R/W	R	R	R	R	R	R	R	R

Table 39.26 RTCAnMONC Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	RTCAnMONC [4:0]	Month of year in BCD

NOTES

1. Perform RTCAnMONC read according to flow described in **Section 39.5.1.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to month count buffer register RTCAnMONTH or to calendar count buffer register RTCAnCAL. See
   - **Section 39.5.1.1, Initial Setting of RTCA**, and
   - **Section 39.5.1.2, Updating Clock Counters.**

39.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write month counter RTCAnMONC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 28_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 39.27 RTCAnMONTH Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write value after reset.
4 to 0	RTCAnMONTH [4:0]	Month of year in BCD

NOTES

1. When writing this register, only decimal values between 01 and 12 in BCD are allowed.
2. Perform RTCAnMONTH read/write as described in
   - **Section 39.5.1.1, Initial Setting of RTCA,**
   - **Section 39.5.1.2, Updating Clock Counters**, and
   - **Section 39.5.1.3, Reading Clock Counters.**

39.3.4.13 RTCAnYEARC — RTCA Year Count Register

This register is year counter. It counts years from 00 to a maximum of 99 in BCD.

Years 00, 04, 08, …, 92, and 96 (every four years) are considered leap years.

This register counts as follows.

- It is triggered by every overflow of month counter RTCAnMONC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEARC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 39.28 RTCAnYEARC Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEARC [7:0]	Year in BCD

NOTES

1. Perform RTCAnYEARC read according to flow described in **Section 39.5.1.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to year count buffer register RTCAnYEAR or to calendar count buffer register RTCAnCAL. See
   - **Section 39.5.1.1, Initial Setting of RTCA**, and
   - **Section 39.5.1.2, Updating Clock Counters.**

39.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write year counter RTCAnYEARC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + $2C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEAR[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 39.29 RTCAnYEAR Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEAR [7:0]	Year in BCD

NOTES

1. When writing this register, only decimal values between 00 and 99 in BCD are allowed.
2. Perform RTCAnYEAR read/write as described in
   - **Section 39.5.1.1, Initial Setting of RTCA,**
   - **Section 39.5.1.2, Updating Clock Counters**, and
   - **Section 39.5.1.3, Reading Clock Counters.**

39.3.5 Details of RTCA Special Counter and Buffer Registers

39.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables RTCAnHOURC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + 68_H

Value after reset: $0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]							—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 39.30 RTCAnTIMEC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	RTCAnHOURC [5:0]	Hours in BCD. See **Table 39.20, 12- and 24-Hour Format**, for details.
15	Reserved	When read, the value after reset is returned.
14 to 8	RTCAnMINC [6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC [6:0]	Seconds in BCD

NOTES

1. Perform RTCAnTIMEC read according to flow described in **Section 39.5.1.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to time count buffer register RTCAnTIME. See
   - **Section 39.5.1.1, Initial Setting of RTCA**, and
   - **Section 39.5.1.2, Updating Clock Counters.**

39.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <RTCAn_base> + 30_H

Value after reset: $0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOUR[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 39.31 RTCAnTIME Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write value after reset.
21 to 16	RTCAnHOUR [5:0]	Hours in BCD See **Table 39.20, 12- and 24-Hour Format**, for details.
15	Reserved	When read, the value after reset is returned. When writing, write value after reset.
14 to 8	RTCAnMIN [6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned. When writing, write value after reset.
6 to 0	RTCAnSEC [6:0]	Seconds in BCD

NOTE

Perform RTCAnTIME read/write as described in

- **Section 39.5.1.1, Initial Setting of RTCA,**
- **Section 39.5.1.2, Updating Clock Counters**, and
- **Section 39.5.1.3, Reading Clock Counters.**

39.3.5.3 RTCAnCALC — RTCA Calendar Count Register

This register enables RTCAnYEARC, RTCAnMONC, RTCAnDAYC, and RTCAnWEEKC counters to be read simultaneously.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + $6C_H$

Value after reset: $0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEARC[7:0]								—	—	—	RTCAnMONC[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	RTCAnDAYC[5:0]						—	—	—	—	—	RTCAnWEEKC[2:0]		
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 39.32 RTCAnCALC Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEARC [7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned.
20 to 16	RTCAnMONC [4:0]	Month of year in BCD
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	RTCAnDAYC [5:0]	Day of month in BCD
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC [2:0]	Day of week in BCD

NOTES

1. Perform RTCAnCALC read according to flow described in **Section 39.5.1.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to clock time setting register RTCAnCAL. See
   - **Section 39.5.1.1, Initial Setting of RTCA**, and
   - **Section 39.5.1.2, Updating Clock Counters.**

39.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register

This register enables RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <RTCAn_base> + 34_H

Value after reset: $0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEAR[7:0]								—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 39.33 RTCAnCAL Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEAR [7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned. When writing, write value after reset.
20 to 16	RTCAnMONTH [4:0]	Month of year in BCD
15, 14	Reserved	When read, the value after reset is returned. When writing, write value after reset.
13 to 8	RTCAnDAY [5:0]	Day of month in BCD
7 to 3	Reserved	When read, the value after reset is returned. When writing, write value after reset.
2 to 0	RTCAnWEEK [2:0]	Day of week in BCD

NOTE

Perform RTCAnCAL read/write as described in

- **Section 39.5.1.1, Initial Setting of RTCA.**
- **Section 39.5.1.2, Updating Clock Counters**, and
- **Section 39.5.1.3, Reading Clock Counters.**

39.3.6 Details of RTCA Alarm Setting Registers

39.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies minute of alarm interrupt.

For details and example settings, see **Section 39.4.3, Alarm Interrupt Function**.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 40_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALM[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 39.34 RTCAnALM Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write value after reset.
6 to 0	RTCAnALM [6:0]	Minute of alarm interrupt in BCD

NOTES

1. If decimal values outside range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When setting of RTCAnALM is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

39.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies hour of alarm interrupt.

For details and example settings, see **Section 39.4.3, Alarm Interrupt Function**.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 44_H

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnALH[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 39.35 RTCAnALH Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write value after reset.
5 to 0	RTCAnALH [5:0]	Hour of alarm interrupt in BCD

NOTES

1. If decimal values outside following range are set, no alarm interrupt request will be generated:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0): 01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1): 00 to 23
2. When setting of RTCAnALH is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

39.3.6.3 RTCAnALW — RTCA Alarm Day of Week Setting Register

This register specifies day(s) of week of alarm interrupt.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 48_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALW[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 39.36 RTCAnALW Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write value after reset.
6 to 0	RTCAnALW [6:0]	Specifies day of week m (m = 0 to 6) as a day, when an alarm interrupt request is generated: 0: No alarm interrupt request is generated on day m. 1: Alarm interrupt request is generated on day m at time set using RTCAnALM and RTCAnALH. Bits of this register correspond to count value of day of week counter (RTCAnWEEKC).

NOTE

When setting of RTCAnALW is changed during sub-counter operation (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

Example

If Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

- To set alarm for Sunday, set RTCAnALW = $0000\ 0001_B$.
- To set alarm for Monday and Wednesday, set RTCAnALW = $0000\ 1010_B$.
- To set alarm for Tuesday, Thursday, and Saturday, set RTCAnALW = $0101\ 0100_B$.

For more examples, see **Section 39.4.3, Alarm Interrupt Function**.

39.4 Operation

RTCA provides only one operation mode:

- Frequency selection mode

Operation mode that can be used depends on available input clock RTCATCKI. Operation mode specifies sub-counter compare value that is used to trigger seconds counter and thus all subsequent counters.

Following table provides an overview of property of the operation mode.

Table 39.37 RTCA Operation Mode Overview

	Frequency Selection Mode
Allowed input clock RTCATCKI	Any frequency from 240 kHz to 2.5 MHz
Sub-counter RTCAnSUBC operation	• Counter overflow at value of RTCAnSCMP • RTCAnSCMP must be set to RTCATCKI-1 (in Hz)

Operation mode is selected by control bit RTCAnCTL0.RTCAnSLSB. For details on how to set operation mode during RTCA initialization, see **Section 39.5.1.1, Initial Setting of RTCA**.

CAUTIONS

1. **Input clock RTCATCKI must not be outside allowed frequency range.**
2. **Operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1).**

39.4.1 Clock Counter Format

Clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on valid data range, number of bits for a digit differs. For example, tens digit of month of year counter has only one bit (for 0 and 1) whereas tens digit of minutes counter has 3 bits (for 0 to 5).

Following table lists decimals 0 to 59 in binary and BCD.

Table 39.38 Example of BCD Code – Seconds or Minutes Counter (0 to 59)

Decimal	Binary	BCD
0	000000	000 0000
1	000001	000 0001
2	000010	000 0010
3	000011	000 0011
4	000100	000 0100
5	000101	000 0101
6	000110	000 0110
7	000111	000 0111
8	001000	000 1000
9	001001	000 1001
10	001010	001 0000
11	001011	001 0001
12	001100	001 0010
:	:	:
58	111010	101 1000
59	111011	101 1001

39.4.2 Fixed Interval Interrupt Function

Interrupt INTRTCA0R can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

Fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

39.4.3 Alarm Interrupt Function

Interrupt INTRTCA0AL can be specified to occur at a certain time on one or several days of week. This interrupt can be used as a wake-up signal.

Alarm interrupt function is enabled and disabled by bit RTCAnCTL1.RTCAnENALM.

Alarm setting is specified by following control registers:

- RTCAnALW selects weekday(s).

Allocation of bits to weekdays is defined by day of week count buffer register RTCAnWEEK.

- RTCAnALH and RTCAnALM specify hour and minute in BCD.

Examples

Following tables show some exemplary settings of alarm control registers for both 12-hour and 24-hour format.

In this example, Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

Table 39.39 Alarm Setting in 12-Hour Format (RTCAnCTL0.RTCAnAMPM = 0)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00 am	01_H	07_H	00_H
Sunday, Monday 12:15 pm	03_H	32_H	15_H
Monday, Wednesday, Friday 5:30 pm	$2A_H$	25_H	30_H
Daily, 10:45 pm	$7F_H$	30_H	45_H

Table 39.40 Alarm Setting in 24-Hour Format (RTCAnCTL0.RTCAnAMPM = 1)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00	01_H	07_H	00_H
Sunday, Monday 12:15	03_H	12_H	15_H
Monday, Wednesday, Friday 17:30	$2A_H$	17_H	30_H
Daily, 22:45	$7F_H$	22_H	45_H

39.5 Procedures

39.5.1 Procedures for Setup, Writing and Reading

Following subsections provide flow charts that illustrate procedures for RTCA setup and for reading and writing RTCA clock counters.

39.5.1.1 Initial Setting of RTCA

RTCA must be stopped before setting initial setting value of each counter.

(1) RTCA Stop Procedure

Stop RTCA according to following flow.

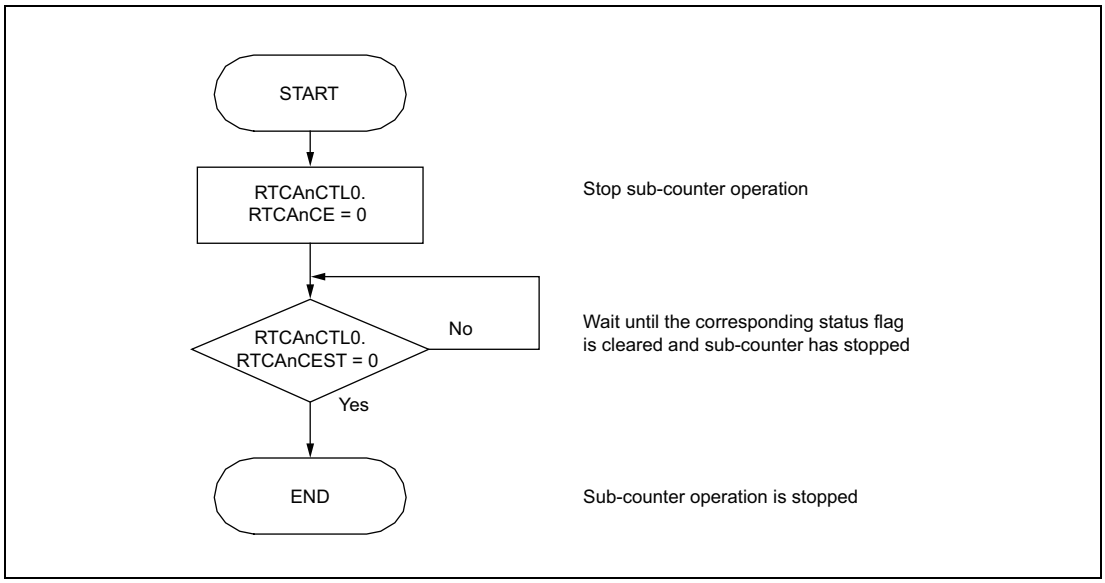

Figure 39.2 RTCA Stop Procedure

(2) RTCA Initialization Procedure

Perform initial setting of RTCA according to following flow:

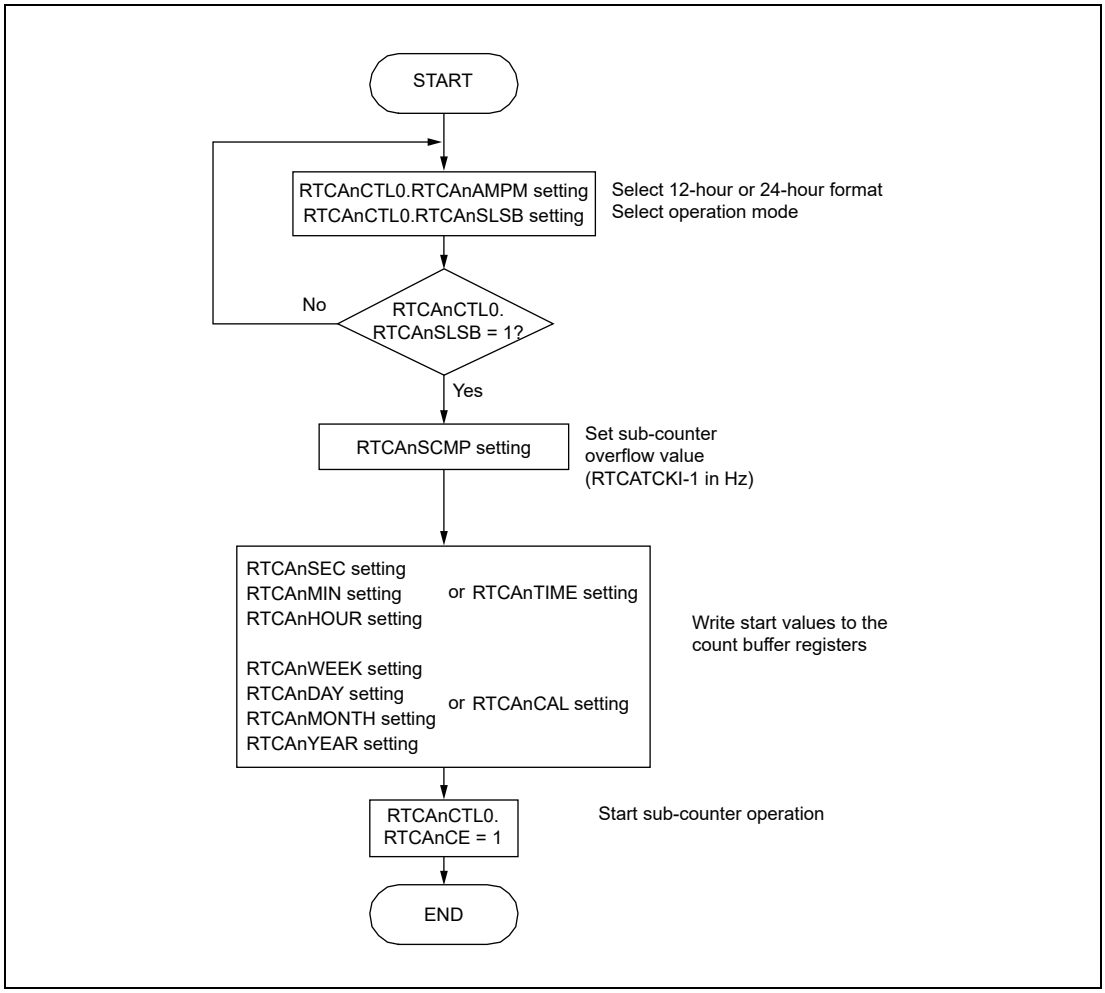

Figure 39.3 RTCA Initial Setup Procedure

CAUTION

Internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before clock counter starting behind END of above flow.

Therefore, PCLK must be continuously supplied until completion of initial setting.

Check that RTCAnCTL0.RTCAnCEST = 1, when supply of PCLK is stopped after setting initial setting value of RTCA.

39.5.1.2 Updating Clock Counters

Clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while sub-counter is running.

To update clock counter when sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow flowchart shown below.

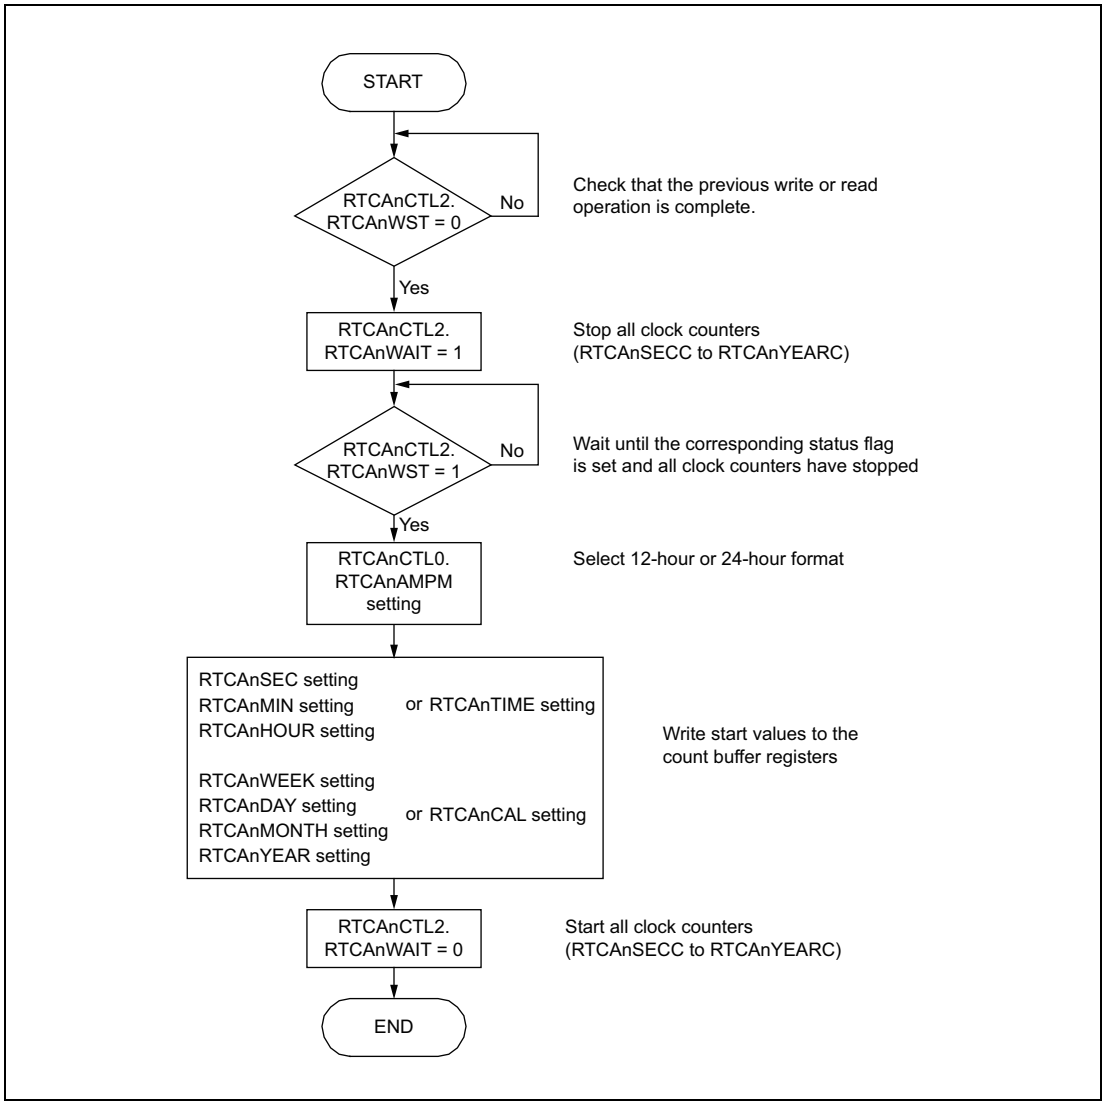

Figure 39.4 Updating Clock Counter Values

CAUTIONS

1. **Internal clock counter is synchronized with RTCATCKI.**
   In addition, two RTCATCKI periods are required before clock counter updating behind END of above flow.
   Therefore, PCLK must be continuously supplied until completion of clock counter updating.
   Check that RTCAnCTL2.RTCAnWST = 0 before stopping supply of PCLK after completion of clock counter updating.
2. **Update procedure must be completed within one second. Otherwise Real-Time Clock will not count correctly any more:**
3. **Only one sub-counter overflow can be held internally and increment seconds counter after restarting clock counters if value is held.**
4. **If sub-counter overflows more than once during clock counter stop, overflow count cannot be held internally. Thus seconds counter is incremented by one instead of by two when it is restarted.**

39.5.1.3 Reading Clock Counters

There are two methods to read clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

Advantages and disadvantages of two methods are summarized in following table.

Table 39.41 Comparison of Two Read Methods

	Advantage	Disadvantage
Reading count buffer registers	It is unnecessary to read clock counters several times because clock counters are read synchronously.	A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.
Reading count registers	Program wait state does not occur.	If sub-counter increments, clock counters must be read several times because they are read asynchronously to RTCATCKI.

(1) Procedure for Reading Count Buffer Registers

Following operations are necessary:

1. Stop all clock counters (RTCAnCTL2.RTCAnWAIT = 1). Value of clock counters is transferred to corresponding count buffer registers.
2. Read count buffer registers.

A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.

Maximum delay is three PCLK periods plus two RTCATCKI periods.

To read count buffer register when sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1), follow flowchart shown below.

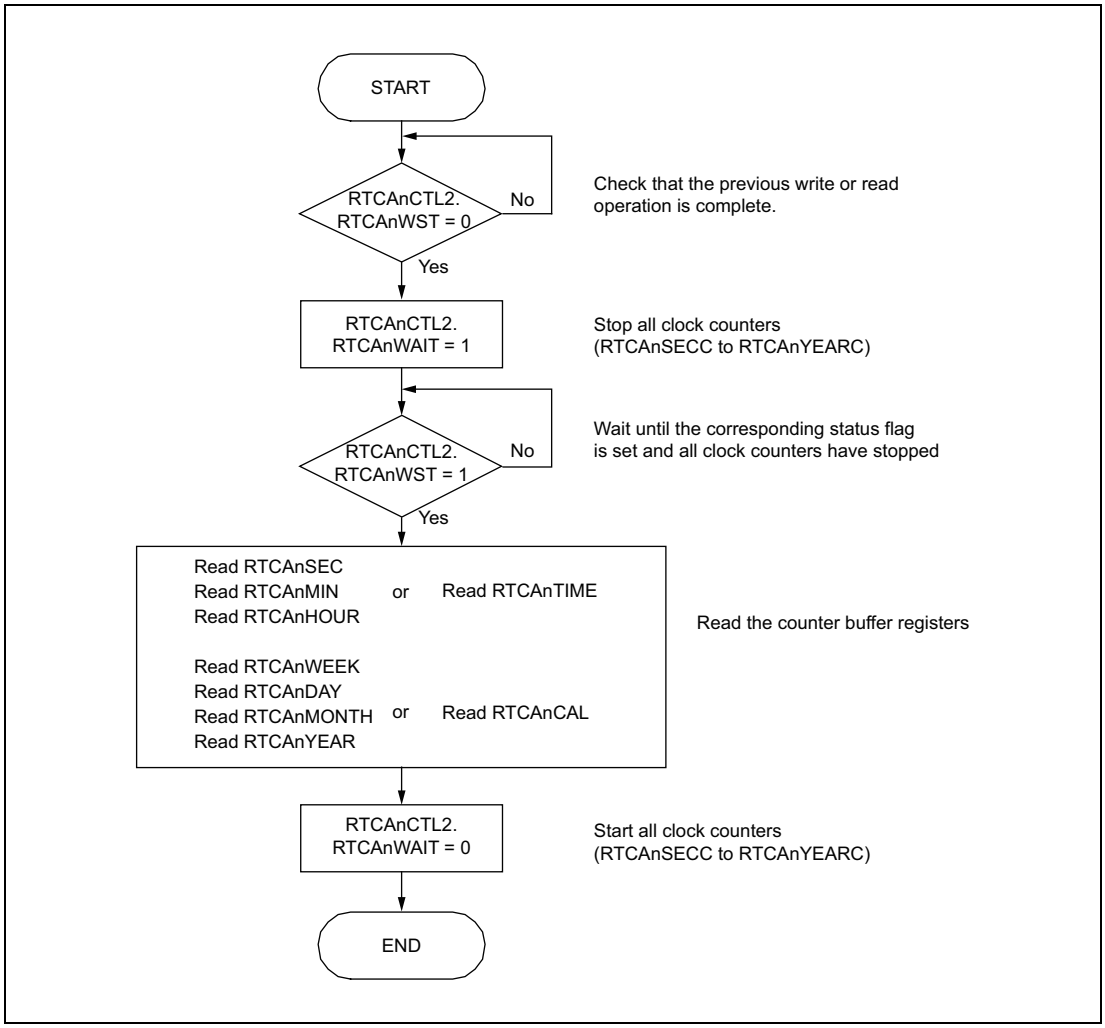

Figure 39.5 Reading Clock Count Buffer Registers

CAUTIONS

1. **Internal clock counter is synchronized with RTCATCKI.**
   In addition, two RTCATCKI periods are required before resuming counter behind END of above flow.
   Therefore, PCLK must be continuously supplied until counter resuming.
   Check that RTCAnCTL0.RTCAnCEST = 1 first to stop supply of PCLK after count buffer register reading.
2. **Reading procedure must be completed within one second. Otherwise Real-Time Clock will not count correctly any more.**
3. **Only one sub-counter overflow can be held internally. If there is a value held internally when clock counter restarts, seconds counter will be incremented by 1.**
4. **If sub-counter overflows more than once during clock counter stop, overflow count cannot be held internally. Thus seconds counter is incremented by one instead of by two when it is restarted.**

(2) Procedure for Reading Counter Registers Directly

To ensure that sub-counter did not overflow while reading counters, seconds counter RTCAnSECC must be read twice in beginning and at end of procedure. first read value is compared with second read value.

- First read value = second read value:
  No overflow of sub-counter occurred during counter read operation.
- First read value ≠ second read value:
  Overflow of sub-counter occurred during counter read operation. counters must be read again to get current counter values.

To read counter register directly when sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow flowchart shown below.

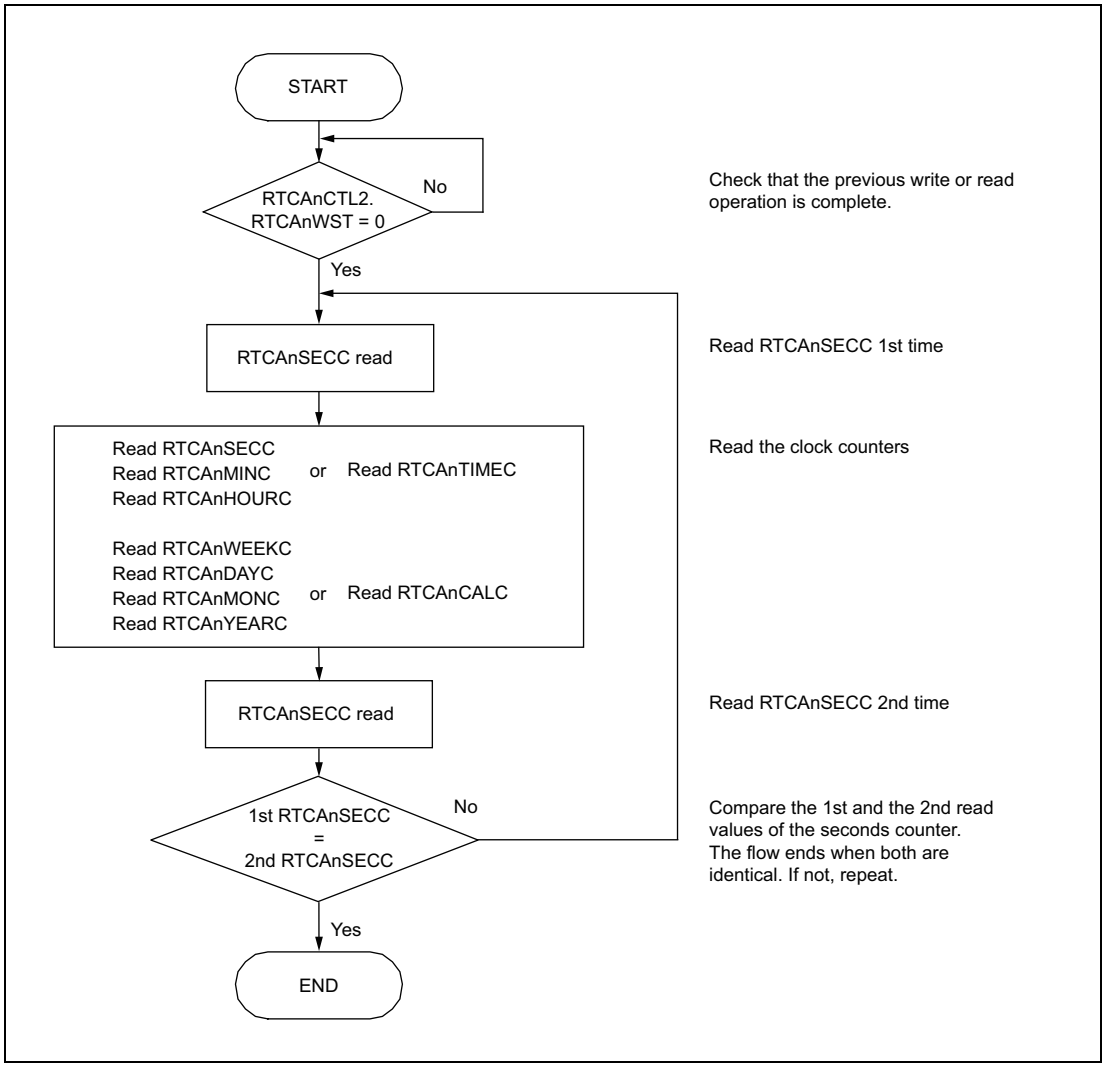

Figure 39.6 Reading Clock Counter Registers

NOTE

Procedure must be completed within one second.

39.5.1.4 Reading RTCAnSRBU

RTCAnSRBU is read buffer register for sub-counter.

When sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), read RTCAnSRBU according to following flow.

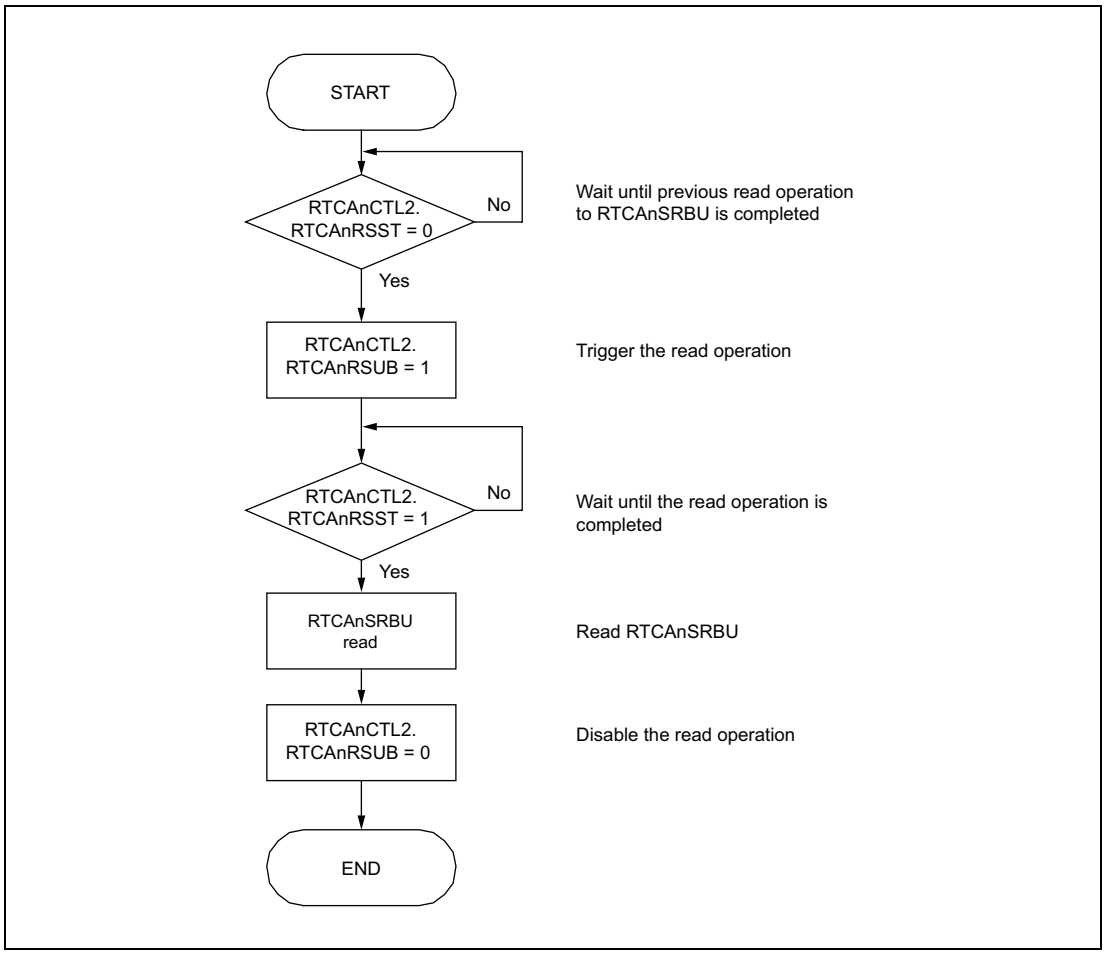

Figure 39.7 Reading RTCAnSRBU Register

39.5.1.5 Writing to RTCAnSCMP

RTCAnSCMP is sub-counter compare register.

When sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSCMP according to flow described below.

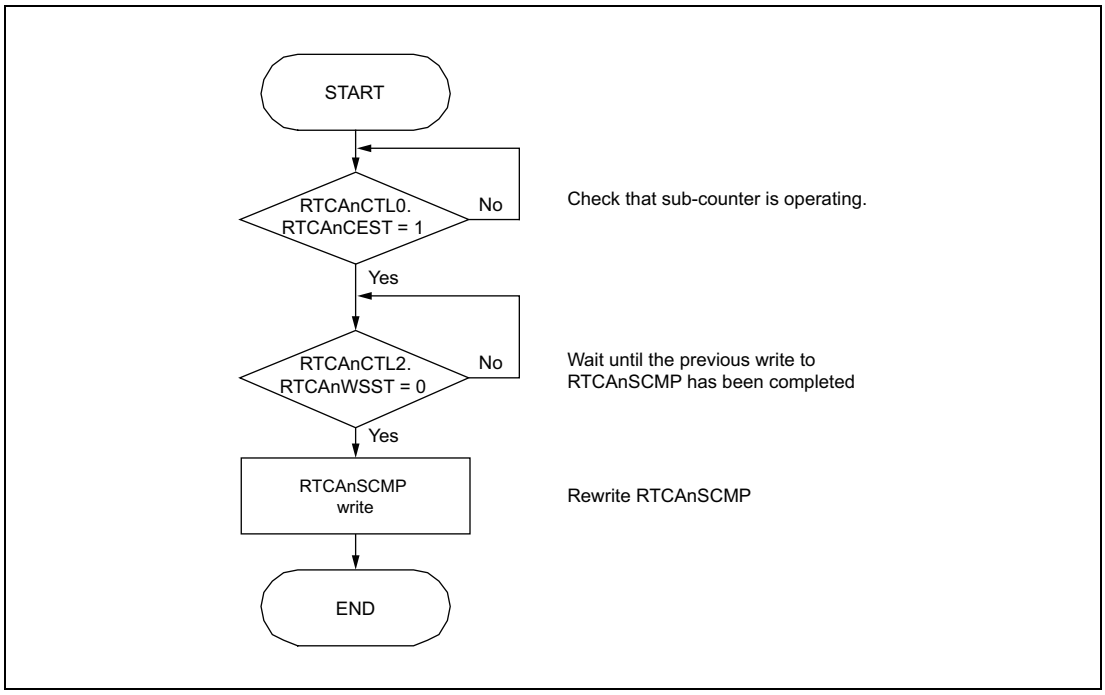

Figure 39.8 Writing RTCAnSCMP Register

NOTE

While sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), status flag RTCAnCTL2.RTCAnWSST is set when RTCAnSCMP is written to. It is cleared when write operation to RTCAnSCMP is completed. This is synchronous with next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWSST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWSST = 1 at beginning of this flow).

39.5.2 Timing Diagrams

39.5.2.1 Timing of Counter Start

Following diagram illustrates counter start after setting time in buffer registers.

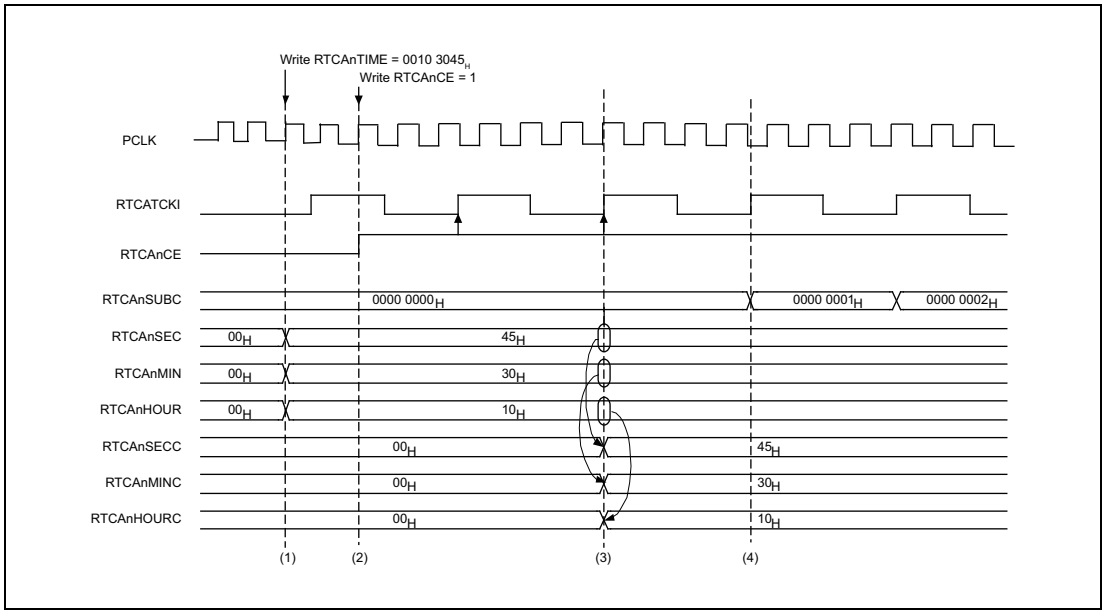

Figure 39.9 Counter Start Timing

Timing diagram above shows following:

(1) Initial setting value of time count buffer is set to 10:30:45 by setting RTCAnTIME = 0010 3045_H. Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE = 1.

(3) When second rising edge of RTCATCKI occurs, buffer register values are loaded to corresponding count registers.

(4) When next rising edge of RTCATCKI occurs, count up of sub-counter starts.

39.5.2.2 Timing of Clock Counter Update while Counter Is Enabled

Following diagram illustrates counter restart after setting time in buffer registers.

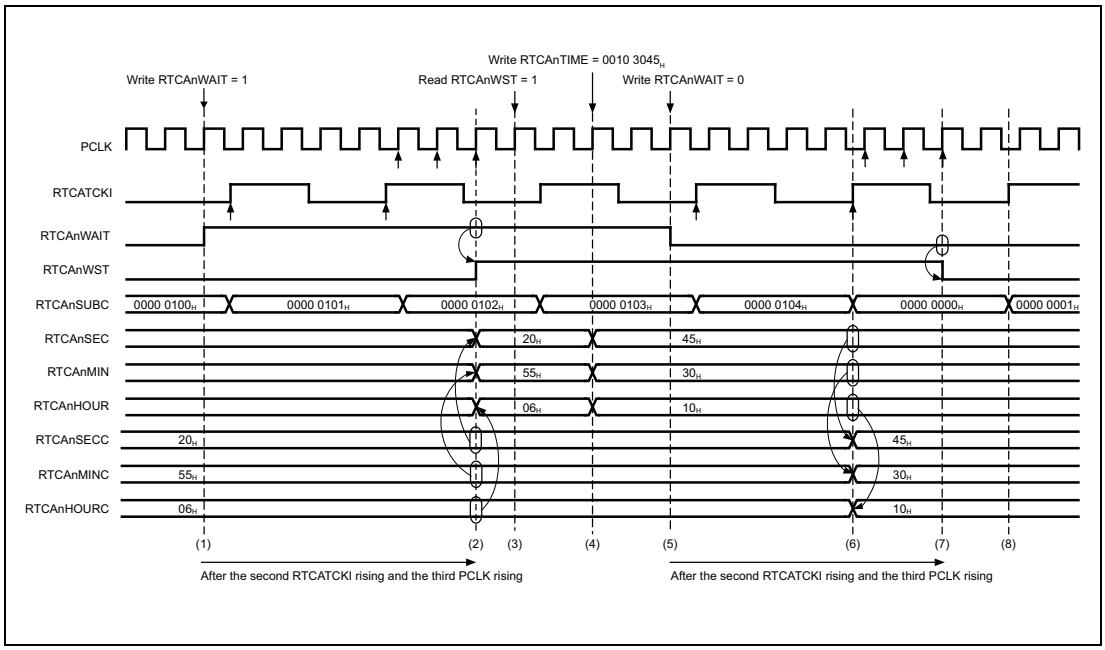

Figure 39.10 Clock Counter Update Timing

Timing diagram above shows following:

(1) Trigger clock counters stop (RTCAnCTL2.RTCAnWAIT = 1).

(2) RTCAnCTL2.RTCAnWST is set to 1 after second rising edge of RTCATCKI and third rising edge of PCLK, and counter clock stops. Sub-counter continues counting.

(3) RTCAnCTL2.RTCAnWST = 1 can be readable.

(4) Initial setting value of time count buffer is set to 10:30:45 by setting RTCAnTIME to 0010 3045_H.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(5) Trigger clock counters restart (RTCAnCTL2.RTCAnWAIT = 0).

(6) When second rising edge of RTCATCKI occurs, values of buffer registers are loaded to corresponding count registers. Write operation to RTCAnSECC is performed and RTCAnSUBC is cleared.

(7) When third rising edge of PCLK occurs, RTCAnCTL2.RTCAnWST is set to 0.

(8) Clock counter operation is resumed.

39.5.2.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

Following diagram illustrates timing when reading sub-counter read buffer RTCAnSRBU.

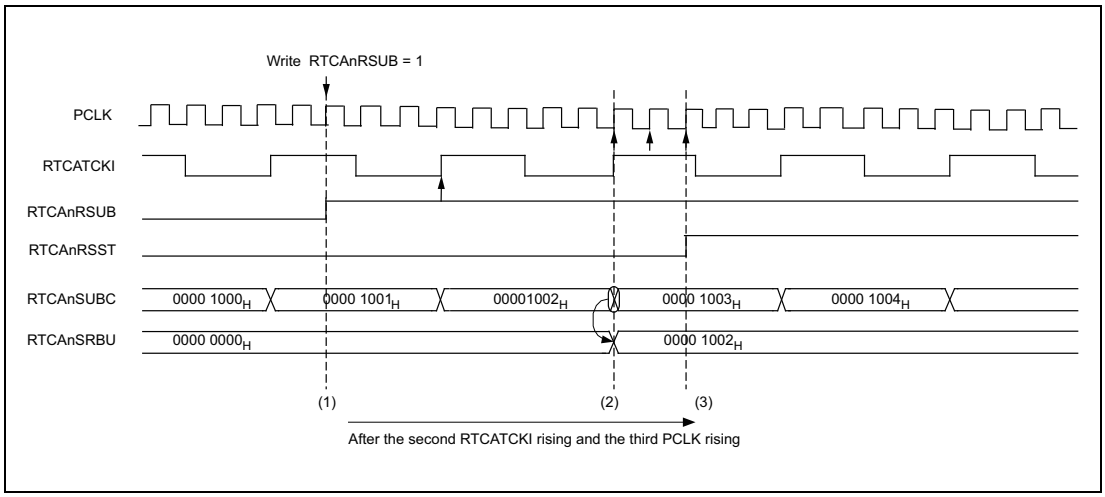

Figure 39.11 Timing when Reading Sub-Counter Read Buffer Register Value

Timing diagram above shows following:

(1) Setting RTCAnRSUB = 1 triggers loading of sub-counter value to RTCAnSRBU.

(2) When second rising edge of RTCATCKI occurs, value of RTCAnSUBC is loaded to RTCAnSRBU.

(3) When third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

Section 40 Encoder Timer A (ENCA)

This section contains a generic description of the Encoder Timer A (ENCA).

The first part of this section describes all RH850/U2A-EVA specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ENCA.

40.1 Features ENCA for RH850/U2A-EVA

40.1.1 Number of Units and Channels

This microcontroller has the following number of ENCA units.

Each ENCA unit has one channel ENCA. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 40.1 Number of Units

Product	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	2 (n = 0, 1)	2 (n = 0, 1)	2 (n = 0, 1)	2 (n = 0, 1)	2 (n = 0, 1)	2 (n = 0, 1)	2 (n = 0, 1)	1 (n = 1)	—	1 (n = 1)
Name	ENCAn									

Table 40.2 Unit Configurations and Channels

Unit Name (Channel Name) ENCAn	Channels per Unit	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
ENCA0	1	√	√	√	√	√	√	√	—	—	—
ENCA1	1	√	√	√	√	√	√	√	√	—	√

Table 40.3 Index

Index	Description
n	Throughout this section, the individual ENCA units are identified by the index “n” (n = 0, 1); for example, ENCAnCTL is the ENCAn control register.

40.1.2 Register Base Addresses

ENCAn base addresses are listed in the following table.

ENCAn register addresses are given as offsets from the base addresses.

Table 40.4 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ENCA0_base>	FFBF 3000_H	P-Bus Group 5
<ENCA1_base>	FFBF 3100_H	P-Bus Group 5

40.1.3 Clock Supply

Clock supply by and to ENCAn is listed in the following table.

Table 40.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
ENCAn	PCLK	CLK_HSB

40.1.4 Interrupt Requests and Error Notifications

ENCAn interrupt requests are listed in the following table.

Table 40.6 Interrupt and DMA/DTS Requests

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number	DTS Trigger Number	Others
ENCA0					
INTENCA0IOV	ENCA0 overflow interrupt	534	Group0-181	Group1-54	—
INTENCA0I0	ENCA0 capture/compare match interrupt 0	536	Group0-183	Group1-56	PIC2
INTENCA0I1	ENCA0 capture/compare match interrupt 1	537	Group0-184	Group1-57	PIC1, PIC2
INTENCA0IUD	ENCA0 underflow interrupt	535	Group0-182	Group1-55	—
INTENCA0IEC	ENCA0 encoder clear interrupt	538	Group0-185	Group1-58	PIC1, PIC2
ENCA1					
INTENCA1IOV	ENCA1 overflow interrupt	539	Group0-186	Group1-59	—
INTENCA1I0	ENCA1 capture/compare match interrupt 0	541	Group0-188	Group1-61	PIC2
INTENCA1I1	ENCA1 capture/compare match interrupt 1	542	Group0-189	Group1-62	PIC1, PIC2
INTENCA1IUD	ENCA1 underflow interrupt	540	Group0-187	Group1-60	—
INTENCA1IEC	ENCA1 encoder clear interrupt	543	Group0-190	Group1-63	PIC1, PIC2

This module has no error notifications.

40.1.5 Reset Sources

ENCAn reset sources are listed in the following table. ENCAn is initialized by these reset sources.

Table 40.7 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
ENCAn	All registers	√	√	√	√	√	√	—

40.1.6 External Input/Output Signals

External input/output signals of ENCAn are listed below.

Table 40.8 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal Name
ENCA0			
ENCA0TTIN0	I	ENCA0 capture trigger input 0*1	ENCA0TIN0*3
ENCA0TTIN1	I	ENCA0 capture trigger input 1*1	ENCA0TIN1*2
ENCA0E0	I	ENCA0 encoder input 0*1	ENCA0E0*2
ENCA0E1	I	ENCA0 encoder input 1*1	ENCA0E1*2
ENCA0EC	I	ENCA0 encoder clear input*1	ENCA0EC*2
ENCA1			
ENCA1TTIN0	I	ENCA1 capture trigger input 0*1	ENCA1TIN0*3
ENCA1TTIN1	I	ENCA1 capture trigger input 1*1	ENCA1TIN1*2
ENCA1E0	I	ENCA1 encoder input 0*1	ENCA1E0*2
ENCA1E1	I	ENCA1 encoder input 1*1	ENCA1E1*2
ENCA1EC	I	ENCA1 encoder clear input*1	ENCA1EC*2

Note 1. Setting of the noise filter for the port is required when the input pin is used. For details, see **Section 2.7, Noise Filter & Edge/Level Detector**.

Note 2. The input signal can be selected by the PIC function. For details, see **Section 41.2.2.23, PIC1REG30 — Timer Input/Output Control Register 30**.

Note 3. The input signal can be selected by the PIC function. For details, see **Section 41.3.2.11, PIC2ENCAnTSEL — Encoder Timer n Trigger Selection Control Register (n = 0, 1)**.

40.1.7 Internal Input/Output Signals

The internal input/output signals of ENCAn are listed below.

Table 40.9 Internal Input/Output Signals

Unit Signal Name	Description	Connected to
ENCAnTSST	Simultaneous start trigger	PIC1
ENCAnTTIN1	ENCAn capture trigger input 1	PIC1
ENCAnTTIN0	ENCAn capture trigger input 0	PIC2
ENCAnE0	ENCAn encoder input 0	PIC1
ENCAnE1	ENCAn encoder input 1	PIC1
ENCAnEC	ENCAn encoder clear input	PIC1
ENCAnTUDC	ENCAn down-count enable signal output	PIC2
ENCAnTCKEN	ENCAn count clock output	PIC2

40.2 Overview

40.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and performs count operation in synchronization with PCLK.
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow and output of error flags and error interrupts
- Five interrupts: 2 capture/compare interrupts, 1 counter clear interrupt, 1 overflow interrupt, and 1 underflow interrupt

40.2.2 Block Diagram

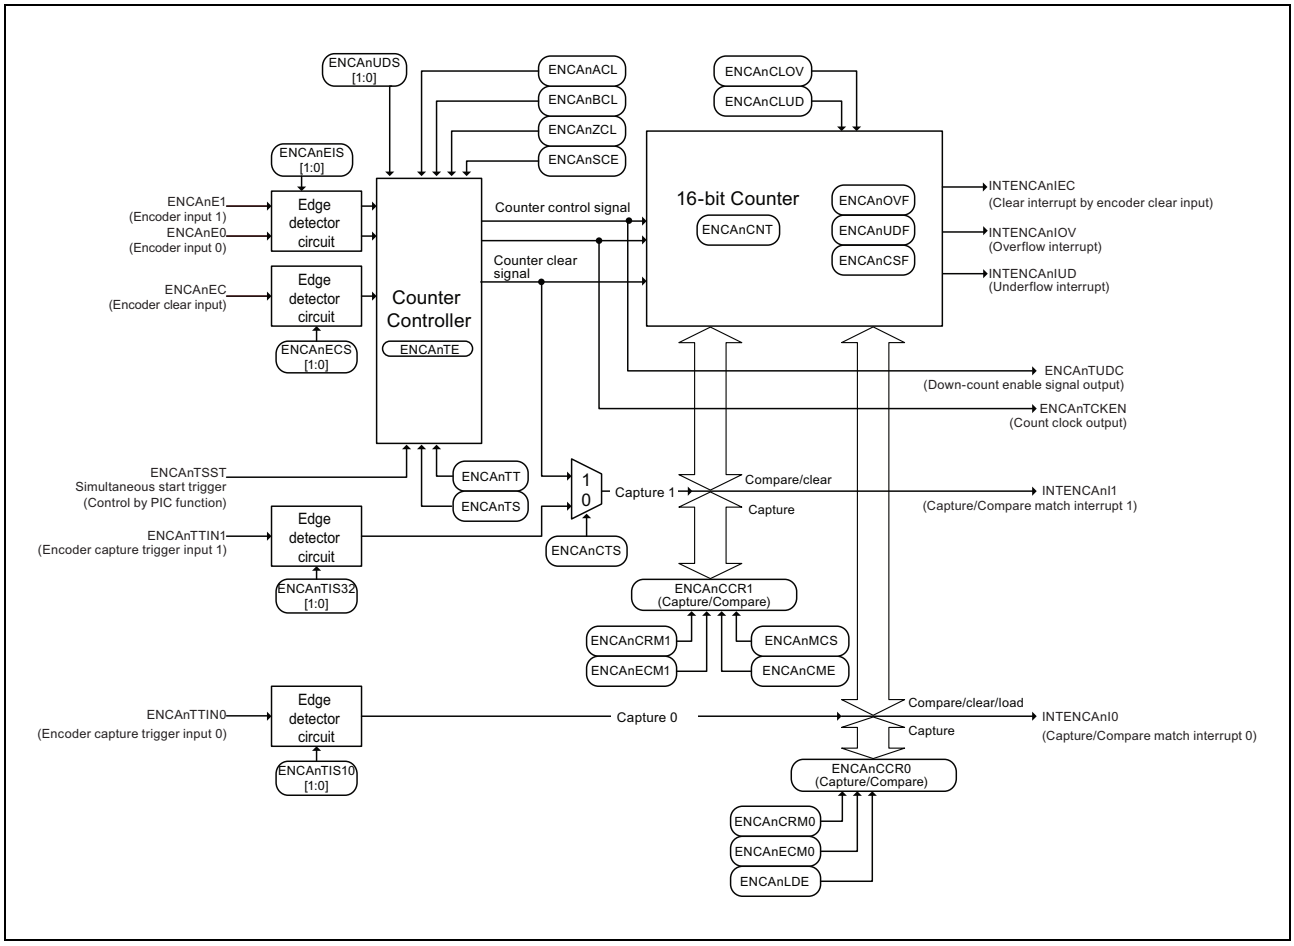

Figure 40.1 Encoder Timer Block Diagram

40.3 Registers

40.3.1 List of Registers

ENCA registers are listed in the following table.

For details about <ENCA_base>, see **Section 40.1.2, Register Base Addresses**.

Table 40.10 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ENCAn	ENCAn capture/compare register 0	ENCAnCCR0	<ENCAn_base>	16	*1	—
ENCAn	ENCAn capture/compare register 1	ENCAnCCR1	<ENCAn_base> + 04_H	16	*1	—
ENCAn	ENCAn counter register	ENCAnCNT	<ENCAn_base> + 08_H	16	*1	—
ENCAn	ENCAn status flag register	ENCAnFLG	<ENCAn_base> + $0C_H$	8	*1	—
ENCAn	ENCAn status flag clear register	ENCAnFGC	<ENCAn_base> + 10_H	8	*1	—
ENCAn	ENCAn timer enable status register	ENCAnTE	<ENCAn_base> + 14_H	8	*1	—
ENCAn	ENCAn timer start trigger register	ENCAnTS	<ENCAn_base> + 18_H	8	*1	—
ENCAn	ENCAn timer stop trigger register	ENCAnTT	<ENCAn_base> + $1C_H$	8	*1	—
ENCAn	ENCAn I/O control register 0	ENCAnIOC0	<ENCAn_base> + 20_H	8	*1	—
ENCAn	ENCAn control register	ENCAnCTL	<ENCAn_base> + 40_H	16	*1	—
ENCAn	ENCAn I/O control register 1	ENCAnIOC1	<ENCAn_base> + 44_H	8	*1	—

Note 1. n = 0: PBG51#8
n = 1: PBG51#9

40.3.2 ENCAnCTL — ENCA Control Register

This register is used to configure various operation settings of the Encoder Timer.

Access: This register can be read or written in 16-bit units.
Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAn CME	ENCAn MCS	—	—	—	—	ENCAn CRM1	ENCAn CRM0	ENCAn CTS	—	—	ENCAn LDE	ENCAn ECM1	ENCAn ECM0	ENCAnUDS [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 40.11 ENCAnCTL Register Contents (1/2)

Bit Position	Bit Name	Function
15	ENCAnCME	Encoder Clear Mask Enable This bit is used to enable/disable masking of compare match interrupt detection when the compare function is used. 0: Disables the compare match interrupt (INTENCAnI1) mask function for the ENCAnCCR1 register 1: Enables the compare match interrupt (INTENCAnI1) mask function for the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 0. When this bit is set to 1, setting ENCAnECM1 to 1 is prohibited.
14	ENCAnMCS	Encoder Mask Clear Select This bit is used to select the trigger for cancelling masking of compare match interrupt detection INTENCAnI1 when the compare function is used. This bit is valid only when ENCAnCRM1 = 0. 0: Masking of compare match interrupt detection is cancelled when the ENCAnCCR1 register is written. 1: Masking of compare match interrupt detection is cancelled when one of the following three operations is performed. – Timer counter clear operation accompanying encoder clear input – Timer counter clear operation upon compare match between ENCAnCNT and ENCAnCCR0 when ENCAnECM0 = 1 – Loading from ENCAnCCR0 to timer counter upon underflow detection when ENCAnLDE = 1
13 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	ENCAnCRM1	ENCAnCCR1 Register Mode 0: ENCAnCCR1 used as compare register. 1: ENCAnCCR1 used as capture register.
8	ENCAnCRM0	ENCAnCCR0 register mode bit 0: ENCAnCCR0 used as compare register. 1: ENCAnCCR0 used as capture register.
7	ENCAnCTS	ENCAnCCR1 Capture Trigger Select This is a trigger selection bit for the capture operation to the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 1. 0: Uses ENCAnTTIN1 of capture trigger 1 signal as the trigger for capturing to the ENCAnCCR1 register. 1: Uses the encoder clear signal selected by ENCAnSCE as the capture trigger to the ENCAnCCR1 register.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40.11 ENCAnCTL Register Contents (2/2)

Bit Position	Bit Name	Function
4	ENCAnLDE	ENCAn Counter Load Enable This bit is used to enable/disable setting value loading to the counter upon underflow occurrence. This bit is valid only when ENCAnCRM0 = 0. When ENCAnCRM0 = 1, loading of the ENCAnCCR0 register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit. 0: Disable loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow. 1: Enable loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow.
3	ENCAnECM1	Encoder Clear Mode 1 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR1 setting value. This bit is valid only when ENCAnCRM1 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value if the next count is a down-count.
2	ENCAnECM0	Encoder Clear Mode 0 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR0 setting value. This bit is valid only when ENCAnCRM0 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value if the next count is a up-count.
1, 0	ENCAnUDS[1:0]	Up/down Count Selection 1 and 0 These are the counter up/down control bits that use ENCAnE0 and ENCAnE1. 00: Upon detection of valid edge of ENCAnE0, - down-count when ENCAnE1 = H, - up-count when ENCAnE1 = L 01: Upon detection of valid edge of ENCAnE0, up-count, Upon detection of valid edge of ENCAnE1, down-count 10: At rising edge of ENCAnE0, down-count At falling edge of ENCAnE0, up-count However, count operation is performed only when ENCAnE1 = L. 11: Detection of both edges of ENCAnE0 and ENCAnE1. Judgment of count operation combining both detected edge and level.

40.3.3 ENCAnIOC0 — ENCA I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCAnTTIN0, ENCAnTTIN1).

Access: This register can be read or written in 8-bit units.

Address: <ENCAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ENCAnTIS32[1:0]		ENCAnTIS10[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 40.12 ENCAnIOC0 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	ENCAnTIS32 [1:0]	Input Edge Selection for Capture Trigger 1 These bits are valid only when ENCAnCTL.ENCAnCRM1 = 1 and ENCAnCTL.ENCAnCTS = 0. All other settings of ENCAnCRM1 and ENCAnCTS are invalid. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection
1, 0	ENCAnTIS10 [1:0]	Input Edge Selection for Capture Trigger 0 These bits are valid only when ENCAnCTL.ENCAnCRM0 = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

40.3.4 ENCAnIOC1 — ENCA I/O Control Register 1

This register is used to perform the clear condition setting and edge selection upon encoder input.

Access: This register can be read or written in 8-bit units.
Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS[1:0]		ENCAnEIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.13 ENCAnIOC1 Register Contents

Bit Position	Bit Name	Function
7	ENCAnSCE	Encoder Special-clear Enable This is an encoder special clear enable bit. When setting this bit to 1, set ENCAnUDS[1:0] to 10_B or 11_B. The operation is not guaranteed if this bit is set to 1 with ENCAnUDS[1:0] set to 00_B or 01_B. 0: Clears the counter upon detection of ENCAnEC valid edge (set with ENCAnECS[1:0]). 1: Clears the counter upon detection of input level condition of ENCAnEC, ENCAnE1, and ENCAnE0 (set with ENCAnZCL bit, ENCAnBCL bit, and ENCAnACL bit).
6	ENCAnZCL	Input-Z Clear Condition Selection This bit is used to set the condition for clearing the encoder clear input (ENCAnEC) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
5	ENCAnBCL	Input-B Clear Condition Selection This bit is used to set the condition for clearing the encoder input 1 (ENCAnE1) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
4	ENCAnACL	Input-A Clear Condition Selection This bit is used to set the condition for clearing the encoder input 0 input (ENCAnE0) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
3, 2	ENCAnECS[1:0]	Encoder Clear Input Edge Selection 1 and 0 These are the encoder clear input edge selection bits. These bits are valid only when ENCAnSCE = 0; they are invalid when ENCAnSCE = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection
1, 0	ENCAnEIS[1:0]	Encoder Edge Input Selection 1 and 0 These are the encoder input edge selection bits. These bits are valid when ENCAnUDS[1:0] is 00_B or 01_B, and are invalid when ENCAnUDS[1:0] is 10_B or 11_B. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

40.3.5 ENCAnFLG — ENCA Status Flag Register

This register is holds the status flags of the timer counter of ENCAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ENCAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENCAnCSF	ENCAnUDF	ENCAnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40.14 ENCAnFLG Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2	ENCAnCSF	Counter Status Flag This bit reflects the current timer counter operation. This bit is cleared at the start of count operation. 0: Timer counter in up-count status 1: Timer counter in down-count status
1	ENCAnUDF	Underflow Flag This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared at the start of count operation. 0: This flag is cleared to 0 upon any of the following events: – 1 is written to ENCAnFGC.ENCAnCLUD – ENCAnTS is set while ENCAnTE = 0 – The input signal of ENCAnTSST is set to “High level” 1: This flag is set to 1 upon occurrence of an underflow during the encoder timer count operation.
0	ENCAnOVF	Overflow Flag This bit reflects the occurrence of an overflow during the timer counter operation. This bit is cleared at the start of count operation. 0: This flag is cleared to 0 upon any of the following events: – 1 is written to ENCAnFGC.ENCAnCLOV – ENCAnTS is set while ENCAnTE = 0 – The input signal of ENCAnTSST is set to “High level” 1: This flag is set to 1 upon occurrence of an overflow during the encoder timer count operation.

40.3.6 ENCAnFGC — ENCA Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.

Access: This register is a write-only register that can be written in 8-bit units.
This register always returns 0 when read.

Address: <ENCAn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ENCAnCLUD	ENCAnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 40.15 ENCAnFGC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	ENCAnCLUD	Underflow Flag Clear This bit clears the underflow flag. 0: Writing is ignored. 1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection).
0	ENCAnCLOV	Overflow Flag Clear This bit clears the overflow flag. 0: Writing is ignored. 1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection).

40.3.7 ENCAnCCR0 — ENCA Capture/Compare Register 0

This register is a 16-bit capture/compare register 0.

Access: This register can be read or written in 16-bit units.
When used as a capture register, this register is only readable. Writing to this register is ignored.
When used as a compare register, this register is readable/writable.

Address: <ENCAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR0[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.16 ENCAnCCR0 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR0 [15:0]	Capture/Compare Register 0 Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the ENCAnLDE bit in ENCA control register ENCAnCTL for details. • If ENCAnCTL.ENCAnCRM0 = 0: ENCAnCCR0 is compare register. Set the value to be compared with the timer counter value. • If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCR0 is capture register The captured timer counter value is stored.

40.3.8 ENCAnCCR1 – ENCA Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.

Access: This register can be read or written in 16-bit units.
When used as a capture register, this register is only readable. Writing to this register is ignored.
When used as a compare register, this register is readable/writable.

Address: <ENCAn_base> + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR1[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.17 ENCAnCCR1 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR1 [15:0]	Capture/Compare Register 1 During capture operation, the trigger for capturing to this register differs according to the ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control register ENCAnCTL for details. • If ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is compare register Set the value to be compared with the timer counter value. • If ENCAnCTL.ENCAnCRM1 = 1: ENCAnCCR1 is capture register The captured timer counter value is stored.

40.3.9 ENCAnCNT — ENCA Counter Register

This register is the 16-bit timer counter register.

Access: This register can be read or written in 16-bit units.
This register can be written only when the operation is stopped.

Address: <ENCAn_base> + 08_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.18 ENCAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCNT [15:0]	Counter Register • ENCAnTE.ENCAnTE status: 0 (initial setting): Count stop An arbitrary value can be set to timer counter. • ENCAnTE.ENCAnTE status: 0 → 1 (operation start)): Count operation start Up/down count operation is started with the set arbitrary value. • ENCAnTE.ENCAnTE status: 1 (operating): Counting Up/down count operation is performed. • ENCAnTE.ENCAnTE status: 1 → 0 (stopped): Count stop The counter value immediately before the operation was stopped is held, and the count operation is stopped.

40.3.10 ENCAnTE — ENCA Timer Enable Status Register

This register indicates the operating status of ENCAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ENCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40.19 ENCAnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ENCAnTE	Timer Status Enable This is a status bit that indicates the operation enabled/stopped status of ENCAn. This bit is cleared to 0 when 1 is written to ENCAnTT.ENCAnTT. This bit is set to 1 when 1 is written to ENCAnTS.ENCAnTS, or when the input signal of ENCAnTSST is set to High level. 0: Operation stopped status 1: Operation enabled status

40.3.11 ENCAnTS — ENCA Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.

Access: This register is a write-only register that can be written in 8-bit units.
This register always returns 00_H when read. This register can be written only when ENCAnTE.ENCAnTE is 0.

Address: <ENCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40.20 ENCAnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTS	Timer Start Trigger This is the trigger bit that sets the ENCAn to the operation enabled state. 0: Writing is ignored. 1: The ENCAn is set to the operation enabled state by setting ENCAnTE.ENCAnTE = 1.

40.3.12 ENCAnTT — ENCA Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.

Access: This register is a write-only register that can be written in 8-bit units.
This register always returns 00_H when read.

Address: <ENCAn_base> + $1C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40.21 ENCAnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTT	Timer Stop Trigger This is the trigger bit that sets the ENCAn to the operation stopped state. 0: Writing is ignored. 1: Clears ENCAnTE.ENCAnTE to 0, to set the ENCAn to the count operation stopped state.

40.4 Operation

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

40.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

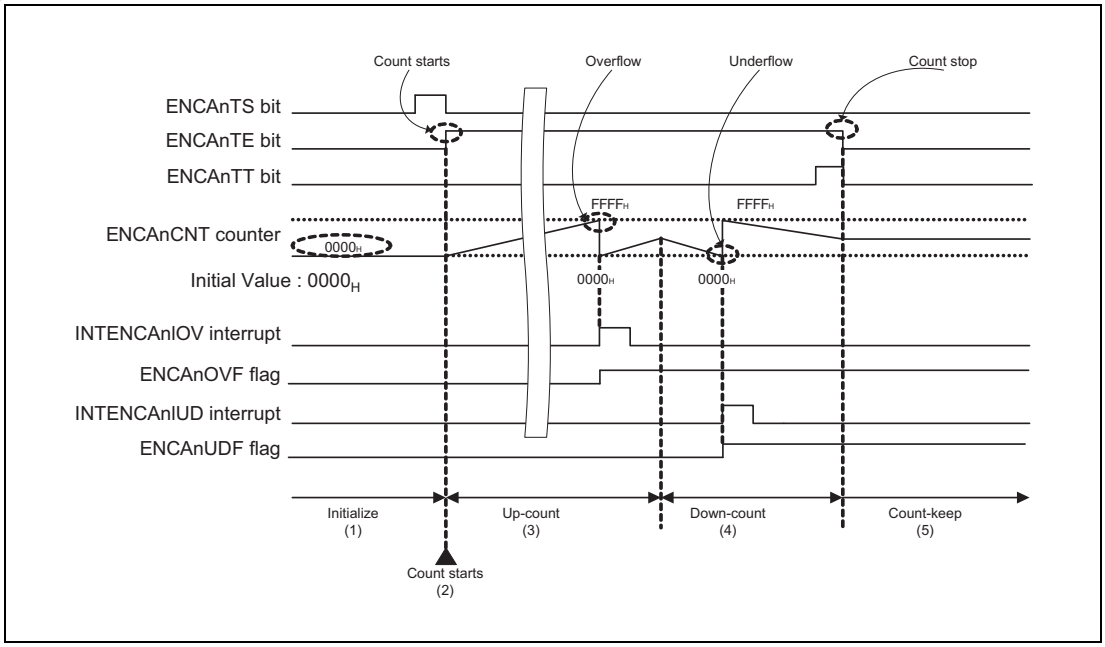

Figure 40.2 Timer Counter Initial Setting Value Setting/Start/Stop

(1) Timer counter initial setting value setting

The initial setting value of the ENCAn counter register (ENCAnCNT) can be set in the counter operation stopped status (ENCAnTE = 0).

(2) Timer counter startup

By writing 1 to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to 1, the count operation is enabled, and counting operation is performed upon detection of the valid edge of the encoder input.

(3) Overflow operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. If the counter value changes from $FFFF_H$ to 0000_H, an overflow interrupt (INTENCAnlOV) is generated, and the overflow flag (ENCAnOVF) is set to 1. The overflow flag (ENCAnOVF) is cleared to 0 when 1 is set to the overflow flag clear (ENCAnCLOV). For details about the operation, see **Section 40.4.8.1, Overflow Occurrence and Overflow Flag Clear Operation**.

(4) Underflow operation

An underflow occurs when down-counting is performed when the counter value is 0000_H. If the counter value changes from 0000_H to $FFFF_H$, an underflow interrupt (INTENCAnlUD) is generated, and the underflow flag (ENCAnUDF) is set to 1. The underflow flag (ENCAnUDF) is cleared to 0 when 1 is set to the underflow flag clear (ENCAnCLUD). For details about the operation, see **Section 40.4.8.2, Underflow Occurrence and Underflow Flag Clear Operation**.

(5) Timer counter stop

By writing 1 to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to 0, and the count operation is stopped. At this time, the timer counter is not reset to 0000_H and holds the value before count operation stop.

40.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of ENCAnUDS[1:0].

40.4.2.1 When ENCAnUDS[1:0] Bits in ENCAnCTL = 00_B

Table 40.22 When ENCAnUDS[1:0] = 00_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 input	ENCAnE1 input	Counting operation
0	0	Rising edge	High level	Down
		Falling edge		
		Both edges		
		Rising edge	Low level	Up
		Falling edge		
		Both edges		

The valid edge for ENCAnE0 is specified by setting ENCAnEIS[1:0].

"Counting operation" indicates that counting up or down proceeds when the valid edges of the ENCAnE0 signal matches the valid level ENCAnE1 signal.

The following timing chart shows counting operation when ENCAnUDS[1:0] = 00_B.

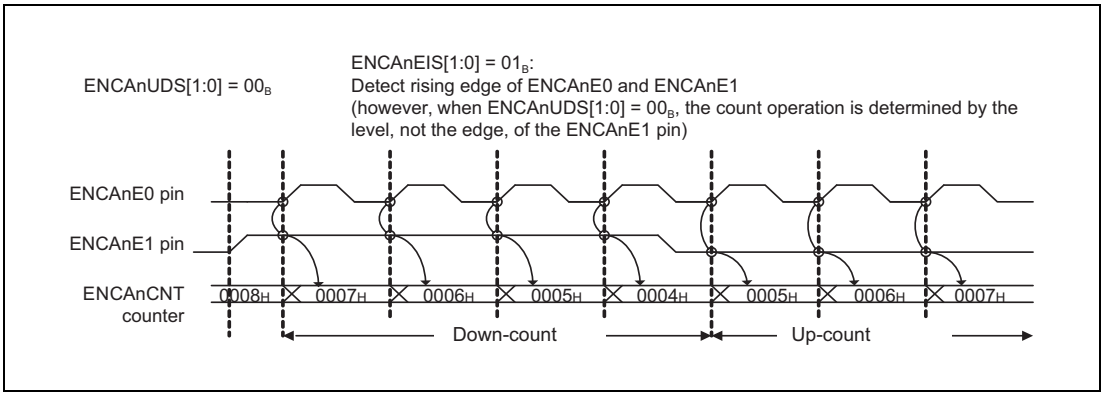

Figure 40.3 Counting Operation when ENCAnUDS[1:0] in ENCAnCTL = 00_B

40.4.2.2 When ENCAnUDS[1:0] Bits in ENCAnCTL = 01_B

Table 40.23 When ENCAnUDS[1:0] = 01_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 input	ENCAnE1 input	Counting operation
0	1	Low level	Rising edge	Down
			Falling edge	
			Both edges	
		High level	Rising edge	
			Falling edge	
			Both edges	
		Rising edge	Low level	Up
		Falling edge		
		Both edges		
		Rising edge	High level	
		Falling edge		
		Both edges		
		Simultaneous input		Hold

The valid edges for ENCAnE0 and ENCAnE1 are specified by setting ENCAnEIS[1:0].

“Counting operation” indicates that counting up or down proceeds when the valid edges and levels of the signals on ENCAnE0 and ENCAnE1 match.

The following timing chart shows counting operation when ENCAnUDS[1:0] = 01_B.

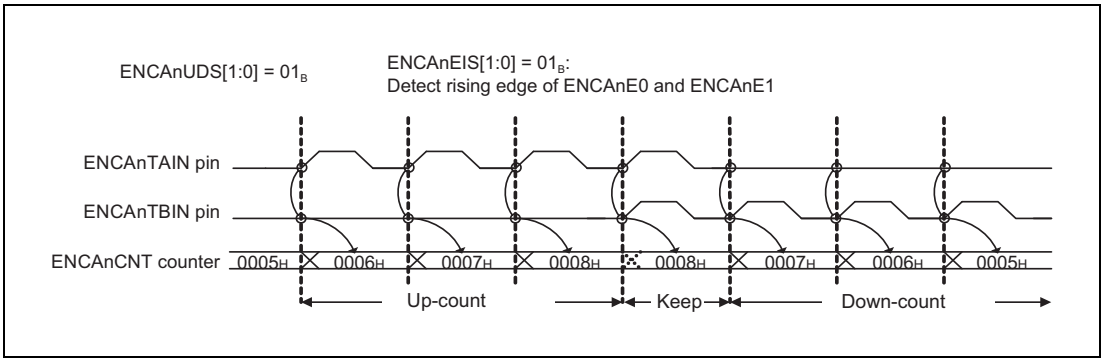

Figure 40.4 Counting Operation when ENCAnUDS[1:0] in ENCAnCTL = 01_B

40.4.2.3 When ENCAnUDS[1:0] Bits in ENCAnCTL = 10_B

Table 40.24 When ENCAnUDS[1:0] = 10_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 input	ENCAnE1 input	Counting operation
1	0	Rising edge	Low level	Down
		Rising edge	Falling edge	
		Falling edge	Low level	Up
		Falling edge	Falling edge	
		Low level	Rising edge	Hold
		Rising edge	Rising edge	
		High level	Rising edge	
		Falling edge	Rising edge	
		Low level	Falling edge	
		Rising edge	High level	
		High level	Falling edge	
		Falling edge	High level	

Valid edge specification for ENCAnE0 and ENCAnE1 (setting to ENCAnEIS[1:0]) is invalid.

The following timing chart shows counting operation when ENCAnUDS[1:0] = 10_B.

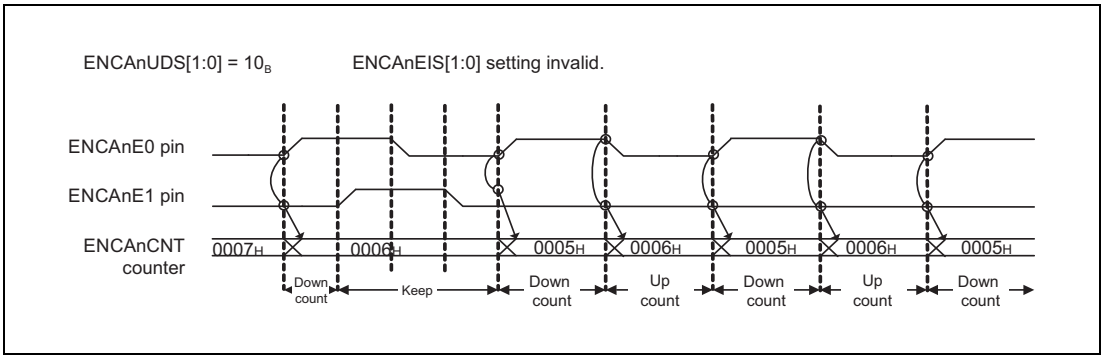

Figure 40.5 Counting Operation when ENCAnUDS[1:0] in ENCAnCTL = 10_B

40.4.2.4 When ENCAnUDS[1:0] Bits in ENCAnCTL = 11_B

Table 40.25 When ENCAnUDS[1:0] = 11_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 input	ENCAnE1 input	Counting operation
1	1	Low level	Falling edge	Down
		Rising edge	Low level	
		High level	Rising edge	
		Falling edge	High level	
		Rising edge	High level	Up
		High level	Falling edge	
		Falling edge	Low level	
		Low level	Rising edge	
		Simultaneous input		Hold

Valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS[1:0]) is invalid.

When the valid edges of the signals on ENCAnE0 and ENCAnE1 coincide, the count is retained.

The following timing chart shows counting operation when ENCAnUDS[1:0] = 11_B

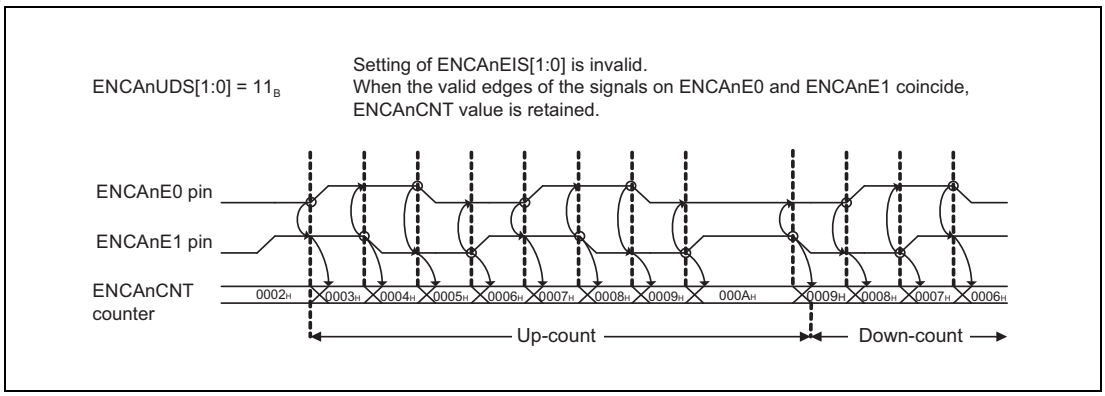

Figure 40.6 Counting Operation when ENCAnUDS[1:0] = 11_B

40.4.3 Timer Counter Clear Control by Encoder Input

The following conditions lead to clearing of the timer counter to 0000_H.

- Detection of a valid edge of the encoder clearing input signal (signal on the ENCAnEC pin)
- Level detection of the encoder input and encoder clearing input signals (signals on the ENCAnE0, ENCAnE1, and ENCAnEC pins)

Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS[1:0] bits of the ENCAnIOC1 register.

Table 40.26 Timer Counter Clear Control by Encoder Input

Clearing method	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS[1:0]
(1)	0	Invalid	Invalid	Invalid	Valid
(2)	1	Valid	Valid	Valid	Invalid

40.4.3.1 Clearing Method when ENCAnSCE = 0

- Upon detection of the valid edge of ENCAnEC, the timer counter is cleared to 0000_H in synchronization with the operation clock.
- The valid edge of ENCAnEC is specified by the setting of the ENCAnECS[1:0] bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (INTENCAnlEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCAnSCE = 0, see the timing chart in **Section 40.4.8.19, Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0**.

40.4.3.2 Clearing Method when ENCAnSCE = 1

- When the clear levels of the ENCAnEC, ENCAnE1, and ENCAnE0 inputs are detected, the timer counter is cleared to 0000_H in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, and ENCAnE0 inputs by the settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS[1:0] bits are invalid.
- An encoder clear interrupt request signal (INTENCAnlEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

Table 40.27 Clearing Conditions of Timer Counter

Counter Clear Condition Setting			Encoder Input Level		
ENCAnZCL	**ENCAnBCL**	**ENCAnACL**	**ENCAnEC**	**ENCAnE1**	**ENCAnE0**
0	0	0	Low	Low	Low
0	0	1	Low	Low	High
0	1	0	Low	High	Low
0	1	1	Low	High	High
1	0	0	High	Low	Low
1	0	1	High	Low	High
1	1	0	High	High	Low
1	1	1	High	High	High

40.4.4 Functions of ENCAnCCR0

40.4.4.1 Compare Function

- When ENCAnCRM0 = 0, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (INTENCAnl0) is output.
- When ENCAnECM0 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 40.28 Compare Function of ENCAnCCR0

ENCAnCCR0 function	Compare match clear control	Next count operation	Timer counter clearing upon compare match with ENCAnCCR0
ENCAnCRM0	ENCAnECM0		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Clears timer counter to 0000_H.
		Down-count	Does not clear (continues count operation).

When ENCAnLDE = 1

- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (INTENCAnlUD) is output.

NOTE

For the timing chart when ENCAnLDE = 1, see the timing charts in **Section 40.4.8.8, Using the ENCAnLDE Function Immediately after Startup** and **Section 40.4.8.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

40.4.4.2 Capture Function

- When ENCAnCRM0 = 1, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCAnTTIN0), the value of the timer counter is stored into ENCAnCCR0.
- A capture 0 interrupt (INTENCAnl0) is output during capture operation.

NOTE

For details about capture operation to ENCAnCCR0, see the timing charts in **Section 40.4.8.14, Capture Operation between Count Clocks (ENCAnCCR0)** and **Section 40.4.8.17, Encoder operation when compare match clear control is disabled**.

40.4.5 Functions of ENCAnCCR1

40.4.5.1 Compare Function

- When ENCAnCRM1 = 0, the ENCAnCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (INTENCAnl1) is output.
- When ENCAnECM1 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 40.29 Compare Function of ENCAnCCR1

ENCAnCCR1 function	Compare match clear control	Next count operation	Timer counter clearing upon compare match with ENCAnCCR1.
ENCAnCRM1	ENCAnECM1		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Does not clear (continues count operation).
		Down-count	Clears timer counter to 0000_H.

Compare match interrupt detection mask function

- When ENCAnCME = 1, the compare 1 match interrupt detection mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCAnCME = 1 and ENCAnMCS = 0, the compare 1 match interrupt detection mask function is disabled by a write operation to the ENCAnCCR1 register.
- When ENCAnCME = 1 and ENCAnMCS = 1, the compare 1 match interrupt detection mask function is disabled by a timer counter clear operation accompanying phase Z or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer counter value.
- When ENCAnCME = 1, ENCAnMCS = 1 and ENCAnLDE = 1, the compare 1 match interrupt detection mask function is disabled by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection.
- Setting ENCAnECM1 to 1 is prohibited when enabling the compare 1 match interrupt detection mask function.

Table 40.30 Compare Match Interrupt Detection Mask Function of ENCAnCCR1

ENCAnCCR1 function	Compare 1 match interrupt mask	Interrupt mask cancel trigger	Compare 1 match interrupt output upon compare match with ENCAnCCR1
ENCAnCRM1	ENCAnCME	ENCAnMCS	
0 (Compare)	0 (Mask function disabled)	— (Setting invalid)	Outputs compare 1 match interrupt upon each compare match.
	1 (Mask function enabled)	0 (Write operation to ENCAnCCR1)	Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.)
		1 (Timer counter clear operation) (Loading of ENCAnCCR0 to timer counter upon underflow occurrence when ENCAnLDE = 1)	

40.4.5.2 Capture Function

When ENCAnCRM1 = 1, the ENCAnCCR1 register functions as a dedicated capture register.

NOTE

For details about capture operation to ENCAnCCR1, see the timing chart in **Section 40.4.8.13, Capture Operation between Count Clocks (ENCAnCCR1)**.

The operations for each of the ENCAnCTS settings are shown in the table below.

Table 40.31 Operations for each of the ENCAnCTS settings

ENCAnCCR1 function	Capture trigger selection			
ENCAnCRM1	ENCAnCTS	Capture trigger signal	Timer counter clearing	Interrupt occurrence
1 (Capture)	0	Capture trigger 1 input (ENCAnTTIN1)	Does not clear timer counter.	(1) Capture 1 interrupt (INTENCAnI1)
	1	Encoder clear input (specified by ENCAnSCE)	Clears timer counter.	(1) Capture 1 interrupt (INTENCAnI1) (2) Encoder clear interrupt (INTENCAnIEC)

NOTE

For details about the timing chart when ENCAnCTS = 0 or ENCAnCTS = 1, see the following:

Section 40.4.8.3, Count Clear and Capture Operation by Encoder Clear Input (ENCAnEC pin), **Section 40.4.8.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 40.4.8.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 40.4.8.11, Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input** and **Section 40.4.8.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

40.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the value of the timer counter and the ENCAnCCR0/ENCAnCCR1 setting value, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in the ENCAnCTL register, is detailed in the following table.

Table 40.32 Timer Counter Clearing Operation upon Compare Register Match

ENCAnECM1 and ENCAnECM0	Next count operation	Timer counter clearing upon compare match with ENCAnCCR1	Timer counter clearing upon compare match with ENCAnCCR0
00	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
01	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000_H.
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
10	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues count operation).
11	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000_H.
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues count operation).

40.4.6 Startup/Stop of Timer Counter

40.4.6.1 Startup of Timer

The timer operation can be started by setting the ENCAnTS bit to 1. Simultaneous start with other timer can be possible by setting the PIC. For details, see **Section 41.2.3.1, Simultaneous Start Trigger Function**

40.4.6.2 Stop of Timer

When the ENCAnTT bit is set to 1, the ENCAnTE bit becomes 0 and the timer stops.

40.4.7 ENCA Setting Sequences

40.4.7.1 Encoder timer setting procedure

The encoder timer setting procedure is described below.

Table 40.33 Encoder Timer Setting Procedure

	Action	Setting status
Initial Setting	Reset deassertion	Power-on status, operation stopped status (Writing to each register is enabled)
ENCAn initial Settings	Perform the following initial settings. • Setting for counter • Setting for counter clear • Setting for ENCAnCCR0 register • Setting for ENCAnCCR1 register	This is the count operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0.
	Perform the counter initial value settings. • Set any 16-bit value to ENCAnCNT register. (When, after setting this register, the ENCAnTS bit is set to 1, the counter operation starts from the set count value.)	The set value is set as the initial value of the counter register value.
Operation Start	Perform the counter operation start setting. • Set the ENCAnTS bit to 1.	This is the counter operation start status. The value of the ENCAnTE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit.
Operating	Only those registers whose setting can be changed during operation can be rewritten. • ENCAnCCR0 register setting • ENCAnCCR1 register setting • ENCAnIOC0 register setting	The count operation set with the initial setting is performed, and up/down counting is performed according to the ENCAnE0 and ENCAnE1 pins.
Operation Stop	Perform the counter operation stop setting during operation. • Set the ENCAnTT bit to 1.	This is the counter operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0.
ENCA stop	Reset	The setting registers are initialized.

(1) Initial Setting Procedure for Counter

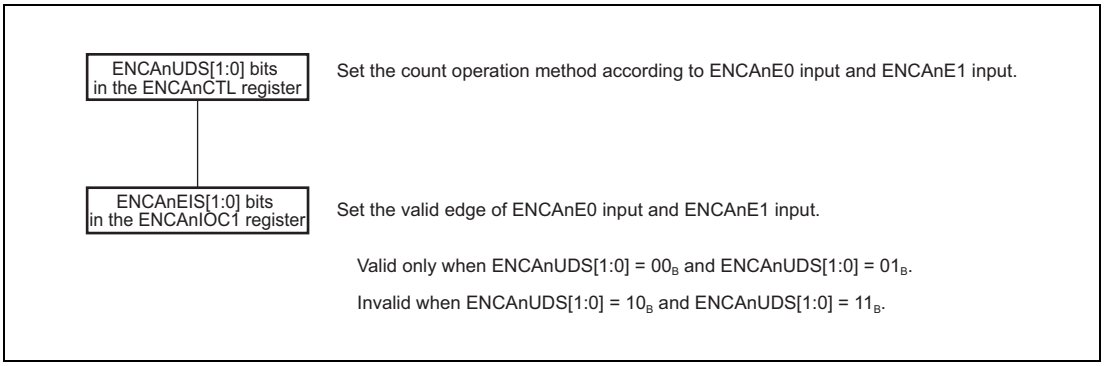

Figure 40.7 Initial Setting Procedure for Counter

(2) Initial Setting Procedure for Counter Clear

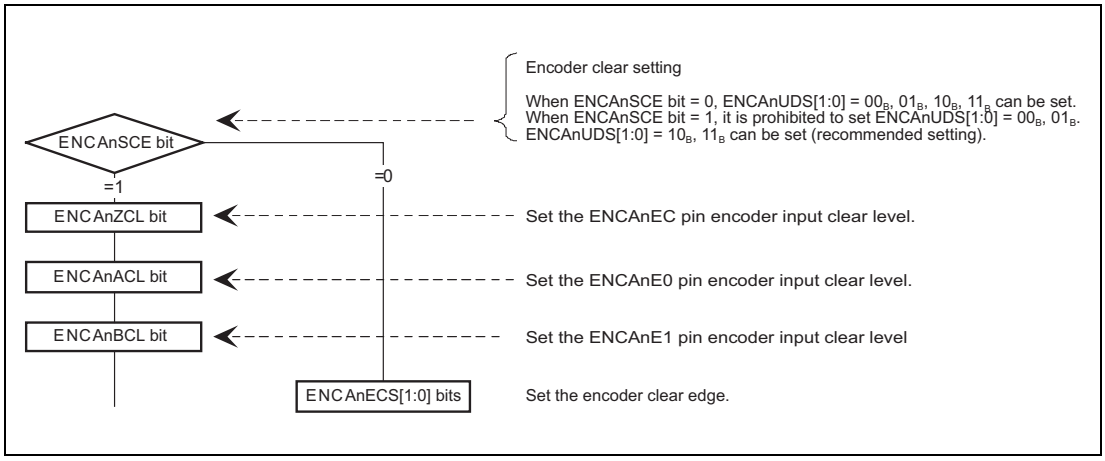

Figure 40.8 Initial Setting Procedure for Counter Clear

(3) Setting Procedure for ENCAnCCR0 Register

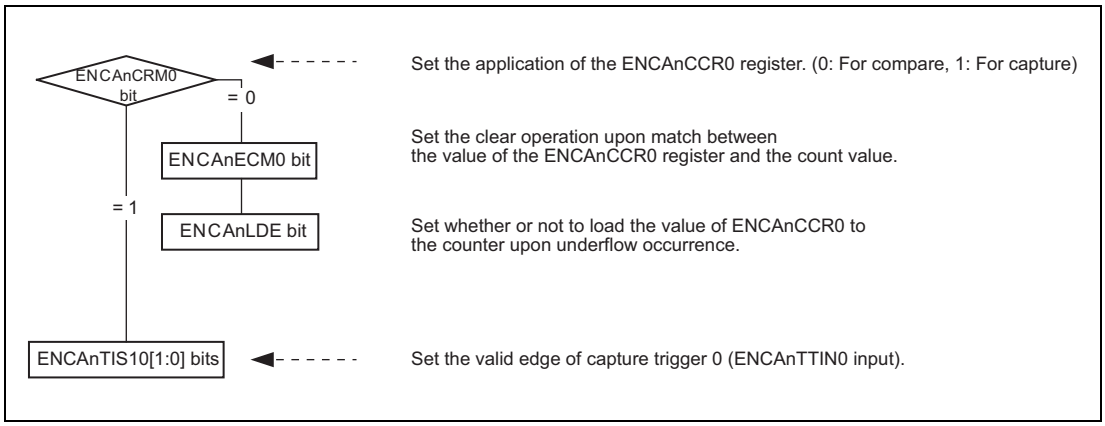

Figure 40.9 Setting Procedure for ENCAnCCR0 register

(4) Setting Procedure for ENCAnCCR1 Register

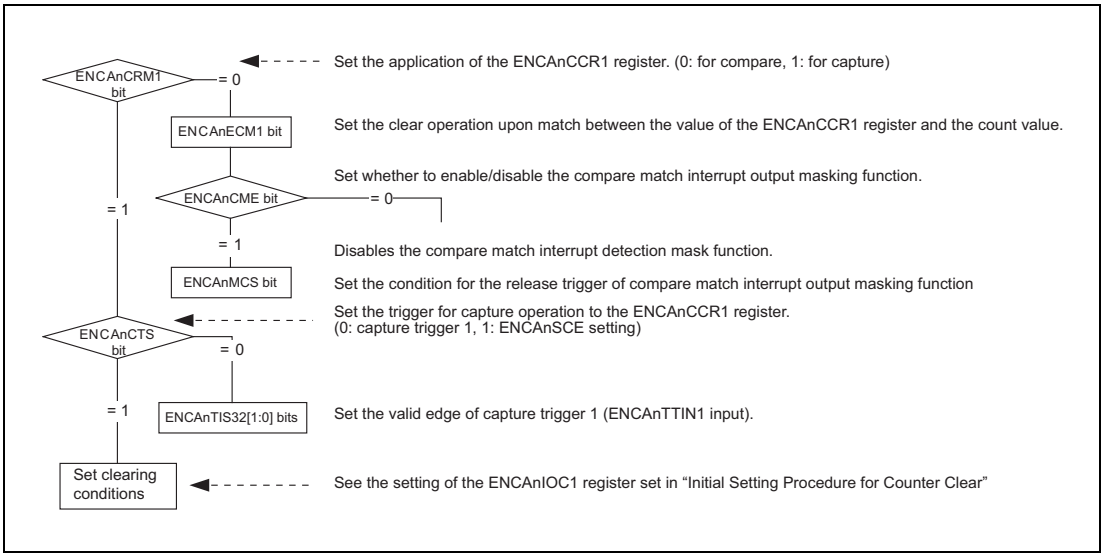

Figure 40.10 Setting Procedure for ENCAnCCR1 register

40.4.8 Timing Chart

40.4.8.1 Overflow Occurrence and Overflow Flag Clear Operation

When an up-counting is performed while the counter value is $FFFF_H$, an overflow occurs. If an overflow occurs, an overflow interrupt (INTENCAnlOV) is output and the overflow flag (ENCAnOVF) is set to 1. The overflow flag clear bit (ENCAnCLOV) is set to 1, the overflow flag (ENCAnOVF) is cleared to 0.

The overflow occurrence and overflow flag clear operation are described as follows.

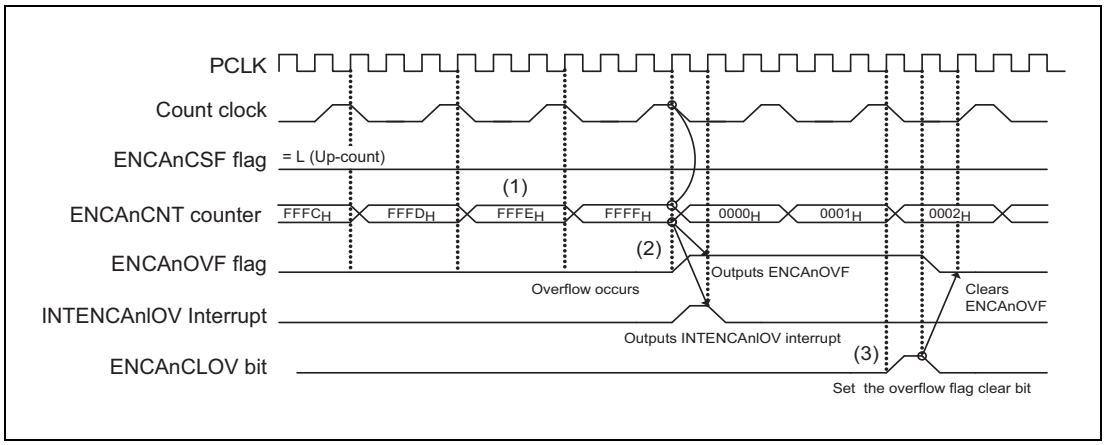

Figure 40.11 Overflow Occurrence and Overflow Flag Clear Setting

(1) The count value is up-counted from $FFFE_H$ to $FFFF_H$.

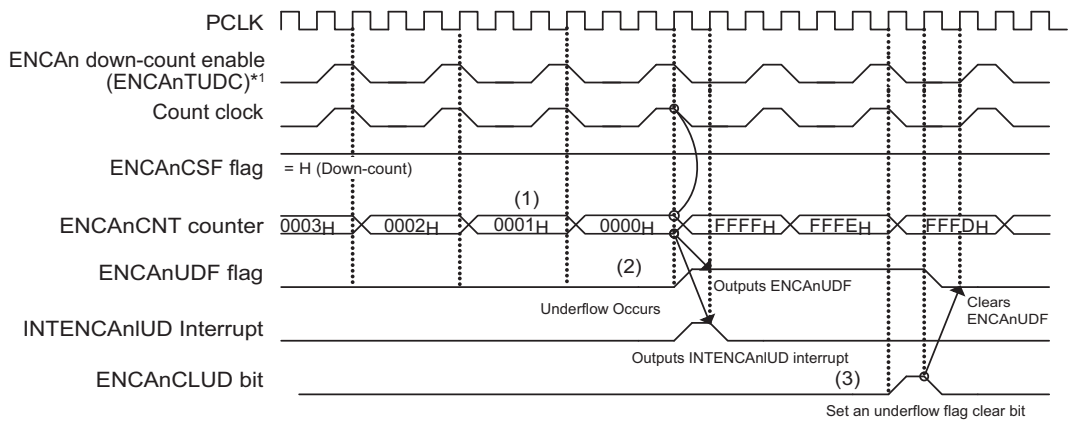
(2) When the count value changes from $FFFF_H$ to 0000_H, an overflow occurs. At the same time, an overflow interrupt is output, and the overflow flag is set to 1.

(3) An overflow flag is cleared to 0 by setting 1 to the ENCAnCLOV bit in the ENCAnFGC register according to the clearing procedure. In addition, an overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 while ENCAnTE.ENCAnTE is 0, or by setting an input signal of the ENCAnTSST (simultaneous start trigger input) to high.

40.4.8.2 Underflow Occurrence and Underflow Flag Clear Operation

When down-counting is performed while the counter value is 0000_H, an underflow occurs. If an underflow occurs, an underflow interrupt (INTENCAnlUD) is output and the underflow flag (ENCAnUDF) is set to 1. The underflow flag clear bit (ENCAnCLUD) is set to 1, the underflow flag (ENCAnUDF) is cleared to 0.

The underflow occurrence and underflow flag clear operation are described as follows.



Note 1. During high-level output of the count clock signal (ENCATCKEN), Down-count enable signal (ENCAnTUDC) output high level to indicate the down status.

Figure 40.12 Underflow Occurrence and Underflow Flag Clear Setting

(1) The count value is down-counted from 0001_H to 0000_H.

(2) When the count value changes from 0000_H to $FFFF_H$, an underflow occurs. At the same time, an underflow interrupt is output, and the underflow flag is set to 1.

(3) An underflow flag is cleared to 0 by setting 1 to the ENCAnCLUD bit in the ENCAnFGC register according to the clearing procedure. In addition, an underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS to 1 while ENCAnTE.ENCAnTE is 0, or by setting an input signal of the ENCAnTSST (simultaneous start trigger input) to high.

40.4.8.3 Count Clear and Capture Operation by Encoder Clear Input (ENCAnEC pin)

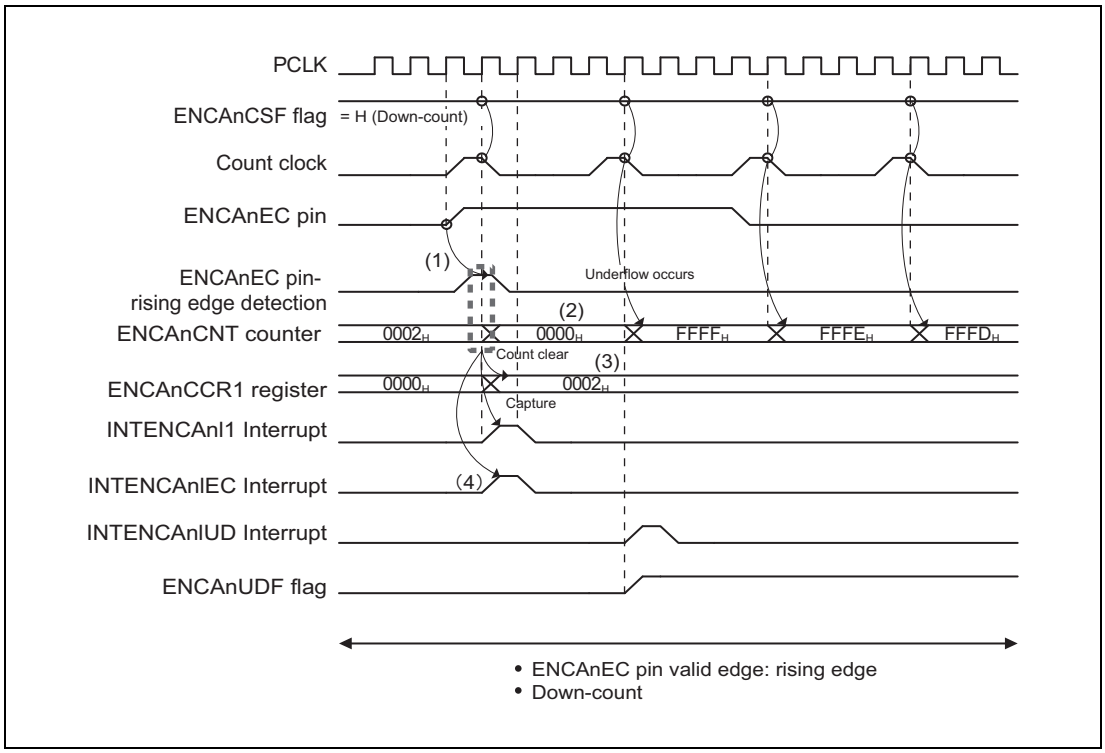


Figure 40.13 Timing Diagram of Count Clear and Capture Operation by Encoder Clear Input (ENCAnEC pin)

[Setting Conditions]

- ENCAnCTL.ENCAnCRM1 = 1
  (ENCAnCCR1 register is selected as capture)
- ENCAnCTL.ENCAnCTS = 1
  (ENCAnEC pin input is selected as a capture trigger input)
- ENCAnIOC1.ENCAnECS[1:0] bits = 01_B
  (Selected as a rising edge detection of the ENCAnEC pin input)

(1) Capture operation is performed by the rising edge of the ENCAnEC pin trigger.

(2) Clear operation is performed by an input to the ENCAnEC pin and the count value is reset to 0000_H.

(3) The counter value (0002_H) is captured to the ENCAnCCR1 at the rising edge of the ENCAnEC pin.

(4) At the same time, by the ENCAnEC pin input, a clear interrupt (INTENCAnlEC) and capture interrupt (INTENCAnl1) are output.

40.4.8.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

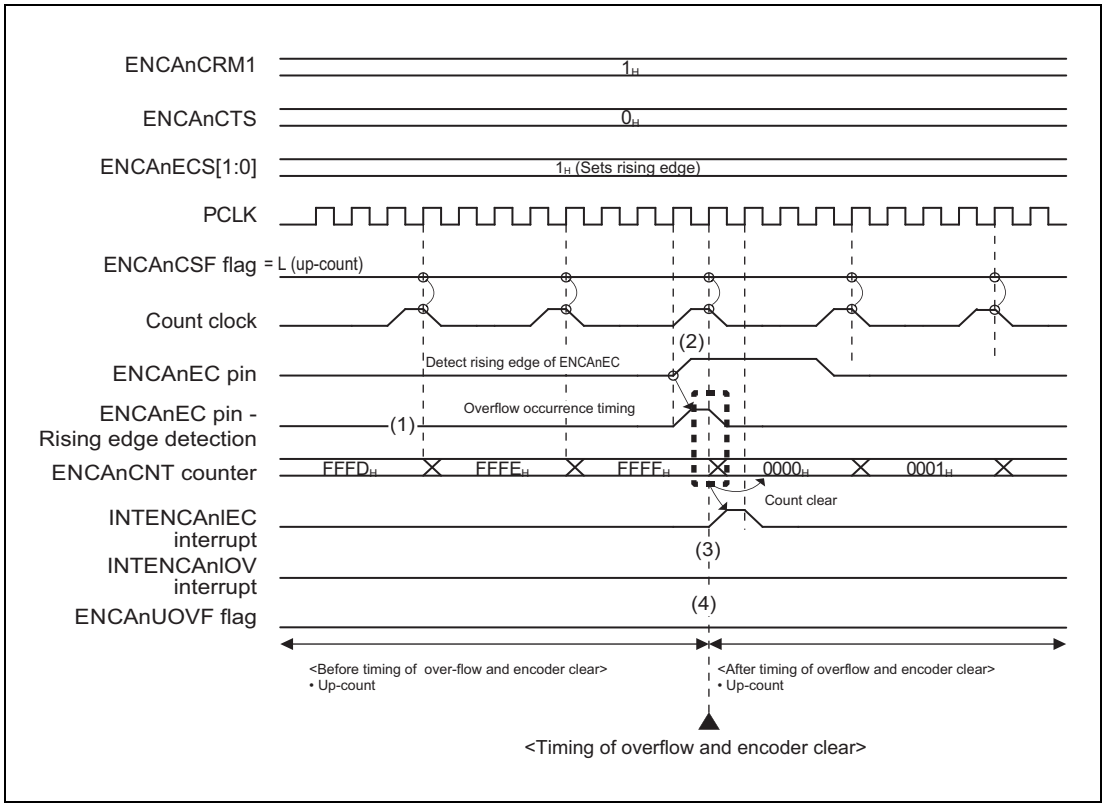

Figure 40.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

(1) An up-count from $FFFD_H$ is continuously performed.

(2) When an overflow occurs if the count value is $FFFF_H$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The counter value is cleared to 0000_H.

(3) When the counter value is cleared by the encoder clear input, a clear interrupt (INTENCAnIEC) by encoder clear input is output simultaneously. Because a clear operation by the phase Z input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output (An overflow does not occur. Clear operation is performed by the phase Z input).

(4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

40.4.8.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

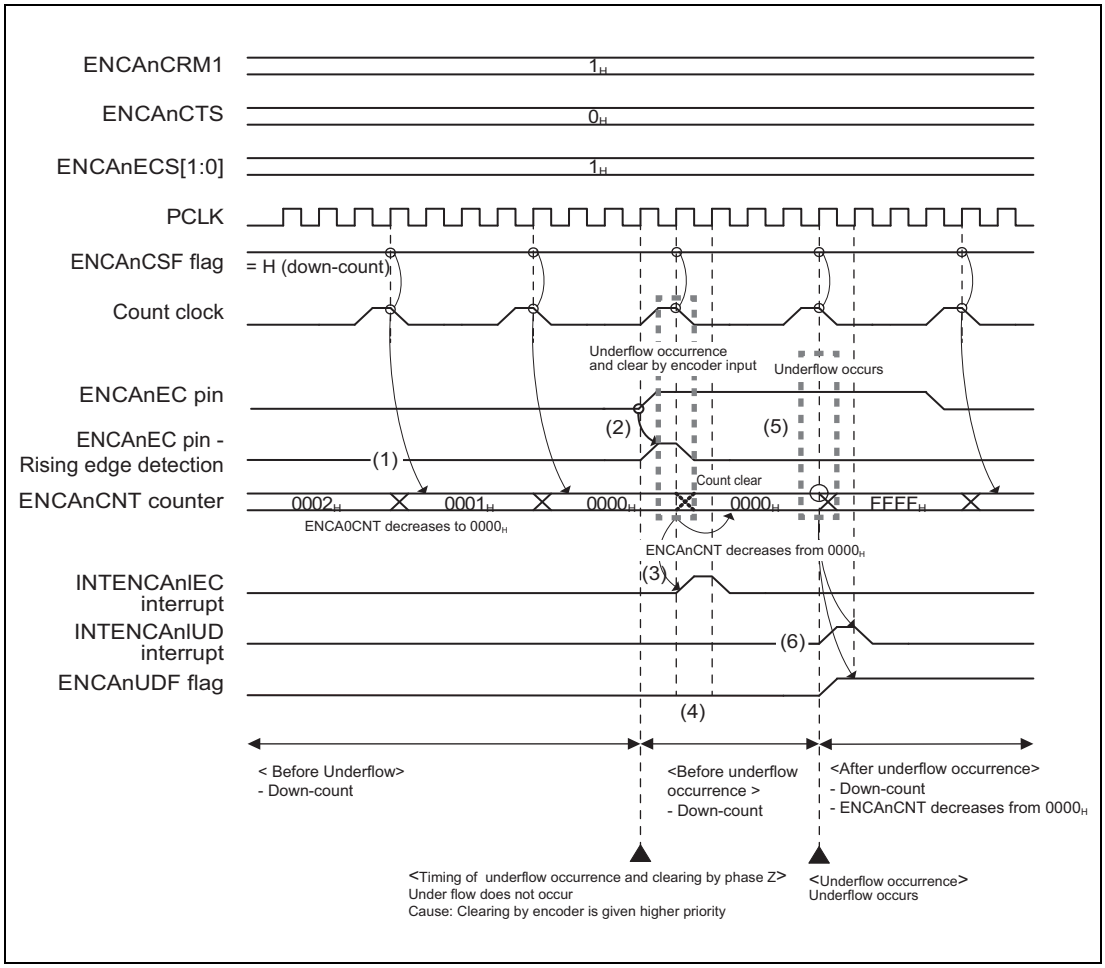

Figure 40.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

(1) A down-count from 0002_H is continuously performed.

(2) When an underflow occurs if the count value is 0000_H, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at 0000_H.

(3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (INTENCAnIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output (An underflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.

(5) When a further down-count is performed after the counter value changes to 0000_H by clear operation by the encoder clear input, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs.

(6) When an underflow occurs, an underflow interrupt ((INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set.

40.4.8.6 Overflow Operation Immediately after Startup

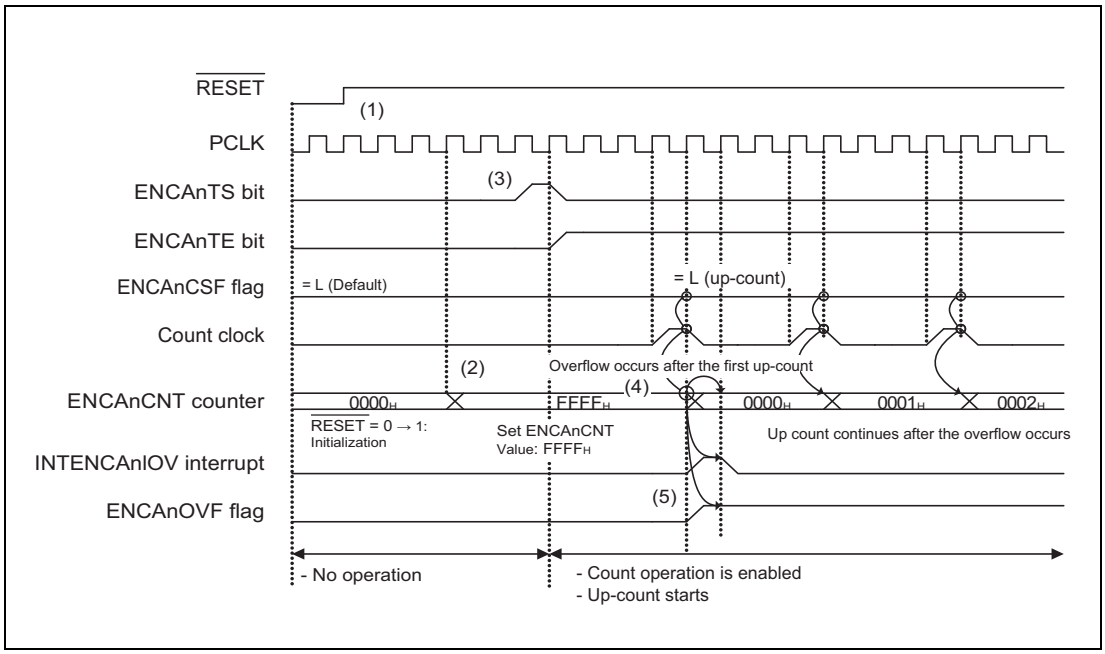

Figure 40.16 Overflow Operation Immediately after Startup

(1) When the $\overline{\text{RESET}}$ value changes from 0 to 1, the status changes from “reset” to “reset release”.

(2) The timer counter is set to $FFFF_H$ as the initial value.

(3) ENCAnTS is set to 1, and operation starts. ENCAnTE changes to 1, which indicates that operation is enabled.

(4) When an up-count is performed from $FFFF_H$ which is the initially set count value, the counter value changes from $FFFF_H$ to 0000_H, and an overflow occurs immediately after operation starts.

(5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (INTENCAnlOV) is output, and the overflow flag (ENCAnOVF) is set.

40.4.8.7 Underflow Operation Immediately after Startup

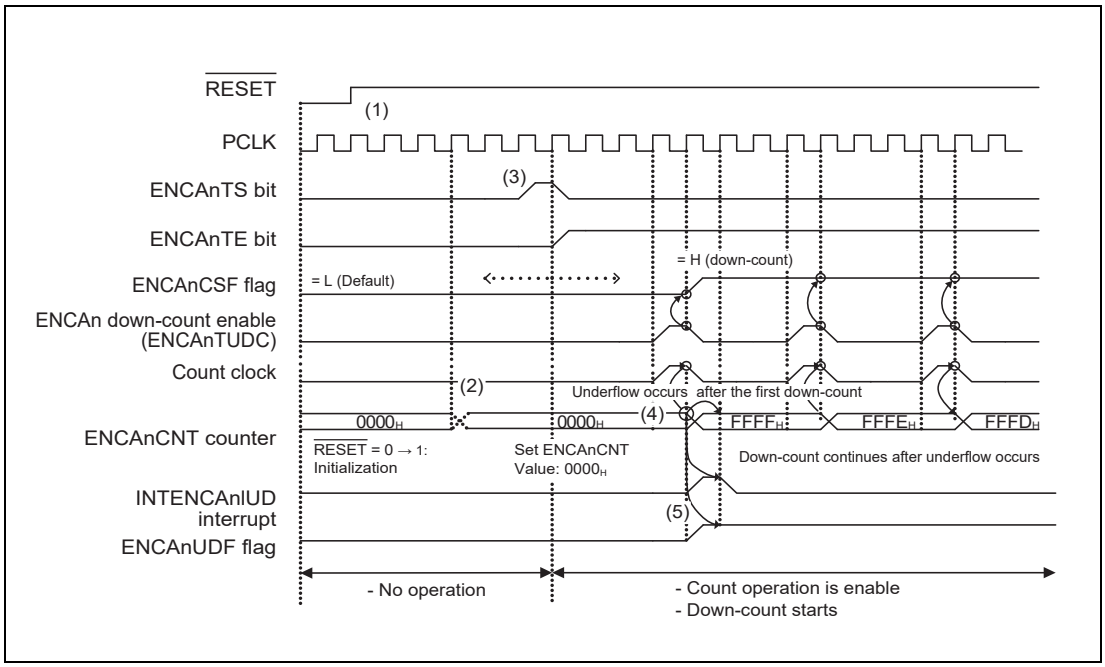

Figure 40.17 Underflow Operation Immediately after Startup

(1) When the $\overline{\text{RESET}}$ value changes from 0 to 1, the status changes from “reset” to “reset release”.

(2) The timer counter is set to 0000_H as the initial value.

(3) ENCAnTS is set to 1, and operation starts. ENCAnTE changes to 1, which indicates that operation is enabled.

(4) When a down-count is performed from 0000_H which is the initially set count value, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs immediately after operation starts.

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (INTENCAnlUD) is output, and the underflow flag (ENCAnUDF) is set.

40.4.8.8 Using the ENCAnLDE Function Immediately after Startup

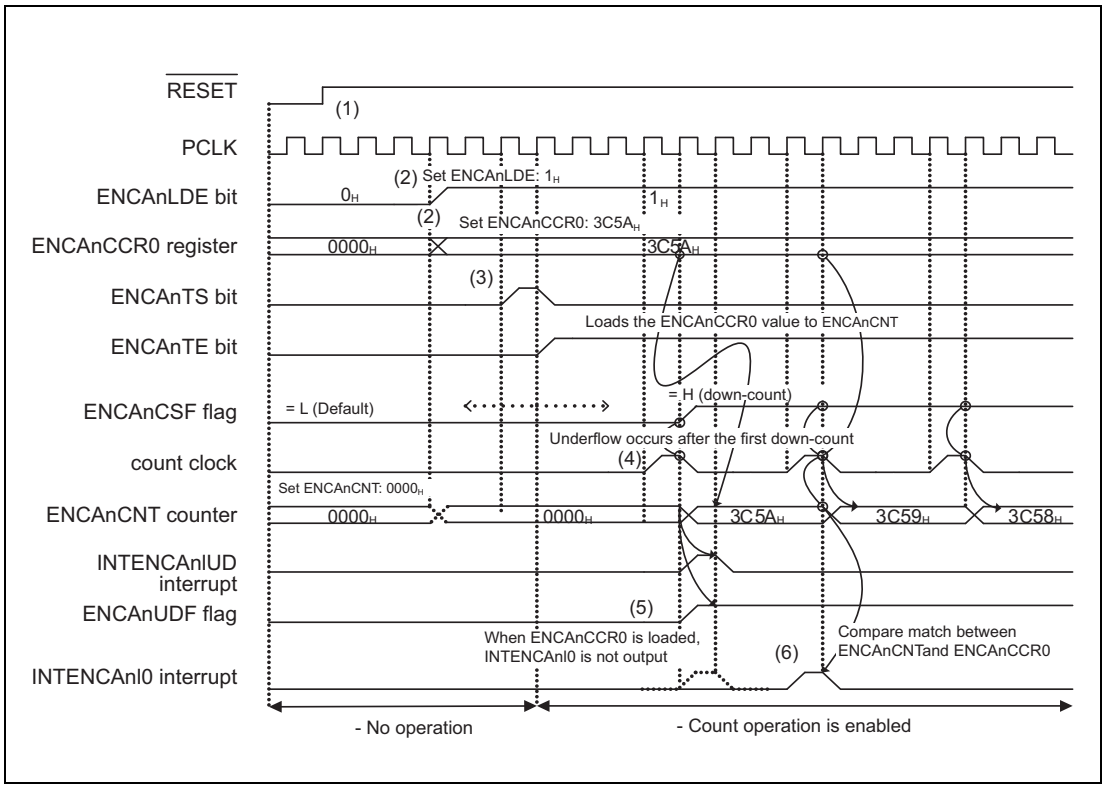

Figure 40.18 Using the ENCAnLDE Function Immediately after Startup

(1) When the $\overline{\text{RESET}}$ value changes from 0 to 1, the status changes from “reset” to “reset release”.

(2) The load enable bit (ENCAnLDE) is set to 1, capture/compare register 0 (ENCAnCCR0) is set to $3C5A_H$, and the timer counter is set to the initial value 0000_H.

(3) ENCAnTS is set to 1, and operation starts. ENCAnTE changes to 1, which indicates that operation is enabled.

(4) When a down-count is performed from 0000_H which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to 1, the ENCAnCCR0 value, $3C5A_H$, is loaded to the timer counter (INTENCAnl0 is not output during loading).

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (INTENCAnlUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-count operation from the loaded value ($3C5A_H$) continues).

(6) After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and INTENCAnl0 is output.

40.4.8.9 ENCAnLDE Function (Loading Count Value)

(1) <When ENCAnLDE = 0>

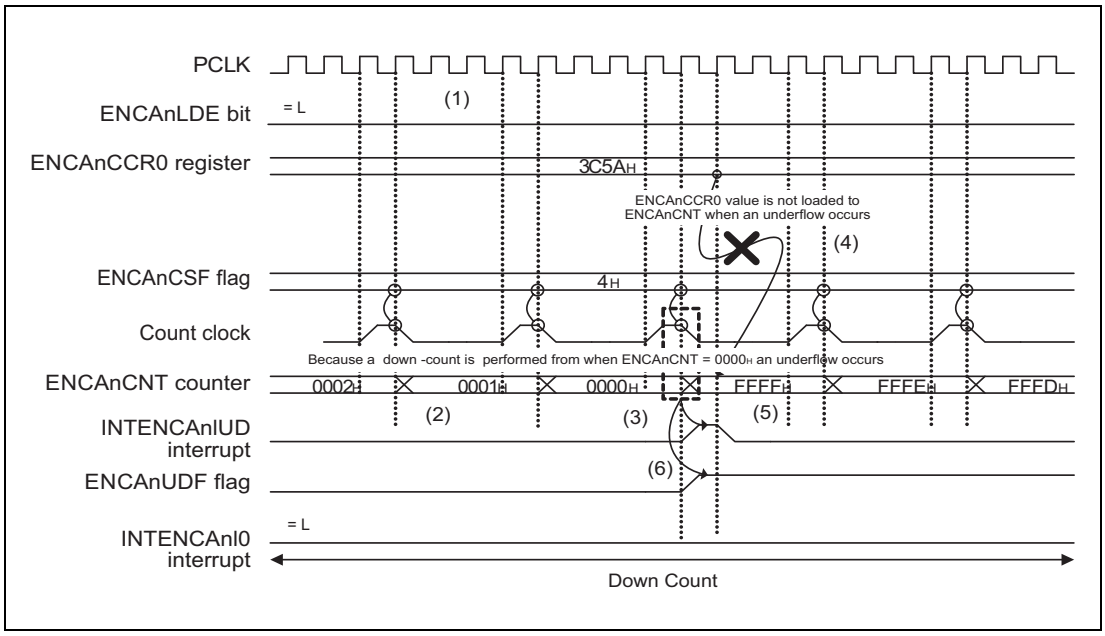

Figure 40.19 ENCAnLDE Function (when ENCAnLDE = 0)

(1) ENCAnLDE is set to 0 (even if an underflow occurs, the ENCAnCCR0 value is not loaded).

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When a further down-count is performed after the counter value changes to 0000_H, an underflow occurs.

(4) Because ENCAnLDE is set to 0, the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.

(5) Operation changes to underflow operation (counter value: $0000_H \rightarrow FFFF_H$).

(6) An underflow interrupt (INTENCAnlUD) is output, and the underflow flag (ENCAnUDF) is set.

(2) <When ENCAnLDE = 1>

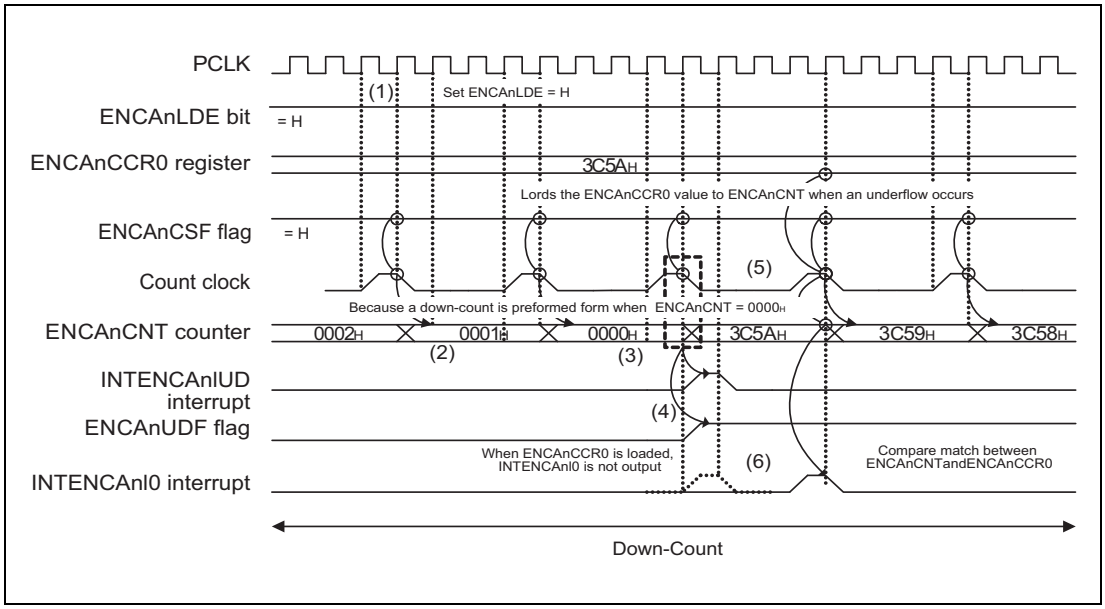

Figure 40.20 ENCAnLDE Function (when ENCAnLDE = 1)

(1) ENCAnLDE is set to 1 (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When a further down-count is performed after the counter value changes to 0000_H, an underflow occurs.

(4) An underflow interrupt is output, and the underflow flag is set.

(5) Because ENCAnLDE is set to 1, the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3C5A_H$.

(6) After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches with the ENCAnCCR0 value on a count clock, a compare match interrupt (INTENCAnI0) is output.

40.4.8.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCR0 Register

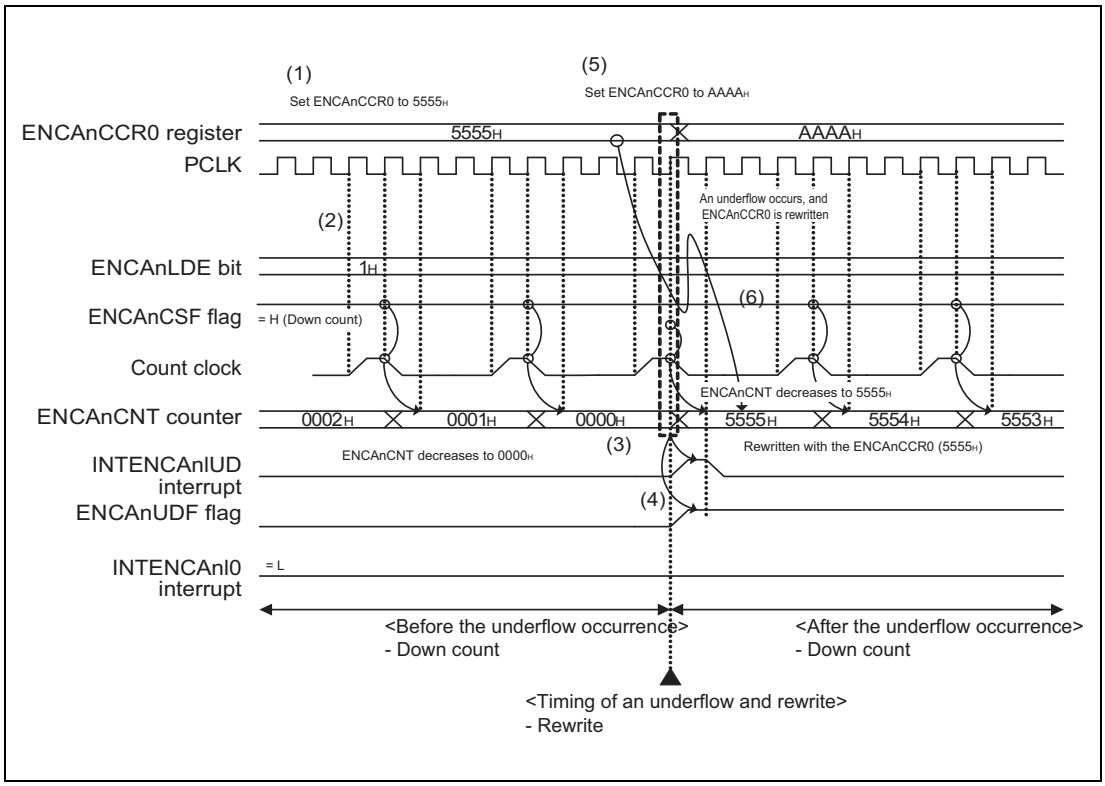

Figure 40.21 Conflict between ENCAnLDE Function and Rewrite of ENCAnCCR0 Register

(1) The ENCAnCCR0 register is currently set to 5555_H.

(2) ENCAnLDE is currently set to 1.

(3) A down-count is performed ($0002_H \rightarrow 0001_H \rightarrow 0000_H$), and an underflow occurs.

(4) An underflow interrupt is output, and the underflow flag is set.

(5) When an underflow occurs, the ENCAnCCR0 register value is changed from 5555_H to $AAAA_H$.

(6) When an underflow occurs, the ENCAnCCR0 value before the rewrite was performed (5555_H) is set in ENCAnCNT.

40.4.8.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

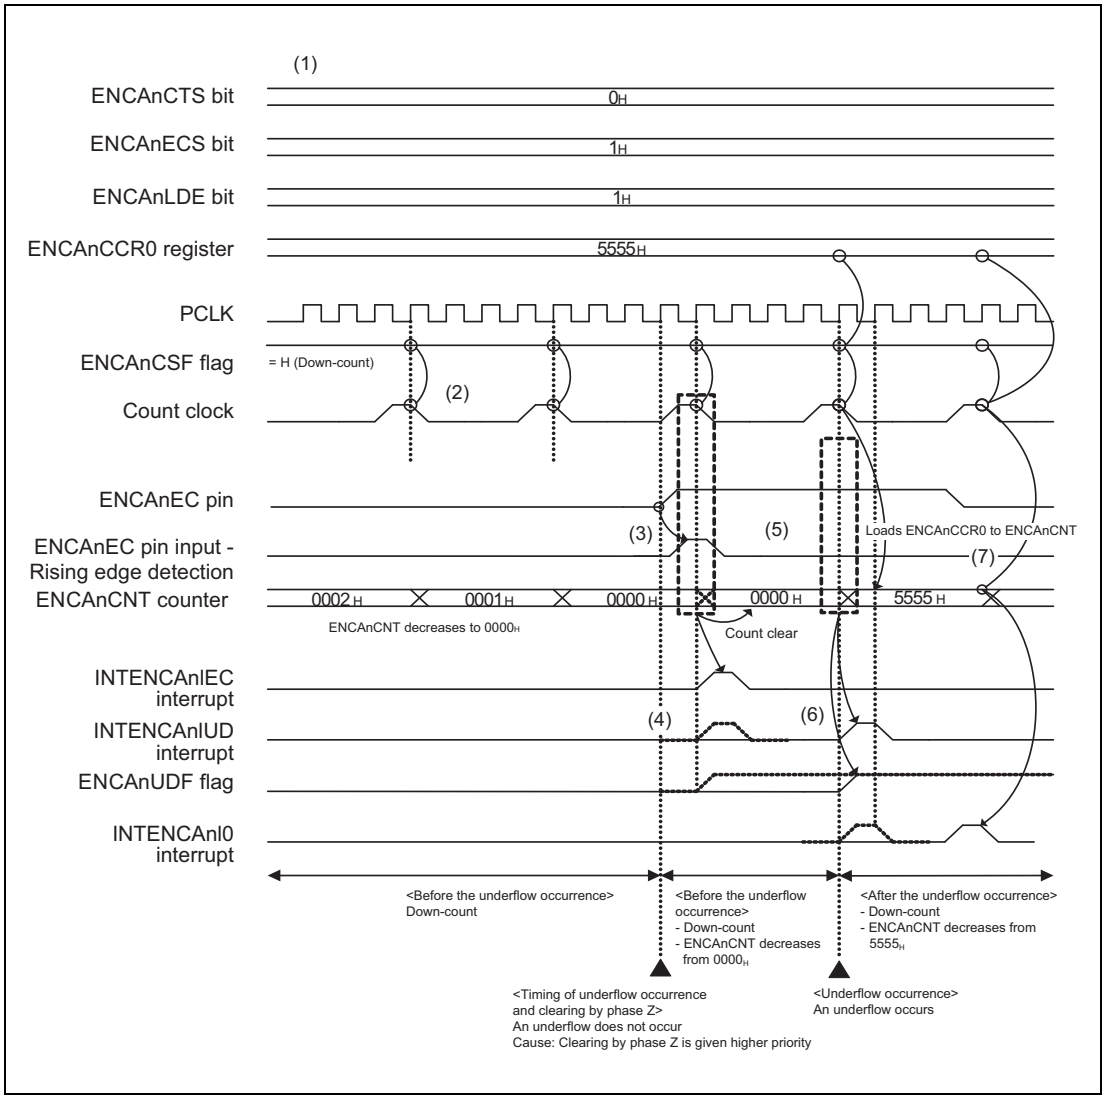

Figure 40.22 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS1 and ENCAnECS0 = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes 0000_H, the rising edge of ENCAnEC is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (INTENCAnlEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is 0000_H. Therefore, an underflow interrupt (INTENCAnlUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to 0000_H by clear operation by the encoder clear input, a down-count is performed and an underflow occurs.

(6) An underflow interrupt (INTENCAnlUD) is output, and the underflow flag (ENCAnUDF) is set.

(7) Because ENCAnLDE = 1, if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.

(8) After the ENCAnCCR0 value is set to ENCAnCNT, a compare match is detected according to the count clock. If the ENCAnCNT value matches with the ENCAnCCR0 value, a compare match interrupt (INTENCAnl0) is output.

40.4.8.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

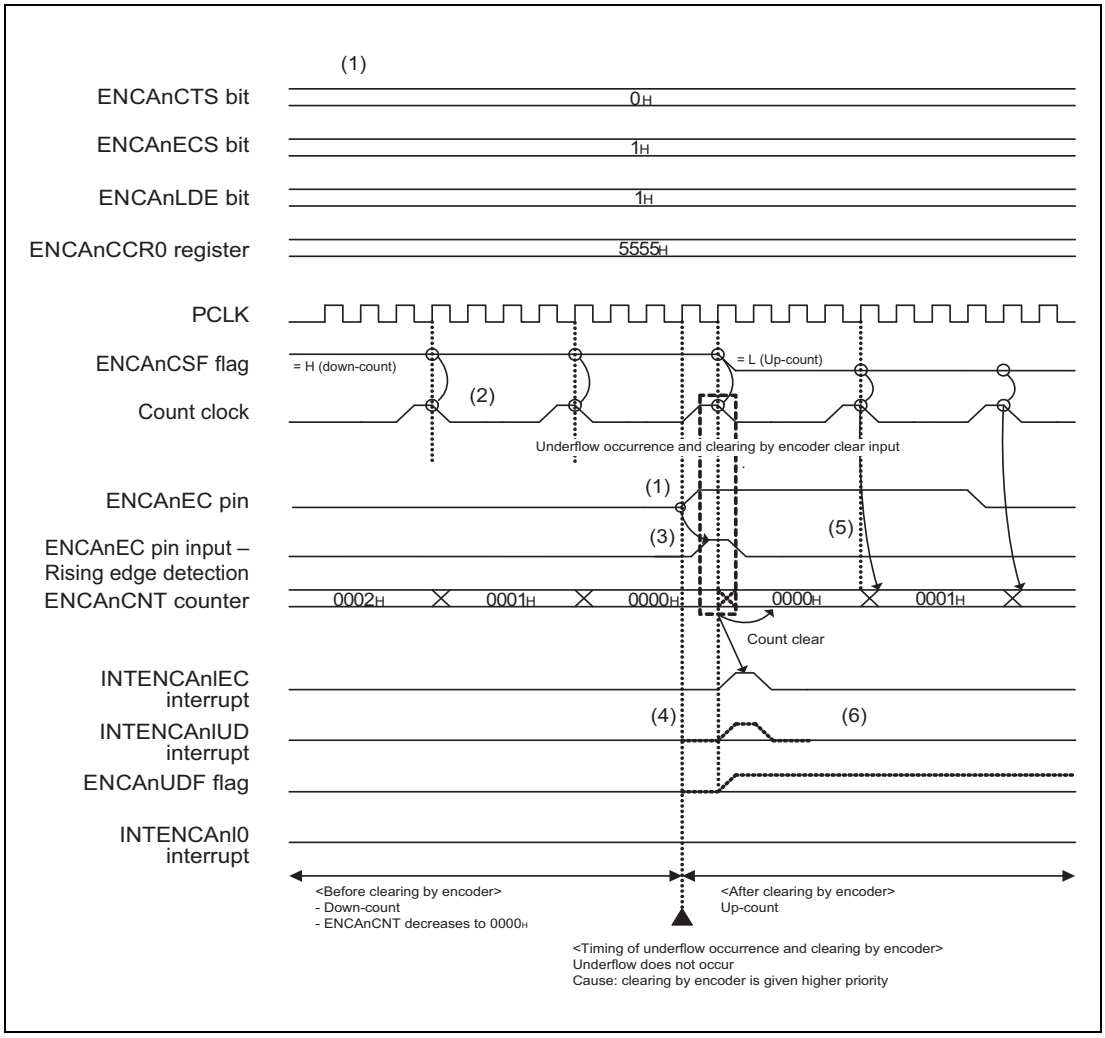

Figure 40.23 Up-count after Conflict between ENCAnLDE Function and Encoder Clear Input

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS1 and ENCAnECS0 = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes 0000_H, the rising edge of ENCAnEC is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (INTENCAnIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is 0000_H. Therefore, an underflow interrupt (INTENCAnIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to 0000_H by clear operation by the encoder clear input, an up-count is performed.

(6) An underflow interrupt (INTENCAnIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

40.4.8.13 Capture Operation between Count Clocks (ENCAnCCR1)

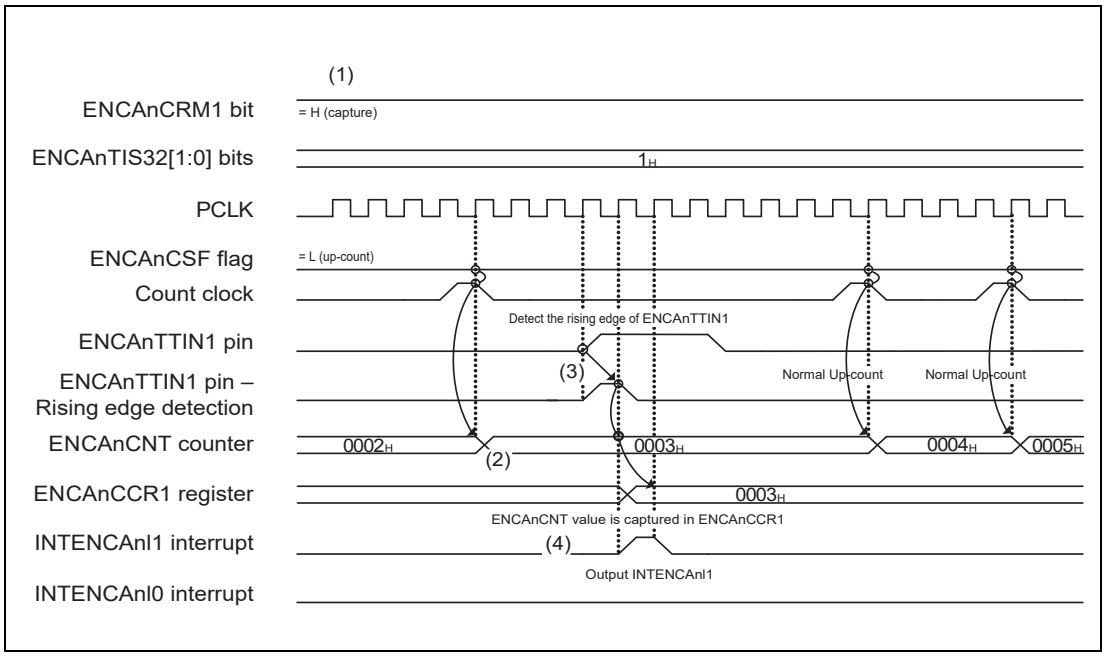

Figure 40.24 Capture Operation between Count Clocks (ENCAnCCR1)

(1) The values are set as follows: ENCAnCRM1 = 1 and ENCAnTIS32[1:0] = 01_B.

(2) An up-count is performed.

(3) The rising edge of the ENCAnTTIN1 input is detected, and the count value is captured in ENCAnCCR1.

(4) An interrupt request signal (INTENCAnI1) corresponding to the capture to the ENCAnCCR1 register is output.

40.4.8.14 Capture Operation between Count Clocks (ENCAnCCR0)

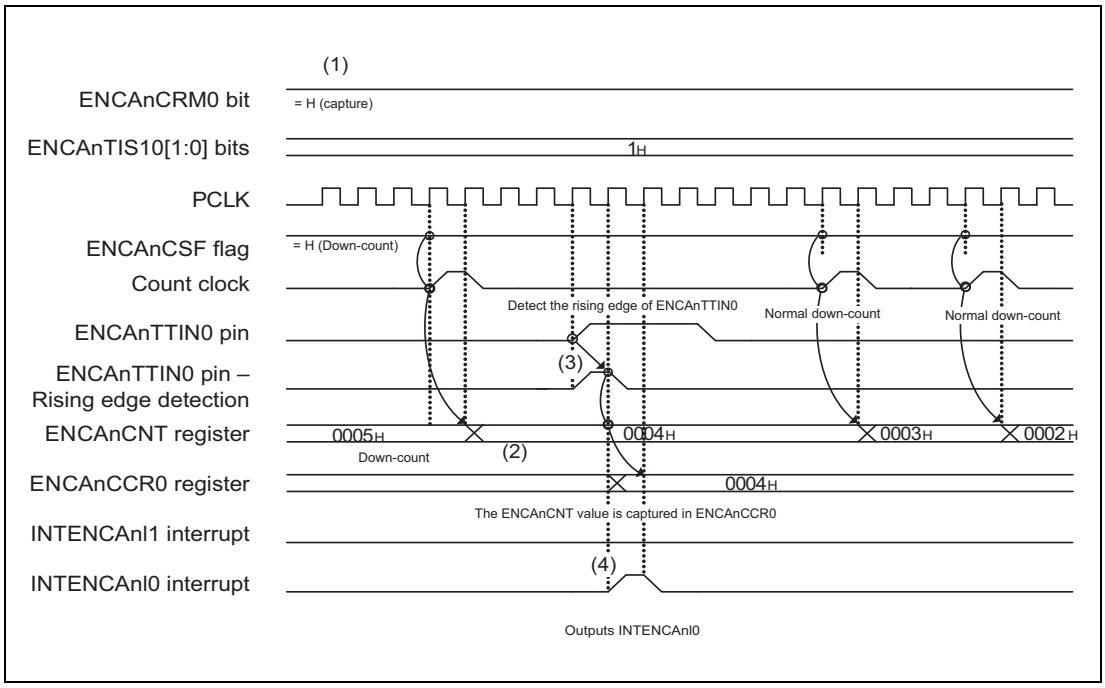

Figure 40.25 Capture Operation between Count Clocks (ENCAnCCR0)

(1) The values are set as follows: ENCAnCRM0 = 1, and ENCAnTIS10[1:0] = 01_B.

(2) A down-count is performed.

(3) The rising edge of the ENCAnTTIN0 input is detected, and the count value is captured in ENCAnCCR0.

(4) An interrupt request signal (INTENCAnI0) corresponding to the capture to the ENCAnCCR0 register is output.

40.4.8.15 Encoder operation when compare match clear control is enabled and ENCAnCTS = 0

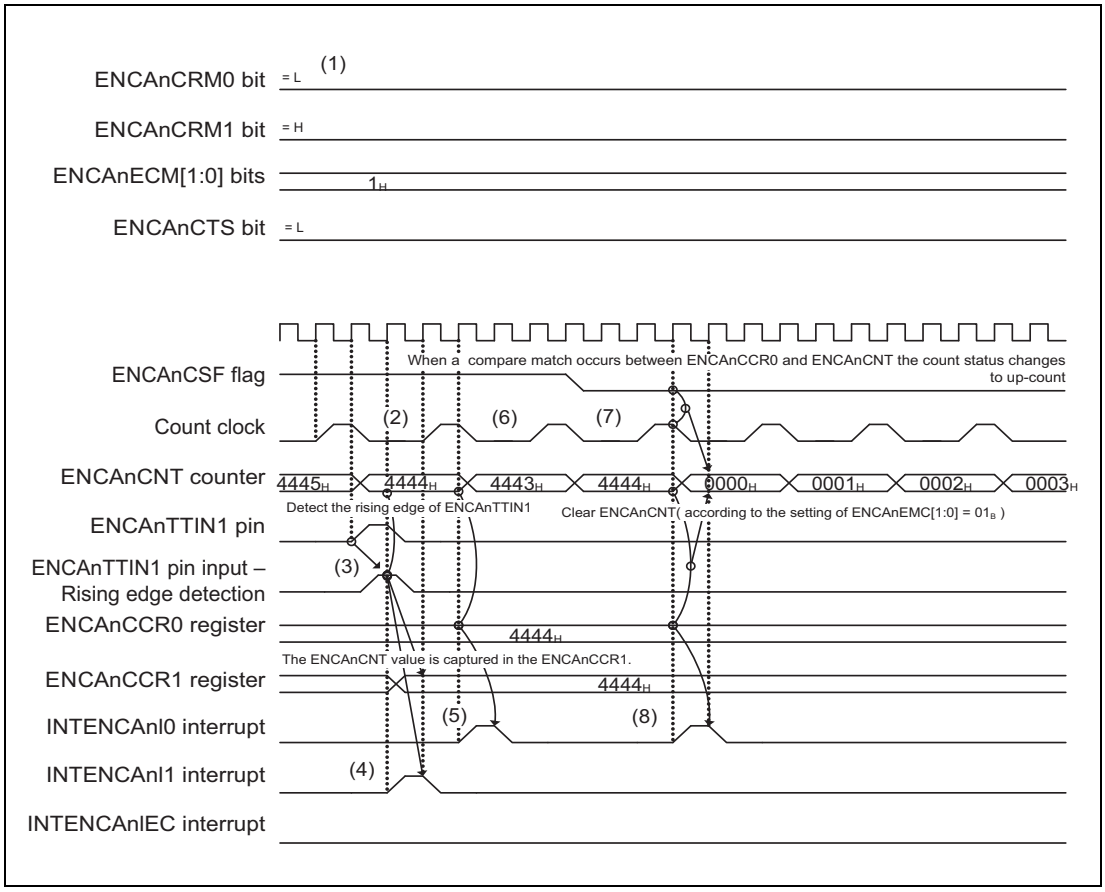

Figure 40.26 Encoder Operation when ENCAnECM[1:0] = 01_B and ENCAnCTS = 0

(1) The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) The rising edge of the ENCAnTTIN1 input is detected, and the ENCAnCNT value (4444_H) is captured in the ENCAnCCR1 register.

(4) An interrupt signal (INTENCAnl1) corresponding to the capture to the ENCAnCCR1 register is output.

(5) When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare match interrupt (INTENCAnl0) with ENCAnCCR0 is output.

(6) The count operation changes to up-count.

(7) When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (01_B), and the ENCAnCNT value changes to 0000_H.

(8) When ENCAnCNT changes to 4444_H, a compare match interrupt (INTENCAnl0) with ENCAnCCR0 is output.

