	OVFCBF _x	Overflow flag clear FB enable 0: Disabled (Default) 1: Clears OVFBF _x of timer status register F (TSRF _x) to 0.
1	OVFAF _x	Overflow flag clear FA enable 0: Disabled (Default) 1: Clears OVFAF _x of timer status register F (TSRF _x) to 0.
0	ICFCF _x	Overflow flag clear F enable 0: Disabled (Default) 1: Clears ICFF _x of timer status register F (TSRF _x) to 0.

Note: x indicates an integer from 0 to SB_F-1.

The timer status clear register F_x (TSCRF00 to TSCRF_{SB_F-1}) is an 8-bit writable register. This register specifies flag clearing in the events of an overflow of time measurement counter A or C, an overflow or an underflow of an event counter, and an input capture occurrence.

TSCRF_x is readable/writable only in 8-bit units. When this register is read, “0” is always returned.

TSCRF_x is initialized to 00_H after reset.

Overflow Flag Clear FC Enable (OVFCCF_x)

When overflow flag FC_x (OVFCF_x) of timer status register F_x (TSRF_x) is set to 1, writing 1 to this register clears OVFCF_x to 0. This register is always read as 0.

Overflow Flag Clear FB Enable (OVFCBF_x)

When overflow flag FB_x (OVFBF_x) of timer status register F_x (TSRF_x) is set to 1, writing 1 to this register clears OVFBF_x to 0. This register is always read as 0.

Overflow Flag Clear FA Enable (OVFAF_x)

When overflow flag FA_x (OVFAF_x) of timer status register F_x (TSRF_x) is set to 1, writing 1 to this register clears OVFAF_x to 0. This register is always read as 0.

Input Capture Flag Clear B0 Enable (ICFCFx)

When input capture flag Fx (ICFFx) of timer status register Fx (TSRFx) is set to 1, writing 1 to this register clears ICFFx to 0. This register is always read as 0.

32.10.2.12 ECNTAFx — Timer Measurement Counters AFx

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECNTAFx[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECNTAFx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.180 ECNTAFx Register Contents

Bit Position	Bit Name	Function
31 to 0	ECNTAFx	Time measurement count AFx Up-counter A

Note: x indicates an integer from 0 to SB_F-1.

Timer measurement counters AFx (ECNTAF0 to ECNTAFSB_F-1) are 32-bit readable/writable registers. These registers are readable/writable only in 32-bit units. Do not write or read 8-bit or 16-bit data for these registers.

This register provided one for each subblock, and executes up-count operation using the input clock. One clock bus from clock buses 0 to 5 can be selected as the input clock according to the setting of the corresponding control register. The input clocks for ECNTAFx and ECNTCFx are the same. Clock source cannot be set independently.

When clearing the counter is done at the counting-up timing, ECNTAFx is cleared to 0000 0001_H, and to 0000 0000_H in other cases.

ECNTAF0 to ECNTAFSB_F-1 are initialized to 0000 0000_H after reset.

32.10.2.13 ECNTBFx — Event Counters Fx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECNTBFx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.181 ECNTBFx Register Contents

Bit Position	Bit Name	Function
15 to 0	ECNTBFx	Event count Fx Up/down counter

Note: x indicates an integer from 0 to SB_F-1.

Event counters Fx (ECNTBF0 to ECNTBF_{SB_F}-1) are 16-bit readable/writable registers. This register is provided one for each subblock, and executes up-count/down-count operation using the input clock. The input clock is given two external input pins (TIFxA, TIFxB). The external pin and edge used to count differs according to the setting of the corresponding control register (operation mode and edge select). The input clock in each mode is listed in Table 32.182. When clearing the counter is done at the count-up timing, ECNTBFx is cleared to 0001_H, and to 0000_H in other cases. ECNTBF0 to ECNTBF_{SB_F}-1 are initialized to 0000_H after reset.

Table 32.182 Event Counter Input Clocks and Count Edges for Each Operation Mode of Timer

Operation Mode	Input Clock	Count Edge
Edge counting in a specified period	TIFxA	Selectable by EGSELFx
Effective edge interval counting	TIFxA	Selectable by EGSELFx
Measurement of time during high/ low input levels	TIFxA	Selectable by EGSELFx (other than both edges)
Measurement of PWM input waveform timing	TIFxA	Selectable by EGSELFx (other than both edges)
Rotation speed/pulse measurement	TIFxA	Selectable by EGSELFx (other than both edges)
Up/down event count	TIFxA (Count direction is specified by TIFxB level)	Both rising/falling edges
Four-time multiplication event count	TIFxA, TIFxB	Both rising/falling edges

32.10.2.14 ECNTCFx — Time Measurement Counters CFx

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECNTCFx[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECNTCFx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.183 ECNTCFx Register Contents

Bit Position	Bit Name	Function
31 to 0	ECNTCFx	Time counter CFx Up-counter C

Note: x indicates an integer from 0 to SB_F-1.

Timer counters CFx (ECNTCF00 to ECNTCF_{SB_F}-1) are 32-bit readable/writable registers. They are up-counters. This register is readable/writable only in 32-bit units. Do not write or read 8-bit or 16-bit data for this register.

This register is provided one for each subblock, and is enabled only in measurement of PWM input waveform timing and rotation speed/pulse measurement modes. This register does not execute count operation in other modes.

This register executes up-count operation using the input clock. One clock bus from clock buses 0 to 6 can be selected as the input clock according to the setting of the corresponding control register. The input clocks for ECNTAFx and ECNTCFx are the same. Clock source cannot be set independently.

The timing of external input and the count value clearing by a compare match with ECNTBFx are synchronized with the count clock of ECNTCFx. At this time, ECNTCFx is cleared to 0000 0001_H.

ECNTCFx are initialized to 0000 0000_H after reset.

32.10.2.15 GRAF_x — General Registers AF_x

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GRAF _x [31:16]

Note: x = 0 to SB_F-1: Corresponding to subblocks F0 to FSB_F-1

Table 32.184 GRAF_x Register Contents

Bit Position	Bit Name	Function
31 to 0	GRAF _x	General registers AF _x Input capture value or output compare match value for the time counter A.

Note: x indicates an integer from 0 to SB_F-1.

General registers AF_x (GRAF00 to GRAFSB_F-1) are 32-bit readable/writable registers. This register is readable/writable only in 32-bit units. Do not write or read 8-bit or 16-bit data for this register. This register is provided one for each subblock, and has two functions such as input capture register and output compare register for the time measurement counter A_x (ECNTAF_x).

Do not set GRAF_x to 0000 0000_H to function this register as the compare match register. Note that if 0000 0000_H is set, incorrect measurement may occur.

GRAF00 to GRAFSB_F-1 are initialized to FFFF FFFF_H after reset.

GRAF00 to GRAFSB_F-1 are mapped to target addresses and become readable and writable when the ARSWAF_x bit of backup control register F_x (BKCRF_x) is 0 (default: 0).

32.10.2.16 BGRAF_x — Backup General Registers AF_x

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 03 to SB_F-1: Corresponding to subblocks F03 to FSB_F-1

Table 32.185 BGRAF_x Register Contents

Bit Position	Bit Name	Function
31 to 0	BGRAF _x [31:0]	When the BKENAF _x bit of BKCRF _x is 1, this register retains the value of general register AF _x (GRAF _x) at the time of reading the capture output register (CDRF _x).

Note: x indicates an integer from 03 to SB_F-1.

Backup general registers AF_x (BGRAF03 to BGRAFSB_F-1) are 32-bit read-only registers. BGRAF_x is provided one for each of subblock 03 to subblock SB_F-1. If the BKENAF_x bit of backup control register F_x (BKCRF_x) is 1, this register retains the content of general register AF_x (GRAF_x) when capture output register F_x (CDRF_x) is read.

BGRAF03 to BGRAFSB_F-1 are initialized to FFFF FFFF_H after reset.

BGRAF_x is mapped to target addresses and becomes readable when the ARSWAF_x bit of backup control register F_x (BKCRF_x) is 1 (default: 0).

32.10.2.17 GRBF_x — General Registers BF_x

Value after reset: FFFF_H

Note: $x = 0$ to SB_F-1 : Corresponding to subblocks F00 to FSB_F-1

Table 32.186 GRBF_x Register Contents

Bit Position	Bit Name	Function
15 to 0	GRBF _x	General registers BF _x Input capture value or output compare match value for event counter.

Note: x indicates an integer from 0 to SB_F-1 .

General registers BF_x (GRBF00 to GRBF SB_F-1) are 16-bit readable/writable registers. GRBF_x is provided one for each subblock, and has two functions such as input capture register and output compare register for the event counter (ECNTBF_x).

Do not set 0000_H when using GRBF_x as the compare match register. If 0000_H is set, incorrect measurement may occur.

GRBF00 to GRBF SB_F-1 are initialized to FFFF_H after reset.

32.10.2.18 GRCFx — General Registers CFx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note: x = 0 to SB_F-1: Corresponding to subblocks F00 to FSB_F-1

Table 32.187 GRCFx Register Contents

Bit Position	Bit Name	Function
31 to 0	GRCFx	General registers CFx Input capture value for the time counter C

Note: x indicates an integer from 0 to SB_F-1.

General registers CF_x (GRCF00 to GRCF_{SB_F-1}) are 32-bit readable/writable registers, and can be read from and written to in 32-bit units. Do not write or read 8-bit or 16-bit data for this register.

GRCF_x is provided one for each subblock, and has a function as the input capture register for the time measurement counter C_x (ECNTCF_x). Triggered by a compare match between ECNTBF_x and GRB_x (in measurement of PWM input waveform timing mode) or edge input of the TIF_xA pin (in rotation speed/pulse measurement mode), ECNTCF_x count number is taken in at the next ECNTCF_x up-count timing.

GRCF_x is valid only in measurement of PWM input waveform timing or rotation speed/pulse measurement mode. Capture operation is not executed in other modes.

GRCF00 to GRCF_{SB_F-1} are initialized to FFFF FFFF_H after reset.

GRCF00 to GRCF_{SB_F-1} are mapped to target addresses and become readable and writable when the ARSWCF_x bit of backup control register F_x (BKCRF_x) is 0 (default: 0).

32.10.2.19 BGRCF_x — Backup General Registers CF_x

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_F-1: Corresponding to subblocks F00 to FSB_F-1

Table 32.188 BGRCF_x Register Contents

Bit Position	Bit Name	Function
31 to 0	BGRCF _x [31:0]	When the BKENC _{Fx} bit of BKCRF _x is 1, this register retains the value of general register (GRCF _x) at the time of reading the capture output register CF _x (F).

Note: x indicates an integer from 0 to SB_F-1.

Backup general registers CF_x (BGRCF00 to BGRCFSB_F-1) are 32-bit read-only registers.

BGRCF_x is provided one for each subblock. If the BKENC_{Fx} bit of backup control register F_x (BKCRF_x) is 1, this register retains the content of general register CF_x (GRCF_x) when capture output register F_x (CDRF_x) is read.

BGRCF00 to BGRCFSB_F-1 are initialized to FFFF FFFF_H after reset.

BGRCF_x is mapped to target addresses and becomes readable when the ARSWCF_x bit of backup control register F_x (BKCRF_x) is 1 (default: 0).

32.10.2.20 GRDF_x — General Registers DF_x

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GRDF _x [31:16]

Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F00 to FSB_F-1

Table 32.189 GRDF_x Register Contents

Bit Position	Bit Name	Function
31 to 0	GRDF _x	General registers DF _x In PWM input waveform measurement mode: Compare match value of time measurement counter C In “rotation speed/pulse measurement” mode: (only for x = 3 to SB _F -1) accumulated value of time measurement counter C

Note: x indicates an integer from 0 to SB_F-1.

General registers DF_x (GRDF00 to GRDFSB_F-1) are 32-bit readable/writable registers that can be read and written only in 32-bit units. Do not read or write these registers in 16 bit or 8-bit units.

GRDF_x is provided one for each subblock. This register operates differently depending on the subblock. For subblocks F00 to F02, this register works only in PWM input waveform measurement mode. This register does not work in other modes.

For subblocks F03 to SB_F-1, this register works in PWM input waveform measurement mode and in “rotation speed/pulse measurement” mode. This register does not work in other modes.

In PWM input waveform measurement mode, this register works as a compare match register, and is always compared with the value of time measurement counter C_x (ECNTCF_x). If the values of both registers coincide, the OVFCF_x bit of timer status register F_x (TSRF_x) is set to 1 at the next PCLK clock cycle. To make this register work as a compare match register, the GRDFCMEN bit of PVFCRF must be set.

In rotation speed/pulse measurement mode, this register works as an input capture register. Triggered by an edge input of the TIF_x pin, this register takes and accumulates the value of time measurement counter C_x (ECNTCF_x) at the next cycle of ECNTCF_x increment.

GRDF00 to GRDFSB_F-1 are initialized to FFFF FFFF_H after reset.

GRDF03 to GRDFSB_F-1 are mapped to target addresses and become readable and writable when the ARSWDF_x bit of backup control register F_x (BKCRF_x) is 0 (default: 0).

32.10.2.21 BGRDFx — Backup General Registers DFx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.190 BGRDFx Register Contents

Bit Position	Bit Name	Function
31 to 0	BGRDFx[31:0]	When the BKENDFx bit of BKCRFx is 1, this register retains the value of general register DFx (GRDFx) at the time of reading the capture output register (CDRFx).

Note: x indicates an integer from 3 to SB_F-1.

Backup general registers DFx (BGRDF3 to BGRDFSB_F-1) are 32-bit read-only registers. BGRDFx is readable only in 32-bit units. Do not read this register in 8-bit or 16-bit units.

BGRDFx is provided one for each of subblocks F03 to subblock FSB_F-1. If the BKENDFx bit of backup control register Fx (BKCRFx) is 1, this register retains the content of general register DFx (GRDFx) when capture output register Fx (CDRFx) is read.

BGRDF3 to BGRDFSB_F-1 are initialized to FFFF FFFF_H after reset.

BGRDFx is mapped to target addresses and becomes readable when the ARSWDFx bit of backup control register Fx (BKCRFx) is 1 (default: 0).

32.10.2.22 CDRFx — Capture Output Registers Fx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDRFx[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	CDRFx[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: x = 0 to SB_F-1: Corresponding to subblocks F00 to FSB_F-1

Table 32.191 CDRFx Register Contents

Bit Position	Bit Name	Function
31 to 0	CDRFx	Capture output registers Fx Data retained in GRAF _x , GRBF _x , or ECNTBF _x is read depending on the operation mode.

Note: x indicates an integer from 0 to SB_F-1.

The capture output register is a 32-bit read-only register. This register is provided one for each subblock. When this register is read, values in GRAF_x, GRBF_x, or ECNTBF_x is read according to the operation mode. A 16-bit value in GRBF_x and ECNTBF_x are read from the 16 lower-order bits in CDRFx. In this case, the 16 higher-order bits in CDRFx are read as 0.

Registers corresponding to various modes are listed below. Writing to these registers are ignored.

Mode	Register
Edge count mode	GRBF _x
Edge input interval measurement mode	GRAF _x
Input high/low period measurement mode	
PWM input waveform measurement mode	
Rotation speed/pulse measurement mode	ECNTBF _x
Up/down count mode	GRBF _x
Four-time multiplication event count mode	

Note: CDRF0 to CDRFSB_F-1 are initialized to FFFF FFFF_H after reset.

Depending on the setting of bits BKENAF_x, BKENC_F, and BKEND_F of backup control register F_x (BKCRF_x), reading CDRFx triggers value saving from general register AF_x (GRAF_x) to backup general register AF_x (BGRAF_x), from general register CF_x (GRCF_x) to backup general register CF_x (BGRCF_x), and from general register DF_x (GRDF_x) to backup general register DF_x (BGRDF_x). For more information, see the sections on backup general registers corresponding to individual general registers.

32.10.2.23 NCNTFAX — Noise Canceler Counters FAX

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCNTFAX[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_F-1: Corresponding to subblocks F00 to FSB_F-1

Table 32.192 NCNTFAX Register Contents

Bit Position	Bit Name	Function
15 to 0	NCNTFAX	Noise cancel counters FAX 16-bit count value

Note: x indicates an integer from 0 to SB_F-1.

Noise canceler counters registers FAX (NCNTFAX) are 16-bit readable/writable registers.

When the noise canceler is enabled by noise canceler control register Fx (NCCRFx) and the operation mode is the premature-transition cancellation mode or minimum time-at-level cancellation mode, a level change of external input pin TIFxA triggers the up-count operation ticked by the noise canceler counter clock provided by the prescaler. In level accumulation cancellation mode, up/down counting is performed based on the external input level.

NCNTFAX is readable/writable only in 16-bit units.

NCNTFAX is initialized to 0000_H after reset.

One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-at-level cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

NCNTFAX starts up-count operation triggered by the level change of input signal in TIFxA under the condition that the NCEFx bit is set to 1 and NCNTFAX is not in count operation. When the count number matches the value in the noise cancel register FAX (NCRFAX), this register stops the count operation, clearing the count value to 0000_H synchronizing with the next PCLK.

NCNTFAX executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

A level change at the start of count operation is output as it is as the signal that passed through the noise canceling operation. Although this signal is the subject of edge detection, the signal does not change because any input level change is masked until the count number matches the value of NCRFAX.

Even if the NCEFx bit is cleared during the count operation, the count operation continues until the count number matches the value of NCRFAX. The input signal is masked during all that time.

- Minimum time-at-level cancellation mode

NCNTFAX starts up-count operation triggered by the level change of input signal in TIFxA under the condition that the NCEF_x bit is set to 1 and NCNTFAX is not in count operation. When the level change of the input signal occurs during the count operation or the count number matches the value in the noise cancel register FAX (NCRFAX), this register stops the count operation, clearing the count value to 0000_H synchronizing with the next PCLK.

NCNTFAX executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

Signals that passed through the noise canceling operation can change only when the count number matches the value of NCRFAX according to the level change at the count start. If the count operation stops before the count number matches the value of NCRFAX, signals that passed through the noise canceling operation do not change because the level changes at the start or stop of counting are masked.

Even if the NCEF_x bit is cleared during the count operation, the count operation and noise canceling processing continue until a compare match occurs or the level of the input signal changes.

- Level accumulation cancellation mode

When the NCEF_x bit is set to 1, NCNTFAX performs up or down counting depending on the input signal level. Up-counting is performed when the input level is high, and if the counter value coincides with NCRFAX, the up-counting stops at the next PCLK cycle. Down-counting is performed when the input level is low, and if the counter value coincides with 0000_H, the down-counting stops at the next PCLK cycle.

Counting of NCNTFAX is performed regardless of the setting of the TFE bit of the ATU master enable register (ATUENR).

If up-counting results in a compare match of NCRFAX, the noise canceler output is updated to 1. If down-counting results in a compare match with 0000_H, the noise canceler output is updated to 0.

If the NCEF_x bit is cleared when counting is in progress, the noise cancel counter stops counting, and the value is changed from the noise canceler output to the current input signal level. Be noted that clearing the NCEF_x bit in level accumulation cancellation mode might cause an edge detection due to this value change.

32.10.2.24 NCNTFBx — Noise Canceler Counters FBx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCNTFBx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to 2: Corresponding to subblocks F00 to F02

Table 32.193 NCNTFBx Register Contents

Bit Position	Bit Name	Function
15 to 0	NCNTFBx	Noise cancel counters FBx 16-bit count value

Note: x indicates an integer from 0 to 2.

Noise cancel counters FBx (NCNTFBx) are 16-bit readable/writable registers.

These registers are available only in up/down event count mode and 4-time multiplication event count mode.

When the noise canceler is enabled by noise canceler control register Fx (NCCRF) and the operation mode is premature-transition cancellation mode or minimum time-at-level cancellation mode, a level change of external input pin TIFxB triggers the up-count operation ticked by the noise canceler counter clock provided by the prescaler. In level accumulation cancellation mode, up/down counting is performed based on the external input level.

NCNTFBx is readable/writable only in 16-bit units.

NCNTFBx is initialized to 0000_H after reset.

One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-at-level cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

NCNTFBx starts up-count operation triggered by the level change of input signal in TIFxB under the condition that the NCEFx bit is set to 1 and NCNTFBx is not in count operation. When the count number matches the value in the noise cancel register FBx (NCRFBx), this register stops the count operation, clearing the count value to 0000_H synchronizing with the next PCLK.

NCNTFBx executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

A level change at the start of count operation is output as it is as the signal that passed through the noise canceling operation. Although this signal is the subject of edge detection, the signal does not change because any input level change is masked until the count number matches the value of NCRFBx.

Even if the NCEFx bit is cleared during the count operation, the count operation continues until the count number matches the value of NCRFBx. The input signal is masked during all that time.

- Minimum time-at-level cancellation mode

NCNTFBx starts up-count operation triggered by the level change of input signal in TIFxB under the condition that the NCEF_x bit is set to 1 and NCNTFBx is not in count operation. When the level change of the input signal occurs during the count operation or the count number matches the value in the noise cancel register FBx (NCRFBx), this register stops the count operation, clearing the count value to 0000_H synchronizing with the next PCLK.

NCNTFBx executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

Signals that passed through the noise canceling operation can change only when the count number matches the value of NCRFBx, according to the level change at the count start. If the count operation stops before the count number matches the value of NCRFBx, signals that passed through the noise canceling operation do not change because the level changes at the start or stop of counting are masked.

Even if the NCEF_x bit is cleared during the count operation, the count operation and noise canceling processing continue until a compare match occurs or the level of the input signal changes.

- Level accumulation cancellation mode

When the NCEF_x bit is set to 1, NCNTFBx performs up or down counting depending on the input signal level. Up-counting is performed when the input level is high, and if the counter value coincides with NCRFBx, the up-counting stops at the next PCLK cycle. Down-counting is performed when the input level is low, and if the counter value coincides with 0000_H, the down-counting stops at the next PCLK cycle.

Counting of NCNTFBx is performed regardless of the setting of the TFE bit of the ATU master enable register (ATUENR).

If an up-count results in a compare match of NCRFBx, the noise canceler output is updated to 1. If down-counting results in a compare match with 0000_H, the noise canceler output is updated to 0.

If the NCEF_x bit is cleared when counting is in progress, the noise cancel counter stops counting, and the value is changed from the noise canceler output to the current input signal level. Be noted that clearing the NCEF_x bit in level accumulation cancellation mode might cause edge detection due to this value change.

32.10.2.25 NCRFAx — Noise Cancel Registers FAx

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCTFAx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.194 NCRFAx Register Contents

Bit Position	Bit Name	Function
15 to 0	NCTFAx	Noise cancel time FAx TIFxA noise cancel period (16-bit compare value)

Note: x indicates an integer from 0 to SB_F-1.

Noise cancel registers (NCRFAx) are 16-bit readable/writable registers that set the upper limit of the noise canceler counter (NCNTFAx). When a period of 128 PCLK cycles is selected as the noise cancel clock, setting of FFFF_H can cancel noise for maximum of 0.21 second period (when PCLK = 40 MHz).

One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-at-level cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

While NCNTFAx is in count operation, the level change of the subsequent input signal is masked. Values in NCNTFAx and NCRFAx are always compared. If a compare match occurs, these registers clear the value in NCNTFAx synchronizing with the next PCLK, stop the count operation, and cancel the masking of the input signal.

- Minimum time-at-level cancellation mode

While NCNTFAx is in count operation, noise canceler processing waiting state is entered. Values in NCNTFAx and NCRFAx are always compared. If a compare match occurs, these registers clear the value in NCNTFAx synchronizing with the next PCLK, stop the count operation, and then cancel the masking of the input signal and the noise canceler outputs the input signal that has passed through the noise canceling processing.

- Level accumulation cancellation mode

When NCNTFAx up-counting is in progress, values of CNTFAx and NCRFAx are compared. When a compare match occurs, the up-counting of NCNTFAx stops at the next PCLK cycle. When NCNTFAx down-counting is in progress, NCNTFAx is compared with 0000_H.

NCRFAx is readable/writable only in 16-bit units.

NCRFAx is initialized to 0000_H after reset.

32.10.2.26 NCRFBx — Noise Cancel Registers FBx

Note: x = 0 to 2: Corresponding to subblocks F00 to F02

Table 32.195 NCRFBx Register Contents

Bit Position	Bit Name	Function
15 to 0	NCTFBx	Noise cancel time FBx TIFxB noise cancel period (16-bit compare value)

Note: x indicates an integer from 0 to 2.

Noise cancel registers (NCRFBx) are 16-bit readable/writable registers that set the upper limit of the noise canceler counter (NCNTFBx). When a period of 128 PCLK cycles is selected as the noise cancel clock, setting of FFFF_H can cancel noise for maximum of 0.21 second period (when PCLK = 40 MHz). This register is effective only during up/down counting and the four-time multiplication event count mode.

One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-at-level cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

While NCNTFBx is in count operation, the level change of the subsequent input signal is masked. Values in NCNTFBx and NCRFBx are always compared. If a compare match occurs, these registers clear the value in NCNTFBx synchronizing with the next PCLK, stop the count operation, and cancel the masking of the input signal.

- Minimum time-at-level cancellation mode

While NCNTFBx is in count operation, noise canceler processing waiting state is entered. Values in NCNTFBx and NCRFBx are always compared. If a compare match occurs, these registers clear the value in NCNTFBx synchronizing with the next PCLK, stop the count operation. Simultaneously the noise canceler outputs the input signal that has passed through noise canceling processing.

- Level accumulation cancellation mode

When NCNTFBx up-counting is in progress, values of CNTFBx and NCRFBx are compared. When a compare match occurs, the up-counting of NCNTFBx stops at the next PCLK cycle. When NCNTFBx down-counting is in progress, NCNTFBx is compared with 0000_H.

NCRFBx is readable/writable only in 16-bit units.

NCRFBx is initialized to 0000_H after reset.

For details of operations for noise cancellation, see the description of the noise cancellation mode register in **Section 32.3.2, Registers Related to Common Controller**.

32.10.3 Details of Operation

32.10.3.1 Edge Counting in a Given Time

When a period over which edges are counted is set in GRAF_x, the number of edges within the period is obtained in GRBF_x. When no edge is detected within the period, 0 is set to GRBF_x. The period set to count is equivalent to the cycle of the ECNTAF_x clock (GRAF_x value). Operation of the timer F_x is described below. **Figure 32.83** shows an operation example. In this example, eight edges are input to 12 cycles of the count source clock. Timer counter ECNTAF_x and event counter ECNTBF_x are driven by the ECNTAF_x and ECNTBF_x clocks, respectively.

- ECNTAF_x: Measures time using one of the clock buses 0 to 5. When a compare match is detected, the count value is cleared synchronized with the next PCLK.
- ECNTBF_x: Counts edges of the signals provided from TIF_xA input. Edge types subject to count can be selected from among rising, falling, or both edges. The example given here counts the falling edges. A delay of two cycles in TIF_xA occurs because of synchronization processing. When a compare match in ECNTAF_x is detected, the count number is cleared synchronized with the next PCLK. In a case where edges subject to count are given simultaneously at a count clearing by a compare match, both operations are regarded to be done in one cycle, setting the count value to 0001_H. **Figure 32.84** shows an example of this.
- GRAF_x: Functions as the compare match register for ECNTAF_x. A compare match is detected when the count values in ECNTAF_x and GRAF_x agree.
- GRBF_x: Functions as the capture register for ECNTBF_x. When a compare match in ECNTAF_x is detected, this register captures the ECNTBF_x count number synchronizing with the next PCLK.
- Compare match interrupt request output: After compare match detection of ECNTAF_x, a compare match interrupt request is issued to CPU at the next PCLK cycle.
- ICFF_x: After detecting a compare match in ECNTAF_x, sets the ICFF_x flag synchronized with the next PCLK.
- ECNTCF_x, GRCF_x, GRDF_x: Do not function.

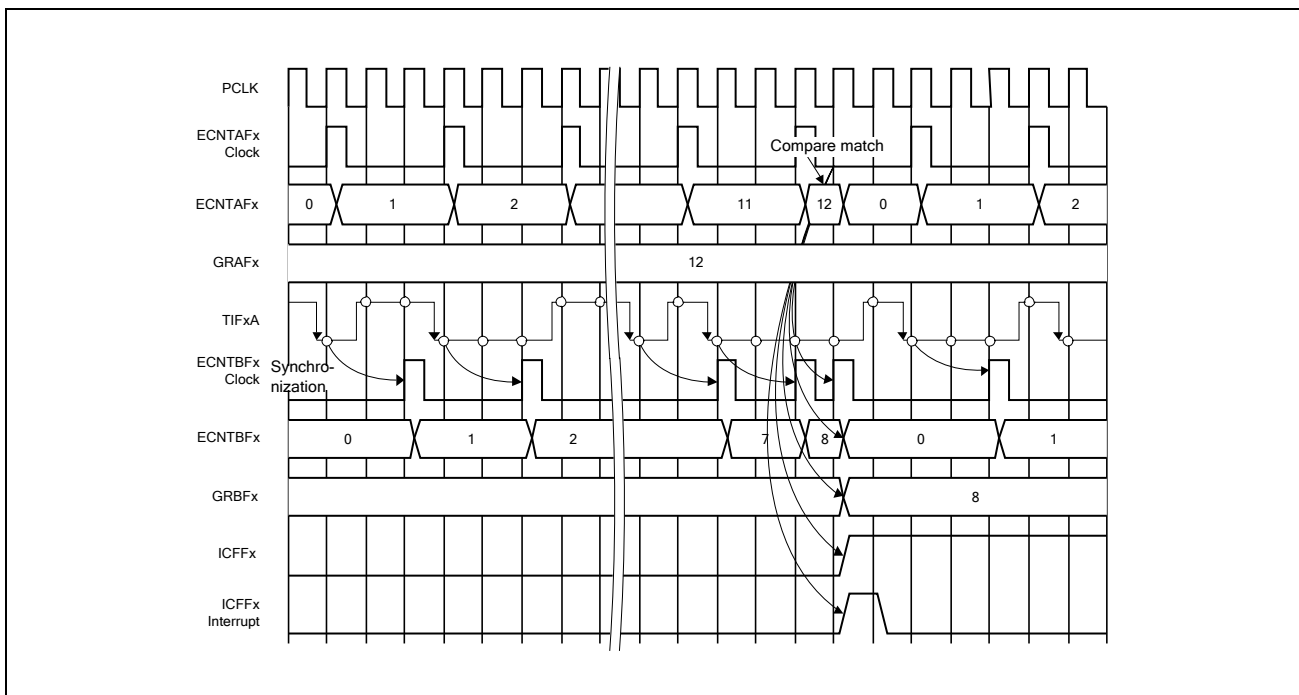

Figure 32.83 Operation Example of Edge Count in a Given Time

Figure 32.84 Operation Example 2 of Edge Count in a Given Time (Same Timing as Compare Match and Event)

32.10.3.2 Effective Edge Interval Counting

When a number of edges are set in GRBFx, the time necessary to count these edges is notified to GRAF_x. The average of input edge intervals is obtained by dividing the time by the number of edges. The outcome is given as the unit of the ECNTAF_x count source clock (GRAF_x). Operation of the timer F_x is described below. **Figure 32.85** shows an operation example. In this example, 13 cycles of the counter clock are needed to detect 12 input edges. Timer counter ECNTAF_x and event counter ECNTBF_x are driven by the ECNTAF_x and ECNTBF_x clocks, respectively.

- ECNTAF_x: Measures time using one of the clock buses 0 to 5. When a compare match between ECNTBF_x and GRBF_x is detected, the count value is cleared synchronized with the next ECNTAF_x clock. Since ECNTAF_x count clear occurs at the same time with count-up, the cleared value becomes 0000 0001_H.
- ECNTBF_x: Counts edges provided from TIFxA. Edge types subject to count can be selected from among rising, falling, or both edges. The example given here counts the falling edges. A delay of two cycles in TIFxA occurs because of synchronization processing. When a compare match is detected, the count number is cleared synchronized with the next PCLK.
- GRAF_x: Functions as the capture register for ECNTAF_x. When a compare match in ECNTBF_x is detected, this register captures the ECNTAF_x count number synchronizing with the next ECNTAF_x clock.
- GRBF_x: Functions as the compare match register for ECNTBF_x. A compare match is detected when the count values in ECNTBF_x and GRBF_x agree
- Compare match interrupt request: After a compare match detection of ECNTBF_x, a compare match interrupt request is issued to CPU at the next “ECNTAF_x Clock” cycle.
- ICFF_x: After detecting a compare match in ECNTBF_x, sets the ICFF_x flag synchronized with the next ECNTAF_x clock.
- ECNTCF_x, GRCF_x, GRDF_x: Do not function.

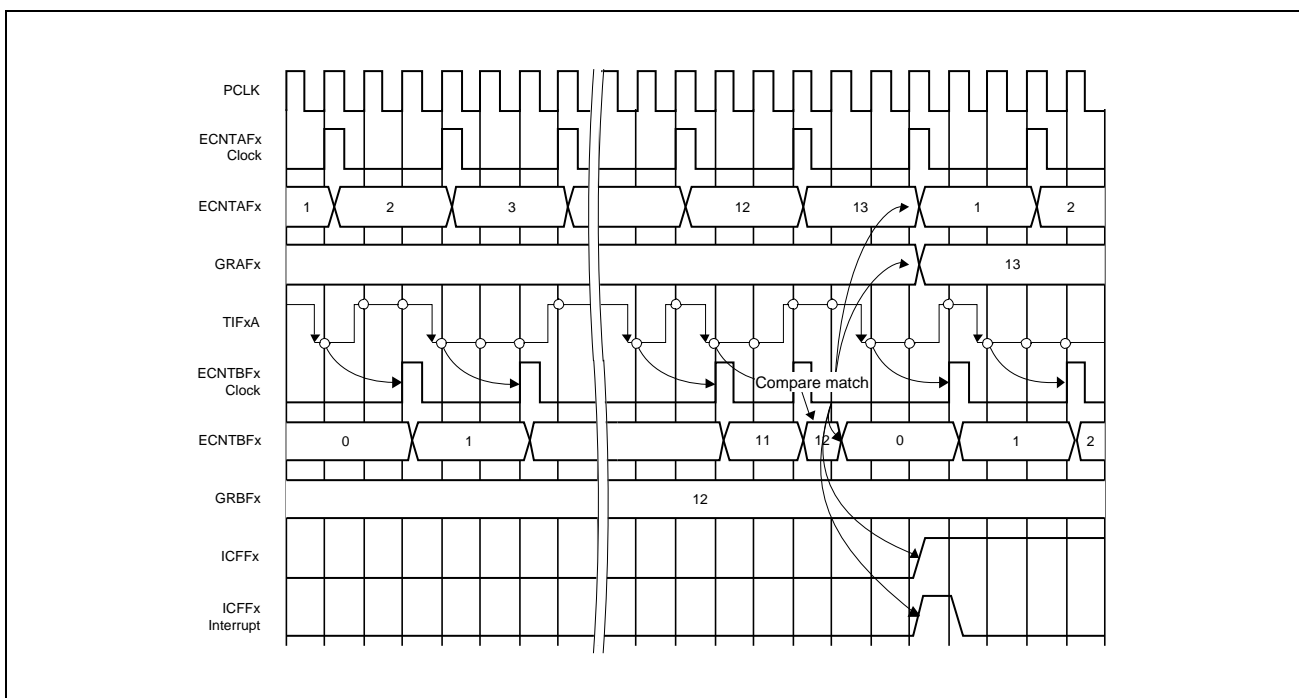

Figure 32.85 Operation Example of Effective Edge Interval Counting

32.10.3.3 Measurement of Time during High/Low Input Levels

Measures the time while TIFxA is driven high or low. The time obtained is indicated using the ECNTAFx clock source as the standard. The width of the measurement time is specified to GRBFx in the form of the pulse number provided for TIFxA (GRBFx value). Operation of the timer F is described below. **Figure 32.86** shows an operation example. This is the example in which the high level periods of the three pulses are measured as nine count source cycles. Timer counter ECNTAFx and event counter ECNTBFx are driven by the ECNTAFx and ECNTBFx clocks, respectively.

- **ECNTAFx:** Executes up-count using one of the clock buses 0 to 5 as a count source and TIFxA level as enable. Therefore, the time period in which TIFxA is in high level (EGSELFx = 2, falling edge selected), or TIFxA is in low level (EGSELFx = 1, rising edge selected) is measured. After detecting a compare match in ECNTBFx, this register clears the count number synchronizing with the next count source clock. If TIFxA is driven high (EGSELFx = 2) or low (EGSELFx = 1) at clearing count by the compare match, the count value becomes 0000 0001_H. **Figure 32.87** is an example of this.
- **ECNTBFx:** Counts the falling edge of the signal from the TIFxA input. Rising or falling edge is selectable to be counted. The operation example shows counting of the TIFxA falling edge. A delay of two cycles occurs because of synchronization processing. When a compare match is detected, the count number is cleared synchronized with the next PCLK.
- **GRAFx:** Functions as the capture register for ECNTAFx. When a compare match in ECNTBFx is detected, this register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock.
- **GRBFx:** Functions as the compare match register for ECNTBFx. A compare match is detected when the count number in ECNTBFx and GRBFx agree.
- **Compare match interrupt request:** After a compare match detection of ECNTBFx, a compare match interrupt request is issued to CPU at the next “ECNTAFx Clock” cycle.
- **ICFFx:** After detecting a compare match in ECNTBFx, sets the ICFFx flag synchronized with the next ECNTAFx clock.
- **ECNTCFx, GRCFx, GRDFx:** Do not function.

Figure 32.86 Operation Example of Measurement of Time during High Input Levels

Figure 32.87 Operation Example of Measurement of Time during High Input Levels (TIFxA is in High Level When Capture is in Operation)

32.10.3.4 Measurement of PWM Input Waveform Timing

Measures the off-duty (non-active) period and cycle time of the PWM waveform input to TIFxA. The off-duty period is measured as the period of either the high or low level input on TIFxA, and the PWM cycle is measured as the interval between two rising or falling edges. Both are measured concurrently. The measured time is expressed in the number of cycles of the clock source for ECNTAFx. The duration of the measurement is set in GRBFx, which is specified as the number of PWM pulses input to TIFxA.

Compare match is possible for the number of PWM cycles. A compare match can issue an interrupt request to CPU.

Operation of timer F is described below. **Figure 32.88** shows an operation example. This is the example in which two PWM cycles in PWM waveform are measured as six counter clock cycles and the off-duty period (low-level period) is measured as four counter clock cycles.

The clocks for ECNTAFx, ECNTBFx, and ECNTCFx in this example provide the timing of counting or clearing operation of the time counter ECNTAFx, event counter ECNTBFx, and ECNTCFx, respectively.

- ECNTAFx: Executes up-count using one of the clock buses 0 to 5 as a count source and TIFxA input level as enable. Therefore, the time period in which TIFxA is in high level (EGSELFx = 2, falling edge selected), or TIFxA is in low level (EGSELFx = 1, rising edge selected) is measured. After detecting a compare match in ECNTBFx, this register clears the count number synchronizing with the next count source clock. If TIFxA is driven high (EGSELFx = 2) or low (EGSELFx = 1) at clearing count by the compare match, the count value becomes 0000 0001_H. The operation example shows measurement of low level.
- ECNTBFx: Counts the edge of the signal from the TIFxA input. Rising or falling edge is selectable to be counted. The operation example shows counting of the rising edge. A delay of two cycles occurs because of synchronization processing. When a compare match is detected, the count number is cleared synchronized with the next PCLK.
- GRAFx: Functions as the capture register for ECNTAFx. When a compare match in ECNTBFx is detected, this register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock.
- GRBFx: Functions as the compare match register for ECNTBFx. A compare match is detected when the count number in ECNTBFx and GRBFx agree.
- ECNTCFx: Measures time using the same count source as ECNTAFx. This register clears the count number synchronizing with the next ECNTAFx clock after detecting a compare match in ECNTBFx. Since ECNTCFx count clear occurs at the same time with count-up, the cleared value is 0000 0001_H. A compare match with GRDFx does not clear ECNTCFx, and the counting continues.
- GRDFx: Functions as the capture register for ECNTCFx. This register captures the ECNTCFx count number synchronizing with the next ECNTAFx clock after detecting a compare match in ECNTBFx.
- Input capture interrupt request: After a compare match detection of ECNTBFx, an input capture interrupt request is issued to CPU at the next "ECNTAFx Clock" cycle.
- ICFFx: After detecting a compare match in ECNTBFx, sets the ICFFx synchronized with the next ECNTAFx clock.
- GRDFx: This register works as a compare match register of ECNTCFx. A compare match occurs when the ECNTCFx count coincides with GRDFx. (Effective when the GRDFCMEN bit of the private function control register (PVFCRF) is 1.)
- Overflow interrupt request output: After a compare match detection of ECNTCFx, an overflow interrupt request is issued to CPU at the next PCLK cycle. (Effective when the GRDFCMEN bit of the private function control register (PVFCRF) is 1.)
- OVFCFx: After detection of a compare match of ECNTCFx, OVFCFx is set at the next PCLK cycle. (Effective when the GRDFCMEN bit of the private function control register F (PVFCRF) is 1.)

Therefore, ECNTBFx (GRBFx) and ECNTAFx (GRAFx) are operating in measurement of time during low input levels mode and ECNTBFx (GRBFx) and ECNTCFx (GRCFxFx) are operating in effective edge interval counting mode.

The measured values in PWM input waveform measurement mode are saved in two 32-bit registers: GRAFx and GRCFxFx. Be noted that, when reading these two registers, a capture might occur in the period between reading one register and reading the other register, resulting in reading incorrect measurements (for example, when an interrupt request was processed in between).

Reading values from backup registers would provide two consistent values. For details, see **Section 32.10.3.9, Simultaneous Access of Multiple Registers**, described below.

Figure 32.88 Operation Example of Measurement of PWM Input Waveform Timing

Figure 32.89 Operation Example of Measurement of PWM Input Waveform Timing

32.10.3.5 Rotation Speed/Pulse Measurement

Measures the number of edges input to TIFxA, the edge input time (time stamp), the off-duty period in the PWM waveform that emerges between the last input edge and the edge this time, and PWM cycle time.

The time obtained is expressed using the ECNTAFx clock source as the standard. The maximum interval of edge input can be set to GRBFx, which enables to output an interrupt request if the edge input interval exceeds the maximum value.

At this moment, the timer F operates as shown below. **Figure 32.89** shows an example of operation.

The ECNTAFx clock, ECNTBFx clock, and ECNTCFx clock show the timing of count operation or clearing for the time counter ECNTAFx, event counter ECNTBFx, and ECNTCFx, respectively.

- **ECNTAFx:** Executes up-count using one of the clock buses 0 to 5 as a count source and TIFxA input level as enable. Therefore, the time period in which TIFxA is in high level (EGSELFx = 2, falling edge selected), or TIFxA is in low level (EGSELFx = 1, rising edge selected) is measured. After inputting the edge to TIFxA, this register clears the count number synchronizing with the next count source clock. If TIFxA is driven high (EGSELFx = 2) or low (EGSELFx = 1) at clearing count by the compare match, the count value becomes 0000 0001_H.
- **ECNTBFx:** Counts the edge of the signal from the TIFxA input. Rising or falling edge is selectable to be counted. The operation example shows counting of the falling edge. A delay of two cycles occurs because of synchronization processing.
- **GRAFx:** Functions as the capture register for ECNTAFx. This register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA.
- **GRBFx:** Functions as the capture register for ECNTCFx. When the ECNTCFx count and the value in the 16 lower-order bits in GRBFx extended with 0 match, this register detects a compare match and set the OVFCFx to 1.
- **ECNTCFx:** Measures time using the same count source as ECNTAFx. This register clears the count number synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA. Since ECNTCFx count clear occurs in the same timing, the cleared value is 0000 0001_H.
- **GRCFx:** Functions as the capture register for ECNTCFx. This register captures the ECNTCFx count number synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA.
- **GRDFx:** Functions as the capture register for ECNTCFx. This register captures the ECNTCFx, whose number being accumulated to GRDFx, synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA. The value to be added is the ECNTCFx value before clearing. (Capture value: GRDFx+ = ECNTCFx).
- **Input capture interrupt request output:** After an edge input to TIFxA, an input capture interrupt request is issued to CPU at the next “ECNTAFx Clock” cycle.
- **ICFFx:** Sets the ICFFx synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA.
- **Overflow interrupt request output:** An overflow interrupt request is issued to CPU at the next PCLK cycle during which values of ECNTCFx and GRBFx coincide (zero extension of 16 lower-order bits).
- **OVFCFx:** Sets the OVFCFx synchronizing with the next PCLK after the values in ECNTCFx and GRBFx (zero extension of 16 lower-order bits) match.

At the time of an input capture interrupt request, reading ECNTBFx, GRAFx, GRCF_x, and GRDF_x provides the number of edges, the off-state duty cycle, the PWM cycle, and the edge input time, respectively.

The capture timing of GRAFx, GRCF_x, and GRDF_x synchronizes with the count clock of ECNTAF_x. Note that if the edge input cycle is shorter than the ECNTAF_x count clock cycle, incorrect measurement may occur.

The measured values in “rotation speed/pulse measurement” mode are saved in three 32-bit registers GRAFx, GRCF_x, and GRDF_x. Be noted that, when reading these three registers, a capture might occur in the period between reading one register and reading another register, resulting in reading incorrect measurements (for example, when an interrupt request was processed in between).

Reading values from backup registers would provide three consistent values. For details, see **Section 32.10.3.9, Simultaneous Access of Multiple Registers**, described below.

Note: Do not set this mode for subblocks other than 03 to SB_F-1.

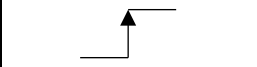

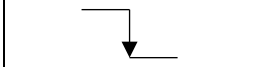

Figure 32.90 Operation Example of Rotation Speed/Pulse Measurement

32.10.3.6 Up/Down Event Count

This register uses the TIFxA pin, one of the two external input pins (TIFxA, TIFxB), as the count source, and TIFxB switches up-count to and from down-count. If a count period is designated to GRAFx the count number after designation can be obtained in GRBFx. The counting period is the period of ECNTAFx count source clock (GRAFx value). At this moment, the timer F operates as shown below. **Figure 32.90** shows an example of operation. The ECNTAFx clock and ECNTBFx clock show the timing that time counter ECNTAFx and event counter ECNTBFx execute the count operation or clearing, respectively.

- ECNTAFx: Measures time using one of the clock buses 0 to 5. When a compare match is detected, the count value is cleared synchronized with the next PCLK.
- ECNTBFx: Upcount/downcount operation is performed at both rising and falling edges of TIFxA. Count direction is determined by the TIFxB input level. (See **Table 32.196**.) Because of synchronization processing, a delay of two cycles occurs in TIFxA and TIFxB.
- GRAFx: Functions as the compare match register for ECNTAFx. A compare match is detected when the count number in ECNTAFx and GRAFx agree.
- GRBFx: Functions as the capture register for ECNTBFx. When a compare match in ECNTAFx is detected, this register captures the ECNTBFx count number synchronizing with the next PCLK.
- Input capture interrupt request output: After compare match detection of ECNTAFx, an interrupt request is issued to CPU at the next PCLK cycle.
- ICFFx: After detecting a compare match in ECNTAFx, sets the ICFFx flag synchronized with the next PCLK.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Table 32.196 Count Direction in Up/Down Event Count Mode

Input	Count Direction	
	Upcount	Downcount
TIFxA		
TIFxB	Low	High

Note: Always set this mode only in subblock 0 to subblock 2.

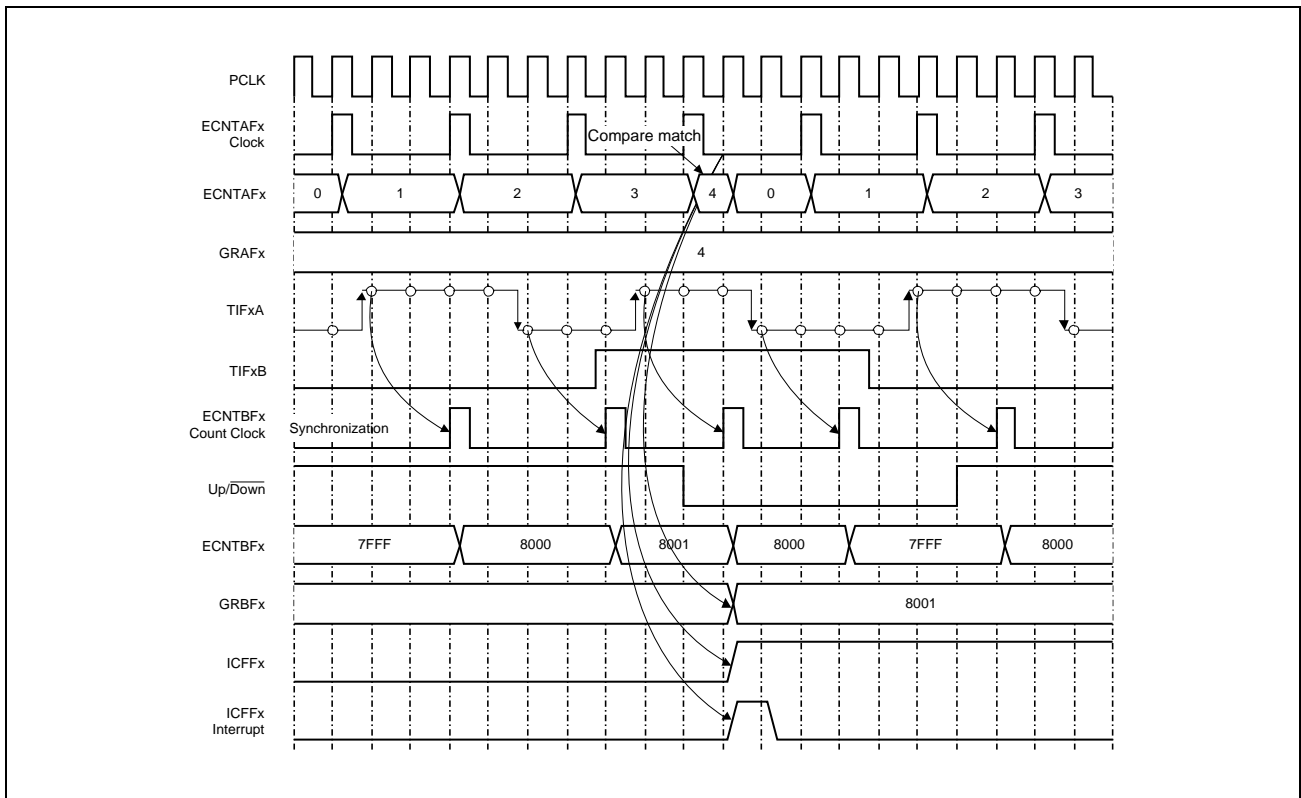

Figure 32.91 Operation Example of Up/Down Event Count

32.10.3.7 Four-time Multiplication Event Count

The count operation is executed using the external two input pins (TIFxA, TIFxB) as the count sources. Upcount or downcount is switched according to their input states. If a count period is designated to GRAFx, the count number after designation can be obtained in GRBFx. The counting period is the period of ECNTAFx count source clock (GRAFx value).

At this moment, the timer F operates as shown below. **Figure 32.91** shows an example of operation. The ECNTAFx clock and ECNTBFx clock show the timing that time counter ECNTAFx and event counter ECNTBFx execute the count operation or clearing, respectively.

- ECNTAFx: Measures time using one of the clock buses 0 to 5. When a compare match is detected, the count value is cleared synchronized with the next PCLK.
- ECNTBFx: Upcount/downcount operation is performed at both rising and falling edges of TIFxA and TIFxB respectively. Count direction is determined by the other signal input level. (See **Table 32.197.**) Because of synchronization processing, a delay of two cycles occurs in TIFxA and TIFxB.
- GRAFx: Functions as the compare match register for ECNTAFx. A compare match is detected when the count number in ECNTAFx and GRAFx agree.
- GRBFx: Functions as the capture register for ECNTBFx. When a compare match in ECNTAFx is detected, this register captures the ECNTBFx count number synchronizing with the next PCLK.
- Input capture interrupt request output: After a compare match detection of ECNTAFx, an input capture interrupt request is issued to CPU at the next PCLK cycle.
- ICFFx: After detecting a compare match in ECNTAFx, sets the ICFFx synchronized with the next PCLK.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Table 32.197 Count Direction in Four-time Multiplication Event Count Mode

Input	Count Direction							
	Upcount				Downcount			
TIFxA	High		Low		High		Low	
TIFxB		High		Low		High		High

NOTE

Operation when edge inputs in TIFxA and TIFxB are detected simultaneously is not guaranteed. The interval between edge inputs in TIFxA and TIFxB must be at least 1.5 cycles (PCLK).

Do not set this mode for the subblocks other than subblocks 0 to 2.

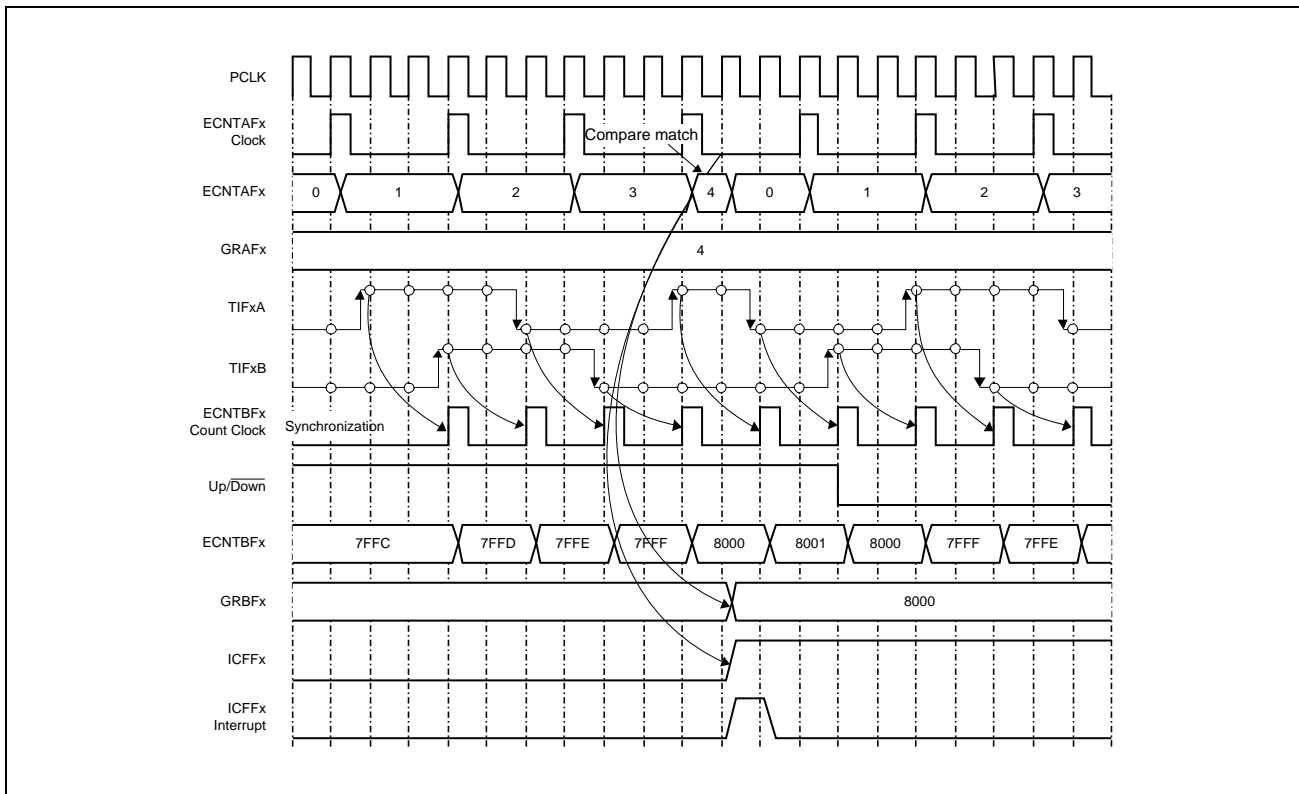

Figure 32.92 Operation Example of Four-time Multiplication Event Count Overflow/Underflow

32.10.3.8 Overflow and Underflow

Counter clearing of FFFFFFFFH (ECNTAFx and ECNTCFx) to 00000000H (ECNTAFx and ECNTCFx) or FFFFH (ECNTBFx) to 0000H (ECNTBFx) causes overflow detection. In this case, the overflow flag is reset and an overflow interrupt request is issued as soon as the counter value becomes 00000000H (or 0000H). (A figure is omitted.) When an overflow of ECNTAFx is detected, OVFAFx is set and an overflow A interrupt request is issued. When an overflow of ECNTBFx is detected, OVFBFx is set and an overflow B interrupt request is issued. When an overflow of ECNTCFx is detected, OVFCFx is set and an overflow C interrupt request is issued.

An underflow is detected when the counter value changes from 0000H (ECNTBFx) to FFFFH (ECNTBFx). In this case, OVFBFx is reset and an overflow interrupt request is issued as soon as the counter value becomes FFFFH. (A figure is omitted.) OVFBFx is also set. An underflow occurs only with ECNTBFx, in which case an overflow B interrupt request is issued.

32.10.3.9 Simultaneous Access of Multiple Registers

In PWM input waveform measurement mode and rotation speed/pulse measurement mode, saving register values of measurement results to backup registers provides multiple register values of the same time point. When the CDRFx register is read, register values are saved from GRAFx to BGRAFx, from GRCFx to BGRCFx, and from GRDFx to BGRDFx.

For saving general register values to backup registers and for reading data from backup registers, the backup control register Fx (BKCRFx) must be set. For details, see the section above explaining backup control registers.

With the above method in PWM input waveform measurement mode, reading CDRFx and then BGRCFx provides the PWM cycle and the duty time of the same time point. In “rotation speed/pulse measurement” mode, reading CDRFx and then BGRAFx, BGRCFx, and BGRDFx provides data of the same time point.

32.11 Timer G

32.11.1 Overview of Operation

The timer G block consists of SB_G timer G subblocks.

A timer G subblock counts the input clock, and when a predetermined time period has elapsed, generates a pulse signal of one PCLK cycle period.

It is provided with external event synchronization mode in which counter operation starts when a synchronize with an AGCK timing signal from timer B.

An input clock can be selected for the counter from the six clocks on the clock bus.

Configuration

Timer G subblock consists of a 32-bit counter (TCNTGx), a compare match register (OCRGx), a reload register (RLDGx), and a controller.

Figure 32.93 Block Diagram of Timer G Configuration

Interrupt Request

Timer G can issue SB_G interrupt requests as described below.

An interrupt request is issued upon compare match detection at timer subblock Gx.

32.11.2 Registers Related to Timer G

32.11.2.1 TSTRG — Timer Start Register G

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	STRG9	STRG8	STRG7	STRG6	STRG5	STRG4	STRG3	STRG2	STRG1	STRG0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.198 TSTRG Register Contents

Bit Position	Bit Name	Function
15 to SB _G	—	These bits are not used. Fix these bits to 0.
SB _G -1 to 0	STRGSB _G -1 to STRG0	Counter G start 0: TCNTG _x is disabled. 1: TCNTG _x is enabled.

Note: x indicates an integer from 0 to SB_G-1.

The timer start register G (TSTRG) is a 16-bit register. This register is an 8-bit/16-bit readable/writable register and specifies whether to start or stop each subblock (timer G0 to timer GSB_G-1) included in timer G. The counting is not performed if the TGE bit of the ATU master enable register (ATUENR) is not enabled even if the start bit of timer G permits counting.

TSTRG is initialized to 0000_H after reset.

Counter G Start (STRG_x)

These bits enable and disable timer counter (TCNTG_x) in the subblocks (G0 to GSB_G-1).

When these bits are cleared to “0”, TCNTG_x is stopped. TCNTG_x retains the value at that time while it is stopped.

When these bits are set to “1”, TCNTG_x resumes counting from the retained value. TCNTG_x runs when these bits and the TGE bit in ATU master enable register are both set to “1”.

CAUTION

The prescalers run independently of the setting of the counter G start bit and are not initialized when the TCNTG_x starts counting. Therefore, the time from when the STRG_x bit is set to when TCNTG_x starts counting may be less than the cycle of the selected count source clock (resolution), being undetermined due to hardware factors.

32.11.2.2 TIERG — Timer Interrupt Enable Register G

Value after reset: 0000_H

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.199 TIERG Register Contents

Bit Position	Bit Name	Function
15 to SB _G	—	These bits are not used. Fix these bits to 0.
SB _G -1 to 0	CMPIEGSB _G -1 to CMPIEG0	Compare match interrupt enable Gx 0: Disable interrupt request upon compare match 1: Enable interrupt request upon compare match

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

The timer interrupt enable register G (TIERG) is a 16-bit register. This register is an 8-bit/16-bit readable/writable register and specifies whether to enable or disable issuance of an interrupt request upon compare match output from each subblock (timer G0 to timer GSB_G-1). TIERG is initialized to 0000_H after reset.

32.11.2.3 RLDCRG — Reload Control Register G

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RLDEN G9	RLDEN G8	RLDEN G7	RLDEN G6	RLDEN G5	RLDEN G4	RLDEN G3	RLDEN G2	RLDEN G1	RLDEN G0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.200 RLDCRG Register Contents

Bit Position	Bit Name	Function
15 to SB _G	—	These bits are not used. When read, “0” is returned. When writing, write “0”.
SB _G -1 to 0	RLDENG _x	Reload Enable G _x 0: Disable the compare match register reload function upon compare match 1: Enable the compare match register reload function upon compare match

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Reload control registers G_x (RLDCRG_x) are 8-bit/16-bit readable/writable registers. RLDENG_x enables and disables the reload function.

RLDCRG_x is initialized to 0000_H after reset.

Reload Enable G_x (RLDENG_x)

When this bit is set to “1” to enable the reload function, the value of the reload register (RLDG_x) is transferred to the compare match register (OCRG_x) upon compare match between the timer counter G_x (TCNTG_x) and compare match register (OCRG_x).

32.11.2.4 TCRGx — Timer Control Register Gx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	CKSELGx[2:0]			—	—	—	EVSIMGx
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R/W

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Table 32.201 TCRGx Register Contents

Bit Position	Bit Name	Function
7	—	This bit is not used. When read, “0” is returned. When writing, write “0”.
6 to 4	CKSELGx[2:0]	Clock Select Gx These bits select the clock source of timer counter G (TCNTGx) of subblock. 000: Clock bus 0 001: Clock bus 1 010: Clock bus 2 011: Clock bus 3 100: Clock bus 4 101: Clock bus 5 110: Setting prohibited 111: Setting prohibited
3 to 1	—	These bits are not used. When read, “0” is returned. When writing, write “0”.
0	EVSIMGx	External event synchronization mode set Gx Specify the operation mode of timer subblock Gx 0: Normal count mode 1: External event synchronization mode

Note: x indicates an integer from 0 to SB_G-1.

Timer control registers Gx (TCRG0 to TCRGSB_G-1) are 8-bit readable/writable registers that set the operating mode of each subblock of timer G (G0 to GSB_G-1).

TCRG0 to TCRGSB_G-1 are initialized to 00_H after reset.

Clock Select Gx (CKSELGx)

These bits select the clock source of timer counter (TCNTGx) of subblocks (G0 to GSB_G-1).

Setting these bits to a value from “000” to “101” selects a clock source from clock bus 0 to clock bus 5. Do not set these bits to “111” or “111”. If “111” or “111” is set, the timer might not work properly.

External Event Synchronization Mode Set (EVSIMGx)

This bit specifies the operation mode for the timer counter Gx (TCNTGx) of timer subblocks G0 to GSB_G-1. If EVSIMGx is set to “1”, external event synchronization mode is set, an input AGCK timing signal is detected in timer B and a count is begun. When selecting the external event synchronous mode, select 101 (Clock bus 5 is selected in a clock source.) in CKSELGx [2:0] and set 1 as CB5SEL (Angle clock of timer B). Also, set CU4SEL of timer B as 1 (Until TCNTB3-1 counts TCNTB4 and, the clear value of TCNTB5 is set as 0.)

32.11.2.5 TSRGx — Timer Status Registers Gx

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	EVDTFGx	OVFGx	CMFGx
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Table 32.202 TSRGx Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. When read, “0” is returned. When writing, write “0”.
2	EVDTFGx	External event detection flag Gx 0: No external event has occurred. 1: An external event has occurred.
1	OVFGx	Overflow flag Gx 0: TCNTGx has not overflowed 1: TCNTGx has overflowed
0	CMFGx	Compare match flag Gx 0: Compare match has not occurred in subblocks Gx 1: Compare match has occurred in subblocks Gx

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Timer status registers Gx (TSRG0 to TSRGSB_G-1) are 8-bit/16-bit read-only registers that measure the time and indicate occurrence of event counter overflow and compare match.

The overflow flag is the status flag that indicates the occurrence of overflow. It is not used to generate interrupts. The compare match flag is a status flag that indicates occurrence of an interrupt request. Setting a bit of the timer status clear register (TSCRGx) clears the corresponding flag. If an interrupt source takes effect when this flag is set, an interrupt request is issued again. An interrupt request is issued even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source. When set and clear competed, clear is given priority to.

TSRG0 to TSRGSB_G-1 are initialized to 00_H after reset.

External Event Detection Flag Gx (EVDTFGx)

Indicates whether an external event is detected. This bit cannot be set to 0 or 1 by software.

- Setting (to 1) condition

When occurrence of the external event selected by input AGCKM timing signal is detected in timer B. (EVSIMGx = “1”)

- Clearing (to 0) condition

When the counter G start bit (STRGx) is set to “0”

Overflow Flag Gx (OVFGx)

Indicates whether timer counter Gx (TCNTGx) has overflowed. This bit cannot be set to 1 or 0 by software.

- Setting (to 1) condition

When TCNTGx has overflowed (from FFFF FFFF_H to 0000 0000_H)

- Clearing (to 0) condition

When “1” is written to OVFCGx in timer status clear register Gx (TSCRGx)

Compare Match Flag Gx (CMFGx)

Indicates whether a compare match has occurred in subblock Gx (G0 to GSB_G-1). This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition

When compare match is detected in subblock Gx

- Clearing (to 0) condition

When “1” is written to CMFCGx of the timer status clear register Gx (TSCRGx)

32.11.2.6 TSCR_{Gx} — Timer Status Clear Register G_x

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OVFCG _x	CMFCG _x
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Table 32.203 TSCR_{Gx} Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. When read, “0” is returned. When writing, write “0”.
1	OVFCG _x	Overflow flag clear G _x enable 0: Disabled (default) 1: Write 0 to OVFCG _x
0	CMFCG _x	Compare match flag clear G _x enable 0: Disabled (default) 1: Write 0 to CMFCG _x

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

TSCR_{Gx} is an 8-bit readable/writable register that clears the overflow and compare match flags.

TSCR_{Gx} is readable/writable only in 8-bit units. When this register is read, “0” is always returned.

TSCR_{Gx} is initialized to 00_H after reset.

Overflow Flag Clear G_x Enable (OVFCG_x)

When overflow flag G_x (OVFCG_x) of timer status register G_x (TSRG_x) is set to “1”, writing “1” to this register clears OVFCG_x to “0”. When read, “0” is always returned.

Compare Match Flag G_x Enable (CMFCG_x)

When compare match flag G_x (CMFCG_x) of timer status register G_x (TSRG_x) is set to “1”, writing “1” to this register clears CMFCG_x to “0”. When read, “0” is always returned.

32.11.2.7 TCNTGx — Timer Counters Gx

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCNTGx[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNTGx[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_{G-1}: Corresponding to subblocks G0 to GSB_{G-1}

Table 32.204 TCNTGx Register Contents

Bit Position	Bit Name	Function
31 to 0	TCNTGx[31:0]	Timer Counter Gx These bits store the up-counter value.

Note: x = 0 to SB_{G-1}: Corresponding to subblocks G0 to GSB_{G-1}

Timer counters Gx (TCNTGx) are 32-bit readable/writable registers. These registers are provided one for each subblock and are incremented by the clock selected in the corresponding control register. Clock bus 0 to 5 can be selected as the input clock.

When 1 is set as EVSYMGx, become the external event synchronous mode, and an input AGCK timing signal is detected in timer B and count start.

These counter values are compared with the value in compare match register Gx (OCRGx). When they match, the compare match flag (CMFGx bit in TSRGx register) is set and the counter value is cleared to 0000 0000_H in the next PCLK cycle. Note, however, that TCNTGx is initialized to 0000 0001_H if counter clearing by compare match and incrementation occur simultaneously. This occurs when TCNTGx is driven by the clock whose frequency is equal to the PCLK. An interrupt request can be issued to the CPU by detection of a compare match.

TCNTGx is initialized to 0000 0000_H after reset.

32.11.2.8 OCRGx — Compare Match Registers Gx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OCRGx[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OCRGx[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Table 32.205 OCRGx Register Contents

Bit Position	Bit Name	Function
31 to 0	OCRGx[31:0]	Compare match Gx These bits set the compare match value.

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Compare match registers Gx (OCRGx) are 32-bit readable/writable registers. These registers are provided one for each subblock, and function as the output compare register for timer counter Gx. A compare match can trigger an interrupt request.

Do not set OCRGx to 0000 0000_H. If set, compare match occurs at unintended timing.

OCRGx is initialized to FFFF FFFF_H after reset.

32.11.2.9 RLDGx — Reload Registers Gx

Value after reset: FFFF FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RLDGx[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RLDGx[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: x = 0 to SB_G-1: Corresponding to subblocks G0 to GSB_G-1

Reload registers Gx (RLDGx) are 32-bit readable/writable registers.

When the reload function is enabled, the value in this register is transferred to the compare match register Gx (OCRGx) upon compare match in the compare register (OCRGx).

Don't set 0000_0000_H as RLDGx. When setting 0000_0000_H, a comparing match occurs by the timing which isn't intended.

RLDGx is initialized to FFFF FFFF_H after reset.

32.11.3 Details of Operation

Specifying a time period in OCRGx generates a positive logical pulse of one PCLK cycle when the specified period has elapsed. The initial value of the output signal is “0”. The counting period is specified based on the clock source of TCNTGx. The generated signals can be used as interrupt request triggers.

The compare match flag (CMFGx) of the timer status register Gx (TSRGx) is set when a compare match occurs. Compare match can be used as a trigger for issuing an interrupt request to the CPU.

Figure 32.94 illustrates the operation example. In this example, the TCNTGx clock is an ideal signal to show the counting and clearing timing of counter TCNTGx.

If EVSYMGx is set to “1”, external event synchronization mode is set, an input AGCK timing signal is detected in timer B and count start.

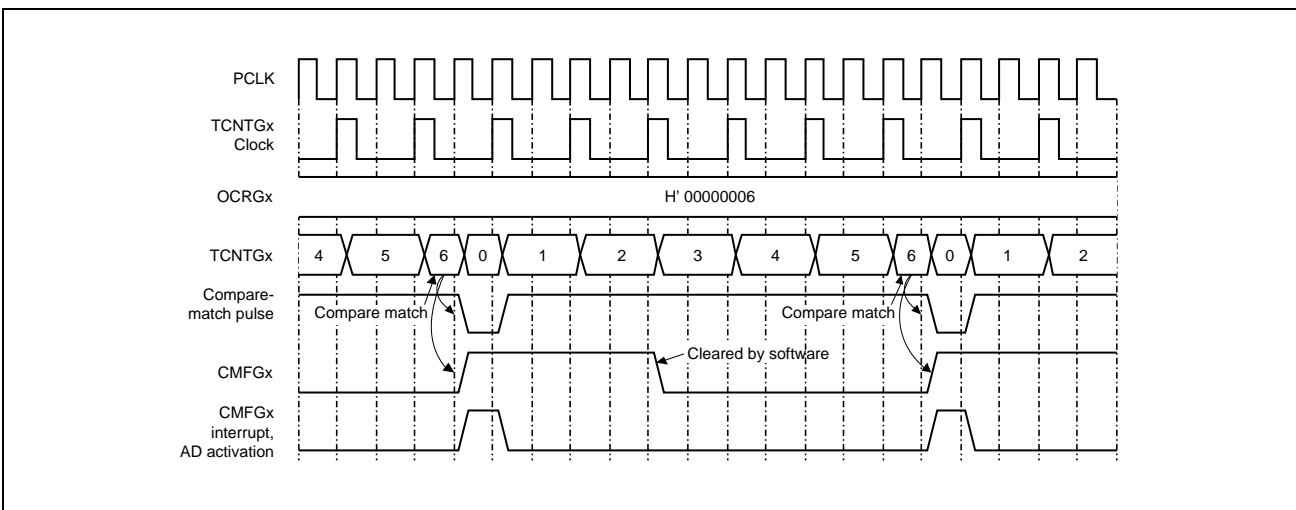

Figure 32.94 Operation Example of Counter and Compare Match

Figure 32.95 Reload Operation (RLDENGx = 1)

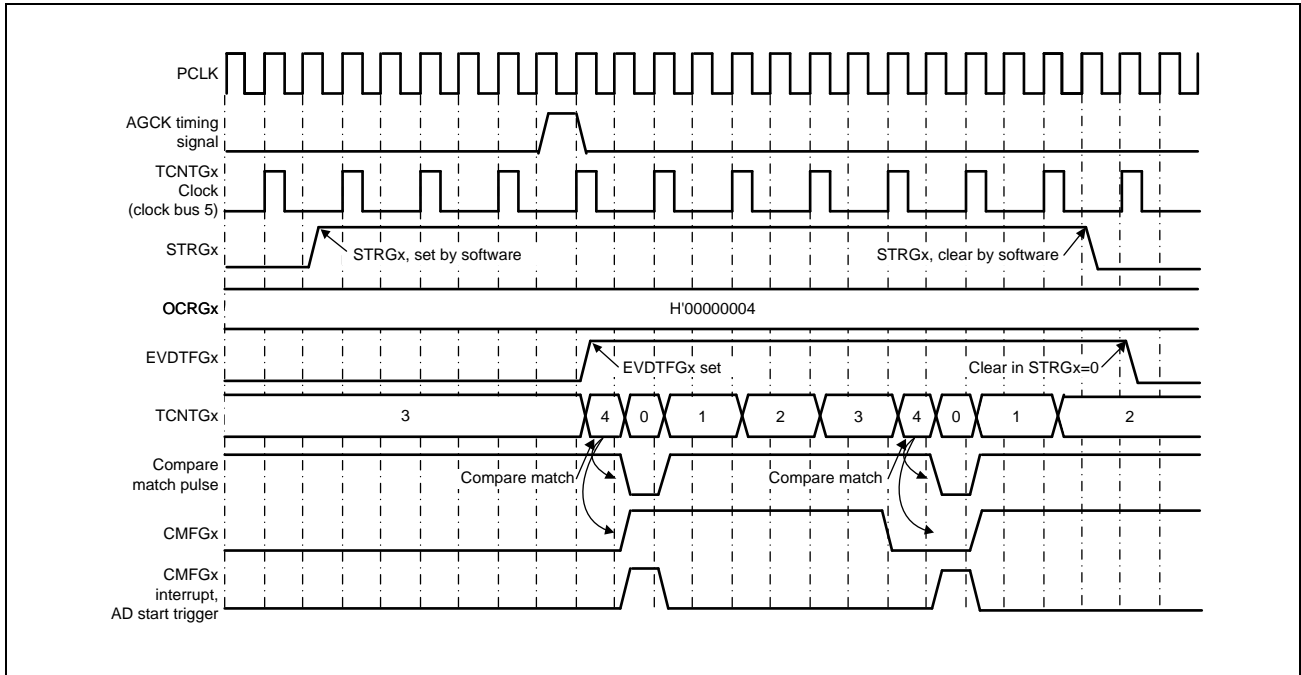

Figure 32.96 External Event Synchronization Mode (EVSIMGx = 1)

32.12 Automatic Switching of DMA and A/D Requests

32.12.1 Operation

This function controls trigger signals to be output to DMA and SAR-AD.

There are three trigger signals of data DMA trigger, count DMA trigger, and SAR-AD trigger signals described below

(1) Data DMA Trigger

DMA output signals AD skipping DMA transfer request 0 and AD skipping DMA transfer request 1 are provided as the data DMA trigger signals.

The data DMA trigger can be selected from AGCK1 from timer B, timer G sub-block G1, G2 compare interrupt output (timer G1 compare interrupt or timer G2 compare interrupt), DF filter completion signal, ADC scan group 0 to 4 end interrupts (ADC0 scan group 0 end interrupt, ADC0 scan group 1 end interrupt, ADC0 scan group 2 end interrupt, ADC0 scan group 3 end interrupt, or ADC0 scan group 4 end interrupt), and output stop.

Either of two data DMA trigger signals is output, and the DMA output to output the trigger is switched at the comparison timing between TCNT1D0 and OCR1D00 of timer D.

(2) Count DMA Trigger

DMA output signals AD skipping DMA transfer request 2 and AD skipping DMA transfer request 3 are provided as the count DMA trigger signals.

The count DMA trigger can be selected from AGCK of timer A, timer G sub-block G3 compare interrupt output (timer G3 compare interrupt), and output stop.

Either of two count DMA trigger signals is output, and the DMA output to output the trigger is switched at the comparison timing between TCNT1D0 and OCR1D00 of timer D.

(3) SAR-AD Trigger

SAR-AD output signal is provided as the SAR-AD trigger signal.

The SAR-AD trigger can be selected from AGCK1 of timer B, timer G sub-block G1, G2 compare interrupt outputs (timer G1 compare interrupt or timer G2 compare interrupt), and output stop.

32.12.2 Registers Related to Automatic Switching of DMA and AD Requests

32.12.2.1 TRGSRDMA0 — Trigger Status Register DMA0

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OUTSRDMA0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.206 TRGSRDMA0 Register Contents

Bit Position	Bit Name	Function
7 to 1	—	These bits are not used. Fix these bits to 0.
0	OUTSRDMA0	0: AD skipping DMA transfer request 0 is selected 1: AD skipping DMA transfer request 1 is selected.

Trigger status register DMA0 is an 8-bit read-only register that indicates the selected data DMA output: AD skipping DMA transfer request 0 or AD skipping DMA transfer request 1.

32.12.2.2 TRGSELDMA00 — Trigger Select Register DMA00

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	INSELDMA00			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 32.207 TRGSELDMA00 Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. Fix these bits to 0.
3 to 0	INSELDMA00	0000: Output stop (output is fixed to “0”.) 0001: AGCK1 is selected. 0010: Timer G subblock G1 compare interrupt signal (CMFG1 interrupt) is selected. 0011: Timer G subblock G2 compare interrupt signal (CMFG2 interrupt) is selected. 0100: DF filter completion signal is selected. 0101: Setting prohibited 0110: Setting prohibited 0111: Setting prohibited 1000: ADC0 scan group 0 end interrupt is selected. 1001: ADC0 scan group 1 end interrupt is selected. 1010: ADC0 scan group 2 end interrupt is selected. 1011: ADC0 scan group 3 end interrupt is selected. 1100: ADC0 scan group 4 end interrupt is selected. 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited

This register is an 8-bit readable/writable register that selects the signal to be output to the data DMA output AD skipping DMA transfer request 0. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

32.12.2.3 TRGSELDMA01 — Trigger Select Register DMA01

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	INSELDMA01			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 32.208 TRGSELDMA01 Register Contents

Bit Position	Bit Name	Function
7 to 4	—	These bits are not used. Fix these bits to 0.
3 to 0	INSELDMA01	0000: Output stop (output is fixed to “0”.) 0001: AGCK1 is selected. 0010: Timer G subblock G1 compare interrupt signal (CMFG1 interrupt) is selected. 0011: Timer G subblock G2 compare interrupt signal (CMFG2 interrupt) is selected. 0100: DF filter completion signal is selected. 0101: Setting prohibited 0110: Setting prohibited 0111: Setting prohibited 1000: ADC0 scan group 0 end interrupt is selected. 1001: ADC0 scan group 1 end interrupt is selected. 1010: ADC0 scan group 2 end interrupt is selected. 1011: ADC0 scan group 3 end interrupt is selected. 1100: ADC0 scan group 4 end interrupt is selected. 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited

This register is an 8-bit readable/writable register that selects the signal to be output to the data DMA output AD skipping DMA transfer request 1. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

32.12.2.4 TRGSELAD — Trigger Select Register AD

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INSELAD	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.209 TRGSELAD Register Contents

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. Fix these bits to 0.
1, 0	INSELAD	00: Output stop (output is fixed to “0”). 01: AGCK1 is selected. 10: Timer G subblock G1 compare interrupt signal (CMFG1 interrupt) is selected. 11: Timer G subblock G2 compare interrupt signal (CMFG2 interrupt) is selected.

This register is an 8-bit readable/writable register that selects the signal to be output to the SAR-AD trigger. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

32.12.2.5 TRGSRDMA1 — Trigger Status Register DMA1

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OUTSRDMA1
Value after reset	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
7 to 2	—	These bits are not used. Fix these bits to 0.
1, 0	INSELDMA11	00: Output stop (output is fixed to "0".) 01: AGCK is selected 10: Timer G subblock G3 compare interrupt signal (CMFG3 interrupt) is selected. 11: Setting prohibited

This register is an 8-bit readable/writable register that selects the signal to be output to the count DMA output AD skipping DMA transfer request 3. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

32.12.3 Details of Operation

The following describes the operation and block diagram of each trigger.

32.12.3.1 Data DMA Trigger

The signal to be output to the data DMA trigger output pin (AD skipping DMA transfer request 0) is selected by the INSELDMA00[3:0] bits in TRGSELDMA00.

The signal to be output to the data DMA trigger output pin (AD skipping DMA transfer request 1) is selected by the INSELDMA01[3:0] bits in TRGSELDMA00.

The data DMA trigger output pin outputs only AD skipping DMA transfer request 0 when the DMA select signal is low, and only AD skipping DMA transfer request 1 when the DMA select signal is high.

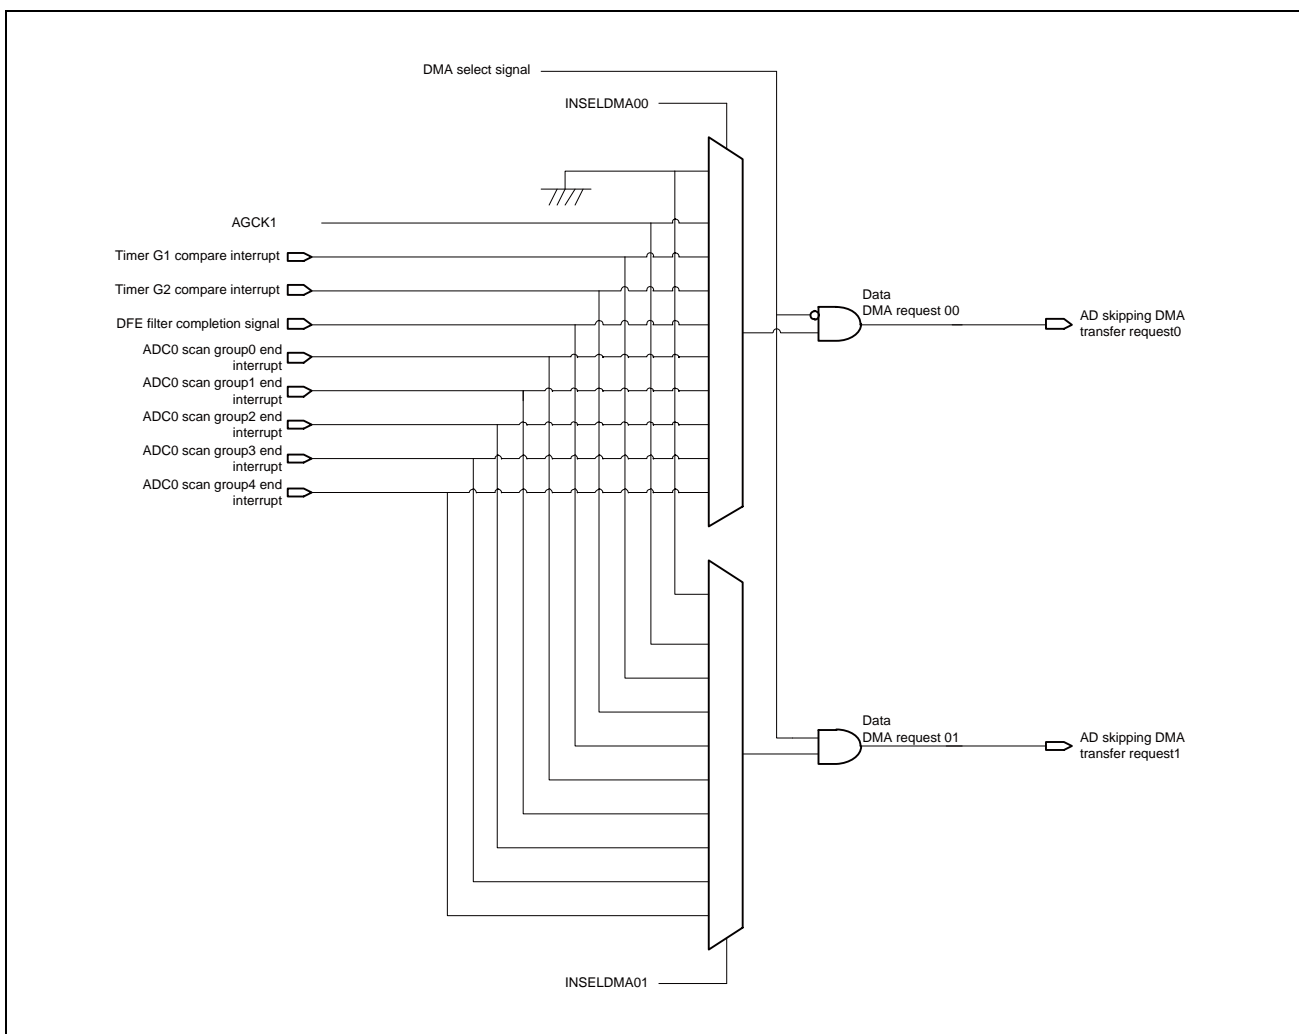

Figure 32.97 Data DMA Trigger Selection Circuit

32.12.3.2 Count DMA Trigger

The signal to be output to the count DMA trigger output pin (AD skipping DMA transfer request 2) is selected by the INSELDMA10[1:0] bits in TRGSELDMA10.

The signal to be output to the data DMA trigger output pin (AD skipping DMA transfer request 3) is selected by the INSELDMA11[1:0] bits in TRGSELDMA11.

The count DMA trigger output pin outputs only AD skipping DMA transfer request 2 when the DMA select signal is low, and only AD skipping DMA transfer request 3 when the DMA select signal is high.

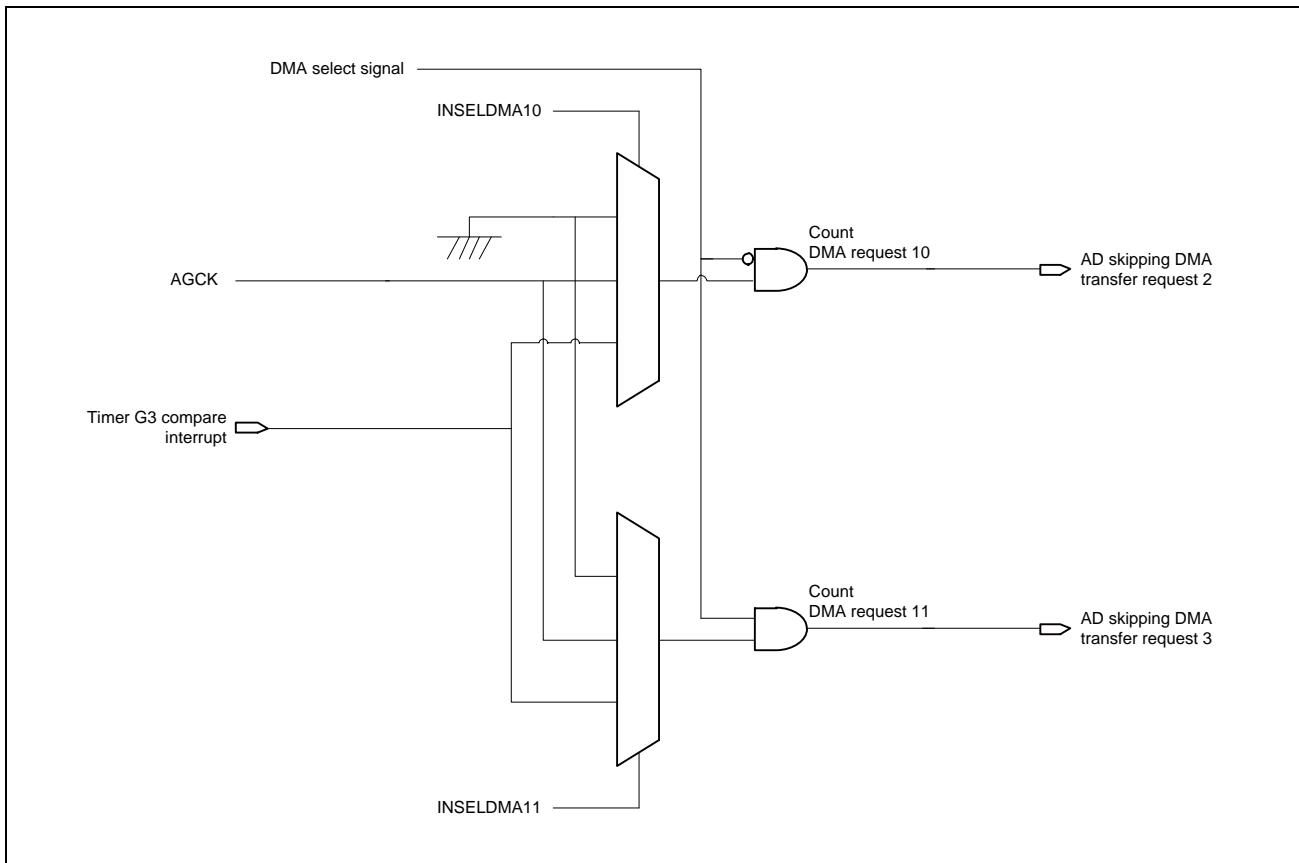

Figure 32.98 Count DMA Trigger Selection Circuit

32.12.3.3 SAR-AD Trigger

The signal to be output to the SAR-AD trigger output pin is selected by the INSELAD[1:0] bits in TRGSELDAD.

Figure 32.99 SAR-AD Trigger Selection Circuit

Figure 32.100 shows the trigger output timing chart.

Figure 32.100 DMA/AD Trigger Timing Chart

32.13 Trigger Select Function

32.13.1 Overview of Operation

The function for which each trigger indicated on the following is selected.

- Interrupt signal communicated to INTC is selected.
- Interrupt signal communicated to sDMA/DTS is selected.
- “Timer DFE Capture trigger i ($i = 0$ to 2)” communicated to DFE selected.
- “Timer FIFO Capture trigger” communicated to DFE is selected.
- “read gate” communicated to DSADC is selected.
- “read gate” communicated to C-ADC is selected.
- “time stamp” and “sync pulse” communicated to PSI5S is selected.

32.13.2 Registers Related to Trigger Select Function

32.13.2.1 ATUINTSELA — ATU TimerA Interrupt Selection Control Register

Value after reset: 0000 0000_H

Table 32.222 ATUDMASELB Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved. When writing to these bits, write 0.
15 to 12 (j=3)	ATU_DMASEL_Bj	Select as DMA request 46+j or 174+j (group 1) or DTS request no.46+j or 110+j (group 2) from the following signals. (j=3 to 0)
11 to 8 (j=2)	[3:0]	
7 to 4 (j = 1)	(j=3 to 0)	
3 to 0 (j = 0)		
		0000: OCRB0 compare match interrupt
		0001: OCRB1 compare match interrupt
		0010: OCRB6 compare match interrupt
		0011: OCRB10 compare match interrupt
		0100: OCRB11 compare match interrupt
		0101: OCRB12 compare match interrupt
		0110: Comparison between TCNTB6M and ICRB6 condition match interrupt
		0111: AND/OR condition of CMFB6 and CMFB6M condition match interrupt
		1000: ICRB0 input capture interrupt
		others: inhibited

The factor communicated to a DMA system is selected from the interrupt signal output from Timer B.

Table 32.237 ATUP5SSEL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	—	Reserved. When writing to these bits, write 0.
27 to 26	ATU_P5SSEL_SSTS B[1:0]	Select as PSI5-S Run-stop time stamp B from the following signals. 00: TIOC31 Timer C (sub-block 3, channel 1) compare-match output 01: TOD31A Timer D (sub-block 3, channel 1) compare-match A output 10: TOD31B Timer D (sub-block 3, channel 1) compare-match B output 11: TOE31 Timer E (sub-block 3, channel 1) PWM output
25 to 24	ATU_P5SSEL_SSTS A[1:0]	Select as PSI5-S Run-stop time stamp A from the following signals. 00: TIOC30 Timer C (sub-block 3, channel 0) compare-match output 01: TOD30A Timer D (sub-block 3, channel 0) compare-match A output 10: TOD30B Timer D (sub-block 3, channel 0) compare-match B output 11: TOE30 Timer E (sub-block 3, channel 0) PWM output
23 to 22	ATU_P5SSEL_CRTS B[1:0]	Select as PSI5-S clear time stamp B from the following signals. 00: TIOC23 Timer C (sub-block 2, channel 3) compare-match output 01: TOD23A Timer D (sub-block 2, channel 3) compare-match A output 10: TOD23B Timer D (sub-block 2, channel 3) compare-match B output 11: TOE23 Timer E (sub-block 2, channel 3) PWM output
21 to 20	ATU_P5SSEL_CRTS A[1:0]	Select as PSI5-S clear time stamp A from the following signals. 00: TIOC22 Timer C (sub-block 2, channel 2) compare-match output 01: TOD22A Timer D (sub-block 2, channel 2) compare-match A output 10: TOD22B Timer D (sub-block 2, channel 2) compare-match B output 11: TOE22 Timer E (sub-block 2, channel 2) PWM output
19 to 18	ATU_P5SSEL_CKTS B[1:0]	Select as PSI5-S clock time stamp B from the following signals. 00: TIOC21 Timer C (sub-block 2, channel 1) compare-match output 01: TOD21A Timer D (sub-block 2, channel 1) compare-match A output 10: TOD21B Timer D (sub-block 2, channel 1) compare-match B output 11: TOE21 Timer E (sub-block 2, channel 1) PWM output

Table 32.237 ATUP5SSEL Register Contents (2/2)

Bit Position	Bit Name	Function
17 to 16	ATU_P5SSEL_CKTS A[1:0]	Select as PSI5-S clock time stamp A from the following signals. 00: TIOC20 Timer C (sub-block 2, channel 0) compare-match output 01: TOD20A Timer D (sub-block 2, channel 0) compare-match A output 10: TOD20B Timer D (sub-block 2, channel 0) compare-match B output 11: TOE20 Timer E (sub-block 2, channel 0) PWM output
15 to 14	ATU_P5SSEL_TGC7[1:0]	Select as PSI5-S Trigger sync channel 7 from the following signals. 00: TIOC13 Timer C (sub-block 1, channel 3) compare-match output 01: TOD13A Timer D (sub-block 1, channel 3) compare-match A output 10: TOD13B Timer D (sub-block 1, channel 3) compare-match B output 11: TOE13 Timer E (sub-block 1, channel 3) PWM output
13 to 12	ATU_P5SSEL_TGC6[1:0]	Select as PSI5-S Trigger sync channel 6 from the following signals. 00: TIOC12 Timer C (sub-block 1, channel 2) compare-match output 01: TOD12A Timer D (sub-block 1, channel 2) compare-match A output 10: TOD12B Timer D (sub-block 1, channel 2) compare-match B output 11: TOE12 Timer E (sub-block 1, channel 2) PWM output
11 to 10	ATU_P5SSEL_TGC5[1:0]	Select as PSI5-S Trigger sync channel 5 from the following signals. 00: TIOC11 Timer C (sub-block 1, channel 1) compare-match output 01: TOD11A Timer D (sub-block 1, channel 1) compare-match A output 10: TOD11B Timer D (sub-block 1, channel 1) compare-match B output 11: TOE11 Timer E (sub-block 1, channel 1) PWM output
9 to 8	ATU_P5SSEL_TGC4[1:0]	Select as PSI5-S Trigger sync channel 4 from the following signals. 00: TIOC10 Timer C (sub-block 1, channel 0) compare-match output 01: TOD10A Timer D (sub-block 1, channel 0) compare-match A output 10: TOD10B Timer D (sub-block 1, channel 0) compare-match B output 11: TOE10 Timer E (sub-block 1, channel 0) PWM output
7 to 6	ATU_P5SSEL_TGC3[1:0]	Select as PSI5-S Trigger sync channel 3 from the following signals. 00: TIOC03 Timer C (sub-block 0, channel 3) compare-match output 01: TOD03A Timer D (sub-block 0, channel 3) compare-match A output 10: TOD03B Timer D (sub-block 0, channel 3) compare-match B output 11: TOE03 Timer E (sub-block 0, channel 3) PWM output
5 to 4	ATU_P5SSEL_TGC2[1:0]	Select as PSI5-S Trigger sync channel 2 from the following signals. 00: TIOC02 Timer C (sub-block 0, channel 2) compare-match output 01: TOD02A Timer D (sub-block 0, channel 2) compare-match A output 10: TOD02B Timer D (sub-block 0, channel 2) compare-match B output 11: TOE02 Timer E (sub-block 0, channel 2) PWM output
3 to 2	ATU_P5SSEL_TGC1[1:0]	Select as PSI5-S Trigger sync channel 1 from the following signals. 00: TIOC01 Timer C (sub-block 0, channel 1) compare-match output 01: TOD01A Timer D (sub-block 0, channel 1) compare-match A output 10: TOD01B Timer D (sub-block 0, channel 1) compare-match B output 11: TOE01 Timer E (sub-block 0, channel 1) PWM output
1 to 0	—	Reserved. When writing to these bits, write 0.

The factor communicated to a PSI5-S (as Time Stamp input) is selected from the external-output signal from Timer C/D/E.

32.13.3 Details of Operation

32.13.3.1 Interrupt signal communicated to INTC is selected.

The function for which interrupt number allocation of an interrupt factor of ATU is selected.

- Timer A

4 of allocation is possible from “ICRA0-7 input capture interrupt” of timer A. One is selected from ICRA0-7 and a factor is assigned by setting of ATUINTSELA register. It can be allocated to interrupt number 10-13.

Figure 32.101 Block Diagram of Timer A Interrupt Selection.

- Timer D

One factor is selected from “OCR1Dxy compare match interrupt”, “OCR2Dxy compare match interrupt”, “1shot pulse ON Dxy occurrence interrupt”, “1shot pulse OFF Dxy occurrence interrupt” and “UDIDxy down-counter underflow interrupt” of timer D and it’s assigned to interrupt. The interrupt number and correspondence with subblock x and channel y are shown to **Table 32.238**.

32.13.3.2 Interrupt signal communicated to sDMA/DTS is selected.

- Timer B

One factor is selected from “OCRB0, OCRB1, OCRB6, OCRB10, OCRB11, OCRB12 compare match interrupt”, “Comparison between TCNTB6M and ICRB6 condition match interrupt”, “AND/OR condition of CMFB6 and CMFB6M condition match interrupt” and “ICRB0 input capture interrupt” of timer B and it’s assigned to sDMA / DTS.

Figure 32.103 Block Diagram of Timer B DMA Selection.

• Timer C / Timer D

One factor is selected from “GRCxy input capture/compare match interrupt” and “OCRCxy input capture/compare match interrupt” of timer C and “OCR1Dxy, OCR2Dxy compare match interrupt”, “1shot pulse ON Dxy occurrence interrupt”, “1shot pulse OFF Dxy occurrence interrupt” and “UDIDxy down-counter underflow interrupt” of timer D and it’s assigned sDMA / DTS. The sDMA/DTS number and correspondence with subblock x and channel y are shown to **Table 32.239**.

32.13.3.3 “Timer DFE Capture trigger i (i = 0 to 2)” communicated to DFE selected.

The factor selected from “GRCxy input capture/compare match interrupt” or “OCRCxy input capture/compare match interrupt” in timer C and “OCR1Dxy, OCR2Dxy compare match interrupt”, “1shot pulse ON Dxy occurrence interrupt”, “1shot pulse OFF Dxy occurrence interrupt” and “UDIDxy down-counter underflow interrupt” of timer D is assigned to a trigger of DFE. A factor of each timer can change enable or disable. It can be chosen from several subblocks and a channel from timer C and timer D. The subblock which can be chosen and a channel are shown to **Table 32.241**.

Figure 32.106 Block Diagram of ATU to DFE Capture Trigger Selection.

32.13.3.4 “Timer FIFO Capture trigger” communicated to DFE is selected.

One factor is selected from “OCRG0-OCRG7 compare-match interrupt” of timer G and it’s assigned to interrupt.

Figure 32.107 Block Diagram of ATU to DFE Capture Trigger Selection.

32.13.3.5 “read gate” communicated to DSADC is selected.

One factor is selected from TIOCxy, TODxyA, TODxyB and TOExy and it’s assigned to read gate in DSADC.

Correspondence with a subblock of the unit of DSADC and each timer and a channel is shown to **Table 32.242**.

Figure 32.108 Block Diagram of ATU to DSADC Read Gate Trigger Selection.

Table 32.242 DSADC Channel Number and Contrast in a Timer C, D and E Subblock and Channel

Unit	Timer C		Timer D		Timer E	
	Sub Block x	Channel y	Sub Block x	Channel y	Sub Block x	Channel y
DSADC00	0	0	0	0	0	0
DSADC10	0	1	0	1	0	1

Run-stop timestamp A	3	0	3	0	3	0
Run-stop timestamp B	3	1	3	1	3	1

32.14 Usage Notes

In ATU-V, status register (TSR) flags deployed in different timers are status flags indicating occurrences of compare match, overflow, underflow, and input capture. If compare match, overflow, underflow, or input capture occurs when the status flag is set to 1, the status flag retains the value “1”, and an interrupt request is issued to the CPU. To find out whether an interrupt is requested properly, check the corresponding flag on the INTC. If two interrupt conditions occur in succession in a period shorter than a PCLK cycle, an interrupt request is generated for the first interrupt condition, and not for the subsequent one.

This section describes the conflicts and operation that may occur during ATU-V operation.

32.14.1 Input Capture Conflict Operation

32.14.1.1 Conflict between Writing to General Register and Input Capture

When a write to a general register occurs simultaneously with input capture, writing takes priority (see the left portion of **Figure 32.111** below). However, an input capture interrupt request is issued, and if input capture status is provided, the input capture flag is set. The waveforms in the right portion of **Figure 32.111** show a case in which writing occurs one PCLK cycle prior to input capture.

Figure 32.111 Conflict between Writing to GRCxy and Input Capture

Timer	Counter (Whose Value is Captured)	Capture Register	Status
Timer C	TCNTCx	GRCxy	IMFCxy
Timer F	ECNTAFx	GRAFx	ICFFx
	ECNTBFx	GRBFx	
	ECNTCFx	GRCFx	
	ECNTCFx + GRDFx	GRDFx	

32.14.1.2 Conflict between Writing to Counter and Input Capture

When a write to a counter occurs simultaneously with input capture, the value immediately before writing is captured (see the left portion of **Figure 32.112**). The waveforms in the right portion of **Figure 32.112** show a case in which writing occurs one PCLK cycle prior to input capture, so the written value is captured.

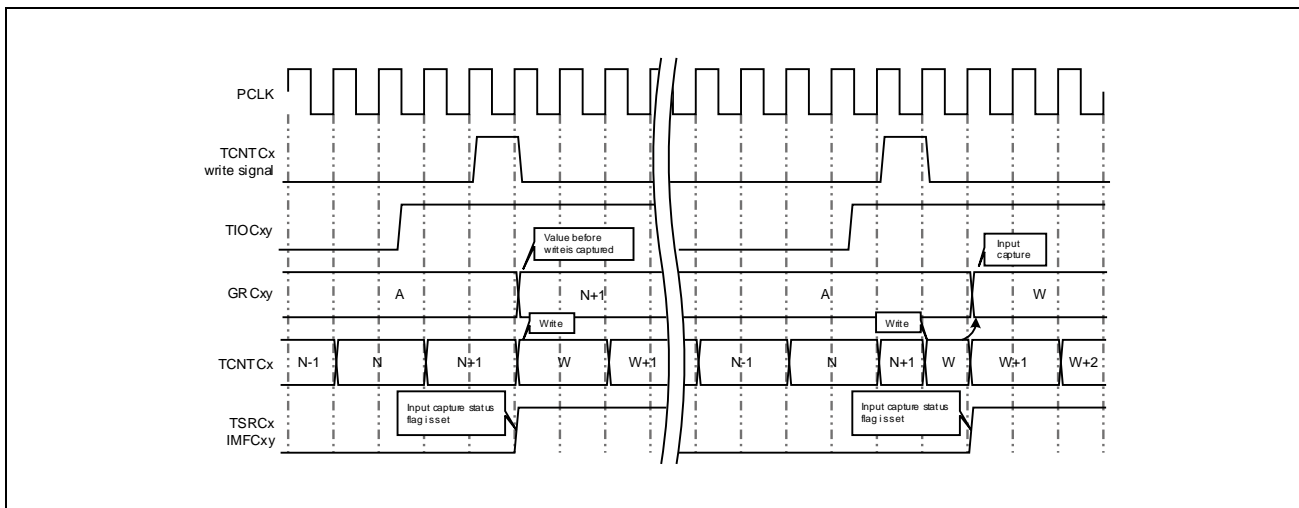

Figure 32.112 Conflict between Writing to TCNTCx and Input Capture

Timer	Counter (Whose Value is Captured)	Capture Register	Status
Timer A	TCNTAx	ICRAx	ICFAx
Timer B	TCNTB0	ICRB0	ICFB0
	TCNTB0 + ICRB1	ICRB1	
	TCNTB6	ICRB6	—
Timer C	TCNTCx	GRCxy	IMFCxy
Timer D	TCNT1Dx	OSBRDx	—
	TCNT1Dx	ICR1Dxy	
	TCNT2Dx	ICR2Dxy	—
Timer F	ECNTAFx	GRAFx	ICFFx
	ECNTBFx	GRBFx	
	ECNTCFx	GRCFx	
	ECNTCFx + GRDFx	GRDFx	

32.14.1.3 Conflict between Setting and Clearing of Input Capture Status Flag

Flag clearing by a timer status clear register takes priority over flag setting by an input capture. The left portion of **Figure 32.113** shows an example where an input capture and a flag clearing occur simultaneously, and the flag is cleared. In contrast with this, the waveforms in the right portion of **Figure 32.113** show an example in which input capture is performed immediately after the flag has been cleared.

Figure 32.113 Conflict between Status Clearing by Writing 1 to Status Clear Register and Input Capture

Timer B	ICFB0
Timer F	ICFFx

32.14.2 Compare Match Conflict Operation

32.14.2.1 Compare Match Signal in Cases of Consecutive Comparison

Matches between the counter and comparison register will take two or more PCLK cycles when the counter clock has a period of or more than two PCLK cycles. Detection of the rising edge of the compare match signal by the timers listed in the table below is handled as the compare match signal.

Timer	Counter	Compare Match Register
Timer C	TCNTCx	GRCxy, OCRCxy
Timer D	TCNT1Dx, TCNT2Dx	OCR1Dxy, RCR1Dx OCR2Dxy, RCR2Dx

32.14.2.2 Conflict between Writing to Compare Match General Register and Compare Match

A conflict between a write to a register provided with the compare match function and compare match is described below, using timer C as an example. If a write occurs after the values of GRCxy and TCNTCx match (see the left portion of **Figure 32.114**), a compare match interrupt request is issued, and the compare match status is set. If GRCxy and TCNTCx do not match in any cycles (see the right portion of **Figure 32.114**), no compare match is detected.

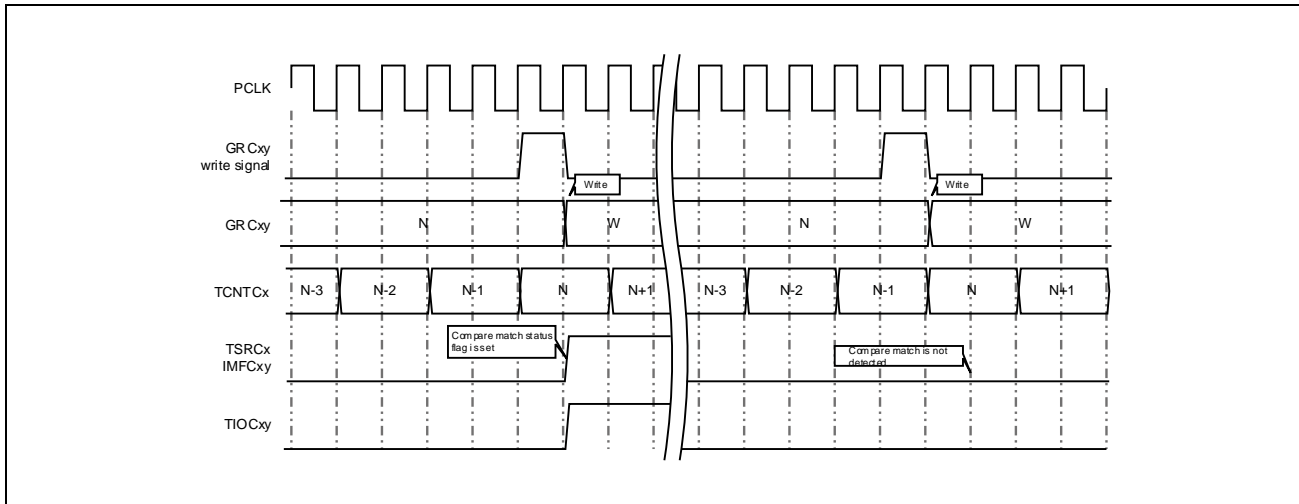

Figure 32.114 Conflict between Writing to GRCxy and Compare Match

Timer	Counter	Compare Match Register	Status
Timer B	TCNTB1	OCRB1	CMFB1
	TCNTB1	OCRB10	CMFB10
	TCNTB1	OCRB11	CMFB11
	TCNTB1	OCRB12	CMFB12
Timer C	TCNTCx	GRCxy	IMFCxy
Timer D	TCNT1Dx	OCR1Dxy	CMFADxy
	TCNT2Dx	OCR2Dxy	CMFBDxy
Timer F	ECNTAFx	GRAFx	—
	ECNTBFx	GRBFx	—
	ECNTCFx	GRBFx	OVFCFx
		GRDFx	OVFCFx
Timer G	TCNTGx	OCRGx	CMFGx

Timing of compare match B0 and compare match B6 of timer B and the cycle match of timer E differ from the timing of these compare matches. For details, see the next **Section 32.14.2.3, Conflict between CYLRExy Write and Cycle Match with TCNTExy**.

32.14.2.3 Conflict between CYLRExy Write and Cycle Match with TCNTExy

Operation when a write to CYLRExy occurs simultaneously with compare match (cycle match) with TCNTExy is shown below. As shown in the left portion of **Figure 32.115**, if a write to CYLRExy occurs at the same timing as cycle match counter clearing, TCNTExy is cleared as in the same manner as normal cycle match, a cycle match interrupt request is issued, and the cycle match status and PWM output are changed. The waveforms in the right portion of **Figure 32.115** show an example in which CYLRExy is written to before the counter is cleared. In this case, no cycle match is detected and TCNTExy continues counting up.

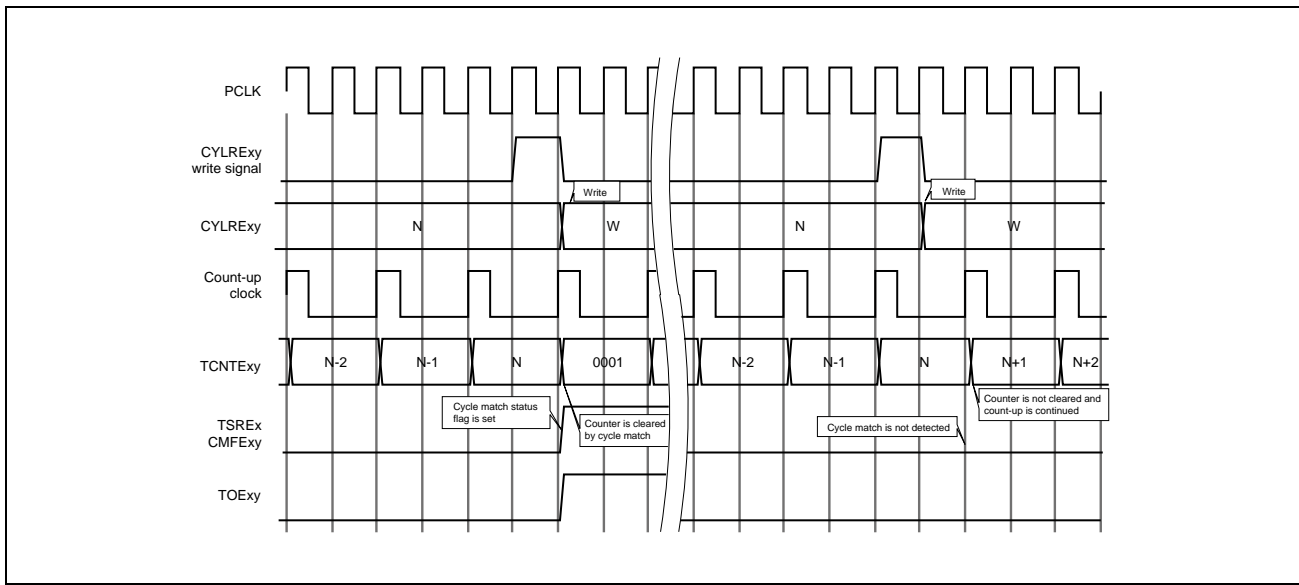

Figure 32.115 Conflict between Writing to CYLRExy and Cycle Match

Timer	Counter	Compare (Cycle) Match Register	Status
Timer B	TCNTB0	OCRB0	CMFB0
	TCNTB6	OCRB6	CMFB6
	TCNTB6M	ICRB6	CMFB6M
Timer E	TCNTExy	CYLRExy	CMFExy

32.14.2.4 Conflict between DTRExy Write and Cycle Match with TCNTExy

The operation is the same as the case of conflicts between CYLRExy writes and cycle matches with TCNTExy described above.