40.4.8.16 Encoder operation when compare match clear control is enabled and ENCAnCTS = 1

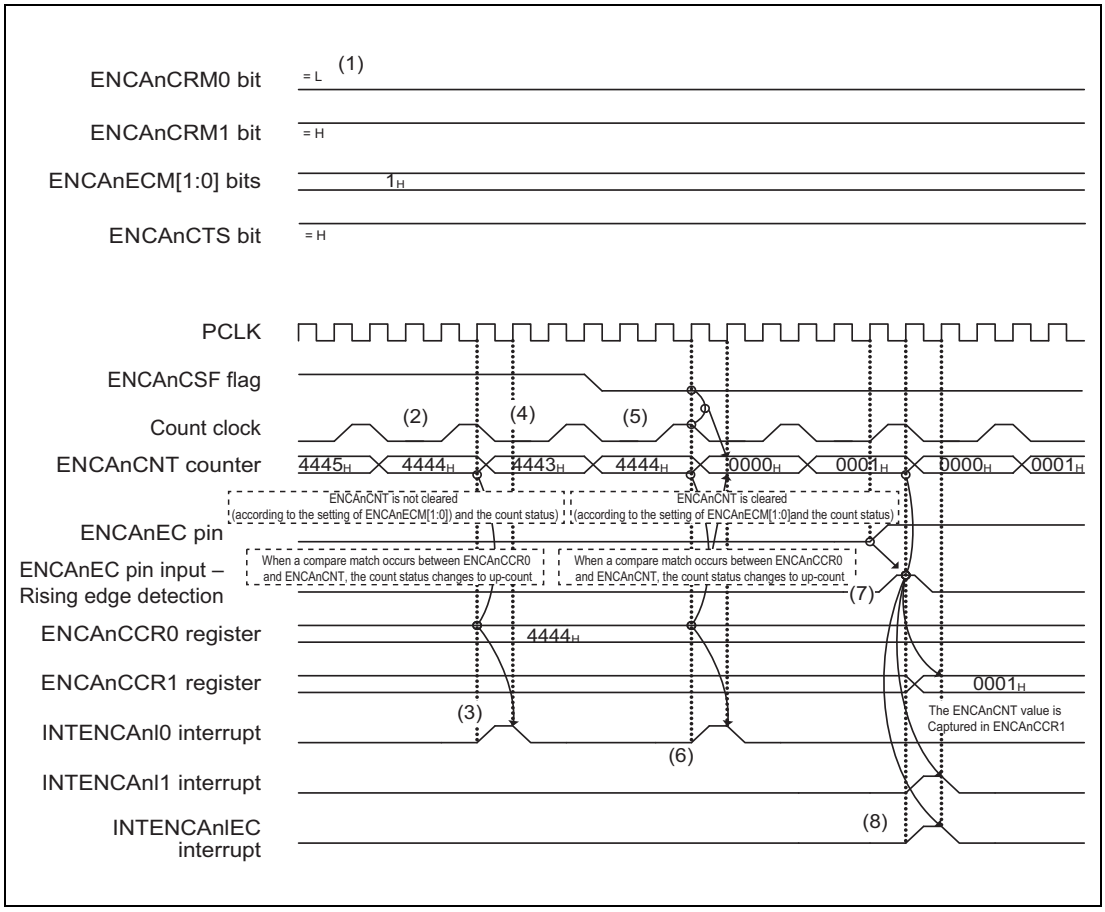

Figure 40.27 Encoder Operation when ENCAnECM[1:0] = 01_B and ENCAnCTS = 1

(1) The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 1.

(2) A down-count is performed.

(3) When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), an interrupt request signal (INTENCAnl0) is output.

(4) The count operation changes to up-count.

(5) When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (01_B), and the ENCAnCNT value changes to 0000_H.

(6) When ENCAnCNT changes to 4444_H, a compare match interrupt (INTENCAnl0) with ENCAnCCR0 is output.

(7) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H. At this point, the ENCAnCNT value (0001_H) is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to 0000_H.

(8) An interrupt (INTENCAnl1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (INTENCAnlEC) by ENCAnEC are output.

40.4.8.17 Encoder operation when compare match clear control is disabled

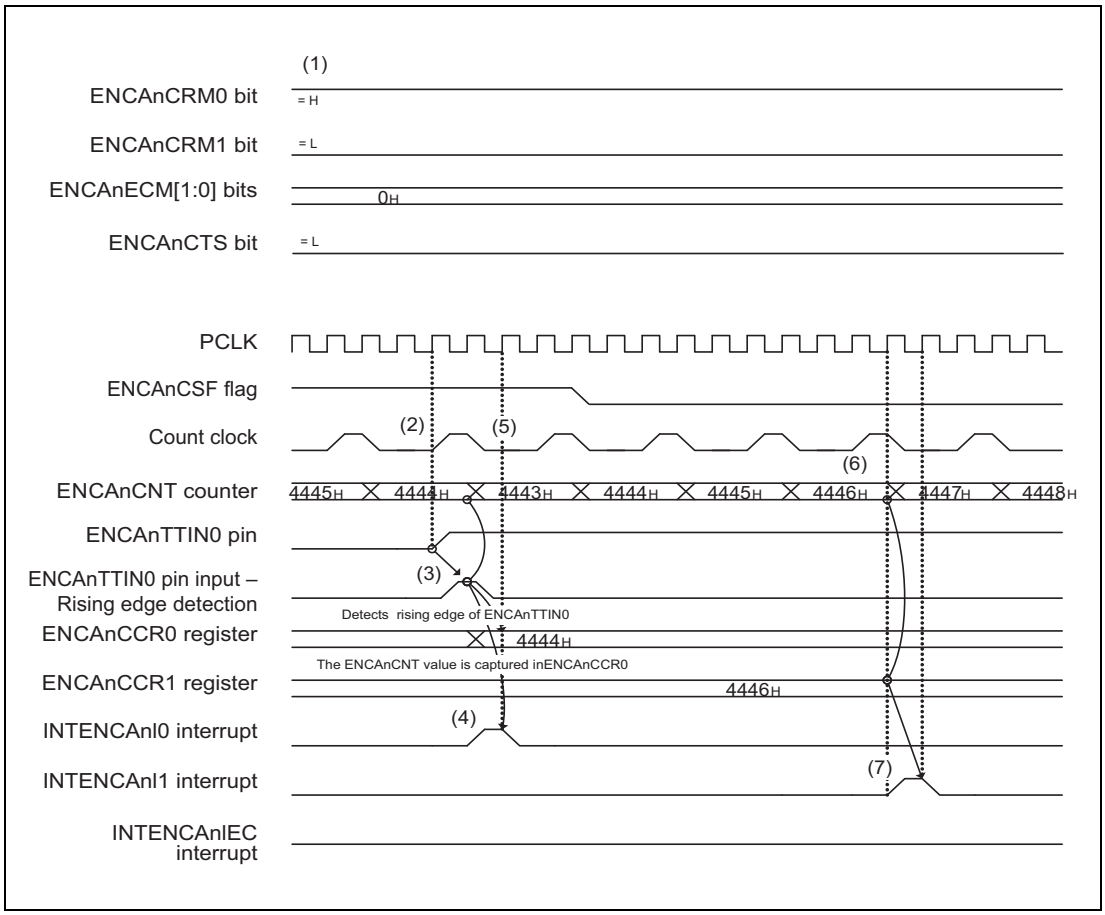

Figure 40.28 Encoder Operation when ENCAnECM[1:0] = 00_B

(1) The values are set as follows: ENCAnCCR1 = 4446_H, ENCAnCRM0 = 1, ENCAnCRM1 = 0, ENCAnECM[1:0] = 00_B, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) When the rising edge of ENCAnTTIN0 is detected, the ENCAnCNT value (4444_H) is captured in ENCAnCCR0.

(4) An interrupt signal (INTENCAnl0) corresponding to the capture to the ENCAnCCR0 register is output.

(5) The count operation changes to up-count.

(6) When ENCAnCNT changes to 4446_H, a compare match with ENCAnCCR1 is detected.

(7) A compare match interrupt (INTENCAnl1) with ENCAnCCR1 is output.

40.4.8.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, and ENCAnE1 when ENCAnSCE = 1

(1) Accompanying Capture Operation

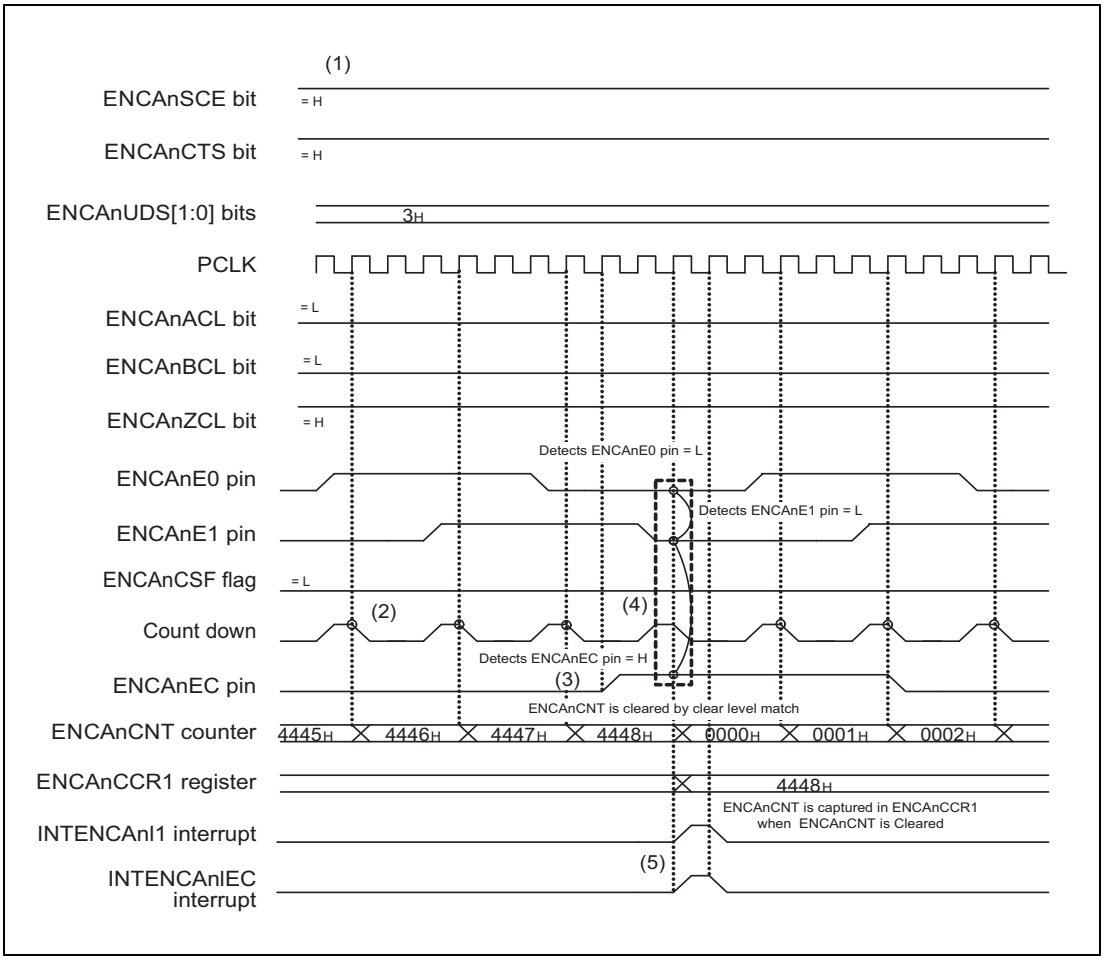

Figure 40.29 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, and ENCAnE1 when ENCAnSCE = 1

(1) The values are set as follows: ENCAnSCE = 1, ENCAnCTS = 1, ENCAnUDS[1:0] = 11_B, ENCAnACL = 0, ENCAnBCL = 0, and ENCAnZCL = 1.

(2) An up-count is performed.

(3) The count value is not cleared upon the rising edge of ENCAnEC.

(4) When ENCAnE0, ENCAnE1, and ENCAnEC reach the set clear level, the count value is cleared. The count value is captured in ENCAnCCR1 at the time of the clearing.

(5) At the time of the clearing, an interrupt (INTENCAnI1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (INTENCAnIEC) by ENCAnEC are output.

(2) When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

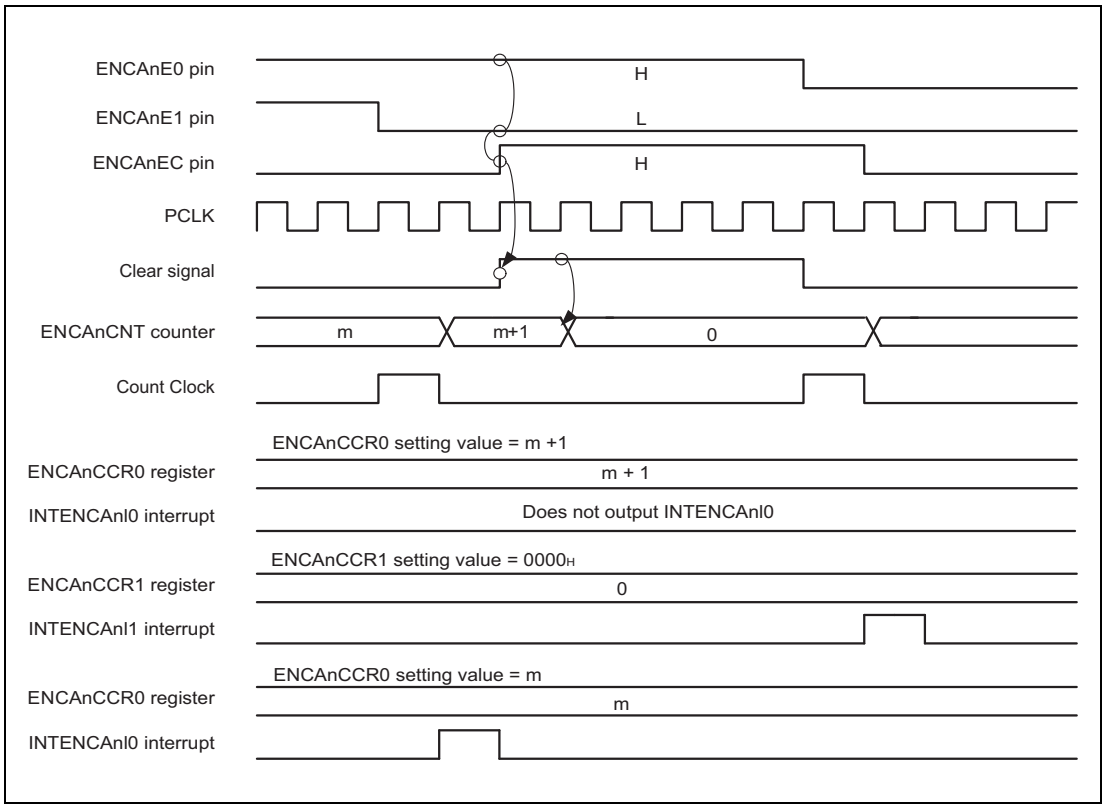

Figure 40.30 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count

(3) When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

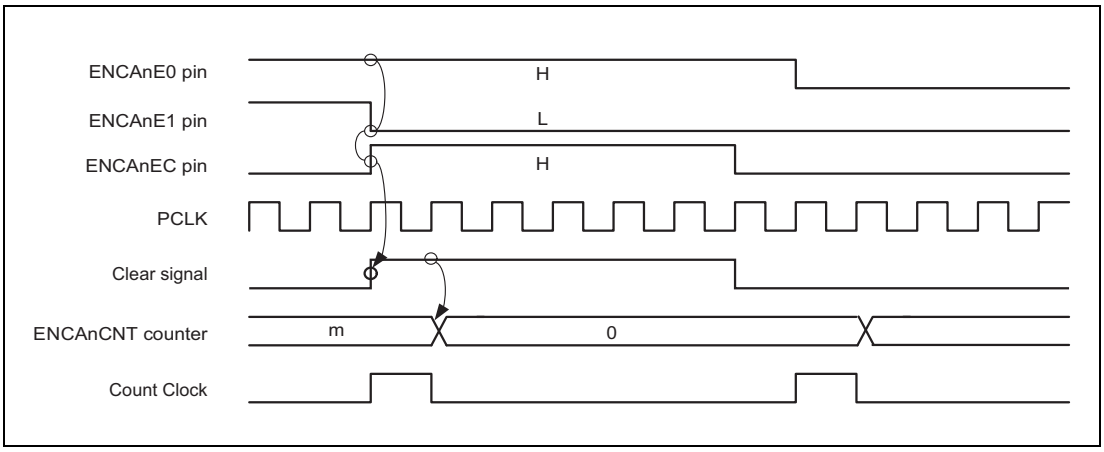

Figure 40.31 Clearing Timing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input During Up-count

(4) When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

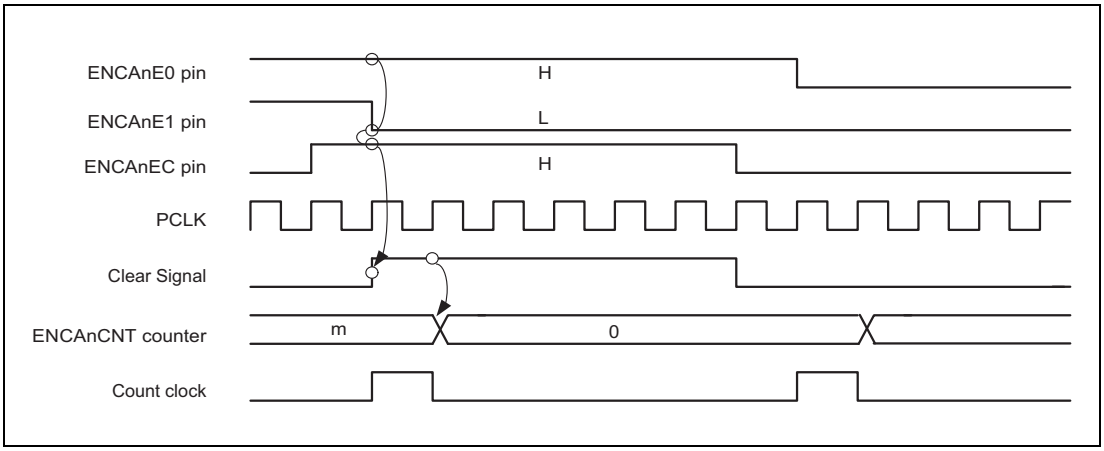

Figure 40.32 Clearing Timing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

(5) When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, ENCAnUDS[1:0] = 11_B)

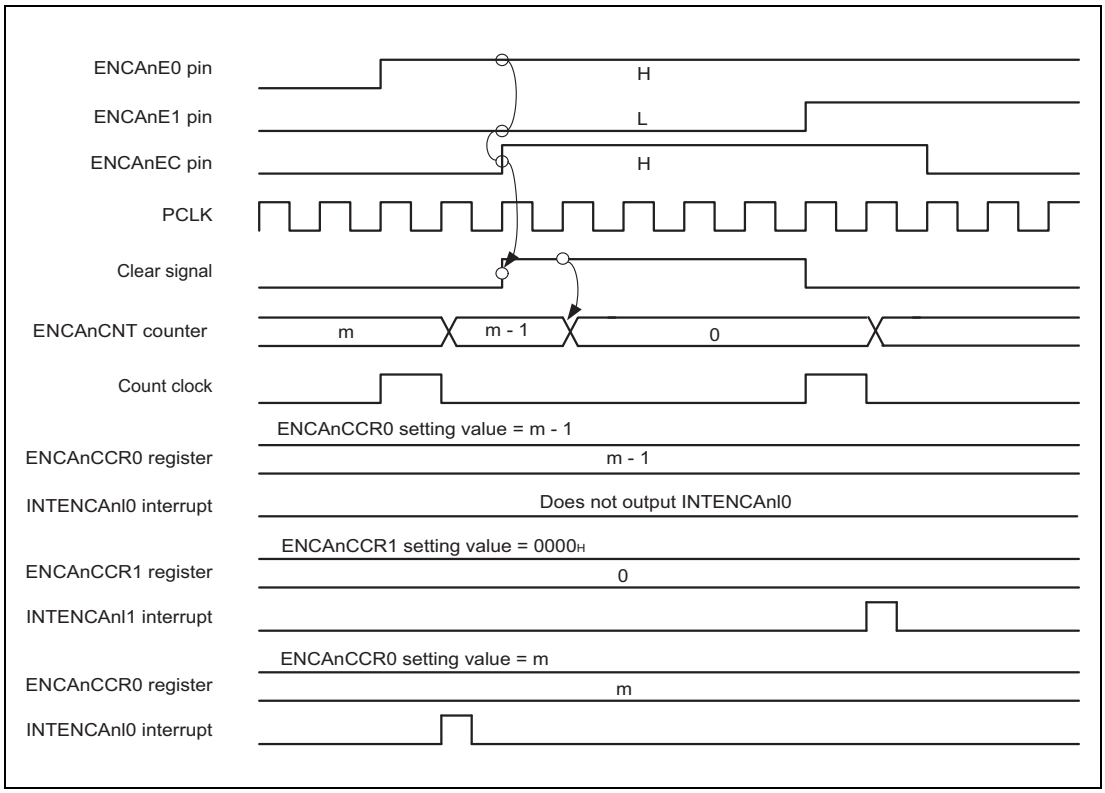

Figure 40.33 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

40.4.8.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

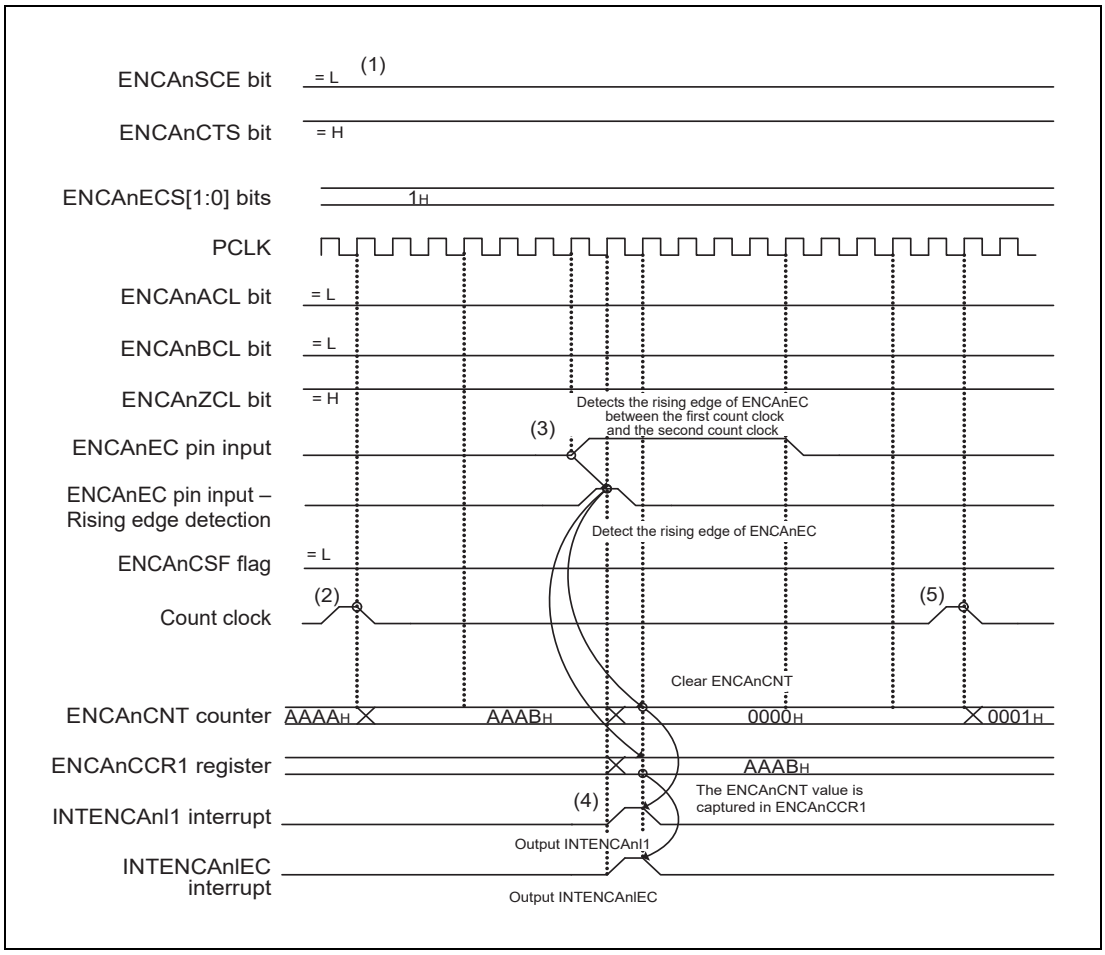

Figure 40.34 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

(1) The values are set as follows: ENCAnSCE = 0, ENCAnCTS = 1, and ENCAnECS[1:0] = 01_B.

(2) An up-count is performed.

(3) The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ($AAAB_H$) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is reset to 0000_H.

(4) An interrupt (INTENCAnI1) corresponding to the capture to the ENCAnCCR1 register and an encoder clear interrupt (INTENCAnIEC) by ENCAnEC are output.

(5) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H.

Section 41 Peripheral Interconnect (PIC)

41.1 Features of RH850/U2A-EVA PIC

Peripheral interconnect (PIC) connects some peripherals with each other in order to achieve enhanced stand-alone functionality. This product includes two PIC units: PIC1 and PIC2.

41.1.1 Number of Units

This microcontroller has the following number of PIC units.

Table 41.1 Number of Units (PIC1)

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1									
Name	PIC1									

Table 41.2 Number of Units (PIC2)

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	3									
Name	PIC20, PIC21, PIC22									

Table 41.3 Index

Index	Meaning
n	The individual unit of each timer and A/D converter is identified by the index “n”.
m	The individual channel of each timer is identified by the index “m”.
i	The individual unit of each GTM sub-modules (ATOM, TIM, MCS) is identified by the index “i”.
x	The individual channel of each GTM sub-modules (ATOM, TIM, MCS) is identified by the index “x”.
j	The scan group number of A/D converter is indicated by the index “j”.
k	The variable used for description is indicated by the index “k”.

41.1.2 Register Base Addresses

PIC base addresses are listed in the following table.

PIC register addresses are given as offsets from the base addresses.

Table 41.4 Register Base Addresses

Base Address Name	Base Address	Bus Group
<PIC1_base>	FFBF AF00$_H$	P-Bus Group 5
<PIC20_base>	FFBF C000$_H$	P-Bus Group 5
<PIC21_base>	FFBF D000$_H$	P-Bus Group 5
<PIC22_base>	FFBF E000$_H$	P-Bus Group 5

41.1.3 Clock Supply

Clock supplies by and to PIC are listed in the following table.

Table 41.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
PIC1	PCLK	CLK_HSB	Peripheral high speed clock
PIC2	PCLK	CLK_HSB	Peripheral high speed clock

41.1.4 Reset Sources

PIC1, PIC2 reset sources are listed in the following table. PIC1, PIC2 are initialized by these reset sources.

Table 41.6 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
PIC1	All registers	√	√	√	√	√	—	—
PIC2	All registers	√	√	√	√	√	—	—

41.1.5 Input/Output Signals

Table 41.7 PIC Input/Output Signals (1/4)

Signal Name	I/O	Function	Connected to
ENCA0TSST	O	ENCA0 simultaneous start trigger signal	ENCA0
ENCA0E0	O	ENCA0 encoder input signal (A phase)	
ENCA0E1	O	ENCA0 encoder input signal (B phase)	
ENCA0EC	O	ENCA0 encoder input signal (Z phase)	
ENCA0TTIN1	O	ENCA0 capture trigger

41.1.6 External Input/Output Signals

External input/output signals of PIC are listed in the following table.

Table 41.8 PIC1 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal Name
ENCA0I1	I	ENCA0 capture trigger input 1	ENCA0TIN1
ENCA1I1	I	ENCA1 capture trigger input 1	ENCA1TIN1
ENCA0E0	I	ENCA0 encoder input (count pulse 0)	ENCA0E0
ENCA0E1	I	ENCA0 encoder input (count pulse 1)	ENCA0E1
ENCA0EC	I	ENCA0 encoder input (clear pulse)	ENCA0EC
TAUD0Im (m = 0 to 15)	I	TAUD0 channel input m (m = 0 to 15)	TAUD0Im (m = 0 to 15)
TAUD1Im (m = 0 to 15)	I	TAUD1 channel input m (m = 0 to 15)	TAUD1Im (m = 0 to 15)
TAUD2Im (m = 0 to 15)	I	TAUD2 channel input m (m = 0 to 15)	TAUD2Im (m = 0 to 15)
TAPA0ESO	I	Hi-Z control for TAUD0/TSG30 output	TAPA0ESO
TAPA1ESO	I	Hi-Z control for TAUD1/TSG31 output	TAPA1ESO
TOP0U	O	Motor control output U phase	TAPA0UP
TOP0UB	O	Motor control output UB phase	TAPA0UN
TOP0V	O	Motor control output V phase	TAPA0VP
TOP0VB	O	Motor control output VB phase	TAPA0VN
TOP0W	O	Motor control output W phase	TAPA0WP
TOP0WB	O	Motor control output WB phase	TAPA0WN
TOP1U	O	Motor control output U phase	TAUD1O10
TOP1UB	O	Motor control output UB phase	TAUD1O11
TOP1V	O	Motor control output V phase	TAUD1O12
TOP1VB	O	Motor control output VB phase	TAUD1O13
TOP1W	O	Motor control output W phase	TAUD1O14
TOP1WB	O	Motor control output WB phase	TAUD1O15
TOP2U	O	Motor control output U phase	TSG30O1
TOP2UB	O	Motor control output UB phase	TSG30O2
TOP2V	O	Motor control output V phase	TSG30O3
TOP2VB	O	Motor control output VB phase	TSG30O4
TOP2W	O	Motor control output W phase	TSG30O5
TOP2WB	O	Motor control output WB phase	TSG30O6
TOP3U	O	Motor control output U phase	TSG31O1
TOP3UB	O	Motor control output UB phase	TSG31O2
TOP3V	O	Motor control output V phase	TSG31O3
TOP3VB	O	Motor control output VB phase	TSG31O4
TOP3W	O	Motor control output W phase	TSG31O5
TOP3WB	O	Motor control output WB phase	TSG31O6
TAUJ0Im	I	TAUJ input	TAUJ0Im (m = 0 to 3)
TAUJ1Im	I	TAUJ input	TAUJ1Im (m = 0 to 3)
TAUJ2Im	I	TAUJ input	TAUJ2Im (m = 0 to 3)

Table 41.9 PIC2 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal Name
ADCJ0TRGj (j = 0, 1, 2, 3, 4)	I	ADCJ0 trigger	ADCJ0TRGj (j = 0, 1, 2, 3, 4)
ADCJ1TRGj (j = 0, 1, 2, 3, 4)	I	ADCJ1 trigger	ADCJ1TRGj (j = 0, 1, 2, 3, 4)
ENCA0I0	I	ENCA0 capture trigger input 0	ENCA0TIN0
ENCA1I0	I	ENCA1 capture trigger input 0	ENCA1TIN0
ENCA1E0	I	ENCA1 encoder input (count pulse 0)	ENCA1E0
ENCA1E1	I	ENCA1 encoder input (count pulse 1)	ENCA1E1
ENCA1EC	I	ENCA1 encoder input (clear pulse)	ENCA1EC
$\overline{\text{ESO0}}$	I	Hi-Z control for GTM output	$\overline{\text{ESO0}}$
$\overline{\text{ESO1}}$	I	Hi-Z control for GTM output	$\overline{\text{ESO1}}$
$\overline{\text{ESO2}}$	I	Hi-Z control for GTM output	$\overline{\text{ESO2}}$
$\overline{\text{ESO3}}$	I	Hi-Z control for GTM output	$\overline{\text{ESO3}}$
GTM0I[x] (x = 0 to 7)	I	GTM timer input signal (TIM0)	GTM0I[x] (x = 0 to 7)
GTM1I[x] (x = 0 to 7)	I	GTM timer input signal (TIM1)	GTM1I[x] (x = 0 to 7)
GTM2I[x] (x = 0 to 7)	I	GTM timer input signal (TIM2)	GTM2I[x] (x = 0 to 7)
GTM3[x] (x = 0 to 7)	I	GTM timer input signal (TIM3)	GTM3I[x] (x = 0 to 7)
RLIN30RX	I	RLIN30 soft macro data input (RX)	RLIN30RX
RLIN31RX	I	RLIN31 soft macro data input (RX)	RLIN31RX
RLIN32RX	I	RLIN32 soft macro data input (RX)	RLIN32RX
RLIN33RX	I	RLIN33 soft macro data input (RX)	RLIN33RX

41.1.7 Block diagram

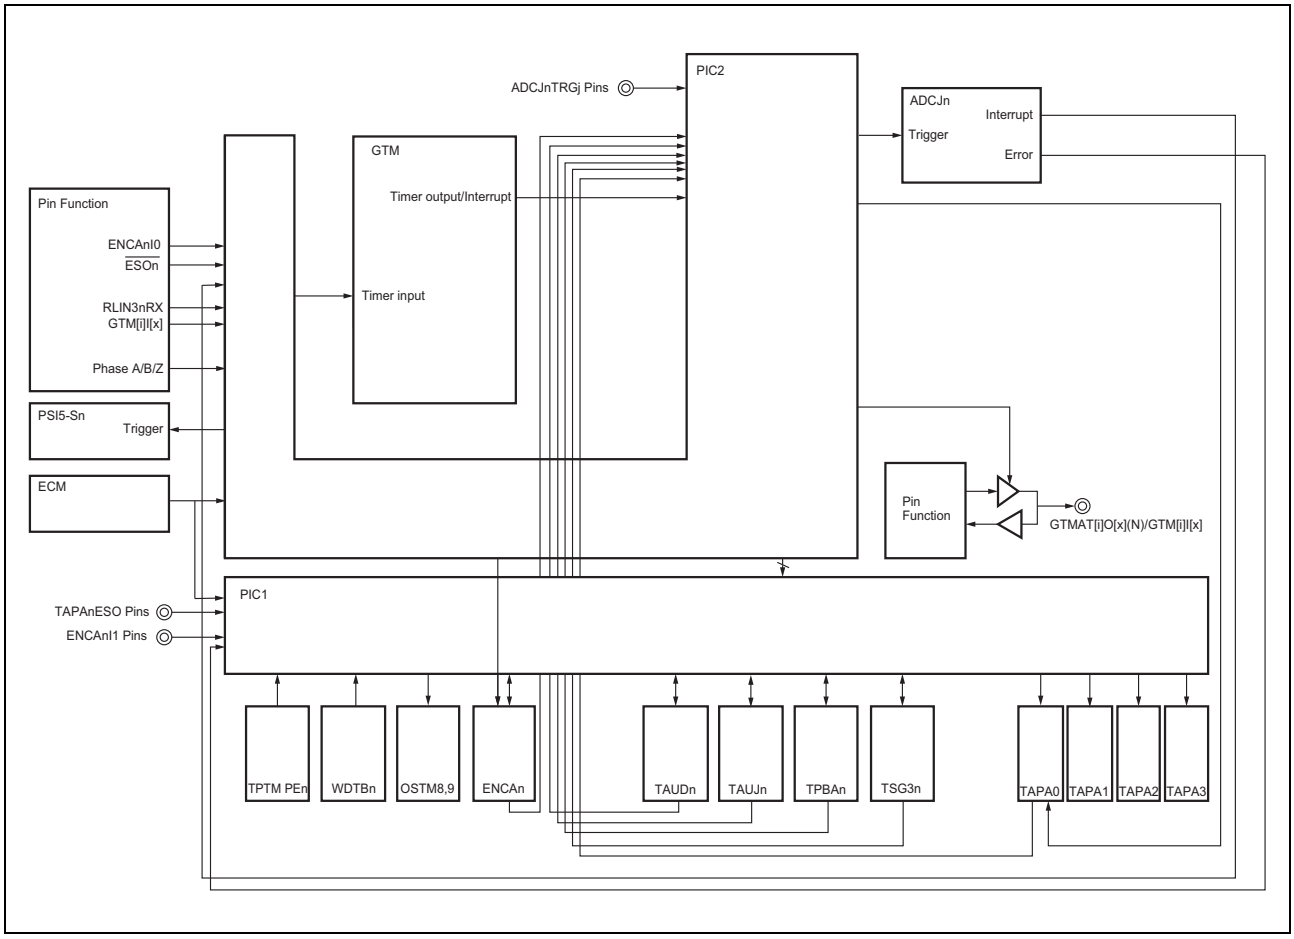

Figure 41.1 PIC block diagram

41.2 Peripheral Interconnect — 1 (PIC1)

41.2.1 Overview

41.2.1.1 Functional Overview

The peripheral interconnect-1 (PIC1) realizes various functions by synchronous operation using multiple timers and by connecting the timer internal I/O signals between the timers.

CAUTION

The signal names used in the following descriptions are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

INTm →INTTAUDnIm

TINm → TAUDnTTINm

TOUTm → TAUDnTTOUTm

CDRm → TAUDnCDRm

CNTm → TAUDnCNTm

The PIC1 has the following functions.

- Simultaneous start trigger function
- INT Signal Output Selection Function
- PWM output function with dead time
- High accuracy triangle wave PWM output function with dead time
- Delay pulse output function with dead time
- Trigger pulse width measurement function
- Encoder capture trigger select function
- Two-phase encoder control function (control method 1)
- Two-phase encoder control function (control method 2)
- Three-phase pulse input control function
- Three-phase encoder control function
- Timer input select function
- Hi-Z control function
- Timer output monitor function
- Timer input monitor function
- TSG3 Synchronous Start and Clear Function

41.2.2 Registers

41.2.2.1 List of Registers

The registers are listed in the following table.

The bits in 32-bit registers can be accessed only in 32-bit units. Access in 16-bits or 8-bits is operated as 32-bit access.

Table 41.10 List of Registers

Register Function	Symbol	Address	Access size	Access Protection	
				PBG	Other
Simultaneous start trigger control register	PIC1SST	<PIC1_base> + 04_H	8	PBG52#0	—
Simultaneous start control register 0	PIC1SSER0	<PIC1_base> + 10_H	16	PBG52#0	—
Simultaneous start control register 1	PIC1SSER1	<PIC1_base> + 14_H	16	PBG52#0	—
Simultaneous start control register 2	PIC1SSER2	<PIC1_base> + 18_H	16	PBG52#0	—
Simultaneous start control register 3	PIC1SSER3	<PIC1_base> + $1C_H$	16	PBG52#0	—
RS flip-flop circuit initialization register 00	PIC1INI00	<PIC1_base> + 20_H	8	PBG52#0	—
DT initialization register 01	PIC1INI01	<PIC1_base> + 24_H	8	PBG52#0	—
RS flip-flop circuit initialization register 10	PIC1INI10	<PIC1_base> + $2C_H$	8	PBG52#0	—
DT initialization register 11	PIC1INI11	<PIC1_base> + 30_H	8	PBG52#0	—
Hall sensor input select register	PIC1TSGHALLSEL	<PIC1_base> + 74_H	8	PBG52#0	—
TAUD0 input select register	PIC1TAUD0SEL	<PIC1_base> + 78_H	32	PBG52#0	—
TAUD1 input select register	PIC1TAUD1SEL	<PIC1_base> + $7C_H$	32	PBG52#0	—
Hi-Z control register 0	PIC1HIZCEN0	<PIC1_base> + 80_H	8	PBG52#0	—
Hi-Z control register 1	PIC1HIZCEN1	<PIC1_base> + 84_H	8	PBG52#0	—
Hi-Z control register 2	PIC1HIZCEN2	<PIC1_base> + 88_H	8	PBG52#0	—
Hi-Z control register 3	PIC1HIZCEN3	<PIC1_base> + $8C_H$	8	PBG52#0	—
ENCATIN1 input select register 400	PIC1ENCSEL400	<PIC1_base> + $B8_H$	8	PBG52#0	—
ENCATIN1 input select register 410	PIC1ENCSEL410	<PIC1_base> + BC_H	8	PBG52#0	—
Timer input/output control register 200	PIC1REG200	<PIC1_base> + $C0_H$	32	PBG52#0	—
Timer input/output control register 201	PIC1REG201	<PIC1_base> + $C4_H$	32	PBG52#0	—
Timer input/output control register 202	PIC1REG202	<PIC1_base> + $C8_H$	32	PBG52#0	—
Timer input/output control register 203	PIC1REG203	<PIC1_base> + CC_H	32	PBG52#0	—
Timer input/output control register 210	PIC1REG210	<PIC1_base> + $D4_H$	32	PBG52#0	—
Timer input/output control register 211	PIC1REG211	<PIC1_base> + $D8_H$	32	PBG52#0	—
Timer input/output control register 212	PIC1REG212	<PIC1_base> + DC_H	32	PBG52#0	—
Timer input/output control register 213	PIC1REG213	<PIC1_base> + $E0_H$	32	PBG52#0	—
Timer input/output control register 30	PIC1REG30	<PIC1_base> + $E8_H$	32	PBG52#0	—
Timer input/output control register 31	PIC1REG31	<PIC1_base> + EC_H	32	PBG52#0	—
Timer input/output control register 50	PIC1REG50	<PIC1_base> + $F8_H$	16	PBG52#0	—
Timer input/output control register 51	PIC1REG51	<PIC1_base> + FC_H	16	PBG52#0	—
Synchronous start and clear enable register	PIC1SELBSSER	FFBF $B200_H$	8	PBG52#0	—
Port output monitor select register	PIC1POMONSEL	FFBF $B400_H$	8	PBG52#0	—
Port input monitor select register	PIC1PIMONSEL	FFBF $B600_H$	8	PBG52#0	—
TAUD2TTINm Input Signal Selection Register	PIC1SELB_TAUD2I	FFBF 6800_H	16	PBG51#3	—
TAUJ2TTINm Input Signal Selection Register	PIC1SELB_TAUJ2I	FFE8 0800_H	8	PBG20#5	—
TAUJ3TTINm Input Signal Selection Register	PIC1SELB_TAUJ3I	FFE8 1800_H	8	PBG20#6	—

Combinations of registers used for each function are listed in the following table.

Table 41.11 Registers Used by Each Function

Section Number	Function Name	PIC1SST	PIC1SSER				PIC1INI				PIC1TSGHALLSEL	PIC1TAUD0SEL	PIC1TAUD1SEL	PIC1HIZCEN				PIC1ENCSEL4		PIC1REG												PIC1POMONSEL	PIC1PIMONSEL	PIC1SELBSSER	PIC1SELB_TAUD2I	PIC1SELB_TAUJ2I	PIC1SELB_TAUJ3I

41.2.2.2 PIC1SST — Simultaneous Start Trigger Control Register

The PIC1SST register is an 8-bit register that selects the simultaneous start trigger.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PIC1SYNCTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 41.12 PIC1SST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1SYNCTRG	Generates a start trigger for the timer for which simultaneous start is enabled. 0: Disabled 1: Simultaneous start trigger (pulse with a width of 1PCLK is output).

Note: PIC1SYNCTRG always reads 0 when read.

41.2.2.3 PIC1SSER0 — Simultaneous Start Control Register 0

The PIC1SSER0 register enables a start trigger for each channel of TAUD0.

Access: This register can be read or written in 16-bit units.

Address: <PIC1_base> + 10_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIC1SSER015	PIC1SSER014	PIC1SSER013	PIC1SSER012	PIC1SSER011	PIC1SSER010	PIC1SSER009	PIC1SSER008	PIC1SSER007	PIC1SSER006	PIC1SSER005	PIC1SSER004	PIC1SSER003	PIC1SSER002	PIC1SSER001	PIC1SSER000

Table 41.13 PIC1SSER0 Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC1SSER0m	Enables or disables a simultaneous start trigger for CHm of TAUD0. 0: Disabled 1: Enabled

41.2.2.4 PIC1SSER1 — Simultaneous Start Control Register 1

The PIC1SSER1 register enables a start trigger for each channel of TAUD1.

Access: This register can be read or written in 16-bit units.

Address: <PIC1_base> + 14_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 41.14 PIC1SSER1 Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC1SSER1m	Enables or disables a simultaneous start trigger for CHm of TAUD1. 0: Disabled 1: Enabled

41.2.2.5 PIC1SSER2 — Simultaneous Start Control Register 2

The PIC1SSER2 register enables a start trigger of TAUJn, TSG3n, TPBAn, and ENCAn.

Access: This register can be read or written in 16-bit units.

Address: <PIC1_base> + 18_H

Value after reset: 0000_H

Table 41.15 PIC1SSER2 Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	PIC1SSER213	Enables or disables a simultaneous start trigger for the ENCA1. 0: Disabled 1: Enabled
12	PIC1SSER212	Enables or disables a simultaneous start trigger for the ENCA0. 0: Disabled 1: Enabled
11	PIC1SSER211	Enables or disables a simultaneous start trigger for the TPBA1. 0: Disabled 1: Enabled
10	PIC1SSER210	Enables or disables a simultaneous start trigger for the TPBA0. 0: Disabled 1: Enabled
9	PIC1SSER209	Enables or disables a simultaneous start trigger for the TSG31. 0: Disabled 1: Enabled
8	PIC1SSER208	Enables or disables a simultaneous start trigger for the TSG30. 0: Disabled 1: Enabled
7	PIC1SSER207	Enables or disables a simultaneous start trigger for CH03 of TAUJ1. 0: Disabled 1: Enabled
6	PIC1SSER206	Enables or disables a simultaneous start trigger for CH02 of TAUJ1. 0: Disabled 1: Enabled
5	PIC1SSER205	Enables or disables a simultaneous start trigger for CH01 of TAUJ1. 0: Disabled 1: Enabled
4	PIC1SSER204	Enables or disables a simultaneous start trigger for CH00 of TAUJ1. 0: Disabled 1: Enabled
3	PIC1SSER203	Enables or disables a simultaneous start trigger for CH03 of TAUJ0. 0: Disabled 1: Enabled
2	PIC1SSER202	Enables or disables a simultaneous start trigger for CH02 of TAUJ0. 0: Disabled 1: Enabled
1	PIC1SSER201	Enables or disables a simultaneous start trigger for CH01 of TAUJ0. 0: Disabled 1: Enabled

Table 41.15 PIC1SSER2 Register Contents (2/2)

Bit Position	Bit Name	Function
0	PIC1SSER200	Enables or disables a simultaneous start trigger for CH00 of TAUJ0. 0: Disabled 1: Enabled

41.2.2.6 PIC1SSER3 — Simultaneous Start Control Register 3

The PIC1SSER3 register enables a start trigger for each channel of OSTM8 and OSTM9.

Access: This register can be read or written in 16-bit units.

Address: <PIC1_base> + $1C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PIC1SSER301	PIC1SSER300
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 41.16 PIC1SSER3 Register Contents

Bit Position	Bit Name	Function
15 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PIC1SSER301	Enables or disables a simultaneous start trigger for OSTM9. 0: Disabled 1: Enabled
0	PIC1SSER300	Enables or disables a simultaneous start trigger for OSTM8. 0: Disabled 1: Enabled

41.2.2.7 PIC1INIn0 — Flip-Flop Circuit Initialization Register n0 (n = 0, 1)

The PIC1INIn0 register enables initialization of the RS flip-flop circuits 4 to 2 (RSn4 to 2).

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 20_H (n=0), <PIC1_base> + $2C_H$ (n=1)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	PIC1INIn04	PIC1INIn03	PIC1INIn02	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R	R

Table 41.17 PIC1INIn0 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 2	PIC1INIn0[4:2]	Enables or disables initialization of the RS flip-flop circuits 4 to 2 (RSn4 to RSn2) used for the PWM output function with dead time. These bits are always read as 0. 0: Disabled 1: Initialized
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

41.2.2.8 PIC1INIn1 — DT Initialization Register n1 (n = 0, 1)

The PIC1INIn1 register enables initialization of the latch & toggle (DT) circuit.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 24_H (n=0), <PIC1_base> + 30_H (n=1)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PIC1INIn12	PIC1INIn11	PIC1INIn10
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 41.18 PIC1INIn1 Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PIC1INIn1[2:0]	Enables or disables initialization of the DT circuit to be used for the trigger pulse width measurement function. These bits are always read as 0. 0: Disabled 1: Initialized

41.2.2.9 PIC1TSGHALLSEL — Hall Sensor Input Select Register

The PIC1TSGHALLSEL register sets the pin conditions to input the external hall sensor signal to the Motor Control Timer (TSG3).

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 74_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG1HALLSEL	TSG0HALLSEL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 41.19 PIC1TSGHALLSEL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	TSG1HALLSEL	Sets pin condition to input the external hall sensor signal.*1 0: Separate input 1: Alternative input with ENCA
0	TSG0HALLSEL	Sets pin condition to input the external hall sensor signal.*1 0: Separate input 1: Alternative input with ENCA

Note 1. When TSG3nPTSI2 to TSG3nPTSI0 are used for input pattern to the TSG3, always set this bit to 1. In addition, set bit 0 in the PIC1REG50 register and bit 0 in the PIC1REG51 register as described below. When those bits are not used, do not change the setting from the value after reset.

TSG1HALLSEL	PIC1REG5100	Function
1	1	Select input pin ENCA1E0, ENCA1E1, and ENCA1EC.
Other than above		Setting prohibited.

TSG0HALLSEL	PIC1REG5000	Function
1	0	Select input pin ENCA0E0, ENCA0E1 and ENCA0EC
Other than above		Setting prohibited

41.2.2.10 PIC1TAUD0SEL — TAUD0 Input Select Register

The PIC1TAUD0SEL register is a 32-bit register that selects TAUDTIN input signals.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + 78_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PIC1TAUD0IN143	PIC1TAUD0IN142	PIC1TAUD0IN141	PIC1TAUD0IN140	PIC1TAUD0IN123	PIC1TAUD0IN122	PIC1TAUD0IN121	PIC1TAUD0IN120	PIC1TAUD0IN103	PIC1TAUD0IN102	PIC1TAUD0IN101	PIC1TAUD0IN100	PIC1TAUD0IN83	PIC1TAUD0IN82	PIC1TAUD0IN81	PIC1TAUD0IN80
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIC1TAUD0IN63	PIC1TAUD0IN62	PIC1TAUD0IN61	PIC1TAUD0IN60	PIC1TAUD0IN43	PIC1TAUD0IN42	PIC1TAUD0IN41	PIC1TAUD0IN40	PIC1TAUD0IN23	PIC1TAUD0IN22	PIC1TAUD0IN21	PIC1TAUD0IN20	PIC1TAUD0IN03	PIC1TAUD0IN02	PIC1TAUD0IN01	PIC1TAUD0IN00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.20 PIC1TAUD0SEL Register Contents

Bit Position	Bit Name	Function
2m+3 2m+2	PIC1TAUD0INm [3:2]	Selects the signal to output to TAUD0TTIN [m+1] output pin. 00: TAUD0I [m+1] is selected. 01: TAUD0I [m] is selected. 10: TAUD1I [m+1] is selected. 11: TAUD1I [m] is selected.
2m+1 2m	PIC1TAUD0INm [1:0]	Selects the signal to output to TAUD0TTIN [m] output pin. 00: TAUD0I [m] is selected. 01: TAUD0I [m+1] is selected. 10: TAUD1I [m] is selected. 11: TAUD1I [m+1] is selected.

Note: m is an even channel number of TAUD0 (CHm_even)

41.2.2.11 PIC1TAUD1SEL — TAUD1 Input Select Register

The PIC1TAUD1SEL register is a 32-bit register that selects TAUDTIN input signals.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + $7C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PIC1TAUD1IN143	PIC1TAUD1IN142	PIC1TAUD1IN141	PIC1TAUD1IN140	PIC1TAUD1IN123	PIC1TAUD1IN122	PIC1TAUD1IN121	PIC1TAUD1IN120	PIC1TAUD1IN103	PIC1TAUD1IN102	PIC1TAUD1IN101	PIC1TAUD1IN100	PIC1TAUD1IN83	PIC1TAUD1IN82	PIC1TAUD1IN81	PIC1TAUD1IN80
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIC1TAUD1IN63	PIC1TAUD1IN62	PIC1TAUD1IN61	PIC1TAUD1IN60	PIC1TAUD1IN43	PIC1TAUD1IN42	PIC1TAUD1IN41	PIC1TAUD1IN40	PIC1TAUD1IN23	PIC1TAUD1IN22	PIC1TAUD1IN21	PIC1TAUD1IN20	PIC1TAUD1IN03	PIC1TAUD1IN02	PIC1TAUD1IN01	PIC1TAUD1IN00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.21 PIC1TAUD1SEL Register Contents

Bit Position	Bit Name	Function
2m+3 2m+2	PIC1TAUD1INm [3:2]	Selects the signal to output to TAUD1TTIN [m+1] output pin 00: TAUD1I [m+1] is selected. 01: TAUD1I [m] is selected. 10: TAUD0I [m+1] is selected. 11: TAUD0I [m] is selected.
2m+1 2m	PIC1TAUD1INm [1:0]	Selects the signal to output to TAUD1TTIN [m] output pin 00: TAUD1I [m] is selected. 01: TAUD1I [m+1] is selected. 10: TAUD0I [m] is selected. 11: TAUD0I [m+1] is selected.

Note: m is an even channel number of TAUD1 (CHm_even)

41.2.2.12 PIC1HIZCEN0 — Hi-Z Control Register 0

The PIC1HIZCEN0 register selects Hi-Z control input signals of ADCJ0, ADCJ1, ERROROUTZ, WDTB, and TAPA0ESO for TAUD0.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 80_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1HIZCEN 07	PIC1HIZCEN 06	PIC1HIZCEN 05	—	—	PIC1HIZCEN 02	—	PIC1HIZCEN 00
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R/W	R	R/W

Table 41.22 PIC1HIZCEN0 Register Contents

Bit Position	Bit Name	Function
7	PIC1HIZCEN 07	Enables or disables Hi-Z control by ADCJ1 error interrupt (INTADCJ1ERR). 0: Disabled 1: Enabled
6	PIC1HIZCEN 06	Enables or disables Hi-Z control by ADCJ0 error interrupt (INTADCJ0ERR). 0: Disabled 1: Enabled
5	PIC1HIZCEN 05	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4, 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC1HIZCEN 02	Enables or disables Hi-Z control by WDTBn(n=0 to 3) (WDTBTNMI). 0: Disabled 1: Enabled
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1HIZCEN 00	Enables or disables Hi-Z control by TAPA0ESO pin input. 0: Disabled 1: Enabled

CAUTIONS

1. Set this register before starting U/V/W outputs or UB/VB/WB outputs of TAUD0.
2. Set TAPA0CTL0.TAPA0DCN = 0 and TAPA0CTL0.TAPA0DCP = 1 when performing Hi-Z control by ADCJ error signal, WDTB error interrupt signal and ERROROUTZ signal.

41.2.2.13 PIC1HIZCEN1 — Hi-Z Control Register 1

The PIC1HIZCEN1 register selects Hi-Z control input signals of ADCJ1, ADCJ0, ERROROUTZ, and TAPA1ESO for TAUD1.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 84_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1HIZCEN 17	PIC1HIZCEN 16	PIC1HIZCEN 15	—	—	—	—	PIC1HIZCEN 10
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R/W

Table 41.23 PIC1HIZCEN1 Register Contents

Bit Position	Bit Name	Function
7	PIC1HIZCEN 17	Enables or disables Hi-Z control by ADCJ1 error interrupt (INTADCJ1ERR). 0: Disabled 1: Enabled
6	PIC1HIZCEN 16	Enables or disables Hi-Z control by ADCJ0 error interrupt (INTADCJ0ERR). 0: Disabled 1: Enabled
5	PIC1HIZCEN 15	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1HIZCEN 10	Enables or disables Hi-Z control by TAPA1ESO pin input. 0: Disabled 1: Enabled

CAUTIONS

1. Set this register before starting U/V/W outputs or UB/VB/WB outputs of TAUD1.
2. Set TAPA1CTL0.TAPA1DCN = 0 and TAPA1CTL0.TAPA1DCP = 1 when performing Hi-Z control by ADCJ error signal and ERROROUTZ signal.

41.2.2.14 PIC1HIZCEN2 — Hi-Z Control Register 2

The PIC1HIZCEN2 register selects Hi-Z control input signals of ADCJ1, ADCJ0, ERROROUTZ, TSG30, and TAPA0ESO for TSG30.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + 88_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1HIZCEN 27	PIC1HIZCEN 26	PIC1HIZCEN 25	—	PIC1HIZCEN 23	—	—	PIC1HIZCEN 20
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R/W	R	R	R/W

Table 41.24 PIC1HIZCEN2 Register Contents

Bit Position	Bit Name	Function
7	PIC1HIZCEN 27	Enables or disables Hi-Z control by ADCJ1 error interrupt (INTADCJ1ERR). 0: Disabled 1: Enabled
6	PIC1HIZCEN 26	Enables or disables Hi-Z control by ADCJ0 error interrupt (INTADCJ0ERR). 0: Disabled 1: Enabled
5	PIC1HIZCEN 25	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PIC1HIZCEN 23	Enables or disables Hi-Z control by INTTSG30IER interrupt signal. 0: Disabled 1: Enabled
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1HIZCEN 20	Enables or disables Hi-Z control by TAPA0ESO pin input. 0: Disabled 1: Enabled

CAUTIONS

1. Set this register before starting TSG30 output.
2. Set TAPA2CTL0.TAPA2DCN = 0 and TAPA2CTL0.TAPA2DCP = 1 when performing Hi-Z control by ADCJ error signal, ERROROUTZ signal, and TSG30 error signal.

41.2.2.15 PIC1HIZCEN3 — Hi-Z Control Register 3

The PIC1HIZCEN3 register selects Hi-Z control input signals of ADCJ1, ADCJ0, ERROROUTZ, TSG31, and TAPA1ESO for TSG31.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + $8C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1HIZCEN 37	PIC1HIZCEN 36	PIC1HIZCEN 35	PIC1HIZCEN 34	—	—	—	PIC1HIZCEN 30
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R/W

Table 41.25 PIC1HIZCEN3 Register Contents

Bit Position	Bit Name	Function
7	PIC1HIZCEN 37	Enables or disables Hi-Z control by ADCJ1 error interrupt (INTADCJ1ERR) 0: Disabled 1: Enabled
6	PIC1HIZCEN 36	Enables or disables Hi-Z control by ADCJ0 error interrupt (INTADCJ0ERR). 0: Disabled 1: Enabled
5	PIC1HIZCEN 35	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4	PIC1HIZCEN 34	Enables or disables Hi-Z control by INTTSG31IER interrupt signal. 0: Disabled 1: Enabled
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1HIZCEN 30	Enables or disables Hi-Z control by TAPA1ESO pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting TSG31 output.

Set TAPA3CTL0.TAPA3DCN = 0 and TAPA3CTL0.TAPA3DCP = 1 when performing Hi-Z control by ADCJ error signal, ERROROUTZ signal, and TSG31 error signal.

41.2.2.16 PIC1ENCSEL400 — ENCATIN1 Input Select Register 400

The PIC1ENCSEL400 register is used for encoder capture trigger select function.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + $B8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1ENCSEL 4007	—	—	—	PIC1ENCSEL 4003	PIC1ENCSEL 4002	PIC1ENCSEL 4001	PIC1ENCSEL 4000
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 41.26 PIC1ENCSEL400 Register Contents

Bit Position	Bit Name	Function
7	PIC1ENCSEL 4007	Enables or disables output of INTTAUD0Im signal selected by PIC1ENCSEL400[3:0]. 0: Disabled 1: Enabled
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	PIC1ENCSEL 400[3:0]	Selects INTTAUD0Im to be used as a capture trigger signal for ENCA0 and ENCA1. 0000_B: INTTAUD0I0 is selected 0001_B: INTTAUD0I1 is selected 0010_B: INTTAUD0I2 is selected 0011_B: INTTAUD0I3 is selected 0100_B: INTTAUD0I4 is selected 0101_B: INTTAUD0I5 is selected 0110_B: INTTAUD0I6 is selected 0111_B: INTTAUD0I7 is selected 1000_B: INTTAUD0I8 is selected 1001_B: INTTAUD0I9 is selected 1010_B: INTTAUD0I10 is selected 1011_B: INTTAUD0I11 is selected 1100_B: INTTAUD0I12 is selected 1101_B: INTTAUD0I13 is selected 1110_B: INTTAUD0I14 is selected 1111_B: INTTAUD0I15 is selected

41.2.2.17 PIC1ENCSEL410 — ENCATIN1 Input Select Register 410

The PIC1ENCSEL410 register is used for encoder capture trigger select function.

Access: This register can be read or written in 8-bit units.

Address: <PIC1_base> + BC_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1ENCSEL4107	—	—	—	PIC1ENCSEL4103	PIC1ENCSEL4102	PIC1ENCSEL4101	PIC1ENCSEL4100

7	PIC1ENCSEL4107	Enables or disables output of INTTAUD1Im signal selected by PIC1ENCSEL410[3:0]. 0: Disabled 1: Enabled
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	PIC1ENCSEL410[3:0]	Selects INTTAUD1Im to be used as a capture trigger signal for ENCA0 and ENCA1. 0000_B: INTTAUD1I0 is selected 0001_B: INTTAUD1I1 is selected 0010_B: INTTAUD1I2 is selected 0011_B: INTTAUD1I3 is selected 0100_B: INTTAUD1I4 is selected 0101_B: INTTAUD1I5 is selected 0110_B: INTTAUD1I6 is selected 0111_B: INTTAUD1I7 is selected 1000_B: INTTAUD1I8 is selected 1001_B: INTTAUD1I9 is selected 1010_B: INTTAUD1I10 is selected 1011_B: INTTAUD1I11 is selected 1100_B: INTTAUD1I12 is selected 1101_B: INTTAUD1I13 is selected 1110_B: INTTAUD1I14 is selected 1111_B: INTTAUD1I15 is selected

41.2.2.18 PIC1REG200 — Timer Input/Output Control Register 200

The PIC1REG200 register selects TAUD0 input signals.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + $C0_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 41.28 PIC1REG200 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	PIC1REG200 [25:24]	Select the TAUD0 channel used by TAPA0TSIM0 and TAPA0TUDCM0. 00: Not selected. 01: TAUD0 channel 0 selected. 10: TAUD0 channel 2 selected. 11: TAUD0 channel 8 selected.
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PIC1REG20018	Select the signal for input as TAUD0TTIN10, TAUD0TTIN12, and TAUD0TTIN14 signals of TAUD0. 1: Select TOUT of TAUD0 CH02. Settings other than above are prohibited.*1
17 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11, 10	PIC1REG200 [11:10]	Select the signal for input as TAUD0TTIN6, TAUD0TTIN7 signals of TAUD0. 10: TSG30PTE signal of TSG30. Settings other than above are prohibited.*1
9, 8	PIC1REG200 [09:08]	Select the signal for input as TAUD0TTIN4, TAUD0TTIN5 signals of TAUD0. 10: TSG30PTE signal of TSG30. Settings other than above are prohibited.*1
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PIC1REG20003	Selects the signal for input as TAUD0TTIN7 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1REG20011, PIC1REG20010 bits (TSG30PTE signal).
2	PIC1REG20002	Select the signal for input as TAUD0TTIN6 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1REG20011 and PIC1REG20010 bits (TSG30PTE signal).
1	PIC1REG20001	Select the signal for input as TAUD0TTIN5 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1REG20009, PIC1REG20008 bits (TSG30PTE signal).

Table 41.28 PIC1REG200 Register Contents (2/2)

Bit Position	Bit Name	Function
0	PIC1REG20000	Select the signal for input as TAUD0TTIN4 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1REG20009 and PIC1REG20008 bits (TSG30PTE signal).

Note 1. Make sure to set an appropriate value when a selectable signal is used. Do not change the value from the value after reset when not used.

41.2.2.19 PIC1REG210 — Timer Input/Output Control Register 210

The PIC1REG210 register selects TAUD1 input signals.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + $D4_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 41.29 PIC1REG210 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PIC1REG21018	Selects the signal for input as TAUD1TTIN10, TAUD1TTIN12, and TAUD1TTIN14 signals of TAUD1. 1: Select TOUT of TAUD1 CH02. Settings other than above are prohibited.*1
17 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11, 10	PIC1REG210 [11:10]	Selects the signal to be input as TAUD1TTIN6 and TAUD1TTIN7 signals of TAUD1. 10: TSG31PTE signal of TSG31 Settings other than above are prohibited.*1
9, 8	PIC1REG210 [09:08]	Selects the signal to be input as TAUD1TTIN4 and TAUD1TTIN5 signals of TAUD1. 10: TSG31PTE signal of TSG31 Settings other than above are prohibited.*1
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PIC1REG21003	Selects the signal to be input as TAUD1TTIN7 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1REG21011 and PIC1REG21010 bits (TSG31PTE signal).
2	PIC1REG21002	Selects the signal to be input as TAUD1TTIN6 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1REG21011 and PIC1REG21010 bits (TSG31PTE signal).
1	PIC1REG21001	Selects the signal to be input as TAUD1TTIN5 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1REG21009 and PIC1REG21008 bits (TSG31PTE signal).
0	PIC1REG21000	Selects the signal to be input as TAUD1TTIN4 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1REG21009 and PIC1REG21008 bits (TSG31PTE signal).

Note 1. Make sure to set an appropriate value when a selectable signal is used. Do not change the value from the value after reset when not used.

41.2.2.20 PIC1REG2n1 — Timer Input/Output Control Register 2n1 (n = 0, 1)

The PIC1REG2n1 register selects the logical operation for the combination circuit PFN0xx.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + $C4_H$(n = 0), <PIC1_base> + $D8_H$(n = 1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 41.30 PIC1REG2n1 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27, 26	PIC1REG2n1 [27:26]	Selects PFN045 WO2 output.*1 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*2
25, 24	PIC1REG2n1 [25:24]	Selects PFN045 WO1 output.*1 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*2
23, 22	PIC1REG2n1 [23:22]	Selects PFCN023 VO2 output.*1 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*2
21, 20	PIC1REG2n1 [21:20]	Selects PFN023 VO1 output.*1 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*2
19, 18	PIC1REG2n1 [19:18]	Selects PFN001 UO2 output.*1 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*2
17, 16	PIC1REG2n1 [17:16]	Selects PFN001 UO1 output.*1 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*2
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. The register value for some functions needs to be set depending on the value of TAUD. For the setting values, see **Section 41.2.3, Function**.

Note 2. Make sure to set an appropriate value when a selectable signal is used. Do not change the value from the value after reset when not used.

Block diagram of PFN001 is shown in the following figure.

PFN023 and PFN045 are operated under the same logic with different input signals and select registers.

For connection of PFN0xx with peripheral circuits, see **Figure 41.14**.

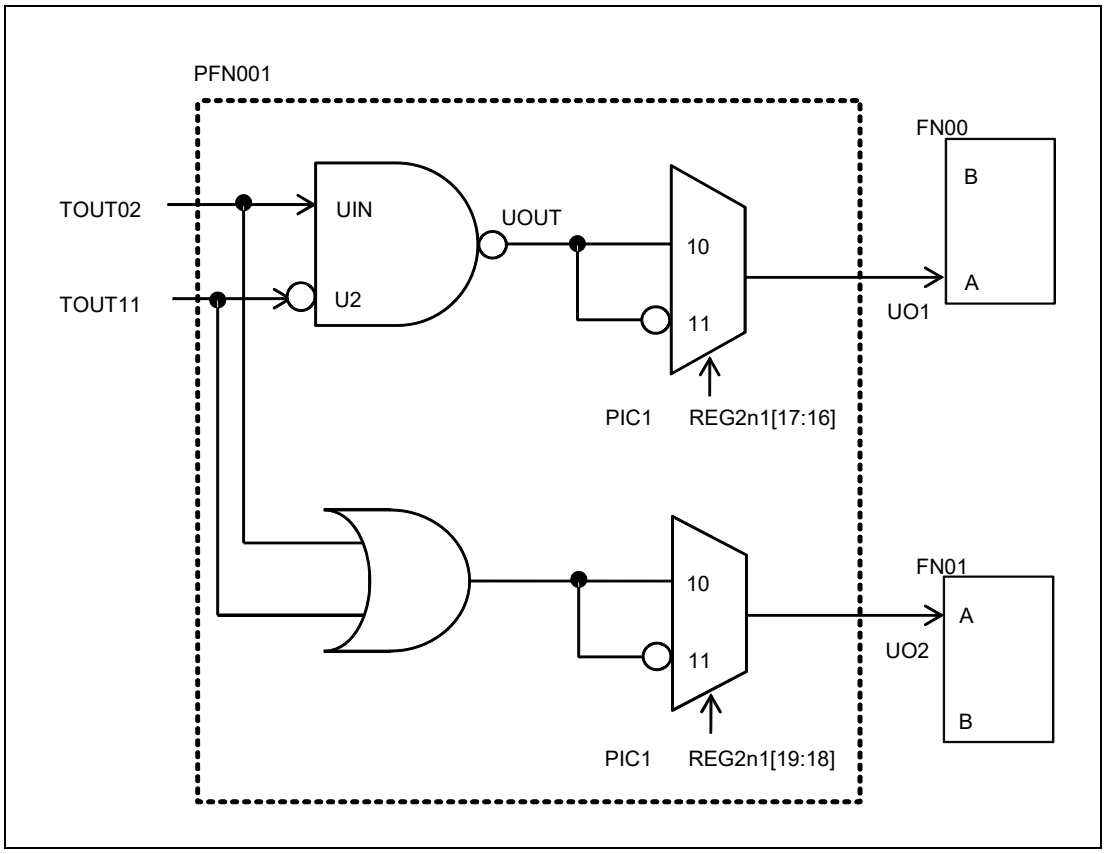

Figure 41.2 Block Diagram of PFN001

41.2.2.21 PIC1REG2n2 — Timer Input/Output Control Register 2n2 (n = 0, 1)

The PIC1REG2n2 register selects input signals of TAUDn CHm.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + $C8_H$ (n = 0), <PIC1_base> + DC_H (n = 1)

Value after reset: 0000 0000_H

Table 41.31 PIC1REG2n2 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27, 26	PIC1REG2n2 [27:26]	Selects the TIN input signal of TAUDnCH15. 00: TIN pin input. 10: Signal selected by PIC1REG2n204 bit (TOUT of TAUDnCH09). Settings other than above are prohibited.
25, 24	PIC1REG2n2 [25:24]	Selects the TIN input signal of TAUDnCH14. 00: TIN pin input 10: Signal selected by PIC1REG2n018 register bit (TOUT of TAUDnCH02). Settings other than above are prohibited.
23, 22	PIC1REG2n2 [23:22]	Selects the TIN input signal of TAUDnCH13. 00: TIN pin input 10: Signal selected by PIC1REG2n203 bit (TOUT of TAUDnCH07). Settings other than above are prohibited.
21, 20	PIC1REG2n2 [21:20]	Selects the TIN input signal of TAUDnCH12. 00: TIN pin input 10: Signal selected by PIC1REG2n018 register bit (TOUT of TAUDnCH02). Settings other than above are prohibited.
19, 18	PIC1REG2n2 [19:18]	Selects the TIN input signal of TAUDnCH11. 00: TIN pin input 10: Signal selected by PIC1REG2n202 bit (TOUT of TAUDnCH05). Settings other than above are prohibited.
17, 16	PIC1REG2n2 [17:16]	Selects the TIN input signal of TAUDnCH10. 00: TIN pin input 10: Signal selected by PIC1REG2n018 register bit (TOUT of TAUDnCH02). Settings other than above are prohibited
15 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	PIC1REG2n2 04	Selects the signal to be supplied to TIN of TAUDnCH15. 0: TOUT of TAUDnCH09. 1: Set/clear output by INTTAUDnI8 and INTTAUDnI9.
3	PIC1REG2n2 03	Selects the signal to be supplied to TIN of TAUDnCH13. 0: TOUT of TAUDnCH07. 1: Set/clear output by INTTAUDnI6 and INTTAUDnI7.

Table 41.31 PIC1REG2n2 Register Contents (2/2)

Bit Position	Bit Name	Function
2	PIC1REG2n202	Selects the signal to be supplied to TIN of TAUDnCH11. 0: TOUT of TAUDnCH05. 1: Set/clear output by INTTAUDnI4 and INTTAUDnI5.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

41.2.2.22 PIC1REG2n3 — Timer Input/Output Control Register 2n3 (n = 0, 1)

The PIC1REG2n3 register selects logical operation for the combination circuit FN0i.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + CC_H (n = 0), <PIC1_base> + $E0_H$ (n = 1)

Value after reset: 0000 0000_H

Table 41.33 PIC1REG30 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22	PIC1REG3022	Selects the input pins (ENCA0E0, ENCA0E1, ENCA0EC internal inputs) of ENCA0 timer. 0: The signal selected by PIC1REG3000 (ENCA0E0), PIC1REG3001 (ENCA0E1), and PIC1REG3017-16 (ENCA0EC) 1: The signal selected by PIC1REG3020 and PIC1REG3019
21	PIC1REG3021	Selects the signal to be supplied to PIC1REG3012-15. 0: ENCA1I1 (signal 1 of the ENCA1 external pin) 1: The signal selected by the PIC1ENCSEL4107 bit of the PIC1ENCSEL410 register.
20,19	PIC1REG30 [20:19]	Selects the input pins (ENCA1E0, ENCA1E1, ENCA1EC) of ENCA1 timer. 00: The ENCA1E0, ENCA1E1, ENCA1EC input pins of ENCA1 timer. Settings other than above are prohibited.
18	PIC1REG3018	Selects the signal to be supplied to PIC1REG3002 to 05. 0: ENCA0I1 (signal 1 of ENCA0 external pin) 1: The signal selected by the PIC1ENCSEL4007 bit of the PIC1ENCSEL400 register.
17, 16	PIC1REG30 [17:16]	Selects the input pins (ENCA0E0, ENCA0E1, ENCA0EC) of ENCA0 timer. 00: The ENCA0E0, ENCA0E1, ENCA0EC input pins of ENCA0 timer. Settings other than above are prohibited.
15 to 12	PIC1REG30 [15:12]	Selects the signal for input as the ENCA1TTIN1 signal. 0000_B: The signal selected by PIC1REG3021. 0001_B: The signal selected by PIC1REG3018. 0010_B: ADCJTTOUT0[4] 0011_B: ADCJTTOUT0[3] 0100_B: ADCJTTOUT0[2] 0101_B: ADCJTTOUT0[1] 0110_B: ADCJTTOUT0[0] 0111_B: ADCJTTOUT1[4] 1000_B: ADCJTTOUT1[3] 1001_B: ADCJTTOUT1[2] 1010_B: ADCJTTOUT1[1] 1011_B: ADCJTTOUT1[0] Settings other than above are prohibited.

Table 41.33 PIC1REG30 Register Contents (2/2)

Bit Position	Bit Name	Function
11, 10	PIC1REG30 [11:10]	Selects the ENCA1EC pin input of timer ENCA1. 00: The signal selected by the PIC1REG3019 and PIC1REG3020 bits. 10: The signal selected by the PIC1REG3016 and PIC1REG3017 bits. 11: ENCAT0EQ1 (ENCA0 timer) or INTTPTMU01 signal Settings other than above are prohibited
9, 8	PIC1REG30 [09:08]	Selects the ENCA1E1 pin input of timer ENCA1. 00: Signal selected by the PIC1REG3019 and PIC1REG3020 bits. 01: The signal selected by the PIC1REG3016 and PIC1REG3017 bits. 10: TSG31PUD signal of TSG31. Settings other than above are prohibited.
7, 6	PIC1REG30 [07:06]	Selects the ENCA1E0 pin input of timer ENCA1. 00: The signal selected by the PIC1REG3019 and PIC1REG3020 bits. 01: The signal selected by the PIC1REG3016 and PIC1REG3017 bits. 10: TSG31PEC signal of TSG31. Settings other than above are prohibited
5 to 2	PIC1REG30 [05:02]	Selects the signal to be input as the ENCA0TTIN1 signal. 0000_B: The signal selected by the PIC1REG3018 bit. 0001_B: The signal selected by the PIC1REG3021 bit. 0010_B: ADCJTTOUT0[4] 0011_B: ADCJTTOUT0[3] 0100_B: ADCJTTOUT0[2] 0101_B: ADCJTTOUT0[1] 0110_B: ADCJTTOUT0[0] 0111_B: ADCJTTOUT1[4] 1000_B: ADCJTTOUT1[3] 1001_B: ADCJTTOUT1[2] 1010_B: ADCJTTOUT1[1] 1011_B: ADCJTTOUT1[0] Settings other than above are prohibited.
1	PIC1REG3001	Selects the signal to input as the ENCA0E1 internal signal. 0: Signal selected by PIC1REG3017 and PIC1REG3016. 1: TSG30PUD signal of TSG30.
0	PIC1REG3000	Selects the signal to input as the ENCA0E0 internal signal. 0: Signal selected by PIC1REG3017 and PIC1REG3016. 1: TSG30PEC signal of TSG30.

41.2.2.24 PIC1REG31 — Timer Input/Output Control Register 31

The PIC1REG31 register selects TAUD0, TAUD1 and TAUJ0 input signals.

Access: This register can be read or written in 32-bit units.

Address: <PIC1_base> + EC_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 41.34 PIC1REG31 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22, 21	PIC1REG31 [22:21]	Selects the TIN input signal of TAUD1CH02. 00: TIN pin input 01: DT output signal of ENCAT1EQ0 or INTTPTMU11 Settings other than above are prohibited.
20	PIC1REG3120	Selects the TIN input signal of TAUD1CH01. 0: TIN pin input 1: The signal selected by PIC1REG3115 to PIC1REG3117
19, 18	PIC1REG31 [19:18]	Selects the TIN input signal of TAUD1CH00. 00: The signal selected by PIC1REG3115 to PIC1REG3117 10: DT output signal of ENCAT1EQ0 or INTTPTMU11 Settings other than above are prohibited.
17 to 15	PIC1REG31 [17:15]	Selects the TIN input signal of TAUD1CH00 and TAUD1CH01. 000: TIN pin input 001: DT output signal of ENCAT1EQ1 or INTTPTMU20 Settings other than above are prohibited.
14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	PIC1REG31 [13:12]	Selects the TIN input signal of TAUD0CH02. 00: TIN pin input 01: DT output signal of ENCAT0EQ0 or INTTPTMU00 Settings other than above are prohibited.
11	PIC1REG3111	Selects the TIN input signal of TAUD0CH01. 0: TIN pin input 1: The signal selected by PIC1REG3106 to PIC1REG3108
10, 9	PIC1REG31 [10:09]	Selects the TIN input signal of TAUD0CH00. 00: The signal selected by PIC1REG3106 to PIC1REG3108 10: DT output signal of ENCAT0EQ0 or INTTPTMU00 Settings other than above are prohibited.
8 to 6	PIC1REG31 [08:06]	Selects the TIN input signal of TAUD0CH00 and TAUD0CH01. 000: TIN pin input 001: DT output signal of ENCAT0EQ1 or INTTPTMU01 Settings other than above are prohibited.

Table 41.34 PIC1REG31 Register Contents (2/2)

Bit Position	Bit Name	Function
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	PIC1REG3104	Selects the TIN input signal of TAUJ0CH03. 0: TIN pin input 1: DT output signal of INTENCA1IEC or INTTPTMU30
3	PIC1REG3103	Selects the TIN input signal of TAUJ0CH02. 0: TIN pin input 1: DT output signal of INTENCA1IEC or INTTPTMU30
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PIC1REG3101	Selects the TIN input signal of TAUJ0CH01. 0: TIN pin input 1: DT output signal of INTENCA0IEC or INTTPTMU10
0	PIC1REG3100	Selects the TIN input signal of TAUJ0CH00. 0: TIN pin input 1: DT output signal of INTENCA0IEC or INTTPTMU10

41.2.2.25 PIC1REG50 — Timer Input/Output Control Register 50

The PIC1REG50 register selects TSG30 input signals.

Access: This register can be read or written in 16-bit units.

Address: <PIC1_base> + $F8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 41.35 PIC1REG50 Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	PIC1REG5010	Selects the signal to be input as the TSG30OPCI0 signal of the TSG30 timer. 0: INTENCA1I1 input of the ENCA1 timer 1: Setting prohibited.
9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PIC1REG5008	Selects the signal to be input as the TSG30OPCI0 signal of the TSG30 timer. 0: INTENCA0I1 input of the ENCA0 timer 1: Setting prohibited.
7	PIC1REG5007	Selects the signal to be input as the TSG30OPCI1 signal of the TSG30 timer. 0: INTTAUD0I7 input of the TAUD0 1: Setting prohibited.
6, 5	PIC1REG50 [06:05]	Selects the signal to be input as the TSG30OPCI0 signal of the TSG30 timer. 01: The signal selected by the PIC1REG5008 bit 10: The signal selected by the PIC1REG5010 bit 11: INTTAUD0I5 output signal of TAUD0. Settings other than above are prohibited.*1
4 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1REG5000	Switches the ENCA signal and external hall sensor signal. For the note on selection of the signals, see Note 1 of **Section 41.2.2.9, PIC1TSGHALLSEL — Hall Sensor Input Select Register**. 0: Select the pin input ENCA0E0, ENCA0E1, ENCA0EC. 1: Setting prohibited.

Note 1. Make sure to set an appropriate value when a selectable signal is used. Do not change the value from the value after reset when not used

41.2.2.26 PIC1REG51 — Timer Input/Output Control Register 51

The PIC1REG51 register selects TSG31 input signals.

Access: This register can be read or written in 16-bit units.

Address: <PIC1_base> + FC_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 41.36 PIC1REG51 Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	PIC1REG5110	Selects the signal to be input as the TSG31OPCI0 signal from the TSG31 timer. 0: INTENCA1I1 input signal of the ENCA1 timer 1: Setting prohibited.
9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PIC1REG5108	Selects the signal to be input as the TSG31OPCI0 signal from TSG31 timer. 0: INTENCA0I1 input signal of the ENCA0 timer 1: Setting prohibited.
7	PIC1REG5107	Selects the signal to be input as the TSG31OPCI1 signal from TSG31 timer. 0: The INTTAUD1I7 signal input of the TAUD1 timer. 1: Setting prohibited.
6, 5	PIC1REG51 [06:05]	Selects the signal to be input as the TSG31OPCI0 signal from TSG31 timer. 01: The signal selected by the PIC1REG5108 bit. 10: The signal selected by the PIC1REG5110 bit. 11: The INTTAUD1I5 output of the TAUD1. Settings other than above are prohibited.*1
4 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC1REG5100	Switches the ENCA signal and external hall sensor signal. For the note on selection of the signals, see Note 1 of **Section 41.2.2.9, PIC1TSGHALLSEL — Hall Sensor Input Select Register**. 1: Select the pin input ENCA1E0, ENCA1E1, ENCA1EC. Settings other than above are prohibited.*1

Note 1. Make sure to set an appropriate value when a selectable signal is used. Do not change the value from the value after reset when not used

41.2.2.27 PIC1POMONSEL — Port Output Monitor Select Register

The PIC1POMONSEL register selects the channels to monitor output of TAUD0, TAUD1, TSG30, TSG31, OSTM8, and OSTM9 timers using TAUD2.

Access: This register can be read or written in 8-bit units.

Address: FFBF B400$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	POMONSEL2	POMONSEL1	POMONSEL0

41.2.2.28 PIC1PIMONSEL — Port Input Monitor Select Register

The PIC1PIMONSEL register selects the channels to monitor input of TAUJ0 and TAUJ1 timers using TAUJ2.

Access: This register can be read or written in 8-bit units.

Address: FFBF $B600_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIMONSEL1	PIMONSEL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 41.39 PIC1PIMONSEL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PIMONSEL[1:0]	Selects the input pin to monitor. For the selectable input pins, see **Table 41.40**.

Table 41.40 Selection of Input Pins to be Monitored by the PIC1PIMONSEL Register

PIMONSEL Setting	00	01	10
ch0	Port (TAUJ2I0)	TAUJ0 ch0	TAUJ1 ch0
ch1	Port (TAUJ2I1)	TAUJ0 ch1	TAUJ1 ch1

ch3	Port (TAUJ2I3)	TAUJ0 ch3	TAUJ1 ch3

41.2.2.29 PIC1SELBSSER — Synchronous Start and Clear Enable Register

The PIC1SELBSSER register selects TAUD0 channels 14 and 15 for synchronous starting or clearing of TSG30 and TSG31.

Access: This register can be read or written in 8-bit units.

Address: FFBF $B200_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SELBSSER[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 41.41 PIC1SELBSSER Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	SELBSSER[2:0]	The SELBSSER[2:0] bits enables synchronous starting or clearing of TSG3 with TAUD0.

SELBSSER[2:0]	Setting for TSG3 Synchronous Starting or Clearing
000_B	TSG30: Disabled TSG31: Disabled
001_B	TSG30: INTTAUD0I14 enabled TSG31: Disabled
010_B	TSG30: Disabled TSG31: INTTAUD0I15 enabled
011_B	TSG30: INTTAUD0I14 enabled TSG31: INTTAUD0I15 enabled
100_B	TSG30: INTTAUD0I15 enabled TSG31: INTTAUD0I15 enabled
Other than above	Setting prohibited

CAUTIONS

1. Using the synchronous clearing and simultaneous starting trigger functions for TSG3 at the same time is prohibited. If you are using synchronous clearing of TSG3, only use the simultaneous start trigger function at the start of counting. After counting has started, set the bits of the simultaneous start control register listed below to 0.
   - PIC1SSER0.PIC1SSER014 (TAUD0 channel 14)
   - PIC1SSER0.PIC1SSER015 (TAUD0 channel 15)
   - PIC1SSER2.PIC1SSER208 (TSG30)
   - PIC1SSER2.PIC1SSER209 (TSG31)

   To start TSG30 and TSG31, and TAUD0 channels 14 and 15 simultaneously while synchronous clearing of TSG3 is in use, disable synchronous clearing of TSG3 before using the simultaneous start trigger function.

   Switching of the above setting while the trigger for synchronous clearing or simultaneous starting of TSG3 is active is prohibited.
2. Writing in the following ways to SSER during counter operation is prohibited.
   - Writing a value other than 000_B or the setting at the start of operation.
   - Writing at a timing that coincides with the occurrence of an interrupt for TAUD0 channel 14 or 15.

41.2.2.30 PIC1SELB_TAUD2I — TAUD2TTINm Input Signal Selection Register

The register selects the TAUD2TTINm input signals.

Access: This register can be read or written in 16-bit units.

Address: FFBF 6800_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

41.2.3 Function

41.2.3.1 Simultaneous Start Trigger Function

(1) Overview

This function allows any combination of timers (TAUDn, TAUJn, TSG3n, TPBAn, OSTMn, and ENCAn) to be started simultaneously.

(2) Configuration

The timers which support simultaneous start trigger function are as follows.

- TAUDn
- TAUJn
- TSG3n
- TPBAn
- OSTMn
- ENCAn

NOTE

n = 8, 9 for OSTM; n = 0, 1 for other timers.

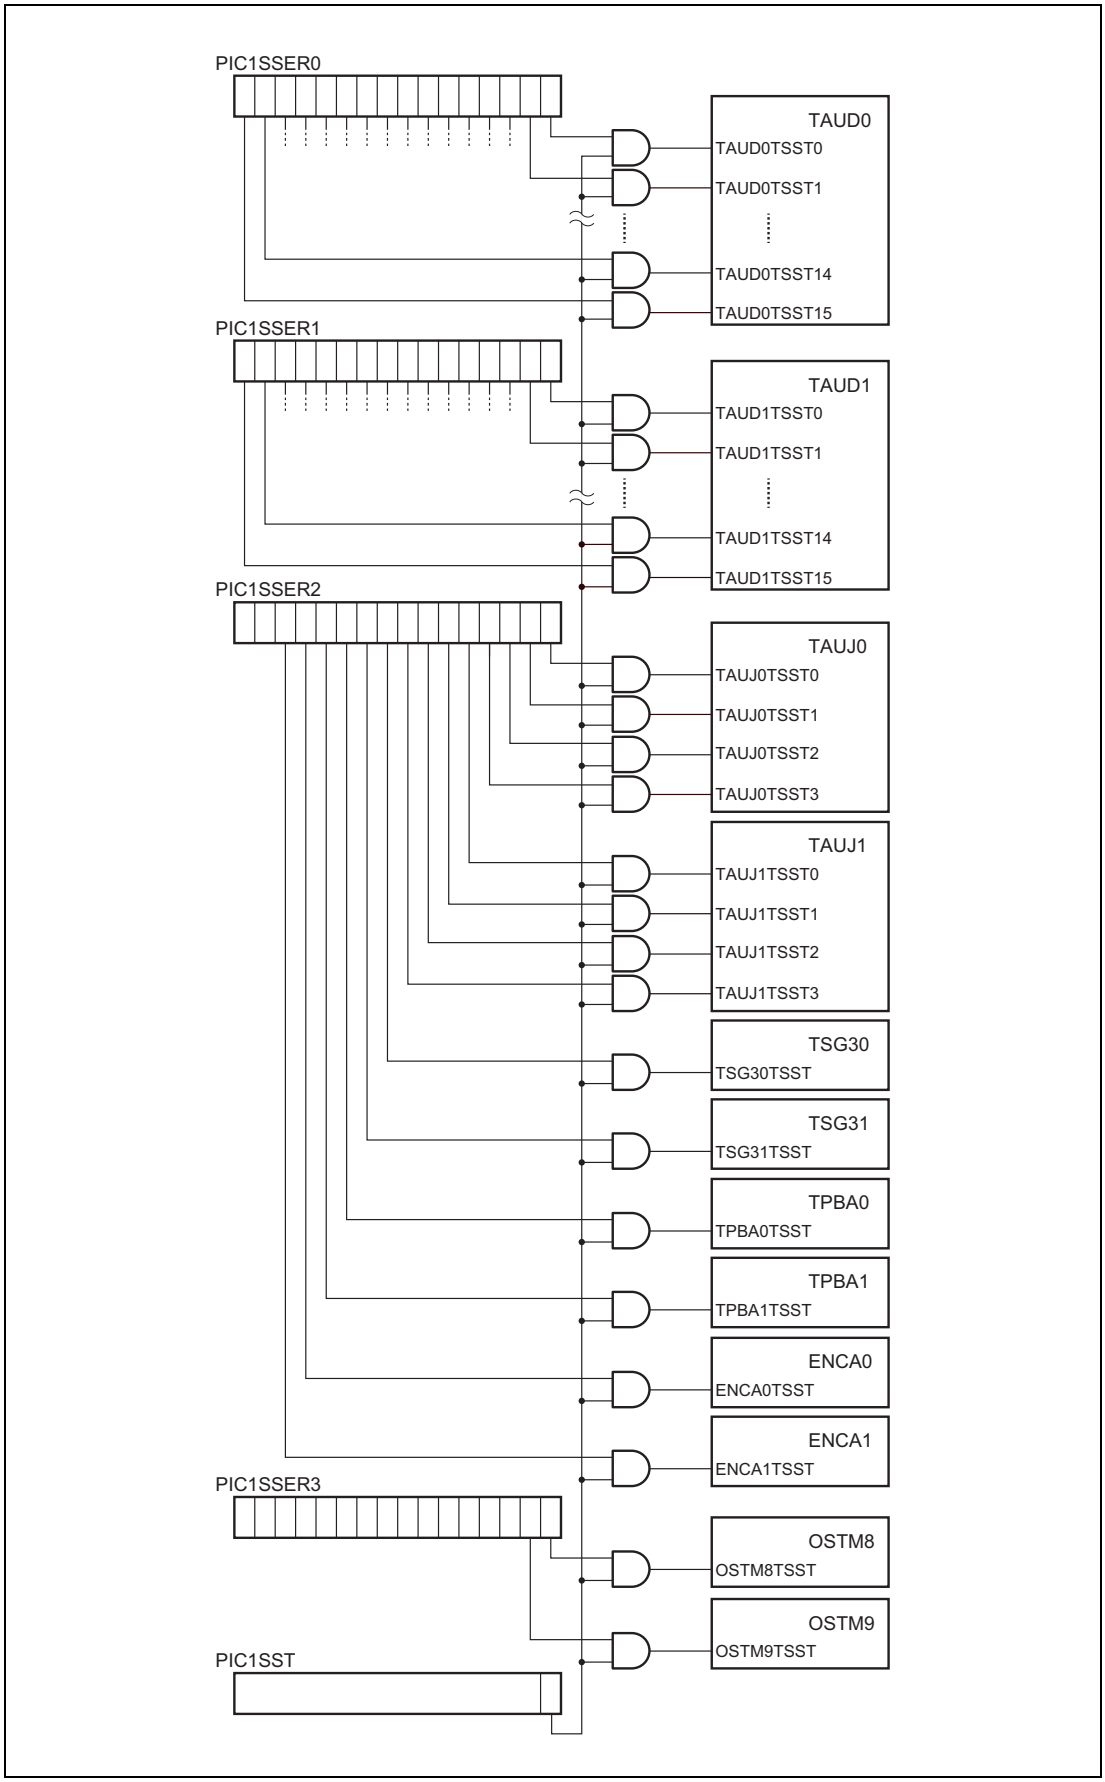

Figure 41.4 Block Diagram of Simultaneous Start Trigger Function

Set 1 to the PIC1SYNCTRG bit of the simultaneous start trigger control register (PIC1SST) after unmasking the target timers. The timer operations start by active signal input to the start trigger of each timer.

(3) Registers

The PIC1 registers set by this function are as follows. For setting value of the registers, see **Section 41.2.2.2** to **Section 41.2.2.6.**

- PIC1 registers to be set
  PIC1SST
  PIC1SSER0
  PIC1SSER1
  PIC1SSER2
  PIC1SSER3

(4) Function

This function allows any combination of timers (TAUDn, TAUJn, TSG3n, TPBAn, OSTMn, and ENCAn) to be started simultaneously.

(5) Flow Chart

The following figure shows the setting flow of this function.

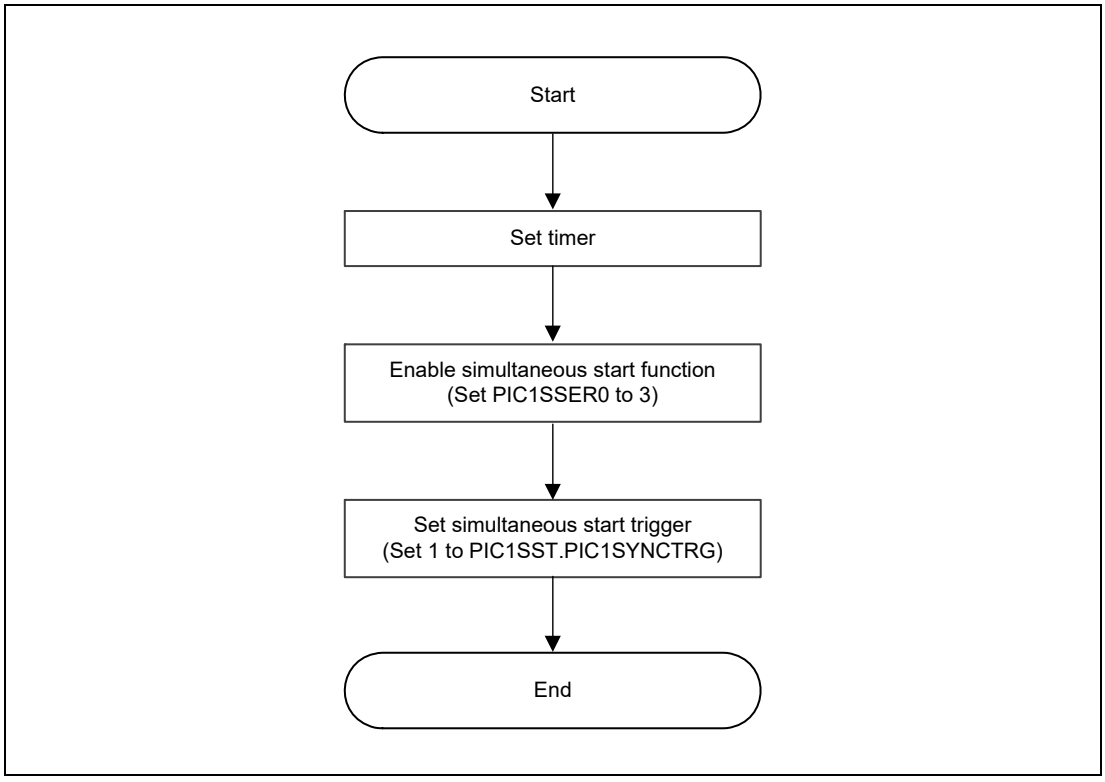

Figure 41.5 Setting Flow

Setting procedures are as follows.

- Set timer
  Set the timers to start simultaneously.
- Enable simultaneous start function
  Set 1 to the applicable bits of the PIC1SSER0, PIC1SSER1, PIC1SSER2, and PIC1SSER3 registers to enable simultaneous start of the corresponding timers.
- Set simultaneous start trigger
  Setting 1 to the PIC1SYNCTRG bit of the simultaneous start trigger control register (PIC1SST) simultaneously starts the timers.

41.2.3.2 INT Signal Output Selection Function

(1) Overview

Request signals for two types of interrupts, peak interrupts and valley interrupts, can be output by the INT signals output by TAUD0.

(2) Configuration

This function generates the peak interrupt INTTAPA0IPEK0 and valley interrupt INTTAPA0IVLY0 by using the TAPA0TSIM0 signal, which is connected to the INT signal on the TAUD's triangular carrier cycle generation channel (master) and TAPA0TUDCM0 signal, which is connected to the counter up/down signal.

For the connection destination of TAPA0TSIM0, see **Section 36.1.6, Internal Input/Output Signal**.

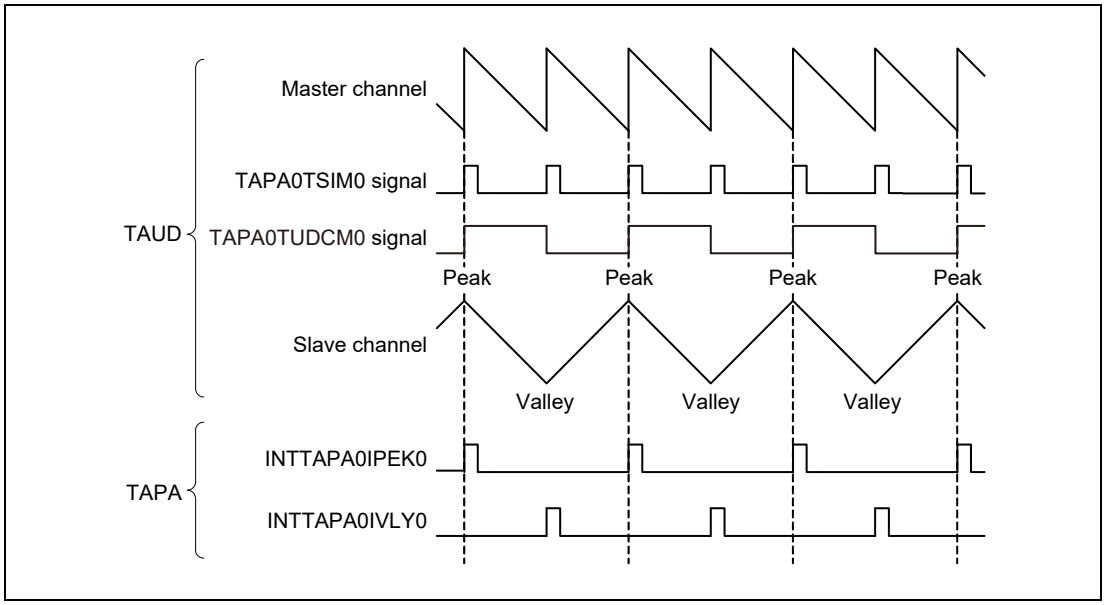

Figure 41.6 Basic Timing of Signals for the INT Signal Output Selection Function

Triangular carrier cycles are generated on the master channel.

The INT signal generated on the master channel in each half triangular carrier cycle is input to TAPA0 as the TAPA0TSIM0 signal. TAPA0 generates the INTTAPA0IPEK0 signal (peak interrupt) during high level of the TAPA0TUDCM0 signal and the INTTAPA0IVLY0 signal (valley interrupt) during low level of the TAPA0TUDCM0 signal by using the TAPA0TSIM0 and TAPA0TUDCM0 input signals.

CAUTION

The peak interrupt INTTAPA0IPEK0 and valley interrupt INTTAPA0IVLY0 are generated regardless of the function of the master channel of TAUD.

When not using these peak and valley interrupts, mask them by using the ICTAPA0IPEK0 and ICTAPA0IVLY0 registers, respectively.

(3) Block Diagram

TAUD0 and TAPA0 are connected in the registers shown below by the INT signal output selection function.

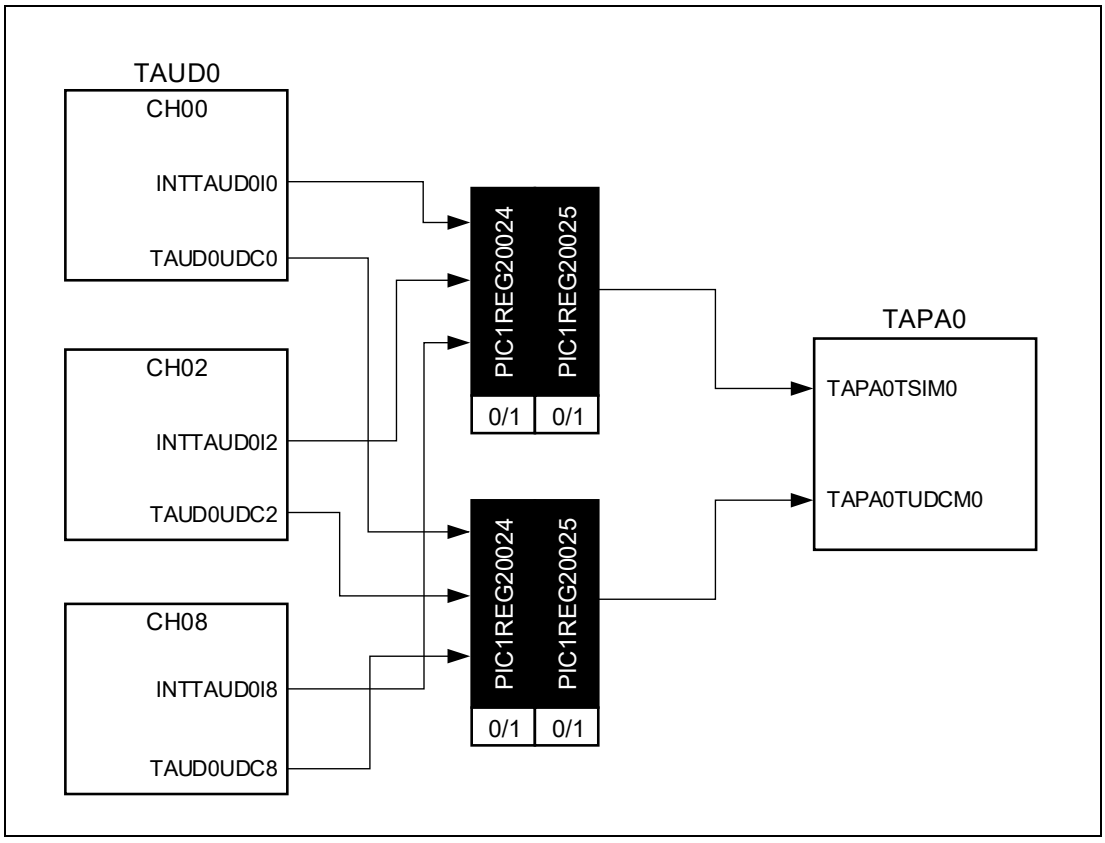

Figure 41.7 Connection of the INT Signals

41.2.3.3 PWM Output Function With Dead Time

(1) Overview

This function generates and outputs PWM waveforms with the dead time from one phase to three phases using TAUDn.

The PWM output function of TAUD sets only the clear timing in a period under the duty ratio specification. This function enables the set timing to be specified in addition to the clear timing to output more flexible PWM waveforms with the dead time.

The following table lists the number of TAUDn channels used.

PWM Output with Dead Time	Number of TAUDn Channels
One-phase PWM output (U phase/UB phase)	5 channels (master channel: 1, slave channel: 4)
Two-phase PWM output (U phase/UB phase, V phase/VB phase)	9 channels (master channel: 1, slave channel: 8)
Three-phase PWM output (U phase/UB phase, V phase/VB phase, W phase/WB phase)	13 channels (master channel: 1, slave channel: 12)

Note: Above are examples of PWM output combinations.

Usages of each TAUDn channel are listed in the following table. CH2 is used as the master channel.

TAUDn Channel	U phase / UB phase	V phase / VB phase	W phase / WB phase	Usage
CH0	—	—	—	Not used
CH1	—	—	—	Not used
CH2	√	√	√	Carrier period (common to each phase)
CH3	—	—	—	Not used
CH4	√	—	—	Duty (U phase setting)
CH5	√	—	—	Duty (U phase clearing)
CH6	—	√	—	Duty (V phase setting)
CH7	—	√	—	Duty (V phase clearing)
CH8	—	—	√	Duty (W phase setting)
CH9	—	—	√	Duty (W phase clearing)
CH10	√	—	—	U phase output (TOUT10)
CH11	√	—	—	UB phase output (TOUT11)
CH12	—	√	—	V phase output (TOUT12)
CH13	—	√	—	VB phase output (TOUT13)
CH14	—	—	√	W phase output (TOUT14)
CH15	—	—	√	WB phase output (TOUT15)

Note: √: Used; —: Not used

(2) Configuration

The PWM output function with the dead time is realized by using the PWM output function/one-phase output PWM function of TAUDn and PIC1 in combination. The following figure shows the block diagram of the PWM output function with the dead time.

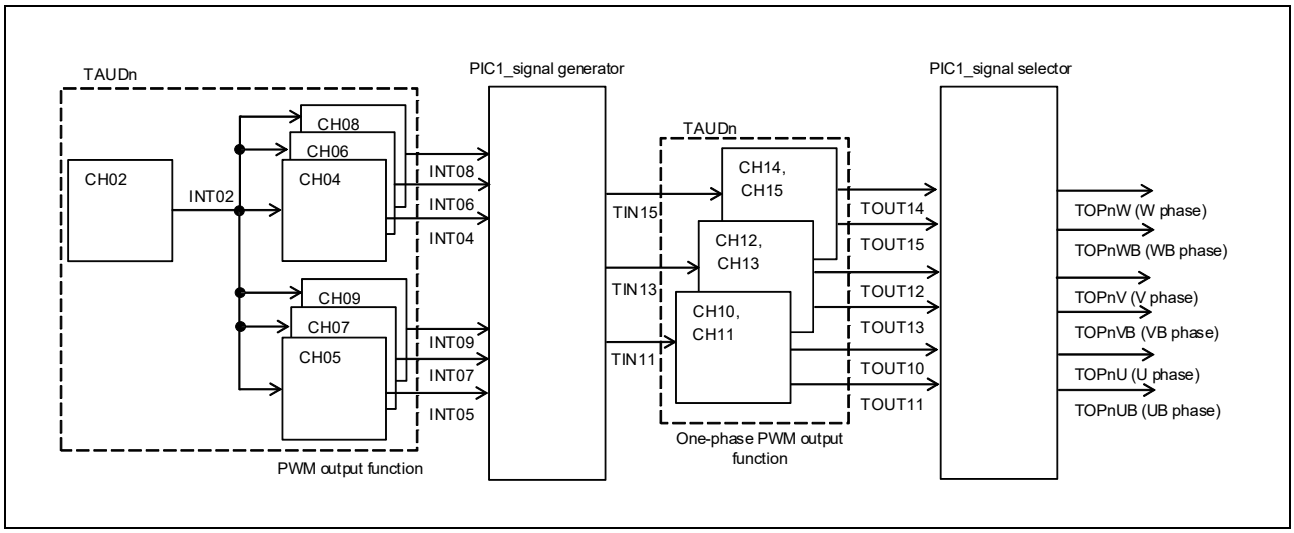

Figure 41.8 Block Diagram of PWM Output Function with Dead Time

The configuration of this function is described below using the PWM output of U phase/UB phase as an example.

- [TAUDn] PWM output function
  CH02, CH04, and CH05 are used in combination. Setting the period, U phase set value, and U phase clear value to CDR02, CDR04, and CDR05, respectively, generates the set and clear PWM signals (INT04 and INT05).
- [PIC1_signal generator] RS flip-flop circuit (RSn2)
  The INT04 and INT05 inputs are selected and TIN11 (PWM signal) is generated.
- [TAUDn] One-phase PWM output function
  CH10 and CH11 are used in combination. A dead time value is set to CDR11, dead time is inserted in the PWM signal to be input to TIN11, and TOUT10 (U phase PWM signal) and TOUT11 (UB phase PWM signal) are output.
- [PIC1_signal selector]
  TOUT10 and TOUT11 inputs are selected and output to TOPnU and TOPnUB pins, respectively.

A similar process occurs for V phase/VB phase and W phase/WB phase.

(3) Registers

The block diagram of PIC1 is shown in the following figure.

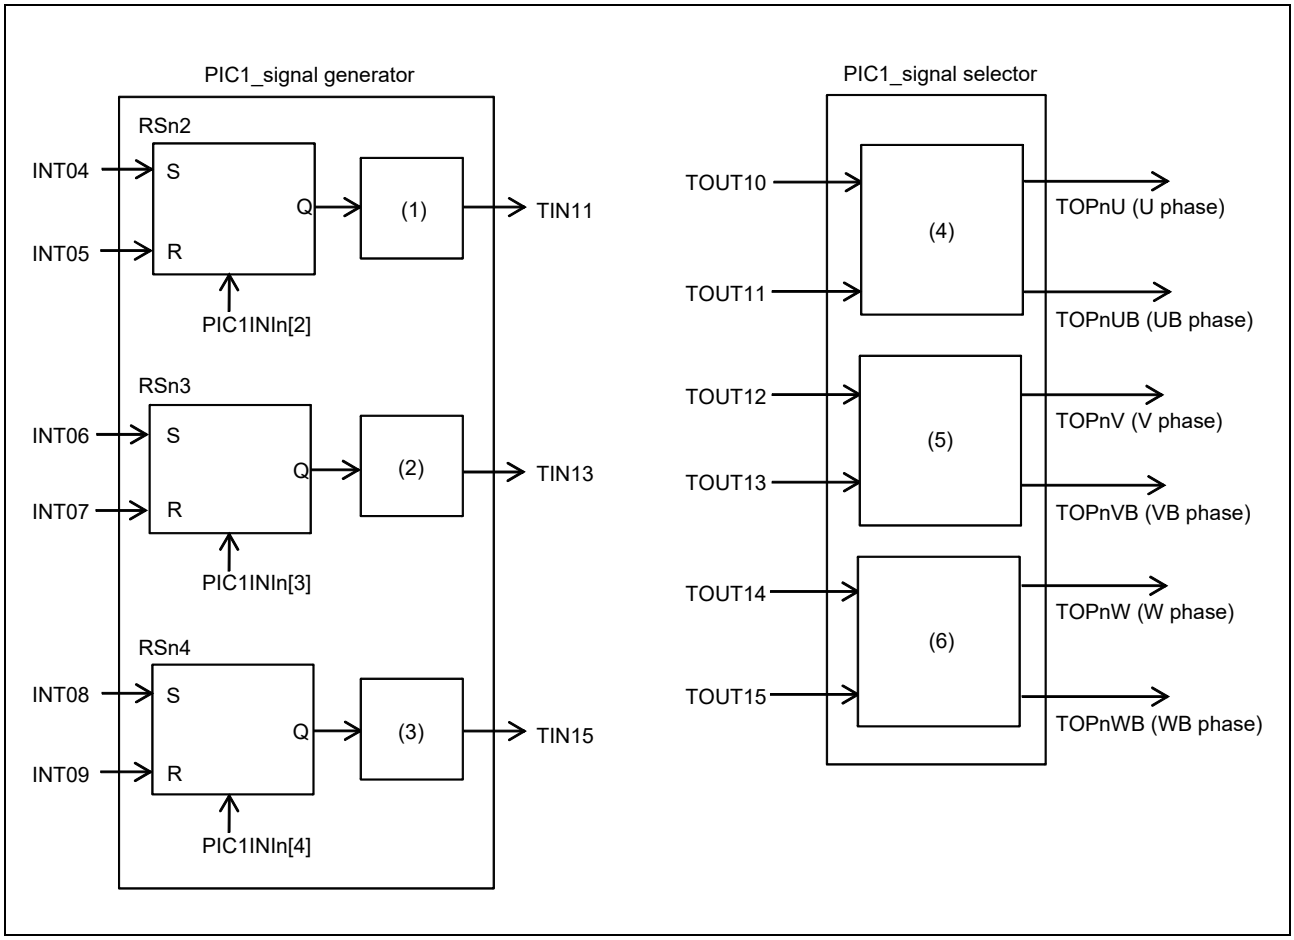

Figure 41.9 Block Diagram of PIC1

The values of PIC1 registers used in this function are as follows.

U phase/ UB phase

The values to output the signal Q from RSn2 as TIN11. (**Figure 41.9**, unit (1))

PIC1REG2n2[19:18] = 10_B

PIC1REG2n2[2] = 1_B

PIC1TAUDnSEL[23:22] = 00_B

The values to output TOUT10 and TOUT11 as TOPnU and TOPnUB, respectively (**Figure 41.9** , unit (4))

PIC1REG2n1[19:16] = 0000_B

PIC1REG2n3[2:0] = 000_B

PIC1REG2n3[6:4] = 000_B

V phase/ VB phase

The values to output the signal Q from RSn3 as TIN13. (**Figure 41.9**, unit (2))

PIC1REG2n2[23:22] = 10_B

PIC1REG2n2[3] = 1_B

PIC1TAUDnSEL[27:26] = 00_B

The values to output TOUT12 and TOUT13 as TOPnV and TOPnVB, respectively (**Figure 41.9**, unit (5))

PIC1REG2n1[23:20] = 0000_B

PIC1REG2n3[10:8] = 000_B

PIC1REG2n3[14:12] = 000_B

W phase/ WB phase

The values to output the signal Q from RSn4 as TIN15. (**Figure 41.9**, unit (3))

PIC1REG2n2[27:26] = 10_B

PIC1REG2n2[4] = 1_B

PIC1TAUDnSEL[31:30] = 00_B

The values to output TOUT14 and TOUT15 as TOPnW and TOPnWB, respectively (**Figure 41.9**, unit (6))

PIC1REG2n1[27:24] = 0000_B

PIC1REG2n3 [18:16] = 000_B

PIC1REG2n3[22:20] = 000_B

Enables initialization of RSn2 to RSn4

The values to enable initialization of RSn2 to RSn4

PIC1INIn0 [4] = 1_B (initialized)

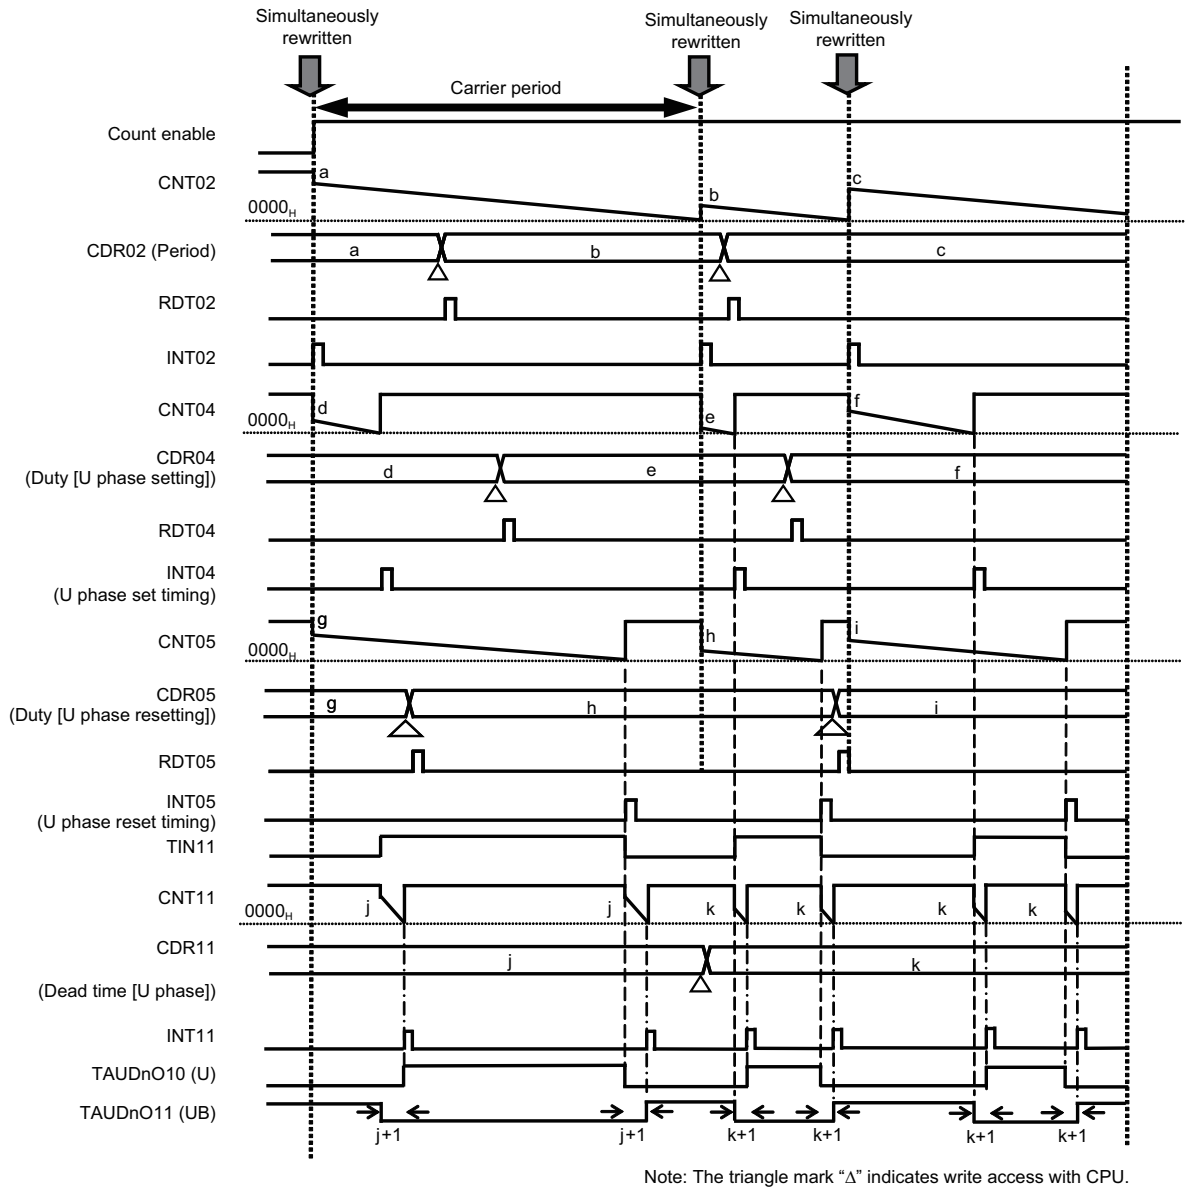
PIC1INIn0 [3] = 1_B (initialized)

PIC1INIn0 [2] = 1_B (initialized)

(4) Function

Details of this function are described using the one-phase PWM output (U phase/UB phase) with dead time as an example.

The following figure shows the timing diagram.



Note: For details of TAUD function including operation timing, see **Section 33, Timer Array Unit D (TAUD)**.

Figure 41.10 Timing Diagram of One-Phase PWM Output with Dead Time (U phase/ UB phase)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.*1

(2) For CH04 and CH05, the values set to CDR04 and CDR05 are reloaded to CNT04 and CNT05, respectively, upon the occurrence of a CH02 underflow.

(3) INT04 is generated and TIN11 becomes high level upon the occurrence of a CH04 underflow, and INT05 is generated and TIN11 becomes low level upon the occurrence of a CH05 underflow. This process generates a PWM waveform.

(4) The set values are reloaded to CNT11 at both edges of TIN11.*2

(5) INT11 is generated and TAUDnO10 becomes high level upon the occurrence of a CH11 underflow, and INT05 is generated and TAUDnO10 becomes low level upon the occurrence of a CH05 underflow. This process generates a U-phase PWM waveform, which is output to TOPnU.

(6) TAUDnO11 becomes low level at the rising edge of TIN11, and INT11 is generated and TAUDnO11 becomes high level upon the occurrence of a CH11 underflow. This process generates a UB-phase PWM waveform, which is output to TOPnUB.

A similar process occurs for V phase/VB phase and W phase/WB phase.

Note 1. Select the count clock signal of the same clock for TAUDn.

Note 2. Set both edges (rising and falling) as the valid edge of TIN11 of TAUDn to be detected.

Details of this function when setting a clear timing longer than the carrier period are described below using V phase/VB phase as an example.

The following figure shows the timing diagram.

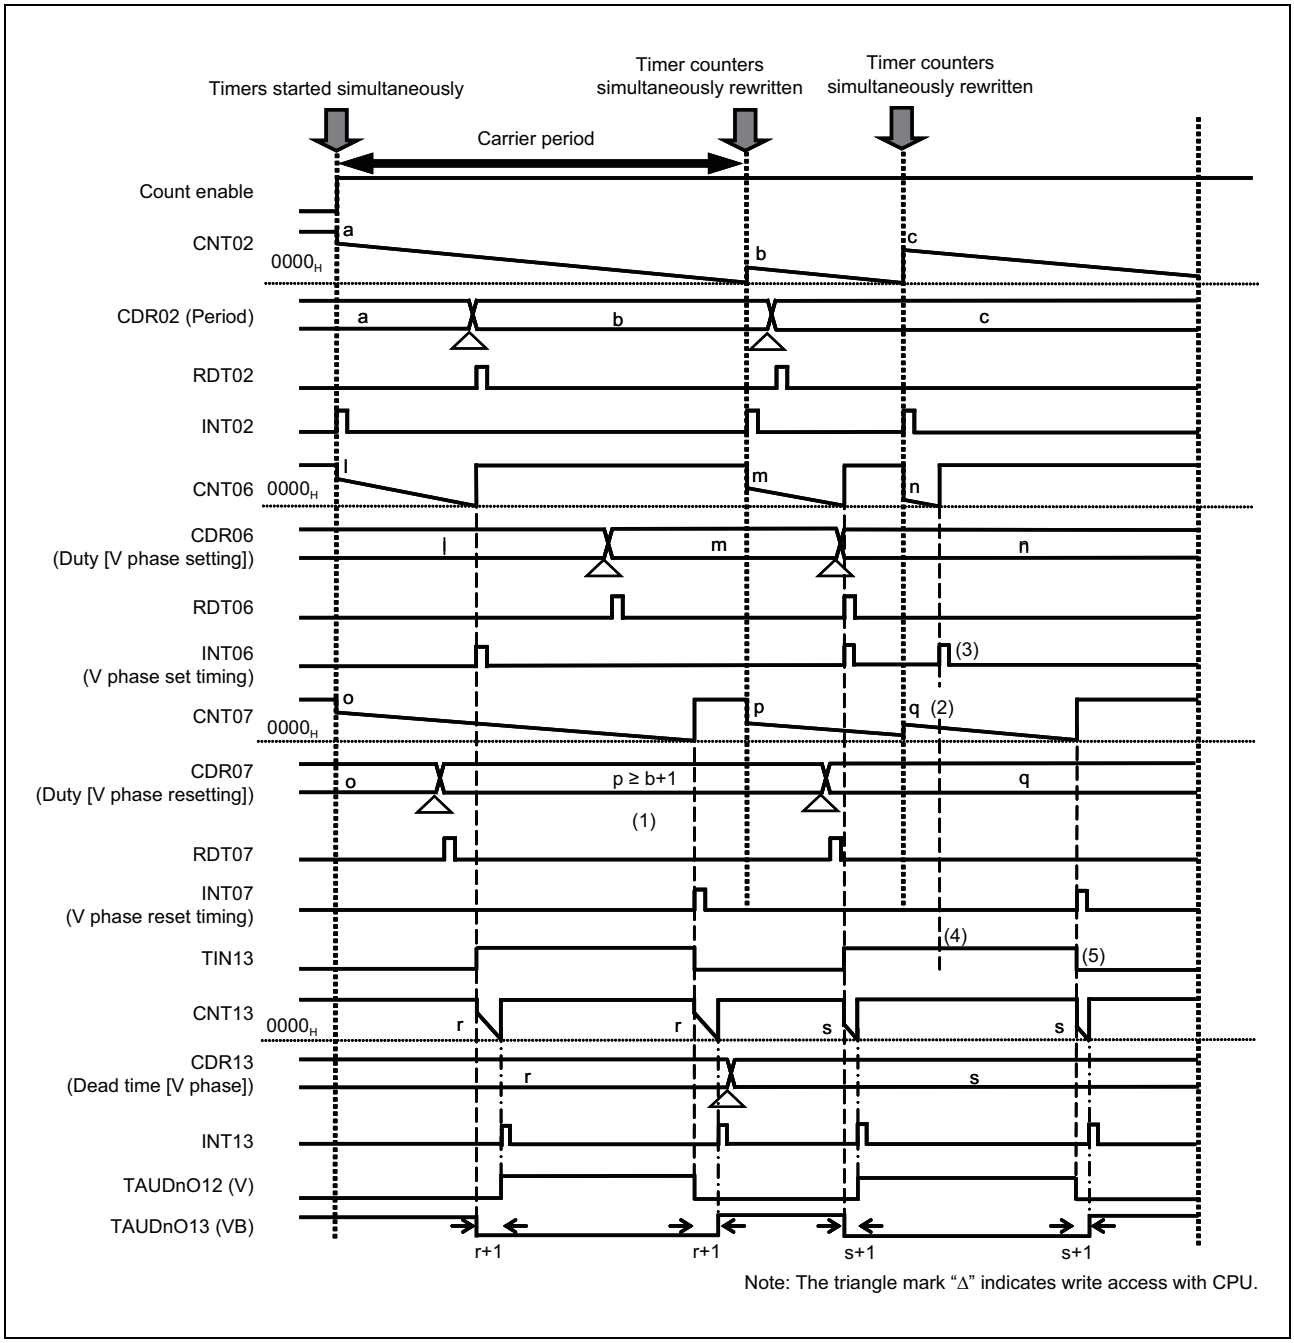


Figure 41.11 Clear Timing Value > Carrier Period Value (V phase/VB phase)

Setting a clear timing longer than the carrier period allows the waveform output to be extended over the carrier period.

An operation example of one-phase PWM output (V phase/VB phase) is shown below. The operation flow from timer operation start to one-phase PWM output by one-phase PWM output function, refer to the description for one-phase PWM output with dead time (U phase/UB phase).

When the value set in CH07 is larger than the value set in CH02 (**Figure 41.11** (1)), underflow of the carrier period timer is generated before generation of V phase clear timing signal (INT07), and the value is reloaded (**Figure 41.11** (2)).

As a result, the V phase clear timing signal (INT07) that should be generated is not generated, and instead the V phase set timing signal (INT06) is generated again (**Figure 41.11** (3)).

At this time, the PWM waveform is not affected because V phase set timing signal is ignored in the PIC circuit (**Figure 41.11** (4)). Therefore, the PWM waveform is output extended over the carrier period (**Figure 41.11** (5))

The following figure shows the timing diagram of three-phase PWM output with the dead time.

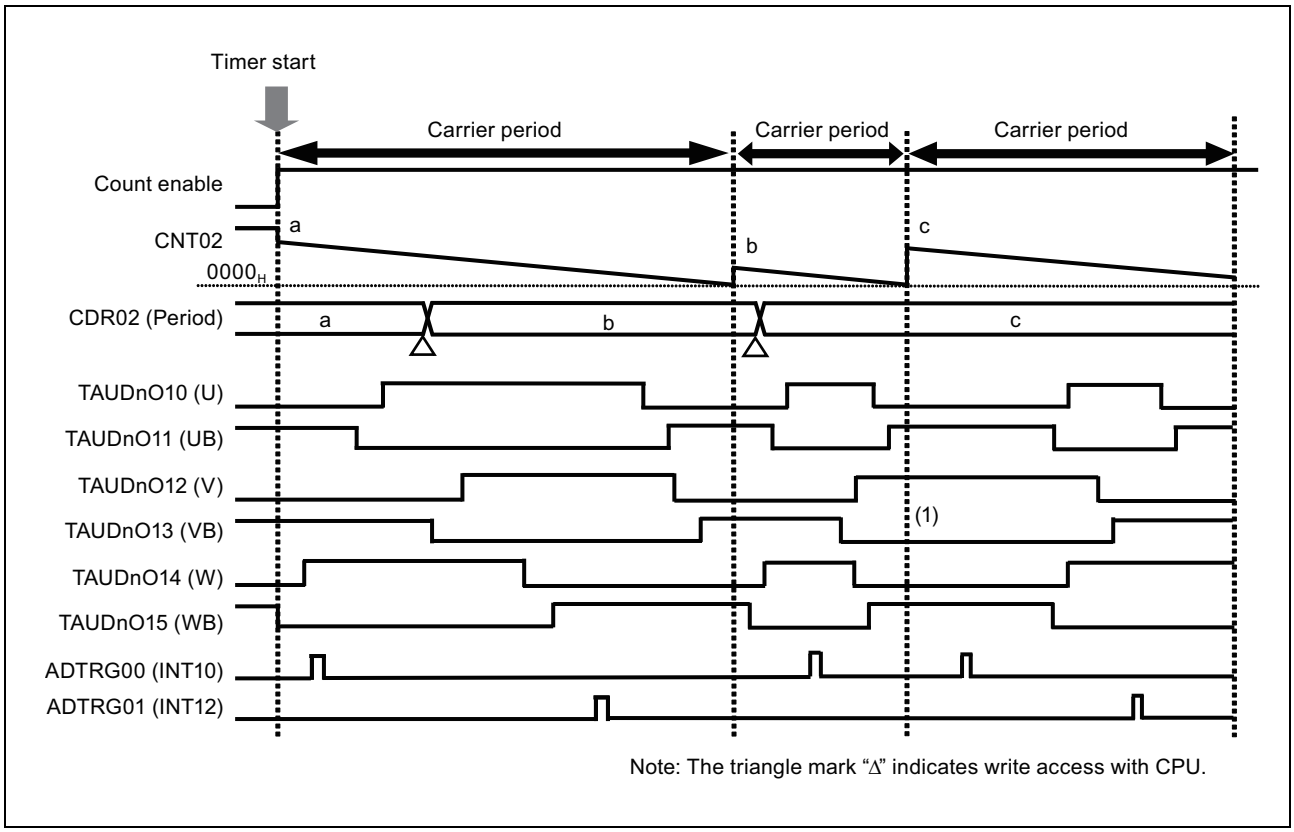

Figure 41.12 Timing Diagram of Three-Phase PWM Output with Dead Time

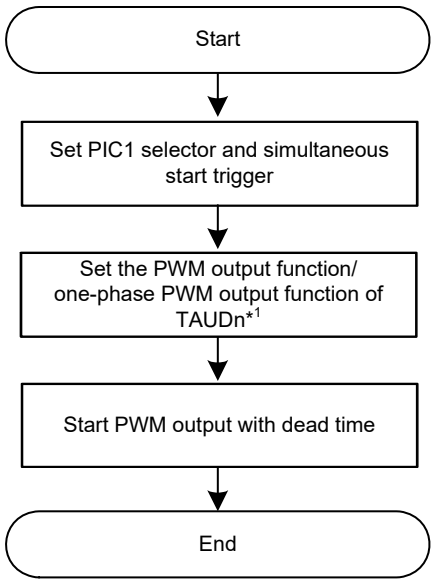
(5) Flow Chart

The following flow chart shows the PMW output function with the dead time.



Note 1. For the setting of PWM output function of TAUDn, see **Section 33.15.1, PWM Output Function**.

(6) Setting Examples for Operation Functions

This section provides example settings for each register.

TAUDn Settings (Active High Example)

Table 41.45 TAUDn: CH2-related (PWM Output Master Channel*1)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 41.46 TAUDn: CH4 to CH9-related (PWM Output Master Channel*1) (m = 4 to 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Any*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register used during PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Table 41.47 TAUDn: CH11, CH13, and CH15-related (One-phase PWM Output) (m = 11, 13, 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*1	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	001	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	11	Both rising and falling TINm edges are detected as valid. (High width)

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output). For details, see **Section 33, Timer Array Unit D (TAUD)**.

Table 41.48 Common TAUDn Channel Settings (1/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15 to 10	TAUDnTOE15 to TAUDnTOE10	0 1	Disable the timer. Enable the timer.
	9 to 4	TAUDnTOE09 to TAUDnTOE04	0	These are fixed to 0 because TOUT09 to TOUT04 are not used.
	3	TAUDnTOE03	Don't care	
	2	TAUDnTOE02	0	This is fixed to 0 because TOUT02 is not used.
	1, 0	TAUDnTOE01, TAUDnTOE00	Don't care	
TAUDnTO	15 to 10	TAUDnTO15 to TAUDnTO10	0*1	Output a low-level signal to TOUT15 to TOUT10.
	9 to 4	TAUDnTO09 to TAUDnTO04	0	Output a low-level signal to TOUT09 to TOUT04.
	3	TAUDnTO03	Don't care	
	2	TAUDnTO02	0	Output a low-level signal to TOUT02.
	1, 0	TAUDnTO01, TAUDnTO00	Don't care	
TAUDnTOM	15 to 4	TAUDnTOM15 to TAUDnTOM04	1	Synchronous operation mode
	3	TAUDnTOM03	Don't care	
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01, TAUDnTOM00	Don't care	
TAUDnTOC	15 to 10	TAUDnTOC15 to TAUDnTOC10	1	Synchronous operation mode 2
	9 to 4	TAUDnTOC09 to TAUDnTOC04	0	Synchronous operation mode 1
	3	TAUDnTOC03	Don't care	
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01, TAUDnTOC00	Don't care	
TAUDnTOL	15 to 4	TAUDnTOL15 to TAUDnTOL04	0*1	Positive logic output (active high)
	3	TAUDnTOL03	Don't care	
	2	TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01, TAUDnTOL00	Don't care	
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	1	Enable dead time control.*2
	9 to 4	TAUDnTDE09 to TAUDnTDE04	0	Disable dead time control.
	3	TAUDnTDE03	Don't care	
	2	TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01, TAUDnTDE00	Don't care	

Table 41.48 Common TAUDn Channel Settings (2/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTDM	15 to 10	TAUDnTDM15 to TAUDnTDM10	1	Output dead time upon detecting a TINm input edge at a lower odd channel.
	9 to 4	TAUDnTDM09 to TAUDnTDM04	0	Invalid because dead time control is disabled.
	3	TAUDnTDM03	Don't care	
	2	TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01, TAUDnTDM00	Don't care	
TAUDnTDL	15	TAUDnTDL15	1*1	Dead time is in the negative segment of the W phase output
	14	TAUDnTDL14	0*1	Dead time is in the positive segment of the W phase output
	13	TAUDnTDL13	1*1	Dead time is in the negative segment of the V phase output
	12	TAUDnTDL12	0*1	Dead time is in the positive segment of the V phase output
	11	TAUDnTDL11	1*1	Dead time is in the negative segment of the U phase output
	10	TAUDnTDL10	0*1	Dead time is in the positive segment of the U phase output
	9 to 4	TAUDnTDL09 to TAUDnTDL04	0	Invalid because dead time control is disabled.
	3	TAUDnTDL03	Don't care	
	2	TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01, TAUDnTDL00	Don't care	
TAUDnTRE	15 to 4	TAUDnTRE15 to TAUDnTRE04	0	Stop real-time output.
	3	TAUDnTRE03	Don't care	
	2	TAUDnTRE02	0	Stop real-time output.
	1, 0	TAUDnTRE01, TAUDnTRE00	Don't care	
TAUDnTRO	15 to 4	TAUDnTRO15 to TAUDnTRO04	0	Invalid because real-time output is disabled.
	3	TAUDnTRO03	Don't care	
	2	TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01, TAUDnTRO00	Don't care	
TAUDnTRC	15 to 4	TAUDnTRC15 to TAUDnTRC04	0	Do not use this channel to generate the real-time output trigger.
	3	TAUDnTRC03	Don't care	
	2	TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01, TAUDnTRC00	Don't care	
TAUDnTME	15 to 4	TAUDnTME15 to TAUDnTME04	0	Disable modulation output for timer output and real-time output.
	3	TAUDnTME03	Don't care	
	2	TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01, TAUDnTME00	Don't care	

Table 41.48 Common TAUDn Channel Settings (3/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnRDE	15	TAUDnRDE15	0	Disable simultaneous rewriting.
	14	TAUDnRDE14	Don't care	
	13	TAUDnRDE13	0	Disable simultaneous rewriting.
	12	TAUDnRDE12	Don't care	
	11	TAUDnRDE11	0	Disable simultaneous rewriting.
	10	TAUDnRDE10	Don't care	
	9 to 4	TAUDnRDE09 to TAUDnRDE04	1	Enable simultaneous rewriting.
	3	TAUDnRDE03	Don't care	
	2	TAUDnRDE02	1	Enable simultaneous rewriting.
	1, 0	TAUDnRDE01, TAUDnRDE00	Don't care	
TAUDnRDS	15	TAUDnRDS15	0	Do not enable simultaneous rewriting by using another upper channel.
	14	TAUDnRDS14	Don't care	
	13	TAUDnRDS13	0	Do not enable simultaneous rewriting by using another upper channel.
	12	TAUDnRDS12	Don't care	
	11	TAUDnRDS11	0	Do not enable simultaneous rewriting by using another upper channel.
	10	TAUDnRDS10	Don't care	
	9 to 4	TAUDnRDS09 to TAUDnRDS04	0	Enable simultaneous rewriting by using a master channel.
	3	TAUDnRDS03	Don't care	
	2	TAUDnRDS02	0	Enable simultaneous rewriting by using a master channel.
	1, 0	TAUDnRDS01, TAUDnRDS00	Don't care	
TAUDnRDM	15	TAUDnRDM15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDM14	Don't care	
	13	TAUDnRDM13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDM12	Don't care	
	11	TAUDnRDM11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDM10	Don't care	
	9 to 4	TAUDnRDM09 to TAUDnRDM04	0	Load the signal when the master channel starts counting.
	3	TAUDnRDM03	Don't care	
	2	TAUDnRDM02	0	Load the signal when the master channel starts counting.
	1, 0	TAUDnRDM01, TAUDnRDM00	Don't care	

Table 41.48 Common TAUDn Channel Settings (4/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnRDC	15	TAUDnRDC15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDC14	Don't care	
	13	TAUDnRDC13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDC12	Don't care	
	11	TAUDnRDC11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDC10	Don't care	
	9 to 4	TAUDnRDC09 to TAUDnRDC04	0	Do not use this channel to generate the simultaneous rewrite trigger.
	3	TAUDnRDC03	Don't care	
	2	TAUDnRDC02	1	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01, TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 33, Timer Array Unit D (TAUD)**.

PIC Settings

Table 41.49 PIC Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC1REG2n2	27	PIC1REG2n227	1	Select the input selected by the PIC1REG2n204 bit.
	23	PIC1REG2n223	1	Select the input selected by the PIC1REG2n203 bit.
	19	PIC1REG2n219	1	Select the input selected by the PIC1REG2n202 bit.
	4	PIC1REG2n204	1	Select the set/clear output according to INTTAUDnI8 and INTTAUDnI9.
	3	PIC1REG2n203	1	Select the set/clear output according to INTTAUDnI6 and INTTAUDnI7.
	2	PIC1REG2n202	1	Select the set/clear output according to INTTAUDnI4 and INTTAUDnI5.

41.2.3.4 High Accuracy Triangle Wave PWM Output Function with Dead Time

(1) Overview

This function generates triangle wave PWM output with dead time from one-phase to three-phases. Compared to the triangle wave PWM output function with dead time of TAUDn, this function enables a control of the variable dead time range, where duty cycle is close to 100% and 0%.

The TAUDn channels used in this function and the numbers of channels are listed in the following table.

High Accuracy Triangle Wave PWM Output with Dead Time	Number of TAUDn Channels
One-phase PWM output (U phase/UB phase)	5 channels (master channel: 1, slave channel: 4)
Two-phase PWM output (U phase/UB phase, V phase/VB phase)	9 channels (master channel: 1, slave channel: 8)
Three-phase PWM output (U phase/UB phase, V phase/VB phase, W phase/WB phase)	13 channels (master channel: 1, slave channel: 12)

Note: Above are examples of PWM output combinations.

Usages of each TAUDn channel are listed in the following table. CH2 is used as the master channel of CH3 to 9.

CHm is used as the master channel of CHm+1 (m = 10, 12, 14).

TAUDn Channel	U phase / UB phase	V phase / VB phase	W phase / WB phase	Usage
CH0	—	—	—	Not used
CH1	—	—	—	Not used
CH2	√	√	√	Carrier period (common to each phase)
CH3	—	—	—	Not used
CH4	√	—	—	Triangle PWM output with dead time (U phase/UB phase)
CH5	√	—	—	
CH6	—	√	—	Triangle PWM output with dead time (V phase/VB phase)
CH7	—	√	—	
CH8	—	—	√	Triangle PWM output with dead time (W phase/WB phase)
CH9	—	—	√	
CH10	√	—	—	Reduced dead time pulse (U phase/UB phase)
CH11	√	—	—	
CH12	—	√	—	Reduced dead time pulse (V phase/VB phase)
CH13	—	√	—	
CH14	—	—	√	Reduced dead time pulse (W phase/WB phase)
CH15	—	—	√	

Note: √: Used; —: Not used

(2) Configuration

The high accuracy triangle wave PWM output function with the dead time is realized by using the triangle wave PWM output function/one-shot pulse output function of TAUDn and PIC1 in combination. The following figure shows the block diagram of the high accuracy triangle wave PWM output function with the dead time.

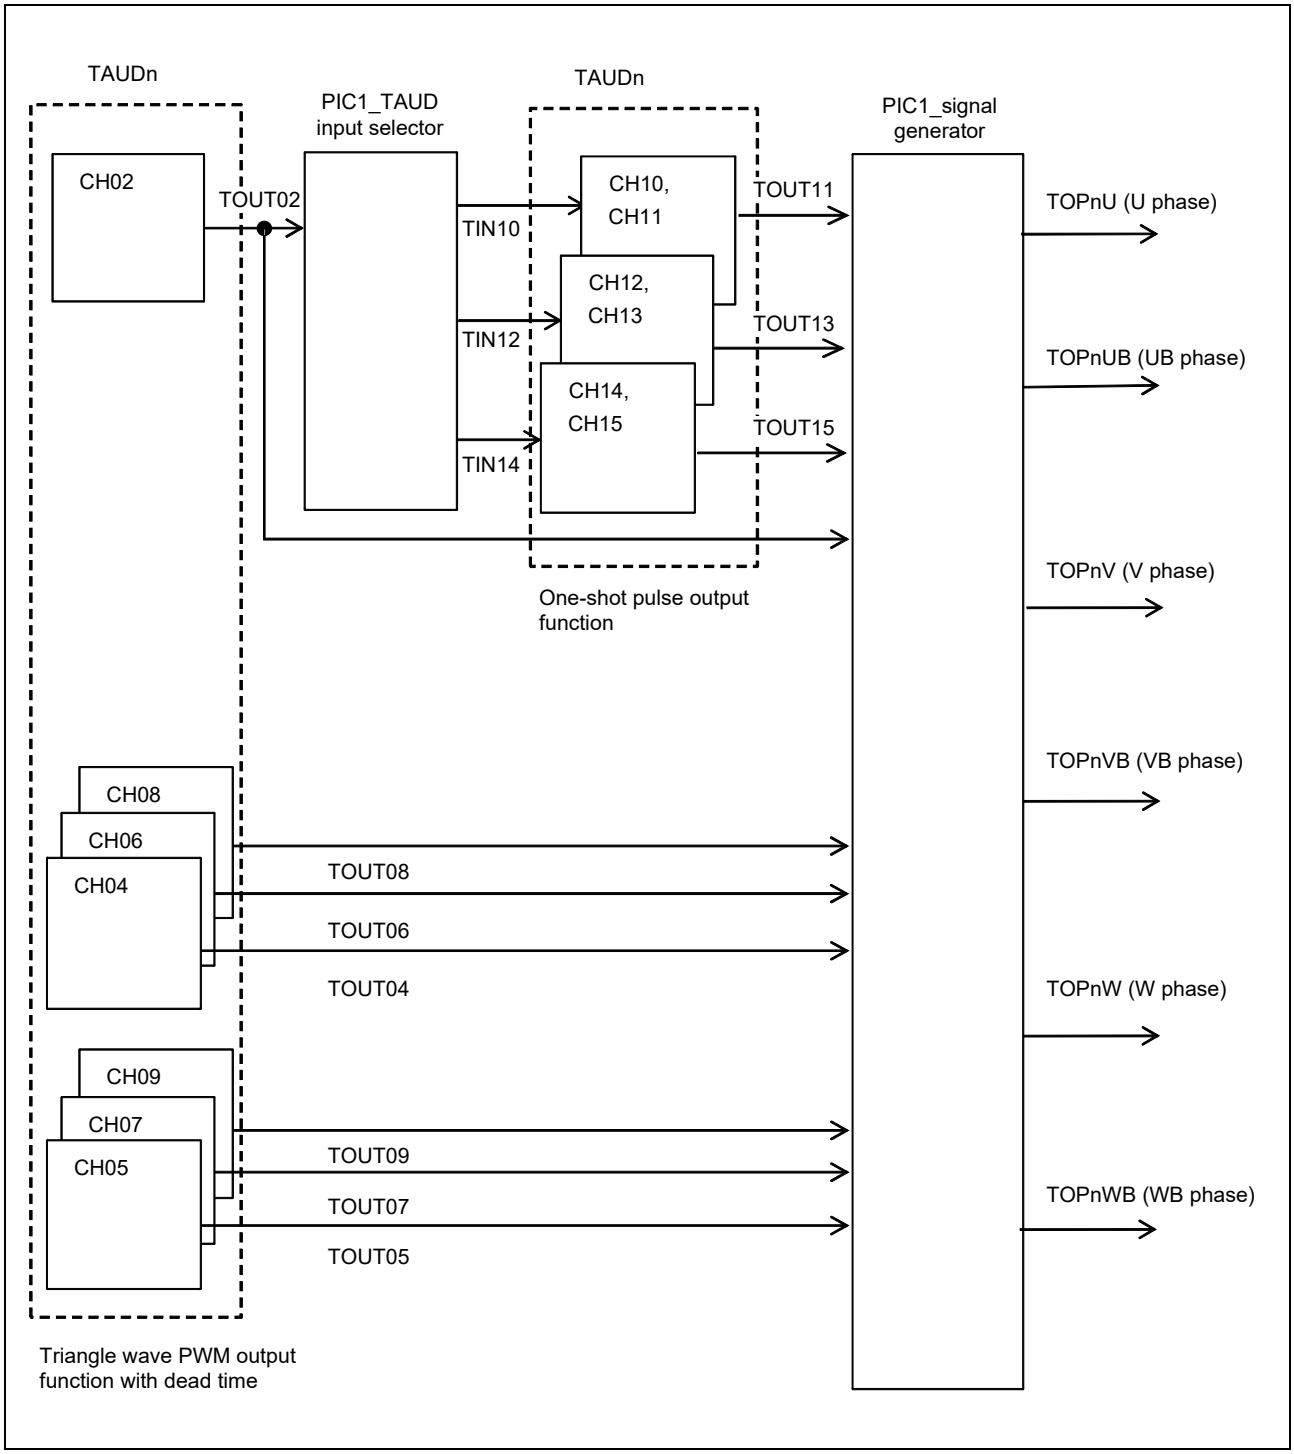


Figure 41.13 Block Diagram of High Accuracy Triangle Wave Three-Phase PWM Output With Dead Time

The configuration of this function is described below using the PWM output of U phase/UB phase as an example.

- [PIC1_TAUD input selector]
  TOUT02 is selected and output to TIN10.
- [TAUDn] One-shot pulse output function
  CH10 and CH11 are used in combination. The delay value and the pulse width are set to CDR10 and CDR11, respectively, and the one-shot pulse output signal (TOUT11) is generated.
- [TAUDn] Triangle wave PWM output function with dead time
  CH02, CH04, and CH05 are used in combination. The period, duty, and dead time are set to CDR02, CDR04, and CDR05, respectively, and a triangle wave PWM output signal with dead time (TOUT04 and TOUT05) is generated.
- [PIC1_signal generator]
  The reduced dead time pulses (UO1 and UO2) are generated at PFN001 from the one-shot pulse output signal.
  UO1 and UO2 are synthesized with TOUT04 and TOUT05 at FN00 and FN01, respectively, a dead time variable range pulse is added, and TOPnU (U phase PWM signal) and TOPnUB (UB phase PWM signal) are generated.

A similar process occurs for V phase/VB phase and W phase/WB phase.

(3) Registers

The following figure shows the block diagram of PIC1.