32.14.2.5 Conflict between Writing to Counter and Compare Match

A conflict between a write to a counter and compare match is described below. If a write occurs after the compare match register and the counter match (see the left portion of **Figure 32.116**), a compare match interrupt request is issued, and the compare match status is set. If the compare match register and the counter do not match in any cycles (see the right portion of **Figure 32.116**), a compare match interrupt request is not issued, and a compare match is not detected.

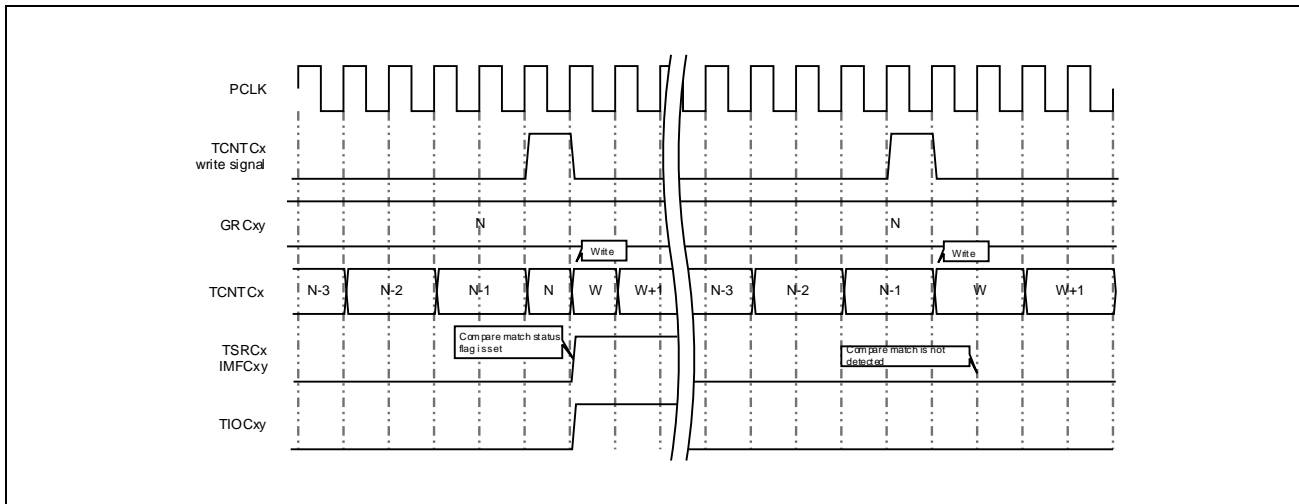

Figure 32.116 Conflict between Writing to TCNTCx and Compare Match

Timer	Counter	Compare Match Register	Status
Timer B	TCNTB1	OCRB1	CMFB1
Timer C	TCNTCx	GRCxy	IMFCxy
Timer D	TCNT1Dx	OCR1Dxy	CMFADxy
	TCNT2Dx	OCR2Dxy	CMFBDxy
Timer F	ECNTAFx	GRAFx	—
	ECNTBFx	GRBFx	—
	ECNTCFx	GRBFx	OVFCFx
		GRDFx	OVFCFx
Timer G	TCNTGx	OCRGx	CMFGx

Timing of compare match B0 and compare match B6 of timer B and the cycle match of timer E differ from the timing of these compare matches. For details, see the **Section 32.14.2.7, Conflict between Writing to TCNTExy and Counter Clearing by Cycle Match** and the **Section 32.14.2.3, Conflict between CYLRExy Write and Cycle Match with TCNTExy**, below.

32.14.2.6 Conflict between Writing to Counter and Counter Clearing by Compare Match

The waveforms shown below are for when the compare match counter clear function is enabled. If a write to a counter and counter clearing by compare match occur simultaneously, the counter is not cleared and the write takes priority (see the left portion of **Figure 32.117**). However, a compare match interrupt request is issued, and the compare match status is set. The waveforms in the right portion of **Figure 32.117** show a case in which writing to TCNTCx is delayed one PCLK cycle.

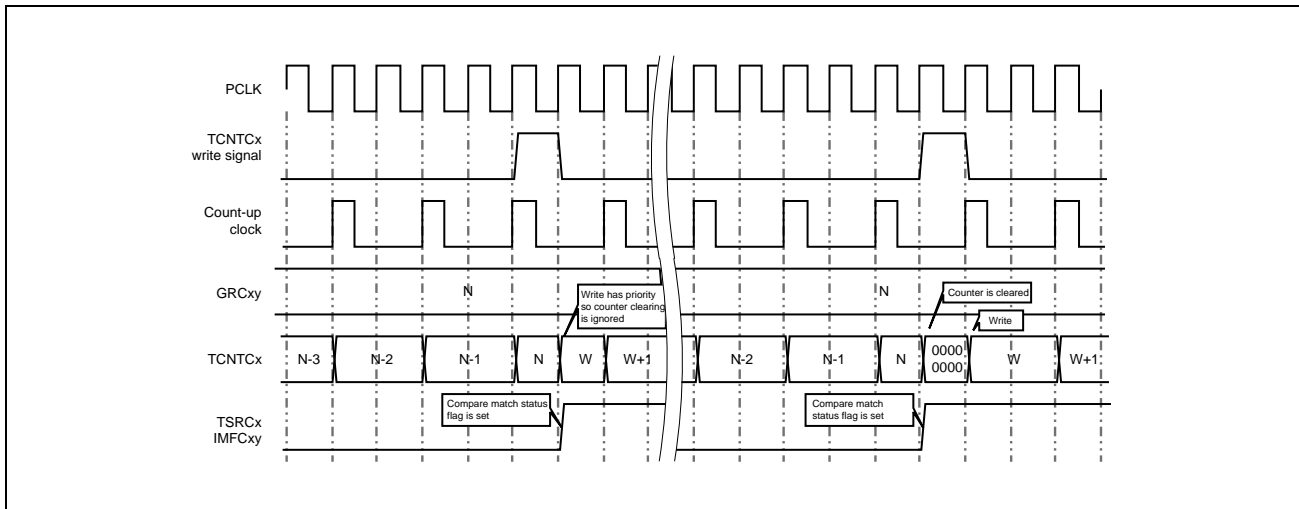

Figure 32.117 Conflict between Writing to TCNTCx and Counter Clearing by Compare Match

Timer	Counter	Compare Match Register	Status
Timer C	TCNTCx	GRCxy	IMFCxy
	TCNTCx	CUCRCx	OVFCx
Timer D	TCNT1Dx	CUCR1Dx	OVF1Dx
	TCNT2Dx	CUCR2Dx	OVF2Dx
Timer F	ECNTAFx	GRAFx	—
	ECNTBFx	GRBFx	—
Timer G	TCNTGx	OCRGx	CMFGx

32.14.2.7 Conflict between Writing to TCNTExy and Counter Clearing by Cycle Match

When a write to TCNTExy occurs simultaneously with counter clearing by cycle match, the counter is not cleared and TCNTExy is written to. However, a cycle match interrupt request is issued, the cycle match status is set, and reload of the cycle-setting register and the duty cycle setting register are performed (see the right portion of **Figure 32.118**). PWM waveform output at the time of cycle match is also performed.

The waveforms in the left portion of **Figure 32.118** show operation when writing is performed one PCLK cycle earlier than the count-up clock.

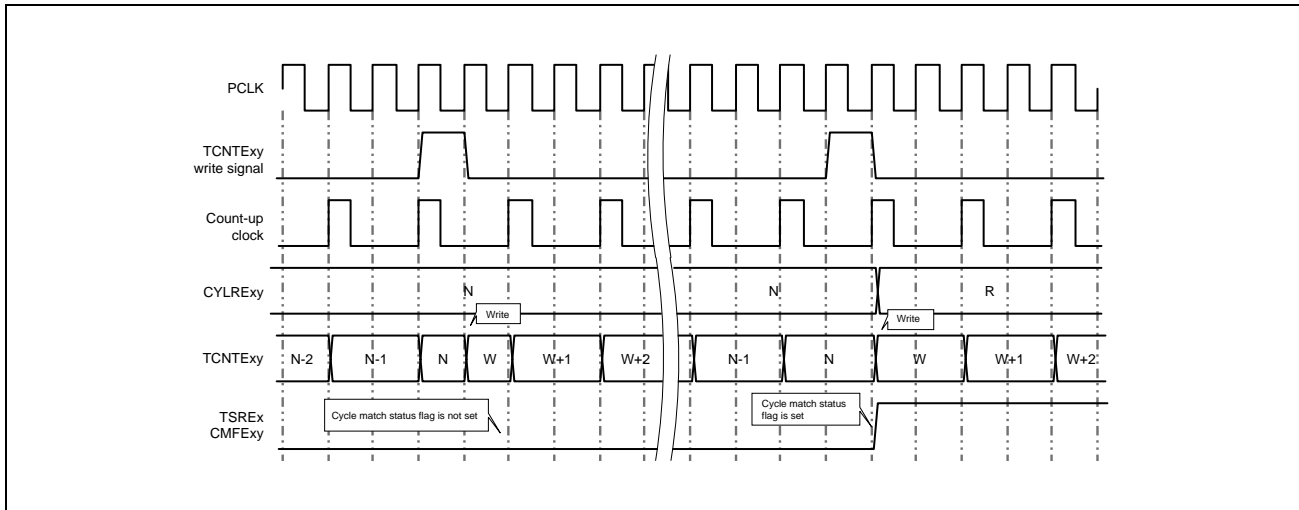

Figure 32.118 Conflict between TCNTExy Write and Counter Clearing by Cycle Match

Timer	Counter	Compare (Cycle) Match Register	Status
Timer B	TCNTB0	OCRB0	CMFB0
	TCNTB6	OCRB6	CMFB6
	TCNTB6M	ICRB6	CMFB6M
Timer E	TCNTExy	CYLRExy	CMFExy

32.14.2.8 Conflict between Setting and Clearing of Compare Match Status Flag

Flag clearing by a timer status clear register takes priority over flag setting by compare match (see the left portion of **Figure 32.119**). The right portion of **Figure 32.119** shows the case where a compare match occurs just after flag clearing.

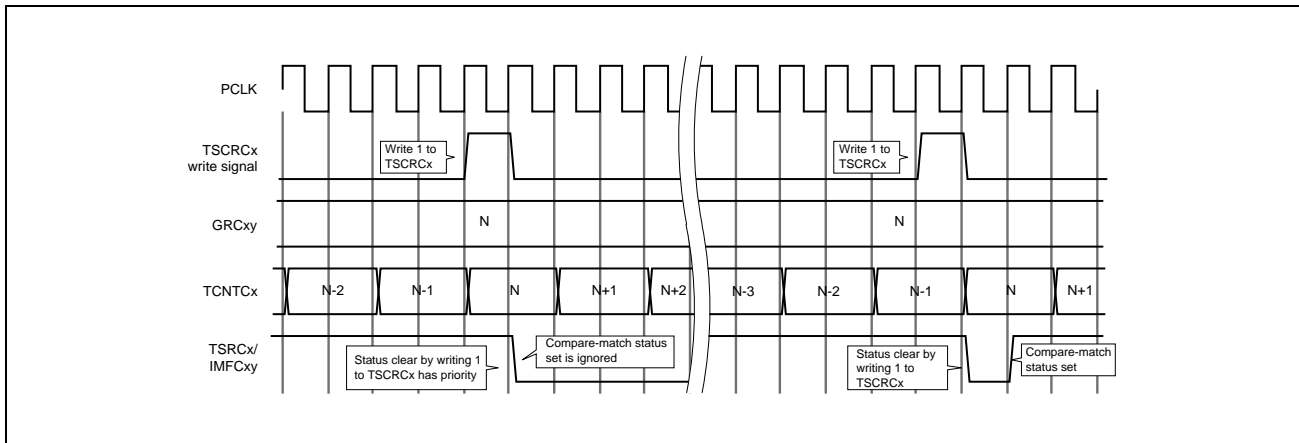

Figure 32.119 Conflict between Setting and Clearing of Compare Match Status Flag

Timer	Counter	Compare Match Register	Status
Timer B	TCNTB1	OCRB1	CMFB1
	TCNTB1	OCRB10	CMFB10
	TCNTB1	OCRB11	CMFB11
	TCNTB1	OCRB12	CMFB12
Timer C	TCNTCx	GRCxy	IMFCxy
Timer D	TCNT1Dx	OCR1Dxy	CMFADxy
	TCNT2Dx	OCR2Dxy	CMFBDxy
Timer F	TCNTCFx	GRDFx	OVFCFx
Timer G	TCNTGx	OCRGx	CMFGx

Timing of compare match B0 and compare match B6 of timer B and the cycle match of timer E differ from the timing of these compare matches. For details, see the next **Section 32.14.2.9, Conflict between Setting of Cycle Match Status Flag and Writing 1 to the Status Clear Register** and the **Section 32.14.2.3, Conflict between CYLRExy Write and Cycle Match with TCNTExy**.

32.14.2.9 Conflict between Setting of Cycle Match Status Flag and Writing 1 to the Status Clear Register

If setting of the cycle match flag (cycle match) and clearing of the flag by the timer status clear register occur simultaneously, clearing of the flag takes priority. The left portion of **Figure 32.120** shows an example where flag setting by cycle match and flag clearing by the timer status clear register occur simultaneously. The waveforms in the right portion of **Figure 32.120** show an example in which the flag is cleared one PCLK cycle earlier than flag setting.

Figure 32.120 Conflict between Cycle Match and Cycle Match Status Clear by Writing 1 to the Status Clear Register

Timer	Counter	Compare (Cycle) Match Register	Status
Timer B	TCNTB0	OCRB0	CMFB0
	TCNTB6	OCRB6	CMFB6
	TCNTB6M	ICRB6	CMFB6M
Timer E	TCNTExy	CYLRExy	CMFExy

32.14.2.10 Conflict between Writing 0 to TCNTExy and Cycle Match

Operation when writing “0” to TCNTExy occurs simultaneously with cycle match is shown below. The waveforms in the left portion of **Figure 32.121** show a case in which 000000_H is written to TCNTExy at the same time TCNTExy is cleared to 000001_H due to cycle match. A cycle match interrupt request is issued and the cycle match status is set, but PWM output does not start because writing “0” takes priority. PWM output restarts when TCNTExy counts up to 000001_H. The waveforms in the middle of **Figure 32.121** show a case in which “0” is written to TCNTExy one PCLK cycle after the counter has been cleared by cycle match. Cycle match detection and PWM output are restarted at the timing when the TCNTExy counter value changes from “N” to “1”. In contrast with this, the waveforms in the right portion of **Figure 32.121** show an example in which “0” is written one PCLK before detection of cycle match. In this case, neither cycle match is detected nor PWM output restarted, and the previous state is retained.

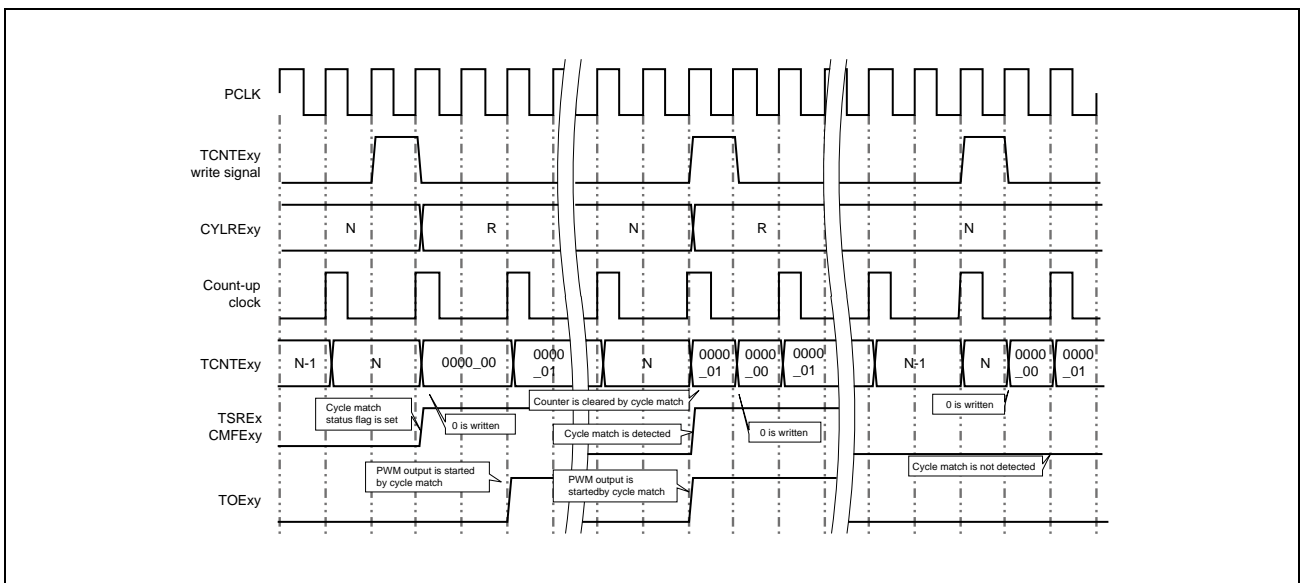

Figure 32.121 Conflict between Writing 0 to TCNTExy and Cycle Match

32.14.3 Load/Reload Conflict Operation

32.14.3.1 Conflict between Data Transfer and Writing to Transfer Destination Register

A conflict between data transfer between registers and a write to the transfer destination register is described below. When data transfer occurs simultaneously with a write to the transfer destination register, writing takes priority and the attempt of data transfer is ignored. **Figure 32.122** shows a conflict between reload to CYLRExy of timer E and a write to it. As shown by the waveforms in the left portion of the figure, if writing to CYLRExy occurs at the same timing as cycle reload, writing takes priority. The waveforms in the right portion of the figure indicate a case in which CYLRExy is written to immediately after cycle reload.

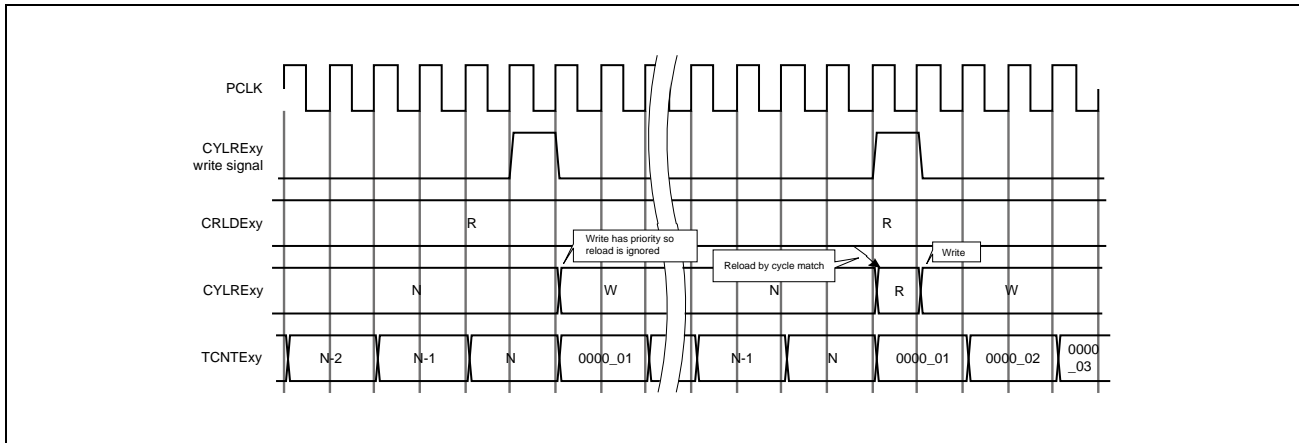

Figure 32.122 Conflict between Writing to CYLRExy and Cycle Reload

Timer	Transfer Data	Transfer Destination Register	Transfer Timing
Timer B	ICRB0	TCNTB2	External event
	LDB		
	TCNTB2 - PIMR		
	TCNTB2 + RLDB		
	ICRB0 - PIMR	RLDB	External event

	TCNTB3 + PIMR	TCNTB3	External event
	TCNTB3	TCNTB4	External event
Timer E	CRLDExy	CYLRExy	Cycle match
	DRLDExy	DTRExy	Cycle match

32.14.3.2 Conflict between Data Transfer and Writing to Transfer Source Register

A conflict between data transfer between registers and a write to the transfer source register is described below. When data transfer occurs simultaneously with a write to the transfer source register, the value prior to writing is transferred. At the same time, the value of the transfer source register is modified. **Figure 32.123** shows the operation when writing to CRLDExy occurs at the timing of cycle reload. If writing to CRLDExy occurs at the same timing as cycle reload (waveforms in the left portion of the figure), the value immediately before writing is reloaded. On the other hand, the waveforms in the right portion of the figure show an example in which CRLDExy is written to one cycle earlier than cycle reload.

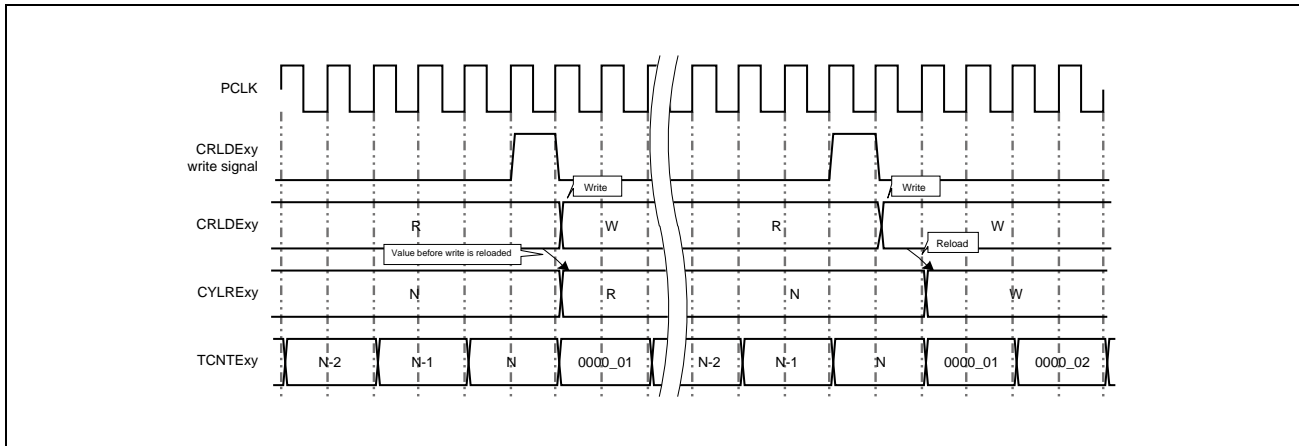

Figure 32.123 Conflict between Writing to CRLDExy and Cycle Reload

Timer	Transfer Source Register	Transferred Value	Transfer Destination Register	Transfer Timing
Timer B	LDB	LDB - PIMR	RLDB	External event
		LDB	TCNTB2	External event
	PIMR	ICRB0 - PIMR	RLDB	External event
		LDB - PIMR	TCNTB2	External event
		TCNTB2 - PIMR	TCNTB2	External event
	RLDB	TCNTB3 + PIMR	TCNTB3	External event
TCNTB2 + RLDB		TCNTB2	External event	
Timer E	CRLDExy	CRLDExy	CYLRExy	Cycle match
	DRLDExy	DRLDExy	DTRExy	Cycle match

32.14.4 Counter Conflict Operation

32.14.4.1 Conflict between Writing to Counter and Count-Up/Count-Down

When a write to a counter occurs simultaneously with incrementation/decrementation of the counter, the write operation takes priority. The attempt to increment/decrement the value is ignored and incrementation/decrementation resumes from the value written in the next counter clock.

32.14.4.2 Conflict between Count-Up and Counter Clearing

When incrementation of a counter occurs simultaneously with clearing of the counter, the counter is not cleared to “0” but cleared to “1”.

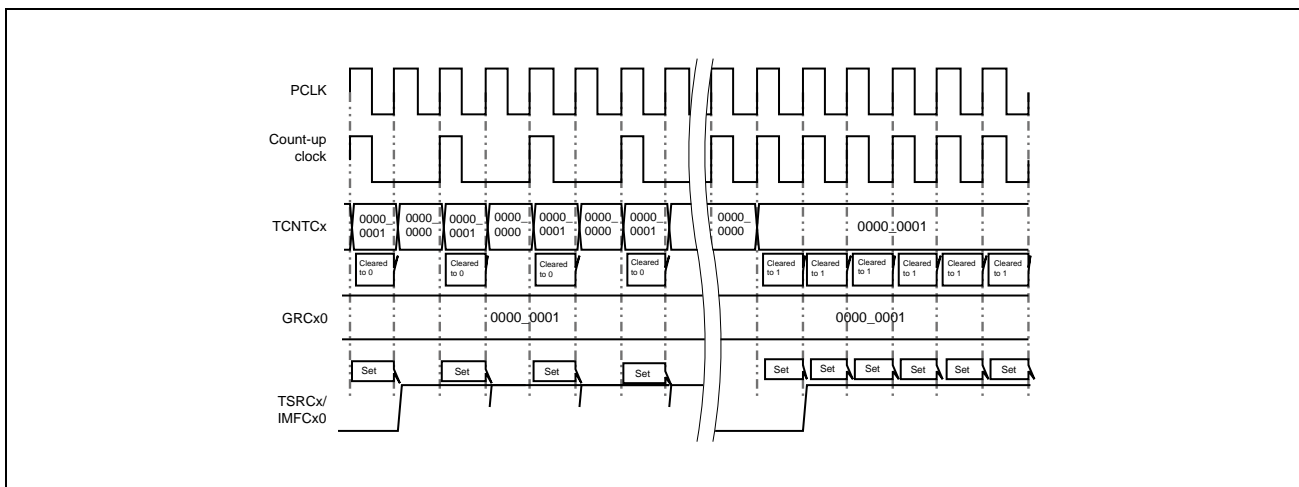

Figure 32.124 Simultaneous Occurrence of Count-Up and Counter Clearing

Timer	Counter	Compare Match Register	Remarks
Timer C	TCNTCx	GRCx0	Only when PWMx0 = “1”
	TCNTCx	CUCRCx	Only when PWMx0 = “0” and CLRCx = “1”
Timer D	TCNT1Dx	CUCR1Dx	Only when CLR1Dx = “1”
	TCNT2Dx	CUCR2Dx	Only when CLR2Dx = “1”
Timer F	ECNTAFx	GRAFx	Only when MDFx = “000”, “110”, or “111”
	ECNTBFx	GRBFx	Only when MDFx = “001”, “010”, or “100”
Timer G	TCNTGx	OCRGx	

32.14.4.3 Conflict between Writing to Counter and Overflow

When counter overflow occurs simultaneously with a write to TCNTCx, writing to TCNTCx takes priority. However, an overflow interrupt request is issued, and the overflow status is set (see the left portion of **Figure 32.125**). If the timing for writing to the counter is earlier than incrementation of the counter (waveforms in the right portion of **Figure 32.125**), the overflow status flag is not set.

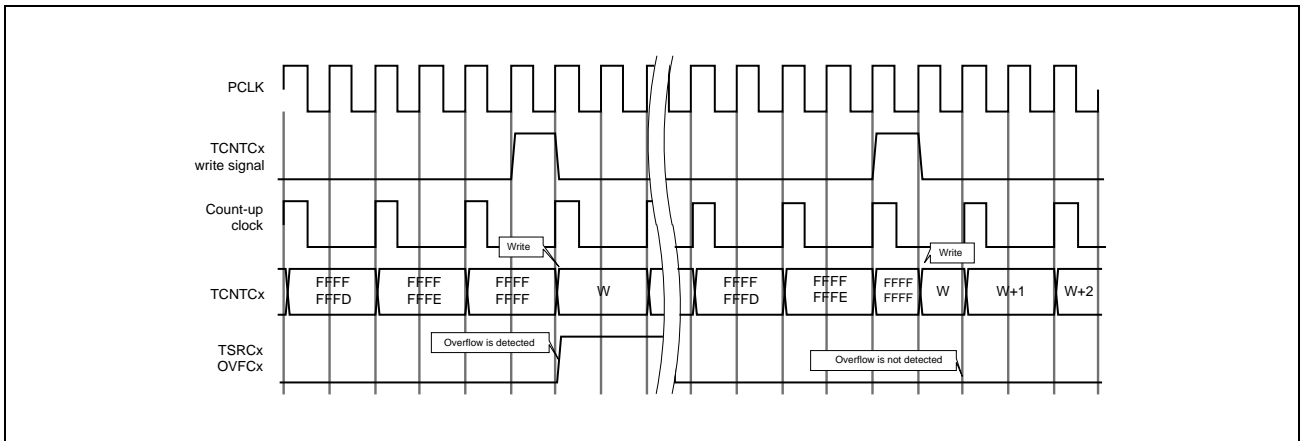

Figure 32.125 Conflict between Writing to TCNTCx and Counter Clearing on Overflow

Timer	Counter	Status
Timer A	TCNTA	OVFA
Timer C	TCNTCx	OVFCx
Timer D	TCNT1Dx	OVF1Dx
	TCNT2Dx	OVF2Dx
Timer E	TCNTExy	OVFExy
Timer F	ECNTAFx	OVFAFx
	ECNTBFx	OVFBFx
	ECNTCFx	OVFCFx

Timer	Counter	Status
Timer G	TCNTGx	OVFGx

32.14.4.4 Conflict between Setting and Clearing of Overflow Status Flag

When clearing and setting of the overflow status flag occur simultaneously, clearing takes priority. The left portion of **Figure 32.126** below shows an example where status flag setting by an overflow of the counter value (FFFF FFFF_H to 0000 0000_H) and flag clearing by the timer status clear register occur simultaneously. The waveforms in the right portion of **Figure 32.126** show the way the overflow status flag is set again immediately after the status flag has been cleared.

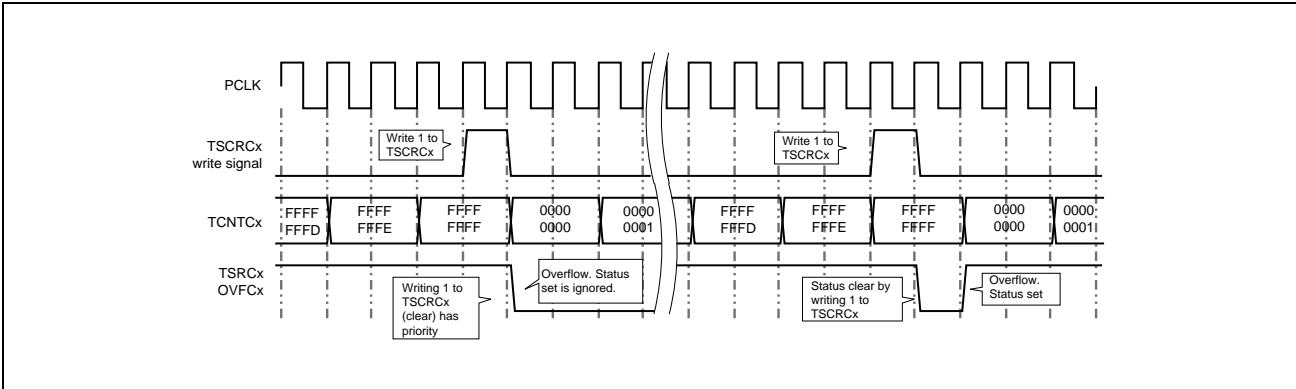

Figure 32.126 Conflict between Setting and Clearing of Overflow Status Flag

Timer	Counter	Status
Timer A	TCNTA	OVFA
Timer C	TCNTCx	OVFCx
Timer D	TCNT1Dx	OVF1Dx
	TCNT2Dx	OVF2Dx
Timer E	TCNTExy	OVFExy
Timer F	ECNTAFx	OVFAFx
	ECNTBFx	OVFBFx
	ECNTCFx	OVFCFx

Timer	Counter	Status
Timer G	TCNTGx	OVFGx

32.14.4.5 Conflict between Overflow and Counter Clearing by Compare Match

If the maximum value is set in a compare match register when the function to clear a counter by compare match is enabled, the counter is cleared when the counter reaches its maximum value. At this time, an overflow interrupt request is not issued even if the counter clock is 1/1PCLK, so an overflow is not detected.

Timer	Counter	Status	Remarks
Timer C	TCNTCx	OVFCx	Only when PWMx0 = "1"
Timer F	ECNTAFx	OVFAFx	Only when MDFx = "000", "110", or "111"
	ECNTBFx	OVFBFx	Only when MDFx = "001"
Timer G	TCNTGx	OVFGx	

If the compare match counter clear function is not provided or is disabled, an overflow interrupt request is issued and the overflow status is set. **Figure 32.127** shows operation when the PWMx bit of timer C is "1" (counter clearing is enabled) and when the PWMx0 bit is "0" (counter clearing is disabled).

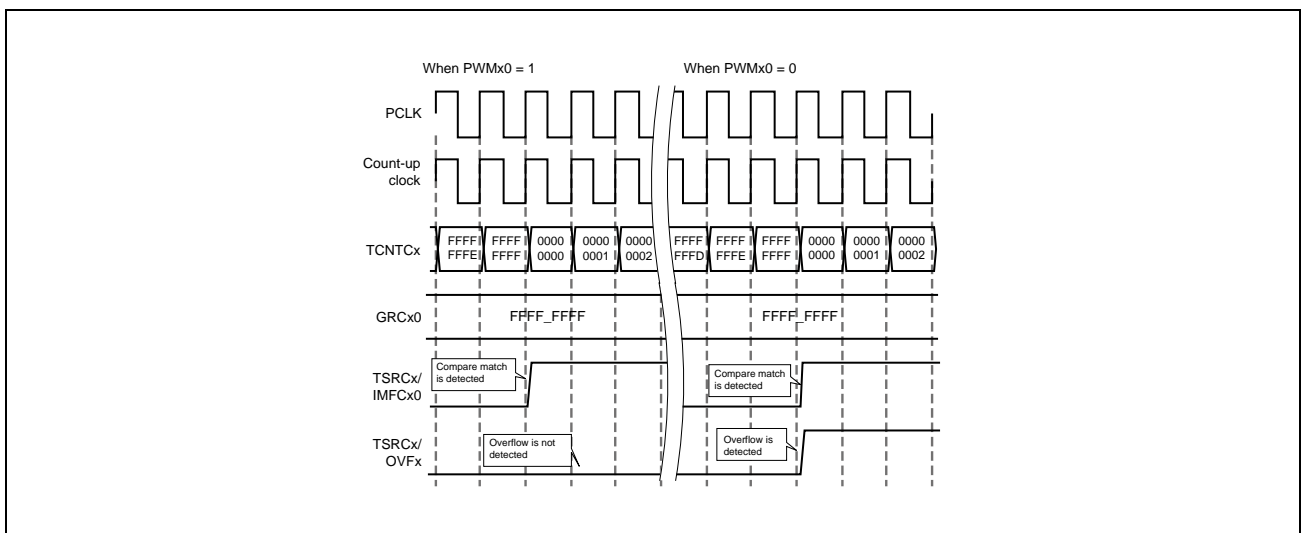

Figure 32.127 Conflict between Clearing of Compare Match Counter of Timer C and Overflow (PWMx0 = 1/0)

32.14.5 Noise Canceler Conflict Operation

This section describes conflicts in the noise cancelers.

Timer	Counter	Compare Match Register
Timer A	NCNTAx	NCRAx
Timer C	NCNTCxy	NCRCxy
Timer F	NCNTAFx	NCRAFx
	NCNTBFx	NCRBFx

32.14.5.1 Conflict between Writing to Noise Canceler Counter and Compare Match with Noise Canceler Register

When a write to NCNT occurs simultaneously with a compare match with NCR, writing takes priority. **Figure 32.128** shows an example in minimum time-at-level cancellation mode. In the left portion of the figure, since writing prevents compare match from occurring, input capture is also not performed. The right portion of the figure shows a case in which writing is performed one PCLK cycle later. In this case, compare match occurs and input capture processing is performed.

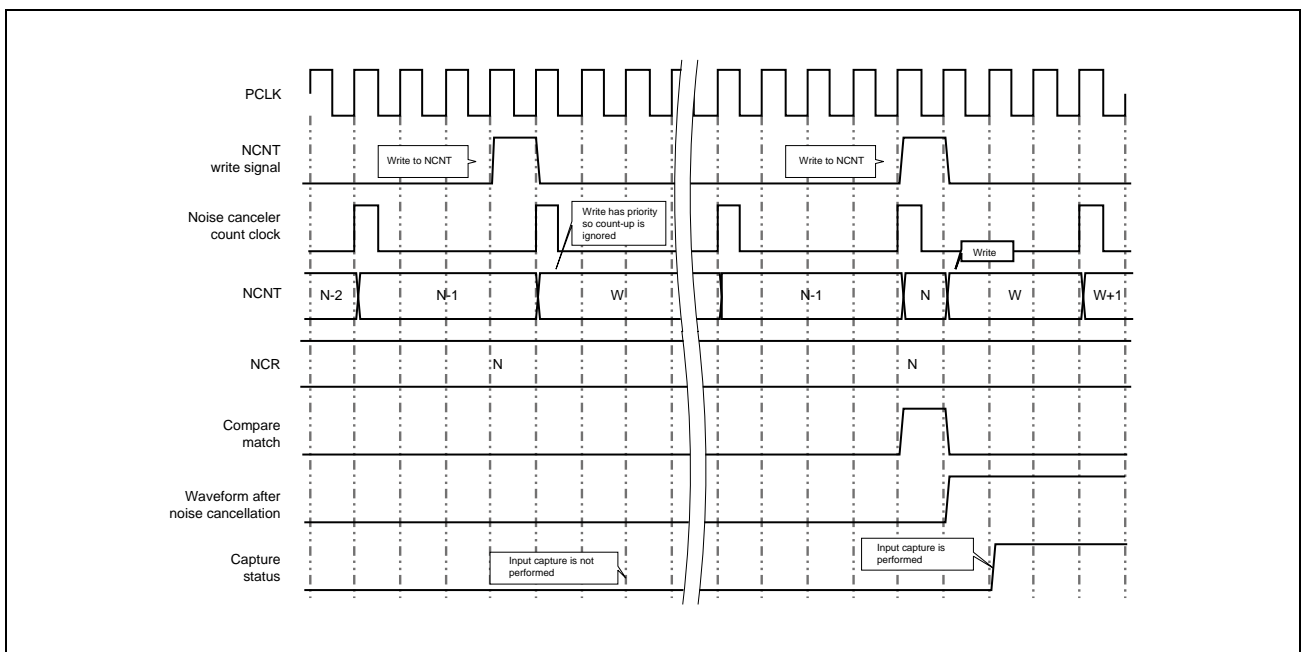

Figure 32.128 Conflict between Writing to NCNT and Compare Match of NCNT-NCR
(Example in Minimum Time-at-level Cancellation Mode)

32.14.5.2 Conflict between Writing to Noise Canceler Register and Compare Match with Noise Canceler Counter

When a write to NCR occurs simultaneously with a compare match with NCNT, writing takes priority. **Figure 32.129** shows an example in minimum time-at-level cancellation mode. In the left portion of the figure, since writing prevents compare match from occurring, input capture is also not performed. The right portion of the figure shows a case in which writing is performed one PCLK cycle later. In this case, compare match occurs and input capture processing is performed.

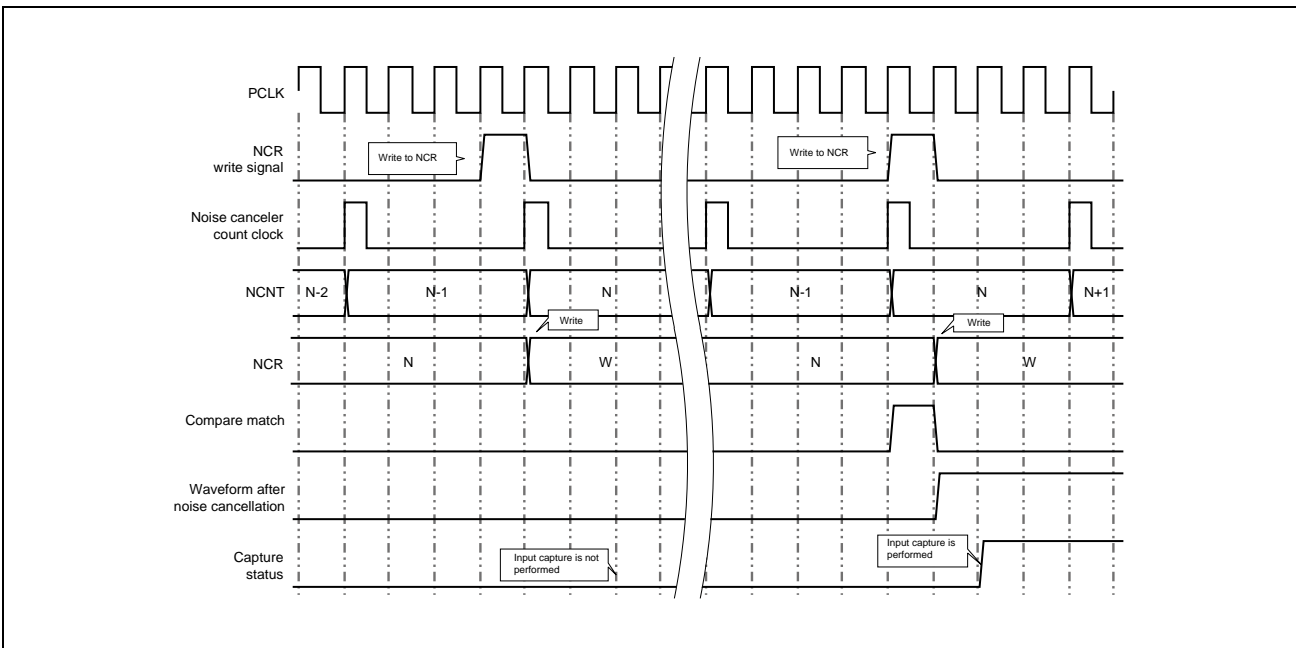

Figure 32.129 Conflict between Writing to NCR and Compare Match of NCR-NCNT (Example in Minimum Time-at-level Cancellation Mode)

32.14.6 Timer Down Counter Dxy Conflict Operation

This section describes conflicts in DCNTDxy.

32.14.6.1 Conflict between Writing to DCNTDxy Counter and Count-Down

When a write occurs simultaneously with decrementation of the down counter, writing to DCNTDxy is performed. The attempt to decrement the value is ignored and decrementation restart at the next count-down clock.

32.14.6.2 Conflict between Writing to DCNTDxy Counter and Underflow

When a write to DCNTDxy occurs simultaneously with underflow, writing to DCNTDxy is performed. The left portion of **Figure 32.130** shows operation when a count-down clock is input simultaneously with a write to DCNTDxy when the DCNTDxy value is 0000 0000_H. Though a new value is written to DCNTDxy, count-down operation is halted because underflow is detected. The underflow status flag is set. The right portion of **Figure 32.130** shows a case where data is written to DCNTDxy one cycle before, in which case an underflow interrupt request is not issued and underflow is not detected.

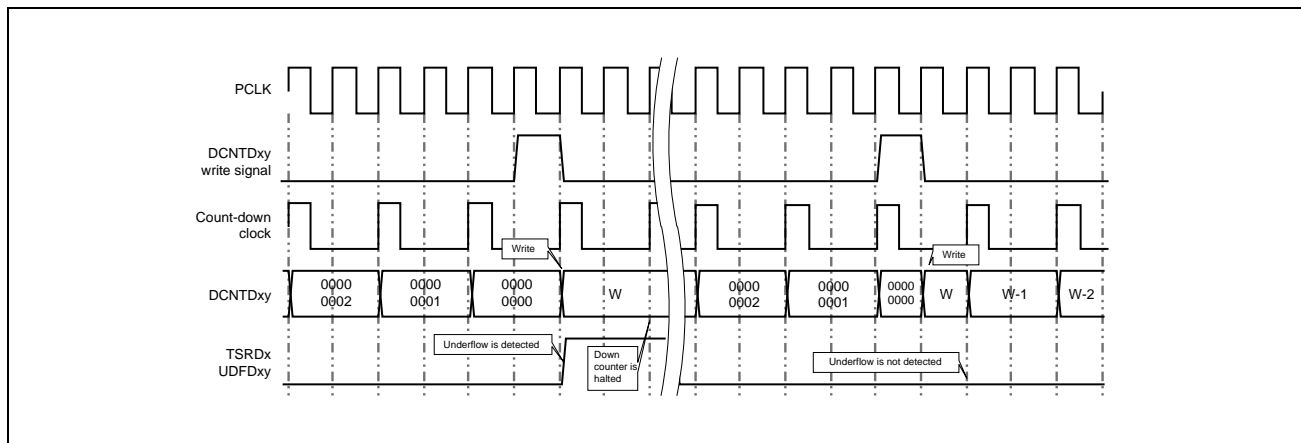

Figure 32.130 Conflict between Writing to DCNTDxy and Underflow

32.14.6.3 Conflict between Writing to DCNTDxy Counter and Compare Match B (Counter Stop Trigger)

When a write to DCNTDxy occurs simultaneously with compare match B, writing to DCNTDxy is performed (if compare match B is selected as a condition to stop the down counter).

The middle portion of **Figure 32.129** below shows an example in which writing to DCNTDxy occurs simultaneously with clearing of the counter by detection of compare match B. Counter clearing of DCNTDxy by compare match B is ignored, and writing takes priority. However, the output on TODxyB is turned off due to compare match B, and DCNTDxy halts with the written value retained. The waveforms in the right portion of **Figure 32.131** show a case in which the write cycle occurs one PCLK cycle earlier. During the PCLK cycle next to writing to DCNTDxy, the counter is cleared by compare match B. The waveforms in the left portion of **Figure 32.131** show an example in which writing is performed immediately after the counter has been cleared by compare match B.

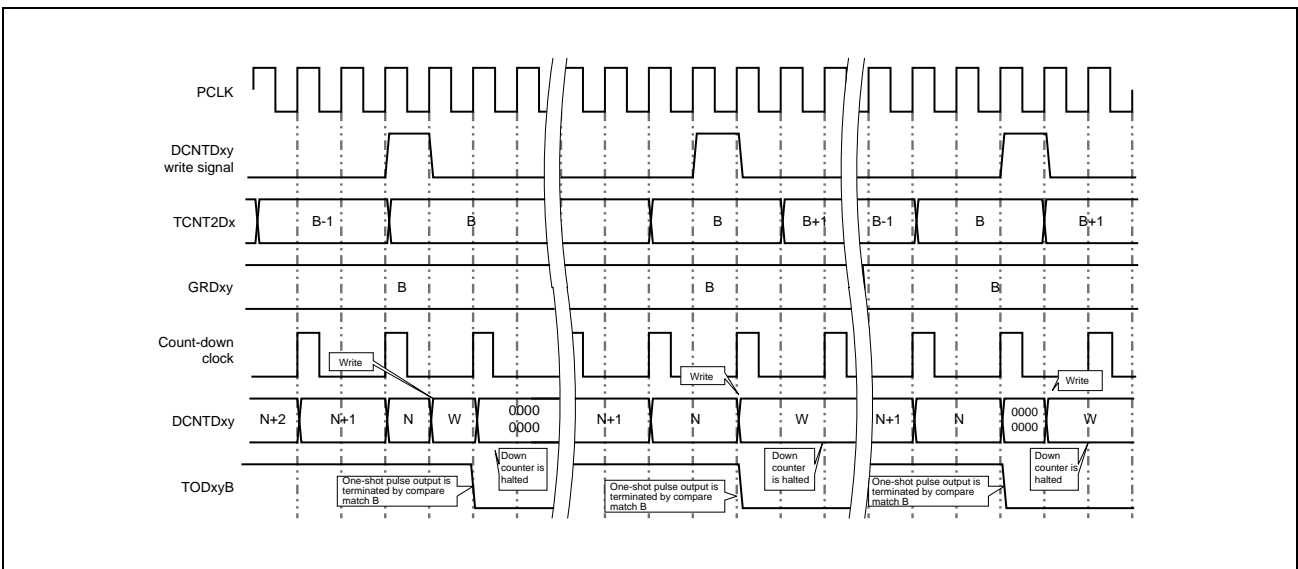

Figure 32.131 Conflict between Writing to DCNTDxy and Counter Clearing by Compare Match B

32.14.6.4 Conflict between Setting of Underflow Status Flag and Clearing by Writing 1 to Status Clear Register

When flag clearing by the timer status clear register and an underflow occurs simultaneously, flag clearing is performed. The left portion of **Figure 32.132** below shows an example where status flag setting by an underflow of DCNTDxy and flag clearing by the timer status clear register occur simultaneously. The waveforms in the right portion of **Figure 32.132** show how the status flag is set again by underflow occurrence immediately after the status flag has been cleared.

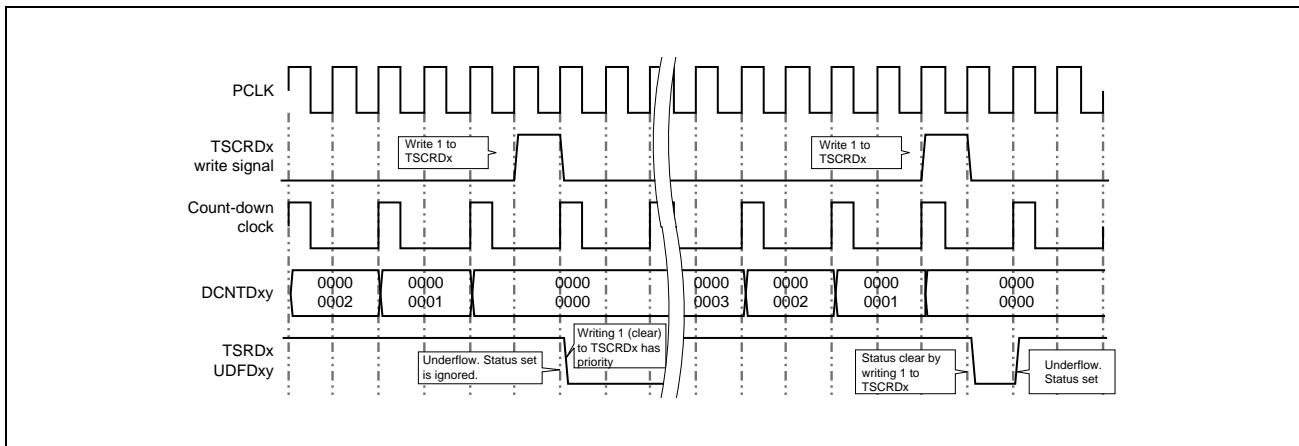

Figure 32.132 Conflict between Setting and Clearing of Underflow Status Flag

32.14.6.5 TODxyB Output upon Occurrence of Down Counter Start Trigger When Down Counter Value is 0000 0000_H

The TODxyB output is not started by down counter underflow and is terminated.

32.14.6.6 TODxyB Output at Simultaneous Occurrence of Start Trigger and Stop Trigger for Down Counter

When the down counter start trigger occurs simultaneously with the down counter stop trigger, the down counter is cleared to “0” by the stop trigger. In this case, the TODxyB output is terminated.

Similarly, if the down counter start trigger occurs and then the down counter stop trigger occurs before the first count-down clock is input, the down counter is cleared to “0” without being decremented even once and the TODxyB output is terminated.

32.14.6.7 Conflict between Down Counter Start Trigger and Underflow

When the down counter start trigger occurs simultaneously with underflow, DCNTDxy remains halted at the value of 0000 0000_H (see the waveforms in the middle of **Figure 32.133**). If the down counter had been in process of decrementing, the TODxyB output is turned off by underflow (see the waveforms in the left portion of **Figure 32.133**). If compare match A occurs while the down counter is halted (DCNTDxy = 0000 0000_H), the TODxyB output is kept negated (see the waveforms in the right portion of **Figure 32.133**). In both cases, the underflow interrupt request and setting of the underflow flag to 1 are performed upon detection of a down count start trigger or at the first cycle of the down count clock after detection.

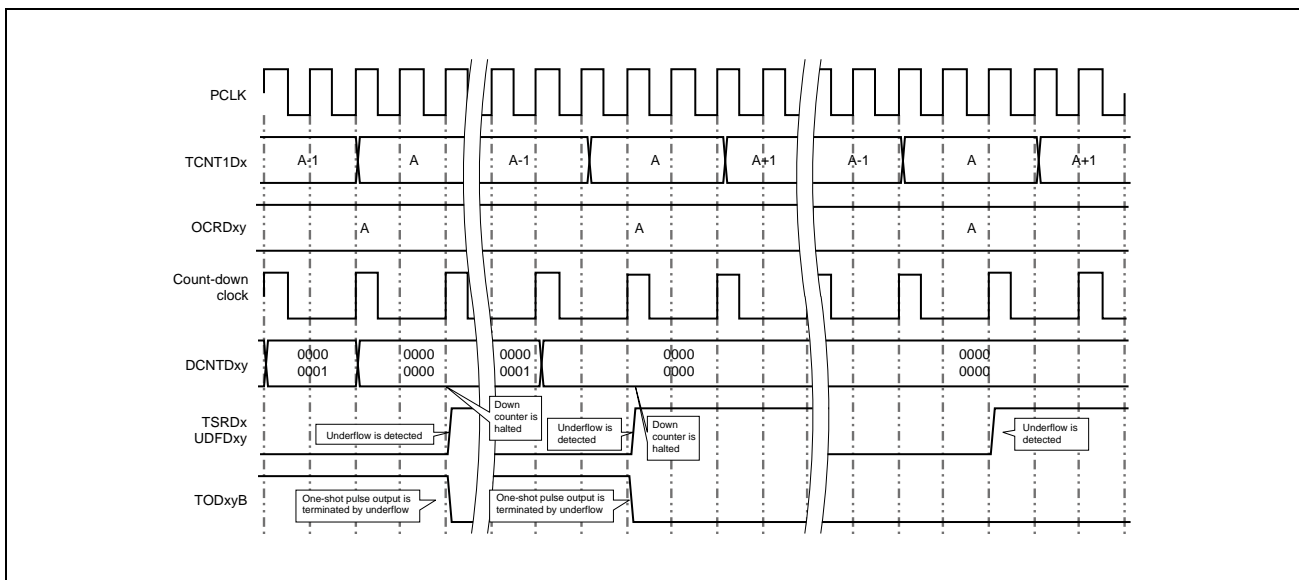

Figure 32.133 Conflict between Compare Match A and Underflow

32.14.7 Coordinated Operation of Timers A, B, and D

This section describes the conflict between counter clear requests from timer B and TCNT1Dx and TCNT2Dx.

32.14.7.1 Conflict Between Counter Clearing of TCNT1Dx and TCNT2Dx and Compare Match

Figure 32.134 shows the operation when clearing of the TCNT1Dx/TCNT2Dx counter by a counter clearing signal from timer B occurs simultaneously with compare match. The waveforms in the left portion of the figure show a case in which the counter is cleared prior to compare match. On the other hand, the waveforms in the right portion of the figure show a case in which the counter is cleared simultaneously with compare match.

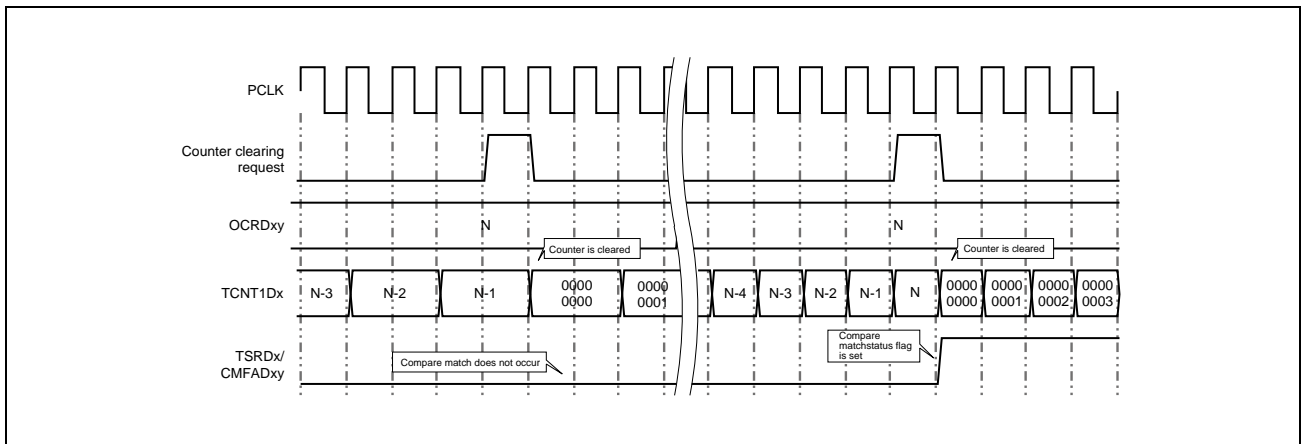

Figure 32.134 Conflict between Counter Clearing by Timer B and Compare Match

Timer	Counter	Counter Clearing Source	Compare Match Register	Status
Timer D	TCNT1Dx	TCNT1Dx/TCNT2Dx clearing request from timer B	OCR1Dxy	CMFADxy
	TCNT2Dx		OCR2Dxy	CMFBDxy

32.14.7.2 Conflict between Writing to TCNT1Dx/TCNT2Dx Counter and Counter Clearing by Timer B

When a write to TCNT1Dx/TCNT2Dx occurs simultaneously with a counter clearing signal from timer B, the counter is not cleared but writing to the counter is performed (see the waveforms in the left portion of **Figure 32.135**). The waveforms in the right portion of **Figure 32.135** show a case in which writing to TCNT1Dx is one PCLK cycle later. This is the same for TCNT2Dx.

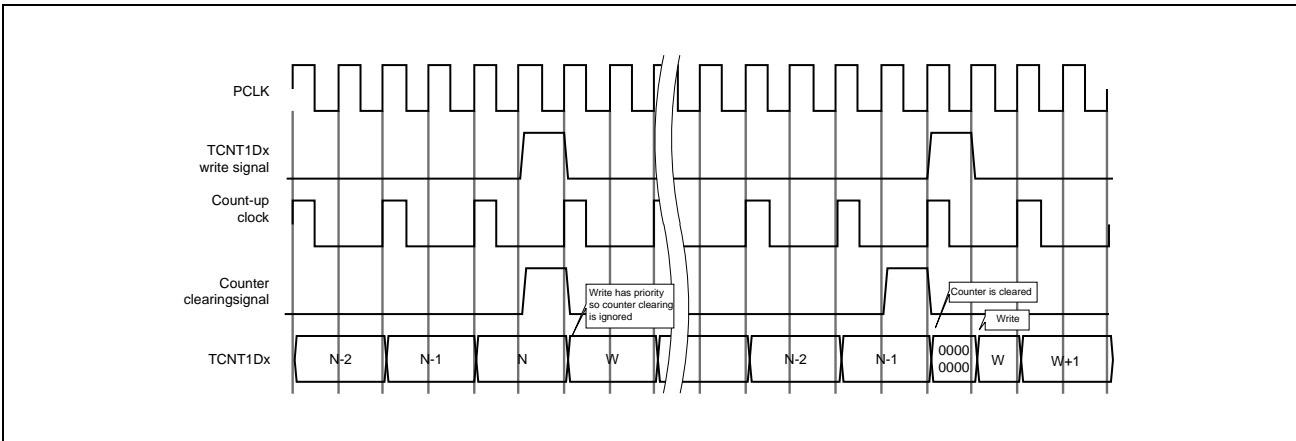

Figure 32.135 Conflict between Writing to TCNT1Dx and Counter Clearing

32.14.7.3 Conflict between TCNT1Dx/TCNT2Dx Counter Overflow and Counter Clearing by Timer B

When TCNT1Dx overflow by the counting up occurs simultaneously with clearing of TCNT1Dx from timer B, the counter value is cleared to 0000 0000_H by the counter clearing signal. In this case, an overflow interrupt request is not issued and the overflow status flag is not set (only for when C1CEDx = “1”). The same applies to TCNT2Dx overflow.

Counter clearing upon match with the value of the upper limit setting register and counter clearing by the signal from timer B must be used exclusively of each other. But if the two events erroneously occur at the same time, the counter gives priority to counter clearing nu the signal from timer B, and its value is cleared to 0000 0000_H. In the case of overflow, match with the value of the upper limit setting register takes priority, and interrupt generation and flag setting are performed. The same applies to TCNT2Dx.

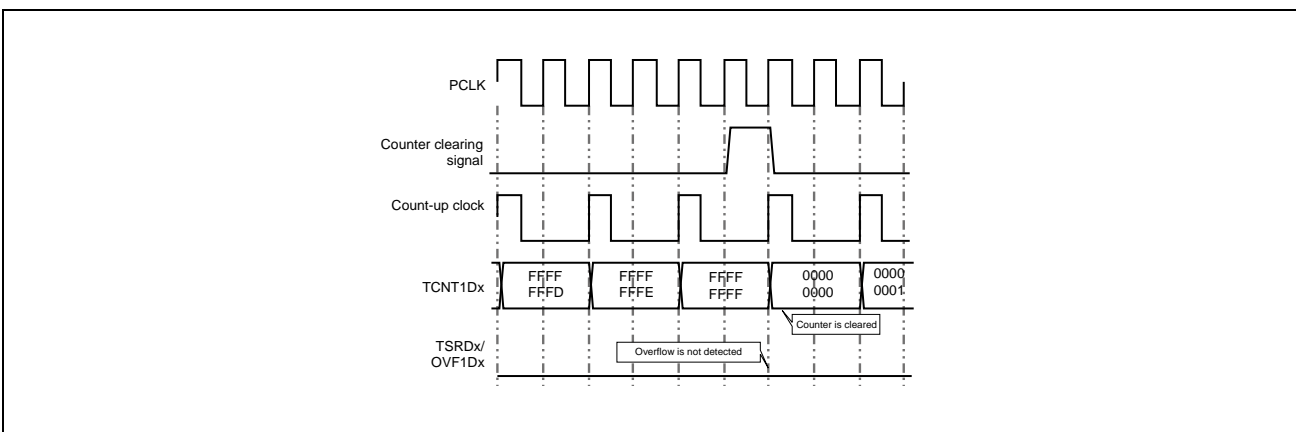

Figure 32.136 Conflict between Counter Clearing and Overflow

32.14.7.4 Conflict between TCNT1Dx Clearing by Clear Signal from Timer B and Input Capture to OSBRDx

Figure 32.137 shows the operation when clearing of the TCNT1Dx counter by timer B occurs simultaneously with input capture to an offset base register. If input capture and counter clearing occur simultaneously, the counter value before clearing is captured in OSBRDx and the TCNT1Dx counter is cleared at the same time (see the waveforms in the left portion of the figure). The waveforms in the right portion of the figure show a case in which input capture is performed one PCLK cycle after the counter has been cleared, and the counter value after clearing is captured in OSBRDx.

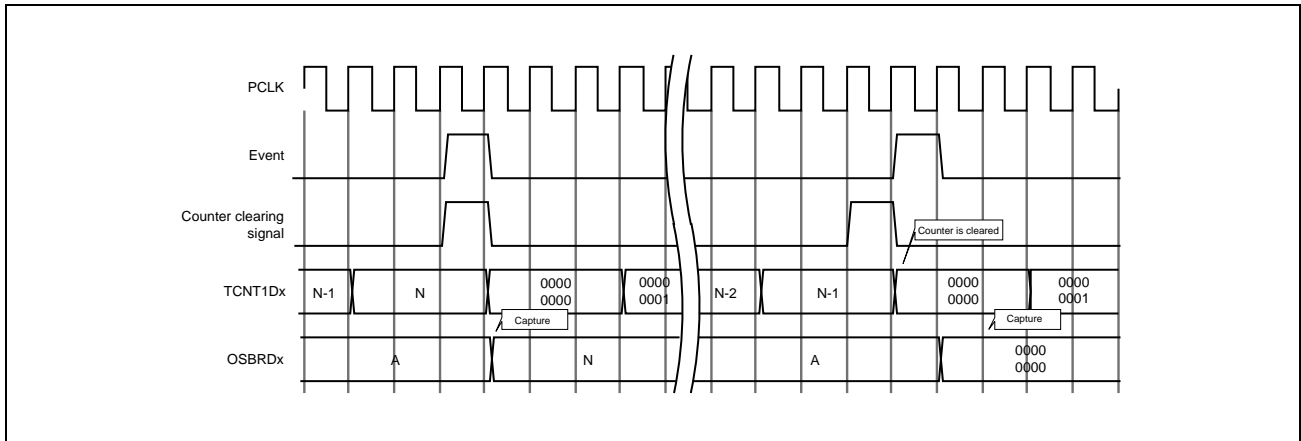

Figure 32.137 Conflict between TCNT1Dx Counter Clearing and Input Capture to OSBRDx

Section 33 Generic Timer Module (GTM)

Generic timer module (GTM) is a modular timer unit implementing common timer functionality for capture/compare of external signals and generation of complex output waveforms. It also implements complex angle clock to support powertrain control applications.

33.1 GTM Features

33.1.1 IP Version

The table below shows GTM-IP version and GTM-IP configuration included in this device.

Table 33.1 IP Version

Product	IP	Device	Revision
RH850/E2x-FCC2	GTM-IP	GTM-IP_359	v3.1.5.1
RH850/E2UH	GTM-IP	GTM-IP_359	v3.1.5.1
RH850/E2H	GTM-IP	GTM-IP_355	v3.1.5.1

33.1.3 Register/RAM Base Address

GTM base addresses are listed in the following table. GTM register and RAM addresses are given as offsets from the base addresses in general.

Table 33.5 Register and RAM Base Addresses

Base Address Name	Base Address	Bus Group
<GTM0_base>	FF80 0000 _H	Peripheral Group 2H
<GTM0_1_base>	FF90 0000 _H	Peripheral Group 2H

33.1.4 Clock Supply

GTM clock supplies are listed in the following table.

Table 33.6 Clock Supply (1/2)

RH850/E2x-FCC2, E2UH		
Unit Name	Clock for the Unit	Supply Clock Name
GTM Cluster 0 to 3 (GTM cluster with DPLL core, MCS0-3 and associated RAM)	GTM Main Clock	CLK_UHSB Switchable between 1/1 (high) and 1/2 (low) frequency.
	Register access clock	CLK_HSB
GTM Cluster 4 to 9 (Other GTM cores and RAM)	GTM Main Clock	CLK_UHSB 1/2 (low) frequency only.
	Register access clock	CLK_HSB

Table 33.7 Clock Supply (2/2)

RH850/E2H		
Unit Name	Clock for the Unit	Supply Clock Name
GTM Cluster 0 to 1 (GTM cluster with DPLL core, MCS0-1 and associated RAM)	GTM Main Clock	CLK_UHSB Switchable between 1/1 (high) and 1/2 (low) frequency.
	Register access clock	CLK_HSB
GTM Cluster 2 to 8 (Other GTM cores and RAM)	GTM Main Clock	CLK_UHSB 1/2 (low) frequency only.
	Register access clock	CLK_HSB

33.1.5 Interrupt Requests

Mapping of ICM outputs to interrupts and DMAC triggers is shown in the following table.

Table 33.8 Interrupt Requests (1/3)

GTM Interrupt Factors	Description	Interrupt Group	DMAC Trigger Group
GTM_AEI_IRQ	AEI Shared interrupt	GTM_INT_10	—
GTM_ARU_IRQ0	ARU_NEW_DATA0 Interrupt	GTM_INT_11	GTM_DMA_9
GTM_ARU_IRQ1	ARU_NEW_DATA1 Interrupt	GTM_INT_12	GTM_DMA_9
GTM_ARU_IRQ2	ARU_ACC_ACK Interrupt	GTM_INT_13	GTM_DMA_9
GTM_BRC_IRQ	BRC Shared interrupt	GTM_INT_14	GTM_DMA_9
GTM_CMP_IRQ	CMP Shared interrupt	GTM_INT_15	GTM_DMA_9
GTM_SPE0_IRQ	SPE0 Shared interrupt	GTM_INT_0	GTM_DMA_0
GTM_SPE1_IRQ	SPE1 Shared interrupt	GTM_INT_1	GTM_DMA_1
GTM_SPE2_IRQ	SPE2 Shared interrupt	GTM_INT_2	GTM_DMA_2
GTM_SPE3_IRQ	SPE3 Shared interrupt	GTM_INT_3	GTM_DMA_3
GTM_SPE4_IRQ*1	SPE4 Shared interrupt	GTM_INT_4	GTM_DMA_4
GTM_SPE5_IRQ*1	SPE5 Shared interrupt	GTM_INT_5	GTM_DMA_5
GTM_PSM0_IRQ[x]	PSM0 Shared interrupts (x: 0...7)	GTM_INT_8	GTM_DMA_9
GTM_PSM1_IRQ[x]	PSM1 Shared interrupts (x: 0...7)	GTM_INT_8	GTM_DMA_9
GTM_DPLL_IRQ0	DPLL_DCGI: DPLL direction change interrupt	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ1	DPLL EDI: DPLL enable or disable interrupt	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ2	DPLL_TINI: DPLL TRIG. min. hold time (THMI) viol. detected	GTM_INT_9	—
GTM_DPLL_IRQ3	DPLL_TAXI: DPLL TRIG. max. hold time (THMA) viol. detected	GTM_INT_9	—
GTM_DPLL_IRQ4	DPLL_SISI: DPLL STATE inactive slope detected	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ5	DPLL_TISI: DPLL TRIGGER inactive slope detected	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ6	DPLL_MSI: DPLL Missing STATE interrupt	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ7	DPLL_MTI: DPLL Missing TRIGGER interrupt	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ8	DPLL_SASI: DPLL STATE active slope detected	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ9	DPLL_TASI: DPLL TRIG. active slope detected while NT1_CNT is 0	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ10	DPLL_PWI: DPLL Plausibility window (PVT) viol. int. of TRIG.	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ11	DPLL_W2I: DPLL Write access to RAM region 2 interrupt	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ12	DPLL_W1I: DPLL Write access to RAM region 1b or 1c int.	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ13	DPLL_GL1I: DPLL Get of lock interrupt for SUB_INC1	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ14	DPLL_LL1I: DPLL Lost of lock interrupt for SUB_INC1	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ15	DPLL_EI: DPLL Error interrupt	GTM_INT_9	—
GTM_DPLL_IRQ16	DPLL_GL2I: DPLL Get of lock interrupt for SUB_INC2	GTM_INT_9	GTM_DMA_9

Table 33.8 Interrupt Requests (2/3)

GTM Interrupt Factors	Description	Interrupt Group	DMAC Trigger Group
GTM_DPLL_IRQ17	DPLL_LL2I: DPLL Lost of lock interrupt for SUB_INC2	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ18	DPLL_TE0I: DPLL TRIGGER event interrupt 0	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ19	DPLL_TE1I: DPLL TRIGGER event interrupt 1	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ20	DPLL_TE2I: DPLL TRIGGER event interrupt 2	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ21	DPLL_TE3I: DPLL TRIGGER event interrupt 3	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ22	DPLL_TE4I: DPLL TRIGGER event interrupt 4	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ23	DPLL_CDTI: DPLL calculated duration interrupt for TRIGGER	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ24	DPLL_CDSI: DPLL calculated duration interrupt for STATE	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ25	DPLL_TORI; TRIGGER out of range interrupt	GTM_INT_9	GTM_DMA_9
GTM_DPLL_IRQ26	DPLL_SORI; STATE out of range interrupt	GTM_INT_9	GTM_DMA_9
GTM_TIM0_IRQ[x]	TIM0 Shared interrupts (x: 0..7)	GTM_INT_0	GTM_DMA_0
GTM_TIM1_IRQ[x]	TIM1 Shared interrupts (x: 0..7)	GTM_INT_1	GTM_DMA_1
GTM_TIM2_IRQ[x]	TIM2 Shared interrupts (x: 0..7)	GTM_INT_2	GTM_DMA_2
GTM_TIM3_IRQ[x]	TIM3 Shared interrupts (x: 0..7)	GTM_INT_3	GTM_DMA_3
GTM_TIM4_IRQ[x]	TIM4 Shared interrupts (x: 0..7)	GTM_INT_4	GTM_DMA_4
GTM_TIM5_IRQ[x]	TIM5 Shared interrupts (x: 0..7)	GTM_INT_5	GTM_DMA_5
GTM_TIM6_IRQ[x]	TIM6 Shared interrupts (x: 0..7)	GTM_INT_6	GTM_DMA_6
GTM_TIM7_IRQ[x]	TIM7 Shared interrupts (x: 0..7)	GTM_INT_7	GTM_DMA_7
GTM_MCS0_IRQ[x]	MCS0 Interrupt for channel x (x: 0..8)	GTM_INT_0	GTM_DMA_0
GTM_MCS1_IRQ[x]	MCS1 Interrupt for channel x (x: 0..8)	GTM_INT_1	GTM_DMA_1
GTM_MCS2_IRQ[x]	MCS2 Interrupt for channel x (x: 0..8)	GTM_INT_2	GTM_DMA_2
GTM_MCS3_IRQ[x]	MCS3 Interrupt for channel x (x: 0..8)	GTM_INT_3	GTM_DMA_3
GTM_MCS4_IRQ[x]	MCS4 Interrupt for channel x (x: 0..8)	GTM_INT_4	GTM_DMA_4
GTM_MCS5_IRQ[x]	MCS5 Interrupt for channel x (x: 0..8)	GTM_INT_5	GTM_DMA_5
GTM_MCS6_IRQ[x]	MCS6 Interrupt for channel x (x: 0..8)	GTM_INT_6	GTM_DMA_6
GTM_MCS7_IRQ[x]*1	MCS7 Interrupt for channel x (x: 0..8)	GTM_INT_7	GTM_DMA_7
GTM_MCS8_IRQ[x]*1	MCS8 Interrupt for channel x (x: 0..8)	GTM_INT_17	GTM_DMA_8, 10
GTM_MCS9_IRQ[x]*1	MCS9 Interrupt for channel x (x: 0..8)	GTM_INT_17	GTM_DMA_8, 10
GTM_TOM0_IRQ[x]	TOM0 Shared interrupts for x: 0..7 = {ch0 ch1,...,ch14 ch15}	GTM_INT_0	GTM_DMA_0
GTM_TOM1_IRQ[x]	TOM1 Shared interrupts for x: 0..7 = {ch0 ch1,...,ch14 ch15}	GTM_INT_1	GTM_DMA_1
GTM_TOM2_IRQ[x]	TOM2 Shared interrupts for x: 0..7 = {ch0 ch1,...,ch14 ch15}	GTM_INT_2	GTM_DMA_2
GTM_TOM3_IRQ[x]	TOM3 Shared interrupts for x: 0..7 = {ch0 ch1,...,ch14 ch15}	GTM_INT_3	GTM_DMA_3
GTM_TOM4_IRQ[x]	TOM4 Shared interrupts for x: 0..7 = {ch0 ch1,...,ch14 ch15}	GTM_INT_4	GTM_DMA_4
GTM_TOM5_IRQ[x]*1	TOM5 Shared interrupts for x: 0..7 = {ch0 ch1,...,ch14 ch15}	GTM_INT_5	GTM_DMA_5

Table 33.8 Interrupt Requests (3/3)

GTM Interrupt Factors	Description	Interrupt Group	DMAC Trigger Group
GTM_ATOM0_IRQ[x]	ATOM0 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_0	GTM_DMA_0
GTM_ATOM1_IRQ[x]	ATOM1 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_1	GTM_DMA_1
GTM_ATOM2_IRQ[x]	ATOM2 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_2	GTM_DMA_2
GTM_ATOM3_IRQ[x]	ATOM3 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_3	GTM_DMA_3
GTM_ATOM4_IRQ[x]	ATOM4 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_4	GTM_DMA_4
GTM_ATOM5_IRQ[x]	ATOM5 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_5	GTM_DMA_5
GTM_ATOM6_IRQ[x]	ATOM6 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_6	GTM_DMA_6
GTM_ATOM7_IRQ[x]	ATOM7 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_7	GTM_DMA_7
GTM_ATOM8_IRQ[x]	ATOM8 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_8	GTM_DMA_8, 10
GTM_ATOM9_IRQ[x]*1	ATOM9 Shared interrupts for x: 0..3 = {ch0 ch1,...,ch6 ch7}	GTM_INT_17	GTM_DMA_8, 10
GTM_ERR_IRQ	GTM Error Interrupt	GTM_INT_16	—

Note 1. Not supported in E2H

Table 33.9 Interrupt Factor Groups

INT Groups	Interrupt Symbol Name	Registers	Interrupt Number
GTM_INT_0	INTGTM0IOS0n	GTM_IRQ_SEL0j	78 to 93
GTM_INT_1	INTGTM0IOS1n	GTM_IRQ_SEL1j	94 to 109
GTM_INT_2	INTGTM0IOS2n	GTM_IRQ_SEL2j	110 to 125
GTM_INT_3	INTGTM0IOS3n	GTM_IRQ_SEL3j	126 to 141
GTM_INT_4	INTGTM0IOS4n	GTM_IRQ_SEL4j	142 to 157
GTM_INT_5	INTGTM0IOS5n	GTM_IRQ_SEL5j	158 to 173
GTM_INT_6	INTGTM0IOS6n	GTM_IRQ_SEL6j	174 to 189
GTM_INT_7	INTGTM0IOS7n	GTM_IRQ_SEL7j	190 to 205
GTM_INT_8	INTGTM0IOS8n	GTM_IRQ_SEL8j	206 to 221
GTM_INT_9	INTGTM0DPLLn	GTM_IRQ_DPLL_SELj	229 to 244

Note 1. Not supported in E2H

33.1.6 Reset Sources

The following table shows GTM reset sources and GTM responses to each reset source.

Table 33.11 Reset Sources

Register Name	Reset Condition					
	Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
All registers	✓	✓	✓	✓	—	—

33.1.7 External Input/Output Signals

External input/output signals of GTM are listed in the following table.

Table 33.12 External Input/Output Signals

RH850/E2x-FCC2, E2UH			
Unit Signal Name	I/O	Outline	Alternative Port Pin Signal
GTM			
TIM[i]_IN0 to TIM[i]_IN7 (i: 0 to 7)	I	Timer input signals for TIM[i] (i: 0 to 7)	TIM[i]_0 to TIM[i]_7 (i: 0 to 7)
TOM[i]_OUT0 to TOM[i]_OUT15 (i: 0 to 5)	O	Timer output signals for TOM[i] (i: 0 to 5)	TOM[i]_0 to TOM[i]_15 (i: 0 to 5)
TOM[i]_OUT0_N to TOM[i]_OUT7_N (i: 0 to 5)	O	Inverted timer output signal for TOM[i] (i: 0 to 5)	TOM[i]_0N to TOM[i]_7N (i: 0 to 5)
ATOM[i]_OUT0 to ATOM[i]_OUT (i: 0 to 9)	O	Timer output signals for ATOM[i] (i: 0 to 9)	ATOM[i]_0 to ATOM[i]_7 (i: 0 to 9)
ATOM[i]_OUT0_N to ATOM[i]_OUT7_N (i: 0 to 6)	O	Inverted timer output signal for ATOM[i] (i: 0 to 6)	ATOM[i]_0N to ATOM[i]_7N (i: 0 to 6)
CMU_ECLK0 to CMU_ECLK2	O	External Clock	GTMECLK0 to GTMECLK2

Table 33.13 External Input/Output Signals

RH850/E2H			
Unit Signal Name	I/O	Outline	Alternative Port Pin Signal
GTM			
TIM[i]_IN0 to TIM[i]_IN7 (i: 0 to 7)	I	Timer input signals for TIM[i] (i: 0 to 7)	TIM[i]_0 to TIM[i]_7 (i: 0 to 7)
TOM[i]_OUT0 to TOM[i]_OUT15 (i: 0 to 4)	O	Timer output signals for TOM[i] (i: 0 to 4)	TOM[i]_0 to TOM[i]_15 (i: 0 to 4)
TOM[i]_OUT0_N to TOM[i]_OUT7_N (i: 0 to 4)	O	Inverted timer output signal for TOM[i] (i: 0 to 4)	TOM[i]_0N to TOM[i]_7N (i: 0 to 4)
ATOM[i]_OUT0 to ATOM[i]_OUT7 (i: 0 to 8)	O	Timer output signals for ATOM[i] (i: 0 to 8)	ATOM[i]_0 to ATOM[i]_7 (i: 0 to 8)
ATOM[i]_OUT0_N to ATOM[i]_OUT7_N (i: 0 to 4)	O	Inverted timer output signal for ATOM[i] (i: 0 to 4)	ATOM[i]_0N to ATOM[i]_7N (i: 0 to 4)
ATOM[i]_OUT0_N to ATOM[i]_OUT3_N (i: 5 to 6)	O	Inverted timer output signal for ATOM[i] (i: 5 to 6)	ATOM[i]_0N to ATOM[i]_3N (i: 5 to 6)
CMU_ECLK0 to CMU_ECLK2	O	External Clock	GTMECLK0 to GTMECLK2

33.2 Overview

33.2.1 Functional Overview

GTM consists of the following sub-modules.

- Advanced Routing Unit (ARU)
 - Data routing between GTM sub-modules.
- Broadcast Module (BRC)
 - Data broadcasting from a source sub-module to multiple destination sub-modules via ARU.
- Parameter Storage Module (PSM)
 - First In First Out Module. (FIFO)
 - AEI-to-FIFO Data Interface. (AFD)
 - FIFO-to-ARU Unit. (F2A)
- Clock Management Unit (CMU)
 - Clock pre-scaler for GTM internal and external clocks.
- Cluster Configuration Module (CCM)
 - Controlling cluster configurations:
 - Cluster's clock frequency.
 - Module clock gating.
 - Status monitoring of the cluster's MCS bus master.
 - Address range protection.
- Time Base Unit (TBU)
 - Three independent 24-bit time bases.
 - One module counter for angular conversions.
 - Supporting the following modes:
 - Free Running Counter Mode.
 - Forward/Backward Counter Mode.
 - Connected to angle clock. (DPLL)
- Timer Input Module (TIM)
 - Filter, capture/compare with a time stamp and input signal timeout.
 - Input from other peripherals to GTM.
- Timer Output Module (TOM)
 - Simple PWM waveform generation with 16-bit time base counter.
 - Input signal to other peripherals.
- ARU-connected Timer Output Module (ATOM)
 - Complex output waveform generation without CPU interactions with 24-bit time base counter.
 - Input signal to other peripherals.

- Dead Time Module (DTM)
 - Hardware support for dead time generation.
- Multi Channel Sequencer (MCS)
 - Programmable sequencer with RISC-like instruction set and dedicated RAM.
- Memory Configuration (MCFG)
 - Mapping MCS physical memory to MCS instances.
- TIM0 Input Mapping Module (MAP)
 - Mapping TIM0 input signals to DPLL.
- Digital PLL (DPLL)
 - Angle calculation and micro tick generation from up to two input signals.
 - Prediction of future behavior of input signal.
- Sensor Pattern Evaluation (SPE)
 - Hardware support for BLDC motors.
- Interrupt Concentrator Module (ICM)
 - Bundling GTM internal interrupts before they are routed to INTC and DMAC.
- Output Compare Unit (CMP)
 - Support for safety relevant applications, compare of DTM outputs.
- Monitoring Unit (MON)
 - Monitoring GTM internal clocks and MCS functionality.

33.2.2 Block Diagram

The following figure shows interconnections between GTM-IP and other peripherals.

Figure 33.1 Block Diagram of GTM

33.3 Registers

33.3.1 List of Registers

Registers in the table below configure routing between ICM outputs and INTC and DMAC/DTS.

For details about <GTM0_base><GTM0_1_base>, see **Section 33.1.3, Register/RAM Base Address**.

Table 33.14 List of Registers (1/7)

Module Name	Register Name	Symbol	Address	Access	Access Protection
GTM0	All of GTM-IP registers	*1	<GTM0_base> + *1	32	—
GTM0_1	GTM Interrupt selection control register 000	GTM_IRQ_SEL000	<GTM0_1_base> + 000 _H	8, 16, 32	—
	GTM Interrupt selection control register 001	GTM_IRQ_SEL001	<GTM0_1_base> + 004 _H	8, 16, 32	—
	GTM Interrupt selection control register 002	GTM_IRQ_SEL002	<GTM0_1_base> + 008 _H	8, 16, 32	—
	GTM Interrupt selection control register 003	GTM_IRQ_SEL003	<GTM0_1_base> + 00C _H	8, 16, 32	—
	GTM Interrupt selection control register 004	GTM_IRQ_SEL004	<GTM0_1_base> + 010 _H	8, 16, 32	—
	GTM Interrupt selection control register 005	GTM_IRQ_SEL005	<GTM0_1_base> + 014 _H	8, 16, 32	—
	GTM Interrupt selection control register 006	GTM_IRQ_SEL006	<GTM0_1_base> + 018 _H	8, 16, 32	—
	GTM Interrupt selection control register 007	GTM_IRQ_SEL007	<GTM0_1_base> + 01C _H	8, 16, 32	—
	GTM Interrupt selection control register 008	GTM_IRQ_SEL008	<GTM0_1_base> + 020 _H	8, 16, 32	—
	GTM Interrupt selection control register 009	GTM_IRQ_SEL009	<GTM0_1_base> + 024 _H	8, 16, 32	—
	GTM Interrupt selection control register 010	GTM_IRQ_SEL010	<GTM0_1_base> + 028 _H	8, 16, 32	—
	GTM Interrupt selection control register 011	GTM_IRQ_SEL011	<GTM0_1_base> + 02C _H	8, 16, 32	—
	GTM Interrupt selection control register 012	GTM_IRQ_SEL012	<GTM0_1_base> + 030 _H	8, 16, 32	—
	GTM Interrupt selection control register 013	GTM_IRQ_SEL013	<GTM0_1_base> + 034 _H	8, 16, 32	—
	GTM Interrupt selection control register 014	GTM_IRQ_SEL014	<GTM0_1_base> + 038 _H	8, 16, 32	—
	GTM Interrupt selection control register 015	GTM_IRQ_SEL015	<GTM0_1_base> + 03C _H	8, 16, 32	—
	GTM Interrupt selection control register 100	GTM_IRQ_SEL100	<GTM0_1_base> + 040 _H	8, 16, 32	—
	GTM Interrupt selection control register 101	GTM_IRQ_SEL101	<GTM0_1_base> + 044 _H	8, 16, 32	—
	GTM Interrupt selection control register 102	GTM_IRQ_SEL102	<GTM0_1_base> + 048 _H	8, 16, 32	—

Table 33.14 List of Registers (5/7)

Module Name	Register Name	Symbol	Address	Access	Access Protection
GTM0_1	GTM DMA selection control register 00	GTM_DMA_SEL00	<GTM0_1_base> + 300 _H	8, 16, 32	—
	GTM DMA selection control register 01	GTM_DMA_SEL01	<GTM0_1_base> + 304 _H	8, 16, 32	—
	GTM DMA selection control register 02	GTM_DMA_SEL02	<GTM0_1_base> + 308 _H	8, 16, 32	—
	GTM DMA selection control register 03	GTM_DMA_SEL03	<GTM0_1_base> + 30C _H	8, 16, 32	—
	GTM DMA selection control register 04	GTM_DMA_SEL04	<GTM0_1_base> + 310 _H	8, 16, 32	—
	GTM DMA selection control register 05	GTM_DMA_SEL05	<GTM0_1_base> + 314 _H	8, 16, 32	—
	GTM DMA selection control register 06	GTM_DMA_SEL06	<GTM0_1_base> + 318 _H	8, 16, 32	—
	GTM DMA selection control register 07	GTM_DMA_SEL07	<GTM0_1_base> + 31C _H	8, 16, 32	—
	GTM DMA selection control register 10	GTM_DMA_SEL10	<GTM0_1_base> + 320 _H	8, 16, 32	—
	GTM DMA selection control register 11	GTM_DMA_SEL11	<GTM0_1_base> + 324 _H	8, 16, 32	—
	GTM DMA selection control register 12	GTM_DMA_SEL12	<GTM0_1_base> + 328 _H	8, 16, 32	—
	GTM DMA selection control register 13	GTM_DMA_SEL13	<GTM0_1_base> + 32C _H	8, 16, 32	—
	GTM DMA selection control register 14	GTM_DMA_SEL14	<GTM0_1_base> + 330 _H	8, 16, 32	—
	GTM DMA selection control register 15	GTM_DMA_SEL15	<GTM0_1_base> + 334 _H	8, 16, 32	—
	GTM DMA selection control register 16	GTM_DMA_SEL16	<GTM0_1_base> + 338 _H	8, 16, 32	—
	GTM DMA selection control register 17	GTM_DMA_SEL17	<GTM0_1_base> + 33C _H	8, 16, 32	—
	GTM DMA selection control register 20	GTM_DMA_SEL20	<GTM0_1_base> + 340 _H	8, 16, 32	—
	GTM DMA selection control register 21	GTM_DMA_SEL21	<GTM0_1_base> + 344 _H	8, 16, 32	—
	GTM DMA selection control register 22	GTM_DMA_SEL22	<GTM0_1_base> + 348 _H	8, 16, 32	—
	GTM DMA selection control register 23	GTM_DMA_SEL23	<GTM0_1_base> + 34C _H	8, 16, 32	—
	GTM DMA selection control register 24	GTM_DMA_SEL24	<GTM0_1_base> + 350 _H	8, 16, 32	—
	GTM DMA selection control register 25	GTM_DMA_SEL25	<GTM0_1_base> + 354 _H	8, 16, 32	—
	GTM DMA selection control register 26	GTM_DMA_SEL26	<GTM0_1_base> + 358 _H	8, 16, 32	—
	GTM DMA selection control register 27	GTM_DMA_SEL27	<GTM0_1_base> + 35C _H	8, 16, 32	—
	GTM DMA selection control register 30	GTM_DMA_SEL30	<GTM0_1_base> + 360 _H	8, 16, 32	—
	GTM DMA selection control register 31	GTM_DMA_SEL31	<GTM0_1_base> + 364 _H	8, 16, 32	—
	GTM DMA selection control register 32	GTM_DMA_SEL32	<GTM0_1_base> + 368 _H	8, 16, 32	—
	GTM DMA selection control register 33	GTM_DMA_SEL33	<GTM0_1_base> + 36C _H	8, 16, 32	—
	GTM DMA selection control register 34	GTM_DMA_SEL34	<GTM0_1_base> + 370 _H	8, 16, 32	—
	GTM DMA selection control register 35	GTM_DMA_SEL35	<GTM0_1_base> + 374 _H	8, 16, 32	—
	GTM DMA selection control register 36	GTM_DMA_SEL36	<GTM0_1_base> + 378 _H	8, 16, 32	—
	GTM DMA selection control register 37	GTM_DMA_SEL37	<GTM0_1_base> + 37C _H	8, 16, 32	—
	GTM DMA selection control register 40	GTM_DMA_SEL40	<GTM0_1_base> + 380 _H	8, 16, 32	—
	GTM DMA selection control register 41	GTM_DMA_SEL41	<GTM0_1_base> + 384 _H	8, 16, 32	—
	GTM DMA selection control register 42	GTM_DMA_SEL42	<GTM0_1_base> + 388 _H	8, 16, 32	—
	GTM DMA selection control register 43	GTM_DMA_SEL43	<GTM0_1_base> + 38C _H	8, 16, 32	—
	GTM DMA selection control register 44	GTM_DMA_SEL44	<GTM0_1_base> + 390 _H	8, 16, 32	—
	GTM DMA selection control register 45	GTM_DMA_SEL45	<GTM0_1_base> + 394 _H	8, 16, 32	—
	GTM DMA selection control register 46	GTM_DMA_SEL46	<GTM0_1_base> + 398 _H	8, 16, 32	—
	GTM DMA selection control register 47	GTM_DMA_SEL47	<GTM0_1_base> + 39C _H	8, 16, 32	—
	GTM DMA selection control register 50	GTM_DMA_SEL50	<GTM0_1_base> + 3A0 _H	8, 16, 32	—
	GTM DMA selection control register 51	GTM_DMA_SEL51	<GTM0_1_base> + 3A4 _H	8, 16, 32	—
	GTM DMA selection control register 52	GTM_DMA_SEL52	<GTM0_1_base> + 3A8 _H	8, 16, 32	—
	GTM DMA selection control register 53	GTM_DMA_SEL53	<GTM0_1_base> + 3AC _H	8, 16, 32	—
	GTM DMA selection control register 54	GTM_DMA_SEL54	<GTM0_1_base> + 3B0 _H	8, 16, 32	—
	GTM DMA selection control register 55	GTM_DMA_SEL55	<GTM0_1_base> + 3B4 _H	8, 16, 32	—
	GTM DMA selection control register 56	GTM_DMA_SEL56	<GTM0_1_base> + 3B8 _H	8, 16, 32	—
	GTM DMA selection control register 57	GTM_DMA_SEL57	<GTM0_1_base> + 3BC _H	8, 16, 32	—

Table 33.14 List of Registers (6/7)

Module Name	Register Name	Symbol	Address	Access	Access Protection
GTM0_1	GTM DMA selection control register 60	GTM_DMA_SEL60	<GTM0_1_base> + 3C0 _H	8, 16, 32	—
	GTM DMA selection control register 61	GTM_DMA_SEL61	<GTM0_1_base> + 3C4 _H	8, 16, 32	—
	GTM DMA selection control register 62	GTM_DMA_SEL62	<GTM0_1_base> + 3C8 _H	8, 16, 32	—
	GTM DMA selection control register 63	GTM_DMA_SEL63	<GTM0_1_base> + 3CC _H	8, 16, 32	—
	GTM DMA selection control register 64	GTM_DMA_SEL64	<GTM0_1_base> + 3D0 _H	8, 16, 32	—
	GTM DMA selection control register 65	GTM_DMA_SEL65	<GTM0_1_base> + 3D4 _H	8, 16, 32	—
	GTM DMA selection control register 66	GTM_DMA_SEL66	<GTM0_1_base> + 3D8 _H	8, 16, 32	—
	GTM DMA selection control register 67	GTM_DMA_SEL67	<GTM0_1_base> + 3DC _H	8, 16, 32	—
	GTM DMA selection control register 70	GTM_DMA_SEL70	<GTM0_1_base> + 3E0 _H	8, 16, 32	—
	GTM DMA selection control register 71	GTM_DMA_SEL71	<GTM0_1_base> + 3E4 _H	8, 16, 32	—
	GTM DMA selection control register 72	GTM_DMA_SEL72	<GTM0_1_base> + 3E8 _H	8, 16, 32	—
	GTM DMA selection control register 73	GTM_DMA_SEL73	<GTM0_1_base> + 3EC _H	8, 16, 32	—
	GTM DMA selection control register 74	GTM_DMA_SEL74	<GTM0_1_base> + 3F0 _H	8, 16, 32	—
	GTM DMA selection control register 75	GTM_DMA_SEL75	<GTM0_1_base> + 3F4 _H	8, 16, 32	—
	GTM DMA selection control register 76	GTM_DMA_SEL76	<GTM0_1_base> + 3F8 _H	8, 16, 32	—
	GTM DMA selection control register 77	GTM_DMA_SEL77	<GTM0_1_base> + 3FC _H	8, 16, 32	—
	GTM DMA selection control register 80	GTM_DMA_SEL80	<GTM0_1_base> + 400 _H	8, 16, 32	—
	GTM DMA selection control register 81	GTM_DMA_SEL81	<GTM0_1_base> + 404 _H	8, 16, 32	—
	GTM DMA selection control register 82	GTM_DMA_SEL82	<GTM0_1_base> + 408 _H	8, 16, 32	—
	GTM DMA selection control register 83	GTM_DMA_SEL83	<GTM0_1_base> + 40C _H	8, 16, 32	—
	GTM DMA selection control register 84	GTM_DMA_SEL84	<GTM0_1_base> + 410 _H	8, 16, 32	—
	GTM DMA selection control register 85	GTM_DMA_SEL85	<GTM0_1_base> + 414 _H	8, 16, 32	—
	GTM DMA selection control register 86	GTM_DMA_SEL86	<GTM0_1_base> + 418 _H	8, 16, 32	—
	GTM DMA selection control register 87	GTM_DMA_SEL87	<GTM0_1_base> + 41C _H	8, 16, 32	—
	GTM DMA Common selection function Register 0	GTM_DMA_COM_SEL0	<GTM0_1_base> + 420 _H	8, 16, 32	—
	GTM DMA Common selection function Register 1	GTM_DMA_COM_SEL1	<GTM0_1_base> + 424 _H	8, 16, 32	—
	GTM DMA Common selection function Register 2	GTM_DMA_COM_SEL2	<GTM0_1_base> + 428 _H	8, 16, 32	—
	GTM DMA Common selection function Register 3	GTM_DMA_COM_SEL3	<GTM0_1_base> + 42C _H	8, 16, 32	—
	GTM DMA Common selection function Register 4	GTM_DMA_COM_SEL4	<GTM0_1_base> + 430 _H	8, 16, 32	—
	GTM DMA Common selection function Register 5	GTM_DMA_COM_SEL5	<GTM0_1_base> + 434 _H	8, 16, 32	—
	GTM DMA Common selection function Register 6	GTM_DMA_COM_SEL6	<GTM0_1_base> + 438 _H	8, 16, 32	—
	GTM DMA Common selection function Register 7	GTM_DMA_COM_SEL7	<GTM0_1_base> + 43C _H	8, 16, 32	—
	GTM DMA Common selection function Register 8	GTM_DMA_COM_SEL8	<GTM0_1_base> + 440 _H	8, 16, 32	—
	GTM DMA Common selection function Register 9	GTM_DMA_COM_SEL9	<GTM0_1_base> + 444 _H	8, 16, 32	—
	GTM DMA selection control register 90*2	GTM_DMA_SEL90	<GTM0_1_base> + 460 _H	8, 16, 32	—
	GTM DMA selection control register 91*2	GTM_DMA_SEL91	<GTM0_1_base> + 464 _H	8, 16, 32	—
	GTM DMA selection control register 92*2	GTM_DMA_SEL92	<GTM0_1_base> + 468 _H	8, 16, 32	—
	GTM DMA selection control register 93*2	GTM_DMA_SEL93	<GTM0_1_base> + 46C _H	8, 16, 32	—
	GTM DMA selection control register 94*2	GTM_DMA_SEL94	<GTM0_1_base> + 470 _H	8, 16, 32	—
	GTM DMA selection control register 95*2	GTM_DMA_SEL95	<GTM0_1_base> + 474 _H	8, 16, 32	—
	GTM DMA selection control register 96*2	GTM_DMA_SEL96	<GTM0_1_base> + 478 _H	8, 16, 32	—
	GTM DMA selection control register 97*2	GTM_DMA_SEL97	<GTM0_1_base> + 47C _H	8, 16, 32	—

Table 33.14 List of Registers (7/7)

Module Name	Register Name	Symbol	Address	Access	Access Protection
GTM0_1	GTM ADCI channel selection register 0	GTM_ADCI_CHSEL0	<GTM0_1_base> + 500 _H	8, 16, 32	—
	GTM ADCI channel selection register 1	GTM_ADCI_CHSEL1	<GTM0_1_base> + 504 _H	8, 16, 32	—
	GTM ADCI channel selection register 2	GTM_ADCI_CHSEL2	<GTM0_1_base> + 508 _H	8, 16, 32	—
	GTM ADCI channel selection register 3	GTM_ADCI_CHSEL3	<GTM0_1_base> + 50C _H	8, 16, 32	—
	GTM ADCI channel selection register 4	GTM_ADCI_CHSEL4	<GTM0_1_base> + 510 _H	8, 16, 32	—
	GTM ADCI storage data selection register	GTM_ADCI_STRSEL	<GTM0_1_base> + 520 _H	8, 16, 32	—

Note 1. For details of GTM-IP registers, please refer to "*GTM-IP Specification*" documents. Also, the access size of RAM has to be 32-bit wide.

Note 2. Not supported in E2H

The table below shows registers that have a different reset value compared to Robert Bosch's GTM-IP specification.

Table 33.15 Initial Value Difference between "GTM-IP Specification Appendix B" and Actual Device

Register Name	Reset Value	
	GTM-IP Specification	GTM-IP_359, GTM-IP_355
GTM_IRQ_MODE	0000 0000 _H	0000 0002 _H
GTM_BRIDGE_PTR1	0040 0000 _H	004X XXXX _H
CCM[i]_HW_CONF (i = 0 to 9)	284F 1339 _H	284F 0339 _H
CMP_IRQ_MODE	0000 0000 _H	0000 0002 _H
ARU_IRQ_MODE	0000 0000 _H	0000 0002 _H
BRC_IRQ_MODE	0000 0000 _H	0000 0002 _H
SPE[i]_IRQ_MODE	0000 0000 _H	0000 0002 _H
TIM[i]_CH[x]_IRQ_MODE	0000 0000 _H	0000 0002 _H
TOM[i]_CH[x]_IRQ_MODE	0000 0000 _H	0000 0002 _H
ATOM[i]_CH[x]_IRQ_MODE	0000 0000 _H	0000 0002 _H
FIFO[i]_CH[x]_IRQ_MODE	0000 0000 _H	0000 0002 _H
DPLL_IRQ_MODE	0000 0000 _H	0000 0002 _H
MCS[i]_CH[x]_IRQ_MODE	0000 0000 _H	0000 0002 _H
MCS[i]_CTRL_STAT	0001 0000 _H	0000 0000 _H

33.3.2 GTM_IRQ_SELij — GTM Interrupt Selection Control Register ij

GTM interrupt factors forwarded to INTC are selected from ICM outputs. Please refer to ICM Chapter in “*GTM-IP Specification*” for list of ICM outputs. (i = 0 to 7, j = 00 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	GTM_SPE[i]_IRQ	GTM_MCS[i]_IRQ[7:0]							GTM_ATOM[i]_IRQ[3:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GTM_TOM[i]_IRQ[7:0]							GTM_TIM[i]_IRQ[7:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 33.16 GTM_IRQ_SELij Register Contents

Bit Position	Bit Name	Function
31 to 29	—	Reserved When writing to these bits, write 0.
28	GTM_SPE[i]_IRQ	SPE[i] Shared interrupt (GTM_SPE[i]_IRQ) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
27 to 20	GTM_MCS[i]_IRQ [7:0]	MCS[i] Interrupt for channel 7 to 0 (GTM_MCS[i]_IRQ[7:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
19 to 16	GTM_ATOM[i]_IRQ [3:0]	ATOM[i] Shared interrupts for 3 to 0 (GTM_ATOM[i]_IRQ[3:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
15 to 8	GTM_TOM[i]_IRQ [7:0]	TOM[i] Shared interrupts for 7 to 0 (GTM_TOM[i]_IRQ[7:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
7 to 0	GTM_TIM[i]_IRQ [7:0]	TIM[i] Shared interrupts for 7 to 0 (GTM_TIM[i]_IRQ[7:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.

Note: i: Number of clusters, j: Number of interrupts per cluster

The bit of cluster i beyond the equipped maximum number of TIM/TOM/ATOM/MCS/SPE will be Reserved.

33.3.3 GTM_IRQ_SEL8j — GTM Interrupt Selection Control Register 8j

GTM interrupt factors forwarded to INTC are selected from ICM outputs. Please refer to ICM Chapter in “*GTM-IP Specification*” for list of ICM outputs. (j = 00 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTENCA[n]IEC	INTENCA[n]1	INTENCA[n]0	INTENCA[n]UD	INTENCA[n]OV	—	—	—	—	—	—	—	GTM_ATOM8_IRQ[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	GTM_PSM1_IRQ[7:0]							GTM_PSM0_IRQ[7:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 33.17 GTM_IRQ_SEL8j Register Contents

Bit Position	Bit Name	Function
31	INTENCA[n]IEC	Encoder clear interrupt (n = 0: j = 00 to 07, n = 1: j = 08 to 15) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
30	INTENCA[n]1	Capture / compare match interrupt 1 (n = 0: j = 00 to 07, n = 1: j = 08 to 15) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
29	INTENCA[n]0	Capture / compare match interrupt 0 (n = 0: j = 00 to 07, n = 1: j = 08 to 15) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
28	INTENCA[n]UD	Underflow interrupt (n = 0: j = 00 to 07, n = 1: j = 08 to 15) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
27	INTENCA[n]OV	Overflow interrupt (n = 0: j = 00 to 07, n = 1: j = 08 to 15) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
26 to 20	—	Reserved When writing to these bits, write 0.
19 to 16	GTM_ATOM8_IRQ [3:0]	ATOM8 Shared interrupts for 3 to 0 (GTM_ATOM8_IRQ[3:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
15 to 8	GTM_PSM1_IRQ[7:0]	PSM1 Shared interrupts (GTM_PSM1_IRQ[7:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
7 to 0	GTM_PSM0_IRQ[7:0]	PSM0 Shared interrupts (GTM_PSM0_IRQ[7:0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.

Note: j: Number of interrupts per cluster, n: Number of Encode Timer (ENCA_n)

33.3.4 GTM_IRQ_SEL9j — GTM Interrupt Selection Control Register 9j

GTM interrupt factors forwarded to INTC are selected from ICM outputs. Please refer to ICM Chapter in “*GTM-IP Specification*” for list of ICM outputs. (j = 00 to 15) (Not supported in E2H)

Value after reset: 0000 0000_H

Table 33.19 GTM_IRQ_DPLL_SELj Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 27	—	Reserved When writing to these bits, write 0.
26	GTM_DPLL_IRQ[26]	DPLL_SORI: STATE out of range interrupt (GTM_DPLL_IRQ[26]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
25	GTM_DPLL_IRQ[25]	DPLL_TORI: TRIGGER out of range interrupt (GTM_DPLL_IRQ[25]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
24	GTM_DPLL_IRQ[24]	DPLL_CDSI: DPLL calculated duration interrupt for STATE (GTM_DPLL_IRQ[24]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
23	GTM_DPLL_IRQ[23]	DPLL_CDTI: DPLL calculated duration interrupt for TRIGGER (GTM_DPLL_IRQ[23]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
22	GTM_DPLL_IRQ[22]	DPLL_TE4I: DPLL TRIGGER event interrupt 4 (GTM_DPLL_IRQ[22]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
21	GTM_DPLL_IRQ[21]	DPLL_TE3I: DPLL TRIGGER event interrupt 3 (GTM_DPLL_IRQ[21]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.

Table 33.19 GTM_IRQ_DPLL_SELj Register Contents (2/3)

Bit Position	Bit Name	Function
20	GTM_DPLL_IRQ[20]	DPLL_TE2I: DPLL TRIGGER event interrupt 2 (GTM_DPLL_IRQ[20]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
19	GTM_DPLL_IRQ[19]	DPLL_TE1I: DPLL TRIGGER event interrupt 1 (GTM_DPLL_IRQ[19]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
18	GTM_DPLL_IRQ[18]	DPLL_TE0I: DPLL TRIGGER event interrupt 0 (GTM_DPLL_IRQ[18]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
17	GTM_DPLL_IRQ[17]	DPLL_LL2I: DPLL Lost of lock interrupt for SUB_INC2 (GTM_DPLL_IRQ[17]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
16	GTM_DPLL_IRQ[16]	DPLL_GL2I: DPLL Get of lock interrupt for SUB_INC2 (GTM_DPLL_IRQ[16]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
15	GTM_DPLL_IRQ[15]	DPLL_EI: DPLL Error interrupt (GTM_DPLL_IRQ[15]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
14	GTM_DPLL_IRQ[14]	DPLL_LL1I: DPLL Lost of lock interrupt for SUB_INC1 (GTM_DPLL_IRQ[14]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
13	GTM_DPLL_IRQ[13]	DPLL_GL1I: DPLL Get of lock interrupt for SUB_INC1 (GTM_DPLL_IRQ[13]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
12	GTM_DPLL_IRQ[12]	DPLL_W1I: DPLL Write access to RAM region 1b or 1c int. (GTM_DPLL_IRQ[12]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
11	GTM_DPLL_IRQ[11]	DPLL_W2I: DPLL Write access to RAM region 2 interrupt (GTM_DPLL_IRQ[11]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
10	GTM_DPLL_IRQ[10]	DPLL_PWI: DPLL Plausibility window (PVT) viol. int. of TRIG. (GTM_DPLL_IRQ[10]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
9	GTM_DPLL_IRQ[9]	DPLL_TASI: DPLL TRIG. active slope detected while NTI_CNT is 0 (GTM_DPLL_IRQ[9]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
8	GTM_DPLL_IRQ[8]	DPLL_SASI: DPLL STATE active slope detected (GTM_DPLL_IRQ[8]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
7	GTM_DPLL_IRQ[7]	DPLL_MTI: DPLL Missing TRIGGER interrupt (GTM_DPLL_IRQ[7]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
6	GTM_DPLL_IRQ[6]	DPLL_MSI: DPLL Missing STATE interrupt (GTM_DPLL_IRQ[6]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
5	GTM_DPLL_IRQ[5]	DPLL_TISI: DPLL TRIGGER inactive slope detected (GTM_DPLL_IRQ[5]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
4	GTM_DPLL_IRQ[4]	DPLL_SISI: DPLL STATE inactive slope detected (GTM_DPLL_IRQ[4]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.

Table 33.19 GTM_IRQ_DPLL_SELj Register Contents (3/3)

Bit Position	Bit Name	Function
3	GTM_DPLL_IRQ[3]	DPLL_TAXI: DPLL TRIG. max. hold time (THMA) viol. detected (GTM_DPLL_IRQ[3]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
2	GTM_DPLL_IRQ[2]	DPLL_TINI: DPLL TRIG. min. hold time (THMI) viol. detected (GTM_DPLL_IRQ[2]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
1	GTM_DPLL_IRQ[1]	DPLL_EDI: DPLL enable or disable interrupt (GTM_DPLL_IRQ[1]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.
0	GTM_DPLL_IRQ[0]	DPLL_DCGI: DPLL direction change interrupt (GTM_DPLL_IRQ[0]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.

Note: j: Number of DPLL interrupts

33.3.6 GTM_DMA_SEL_{ij} — GTM DMA Selection Control Register ij

GTM outputs and ICM outputs can be forwarded to DMAC/DTS. Please refer to ICM, TOM and ATOM Sections in “GTM-IP Specification” for list of ICM outputs. (i = 0 to 7, j = 0 to 7)

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31 to 6	—	Reserved When writing to these bits, write 0.
5 to 0	GTM_DMA_COM_SEL[5:0]	Selects a DMA trigger from ICM. 0: GTM_AEI_IRQ 1 + x: GTM_ARU_IRQ[x] (x = 0 to 2) 4: GTM_BRC_IRQ 5: GTM_CMP_IRQ 6 + x: GTM_PSM0_IRQ[x] (x = 0 to 7) 14 + x: GTM_PSM1_IRQ[x] (x = 0 to 7) 22 + x: GTM_DPLL_IRQ[x] (x = 0 to 1) 20 + x: GTM_DPLL_IRQ[x] (x = 4 to 14) 19 + x: GTM_DPLL_IRQ[x] (x = 16 to 26) Other: Reserved

Note: j: Number of DMA triggers per cluster

33.3.10 GTM_ADCI_CHSELn — GTM ADCI channel selection register n

Results of A/D conversion are stored in ADC_CH[y]_DATA registers (y = 0..31). Either registers 0 to 15 or registers 16 to 31 can be used based on GTM_ADCI_CHSELn.CHS. In addition, a register designation is also based on DFTAG (ADCH and CADC) or DFES (DSADC). For more information about DFTAG and DFES configuration please refer to **Section 36, Analog to Digital Converter (ADCH)**, **Section 37, Delta-Sigma Analog to Digital Converter (DSADC)** and **Section 38, Cyclic Analog to Digital Converter (CADC)**. (n = 0 to 3: ADCHn, n = 4: CADC)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 33.25 GTM_ADCI_STRSEL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 20	—	Reserved When writing to these bits, write 0.
19	DFE1_CH03_SEL	Select the data to be stored in ADC_CH19_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE1 CH3.
18	DFE1_CH02_SEL	Select the data to be stored in ADC_CH18_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE1 CH2.
17	DFE1_CH01_SEL	Select the data to be stored in ADC_CH17_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE1 CH1.
16	DFE1_CH00_SEL	Select the data to be stored in ADC_CH16_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE1 CH0.
15	DFE0_CH15_SEL	Select the data to be stored in ADC_CH15_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH15.
14	DFE0_CH14_SEL	Select the data to be stored in ADC_CH14_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH14.
13	DFE0_CH13_SEL	Select the data to be stored in ADC_CH13_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH13.
12	DFE0_CH12_SEL	Select the data to be stored in ADC_CH12_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH12.
11	DFE0_CH11_SEL	Select the data to be stored in ADC_CH11_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH11.

Table 33.25 GTM_ADCI_STRSEL Register Contents (2/2)

Bit Position	Bit Name	Function
10	DFE0_CH10_SEL	Select the data to be stored in ADC_CH10_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH10.
9	DFE0_CH09_SEL	Select the data to be stored in ADC_CH9_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH9.
8	DFE0_CH08_SEL	Select the data to be stored in ADC_CH8_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH8.
7	DFE0_CH07_SEL	Select the data to be stored in ADC_CH7_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH7.
6	DFE0_CH06_SEL	Select the data to be stored in ADC_CH6_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH6.
5	DFE0_CH05_SEL	Select the data to be stored in ADC_CH5_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH5.
4	DFE0_CH04_SEL	Select the data to be stored in ADC_CH4_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH4.
3	DFE0_CH03_SEL	Select the data to be stored in ADC_CH3_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH3.
2	DFE0_CH02_SEL	Select the data to be stored in ADC_CH2_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH2.
1	DFE0_CH01_SEL	Select the data to be stored in ADC_CH1_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH1.
0	DFE0_CH00_SEL	Select the data to be stored in ADC_CH0_DATA registers. 0: Stores the analog to digital conversion results of ADCH, DSADC and CADC. 1: Stores the filter result of DFE0 CH0.