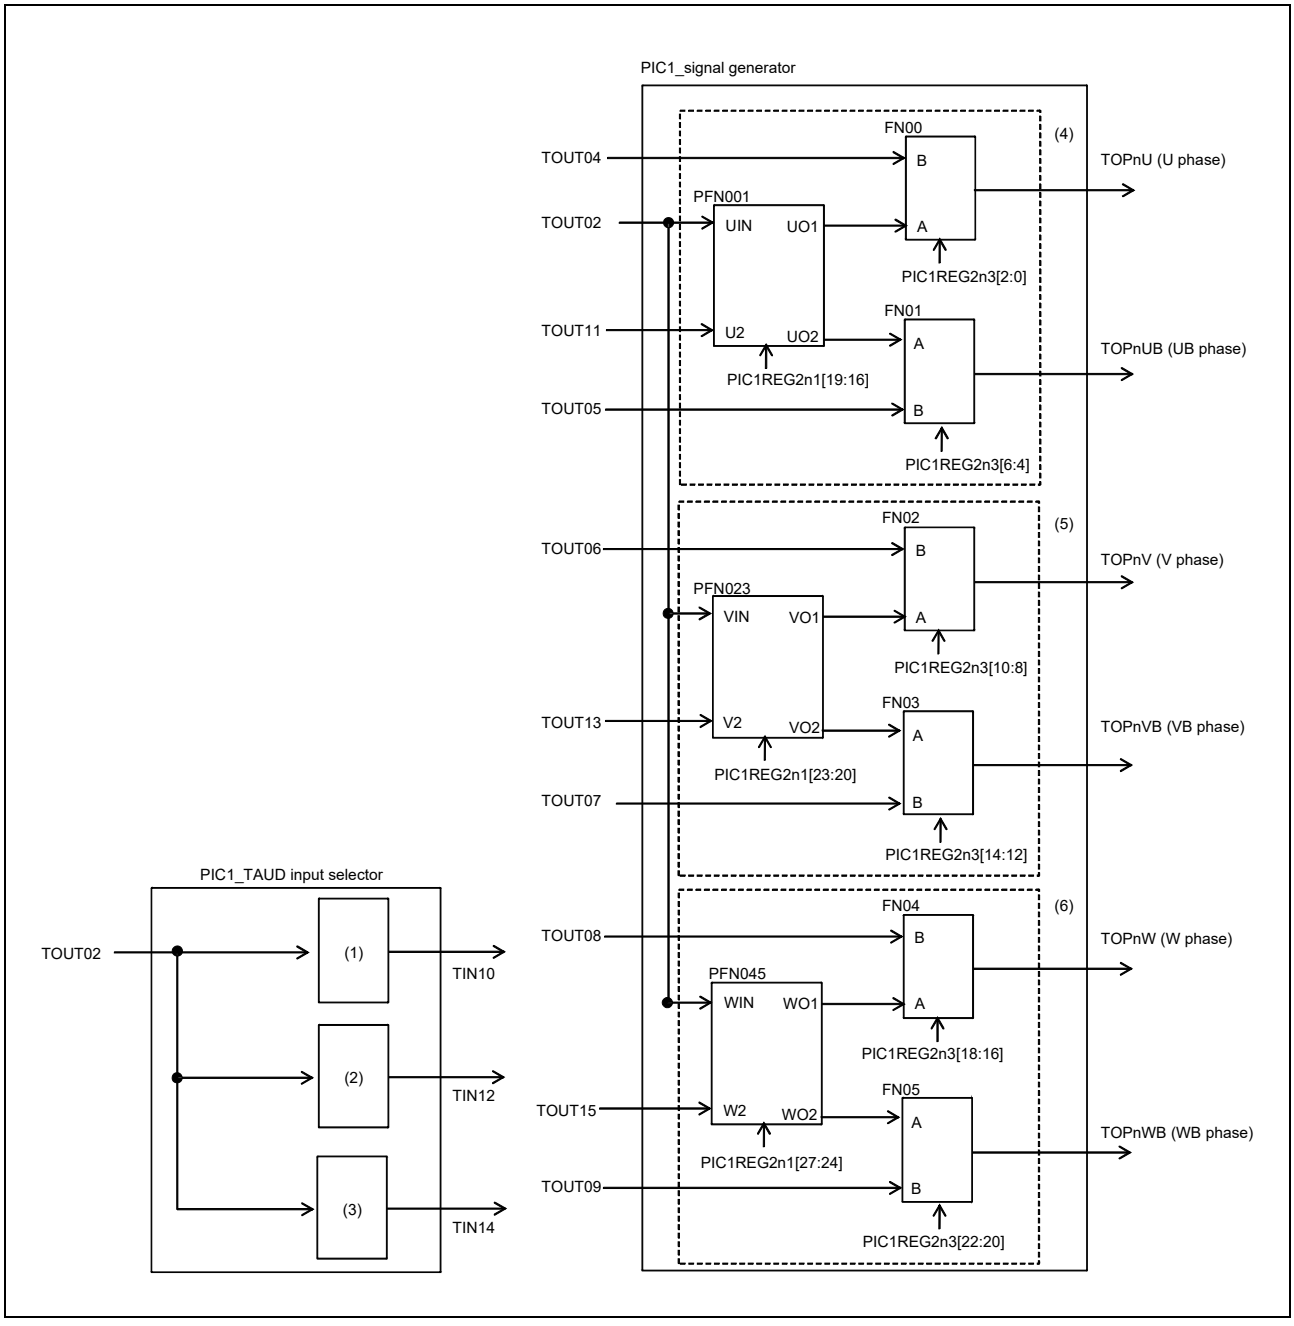

Figure 41.14 Block Diagram of PIC1

The values of PIC1 registers used in this function are as follows.

(1) PIC1_TAUD input selector (U phase/ UB phase)
The values to output TOUT02 as TIN10 (common to active high/low)
PIC1REG2n0[18] = 1_B
PIC1REG2n2[17:16] = 10_B
PIC1TAUDnSEL[21:20] = 00_B

(2) PIC1_TAUD input selector (V phase/ VB phase)
The values to output TOUT02 as TIN12 (common to active high/low)
PIC1REG2n0[18] = 1_B
PIC1REG2n2[21:20] = 10_B
PIC1TAUDnSEL[25:24] = 00_B

(3) PIC1_TAUD input selector (W phase/ WB phase)
The values to output TOUT02 as TIN14 (common to active high/low)
PIC1REG2n0[18] = 1_B
PIC1REG2n2[25:24] = 10_B
PIC1TAUDnSEL[29:28] = 00_B

(4) PIC1_ signal generator (U phase/ UB phase)
The values to output one-phase PWM (active high/low) from TAUDnO10 and TAUDnO11
PIC1REG2n1[19:16] = 1010_B (active high), 1111_B (active low)
PIC1REG2n3 [06:04] = 100_B (active high), 101_B (active low)
PIC1REG2n3[02:00] = 100_B (active high), 101_B (active low)

(5) PIC1_signal generator (V phase/ VB phase)
The values to output one-phase PWM (active high/low) from TAUDnO12 and TAUDnO13
PIC1REG2n1[23:20] = 1010_B (active high), 1111_B (active low)
PIC1REG2n3 [14:12] = 100_B (active high), 101_B (active low)
PIC1REG2n3[10:08] = 100_B (active high), 101_B (active low)

(6) PIC1_signal generator (W phase/ WB phase)
The values to output one-phase PWM (active high/low) from TAUDnO14 and TAUDnO15
PIC1REG2n1[27:24] = 1010_B (active high), 1111_B (active low)
PIC1REG2n3 [22:20] = 100_B (active high), 101_B (active low)
PIC1REG2n3[18:16] = 100_B (active high), 101_B (active low)

(4) Function

Details of this function are described using U phase/UB phase as an example. The function with V phase/VB phase and W phase/WB phase are operated under the same logic as that of U phase/UB phase with different input signals and register settings.

- U phase combination circuit (PFN001)
  This circuit generates reduced dead time pulses*1 (FN00A and FN01A) that are used to insert the pulse generated by the one-shot pulse output function into the triangle wave PWM generated by the triangle wave PWM output function with the dead time. For the block diagram, see **Figure 41.2, Block Diagram of PFN001**.

Note 1. Reduced dead time pulses are the pseudo pulses that are inserted into the PWM output provided by the triangle wave PWM output function with dead time of TAUDn and that are modeled on the dead time pulses that are generated in the range where duty cycle is close to 100% or 0% in PWM output in HT-PWM mode of TSG3n.

- Logical operation circuits (FN0i) (i = 0, 1)
  This circuit synthesizes the triangle wave PWM output (TOUT04 and TOUT05) from the triangle wave PWM output function with the dead time and the outputs from the combinational circuit PFN001 (UO0 and UO1) to generate PWM with variable dead time range pulse inserted. The synthesizing logic of this circuit is selected with PIC1REG2n3k (k = 00 to 02, 04 to 06). For the block diagram, see **Figure 41.3, Block Diagram of FN00**.

Details of this function are described using high accuracy triangle wave PWM output function (U phase/UB phase) as an example.

The following figure shows the timing diagram when U phase duty cycle = 0% and UB phase duty cycle = 100% at active high.

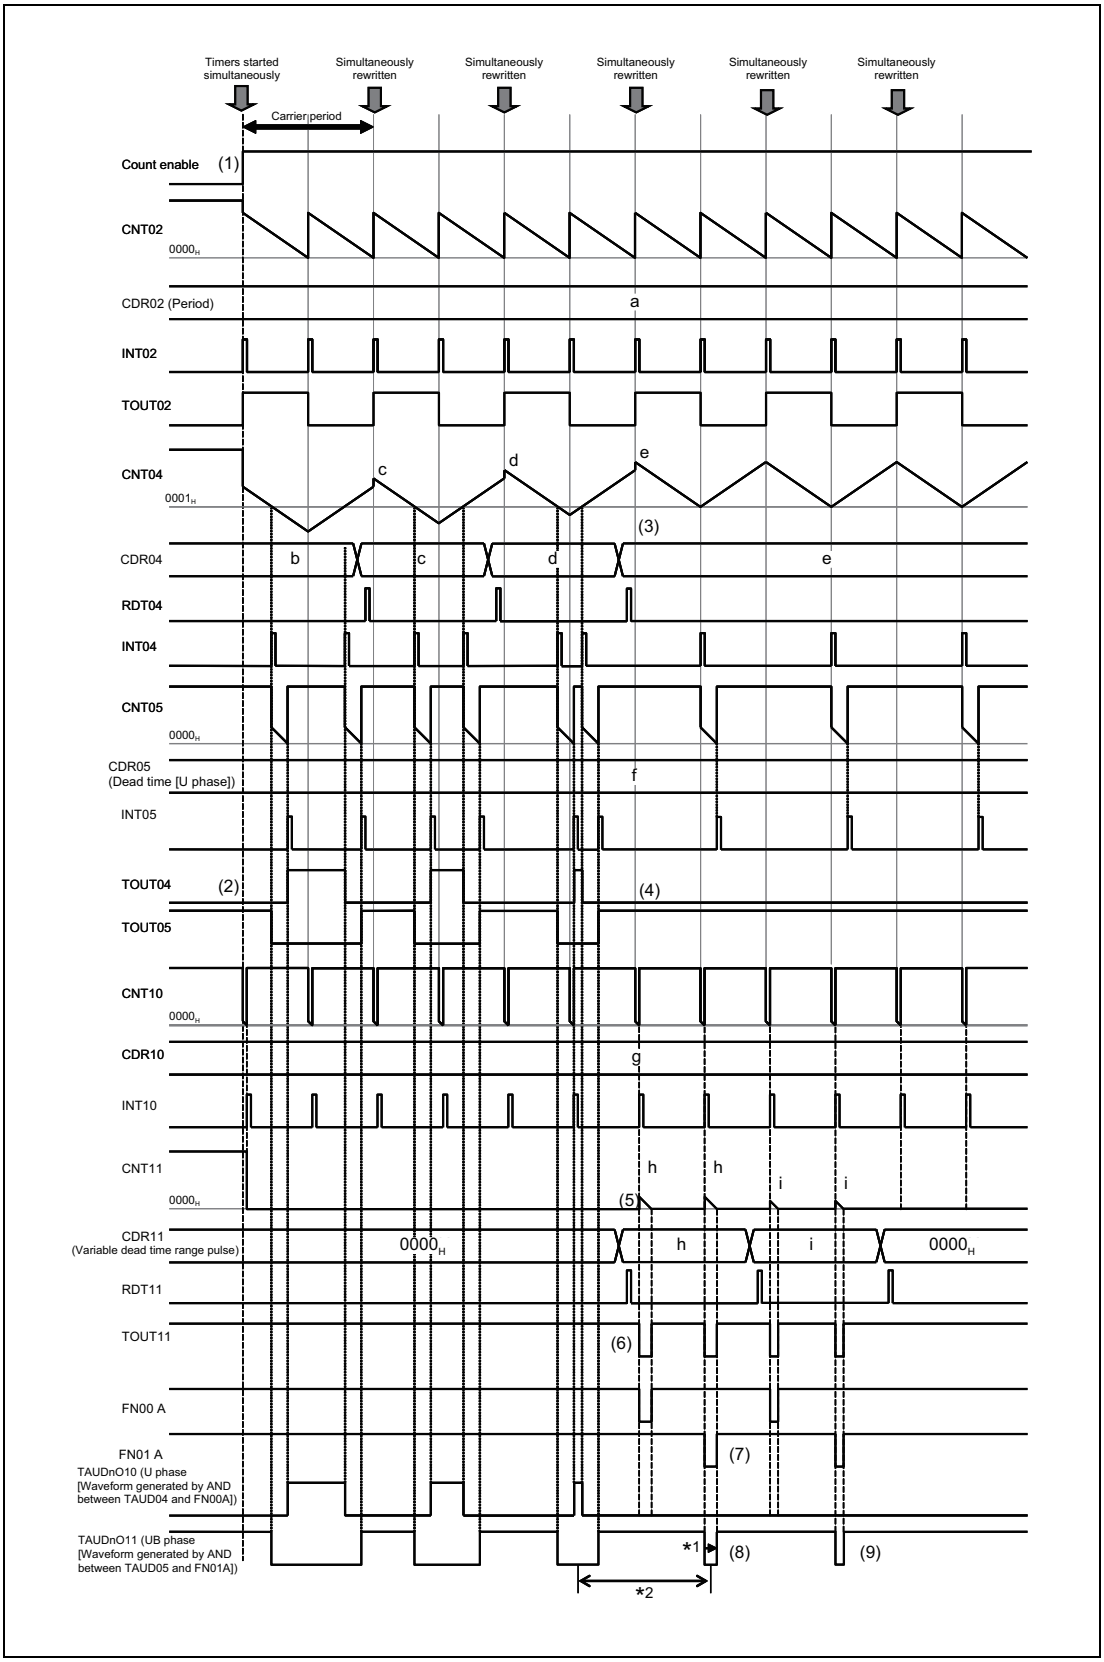

Figure 41.15 Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 0%, UB phase duty cycle = 100%) Output with Dead Time (Active High)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) TOUT04 and TOUT05 are generated by the triangle wave PWM output function with dead time.

(3) A 0% duty cycle value is set in CDR04 for U phase output.

(4) The setting described in step (3) sets the TOUT04 output to the inactive level and the TOUT05 output to the active level.

(5) To generate the variable dead time range pulse, a value for the reduced dead time pulse width is set in CDR11 when a 0% duty cycle value for U phase output is set in step (3).

(6) CH10 count starts with the effective edge of TOUT02 and INT10 is generated when the counter underflows. CH11 count starts by generation of INT10 and the reduced dead time pulse (TOUT11) of the width set in CDR11 is output.

(7) The reduced dead time pulse (UO1 and UO2) are generated from TOUT02 and TOUT11 in PFN001.

(8) UO1 and UO2 are synthesized with TOUT04 and TOUT05 in FN00 and FN01, and are output as TOPnU (U phase PWM signal) and TOPnUB (UB phase PWM signal).

CAUTION

Since the reduced dead time pulses are saw tooth waves, they expand and contract on one side, unlike the triangle wave pulses, which expand and contract on both sides. Since one-side expansion and contraction applies to the reduced dead time pulses, a one-phase PWM output period in the variable dead time range is longer by half the width of the inserted reduced dead time pulse.

The following figure shows the timing diagram when U phase duty cycle = 100% and UB phase duty cycle = 0% at active high.

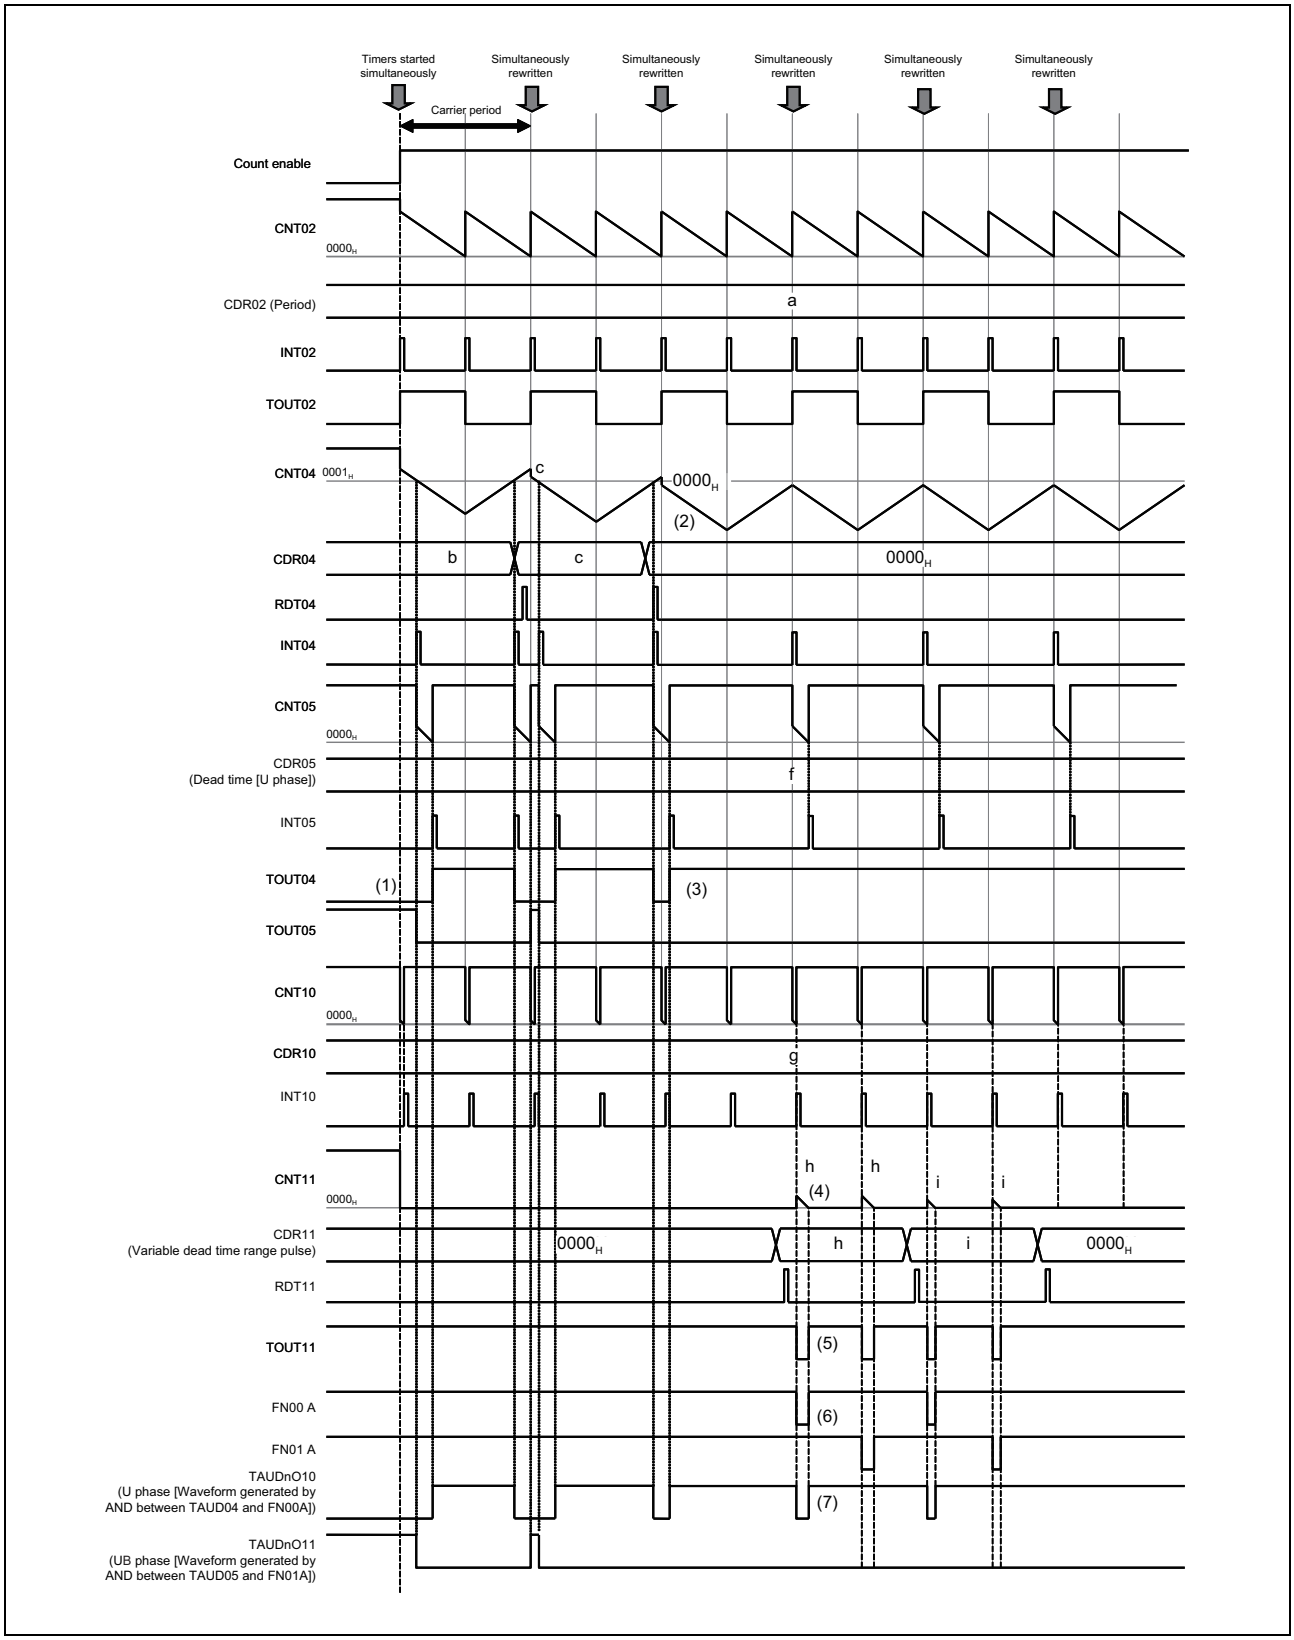

Figure 41.16 Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 100%, UB phase duty cycle = 0%) Output with Dead Time (Active High)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) TOUT04 and TOUT05 are generated by the triangle wave PWM output function with dead time.

(3) A 100% duty cycle value (CDR4 = 0000_H) is set in CDR04 for U phase output.

(4) TOUT04 outputs the active level and TOUT05 outputs the inactive level.

(5) A value for the reduced dead time pulse width is set in CDR11 one period after setting 100% duty cycle for U phase output.

(6) CH10 count starts with the effective edge of TOUT02 and INT10 is generated when the counter underflows. CH11 count starts by generation of INT10 and the reduced dead time pulse (TOUT11) of the width set in CDR11 is output.

(7) The reduced dead time pulse (UO1 and UO2) are generated from TOUT02 and TOUT11 in PFN001.

(8) UO1 and UO2 are synthesized with TOUT04 and TOU05 in FN00 and FN01, and are output as TOPnU (U phase PWM signal) and TOPnUB (UB phase PWM signal).

CAUTION

As shown in Figure 41.17, if a value is set for the variable dead time range pulse width in CDR11 at the same time as a 100% duty cycle value is set for U phase output in CDR04, the variable dead time range pulse affects the last PWM output from TOUT04 (indicated by Figure 41.17, (1)) by the amount of time indicated by Figure 41.17, (2). CDR11 must be set one period after setting CDR04.

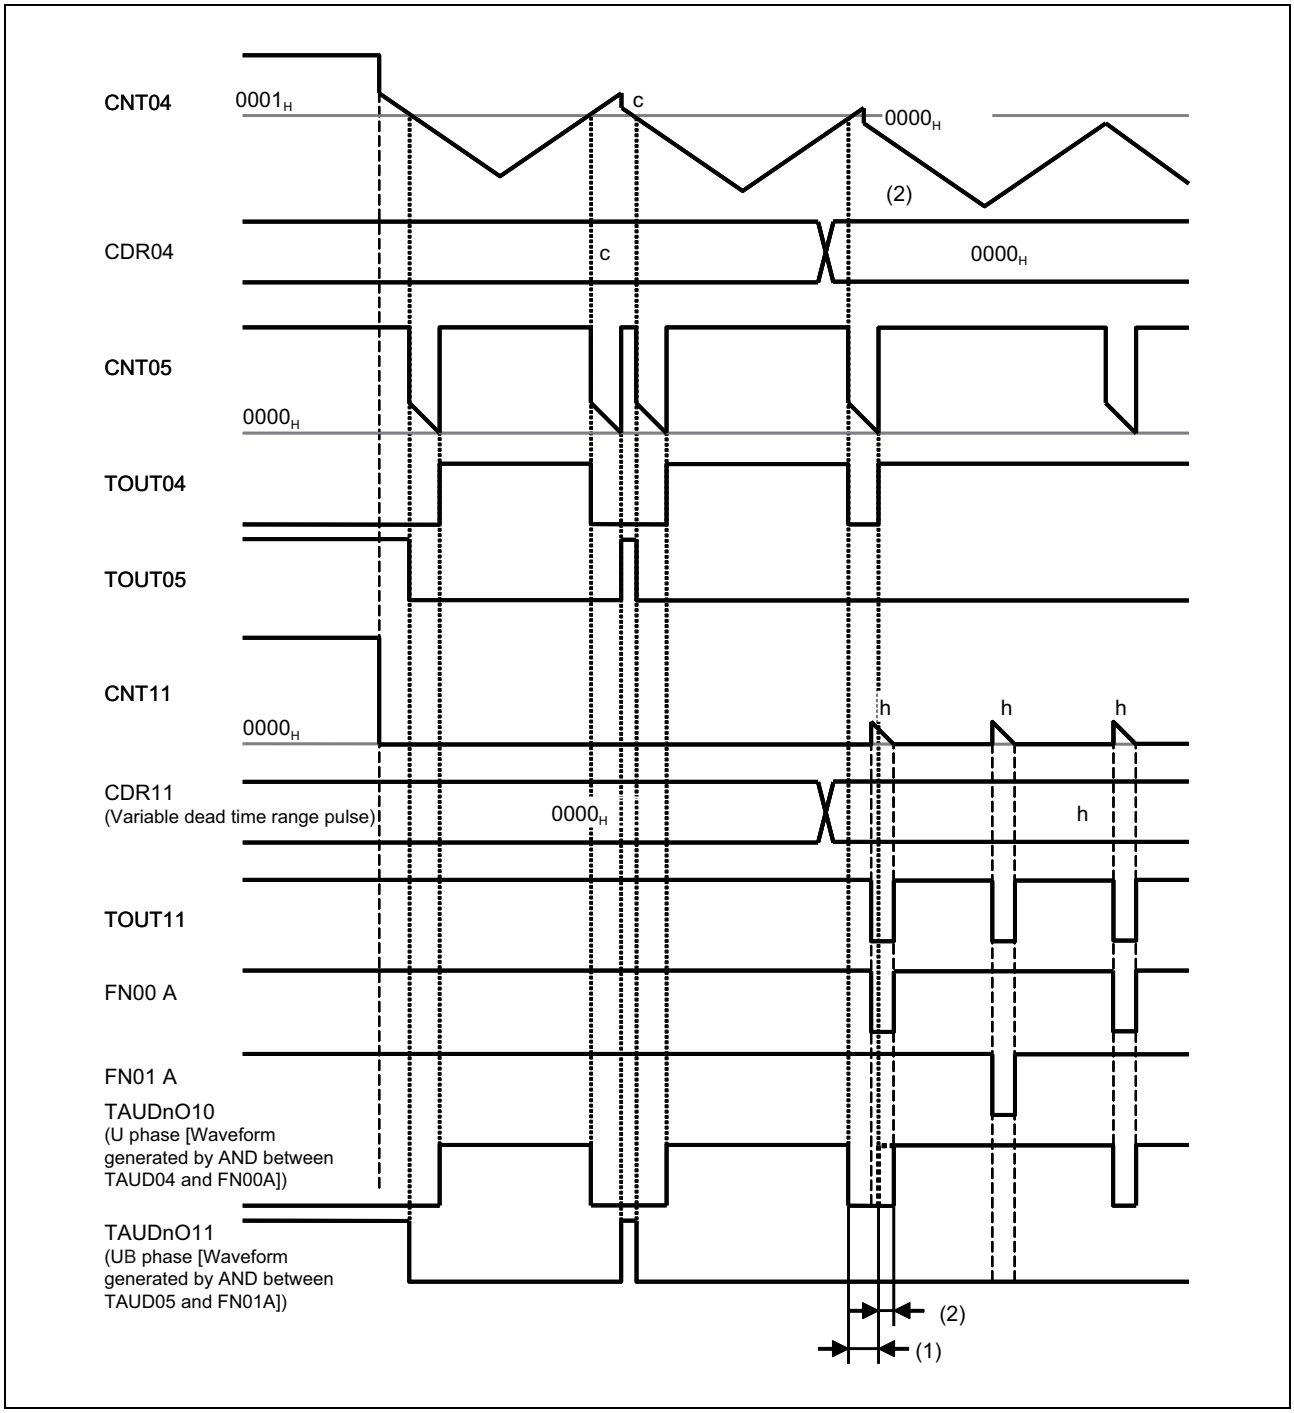

Figure 41.17 Timing Diagram of Variable Dead Time Range Pulse Affecting Triangle Wave PWM Output with Dead Time

The following figure shows the timing diagram when U phase duty cycle = 100% and UB phase duty cycle = 0% at active low.

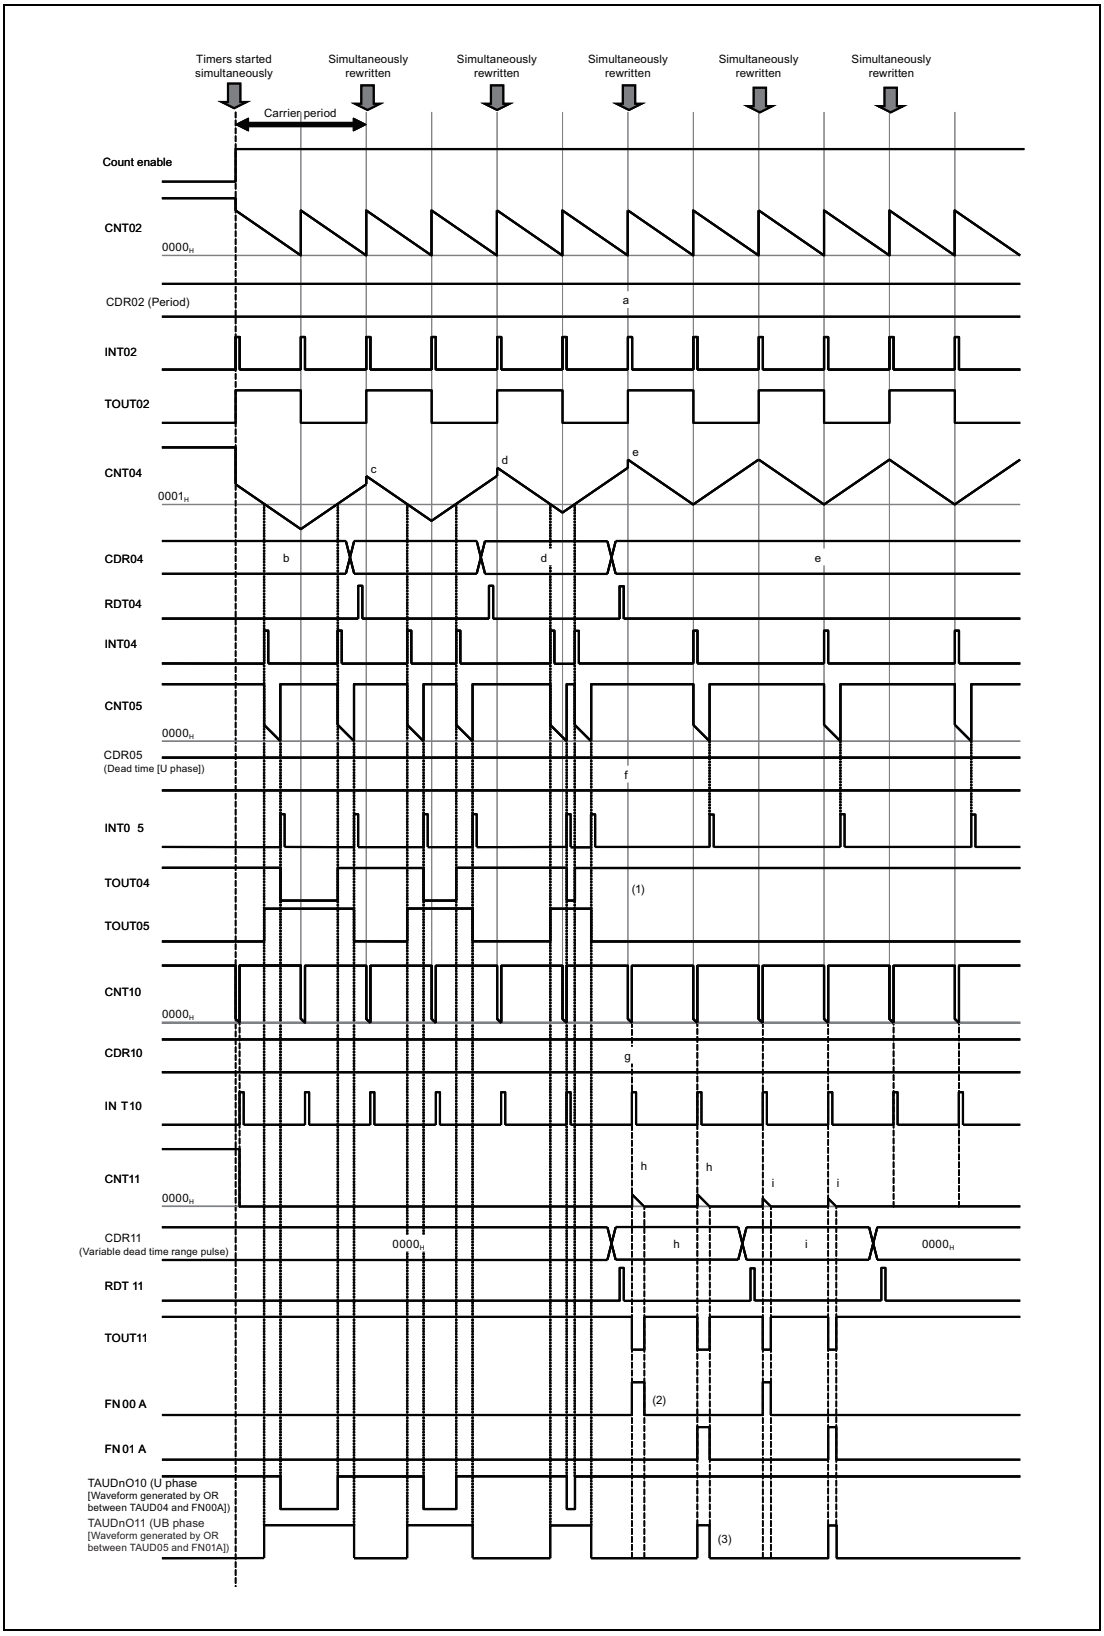

Figure 41.18 Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 100%, UB phase duty cycle = 0%) Output with Dead Time (Active Low)

The operation flow from timer operation start to triangle wave PWM output with dead time is same as **Figure 41.16, Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 100%, UB phase duty cycle = 0%) Output with Dead Time (Active High)**, with the difference of the PWM output signal from TOUT04 and TOUT05 are active low.

CAUTION

Set each CDR for the one-shot pulse output function so that the following condition is satisfied.

CDR05 ≥ (CDR10 + CDR11)

If the condition above is not satisfied, the output waveform may be influenced. To minimize the influence, satisfy the condition above, and also fix the value of CDR11 to 0000_H until the reduced dead time pulse is required.

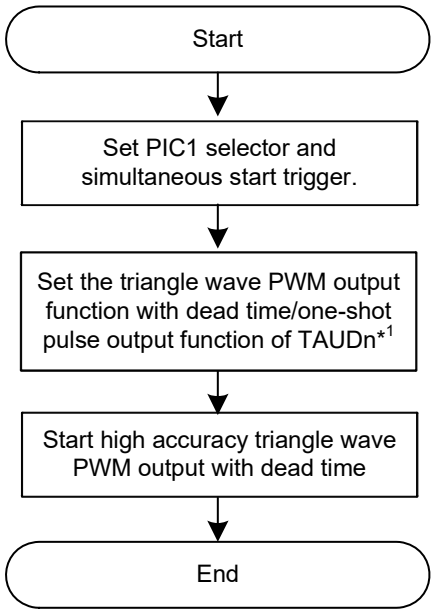
Set the both edges to be detected of TIN10 (TOUT02) as effective, and set TAUDnTOL11 to 1 (active low).

Select the count clock signal (CK0 to 3) of the same clock for TAUDn.

After high accuracy triangle wave PWM output with dead time is started, do not set the value of variable dead time pulse width at the same time as setting a 100% duty cycle value for U phase, V phase, and W phase.

(5) Flow Chart

The flow chart of this function is shown in the following figure.



Note 1. For the setting of triangle wave PWM output function with dead time of TAUDn, see **Section 33.15.8, Triangle PWM Output Function with Dead Time**, or the setting of one-shot pulse output function, see **Section 33.15.2, One-Shot Pulse Output Function**.

(6) Setting Examples for Operation Functions

This section provides example settings for each register.

TAUDn Settings (Active High Example)

Table 41.50 TAUDn: CH2-related (Master Channel Used to Output a Triangle PWM Signal with Dead Time*1)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	At the start of operation, output INTm and toggle TOUTm.
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	Fixed

Note 1. The master channel and slave channel names are defined for TAUD triangle PWM output with dead time. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register of the master channel used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.
For this feature, set TAUDnMD0 to 1.

Table 41.51 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Triangle PWM Signal with Dead Time*1) (m = 4, 6, 8)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	111	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	1001	
	0	TAUDnMD0	0	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 41.52 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Triangle PWM Signal with Dead Time*1) (m = 5, 7, 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	110	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 41.53 TAUDn: CH10, CH12, and CH14-related (Master Channel used to Output a One-shot Pulse*1) (m = 10, 12, 14)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	001	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	0	Disable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	10	Detect both rising and falling edges as valid.

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 41.54 TAUDn: CH11, CH13, and CH15-related (Slave Channel used to Output a One-shot Pulse*1) (m = 11, 13, 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	1010	
	0	TAUDnMD0	0	Disable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel. Specify the same clock setting as for the master channel (CH2) used to output a triangle PWM signal with dead time.

NOTE

For the TAUDnCMORm register used during one-shot pulse output, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.
For this feature clear TAUDnMD0 to 0.

Table 41.55 Common TAUDn Channel Settings (1/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15	TAUDnTOE15	0 1	Disable the timer. Enable the timer.
	14	TAUDnTOE14	0	
	13	TAUDnTOE13	0 1	Disable the timer. Enable the timer.
	12	TAUDnTOE12	0	
	11	TAUDnTOE11	0 1	Disable the timer. Enable the timer.
	10	TAUDnTOE10	0	
	9 to 4	TAUDnTOE09 to TAUDnTOE04	0 1	Disable the timer. Enable the timer.
	3	TAUDnTOE03	Don't care	
	2	TAUDnTOE02	0 1	Disable the timer. Enable the timer.
	1, 0	TAUDnTOE01, TAUDnTOE00	Don't care	

Table 41.55 Common TAUDn Channel Settings (2/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTO	15	TAUDnTO15	1*[1]	Output a high-level signal to TOUT15.
	14	TAUDnTO14	Don't care	
	13	TAUDnTO13	1*[1]	Output a high-level signal to TOUT13.
	12	TAUDnTO12	Don't care	
	11	TAUDnTO11	1*[1]	Output a high-level signal to TOUT11.
	10	TAUDnTO10	Don't care	
	9 to 4	TAUDnTO09 to TAUDnTO04	0*[1]	Output a low-level signal to TOUT09 to TOUT04.
	3	TAUDnTO03	Don't care	
	2	TAUDnTO02	0	Output a low-level signal to TOUT02.
	1, 0	TAUDnTO01, TAUDnTO00	Don't care	
TAUDnTOM	15 to 10	TAUDnTOM15 to TAUDnTOM10	0	Independent operation mode
	9 to 4	TAUDnTOM09 to TAUDnTOM04	1	Synchronous operation mode
	3	TAUDnTOM03	Don't care	
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01, TAUDnTOM00	Don't care	
TAUDnTOC	15	TAUDnTOC15	1	Operation mode 2
	14	TAUDnTOC14	0	Operation mode 1
	13	TAUDnTOC13	1	Operation mode 2
	12	TAUDnTOC12	0	Operation mode 1
	11	TAUDnTOC11	1	Operation mode 2
	10	TAUDnTOC10	0	Operation mode 1
	9 to 4	TAUDnTOC09 to TAUDnTOC04	1	Operation mode 2
	3	TAUDnTOC03	Don't care	
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01, TAUDnTOC00	Don't care	
TAUDnTOL	15	TAUDnTOL15	1*[1]	Inverted logic output (active low)
	14	TAUDnTOL14	Don't care	
	13	TAUDnTOL13	1*[1]	Inverted logic output (active low)
	12	TAUDnTOL12	Don't care	
	11	TAUDnTOL11	1*[1]	Inverted logic output (active low)
	10	TAUDnTOL10	Don't care	
	9 to 4	TAUDnTOL09 to TAUDnTOL04	0*[1]	Positive logic output (active high)
	3	TAUDnTOL03	Don't care	
	2	TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01, TAUDnTOL00	Don't care	

Table 41.55 Common TAUDn Channel Settings (3/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	0	Disable dead time control.
	9 to 4	TAUDnTDE09 to TAUDnTDE04	1	Enable dead time control.*2
	3	TAUDnTDE03	Don't care	
	2	TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01, TAUDnTDE00	Don't care	
TAUDnTDM	15 to 4	TAUDnTDM15 to TAUDnTDM04	0	
	3	TAUDnTDM03	Don't care	
	2	TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01, TAUDnTDM00	Don't care	
TAUDnTDL	15 to 10	TAUDnTDL15 to TAUDnTDL10	0	Invalid because dead time control is disabled.
	9	TAUDnTDL09	1*1	Dead time is in the negative segment of the W phase output
	8	TAUDnTDL08	0*1	Dead time is in the positive segment of the W phase output
	7	TAUDnTDL07	1*1	Dead time is in the negative segment of the V phase output
	6	TAUDnTDL06	0*1	Dead time is in the positive segment of the V phase output
	5	TAUDnTDL05	1*1	Dead time is in the negative segment of the U phase output
	4	TAUDnTDL04	0*1	Dead time is in the positive segment of the U phase output
	3	TAUDnTDL03	Don't care	
	2	TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01, TAUDnTDL00	Don't care	
TAUDnTRE	15 to 4	TAUDnTRE15 to TAUDnTRE04	0	Disable real-time output.
	3	TAUDnTRE03	Don't care	
	2	TAUDnTRE02	0	Disable real-time output.
	1, 0	TAUDnTRE01, TAUDnTRE00	Don't care	
TAUDnTRO	15 to 4	TAUDnTRO15 to TAUDnTRO04	0	Invalid because real-time output is disabled.
	3	TAUDnTRO03	Don't care	
	2	TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01, TAUDnTRO00	Don't care	
TAUDnTRC	15 to 4	TAUDnTRC15 to TAUDnTRC04	0	Do not use this channel to generate the real-time output trigger.
	3	TAUDnTRC03	Don't care	
	2	TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01, TAUDnTRC00	Don't care	

Table 41.55 Common TAUDn Channel Settings (4/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTME	15 to 4	TAUDnTME15 to TAUDnTME04	0	Disable modulation output for timer output and real-time output.
	3	TAUDnTME03	Don't care	
	2	TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01, TAUDnTME00	Don't care	
TAUDnRDE	15 to 4	TAUDnRDE15 to TAUDnRDE04	1	Enable simultaneous rewriting.
	3	TAUDnRDE03	Don't care	
	2	TAUDnRDE02	1	Enable simultaneous rewriting.
	1, 0	TAUDnRDE01, TAUDnRDE00	Don't care	
TAUDnRDS	15 to 4	TAUDnRDS15 to TAUDnRDS04	0	Do not enable simultaneous rewriting by using another upper channel.
	3	TAUDnRDS03	Don't care	
	2	TAUDnRDS02	0	Do not enable simultaneous rewriting by using another upper channel.
	1, 0	TAUDnRDS01, TAUDnRDS00	Don't care	
TAUDnRDM	15 to 10	TAUDnRDM15 to TAUDnRDM10	0	Perform simultaneous rewriting when the master channel starts counting.
	9 to 4	TAUDnRDM09 to TAUDnRDM04	1	Perform simultaneous rewriting after the master channel starts counting when there is a peak in the triangle wave on the corresponding slave channel.
	3	TAUDnRDM03	Don't care	
	2	TAUDnRDM02	1	Perform simultaneous rewriting after the master channel starts counting when there is a peak in the triangle wave on the corresponding slave channel.
	1, 0	TAUDnRDM01, TAUDnRDM00	Don't care	
TAUDnRDC	15 to 4	TAUDnRDC15 to TAUDnRDC04	0	Do not use this channel to generate the simultaneous rewrite trigger.
	3	TAUDnRDC03	Don't care	
	2	TAUDnRDC02	0	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01, TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 33, Timer Array Unit D (TAUD)**.

PIC Settings (Active High Example)

Table 41.56 PIC Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC1REG2n0	18	PIC1REG2n018	1	Select the TOUT signal of CH2 of TAUDn.
PIC1REG2n1	27, 26	PIC1REG2n127, PIC1REG2n126	1 0	Negative W phase active high combination circuit output
	25, 24	PIC1REG2n125, PIC1REG2n124	1 0	Positive W phase active high combination circuit output
	23, 22	PIC1REG2n123, PIC1REG2n122	1 0	Negative V phase active high combination circuit output
	21, 20	PIC1REG2n121, PIC1REG2n120	1 0	Positive V phase active high combination circuit output
	19, 18	PIC1REG2n119, PIC1REG2n118	1 0	Negative U phase active high combination circuit output
	17, 16	PIC1REG2n117, PIC1REG2n116	1 0	Positive U phase active high combination circuit output
PIC1REG2n2	25	PIC1REG2n225	1	Select the input selected by the PIC1REG2n018 bit.
	21	PIC1REG2n221	1	Select the input selected by the PIC1REG2n018 bit.
	17	PIC1REG2n217	1	Select the input selected by the PIC1REG2n018 bit.
PIC1REG2n3	22, 21, 20	PIC1REG2n322, PIC1REG2n321, PIC1REG2n320	1 0 0	Negative W phase active high logical operation circuit output
	18, 17, 16	PIC1REG2n318, PIC1REG2n317, PIC1REG2n316	1 0 0	Positive W phase active high logical operation circuit output
	14, 13, 12	PIC1REG2n314, PIC1REG2n313, PIC1REG2n312	1 0 0	Negative V phase active high logical operation circuit output
	10, 9, 8	PIC1REG2n310, PIC1REG2n309, PIC1REG2n308	1 0 0	Positive V phase active high logical operation circuit output
	6, 5, 4	PIC1REG2n306, PIC1REG2n305, PIC1REG2n304	1 0 0	Negative U phase active high logical operation circuit output
	2, 1, 0	PIC1REG2n302, PIC1REG2n301, PIC1REG2n300	1 0 0	Positive U phase active high logical operation circuit output

41.2.3.5 Delay Pulse Output Function with Dead Time

(1) Overview

This function allows generation of PWM output with the dead time, that is, delayed as specified from the period timing using TAUDn.

With this function, PWM output can be reset in the next period unlike with the function described in **Section 41.2.3.3, PWM Output Function With Dead Time**.

The following table lists the number of channels used.

PWM Output with Dead Time	Number of TAUDn Channels
One-phase PWM output (U phase/UB phase)	5 channels (master channel: 1, slave channel: 4)
Two-phase PWM output (U phase/UB phase, V phase/VB phase)	9 channels (master channel: 1, slave channel: 8)
Three-phase PWM output (U phase/UB phase, V phase/VB phase, W phase/WB phase)	13 channels (master channel: 1, slave channel: 12)

Note: Above are examples of PWM output combinations.

Usages of each TAUDn channel are listed in the following table. CH2 is used as the master channel of CH3 to 9.

TAUDn Channel	U phase / UB phase	V phase / VB phase	W phase / WB phase	Usage
CH0	—	—	—	Not used
CH1	—	—	—	Not used
CH2	√	√	√	Carrier period (common to each phase)
CH3	√	√	√	Reserved
CH4	√	—	—	Delay pulse input (U phase/UB phase)
CH5	√	—	—	
CH6	—	√	—	Delay pulse input (V phase/VB phase)
CH7	—	√	—	
CH8	—	—	√	Delay pulse input (W phase/WB phase)
CH9	—	—	√	
CH10	√	—	—	U phase output (TOUT10)
CH11	√	—	—	UB phase output (TOUT11)
CH12	—	√	—	V phase output (TOUT12)
CH13	—	√	—	VB phase output (TOUT13)
CH14	—	—	√	W phase output (TOUT14)
CH15	—	—	√	WB phase output (TOUT15)

Note: √: Used; —: Not used

(2) Configuration

The delay pulse output function with the dead time is realized by using the delay pulse output function/ one-phase PWM output function of TAUDn and PIC1 in combination. The following figure shows the block diagram of the delay pulse output function with the dead time.

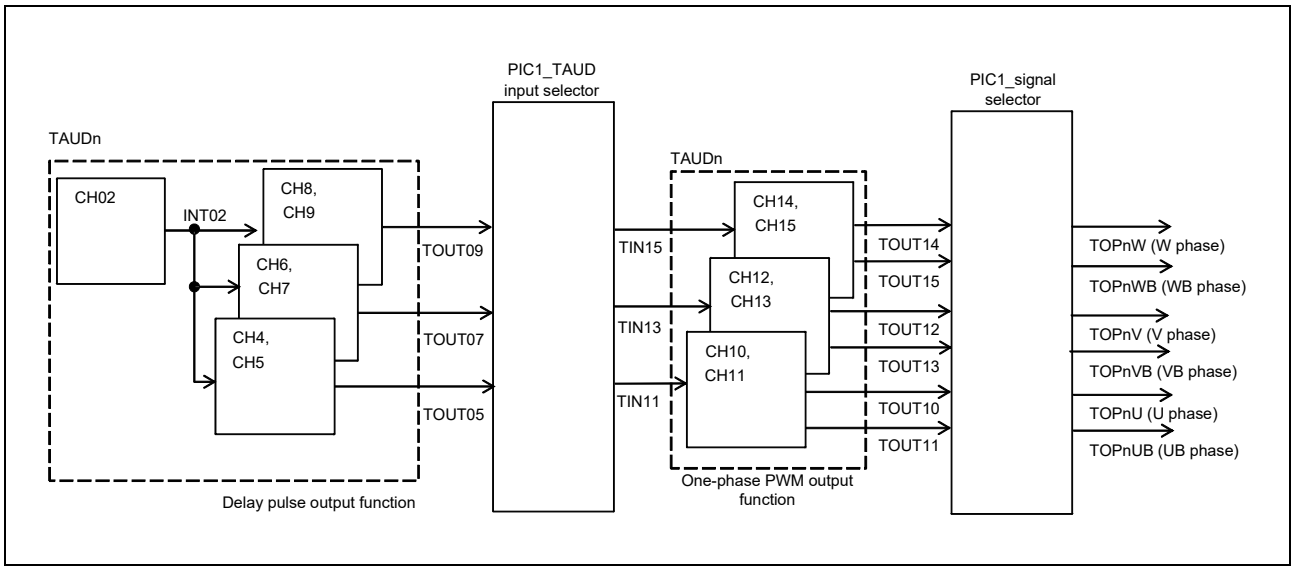


Figure 41.19 Block Diagram of Delay Pulse Output Function with Dead Time

The configuration of this function is described as follows using the PWM output of U phase/UB phase as an example.

- [TAUDn] Delay pulse output function
  CH02, CH04, and CH05 are used in combination. The period, delay value, and the pulse width are set to CDR02, CDR04, and CDR05, respectively, and the delay pulse output signal (TOUT05) is generated.
- [PIC1_TAUD input selector]
  TOUT05 is selected for output as TIN11.
- [TAUDn] One-phase PWM output function
  CH10 and CH11 are used in combination. The dead time value is set to CDR11, dead time is inserted in the PWM signal to be input to TIN11, and TOUT10 (U phase PWM signal) and TOUT11 (UB phase PWM signal) are output.
- [PIC1_signal selector]
  TOUT10 and TOUT11 inputs are selected and output to TOPnU and TOPnUB pins, respectively.

A similar process occurs for V phase/VB phase and W phase/WB phase.

(3) Registers

A block diagram of PIC1 is shown in the following figure.

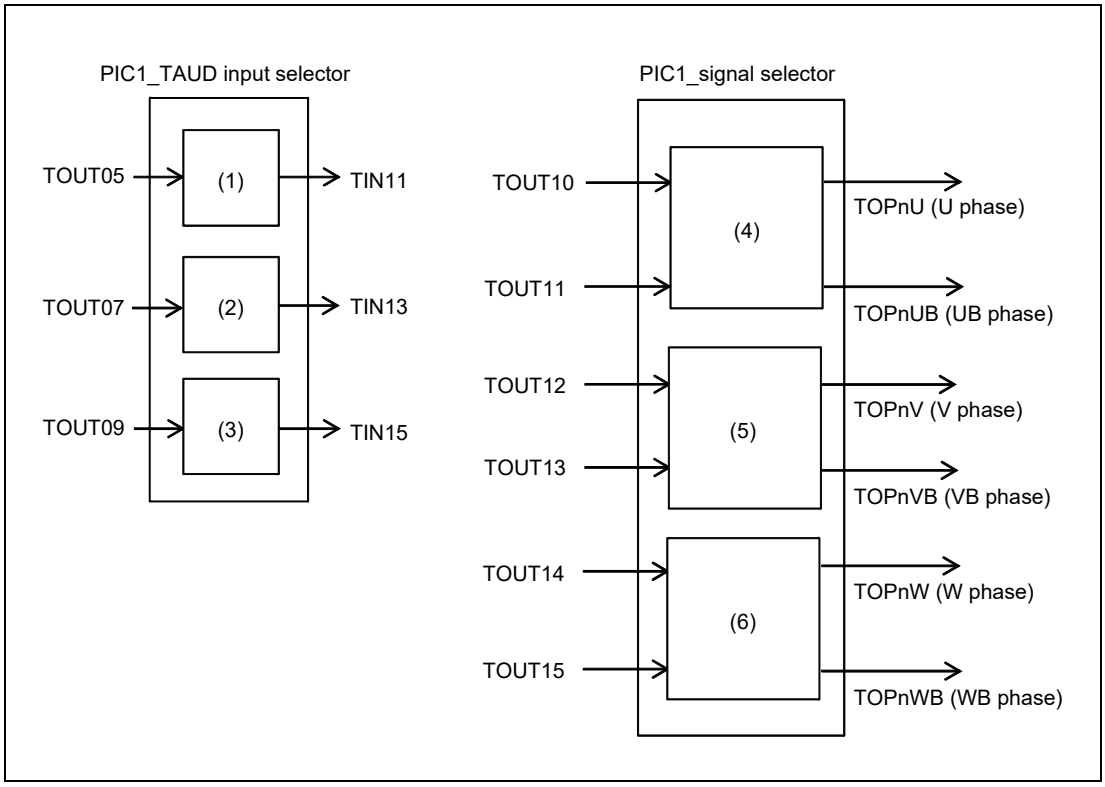

Figure 41.20 Block Diagram of PIC1

The values of PIC1 registers used in this function are as follows.

U phase/ UB phase

The values to output TOUT05 as TIN11 (**Figure 41.20**, unit (1))

PIC1REG2n2[19:18] = 10_B

PIC1REG2n2[2] = 0_B

PIC1TAUDnSEL[23:22] = 00_B

The values to output the TOUT10 and TOUT11 as TOPnU and TOPnUB, respectively (**Figure 41.20**, unit (4))

PIC1REG2n1[19:16] = 0000_B

PIC1REG2n3[2:0] = 000_B

PIC1REG2n3[6:4] = 000_B

V phase/ VB phase

The values to output TOUT07 as TIN13 (**Figure 41.20**, unit (2))

PIC1REG2n2[23:22] = 10_B

PIC1REG2n2[3] = 0_B

PIC1TAUDnSEL[27:26] = 00_B

The values to output TOUT12 and TOUT13 as TOPnV and TOPnVB, respectively (**Figure 41.20**, unit (5))

PIC1REG2n1[23:20] = 0000_B

PIC1REG2n3[10:8] = 000_B

PIC1REG2n3[14:12] = 000_B

W phase/ WB phase

The values to output TOUT09 as TIN15 (**Figure 41.20**, unit (3))

PIC1REG2n2[27:26] = 10_B

PIC1REG2n2[4] = 0_B

PIC1TAUDnSEL[31:30] = 00_B

The values to output TOUT14 and TOUT15 as TOPnW and TOPnWB, respectively (**Figure 41.20**, unit (6))

PIC1REG2n1[27:24] = 0000_B

PIC1REG2n3 [18:16] =000_B

PIC1REG2n3[22:20] =000_B

(4) Function

Details of this function are described using the delay pulse output with dead time (U phase/UB phase) as an example.

The following figure shows the timing diagram.

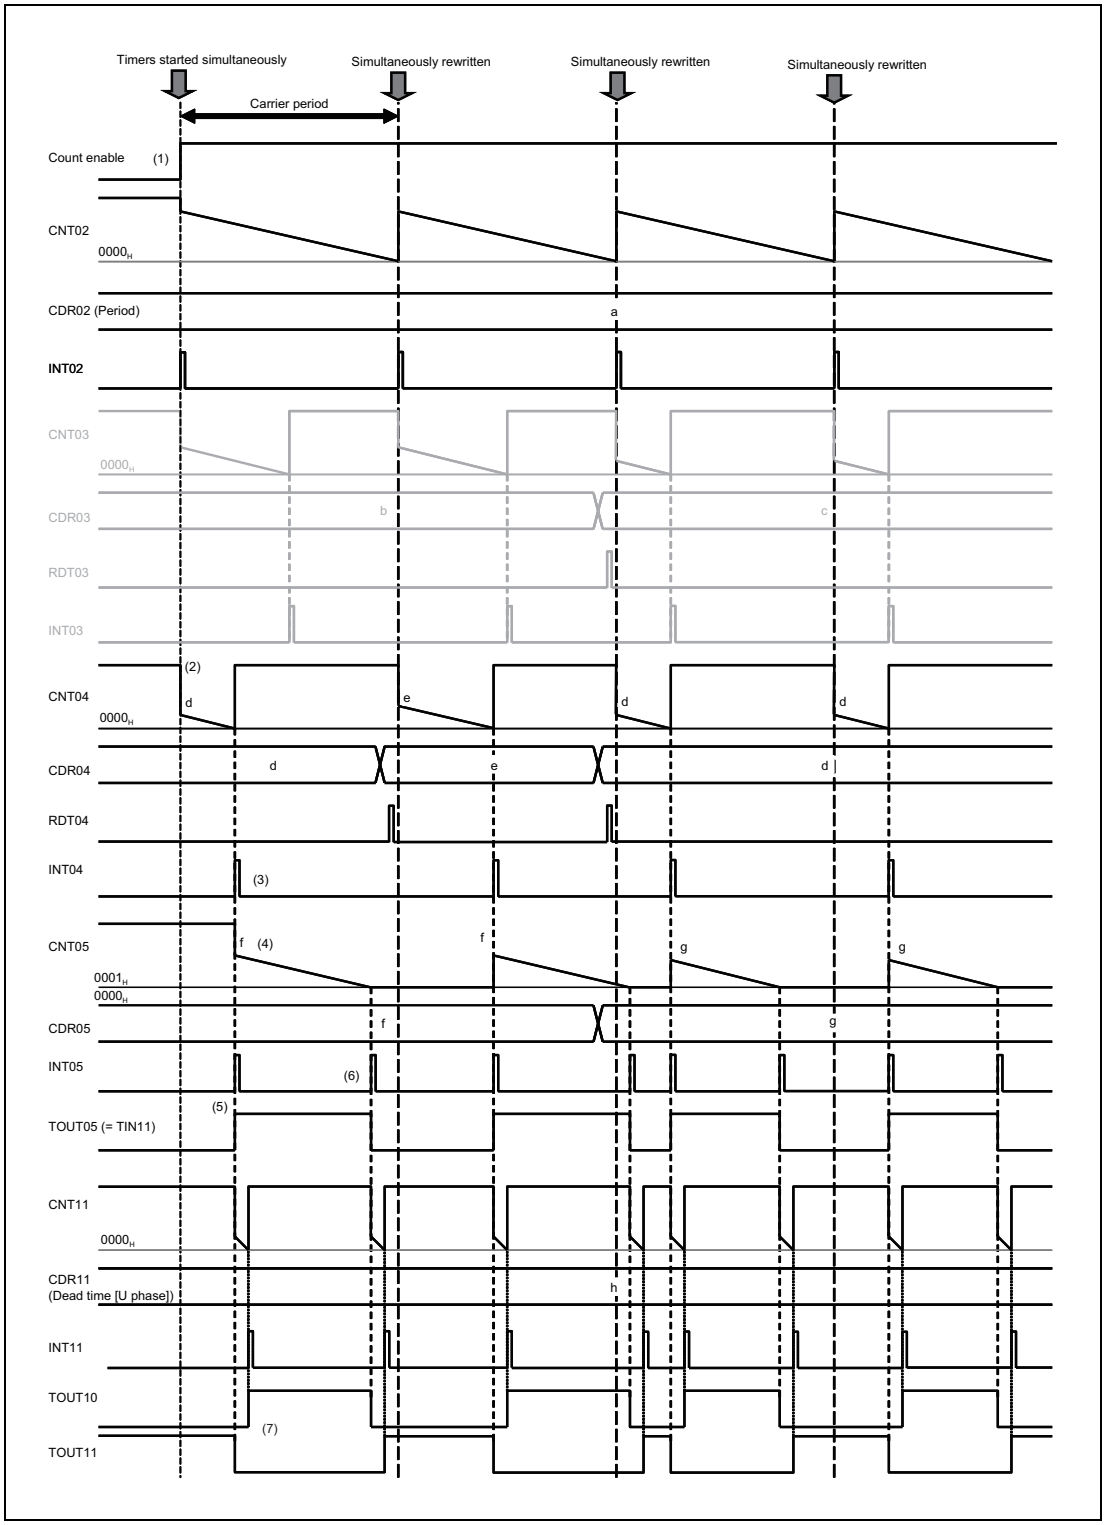

Figure 41.21 Timing Diagram of Delay Pulse Output with Dead Time (U phase/ UB phase)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) For CH04, the set value is reloaded to CNT04 upon the occurrence of a CH02 underflow.

(3) INT04 is generated upon the occurrence of a CH04 underflow.

(4) The set value is reloaded to CDR05 upon the generation of INT04, causing CH05 to start operating.

(5) When CH05 starts operating, INT05 is generated and the TOUT05 output level changes to the active level.

(6) Upon CH05 underflow, INT05 is generated again and the TOUT05 output level changes to the inactive level. TOUT05 is supplied to TIN11.

(7) The U phase PWM signal (TOUT10) and UB phase PWM signal (TOUT11) with the dead time are generated and output at the detection of the TIN11 edge, and output to TOPnU and TOPnUB.

A similar process occurs for V phase/VB phase and W phase/WB phase.

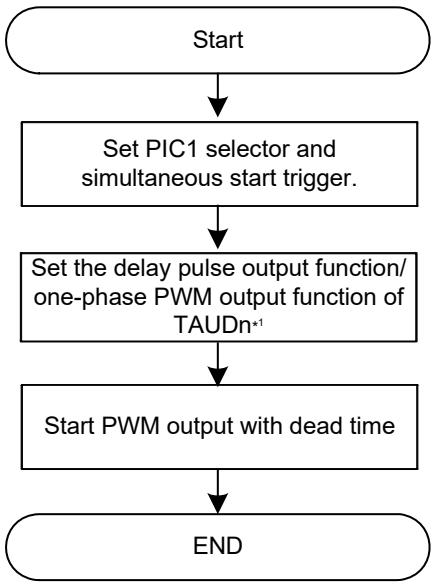
CAUTION

Do not set the delay value which extends over carrier period.

Select the count clock signal of the same clock for TAUDn.

(5) Flow Chart

The following flow chart shows the PMW output function with the dead time.



Note 1. For the setting of delay pulse output function of TAUDn, see **Section 33.15.4, Delay Pulse Output Function**.

(6) Setting Examples for Operation Functions

This section provides example settings for each register.

TAUDn Settings

Table 41.57 TAUDn: CH2-related (Master Channel used to Output a Delay Pulse*1)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	Output INTm at the start of operation.
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 41.58 TAUDn: CH3-related (Slave Channel used to Output a Delay Pulse*1*2)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR3	15, 14	TAUDnCKS[1:0]	Don't care*3	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	Start trigger: INTm detection on the master channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMUR3	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Note 3. For this feature, the channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Table 41.59 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Delay Pulse*1) (m = 4, 6, 8)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	Start trigger: INTm detection on the master channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Table 41.60 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Delay Pulse*1) (m = 5, 7, 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	101	Start trigger: INTm detection on an upper channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	1010	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 33, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 41, Peripheral Interconnect (PIC)**.

Table 41.61 TAUDn: CH11, CH13, and CH15-related (One-phase PWM Output) (m = 11, 13, 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*1	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	001	Start trigger: Detection of a TINm-input valid edge
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	11	Both rising and falling TINm edges are detected as valid. (High width)

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 33, Timer Array Unit D (TAUD)**. CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output).

Table 41.62 Common TAUDn Channel Settings (1/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15 to 10	TAUDnTOE15 to TAUDnTOE10	0 1	Disable the timer. Enable the timer.
	9	TAUDnTOE09	0 1	Disable the timer. Enable the timer.
	8	TAUDnTOE08	0	This is fixed to 0 because TOUT08 is not used.
	7	TAUDnTOE07	0 1	Disable the timer. Enable the timer.
	6	TAUDnTOE06	0	This is fixed to 0 because TOUT06 is not used.
	5	TAUDnTOE05	0 1	Disable the timer. Enable the timer.
	4	TAUDnTOE04	0	This is fixed to 0 because TOUT04 is not used.
	3	TAUDnTOE03	0	This is fixed to 0 because TOUT03 is not used.
	2	TAUDnTOE02	0	This is fixed to 0 because TOUT02 is not used.
	1, 0	TAUDnTOE01, TAUDnTOE00	Don't care	
TAUDnTO	15 to 10	TAUDnTO15 to TAUDnTO10	0*1	Output a low-level signal to TOUT15 to TOUT10.
	9 to 2	TAUDnTO09 to TAUDnTO02	0	Output a low-level signal to TOUT09 to TOUT02.
	1, 0	TAUDnTO01, TAUDnTO00	Don't care	

Table 41.62 Common TAUDn Channel Settings (2/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOM	15 to 10	TAUDnTOM15 to TAUDnTOM10	1	Synchronous operation mode
	9 to 4	TAUDnTOM09 to TAUDnTOM04	0	Independent operation mode
	3	TAUDnTOM03	1	Synchronous operation mode
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01, TAUDnTOM00	Don't care	
TAUDnTOC	15 to 10	TAUDnTOC15 to TAUDnTOC10	1	Synchronous operation mode 2
	9 to 4	TAUDnTOC09 to TAUDnTOC04	1, 0, 1 0, 1, 0	CH5, CH7, CH9: Operation mode 2 CH4, CH6, CH8: Operation mode 1
	3	TAUDnTOC03	0	Operation mode 1
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01, TAUDnTOC00	Don't care	
TAUDnTOL	15 to 10	TAUDnTOL15 to TAUDnTOL10	0*1	Positive logic output (active high)
	9 to 2	TAUDnTOL09 to TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01, TAUDnTOL00	Don't care	
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	1	Enable dead time control.*2
	9 to 2	TAUDnTDE09 to TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01, TAUDnTDE00	Don't care	
TAUDnTDM	15 to 10	TAUDnTDM15 to TAUDnTDM10	1	Output dead time upon detecting a TINm input edge at a lower odd channel.
	9 to 2	TAUDnTDM09 to TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01, TAUDnTDM00	Don't care	
TAUDnTDL	15	TAUDnTDL15	1*1	Add dead time to the negative W phase period.
	14	TAUDnTDL14	0*1	Add dead time to the positive W phase period.
	13	TAUDnTDL13	1*1	Add dead time to the negative V phase period.
	12	TAUDnTDL12	0*1	Add dead time to the positive V phase period.
	11	TAUDnTDL11	1*1	Add dead time to the negative U phase period.
	10	TAUDnTDL10	0*1	Add dead time to the positive U phase period.
	9 to 2	TAUDnTDL09 to TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01, TAUDnTDL00	Don't care	
TAUDnTRE	15 to 2	TAUDnTRE15 to TAUDnTRE02	0	Disable real-time output.
	1, 0	TAUDnTRE01, TAUDnTRE00	Don't care	

Table 41.62 Common TAUDn Channel Settings (3/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTRO	15 to 2	TAUDnTRO15 to TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01, TAUDnTRO00	Don't care	
TAUDnTRC	15 to 2	TAUDnTRC15 to TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01, TAUDnTRC00	Don't care	
TAUDnTME	15 to 2	TAUDnTME15 to TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01, TAUDnTME00	Don't care	
TAUDnRDE	15	TAUDnRDE15	0	Disable simultaneous rewriting.
	14	TAUDnRDE14	Don't care	
	13	TAUDnRDE13	0	Disable simultaneous rewriting.
	12	TAUDnRDE12	Don't care	
	11	TAUDnRDE11	0	Disable simultaneous rewriting.
	10	TAUDnRDE10	Don't care	
	9 to 2	TAUDnRDE09 to TAUDnRDE02	1	Enable simultaneous rewriting.
	1, 0	TAUDnRDE01, TAUDnRDE00	Don't care	
TAUDnRDS	15	TAUDnRDS15	0	Do not enable simultaneous rewriting by using another upper channel.
	14	TAUDnRDS14	Don't care	
	13	TAUDnRDS13	0	Do not enable simultaneous rewriting by using another upper channel.
	12	TAUDnRDS12	Don't care	
	11	TAUDnRDS11	0	Do not enable simultaneous rewriting by using another upper channel.
	10	TAUDnRDS10	Don't care	
	9 to 2	TAUDnRDS09 to TAUDnRDS02	0	Enable simultaneous rewriting by using a master channel.
	1, 0	TAUDnRDS01, TAUDnRDS00	Don't care	
TAUDnRDM	15	TAUDnRDM15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDM14	Don't care	
	13	TAUDnRDM13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDM12	Don't care	
	11	TAUDnRDM11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDM10	Don't care	
	9 to 2	TAUDnRDM09 to TAUDnRDM02	0	Load the signal when the master channel starts counting.
	1, 0	TAUDnRDM01, TAUDnRDM00	Don't care	

Table 41.62 Common TAUDn Channel Settings (4/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnRDC	15	TAUDnRDC15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDC14	Don't care	
	13	TAUDnRDC13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDC12	Don't care	
	11	TAUDnRDC11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDC10	Don't care	
	9 to 2	TAUDnRDC09 to TAUDnRDC02	0	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01, TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 33, Timer Array Unit D (TAUD)**.

PIC Settings

Table 41.63 Peripheral Interconnect Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC1REG2n2	27	PIC1REG2n227	1	Select the input selected by the PIC1REG2n204 bit.
	23	PIC1REG2n223	1	Select the input selected by the PIC1REG2n203 bit.
	19	PIC1REG2n219	1	Select the input selected by the PIC1REG2n202 bit.
	4	PIC1REG2n204	0	Select TAUDnTTOUT9.
	3	PIC1REG2n203	0	Select TAUDnTTOUT7.
	2	PIC1REG2n202	0	Select TAUDnTTOUT5.

41.2.3.6 Trigger Pulse Width Measurement Function

(1) Overview

This function allows measurement of trigger periods by inputting the trigger signal output from ENCAn and TPTM PEn to TAUJ0 and TAUDn.

The following table lists the ENCAn and TPTM PEn interrupt trigger signals to be measured by each timer and channel.

Timer	Channel	Interrupt Signal to be Measured
TAUJ0	CH0	INTENCA0IEC or INTTPTMU10
	CH1	INTENCA0IEC or INTTPTMU10
	CH2	INTENCA1IEC or INTTPTMU30
	CH3	INTENCA1IEC or INTTPTMU30
TAUD0	CH0	ENCAT0EQ0 or ENCAT0EQ1 or INTTPTMU00
	CH1	ENCAT0EQ1 or INTTPTMU01
	CH2	ENCAT0EQ0 or INTTPTMU00
TAUD1	CH0	ENCAT1EQ0 or ENCAT1EQ1 or INTTPTMU11
	CH1	ENCAT1EQ1 or INTTPTMU20
	CH2	ENCAT1EQ0 or INTTPTMU11

(2) Configuration

The trigger and pulse width measurement function is realized by using the TAUJ0 and TINm input pulse width measurement function of TAUDn and PIC1 in combination. The following figure shows the block diagram of the trigger and pulse width measurement function.

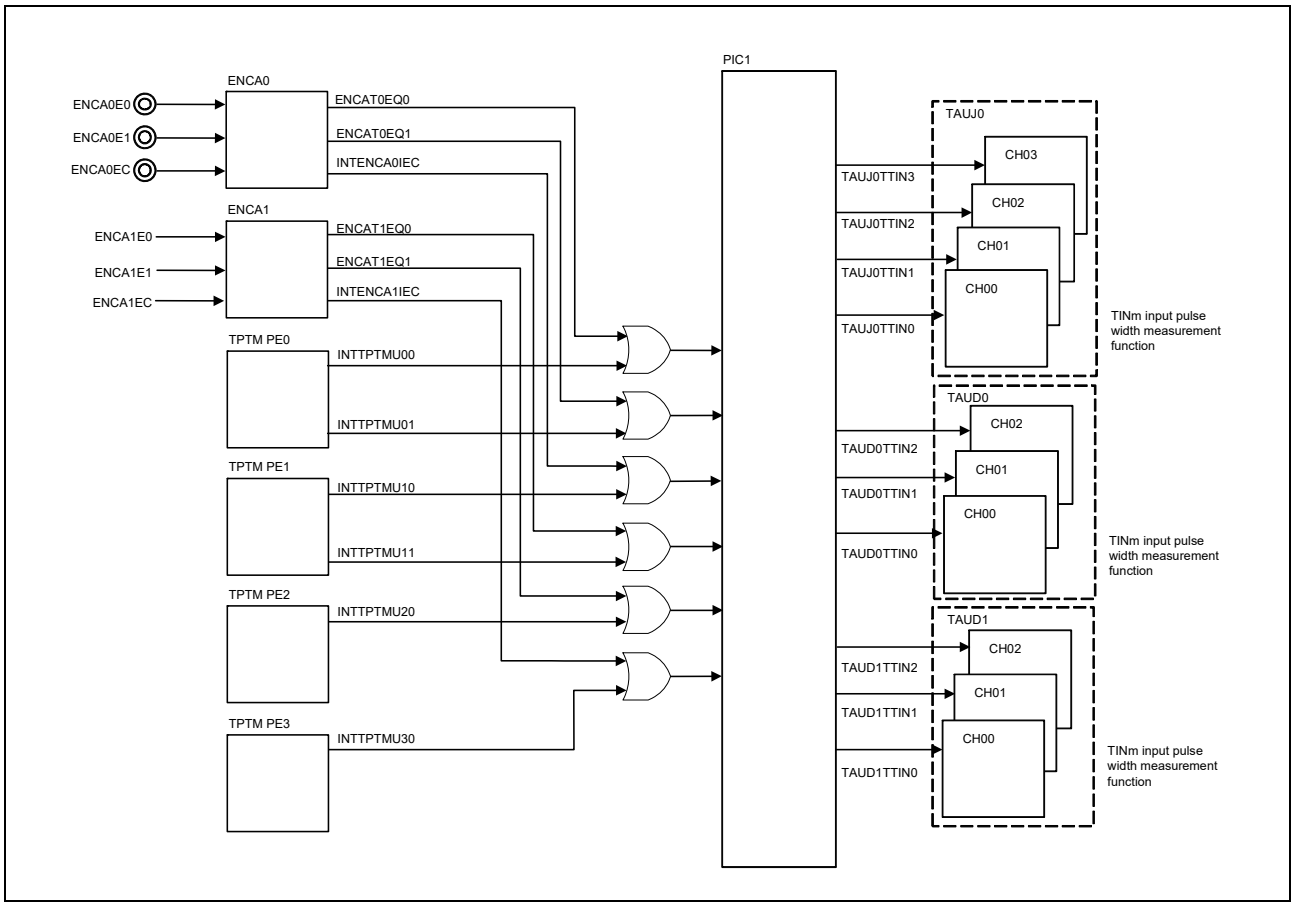


Figure 41.22 Block Diagram of Trigger and Pulse Width Measurement Function

The configuration of this function is described below using TAUJ0 CH0 as an example.

- [ENCA0]
  INTENCA0IEC interrupt signal is generated each time ENCA0 timer counter is cleared by input from ENCA0EC pin.
- [TPTM PE1]
  INTTPTMU10 interrupt signal is generated each time compare hit (CMP0) of each up counter from CPU1 occurs.
- [PIC1] Latch and toggle output (DT) circuit
  INTENCA0IEC or INTTPTMU10 interrupt trigger signal selected by the DT circuit is converted into a level-sensitive toggle signal and output to TAUJ0TTIN0.
- [TAUJ0] TINm input pulse interval measurement function
  TAUJ0 CH0 is used. TAUJ0CNT0 is captured each time input signal is toggled. The counter is cleared and restarted.

Similar configuration is applied for trigger and pulse width measurement of TAUD0 and TAUD1.

(3) Registers

Block diagram of PIC1 is shown in the following figure.

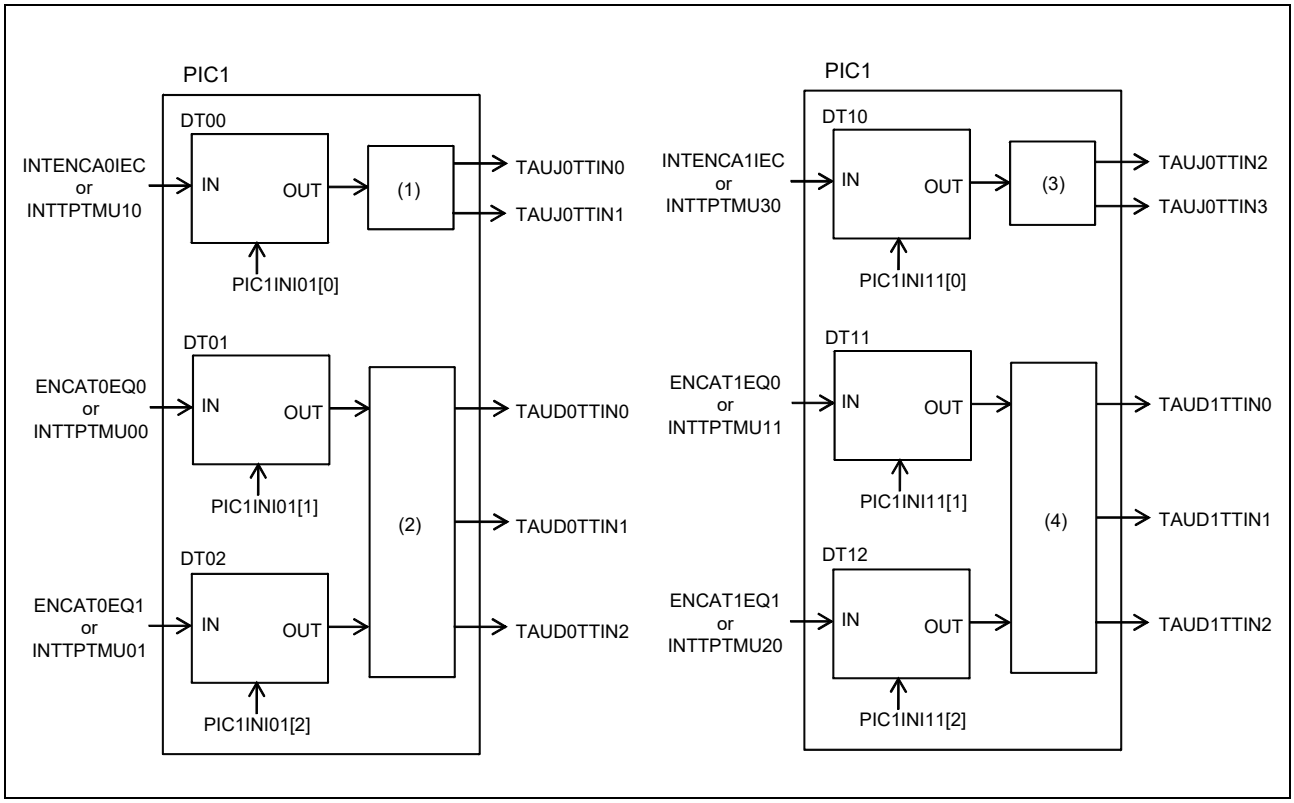

Figure 41.23 Block Diagram of PIC1

The values of PIC1 registers used in this function are as follows.

ENCA0 and TPTM PEn (n = 0,1)

- INTENCA0IEC/INTTPTMU10 trigger and pulse width measurement
  The register values to select the timer which performs INTENCA0IEC/INTTPTMU10 trigger and pulse width measurement. (**Figure 41.23**, unit (1))

Register Value			
PIC1REG31			
1	0	TAUJ0.TIN00	TAUJ0.TIN01
0	0	Not selected.	
0	1	INTENCA0IEC/INTTPTMU10	—
1	0	—	INTENCA0IEC/INTTPTMU10
1	1	INTENCA0IEC/INTTPTMU10	INTENCA0IEC/INTTPTMU10

Note: Write 0 (value after reset) to PIC1REG30[22,17:16]

- ENCAT0EQ0/INTTPTMU00 and ENCAT0EQ1/INTTPTMU01 trigger and pulse width measurement
  The register values to select the timer which performs ENCAT0EQ0/INTTPTMU00 and ENCAT0EQ1/INTTPTMU01 trigger and pulse width measurement. (**Figure 41.23**, unit (2))

Register Value										
PIC1REG31										
13	12	11	10	9	8	7	6	TAUD0.TIN00	TAUD0.TIN01	TAUD0.TIN02
0	0	0	0	0	0	0	0	Not selected.		
0	0	1	1	0	0	0	1	ENCAT0EQ0/ INTTPTMU00	ENCAT0EQ1/ INTTPTMU01	—
0	1	0	0	0	0	0	1	ENCAT0EQ1/ INTTPTMU01	—	ENCAT0EQ0/ INTTPTMU00
0	1	1	0	0	0	0	1	ENCAT0EQ1/ INTTPTMU01	ENCAT0EQ1/ INTTPTMU01	ENCAT0EQ0/ INTTPTMU00
0	1	1	1	0	0	0	1	ENCAT0EQ0/ INTTPTMU00	ENCAT0EQ1/ INTTPTMU01	ENCAT0EQ0/ INTTPTMU00

Note: Do not set the values other than those listed above for this function. Write 0 (value after reset) to PIC1TAUD0SEL[5:0] and PIC1REG30[22,17:16,1:0].

- Enable initialization of the DT02 to DT00 circuits
  The register values to enable initialization of the DT02 to DT00 circuits.
  PIC1INI01[2:0] = 111_B (initialized)

ENCA1 and TPTM PEn (n = 1, 2, 3)

INTENCA1IEC/INTTPTMU30 trigger and pulse width measurement

The register values to select the timer which performs INTENCA1IEC/INTTPTMU30 trigger and pulse width measurement. (**Figure 41.23**, unit (3))

Register Value			
PIC1REG31			
4	3	TAUJ0.TIN02	TAUJ0.TIN03
0	0	Not selected.	
0	1	INTENCA1IEC/ INTTPTMU30	—
1	0	—	INTENCA1IEC/ INTTPTMU30
1	1	INTENCA1IEC/ INTTPTMU30	INTENCA1IEC/ INTTPTMU30

Note: Write 0 (value after reset) to PIC1REG30[20:19,11:10]

- ENCAT1EQ0/INTTPTMU11 and ENCAT1EQ1/INTTPTMU20 trigger and pulse width measurement
  The register values to select the timer which performs ENCAT1EQ0/INTTPTMU11 and ENCAT1EQ1/INTTPTMU20 trigger and pulse width measurement. (**Figure 41.23**, unit (4))

Register Value										
PIC1REG31										
22	21	20	19	18	17	16	15	TAUD1.TIN00	TAUD1.TIN01	TAUD1.TIN02
0	0	0	0	0	0	0	0	Not selected.

Note: Do not set the values other than those listed above for this function. Write 0 (value after reset) to PIC1TAUD1SEL[5:0] and PIC1REG30[20:19,9:6].

- Enable initialization of DT12 to DT10 circuits
  The register values to enable initialization of the DT12 to DT10 circuits.
  PIC1INI11[2:0] = 111_B (initialized)

(4) Function

Details of this function are described as follows using ENCAn as an example.

The following figure shows the timing diagram.

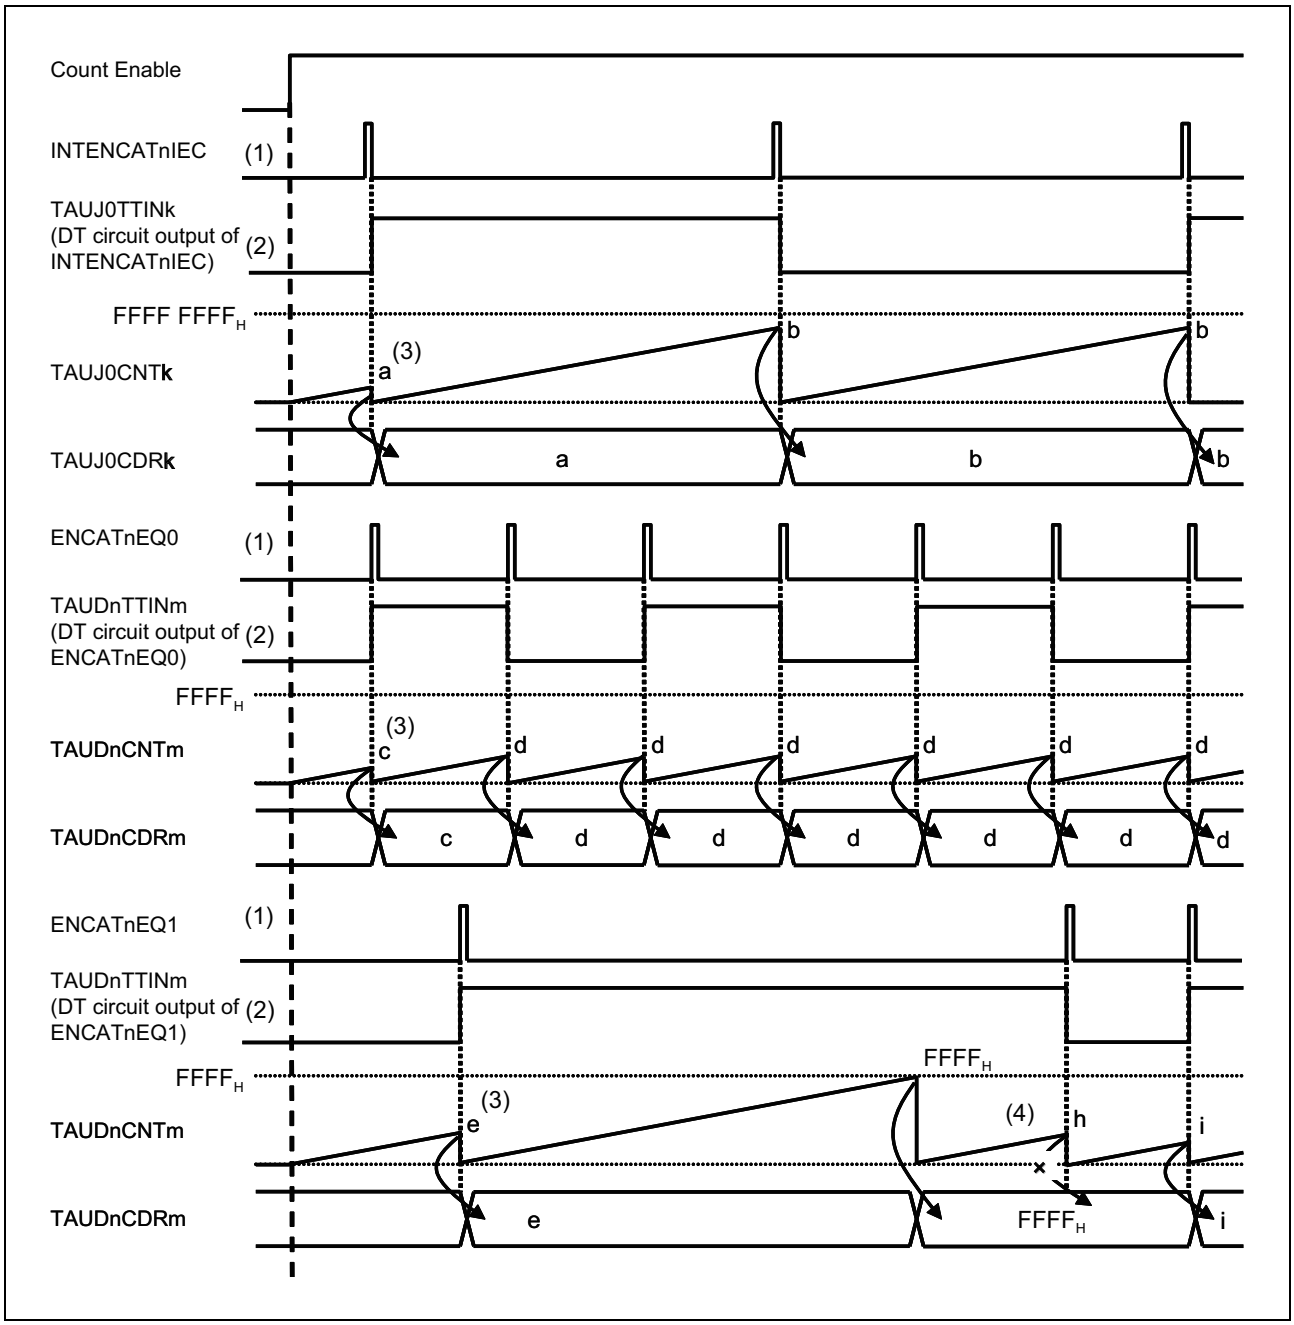

Figure 41.24 Timing Diagram of Trigger and Pulse Width Measurement

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) The interrupt trigger signal output from ENCAn is converted to the level-sensitive toggle signal by the DT circuit and is output to TINm of TAUJ0 and TINm of TAUDn.

(3) The CNTm value is captured into CDRm on the TINm toggle timing and cleared.

(4) When an overflow occurs, the greatest count value ($FFFF_H$ for TAUDn and FFFF $FFFF_H$ for TAUJ0) is captured and the counter is cleared at the same time. The count value is not captured on the first trigger after the overflow. (When TAUDnCMORm.TAUDnCOS[1] = 1_B)

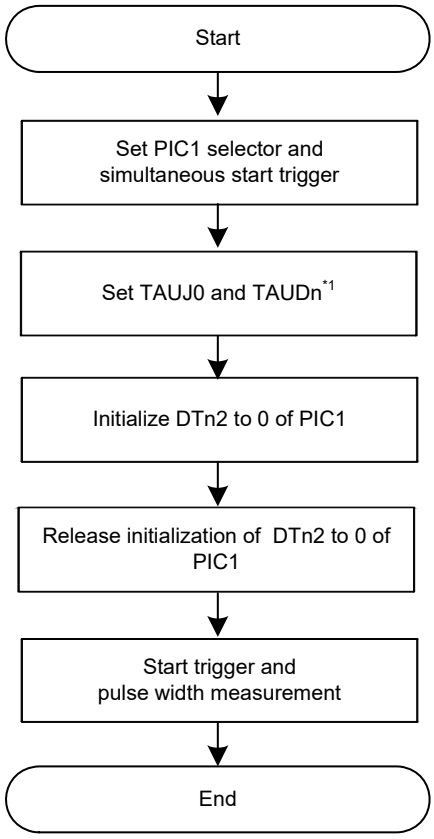
CAUTION

Operation at an overflow varies depending on the setting of TAUJ and TAUD. For details of the TAUJ setting, see Section 34.4.9.3, TAUJnTTINm Input Pulse Interval Measurement Function, see Section 33.12.7, TAUDnTTINm Input Pulse Interval Measurement Function. In this function, set the effective edge to be detected by TAUJ0 and TINm of TAUDn as both edges (rising and falling).

(5) Flow Chart

The following figure shows the setting flow of this function.

This flow chart can be set at both during ENCAn, TPTMPEn operating and while for simultaneous start trigger.



Note 1. For the setting of TAUDn, see **Section 33.12.7, TAUDnTTINm Input Pulse Interval Measurement Function**, for the setting of TAUJ0, see **Section 34.4.9.3, TAUJnTTINm Input Pulse Interval Measurement Function**.

The ENCAn settings to use this function are as follows.

ENCAnCTL[15:0] = xx00 0000 x00x $xxxx_B$

ENCAnIOC0[7:0] = 0000 0000_B

ENCAnIOC1[7:0] = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 40, Encoder Timer A (ENCA)**.

(6) Setting Examples for Operation Functions

This section provides example setting for each register.

The set up example shown in this section describes how to set up measurement of the pulse interval for all the combinations below.

Encoder Timer	Trigger Signal	Measurement Timer
ENCA0	INTENCA0IEC	TAUJ0 CH0, TAUJ0 CH1
	ENCAT0EQ0	TAUD0 CH0, TAUD0 CH2
	ENCAT0EQ1	TAUD0 CH0, TAUD0 CH1

Table 41.64 ENCA0 Setting

Register	Bit Position	Bit Name	Setting Value	Note
ENCA0CTL	15	ENCA0CME	Don't care	Enables or disables compare match interrupt detection mask
	14	ENCA0MCS	Don't care	Selects a cancelation trigger for compare match interrupt detection mask
	13 to 10		0	Fixed to 0
	9	ENCA0CRM1	Don't care	Selects the ENCA0CCR1 register function
	8	ENCA0CRM0	Don't care	Selects the ENCA0CCR0 register function
	7	ENCA0CTS	Don't care	Selects trigger for capture operation of ENCA0CCR1.
	6, 5		0	Fixed to 0
	4	ENCA0CLDE	Don't care	Enables or disables reload operation when underflow is generated
	3	ENCA0ECM1	Don't care	Enables or disables clearing of the counter on compare match of ENCA0CCR1
	2	ENCA0ECM0	Don't care	Enables or disables clearing of the counter on compare match of ENCA0CCR0
	1, 0	ENCA0UDS[1:0]	Don't care	Selects the counter up/down control by ENCA0E0 and ENCA0E1
ENCA0IOC0	7 to 4		0	Fixed to 0
	3, 2	ENCA0TIS[3:2]	Don't care	Selects the valid edge for capture trigger 1 (ENCA0I1)
	1, 0	ENCA0TIS[1:0]	Don't care	Selects the valid edge for capture trigger 0 (ENCA0I0)
ENCA0IOC1	7	ENCA0SCE	Don't care	Enables encoder special-clear
	6	ENCA0ZCL	Don't care	Selects the clear level of Z phase for encoder special-clear
	5	ENCA0BCL	Don't care	Selects the clear level of B phase for encoder special-clear
	4	ENCA0ACL	Don't care	Selects the clear level of A phase for encoder special-clear
	3, 2	ENCA0ECS[1:0]	Don't care	Selects encoder clear input (Z phase) edge
	1, 0	ENCA0EIS[1:0]	Don't care	Selects encoder input (A or B phase) edge

Table 41.65 TAUJ0 Setting (k = 0, 1)
TAUJ0 (TAUJnTTINm Input Pulse Interval Measurement Function)

Register	Bit Position	Bit Name	Setting Value	Note
TAUJ0CMORk	15, 14	TAUJ0CKS[1:0]	Don't care	Operation clock setting
	13, 12	TAUJ0CCS[1:0]	00	
	11	TAUJ0MAS	0	
	10, 9, 8	TAUJ0STS[2:0]	001	
	7, 6	TAUJ0COS[1:0]	11	
	5		0	Fixed to 0
	4, 3, 2, 1	TAUJ0MD[4:1]	0010	
	0	TAUJ0MD0	Don't care	
TAUJ0CMURk	1, 0	TAUJ0TIS[1:0]	10	

NOTE

When TAUJ0CMORk is used for the TAUDnTTINm input pulse interval measurement function, the TAUJ0CKS[1:0] (operating clock selection) and TAUJ0MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUJ0COS[1:0] (overflow mode selection) bits can also set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 34, Timer Array Unit J (TAUJ)**.

For TAUJ common registers (TAUJ0TOE, TAUJ0TO, TAUJ0TOM, TAUJ0TOC, TAUJ0TOL, TAUJ0RDE, and TAUJ0RDM), only set the bits corresponding to the used channels to 0.

Table 41.66 TAUD0 Setting (m = 0 to 2)
TAUD0 (TAUDnTTINm Input Pulse Interval Measurement Function)

Register	Bit Position	Bit Name	Setting Value	Note
TAUD0CMORm	15, 14	TAUD0CKS[1:0]	Don't care	Operation clock setting
	13, 12	TAUD0CCS[1:0]	00	
	11	TAUD0MAS	0	
	10, 9, 8	TAUD0STS[2:0]	001	
	7, 6	TAUD0COS[1:0]	11	
	5		0	Fixed to 0
	4, 3, 2, 1	TAUD0MD[4:1]	0010	
	0	TAUD0MD0	Don't care	
TAUD0CMURm	1, 0	TAUD0TIS[1:0]	10	

NOTE

When TAUD0CMORm is used for the TAUDnTTINm input pulse interval measurement function, the TAUD0CKS[1:0] (operating clock selection) and TAUD0MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUD0COS[1:0] (overflow mode selection) bits can also set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 33, Timer Array Unit D (TAUD)**.

For TAUD common registers (TAUD0TOE, TAUD0TO, TAUD0TOM, TAUD0TOC, TAUD0TOL, TAUD0TDE, TAUD0TDM, TAUD0TDL, TAUD0TRE, TAUD0TRO, TAUD0TRC, TAUD0TME, TAUD0RDE, TAUD0RDS, TAUD0RDM, and TAUD0RDC), only set the bits corresponding to the used channels to 0.

Table 41.67 PIC Setting

Register	Bit Position	Bit Name	Setting Value	Note
PIC1REG31	13, 12	PIC1REG3113 PIC1REG3112	0 1	Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN2 input signal
	11	PIC1REG3111	1	Selects the signal selected with PIC1REG3106 to PIC1REG3108 (DT output signal from ENCAT0EQ1) as TAUD0TTIN1 input signal
	10, 9	PIC1REG3110 PIC1REG3109	1 0	Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN0 input signal
	8 to 6	PIC1REG3108 PIC1REG3107 PIC1REG3106	0 0 1	Selects the DT output signal from ENCAT0EQ1 as TAUD0TTIN1 or TAUD0TTIN0 input signal
	1	PIC1REG3101	1	Selects the DT output signal from INTENCA0IEC as TAUJ0TTIN1 input signal
	0	PIC1REG3100	1	Selects the DT output signal from INTENCA0IEC as TAUJ0TTIN0 input signal

41.2.3.7 Encoder Capture Trigger Select Function

(1) Overview

The function selects any of the ADCJTTOUTn[j] (ADCJn conversion start trigger signal j), INTTAUDnIm (TAUDn-CHm interrupt signal), and ENCAnI1 (signal 1 of the ENCAn external pin input) as the ENCAn capture trigger signal.

(2) Configuration

The encoder capture trigger select function is realized by using ADCJTTOUTn[j] (ADCJn conversion start trigger signal j), INTTAUDnIm (TAUDn CHm interrupt signal), ENCAnI1 (ENCAn external pin input 1 signal), and PIC1.

Block diagram of this function is shown in the following figure.

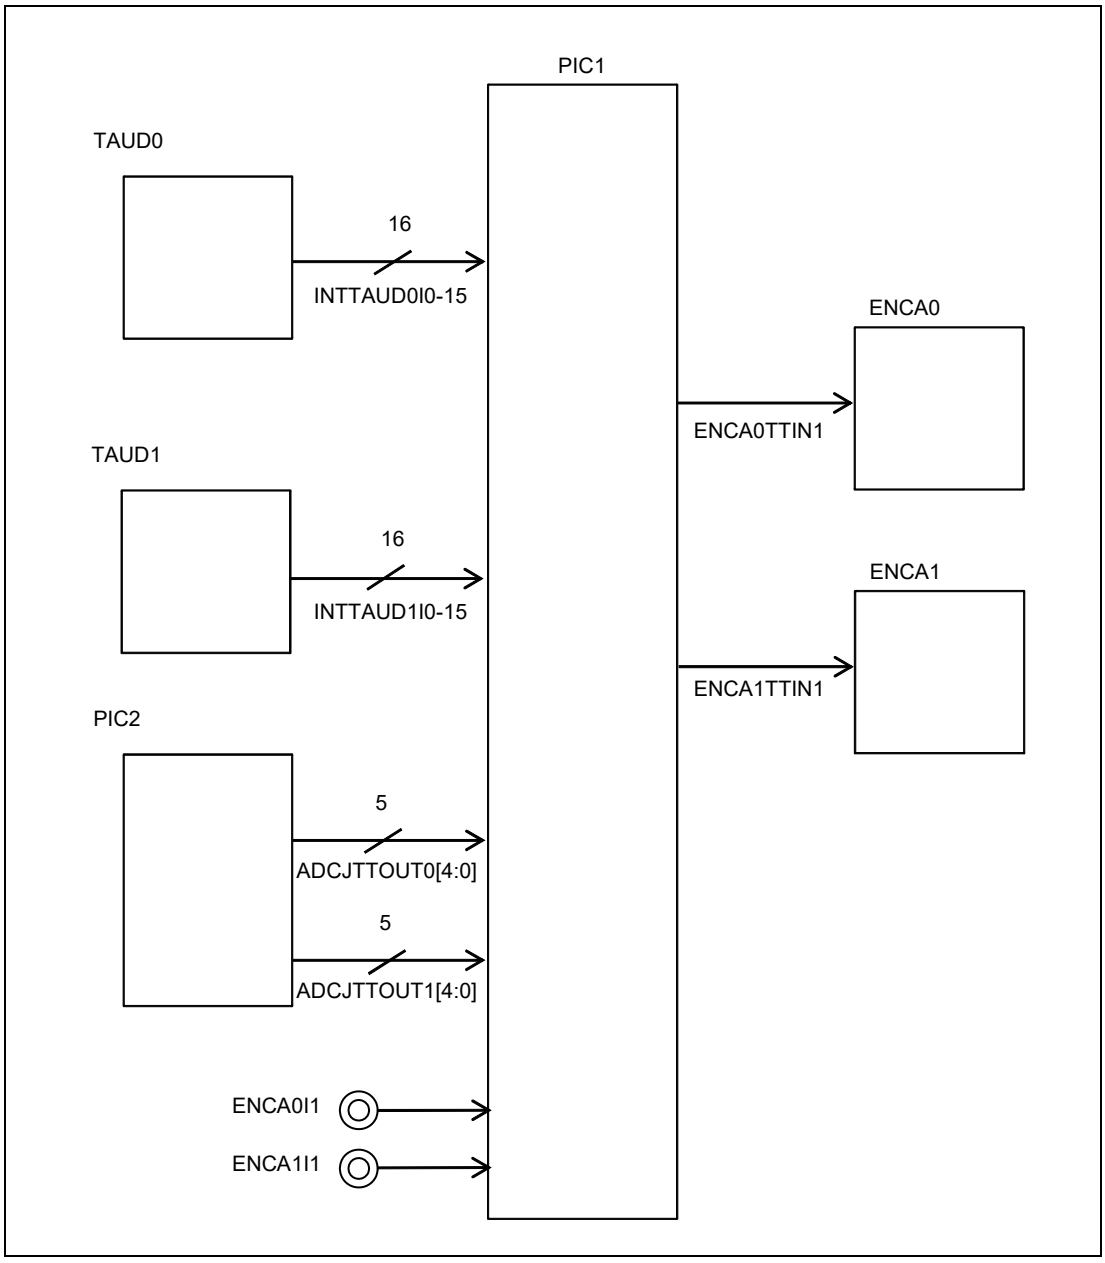


Figure 41.25 Block Diagram of Encoder Capture Trigger Select Function

An example of selecting CH0 of TAUD0 as a capture trigger input of ENCA0 is described below.

PIC1ENCSEL400[7] = 1_B

PIC1ENCSEL400[3:0] = 0000_B

PIC1REG30[18] = 1_B

PIC1REG30[5:2] = 0000_B

(3) Registers

Block diagram of PIC1 is shown in the following figure.

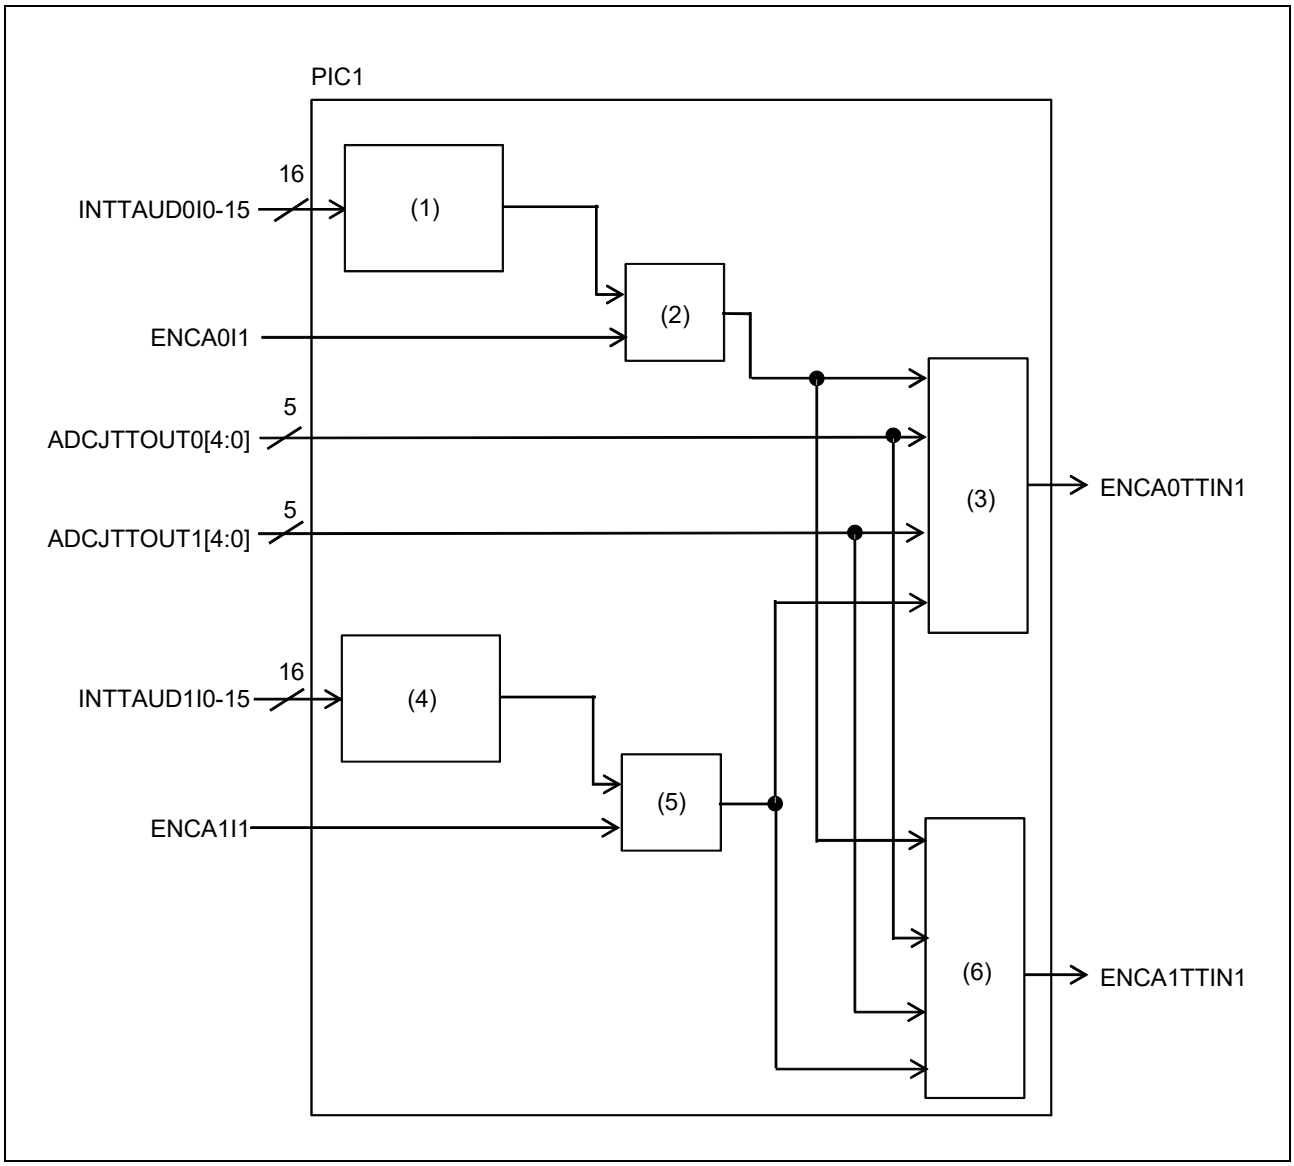

Figure 41.26 Block Diagram of PIC1

The values of PIC1 registers used in this function are as follows.

ENCA0

(1) INTTAUD0Im selection
The register values to select INTTAUD0Im. Set 1 to the PIC1ENCSEL400[7] to select INTTAUD0Im.

Register Values					
PIC1ENCSEL400					
7	3	2	1	0	Output of (1)
1	0	0	0	0	INTTAUD0I0
1	0	0	0	1	INTTAUD0I1
1	0	0	1	0	INTTAUD0I2
1	0	0	1	1	INTTAUD0I3
1	0	1	0	0	INTTAUD0I4
1	0	1	0	1	INTTAUD0I5
1	0	1	1	0	INTTAUD0I6
1	0	1	1	1	INTTAUD0I7
1	1	0	0	0	INTTAUD0I8
1	1	0	0	1	INTTAUD0I9
1	1	0	1	0	INTTAUD0I10
1	1	0	1	1	INTTAUD0I11
1	1	1	0	0	INTTAUD0I12
1	1	1	0	1	INTTAUD0I13
1	1	1	1	0	INTTAUD0I14
1	1	1	1	1	INTTAUD0I15

(2) INTTAUD0Im and ENCA0I1 pins selection
The register values to select either the output (1) or ENCA0I1.

Register Values	
PIC1REG30	
18	Output (2)
1	Output (1)
0	ENCA0I1

(3) ENCA0I1 selection

The register values to select any of the output (2), output (5), ADCJTTOUT0[4:0], or ADCJTTOUT1[4:0].

Register Values				
PIC1REG30				
5	4	3	2	ENCA0I1
0	0	0	0	Output (2)
0	0	0	1	Output (5)
0	0	1	0	ADCJTTOUT0[4]
0	0	1	1	ADCJTTOUT0[3]
0	1	0	0	ADCJTTOUT0[2]
0	1	0	1	ADCJTTOUT0[1]
0	1	1	0	ADCJTTOUT0[0]
0	1	1	1	ADCJTTOUT1[4]
1	0	0	0	ADCJTTOUT1[3]
1	0	0	1	ADCJTTOUT1[2]
1	0	1	0	ADCJTTOUT1[1]
1	0	1	1	ADCJTTOUT1[0]

Note: Do not set the values other than those listed above for this function.

ENCA1

(4) INTTAUD1Im selection

The register values to select INTTAUD1Im. Set 1 to the PIC1ENCSEL410[7] to select INTTAUD1Im.

Register Values					
PIC1ENCSEL410					
7	3	2	1	0	Output (4)
1	0	0	0	0	INTTAUD1I0
1	0	0	0	1	INTTAUD1I1
1	0	0	1	0	INTTAUD1I2
1	0	0	1	1	INTTAUD1I3
1	0	1	0	0	INTTAUD1I4
1	0	1	0	1	INTTAUD1I5
1	0	1	1	0	INTTAUD1I6
1	0	1	1	1	INTTAUD1I7
1	1	0	0	0	INTTAUD1I8
1	1	0	0	1	INTTAUD1I9
1	1	0	1	0	INTTAUD1I10
1	1	0	1	1	INTTAUD1I11
1	1	1	0	0	INTTAUD1I12
1	1	1	0	1	INTTAUD1I13
1	1	1	1	0	INTTAUD1I14
1	1	1	1	1	INTTAUD1I15

(5) INTTAUD1Im and ENCA1I1 pins selection

The register values to select either the output (4) or ENCA1I1.

Register Values	
PIC1REG30	
21	Output (5)
1	Output (4)
0	ENCA1I1

(6) ENCA1I1 selection

The register values to select any of the output (2), output (5), ADCJTTOUT0[4:0], or ADCJTTOUT1[4:0].

Register Values				
PIC1REG30				
15	14	13	12	ENCA1I1
0	0	0	0	Output (5)
0	0	0	1	Output (2)
0	0	1	0	ADCJTTOUT0[4]
0	0	1	1	ADCJTTOUT0[3]
0	1	0	0	ADCJTTOUT0[2]
0	1	0	1	ADCJTTOUT0[1]
0	1	1	0	ADCJTTOUT0[0]
0	1	1	1	ADCJTTOUT0[4]
1	0	0	0	ADCJTTOUT0[3]
1	0	0	1	ADCJTTOUT0[2]
1	0	1	0	ADCJTTOUT0[1]
1	0	1	1	ADCJTTOUT0[0]

Note: Do not set the values other than those listed above for this function.

(4) Function

Details of this function is described with an example of selecting INTTAUDnIm as a capture trigger signal.

The following figure shows the timing diagram.

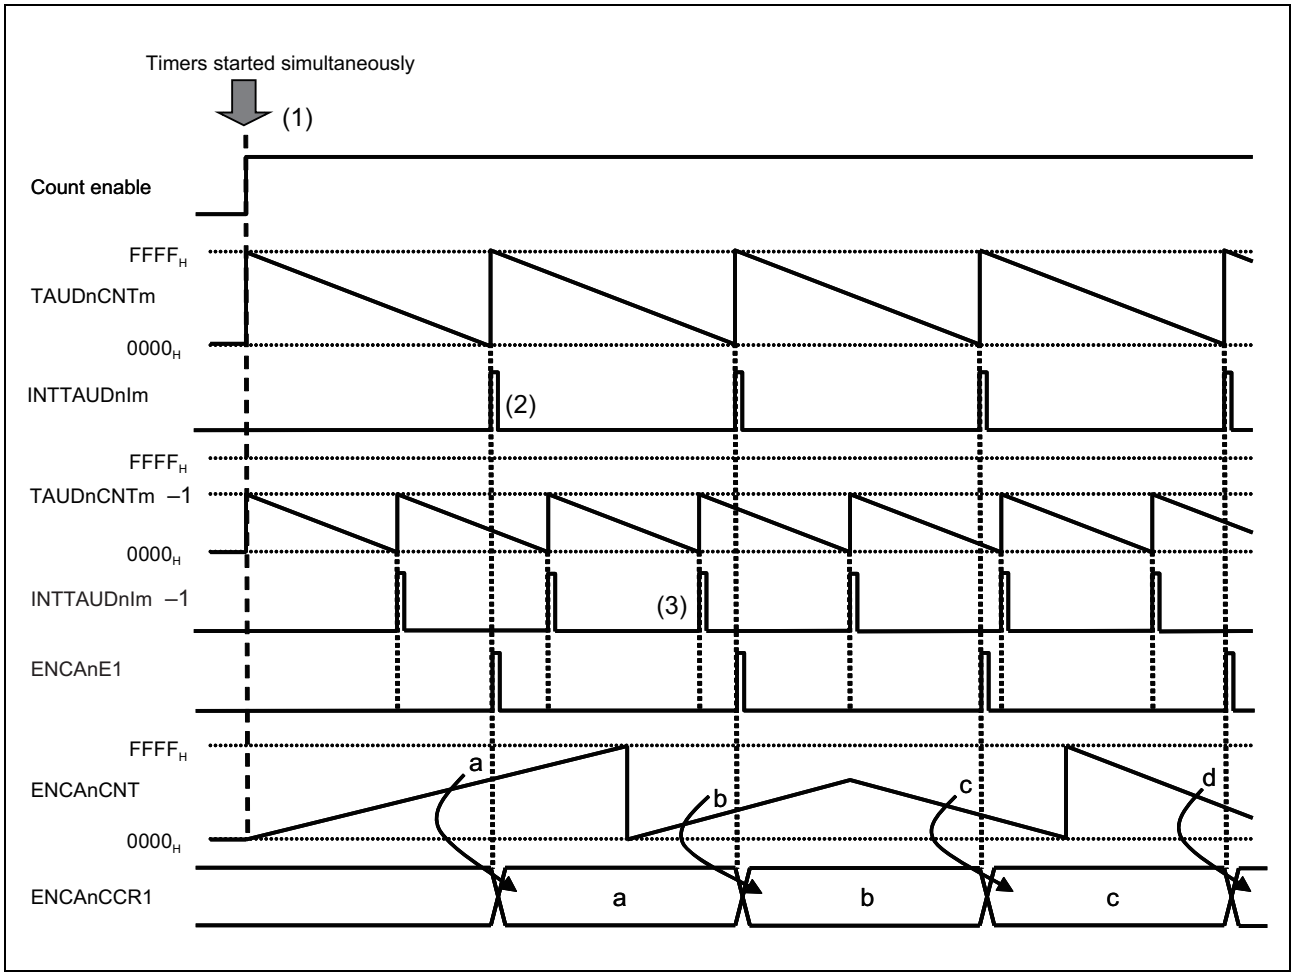

Figure 41.27 Timing Diagram of Encoder Capture Trigger Select Function (INTTAUDnIm)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) On generation of an effective edge of INTTAUDnIm, ENCAn captures ENCAnCNT.

Do not select ENCAn interrupt trigger signal (INTENCATnI1) as the ADCJn trigger described in **Section 41.3.3.1, ADCJ Trigger Select Function**, the correct operation cannot be performed because the following loop occurs: ADCJTTOUTn[j] generation → ENCAn capture operation → INTENCAnI1 generation by capture operation → ADCJTTOUTn[j] generation.

The following figure shows the loop paths of PIC1, PIC2, and ENCAn.

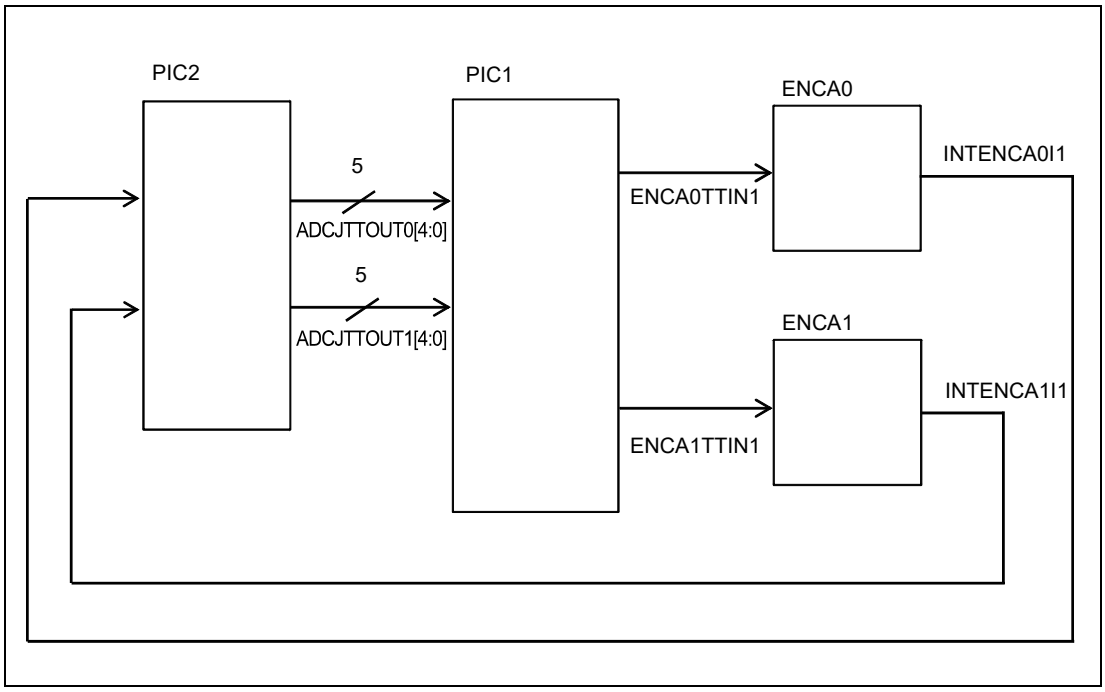

Figure 41.28 Timing Chart of Loop Paths of PIC1, PIC2, and ENCAn

(5) Flow Chart

Select the encoder capture trigger before starting the encoder timer.

ENCAn settings to use this function are as follows.

ENCAnCTL[15:0] = 0000 001x 000x $xxxx_B$

ENCAnIOC0[7:0] = 0000 $01xx_B$

ENCAnIOC1[7:0] = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 40, Encoder Timer A (ENCA)**.

(6) Setting Examples for Operation Functions

This section provides example setting for each register.

The set up example shown in this section describes how to set up capture operation of encoder timer ENCA0 base on the ADCJTTOUT0[4:0] signal. Change the settings depending on the hardware trigger to perform the capture operation.

Table 41.68 ENCAn Setting

Register	Bit Position	Bit Name	Setting Value	Note
ENCAnCTL	15	ENCAnCME	0	Disables compare match interrupt detection masking
	14	ENCAnMCS	0	Selects release trigger for compare match interrupt detection masking
	13 to 10		0	Fixed to 0
	9	ENCAnCRM1	1	Sets the ENCAnCCR1 register for capture operation
	8	ENCAnCRM0	Don't care	Selects the function of ENCAnCCR0 register
	7	ENCAnCTS	0	Selects ENCAnTTIN1 as trigger for capture operation
	6, 5		0	Fixed to 0
	4	ENCAnLDE	Don't care	Enables or disables reload operation when ENCAnCCR0 register underflow occurs
	3	ENCAnECM1	Don't care	Enables or disables clearing of the counter on compare match of ENCAnCCR1 register
	2	ENCAnECM0	Don't care	Enables or disables clearing of the counter on compare match of ENCAnCCR0 register
	1, 0	ENCAnUDS[1:0]	Don't care	Selects the counter up/down control by ENCAnE0 and ENCAnE1
ENCAnIOC0	7 to 4		0	Fixed to 0
	3, 2	ENCAnTIS[3:2]	0*1 1*1	Select the valid edge of capture trigger 1 (ENCAnTTIN1) for the rising edge detection
	1, 0	ENCAnTIS[1:0]	Don't care	Select the valid edge of capture trigger 0 (ENCAnTTIN0)
ENCAnIOC1	7	ENCAnSCE	Don't care	Enables encoder special-clear
	6	ENCAnZCL	Don't care	Selects the clear level (input level) of Z phase for encoder special-clear
	5	ENCAnBCL	Don't care	Selects the clear level (input level) of B phase for encoder special-clear
	4	ENCAnACL	Don't care	Selects the clear level (input level) of A phase for encoder special-clear
	3, 2	ENCAnECS[1:0]	Don't care	Selects encoder clear input (Z phase) edge
	1, 0	ENCAnEIS[1:0]	Don't care	Selects encoder input (A or B phase) edge
PIC1REG30	4	PIC1REG3004	Don't care	Selects ADCJ0 trigger signal of ENCAnTTIN1
	3	PIC1REG3003	Don't care	
	2	PIC1REG3002	Don't care	

Note 1. Change the setting depending on the hardware trigger to perform the capture operation.

NOTE

Bits ENCA0CRM1 and ENCA0CTS in ENCA0CTL are fixed: ENCA0CRM1 = 1 (ENCA0CCR1 register function) and ENCA0CTS = 0 (trigger source of capture to the ENCA0CCR1 register). All the other bits can be set arbitrarily.

41.2.3.8 Two-Phase Encoder Control Function (Control Method 1)

(1) Overview

This function allows switching of the output patterns of the motor control function (TSG3n) in 120-DC mode using the two-phase encoder control function (ENCAn).

(2) Configuration

Switching of output pattern in 120-DC mode by encoder result is realized by using ENCAn and TSG3n, and PIC1 in combination. The following figure describes the block diagram of two-phase encoder control function (control method 1).

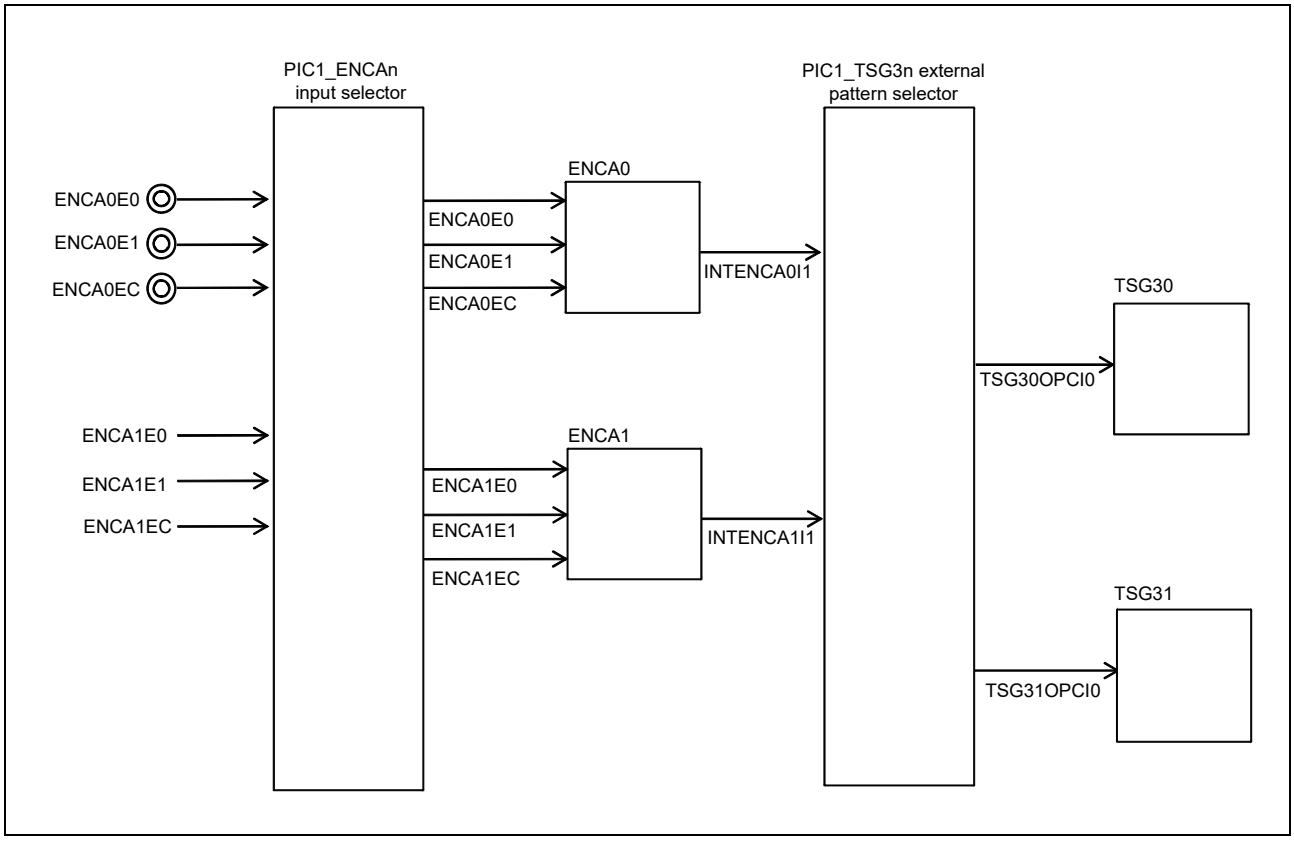

Figure 41.29 Block Diagram of Two-Phase Encoder Control Function (Control Method 1)

The configuration of two-phase encoder control function (control method 1) is described below.

- [PIC1_ENCAn input selector]
  ENCAnE0, ENCAnE1, and ENCAnEC pin inputs are selected and output as ENCAnE0, ENCAnE1, and ENCAnEC.
- [ENCAn]
  INTENCAnI1 is output by two-phase encoder processing.
- [PIC1_TSG3n external pattern selector]
  INTENCAnI1 is selected and output to TSG30OPCI0 or TSG31OPCI0.
- [TSG3n]
  Output pattern in 120-DC mode is switched by TSG3nOPCI0.

(3) Registers

The values of PIC1 registers used in this function are as follows.

PIC1_ENCAn input selector

The register values to output ENCAn pin inputs (ENCAnE0, ENCAnE1, and ENCAnEC) as ENCAnE0, ENCAnE1, and ENCAnEC.

PIC1REG30[22] = 0_B

PIC1REG30[20:19] = 00_B

PIC1REG30[17:16] = 00_B

PIC1REG30[11:6] = 000000_B

PIC1REG30[1:0] = 00_B

PIC1_TSG3n external pattern selection

The register values to select the interrupt signal to be input as TSG30 external pattern.

Register Values				
PIC1REG50				
10	8	6	5	TSG30OPCI0
X	0	0	1	INTENCA0I1
0	X	1	0	INTENCA1I1

Note: Do not set the values other than those listed above for this function.

The register values to select the interrupt signal to be input as TSG31 external pattern.

Register Values				
PIC1REG51				
10	8	6	5	TSG31OPCI0
X	0	0	1	INTENCA0I1
0	X	1	0	INTENCA1I1

Note: Do not set the values other than those listed above for this function.

(4) Function

Details of this function are described using the two-phase encoder control function (method 1) at up count (normal rotation) as an example.

The following figure shows the timing diagram.

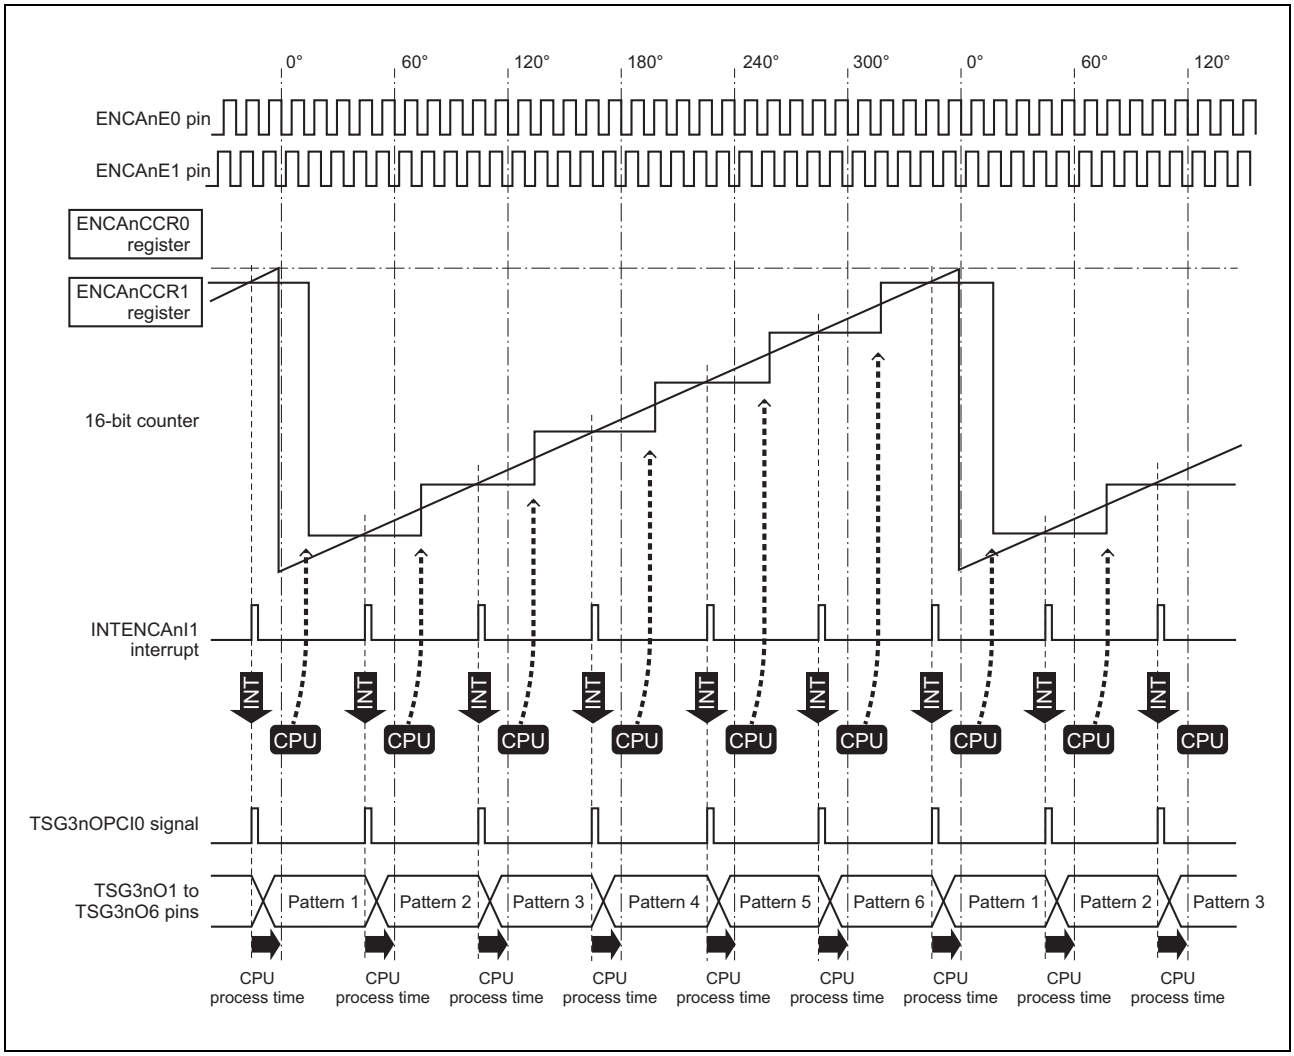

Figure 41.30 Timing Diagram of Two-Phase Encoder Control Function (Control Method 1) at Up Count (Normal Rotation)

(1) The encoder counter value matches the ENCAnCCR1, INTENCAnI1 is generated, and the set pattern is output from the TSG3nO1 to TSG3nO6 pins.

(2) CPU calculates the next timing to switch output patterns by an interrupt processing and sets the value to ENCAnCCR1.

(3) Upon a match of the encoder counter value and ENCAnCCR0, the encoder counter is cleared.

CAUTION

It is necessary to set ENCAnCCR1 at each pattern switch (each INTENCAnI1 interrupt). It is necessary to match the initial output pattern of timer TSG3n to the set value of ENCAnCCR1 before starting, because this value is not cleared by the encoder clear input.

Switching between normal and reverse rotations of output patterns is set with the TSG3nPSC bit of the TSG3nOPT0 register.

The following figure shows the timing diagram at down count (reverse rotation).

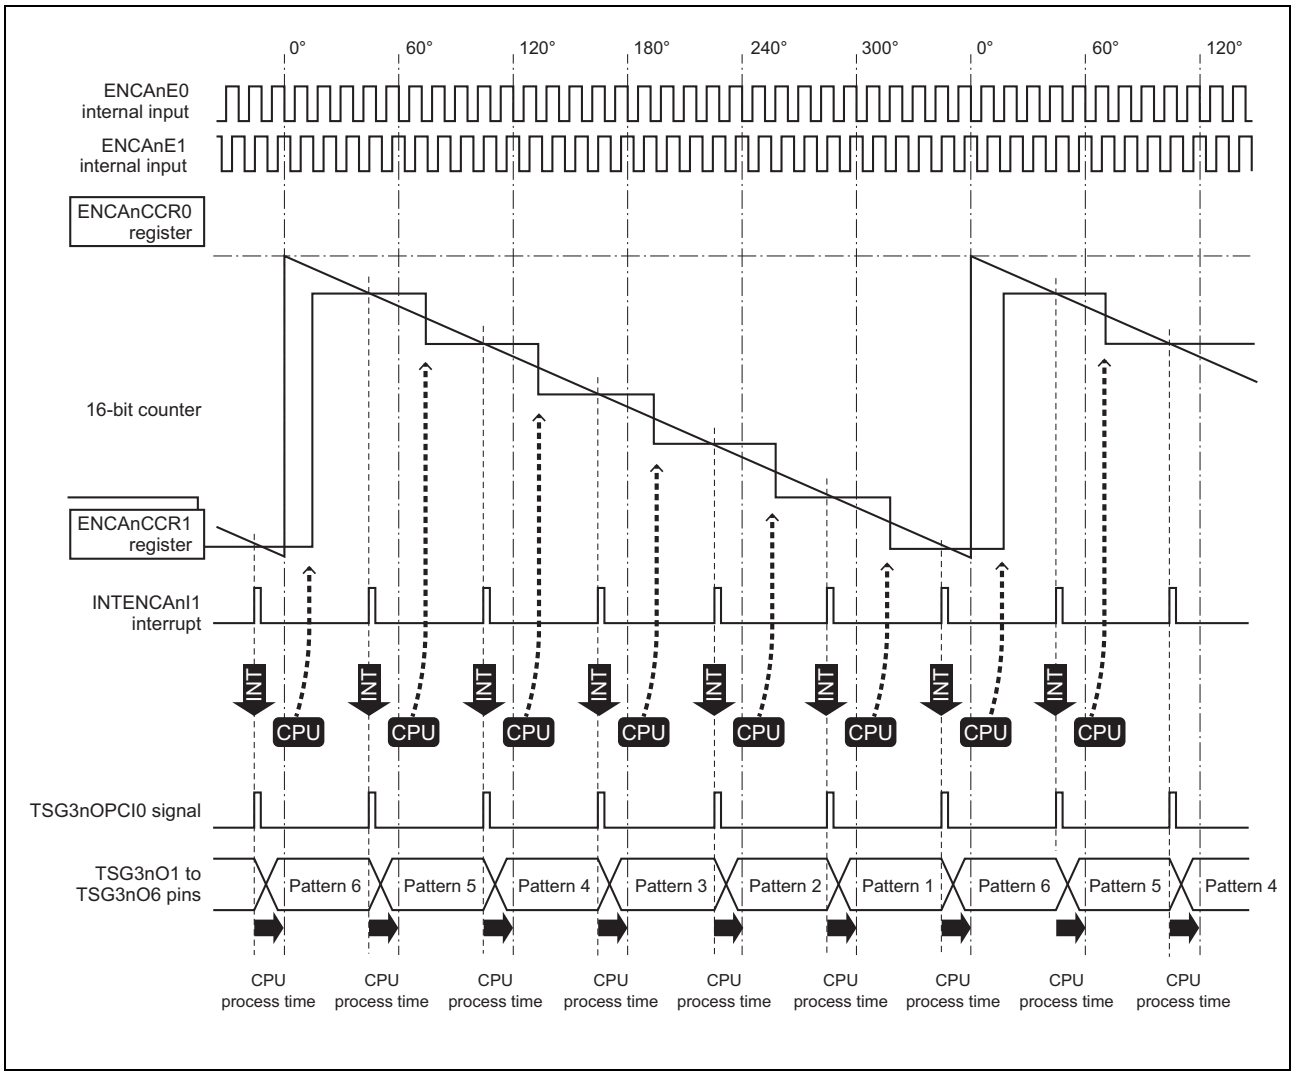

Figure 41.31 Timing Diagram of Two-Phase Encoder Control Function (Control Method 1) at Down Count (Reverse Rotation)

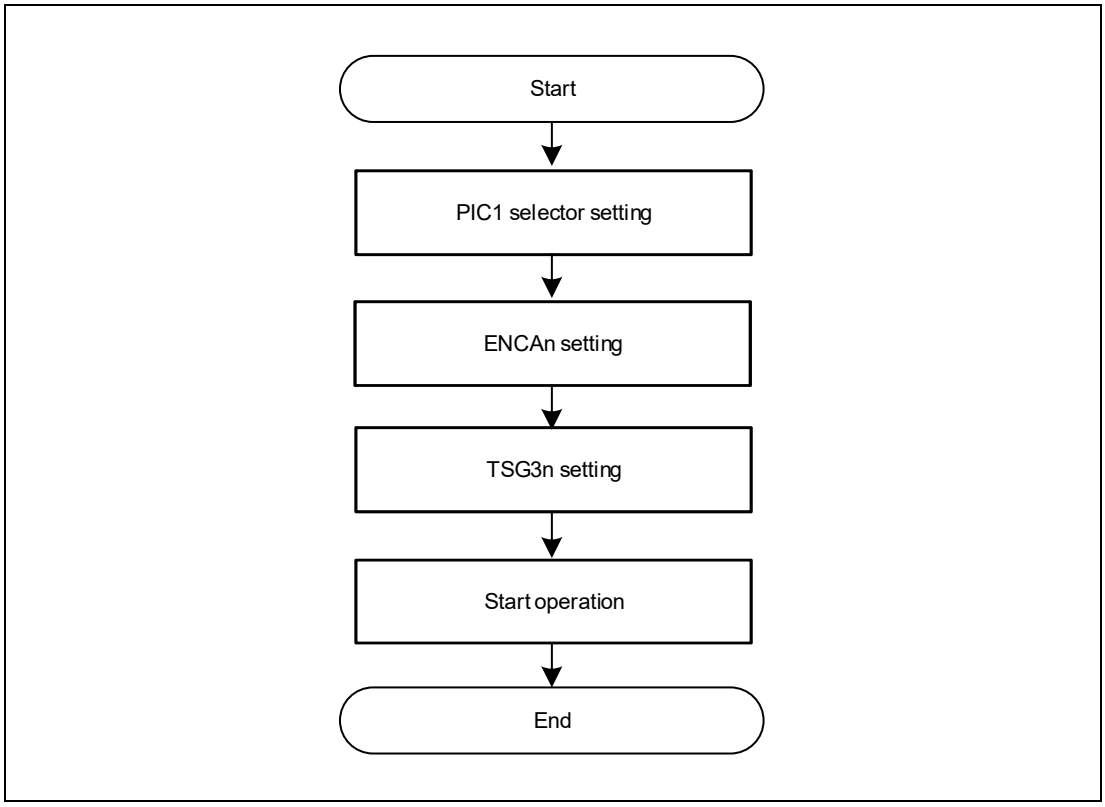
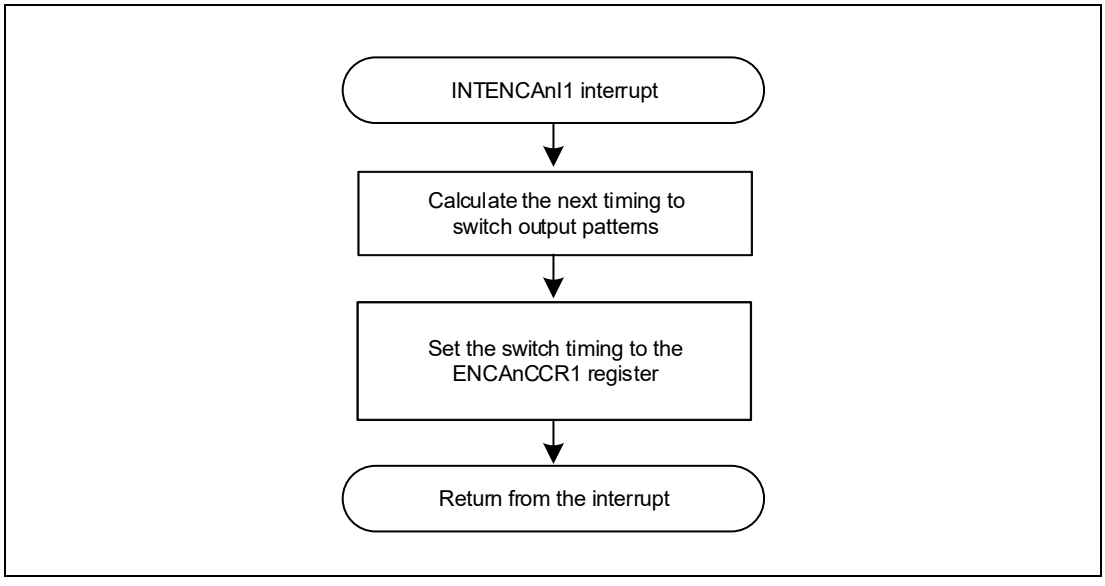
(5) Flow Chart

The following figure shows the setting flow of this function.



The following figure shows the flow chart after interrupt processing.



The values of ENCAn registers used in this function are as follows.

ENCAnCTL[15:0] = 1000 0000 000x 01xx_B

ENCAnIOC1[7:0] = 0000 00xx_B

ENCAnCCR0= (set any value)

ENCAnCCR1= (set any value)

ENCAnCNT= (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 40, Encoder Timer A (ENCA)**.

The values of TSG3n registers used in this function are as follows.

TSG3nCTL0[7:0] = 000x 0011_B

TSG3nCTL3[7:0] = 0000 00xx_B

TSG3nCTL4[15:0] = 0000 0001 xxx0 0000_B

TSG3nIOC0[7:0] = 0111 1110_B

TSG3nIOC2[15:0] = 0xxx xxx0 0000 0000_B

TSG3nOPT0[7:0] = 0011 1xx0_B

TSG3nOPT1[7:0] = 0000 0xxx$_B$

TSG3nCMP0 = (set any value)

TSG3nCMP1W,5W,9W = (set any value)

TSG3nCMP1,5,9 = (set any value)

TSG3nPAT0W,1W = (set any value)

TSG3nDTC0W,1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 35, Motor Control Timer (TSG3)**.

41.2.3.9 Two-Phase Encoder Control Function (Control Method 2)

(1) Overview

This function allows switching the phase lead and phase lag control of the motor control function (TSG3n) output patterns in 120-DC mode using the two-phase encoder control function (ENCAn).

(2) Configuration

The same configuration as the **Section 41.2.3.8, Two-Phase Encoder Control Function (Control Method 1)** applies to this function. See **(2) Configuration** of **Section 41.2.3.8, Two-Phase Encoder Control Function (Control Method 1)**.

(3) Registers

The same register values as the **Section 41.2.3.8, Two-Phase Encoder Control Function (Control Method 1)** applies to this function. See **(3) Registers** in **Section 41.2.3.8, Two-Phase Encoder Control Function (Control Method 1)**.

(4) Function

Details of this function are described using **Section 41.2.3.9, Two-Phase Encoder Control Function (Control Method 2)** with phase lead (normal rotation) as an example.

The following figure shows the timing diagram.

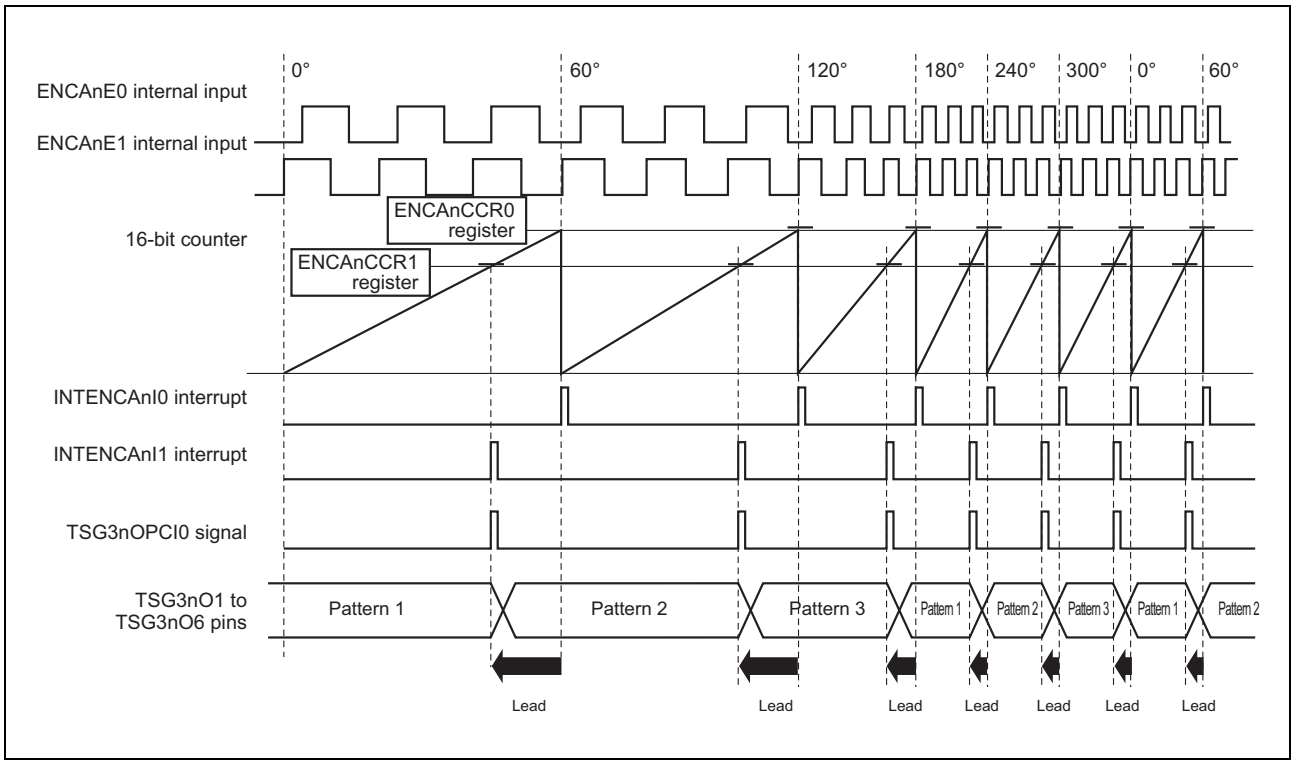


Figure 41.32 Timing Diagram of Two-Phase Encoder Control Function (Method 2) with Phase Lead (Normal Rotation)

(1) Upon a match of the encoder counter value and ENCAnCCR1 (corresponds to the output pattern switch position for TSG3n), INTENCAnI1 is generated, and the set pattern is output from the TSG3nO1 to 6 pins.

(2) Upon a match of the encoder counter value and ENCAnCCR0 (corresponds to the phase lead or lag of the switch position), INTENCAnI0 is generated and the encoder counter is cleared.

CAUTION

It is necessary to set ENCAnCCR1 at each pattern switch (each INTENCAnI1 interrupt). It is necessary to match the initial output pattern of timer TSG3n to the set value of ENCAnCCR0 before starting, because this value is not cleared by the encoder clear input.

Switching between normal and reverse rotations of output patterns is set with the TSG3nPSC bit of the TSG3nOPT0 register.

The following figure shows the timing diagram with phase lag (normal rotation).

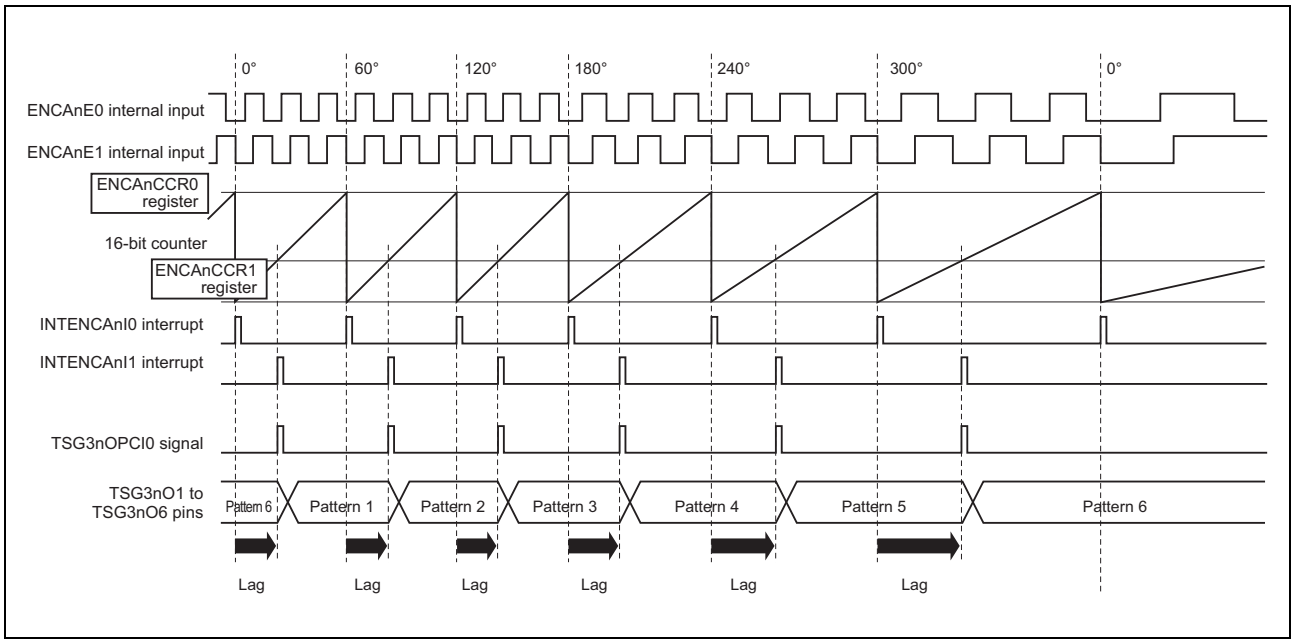

Figure 41.33 Timing Diagram of Two-Phase Encoder Control Function (Method 2) with Phase Lag (Normal Rotation)

By setting greater value to ENCAnCCR1 than that of ENCAnCCR0, TSG3n output pattern phase can be made to lag.

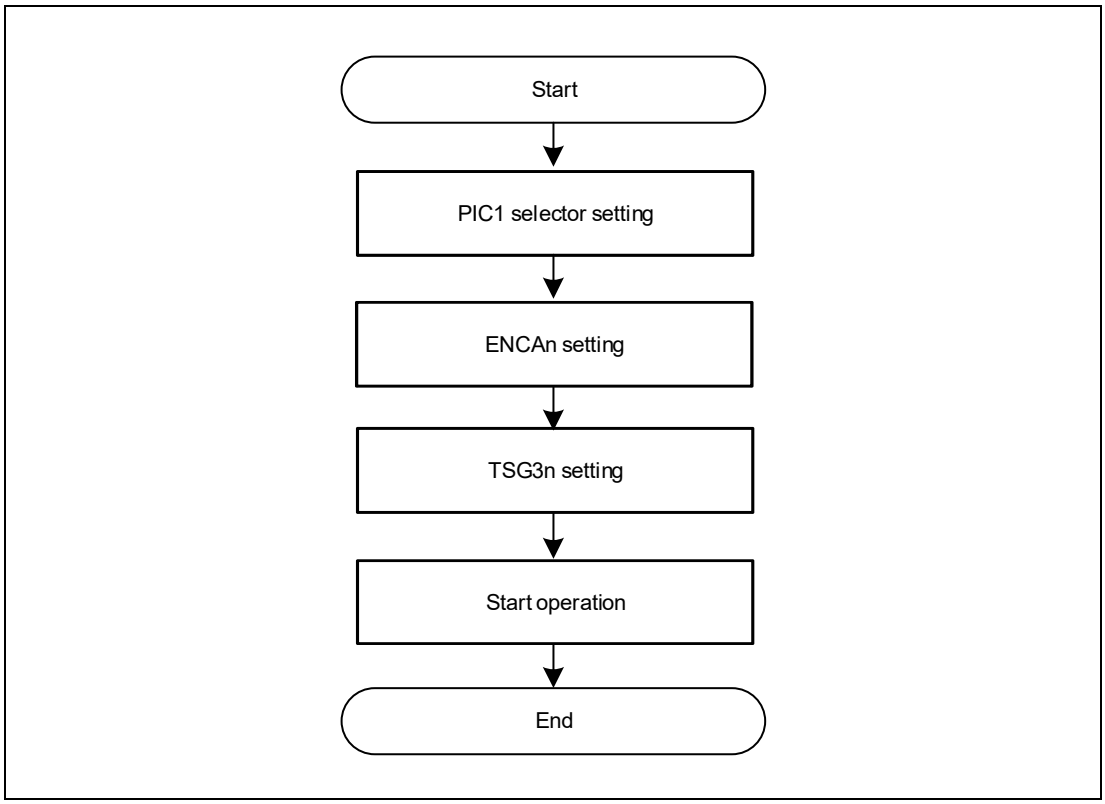
NOTE

This function can be used for phase lead and phase lag control both at up count and down count.

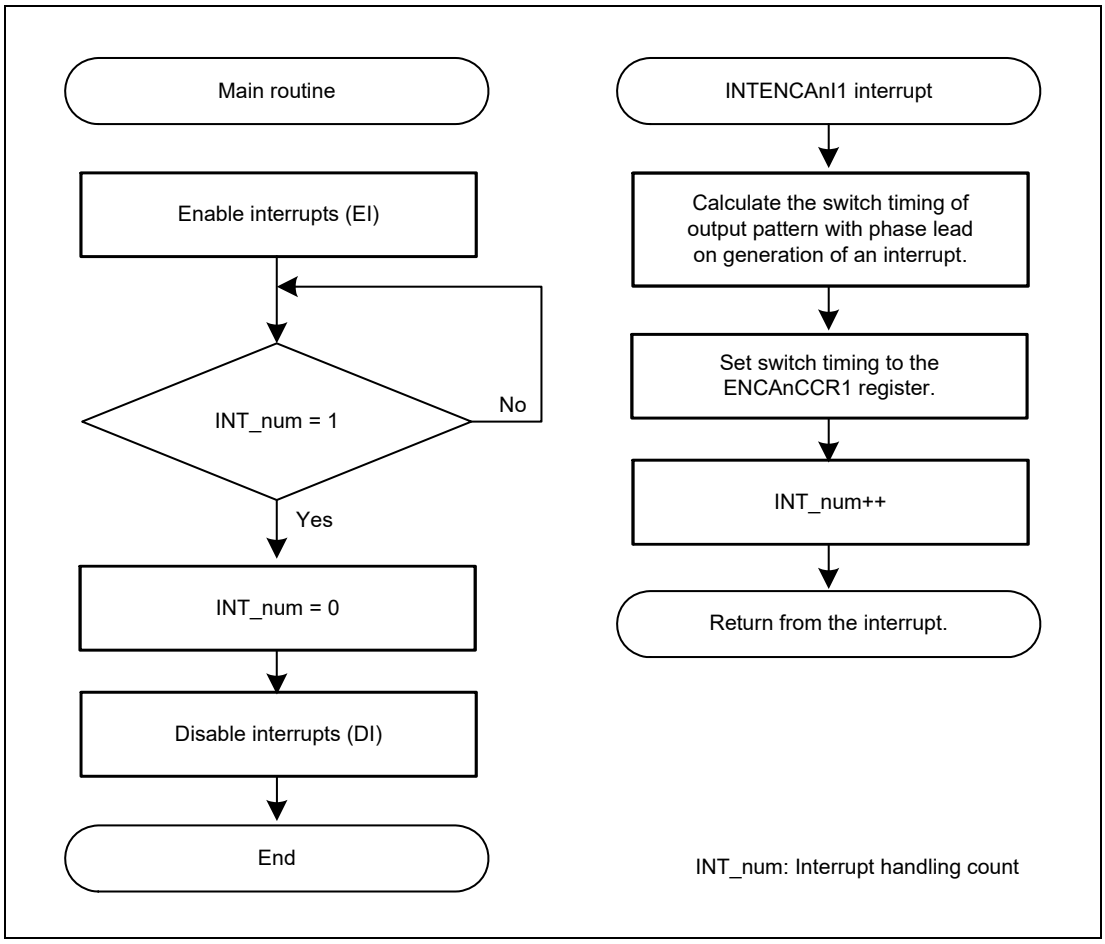
(5) Flow Chart

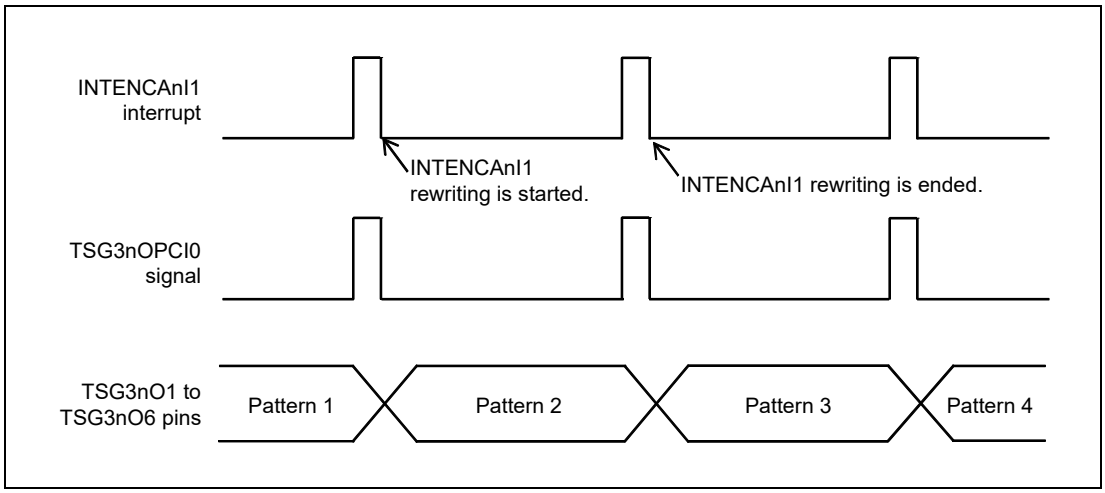
The flow charts for this function are shown below.

Flow chart of main routine.

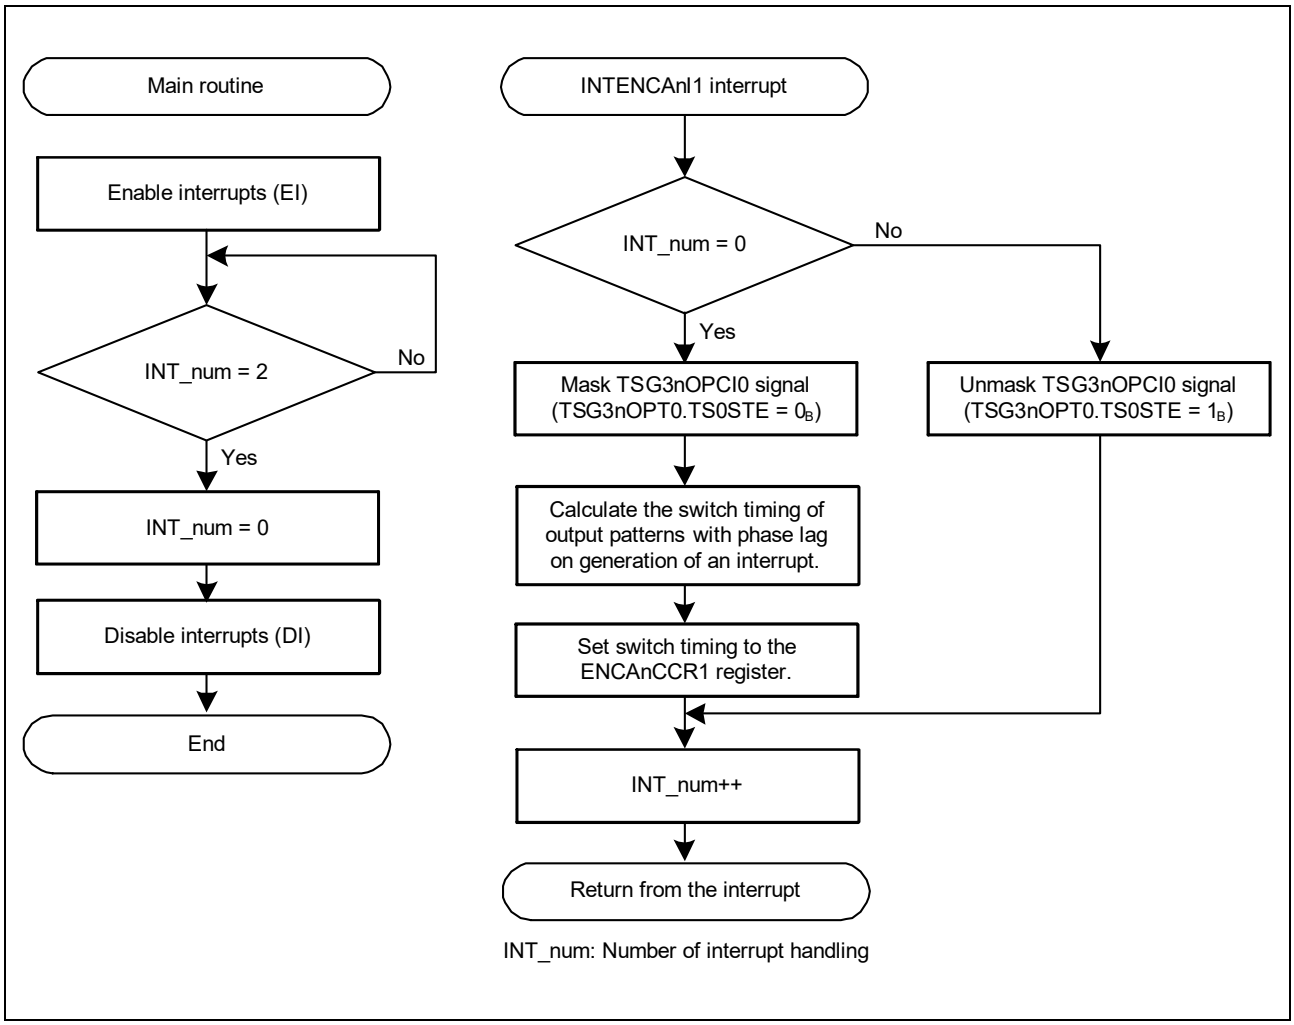


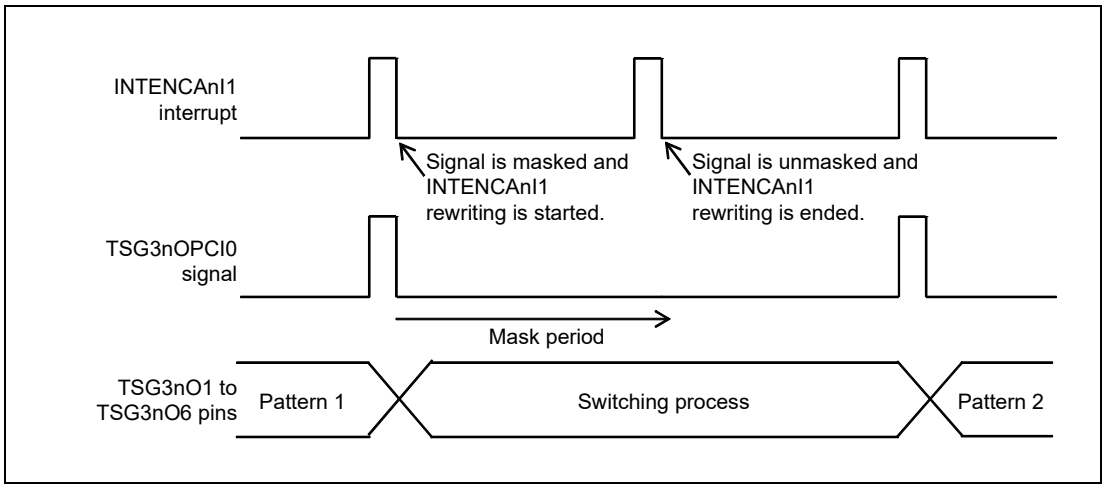
Flow chart of ENCAnCCR1 rewrite processing with phase lead.





Flow chart of ENCAnCCR1 rewrite processing with phase lag.





The register settings for ENCAn to use this function are as follows.

ENCAnCTL[15:0] = 1000 0000 000x $01xx_B$

ENCAnIOC1[7:0] = 0000 $00xx_B$

ENCAnCCR0 = (set any value)

ENCAnCCR1 = (set any value)

ENCAnCNT = (set any value)

"x" can be set arbitrarily. For the registers specifications, **Section 40, Encoder Timer A (ENCA)**.

The register settings for TSG3n to use this function are as follows.

TSG3nCTL0[7:0] = 000x 0011_B

TSG3nCTL3[7:0] =0000 $00xx_B$

TSG3nCTL4[15:0] = 0000 0001 xxx0 0000_B

TSG3nIOC0[7:0] = 0111 1110_B

TSG3nIOC2[15:0] = 0xxx xxx0 0000 0000_B

TSG3nOPT0[7:0] = 0011 $1xx0_B$

TSG3nOPT1[7:0] = 0000 $0xxx_B$

TSG3nCMP0 = (set any value)

TSG3nCMP1W, 5W, 9W = (set any value)

TSG3nCMP1, 5, 9 = (set any value)

TSG3nPAT0W, 1W = (set any value)

TSG3nDTC0W, 1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, **Section 35, Motor Control Timer (TSG3)**.

41.2.3.10 Three-Phase Pulse Input Control Function

(1) Overview

This function allows variable phase control of TSG3n pattern output in 120-DC mode using TSG3n and TAUDn.

The following diagram shows the method of three-phase pulse input control.

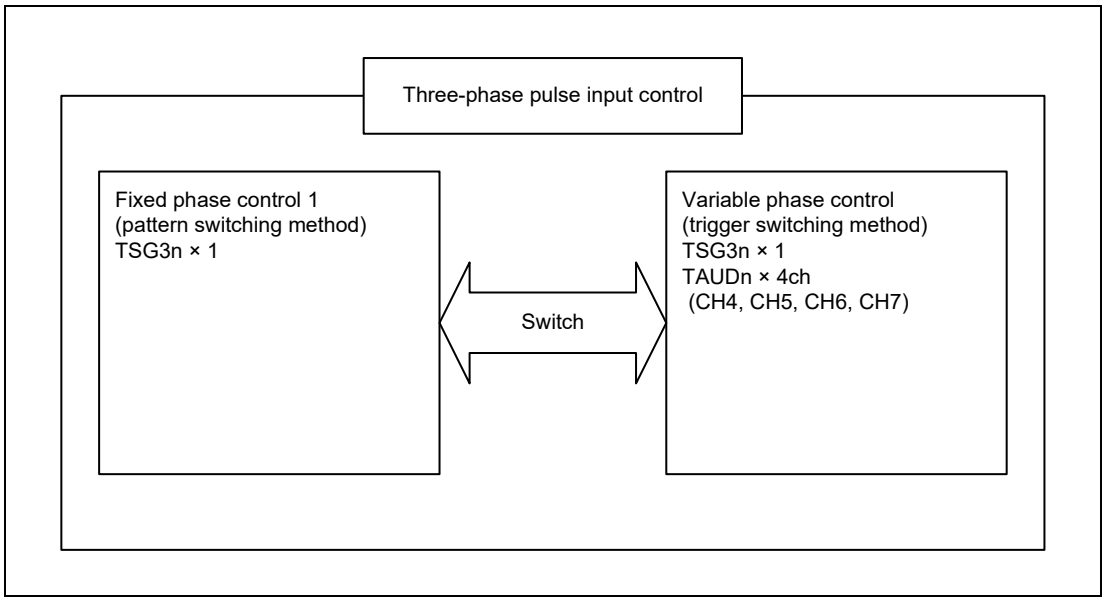


Figure 41.34 Control Method of Three-Phase Pulse Input Control Function

Control Method	Function
Fixed phase control 1 (pattern switching method)	Outputs a fixed pattern at constant rotation angle.
Variable phase control (trigger switching method)	Varies the phase by arbitrary angle (or time) up to ±60 degrees with reference to the rotation angle and outputs the pattern.

(2) Configuration

Three-phase pulse input control function is realized by using three-phase pulse input and TAUDn offset trigger mode, and PIC1 in combination.

The following figure shows the block diagram of three-phase pulse input control function.

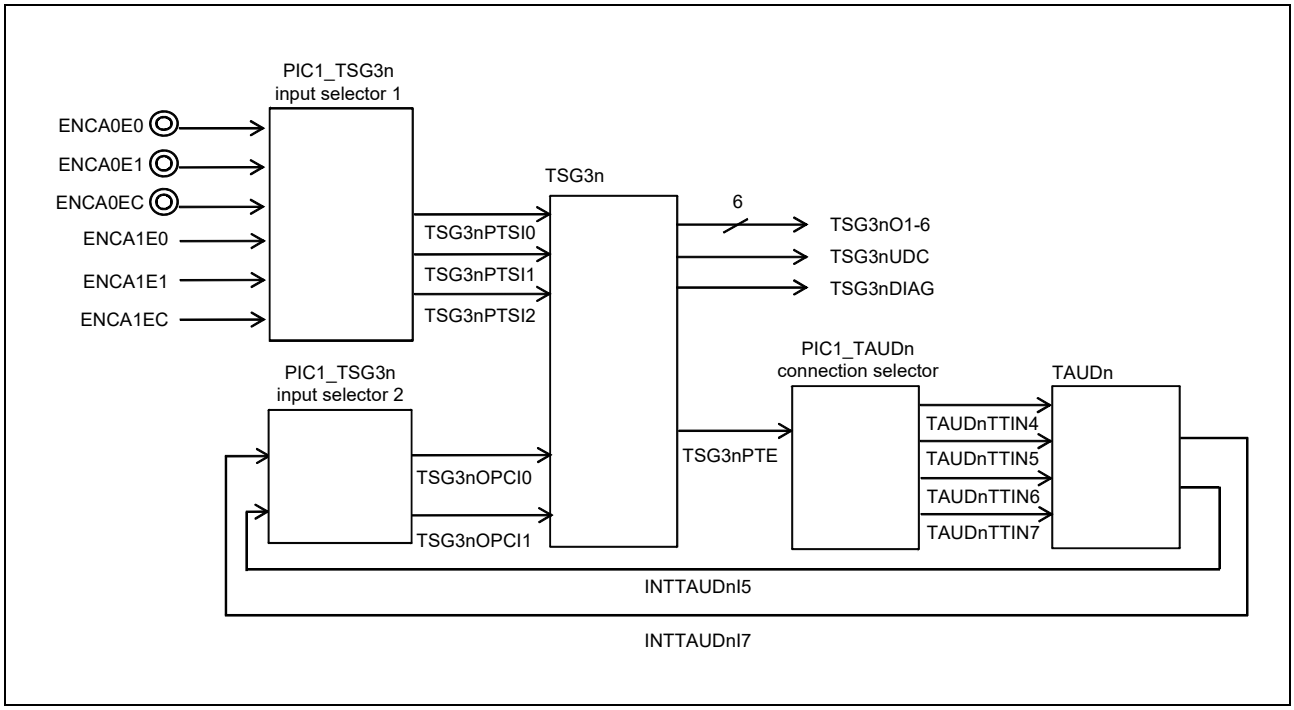

Figure 41.35 Block Diagram of Three-Phase Pulse Input Control

The configuration of this function is described below.

- [PIC1_TSG3n input selector 1]
  ENCAnE0, ENCAnE1, and ENCAnEC pin inputs are selected and output to TSG3nPTSI0 to TSG3nPTSI2.
- [TSG3n]
  Patterns set in TSG3nO1 to TSG3nO6 are output in response to the input of TSG3nPTSI0 to TSG3nPTSI2 signals. TSG3nPTE is toggled each time the output patterns are switched.
- [PIC1_TAUDn connection selector]
  TSG3nPTE input is selected and output to TAUDnTTIN4 to TAUDnTTIN7.
- [TAUDn]
  Interrupt signals INTTAUDnI5 and INTTAUDnI7 for output pattern phase generation are output with the offset trigger mode.
- [PIC1_TSG3n input selector 2]
  INTTAUDnI5 and INTTAUDnI7 inputs are selected and output as TSG3nOPCI0 and TSG3nOPCI1.

(3) Registers

Block diagram of PIC1 is shown in the following figure.

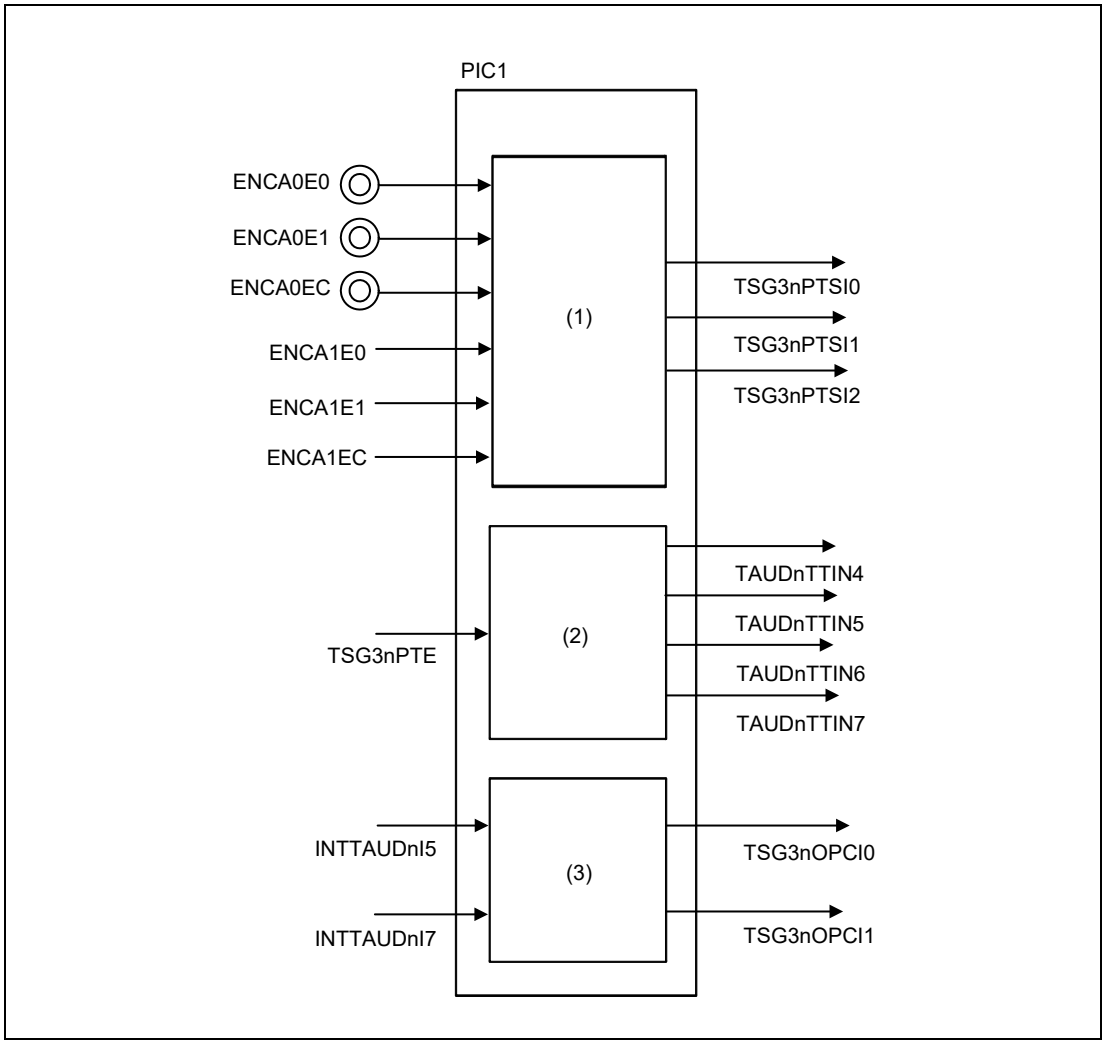

Figure 41.36 Block Diagram of PIC1

The values of PIC1 registers used in this function are as follows.

Unit (1): PIC1_TSG3n input selector 1

The values to output ENCA0E0, ENCA0E1, and ENCA0EC as TSG30PTSI0 to TSG30PTSI2

PIC1TSGHALLSEL[0] = 1_B

PIC1REG50[0] = 0_B

The values to output ENCA1E0, ENCA1E1, and ENCA1EC as TSG31PTSI0 to TSG31PTSI2

PIC1TSGHALLSEL[1] = 1_B

PIC1REG51[0] = 1_B

Unit (2): PIC1_TAUDn connection selector

The values to output TSG3nPTE to TAUDnTTIN4 to TAUDnTTIN7.

PIC1REG2n0[11:8] =1010_B

PIC1REG2n0[3:0] = 1111_B

PIC1TAUDnSEL[15:8] = 00_H

Unit (3): PIC1_ENCAn input selector 2

The values to output INTTAUDnI5 and INTTAUDnI7 to TSG3nOPCI0 and TSG3nOPCI1.

PIC1REG5n[7:5] = 011_B

(4) Function

Details of the three-phase pulse input control function are described here.

The following figure shows the timing diagram.

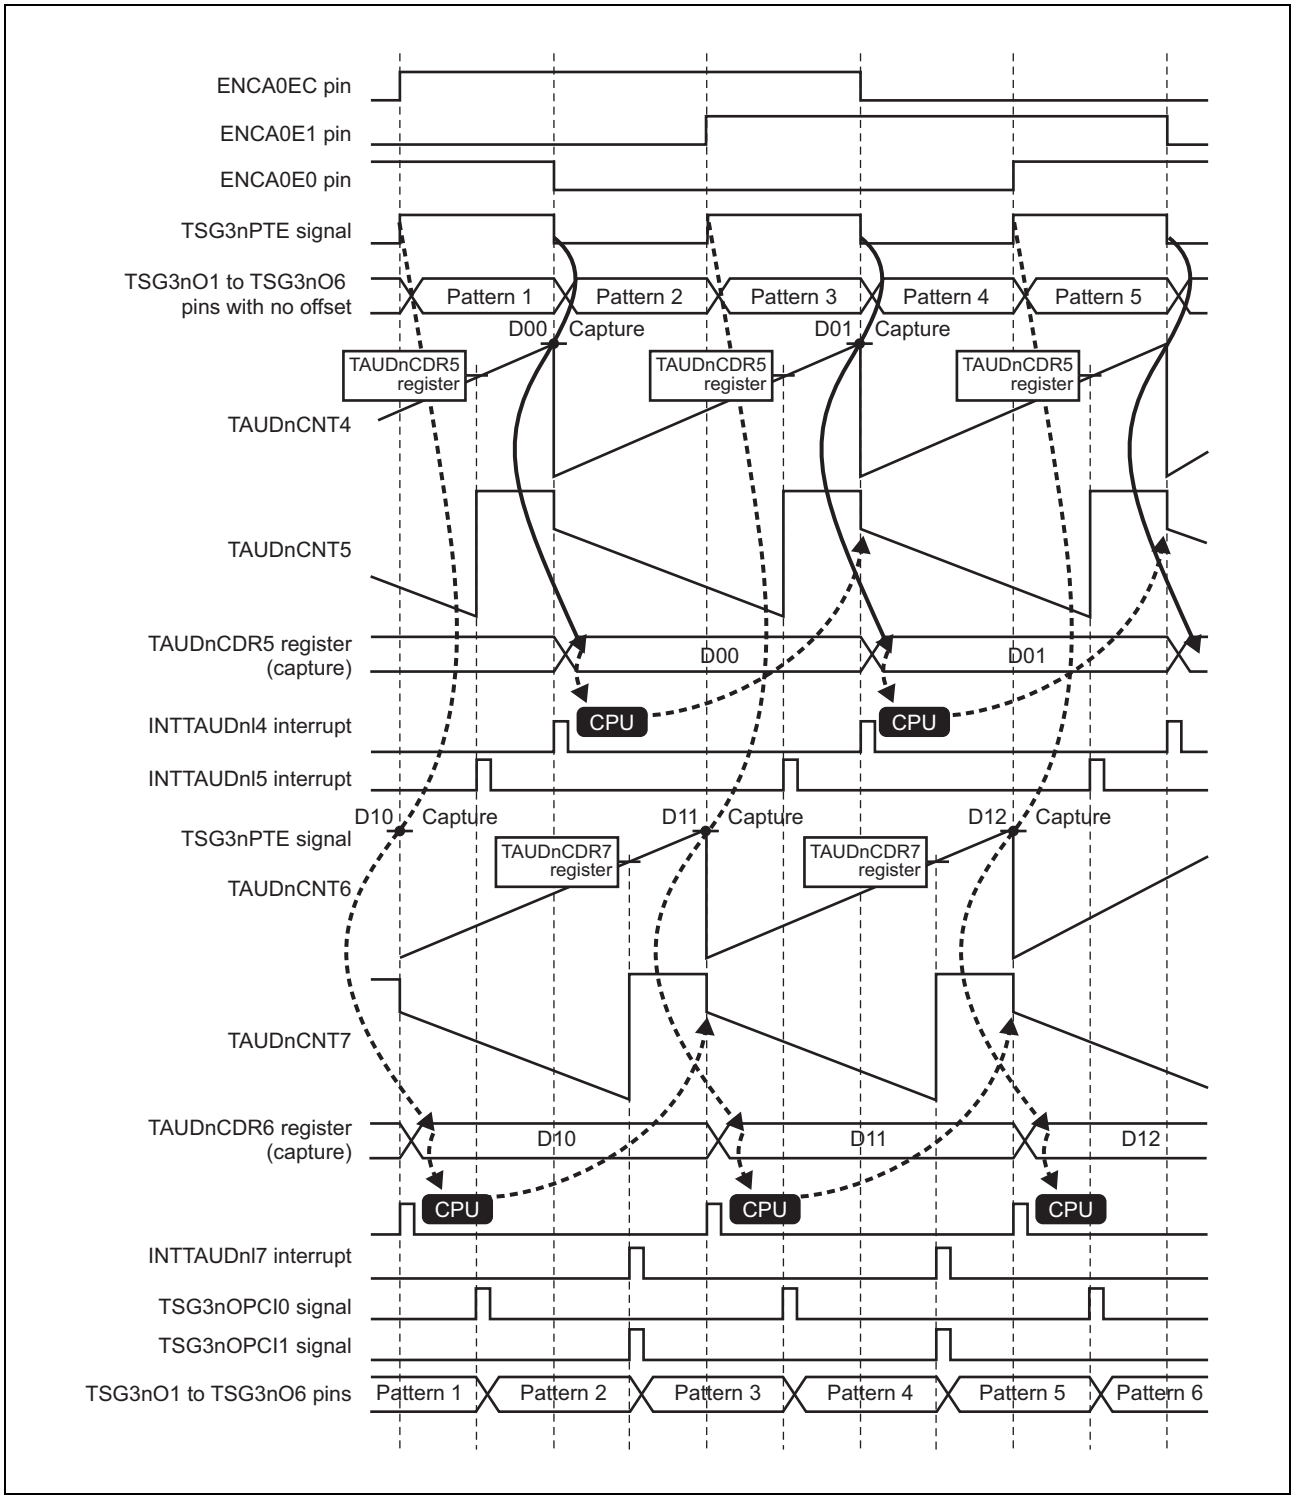

Figure 41.37 Three-Phase Pulse Input Control Function

(1) The output patterns are switched by the TSG pattern switching method on detection of ENCAn pin signal. The TSG3nPTE signal toggles each time the patterns are switched.

(2) TAUDnCNT6 and TAUDnCNT4 are captured at the rising edge and falling edge of the TSG3nPTE signal. The interval to switch patterns is calculated according to the captured value.

(3) CPU calculates the phase of the next output pattern and set the values to TAUDnCNT5 and TAUDnCNT7. The signals corresponding to the values are output as TSG3nOPCI0 and

TSG3nOPCI1. At this time, the patterns delayed for the set phase are output by switching the output patterns by the trigger switching method.

The following table lists the relation between the value set to TAUDnCNTm and the captured value in TAUDnCDR (n = 0, 1) (m = 5, 7).

TAUDnCNTm Register Setting	TSG3n Pattern Output Switch Timing
TAUDnCNTm = 0000_H	The patterns are switched on detection of an edge of TSG3nPTE signal with a delay of up to one cycle of the clock signal being counted by TAUDn is generated.
TAUDnCNTm = Captured value	The patterns are switched on detection of an edge of TSG3nPTE signal.
TAUDnCNTm < Captured value	The patterns are switched on the timing after the phase delayed from detection of an edge of TSG3nPTE signal.
TAUDnCNTm > Captured value	Setting prohibited

An example of switch operation from fixed phase control 1 to variable phase control

The following figure shows an example of switch operation from fixed phase control 1 to variable phase control.

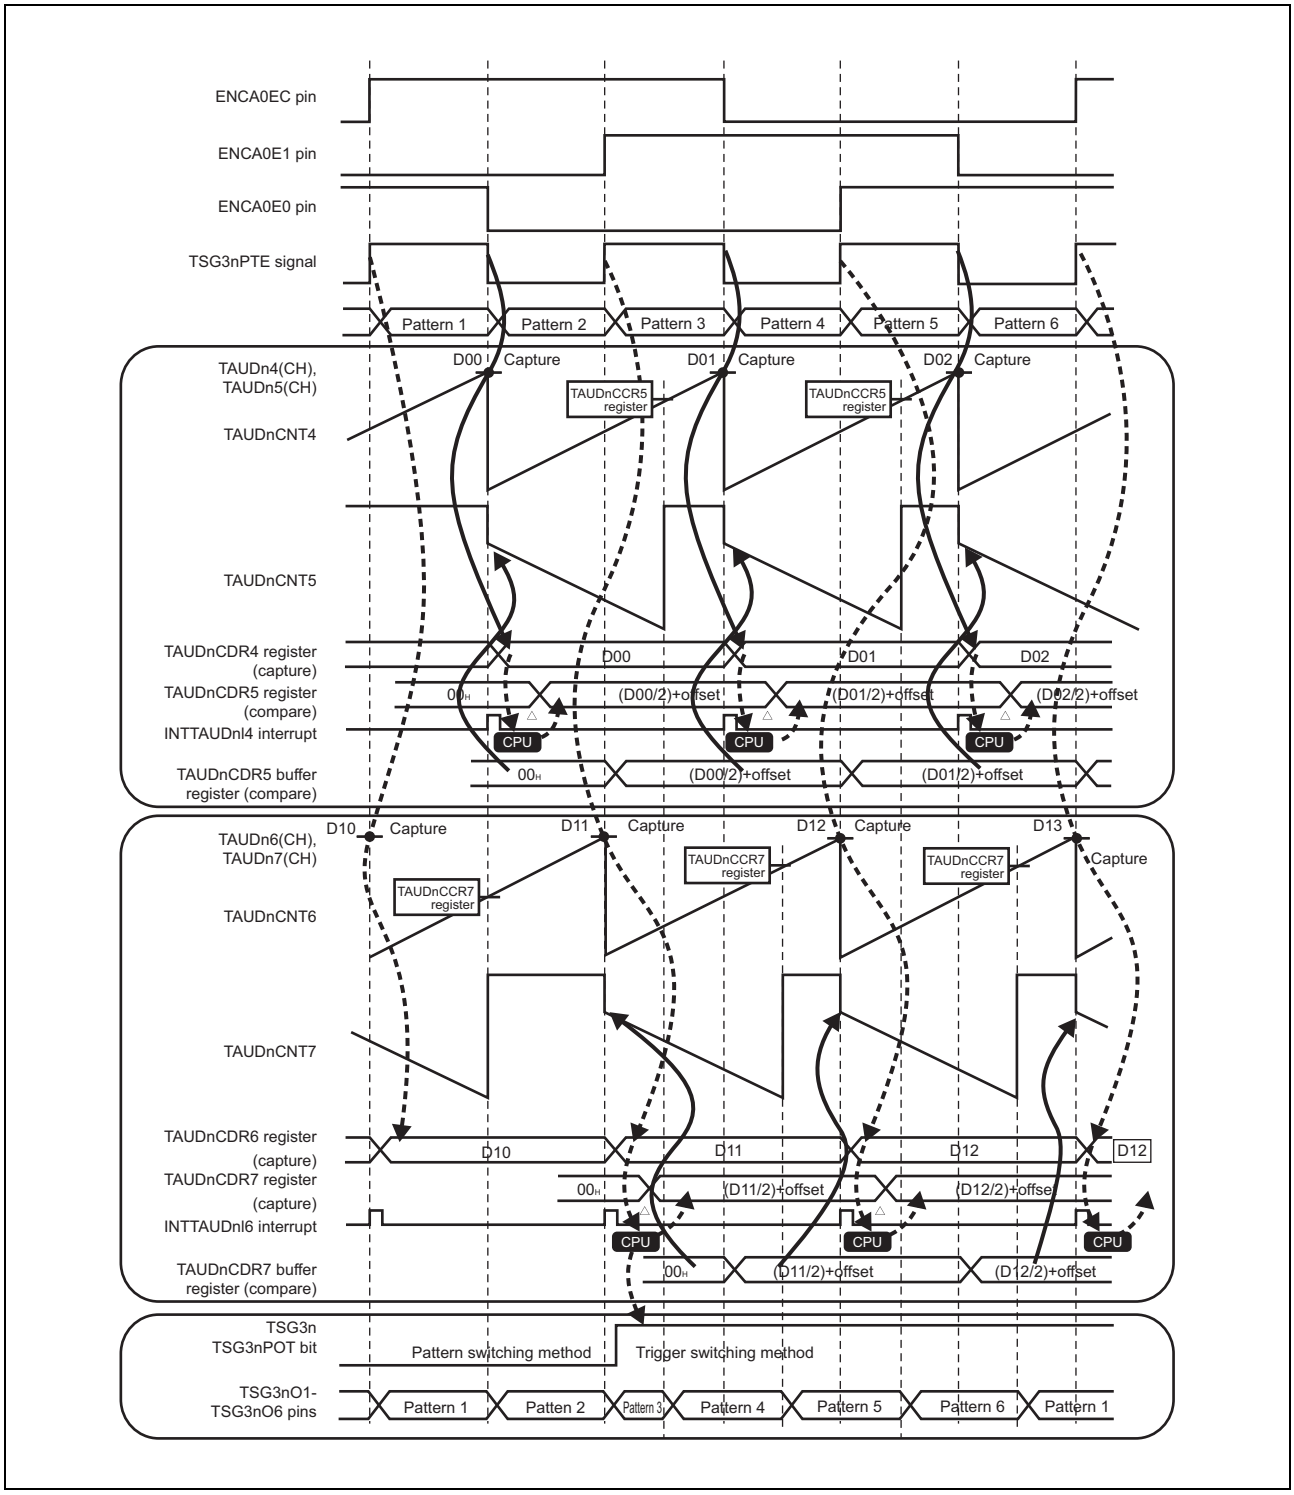

Figure 41.38 An Example of Switch Operation from Fixed Phase Control 1 to Variable Phase Control

By changing the TSG3nPOT bit from low level to high level, the output pattern switching method is changed to the trigger switching method, and the variable phase control is enabled.

An example of switch operation from variable phase control to fixed phase control 1

The following figure shows an example of switch operation from variable phase control to fixed phase control 1.

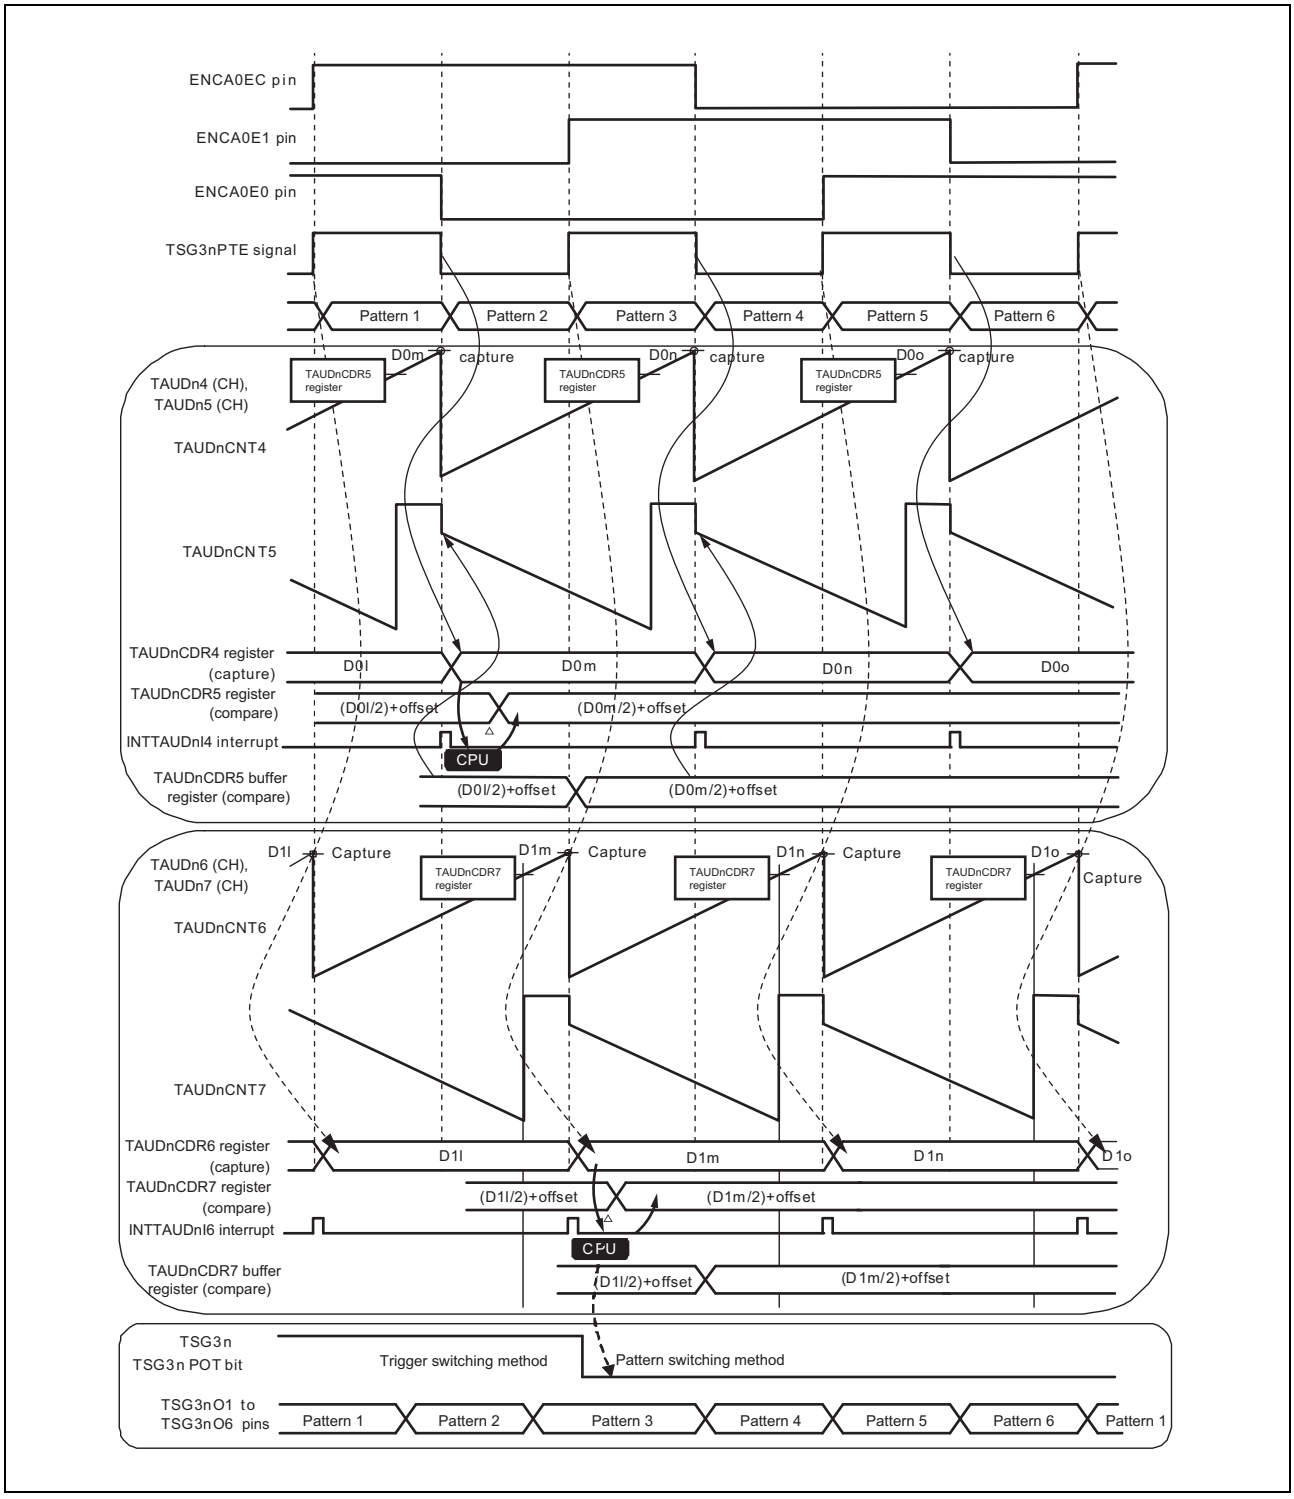

Figure 41.39 Example of Switch Operation from Variable Phase Control to Fixed Phase Control 1

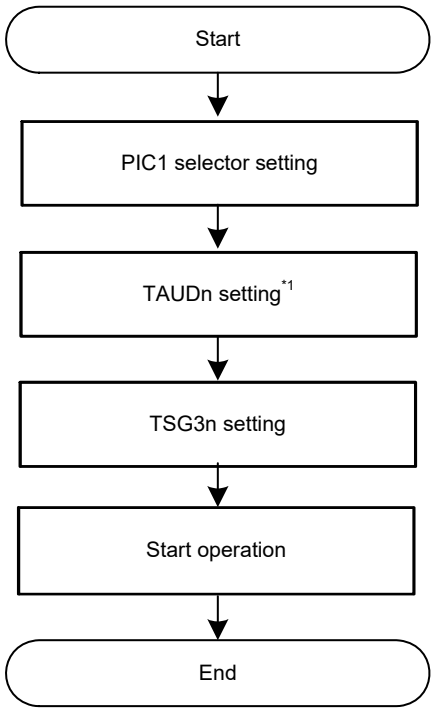
By changing the TSG3nPOT bit from high level to low level, the output pattern switching method is changed to the pattern switching method, and the fixed phase control 1 is enabled.

(5) Flow Chart

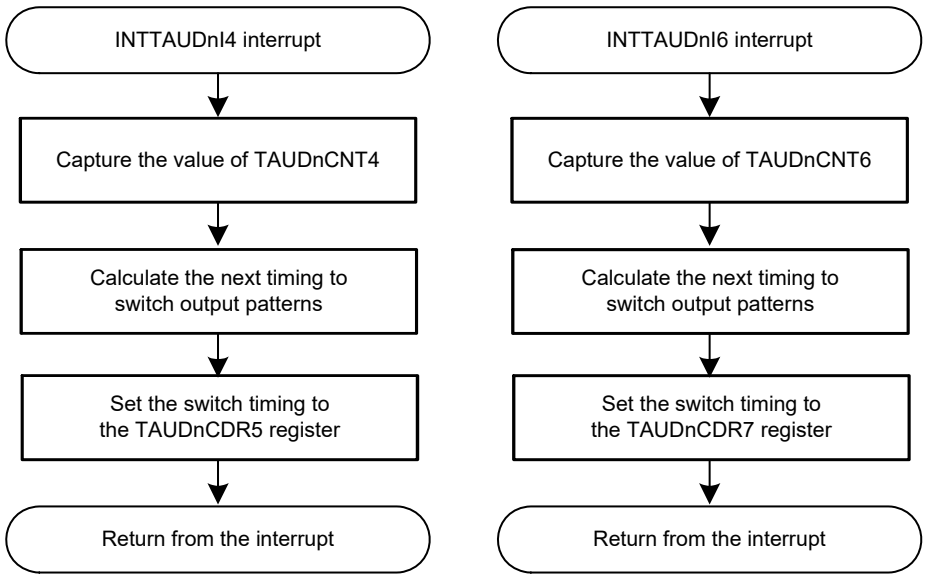
The flow charts for this function are shown below.

Flow chart of main routine



Note 1. For the settings of TAUDn, see **Section 33.15.5, Offset Trigger Output Function**.

Flow chart for rewriting of TAUDnCDR5 and TAUDnCDR7 during operation



Note: For the settings of TAUDn, see **Section 33.15.5, Offset Trigger Output Function**.

The values of TSG3n registers used in this function are as follows.

TSG3nCTL0[7:0] = $0000\ 0011_B$

TSG3nCTL3[7:0] = $0000\ 00xx_B$

TSG3nCTL4[15:0] = $0000\ 0001\ xxx0\ 0000_B$

TSG3nIOC0[7:0] = $0111\ 1110_B$

TSG3nIOC1[7:0] = $0001\ xxxx_B$

TSG3nIOC2[15:0] = $0xxx\ xxx0\ 0000\ 0000_B$

TSG3nOPT0[7:0] = $0011\ 1xx0_B$

TSG3nOPT1[7:0] = $0000\ 0xxx_B$

TSG3nCMP0 = (set any value)

TSG3nCMP1W,5W,9W = (set any value)

TSG3nCMP1,5,9 = (set any value)

TSG3nPAT0W,1W = (set any value)

TSG3nDTC0W,1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 35, Motor Control Timer (TSG3)**.

41.2.3.11 Three-Phase Encoder Control Function

(1) Overview

The function allows three-phase external pattern inputs (TSG3nPTSI0 to TSG3nPTSI2) to be encoded using ENCAn

(2) Configuration

The three-phase encoder control function is realized by using TSG3n, ENCAn, and PIC1 in combination. The following figure shows the block diagram of three-phase encoder control function.

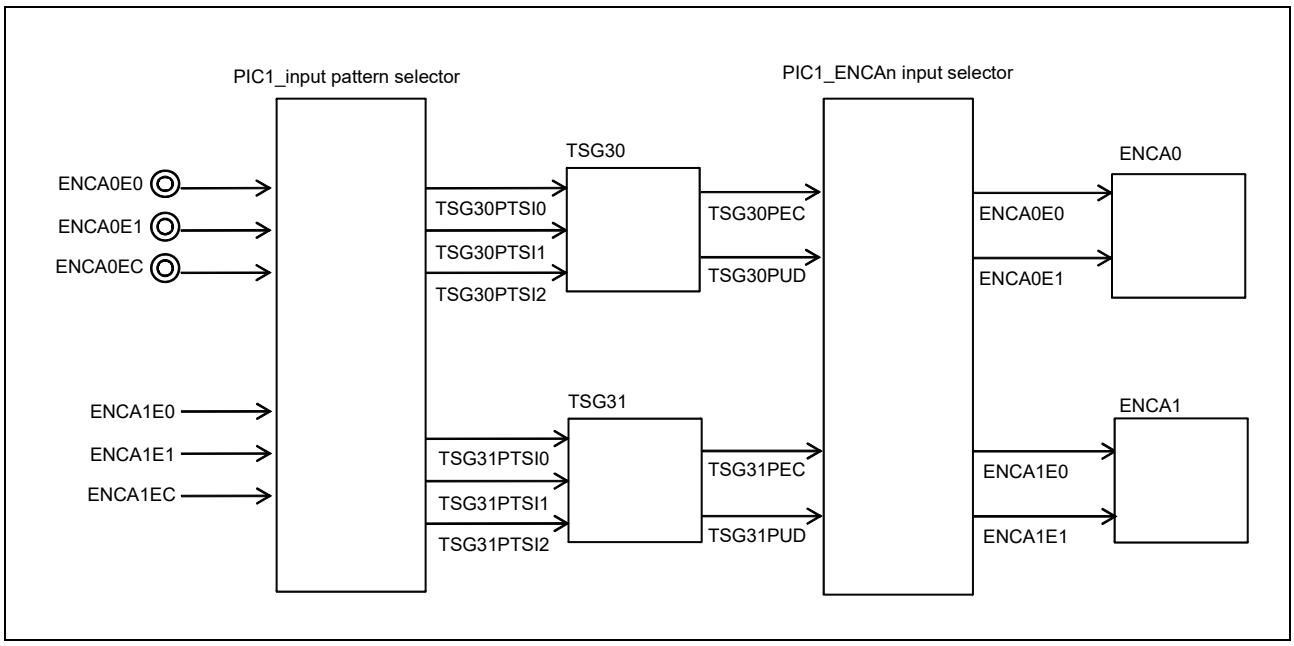


Figure 41.40 Block Diagram of Three-Phase Encoder Control Function

The configuration of this function is described below.

- [PIC1_input pattern selector]
  ENCAnE0, ENCAnE1, and ENCAnEC pin inputs are selected and output to TSG3nPTSI0 to TSG3nPTSI2.
- [TSG3n]
  Patterns set in TSG3nPEC are output in response to the input of the TSG3nPTSI0 to TSG3nPTSI2 signals. TSG3nPUD is output depending on the rotation (normal or reverse).
- [PIC1_ENCAn input selector]
  TSG3nPEC is selected and output to ENCAnE0. TSG3nPUD is selected and output to ENCAnE1.
- [ENCAn]
  ENCAnE0 and ENCAnE1 are encoded.

(3) Registers

Block diagram of PIC1 is shown in the following figure.

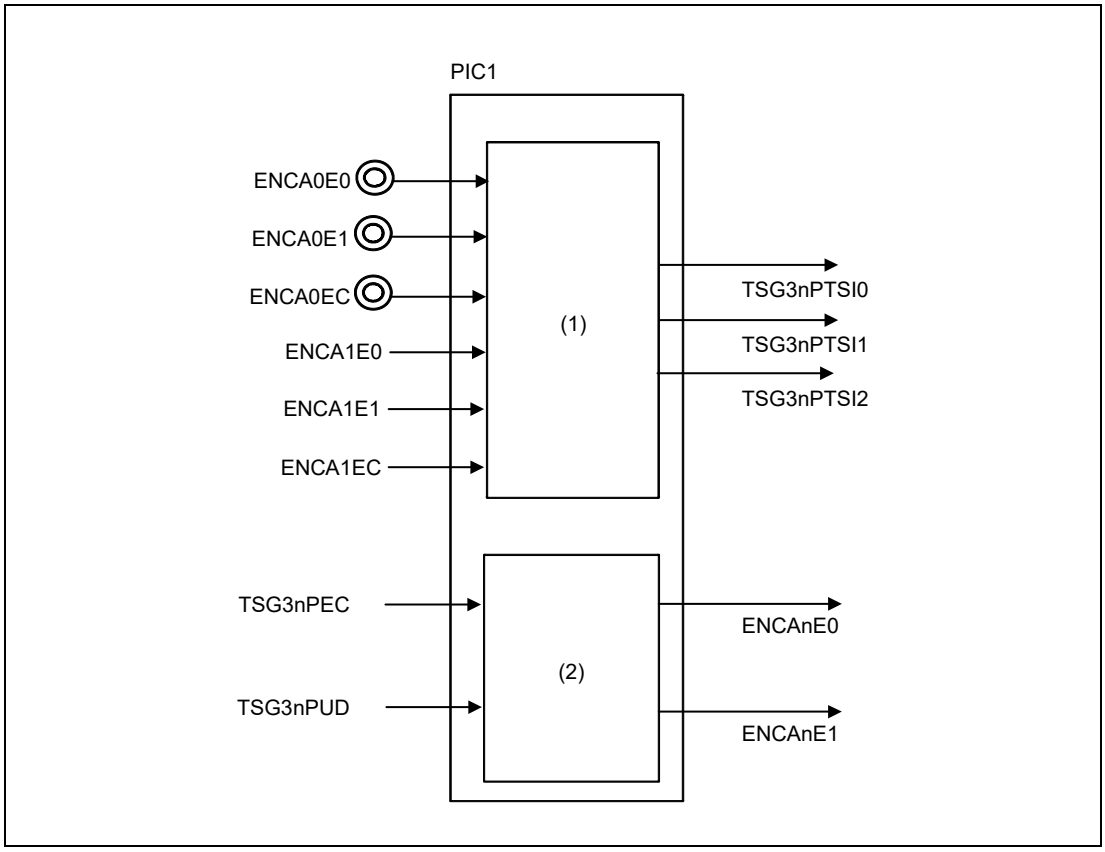

Figure 41.41 Block Diagram of PIC1

The register settings for PIC1 to use this function are as follows.

Unit (1): PIC1_ input pattern selector

The values to output ENCA0E0, ENCA0E1, and ENCA0EC as TSG30PTSI0 to TSG30PTSI2

PIC1TSGHALLSEL[0] = 1_B

PIC1REG50[0] = 0_B

The value to output ENCA1E0, ENCA1E1, and ENCA1EC as TSG31PTSI0 to TSG31PTSI2

PIC1TSGHALLSEL[1] = 1_B

PIC1REG51[0] = 1_B

Unit (2): PIC1_ENCAn input selector

The values to output the TSG30PEC and TSG30PUD as ENCA0E0 and ENCA0E1, respectively

PIC1REG30[22] = 0_B

PIC1REG30[1:0] = 11_B

The values to output the TSG31PEC and TSG31PUD as ENCA1E0 and ENCA1E1, respectively

PIC1REG30[9:8] = 10_B

PIC1REG30[7:6] = 10_B

(4) Function

Details of the three-phase encoder control function are described below.

The following figure shows the timing diagram.

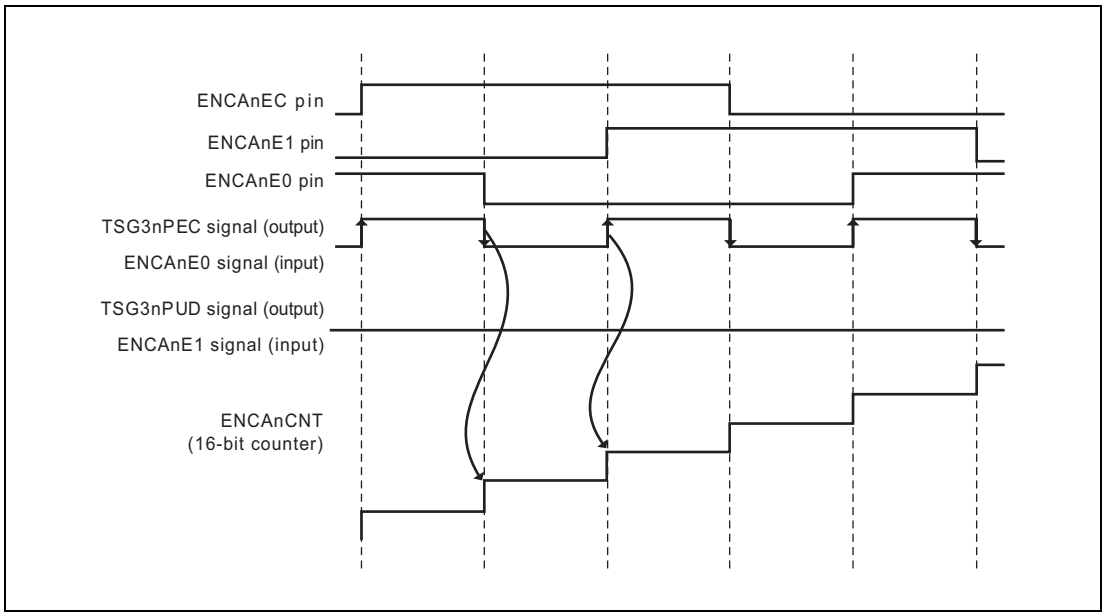

Figure 41.42 Timing Diagram of Three-Phase Encoder Control Function_ENCAnUDS1 and ENCAnUDS0 = 00_B

(1) When the low level is input to ENCAnE1, the count is incremented each time an active edge is input to ENCAnE0.

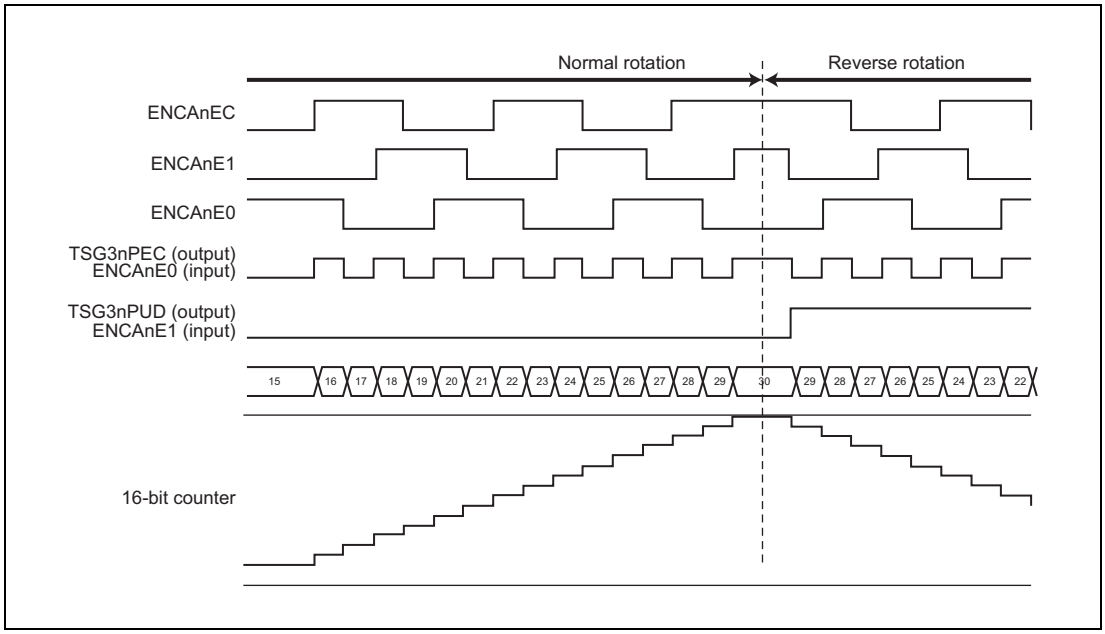

Figure 41.43 Timing Diagram of Three-Phase Encoder Control Function_Normal Rotation/Reverse Rotation

(5) Flow Chart

Set PIC before using the three-phase encoder control function.

The values of ENCAn registers used in this function are as follows.

ENCAnCTL[15:0] = xx00 00xx 000x $xx00_B$

ENCAnIOC1[7:0] = 0000 $00xx_B$*1

ENCAnCCR0 = (set any value)

ENCAnCCR1 = (set any value)

ENCAnCNT = (set any value)

"x" can be set arbitrarily. For the registers specifications, **Section 40, Encoder Timer A (ENCA)**.

Note 1. Except for ENCAnIOC1[1:0] = 00_B (no edge detected) because edge detection is necessary.

The values of TSG3n registers used in this function are as follows.

TSG3nCTL0[7:0] = 0000 0001_B

TSG3nCTL3[7:0] = 0000 $00xx_B$

TSG3nCTL4[15:0] = 0000 000x xxxx $xxxx_B$

TSG3nIOC0[7:0] = 0xxx $xxx0_B$

TSG3nIOC1[7:0] = 0001 $xxxx_B$

TSG3nIOC2[15:0] = 0xxx xxx0 0000 0000_B

TSG3nOPT0[7:0] = 0xxx $xxx0_B$

TSG3nOPT1[7:0] = 0000 $0xxx_B$

TSG3nCMP0 = (set any value)

TSG3nCMP1W,5W,9W = (set any value)

TSG3nCMP1,5,9 = (set any value)

TSG3nPAT0W,1W = (set any value)

TSG3nDTC0W,1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, **Section 35, Motor Control Timer (TSG3)**.

41.2.3.12 Timer Input Select Function

(1) Overview

This function allows to select input signal for TAUDn and TAUJn.

(2) Configuration

TAUD0/TAUD1

The function selects TAUDn input signal to be input as TAUDnTTINm/m+1 signal from either TAUD0Im/m+1 signal or TAUD1Im/m+1 signal (n = 0, 1 and m is an even number between 0 and 15).

The TAUD input select function is realized by using TAUDn input signals and PIC1 in combination.

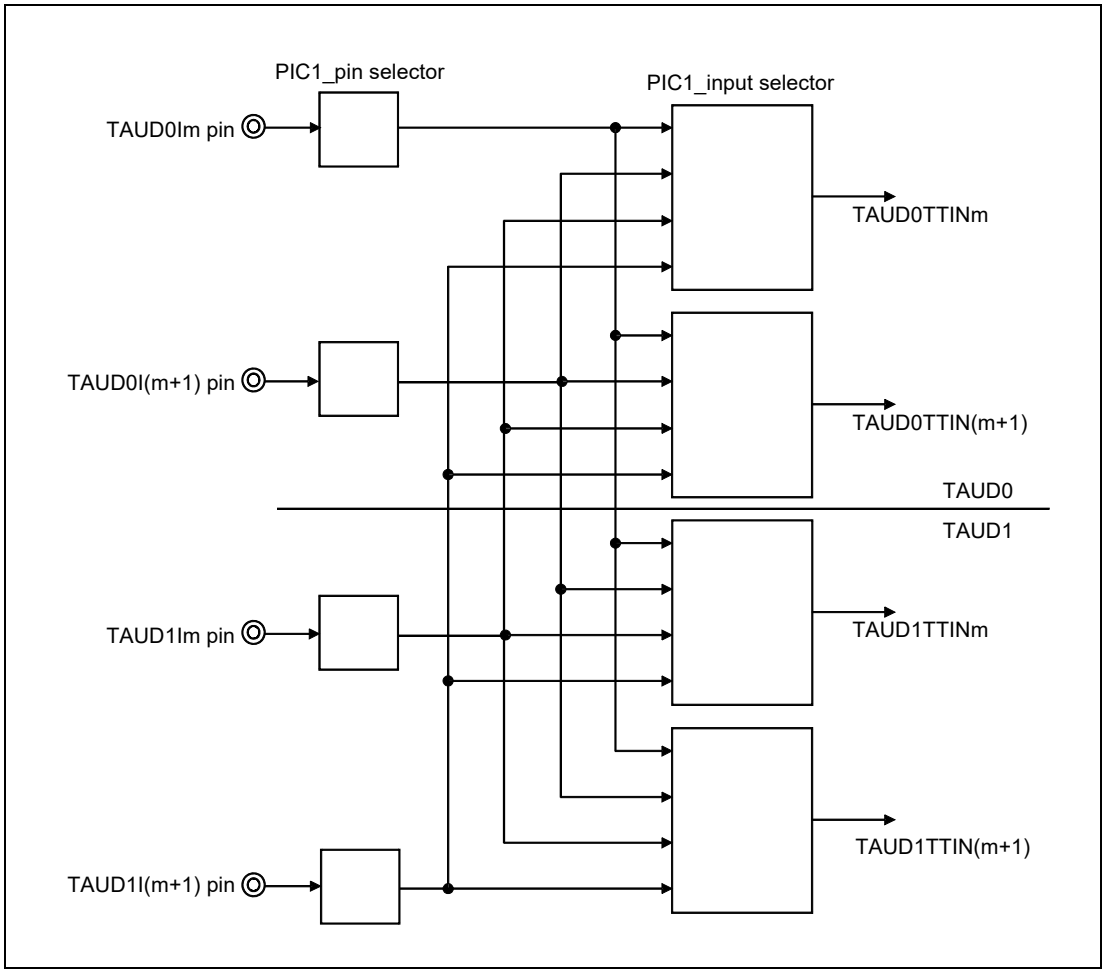

Figure 41.44 Block Diagram of TAUD Input Select Function

TAUD2

The output from port TAUD2Im (m = 0 to 15) can be input to TAUD2TTINm (m = 0 to 15) as shown in the following figure.

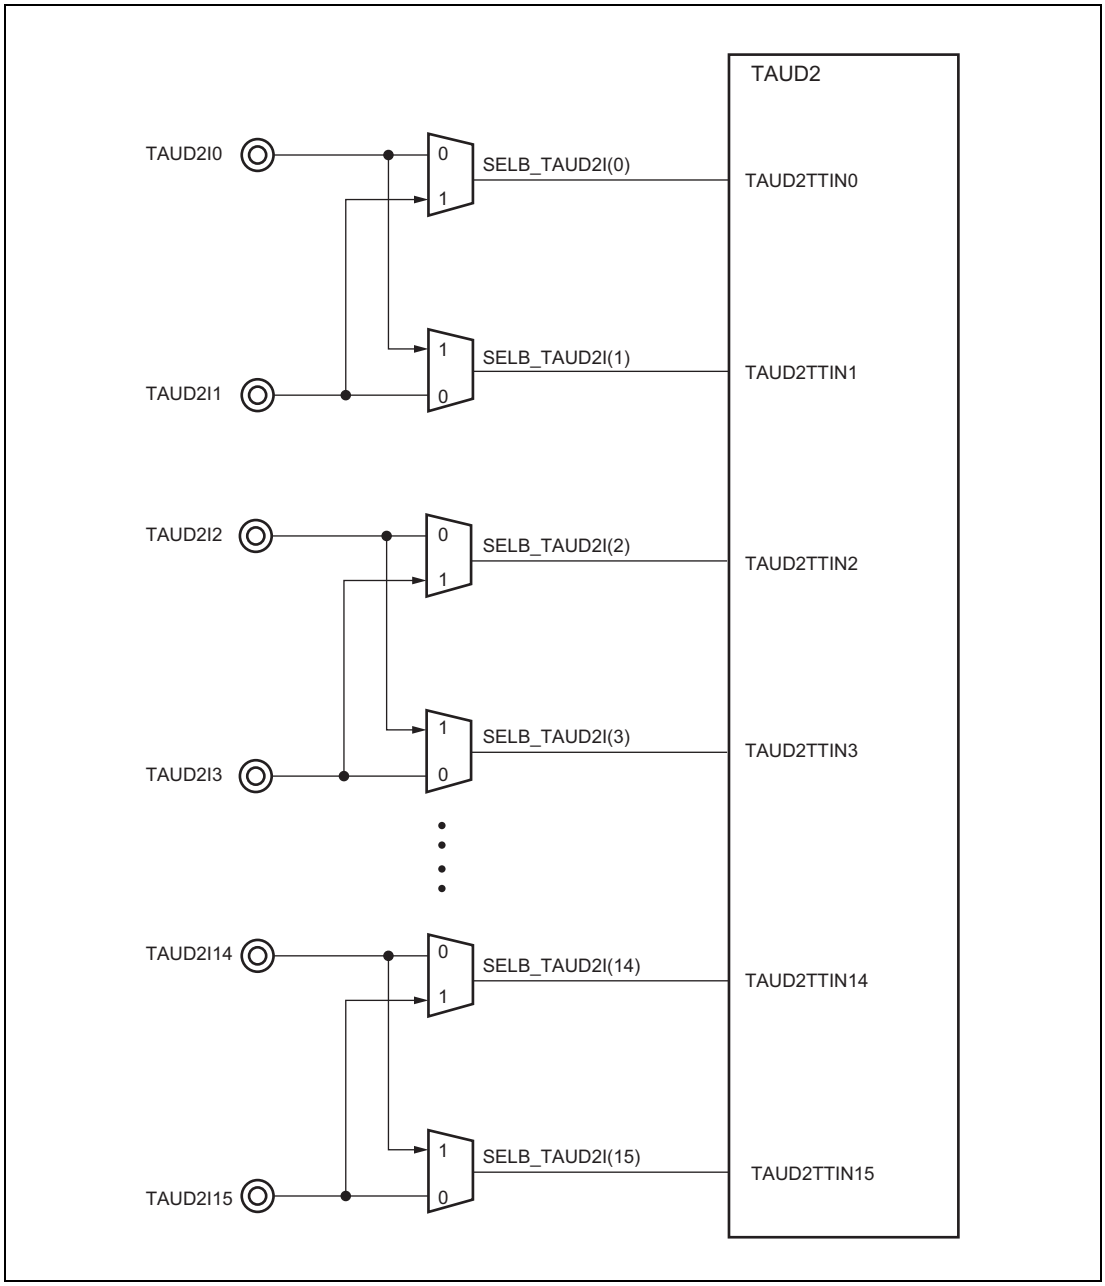

Figure 41.45 Selection of Signals Input to TAUD2

TAUJ2/TAUJ3

The output from TAUJ1 (TAUJ1TTOUT0) can be input to TAUJ2TTIN2 and TAUJ2TTIN3 as shown in the following figure.

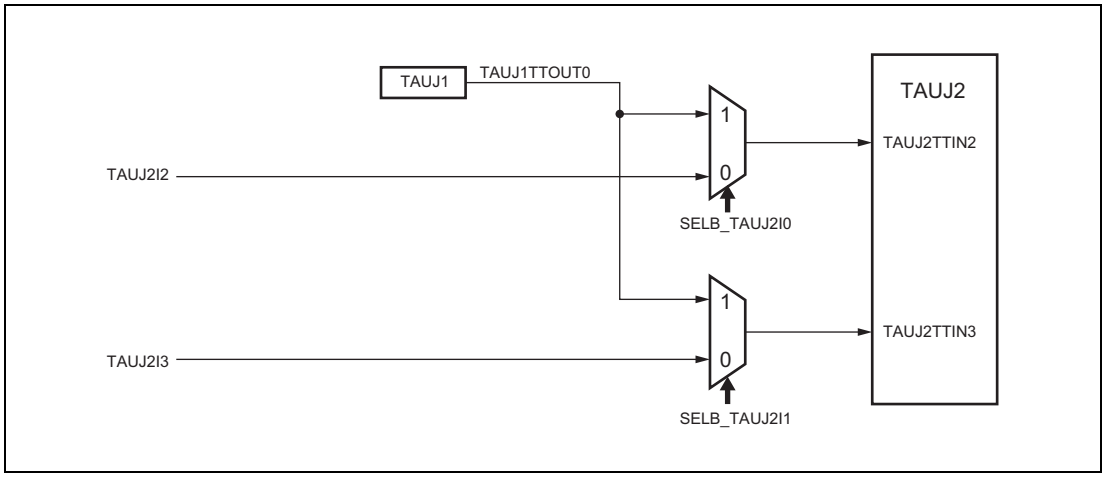

Figure 41.46 Selection of Signals Input to TAUJ2

The 1-Hz pulse output (RTCA0OUT) from RTCA0 and the output (TAUJ0TTOUT0) from TAUJ0 can be input to TAUJ3TTIN2 and TAUJ3TTIN3 as shown in the following figure.

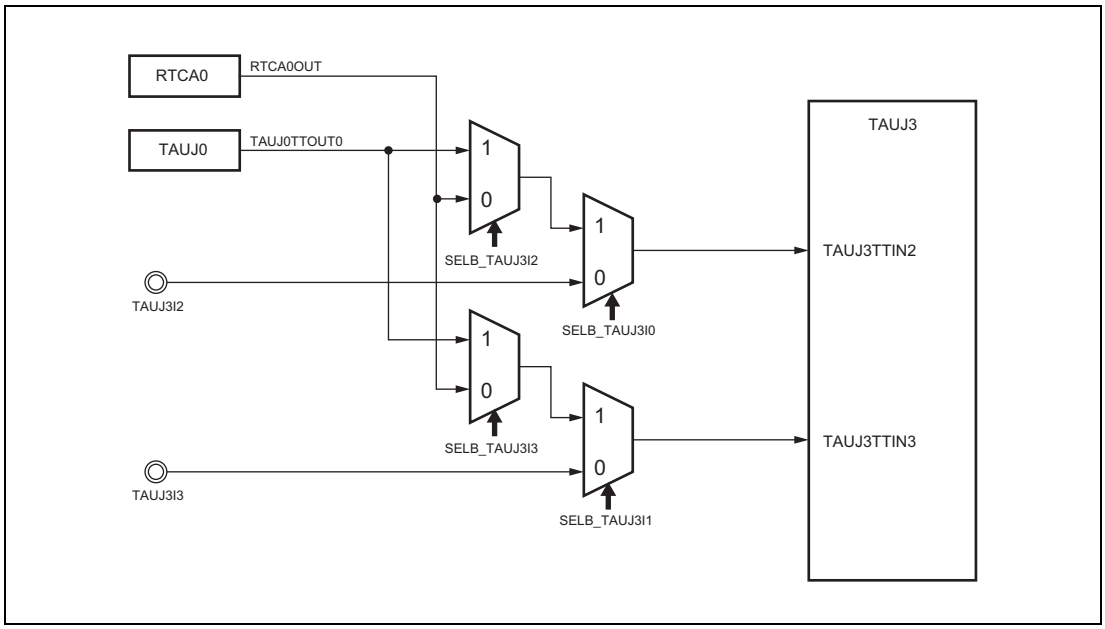

Figure 41.47 Selection of Signals Input to TAUJ3

(3) Registers

The register settings for PIC1 to use this function are described as follows.

PIC1_ pin selector

Select TAUDn external channel input pin for output from PIC1 pin selector.

PIC1_input selector

Select by the registers listed as follows.

PIC1TAUD0SEL

PIC1TAUD1SEL

PIC1REG2n0

PIC1REG2n2

PIC1REG31

For details of the register settings, **Section 41.2.2.10, Section 41.2.2.11, Section 41.2.2.18, Section 41.2.2.19, Section 41.2.2.21**, and **Section 41.2.2.24**.

(4) Function

Detail of this function is described using selection of the TAUD0TTIN[1:0] signal as an example.

The following table lists an example of selection of the TAUD0TTIN[1:0] signals. Setting 000000 to PIC1REG31[11:6], and setting 01 to PIC1TAUD0SEL[3:2] and PIC1TAUD0SEL[1:0] allows TAUD0TTIN0 and TAUD0TTIN1 signals to be input to TAUD0TTIN1 and TAUD0TTIN0 input pins of the TAUD0 timer. Setting 1 to PIC1TAUD0SEL[3] and PIC1TAUD0SEL[1] selects TIN pin signal of TAUD1.

Register Setting PIC1TAUD0SEL [1:0]	TAUD0TTIN0
00_B	TAUD0I0 pin
01_B	TAUD0I1 pin
10_B	TAUD1I0 pin
11_B	TAUD1I1 pin

Register Setting PIC1TAUD0SEL [3:2]	TAUD0TTIN1
00_B	TAUD0I1 pin
01_B	TAUD0I0 pin
10_B	TAUD1I1 pin
11_B	TAUD1I0 pin

The following table shows the method of selecting input signals to several TAUD2 inputs.

Table 41.69 TAUD2 Input Selection

Input Signal	Function	Settings
TAUD2TTIN[m]	Port TAUD2I[m]	SELB_TAUD2I[m] = 0
	Port TAUD2I[m+1]	SELB_TAUD2I[m] = 1
TAUD2TTIN[m+1]	Port TAUD2I[m+1]	SELB_TAUD2I[m+1] = 0
	Port TAUD2I[m]	SELB_TAUD2I[m+1] = 1

The following table shows how to select signals input to the TAUJ.

Table 41.70 TAUJ2 Input Selections

Input Signal	Function	Settings	
		SELB_ TAUJ2I1	SELB_ TAUJ2I0
TAUJ2TTIN2	Port TAUJ2I2	—	0
	TAUJ1TTOUT0	—	1
TAUJ2TTIN3	Port TAUJ2I3	0	—
	TAUJ1TTOUT0	1	—

Table 41.71 TAUJ3 Input Selections

Input Signal	Function	Settings			
		SELB_ TAUJ3I3	SELB_ TAUJ3I2	SELB_ TAUJ3I1	SELB_ TAUJ3I0
TAUJ3TTIN2	Port TAUJ3I2	—	—	—	0
	RTCA0OUT (Real-time clock 1-Hz output)	—	0	—	1
	TAUJ0TTOUT0	—	1	—	1
TAUJ3TTIN3	Port TAUJ3I3	—	—	0	—
	RTCA0OUT (Real-time clock 1-Hz output)	0	—	1	—
	TAUJ0TTOUT0	1	—	1	—

(5) Flow Chart

Set PIC1 before starting the TAUDn timer.

41.2.3.13 Hi-Z Control Function

(1) Overview

The function disconnects three-phase output signal and changes to Hi-Z state.

For details of the purpose and operation of the Hi-Z control function, see **Section 36.4.1, Asynchronous Hi-Z Control Function**.

(2) Configuration

The TAPAnESO, ERROROUTZ, INTTSG30IER, INTTSG31IER, WDTBnTNMI (n=0, 1, 2, 3), INTADCJ0ERR, and INTADCJ1ERR signals are masked and OR'ed in PIC1, and output to TAPAn as the signal for Hi-Z control.

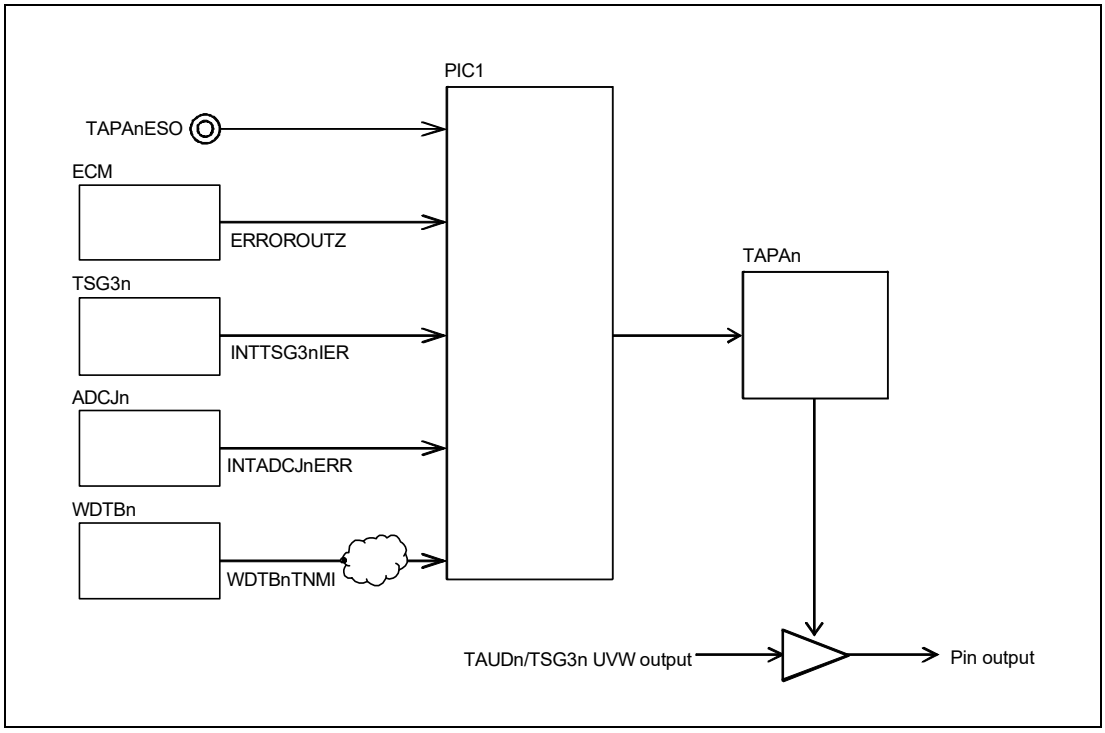

Figure 41.48 Block Diagram of Hi-Z Control

(3) Registers

The block diagram of PIC1 is shown in the following figure.

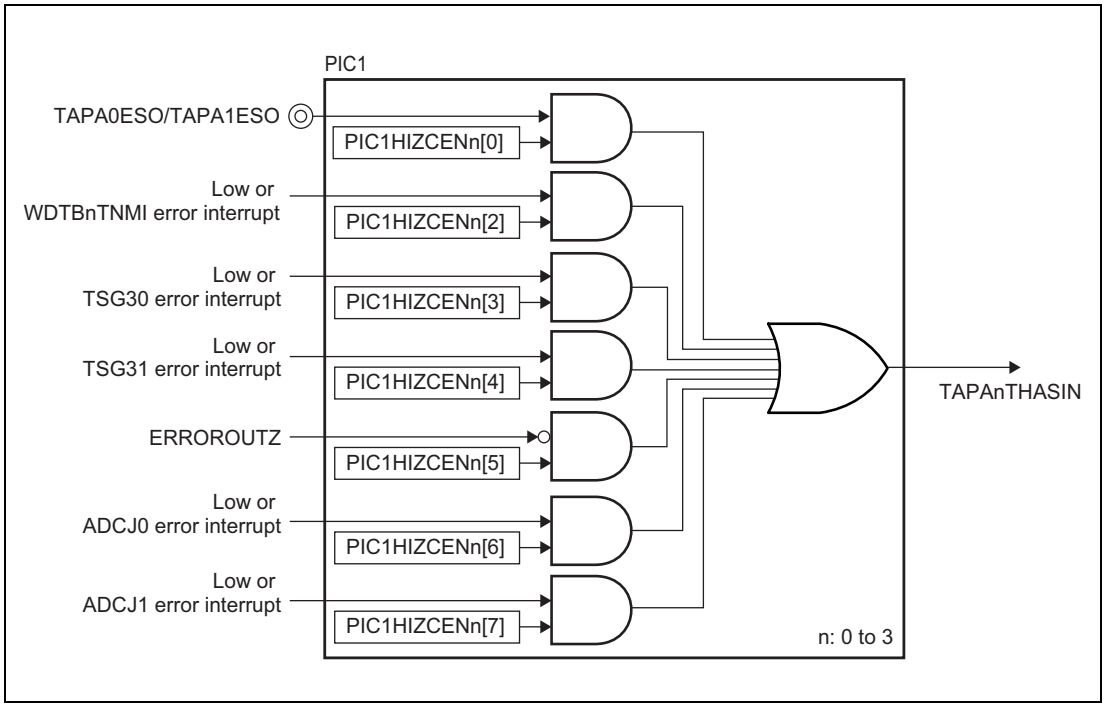

Figure 41.49 Block Diagram of PIC1

The register settings for PIC1 to use this function are as follows.

PIC1HIZCENn[5] = 1 (enabled), 0 (disabled): ERROROUTZ

PIC1HIZCENn[0] = 1 (enabled), 0 (disabled): TAPA0ESO or TAPA1ESO

PIC1HIZCENn[2] = 1 (enabled), 0 (disabled): WDTBnTNMI

PIC1HIZCENn[3] = 1 (enabled), 0 (disabled): INTTSG30IER

PIC1HIZCENn[4] = 1 (enabled), 0 (disabled): INTTSG31IER

PIC1HIZCENn[6] = 1 (enabled), 0 (disabled): INTADCJ0ERR

PIC1HIZCENn[7] = 1 (enabled), 0 (disabled): INTADCJ1ERR

n = 0, 1 is available for TAUD0/TAUD1 and not available for PIC1HIZCENn[3] and PIC1HIZCENn[4].

n = 2 is available for TSG30 and not available for PIC1HIZCENn[4].

n = 3 is available for TSG31 and not available for PIC1HIZCENn[3].

Table 41.72 Correspondence between the Hi-Z Control Function Input Pins and Control Pins

Input Pin Name	Control Register	TAPA Unit Number	Target Timers for Hi-Z Control
TAPA0ESO	PIC1HIZCEN0	TAPA0	TAUD0
TAPA1ESO	PIC1HIZCEN1	TAPA1	TAUD1
TAPA0ESO	PIC1HIZCEN2	TAPA2	TSG30
TAPA1ESO	PIC1HIZCEN3	TAPA3	TSG31

(4) Function

The TAPA0ESO/TAPA1ESO pins, WDTBnTNMI, ERROROUTZ, INTTSG30IER, INTTSG31IER, INTADCJ0ERR, and INTADCJ1ERR for Hi-Z control are masked and OR'ed in PIC1, and output to TAPAn. For Hi-Z control by TAPA, see **Section 36.4.2.1, Basic Operation**.

(5) Flow Chart

Set PIC1 before starting Hi-Z control.

For the operation flow of TAPA, see **Section 36.4.1, Asynchronous Hi-Z Control Function**.

41.2.3.14 Timer Output Monitor Function

(1) Overview

With this function, output signals of TAUD0, TAUD1, TSG30, TSG31, OSTM8, and OSTM9 are monitored using TAUD2.

(2) Configuration

Monitoring of output signals of TAUD0, TAUD1, TSG30, TSG31, OSTM8, and OSTM9 is realized using TAUD2 and PIC1 in combination.

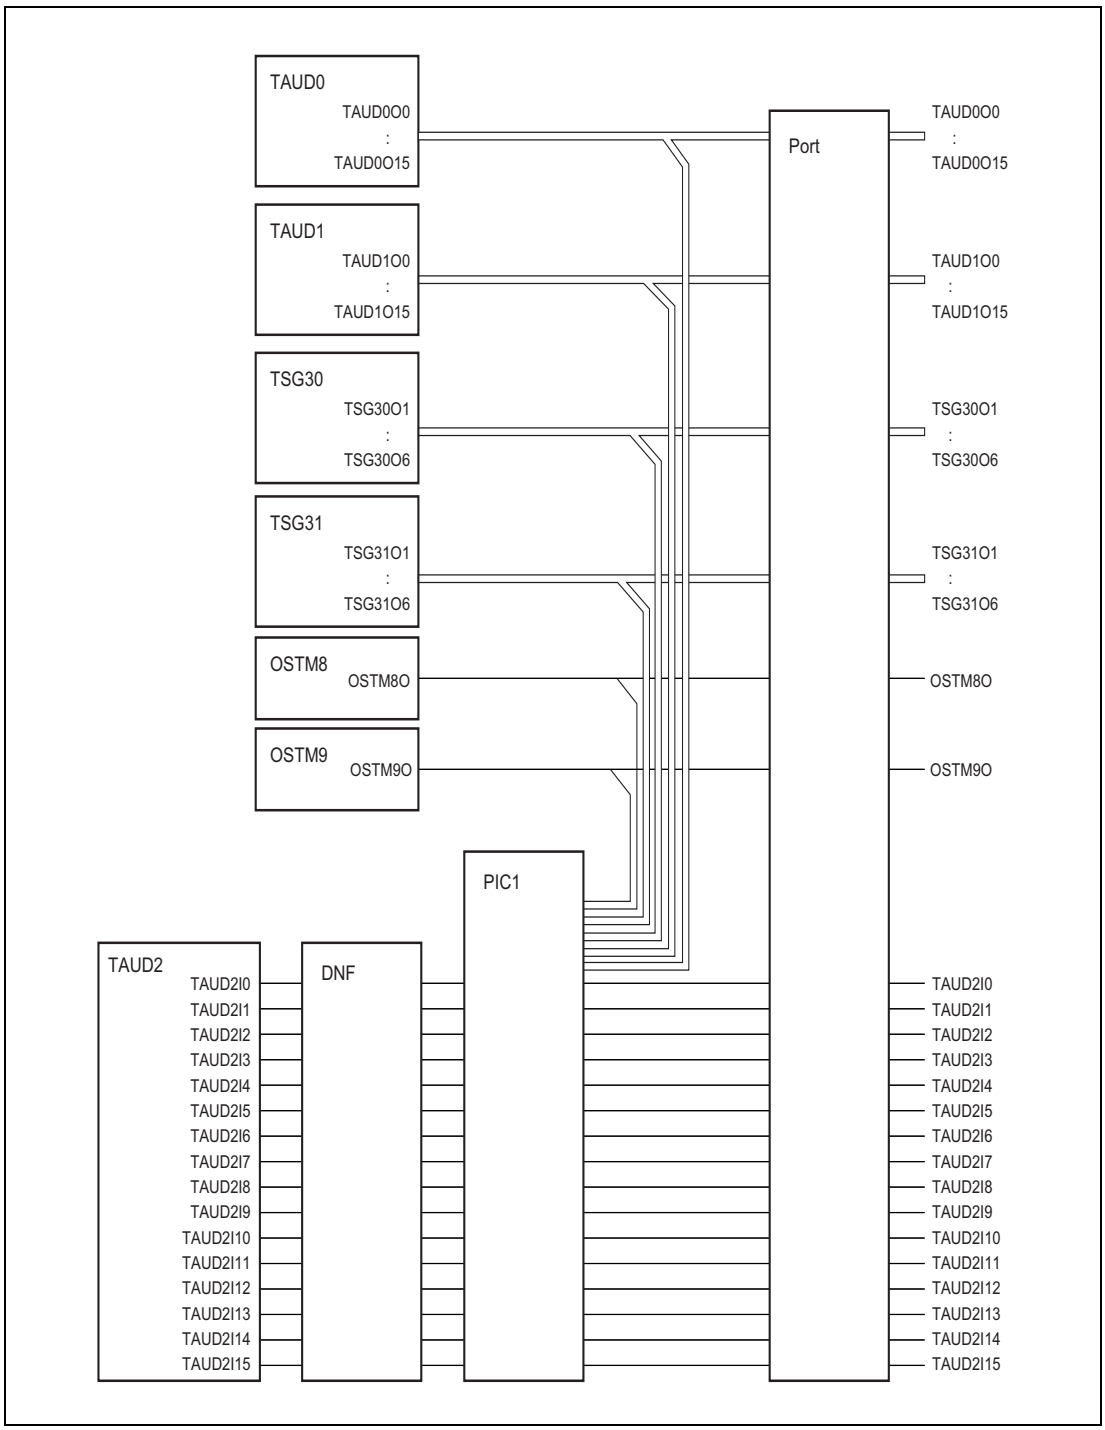

Figure 41.50 Block Diagram of Timer Output Monitor Function

(3) Registers

- The PIC1POMONSEL register selects the output signal to be monitored.
- Set the alternative output level loopback function for the port of the output signal to be monitored. For details, see **Section 2.5.14, PBDCn/APBDCn/JPBDC0 — Port Bi-Direction Control Register**.

41.2.3.15 Timer Input Monitor Function

(1) Overview

With this function, input signals of TAUJ0 and TAUJ1 are monitored using TAUJ2.

(2) Configuration

Monitoring of input signals of TAUJ0 and TAUJ1 is realized using TAUJ2 and PIC1 in combination.

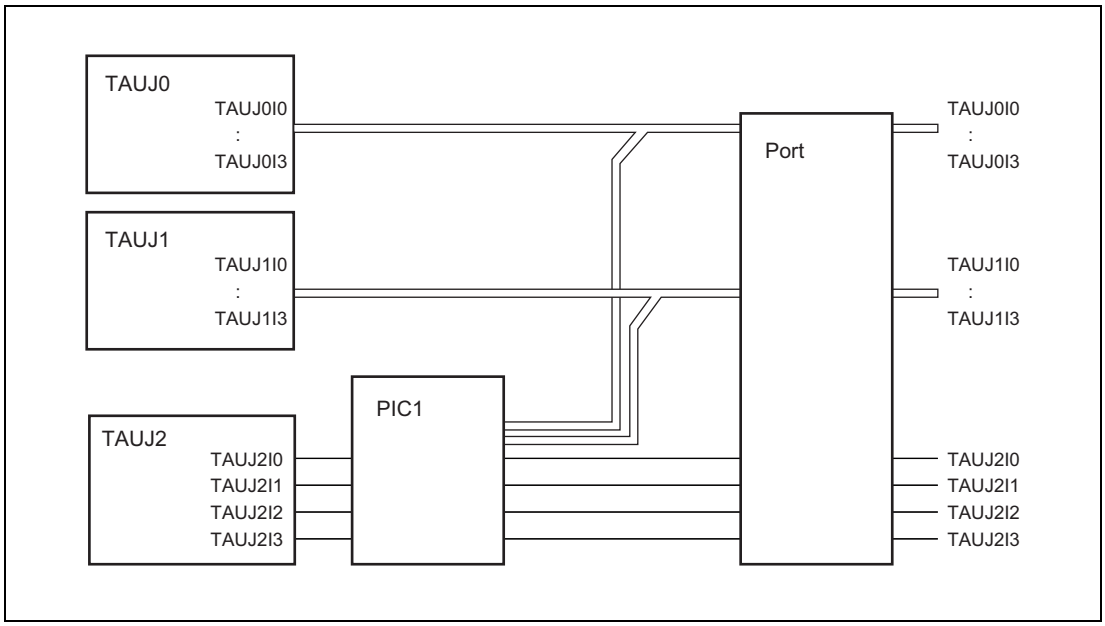

Figure 41.51 Block Diagram of Timer Input Monitor Function

(3) Registers

The PIC1PIMONSEL register selects the input signals to be monitored.

41.2.3.16 TSG3 Synchronous Start and Clear Function

(1) Overview

This function allows synchronous starting and clearing of TSG30 and TSG31.

(2) Configuration

The interrupt signals from TAUD0 channels 14 and 15 are used as synchronous start triggers to initiate synchronous starting or clearing of TSG30 and TSG31.

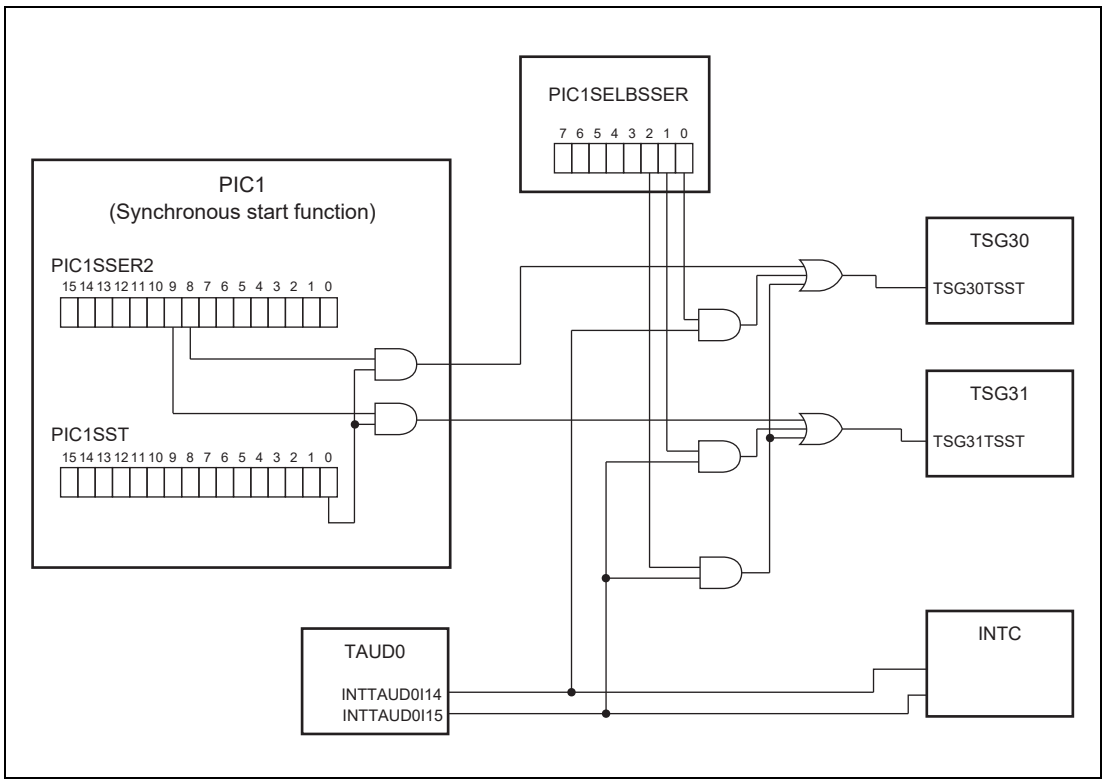

Figure 41.52 Block Diagram of TSG3 Synchronous Clear Function

41.3 Peripheral Interconnect — 2 (PIC2)

41.3.1 Overview

41.3.1.1 Functional Overview

Peripheral interconnect-2 (PIC2) handles configuration of triggers to ADCJn, ENCAn, PSI5-Sn (n = 0, 1) and GTM from various peripheral modules.

The PIC2 has following functions.

- ADCJ Trigger Select Function
- Baud rate measurement for an UART (RLIN3)
- Hi-Z control function over external pin for GTM output
- GTM output monitor for PWM diagnostic
- ENCA Trigger Selection Function
- PSI5-S Timestamp and the Sync Pulse Signal Selection Function
- GTM Timer Input (TIM) Selection Function
- ENCA Encoder Input Selection

41.3.2 Registers

41.3.2.1 List of Registers

PIC2 registers are listed in the following table.

Table 41.73 List of Registers (1/3)

Register Name	Symbol	Address	Access size	Access Protection	
				PBG	Other
ADC trigger selection control register					
A/D converter 0 trigger select control register 0	PIC2ADCJ0TSEL0	<PIC20_base> + 000_H	16, 32	PBG52#1	—
A/D converter 0 trigger select control register 1	PIC2ADCJ0TSEL1	<PIC20_base> + 004_H	16, 32	PBG52#1	—
A/D converter 0 trigger select control register 2	PIC2ADCJ0TSEL2	<PIC20_base> + 008_H	16, 32	PBG52#1	—
A/D converter 0 trigger select control register 3	PIC2ADCJ0TSEL3	<PIC20_base> + $00C_H$	16, 32	PBG52#1	—
A/D converter 0 trigger select control register 4	PIC2ADCJ0TSEL4	<PIC20_base> + 010_H	16, 32	PBG52#1	—
A/D converter 0 trigger edge select control register	PIC2ADCJ0EDGSEL	<PIC20_base> + $01C_H$	16	PBG52#1	—
A/D converter 1 trigger select control register 0	PIC2ADCJ1TSEL0	<PIC20_base> + 020_H	16, 32	PBG52#1	—
A/D converter 1 trigger select control register 1	PIC2ADCJ1TSEL1	<PIC20_base> + 024_H	16, 32	PBG52#1	—
A/D converter 1 trigger select control register 2	PIC2ADCJ1TSEL2	<PIC20_base> + 028_H	16, 32	PBG52#1	—

41.3.2.2 PIC2ADCJnTSELj — A/D Converter n Trigger Select Control Register j (n = 0, 1; j = 0 to 4)

The PIC2ADCJnTSELj register selects triggers for ADCJn scan group j (n = 0, 1; j = 0 to 4).

Access: This register can be read or written in 16-bit or 32-bit units.

Address: <PIC20_base> + 000_H (n = 0, j = 0), <PIC20_base> + 004_H (n = 0, j = 1),
<PIC20_base> + 008_H (n = 0, j = 2), <PIC20_base> + $00C_H$ (n = 0, j = 3),
<PIC20_base> + 010_H (n = 0, j = 4),
<PIC20_base> + 020_H (n = 1, j = 0), <PIC20_base> + 024_H (n = 1, j = 1),
<PIC20_base> + 028_H (n = 1, j = 2), <PIC20_base> + $02C_H$ (n = 1, j = 3),
<PIC20_base> + 030_H (n = 1, j = 4)

Value after reset: $0000\ 0000_H$

Table 41.74 PIC2ADCJnTSELj Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	ADCJn TSELj28	Output value of ENCAn interrupt signal selected by PIC2ADTEN42j. 0: Selection of the above signal as an ADCJn SGj trigger is disabled. 1: Selection of the above signal as an ADCJn SGj trigger is enabled.
27	ADCJn TSELj27	Selects the INTTSG31I12 signal of TSG31 as the trigger source for ADCJn SGj. 0: INTTSG31I12 is not selected. 1: INTTSG31I12 is selected.
26	ADCJn TSELj26	Selects the INTTSG31I11 signal of TSG31 as the trigger source for ADCJn SGj. 0: INTTSG31I11 is not selected. 1: INTTSG31I11 is selected.
25	ADCJn TSELj25	Selects the INTTSG31I8 signal of TSG31 as the trigger source for ADCJn SGj. 0: INTTSG31I8 is not selected. 1: INTTSG31I8 is selected.
24	ADCJn TSELj24	Selects the INTTSG31I7 signal of TSG31 as the trigger source for ADCJn SGj. 0: INTTSG31I7 is not selected. 1: INTTSG31I7 is selected.
23	ADCJn TSELj23	Selects the INTTSG31I4 signal of TSG31 as the trigger source for ADCJn SGj. 0: INTTSG31I4 is not selected. 1: INTTSG31I4 is selected.
22	ADCJn TSELj22	Selects the INTTSG31I3 signal of TSG31 as the trigger source for ADCJn SGj. 0: INTTSG31I3 is not selected. 1: INTTSG31I3 is selected.
21	ADCJn TSELj21	Selects the TAPATADOUT1 signal of TAPA0 as the trigger source for ADCJn SGj. 0: TAPA0TADOUT1 is not selected. 1: TAPA0TADOUT1 is selected.

Table 41.74 PIC2ADCJnTSELj Register Contents (2/3)

Bit Position	Bit Name	Function
20	ADCJn TSELj20	Selects the TAPATADOUT0 signal of TAPA0 as the trigger source for ADCJn SGj. 0: TAPA0TADOUT0 is not selected. 1: TAPA0TADOUT0 is selected.
19	ADCJn TSELj19	Selects the INTTSG30I12 signal of TSG30 as the trigger source for ADCJn SGj. 0: INTTSG30I8 is not selected. 1: INTTSG30I8 is selected.
18	ADCJn TSELj18	Selects the INTTSG30I11 signal of TSG30 as the trigger source for ADCJn SGj. 0: INTTSG30I11 is not selected. 1: INTTSG30I11 is selected.
17	ADCJn TSELj17	Selects the INTTSG30I8 signal of TSG30 as the trigger source for ADCJn SGj. 0: INTTSG30I8 is not selected. 1: INTTSG30I8 is selected.
16	ADCJn TSELj16	Selects the INTTSG30I7 signal of TSG30 as the trigger source for ADCJn SGj. 0: INTTSG30I7 is not selected. 1: INTTSG30I7 is selected.
15	ADCJn TSELj15	Selects the INTTSG30I4 signal of TSG30 as the trigger source for ADCJn SGj. 0: INTTSG30I4 is not selected. 1: INTTSG30I4 is selected.
14	ADCJn TSELj14	Selects the INTTSG30I3 signal of TSG30 as the trigger source for ADCJn SGj. 0: INTTSG30I3 is not selected. 1: INTTSG30I3 is selected.
13	ADCJn TSELj13	Selects the ADCJnTRG4 signal of ADCJn as the trigger source for ADCJn SGj. 0: ADCJnTRG4 is not selected. 1: ADCJnTRG4 is selected.
12	ADCJn TSELj12	Selects the ADCJnTRG3 signal of ADCJn as the trigger source for ADCJn SGj. 0: ADCJnTRG3 is not selected. 1: ADCJnTRG3 is selected.
11	ADCJn TSELj11	Selects the ADCJnTRG2 signal of ADCJn as the trigger source for ADCJn SGj. 0: ADCJnTRG2 is not selected. 1: ADCJnTRG2 is selected.
10	ADCJn TSELj10	Selects the ADCJnTRG1 signal of ADCJn as the trigger source for ADCJn SGj. 0: ADCJnTRG1 is not selected. 1: ADCJnTRG1 is selected.
9	ADCJn TSELj09	Selects the ADCJnTRG0 signal of ADCJn as the trigger source for ADCJn SGj. 0: ADCJnTRG0 is not selected. 1: ADCJnTRG0 is selected.
8	ADCJn TSELj08	Selects the TSG31ADTRG1 signal of TSG31 as the trigger source for ADCJn SGj. 0: TSG31ADTRG1 is not selected. 1: TSG31ADTRG1 is selected.
7	ADCJn TSELj07	Selects the TSG31ADTRG0 signal of TSG31 as the trigger source for ADCJn SGj. 0: TSG31ADTRG0 is not selected. 1: TSG31ADTRG0 is selected.
6	ADCJn TSELj06	Selects the TSG30ADTRG1 signal of TSG30 as the trigger source for ADCJn SGj. 0: TSG30ADTRG1 is not selected. 1: TSG30ADTRG1 is selected.
5	ADCJn TSELj05	Selects the TSG30ADTRG0 signal of TSG30 as the trigger source for ADCJn SGj. 0: TSG30ADTRG0 is not selected. 1: TSG30ADTRG0 is selected.
4	ADCJn TSELj04	Selects the INTTAUJ1I3 signal of TAUJ1 as the trigger source for ADCJn SGj. 0: INTTAUJ1I3 is not selected. 1: INTTAUJ1I3 is selected.

Table 41.74 PIC2ADCJnTSELj Register Contents (3/3)

Bit Position	Bit Name	Function
3	ADCJn TSELj03	Selects the INTTAUJ0I3 signal of TAUJ0 as the trigger source for ADCJn SGj. 0: INTTAUJ0I3 is not selected. 1: INTTAUJ0I3 is selected.
2	ADCJn TSELj02	Output value of GTM timer output selected by PIC2ADTEN50j, PIC2ADTEN60j, PIC2ADTEN70j, PIC2ADTEN80j. 0: Selection of the above signal as an ADCJn SGj trigger is disabled. 1: Selection of the above signal as an ADCJn SGj trigger is enabled.
1	ADCJn TSELj01	Selects the TAUD1 interrupt signal selected by the PIC2ADTEN41j register as the trigger source for ADCJn SGj. 0: TAUD1 interrupt is not selected. 1: TAUD1 interrupt is selected.
0	ADCJn TSELj00	Selects the TAUD0 interrupt signal selected by the PIC2ADTEN40j register as the trigger source for ADCJn SGj. 0: TAUD0 interrupt is not selected. 1: TAUD0 interrupt is selected.

41.3.2.3 PIC2ADCJnEDGSEL — A/D Converter Trigger Edge Control Register (n = 0, 1)

The PIC2ADCJnEDGSEL register selects an effective edge for the one-shot pulse generation circuit which generates an ADCJn trigger.

Access: This register can be read or written in 16-bit units.

Address: <PIC20_base> + $01C_H$ (n = 0), <PIC20_base> + $03C_H$ (n = 1)

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIC2ADCJnEDGSEL[9:0]

Table 41.75 PIC2ADCJnEDGSEL Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	PIC2ADCJnEDGSEL[9:8]	Selects an effective edge of ADCJn scan group 4. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited.)
7, 6	PIC2ADCJnEDGSEL[7:6]	Selects an effective edge of ADCJn scan group 3. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited.)
5, 4	PIC2ADCJnEDGSEL[5:4]	Selects an effective edge of ADCJn scan group 2. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited.)
3, 2	PIC2ADCJnEDGSEL[3:2]	Selects an effective edge of ADCJn scan group 1. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited.)
1, 0	PIC2ADCJnEDGSEL[1:0]	Selects an effective edge of ADCJn scan group 0. 00: Rising edge is selected. 01: Falling edge is selected. 10: Both edges are selected. 11: — (setting prohibited.)

NOTE

The selection of “falling edge” and “both edges” is not available for ADC trigger signals from GTM.

For procedure to use a falling edge or both edges of a GTM output signal, refer to **Section 41.3.3.1, ADCJ Trigger Select Function** for more details.

41.3.2.4 PIC2ADTEN4kj — A/D Converter Trigger Output Select Control Register (k = 0, 1; j = 0 to 4)

The PIC2ADTEN4kj register enables selecting a trigger source from TAUDn channel m (n = 0, 1; m = 0 to 15) as the ADCJn trigger (n = 0, 1; j = 0 to 4). This register is common to ADCJ0 and ADCJ1.

Access: This register can be read or written in 16-bit units.

Address: <PIC20_base> + 080_H (k = 0, j = 0), <PIC20_base> + 084_H (k = 0, j = 1),
<PIC20_base> + 088_H (k = 0, j = 2), <PIC20_base> + $08C_H$ (k = 0, j = 3),
<PIC20_base> + 090_H (k = 0, j = 4),
<PIC20_base> + $0A0_H$ (k = 1, j = 0), <PIC20_base> + $0A4_H$ (k = 1, j = 1),

Bit Position	Bit Name	Function
15 to 0	PIC2ADTEN4kjm (m = 0 to 15)	Set a trigger source from TAUDn channel m. 0: Trigger source of TAUDn channel m cannot be selected as the ADCJ trigger. 1: Trigger source of TAUDn channel m can be selected as the ADCJ trigger.

41.3.2.5 PIC2ADTEN4kj — A/D Converter Trigger Output Select Control Register (k = 2; j = 0 to 4)

The PIC2ADTEN4kj register enables selecting a trigger source from ENCAn interrupt as the ADCJ trigger.

This register is common to ADCJ0 and ADCJ1.

Access: This register can be read or written in 16-bit units.

Address: <PIC20_base> + $0C0_H$ (k = 2, j = 0), <PIC20_base> + $0C4_H$ (k = 2, j = 1), <PIC20_base> + $0C8_H$ (k = 2, j = 2), <PIC20_base> + $0CC_H$ (k = 2, j = 3), <PIC20_base> + $0D0_H$ (k = 2, j = 4)

2	PIC2ADTEN4kj2	ENCA0 Clear interrupt signal by encoder input (phase Z) 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
1	PIC2ADTEN4kj1	ENCA0 Compare 1 match or Capture 1 interrupt signal 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
0	PIC2ADTEN4kj0	ENCA0 Compare 0 match or Capture 0 interrupt signal 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.

41.3.2.6 PIC2ADTEN5nj — A/D Converter Trigger Output Select Control Register 5nj (n = 0, 1; j = 0 to 4)

The PIC2ADTEN5nj register enables a trigger source from GTM TIM shared interrupt to be selected as an ADCJn trigger (n = 0, 1; j = 0 to 4).

Access: This register can be read or written in 16-bit or 32-bit units.

Address: <PIC20_base> + 180_H (n = 0, j = 0), <PIC20_base> + 184_H (n = 0, j = 1),
<PIC20_base> + 188_H (n = 0, j = 2), <PIC20_base> + $18C_H$ (n = 0, j = 3),

41.3.2.8 PIC2ADTEN7nj — A/D Converter Trigger Output Select Control Register 7nj (n = 0, 1; j = 0 to 4)

The PIC2ADTEN7nj register enables a trigger source from GTM timer output to be selected as an ADCJn trigger (n = 0, 1; j = 0 to 4).

Access: This register can be read or written in 16-bit or 32-bit units.

Address: <PIC20_base> + 280_H (n = 0, j = 0), <PIC20_base> + 284_H (n = 0, j = 1),
<PIC20_base> + 288_H (n = 0, j = 2), <PIC20_base> + $28C_H$ (n = 0, j = 3),
<PIC20_base> + 290_H (n = 0, j = 4),
<PIC20_base> + $2A0_H$ (n = 1, j = 0), <PIC20_base> + $2A4_H$ (n = 1, j = 1),
<PIC20_base> + $2A8_H$ (n = 1, j = 2), <PIC20_base> + $2AC_H$ (n =1, j = 3),

30	PIC2ADTEN7nj 30	Timer output signals for ATOM3 for channel 7 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
29	PIC2ADTEN7nj 29	Inverted timer output signal for ATOM3 for channel 6 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
28	PIC2ADTEN7nj 28	Timer output signals for ATOM3 for channel 6 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
27	PIC2ADTEN7nj 27	Inverted timer output signal for ATOM3 for channel 5 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
26	PIC2ADTEN7nj 26	Timer output signals for ATOM3 for channel 5 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
25	PIC2ADTEN7nj 25	Inverted timer output signal for ATOM3 for channel 4 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
24	PIC2ADTEN7nj 24	Timer output signals for ATOM3 for channel 4 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
23	PIC2ADTEN7nj 23	Inverted timer output signal for ATOM3 for channel 3 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.

Table 41.80 PIC2ADTEN7nj Register Contents (2/3)

Bit Position	Bit Name	Function
22	PIC2ADTEN7nj 22	Timer output signals for ATOM3 for channel 3 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
21	PIC2ADTEN7nj 21	Inverted timer output signal for ATOM3 for channel 2 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
20	PIC2ADTEN7nj 20	Timer output signals for ATOM3 for channel 2 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
19	PIC2ADTEN7nj 19	Inverted timer output signal for ATOM3 for channel 1 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
18	PIC2ADTEN7nj 18	Timer output signals for ATOM3 for channel 1 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
17	PIC2ADTEN7nj 17	Inverted timer output signal for ATOM3 for channel 0 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
16	PIC2ADTEN7nj 16	Timer output signals for ATOM3 for channel 0 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
15	PIC2ADTEN7nj 15	Inverted timer output signal for ATOM2 for channel 7 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
14	PIC2ADTEN7nj 14	Timer output signals for ATOM2 for channel 7 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
13	PIC2ADTEN7nj 13	Inverted timer output signal for ATOM2 for channel 6 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
12	PIC2ADTEN7nj 12	Timer output signals for ATOM2 for channel 6 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
11	PIC2ADTEN7nj 11	Inverted timer output signal for ATOM2 for channel 5 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
10	PIC2ADTEN7nj 10	Timer output signals for ATOM2 for channel 5 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
9	PIC2ADTEN7nj 09	Inverted timer output signal for ATOM2 for channel 4 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
8	PIC2ADTEN7nj 08	Timer output signals for ATOM2 for channel 4 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
7	PIC2ADTEN7nj 07	Inverted timer output signal for ATOM2 for channel 3 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
6	PIC2ADTEN7nj 06	Timer output signals for ATOM2 for channel 3 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
5	PIC2ADTEN7nj 05	Inverted timer output signal for ATOM2 for channel 2 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
4	PIC2ADTEN7nj 04	Timer output signals for ATOM2 for channel 2 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.

Table 41.80 PIC2ADTEN7nj Register Contents (3/3)

Bit Position	Bit Name	Function
3	PIC2ADTEN7nj03	Inverted timer output signal for ATOM2 for channel 1 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
2	PIC2ADTEN7nj02	Timer output signals for ATOM2 for channel 1 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
1	PIC2ADTEN7nj01	Inverted timer output signal for ATOM2 for channel 0 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
0	PIC2ADTEN7nj00	Timer output signals for ATOM2 for channel 0 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.

41.3.2.9 PIC2ADTEN8nj — A/D Converter Trigger Output Select Control Register 8nj (n = 0, 1; j = 0 to 4)

The PIC2ADTEN8nj register enables a trigger source from GTM timer output to be selected as an ADCJn trigger (n = 0, 1; j = 0 to 4).

Access: This register can be read or written in 16-bit or 32-bit units.

Address: <PIC20_base> + 300_H (n = 0, j = 0), <PIC20_base> + 304_H (n = 0, j = 1),
<PIC20_base> + 308_H (n = 0, j = 2), <PIC20_base> + $30C_H$ (n = 0, j = 3),
<PIC20_base> + 310_H (n = 0, j = 4),
<PIC20_base> + 320_H (n = 1, j = 0), <PIC20_base> + 324_H (n = 1, j = 1),
<PIC20_base> + 328_H (n = 1, j = 2), <PIC20_base> + $32C_H$ (n =1, j = 3),
<PIC20_base> + 330_H (n = 1, j = 4)

Value after reset: $0000\ 0000_H$

10	PIC2ADTEN8nj 10	MCS1 interrupt for channel 2 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
9	PIC2ADTEN8nj 09	MCS1 interrupt for channel 1 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
8	PIC2ADTEN8nj 08	MCS1 interrupt for channel 0 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
7	PIC2ADTEN8nj 07	MCS0 interrupt for channel 7 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
6	PIC2ADTEN8nj 06	MCS0 interrupt for channel 6 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
5	PIC2ADTEN8nj 05	MCS0 interrupt for channel 5 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
4	PIC2ADTEN8nj 04	MCS0 interrupt for channel 4 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.

Table 41.81 PIC2ADTEN8nj Register Contents (3/3)

Bit Position	Bit Name	Function
3	PIC2ADTEN8nj03	MCS0 interrupt for channel 3 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
2	PIC2ADTEN8nj02	MCS0 interrupt for channel 2 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
1	PIC2ADTEN8nj01	MCS0 interrupt for channel 1 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.
0	PIC2ADTEN8nj00	MCS0 interrupt for channel 0 0: Selection of the above signal as an ADCJ trigger is disabled. 1: Selection of the above signal as an ADCJ trigger is enabled.

41.3.2.10 PIC2ENHIZDTM — Hi-Z Function for GTM Output Enable Control Register

The PIC2ENHIZDTM register enables Hi-Z function for GTM outputs.

Access: This register can be read or written in 8-bit units.

Address: <PIC20_base> + $A00_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HIZ3ECM	HIZ2ECM	HIZ1ECM	HIZ0ECM	HIZ3ESO	HIZ2ESO	HIZ1ESO	HIZ0ESO
Value after reset	0	0	0	0	0	0	0	0

Table 41.82 PIC2ENHIZDTM Register Contents

Bit Position	Bit Name	Function
7	HIZ3ECM	Enables/disables Hi-Z control by ECM for GTM ATOM3 outputs 0: Disabled 1: Enabled
6	HIZ2ECM	Enables/disables Hi-Z control by ECM for GTM ATOM2 outputs 0: Disabled 1: Enabled
5	HIZ1ECM	Enables/disables Hi-Z control by ECM for GTM ATOM1 outputs 0: Disabled 1: Enabled
4	HIZ0ECM	Enables/disables Hi-Z control by ECM for GTM ATOM0 outputs 0: Disabled 1: Enabled
3	HIZ3ESO	Enables/disables Hi-Z control by $\overline{ESO3}$ for GTM ATOM3 outputs 0: Disabled 1: Enabled
2	HIZ2ESO	Enables/disables Hi-Z control by $\overline{ESO2}$ for GTM ATOM2 outputs 0: Disabled 1: Enabled
1	HIZ1ESO	Enables/disables Hi-Z control by $\overline{ESO1}$ for GTM ATOM1 outputs 0: Disabled 1: Enabled
0	HIZ0ESO	Enables/disables Hi-Z control by $\overline{ESO0}$ for GTM ATOM0 outputs 0: Disabled 1: Enabled

41.3.2.11 PIC2ENCAnTSEL — Encoder Timer n Trigger Selection Control Register (n = 0, 1)

The PIC2ENCAnTSEL register selects a trigger for ENCAnTTIN0 (n = 0, 1).

Access: This register can be read or written in 16-bit or 32-bit units.

Address: <PIC21_base> + 000_H (n = 0),
<PIC21_base> + 020_H (n = 1)

Value after reset: 0000 0000_H

Table 41.83 PIC2ENCAnTSEL Register Contents (1/2)

Bit Position	Bit Name	Function
31	PIC2ENCAnTSEL31	Selects the INTENCA1IEC as a trigger source for ENCAnTTIN0. (INTENCA1IEC clear interrupt signal by encoder) 0: INTENCA1IEC is not selected. 1: INTENCA1IEC is selected.
30	PIC2ENCAnTSEL30	Selects the INTENCA1I1 as a trigger source for ENCAnTTIN0. (INTENCA1I1 compare 1 match or capture 1 interrupt) 0: INTENCA1I1 is not selected. 1: INTENCA1I1 is selected.
29	PIC2ENCAnTSEL29	Selects the INTENCA1I0 as a trigger source for ENCAnTTIN0. (INTENCA1I0 compare 0 match or capture 0 interrupt) 0: INTENCA1I0 is not selected. 1: INTENCA1I0 is selected.
28	PIC2ENCAnTSEL28	Selects the INTENCA0IEC as a trigger source for ENCAnTTIN0. (INTENCA0IEC clear interrupt signal by encoder) 0: INTENCA0IEC is not selected. 1: INTENCA0IEC is selected.
27	PIC2ENCAnTSEL27	Selects the INTENCA0I1 as a trigger source for ENCAnTTIN0. (INTENCA0I1 compare 1 match or capture 1 interrupt) 0: INTENCA0I1 is not selected. 1: INTENCA0I1 is selected.
26	PIC2ENCAnTSEL26	Selects the INTENCA0I0 as a trigger source for ENCAnTTIN0. (INTENCA0I0 compare 0 match or capture 0 interrupt) 0: INTENCA0I0 is not selected. 1: INTENCA0I0 is selected.
25 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	PIC2ENCAnTSEL05	Selects the ENCA1I0 pin as a trigger source for ENCAnTTIN0. 0: ENCA1I0 is not selected. 1: ENCA1I0 is selected.
4	PIC2ENCAnTSEL04	Selects the ENCA0I0 pin as a trigger source for ENCAnTTIN0. 0: ENCA0I0 is not selected. 1: ENCA0I0 is selected.

Table 41.83 PIC2ENCAnTSEL Register Contents (2/2)

Bit Position	Bit Name	Function
3	PIC2ENCAn TSEL03	Output value of GTM timer output and TIM interrupt selected by PIC2ENCATCFG1 bit 15 to 8. 0: Selection of the above signal as an ENCA trigger is disabled. 1: Selection of the above signal as an ENCA trigger is enabled.
2	PIC2ENCAn TSEL02	Output value of GTM timer output and TIM interrupt selected by PIC2ENCATCFG1 bit 7 to 0. 0: Selection of the above signal as an ENCA trigger is disabled. 1: Selection of the above signal as an ENCA trigger is enabled.
1	PIC2ENCAn TSEL01	Output value of GTM timer output and TIM interrupt selected by PIC2ENCATCFG0 bit 15 to 8. 0: Selection of the above signal as an ENCA trigger is disabled. 1: Selection of the above signal as an ENCA trigger is enabled.
0	PIC2ENCAn TSEL00	Output value of GTM timer output and TIM interrupt selected by PIC2ENCATCFG0 bit 7 to 0. 0: Selection of the above signal as an ENCA trigger is disabled. 1: Selection of the above signal as an ENCA trigger is enabled.

41.3.2.12 PIC2PSI5SnENk — PSI5-Sn Sync Output Control Register k (n = 0, 1; k = 0 to 3)

The PIC2PSI5SnENk register selects a source of a sync trigger of PSI5-Sn (n = 0, 1; k = 0 to 3).

Access: This register can be read or written in 16-bit or 32-bit units.

Address: <PIC22_base> + 070_H (n = 0, k = 0), <PIC22_base> + 074_H (n = 0, k = 1),
<PIC22_base> + 078_H (n = 0, k = 2), <PIC22_base> + $07C_H$ (n = 0, k = 3),
<PIC22_base> + $0A0_H$ (n = 1, k = 0), <PIC22_base> + $0A4_H$ (n = 1, k = 1),
<PIC22_base> + $0A8_H$ (n = 1, k = 2), <PIC22_base> + $0AC_H$ (n = 1, k = 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

41.3.3 Function

41.3.3.1 ADCJ Trigger Select Function

(1) Overview

The function allows generation of ADCJ hardware trigger signal for individual scan groups by the signals from each IP. The IPs can be selected from TAUD0, TAUD1, GTM, TAUJ0, TAUJ1, TAPA0, ENCA0, ENCA1, TSG30, TSG31 and ADCJn external trigger pins.

(2) Configuration

The ADCJ trigger select function is realized by using individual IPs and PIC2 in combination. The following figure shows the block diagram of ADCJ trigger select function.

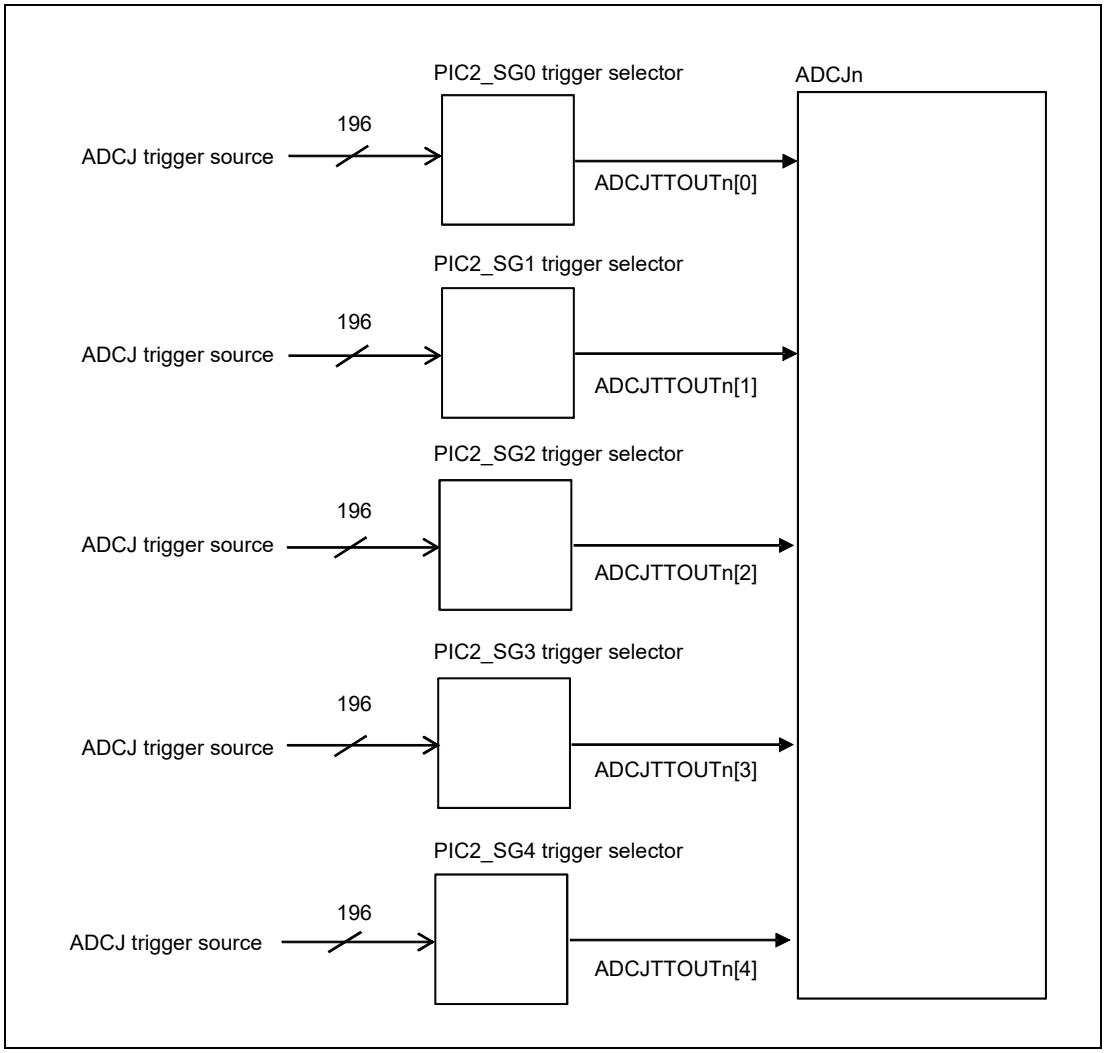

Figure 41.53 Block Diagram of ADCJ Trigger Select Function

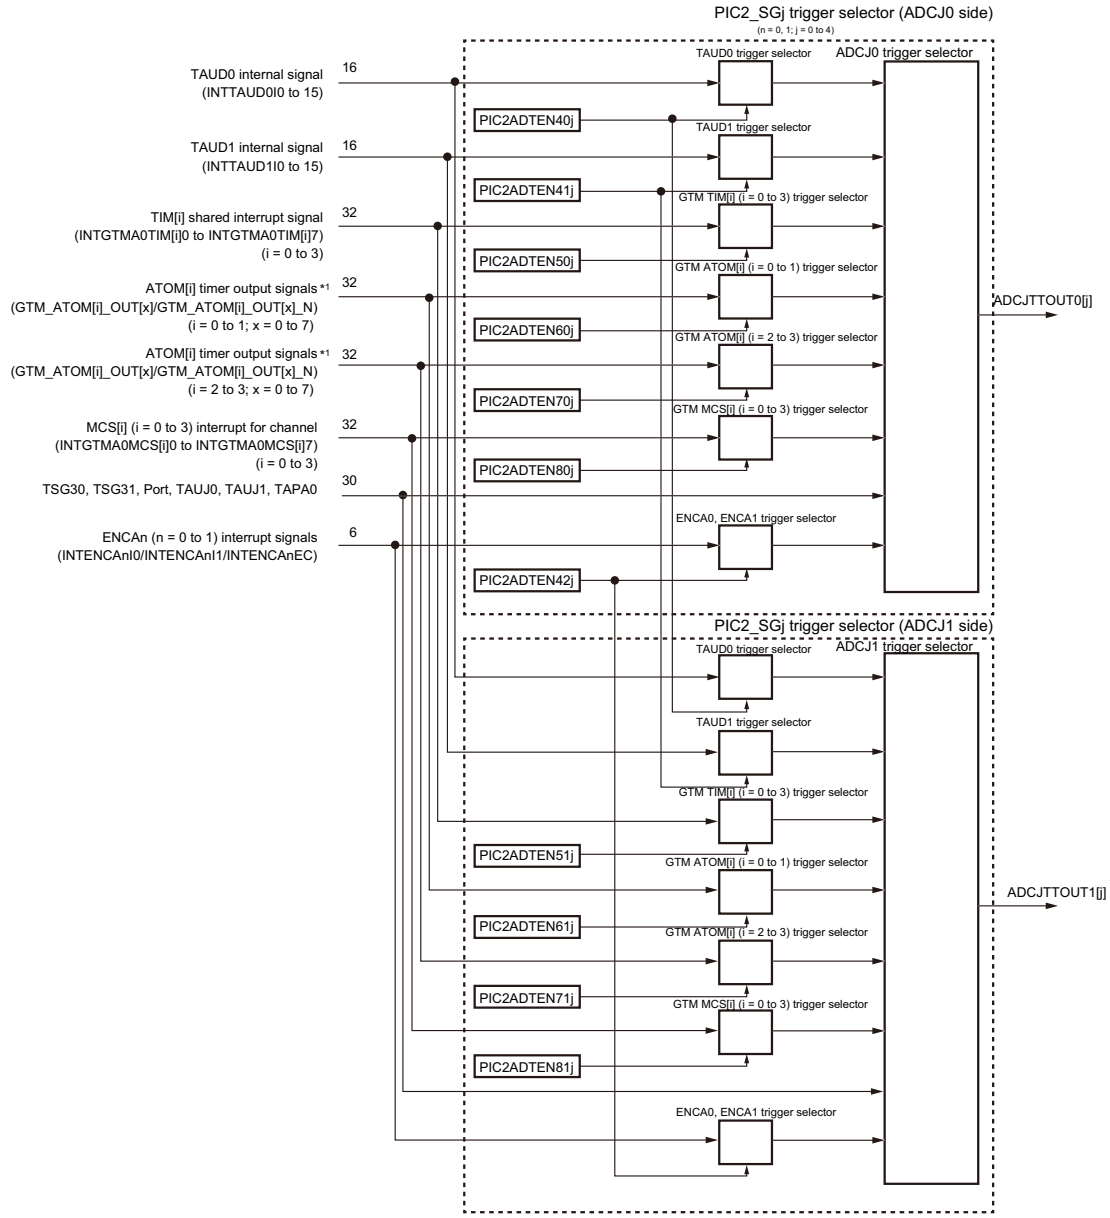


Note 1. PIC2 detects only the rising edge from the above GTM signals and generates a pulse at the time. Each pulse is used as the trigger source for each ADCJn (n=0-1) instead of the above GTM signals. Therefore, to use falling edges of the above GTM signals to trigger the ADCJn scan group, select the rising edge detection by the PIC2ADCJnEDGSEL register, and generate a pulse at the falling edge with reference to one of the examples shown below.

- Invert the polarity of the GTM signal in the GTM, and select the inverted signal as the trigger source in the PIC2.
- Use the DTM in the GTM to generate a pulse synchronized with the falling edge of the GTM signal.
- Use a TIM in the GTM, route the ATOM signal to the TIM auxiliary input (TIM_AUX_IN), and generate an interrupt pulse (INTGTMA0TIM[i][x]) by detecting the falling edge of the ATOM with the TIM.

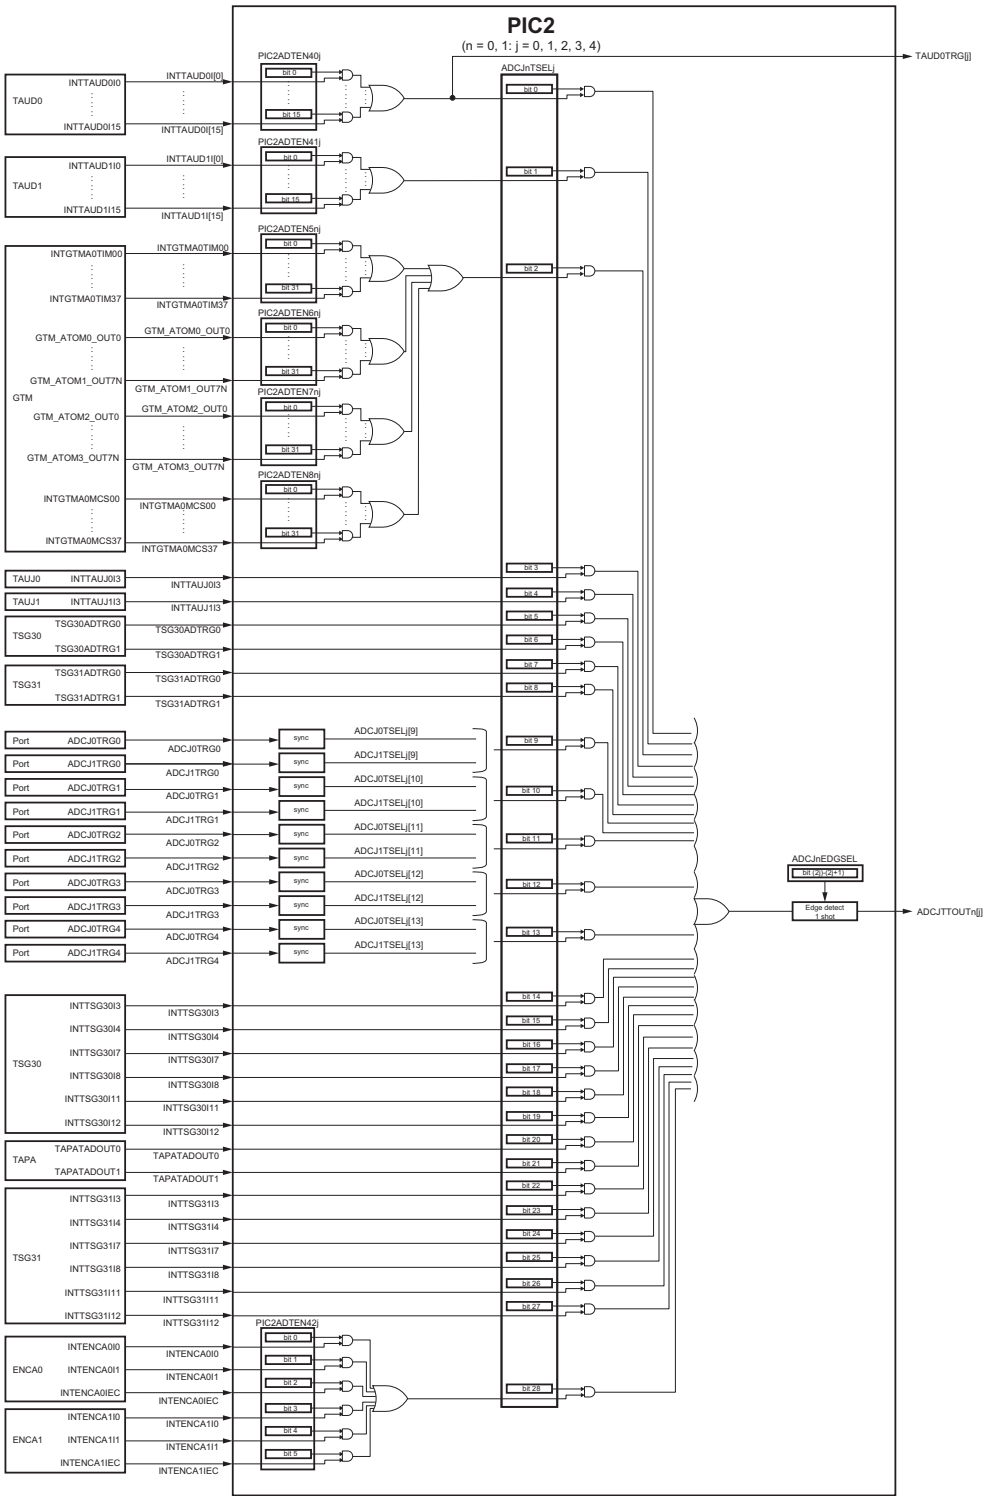
When using both rising and falling edges to trigger the ADCJn scan group, choose one of the following options:

- Generate the trigger pulses at the rising edge and the falling edge individually and merge them by using PIC2.
- Generate the pulses at both edges by the DTM in the GTM.

Figure 41.54 Block Diagram of PIC2_SGj Trigger Selection

(3) Registers

For the settings of the registers used in this function, see **Figure 41.55, Block Diagram of PIC2**, and from **Section 41.3.2.2** to **Section 41.3.2.4.**



Note 1. For external trigger signal, a delay of up to two clock cycles (12.5ns (80 MHz) @ 1clk) is generated because of the synchronization circuit (Sync) which needs to be considered when selecting an external trigger signal as the ADCJ trigger.

Figure 41.55 Block Diagram of PIC2

(4) Function

A/D trigger signal can be selected for individual ADCJn scan groups and output can be selected from rising edge, falling edge, and both edges. The TAUD trigger for the scan group with the same number is shared between ADCJ0 and ADCJ1.

(5) Flow

Set this function before starting A/D converter.