33.4 Operation

33.4.1 Peripheral Bus Access

GTM is connected to a system bus as a slave. Access by CPU or DMA to registers and RAM (MCS and DPLL) is provided through AEI interface. Only 32 bit access to GTM registers and RAM is supported.

GTM MCS and DPLL RAM are not shared with other functionality. They can be accessed via system bus in a certain address range. For details of the memory map, please refer to **Figure 33.2**, **Figure 33.3**.

GTM is accessible by all cores with the same access speed except the ICU-M core. Please refer to **Section 3, CPU System** for more details on CPU to peripheral access speed.

33.4.2 Reset

GTM is resettable by a dedicated bit, which allows the software to set GTM in reset state without using external reset.

Please refer to “GTM-IP Specification” document.

33.4.3 Interconnections of Interrupt Factors

GTM internal interrupt factors are consolidated by GTM Interrupt Concentrator Module (ICM) into fewer interrupts visible outside GTM. The functionality of ICM is described in GTM-IP Specification. For list of interrupt factors visible outside GTM-IP chapter see **Section 33.1.5, Interrupt Requests**.

Outputs of ICM are further multiplexed outside GTM and then routed to interrupt controller (INTC) and DMA controller (DMAC/DTS). This multiplexing is described here. For register definitions please see **Section 33.3.1, List of Registers**.

33.4.4 Outputs to AD

33.4.4.1 Outputs to ADCH

GTM outputs can trigger start of ADCH conversion. The following GTM outputs can be used as ADCH trigger sources:

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the ADCH. Multiplexing scheme is described in **Section 35, Peripheral Interconnection (PIC)**. The GTM can trigger AD groups 0 to 4. TOM_OUT and ATOM_OUT are described in “*GTM-IP Specification*”. For more information about ADCH functionality please refer to **Section 36, Analog to Digital Converter (ADCH)**.

33.4.4.2 Outputs to DSADC

GTM outputs can trigger

- Starting and stopping of DSADC conversion
- Incrementing of DSADC input channel
- Gate reading of DSADC samples and time stamps

The following GTM outputs can be used as DSADC trigger sources

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the DSADC. Multiplexing scheme is described in **Section 35, Peripheral Interconnection (PIC)**. All DSADC triggers can be mapped to GTM outputs. TOM_OUT and ATOM_OUT are described in “*GTM-IP Specification*”. For more information about DSADC functions please refer to **Section 37, Delta-Sigma Analog to Digital Converter (DSADC)**.

33.4.4.3 Outputs to CADC

GTM outputs can trigger

- Starting and stopping of CADC conversion
- Incrementing of CADC input channel
- Gate reading of CADC samples

The following GTM outputs can be used as CADC trigger sources

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the CADC. Each CADC trigger can be mapped to GTM outputs. Multiplexing scheme is described in **Section 35, Peripheral Interconnection (PIC)**. TOM_OUT and ATOM_OUT signals are described in “*GTM-IP Specification*”. For more information about CADC functions please refer to **Section 38, Cyclic Analog to Digital Converter (CADC)**.

33.4.5 Outputs to ENCA

GTM outputs can trigger the ENCA timer counter capture. The following GTM outputs can be used as ENCS trigger sources.

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the ENCA. The GTM outputs can trigger capture trigger inputs 0 and 1. Multiplexing scheme is described in **Section 35, Peripheral Interconnection (PIC)**. TOM_OUT and ATOM_OUT signals are described in “*GTM-IP Specification*”. For more information about ENCA functionality please refer to **Section 34, Encoder Timer (ENCA)**.

33.4.6 Outputs to DFE

GTM outputs can trigger DFE

- Timer trigger compare
- Timer DFE Capture trigger
- Timer FIFO Capture trigger

The following GTM outputs can be used as DFE trigger sources.

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the DFE. Multiplexing scheme is described in **Section 35, Peripheral Interconnection (PIC)**. TOM_OUT and ATOM_OUT signals are described in “*GTM-IP Specification*”. For more information about DFE functionality please refer to **Section 39, Digital Filter Engine (DFE)**.

33.4.7 Outputs to PSI5-S

GTM outputs can be routed to PSI5-S signals enable, clear, clock and sync pulse signal. The following GTM outputs can be routed to PSI5-S

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the PSI5-S. Multiplexing scheme is described in **Section 35, Peripheral Interconnection (PIC)**. TOM_OUT and ATOM_OUT signals are described in “*GTM-IP Specification*”. For more information about PSI5-S functionality please refer to **Section 27, Peripheral Sensor Interface 5 S (PSI5-S)**.

33.4.8 Peripheral Inputs

Outputs of other peripherals can be connected to GTM inputs. Those outputs are routed to TIM input channels. See **Section 35, Peripheral Interconnection (PIC)** for routing schemes.

33.4.8.1 Inputs from PORT

If port pin alternative GTM function is selected, a signal from a micro pin is routed to a corresponding TIM channel. Please see **Section 2, Pin Function** for possible routing options to TIM channels. Whether a signal from a micro pin is used by TIM channel as an input also depends on TIM sub-module configuration inside GTM. For more details about TIM please refer to “*GTM-IP Specification*”.

33.4.8.2 Inputs from ADCH

The following interrupt factors of ADCH can be routed to TIM input channels

- Conversion ending of the ADCH scan group
- Analog Boundary Flag (via Virtual PORT)

33.4.8.3 Inputs from DSADC

The following interrupt factors of DSADC can be routed to TIM input channels

- completion of DSADC conversion
- Analog Boundary Flag (via Virtual PORT)

33.4.8.4 Inputs from CADC

The following interrupt factors of CADC can be routed to TIM input channels

- completion of CADC conversion
- Analog Boundary Flag (via Virtual PORT)

33.4.8.5 Input from ENCA

All ENCA interrupt factors can be routed to GTM TIM input channels:

- Encoder input (phase A, B, Z)
- Compare match or capture
- clear interrupt by ENCA input
- clock enable output
- encoder output count status

33.4.8.6 Inputs from DFE

The following DFE interrupt factors can be routed to TIM input channels:

- peak and hold update
- output data available

33.4.9 ADC Interface

Results of A/D conversion are stored in ADC_CH[y]_DATA registers (y = 0..31). Either registers 0 to 15 or registers 16 to 31 can be used based on GTM_ADCI_CHSELj.CHS. In addition, a register designation is also based on DFTAG (ADCH and CADC) or DFES (DSADC). For more information about DFTAG and DFES configuration please refer to **Section 36, Analog to Digital Converter (ADCH)**, **Section 37, Delta-Sigma Analog to Digital Converter (DSADC)** and **Section 38, Cyclic Analog to Digital Converter (CADC)**.

It is not possible to send one piece of A/D data to multiple ADC_CH[y]_DATA registers based on DFTAG. Sending multiple A/D results to a same ADC_CH[y]_DATA register based on DFTAG is possible but has to be carefully designed to avoid data overwrites.*¹

The data format in ADC_CH[y]_DATA register matches configuration of corresponding A/D channel.

ADC_CH [y]_DATA registers selects the data to be stored from the ADC conversion result or the DFE filter result.

Note 1. For example, choosing DFTAG=3h for conversion result of ADCH and DFES=0h and DFTAG=3h for conversion result of Delta/Sigma ADC is not allowed.

Table 33.26 Allocation of an ADC_CH[y]_DATA Register and DFTAG, DFES Setting (1/2)

ADC_CH29_DATA	1 _H	D _H	1 _H	D _H	1 _H	D _H	—
ADC_CH30_DATA	1 _H	E _H	1 _H	E _H	1 _H	E _H	—
ADC_CH31_DATA	1 _H	F _H	1 _H	F _H	1 _H	F _H	—

The figure below shows the bit correspondence between the AD conversion result and the DFE filter result and the ADC_CH[y]_DATA register of GTM.

Figure 33.5 Comparison of AD conversion result with ADC_CH[y]_DATA register of GTM

Figure 33.6 Comparison of DFE filter result with ADC_CH[y]_DATA register of GTM

CAUTION

ADC_CH[y]_STA has no information and returns the same value as ADC_CH[y]_DATA when read.

Bits 31 to 24 of ADC_CH[y]_DATA are always reads as 0xC0. ADC_NEW_DATA is not supported. For details about ADC_NEW_DATA, please refer to “GTM-IP Specification” documents.

33.4.10 Safety Mechanism

MCS RAM is protected by ECC function. ECC error of MCS RAM is also reported by MCS channel. For more details about the ECC function, please refer to **Section 40, Functional Safety**.

33.4.11 GTM Debug Function

GTM debug feature is as follows.

- Run, break
- Single step execution of MCS
- On-chip breakpoint by:
 - MCS instruction or data access
 - DPLL RAM data access
 - ARU data access
 - TBU counter
- Trace the followings with timestamp: (E2xFCC2 only)
 - MCS instruction or data access
 - DPLL RAM data access
 - ARU data access
 - TBU counter
 - TIM/TOM/ATOM state change

CAUTION

The register behaviors of AFD[i]_CH[x]_BUFFACC, TIM[i]_CH[x]_GPR0/1 and ATOM[i]_CH[x]_SR0/1 in case of debugger read access described in “GTM-IP Specification” are not supported.

Section 34 Encoder Timer (ENCA)

This section contains general descriptions of the Encoder Timer (ENCA).

The first part in this section describes all specific properties of this product, such as the number of units, and register base addresses.

The remainder of the section describes the functions and registers of the ENCA.

34.1 Features of ENCA

34.1.1 Number of Units

This microcontroller has the following number of ENCA units.

Each ENCA unit has one-channel encoder timer.

Table 34.1 Number of Units

Product Name	RH850/E2x-FCC2	
	468 pins	373 pins
Number of Units	2	2
Name	ENCA _n (n = 0 to 1)	ENCA _n (n = 0 to 1)

Table 34.2 Number of Units

Product Name	RH850/E2UH	
	468 pins	373 pins
Number of Units	2	2
Name	ENCA _n (n = 0 to 1)	ENCA _n (n = 0 to 1)

Table 34.3 Number of Units

Product Name	RH850/E2H	
	468 pins	373 pins
Number of Units	2	2
Name	ENCA _n (n = 0 to 1)	ENCA _n (n = 0 to 1)

Table 34.4 Index

Index	Description
n	Throughout this section, the individual ENCA units are identified by the index "n" (n = 0, 1); for example, ENCA _n CTL is the ENCA _n control register.

34.1.2 Register Base Addresses

The ENCA_n base addresses are listed in the following table.

The ENCA_n register addresses are given as offsets from the base addresses.

Table 34.5 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ENCA0_base>	FFE8 0000 _H	Peripheral Group 2H
<ENCA1_base>	FFE8 1000 _H	Peripheral Group 2H

34.1.3 Clock Supply

The ENCA_n clock supply is shown in the following table.

Table 34.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
ENCA _n	PCLK	CLK_HSB

34.1.4 Interrupt Requests

The ENCA interrupt requests are listed in the following table.

Table 34.7 Interrupts and DMA/DTS Requests

Interrupt Symbol Name	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
ENCA0				
INTENCA0IOV	ENCATIOV	206-213 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA0IUD	ENCATIUD	206-213 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA0I0	ENCATINT0	206-213 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA0I1	ENCATINT1	206-213 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA0IEC	ENCATIEC	206-213 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
ENCA1				
INTENCA1IOV	ENCATIOV	214-221 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA1IUD	ENCATIUD	214-221 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA1I0	ENCATINT0	214-221 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA1I1	ENCATINT1	214-221 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)
INTENCA1IEC	ENCATIEC	214-221 (selectable)	group1 64-71 (selectable)	group2 110-117, group3 70-77 (selectable)

NOTES

1. Interrupt Number can be selected at the GTM_IRQ_SEL8j register. (j = 0 to 15)
2. DMAC Trigger Number can be selected at the GTM_DMA_SEL8j (j = 0 to 7)
3. GTM_IRQ_SEL8j (j = 0 to 15) and GTM_DMA_SEL8j (j = 0 to 7) can be set without depending on the setting of option byte (OPBT8.ATU_GTM_SEL) and module standby (MSR_GTM.MS_GTM).

34.1.5 Reset Sources

The ENCA_n reset sources are listed in the following table. The ENCA_n is initialized by these reset sources.

Table 34.8 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
ENCA _n	All registers	✓	✓	✓	✓	—	—

34.1.6 External Input/Output Signals

The external input/output signals of ENCA_n are listed below.

Table 34.9 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal Name
ENCA0		
ENCA0E0	Encoder input (phase A)*1	ENCA _n E0
ENCA0E1	Encoder input (phase B)*1	ENCA _n E1
ENCA0EC	Encoder input (phase Z)*1	ENCA _n EC
ENCA1		
ENCA1E0	Encoder input (phase A)*1	ENCA _n E0
ENCA1E1	Encoder input (phase B)*1	ENCA _n E1
ENCA1EC	Encoder input (phase Z)*1	ENCA _n EC

Note 1. This input passes PIC.

34.2 Overview

34.2.1 Functional Overview

- Counter control signal generation from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the count value with an external trigger signal
- Compare function for compare match judgment with the count value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow, and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

34.2.2 Block Diagram

Figure 34.1 ENCA Block Diagram

34.3 Registers

34.3.1 List of Registers

The ENCA registers are listed in the following table.

<ENCA_n_base> is defined in Register Base Address.

Table 34.10 Registers

Module	Register	Symbol	Address	Access	Access Protection
ENCA _n	ENCA _n Capture/Compare Register 0	ENCA _n CCR0	<ENCA _n _base>	16	—
ENCA _n	ENCA _n Capture/Compare Register 1	ENCA _n CCR1	<ENCA _n _base> + 04 _H	16	—
ENCA _n	ENCA _n Counter Register	ENCA _n CNT	<ENCA _n _base> + 08 _H	16	—
ENCA _n	ENCA _n Status Flag Register	ENCA _n FLG	<ENCA _n _base> + 0C _H	8	—
ENCA _n	ENCA _n Status Flag Clear Register	ENCA _n FGC	<ENCA _n _base> + 10 _H	8	—
ENCA _n	ENCA _n Timer Enable Status Register	ENCA _n TE	<ENCA _n _base> + 14 _H	8	—
ENCA _n	ENCA _n Timer Start Trigger Register	ENCA _n TS	<ENCA _n _base> + 18 _H	8	—
ENCA _n	ENCA _n Timer Stop Trigger Register	ENCA _n TT	<ENCA _n _base> + 1C _H	8	—
ENCA _n	ENCA _n I/O Control Register 0	ENCA _n IOC0	<ENCA _n _base> + 20 _H	8	—
ENCA _n	ENCA _n Control Register	ENCA _n CTL	<ENCA _n _base> + 40 _H	16	—
ENCA _n	ENCA _n I/O Control Register 1	ENCA _n IOC1	<ENCA _n _base> + 44 _H	8	—
ENCA _n	ENCA _n Emulation Register	ENCA _n EMU	<ENCA _n _base> + 48 _H	8	—

34.3.2 Details of Registers

34.3.2.1 ENCA_nCTL — ENCA_n Control Register

This register is used to configure various operation settings of the Encoder Timer.

Writing to this register during operation is prohibited.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCA _n CME	ENCA _n MCS	—	—	—	—	ENCA _n CRM1	ENCA _n CRM0	ENCA _n CTS	—	—	ENCA _n LDE	ENCA _n ECM1	ENCA _n ECM0	ENCA _n UDS [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 34.11 ENCA_nCTL Register Contents (1/2)

Bit Position	Bit Name	Function
15	ENCA _n CME	Encoder Clear Mask Enable This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used. 0: Disables the compare-match interrupt (ENCA _n TINT1) mask function for the ENCA _n CCR1 register 1: Enables the compare-match interrupt (ENCA _n TINT1) mask function for the ENCA _n CCR1 register. This bit is valid only when ENCA _n CRM1 = 0. When this bit is set to "1", setting ENCA _n ECM1 to "1" is prohibited.
14	ENCA _n MCS	Encoder Mask Clear Select This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCA _n TINT1 when the compare function is used. This bit is valid only when ENCA _n CRM1 = 0. 0: Masking of compare-match interrupt detection is canceled when the ENCA _n CCR1 register is written. 1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed. Timer counter clear operation accompanying encoder clear input. Timer counter clear operation upon compare-match between ENCA _n CNT and ENCA _n CCR0 when ENCA _n ECM0 = 1. Loading from ENCA _n CCR0 to the timer counter upon underflow detection when ENCA _n LDE = 1.
13 to 10	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
9	ENCA _n CRM1	ENCA _n CCR1 Register Mode 0: ENCA _n CCR1 used as compare register. 1: ENCA _n CCR1 used as capture register.
8	ENCA _n CRM0	ENCA _n CCR0 Register Mode 0: ENCA _n CCR0 used as compare register. 1: ENCA _n CCR0 used as capture register.

Table 34.11 ENCACTL Register Contents (2/2)

Bit Position	Bit Name	Function
7	ENCAAnCTS	<p>ENCAAnCCR1 Capture Trigger Select</p> <p>This is a trigger selection bit for the capture operation to the ENCAAnCCR1 register.</p> <p>This bit is valid only when ENCAAnCRM1 = 1.</p> <p>0: Uses ENCATTIN1 of capture trigger 1 signal as the capture trigger for the ENCAAnCCR1 register.</p> <p>1: Uses the counter clear signal selected with ENCAAnSCE as the capture trigger for the ENCAAnCCR1 register.</p>
6, 5	—	<p>Reserved</p> <p>When read, the value after reset is returned. When writing, write the value after reset.</p>
4	ENCAAnLDE	<p>ENCAAn Counter Load Enable</p> <p>This bit is used to enable/disable setting value loading to the counter upon underflow occurrence.</p> <p>This bit is valid only when ENCAAnCRM0 = 0.</p> <p>When ENCAAnCRM0 = 1, ENCAAnCCR0 register setting value is not loaded to the counter upon occurrence of an underflow, regardless of the value of this bit.</p> <p>0: Disables loading of ENCAAnCCR0 register setting value to counter upon occurrence of a counter underflow.</p> <p>1: Enables loading of ENCAAnCCR0 register setting value to counter upon occurrence of a counter underflow.</p>
3	ENCAAnECM1	<p>Encoder Clear Mode 1</p> <p>This bit is used to set the counter clear operation upon match between the count value and ENCAAnCCR1 setting value.</p> <p>This bit is valid only when ENCAAnCRM1 = 0.</p> <p>0: Does not clear the counter to 0000_H upon match of timer count value and ENCAAnCCR1 setting value.</p> <p>1: Clears the counter to 0000_H upon match of timer count value and ENCAAnCCR1 setting value if the next count is a down-count.</p>
2	ENCAAnECM0	<p>Encoder Clear Mode 0</p> <p>This bit is used to set the counter clear operation upon match between the count value and ENCAAnCCR0 setting value.</p> <p>This bit is valid only when ENCAAnCRM0 = 0.</p> <p>0: Does not clear the counter to 0000_H upon match of timer count value and ENCAAnCCR0 setting value.</p> <p>1: Clears the counter to 0000_H upon match of timer count value and ENCAAnCCR0 setting value if the next count is an up-count.</p>
1, 0	ENCAAnUDS[1:0]	<p>Up/down Count Selection 1 and 0</p> <p>These are the counter up/down control bits using ENCAAnE0 and ENCAAnE1.</p> <p>00: Upon detection of valid edge of ENCAAnE0, - down-count when ENCAAnE1 = H - up-count when ENCAAnE1 = L</p> <p>01: Upon detection of valid edge of ENCAAnE0, up-count, Upon detection of valid edge of ENCAAnE1, down-count</p> <p>10: At rising edge of ENCAAnE0, down-count At falling edge of ENCAAnE0, up-count However, count operation is performed only when ENCAAnE1 = L.</p> <p>11: Detection of both edges of ENCAAnE0, ENCAAnE1. The count operation is determined based on the combination of the detected edge and level.</p>

34.3.2.2 ENCA_nIOC0 — ENCA_n I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ENCA _n TIS[3:2]		ENCA _n TIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 34.12 ENCA_nIOC0 Register Contents

Bit Position	Bit Name	Function
7 to 4	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
3, 2	ENCA _n TIS[3:2]	Input Edge Selection for Capture Trigger 1 These bits are valid only when ENCA _n CTL.ENCA _n CRM1 = 1 and ENCA _n CTL.ENCA _n CTS = 0. All other settings of ENCA _n CRM1 and ENCA _n CTS are invalid. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection
1, 0	ENCA _n TIS[1:0]	Input Edge Selection for Capture Trigger 0 These bits are valid only when ENCA _n CTL.ENCA _n CRM0 = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

34.3.2.3 ENCAIOC1 — ENCA I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.

Writing to this register during operation is prohibited.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAoSCE	ENCAoZCL	ENCAoBCL	ENCAoACL	ENCAoECS[1:0]		ENCAoEIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.13 ENCAIOC1 Register Contents (1/2)

Bit Position	Bit Name	Function
7	ENCAoSCE	Encoder Special-Clear Enable This is an encoder special clear enable bit. When setting this bit to 1, set ENCAoUDS1 and ENCAoUDS0 to 10 _B or 11 _B . The operation is not guaranteed if this bit is set to 1 with ENCAoUDS1 and ENCAoUDS0 set to 00 _B or 01 _B . 0: Clears the counter upon detection of ENCAoEC valid edge (set with ENCAoECS1 and ENCAoECS0). 1: Clears the counter upon detection of input level condition of ENCAoE0, ENCAoE1 and ENCAoEC (set with ENCAoZCL bit, ENCAoBCL bit, and ENCAoACL bit).
6	ENCAoZCL	Input-Z Clear Condition Selection This bit is used to set the condition for clearing the encoder clear input (ENCAoEC) when the encoder special clear function is used. This bit is valid only when ENCAoSCE = 1; and is invalid when ENCAoSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
5	ENCAoBCL	Input-B Clear Condition Selection This bit is used to set the condition for clearing the encoder input 1 (ENCAoE1) when the encoder special clear function is used. This bit is valid only when ENCAoSCE = 1; and is invalid when ENCAoSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
4	ENCAoACL	Input-A Clear Condition Selection This bit is used to set the condition for clearing the encoder input 0 (ENCAoE0) when the encoder special clear function is used. This bit is valid only when ENCAoSCE = 1; and is invalid when ENCAoSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
3, 2	ENCAoECS[1:0]	Encoder Clear Input Edge Selection 1 and 0 These are the encoder clear input edge selection bits. These bits are valid only when ENCAoSCE = 0; and are invalid when ENCAoSCE = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

Table 34.13 ENCA_nIOC1 Register Contents (2/2)

Bit Position	Bit Name	Function
1, 0	ENCA _n EIS[1:0]	Encoder Edge Input Selection 1 and 0 These are the encoder input edge selection bits. These bits are valid when ENCA _n UDS1 and ENCA _n UDS0 = 00 _B or 01 _B , and are invalid when ENCA _n UDS1 and ENCA _n UDS0 = 10 _B or 11 _B . 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

34.3.2.4 ENCA_nFLG — ENCA_n Status Flag Register

This register holds the status flags of the timer counter of ENCA_n.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENCA _n CSF	ENCA _n UDF	ENCA _n OVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.14 ENCA_nFLG Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned.
2	ENCA _n CSF	Counter Status Flag This bit reflects the current timer counter operation. 0: Timer counter in up-count status 1: Timer counter in down-count status
1	ENCA _n UDF	Underflow Flag This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared at the start of count operation. 0: This flag is cleared to 0 upon any of the following events: - "1" is written to ENCA _n FGC.ENCA _n CLUD. - The flag is cleared to 0 by setting ENCA _n TS bit to "1" when ENCA _n TE = 0. 1: This flag is set to "1" upon occurrence of an underflow during the encoder timer count operation.
0	ENCA _n OVF	Overflow Flag This bit reflects the occurrence of an overflow during the timer counter operation. This bit is cleared at the start of count operation. 0: This flag is cleared to 0 upon any of the following events: - "1" is written to ENCA _n FGC.ENCA _n CLOV. - The flag is cleared to 0 by setting ENCA _n TS bit to "1" when ENCA _n TE = 0. 1: This flag is set to "1" upon occurrence of an overflow during the encoder timer count operation.

34.3.2.5 ENCA_nFGC — ENCA_n Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCA_nFLG.

This register always returns 0 when read.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ENCA _n CLUD	ENCA _n CLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 34.15 ENCA_nFGC Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved When writing, write the value after reset.
1	ENCA _n CLUD	Underflow Flag Clear This bit clears the underflow flag. 0: Writing is ignored. 1: Clears ENCA _n UDF of the ENCA _n FLG register (clears underflow detection).
0	ENCA _n CLOV	Overflow Flag Clear This bit clears the overflow flag. 0: Writing is ignored. 1: Clears ENCA _n OVF of the ENCA _n FLG register (clears overflow detection).

34.3.2.6 ENCA_nCCR0 — ENCA_n Capture/Compare Register 0

This register is a 16-bit capture/compare register 0.

When this register functions as a capture register, only reading is possible, and write operation is ignored.

When this register functions as a compare register, reading and writing is possible.

Value after reset: 0000_H

Table 34.16 ENCA_nCCR0 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCA _n CCR0 [15:0]	Capture/Compare Register 0 Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCA _n CTL.ENCA _n LDE setting. See the description of the ENCA _n LDE bit in ENCA control register ENCA _n CTL for details. <ul style="list-style-type: none"> • If ENCA_nCTL.ENCA_nCRM0 = 0: ENCA_nCCR0 is a compare register. Set the value to be compared with the timer count value. • If ENCA_nCTL.ENCA_nCRM0 = 1: ENCA_nCCR0 is a capture register. The captured timer count value is stored.

34.3.2.7 ENCA_nCCR1 — ENCA_n Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.

When this register functions as a capture register, only reading is possible, and write operation is ignored.

When this register functions as a compare register, reading and writing is possible.

Value after reset: 0000_H

Table 34.17 ENCA_nCCR1 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCA _n CCR1 [15:0]	Capture/Compare Register 1 During capture operation, the capture trigger to this register differs according to the ENCA _n CTL.ENCA _n CTS setting. See the description of the ENCA _n CTS bit in ENCA control register ENCA _n CTL for details if ENCA _n CTL.ENCA _n CRM1 = 0: ENCA _n CCR1 is a compare register. Set the value to be compared with the timer count value. If ENCA _n CTL.ENCA _n CRM1 = 1: ENCA _n CCR1 is a capture register. The captured timer count value is stored.

34.3.2.8 ENCA_nCNT — ENCA_n Counter Register

This register is the 16-bit timer counter register.

This register can be written only when the operation is stopped.

Value after reset: 0000_H

Table 34.18 ENCA_nCNT Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCA _n CNT [15:0]	Counter Register <ul style="list-style-type: none"> • ENCA_nTE.ENCA_nTE status: 0 (initial setting): Count stop An arbitrary value can be set to timer counter. • ENCA_nTE.ENCA_nTE status: 0 → 1 (operation start): Count operation start Up/down count operation is started with the set arbitrary value. • ENCA_nTE.ENCA_nTE status: 1 (operating): Counting Up/down count operation is performed. • ENCA_nTE.ENCA_nTE status: 1 → 0 (stopped): Count stop The count value immediately before the operation was stopped is held, and the count operation is stopped.

34.3.2.9 ENCA_nTE — ENCA_n Timer Enable Status Register

This register indicates the operating status of ENCA_n.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCA _n TE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.19 ENCA_nTE Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned.
0	ENCA _n TE	Timer Status Enable This is a status bit that indicates the operation enabled/stopped status of ENCA _n . This bit is cleared to 0 when “1” is written to ENCA _n TT.ENCA _n TT. This bit is set to “1” when “1” is written to ENCA _n TS.ENCA _n TS. 0: Operation stopped 1: Operation enabled

34.3.2.10 ENCA_nTS — ENCA_n Timer Start Trigger Register

This register provides the trigger bit for setting the ENCA_n to the operation enabled state.

This register is always read as 00_H. It can be written only when ENCA_nTE.ENCA_nTE is 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCA _n TS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 34.20 ENCA_nTS Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing, write the value after reset.
0	ENCA _n TS	Timer Start Trigger This is the trigger bit that sets the ENCA _n to the operation enabled state. 0: Writing is ignored. 1: The ENCA _n is set to the operation enabled state by setting ENCA _n TE.ENCA _n TE = 1.

34.3.2.11 ENCA_nTT — ENCA_n Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCA_n to the operation stopped state.

This register is always read as 00_H.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCA _n TT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 34.21 ENCA_nTT Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing, write the value after reset.
0	ENCA _n TT	Timer Stop Trigger This is the trigger bit that sets the ENCA _n to the operation stopped state. 0: Writing is ignored. 1: Clears ENCA _n TE. ENCA _n TE to "0", to set the ENCA _n to the count operation stopped state.

34.3.2.12 ENCA_nEMU — ENCA_n Emulation Register

This register controls operations by SVSTOP.

Writing to this register should be performed in the counter operation stopped status (ENCA_nTE.ENCA_nTE = 0 and EPC.SVSTOP = 0).

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCA _n SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 34.22 ENCA_nEMU Register Contents

Bit Position	Bit Name	Function
7	ENCA _n SVSDIS	When EPC.SVSTOP bit = 0: The count clock continues when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock stops when the debugger assumes control of the microcontroller (at a break point, etc.). 1: The count clock continues when the debugger assumes control of the microcontroller (at a break point, etc.).
6 to 0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

34.4 Operation

The ENCA_n operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCA_nCCR0 and ENCA_nCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

34.4.1 Timer Counter Operation

The timer counter operations of the ENCA_n are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

Figure 34.2 Timer Counter Initial Value Setting/Start/Stop

(1) Timer Counter Initial Value Setting

The initial value of the ENCA_n counter register (ENCA_nCNT) can be set to the counter operation stopped state (ENCA_nTE = 0).

(2) Timer Counter Startup

By writing “1” to the timer start trigger bit (ENCA_nTS), the timer status enable bit (ENCA_nTE) is set to “1”, the count operation is enabled, and counting is performed upon detection of the valid edge of the encoder input.

(3) Overflow Operation

An overflow occurs when up-counting is performed when the count value is FFFF_H. If the count value changes from FFFF_H to 0000_H, an overflow interrupt (ENCATIOV) is generated, and the overflow flag (ENCA_nOVF) is set to “1”. The overflow flag (ENCA_nOVF) is cleared to “0” when “1” is set to the overflow flag clear bit (ENCA_nCLOW). For details about the operation, see “**Section 34.6.1, Overflow Occurrence and Overflow Flag Clear Operation**”

(4) Underflow Operation

An underflow occurs when down-counting is performed when the count value is 0000_H. If the count value changes

from 0000_H to FFFF_H, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCA_nUDF) is set to “1”. The underflow flag (ENCA_nUDF) is cleared to “0” when “1” is set to the underflow flag clear bit (ENCA_nCLUD). For details about the operation, see “**Section 34.6.2, Underflow Occurrence and Underflow Flag Clear Operation**”.

(5) Timer Counter Stop

By writing “1” to the timer stop trigger bit (ENCA_nTT), the timer status enable bit (ENCA_nTE) is cleared to “0”, and the count operation is stopped. At this time, the timer counter is not reset to 0000_H and holds the value before count operation stops.

34.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCA_nE0, ENCA_nE1) according to the settings of ENCA_nUDS1 and ENCA_nUDS0.

34.4.2.1 When the ENCAAnUDS1/ENCAAnUDS0 Bits in the ENCAAnCTL Register = 00_B

Table 34.23 When ENCAAnUDS1/ENCAAnUDS0 Bits = 00_B

ENCAAnUDS1	ENCAAnUDS0	Operation Description		
		ENCAAnE0 Pin	ENCAAnE1 Pin	Count Operation
0	0	Rising edge	High level	Down
		Falling edge		
		Rising and falling edges		
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		

The valid edge for ENCAAnE0 is specified by setting ENCAAnEIS1 and ENCAAnEIS0.

Up/down count operation is performed when the valid edges and levels of ENCAAnE0 and ENCAAnE1 match.

The following timing chart shows the count operation when ENCAAnUDS1 and ENCAAnUDS0 bits = 00_B.

Figure 34.3 Count Operation when the ENCAAnUDS1/ENCAAnUDS0 Bits in the ENCAAnCTL Register = 00_B

34.4.2.2 When the ENCAAnUDS1/ENCAAnUDS0 Bits in the ENCAAnCTL Register = 01_B

Table 34.24 When the ENCAAnUDS1/ENCAAnUDS0 Bits = 01_B

ENCAAnUDS1	ENCAAnUDS0	Operation Description		
		ENCAAnE0 Pin	ENCAAnE1 Pin	Count Operation
0	1	Low level	Rising edge	Down
			Falling edge	
			Rising and falling edges	
		High level	Rising edge	
			Falling edge	
			Rising and falling edges	
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		
		Rising edge	High level	
		Falling edge		
		Rising and falling edges		
		Simultaneous input		

The valid edges for ENCAAnE0 and ENCAAnE1 are specified by setting ENCAAnEIS1 and ENCAAnEIS0.

Up/down count operation is performed when the valid edges and levels of the ENCAAnE0/ENCAAnE1 pins match, and the count is held when the valid edges overlap.

The following timing chart shows the count operation when ENCAAnUDS1 and ENCAAnUDS0 bits = 01_B.

Figure 34.4 Count Operation when the ENCAAnUDS1/ENCAAnUDS0 Bits in the ENCAAnCTL Register = 01_B

34.4.2.3 When the ENCA_nUDS1 and ENCA_nUDS0 Bits in the ENCA_nCTL Register = 10_B

Table 34.25 When the ENCA_nUDS1, ENCA_nUDS0 Bits = 10_B

ENCA _n UDS1	ENCA _n UDS0	Operation Description		
		ENCA _n E0 Pin	ENCA _n E1 Pin	Count Operation
1	0	Rising edge	Low level	Down
		Rising edge	Falling edge	
		Falling edge	Low level	Up
		Falling edge	Falling edge	
		Low level	Rising edge	Hold
		Rising edge	Rising edge	
		High level	Rising edge	
		Falling edge	Rising edge	
		Low level	Falling edge	
		Rising edge	High level	
		High level	Falling edge	
		Falling edge	High level	

Specification of valid edges for ENCA_nE0 and ENCA_nE1 (settings of ENCA_nEIS1 and ENCA_nEIS0) is invalid.

The following timing chart shows the count operation when the ENCA_nUDS1/ENCA_nUDS0 bits = 10_B.

Figure 34.5 Count Operation when ENCA_nUDS1/ENCA_nUDS0 Bits in ENCA_nCTL Register = 10_B

34.4.2.4 When ENCAAnUDS1/ENCAAnUDS0 Bits in the ENCAAnCTL Register = 11_B

Table 34.26 When ENCAAnUDS1/ENCAAnUDS0 Bits = 11_B

ENCAAnUDS1	ENCAAnUDS0	Operation Description		
		ENCAAnE0 Pin	ENCAAnE1 Pin	Count Operation
1	1	Low level	Falling edge	Down
		Rising edge	Low level	
		High level	Rising edge	
		Falling edge	High level	
		Rising edge	High level	Up
		High level	Falling edge	
		Falling edge	Low level	
		Low level	Rising edge	
		Simultaneous input		

Specification of valid edges for ENCAAnE0 and ENCAAnE1 (settings of ENCAAnEIS1 and ENCAAnEIS0) is invalid.

The count value is held when the valid edges of ENCAAnE0 and ENCAAnE1 overlap.

The following timing chart shows the count operation when ENCAAnUDS1/ENCAAnUDS0 Bits = 11_B.

Figure 34.6 Count Operation when ENCAAnUDS1 and ENCAAnUDS0 Bits in the ENCAAnCTL Register = 11_B

34.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to 0000_H by encoder clear input (ENCAnEC).

Two types of clearing methods can be selected by controlling the ENCA_nSCE, ENCA_nZCL, ENCA_nBCL, ENCA_nACL, ENCA_nECS1, and ENCA_nECS0 bits of the ENCA_nIOC1 register.

Table 34.27 Timer Counter Clear Control by Encoder Input

Clearing Method	ENCA _n SCE	ENCA _n ZCL	ENCA _n BCL	ENCA _n ACL	ENCA _n ECS1, ENCA _n ECS0
(1)	0	Invalid	Invalid	Invalid	Valid
(2)	1	Valid	Valid	Valid	Invalid

34.4.3.1 Clearing Method when ENCA_nSCE = 0

- Upon detection of the valid edge of ENCA_nEC, the timer counter is cleared to 0000_H in synchronization with the operation clock.
- The valid edge of ENCA_nEC is specified by the setting of the ENCA_nECS1 and ENCA_nECS0 bits.
- The settings of the ENCA_nZCL, ENCA_nBCL, and ENCA_nACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCA_nSCE = 0, see the timing chart in **34.6.19 Capture Operation Performed upon Clearing by ENCA_nEC when ENCA_nSCE = 0**.

34.4.3.2 Clearing Method when ENCA_nSCE = 1

- When the clear levels of the ENCA_nEC, ENCA_nE1, ENCA_nE0 inputs are detected, the timer counter is cleared to 0000_H in synchronization with the operating clock.
- Specify the clear levels of the ENCA_nEC, ENCA_nE1, ENCA_nE0 inputs by the settings of the ENCA_nZCL, ENCA_nBCL, and ENCA_nACL bits.
- The settings of the ENCA_nECS1 and ENCA_nECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCA_nZCL, ENCA_nBCL, and ENCA_nACL settings are listed in the table below.

Table 34.28 Clearing Conditions of the Timer Counter

Counter Clear Condition Setting			Encoder Pin Input Level		
ENCA _n ZCL	ENCA _n BCL	ENCA _n ACL	ENCA _n EC	ENCA _n E1	ENCA _n E0
0	0	0	Low	Low	Low
0	0	1	Low	Low	High
0	1	0	Low	High	Low
0	1	1	Low	High	High
1	0	0	High	Low	Low
1	0	1	High	Low	High
1	1	0	High	High	Low
1	1	1	High	High	High

34.4.4 Functions of ENCA_nCCR0

34.4.4.1 Compare Function

- When ENCA_nCRM0 = 0, the ENCA_nCCR0 register functions as a dedicated compare register.
- Upon compare match between the values of the timer counter and the ENCA_nCCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCA_nECM0 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 34.29 Compare Function of ENCA_nCCR0

ENCA _n CCR0 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCA _n CCR0
ENCA _n CRM0	ENCA _n ECM0		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Clears timer counter to 0000 _H .
		Down-count	Does not clear (continues count operation).

- When ENCA_nLDE = 1
 - Upon occurrence of an underflow, the setting value of the ENCA_nCCR0 register is loaded to the timer counter.
 - An underflow interrupt (ENCATIUD) is output.

NOTE

For the timing chart when ENCA_nLDE = 1, see “**Section 34.6.8, Using the ENCA_nLDE Function Immediately after Startup**” to “**Section 34.6.12, Up-count after Conflict between ENCA_nLDE Function (Loading Count Value) and Encoder Clearing**”.

34.4.4.2 Capture Function

- When ENCA_nCRM0 = 1, the ENCA_nCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCA_nCCR0.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

NOTE

For details about capture operation for ENCA_nCCR0, see the timing charts in “**Section 34.6.15, Encoder Operation when Compare Match Clear Control is Enabled and ENCA_nCTS = 0**” and “**Section 34.6.17, Encoder Operation when Compare Match Clear Control is Disabled**”.

34.4.5 Functions of ENCA_nCCR1

34.4.5.1 Compare Function

- When ENCA_nCRM1 = 0, the ENCA_nCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCA_nCCR1 setting value, a compare 1 match interrupt (ENCATINT1) is output.
- When ENCA_nECM1 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 34.30 Compare Function of ENCA_nCCR1

ENCA _n CCR1 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCA _n CCR1
ENCA _n CRM1	ENCA _n ECM1		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Does not clear (continues count operation).
		Down-count	Clears timer counter to 0000 _H .

Compare match interrupt mask function

- When ENCA_nCME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCA_nCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCA_nCME = 1 and ENCA_nMCS = 0, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCA_nCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCA_nCME = 1 and ENCA_nMCS = 1, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCA_nCCR0 register value and the timer count value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCA_nCME = 1, ENCA_nMCS = 1 and ENCA_nLDE = 1, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCA_nCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCA_nECM1 to “1” is prohibited when enabling the compare 1 match interrupt mask function.

Table 34.31 Compare Match Interrupt Mask Function of ENCA_nCCR1

ENCA _n CCR1 Function	Compare 1 Match Interrupt Mask	Interrupt Mask Cancel Trigger	Compare 1 Match Interrupt Output upon Compare Match with ENCA _n CCR1
ENCA _n CRM1	ENCA _n CME	ENCA _n MCS	
0 (Compare)	0 (Mask function disabled)	— (Setting invalid)	Outputs compare 1 match interrupt upon each compare match.
		0 (Write operation to ENCA _n CCR1)	
	1 (Mask function enabled)	1 (Timer counter clear operation) (Loading from ENCA _n CCR0 to the timer counter upon underflow occurrence when ENCA _n LDE = 1)	Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.)

34.4.5.2 Capture Function

When ENCA_nCRM1 = 1, the ENCA_nCCR1 register functions as a dedicated capture register.

NOTE

For details about capture operation of ENCA_nCCR1, see the timing chart in “Section 34.6.13, Capture Operation between Count Clocks (ENCA_nCCR1)”.

The operations for each of the ENCA_nCTS settings are shown in the table below.

Table 34.32 Operations for Each of the ENCA_nCTS Settings

ENCA _n CCR1 Function	Capture Trigger Selection			
ENCA _n CRM1	ENCA _n CTS	Capture Trigger Signal	Timer Counter Clearing	Interrupt Occurrence
1 (Capture)	0	Capture trigger 1 input (ENCATTIN1)	Does not clear timer counter.	(1) Capture 1 interrupt (ENCATINT1)
	1	Encoder clear input (set with ENCA _n SCE)	Clears timer counter.	(1) Capture 1 interrupt (ENCATINT1) (2) Encoder clear interrupt (ENCATIEC)

NOTE

For details about the timing chart when ENCA_nCTS = 0 or ENCA_nCTS = 1, see the following: “Section 34.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCA_nEC Pin)”, “Section 34.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCA_nEC Pin)”, “Section 34.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCA_nEC Pin)”, “Section 34.6.11, Conflict between ENCA_nLDE Function (Loading Count Value) and Clear Operation by Encoder Clear Input (ENCA_nEC Pin)” and “Section 34.6.12, Up-count after Conflict between ENCA_nLDE Function (Loading Count Value) and Encoder Clearing”.

34.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the values of the timer counter and the ENCA_nCCR0/1 setting value, according to the settings of the ENCA_nECM1 and ENCA_nECM0 bits in the ENCA_nCTL register, is detailed in the following table.

Table 34.33 Timer Counter Clearing Operation upon Compare Register Match

ENCA _n ECM1 and ENCA _n ECM0	Next Count Operation	Timer Counter Clearing upon Compare Match with ENCA _n CCR1	Timer Counter Clearing upon Compare Match with ENCA _n CCR0
00	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
01	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000 _H .
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
10	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Clears timer counter to 0000 _H .	Does not clear (continues count operation).
11	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000 _H .
	Down-count	Clears timer counter to 0000 _H .	Does not clear (continues count operation).

34.5 ENCA_n Setting Sequences

34.5.1 ENCA_n Setting Procedure

The ENCA_n setting procedure is described below.

Table 34.34 ENCA_n Setting Procedure

Initial Setting	Action	Setting status
Initial setting	Reset deassertion	Power-on, operation stopped. (Writing to each register is enabled)
ENCA _n initial setting	Perform the following initial settings. <ul style="list-style-type: none"> • Setting for counter • Setting for counter clear • Setting for ENCA_nCCR0 register • Setting for ENCA_nCCR1 register 	Count operation stopped. The value of the ENCA _n TE bit indicating the operating status is 0.
	Perform the counter initial value settings. <ul style="list-style-type: none"> • Set any 16-bit value to ENCA_nCNT register. (When, after setting this register, the ENCA_nTS bit is set to "1", the counter operation starts from the set count value.) 	The value is set as the initial value of the counter register.
Operation start	Start the counter operation. <ul style="list-style-type: none"> • Set the ENCA_nTS bit to "1". 	Counter operation started. The value of the ENCA _n TE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit.
Operating	Only those registers whose setting can be changed during operation can be rewritten. <ul style="list-style-type: none"> • ENCA_nCCR0 register setting. • ENCA_nCCR1 register setting. • ENCA_nIOC0 register setting. 	The count operation set with the initial setting is performed, and up/down counting is performed according to ENCA _n E0 and ENCA _n E1 pins.
Operation stop	Stop the counter operation during operation. <ul style="list-style-type: none"> • Set the ENCA_nTT bit to "1". 	Counter operation stopped. The value of the ENCA _n TE bit indicating the operating status is 0.
ENCA _n stop	Reset	The setting registers are initialized.

34.5.1.1 Initial Setting Procedure for the Counter

34.5.1.2 Initial Setting Procedure for Counter Clearing

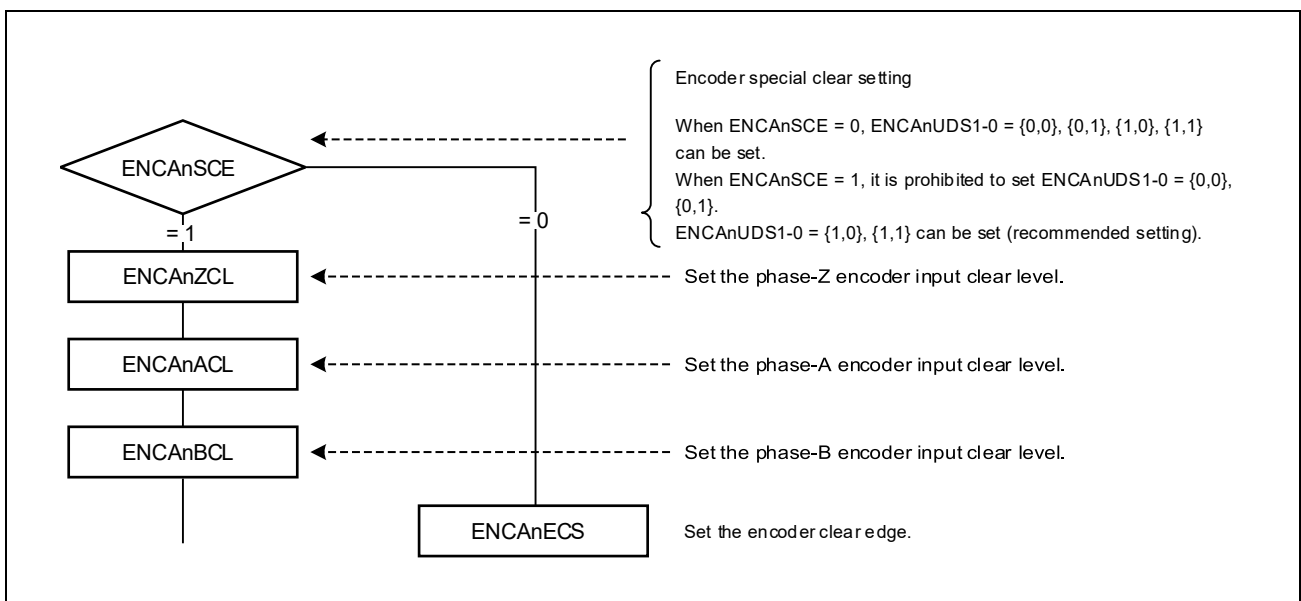

Figure 34.8 Initial Setting Procedure for Counter Clearing

34.5.1.3 Setting Procedure for ENCA_nCCR0 Register

Figure 34.9 Setting Procedure for ENCA_nCCR0 Register

34.5.1.4 Setting Procedure for ENCA_nCCR1 Register

Figure 34.10 Setting Procedure for ENCA_nCCR1 Register

34.6 Timing Chart

34.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the count value is $FFFF_H$. Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCA_nOVF) is set to 1. When the overflow clear bit (ENCA_nCLOV) is set to 1, the overflow flag (ENCA_nOVF) is cleared to 0.

The operations of overflow occurrence and overflow flag clearing are described below.

Figure 34.11 Settings of Overflow Occurrence and Overflow Flag Clear Operation

- (1) The count value is counted up from $FFFE_H$ to $FFFH$.
- (2) When the count value changes from $FFFH$ to 0000_H , an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1.
- (3) By setting the ENCA_nCLOV bit in the ENCA_nFGC register to 1 using the overflow flag clearing method, the overflow flag is cleared to 0. The overflow flag is also cleared by setting the ENCA_nTS bit in the ENCA_nTS register to 1 when the ENCA_nTE bit in the ENCA_nTE register is 0.

34.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the count value is 0000_H .

Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCA_nUDF) is set to 1. When the underflow clear bit (ENCA_nCLUD) is set to 1, the underflow flag (ENCA_nUDF) is cleared to 0.

The operations of underflow occurrence and underflow flag clearing are described below.

Figure 34.12 Settings of Underflow Occurrence and Underflow Flag Clear Operation

- (1) The count value is counted down from 0001_H to 0000_H .
- (2) When the count value changes from 0000_H to $FFFF_H$, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1.
- (3) By setting the ENCA_nCLUD bit in the ENCA_nFGC register to 1 using the underflow flag clearing method, the underflow flag is cleared to 0. The underflow flag is also cleared by setting the ENCA_nTS bit in the ENCA_nTS register to 1 when the ENCA_nTE bit in the ENCA_nTE register is 0.

34.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCA_nEC Pin)

Figure 34.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCA_nEC Pin)

Setting conditions

- ENCA_nCRM1 bit in the ENCA_nCTL register = 1
(Select the ENCA_nCCR1 register as capture.)
- ENCA_nCTS bit in the ENCA_nCTL register = 1
(Select the ENCA_nEC pin input as capture trigger input.)
- ENCA_nECS1 and ENCA_nECS0 bits in the ENCA_nIOC1 register = 01_B
(Select the ENCA_nEC pin input as rising edge detection.)

- (1) Capture operation is performed by the rising edge of the ENCA_nEC pin input trigger.
- (2) Clearing is performed by the ENCA_nEC pin input and the counter value is set to 0000_H.
- (3) The count value (0002_H) is captured in the ENCA_nCCR1 register by the rising edge of the ENCA_nEC pin input.
- (4) At the same time, a clear interrupt (ENCA_nCATIEC) and capture interrupt (ENCA_nCATINT1) due to the ENCA_nEC pin input are output.

34.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

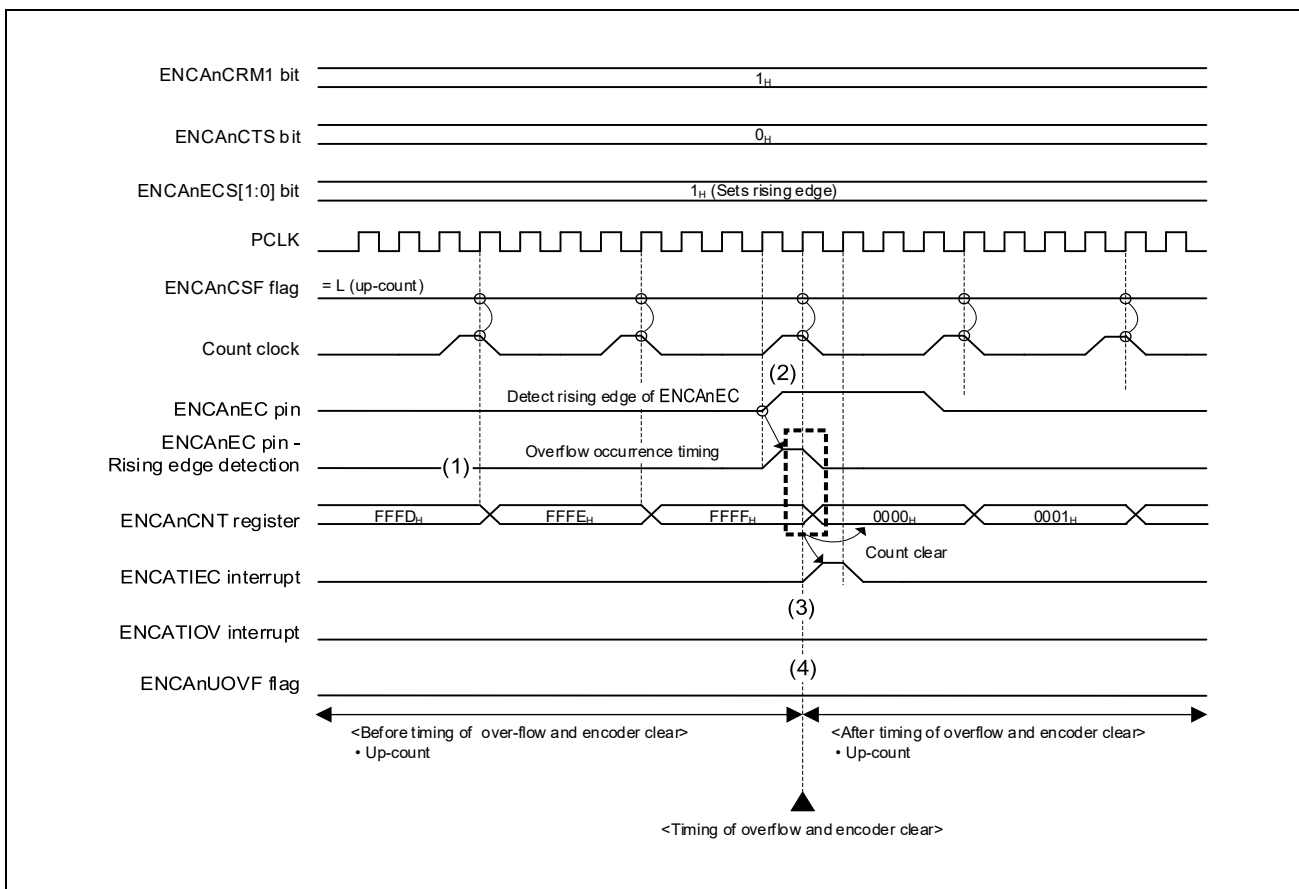

Figure 34.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

- (1) An up-count from $FFFD_H$ is continuously performed.
- (2) When an overflow occurs if the count value is $FFFF_H$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The count value is cleared to 0000_H .
- (3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCATIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output. (An overflow does not occur. Clear operation is performed by the encoder clear input.).
- (4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

34.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCA_nEC Pin)

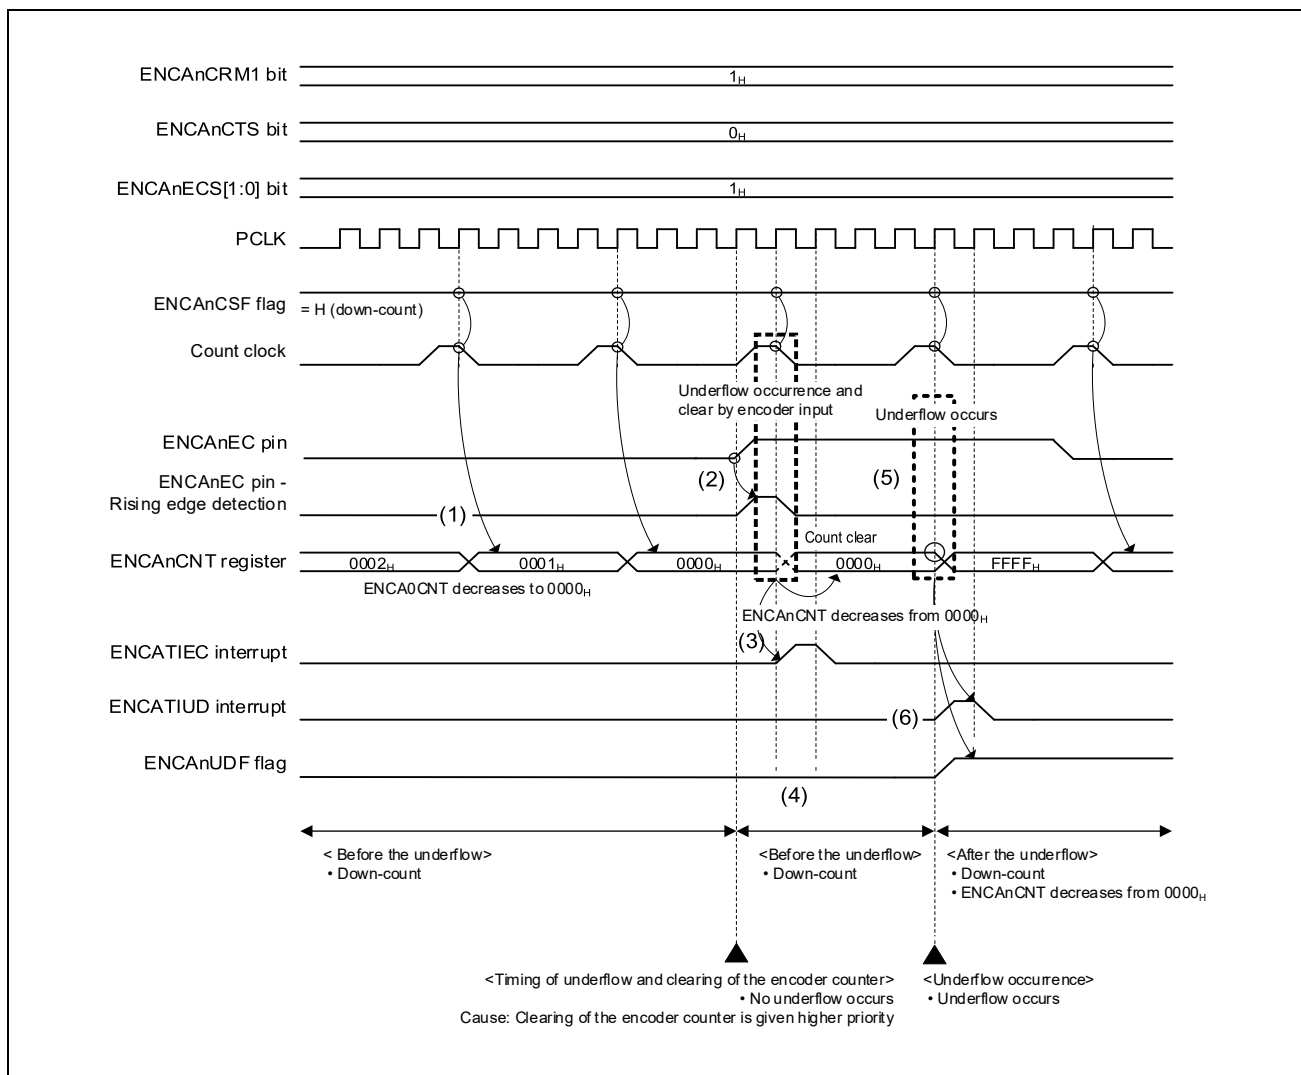

Figure 34.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCA_nEC Pin)

- (1) A down-count from 0002_H is continuously performed.
- (2) When an underflow occurs if the count value is 0000_H, and the rising edge of ENCA_nEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at 0000_H.
- (3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCATIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output. (An underflow does not occur. Clear operation is performed by the encoder clear input.).
- (4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.
- (5) When a further down-count is performed after the count value changes to 0000_H by clear operation of the encoder clear input, the count value changes from 0000_H to FFFF_H, and an underflow occurs.
- (6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCA_nUDF) is set.

34.6.6 Overflow Operation Immediately after Startup

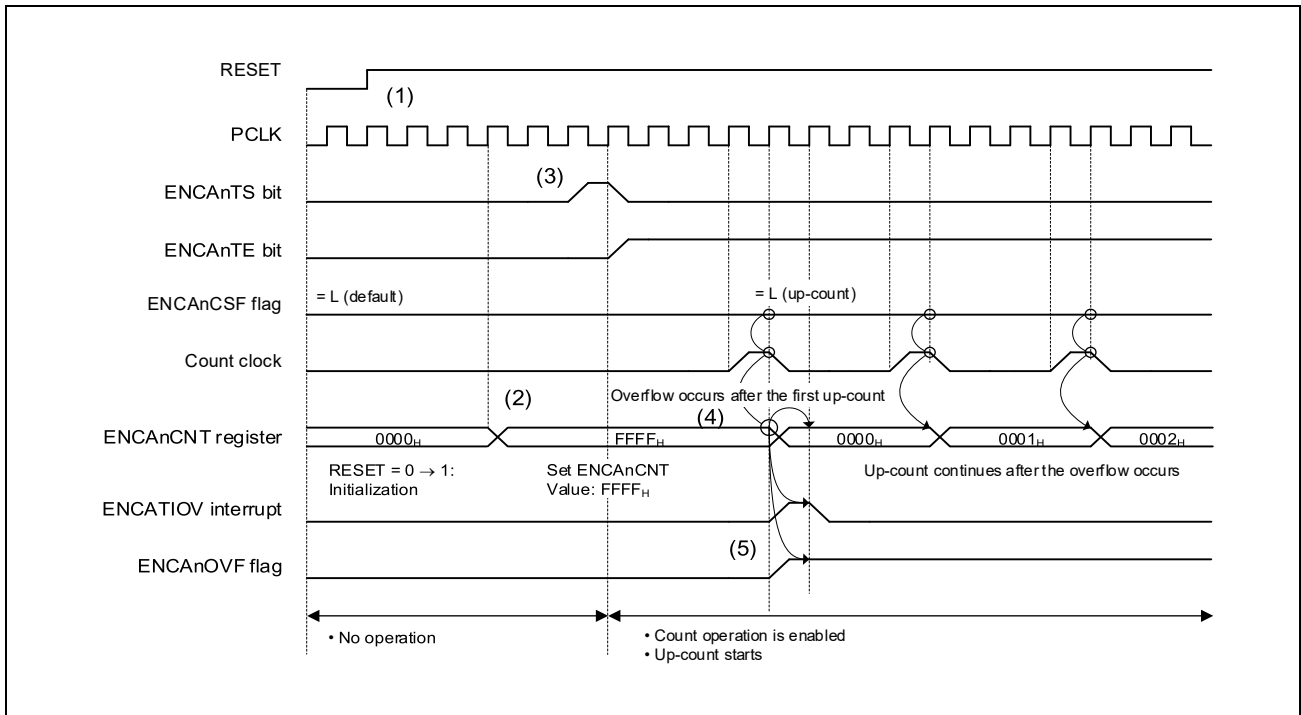

Figure 34.16 Overflow Operation Immediately after Startup

- (1) When the RESET value changes from “0” to “1”, the status changes from reset asserted to reset deasserted.
- (2) The timer counter is set to FFFF_H as the initial value.
- (3) ENCAncTS is set to “1”, and operation starts. ENCAncTE changes to “1”, which indicates that operation is enabled.
- (4) When an up-count is performed from FFFF_H which is the initially set count value, the count value changes from FFFF_H to 0000_H, and an overflow occurs immediately after operation starts.
- (5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCAncIOV) is output, and the overflow flag (ENCAncOVF) is set.

34.6.7 Underflow Operation Immediately after Startup

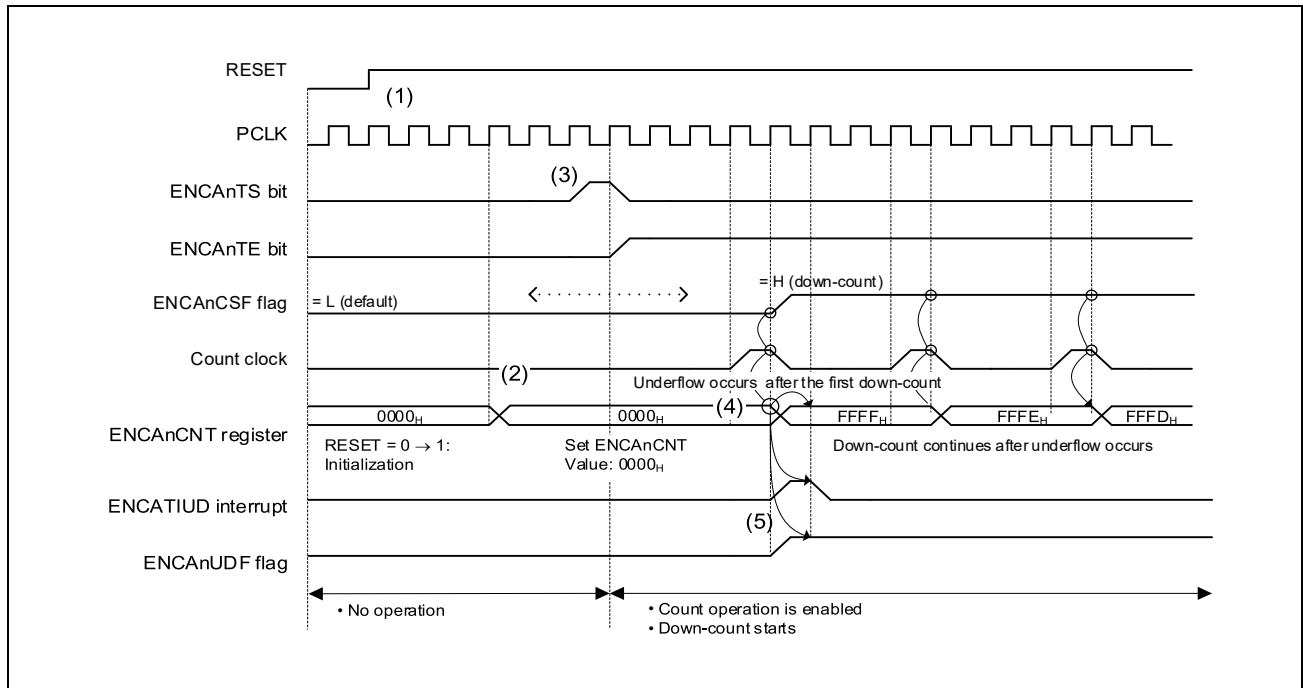

Figure 34.17 Underflow Operation Immediately after Startup

- (1) When the RESET value changes from “0” to “1”, the status changes from reset asserted to reset deasserted.
- (2) The timer counter is set to 0000_{H} as the initial value.
- (3) ENCA nTS is set to “1”, and operation starts. ENCA nTE changes to “1”, which indicates that operation is enabled.
- (4) When a down-count is performed from 0000_{H} which is the initially set count value, the count value changes from 0000_{H} to $FFFF_{\text{H}}$, and an underflow occurs immediately after operation starts.
- (5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCA nTIUD) is output, and the underflow flag (ENCA nUDF) is set.

34.6.8 Using the ENCA_nLDE Function Immediately after Startup

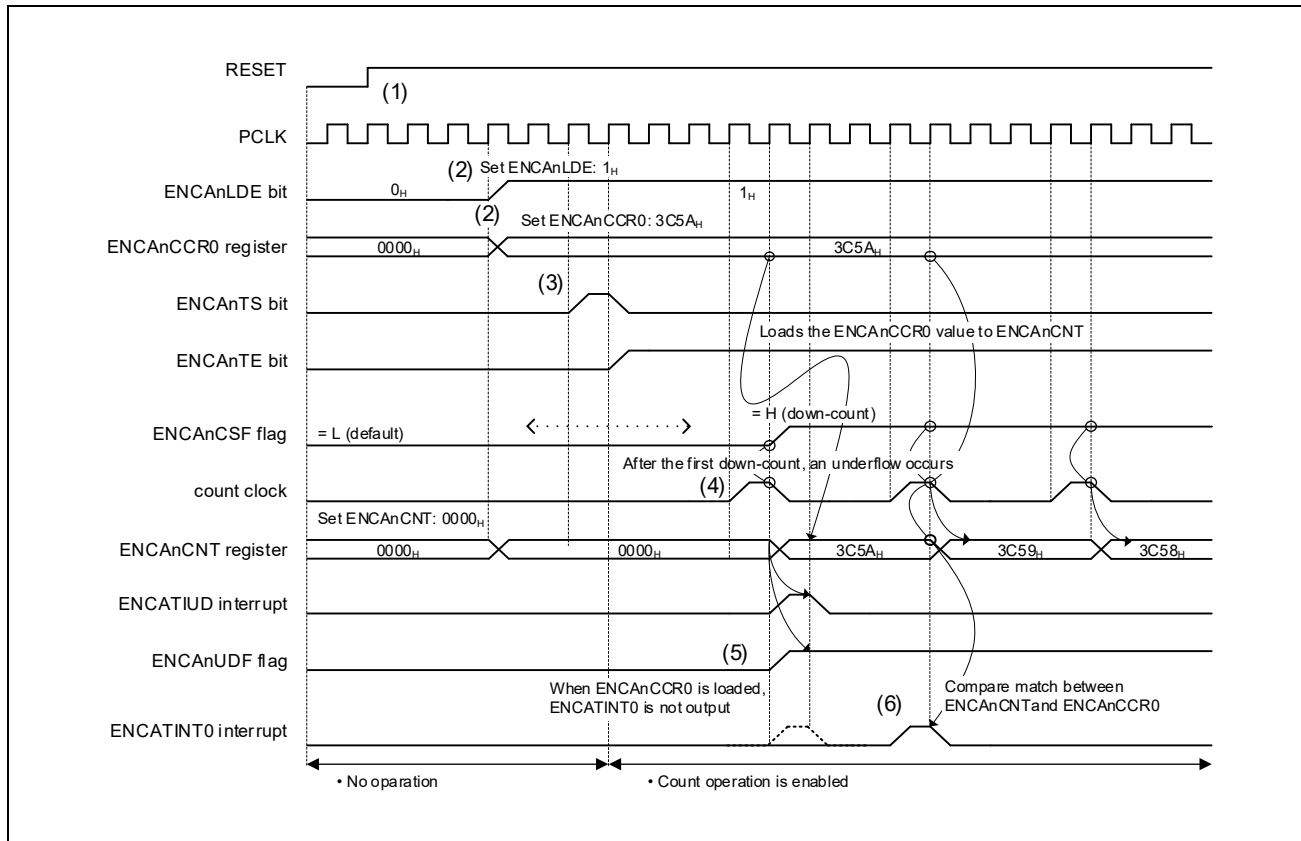

Figure 34.18 Using the ENCA_nLDE Function Immediately after Startup

- (1) When the RESET value changes from “0” to “1”, the status changes from reset asserted to reset deasserted”.
- (2) The load enable bit (ENCA_nLDE) is set to “1”, capture/compare register 0 (ENCA_nCCR0) is set to 3C5A_H, and the timer counter is set to the initial value 0000_H.
- (3) ENCA_nTS is set to “1”, and operation starts. ENCA_nTE changes to “1”, which indicates that operation is enabled.
- (4) When a down-count is performed from 0000_H which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCA_nLDE is set to “1”, the ENCA_nCCR0 value, 3C5A_H, is loaded to the timer counter (ENCA_nTINT0 is not output during loading).
- (5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCA_nTIUD) is output, and the underflow flag (ENCA_nUDF) is set (after an underflow occurs, down-count operation from the loaded value (3C5A_H) continues).
- (6) After the ENCA_nCCR0 value is loaded to ENCA_nCNT, a match with ENCA_nCCR0 is detected, and ENCA_nTINT0 is output.

34.6.9 ENCA_nLDE Function (Loading Count Value)

(a) <When ENCA_nLDE = 0>

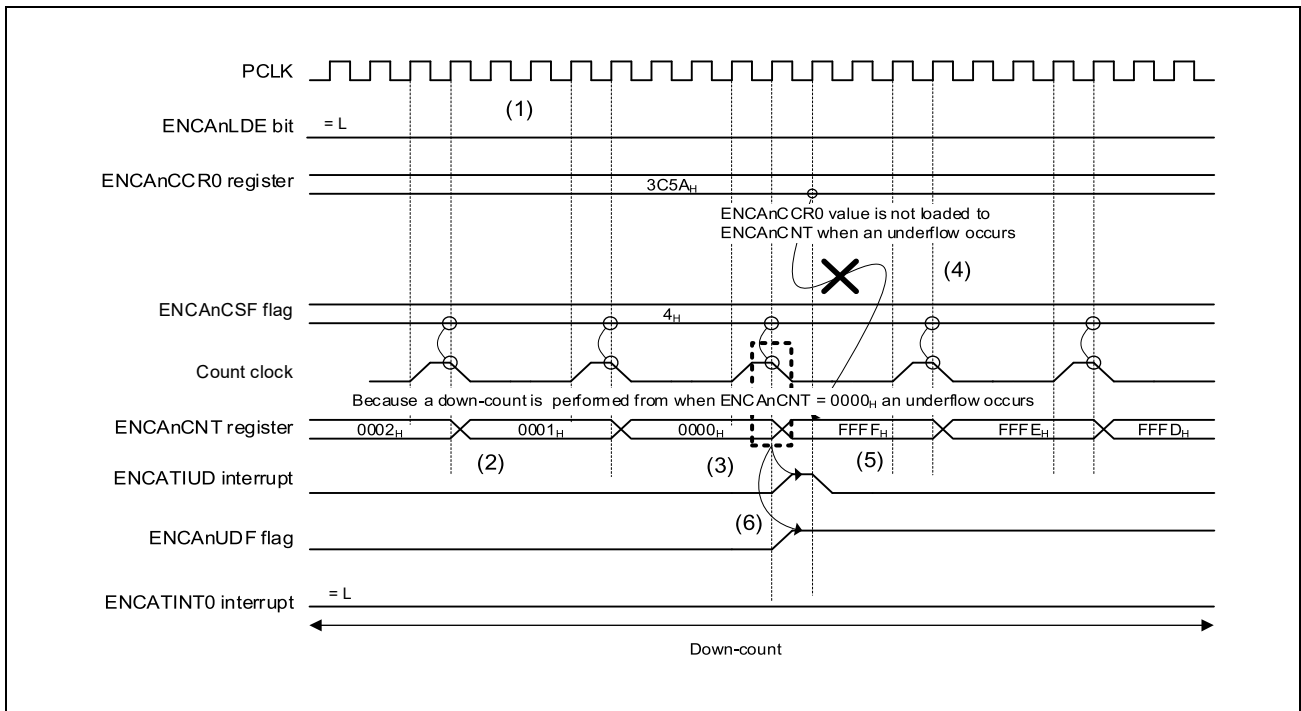

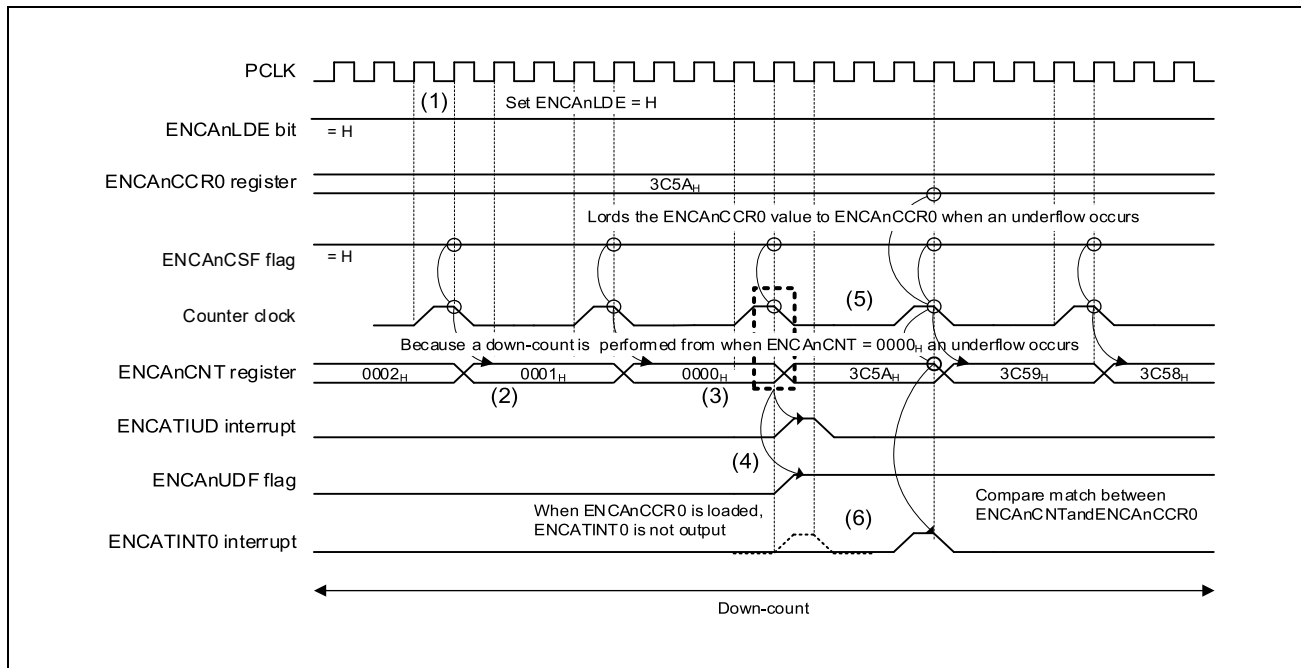

Figure 34.19 ENCA_nLDE Function (when ENCA_nLDE = 0)

- (1) ENCA_nLDE is set to “0” (even if an underflow occurs, the ENCA_nCCR0 value is not loaded).
- (2) A down-count is performed: 0002_H → 0001_H → 0000_H
- (3) When a further down-count is performed after the count value changes to 0000_H, an underflow occurs.
- (4) Because ENCA_nLDE is set to “0”, the setting value of the ENCA_nCCR0 register is not loaded to the counter even if an underflow occurs.
- (5) Operation changes to underflow operation (count value: 0000_H → FFFF_H).
- (6) An underflow interrupt (ENCA_nTIUD) is output, and the underflow flag (ENCA_nUDF) is set.

(b) <When ENCA_nLDE = 1>Figure 34.20 ENCA_nLDE Function (when ENCA_nLDE = 1)

- (1) ENCA_nLDE is set to "1" (if an underflow occurs, the ENCA_nCCR0 value is loaded to the counter).
- (2) A down-count is performed: 0002_H → 0001_H → 0000_H
- (3) When a further down-count is performed after the count value changes to 0000_H, an underflow occurs.
- (4) An underflow interrupt is output, and the underflow flag is set.
- (5) Because ENCA_nLDE is set to "1", the setting value of the ENCA_nCCR0 register is loaded to the counter if an underflow occurs. ENCA_nCNT is set to 3C5A_H.
- (6) After the ENCA_nCCR0 value is set to ENCA_nCNT, if the ENCA_nCNT value matches the ENCA_nCCR0 value on a count clock, a compare match interrupt (ENCA_nTINT0) is output.

34.6.10 Conflict between ENCA_nLDE Function (Loading Count Value) and Rewrite of ENCA_nCCR0 Register

Figure 34.21 Conflict between ENCA_nLDE Function and Rewrite of ENCA_nCCR0 Register

- (1) The ENCA_nCCR0 register is currently set to 5555_H.
- (2) ENCA_nLDE is currently set to “1”.
- (3) A down-count is performed (0002_H → 0001_H → 0000_H), and an underflow occurs.
- (4) An underflow interrupt (ENCA_nTIUD) is output, and the underflow flag (ENCA_nUDF) is set.
- (5) When an underflow occurs, the ENCA_nCCR0 register value is changed from 5555_H to AAAA_H.
- (6) Additionally, when an underflow occurs, the ENCA_nCCR0 value before the rewrite is performed (5555_H) is set in ENCA_nCNT.

34.6.11 Conflict between ENCA_nLDE Function (Loading Count Value) and Clear Operation by Encoder Clear Input (ENCA_nEC Pin)

Figure 34.22 Conflict between ENCA_nLDE Function and Clear Operation by Encoder Clear Input

- (1) The values are set as follows: ENCA_nCTS = 0, ENCA_nECS[1:0] = 01_B, ENCA_nLDE = 1, and ENCA_nCCR0 = 5555_H.
- (2) A down-count is performed: 0002_H → 0001_H → 0000_H
- (3) When the count value becomes 0000_H, the rising edge of ENCA_nEC pin is detected, and clear operation by the encoder clear input is performed.
- (4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is 0000_H. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCA_nUDF) is not set.

- (5) After the count value is cleared to 0000_H by clear operation of the encoder clear input, a down-count is performed and an underflow occurs.
- (6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCA_nUDF) is set.
- (7) Because ENCA_nLDE = “1”, if an underflow occurs, the ENCA_nCCR0 value is loaded to ENCA_nCNT.
- (8) After the ENCA_nCCR0 value is set to ENCA_nCNT, a compare match is detected according to the count clock. If the ENCA_nCNT value matches the ENCA_nCCR0 value, a compare match interrupt (ENCATINT0) is output.

34.6.12 Up-count after Conflict between ENCA_nLDE Function (Loading Count Value) and Encoder Clearing

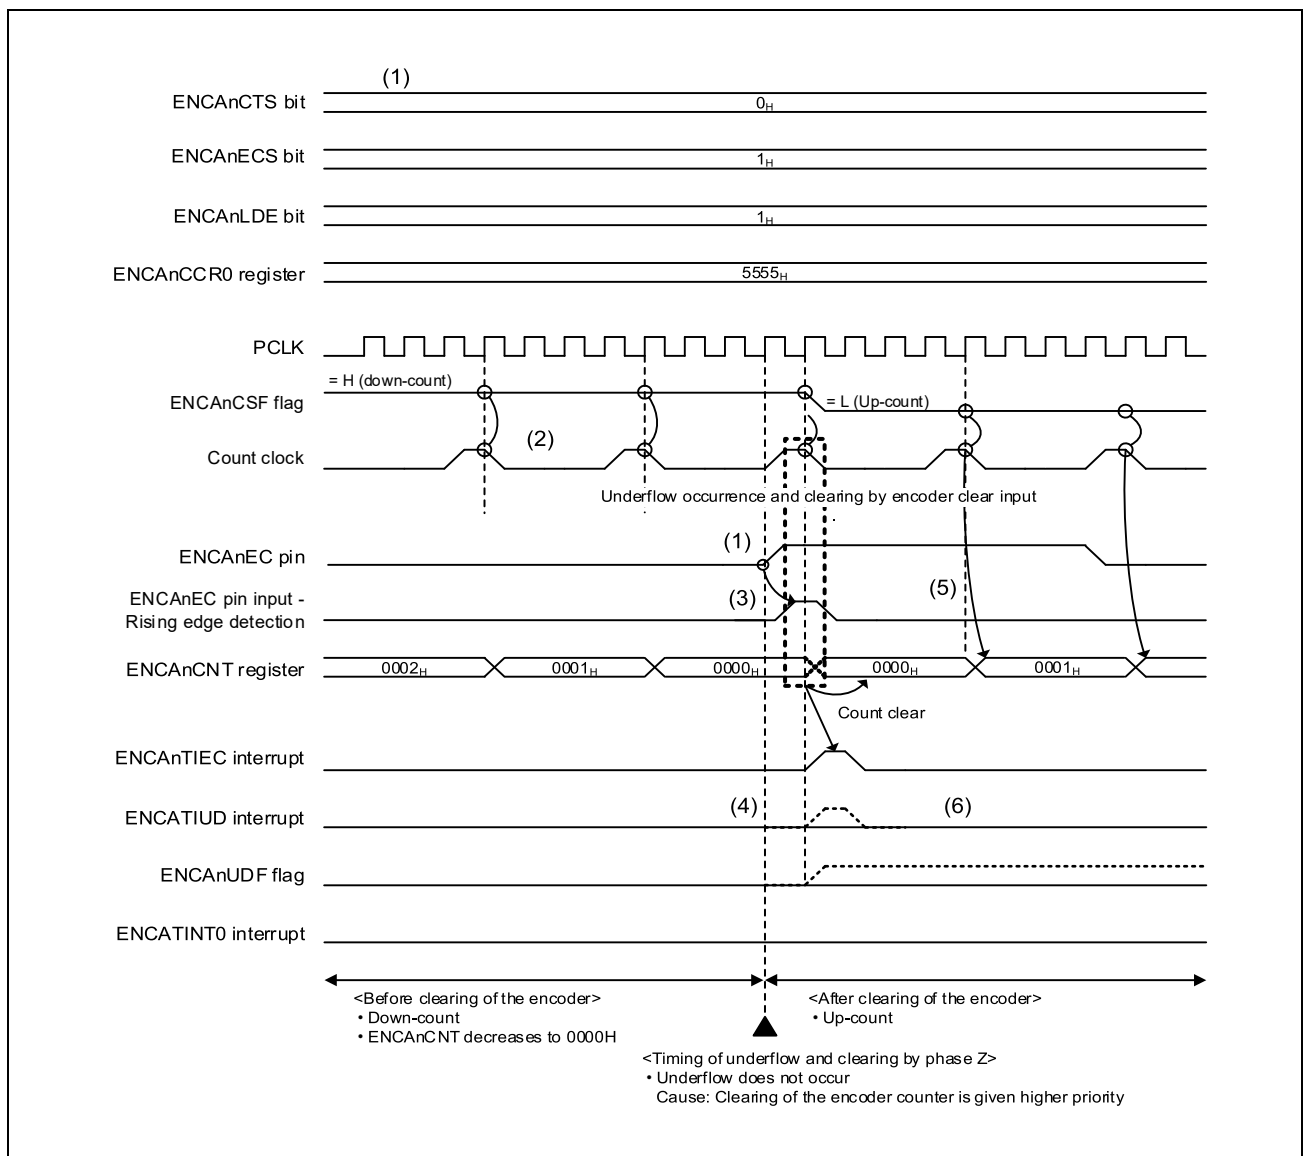

Figure 34.23 Up-count after Conflict between ENCA_nLDE Function and Encoder Clearing

- (1) The values are set as follows: ENCA_nCTS = 0, ENCA_nECS[1:0] = 01_B, ENCA_nLDE = 1, and ENCA_nCCR0 = 5555_H.
- (2) A down-count is performed: 0002_H → 0001_H → 0000_H
- (3) When the count value becomes 0000_H, the rising edge of ENCA_nEC pin is detected, and clear operation by the encoder clear input is performed.
- (4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is 0000_H. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCA_nUDF) is not set.
- (5) After the count value is cleared to 0000_H by clear operation of the encoder clear input, an up-count is performed.
- (6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCA_nUDF) is not set.

34.6.13 Capture Operation between Count Clocks (ENCA_nCCR1)

Figure 34.24 Capture Operation between Count Clocks (ENCA_nCCR1)

- (1) The values are set as follows: ENCA_nCRM1 = 1, and ENCA_nTIS[3:2] = 01_B.
- (2) An up-count is performed.
- (3) The rising edge of the ENCA_nTTIN1 input is detected, and the count value is captured in ENCA_nCCR1.
- (4) An interrupt (ENCA_nTINT1) corresponding to the capture to the ENCA_nCCR1 register is output.

34.6.14 Capture Operation between Count Clocks (ENCA_nCCR0)

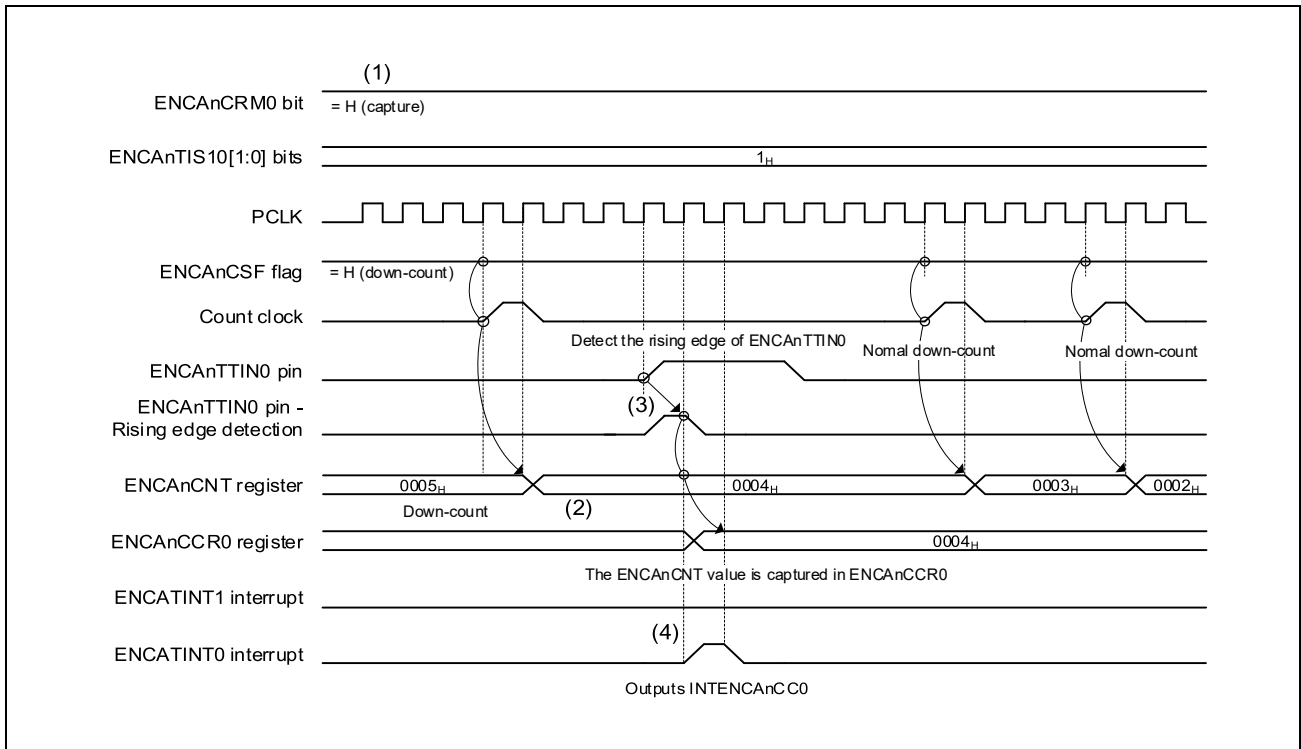

Figure 34.25 Capture Operation between Count Clocks (ENCA_nCCR0)

- (1) The values are set as follows: ENCA_nCRM0 = 1, and ENCA_nTIS[1:0] = 01_B.
- (2) A down-count is performed.
- (3) The rising edge of the ENCA_nTTIN0 input is detected, and the count value is captured in ENCA_nCCR0.
- (4) An interrupt (ENCA_nTINT0) corresponding to the capture to the ENCA_nCCR0 register is output.

34.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCA_nCTS = 0

Figure 34.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCA_nCTS = 0

- (1) The values are set as follows: ENCA_nCCR0 = 4444_H, ENCA_nCRM0 = 0, ENCA_nCRM1 = 1, ENCA_nECM[1:0] = 01_B, and ENCA_nCTS = 0.
- (2) A down-count is performed.
- (3) The rising edge of the ENCA_nTTIN1 input is detected, and the ENCA_nCNT value (4444_H) is captured in the ENCA_nCCR1 register.
- (4) An interrupt signal (ENCA_nTINT1) corresponding to the capture to the ENCA_nCCR1 register is output.
- (5) When a compare match occurs between ENCA_nCNT (counted down from 4445_H to 4444_H) and ENCA_nCCR0 (4444_H), a compare match interrupt (ENCA_nTINT0) with ENCA_nCCR0 is output.
- (6) The count operation changes to up-count.
- (7) When ENCA_nCNT is counted up from 4443_H to 4444_H, a compare match with ENCA_nCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCA_nECM1 and ENCA_nECM0 (01_B), and the ENCA_nCNT value changes to 0000_H.
- (8) When ENCA_nCNT changes to 4444_H, a compare match interrupt (ENCA_nTINT0) with ENCA_nCCR0 is output.

34.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCA_nCTS = 1

Figure 34.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCA_nCTS = 1

- (1) The values are set as follows: ENCA_nCCR0 = 4444_H, ENCA_nCRM0 = 0, ENCA_nCRM1 = 1, ENCA_nECM[1:0] = 01_B, and ENCA_nCTS = 1.
- (2) A down-count is performed.
- (3) When a compare match occurs between ENCA_nCNT (counted down from 4445_H to 4444_H) and ENCA_nCCR0 (4444_H), a compare/capture interrupt (ENCATINT0) is output.
- (4) The count operation changes to up-count.
- (5) When ENCA_nCNT is counted up from 4443_H to 4444_H, a compare match with ENCA_nCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCA_nECM1 and ENCA_nECM0 (01_B), and the ENCA_nCNT value changes to 0000_H.
- (6) When ENCA_nCNT changes to 4444_H, a compare match interrupt (ENCATINT0) with ENCA_nCCR0 is output.
- (7) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H. At this point, the ENCA_nCNT value (0001_H) is captured in ENCA_nCCR1 by detecting the rising edge of the ENCA_nEC signal, and the counter is cleared to 0000_H.
- (8) An interrupt (ENCATINT1) corresponding to the capture to the ENCA_nCCR1 register and a clear interrupt (ENCATIEC) by ENCA_nEC are output.

34.6.17 Encoder Operation when Compare Match Clear Control is Disabled

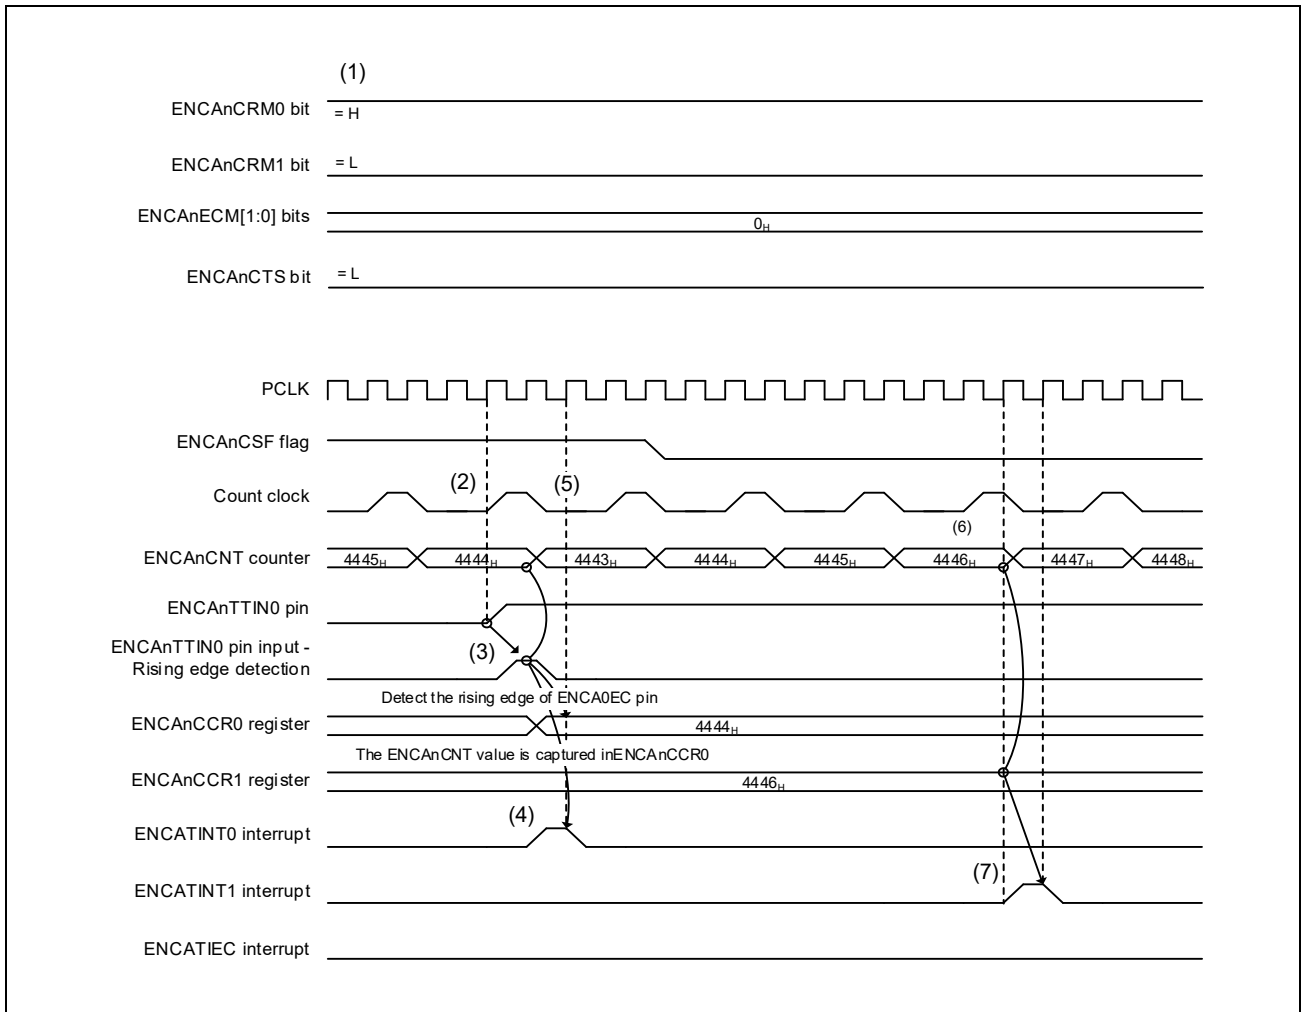

Figure 34.28 Encoder Operation when Compare Match Clear Control is Disabled

- (1) The values are set as follows: ENCAAnCCR1 = 4446_H, ENCAAnCRM0 = 1, ENCAAnCRM1 = 0, ENCAAnECM[1:0] = 00_B, and ENCAAnCTS = 0.
- (2) A down-count is performed.
- (3) When the rising edge of ENCAAnTTIN0 is detected, the ENCAAnCNT value (4444_H) is captured in ENCAAnCCR0.
- (4) An interrupt signal (ENCAAnTINT0) corresponding to the capture to the ENCAAnCCR0 register is output.
- (5) The count operation changes to up-count.
- (6) When ENCAAnCNT changes to 4446_H, a compare match with ENCAAnCCR1 is detected.
- (7) A compare match interrupt (ENCAAnTINT1) with ENCAAnCCR1 is output.

34.6.18 Capture Operation Performed upon Clearing by ENCA_nEC, ENCA_nE0, or ENCA_nE1 when ENCA_nSCE = 1

34.6.18.1 Accompanying Capture Operation

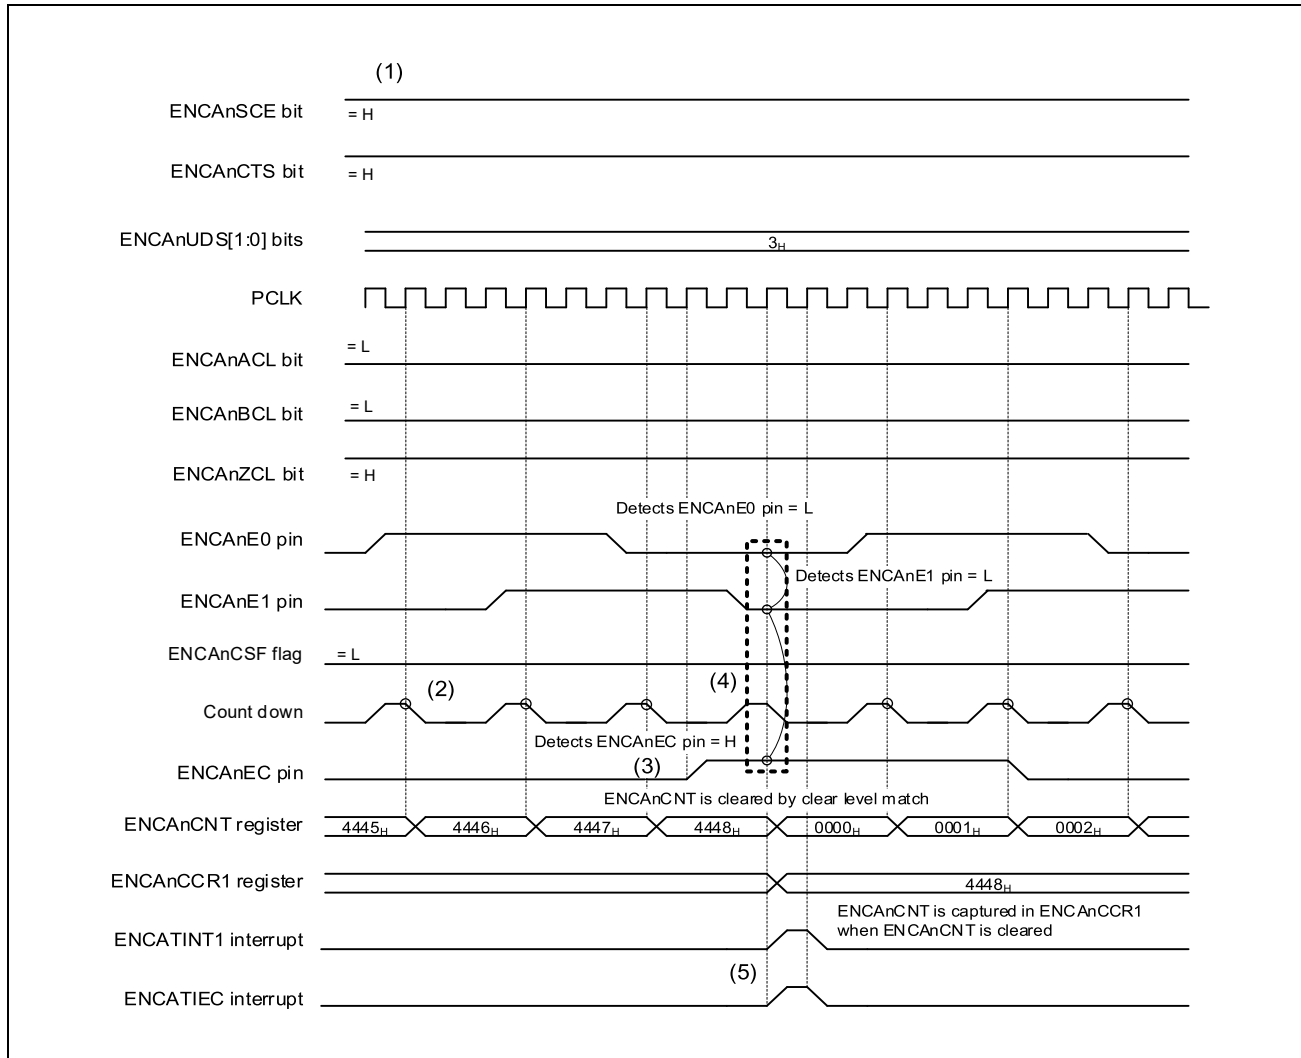

Figure 34.29 Capture Operation Performed upon Clearing by ENCA_nEC, ENCA_nE0, or ENCA_nE1 when ENCA_nSCE = 1

- (1) The values are set as follows: ENCA_nSCE = 1, ENCA_nCTS = 1, ENCA_nUDS[1:0] = 11_B, ENCA_nACL = 0, ENCA_nBCL = 0, and ENCA_nZCL = 1.
- (2) An up-count is performed.
- (3) The count value is not cleared upon the rising edge of ENCA_nEC.
- (4) When ENCA_nE0, ENCA_nE1 and ENCA_nEC reach the set clear level, the count value is cleared. The count value is captured in ENCA_nCCR1 at the time of the clearing.
- (5) At the time of the clearing, an interrupt (ENCA_nTINT1) corresponding to the capture to the ENCA_nCCR1 register and a clear interrupt (ENCA_nTIEC) by ENCA_nEC are output.

34.6.18.2 When the Timing of the ENCA_nEC Input is Later than that of the ENCA_nE1 Input during Up-count (When ENCA_nACL = 1, ENCA_nBCL = 0, ENCA_nZCL = 1, and ENCA_nUDS[1:0] = 11_B)

Figure 34.30 Clearing Timing for when the Timing of the ENCA_nEC Input is Later than that of the ENCA_nE1 Input during Up-count

34.6.18.3 When the Timing of the ENCA_nEC Input is the Same as that of the ENCA_nE1 Input during Up-count (When ENCA_nACL = 1, ENCA_nBCL = 0, ENCA_nZCL = 1, and ENCA_nUDS[1:0] = 11_B)

Figure 34.31 Clearing Timing for when the Timing of the ENCA_nEC Input is the Same as that of the ENCA_nE1 Input during Up-count

34.6.18.4 When the Timing of the ENCA_nEC Input is Earlier than that of the ENCA_nE1 Input during Up-count (When ENCA_nACL = 1, ENCA_nBCL = 0, ENCA_nZCL = 1, and ENCA_nUDS[1:0] = 11_B)

Figure 34.32 Clearing Timing for when the Timing of the ENCA_nEC Input is Earlier than that of the ENCA_nE1 Input during Up-count

34.6.18.5 When the Timing of the ENCA_nEC Input is Later than that of the ENCA_nE1 Input during Down-count (When ENCA_nACL = 1, ENCA_nBCL = 0, ENCA_nZCL = 1, and ENCA_nUDS[1:0] = 11_B)

Figure 34.33 Clearing Timing for when the Timing of the ENCA_nEC Input is Later than that of the ENCA_nE1 Input during Down-count

34.6.19 Capture Operation Performed upon Clearing by ENCA_nEC when ENCA_nSCE = 0

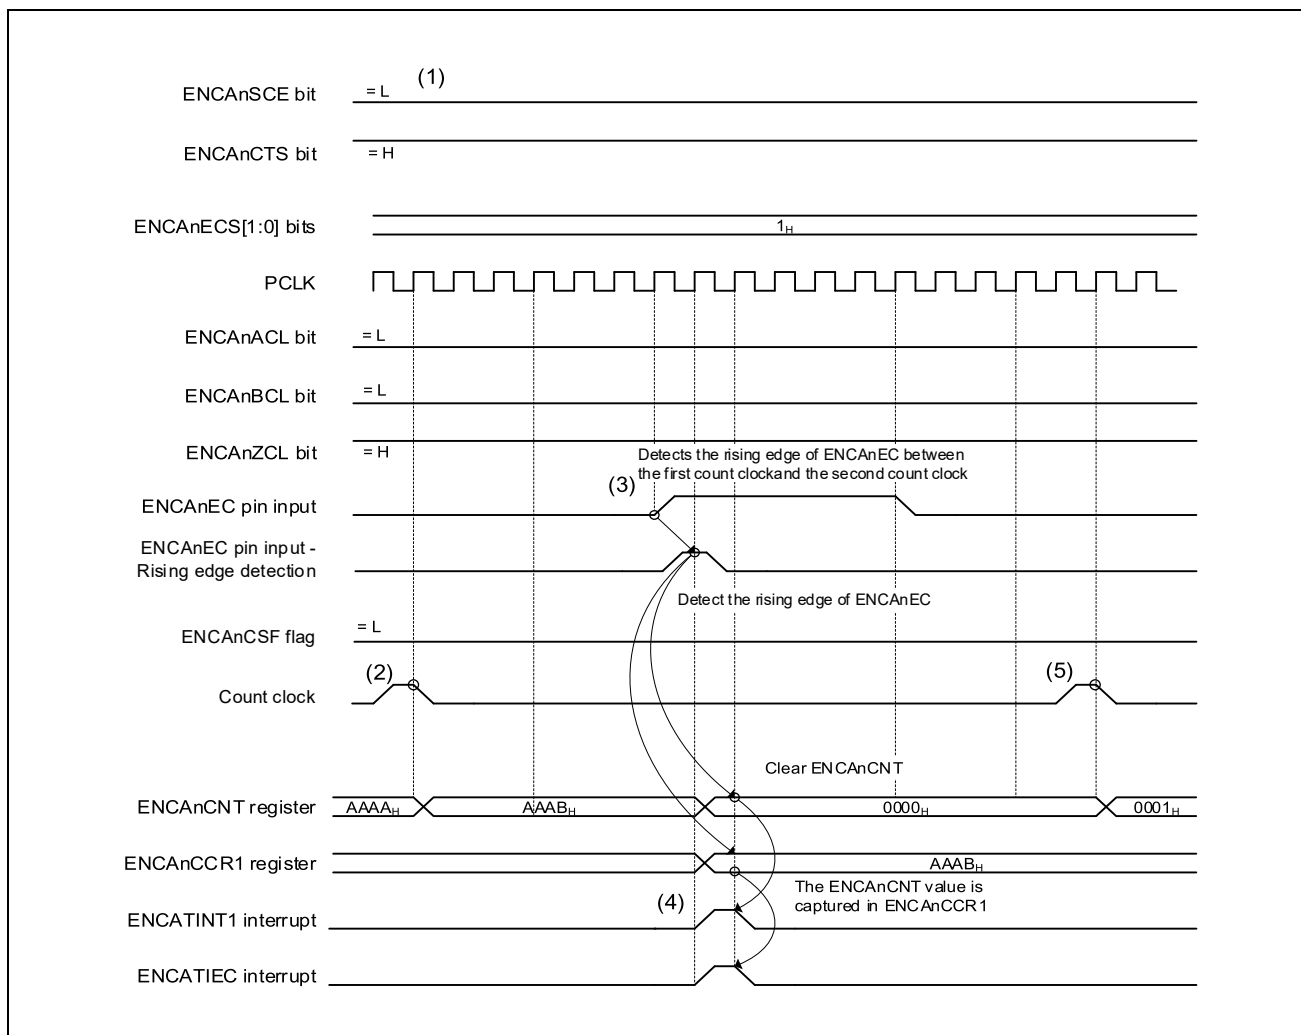

Figure 34.34 Capture Operation Performed upon Clearing by ENCA_nEC when ENCA_nSCE = 0

- (1) The values are set as follows: ENCA_nSCE = 0, ENCA_nCTS = 1, and ENCA_nECS[1:0] = 01_B.
- (2) An up-count is performed.
- (3) The rising edge of the ENCA_nEC input is detected, and the ENCA_nCNT value (AAAB_H) is captured in the ENCA_nCCR1 register. Concurrently, clear operation by ENCA_nEC is performed, and ENCA_nCNT is cleared to 0000_H.
- (4) A capture interrupt 1 (ENCA_nTINT1) to the ENCA_nCCR1 register and an encoder value clear interrupt (ENCA_nTIEC) by ENCA_nEC are output.
- (5) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H.

Section 35 Peripheral Interconnection (PIC)

35.1 Features of PIC

This section contains a generic description of the peripheral interconnection (PIC).

The first part of this section describes specific properties of this peripheral, such as the number of units, and register base addresses. The remainder of the section describes the functions and registers of the PIC (PIC1, PIC2).

35.1.1 Number of Units

This microcontroller has the following number of PIC units.

Table 35.1 Number of Units (PIC1)

Product Name	RH850/E2x-FCC2 Series
Number of Units	1
Name	PIC1

Table 35.2 Number of Units (PIC2)

Product Name	RH850/E2x-FCC2 Series
Number of Units	3
Name	PIC2

35.1.2 Register Base Addresses

PIC base addresses are listed in the following table.

PIC register addresses are given as offsets from the base addresses in general.

Table 35.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<PIC1_base>	FFDD 0000 _H	Peripheral Group 2H
<PIC20_base>	FFDD 1000 _H	Peripheral Group 2H
<PIC21_base>	FFDD 1800 _H	Peripheral Group 2H
<PIC22_base>	FFDD 2000 _H	Peripheral Group 2H

35.1.3 Clock Supply

PIC clock supplies are listed in the following table.

Table 35.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
PIC1	CLK_HSB	Peripheral high speed
PIC2	CLK_HSB	Peripheral high speed

35.1.4 Reset Sources

PIC reset sources are listed in the following table. PIC is initialized by these reset sources.

Table 35.5 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
PIC1	All registers	✓	✓	✓	✓	—	—
PIC2	All registers	✓	✓	✓	✓	—	—

35.1.5 External Input/Output Signals

External input/output signals of PIC are listed in the following table.

Table 35.6 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
ADTRG0	ADCH0 conversion startup trigger input	S_INEXT0Z
ADTRG1	ADCH1 conversion startup trigger input	S_INEXT1Z
ADTRG2	ADCH2 conversion startup trigger input	S_INEXT2Z
ADTRG3	ADCH3 conversion startup trigger input	S_INEXT3Z
DSADTRG00	DSADC00 conversion trigger input	D_INEXTZ0
DSADTRG10	DSADC10 conversion trigger input	D_INEXTZ1
DSADTRG20	DSADC20 conversion trigger input	D_INEXTZ2
DSADTRG12	DSADC12 conversion trigger input	D_INEXTZ3
DSADTRG13	DSADC13 conversion trigger input	D_INEXTZ4
DSADTRG11	DSADC11 conversion trigger input	D_INEXTZ5
DSADTRG15	DSADC15 conversion trigger input	D_INEXTZ6
DSADTRG14	DSADC14 conversion trigger input	D_INEXTZ7
DSADTRG22	DSADC22 conversion trigger input	D_INEXTZ8
DSADTRG21	DSADC21 conversion trigger input	D_INEXTZ9
CADTRG00	CADC00 conversion trigger input	D_INEXTZ10
ENCA0E0	ENCA0 encoder input (Phase A)	ENCA0E0
ENCA0E1	ENCA0 encoder input (Phase B)	ENCA0E1
ENCA0EC	ENCA0 encoder input (Phase Z)	ENCA0EC
ENCA1E0	ENCA1 encoder input (Phase A)	ENCA1E0
ENCA1E1	ENCA1 encoder input (Phase B)	ENCA1E1
ENCA1EC	ENCA1 encoder input (Phase Z)	ENCA1EC

35.2 Timer Synchronization Function (PIC1)

35.2.1 Overview

35.2.1.1 Functional Overview

The peripheral interconnection (PIC1) handles synchronous start of multiple OSTM timers.

The overview of PIC1 specification is shown in **Table 35.7**.

Table 35.7 PIC1 Specification Overview

Item	Description
Timer synchronization	Simultaneous start of any combination of timers (OSTMn).

35.2.1.2 Block Diagram

The following figure shows a block diagram of PIC1.