41.3.3.2 Baud Rate Measurement for an UART (RLIN3)

To measure the baud rate of the received data a connection from the RLIN3 soft macro data input (RX) to GTM input is made. The connection can be selected by a control register.

Table 41.93 Connections between RLIN3 and GTM

Signal source	GTM input	Supporting device									
		RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
RLIN30RX	GTM_TIM0_IN5	√	√	√	√	√	√	√	√	√	√
RLIN31RX	GTM_TIM0_IN6	√	√	√	√	√	√	√	√	—	—
RLIN32RX	GTM_TIM1_IN5	√	√	√	√	√	√	√	√	—	√
RLIN33RX	GTM_TIM1_IN6	√	√	√	√	√	√	√	√	√	√

41.3.3.3 Hi-Z Control Function Over External Pin for GTM Output

The I/O driven by GTM output can be set to Hi-Z over an external pin but also by the ECM module within 50 ns. The path to Hi-Z control of the I/O buffers can be enabled by a register in the PIC module.

The signals from the ECM and from the ESO pin can be masked independently from each other.

For this device, GTM has four output groups and each group has an independent Hi-Z control signal.

The controlled output signals are GTMAT[i]O[x] and GTMAT[i]O[x]N with i = 0 to 3 and x = 0 to 7.

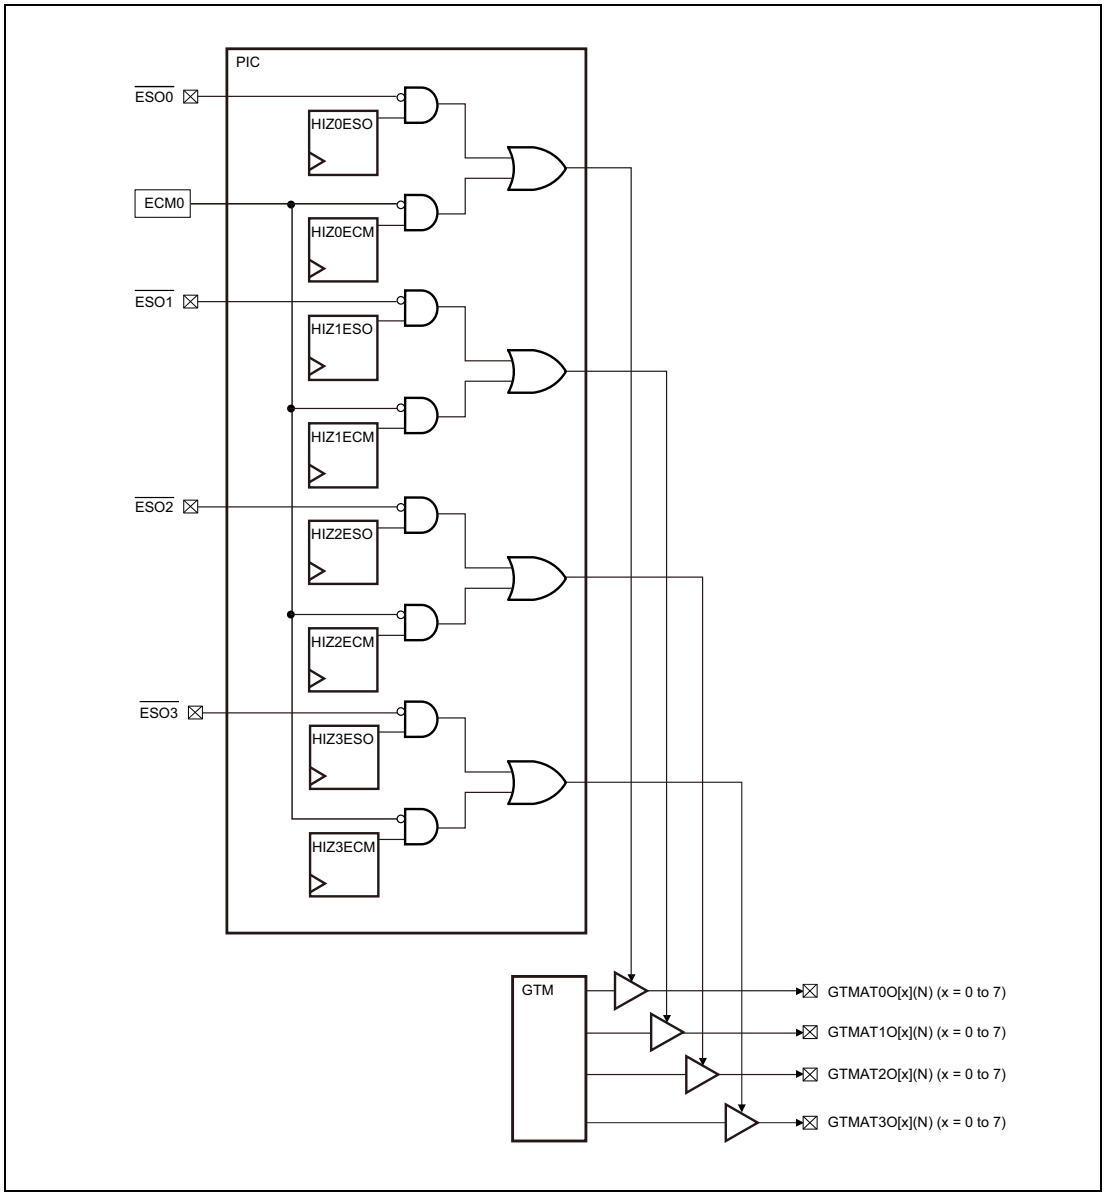


Figure 41.56 Hi-Z Control of GTM Output

41.3.3.4 GTM Output Monitor for PWM Diagnostic

This function helps to verify the output of the GTM by loop-back. The monitoring point is in the IO-buffer itself were the input path must be enabled over the port function. The signal is routed back to GTM input over the PIC. In the PIC this path can be enabled over a register. The block diagram is shown in **Figure 41.57**.

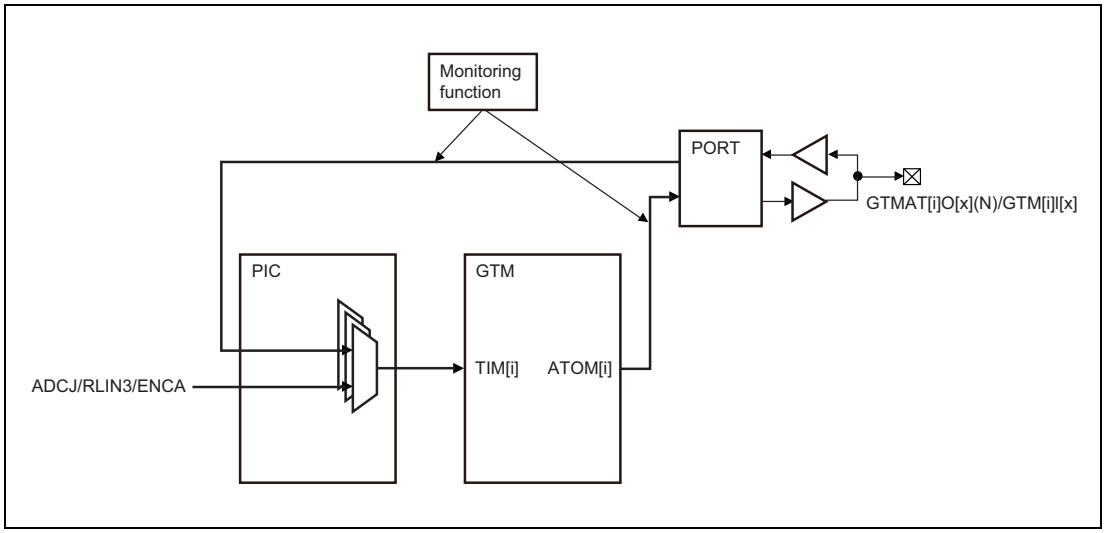

Figure 41.57 Block Diagram for GTM Output Monitoring Function

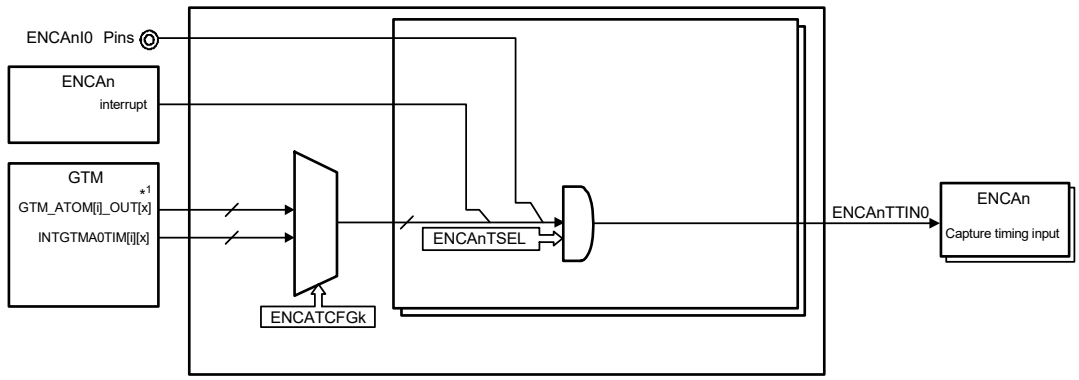
The assignment of the GTM outputs and the corresponding GTM inputs is bound to the pin multiplexing since the monitoring point is the pin itself. For details of the assignment, refer to **Section 2, Pin Functions**.

Note: For this function the respective port has to be set into bi-directional mode and TIM[i] inputs have to be configured accordingly.

41.3.3.5 ENCA Trigger Selection Function

ENCA has the trigger which captures the encoder counter value to a capture register. It's possible to map GTM output to capture trigger of ENCA. In this case GTM outputs are multiplexed.

- GTM trigger selection
  ENCA trigger can be generated from GTM_ATOM[i]_OUT[x]*1 and INTGTMA0TIM[i][x] (i = 0 to 3; x = 0 to 7).



Note 1. PIC2 detects only the rising edge from the above GTM signals and generates a pulse at the time.
Each pulse is used as the trigger source for each ENCAn instead of the above ATOM signals.

Therefore, to use falling edges of the above ATOM signals to capture the encoder counter value, select the rising edge detection by the ENCAnIOC0 register, and generate a pulse at the falling edge with reference to one of the example as shown below.
- Invert the polarity of the ATOM signal in the GTM, and select the inverted signal as the trigger source in the PIC2.
- Use the DTM in the GTM to generate a pulse synchronized with the falling edge of the GTM signal.
- Use a TIM in the GTM, route the ATOM signal to the TIM auxiliary input (TIM_AUX_IN), and generate an interrupt pulse (INTGTMA0TIM[i][x]) by detecting the falling edge of the ATOM signal with the TIM.

When using both rising and falling edges to capture the encoder counter value, choose one of the following options:
- Generate the trigger pulses at the rising edge and the falling edge individually and merge them by using PIC2.
- Generate the pulses at both edges by the DTM from ATOM signals.
- Generate TIM interrupts at the rising and falling edges of ATOM signals.

Figure 41.58 Block Diagram of Trigger Selection Function of ENCA

41.3.3.6 PSI5-S Timestamp and the Sync Pulse Signal Selection Function

PSI5-S has Time stamp and Sync Pulse Generation. GTM outputs can be mapped to Time stamp (clock, enable, clear) and Sync Pulse of PSI5-S. GTM outputs in this case are multiplexed.

- GTM trigger selection
  PSI5-S time stamp trigger and sync pulse can be generated from GTM_ATOM[i]_OUT[x] (i = 0 to 3; x = 0 to 7).

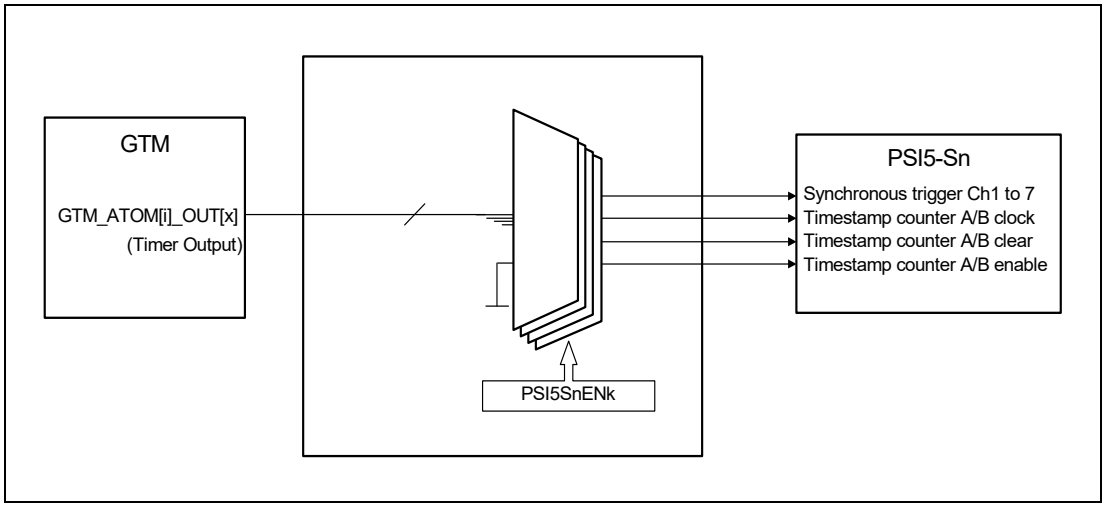


Figure 41.59 Block Diagram of Trigger Selection Function of PSI5-S

41.3.3.7 GTM Timer Input (TIM) Selection Function

Source of GTM Timer Input signals for TIM[i] (i: 0 to 3) can be selected from

- PORT
  It's possible to select the GTM timer input chosen in GPIO. (Defaults)
- ADCJ
  It's possible to select AD conversion end interrupt as timer input of GTM.
- ENCA
  It's possible to select count clock and down-count enable signal from encoder input (phase A, phase B, phase Z) and compare capture interrupt and phase Z edge detection as timer input of GTM.
- RLIN
  It's possible to select RLIN3 soft macro data input (RX) as timer input of GTM.

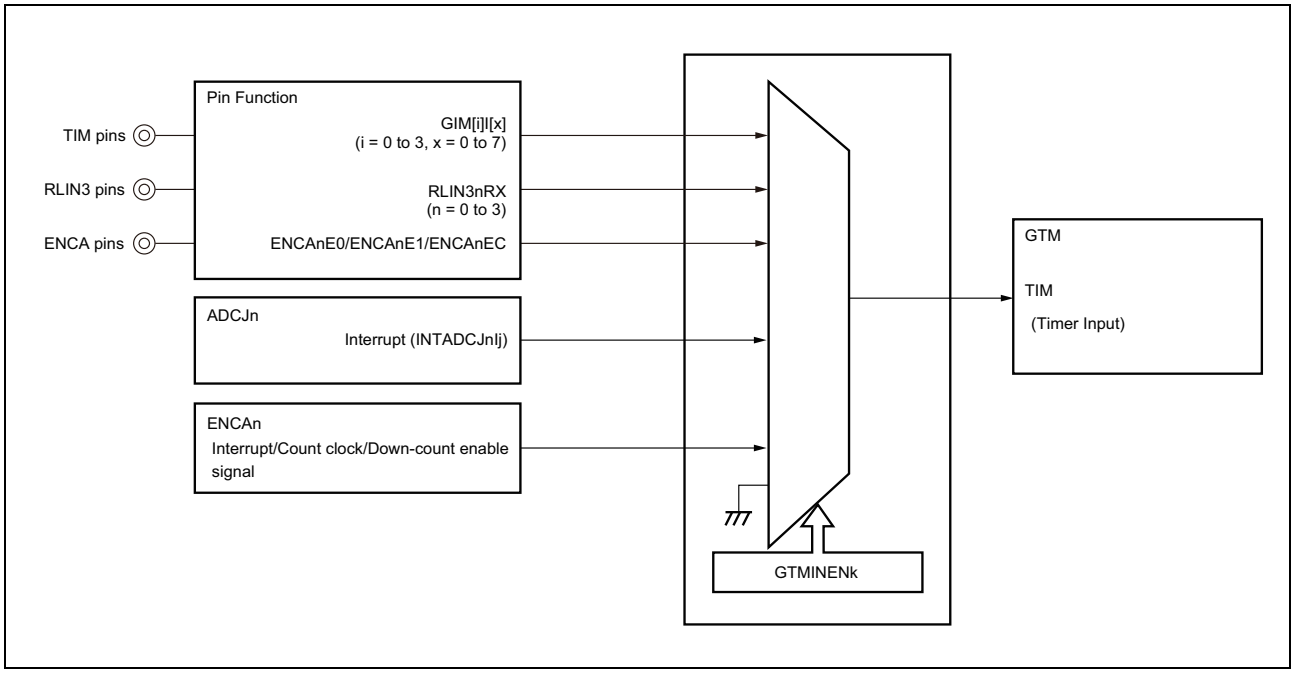

Figure 41.60 Block Diagram of Trigger Selection Function of GTM

41.3.3.8 ENCA Encoder Input Selection

It's possible to select encoder input of an encoder timer (phase A, phase B, phase Z) to ENCAn.

Encoder input can be selected as series, parallel or cascade connection.

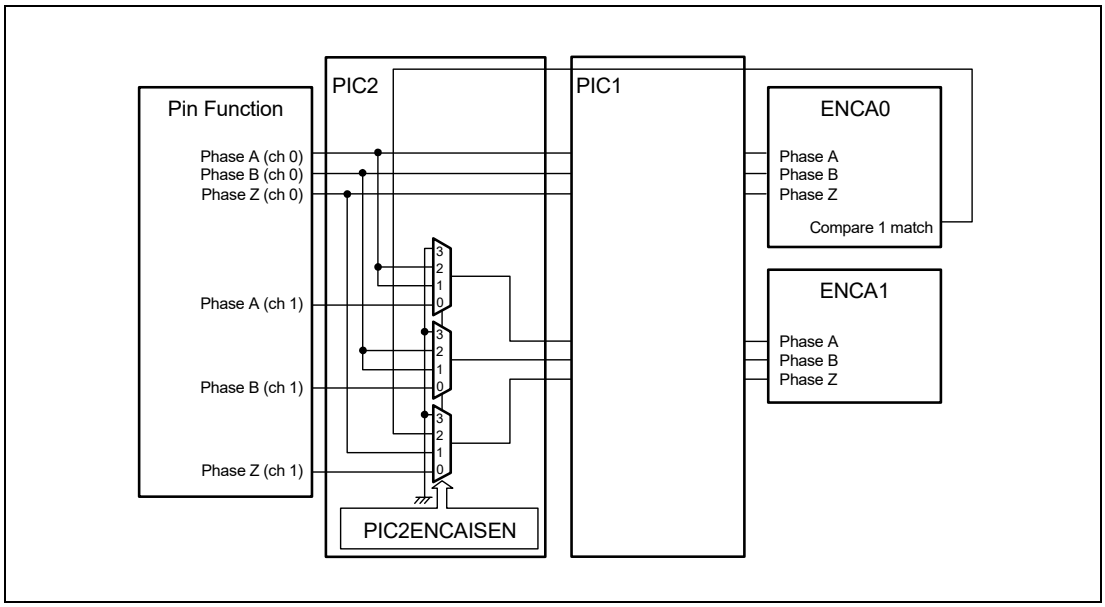

Figure 41.61 Block Diagram of ENCA Input Selection Function

Section 42 PWM Output/Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).

The first part of this section describes all RH850/U2A-EVA specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the units constituting PWM-Diag.

42.1 Features PWM-Diag for RH850/U2A-EVA

42.1.1 Number of Units and Channels

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGC blocks that generate PWM signals, and a PWSD block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGC unit has one PWM channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 42.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)

Number of Units	96 (n = 0 to 95)	96 (n = 0 to 95)	96 (n = 0 to 95)	96 (n = 0 to 95)	96 (n = 0 to 95)	96 (n = 0 to 95)	96 (n = 0 to 95)	76 (n = 0 to 8, 11 to 14, 19 to 21, 26 to 69, 71 to 86)	50 (n = 0, 14, 20, 21, 27, 28, 30, 31, 33 to 46, 49, 52 to 63, 65, 66, 68,69, 73, 74, 77 to 80, 82 to 86)	64 (n = 0, 2, 11 to 21, 23, 26 to 31, 34 to 40, 44, 45, 48 to 69, 71 to 83)
Name	PWGCn									
Number of Units	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)
Name	PWSDn									

Table 42.2 Indices (1/2)

Index	Description
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register.
m	The PWBA generation clock and PWGC period setting registers are identified by the index “m” (m = 0 to 3); for example, PWBAnBRSm indicates the PWMCLKm clock cycle configuration register.
x	An A/D converter configuration register number or A/D conversion result corresponding to a PWM-Diag channel is identified by the index “x”; for example, PWSDnPVCRx (x = 00 to 95).
j	Registers storing trigger channel numbers (encoded value) from PWGCn are identified by the index “j”; for example, the PWSDnQUEj register (j = 0 to 7).
k	Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGCk register (k = 0 to 2).

Table 42.2 Indices (2/2)

Index	Description
h	Sets of registers where each has the same function are identified by the index “h”; for example, the PWGCINTFhk register (h = 0 to 3).
v	Throughout this section, individual units of A/D converter are identified by the index “v”; for example, ADCJvPWDVCR register (v = 0 to 2).
q	Sets of registers where each has the same function are identified by the index “q”; for example, the PWGCPRDSLq register (q = 0 to 5).

The following table shows values indicated by the indices of each product.

Table 42.3 Indices of Products

Indices of each product									
RH850/U2A-EVA (516 pins)	**RH850/ U2A16 (516 pins)**	**RH850/ U2A16 (373 pins)**	**RH850/ U2A16 (292 pins)**	**RH850/ U2A8 (373 pins)**	**RH850/ U2A8 (292 pins)**	**RH850/ U2A6 (292 pins)**	**RH850/ U2A6 (176 pins)**	**RH850/ U2A6 (156 pins)**	**RH850/ U2A6 (144 pins)**
m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3	m = 0 to 3
x = 00 to 95	x = 00 to 95	x = 00 to 95	x = 00 to 95	x = 00 to 95	x = 00 to 95	x = 00 to 95	x = 0 to 8, 11 to 14, 19 to 21, 26 to 69, 71 to 86	x = 0, 14, 20, 21, 27, 28, 30, 31, 33 to 46, 49, 52 to 63, 65, 66, 68,69, 73, 74, 77 to 80, 82 to 86	x = 0, 2, 11 to 21, 23, 26 to 31, 34 to 40, 44, 45, 48 to 69, 71 to 83

42.1.2 Register Base Addresses

PWM-Diag base addresses are listed in the following table.

PWM-Diag register addresses are given as offsets from the base addresses.

Table 42.4 Register Base Addresses

Base Address Name	Base Address	Bus Group
<PWBAn_base>	FFEF F000$_H$	P-Bus Group 6L
<PWGCn_base>	FFF0 0000$_H$ + 200$_H$ × n	P-Bus Group 6L
<PWSDn_base>	FFF0 E000$_H$	P-Bus Group 6L
<SLPW_base>	FFF0 C000$_H$	P-Bus Group 6L
<PWGCINTF_base>	FFF0 C200$_H$	P-Bus Group 6L

42.1.3 Clock Supply

The PWM-Diag clock supply is shown in the following table.

Table 42.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
PWBAn	PCLK	CLK_LSB	Peripheral low speed clock
PWGCn	PCLK	CLK_LSB	Peripheral low speed clock
PWSDn	PCLK	CLK_LSB	Peripheral low speed clock
SLPW	PCLK	CLK_LSB	Peripheral low speed clock
PWGCINTFhk	PCLK	CLK_LSB	Peripheral low speed clock

42.1.4 Interrupt Requests and Error Notifications

PWM-Diag interrupt requests are listed in the following table.

Table 42.6 Interrupt Requests (1/3)

Unit Interrupt Signal	Signal Outline	Interrupt Number	DMA/DTS Trigger Number
PWGC_INT0	PWGC0 interrupt	660, 663, 666, 669	—
PWGC_INT1	PWGC1 interrupt	660, 663, 666, 669	—
PWGC_INT2	PWGC2 interrupt	660, 663, 666, 669	—
PWGC_INT3	PWGC3 interrupt	660, 663, 666, 669	—
PWGC_INT4	PWGC4 interrupt	660, 663, 666, 669	—
PWGC_INT5	PWGC5 interrupt	660, 663, 666, 669	—
PWGC_INT6	PWGC6 interrupt	660, 663, 666, 669	—
PWGC_INT7	PWGC7 interrupt	660, 663, 666, 669	—
PWGC_INT8	PWGC8 interrupt	660, 663, 666, 669	—
PWGC_INT9	PWGC9 interrupt	660, 663, 666, 669	—
PWGC_INT10	PWGC10 interrupt	660, 663, 666, 669	—
PWGC_INT11	PWGC11 interrupt	660, 663, 666, 669	—
PWGC_INT12	PWGC12 interrupt	660, 663, 666, 669	—
PWGC_INT13	PWGC13 interrupt	660, 663, 666, 669	—
PWGC_INT14	PWGC14 interrupt	660, 663, 666, 669	—
PWGC_INT15	PWGC15 interrupt	660, 663, 666, 669	—
PWGC_INT16	PWGC16 interrupt	660, 663, 666, 669	—
PWGC_INT17	PWGC17 interrupt	660, 663, 666, 669	—
PWGC_INT18	PWGC18 interrupt	660, 663, 666, 669	—
PWGC_INT19	PWGC19 interrupt	660, 663, 666, 669	—
PWGC_INT20	PWGC20 interrupt	660, 663, 666, 669	—
PWGC_INT21	PWGC21 interrupt	660, 663, 666, 669	—
PWGC_INT22	PWGC22 interrupt	660, 663, 666, 669	—
PWGC_INT23	PWGC23 interrupt	660, 663, 666, 669	—
PWGC_INT24	PWGC24 interrupt	660, 663, 666, 669	—
PWGC_INT25	PWGC25 interrupt	660, 663, 666, 669	—
PWGC_INT26	PWGC26 interrupt	660, 663, 666, 669	—
PWGC_INT27	PWGC27 interrupt	660, 663, 666, 669	—

Table 42.6 Interrupt Requests (2/3)

Unit Interrupt Signal	Signal Outline	Interrupt Number	DMA/DTS Trigger Number
PWGC_INT28	PWGC28 interrupt	660, 663, 666, 669	—
PWGC_INT29	PWGC29 interrupt	660, 663, 666, 669	—
PWGC_INT30	PWGC30 interrupt	660, 663, 666, 669	—
PWGC_INT31	PWGC31 interrupt	660, 663, 666, 669	—
PWGC_INT32	PWGC32 interrupt	661, 664, 667, 670	—
PWGC_INT33	PWGC33 interrupt	661, 664, 667, 670	—
PWGC_INT34	PWGC34 interrupt	661, 664, 667, 670	—
PWGC_INT35	PWGC35 interrupt	661, 664, 667, 670	—
PWGC_INT36	PWGC36 interrupt	661, 664, 667, 670	—
PWGC_INT37	PWGC37 interrupt	661, 664, 667, 670	—
PWGC_INT38	PWGC38 interrupt	661, 664, 667, 670	—
PWGC_INT39	PWGC39 interrupt	661, 664, 667, 670	—
PWGC_INT40	PWGC40 interrupt	661, 664, 667, 670	—
PWGC_INT41	PWGC41 interrupt	661, 664, 667, 670	—
PWGC_INT42	PWGC42 interrupt	661, 664, 667, 670	—
PWGC_INT43	PWGC43 interrupt	661, 664, 667, 670	—
PWGC_INT44	PWGC44 interrupt	661, 664, 667, 670	—
PWGC_INT45	PWGC45 interrupt	661, 664, 667, 670	—
PWGC_INT46	PWGC46 interrupt	661, 664, 667, 670	—
PWGC_INT47	PWGC47 interrupt	661, 664, 667, 670	—
PWGC_INT48	PWGC48 interrupt	661, 664, 667, 670	—
PWGC_INT49	PWGC49 interrupt	661, 664, 667, 670	—
PWGC_INT50	PWGC50 interrupt	661, 664, 667, 670	—
PWGC_INT51	PWGC51 interrupt	661, 664, 667, 670	—
PWGC_INT52	PWGC52 interrupt	661, 664, 667, 670	—
PWGC_INT53	PWGC53 interrupt	661, 664, 667, 670	—
PWGC_INT54	PWGC54 interrupt	661, 664, 667, 670	—
PWGC_INT55	PWGC55 interrupt	661, 664, 667, 670	—
PWGC_INT56	PWGC56 interrupt	661, 664, 667, 670	—
PWGC_INT57	PWGC57 interrupt	661, 664, 667, 670	—
PWGC_INT58	PWGC58 interrupt	661, 664, 667, 670	—
PWGC_INT59	PWGC59 interrupt	661, 664, 667, 670	—
PWGC_INT60	PWGC60 interrupt	661, 664, 667, 670	—
PWGC_INT61	PWGC61 interrupt	661, 664, 667, 670	—
PWGC_INT62	PWGC62 interrupt	661, 664, 667, 670	—
PWGC_INT63	PWGC63 interrupt	661, 664, 667, 670	—
PWGC_INT64	PWGC64 interrupt	662, 665, 668, 671	—
PWGC_INT65	PWGC65 interrupt	662, 665, 668, 671	—
PWGC_INT66	PWGC66 interrupt	662, 665, 668, 671	—
PWGC_INT67	PWGC67 interrupt	662, 665, 668, 671	—
PWGC_INT68	PWGC68 interrupt	662, 665, 668, 671	—
PWGC_INT69	PWGC69 interrupt	662, 665, 668, 671	—
PWGC_INT70	PWGC70 interrupt	662, 665, 668, 671	—

Table 42.6 Interrupt Requests (3/3)

Unit Interrupt Signal	Signal Outline	Interrupt Number	DMA/DTS Trigger Number
PWGC_INT71	PWGC71 interrupt	662, 665, 668, 671	—
PWGC_INT72	PWGC72 interrupt	662, 665, 668, 671	—
PWGC_INT73	PWGC73 interrupt	662, 665, 668, 671	—
PWGC_INT74	PWGC74 interrupt	662, 665, 668, 671	—
PWGC_INT75	PWGC75 interrupt	662, 665, 668, 671	—
PWGC_INT76	PWGC76 interrupt	662, 665, 668, 671	—
PWGC_INT77	PWGC77 interrupt	662, 665, 668, 671	—
PWGC_INT78	PWGC78 interrupt	662, 665, 668, 671	—
PWGC_INT79	PWGC79 interrupt	662, 665, 668, 671	—
PWGC_INT80	PWGC80 interrupt	662, 665, 668, 671	—
PWGC_INT81	PWGC81 interrupt	662, 665, 668, 671	—
PWGC_INT82	PWGC82 interrupt	662, 665, 668, 671	—
PWGC_INT83	PWGC83 interrupt	662, 665, 668, 671	—
PWGC_INT84	PWGC84 interrupt	662, 665, 668, 671	—
PWGC_INT85	PWGC85 interrupt	662, 665, 668, 671	—
PWGC_INT86	PWGC86 interrupt	662, 665, 668, 671	—
PWGC_INT87	PWGC87 interrupt	662, 665, 668, 671	—
PWGC_INT88	PWGC88 interrupt	662, 665, 668, 671	—
PWGC_INT89	PWGC89 interrupt	662, 665, 668, 671	—
PWGC_INT90	PWGC90 interrupt	662, 665, 668, 671	—
PWGC_INT91	PWGC91 interrupt	662, 665, 668, 671	—
PWGC_INT92	PWGC92 interrupt	662, 665, 668, 671	—
PWGC_INT93	PWGC93 interrupt	662, 665, 668, 671	—
PWGC_INT94	PWGC94 interrupt	662, 665, 668, 671	—
PWGC_INT95	PWGC95 interrupt	662, 665, 668, 671	—
PWSD_INT_QFULL	PWSD queue full interrupt	672	—

This module has no error notifications.

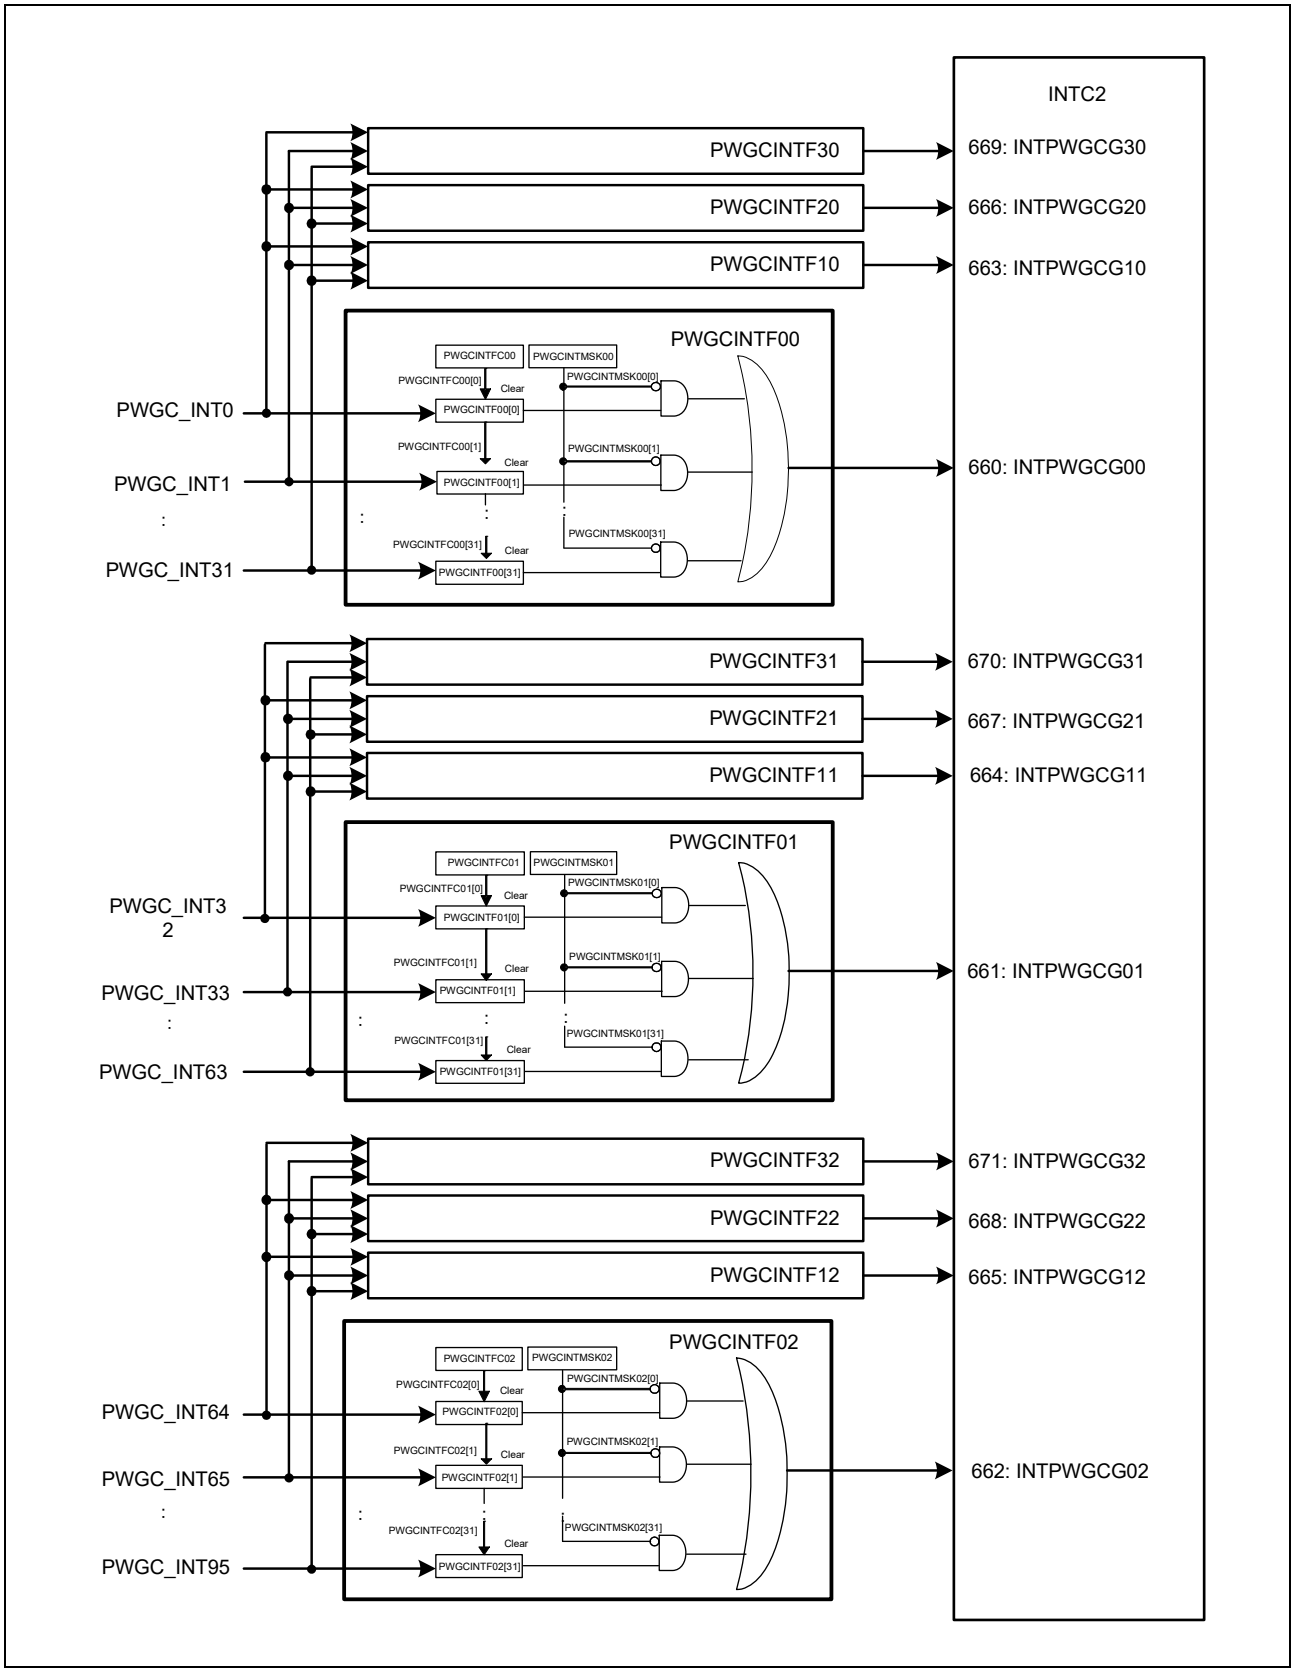

Figure 42.1 PWGC Interrupt Connection Image

42.1.5 Reset Sources

PWM-Diag reset sources are listed in the following table. The individual PWM-Diag units are initialized by these reset sources.

Table 42.7 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
PWBA	All registers	√	√	√	√	√	√	—
PWGCn	All registers	√	√	√	√	√	√	—
PWSD	All registers	√	√	√	√	√	√	—
SLPW	All registers	√	√	√	√	√	√	—
PWGCINTF	All registers	√	√	√	√	√	√	—

42.1.6 External Input/Output Signals

External input/output signals of the PWM-Diag are listed below.

Table 42.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
PWGC_TOUTn (Unit: PWGC)	PWGC unit n output	PWGCnO

42.1.7 Internal Output Signals

The I/O signals for connecting two PWM-Diag channels or a PWM-Diag and another function are listed below.

Table 42.9 Internal Output Signals

Unit Signal Name	Description	Connected to
PWBA		
PWMCLK0	PWGC count clock 0	PWGCn
PWMCLK1	PWGC count clock 1	PWGCn
PWMCLK2	PWGC count clock 2	PWGCn
PWMCLK3	PWGC count clock 3	PWGCn
PWGCn		
PWGC_TRGOUTn	PWGCn trigger	PWSD0
PWSD0		
PWSD_ADTRGv	A/D converter unit select signal	ADCJ0, ADCJ1, ADCJ2
PWSD_PVCR_VALUE[17:0]	A/D converter control signal	ADCJ0, ADCJ1, ADCJ2
ADCJv		
ADC_CONV_ENDv	A/D conversion completion signal	PWSD0
ADC_PWDDRv[15:0]	A/D conversion result signal	PWSD0

42.2 Overview

42.2.1 Functional Overview

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGC), A/D conversion trigger select function (PWSD), and A/D converter (ADCJ).

PWBA

- Clock divider
  PWBA generates a PWMCLKm count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGC.
  The cycle of the PWMCLKm count clock signal can be calculated from the setting of the PWBAnBRSm register by the equation below.
  - When the PWBAnBRSm = 1 to 2047
    PWMCLKm count clock cycle = (PWBAnBRSm value × 2) × PCLK cycle
  - When the PWBAnBRSm = 0
    PWMCLKm count clock cycle = PCLK cycle

PWGC

PWGC outputs PWM waveforms and A/D conversion trigger to PWSD by using the clock PWMCLKm input from PWBA.

- PWM waveform output PWGC_TOUTn
  This generator outputs PWM waveforms from the PWGC_TOUTn pin. The PWM cycle is controlled by the match timing of PWGCnCNT register value and the PWGC_PERIOD input value can be set by PWGCPRDm, PWGCPRDSLq register setting. Set the high-level period of PWM output in the PWGCnCSDR and PWGCnCRDR registers.

  The PWM waveform cycle and duty can be calculated by the equations below.

  PWM waveform cycle = (PWGC_PERIOD + 1) × PWMCLKm count clock cycle

  When PWGCnCRDR[15:0] > PWGCnCSDR[15:0],

  High-level period of PWM waveform =
  (PWGCnCRDR register value – PWGCnCSDR register value)
  × PWMCLKm count clock cycle

  PWM waveform duty (%) = High-level period of PWM waveform/PWM waveform cycle × 100 = (PWGCnCRDR register value – PWGCnCSDR register value)/(PWGC_PERIOD + 1) × 100

  Note that the PWM output is fixed to the low level when the PWGCnCRDR register value is equal to the PWGCnCSDR register value.

  When 1_xxxx_H or value higher than PWGC_PERIOD is set in the PWGCnCRDR register (i.e. bit 16 is set to 1), the PWM output is fixed to the high level.

  During counting state, when PWGCnFOT is set to 1, PWGC_TOUTn is forcibly fixed to the level of selected by PWGCnFOS from the timing of writing to PWGCnFOT to the timing of PWGCnCNT = PWGCnCSBR.

  When counter is stopped during forcible PWGC_TOUTn output level fix, PWGC_TOUTn becomes low level at the timing of stop.

The output level during forcible PWGC_TOUTn output level fix is not affected by changing the value of PWGCnFOS.

- A/D conversion trigger output PWGC_TRGOUTn
  The A/D conversion trigger signal PWGC_TRGOUTn for PWSD is generated when the PWGCnCTDR register value and the PWGCnCNT register value match and its timing can be set by PWGCnOCL.
  The output enable/disable of PWGC_TRGOUTn is controlled by PWGCnTCR register.
  The timing can be calculated by the equation below.

  A/D conversion trigger signal generation timing = PWGCnCTDR register value × PWMCLKm count clock cycle

- PWGC interrupt request signal PWGC_INTn
  PWGC generates the interrupt request signal PWGC_INTn at the timing which PWGCn_CNT value matches with PWGCnCSBR value (regardless of the state of PWGC_TOUT) or PWGCn_CNT value matches with PWGCn_CRBR or PWGCnCNT matches with 0 during PWM 100% output. The time of generation of PWGC_INTn depends on PWGCnCTL[15:14].

PWSD

PWSD transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGC_TRGOUTn from the PWM generator (PWGC).

- A/D conversion control by PWSD
  PWSD outputs the information required for the A/D conversion, which is set in the corresponding PWSDnPVCRx register for the channel number of the trigger input from PWGCn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) to the A/D converter.
  At the same timing, A/D conversion trigger (PWSD_ADTRGv) is output to ADCJ0, ADCJ1 or ADCJ2. (A maximum of eight input trigger signal PWGC_TRGOUTn data received during A/D conversion are stored and kept in PWSDnQUE.)
  The setting information to be output to the A/D converter is kept until the next trigger is generated.
  When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSD triggers the next A/D conversion based on the data stored in the PWSDnQUE register.

- Queuing of A/D conversion triggers from PWGC
  The A/D conversion trigger signal (PWGC_TRGOUTn) input from PWGCn is stored in the PWSDnQUEj register as a channel number. The PWSDnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGC_TRGOUTn received during A/D conversion in a queue structure.
  A PWSD queue full interrupt occurs in the following states, when the queue of the PWSDnQUEj register becomes full:
  - A trigger number is written to PWSDnQUE7
  - A trigger number has already been written to PWSDnQUE7 and cannot be written when PWGC_TRGOUTn is input.

- Storing A/D conversion result
  The A/D conversion result is stored in PWSDnPWDDIRx register.

ADCJ

A/D conversion is executed upon receipt of information required for A/D conversion and A/D conversion trigger from PWSD.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the A/D conversion, it is reported to the PWSD.

For the basic operation of the A/D converter, see **Section 43, Analog to Digital Converter (ADCJ)**.

For the A/D converter operation with the PWM-Diag function, see **Section 43.4.16, PWM-Diag [Example of PWM-Diag]**.

42.2.2 Block Diagram

The following figure shows an example of connecting the LED control circuit combining the PWM-Diag and the A/D converter.

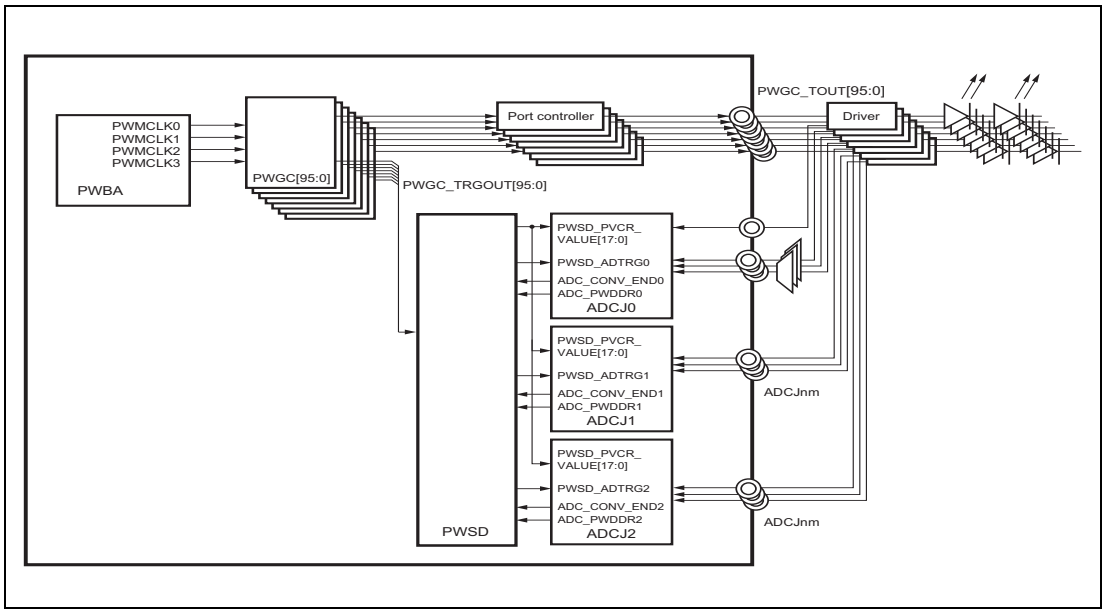

Figure 42.2 Example of Connecting the LED Control Circuit using the PWM-Diag and the A/D Converter

42.3 Registers

42.3.1 List of Registers

PWM Output/Diagnostic registers are listed in the following table.

<PWBAn_base>, <PWSDn_base>, and <PWGCn_base> are defined in **Section 42.1.2, Register Base Addresses**.

Table 42.10 List of Registers (1/2)

Module name	Register name	Symbol	Address	Access size	Access Protection	
					PBG	Other
PWBAn	PWMCLKm cycle configuration register	PWBAnBRSm	<PWBAn_base> + 0004_H × m	16	PBG6L0#5	—
	PWMCLKm enable status register	PWBAnTE	<PWBAn_base> + 0010_H	8	PBG6L0#5	—
	PWMCLKm start trigger register	PWBAnTS	<PWBAn_base> + 0014_H	8	PBG6L0#5	—
	PWMCLKm stop trigger register	PWBAnTT	<PWBAn_base> + 0018_H	8	PBG6L0#5	—
PWGCn	PWM output set condition register	PWGCnCSDR	<PWGCn_base> + 0000_H	16	PBG6L0#5	—
	PWM output reset condition register	PWGCnCRDR	<PWGCn_base> + 0004_H	32	PBG6L0#5	—
	PWGC_TRGOUTn generation condition register	PWGCnCTDR	<PWGCn_base> + 0008_H	16	PBG6L0#5	—
	Buffer register reload trigger register	PWGCnRDT	<PWGCn_base> + $000C_H$	8	PBG6L0#5	—
	PWGC status register	PWGCnST	<PWGCn_base> + 0010_H	16	PBG6L0#5	—
	PWM cycle count register	PWGCnCNT	<PWGCn_base> + 0014_H	16	PBG6L0#5	—
	PWGC_TRGOUTn control register	PWGCnTCR	<PWGCn_base> + 0018_H	8	PBG6L0#5	—
	PWGCnTCR buffer register	PWGCnTCBR	<PWGCn_base> + $001C_H$	8	PBG6L0#5	—
	PWGC control register	PWGCnCTL	<PWGCn_base> + 0020_H	16	PBG6L0#5	—
	PWGCnCSDR buffer register	PWGCnCSBR	<PWGCn_base> + 0024_H	16	PBG6L0#5	—
	PWGCnCRDR buffer register	PWGCnCRBR	<PWGCn_base> + 0028_H	32	PBG6L0#5	—
	PWGCnCTDR buffer register	PWGCnCTBR	<PWGCn_base> + $002C_H$	16	PBG6L0#5	—
	Forcible PWGC_TOUTn output level fix trigger register	PWGCnFOT	<PWGCn_base> + $003C_H$	8	PBG6L0#5	—
SLPWG	PWGC synchronous trigger register	SLPWGCk	<SLPW_base> + k × 4_H	32	PBG6L0#5	—
	PWGC period setting register	PWGCPRDm	<SLPW_base> + $000C_H$ + m × 4_H	16	PBG6L0#5	—
	PWGC period selection register	PWGCPRDSLq	<SLPW_base> + $001C_H$ + q × 4_H	32	PBG6L0#5	—

	PWGC interrupt factor clear register	PWGCINTFChk	<PWGCINTFhk_base> + h × 600_H + k × 200_H + 8_H	32	PBG6L0#5	—

42.3.2 PWBAnBRSm — PWMCLKm Cycle Configuration Register

This register sets the clock cycle of PWMCLKm.

Access: This register can be read or written in 16-bit units.

Address: <PWBAn_base> + 0004_H × m

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWBAnBRSm[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.11 PWBAnBRSm Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	PWBAnBRSm [10:0]	Register for setting the clock cycle of PWMCLKm. – PWBAnBRSm = 0: PWMCLKm = PCLK – PWBAnBRSm = 1: PWMCLKm = PCLK × (2 × 1) – PWBAnBRSm = 2: PWMCLKm = PCLK × (2 × 2) ... – PWBAnBRSm = n: PWMCLKm = PCLK × (2 × n) (n = 1 to 2047) These bits can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).

42.3.3 PWBAnTE — PWMCLKm Enable Status Register

This is a status register that indicates the output status of PWMCLKm (m = 0 to 3).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWBAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTE3	PWBAnTE2	PWBAnTE1	PWBAnTE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 42.12 PWBAnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3	PWBAnTE3	A status flag indicating the operation status of PWMCLK3 0: Not operating 1: Operating
2	PWBAnTE2	A status flag indicating the operation status of PWMCLK2 0: Not operating 1: Operating
1	PWBAnTE1	A status flag indicating the operation status of PWMCLK1 0: Not operating 1: Operating
0	PWBAnTE0	A status flag indicating the operation status of PWMCLK0 0: Not operating 1: Operating

42.3.4 PWBAnTS — PWMCLKm Start Trigger Register

This register is a start trigger register for PWMCLKm (m = 0 to 3).

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWBAn_base> + 0014_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTS3	PWBAnTS2	PWBAnTS1	PWBAnTS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 42.13 PWBAnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3	PWBAnTS3	Start Trigger for PWMCLK3 0: Writing 0 has no effect. 1: Starts the output of PWMCLK3.
2	PWBAnTS2	Start Trigger for PWMCLK2 0: Writing 0 has no effect. 1: Starts the output of PWMCLK2.
1	PWBAnTS1	Start Trigger for PWMCLK1 0: Writing 0 has no effect. 1: Starts the output of PWMCLK1.
0	PWBAnTS0	Start Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Starts the output of PWMCLK0.

42.3.5 PWBAnTT — PWMCLKm Stop Trigger Register

This register is a stop trigger register for PWMCLKm (m = 0 to 3).

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWBAn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTT3	PWBAnTT2	PWBAnTT1	PWBAnTT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 42.14 PWBAnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3	PWBAnTT3	Stop Trigger for PWMCLK3 0: Writing 0 has no effect. 1: Stops the output of PWMCLK3.
2	PWBAnTT2	Stop Trigger for PWMCLK2 0: Writing 0 has no effect. 1: Stops the output of PWMCLK2.
1	PWBAnTT1	Stop Trigger for PWMCLK1 0: Writing 0 has no effect. 1: Stops the output of PWMCLK1.
0	PWBAnTT0	Stop Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Stops the output of PWMCLK0.

42.3.6 PWGCnCTL — PWGC Control Register

PWGCnCTL is used to select the count clock from PWBA, setting output condition of PWGC_TRGOUTn, output level of forcible PWGC_TOUTn output level fix and output permission for interrupt.

Access: This register can be read or written in 16-bit units.

Address: <PWGCn_base> + 0020_H

Value after reset: 8000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnTFIE	PWGCnTRIE	—	—	—	—	—	PWGCnFOS	PWGCnOCL	—	PWGCnTCUT[1:0]		—	—	PWGCnCKS[1:0]	
Value after reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R/W	R/W

Table 42.15 PWGCnCTL Register Contents (1/2)

Bit Position	Bit Name	Function
15	PWGCnTFIE	This bit controls interrupt of PWGC_INTn at timing PWGCnCNT value matches with PWGCn_CRBR or PWGCn_CNT value is 0 during PWGC_TOUT 100% output. 0: PWGC_INTn is disabled 1: PWGC_INTn is enabled Note 1. When PWGCnTFIE = 1, after compare register simultaneous rewrite, when 1st PWGCnCNT = PWGCnCRBR occurs before PWGCnCNT = PWGCnCSBR, PWGC_INTn is not generated. It is generated at the timing of 2nd PWGCnCNT = PWGCnCRBR after PWGCnCNT = PWGCnCSBR. Note 2. When PWGCnTFIE = 1, PWGC_INTn is generated at falling edge of PWGC_TOUTn (PWGCnCNT = PWGCnCRBR) or PWGCnCNT is match with 0 during PWM 100% output.
14	PWGCnTRIE	This bit controls interrupt of PWGC_INTn at timing PWGCnCNT value matches with PWGCn_CSBR value. 0: PWGC_INTn is disabled 1: PWGC_INTn is enabled **Note:** When forcible PWGC_TOUTn output fix level function is used (PWGCnFOT = 1) and PWGCnTRIE = 1, PWGC_INTn is generated when PWGCnCNT matches with PWGCnCSBR regardless of state of PWGC_TOUTn.
13 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PWGCnFOS	This bit selects the output level for forcible PWGC_TOUTn output fix level. 0: PWGC_TOUTn is forcibly fixed to low level 1: PWGC_TOUTn is forcibly fixed to high level
7	PWGCnOCL	This bit selects the PWGC_TRGOUTn output condition related with PWGC_TOUTn*1. 0: PWGC_TRGOUTn output at the condition of high level of PWGC_TOUTn 1: PWGC_TRGOUTn output at the condition of both high and low level of PWGC_TOUTn Note 1. When PWGCnOCL = 0, PWGC_TRGOUTn is generated with checking PWGC_TOUTn output level before applying forcible output level fix even if PWGC_TOUTn output level is forcibly fixed.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 42.15 PWGCnCTL Register Contents (2/2)

Bit Position	Bit Name	Function
5, 4	PWGCnTCUT [1:0]	These bits select the update timing of PWGCnTCBR register*1. 00: No update 01: Update at rising edge of PWGC_TOUTn at the condition of PWGCnTCBR rewrite in progress (PWGCnRSFT = 1) 10: Update at falling edge of PWGC_TOUTn at the condition of PWGCnTCBR rewrite in progress (PWGCnRSFT = 1) 11: Update immediately (PWGCnTCBR rewrite request trigger of PWGCnRDTT = 1 setting is invalid) Note 1. When PWGCnTCUT[1:0] = 01_B or 10_B, forcible PWGC_TOUTn output level fix does not cause updating of PWGCnTCBR. The changing of output level before applying forcible output level fix is used to update PWGCnTCBR.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PWGCnCKS [1:0]	Count Clock Enable Input PWMCLK3 to PWMCLK0 Select 00: Uses PWMCLK0 as count clock 01: Uses PWMCLK1 as count clock 10: Uses PWMCLK2 as count clock 11: Uses PWMCLK3 as count clock These bits can only be rewritten when the PWGCn operation is stopped (SLPWGCk.SLPWGC[31:0] = 0).

42.3.7 PWGCnCNT — PWM Cycle Count Register

This is a count register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGCn_base> + 0014_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.16 PWGCnCNT Register Contents

Bit Position	Bit Name	Function
15 to 0	PWGCnCNT [15:0]	16-bit counter value

42.3.8 PWGCnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGC_TOUTn output.

Access: This register can be read or written in 16-bit units.

Address: <PWGCn_base> + 0000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCSDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.17 PWGCnCSDR Register Contents

Bit Position	Bit Name	Function
15 to 0	PWGCnCSDR [15:0]	These bits set the setting condition for PWM output. The set value is reflected to the PWGCnCSBR register at the start of PWGCn operation (SLPWGCk.SLPWGC of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGCnRDT.PWGCnRDT = 1).

NOTE

The setting of PWGCnCSDR > PWGC_PERIOD is prohibited.

42.3.9 PWGCnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGC_TOUTn output.

Access: This register can be read or written in 32-bit units.

Address: <PWGCn_base> + 0004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWGCnCRDR [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCRDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.18 PWGCnCRDR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16 to 0	PWGCnCRDR [16:0]	These bits set the reset condition for PWM output. The set value is reflected to the PWGCnCRBR register at the start of PWGCn operation (SLPWGCk.SLPWGC of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGCnRDT.PWGCnRDT = 1).

42.3.10 PWGCnCTDR — PWGC_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGC_TRGOUTn.

Access: This register can be read or written in 16-bit units.

Address: <PWGCn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCTDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.19 PWGCnCTDR Register Contents

Bit Position	Bit Name	Function
15 to 0	PWGCnCTDR [15:0]	These bits set the A/D conversion trigger generation condition for PWSDn. The set value is reflected to the PWGCnCTBR register at the start of PWGCn operation (SLPWGCk.SLPWGC of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGCnRDT.PWGCnRDT = 1).

42.3.11 PWGCnCSBR — PWGCnCSDR Buffer Register

This is a buffer register for the PWGCnCSDR register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGCn_base> + 0024_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCSBR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.20 PWGCnCSBR Register Contents

Bit Position	Bit Name	Function
15 to 0	PWGCnCSBR [15:0]	The PWGCnCSDR register value is reflected to this register at the start of PWGCn operation (SLPWGCk.SLPWGC of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGCnRDT.PWGCnRDT = 1). When the value matches the PWGCnCNT register value and does not match the PWGCnCRBR, the pin output is driven high. When PWGC_TOUTn is forcibly fixed, forcible PWGC_TOUTn output level fix is continued until PWGCnCNT = PWGCnCSBR.

42.3.12 PWGCnCRBR — PWGCnCRDR Buffer Register

This is a buffer register for the PWGC_TOUTn reset condition.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PWGCn_base> + 0028_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWGCnCRBR[16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCRBR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.21 PWGCnCRBR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned.
16 to 0	PWGCnCRBR [16:0]	The PWGCnCRDR register value is reflected to this register at the start of PWGCn operation (SLPWGCk.SLPWGC of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGCnRDT.PWGCnRDT = 1). When the value matches the PWGCnCNT register value, the pin output is driven low except for during forcible PWGC_TOUTn output level fix and case that PWGCnCNT = PWGCnCRBR occurs by PWGCnCNT = PWGCnCSBR after compare buffer register simultaneous rewrite.

42.3.13 PWGCnCTBR — PWGCnCTDR Buffer Register

This is a buffer register for the PWGC_TRGOUTn generation condition.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGCn_base> + $002C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCnCTBR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.22 PWGCnCTBR Register Contents

Bit Position	Bit Name	Function
15 to 0	PWGCnCTBR [15:0]	The PWGCnCTDR register value is reflected to this register at the start of PWGCn operation (SLPWGCk.SLPWGC of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGCnRDT.PWGCnRDT = 1). When the value matches the PWGCnCNT register value, a trigger is transmitted to PWSDn.

42.3.14 PWGCnST — PWGC Status Register

This register is a status register for compare buffer register rewrite control and forcible PWGC_TOUTn output level fix.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGCn_base> + 0010_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGCnFOF	—	—	—	—	—	—	PWGCnRSFT	PWGCnRSF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.23 PWGCnST Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned.
8	PWGCnFOF	This bit indicates forcible PWGC_TOUTn output level fix status. 0: PWGC_TOUTn output PWM waveforms. 1: PWGC_TOUTn output level is forcibly fixed.
7 to 2	Reserved	When read, the value after reset is returned.
1	PWGCnRSFT	PWGCnTCBR Rewrite Control Status
0	PWGCnRSF	Simultaneous Rewrite Control Status 0: Simultaneous rewrite is enabled. This value indicates the completion of simultaneous rewrite after the generation of a simultaneous rewrite trigger signal. 1: Simultaneous rewrite is in progress. This value indicates the waiting state for completion.

42.3.15 PWGCnTCR — PWGC_TRGOUTn Control Register

This register controls enable/disable of PWGC_TRGOUTn.

Access: This register can be read or written in 8-bit units.

Address: <PWGCn_base> + 0018_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGCnTOE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W

Table 42.24 PWGCnTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWGCnTOE	This bit sets the output enable/disable of PWGC_TRGOUTn. 0: Output disable of PWGC_TRGOUTn 1: Output enable of PWGC_TRGOUTn This register value is reflected to the PWGCnTCBR at the update timing selected by PWGCnTCUT[1:0].

NOTE

PWGCnTOE bit has to be set before count operation. In addition, in case of PWGCnTCUT = 01_B or 10_B, PWGCnTOE bit has to be set before PWGCnTCBR rewrite request.

42.3.16 PWGCnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWGCn_base> + $000C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWGCnRDTT	PWGCnRDT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 42.25 PWGCnRDT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	PWGCnRDTT	PWGCnTCBR Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the rewrite request for PWGCnTCBR, and sets PWGCnST.PWGCnRSFT to 1. In case of PWGCnTCUT = 00_B or 11_B, write to this bit “1” is invalid.
0	PWGCnRDT	Compare Buffer Register Simultaneous Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the simultaneous rewrite request for the compare registers (PWGCnCSDR, PWGCnCRDR, and PWGCnCTDR), and sets PWGCnST.PWGCnRSF to 1.

42.3.17 PWGCnTCBR — PWGCnTCR Buffer Register

This is a buffer register for the PWGCnTCR register.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWGCn_base> + $001C_H$

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGCnTOBE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 42.26 PWGCnTCBR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	PWGCnTOBE	The PWGCnTCR register value is reflected to this register at the update timing selected by PWGCnCTL.PWGCnTCUT[1:0]. 0: Output disable of PWGC_TRGOUTn. 1: Output enable of PWGC_TRGOUTn.

42.3.18 PWGCnFOT — Forcible PWGC_TOUTn Output level Fix Trigger Register

This register is a trigger register to set PWGC_TOUTn output level forcibly.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWGCn_base> + $003C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGCnFOT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 42.27 PWGCnFOT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	PWGCnFOT	Trigger bit to set PWGC_TOUTn output level forcibly. 0: Writing 0 has no effect. 1: Set PWGC_TOUTn to level selected by PWGCnFOS bit forcibly.

Note: During counting state, setting this bit is available.

42.3.19 SLPWGCk — PWGC Synchronous Trigger Register (k = 0 to 2)

This register triggers start and stop for multiple channels simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <SLPW_base> + k × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SLPWGC[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.28 SLPWGCk Register Contents

Bit Position	Bit Name	Function
31 to 0	SLPWGC [31:0]	Trigger start and stop to multiple channels simultaneously. 0: Stops the corresponding channels. 1: Starts the corresponding channels. The bits correspond to the following channels. SLPWGC0.SLPWGC[31:0]: PWGC31 - PWGC0 SLPWGC1.SLPWGC[31:0]: PWGC63 - PWGC32 SLPWGC2.SLPWGC[31:0]: PWGC95 - PWGC64

42.3.20 PWSDnCTL — PWSD Control Register

This register is used to control operations of PWSD.

Access: This register can be read or written in 8-bit units.

Address: <PWSDn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PWSDnARSE	—	—	—	—	—	—	PWSDnENBL
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R/W

Table 42.29 PWSDnCTL Register Contents

Bit Position	Bit Name	Function
7	PWSDnARSE	A/D conversion result storing control 0: Storing the ADCJvPWDDIR register to PWSDnPWDDIRx register is disabled. 1: Storing the ADCJvPWDDIR register to PWSDnPWDDIRx register is enabled.
6 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWSDnENBL	Operation Permission Control 0: Operation is prohibited (initial state). Writing 0 initializes PWSDnSTR and PWSDnQUEj, PWSDnOWE and PWSDnWFLG. 1: Operation is enabled.

NOTE

PWSDnARSE setting has to be changed during the state of trigger has not been input (PWSDnQUE0 = $7F_H$) and condition of not input the trigger from PWGC.

42.3.21 PWSDnSTR — Trigger Queue Status Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSDnQUEj register.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWSDn_base> + 0004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSDnQFL	PWSDnQNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 42.30 PWSDnSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	PWSDnQFL	Indicates the queuing state of the A/D conversion trigger. 0: Some PWSDnQUEj registers do not store a channel number. 1: All of the PWSDnQUEj registers store a channel number.
0	PWSDnQNE	Bit indicating that there is a trigger in the trigger queue 0: A channel number is not stored in a PWSDnQUEj register, or A/D conversion is in progress while only PWSDnQUE0 stores a channel number. 1: The number of the channel waiting for conversion is stored in j = 1 and subsequent PWSDnQUEj registers.

42.3.22 PWSDnSTC — Trigger Queue Status Clear Register

This register clears the status of the PWSDnSTR register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWSDn_base> + 0008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSDnCLFL	PWSDnCLNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 42.31 PWSDnSTC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	PWSDnCLFL	PWSDnQFL Clear 0: PWSDnQFL retains the status (Writing 0 has no effect). 1: PWSDnQFL is cleared to 0.
0	PWSDnCLNE	PWSDnQNE Clear 0: PWSDnQNE retains the status (Writing 0 has no effect). 1: PWSDnQNE is cleared to 0.

42.3.23 PWSDnQUEj (j = 0 to 7) — Trigger Queue Register

This register stores the channel number that received the trigger from PWGCn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWSDn_base> + $0020_H + j \times 4_H$

Value after reset: $7F_H$

Bit	7	6	5	4	3	2	1	0
	—	PWSDnQUEj[6:0]						
Value after reset	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R

Table 42.32 PWSDnQUEj Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	PWSDnQUEj [6:0]	These bits hold the channel number (0 to 95) of the PWGC for which a trigger was generated in order from PWSDnQUE0 to PWSDnQUE7. After the A/D conversion of PWSDnQUE0 is completed, the values in PWSDnQUE1 to PWSDnQUE7 shift to PWSDnQUE0 to PWSDnQUE6.

NOTE

If a trigger occurs simultaneously for multiple channels, the trigger with the smaller channel number has priority.

42.3.24 PWSDnPVCRx — PWM-Diag Mode A/D Setting Register

This register is used to set the corresponding A/D converter for each channel.

At the generation of a trigger, the set value is transmitted to the ADCJvPWDVCR register of the A/D converter.

For the ADCJvPWDVCR register, see **Section 43, Analog to Digital Converter (ADCJ)**.

Access: This register can be read or written in 32-bit units.

Address: <PWSDn_base> + 0100_H + x × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	PWSDnWTTSx[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWSDnMPXEx	PWSDnMPXVx[2:0]			PWSDnVCULLMTBSx[3:0]				PWSDnSLADx[1:0]		PWSDnGCTRLx[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.33 PWSDnPVCRx Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	PWSDnWTTSx [3:0]	These bits indicate the setting value of ADCJvPWDVCR.WTTS[3:0] that selects wait time table in ADCTL.
15	PWSDnMPXEx	This bit indicates the setting value of ADCJvPWDVCR.MPXE that selects the use of MPX in ADCTL.
14 to 12	PWSDnMPXVx [2:0]	These bits indicate the setting value of ADCJvPWDVCR.MPXV[2:0] that selects MPX channel in ADCTL.
11 to 8	PWSDnVCULL MTBSx[3:0]	These bits indicate the setting value of ADCJvPWDVCR.VCULLMTBS[3:0] that selects upper limit/lower limit table.
7, 6	PWSDnSLADx [1:0]	ADCJ Select: 00: Output to ADCJ0 01: Output to ADCJ1 10: Output to ADCJ2 11: Setting prohibited
5 to 0	PWSDnGCTRLx [5:0]	These bits indicate the setting value of the ADCAnPWDVCR.GCTRL[5:0] that selects physical channel in ADCTL.

42.3.25 PWSDnPWDDIRx — PWM-Diag Data Supplementary Information Register

This register stores the A/D conversion result correspond to PWSDnPVCRx register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PWSDn_base> + 0300_H + x × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWSDnMPXE	PWSDnMPXV[2:0]			—	PWSDnOWE	PWSDnWFLG	—	—	—	PWSDnID[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWSDnPWDDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.34 PWSDnPWDDIRx Register Contents

Bit Position	Bit Name	Function
31	PWSDnMPXE	This bit mirrors PWSDnPVCRx.PWSDnMPXEx.
30 to 28	PWSDnMPXV [2:0]	These bits mirror PWSDnPVCRx.PWSDnMPXVx[2:0]
27	Reserved	When read, the value after reset is returned.
26	PWSDnOWE	This bit indicates overwrite error flag of the A/D conversion result storing. Set timing is same as PWSDnPWDDR stored timing at the condition of PWSDnWFLG = 1. 0: An overwrite error is not detected. 1: An overwrite error is detected. Setting condition: PWSDnWFLG = 1, and new A/D conversion result is written to PWSDnPWDDR[15:0]. Clearing condition: Reading this register, or clearing the PWSDnENBL bit.
25	PWSDnWFLG	This bit indicates write flag of the A/D conversion result storing. Set timing is same as PWSDnPWDDR stored timing. 0: This register is read, or A/D conversion is not finished. 1: The A/D conversion result is stored (not read yet). Setting condition: The A/D conversion result is written to PWSDnPWDDR[15:0]. Clearing condition: Reading this register, or clearing the PWSDnENBL bit.
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	PWSDnID[5:0]	These bits mirror PWSDnPVCRx.PWSDnGCTRLx[5:0]
15 to 0	PWSDnPWDDR [15:0]	These bits indicate the A/D conversion result which is sent by ADC_PWDDRv[15:0] pins from ADCJv. The data format is same as ADCJvPWDTSNDR.PWDDR[15:0].

42.3.26 PWGCPRDm — PWGC Period Setting Register (m = 0 to 3)

This register is used to set the PWGC counter period.

Access: This register can be read or written in 16-bit units.

Address: <SLPW_base> + $000C_H$ + m × 4_H

Value after reset: m = 0: $0FFF_H$
m = 1 to 3: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGCPRD[15:0]															
Value after reset	0/1*1	0/1*1	0/1*1	0/1*1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 42.35 PWGCPRDm Register Contents

Bit Position	Bit Name	Function
15 to 0	PWGCPRD [15:0]	These bits set the PWGC counter period (= PWGC_PERIOD). The period of PWGC_TOUTn can be flexible changed by setting this register and PWGCPRDSLq register. Note 1. – m = 0: PWGCPRD initial value = $0FFF_H$ – m = 1 to 3: PWGCPRD initial value = $FFFF_H$

NOTE

PWGCPRDm register setting change is prohibited during count operation.

42.3.27 PWGCPRDSLq — PWGC Period Selection Register (q = 0 to 5)

This register is used to select the PWGC counter period from PWGCPRDm register setting.

Access: This register can be read or written in 32-bit units.

Address: <SLPW_base> + $001C_H$ + q × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 42.36 PWGCPRDSLq Register Contents

Bit Position	Bit Name	Function
31 to 0	PWGCPRDSLq [31:0]	Select the PWGC counter period by PWSDPRDm register setting. PWGCPRDSL0[1:0] select counter period for PWGC0 PWGCPRDSL0[3:2] select counter period for PWGC1 PWGCPRDSL0[5:4] select counter period for PWGC2 - - - - - PWGCPRDSL5[31:30] select counter period for PWGC95 Below is example for PWGCPRDSL0[1:0] select counter period for PWGC0: **PWGCPRDSL0[1:0] / Description** 00 / PWGCPRD0 (default) 01 / PWGCPRD1 10 / PWGCPRD2 11 / PWGCPRD3 The bits correspond to the following channels. PWGCPRDSL0: PWGC15 to PWGC0 PWGCPRDSL1: PWGC31 to PWGC16 PWGCPRDSL2: PWGC47 to PWGC32 PWGCPRDSL3: PWGC63 to PWGC48 PWGCPRDSL4: PWGC79 to PWGC64 PWGCPRDSL5: PWGC95 to PWGC80

42.3.28 PWGCINTFhk — PWGC Interrupt Factor Register (k = 0 to 2, h = 0 to 3)

These registers contain information about which PWGCn interrupt (PWGC_INTn) has been generated without depending on PWGCINTMSKhk setting. Regarding block diagram image, see **Figure 42.1, PWGC Interrupt Connection Image**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PWGCINTF_base> + h × 600_H + k × 200_H + 0_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 42.37 PWGCINTFhk Register Contents

Bit Position	Bit Name	Function
31 to 0	PWGCINTFhk [31:0]	PWGC_INTn interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred The bits correspond to the following channels. PWGCINTFh0[31:0]: PWGC31 to PWGC0 PWGCINTFh1[31:0]: PWGC63 to PWGC32 PWGCINTFh2[31:0]: PWGC95 to PWGC64

42.3.29 PWGCINTMSKhk — PWGC Interrupt Mask Register (k = 0 to 2, h = 0 to 3)

These registers mask PWGCn interrupt output to INTC2 by each channels. Regarding block diagram image, see **Figure 42.1, PWGC Interrupt Connection Image**.

Access: This register can be read or written in 32-bit units.

Address: <PWGCINTF_base> + h × 600_H + k × 200_H + 4_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

42.3.30 PWGCINTFChk — PWGC Interrupt Factor Clear Register (k = 0 to 2, h = 0 to 3)

These registers clear the bits of PWGC interrupt factor register (PWGCINTFhk). Regarding block diagram image, see **Figure 42.1, PWGC Interrupt Connection Image**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <PWGCINTF_base> + h × 600_H + k × 200_H + 8_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

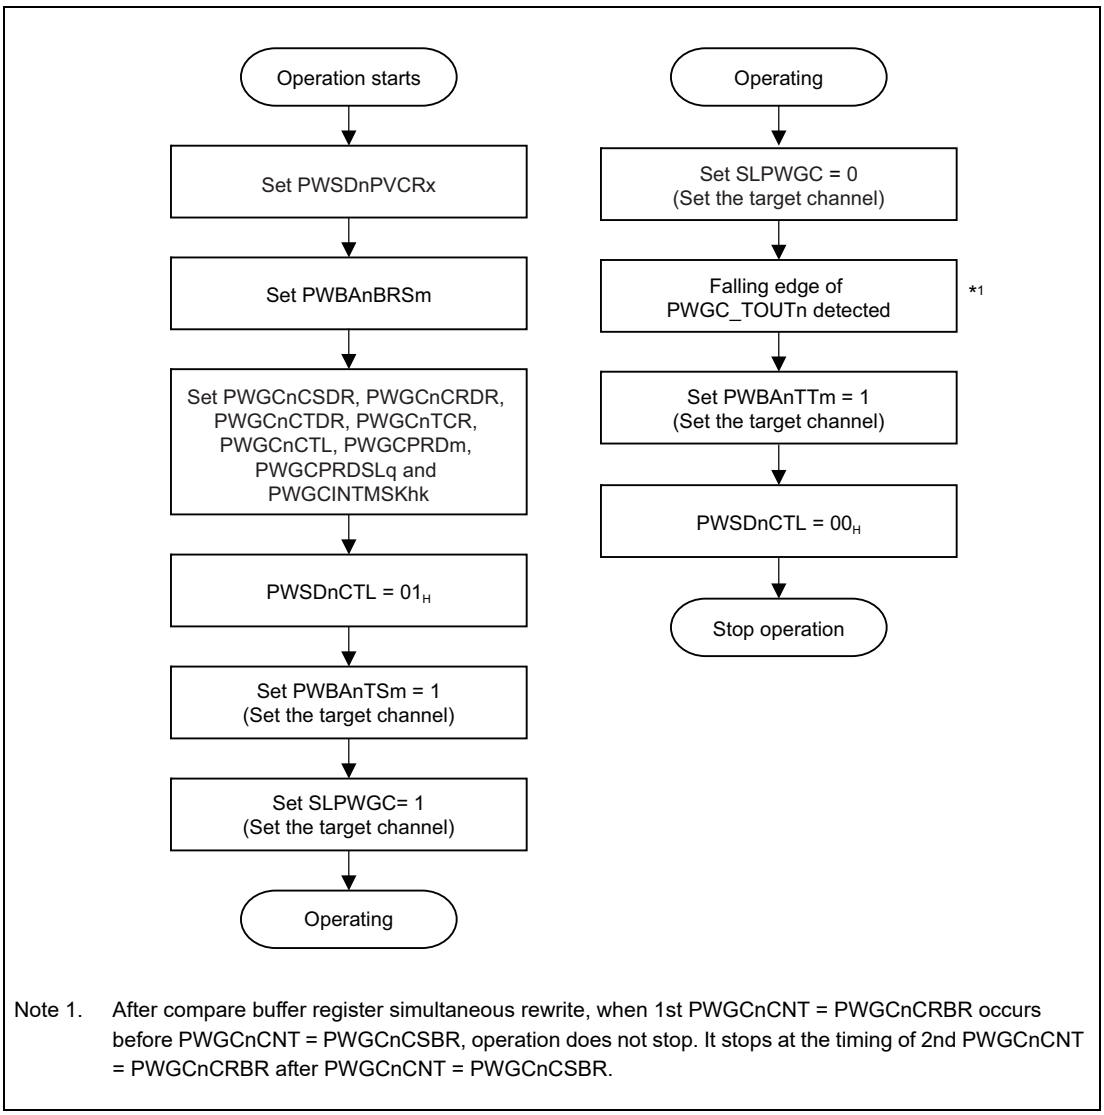
42.4 Operation

42.4.1 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.



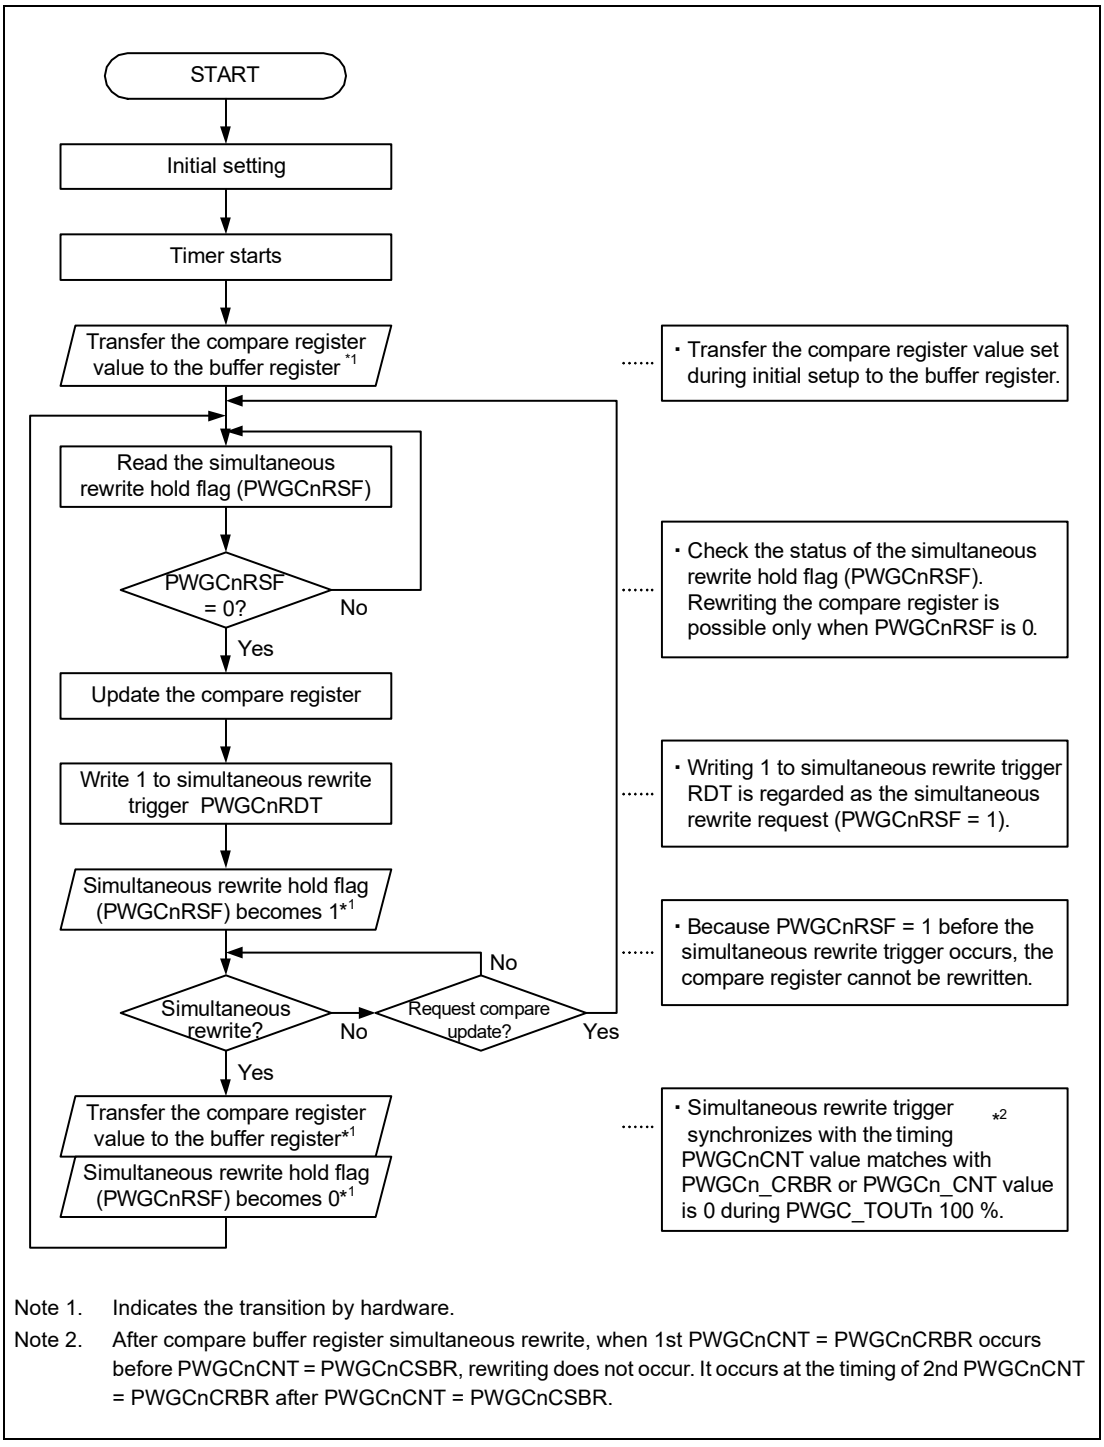
Note 1. After compare buffer register simultaneous rewrite, when 1st PWGCnCNT = PWGCnCRBR occurs before PWGCnCNT = PWGCnCSBR, operation does not stop. It stops at the timing of 2nd PWGCnCNT = PWGCnCRBR after PWGCnCNT = PWGCnCSBR.

Figure 42.3 PWM-Diag Operating Procedure

Procedures for simultaneous rewrite of PWGC are illustrated below.

The described term “compare register” indicates PWGCnCSDR, PWGCnCRDR, or PWGCnCTDR.

In addition, the described term “buffer register” indicates PWGCnCSBR, PWGCnCRBR, or PWGCnCTBR.



Note 1. Indicates the transition by hardware.

Note 2. After compare buffer register simultaneous rewrite, when 1st PWGCnCNT = PWGCnCRBR occurs before PWGCnCNT = PWGCnCSBR, rewriting does not occur. It occurs at the timing of 2nd PWGCnCNT = PWGCnCRBR after PWGCnCNT = PWGCnCSBR.

Figure 42.4 Simultaneous Rewrite Procedure

42.4.2 Operation Waveform of PWM-Diag

42.4.2.1 PWM Waveform Output by PWGC and Operation Waveform for A/D Conversion Trigger Output

(1) Basic Operation Waveform of PWGC

The basic operation waveforms of PWGC are illustrated below.

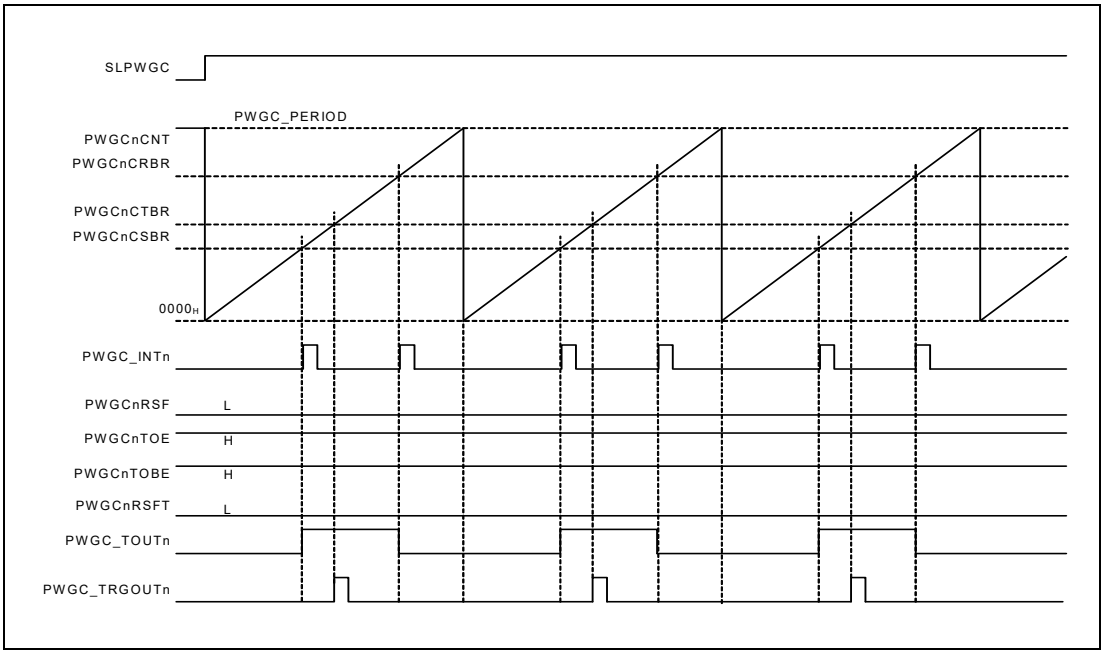


Figure 42.5 Basic Waveform (when PWGCnTFIE = 1 and PWGCnTRIE = 1)

(2) Operation Waveform when Simultaneous Rewrite for PWGC is Executed

The following figure illustrates the operation waveforms when simultaneous rewrite for PWGC is executed.

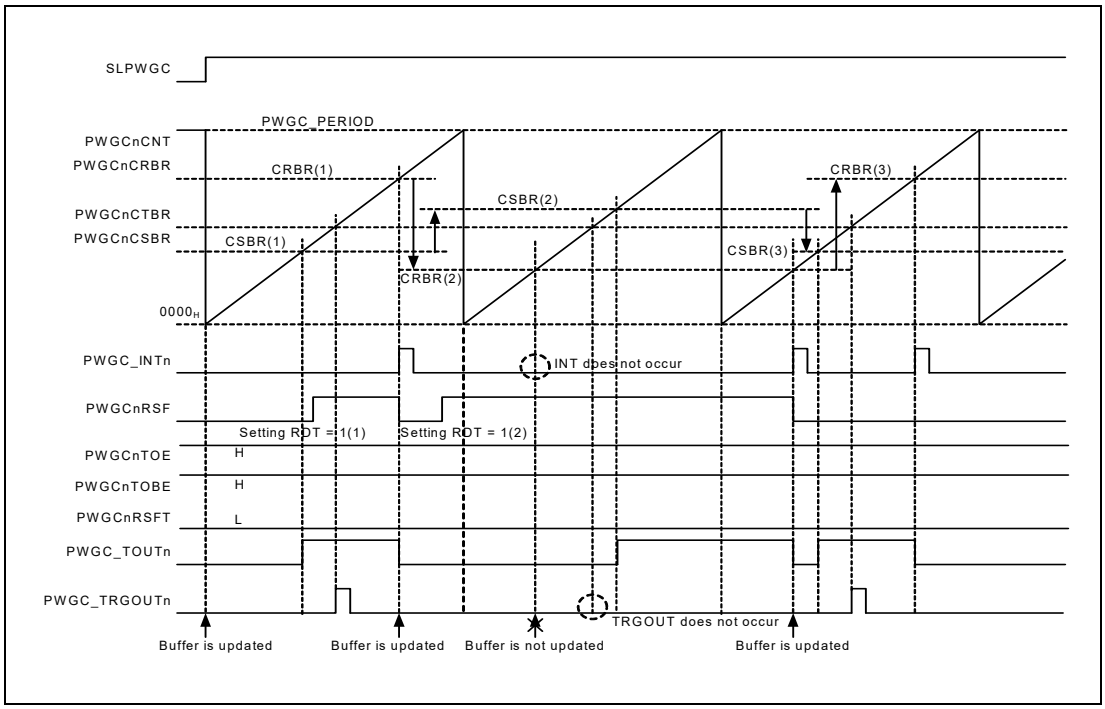

Figure 42.6 Waveform when compare buffer register simultaneous rewrite is executed (PWGCnOCL = 0, PWGCnTFIE = 1 and PWGCnTRIE = 0)

Compare buffer register simultaneous rewrite is executed by re-setting the PWGCnCSDR and PWGCnCRDR registers, then setting either the PWGCnRDT or SLPWGCk register.

Moreover, if the relationship between set values in one interval is PWGCnCSDR > PWGCnCRDR, a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

In case of PWGCnOCL = 1, PWGCn_TRGOUTn is also occurred at the timing of “TRGOUT does not occur” in **Figure 42.6, Waveform when compare buffer register simultaneous rewrite is executed (PWGCnOCL = 0, PWGCnTFIE = 1 and PWGCnTRIE = 0)**.

(3) Operation Waveform when Stopping and Resuming PWGC Operation

The following figure illustrates the operation waveforms when stopping and resuming PWGC operation.

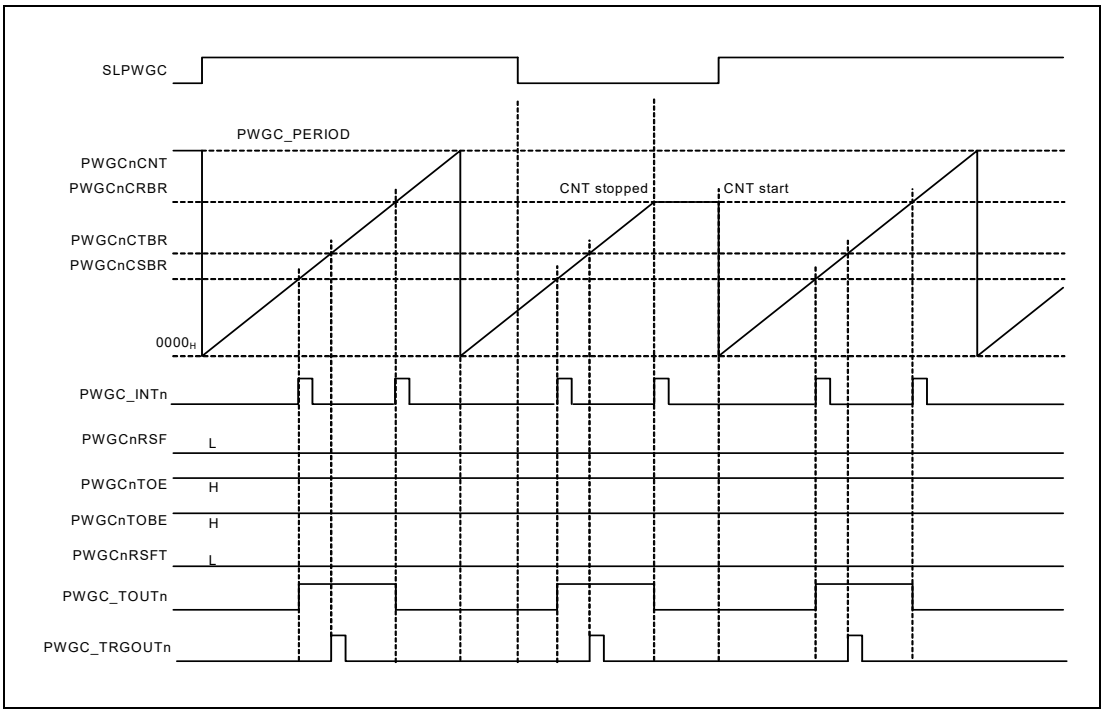

Figure 42.7 Stopping and Resuming Operation when PWGCnTFIE = 1 and PWGCnTRIE = 1 (1)

After the setting of SLPWGC has been changed from 1 to 0, PWGCnCNT stops operation because PWGC_INTn is generated.

After PWGC_INTn has been generated, by changing the setting of SLPWGC from 0 to 1, PWGCnCNT resumes counting from 0000_H.

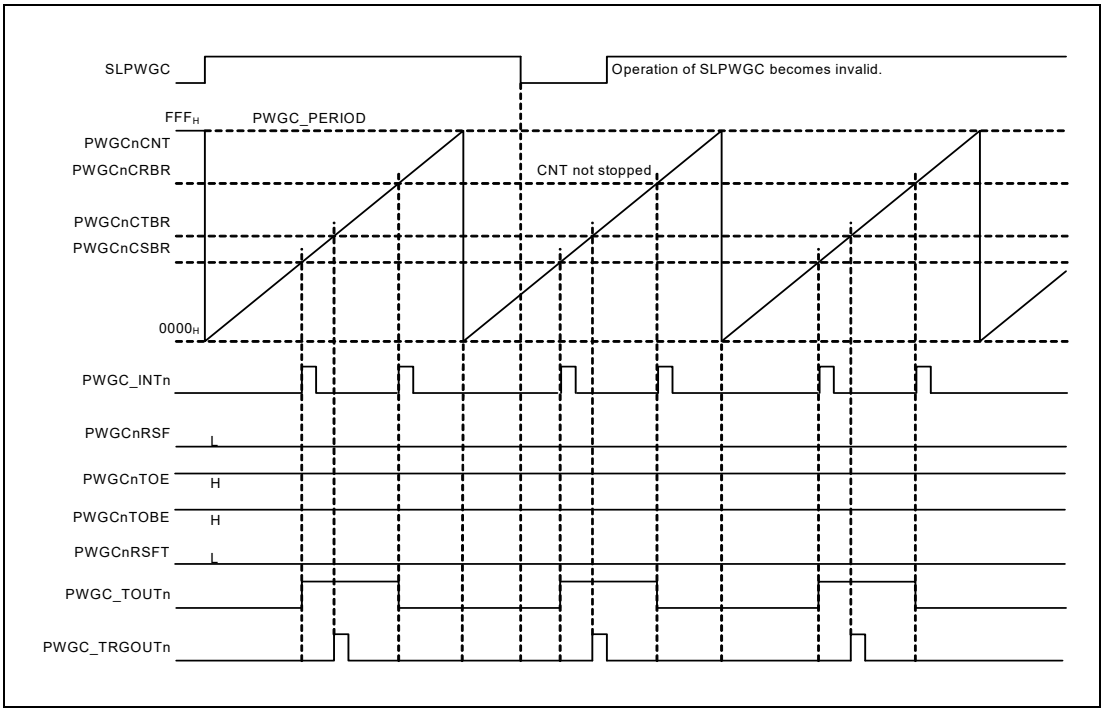

Figure 42.8 Stopping and Resuming Operation when PWGCnTFIE = 1 and PWGCnTRIE = 1 (2)

After the setting of SLPWGC has been changed from 1 to 0, if the setting of SLPWGC is changed from 0 to 1 before PWGC_INTn is generated, operations of SLPWGC become invalid, and PWGCnCNT continues counting.

(4) Waveforms of PWGC Operation with Specific Settings

The following figures illustrate the waveforms of PWGC operation with specific settings.

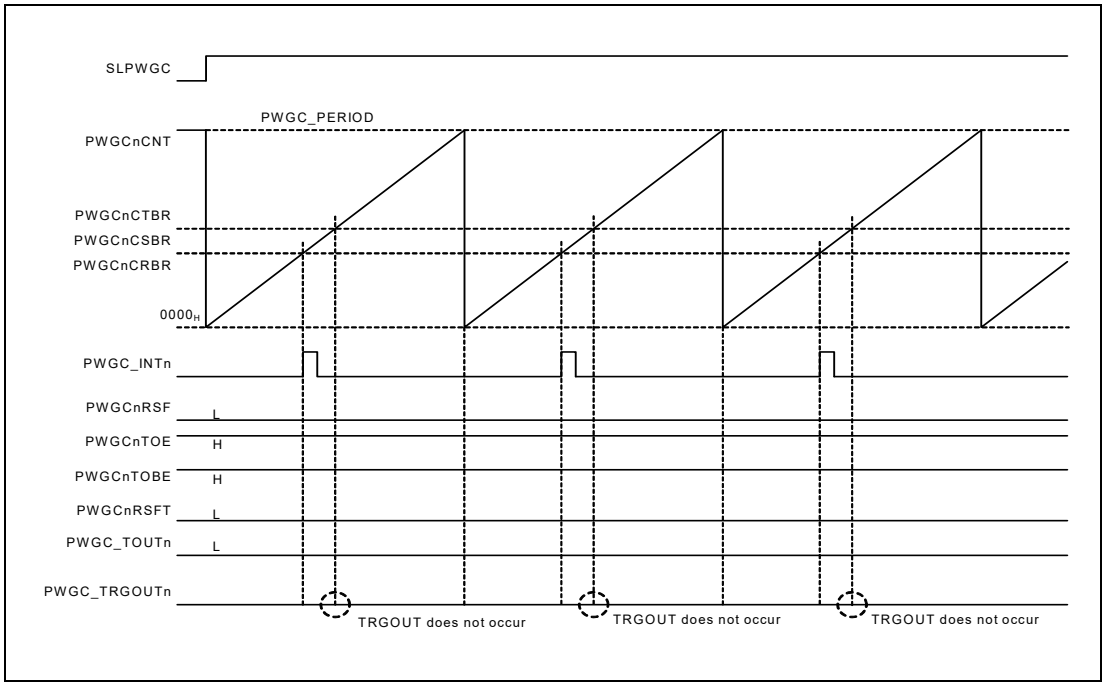

Figure 42.9 PWGC_TOUTn = 0% Output Waveform (PWGCnTFIE = 1 and PWGCnTRIE = 1)

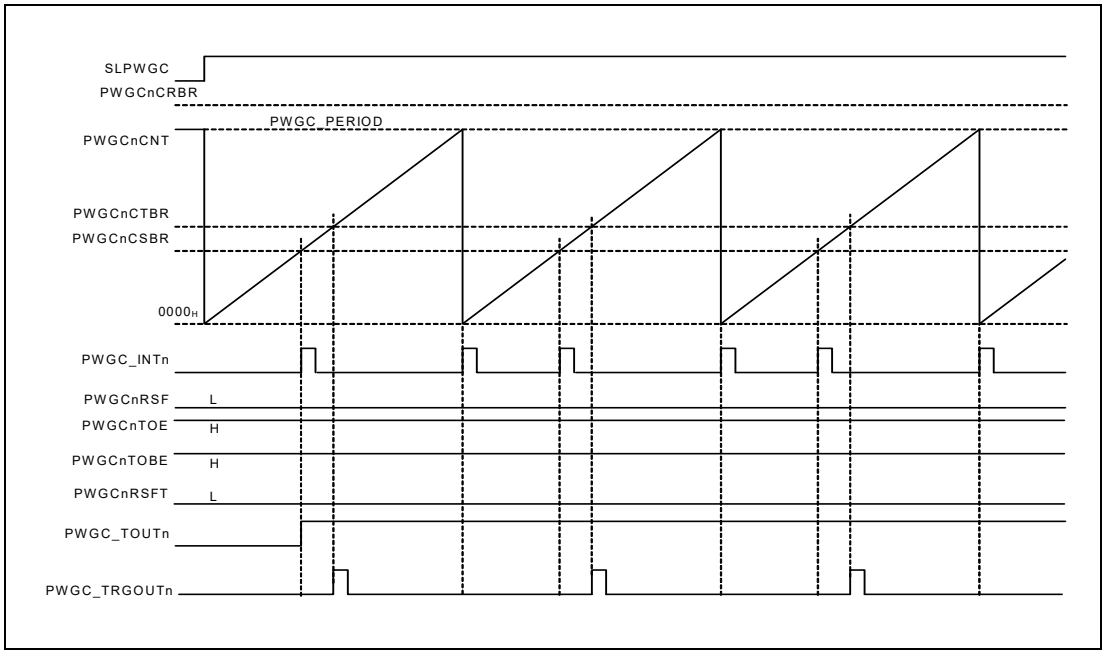

Figure 42.10 PWGC_TOUTn = 100% Output Waveform (PWGCnTFIE = 1 and PWGCnTRIE = 1)

42.4.2.2 Operating wave form when forcible PWGC_TOUTn output level fix

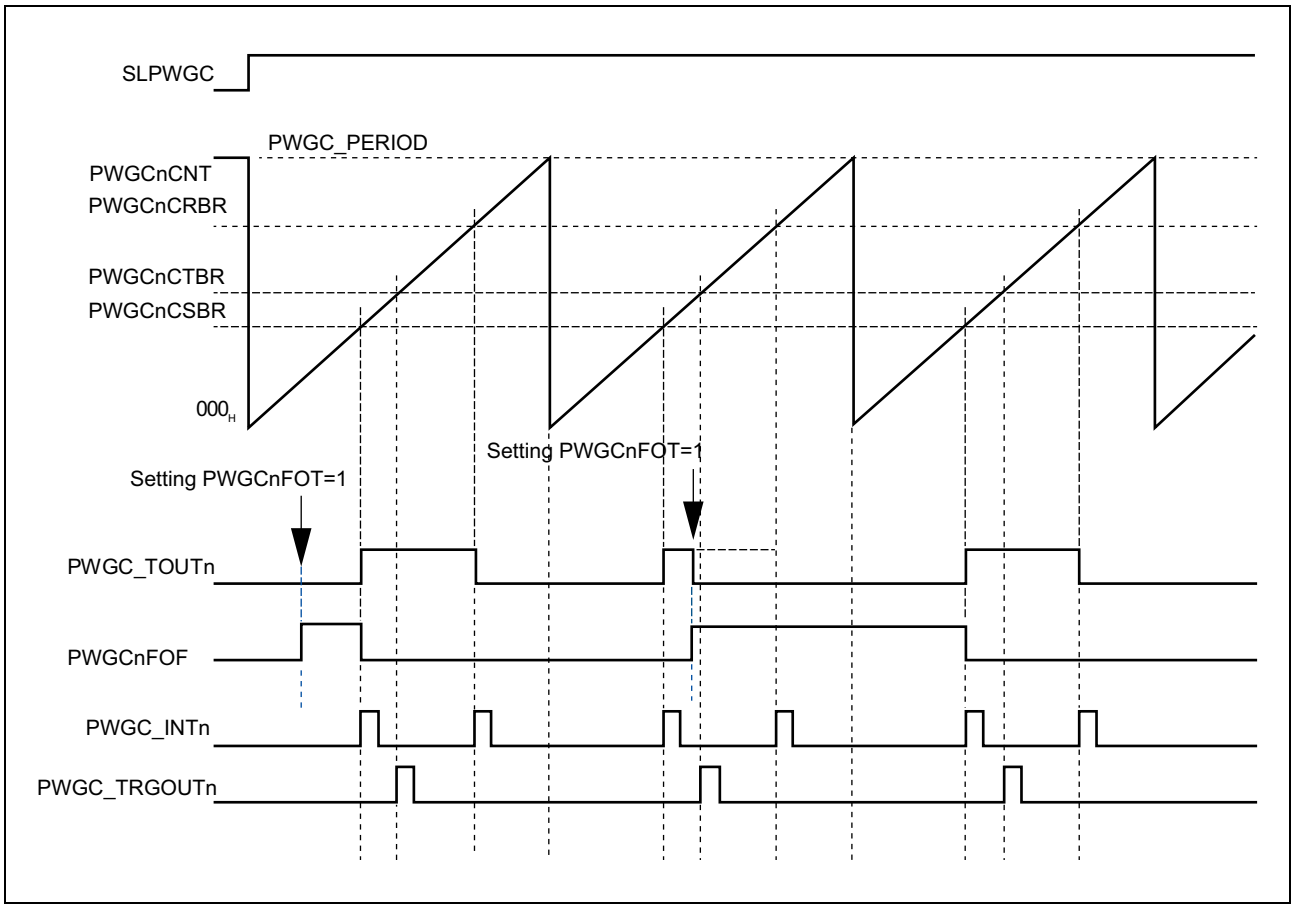

Figure 42.11 PWGC_TOUTn Output Fixed to Low Level Waveform

When PWGCnFOT is set to 1 in the state of PWGCnFOS=0, PWGC_TOUTn is forcibly set to low level immediately until the next PWGCnCSBR matching.

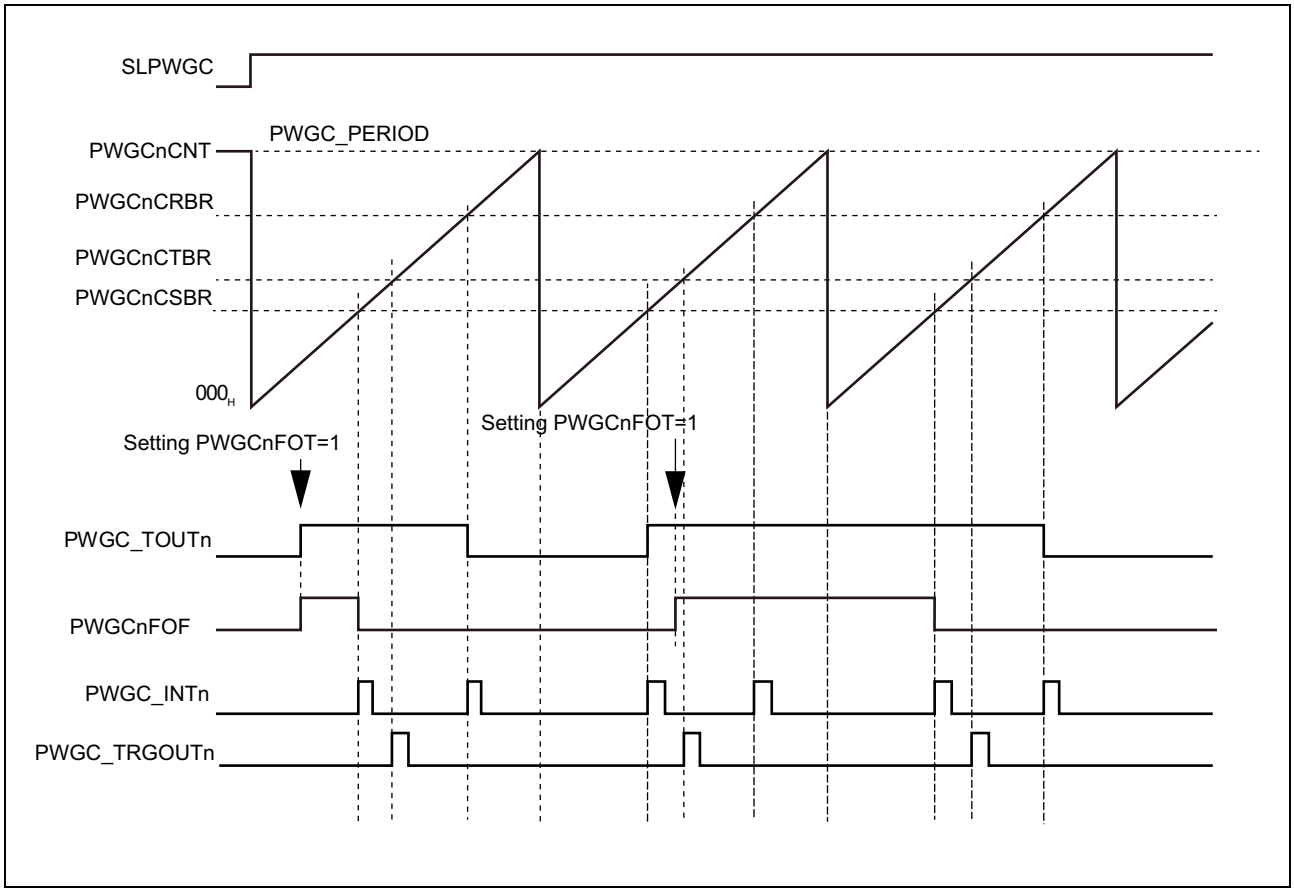

Figure 42.12 PWGC_TOUTn Output Fixed to High Level Waveform

When PWGCnFOT is set to 1 in the state of PWGCnFOS=1, PWGC_TOUTn is forcibly set to high level immediately until the next PWGCnCSBR matching.

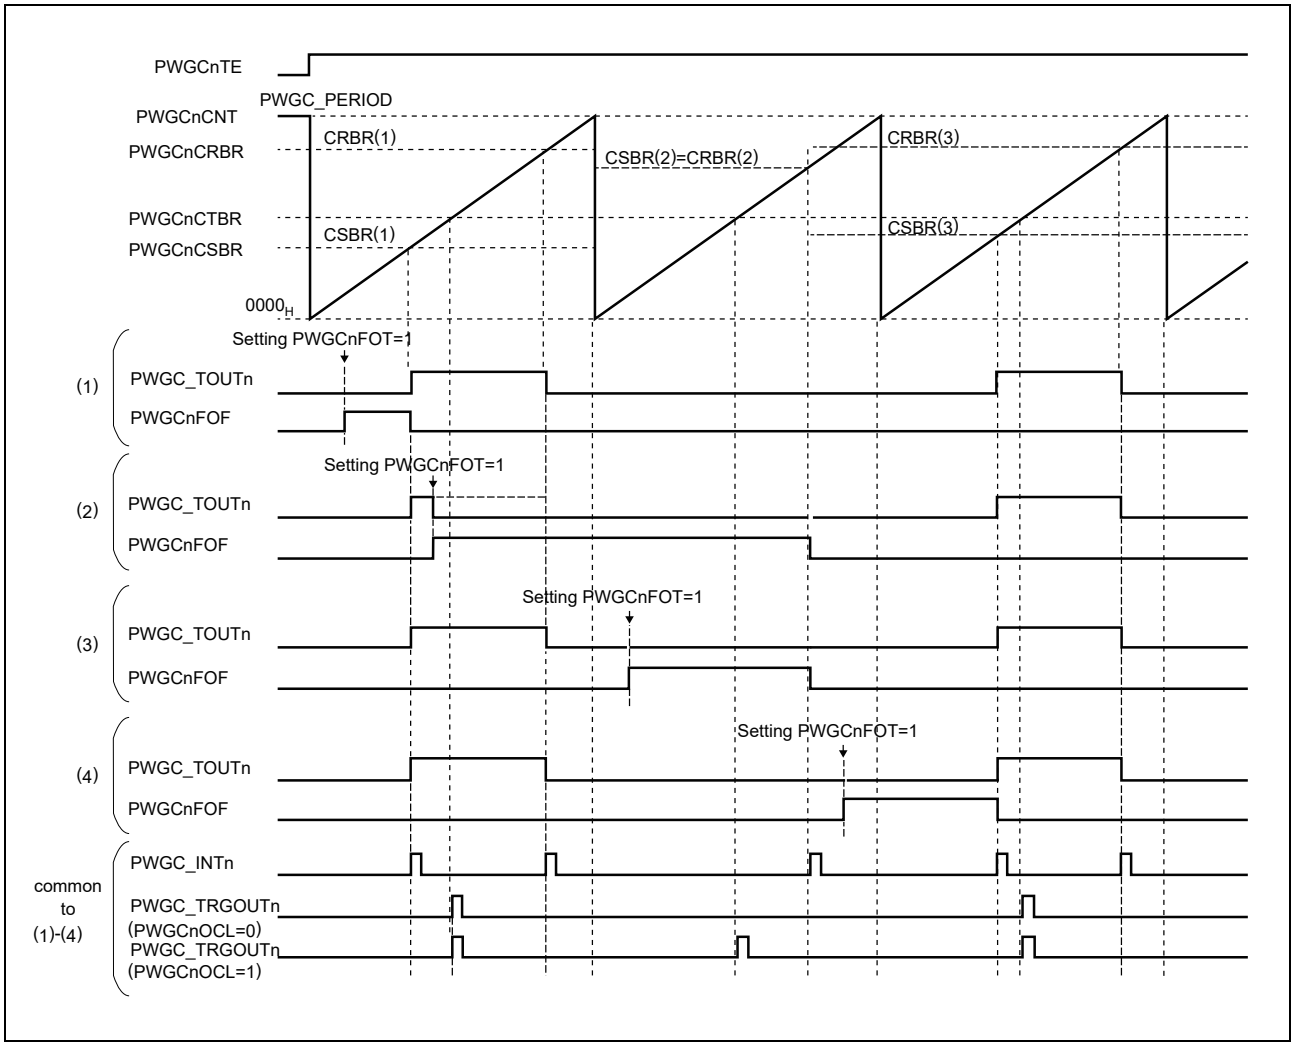

Figure 42.13 PWGC_TOUTn Output Fixed to Low Level for PWM 0% Output Waveform

(1) shows the case of forcible low level fix during the low level period of PWM normal output before PWM 0% output.

(2) shows the case of forcible low level fix during the high level period of PWM normal output before PWM 0% output.

(3) shows the case of forcible low level fix during PWM 0% output.

(4) shows the case of forcible low level fix during the low level period of PWM normal output after PWM 0% output.

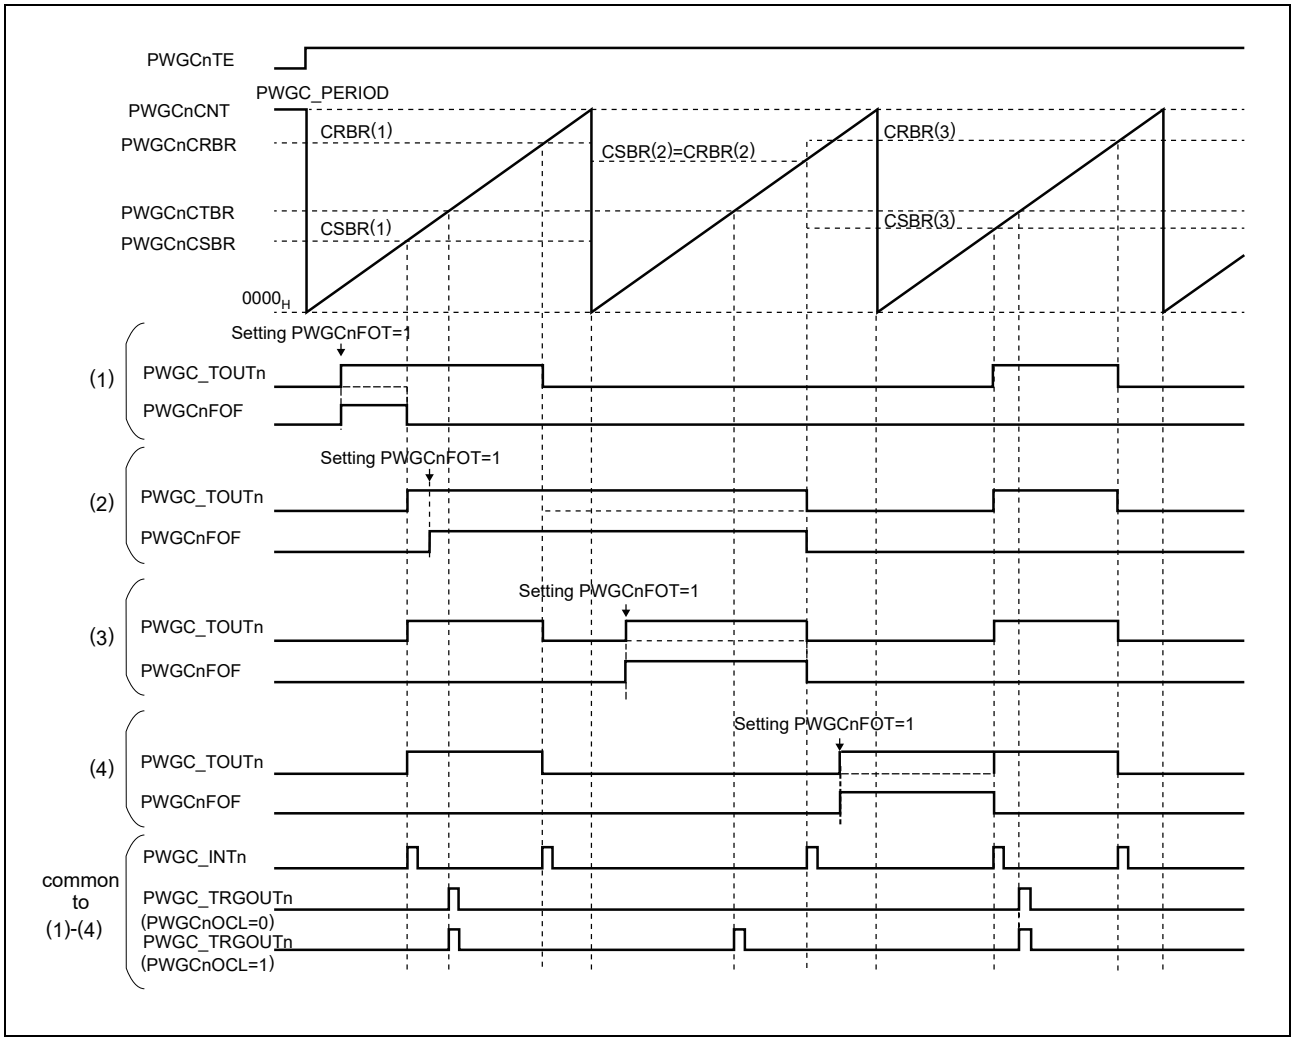

Figure 42.14 PWGC_TOUTn Output Fixed to High Level for PWM 0% Output Waveform

(1) shows the case of forcible high level fix during the low level period of PWM normal output before PWM 0% output.

(2) shows the case of forcible high level fix during the high level period of PWM normal output before PWM 0% output.

(3) shows the case of forcible high level fix during PWM 0% output.

(4) shows the case of forcible high level fix during the low level period of PWM normal output after PWM 0% output.

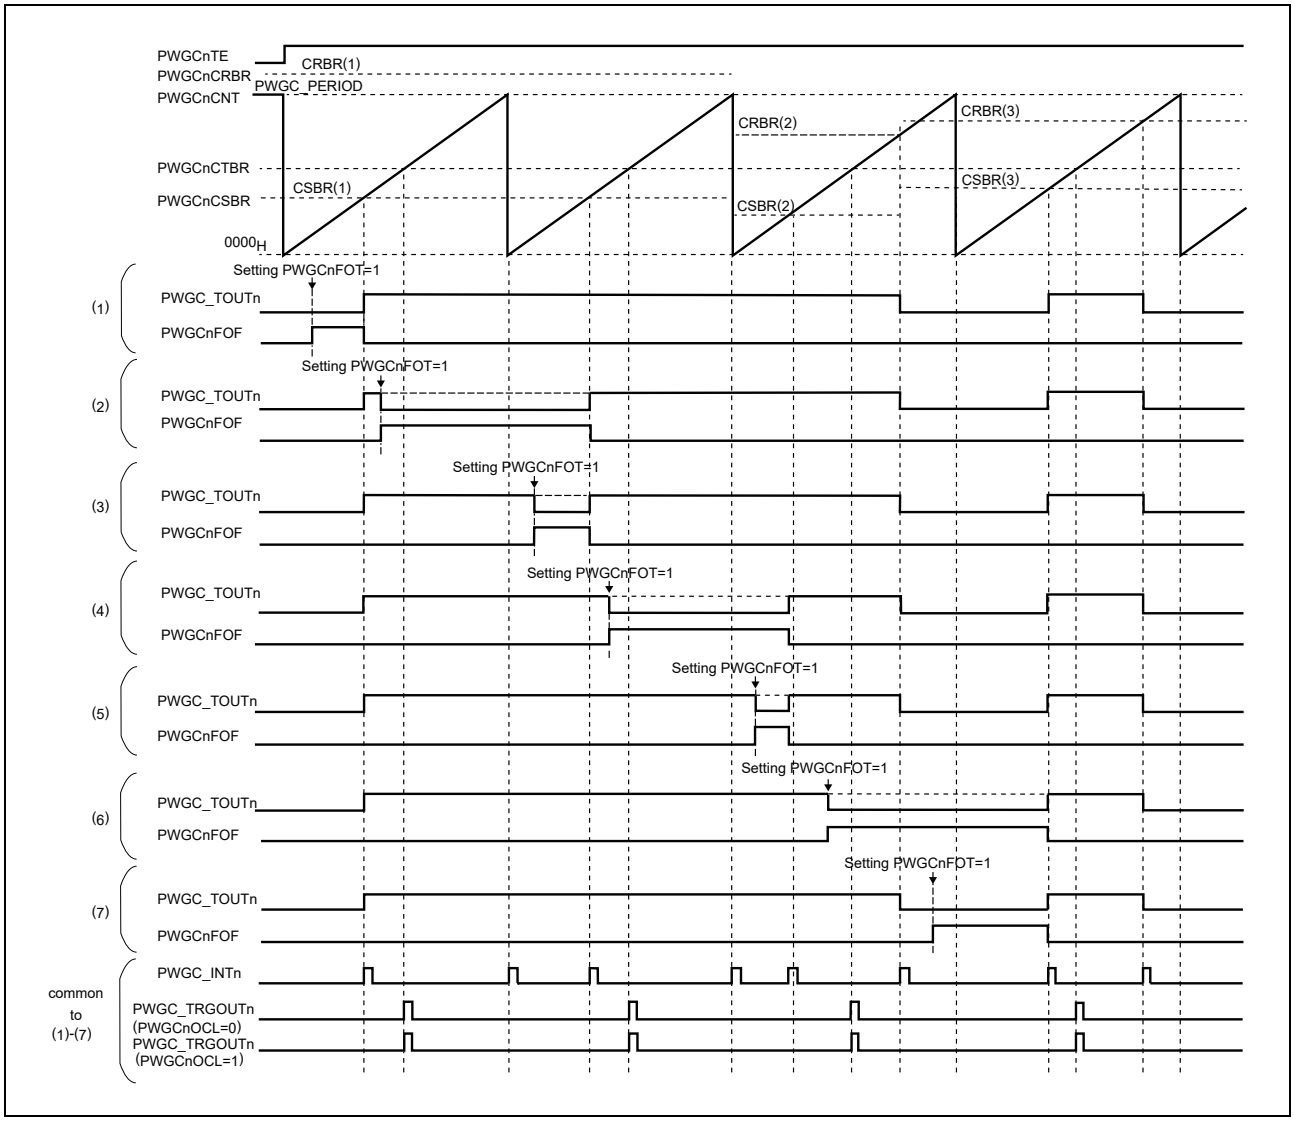

Figure 42.15 PWGC_TOUTn Output Fixed to Low Level for PWM 100% Output Waveform

(1) shows the case of forcible low level fix during the low level period of transmission to PWM 100% output.

(2) shows the case of forcible low level fix during the high level period of transmission to PWM 100% output.

(3) shows the case of forcible low level fix during PWGCnCNT<=PWGCnCSBR period of PWM 100% output.

(4) shows the case of forcible low level fix during PWGCnCSBR<PWGCnCNT<=PWGC_PERIOD period of PWM 100% output.

(5) shows the case of forcible low level fix during PWGCnCNT<=PWGCnCSBR period of transmission from PWM 100% output to PWM normal output.

(6) shows the case of forcible low level fix during PWGCnCSBR<PWGCnCNT<=PWGCnCRBR period of transmission from PWM 100% output to PWM normal output.

(7) shows the case of forcible low level fix during the low level period of PWM normal output after PWM 100% output.

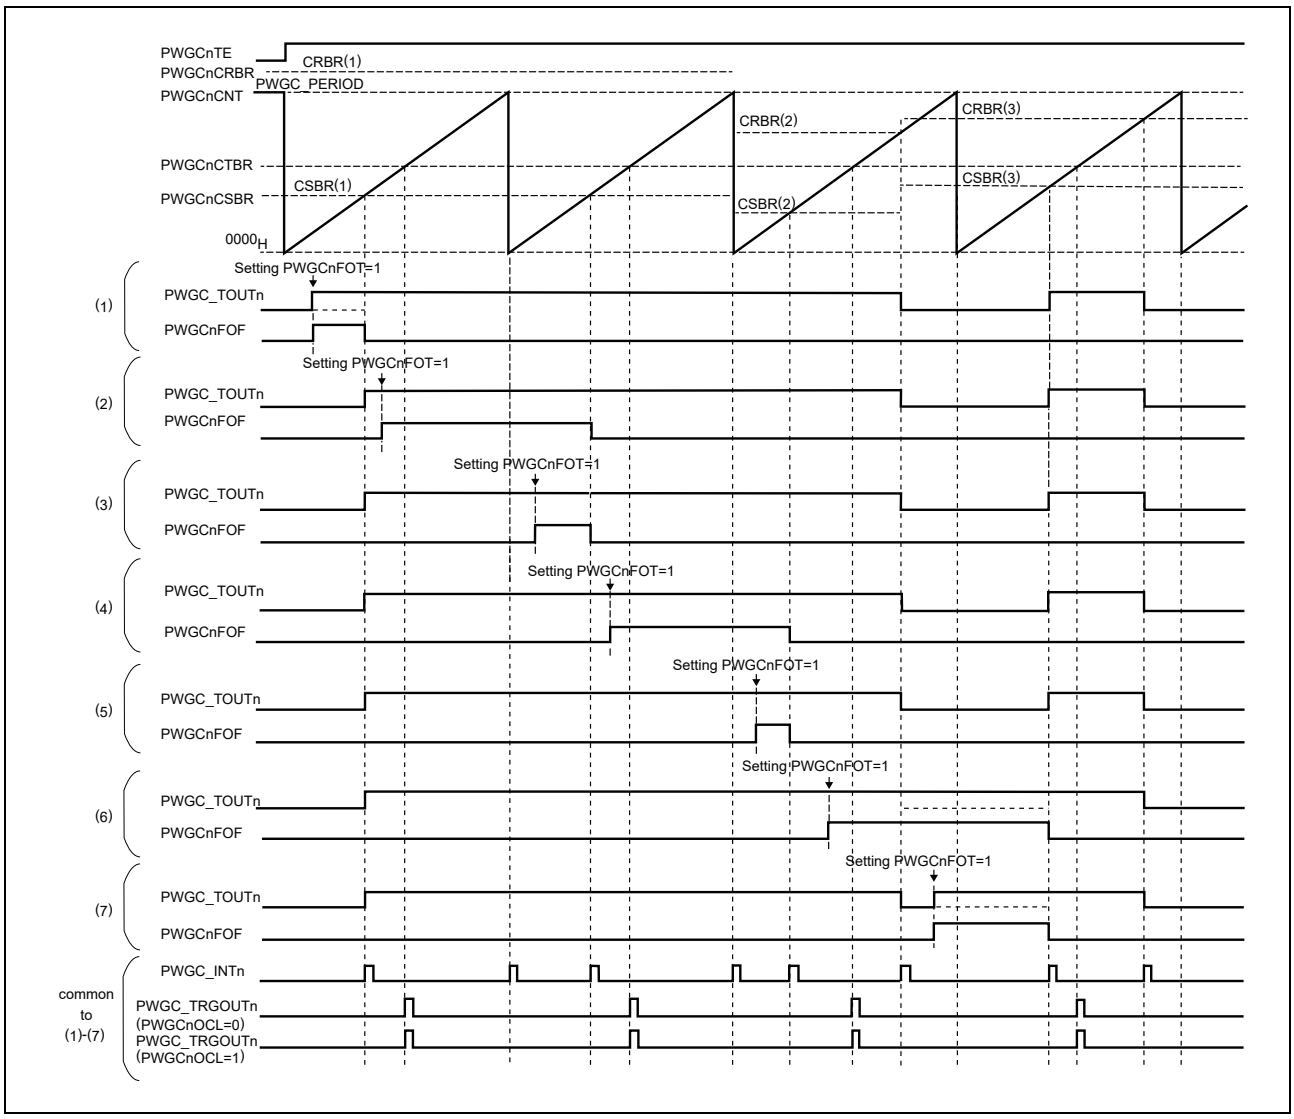

Figure 42.16 PWGC_TOUTn Output Fixed to High Level for PWM 100% Output Waveform

(1) shows the case of forcible high level fix during the low level period of transmission to PWM 100% output.

(2) shows the case of forcible high level fix during the high level period of transmission to PWM 100% output.

(3) shows the case of forcible high level fix during PWGCnCNT<=PWGCnCSBR period of PWM 100% output.

(4) shows the case of forcible high level fix during PWGCnCSBR<PWGCnCNT<=PWGC_PERIOD period of PWM 100% output.

(5) shows the case of forcible high level fix during PWGCnCNT<=PWGCnCSBR period of transmission from PWM 100% output to PWM normal output.

(6) shows the case of forcible high level fix during PWGCnCSBR<PWGCnCNT<=PWGCnCRBR period of transmission from PWM 100% output to PWM normal output.

(7) shows the case of forcible high level fix during the low level period of PWM normal output after PWM 100% output.

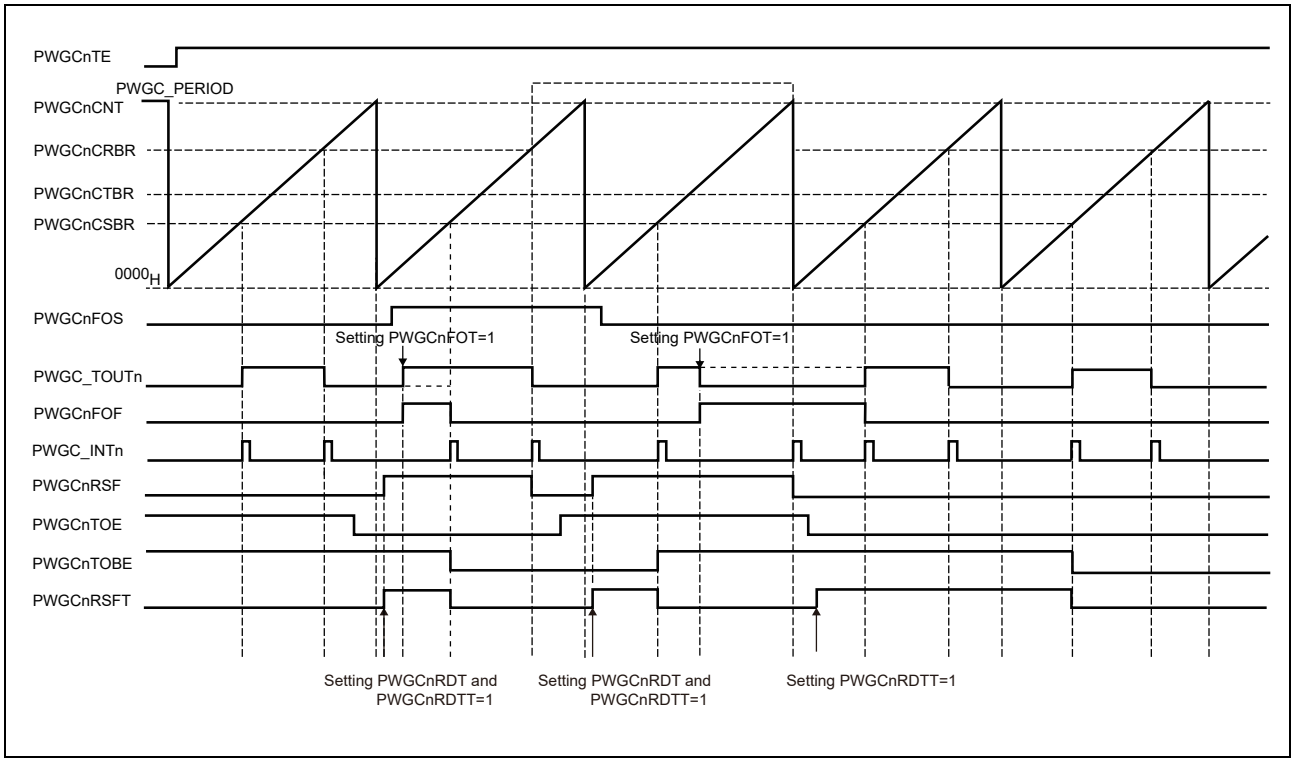

Figure 42.17 PWGCnTCBR Rewrite Waveform for Forcible PWGC_TOUTn Output Level Fix (PWGCnTCUT=01_B)

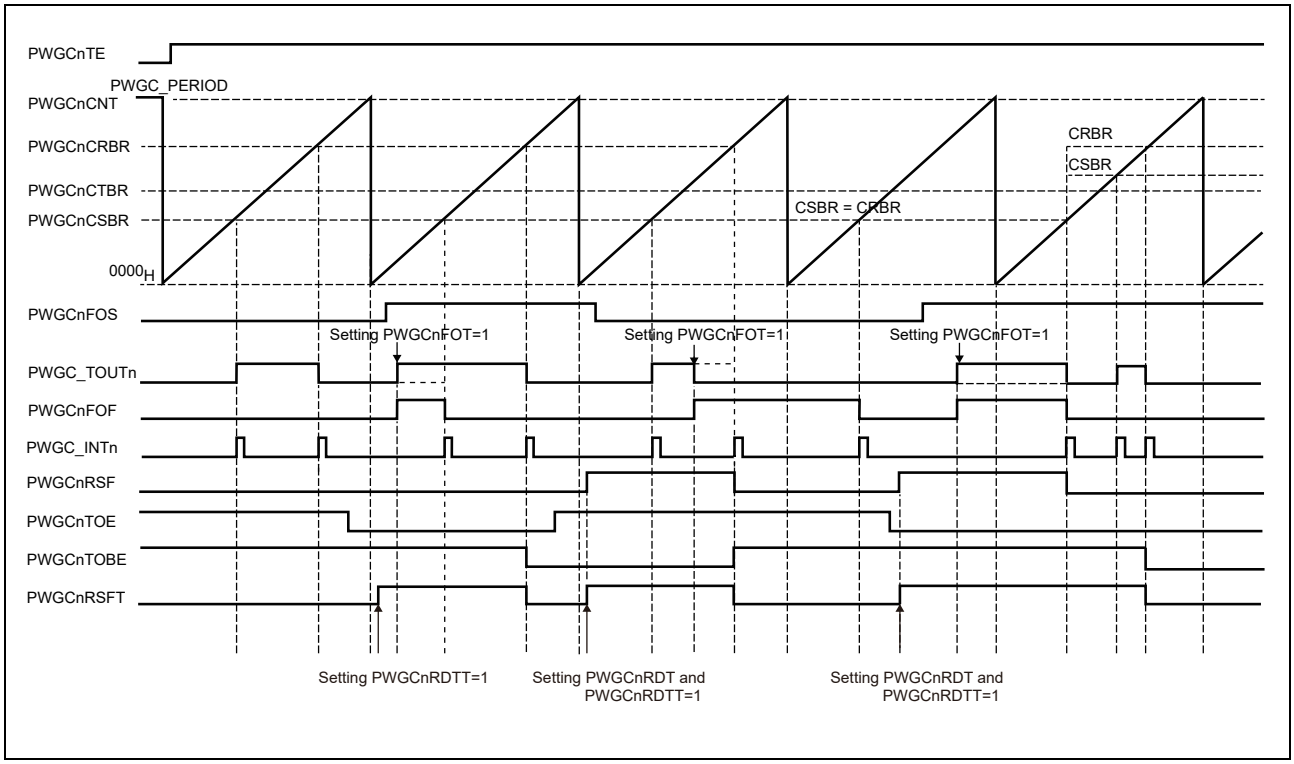

Figure 42.18 PWGCnTCBR Rewrite Waveform for Forcible PWGC_TOUTn Output Level Fix (PWGCnTCUT=10_B)

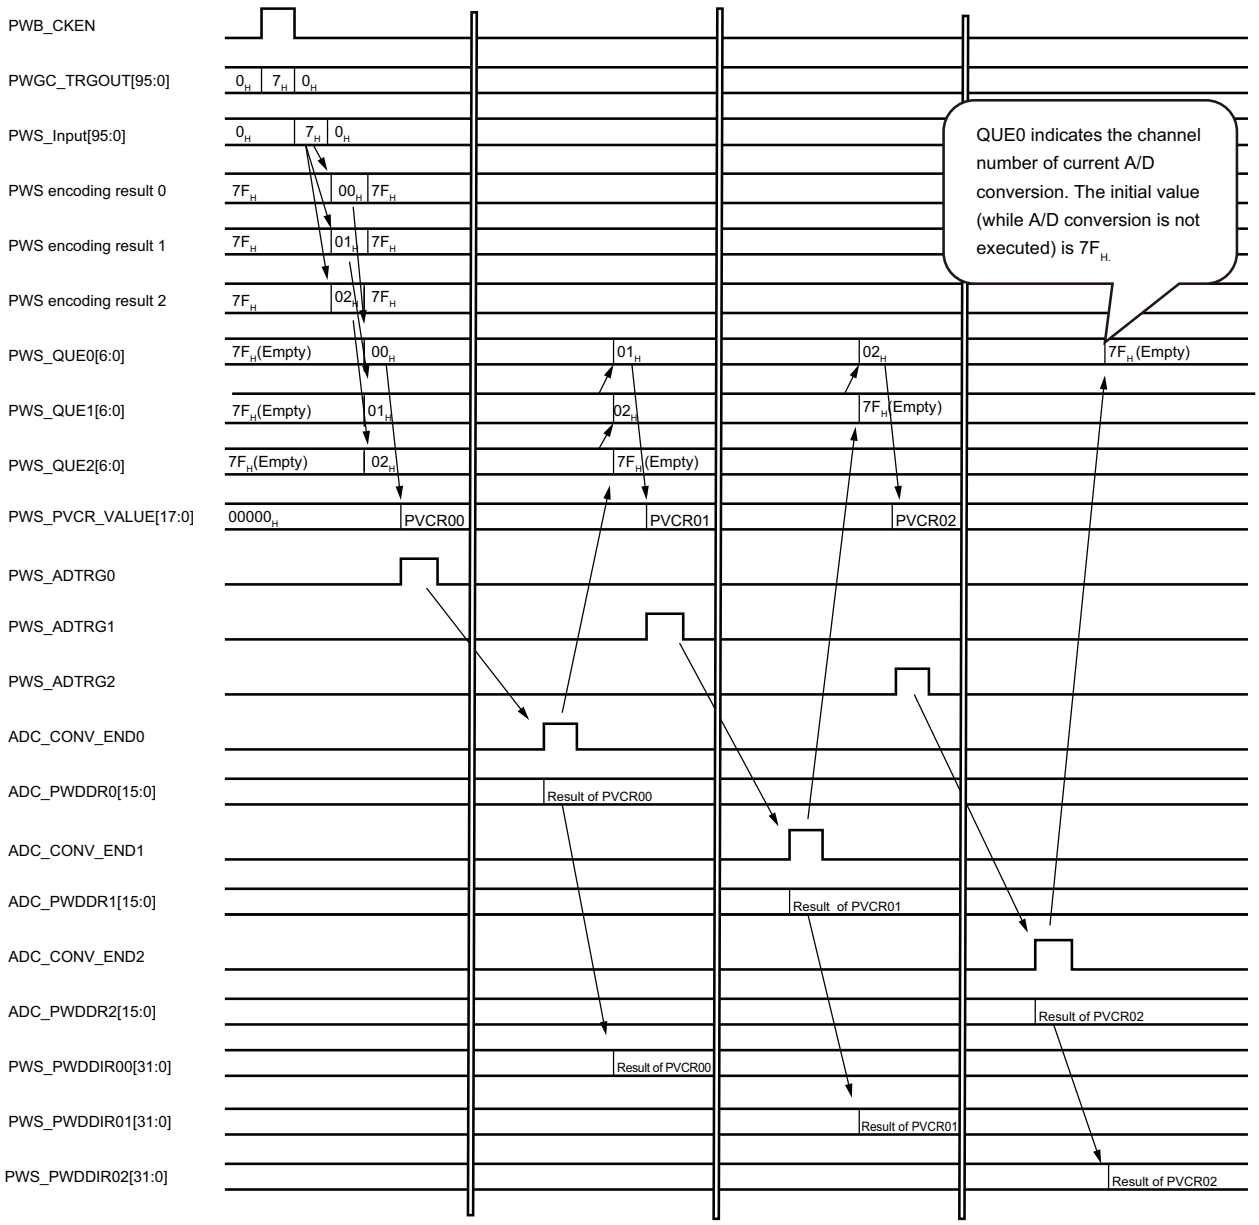
42.4.2.3 Operation Waveform when A/D Conversion Trigger Occurs in PWSD

An example of the PWSD operation is shown below.



Note 1. QUE0 indicates the PWGC_TRG number while the A/D conversion is executed. The initial value (while the A/D conversion is not executed) is $7F_H$.

Figure 42.19 Example of PWSD Operation

(1) Triggers occur simultaneously in channels 0, 1 and 2 of PWGC. Channel 0 with the smallest channel number is stored in PWSDnQUE0, channel 1 with the larger channel number is stored in PWSDnQUE1, and channel 2 with the largest channel number is stored in PWSDnQUE2. The value of PWSDnPVCR00 corresponding to the value stored in PWSDnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.
The A/D converter ADCJ0, ADCJ1 or ADCJ2 is selected by PWSDnSLAD00 bit of PWSDnPVCR00. This example shows that ADCJ0 is selected when PWSDnSLAD00 is 0.
At this time, as the A/D conversion for channel 1 and channel 2 is in the waiting state, the PWSDnSTR.PWSDnQNE bit is set.

(2) On completion of A/D conversion executed in step (1), the result of A/D conversion is stored in the lower 16 bits of PWSDnPWDDIR00. The higher 16 bits of PWSDnPWDDIR00 mirrors the information of PWSDnPVCR00. The channel number of PWSDnQUE1 shifts to PWSDnQUE0, PWSDnQUE2 shifts to PWSDnQUE1and PWSDnQUE2 enter empty state.
After that, as similar to step (1), the value of PWSDnPVCR01 corresponding to the value stored in PWSDnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. This example shows that ADCJ1 is selected when PWSDnSLAD01 is 1.

(3) On completion of A/D conversion executed in step (2), the result of A/D conversion is stored in the lower 16 bits of PWSDnPWDDIR01. The higher 16 bits of PWSDnPWDDIR01 mirrors the information of PWSDnPVCR01. The channel number of PWSDnQUE1 shifts to PWSDnQUE0, PWSDnQUE1 enters empty state.
After that, as similar to step (1) or step (2), the value of PWSDnPVCR02 corresponding to the value stored in PWSDnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. This example shows that ADCJ2 is selected when PWSDnSLAD02 is 2.

(4) On completion of A/D conversion executed in step (3), the result of A/D conversion is stored in the lower 16 bits of PWSDnPWDDIR02. The higher 16 bits of PWSDnPWDDIR02 mirrors the information of PWSDnPVCR02. PWSDnQUE0 enters the empty state, PWSDnSTR.PWSDnQNE bit is cleared.

42.4.3 PWM-Diag Related Functions in A/D Converter (ADCJ)

This section describes the A/D converter used for the PWM-Diag function.

42.4.3.1 ADCJ registers when the PWM-Diag function is used

- Before starting PWSD operation, the A/D converter must be set using the following register.
  - PWM-Diag scan group control register (ADCJvPWDSGCR)
- When the PWM-Diag is running, the PWSDnPVCRx value corresponding to the channel under conversion is set in the following register of the A/D converter.
  - PWM-Diag virtual channel register (ADCJvPWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
  - PWM-Diag data register (ADCJvPWDDR)
  - PWM-Diag data supplementary information register (ADCJvPWDDIR, PWSDnPWDDIRx*1)
- When A/D conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
  - Upper limit/lower limit error register (ADCJvSGULCR4)

Note 1. PWSDnPWDDIRx register is in PWSD.

Section 43 Analog to Digital Converter (ADCJ)

This section contains a description of the A/D Converter (ADCJ).
The first part of this section describes all of this products specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ADCJ.

43.1 Features of RH850/U2A-EVA ADCJ

43.1.1 Number of Units

This microcontroller has the following number of ADCJ units.

Table 43.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Name	ADCJn									
Number of ADCJ Units	3 (n = 0 to 2)	3 (n = 0 to 2)	3 (n = 0 to 2)	3 (n = 0 to 2)	3 (n = 0 to 2)	3 (n = 0 to 2)	3 (n = 0 to 2)	3 (n = 0 to 2)	2 (n = 0, 1)	3 (n = 0 to 2)
Name	AVSEG									
Number of AVSEG Units	1	1	1	1	1	1	1	1	1	1

The number of physical channels and virtual channels on individual product are listed below.

Table 43.2 Unit Configurations and Physical Channels

Unit Name (Number of Channels) ADCJn		RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
ADCJ0	High accuracy inputs	20	20	20	20	20	20	20	14	8	10
	Low accuracy inputs	10	10	10	10	10	10	10	10	6	3
ADCJ1	High accuracy inputs	20	20	20	20	20	20	20	14	8	10
	Low accuracy inputs	14	14	14	14	14	14	14	14	7	10
ADCJ2	High accuracy inputs	20	20	20	5	20	5	5	5	0	0
	Low accuracy inputs	10	10	10	10	10	10	10	7	0	6

Table 43.3 Unit Configurations and Virtual Channels

Unit Name (Number of Channels) ADCJn	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
ADCJ0	64	64	64	64	64	64	64	64	64	64
ADCJ1	64	64	64	64	64	64	64	64	64	64
ADCJ2	64	64	64	64	64	64	64	64	0	64

Table 43.4 Indices of Products

Index	Meaning
n	Throughout this section, the individual ADCJ units are identified by the index “n” (n = 0 to 2); for example, ADCJnADHALTR indicates the A/D force halt register.
p	Throughout this section, the individual physical channel groups (channel group in the unit) of ADCJn are identified by the index “p”; for example, ANnpq.
q	Throughout this section, the individual physical sub channels (sub channel in the unit) of ADCJn are identified by the index “q”; for example, ANnpq.
j	Throughout this section, the individual virtual channels of ADCJn are identified by the index “j”; for example, ADCJnVCRj indicates the virtual channel register.
x	Throughout this section, the individual scan groups (SG) of ADCJn are identified by the index “x” (x = 0 to 4); for example, ADCJnSGSTCRx indicates the scan group x start control register.
y	Throughout this section, the individual MPX wait time setting or upper/lower limit setting registers are identified by the index “y” (y = 0 to 7); for example, ADCJnVCULLMTBRy indicates the Upper/Lower Limit Check Table Register y.
z	Throughout this section, the individual T&H unit are identified by the index “z” (z = 0 to 3); for example, THzE indicates the T&H unit z.
v	Throughout this section, the A/D conversion monitor channel pointer is indicated by the index “v” (v = 0 to 4); for example, ADCJnADENDPv indicates the A/D Conversion Monitor Virtual Channel Pointer v.

43.1.2 Register Base Addresses

The ADCJn base addresses are listed in the following table.

The ADCJn register addresses are given as offsets from the base address.

Table 43.5 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ADCJ0_base>	FFCA 0000$_H$	P-Bus Group 6L
<AVSEG_base>	FFCA 2000$_H$	P-Bus Group 6L
<ADCJ1_base>	FFF2 0000$_H$	P-Bus Group 7
<ADCJ2_base>	FF9A 2000$_H$	P-Bus Group 2L
<ADCJ2_SELB_base>	FF9A 3800$_H$	P-Bus Group 2L

43.1.3 Clock Supply

The ADCJn clock supplies are shown in the following table.

Table 43.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
ADCJn (n = 0, 1)	CLKAD	CLK_ADC
	Register access clock	CLK_LSB
ADCJ2	CLKAD	CLKA_ADC
	Register access clock	CLKA_ADC
AVSEG	Register access clock	CLK_LSB

43.1.4 Interrupt Requests and Error Notifications

ADCJ interrupt requests are listed in the following table.

Table 43.7 Interrupt and DMA/DTS Requests

Interrupt Symbol Name	Unit Interrupt Name	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number	Other Trigger Signals
ADCJ0						
	INTADCJ0ERR (merged INT_ADE0 & INT_UL0)	A/D error interrupt upper/lower limit error interrupt	226	—	—	TAPA*2
	INTADCJ0SEC	Secondary voltage monitor error interrupt	225	—	—	—
	INTADCJ0I0	Scan group 0 (SG0) end interrupt	227	Group0-0	Group0-0	GTM*1
	INTADCJ0I1	Scan group 1 (SG1) end interrupt	228	Group0-1	Group0-1	GTM*1
	INTADCJ0I2	Scan group 2 (SG2) end interrupt	229	Group0-2	Group0-2	GTM*1
	INTADCJ0I3	Scan group 3 (SG3) end interrupt	230	Group0-3	Group0-3	GTM*1
	INTADCJ0I4	Scan group 4 (SG4) end interrupt	231	Group0-4	Group0-4	GTM*1
	ADMPXI0	MPX DMA trigger request	—	Group0-5	—	—
	ADC_CONV_END0	PWM A/D conversion end signal	—	Group0-6	Group0-5	—
ADCJ1						
	INTADCJ1ERR (merged INT_ADE1 & INT_UL1)	A/D error interrupt upper/lower limit error interrupt	232	—	—	TAPA*2
	INTADCJ1I0	Scan group 0 (SG0) end interrupt	233	Group0-7	Group0-6	GTM*1
	INTADCJ1I1	Scan group 1 (SG1) end interrupt	234	Group0-8	Group0-7	GTM*1
	INTADCJ1I2	Scan group 2 (SG2) end interrupt	235	Group0-9	Group0-8	GTM*1
	INTADCJ1I3	Scan group 3 (SG3) end interrupt	236	Group0-10	Group0-9	GTM*1
	INTADCJ1I4	Scan group 4 (SG4) end interrupt	237	Group0-11	Group0-10	GTM*1
	ADMPXI1	MPX DMA trigger request	—	Group0-12	—	—
	ADC_CONV_END1	PWM A/D conversion end signal	—	Group0-13	Group0-11	—
ADCJ2						
	INTADCJ2ERR (merged INT_ADE2 & INT_UL2)	A/D error interrupt upper/lower limit error interrupt	238	—	—	—
	INTADCJ2I0	Scan group 0 (SG0) end interrupt	239	Group0-14	Group0-12	LPS, WUP2
	INTADCJ2I1	Scan group 1 (SG1) end interrupt	240	Group0-15	Group0-13	LPS, WUP2
	INTADCJ2I2	Scan group 2 (SG2) end interrupt	241	Group0-16	Group0-14	LPS, WUP2
	INTADCJ2I3	Scan group 3 (SG3) end interrupt	242	Group0-17	Group0-15	LPS, WUP2
	INTADCJ2I4	Scan group 4 (SG4) end interrupt	243	Group0-18	Group0-16	LPS, WUP2
	ADMPXI2	MPX DMA trigger request	—	Group0-19	—	—
	ADC_CONV_END2	PWM A/D conversion end signal	—	Group0-20	Group0-17	—

Note 1. INTADCJ0I0 to INTADCJ0I4, INTADCJ1I0 to INTADCJ1I4 are chosen by the PIC (Peripheral Interconnect), and they are forwarded to the GTM. For details, refer to **Section 41, Peripheral Interconnect (PIC)**.

Note 2. INTADCJ0ERR and INTADCJ1ERR are chosen by the PIC (Peripheral Interconnect), and they are forwarded to the TAPA. For details, refer to **Section 41, Peripheral Interconnect (PIC)**.

ADCJ error notifications are listed in the following table.

Table 43.8 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
A/D converter parity error	ADCJ0 parity error	72	—
	ADCJ1 parity error	72	—
	ADCJ2 parity error	72	—

43.1.5 Reset Sources

ADCJn reset sources are listed in the following table. ADCJn is initialized by these reset sources.

Table 43.9 Reset Sources (For RH850/U2A-EVA)

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
ADCJn (n = 0, 1)	All registers	√	√	√	√	√	√	—
ADCJ2	All registers	√	√	√	√	—	—	—
AVSEG	All registers	√	√	√	√	√	√	—

43.1.6 External Input/Output Signals

External input/output signals of ADCJ are listed in the following table.

Table 43.10 External Input/Output Signals (1/4)*2

Unit Signal Name	Outline	Alternative Port Pin Signal
ADCJ0		
A0VCC*3	Power supply pin for the analog part	A0VCC
A0VSS	Ground pin for the analog part	A0VSS
A0VREFH*3	Reference voltage pin for the analog part	A0VREFH
AN000	Analog input pin	ADCJ0I0
AN001	Analog input pin	ADCJ0I1
AN002	Analog input pin	ADCJ0I2
AN003	Analog input pin	ADCJ0I3

ADEND0	A/D conversion timing monitor pin 0	ADCJ2CNV0
ADEND1	A/D conversion timing monitor pin 1	ADCJ2CNV1
ADEND2	A/D conversion timing monitor pin 2	ADCJ2CNV2
ADEND3	A/D conversion timing monitor pin 3	ADCJ2CNV3
ADEND4	A/D conversion timing monitor pin 4	ADCJ2CNV4

Note 1. Low accuracy inputs.
Note 2. For available pins of each product, see **Section 2, Pin Functions**.
Note 3. For U2A6, the AnVREFH should be connected with AnVCC.

For ADCJn, it's possible to perform an A/D conversion of an analog input with the assistance of RRAMP.

For ADCJ0, it's possible to perform an A/D conversion of VCC, E0VCC, ISOVDD and AWOVDD as secondary power supply voltage monitor.

For analog inputs and VMON (Secondary power supply voltage monitor), the correspondence list of physical channel, physical channel groups, physical sub channel and RRAMP is shown in the following table.

Table 43.11 ADCJ0 Physical Channel, Physical Channel Group, Physical Sub Channel and RRAMP

Analog Input or VMON	Physical Channel	Physical Channel Group	Physical Sub Channel	Pin-Level Self-Diagnosis Voltage Group	T&H Connection	RRAMP Correspondence	
						RRAMP00	RRAMP01

43.2 Overview

43.2.1 Functional Overview

(1) Basic functions

- A/D converter
  Resolution: 12-bit
  A/D conversion method: Successive approximation
  Conversion speed: 1.0 µs (min)
- Sample-and-hold function
  Each ADCJ has an internal sample-and-hold circuit that enables each module to perform an A/D conversion independently. The sampling time can be selected from several options.
- Extended physical channels (MPX function)
  Each ADCJ can extend physical channels by using an external analog multiplexer.
- Track & Hold (T&H) input channels
  Several channel inputs can select T&H circuit for synchronize conversion.
- A/D-converted value adding function
  The ADCJ performs A/D conversion sequentially twice or four times for a channel, and stores the addition result in the data register.
- A/D conversion monitor output
  The processing timing of a desired virtual channel can be output to the A/D conversion monitor output pin.

(2) Virtual channels

- Virtual channel concept
  The number of virtual channels is larger than the number of physical channels.
  Each virtual channel can be freely assigned to each physical conversion channel.
- Data registers
  Data registers corresponding to virtual channels are provided.

(3) Scan group

- Supporting 5 scan groups
  Each ADCJ has 5 scan groups (SG0, SG1, SG2, SG3, and SG4).
  SG4 can select PWM-Diag function.
  Scan settings can be made independently for each scan group.
- ADCJ has two scan modes.
  - Multicycle scan mode executes the specified number of scans.
  - Continuous scan mode executes scans repeatedly without limit.
- Start trigger for each scan group
  Hardware triggers and software triggers can start the processing of each scan group. Only scan groups 3(SG3) and 4(SG4) can start processing by an A/D timer trigger.
- Asynchronous/synchronous suspend and resume function
  A processing for a scan group can be interrupted to run the processing for another scan group.
- Scan end interrupt

Each scan group can generate an interrupt request to the INTC and activate the DMAC/DTS each time a processing for the virtual channel indicated by the end virtual channel pointer ends or a virtual channel ends.

- Interval function
  ADCJ can start scan groups in any cycle by using the A/D timer equipped in the scan groups 3 and 4. This enables scans with intervals inserted.

(4) Safety-related functions

- Diagnosis
  - wiring-break detection
  - voltage monitor
- Self-diagnosis
  - Self-diagnosis of the wiring-break detection
  - A/D converter self-diagnosis
  - Pin-level self-diagnosis
  - Self-diagnosis of the T&H path
  - Self-diagnosis of the voltage monitor function
  - A/D conversion of A/D conversion data path diagnosis
- Error Detection
  - Read and clear functions for the data registers
  - Parity check for the data registers
  - Overwrite check for the data registers
  - ID error
  - Upper/Lower Limit Check (8 tables)
  - Trigger overlap Check
- Upper/lower-limit-excess-notice-function to ADC VMON secondary error generator (AVSEG) in each virtual channel
  The ADCJ0 can output to the ADC-VMON-secondary-error-generator (AVSEG) a signal to notify that an A/D conversion result has increased above the upper limit value of the designated table in each virtual channel or that an A/D conversion result has decreased below the lower limit value of the designated table in each virtual channel. Once the Table register for the upper/lower limit value is set, it can be rewritten at any time.
  For details of the AVSEG, see **Section 43.7, ADC VMON Secondary Error Generator (AVSEG)**.
- Secondary power supply voltage monitor (VMON)
  The ADCJ0 can convert the voltage of VCC, E0VCC, ISOVDD and AWOVDD power supply in AD. Secondary HDET, Secondary LDET of each power supply (VCC, E0VCC, ISOVDD and AWOVDD) can generate an interrupt request to INTC by using the upper/lower-limit-execution-notice-function of ADCJ0 and AVSEG.
  For details of the AVSEG, see **Section 43.7, ADC VMON Secondary Error Generator (AVSEG)**.
  For the whole description of power supply voltage monitor, refer to **Section 11, Power Supply Voltage Monitor**.

43.2.2 Block Diagram

Figure 43.1 show the ADCJn block diagram.

(1) ADCJ0 block diagram

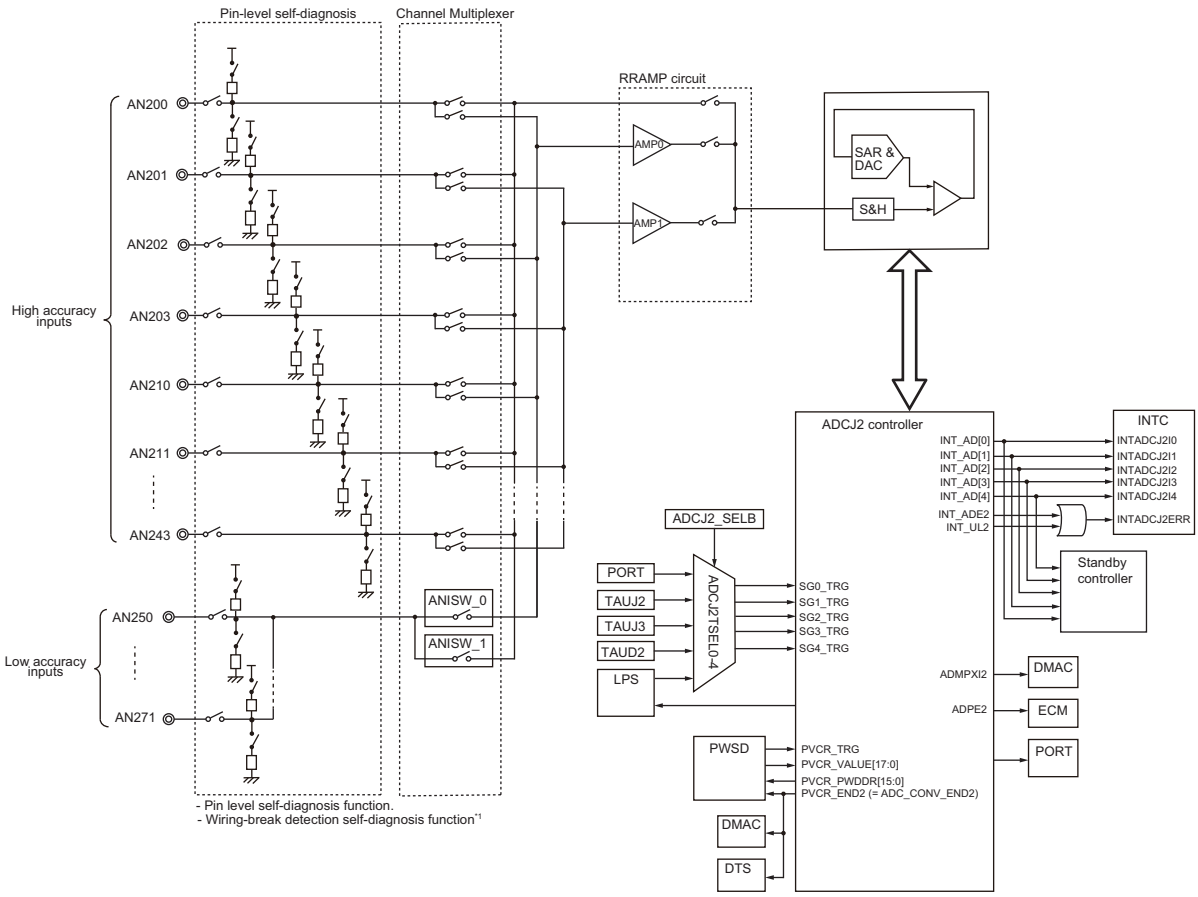
(3) ADCJ2 block diagram



Note 1. For details, see **Section 43.4.10, Self-Diagnostic Functions**.

Figure 43.3 Block Diagram of ADCJ2

43.2.3 Explanation of Terms

43.2.3.1 Physical channel

Physical channel means ANnpq that is an A/D conversion target of the 12-bit A/D converter.

43.2.3.2 Virtual Channel

Virtual channel means a structure to enable settings (such as A/D conversion type and physical channel) necessary for A/D conversion by setting a single register. Physical channel numbers can be freely selected for each virtual channel (ADCJnVCRj) by setting the GCTRL[5:0] bits in ADCJnVCRj.

Arbitrary consecutive virtual channel numbers can be set for each scan group (SG0-SG4). Set the starting virtual channel number and the end virtual channel number in the scan group x virtual channel pointer register (ADCJnSGVCPRx) provided for each scan group.
Because the ADCJ is configured to input the virtual channel setting one by one to 12-bit A/D converter for execution, multiple A/D conversion is not processed concurrently.

Starting virtual channel pointer	ADCJnSGVCPRx.VCSP[5:0]
End virtual channel pointer	ADCJnSGVCPRx.VCEP[5:0]

A/D conversion result is stored in the data register (ADCJnDRj) provided for each virtual channel.

A/D conversion result data for consecutive two channels (16 bits × 2 = 32 bits) is stored in ADCJnDRj.

A/D conversion result is also stored in the data supplementary information register (ADCJnDIRj). This register includes supplementary information in addition to A/D conversion result.

43.2.3.3 Scan Group

Set arbitrary number of consecutive virtual channels and activate a scan group by a startup trigger to perform A/D conversion continuously in ascending order with the virtual channel setting.

The priority is set for each scan group as follows:

SG0 < SG1 < SG2 < SG3 < SG4

If a high-priority scan group is activated while scan group x is operating, the scan group in progress is suspended and the high-priority scan group is executed instead. After all virtual channels in the high-priority scan group have been processed, processing of scan group x is resumed.

For details, see **Section 43.4.17, Example of Suspend and Resume Operation**.

Figure 43.4 shows that the relationship between virtual channel transition, virtual channel and Data Register, virtual channel and scan group. This figure shows that scan group 2 is processed from virtual channel 16 to 20, and scan group 1 is processed from virtual channel 4 and virtual channel 7 is being processed now.
The number of Data Register corresponds with the number of virtual channel. The number of physical channel can be set each virtual channel, same physical channel number can be set different virtual channels.

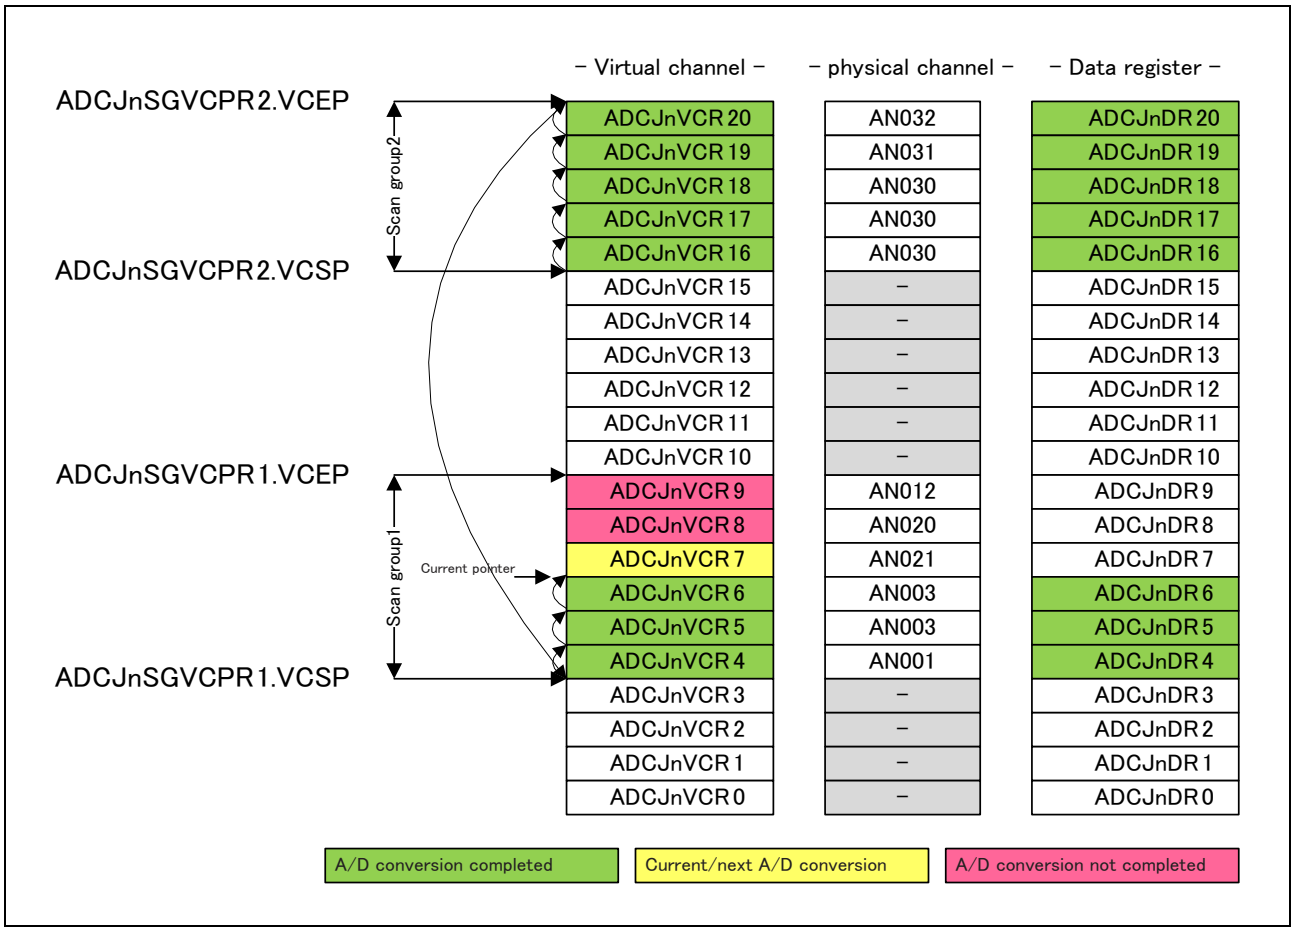


Figure 43.4 Relationship among physical channels, Virtual Channels, and Scan Groups

43.2.3.4 Data Format

This section describes data formats of the ADCJ.

(1) Data Formats of Data Registers

Formats in combination of data format (ADCJnADCR2.DFMT[2:0]), addition mode (ADCJnVCRj.CNVCLS[3:0]), and addition count (ADCJnADCR2.ADDNT, ADCJnODCR.WADDE) stored in data registers (ADCJnDRj, ADCJnPWDDR) are shown below.

(1) For 12bit signed fixed-point format (DFMT[2:0] = 000_B)

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S													0	0	0
Convert twice	S														0	0
Convert 4 times	S															0

↑ Position of decimal point

(2) For 12-bit signed integer format (DFMT[2:0] = 001_B)

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S	S	S	S												
Convert twice	S	S	S													
Convert 4 times	S	S														

↗ Position of decimal point

(3) For 12-bit unsigned fixed-point format (DFMT[2:0] = 010_B)

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once													0	0	0	0
Convert twice														0	0	0
Convert 4 times															0	0

↑ Position of decimal point

(4) For 12-bit unsigned integer format (Right) (DFMT[2:0] = 100_B)

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	0	0	0	0												
Convert twice	0	0	0													
Convert 4 times	0	0														

↗ Position of decimal point

(5) For 12-bit unsigned integer format (Left) (DFMT[2:0] = 101_B)

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once													0	0	0	0
Convert twice														0	0	0
Convert 4 times															0	0

Position of decimal point

S	: Sign bit (always 0)
0	: Zero extension

The format setting in ADDNT is valid when CNVCLS[3:0] = 4_H or 6_H.

If CNVCLS[3:0] is not 4_H or 6_H, the format is “convert once”.

CAUTION

Setting any value other than above values for ADCJnADCR2.DFMT[2:0] is prohibited.

(2) Data Format of Upper/Lower Limit Check Table Register for data register

When upper/lower limit check is used for data register (ADCJnDRj, ADCJnPWDDR), set the value in the upper/lower limit check table register as shown below.

(1) When DFMT[2:0] = 000_B, DFMT[2:0] = 010_B

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S													0	0	0
Convert twice	S														0	0
Convert 4 times	S															0

(2) When DFMT[2:0] = 001_B

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S	S	S	S												
Convert twice	S	S	S													
Convert 4 times	S	S														

(3) When DFMT[2:0] = 100_B, DFMT[2:0] = 101_B

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S	S	S	S												
Convert twice	S	S	S													
Convert 4 times	S	S														

(3) Data Format for Output to GTM

The data format for output to GTM is independent of the ADCJnADCR2.DFMT[2:0] setting. Data is output in the 12-bit signed fixed-point format as shown below.

- Data is output in the 12-bit (resolution) signed fixed-point format.

Number of addition	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S													0	0	0
Convert twice	S														0	0
Convert 4 times	S															0

↑ Position of decimal point

Shaded part: Fixed to 0 when DFMT = 011_B

S	: Sign bit (always 0)
0	: Zero extension

The format setting in ADDNT is valid when CNVCLS[3:0] = 4_H or 6_H.

If CNVCLS[3:0] is not 4_H or 6_H, the format is “convert once”.

43.3 Registers

43.3.1 List of Registers

ADCJ registers are listed in the following table.

Table 43.14 List of Registers (1/3)

Register Name	Symbol	Address	Access Protection	
			PBG	Other
ADC specific registers (virtual channel)				
Virtual channel register j	ADCJnVCRj	<ADCJn_base> + j × 4_H	*1	—
PWM-Diag Virtual Channel Register	ADCJnPWDVCR	<ADCJn_base> + 180_H	*1	—
Data register j (j = only even numbers)	ADCJnDRj	<ADCJn_base> + $1A0_H$ + j × 2_H	*1	—
PWM-Diag Data Register	ADCJnPWDDR	<ADCJn_base>+260_H	*1	—
Data supplementary information register j	ADCJnDIRj	<ADCJn_base> + 280_H + j × 4_H	*1	—
PWM-Diag data supplementary information register	ADCJnPWDDIR	<ADCJn_base>+400_H	*1	—
Scan group 0 start control register	ADCJnSGSTCR0	<ADCJn_base>+440_H	*1	—
Scan group 0 stop control register	ADCJnSGSTPCR0	<ADCJn_base>+444_H	*1	—
Scan group 0 control register	ADCJnSGCR0	<ADCJn_base>+450_H	*1	—
Scan group 0 virtual channel pointer	ADCJnSGVCPR0	<ADCJn_base>+454_H	*1	—
Scan group 0 multicycle register	ADCJnSGMCYCR0	<ADCJn_base>+458_H	*1	—
Scan group 0 status register	ADCJnSGSR0	<ADCJn_base>+460_H	*1	—
Scan group 1 start control register	ADCJnSGSTCR1	<ADCJn_base>+480_H	*1	—
Scan group 1 stop control register	ADCJnSGSTPCR1	<ADCJn_base>+484_H	*1	—
Scan group 1 control register	ADCJnSGCR1	<ADCJn_base>+490_H	*1	—
Scan group 1 virtual channel pointer	ADCJnSGVCPR1	<ADCJn_base>+494_H	*1	—
Scan group 1 multicycle register	ADCJnSGMCYCR1	<ADCJn_base>+498_H	*1	—
Scan group 1 status register	ADCJnSGSR1	<ADCJn_base>+$4A0_H$	*1	—
Scan group 2 start control register	ADCJnSGSTCR2	<ADCJn_base>+$4C0_H$	*1	—
Scan group 2 stop control register	ADCJnSGSTPCR2	<ADCJn_base>+$4C4_H$	*1	—
Scan group 2 control register	ADCJnSGCR2	<ADCJn_base>+$4D0_H$	*1	—
Scan group 2 virtual channel pointer	ADCJnSGVCPR2	<ADCJn_base>+$4D4_H$	*1	—
Scan group 2 multicycle register	ADCJnSGMCYCR2	<ADCJn_base>+$4D8_H$	*1	—
Scan group 2 status register	ADCJnSGSR2	<ADCJn_base>+$4E0_H$	*1	—
Scan group 3 start control register	ADCJnSGSTCR3	<ADCJn_base>+500_H	*1	—
Scan group 3 stop control register	ADCJnSGSTPCR3	<ADCJn_base>+504_H	*1	—
A/D timer 3 start control register	ADCJnADTSTCR3	<ADCJn_base>+508_H	*1	—
A/D timer 3 end control register	ADCJnADTENDCR3	<ADCJn_base>+$50C_H$	*1	—
Scan group 3 control register	ADCJnSGCR3	<ADCJn_base>+510_H	*1	—
Scan group 3 virtual channel pointer	ADCJnSGVCPR3	<ADCJn_base>+514_H	*1	—
Scan group 3 multicycle register	ADCJnSGMCYCR3	<ADCJn_base>+518_H	*1	—
Scan group 3 status register	ADCJnSGSR3	<ADCJn_base>+520_H	*1	—
A/D timer 3 initial phase register	ADCJnADTIPR3	<ADCJn_base>+524_H	*1	—
A/D timer 3 cycle register	ADCJnADTPRR3	<ADCJn_base>+528_H	*1	—
Scan group 4 start control register	ADCJnSGSTCR4	<ADCJn_base>+540_H	*1	—
Scan group 4 stop control register	ADCJnSGSTPCR4	<ADCJn_base>+544_H	*1	—
A/D timer 4 start control register	ADCJnADTSTCR4	<ADCJn_base>+548_H	*1	—
A/D timer 4 end control register	ADCJnADTENDCR4	<ADCJn_base>+$54C_H$	*1	—
Scan group 4 control register	ADCJnSGCR4	<ADCJn_base>+550_H	*1	—
Scan group 4 virtual channel pointer	ADCJnSGVCPR4	<ADCJn_base>+554_H	*1	—

Table 43.14 List of Registers (2/3)

Register Name	Symbol	Address	Access Protection	
			PBG	Other
Scan group 4 multicycle register	ADCJnSGMCYCR4	<ADCJn_base>+558_H	*1	—
Scan group 4 status register	ADCJnSGSR4	<ADCJn_base>+560_H	*1	—
A/D timer 4 initial phase register	ADCJnADTIPR4	<ADCJn_base>+564_H	*1	—
A/D timer 4 cycle register	ADCJnADTPRR4	<ADCJn_base>+568_H	*1	—
PWM-Diag control register	ADCJnPWDCR	<ADCJn_base>+580_H	*1	—
PWM-Diag scan group control register	ADCJnPWDSGCR	<ADCJn_base>+584_H	*1	—
Scan Group Common Status Register	ADCJnSGSTR	<ADCJn_base>+600_H	*1	—
A/D synchronization start control register	ADCJnADSYNSTCR	<ADCJn_base>+610_H	*1, *2	—
A/D timer synchronization start control register	ADCJnADTSYNSTCR	<ADCJn_base>+614_H	*1, *2	—
A/D halt register	ADCJnADHALTR	<ADCJn_base>+640_H	*1	—
A/D control register 1	ADCJnADCR1	<ADCJn_base>+644_H	*1	—
A/D control register 2	ADCJnADCR2	<ADCJn_base>+648_H	*1	—
Sampling Control Register	ADCJnSMPCR	<ADCJn_base>+$64C_H$	*1	—
MPX current control register	ADCJnMPXCURCR	<ADCJn_base>+650_H	*1	—
MPX interrupt enable register	ADCJnMPXINTER	<ADCJn_base>+654_H	*1	—
MPX current register 1	ADCJnMPXCURR1	<ADCJn_base>+658_H	*1	—
MPX current register 2	ADCJnMPXCURR2	<ADCJn_base>+$65C_H$	*1	—

Note 1. n = 0: PBG6L0#4
n = 1: PBG70#2
n = 2: PBG20#9

Note 2. These registers are supported for ADCJ0 only.

Note 3. These registers are supported for ADCJ0 & ADCJ1 only.

Note 4. This register is supported for ADCJ2 only.

NOTE

For the number of units and indices, see **Section 43.1.1, Number of Units**.

43.3.2 ADC Specific Registers (Virtual Channel)

43.3.2.1 ADCJnVCRj — Virtual Channel Register j

ADCJnVCRj is a readable and writable register to make settings for each virtual channel.

Access: This register can be read or written in 32-bit units.

Address: <ADCJn_base> + j × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.15 ADCJnVCRj Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	VCULLMTBS [3:0]	Upper/Lower Limit Check Table Register Select Select an upper/lower limit check table register to be compared. 0_H: Disabled 1_H: ADCJnVCULLMTBR0 is chosen 2_H: ADCJnVCULLMTBR1 is chosen 3_H: ADCJnVCULLMTBR2 is chosen 4_H: ADCJnVCULLMTBR3 is chosen 5_H: ADCJnVCULLMTBR4 is chosen 6_H: ADCJnVCULLMTBR5 is chosen 7_H: ADCJnVCULLMTBR6 is chosen 8_H: ADCJnVCULLMTBR7 is chosen Other than above: Setting prohibited (same as 0_H).
27 to 24	WTTS[3:0]	Wait Time Table Select 0_H: Disabled 1_H: ADCJnWAITTR0 is chosen. 2_H: ADCJnWAITTR1 is chosen. 3_H: ADCJnWAITTR2 is chosen. 4_H: ADCJnWAITTR3 is chosen. 5_H: ADCJnWAITTR4 is chosen. 6_H: ADCJnWAITTR5 is chosen. 7_H: ADCJnWAITTR6 is chosen. 8_H: ADCJnWAITTR7 is chosen. Other than above: Setting prohibited (same as 0_H).
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	GTMENT	GTM Entry 0: Entry disabled 1: Entry enabled Select whether to perform entry to the GTM. Entry is available only in scan groups enabled by GTMENTSGxE in ADCJnGTMENTSGER.
19 to 16	GTMTAG[3:0]	GTM-TAG When entry is requested to GTM, entry is performed to the channel of GTM for which the value of TAG is same as GTMTAG[3:0]. If multiple channels match, entry is performed t to them.

Table 43.15 ADCJnVCRj Register Contents (2/3)

Bit Position	Bit Name	Function
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 11	CNVCLS[3:0]	Conversion Type 0_H: Normal A/D conversion 1_H: Hold value A/D conversion 2_H: Normal A/D conversion at extended sampling cycle 3_H: ADcore self-diagnosis A/D conversion 4_H: Addition mode A/D conversion 5_H: MPX normal A/D conversion 6_H: MPX addition mode A/D conversion 7_H: Pin level self-diagnosis A/D conversion 8_H: A/D conversion in wiring-break detection mode 1 9_H: A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down) A_H: A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up) B_H: Self-diagnosis A/D conversion in wiring-break detection mode 1 C_H: Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down) D_H: Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up) E_H: A/D conversion of A/D conversion data path diagnosis (ADVAL mode) F_H: Reserved
10 to 8	MPXV[2:0]	MPX channel setting These bits are used to set the channel of external MPX to be transferred to the external analog multiplexer.
7	ADIE	Virtual Channel End Interrupt Enable 0: INT_ADx is not output at the end of virtual channel n in SGx. 1: INT_ADx is output at the end of virtual channel n in SGx. For details of the relationship between ADIE in ADCJnSGCRx and ADIE in ADCJnVCRj, see **Section 43.4.19.1, Scan End Interrupt Request**.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 43.15 ADCJnVCRj Register Contents (3/3)

Bit Position	Bit Name	Function
5 to 0	GCTRL[5:0]	General Control Set A/D conversion for each conversion mode. Normal A/D conversion (CNVCLS[3:0] = 0_H) GCTRL[5:2]: Set the physical channel group number. 0_H: Group number of physical channels ANn00 to ANn03 1_H: Group number of physical channels ANn10 to ANn13 : 7_H: Group number of physical channels ANn70 to ANn73 8_H: Group number of physical channels ANn80 to ANn81 GCTRL[1:0]: Set the physical sub channel number. 0_H: Sub channel 0 of the physical channel group specified by GCTRL[5:2] 1_H: Sub channel 1 of the physical channel group specified by GCTRL[5:2] 2_H: Sub channel 2 of the physical channel group specified by GCTRL[5:2] 3_H: Sub channel 3 of the physical channel group specified by GCTRL[5:2] Example of setting: To specify ANn10, set GCTRL[5:2]: = 1_H and GCTRL[1:0] = 0_H. To specify ANn72, set GCTRL[5:2]: = 7_H and GCTRL[1:0] = 2_H. Hold value A/D conversion (CNVCLS[3:0] = 1_H) GCTRL[5:3]: Set 000_B. GCTRL[2:0]: Set the T&H channel number. 0_H: The T&H0 value is AD converted. 1_H: The T&H1 value is AD converted. 2_H: The T&H2 value is AD converted. 3_H: The T&H3 value is AD converted. Others: Setting prohibited. Normal A/D conversion with extended Sampling time (CNVCLS[3:0] = 2_H) Make the same settings as normal A/D conversion (CNVCLS[3:0] = 0_H). ADcore self-diagnosis A/D conversion (CNVCLS[3:0] = 3_H) GCTRL[5]: Set 0. GCTRL[4:0]: Set the ADcore self-diagnosis voltage level. 10_H: AnVREFH × 1 $0C_H$: AnVREFH × 3/4 08_H: AnVREFH × 1/2 04_H: AnVREFH × 1/4 00_H: AnVREFH × 0 Other than above: Setting prohibited When the CNVCLS[3:0] value is set to the following value (CNVCLS[3:0] = 4_H to D_H), make the same settings as normal A/D conversion (CNVCLS[3:0] = 0_H). For addition mode A/D conversion (CNVCLS[3:0] = 4_H) For MPX normal A/D conversion (CNVCLS[3:0] = 5_H) For MPX addition mode A/D conversion (CNVCLS[3:0] = 6_H) For pin level self-diagnosis A/D conversion (CNVCLS[2:0] = 7_H) For A/D conversion in wiring-break detection mode 1 (CNVCLS[3:0] = 8_H) For A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down) (CNVCLS[3:0] = 9_H) For A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up) (CNVCLS[3:0] = A_H) For self-diagnosis A/D conversion in wiring-break detection mode 1 (CNVCLS[3:0] = B_H) For self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down) (CNVCLS[3:0] = C_H) For self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up) (CNVCLS[3:0] = D_H) A/D conversion data path diagnosis A/D conversion (ADVAL mode) (CNVCLS[3:0] = E_H) 00: Fix the A/D conversion data from ADCore to AAA_H. 01: Fix the A/D conversion data from ADCore to 555_H. Other than above: Setting prohibited.

CAUTIONS

1. To prevent a malfunction, this register has restrictions on updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".
2. When not used MPX normal A/D conversion or MPX addition mode A/D conversion, be sure to set MPXV[2:0] = 000_B.
3. When using MPX normal A/D conversion or MPX addition mode A/D conversion, be sure to insert a wait.
4. It is prohibited to set the value corresponding to no implemented physical channel or T&H channel to GCTRL[5:0]. In this case, A/D conversion result of these channels is not guaranteed because A/D conversion is executed with no selecting I/O or T&H.

43.3.2.2 ADCJnPWDVCR — PWM-Diag Virtual Channel Register

ADCJnPWDVCR is a read-only register to control PWM-Diag virtual channels.

Access: This register can be read in 32-bit units.

Address: <ADCJn_base> + 180_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	WTTS[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MPXE	MPXV[2:0]			VCULLMTBS[3:0]				—	—	GCTRL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.16 ADCJnPWDVCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 16	WTTS[3:0]	Wait Time Table Select 0_H: Disabled 1_H: ADCJnWAITTR0 is chosen. 2_H: ADCJnWAITTR1 is chosen. 3_H: ADCJnWAITTR2 is chosen. 4_H: ADCJnWAITTR3 is chosen. 5_H: ADCJnWAITTR4 is chosen. 6_H: ADCJnWAITTR5 is chosen. 7_H: ADCJnWAITTR6 is chosen. 8_H: ADCJnWAITTR7 is chosen. Other than above: Setting prohibited (same as 0_H).
15	MPXE	MPX Enable When operating this bit, set MPXE in the register of the PWSD module. 0: Normal A/D conversion is performed. The MPXV[2:0] value is not transferred to the output pin PVCR_MUXCUR[2:0]. No wait is inserted before A/D conversion starts. 1: MPX normal A/D conversion is performed. The MPXV[2:0] value is transferred to the output pin PVCR_MUXCUR[2:0]. A wait is inserted before A/D conversion starts.
14 to 12	MPXV[2:0]	MPX Channel Value When operating these bits, set MPXV[2:0] in the register of the PWSD module. Use this bit to select an MPX channel of the external analog multiplexer.
11 to 8	VCULLMTBS [3:0]	Upper/Lower Limit Check Table Register Select When operating these bits, set VCULLMTBS[3:0] in the register of the PWSD module. Select the upper/lower limit check table register to be compared. 0_H: Disabled 1_H: ADCJnVCULLMTBR0 is chosen. 2_H: ADCJnVCULLMTBR1 is chosen. 3_H: ADCJnVCULLMTBR2 is chosen. 4_H: ADCJnVCULLMTBR3 is chosen. 5_H: ADCJnVCULLMTBR4 is chosen. 6_H: ADCJnVCULLMTBR5 is chosen. 7_H: ADCJnVCULLMTBR6 is chosen. 8_H: ADCJnVCULLMTBR7 is chosen. Other than above: Setting prohibited (same as 0_H).
7, 6	Reserved	When read, the value after reset is returned.

Table 43.16 ADCJnPWDVCR Register Contents (2/2)

Bit Position	Bit Name	Function
5 to 0	GCTRL[5:0]	When operating these bits, set GCTRL[5:0] in the register of the PWSD module. GCTRL[5:2]: Set the physical channel group number. GCTRL[1:0]: Set the physical sub channel number. Example of setting: To specify ANn10, set GCTRL[5:2]: = 1_H and GCTRL[1:0] = 0_H. To specify ANn81, set GCTRL[5:2]: = 8_H and GCTRL[1:0] = 1_H.

CAUTIONS

1. When using MPX normal A/D conversion, be sure to insert a wait.
2. When not used MPX normal A/D conversion or MPX addition mode A/D conversion, be sure to set MPXV[2:0] to 000_B.
3. It is prohibited to set the value corresponding to no implemented physical channel to GCTRL[5:0]. In this case, A/D conversion result of these channels is not guaranteed because A/D conversion is executed with no selecting I/O.

NOTES

1. VCULLMTBS[3:0] in ADCJnPWDVCR and VCULLMTBS[3:0] in ADCJnVCRj are the same function.
2. PVCR_VALUE[17:0] is allocated to the following bits.
   PVCR_VALUE[17:14] = WTTS[3:0]
   PVCR_VALUE[13] = MPXE
   PVCR_VALUE[12:10] = MPXV[2:0]
   PVCR_VALUE[9:6] = VCULLMTBS[3:0]
   PVCR_VALUE[5:0] = GCTRL[5:0]

43.3.2.3 ADCJnDRj— Data Register j

ADCJnDRj is a read-only register to store A/D conversion value.

Access: This register is a read-only register that can be read in 32- or 16-bit units.

Address: <ADCJn_base> + $1A0_H$ + j × 2_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRj[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.17 ADCJnDRj Register Contents

Bit Position	Bit Name	Function
15 to 0	DRj[15:0]	Data Register These bits store A/D conversion result data ADCJnVCRj.

Data format of ADCJnDRj depends on the settings of data format bit (ADCJnADCR2.DFMT[2:0]). Regardless of the setting of the data format, data format translated to GTM is 12-bit (resolution) signed fixed-point format. Refer to **Section 43.2.3.4, Data Format** for details.

When the read and clear enable bit is valid (ADCJnSFTCR.RDCLRE = 1), ADCJnDRj is cleared by reading ADCJnDRj. And when ADCJnDRj is read, both ADCJnDRj and ADCJnDRj+1 are read at the same time because ADCJnDRj and ADCJnDRj+1 are stored in 32-bit border.

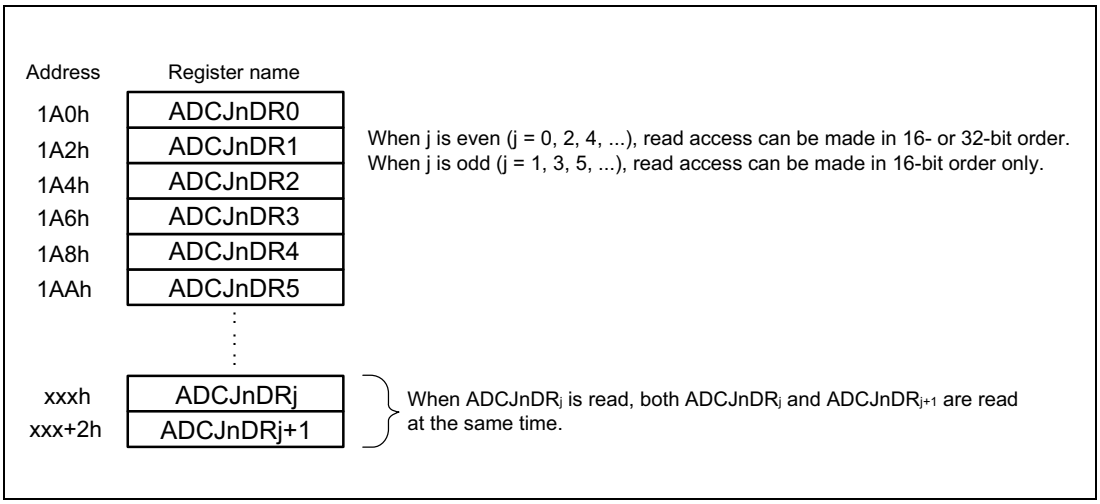

Figure 43.5 ADCJnDRj Read Specifications

When whether ADCJnDRj or ADCJnDRj+1 is read by CPU order, the other ADCJnDRj or ADCJnDRj+1 is cleared. So, set the read and clear enable bit invalid (ADCJnSFTCR.RDCLRE = 0).

And when whether ADCJnDRj or ADCJnDRj+1 is read by CPU order, it is prohibited to use the overwrite function*1. So, disable the overwrite function*2.

Note 1. Refer to NOTE 6 in **Section 43.3.2.5, ADCJnDIRj — Data Supplementary Information Register j** for details.

Note 2. When all of the following three conditions are met, the overwrite function is disabled.
(1) Do not compare the expected value of the WFLAG bit in ADCJnDIRj.
(2) Do not judge an error using the OWE bit in ADCJnOWER.
(3) Set the OWEIE bit in ADCJnSFTCR to 0 (disabled).

CAUTION

When the effective bit range of data is changed without reading ADCJnDRj after storing A/D conversion result, pseudo parity error may occur. Refer to CAUTION of Section 43.4.19.3, Parity Error Interrupt Request for details.

NOTES

1. When the read and clear enable bit is valid (ADCJnSFTCR.RDCLRE = 1), and when either ADCJnDRj or ADCJnDRj+1 is read as 16-bit data by a CPU instruction, both ADCJnDRj and ADCJnDRj+1 are cleared at the same time.
2. When the read and clear enable bit is valid (ADCJnSFTCR.RDCLRE = 1), ADCJnDRj is cleared by reading ADCJnDIRj.

When read and clear is valid (ADCJnSFTCR.RDCLRE = 1), set virtual channel number assignment constraint between scan groups to recommended settings 1 and 2 of **Figure 43.6**.

When virtual channel numbers of two scan groups are consecutively like a prohibited setting of **Figure 43.6**, by reading ADCJnDRj of one scan group target, ADCJnDRj+1 of the other scan group target is cleared, too. So this setting is prohibited.

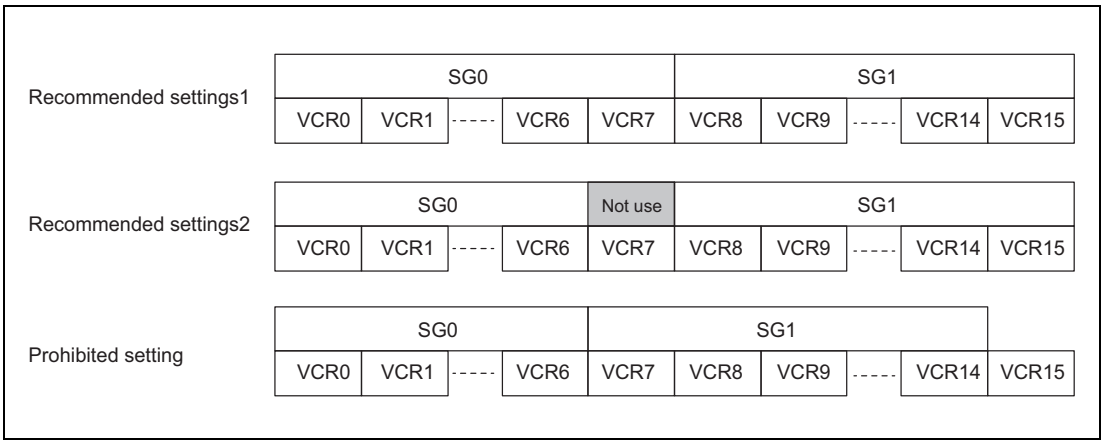

Figure 43.6 Restriction of Virtual channel number assignment constraint between scan groups

43.3.2.4 ADCJnPWDDR — PWM-Diag Data Register

ADCJnPWDDR is a read-only register to store A/D conversion value of PWM-Diag.

No overwrite error of ADCJnPWDDR is generated.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <ADCJn_base> + 260_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWDDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.18 ADCJnPWDDR Register Contents

Bit Position	Bit Name	Function
15 to 0	PWDDR[15:0]	PWM-Diag Data Register These bits are used to store the A/D conversion result data for the PWM-Diag.

CAUTION

When the effective bit range of data is changed without reading ADCJnPWDDR after storing A/D conversion result, pseudo parity error may occur. Refer to CAUTION of **Section 43.4.19.3, Parity Error Interrupt Request** for details.

NOTES

1. The ADCJnPWDDR format varies with the setting of data format (ADCJnADCR2.DFMT[2:0]). For details, check **(1), Data Formats of Data Registers**.
2. When the read and clear enable bit is valid (ADCJnSFTCR.RDCLRE = 1), ADCJnPWDDR is cleared by reading ADCJnPWDDIR.

43.3.2.5 ADCJnDIRj — Data Supplementary Information Register j

ADCJnDIRj is a read-only register to store supplementary information of ADCJnDRj and A/D converted value.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCJn_base> + 280_H + j × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.19 ADCJnDIRj Register Contents (1/2)

Bit Position	Bit Name	Function
31	MPXE	MPX Enable Flag 0: The MPX function is not used. 1: The MPX function is used.
30 to 28	MPXV[2:0]	MPX Channel Value These bits are used to store the MPX channel number transferred to the external analog multiplexer.
27	Reserved	When read, the value after reset is returned.
26	IDEF	ID Error 0: There is an error. 1: There is no error.
25	WFLAG	Write Flag Setting and clearing conditions 0: Clearing conditions Reading ADCJnDRj or ADCJnDIRj 1: Setting condition Storing A/D conversion value in ADCJnDRj
24	PRTY	Even parity bit of DRj[15:0], ID[5:0], IDEF, MPXV[2:0], and MPXE
23, 22	Reserved	When read, the value after reset is returned.

Table 43.19 ADCJnDIRj Register Contents (2/2)

Bit Position	Bit Name	Function
21 to 16	ID[5:0]	ID Information The channel number that A/D conversion has been executed is stored. When normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 0_H) is performed, the ID[5:2] value means physical channel group and the ID[1:0] value means physical sub channel. When hold value A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 1_H) is performed, the T&H whose hold value was A/D converted is stored in ID[2:0]. 0_H: The hold value of T&H0 is A/D converted. 1_H: The hold value of T&H1 is A/D converted. 2_H: The hold value of T&H2 is A/D converted. 3_H: The hold value of T&H3 is A/D converted. The ID bits value other than above is always 0. When normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 2_H) at the extended sampling cycle is performed, the same information as normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 0_H) is stored. When ADcore self-diagnosis A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 3_H) is performed, the ADcore self-diagnosis level is stored in ID[4:0]. 10_H: AnVREFH × 1 $0C_H$: AnVREFH × 3/4 08_H: AnVREFH × 1/2 04_H: AnVREFH × 1/4 00_H: AnVREFH × 0 The ID bits value other than above is always 0. When the ADCJnVCRj.CNVCLS[3:0] value is set to the following value (ADCJnVCRj.CNVCLS[3:0] = 4_H to E_H), the same information as normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 0_H) is stored. For addition mode A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 4_H) For MPX normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 5_H) For MPX addition mode A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 6_H) For pin level self-diagnosis A/D conversion (ADCJnVCRj.CNVCLS[2:0] = 7_H) For A/D conversion in wiring-break detection mode 1 (ADCJnVCRj.CNVCLS[3:0] = 8_H) For A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down) (ADCJnVCRj.CNVCLS[3:0] = 9_H) For A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up) (ADCJnVCRj.CNVCLS[3:0] = A_H) For self-diagnosis A/D conversion in wiring-break detection mode 1 (ADCJnVCRj.CNVCLS[3:0] = B_H) For self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down) (ADCJnVCRj.CNVCLS[3:0] = C_H) For self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up) (ADCJnVCRj.CNVCLS[3:0] = D_H) When A/D conversion data path diagnosis (ADVAL mode) (ADCJnVCRj.CNVCLS[3:0] = E_H) is performed, the executed GCTRL[5:0] value in ADCJnVCRj is stored.
15 to 0	DRj[15:0]	Data Register It is ADCJnDRj itself. Refer to **Section 43.3.2.3, ADCJnDRj— Data Register j** for details.

CAUTION

When the effective bit range of data is changed without reading ADCJnDIRj after storing A/D conversion result, pseudo parity error may occur. Refer to CAUTION of **Section 43.4.19.3, Parity Error Interrupt Request** for details.

NOTES

1. When read & clear is valid (ADCJnSFTCR.RDCLRE = 1), value of IDEF bit is changed by the following condition.

Condition	Value of IDEF
Initial state (reset value)	0
Reading ADCJnDRj or reading ADCJnDIRj	
Detection of ID error	
No detection of ID error	1

When read & clear is invalid (ADCJnSFTCR.RDCLRE = 0), value of IDEF bit is changed by the following condition.

Condition	Value of IDEF
Initial state (reset value)	0
Detection of ID error	
No detection of ID error	1

2. The MPXE bit is set to 1 when the MPX is in use (ADCJnVCRj.CNVCLS = 5_H or 6_H) in the executed virtual channel.
3. The MPXV bit of the executed virtual channel is stored in the MPXV[2:0] bits.
4. When reading ADCJnDRj or ADCJnDIRj, ADCJnDIRj is cleared by the following condition.

Condition	ADCJnDIRj	
	Cleared	Not cleared
Read & clear is enabled (ADCJnSFTCR.RDCLRE = 1)	MPXE, MPXV, IDEF, WFLAG, PRTY, ID, DRj	Nothing
Read & clear is disabled (ADCJnSFTCR.RDCLRE = 0)	WFLAG	MPXE, MPXV, IDEF, PRTY, ID, DRj

5. DRj bit is ADCJnDRj register itself. So, when the read and clear is valid (ADCJnSFTCR.RDCLRE = 1), all bits of ADCJnDIRj are cleared by read ADCJnDRj register.
6. The overwrite is the function that is independent of Read & Clear. When either ADCJnDRj or ADCJnDRj+1 is read by CPU order, the other WFLAG bit register is also cleared. Therefore, when either ADCJnDRj or ADCJnDRj+1 is read by CPU order, it is prohibited to use the overwrite function.
7. When the read & clear is valid (ADCJnSFTCR.RDCLRE = 1), and when either ADCJnDRj or ADCJnDRj+1 is read by CPU order, both all bits of ADCJnDIRj and ADCJnDIRj+1 are cleared at the same time.

43.3.2.6 ADCJnPWDDIR — PWM-Diag Data Supplementary Information Register

ADCJnPWDDIR is a read-only register to store supplementary information of ADCJnPWDDR and A/D conversion values.

PWDDR in this bit is ADCJnPWDDR.PWDDR[15:0] itself. Supplementary information of A/D conversion result is transferred from MPX enable (MPXE), MPX channel value (MPXV[2:0]) and physical channel number (ID[5:0]) in ADCJnPWDVCR.

No overwrite error of ADCJnPWDDIR is generated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCJn_base> + 400_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MPXE	MPXV[2:0]			—	IDEF	WFLAG	PRTY	—	—	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWDDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.20 ADCJnPWDDIR Register Contents

Bit Position	Bit Name	Function
31	MPXE	MPX Enable Flag 0: The MPX function is not used. 1: The MPX function is used.
30 to 28	MPXV[2:0]	MPX Channel Value These bits are used to store the MPX channel number transferred to the external analog multiplexer.
27	Reserved	When read, the value after reset is returned.
26	IDEF	ID Error 0: There is an error. 1: There is no error.
25	WFLAG	Write Flag Setting and clearing conditions 0: Clearing conditions Reading ADCJnPWDDR or ADCJnPWDDIR 1: Setting condition Storing A/D conversion value in ADCJnPWDDR
24	PRTY	Even parity bit of PWDDR[15:0], ID[5:0], IDEF, MPXV[2:0], and MPXE
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	ID[5:0]	ID Information The value of ADCJnPWDVCR.GCTRL that has been executed is stored.
15 to 0	PWDDR[15:0]	PWM-Diag Data Register It is ADCJnPWDDR itself. Refer to **Section 43.3.2.4, ADCJnPWDDR — PWM-Diag Data Register** for details.

CAUTION

When the effective bit range of data is changed without reading ADCJnPWDDIR after storing A/D conversion result, pseudo parity error may occur. Refer to CAUTION of **Section 43.4.19.3, Parity Error Interrupt Request** for details.

NOTES

1. When read & clear is valid (ADCJnSFTCR.RDCLRE = 1), value of IDEF bit is changed by the following condition.

Condition	Value of IDEF
Initial state (reset value)	0
Reading ADCJnPWDDR or reading ADCJnPWWDIR	
Detection of ID error	
No detection of ID error	1

When read & clear is invalid (ADCJnSFTCR.RDCLRE = 0), value of IDEF bit is changed by the following condition.

Condition	Value of IDEF
Initial state (reset value)	0
Detection of ID error	
No detection of ID error	1

2. The MPXE bit is set to 1 when the MPX is in use (MPXE = 1) in the executed ADCJnPWDVCR.
3. The MPXV bit value in ADCJnPWDVCR is stored in the MPXV[2:0] bits.
4. When reading ADCJnPWDDR or ADCJnPWDDIR, ADCJnPWDDIR is cleared by the following condition.

Condition	ADCJnPWDDIR	
	Cleared	Not cleared
Read & clear is enabled (ADCJnSFTCR.RDCLRE = 1)	MPXE, MPXV, IDEF, WFLAG, PRTY, ID, PWDDR	Nothing
Read & clear is disabled (ADCJnSFTCR.RDCLRE = 0)	WFLAG	MPXE, MPXV, IDEF, PRTY, ID, PWDDR

5. PWDDR bit is ADCJnPWDDR register itself. So, when the read and clear is valid (ADCJnSFTCR.RDCLRE = 1), all bits of ADCJnPWDDIR is cleared by read ADCJnPWDDR register.

43.3.3 ADC Scan Group Specific Registers

43.3.3.1 ADCJnSGCRx — Scan Group x Control Register

ADCJnSGCRx is a readable and writable register to control scan group x.

Access: This register can be read or written in 8-bit units.

Address: ADCJnSGCR0: <ADCJn_base> + 450_H
ADCJnSGCR1: <ADCJn_base> + 490_H
ADCJnSGCR2: <ADCJn_base> + $4D0_H$
ADCJnSGCR3: <ADCJn_base> + 510_H
ADCJnSGCR4: <ADCJn_base> + 550_H

Value after reset: 00_H

When x = 0 to 2

Bit	7	6	5	4	3	2	1	0
	—	ADSTARTE	SCANMD	ADIE	—	—	—	TRGMD[0]
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R/W

Table 43.21 ADCJnSGCRx Register Contents (x = 0 to 2)

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	ADSTARTE	A/D Conversion Simultaneous Start Enable This bit is used to set whether to enable or disable the A/D conversion simultaneous start bit (ADCJnADSYNSTCR.ADSTART). 0: Disabled 1: Enabled
5	SCANMD	Scan Mode This bit is used to set scan mode of scan group x. 0: Multicycle scan mode 1: Continuous scan mode
4	ADIE	Scan End Interrupt Enable This bit is used to set whether to enable or disable output of the end interrupt signal (INT_ADx) of scan group x. 0: Output disabled 1: Output enabled For details of relationship between ADIE in ADCJnVCRj and ADIE in ADCJnSGCRx, see “**Section 43.4.19.1, Scan End Interrupt Request**”.
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TRGMD[0]	Trigger Mode This bit is used to set whether to enable or disable hardware triggers of scan group x. 0: Disabled 1: Enabled

TRGMD[0] is a enable bit that controls the start of scan group x by hardware trigger.

TRGMD[1:0]	Scan group x (x = 0, 1, 2)			
	Input			Output
	Hardware trigger (sgx_trg)	Software trigger (ADCJnSGSTCRx.SGST)	A/D conversion simultaneous start trigger (ADCJnADSYNSTCR.ADSTART)	Scan group Start
0_H	—	√	√	valid
1_H	√	√	√	valid

When x = 3, 4

Bit	7	6	5	4	3	2	1	0
	ADTSTARTE	ADSTARTE	SCANMD	ADIE	—	—	TRGMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Table 43.22 ADCJnSGCRx Register Contents (x = 3, 4)

Bit Position	Bit Name	Function
7	ADTSTARTE	A/D Timer Simultaneous Start Enable This bit is used to set whether to enable or disable the A/D timer simultaneous start bit (ADCJnADTSYNSTCR.ADTSTART). 0: Disabled 1: Enabled
6	ADSTARTE	A/D Conversion Simultaneous Start Enable This bit is used to set whether to enable or disable the A/D conversion simultaneous start bit (ADCJnADSYNSTCR.ADSTART). 0: Disabled 1: Enabled
5	SCANMD	Scan Mode This bit is used to set scan mode of scan group x. 0: Multicycle scan mode 1: Continuous scan mode
4	ADIE	Scan End Interrupt Enable This bit is used to set whether to enable or disable output of the end interrupt signal of scan group x. 0: Output disabled 1: Output enabled
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	TRGMD[1]	A/D Timer Trigger x Enable This bit is used to set whether to enable or disable A/D timer trigger x. 0: A/D timer trigger x is not requested 1: It is permitted for scan group x to start by A/D timer trigger x. * A/D timer trigger is internal trigger of ADCJ that activates scan group x at initial phase and every setting period of A/D timer x.
0	TRGMD[0]	Trigger Mode This bit is used to set whether to enable or disable hardware triggers of scan group x. 0: Disabled 1: Enabled

TRGMD[1:0] is a enable bit that controls both the start of scan group x and the start of A/D timer x by hardware trigger

- A/D timer x
  When TRGMD[1] is set to 1, A/D timer trigger x that A/D timer x outputs is valid. A/D timer x outputs A/D timer trigger x after initial phase or every period. And scan group x starts by A/D timer trigger x.
  When A/D timer x is started by hardware trigger, set TRGMD[1:0] to 3_H.

TRGMD [1:0]	A/D timer x (x = 3, 4)				
	Input			Output	
	Hardware trigger (sgx_trg)	Software trigger (ADCJnADTSTCRx.ADTST)	A/D timer simultaneous start trigger (ADCJnADTSYNSTCR.ADTSTART)	A/D timer Start	A/D timer trigger x
0_H	—	√	√	valid	Not output
1_H	—	√	√	valid	Not output
2_H	—	√	√	valid	Output
3_H	√	√	√	valid	Output

- Scan group x
  When scan group x is started by hardware trigger, set TRGMD[1:0] to 1_H.
  When A/D timer x is started by hardware trigger, set TRGMD[1:0] to 3_H.

TRGMD [1:0]	Scan group x (x = 3, 4)				
	Input				Output
	Hardware trigger (sgx_trg)	Software trigger (ADCJnADTSTCRx.ADTST)	A/D timer simultaneous start trigger (ADCJnADTSYNSTCR.ADTSTART)	A/D timer trigger x	Scan group x start
0_H	—	√	√	—	valid
1_H	√	√	√	—	valid
2_H	—	√	√	√	valid
3_H	—	√	√	√	valid

NOTES

1. x = 0 to 4
2. x = 0 to 2
   When ADCJnSGCRx.TRGMD is set to 1_H, it is enable to start scan group x by hardware trigger.
3. x = 3, 4
   When ADCJnSGCRx.TRGMD[1:0] is set to 1_H, it is enable to start scan group x by hardware trigger. When ADCJnSGCRx.TRGMD[1:0] is set to 3_H, it is enable to start A/D timer x by hardware trigger. And scan group x is started by A/D timer x in period of initial phase and in every period of each period.

CAUTIONS

1. A/D conversion start trigger input of the same scan group x occurred during A/D conversion of scan group x is ignored.
2. When continuous scan mode is set (SCANMD = 1) for any scan group, scan groups of lower priority than that of the scan group are disabled.
3. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**". However, clearing the ADIE and TRGMD bits to 0 when stopping a scan group is excluded.

43.3.3.2 ADCJnSGVCPRx — Scan Group x Virtual Channel Pointer Register

ADCJnSGVCPRx is a readable and writable register to specify the starting pointer and end pointer of virtual channels.

Write this register with a 16-bit width only.

Access: This register can be read or written in 16-bit units.

Address: ADCJnSGVCPR0: <ADCJn_base> + 454_H
ADCJnSGVCPR1: <ADCJn_base> + 494_H
ADCJnSGVCPR2: <ADCJn_base> + $4D4_H$
ADCJnSGVCPR3: <ADCJn_base> + 514_H
ADCJnSGVCPR4: <ADCJn_base> + 554_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	VCEP[5:0]						—	—	VCSP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.23 ADCJnSGVCPRx Register Contents

Bit Position	Bit Name	Function
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	VCEP[5:0]	End Virtual Channel Pointer
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCSP[5:0]	Starting Virtual Channel Pointer

CAUTIONS

1. Do not set a value larger than the number of implemented virtual channels.
2. Set this register to satisfy ADCJnSGVCPRx.VCSP ≤ ADCJnSGVCPRx.VCEP.
3. Setting a virtual channel (ADCJnVCRj) for multiple scan groups x is prohibited by setting the starting pointer and end pointer.
4. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”.

43.3.3.3 ADCJnSGMCYCRx — Scan Group x Multicycle Register

ADCJnSGMCYCRx is a readable and writable register to specify the scan count in multicycle scan mode.

Access: This register can be read or written in 8-bit units.

Address: ADCJnSGMCYCR0: <ADCJn_base> + 458_H
ADCJnSGMCYCR1: <ADCJn_base> + 498_H
ADCJnSGMCYCR2: <ADCJn_base> + $4D8_H$
ADCJnSGMCYCR3: <ADCJn_base> + 518_H
ADCJnSGMCYCR4: <ADCJn_base> + 558_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	MCYC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.24 ADCJnSGMCYCRx Register Contents

Bit Position	Bit Name	Function
7 to 0	MCYC[7:0]	Multicycle These bits are used to set the scan count in multicycle scan mode. Scan count = MCYC[7:0] + 1 When operating the PWM-Diag in SG4 with PWE in ADCJnPWDCR set to 1, ADCJnSMGCYCR4 can be set only to 00_H.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.3.4 ADCJnSGSTCRx — Scan Group x Start Control Register

ADCJnSGSTCRx is a write-only register to control start of scan group x. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: ADCJnSGSTCR0: <ADCJn_base> + 440_H
ADCJnSGSTCR1: <ADCJn_base> + 480_H
ADCJnSGSTCR2: <ADCJn_base> + $4C0_H$
ADCJnSGSTCR3: <ADCJn_base> + 500_H
ADCJnSGSTCR4: <ADCJn_base> + 540_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SGST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.25 ADCJnSGSTCRx Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	SGST	Scan Group Start This software trigger is used to start A/D conversion of scan group x. 0: No function (Writing 0 to this bit is ignored.) 1: A/D conversion start Start A/D conversion when the scan group status (ADCJnSGSRx.SGACT) = 0.

43.3.3.5 ADCJnSGSTPCRx — Scan Group x Stop Control Register

ADCJnSGSTPCRx is a write-only register to control stop of scan group x. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: ADCJnSGSTPCR0: <ADCJn_base> + 444_H
ADCJnSGSTPCR1: <ADCJn_base> + 484_H
ADCJnSGSTPCR2: <ADCJn_base> + $4C4_H$
ADCJnSGSTPCR3: <ADCJn_base> + 504_H
ADCJnSGSTPCR4: <ADCJn_base> + 544_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SGSTP
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.26 ADCJnSGSTPCRx Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	SGSTP	Scan Group Stop This software trigger is used to stop A/D conversion of scan group x. 0: No function (Writing 0 to this bit is ignored.) 1: A/D conversion stop Writing 1 to this bit is ignored when the scan group status (ADCJnSGSRx.SGACT) = 0.

43.3.3.6 ADCJnADTSTCRx — A/D Timer x Start Control Register

ADCJnADTSTCRx is a write-only register to control start of A/D timer x. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: ADCJnADTSTCR3: <ADCJn_base> + 508_H
ADCJnADTSTCR4: <ADCJn_base> + 548_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ADTST	A/D Timer Start This software trigger is used to start A/D timer x. 0: No function (Writing 0 to this bit is ignored.) 1: A/D timer start. Start the A/D timer when the A/D timer status (ADCJnSGSRx.ADTACT) = 0.

NOTE

x = 3, 4

43.3.3.7 ADCJnADTENDCRx — A/D Timer x End Control Register

ADCJnADTENDCRx is a write-only register to control end of A/D timer x. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: ADCJnADTENDCR3: <ADCJn_base> + $50C_H$
ADCJnADTENDCR4: <ADCJn_base> + $54C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ADTEND	A/D Timer End This software trigger is used to terminate the A/D timer. 0: No function (Writing 0 to this bit is ignored.) 1: A/D timer end

NOTE

x = 3, 4

43.3.3.8 ADCJnADTIPRx — A/D Timer x Initial Phase Register

ADCJnADTIPRx is a readable and writable register to set the initial phase of A/D timer x.

Access: This register can be read or written in 32-bit units.

Address: ADCJnADTIPR3: <ADCJn_base> + 524_H
ADCJnADTIPR4: <ADCJn_base> + 564_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADTIP[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADTIP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.29 ADCJnADTIPRx Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 0	ADTIP[20:0]	A/D Timer Initial Phase These bits are used to set the initial phase of A/D timer x. Setting range: 00_0000_H to $1F\_FFFF_H$

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

NOTES

1. For details, see "**Section 43.4.13, Example of A/D Timer Operation**".
2. x = 3, 4

43.3.3.9 ADCJnADTPRRx — A/D Timer x Cycle Register

ADCJnADTPRRx is a readable and writable register to set the cycle of A/D timer x.

Access: This register can be read or written in 32-bit units.

Address: ADCJnADTPRR3: <ADCJn_base> + 528_H
ADCJnADTPRR4: <ADCJn_base> + 568_H

Value after reset: 001F FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADTPR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1

Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.30 ADCJnADTPRRx Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 0	ADTPR[20:0]	A/D Timer Cycle These bits are used to set the cycle of A/D timer x. Setting range: 00_0000$_H$ to 1F_FFFF$_H$

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

NOTES

1. For details, see "**Section 43.4.13, Example of A/D Timer Operation**".
2. x = 3, 4

43.3.3.10 ADCJnSGSRx — Scan Group x Status Register

ADCJnSGSRx is a read-only register that indicates the status of scan group x.

Access: This register is a read-only register that can be read in 8-bit units.

Address: ADCJnSGSR0: <ADCJn_base> + 460_H
ADCJnSGSR1: <ADCJn_base> + $4A0_H$
ADCJnSGSR2: <ADCJn_base> + $4E0_H$
ADCJnSGSR3: <ADCJn_base> + 520_H
ADCJnSGSR4: <ADCJn_base> + 560_H

Value after reset: 00_H

When x = 0 to 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SGACT	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.31 ADCJnSGSRx Register Contents (x = 0 to 2)

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	SGACT	Scan Group Status This bit indicates the A/D conversion status of scan group x. 0: Scan group x is in idle state. 1: A/D conversion of scan group x is in progress.
0	Reserved	When read, the value after reset is returned.

When x = 3, 4

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADTACT	SGACT	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.32 ADCJnSGSRx Register Contents (x = 3, 4)

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2	ADTACT	A/D Timer Status This bit indicates the operating status of A/D timer x. 0: A/D timer x is in idle state. 1: A/D timer x is running
1	SGACT	Scan Group Status This bit indicates the A/D conversion status of scan group x. 0: Scan group x is in idle state. 1: A/D conversion of scan group x is in progress.
0	Reserved	When read, the value after reset is returned.

NOTES

1. x = 0 to 4
2. ADCJnSGSRx.SGACT bit is set to 1 after the start trigger of scan group x is input. There are the following 3 conditions that SGACT bit is set to 0 except reset.
   1) When the A/D conversion of virtual channel j that is set in ADCJnSGVCPRx.VCEP is finished.
   2) When Forced Termination (ADCJnADHALTR.HALT) is written to 1.
   3) When Scan Group Stop (ADCJnSGSTPCRx.SGSTP) is written to 1.

43.3.3.11 ADCJnPWDCR — PWM-Diag Control Register

ADCJnPWDCR is a readable and writable register to control the PWM-Diag.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 580_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.33 ADCJnPWDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWE	PWM-Diag Enable 0: The PWM-Diag is disabled. 1: The PWM-Diag is enabled.

NOTE

When ADCJnPWDCR.PWE is set to 1, SG4 executes the PWM-Diag function.

CAUTIONS

1. When ADCJnPWDCR.PWE is set to 1, setting of the A/D timer of SG4, multicycle setting, and the setting of the virtual channel pointer are disabled. Use the PWM-Diag scan group control register (ADCJnPWDSGCR) to control (ADCJnSGCR4, ADCJnSGVCPR4, ADCJnSGMCYCR4, ADTSTCR4, and ADTENDCR4) SG4.
2. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”.

43.3.3.12 ADCJnPWDSGCR — PWM-Diag Scan Group Control Register

ADCJnPWDSGCR is a readable and writable register to control the PWM-Diag hardware trigger.

When the PWM-Diag is used, a scan end interrupt is always output.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 584_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TRGMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.34 ADCJnPWDSGCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TRGMD	Trigger Mode This bit is used to set whether to enable or disable hardware triggers of the PWM-Diag. 0: Disabled 1: Enabled

CAUTIONS

1. When ADCJnPWDCR.PWE = 1, this register setting is enabled.
2. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see **Section 43.4.4, Restrictions on Updating Settings**.

43.3.3.13 ADCJnSGSTR — Scan Group Common Status Register

ADCJnSGSTR is a read-only register that indicates the scan group status.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <ADCJn_base> + 600_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ADTACT[4:3]		—	—	—	—	SHACT	SVSACT	SGACT[4:0]					—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.35 ADCJnSGSTR Register Contents

Bit Position	Bit Name	Function
15, 14	Reserved	When read, the value after reset is returned.
13	ADTACT[4]	A/D Timer 4 Status 0: A/D timer 4 is in idle state. 1: A/D timer 4 is running.
12	ADTACT[3]	A/D Timer 3 Status 0: A/D timer 3 is in idle state. 1: A/D timer 3 is running.
11 to 8	Reserved	When read, the value after reset is returned.
7	SHACT	T&H Status Flag 0: T&H is stopped. 1: T&H conversion or sampling is in progress.
6	SVSACT	SVSTOP Status Flag 0: SVSTOP is canceled. 1: SVSTOP is accepted.
5	SGACT[4]	SGACT[4] Scan Group 4 / PWM-Diag (SG4 / PWM-Diag) Status Flag 0: A/D conversion for SG4 / PWM-Diag is completed. 1: A/D conversion for SG4 / PWM-Diag is in processing or suspension.
4	SGACT[3]	SGACT[3] Scan Group 3 (SG3) Status Flag 0: A/D conversion for SG3 is completed. 1: A/D conversion for SG3 is in processing or suspension.
3	SGACT[2]	SGACT[2] Scan Group 2 (SG2) Status Flag 0: A/D conversion for SG2 is completed. 1: A/D conversion for SG2 is in processing or suspension.
2	SGACT[1]	SGACT[1] Scan Group 1 (SG1) Status Flag 0: A/D conversion for SG1 is completed. 1: A/D conversion for SG1 is in processing or suspension.
1	SGACT[0]	SGACT[0] Scan Group 0 (SG0) Status Flag 0: A/D conversion for SG0 is completed. 1: A/D conversion for SG0 is in processing or suspension.
0	Reserved	When read, the value after reset is returned.

43.3.3.14 ADCJnADSYNSTCR — A/D Synchronization Start Control Register

ADCJnADSYNSTCR is a write-only register to control simultaneous start of A/D conversion of scan groups ADCJ0 and ADCJ1. This register is always read as 0.

This register setting is available only for ADCJ0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJ0_base> + 610_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.36 ADCJnADSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ADSTART	A/D Conversion Simultaneous Start This software trigger is used to simultaneously start A/D conversion of scan groups ADCJ0 and ADCJ1. 0: No function (Writing 0 to this bit is ignored.) 1: A/D conversion start Set the scan group synchronization start enable bit (ADCJnSGCRx.ADSTARTE bit of ADCJ0 and ADCJ1) of desired scan group x in advance.

43.3.3.15 ADCJnADTSYNSTCR — A/D Timer Synchronization Start Control Register

ADCJnADTSYNSTCR is a write-only register to control simultaneous count operation start of each A/D timer of ADCJ0 and ADCJ1. This register is always read as 0.

This register setting is available only for ADCJ0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJ0_base> + 614_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.37 ADCJnADTSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ADTSTART	A/D Timer Simultaneous Start This software trigger is used to simultaneously start A/D timer count operation of ADCJ0 and ADCJ1. 0: No function (Writing 0 to this bit is ignored.) 1: A/D timer count start The A/D timer is implemented in scan groups 3 and 4. Set the A/D timer synchronization start enable bit (ADCJnSGCRx.ADTSTARTE bit of ADCJ0 and ADCJ1) of desired scan group x in advance. A/D conversion of the scan group starts at the end of A/D timer count.

43.3.4 Hardware Trigger Specific Register

43.3.4.1 ADCJnSGTSELx — Scan Group x Start Trigger Control Register

This register is used to select the A/D conversion trigger (hardware trigger) for SGx (x = 0 to 4).

This register setting is available only for ADCJ2.

Access: This register can be read or written in 32-bit units.

Address: <ADCJ2_SELB_base> + x × 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TxSEL5	TxSEL4	TxSEL3	TxSEL2	TxSEL1	TxSEL0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.38 ADCJnSGTSELx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	TxSELp (p = 0 to 5)	A/D Conversion Trigger (Hardware Trigger) Select 0: Hardware trigger is disabled. 1: Hardware trigger is enabled. **CAUTION** When setting TxSELp to 1, set only one of the bits to 1.

The list below shows the hardware triggers to be selected.

Table 43.39 List of A/D Conversion Hardware Triggers

Unit	Control Register/Bit		Trigger Input Signal	
	Register Name	Bit Name	Symbol	Connection Destination Unit
ADCJ2	ADCJ2SGTSEL0	T0SEL0	INTTAUD2I7	TAUD2
		T0SEL1	INTTAUD2I15	TAUD2
		T0SEL2	INTTAUJ2I3	TAUJ2
		T0SEL3	INTTAUJ3I3	TAUJ3
		T0SEL4	ADCJ2TRG0	External trigger pin
		T0SEL5	SEQADTRG	LPS
	ADCJ2SGTSEL1	T1SEL0	INTTAUD2I7	TAUD2
		T1SEL1	INTTAUD2I15	TAUD2
		T1SEL2	INTTAUJ2I3	TAUJ2
		T1SEL3	INTTAUJ3I3	TAUJ3
		T1SEL4	ADCJ2TRG1	External trigger pin
		T1SEL5	SEQADTRG	LPS
	ADCJ2SGTSEL2	T2SEL0	INTTAUD2I7	TAUD2
		T2SEL1	INTTAUD2I15	TAUD2
		T2SEL2	INTTAUJ2I3	TAUJ2
		T2SEL3	INTTAUJ3I3	TAUJ3
		T2SEL4	ADCJ2TRG2	External trigger pin
		T2SEL5	SEQADTRG	LPS
	ADCJ2SGTSEL3	T3SEL0	INTTAUD2I7	TAUD2
		T3SEL1	INTTAUD2I15	TAUD2
		T3SEL2	INTTAUJ2I3	TAUJ2
		T3SEL3	INTTAUJ3I3	TAUJ3
		T3SEL4	ADCJ2TRG3	External trigger pin
		T3SEL5	SEQADTRG	LPS
	ADCJ2SGTSEL4	T4SEL0	INTTAUD2I7	TAUD2
		T4SEL1	INTTAUD2I15	TAUD2
		T4SEL2	INTTAUJ2I3	TAUJ2
		T4SEL3	INTTAUJ3I3	TAUJ3
		T4SEL4	ADCJ2TRG4	External trigger pin
		T4SEL5	SEQADTRG	LPS

CAUTIONS

1. **To prevent malfunction, ADCJnSGTSELx should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.**
2. **When SEQADTRG (LPS) is selected as hardware trigger, perform AD conversion in 1 Scan group only (It's prohibited to select SEQADTRG for multiple Scan groups).**

43.3.5 ADC Specific Registers (Control)

43.3.5.1 ADCJnADHALTR — A/D Halt Register

ADCJnADHALTR is a write-only register to forcibly terminate the ADCJ. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + 640_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HALT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.40 ADCJnADHALTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	HALT	Forced Termination This bit is used to forcibly terminate and initialize all scan groups and all A/D timers to drive the ADC to idle state. 0: No function (Writing 0 to this bit is ignored). 1: All scan groups and all A/D timers are forcibly terminated.

43.3.5.2 ADCJnADCR1 — A/D Control Register 1

ADCJnADCR1 is a readable and writable register for common control of the ADCJ.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 644_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SUSMTD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 43.41 ADCJnADCR1 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SUSMTD[1:0]	Suspending Method These bits are used to set the suspending method between scan groups. 0_H: Synchronous suspend 1_H: Synchronous/asynchronous mixed suspend 2_H: Asynchronous suspend 3_H: Setting prohibited (synchronous suspend)

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.5.3 ADCJnADCR2 — A/D Control Register 2

ADCJnADCR2 is a readable and writable register for common control of the ADCJ.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 648_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	DFMT[2:0]			—	—	—	ADDNT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R/W

Table 43.42 ADCJnADCR2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	DFMT[2:0]	Data Format These bits are used to specify the data format of ADCJnDRj, ADCJnPWDDR. 000_B: Resolution 12-bit signed fixed-point format 001_B: Resolution 12-bit signed integer format 010_B: Resolution 12-bit unsigned fixed-point format 100_B: Resolution 12-bit unsigned integer format (right-justified) 101_B: Resolution 12-bit unsigned integer format (left-justified) For GTM Data is output to the GTM in the format described in "**Section 43.2.3.4, (3) Data Format for Output to GTM**" regardless of the DFMT[2:0] bits setting. For the data format for ADCJnVCULLMTBRy specified by this register setting value, see "**Section 43.2.3.4, (2) Data Format of Upper/Lower Limit Check Table Register for data register**".
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ADDNT	Addition Count Select This bit is used to select the addition times of addition mode A/D conversion 0: Addition twice 1: Addition four times ADCJ has the following 3 types of addition mode A/D conversion. (1) Addition mode A/D conversion. (2) MPX addition mode A/D conversion. (3) Addition mode Wiring-Break detection*1. Note 1. Refer to WADDE bit in **Section 43.3.6.2, ADCJnODCR — Wiring Break Detection Control Register** for details.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.5.4 ADCJnSMPCR — Sampling Control Register

ADCJnSMPCR is a readable and writable register to control sampling.

Access: This register can be read or written in 32-bit units.

Address: <ADCJn_base> + $64C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	EXSMPT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BUFAMPD	—	—	SMPTS	—	—	—	—	SMPT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.43 ADCJnSMPCR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	EXSMPT[7:0]	Extended Sampling Period These bits are selected when CNVCLS[3:0] = extended sampling A/D conversion mode. 00_H: Set to 60 states. 63_H: Set to 99 states. $8A_H$: Set to 138 states. FC_H: Set to 252 states. Other than above: Setting prohibited
15	BUFAMPD	Buffer Amplifier Disable 0: A buffer amplifier is used. 1: No buffer amplifier is used.
14, 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	SMPTS	Sampling Period Select 0: The SMPT[7:0] bits are not selected. 1: The SMPT[7:0] bits are selected.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	SMPT[7:0]	Sampling Period 00_H: Set to 18 states. 63_H: Set to 99 states. CC_H: Set to 204 states. FC_H: Set to 252 states. Other than above: Setting prohibited

For the settings of sampling period and buffer amplifier, see "**Section 43.4.11.3, Sampling Period Setting**".

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.5.5 ADCJnMPXCURCR — MPX Current Control Register

ADCJnMPXCURCR is a readable and writable register to control the ADCJnMPXCURR1 format.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 650_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	MSKCFMT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 43.44 ADCJnMPXCURCR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	MSKCFMT[3:0]	Mask Control Format These bits are used to set the format of the mask control bits (ADCJnMPXCURR1.MSKC[15:0]) in the MPX current register. MSKCFMT[3] 0: MSKC[15:12] = 0000 1: MSKC[15:12] = 1111 MSKCFMT[2] 0: MSKC[11:8] = 0000 1: MSKC[11:8] = 1111 MSKCFMT[1] 0: MSKC[7:4] = 0000 1: Setting prohibited MSKCFMT[0] 0: MSKC[3:0] = 0000 1: MSKC[3:0] = 0111

CAUTIONS

1. Decide the setting value referring to the I/O port specifications.
2. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

NOTE

ADCJnMPXCURCR is the register that is arranged in 32-bit area. When ADCJnMPXCURCR is read, the 32-bit read data is only ADCJnMPXCURCR.

43.3.5.6 ADCJnMPXINTER — MPX Interrupt Enable Register

ADCJnMPXINTER is a readable and writable register to control MPX interrupt INT_MPX output.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 654_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADMPXIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.45 ADCJnMPXINTER Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ADMPXIE	MPX Interrupt Enable This bit is used to control the output of MPX interrupt INT_MPX. 0: INT_MPX is not output. 1: INT_MPX is output.

NOTE

ADCJnMPXINTER is the register that is arranged in 32-bit area. When ADCJnMPXINTER is read, the 32-bit read data is only ADCJnMPXINTER.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”.

43.3.5.7 ADCJnMPXCURR1 — MPX Current Register 1

ADCJnMPXCURR1 is a read-only register to store the MPX value.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCJn_base> + 658_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSKC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MPXCMD[7:0]								—	—	—	—	—	MPXCUR[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.46 ADCJnMPXCURR1 Register Contents

Bit Position	Bit Name	Function
31 to 16	MSKC[15:0]	Mask Control The mask format is stored according to the MSKCFMT[3:0] setting in ADCJnMPXCURCR.
15 to 8	MPXCMD[7:0]	SPI Communication Command Information The MPX command information register (ADCJnMPXCMDR) value is stored at the start of MPX normal A/D conversion or MPX addition mode A/D conversion.
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	MPXCUR[2:0]	Current MPX Value The MPXV[2:0] value in ADCJnVCRj is stored at the start of MPX normal A/D conversion or MPX addition mode A/D conversion.

NOTE

For details of operation, see “**Section 43.4.8, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode**”.

43.3.5.8 ADCJnMPXCURR2 — MPX Current Register 2

ADCJnMPXCURR2 is a read-only register to store the MPX value for an external analog multiplexer.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ADCJn_base> + $65C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	MPXCUR[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.47 ADCJnMPXCURR2 Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	MPXCUR[2:0]	Current MPX Value These bits store the MPXV[2:0] value in ADCJnPWDVCR (if a virtual channel is started with MPXE in ADCJnPWDVCR set to 1_H) or store the MPXV[2:0] value in ADCJnVCRj (if a virtual channel is started with CNVCLS[3:0] in ADCJnVCRj set to 5_H or 6_H).

NOTE

For details of operation, see "**Section 43.4.8, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode**".

43.3.5.9 ADCJnMPXCMDR — MPX Command Information Register

ADCJnMPXCMDR is a readable and writable register to store the SPI communication command information to be transferred to an external analog multiplexer.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 660_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	MPXCMD[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.48 ADCJnMPXCMDR Register Contents

Bit Position	Bit Name	Function
7 to 0	MPXCMD[7:0]	SPI Communication Command Information These bits are used to set the MSPI (SPI I/F) command to control MPX. When MPX normal A/D conversion or MPX addition mode A/D conversion starts, this command information is transferred to the SPI communication command information bits (ADCJnMPXCURR1.MPXCMD[7:0]) in the MPX current register.

CAUTIONS

1. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".
2. Determine the setting value according to the MSPI specifications.

43.3.5.10 ADCJnGTMENTSGER — GTM Entry Scan Group Enable Register

ADCJnGTMENTSGER is a readable and writable register to control whether to enable or disable scan groups to be entered in the GTM.

Access: This register can be read or written in 16-bit units.

Address: <ADCJn_base> + 670_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GTMENTSG4E	GTMENTSG3E	GTMENTSG2E	GTMENTSG1E	GTMENTSG0E	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 43.49 ADCJnGTMENTSGER Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	GTMENTSGxE	GTM Entry Scan Group Enable 0: GTM entry when SGx is activated is disabled. 1: GTM entry when SGx is activated is enabled. Entry is made in a virtual channel for which GTMENT in ADCJnVCRj is set to 1.
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.5.11 ADCJnADENDPv — A/D Conversion Monitor Virtual Channel Pointer v

ADCJnADENDPv is a readable and writable register to select a virtual channel that outputs the A/D conversion timing signal to ADENDv.

Access: This register can be read or written in 8-bit units.

Address: ADCJnADENDP0: <ADCJn_base> + 674_H
ADCJnADENDP1: <ADCJn_base> + 678_H
ADCJnADENDP2: <ADCJn_base> + $67C_H$
ADCJnADENDP3: <ADCJn_base> + 680_H
ADCJnADENDP4: <ADCJn_base> + 684_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	ENDP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.50 ADCJnADENDPv Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	ENDP[5:0]	A/D Conversion Monitor Virtual Channel Pointer These bits are used to set virtual channel numbers that monitor ongoing A/D conversion. 00_H to $3F_H$: Virtual channels 00 to 63 are set. The ADENDv pin is set to high level at the start of A/D conversion of the set virtual channel, and is set to low level at the end of A/D conversion.

CAUTION

1. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”.
2. PWM-Diag Virtual Channel Register (ADCJnPWDVCR) is not set to ENDP[5:0] of ADCJnADENDPv.

43.3.5.12 ADCJnTHSMPSTCR — T&H Sampling Start Control Register

ADCJnTHSMPSTCR is a write-only register to control sampling start of all T&H. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + 690_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SMPST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.51 ADCJnTHSMPSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	SMPST	T&H Sampling Start This software trigger is used to start sampling of all T&H. 0: No function (Writing 0 to this bit is ignored.) 1: Sampling start

NOTE

The T&H sampling processing is activated only by a software trigger (ADCJnTHSMPSTCR.SMPT), but is not activated by a hardware trigger.

CAUTIONS

1. **To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see 43.4.4, Restrictions on Updating Settings. For relevant setting flow, see 43.4.2.2, SG1/SG2 Startup Flow and 43.4.2.3, SG3/SG4 Startup Flow.**
   - **When T&H is used, it is recommended to set 0 to ADCJnTHCR.ASMPMSK (Automatic sampling is effective).**
   - **When the automatic sampling is effective, the setting of T&H sampling start is needed only first startup-time. Set the first T&H sampling start while all scan groups are stopped.**
2. **ADCJnTHSMPSTCR.SMPST is forced to start sampling processing of all T&Hs. It is prohibited to write this bit to 1 when the scan group of T&H group A is processing.**

43.3.5.13 ADCJnTHSTPCR — T&H Stop Control Register

ADCJnTHSTPCR is a write-only register to control stop of all T&H. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + 694_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	THSTP
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.52 ADCJnTHSTPCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	THSTP	T&H Sampling Stop This software trigger is used to stop all T&H. 0: No function (Writing 0 to this bit is ignored.) 1: All T&H is stopped

CAUTION

Use the THSTP bit after all scan groups have been forcibly stopped by ADCJnADHALTR.HALT.

Furthermore, after T&H is stopped by the THSTP bit, set the THzE (z = 0 to 3) bits to all 0 to prevent re-sampling by the automatic sampling function (ADCJnTHCR.ASMPMASK).

43.3.5.14 ADCJnTHCR — T&H Control Register

ADCJnTHCR is a readable and writable register to control the automatic sampling function of T&H.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 698_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ASMPMSK
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.53 ADCJnTHCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ASMPMSK	Automatic Sampling Mask This bit is used to set whether to start sampling automatically at the end of hold value A/D conversion. 0: Sampling starts automatically. 1: Sampling does not start automatically.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”.

43.3.5.15 ADCJnTHAHLDSTCR— T&H Group A Hold Start Control Register

ADCJnTHAHLDSTCR is a write-only register to control hold start of T&H group A. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + $6A0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HLDST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 43.54 ADCJnTHAHLDSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	HLDST	T&H Hold Start This software trigger is used to start hold of T&H group A. 0: No function (Writing 0 to this bit is ignored.) 1: Hold start

43.3.5.16 ADCJnTHER — T&H Enable Register

ADCJnTHER is a readable and writable register to control whether to enable or disable each T&H.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + $6B4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TH3E	TH2E	TH1E	TH0E
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 43.55 ADCJnTHER Register Contents

Bit Position	Bit Name	Function
7to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	THzE	T&H Enable These bits are used to set whether to enable or disable track and hold operation of the T&Hz circuit. 0: Disabled 1: Enabled

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”.

43.3.5.17 ADCJnTHACR — T&H Group A Control Register

ADCJnTHACR is a readable and writable register to control T&H group A.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + $6C0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 43.56 ADCJnTHACR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	HLDCTE	Hold Control Enable This bit is used to specify whether to enable or disable the hold control. 0: Hold control is disabled. 1: Hold control is enabled.
4	HLDTE	Hold Trigger Enable This bit is used to specify whether to enable or disable hardware trigger signals. 0: Disabled 1: Hardware trigger signals of the scan group selected by the scan group select bits (ADCJnTHACR.SGS[1:0]) are enabled.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SGS[1:0]	Selecting Scan Group These bits are used to select scan group x of T&H group A. 0_H: SG1 1_H: SG2 2_H: SG3 3_H: SG4 **CAUTION** SG0 is not selectable. When running the PWM-Diag in SG4 with the PWE bit in ADCJnPWDCR set to 1, setting SG4 is prohibited.

CAUTIONS

1. SG0 is not selectable for the T&H target scan group.
2. When the PWE bit in ADCJnPWDCR is set to 1, and when the PWM-Diag is operated with SG4, it is prohibited to select the T&H target scan group to SG4.
3. When using T&H, set SUSMTD[1:0] in ADCJnADCR1 to 2_H. Setting any other value is prohibited.
4. Set TRGMD in ADCJnSGCRx in the T&H target scan group to 1_H. Setting any other value is prohibited.
5. When using T&H, select multicycle scan mode (ADCJnSGCRx.SCANMD = 0_H) of the T&H target scan group and set the scan count to one (ADCJnSGMCYCRx.MCYC[7:0] = 0_H). Any other combination of settings is prohibited.
6. When using hardware triggers by the T&H function, set ADCJnTHACR.HLDCTE = 1 and ADCJnTHACR.HLDTE = 1.
7. When using software triggers by the T&H function, set ADCJnTHACR.HLDCTE = 1 and ADCJnTHACR.HLDTE = 0.
8. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see “**Section 43.4.4, Restrictions on Updating Settings**”. However, clearing the HLDTE bit to 0 when stopping a scan group is excluded.

43.3.5.18 ADCJnWAITTRy — Wait Setting Register y

ADCJnWAITTRy is a readable and writable register to set arbitrary wait time before executing a virtual channel.

Access: This register can be read or written in 16-bit units.

Address: ADCJnWAITTR0: <ADCJn_base> + 700_H
ADCJnWAITTR1: <ADCJn_base> + 704_H
ADCJnWAITTR2: <ADCJn_base> + 708_H
ADCJnWAITTR3: <ADCJn_base> + $70C_H$
ADCJnWAITTR4: <ADCJn_base> + 710_H
ADCJnWAITTR5: <ADCJn_base> + 714_H
ADCJnWAITTR6: <ADCJn_base> + 718_H
ADCJnWAITTR7: <ADCJn_base> + $71C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	WAITTIME[13:0]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.57 ADCJnWAITTRy Register Contents

Bit Position	Bit Name	Function
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	WAITTIME[13:0]	These bits are used to set arbitrary wait time to be inserted before executing a virtual channel. 0000_H: No wait is inserted before executing a virtual channel. Other than 0000_H: A wait for the set time period is inserted before executing a virtual channel. Calculating formula: Wait time (μs) = WAITTIME[13:0] × CLKAD cycle (μs) * An example of cycle period setting is shown below. * CLKAD cycle (μs) = 1/CLKAD frequency (MHz)

Example of WAITTIME[13:0] Setting

Stabilization Time (μs)	CLKAD Frequency (MHz)					
	10	12	16	20	24	40
1	$000A_H$	$000C_H$	0010_H	0014_H	0018_H	0028_H
100	$03E8_H$	$04B0_H$	0640_H	$07D0_H$	0960_H	$0FA0_H$
250	$09C4_H$	$0BB8_H$	$0FA0_H$	1388_H	1770_H	2710_H
400	$0FA0_H$	$12C0_H$	1900_H	$1F40_H$	2580_H	$3E80_H$

CAUTIONS

1. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".
2. When using a multiplexer in the first virtual channel of each scan group (ADCJnVCRj.CNVCLS[3:0] = 5_H or 6_H or ADCJnPWDVCR.MPXE = 1), insert a wait to the first virtual channel. When using no multiplexer, do not insert a wait to the first virtual channel of each scan group.

43.3.5.19 ADCJnVMONVDCR1 — Voltage Monitoring Voltage Divider Control Register 1

ADCJnVMONVDCR1 is a readable and writable register to control the voltage monitoring voltage divider of the power supply. This register setting is available only for ADCJ0.

Access: This register can be read or written in 8-bit units.

Address: <ADCJ0_base> + 740_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDE1
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.58 ADCJnVMONVDCR1 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	VDE1	Voltage Divider Enable (Voltage Dividing Resistor Control) This bit is used to control the voltage dividing resistor together with the VDE2 bit in ADCJnVMONVDCR2. For details, see "**Table 43.60, Resistance voltage divide and Pull-Down Control Setting Table**".

CAUTIONS

1. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".
2. Do not perform A/D conversion with the setting of ADCJnVMONVDCR1.VDE1 or ADCJnVMONVDCR2.VDE2 = 01_B or 10_B.

43.3.5.20 ADCJnVMONVDCR2 — Voltage Monitoring Voltage Divider Control Register 2

ADCJnVMONVDCR2 is a readable and writable register to control the voltage monitoring voltage divider of the power supply. This register setting is available only for ADCJ0.

Access: This register can be read or written in 8-bit units.

Address: <ADCJ0_base> + 744_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDE2
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.59 ADCJnVMONVDCR2 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	VDE2	Voltage Divider Enable (Voltage Dividing Resistor Control) This bit is used to control the voltage dividing resistor together with the VDE1 bit in ADCJnVMONVDCR1. For details, see "**Table 43.60, Resistance voltage divide and Pull-Down Control Setting Table**".

CAUTIONS

1. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".
2. Do not perform A/D conversion with the setting of ADCJnVMONVDCR1.VDE1 or ADCJnVMONVDCR2.VDE2 = 01_B or 10_B.

Table 43.60 Resistance voltage divide and Pull-Down Control Setting Table

VDE1	VDE2	Resistance voltage divide	Pull-Down
0	0	OFF	ON
0	1	OFF	OFF
1	0	OFF	OFF
1	1	ON	OFF

43.3.6 ADC Specific Registers (Safety-Related)

43.3.6.1 ADCJnTDCR — Pin Level Self-Diagnostic Control Register

ADCJnTDCR is a readable and writable register to control T&H path self-diagnosis and pin-level self-diagnosis.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 760_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	THSDE	—	—	—	—	—	TDLV[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R/W	R/W

Table 43.61 ADCJnTDCR Register Contents

Bit Position	Bit Name	Function
7	THSDE	T&H Path Self-Diagnosis Enable 0: T&H path self-diagnosis is disabled. 1: T&H path self-diagnosis is enabled.
6 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TDLV[1:0]	Pin-Level Self-Diagnosis Voltage Level These bits are used to set a voltage level applied at the time of pin-level self-diagnosis. • Target physical channel is high accuracy input 0_H: Even groups of Pin-Level Self-Diagnosis Voltage are discharged to AnVSS and odd groups are charged to AnVCC. 1_H: Even groups of Pin-Level Self-Diagnosis Voltage are charged to AnVCC and odd groups are discharged to AnVSS. 2_H: Even groups of Pin-Level Self-Diagnosis Voltage are discharged to AnVSS and odd groups are charged to 1/2 × AnVCC. 3_H: Even groups of Pin-Level Self-Diagnosis Voltage are charged to 1/2 × AnVCC and odd groups are discharged to AnVSS. • Target physical channel is low accuracy input 0_H: Even groups of Pin-Level Self-Diagnosis Voltage are discharged to AnVSS and odd groups are charged to EnVCC. 1_H: Even groups of Pin-Level Self-Diagnosis Voltage are charged to EnVCC and odd groups are discharged to AnVSS. 2_H: Setting prohibited. 3_H: Setting prohibited.

CAUTIONS

1. When T&H path self-diagnosis is executed, set registers by seeing "**Section 43.4.10.2, Self-Diagnosis of the T&H Path**".
2. To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.6.2 ADCJnODCR — Wiring Break Detection Control Register

ADCJnODCR is a readable and writable register to control wiring-break detection.

Access: This register can be read or written in 16-bit units.

Address: <ADCJn_base> + 764_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WADDE	—	—	—	ODPW[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 43.62 ADCJnODCR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	WADDE	Addition Mode Wiring-Break Detection Enable 0: A/D conversion of wiring-break detection mode is performed in normal mode. 1: A/D conversion of wiring-break detection mode is performed in addition mode.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	ODPW[4:0]	Wiring-Break Detection Pulse Width for Wiring-Break Detection Mode 1 04_H: 1 state (of internal clock) 05_H: 2 states (of internal clock) : 13_H: 16 states (of internal clock) 14_H: 17 states (of internal clock) Setting a value equal to or less than 03_H and equal to or more than 15_H is prohibited.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

NOTES

1. A/D conversion target analog pins are discharged with the pulse width specified by ODPW[4:0] after the A/D conversion sampling has been completed.
2. A/D conversion of wiring-break detection mode means the following setting.

   Virtual channel j of Scan group x

ADCJnVCRj.CNVCLS[3:0]	Function
8_H	A/D conversion in wiring-break detection mode 1
9_H	A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down)
A_H	A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up)
B_H	Self-diagnosis A/D conversion in wiring-break detection mode 1
C_H	Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down)
D_H	Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up)

43.3.6.3 ADCJnSFTCR — Safety Control Register

ADCJnSFTCR is a readable and writable register for safety control.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 770_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	TOCEIE	—	RDCLRE	—	OWEIE	PEIE	IDEIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R/W	R	R/W	R/W	R/W

Table 43.63 ADCJnSFTCR Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TOCEIE	Trigger Overlap Check Error Interrupt Enable This bit specifies whether to enable or disable trigger overlap check error interrupts. 0: Disabled 1: Enabled
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	RDCLRE	Read and Clear Enable This bit sets read and clear enable operation. This bit specifies whether to clear the clearing target register by reading the following target registers. Clearing target registers: ADCJnDRj, ADCJnDIRj, ADCJnPWDDR, and ADCJnPWDDIR. 0: Not cleared by reading. 1: Cleared by reading.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	OWEIE	Overwrite Error Interrupt Enable This bit specifies whether to enable or disable overwrite error interrupts. 0: Disabled 1: Enabled
1	PEIE	Parity Error Interrupt Enable This bit specifies whether to enable or disable parity error interrupts. 0: Disabled 1: Enabled
0	IDEIE	ID Error Interrupt Enable This bit specifies whether to enable or disable ID error interrupts. 0: Disabled 1: Enabled

NOTE

Refer to Note in the following chapter for clear condition of each bits of Data Supplementary Register.
Section 43.3.2.5, ADCJnDIRj — Data Supplementary Information Register j
Section 43.3.2.6, ADCJnPWDDIR — PWM-Diag Data Supplementary Information Register

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.6.4 ADCJnTOCCR — Trigger Overlap Check Control Register

ADCJnTOCCR is a readable and writable register to control trigger overlap check.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + 774_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TOCE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.64 ADCJnTOCCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TOCE	Trigger Overlap Check Function Enable 0: Disabled 1: Enabled

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.6.5 ADCJnTOCER — Trigger Overlap Check Error Status Register

ADCJnTOCER is a read-only register that indicates a trigger overlap check error.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ADCJn_base> + 790_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	TOCESG[4:0]					—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.65 ADCJnTOCER Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 1	TOCESG[4:0]	These bits indicate that a trigger overlap check error has occurred in SG0 to SG4. TOCESG[x] 0: No error in SGx 1: An error in SGx
0	Reserved	When read, the value after reset is returned.

CAUTIONS

1. The TOCESG[x] value is retained until a value of 1 is written to the SGx trigger overlap check error clear bit (ADCJnECR.TOCESGC[x]).
2. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when TOCESG[x] = 0, setting takes precedence (TOCESG[x] = 1).
   If a conflict occurs when TOCESG[x] = 1, clearing takes precedence (TOCESG[x] = 0).

43.3.6.6 ADCJnOWER — Overwrite Error Register

ADCJnOWER is a read-only register that indicates an overwrite error.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ADCJn_base> + $79C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	OWE	—	OWECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.66 ADCJnOWER Register Contents

Bit Position	Bit Name	Function
7	OWE	Overwrite Error 0: No error is present. 1: An error is present.
6	Reserved	When read, the value after reset is returned.
5 to 0	OWECAP[5:0]	Overwrite Error Capture These bits indicate the first virtual channel number in which an overwrite error has occurred. 00_H-$3F_H$: An overwrite error has occurred in ADCJnVCRj. No value other than above is indicated.

CAUTIONS

1. This register value is retained until a value of 1 is written to the overwrite error clear bit (ADCJnECR.OWEC). This register is set simultaneously when the A/D conversion result is stored in the data register (ADCJnDRj).
2. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when OWE = 0, setting takes precedence (OWE = 1, OWECAP capture).
   If a conflict occurs when OWE = 1, clearing takes precedence (OWE = 0, OWECAP clear).

43.3.6.7 ADCJnPER — Parity Error Status Register

ADCJnPER is a read-only register that indicates a parity error.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ADCJn_base> + $7A0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PE	PECAP[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.67 ADCJnPER Register Contents

Bit Position	Bit Name	Function
7	PE	Parity Error 0: No error is present. 1: An error is present.
6 to 0	PECAP[6:0]	Parity Error Capture These bits indicate the first virtual channel number in which a parity error has occurred. 00_H-$3F_H$: A parity error has occurred in ADCJnVCRj. 70_H: A parity error has occurred in ADCJnPWDVCR. No value other than the above values is indicated.

CAUTIONS

1. This register value is retained until a value of 1 is written to the parity error clear bit (ADCJnECR.PEC). This register is set simultaneously when reading ADCJnDRj, ADCJnDIRj, ADCJnPWDDR, or ADCJnPWDDIR has been completed.
2. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when PE = 0, setting takes precedence (PE = 1, PECAP capture).
   If a conflict occurs when PE = 1, clearing takes precedence (PE = 0, PECAP clear).

43.3.6.8 ADCJnIDER — ID Error Register

ADCJnIDER is a read-only register that indicates an ID error.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ADCJn_base> + $7A4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDE	IDECAP[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 43.68 ADCJnIDER Register Contents

Bit Position	Bit Name	Function
7	IDE	ID Error 0: No error is present. 1: An error is present.
6 to 0	IDECAP[6:0]	ID Error Capture These bits indicate the first virtual channel number in which an ID error has occurred. 00_H-$3F_H$: An ID error has occurred in ADCJnVCRj. 70_H: An ID error has occurred in ADCJnPWDVCR. No value other than the above values is indicated.

CAUTIONS

1. This register value is retained until a value of 1 is written to the ID error clear bit (ADCJnECR.IDEC). This register is set simultaneously when storing the A/D conversion result in the data register (ADCJnDRj, or ADCJnPWDDR).
2. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when IDE = 0, setting takes precedence (IDE = 1, IDECAP capture).
   If a conflict occurs when IDE = 1, clearing takes precedence (IDE = 0, IDECAP clear).

43.3.6.9 ADCJnECR — Error Clear Register

ADCJnECR is a write-only register to control error clear. This register is always read as 0.

Access: This register is a write-only register that can be written in 16-bit units.

Address: <ADCJn_base> + $7A8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TOCESGC[4:0]					—	—	—	—	—	—	OWEC	PEC	IDEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	W	W	W	W	W	R	R	R	R	R	R	W	W	W

Table 43.69 ADCJnECR Register Contents

Bit Position	Bit Name	Function
15, 14	Reserved	When writing, write the value after reset.
13 to 9	TOCESGC[4:0]	SGx Trigger Overlap Check Error Clear 0: TOCESG[x] is not cleared. 1: TOCESG[x] is cleared.
8 to 3	Reserved	When writing, write the value after reset.
2	OWEC	Overwrite Error Clear 0: Overwrite error is not cleared. 1: Overwrite error is cleared.
1	PEC	Parity Error Clear 0: Parity error is not cleared. 1: Parity error is cleared.
0	IDEC	ID Error Clear 0: ID error is not cleared. 1: ID error is cleared.

43.3.6.10 ADCJnVCULLMTBRy — Upper/Lower Limit Check Table Register y

ADCJnVCULLMTBRy is a readable and writable register to set the upper-limit threshold value and the lower-limit threshold value of A/D conversion values.

Be sure to write a 32-bit value to this register.

Access: This register can be read or written in 32-bit units.

Address: ADCJnVCULLMTBR0: <ADCJn_base> + 800_H
ADCJnVCULLMTBR1: <ADCJn_base> + 804_H
ADCJnVCULLMTBR2: <ADCJn_base> + 808_H
ADCJnVCULLMTBR3: <ADCJn_base> + $80C_H$
ADCJnVCULLMTBR4: <ADCJn_base> + 810_H
ADCJnVCULLMTBR5: <ADCJn_base> + 814_H
ADCJnVCULLMTBR6: <ADCJn_base> + 818_H
ADCJnVCULLMTBR7: <ADCJn_base> + $81C_H$

Value after reset: 7FFF 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.70 ADCJnVCULLMTBRy Register Contents

Bit Position	Bit Name	Function
31 to 16	VCULMTB[15:0]	Upper-Limit Threshold Value Table These bits are used to specify the upper-limit threshold value of A/D conversion values. For the data format to be set in this register, see **Section 43.2.3.4, (2) Data Format of Upper/Lower Limit Check Table Register for data register**.
15 to 0	VCLLMTB[15:0]	Lower-Limit Threshold Value Table These bits are used to specify the lower-limit threshold value of A/D conversion values. For the data format to be set in this register, see **Section 43.2.3.4, (2) Data Format of Upper/Lower Limit Check Table Register for data register**.

NOTE

ADCJnVCULLMTBRy is selected bye the following registers.

Register bit name	Category
ADCJnVCRj.VCULLMTBS[3:0]	Scan group x
ADCJnPWDVCR.VCULLMTBS[3:0]	PWM-Diag scan group

43.3.6.11 ADCJnVCLMINTER1 — Upper/Lower Limit Check Interrupt Enable Register 1

ADCJnVCLMINTER1 is a readable and writable register to control upper/lower limit check interrupt output of virtual channels 0 to 31.

Access: This register can be read or written in 32-bit units.

Address: <ADCJn_base> + 840_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 0	ADULjIE	Upper/Lower Limit Check Interrupt Enable 0: An upper/lower limit check interrupt (INT_UL) is not output. 1: An upper/lower limit check interrupt (INT_UL) is output.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

NOTE

j = 00 to 31

43.3.6.12 ADCJnVCLMINTER2 — Upper/Lower Limit Check Interrupt Enable Register 2

ADCJnVCLMINTER2 is a readable and writable register to control upper/lower limit check interrupt output of virtual channels 32 to 63.

Access: This register can be read or written in 32-bit units.

Address: <ADCJn_base> + 844_H

Value after reset: $0000\ 0000_H$

Table 43.72 ADCJnVCLMINTER2 Register Contents

Bit Position	Bit Name	Function
31 to 0	ADULjIE	Upper/Lower Limit Check Interrupt Enable 0: An upper/lower limit check interrupt (INT_UL) is not output. 1: An upper/lower limit check interrupt (INT_UL) is output.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

NOTE

j = 32 to 63

43.3.6.13 ADCJnPWVCLMINTER — PWM-Diag Upper/Lower Limit Check Interrupt Enable Register

ADCJnPWVCLMINTER is a readable and writable register to control upper/lower limit check interrupt output of PWM-Diag virtual channels.

Access: This register can be read or written in 8-bit units.

Address: <ADCJn_base> + $84C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWADULIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 43.73 ADCJnPWVCLMINTER Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWADULIE	PWM-Diag Upper/Lower Limit Check Interrupt Enable 0: An upper/lower limit check interrupt (INT_UL) is not output. 1: An upper/lower limit check interrupt (INT_UL) is output.

CAUTION

To prevent a malfunction, this register has restrictions for updating settings. For restrictions on updating settings, see "**Section 43.4.4, Restrictions on Updating Settings**".

43.3.6.14 ADCJnVCLMSR1 — Upper/Lower Limit Check Status Register 1

ADCJnVCLMSR1 is a read-only register that indicates the upper/lower limit decision result of virtual channels 0 to 31.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCJn_base> + 860_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VC31LMS	VC30LMS	VC29LMS	VC28LMS	VC27LMS	VC26LMS	VC25LMS	VC24LMS	VC23LMS	VC22LMS	VC21LMS	VC20LMS	VC19LMS	VC18LMS	VC17LMS	VC16LMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VC15LMS	VC14LMS	VC13LMS	VC12LMS	VC11LMS	VC10LMS	VC09LMS	VC08LMS	VC07LMS	VC06LMS	VC05LMS	VC04LMS	VC03LMS	VC02LMS	VC01LMS	VC00LMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.74 ADCJnVCLMSR1 Register Contents

Bit Position	Bit Name	Function
31 to 0	VCjLMS	Upper/Lower Limit Check Status of Virtual Channels 0: Status is not reported. 1: Status is reported. Setting condition Each status bit is set to 1 when the A/D conversion value is larger than the upper-limit check table value or smaller than the lower-limit check table value. Clearing condition (1) Each status bit is cleared to 0 by writing 1 to ADCJnVCLMSCR1.VCjLMSC (bit corresponding to each status). (2) Each status bit is cleared to 0 by writing 1 to ADCJnVCLMASCR.ALLMSC.

CAUTIONS

1. These register bits are set simultaneously when storing the A/D conversion result in the data register.
2. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when VCjLMS = 0, setting takes precedence (VCjLMS = 1).
   If a conflict occurs when VCjLMS = 1, clearing takes precedence (VCjLMS = 0).

NOTE

j = 00 to 31

43.3.6.15 ADCJnVCLMSR2 — Upper/Lower Limit Check Status Register 2

ADCJnVCLMSR2 is a read-only register that indicates the upper/lower limit decision result of virtual channels 32 to 63.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCJn_base> + 864_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VC63LMS	VC62LMS	VC61LMS	VC60LMS	VC59LMS	VC58LMS	VC57LMS	VC56LMS	VC55LMS	VC54LMS	VC53LMS	VC52LMS	VC51LMS	VC50LMS	VC49LMS	VC48LMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VC47LMS	VC46LMS	VC45LMS	VC44LMS	VC43LMS	VC42LMS	VC41LMS	VC40LMS	VC39LMS	VC38LMS	VC37LMS	VC36LMS	VC35LMS	VC34LMS	VC33LMS	VC32LMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.75 ADCJnVCLMSR2 Register Contents

Bit Position	Bit Name	Function
31 to 0	VCjLMS	Upper/Lower Limit Check Status of Virtual Channels 0: Status is not reported. 1: Status is reported. Setting condition Each status bit is set to 1 when the A/D conversion value is larger than the upper-limit check table value or smaller than the lower-limit check table value. Clearing condition (1) Each status bit is cleared to 0 by writing 1 to ADCJnVCLMSCR2.VCjLMSC (bit corresponding to each status). (2) Each status bit is cleared to 0 by writing 1 to ADCJnVCLMASCR.ALLMSC.

CAUTIONS

1. These register bits are set simultaneously when storing the A/D conversion result in the data register.
2. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when VCjLMS = 0, setting takes precedence (VCjLMS = 1).
   If a conflict occurs when VCjLMS = 1, clearing takes precedence (VCjLMS = 0).

NOTE

j = 32 to 63

43.3.6.16 ADCJnPWVCLMSR — PWM-Diag Upper/Lower Limit Check Status Register

ADCJnPWVCLMSR is a read-only register that indicates the upper/lower limit check result of PWM-Diag virtual channel.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCJn_base> + $86C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWVCLMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.76 ADCJnPWVCLMSR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	PWVCLMS	PWM-Diag Upper/Lower Limit Check Status 0: Status is not reported. 1: Status is reported. Setting condition PWVCLMS is set to 1 when the A/D conversion value is larger than the upper limit or smaller than the lower limit. Clearing condition (1) This bit is cleared to 0 by writing 1 to the PWVCLMSC bit in ADCJnPWVCLMSCR. (2) This bit is cleared to 0 by writing 1 to the ALLMSC bit in ADCJnVCLMASCR.

CAUTION

Bit 0 is set to 1 simultaneously when the A/D conversion result is stored in the PWM-Diag data register (ADCJnPWDDR). When setting timing conflicts with clearing timing, this register operates as follows:

If a conflict occurs when PWVCLMS = 0, setting takes precedence (PWVCLMS = 1).

If a conflict occurs when PWVCLMS = 1, clearing takes precedence (PWVCLMS = 0).

43.3.6.17 ADCJnSGULCRx — Scan Group x Upper/Lower Limit Check Status Register

ADCJnSGULCRx is a read-only register that indicates the upper/lower limit decision result of each scan group.

If upper-limit or lower-limit status is reported again without clearing ADCJnSGULCRx, the latest information is discarded and the previous value is retained.

Access: This register is a read-only register that can be read in 16-bit units.

Address: ADCJnSGULCR0: <ADCJn_base> + 880_H
ADCJnSGULCR1: <ADCJn_base> + 884_H
ADCJnSGULCR2: <ADCJn_base> + 888_H
ADCJnSGULCR3: <ADCJn_base> + $88C_H$
ADCJnSGULCR4: <ADCJn_base> + 890_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UE	LE	—	—	MPXE	MPXV[2:0]			ULE	—	ULPC[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.77 ADCJnSGULCRx Register Contents

Bit Position	Bit Name	Function
15	UE	Upper-Limit Check Status 0: The upper-limit status is not reported. 1: The upper-limit status is reported.
14	LE	Lower-Limit Check Status 0: The lower-limit status is not reported. 1: The lower-limit status is reported.
13, 12	Reserved	When read, the value after reset is returned.
11	MPXE	Use of MPX 0: When upper-limit or lower-limit status is reported, the MPX function is not used. 1: When upper-limit or lower-limit status is reported, the MPX function is used.
10 to 8	MPXV[2:0]	MPX Value when Upper/Lower Limit Check Status Is Reported 000 to 111: The MPX value when upper-limit or lower-limit status is reported is stored.
7	ULE	Upper/Lower Limit Check Status 0: The upper-limit or lower-limit status is not reported. 1: The upper-limit or lower-limit status is reported.
6	Reserved	When read, the value after reset is returned.
5 to 0	ULPC[5:0]	Upper/Lower Limit Check Status Capture The first physical channel number in which upper-limit or lower-limit status was reported is output.

CAUTIONS

1. The upper/lower limit threshold value check result is incorporated in this register.
2. This register value is retained until 1 is written to the scan group x upper/lower limit check status clear bit (ADCJnSGULCCR.SGULCC[x]). This register is set simultaneously when the A/D conversion result is stored in the data register (ADCJnDRj or ADCJnPWDDR).
3. When setting timing conflicts with clearing timing, this register operates as follows:
   If a conflict occurs when UE = 0, setting takes precedence (UE = 1, all status set).
   If a conflict occurs when UE = 1, clearing takes precedence (UE = 0, all status clear).
   These operations also apply to LE/MPXE/MPXV[2:0], and ULE/ULPC[6:0].
4. When PWM-Diag is used, ADCJnSGULCRx of target scan group is upper/lower limit check status of PWM-Diag.

43.3.6.18 ADCJnVCLMSCR1 — Upper/Lower Limit Check Status Clear Register 1

ADCJnVCLMSCR1 is a write-only register to clear the upper/lower limit check status register 1 (ADCJnVCLMSR1). This register is always read as 0.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <ADCJn_base> + $8A0_H$

Value after reset: $0000\ 0000_H$

31 to 0	VCjLMSC	Upper/Lower Limit Check Status Clear 0: No function (Writing 0 to this bit is ignored.) 1: Corresponding status bits in the upper/lower limit check status register 1 (ADCJnVCLMSR1) are cleared.

NOTE

j = 00 to 31

43.3.6.19 ADCJnVCLMSCR2 — Upper/Lower Limit Check Status Clear Register 2

ADCJnVCLMSCR2 is a write-only register to clear the upper/lower limit check status register 2 (ADCJnVCLMSR2). This register is always read as 0.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <ADCJn_base> + $8A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.79 ADCJnVCLMSCR2 Register Contents

Bit Position	Bit Name	Function
31 to 0	VCjLMSC	Upper/Lower Limit Check Status Clear 0: No function (Writing 0 to this bit is ignored.) 1: Corresponding status bits in the upper/lower limit check status register 2 (ADCJnVCLMSR2) are cleared.

NOTE

j = 32 to 63

43.3.6.20 ADCJnPWVCLMSCR — PWM-Diag Upper/Lower Limit Check Status Clear Register

ADCJnPWVCLMSCR is a write-only register to clear the PWM-Diag upper/lower limit check status register (ADCJnPWVCLMSR). This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + $8AC_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWVCLMSC
Value after reset	0	0	0	0	0	0	0	0

Table 43.80 ADCJnPWVCLMSCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	PWVCLMSC	PWM-Diag Upper/Lower Limit Check Status Clear 0: No function (Writing 0 to this bit is ignored.) 1: The PWVCLMS bit in ADCJnPWVCLMSR is cleared.

43.3.6.21 ADCJnSGULCCR — Scan Group Upper/Lower Limit Check Status Clear Register

ADCJnSGULCCR is a write-only register to clear upper/lower limit check status register of each scan group.
This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + $8B4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	SGULCC[4:0]					—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	W	W	W	W	W	R

Table 43.81 ADCJnSGULCCR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When writing, write the value after reset.
5 to 1	SGULCC[4:0]	Scan Group x Upper/Lower Limit Check Status Clear SGULCC[x] 0: No function (Writing 0 to this bit is ignored.) 1: Scan Group x upper/lower limit check status register (SGULCRx) is cleared.
0	Reserved	When writing, write the value after reset.

43.3.6.22 ADCJnVCLMASCR — Virtual Channel Upper/Lower Limit Check All Status Clear Register

ADCJnVCLMASCR is a write-only register to clear virtual channel upper/lower limit check status registers. This register is always read as 0.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <ADCJn_base> + $8B8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ALLMSC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ALLMSC	Virtual Channel Upper/Lower Limit Check Status (*) Clear 0: No function (Writing 0 to this bit is ignored.) 1: All upper/lower limit check status registers are cleared. (*) All upper/lower limit check status registers are listed below. **Bit name** ADCJnVCLMSR1-2.VCnLMS ADCJnPWVCLMSR.PWVCLMS

43.4 Function

43.4.1 Setting Procedure

43.4.1.1 Initial Setting Procedure

Figure 43.7 shows the initial setting flow of this product. Settings of each register (except for ADCJnSGCR0 to ADCJnSGCR4, and ADCJnPWDSGCR) after reset until startup trigger input are arranged in a random order.

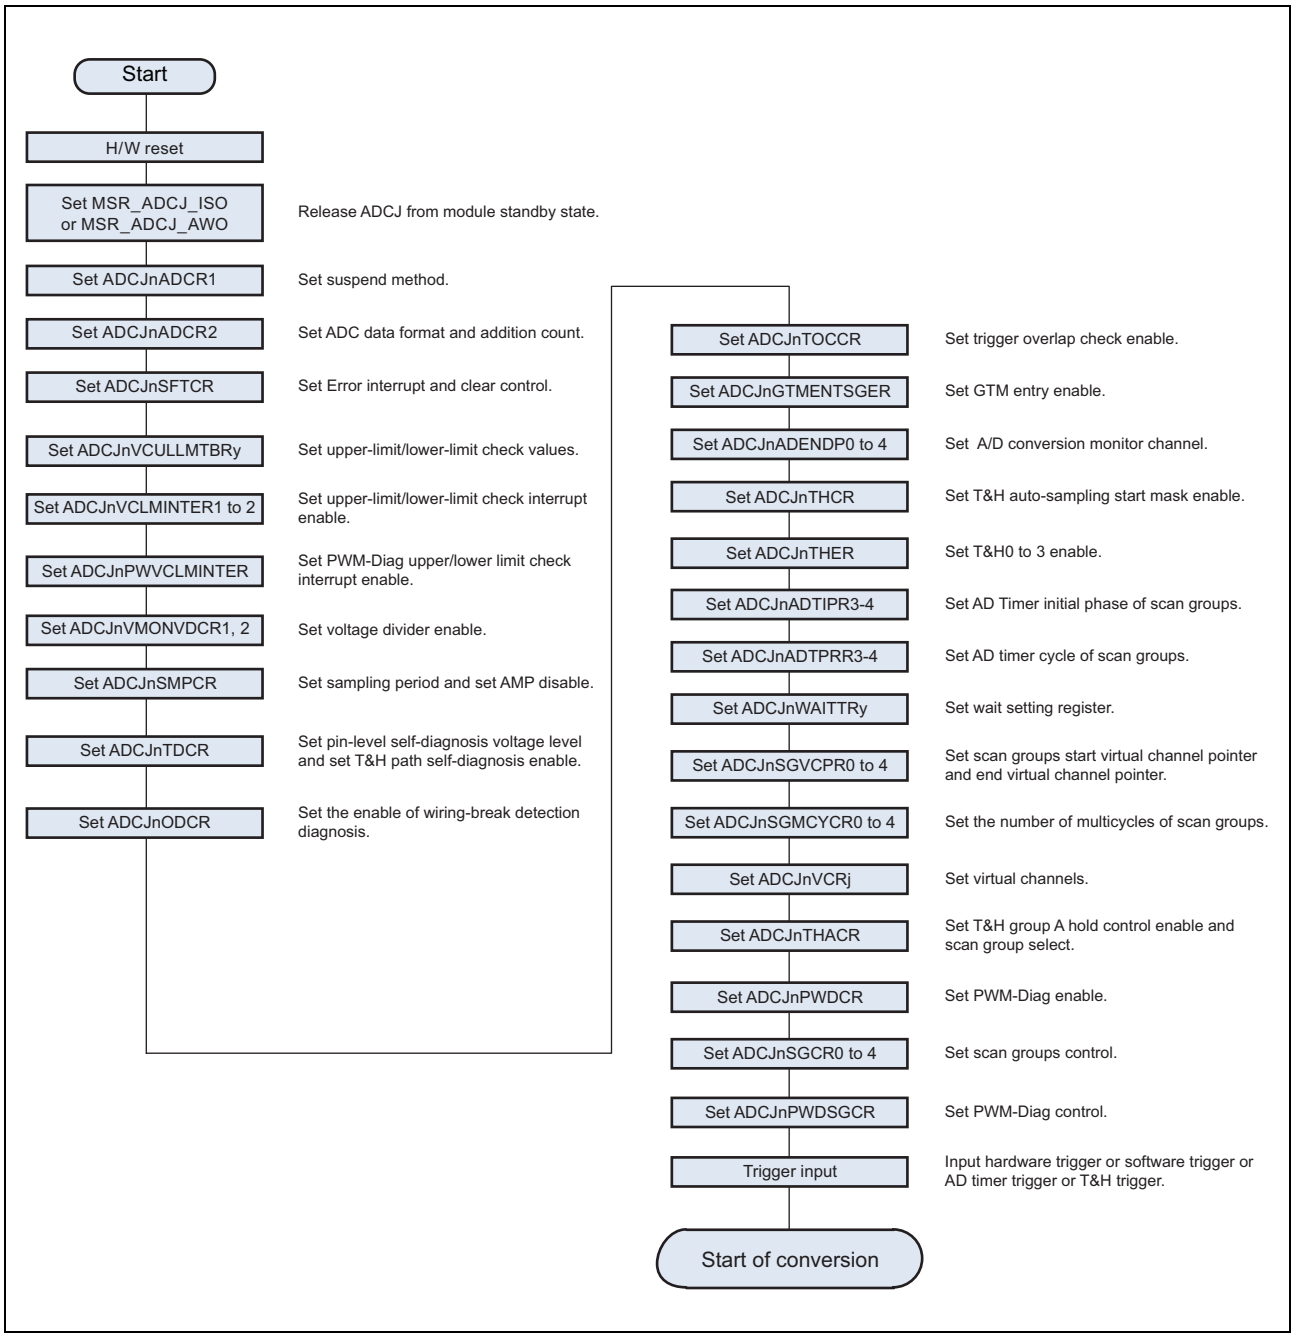

Figure 43.7 Initial Setting Flow

43.4.2 Startup Method

43.4.2.1 SG0 Startup Flow

Figure 43.8 shows the startup flow of SG0.

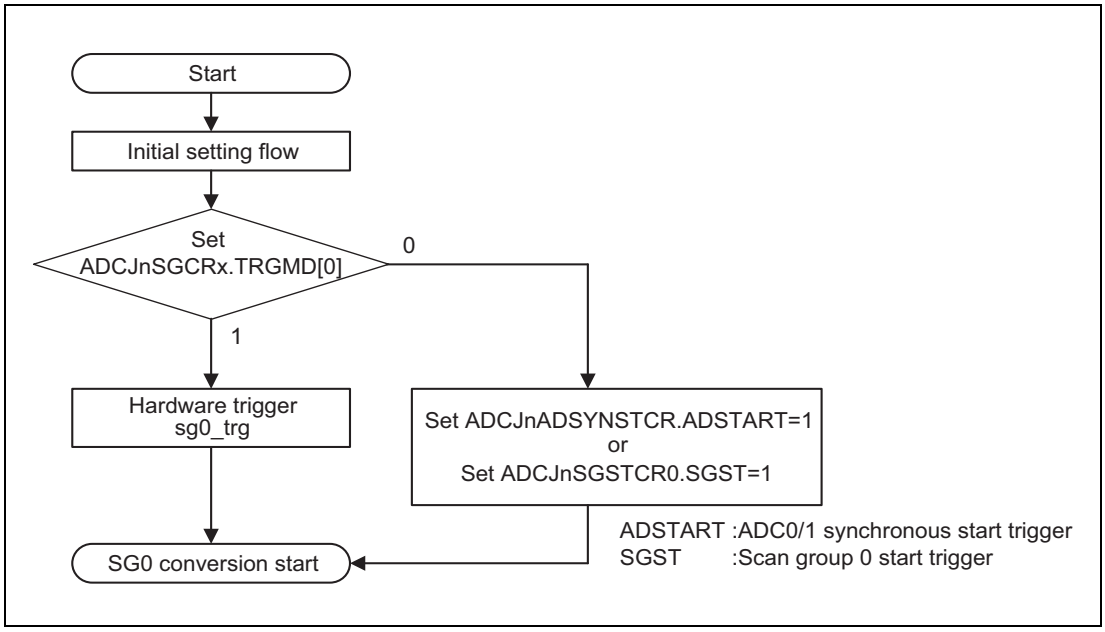

Figure 43.8 Startup Flow (SG0)

43.4.2.2 SG1/SG2 Startup Flow

Figure 43.9 shows the startup flow of SG1 and SG2.

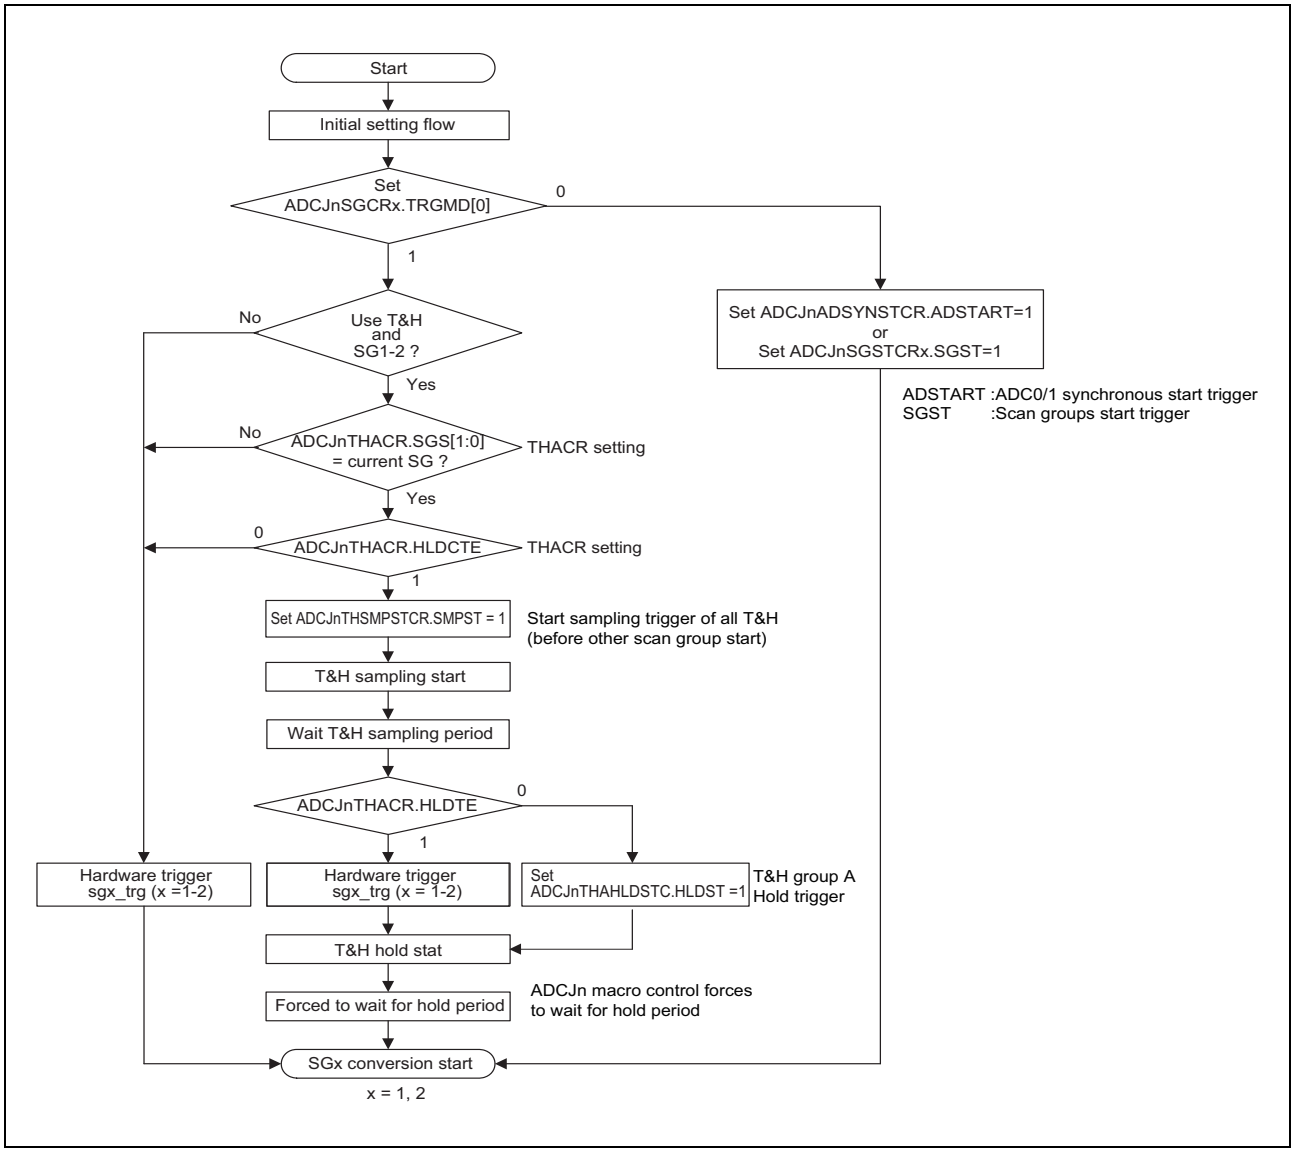

Figure 43.9 Startup Flow (SG1 and SG2)

NOTE

When SGx is started individually, There are specification restrictions in ADCJnTHSMPSTCR.SMPST. Refer to **Section 43.3.5.12, ADCJnTHSMPSTCR — T&H Sampling Start Control Register** for details.

43.4.2.3 SG3/SG4 Startup Flow

Figure 43.10 shows the startup flow of SG3 and SG4.

When the PWM-Diag is used, the following figure shows the startup flow of SG3.

For the PWM-Diag startup flow, see "**Section 43.4.2.4, PWM-Diag Startup Flow**".

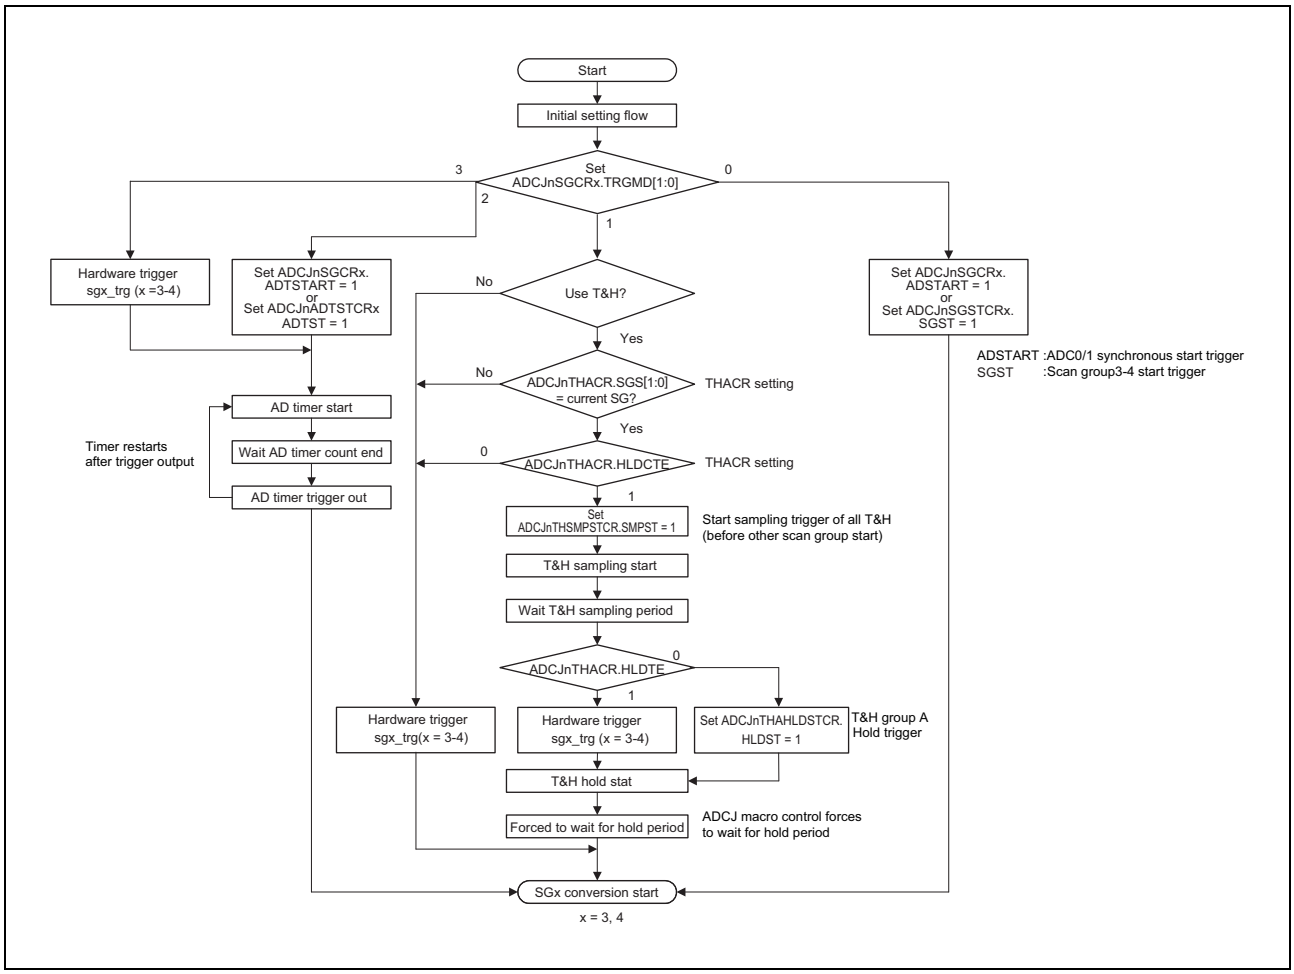

Figure 43.10 Startup Flow (SG3 and SG4)

NOTES

1. When using T&H, be sure to set ADCJnSGCR3-4.TRGMD to 1.
2. When using T&H, setting ADCJnSGCR3-4.TRGMD to 0, 2, or 3 is prohibited.
3. When SGx is started individually, there are specification restrictions in ADCJnTHSMPSTCR.SMPST.
   Refer to **Section 43.3.5.12, ADCJnTHSMPSTCR — T&H Sampling Start Control Register** for details.

43.4.2.4 PWM-Diag Startup Flow

Figure 43.11 shows the startup flow of the PWM-Diag.

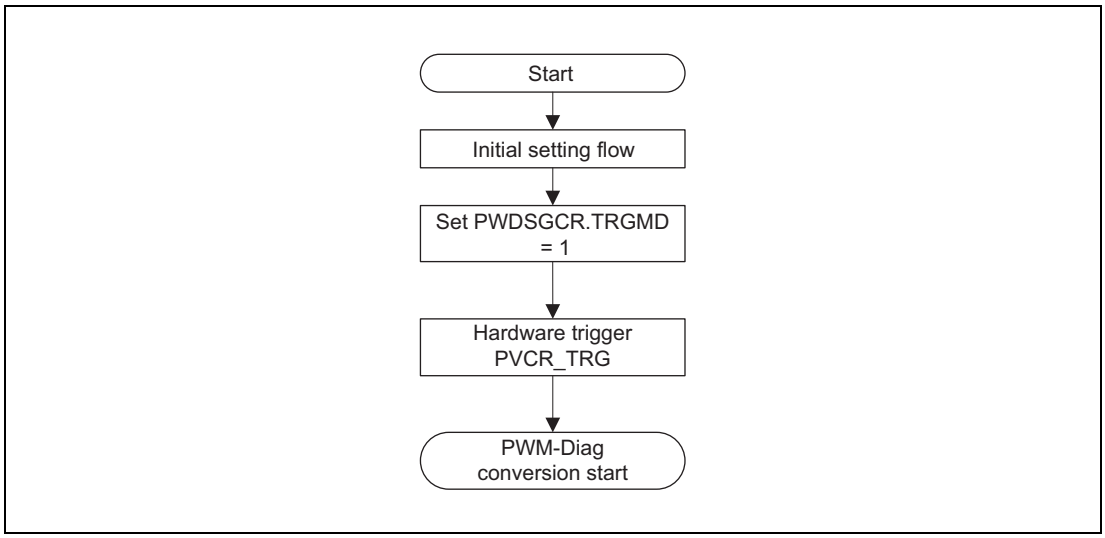

Figure 43.11 Startup Flow (PWM-Diag)

43.4.3 Termination Procedure

43.4.3.1 Forced Termination Flow of All Scan Groups

Figure 43.12 shows the forced termination flow of all scan groups.

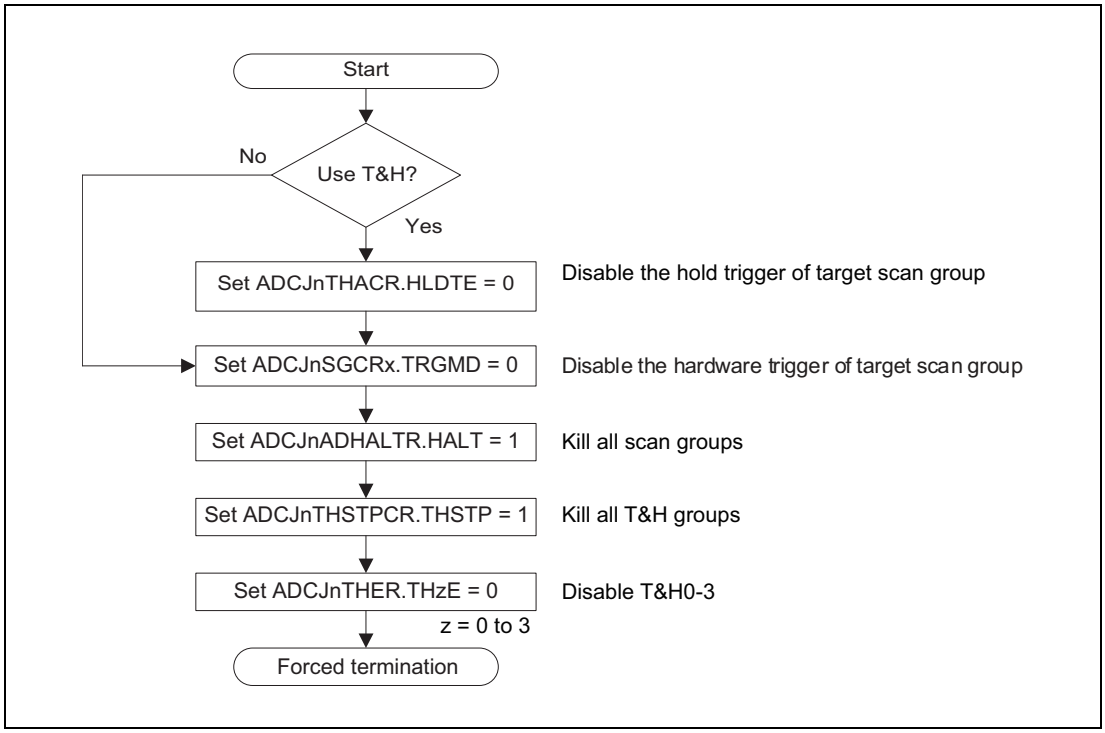

Figure 43.12 Forced Termination Flow of All Scan Groups

43.4.3.2 Individual Stopping Flow of Scan Group x

This section describes the flow to individually stop scan group x. To stop two or more scan groups, perform the following stopping flow for each scan group.

When scan group x is set for group A of T&H, the hold trigger of the target T&H group and the T&H channel of the target T&H group must be disabled.

(1) Individual Stopping Flow of Scan Group x (1)

Only multicycle scan mode is available in the stopping flow below. When an activate scan group is stopped in continuous scan mode, use the flow of **Section 43.4.3.1, Forced Termination Flow of All Scan Groups** or **Section (2), Individual Stopping Flow of Scan Group x (2)**.