Figure 35.1 Block Diagram of PIC1

35.2.2 Registers

35.2.2.1 List of Registers

The list of PIC1 registers is shown in **Table 35.8**.

For information about restrictions on the individual registers and bits, see the register description in the following sections.

Table 35.8 List of PIC1 Registers

Register Name	Symbol	Address	Access	Access Protection
Simultaneous Start Trigger Control Register	PIC1SST	<PIC1_base> + 04 _H	8	—
Simultaneous Start Control Register 0	PIC1SSER0	<PIC1_base> + 10 _H	16	—

35.2.2.2 PIC1SST — Simultaneous Start Trigger Control Register

The PIC1SST register generates start triggers for timers for which simultaneous start is enabled.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SYNCTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 35.9 PIC1SST Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing to these bits, write 0.
0	SYNCTRG* ¹	Generate start triggers for timers for which simultaneous start is enabled. 0: Invalid setting 1: Trigger simultaneous start (generates a trigger pulse of 1-PCLK-cycle to timers for which simultaneous start is enabled)

Note 1. When this bit is read, the result is always 0.

35.2.2.3 PIC1SSER0 — Simultaneous Start Control Register 0

The PIC1SSER0 register defines OSTMn timers (n = 0 to 6) for which simultaneous start is enabled.

Value after reset: 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	PIC1SSER006	PIC1SSER005	PIC1SSER004	PIC1SSER003	PIC1SSER002	PIC1SSER001	PIC1SSER000
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.10 PIC1SSER0 Register Contents

Bit Position	Bit Name	Function
15 to 7	—	Reserved When writing to these bits, write 0.
6	PIC1SSER006*1	Enable simultaneous start for OSTM6. 0: Simultaneous start not enabled for OSTM6. 1: Simultaneous start is enabled for OSTM6.
5	PIC1SSER005*1	Enable simultaneous start for OSTM5. 0: Simultaneous start not enabled for OSTM5. 1: Simultaneous start is enabled for OSTM5.
4	PIC1SSER004	Enable simultaneous start for OSTM4. 0: Simultaneous start not enabled for OSTM4. 1: Simultaneous start is enabled for OSTM4.
3	PIC1SSER003	Enable simultaneous start for OSTM3. 0: Simultaneous start not enabled for OSTM3. 1: Simultaneous start is enabled for OSTM3.
2	PIC1SSER002	Enable simultaneous start for OSTM2. 0: Simultaneous start not enabled for OSTM2. 1: Simultaneous start is enabled for OSTM2.
1	PIC1SSER001	Enable simultaneous start for OSTM1. 0: Simultaneous start not enabled for OSTM1. 1: Simultaneous start is enabled for OSTM1.
0	PIC1SSER000	Enable simultaneous start for OSTM0. 0: Simultaneous start not enabled for OSTM0. 1: Simultaneous start is enabled for OSTM0.

Note 1. Not supported for E2H

35.2.3 Operation

35.2.3.1 Timer Synchronization

- (1) Configure timers (OSTMn). For more details about the configuration of the OSTMn timers see **Section 31, OS Timer (OSTM)**.
- (2) For the timers that should be started simultaneously, write 1 to their corresponding PIC1SSER00n bits of PIC1SSER0.
- (3) Write 1 to the SYNCTRG bit of PIC1SST0 to generate a start trigger.
- (4) Repeat (2) and (3) for timers that are not started yet to allow different timer groups to operate in a different timing.

35.3 Trigger Selection Function (PIC2)

35.3.1 Overview

35.3.1.1 Functional Overview

Peripheral interconnection (PIC2) handles configuration of triggers to ADCH, DSADC, ENCA, DFE, PSI5-S, GTM and CADC from various peripheral modules.

The overview of PIC2 specifications with ATU is shown in **Table 35.11**.

Table 35.11 Overview of PIC2 Specifications with ATU

Item	Description
ADC trigger selection	Selects sources from ATU for ADC
(selection from ATU timers, peripheral IPs, and above described sources)	Selects an AD trigger from the above selected sources and internal signals from peripheral IPs.
DSADC trigger selection	Selects an AD trigger for DSADC from ATU and external pins.
CADC trigger selection	Selects an AD trigger for CADC from ATU and external pins.

The overview of PIC2 specifications with GTM is shown in **Table 35.12**.

Table 35.12 Overview of PIC2 Specifications with GTM

Item	Description
ADC trigger selection	Selects sources from GTM for ADC
(selection from GTM timers, peripheral IPs, and above described sources)	Selects an AD trigger from the above selected sources and internal signals from peripheral IPs.
DSADC trigger selection	Selects an AD trigger for DSADC from GTM and external pins.
	Selects an AD read gate for DSADC from GTM.
CADC trigger selection	Selects an AD trigger for CADC from GTM and external pins.
	Selects an AD read gate for CADC from GTM.
ENCA trigger selection	Selects capture timing trigger from GTM for ENCA.
	Selects an ENCA capture timing trigger from the above selected sources and internal signals from peripheral IPs.
DFE trigger selection	Selects compare timer trigger and capture trigger, angle 1 deg trigger from GTM for DFE.
PSI5-S time stamp and sync signal selection	Selects time stamp and sync pulse signal from GTM for PSI5-S.
GTM timer input selection	
–PORT	Selects a timer input signal for GTM from GPIO.
–ADCH	Selects an AD scan end interrupt for GTM from ADCH.
–DSADC	Selects an AD conversion end timing interrupt for GTM from DSADC.
–CADC	Selects an AD conversion end timing interrupt for GTM from CADC.
–ENCA	Selects an ENCA count clock output and direction of rotation notice from encoder input (phases A/B/Z) and compare capture interrupt and phase Z edge detection for GTM from ENCA.
–DFE	Selects a DFE peak hold update notification for GTM from DFE.
ENCA encoder input selection	Selects an encoder input signal for ENCA from GPIO.

35.3.1.2 Block Diagrams

The following figure shows a block diagram of PIC2 configured with ATU.

Figure 35.2 Block Diagram of PIC2 Configured with ATU

The following figure shows a block diagram of PIC2 configured with GTM.

Figure 35.3 Block Diagram of PIC2 Configured with GTM

35.3.2 Register

35.3.2.1 List of Registers

The list of PIC2 registers is shown in **Table 35.13**.

For information about restrictions on the individual registers and bits, see the register description in the following sections.

Table 35.13 List of PIC2 Registers (1/7)

Register Name	Symbol	Address	Access	Access Protection
ADC Trigger Selection Control Register				
AD Converter 0 Trigger Selection Control Register 0	PIC2ADCH0TSEL0	<PIC20_base> + 00 _H	16, 32	—
AD Converter 0 Trigger Selection Control Register 1	PIC2ADCH0TSEL1	<PIC20_base> + 04 _H	16, 32	—
AD Converter 0 Trigger Selection Control Register 2	PIC2ADCH0TSEL2	<PIC20_base> + 08 _H	16, 32	—
AD Converter 0 Trigger Selection Control Register 3	PIC2ADCH0TSEL3	<PIC20_base> + 0C _H	16, 32	—
AD Converter 0 Trigger Selection Control Register 4	PIC2ADCH0TSEL4	<PIC20_base> + 10 _H	16, 32	—
AD Converter 0 Trigger Edge Selection Control Register	PIC2ADCH0EDGSEL	<PIC20_base> + 1C _H	16	—
AD Converter 1 Trigger Selection Control Register 0	PIC2ADCH1TSEL0	<PIC20_base> + 20 _H	16, 32	—
AD Converter 1 Trigger Selection Control Register 1	PIC2ADCH1TSEL1	<PIC20_base> + 24 _H	16, 32	—
AD Converter 1 Trigger Selection Control Register 2	PIC2ADCH1TSEL2	<PIC20_base> + 28 _H	16, 32	—
AD Converter 1 Trigger Selection Control Register 3	PIC2ADCH1TSEL3	<PIC20_base> + 2C _H	16, 32	—
AD Converter 1 Trigger Selection Control Register 4	PIC2ADCH1TSEL4	<PIC20_base> + 30 _H	16, 32	—
AD Converter 1 Trigger Edge Selection Control Register	PIC2ADCH1EDGSEL	<PIC20_base> + 3C _H	16	—
AD Converter 2 Trigger Selection Control Register 0	PIC2ADCH2TSEL0	<PIC20_base> + 40 _H	16, 32	—
AD Converter 2 Trigger Selection Control Register 1	PIC2ADCH2TSEL1	<PIC20_base> + 44 _H	16, 32	—
AD Converter 2 Trigger Selection Control Register 2	PIC2ADCH2TSEL2	<PIC20_base> + 48 _H	16, 32	—
AD Converter 2 Trigger Selection Control Register 3	PIC2ADCH2TSEL3	<PIC20_base> + 4C _H	16, 32	—
AD Converter 2 Trigger Selection Control Register 4	PIC2ADCH2TSEL4	<PIC20_base> + 50 _H	16, 32	—
AD Converter 2 Trigger Edge Selection Control Register	PIC2ADCH2EDGSEL	<PIC20_base> + 5C _H	16	—
AD Converter 3 Trigger Selection Control Register 0	PIC2ADCH3TSEL0	<PIC20_base> + 60 _H	16, 32	—
AD Converter 3 Trigger Selection Control Register 1	PIC2ADCH3TSEL1	<PIC20_base> + 64 _H	16, 32	—
AD Converter 3 Trigger Selection Control Register 2	PIC2ADCH3TSEL2	<PIC20_base> + 68 _H	16, 32	—
AD Converter 3 Trigger Selection Control Register 3	PIC2ADCH3TSEL3	<PIC20_base> + 6C _H	16, 32	—
AD Converter 3 Trigger Selection Control Register 4	PIC2ADCH3TSEL4	<PIC20_base> + 70 _H	16, 32	—
AD Converter 3 Trigger Edge Selection Control Register	PIC2ADCH3EDGSEL	<PIC20_base> + 7C _H	16	—
AD Converter Trigger Output Control Register 500	PIC2ADTEN500	<PIC20_base> + 180 _H	16, 32	—
AD Converter Trigger Output Control Register 501	PIC2ADTEN501	<PIC20_base> + 184 _H	16, 32	—
AD Converter Trigger Output Control Register 502	PIC2ADTEN502	<PIC20_base> + 188 _H	16, 32	—
AD Converter Trigger Output Control Register 503	PIC2ADTEN503	<PIC20_base> + 18C _H	16, 32	—
AD Converter Trigger Output Control Register 504	PIC2ADTEN504	<PIC20_base> + 190 _H	16, 32	—
AD Converter Trigger Output Control Register 510	PIC2ADTEN510	<PIC20_base> + 1A0 _H	16, 32	—
AD Converter Trigger Output Control Register 511	PIC2ADTEN511	<PIC20_base> + 1A4 _H	16, 32	—
AD Converter Trigger Output Control Register 512	PIC2ADTEN512	<PIC20_base> + 1A8 _H	16, 32	—
AD Converter Trigger Output Control Register 513	PIC2ADTEN513	<PIC20_base> + 1AC _H	16, 32	—
AD Converter Trigger Output Control Register 514	PIC2ADTEN514	<PIC20_base> + 1B0 _H	16, 32	—
AD Converter Trigger Output Control Register 520	PIC2ADTEN520	<PIC20_base> + 1C0 _H	16, 32	—

Table 35.13 List of PIC2 Registers (2/7)

Register Name	Symbol	Address	Access	Access Protection
AD Converter Trigger Output Control Register 521	PIC2ADTEN521	<PIC20_base> + 1C4 _H	16, 32	—
AD Converter Trigger Output Control Register 522	PIC2ADTEN522	<PIC20_base> + 1C8 _H	16, 32	—
AD Converter Trigger Output Control Register 523	PIC2ADTEN523	<PIC20_base> + 1CC _H	16, 32	—
AD Converter Trigger Output Control Register 524	PIC2ADTEN524	<PIC20_base> + 1D0 _H	16, 32	—
AD Converter Trigger Output Control Register 530	PIC2ADTEN530	<PIC20_base> + 1E0 _H	16, 32	—
AD Converter Trigger Output Control Register 531	PIC2ADTEN531	<PIC20_base> + 1E4 _H	16, 32	—
AD Converter Trigger Output Control Register 532	PIC2ADTEN532	<PIC20_base> + 1E8 _H	16, 32	—
AD Converter Trigger Output Control Register 533	PIC2ADTEN533	<PIC20_base> + 1EC _H	16, 32	—
AD Converter Trigger Output Control Register 534	PIC2ADTEN534	<PIC20_base> + 1F0 _H	16, 32	—
AD Converter Trigger Output Control Register 600	PIC2ADTEN600	<PIC20_base> + 200 _H	32	—
AD Converter Trigger Output Control Register 601	PIC2ADTEN601	<PIC20_base> + 204 _H	32	—
AD Converter Trigger Output Control Register 602	PIC2ADTEN602	<PIC20_base> + 208 _H	32	—
AD Converter Trigger Output Control Register 603	PIC2ADTEN603	<PIC20_base> + 20C _H	32	—
AD Converter Trigger Output Control Register 604	PIC2ADTEN604	<PIC20_base> + 210 _H	32	—
AD Converter Trigger Output Control Register 610	PIC2ADTEN610	<PIC20_base> + 220 _H	32	—
AD Converter Trigger Output Control Register 611	PIC2ADTEN611	<PIC20_base> + 224 _H	32	—
AD Converter Trigger Output Control Register 612	PIC2ADTEN612	<PIC20_base> + 228 _H	32	—
AD Converter Trigger Output Control Register 613	PIC2ADTEN613	<PIC20_base> + 22C _H	32	—
AD Converter Trigger Output Control Register 614	PIC2ADTEN614	<PIC20_base> + 230 _H	32	—
AD Converter Trigger Output Control Register 620	PIC2ADTEN620	<PIC20_base> + 240 _H	32	—
AD Converter Trigger Output Control Register 621	PIC2ADTEN621	<PIC20_base> + 244 _H	32	—
AD Converter Trigger Output Control Register 622	PIC2ADTEN622	<PIC20_base> + 248 _H	32	—
AD Converter Trigger Output Control Register 623	PIC2ADTEN623	<PIC20_base> + 24C _H	32	—
AD Converter Trigger Output Control Register 624	PIC2ADTEN624	<PIC20_base> + 250 _H	32	—
AD Converter Trigger Output Control Register 630	PIC2ADTEN630	<PIC20_base> + 260 _H	32	—
AD Converter Trigger Output Control Register 631	PIC2ADTEN631	<PIC20_base> + 264 _H	32	—
AD Converter Trigger Output Control Register 632	PIC2ADTEN632	<PIC20_base> + 268 _H	32	—
AD Converter Trigger Output Control Register 633	PIC2ADTEN633	<PIC20_base> + 26C _H	32	—
AD Converter Trigger Output Control Register 634	PIC2ADTEN634	<PIC20_base> + 270 _H	32	—
AD Converter Trigger Output Control Register 700	PIC2ADTEN700	<PIC20_base> + 280 _H	32	—
AD Converter Trigger Output Control Register 701	PIC2ADTEN701	<PIC20_base> + 284 _H	32	—
AD Converter Trigger Output Control Register 702	PIC2ADTEN702	<PIC20_base> + 288 _H	32	—
AD Converter Trigger Output Control Register 703	PIC2ADTEN703	<PIC20_base> + 28C _H	32	—
AD Converter Trigger Output Control Register 704	PIC2ADTEN704	<PIC20_base> + 290 _H	32	—
AD Converter Trigger Output Control Register 710	PIC2ADTEN710	<PIC20_base> + 2A0 _H	32	—
AD Converter Trigger Output Control Register 711	PIC2ADTEN711	<PIC20_base> + 2A4 _H	32	—
AD Converter Trigger Output Control Register 712	PIC2ADTEN712	<PIC20_base> + 2A8 _H	32	—
AD Converter Trigger Output Control Register 713	PIC2ADTEN713	<PIC20_base> + 2AC _H	32	—
AD Converter Trigger Output Control Register 714	PIC2ADTEN714	<PIC20_base> + 2B0 _H	32	—
AD Converter Trigger Output Control Register 720	PIC2ADTEN720	<PIC20_base> + 2C0 _H	32	—
AD Converter Trigger Output Control Register 721	PIC2ADTEN721	<PIC20_base> + 2C4 _H	32	—
AD Converter Trigger Output Control Register 722	PIC2ADTEN722	<PIC20_base> + 2C8 _H	32	—
AD Converter Trigger Output Control Register 723	PIC2ADTEN723	<PIC20_base> + 2CC _H	32	—

Table 35.13 List of PIC2 Registers (3/7)

Register Name	Symbol	Address	Access	Access Protection
AD Converter Trigger Output Control Register 724	PIC2ADTEN724	<PIC20_base> + 2D0 _H	32	—
AD Converter Trigger Output Control Register 730	PIC2ADTEN730	<PIC20_base> + 2E0 _H	32	—
AD Converter Trigger Output Control Register 731	PIC2ADTEN731	<PIC20_base> + 2E4 _H	32	—
AD Converter Trigger Output Control Register 732	PIC2ADTEN732	<PIC20_base> + 2E8 _H	32	—
AD Converter Trigger Output Control Register 733	PIC2ADTEN733	<PIC20_base> + 2EC _H	32	—
AD Converter Trigger Output Control Register 734	PIC2ADTEN734	<PIC20_base> + 2F0 _H	32	—
AD Converter Trigger Output Control Register 800	PIC2ADTEN800	<PIC20_base> + 300 _H	32	—
AD Converter Trigger Output Control Register 801	PIC2ADTEN801	<PIC20_base> + 304 _H	32	—
AD Converter Trigger Output Control Register 802	PIC2ADTEN802	<PIC20_base> + 308 _H	32	—
AD Converter Trigger Output Control Register 803	PIC2ADTEN803	<PIC20_base> + 30C _H	32	—
AD Converter Trigger Output Control Register 804	PIC2ADTEN804	<PIC20_base> + 310 _H	32	—
AD Converter Trigger Output Control Register 810	PIC2ADTEN810	<PIC20_base> + 320 _H	32	—
AD Converter Trigger Output Control Register 811	PIC2ADTEN811	<PIC20_base> + 324 _H	32	—
AD Converter Trigger Output Control Register 812	PIC2ADTEN812	<PIC20_base> + 328 _H	32	—
AD Converter Trigger Output Control Register 813	PIC2ADTEN813	<PIC20_base> + 32C _H	32	—
AD Converter Trigger Output Control Register 814	PIC2ADTEN814	<PIC20_base> + 330 _H	32	—
AD Converter Trigger Output Control Register 820	PIC2ADTEN820	<PIC20_base> + 340 _H	32	—
AD Converter Trigger Output Control Register 821	PIC2ADTEN821	<PIC20_base> + 344 _H	32	—
AD Converter Trigger Output Control Register 822	PIC2ADTEN822	<PIC20_base> + 348 _H	32	—
AD Converter Trigger Output Control Register 823	PIC2ADTEN823	<PIC20_base> + 34C _H	32	—
AD Converter Trigger Output Control Register 824	PIC2ADTEN824	<PIC20_base> + 350 _H	32	—
AD Converter Trigger Output Control Register 830	PIC2ADTEN830	<PIC20_base> + 360 _H	32	—
AD Converter Trigger Output Control Register 831	PIC2ADTEN831	<PIC20_base> + 364 _H	32	—
AD Converter Trigger Output Control Register 832	PIC2ADTEN832	<PIC20_base> + 368 _H	32	—
AD Converter Trigger Output Control Register 833	PIC2ADTEN833	<PIC20_base> + 36C _H	32	—
AD Converter Trigger Output Control Register 834	PIC2ADTEN834	<PIC20_base> + 370 _H	32	—
DSADC Trigger Selection Control Register				
DSADC Start Trigger Output Control Register 00	PIC2DSADTEN000	<PIC20_base> + 400 _H	16, 32	—
DSADC Start Trigger Output Control Register 01	PIC2DSADTEN001	<PIC20_base> + 404 _H	32	—
DSADC Start Trigger Output Control Register 02	PIC2DSADTEN002	<PIC20_base> + 408 _H	32	—
DSADC Start Trigger Output Control Register 03	PIC2DSADTEN003	<PIC20_base> + 40C _H	32	—
DSADC Stop Trigger Output Control Register 00	PIC2DSADTEN100	<PIC20_base> + 410 _H	16, 32	—
DSADC Stop Trigger Output Control Register 01	PIC2DSADTEN101	<PIC20_base> + 414 _H	32	—
DSADC Stop Trigger Output Control Register 02	PIC2DSADTEN102	<PIC20_base> + 418 _H	32	—
DSADC Stop Trigger Output Control Register 03	PIC2DSADTEN103	<PIC20_base> + 41C _H	32	—
DSADC Start Trigger Output Control Register 10	PIC2DSADTEN010	<PIC20_base> + 420 _H	16, 32	—
DSADC Start Trigger Output Control Register 11	PIC2DSADTEN011	<PIC20_base> + 424 _H	32	—
DSADC Start Trigger Output Control Register 12	PIC2DSADTEN012	<PIC20_base> + 428 _H	32	—
DSADC Start Trigger Output Control Register 13	PIC2DSADTEN013	<PIC20_base> + 42C _H	32	—
DSADC Stop Trigger Output Control Register 10	PIC2DSADTEN110	<PIC20_base> + 430 _H	16, 32	—
DSADC Stop Trigger Output Control Register 11	PIC2DSADTEN111	<PIC20_base> + 434 _H	32	—
DSADC Stop Trigger Output Control Register 12	PIC2DSADTEN112	<PIC20_base> + 438 _H	32	—
DSADC Stop Trigger Output Control Register 13	PIC2DSADTEN113	<PIC20_base> + 43C _H	32	—

Table 35.13 List of PIC2 Registers (4/7)

Register Name	Symbol	Address	Access	Access Protection
DSADC Start Trigger Output Control Register 20	PIC2DSADTEN020	<PIC20_base> + 440 _H	16, 32	—
DSADC Start Trigger Output Control Register 21	PIC2DSADTEN021	<PIC20_base> + 444 _H	32	—
DSADC Start Trigger Output Control Register 22	PIC2DSADTEN022	<PIC20_base> + 448 _H	32	—
DSADC Start Trigger Output Control Register 23	PIC2DSADTEN023	<PIC20_base> + 44C _H	32	—
DSADC Stop Trigger Output Control Register 20	PIC2DSADTEN120	<PIC20_base> + 450 _H	16, 32	—
DSADC Stop Trigger Output Control Register 21	PIC2DSADTEN121	<PIC20_base> + 454 _H	32	—
DSADC Stop Trigger Output Control Register 22	PIC2DSADTEN122	<PIC20_base> + 458 _H	32	—
DSADC Stop Trigger Output Control Register 23	PIC2DSADTEN123	<PIC20_base> + 45C _H	32	—
DSADC Start Trigger Output Control Register 30	PIC2DSADTEN030	<PIC20_base> + 460 _H	16, 32	—
DSADC Start Trigger Output Control Register 31	PIC2DSADTEN031	<PIC20_base> + 464 _H	32	—
DSADC Start Trigger Output Control Register 32	PIC2DSADTEN032	<PIC20_base> + 468 _H	32	—
DSADC Start Trigger Output Control Register 33	PIC2DSADTEN033	<PIC20_base> + 46C _H	32	—
DSADC Stop Trigger Output Control Register 30	PIC2DSADTEN130	<PIC20_base> + 470 _H	16, 32	—
DSADC Stop Trigger Output Control Register 31	PIC2DSADTEN131	<PIC20_base> + 474 _H	32	—
DSADC Stop Trigger Output Control Register 32	PIC2DSADTEN132	<PIC20_base> + 478 _H	32	—
DSADC Stop Trigger Output Control Register 33	PIC2DSADTEN133	<PIC20_base> + 47C _H	32	—
DSADC Start Trigger Output Control Register 40	PIC2DSADTEN040	<PIC20_base> + 480 _H	16, 32	—
DSADC Start Trigger Output Control Register 41	PIC2DSADTEN041	<PIC20_base> + 484 _H	32	—
DSADC Start Trigger Output Control Register 42	PIC2DSADTEN042	<PIC20_base> + 488 _H	32	—
DSADC Start Trigger Output Control Register 43	PIC2DSADTEN043	<PIC20_base> + 48C _H	32	—
DSADC Stop Trigger Output Control Register 40	PIC2DSADTEN140	<PIC20_base> + 490 _H	16, 32	—
DSADC Stop Trigger Output Control Register 41	PIC2DSADTEN141	<PIC20_base> + 494 _H	32	—
DSADC Stop Trigger Output Control Register 42	PIC2DSADTEN142	<PIC20_base> + 498 _H	32	—
DSADC Stop Trigger Output Control Register 43	PIC2DSADTEN143	<PIC20_base> + 49C _H	32	—
DSADC Start Trigger Output Control Register 50	PIC2DSADTEN050	<PIC20_base> + 4A0 _H	16, 32	—
DSADC Start Trigger Output Control Register 51	PIC2DSADTEN051	<PIC20_base> + 4A4 _H	32	—
DSADC Start Trigger Output Control Register 52	PIC2DSADTEN052	<PIC20_base> + 4A8 _H	32	—
DSADC Start Trigger Output Control Register 53	PIC2DSADTEN053	<PIC20_base> + 4AC _H	32	—
DSADC Stop Trigger Output Control Register 50	PIC2DSADTEN150	<PIC20_base> + 4B0 _H	16, 32	—
DSADC Stop Trigger Output Control Register 51	PIC2DSADTEN151	<PIC20_base> + 4B4 _H	32	—
DSADC Stop Trigger Output Control Register 52	PIC2DSADTEN152	<PIC20_base> + 4B8 _H	32	—
DSADC Stop Trigger Output Control Register 53	PIC2DSADTEN153	<PIC20_base> + 4BC _H	32	—
DSADC Start Trigger Output Control Register 60	PIC2DSADTEN060	<PIC20_base> + 4C0 _H	16, 32	—
DSADC Start Trigger Output Control Register 61	PIC2DSADTEN061	<PIC20_base> + 4C4 _H	32	—
DSADC Start Trigger Output Control Register 62	PIC2DSADTEN062	<PIC20_base> + 4C8 _H	32	—
DSADC Start Trigger Output Control Register 63	PIC2DSADTEN063	<PIC20_base> + 4CC _H	32	—
DSADC Stop Trigger Output Control Register 60	PIC2DSADTEN160	<PIC20_base> + 4D0 _H	16, 32	—
DSADC Stop Trigger Output Control Register 61	PIC2DSADTEN161	<PIC20_base> + 4D4 _H	32	—
DSADC Stop Trigger Output Control Register 62	PIC2DSADTEN162	<PIC20_base> + 4D8 _H	32	—
DSADC Stop Trigger Output Control Register 63	PIC2DSADTEN163	<PIC20_base> + 4DC _H	32	—
DSADC Start Trigger Output Control Register 70	PIC2DSADTEN070	<PIC20_base> + 4E0 _H	16, 32	—
DSADC Start Trigger Output Control Register 71	PIC2DSADTEN071	<PIC20_base> + 4E4 _H	32	—
DSADC Start Trigger Output Control Register 72	PIC2DSADTEN072	<PIC20_base> + 4E8 _H	32	—

Table 35.13 List of PIC2 Registers (5/7)

Register Name	Symbol	Address	Access	Access Protection
DSADC Start Trigger Output Control Register 73	PIC2DSADTEN073	<PIC20_base> + 4EC _H	32	—
DSADC Stop Trigger Output Control Register 70	PIC2DSADTEN170	<PIC20_base> + 4F0 _H	16, 32	—
DSADC Stop Trigger Output Control Register 71	PIC2DSADTEN171	<PIC20_base> + 4F4 _H	32	—
DSADC Stop Trigger Output Control Register 72	PIC2DSADTEN172	<PIC20_base> + 4F8 _H	32	—
DSADC Stop Trigger Output Control Register 73	PIC2DSADTEN173	<PIC20_base> + 4FC _H	32	—
DSADC Start Trigger Output Control Register 80	PIC2DSADTEN080	<PIC20_base> + 500 _H	16, 32	—
DSADC Start Trigger Output Control Register 81	PIC2DSADTEN081	<PIC20_base> + 504 _H	32	—
DSADC Start Trigger Output Control Register 82	PIC2DSADTEN082	<PIC20_base> + 508 _H	32	—
DSADC Start Trigger Output Control Register 83	PIC2DSADTEN083	<PIC20_base> + 50C _H	32	—
DSADC Stop Trigger Output Control Register 80	PIC2DSADTEN180	<PIC20_base> + 510 _H	16, 32	—
DSADC Stop Trigger Output Control Register 81	PIC2DSADTEN181	<PIC20_base> + 514 _H	32	—
DSADC Stop Trigger Output Control Register 82	PIC2DSADTEN182	<PIC20_base> + 518 _H	32	—
DSADC Stop Trigger Output Control Register 83	PIC2DSADTEN183	<PIC20_base> + 51C _H	32	—
DSADC Start Trigger Output Control Register 90	PIC2DSADTEN090	<PIC20_base> + 520 _H	16, 32	—
DSADC Start Trigger Output Control Register 91	PIC2DSADTEN091	<PIC20_base> + 524 _H	32	—
DSADC Start Trigger Output Control Register 92	PIC2DSADTEN092	<PIC20_base> + 528 _H	32	—
DSADC Start Trigger Output Control Register 93	PIC2DSADTEN093	<PIC20_base> + 52C _H	32	—
DSADC Stop Trigger Output Control Register 90	PIC2DSADTEN190	<PIC20_base> + 530 _H	16, 32	—

Table 35.14 PIC2ADCHnTSELj Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved When writing to these bits, write 0.
15	PIC2ADCHnTSELj15	Selects the trigger selected by the “PIC2ADTEN5nj PIC2ADTEN6nj PIC2ADTEN7nj PIC2ADTEN8nj” register as a trigger source of ADCHn scan group i. 0: Does not select the trigger selected by register “PIC2ADTEN5nj,6nj,7nj,8nj”. 1: Selects the trigger selected by register “PIC2ADTEN5nj,6nj,7nj,8nj”.
14 to 9	—	Reserved When writing to these bits, write 0.
8	PIC2ADCHnTSELj08	Selects the ADTRGn pin as a trigger source of ADCHn scan group j. 0: The ADTRGn pin is not selected. 1: The ADTRGn pin is selected.
7 to 0	—	Reserved When writing to these bits, write 0.

35.3.2.3 PIC2ADCHnEDGSEL — AD Converter n Trigger Edge Selection Control Register (n = 0 to 3)

The PIC2ADCHnEDGSEL register selects an effective edge for the one-shot pulse generation circuit which generates an ADCH trigger.

The ADCH external pin trigger is input in negative logic, but it is converted to positive logic for trigger source selection. Since edge detection is made for a trigger source after selection, note that the definition of an edge is reversed for an ADCH external pin signal. (Setting 00 enables selection of a falling edge of ADCH external pin triggers ADTRG0, ADTRG1, ADTRG2, and ADTRG3.)

Value after reset: 0000H

Table 35.15 PIC2ADCHnEDGSEL Register Contents

Bit Position	Bit Name	Function
15 to 10	—	Reserved When writing to these bits, write 0.
9, 8	PIC2ADCHnEDGSEL98[9:8]	Select an effective edge of ADCHn scan group 4. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited)
7, 6	PIC2ADCHnEDGSEL76[7:6]	Select an effective edge of ADCHn scan group 3. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited)
5, 4	PIC2ADCHnEDGSEL54[5:4]	Select an effective edge of ADCHn scan group 2. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited)
3, 2	PIC2ADCHnEDGSEL32[3:2]	Select an effective edge of ADCHn scan group 1. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited)
1, 0	PIC2ADCHnEDGSEL10[1:0]	Select an effective edge of ADCHn scan group 0. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited)

35.3.2.4 PIC2ADTEN5nj — AD Converter Trigger Output Control Register 5nj (n = 0 to 3; j = 0 to 4)

The PIC2ADTEN5nj register enables a trigger source from ATU timer C compare match, ATU timer G compare match, and ATU DMA request switch function to be selected as an ADCH trigger (n = 0 to 3; j = 0 to 4).

Value after reset: 0000 0000_H

30	PIC2ADTEN6nj30	OCR1D142 compare match interrupt (ATU5 timer D subblock 14 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
29	PIC2ADTEN6nj29	OCR1D141 compare match interrupt (ATU5 timer D subblock 14 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
28	PIC2ADTEN6nj28	OCR1D140 compare match interrupt (ATU5 timer D subblock 14 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
27	PIC2ADTEN6nj27	OCR1D133 compare match interrupt (ATU5 timer D subblock 13 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
26	PIC2ADTEN6nj26	OCR1D132 compare match interrupt (ATU5 timer D subblock 13 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
25	PIC2ADTEN6nj25	OCR1D131 compare match interrupt (ATU5 timer D subblock 13 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.

Table 35.17 PIC2ADTEN6nj Register Contents (2/3)

Bit Position	Bit Name	Function
24	PIC2ADTEN6nj24	OCR1D130 compare match interrupt (ATU5 timer D subblock 13 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
23	PIC2ADTEN6nj23	OCR1D123 compare match interrupt (ATU5 timer D subblock 12 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
22	PIC2ADTEN6nj22	OCR1D122 compare match interrupt (ATU5 timer D subblock 12 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
21	PIC2ADTEN6nj21	OCR1D121 compare match interrupt (ATU5 timer D subblock 12 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
20	PIC2ADTEN6nj20	OCR1D120 compare match interrupt (ATU5 timer D subblock 12 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
19	PIC2ADTEN6nj19	OCR1D113 compare match interrupt (ATU5 timer D subblock 11 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
18	PIC2ADTEN6nj18	OCR1D112 compare match interrupt (ATU5 timer D subblock 11 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
17	PIC2ADTEN6nj17	OCR1D111 compare match interrupt (ATU5 timer D subblock 11 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
16	PIC2ADTEN6nj16	OCR1D110 compare match interrupt (ATU5 timer D subblock 11 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
15	PIC2ADTEN6nj15	OCR1D63 compare match interrupt (ATU5 timer D subblock 6 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
14	PIC2ADTEN6nj14	OCR1D62 compare match interrupt (ATU5 timer D subblock 6 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
13	PIC2ADTEN6nj13	OCR1D61 compare match interrupt (ATU5 timer D subblock 6 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.

Table 35.17 PIC2ADTEN6nj Register Contents (3/3)

Bit Position	Bit Name	Function
12	PIC2ADTEN6nj12	OCR1D60 compare match interrupt (ATU5 timer D subblock 6 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
11	PIC2ADTEN6nj11	OCR1D43 compare match interrupt (ATU5 timer D subblock 4 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
10	PIC2ADTEN6nj10	OCR1D42 compare match interrupt (ATU5 timer D subblock 4 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
9	PIC2ADTEN6nj9	OCR1D41 compare match interrupt (ATU5 timer D subblock 4 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
8	PIC2ADTEN6nj8	OCR1D40 compare match interrupt (ATU5 timer D subblock 4 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
7	PIC2ADTEN6nj7	OCR1D23 compare match interrupt (ATU5 timer D subblock 2 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
6	PIC2ADTEN6nj6	OCR1D22 compare match interrupt (ATU5 timer D subblock 2 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
5	PIC2ADTEN6nj5	OCR1D21 compare match interrupt (ATU5 timer D subblock 2 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
4	PIC2ADTEN6nj4	OCR1D20 compare match interrupt (ATU5 timer D subblock 2 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
3	PIC2ADTEN6nj3	OCR1D03 compare match interrupt (ATU5 timer D subblock 0 channel 3 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
2	PIC2ADTEN6nj2	OCR1D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
1	PIC2ADTEN6nj1	OCR1D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
0	PIC2ADTEN6nj0	OCR1D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match A interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.

35.3.2.6 PIC2ADTEN7nj — AD Converter Trigger Output Control Register 7nj (n = 0 to 3; j = 0 to 4)

The PIC2ADTEN7nj register enables a trigger source from ATU timer D compare match B to be selected as an ADCH trigger (n = 0 to 3; j = 0 to 4).

2	PIC2ADTEN7nj2	OCR2D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match B interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
1	PIC2ADTEN7nj1	OCR2D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match B interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
0	PIC2ADTEN7nj0	OCR2D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match B interrupt) 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.

35.3.2.7 PIC2ADTEN8nj — AD Converter Trigger Output Control Register 8nj (n = 0 to 3; j = 0 to 4)

The PIC2ADTEN8nj register enables a trigger source from GTM (by set output in A/D converter trigger output configuration register) and ENCA interrupts to be selected as an ADCH trigger (n = 0 to 3; j = 0 to 4).

Table 35.19 PIC2ADTEN8nj Register Contents (2/3)

Bit Position	Bit Name	Function
25 to 20	—	Reserved When writing to these bits, write 0.
19	PIC2ADTEN8nj19	Output value of GTM timer output selected by PIC2ADTCFG4 bits 31 to 24. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
18	PIC2ADTEN8nj18	Output value of GTM timer output selected by PIC2ADTCFG4 bits 23 to 16. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
17	PIC2ADTEN8nj17	Output value of GTM timer output selected by PIC2ADTCFG4 bits 15 to 8. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
16	PIC2ADTEN8nj16	Output value of GTM timer output selected by PIC2ADTCFG4 bits 7 to 0. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
15	PIC2ADTEN8nj15	Output value of GTM timer output selected by PIC2ADTCFG3 bits 31 to 24. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
14	PIC2ADTEN8nj14	Output value of GTM timer output selected by PIC2ADTCFG3 bits 23 to 16. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
13	PIC2ADTEN8nj13	Output value of GTM timer output selected by PIC2ADTCFG3 bits 15 to 8. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
12	PIC2ADTEN8nj12	Output value of GTM timer output selected by PIC2ADTCFG3 bits 7 to 0. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
11	PIC2ADTEN8nj11	Output value of GTM timer output selected by PIC2ADTCFG2 bits 31 to 24. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
10	PIC2ADTEN8nj10	Output value of GTM timer output selected by PIC2ADTCFG2 bits 23 to 16. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
9	PIC2ADTEN8nj9	Output value of GTM timer output selected by PIC2ADTCFG2 bits 15 to 8. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
8	PIC2ADTEN8nj8	Output value of GTM timer output selected by PIC2ADTCFG2 bits 7 to 0. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
7	PIC2ADTEN8nj7	Output value of GTM timer output selected by PIC2ADTCFG1 bits 31 to 24. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
6	PIC2ADTEN8nj6	Output value of GTM timer output selected by PIC2ADTCFG1 bits 23 to 16. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.

Table 35.19 PIC2ADTEN8nj Register Contents (3/3)

Bit Position	Bit Name	Function
5	PIC2ADTEN8nj5	Output value of GTM timer output selected by PIC2ADTCFG1 bits 15 to 8. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
4	PIC2ADTEN8nj4	Output value of GTM timer output selected by PIC2ADTCFG1 bits 7 to 0. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
3	PIC2ADTEN8nj3	Output value of GTM timer output selected by PIC2ADTCFG0 bits 31 to 24. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
2	PIC2ADTEN8nj2	Output value of GTM timer output selected by PIC2ADTCFG0 bits 23 to 16. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
1	PIC2ADTEN8nj1	Output value of GTM timer output selected by PIC2ADTCFG0 bits 15 to 8. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.
0	PIC2ADTEN8nj0	Output value of GTM timer output selected by PIC2ADTCFG0 bits 7 to 0. 0: Selection of the above signal as an ADCH trigger is disabled. 1: Selection of the above signal as an ADCH trigger is enabled.

35.3.2.8 PIC2DSADTEN0n0 — DSADC Start Trigger Output Control Register n0 (n = 0 to 9)

DSADC start trigger output control register n0 enables a trigger source from ATU timer C compare match and ATU timer G compare match to be selected as a trigger for starting DSADC.

(n=0 DSADC00, n=1 DSADC10, n=2 DSADC20, n=3 DSADC12, n=4 DSADC13, n=5 DSADC11, n=6 DSADC15, n=7 DSADC14, n=8 DSADC22, n=9 DSADC21)

Bit Position	Bit Name	Function
31	PIC2DSADTEN0n031	OCRC133 capture / compare match interrupt (ATU5 timer C subblock 13 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
30	PIC2DSADTEN0n030	OCRC132 capture / compare match interrupt (ATU5 timer C subblock 13 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
29	PIC2DSADTEN0n029	OCRC131 capture / compare match interrupt (ATU5 timer C subblock 13 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
28	PIC2DSADTEN0n028	OCRC130 capture / compare match interrupt (ATU5 timer C subblock 13 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
27	PIC2DSADTEN0n027	OCRC123 capture / compare match interrupt (ATU5 timer C subblock 12 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
26	PIC2DSADTEN0n026	OCRC122 capture / compare match interrupt (ATU5 timer C subblock 12 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
25	PIC2DSADTEN0n025	OCRC121 capture / compare match interrupt (ATU5 timer C subblock 12 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.

Table 35.20 PIC2DSADTEN0n0 Register Contents (2/3)

Bit Position	Bit Name	Function
24	PIC2DSADTEN0n024	OCRC120 capture / compare match interrupt (ATU5 timer C subblock 12 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
23	PIC2DSADTEN0n023	OCRC113 capture / compare match interrupt (ATU5 timer C subblock 11 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
22	PIC2DSADTEN0n022	OCRC112 capture / compare match interrupt (ATU5 timer C subblock 11 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
21	PIC2DSADTEN0n021	OCRC111 capture / compare match interrupt (ATU5 timer C subblock 11 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
20	PIC2DSADTEN0n020	OCRC110 capture / compare match interrupt (ATU5 timer C subblock 11 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
19	PIC2DSADTEN0n019	OCRC103 capture / compare match interrupt (ATU5 timer C subblock 10 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
18	PIC2DSADTEN0n018	OCRC102 capture / compare match interrupt (ATU5 timer C subblock 10 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
17	PIC2DSADTEN0n017	OCRC101 capture / compare match interrupt (ATU5 timer C subblock 10 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
16	PIC2DSADTEN0n016	OCRC100 capture / compare match interrupt (ATU5 timer C subblock 10 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
15	PIC2DSADTEN0n015	OCRG7 compare match interrupt (ATU5 timer G subblock 7) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
14	PIC2DSADTEN0n014	OCRG6 compare match interrupt (ATU5 timer G subblock 6) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
13	PIC2DSADTEN0n013	OCRG5 compare match interrupt (ATU5 timer G subblock 5) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
12	PIC2DSADTEN0n012	OCRG4 compare match interrupt (ATU5 timer G subblock 4) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
11	PIC2DSADTEN0n011	OCRG3 compare match interrupt (ATU5 timer G subblock 3) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.

Table 35.20 PIC2DSADTEN0n0 Register Contents (3/3)

Bit Position	Bit Name	Function
10	PIC2DSADTEN0n010	OCRG2 compare match interrupt (ATU5 timer G subblock 2) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
9	PIC2DSADTEN0n09	OCRG1 compare match interrupt (ATU5 timer G subblock 1) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
8	PIC2DSADTEN0n08	OCRG0 compare match interrupt (ATU5 timer G subblock 0) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
7	PIC2DSADTEN0n07	OCRC93 capture / compare match interrupt (ATU5 timer C subblock 9 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
6	PIC2DSADTEN0n06	OCRC92 capture / compare match interrupt (ATU5 timer C subblock 9 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
5	PIC2DSADTEN0n05	OCRC91 capture / compare match interrupt (ATU5 timer C subblock 9 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
4	PIC2DSADTEN0n04	OCRC90 capture / compare match interrupt (ATU5 timer C subblock 9 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
3	PIC2DSADTEN0n03	OCRC83 capture / compare match interrupt (ATU5 timer C subblock 8 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
2	PIC2DSADTEN0n02	OCRC82 capture / compare match interrupt (ATU5 timer C subblock 8 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
1	PIC2DSADTEN0n01	OCRC81 capture / compare match interrupt (ATU5 timer C subblock 8 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
0	PIC2DSADTEN0n00	OCRC80 capture / compare match interrupt (ATU5 timer C subblock 8 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.

35.3.2.9 PIC2DSADTEN0n1 — DSADC Start Trigger Output Control Register n1 (n = 0 to 9)

DSADC start trigger output control register n1 enables a trigger source from ATU timer D compare match A to be selected as a trigger for starting DSADC.

(n=0 DSADC00, n=1 DSADC10, n=2 DSADC20, n=3 DSADC12, n=4 DSADC13, n=5 DSADC11, n=6 DSADC15, n=7 DSADC14, n=8 DSADC22, n=9 DSADC21)

29	PIC2DSADTEN0n229	OCR2D141 compare match interrupt (ATU5 timer D subblock 14 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
28	PIC2DSADTEN0n228	OCR2D140 compare match interrupt (ATU5 timer D subblock 14 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
27	PIC2DSADTEN0n227	OCR2D133 compare match interrupt (ATU5 timer D subblock 13 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
26	PIC2DSADTEN0n226	OCR2D132 compare match interrupt (ATU5 timer D subblock 13 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
25	PIC2DSADTEN0n225	OCR2D131 compare match interrupt (ATU5 timer D subblock 13 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.

Table 35.22 PIC2DSADTEN0n2 Register Contents (2/3)

Bit Position	Bit Name	Function
24	PIC2DSADTEN0n224	OCR2D130 compare match interrupt (ATU5 timer D subblock 13 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
23	PIC2DSADTEN0n223	OCR2D123 compare match interrupt (ATU5 timer D subblock 12 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
22	PIC2DSADTEN0n222	OCR2D122 compare match interrupt (ATU5 timer D subblock 12 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
21	PIC2DSADTEN0n221	OCR2D121 compare match interrupt (ATU5 timer D subblock 12 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
20	PIC2DSADTEN0n220	OCR2D120 compare match interrupt (ATU5 timer D subblock 12 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
19	PIC2DSADTEN0n219	OCR2D113 compare match interrupt (ATU5 timer D subblock 11 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
18	PIC2DSADTEN0n218	OCR2D112 compare match interrupt (ATU5 timer D subblock 11 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
17	PIC2DSADTEN0n217	OCR2D111 compare match interrupt (ATU5 timer D subblock 11 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
16	PIC2DSADTEN0n216	OCR2D110 compare match interrupt (ATU5 timer D subblock 11 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
15	PIC2DSADTEN0n215	OCR2D63 compare match interrupt (ATU5 timer D subblock 6 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
14	PIC2DSADTEN0n214	OCR2D62 compare match interrupt (ATU5 timer D subblock 6 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
13	PIC2DSADTEN0n213	OCR2D61 compare match interrupt (ATU5 timer D subblock 6 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
12	PIC2DSADTEN0n212	OCR2D60 compare match interrupt (ATU5 timer D subblock 6 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.

Table 35.22 PIC2DSADTEN0n2 Register Contents (3/3)

Bit Position	Bit Name	Function
11	PIC2DSADTEN0n211	OCR2D43 compare match interrupt (ATU5 timer D subblock 4 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
10	PIC2DSADTEN0n210	OCR2D42 compare match interrupt (ATU5 timer D subblock 4 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
9	PIC2DSADTEN0n29	OCR2D41 compare match interrupt (ATU5 timer D subblock 4 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
8	PIC2DSADTEN0n28	OCR2D40 compare match interrupt (ATU5 timer D subblock 4 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
7	PIC2DSADTEN0n27	OCR2D23 compare match interrupt (ATU5 timer D subblock 2 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
6	PIC2DSADTEN0n26	OCR2D22 compare match interrupt (ATU5 timer D subblock 2 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
5	PIC2DSADTEN0n25	OCR2D21 compare match interrupt (ATU5 timer D subblock 2 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
4	PIC2DSADTEN0n24	OCR2D20 compare match interrupt (ATU5 timer D subblock 2 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
3	PIC2DSADTEN0n23	OCR2D03 compare match interrupt (ATU5 timer D subblock 0 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
2	PIC2DSADTEN0n22	OCR2D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
1	PIC2DSADTEN0n21	OCR2D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.
0	PIC2DSADTEN0n20	OCR2D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn start trigger is disabled. 1: Selection of the above signal as a DSADCn start trigger is enabled.

35.3.2.11 PIC2DSADTEN0n3 — DSADC Start Trigger Output Control Register n3 (n = 0 to 9)

- When Option Byte 35 to 32 Bit Arrangement OPBT8.ATU_GTM_SEL=0 (ATU: disable, GTM:enable)

DSADC start trigger output control register n3 enables a trigger source from GTM and ENCA to be selected as a trigger for starting DSADC. Whether enabled trigger source is used or not is defined by set timer output in DSADC Start / Stop trigger output configuration register.

(n=0 DSADC00, n=1 DSADC10, n=2 DSADC20, n=3 DSADC12, n=4 DSADC13, n=5 DSADC11, n=6 DSADC15, n=7 DSADC14, n=8 DSADC22, n=9 DSADC21)

Table 35.26 PIC2DSADTEN1n2 Register Contents (3/3)

Bit Position	Bit Name	Function
12	PIC2DSADTEN1n212	OCR2D60 compare match interrupt (ATU5 timer D subblock 6 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
11	PIC2DSADTEN1n211	OCR2D43 compare match interrupt (ATU5 timer D subblock 4 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
10	PIC2DSADTEN1n210	OCR2D42 compare match interrupt (ATU5 timer D subblock 4 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
9	PIC2DSADTEN1n29	OCR2D41 compare match interrupt (ATU5 timer D subblock 4 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
8	PIC2DSADTEN1n28	OCR2D40 compare match interrupt (ATU5 timer D subblock 4 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
7	PIC2DSADTEN1n27	OCR2D23 compare match interrupt (ATU5 timer D subblock 2 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
6	PIC2DSADTEN1n26	OCR2D22 compare match interrupt (ATU5 timer D subblock 2 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
5	PIC2DSADTEN1n25	OCR2D21 compare match interrupt (ATU5 timer D subblock 2 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
4	PIC2DSADTEN1n24	OCR2D20 compare match interrupt (ATU5 timer D subblock 2 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
3	PIC2DSADTEN1n23	OCR2D03 compare match interrupt (ATU5 timer D subblock 0 channel 3 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
2	PIC2DSADTEN1n22	OCR2D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
1	PIC2DSADTEN1n21	OCR2D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.
0	PIC2DSADTEN1n20	OCR2D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match B interrupt) 0: Selection of the above signal as a DSADCn end trigger is disabled. 1: Selection of the above signal as a DSADCn end trigger is enabled.

35.3.2.15 PIC2DSADTEN1n3 — DSADC Stop Trigger Output Control Register n3 (n = 0 to 9)

- When Option Byte 35 to 32 Bit Arrangement OPBT8.ATU_GTM_SEL=0 (ATU: disable, GTM:enable)

DSADC stop trigger output control register n3 enables a trigger source from GTM and ENCA encoder to be selected as a trigger for stopping DSADC. Whether enabled trigger source is used or not is defined by set timer output in DSADC Start / Stop trigger output configuration register.

(n=0 DSADC00, n=1 DSADC10, n=2 DSADC20, n=3 DSADC12, n=4 DSADC13, n=5 DSADC11, n=6 DSADC15, n=7 DSADC14, n=8 DSADC22, n=9 DSADC21)

27	PIC2CADTEN00027	OCRC123 capture / compare match interrupt (ATU5 timer C subblock 12 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
26	PIC2CADTEN00026	OCRC122 capture / compare match interrupt (ATU5 timer C subblock 12 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
25	PIC2CADTEN00025	OCRC121 capture / compare match interrupt (ATU5 timer C subblock 12 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

Table 35.31 PIC2CADTEN000 Register Contents (2/3)

Bit Position	Bit Name	Function
24	PIC2CADTEN00024	OCRC120 capture / compare match interrupt (ATU5 timer C subblock 12 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
23	PIC2CADTEN00023	OCRC113 capture / compare match interrupt (ATU5 timer C subblock 11 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
22	PIC2CADTEN00022	OCRC112 capture / compare match interrupt (ATU5 timer C subblock 11 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
21	PIC2CADTEN00021	OCRC111 capture / compare match interrupt (ATU5 timer C subblock 11 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
20	PIC2CADTEN00020	OCRC110 capture / compare match interrupt (ATU5 timer C subblock 11 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
19	PIC2CADTEN00019	OCRC103 capture / compare match interrupt (ATU5 timer C subblock 10 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
18	PIC2CADTEN00018	OCRC102 capture / compare match interrupt (ATU5 timer C subblock 10 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
17	PIC2CADTEN00017	OCRC101 capture / compare match interrupt (ATU5 timer C subblock 10 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
16	PIC2CADTEN00016	OCRC100 capture / compare match interrupt (ATU5 timer C subblock 10 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
15	PIC2CADTEN00015	OCRG7 compare match interrupt (ATU5 timer G subblock 7) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
14	PIC2CADTEN00014	OCRG6 compare match interrupt (ATU5 timer G subblock 6) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
13	PIC2CADTEN00013	OCRG5 compare match interrupt (ATU5 timer G subblock 5) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
12	PIC2CADTEN00012	OCRG4 compare match interrupt (ATU5 timer G subblock 4) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
11	PIC2CADTEN00011	OCRG3 compare match interrupt (ATU5 timer G subblock 3) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

Table 35.31 PIC2CADTEN000 Register Contents (3/3)

Bit Position	Bit Name	Function
10	PIC2CADTEN00010	OCRG2 compare match interrupt (ATU5 timer G subblock 2) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
9	PIC2CADTEN00009	OCRG1 compare match interrupt (ATU5 timer G subblock 1) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
8	PIC2CADTEN00008	OCRG0 compare match interrupt (ATU5 timer G subblock 0) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
7	PIC2CADTEN00007	OCRC93 capture / compare match interrupt (ATU5 timer C subblock 9 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
6	PIC2CADTEN00006	OCRC92 capture / compare match interrupt (ATU5 timer C subblock 9 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
5	PIC2CADTEN00005	OCRC91 capture / compare match interrupt (ATU5 timer C subblock 9 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
4	PIC2CADTEN00004	OCRC90 capture / compare match interrupt (ATU5 timer C subblock 9 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
3	PIC2CADTEN00003	OCRC83 capture / compare match interrupt (ATU5 timer C subblock 8 channel 3 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
2	PIC2CADTEN00002	OCRC82 capture / compare match interrupt (ATU5 timer C subblock 8 channel 2 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
1	PIC2CADTEN00001	OCRC81 capture / compare match interrupt (ATU5 timer C subblock 8 channel 1 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
0	PIC2CADTEN00000	OCRC80 capture / compare match interrupt (ATU5 timer C subblock 8 channel 0 capture / compare match interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

35.3.2.20 PIC2CADTEN001 — CADC Start Trigger Output Control Register 01

CADC start trigger output control register 01 enables a trigger source from ATU timer D compare match A to be selected as a trigger for starting CADC00.

Bit Position	Bit Name	Function
31	PIC2CADTEN00131	OCR1D143 compare match interrupt (ATU5 timer D subblock 14 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
30	PIC2CADTEN00130	OCR1D142 compare match interrupt (ATU5 timer D subblock 14 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
29	PIC2CADTEN00129	OCR1D141 compare match interrupt (ATU5 timer D subblock 14 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
28	PIC2CADTEN00128	OCR1D140 compare match interrupt (ATU5 timer D subblock 14 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
27	PIC2CADTEN00127	OCR1D133 compare match interrupt (ATU5 timer D subblock 13 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
26	PIC2CADTEN00126	OCR1D132 compare match interrupt (ATU5 timer D subblock 13 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
25	PIC2CADTEN00125	OCR1D131 compare match interrupt (ATU5 timer D subblock 13 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

Table 35.32 PIC2CADTEN001 Register Contents (2/3)

Bit Position	Bit Name	Function
24	PIC2CADTEN00124	OCR1D130 compare match interrupt (ATU5 timer D subblock 13 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
23	PIC2CADTEN00123	OCR1D123 compare match interrupt (ATU5 timer D subblock 12 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
22	PIC2CADTEN00122	OCR1D122 compare match interrupt (ATU5 timer D subblock 12 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
21	PIC2CADTEN00121	OCR1D121 compare match interrupt (ATU5 timer D subblock 12 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
20	PIC2CADTEN00120	OCR1D120 compare match interrupt (ATU5 timer D subblock 12 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
19	PIC2CADTEN00119	OCR1D113 compare match interrupt (ATU5 timer D subblock 11 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
18	PIC2CADTEN00118	OCR1D112 compare match interrupt (ATU5 timer D subblock 11 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
17	PIC2CADTEN00117	OCR1D111 compare match interrupt (ATU5 timer D subblock 11 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
16	PIC2CADTEN00116	OCR1D110 compare match interrupt (ATU5 timer D subblock 11 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
15	PIC2CADTEN00115	OCR1D63 compare match interrupt (ATU5 timer D subblock 6 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
14	PIC2CADTEN00114	OCR1D62 compare match interrupt (ATU5 timer D subblock 6 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
13	PIC2CADTEN00113	OCR1D61 compare match interrupt (ATU5 timer D subblock 6 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
12	PIC2CADTEN00112	OCR1D60 compare match interrupt (ATU5 timer D subblock 6 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

Table 35.32 PIC2CADTEN001 Register Contents (3/3)

Bit Position	Bit Name	Function
11	PIC2CADTEN00111	OCR1D43 compare match interrupt (ATU5 timer D subblock 4 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
10	PIC2CADTEN00110	OCR1D42 compare match interrupt (ATU5 timer D subblock 4 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
9	PIC2CADTEN00109	OCR1D41 compare match interrupt (ATU5 timer D subblock 4 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
8	PIC2CADTEN00108	OCR1D40 compare match interrupt (ATU5 timer D subblock 4 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
7	PIC2CADTEN00107	OCR1D23 compare match interrupt (ATU5 timer D subblock 2 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
6	PIC2CADTEN00106	OCR1D22 compare match interrupt (ATU5 timer D subblock 2 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
5	PIC2CADTEN00105	OCR1D21 compare match interrupt (ATU5 timer D subblock 2 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
4	PIC2CADTEN00104	OCR1D20 compare match interrupt (ATU5 timer D subblock 2 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
3	PIC2CADTEN00103	OCR1D03 compare match interrupt (ATU5 timer D subblock 0 channel 3 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
2	PIC2CADTEN00102	OCR1D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
1	PIC2CADTEN00101	OCR1D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
0	PIC2CADTEN00100	OCR1D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match A interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

35.3.2.21 PIC2CADTEN002 — CADC Start Trigger Output Control Register 02

CADC start trigger output control register 02 enables a trigger source from ATU timer D compare match B to be selected as a trigger for starting CADC00.

20	PIC2CADTEN00220	OCR2D120 compare match interrupt (ATU5 timer D subblock 12 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
19	PIC2CADTEN00219	OCR2D113 compare match interrupt (ATU5 timer D subblock 11 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
18	PIC2CADTEN00218	OCR2D112 compare match interrupt (ATU5 timer D subblock 11 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
17	PIC2CADTEN00217	OCR2D111 compare match interrupt (ATU5 timer D subblock 11 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
16	PIC2CADTEN00216	OCR2D110 compare match interrupt (ATU5 timer D subblock 11 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
15	PIC2CADTEN00215	OCR2D63 compare match interrupt (ATU5 timer D subblock 6 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
14	PIC2CADTEN00214	OCR2D62 compare match interrupt (ATU5 timer D subblock 6 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
13	PIC2CADTEN00213	OCR2D61 compare match interrupt (ATU5 timer D subblock 6 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
12	PIC2CADTEN00212	OCR2D60 compare match interrupt (ATU5 timer D subblock 6 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

Table 35.33 PIC2CADTEN002 Register Contents (3/3)

Bit Position	Bit Name	Function
11	PIC2CADTEN00211	OCR2D43 compare match interrupt (ATU5 timer D subblock 4 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
10	PIC2CADTEN00210	OCR2D42 compare match interrupt (ATU5 timer D subblock 4 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
9	PIC2CADTEN00209	OCR2D41 compare match interrupt (ATU5 timer D subblock 4 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
8	PIC2CADTEN00208	OCR2D40 compare match interrupt (ATU5 timer D subblock 4 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
7	PIC2CADTEN00207	OCR2D23 compare match interrupt (ATU5 timer D subblock 2 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
6	PIC2CADTEN00206	OCR2D22 compare match interrupt (ATU5 timer D subblock 2 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
5	PIC2CADTEN00205	OCR2D21 compare match interrupt (ATU5 timer D subblock 2 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
4	PIC2CADTEN00204	OCR2D20 compare match interrupt (ATU5 timer D subblock 2 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
3	PIC2CADTEN00203	OCR2D03 compare match interrupt (ATU5 timer D subblock 0 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
2	PIC2CADTEN00202	OCR2D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
1	PIC2CADTEN00201	OCR2D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
0	PIC2CADTEN00200	OCR2D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

35.3.2.22 PIC2CADTEN003 — CADC Start Trigger Output Control Register 03

- When Option Byte 35 to 32 Bit Arrangement OPBT8.ATU_GTM_SEL=0 (ATU: disable, GTM:enable)

CADC start trigger output control register 03 enables a trigger source from GTM and ENCA to be selected as a trigger for starting CADC00. Whether enabled trigger source is used or not is defined by set timer output in CADC Start / Stop trigger output configuration register.

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31	PIC2CADTEN00331	Selects the INTENCA1IEC as a trigger source of CADC00. (ENCA1 ENCATIEC Clear interrupt signal by encoder) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
30	PIC2CADTEN00330	Selects the INTENCA1I1 as a trigger source of CADC00. (ENCA1 ENCATINT1 Compare 1 match or Capture 1 interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
29	PIC2CADTEN00329	Selects the INTENCA1I0 as a trigger source of CADC00. (ENCA1 ENCATINT0 Compare 0 match or Capture 0 interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
28	PIC2CADTEN00328	Selects the INTENCA0IEC as a trigger source of CADC00. (ENCA0 ENCATIEC Clear interrupt signal by encoder) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
27	PIC2CADTEN00327	Selects the INTENCA0I1 as a trigger source of CADC00. (ENCA0 ENCATINT1 Compare 1 match or Capture 1 interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
26	PIC2CADTEN00326	Selects the INTENCA0I0 as a trigger source of CADC00. (ENCA0 ENCATINT0 Compare 0 match or Capture 0 interrupt) 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
25 to 2	—	Reserved When writing to these bits, write 0.

Table 35.34 PIC2CADTEN003 Register Contents (2/5)

Bit Position	Bit Name	Function
1	PIC2CADTEN0031	Output value of GTM timer output selected by PIC2CADTCFG0 bits 15 to 8 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.
0	PIC2CADTEN0030	Output value of GTM timer output selected by PIC2CADTCFG0 bit 7 to 0 0: Selection of the above signal as a CADC00 start trigger is disabled. 1: Selection of the above signal as a CADC00 start trigger is enabled.

- When Option Byte 35 to 32 Bit Arrangement OPBT8.ATU_GTM_SEL=1 (ATU: enable, GTM:disable)

CADC start trigger output control register 03 enables a trigger source from ATU timer C compare match to be selected as a trigger for starting CADC00. Whether enabled trigger source is used or not is defined by set timer output in CADC Start / Stop trigger output configuration register.

7	PIC2CADTEN10207	OCR2D23 compare match interrupt (ATU5 timer D subblock 2 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
6	PIC2CADTEN10206	OCR2D22 compare match interrupt (ATU5 timer D subblock 2 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
5	PIC2CADTEN10205	OCR2D21 compare match interrupt (ATU5 timer D subblock 2 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
4	PIC2CADTEN10204	OCR2D20 compare match interrupt (ATU5 timer D subblock 2 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
3	PIC2CADTEN10203	OCR2D03 compare match interrupt (ATU5 timer D subblock 0 channel 3 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
2	PIC2CADTEN10202	OCR2D02 compare match interrupt (ATU5 timer D subblock 0 channel 2 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
1	PIC2CADTEN10201	OCR2D01 compare match interrupt (ATU5 timer D subblock 0 channel 1 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.
0	PIC2CADTEN10200	OCR2D00 compare match interrupt (ATU5 timer D subblock 0 channel 0 compare match B interrupt) 0: Selection of the above signal as a CADC00 end trigger is disabled. 1: Selection of the above signal as a CADC00 end trigger is enabled.

35.3.2.26 PIC2CADTEN103 — CADC Stop Trigger Output Control Register 03

- When Option Byte 35 to 32 Bit Arrangement OPBT8.ATU_GTM_SEL=0 (ATU: disable, GTM:enable)

CADC stop trigger output control register 03 enables trigger source from GTM and ENCA to be selected as a trigger for stopping CADC00. Whether enabled trigger source is used or not is defined by set timer output in CADC Start / Stop trigger output configuration register.

Value after reset: 0000 0000_H

7 to 2	—	Reserved When writing to these bits, write 0.
1 to 0	PIC2ENCAISEN0[1:0]	Selects the input pins (ENCA _n E0, ENCA _n E1, ENCA _n EC) of ENCA _n timer. (n = 0 to 1) 00: Series connection 01: Parallel connection 10: Cascade connection 11: Reserved

35.3.3 Function

35.3.3.1 ADCH Trigger Selection Function

Each of 5 ADCH_n*¹ scan groups can be triggered by a hardware trigger.

Trigger signals from ATU or GTM selected by ADCH_nTSEL_m are ORed with trigger signal from external pin ADTRG before they are mapped to ADCH scan group hardware triggers.

Note 1. E2xFCC2: (n = 0 to 3), E2UH: (n = 0 to 3), E2H: (n = 0 to 3)

NOTE

One external ADTRG pin is mapped to all ADCH scan groups.

- ATU Trigger Selection

Hardware triggers for each scan group in each ADCH_n*¹ can be generated from 16 sources of ATU timer C compare match, 32 sources of ATU timer D compare match A, 32 sources of ATU timer D compare match B, 8 sources of ATU timer G compare match, and 1 source of ATU DMA switch function. Total of 20 ADCH scan group triggers can be mapped to ATU outputs.

Note 1. E2xFCC2: (n = 0 to 3), E2UH: (n = 0 to 3), E2H: (n = 0 to 3)

Figure 35.4 Block Diagram of Trigger Selection for ADCH_n Scan Group j in ATU Configuration

- GTM Trigger Selection

Hardware triggers for each scan groups in each ADCHn*¹ can be generated from GTM TOM[i]_CH[n]*² and ATOM[j]_CH[m]*³.

PIC2 detects only the rising edge from the above GTM signals and generates a pulse at the time. Each pulse is used as the trigger source for each ADCHn instead of the above GTM signals.

Therefore, to use falling edges of the above GTM signals to trigger the ADCHn scan group, select the rising edge detection by the PIC2ADCHnEDGSEL register, and generate a pulse at the falling edge with reference to one of the examples shown below.

- Invert the polarity of the GTM signal in the GTM, and select the inverted signal as the trigger source in the PIC2.
- Use the DTM in the GTM to generate a pulse synchronized with the falling edge of the GTM signal.

When using both rising and falling edges to trigger the ADCHn scan group, choose one of the following options:

- Generate the trigger pulses at the rising edge and the falling edge individually and merge them by using the PIC2.
- Generate the pulses at both edges by the DTM in the GTM.

Note 1. E2xFCC2: (n = 0 to 3), E2UH: (n = 0 to 3), E2H: (n = 0 to 3)

Note 2. E2xFCC2: (i = 0 to 5, n = 0 to 15), E2UH: (i = 0 to 5, n = 0 to 15), E2H: (i = 0 to 4, n = 0 to 15)

Note 3. E2xFCC2: (j = 0 to 9, m = 0 to 7), E2UH: (j = 0 to 9, m = 0 to 7), E2H: (j = 0 to 8, m = 0 to 7)

Figure 35.5 Block Diagram of Trigger Selection for ADCHn Scan Group j in GTM Configuration

35.3.3.2 DSADC Trigger Selection Function

DSADC has hardware triggers for start and stop. ATU or GTM outputs and external pin DSADTRGn are ORed before they are mapped to DSADC hardware triggers.

DSADC has hardware triggers for the read gate function. GTM outputs can be mapped to DSADC hardware read gate triggers. In this case GTM outputs are multiplexed.

- ATU trigger selection

Hardware triggers for each DSADC channel can be generated from 24 sources of ATU timer C OCRC compare match, 24 sources of ATU timer C GCR compare match, 32 sources of ATU timer D compare match A, 32 sources of ATU timer D compare match B, and 8 sources of ATU timer G compare match.

Figure 35.6 Block Diagram of Trigger Selection Function for DSADCn in ATU Configuration

• GTM trigger selection

Hardware triggers for each DSADC channel can be generated from GTM TOM[i]_CH[n]*¹ and ATOM[j]_CH[m]*².

Note 1. E2xFCC2: (i = 0 to 5, n = 0 to 15), E2UH: (i = 0 to 5, n = 0 to 15), E2H: (i = 0 to 4, n = 0 to 15)

Note 2. E2xFCC2: (j = 0 to 9, m = 0 to 7), E2UH: (j = 0 to 9, m = 0 to 7), E2H: (j = 0 to 8, m = 0 to 7)

Figure 35.7 Block Diagram of Trigger Selection Function for DSADCn in GTM Configuration

35.3.3.3 CADC Trigger Selection Function

CADC has hardware triggers for start and stop. ATU or GTM signals and external pin CADTRG00 are ORed before result is input to CADC hardware triggers.

CADC has hardware triggers for the read gate function. GTM outputs can be mapped to CADC hardware read gate triggers. In this case GTM outputs are multiplexed.

- ATU trigger selection

Hardware triggers for each CADC channel can be generated from 24 sources of ATU timer C OCRC compare match, 24 sources of ATU timer C GCR compare match, 32 sources of ATU timer D compare match A, 32 sources of ATU timer D compare match B, and 8 sources of ATU timer G compare match.

Figure 35.8 Block Diagram of Trigger Selection Function for CADC00 in ATU Configuration

• GTM Trigger selection

Hardware triggers for each CADC channel can be generated from GTM TOM[i]_CH[n]*¹ and ATOM[j]_CH[m]*²

Note 1. E2xFCC2: (i = 0 to 5, n = 0 to 15), E2UH: (i = 0 to 5, n = 0 to 15), E2H: (i = 0 to 4, n = 0 to 15)

Note 2. E2xFCC2: (j = 0 to 9, m = 0 to 7), E2UH: (j = 0 to 9, m = 0 to 7), E2H: (j = 0 to 8, m = 0 to 7)

Figure 35.9 Block Diagram of Trigger Selection Function for CADC00 in GTM Configuration

35.3.3.4 ENCA Trigger Selection Function

ENCA has the trigger which captures the encoder counter value to a capture register. It's possible to map GTM output to capture trigger of ENCA. In this case GTM outputs are multiplexed.

- GTM Trigger selection

ENCA trigger can be generated from the GTM TOM[i]_CH[n]*¹, ATOM[j]_CH[m]*² and TIM[k]_IRQ[p]*³.

PIC2 detects only the rising edge from the above GTM signals and generates a pulse at the time. Each pulse is used as the trigger source for each ENCA_n instead of the above TOM and ATOM signals.

Therefore, to use falling edges of the above TOM or ATOM signals to capture the encoder counter value, select the rising edge detection by the ENCA_nIOC0 register, and generate a pulse at the falling edge with reference to one of the examples shown below.

- Invert the polarity of the TOM or ATOM signal in the GTM, and select the inverted signal as the trigger source in the PIC2.
- Use the DTM in the GTM to generate a pulse synchronized with the falling edge of the GTM signal.
- Use a TIM in the GTM, route the TOM or ATOM signal to the TIM auxiliary input (TIM_AUX_IN), and generate an interrupt pulse (TIM[k]_IRQ[p]) by detecting the falling edge of the TOM or ATOM signal with the TIM.

When using both rising and falling edges to capture the encoder counter value, choose one of the following options:

- Generate the trigger pulses at the rising edge and the falling edge individually and merge them by using the PIC2.
- Generate the pulses at both edges by the DTM from the TOM or ATOM signals.
- Generate TIM interrupts at the rising and falling edges of TOM or ATOM signals.

Note 1. E2xFCC2: (i = 0 to 5, n = 0 to 15), E2UH: (i = 0 to 5, n = 0 to 15), E2H: (i = 0 to 4, n = 0 to 15)

Note 2. E2xFCC2: (j = 0 to 9, m = 0 to 7), E2UH: (j = 0 to 9, m = 0 to 7), E2H: (j = 0 to 8, m = 0 to 7)

Note 3. E2xFCC2: (k = 0 to 7, p = 0 to 7), E2UH: (k = 0 to 7, p = 0 to 7), E2H: (k = 0 to 7, p = 0 to 7)

Figure 35.10 Block Diagram of Trigger Selection Function of ENCA

35.3.3.5 DFE Trigger Selection Function

DFE has a comparing timer trigger, a filter result capture trigger and an FIFO capture trigger. GTM outputs can be mapped to each DFE trigger. GTM outputs in this case are multiplexed.

- GTM Trigger selection

DFE triggers can be generated for each DFE channel from the GTM TOM[i]_CH[n]*¹ and ATOM[j]_CH[m]*²

Note 1. E2xFCC2: (i = 0 to 5, n = 0 to 15), E2UH: (i = 0 to 5, n = 0 to 15), E2H: (i = 0 to 4, n = 0 to 15)

Note 2. E2xFCC2: (j = 0 to 9, m = 0 to 7), E2UH: (j = 0 to 9, m = 0 to 7), E2H: (j = 0 to 8, m = 0 to 7)

Figure 35.11 Block Diagram of Trigger Selection Function of DFE

35.3.3.6 PSI5-S Timestamp and the Sync Pulse Signal Selection Function

PSI5-S has Time stamp and Sync Pulse Generation. GTM outputs can be mapped to Time stamp (clock, enable, clear) and Sync Pulse of PSI5-S. GTM outputs in this case are multiplexed.

- GTM Trigger selection

PSI5-S time stamp trigger and sync pulse can be generated from GTM TOM[i]_CH[n]*¹ and ATOM[j]_CH[m]*²

Note 1. E2xFCC2: (i = 0 to 5, n = 0 to 15), E2UH: (i = 0 to 5, n = 0 to 15), E2H: (i = 0 to 4, n = 0 to 15)

Note 2. E2xFCC2: (j = 0 to 9, m = 0 to 7), E2UH: (j = 0 to 9, m = 0 to 7), E2H: (j = 0 to 8, m = 0 to 7)

Figure 35.12 Block Diagram of Trigger Selection Function of PSI5-S

35.3.3.7 GTM Timer Input (TIM) Selection Function

Source of GTM Timer Input signals for TIM[i] (i: 0 to 7) can be selected from the following:

- PORT
It's possible to select the GTM timer input chosen in GPIO. (Defaults)
- ADCH
It's possible to select AD conversion end interrupt as timer input of GTM.
- DSADC
It's possible to select AD conversion update interrupt as timer input of GTM.
- CADC
It's possible to select AD conversion update interrupt as timer input of GTM.
- ENCA
It's possible to select count clock output and direction of rotation notifications from encoder inputs (phase A, phase B, phase Z) and compare capture interrupt and phase Z edge detection as timer input of GTM.
- DFE
It's possible to select peak hold renewal notice of a filter result as timer input of GTM.

Figure 35.13 Block Diagram of Trigger Selection Function of GTM

35.3.3.8 ENCA Encoder Input Selection

It's possible to select encoder inputs of an encoder timer (phase A, phase B, phase Z) to ENCA_n.

Encoder inputs can be selected for a series, parallel or cascade connection.

Figure 35.14 Block Diagram of ENCA Encoder Input Selection Function

Section 36 Analog to Digital Converter (ADCH)

This section contains a description of the A/D Converter (ADCH).

The first part of this section describes all of this products specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ADCH.

36.1 Features

36.1.1 Number of Units and Channels

This microcontroller has the following number of ADCH units.

Table 36.1 Number of Units

Product Name	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
Number of ADCH Units	4	4
Name of ADCH Units	ADCHn (n = 0 to 3)	
Number of IFC Units	2	2
Name of IFC Units	IFCu (u = 0, 1)	
Number of ASF Units	1	1
Name of ASF Units	ASF _r (r = 0)	
Number of AVSEG Units	1	1
Name of AVSEG Units	AVSEG	
Number of ABFG Units	1	1
Name of ABFG Units	ABFG	
Number of AIR Units	1	1
Name of AIR Units	AIR	

An ADCH_n unit has the same number of physical channels as the number of A/D input pins and the same number of virtual channels as the number of addresses where the results of A/D conversion will be stored. The numbers of channels on individual products are listed below.

Table 36.2 Unit Configurations and Physical Channels

Unit Name(Number of Channels)		RH850/E2x-FCC2, E2UH, E2H	
		373 Pins	468 Pins
ADCH0	Dedicated inputs	20	20
ADCH1	Dedicated inputs	12	12
ADCH0, 1	Shared inputs	8	8
ADCH2	Dedicated inputs	20	24
ADCH3	Dedicated inputs	12	24
ADCH2, 3	Shared inputs	8	8

Table 36.3 Unit Configurations and Virtual Channels

Unit Name (Number of Channels)	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
ADCH0	40	40
ADCH1	40	40
ADCH2	40	40
ADCH3	40	40

Floating-point data register 0j and 2j of an IFC0 unit has the same number of virtual channels with ADCH0 and ADCH2.

Floating-point data register 1j and 3j of an IFC1 unit has the same number of virtual channels with ADCH1 and ADCH3.

An ASFr unit has the same number of channels.

Table 36.4 Unit Configurations and Channels of ASF

Unit Name (Number of Channels)	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
ASF0	16	16

An ABFG unit has the same number of boundary flags.

Table 36.5 Unit Configurations and Boundary Flags of ABFG

Unit Name	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
ABFG	48	48

Table 36.6 Indices

Index	Description
n	Throughout this section, the individual ADCH units are identified by the index "n" (n = 0 to 3); for example, ADCHnADHALTR indicates the A/D force halt register.
p	Throughout this section, the individual physical channel groups (channel group in the unit) of ADCHn are identified by the index "p"; for example, ANnpq.
q	Throughout this section, the individual physical sub channels (sub channel in the unit) of ADCHn are identified by the index "q"; for example, ANnpq.
j	Throughout this section, the individual virtual channels of ADCHn are identified by the index "j"; for example, ADCHnVCRj indicates the virtual channel register
x	Throughout this section, the individual scan groups (SG) of ADCHn are identified by the index "x" (x = 0 to 4); for example, ADCHnSGSTCRx indicates the scan group x start control register.
y	Throughout this section, the individual A/D timers of ADCHn are identified by the index "y" (y = 3 to 4); for example, ADCHnADTSTCRy indicates the A/D timer y start control register.
u	Throughout this section, the individual IFC units are identified by the index "u" (u = 0 to 1)
r	Throughout this section, the individual ASF units are identified by the index "r" (r = 0); for example, ASFrDRi indicates the Accumulation data register i.
i	Throughout this section, the individual ASF units are identified by the index "i"; for example, ASFrDRi indicates the Accumulation data register i.
w	Throughout this section, the individual boundary flags of ABFG are identified by the index "w"; for example, ABFGBFGCRw indicates the Input boundary flag control register w.

Table 36.7 Indices of Products

Indices of Each Product	
RH850/E2x-FCC2, E2UH, E2H 373 Pins	RH850/E2x-FCC2, E2UH, E2H 468 Pins
p = 0 to 6 (ADCH0) p = 0 to 4 (ADCH1) p = 0 to 6 (ADCH2) p = 0 to 4 (ADCH3)	p = 0 to 6 (ADCH0) p = 0 to 4 (ADCH1) p = 0 to 7 (ADCH2) p = 0 to 7 (ADCH3)
q = 0 to 3 (ADCH0) q = 0 to 3 (ADCH1) q = 0 to 3 (ADCH2) q = 0 to 3 (ADCH3)	q = 0 to 3 (ADCH0) q = 0 to 3 (ADCH1) q = 0 to 3 (ADCH2) q = 0 to 3 (ADCH3)
j = 0 to 39 (ADCH0) j = 0 to 39 (ADCH1) j = 0 to 39 (ADCH2) j = 0 to 39 (ADCH3)	j = 0 to 39 (ADCH0) j = 0 to 39 (ADCH1) j = 0 to 39 (ADCH2) j = 0 to 39 (ADCH3)
x = 0 to 4	x = 0 to 4
y = 3 to 4	y = 3 to 4
i = 0 to 15 (ASF0)	i = 0 to 15 (ASF0)
w = 0 to 47 (ABFG)	w = 0 to 47 (ABFG)

36.1.2 Register Base Address

The ADCH_n base addresses are listed in the following table.

The ADCH_n register addresses are given as offsets from the base address.

Table 36.8 Register Base Address

Base Address Name	Base Address	Bus Group
<ADCH0_base>	FFF2 0000 _H	Peripheral Group 7
<ADCH2_base>	FFF2 1000 _H	Peripheral Group 7
<ASF0_base>	FFF2 2000 _H	Peripheral Group 7
<IFC0_base>	FFF2 3000 _H	Peripheral Group 7
<ADCH1_base>	FFF2 8000 _H	Peripheral Group 8
<ADCH3_base>	FFF2 9000 _H	Peripheral Group 8
<IFC1_base>	FFF2 A000 _H	Peripheral Group 8
<AVSEG_base>	FFF4 4000 _H	Peripheral Group 7
<ABFG_base>	FFF4 5000 _H	Peripheral Group 7
<AIR_base>	FFF4 6000 _H	Peripheral Group 7

36.1.3 Clock Supply

The ADCH_n clock supplies are shown in the following table.

Table 36.9 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
ADCH _n	ADCLK	CLK_LSB
	Register access clock	CLK_LSB
IFCu	Register access clock	CLK_LSB
ASFr	Register access clock	CLK_LSB
AVSEG	Register access clock	CLK_LSB
ABFG	Register access clock	CLK_LSB
AIR	Register access clock	CLK_LSB

36.1.4 Interrupt Requests

The ADCHn interrupt requests are listed in the following table.

Table 36.10 Interrupt Requests (1)

Interrupt symbol name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Other Trigger Signals
ADCH0						
*1	ADE0 (merged INT_UL0)	A/D error interrupt Upper/lower limit error interrupt	*1	—	—	—
*1	ADI00	Scan group 0 (SG0) end interrupt	*1	*1	*1	GTM*2/ATU
*1	ADI01	Scan group 1 (SG1) end interrupt	*1	*1	*1	GTM*2/ATU
*1	ADI02	Scan group 2 (SG2) end interrupt	*1	*1	*1	GTM*2/ATU
*1	ADI03	Scan group 3 (SG3) end interrupt	*1	*1	*1	GTM*2/ATU
*1	ADI04	Scan group 4 (SG4) end interrupt	*1	*1	*1	GTM*2/ATU
*1	ADMPXI0	MPX interrupt	*1	*1	*1	—
ADCH2						
*1	ADE2 (merged INT_UL2)	A/D error interrupt Upper/lower limit error interrupt	*1	—	—	—
*1	ADI20	Scan group 0 (SG0) end interrupt	*1	*1	*1	GTM*2
*1	ADI21	Scan group 1 (SG1) end interrupt	*1	*1	*1	GTM*2
*1	ADI22	Scan group 2 (SG2) end interrupt	*1	*1	*1	GTM*2
*1	ADI23	Scan group 3 (SG3) end interrupt	*1	*1	*1	GTM*2
*1	ADI24	Scan group 4 (SG4) end interrupt	*1	*1	*1	GTM*2
*1	ADMPXI2	MPX interrupt	*1	*1	*1	—

Note 1. ADE0, ADE2, ADI00 to ADI04, ADI20 to ADI24, ADMPXI0 and ADMPXI2 are chosen by the AIR (ADC Interrupt Router), and these are forwarded to the INTC and DMAC.

For the Interrupt Number and DMA Trigger Number, refer to **Table 36.15** to **Table 36.28**.

Note 2. ADI00 to ADI04 and ADI20 to ADI24 are chosen by the PIC (Peripheral Interconnection), and these are forwarded to the GTM. For details, refer to **Section 35, Peripheral Interconnection (PIC)**.

Table 36.11 Interrupt Requests (2)

Interrupt symbol name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Other Trigger Signals
ADCH1						
*1	ADE1 (merged INT_UL1)	A/D error interrupt Upper/lower limit error interrupt	*1	—	—	—
*1	ADI10	Scan group 0 (SG0) end interrupt	*1	*1	*1	GTM*2
*1	ADI11	Scan group 1 (SG1) end interrupt	*1	*1	*1	GTM*2
*1	ADI12	Scan group 2 (SG2) end interrupt	*1	*1	*1	GTM*2
*1	ADI13	Scan group 3 (SG3) end interrupt	*1	*1	*1	GTM*2
*1	ADI14	Scan group 4 (SG4) end interrupt	*1	*1	*1	GTM*2
*1	ADMPX1	MPX interrupt	*1	*1	*1	—
ADCH3						
*1	ADE3 (merged INT_UL3)	A/D error interrupt Upper/lower limit error interrupt	*1	—	—	—
*1	ADI30	Scan group 0 (SG0) end interrupt	*1	*1	*1	GTM*2
*1	ADI31	Scan group 1 (SG1) end interrupt	*1	*1	*1	GTM*2
*1	ADI32	Scan group 2 (SG2) end interrupt	*1	*1	*1	GTM*2
*1	ADI33	Scan group 3 (SG3) end interrupt	*1	*1	*1	GTM*2
*1	ADI34	Scan group 4 (SG4) end interrupt	*1	*1	*1	GTM*2
*1	ADMPX3	MPX interrupt	*1	*1	*1	—

Note 1. ADE1, ADE3, ADI10 to ADI14, ADI30 to ADI34, ADMPX1 and ADMPX3 are chosen by the AIR (ADC Interrupt Router), and these are forwarded to INTC and DMAC.

For the Interrupt Number and DMA Trigger Number, refer to **Table 36.15** to **Table 36.28**.

Note 2. ADI10 to ADI14 and ADI30 to ADI34 are chosen by PIC (Peripheral Interconnection), and these are forwarded to the GTM.

For details, refer to **Section 35, Peripheral Interconnection (PIC)**.

Table 36.12 Interrupt Requests (3)

Interrupt symbol name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Other Trigger Signals
ASF0						
*1	ASI0	Ch0 integration end interrupt	*1	*1	*1	—
*1	ASI1	Ch1 integration end interrupt	*1	*1	*1	—
*1	ASI2	Ch2 integration end interrupt	*1	*1	*1	—
*1	ASI3	Ch3 integration end interrupt	*1	*1	*1	—
*1	ASI4	Ch4 integration end interrupt	*1	*1	*1	—
*1	ASI5	Ch5 integration end interrupt	*1	*1	*1	—
*1	ASI6	Ch6 integration end interrupt	*1	*1	*1	—
*1	ASI7	Ch7 integration end interrupt	*1	*1	*1	—
*1	ASI8	Ch8 integration end interrupt	*1	*1	*1	—
*1	ASI9	Ch9 integration end interrupt	*1	*1	*1	—
*1	ASI10	Ch10 integration end interrupt	*1	*1	*1	—
*1	ASI11	Ch11 integration end interrupt	*1	*1	*1	—
*1	ASI12	Ch12 integration end interrupt	*1	*1	*1	—
*1	ASI13	Ch13 integration end interrupt	*1	*1	*1	—
*1	ASI14	Ch14 integration end interrupt	*1	*1	*1	—
*1	ASI15	Ch15 integration end interrupt	*1	*1	*1	—

Note 1. ASI0 to ASI15 are chosen by the AIR (ADC Interrupt Router), and these are forwarded to the INTC and DMAC.
For the Interrupt Number and DMA Trigger Number, refer to **Table 36.15** to **Table 36.28**.

Table 36.13 Interrupt Requests (4)

Interrupt symbol name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Other Trigger Signals

36.1.5 Reset Source

The ADCHn reset sources are listed in the following table. The ADCHn is initialized by the following reset sources.

Table 36.29 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
ADCHn	All registers	✓	✓	✓	✓	—	—
IFCu	All registers	✓	✓	✓	✓	—	—
ASFr	All registers	✓	✓	✓	✓	—	—
AVSEG	All registers	✓	✓	✓	✓	—	—
ABFG	All registers	✓	✓	✓	✓	—	—
AIR	All registers	✓	✓	✓	✓	—	—

36.1.6 External Input/Output Signals

The External Input/Output signals of the ADCHn are listed below.

Table 36.30 ADCH0 External Input / Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
ADCH0		
A0VCC	Power supply pin for the analog part	A0VCC
A0VSS	Ground pin for the analog part	A0VSS
A0VREFH	Reference voltage pin for the analog part	A0VREFH
AN000	Analog input pin	AN000
AN001	Analog input pin	AN001
AN002	Analog input pin	AN002
AN003	Analog input pin	AN003
AN010	Analog input pin	AN010
AN011	Analog input pin	AN011
AN012	Analog input pin	AN012
AN013	Analog input pin	AN013
AN020	Analog input pin	AN020
AN021	Analog input pin	AN021
AN022	Analog input pin	AN022
AN023	Analog input pin	AN023
AN030	Analog input pin	AN030
AN031	Analog input pin/ External analog multiplexer input pin	AN031
AN032	Analog input pin	AN032
AN033	Analog input pin	AN033
AN040	Analog input pin	AN040
AN041	Analog input pin	AN041
AN042	Analog input pin	AN042
AN043	Analog input pin	AN043
AN050	Analog input pin	AN050
AN051	Analog input pin	AN051
AN052	Analog input pin	AN052
AN053	Analog input pin	AN053
AN060	Analog input pin	AN060
AN061	Analog input pin	AN061
AN062	Analog input pin	AN062
AN063	Analog input pin	AN063
ADTRG0	External trigger pin*1	ADTRG0
ADEND0	A/D conversion timing monitor pin	ADEND0
ADMPX00	ADMPX value	ADMPX00
ADMPX01	ADMPX value	ADMPX01
ADMPX02	ADMPX value	ADMPX02
ADMPX03	ADMPX value	ADMPX03
ADMPX04	ADMPX value	ADMPX04

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to **Section 2, Pin Function**.

Table 36.31 ADCH2 External Input / Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
ADCH2		
A2VCC	Power supply pin for the analog part	A2VCC
A2VSS	Ground pin for the analog part	A2VSS
A2VREFH	Reference voltage pin for the analog part	A2VREFH
AN200	Analog input pin	AN200
AN201	Analog input pin	AN201
AN202	Analog input pin	AN202
AN203	Analog input pin	AN203
AN210	Analog input pin	AN210
AN211	Analog input pin	AN211
AN212	Analog input pin	AN212
AN213	Analog input pin	AN213
AN220	Analog input pin	AN220
AN221	Analog input pin	AN221
AN222	Analog input pin	AN222
AN223	Analog input pin	AN223
AN230	Analog input pin	AN230
AN231	Analog input pin	AN231
AN232	Analog input pin	AN232
AN233	Analog input pin	AN233
AN240	Analog input pin	AN240
AN241	Analog input pin	AN241
AN242	Analog input pin	AN242
AN243	Analog input pin / External analog multiplexer input pin	AN243
AN250	Analog input pin	AN250
AN251	Analog input pin	AN251
AN252	Analog input pin	AN252
AN253	Analog input pin	AN253
AN260	Analog input pin	AN260
AN261	Analog input pin	AN261
AN262	Analog input pin	AN262
AN263	Analog input pin	AN263
AN270	Analog input pin	AN270*2
AN271	Analog input pin	AN271*2
AN272	Analog input pin	AN272*2
AN273	Analog input pin	AN273*2
ADTRG2	External trigger pin*1	ADTRG2
ADEND2	A/D conversion timing monitor pin	ADEND2
ADMPX20	ADMPX value	ADMPX20
ADMPX21	ADMPX value	ADMPX21
ADMPX22	ADMPX value	ADMPX22
ADMPX23	ADMPX value	ADMPX23
ADMPX24	ADMPX value	ADMPX24

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to **Section 2, Pin Function**.

Note 2. These signals are not allocated to terminals in the 373-pin package.

Table 36.32 ADCH1 External Input / Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
ADCH1		
A1VCC	Power supply pin for the analog part	A1VCC
A1VSS	Ground pin for the analog part	A1VSS
A1VREFH	Reference voltage pin for the analog part	A1VREFH
AN100	Analog input pin / External analog multiplexer input pin	AN100
AN101	Analog input pin	AN101
AN102	Analog input pin	AN102
AN103	Analog input pin	AN103
AN110	Analog input pin	AN110
AN111	Analog input pin	AN111
AN112	Analog input pin	AN112
AN113	Analog input pin	AN113
AN120	Analog input pin	AN120
AN121	Analog input pin	AN121
AN122	Analog input pin	AN122
AN123	Analog input pin	AN123
AN130	Analog input pin	AN130
AN131	Analog input pin	AN131
AN132	Analog input pin	AN132
AN133	Analog input pin	AN133
AN140	Analog input pin	AN140
AN141	Analog input pin	AN141
AN142	Analog input pin	AN142
AN143	Analog input pin	AN143
ADTRG1	External trigger pin*1	ADTRG1
ADEND1	A/D conversion timing monitor pin	ADEND1
ADMPX10	ADMPX value	ADMPX10
ADMPX11	ADMPX value	ADMPX11
ADMPX12	ADMPX value	ADMPX12
ADMPX13	ADMPX value	ADMPX13
ADMPX14	ADMPX value	ADMPX14

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to **Section 2, Pin Function**.

Table 36.33 ADCH3 External Input / Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
ADCH3		
A3VCC	Power supply pin for the analog part	A3VCC
A3VSS	Ground pin for the analog part	A3VSS
A3VREFH	Reference voltage pin for the analog part	A3VREFH
AN300	Analog input pin / External analog multiplexer input pin	AN300
AN301	Analog input pin	AN301
AN302	Analog input pin	AN302
AN303	Analog input pin	AN303
AN310	Analog input pin	AN310
AN311	Analog input pin	AN311
AN312	Analog input pin	AN312
AN313	Analog input pin	AN313
AN320	Analog input pin	AN320
AN321	Analog input pin	AN321
AN322	Analog input pin	AN322
AN323	Analog input pin	AN323
AN330	Analog input pin	AN330
AN331	Analog input pin	AN331

AN333	Analog input pin	AN333
AN340	Analog input pin	AN340
AN341	Analog input pin	AN341
AN342	Analog input pin	AN342
AN343	Analog input pin	AN343
AN350	Analog input pin	AN350 *2
AN351	Analog input pin	AN351 *2
AN352	Analog input pin	AN352 *2
AN353	Analog input pin	AN353 *2
AN360	Analog input pin	AN360 *2
AN361	Analog input pin	AN361 *2
AN362	Analog input pin	AN362 *2
AN363	Analog input pin	AN363 *2
AN370	Analog input pin	AN370 *2
AN371	Analog input pin	AN371 *2
AN372	Analog input pin	AN372 *2
AN373	Analog input pin	AN373 *2
ADTRG3	External trigger pin*1	ADTRG3
ADEND3	A/D conversion timing monitor pin	ADEND3
ADMPX30	ADMPX value	ADMPX30
ADMPX31	ADMPX value	ADMPX31
ADMPX32	ADMPX value	ADMPX32
ADMPX33	ADMPX value	ADMPX33
ADMPX34	ADMPX value	ADMPX34

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to **Section 2, Pin Function**.

Note 2. These signals are not allocated to terminals in the 373-pin package.

For ADCH_n, it's possible to perform an A/D conversion of an analog input with the assistance of RRAMP.

For ADCH₀, it's possible to perform an A/D conversion of VCC, E0VCC (called EVCC hereafter) and VDD as secondary power supply voltage monitor.

For analog inputs and VMON (Secondary power supply voltage monitor), the correspondence list of physical channel, physical channel groups, physical sub channel and RRAMP is shown in the following table.

Table 36.34 ADCH₀ Physical Channel, Physical Channel Group, Physical Sub Channel and RRAMP

Analog Input or VMON	Physical Channel	Physical Channel Group	Physical Sub Channel	RRAMP Correspondence			
				RRAMP00	RRAMP01	RRAMP02	—
AN000	0	0	0	✓	—	—	—

36.2 Overview

36.2.1 Functional Overview

The ADCH has the following features.

- Configuration of analog input pins
See **Section 36.1.1, Number of Units and Channels** about the number of modules, the number of total analog input pins, the number of dedicated analog input pins and the number of shared analog input pins.
- Sample-and-hold function
Each module has an internal sample-and-hold circuit that enables each module to perform an A/D conversion independently.
- Advanced A/D converter
Resolution: 12 / 10 bits
A/D conversion method: Successive approximation
Conversion speed: 1.0 μ s
- Supporting five scan groups
Each ADCH has five scan groups. Scan settings can be made independently for each scan group.
- Two scan modes
Each ADCH has two scan modes.
Multicycle scan mode executes the specified number of scans.
Continuous scan mode executes scans repeatedly without limit.
- Virtual channels
Each ADCH has several virtual channels. See **Section 36.1.1, Number of Units and Channels** about the number of virtual channels. Analog channels for which A/D conversion is to be made and other accompanying information are set for each virtual channel. By sequentially performing the processing for the virtual channels indicated by the start virtual channel pointer and the end virtual channel pointer in each scan group, scans (which can perform A/D conversion for any analog channels in any order) can be executed. Each virtual channel can be mapped to any physical channel.
- Extended physical channels
Each ADCH can extend physical channels by using an external analog multiplexer. Furthermore, an external analog multiplexer can be used with either I/O port (pins) or the CSIH (peripheral). The I/O port and/or CSIH is under the control of the ADCH for multiplexer channel selection. The CSIH interface requires DMA when used. (One channel can be set for each ADCH.)
- Interval function
The ADCH can start scan groups in any cycle by using the A/D timer equipped in the scan groups 3 and 4. This enables scans with intervals inserted.
- A/D-converted value adding function
The ADCH performs A/D conversion sequentially twice or four times for a channel, and stores the addition result in the data register. The setting of use or not use of the addition function can be set each virtual channel. But the setting of addition count can be set as common setting in all virtual channels.
The effect of the moving average filter can be gained by using this function.
In addition, using the optional ADC Summation Function (ASF) makes an extended summation function available.
For details, see **Section 36.8, ADC Summation Function (ASF)**.

- Data registers

Data registers corresponding to virtual channels are provided.

- Start trigger for each scan group

Hardware triggers and software triggers can start the processing of each scan group. Only scan groups 3 and 4 can start processing by an A/D timer trigger.

- Asynchronous/synchronous suspend and resume function

Processing for a scan group can interrupt an ongoing processing for another scan group.

The priority is as follows:

Low	High	
$SG0 < SG1 < SG2 < SG3 < SG4$		(SG: Scan group)

The following suspend methods can be chosen:

Synchronous suspend: Processing is suspended after the ongoing virtual channel processing has stopped.

Asynchronous suspend: Processing is suspended immediately.

Synchronous/asynchronous mixture type suspend:

SGx except for SG0 is “synchronous suspend” mode.

SG0 is in “asynchronous suspend” mode.

- Entry to the digital filter engine, and the ADC summation function, and the Generic Timer Module

A/D-converted values can be directly entered into the Digital Filter Engine (DFE), or the ADC Summation Function (ASF), or the Generic Timer Module (GTM). Whether to enable or disable entry and a tag used to define the target channel to be entered can be set for each virtual channel. Entry to the DFE (GTM) or entry to the ASF can be set for each scan group.

For details of the DFE, refer to **Section 39, Digital Filter Engine (DFE)**.

For details of the ASF, refer to **Section 36.8, ADC Summation Function (ASF)**.

For details of the GTM, refer to **Section 33, Generic Timer Module (GTM)**.

- Scan end interrupt and DMA transfer

Each scan group can generate an interrupt request to the INTC and activate the DMAC each time a processing for the virtual channel indicated by the end virtual channel pointer ends or a virtual channel ends.

- Interrupt and DMA transfer for an external analog multiplexer

The ADCH can generate an interrupt request to the INTC and activate the DMAC when the specified virtual channel is started. This enables transfer of the MPX value to an external analog multiplexer in cooperation with an I/O port or CSIH. There is a register to provide for a programmable ADC conversion delay (N us (N = 0, 1, 2, ..., 10)) for DMA transfer time and external multiplexer settling time.

- Selectable analog conversion voltage

The AnVREFH pin can be used to set the voltage range for analog conversion.

- A/D conversion monitor output

The processing timing of a desired virtual channel can be output to the A/D conversion monitor output pin (ADENDn).

- A wide range of safety functions

The ADCH has various safety functions, including self-diagnosis, pin-level self-diagnosis, wiring-break detection, self-diagnosis of the wiring-break detection function, self-diagnosis of the secondary power supply voltage monitor function, normality check for analog selection; and for the data registers, upper-limit/lower-limit check, parity check, overwrite check, and read and clear functions.

- Upper/lower-limit-excursion-notice-function to ADC VMON secondary error generator (AVSEG) or ADC boundary flag generator (ABFG) in each virtual channel

The ADCHn can output to the ADC-VMON-secondary-error-generator (AVSEG) (The output to AVSEG is ADCH0 only) or the ADC-boundary-flag-generator (ABFG) a signal to notify that an A/D conversion result has increased above the upper limit value of the designated table in each virtual channel or that an A/D conversion result has decreased below the lower limit value of the designated table in each virtual channel.

Once the Table register for the upper/lower limit value is set, it can be rewritten at any time.

For details of the AVSEG, **Section 36.9, ADC VMON Secondary Error Generator (AVSEG)**.

For details of the ABFG, **Section 36.10, ADC Boundary Flag Generator (ABFG)**.

- Secondary power supply voltage monitor (VMON)

The ADCH0 can convert the voltage of VCC, EVCC, and the VDD power supply in AD.

Secondary HDET, Secondary LDET of each power supply (VCC, EVCC and VDD) can be notified to ECM by using the upper/lower-limit-excess-notice-function of ADCH0 and AVSEG.

For details of AVSEG, **Section 36.9, ADC VMON Secondary Error Generator (AVSEG)**.

For the whole description of power supply voltage monitor, refer to **Section 12, Power Supply Voltage Monitor**.

36.2.2 Block Diagram

The block diagram of ADCH0 is shown in **Figure 36.1**. The block diagram of ADCH2 is shown in **Figure 36.2**. The block diagram of ADCH1 is shown in **Figure 36.3**. The block diagram of ADCH3 is shown in **Figure 36.4**.

36.3.2 ADCH Common Registers

This section describes the common registers for each ADCH.

36.3.2.1 ADCH0ADSYNSTCR — A/D Synchronization Start Control Register

ADCH0ADSYNSTCR is an 8-bit write-only register that controls the simultaneous start of A/D conversions for scan groups of each ADCH. The register bits are always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.39 ADCH0ADSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADSTART	This bit starts an A/D conversion for scan groups of each ADCH. The Start condition for SGx of ADCHn: 1 is written to ADSTART when SGACTION for SGx of ADCHn is 0 and ADSTARTEN is 1. The A/D conversion is started simultaneously for the scan groups (of each ADCH) for which ADSTARTEN has been set to 1. Writing 0 to this bit is ignored.

36.3.2.2 ADCH0ADTSYNSTCR — A/D Timer Synchronization Start Control Register

ADCH0ADTSYNSTCR is an 8-bit write-only register that controls the simultaneous start of counting by the A/D timers of each ADCH. The register bits are always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.40 ADCH0ADTSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADTSTART	This bit starts the counting by the A/D timers of each ADCH. The start condition for SGx of ADCHn: 1 is written to ADTSTART when ADTACT for A/D timer y of ADCHn is 0 and ADTSTARTE is 1. The A/D timers (of each ADCH) for which ADTST has been set to 1 start counting simultaneously. Writing 0 to this bit is ignored.

36.3.2.3 ADCH0VMONVDCR1 — Voltage Monitor Voltage Divider Control Register 1

ADCH0VMONVDCR1 is an 8-bit readable / writable register that controls the voltage monitor voltage divider of the power supply. This is only present in ADCH0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDE1
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 36.41 ADCH0VMONVDCR1 Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	VDE1	Voltage divider enable (resistance voltage divider control) The resistance voltage divider is controlled by ADCH0VMONVDCR2.VDE2 and VDE1. For details, refer to Table 36.43 .

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

Do not perform an A/D conversion with ADCH0VMONVDCR1.VDE1, ADCH0VMONVDCR2.VDE2 = 01_B or 10_B.

36.3.2.4 ADCH0VMONVDCR2 — Voltage Monitor Voltage Divider Control Register 2

ADCH0VMONVDCR2 is an 8-bit readable / writable register that controls the voltage monitor voltage divider of the power supply. This is only present in ADCH0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDE2
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 36.42 ADCH0VMONVDCR2 Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	VDE2	Voltage divider enable (resistance voltage divider control) The resistance voltage divider is controlled by ADCH0VMONVDCR1.VDE1 and VDE2. For details, refer to Table 36.43 .

CAUTION

To prevent a malfunction, there are the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

Do not perform an A/D conversion with ADCH0VMONVDCR1.VDE1, ADCH0VMONVDCR2.VDE2 = 01_B or 10_B setting.

Table 36.43 Resistance Voltage Divider and Pull-down Control Setting Table

VDE1	VDE2	Resistance voltage divide	Pull-down
0	0	Off	On
0	1	Off	Off
1	0	Off	Off
1	1	On	Off

36.3.3 ADCH Specific Registers (Virtual Channel, Control, Safety-related)

36.3.3.1 ADCHnVCRj — Virtual Channel Register j

ADCHnVCRj is a 32-bit readable/writable register used for each virtual channel. ADCHnVCRj is initialized to 0000 0000_H at reset.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.44 ADCHnVCRj Register Contents (1/3)

Bit Position	Bit Name	Function
31	VCULME	Virtual channel upper limit excess notice enable 0: An A/D conversion result greater than the upper limit of the virtual channel is not notified. 1: An A/D conversion result greater than the upper limit of the virtual channel is notified. Notification is made by vcend[j] (A/D conversion end notice of ADCHnVCRj) and vculmo (virtual channel upper limit excess notice). For details, first see Figure 36.27 and see Section 36.4.9, Virtual Channel Upper/Lower Limit Excess Notice .
30	VCLLME	Virtual channel lower limit excess notice enable 0: An A/D conversion result is less than the lower limit of the virtual channel is not notified. 1: An A/D conversion result is less than the lower limit of the virtual channel is notified. Notification is made by vcend[j] (A/D conversion end notice of ADCHnVCRj) and vcllmo (virtual channel lower limit excess notice). For details, first see Figure 36.27 and see Section 36.4.9, Virtual Channel Upper/Lower Limit Excess Notice .
29 to 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

Table 36.44 ADCHnVCRj Register Contents (2/3)

Bit Position	Bit Name	Function
26 to 24	VCULLMTBS[2:0]	Virtual channel upper/lower limit table register selection Selects Virtual channel upper/lower limit table register that is the comparative target. 0 _H : ADCHnVCULLMTBR0 is chosen [default] 1 _H : ADCHnVCULLMTBR1 is chosen 2 _H : ADCHnVCULLMTBR2 is chosen 3 _H : ADCHnVCULLMTBR3 is chosen 4 _H : ADCHnVCULLMTBR4 is chosen 5 _H : ADCHnVCULLMTBR5 is chosen 6 _H : ADCHnVCULLMTBR6 is chosen 7 _H : Setting prohibited
23 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 13	CNVCLS[2:0]	Conversion Class 0 _H : Normal A/D conversion 3 _H : A/D converter self-diagnosis 4 _H : Normal A/D conversion in addition mode 5 _H : Normal A/D conversion with the MPX 6 _H : Normal A/D conversion with the MPX in addition mode Other than above: Setting prohibited
12	DFENT	DFE Entry 0: Entry disabled 1: Entry enabled This bit specifies whether to enable or disable entry to the DFE (Digital Filter Engine), or ASF (ADC summation function). Only the scan groups enabled by DFENTSGxE and ASENTSGxE in the ADCHnDFASENTSGER are entered.
11 to 8	DFTAG[3:0]	DFE-TAG When entry to the DFE is requested, entry is made to the DFE channel for which the same tag with DFTAG[3:0] is set. If this applies to multiple channels, entry is made to multiple channels. When entry to the ASF is requested, entry is made to the ASF channel corresponding to the values set in DFTAG[3:0]. When entry to the ASF is requested, set the DFTAG [3:0] of each ADCHnVCRj to a different value. When the DFTAG [3:0] of several ADCHnVCRj is set to the same value, accumulation data of ASF can't be guaranteed.
7	ADIE	Virtual Channel End Interrupt Enable 0: ADInx is not output when the A/D conversion for virtual channel n ends in SGx. 1: ADInx is output when the A/D conversion for virtual channel n ends in SGx. ADIE in ADCHnSGCRx is independent of ADIE in ADCHnVCRj. For details, see Section 36.4.6.1, Scan End Interrupt Request .
6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

Table 36.44 ADCHnVCRj Register Contents (3/3)

Bit Position	Bit Name	Function
5 to 0	GCTRL[5:0]	<p>General Control</p> <ul style="list-style-type: none"> ●For normal A/D conversions (CNVCLS[2:0] = 0_H) <ul style="list-style-type: none"> –GCTRL[4:2]: Physical Channel Group These bits specify a physical channel group. –GCTRL[1:0]: Physical Sub channel These bits specify a physical sub channel. Always set the other GCTRL bits to 0. ●For self-diagnosis (CNVCLS[2:0] = 3_H) <ul style="list-style-type: none"> – GCTRL[4:0]: Self-diagnostic Voltage Level 10_H: AnVREFH × 1 0C_H: AnVREFH × 3/4 08_H: AnVREFH × 1/2 04_H: AnVREFH × 1/4 00_H: AnVREFH × 0 Other than the above: Setting prohibited Always set the other GCTRL bits to 0. ●For normal A/D conversions in addition mode (CNVCLS[2:0] = 4_H) <ul style="list-style-type: none"> –GCTRL[4:2]: Physical Channel Group These bits specify a physical channel group. –GCTRL[1:0]: Physical sub channel These bits specify a physical sub channel. Always set the other GCTRL bits to 0. The count specified by ADDNT is reflected as the number of addition times. ●For normal A/D conversions with the MPX (CNVCLS[2:0] = 5_H) <ul style="list-style-type: none"> –GCTRL[4:0]: MPX Channel Setting These bits set the MPX value to be transferred to an external analog multiplexer. The GCTRL[4:0] value is transferred to ADCHnMPXCURR at the start of a virtual channel, and an interrupt request (ADMPXIn) or a DMA request is issued. Activating an interrupt or the DMAC, and transferring ADCHnMPXCURR to PSRn of the I/O port, or to CSIHnTX0H of CSIH enables the transfer of the MPX value to an external analog multiplexer. For details, see Section 36.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode. Always set the other GCTRL bits to 0. ●For normal A/D conversions with the MPX in addition mode (CNVCLS[2:0] = 6_H) <ul style="list-style-type: none"> –GCTRL[4:0]: MPX Channel Setting These bits set the MPX value to be transferred to an external analog multiplexer. The GCTRL[4:0] value is transferred to ADCHnMPXCURR at the start of a virtual channel, and an interrupt request (ADMPXIn) or a DMA request is issued. Activating an interrupt or the DMAC, and transferring ADCHnMPXCURR to PSRn of the I/O port, or to CSIHnTX0H of CSIH enables the transfer of the MPX value to an external analog multiplexer. For details, see Section 36.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode. The count specified by ADDNT is reflected as the number of addition times. Always set the other GCTRL bits to 0.

CAUTION

To prevent a malfunction, there are the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**. But when scan group is terminated, clearing ADIE to 0 isn't included in the limitations.

36.3.3.2 ADCHnDRj — Data Register j

ADCHnDRj is a 16-bit read-only register that stores an A/D converted value.

ADCHnDRj is provided for each virtual channel, and its format depends on the DFMT[1:0] setting for the ADCHnADCR2 and the ADDNT setting when CNVCLS[2:0] = 4_H or 6_H. The format of data transferred to the Digital Filter Engine (DFE), ADC Summation Function (ASF), and Integer/Floating-point Conversion module (IFC) also depends on the above settings.

When unsigned fixed-point format is selected, the format of the data transferred to the DFE, ASF and IFC is signed fixed-point format.

ADCHnDRj is initialized to 0000_H at reset.

A method of rounding from 12-bit to 10-bit resolution is described below.

Table 36.45 A rounding method from 12-bit to 10-bit resolution

Addition	12 bit A/D conversion value			10 bit A/D conversion value
	[11:2]	[1]	[0]	[9:0]
None (One time conversion)	3FF _H	Round-down	Round-down	12 bit A/D conversion value[11:2]
	3FE _H to 000 _H	This bit is added to [11:2]		12 bit A/D conversion value[11:2] + 12 bit A/D conversion value[1]
Addition	12 bit A/D conversion value			10 bit A/D conversion value
	[12:2]	[1]	[0]	[10:0]
Twice	7FF _H	Round-down	Round-down	12 bit A/D conversion value[12:2]
	7FE _H to 000 _H	This bit is added to [12:2]		12 bit A/D conversion value[12:2] + 12 bit A/D conversion value[1]
Addition	12 bit A/D conversion value			10 bit A/D conversion value
	[13:2]	[1]	[0]	[11:0]
4 times	FFF _H	Round-down	Round-down	12 bit A/D conversion value[13:2]
	FFE _H to 000 _H	This bit is added to [13:2]		12 bit A/D conversion value[13:2] + 12 bit A/D conversion value[1]

The format of ADCHnDRj or ADCHnDIRj by the combination of the data format (ADCHnADCR2.DFMT [1:0]), the addition mode (ADCHnVCRj.CNVCLS [2:0]) and the number of addition times (ADCHnADCR2.ADDNT) is described below.

When the data format (ADCHnADCR2.DFMT [1:0]), the addition mode (ADCHnVCRj.CNVCLS [2:0]) and the number of addition times (ADCHnADCR2.ADDNT) are rewritten before reading ADCHnDRj or ADCHnDIRj, ADCHnDRj or ADCHnDIRj are read in the rewritten format.