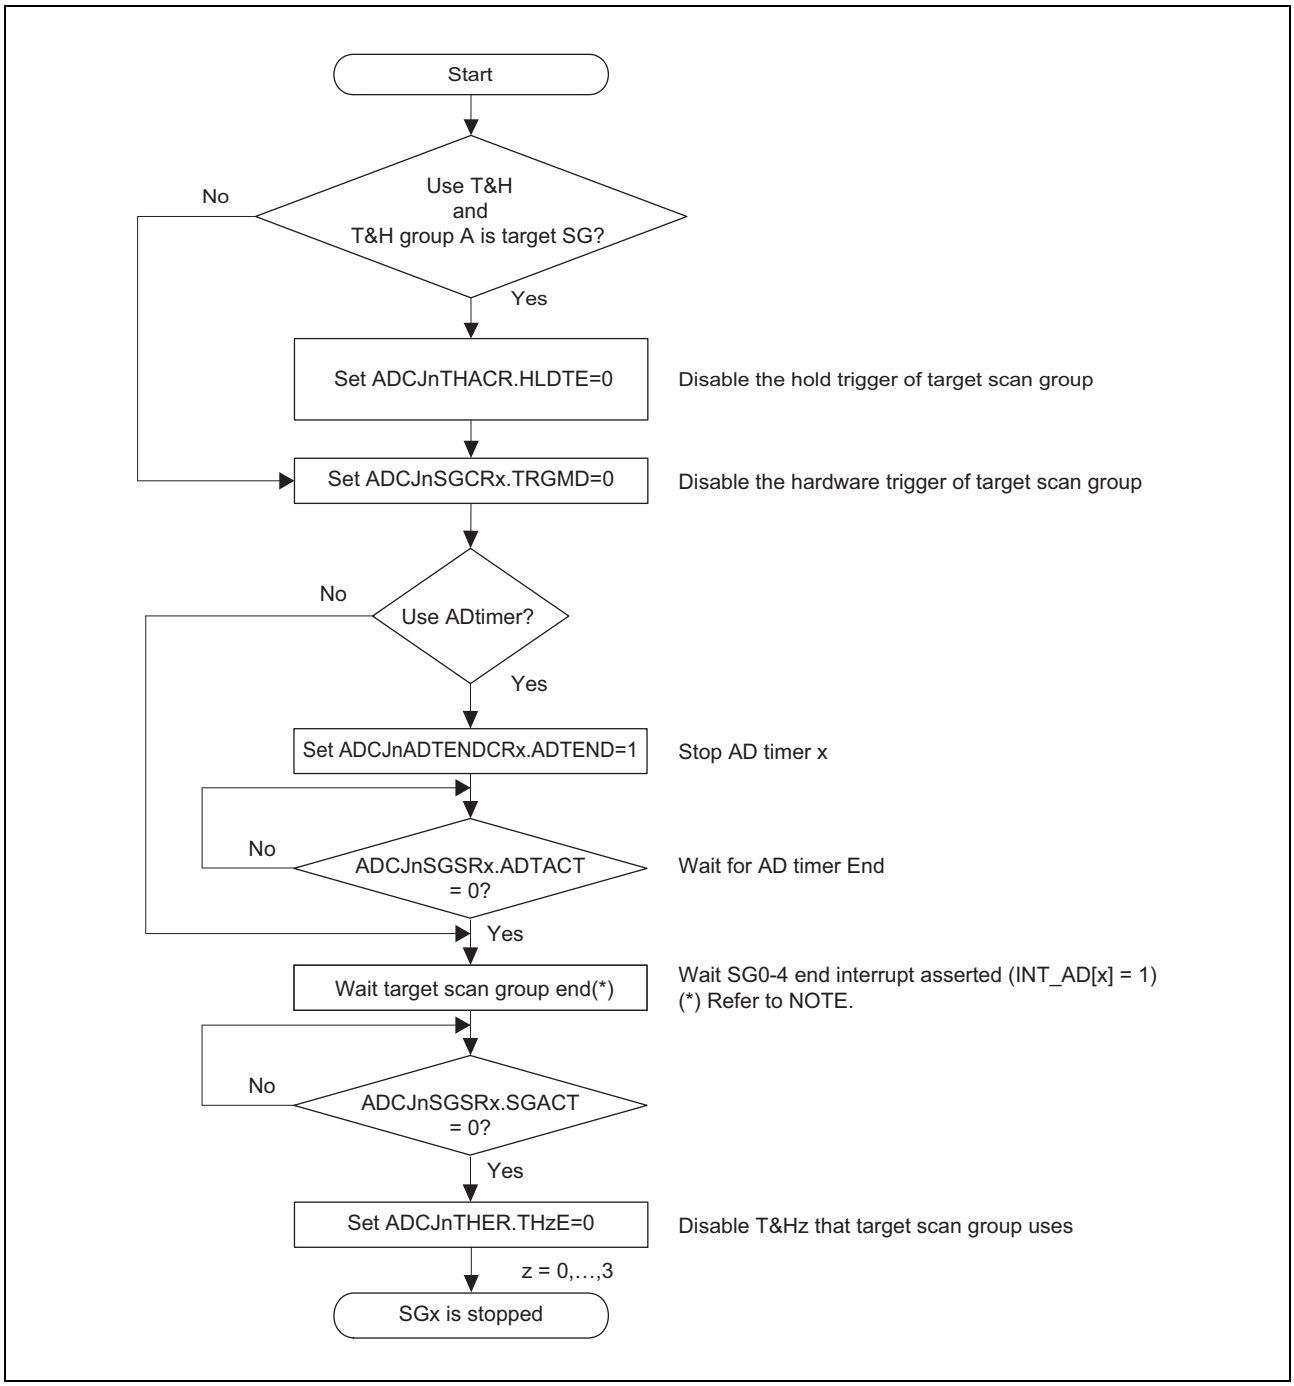

Figure 43.13 Individual Stopping Flow of Scan Groups (1)

NOTES

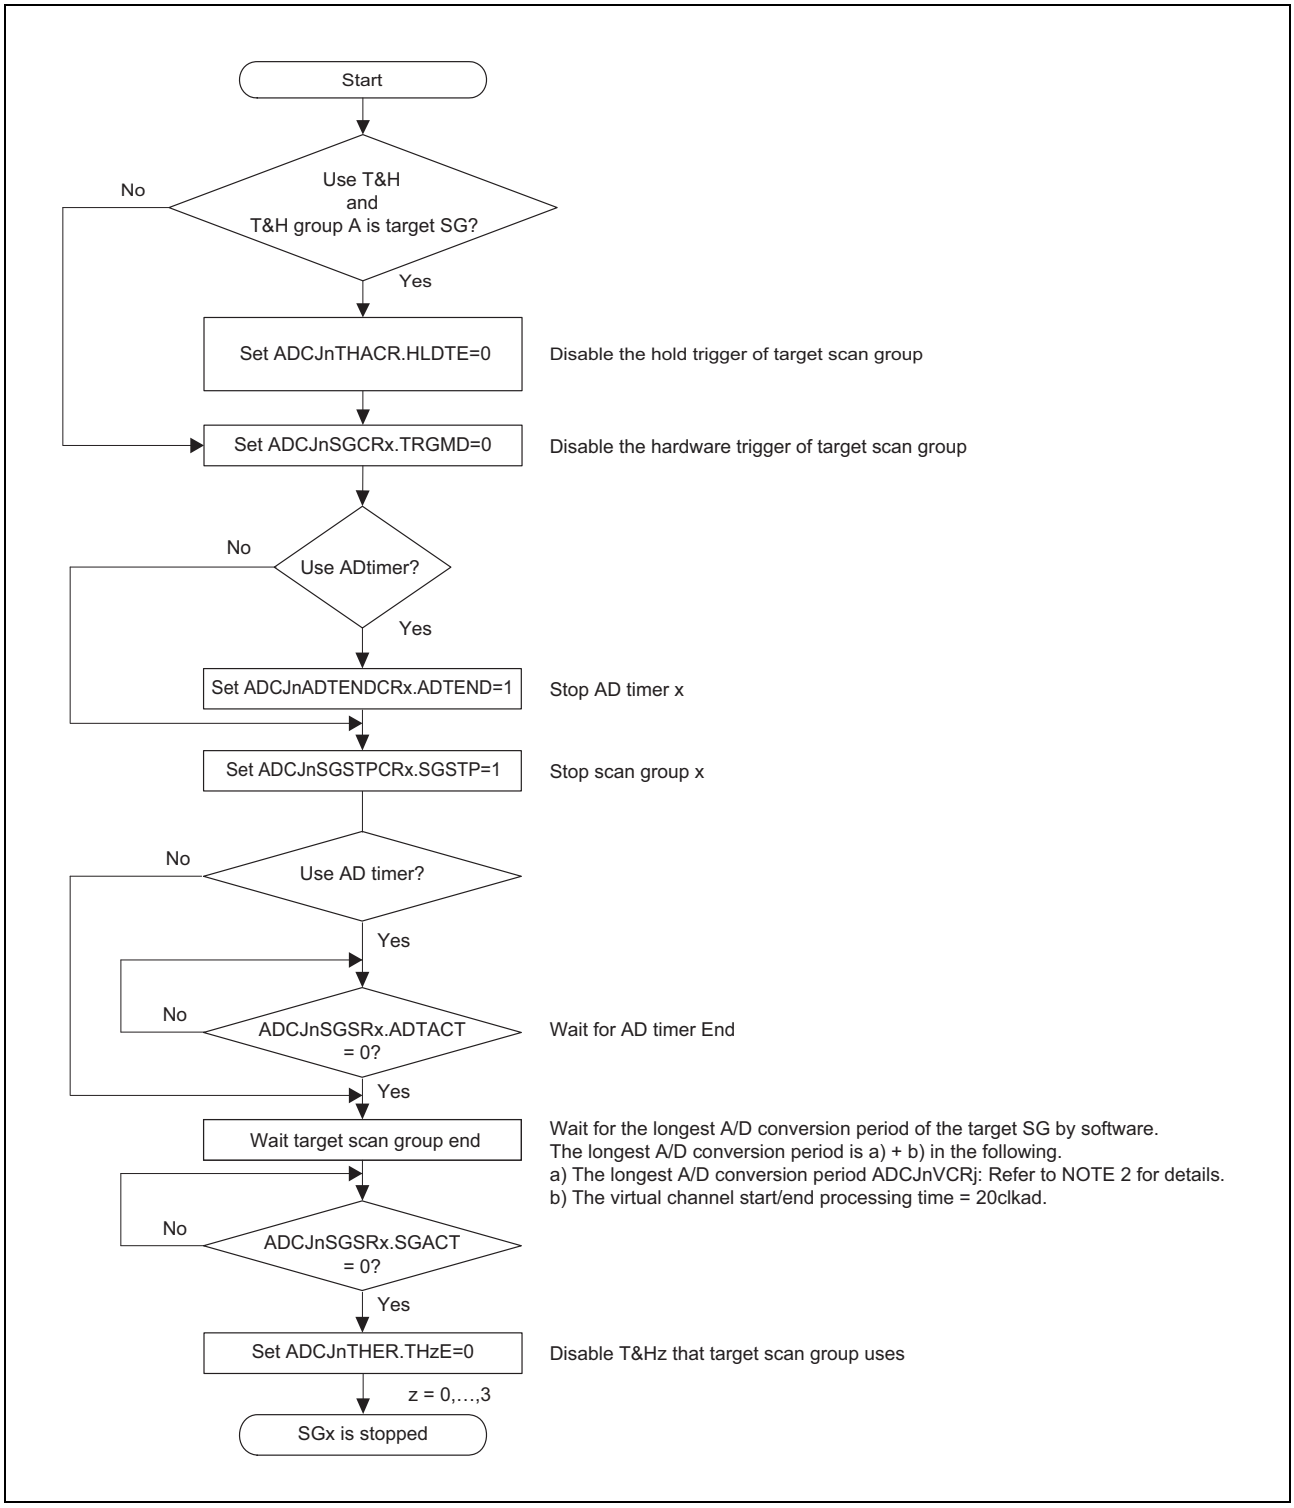
1. When the scan group x end interrupt is not used, wait time for the end of target scan group depends on user system. Because scan group has the priority. For example, in the case of scan group 4, when you read ADCJnSGSR4.SGACT=0 after you wait the period of all virtual channels set by virtual channel pointer, it indicates the end of scan group 4. But in the case of low priority scan group, when a high priority scan group is interrupted, the wait time is the time until the high scan group is end, and further more, the processing time of stopped virtual channel of the low priority scan group is added to the wait time in the case of asynchronous suspend mode. And when a high priority scan group is started again after the low priority can group is resumed, the wait time is added more. So, when this individual stopping flow of scan group x is selected, take into account the input interval of start triggers of each scan group.
2. About operation of suspend processing, refer to **Section 43.4.17, Example of Suspend and Resume Operation** for details.

(2) Individual Stopping Flow of Scan Group x (2)

Both multicycle scan mode and continuous scan mode are available in the stopping flow below.

When stopping scan group x in this flow, write 1 to SGSTP to stop the ongoing virtual channel processing.

Then the scan group x is stopped.



NOTES

1. If SGSTP is set to 1 before A/D conversion is completed, the target scan group enters the IDLE state but an A/D conversion end interrupt or a scan end interrupt may be output depending on register settings. In case interrupt output affects the system, set 0 to interrupt enable bits (ADCJnVCRj.ADIE, ADCJnSGCRx.ADIE) and then, set SGSTP to 1.
2. About the longest A/D conversion period of ADCJnVCRj.
   A/D conversion period is defined as tWAIT + tSPL + tSAR.

   tWAIT: Wait time of "wait (1) and wait (2)". About "wait (1) and wait (2)", refer to **Section 43.4.11, Wait Function**.
   tSPL, tSAR: Refer to **Section 43.4.24, Analog Input Sampling and Scan Group Processing Time**.

43.4.3.3 Individual Stopping Flow of PWM-Diag

Figure 43.15 shows the flow to stop the PWM-Diag.

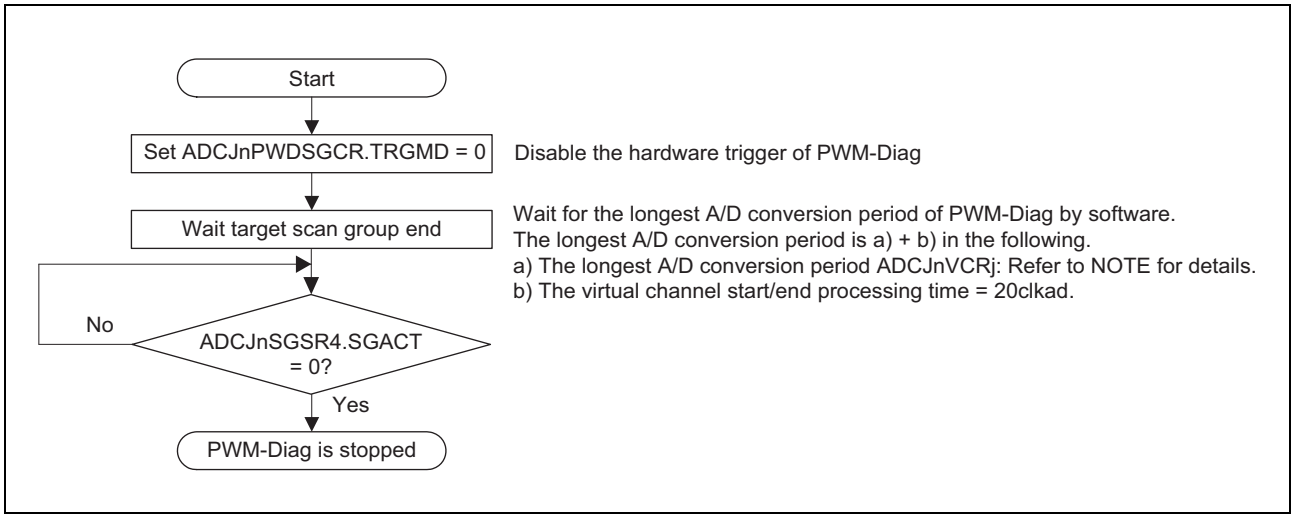


Figure 43.15 Individual Stopping Flow of PWM-Diag

NOTE

About the longest A/D conversion period of ADCJnVCRj, refer to **Section 43.4.24, Analog Input Sampling and Scan Group Processing Time** for details.

43.4.4 Restrictions on Updating Settings

Restrictions on setting updatable period are provided for registers shown in the initial setting flow.

Updating method

Stop scan group → Update register settings → Start scan group

If a scan group to be stopped uses hardware triggers, disable them before stopping the scan group.

Updatable periods vary with register as shown in the table below.

Perform the specified stopping procedure, and then update register settings according to the table below.

Table 43.83 Register Updatable Period for Initial Setting Flow (1/2)

Register	Bit	Updatable Period
ADCJnADCR1	All bits	While all scan groups are stopped
ADCJnADCR2		
ADCJnSFTCR		
ADCJnTOCCR		
ADCJnODCR		
ADCJnSMPCR		
ADCJnMPXCURCR		
ADCJnADENDPv		
ADCJnTDCR	All bits	While all scan groups are stopped (Only in the flow of Pin-level Self-Diagnosis of the T & H path which explained in **Section 43.4.10.2, Self-Diagnosis of the T&H Path**, TDLV is updatable in spite of scan group operating)
ADCJnWAITTRy	All bits	While all scan groups are stopped
ADCJnVCLMINTER1/2		
ADCJnSGCRx	SCANMD, ADSTARTE, ADTSTARTE, ADIE/TRGMD set	While relative scan group x is stopped
	ADIE clear	Always updatable
	TRGMD clear	
ADCJnTHER	THzE (Used by T&H group that is set to target scan group x)	While relative scan group x is stopped
ADCJnTHACR	HLDCTE, SGS[1:0], HLDTE set	
	HLDTE clear	Always updatable
ADCJnSGMCYCRx	All bits	While relative scan group x is stopped
ADCJnADTIPRx	All bits	While relative A/D timer x is stopped
ADCJnADTPRRx		
ADCJnVCRj	VCULLMTBS, WTTS, GTMENT, GTMTAG, CNVCLS, MPXV, GCTRL, ADIE set	While relative scan group x is stopped
	ADIE clear	While relative scan group x is stopped. (There is an exception. Refer below paragrapth)
ADCJnTHCR	All bits	While relative scan group x is stopped
ADCJnSGVCPRx	All bits	Always updatable
ADCJnVCULLMTBRy		

Table 43.83 Register Updatable Period for Initial Setting Flow (2/2)

Register	Bit	Updatable Period
ADCJnGTMENTSGER	All bits	While all scan groups are stopped
ADCJnVMONVDCR1/2		
ADCJnMPXINTER		
ADCJnMPXCMDR	All bits	Always updatable
ADCJnPWVCLMINTER	All bits	While all scan groups are stopped
ADCJnPWDCR		
ADCJnPWDSGCR	TRGMD set	While relative scan group x is stopped
	TRGMD clear	Always updatable
ADCJnTHSMPSTCR	SMPST	While all scan groups are stopped

ADCJnSGVCPRx, ADCJnVCULLMTBRy, ADCJnMPXCMDR, ADCJnMPXINTER, ADCJnVCLMINTER1-2 and ADCJnPWVCLMINTER are always updatable regardless of whether scan groups are operating or stopped.

Updated setting values are incorporated at the following timing.

Register	Updated setting timing
ADCJnSGVCPRx	Next startup of the relevant scan group x
ADCJnVCULLMTBRy, ADCJnMPXINTER, ADCJnVCLMINTER1-2, ADCJnPWVCLMINTER	Immediately
ADCJnMPXCMDR	At the beginning of MPX mode A/D conversion or MPX addition mode A/D conversion

There is a exception to constraints clearing ADCJnVCRj.ADIE.

When a scan group is stopped according to **Section 43.4.3.2, (2) Individual Stopping Flow of Scan Group x (2)**, and when it is necessary to clear ADCJnVCRj.ADIE, clear ADCJnVCRj.ADIE according to NOTE 1 of **Section 43.4.3.2, (2) Individual Stopping Flow of Scan Group x (2)**.

43.4.5 Conversion Class

There are 15 conversion types. Set them for each virtual channel.

Table 43.84 Conversion Class List (1/2)

ADCJnVCRj.CNVCLS	Conversion Class	Description	Reference Section
0_H	Normal A/D conversion	Performs A/D conversion of analog inputs of physical channels.	**43.4.6**
1_H	Hold value A/D conversion	Performs A/D conversion of analog inputs held by the T&H function. Use this A/D conversion together with the T&H function.	**43.4.18**
2_H	Normal A/D conversion at extended sampling cycle	Performs A/D conversion of analog inputs of physical channels at the sampling cycle specified by the EXSMPT[7:0] bits in ADCJnSMPCR.	**43.4.11.3**
3_H	ADcore self-diagnosis A/D conversion	This A/D conversion is one of safety functions, which isolates physical channels and applies the predetermined voltage to analog input pins of the ADcore hardware macro to perform A/D conversion.	**43.4.10.3**
4_H	Addition mode A/D conversion	Performs A/D conversion of analog inputs of physical channels twice or four times in series, and then stores added values in the data register. The addition count (twice or four times) are common to all virtual channels.	**43.4.7**
5_H	MPX normal A/D conversion	This function selects an MPX input channel (MPX value) and performs A/D conversion in physical channels connected to an external MPX.	**43.4.8**
6_H	MPX addition mode A/D conversion	Selects an MPX input channel (MPX value) and performs A/D conversion twice or four times in series, and then stores added values in the data register in physical channels connected to an external MPX.	**43.4.8**
7_H	Pin level self-diagnosis A/D conversion	This function applies different voltage values to even channel groups and odd channel groups to perform A/D conversion. Thus this function diagnoses errors in the analog input path.	**43.4.10.1**
8_H	A/D conversion in wiring-break detection mode 1	This function detects solder stripping. This function pulls down physical channels ANnpq and performs normal A/D conversion to decide whether wiring-break is present with the pull-down result of nearly 0 V or not.	**43.4.9.1**
9_H	A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down)	This function detects solder stripping. This function pulls down physical channels ANnpq and performs normal A/D conversion to decide whether wiring-break is present with the pull-down result of nearly 0 V or not.	**43.4.9.2**
A_H	A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up)	This function detects solder stripping. This function pulls up physical channels ANnpq and performs normal A/D conversion to decide whether wiring-break is present with the pull-up result of nearly 5 V or not.	**(2)**
B_H	Self-diagnosis A/D conversion in wiring-break detection mode 1	This A/D conversion is a self-diagnostic function to verify that wiring-break detection mode 1 operates normally.	**(1)**
C_H	Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down)	This A/D conversion is a self-diagnostic function to verify that wiring-break detection mode 2 A/D conversion (physical channel IO pull-down) operates normally.	**(2)**

Table 43.84 Conversion Class List (2/2)

ADCJnVCRj.CNVCLS	Conversion Class	Description	Reference Section
D_H	Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up)	This A/D conversion is a self-diagnostic function to verify that wiring-break detection mode 2 A/D conversion (physical channel IO pull-up) operates normally.	**(2)**
E_H	A/D conversion of A/D conversion data path diagnosis (ADVAL mode)	The A/D conversion data path diagnosis checks the data path until data is stored in the data register from the ADCore.	**43.4.10.6**
F_H	Reserved	—	—

43.4.6 Examples of Normal A/D Conversion Operation

Analog inputs of physical channels are A/D-converted in normal A/D conversion.

For A/D conversion operations, see **Section 43.4.12, Scan Mode**.

43.4.7 Example of Addition Mode A/D Conversion Operation

In addition mode A/D conversion, analog signals of physical channels are A/D-converted twice or four times in series, and added values are stored in the data register. The addition count (twice or four times) is common to all virtual channels.

Figure 43.16 shows an example of A/D conversion operation.

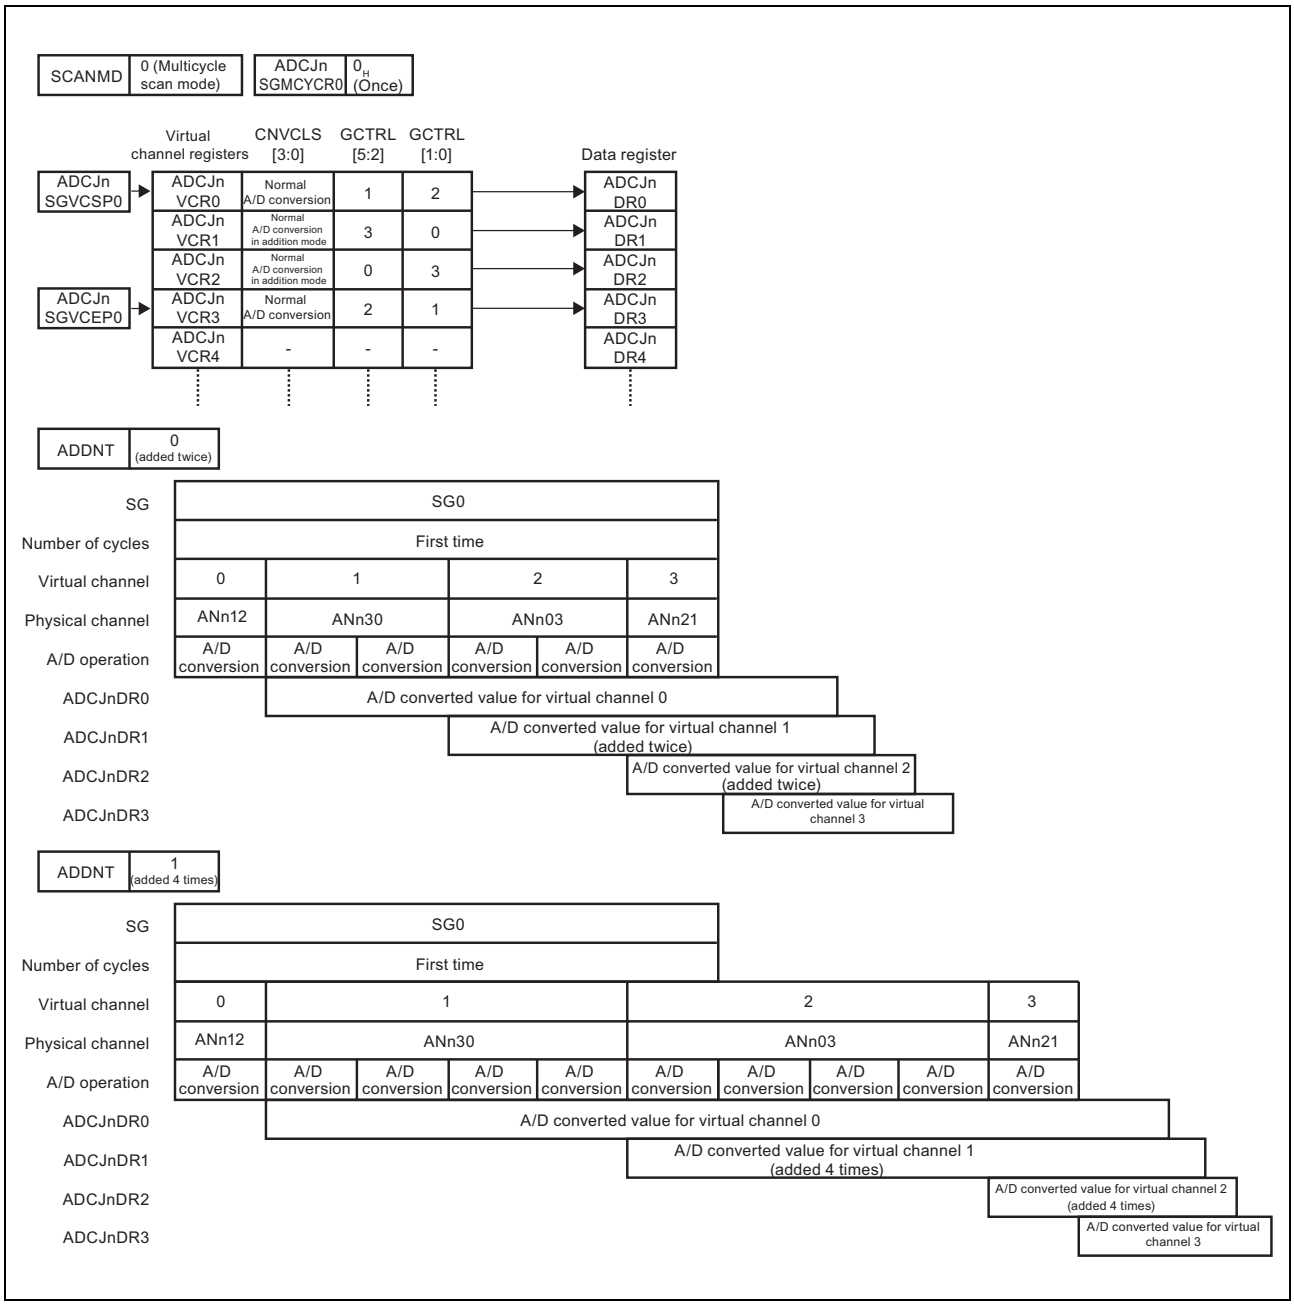

Figure 43.16 Example of Addition Mode Normal A/D Conversion Operation

For operation if a synchronous suspension or asynchronous suspension occurs while addition mode A/D conversion is in progress, see "**Section 43.4.17, Example of Suspend and Resume Operation**" For operation of suspension caused by a hold trigger, see case 4 and case 5 in "**Section 43.4.18, Example of Track and Hold Operation (T&H)**."

43.4.8 Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode

This function selects an MPX input channel (MPX value) in physical channels connected to an external MPX and performs A/D conversion. This function includes MPX normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 5_H) and MPX addition mode A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 6_H).

To transfer the MPX value to the external MPX, functions (such as DMAC and I/O port MSPI) and the output port MPXCUR[2:0] are used.

Set the wait time to ensure the MPX value transfer period and the MPX output settling period.

For how to set the wait time, see "**Section 43.3.5.18, ADCJnWAITTRy — Wait Setting Register y**".

When MPX normal A/D conversion or MPX addition mode A/D conversion is in progress or when a synchronous suspension or asynchronous suspension occurs during the wait state, ADCJ operates in the same way as when normal A/D conversion or addition mode A/D conversion is in progress or when a synchronous suspension or asynchronous suspension occurs during the wait state in normal A/D conversion. For details, see "**Section 43.4.17, Example of Suspend and Resume Operation**."

For operation of suspension caused by a hold trigger, see case 4 and case 5 in "**Section 43.4.18, Example of Track and Hold Operation (T&H)**"

NOTES

1. MPX value transfer period is the period from starting MPX A/D conversion to output INT_MPX.
2. MPX output setting period is the period from the INT_MPX output to the MPX value is fixed at the external Multiplexer and the analog voltage input is stabilized. Specify the period after evaluating by user.

43.4.8.1 Using I/O Port Output

An example of configuration using DMA and I/O port output and an example of operation are shown below.

Set the following registers according to each function and IP specifications.

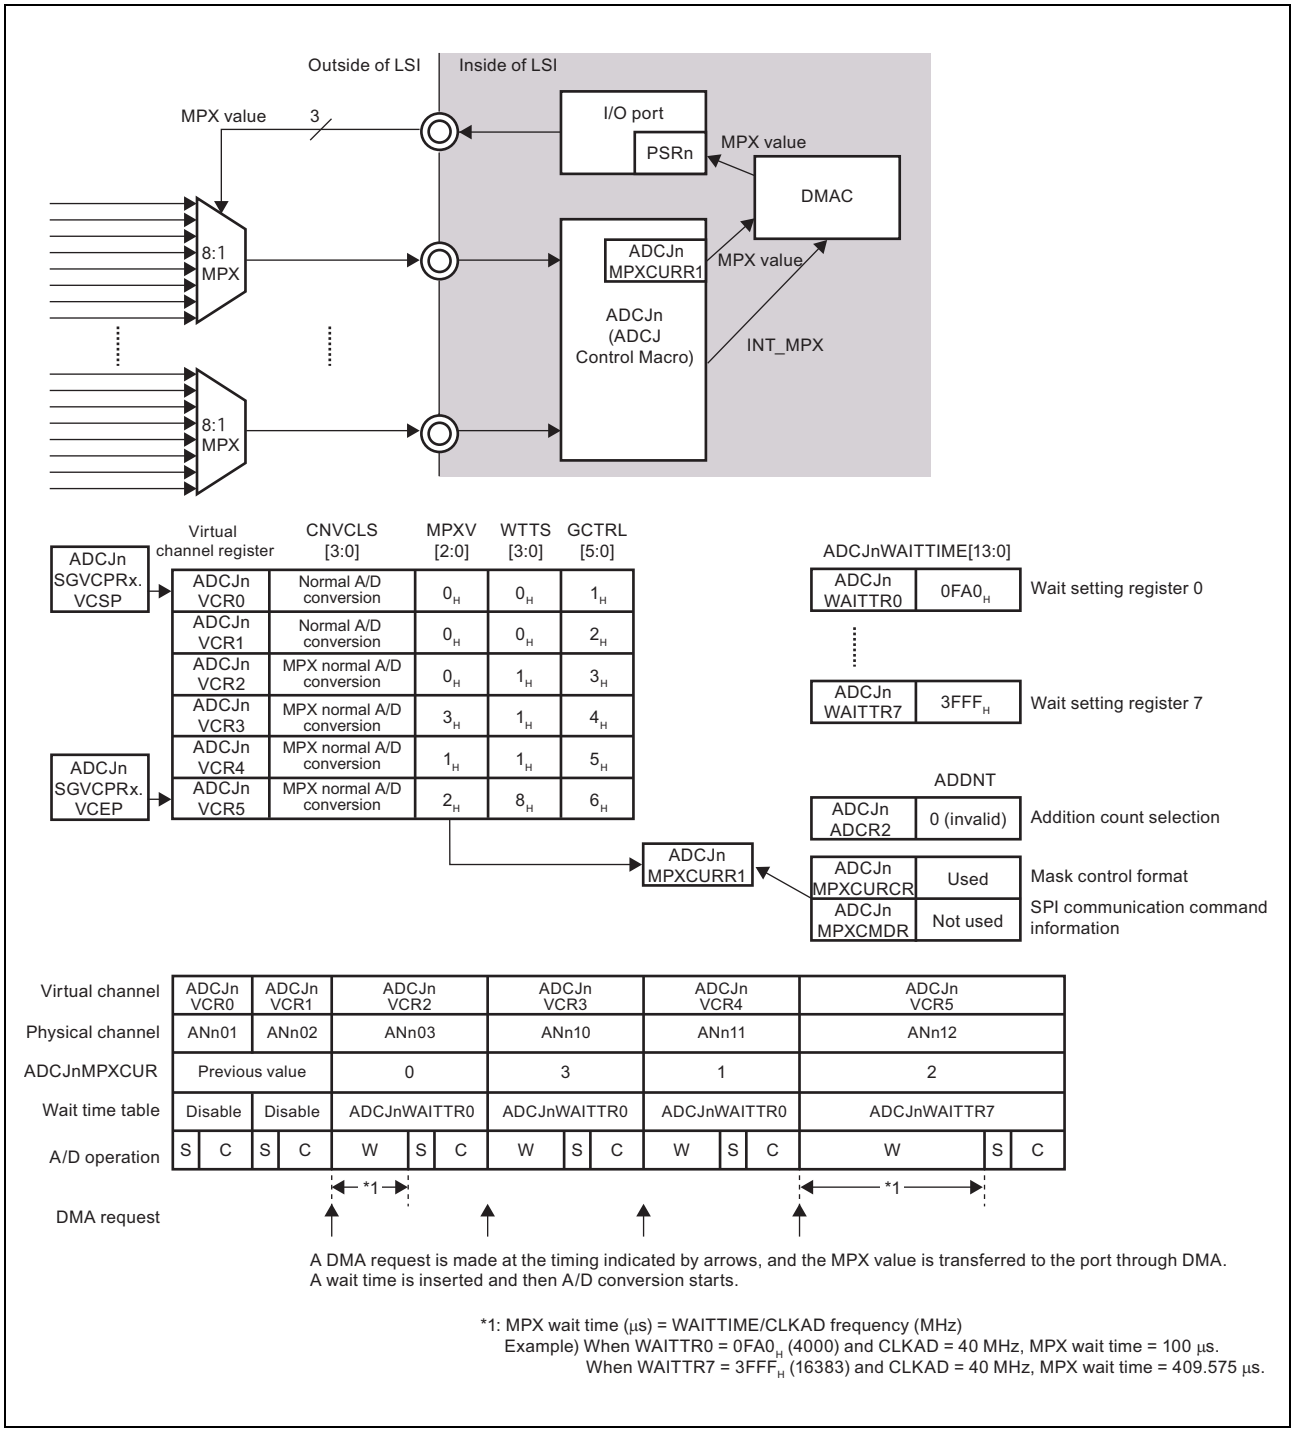
- MPX current control register (ADCJnMPXCURCR)
- External MPX channel (ADCJnVCRj.MPXV[2:0])
- Wait time table selection value (ADCJnVCRj.WTTS[3:0])
- Physical channel group/sub channel number (ADCJnVCRj.GCTRL[5:0])
- Wait setting register y (ADCJnWAITTRy.WAITTIME[13:0])
- MPX interrupt enable register (ADCJnMPXINTER)

The ADCJ performs the following operations.

1. Stores the ADCJnMPXCURCR and ADCJnVCRj.MPXV[2:0] values in the MPX current register 1 (ADCJnMPXCURR1) at the beginning of virtual channels and outputs the interrupt signal (INT_MPX).
2. Inserts arbitrary wait time using the wait setting value (ADCJnWAITTRy.WAITTIME[13:0]) selected by the WTTS[3:0] bits in ADCJnVCRj before executing virtual channels.
   (Waiting for MPX value transfer by the DMAC, I/O port, etc. and settling of MPX output)
3. Perform A/D conversion of physical channels connected to the MPX.

Set the mask setting value of the MPX current control register according to the I/O port specifications.

This set value is used for I/O port output, but is not used for MSPI output.



A DMA request is made at the timing indicated by arrows, and the MPX value is transferred to the port through DMA.
A wait time is inserted and then A/D conversion starts.

*1: MPX wait time (μs) = WAITTIME/CLKAD frequency (MHz)
Example) When WAITTR0 = $0FA0_H$ (4000) and CLKAD = 40 MHz, MPX wait time = 100 μs.
When WAITTR7 = $3FFF_H$ (16383) and CLKAD = 40 MHz, MPX wait time = 409.575 μs.

Figure 43.17 Example of Using MPX (Output to I/O Port)

43.4.8.2 Using MSPI Output

An example of configuration using DMA and MSPI output and an example of operation are shown below.

Set the following registers according to each function and IP specifications.

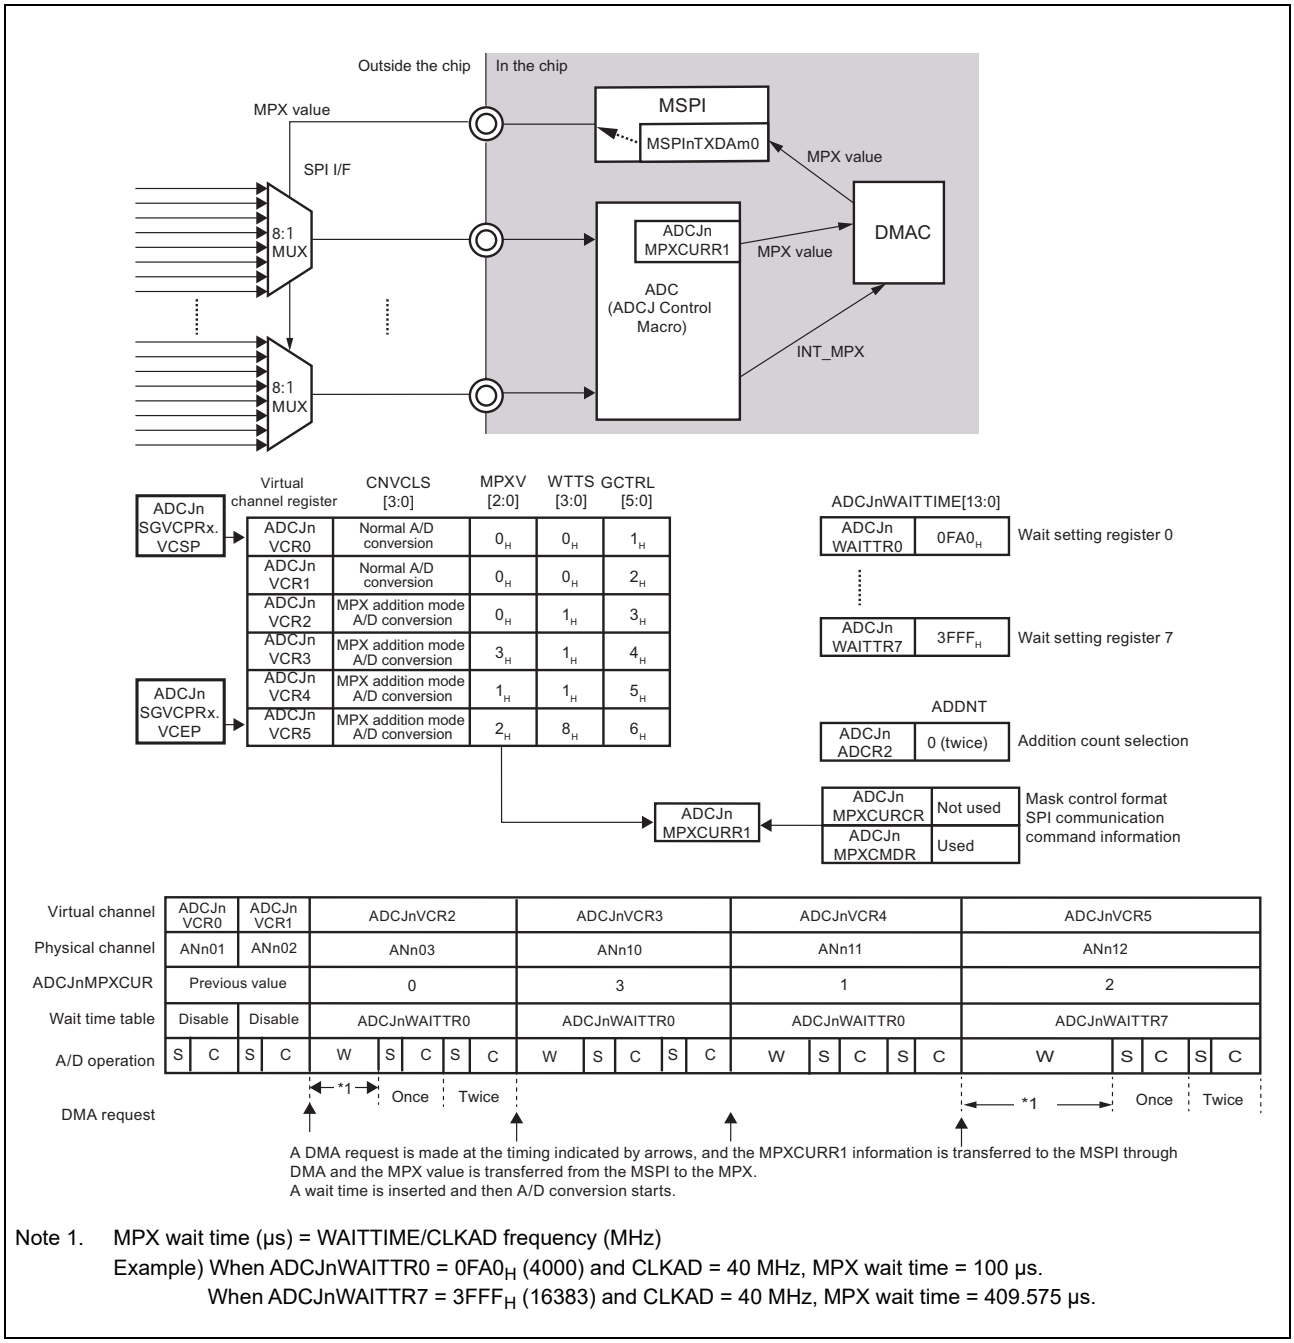
- MPX command information register (ADCJnMPXCMDR)
- External MPX channel (ADCJnVCRj.MPXV[2:0])
- Wait time table selection value (ADCJnVCRj.WTTS[3:0])
- Physical channel group/sub channel number (ADCJnVCRj.GCTRL[5:0])
- Wait setting register y (ADCJnWAITTRy.WAITTIME[13:0])
- MPX interrupt enable register (ADCJnMPXINTER)

The ADCJ performs the following operations.

1. Stores the ADCJnMPXCMDR and ADCJnVCRj.MPXV[2:0] values in the MPX current register 1 (ADCJnMPXCURR1) at the beginning of virtual channels and outputs the interrupt signal (INT_MPX).
2. Inserts arbitrary wait time using the wait setting value (ADCJnWAITTRy.WAITTIME[13:0]) selected by the WTTS[3:0] bits in ADCJnVCRj before executing virtual channels.
(Waiting for MPX value transfer by the DMAC, MSPI, etc. and settling of MPX output)
3. Perform A/D conversion of physical channels connected to the MPX.

Set the SPI communication command information of the MSPI in the MPX command information register.

This set value is used for MSPI output, but is not used for I/O port output.



Note 1. MPX wait time (µs) = WAITTIME/CLKAD frequency (MHz)
Example) When ADCJnWAITTR0 = $0FA0_H$ (4000) and CLKAD = 40 MHz, MPX wait time = 100 µs.
When ADCJnWAITTR7 = $3FFF_H$ (16383) and CLKAD = 40 MHz, MPX wait time = 409.575 µs.

Figure 43.18 Example of Using MPX (Output to MSPI)

43.4.8.3 Using Output Port

An example of configuration using the output port MPXCUR[2:0] and an example of operation are shown below.

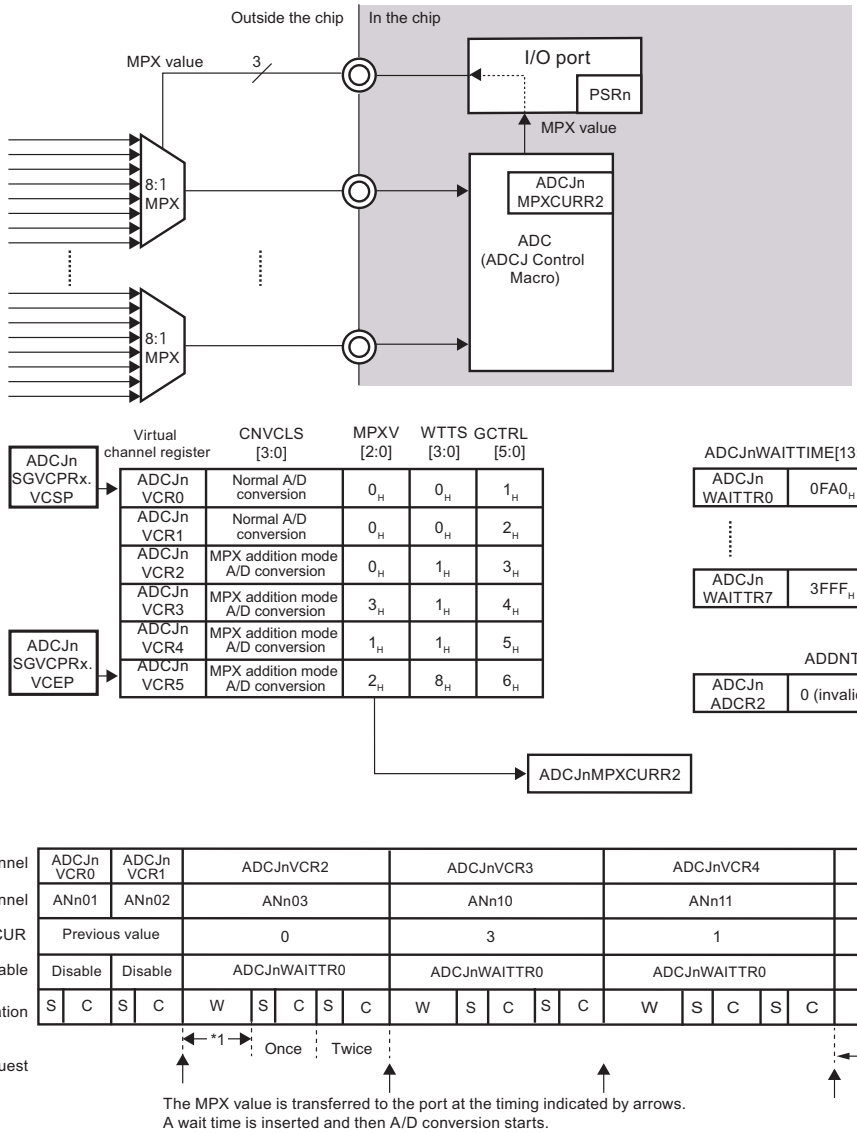
Set the following registers.

- External MPX channel (ADCJnVCRj.MPXV[2:0])
- Wait time table selection value (ADCJnVCRj.WTTS[3:0])
- Physical channel group/sub channel number (ADCJnVCRj.GCTRL[5:0])
- Wait setting register y (ADCJnWAITTRy.WAITTIME[13:0])

The ADCJ performs the following operations.

1. Stores the ADCJnVCRj.MPXV[2:0] value in the MPX current register 2 (ADCJnMPXCURR2) and sets the value for the output port MPXCUR[2:0] at the beginning of virtual channels.
2. Inserts arbitrary wait time using the wait setting value (ADCJnWAITTRy.WAITTIME[13:0]) selected by the WTTS[3:0] bits in ADCJnVCRj before executing virtual channels. (Waiting for setting MPX output)
3. Perform A/D conversion of physical channels connected to the MPX.

For operation when the MPX is enabled in the PWM-Diag, see **Section 43.4.16, PWM-Diag [Example of PWM-Diag]**.



Note 1. MPX wait time (µs) = WAITTIME/CLKAD frequency (MHz)
Example) When ADCJnWAITTR0 = $0FA0_H$ (4000) and CLKAD = 40 MHz, MPX wait time = 100 µs.
When ADCJnWAITTR7 = $3FFF_H$ (16383) and CLKAD = 40 MHz, MPX wait time = 409.575 µs.

Figure 43.19 Example of Using MPX (Output Port)

43.4.9 Diagnosis Functions

The ADCJ is equipped with the following three diagnostic functions.

- Wiring-break detection mode 1 (pull-down)
- Wiring-break detection mode 2 (pull-down or pull-up)
- Voltage monitoring function

43.4.9.1 Wiring-Break Detection Mode 1

Wiring-break detection mode 1 is a function to detect solder stripping.

Analog inputs are pulled down during sequential conversion, A/D conversion of wiring-break detection mode 1 is executed continuously several times for same physical channel. If wiring-break is present, the conversion result attenuates to near 0 V. This can be determined as wiring-break detection. For detailed timing, see **Figure 43.20, Wiring-Break Detection Mode 1 Flow**.

[Recommended flow]

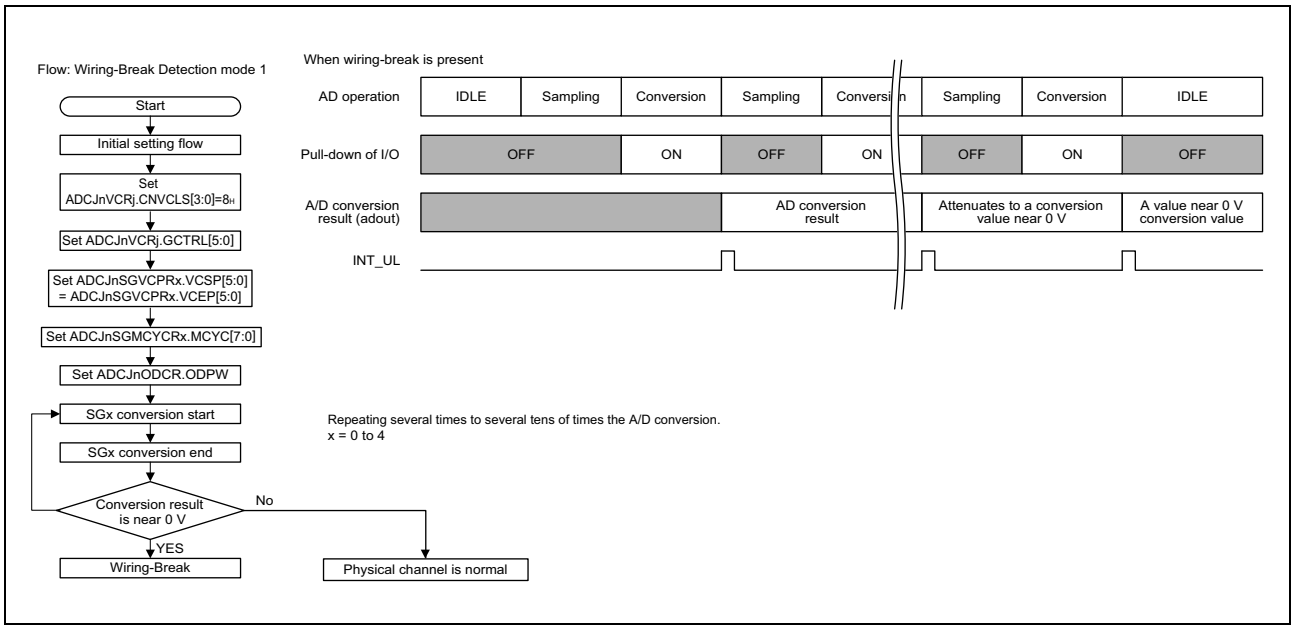


Figure 43.20 Wiring-Break Detection Mode 1 Flow

1. Make settings according to the initial settings (**Section 43.4.1.1, Initial Setting Procedure**).
2. In the Virtual Channel Register j (ADCJnVCRj), set CNVCLS[3:0] to 8H and set any physical channels in GCTRL[5:0].
3. Set only one virtual channel by Scan Group x Virtual Channel Pointer Register (ADCJnSGVCPRx). Set the number of virtual channel j to both VCSP[5:0] and VCEP[5:0].
4. Set the number of A/D conversion of wiring-break detection mode 1 to Scan Group x Multicycle register (ADCJnSGMCYCRx.MCYC).
5. In the wiring-break detection control register (ADCJnODCR), set any wiring-break detection pulse width in ODPW[4:0].
6. Activate the scan group x to perform A/D conversion of wiring-break detection mode 1.

7. Perform A/D conversion of wiring-break detection mode 1 several times. If the A/D conversion results attenuate to near 0 V, a wiring-break may be present.

CAUTIONS

1. **Execute the wiring-break detection for physical channel connected to T&H only when the T&H function is disabled.**
2. **When the normal A/D conversion result is near 0 V, it cannot determine wiring-break.**
3. **When performing normal A/D conversion after the wiring-break detection function is used, provide a sufficient charging period considering external stabilizing capacitor and signal source impedance.**
4. **When buffer amp disable is valid (ADCJnSMPCR.BUFAMPD = 1), it is prohibited to use wiring-break detection mode 1 because I/O pull-down is invalid during conversion time.**

43.4.9.2 Wiring-Break Detection Mode 2

Wiring-break detection mode 2 is a function to detect solder stripping.

Because analog inputs are pulled up or pulled down during sampling, the conversion result is affected by pull-up or pull-down. Therefore, when no wiring-break is present, the A/D conversion result cannot be used as a normal A/D conversion result value.

CAUTIONS

1. **Execute the wiring-break detection for physical channel connected to T&H only when the T&H function is disabled.**
2. **When performing normal A/D conversion after the wiring-break detection function is used, provide a sufficient charging period considering external stabilizing capacitor and signal source impedance.**

(1) Wiring-Break Detection Mode 2 (Pull-Down for physical channel I/O)

[Recommended flow]

The I/O buffer of the ANnpq pin to be detected is driven to the pull-down state.

Make the following settings in the virtual channel register j (ADCJnVCRj) according to the initial setting flow (**Section 43.4.1.1, Initial Setting Procedure**).

ADCJnVCRj number	CNVCLS[3:0]	GCTRL[5:0]
N	9_H	ANnpq number

Assign the virtual channel j shown above to scan group x.

Start scan group x according to the startup flow and perform A/D conversion.

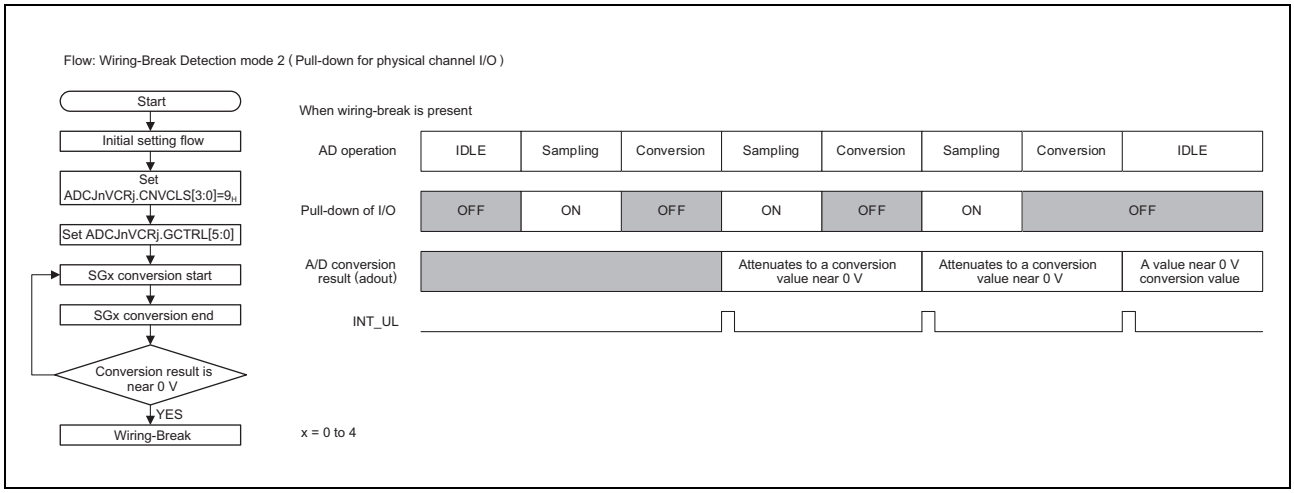

Figure 43.21 Recommended Flow of Wiring-Break Detection Mode 2 (Pull-Down for physical channel I/O)

[Decision method]

If the A/D conversion result attenuates to near 0 V, a wiring-break may be present.

We recommend that you perform A/D conversion several times and check the results.

For detailed timing, see "**Figure 43.21, Recommended Flow of Wiring-Break Detection Mode 2 (Pull-Down for physical channel I/O)**".

(2) Wiring-Break Detection Mode 2 (Difference Comparison)

This mode is usable to compare differences in A/D conversion results to detect wiring-break using wiring-break detection mode 2 (pull-down for physical channel I/O) and wiring-break detection mode 2 (pull-up for physical channel I/O).

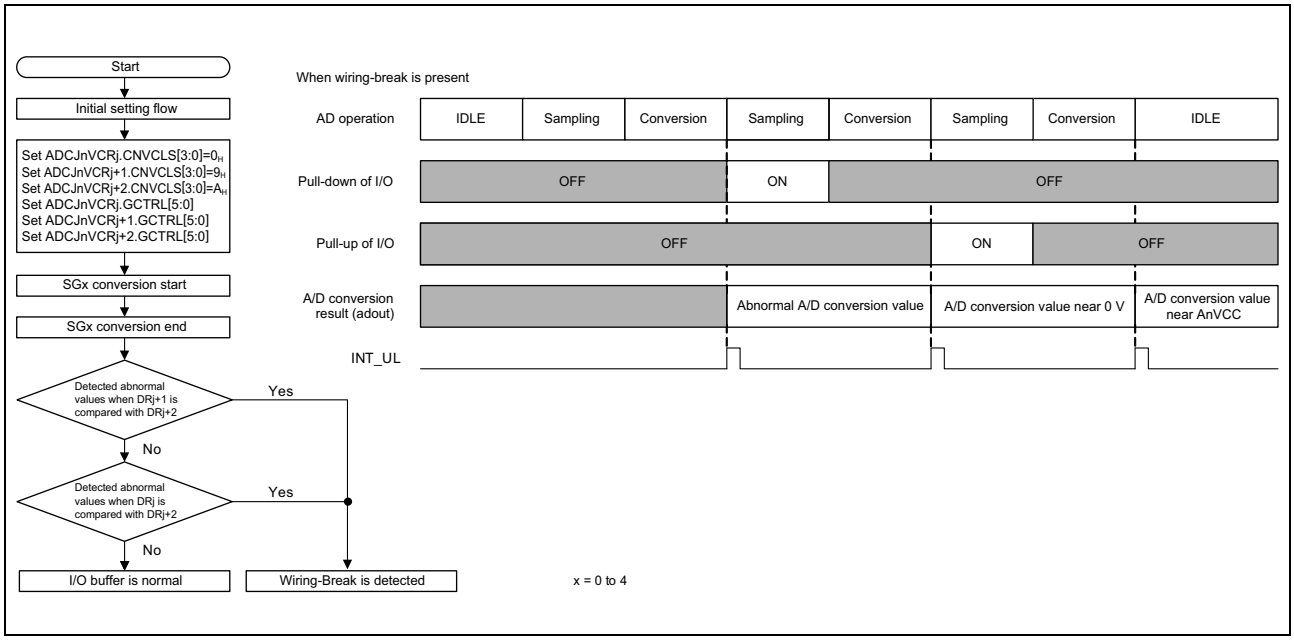

Figure 43.22 Recommended Flow of Wiring-Break Detection Mode 2 (Difference Comparison)

Set the I/O buffer of the ANnpq pin to be detected to the pull-up, pull-down, or pin connection state. Make the following settings for consecutive three virtual channels (ADCJnVCRj) according to "**Section 43.4.1.1, Initial Setting Procedure**".

I/O buffer	ADCJnVCRj number	CNVCLS[3:0]	GCTRL[5:0]
Pin connection	j	0_H	ANnpq number
Pull-down	j+1	9_H	
Pull-up	j+2	A_H	

Assign the set ADCJnVCRj to ADCJnVCRj+2 to the same scan group x.

Start scan group x according to the startup flow and perform A/D conversion.

[An Example of Decision method]

Compare:

1. between ADCJnVCRj +1 and ADCJnVCRj+2
2. between ADCJnVCRj and ADCJnVCRj+2

If wiring-break is present, the A/D conversion result of $ADCJnVCR_{j+1}$ attenuates to near 0 V and the A/D conversion result of $ADCJnVCR_{j+2}$ rises to near AnVCC. For this reason, abnormal values can be detected from the result of comparison 1 and 2 above. Thus, wiring-break can be decided. For detailed timing, see "**Figure 43.22, Recommended Flow of Wiring-Break Detection Mode 2 (Difference Comparison)**".

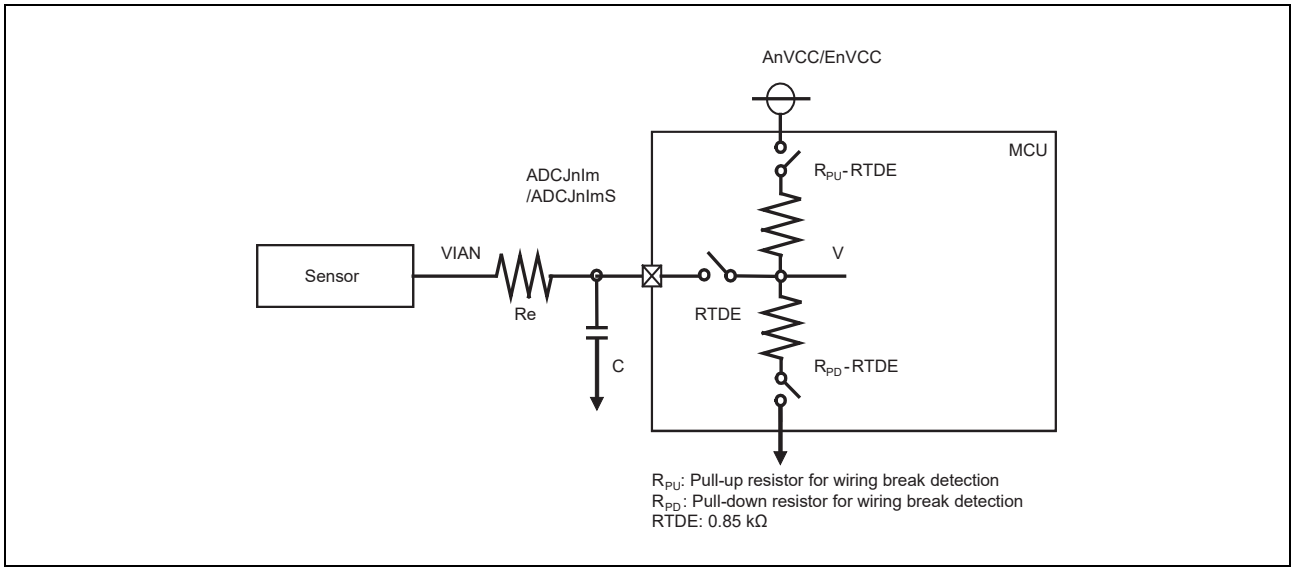

Figure 43.23 Schematic for Wiring Break Detection Formula

- $DR_{j+2} = V \times 4096 / AnVREFH = (AnVCC - (AnVCC - VIAN) * (R_{PU} - RTDE) / (Re + R_{PU})) * 4096 / AnVREFH$
- $DR_{j+1} = V \times 4096 / AnVREFH = (VIAN * (R_{PD} - RTDE) / (Re+R_{PD})) * 4096 / AnVREFH$

Because R_{PU} and R_{PD} depend on VIAN according to **Table 55.94, ADC Characteristics**, DR_{j+2} is maximum when R_{PU} is minimum and DR_{j+1} is minimum when R_{PD} is minimum.

The following is the example of formula for high accuracy pins (ADCJnlm).

If AnVCC = 5 V, AnVREFH = 5 V, VIAN = 2.5 V, Re = 1 kΩ, min $[R_{PU}]$@VIAN = AnVCC/2 is 5 kΩ, min $[R_{PD}]$@VIAN = AnVCC/2 is 5 kΩ,

- max $[DR_{j+2}] = (5 - (5 - 2.5) * (5 - 0.85) / (1 + 5)) * 4096 / 5 = 2680$ [LSB]
- min $[DR_{j+1}] = (2.5 * (5 - 0.85) / (1 + 5)) * 4096 / 5 = 1416$ [LSB]
- $DRj = 2.5 * 4096 / 5 = 2048$ [LSB]
- In comparison1, if $DR_{j+2} - DR_{j+1} > 1264$ (= 2680 - 1416) [LSB], wiring break is detected.
- In comparison2, if $DR_{j+2} - DR_j > 632$ (= 2680 - 2048) [LSB], wiring break is detected.

43.4.9.3 Secondary Power Supply Voltage Monitoring Function

The ADCJ0 can A/D-convert VCC, E0VCC, ISOVDD and AWOVDD power voltages. Setting the voltage divider enable bits 1 and 2 (VDE1, VDE2) in the voltage monitoring voltage divider control registers 1 and 2 (ADCJ0VMONVDCR1, ADCJ0VMONVDCR2) to 1 allows A/D conversion of each voltage. Divided voltages of VCC and E0VCC are A/D-converted.

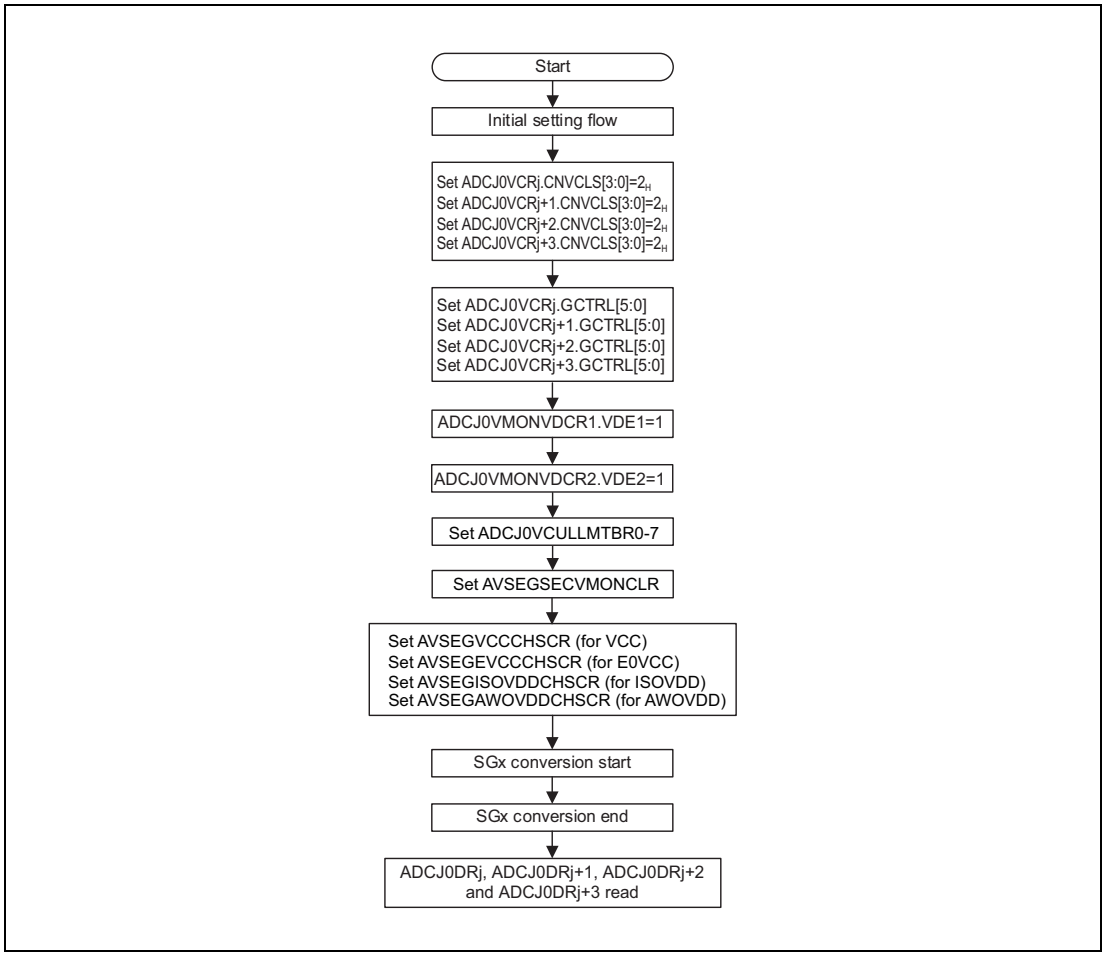

Figure 43.24 Recommended Flow

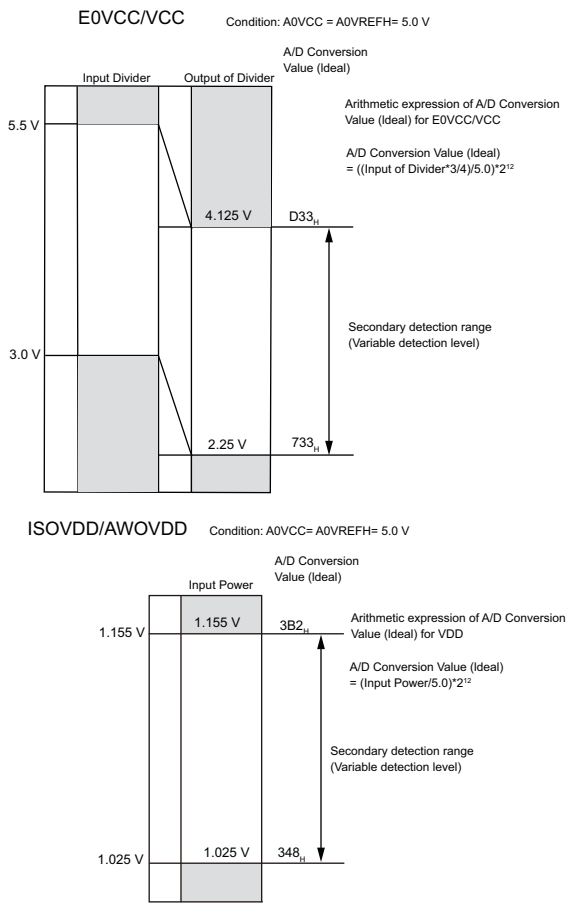
1. Make settings according to the initial settings (**Section 43.4.1.1, Initial Setting Procedure**).
2. Set CNVCLS[3:0] = 2_H and set each physical channel of power voltages (VCC, E0VCC, ISOVDD and AWOVDD) for GCTRL[5:0] in virtual channel setting registers ADCJ0VCR0, ADCJ0VCR1, ADCJ0VCR2, and ADCJ0VCR3. (* Settings can be made freely if four ADCJ0VCRs are consecutive.)
3. Set VDE1 in the voltage monitoring voltage divider control register 1 to 1, and then set VDE2 in the voltage monitoring voltage divider control register 2 to 1.
4. Set upper limit value and lower limit value of each power supply voltage to ADCJ0VCULLMTBR0 to ADCJ0VCULLMTBR7 (any of ADCJ0VCULLMTBR (ADCJ0VCULLMTBR0 to ADCJ0VCULLMTBR7) are able to be used as voltage monitor). For reference value of upper/lower limit value, refer to **Figure 43.25**.

5. Set AVSEGVCCCHSCR (for VCC), AVSEGEVCCCHSCR (for E0VCC), AVSEGISOVDDCHSCR (for ISOVDD) and AVSEGAWOVDDCHSCR (for AWOVDD) to allocate virtual channels which corresponds to each power source. For details of this setting, refer to **Section 43.7, ADC VMON Secondary Error Generator (AVSEG)**.
6. Set configuration of a filter to AVSEGVCCCNTCR (for VCC), AVSEGEVCCCNTCR (for E0VCC), AVSEGISOVDDCNTCR (for ISOVDD) and AVSEGAWOVDDCNTCR (for AWOVDD). For details of this setting, refer to **Section 43.7, ADC VMON Secondary Error Generator (AVSEG)**.
7. Activate SG, and then perform A/D conversion.

Using the upper/lower limit check function together makes it possible to output an interrupt request (INTADCJ0SEC) if an unexpected voltage is generated. Also, check value of AVSEGSECVMONERR register to confirm error status is kept.



Note 1. Set the upper/lower limit value as the value with which the absolute error of A/D conversion of power supply voltage is added to a reference value of this figure.

Note 2. For more information, refer to **Section 11, Power Supply Voltage Monitor**.

Figure 43.25 Reference Value of Upper/Lower Limit Value of Secondary Power Supply Voltage Monitor

Figure 43.26 shows operating example of voltage monitoring function.

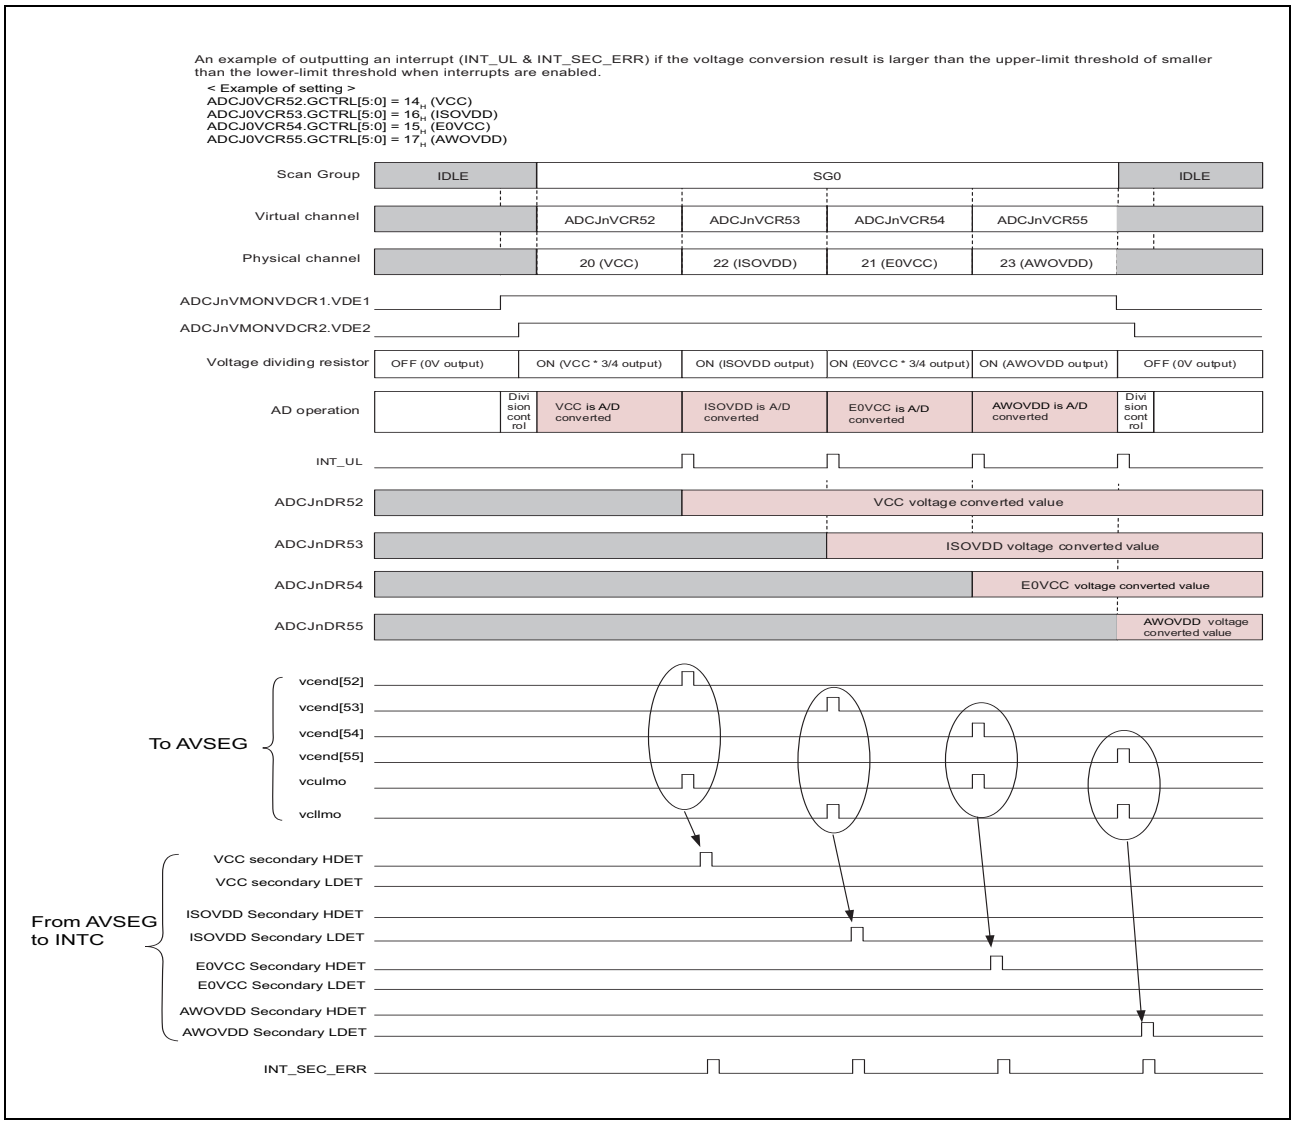


Figure 43.26 Example of Voltage Monitoring Operation

NOTE

For details about register setting and operation of INT_UL, vculmo, vcllmo, refer to **Section 43.4.19.5, Upper/Lower Limit Check**.

Refer to **Section 43.4.3.1, Forced Termination Flow of All Scan Groups**.

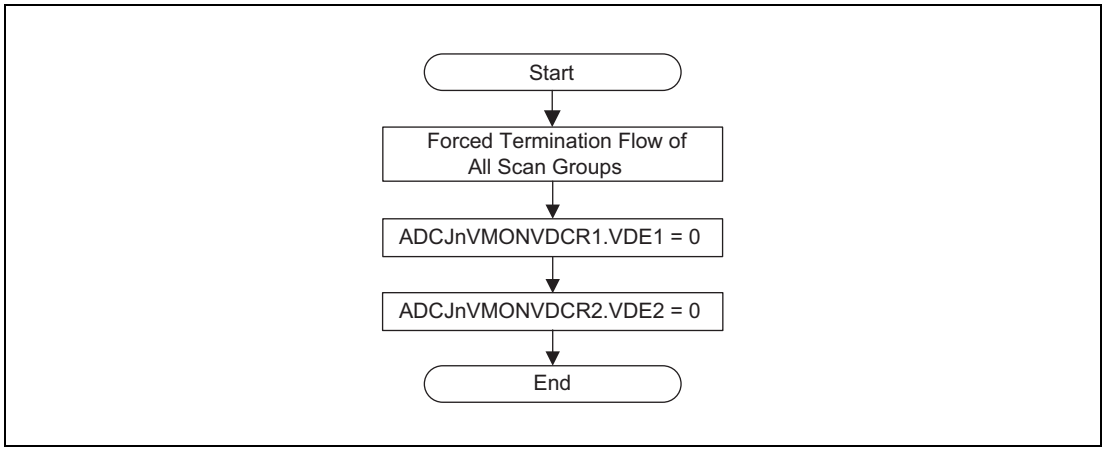

Figure 43.27 Stopping flow of Voltage Divider Enable bit 1/2

CAUTIONS

1. **Before stopping the ADCJ0 by module standby mode, set the voltage divider enable bits 1 and 2 (VDE1, VDE2) to 0.**
2. **Suppress the AnVREFH swing as much as possible.**

43.4.10 Self-Diagnostic Functions

The ADCJ is equipped with the following six self-diagnostic functions.

- Pin-level self-diagnostic function
- T&H path self-diagnostic function
- ADcore self-diagnostic function
- Wiring-break detection self-diagnostic function
- Voltage monitoring self-diagnostic function
- A/D conversion of A/D conversion data path diagnosis

43.4.10.1 Pin-Level Self-Diagnosis

The pin-level self-diagnosis function applies different voltage values to the physical channels of the even group and to the physical channel of the odd group respectively and performs A/D conversion to diagnose errors in the path from the I/O buffer of physical channels to the ADcore. If the A/D conversion result differs from the voltage applied to corresponding physical channel, target analog input path may be damaged.

There are 3 types of path from the I/O buffer of physical channels to the ADCore.

(1) When ADCJnSMPCR.BUFAMPD is set to 0, I/O buffer → RRAMP → ADcore input (shown in this section)

(2) When ADCJnSMPCR.BUFAMPD is set to 1, I/O buffer → ADcore input

(3) I/O buffer → T&H circuit → ADcore input (shown in **Section 43.4.10.2, Self-Diagnosis of the T&H Path**)

When diagnosing the path of (1), (2) or (3), the voltage to be applied to the I/O buffer is determined by the ADCJnTDCR.TDLV[1:0] setting.

	Voltage Applied to High Accuracy Input Pins		Voltage Applied to Low Accuracy Input Pins	
ADCJnTDCR.TDLV[1:0]	Even group	Odd group	Even group	Odd group
0_H	AnVSS	AnVCC	AnVSS	EnVCC
1_H	AnVCC	AnVSS	EnVCC	AnVSS
2_H	AnVSS	1/2×AnVCC	Not available	Not available
3_H	1/2×AnVCC	AnVSS	Not available	Not available

(1) The following describes self-diagnosis mode that diagnoses errors in the path from the I/O buffer through RRAMP to ADcore input.

[Recommended flow]

Set 0 to ADCJnSMPCR.BUFAMPD, and set the virtual channel register j (ADCJnVCRj) and TDLV[1:0] in the pin-level self-diagnosis register ADCJnTDCR according to the initial setting flow (**Section 43.4.1.1, Initial Setting Procedure**).

ADCJnVCRj number	CNVCLS[3:0]	GCTRL[5:0]
N	7_H	ANnpq number

Assign virtual channel n shown above to scan group x.

Start scan group x according to the startup flow and perform A/D conversion.

NOTE

When diagnosing errors in the path from (2) I/O buffer to ADcore input, the buffer amplifier setting has to change to disabled from the setting of [Recommended flow]. So, set SMPCR.BUFAMPD to 1, set other settings same as [Recommended flow], and start scan group x.

43.4.10.2 Self-Diagnosis of the T&H Path

This section describes self-diagnosis mode that diagnoses errors in the path from the I/O buffer through the T&H circuit to ADcore input.

Confirm that both the following (a) and (b) satisfy the diagnosis voltage values of physical channels connected to T&H.

	Route to be diagnosed	Diagnosis method
(a)	IO buffer ⇒ T&H circuit ⇒ ADcore input	Pin-Level Self-Diagnosis of the T&H Path
(b)	IO buffer ⇒ RRAMP ⇒ ADcore input	Pin-Level Self-Diagnosis of physical channel

Perform this diagnosis for all cases of the pin-level self-diagnosis level bits (ADCJnTDCR.TDLV) = 0_H, 1_H, 2_H, and 3_H. When respective diagnosis voltage values are satisfied, it can be decided that the T&H path is normal.

The setting method and judgment method of both (a) and (b) are explained in **(1), Pin-Level Self-Diagnosis of the T&H Path**.

Note: Even/odd group of self-diagnosis of the T&H path means even/odd physical channel number.
Even group = ANn00, ANn02
Odd group = ANn01, ANn03

(1) Pin-Level Self-Diagnosis of the T&H Path

[Recommended flow]

1. Initialize the settings according to "**Section Figure 43.29, Initialization Settings for Self-Diagnosis of the T&H Path**"
2. Write 1 to the sampling start bit (ADCJnTHSMPSTCR.SMPST) to start T&H sampling processing.
3. After waiting the period of T&H sampling*1, write 1 to the hold start bit (ADCJnTHAHLDSTCR.HLDST) to start T&H hold processing.
4. Write 1 to the scan group 1 start bit (ADCJnSGSTCR1.SGST), and scan group 1 is held suspended during the period of T&H hold processing.
5. After T&H hold processing, scan group 1 is started.
6. After generated the first scan End interrupt of virtual channel 0, change the self-diagnosis voltage level by writing pin-level self-diagnosis level bits (ADCJnTDCR.TDLV).
7. After scan group 1 is end, check the A/D conversion result. The expected value of hold value A/D conversion that is from ADCJnVCR2 to ADCJnVCR5 is the self-diagnosis voltage level before changing the self-diagnosis voltage level, and the expected value of pin-level self-diagnosis A/D conversion that is from ADCJnVCR6 to ADCJnVCR9 is the self-diagnosis voltage level after changing the self-diagnosis voltage level.
8. Change the pin-level self-diagnosis level bits (ADCJnTDCR.TDLV) from 0_H to 3_H, and repeat step from 1) to 7). If each value of data register n (ADCJnDR2 to ADCJnDR9) satisfies with the self-diagnosis voltage level of both odd group and even group, T&H path is judged to be normal.

Note 1. Wait for at least 0.45 µs (minimum sampling time of T&H) from the T&H sampling start in step 2), and then carry out the hold start control in step 4).

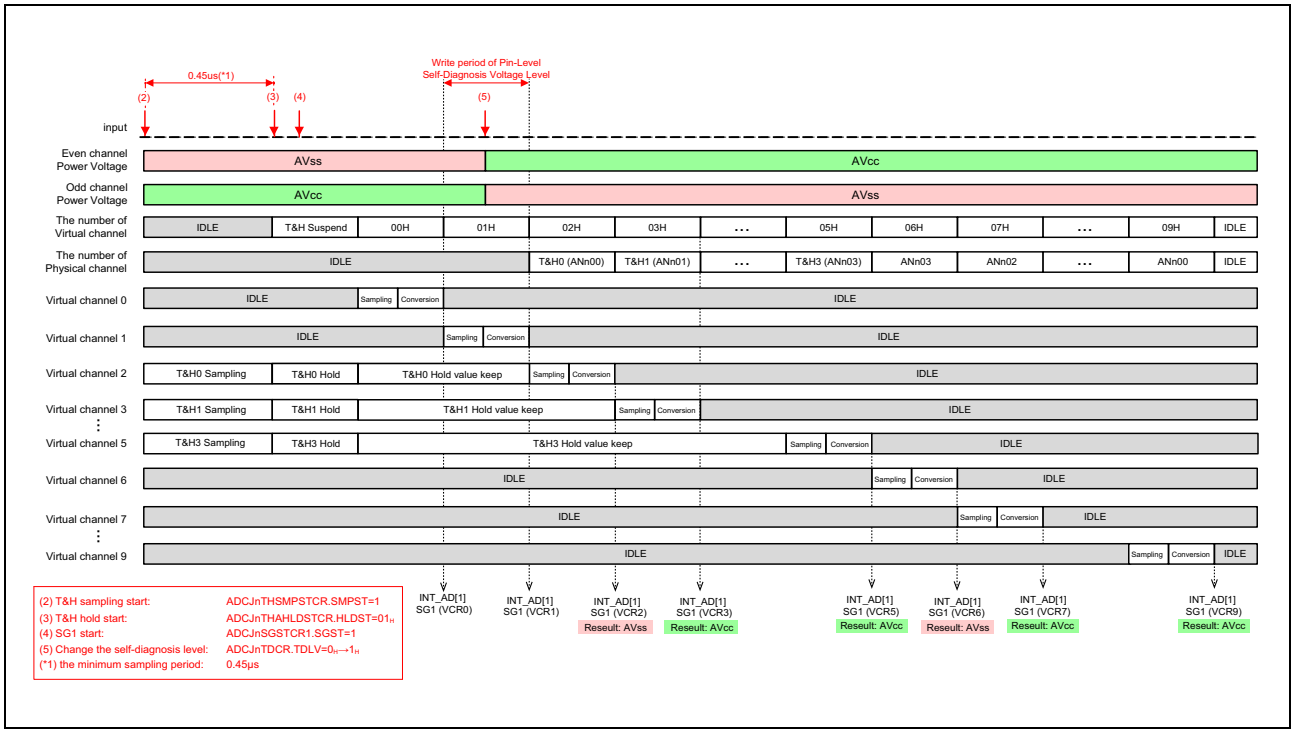

Figure 43.28 Example of Self-Diagnosis of the T&H Path Timing Chart

CAUTION

About the value of A/D conversion of self-diagnosis voltage level, refer to **Section 55, Electrical Characteristics**.

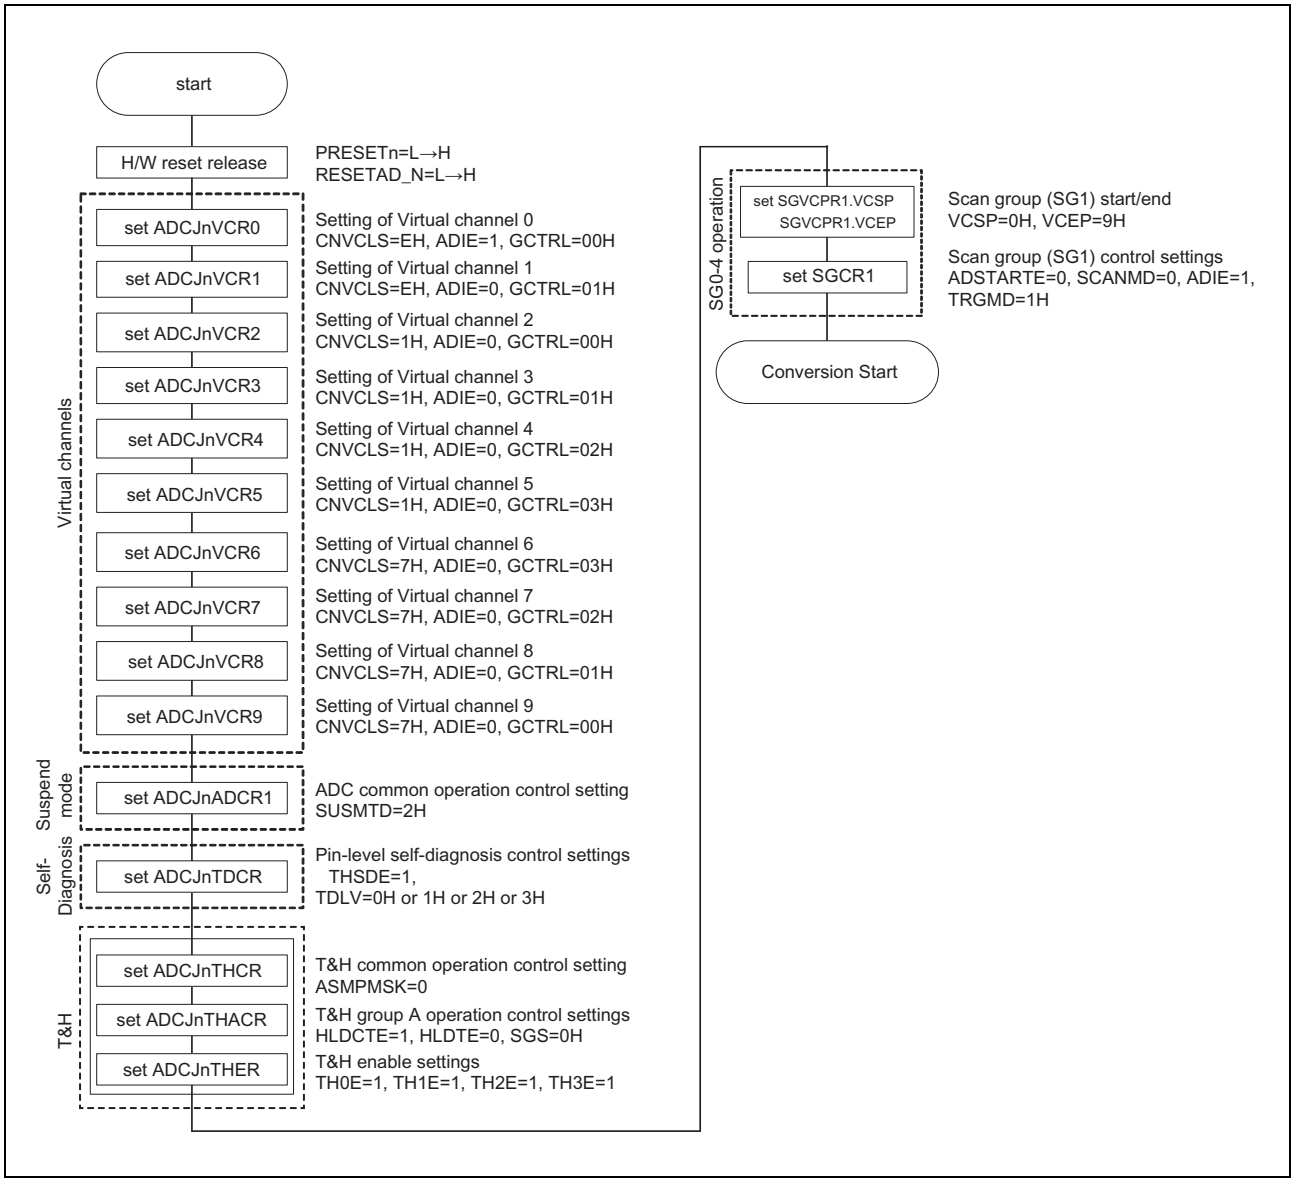

Figure 43.29 Initialization Settings for Self-Diagnosis of the T&H Path

43.4.10.3 A/Dcore Self-Diagnosis Function

The A/D core self-diagnosis function is used to verify that A/D conversion operates normally.

If the A/D conversion result differs from the expected value, the ADcore macro may be damaged.

To set a voltage value, set the CNVCLS[3:0] to 3_H and set GCTRL[5:0] in the virtual channel register j.

Conversions by AnVREFH × 1, AnVREFH × 3/4, AnVREFH × 1/2, AnVREFH × 1/4, and AnVREFH × 0 are available.

[Recommended flow]

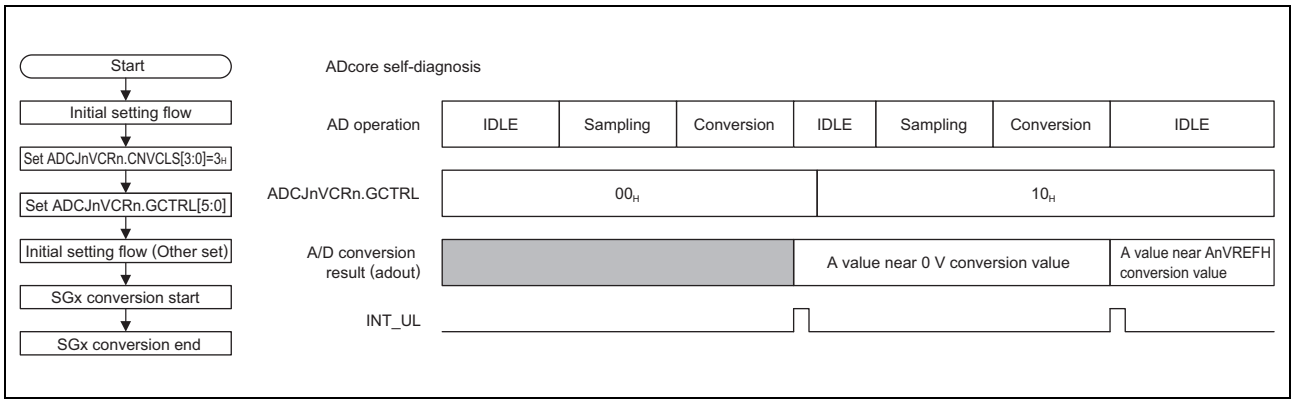

Figure 43.30 A/D core Self-Diagnosis Flow

1. Make settings according to the initial settings (**Section 43.4.1.1, Initial Setting Procedure**).
2. In the virtual channel setting register ADCJnVCRj (j = 0 to 63), set CNVCLS[3:0] to 3_H and set any A/D core self-diagnosis voltage level in GCTRL[5:0].
3. Make other necessary settings according to the initial settings (**Section 43.4.1.1, Initial Setting Procedure**).
4. Assert triggers of SG0 to SG4 and perform A/D conversion.

43.4.10.4 Self-Diagnosis of the Wiring-Break Detection Function

(1) Self-Diagnosis of Wiring-Break Detection Mode 1

The self-diagnosis A/D conversion in wiring-break detection mode 1 is used to check that the wiring-break detection mode 1 works normally. The A/D conversion executes in disabling ANI input and pull-down the ANI by ADCJnVCRj and ADCJnODCR setting. The self-diagnosis A/D conversion in wiring-break detection mode 1 is executed continuously several times for same physical channel. When the A/D conversion result of pull-down attenuates to approximately 0 V, the wiring-break detection mode 1 is judged to be working normally.

[Recommended flow]

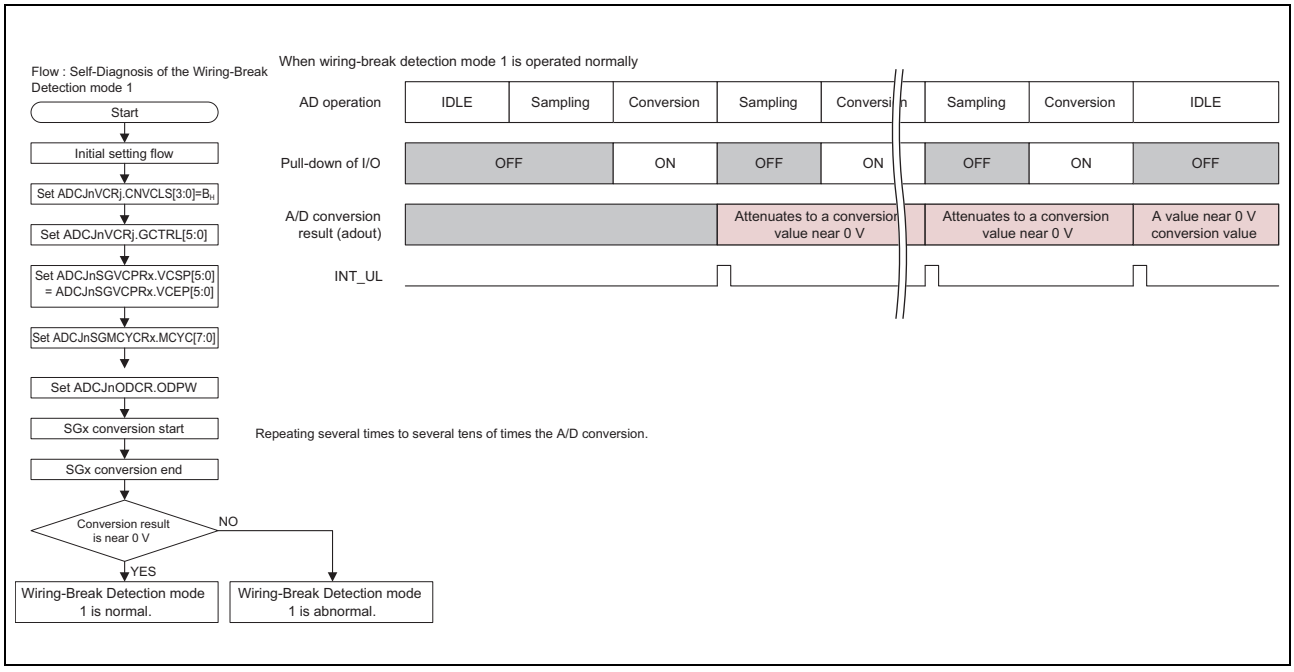

Figure 43.31 Recommended Flow of Self-Diagnosis of Wiring-Break Detection Mode 1

1. Make settings according to the initial setting procedure (**Section 43.4.1.1, Initial Setting Procedure**).
2. In the virtual channel setting register (ADCJnVCRj (j = 0 to 63)), set CNVCLS[3:0] to B_H and set any physical channels in GCTRL[5:0].
3. Set only one virtual channel by Scan Group x Virtual Channel Pointer Register (ADCJnSGVCPRx). Set the number of virtual channel j to both VCSP[5:0] and VCEP[5:0].
4. Set the number of self-diagnosis A/D conversion in wiring-break detection mode 1 to Scan Group x Multicycle register (ADCJnSGMCYCRx.MCYC).
5. In the wiring-break detection control register (ADCJnODCR), set any wiring-break detection pulse width in ODPW[4:0].
6. Activate the scan group x to perform the self-diagnosis A/D conversion in wiring-break detection mode 1.

7. Perform the self-diagnosis A/D conversion in wiring-break detection mode 1 several times.
   If the A/D conversion results attenuate to near 0 V, it is determined that wiring-break detection mode 1 (pull-down function) is operating normally.

(2) Self-Diagnosis of Wiring-Break Detection Mode 2

The wiring-break detection mode 2 self-diagnosis function is used to check that wiring-break detection mode 2 works normally.

The first A/D conversion execute in disabling ANI input and pull-down the ANI, and then the A/D conversion result of pull-down indicate approximately 0 V. The second A/D conversion execute in disabling ANI input and pull-up the ANI, and then the A/D conversion result of pull-up indicate approximately 5 V. The wiring-break detection mode 2 is judged to be working normally from each A/D conversion result.

[Feature]

Users can freely set physical channels to which wiring-break detection mode 2 self-diagnosis is applied.

[Recommended flow]

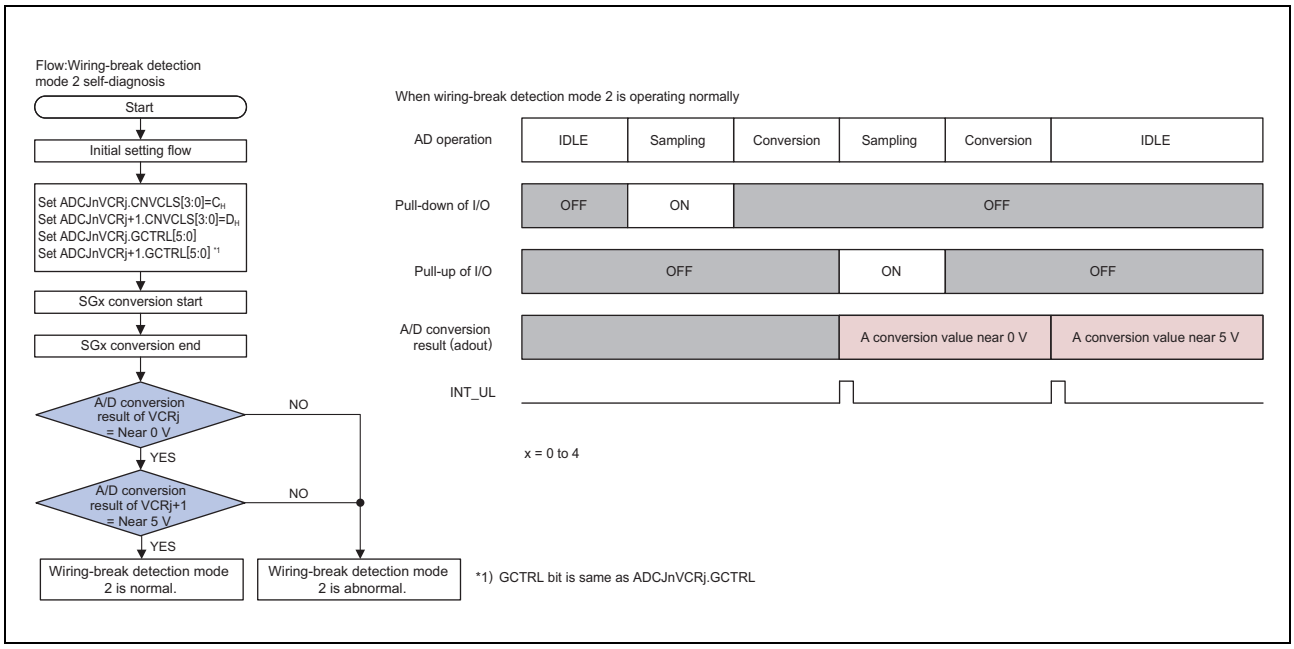

Figure 43.32 Recommended Flow of Self-Diagnosis of Wiring-Break Detection Mode 2

Set the I/O buffer of the ANnpq pin to be detected to the pull-up or pull-down state.

Make the following settings for consecutive two virtual channels (ADCJnVCRj) according to "**Section 43.4.1.1, Initial Setting Procedure**".

I/O buffer	ADCJnVCRj number	CNVCLS[3:0]	GCTRL[5:0]
Pull-down	j	C_H	ANnpq number
Pull-up	j+1	D_H	

Assign the set ADCJnVCRj and ADCJnVCRj+1 to the same scan group x.

Start scan group x according to the startup flow and perform A/D conversion.

[Decision method]

When wiring-break detection mode operates normally, the A/D conversion result of ADCJnVCRj attenuates to near 0 V and the A/D conversion result of ADCJnVCRj+1 rises to near AnVCC. Therefore, it can be diagnosed from each A/D conversion result that wiring-break detection mode 2 is operating normally.

43.4.10.5 Self-Diagnosis of the Voltage Monitoring Function

The voltage monitoring self-diagnosis function performs A/D conversion with the voltage dividing resistor in the power voltage monitoring circuit set to OFF by the voltage monitoring voltage divider control registers 1 and 2 (ADCJnVMONVDCR1, ADCJnVMONVDCR2). When the conversion result becomes near 0 V, it verifies that the voltage dividing resistor for voltage monitoring is normally controlled.

When performing self-diagnosis, perform A/D conversion and self-diagnosis of the power voltage alternately for each channel. For example of operation, see "**Figure 43.33, Example of Operation of Self-Diagnosis of Voltage Monitor**".

[Recommended flow]

1. Make settings according to the initial settings (**Section 43.4.1.1, Initial Setting Procedure**). However, when using the self-diagnosis function of the voltage monitor, operate only one target scan group. It is prohibited to perform A/D conversion of other scan group during using the self-diagnosis function of voltage monitor.
2. In the virtual channel setting register (ADCJnVCRj (j = 0 to 63)), set CNVCLS[3:0] to 0_H and set the channel for power voltage in GCTRL[5:0] for one channel.
3. In the voltage monitoring voltage divider control register 1, set VDE1 to 1, and then set VDE2 in the voltage monitoring voltage divider control register 2 to 1.
4. Perform A/D conversion, and then confirm that the conversion result is the power voltage value.
5. In the voltage monitoring voltage divider control register 1, set VDE1 to 0, and then set VDE2 in the voltage monitoring voltage divider control register 2 to 0.
6. Perform A/D conversion (self-diagnosis), and then confirm that the conversion result is near 0 V.

Figure 43.33 shows example of operation of Self-Diagnosis of Voltage Monitor. Rewrite ADCJnVMONVDCR1.VDE1 and ADCJnVMONVDCR2.VDE2 to 0 according to **Figure 43.27, Stopping flow of Voltage Divider Enable bit 1/2**.

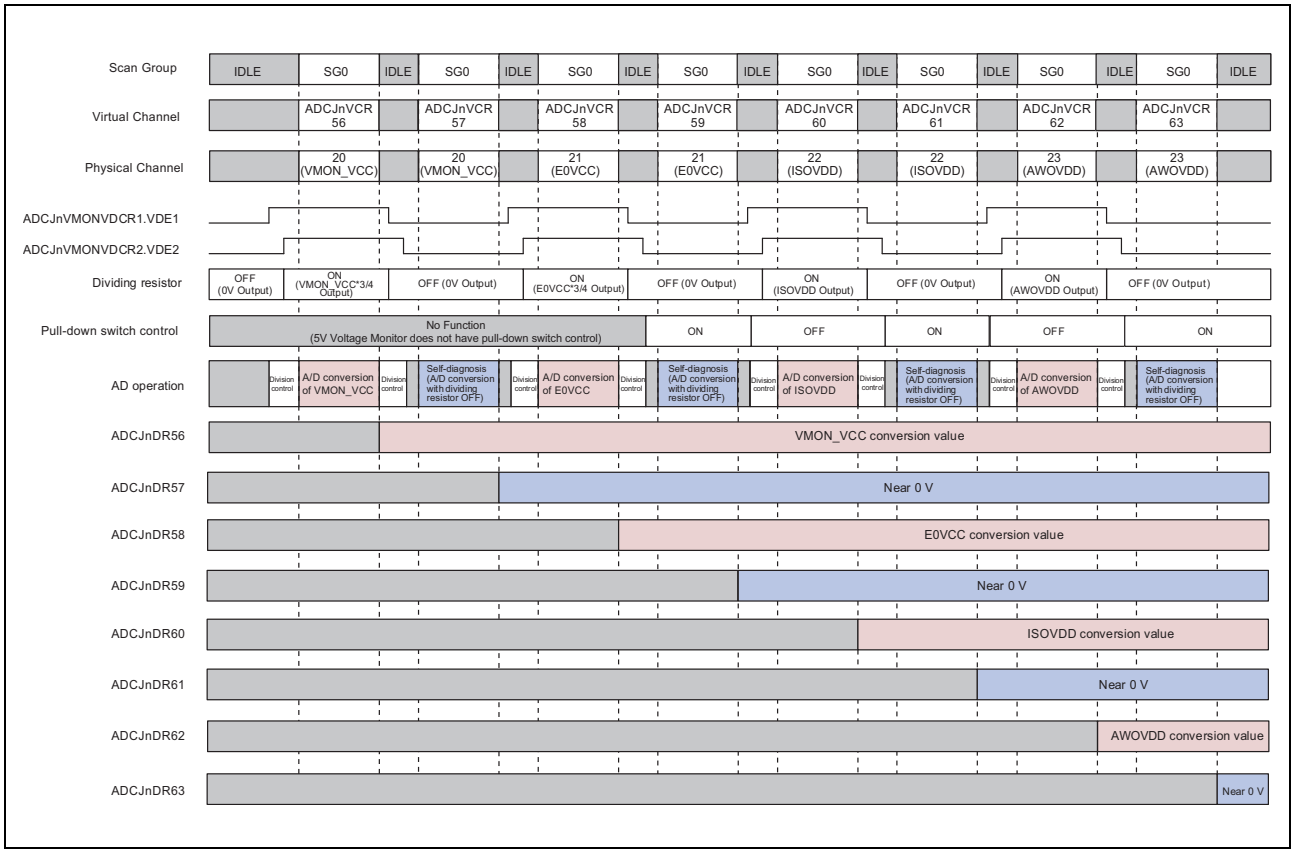

Figure 43.33 Example of Operation of Self-Diagnosis of Voltage Monitor

43.4.10.6 A/D Conversion Data Path Diagnosis

The A/D conversion data path diagnosis is used to diagnose the data path until data is stored in the data register from the ADCore.

Select a fixed value of A/D conversion data from the ADCore from GCTRL[5:0] in the virtual channel register ADCJnVCRj, and then perform A/D conversion.

If the A/D conversion result is equal to the fixed value of A/D conversion data selected from GCTRL[5:0], the data path is decided to be normal.

CAUTION

Because the A/D conversion data fixed value is 12 bits, select the 12-bit data format. A/D conversion data is stored in the data register with the data format selected by the DFMT bit.

[Recommended flow]

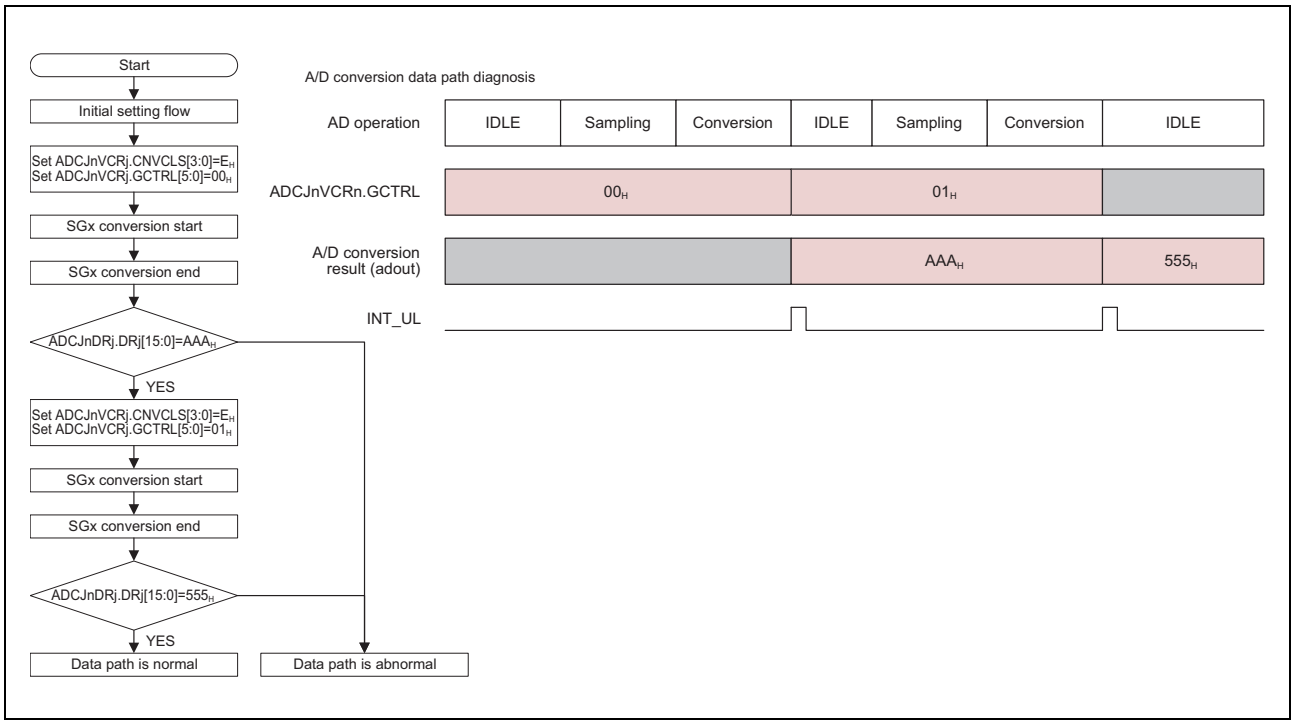

Figure 43.34 Recommended Flow of A/D Conversion Data Path Diagnosis

[Recommended flow]

1. Make settings according to the initial settings (**Section 43.4.1.1, Initial Setting Procedure**).
2. In the virtual channel setting register ADCJnVCRj (j = 0 to 63), set CNVCLS[3:0] = E_H and GCTRL[5:0] = 00_H.
3. Assert triggers of SG0 to SG4 and perform A/D conversion.
4. After the A/D conversion, compare the A/D conversion result with the fixed value (AAA_H) selected by GCTRL[5:0].
5. In the virtual channel setting register ADCJnVCRj (n = 0 to 63), set CNVCLS[3:0] = E_H and GCTRL[5:0] = 01_H.
6. Assert triggers of SG0 to SG4 and perform A/D conversion.
7. After the A/D conversion, compare the A/D conversion result with the fixed value (555_H) selected by GCTRL[5:0].
8. When the comparison results in steps 4) and 7) are equal to the fixed values respectively, the data path is decided to be normal.

43.4.11 Wait Function

The ADCJ can insert a wait before the A/D conversion sampling time. Decide whether to insert a wait by the CNVCLS[3:0] setting in ADCJnVCRj. The table below shows A/D conversion types in which wait (1) and wait (2) can be inserted.

(1) A/D conversion types in which a wait can be inserted into the first virtual channel at the beginning of scan group

(2) A/D conversion types in which a wait can be inserted into channels other than the first virtual channel

Table 43.85 A/D Conversion Types in Which a Wait Can Be Inserted

ADCJnVCRj.CNVCLS	Conversion Type	(1) Insertion of wait into the first channel	(2) Insertion of wait into other channels
0_H	Normal A/D conversion	×	√
1_H	Hold value A/D conversion	×	×
2_H	Normal A/D conversion at extended sampling cycle	×	√
3_H	ADcore self-diagnosis A/D conversion	×	×
4_H	Addition mode A/D conversion	×	√
5_H	MPX normal A/D conversion	√	√
6_H	MPX addition mode A/D conversion	√	√
7_H	Pin-level self-diagnosis A/D conversion	×	√
8_H	A/D conversion in wiring-break detection mode 1	×	√
9_H	A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down)	×	√
A_H	A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up)	×	√
B_H	Self-diagnosis A/D conversion in wiring-break detection mode 1	×	√
C_H	Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-down)	×	√
D_H	Self-diagnosis A/D conversion in wiring-break detection mode 2 (physical channel IO pull-up)	×	√
E_H	A/D conversion of A/D conversion data path diagnosis (ADVAL mode)	×	×
F_H	Reserved	—	—

√ : Wait inserted
×: Wait not inserted

CAUTION

When the CNVCLS[3:0] value in ADCJnVCRj is 1_H, 3_H, or E_H, no wait is inserted even with the wait insertion setting (ADCJnVCRj.WTTS[3:0] = 1_H to 8_H and the ADCJnWAITTRy.WAITTIME[13:0] value specified by ADCJnVCRj.WTTS[3:0] is 0008_H or more).

The table below shows settable wait time and the number of wait time tables.

Category	Explanation
Wait time	ADCJnWAITTRy.WAITTIME[13:0] × CLKAD period
The number of wait time tables	8
Wait setting target	Each virtual channel

With the following settings, the ADCJ inserts a wait time.

Category	Explanation
Wait enable	ADCJnVCRj.WTTS[3:0] = 1_H to 8_H
Wait table setting	ADCJnVCRj.WTTS[3:0] = 1_H to 8_H
Wait time setting	ADCJnWAITTRy.WAITTIME[13:0]

NOTES

1. In addition mode, the wait is input before first A/D conversion is processed (see **Figure 43.35, Wait function when addition mode**).

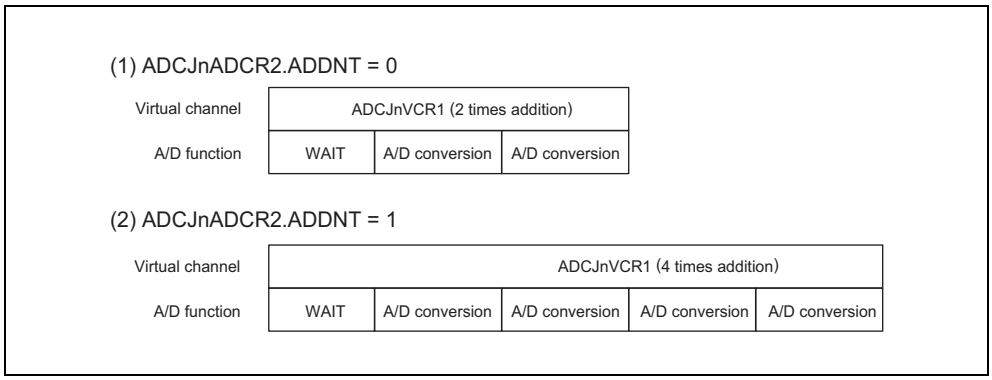

Figure 43.35 Wait function when addition mode

2. After the last virtual channel processing has been completed, no wait is inserted.
3. Even in MPX normal A/D conversion or MPX addition mode A/D conversion, no wait is inserted unless wait is enabled in the setting.

CAUTION

Wait setting is prohibited for all applicable virtual channels in scan groups including virtual channels that perform hold value A/D conversion.

43.4.11.1 Example of Wait Function between Virtual Channels

(1) Example of Wait Function (Multicycle Scan Mode that Scan Count is Once)

Register Name	Setting	Notes
ADCJnSGCR1.SCANMD	0_H	Multicycle scan mode
ADCJnSGMCYCR1.MCYC[7:0]	0_H	The scan count is once
ADCJnSGVCPR1.VCSP[6:0]	0_H	Starting pointer: ADCJnVCR0
ADCJnSGVCPR1.VCEP[6:0]	3_H	End pointer: ADCJnVCR3
ADCJnVCR0.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR0.WTTS[3:0]	1_H	A wait inserted
ADCJnVCR1.CNVCLS[3:0]	4_H	Addition mode A/D conversion
ADCJnVCR1.WTTS[3:0]	1_H	A wait inserted and wait table 0 selected
ADCJnVCR2.CNVCLS[3:0]	5_H	MPX normal A/D conversion
ADCJnVCR2.WTTS[3:0]	2_H	A wait inserted and wait table 1 selected
ADCJnVCR3.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR3.WTTS[3:0]	0_H	No wait inserted

Because the first virtual channel is not MPX normal A/D conversion or MPX addition mode A/D conversion, no wait is inserted in the first virtual channel 0.

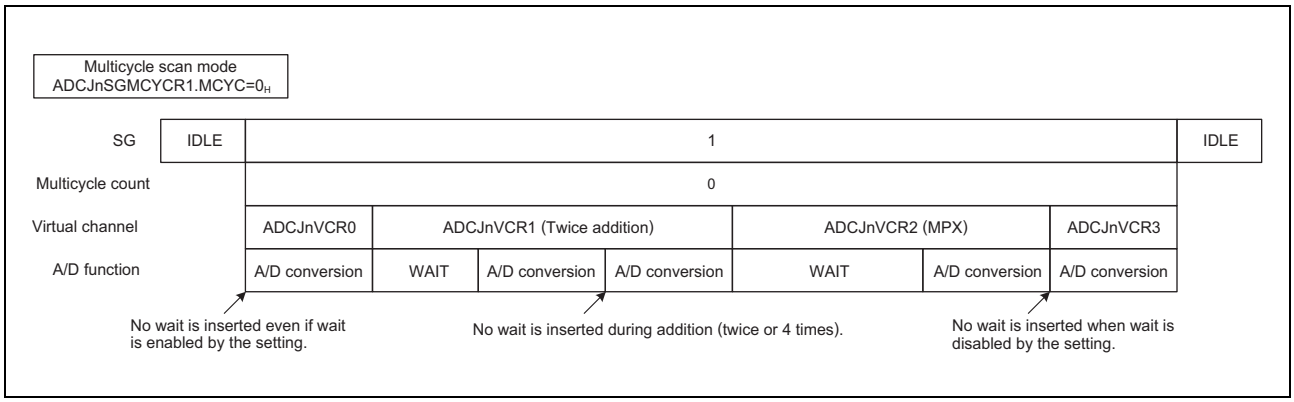

Figure 43.36 Wait Function (Multicycle Scan Mode that Scan Count is Once)

(2) Example of Wait Function (Multicycle Scan Mode that Scan Count is Twice)

Register Name	Setting	Notes
ADCJnSGCR1.SCANMD	0_H	Multicycle scan mode
ADCJnSGMCYCR1.MCYC[7:0]	1_H	The scan count is twice
ADCJnSGVCPR1.VCSP[6:0]	0_H	Starting pointer: ADCJnVCR0
ADCJnSGVCPR1.VCEP[6:0]	3_H	End pointer: ADCJnVCR3
ADCJnVCR0.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR0.WTTS[3:0]	1_H	A wait inserted
ADCJnVCR1.CNVCLS[3:0]	4_H	Addition mode A/D conversion
ADCJnVCR1.WTTS[3:0]	1_H	A wait inserted and wait table 0 selected
ADCJnVCR2.CNVCLS[3:0]	5_H	MPX normal A/D conversion
ADCJnVCR2.WTTS[3:0]	2_H	A wait inserted and wait table 1 selected
ADCJnVCR3.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR3.WTTS[3:0]	0_H	No wait inserted

Because the first virtual channel is not MPX normal A/D conversion or MPX addition mode A/D conversion, no wait is inserted in the first virtual channel 0. However, a wait is inserted in the virtual channel 0 of the second or later scan.

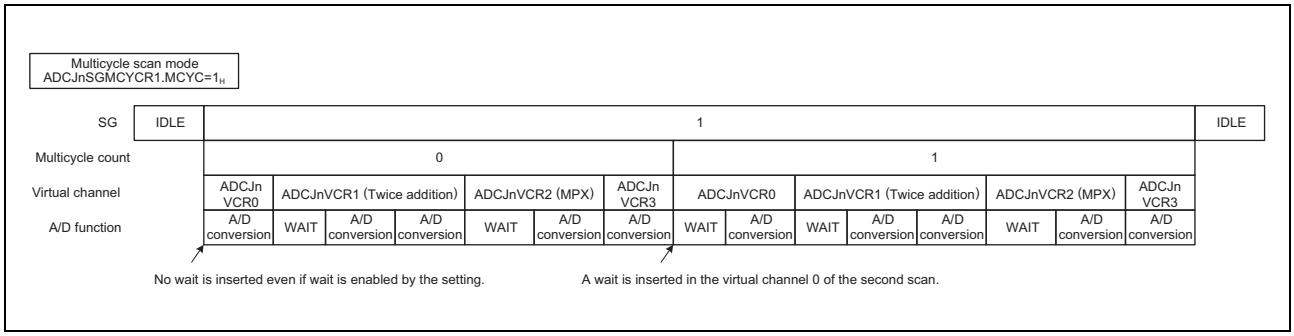

Figure 43.37 Wait Function (Multicycle Scan Mode that Scan Count is Twice)

(3) Example of Wait Function (Continuous Scan Mode)

Register Name	Setting	Notes
ADCJnSGCR1.SCANMD	1_H	Continuous scan mode
ADCJnSGVCPR1.VCSP[6:0]	0_H	Starting pointer: ADCJnVCR0
ADCJnSGVCPR1.VCEP[6:0]	3_H	End pointer: ADCJnVCR3
ADCJnVCR0.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR0.WTTS[3:0]	1_H	A wait inserted
ADCJnVCR1.CNVCLS[3:0]	4_H	Addition mode A/D conversion
ADCJnVCR1.WTTS[3:0]	1_H	A wait inserted and wait table 0 selected
ADCJnVCR2.CNVCLS[3:0]	5_H	MPX normal A/D conversion
ADCJnVCR2.WTTS[3:0]	2_H	A wait inserted and wait table 1 selected
ADCJnVCR3.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR3.WTTS[3:0]	0_H	No wait inserted

Because the first virtual channel is not MPX normal A/D conversion or MPX addition mode A/D conversion, no wait is inserted in the first virtual channel 0. However, a wait is inserted in virtual channel 0 of the starting pointer in the second continuous scan mode or later.

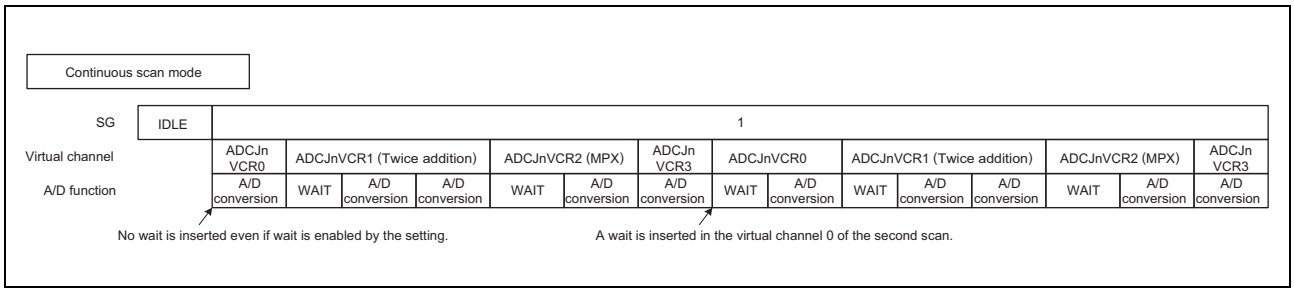

Figure 43.38 Wait Function (Continuous Scan Mode)

(4) Example of Wait Function (Synchronous Suspension)

This example shows operation of interrupt of a high-priority scan group (SG2 in the figure below) into a low-priority scan group (SG1 in the figure below) under the following conditions.

<Case1> An interrupt during A/D conversion of a low-priority scan group

<Case2> An interrupt during the wait time of a virtual channel of a low-priority scan group

<Case3> An interrupt during A/D conversion of a virtual channel with wait of a low-priority scan group

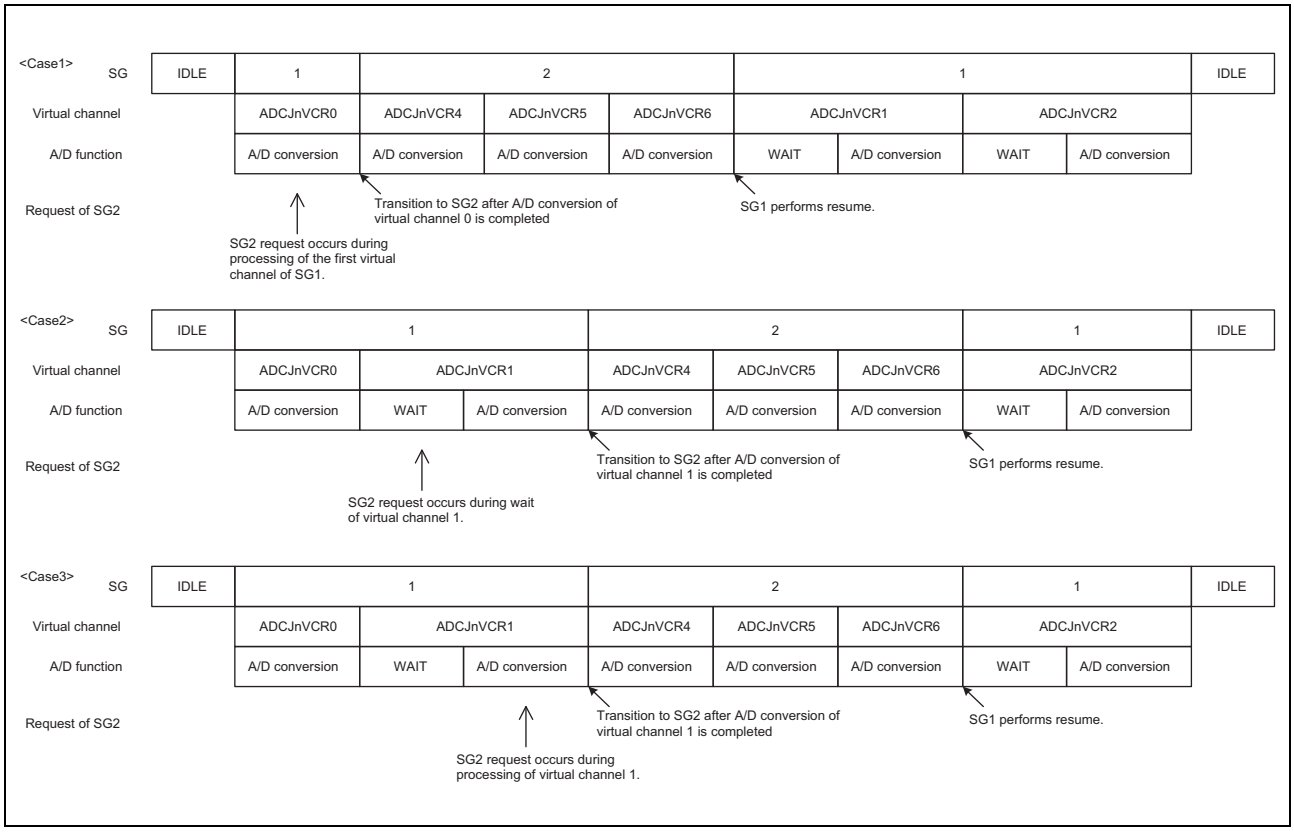

Figure 43.39 Wait Function (Synchronous Suspension)

(5) Example of Wait Function (Asynchronous Suspension)

This example shows operation of interrupt of a high-priority scan group (SG2 in the figure below) into a low-priority scan group (SG1 in the figure below) under the following conditions.

<Case1> An interrupt during A/D conversion of a low-priority scan group

<Case2> An interrupt during the wait time of a virtual channel of a low-priority scan group

<Case3> An interrupt during A/D conversion of a virtual channel with wait of a low-priority scan group

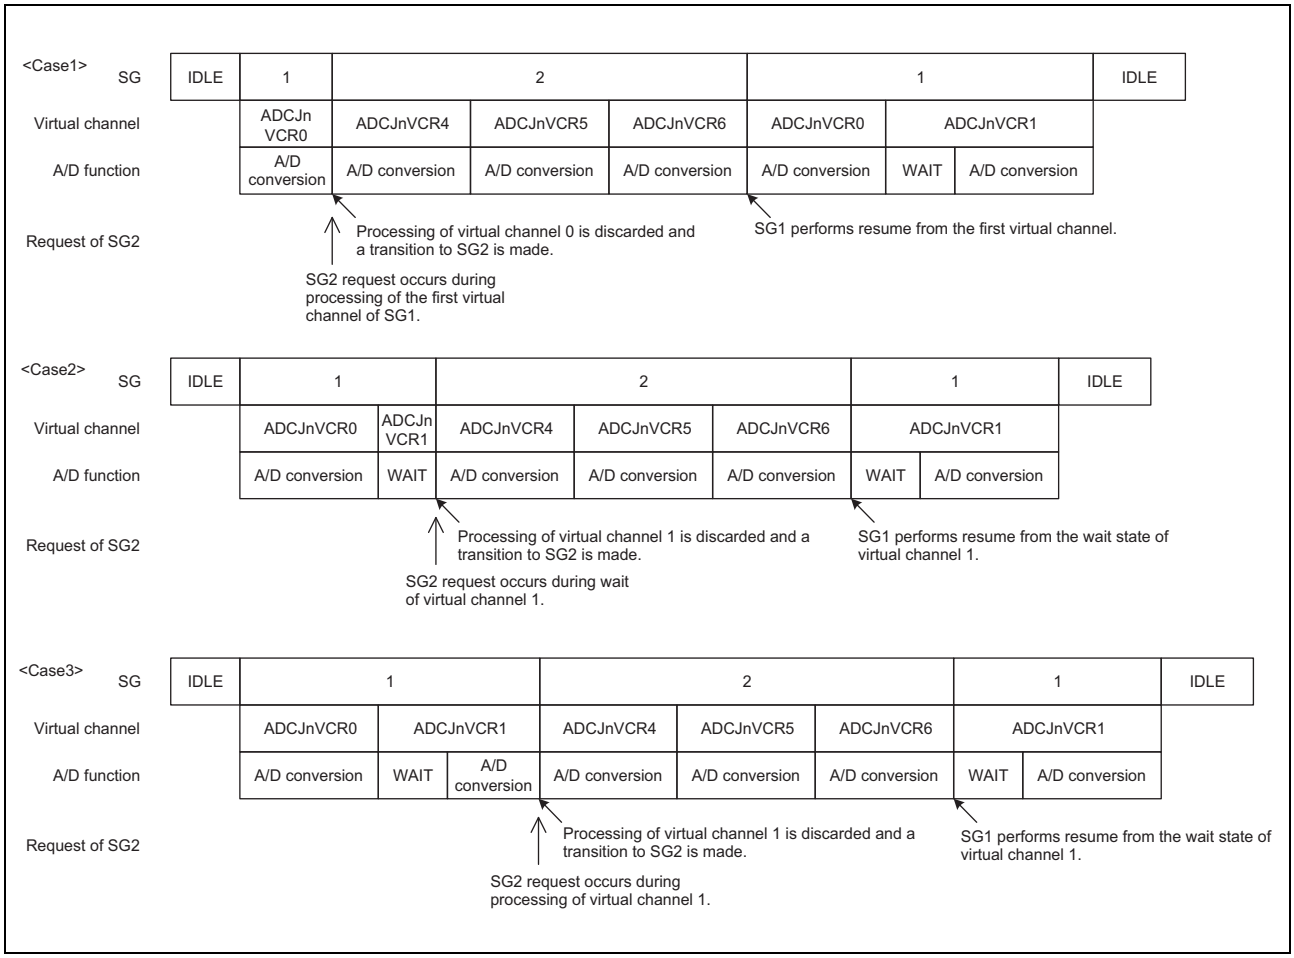

Figure 43.40 Wait Function (Asynchronous Suspension)

43.4.11.2 Example of MPX Wait

Register Name	Setting	Notes
ADCJnSGCR1.SCANMD	0_H	Multicycle scan mode
ADCJnSGMCYCR1.MCYC[7:0]	1_H	The scan count is twice
ADCJnSGVCPR1.VCSP[6:0]	0_H	Starting pointer: ADCJnVCR0
ADCJnVCR0.CNVCLS[3:0]	5_H	MPX normal A/D conversion
ADCJnVCR0.WTTS[3:0]	2_H	A wait inserted and wait table 1 selected
ADCJnVCR1.CNVCLS[3:0]	4_H	Addition mode A/D conversion
ADCJnVCR1.WTTS[3:0]	1_H	A wait inserted and wait table 0 selected
ADCJnVCR2.CNVCLS[3:0]	0_H	Normal A/D conversion
ADCJnVCR2.WTTS[3:0]	0_H	No wait inserted

When the A/D conversion type of a virtual channel of the starting pointer is MPX normal A/D conversion or MPX addition mode A/D conversion and wait is enabled by the setting, a wait is inserted in the first virtual channel 0. A wait is also inserted in virtual channel 0 in the second or later scan.

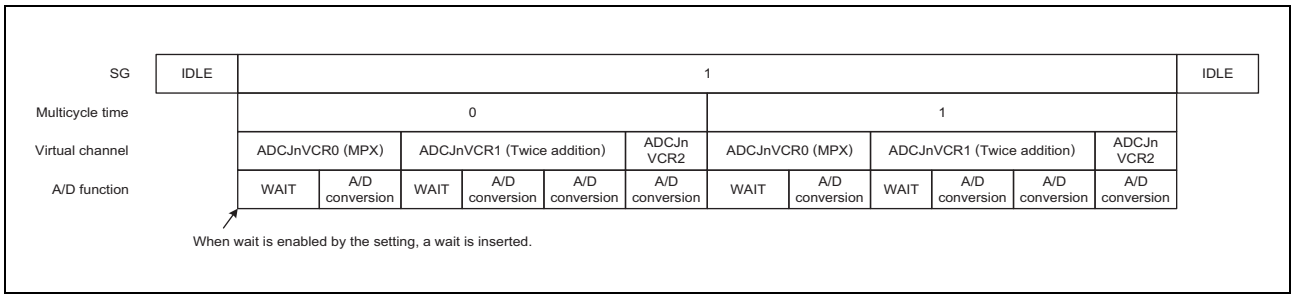

Figure 43.41 Wait Function (MPX A/D Conversion)

43.4.11.3 Sampling Period Setting

The following combinations for setting sampling period and buffer amplifier are supported.

Settings of other combinations are prohibited.

Category	Support Period Setting (Cycle)	Support Buffer AMP Setting (ADCJnSMPCR.BUFAMPD)	Notes
Extended sampling normal A/D conversion	60 or 99 or 138 or 252	0 (RRAMP enabled)	ADCJnVCRj.CNVCLS[3:0] = 2H
Common settings for all scans	99 or 204 or 252	1 (RRAMP disabled)	ADCJnSMPCR.SMPTS = 1
Default	18	0 (RRAMP enabled)	

The logic diagram for sampling period setting is shown below.

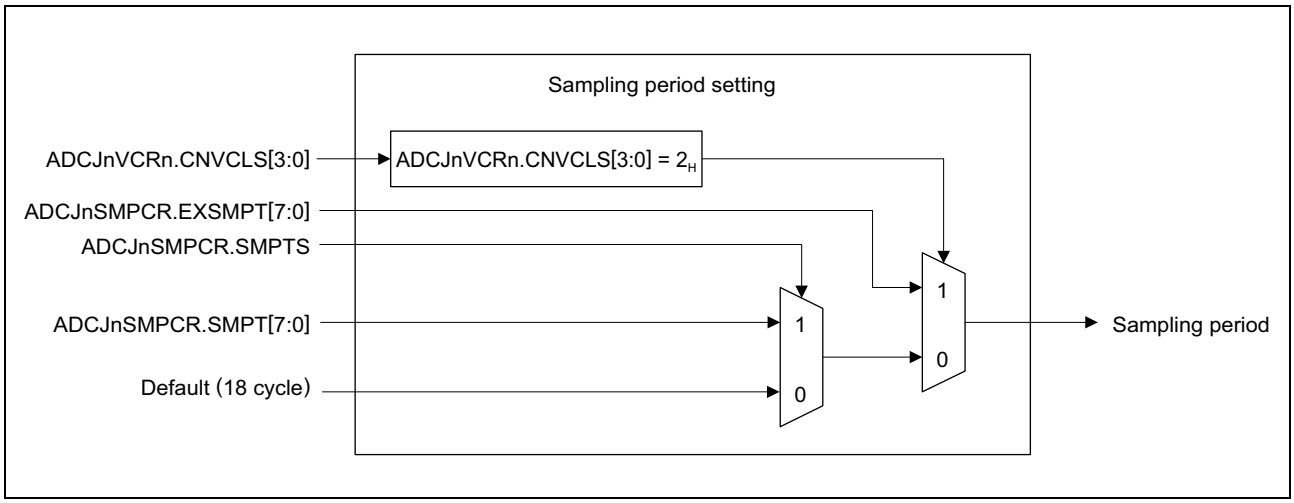

Figure 43.42 Logic Diagram of Sampling Period

43.4.12 Scan Mode

43.4.12.1 Multicycle Scan Mode

Multicycle scan mode is enabled by setting SCANMD in ADCJnSGCRx to 0.

Set the number of scan count (00_H to FF_H) in ADCJnSGMCYCRx. Set a value of (desired scan count - 1).

Figure 43.43 shows an example of multicycle scan mode operation when the scan count = 1 and 2.

- Conversion type: Normal A/D conversion mode (CNVCLS[3:0] = 0_H)
- Scan group 0
- Virtual channels: ADCJnVCR0 to ADCJnVCR3

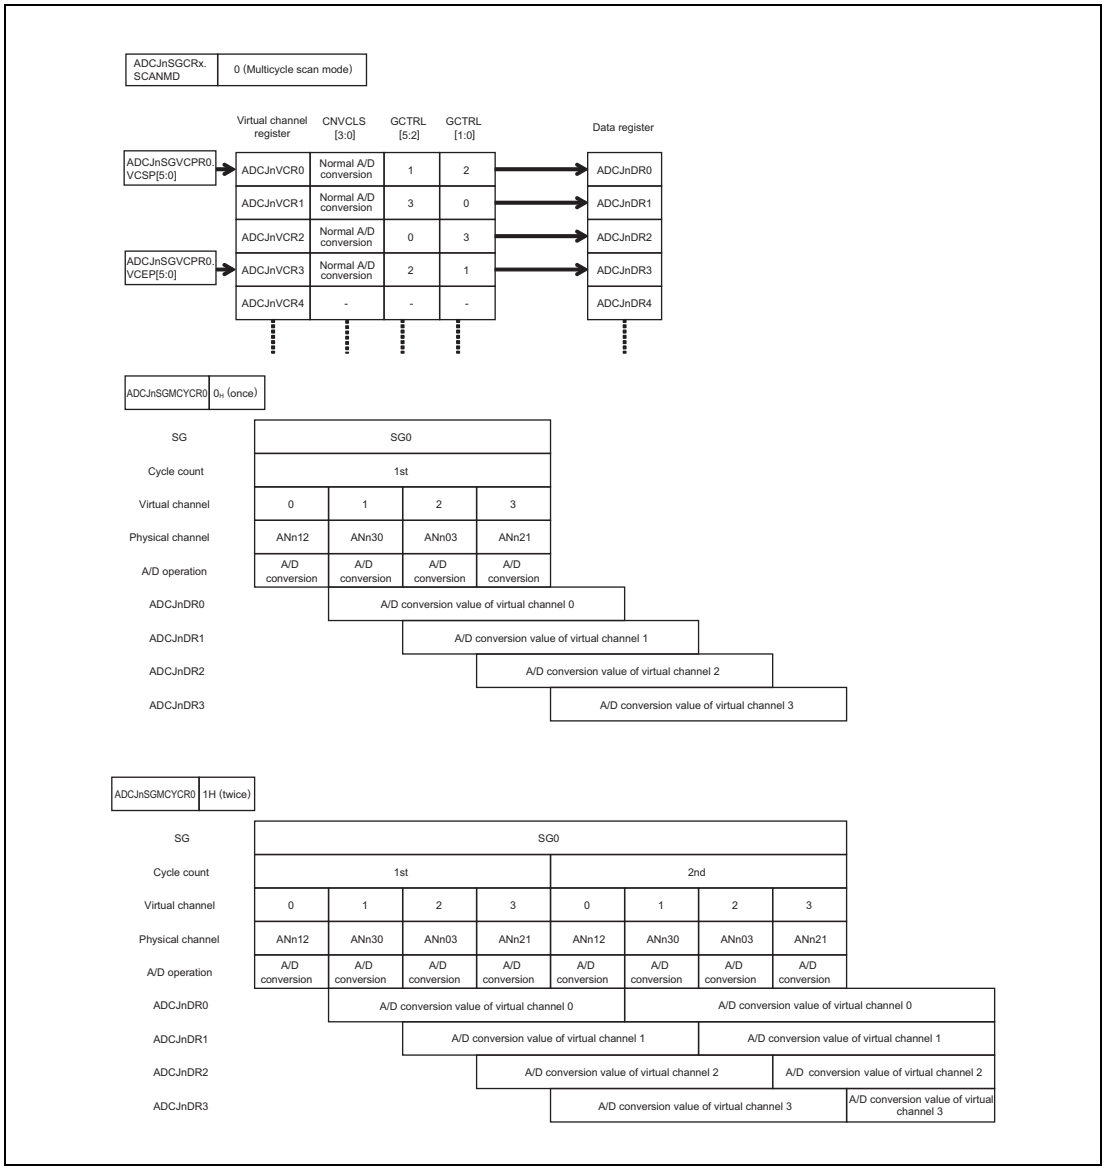

Figure 43.43 Example of Multicycle Scan Mode Operation

43.4.12.2 Continuous Scan Mode

In this mode, A/D conversion of virtual channels assigned to the target SGx is repeated unlimitedly.

Continuous scan mode is enabled by setting SCANMD in ADCJnSGCRx to 1. The set ADCJnSGMCYCRx value is invalid.

Figure 43.44 shows an example of continuous scan mode operation

- Conversion type: Normal A/D conversion mode (CNVCLS[3:0] = 0_H)
- Scan group 0
- Virtual channels: ADCJnVCR0 to ADCJnVCR3

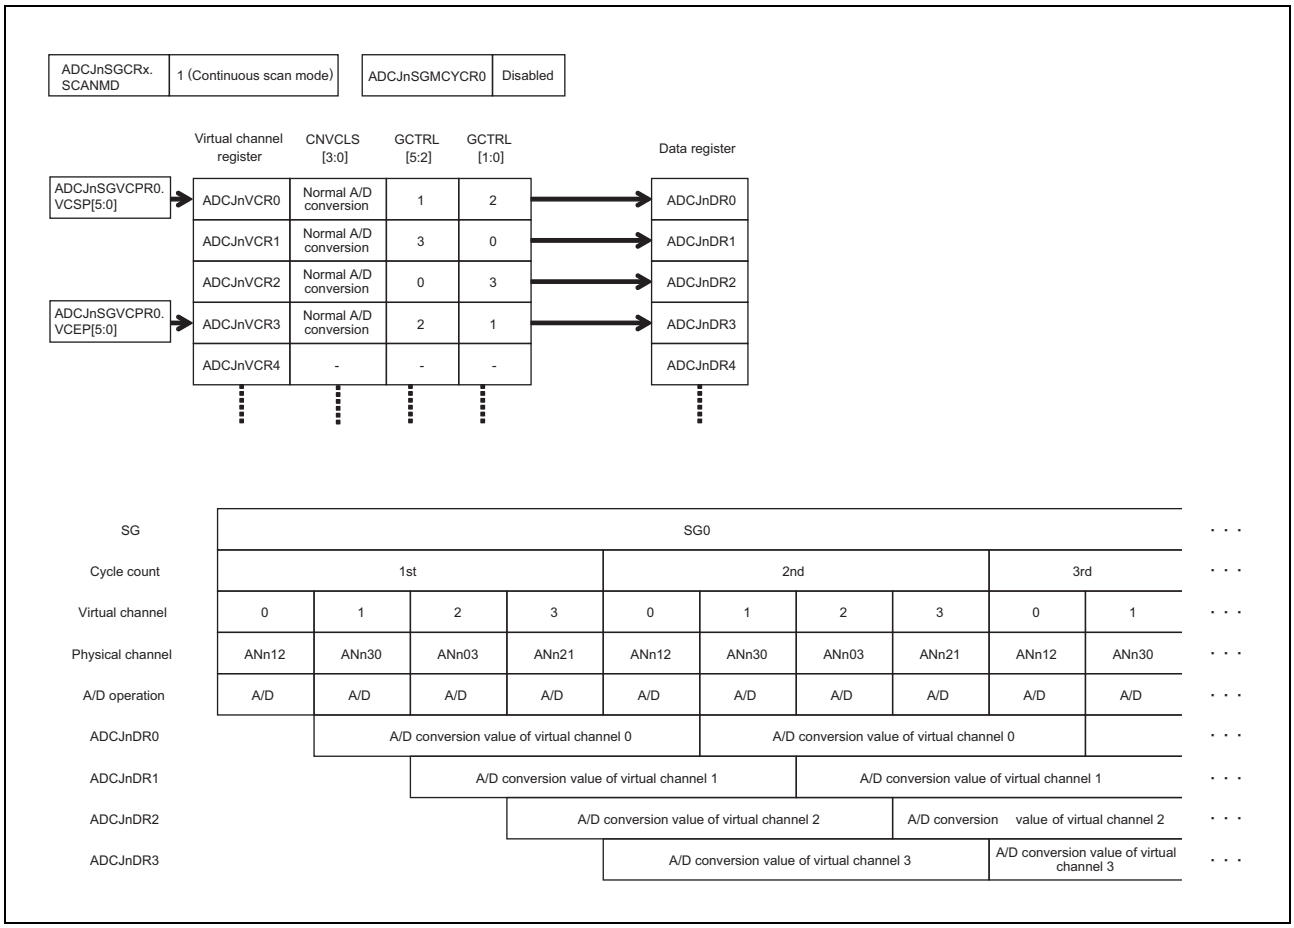

Figure 43.44 Example of Continuous Scan Mode Operation

43.4.13 Example of A/D Timer Operation

Scan group x can be activated at constant intervals by using the A/D timer trigger.