(1) The format when reading from the P-Bus

For signed 12 bit fixed-point format (DFMT[1:0] = 00_B)

Addition	CNVCLS	ADDNT	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
None (One time conversion)	≠ 4 _H , 6 _H	—	S													0	0	0
Twice	= 4 _H , 6 _H	0	S														0	0
4 times		1	S															0

Position of decimal point ↑

For signed 12 bit integer point format (DFMT[1:0] = 01_B)

Addition	CNVCLS	ADDNT	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
None (One time conversion)	≠ 4 _H , 6 _H	—	S	S	S	S												
Twice	= 4 _H , 6 _H	0	S	S	S													
4 times		1	S	S														

Position of decimal point ↗

For unsigned 12 bit fixed-point format (DFMT[1:0] = 10_B)

Addition	CNVCLS	ADDNT	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
None (One time conversion)	≠ 4 _H , 6 _H	—														0	0	0
Twice	= 4 _H , 6 _H	0															0	0
4 times		1																0

Position of decimal point ↑

For unsigned 10 bit fixed-point format (DFMT[1:0] = 11_B)

Addition	CNVCLS	ADDNT	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
None (One time conversion)	≠ 4 _H , 6 _H	—												0	0	0	0	0
Twice	= 4 _H , 6 _H	0												0	0	0	0	0
4 times		1													0	0	0	0

Position of decimal point ↑

S : Sign bit (always 0)

0 : Zero extension

(2) The format of the data transferred to the DFE, GTM, ASF, IFC

For unsigned 12 bit fixed-point format (DFMT[1:0] = 00_B/10_B/11_B)

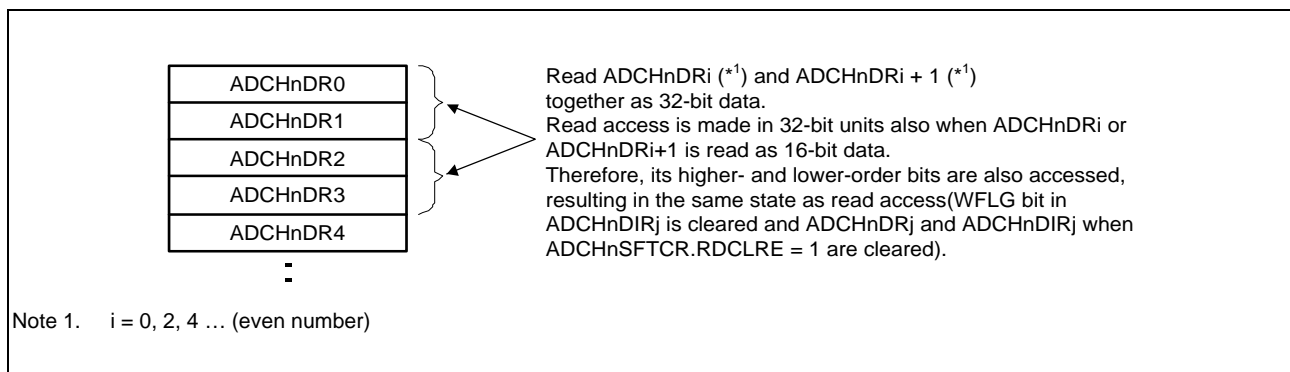

Addition	CNVCLS	ADDNT	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
None (One time conversion)	≠ 4 _H , 6 _H	—	S													0	0	0
Twice	= 4 _H , 6 _H	0	S														0	0
4 times		1	S															0

↑
Position of decimal point

ADCHnDRj is cleared to 0000_H when the ACDHnDRj or the ADCHnDIRj is read or ADCHnDRj is read via the IFC while RDCLRE is set to 1.

ADCHnDRi and ADCHnDRi+1 (i = 0, 2, 4, ... (even number)) must always be read together as 32-bit data.

When reading the ADCHnDRj by 16 bits, set the “Read and Clear Enable” to invalid (ADCHnSFTCR.RDCLRE=0) and set “Overwrite check Function” to invalid and then read ADCHnDRj*1.

Note 1. – Don't perform the expected value comparison of the WFLG bit of ADCHnDIRj.
 – Don't perform the expected value comparison of an overwrite error register.
 – Set the “Overwrite Error Interrupt Enable (OWEIE)” of the “Safety Control Register (ADCHnSFTCR)” to 0 (disable).

Note 2. When using DFE, ASF and IFC, setting to the signed 12 bit integer point format is prohibited.

Note 3. When after one of them of (i) to (v) is done and before A/D conversion value is updated, then ADCHnDRi and ADCHnDRi+1 where the A/D conversion value was stored is read, there is a possibility that parity error which isn't intended occur, so be careful and use.

- (i) The set value of ADCHnADCR2.DFMT[1:0] is changed from one of 0_H, 1_H and 2_H to 3_H.
- (ii) The set value of ADCHnADCR2.DFMT[1:0] is changed from 3_H to one of 0_H, 1_H and 2_H.
- (iii) The set value of ADCHnADCR2.ADDNT is changed.
- (iv) The set value of ADCHnVCRj.CNVCLS[2:0] of corresponding scan group is changed from one of 0_H, 3_H and 5_H to one of 4_H and 6_H.

(v) The set value of ADCHnVCRj.CNVCLS[2:0] of corresponding scan group is changed from one of 4_H and 6_H to one of 0_H, 3_H and 5_H.

Note 4. For ADCHnDRj reading, when ADCHnDRi or ADCHnDRi+1 is read by 16 bits, ADCHnDRi and ADCHnDRi+1 are made the target of reading.

For example, one of them of (i) to (v) is done after scan group completion, then the scan group is performed again in setting of ADCHnSFTCR.RDCLRE=0.

Then if ADCHnDRi is read by 16bits or 32bits before the A/D conversion value is stored in ADCHnDRi+1, there is a possibility that parity error which isn't intended occur.

36.3.3.3 ADCHnDIRj — Data Supplementary Information Register j

ADCHnDIRj is a 32-bit read-only register that stores the supplementary information of ADCHnDRj and the A/D converted value. This register is readable as 32-bit or as 16-bit data.

When reading the ADCHnDIRj by 16 bits, read along with the indicated restrictions for reading of 16 bits as described in on **Section 36.3.3.2, ADCHnDRj — Data Register j**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IDEF	WFLG	PRTY	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADCHnDRj															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.46 ADCHnDIRj Register Contents

Bit Position	Bit Name	Function
31 to 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26	IDEF	ID error 0: There is an error 1: There is no error
25	WFLG	Write Flag Setting condition An A/D converted value is stored in the ADCHnDRj. Clearing conditions ADCHnDRj or ADCHnDIRj is read. ADCHnDRj is read via the IFC.
24	PRTY	Parity Parity bit (even parity) for ADCHnDRj and IDEF.
23 to 16	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

The IDEF bit will be 0 at the initial condition or when using a Read-and-Clear or at occurrence of an ID error. When an ID error is not detected by an A/D conversion, the IDEF bit will be 1. The timing for when this bit is set is simultaneous with the timing for which an A/D conversion result is stored in a data register (ADCHnDRj).

The WFLG is cleared when ADCHnDRj or ADCHnDIRj is read or when ADCHnDRj is read via the IFC regardless of the RDCLRE setting.

The IDEF, PRTY and ADCHnDRj[15:0] bits are cleared when ADCHnDRj or ADCHnDIRj is read or when ADCHnDRj is read via the IFC while RDCLRE is set to 1.

36.3.3.4 ADCHnADHALTR — A/D Halt Register

ADCHnADHALTR is an 8-bit write-only register that forcibly terminates the A/D conversion. The register bits are always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HALT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.47 ADCHnADHALTR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	HALT	Halt All scan groups and all AD timers are halted and initialized, and the ADC changes to the idle state. Writing 0: Scan groups and timers are not halted. Writing 1: Scan groups and timers are halted.

36.3.3.5 ADCHnADCR1 — A/D Control Register 1

ADCHnADCR1 is an 8-bit readable/writable register for ADC common control. ADCHnADCR1 is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SUSMTD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 36.48 ADCHnADCR1 Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SUSMTD[1:0]	<p>Suspend Method</p> <p>These bits select the suspend method when a higher-priority scan group interrupts a lower-priority scan group.</p> <p>Synchronous suspend: If a request from a higher-priority SG is present while a lower-priority SG is being processed, processing for the lower-priority SG is suspended after the ongoing virtual channel processing is completed, and then processing for the higher-priority SG is executed. After processing for the higher-priority SG is completed, the suspended virtual channel processing for the lower-priority SG is resumed.</p> <p>Asynchronous suspend: If a request from a higher-priority SG is present while a lower-priority SG is being processed, the ongoing virtual channel processing is immediately suspended, and then processing for the higher-priority SG is executed. After processing for the higher-priority SG is completed, the suspended virtual channel processing for the lower-priority SG is resumed.</p> <p>0_H: Synchronous suspend 1_H: Asynchronous suspend when a higher-priority SG interrupts SG0, Synchronous suspend when a higher-priority SG interrupts a lower-priority SG (except for SG0) 2_H: Asynchronous suspend 3_H: Setting prohibited</p> <p>For details, see Figure 36.11 and Figure 36.12.</p>

CAUTION

To prevent a malfunction, there are the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.3.6 ADCHnMPXCURCR — MPX Current Control Register

ADCHnMPXCURCR is an 8-bit readable/writable register that controls the ADCHnMPXCURR format.

ADCHnMPXCURCR is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	MSKCFMT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 36.49 ADCHnMPXCURCR Register Contents

Bit Position	Bit Name	Function
7 to 4	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	MSKCFMT[3:0]	MSKC Format Specification These bits specify the MSKC[15:0] format of ADCHnMPXCURR. MSKCFMT[3] 0: MSKC[15:12] = 0000 _B 1: MSKC[15:12] = 1111 _B MSKCFMT[2] 0: MSKC[11:8] = 0000 _B 1: MSKC[11:8] = 1111 _B MSKCFMT[1] 0: MSKC[7:4] = 0000 _B 1: MSKC[7:4] = 0001 _B MSKCFMT[0] 0: MSKC[3:0] = 0000 _B 1: MSKC[3:0] = 1111 _B

CAUTION

To prevent a malfunction, there are the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.3.7 ADCHnMPXINTER — MPX Interrupt Enable Register

ADCHnMPXINTER is an 8-bit readable/writable register that controls the interrupt (ADMPXIn) output.

ADCHnMPXINTER is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADMPXIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

	MPXCMD[7:0]							—	—	—	MPXCUR[4:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.51 ADCHnMPXCURR Register Contents

Bit Position	Bit Name	Function
31 to 16	MSKC[15:0]	Mask Control When a virtual channel in which CNVCLS[2:0] in ADCHnVCRj is set to 5 _H or 6 _H is started, value of the format that depends on the MSKCFMT[3:0] setting of ADCHnMPXCURCR is transferred to MSKC[15:0] in ADCHnMPXCURR. For details, see Section 36.3.3.6, ADCHnMPXCURCR — MPX Current Control Register .
15 to 8	MPXCMD[7:0]	SPI Communication Command Information A command information register to control an external analog multiplexer by using SPI communication. When a virtual channel in which CNVCLS[2:0] in ADCHnVCRj is set to 5 _H or 6 _H is started, the MPXCMD[7:0] value in ADCHnMPXCMDR is transferred to MPXCMD[7:0] in ADCHnMPXCURR.
7 to 5	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	MPXCUR[4:0]	Current MPX Value When a virtual channel for which CNVCLS[2:0] in ADCHnVCRj is set to 5 _H or 6 _H is started, GCTRL[4:0] in ADCHnVCRj is transferred to MPXCUR[4:0]. At this time, an interrupt request to the INTC or a DMA transfer request is generated. The DMAC transfers ADCHnMPXCURR to PSRn of the I/O port or to CSIHnTX0H of CSIH, enabling the MPX value to be sent to an external analog multiplexer. When PSRn is used, transfer the MPX value as a 32-bit value. This enables rewriting of only the necessary ports by using the format control in MSKC[15:0]. When transferring the value to CSIHnTX0H, transfer the lower 16 bits. For details, see Section 36.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode .

36.3.3.9 ADCHnMPXOWR — MPX Optional Wait register

ADCHnMPXOWR is an 8-bit readable/writable register that specifies the wait time to be inserted for an external analog multiplexer. ADCHnMPXOWR is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	MPXOW[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 36.52 ADCHnMPXOWR Register Contents

Bit Position	Bit Name	Function
7 to 4	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	MPXOW[3:0]	MPX Optional Wait These bits specify the wait time to be inserted before an A/D conversion is started after a virtual channel for which CNVCLS[2:0] in ADCHnVCRj is 5 _H or 6 _H is started. 0 _H : 0 μs 1 _H : 1 μs 2 _H : 2 μs 3 _H : 3 μs 4 _H : 4 μs 5 _H : 5 μs 6 _H : 6 μs 7 _H : 7 μs 8 _H : 8 μs 9 _H : 9 μs A _H : 10 μs B _H to F _H : Setting prohibited For details, see Section 36.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode.

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.10 ADCHnMPXCMDR — MPX Command Information Register

ADCHnMPXCMDR is an 8-bit readable/writable register that stores SPI communication command information to be transferred to an external analog multiplexer. ADCHnMPXCMDR is initialized to 00_H at reset.

Value after reset: 00_H

Table 36.53 ADCHnMPXCMDR Register Contents

Bit Position	Bit Name	Function
7 to 0	MPXCMD[7:0]	SPI Communication Command Information These bits store command information for controlling an external analog multiplexer by using the SPI communication. When a virtual channel for which CNVCLS[2:0] in ADCHnVCRj is set to 5 _H or 6 _H is started, MPXCMD[7:0] in ADCHnMPXCMDR is transferred to MPXCMD[7:0] in ADCHnMPXCURR and it can be read by ADCHnMPXCURR together with MPXCUR[4:0].

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.11 ADCHnADCR2 — A/D Control Register 2

ADCHnADCR2 is an 8-bit readable/writable register for ADC common control.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	DFMT[1:0]		—	—	—	ADDNT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Table 36.54 ADCHnADCR2 Register Contents

Bit Position	Bit Name	Function
7 to 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 4	DFMT[1:0]	Data Format 00 _B : Signed 12bit fixed-point format 01 _B : Signed 12bit integer format 10 _B : Unsigned 12bit fixed-point format 11 _B : Unsigned 10bit fixed-point format For data transferred to the DFE.GTM and ASF, it is always signed fixed-point format regardless of the DFMT setting. For details of data format, see Section 36.3.3.2, ADCHnDRj — Data Register j.
3 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADDNT	Addition Count Select 0: Add twice 1: Add 4 times This register is valid only when CNVCLS[2:0] is 4 _H or 6 _H .

CAUTION

To prevent a malfunction, there are the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.12 ADCHnDFASENTSGER — DFE/ASF Entry Scan Group Enable Register

ADCHnDFASENTSGER is a 16-bit readable/writable register that enables or disables scan groups to be transferred to the DFE, and the ASF. ADCHnDFASENTSGER is initialized to 0000_H at reset.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DFENT SG4E	DFENT SG3E	DFENT SG2E	DFENT SG1E	DFENT SG0E	—	—	—	ASENT SG4E	ASENT SG3E	ASENT SG2E	ASENT SG1E	ASENT SG0E
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 36.55 ADCHnDFASENTSGER Register Contents

Bit Position	Bit Name	Function
15 to 13	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	DFENTSGxE	DFE Entry Scan Group Enable 0: Entry to DFE is disabled when starting SGx. 1: Entry to DFE is enabled when starting SGx. Entry is performed for virtual channels for which DFENT in ADCHnVCRj is set to 1.
7 to 5	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	ASENTSGxE	ASF Entry Scan Group Enable 0: Entry to ASF is disabled when starting SGx. 1: Entry to ASF is enabled when starting SGx. Entry is performed for virtual channels for which DFENT in ADCHnVCRj is set to 1. Use the ASENTSGxE bits by setting one of these bits to 1.

CAUTIONS

- To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.
- Do not set both DFENTSGxE and ASENTSGxE for the same scan group to 1. If it is enabled for the same scan group, entry is performed for both DFE and ASF of virtual channels for which DFENT in ADCHnVCRj is set to 1 for the scan group.

36.3.3.13 ADCHnADENDP — A/D Conversion Monitor Virtual Channel Pointer

ADCHnADENDP is an 8-bit readable/writable register that selects a virtual channel that outputs the A/D conversion timing to ADENDn. ADCHnADENDP is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0	
	—	—	ENDP[5:0]						
Value after reset	0	0	0	0	0	0	0	0	
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	

Table 36.56 ADCHnADENDP Register Contents

Bit Position	Bit Name	Function
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	ENDP[5:0]	A/D Conversion Monitor Virtual Channel Pointer Set virtual channel number which monitor ongoing A/D conversion. 00 _H to 27 _H : Virtual channel 0 to 39 Other than above: Setting prohibited When the virtual channel selected by ADCHnADENDP is started, a high level is output to ADENDn. When the virtual channel selected by ADCHnADENDP ends, a low level is output.

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.14 ADCHnSFTCR — Safety Control Register

ADCHnSFTCR is an 8-bit readable/writable register for safety control. ADCHnSFTCR is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RDCLRE	—	OWEIE	PEIE	IDEIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R/W	R/W	R/W

Table 36.57 ADCHnSFTCR Register Contents

Bit Position	Bit Name	Function
7 to 5	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
4	RDCLRE	Read and Clear Enable 0: ADCHnDRj and ADCHnDIRj are not cleared by reading ADCHnDRj or ADCHnDIRj or by reading ADCHnDRj via the IFC. 1: ADCHnDRj and ADCHnDIRj are cleared by reading ADCHnDRj or ADCHnDIRj or by reading ADCHnDRj via the IFC. CAUTION: WFLG in ADCHnDIRj is cleared by reading ADCHnDRj or ADCHnDIRj or by reading ADCHnDRj via the IFC regardless of the RDCLRE setting.
3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2	OWEIE	Overwrite Error Interrupt Enable 0: Disabled 1: Enabled
1	PEIE	Parity Error Interrupt Enable 0: Disabled 1: Enabled
0	IDEIE	ID Error Interrupt Enable 0: Disabled 1: Enabled

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.3.15 ADCHnTDCR — Pin-Level Self-Diagnosis Control Register

ADCHnTDCR is an 8-bit readable/writable register that controls the pin-level self-diagnosis. ADCHnTDCR is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TDE	—	—	—	—	—	TDLV[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R/W	R/W

Table 36.58 ADCHnTDCR Register Contents

Bit Position	Bit Name	Function
7	TDE	Pin-Level Self-Diagnosis 0: Pin-level self-diagnosis is disabled. 1: Pin-level self-diagnosis is enabled. When TDE is set to 1, all analog pins are disconnected from the input buffer. When TDE is set to 0, all analog pins are connected to the input buffer. When TDE is set to 1, the voltage is fixed to the level specified by TDLV[1:0]. Performing an A/D conversion in this state and checking the A/D converted value allows diagnosis of the path from an analog pin to the ADC.
6 to 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TDLV[1:0]	Pin-Level Self-Diagnosis 0 _H : Even numbers of physical channel groups are discharged to AnVSS, and odd numbers of physical channel groups are charged to AnVCC. 1 _H : Even numbers of physical channel groups are charged to AnVCC, and odd numbers of physical channel groups are discharged to AnVSS. 2 _H : Even numbers of physical channel groups are discharged to AnVSS, and odd numbers of physical channel groups are charged to 1/2*AnVCC. 3 _H : Even numbers of physical channel groups are charged to 1/2*AnVCC, and odd numbers of physical channel groups are discharged to AnVSS.*1

Note 1. Regarding AN13q (q = 0 to 3) ports in E2H, the injection voltage is 1/2*AnVCC.
Take care that there is a difference of specification with E2x-FCC2/E2UH.
Please use ADCHnTDCR.TDLV[1:0] = 1H setting for Pin-Level Self-Diagnosis of AnVSS level.

CAUTION

To prevent a malfunction, there are the limitations of setting update in this register.
For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.3.16 ADCHnODCR — Wiring-break Detection Control Register

ADCHnODCR is a 32-bit readable/writable register that controls wiring-break detection.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ODDE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ODE	—	ODPW[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 36.59 ADCHnODCR Register Contents

Bit Position	Bit Name	Function
31	ODDE	Wiring-break Detection Self-diagnosis Enable 0: Wiring-break detection self-diagnosis is not enabled. 1: Wiring-break detection self-diagnosis is enabled. When ODDE is set to 1, wiring-break detection self-diagnosis is enabled for all analog pins.
30 to 8	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
7	ODE	Wiring-break Detection Enable 0: Wiring-break detection is not enabled. 1: Wiring-break detection is enabled. When ODE is set to 1, wiring-break detection is enabled for all analog pins. After sampling for an A/D conversion ends, analog pins for which an A/D conversion is to be performed are discharged with the pulse width specified in ODPW[5:0].
6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	ODPW[5:0] ^{*1}	Wiring-break Detection Pulse Width 04 _H : 1 state (of internal clock) 05 _H : 2 states (of internal clock) : 13 _H : 16 states (of internal clock) 14 _H : 17 states (of internal clock)

Note 1. The setting of ODPW[5:0] must be greater than 03_H and less than 15_H.

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.17 ADCHnECR — Error Clear Register

ADCHnECR is an 8-bit write-only register that controls error clearing. The register bits are always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OWEC	PEC	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	W	W	R

Table 36.60 ADCHnECR Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2	OWEC	Overwrite Error Clear Writing 0: Not cleared Writing 1: Cleared
1	PEC	Parity Error Clear Writing 0: Not cleared Writing 1: Cleared
0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

36.3.3.18 ADCHnOWER — Overwrite Error Register

ADCHnOWER is an 8-bit read-only register that indicates an overwrite error.

ADCHnOWER is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0	
	OWE	—	OWECAP[5:0]						
Value after reset	0	0	0	0	0	0	0	0	
R/W	R	R	R	R	R	R	R	R	

Table 36.61 ADCHnOWER Register Contents

Bit Position	Bit Name	Function
7	OWE	Overwrite Error 0: No error is present 1: An error is present. Setting condition The A/D converted value is written to ADCHnDRj when WFLG = 1. Clearing condition A value of 1 is written to OWEC in ADCHnECR.
6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	OWECAP[5:0]	Overwrite Error Capture The virtual channel at the time when an overwrite error occurred is captured. Capturing condition The A/D converted value is written to ADCHnDRj when OWE = 0 and WFLG = 1. Clearing condition A value of 1 is written to OWEC in ADCHnECR.

CAUTION

ADCHnOWER is updated when the A/D converted value is written to ADCHnDRj.

36.3.3.19 ADCHnPER — Parity Error Register

ADCHnPER is an 8-bit read-only register that indicates a parity error. ADCHnPER is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0	
	PE	—	PECAP[5:0]						
Value after reset	0	0	0	0	0	0	0	0	
R/W	R	R	R	R	R	R	R	R	

Table 36.62 ADCHnPER Register Contents

Bit Position	Bit Name	Function
7	PE	Parity Error 0: No errors present 1: An error is present. Setting condition A parity error is detected. Clearing condition A value of 1 is written to PEC in ADCHnECCR.
6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	PECAP[5:0]	Parity Error Capture The virtual channel at the time when a parity error occurred is captured. Capturing condition A parity error is detected when PE = 0. Clearing condition A value of 1 is written to PEC in ADCHnECCR.

CAUTION

ADCHnPER is updated when ADCHnDRj or ADCHnDIRj is read, but is not updated when ADCHnDRj is read via the IFC.

36.3.3.20 ADCHnVCULLMTBR0 to 6 — Virtual Channel Upper/Lower Limit Table Register 0 to 6

ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6 are 32-bit readable/writable registers. ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6 are selected from ADCHnVCRj.VCULLMTBS[2:0]. These registers are initialized to 7FFE 0000_H by reset.

Value after reset: 7FFE 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 to 0	VCLLMTB[15:0]	<p>Lower Limit Table</p> <p>These bits specify the lower-limit value of an A/D converted value.</p> <p>Setting range: 0000_H to 7FFE_H</p> <p>Be sure to set it to the signed fixed-point format.</p> <p>VCLLMTB[15] and VCLLMTB[0] are always fixed to 0.</p> <p>When in normal-A/D-conversion-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] = 4_H), or normal-A/D-conversion-with-the-MPX-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] = 6_H), set the comparative value to the addition sum.</p>

36.3.3.21 ADCHnVCLMINTER1 — Virtual Channel Upper/Lower Limit Error Interrupt Enable Register 1

ADCHnVCLMINTER1 is a 32-bit readable/writable register for output control of the upper/lower limit error interrupt for virtual channels 0 to 31. ADCHnVCLMINTER1 is initialized to 0000 0000_H at reset.

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31 to 0	ADULjIE	Virtual channel upper / lower limit error enable 0: The upper / lower limit error interrupt (INT_ULn) is not output by result of the virtual channel j. 1: The upper / lower limit error interrupt (INT_ULn) is output by the result of the virtual channel j.

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.22 ADCHnVCLMINTER2 — Virtual Channel Upper/Lower Limit Error Interrupt Enable Register 2

ADCHnVCLMINTER2 is a 32-bit readable/writable register for output control of the upper/lower limit error interrupt for virtual channels 32 to 39. ADCHnVCLMINTER2 is initialized to 0000 0000_H at reset.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.65 ADCHnVCLMINTER2 Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	ADULjIE	Virtual channel upper / lower limit error enable 0: The upper / lower limit error interrupt (INT_ULn) is not output by the result of the virtual channel j. 1: The upper / lower limit error interrupt (INT_ULn) is output by the result of the virtual channel j.

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.3.23 ADCHnVCLMSR1 — Virtual Channel Upper/Lower Limit Excess Status Register 1

ADCHnVCLMSR1 is a 32-bit read-only register that indicates an upper/lower limit excursion of virtual channel 0 to 31. ADCHnVCLMSR1 is initialized to 0000 0000_H at reset.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 0	VCjLMS	Virtual channel j upper / lower limit status 0: Limit has not been passed. 1: Limit has been passed. Setting condition The upper limit or the lower limit excursion has been detected. Clearing condition A value of 1 is written to VCjLMSC of ADCHnVCLMSR1.

36.3.3.24 ADCHnVCLMSR2 — Virtual Channel Upper/Lower Limit Excess Status Register 2

ADCHnVCLMSR2 is a 32-bit read-only register that indicates an upper/lower limit excursion of virtual channel 32 to 39. ADCHnVCLMSR2 is initialized to 0000 0000_H at reset.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

36.3.3.25 ADCHnVCLMSR1 — Virtual Channel Upper/Lower Limit Excess Status Clear Register 1

ADCHnVCLMSR1 is a 32-bit write-only register that clears virtual channel upper/lower limit excursion status register1 (ADCHnVCLMSR1). The register bits are always read as 0.

Value after reset: 0000 0000_H

Table 36.69 ADCHnVCLMSR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	VCjLMSR	Virtual channel j upper / lower limit excess status clear 0: Not cleared. 1: VCjLMSR of ADCHnVCLMSR2 is cleared.

36.3.4 Scan Group Specific Registers

This section describes registers provided for each scan group.

36.3.4.1 ADCHnSGSTCRx — Scan Group x Start Control Register

ADCHnSGSTCRx is an 8-bit write-only register that controls the start of scan group x. The register bits are always read as 0.

Value after reset: 00H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SGST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.70 ADCHnSGSTCRx Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	SGST	Scan Group Start Condition for starting scan group x: A value of 1 is written to SGST when SGACTION = 0 Writing 0 to this bit is ignored.

36.3.4.2 ADCHnSGSTPCR_x — Scan Group x Stop Control Register

ADCHnSGSTPCR_x is an 8-bit write-only register that controls the stop of scan group x. The register bits are always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SGSTP
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.71 ADCHnSGSTPCR_x Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	SGSTP	Scan Group Stop Condition for stopping scan group x: A value of 1 is written to SGSTP when SGACT = 1 When SGACT = 0, writing 1 to this bit is ignored. Writing 0 to this bit is ignored.

36.3.4.3 ADCHnADTSTCRy — A/D Timer y Start Control Register

ADCHnADTSTCRy is an 8-bit write-only register that controls the start of A/D timer y. The register bits are always read as 0.

Value after reset: 00H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.72 ADCHnADTSTCRy Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADTST	A/D Timer Start Condition for starting A/D timer y: A value of 1 is written to ADTST when ADTACT = 0 Writing 0 to this bit is ignored.

36.3.4.4 ADCHnADTENDCRy — A/D Timer y End Control Register

ADCHnADTENDCRy is an 8-bit write-only register that controls stop of A/D timer y. The register bits are always read as 0.

Value after reset: 00H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.73 ADCHnADTENDCRy Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADTEND	A/D Timer End Condition for finishing A/D timer y: A value of 1 is written to ADTEND when ADTACT = 1 Writing 0 to this bit is ignored.

36.3.4.5 ADCHnSGCRx — Scan Group x Control Register

ADCHnSGCRx is an 8-bit readable/writable register that controls scan group x. ADCHnSGCRx is initialized to 00_H at reset.

Value after reset: 00_H

• When x = 0 to 2

Bit	7	6	5	4	3	2	1	0
	—	ADSTARTE	SCANMD	ADIE	—	—	—	TRGMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R/W

Table 36.74 ADCHnSGCRx Register Contents (x = 0 to 2)

Bit Position	Bit Name	Function
7	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
6	ADSTARTE	Scan Group Synchronization Start Enable 0: ADSTART is disabled. 1: ADSTART is enabled.
5	SCANMD	Scan Mode 0: Multicycle scan mode 1: Continuous scan mode In multicycle scan mode, scans are repeated as many times as specified in ADCHnSGMCCRx. In continuous scan mode, scans are repeated with no limit of times.
4	ADIE	Scan End Interrupt Enable 0: ADInx is not output at the end of scan for SGx. 1: ADInx is output at the end of scan for SGx. ADIE of ADCHnSGCRx is independent of ADIE of ADCHnVCRj. For details, see Section 36.4.6.1, Scan End Interrupt Request.
3 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	TRGMD	Trigger Mode 0: Trigger input to SGx is disabled. 1: The SGx_TRG hardware trigger is selected for the trigger input to SGx.

• When x = 3 or 4

Bit	7	6	5	4	3	2	1	0
	ADTSTARTE	ADSTARTE	SCANMD	ADIE	—	—	TRGMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Table 36.75 ADCHnSGCRx Register Contents (x = 3 or 4)

Bit Position	Bit Name	Function
7	ADTSTARTE	A/D Timer Synchronization Start Enable 0: ADTSTART is disabled. 1: ADTSTART is enabled.
6	ADSTARTE	Scan Group Synchronization Start Enable 0: ADSTART is disabled. 1: ADSTART is enabled.
5	SCANMD	Scan Mode 0: Multicycle scan mode 1: Continuous scan mode In multicycle scan mode, scans are repeated as many times as specified in ADCHnSGMCCRx. In continuous scan mode, scans are repeated with no limit of times.
4	ADIE	Scan End Interrupt Enable 0: ADInx is not output at the end of scan for SGx. 1: ADInx is output at the end of scan for SGx. ADIE of ADCHnSGCRx is independent of ADIE of ADCHnVCRj. For details, see Section 36.4.6.1, Scan End Interrupt Request .
3, 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TRGMD[1:0]	Trigger Mode 0 _H : Trigger input to SGx is disabled. Trigger input to A/D timer x is disabled. 1 _H : SGx_TRG hardware trigger is selected for the trigger input to SGx. Trigger input to A/D timer x is disabled. 2 _H : A/D timer trigger x is selected for the trigger input to SGx. Trigger input to A/D timer x is disabled. 3 _H : A/D timer trigger x is selected for the trigger input to SGx. The SGx_TRG hardware trigger is selected for the trigger input to A/D timer x.

CAUTIONS

- To prevent a malfunction, there are the limitations of setting update in this register.
For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.
- If a higher-priority scan group is set to continuous scan mode (SCANMD = 1), a lower-priority scan group can not operate.
- Hardware trigger (scan group x start) input to a started scan group x is ignored.

36.3.4.6 ADCHnSGVCSPx — Scan Group x Start Virtual Channel Pointer

See **Section 36.3.4.12, ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register** together.

ADCHnSGVCSPx is an 8-bit readable/writable register that specifies the start pointer of a virtual channel.

ADCHnSGVCSPx is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0	
	—	—	VCSP[5:0]						
Value after reset	0	0	0	0	0	0	0	0	
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	

Table 36.76 ADCHnSGVCSPx Register Contents

Bit Position	Bit Name	Function
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCSP[5:0]	Start Virtual Channel Pointer These bits select the virtual channel from which the scan is to be started. When an SGx is started, processing for the virtual channels from ADCHnSGVCSPx to ADCHnSGVCEPx is executed.

CAUTIONS

- Do not set the value greater than 39.
- ADCHnSGVCSPx must be equal to or less than ADCHnSGVCEPx.
- This register has a mirror structure as follows. While scan group x is executing, if it is necessary to rewrite SGVCSP and SGVCEPx, be sure to use a mirror register.

This Register	Mirror Register
ADCHnVCSPx.VCSP[5:0]	ADCHnVCPRx.VCSP[5:0]

- It is possible to set same virtual channel n (ADCHnVCRj) in more than one scan group x by setting the start / end virtual channel pointer.
But, when a virtual channel is overwritten while one scan group is operating, the setting for A/D conversion might be different from the desired setting for this scan group.

Make sure to use caution of the information below to avoid this problem.

- When designing a system, always specify the same value for the ADCHnVCRj setting when it is used by multiple scan groups for the target channel.
- Rewrite ADCHnVCRj after stopping all scan groups of a target channel.

When these are not obeyed, A/D conversion results can't be guaranteed.

- To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.4.7 ADCHnSGVCEPx — Scan Group x End Virtual Channel Pointer

See **Section 36.3.4.12, ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register** together.

ADCHnSGVCEPx is an 8-bit readable/writable register that specifies the end pointer of a virtual channel.

ADCHnSGVCEPx is initialized to 00_H at reset.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0	
	—	—	VCEP[5:0]						
Value after reset	0	0	0	0	0	0	0	0	
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	

Table 36.77 ADCHnSGVCEPx Register Contents

Bit Position	Bit Name	Function
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCEP[5:0]	End Virtual Channel Pointer These bits select the virtual channel at which the scan is to be ended. When SGx is started, processing for the virtual channels from ADCHnSGVCSPx to ADCHnSGVCEPx is executed.

CAUTIONS

- This register has a mirror structure as follows. While scan group x is executing, if it is necessary to rewrite SGVCSP and SGVCEP, be sure to use a mirror register.

This Register	Mirror Register
ADCHnVCEPx.VCSP[5:0]	ADCHnVCPRx.VCEP[5:0]

See **Section 36.3.4.6, ADCHnSGVCSPx — Scan Group x Start Virtual Channel Pointer** for other cautions.

- To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.4.8 ADCHnSGMCYCRx — Scan Group x Multicycle Register

ADCHnSGMCYCRx is an 8-bit readable/writable register that specifies the number of scan cycles in multicycle scan mode. ADCHnSGMCYCRx is initialized to 00_H at reset.

Table 36.78 ADCHnSGMCYCRx Register Contents

Bit Position	Bit Name	Function
7 to 0	MCYC[7:0]	Multicycle Specification These bits specify the number of scan cycles in multicycle scan mode. Number of scan cycles = MCYC[7:0] + 1 When SGx is started, scans are repeated for virtual channels from ADCHnSGVCSPx to ADCHnSGVCEPx for many cycles as specified in ADCHnSGMCYCRx.

CAUTION

To prevent malfunction, there is the limitations of setting update in this register.
 For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.3.4.9 ADCHnSGSRx — Scan Group x Status Register

ADCHnSGSRx is an 8-bit read-only register that indicates the status of scan group x.

Value after reset: 00_H

• When x = 0 to 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SGACT	—
Value after reset	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2	ADTACT	A/D Timer Status 0: A/D timer x is in idle state. 1: A/D timer x is running.
1	SGACT	Scan Group Status 0: There is no source in SGx. 1: There is a source in SGx. (The period from the reception of a starting trigger until A/D conversion completion, or until aborting by ADHALT or SGSTP.)
0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

36.3.4.10 ADCHnADTIPRy — A/D Timer y Initial Phase Register

ADCHnADTIPRy is a 32-bit readable/writable register that sets the initial count of A/D timer y. ADCHnADTIPRy is initialized to 0000 0000_H at reset.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADTIP[20:16]

Table 36.81 ADCHnADTIPRy Register Contents

Bit Position	Bit Name	Function
31 to 21	-	Reserved When read, the value after reset is returned. When writing, write the value after reset.
20 to 0	ADTIP[20:0]	A/D Timer Initial Phase These bits set the initial phase of A/D timer y. (1) After A/D timer y is started, ADCHnADTIPRy is loaded to A/D timer y and the timer counts down. (2) After A/D timer y becomes 0, A/D timer trigger y is output for one cycle, ADCHnADTPRRy is loaded to A/D timer y, and the timer counts down again. After that, (2) is repeated. For details, see Section 36.4.5.3, A/D Timer Trigger .

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.4.11 ADCHnADTPRRy — A/D Timer y Cycle Register

ADCHnADTPRRy is a 32-bit readable/writable register that sets the cycle count of A/D timer y. ADCHnADTPRRy is initialized to 001F FFFF_H at reset.

Value after reset: 001F FFFF_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADTPR[20:16]

Table 36.82 ADCHnADTPRRy Register Contents

Bit Position	Bit Name	Function
31 to 21	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
20 to 0	ADTPR[20:0]	A/D Timer Cycle These bits set the cycle of A/D timer y. (1) After A/D timer y is started, ADCHnADTIPRy is loaded to A/D timer y and the timer counts down. (2) After A/D timer y becomes 0, A/D timer trigger y is output for one cycle, ADCHnADTPRRy is loaded to A/D timer y, and the timer counts down again. After that, (2) is repeated. For details, see Section 36.4.5.3, A/D Timer Trigger .

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update**.

36.3.4.12 ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register

ADCHnSGVCPRx is a 16-bit readable/writable register that specifies the start/end pointer of a virtual channel. For this register, write as 16-bit.

Value after reset: 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	VCEP[5:0]						—	—	VCSP[5:0]

Table 36.83 ADCHnSGVCPRx Register Contents

Bit Position	Bit Name	Function
15 to 14	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	VCEP[5:0]*1	End Virtual Channel Pointer (mirror of ADCHnSGVCEP)
7 to 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCSP[5:0]*1	Start Virtual Channel Pointer (mirror of ADCHnSGVCSP)

Note 1. For details of this function, see **Section 36.3.4.6, ADCHnSGVCSPx — Scan Group x Start Virtual Channel Pointer** and **Section 36.3.4.7, ADCHnSGVCEPx — Scan Group x End Virtual Channel Pointer**.

36.3.4.13 ADCHnSGVCOWRx — Scan Group x Virtual Channel Optional Waiting Times Register

ADCHnSGVCOWRx is a 16-bit readable/writable register that specifies an optional wait time in an execution interval of virtual channel j and virtual channel j+1.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VCOW[11:0]

Table 36.84 ADCHnSGVCOWRx Register Contents

Bit Position	Bit Name	Function
15 to 12	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	VCOW[11:0]	Wait Time Specification Between Virtual Channels of same scan group 000 _H : No wait. 001 _H to FFF _H : set value x 4 ADCLK Note: For example, to set wait times to 1us, set VCOW[11:0] to 00A _H . Wait time, please set the VCOW value in the range of 1...400us at 1us intervals.

CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to **Section 36.4.1.4, Limitations of Setting Update.**

36.4 Operation

A/D conversion is performed by scan group.

Virtual channels that are assigned by the scan group start/end pointer are scanned in ascending order.

When multiple scan groups start up, the processing is performed from the scan group with the highest priority.

After the initial settings, scan starts by input of the start trigger.

Scan ends when A/D conversion ends for the specified count or by forced termination.

Information about the settings, functions, and operations is described below.

36.4.1 Setting Procedure

36.4.1.1 Initial Settings

The initial settings must be specified while the trigger of all the scan groups is disabled and all the scan groups and all accumulation channels stop.

If such items shown above are running, perform the termination procedure.

Use the value after reset for the register setting value of the function that is not to be used.

(1) Registers that must be set

The control bit that is required to be set at minimum for executing A/D conversion is defined as a required setting bit.

The required setting bit contains the following bits:

- Bits that determine the operating mode of the SAR-ADC (SM).
- Bits that determine physical channels and virtual channels to be subject to A/D conversion.

Registers that contain the required setting bits are as below:

Table 36.85 Required Registers which must be set for proper operation

Classification	Register	Indispensable Setting Bit	Explanation	Addition
Required	ADCHnADCR1	SUSMTD	Suspend method	—
	ADCHnADCR2	DFMT	Data format	—
	ADCHnVCRj	CNVCLS, GCTRL	Conversion class, General control	Setting is unnecessary for ADCHnVCRj which are not used.
	ADCHnSGCRx	SCANMD	Scan mode	Setting is unnecessary for SGx which are not used.
	ADCHnSGMCYCRx	MCYC[7:0]	The number of multi-cycle-scan times	Setting is unnecessary for SGx that a continuous mode is chosen.
	ADCHnSGVCOWRx	VCOM[11:0]	Optional waiting times of between virtual channels	Setting is unnecessary for SGx that the waiting times aren't inserted between the virtual channels.
At least one of these must be set	ADCHnSGVCSPx, ADCHnSGVCEPx	VCSP, VCEP	Starting / end pointer	Setting is unnecessary for SGx which isn't used.
	ADCHnSGVCPRx			

Please set registers other than these properly according to the function to use.

(2) About Setting Order

Any register setting sequence is acceptable regardless of whether the register contains the required setting bit.

Set registers in the desired order.

The initial setting flow is shown below. The setting order in the flow is for convenience.

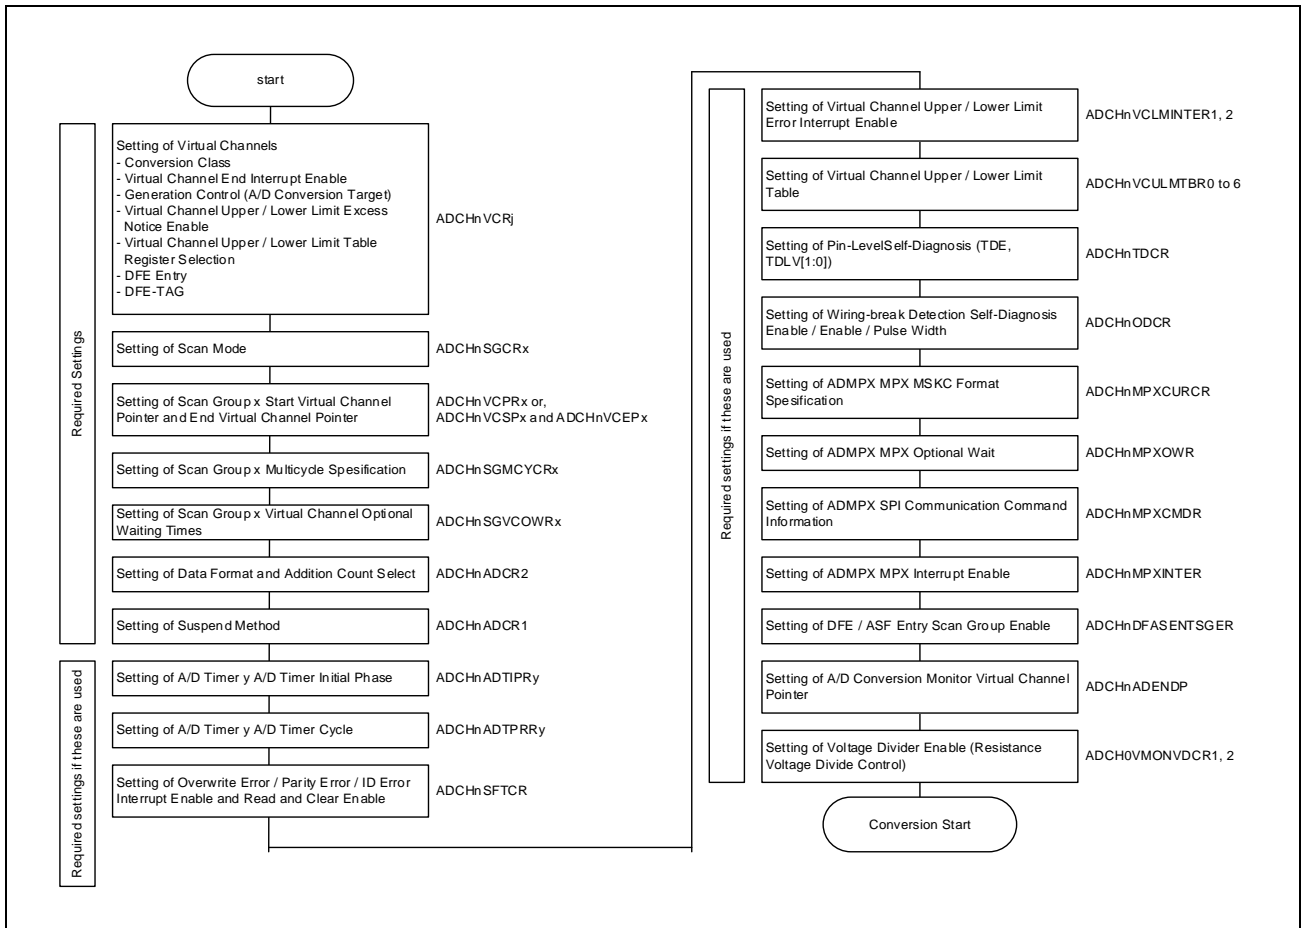

Figure 36.5 Initial Setting Flow

36.4.1.2 Startup Method

This section describes how to start up scan group x, AD timer x.

The procedure differs depending on the startup target.

Perform the startup procedure during the initial setting, or while scan group x to be started is stopped (ADCHnSGSRx.SGACT = 0) after the settings have been updated.

The startup procedure is ignored if the target is already operating.

Table 36.86 Startup Method of Scan Group x, AD Timer y and ASF

Starting target	Trigger type	Starting method
Scan group x	S/W trigger	Write 1 to ADCHnSGSTCRx.SGST.
	H/W trigger	<ol style="list-style-type: none"> 1. Set 1_H to SGCRx.TRGM [1:0]. 2. Input a High pulse signal of 1ADCLK width to the SGx_TRG terminal.
A/D conversion synchronous start	S/W trigger	<ol style="list-style-type: none"> 1. Set SGCRx.ADSTARTE to 1 for scan group x of ADCH0. 2. Set SGCRx.ADSTARTE to 1 for scan group x of ADCH2. 3. Set SGCRx.ADSTARTE to 1 for scan group x of ADCH1. 4. Set SGCRx.ADSTARTE to 1 for scan group x of ADCH3. 5. Write 1 to ADSYNSTCR.ADSTART.
A/D timer y	S/W trigger	Write 1 to ADTSTCRx.ADTST.
	H/W trigger	<ol style="list-style-type: none"> 1. Set SGCRx.TRGM [1:0] to 3H. 2. Input the H pulse signal with 1 clkad width to the SGx_TRG pin.
A/D timer synchronous start	S/W trigger	<ol style="list-style-type: none"> 1. Set SGCRx.ADTSTARTE to 1 for scan group x of ADCH0. 2. Set SGCRx.ADTSTARTE to 1 for scan group x of ADCH2. 3. Set SGCRx.ADTSTARTE to 1 for scan group x of ADCH1. 4. Set SGCRx.ADTSTARTE to 1 for scan group x of ADCH3. 5. Write 1 to ADTSYNSTCR.ADTSTART.
Setting of ASF	—	See Section 36.8, ADC Summation Function (ASF) .

36.4.1.3 Terminating Procedure

This section describes the procedure to terminate scan groups.

There are three termination methods: termination of all scan groups (forced termination), termination of scan group x 1 and termination of scan group x 2.

For the detailed description of ASFrCTL1 register in each flow, please see **Section 36.8, ADC Summation Function (ASF)**.

(1) To Terminate All Scan Groups (Forced Termination)

This procedure is to terminate all scan groups.

Please clear the multiplication counter in ASF and all intermediate buffers as ASFrCTL1.ASFrST = 0 of ASF when either of scanning group is using ASF.

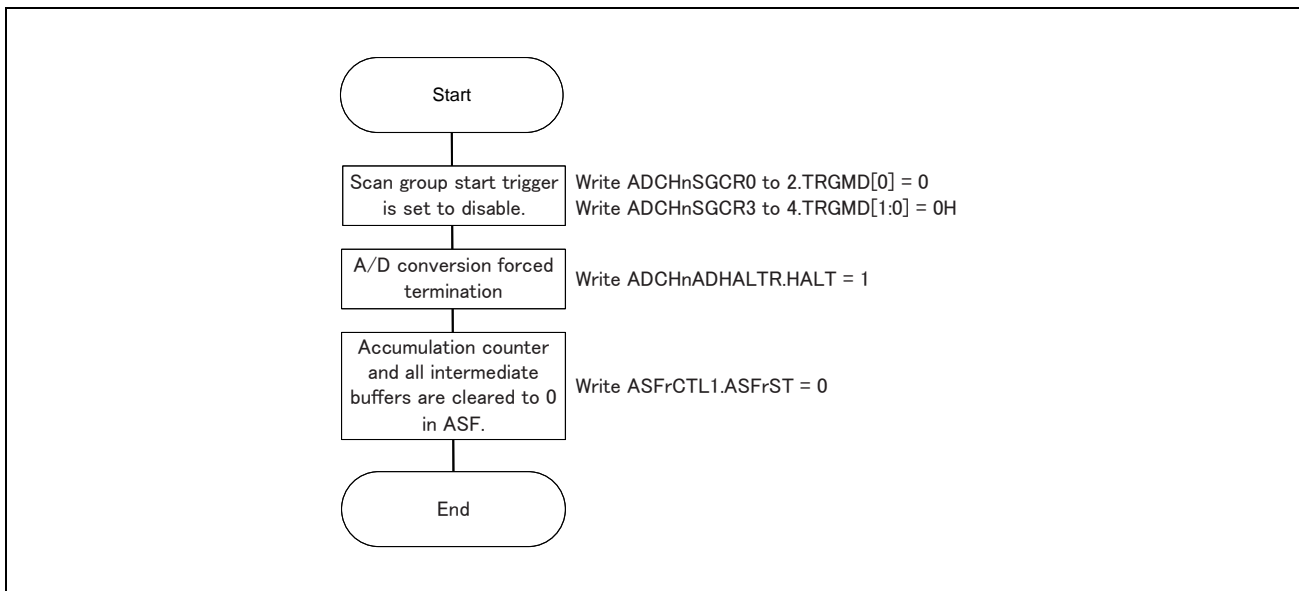

Figure 36.6 All Scan Group (A/D halt) Flow

For the detailed description of termination timing, please see **Section 36.4.14.1, Example of All Scan Group Stop (A/D Halt)**.

(2) Scan Group x Termination Procedure 1

This procedure is to terminate scan group x individually.

To terminate multiple scan groups, perform this termination procedure for each scan group.

This procedure can be applied to scan groups that are operating in multicycle scan mode.

When terminating a scan group that is operating in continuous scan mode, please see **Section 36.4.1.3(1), To Terminate All Scan Groups (Forced Termination)** or **Section 36.4.1.3(3), Scan Group x Termination Procedure 2**.

Please clear the multiplication counter in ASF and all intermediate buffers as `ASFrCTL1.ASFrST=0` of ASF when the scanning group that stops is using ASF.

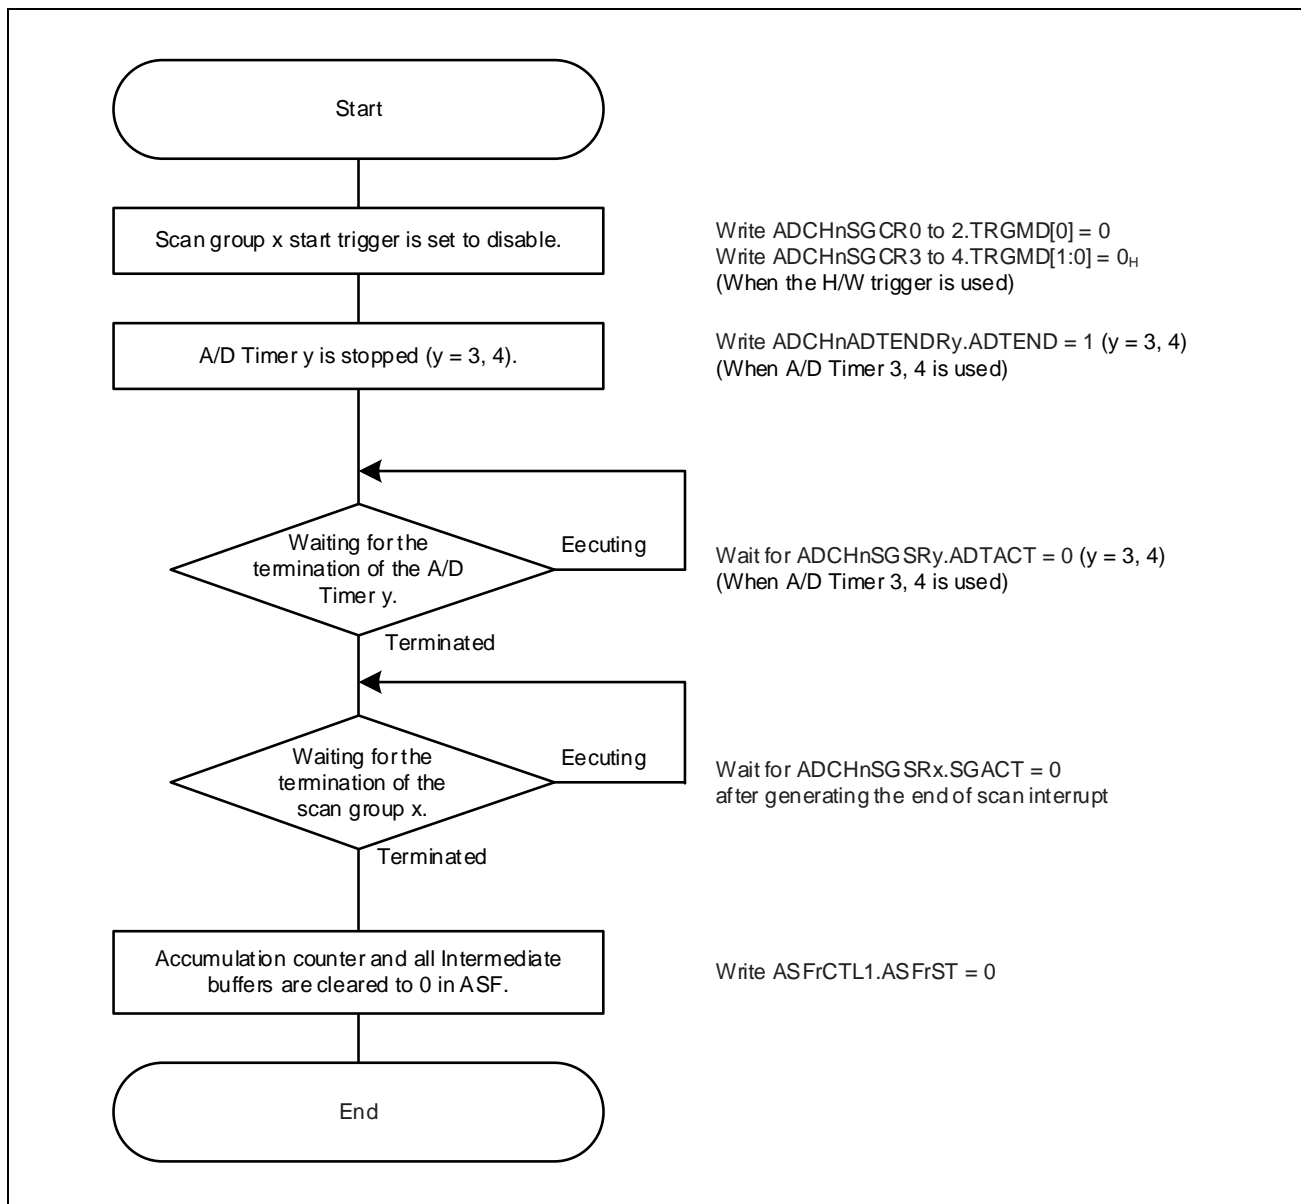

Figure 36.7 Scan Group x Termination Flow 1

(3) Scan Group x Termination Procedure 2

This procedure stops individual scanning group x.

Please execute the shutdown procedure to each scanning group when stopping two or more scanning groups.

This procedure can be applied to the scanning group operating by either of the multi cycle scanning mode/mode of a continuous scanning.

When scan group x is stopped by this procedure, it operates as the following.

When scan group x stop control register is written as 1, an ongoing virtual channel is ended with waiting completion of the remaining processing.

When an ongoing virtual channel is ended, scan group x is ended.

Please clear the multiplication counter in ASF and all intermediate buffers as $ASF1nCTL1.ASF1nST=0$ of ASF when the scanning group that stops is using ASF.

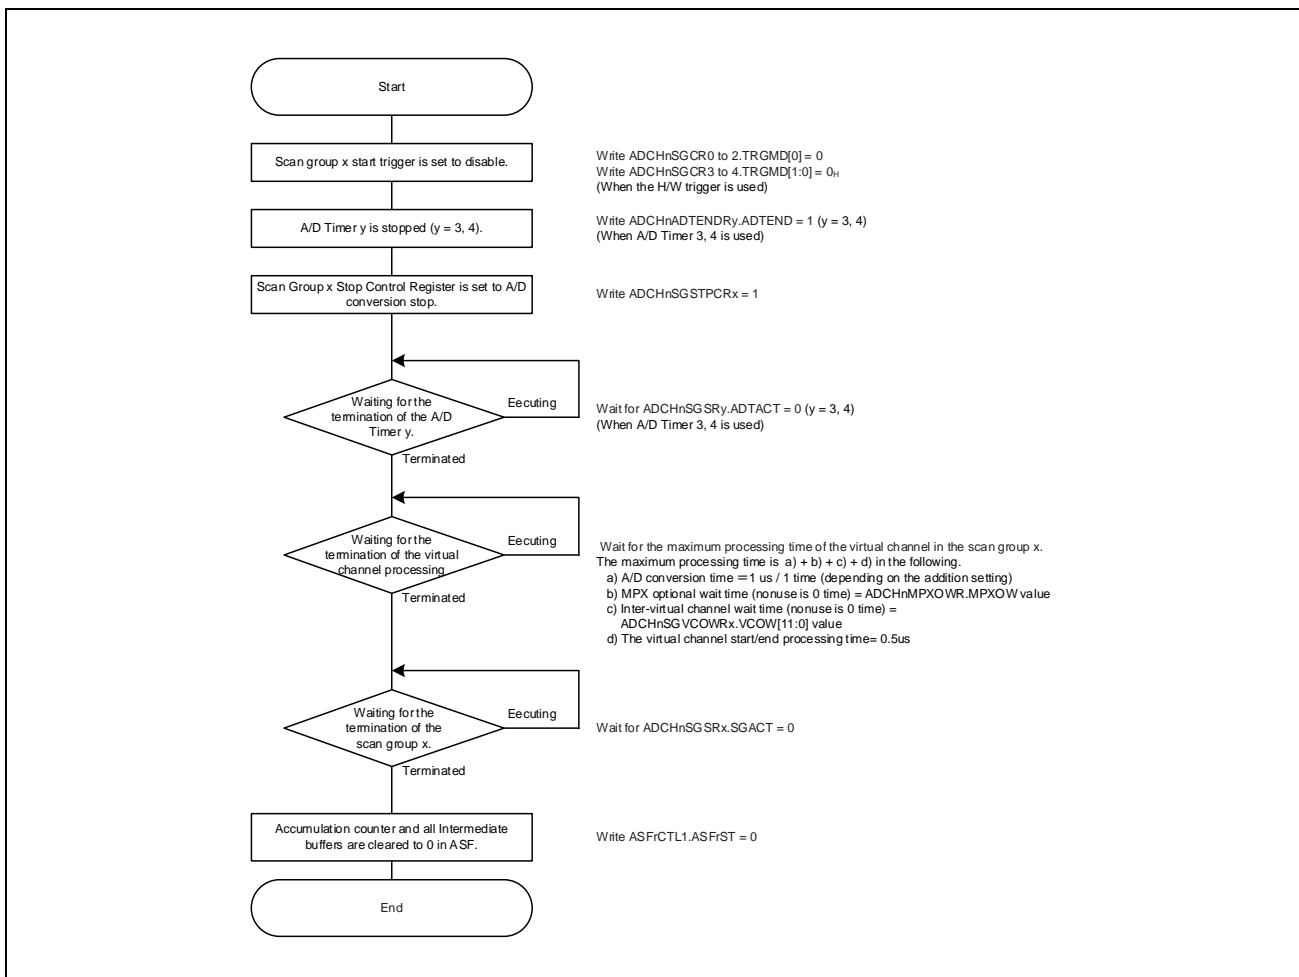

Figure 36.8 Scan Group x Termination Flow 2

When scan group x stop control register is written as 1 in near the end of the A/D conversion, scan group which corresponds changes to IDLE as intended.

But if interrupt-enable-bit (ADCHnSGCRx.ADIE and ADCHnVCRj.ADIE) is set as 1, there is potential which the scan end interrupt request (ADInx) is output.

So if this is dissatisfied, set interrupt-enable-bit (ADCHnSGCRx.ADIE and ADCHnVCRj.ADIE) as 0 before scan group x stop control register is written as 1.

For the detailed description of termination timing, please see **Section 36.4.14.2, Example of Scan Group x Stop.**

36.4.1.4 Limitations of Setting Update

A period to update the setting is limited for the registers shown in the initial setting flow.

To update:

Scan group stop → Register setting update → Scan group startup

Note 1. When a scan group of a stop target is using H/W trigger, invalidate H/W trigger before stopping.

The period for updating differs depending on registers as follows.

Update settings after the specified termination procedure according to the following table:

Table 36.87 Possible Period of Setting Update of Register for Initial Setup

Register	Bits	Update Possible Period
ADCHnADCR1	All bits	1) All scan groups stop
ADCHnADCR2		
ADCHnSFTCR		
ADCHnTDCR		
ADCHnODCR		
ADCHnMPXCURCR		
ADCHnMPXOWR		
ADCHnMPXINTER		
ADCHnDFASENTSGER		
ADCHnADENDP		
ADCHnVMONVDCR1, 2		
ADCHnVCLMINTER1, 2		
ADCHnSGVCOWRx		
ADCHnSGCRx		
ADCHnSGMCYCRx	All bits	
ADCHnSGVCSPx		
ADCHnSGVCEPx		
ADCHnVCR00 to 39		
ADCHnSGCRx	ADTSTARTE, ADSTARTE, TRGMD[1:0] *, ADIE (Clear only)	3) Always updatable
ADCHnSGVCPRx	All bits	
ADCHnVCULLMTBR0 to 6		
ADCHnMPXCMDR	All bits	
ADCHnADTIPR3 to 4		4) Setting target AD timer y stop
ADCHnADTPRR3 to 4		

Note: For TRGMD[1:0], ADTSTARTE and ADSTARTE, see **Section 36.4.1.2, Startup Method** and **Section 36.4.1.3, Terminating Procedure** also.

The updated setting value is applied at the following timing.

ADCHnSGCRx: Immediately

ADCHnSGVCPRx: Next time the corresponding scan group x starts up

ADCHnVCULLMTBR0~6: Immediately

ADCHnMPXCMDR: Start time of normal A/D conversion with the MPX or normal A/D conversion with the MPX in addition mode

36.4.2 Scan Mode

There are two scan modes.

36.4.2.1 Multicycle Scan Mode

A/D conversion for virtual channels assigned to the target SGx is repeated for a specified count (1 to 256 times.)

Set the SGCRx.SCANMD bit to 0 to start multicycle scan mode.

Specify the scan count in the SGMCYCR register. The setting range of the values is from 00H to FFH. The setting value should be a value obtained by subtracting 1 from the desired execution count.

The following figure shows an operation example when the scan count is 2.

- Conversion type: Normal A/D conversion mode (CNVCLS[2:0] = 0H)
- Scan group 0
- Virtual channel: ADCHnVCR0 to ADCHnVCR3

Figure 36.9 Example of Operation in Multicycle Scan Mode

36.4.2.2 Continuous Scan Mode

A/D conversion for virtual channels assigned to the target SGx is repeated with unlimited count.

Set the SGCRx.SCANMD bit to 1 to start continuous scan mode. The setting value of the SGMCYCR register is not effective.

The following figure shows an operation example.

- Conversion type: Normal A/D conversion mode (CNVCLS[2:0] = 0H)
- Scan group 0
- Virtual channel: ADCHnVCR0 to ADCHnVCR3

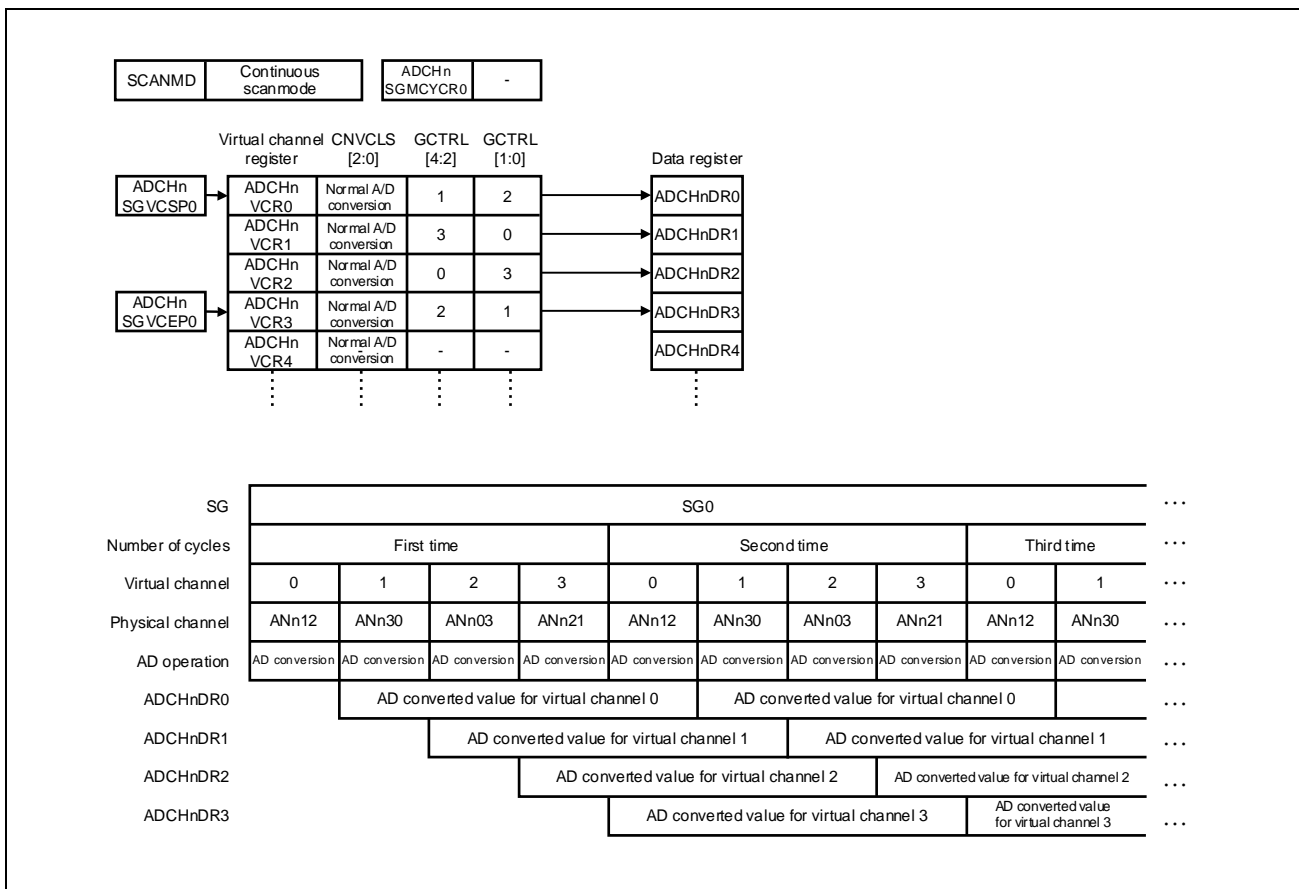

Figure 36.10 Example of Operation in Continuous Scan Mode

36.4.3.1 Synchronous Suspend

The synchronous suspend function interrupts the processing after A/D conversion operation for the virtual channel in progress ends and then starts A/D conversion for the scan group with higher priority.

After A/D conversion for the scan group with higher priority is completed, A/D conversion for the interrupted virtual channel resumes.

The following figure shows an operation example of synchronous suspend.

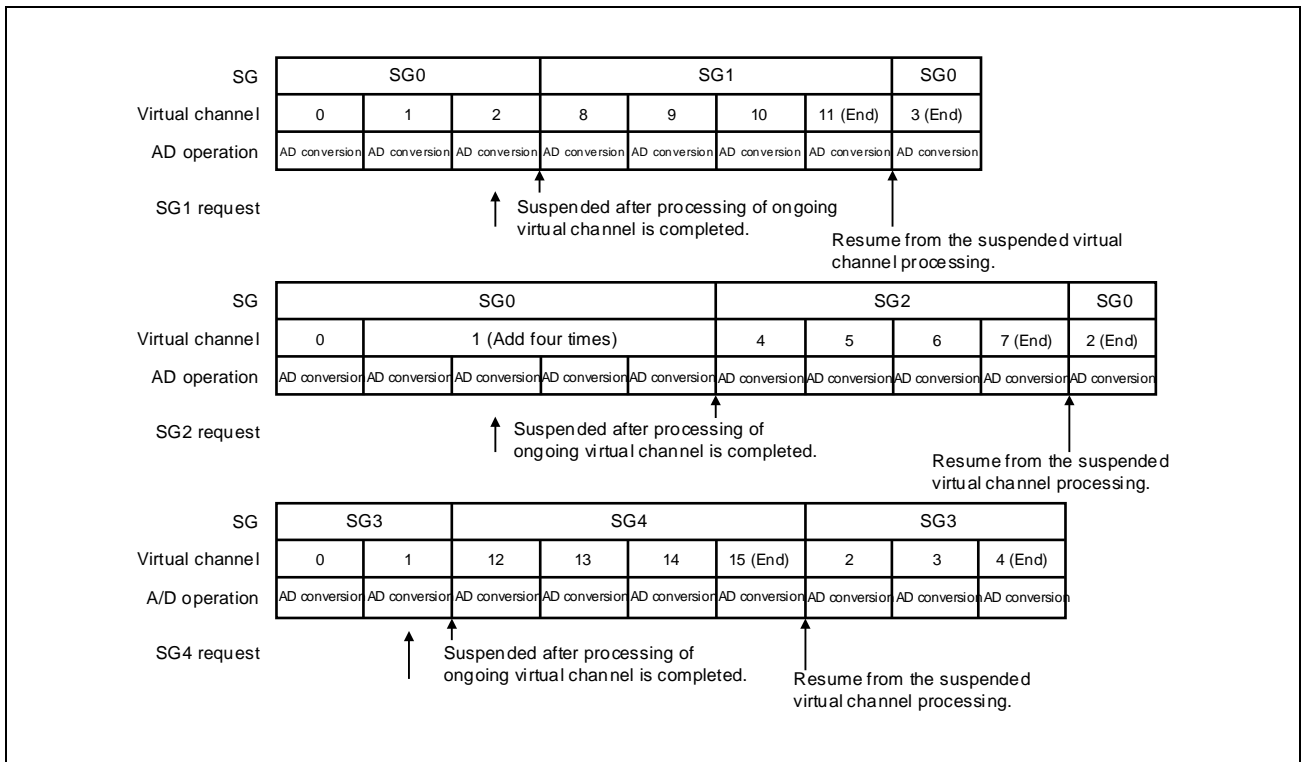

Figure 36.11 Example of Synchronous Suspend and Resume Operation

36.4.3.2 Asynchronous Suspend

The asynchronous suspend function immediately interrupts the processing without waiting until A/D conversion operation for the virtual channel in progress ends and then starts A/D conversion for the scan group with higher priority. After A/D conversion for the scan group with higher priority is completed, A/D conversion for the interrupted virtual channel resumes from the beginning.

The following figure shows an operation example of asynchronous suspend.

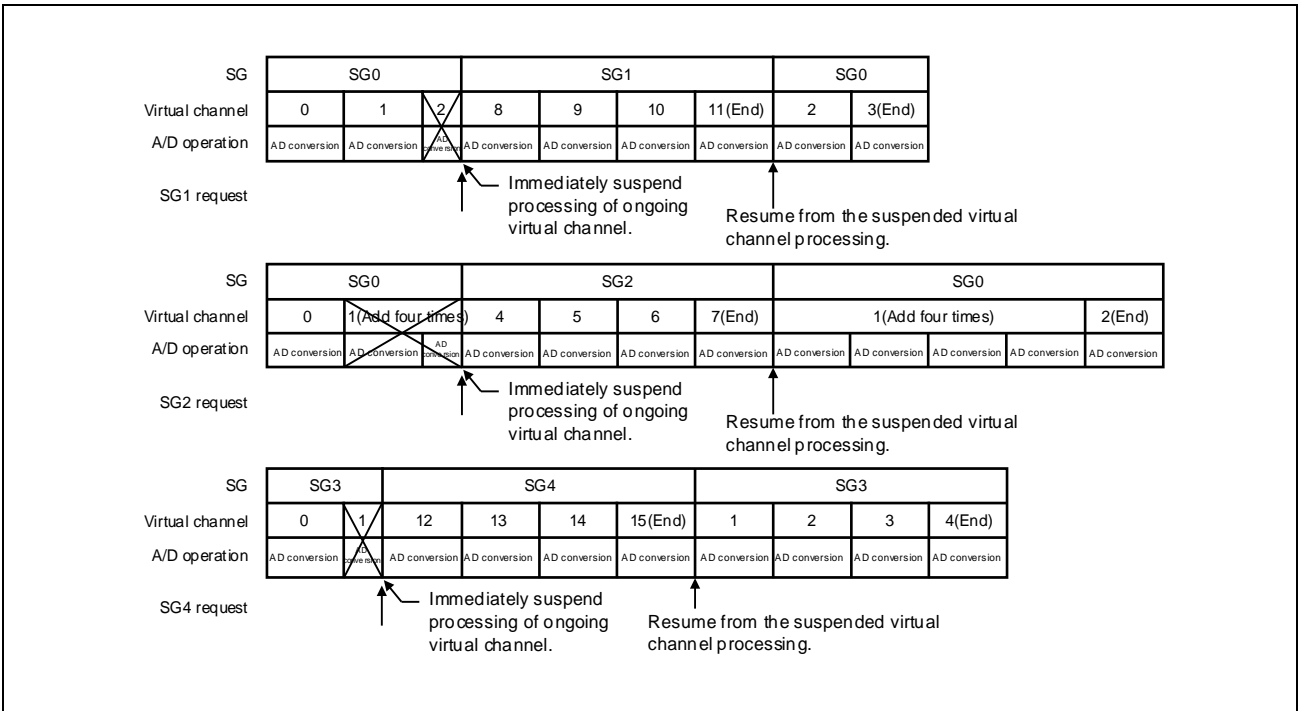

Figure 36.12 Example of Asynchronous Suspend and Resume Operation

36.4.3.3 Synchronous/Asynchronous Mixture Type Suspend

When a scan group with higher priority interrupts scan group 0, the asynchronous suspend method is applied. When a scan group with higher priority interrupts scan groups other than scan group 0, the synchronous suspend method is applied.

The following figure shows an operation example of synchronous/asynchronous-mixed suspend.

Figure 36.13 Synchronous/Asynchronous-Mixed Suspend

36.4.4 Conversion Class

There are 5 conversion types. The conversion type must be set for each virtual channel, see **Section 36.4.13, Optional Waiting Times Insertion Function of Between Virtual Channels.**

36.4.4.1 Normal A/D Conversion

Normal A/D conversion converts an analog signal in the physical channel to a digital signal as-is.

For details about the operation, see **Section 36.4.2, Scan Mode.**

36.4.4.2 A/D Converter Self-Diagnosis

This conversion method is one of the safety functions.

A/D converter self-diagnosis A/D conversion separates the physical channel and applies the specified voltage to the analog input pin of the A/D converter to perform A/D conversion.

For details about the operation, see **Section 36.4.11.2, A/D Converter Self-Diagnosis.**

36.4.4.3 Example of Addition Mode A/D Conversion Operation

Addition mode A/D conversion converts an analog signal in the physical channel to a digital signal two or four times continuously, and then stores the addition value in the data register. The number of addition times (two or four times) is common among all the virtual channels.

The following figure shows an example of the operation:

Figure 36.14 Example of Normal A/D Conversion Operation in Addition Mode

For operation when suspend occurs during execution of addition mode A/D conversion, refer to **Section 36.4.3, Suspend Method**.

36.4.4.4 Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode

These functions perform A/D conversion by selecting the MPX input channel (MPX value) in the physical channel for which the MPX is connected to the external of the LSI.

There are two methods: normal A/D conversion (without addition) and addition mode A/D conversion.

To transfer the MPX value to the external of the LSI, use functions of the DMAC, IO port, CSIH, and ADMPXn4 to ADMPXn0.

The following registers must be set in advance. See the specifications of each function to set the following registers:

- MPX current control register (ADCHnMPXCURCR)
- MPX command information register (ADCHnMPXCMDR)
- MPX physical channel number of the virtual channel register n (ADCHnVCRj.GCTRL[4:0])
- MPX optional wait register (ADCHnMPXOWR)
- MPX interrupt enable register (ADCHnMPXINTER)

The ADCHn operates as follows:

- (1) Stores the values of ADCHnMPXCURCR, ADCHnMPXCMDR, ADCHnVCRj.GCTRL[4:0] in the MPX current register (ADCHnMPXCURR) when starting the virtual channel and outputs an interrupt signal (ADMPXIn).
- (2) Output the ADCHnMPXCURR.MPXCUR[4:0] value to ADMPXn4 to ADMPXn0 when ADMPXIn outputs.
- (3) Inserts wait states specified in MPXOWR.
(Waits until the MPX value is transferred by the DMAC, IO port, or CSIH and MPX output is settled.)
- (4) Performs A/D conversion for the physical channel connected with the MPX.

Wait states must be set so that the MPX value transfer time and MPX output settling time can be secured.

Wait states can be set within the range from 0 to 10. 1 wait state is 40 ADCLK.

See the IO port specifications to set the mask setting value of the MPX current control register.

This setting value is used for IO port output and is not used for CSIH output.

Set the CSIH command information in the SPI command information register.

This setting value is used for CSIH output and is not used for IO port output.

For operation when suspend occurs during execution of Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode, refer to **Section 36.4.3, Suspend Method**.

(1) Using I/O Port Output

The following figure shows a structure and operation example when the DMA and IO port output are used.

- Normal A/D conversion w/MPX
- MPX wait state = 2 wait states
- ADCHnVCR2 to ADCHnVCR5 are used.

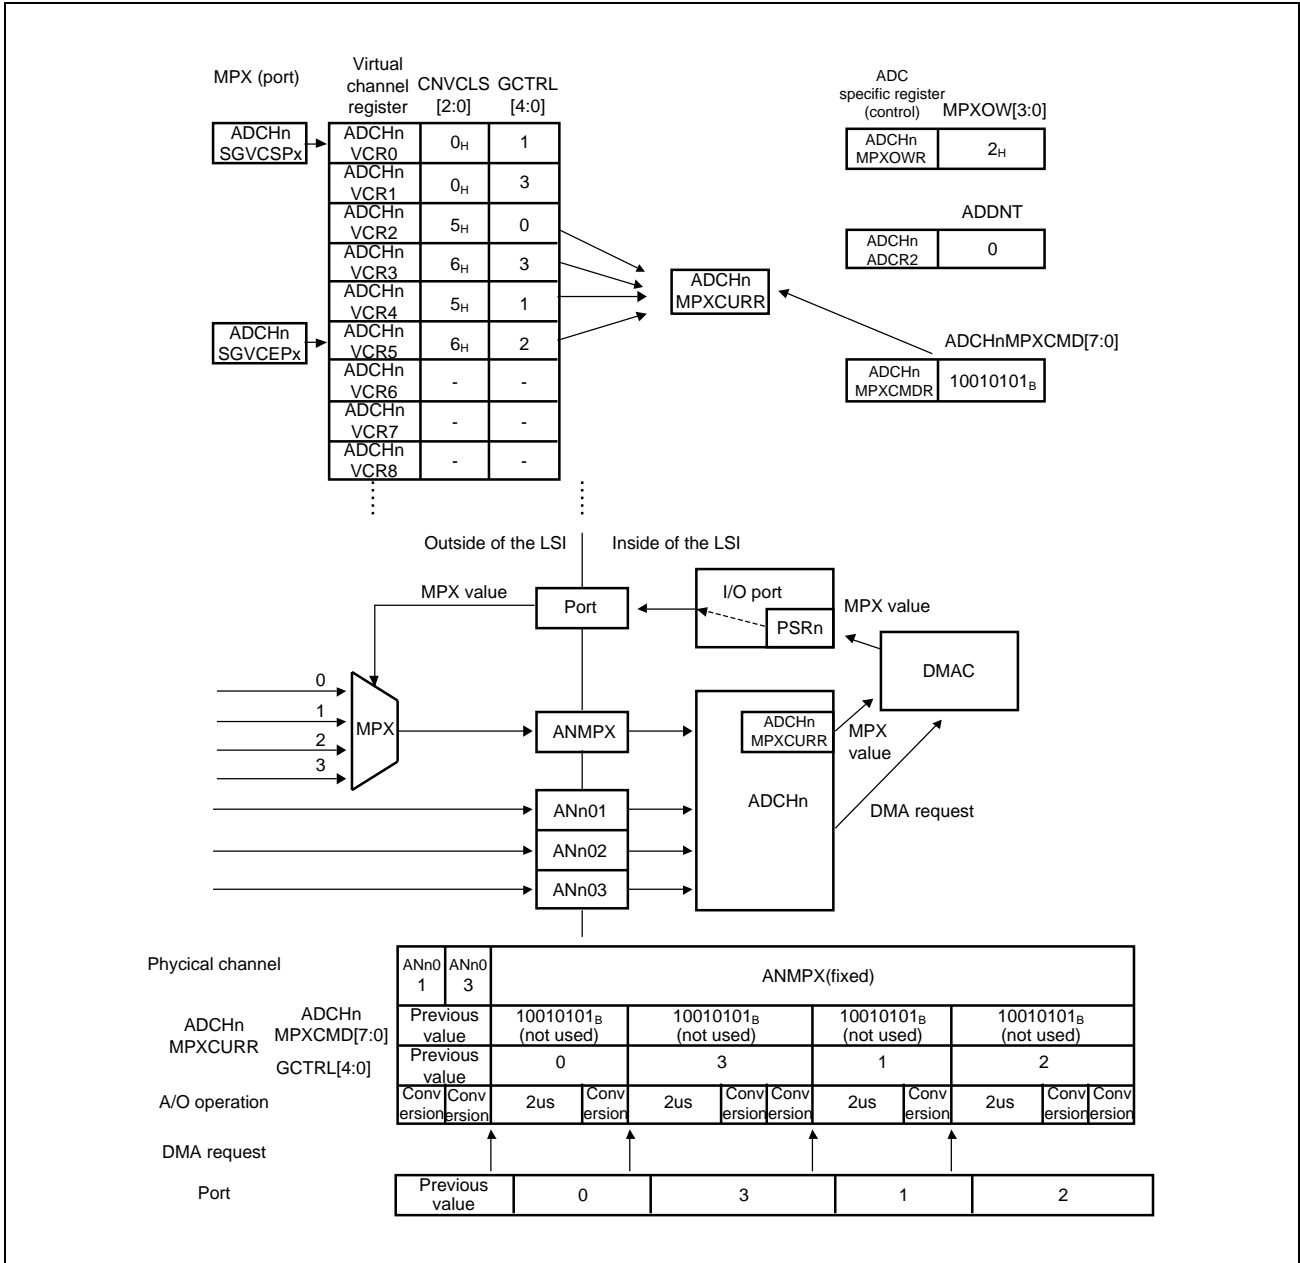

Figure 36.15 Example of Using an External Analog Multiplexer — I/O Port Output

NOTE

ADCH0: ANMPX = AN031; ADCH2: ANMPX = AN243; ADCH1: ANMPX = AN100; ADCH3: ANMPX = AN300

(2) Using CSIH Output

The following figure shows a structure and operation example when the DMA and CSIH output are used.

- Addition mode A/D conversion w/MPX
- MPX wait state = 2 wait states
- ADCHnVCR2 to ADCHnVCR5 are used.

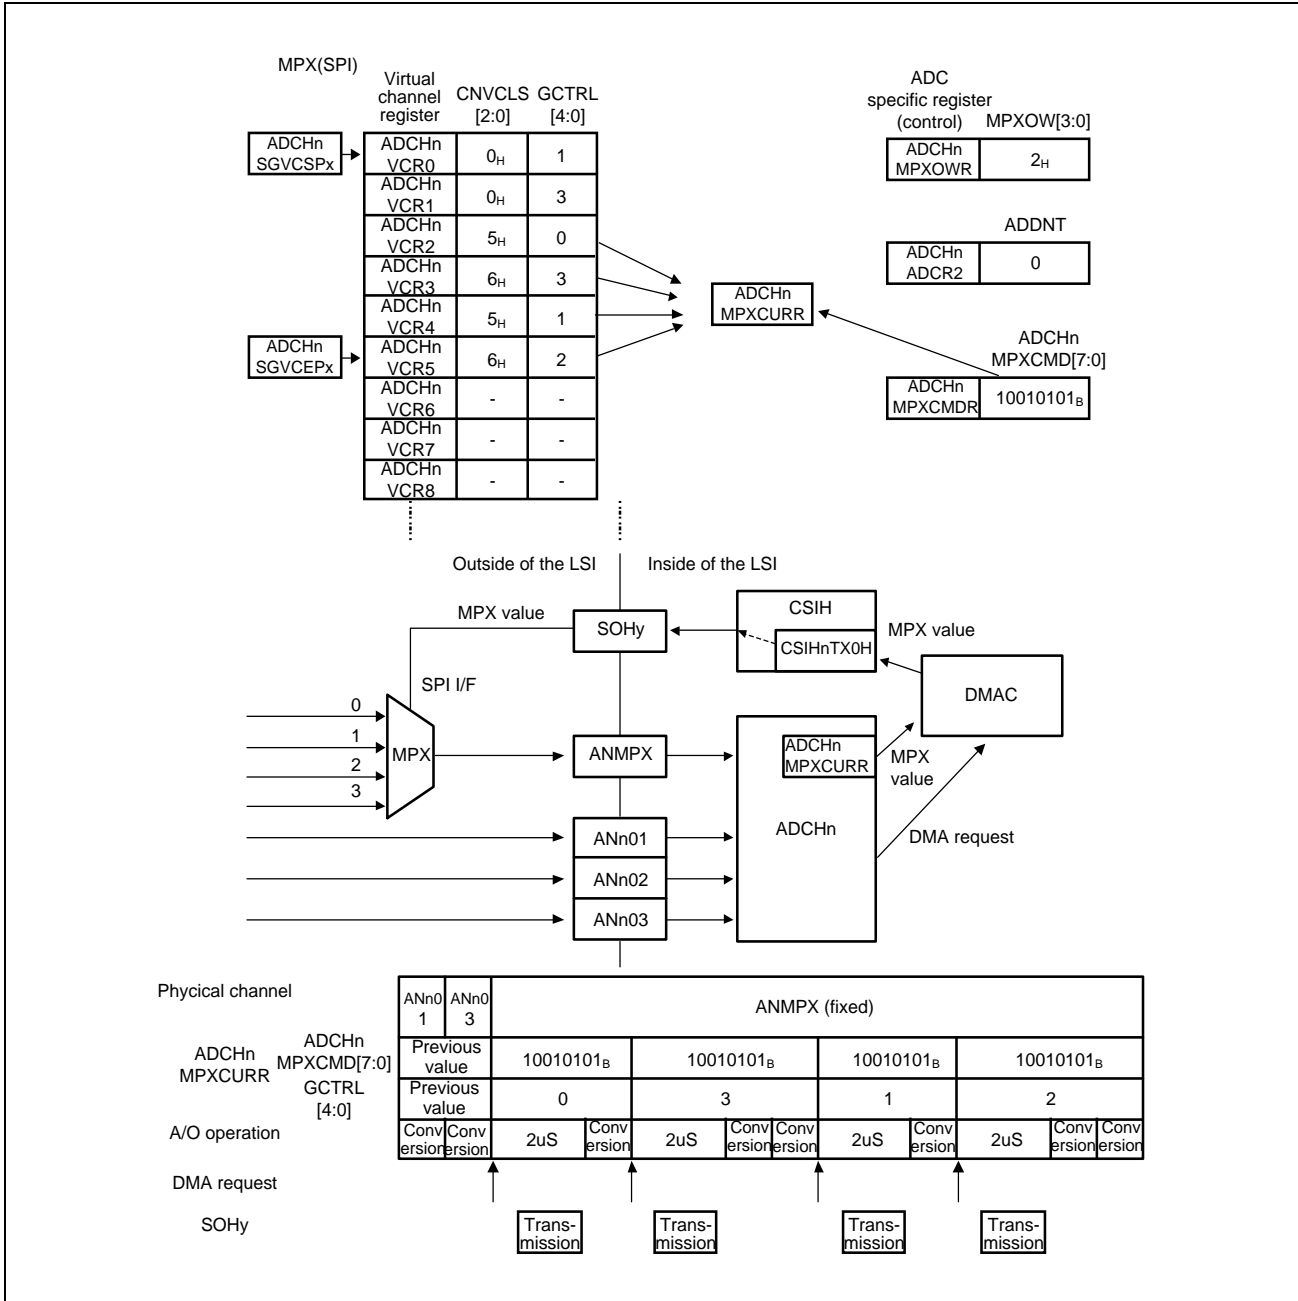

Figure 36.16 Example of Using an External Analog Multiplexer — CSIH Output

NOTE

ADCH0: ANMPX = AN031; ADCH2: ANMPX = AN243; ADCH1: ANMPX = AN100; ADCH3: ANMPX = AN300

36.4.5 Trigger Functions

The ADCH_n has an S/W and H/W trigger.

When the scan group is operating (ADCH_nSGSR_x.SGACT = 1), start trigger for the same scan group is ignored.

When the AD timer is operating (ADCH_nSGSR_x.ADTACT = 1), start trigger for the same AD timer is ignored.

The following table shows availability of the trigger function in each scan group:

Table 36.88 List of trigger functions for each a scan group

Classification	Function	Register bit name or terminal name	SG0	SG1	SG2	SG3	SG4
S/W Trigger	Scan Group x Starting	ADCH _n SGSTCR _x .SGST	✓	✓	✓	✓	✓
	Scan Group x End	ADCH _n SGSTPCR _x .SGSTP	✓	✓	✓	✓	✓
	A/D Conversion Synchronous Start	ADCH _n ADSYNSTCR.ADSTART	✓	✓	✓	✓	✓
	A/D Abort	ADCH _n ADHALTR.HALT	✓	✓	✓	✓	✓
	AD Timer Start	ADCH _n ADTSTCR _y .ADTST	—	—	—	✓	✓
	AD Timer Synchronous Start	ADCH _n ADSYNSTCR.ADTSTART	—	—	—	✓	✓
	AD Timer end	ADCH _n ADTENDCR _x .ADTEND	—	—	—	✓	✓
H/W Trigger	SG _x Trigger	SG _x _TRG	✓	✓	✓	✓	✓

Note: ✓: Function present
—: Function not present

36.4.5.1 S/W Trigger

A S/W trigger occurs when a bit of a register is set to 1. Each S/W trigger possesses a single function.

(1) Scan Group x Starting Trigger

The A/D conversion of scan group x is started.

This trigger is always valid.

(2) Scan Group x Stop Trigger

The A/D conversion of scan group x is stopped.

This trigger is always valid.

(3) A/D Conversion Synchronous Start Trigger

The A/D conversion of scan group x in each ADCH is started at the same time.

This trigger is valid for each scan group x where an A/D conversion synchronous starting enable bit of scan group x control register (ADCH_nSGCR_x.ADSTARTE) of each ADCH is set 1.

(4) A/D Halt Trigger

Operation of all scan groups of the whole A/D conversion operation (including the scan group which is suspended) is halted and the internal state machine is initialized.

It is not possible to halt only a specific scan group x.

When scan group x has been started once again, scan group x cannot be resumed from the virtual channel set at the end of the prior conversion.

Processing is started from the virtual channel indicated by a start pointer.

This trigger is always valid.

(5) A/D Timer Starting Trigger

The Count operation of AD timer y is started.

It is possible to start scan group x at desired periods.

This trigger is always valid.

For details, see **Section 36.4.5.3, A/D Timer Trigger**.

(6) A/D Timer Synchronous Starting Trigger

The Count operation of A/D timer y in each ADCH is started at the same time.

It is possible to start scan group y at the desired periods.

This trigger is valid to scan group x where the A/D timer synchronous starting enable bit of scan group y control register (SGCRy.ADTSTARTE) of each ADCH is set 1.

For details, see **Section 36.4.5.3, A/D Timer Trigger**.

(7) A/D Timer Stop Trigger

The Count operation of AD timer y is stopped.

This trigger is always valid.

For details, see **Section 36.4.5.3, A/D Timer Trigger**.

36.4.5.2 H/W Trigger

A H/W trigger is a rising edge of SGx_TRG.

There are external triggers (ADTRGn) as well as ATU and GTM as a trigger sources of SGx_TRG of each ADCHn, and they are chosen by the PIC. For details, refer to **Section 35, Peripheral Interconnection (PIC)**.

It functions as scan group start/AD timer start.

The function is chosen by a register setting.

(1) H/W Trigger List

The H/W trigger function chosen by each setting is indicated in the following table.

Table 36.89 H/W Trigger Functions List

SGx_TRG					ADCHnSGCRx		SGx_TRG Functions	Notes
4	3	2	1	0	TRGMD[1]	TRGMD[0]		
✓	✓	✓	✓	✓	0	0	Invalid	Scan of SGx is not started.
						1	SGx scan start	
✓	✓	—	—	—	1	0	Invalid	Scan of SGx is not started.
						1	AD timer y start	

Note: ✓: Function present —: Function not present

(2) H/W Trigger Route

The route of H/W trigger input is illustrated using figure.

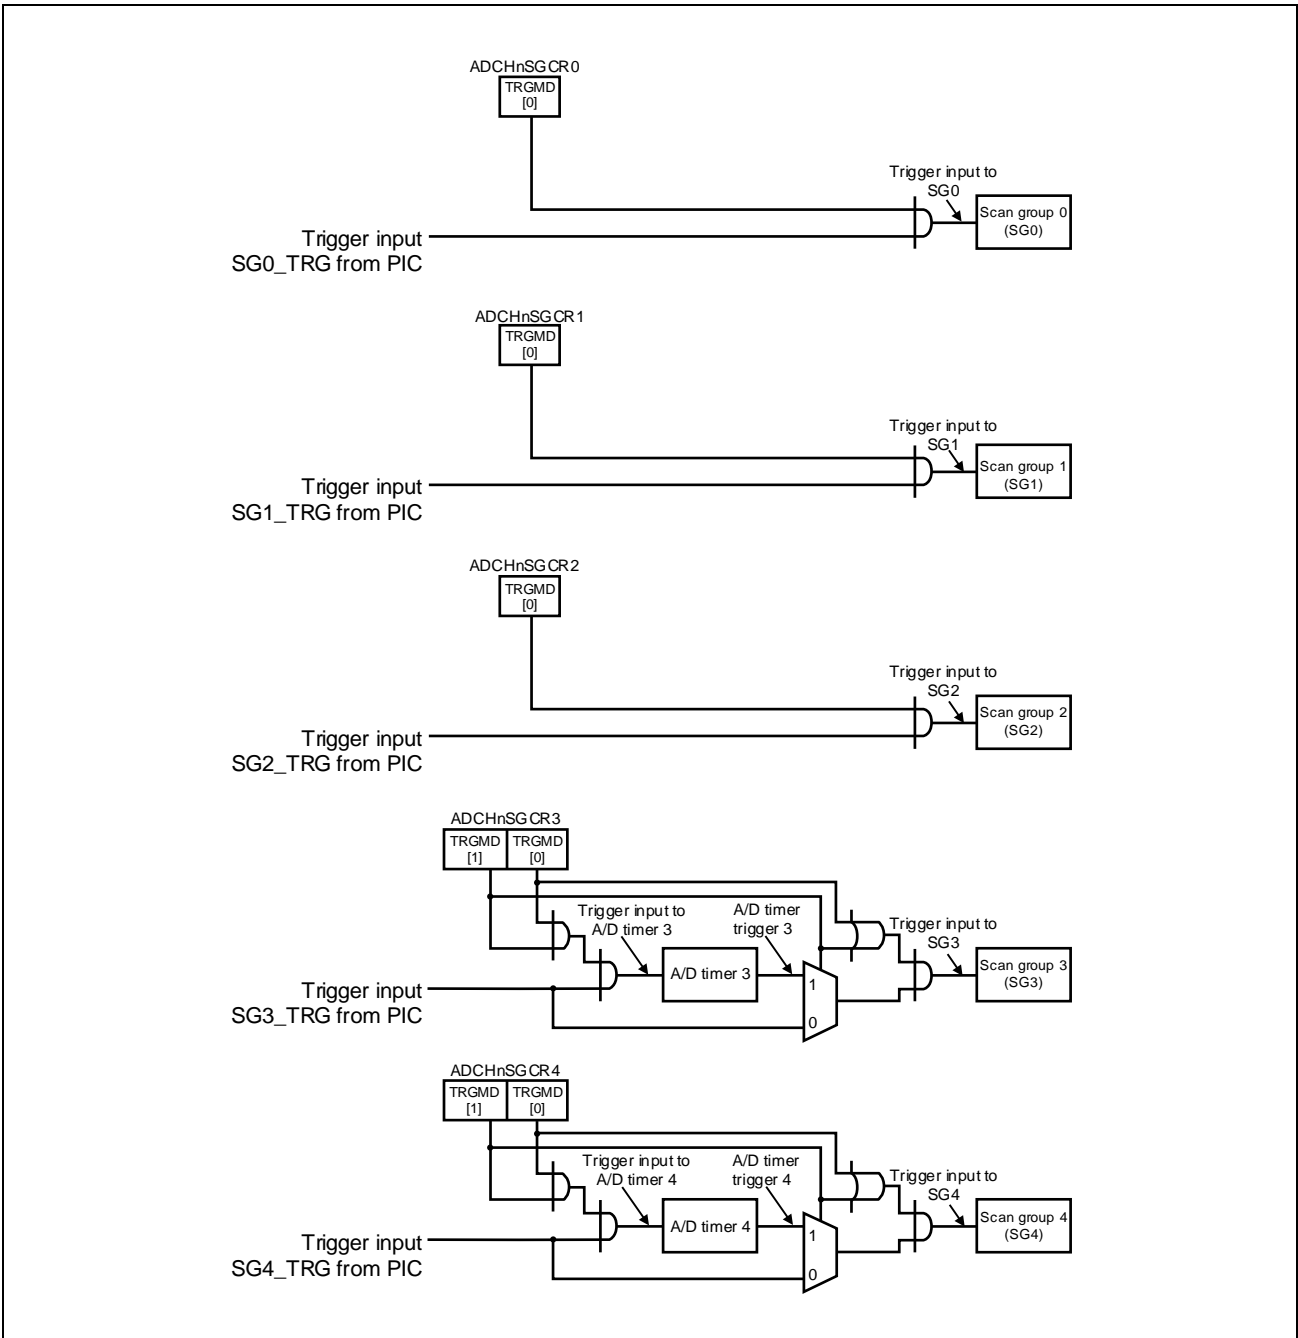

Figure 36.17 Route of Trigger Input

36.4.5.3 A/D Timer Trigger

It is possible to start a scan group y at a constant interval by using an A/D timer trigger.

The A/D timer counts in synchronization with the ADCLK.

[Recommendation flow]

The A/D timer y initial phase register (ADCHnADTIPRy) and A/D timer y cycle register (ADCHnADTPRR) is set according to the initial settings.

The range of these registers is 00_0000_H to 1F_FFFF_H.

Set these register so that the period of the A/D timer trigger does not become shorter than the execution time of scan group y .

The AD timer y is started by an AD timer starting trigger.

The AD timer y is stopped by an AD timer stop trigger or A/D conversion halt (ADCHnADHALTR.HALT = 1).

An operation example is shown in the following.

- (1) When A/D timer y is started, ADCHnADTIPRx is loaded in A/D timer y and the timer counts down.
- (2) When A/D timer y reaches 0, A/D timer trigger y is output in 1 ADCLK period, and ADCHnADTPRRx is loaded in A/D timer y and the timer counts down again.

After this, Step (2) will be repeated until A/D timer y is stopped.

When A/D timer y accepts the A/D timer starting trigger after A/D timer y is stopped, it is started from step (1).

It is possible to begin an AD timer of each ADCHn at the same time by an AD timer synchronous start trigger.

The operation after a synchronous start is same as above.

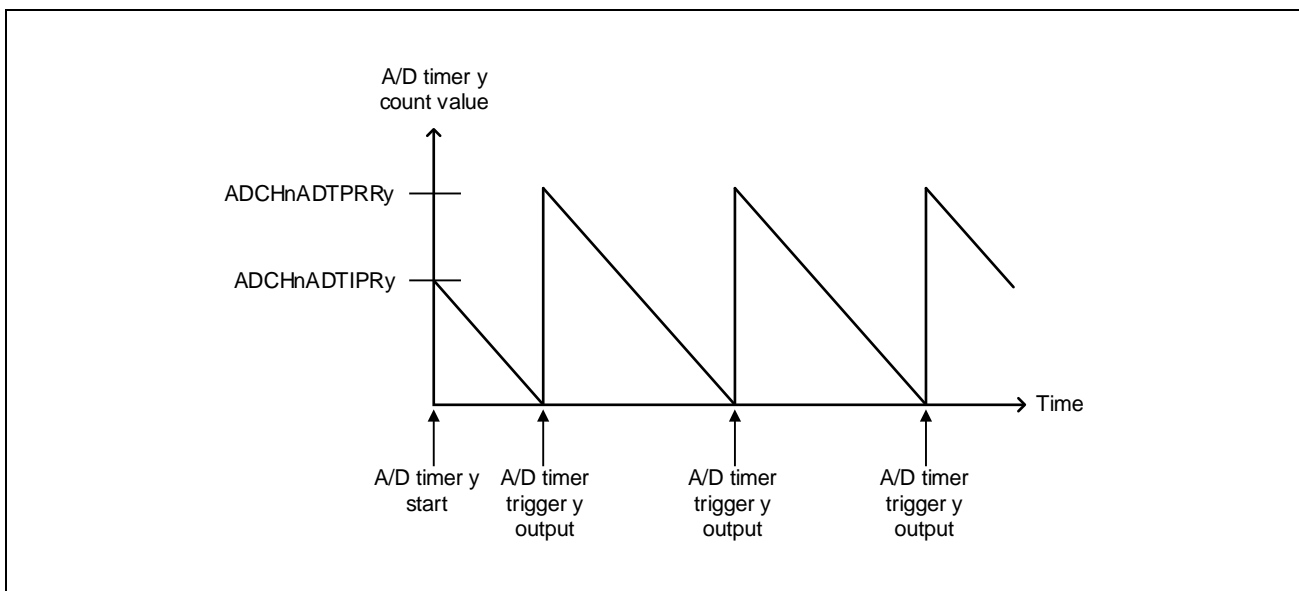

Figure 36.18 Example of A/D Timer Operation

36.4.6 Interrupt Request Functions

There is a scan end interrupt, A/D error interrupt, parity error interrupt, MPX interrupt, and upper/lower limit error interrupt.

The interrupt request is output in 1 register access clock period.

36.4.6.1 Scan End Interrupt Request

When scan group x (*1), or ADCHnVCRj has ended, a scan end interrupt request (ADInx) is generated.

A DMAC can be started by a scan end interrupt.

Output of ADInx is set by the permissions determined by the following bit.

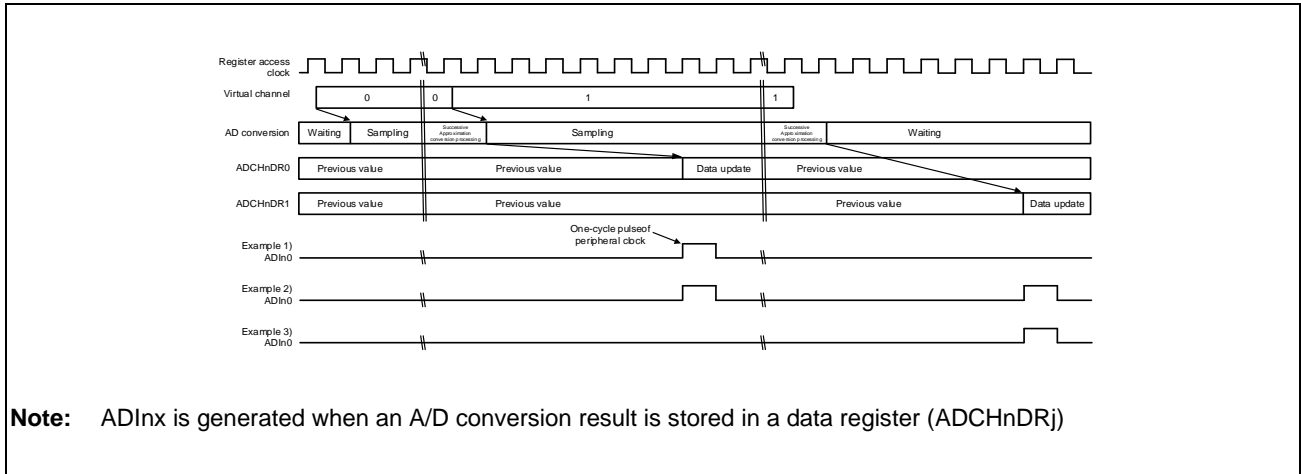

- Scan end interrupt enable bit (ADCHnSGCRx.ADIE) in scan group x
- Virtual channel end interrupt enable bit (ADCHnVCRj.ADIE) in virtual channel register n

Table 36.90 ADInx Generation Permission / No Permission Settling List

ADCHnSGCRx ADIE	ADCHnVCRj ADIE	ADInx Output	Generation Condition
0	0	Not permitted	—
	1	Permitted	Virtual channel j is ended
1	0	Permitted	Scan group x is ended (*1)
	1	Permitted	Scan group x is ended (*1), or virtual channel j is ended

Note 1. The meaning of 'the end the time of scan group x' is shown in the following.

- When an A/D conversion of the virtual channel indicated by 'the Scan Group x End Virtual Channel Pointer (ADCHnSGVCEPx)' is completed.
- When an A/D conversion of the virtual channel indicated by 'VCEP of the Scan Group x Virtual Channel Pointer Register (ADCHnSGVCPRx)' is completed.

Note: ADInx is generated when an A/D conversion result is stored in a data register (ADCHnDRj)

Figure 36.19 Scan Conversion End Interrupt Occurrence Timing

36.4.6.2 A/D Error Interrupt Request

When the following A/D error occurs, an A/D error interrupt (ADEn) is generated.

The generation timing of the A/D error interrupt is same as the generation timing of the scan end interrupt.

Clear the error status in the interrupt handler, after the interrupt is generated.

A/D error interrupt is generated when the OR-condition of the interrupt-enable-bit of the safety-control-register (ADCHnSFTCR) is valid.

Table 36.91 ADEn Generation Permitted List

ADCHnSFTCR		ADEn	Generation Condition
OWEIE	IDEIE		
0	0	Not permitted	—
0	1	Permitted	ID error is occurred
1	0	Permitted	Overwrite error is occurred
1	1	Permitted	Overwrite error is occurred, ID error is occurred

Each error detection is always valid.

Error status information is stored in the error register for each error.

When overwrite error were detected, the error flag bit is set 1, and the virtual channel number for the error generated is captured in the capture bit.

When ID error is detected, the error bit of the data supplementary information register j (ADCHnDIRj) which corresponds with the virtual channel (ADCHnVCRj) where an ID error is detected is set to 0. When an ID error is not detected, the error bit is set to 1.

Error status information except for that in the ADCHnDIRj.IDEF is maintained until it's cleared by the clear bit of each error flag of an error-clear-register. When the Read-and-Clear-Enable (RDCLRE) is set 1, ADCHnDIRj.IDEF maintains its status until the flag bit of the relevant error is read.

When the same error occurs once again without being cleared, the error is ignored.

If the interrupt-enable-bit is set to a valid state, when an error of following type occurs, the AD error interrupt is output.

Table 36.92 ADEn Error Factor Register List

Error Name	Error Register		Error Clear Register
	Flag Bit	Capture Bit	Clear Bit
Overwrite error	ADCHnQWER.OWE	ADCHnOWER.OWECAP[5:0]	ADCHnECR.OWEC
ID error	ADCHnDIRj.IDEF	no function.	no function.*1

Note 1. When the Read-and-Clear-Enable (RDCLRE) is set 1, and the data supplementary information register j (ADCHnDIRj) is read, the Error Clear Register clear bit set to 0.

Figure 36.20 Timing of A/D Error Interrupt and Parity Error Interrupt Generation

36.4.6.3 Overwrite Error

This error indicates that the new A/D conversion result is overwritten to the data register before the data register (ADCHnDRj) is read.

When the write flag (ADCHnDIRj.WFLG) of the data accessory information register is 1 and the new A/D conversion result is stored in the corresponding data register j (ADCHnDRj), the error is detected.

36.4.6.4 ID Error

This error indicates that the physical channel specified in the virtual channel register (ADCHnVCRj) is inconsistent with the actually-converted physical channel, that is, an operational failure occurred in the internal analog switch of the IO buffer/RRAMP.

ID Error detection result is stored in the ID error bit of Data Supplementary Information Register j (ADCHnDIRj) that is corresponded to detect the Virtual Channel Register n (ADCHnVCRj) that detected ID error.

The signal level of feedback from IO buffer/RRAMP is checked.

The setting of ADCHnVCRj.GCTRL[5:0] is compared with IO buffer/RRAMP number that is activated, then when the result is not equal, the error is detected. Because IO buffer/RRAMP are controlled by one-hot, if feedback signal is not one-hot signal, the error is detected.

The ID error is detected when any of the following condition is met.

- (1) Mismatched between selecting physical channel number and activated I/O buffer number.
- (2) Mismatched between physical channel number that is assigned to the MPX and the I/O buffer number that is activated.*1
- (3) Mismatched between activated I/O buffer number and activated RRAMP number.*2
- (4) More than two of I/O buffer are activated (One-hot error) when A/D conversion is executed.
- (5) More than two of RRAMP are activated (One-hot error) when A/D conversion is executed.
- (6) More than one of RRAMP are activated in the period that all RRAMP output should off when A/D conversion is executed.

Note 1. Because there are no feedback from MPX, the check cannot be done comparing with MPXvalue.

Note 2. The RRAMP number of physical channel number change by ADCHn. For a detail description, please see **Section 36.1.6, External Input/Output Signals.**

The detection condition changes by the detection factor.

Table 36.93 ID Error Detect List

Class of Conversion	(1)	(2)	(3)	(4)	(5)	(6)
Normal A/D conversion	✓	—	✓	✓	✓	✓
Normal A/D conversion in addition mode	✓	—	✓	✓	✓	✓
Normal A/D conversion with MPX	—	✓	✓	✓	✓	✓
Normal A/D conversion with MPX in addition mode	—	✓	✓	✓	✓	✓
A/D convertor self-diagnosis	—	—	—	—	—	—

36.4.6.5 Parity Error Interrupt Request

The ADCHn can issue a Parity Error notification (ADPE_n) to the ECM.

The Parity Error is detected in second cycle when ADCHmDR_j or ADCHmDIR_j is read.

The Parity Error notification is generated by parity error when ADCHnSFTCR.PEIE is set to 1.

The Parity Error can be checked by reading ADCHnDIR_j.PRTY.

The parity bit is even parity for ADCHnDR_j and ADCHnDIR_j.IDEF.

The error status information is stored in PER register. When parity error is detected, PER.PE is set to 1 and PER.PRCAP[5:0] is set the virtual channel number that generate parity error.

The error status information is cleared by writing to 1 to ADCHnECR.PEC.

When PER.PE is set, next error is ignored, but when ADCBnSFTCR.PEIE is set to 1, the parity error is output to ECM if next error is generated.

36.4.6.6 MPX Interrupt Request

The ADCH_n can issue an MPX interrupt request (ADMPXIn) to the INTC.

If the MPX-interrupt-enable-bit is set to a valid (ADCH_nMPXINTER.ADMPXIE = 1) level, ADMPXIn is generated when a virtual channel for which normal-A/D-conversion-with-MPX (ADCH_nVCRj.CNVCLS[2:0] = 5_H) or normal-A/D-conversion-with-MPX-in-addition-mode (ADCH_nVCRj.CNVCLS[2:0] = 6_H) is started.

In both cases such as MPX wait and wait between virtual channels, ADMPXIn is output 4 register access clocks after the conversion is started.

The DMAC can be activated when an ADMPXIn occurs.

If the MPX-interrupt-enable-bit was set to an invalid state (ADCH_nMPXINTER.ADMPXIE = 0), ADMPXIn is not output.

However, the ADMPX_{n0} to ADMPX_{n4} of the output ports is updated irrespective of the value of ADCH_nMPXINTER.ADMPXIE.

ADMPX_{n0} to ADMPX_{n4} is output just as ADCH_nMPXCURR.MPXCUR[4:0] is transferred, so the update timing is the same as ADCH_nMPXCURR.MPXCUR[4:0].

Figure 36.21 Timing of an MPX Interrupt Occurrence

36.4.6.7 Virtual Channel Upper/Lower Limit Error Interrupt

ADCH_n detects that the A/D conversion result is above the upper limit or below the lower limit for each virtual channel, and generates an interrupt request (INT_UL_n).

(1) Setting Registers

INT_UL_n is to set the upper/lower-limit-error-interrupt-enable-bit (ADCH_nVCLMINTER1.ADUL_jIE, ADCH_nVCLMINTER2.ADUL_jIE) and the virtual-channel-upper-limit-excess-notice-enable-bit (ADCH_nVCR_j.VCULME) or virtual-channel-lower-limit-excess-notice-enable-bit (ADCH_nVCR_j.VCLLME) as 1, and this function is set to valid or invalid in each virtual channel.

When it is set as valid, the result which compares the A/D conversion result with the virtual-channel-upper/lower-limit-table-register (ADCH_nVCULLMTBR0 to ADCH_nVCULLMTBR6) is output to INT_UL_n.

When ADUL_nIE is set as “0” or both of VCULME and VCLLME are set as “0”, INT_UL_n is not output (the output is fixed low.)

Table 36.94 INT_UL_n, v_{ce}nd[j], v_{cu}lmo and v_{cl}lmo Output Setting

ADUL _j IE	VCULME	VCLLME	INT_UL _n	v _{cu} lmo	v _{cl} lmo	v _{ce} nd[j]
0	0	0	—	—	—	—
		1	—	—	✓	✓
	1	0	—	✓	—	✓
		1	—	✓	✓	✓
1	0	0	—	—	—	—
		1	✓	—	✓	✓
	1	0	✓	✓	—	✓
		1	✓	✓	✓	✓

Note: For details of v_{ce}nd[j], v_{cu}lmo and v_{cl}lmo, first see **Figure 36.27** and see **Section 36.4.9, Virtual Channel Upper/Lower Limit Excess Notice**.

✓: Valid —: Invalid

The output condition of the upper/lower limit error interrupt signal (INT_UL_n) is as follows.

Precondition: When the A/D conversion value is greater than the upper limit value or less than the lower limit value.

- (1) INT_UL_n is not output irrespective of the setting of VCULME and VCLLME if ADUL_jIE=0.
- (2) INT_UL_n is not output irrespective of the setting of ADUL_jIE if VCULME=0 and VCLLME=0.
- (3), (4), (5) When ADUL_jIE = 1 and both VCULLME, VCLLME are set to “1” or VCULLME = 1 or VCLLME = 1, INT_UL_n is output at same timing as scan end interrupt (ADIn).

When the class of conversion is “normal A/D conversion in addition mode”, INT_UL_n is output only after the end of the addition number of times of the designated A/D virtual channel.

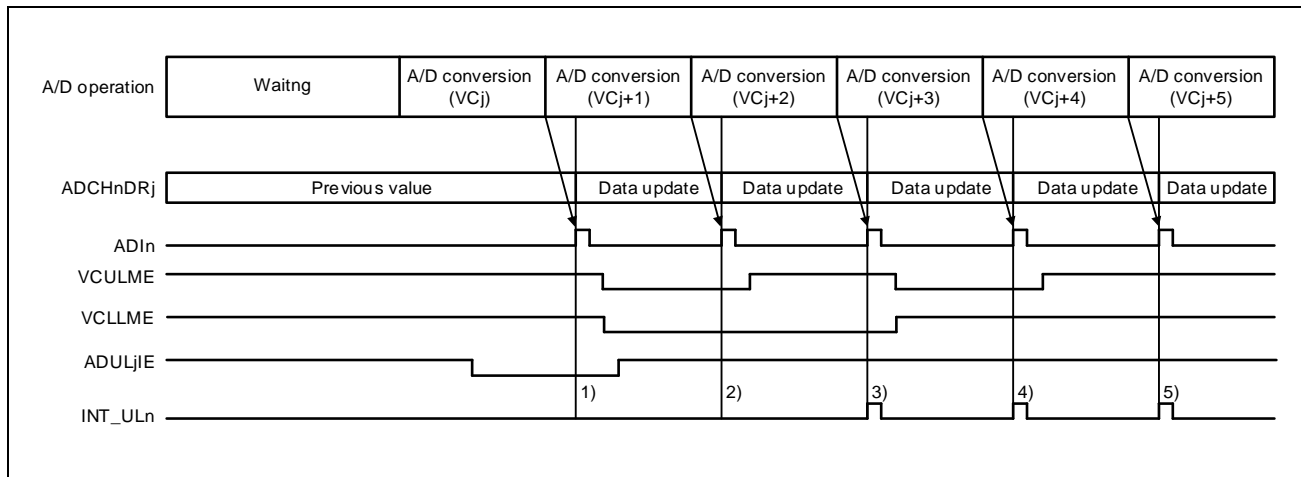

Figure 36.22 Output Condition of Upper / Lower Limit Error Interrupt

Table 36.95 INT_ULn Output Permitted List for Each Conversion Class

ADCHnVCRj. CONVCLS[2:0]	Conversion Class	Valid / Invalid	Notes
0 _H	Normal A/D conversion	✓	
1 _H	Setting prohibited	—	
2 _H	Setting prohibited	—	
3 _H	A/D converter self-diagnosis	✓	
4 _H	Normal A/D conversion in addition mode	✓	It is asserted only at the end of the designated addition counts.
5 _H	Normal A/D conversion with the MPX	✓	
6 _H	Normal A/D conversion with the MPX in addition mode	✓	It is asserted only at the end of the designated addition counts.
7 _H	Setting prohibited	—	

Note: ✓: Valid —: Invalid

(2) Table Registers

See **Section 36.4.9.2, Table Registers**.

(3) Interface Signals

When this function is set as valid, every time A/D conversion in a virtual channel ends, a table register is compared with an A/D conversion result, and `INT_ULn` is output.

`INT_ULn` is a common signal for all virtual channels.

`INT_ULn` is one-shot-pulse signal output by a register access clock.

It's possible to determine the detected number of the virtual channel by reading the virtual-channel-upper/lower-limit-excess-status-register 1 (`ADCHnVCLMSR1`) and virtual-channel-upper/lower-limit-excess-status-register 2 (`ADCHnVCLMSR2`).

(4) Operating Timing

INT_ULn signals are synchronized with the register access clock.

Asserting-timing of this signal is the same as the assert-timing of a scan end interrupt signal (ADIn).

The operating timing chart is indicated below.

- 1st comparison period: A/D conversion result = 7FF8_H, INT_ULn is generated by upper limit value excess and flag is set.
- 2nd comparison period: A/D conversion result = 4FF8_H, INT_ULn is generated by lower limit value excess and flag is set.

Figure 36.23 Timing Chart of Upper / Lower Limit Error Interrupt

36.4.7 DFE/GTM/ASF Entry Function

The ADCH_n can issue a request for entry to the DFE or GTM and a request for entry to the ASF for DFE, GTM, and ASF according to the settings of DFENT in ADCH_nVCR_j and DFENTSG_xE and ASENTSG_xE in ADCH_nDFASENTSGER. At the same time, ADCH_n outputs the TAG information and A/D conversion data that are set in DFTAG in ADCH_nVCR_j. For the format of the output A/D conversion data, see **Section 36.3.3.2, ADCH_nDR_j — Data Register j**.

For allocation of each ADCH_n and each channel of DFE, refer to **Section 39, Digital Filter Engine (DFE)**.

For allocation of each ADCH_n and each channel of GTM, refer to **Section 33, Generic Timer Module (GTM)**.

For allocation of ADCH₀ and each channel of ASF, refer to **Section 36.8, ADC Summation Function (ASF)**.

Figure 36.24 DFE/ASF Entry Timing

Figure 36.25 DFE/GTM/ASF Entry Timing

36.4.8 Monitoring Function Using the A/D Conversion Monitor Pin

ADENDn can be used to monitor the processing timing of the virtual channel specified by ADCHnADENDP. For details of pin settings, see **Section 2, Pin Function**.

Figure 36.26 shows the A/D conversion monitor timing.

Figure 36.26 A/D Conversion Monitor Timing

CAUTION

If the high-level voltage is output from ADENDn in a lower-priority scan group and a higher-priority scan group suspends (asynchronous suspend) the processing of the lower-priority scan group, the low-level voltage is output from ADENDn. Since the suspended virtual channel processing for the lower-priority scan group resumes after that, the high-level voltage is output again from ADENDn.

36.4.9 Virtual Channel Upper/Lower Limit Excess Notice to ADC VMON Secondary Error Generator (AVSEG), or to ADC Boundary Flag Generator (ABFG)

The ADCHn can detect that the A/D conversion result is greater than the upper limit value or less than the lower limit value for each virtual channel, and it is possible to notify the ADC VMON secondary error generator (AVSEG), or ADC boundary flag generator (ABFG).

36.4.9.1 Setting Registers

It is possible to set this function as valid or invalid in each virtual channel if the virtual-channel-upper-limit-excess-notice-enable-bit (ADCHnVCRj.VCULME) or virtual-channel-lower-limit-excess-notice-enable-bit (ADCHnVCRj.VCLLME) is set.

When it is set as valid, the A/D conversion result is compared with the virtual-channel-upper/lower-limit-table-register (ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6) and is output to vchend[j] (A/D conversion end notice), vculmo (virtual channel upper limit excess notice) and vcllmo (virtual channel lower limit excess notice).

When both of VCULME and VCLLME are set to “0”, vculmo, vcllmo, and vchend[j] are not output (output is fixed low).

For details of vculmo, vcllmo, and vchend[j], see **Figure 36.27**.

Table 36.96 vchend[j], vculmo and vcllmo Output Setting

VCULME	VCLLME	Virtual Channel Upper Limit Excess Noticevculmo	Virtual Channel Lower Limit Excess Noticevcllmo	A/D Conversion End Noticevchend[j]

Note: ✓: Valid —: Invalid

36.4.9.2 Table Registers

The virtual-channel-upper/lower-limit-table-register (ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6) are specified by the VCULLMTBS [2:0] bits of the virtual channel register (ADCHnVCRj).

The upper limit value table and the lower limit table are sets.

Therefore it isn't possible to choose the lower limit table for the register number different from the upper limit value table in one virtual channel.

Set the upper limit value to the upper-side 16 bits of the chosen ADCHnVCULLMTBR and set the lower limit value to the lower-side 16 bits of the chosen ADCHnVCULLMTBR.

Write using a 32 bit width. This register cannot be written using a 16 bit width or 8 bit width.

ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6 can be rewritten at any time irrespective of the timing before scan group start and after scan group start.

Table 36.98 Correlation between ADCHnVCRj.VCULLMTBS[2:0] and ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6

ADCHnVCRj.VCULLMTBS[2:0]	Register Name	Upper Limit Side Condition	Lower Limit Side Condition
0 _H	ADCHnVCULLMTBR0	A/D conversion value > VCULLMTB[15:0]	A/D conversion value < VCULLMTB[15:0]
1 _H	ADCHnVCULLMTBR1		
2 _H	ADCHnVCULLMTBR2		
3 _H	ADCHnVCULLMTBR3		
4 _H	ADCHnVCULLMTBR4		
5 _H	ADCHnVCULLMTBR5		
6 _H	ADCHnVCULLMTBR6		
7 _H	Setting prohibited		

36.4.9.3 Interface Signals

When this function is used, every time an A/D conversion in a virtual channel has ended, a table register is compared with an A/D conversion result, and `vcend[j]` (A/D conversion end notice), `vculmo` (virtual channel upper limit excess notice) and `vcllmo` (virtual channel lower limit excess notice) are output.

`vcend[j]`, `vculmo` and `vcllmo` are one-shot-pulse signals output by the register access clock.

These signals are output when the A/D conversion ends.

`vcend[j]` is output irrespective of the result of the comparison.

Only when the upper limit value excess is detected, `vculmo` is output, and only when the lower limit value excess is detected, `vcllmo` is output.

`vculmo` and `vcllmo` are common signals for all virtual channels.

It's possible to determine the detected number of the virtual channel by using a pair of `vcend[j]` and `vculmo`, or using a pair of `vcend[j]` and `vcllmo`.

For details of `vculmo`, `vcllmo`, and `vcend[j]`, see **Figure 36.27**.

Table 36.99 `vcend[j]`, `vculmo` and `vcllmo` Output Timing

Signal Name	Means	Operation	Synchronizing Clock
<code>vcend[j]</code>	Virtual channel A/D conversion end notice	It is output at the A/D conversion end.	register access clock
<code>vculmo</code>	Virtual channel upper limit excess notice	When it occurs, it is output at the time of A/D conversion end.	
<code>vcllmo</code>	Virtual channel lower limit excess notice	When it occurs, it is output at the time of A/D conversion end.	

36.4.9.4 Operating Timing

The operation timing chart is indicated below.

vcend[j], vculmo and vcllmo are the signals which are with the register access clock.

Assert-timing of these signals is same as the assert-timing of the scan end interrupt signal (ADIn).

Figure 36.27 Output Timing Chart of Virtual Channel Upper / Lower Limit Excess Notice

The following diagram shows the timing chart when ADCHnDRj storage and ADCHnVCLLMTBR rewrite compete against each other.

Comparison is performed 1 register access clock period before ADCHnDRj storage. Therefore, if ADCHnDRj storage and ADCHnVCULLMTBR rewrite are performed simultaneously, the previous value of ADCHnVCULLMTBR is used for comparison.

Figure 36.28 Timing Chart of Competition of Storing of ADCHnDRj and Rewriting of ADCHnVCULLMTBR

36.4.10 Wiring-Break Detection Function

The wiring-break detection function detects a wiring-break of the ANI. If a wiring-break is present, the conversion result attenuates to approximately 0 V, and an abnormal value is detected in the conversion result by repeating the A/D conversion several times. This can be determined as a wiring-break. For details timing, refer to **Figure 36.29**.

[Feature]

- (1) Users can select desired physical channels for which the wiring-break is to be detected.

[Recommendation flow]

- (1) Set registers according to the initial settings (**Figure 36.5**).
- (2) Set CNVCLS[2:0] in the virtual channel register ADCHnVCRj to 0_H and set GCTRL[5:0] to select desired channels.
- (3) Set ODE in the wiring-break detection control register to 1_H and set ODPW[5:0] to specify the desired wiring-break detection pulse width.
- (4) Assert SG0 to SG4 trigger signals to perform an A/D conversion.
- (5) When the read A/D conversion result has attenuated to approximately 0V after repeating A/D conversion several times, judge that a wiring-break has occurred.

Figure 36.29 Timing Chart of Wiring-Break Detection Function

Note: About prohibiting using the pin level self-diagnosis function and the wiring-break-detection functions at same time, refer to **Section 36.4.11.1, Pin-Level Self-Diagnosis**.

36.4.11 Self-Diagnostic Functions

The ADC is equipped with the following four self-diagnostic functions.

- Pin-level self-diagnosis
- A/D conversion circuit self-diagnosis
- Wiring-break detection self-diagnosis
- Secondary power supply voltage monitor self-diagnosis

36.4.11.1 Pin-Level Self-Diagnosis

The pin-level self-diagnosis performs an A/D conversion that is set to a different voltage for even-numbered physical channel groups and odd-number physical channel groups to check for an abnormal path from the analog input.

When an A/D conversion result is not a static value, there is a possibility that the A/D converter is broken.

[Analog input route]

I/O Buffer → RRAMP → A/D Converter

[Recommendation flow]

Set the virtual channel register j (ADCHnVCRj) and pin level self-diagnosis register (ADCHnTDCR) according to the initial setting flow.

ADCHnVCRj

VCR number	CNVCLS[2:0]	GCTRL[5:0]
N	0H	ANlxx number

ADCHnTDCR

ADCHnTDCR		Injection Voltage to Physical Channel Group	
TDE	TDLV[1:0]	Even Group	Odd Group
0	*	—	—
1	0H	AnVSS	AnVCC
1	1H	AnVCC	AnVSS
1	2H	AnVSS	1/2 x AnVCC
1	3H	1/2 x AnVCC	AnVSS 1/2 x AnVCC* ¹

Note 1. Regarding AN13q (q = 0 to 3) ports in E2H, the injection voltage is 1/2 x AnVCC.

Take care that there is a difference of specification with E2x-FCC2/E2UH.

Please use ADCHnTDCR.TDLV[1:0] = 1H setting for Pin-Level Self-Diagnosis of AnVSS level.

Allocate the above-mentioned virtual channel n to scan group x.

Note: About prohibiting using the pin level self-diagnosis function and the wiring-break-detection functions at same time, set ADCHnODCR.ODE, ADCHnODCR.ODDE and ADCHnTDCR.TDE as the following.

Setting			Pin function			Operation
ODDE	ODE	TDE	Analog input	Discharge	Voltage injection	
0	0	0	✓	—	—	Normal
0	0	1	—	—	✓	Pin level self-diagnosis
0	1	0	✓	✓	—	Wiring-break detection
1	1	0	—	✓	—	Wiring-break detection self-diagnosis
Other than above						Setting prohibited

✓: Valid —: Invalid

36.4.11.2 A/D Converter Self-Diagnosis

The A/D converter self-diagnosis is used to verify that A/D conversion operates correctly.

When the A/D conversion value is different from the expected value, there is a possibility that the A/D converter is broken.

The voltage value setting is made in GCTRL[4:0] when CNVCLS[2:0] = 3_H, and can be converted for AnVREFH × 1, AnVREFH × 3/4, AnVREFH × 1/2, AnVREFH × 1/4, and AnVREFH × 0.

Features of the A/D conversion circuit self-diagnosis are described below.

[Recommendation flow]

- (1) Set registers according to the initial settings (**Figure 36.5**).
- (2) Set CNVCLS[2:0] in the virtual channel register ADCHnVCRj to 3_H and set GCTRL[5:0] to specify the desired self-diagnosis voltage level.
- (3) Set registers required for A/D conversion according to the initial settings (**Figure 36.5**).
- (4) Assert SG0 to SG4 trigger signals to perform A/D conversions.

36.4.11.3 Wiring-Break Detection Self-Diagnosis

The self-diagnosis function of wiring-break detecting function is used to check that the wiring-break detecting function works normally.

A/D conversion execute in disabling ANI input and pull-down the ANI by ADCHnODCR setting. A/D conversion repeat several times, then the A/D conversion result of pull-down attenuates to approximately 0 V, the wiring-break detecting function is judged to be working normally. For the detail, refer to **Figure 36.30**.

[Feature]

- 1) Users can select desired physical channels for which self-diagnosis of wiring-break detection function is performed by setting virtual channels.

[Recommended flow]

- 1) Set the initial value (refer to **(Figure 36.5)**)
- 2) Set the physical channel by setting of ADCHnVCRj of CNVCLS[2:0] = 0_H and GCTRL[5:0].
- 3) Set ODE and ODDE in the wiring-break detection control register(ADCHnODCR) to 1 and set ODPW[5:0] to specify the desired wiring-break detection pulse width.
- 4) Execute the A/D conversion by asserting SG0-4 trigger.
- 5) After repeat the A/D conversion several times, read the result of A/D conversion value. If the value attenuates to approximately 0V, the wiring-break detecting function is judged to be working normally.

Figure 36.30 Timing Chart of Wiring-Break Detection Self-Diagnosis

Note: About prohibiting using the pin level self-diagnosis function and the wiring-break-detection functions at same time, refer to **Section 36.4.11.1, Pin-Level Self-Diagnosis**.

36.4.11.4 Secondary Power Supply Voltage Monitor Self-Diagnosis

The self-diagnosis function of secondary power supply voltage monitor function is used to check that the secondary power supply voltage monitor function works normally.

A/D conversion is performed when divided resistance is off by VMONVDCR1 and VMONVDCR2. Then the A/D conversion result becomes proximity 0V, the function is judged to be working normally.

When secondary power supply voltage monitor self-diagnosis function is used, A/D conversion of power supply and secondary power supply voltage monitor self-diagnosis should alternately be performed each power supply. For operation example, refer to **Figure 36.31**.

[Recommended flow]

- 1) Set the initial value (refer to **(Figure 36.5)**)
- 2) Set the secondary power supply voltage monitor channel by setting of ADCH0VCRj of CNVCLS[2:0] = 0_H and GCTRL[5:0] (VCC=28, EVCC=29, VDD=30).
- 3) Set VDE1 to 1, set VDE2 to 1.
- 4) A/D conversion is performed, then check that the result is same as power supply voltage.
- 5) Set VDE1 to 0, set VDE2 to 0.
- 6) A/D conversion (secondary power supply voltage monitor self-diagnosis) is performed, then check that the result is approximately 0V.

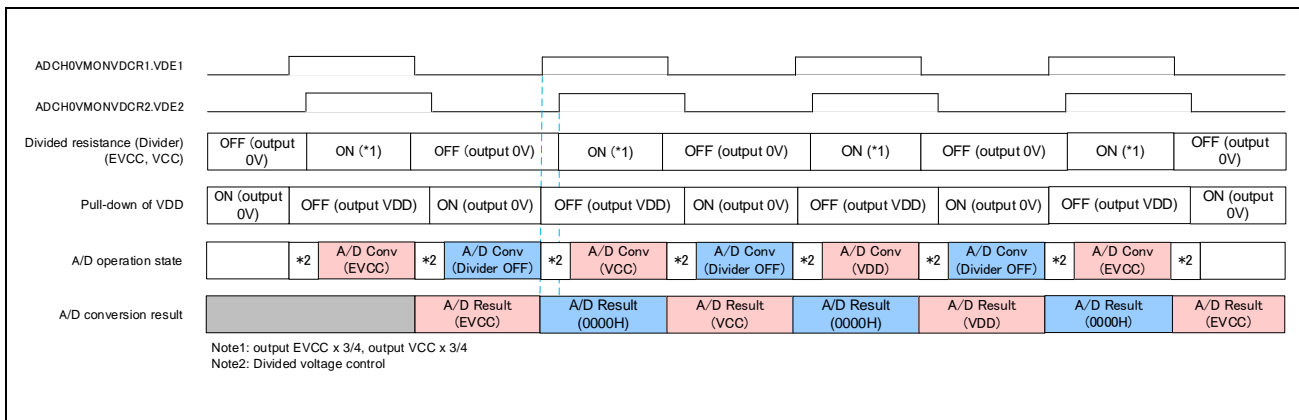

Figure 36.31 Example of Operation of Secondary Power Supply Voltage Monitor Self-Diagnosis

36.4.12 Timing Regulations

The operating timing of ADCH_n is shown below.

Table 36.100 Timing in Normal A/D Conversion

Item	Symbol	Period	Unit
Scan group start delay time	tD	(2 to 4) × Pφ + 5 × Iφ	Pφ (register access clock) Iφ (ADCLK)
Sampling time	tSPL	18 × Iφ	Iφ (ADCLK)
Successive approximation conversion processing time	tSAR	22 × Iφ	Iφ (ADCLK)
Scan group end delay time	tED	(2 to 4) × Iφ + 3 × Pφ	Pφ (register access clock) Iφ (ADCLK)
Scan group processing time	tSG	47 × Iφ + 5 × Pφ to 49 × Iφ + 7 × Pφ	Pφ (register access clock) Iφ (ADCLK)

The processing time for a scan group (tSG) can be obtained from the following formula, where the number of virtual channels is *i* and the number of multicycles is *j* in multicycle scan mode:

$$tSG = tD + (tSPL + tSAR) \times i \times j + tED$$

The processing time for the first cycle of a scan in continuous scan mode is as follows:

$$tD + (tSPL + tSAR) \times i$$

The processing time for the second (or subsequent) cycle of a scan in continuous scan mode is as follows:

$$(tSPL + tSAR) \times i$$

Figure 36.32 Timing Chart of Normal A/D Conversion Operation

36.4.13 Optional Waiting Times Insertion Function of Between Virtual Channels

The wait function is the function to insert any wait time in the processing between a virtual channel processing and a virtual channel processing. The wait time can set each scan group, but cannot set difference time in same scan group.

This function inserts waiting times before virtual channel (other than first virtual channel of first scan) processing of the following.

The conversion class is:

- Normal A/D conversion
- Addition mode A/D conversion
- Normal A/D conversion with the MPX
- Normal A/D conversion with the MPX in addition mode

This function doesn't insert waiting times before virtual channel processing of the following.

The conversion class is:

- A/D converter self-diagnosis

The waiting times is specified by ADCHnSGVCOWRx.VCOW[11:0] to each scan group.

36.4.13.1 Waiting Times Insertion in Normal A/D Conversion

When the normal A/D conversion is executed by using the wait function, a wait is inserted between virtual channel processes regardless of using MPX wait function.

A case by which the number of scan is 3 times is shown in **Figure 36.33**.

Figure 36.33 Example of Operation of Waiting Timing Insertion in Normal A/D Conversion (the number of scan is 3 times)

It is shown in the following for ① to ③ in **Figure 36.33**.

- ① Waiting times is not inserted before the first virtual channel processing of the first scan. The continuous scan mode is also same.
- ② Waiting times is inserted between virtual channel processing. The continuous scan mode is also same.
- ③ Waiting times is not inserted after the last virtual channel processing of the last scan.

A case by which the number of scan is 1 time is shown in **Figure 36.34**.

Figure 36.34 Example of Operation of Waiting Timing Insertion in Normal A/D Conversion (the number of scan is 1 time)

When using “Addition mode A/D conversion” or “Normal A/D conversion with the MPX in addition mode”, the waiting times is not inserted in ongoing addition processing (within completion of second A/D conversion in 2 times addition mode, or within completion of fourth A/D conversion in 4 times addition mode).

36.4.13.2 Waiting Time Insertion in Synchronous Suspend Movement

There are two cases that scan group with higher priority (SG2) interrupt to scan group with lower priority (SG1).

<Case 1> Processing a virtual channel of scan group with lower priority (SG1)

<Case 2> Waiting between virtual channels of scan group with lower priority (SG1)

A sample case shows in **Figure 36.35**.

Figure 36.35 Example of Operation of Waiting Timing Insertion in Synchronous Suspend Movement

36.4.13.3 Waiting Times Insertion in Asynchronous Suspend Movement

There are two cases that scan group with higher priority (SG2) interrupt to scan group with lower priority (SG1).

<Case 1> First virtual channel processing of scan group with lower priority (SG1)

<Case 2> A virtual channel processing other than first of scan group with lower priority (SG1).

<Case 3> Waiting times between virtual channels processing of scan group with lower priority (SG1).

When a scan group with lower priority (SG1) restart, a wait is not asserted in <Case 1>, but a wait is asserted in <Case 2> and <Case 3>.

A sample case shows in **Figure 36.36**.

Figure 36.36 Example of Operation of Waiting Timing Insertion in Asynchronous Suspend Movement

36.4.14 Example of Scan Group Stop

The example shows about the function of all scan groups stop (ADCHnADHALTR.HALT) and each scan group stop (ADCHnSGSTPCRx.SGSTP).

36.4.14.1 Example of All Scan Group Stop (A/D Halt)

When ADCHnADHALTR.HALT is set to 1, all scan groups and all AD timers are halted and initialized, and the ADC becomes the idle state (ADCHnSGSRx.SGACT = 0) immediately (by at most 4 register access clocks).

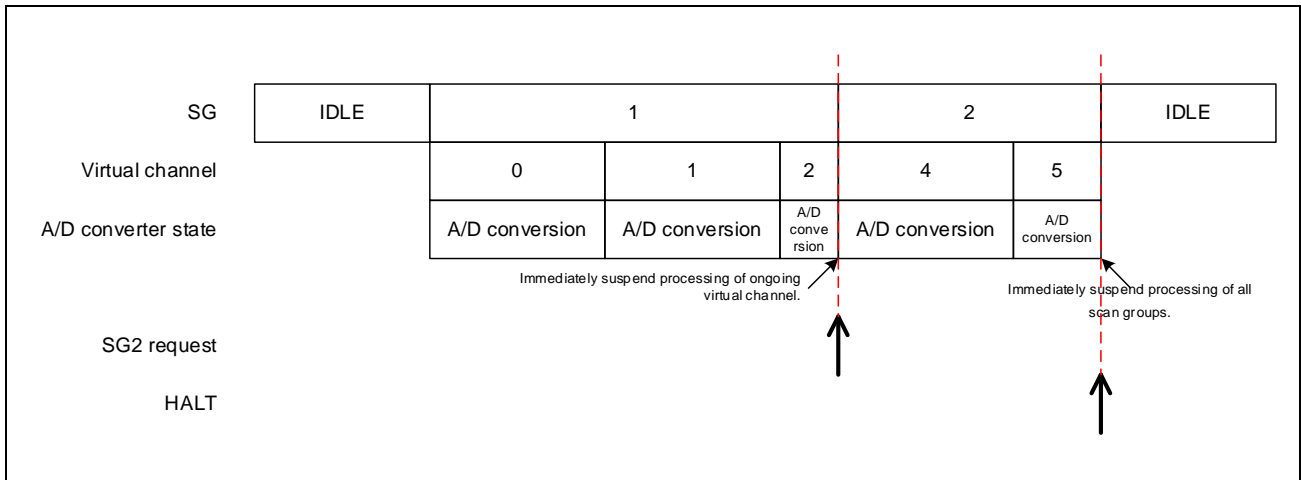

Figure 36.37 Example of All Scan Group Stop (A/D Halt)

36.4.14.2 Example of Scan Group x Stop

When ADCHnSGSTPCRx.SGSTP is set to 1, corresponding scan group become to be idle state (ADCHnSGSRx.SGACT = 0) after finishing current virtual channel process. A sample case shows in **Figure 36.38**.

Figure 36.38 Example of Scan Group x Stop 1

ADCHnSGSTPCR_x.SGSTP is set to 1, and when processing of ongoing virtual channel is suspended by asynchronous suspend function of higher priority scan group, processing of ongoing virtual channel is stopped and transits to idle state (SGACT = 0) (Case 1 of **Figure 36.39**).

When ADCHnSGSTPCR_x.SGSTP is set to 1 in suspended state by synchronous suspend function or asynchronous suspend function, ADCH is not resumed and transits to idle state (SGACT = 0) (Case 2 of **Figure 36.39**).

When synchronous suspend is occurred by higher priority scan group during the A/D conversion process, ADCH transits to idle state (SGACT = 0) after the A/D conversion for the virtual channel is finished.

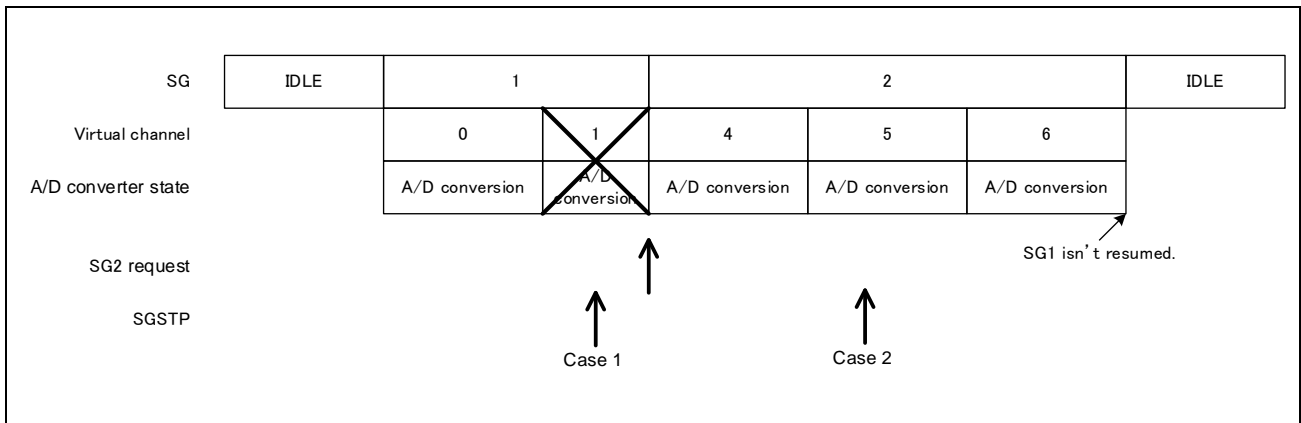

Figure 36.39 Example of Scan Group x Stop 2

36.4.15 Secondary Power Supply Voltage Monitor Function

ADCH0 can convert the voltage of VCC, EVCC, and the VDD power supply in AD. When voltage divider enable bit 1 and 2 (VDE1 and VDE2) of voltage monitor voltage divider control register 1 and 2 (ADCH0VMONVDCR1 and ADCH0VMONVDCR2) are set as 1, it is possible to perform A/D conversion of each power supply voltage.

About VCC and EVCC, A/D conversion of divided voltage are performed.

For the self-diagnosis flow of secondary power supply voltage monitor function, refer to **Section 36.4.11.4 Secondary Power Supply Voltage Monitor Self-Diagnosis**.

[Recommendation flow]

- 1) Set the initial value (refer to **Figure 36.5**)
- 2) Set CNVCLS[2:0] = 0H, and set each power supply voltage (VCC=28, EVCC=29, VDD=30) to GCTRL[5:0] of ADCH0VCR0, ADCH0VCR1, and ADCH0VCR2. (When they are three consecutive ADCH0VCRj, arbitrary setting is permitted).
Additionally, set VCULME=1, VCLLME=1 and VCULLMTBS[2:0] = corresponding ADCH0VCULLMTBR.
- 3) Set VDE1 to 1, set VDE2 to 1.
- 4) Set upper limit value and lower limit value of each power supply voltage to ADCH0VCULLMTBR0, ADCH0VCULLMTBR1 and ADCH0VCULLMTBR2 (any of ADCH0VCULLMTBR (ADCH0VCULLMTBR0 to ADCH0VCULLMTBR6) are able to be used as voltage monitor). For reference value of upper / lower limit value, refer to **Figure 36.40**.
- 5) Allocate AVSEGVCCCHSCR (for VCC), AVSEGEVCCCHSCR (for EVCC) and AVSEGVDDCHSCR (for VDD) a virtual channels which corresponds to each power source. For details of this setting, refer to **Section 36.9 ADC VMON Secondary Error Generator (AVSEG)**.
- 6) Set configuration of a filter to AVSEGVCCNTCR (for VCC), AVSEGEVCCNTCR (for EVCC) and AVSEGVDDCNTCR (for VDD). For details of this setting, refer to **Section 36.9 ADC VMON Secondary Error Generator (AVSEG)**.
- 7) Start SG, and perform A/D conversion.

Figure 36.40 Reference Value of Upper / Lower Limit Value of Secondary Power Supply Voltage Monitor

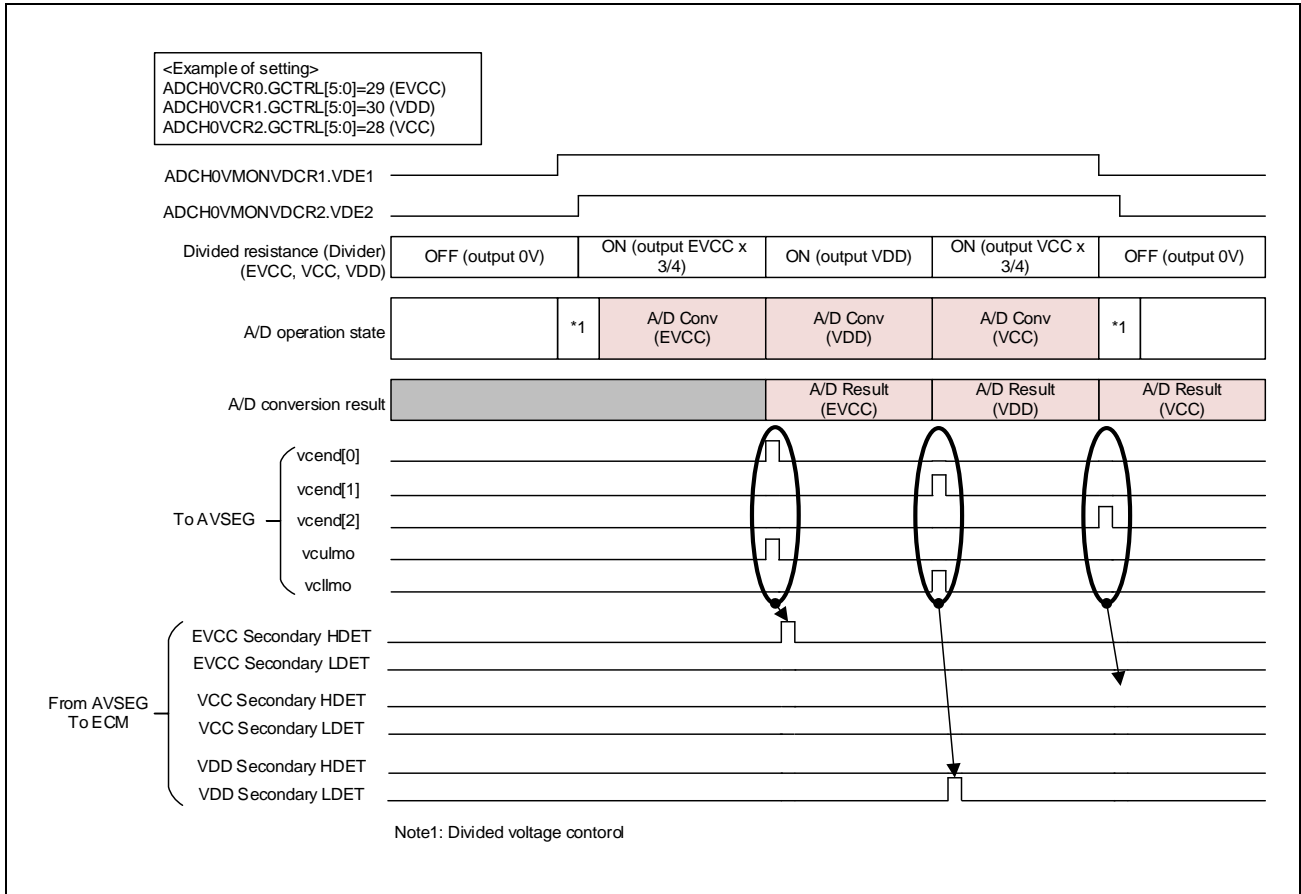

Figure 36.41 Example of Operation of Secondary Power Supply Voltage Monitor

NOTE

- When making it to the module standby, set VDE1 and VDE2 as 0 respectively, before it changes to the module standby.
- Please remove voltage fluctuation of A0VREFH as much as possible.

36.5 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined below.

- Resolution

Number of digital output codes of the A/D converter

- Quantization error

An error essentially contained in A/D converters, which is given as 1/2LSB (**Figure 36.42**).

- Offset error

Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value 000_H to 001_H. However, the quantization error is not included (**Figure 36.42**).

- Full-scale error

Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from FFE_H to FFF_H. However, the quantization error is not included (**Figure 36.42**).

- DNL (Differential nonlinear error)

Deviation between the ideal digital output code width (V_q) and the actual digital output code width (V_a), which is given as $(V_a - V_q)/V_q$. However, the offset error, the full-scale error, and the quantization error are not included (**Figure 36.42**).

- INL (Integral nonlinear error)

Deviation of the actual value from the ideal A/D conversion characteristics, from the zero voltage to the full-scale voltage, which is given as an integral of DNL from 000_H to a digital output code. However, the offset error, the full-scale error, and the quantization error are not included (**Figure 36.42**).

- TUE (Total unadjusted error)

Deviation between the digital value and the analog input value. The offset error, the full-scale error, the quantization error, DNL, and INL are included (**Figure 36.42**).

Figure 36.42 Definition of A/D Conversion Accuracy

36.6 Usage Notes

36.6.1 Notes on Using an External Analog Multiplexer

When using an external multiplexer, observe the following notes so as not to cause system issues.

Other than for the exceptions below, set the MPX wait as follows:

- When an MPX value is transferred to a port: Insert a wait of at least 1 μ s.
- When an MPX value is transferred with the SPI interface: Insert a wait of at least the SPI transmission time + 1 μ s.

Exception 1) When an external multiplexer is used for one scan group

When an external multiplexer is used for SG0 with SUSMTD[1:0] set to 1_H, or when an external multiplexer is used for any of SG0 to SG3 with SUSMTD[1:0] set to 2_H, set the MPX wait as follows:

- When an MPX value is transferred to a port: Insert a wait of at least 1 μ s.
- When an MPX value is transferred with the SPI interface: Insert a wait of at least SPI transmission time \times 2.

Exception 2) When an external multiplexer is used for multiple scan groups

When an external multiplexer is used with SUSMTD[1:0] set to 1_H or 2_H, observe the following notes.

- For the starting virtual channel of each scan group, setup so as not to use an external multiplexer. (However, for the start virtual channel of the scan group whose priority is lowest among the scan groups for which the external multiplexer is used, settings to use an external multiplexer does not cause any problem.)
- Up to two scan groups can be transferred with the SPI interface.

Furthermore, set the MPX wait time as follows:

- When an MPX value is transferred to a port: Insert a wait of at least 1 μ s.
- When an MPX value is transferred with the SPI interface: Insert a wait of at least SPI transmission time \times 2.

36.6.2 Notes on Using Analog Input Pins

Do not perform an A/D conversion for the same analog pin with Delta-Sigma ADC, Cyclic ADC and SAR-ADC at the same time. Also, do not perform an A/D conversion with the SAR-ADC for an analog pin that is being used for a digital input. Doing so may degrade the A/D conversion accuracy.

When a digital input or output signal is multiplexed with an analog input signal, it can also be used as a digital general-purpose input or output pin. Changes in a digital input or output during an AD conversion may reduce the precision of conversion. Noise from the operation of digital pins near analog input pins may also reduce the precision of conversion. Notes on how to reduce the effects of digital input and output noise on the results of AD conversion are given below.

(1) Notes on Analog Input Pins

(a) **Place the capacitors of RC circuits as close to the LSI pin as is possible. This reduces the effects of digital inputs and outputs on the precision of conversion. Since the improvement in precision also depends on other conditions of the board, evaluate the situation on the actual board.**

(2) Notes on Digital Input and Output Pins near Analog Pins

(a) **If digital input through the pin is not essential, disable the digital input.**

(b) **If a digital signal is input to such a pin, the signal should not include overshoot or undershoot.**

(c) **Design the board so that load capacitances connected to output pins to suppress discharge currents are small.**

(d) **Lower the output driving ability of pins that may be affected.**

(3) Software Measures against Effects on the Results of Conversion

(a) **Use an average of multiple results of AD conversion.**

(b) **When using multiple consecutive results of ADC conversion, exclude outlying results.**

36.6.3 Module Standby Function

The ADCHn has a module standby function.

Module standby stops the clock supply to ADCH0, ASF0 and AVSEG by setting MSR_SAD.MS_SAD0.

Module standby stops the clock supply to ADCH2 by setting MSR_SAD.MS_SAD2.

Module standby stops the clock supply to ADCH1 by setting MSR_SAD.MS_SAD1.

Module standby stops the clock supply to ADCH3 by setting MSR_SAD.MS_SAD3.

Module standby stops the clock supply to IFC0. For the clock supply stop condition of IFC0, refer to **Table 36.101**.

Module standby stops the clock supply to IFC1. For the clock supply stop condition of IFC1, refer to **Table 36.102**.

Module standby stops the clock supply to ABFG and AIR. For the clock supply stop condition of ABFG and AIR, refer to **Table 36.103**.

36.7 Integer/Floating-Point Conversion Module (IFC)

The IFC module can read data in the data register of ADCH via the IFC and convert it to floating-point format.

36.7.1 Overview

36.7.1.1 Function Overview

The IFC has the following features:

- Floating-point format: IEEE754 standard single-precision
- Supported registers: Data registers for all virtual channels of the ADCH
IFC0: ADCH0, ADCH2
IFC1: ADCH1, ADCH3

36.7.1.2 Block Diagram

Figure 36.43 is a configuration block diagram of the IFC0.

Figure 36.43 IFC0 Block Diagram

Figure 36.44 is a configuration block diagram of the IFC1.

Figure 36.44 IFC1 Block Diagram

36.7.2 Registers

36.7.2.1 List of Registers

Table 36.104 List of Registers

Module Name	Register Name	Symbol	Address	Access	Access Protection
IFC0	Floating-Point Data Register 0j	IFC0FDR0j	<IFC0_base> + j × 4 _H	32	—
IFC0	Floating-Point Data Register 2j	IFC0FDR2j	<IFC0_base> + 100 _H + j × 4 _H	32	—
IFC1	Floating-Point Data Register 1j	IFC1FDR1j	<IFC1_base> + j × 4 _H	32	—
IFC1	Floating-Point Data Register 3j	IFC1FDR3j	<IFC1_base> + 100 _H + j × 4 _H	32	—

36.7.2.2 IFC Specific Registers

(1) IFCuFDRj — Floating-Point Data Register nj

IFCuFDRj is a 32-bit read-only register that can read the ADCHnDRj of ADCHn, converting it to the floating-point format. Data in an ADC data register is converted from the signed fixed-point format to the floating-point format. Even data in the signed integer format (DFMT bit in ADCHnADCR2 of ADCHn is set to 1) is regarded as data in the signed fixed-point format, and converted to the floating-point format.

Value after reset: 0000 0000_H

• Floating-point format

Table 36.105 IFCuFDRj Register Contents

Bit Position	Bit Name	Function
31	S	Sign bit
30 to 23	EXP[7:0]	Exponent
22 to 0	FRACTION[22:0]	Mantissa

Note: Expression: $-1^S \times 2^{(EXP-127)} \times (1 + (Fraction \times 2^{-23}))$

• Reference: ADCHnDRj signed fixed-point format

Floating-point data register 0j of IFC0 (IFC0FDR0j) correspond with virtual channel j of ADCH0 (ADCH0DRj).

Floating-point data register 2j of IFC0 (IFC0FDR2j) correspond with virtual channel j of ADCH2 (ADCH2DRj).

Floating-point data register 1j of IFC1 (IFC1FDR1j) correspond with virtual channel j of ADCH1 (ADCH1DRj).

Floating-point data register 3j of IFC1 (IFC1FDR3j) correspond with virtual channel j of ADCH3 (ADCH3DRj).

36.8 ADC Summation Function (ASF)

The ASF is a function that accumulates the A/D converted value from the ADCH the specified number of times, and then stores the total value in a register.

36.8.1 Overview

36.8.1.1 Function Overview

The ASF has the following features:

- Compatible module: ADCH0
- Number of accumulation channels: 16
- Entry from ADCH:

Upon receiving an ASF entry request, TAG for DFE, and data for DFE from the ADCH, is transferred by the ASF to each accumulation channel (with the same number as the TAG value for DFE) of the ASF.

- Accumulation data register: 32 bits
- Accumulation end interrupt:

Each time accumulation for the number of cycles specified in each channel ends, an interrupt request (ASI00 to ASI15) to the CPU can be generated.

36.8.1.2 Block Diagram

Figure 36.45 illustrates the ASF0 block diagram.

36.8.2.2 ASF Specific Registers

(1) ASFrDRi — Accumulation Data Register i

ASFrDRi is a 32-bit read-only register that stores an accumulation value. When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi. The ASFrDRi value is retained until the next compare match occurs.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ASFrDRi[20:5]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ASFrDRi[4:0]					—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.107 ASFrDRi Register Contents

Bit Position	Bit Name	Function
31 to 11	ASFrDRi[20:0]	Accumulation Data When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi.
10 to 0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

A 12-bit (bit14 to bit3) value is extracted from the data for DFE from the ADCHn for use in the input of accumulation as a 12-bit integer. Therefore, even if the valid number of digits of the data for DFE is 13 or 14 bits after addition is performed twice or four times in the ADCHn, the valid number of digits is regarded as 12 bits and accumulation processing is performed. The signed integer format (DFMT[1:0] = 01_B is set in the ADCHn) is regarded as signed fixed-point format and accumulation processing is performed. For this reason, when using the ASF function, conversion-class of ADCHn must be set to normal-A/D-conversion, or A/D-converter-self-diagnosis, or normal-A/D-conversion-with-the-MPX, and DFMT[1:0] must be set to a value different from 01_B.

An effective bit is also dealt with as 12bit in case of 10-bit-format (at the time of DFMT[1:0] = 11_B set by ADCHn), but lower 2bit of the accumulation-input-format, accumulation-value-format and ASFrDRi will be fixed to 0.

ASFrDRi is a format with left-aligned valid bits according to the accumulation count of 21-bit accumulation value.

Figure 36.46 Accumulation Data Reading Register i (ASFrDRi) Bit Format

(2) ASFrCMPi — Accumulation Compare Match Register i

ASFrCMPi is a 16-bit readable/writable register that control the accumulation end interrupt output control, enables or disables accumulation processing for accumulation channel i and specifies the ASFrCNT compare match value for updating ASFrDRi. ASFrCMPi is initialized to 0000_H at reset.

Value after reset: 0000_H

Table 36.108 ASFrCMPi Register Contents

Bit Position	Bit Name	Function
15	ASliIE	Accumulation end interrupt enable 0: Accumulation end interrupt (ASli) is not output. 1: Accumulation end interrupt (ASli) is output.
14 to 8	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
7	ASFrCHEi	Accumulation Channel i Enable 0: Accumulation is disabled. •Intermediate buffer i is cleared to 0. •ASFrDRi is not updated. •Accumulation end interrupt (ASli) is not generated. 1: Accumulation is enabled. •Each time an ASF entry request of TAG for DFE (TAG for DFE = i) that matches accumulation channel i is accepted, the result of sum of data for DFE and intermediate buffer i is stored in intermediate buffer i (accumulation processing for accumulation channel i). •When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi and intermediate buffer i is cleared to 0 (ASFrDRi update). •An accumulation end interrupt (ASli) is generated on compare match.
6 to 5	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	ASFrCMPi[4:0]	Accumulation Compare Match [When ASFrCTL0.ASFRTD=0] When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi. [When ASFrCTL0.ASFRTD=1] Regardless of the set ASFrCMPi value, the accumulator i value is stored in ASFrDR i when ASFrCNTi[8:0] = 0. These bits must not be modified during operation (while ASFrST = 1).

CAUTIONS

1. Each time ASFrCNT[8:0] matches {0000_B,ASFrCMPi[4:0]}, the intermediate buffer i value is stored in ASFrDRi[20:0] and an ASli interrupt is generated.
Therefore, the first accumulation count in ASFrDRi[20:0] is not ensured after accumulation processing (where ASFrST is changed from 0 to 1) is started, or immediately after an accumulation channel (for which ASFrCHEi is changed from 0 to 1 during accumulation processing) is enabled (the accumulation count is variable).
For example of operation, see **Section 36.8.3.1, Example of Accumulation Processing Operation**.
 2. Set ASFrCMPi[4:0] to a value less than the accumulation count selected by ASFrACSL[2:0]. If a value equal to or greater than the accumulation count is set in ASFrCMPi[4:0], ASFrCNT[8:0] does not match {0000_B,ASFrCMPi[4:0]}, so the ASFrDRi[20:0] value is not updated.
-

(3) ASFrCTL0 — Accumulation Counter Control Register 0

ASFrCTL0 is a 32-bit readable/writable register that sets count-up conditions for ASFrCNT. ASFrCTL0 is initialized to 0000 0000_H at a reset.

This register must not be modified during operation (while ASFrST = 1).

Value after reset: 0000 0000_H

7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ASFrST	Accumulation Counter Start 0: The accumulation counter and all intermediate buffers are cleared to 0. 1: Counting up and accumulation processing by the accumulation counter are enabled. When an ASF entry request of TAG for DFE that matches ASFrCTAG is accepted with ASFrST set to 1, ASFrCNT starts counting up.

(5) ASFrCNT — Accumulation Count Reading Register

ASFrCNT is an 16-bit read-only register that indicates the count value of the accumulation counter. ASFrCNT is initialized to 0000_H at a reset. When ASFrCTL0.ASFrRTD = 0, the current summation count can be read. When ASFrCTL0.ASFrRTD = 1, this register value is not guaranteed. This register is updated when the input value dftag[3:0] matches the set ASFrCTL0.ASFrCTAG[3:0] value at the rising edge of ASF entry request (asreq).

Value after reset: 0000_H

15 to 9	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	ASFrCNT[8:0]	Accumulation Counter Case of ASFrCTL0.ASFrRTD=0 When ASFrST is set to 1, ASFrCNT counts up each time an ASF entry request of TAG for DFE that matches ASFrCTAG is accepted. When ASFrST is set to 0, ASFrCNT is cleared to 0. <ul style="list-style-type: none"> ●When ASFrACSL = 000_B (4 accumulation times) The counter counts up to 3 and then returns to 0. ●When ASFrACSL = 001_B (8 accumulation times) The counter counts up to 7 and then returns to 0. ●When ASFrACSL = 010_B (16 accumulation times) The counter counts up to 15 and then returns to 0. ●When ASFrACSL = 011_B (32 accumulation times) The counter counts up to 31 and then returns to 0. ●When ASFrACSL = 100_B (64 accumulation times) The counter counts up to 63 and then returns to 0. ●When ASFrACSL = 101_B (128 accumulation times) The counter counts up to 127 and then returns to 0. ●When ASFrACSL = 110_B (256 accumulation times) The counter counts up to 255 and then returns to 0. ●When ASFrACSL = 111_B (512 accumulation times) The counter counts up to 511 and then returns to 0. When ASFrCTL0.ASFrRTD=1 The read value of this register cannot be guaranteed.

(6) ASFrRTDRi — Accumulation Data/Accumulation Counter Intermediate Reading Register i

ASFrRTDRi is a 32-bit read-only register that stores an accumulation data and accumulation counter value.

When ASFrCTL0.ASFrRTD = 0, the read value of this register cannot be guaranteed.

When ASFrCTL0.ASFrRTD = 1, current accumulation data and current accumulation cycles can be read from this register. This register is updated at the timing of an ASF entry request (asreq).

ASFrRTDRi of the accumulation channel (for example, when dftag=1_H, then it is ASFrRTDR01) indicated by TAG data (dftag [3:0]) is updated. For details, see **Section 36.8.3.1, Example of Accumulation Processing Operation**.

The data format of an accumulation-data/accumulation-counter-intermediate-reading-register-i (ASFrRTDRi) is according to **Figure 36.46** and **Section 36.8.2.2(5), ASFrCNT — Accumulation Count Reading Register**.

When an accumulation counter start is cleared to 0, this register is cleared to 0.

Value after reset: 0000 0000 _H																
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.112 ASFrRTDRi Register Contents

Bit Position	Bit Name	Function
31 to 11	ASFrRTDRi [20:0]	Accumulation Data Intermediate Value When ASFrCTL0.ASFrRTD=0 The read value of this register cannot be guaranteed. When ASFrCTL0.ASFrRTD=1 Accumulation data value during the accumulation process.
10 to 9	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	ASFrCNTi[8:0]	Accumulation Counter Intermediate Value When ASFrCTL0.ASFrRTD=0 The read value of this register cannot be guaranteed. When ASFrCTL0.ASFrRTD=1 Accumulation counter value during the accumulation process.

CAUTION

ASF is equipped with only 1 accumulation counter.

Therefore, when DFTAG value for more than one ADCHnVCRj.DFTAG[3:0] of ADCHn value overlaps, a mismatch occurs between accumulation-data-intermediate-value and accumulation-counter-intermediate-value in specific accumulation channel.

ADCHnVCRj.DFTAG [3:0] has to be set as a unique value so that the accumulation channel for the requested entry doesn't overlap when more than one accumulation channel is requested for entry.

When an accumulation channel is terminated independently, a value of this register of terminated channel in period of "from terminated time to the first generating time of accumulation end interrupt after restarting" cannot be guaranteed.

36.8.3 Operation

The ADC summation function (ASF) accumulates the results of ADCH_n conversions from the ADCH_n, stores the accumulation value in a register, and generates an interrupt request each time accumulation for the specified number of cycles is completed.

The ASF allows accumulation for up to 16 channels. The number of accumulation cycles is selectable from 4, 8, 16, 32, 64, 128, 256 and 512. However, the number of accumulation cycles is common for all channels (it cannot be set individually for each channel). Furthermore, interrupt timing offset is enabled by register setting.

After ASFrST is set to 1 to enable accumulation processing, the ADCH_n conversion result is added to the accumulation channel that is the same as the TAG value for DFE each time an ASF entry request from the ADCH_n is set to a high level.

The accumulation counter (ASFrCNT[8:0]) counts up when TAG for DFE that matches ASFrCTAG[3:0] is input and an ASF entry request is set to a high level. When ASFrCTAG[3:0] matches the TAG for DFE and the accumulation count reaches number of accumulation cycles specified by ASFrACSL[2:0] - 1, the accumulation counter returns to 0 at the next ASF entry request.

When ASFr1nCTL0.ASFrRTD = 0, and {0000_B,ASFrCMPi[4:0]} matches with ASFrCNT[8:0], the accumulation data (ASFrDRi[31:0]) is updated and an accumulation end interrupt ASFi is generated.

When ASFr1nCTL0.ASFrRTD = 1, accumulation data (ASFrDRi[31:0]) is updated when ASFrRTCNTi[8:0] returns to 0 irrespective of the value of ASFrCMPi[4:0], and accumulation end interrupt (ASFi) is generated at the same time.

When ASFr1nCTL0.ASFrRTD = 1, accumulation-data-intermediate-value and accumulation-count-intermediate-values can be read from ASFrRTDRi.

ASFrRTDRi of the accumulation channel (for example, when dftag = 1_H, then it is ASFrRTDR01) indicated by TAG data (dftag[3:0]) is updated at the time that ASF entry request (asreq) is requested.

[Operating Example]

- (1) The following registers must be set when state of ASFrCTL1.ASFrST = 0.
ASFrCTL0.ASFrACSL[2:0] = 000_B, ASFrCTL0.ASFrCTAG[3:0] = 1_H, ASFrCMP00.ASFrCHE0=1,
ASFrCMP01.ASFrCHE1 = 1, ASFrCMP00.ASI00IE=1, ASFrCMP01.ASI01IE = 1, ASFrCTL0.ASFrRTD = 0/1,
ASFrCMP00.ASFrCMP00[4:0] = 00_H, ASFrCMP01.ASFrCMP01[4:0] = 01_H.(There are no regulations for the order in which these registers should set.)
- (2) Set ASFrCTL1.ASFrST to 1 to enable (start) the accumulation processing operation.
- (3)
 1. When ASFrCTL0.ASFrRTD = 0, after any accumulation end interrupt ASFi (except for the first one) is generated, ASFrDR00.ASFrDR00[20:0] is read and accumulated value of A/D conversion result is acquired.
See note below for instructions on how to handle the first accumulation end interrupt.
 2. When ASFrCTL0.ASFrRTD = 1, accumulation-data-intermediate-value and accumulation-count-intermediate-value can be read from accumulation-data/accumulation-counter-intermediate-read-register (ASFr1nRTDRi).
- (4) After the required accumulation value of the ADCH_n conversion results is obtained, set ASFrCTL1.ASFrST to 0 to stop the accumulation processing.

CAUTION

Ignore the first accumulation end interrupt (ASli) (or discard the ASFrDRi[20:0] read value).

Because the first accumulation count after accumulation start is undefined.

36.8.3.1 Example of Accumulation Processing Operation

(1) Operation start

When 1 is written to ASFrST of accumulation counter control register 1 (ASFrCTL1), accumulation processing is started.

• When ASFrRTD = 0:

Figure 36.47 shows an example of accumulation processing operation for two channels when the number of accumulation cycles is set to 4 (ASFrACSL[2:0] = 000_B, ASFrCTAG[3:0] = 1_H, ASFrCMP00[4:0] = 00_H, ASFrCMP01[4:0] = 02_H).

In this example, data (dfdata[15:0]) of dftag[3:0] = 0_H is always 10, data (dfdata[15:0]) of dftag[3:0] = 1_H is always 20 for convenience.

- (1) The counts up operation of ASFrCNT is started (is permitted) by ASFrST=1.
- (2) When the Accumulation Counter (ASFrCNT[8:0]) matches the Accumulation Compare Match ({0000_B, ASFrCMP00[4:0]}), the Accumulation Data (ASFrDR00[31:0]) is updated. The accumulation end interrupt (ASI0) is generated at the same time (the first time). Refer to 'CAUTION' of Section 36.8.3, Operation.
- (3) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1, the Accumulation Counter (ASFrCNT[8:0]) perform counts up.
- (4) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1 and defined Accumulation Cycles (ASFrACSL[2:0] - 1) is 3, the Accumulation Counter (ASFrCNT[8:0]) returns to 0.
- (5) When the Accumulation Counter (ASFrCNT[8:0]) matches the Accumulation Compare Match ({0000_B, ASFrCMP00[4:0]}), the Accumulation Data (ASFrDR00[31:0]) is updated. The accumulation end interrupt (ASI0) is generated at the same time (the second time).

Figure 36.47 Timing of Accumulation Processing Start Operation Example (When ASFrRTD = 0)

• When ASFrRTD=1:

Figure 36.48 shows an example of accumulation processing operation for two channels when the number of accumulation cycles is set to 4 (ASFrACSL[2:0] = 000_B, ASFrCTAG[3:0] = 1_H, ASFrCMP00[4:0] = 00_H, ASFrCMP01[4:0] = 01_H).

In this example, data (dfdata[15:0]) of dftag[3:0] = 0_H is always 10, data (dfdata[15:0]) of dftag[3:0] = 1_H is always 20 for convenience.

- (1) The counts up operation of ASFrCNT is started (is permitted) by ASFrST=1.
- (2) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1, ASF transfers from non-operating state to operating state.
- (3) When dftag[3:0] matches 0_H and the ASF entry request (asreq) is 1, the intermediate buffer (ASF1nRTDR00[20:0]) is updated and the intermediate accumulation counter (ASFrRTCNT00[8:0]) perform counts up (+ 1).
- (4) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1, the Accumulation Counter (ASFrCNT[8:0]) perform counts up.
- (5) When the intermediate accumulation counter (ASFrRTCNT00[8:0]) returns to 0, the Accumulation Data (ASFrDR00[31:0]) is updated. The accumulation end interrupt (ASIO0) is generated at the same time.
- (6) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1 and defined Accumulation Cycles (ASFrACSL[2:0] - 1) is 3, the Accumulation Counter (ASFrCNT[8:0]) returns to 0.

Figure 36.48 Timing of Accumulation Processing Start Operation Example (When ASFrRTD = 1)

(2) Operation Stop and Restart

Figure 36.49 shows an example of accumulation processing stop and restart operation.

When ASFrST is set to 0, the accumulation counter ASFrCNT[8:0] and intermediate buffer i are cleared to 0.

When ASFrST is set to 1, accumulation processing is started again.

Figure 36.49 Timing of Accumulation Processing Stop and Restart Operation Example

(3) Channel Stop

Figure 36.50 shows an example of accumulation processing stop and restart operation for an accumulation channel.

When ASFrCHEi is set to 0, intermediate buffer i is cleared to 0.

When ASFrCHEi is set to 1, accumulation processing is started again.

When ASFrCHEi is set to 0, ignore the first accumulation end interrupt (ASi) (or discard the ASFrDRi[20:0] read value) because the first accumulation count after accumulation start is undefined.

When ASFrRTD=1, value of accumulation-data/accumulation-counter-intermediate-reading-register (ASFrRTDRi) cannot be guaranteed until the first accumulation end interrupt (ASi) generated.

Figure 36.50 Timing of Accumulation Processing Stop Operation Example using ASFrCHEi

(4) Accumulation End Interrupt Request Function

The ASF can output a accumulation end interrupt request (ASLi). An accumulation end interrupt request is output in 1 register access clock period.

When ASFrCMPi.ASiIE is set, a accumulation end interrupt request (ASLi) is output.

For details, see **Figure 36.47** and **Figure 36.48**.

If the accumulation channel i enable bit (ASFrCHEi) or the accumulation counter start bit (ASFrST) is cleared to 0 immediately before the summation ends, the processing ends but a summation end interrupt may be output.

If the accumulation end interrupt enable bit (ASiIE) is cleared to 0 immediately before the accumulation ends, an accumulation end interrupt may be output.

36.9 ADC VMON Secondary Error Generator (AVSEG)

36.9.1 Overview

36.9.1.1 Function Overview

AVSEG is equivalent to the function which notify an upper error pulse (secondary HDET) and a lower error pulse (Secondary LDET) of each power supply (VCC, EVCC and VDD) to ECM in the secondary power supply voltage monitor.

- Upper Error Pulse Control and Lower Error Pulse Control

This function generates an error signal from ADCH0 to ECM if an upper or lower bound is exceeded.

- Noise Filter

The upper and lower error pulses are generated by signals passed through a filter to reduce noise.

CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

36.9.1.2 Block Diagram

Figure 36.51 illustrates the AVSEG block diagram.

Figure 36.51 AVSEG Block Diagram

Table 36.119 AVSEGVDDCNTCR Register Contents

Bit Position	Bit Name	Function
31 to 29	—	Reserved These bits are always read as 0. The write value should always be 0.
28	AVSEGVDDENB	Filter Enable This bit enable AVSEG for VDD 0: Disabled 1: Enables the filter. When set to disabled all AVSEG for VDD functions are disabled.
27 to 12	—	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	AVSEGVDDNRCNT	Recovery Counter Settings These bits control the number of counts until the signal is considered recovered. Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. The counter value is reset when one of the following values is written to AVSEGVDDNRCNT. 1 _H : Recovery after the signal is within the boundaries for 1 count. : F _H : Recovery after the signal is within the boundaries for 15 consecutive counts.
7 to 4	—	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	AVSEGVDDERRCNT	Error Counter Control These bits control the number of counts until the signal is considered out of bounds. The signal is considered out of bounds once the set number of consecutive error pulses are detected. The counter value is reset when one of the following values is written to AVSEGVDDERRCNT. 1 _H : Out of bounds when the signal violates the boundaries for 1 count. : F _H : Out of bounds when the signal violates the boundaries for 15 consecutive counts.

CAUTION

Setting AVSEGVDDNRCNT and AVSEGVDDERRCNT to 0_H is prohibited.

36.9.3 Operation

36.9.3.1 Noise Count Method

The AVSEG noise count methods are shown below. Noise is filtered and reduced by counting the number of times the ADC boundary values are exceeded using the input error pulses.

CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

Example for the upper error pulse AVSEG for VCC:

Method 1:

AVSEGVCCNTCR.AVSEGVCCERM CNT = 1_H to 3_H and AVSEGVCCNTCR.AVSEGVCCNRM CNT = 1_H.

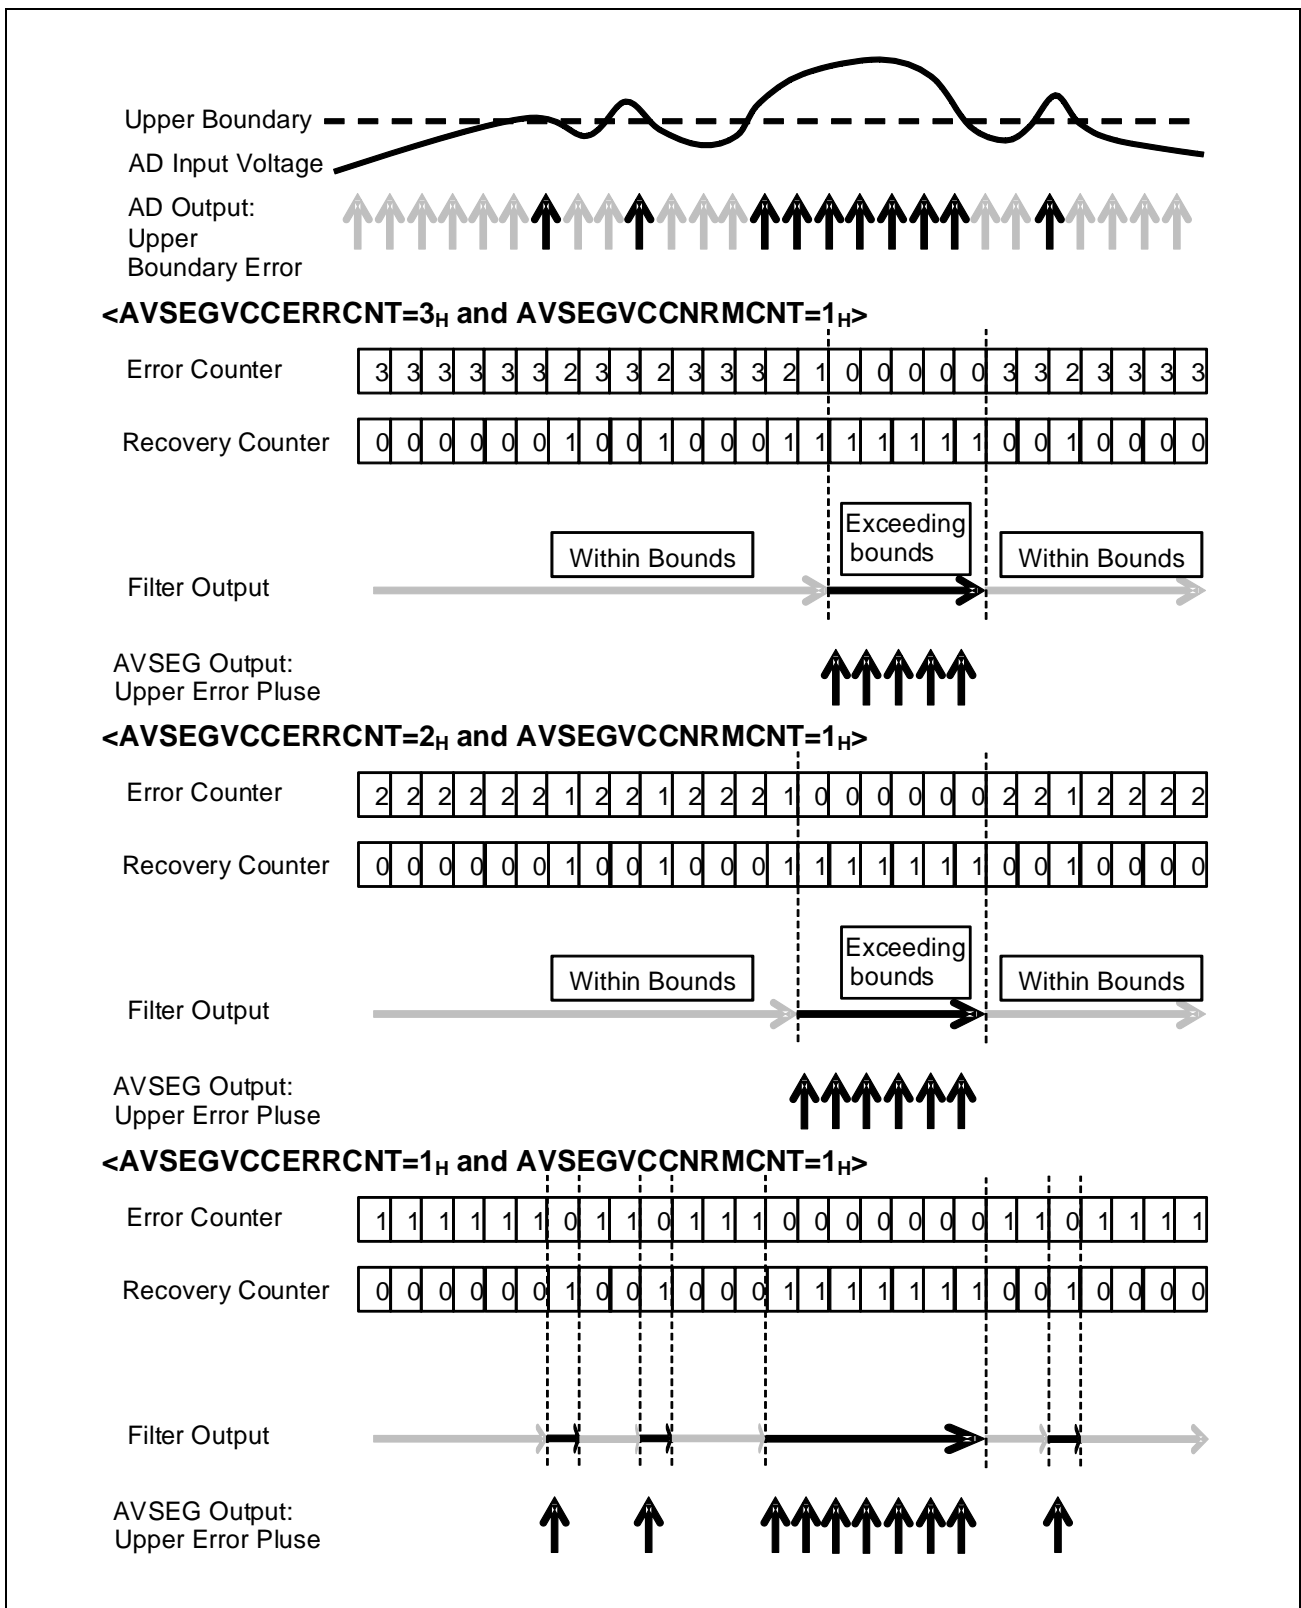

Figure 36.52 Noise Count (1)

Method 2:

AVSEGVCCNTCR.AVSEGVCCERM CNT = 1_H to 3_H and AVSEGVCCNTCR.AVSEGVCCNRM CNT = 2_H.

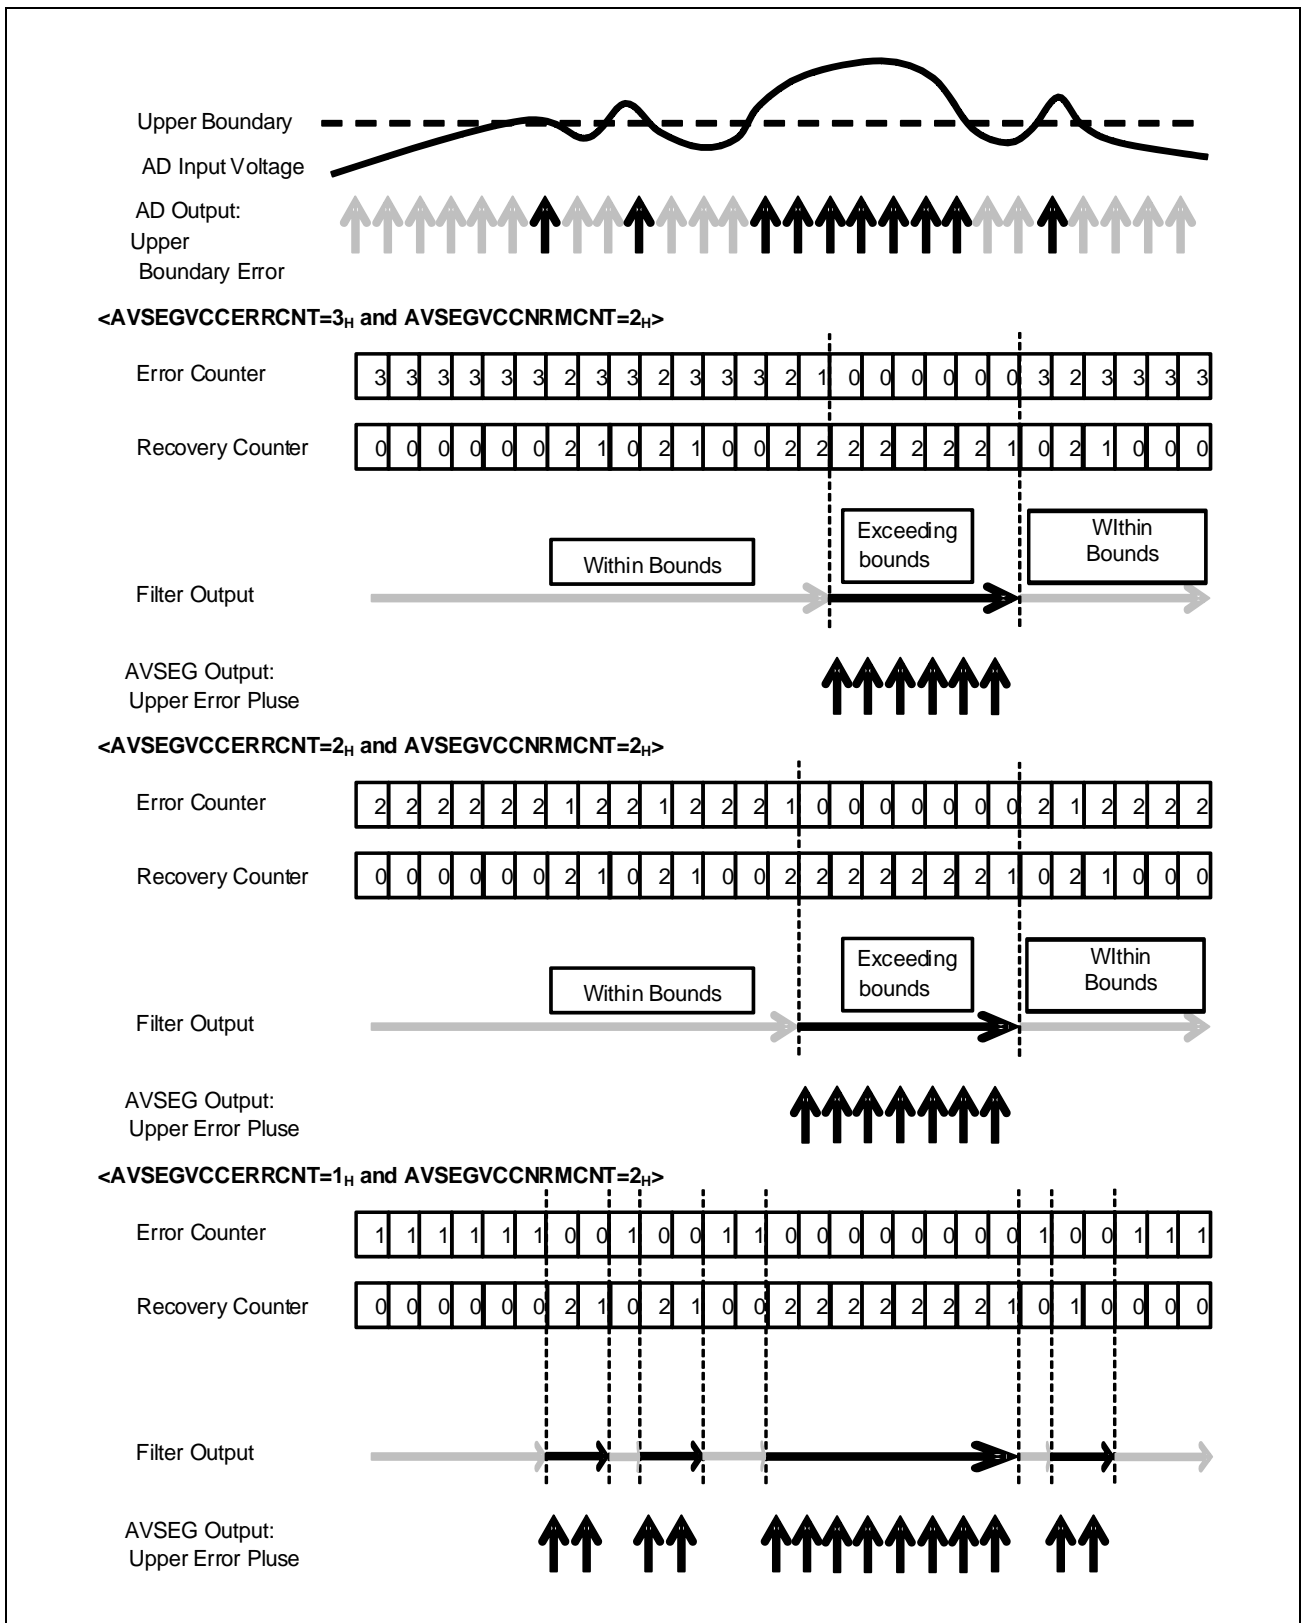

Figure 36.53 Noise Count (2)

Method 3:

AVSEGVCCNTR.AVSEGVCCERRCNT = 1_H to 3_H and AVSEGVCCNTR.AVSEGVCCNRMCMNT = 3_H.

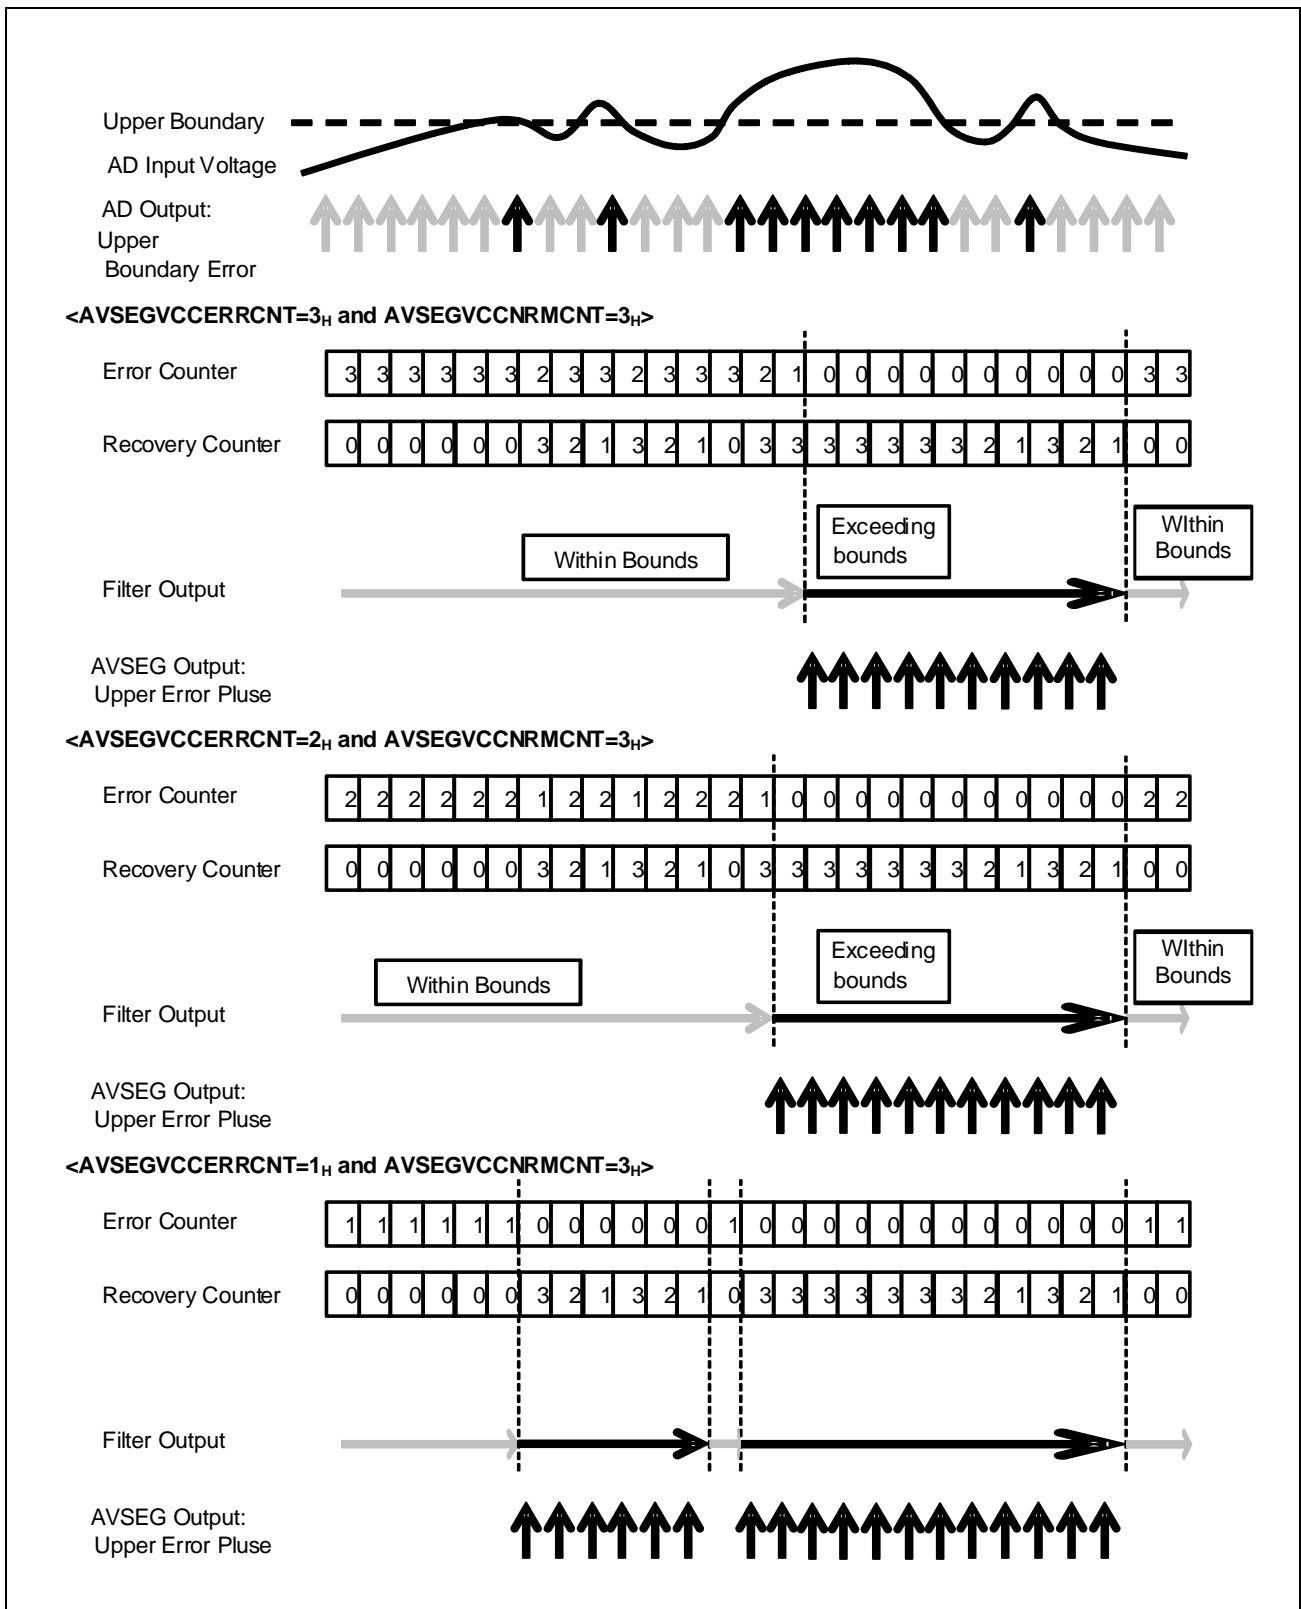

Figure 36.54 Noise Count (3)

36.9.3.2 Upper/Lower Error Pulse Output

The AVSEG upper/lower error pulse output signals are shown below. All output signals are generated by signals that have passed through the filter function to reduce noise.

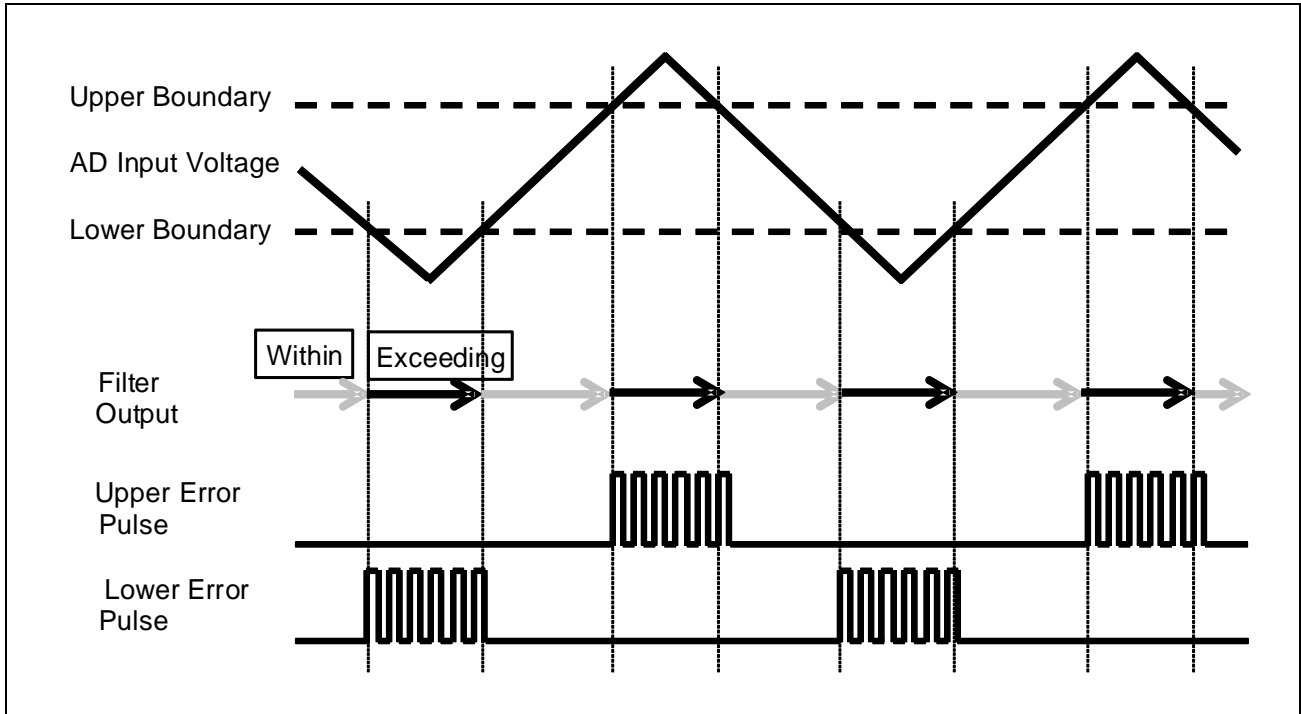

Figure 36.55 Upper/Lower Error Pulse Output

36.9.4 Use Method

(1) Startup Procedure Example

(a) ADC Settings (For details, refer to Section 36, Analog to Digital Converter (ADCH))

Set the virtual channel registers and virtual channel upper/lower limit table registers so that comparisons are made between the limit registers and the input voltage during conversion.

(b) ECM Settings

Refer to **Section 41, Error Control Module (ECM)**.

(c) AVSEG Settings

Set the Input Channel Selector Register of respective voltage (AVSEGVCCCHSCR, AVSEGEVCCCHSCR and AVSEGVDDCHSCR).

Set the Filter Counter Control Register of respective voltage (AVSEGVCCNTCR, AVSEGEVCCNTCR and AVSEGVDDCNTCR).

(d) Begin AD Conversion

Begin AD conversion after setting up AVSEG. If the AVSEG Filter Counter Control Register is modified, the error counter and recovery counter will be set with the written values, and all outputs change will be masked.

(2) Stop Procedure Example

(a) End A/D Conversion

Stop the ADCH0.

(b) AVSEG Setting

Set the filter counter enable bit, AVSEGVCCNTCR. AVSEGVCCENB, AVSEGEVCCNTCR. AVSEGEVCCENB and AVSEGVDDCNTCR. AVSEGVDDENB to 0.

This will prevent any and all pulse signals from being output from AVSEG.

NOTE

The internal filter counters will be reset to the written values during the AVSEGVCCNTCR, AVSEGEVCCNTCR and AVSEGVDDCNTCR write procedure.

(3) Usage Notes

(a) The input of both upper and lower error pulses into the same module at the same time is prohibited.

(b) Setting AVSEGVCCNRMNT, AVSEGVCCERRCNT, AVSEGEVCCNRMNT, AVSEGEVCCERRCNT, AVSEGVDDNRMNT and AVSEGVDDERRCNT to 0_H is prohibited.

36.10 ADC Boundary Flag Generator (ABFG)

36.10.1 Overview

36.10.1.1 Function Overview

ABFG has the following functions.

- **Boundary Flag Control**
This function generates a boundary flag by using virtual channel conversion end pulse signals with their respective upper-limit/lower-limit error pulse signals provided by the SAR-ADC, Delta-Sigma ADC and Cyclic ADC converters.
- **Boundary Pulse Control**
This function generates an interrupt request and/or DMAC request that indicates the current state of the boundary flag.
- **Noise Filter**
The boundary flag, and boundary pulse are generated by signals passed through a filter to reduce noise.

CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

36.10.1.2 Block Diagram

Figure 36.56 illustrates the ABFG block diagram.

Figure 36.56 ABFG Block Diagram

Figure 36.57 illustrates the ABFG block diagram.

(2) ABFGNTRw — Filter Counter Control Register w

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Value after reset: 0000 0101_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	ABFGwENB	—	—	—	—	—	—	—	—	—	—	—	—

Table 36.130 ABFGNTRw Register Contents

Bit Position	Bit Name	Function
31 to 29	—	Reserved These bits are always read as 0. The write value should always be 0.
28	ABFGwENB	Filter Enable This bit enable boundary flag w functions. 0: Disabled 1: Enables the filter When set to disabled, all boundary flag w functions are disabled.
27 to 12	—	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	ABFGwNRCNT	Recovery Counter Settings These bits control the number of counts until the signal is considered recovered. Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. The counter value is reset when one of the following values is written to ABFGwNRCNT. 1 _H : Recovery after the signal is within the boundaries for 1 count. : F _H : Recovery after the signal is within the boundaries for 15 consecutive counts.
7 to 4	—	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	ABFGwERRCNT	Error Counter Control These bits control the number of counts until the signal is considered out of bounds. The signal is considered out of bounds once the set number of consecutive error pulses are detected. The counter value is reset when one of the following values is written to ABFGwERRCNT. 1 _H : Out of bounds when the signal violates the boundaries for 1 count. : F _H : Out of bounds when the signal violates the boundaries for 15 consecutive counts.

CAUTION

Setting ABFGwNRCNT and ABFGwERRCNT to 0_H is prohibited.

(3) ABFGBFSRw — Boundary Flag Status Register w

This register shows the status of the boundary flag.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ABFGwBFS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 36.131 ABFGBFSRw Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should always be 0.
0	ABFGwBFS	Boundary Flag Status This bit shows the status of the boundary flag. It is possible to set the boundary flag directly by writing to this register.

CAUTION

Writing to this register while ABFGCNTCRw.ABFGwENB is 1 is prohibited.

36.10.3 Operation

36.10.3.1 Noise Count Method

The boundary flag noise count methods are shown below. Noise is filtered and reduced by counting the number of times the ADC boundary values are exceeded using the input error pulses.

CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

Example for the upper boundary error.

Method 1:

$ABFGNTRw.ABFGwERRCNT = 1_H$ to 3_H and $ABFGNTRw.ABFGwNRCNT = 1_H$.

Figure 36.58 Noise Count (1)

Method 2:

$$ABFGNTRw.ABFGwERRCNT = 1_H \text{ to } 3_H \text{ and } ABFGNTRw.ABFGwNRCNT = 2_H.$$

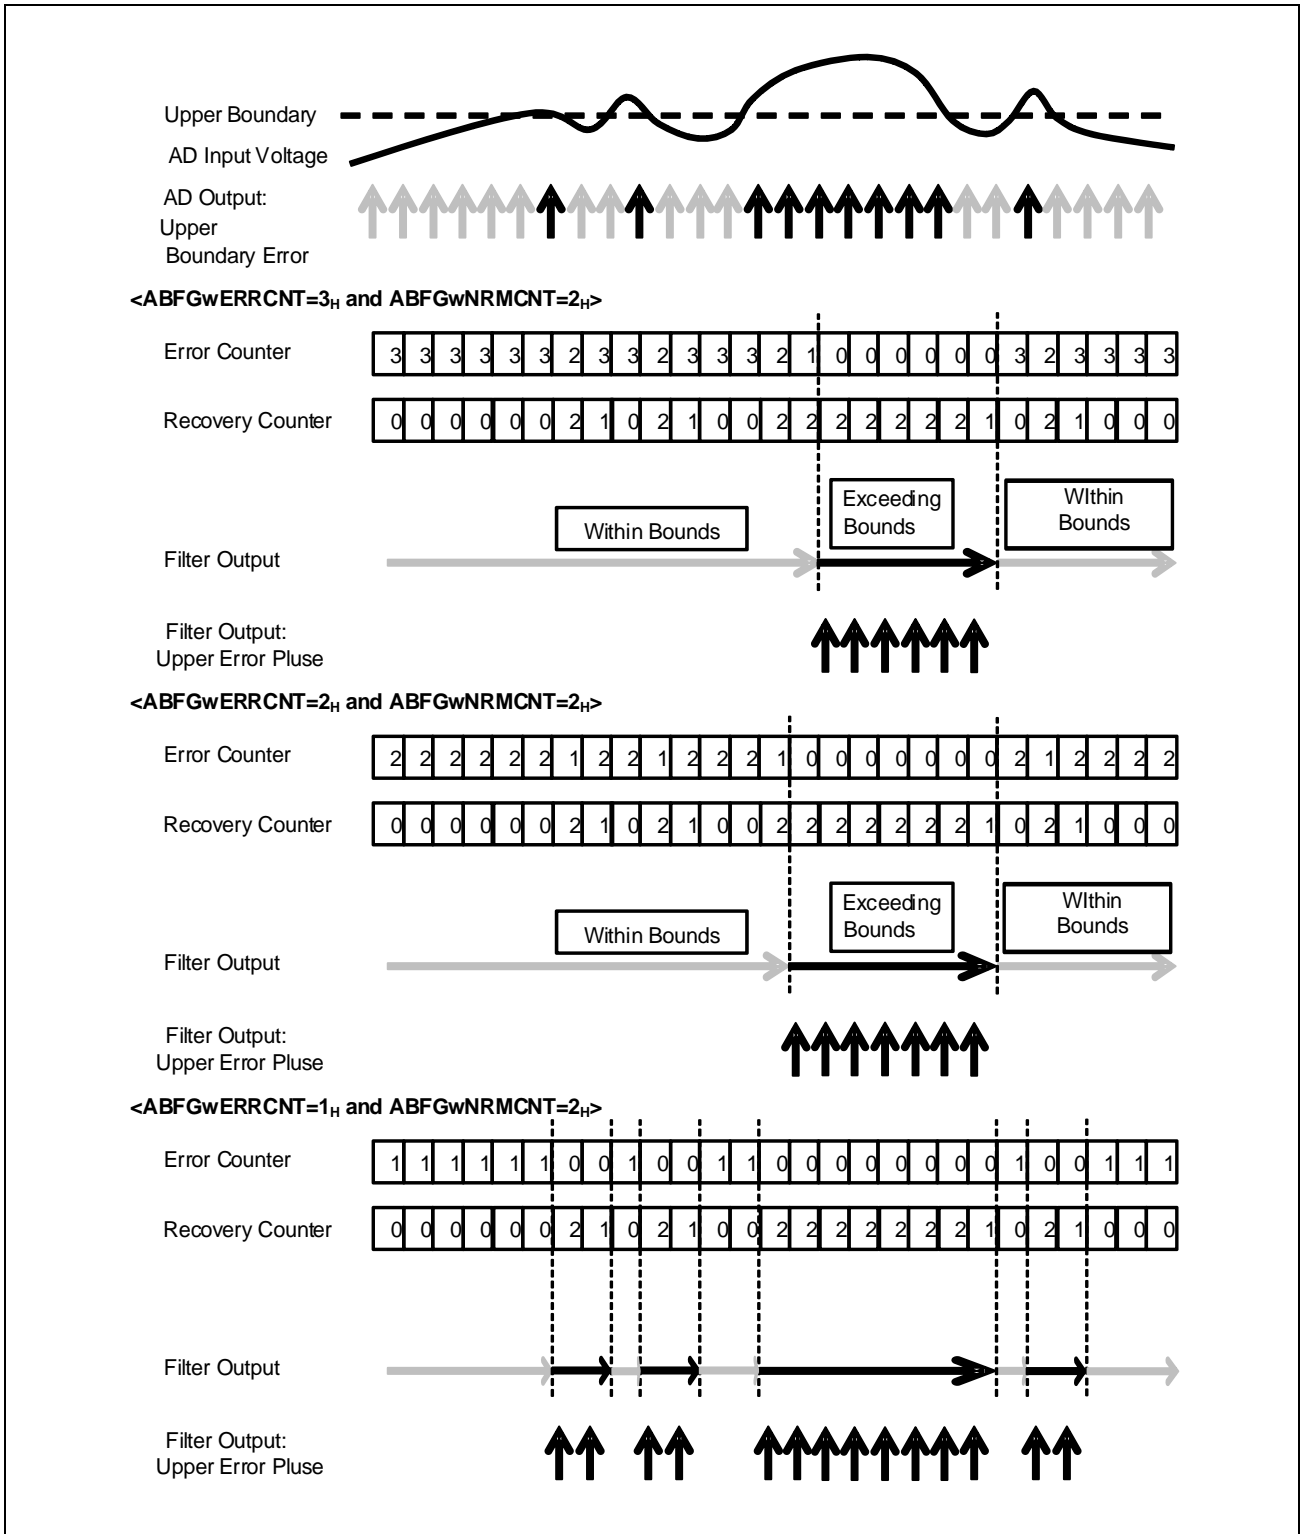

Figure 36.59 Noise Count (2)

Method 3:

ABFGNTRw.ABFGwERRCNT = 1_H to 3_H and ABFGNTRw.ABFGwNRM CNT = 3_H.

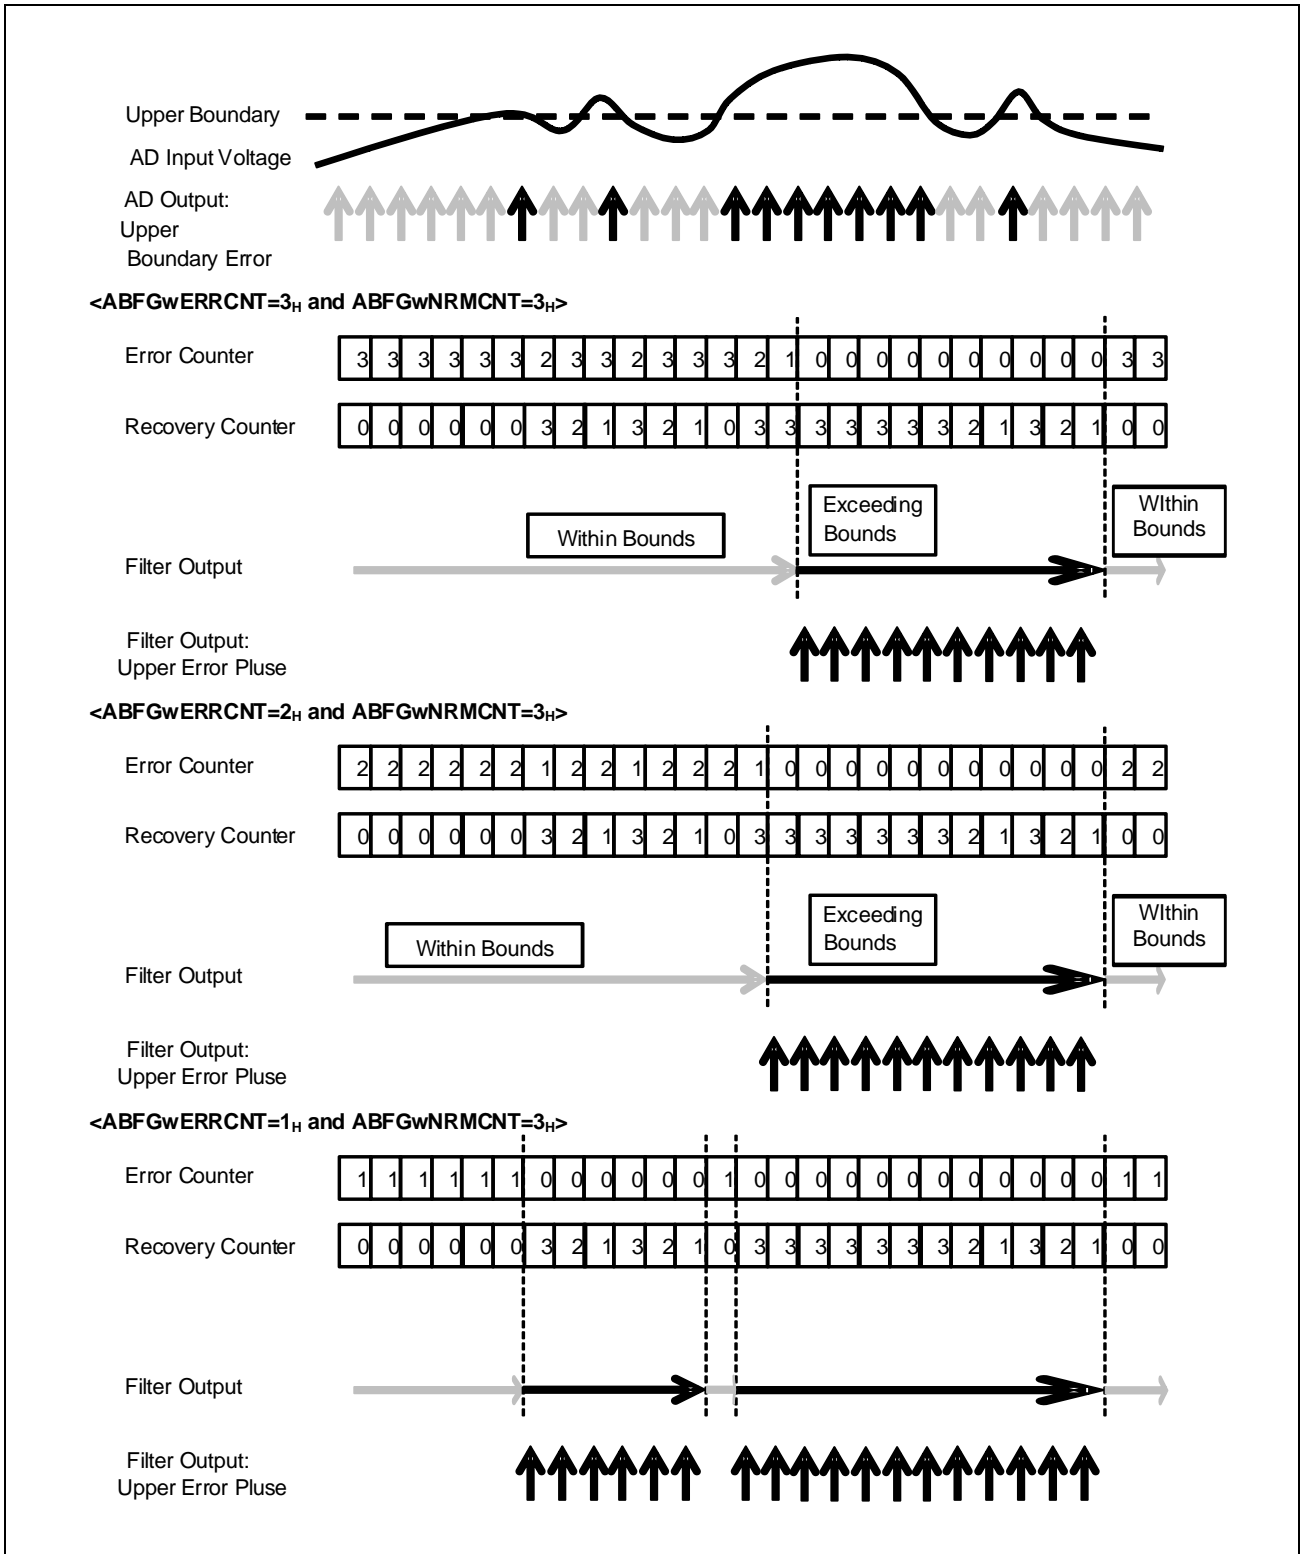

Figure 36.60 Noise Count (3)

36.10.3.2 Boundary Flag Output, Boundary Flag Pulse Output

The ABFG boundary flag output, boundary flag pulse output signals are shown below. All output signals are generated by signals that have passed through the filter function to reduce noise. The boundary flag can be generated using 4 different methods. The boundary flag pulse is generated by detecting the rising and/or falling edges of the boundary flag with 4 modes of output.

Figure 36.61 Boundary Flag Output, Boundary Flag Pulse Output

36.10.4 Use Method

(1) Starting Procedure Example

- (a) **ADC Settings (For details, refer to Section 36, Analog to Digital Converter (ADCH), Section 37, Delta-Sigma Analog to Digital Converter (DSADC) and Section 38, Cyclic Analog to Digital Converter (CADC))**

Set the virtual channel registers and virtual channel upper/lower limit table registers so that comparisons are made between the limit registers and the input voltage during conversion.

(b) ATU, GTM, INTC, DMAC Settings

Refer to **Section 32, ATU-V**, **Section 33, Generic Timer Module (GTM)**, **Section 6, Interrupts**, **Section 7, sDMA Controller (sDMAC)**, **Section 8, DTS Controller**.

(c) ABFG Settings

Set the boundary flag control register with the input channel, pulse generation and toggle methods (ABFGBFGCRw).

Set the boundary flag status (ABFGBFSRw) (optional).

Set the filter counter value (ABFGNCTCRw).

(d) Begin AD Conversion

Begin AD conversion after setting up ABFG. If the ABFG Filter Counter Control Register is modified, the error counter and recovery counter will be set with the written values, and all outputs change will be masked.

(2) Stop Procedure Example

(a) End A/D Conversion

Stop the ADCH, DSADC and CADC.

For details, refer to **Section 36, Analog to Digital Converter (ADCH)**, **Section 37, Delta-Sigma Analog to Digital Converter (DSADC)** and **Section 38, Cyclic Analog to Digital Converter (CADC)**.

(b) ABFG Setting

Set the filter counter enable bit, ABFGNCTCRw.ABFGwENB to 0.

This will prevent any and all pulse signals from being output from ABFG, and the boundary flag signal will hold its level until ABFGBFSRw register is changed or ABFG is turned back on.

NOTE

The internal filter counters will be reset to the written values during the ABFGNCTCRw write procedure.

(3) Usage Notes

- (a) The input of both upper and lower error pulses into the same module at the same time is prohibited.**
- (b) Setting ABFGwNRMCNT and ABFGwERRCNT to 0_H is prohibited.**
- (c) Writing to ABFGBFSRw while ABFGCNTCRw.ENB is 1 is prohibited.**

36.11 ADC Interrupt Router (AIR)

The AIR is a function that selects signals from all A/D related resources, and outputs interrupt requests and DMA requests.

36.11.1 Overview

36.11.1.1 Function Overview

- AIR selects interrupt requests from resource 0 (ADCH, DSADC and CADC) and resource 1 (ABFG).
- AIR selects DMA requests from resource 0 (ADCH, DSADC and CADC) and resource 1 (ABFG).

36.11.1.2 Block Diagram

Figure 36.62 illustrates the AIR block diagram.

Section 37 Delta-Sigma Analog to Digital Converter (DSADC)

This section contains a description of the Delta Sigma A/D Converter (DSADC).

The first part of this section describes all of the products, such as the number of units, and register base addresses. The remainder of the section describes the functions and registers of the DSADC.

37.1 Features

37.1.1 Number of Units

This microcontroller has following number of DSADC units.

Table 37.1 Number of Units

Product Name	RH850/E2x-FCC2, E2UH and E2H	
	373 Pins	468 Pins
Number of DSADC Common Units	1	1
Number of DSADC Channel Units	10	10
Name of DSADC Units	DSADC DSADCn (n = 00, 10, 11, 12, 13, 20, 14, 15, 21, 22)	

A DSADCn unit has the same number of physical channels as the number of A/D input pins. The numbers of channels on individual products are listed below.

Table 37.2 Unit Configurations and Physical Channels

Unit Name (Number of Channels)	RH850/E2x-FCC2, E2UH and E2H	
	373 Pins	468 Pins
DSADC00	8	8
DSADC10	4	4
DSADC20	2	2
DSADC12	4	4
DSADC13	4* ¹	4* ¹
DSADC11	4* ¹	4* ¹
DSADC15	4	4
DSADC14	8* ¹	8* ¹
DSADC22	2	2
DSADC21	2	2

Note 1. The 2 physical channels (DSAN143P and DSAN143N) of DSADC14 are shared with the 2 physical channels (DSAN110P and DSAN110N) of DSADC11.

The 2 physical channels (DSAN142P and DSAN142N) of DSADC14 are shared with the 2 physical channels (DSAN131P and DSAN131N) of DSADC13.

Table 37.3 Unit Configurations and Virtual Channels

Unit Name (Number of Channels)	RH850/E2x-FCC2, E2UH and E2H	
	373 Pins	468 Pins
DSADC00	8	8
DSADC10	4	4
DSADC20	2	2
DSADC12	4	4
DSADC13	4	4
DSADC11	4	4
DSADC15	4	4
DSADC14	8	8
DSADC22	2	2
DSADC21	2	2

Table 37.4 Indices

Index	Description
n	Throughout this section, the individual DSADC units are identified by the index "n" (n = 00, 10, 20, 12, 13, 11, 15, 14, 22, 21); For example, DSADCnCCR indicates the channel control register.
x	Throughout this section, the individual analog input attributes at differential input are identified by the index "x" (x = P, N); for example, DSANn0x.
j	Number of the virtual channel

37.1.2 Register Base Addresses

The DSADC and DSADCn base addresses are listed in the following table.

The DSADC and DSADCn register addresses are given as offsets from the base address.

Table 37.5 Register Base Addresses

Base Address Name	Base Address	Bus Group
<DSADC_base>	FFF3 0000 _H	Peripheral Group 7
<DSADC00_base>	FFF3 1000 _H	Peripheral Group 7
<DSADC10_base>	FFF3 2000 _H	Peripheral Group 7
<DSADC20_base>	FFF3 3000 _H	Peripheral Group 7
<DSADC12_base>	FFF3 4000 _H	Peripheral Group 7
<DSADC13_base>	FFF5 0000 _H	Peripheral Group 8
<DSADC11_base>	FFF5 1000 _H	Peripheral Group 8
<DSADC15_base>	FFF5 2000 _H	Peripheral Group 8
<DSADC14_base>	FFF5 3000 _H	Peripheral Group 8
<DSADC22_base>	FFF5 4000 _H	Peripheral Group 8
<DSADC21_base>	FFF5 5000 _H	Peripheral Group 8

37.1.3 Clock Supply

The DSADC and DSADCn clock supplies are shown in the following table.

Table 37.6 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
DSADC	ADCLK	CLK_HSB
	Register access clock	CLK_LSB
DSADCn	ADCLK	CLK_HSB
	Register access clock	CLK_LSB

37.1.4 Interrupt Requests

The DSADCn interrupt requests are listed in the following table.

Table 37.7 Interrupt Requests

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMAC Trigger Number	DTS Trigger Number	Other Trigger Signals
DSADCn						
*1	DSADEn	A/D error interrupt Upper limit/lower limit error interrupt	*1	—	—	—
*1	DSADIn	A/D conversion end interrupt	—	*1	*1	—

Note 1. DSADEn and DSADIn are chosen by the AIR (ADC Interrupt Router), and those are forwarded to the INTC and DMAC.

For Interrupt Number and DMA Trigger Number, see **Section 36, Analog to Digital Converter (ADCH)**.

37.1.5 Reset Source

The DSADC and DSADCn reset sources are listed in the following table. The DSADC and DSADCn are initialized by the following reset sources.

Table 37.8 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
DSADC	All registers	✓	✓	✓	✓	—	—
DSADCn	All registers	✓	✓	✓	✓	—	—

37.1.6 External Input/Output Signals

The External Input/Output signals of the DSADCn are listed below.

Table 37.9 DSADC External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
DSADCn Common		
ADSVCC	Power supply pin for the analog part	ADSVCC
ADSVSS	Ground pin for the analog part	ADSVSS
ADSVREFH	Upper reference voltage pin for the analog part	ADSVREFH
ADSVREFL	Lower reference voltage pin for the analog part	ADSVREFL
ADSVCL	Delta sigma ADC external capacitor pin	ADSVCL

Table 37.10 DSADCn (n = 00, 14) External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
DSANn0P	Analog input pin (for single-ended/differential P)	DSANn0P
DSANn0N	Analog input pin (for single-ended/differential N)	DSANn0N
DSANn1P	Analog input pin (for single-ended/differential P)	DSANn1P
DSANn1N	Analog input pin (for single-ended/differential N)	DSANn1N
DSANn2P	Analog input pin (for single-ended/differential P)	DSANn2P
DSANn2N	Analog input pin (for single-ended/differential N)	DSANn2N
DSANn3P	Analog input pin (for single-ended/differential P)	DSANn3P
DSANn3N	Analog input pin (for single-ended/differential N)	DSANn3N
DSADTRGn	External trigger pin	DSADTRGn
DSADENDn	A/D conversion timing monitor pin	DSADENDn

Table 37.11 DSADCn (n = 10, 11, 12, 13, 15) External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
DSANn0P	Analog input pin (for single-ended/differential P)	DSANn0P
DSANn0N	Analog input pin (for single-ended/differential N)	DSANn0N
DSANn1P	Analog input pin (for single-ended/differential P)	DSANn1P
DSANn1N	Analog input pin (for single-ended/differential N)	DSANn1N
DSADTRGn	External trigger pin	DSADTRGn
DSADENDn	A/D conversion timing monitor pin	DSADENDn

Table 37.12 DSADCn (n = 20, 21, 22) External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
DSANn0P	Analog input pin (for single-ended/differential P)	DSANn0P
DSANn0N	Analog input pin (for single-ended/differential N)	DSANn0N
DSADTRGn	External trigger pin	DSADTRGn
DSADENDn	A/D conversion timing monitor pin	DSADENDn

37.2 Overview

37.2.1 Function Overview

The following describes the features (provides a functional overview) of the DSADC.

- A/D conversion method: Delta sigma modulation method
- Configuration of analog input pins
 - 10 modules, 38 analog input pins in total
 - DSADC00, 14: 8 single-ended inputs (4 differential inputs)
 - DSADC1y (y = 0 to 3 and 5): 4 single-ended inputs (2 differential inputs)
 - DSADC20, 21, 22: 2 single-ended inputs (1 differential input)

NOTES

1. One differential input can be used as two single-ended inputs.
2. All analog inputs are multiplexed with ADCH analog inputs.

- Input type: Single-ended input and differential input
 - Single-ended input or differential input can be selected for each DSADCn.
 - In single-ended mode:
 - The A/D conversion value format of unsigned 16-bit resolution is generated when ADSVREFL is chosen as the common mode voltage.
 - Range of the A/D conversion value: 0000_H to FFFF_H
 - The A/D conversion value format of signed 15-bit resolution (15-bit value preceded by the sign bit) is generated when ADSVREFH/2 is chosen as the common mode voltage.
 - Range of the A/D conversion value: C000_H to 3FFF_H (When gain is ×1), 8000_H to 7FFF_H (When gain is ×2, ×4, or ×8)
 - In differential mode:
 - The A/D conversion value format of signed 15-bit resolution (15-bit value preceded by the sign bit) is generated.
 - Range of the A/D conversion value: 8000_H to 7FFF_H
- Input gain function (PGA): ×1, ×2, ×4, or ×8 can be selected by each virtual channel using PGA (programmable gain amplifier) in each DSADCn.
- Sampling rate (Fs): 100 ksps, 200 ksps, 400ksps, 800ksps and 1600 ksps (Fos (Over sampling rate) is 8Msps)
- Pass band: 30 kHz, 60 kHz, 90 kHz, 100 kHz and 200 kHz
- Virtual channels
 - See **Section 37.1.1, Number of Units.**
- Calibration function
 - It is possible to achieve highly accurate A/D conversions by using the calibration function in spite of the use environment.
- Data register
 - A data register corresponding to each DSADCn is contained in the data supplementary information register j (DSADCnDIRj per virtual channel) or the unit data supplementary information register (DSADCnUDIR).
 - The latest data can be read from DSADCnUDIR, even if not reading virtual channel pointer.
- A/D conversion start trigger
 - Each DSADCn can start an A/D conversion by software, each timer trigger, or an external trigger (DSADTRGn).

- A/D conversion end trigger
Each DSADC_n can terminate A/D conversion by software, by each timer trigger, or by an external trigger (DSADTRG_n).
- Entry to the digital filter engine and the Generic Timer Module
A/D converted values can be entered directly into the Digital Filter Engine (DFE), or Generic Timer Module (GTM). Each DSADC_n can select from DFE0 and DFE1 as an entry target.
Whether to enable or disable DFE entry and the TAG to determine the channels for entry can be set for each virtual channel.
For details of the DFE, see **Section 39, Digital Filter Engine (DFE)**.
For details of the GTM, see **Section 33, Generic Timer Module (GTM)**.
- Timestamp function
The lapsed time from the result output is stored in the timestamp register at the rise time of the read-gate (DSADRGT_n) from the timer (ATU, GTM) as timestamp information. This function allows measurement of the time difference between the DSADRGT_n and input sampling time.
For details of the ATU, see **Section 32, ATU-V**.
For details of the GTM, see **Section 33, Generic Timer Module (GTM)**.
- DMA transfer based on A/D conversion end timing
Each time an A/D conversion ends, each DSADC_n outputs a DMA request on completion of the A/D conversion (DSADIn), which can generate DMA request sources (DSADIn) to the DMAC or activate the DMAC.
The output of the DSADIn is capable of beginning limited by the read-gate from a timer (ATU, GTM).
- Boundary flag output function
It is possible to output a boundary flag generating signal (DSADUEn, DSADLEn and DSADCnVCI_j) to the ABFG (ADC Boundary Flag Generator).
For details of the ABFG, see **Section 36, Analog to Digital Converter (ADCH)**.
- AD error interrupt request and AD parity error notification
Each DSADC can generate an AD error interrupt request (DSADEn) to the INTC and an AD parity error notification (DSADPE_n) to the ECM (Error Control Module).
- Settable analog conversion voltage range
An analog conversion voltage range can be set using the ADSVREFH pin and the ADSVREFL pin. When performing an A/D conversion by using a single-ended input, either ADSVREFL or ADSVREFH/2 can be selected as the common voltage.
- A/D conversion monitor output
A/D conversion timing can be output to the A/D conversion monitor output pin (DSADEND_n).
- A wide range of safety functions
A variety of safety functions are provided, including AD self-diagnosis, pin-level self-diagnosis, wiring-break detection, self-diagnosis of wiring-break detection, normality check for analog selection, upper-limit/lower-limit check for data registers, data register parity check for data registers, overwrite check for data registers, and read and clear function for data registers.

37.2.2 Block Diagram

The block diagram of the DSADC is shown in **Figure 37.1**.

Figure 37.1 Block Diagram of DSADC

37.3 Registers

37.3.1 List of Registers

The DSADC registers are listed in following table.

For details about <DSADC_base> and <DSADCn_base>, see **Section 37.1.2, Register Base Address**.

Table 37.13 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	Access	Access Protection
DSADC	AD Synchronization Start Control Register	DSADCSYNSTCR	<DSADC_base> + 00 _H	8	—
DSADC	AD Global Control Register	DSADCADGCR	<DSADC_base> + 04 _H	8	—
DSADC	Pin Level Self-Diagnosis Control Register	DSADCTDCR	<DSADC_base> + 0C _H	8	—

DSADCn	Upper-Limit/Lower-Limit Table Register 2*2	DSADCnULTBR2	<DSADCn_base> + 88 _H	16, 32	—
DSADCn	Upper-Limit/Lower-Limit Table Register 3*2	DSADCnULTBR3	<DSADCn_base> + 8C _H	16, 32	—

- Note 1. For n = 00/14: “Virtual Channel Register” and “Data Supplementary Information Register” numbers are from 0 to 7.
 For n = 10/12/13/11/15: “Virtual Channel Register” and “Data Supplementary Information Register” numbers are from 0 to 3.
 For n = 20/22/21: “Virtual Channel Register” and “Data Supplementary Information Register” numbers are from 0 to 1.
- Note 2. For n = 00/14: “Upper-Limit/Lower-Limit Table Register” numbers are from 0 to 3.
 For n = 10/12/13/11/15: “Upper-Limit/Lower-Limit Table Register” numbers are from 0 to 1.
 For n = 20/22/21: “Upper-Limit/Lower-Limit Table Register” number is 0.
- Note 3. When reading DSADCnDIRj in 16-bit units, see **Section 37.5.2, DSADCnDIRj — Data Supplementary Information Register j**.

37.4 Delta-Sigma ADC Common Registers

This section describes the registers shared by all Delta-Sigma ADCs (DSADCn).

37.4.1 DSADCSYNSTCR — AD Synchronization Start Control Register

DSADCSYNSTCR is an 8-bit write-only register to control the simultaneous start of each Delta-Sigma ADC. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 37.14 DSADCSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADSTART	<p>A/D Conversion Start of Each Delta-Sigma ADC</p> <p>A/D conversion start condition of DSADCn with ADSTART:</p> <p>When ADSTART is set to 1 with ADSTTE = 1.</p> <p>All DSADCn in which ADSTARTE is set to 1 are activated simultaneously.</p> <p>However, DSADCB and DSADCA operate with a shift of half oversampling rate cycles.</p> <p>When 1 is written to this bit with A/D conversion operating, if the DSADCnUCR.VCEP[2:0] value is 0_H, the ongoing A/D conversion stops and A/D conversion of the virtual channel 0 starts.</p> <p>When 1 is written to this bit with A/D conversion operating, if the DSADCnUCR.VCEP[2:0] value is not 0_H, the ongoing A/D conversion stops and A/D conversion of the next virtual channel starts.</p> <p>When 1 is written to this bit in DSADCnADTCR.ADSTTE = 0, it is ignored and A/D conversion does not start.</p> <p>Writing 0 to this bit is ignored.</p> <p>Note: DSADCA is DSADC00, DSADC20, DSADC13, DSADC15 and DSADC22. DSADCB is DSADC10, DSADC12, DSADC11, DSADC14 and DSADC21.</p>

NOTE

We recommend that ADSTART be written with STTRGE and ENDTRGE for all Delta-Sigma ADCs set to 0 and not used with external triggers.

37.4.2 DSADCADGCR — AD Global Control Register

DSADCADGCR is an 8-bit read/write register to fully control the AD.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	ODDE	ODE	—	—	—	UNSN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Table 37.15 DSADCADGCR Register Contents

Bit Position	Bit Name	Function
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5	ODDE	Wiring-break Detection Function Self-Diagnosis Enable 0: Self-diagnosis of the wiring-break detection function is disabled. 1: Self-diagnosis of the wiring-break detection function is enabled. When ODDE is set to 1, wiring-break detection function self-diagnosis and pin level self-diagnosis are enabled. When doing pin level self-diagnosis, set ODDE to 1 before setting TDE to 1. If TDE is set to 1 with ODDE = 0, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device.
4	ODE	Wiring-break Detection Enable 0: Wiring-break detection is disabled. 1: Wiring-break detection is enabled. When ODE is set to 1, wiring-break detection is enabled for all analog pins. Setting this bit in 1 simultaneously with pin level self-diagnosis (TDE=1) is prohibited. When setting DSADCADGCR.ODE as 1, if DSADCnVCRj.CNVCLS[1:0] value is set to anything but 0 _H , A/D conversion is prohibited.
3 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	UNSN	Unsigned Conversion Result Output Enable When this bit is set to 1, the A/D conversion result (when ADSVREFL is selected for the single-ended common voltage) can be output as an unsigned value. 0: The A/D conversion result is output as a signed value. 1: When single-ended common voltage = ADSVREFL, the A/D conversion result is output as an unsigned value.*1 Otherwise, it is output as a signed value. For differences in data format due to UNSND setting, see the description on the Section 37.5.2, DSADCnDIRj — Data Supplementary Information Register j format.

Note 1. When the calculation result after correction is a negative value, an A/D conversion result of 0 is output.

NOTE

To prevent a malfunction, set DSADCADGCR when ADACT and CLBACT of all Delta-Sigma ADCs = 0 (before starting an A/D conversion) and STTRGE of all Delta-Sigma ADCs = 0.

37.4.3 DSADCTDCR — Pin Level Self-Diagnosis Control Register

DSADCTDCR is an 8-bit read/write register to control pin level self-diagnosis.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TDE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 37.16 DSADCTDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	TDE	<p>Pin Level Self-Diagnosis Enable</p> <p>0: Pin level self-diagnosis is disabled. 1: Pin level self-diagnosis is enabled.</p> <p>When TDE is set to 1, all analog pins are disconnected from the analog I/O buffer. When TDE is set to 0, all analog pins are connected to the analog I/O buffer.</p> <p>When TDE = 1, analog pin DSANn0x to DSANn3x is fixed to the level specified by DSADCnTDLVR.AN0xLV to DSADCnTDLVR.AN3xLV.</p> <p>By performing an A/D conversion in this state and checking the A/D converted value, the path between the analog pin and the Delta-Sigma ADC can be diagnosed.</p> <p>Do not set this bit as 1 simultaneously with ODE = 1 (wiring-break detection enable) and CNVCLS = 3_H (A/D self-diagnosis).</p> <p>When doing pin level self-diagnosis, set ODDE to 1 before setting TDE to 1.</p> <p>If TDE is set to 1 with ODDE = 0, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device.</p>

NOTE

To prevent a malfunction, set DSADCTDCR when ADACT and CLBACT of all delta-sigma ADCs = 0 (before starting A/D conversion) and STTRGE of all delta-sigma ADCs = 0.

37.5 Delta-Sigma ADC Unit-Specific Registers

This section describes registers provided for each Delta-Sigma ADC unit.

37.5.1 DSADCnVCRj — Virtual Channel Register j

DSADCnVCRj is a 32-bit read/write register to control virtual channels.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	GAIN[1:0]		VCULME	VCLLME	VCULLMTBS[1:0]		ORT	TPVSL[2:0]			—	—	DSDFTYP[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Table 37.17 DSADCnVCRj Register Contents (1/3)

Bit Position	Bit Name	Function
31, 30	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
29, 28	GAIN[1:0]	Gain These bits specify the input gain. 0 _H : × 1 1 _H : × 2 2 _H : × 4 (When high resolution mode is set, this setting is prohibited.) 3 _H : × 8 (When high resolution mode is set, this setting is prohibited.)
27	VCULME	Virtual Channel Upper-Limit Excess Notification Enable 0: An A/D conversion greater than the result upper-limit of the virtual channel is not notified. 1: An A/D conversion greater than the result upper-limit of the virtual channel is notified.
26	VCLLME	Virtual Channel Lower-Limit Excess Notification Enable 0: An A/D conversion less than the result lower-limit of virtual channel is not notified. 1: An A/D conversion less than the result lower-limit of virtual channel is notified.
25, 24	VCULLMTBS [1:0]	Virtual Channel Upper-Limit/Lower-Limit Table Register Select These bits select the upper-limit/lower-limit table register to be compared. 0 _H : Upper-limit/lower-limit values are checked by DSADCnULTBR0. [Initial value] 1 _H : Upper-limit/lower-limit values are checked by DSADCnULTBR1. 2 _H : Upper-limit/lower-limit values are checked by DSADCnULTBR2. 3 _H : Upper-limit/lower-limit values are checked by DSADCnULTBR3. When the A/D converted value is stored in the DR, upper-limit/lower-limit values are checked by using the upper-limit value/lower-limit value table.

Table 37.17 DSADCnVCRj Register Contents (2/3)

Bit Position	Bit Name	Function
23	ORT	<p>Delta-Sigma ADC Post-Filter 2nd Stage Output Rate Select</p> <p>This bit is invalid when TPVSL[2:0] = 0_H (2nd stage not used).</p> <p>0: The 2nd stage output rate is set to 1/2. 1: The 2nd stage output rate is set to 1/4.</p> <p>The output rate (entire filter type) is determined in combination with the DSDFTYP set value. Specifications of the settable filter type are provided in Table 37.36. Setting to any combination of ORT, TPVSL, and DSDFTYP other than the settings shown in Table 37.36 is prohibited.</p>
22 to 20	TPVSL[2:0]	<p>Use of the Delta-Sigma ADC Post-Filter 2nd Stage and the TAP Coefficient Select</p> <p>These bits are valid when DSDFTYP = 0_H. See Table 37.18 Coefficients.</p> <p>0_H: The 2nd stage of the post-filter in the delta-sigma ADC is not used. (Fs = 400kpsps) 1_H: The 2nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 1 is applied. 2_H: The 2nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 2 is applied. 3_H: The 2nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 3 is applied. 4_H: The 2nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 4 is applied. 5 to 7_H: Setting prohibited</p> <p>Specifications of settable filter type are provided in Table 37.36. Setting to any combination of ORT, TPVSL, and DSDFTYP other than the settings shown in Table 37.36 is prohibited.</p>
19, 18	—	<p>Reserved</p> <p>When read, the value after reset is returned. When writing, write the value after reset.</p>
17, 16	DSDFTYP[1:0]	<p>Delta-Sigma ADC Post-Filter Type</p> <p>These bits specify the type of the post-filter in the delta-sigma ADC.</p> <p>0_H: The filter type depends on the ORT and TPVSL settings. (See Table 37.36.) Set ORT and TPVSL. 1_H: Fs = 1.6 Msps (2nd stage not used, small group delay) 2_H: Fs = 800 kpsps (2nd stage not used, large group delay) 3_H: Setting prohibited</p> <p>Specifications of settable filter type are provided in Table 37.36. Setting to any combination of ORT, TPVSL, and DSDFTYP other than the settings shown in Table 37.36 is prohibited.</p>
15	ADIE	<p>Conversion End Interrupt Enable</p> <p>0: DSADIn is not output by writing to DSADCnDIRj. 1: DSADIn is output by writing to DSADCnDIRj.</p>
14	ULEIE	<p>Upper-Limit/Lower-Limit Error Interrupt Enable</p> <p>0: DSADEn is not output at an upper-limit or lower-limit error of DSADCnDIRj. 1: DSADEn is output at an upper-limit or lower-limit error of DSADCnDIRj.</p>
13	—	<p>Reserved</p> <p>When read, the value after reset is returned. When writing, write the value after reset.</p>
12	DFENT	<p>DFE Entry</p> <p>0: Entry is not performed. 1: Entry is performed.</p> <p>This bit selects whether to perform entry to the DFE0 or DFE1 (Digital Filter Engine).</p>

Table 37.17 DSADnVCRj Register Contents (3/3)

Bit Position	Bit Name	Function
11 to 8	DFTAG[3:0]	DFE-TAG These bits are used to perform entry to a channel of the DFE for which the TAG identical to the setting of DFTAG[3:0] is set. If the TAG matches the setting of DFTAG[3:0] for multiple channels, entry to multiple channels is performed.
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5, 4	CNVCLS[1:0]	Conversion Type 0 _H : Single-ended input, common voltage = ADSVREFL 1 _H : Single-ended input, common voltage = ADSVREFH/2 2 _H : Differential input 3 _H : Self-diagnosis
3 to 0	GCTRL[3:0]	General Control These bits set the A/D conversion for each conversion mode. Single-ended input (CNVCLS = 0 _H , 1 _H) Analog input channels are selected by the GCTRL[3:0] bits. 0 _H : DSANn0P 1 _H : DSANn0N 2 _H : DSANn1P 3 _H : DSANn1N 4 _H : DSANn2P 5 _H : DSANn2N 6 _H : DSANn3P 7 _H : DSANn3N Setting of unsupported channels is prohibited. Differential input (CNVCLS = 2 _H) Analog input channels are selected by the GCTRL[3:0] bits. 0 _H : DSANn0P/DSANn0N 1 _H : Setting prohibited 2 _H : DSANn1P/DSANn1N 3 _H : Setting prohibited 4 _H : DSANn2P/DSANn2N 5 _H : Setting prohibited 6 _H : DSANn3P/DSANn3N 7 _H : Setting prohibited Setting of unsupported channels is prohibited. Self-diagnosis (CNVCLS[1:0] = 3 _H) Self-diagnosis level is selected by the GCTRL[3:0] bits. 7 _H : ADSVREFH × 1 4 _H : ADSVREFH × 1/2 0 _H : ADSVREFH × 0 C _H : - ADSVREFH × 1/2 8 _H : - ADSVREFH × 1 Other than the above: Setting prohibited NOTE: Setting of self-diagnosis level does not correspond to gain ×8. Set gain ×4 as self-diagnosis in the high impedance mode when using gain of more than ×4 in the high impedance mode. And always set gain ×1 or ×2 in the high resolution mode.

NOTE

To prevent a malfunction, set DSADCNVCRJ when ADACT = 0 and CLBACT = 0 (before starting A/D conversion) and STTRGE = 0. When rewriting this register after A/D conversion stop, change the setting after it is confirmed that ADACT was cleared by reading ADSR.

Table 37.18 Coefficients of Post-Filter 2nd Stage in Delta-Sigma ADC

No.	Coefficient 1 (TPVSL = 1 _H) BW = 30 kHz @ 400 kSps	Coefficient 2 (TPVSL = 2 _H) BW = 60 kHz @ 400 kSps	Coefficient 3 (TPVSL = 3 _H) BW = 30 kHz @ 400 kSps	Coefficient 4 (TPVSL = 4 _H) BW = 60 kHz @ 400 kSps

21	58	-53	177	161

37.5.2 DSADCnDIRj — Data Supplementary Information Register j

DSADCnDIRj is a 32-bit read-only register to store A/D converted values and their supplementary information. This register is cleared to 0000 0000_H by reading this register when RDCLRE is set to 1. Additionally, DSADCnUDIR is also cleared to 0000 0000_H by reading this register which is mirrored to DSADCnUDIR when DSADCnRDCLRE is set to 1. The WFLG bit is cleared by reading this register regardless of the RDCLRE value.

When reading the DSADCnDIRj in 16-bit units, disable Read-and-Clear-Enable (DSADCnSFTCR.RDCLRE = 0) and disable the overwriting function (*1).

Note 1. The expected value comparison of the WFLG bit of DSADCnDIRj and Overwrite-Error of the Error-Register is not put into effect, and the Overwrite-Error-Interrupt-Enable (OWEIE) of the Safety-Control-Register (DSADCnSFTCR) is 0 (prohibited).

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IDEF	WFLG	PRTY	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.19 DSADCnDIRj Register Contents

Bit Position	Bit Name	Function
31 to 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26	IDEF	ID Error 0: An error is present. 1: No error is present.
25	WFLG	Write Flag Setting condition Storing an A/D converted value in DSADCnDIRj Clearing condition Reading DSADCnDIRj
24	PRTY	Parity This bit indicates the even parity bit of DR and IDEF.
23 to 16	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	DR[15:0]	These bits are used to store the A/D converted value. For the data format, see “Bits 15 to 0 DR Data Register Data Format”.

The setting timing of IDEF, WFLG and PRTY is simultaneous with the timing at which the A/D conversion result is stored up in a data register (DR).

When update (setting) and reading (clearance) of IDEF, WFLG and PRTY are in contention, update (setting) is given priority.

Bits 15 to 0 DR Data Register Data Format

The A/D converted value is stored in the DR. The data format of the DR is shown below. The format of the data to be transferred to the DFE (Digital Filter Engine) or the GTM (Generic Timer Module) is in the signed fixed-point format regardless of the UNSND setting.

Figure 37.2 DR (Data Register) Data Format 1

Figure 37.3 DR (Data Register) Data Format 2

37.5.3 DSADCnADSTCR — AD Start Control Register

DSADCnADSTCR is an 8-bit write-only register to control the Delta-Sigma ADC start. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 37.20 DSADCnADSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADST	A/D Conversion Start A/D conversion start condition with ADST Writing 1 to ADST When 1 is written to this bit with A/D conversion operating, the ongoing A/D conversion stops and A/D conversion of the next virtual channel starts. When 1 is written to this bit with A/D conversion operating, if the DSADCnUCR.VCEP[2:0] value is 0 _H , the ongoing A/D conversion stops and A/D conversion of the virtual channel 0 starts. Writing 0 to this bit is ignored.

NOTE

We recommend that a value be written to the ADST bit when STTRGE = 0 and ENDTRGE = 0. When the external trigger and write to ADST occur at the same time, the count value of the channel sometimes does not match the number of inputs of the trigger.

To prevent a malfunction, the ADST bit must be set after confirmation of calibration completion following the A/D conversion flow in **Figure 37.4**.

37.5.4 DSADCnADENDCR — AD Stop Control Register

DSADCnADENDCR is an 8-bit write-only register to control the Delta-Sigma ADC stop. This register is always read as 0.

Value after reset: 00H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 37.21 DSADCnADENDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	ADEND	A/D Conversion End A/D conversion stop condition with ADEND Writing 1 to this bit stops A/D conversion when A/D conversion is operating. When A/D conversion is stopped with VPRSTE = 0, the virtual channel is incremented. When A/D conversion is stopped with VPRSTE = 1, the virtual channel is cleared to 0. Writing 1 to this bit is ignored when A/D conversion is stopped. Writing 0 to this bit is ignored.

NOTE: When changing the other register setting after an A/D conversion is stopped, please be sure to confirm that ADACT is 0.

NOTE

We recommend that a value be written to the ADEND bit when STTRGE = 0 and ENDTRGE = 0.

37.5.5 DSADCnCLBSTCR — Calibration Start Control Register

DSADCnCLBSTCR is an 8-bit write-only register to control calibration start. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLBST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 37.22 DSADCnCLBSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CLBST	Calibration Start Calibration start condition with CLBST Writing 1 to this bit starts calibration when calibration and A/D conversion are stopped. Writing 1 to this bit is ignored when calibration or A/D conversion is operating.

37.5.6 DSADCnCLBEDCR — Calibration Stop Control Register

DSADCnCLBEDCR is an 8-bit write-only register to control calibration stop. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLBEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 37.23 DSADCnCLBEDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CLBEND	Calibration Stop Calibration stop condition with CLBEND Writing 1 to this bit stops calibration when calibration is operating. Writing 1 to this bit is ignored when calibration is stopped. CAUTION: If calibration is suspended by CLBEND before calibration is completed, the correction value before calibration is performed is retained. Writing 0 to this bit is ignored.

NOTE

To prevent a malfunction, A/D conversion must be restarted from the initialization process following the A/D conversion flow in **Figure 37.4** after writing 1 to the CLBEND bit in during calibration.

Setting of ADST or CLBST must not be done before at least 6 register access cycles after confirmation of calibration stop.

37.5.7 DSADcNADTCR — AD Conversion Trigger Control Register

DSADcNADTCR is an 8-bit read/write register to control the Delta-Sigma ADC.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ADSTTE	—	—	—	—	ENDTRGE	STTRGE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R	R/W	R/W

Table 37.24 DSADcNADTCR Register Contents

Bit Position	Bit Name	Function
7	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
6	ADSTTE	A/D Synchronization Start Enable 0: ADSTART is disabled. 1: ADSTART is enabled.
5 to 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1	ENDTRGE	A/D Conversion End Trigger Enable 0: A/D conversion end trigger n is disabled. 1: A/D conversion end trigger n is enabled. The trigger selection function is used to set the trigger source selection for A/D conversion end trigger n. For details, see Section 35, Peripheral Interconnection (PIC) .
0	STTRGE	A/D Conversion Start Trigger Enable 0: A/D conversion start trigger n is disabled. 1: A/D conversion start trigger n is enabled. The trigger selection function is used to set the trigger source selection for A/D conversion start trigger n. For details, see Section 35, Peripheral Interconnection (PIC) .

NOTE

Enable the module standby function when ENDTRGE = 0 and STTRGE = 0. For details, see **Section 37.7.2, Module Standby Function**.

37.5.8 DSADCnUCR — Unit Control Register

DSADCnUCR is a 32-bit read/write register to control the Delta-Sigma AD units.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R	R/W	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DFMT[3:0]				—	—	—	—	—	VCEP[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 37.25 DSADCnUCR Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
29	VPRSTE	Virtual Channel Pointer Reset Enable 0: The virtual channel pointer is incremented at the end of the A/D conversion by the A/D conversion end trigger n or ADEND. 1: The virtual channel pointer is set as 0 at the end of the A/D conversion by the A/D conversion end trigger n or ADEND.
28	RDMA	Read Gate DMA Mode This bit selects a DMA transfer request output condition. 0: A DMA transfer request is output for all A/D conversion results. 1: A DMA transfer request is output for the A/D conversion result for which DSADRGTn is being asserted.
27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26	RESO0	High Resolution Mode 0: High resolution mode 1: High impedance mode Be sure to perform calibration after high resolution mode is changed.
25	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
24	DFES	DFE Channel Select This bit sets the DFE channel to be assigned to DSADCn. Entry to the DFE is performed for each VCR register. 0: DFE0 is selected. 1: DFE1 is selected.
23 to 12	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

Table 37.25 DSADCnUCR Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 8	DFMT[3:0]	<p>Data Format</p> <p>These bits specify the lower bits to be zero-masked (rounded in the $-\infty$ direction).</p> <p>0_H: Not masked 1_H: Lower 1 bit masked 2_H: Lower 2 bits masked 3_H: Lower 3 bits masked 4_H: Lower 4 bits masked 5_H: Lower 5 bits masked 6_H: Lower 6 bits masked 7_H: Lower 7 bits masked 8_H: Lower 8 bits masked Others: Setting prohibited</p> <p>The setting of these bits depends on the format of the data for DR, DFE, and GTM. For details about the data format, see Section 37.5.2, DSADCnDIRj — Data Supplementary Information Register j.</p>
7 to 3	—	<p>Reserved</p> <p>When read, the value after reset is returned. When writing, write the value after reset.</p>
2 to 0	VCEP[2:0]	<p>End Virtual Channel Pointer</p> <p>These bits set the end virtual channel number.</p>

NOTE

To prevent a malfunction, set DSADCnUCRn when A_{DACT} = 0 and CL_{BACT} = 0 (before starting A/D conversion) and ST_{TRGE} = 0.

37.5.9 DSADCnVCPTRR — Virtual Channel Pointer Control Register

DSADCnVCPTRR is an 8-bit read/write register to monitor the number of the virtual channel for which A/D conversion is in progress.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCPTR[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 37.26 DSADCnVCPTRR Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	VCPTR[2:0]	A/D Conversion Ongoing Virtual Channel Number These bits output the number of virtual channels for which A/D conversion is in progress. If a value is written to these bits while A/D conversion is not ongoing, the virtual channel number is updated and A/D conversion starts for the channel written at the next conversion start. Writing to these bits during A/D conversion is prohibited. When any value is written to these bits with A/D conversion operating, the A/D conversion of the next start channel cannot be guaranteed. The number of the channel for which the next A/D conversion is processed is retained while conversion is stopped or calibration is processed. A setting exceeding the end pointer is prohibited. When changing a channel by the external trigger or ADST, it is necessary to wait up to 20 register access cycles until the change is reflected to VCPTR.

NOTE

To prevent a malfunction, set DSADCnVCPTRR when ADACT = 0 and CLBACT = 0 (before starting A/D conversion) and ADSTTE = 0 and STTRGE = 0 and ENDTRGE = 0. When writing during external trigger use, be sure to stop A/D conversion. When writing to VCPTR, set ADSTTE, STTRGE and ENDTRGE as 0, and confirm ADACT = 0, or write ADEND = 1 to ensure that A/D conversion stops.

37.5.10 DSADCnADSR — AD Conversion Status Register

DSADCnADSR is an 8-bit read-only register that indicates the delta-sigma ADC status.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLBACT	ADACT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.27 DSADCnADSR Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1	CLBACT	Calibration Status 0: Calibration is not in progress. 1: Calibration is in progress.
0	ADACT	A/D Conversion Status 0: A/D conversion is not in progress. 1: A/D conversion is in progress. The ADACT bit is set to 1 when an A/D conversion start source is generated, and it is set to 0 when an A/D conversion end source is generated. This bit is continuously set to 1 unless an A/D conversion end source is generated. (This bit is not cleared to 0 by storing the converted data in the data register.) If an A/D conversion start source is generated when ADACT = 1 (where the period of ADACT=0 just after the ADST set is included, or the period of ADACT=1 just after the ADEND set is not included), the ongoing A/D conversion is stopped and A/D conversion of the next virtual channel is started. An A/D conversion end source generated when ADACT = 0 (where the period of ADACT=0 just after the ADST set is not included, or the period of ADACT=1 just after the ADEND set is included) is ignored. About the timing of setting or clearing of ADACT, see Figure 37.5 .

NOTE

Enable module standby function when ADACT = 0 and CLBACT = 0. For details, see **Section 37.7.2, Module Standby Function**.

37.5.11 DSADCnUDPTRR — Unit Data Pointer Register

DSADCnUDPTRR is an 8-bit read-only register that indicates the virtual channel number of DSADCnUDIR.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	UDPTR[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.28 DSADCnUDPTRR Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	UDPTR	Unit Data Pointer These bits indicate the virtual channel number in which the latest A/D conversion result is stored.

37.5.12 DSADCnUDIR — Unit Data Supplementary Information Register

DSADCnUDIR is a 32-bit read-only register to output all A/D conversion results of DSADCn units regardless of the selection of the virtual channel. The bit besides CHNUM[2:0] and UPRTY of this register is a mirror register of DSADCnDIRj specified by UDPTR[3:0]. When DSADCnUDIR is read, the WFLG of the actual DSADCnDIRj is cleared at the same time, and DR[15:0], PRTY and IDEF in DSADCnDIRj as well as CHNUM[2:0] and UPRTY in this register are also cleared when RDCLRE is set to 1.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CHNUM[2:0]			—	—	UIDEF	UWFLG	UPRTY	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.29 DSADCnUDIR Register Contents

Bit Position	Bit Name	Function
31 to 29	CHNUM[2:0]	Virtual Channel Number Virtual channel number of UDR[15:0]
28, 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26	UIDEF	ID Error 0: An error is present. 1: No error is present.
25	UWFLG	Write Flag Setting condition Stores an A/D converted value in DSADCnUDIR. Clearing condition Reads DSADCnUDIR or DSADCnDIRj of the channel indicated by UDPTR.
24	UPRTY	Parity This bit indicates the even parity bit of UDR, IDEF and CHNUM.
23 to 16	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	UDR[15:0]	All A/D converted values of DSADCn are stored in these bits. The data format is the same as DSADCnDIRj.

37.5.13 DSADCnTSVAL — Timestamp Register

DSADCnTSVAL is a 32-bit read-only register to output timestamp data. When DSADRGTn from ATU or GTM is rising edge, the timestamp value and A/D conversion result can be captured in this register.

Value after reset: 007F 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	TSVAL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.30 DSADCnTSVAL Register Contents

Bit Position	Bit Name	Function
31 to 23	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	TSVAL[6:0]	Timestamp Data at the DSADRGTn Rising edge The lapsed time (oversampling cycles) after the previous conversion ended can be monitored. A value of 7F _H is output during A/D conversion stop or the first A/D conversion.
15 to 0	TSDR[15:0]	Timestamp Data Output The A/D conversion result when reading the timestamp can be monitored. It is the signed fixed point format. It does not correspond to DFMT.

37.5.14 DSADCnSFTCR — Safety Control Register

DSADCnSFTCR is an 8-bit read/write register for safety control.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RDCLRE	—	—	—	—	OWEIE	PEIE	IDEIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Table 37.31 DSADCnSFTCR Register Contents

Bit Position	Bit Name	Function
7	RDCLRE	Read and Clear Enable 0: DSADCnDIRj (DSADCnUDIR) is not cleared by reading DSADCnDIRj (DSADCnUDIR). 1: DSADCnDIRj (DSADCnUDIR) is cleared by reading DSADCnDIRj (DSADCnUDIR). The WFLG of DSADCnDIRj (DSADCnUDIR) is cleared by reading DSADCnDIRj (DSADCnUDIR) regardless of the RDCLRE value. When DSADCnUDIR is read after RDCLRE has been set to 1, DSADCnDIRj which corresponds with DSADCnUDPTR is also cleared at the same time. When DSADCnDIRj which corresponds with DSADCnUDPTR is read, DSADCnUDIR is also cleared at the same time.
6 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2	OWEIE	Overwrite Error Interrupt Enable 0: Disabled 1: Enabled When using DMA transfer with read-gate, if read-gate is in the inactive state, a DMA request is not output, but, on the other hand, an overwrite error occurs. Therefore, the overwrite Error Interrupt and DMA transfer by the DSADIn with read-gate cannot be used at the same time.
1	PEIE	Parity Error Interrupt Enable 0: Disabled 1: Enabled
0	IDEIE	ID Error Interrupt Enable 0: Disabled 1: Enabled

NOTE

To prevent a malfunction, set DSADCnSFTCR when ADACT = 0 (before starting A/D conversion) and STTRGE = 0.

37.5.15 DSADCnECR — Error Clear Register

DSADCnECR is an 8-bit write-only register to control error clear. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	ULEC	LLEC	OWEC	PEC	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	W	W	W	W	R

Table 37.32 DSADCnECR Register Contents

Bit Position	Bit Name	Function
7 to 5	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
4	ULEC	Upper-Limit Error Clear 0: Does not clear the upper-limit error. 1: Clears the upper-limit error.
3	LLEC	Lower-Limit Error Clear 0: Does not clear the lower-limit error. 1: Clears the lower-limit error.
2	OWEC	Overwrite Error Clear 0: Does not clear the overwrite error. 1: Clears the overwrite error.
1	PEC	Parity Error Clear 0: Does not clear the parity error. 1: Clears the parity error.
0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

37.5.16 DSADCnER — Error Register

DSADCnER is a 32-bit read-only register that indicates errors.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULE	LLE	—	—	—	ULECAP[2:0]			OWE	—	—	—	—	OWECAP[2:0]

	PE	—	—	—	—	PECAP[2:0]			—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.33 DSADCnER Register Contents (1/2)

Bit Position	Bit Name	Function
31	ULE ^(*)	Upper-Limit Error 0: No upper-limit error is present. 1: An upper-limit error is present. Setting condition The A/D converted value exceeds the specified upper-limit table range. Clearing condition Writing 1 to ULEC in DSADCnECR. When LLE is set to 1, ULE is not set to 1 even if an upper-limit error occurred.
30	LLE ^(*)	Lower-Limit Error 0: No lower-limit error is present. 1: A lower-limit error is present. Setting condition The A/D converted value exceeds the specified lower-limit table range. Clearing condition Writing 1 to ULEC in DSADCnECR. When ULE is set to 1, LLE is not set to 1 even if a lower-limit error occurred.
29 to 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26 to 24	ULECAP[2:0]	Upper-Limit/Lower-Limit Error Capture These bits show the virtual channel number in which an upper-limit or lower-limit error occurred. When writing 1 to ULEC, these bits are cleared to 0 _H .

Table 37.33 DSADCnER Register Contents (2/2)

Bit Position	Bit Name	Function
23	OWE	Overwrite Error 0: No overwrite error is present. 1: An overwrite error is present. Setting condition Writing an A/D converted value to DSADCnDIRj.DR occurs when WFLG = 1. Even if DSADCnUDIR.UDR is overwritten when DSADCnUDIR.UWFLG = 1, this bit is not set to 1 if DSADCnDIRj.DR is not overwritten. Clearing condition Writing 1 to OWEC in DSADCnECR.
22 to 19	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	OWECAP[2:0]	Overwrite Error Capture These bits show the virtual channel number in which an overwrite error occurred. When writing 1 to OWEC, these bits are cleared to 0 _H .
15	PE	Parity Error 0: No parity error is present. 1: A parity error is present. Setting condition A parity error is detected. Clearing condition Writing 1 to PEC in DSADCnECR.
14 to 11	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	PECAP[2:0]	Parity Error Capture These bits show the virtual channel number in which a parity error occurred. When writing 1 to PEC, these bits are cleared to 0 _H . When a parity error is indicated by DSADCnUDIR, the number of DSADCnUDIR.CHNUM[2:0] is shown.
7 to 0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

NOTES

The ULE and OWE bits are updated when an A/D converted value is written to the DIR. The PE bit is updated when the DIR is read.

When an AD error interrupt request is generated, read the error register and check for the “1” bits in the interrupt exception handler, and then clear them to 0 by using the corresponding clear bits in the ECR.

When an error bit is not cleared and an error occurs during the next A/D conversion, the following operation takes place and the error cannot be detected or identified.

- When the same error (error bit = 1) occurs:
 No AD error interrupt request is made.
 The relevant error bit in the ER remains 1.
 (*) ULE and LLE are handled as the same error.
- When a different error (error bit = 0) occurs:
 An AD error interrupt request is made.
 The error bit that was generated in the previous A/D conversion remains 1 and the relevant error bit in the ER is set to 1.
 (*) ULE and LLE are handled as the same error.

37.5.17 DSADCnTDLVR — Pin Level Self-Diagnosis Level Register

DSADCnTDLVR is an 8-bit read/write register to specify pin level self-diagnosis levels. Write to this register, when the DSADCTDCR.TDE bit is in the state of 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	AN3NLV	AN3PLV	AN2NLV	AN2PLV	AN1NLV	AN1PLV	AN0NLV	AN0PLV
Value after reset	0	0	0	0	0	0	0	0

2	AN1PLV	Pin Level Self-Diagnosis Level of DSANn1P 0: DSANn1P is discharged (ADSVSS). 1: DSANn1P is charged (ADSVCC).
1	AN0NLV	Pin Level Self-Diagnosis Level of DSANn0N 0: DSANn0N is discharged (ADSVSS). 1: DSANn0N is charged (ADSVCC).
0	AN0PLV	Pin Level Self-Diagnosis Level of DSANn0P 0: DSANn0P is discharged (ADSVSS). 1: DSANn0P is charged (ADSVCC).

NOTE

To prevent a malfunction, set DSADCnTDLVR when ADACT = 0 (before starting A/D conversion) and STTRGE = 0.

37.5.18 DSADCnULTBR0/1/2/3 — Upper-Limit/Lower-Limit Table Register 0/1/2/3

DSADCnULTBR0 to DSADCnULTBR3 are 32-bit read/write registers to set the upper-limit and lower-limit values of the A/D converted values.

Value after reset: 7FFF 8000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULMTB[15:0]

Table 37.35 DSADCnULTBR0/1/2/3 Register Contents

Bit Position	Bit Name	Function
31 to 16	ULMTB[15:0]	<p>Upper-Limit Table</p> <p>These bits specify the upper-limit value of the A/D converted value. When the following condition is met, the ULE (upper-limit error) is set to 1.</p> <p style="padding-left: 20px;">ULMTB[15:0] < A/D converted value</p> <p>The ULMTB[15:0] format is the same as the DR format.</p> <p>For the unsigned format, it is compared with the A/D converted value as unsigned.</p> <p>The A/D converted values are compared by using the values before they are masked by DFMT[3:0].</p>
15 to 0	LLMTB[15:0]	<p>Lower-Limit Table</p> <p>These bits specify the lower-limit value of the A/D converted value. When the following condition is met, the LLE (lower-limit error) is set to 1</p> <p style="padding-left: 20px;">LLMTB[15:0] > A/D converted value</p> <p>The LLMTB[15:0] format is the same as the DR format.</p> <p>For the unsigned format, it is compared with the A/D converted value as unsigned.</p> <p>The A/D converted values are compared by using the values before they are masked by DFMT[3:0].</p>

NOTE

To prevent a malfunction, set DSADCnULTBR0 to DSADCnULTBR3 when ADACT = 0 (before starting A/D conversion) and STTRGE = 0.

37.6 Operation

37.6.1 A/D Conversion Flow

The delta-sigma ADC starts A/D conversion by setting the registers shown in **Figure 37.4**.

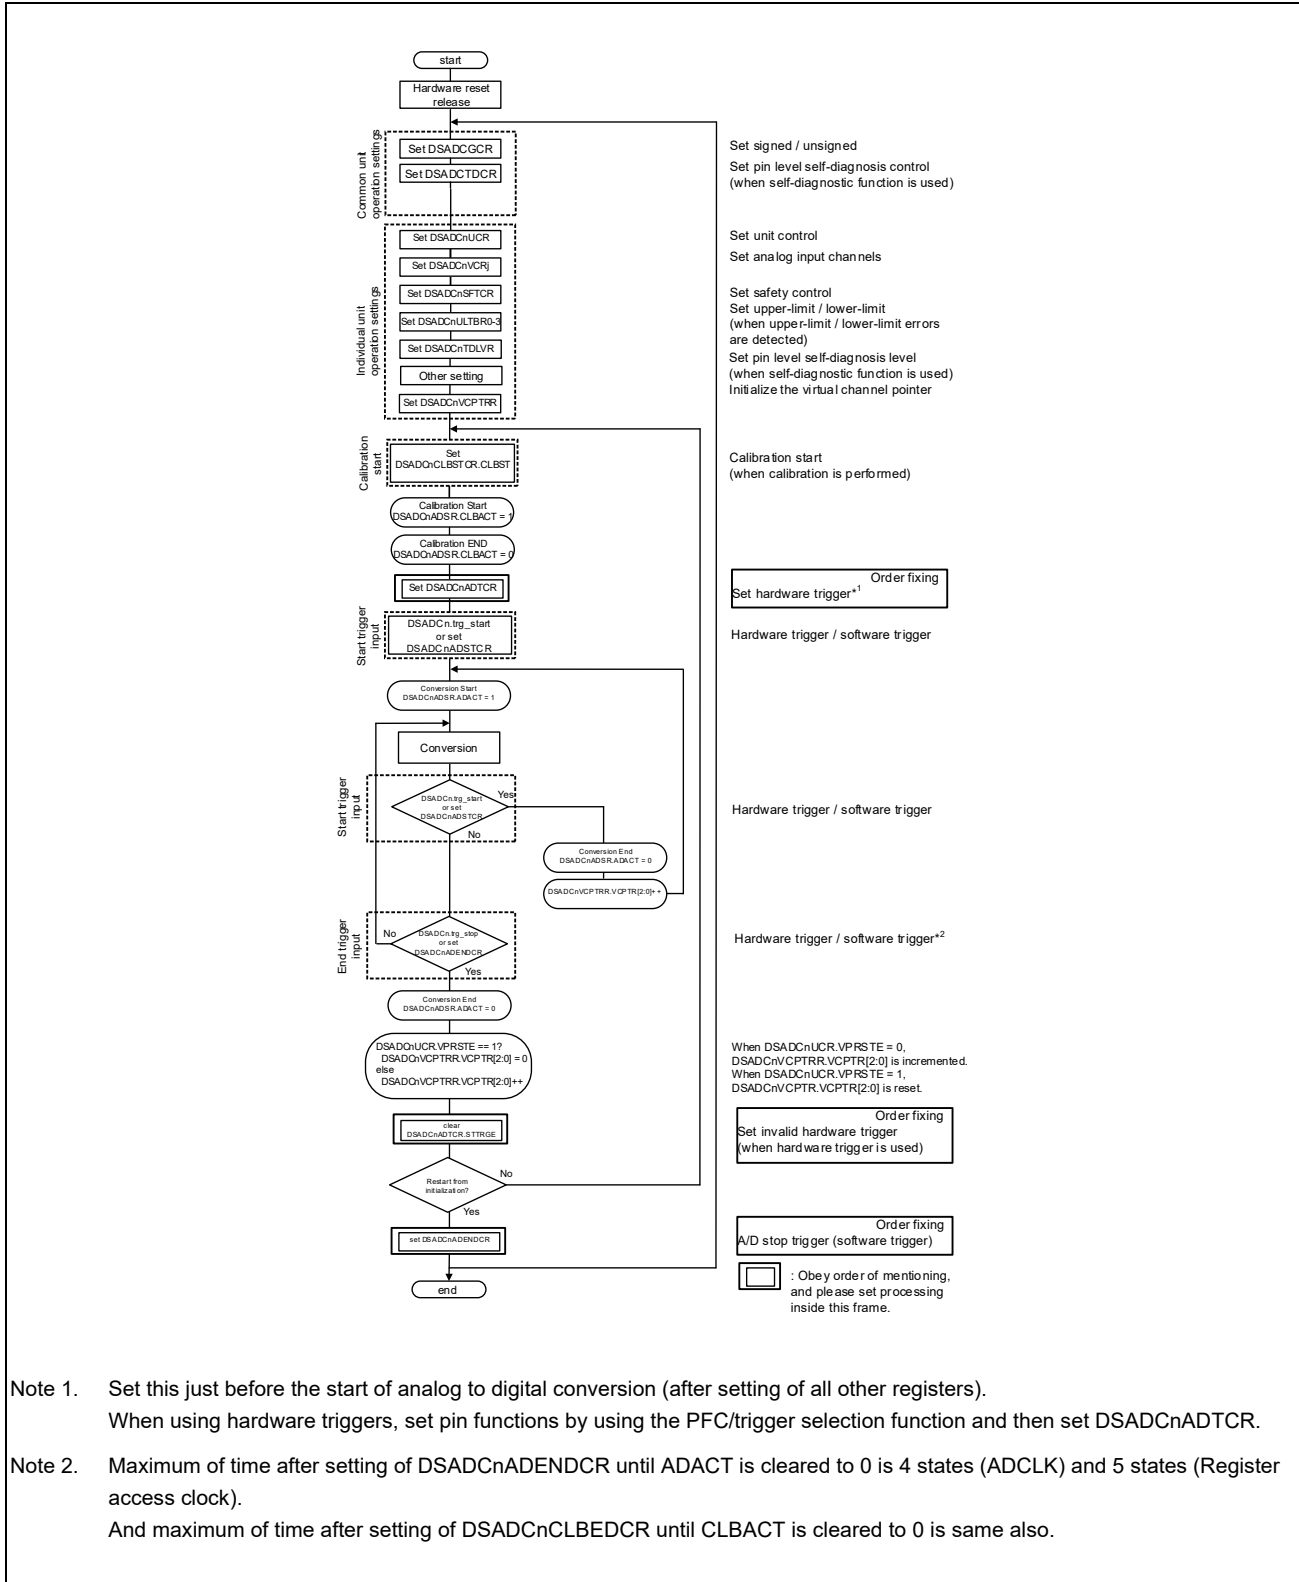

Figure 37.4 A/D Conversion Flow

37.6.2 Filter Type Setting

Filter types vary with the combinations of the values set in DSADCnADGCR, DSADCnUCR, and DSADCnVCRj. Set the filter types according to the purpose, as shown below.

Table 37.36 Register Set Values for Each Filter Type

Item	2nd Stage Used Case 1 (F1a)	2nd Stage Used Case 2 (F1b)	2nd Stage Used Case 3 (F2)	2nd Stage Used Case 4 (F3a)	2nd Stage Used Case 5 (F3b)	2nd Stage Used Case 6 (F4)	Case 7 (F5)	(F7)	(F6)

Note 1. Software delay excluded

37.6.3 A/D Conversion Time

After the ADST bit in DSADCnADSTCR is set to 1 and the A/D conversion start delay time (tD) and the internal stabilization time (tW) have passed, the delta-sigma ADC starts A/D conversion processing.

Figure 37.5 shows the A/D conversion start timing and end timing. **Figure 37.6** shows the A/D conversion restart timing. **Figure 37.7** shows the time budget of A/D conversion processing. The A/D conversion processing time (ADST setting during A/D conversion stop) (tAD) includes the A/D conversion start delay time (tD), the internal stabilization time (tW), and the delta-sigma ADC post-filter processing delay time (tDF). The A/D conversion processing time (second time and later) (tAD) is the sampling cycle (tS). A/D conversion processing time (ADST setting during A/D conversion operating) (tAD) includes the A/D conversion restart delay time (tR), the internal stabilization time (tW), and the delta-sigma ADC post-filter processing delay time (tDF). **Table 37.37** shows the A/D conversion processing time.

The A/D conversion processing time (tAD) is calculated by the following formula.

A/D conversion processing time (ADST setting during A/D conversion stop): $tAD = tD + tW + tDF$

A/D conversion processing time (ADST setting during A/D conversion operating): $tAD = tR + tW + tDF$

A/D conversion processing time (From the second time for both cases): $tAD = tS$

Table 37.37 A/D Conversion Time (When Register Access Clock = 40 MHz, ADCLK = 80 MHz, Unit: Register Access Clock)

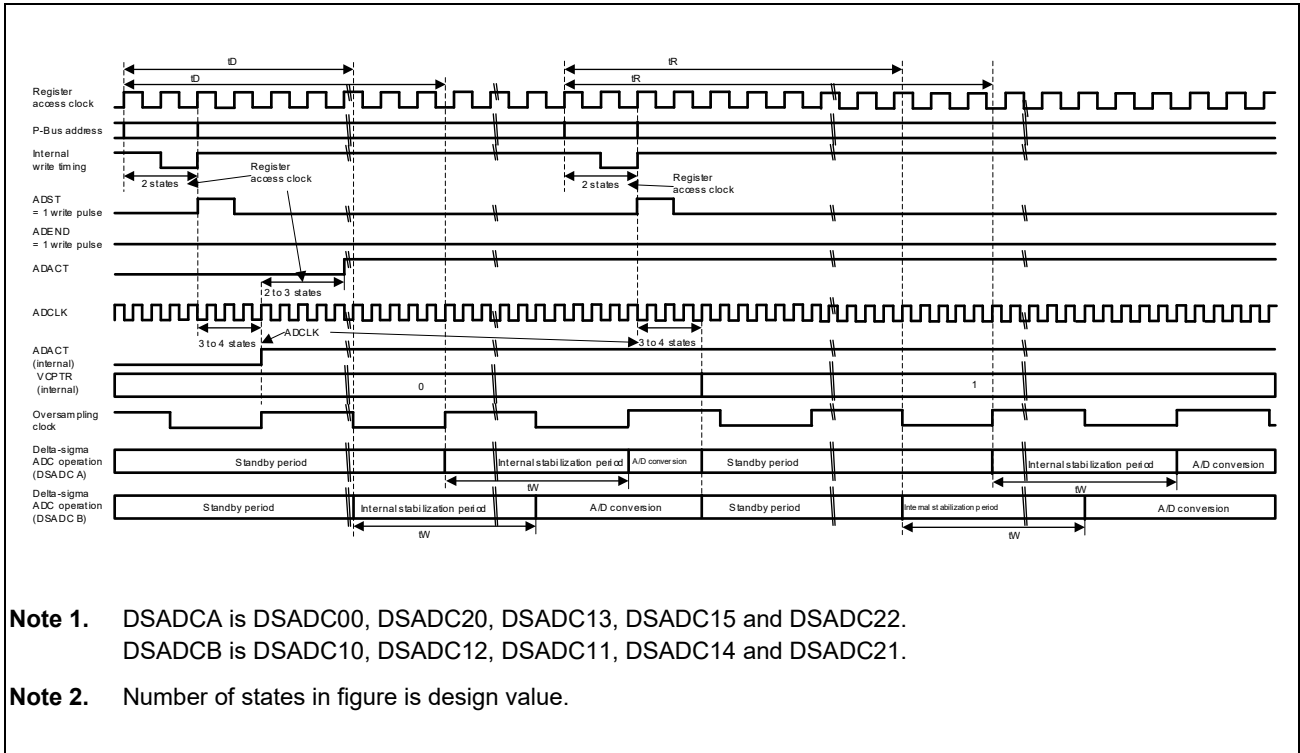

Figure 37.6 A/D Conversion Stop and Restart (when ADST Is Set during Conversion)

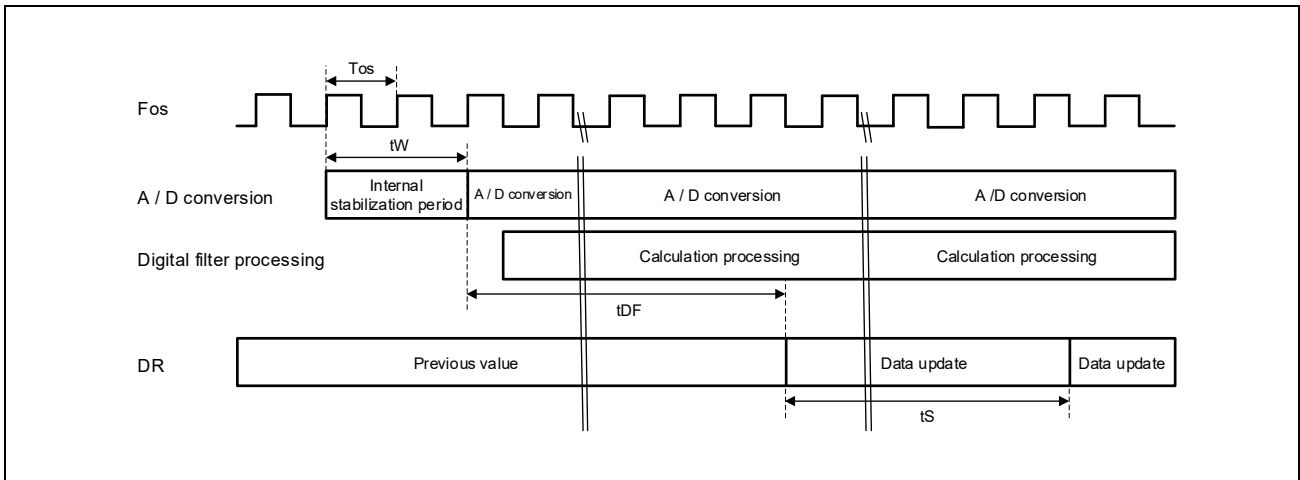

Figure 37.7 Budget of A/D Conversion Processing

37.6.4 Starting an A/D Conversion by an External Trigger

A/D conversion of the DSADC_n can be started by DSADTRG_n input. To start a DSADC_n by DSADTRG_n, input a high level to DSADTRG_n, and then set STTRGE in DSADC_nADTCR to 1. When a low level is input to the DSADTRG_n in this state, the DSADC_n detects a falling edge and sets ADACT to 1.

Figure 37.8 shows the external trigger input timing. ADACT is set to 1 in 3 to 4 states of ADCLK and 2 to 3 states of the register access clock after the falling edge of DSADTRG_n.

The timing after ADACT is set to 1 until DSADC_n is started is the same as the case where ADST is set to 1 by the software. For the pin function settings, see **Section 2, Pin Function**. For selecting the A/D conversion start trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

Figure 37.8 External Trigger Input Timing

37.6.5 Terminating an A/D Conversion by an External Trigger

The DSADCn can be terminated by the DSADTRGn input. To terminate the DSADCn by the DSADTRGn, set the pin functions by using the PFC (pin function controller) and select an A/D conversion end trigger n source by using the trigger selection function. Input a high level to DSADTRGn and then set ENDTRGE in DSADCnADTCR to 1. When a low level is input to DSADTRGn in this state, the DSADCn detects a falling edge and clears ADACT to 0 to terminate the DSADCn.

ADACT is cleared to 0 in 3 to 4 states of the ADCLK and 2 to 3 states of the register access clock after the falling edge of DSADTRGn.

For the pin function settings, see **Section 2, Pin Function**. For selecting the A/D conversion end trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

To terminate an A/D conversion by an external trigger, input an external trigger when ADACT = 1. If an external trigger is input when ADACT = 0, this input is ignored.

37.6.6 Starting an A/D Conversion by a Timer Trigger

The DSADCn can be started by an arbitrary timer trigger. To start the DSADCn by using a timer trigger, select a timer trigger as an A/D conversion start trigger n source by using the trigger selection function. Set STTRGE in DSADCnADTCR to 1.

When the selected timer trigger is input in this state, ADACT is set to 1. The period after ADACT is set to 1 until the DSADCn is started is the same as the case where ADST is set to 1 by the software.

For selecting the A/D conversion start trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

To stop the DSADCn, write 1 to ADEND in DSADCnADENDCR.

37.6.7 Terminating an A/D Conversion by a Timer Trigger

The DSADCn can be terminated by an arbitrary timer trigger. To terminate the DSADCn by using a timer trigger, select a timer trigger as an A/D conversion end trigger n source by using the trigger selection function. Set ENDTRGE in DSADCnADTCR to 1.

When the selected timer trigger is input in this state, ADACT is cleared to 0 to terminate the DSADCn.

For selecting the A/D conversion end trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

To terminate an A/D conversion by a timer trigger, input a timer trigger when ADACT = 1. If a timer trigger is input when ADACT = 0, the timer trigger is ignored.

37.6.8 Switching Virtual Channels via Start and End Triggers

When the VCEP[2:0] bits are set as a channel besides 0 in DSADCnUCR, they are incremented (+) at each input of an external trigger (start trigger or stop trigger) or a software trigger (start trigger or stop trigger) during A/D conversion. Virtual channels can be sequentially switched from DSADCnVCR0 to DSADCnVCRj (j = VCEP[2:0] set value) for A/D conversion by inputting a trigger continuously at more than 1 cycle (ADCLK) intervals from the external timer. The channel switching is not performed normally by inputting a start trigger or a stop trigger continuously at less than 1 cycle (ADCLK) intervals. When VPRSTE is set to 1, virtual channels always return to DSADCnVCR0 at a stop trigger. By using this operation, an A/D conversion can also be started from any DSADCnVCRj by continuously generating a start trigger after a stop trigger. If a trigger is input during an A/D conversion of the channel set by VCEP[2:0], the channel returns to DSADCnVCR0 again and then an A/D conversion is performed. **Figure 37.9** to **Figure 37.11** show examples of virtual channel switching made by start triggers and end triggers.

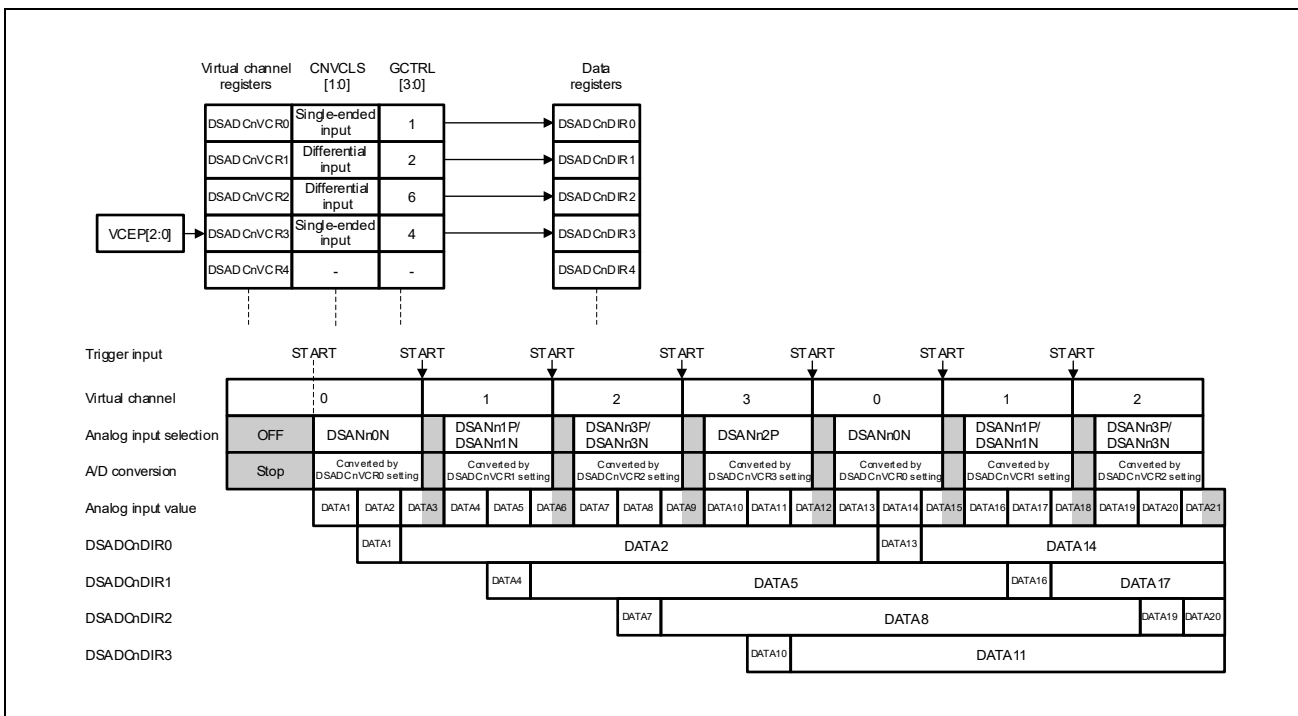

Figure 37.9 Switching Virtual Channels by a Start Trigger

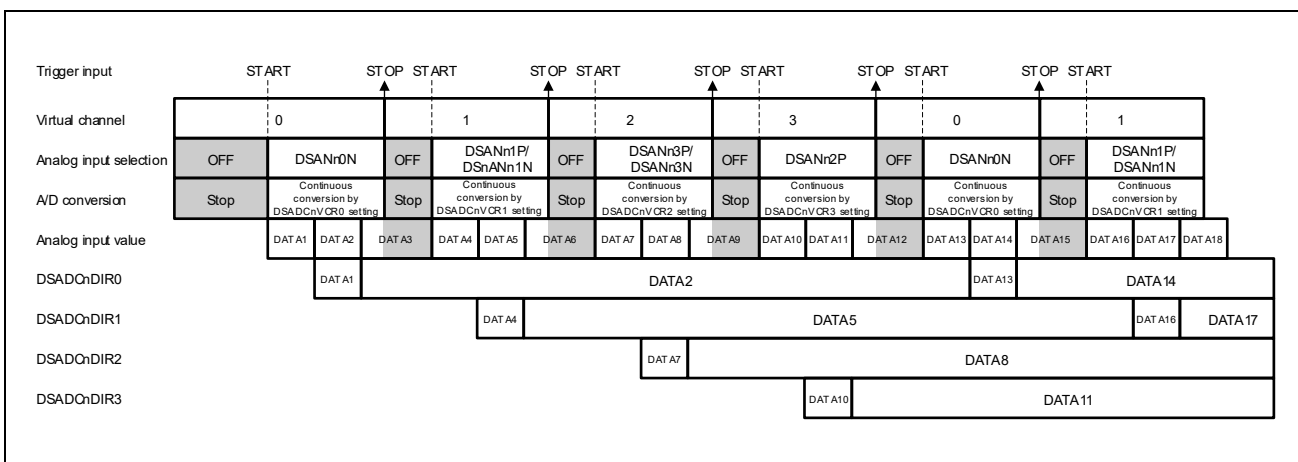

Figure 37.10 Switching Virtual Channels by an End Trigger (VPRSTE = 0)

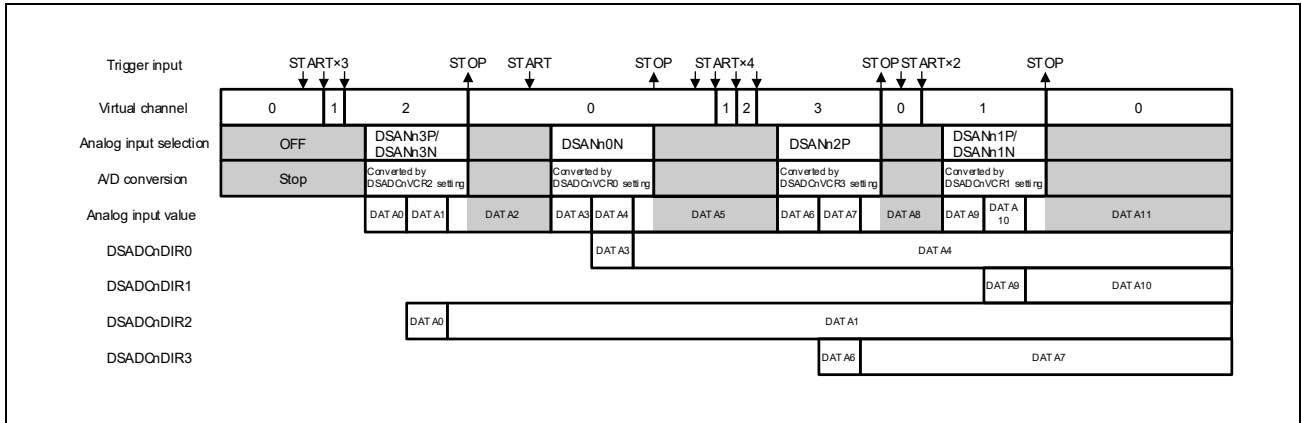

Figure 37.11 Switching Virtual Channels by an End Trigger (VPRSTE = 1)

37.6.9 Calculating Correction Values by Using Calibration

Accurate A/D conversions can be performed by calculating an offset correction value and a gain error correction value under current operating conditions by using calibration. In calibration, the reference voltage is A/D converted in self-diagnosis mode and the best correction values are determined from errors included in the conversion result. Calibration operation starts by writing 1 to CLBST.

37.6.9.1 Calibration Time

Table 37.38 Calibration Time (When Register Access Clock = 40 MHz, ADCLK = 80 MHz, Unit: Register Access Clock)

Conversion Mode	Calibration Time
High Resolution Mode	34907.5 to 35017.5
High Impedance Mode	69827.5 to 70047.5

37.6.10 A/D Conversion Result Error Correction Processing

The post-filter 2nd stage in the Delta-Sigma ADC has the gain error. The gain error specified in Electrical Characteristic are the gain error of A/D conversion result corrected by software processing or by DFE. Correction formula and correction coefficient are shown the following.

Table 37.39 Correction Formula and Correction Coefficient for the Post-Filter 2nd Stage

Filter type	Correction Coefficient
F1a, F1b	4076/4096
F2	4119/4096
F3a, F3b	4073/4096
F4	4089/4096
2nd stage not used (F5, F6, F7)	4096/4096

Correction formula

$$\text{Corrected A/D conversion result} = \text{A/D conversion result} \times \text{Correction coefficient}$$

37.6.11 A/D Conversion Monitoring Function Using Monitor Pins

The A/D conversion of the DSADC_n can be monitored by the DSADEND_n. The DSADEND_n pins directly output A/D conversion result of DSADC_n. CLBACT is not output. For the pin settings, see **Section 2, Pin Function**.

Figure 37.12 shows an example of A/D conversion monitor pin output.

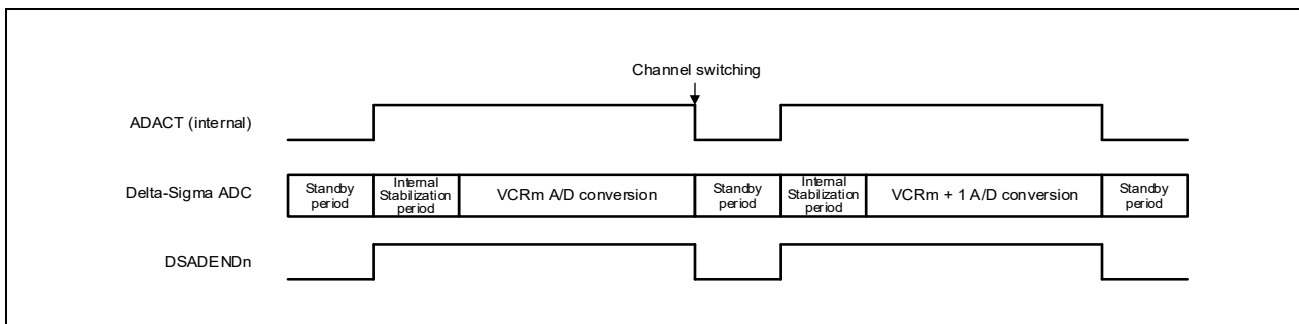

Figure 37.12 Example of A/D Conversion Monitor Pin Output

37.6.12 DMA Request Source

The Delta-Sigma ADC generates DMA request sources (DSADIn) to activate the DMAC (without generating an interrupt to the INTC). When the ADIE in DSADCnVCRj is set to 1, the DSADIn is output at the end of an A/D conversion. When the ADIE in DSADCnADTCR is cleared to 0, the DSADIn output is disabled even at the end of an A/D conversion.

For DMAC settings, see **Section 7, sDMA Controller (sDMAC)** and **Section 8, DTS Controller**.

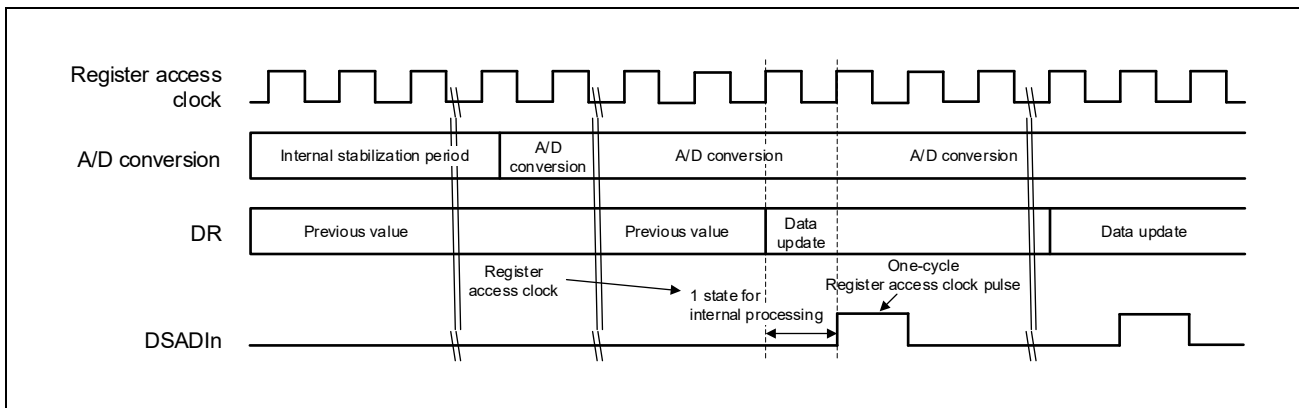

Figure 37.13 Example of DMA Request Source

37.6.13 AD Error Interrupt Request and AD Parity Error Interrupt Request

The Delta-Sigma ADC can generate an AD error interrupt request (DSADEn) to the INTC and an AD parity error interrupt request (DSADPEn) to the ECM (Error Control Module). Any of the error sources for which ULEIE in DSADCnVCRj or IDEIE or OWEIE in DSADCnSFTCR is set to 1 are output as DSADEn. Error sources DSADEn for which ULEIE in DSADCnVCRj or IDEIE or OWEIE in DSADCnSFTCR are set to 0 can be disabled. When PEIE in DSADCnSFTCR is set to 1, DSADPEn is enabled. When PEIE is set to 0, DSADPEn is disabled.

Table 37.40 Correspondence between Interrupt Sources and Interrupt Signals

Status	Interrupt Signal	Interrupt Enable
LLE	DSADEn	DSADCnVCRj.ULEIE and DSADCnVCRj.VCLLME
ULE		DSADCnVCRj.ULEIE and DSADCnVCRj.VCULME
IDE		IDEIE
OWE		OWEIE
PE	DSADPEn	PEIE

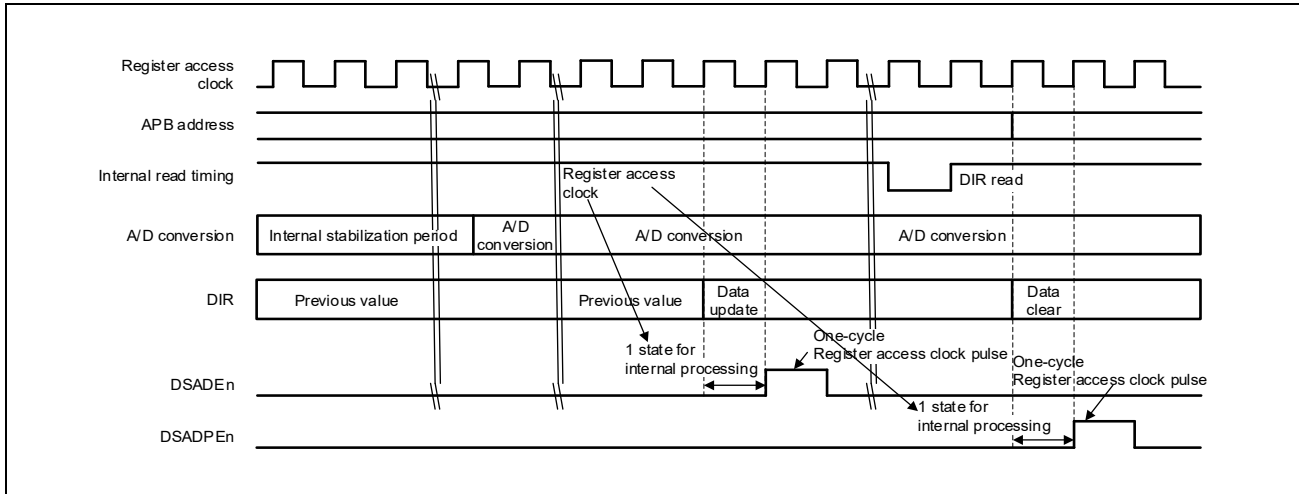

Figure 37.14 Example of an AD Error Interrupt and an AD Parity Error Interrupt

37.6.13.1 Upper-Limit/Lower-Limit Errors

These errors indicate that the A/D conversion result has exceeded the set value.

When the comparison result between the A/D conversion result and the upper-limit/lower-limit table register value (ULTBR0 to ULTBR3.ULMTB[15:0], LLMTB[15:0]) by setting VCULME and VCLLME of DSADCnVCRj is as follows, it is determined as an error.

A/D conversion result > ULMTB[15:0] (When upper-limit table is effective: DSADCnVCRj.VCULME = 1)

A/D conversion result < LLMTB[15:0] (When lower-limit table is effective: DSADCnVCRj.VCLLME = 1)

Detection of these errors is made each time an A/D conversion result is stored.

37.6.13.2 Overwrite Error

This error indicates that a new A/D conversion result has been overwritten to the data register before the data supplementary information register j (DSADCnDIRj) is read.

When the write flag (DSADCnDIRj.WFLG) in the data supplementary information register j is 1 and a new A/D conversion result is stored in the relevant data supplementary information register j (DSADCnDIRj), an overwrite error is detected.

37.6.13.3 ID Error

This error indicates that the physical channel set by the virtual channel register j (DSADCnVCRj) is different from the physical channel in which the A/D conversion was actually performed. In other words, this error indicates the occurrence of a malfunction of the analog switch in the I/O buffer.

The ID error detection result is stored in the ID Error bit in the data supplementary information register j (DSADCnDIRj) corresponding to the virtual channel (DSADCnVCRj) in which an ID error was detected.

The level of the feedback signal from the I/O buffer is checked.

The general control bit (DSADCnVCRj.GCTRL[3:0]) value in the virtual channel register j is compared with the I/O buffer number that is actually activated. If these values do not match, an ID error is detected.

Because the I/O buffer is controlled in a one-hot manner, this error is detected also when the feedback signal is not a one-hot signal.

Either of the following are detected.

- (1) Whether the specified physical channel number does not match the activated I/O buffer number
- (2) Whether differential inputs of two channels or more or single-ended input I/O buffers are simultaneously activated during an A/D conversion (one-hot error)

37.6.14 Boundary Flag Generating Signal Output Function

The boundary flag is a level signal that shows whether the input voltage is within the specified voltage range.

The Delta-Sigma ADC outputs upper-limit/lower-limit error pulse signals (DSADUEn, DSADLEn) and a virtual channel conversion end pulse signal (DSADCnDSADVCIj) as boundary flag generating signals.

When A/D conversion in a virtual channel that corresponds has ended, a virtual channel conversion end pulse (DSADCnDSADVCIj) is always output in spite of setting for ADIE in DSADCnVCRj.

When setting VCULME in DSADCnVCRj as 1, if upper limit error has been detected, the upper limit error pulse (DSADUEn) is output.

When setting VCLLME in DSADCnVCRj as 1, if lower limit error was detected, the lower limit error pulse (DSADLEn) is output.

A boundary flag is generated by ACFG (ADC Boundary Flag Generator). When using the boundary flag, set VCULME and VCLLME in DSADCnVCRj to 1. For ACFG, see **Section 36, Analog to Digital Converter (ADCH)**.

On the other hand, after every unit is merged*¹, a virtual channel conversion end pulse (DSADCnDSADVCIj)*² is output to the GTM*³ as a conversion end pulse (DSADCnDSADCEP).

Note 1. The merging method is OR.

Note 2. DSADCnDSADVCIj is output irrespective of the settings for VCULME and VCLLME in DSADCnVCRj.

Note 3. DSADCnDSADCEP is chosen by the PIC (Peripheral Interconnection), and those are forwarded to the GTM. For details, see **Section 35, Peripheral Interconnection (PIC)**.

37.6.15 Timestamp Function

The lapsed time from the last results output is stored in the DSADCnTSVAL register at the rising edge timing of the DSADRGTn from timer (ATU, GTM) as timestamp information. This function allows measurement of the time difference between the DSADRGTn and the input sampling time. When RDMA in DSADCnUCR is set to 1, the DSADIn is output only while the DSADRGTn is asserted.

The DSADIn output is valid only when DSADRGTn from a timer (ATU, GTM) is asserted.

To continuously toggle DSADRGTn while inputting the operation clock, maintain a pulse width (the Low width and the High width) as wide as at least 2 PCLK clocks (register access clock).

Maintain the rising edge interval of DSADRGTn more than 10 clocks (register access clock).

When the rising edge interval of DSADRGTn is below 10 clocks (register access clock), the second and the following time stamp updates at the rising edge timing of DSADRGTn is waited until the former time stamp updating is complete. Therefore, DMAC cannot read updated time stamp values sometimes.

Figure 37.15 shows the operation of the timestamp function.

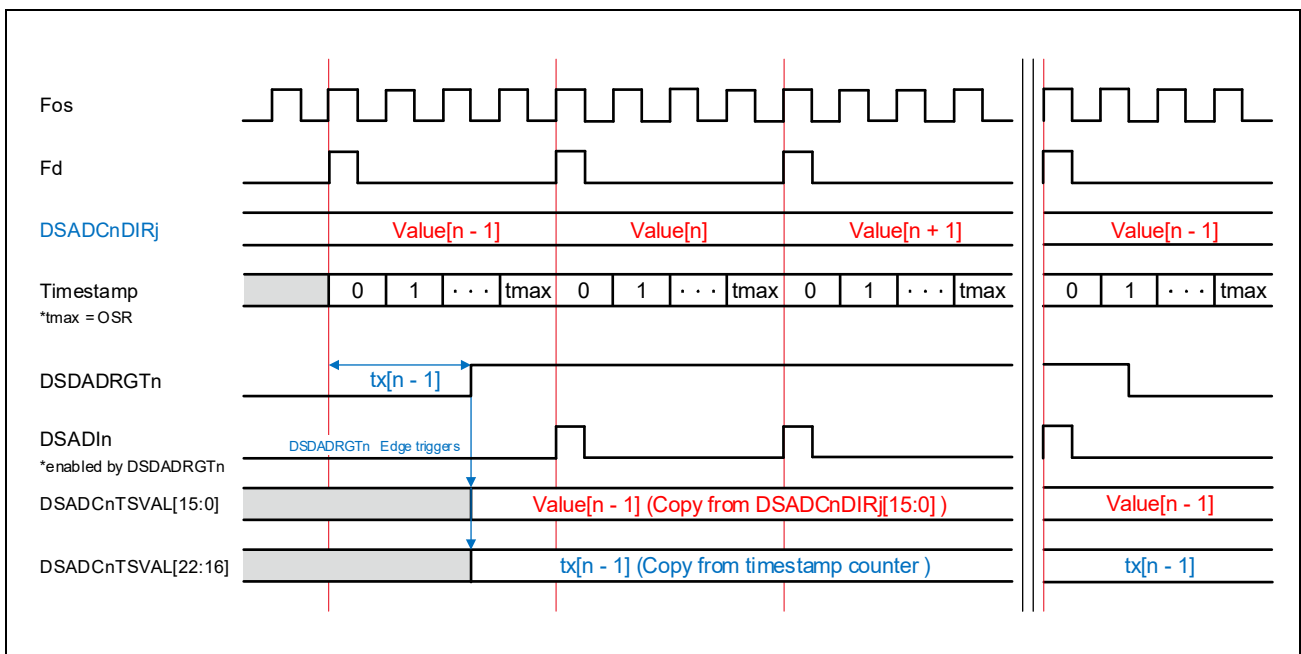

Figure 37.15 Example of the Timestamp Function Operation (RDMA = 1)

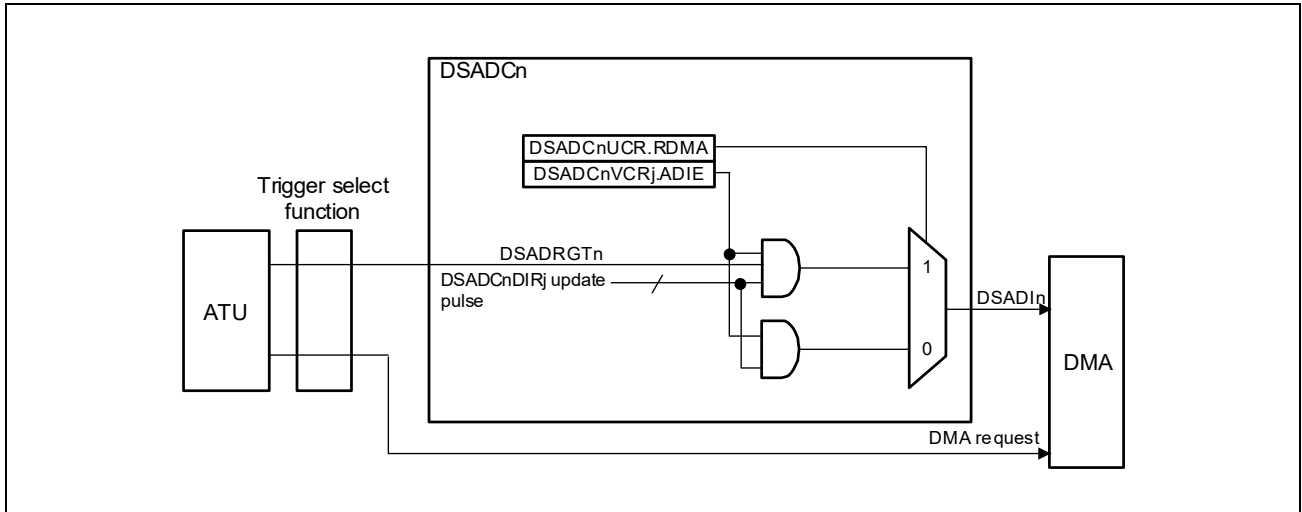

Figure 37.16 DMA Request by DSADRGTn from the ATU

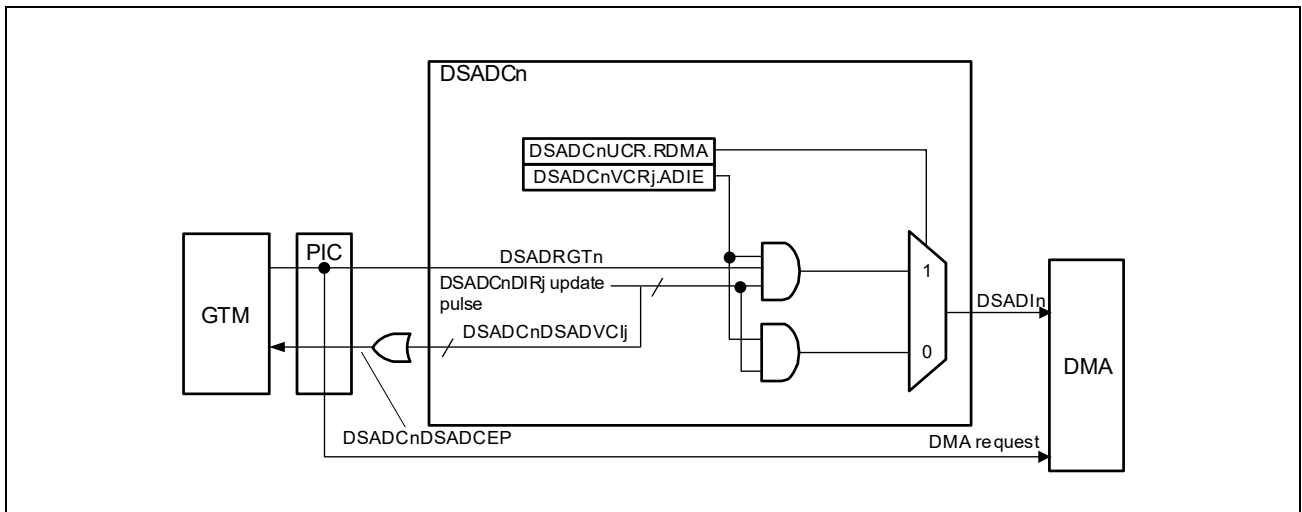

Figure 37.17 DMA Request by DSADRGTn from the GTM

37.6.16 Wiring-Break Detection Function

The wiring-break detection function is used to detect wiring-breaks of DSANn0P/DSANn0N to DSANn3P/DSANn3N.

If a wiring-break is present, the conversion results attenuates to approximately 0 V, and an abnormal value is detected in the conversion results by repeating the A/D conversion several times.

This can be determined as detection of wiring-break.

It is not possible to use the wiring-break detection function simultaneously with normal A/D conversion.

Use a wiring-break detection function before normal A/D conversion is started or between normal A/D conversions.

[Feature]

(1) Users can select desired physical channels for which wiring-break is to be detected by setting virtual channels.

[Recommended flow]

- (1) Make settings according to the initial settings (**Figure 37.4**).
- (2) Set CNVCLS[1:0] in the virtual channel register j (DSADCnVCRj) to 0_H and set GCTRL[3:0] to select the desired channels.
- (3) Set ODE in the AD control register (DSADCADGCR) to 1.
- (4) Set ADST in the AD start control register (DSADCnADSTCR) to 1, and then perform A/D conversion.
- (5) When the read A/D conversion results are attenuated to approximately 0V after repeating A/D conversion several times, judge that wiring-break occurred.
- (6) Repeat steps (4) to (5) for all channels which have DSADCnVCRj set.

37.6.17 Self-Diagnosis

37.6.17.1 Self-Diagnosis of Wiring-Break Detection Function

The self-diagnosis function of the wiring-break detection function is used to check that the wiring-break detection function is working normally.

Enable the I/O buffer self-diagnosis and wiring detection of DSANn0P/DSANn0N to DSANn3P/DSANn3N by setting A/D control register (DSADCADGCR), and then perform A/D conversion.

The conversion results attenuates to approximately 0 V, and an abnormal value is detected in the conversion results by repeating the A/D conversion several times.

This means that the wiring-break detection function is normally processed.

[Feature]

(1) Users can select desired physical channels for which self-diagnosis of wiring-break detection function is performed by setting virtual channels.

[Recommended flow]

(1) Make settings according to the initial settings (**Figure 37.4**).

(2) Set CNVCLS[1:0] in the virtual channel register j (DSADCnVCRj) to 0_H and set GCTRL[3:0] to select the desired channels.

(3) Set both ODE and ODDE in the A/D control register (DSADCADGCR) to 1.

(4) Set ADST in the A/D start control register (DSADCnADSTCR) to 1, and then perform the A/D conversion.

(5) When the read A/D conversion results are attenuated to approximately 0V after repeating A/D conversion several times, judge that self-diagnosis of wiring-break detection function is working normally.

(6) Repeat steps (4) to (5) for all channels which DSADCnVCRj is set.

37.6.17.2 A/D Self-Diagnosis Function

A/D self-diagnosis is used to check that the A/D conversion works normally.

If the expectation value does not match the A/D conversion results, there is a possibility that the A/D converter is broken.

The voltage value is set by setting CNVCLS[1:0] of virtual channel register j to 3_H and selecting from GCTRL [3:0].

It is possible that A/D conversion for $ADSVREFH \times 1$, $ADSVREFH \times 1/2$, $-ADSVREFH \times 1/2$, $-ADSVREFH \times 1$ or $ADSVREFH \times 0$ is performed.

When using A/D self-diagnosis, set gain $\times 1$ or gain $\times 2$ for high resolution mode, and set gain $\times 1$, gain $\times 2$ or gain $\times 4$ for high impedance mode.

Settings other than above are prohibited.

[Setting]

- (1) Make settings according to the initial settings (**Figure 37.4**).
- (2) Set CNVCLS[1:0] in the virtual channel register j (DSADCnVCRj) to 3_H and set GCTRL[3:0] to select the desired A/D self-diagnosis voltage level.
- (3) Make other appropriate settings (**Figure 37.4**).
- (4) Set ADST in the A/D start control register (DSADCnADSTCR) to 1, and then perform the A/D conversion.

37.6.17.3 Pin Level Self-Diagnosis Function

Pin level self-diagnosis is the function to diagnose abnormal analog input by applying different voltages and performing A/D conversion for each physical channel.

When using pin level self-diagnosis, set gain $\times 1$.

Settings other than above are prohibited.

[Analog Input Process]

I/O Buffer to A/D Converter

[Setting]

Make the settings for A/D control register (DSADCADGCR), virtual channel register j (DSADCnVCRj), pin level self-diagnosis control register (DSADCTDCR) and pin level self-diagnosis level register (DSADCnTDLVR) according to the initial settings.

- (1) DSADCADGCR

ODDE	ODE
1	0

- (2) DSADCTDCR

TDE
1

(3) DSADC_nVCR_j

VCR Number	CNVCLS[1:0]	GCTRL[3:0]
N	0 _H , 1 _H , 2 _H	Physical Channel Number

(4) DSADC_nTDLVR

AN0PLV/AN0NLV AN1PLV/AN1NLV AN2PLV/AN2NLV AN3PLV/AN3NLV	Injecting Voltage of Physical Channel
0	ADSVSS
1	ADSVCC

Perform A/D conversion according to the A/D conversion flow.

NOTE

Set ODDE of the A/D control register (DSADCADGCR) to 1 before setting TDE of the pin level self-diagnosis control register (DSADCTDCR) to 1.

Do not use the pin level self-diagnosis function and wiring-break detection function at the same time.

37.6.18 DFE Control

Entry to the DFE or GTM is enabled by setting the DFENT bit in the DSADCnVCRj register to 1. This A/D has two DFE channels and uses one of them. A DFE channel to use can be selected for each A/D unit according to the settings of the DFES bit in the DSADCnUCR register.

37.7 Usage Notes

37.7.1 Notes on Using Analog Input Pins

Do not perform an A/D conversion on the value of the same analog pin simultaneously by the Delta-Sigma ADC and the SAR-ADC or multiple Delta-Sigma ADC. Also, do not allow the Delta-Sigma ADC to perform an A/D conversion on the value of an analog pin currently selected for digital input. This may degrade A/D accuracy.

When the Delta-Sigma ADC is used with a single-ended input, and only the analog input pins on the P side (or N side) of a differential input are used, the analog input pins on the N side (or P side) can be used for other ADC inputs.

37.7.2 Module Standby Function

The Delta-Sigma ADC has a module standby function.

Module standby stops the clock supply to DSADC00 and DSADC10 by setting MSR_DAD.MS_DAD00_10.

Module standby stops the clock supply to DSADC20 and DSADC12 by setting MSR_DAD.MS_DAD20_12.

Module standby stops the clock supply to DSADC13 and DSADC11 by setting MSR_DAD.MS_DAD13_11.

Module standby stops the clock supply to DSADC15 and DSADC14 by setting MSR_DAD.MS_DAD15_14.

Module standby stops the clock supply to DSADC22 and DSADC21 by setting MSR_DAD.MS_DAD22_21.

Module standby stops clock supply to DSADC (common). For the clock supply stop condition for the DSADC (common), see **Table 37.41**.

Table 37.41 Clock Supply Stop Condition of DSADC (common) by Module Standby

States	MSR_DAD. MS_DAD00_10	MSR_DAD. MS_DAD20_12	MSR_DAD. MS_DAD13_11	MSR_DAD. MS_DAD15_14	MSR_DAD. MS_DAD22_21	MSR_CAD. MS_CAD
Clock Supply	0	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1
Clock Supply	1	0	0 or 1	0 or 1	0 or 1	0 or 1
Clock Supply	1	1	0	0 or 1	0 or 1	0 or 1
Clock Supply	1	1	1	0	0 or 1	0 or 1
Clock Supply	1	1	1	1	0	0 or 1
Clock Supply	1	1	1	1	1	0
Clock Supply Stop	1	1	1	1	1	1

To prevent a malfunction, do not set the module standby mode during an A/D conversion, calibration or while an A/D conversion start/end trigger is enabled. Before setting the module standby mode, set the related channels as follows.

Also, set module standby mode after maintaining the following state during 10 states of the register access clock:

- DSADCnADSR.ADACT = 0, and
- DSADCnADSR.CLBACT = 0, and
- DSADCnADTCR.ENDTRGE = 0, and
- DSADCnADTCR.STTRGE = 0

Section 38 Cyclic Analog to Digital Converter (CADC)

This section contains a description of the Cyclic A/D Converter (CADC).

The first part of this section describes all of the features specific to this product, such as the number of units and register base addresses. The remainder of the section describes the functions and registers of the CADC.

38.1 Features

38.1.1 Number of Units and Channels

This microcontroller has the following number of CADC units.

Table 38.1 Number of Units

Product Name	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
Number of CADC Common Units	1	1
Number of CADC Channel Units	1	1
Name of CADC Units	CADC CADC _n (n = 00)	

A CADC_n unit has the same number of physical channels as the number of A/D input pins. The numbers of channels of individual products are listed below.

Table 38.2 Unit Configurations and Physical Channels

Unit Name (Number of Channels)	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
CADC _n		
CADC00	8	8

Table 38.3 Unit Configurations and Virtual Channels

Unit Name (Number of Channels)	RH850/E2x-FCC2, E2UH, E2H	
	373 Pins	468 Pins
CADC _n		
CADC00	8	8

Table 38.4 Indices

Index	Description
n	Throughout this section, the individual CADC units are identified by the index "n" (n = 00); For example, CADC _n CCR indicates the channel control register.
x	Throughout this section, the individual analog input attribute at differential input are identified by the index "x" (x = P, N); for example, CAN _n x.
j	The number of a virtual channel.

38.1.2 Register Base Addresses

The CADC and CADCn base addresses are listed in the following table.

The CADC and CADCn register addresses are given as offsets from the base address in general.

Table 38.5 Register Base Addresses

Base Address Name	Base Address	Bus Group
<CADC_base>	FFF4 0000 _H	Peripheral Group 7
<CADCn_base>	FFF4 1000 _H	Peripheral Group 7

38.1.3 Clock Supply

The CADC and CADCn clock supplies are shown in the following table.

Table 38.6 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
CADC	ADCLK	CLK_HSB
	Register access clock, PCLK	CLK_LSB
CADCn	ADCLK	CLK_HSB
	Register access clock, PCLK	CLK_LSB

38.1.4 Interrupt Requests

The CADCn interrupt requests are listed in the following table.

Table 38.7 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number	DMA Trigger Number (DMA or DTS)	Other Trigger Signals
CADCn				
CADEn	A/D error interrupt	*1	—	—
	Upper/lower limit error interrupt			
CADIn	A/D conversion end interrupt	—	*1	—

Note 1. CADEn and CADIn are chosen by the AIR (ADC Interrupt Router), and those are forwarded to the INTC and DMAC.

For Interrupt Number and DMA Trigger Numbers, see **Section 36, Analog to Digital Converter (ADCH)**.

38.1.5 Reset Sources

The CADC and CADCn reset sources are listed in the following table. The CADC and CADCn are initialized by these reset sources.

Table 38.8 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
CADC	All registers	✓	✓	✓	✓	—	—
CADCn	All registers	✓	✓	✓	✓	—	—

38.1.6 External Input/Output Signals

The External Input/Output signals of the CADC_n are listed below.

Table 38.9 CADC External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
CADC _n Common		
ADSVCC	Power supply pin for the analog part	ADSVCC
ADSVSS	Ground pin for the analog part	ADSVSS
ADSVREFH	Upper reference voltage pin for the analog part	ADSVREFH
ADSVREFL	Lower reference voltage pin for the analog part	ADSVREFL

Table 38.10 CADC00 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
CAN000P	Analog input pin (for single-ended/differential P)	CAN000P
CAN000N	Analog input pin (for single-ended/differential N)	CAN000N
CAN001P	Analog input pin (for single-ended/differential P)	CAN001P
CAN001N	Analog input pin (for single-ended/differential N)	CAN001N
CAN002P	Analog input pin (for single-ended/differential P)	CAN002P
CAN002N	Analog input pin (for single-ended/differential N)	CAN002N
CAN003P	Analog input pin (for single-ended/differential P)	CAN003P
CAN003N	Analog input pin (for single-ended/differential N)	CAN003N
CADTRG00	External trigger pin	CADTRG00
CADEND00	A/D conversion timing monitor pin	CADEND00

38.2 Overview

38.2.1 Function Overview

The following describes features (functional overview) of the CADC.

- A/D conversion method: Cyclic method
- Configuration of analog input channels
 - 1 module, 8 analog input channels in total.
 - CADC00: 8 single-ended inputs (4 differential inputs).

NOTES

1. One differential input can be used as two single-ended inputs.
2. All analog inputs are multiplexed with ADCH analog inputs.

- Input type: Single-ended input and differential input
 - Single-ended input or differential input can be selected for each virtual channels.
 - In single-ended mode:
 - The A/D conversion value format of unsigned 16-bit resolution is generated when ADSVREFL is chosen as the common mode voltage.
 - Range of the A/D conversion value: 0000_H to FFFF_H
 - The A/D conversion value format of signed 15-bit resolution (15-bit value preceded by the sign bit) is generated when ADSVREFH/2 is chosen as the common mode voltage.
 - Range of the A/D conversion value: C000_H to 3FFF_H
 - In differential mode:
 - The A/D conversion value format of signed 15-bit resolution (15-bit value preceded by the sign bit) is generated.
 - Range of the A/D conversion value: 8000_H to 7FFF_H
- Input gain function (PGA): × 1 only.
 - Sampling rate: 1 Msps (Fos (Over sampling rate) is 2Msps)
- Pass band: 500 kHz
- Virtual channels
 - See **Section 38.1.1, Number of Units and Channels**.
- Calibration function
 - The CADC has a calibration function, and the execution of the calibration routine realize a high accuracy A/D conversion.
- Data register
 - A data register is contained in the data supplementary information register j.
- A/D conversion start trigger
 - Each CADC can start an A/D conversion with software, each timer trigger, or an external trigger (CADTRGn).
- A/D conversion end trigger
 - Each CADC can terminate an A/D conversion with software, each timer trigger, or an external trigger (CADTRGn).
- Entry to the digital filter engine, and the Generic Timer Module
 - A/D converted values can be entered directly into the digital filter engine (DFE), or Generic Timer Module (GTM).

Whether to enable or disable DFE entry and a TAG to determine channels for entry can be set for each virtual channel.

For details of DFE, see **Section 39, Digital Filter Engine (DFE)**.

For details of GTM, see **Section 33, Generic Timer Module (GTM)**.

- DMA transfer based on A/D conversion end timing

Each time an A/D conversion ends, each CADC outputs a DMA request on completion of an A/D conversion (CADIn), which can generate DMA request sources (CADIn) to the DMAC or activate the DMAC.

The output of the CADIn is capable of being limited by a read-gate (CADRG_{Tn}) from a timer (ATU GTM).

For details of the ATU, see **Section 32, ATU-V**.

For details of the GTM, see **Section 33, Generic Timer Module (GTM)**.

- Boundary flag output function

It is possible to output a boundary flag generating signal (CADUE_n, CADLE_n and CADC_nVCI_j) to the ABFG (ADC Boundary Flag Generator).

For details of the ABFG, see **Section 36, Analog to Digital Converter (ADCH)**.

- AD error interrupt request and AD parity error notification

Each CADC can generate an AD error interrupt request (CADE_n) to the INTC and an AD parity error notification (CADPE_n) to the ECM (error control module).

- Settable analog conversion voltage range

An analog conversion voltage range can be set using the ADSVREFH pin and the ADSVREFL pin. When performing an A/D conversion by using the single-ended input, either ADSVREFL or ADSVREFH/2 is selectable as a common voltage.

- A/D conversion monitor output

A/D conversion timing can be output to the A/D conversion monitor output pin (CADEND_n).

- A wide range of safety functions

A variety of safety functions are provided, including self-diagnosis, pin-level self-diagnosis, wiring-break detection, normality check for analog selection, upper-limit/lower-limit check for data registers, data register parity check for data registers, overwrite check for data registers, and read and clear function for data registers.

38.2.2 Block Diagram

The block diagram of the CADC is shown in **Figure 38.1**.

Figure 38.1 Block Diagram of CADC

38.3 Registers

38.3.1 List of Registers

The CADC registers are listed in the following table.

For detail about <CADC_base> and <CADCn_base>, see **Section 38.1.2, Register Base Address**.

Table 38.11 List of Registers

Module Name	Register Name	Symbol	Address	Access	Access Protection
CADC	AD Control Register	CADCADGCR	<CADC_base> + 04 _H	8	—
CADC	Pin Level Self-Diagnosis Control Register	CADCTDCR	<CADC_base> + 0C _H	8	—
CADCn	Virtual Channel Register 0	CADCnVCR0	<CADCn_base> + 00 _H	8, 16, 32	—
CADCn	Virtual Channel Register 1	CADCnVCR1	<CADCn_base> + 04 _H	8, 16, 32	—
CADCn	Virtual Channel Register 2	CADCnVCR2	<CADCn_base> + 08 _H	8, 16, 32	—
CADCn	Virtual Channel Register 3	CADCnVCR3	<CADCn_base> + 0C _H	8, 16, 32	—
CADCn	Virtual Channel Register 4	CADCnVCR4	<CADCn_base> + 10 _H	8, 16, 32	—
CADCn	Virtual Channel Register 5	CADCnVCR5	<CADCn_base> + 14 _H	8, 16, 32	—
CADCn	Virtual Channel Register 6	CADCnVCR6	<CADCn_base> + 18 _H	8, 16, 32	—
CADCn	Virtual Channel Register 7	CADCnVCR7	<CADCn_base> + 1C _H	8, 16, 32	—
CADCn	Data Supplementary Information Register 0	CADCnDIR0	<CADCn_base> + 20 _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 1	CADCnDIR1	<CADCn_base> + 24 _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 2	CADCnDIR2	<CADCn_base> + 28 _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 3	CADCnDIR3	<CADCn_base> + 2C _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 4	CADCnDIR4	<CADCn_base> + 30 _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 5	CADCnDIR5	<CADCn_base> + 34 _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 6	CADCnDIR6	<CADCn_base> + 38 _H	16 ^{*1} , 32	—
CADCn	Data Supplementary Information Register 7	CADCnDIR7	<CADCn_base> + 3C _H	16 ^{*1} , 32	—
CADCn	AD Start Control Register	CADCnADSTCR	<CADCn_base> + 40 _H	8	—
CADCn	AD Stop Control Register	CADCnADENDCR	<CADCn_base> + 44 _H	8	—
CADCn	Calibration Start Control Register	CADCnCLBSTCR	<CADCn_base> + 48 _H	8	—
CADCn	Calibration Stop Control Register	CADCnCLBEDCR	<CADCn_base> + 4C _H	8	—
CADCn	AD Conversion Trigger Control Register	CADCnADTCR	<CADCn_base> + 50 _H	8	—
CADCn	Unit Control Register	CADCnUCR	<CADCn_base> + 54 _H	8, 16, 32	—
CADCn	Virtual Channel Pointer Register	CADCnVCPTRR	<CADCn_base> + 58 _H	8	—
CADCn	AD Conversion Status Register	CADCnADSR	<CADCn_base> + 60 _H	8	—
CADCn	Unit Data Pointer Register	CADCnUDPTRR	<CADCn_base> + 64 _H	8	—
CADCn	Unit Data Supplementary Information Register	CADCnUDIR	<CADCn_base> + 68 _H	32	—
CADCn	Sampling Rate Control Register	CADCnSMPCR	<CADCn_base> + 6C _H	8, 16, 32	—
CADCn	Safety Control Register	CADCnSFTCR	<CADCn_base> + 70 _H	8	—
CADCn	Error Clear Register	CADCnECR	<CADCn_base> + 74 _H	8	—

CADCn	Pin Level Self-Diagnosis Level Register	CADCnTDLVR	<CADCn_base> + 7C _H	8	—
CADCn	Upper-Limit/Lower-Limit Table Register 0	CADCnULTBR0	<CADCn_base> + 80 _H	16, 32	—
CADCn	Upper-Limit/Lower-Limit Table Register 1	CADCnULTBR1	<CADCn_base> + 84 _H	16, 32	—
CADCn	Upper-Limit/Lower-Limit Table Register 2	CADCnULTBR2	<CADCn_base> + 88 _H	16, 32	—
CADCn	Upper-Limit/Lower-Limit Table Register 3	CADCnULTBR3	<CADCn_base> + 8C _H	16, 32	—

Note 1. When reading CADCnDIRj in 16-bit units, see **Section 38.5.2, CADCnDIRj — Data Supplementary Information Register j**.

38.4 Cyclic ADC Common Registers

This section describes the registers shared by all of the Cyclic ADC units.

38.4.1 CADCADGCR — AD Control Register

CADCADGCR is an 8-bit read/write register to totally control A/D conversion.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	CADCODDE	CADCODE	—	—	—	CADCUNSND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Table 38.12 CADCADGCR Register Contents

Bit Position	Bit Name	Function
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5	CADCODDE	Wiring-break Detection Function Self-Diagnosis Enable 0: Self-diagnosis of the wiring-break detection function is disabled. 1: Self-diagnosis of the wiring-break detection function is enabled. When CADCODDE is set to 1, wiring-break detection function self-diagnosis and pin level self-diagnosis are enabled. When doing pin level self-diagnosis, set CADCODDE to 1 before setting CADCTDE to 1. If CADCTDE is set to 1 with CADCODDE = 0, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device.
4	CADCODE	Wiring-break Detection Enable 0: Wiring-break detection is disabled. 1: Wiring-break detection is enabled. When CADCODE is set to 1, wiring-break detection is enabled for all analog pins. Setting this bit in 1 simultaneously with pin level self-diagnosis (CADCTDE=1) is prohibited. When setting CADCADGCR.CADCODE as 1, if CADCnVCRj.CADCnCNVCLS[1:0] value is set to anything but 0 _H , A/D conversion is prohibited.
3 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CADCUNSND	Unsigned Conversion Result Output Enable When unsigned output is enabled in this register, the A/D conversion result (when ADSVREFL is selected for the single-ended common voltage) can be output as an unsigned value. 0: A/D conversion result is output as a signed value. 1: When the single-ended common voltage = ADSVREFL, A/D conversion result is output as an unsigned value.*1 For details about the difference in the data format for this bit, see Section 38.5.2, CADCnDIRj — Data Supplementary Information Register j .

Note 1. When the calculation result after correction is a negative value, an A/D conversion result of 0 is output.

NOTE

To prevent a malfunction, set CADCADGCR when CADCnADACT and CADCnCLBACT of the Cyclic ADC = 0 (before starting A/D conversion) and CADCnSTTRGE of all Cyclic ADCs = 0.

38.4.2 CADCTDCR — Pin Level Self-Diagnosis Control Register

CADCTDCR is an 8-bit read/write register to control pin level self-diagnosis.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CADCTDE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 38.13 CADCTDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CADCTDE	<p>Pin Level Self-Diagnosis Enable</p> <p>0: Pin level self-diagnosis is disabled. 1: Pin level self-diagnosis is enabled.</p> <p>When CADCTDE is set to 1, all analog pins are disconnected from the analog I/O buffer. When CADCTDE is set to 0, all analog pins are connected to the analog I/O buffer.</p> <p>When CADCTDE = 1, analog pins CANn0x to CANn3x are fixed to the level specified by CADCnTDLVR.AN0xLV to CADCnTDLVR.AN3xLV. By performing A/D conversion in this state and checking the A/D converted value, the path between the analog pins and Cyclic ADC can be diagnosed.</p> <p>Do not set this bit as 1 simultaneously with CADCODE = 1 (wiring-break detection enable) and CADCCNVCLS = 3_H (A/D self-diagnosis).</p> <p>When doing pin level self-diagnosis, set CADCODDE to 1 before setting CADCTDE to 1.</p> <p>If CADCTDE is set to 1 with CADCODDE = 0, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device.</p>

NOTE

To prevent a malfunction, set CADCTDCR when CADCnADACT and CADCnCLBACT of the Cyclic ADC = 0 (before starting A/D conversion) and CADCnSTTRGE of all Cyclic ADCs = 0.

38.5 Cyclic ADC Unit-Specific Registers

This section describes the registers provided to control each individual Cyclic ADC unit controller.

38.5.1 CADCnVCRj — Virtual Channel Register j

CADCnVCRj is a 32-bit read/write register to control virtual channels.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	CADCnVCULME	CADCnVCLLME	CADCnVCULLMTBS[1:0]		—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADCnADIE	CADCnULEIE	—	CADCnDFENT	CADCnDFTAG[3:0]			—	—	CADCnCNVCLS[1:0]		CADCnGCTRL[3:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.14 CADCnVCRj Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
27	CADCnVCULME	Virtual Channel Upper-Limit Excess Notification Enable 0: If the A/D conversion result is greater than the upper limit of the virtual channel, it is not notified. 1: If the A/D conversion result is greater than the upper limit of the virtual channel, it is notified.
26	CADCnVCLLME	Virtual Channel Lower-Limit Excess Notification Enable 0: If the A/D conversion result is less than lower limit of the virtual channel, it is not notified. 1: If the A/D conversion result is less than lower limit of the virtual channel, it is notified.

Table 38.14 CADcNVCRj Register Contents (2/3)

Bit Position	Bit Name	Function
25, 24	CADcNVCULLMTBS [1:0]	Virtual Channel Upper-Limit/Lower-Limit Table Register Select These bits select the upper-limit/lower-limit table register to be compared. 0 _H : Upper-limit/lower-limit values are checked by CADcNULTBR0. [Initial value] 1 _H : Upper-limit/lower-limit values are checked by CADcNULTBR1. 2 _H : Upper-limit/lower-limit values are checked by CADcNULTBR2. 3 _H : Upper-limit/lower-limit values are checked by CADcNULTBR3. When the A/D converted value is stored in the CADcNDR, upper-limit/lower-limit values are checked by using the upper-limit value/lower-limit value table.
23 to 16	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
15	CADcNADIE	Conversion End Interrupt Enable 0: CADcN is not output when the CADcNDRj conversion result is output. 1: CADcN is output when the CADcNDRj conversion result is output.
14	CADcNULEIE	Upper-Limit/Lower-Limit Error Interrupt Enable 0: CADcN is not output upon an upper-limit or lower-limit error of CADcNDRj. 1: CADcN is output upon an upper-limit or lower-limit error of CADcNDRj.
13	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
12	CADcNDFENT	DFE Entry 0: Entry is not performed. 1: Entry is performed. This bit selects whether or not to perform entry to the DFE (digital filter engine).
11 to 8	CADcNDFTAG[3:0]	DFE-TAG These bits are used to perform entry to a channel of the DFE for which the TAG is identical to the setting of CADcNDFTAG[3:0]. If the TAG matches the setting of CADcNDFTAG[3:0] for multiple channels, entry to multiple DFE channels is performed.
7, 6	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
5, 4	CADcNCNVCLS[1:0]	Conversion Type 0 _H : Single-ended input, common voltage = ADSVREFL 1 _H : Single-ended input, common voltage = ADSVREFH/2 2 _H : Differential input 3 _H : Self-diagnosis

Table 38.14 CADCnVCRj Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	CADCnGCTRL[3:0]	<p>General Control</p> <p>These bits set the A/D conversion in each conversion mode.</p> <p>Single-ended input (CADCnCNVCLS = 0_H, 1_H)</p> <p>Analog input channels are selected by the CADCnGCTRL[3:0] bits.</p> <p>0_H: CANn0P 1_H: CANn0N 2_H: CANn1P 3_H: CANn1N 4_H: CANn2P 5_H: CANn2N 6_H: CANn3P 7_H: CANn3N Other than the above: Setting prohibited.</p> <p>Differential input (CADCnCNVCLS = 2_H)</p> <p>Analog input channels are selected by the CADCnGCTRL[3:0] bits.</p> <p>0_H: CANn0P/CANn0N 1_H: Setting prohibited 2_H: CANn1P/CANn1N 3_H: Setting prohibited 4_H: CANn2P/CANn2N 5_H: Setting prohibited 6_H: CANn3P/CANn3N 7_H: Setting prohibited Other than the above: Setting prohibited.</p> <p>For self-diagnosis (CADCnCNVCLS[1:0] = 3_H), a self-diagnosis level is selected by the CADCnGCTRL[3:0] bits.</p> <p>7_H: ADSVREFH × 1 4_H: ADSVREFH × 1/2 0_H: ADSVREFH × 0 C_H: – ADSVREFH × 1/2 8_H: – ADSVREFH × 1 Other than the above: Setting prohibited</p>

NOTE

To prevent a malfunction, set CADCnVCRj when CADCnADACT and CADCnCLBACT = 0 (before starting A/D conversion) and CADCnSTTRGE = 0. When rewriting this register after A/D conversion stop, change the setting after clearing of CADCnADACT is confirmed by reading CADCnADSR.

38.5.2 ADCnDIRj — Data Supplementary Information Register j

CADCnDIRj is a 32-bit read-only register to store A/D converted values and their supplementary information. This register is cleared to 0000 0000_H by reading this register when CADCnRDCLRE is set to 1. Additionally, CADCnUDIR is also cleared to 0000 0000_H by reading this register, which is mirrored to CADCnUDIR when CADCnRDCLRE is set to 1. The CADCnWFLG bit is cleared by reading this register regardless of the CADCnRDCLRE value.

When reading the CADCnDIRj in 16-bit units, invalidate Read-and-Clear-Enable (CADCnSFTCR.CADCnRDCLRE = 0) and invalidate the overwriting function*¹.

Note 1. The expected value comparison of the CADCnWFLG of CADCnDIRj and Overwrite-Error of the Error-Register is not put into effect, and Overwrite-Error-Interrupt-Enable (CADCnOWEIE) of the Safety-Control-Register (CADCnSFTCR) is 0 (prohibited).

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	CADCnI DEF	CADCn WFLG	CADCn PRTY	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADCnDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.15 CADCnDIRj Register Contents

Bit Position	Bit Name	Function
31 to 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26	CADCnIDEF	ID Error 0: An error has occurred. 1: No error has occurred.
25	CADCnWFLG	Write Flag Setting condition Storing an A/D converted value in CADCnDIRj Clearing condition Reading CADCnDIRj
24	CADCnPRTY	Parity This bit indicates the even parity bit of CADCnDR and CADCnIDEF.
23 to 16	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CADCnDR[15:0]	These bits are used to store the A/D converted value. For the data format, see “Bits 15 to 0 DR Data Register Data Format”.

The setting timing of CADCnIDEF, CADCmWFLG and CADCnPRTY are same timing to set the data register to the A/D conversion result (CADCnDR).

If setting and clearing of CADCnIDEF, CADCmWFLG and CADCnPRTY are conflicted, the setting is high priority.

Bits 15 to 0 DR Data Register Data Format

The A/D converted value is stored in the CADCnDR. The data format of the CADCnDR is shown below. The format of data to be transferred to the DFE (digital filter engine) or the GTM (Generic Timer Module) is in the signed fixed-point format regardless of the UNSND setting.

Figure 38.2 DR (Data Register) Data Format 1

Figure 38.3 DR (Data Register) Data Format 2

38.5.3 CADCnADSTCR — AD Start Control Register

CADCnADSTCR is an 8-bit write-only register to control Cyclic ADC start. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CADCnADST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 38.16 CADCnADSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CADCnADST	A/D Conversion Start A/D conversion start condition with CADCnADST Writing 1 to CADCnADST starts an A/D conversion When 1 is written to this bit while an A/D conversion is already in progress, if the CADCnVCEP[2:0] value in CADCnUCR is not 0 _H , the ongoing A/D conversion stops and A/D conversion of the next virtual channel starts. Writing 1 to this bit while ADACT = 1 and CADCnVCEP[2:0] in CADCnUCR is 0 _H suspends the A/D conversion and repeats the A/D conversion of virtual channel 0. When 1 is written to this bit while calibration is in progress, calibration stops and A/D conversion of the next virtual channel that is indicated by the CADCnVCPTR bit starts. Writing 0 to this bit is ignored.

NOTE

It is recommended that a value be written to the CADCnADST bit when CADCnSTRGE = 0 and CADCnENDTRGE = 0. When the external trigger and to write to CADCnADST occurred at the same time, count value of channel isn't sometimes matched with the number of inputs of the trigger.

38.5.4 CADCnADENDCR — AD Stop Control Register

CADCnADENDCR is an 8-bit write-only register to control Cyclic ADC stop. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CADCnADEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 38.17 CADCnADENDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CADCnADEND	A/D Conversion End A/D conversion stop condition with CADCnADEND Writing 1 to CADCnADEND stops an active A/D conversion. When A/D conversion is stopped with CADCnVPRSTE = 0, the virtual channel is incremented. When A/D conversion is stopped with CADCnVPRSTE = 1, the virtual channel is cleared to 0. Writing 1 to this bit when CADCnADACT = 0 is ignored. Writing 0 to this bit is ignored.

NOTE: When changing the other register setting after an A/D conversion is stopped, please be sure to confirm that CADCnADACT is 0.

NOTE

It is recommended that a value be written to the CADCnADEND bit when CADCnSTTRGE = 0 and CADCnENDTRGE = 0.

38.5.5 CADCnCLBSTCR — Calibration Start Control Register

CADCnCLBSTCR is an 8-bit write-only register to control calibration start. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CADCnCLBST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 38.18 CAD0nCLBSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CADCnCLBST	Calibration Start Calibration start condition with CADCnCLBST Writing 1 to CADCnCLBST when both calibration and A/D conversion are stopped starts A/D calibration. Writing 1 to this bit when calibration is active or A/D conversion is active is ignored.

38.5.6 CADCnCLBEDCR — Calibration Stop Control Register

CADCnCLBEDCR is an 8-bit write-only register to control calibration stop. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CADCCLBEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 38.19 CADCnCLBEDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
0	CADCnCLBEND	Calibration Stop Calibration stop condition with CADCnCLBEND Writing 1 to CADCnCLBEND when calibration is active, stops A/D calibration. Writing 1 to this bit when calibration is stopped is ignored. If calibration is terminated by CADCnCLBEND before calibration is completed, the correction value present before calibration is started is retained. Writing 0 to this bit is ignored.

38.5.7 CADCnADTCR — AD Conversion Trigger Control Register

CADCnADTCR is an 8-bit read/write register to control the Cyclic ADC.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CADCn ENDTRGE	CADCnSTTRGE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 38.20 CADCnADTCR Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1	CADCnENDTRGE	AD End Trigger Enable 0: AD end trigger n is disabled. 1: AD end trigger n is enabled. The trigger selection function is used to set the trigger source selection for AD end trigger n. For details, see Section 35, Peripheral Interconnection (PIC) .
0	CADCnSTTRGE	AD Start Trigger Enable 0: AD start trigger n is disabled. 1: AD start trigger n is enabled. The trigger selection function is used to set the trigger source selection for AD start trigger n. For details, see Section 35, Peripheral Interconnection (PIC) .

NOTE

Enable the module standby function when CADCnENDTRGE = 0 and CADCnSTTRGE = 0. For details, see **Section 38.7.2, Module Standby Function**.

38.5.8 CADCnUCR — Unit Control Register

CADCnUCR is a 32-bit read/write register to control the cyclic AD units.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31, 30	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
29	CADCnVPRSTE	Virtual Channel Pointer Reset Enable 0: The virtual channel pointer is incremented at the end of an A/D conversion by AD end trigger n or CADCnADEND. 1: The virtual channel pointer is cleared to 0 at the end of an A/D conversion by AD end trigger n or CADCnADEND.
28	CADCnRDMA	Read Gate DMA Mode This bit selects the DMA transfer request output condition. 0: A DMA transfer request is output for all A/D conversion results. 1: A DMA transfer request is output for the A/D conversion result only when CADRGTn is being asserted.
27 to 12	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

Table 38.21 CADcNUCR Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 8	CADcNDFMT[3:0]	<p>Data Format</p> <p>These bits specify the lower bits to be zero-masked (rounded in the $-\infty$ direction).</p> <p>0_H: Not masked 1_H: Lower 1 bit masked 2_H: Lower 2 bits masked 3_H: Lower 3 bits masked 4_H: Lower 4 bits masked 5_H: Lower 5 bits masked 6_H: Lower 6 bits masked 7_H: Lower 7 bits masked 8_H: Lower 8 bits masked Others: Setting prohibited</p> <p>The setting of these bits is the format of the data for the CADcNDR, DFE and GTM. For details of data format, see Section 38.5.2, CADcNDIRj — Data Supplementary Information Register j.</p>
7 to 3	—	<p>Reserved</p> <p>When read, the value after reset is returned. When writing, write the value after reset.</p>
2 to 0	CADcNVCEP[2:0]	<p>End Virtual Channel Pointer</p> <p>These bits set the end virtual channel number.</p>

NOTE

To prevent a malfunction, set CADcNUCR when CADcNADACT = 0 and CADcNCLBACT = 0 (before starting A/D conversion) and CADcNSTTRGE = 0.

38.5.9 CADCnVCPTRR — Virtual Channel Pointer Register

CADCnVCPTRR is an 8-bit read/write register to monitor the number of the virtual channels in which A/D conversion is in progress.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	CADCnVCPTR[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 38.22 CADCnVCPTRR Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	CADCnVCPTR[2:0]	A/D Conversion Ongoing Virtual Channel Number These bits output the number of virtual channels in which the A/D conversion is in progress. If a value is written to these bits while A/D conversion is not ongoing, the virtual channel number is updated and A/D conversion starts for the channel written at the next conversion start. Writing to these bits during A/D conversion is prohibited. The channel number for which A/D conversion is to be made next is retained during conversion stop or during calibration. A setting exceeding the end pointer is prohibited. When the virtual channel is switched by external trigger or CADCnADST setting, 20 register access cycles are required to update CADCnVCPTR register.

NOTE

To prevent a malfunction, set CADCnVCPTRR when CADCnADACT = 0, CADCnCLBACT = 0 (before starting A/D conversion) and CADCnSTTRGE, CADCnENDTRGE = 0. When writing to CADCnVCPTR with external trigger use, it is necessary to stop A/D conversion at the exact timing. When writing to CADCnVCPTR, set CADCnSTTRGE and CADCnENDTRGE as 0, and confirm CADCnADACT = 0, or write CADCnADEND = 1 to ensure that A/D conversion stops.

38.5.10 CADCnADSR — AD Conversion Status Register

CADCnADSR is an 8-bit read-only register that indicates the Cyclic ADC status.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CADCnCLBACT	CADCnADACT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 38.23 CADCnADSR Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
1	CADCnCLBACT	Calibration Status 0: Calibration is not ongoing. 1: Calibration is in progress.
0	CADCnADACT	A/D Conversion Status 0: A/D conversion is stopped. 1: A/D conversion is ongoing. The CADCnADACT bit is set to 1 when an A/D conversion start source is generated, and is set to 0 when the A/D conversion end source is generated. This bit is continuously set to 1 unless an A/D conversion end source is generated. (This bit is not cleared to 0 by storing in the data register.) If an A/D conversion start source is generated when CADCnADACT = 1 (where the period of CADCnADACT=0 just after the CADCnADST set is included, or the period of CADCnADACT=1 just after the CADCnADEND set is not included), the ongoing A/D conversion is stopped and A/D conversion of the next virtual channel is started. An A/D conversion end source that is generated when CADCnADACT = 0 (where the period of CADCnADACT=0 just after the CADCnADST set is not included, or the period of CADCnADACT=1 just after the CADCnADEND set is included) is ignored. About the timing of setting or clearing of CADCnADACT, see Figure 38.5 .

NOTE

Enable the module standby function when CADCnADACT and CADCnCLBACT = 0. For details, see **Section 38.7.2, Module Standby Function**.

38.5.11 CADCnUDPTRR — Unit Data Pointer Register

CADCnUDPTRR is an 8-bit read-only register that indicates the virtual channel number of CADCnUDIR.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	CADCnUDPTR[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 38.24 CADCnUDPTRR Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	CADCnUDPTR[2:0]	Unit Data Pointer These bits indicate the virtual channel number in which the latest A/D conversion result is stored.

38.5.12 ADCnUDIR — Unit Data Supplementary Information Register

CADCnUDIR is a 32-bit read-only register to output all A/D conversion results of CADCn units regardless of the selection of the virtual channel. Except for CADCnCHNUM[2:0] and CADCnUPRTY, this register is a mirror register of CADCnDIRj specified by CADCnUDPTR[3:0]. When CADCnUDIR is read, CADCnWFLG of the actual CADCnDIRj is cleared at the same time. When CADCnRDCLRE is set to 1, the CADCnDR[15:0], CADCnPRTY, and CADCnIDEF bits in CADCnDIRj register are cleared in addition to the CADCnCHNUM[2:0] and CADCnUPRTY bits in this register.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADCnCHNUM[2:0]			—	—	CADCnUIDEF	CADCnUWFLG	CADCnUPRTY	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADCnUDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.25 CADCnUDIR Register Contents

Bit Position	Bit Name	Function
31 to 29	CADCnCHNUM[2:0]	Virtual Channel Number These bits indicate the virtual channel number of CADCnUDR[15:0].
28, 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26	CADCnUIDEF	ID Error 0: An error is present. 1: No error is present.
25	CADCnUWFLG	Write Flag Setting condition Stores an A/D converted value in CADCnUDIR Clearing condition Reads CADCnUDIR or reading CADCnDIRj corresponding to CADCnUDPTR
24	CADCnUPRTY	Parity This bit indicates the even parity bit of CADCnUDR, CADCnUIDEF, and CADCnCHNUM.
23 to 16	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CADCnUDR[15:0]	All A/D converted values of CADCn are stored in these bits. The data format is the same as CADCnDIRj.

38.5.13 CADCNMPCR — Sampling Rate Control Register

CADCNMPCR is a 32-bit read/write register to set the sampling rate.

Value after reset: 0001 0707_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CADCN ODAV
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.26 CADCNMPCR Register Contents

Bit Position	Bit Name	Function
31 to 17	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
16	CADCNODAV	Output Data Averaging 0: Data is output without averaging (oversampling rate = 1) 1: Data is output with averaging (oversampling rate = 2)
15 to 0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

NOTE

To prevent a malfunction, set CADCNMPCR when CADCNADACT and CADCNCLBACT = 0 (before starting A/D conversion) and CADCNSTTRGE = 0.

38.5.14 CADcNcSFTCR — Safety Control Register

CADcNcSFTCR is an 8-bit read/write register for safety control.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CADcNcRDCLRE	—	—	—	—	CADcNcOWEIE	CADcNcPEIE	CADcNcIDEIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Table 38.27 CADcNcSFTCR Register Contents

Bit Position	Bit Name	Function
7	CADcNcRDCLRE	Read and Clear Enable 0: CADcNcDIRj (CADcNcUDIR) is not cleared by reading CADcNcDIRj (CADcNcUDIR). 1: CADcNcDIRj (CADcNcUDIR) is cleared by reading CADcNcDIRj (CADcNcUDIR). The WFLG of CADcNcDIRj (CADcNcUDIR) is cleared by reading CADcNcDIRj (CADcNcUDIR) regardless of the RDCLRE value. When CADcNcUDIR is read after CADcNcRDCLRE has been set to 1, CADcNcDIRj which corresponds with CADcNcUDPTR is also cleared at the same time. When CADcNcDIRj which corresponds with CADcNcUDPTR is read, CADcNcUDIR is also cleared at the same time.
6 to 3	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
2	CADcNcOWEIE	Overwrite Error Interrupt Enable 0: Disabled 1: Enabled The Overwrite Error Interrupt and DMA transfer using CADIn with read-gate cannot be used at the same time. Because overwrite errors occur in spite of using read gate function, using read gate function and overwrite error function at the same time is prohibited.
1	CADcNcPEIE	Parity Error Interrupt Enable 0: Disabled 1: Enabled
0	CADcNcIDEIE	ID Error Interrupt Enable 0: Disabled 1: Enabled

NOTE

To prevent a malfunction, set CADcNcSFTCR when CADcNcADACT = 0 (before starting A/D conversion) and CADcNcSTTRGE = 0.

38.5.15 CADCECR — Error Clear Register

CADCECR is an 8-bit write-only register to control error clear. This register is always read as 0.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	CADCEULEC	CADCELLEC	CADCEOWEC	CADCEPEC	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	W	W	W	W	R

Table 38.28 CADCECR Register Contents

Bit Position	Bit Name	Function
7 to 5	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
4	CADCEULEC	Upper-Limit Error Clear 0: Does not clear the upper-limit error. 1: Clears the upper-limit error.
3	CADCELLEC	Lower-Limit Error Clear 0: Does not clear the lower-limit error. 1: Clears the lower-limit error.
2	CADCEOWEC	Overwrite Error Clear 0: Does not clear the overwrite error. 1: Clears the overwrite error.
1	CADCEPEC	Parity Error Clear 0: Does not clear the parity error. 1: Clears the parity error.
0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

38.5.16 ADCnER — Error Register

ADCnER is a 32-bit read-only register that indicates errors.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADCnULE	CADCnLLE	—	—	—	CADCnULECAP[2:0]			CADCnOWE	—	—	—	—	CADCnOWECAP[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADCnPE	—	—	—	—	CADCnPECAP[2:0]			—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.29 ADCnER Register Contents (1/2)

Bit Position	Bit Name	Function
31	CADCnULE	Upper-Limit Error 0: No upper-limit error is present. 1: An upper-limit error is present. Setting condition The A/D converted value exceeds the specified upper-limit table range. Clearing condition Writing 1 to CADCnULEC When CADCnLLE is set already, CADCnULE is not set.
30	CADCnLLE	Lower-Limit Error 0: No lower-limit error is present. 1: A lower-limit error is present. Setting condition The A/D converted value exceeds the specified lower-limit table range. Clearing condition Writing 1 to CADCnLLEC When CADCnULE was set already, CADCnLLE is not set.
29 to 27	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
26 to 24	CADCnULECAP[2:0]	Upper-Limit/Lower-Limit Error Capture These bits show the virtual channel number in which an upper-limit or lower-limit error occurred. When writing 1 to CADCnULEC, these bits are cleared to 0 _H .
23	CADCnOWE	Overwrite Error 0: No overwrite error is present. 1: An overwrite error is present. Setting condition Writing the A/D converted value to CADCnDIRj.DR when CADCnWFLG = 1 Even if CADCnUDIR.CADCnUDR is overwritten when CADCnUDIR.CADCnUWFLG = 1, this bit is not set to 1 if CADCnDIRj.CADCnDR is not overwritten. Clearing condition Writing 1 to CADCnOWEC
22 to 19	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

Table 38.29 CADCnER Register Contents (2/2)

Bit Position	Bit Name	Function
18 to 16	CADCnOWECAP[2:0]	Overwrite Error Capture These bits show the virtual channel number in which an overwrite error occurred. When writing 1 to CADCnOWEC, these bits are cleared to 0 _H .
15	CADCnPE	Parity Error 0: No parity error is present. 1: A parity error is present. Setting condition A parity error is detected. Clearing condition Writing 1 to CADCnPEC
14 to 11	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	CADCnPECAP[2:0]	Parity Error Capture These bits show the virtual channel number in which a parity error occurred. When writing 1 to CADCnPEC, these bits are cleared to 0 _H . When a parity error occurred in CADCnUDIR, these bits indicate the number of CADCnCHNUM.
7 to 0	—	Reserved When read, the value after reset is returned. When writing, write the value after reset.

NOTE

The CADCnULE and CADCnOWE bits are updated when an A/D converted value is written to the CADCnDIR.

The CADCnPE bit is updated when the CADCnDIR is read.

When an AD error interrupt request is generated, read the CADCnER and check for the “1” bits in the interrupt exception handling, and then clear them to 0 by using the corresponding clear bits in the CADCnECCR.

When an error bit is not cleared and an error occurs during the next A/D conversion, the following operation takes place and the error cannot be detected or identified.

- (1) When the same error (error bit = 1) occurs:
 - No AD error interrupt request is made.
 - The relevant error bit in the CADCnER remains 1.
 - CADCnULE and CADCnLLE are treated as the same error.
- (2) When a different error (error bit = 0) occurs:
 - An AD error interrupt request is made.
 - The error bit that was generated in the previous A/D conversion remains 1 and the relevant error bit in the CADCnER is set to 1.
 - CADCnULE and CADCnLLE are treated as the same error.

38.5.17 ADCnTDLVR — Pin Level Self-Diagnosis Level Register

ADCnTDLVR is a 8-bit readable/writable register to specify pin level self-diagnosis levels.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CADCnAN3NLV	CADCnAN3PLV	CADCnAN2NLV	CADCnAN2PLV	CADCnAN1NLV	CADCnAN1PLV	CADCnAN0NLV	CADCnAN0PLV
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.30 ADCnTDLVR Register Contents

Bit Position	Bit Name	Function
7	CADCnAN3NLV	Pin Level Self-Diagnosis Level of CANn3N 0: CANn3N is discharged (ADSVSS). 1: CANn3N is charged (ADSVCC).
6	CADCnAN3PLV	Pin Level Self-Diagnosis Level of CANn3P 0: CANn3P is discharged (ADSVSS). 1: CANn3P is charged (ADSVCC).
5	CADCnAN2NLV	Pin Level Self-Diagnosis Level of CANn2N 0: CANn2N is discharged (ADSVSS). 1: CANn2N is charged (ADSVCC).
4	CADCnAN2PLV	Pin Level Self-Diagnosis Level of CANn2P 0: CANn2P is discharged (ADSVSS). 1: CANn2P is charged (ADSVCC).
3	CADCnAN1NLV	Pin Level Self-Diagnosis Level of CANn1N 0: CANn1N is discharged (ADSVSS). 1: CANn1N is charged (ADSVCC).
2	CADCnAN1PLV	Pin Level Self-Diagnosis Level of CANn1P 0: CANn1P is discharged (ADSVSS). 1: CANn1P is charged (ADSVCC).
1	CADCnAN0NLV	Pin Level Self-Diagnosis Level of CANn0N 0: CANn0N is discharged (ADSVSS). 1: CANn0N is charged (ADSVCC).
0	CADCnAN0PLV	Pin Level Self-Diagnosis Level of CANn0P 0: CANn0P is discharged (ADSVSS). 1: CANn0P is charged (ADSVCC).

NOTE

To prevent a malfunction, set ADCnTDLVR when ADCnADACT = 0 (before starting A/D conversion) and ADCnSTTRGE = 0.

38.5.18 CADCnULTBR0/1/2/3 — Upper-Limit/Lower-Limit Table Register 0/1/2/3

CADCnULTBR0 to CADCnULTBR3 are 32-bit readable/writable registers to set upper-limit and lower-limit values of A/D converted values.

Value after reset: 7FFF 8000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CADCnULMTB[15:0]															
Value after reset	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CADCnLLMTB[15:0]															
Value after reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.31 CADCnULTBR0/1/2/3 Register Contents

Bit Position	Bit Name	Function
31 to 16	CADCnULMTB[15:0]	<p>Upper-Limit Table</p> <p>These bits specify the upper-limit value of the A/D converted value. When the following condition is met, CADCnULE (upper-limit error) is set to 1.</p> <p style="padding-left: 20px;">ULMTB[15:0] < A/D converted value</p> <p>The ULMTB[15:0] format is the same as the DR format. For unsigned format, the value is compared as unsigned. A/D converted values are compared by using the values before they are masked by DFMT[3:0].</p>
15 to 0	CADCnLLMTB[15:0]	<p>Lower-Limit Table</p> <p>These bits specify the lower-limit value of the A/D converted value. When the following condition is met, CADCnLLE (lower-limit error) is set to 1.</p> <p style="padding-left: 20px;">LLMTB[15:0] > A/D converted value</p> <p>The LLMTB[15:0] format is the same as the DR format. For unsigned format, the value is compared as unsigned. A/D converted values are compared by using the values before they are masked by DFMT[3:0].</p>

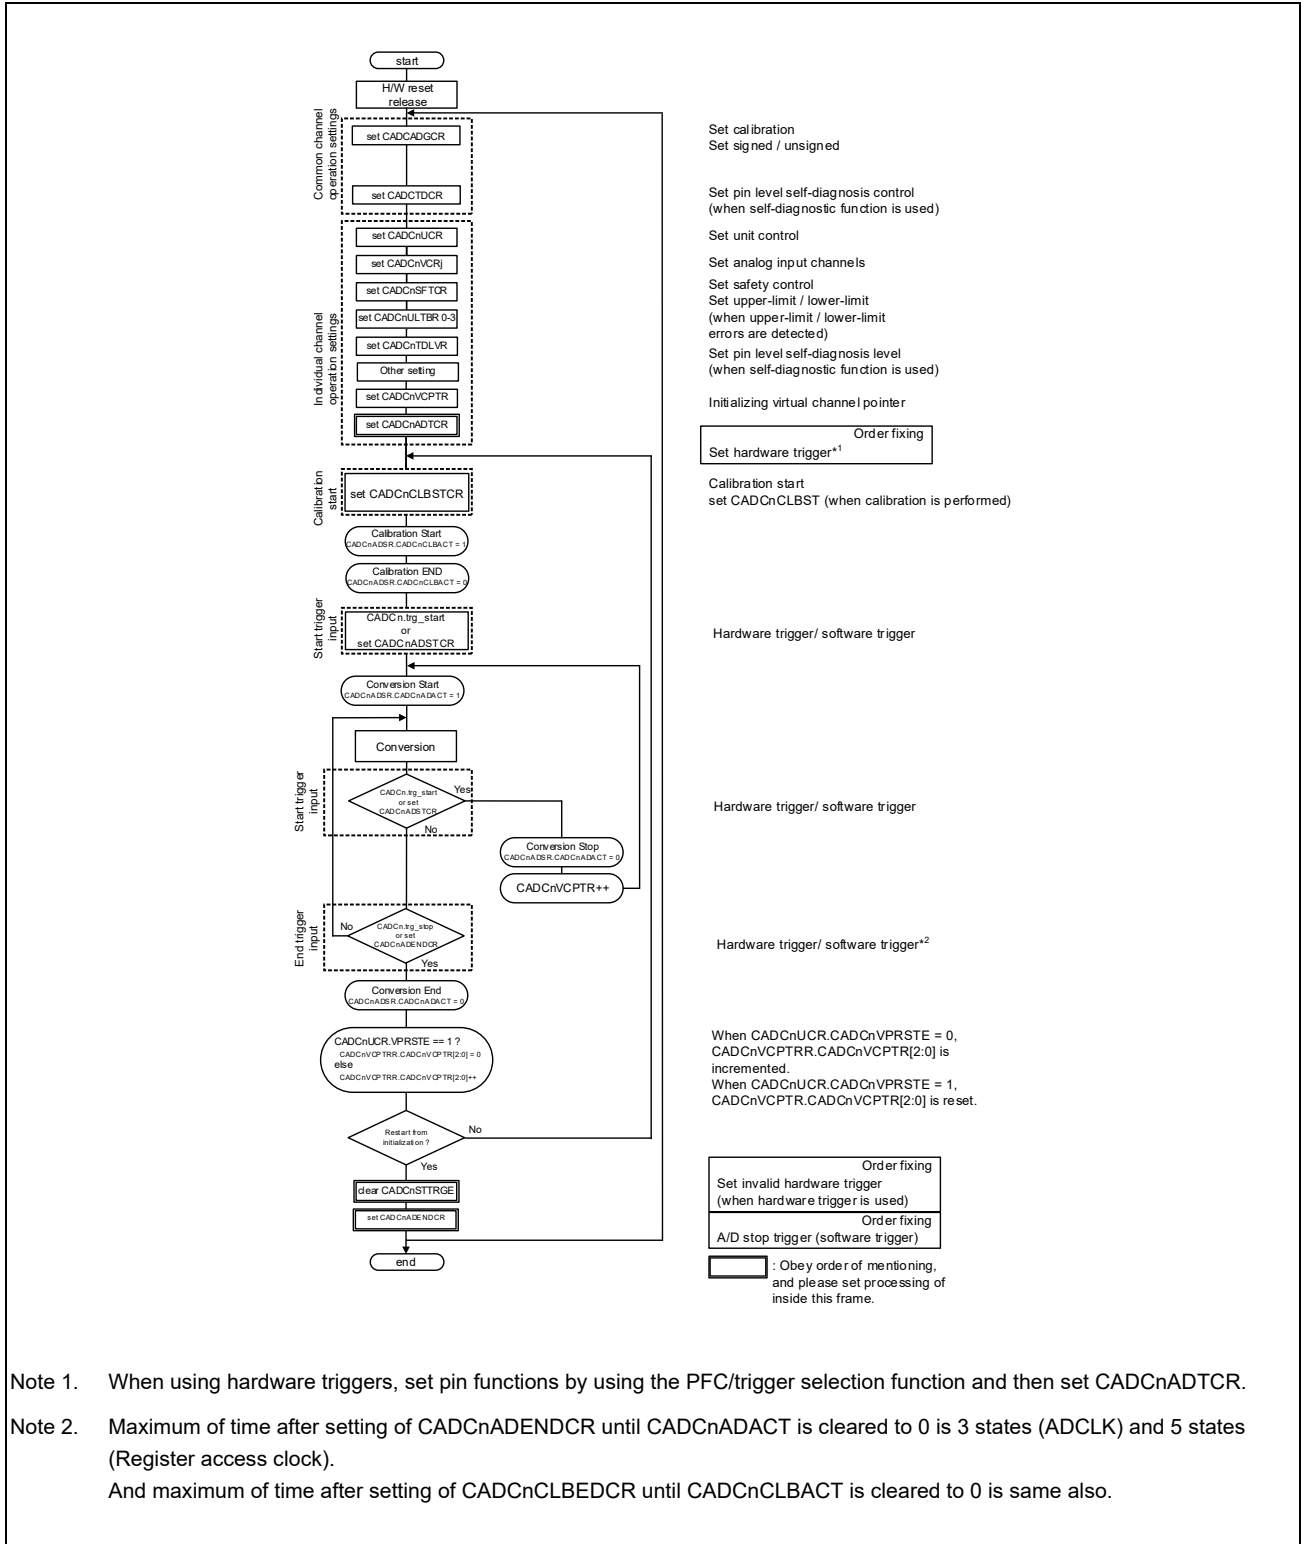

NOTE

To prevent a malfunction, set CADCnULTBR0/1/2/3 when CADCnADACT = 0 (before starting A/D conversion) and CADCnSTTRGE = 0.

38.6 Operation

38.6.1 A/D Conversion Flow

The Cyclic ADC starts A/D conversion by setting the registers shown in **Figure 38.4**.

- Note 1. When using hardware triggers, set pin functions by using the PFC/trigger selection function and then set CADChADTCR.
- Note 2. Maximum of time after setting of CADChADENDCR until CADChADACT is cleared to 0 is 3 states (ADCLK) and 5 states (Register access clock).
And maximum of time after setting of CADChCLBEDCR until CADChCLBACT is cleared to 0 is same also.

Figure 38.4 A/D Conversion Flow

38.6.2 A/D Conversion time

The Cyclic ADC starts A/D conversion processing immediately after the ADST bit in ADSTCR is set to 1.

Figure 38.5 shows the A/D conversion start timing and end timing. **Figure 38.6** and **Figure 38.7** show the budget of A/D conversion processing. The first A/D processing time (t_{AD}) includes the A/D conversion start delay time (t_D), the internal stabilization time (t_W), and the result calculation processing delay time (t_{DF}). Subsequent A/D conversion processing time (t_{AD}) is the sampling period (t_S). **Table 38.32** shows A/D conversion processing time.

A/D conversion processing time (t_{AD}) is calculated by the following formula.

$$\text{First A/D processing time } t_{AD} = t_D + t_W + t_{DF}$$

$$\text{Subsequent A/D processing time } t_{AD} = t_S$$

Table 38.32 Conversion Time (When Register Access Clock = 40 MHz, ADCLK = 80 MHz, Unit: Register Access Clocks)

Item	Without averaging	With averaging
t_{AD}	907 to 913	927 to 933
t_D	18 to 22	18 to 22
t_W	840.5 to 842.5	840.5 to 842.5
t_{DF}	48.5	68.5
t_S	20	40

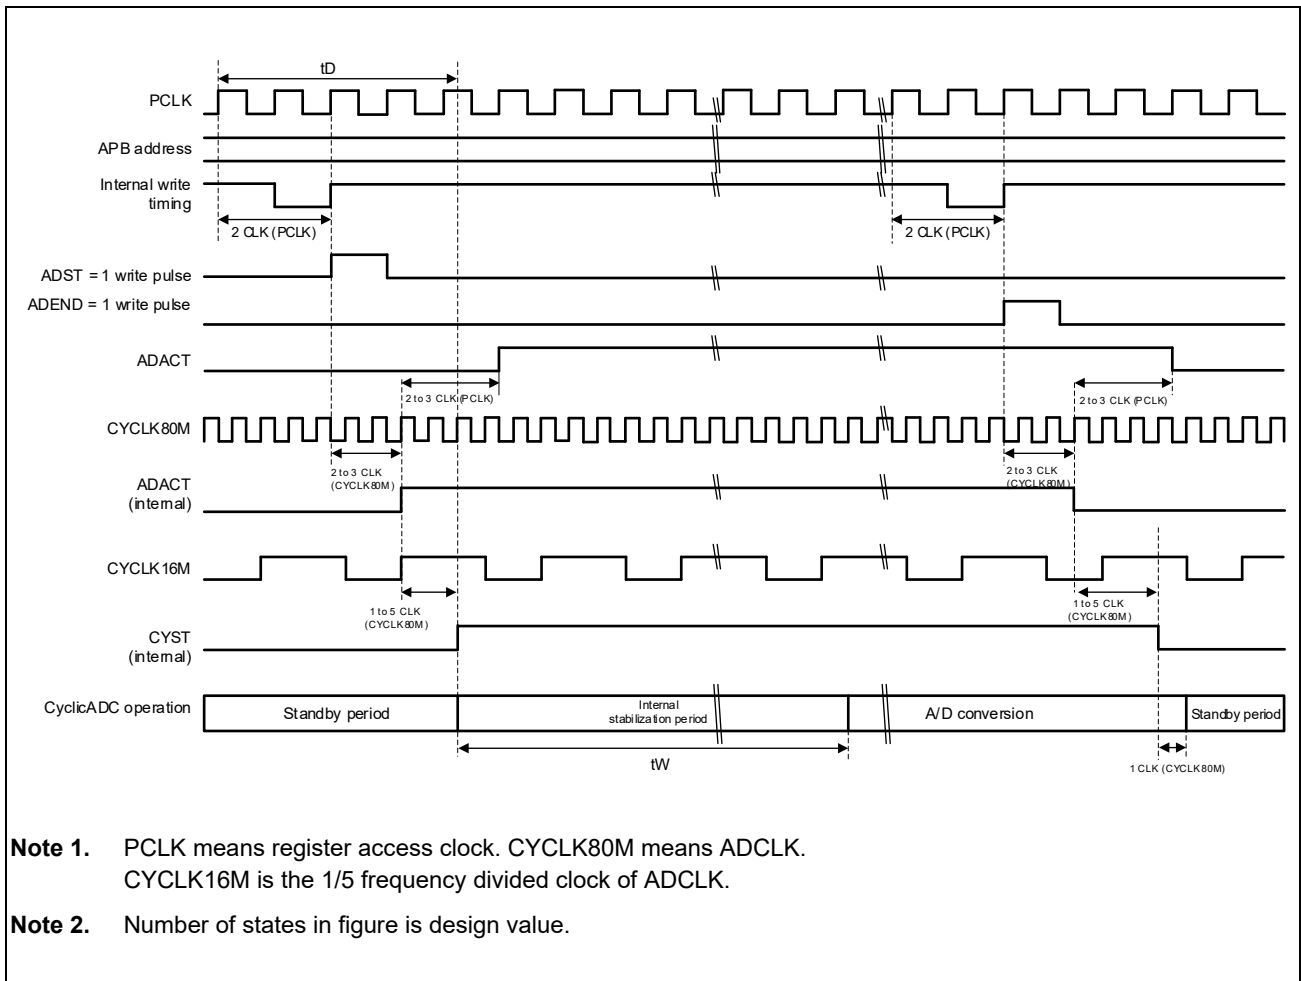

Figure 38.5 A/D Conversion Start and End

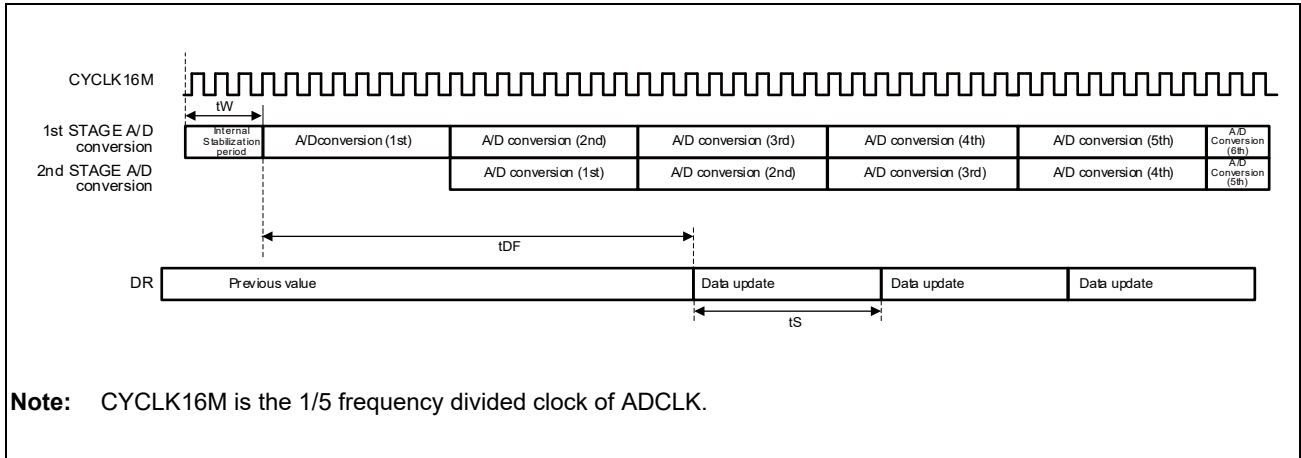

Figure 38.6 Budget of A/D Conversion Processing (CADCnODAV = 0)

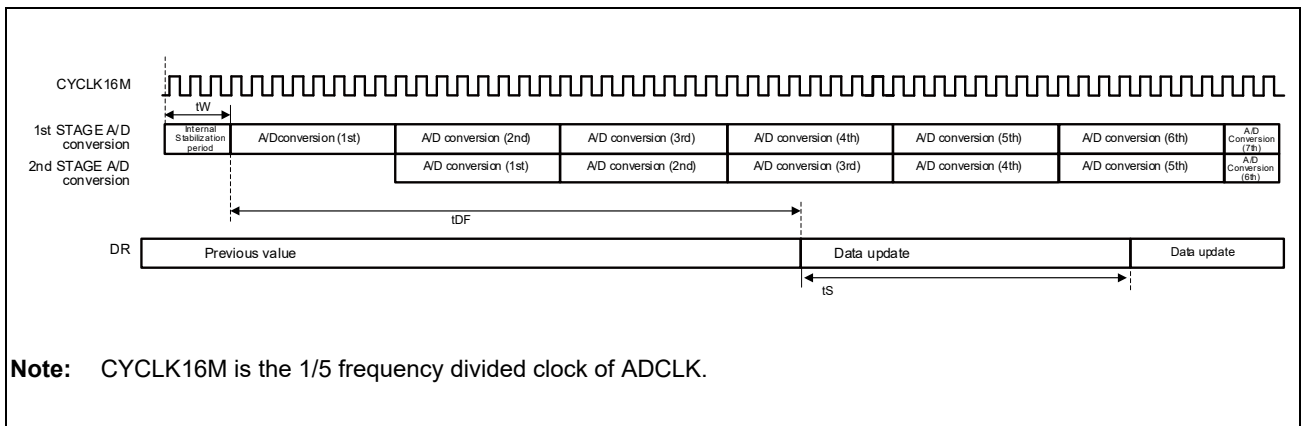

Figure 38.7 Budget of A/D Conversion Processing (CADCnODAV = 1)

38.6.3 Starting an A/D Conversion by External Triggers

A CADC_n A/D conversion can be started by a CADTRG_n input. To start a CADC_n by a CADTRG_n, input a high level to CADTRG_n, and then set CADC_nSTTRGE in CADC_nADTCR to 1. When a low level is input to CADTRG_n in this state, the CADC_n detects a pulse falling edge and sets CADC_nADACT to 1.

Figure 38.8 shows the external trigger input timing. CADC_nADACT is set to 1 in 3 to 4 states of the ADCLK and 2 to 3 states of the register access clock after the CADTRG_n falling edge is sampled.

The timing after CADC_nADACT is set to 1 until CADC_n is started is the same as when the CADC_nADST is set to 1 by the software. For pin functions, see **Section 2, Pin Function**. For selecting the AD start trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

Figure 38.8 External Trigger Input Timing

38.6.4 Terminating an A/D Conversion via an External Trigger

A ADCn conversion can be terminated via a CADTRGn input. To terminate a ADCn conversion via a CADTRGn, set pin functions by using the PFC (pin function controller) and select the AD end trigger n source by using the trigger selection function. Input a high level to CADTRGn, and then set CADCnENDTRGE in CADCnADTCR to 1. When a low level is input to CADTRGn in this state, ADCn detects a pulse falling edge and clears CADCnADACT to 0 to terminate the ADCn conversion.

CADCnADACT is cleared to 0 in 3 to 4 states of the ADCLK and 2 to 3 states of the register access clock after the CADTRGn falling edge is sampled.

For pin functions setting, see **Section 2, Pin Function**. For selecting AD end trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

To terminate A/D conversion via an external trigger, input an external trigger when CADCnADACT = 1. If an external trigger is input when CADCnADACT = 0, the external trigger is ignored.

38.6.5 Starting an A/D Conversion via a Timer Trigger

A ADCn conversion can be started via an arbitrary timer trigger. To start a ADCn conversion via a timer trigger, select a timer trigger as an AD start trigger n source by using the trigger selection function. Set CADCnSTTRGE in CADCnADTCR to 1.

When the selected timer trigger is input in this state, CADCnADACT is set to 1. The timing after CADCnADACT is set to 1 until the ADCn conversion is started is the same as the case where CADCnADST is set to 1 by the software.

For selecting the AD start trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

To stop ADCn conversion, write 1 to CADCnADEND.

38.6.6 Terminating an A/D Conversion via a Timer Trigger

A ADCn conversion can be terminated via an arbitrary timer trigger. To terminate a ADCn conversion via a timer trigger, select a timer trigger as an AD end trigger n source by using the trigger selection function. Set CADCnENDTRGE in CADCnADTCR to 1.

When the selected timer trigger is input in this state, CADCnADACT is cleared to 0 to terminate ADCn.

For selecting the AD end trigger n source, see **Section 35, Peripheral Interconnection (PIC)**.

To terminate A/D conversion via a timer trigger, input a timer trigger when CADCnADACT = 1. If a timer trigger is input when CADCnADACT = 0, the timer trigger is ignored.

38.6.7 Switching Virtual Channels via Start and End Triggers

When the CADCNVCEP[2:0] bits in the CADCNUCR register are set to a channel other than 0, they are incremented (+) at each input of an external trigger (start trigger or stop trigger) or a software trigger (start trigger or stop trigger) during A/D conversion. Virtual channels can be sequentially switched from CADCNVCR0 to CADCNVCRj (j = CADCNVCEP[2:0] set value) for A/D conversion by inputting a trigger continuously at constant intervals over ADCLK x 1 cycle from the external timer. In addition, when start or end pulse inputting interval is less than ADCLK x 1 cycle, switching virtual channels cannot operate correctly. When CADCNVPRSTE is set to 1, virtual channels always return to CADCNVCR0 at a stop trigger. By using this operation, an A/D conversion can also be started from any CADCNVCRj by continuously generating a start trigger after a stop trigger. If a trigger is input during A/D conversion of the channel set by CADCNVCEP[2:0], the channel returns to CADCNVCR0 again, and then A/D conversion is performed.

Figure 38.9 to Figure 38.11 show examples of normal virtual channel switching made by a start trigger and an end trigger.

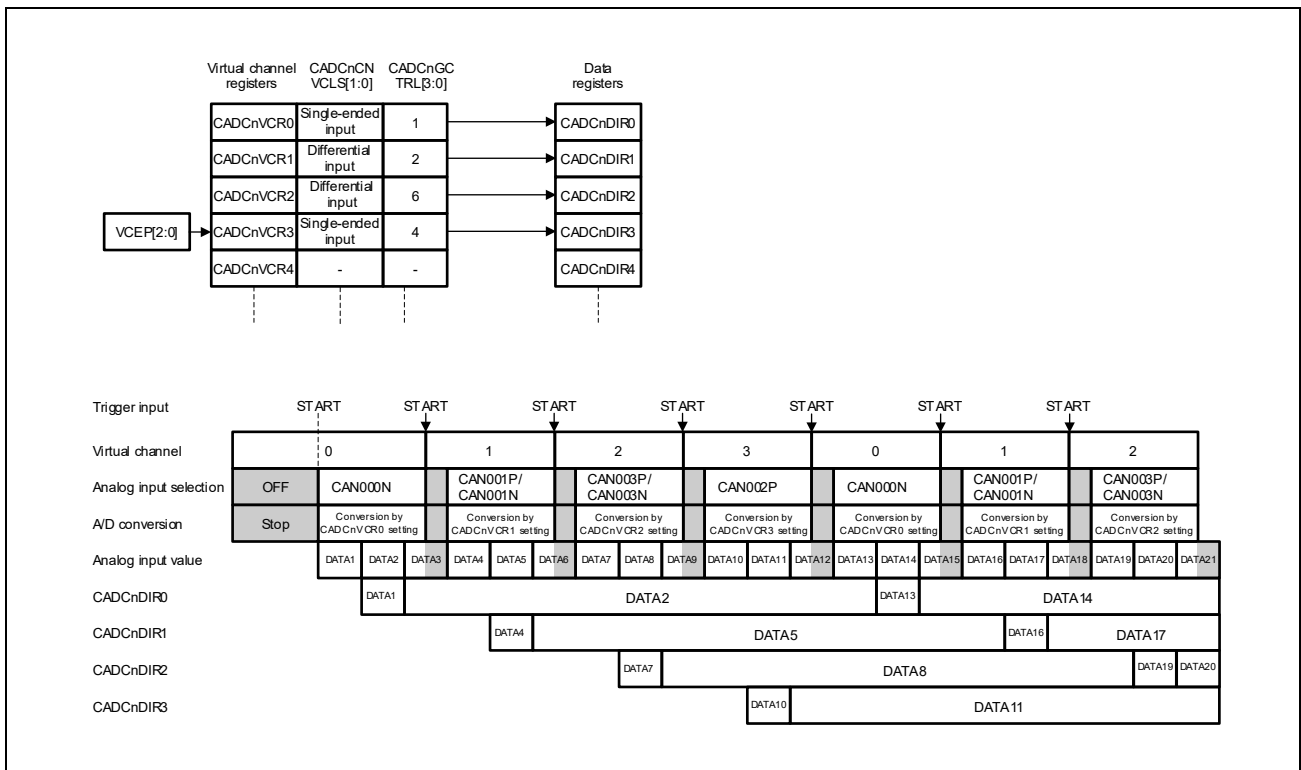

Figure 38.9 Switching Virtual Channels via a Start Trigger

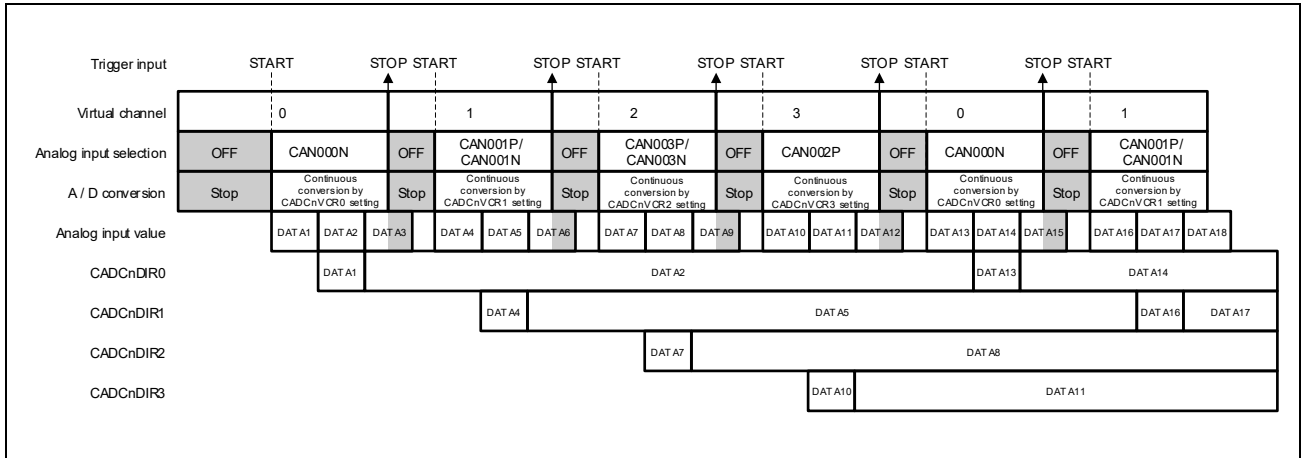

Figure 38.10 Switching Virtual Channels via an End Trigger (VPRSTE = 0)

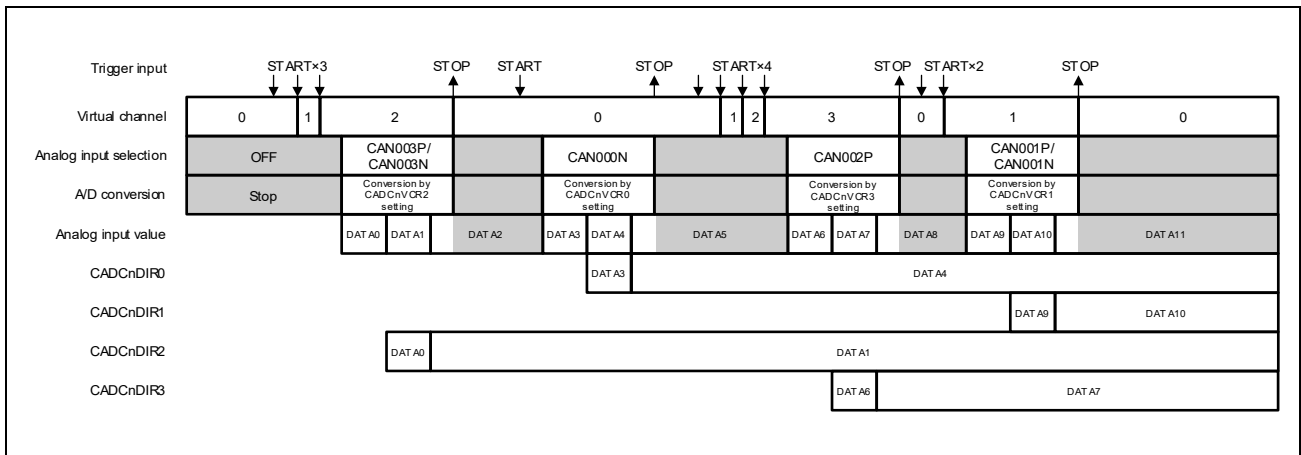

Figure 38.11 Switching Virtual Channels via an End Trigger (VPRSTE = 1)

38.6.8 A/D Conversion Monitoring Function Using Monitor Pins

A/D conversion of the $CADC_n$ can be monitored by the $CADEND_n$. $CADEND_n$ pins directly output $CADC_nADACT$ of unit n . For the pin settings, see **Section 2, Pin Function**.

Figure 38.12 shows an example of A/D conversion monitor pin output.

Figure 38.12 Example of A/D Conversion Monitor Pin Output

38.6.9 DMA Request Sources

The Cyclic ADC generates DMA request sources (CADIn) to activate the DMAC (without generating an interrupt to the INTC). When the CADnADIE in CADnVCRj is set to 1, the CADIn is output at the end of the A/D conversion. When the CADnADIE in CADnVCRj is cleared to 0, the CADIn output is disabled even at the end of the A/D conversion.

For the DMAC settings, see **Section 7, sDMA Controller (sDMAC)**.

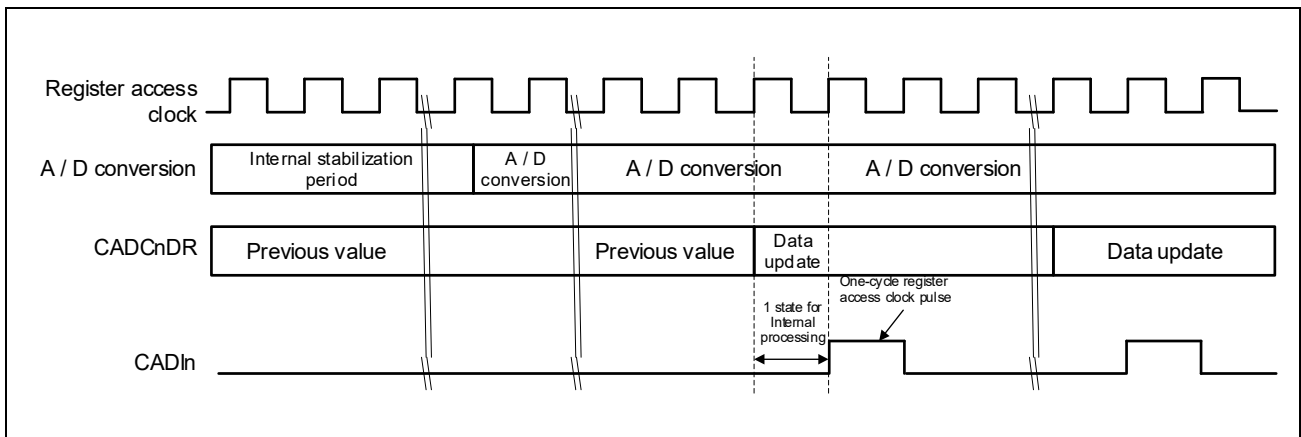

Figure 38.13 Example of DMA Request Source

38.6.10 AD Error Interrupt Request and AD Parity Error Interrupt Request

The Cyclic ADC can generate an AD error interrupt request (CADEn) to the INTC and an AD parity error interrupt request (CADPEn) to the ECM (error control module). If CADCnULEIE in CADCnVCRj, or CADCnIDEIE or CADCnOWEIE in CADCnSFTCR, is set to 1, that can be an error source, CADEn. If CADCnULEIE in CADCnVCRj, or CADCnIDEIE or CADCnOWEIE in CADCnSFTCR, is set to 0, that cannot be an error source, CADEn. When CADCnPEIE in CADCnSFTCR is set to 1, CADPEn is enabled. When CADCnPEIE is set to 0, CADPEn is disabled.

Table 38.33 Correspondence between Interrupt Sources and Interrupt Signals

Status	Interrupt Signal	Interrupt Enable
CADCnLLE	CADEn	CADCnVCRj.CADCnULEIE and CADCnVCRj.CADCnVCLLME
CADCnULE		CADCnVCRj.CADCnULEIE and CADCnVCRj.CADCnVCULME
CADCnIDE		CADCnIDEIE
CADCnOWE		CADCnOWEIE
CADCnPE	CADPEn	CADCnPEIE

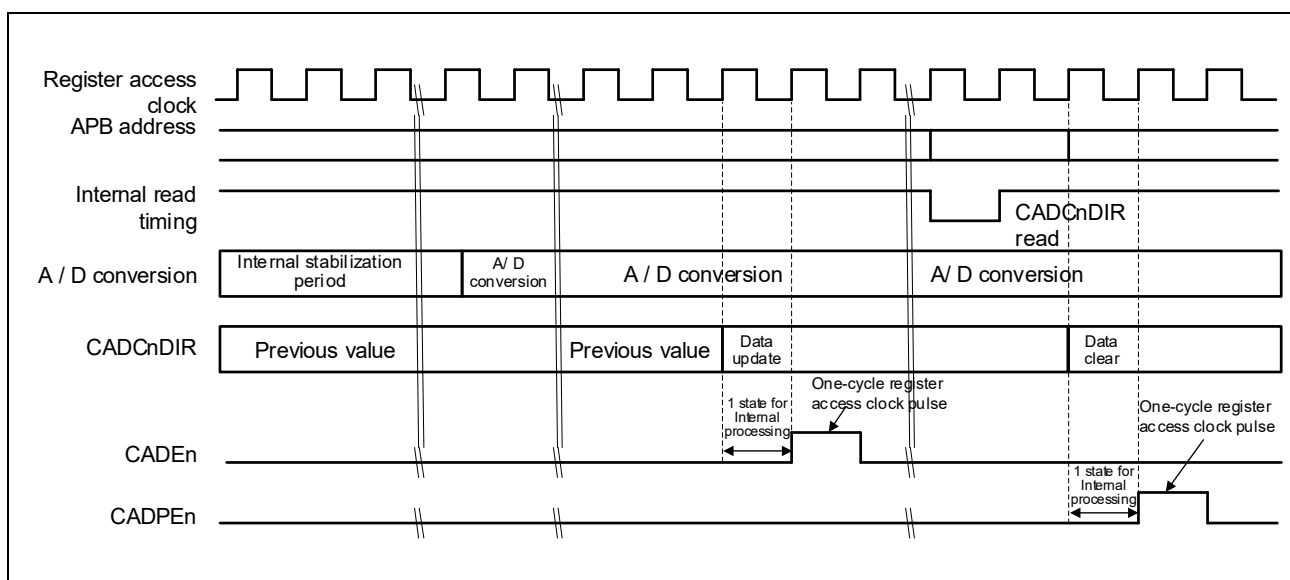

Figure 38.14 Example of AD Error Interrupt and AD Parity Error Interrupt

Upper-limit/lower-limit errors

These errors indicate that the A/D conversion results exceeded the set value.

When the comparison result between the A/D conversion result and the upper-limit/lower-limit table register value (CADCnULTBR0 to CADCnULTBR3.CADCnULMTB[15:0], CADCnLLMTB[15:0]) by CADCnVCULME and CADCnVCLLME is as follows, it is determined to be an error.

A/D conversion result > CADCnULMTB[15:0] (When upper-limit table is enabled: CADCnVCULME = 1)

A/D conversion result < CADCnLLMTB[15:0] (When lower-limit table is enabled: CADCnVCLLME = 1)

Detection of these errors is made each time the A/D conversion result is stored.

Overwrite error

This error indicates that a new A/D conversion result was overwritten to the data register before the data supplementary information register j (CADCNDIRj) was read.

When the write flag (CADCNDIRj.CADCnWFLG) in the data supplementary information register j is 1 and a new A/D conversion result is stored in the relevant data supplementary information register j (CADCNDIRj), an overwrite error is detected.

ID error

This error indicates that the physical channel set by the virtual channel register j (CADCNVCRj) is different from the physical channel upon which A/D conversion was actually performed, that is, this error indicates the occurrence of a malfunction of the analog switch in the I/O buffer.

The ID error detection result is stored in the ID Error bit in the data supplementary information register j (CADCNDIRj) corresponding to the virtual channel (CADCNVCRj) in which an ID error was detected.

The level of the feedback signal from the I/O buffer is checked.

The general control bit (CADCNVCRj.CADCnGCTRL[3:0]) value in the virtual channel register j is compared with the I/O buffer number that is actually activated. If these values do not match, an ID error is detected.

Because the I/O buffer is controlled in a one-hot manner, this error is detected also when the feedback signal is not a one-hot signal.

Either of the following are detected:

- (1) Whether the specified physical channel number does not match the activated I/O buffer number
- (2) Whether differential inputs of two or more channels or single-ended input I/O buffers are simultaneously activated during A/D conversion (one-hot error)

38.6.11 Boundary Flag Output Function

The boundary flag is a level signal that shows whether the input voltage is within the specified voltage range.

The Cyclic ADC outputs upper-limit/lower-limit error pulse signals (CADUEn, CADLEn) and a virtual channel conversion end pulse signal (CADCnVCIj) as boundary flag generating signals. A virtual channel conversion end pulse signal (CADCnVCIj) is always output in spite of CADCnADIE setting when corresponding virtual channel conversion is finished. CADUEn is output when an upper limit error is detected while CADCnVCULME is set to 1. CADLEn is output when a lower limit error is detected while CADCnVCLLME is set to 1. A boundary flag is generated by the ABFG (ADC Boundary Flag Generator). When using the boundary flag, set VCULME and VCLLME in CADCnVCRj to 1. For the ABFG, see **Section 36, Analog to Digital Converter (ADCH)**.

And after being merged*¹, a virtual channel conversion end pulse (CADCnVCIj)*² is output to the GTM as a conversion end pulse (CADCnCADCEP)*³.

Note 1. The merging method is OR.

Note 2. CADCnVCIj is output irrespective of the setting for VCULME and VCLLME in CADCnVCRj.

Note 3. CADCnCADCEP is chosen by the PIC (Peripheral Interconnection), and those are forwarded to the GTM. For details, see **Section 35, Peripheral Interconnection (PIC)**.

38.6.12 Read Gate Function

When CADCnUCR.RDMA is set to 1, CADIn is output only while CADRGTn is asserted.

Figure 38.15 shows a schematic of the DMA request circuit having a read gate from the ATU.

Figure 38.16 shows a schematic of the DMA request circuit having a read gate from the GTM.

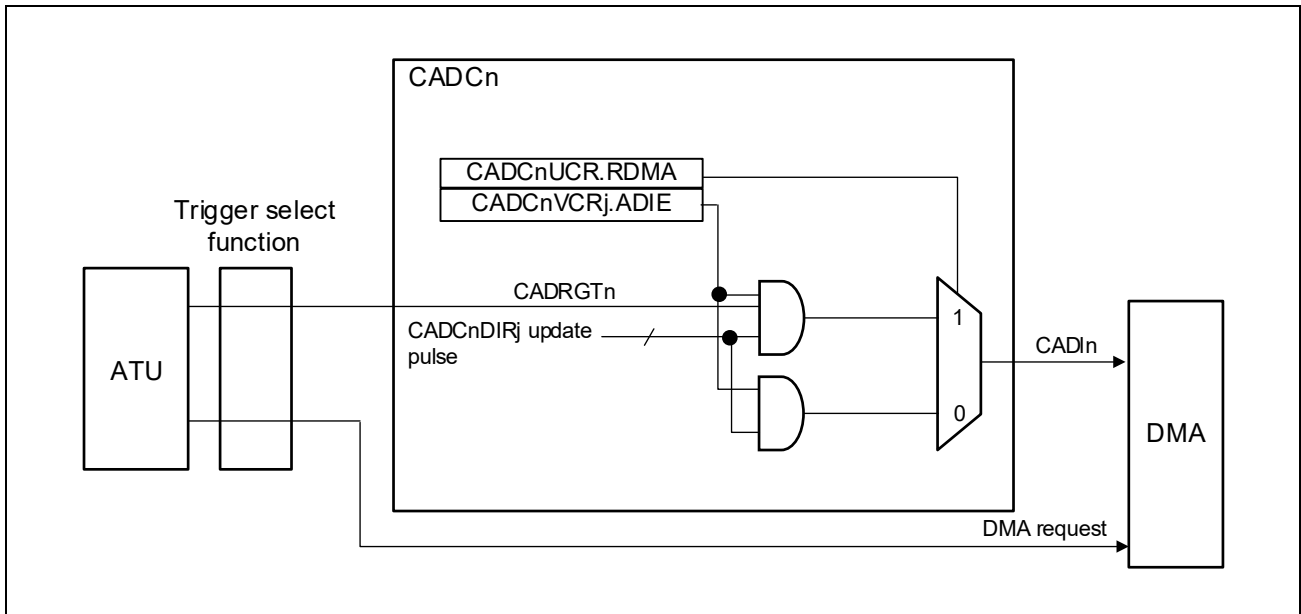

Figure 38.15 DMA Request by CADRGTn from the ATU

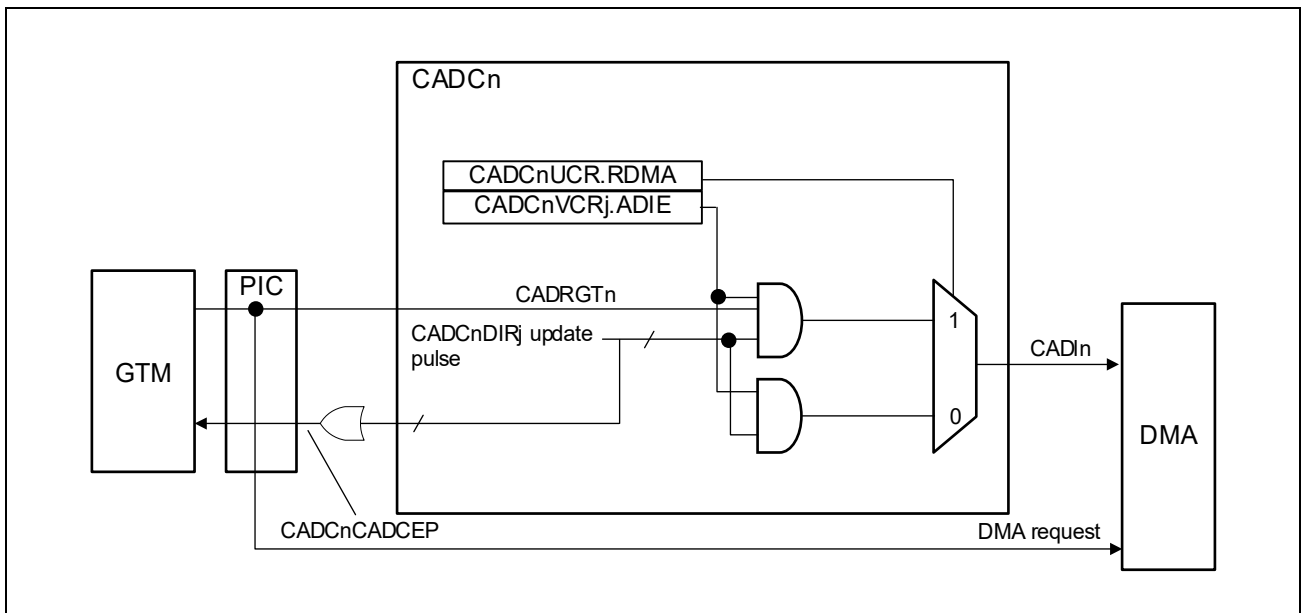

Figure 38.16 DMA Request by CADRGTn from the GTM

38.6.13 Wiring-break Detection Function

The wiring-break detection function is a function that can detect the wiring-breaks for the CAN000P-CAN003P/CAN000N-CAN003N. When A/D conversion is repeated, the conversion result attenuates to approximately 0 V and the abnormal value is detected, which means a wiring-break is detected.

This can be determined as detection of wiring-break.

It is not possible to use the wiring-break detection function simultaneously with normal A/D conversion.

Use a wiring-break detection function before normal A/D conversion is started or between normal A/D conversions.

[Feature]

- 1) Users can select desired physical channels for which wiring-break is to be detected by setting virtual channels.

[Recommended flow]

- 1) Make settings according to the initial value (see **Figure 38.4**)
- 2) Set the CADCnVCRj register for CADCnCNVCLS[1:0] = 0_H and for arbitrary physical channel by CADCnGCTRL[3:0].
- 3) Set the CADCODE bit to 1.
- 4) Execute the A/D conversion with the CADCnADST bit setting.
- 5) After repeating the A/D conversion, read the results of the A/D conversion value. When the value attenuates to approximately 0V, it is detected as a wiring-break.
- 6) Repeat steps 4) and 5) until the conversion is finished for all the channels.

38.6.14 Self-Diagnosis Function

There are three self-diagnosis functions for CADC.

38.6.14.1 Self-Diagnosis of Wiring-break Detection Function

The self-diagnosis function of wiring-break detection function is used to check that the wiring-break detection function is working normally.

Enable the wiring-break detection function and I/O buffer self-diagnosis of CAN000P-CAN003P/CAN000N-CAN003N input by CADCADGCR setting, then perform A/D conversion. When A/D conversion is repeated and the A/D conversion result attenuates to approximately 0V, wiring-break detection works correctly.

[Feature]

- 1) Users can select desired physical channels for which self-diagnosis of wiring-break detection function is performed by setting virtual channels.

[Recommended flow]

- 1) Make settings according to the initial value (see **Figure 38.4**)
- 2) Set the CADCnVCRj register for CADCnCNVCLS[1:0] = 0_H and for arbitrary physical channel by CADCnGCTRL[3:0].
- 3) Set CADCODE and CADCODDE bit to 1.
- 4) Execute the A/D conversion with the CADCnADST bit setting.
- 5) After repeating the A/D conversion, read the result of A/D conversion value. When the value attenuates to approximately 0V, it is detected as a wiring break.
- 6) Repeat steps 4) and 5) until the conversion is finished for all the channels.

38.6.14.2 A/D Converter Self-Diagnosis Function

AD self-diagnosis can check that A/D conversion is working normally. When the A/D conversion result differs from the expecting result, A/D converter have some potential of failure. The voltage value is set by setting CNVCLS[1:0] of virtual channel register j to 3_H and selecting from GCTRL[3:0]. It is possible that A/D conversion of ADSVREFH x 1, ADSVREFH x 1/2, - ADSVREFH x 1/2, - ADSVREFH x 1 or ADSVREFH x 0 is performed.

[Setting]

- 1) Make settings according to the initial value (see **Figure 38.4**)
- 2) Set CADCnCNVCLS[1:0] in the virtual channel register j (CADCnVCRj) to 3_H and set CADCnGCTRL[3:0] to select desired AD self-diagnosis voltage level.
- 3) According to the initial setting flow (see **Figure 38.4**), make the other needed setting for A/D conversion.
- 4) Execute the A/D conversion with the CADCnADST bit setting.

38.6.14.3 Pin Level Self-Diagnosis Function

Pin level self-diagnosis can check the analog input path with an A/D conversion by inputting the different voltage levels of each physical channel. When the A/D conversion result is not static, A/D converter have some potential of failure.

[Analog Input Process]

I/O Buffer to A/D Converter

[Setting]

Make the settings for A/D control register (CADCADGCR), virtual channel register j (CADCnVCRj), pin level self-diagnosis control register (CADCTDCR) and pin level self-diagnosis level register (CADCnTDLVR) according to the initial settings.

- (1) CADCADGCR

CADCODDE	CADCODE
1	0

- (2) CADCTDCR

CADCTDE
1

(3) CADCnVCRj

VCR Number	CADCnCNVCLS[1:0]	CADCnGCTRL[3:0]
N	0 _H , 1 _H , 2 _H	Physical Channel Number

(4) CADCnTDLVR

AN0PLV/AN0NLV AN1PLV/AN1NLV AN2PLV/AN2NLV AN3PLV/AN3NLV	Injecting Voltage of Physical Channel
0	ADSVSS
1	ADSVCC

Execute the A/D conversion with the A/D conversion flow.

Note 1: Set CADCODDE bit to 1 before setting the CADCTDE bit to 1.

Note 2: When CADCTDE = 1, do not set CADCODE bit to 1.

38.6.15 DFE Control

Entry to DFE or GTM is enabled by setting the ADCnDFENT bit in the ADCnVCRj register to 1.

For allocation of each ADCn and each channel of DFE, see **Section 39, Digital Filter Engine (DFE)**.

For allocation of each ADCn and each channel of GTM, see **Section 33, Generic Timer Module (GTM)**.

38.7 Usage Notes

38.7.1 Notes on Using Analog Input Pins

Do not perform an A/D conversion on the value of the same analog pin simultaneously with the Cyclic ADC and SAR-ADC. Also, do not allow the Cyclic ADC to perform A/D conversion on the value of an analog pin currently selected for digital input. This may diminish A/D accuracy.

When the Cyclic ADC is used with a single-ended input, and only the analog input pins on the P side (or N side) of a differential input are used, the analog input pins on the N side (or P side) can be used for other ADC inputs.

38.7.2 Module Standby Function

The Cyclic ADC has a module standby function.

Module standby stops the clock supply to CADC00 by setting MSRCAD.MS_CAD.

Module standby stops the clock supply to CADC (common). For the clock supply stop condition of the CADC (common), see **Table 38.34**.

Table 38.34 Clock Supply Stop Condition of CADC (common) by Module Standby

States	MSR_DAD. MS_DAD00_10	MSR_DAD. MS_DAD20_12	MSR_DAD. MS_DAD13_11	MSR_DAD. MS_DAD15_14	MSR_DAD. MS_DAD22_21	MSR_CAD. MS_CAD
Clock Supply	0	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1
Clock Supply	1	0	0 or 1	0 or 1	0 or 1	0 or 1
Clock Supply	1	1	0	0 or 1	0 or 1	0 or 1
Clock Supply	1	1	1	0	0 or 1	0 or 1
Clock Supply	1	1	1	1	0	0 or 1
Clock Supply	1	1	1	1	1	0
Clock Supply Stop	1	1	1	1	1	1

To prevent a malfunction, do not set module standby mode during A/D conversion or during calibration or while A/D conversion start/end trigger is enabled. Before setting module standby mode, set the related channels as follows, and wait for 10 states of the register access clock.

- CADCnADSR.CADCnADACT = 0
- CADCnADSR.CADCnCLBACT = 0
- CADCnADTCR.CADCnENDTRGE = 0
- CADCnADTCR.CADCnSTTRGE = 0

Section 39 Digital Filter Engine (DFE)

This section contains a description of the Digital Filter Engine (DFE) and DFE FIFO.

The first part in this section describes the features specific to this product, including register base addresses and input/output signals. The subsequent sections describe the functions and registers of DFE and DFE FIFO.

39.1 Features

39.1.1 Units and Channels

This microcontroller has following number of units and channels for the Digital Filter Engine (DFE) and DFE FIFO.

Table 39.1 Number of Units for DFE

Product Name	RH850/E2x-FCC2	
	468 Pins	373 Pins
Number of Units	2	2
Unit Name	DFEj (j = 0,1)	DFEj (j = 0,1)

Product Name	RH850/E2UH	
	468 Pins	373 Pins
Number of Units	2	2
Unit Name	DFEj (j = 0,1)	DFEj (j = 0,1)

Product Name	RH850/E2H	
	468 Pins	373 Pins
Number of Units	2	2
Unit Name	DFEj (j = 0,1)	DFEj (j = 0,1)

Table 39.2 Number of Units for DFE FIFO

Product Name	RH850/E2x-FCC2	
	468 Pins	373 Pins
Number of Units	1	1
Unit Name	DFE FIFO	DFE FIFO

Product Name	RH850/E2UH

Number of Units	1	1
Unit Name	DFE FIFO	DFE FIFO

Product Name	RH850/E2H	
	468 Pins	373 Pins
Number of Units	1	1
Unit Name	DFE FIFO	DFE FIFO

Table 39.3 Number of Channels

DFEj	Number of Channels
DFE0	16
DFE1	4

Table 39.4 Index

Index	Description
j	The individual DFE units are identified by the index “j” (j = 0, 1).

39.1.2 Register Base Address

The DFE and DFE FIFO base addresses are listed in the following table.

The DFE and DFE FIFO register addresses are given as offsets from the base address.

Table 39.5 Register Base Address

Base Address Name	Base Address	Bus Group
<DFE0_base>	FFBF 0000 _H	Peripheral Group 5
<DFE1_base>	FFBF 4000 _H	Peripheral Group 5
<DFE_FIFO_base>	FFBF 8000 _H	Peripheral Group 5

39.1.3 Clock Supply

The DFE and DFE FIFO clock supplies are shown in the following table.

Table 39.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
DFEj	PCLKHIN	CLK_UHSB
	PCLKLIN	CLK_HSB
DFE FIFO	PCLKLIN	CLK_HSB

Note: j = 0, 1

39.1.4 Interrupt Requests

The DFE and DFE FIFO interrupt requests are listed in the following table.

Table 39.7 Interrupt Requests (1/2)

Interrupt Symbol Name	Unit Interrupt Signal	Outline	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
DFE0					
INTDFE0DOUTCND0	INTDFE0DOUT[0]	CH0 output data interrupt	309	group0-64	group0-64
	INTDFE0CND0[0]	CH0 condition match interrupt 0			
INTDFE0DOUTCND1	INTDFE0DOUT[1]	CH1 output data interrupt	310	group0-65	group0-65
	INTDFE0CND0[1]	CH1 condition match interrupt 0

INTDFEFIFOERR	INTDFEFIFOERR	Error interrupt	321	—	—

NOTE

INTDFEFIFOERR is merged with INTDFE0ERR

39.1.5 Reset Sources

The DFE and DFE FIFO reset sources are listed in the following table. DFE and DFE FIFO are initialized by these reset sources.

Table 39.8 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	Module Reset	JTAG Reset
DFE0	All registers	✓	✓	✓	✓	—	—
DFE1	All registers	✓	✓	✓	✓	—	—
DFE FIFO	All registers	✓	✓	✓	✓	—	—

39.1.6 External Input/Output Signals

DFE_j (j = 0, 1) and DFE FIFO have no external input/output signals.

39.2 Overview

39.2.1 Features

- Incorporates a 16- or 4-channel FIR and IIR digital filter unit in a DFE IP (A 64-tap FIR filter can be selected only with even-numbered channels).
- Filter coefficients and data are stored in the on-chip RAM.
- Incorporates an accumulation circuit (for accumulation processing or decimation processing for filtered data) and a peak-hold circuit (for peak hold processing or comparison processing).
- Subtraction circuit is incorporated for subtraction on output data from two channels.
- Peak-Hold circuit is incorporated for peak holding and comparison
- With the peak-holding function, either upper peaks or lower peaks can be selected.
- On a single arbitrary channel, three different peak values can be detected and held during a single Peak-Hold process.
- Generates an interrupt request if the comparison calculation result is true.
- Inputs converted data from the on-chip A/D converter*1.
- Two types of FIFOs can be used: 8-input 8-stage buffer and 1-input 8-stage buffer.

Note 1. In this section, ADCH, DSADC and CADC are called SAR-ADC, DS-ADC and C-ADC, respectively.

39.2.2 Overall Configuration

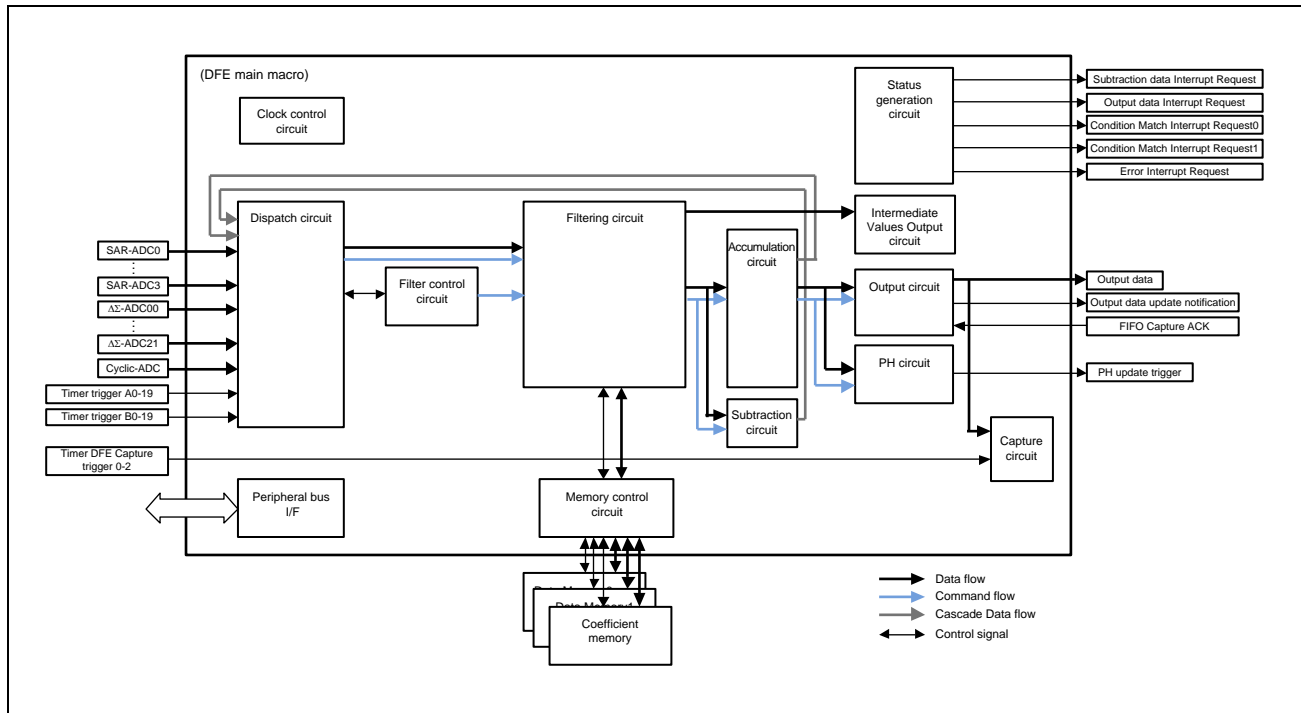

Figure 39.1 Overall Configuration of the DFE

The digital filter engine (DFE) is able to execute 20-channel filter processing on a time-division basis. FIR (up to 64 taps) or IIR (up to 6 stages) is selectable as a filter algorithm. When data is transferred from the A/D converter via private bus or is written to the software data input register through peripheral bus, the DFE executes FIR/IIR filter processing automatically. In normal mode, all filter processing results are stored in the output data register. In decimation mode, output data is stored in the output data register once every fourth filter processing cycle, for example. When data is stored in the output data register, an interrupt request can be issued. Furthermore, the digital filter processing result can be input again to the filtering circuit. This process is referred to as a cascade input in these specifications.

The DFE can execute subtraction on the values of the output data registers of any two channels. The subtraction result is stored in the register as subtraction output data, similar to the output data. When data is stored in the subtraction output data register, an interrupt can be requested. The subtraction result can also be selected as a cascade input.

39.2.3 Overall Configuration of the FIFO Macro

Figure 39.2 Overall Configuration of the FIFO Macro

With the FIFO macro, it is possible to select data from up to 16 DFE0 channels and 4 DFE1 channels for a 8-input 8-stage buffer (hereinafter referred to as buffer A) or a 1-input 8-stage buffer (hereinafter referred to as buffer B), and store the data in the FIFO.

(1) Buffer A Circuit

- Simultaneously stores eight items of output data from DFE channels in the FIFO, in response to the capture trigger output from the timer. The Buffer A circuit has FIFO channels to store output data. The Buffer A circuit can have a maximum number of eight FIFO channels
- Issues the buffer A capture end interrupt request after storing the valid data in the FIFO. For details of the interrupt request issue timing, refer to **Section 39.5.27.2(1), Buffer A Capture End Interrupt Request**.
- Issues the error interrupt request caused by an overflow error if more than 8-stage data is stored in the FIFO.

(2) Buffer B Circuit

- Automatically stores data in the FIFO each time the data of the target channel is updated.
- Issues the buffer B capture end interrupt request after storing the data in the FIFO four times. For details of the interrupt request issue timing, refer to **Section 39.5.27.2(2), Buffer B Capture End Interrupt Request**.
- Issues the error interrupt request caused by an overflow error if more than 8-stage data is stored in the FIFO.

39.2.4 Data Format

Figure 39.3 Data Format

39.2.5 Filtering Circuit

39.2.5.1 FIR Filter

- Number of taps: Selectable from 8, 16, 24, 32, and 64
- Input data and coefficients: 16-bit signed fixed-point (S.15) /16-bit integer (S15)
- Intermediate values: 38-bit signed fixed-point data
- Output data: 32-bit signed fixed-point/32-bit integer
- Product-sum operation accuracy: 32 bits
- Filter processing cycles: 64 taps (no initialization) takes 50 cycles.

39.2.5.2 IIR Filter

- Number of secondary biquad stages: Selectable from 1, 2, and 3 (in the case of secondary biquad 2 or 3 stages, the gain adjustment function is selectable).
- Input data: 16-bit signed fixed-point data (S.15)
- Coefficient data format: 16-bit signed fixed-point data (S1.14)
- Intermediate data and output data: 32-bit signed fixed-point data
- Product-sum operation accuracy: 32 bits
- Filter processing cycles: Secondary biquad 3 stage (no initialization) takes 44 cycles.

39.2.6 Dispatch Circuit

The dispatch circuit accepts data to be filtered from the A/D converter and peripheral bus. It assigns the accepted data to sixteen channels, then selects data to be filtered and outputs that data to the filter circuit. The data that can be input is specified for each channel. **Table 39.9** lists the data that can be input for each channel.

Table 39.9 Data that can be Input for Each Channel

AD unit Number		SAR-ADC				DS-ADC								C-ADC	Cascade	SW		
		0	2	1	3	00	10	20	11	12	13	14	15	21	22	0	0	0

	CH3	x	x	x	x	✓	✓	✓	x	x	x	x	x	x	x	✓	✓	✓

Note: ✓: Data can be input; x: Data cannot be input

Please refer to Section ADCH, DSADC about useable AD unit.

39.2.7 Accumulation Circuit

The accumulation circuit allows absolute value calculation, accumulation, and decimation processing for filtering results of all channels. Either accumulation or decimation can be specified.

- **Absolute value:** The absolute value of each filtering result is calculated.
- **Accumulation:** Accumulation of filtering results can be obtained. The maximum accumulation count is 511. Filtering results are of the S9.22 format. After accumulation processing for the predetermined number of times has been completed, one accumulation result is sent to the next processing step.
- **Decimation:** Filtering results are decimated. If the decimation count is set to 4, for example, the filtering result is output once for every five filter processes. The maximum decimation count is 511.

39.2.8 Subtraction Circuit

The subtraction circuit can execute subtraction on the filtering results of any two channels.

The subtraction circuit outputs the subtraction output data when the filtering results of both the minuend and subtrahend channels are updated. The subtraction results are stored in the subtraction output data registers for each channel. When the data of any two channels is both input in the fixed-point format, the format of the subtraction output data can be converted to the floating-point format (IEEE754).

$$[\textit{Subtraction output data}] = [\textit{Minuend channel filtering result} - \textit{Subtrahend channel filtering result}]$$

39.2.9 Peak-Hold (PH) Circuit

The Peak-Hold circuit has the peak-holding function and a comparison function. With the Peak-Hold circuit, it is possible to specify and execute one of the peak-holding and comparison functions; and it is also possible to select both the peak-holding and comparison functions simultaneously.

The peak-hold circuit allows peak hold or comparison calculation for all channels. The peak-hold circuit can be linked to the accumulation circuit. For example, when accumulation/decimation is set with a specified count, peak hold processing or comparison calculation is executed on each specified count. When accumulation/decimation is not set, peak-hold processing or comparison calculation is executed on each filter processing cycle.

- **Peak-Hold (PH):** The peaks of filter results or the accumulation circuit output results can be held. Either the upper or lower peaks can be selected. A Peak-Hold update notification can be issued when the Peak-Hold result register of the selected channel is updated.

NOTE

The table below shows the conditions for updating the Peak-Hold result registers for the upper or lower peaks and the conditions for outputting the Peak-Hold update notification.

Peak	Function	Number Times of PH	Issue Condition
Upper peaks	PH update notification	First time*1	PH circuit input data*2 > The value of the peak-hold initial value setting register*3
		After the first time	PH circuit input data*2 > The value of the DFEjPHCHn*4
Lower peaks	PH update notification	First time*1	PH circuit input data*2 < The value of the peak-hold initial value setting register*3
		After the first time	PH circuit input data*2 < The value of the DFEjPHCHn*4

Peak	Function	Number Times of PH	Update Condition	Stored Data in DFEjPHCHn
Upper peaks	Peak-Hold Result register	First time*1	PH circuit input data*2 > The value of the peak-hold initial value setting register*3	PH circuit input data
			PH circuit input data*2 ≤ The value of the peak-hold initial value setting register*3	The value of the peak-hold initial value setting register*3
		After the first time	PH circuit input data*2 > The value of the DFEjPHCHn*4	PH circuit input data
			PH circuit input data*2 ≤ The value of the DFEjPHCHn*4	Holds the value of DFEjPHCHn
Lower peaks	Peak-Hold Result register	First time*1	PH circuit input data*2 < The value of the peak-hold initial value setting register*3	PH circuit input data
			PH circuit input data*2 ≥ The value of the peak-hold initial value setting register*3	The value of the peak-hold initial value setting register*3
		After the first time	PH circuit input data*2 < The value of the DFEjPHCHn*4	PH circuit input data
			PH circuit input data*2 ≥ The value of the DFEjPHCHn*4	Holds the value of DFEjPHCHn

Note 1. The first time means when filter processing is executed after PH initialization flag is valid.

Note 2. PH input data is the output data of the filter circuit or accumulation/decimation circuit.

Note 3. The register means one of the DFEjPHIA-DFEjPHID registers.

Note 4. These values are compared in either fixed-point format or integer format regardless of the DFEjCTLBCHn.PFMT bit setting.

- **Peak-hold index:** Indicates the round of peak-hold processing in which the peak-hold result register was updated to hold its current value.
- **Comparison:** A filter result or accumulation circuit output result is compared with the predetermined value (=, <, >, ≥, ≤) and an interrupt can be requested according to the condition matched.

The comparison value can be selected as follows.

Selectable Values to be Compared	Comparison Selected Exclusively	PH processing and Comparison Selected Simultaneously	PH23 Function
Comparison value registers A to D	OK	OK	NG*2
PH result register + α*1		NG*2	OK

Note 1. α is the value of the comparison offset value register.

Note 2. Setting the NG conditions is prohibited.

- **PH23 function:** Expansion of the PH processing. Three peaks can be held for a 1-channel filtering result or accumulation circuit output result. A PH update notification can be separately issued when the PH result register for each peak is updated.

39.2.10 Output Circuit

In the output circuit, calculation results are stored in the output data register for each channel. When accumulation or decimation is specified, an interrupt can be requested at the same time data is stored. When fixed-point format data is input, the data format can be converted to the floating-point (IEEE754) format and the data can be stored in the output data register.

39.2.11 Intermediate Values Output Circuit

Even number channels have an intermediate value output register, which holds intermediate values (values from filter calculations prior to processing for rounding) from the intermediate value output circuit. When FIR filtering is selected, the values are input in fixed-point format. Conversion to fixed or floating point (IEEE754) format for storage is available.

39.2.12 Capture Circuit

The capture circuit stores the values of the output data register in the capture result register upon receiving the output data capturing trigger. The format of the captured data conforms to the format of the output data register of the selected channel.

39.2.13 Buffer A Circuit

The buffer A circuit, incorporated in the FIFO macro, selects up to eight channels from the DFE0 and DFE1 channels and stores the values of the output data registers in the FIFO, in response to the FIFO capture triggers. The format of the output data stored in buffer A conforms to the format of the output data register of the selected channel.

39.2.14 Buffer B Circuit

The buffer B circuit, incorporated in the FIFO macro, selects one channel from the DFE0 and DFE1 channels and automatically stores the values of the output data registers in the FIFO, each time the output data register is updated. The format of the output data stored in buffer B conforms to the format of the output data register of the selected channel.

39.2.15 Terms

Table 39.10 provides definitions of terms used in this section.

Table 39.10 List of Terms (1/3)

Term	Definition in this Section
DFE operating clock	160 MHz clock to be input to the DFE
Filtering circuit	A circuit to perform FIR filtering and IIR filtering
Data to be processed	Data for which the DFE performs filter processing, including data to be input by the AD and peripheral bus and filter processing result re-entry (cascade) data
Software input	Activation of the DFE by writing data to be processed to a register from the CPU or DMA through the peripheral bus
Input data register	A register for writing data to be processed, which is provided for 16 channels
DFE activation signal	DFE processing start signal to be input to the DFE together with data to be processed
AD tag	A tag value to be input to the DFE by the AD together with data to be processed
AD data	Data to be processed and input to the DFE by the AD
AD input	AD tag or AD data or DFE activation signal to be input by the AD In figures shown in this section, AD input shows DFE activation signal to be input by the AD.
Channel tag	A tag signal specified by the DFE's control register A, which is provided for each channel
Dispatch	Writing data to be processed to an input data register Dispatch means writing data to the input data register of the matched channel through comparison between channel tag and AD tag signal after processing is started by the DFE activation signal.
Dispatch circuit	A circuit to output filtering target data to the dispatch processing and filtering circuit
Accumulation	Accumulation of filter processing result data in each channel for the count specified in the control register
Decimation	Decimation (thinning) of filter processing result data for the count specified in the control register
Accumulation circuit	A circuit to perform absolute value calculation, accumulation, and decimation for filter processing result data
Subtraction	Subtraction on two arbitrary channels
Subtraction circuit	Circuit that performs subtraction on the filtering result data of two channels for subtraction
Subtraction result register	Register that holds subtraction result values
Subtrahend flag	Subtrahend channel data input enabling bit (SUBF)
Minuend flag	Minuend channel data input enabling bit (MINF)
Peak-hold processing	Processing to hold the maximum or minimum of output data from the accumulation circuit
Peak-hold circuit	A circuit to perform peak-hold processing and comparison processing
Peak-hold result register	A register that retains the peak-hold processing result value
Peak-hold index register	A register that indicates the number of times from the beginning of peak-hold processing when the peak-hold result register value is input to the peak-hold circuit
Output circuit	A circuit to write accumulation circuit output data to the output data register and to convert accumulation circuit output data to floating-point format data and write the data to the output data register
Output data register	A register used to write data after DFE processing is completed, which is provided for 16 channels
Intermediate value output circuit	Circuit that writes the intermediate values output from the filtering circuit to the intermediate value output data register when FIR is selected.
Intermediate value output register	Register to which the intermediate value data is written.
Capture circuit	Circuit that writes the value of the output data register of the specified channel to the capture result register when a capture trigger is input.
Capture result register	Register to which the value of the specified channel output data register is written.
Buffer A circuit	Circuit that selects up to six channels from the DFE0 and DFE1 channels and stores the values of the output data registers in the FIFO, in response to the FIFO capture triggers.
Buffer B circuit	Circuit that selects one channel from the DFE0 and DFE1 channels and automatically stores the values of the output data registers in the FIFO, each time the output data is updated.

Table 39.10 List of Terms (2/3)

Term	Definition in this Section
Input data overwrite error (DIOW)	An error that occurs when new data is written to the input data register while valid data is contained in the input data register (filter processing wait state in the DFE, during filter processing, or during accumulation circuit processing)
Output data overwrite error (DOOW)	An error that occurs when new data is written to the output data register while valid data is contained in the output data register (after the DFE has written filter processing result or accumulation processing result to the output data register)
Multiplication error	An error that occurs during execution of $8000_H \times 8000_H$ in the filtering circuit
Guard error	A guard bit overflow or underflow error that occurs during execution of accumulation in the filtering circuit
Cascade error	An overflow error that occurs when the 32-bit accumulation circuit output data is rounded to 16-bit data when cascade processing is enabled
Absolute value calculation error	An error generated when $8000\ 0000_H$ is input during calculation of absolute values in the accumulation circuit
Timer trigger	Triggers to which timer trigger A/B from the timer (GTM or ATU) were allotted as the function of "PH initialization", "PH Mask Start/End", "Addition/Decimation Initialization/Prohibition" or "Subtraction Start/End". Please see section PIC or ATU.
Software trigger	A trigger generated by writing 1 to the software trigger register from the CPU or DMA
Trigger flag	There are nine flags: accumulation/decimation initialization flag, accumulation/decimation disable flag, peak-hold initialization flag, peak-hold end flag, peak-hold mask start flag, peak-hold mask end flag, subtraction starting flag, subtraction ending flag, and filter initialization flag, which are generated by the DFE at a timer trigger, software trigger, or trigger setting register (control register in the DFE)
Accumulation/decimation initialization flag	A trigger flag that functions as an accumulation initialization flag when accumulation is specified or as a decimation initialization flag when decimation is specified, which is used to initialize the counter in the accumulation circuit.
Accumulation/decimation disable flag	A trigger flag that functions as an accumulation disable flag when accumulation is specified or as a decimation disable flag when decimation is specified, which stops the counter in the accumulation circuit and disables accumulation processing and decimation processing without updating output data after execution
Peak-hold(PH) initialization flag	A trigger flag that is enabled when peak-hold (PH) operation is specified, which is used to initialize the counter in the peak-hold (PH) circuit.
Peak-hold(PH) end flag	A trigger flag that is enabled when peak-hold (PH) operation is specified, which is a command to terminate peak-hold (PH) processing
Peak-hold (PH) mask starting flag	One of the trigger flags. Enabled when PH is specified. Stops a PH process when a PH operation is in progress.
Peak-hold (PH) mask ending flag	One of the trigger flags. Enabled when PH is specified. Restarts the PH process that has been stopped by the PH mask starting flag.
Filter initialization flag	A trigger flag to performed adding the initialization sequence to the initialization for the address pointer used in filter processing and normal filter processing.
Subtraction starting flag	One of the trigger flags. Enabled when the subtraction circuit is enabled, and starts a subtraction process.
Subtraction ending flag	One of the trigger flags. Enabled when the subtraction circuit is enabled, and ends a subtraction process.
Interrupt request	An interrupt to request activation of the interrupt controller, CPU, or DMA.
Buffer A	Buffer A circuit has 8 number of 8-stage FIFOs. For each of the eight inputs, data of different DFE channels can be separately captured.
Buffer B	Incorporates one 8-stage FIFO. Data of one DFE channel can be selected.
FIFO channels	The name each peculiar to up to 8 FIFO which buffer A circuit has is defined. This is called FIFO channels.
FIFO empty	State in which no data is stored in the FIFO buffer. Specifically, the FIFO empty state is entered immediately after the FIFO is reset, and when data having been captured in the FIFO buffer is read from all the stages.
FIFO full	State in which data is stored in all of the eight stages of the FIFO buffer.
SCH	Subtraction channels used for the subtraction circuit, three channels are supported.
CCH	Capture channels used for the capture circuit. Three channels are supported.

Table 39.10 List of Terms (3/3)

Term	Definition in this Section
FCH	FIFO channels used for the buffer A circuit eight channels are supported.
Timer trigger A	Triggers that are input from the timer. In this section, these are called "Timer triggerA", "compare A" or "compare match A".
Timer trigger B	Triggers that are input from the timer. In this section, these are called "Timer triggerB", "compare B" or "compare match B".
Timer DFE Capture trigger	Triggers that are input from the timer. In this section, these are called "Timer DFE Capture trigger" or "DFE Timer capture trigger".
Timer FIFO Capture trigger	A trigger that is input from the timer.
PH update notification	Triggers that are output to the timer. In this section, these are called "PH update trigger" or "PH update notification".

39.3 Control Registers

39.3.1 List of Registers for DFE Macro

Table 39.11 lists registers and memory addresses of the DFE macro. 8, 16 or 32-bit write access to all registers is possible. 32-bit read access to all registers is possible. 32-bit write access to the coefficient memory is possible, and upper 16-bit or lower 16-bit or 32-bit write access to the data memory is possible.

Table 39.11 List of Registers for DFE Macro (1/9)

Module Name	Register Name	Symbol	Address	Access Size	Access Protect
DFE0					
DFE0	Control Register A (Channel 0)	DFE0CTLACH0	<DFE0_base> + 0000 _H	8, 16, 32	—
DFE0	Control Register A (Channel 1)	DFE0CTLACH1	<DFE0_base> + 0004 _H	8, 16, 32	—
DFE0	Control Register A (Channel 2)	DFE0CTLACH2	<DFE0_base> + 0008 _H	8, 16, 32	—
DFE0	Control Register A (Channel 3)	DFE0CTLACH3	<DFE0_base> + 000C _H	8, 16, 32	—
DFE0	Control Register A (Channel 4)	DFE0CTLACH4	<DFE0_base> + 0010 _H	8, 16, 32	—
DFE0	Control Register A (Channel 5)	DFE0CTLACH5	<DFE0_base> + 0014 _H	8, 16, 32	—
DFE0	Control Register A (Channel 6)	DFE0CTLACH6	<DFE0_base> + 0018 _H	8, 16, 32	—
DFE0	Control Register A (Channel 7)	DFE0CTLACH7	<DFE0_base> + 001C _H	8, 16, 32	—
DFE0	Control Register A (Channel 8)	DFE0CTLACH8	<DFE0_base> + 0020 _H	8, 16, 32	—
DFE0	Control Register A (Channel 9)	DFE0CTLACH9	<DFE0_base> + 0024 _H	8, 16, 32	—
DFE0	Control Register A (Channel 10)	DFE0CTLACH10	<DFE0_base> + 0028 _H	8, 16, 32	—
DFE0	Control Register A (Channel 11)	DFE0CTLACH11	<DFE0_base> + 002C _H	8, 16, 32	—
DFE0	Control Register A (Channel 12)	DFE0CTLACH12	<DFE0_base> + 0030 _H	8, 16, 32	—
DFE0	Control Register A (Channel 13)	DFE0CTLACH13	<DFE0_base> + 0034 _H	8, 16, 32	—
DFE0	Control Register A (Channel 14)	DFE0CTLACH14	<DFE0_base> + 0038 _H	8, 16, 32	—
DFE0	Control Register A (Channel 15)	DFE0CTLACH15	<DFE0_base> + 003C _H	8, 16, 32	—
DFE0	Control Register B (Channel 0)	DFE0CTLBCH0	<DFE0_base> + 0040 _H	8, 16, 32	—
DFE0	Control Register B (Channel 1)	DFE0CTLBCH1	<DFE0_base> + 0044 _H	8, 16, 32	—
DFE0	Control Register B (Channel 2)	DFE0CTLBCH2	<DFE0_base> + 0048 _H	8, 16, 32	—
DFE0	Control Register B (Channel 3)	DFE0CTLBCH3	<DFE0_base> + 004C _H	8, 16, 32	—
DFE0	Control Register B (Channel 4)	DFE0CTLBCH4	<DFE0_base> + 0050 _H	8, 16, 32	—
DFE0	Control Register B (Channel 5)	DFE0CTLBCH5	<DFE0_base> + 0054 _H	8, 16, 32	—
DFE0	Control Register B (Channel 6)	DFE0CTLBCH6	<DFE0_base> + 0058 _H	8, 16, 32	—
DFE0	Control Register B (Channel 7)	DFE0CTLBCH7	<DFE0_base> + 005C _H	8, 16, 32	—
DFE0	Control Register B (Channel 8)	DFE0CTLBCH8	<DFE0_base> + 0060 _H	8, 16, 32	—
DFE0	Control Register B (Channel 9)	DFE0CTLBCH9	<DFE0_base> + 0064 _H	8, 16, 32	—
DFE0	Control Register B (Channel 10)	DFE0CTLBCH10	<DFE0_base> + 0068 _H	8, 16, 32	—
DFE0	Control Register B (Channel 11)	DFE0CTLBCH11	<DFE0_base> + 006C _H	8, 16, 32	—
DFE0	Control Register B (Channel 12)	DFE0CTLBCH12	<DFE0_base> + 0070 _H	8, 16, 32	—
DFE0	Control Register B (Channel 13)	DFE0CTLBCH13	<DFE0_base> + 0074 _H	8, 16, 32	—
DFE0	Control Register B (Channel 14)	DFE0CTLBCH14	<DFE0_base> + 0078 _H	8, 16, 32	—
DFE0	Control Register B (Channel 15)	DFE0CTLBCH15	<DFE0_base> + 007C _H	8, 16, 32	—
DFE0	Output Data Register (Channel 0)	DFE0DOCH0	<DFE0_base> + 0080 _H	32	—
DFE0	Output Data Register (Channel 1)	DFE0DOCH1	<DFE0_base> + 0084 _H	32	—
DFE0	Output Data Register (Channel 2)	DFE0DOCH2	<DFE0_base> + 0088 _H	32	—
DFE0	Output Data Register (Channel 3)	DFE0DOCH3	<DFE0_base> + 008C _H	32	—
DFE0	Output Data Register (Channel 4)	DFE0DOCH4	<DFE0_base> + 0090 _H	32	—
DFE0	Output Data Register (Channel 5)	DFE0DOCH5	<DFE0_base> + 0094 _H	32	—
DFE0	Output Data Register (Channel 6)	DFE0DOCH6	<DFE0_base> + 0098 _H	32	—
DFE0	Output Data Register (Channel 7)	DFE0DOCH7	<DFE0_base> + 009C _H	32	—
DFE0	Output Data Register (Channel 8)	DFE0DOCH8	<DFE0_base> + 00A0 _H	32	—
DFE0	Output Data Register (Channel 9)	DFE0DOCH9	<DFE0_base> + 00A4 _H	32	—
DFE0	Output Data Register (Channel 10)	DFE0DOCH10	<DFE0_base> + 00A8 _H	32	—

Table 39.11 List of Registers for DFE Macro (2/9)

Module Name	Register Name	Symbol	Address	Access Size	Access Protect
DFE0	Output Data Register (Channel 11)	DFE0DOCH11	<DFE0_base> + 00AC _H	32	—
DFE0	Output Data Register (Channel 12)	DFE0DOCH12	<DFE0_base> + 00B0 _H	32	—

DFE0	IIR Filter Gain Setting Register (Channel 5)	DFE0GAINCH5	<DFE0_base> + 0394 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 6)	DFE0GAINCH6	<DFE0_base> + 0398 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 7)	DFE0GAINCH7	<DFE0_base> + 039C _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 8)	DFE0GAINCH8	<DFE0_base> + 03A0 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 9)	DFE0GAINCH9	<DFE0_base> + 03A4 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 10)	DFE0GAINCH10	<DFE0_base> + 03A8 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 11)	DFE0GAINCH11	<DFE0_base> + 03AC _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 12)	DFE0GAINCH12	<DFE0_base> + 03B0 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 13)	DFE0GAINCH13	<DFE0_base> + 03B4 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 14)	DFE0GAINCH14	<DFE0_base> + 03B8 _H	8,16,32	—
DFE0	IIR Filter Gain Setting Register (Channel 15)	DFE0GAINCH15	<DFE0_base> + 03BC _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 0)	DFE0TMTRGCH0	<DFE0_base> + 03C0 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 1)	DFE0TMTRGCH1	<DFE0_base> + 03C4 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 2)	DFE0TMTRGCH2	<DFE0_base> + 03C8 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 3)	DFE0TMTRGCH3	<DFE0_base> + 03CC _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 4)	DFE0TMTRGCH4	<DFE0_base> + 03D0 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 5)	DFE0TMTRGCH5	<DFE0_base> + 03D4 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 6)	DFE0TMTRGCH6	<DFE0_base> + 03D8 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 7)	DFE0TMTRGCH7	<DFE0_base> + 03DC _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 8)	DFE0TMTRGCH8	<DFE0_base> + 03E0 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 9)	DFE0TMTRGCH9	<DFE0_base> + 03E4 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 10)	DFE0TMTRGCH10	<DFE0_base> + 03E8 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 11)	DFE0TMTRGCH11	<DFE0_base> + 03EC _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 12)	DFE0TMTRGCH12	<DFE0_base> + 03F0 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 13)	DFE0TMTRGCH13	<DFE0_base> + 03F4 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 14)	DFE0TMTRGCH14	<DFE0_base> + 03F8 _H	8,16,32	—
DFE0	Timer Trigger Setting Register (Channel 15)	DFE0TMTRGCH15	<DFE0_base> + 03FC _H	8,16,32	—
DFE0	Comparison Offset Value Setting Register 0	DFE0CPOFST0	<DFE0_base> + 0440 _H	8,16,32	—
DFE0	Comparison Offset Value Setting Register 1	DFE0CPOFST1	<DFE0_base> + 0444 _H	8,16,32	—
DFE0	Comparison Offset Value Setting Register 2	DFE0CPOFST2	<DFE0_base> + 0448 _H	8,16,32	—
DFE0	Peak-Hold 23 Common Control Register 0	DFE0PH23CCTL0	<DFE0_base> + 0700 _H	8,16,32	—
DFE0	Peak-Hold 2 Control Register 0	DFE0PH2CTL0	<DFE0_base> + 0704 _H	8,16,32	—
DFE0	Peak-Hold 3 Control Register 0	DFE0PH3CTL0	<DFE0_base> + 0708 _H	8,16,32	—

Table 39.11 List of Registers for DFE Macro (6/9)

Module Name	Register Name	Symbol	Address	Access Size	Access Protect
DFE0	Peak-Hold 2 Result Register 0	DFE0PH20	<DFE0_base> + 0780 _H	32	—
DFE0	Peak-Hold 3 Result Register 0	DFE0PH30	<DFE0_base> + 0784 _H	32	—
DFE0	Peak-Hold 2 Index Register 0	DFE0PH2IND0	<DFE0_base> + 07E0 _H	32	—
DFE0	Peak-Hold 3 Index Register 0	DFE0PH3IND0	<DFE0_base> + 07E4 _H	32	—
DFE0	Subtraction Control Register (SCH0)	DFE0SUBCTLCH0	<DFE0_base> + 0840 _H	8,16,32	—
DFE0	Subtraction Control Register (SCH1)	DFE0SUBCTLCH1	<DFE0_base> + 0844 _H	8,16,32	—
DFE0	Subtraction Control Register (SCH2)	DFE0SUBCTLCH2	<DFE0_base> + 0848 _H	8,16,32	—
DFE0	Subtraction Result Register (SCH0)	DFE0SUBDOCH0	<DFE0_base> + 0860 _H	32	—
DFE0	Subtraction Result Register (SCH1)	DFE0SUBDOCH1	<DFE0_base> + 0864 _H	32	—
DFE0	Subtraction Result Register (SCH2)	DFE0SUBDOCH2	<DFE0_base> + 0868 _H	32	—
DFE0	Subtraction Status Register (SCH0)	DFE0SUBSTCH0	<DFE0_base> + 0880 _H	32	—