One count of the A/D timer = 1 CLKAD cycle

[Recommended flow]

Set the A/D timer initial phase register (ADCJnADTIPRx) and the A/D timer cycle register (ADCJnADTPRR) according to the initial setting flow (**Section 43.4.1.1, Initial Setting Procedure**).

The settable range is 00_0000_H to $1F\_FFFF_H$.

Set these registers considering the period required for one cycle of scan group x.

Activate A/D timer x with the A/D timer start trigger.

Stop A/D timer x with the A/D timer end trigger or by the A/D conversion forced termination setting (ADCJnADHALTR.HALT = 1).

The following describes an example of operation.

(1) When A/D timer x is activated, ADCJnADTIPRx is loaded to A/D timer x and the timer starts counting down.

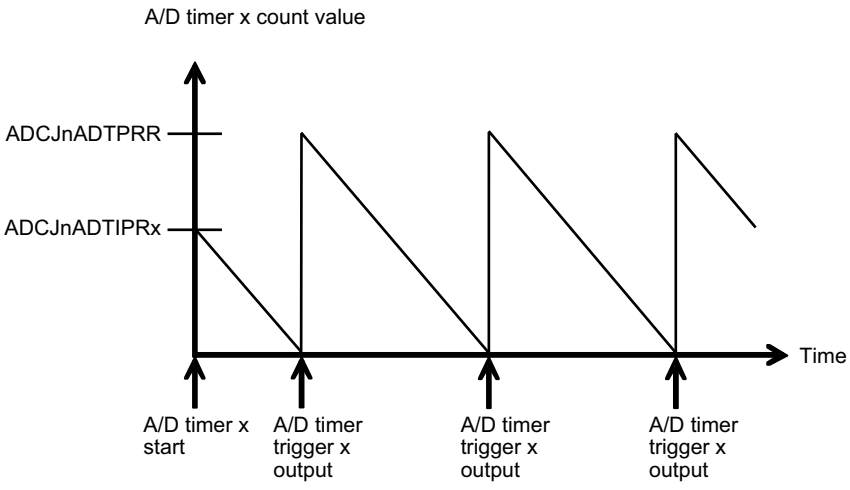
(2) When the A/D timer x becomes 0, the A/D timer trigger x is output for one CLKAD cycle and ADCJnADTPRRx is loaded to A/D timer x to restart down-counting.

After that, step (2) is repeated until the timer is halted.

If the A/D timer start trigger is received again after the A/D timer x is halted, operation starts from step (1).

The A/D timer synchronization start trigger enables A/D timers ADCJ0 and ADCJ1 to start simultaneously.

After synchronization start, A/D timers operate in the same way as above.



Note: x = 3, 4

Figure 43.45 Example of A/D Timer Operation

43.4.14 Trigger Function

The ADCJ has software triggers and hardware triggers.

While a scan group is operating (ADCJnSGSRx.SGACT = 1), if an A/D conversion start trigger of the same scan group is generated, the A/D conversion start trigger is ignored. Furthermore, while a scan group is operating (ADCJnSGSRx.SGACT = 1), a T&H hold start trigger of the same scan group is generated, the T&H hold start trigger is ignored.

At this time, an A/D error interrupt request can be output. For details, see "**Section 43.4.19.2, (1) Trigger Overlap Check Interrupt Request**"

While an A/D timer is operating (ADCJnSGSRx.ADTACT = 1), if an A/D timer start trigger of the same scan group is generated, the A/D timer start trigger is ignored.

A software trigger is generated by writing 1 to the bit in the register. Each software trigger has a single function.

The table below shows whether the trigger function of each scan group is provided or not.

Table 43.86 List of Availability of the Trigger Function in Each Scan Group

Category	Function	Register Bit Name or Pin Name	SG0	SG1	SG2	SG3	SG4	
							*1	*2
Software triggers	Scan group x start	ADCJnSGSTCRx.SGST	√	√	√	√	√	–
	Scan group x stop	ADCJnSGSTPCRx.SGSTP	√	√	√	√	√	–
	A/D conversion synchronization start	ADCJnADSYNSTCR.ADSTART	√	√	√	√	√	–
	AD forced termination	ADCJnADHALTR.HALT	√	√	√	√	√	√
	AD timer start	ADTSTCRx.ADTST	–	–	–	√	√	–
	AD timer synchronization start	ADCJnADTSYNSTCR.ADTSTART	–	–	–	√	√	–
	AD timer end	ADTENDCRx.ADTEND	–	–	–	√	√	–
	T&H sampling start	ADCJnTHSMPSTCR.SMPST	–	√	√	√	√	–
	T&H A hold	ADCJnTHAHLDSTCR.HLDST	–	√	√	√	√	–
	T&H stop	ADCJnTHSTPCR.THSTP	–	√	√	√	√	–
Hardware triggers	SGx trigger	SGx_TRG	√	√	√	√	√	–
	PWM-Diag trigger	PVCR_TRG	–	–	–	–	–	√

Note 1. ADCJnPWDCR.PWE=0

Note 2. ADCJnPWDCR.PWE=1

Note: √: Function provided
–: Function not provided

Note: x: 0 to 4

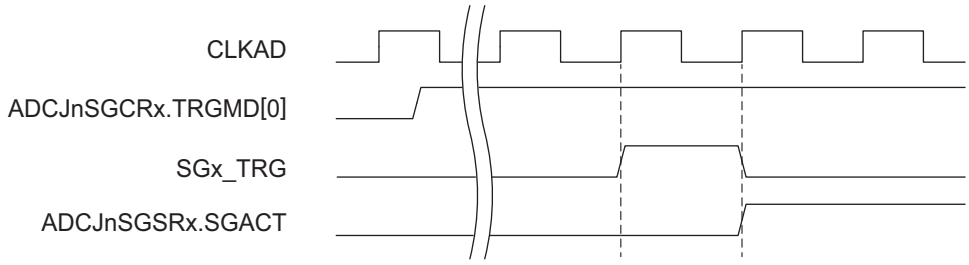
A hardware trigger is a rising edge of SGx_TRG.

For ADCJ0 & ADCJ1, there are external triggers (ADCJnTRGx), other Timers can become as trigger sources of SGx_TRG of each ADCJn, and they are chosen by the PIC (Peripheral Interconnect). For details, refer to **Section 41, Peripheral Interconnect (PIC)**.

For ADCJ2, there are external triggers (ADCJ2TRGx), TAUD2, TAUJ2, TAUJ3 and LPS can become as trigger sources of SGx_TRG of ADCJ2, and they are chosen by the ADCJnSGTSELx register. For details, refer to **Section 43.3.4.1, ADCJnSGTSELx — Scan Group x Start Trigger Control Register**.

43.4.14.1 Starting a Scan Group by Using a Hardware Trigger

When hardware triggers are enabled (ADCJnSGCRx.TRGMD[0] = 1) for trigger mode of scan group x, the scan group x status (ADCJnSGSRx.SGACT) is set to 1 after SGx_TRG is input.



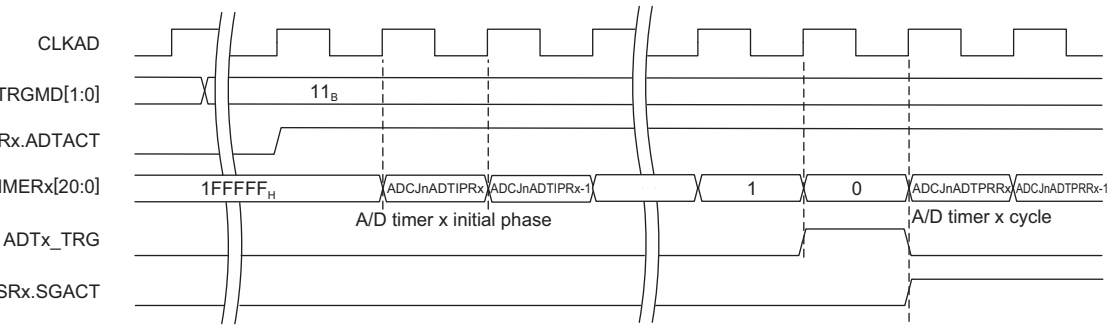
Note: x = 0 to 4

Figure 43.46 Hardware Trigger Timing

43.4.14.2 Starting a Scan Group by Using an A/D Timer Trigger

When scan group x and AD timer trigger x hardware triggers are enabled (ADCJnSGCRx.TRGMD[1:0] = 11_B) for trigger mode of scan group x, the scan group x status (ADCJnSGSRx.SGACT) is set to 1 after the AD timer trigger is input.

For AD timer x operation, see "**Section 43.4.13, Example of A/D Timer Operation**."



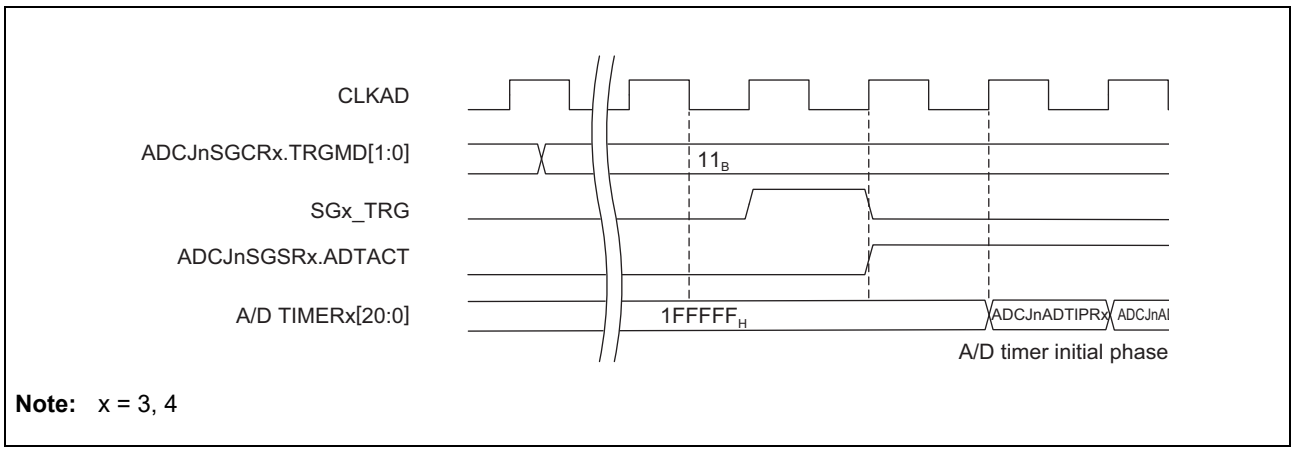
Note: x = 3, 4

Figure 43.47 A/D Timer x Hardware Trigger Timing

43.4.14.3 Starting A/D Timer by Using a Hardware Trigger

When scan group x and AD timer trigger x hardware triggers are enabled (ADCJnSGCRx.TRGMD[1:0] = 11_B) for trigger mode of scan group x, the AD timer status of scan group x (ADCJnSGSRx.ADTACT) is set to 1 (AD timer operating) after SGx_TRG is input.

For AD timer x operation, see "**Section 43.4.13, Example of A/D Timer Operation**."



Note: x = 3, 4

Figure 43.48 Hardware Trigger Timing (AD Timer x)

43.4.15 Example of Scan Group Stop

This section provides an example of concurrent stop operation of all scan groups (ADCJnADHALTR.HALT) and an example of individual stop operation of each scan group (ADCJnSGSTPCRx.SGSTP).

43.4.15.1 Example of Stopping All Scan Groups (A/D Halt)

When the HALT bit in ADCJnADHALTR is set to 1, all running scan groups are immediately stopped and transitioned to the idle state and the SGACT signal of each scan group are cleared to 0 (by at most 4 register access clocks).

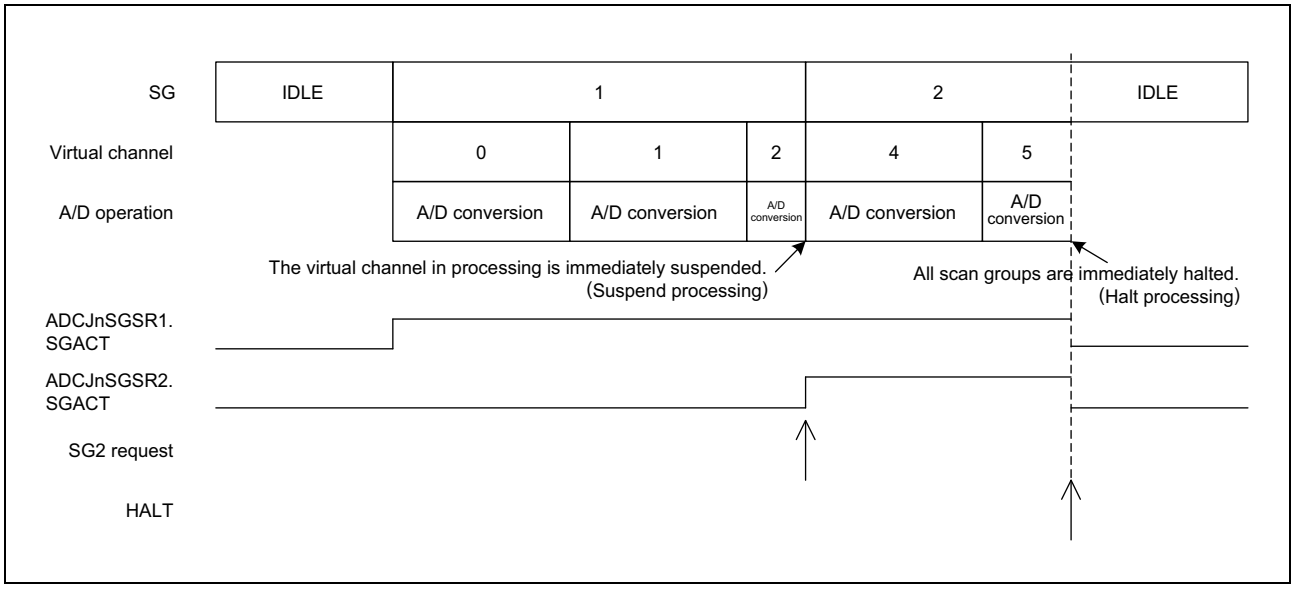


Figure 43.49 Example of Stopping All Scan Groups (Forced Termination)

43.4.15.2 Example of Stopping Scan Group x

When the scan group stop bit (ADCJnSGSTPCRx.SGSTP) is set to 1, the corresponding scan group terminates the processing virtual channel and then enters the idle state and clears the SGACT bit to 0. An example of operation is shown in **Figure 43.50**.

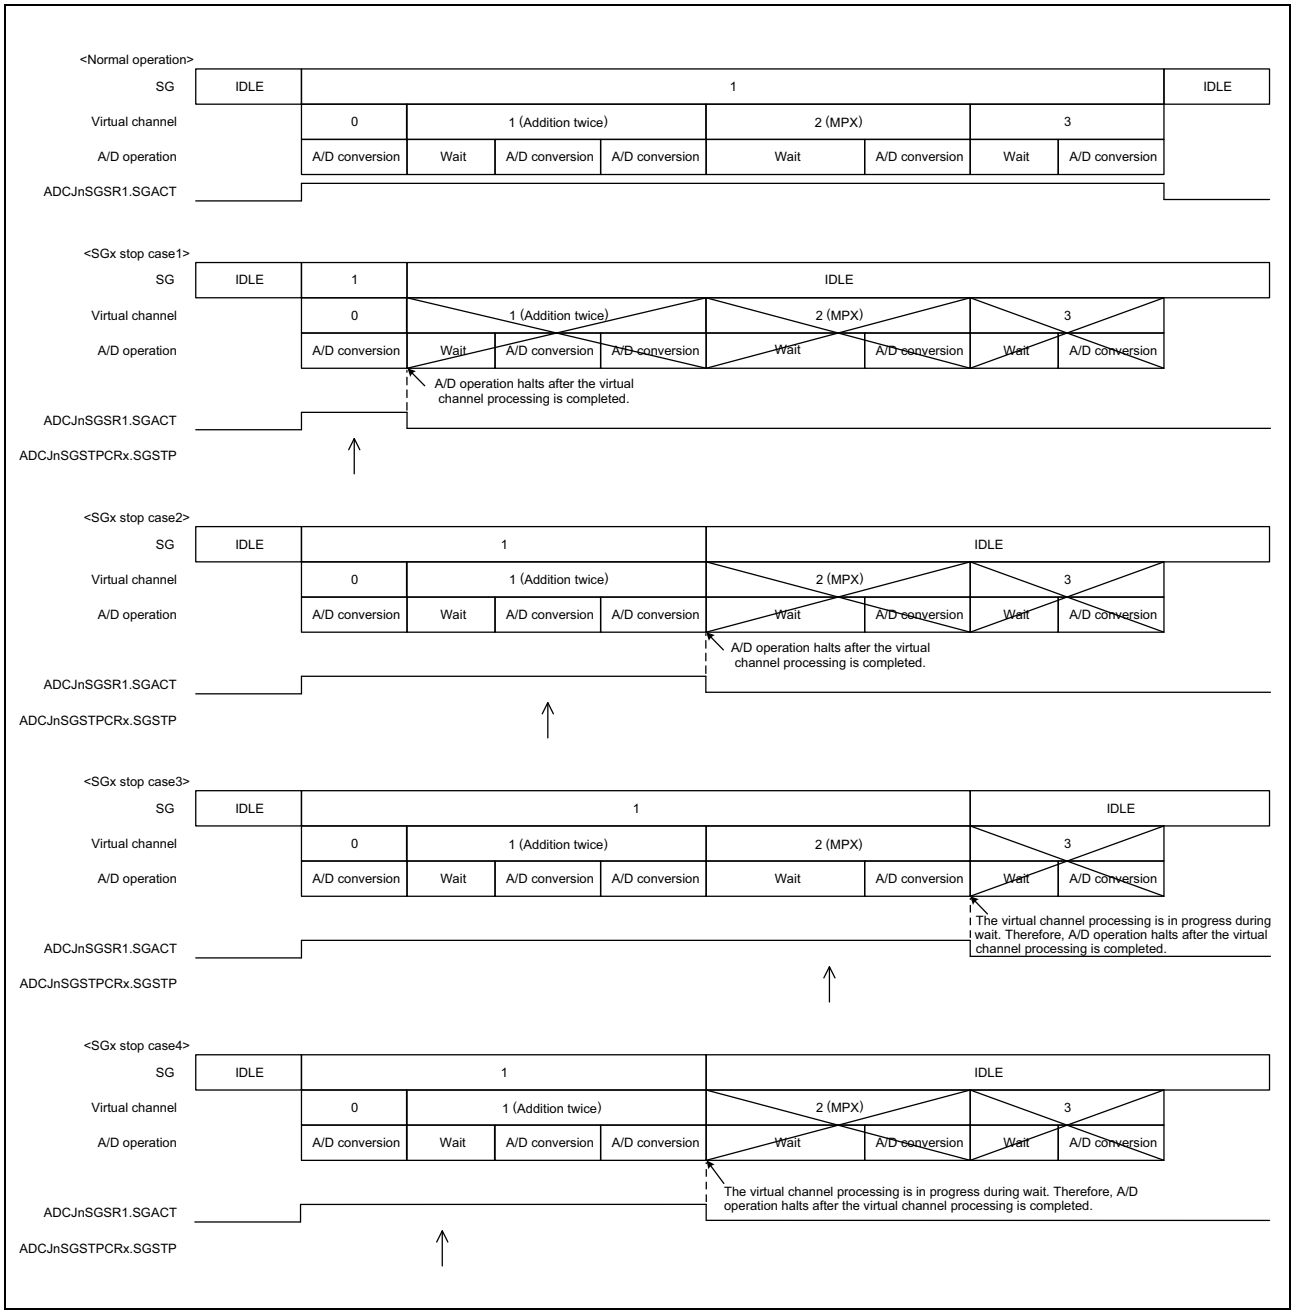

Figure 43.50 Example of Stopping Scan Group x 1

When the scan group stop bit (ADCJnSGSTPCRx.SGSTP) is set to 1 while a scan group applicable to T&H group A is performing T&H hold processing, the T&H hold processing halts after A/D conversion of the first virtual channel is performed.

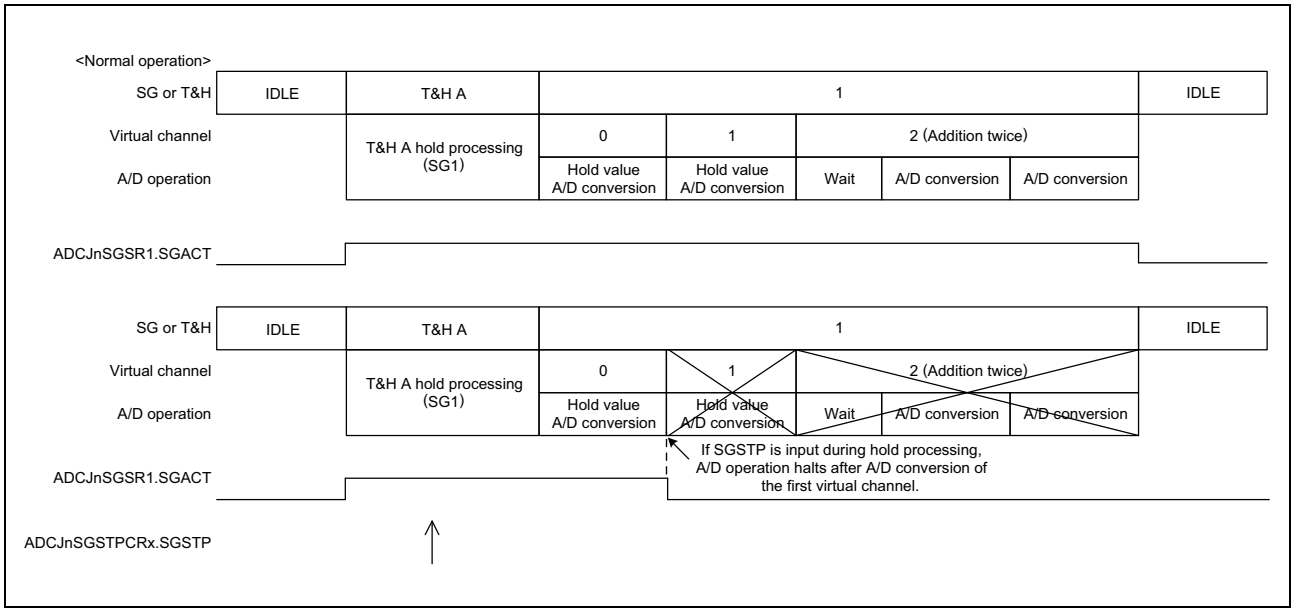

Figure 43.51 Example of Stopping T&H Target Scan Group x 2

When stopping multiple operating scan groups by the SGSTP bit, they halt immediately unless they are in processing (because they are suspended). Scan groups in processing halt after A/D conversion of the virtual channel in processing is completed.

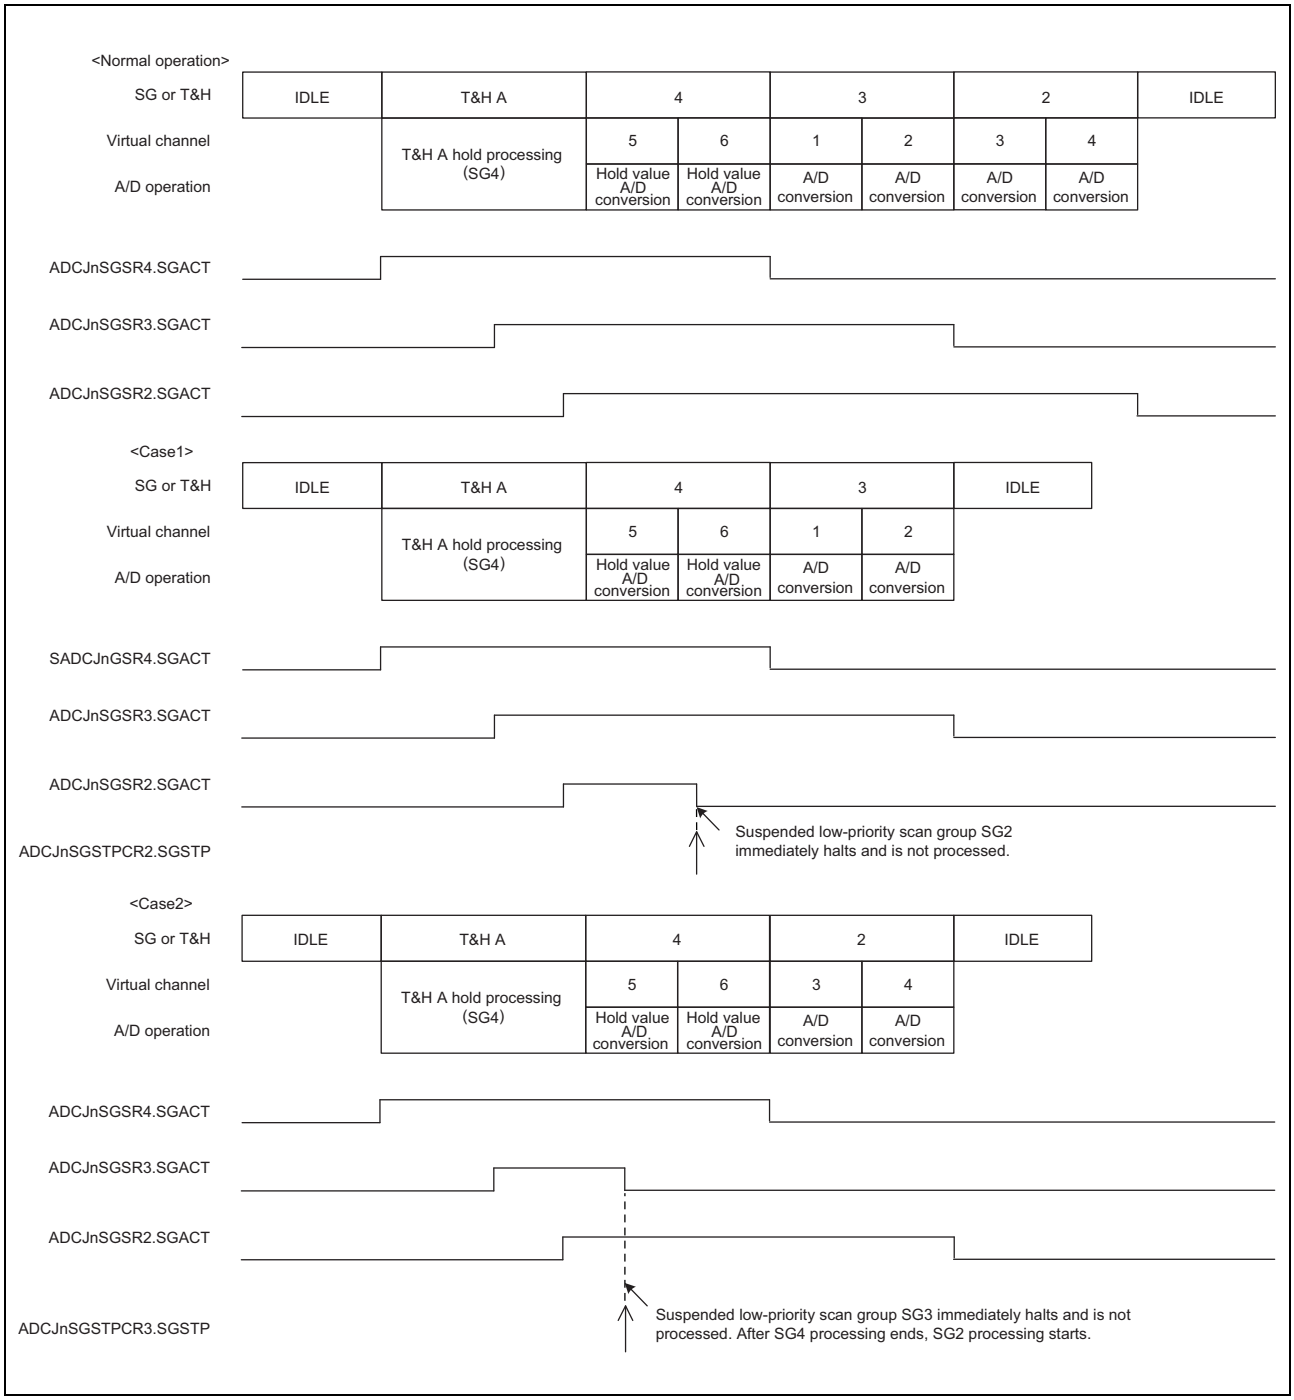

Figure 43.52 Example of Stopping Scan Group x when Multiple Scan Groups Are Operating

After hold processing of T&H that is target of the low priority scan group is executed, when the low priority scan group is stopped by SGSTP during the processing of high priority scan group, the low priority scan group is stopped as follows.

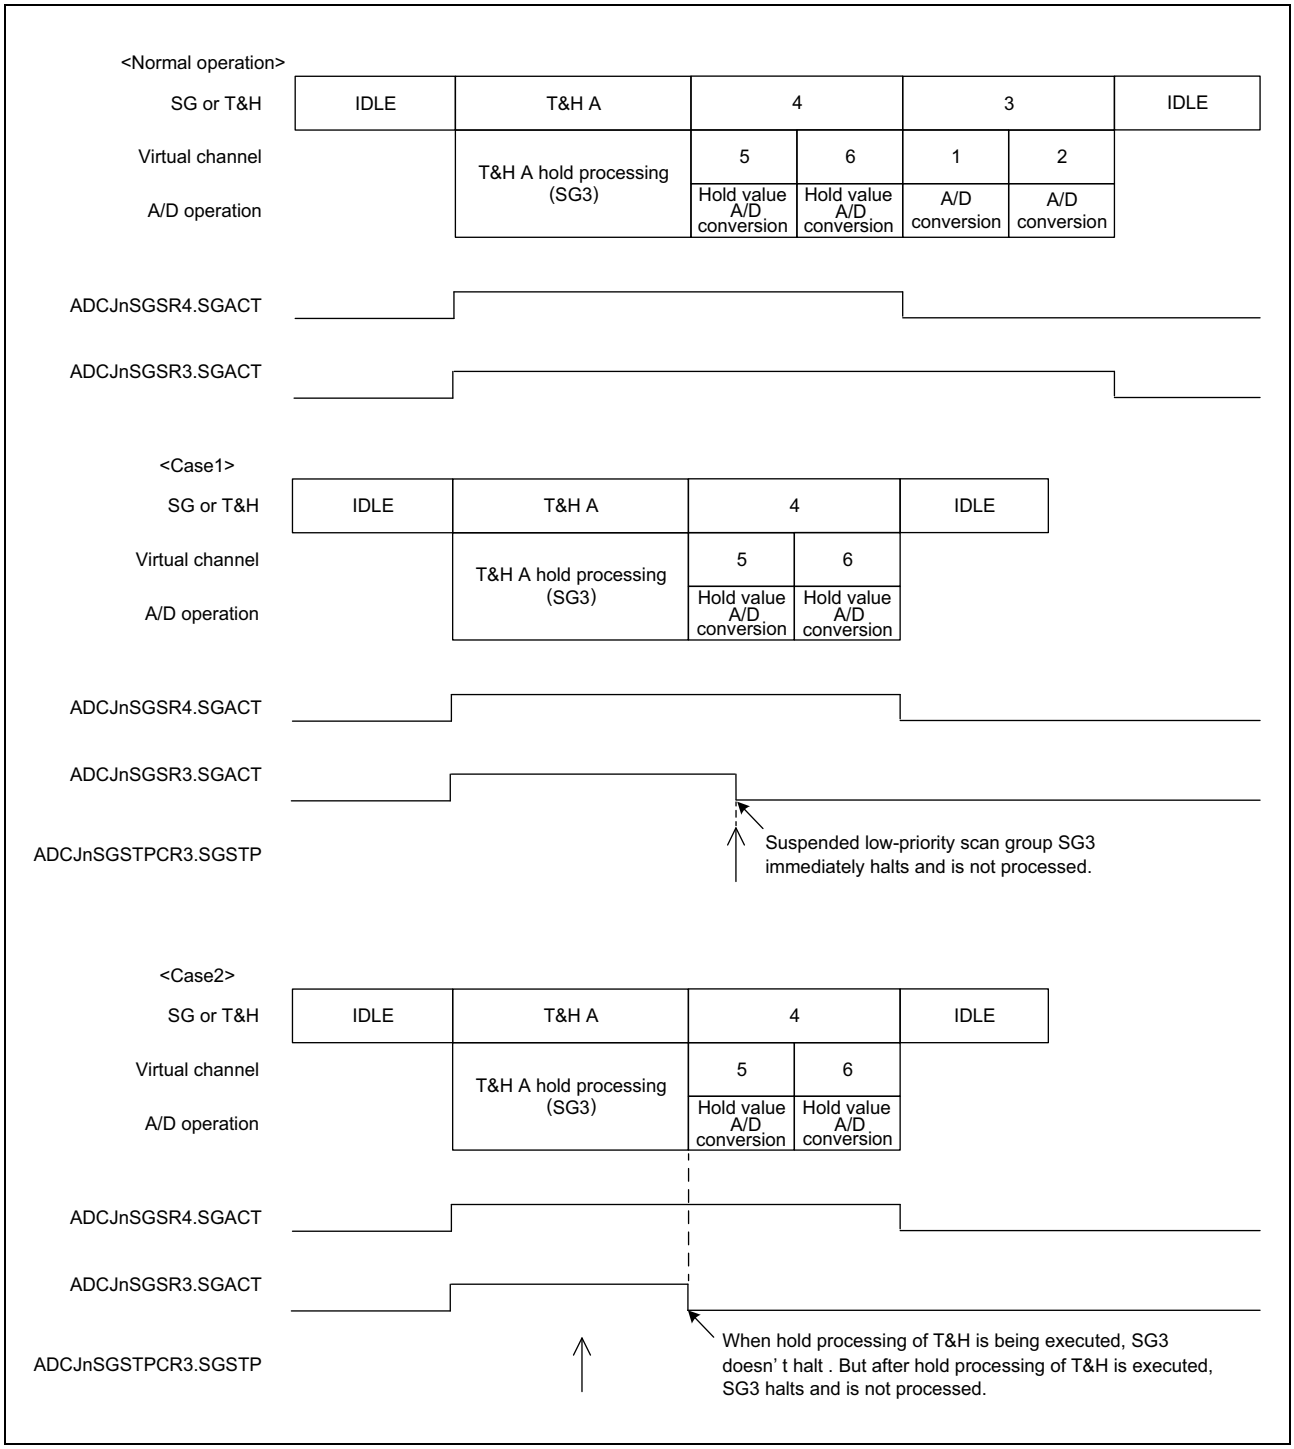

Figure 43.53 Example of Stopping Low Priority Scan Group x after hold processing of T&H is processing

43.4.16 PWM-Diag [Example of PWM-Diag]

The A/D conversion of ADCJ can be started by the request from PWM-Diag. The scan group (SG4) is appropriated for this function. The wait time of PWM-Diag is selected by WTTS in ADCJnPWDVCR. With the PWM-Diag function enabled by PWE in the ADCJnPWDCR register, A/D conversion is performed by the instruction from the PWM-Diag. Therefore, the instruction of A/D conversion for this function must be prepared in the PWM-Diag. At the end of A/D conversion, A/D conversion result is output to PWM-Diag with the data format setting by ADCJnADCR2.DFMT[2:0].
For details, see the PWM-Diag specification.

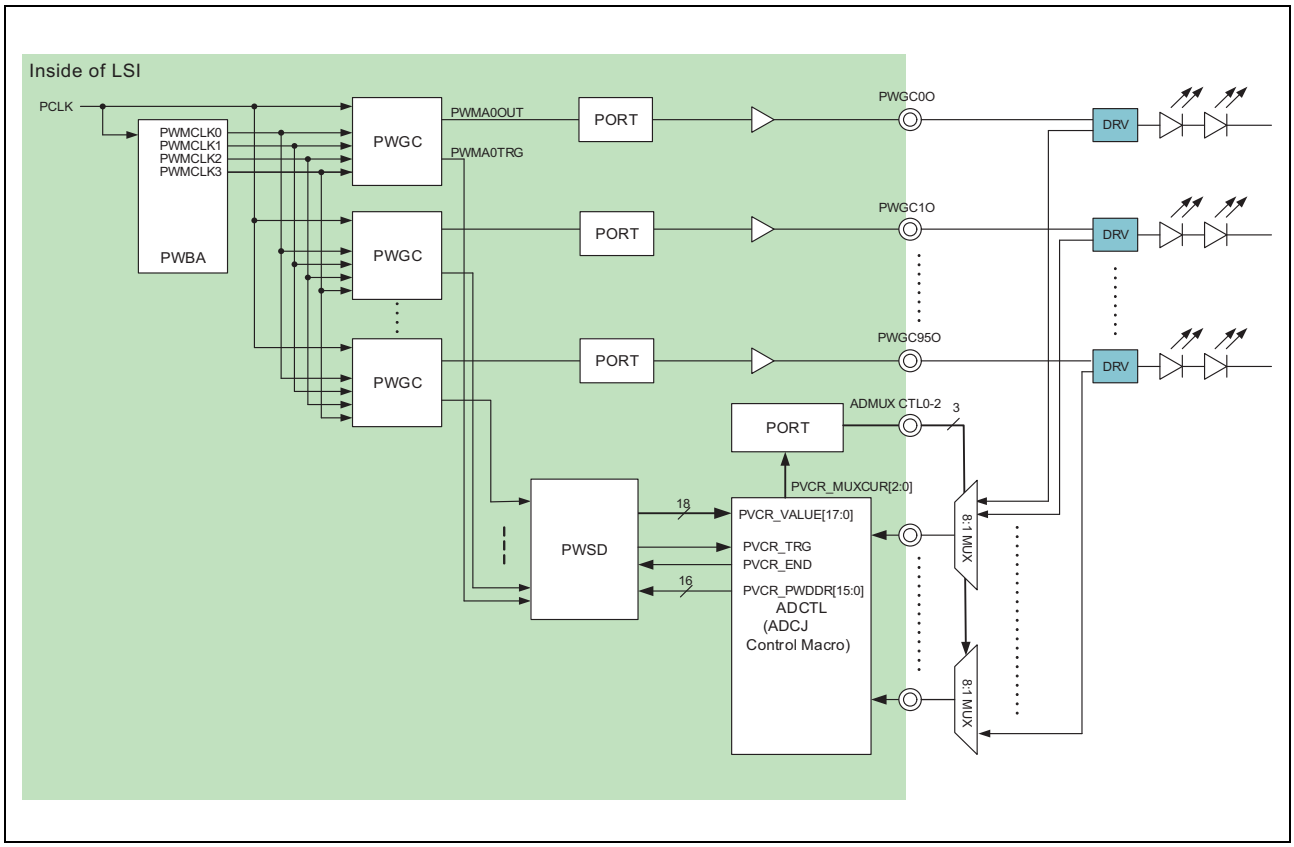

Figure 43.54 PWM-Diag Configuration

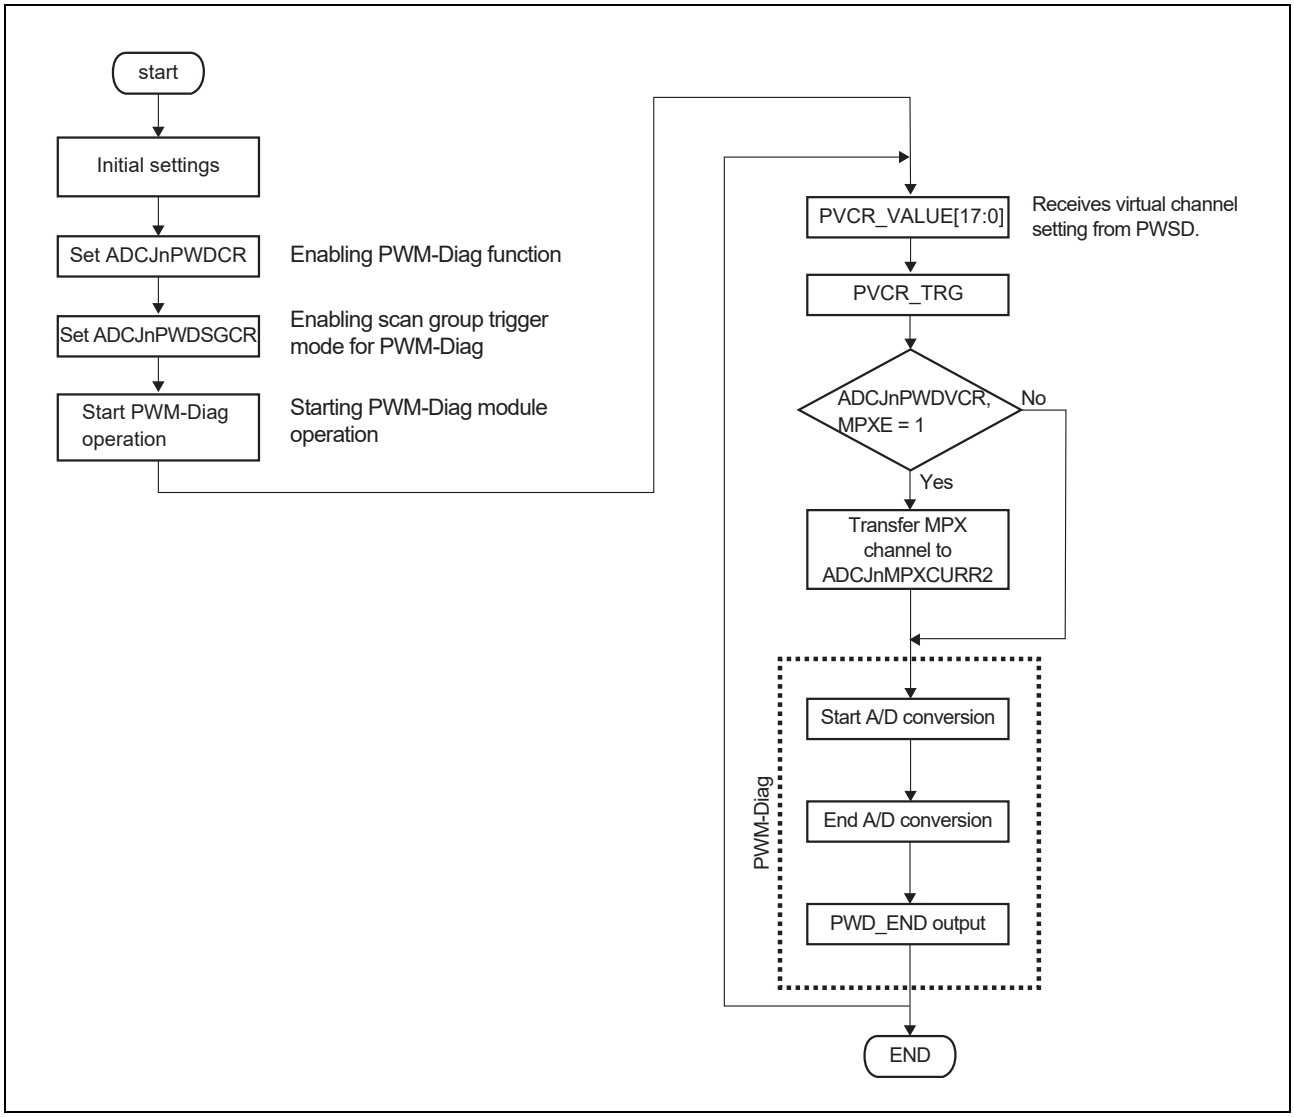

Figure 43.55 PWM-Diag Operation Flow

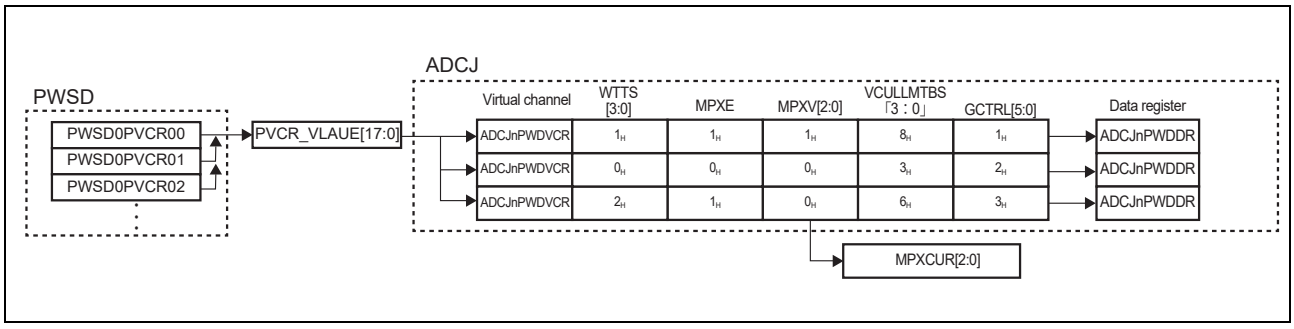

Figure 43.56 Data Transfer and Register Settings

Example 1: Example of operation shown in **Figure 43.56**

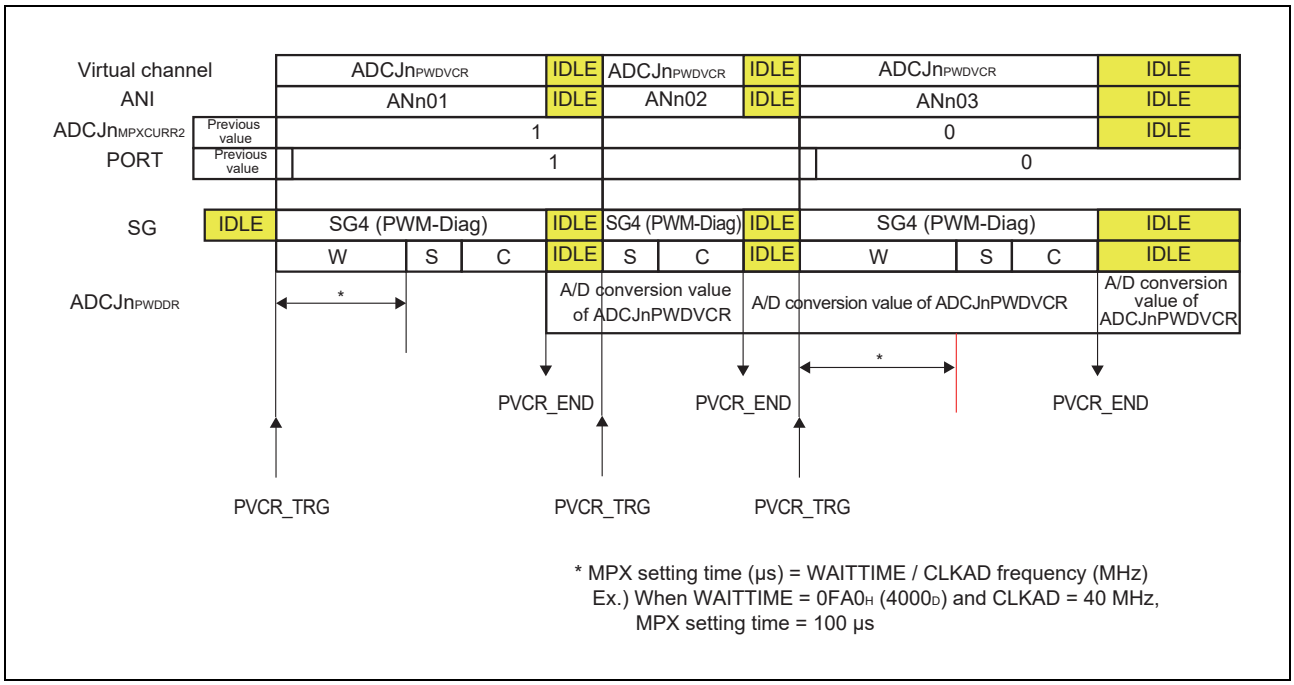

Figure 43.57 PWM-Diag Operation

43.4.17 Example of Suspend and Resume Operation

When a start trigger of a high-priority scan group is accepted during operation of a low-priority scan group, the suspension function suspends the operation of the low-priority scan group and executes the high-priority scan group.

After operation of the high-priority scan group is completed, the suspended low-priority scan group is resumed.

When a start trigger of a low-priority scan group is accepted during operation of a high-priority scan group, operation of the high-priority scan group continues and the low-priority scan group is suspended. After operation of the high-priority scan group is completed, the suspended low-priority scan group is started.

While a scan group is operating or suspended, a start trigger of the same scan group is not accepted.

Three suspension methods are provided.

The priority order of scan groups 0 to 4 is as follows:

Low High

SG0 < SG1 < SG2 < SG3 < SG4 (PWM-Diag*1)

Note 1. When ADCJnPWDCR.PWE = 1, SG4 operates in the PWM-Diag.

43.4.17.1 Example of Synchronous Suspend and Resume Operation

In synchronous suspension, after the A/D conversion operation of a virtual channel in a low priority scan group is completed, the scan group is suspended and then the A/D conversion of a high-priority scan group is started.

Upon completion of the A/D conversion of the high-priority scan group, the low-priority scan group is resumed from the suspended virtual channel.

Figure 43.58 shows an example of synchronous suspend operation.

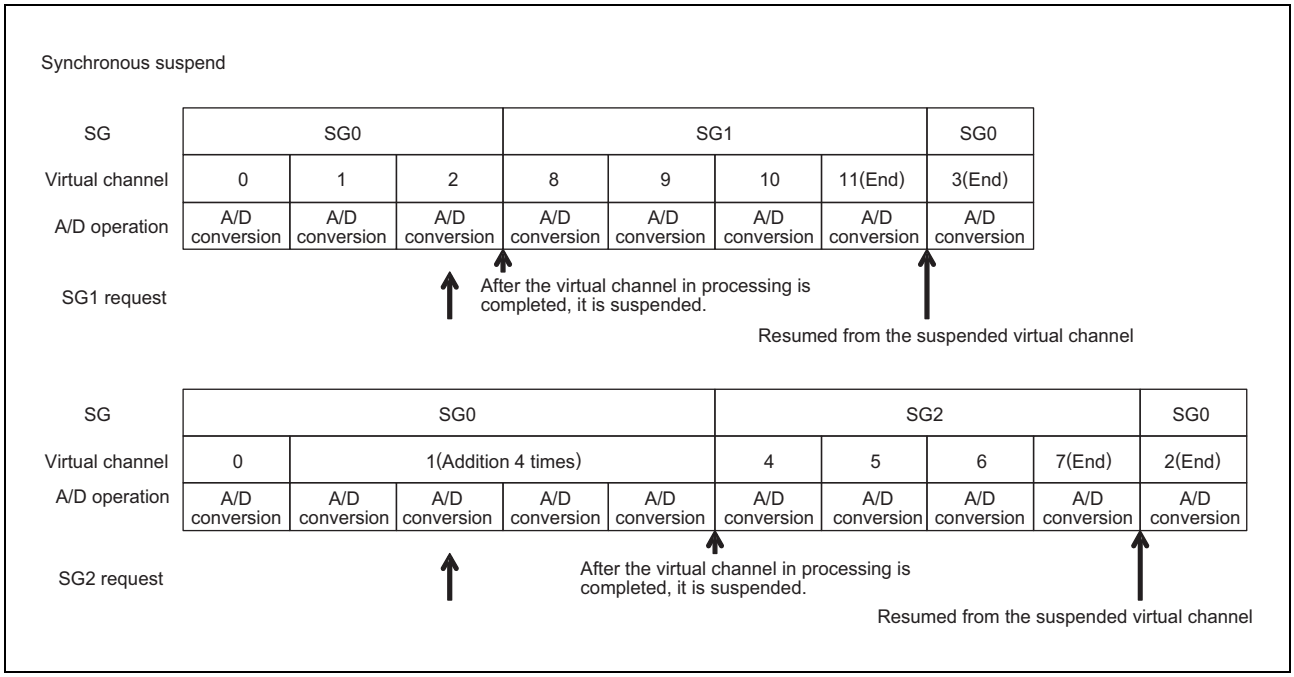

Figure 43.58 Example of Synchronous Suspend and Resume Operation

43.4.17.2 Example of Asynchronous Suspend and Resume Operation

In asynchronous suspension, the A/D conversion operation of a virtual channel in processing is immediately suspended before it is completed and the A/D conversion of a high-priority scan group is started.

Upon completion of the A/D conversion of all virtual channel in the high-priority scan group, the low-priority scan group is resumed from the suspended virtual channel.

Figure 43.59 shows an example of asynchronous suspend operation.

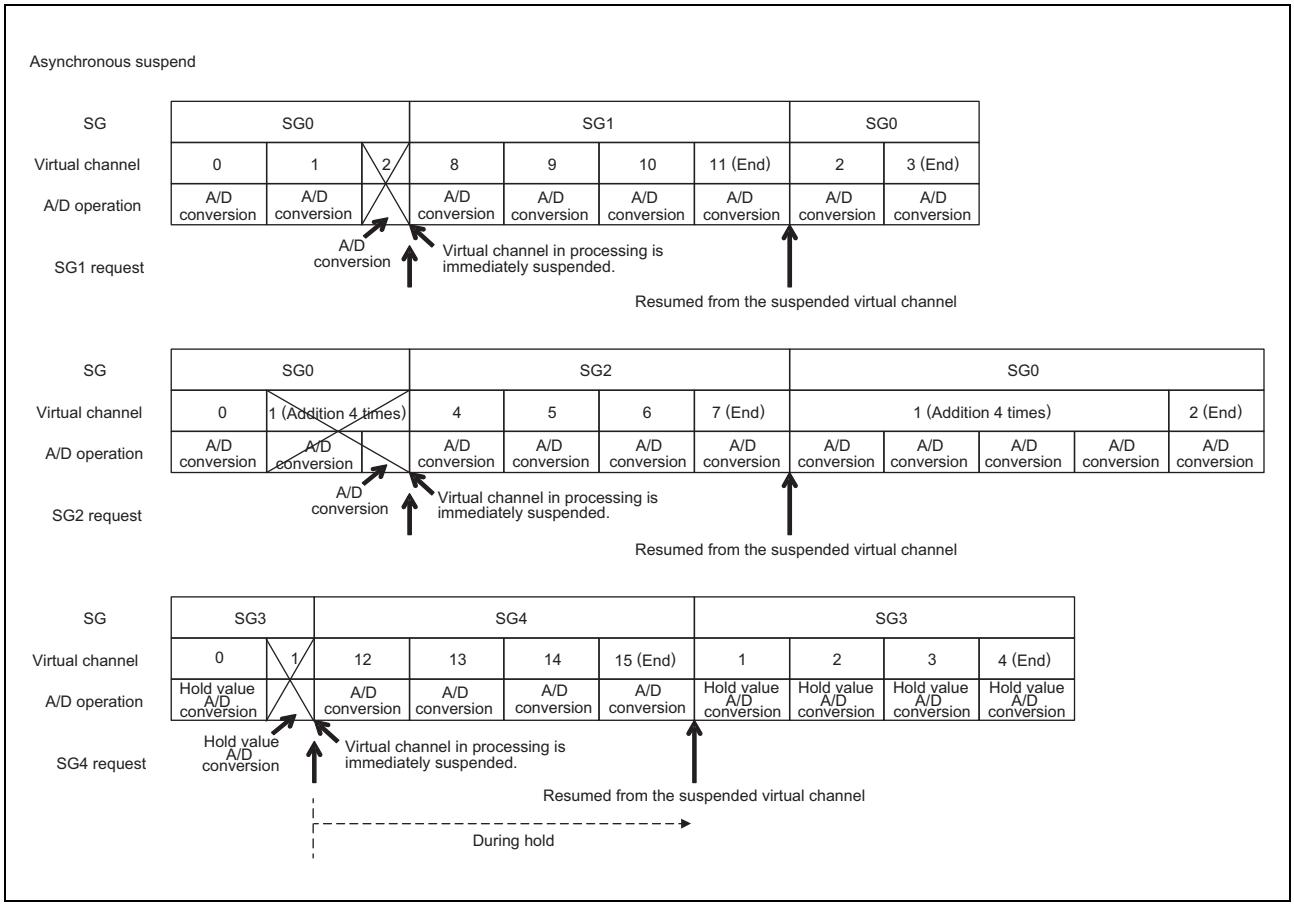

Figure 43.59 Example of Asynchronous Suspend and Resume Operation

43.4.17.3 Synchronous/Asynchronous Mixture Type Suspend

When a high-priority scan group interrupts scan group 0, the asynchronous suspension method is used.

When a high-priority scan group interrupts a scan group other than scan group 0, the synchronous suspension method is used.

Figure 43.60 shows an example of synchronous/asynchronous mixture type suspend operation.

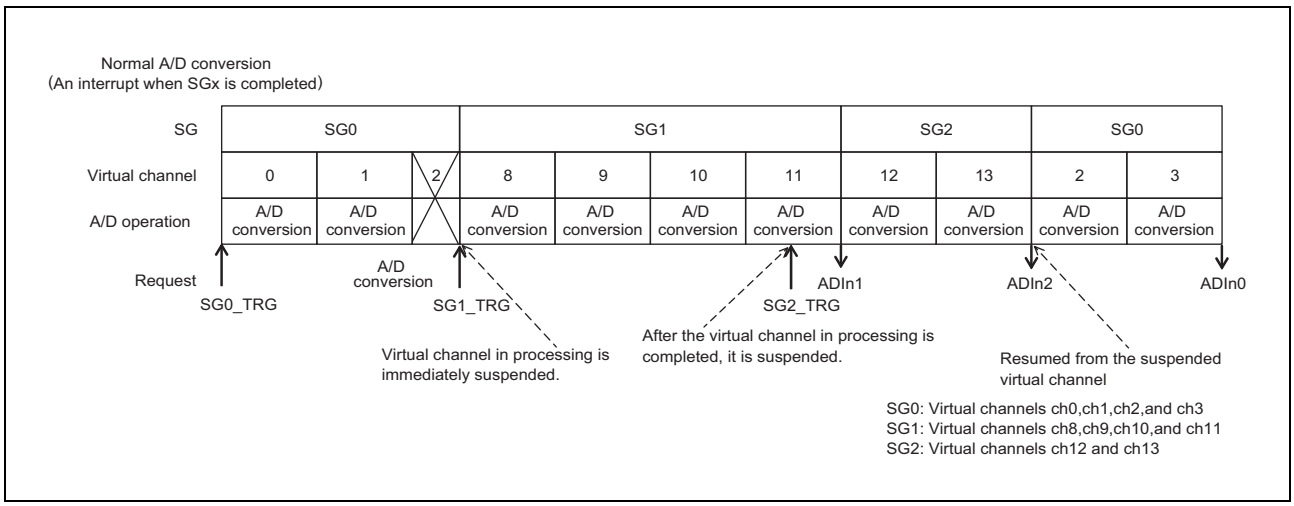

Figure 43.60 Example of Synchronous/Asynchronous Mixture Type Suspend Operation

43.4.18 Example of Track and Hold Operation (T&H)

The T&H processing function performs A/D conversion of multiple analog inputs at the same time. This function is achieved by holding analog input voltages simultaneously in up to four T&H circuits and then performing A/D conversion of outputs from the T&H circuits.

There is 1 group (T&H group A) for T&H processing. T&H sampling is activated by a software trigger for this group. T&H hold is activated by either software trigger or hardware trigger. The hardware trigger (sgx_trg) that activates scan groups also activates T&H hold.
Therefore, select a scan group to be a target of T&H group A from ADCJnTHACR.SGS[1:0]. Scan group 0 cannot be a target of T&H processing.

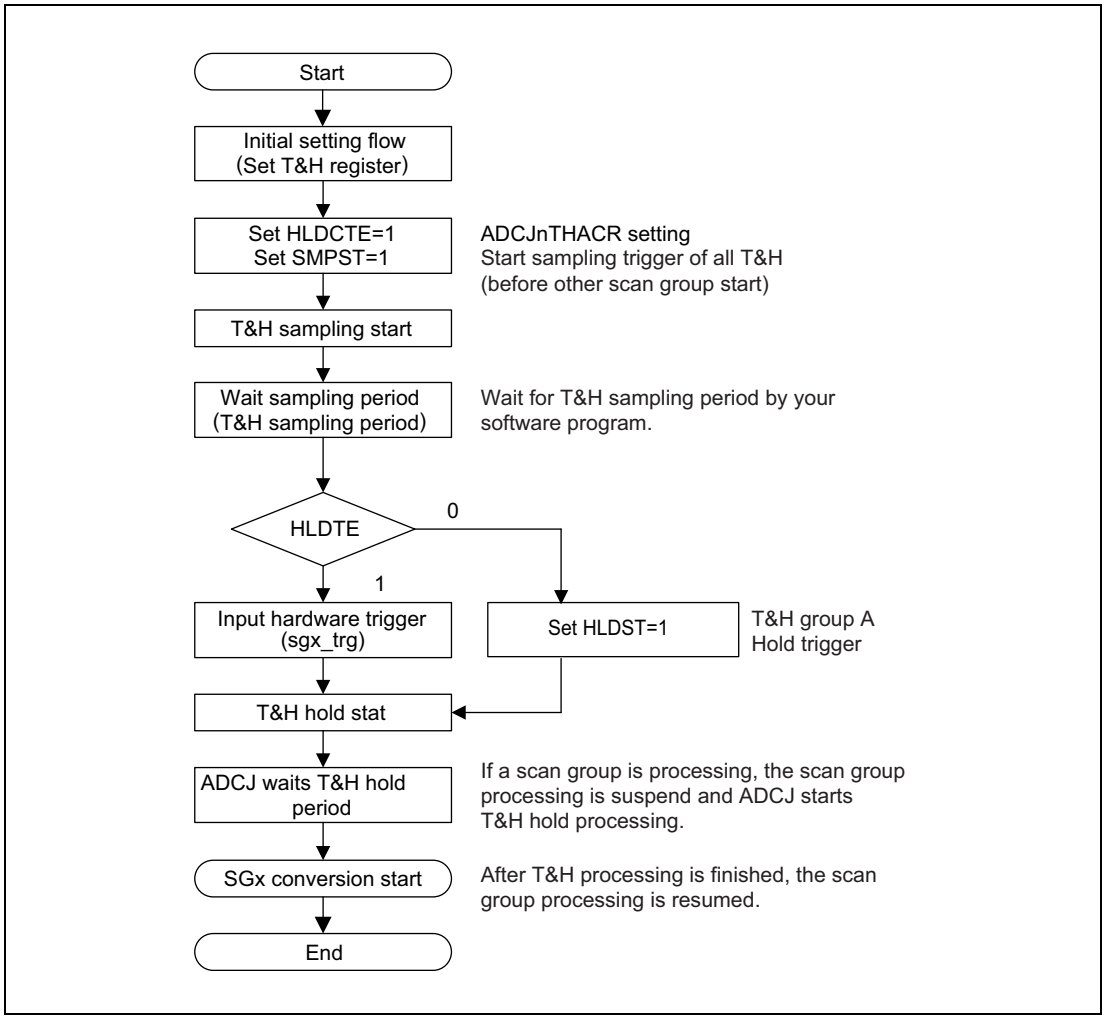

Figure 43.61 Recommended T&H Operation Flow

1. Set the T&H register according to the initial setting flow "**Section 43.4.1.1, Initial Setting Procedure**".
2. When using T&H group A in SG1/SG2 after initial settings have been completed, start T&H sampling and hold processing according to "**Section 43.4.2.2, SG1/SG2 Startup Flow**". When using T&H group A in SG3/SG4, start T&H sampling and hold processing according to "**Section 43.4.2.3, SG3/SG4 Startup Flow**".
3. After the T&H hold processing has been completed, perform A/D conversion.

CAUTIONS

1. **When using T&H, set ADCJnADCR1.SUSMTD[1:0] to 2_H. Other settings are prohibited.**
2. **Set ADCJnSGCRx.TRGMD of T&H target scan groups to 1_H. Other settings are prohibited.**
3. **When using T&H, select multicycle scan mode (ADCJnSGCRx.SCANMD = 0_H) for T&H target scan groups, and specify a single scan count (ADCJnSGMCYCRx.MCYC[7:0] = 0_H). Settings other than this combination are prohibited.**

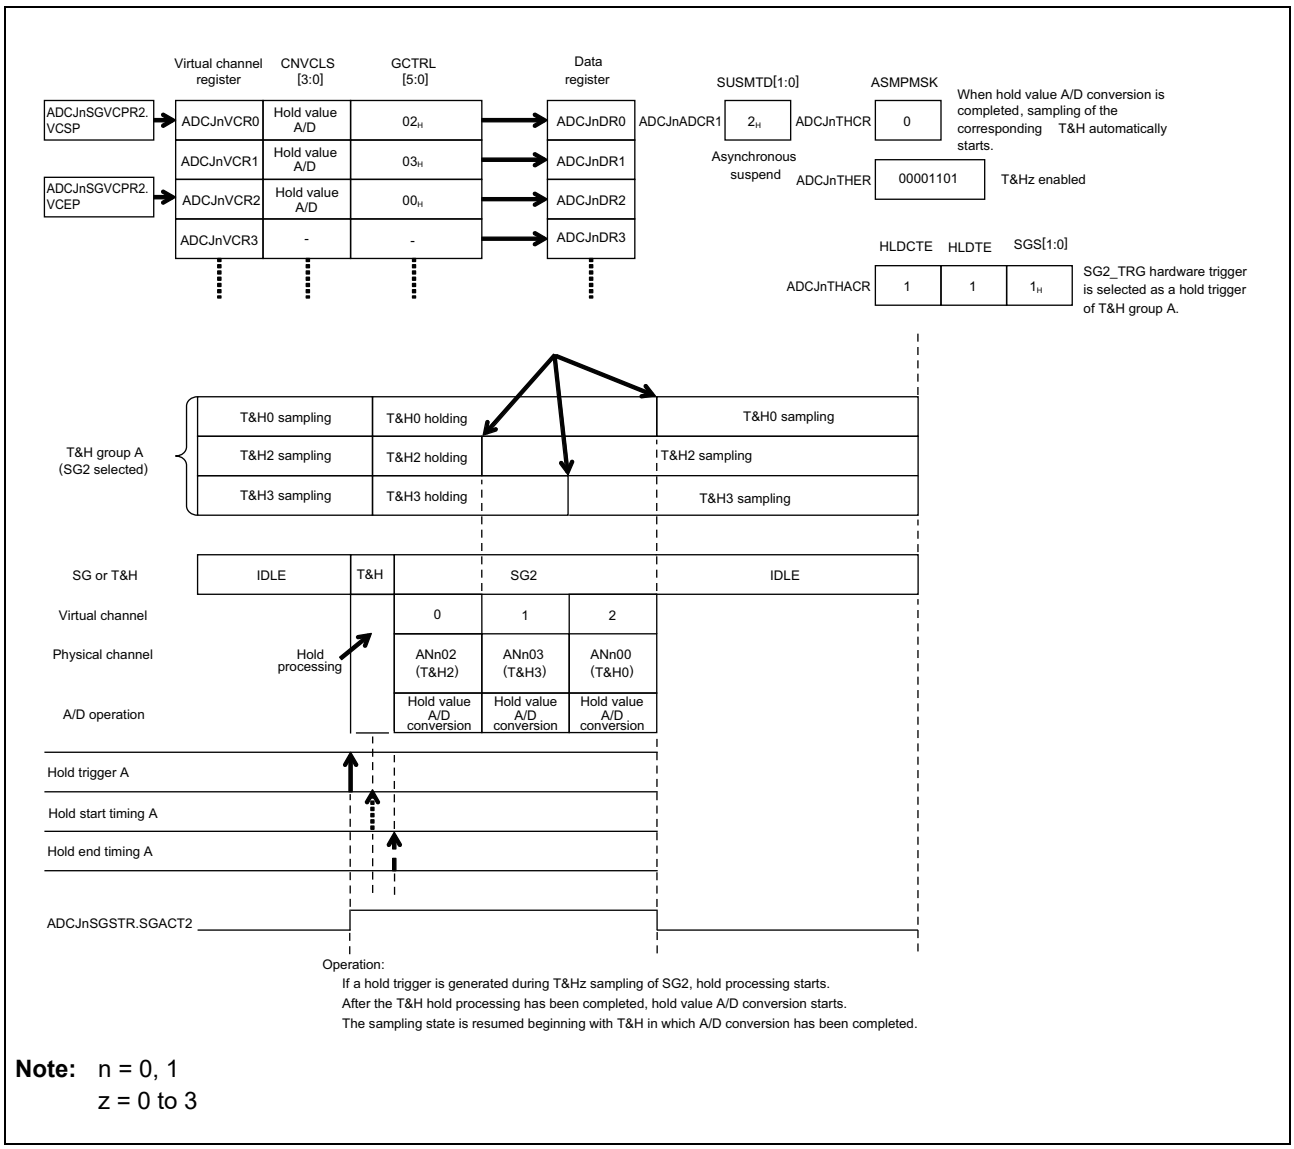
[Asynchronous suspend operation by T&H]

When starting T&H hold processing during scan group processing, T&H hold processing is started after suspension without waiting until the A/D conversion operation of the scan group is completed. After the T&H hold processing is completed, A/D conversion of the highest-priority scan group is resumed.

For details of operation, see Case1 to Case6 below.

- Case1: Using single scan group
- Case2: Asynchronously suspended by T&H hold trigger
- Case3: A trigger of high-priority scan group is input during T&H hold processing

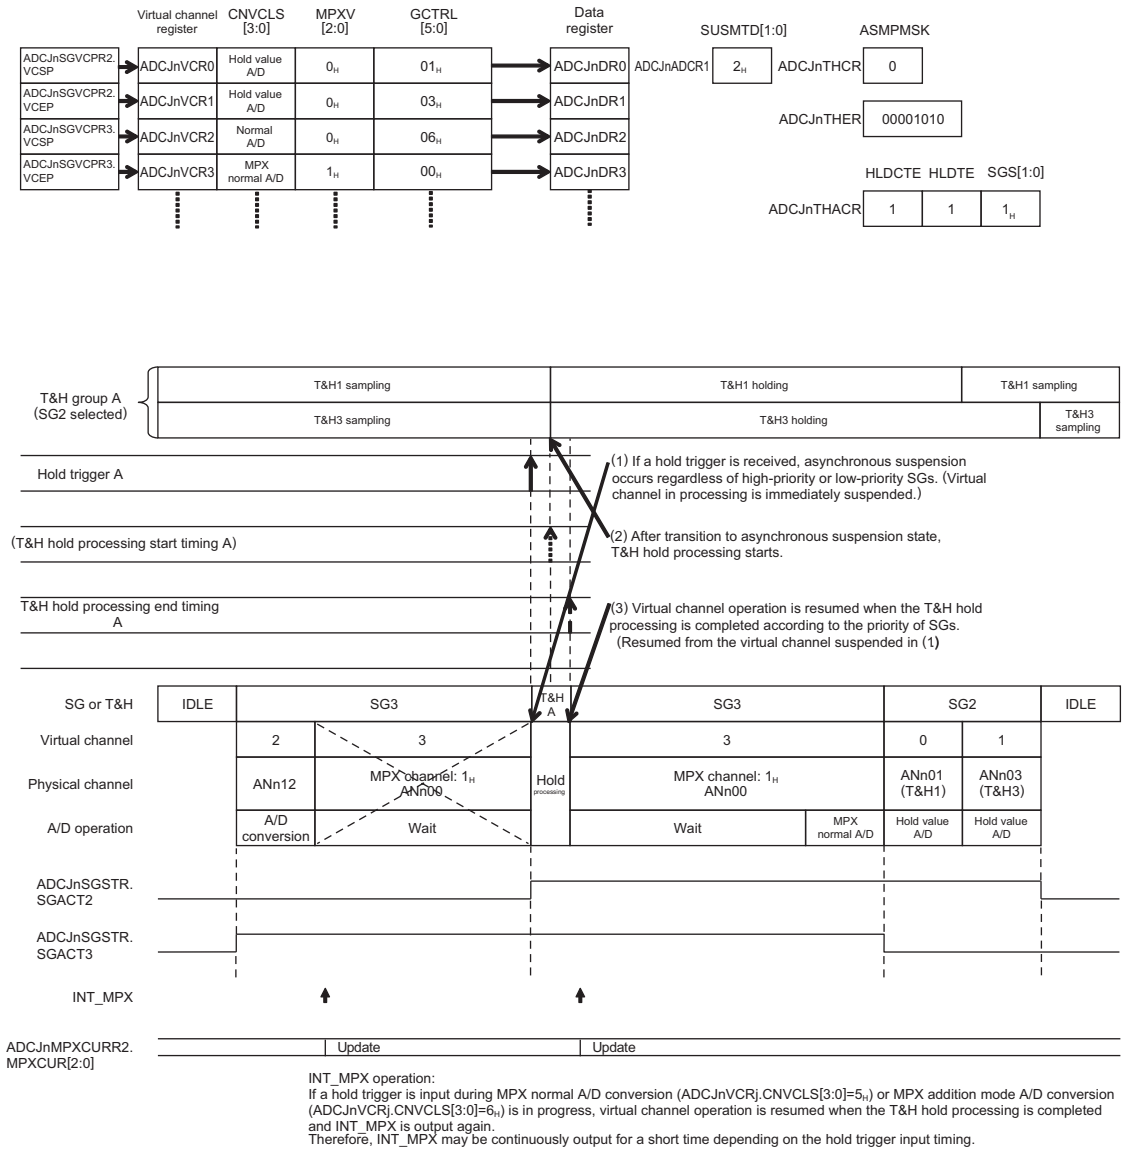
(1) Case1 Using a single group



Note: n = 0, 1
z = 0 to 3

Figure 43.62 Example of Track and Hold Processing (T&H Control / Case1)

(2) Case2 Asynchronously suspended by T&H hold trigger



Note: This example shows suspend and resume operation when a hold trigger is generated during the wait period. The same operation is performed when a hold trigger is generated during A/D conversion of other conversion types. Example: When a hold trigger is generated during addition mode A/D conversion, A/D conversion is resumed from the virtual channel suspended by the hold trigger (first addition) in the resume operation.

Note: n = 0, 1

Figure 43.63 Example of Track and Hold Processing (T&H Control / Case 2)

(3) Case3 A trigger of high-priority scan group is input during T&H hold processing

When a scan group is activated during the T&H hold processing, all scan groups are suspended until the T&H hold processing is completed. After the T&H hold processing has been completed, processing of the high-priority scan group is resumed.

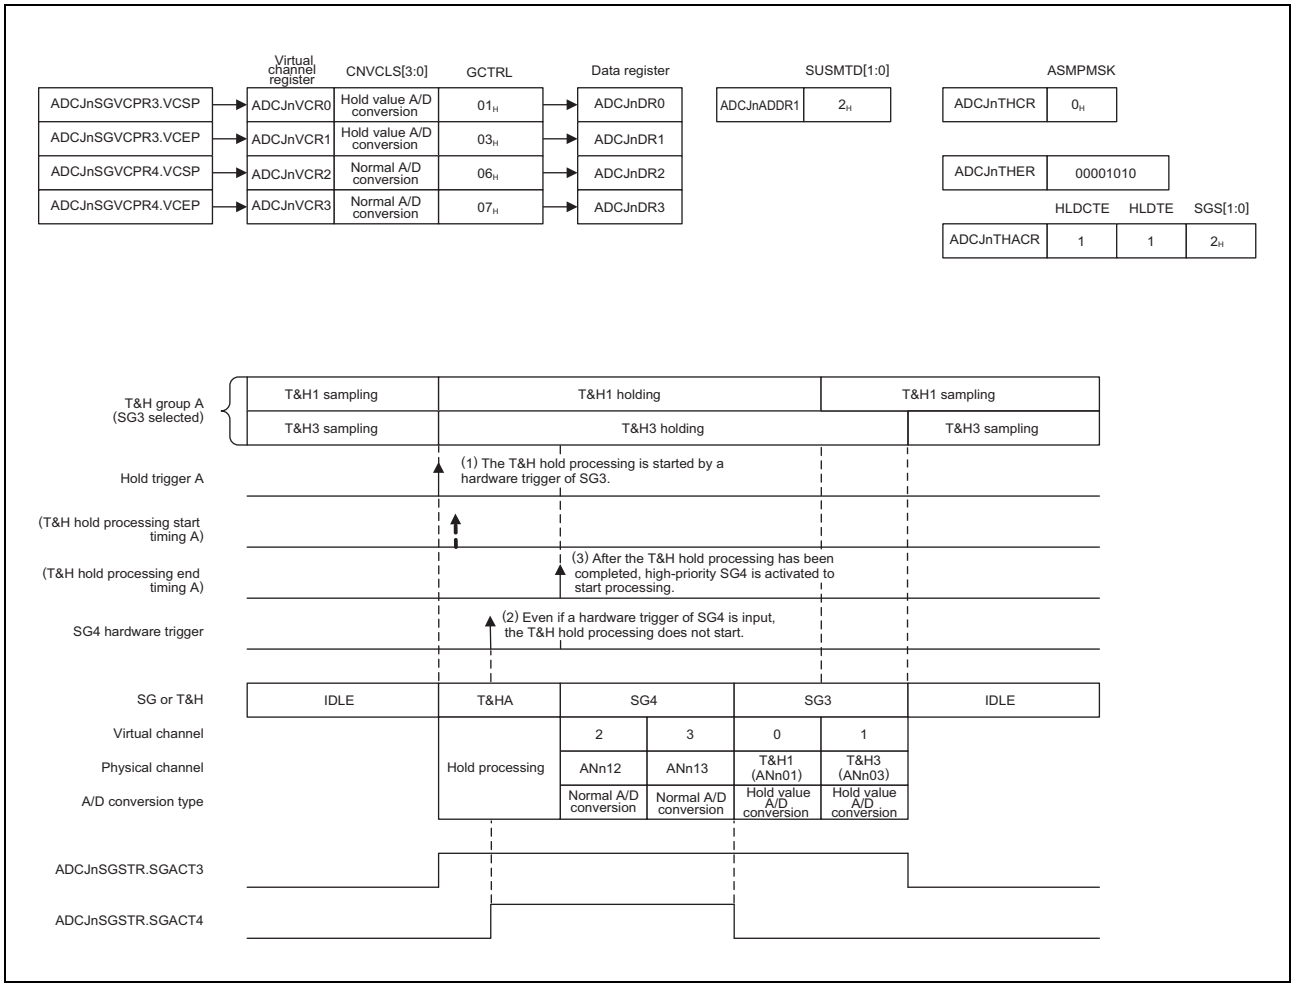


Figure 43.64 Example of Track and Hold Processing (T&H Control / Case 3)

43.4.19 Interrupt Request Functions

Interrupts of this IP include scan end interrupt, A/D error interrupt, upper/lower limit check interrupt (INT_UL), overwrite error interrupt, ID error interrupt, trigger overlap check error interrupt, parity error interrupt, and MPX interrupt.

43.4.19.1 Scan End Interrupt Request

(1) INT_ADx Interrupt Request

The ADCJ generates a scan end interrupt request (INT_ADx) at the end of scan group x*1 and at the end of ADCJnVCRj.

The scan end interrupt can activate the DMAC and DTS.

The INT_ADx output enable/disable setting is made by the following bits.

- Scan end interrupt enable bit (ADCJnSGCRx.ADIE) of scan group x
- Virtual channel end interrupt enable bit (ADCJnVCRj.ADIE) of the virtual channel register n

Table 43.87 INT_ADx Generation Enable/Disable Settings

ADCJnSGCRx.ADIE	ADCJnVCRj.ADIE	INT_ADx Output	Interrupt Request Generation Condition
0	0	Disabled	—
0	1	Enabled	At the end of A/D conversion of virtual channel n
1	0	Enabled	At the end of scan group x*1
1	1	Enabled	At the end of scan group x*1 or at the end of A/D conversion of virtual channel n

Note 1. When A/D conversion of the virtual channel specified by the scan group x virtual channel pointer register (ADCJnSGVCPRx.VCEP[5:0]) is completed

The INT_ADx signal is generated when the A/D conversion result is stored in the data register (ADCJnDRj).

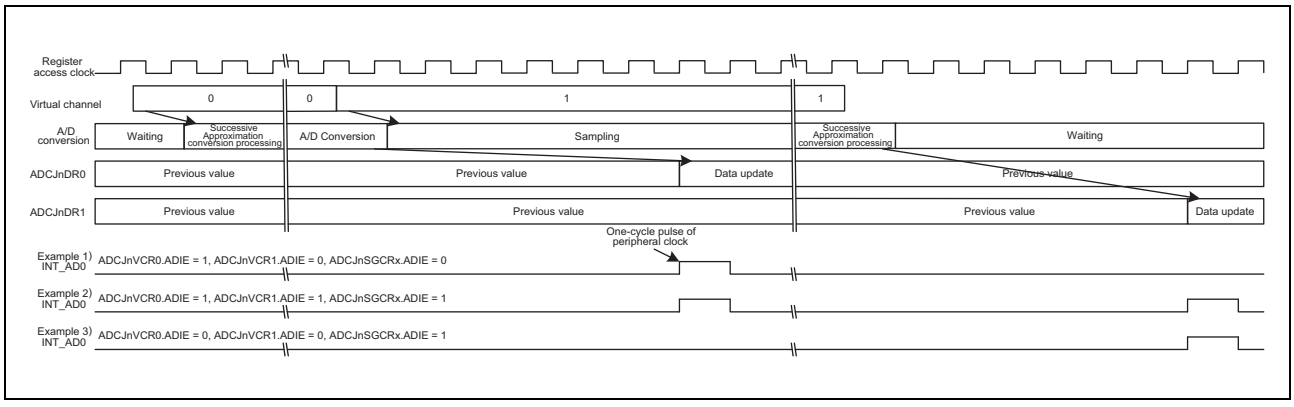

Figure 43.65 Example of Multicycle Scan Mode Operation

43.4.19.2 A/D Error Interrupt Request (INT_ADE)

When AD errors occur, the ADCJ generates an AD error interrupt (INT_ADE).

The generate timing of AD error interrupt is the same as the scan end interrupt generate timing except for trigger overlap check error.

After an interrupt occurs, clear the error status in the interrupt handler.

AD error interrupt is generated with all error factor that is set error interrupt enable bit of safety control register (ADCJnSFTCR) to valid as **Table 43.88**.

Table 43.88 INT_ADE Output Enable/Disable Settings

ADCJnSFTCR			INT_ADE	Interrupt Request Generation Condition
TOCEIE	OWEIE	IDEIE		
0	0	0	Disabled	—
1	*	*	Enabled	Trigger overlap check error
*	1	*	Enabled	Overwrite error
*	*	1	Enabled	ID error

Error status information is stored in the relevant error register.

When a trigger overlap check error is detected, a value of 1 is stored in the bit corresponding to the error scan group.

When an overwrite error are detected, a value of 1 is stored in the error bits and the virtual channel number in which the error occurred is stored in the capture bit.

When an ID error is detected, a value of 0 is stored in IDEF in the data supplementary information register (ADCJnDIRj or ADCJnPWDDIR) corresponding to the virtual channel (ADCJnVCRj or ADCJnPWDVCR) in which the ID error was detected. When no ID error is detected, a value of 1 is stored. Furthermore, when an ID error is detected, a value of 1 is stored in the error bit in the ID error register (ADCJnIDER) and the virtual channel number in which an ID error was detected first is stored in the capture bit.

Error status information except for ADCJnDIRj.IDEF and ADCJnPWDDIR.IDEF is retained until the flag bit of the corresponding error is cleared by the error clear register. Information ADCJnDIRj.IDEF and ADCJnPWDDIR.IDEF is retained until the flag bit of the corresponding error is read with the read and clear enable bit (RDCLRE) set to 1.

If the same error occurs again with the error remaining, the subsequent error information is discarded. However, if the interrupt enable bit is set to 1, an AD error interrupt is output even a subsequent error occurs.

Table 43.89 INT_ADE Error Source Registers

Error Name	Error Register		Error Clear Register
	Flag Bit	Capture Bit	Clear Bit
Trigger overlap check error	SG0 : ADCJnTOCER.TOCESG[0]	None	SG0 : ADCJnECR.TOCESGC[0]
Trigger overlap check error	SG1 : ADCJnTOCER.TOCESG[1]	None	SG1 : ADCJnECR.TOCESGC[1]
Trigger overlap check error	SG2 : ADCJnTOCER.TOCESG[2]	None	SG2 : ADCJnECR.TOCESGC[2]
Trigger overlap check error	SG3 : ADCJnTOCER.TOCESG[3]	None	SG3 : ADCJnECR.TOCESGC[3]
Trigger overlap check error	SG4 : ADCJnTOCER.TOCESG[4]	None	SG4 : ADCJnECR.TOCESGC[4]
Overwrite error	ADCJnOWER.OWE	ADCJnOWER.OWECAP[5:0]	ADCJnECR.OWEC
ID error	ADCJnDIRj.IDEF	None	None*1
ID error	ADCJnPWDDIR.IDEF	None	None*1
ID error	ADCJnIDER.IDE	ADCJnIDER.IDECAP[5:0]	ADCJnECR.IDEC

Note 1. When the data supplementary information registers (ADCJnDIRj, ADCJnPWDDIR) is read with RDCLRE being set 1, the register is cleared to 0.

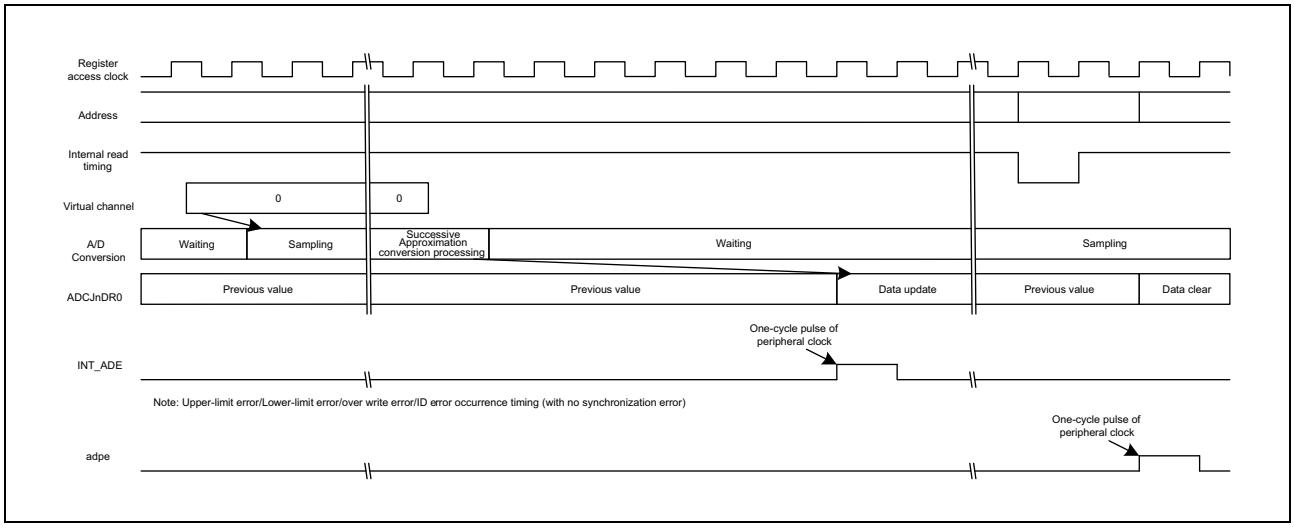

Figure 43.66 A/D Error Interrupt and Parity Error Interrupt Timing

(1) Trigger Overlap Check Interrupt Request

The trigger overlap check function is one of the generation factor of A/D error interrupt request.

When a startup trigger of the same scan group is enabled during scan group operation (ADCJnSGSRx.SGACT = 1), an A/D error interrupt request due to trigger overlap check is output.

When an A/D error interrupt occurs, reading the trigger overlap check error status register (ADCJnTOCER) makes it possible to check scan groups in which a trigger overlap check error occurred.

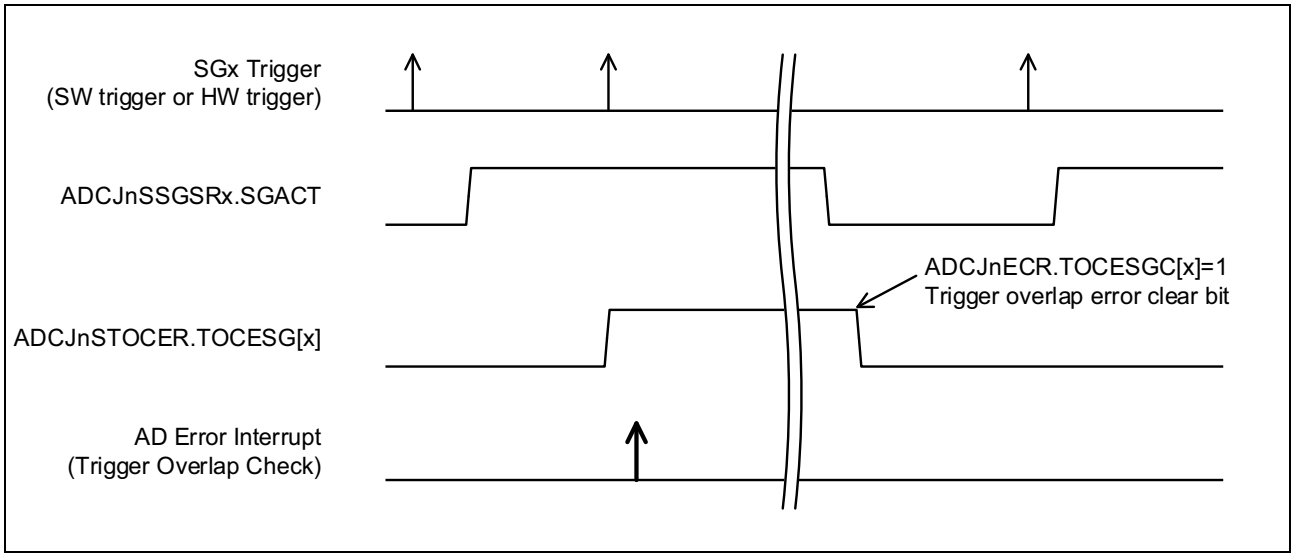

Figure 43.67 Trigger Overlap Check Error Interrupt Request

(2) Overwrite Error

This error indicates that a new A/D conversion result has been overwritten before the data register (ADCJnDRj) is read.

If a new A/D conversion result is stored in the relevant data register (ADCJnDRj) when the write flag (ADCJnDIRj.WFLAG) in the data supplementary information register = 1, an overwrite error is detected.

(3) ID Error

When data is stored in each channel's Data Supplementary Information Register (ADCJnDIRj, ADCJnPWDDIR), ID error is detected when there is inconsistency between feedback signal of I/O buffer/RRAMP/Track and Hold circuit and internal state of ADCJ.

ID error shows that operation failures occurred in the internal analog switch control of I/O buffer/ RRAMP/T&H circuit.

The ID error detection result is stored in the ID error bit in the data supplementary information registers (ADCJnDIRj, ADCJnPWDDIR) of the virtual channel in which an ID error was detected.

Furthermore, the virtual channel number in which an ID error was detected first and ID error information are stored in the ID error register (ADCJnIDER).

43.4.19.3 Parity Error Interrupt Request

When a parity error occurs, the ADCJ can generate a parity error notification (adpe) to the ECM. Parity of ADCJ is even parity. Parity error notification is generated when parity error occurs and when parity error interrupt enable bit of safety control register (ADCJnSFTCR.PEIE) is set to 1. Parity error is detected by the following procedure of **(1)**, **(2)** in ADCJ.

(1) When A/D conversion result is stored, a parity is generated for target bit of data supplementary information registers. After that, the result is stored in parity bit (ADCJnDIRj.PRTY). **Table 43.90** shows the parity target bits of each data supplementary information register.

Table 43.90 Parity Error Target Bits

Parity Bits in Data Supplementary Information Registers	Bits in Data Supplementary Information Registers				A/D Conversion Value	
	MPXE	MPXV[2:0]	ID[5:0]	IDEF	ADCJnDRj.DRj[15:0]	ADCJnPWDDR.PWDDR[15:0]
ADCJnDIRj.PRTY	√*1	√*1	√	√	√	–
ADCJnPWDDIR.PRTY	√*1	√*1	√	√	–	√

Note: √: Applicable, –: Inapplicable

Note 1. MPXE and MPXV[2:0] are target of the parity check only when MPX normal A/D conversion and MPX addition A/D conversion are executed.

(2) When the data register (ADCJnDRj or ADCJnPWDDR) or the data supplementary information register (ADCJnDIRj or ADCJnPWDDIR) is read, the parity check is executed. Parity error is output when this parity check result is abnormal.

The error status information is stored in the parity error register (ADCJnPER).
When a parity error is detected, the parity error flag bit (ADCJnPER.PE) is set to 1 and the number of the virtual channel j in which the parity error occurred is stored in the parity error capture bits (ADCJnPER.PECAP[5:0]).

The error status information is cleared by writing 1 to the parity error clear bit (ADCJnECR.PEC) in the error clear register.

If other virtual channel's parity error occurs without clearing the error, this parity error information is discarded. However, when the parity error interrupt enable bit is set to 1, a parity error notification is output to the ECM also when this parity error occurs.

CAUTION

After the register bits that shows in Table 43.91 are changed after storing A/D conversion result, if data register or data supplementary register is read, pseudo parity error may occur.

Table 43.91 The register bit that causes pseudo parity error and several example settings

Target register bit	Several Example Settings	
	Value Setting	Setting Explanation
ADCJnVCRj.CNVCLS[3:0]	$4_H \Rightarrow 0_H$	Change from addition mode to normal mode
ADCJnADCR2.ADDNT	$1_B \Rightarrow 0_B$	Change from 4 times addition to 2 times addition
ADCJnODCR.WADDE	$1_B \Rightarrow 0_B$	Change from addition mode of wiring-break detection to normal mode of wiring-break detection

43.4.19.4 MPX Interrupt Request

The ADCJ can generate an MPX interrupt request (INT_MPX).

When MPX interrupt is enabled (ADCJnMPXINTER.ADMPXIE = 1), an interrupt request INT_MPX is generated while MPX normal A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 5_H) or MPX addition mode A/D conversion (ADCJnVCRj.CNVCLS[3:0] = 6_H) is in progress.

Occurrence of INT_MPX can activate the DMAC.

When MPX interrupts are disabled (ADCJnMPXINTER.ADMPXIE = 0), no INT_MPX interrupt request is output.

The output port MPXCUR[2:0] value is updated regardless of the ADMPXIE value in ADCJnMPXINTER.

The register (ADCJnMPXCURR1.MPXCUR[2:0]) is updated at the same time as the output port MPXCUR[2:0] update.

43.4.19.5 Upper/Lower Limit Check

The ADCJ can generate an interrupt request signal (INT_UL), over upper-limit threshold value notice signal (vculmo), under lower-limit threshold value notice signal (vcllmo), and end notification signal (Refer to **Table 43.92**) for each virtual channel after detecting that the A/D conversion result is above the upper-limit threshold value or below the lower-limit threshold value.
Also, it's possible to notify the ADC VMON Secondary Error generator (AVSEG).

NOTE

The End Notification Signal indicates the signal name of **Table 43.92**.

Table 43.92 Correspondence Table of End Notification Signal

Signal name	Target scan group	Explanation
vcend[j]	Scan group x	Virtual channel A/D conversion end notice
pvcr_end	PWM-Diag	PWM-Diag A/D conversion end notice

(1) Setting Registers

Functions of INT_UL, vculmo, vcllmo, and end notification signals can be enabled or disabled for each virtual channel by setting.

When they are enabled, the A/D conversion result is compared with the upper/lower limit check table registers ADCJnVCULLMTBRy and signals INT_UL, vculmo, vcllmo, and end notification signals are output.

Table 43.93, **Table 43.94** list settings to enable or disable INT_UL, vculmo, vcllmo, and end notification signals functions.

Table 43.93 Settings to Enable/Disable INT_UL, vculmo, vcllmo, and vcend[j] Functions of ADCJnVCRj

Register Setting		Output Pin			
ADCJnVCLMINTER1/2. ADULnIE	ADCJnVCRj. VCULLMTBS	INT_UL	vculmo	vcllmo	vcend[j]
0	0_H	Disabled	Disabled	Disabled	Disabled
0	1_H to 8_H	Disabled	Enabled	Enabled	Enabled
1	0_H	Disabled	Disabled	Disabled	Disabled
1	1_H to 8_H	Enabled	Enabled	Enabled	Enabled

Table 43.94 Settings to Enable/Disable INT_UL Functions of PWM-Diag

Register Setting		Output Pin
ADCJnPWVCLMINTER.PWADULIE	ADCJnPWDVCR.VCULLMTBS	INT_UL
0	0_H	Disabled
0	1_H to 8_H	Disabled
1	0_H	Disabled
1	1_H to 8_H	Enabled

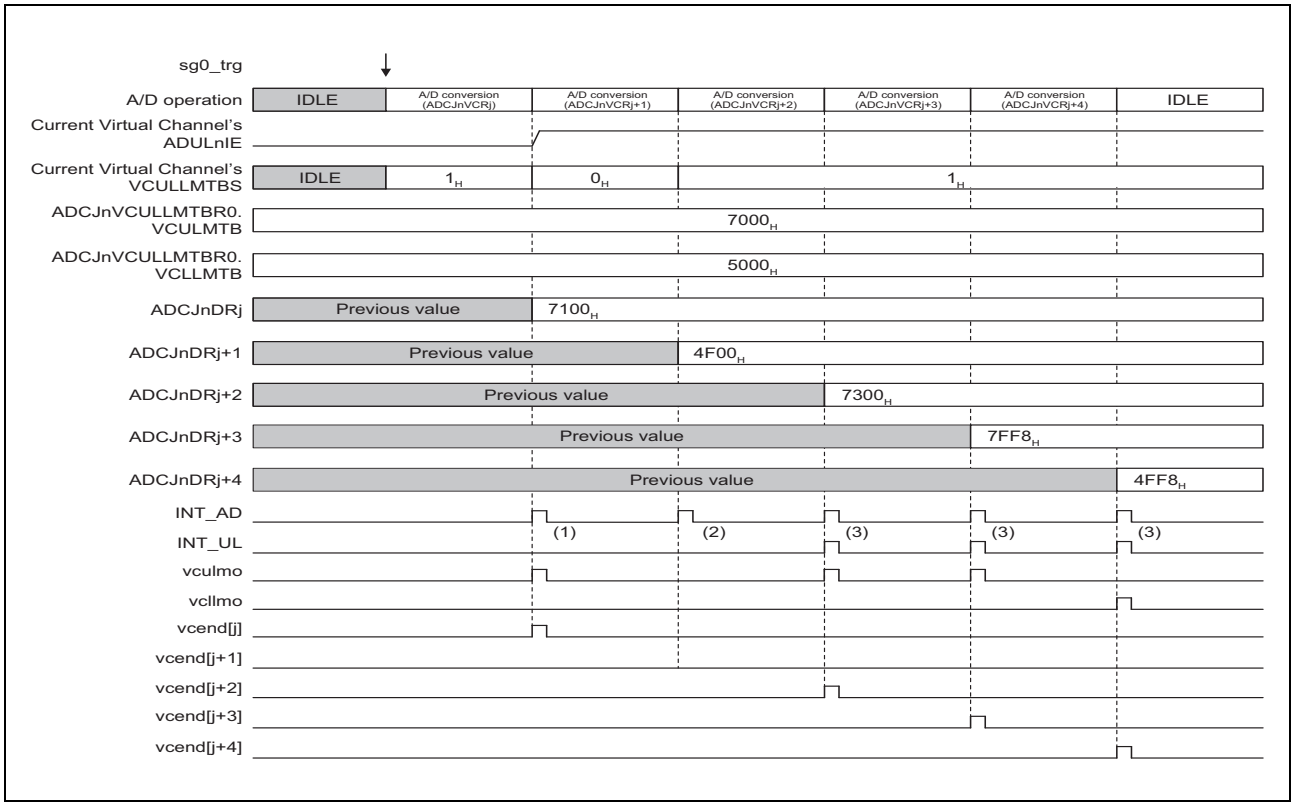

Figure 43.68 Upper/Lower Limit Check Signal Output Conditions

(1) When ADULnIE = 0, INT_UL is not output, but when ADCJnVCRj.VCULLMTBS = 1_H to 8_H, vculmo, vcllmo, and vcend[j] are output.

(2) When ADCJnVCRj.VCULLMTBS = 0_H, INT_UL, vculmo, vcllmo, and vcend[j] are not output regardless of the ADULnIE setting.

(3) When ADULnIE = 1 and ADCJnVCRj.VCULLMTBS = 1_H to 8_H, INT_UL, vculmo, vcllmo, and vcend[j] are output.

When the conversion type is addition mode A/D conversion or MPX addition mode A/D conversion, INT_UL, vculmo, vcllmo, and vcend[j] are output only at the end of the predetermined addition count.

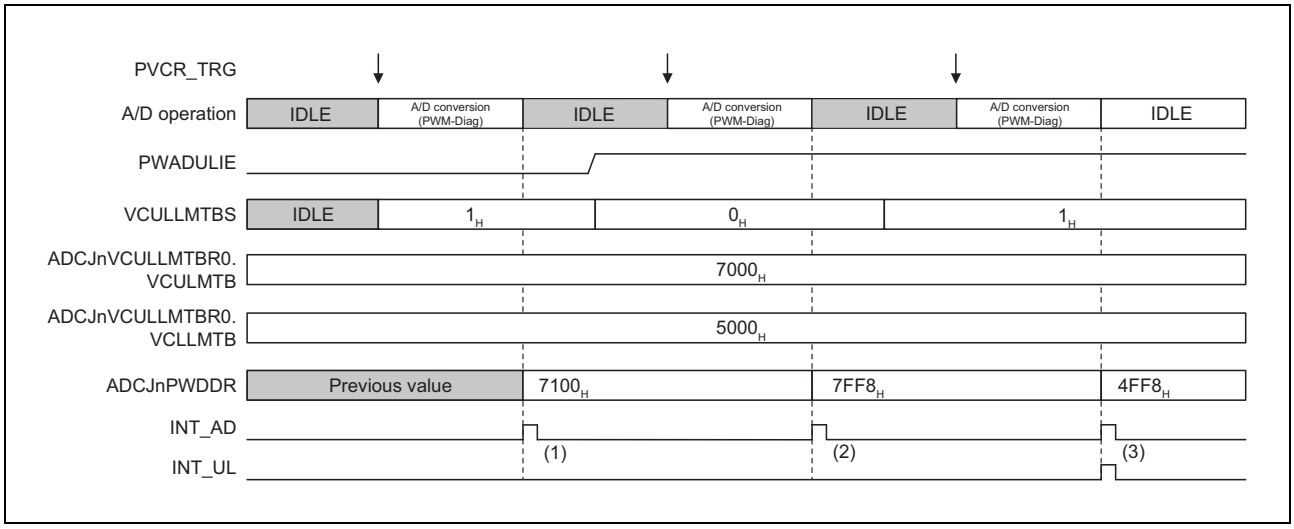

Figure 43.69 Upper/Lower Limit Check Signal Output Conditions (PWM-Diag)

(1) When PWADULIE = 0, INT_UL is not output.

(2) When ADCJnPWDVCR.VCULLMTBS = 0_H, INT_UL is not output regardless of the PWADULIE setting.

(3) When PWADULIE = 1 and ADCJnPWDVCR.VCULLMTBS = 1_H to 8_H, INT_UL is output.

(2) Table Register

ADCJnVCULLMTBRy is selected by upper/lower limit check table register select bits (Refer to **Table 43.96**).

Combinations of upper-limit threshold values and lower-limit threshold values are provided as sets.

No different table register number can be selected for the upper-limit side and lower-limit side of a virtual channel.

Set the upper-limit threshold value in the upper 16 bits and set the lower-limit threshold value in the lower 16 bits of the selected ADCJnVCULLMTBRy.

Write 32-bit values. Writing 16-bit or 8-bit values is prohibited.

ADCJnVCULLMTBRy can be modified at any time regardless of whether the scan group is active or not.

Table 43.95 Relationship between ADCJnVCRj.VCULLMTBS[3:0] and ADCJnVCULLMTBy

VCULLMTBS	Register Name	Upper-Limit Side Notice Condition	Lower-Limit Side Notice Condition
0_H	Upper/lower limit check disabled		
1_H	ADCJnVCULLMTBR0	See **Table 43.99, Output condition (1) of upper/lower limit check notification**.	See **Table 43.99, Output condition (1) of upper/lower limit check notification**.

	Convert twice	{000, Data register[15:3]} > VCULMTB[15:0]	{000, Data register[15:3]} < VCLLMTB[15:0]
	Convert 4 times	{00, Data register[15:2]} > VCULMTB[15:0]	{00, Data register[15:2]} < VCLLMTB[15:0]

43.4.20 Function to Detect Overvoltage in Chip Standby Mode (LPS Operation)

As main assumption, ADCJ2 activates by intermittent trigger from LPS operation during Chip standby mode without CPU operation.
Because the register access clock does not operate during the Chip standby mode, ADCJ2 operates by CLKAD (CLKA_ADC) to continue LPS operation. And all register settings necessary for LPS operation must be completed before transition to Chip standby mode.

ADCJ2 starts A/D conversion by a trigger from LPS. When ADCJ2 outputs conversion end interrupt at the end of A/D conversion, LPS detects this interrupt and enters idle state again. If A/D conversion result exceeds the threshold value set in ADCJ2VCULLMTBRy, outputs the ULE flag directly to standby controller and Wake-Up operation can be realized.

For details about LPS operation, refer to **Section 16, Low-Power Sampler (LPS)**.

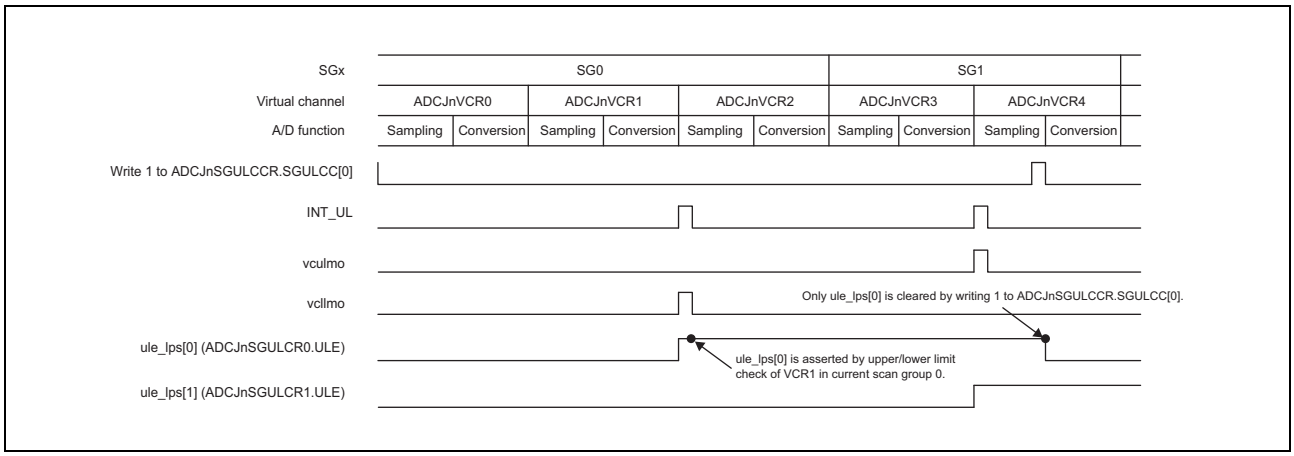

Figure 43.70 ule_lps[4:0] Operation

43.4.21 SVSTOP Function

The SVSTOP is output from the on-chip debugger to operate.

This function masks the scan group start trigger to prevent scan groups from starting during emulation break. The scan group start trigger (including PWM-Diag trigger) that is input during SVSTOP is retained by the hardware until SVSTOP is reset, and retained scan groups are started after SVSTOP is reset. Scan groups for which ADCJnSGSRx.SGACT is set before SVSTOP start are not suspended by SVSTOP. Furthermore, scan groups in continuous scan mode are not suspended even during SVSTOP.

NOTE

During SVSTOP, the A/D timer count is not stopped but the A/D timer trigger is ignored. Therefore new scan group can not started by the A/D timer during SVSTOP.

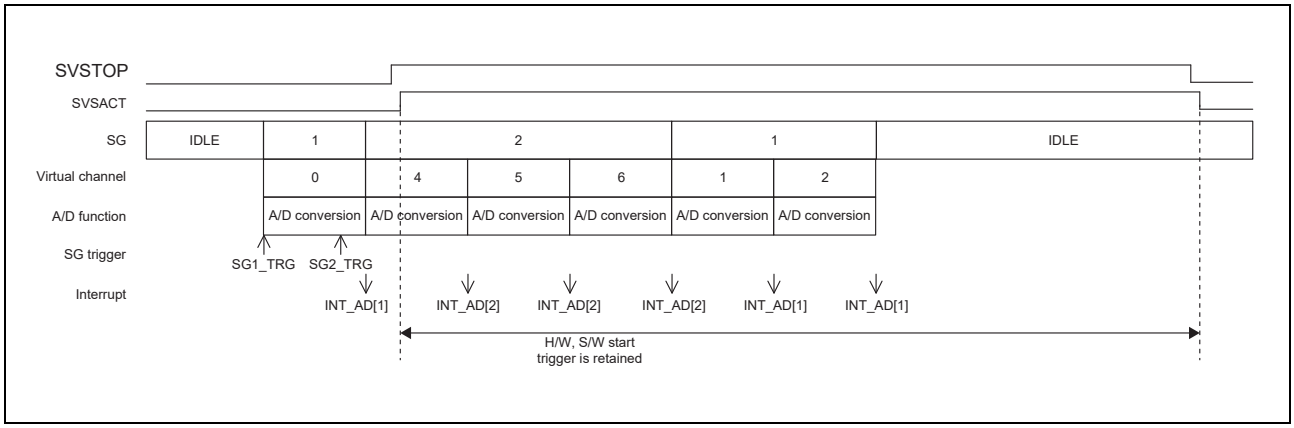

Figure 43.71 SVSTOP Start during A/D Conversion (Synchronous Suspend)

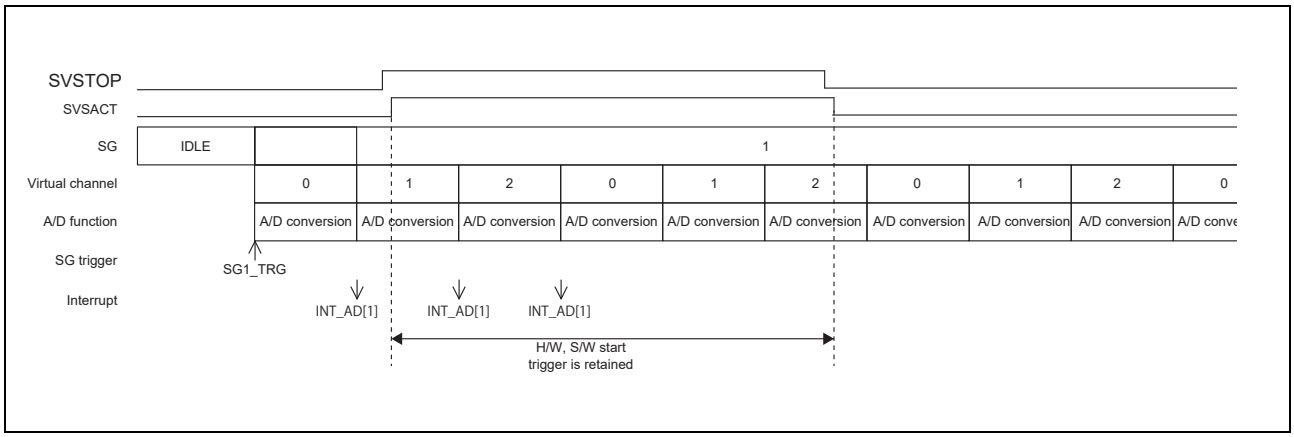

Figure 43.72 SVSTOP Start during A/D Conversion (Continuous Scan Mode)

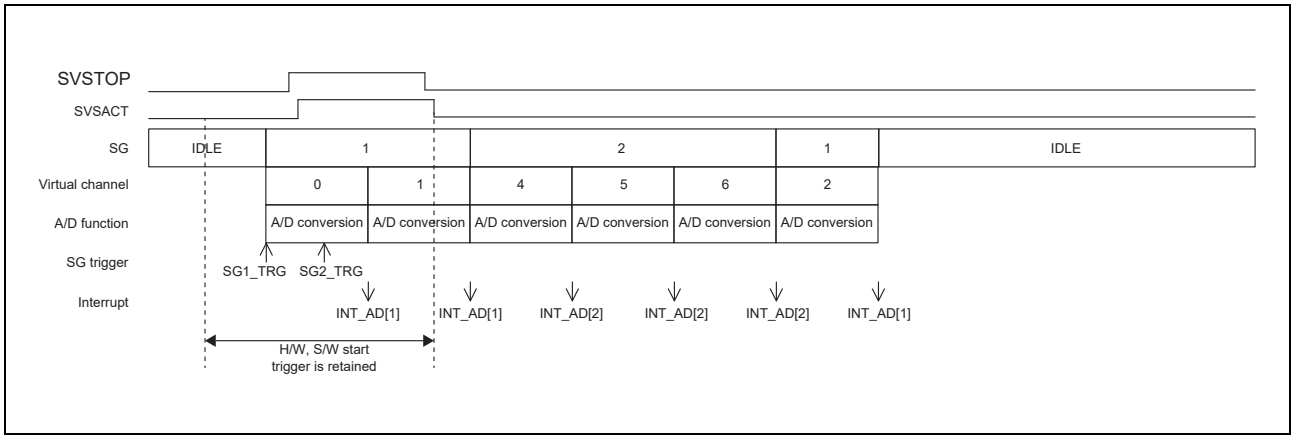

Figure 43.73 SVSTOP Start during A/D Conversion (Synchronous Suspend)

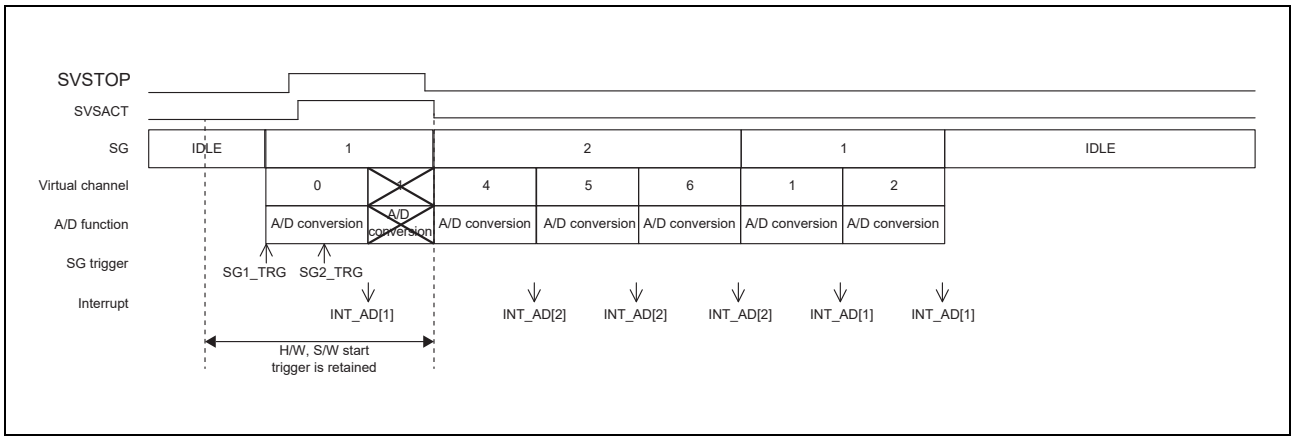

Figure 43.74 Scan Group and SVSTOP Start Alternately (Asynchronous Suspend)

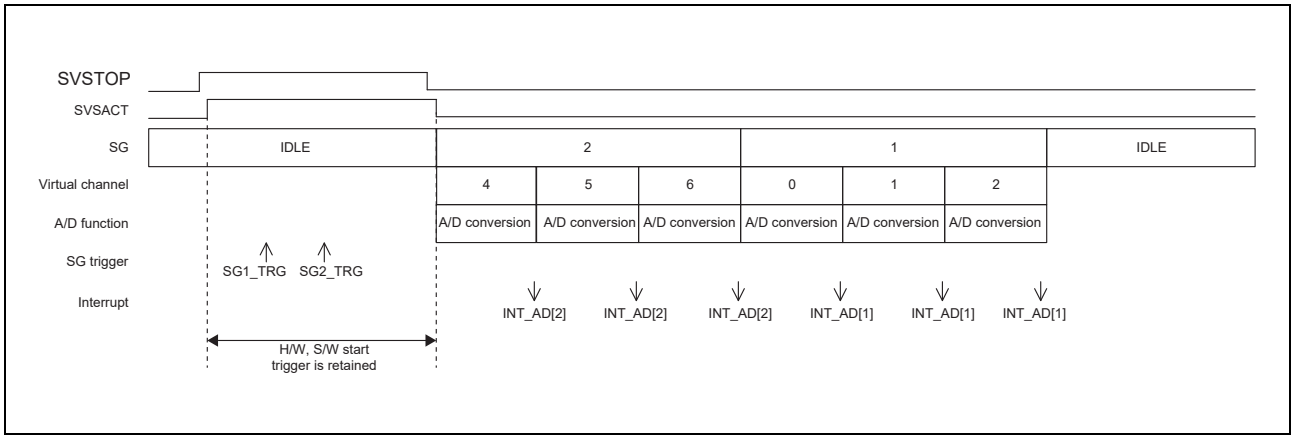

Figure 43.75 Scan Group Start in SVSTOP

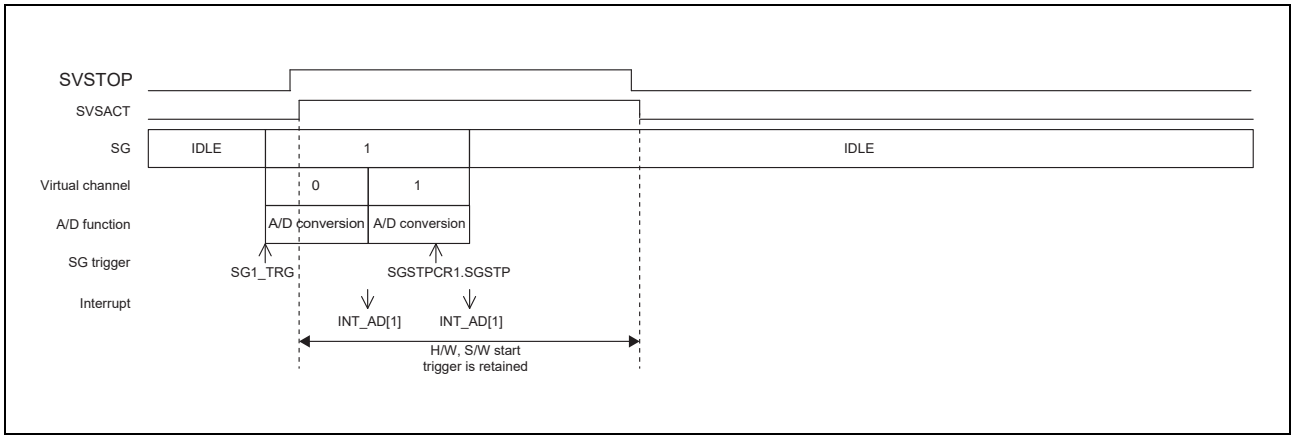

Figure 43.76 Scan Group Stop in SVSTOP (Prohibited Operation)

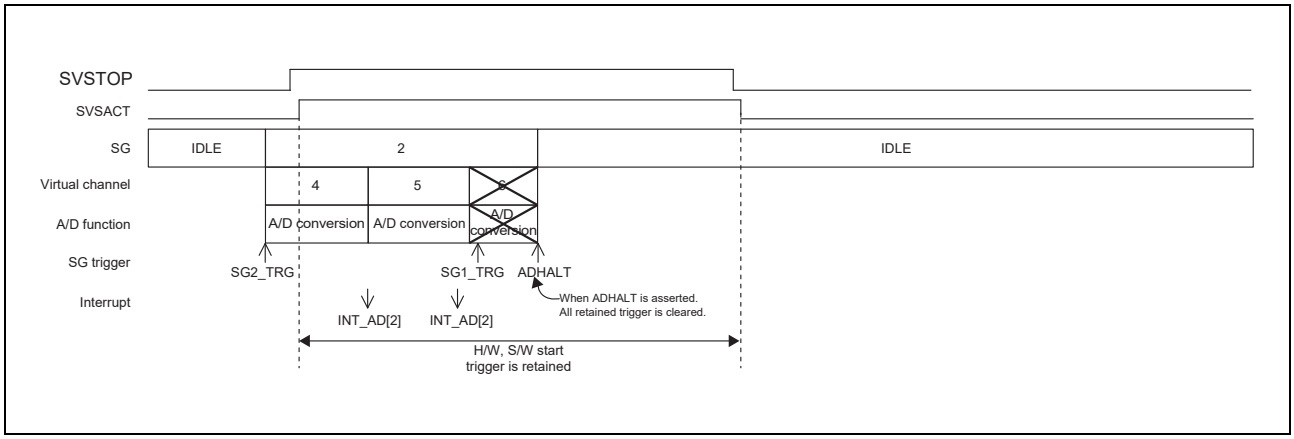

Figure 43.77 AD Forced Termination in SVSTOP (Prohibited Operation)

While SVSTOP operation, the data/flag clear function by reading ADCJnDRj, ADCJnDIRj, ADCJnPWDDR, and ADCJnPWDDIR registers is disabled.

Settings for A/D forced termination (ADCJnADHALTR.HALT = 1) during SVSTOP or stop control (ADCJnSGSTPCRx.SGSTP = 1) for each scan group are prohibited.

Table 43.101 shows differences of ADCJ operation during SVSTOP and in other cases.

Table 43.101 Conditions during SVSTOP Operation

Item	Not during SVSTOP	During SVSTOP
Software trigger/hardware trigger to SG0 to SG4, and PWM-Diag	Enabled	Retained (Disabled if SGACTx has been set)
Software trigger/hardware trigger to T&H group A (Hold trigger of T&H group A)	Enabled	Retained (Disabled if SGACTx has been set)
A/D timer trigger x (x = 3, 4)	Enabled	Disabled (A/D timer trigger is not retained)
SVSTOP status (ADCJnSGSTR:SVSACT)	Cleared	Set
Read and clear of data write flag (ADCJnDIRj.WFLAG, ADCJnPWDDIR.WFLAG)	Enabled	Disabled
Read and clear of data register (ADCJnDRj, ADCJnDIRj, ADCJnPWDDR, and ADCJnPWDDIR)	Enabled	Disabled

43.4.22 Monitoring Function Using the A/D Conversion Monitor Pin

The processing timing of the virtual channel specified by ADCJnADENDPv can be monitored using the ADENDv pin.

The ADENDv pin outputs a high level at the start of A/D conversion of the specified virtual channel, and outputs a low level before the A/D conversion ends.

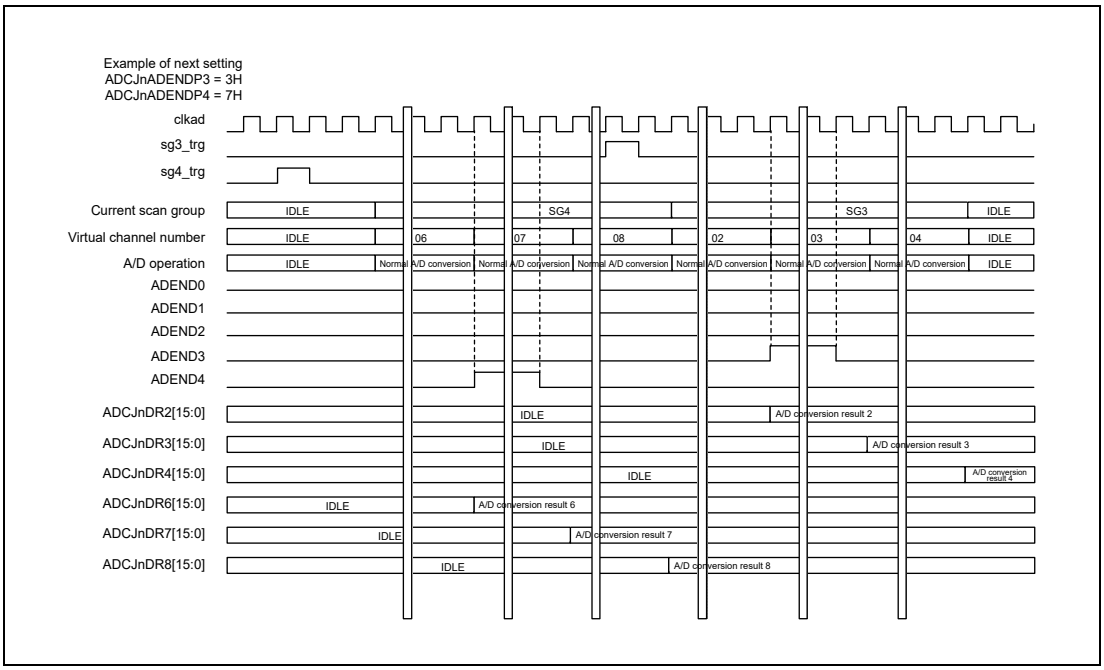

Figure 43.78 A/D Conversion Monitoring Timing

While the ADENDv pin outputs a high level in a low-priority scan group, if operation is suspended (asynchronous suspension) by a high-priority scan group, a low level is output once. When the virtual channel in the suspended low-priority scan group is resumed, the ADENDv pin outputs a high level again.

The ADENDv pin during the asynchronous suspension period due to a hold trigger outputs a low level.

43.4.23 External Module Option Function

43.4.23.1 GTM Entry Function

The ADCJ can output an entry request to the GTM according to the settings of GTMENT in ADCJnVCRj and GTMENTSGxE in ADCJnGTMENTSGER to enter GTM.

At the same time, the ADCJ outputs TAG information set in GTMTAG of ADCJnVCRj and A/D conversion data.

For the format of A/D conversion data to be output, see **Section 43.2.3.4, (3) Data Format for Output to GTM**.

43.4.24 Analog Input Sampling and Scan Group Processing Time

ADCJ has embedded-sample & hold circuit. After SGST bit of ADCJnSGSTCRx is set to 1 and scan group start delay time (tD) has passed, the ADC executes sampling and then starts sequential compare transition processing.

Scan group processing time (tSG) includes scan group start delay time (tD), sampling time (tSPL), sequential compare conversion processing time (tSAR), and scan group end delay time (tED). **Table 43.102, Scan Group Processing Time** shows scan group processing time.

In multicycle scan mode, the scan group processing time (tSG) can be calculated in the formula below when i = the number of virtual channels and j = the number of multicycles.

tSG = tD + (tSPL + tSAR) × i × j + tED

1st cycle scan in continuous scan mode: tD + (tSPL + tSAR) × i

2nd and onward scan in continuous scan mode: (tSPL + tSAR) × i

Table 43.102 Scan Group Processing Time

Item	Symbol	Period	Unit
Scan group start delay time	tD	(2 to 4) × P_Φ + 5 × I_Φ	Refer to *4
Sampling time	tSPL	SMPT × I_Φ *1 or EXSMPT × I_Φ *2	Refer to *4
Sequential compare conversion processing time	tSAR	22 × I_Φ	Refer to *4
Scan group end delay time	tED	(2 to 4) × I_Φ + 3 × P_Φ	Refer to *4
Scan group processing time	tSG	47 × I_Φ + 5 × P_Φ to 49 × I_Φ + 7 × P_Φ *3	Refer to *4

Note 1. Select from SMPT = 18 (default), 99, 204, 252. Set by ADCJnSMPCR register.

Note 2. Select from EXSMPT = 60 (default), 99, 138, 252. Set by ADCJnSMPCR register that valid during CNVCLS[3:0] = 2_H.
(Normal A/D conversion at extended sampling cycle)

Note 3. In case of SMPT = 18 (default) setting.

Note 4. for ADCJ0/1: P_Φ (CLK_LSB), I_Φ (CLK_ADC)
for ADCJ2: P_Φ (CLKA_ADC), I_Φ (CLKA_ADC)

43.5 Notes on Using

43.5.1 Notes on switching clocks

It is prohibited to switch clock frequency of ADCJ during A/D conversion and register access.
So, when clock frequency is switched to use the detect overvoltage function during stand-by mode, user should switch clock frequency after all scan groups halt by setting HALT of ADCJnADHALTR register.

43.5.2 Notes on Using Module Standby Mode

1. When using module standby mode of ADCJ, module standby mode should be set to valid after scan group x stops by using **Section 43.4.3.1, Forced Termination Flow of All Scan Groups** flow because of preventing scan group x activation by unnecessary hardware trigger. Or when the following all status bits are IDLE state, set the module standby mode valid.

Register bit name	Value	Explanation
ADCJnSGSTR.SGACT[4:0]	0_H	All scan groups is IDLE state.
ADCJnSGSTR.ADTACT[4:3]	0_H	All AD timer x is IDLE state.
ADCJnSGSTR.SHACT	0_H	T&H group A is IDLE state.

2. When module standby mode is used setting hardware trigger to valid (ADCJnSGCRx.TRGMD[0]=1), it is prohibited that the hardware trigger is input while ADCJ stop processing starts and module standby mode is valid.

43.5.3 Notes on Using T&H

1. When T&H is effective(ADCJnTHER.THzE=1), the physical channel connected to T&H must be used as Hold value A/D conversion. Exceptionally, the use case of Self-Diagnosis of the T&H Path described in **Section 43.4.10.2, Self-Diagnosis of the T&H Path** is available.
2. It is prohibited to connect MPX to any T&H target physical channel.
3. When T&H is effective(ADCJnTHER.THzE=1), It is prohibited to execute A/D conversion of PWM-Diag to any T&H target physical channel.
4. When using the T&H function, observe the following two T&H analog specifications for products. If a trigger that does not meet the following specifications is asserted, the quality of the ADCJ is not guaranteed.
   a) T&H sampling period from sampling start trigger to hold trigger
   b) T&H hold settling time from hold trigger to hold completion
5. When controlling T&H, use multicycle scan mode (ADCJnSGCRx.SCANMD = 0_H) and select a single scan (ADCJnSGMCYCRx.MCYC[7:0] = 0_H).
6. When using the T&H function, it is prohibited to insert a wait using the WAITTIME[13:0] bits in ADCJnWAITTRy. For wait operation, see **Section 43.4.11.1, Example of Wait Function between Virtual Channels**.

43.5.4 Notes on Using MPX

When using MPX normal A/D conversion or MPX addition mode A/D conversion, be sure to insert a wait.

Also, observe the following notes when using MPX to prevent a system failure.

With the exception, set the number of wait states of the MPX.

Option for [MPX (to I/O port via DMAC)]

Table 43.103 Number of MPX Wait States

MPX Value Transfer Method	Wait State
I/O port	A/D conversion period (default: 1 μsec) or more

Option for [MPX (to MSPI via DMAC)]

Table 43.104 Number of MPX Wait States

MPX Value Transfer Method	Wait State
MSPI(SPI I/F)	A/D conversion period (default: 1 μsec) + MSPI transmission time or more

Option for [MPX (direct output to I/O port)]

Table 43.105 Number of MPX Wait States

MPX Value Transfer Method	Wait State
Output port	A/D conversion period (default: 1 μsec) or more

Exception 1) Set the number of MPX wait states as follows when using MPX in a scan group in any of the following cases.

- In SG0 using the synchronous/asynchronous mixture type suspension method
- In SG0, SG1, SG2, or SG3 using the asynchronous suspension method

Option for [MPX (to I/O port via DMAC)]

Table 43.106 Number of MPX Wait States (Exception 1)

MPX Value Transfer Method	Wait State
I/O port	A/D conversion period (default: 1 μsec) or more

Option for [MPX (to MSPI via DMAC)]

Table 43.107 Number of MPX Wait States (Exception 1)

MPX Value Transfer Method	Wait State
MSPI(SPI I/F)	MSPI transmission time × 2 or more

Option for [MPX (direct output to I/O port)]

Table 43.108 Number of MPX Wait States (Exception 1)

MPX Value Transfer Method	Wait State
Output port	A/D conversion period (default: 1 μsec) or more

Exception 2) Observe the following notes when using MPX in two or more scan groups in any of the following cases.

- Using the synchronous/asynchronous mixture type suspension method
- Using the asynchronous suspension method

Option for [MPX (to I/O port via DMAC)]

Option for [MPX (to MSPI via DMAC)]

Make settings not to use MPX for the first virtual channel of each scan group. (However, there is no problem with the setting to use MPX for the first virtual channel of the lowest-priority scan group among scan groups using MPX.)

Specify one or two scan groups to be transferred by the MSPI (SPI I/F).

Set the number of MPX wait states as follows.

Option for [MPX (to I/O port via DMAC)]

Table 43.109 Number of MPX Wait States (Exception 2)

MPX Value Transfer Method	Wait State
I/O port	A/D conversion period (default: 1 μsec) or more

Option for [MPX (to MSPI via DMAC)]

Table 43.110 Number of MPX Wait States (Exception 2)

MPX Value Transfer Method	Wait State
MSPI(SPI I/F)	MSPI transmission time × 2 or more

Option for [MPX (direct output to I/O port)]

Table 43.111 Number of MPX Wait States (Exception 2)

MPX Value Transfer Method	Wait State
Output port	A/D conversion period (default: 1 μsec) or more

43.5.5 Notes of Upper/Lower Limit Check Function and Status Register

Upper/Lower Limit Check is the function that compare A/D conversion result with the setting value of Upper/Lower Limit Check Table register (ADCJnVCULLMTBRy) after A/D conversion of each virtual channel is end. Status register of compare result has 2 type that are “1. each virtual channel” and “2.each scan group”.

Virtual Channel Upper/Lower Limit Check Status has 2 type clear that are “1.individual clear” and “2.all clear”. When all clear(ADCJnVCLMASCR.ALLMSC) is used during ADCJ operation, the status of each virtual channel that is being operated is cleared. So it is recommended to use individual clear when ADCJ is operating.

Scan Group Upper/Lower Limit Check Status has individual clear. All clear can be used because individual clear of all scan groups is set one register.

Table 43.112 The relation between Upper/Lower Limit Check and Clear Register

Function	Category	Status (bit or register)	Clear register name	
			Cleared individually	Cleared at once
Upper/Lower Limit Check	Each Virtual Channel	ADCJnVCLMSR1.VC00LMS to VC31LMS	ADCJnVCLMSCR1.VC00LMSC to VC31LMSC	ADCJnVCLMASCR .ALLMSC
		ADCJnVCLMSR2.VC32LMS to VC63LMS	ADCJnVCLMSCR2.VC32LMSC to VC63LMSC	
		ADCJnPWVCLMSR.PWVCLMS	ADCJnPWVCLMSCR.PWVCLMSC	
	Each Scan Group	ADCJnSGULCR0	ADCJnSGULCCR.SGULCC[0]	—
		ADCJnSGULCR1	ADCJnSGULCCR.SGULCC[1]	
		ADCJnSGULCR2	ADCJnSGULCCR.SGULCC[2]	
		ADCJnSGULCR3	ADCJnSGULCCR.SGULCC[3]	
		ADCJnSGULCR4	ADCJnSGULCCR.SGULCC[4]	

43.6 Definitions with Respect to A/D Conversion Accuracy

The following describes A/D conversion accuracy. Definitions (3) to (7) are illustrated.

(1) Resolution
Number of digital output codes of A/D converter

(2) Quantization error
An error that A/D converter essentially has, which is given as 1/2LSB

(3) Offset error
Deviation from ideal A/D conversion characteristic of analog input voltage value when digital output changes from the minimum voltage value 000_H to 001_H, excluding quantization error

(4) Full-scale error
Deviation from ideal A/D conversion characteristic of analog input voltage value when digital output changes from FFEH to FFFH, excluding quantization error

(5) DNL (Differential non-linearity error)
Deviation between ideal digital output code width (Vq) and actual digital output code width (Va), which is given as (Va - Vq)/Vq, excluding offset error, full-scale error, and quantization error

(6) INL (Integral non-linearity error)
Deviation from ideal A/D conversion characteristic from zero voltage to full-scale voltage, which is given as integral of DNL from 000_H to an arbitrary digital output code, excluding offset error, full-scale error, and quantization error

(7) Total error
Deviation between digital value and analog input value, including offset error, full-scale error, quantization error, DNL, and INL

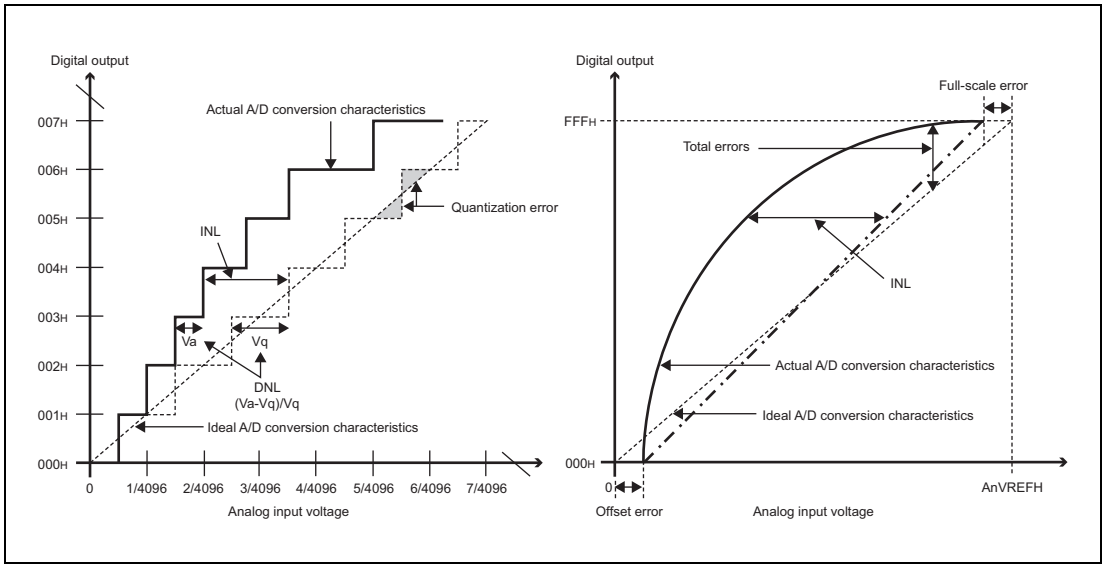

Figure 43.79 Definition of A/D Conversion Accuracy

43.7 ADC VMON Secondary Error Generator (AVSEG)

43.7.1 Overview

43.7.1.1 Function Overview

AVSEG is equivalent to the function which notify an upper error pulse (secondary HDET) and a lower error pulse (Secondary LDET) of each power supply (VCC, E0VCC, ISOVDD and AWOVDD) to INTC in the secondary power supply voltage monitor (Upper error pulse & Lower error pulse are merged together then routing to INTC).

- Upper Error Pulse Control and Lower Error Pulse Control
  This function generates an error signal from ADCJ0 to INTC if an upper or lower bound is exceeded.
- Noise Filter
  The upper and lower error pulses are generated by signals passed through a filter to reduce noise.

CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

43.7.1.2 Block Diagram

Figure 43.80 illustrates the AVSEG block diagram.

43.7.3.1 AVSEG Specific Registers

(1) AVSEGVCCCHSCR — Input Channel Selector Register VCC

This register selects the input channel.

Access: This register can be read or written in 32-bit units.

Address: <AVSEG_base> + 00_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	AVSEGVCCCHS[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.114 AVSEGVCCCHSCR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	AVSEGVCCCHS[5:0]	Input Channel Selector These bits select the channel used for generating error of VCC in the secondary power supply voltage monitor. 00_H: Selects ADCJ0 virtual channel 0 : $3F_H$: Selects ADCJ0 virtual channel 63

(2) AVSEGVCCCNTCR — Filter Counter Control Register VCC

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Access: This register can be read or written in 32-bit units.

Address: <AVSEG_base> + 04_H

Value after reset: $0000\ 0101_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	AVSEGVCCENB	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	AVSEGVCCNRMCNT				—	—	—	—	AVSEGVCCERRCNT			
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 43.115 AVSEGVCCCNTCR Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	AVSEGVCCENB	Filter Enable This bit enable AVSEG for VCC 0: Disabled 1: Enables the filter. When set to disable all AVSEG for VCC functions are disabled.
27 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 8	AVSEGVCCNRMCNT	Recovery Counter Settings These bits control the number of counts until the signal is considered recovered. Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. The counter value is reset when one of the following values is written to AVSEGVCCNRMCNT. 1_H: Recovery after the signal is within the boundaries for 1 count. : F_H: Recovery after the signal is within the boundaries for 15 consecutive counts.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	AVSEGVCCERRCNT	Error Counter Control These bits control the number of counts until the signal is considered out of bounds. The signal is considered out of bounds once the set number of consecutive error pulses are detected. The counter value is reset when one of the following values is written to AVSEGVCCERRCNT. 1_H: Out of bounds when the signal violates the boundaries for 1 count. : F_H: Out of bounds when the signal violates the boundaries for 15 consecutive counts.

CAUTION

Setting AVSEGVCCNRMCNT and AVSEGVCCERRCNT to 0_H is prohibited.
If AVSEGVCCNRMCNT is set to 0_H the counter will act as if it was set to 1_H.
The filter will not output any signals if AVSEGVCCERRCNT is set to 0_H.

(3) AVSEGEVCCCHSCR — Input Channel Selector Register EVCC

This register selects the input channel.

Access: This register can be read or written in 32-bit units.
Address: <AVSEG_base> + 10_H
Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 43.116 AVSEGEVCCCHSCR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	AVSEGEVCCCHS[5:0]	Input Channel Selector These bits select the channel used for generating error of E0VCC in the secondary power supply voltage monitor 00_H: Selects ADCJ0 virtual channel 0 : $3F_H$: Selects ADCJ0 virtual channel 63

(4) AVSEGEVCCCNTCR — Filter Counter Control Register EVCC

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Access: This register can be read or written in 32-bit units.

Address: <AVSEG_base> + 14_H

Value after reset: 0000 0101_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	AVSEGEVCCENB	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 43.117 AVSEGEVCCCNTCR Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	AVSEGEVCCENB	Filter Enable This bit enable AVSEG for E0VCC 0: Disabled 1: Enables the filter. When set to disable all AVSEG for E0VCC functions are disabled.
27 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 8	AVSEGEVCCNRMCNT	Recovery Counter Settings These bits control the number of counts until the signal is considered recovered. Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. The counter value is reset when one of the following values is written to AVSEGEVCCNRMCNT. 1_H: Recovery after the signal is within the boundaries for 1 count. : F_H: Recovery after the signal is within the boundaries for 15 consecutive counts.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	AVSEGEVCCERRCNT	Error Counter Control These bits control the number of counts until the signal is considered out of bounds. The signal is considered out of bounds once the set number of consecutive error pulses are detected. The counter value is reset when one of the following values is written to AVSEGEVCCERRCNT. 1_H: Out of bounds when the signal violates the boundaries for 1 count. : F_H: Out of bounds when the signal violates the boundaries for 15 consecutive counts.

CAUTION

Setting AVSEGEVCCNRMCNT and AVSEGEVCCERRCNT to 0H is prohibited.
If AVSEGEVCCNRMCNT is set to 0_H the counter will act as if it was set to 1_H.
The filter will not output any signals if AVSEGEVCCERRCNT is set to 0_H.

(5) AVSEGAWOVDDCHSCR — Input Channel Selector Register AWOVDD

This register selects the input channel.

Access: This register can be read or written in 32-bit units.
Address: <AVSEG_base> + 20_H
Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.119 AVSEGAWOVDDCNTCR Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	AVSEGAWOVDDENB	Filter Enable This bit enable AVSEG for ISOVDD 0: Disabled 1: Enables the filter. When set to disable all AVSEG for AWOVDD functions are disabled.
27 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 8	AVSEGAWOVDDNRMCNT	Recovery Counter Settings These bits control the number of counts until the signal is considered recovered. Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. The counter value is reset when one of the following values is written to AVSEGAWOVDDNRMCNT. 1_H: Recovery after the signal is within the boundaries for 1 count. : F_H: Recovery after the signal is within the boundaries for 15 consecutive counts.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	AVSEGAWOVDDERRCNT	Error Counter Control These bits control the number of counts until the signal is considered out of bounds. The signal is considered out of bounds once the set number of consecutive error pulses are detected. The counter value is reset when one of the following values is written to AVSEGAWOVDDERRCNT. 1_H: Out of bounds when the signal violates the boundaries for 1 count. : F_H: Out of bounds when the signal violates the boundaries for 15 consecutive counts.

CAUTION

Setting AVSEGAWOVDDNRMCNT and AVSEGAWOVDDERRCNT to 0H is prohibited.
If AVSEGAWOVDDNRMCNT is set to 0_H the counter will act as if it was set to 1_H.
The filter will not output any signals if AVSEGAWOVDDERRCNT is set to 0_H.

(7) AVSEGISOVDDCHSCR — Input Channel Selector Register ISOVDD

This register selects the input channel.

Access: This register can be read or written in 32-bit units.
Address: <AVSEG_base> + 30_H
Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.120 AVSEGISOVDDCHSCR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	AVSEGISOVDDCHS[5:0]	Input Channel Selector These bits select the channel used for generating error of ISOVDD in the secondary power supply voltage monitor 00_H: Selects ADCJ0 virtual channel 0 : $3F_H$: Selects ADCJ0 virtual channel 63

(8) AVSEGISOVDDCNTCR — Filter Counter Control Register ISOVDD

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Access: This register can be read or written in 32-bit units.

Address: <AVSEG_base> + 34_H

Value after reset: $0000\ 0101_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	AVSEGISOVDDENB	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	AVSEGISOVDDNRMCNT				—	—	—	—	AVSEGISOVDDERRCNT			
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 43.121 AVSEGISOVDDCNTCR Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	AVSEGISOVDDENB	Filter Enable This bit enable AVSEG for ISOVDD 0: DISABLED 1: Enables the filter. When set to DISABLED all AVSEG for ISOVDD functions are disabled.
27 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 8	AVSEGISOVDDNRMCNT	Recovery Counter Settings These bits control the number of counts until the signal is considered recovered. Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. The counter value is reset when one of the following values is written to AVSEGISOVDDNRMCNT. 1_H: Recovery after the signal is within the boundaries for 1 count. : F_H: Recovery after the signal is within the boundaries for 15 consecutive counts.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	AVSEGISOVDDERRCNT	Error Counter Control These bits control the number of counts until the signal is considered out of bounds. The signal is considered out of bounds once the set number of consecutive error pulses are detected. The counter value is reset when one of the following values is written to AVSEGISOVDDERRCNT. 1_H: Out of bounds when the signal violates the boundaries for 1 count. : F_H: Out of bounds when the signal violates the boundaries for 15 consecutive counts.

CAUTION

Setting AVSEGISOVDDNRMCNT and AVSEGISOVDDERRCNT to 0H is prohibited.
If AVSEGISOVDDNRMCNT is set to 0_H the counter will act as if it was set to 1_H.
The filter will not output any signals if AVSEGISOVDDERRCNT is set to 0_H.

(9) AVSEGSECVMONERR – Secondary voltage monitor error register

AVSEGSECVMONERR is a readable register that indicates Secondary voltage monitor error of VCC, E0VCC, ISOVDD and AWOVDD. AVSEGSECVMONERR is initialized to 0000 0000_H at reset.

Access: This register is a read-only register that can be read in 32-bit units.
Address: <AVSEG_base> + 40_H
Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	AWOVDD_ULME	ISOVDD_ULME	EVCC_ULME	VCC_ULME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AWOVDD_LLME	ISOVDD_LLME	EVCC_LLME	VCC_LLME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 43.122 AVSEGSECVMONERR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19	AWOVDD_ULME	Upper limit voltage error AWOVDD 0: No error present 1: An error is present Setting condition Upper limit voltage error of AWOVDD is detected Clearing condition A value of 1 is written to AWOVDD_ULMEC in AVSEGSECVMONCLR
18	ISOVDD_ULME	Upper limit voltage error ISOVDD 0: No error present 1: An error is present Setting condition Upper limit voltage error of ISOVDD is detected Clearing condition A value of 1 is written to ISOVDD_ULMEC in AVSEGSECVMONCLR
17	EVCC_ULME	Upper limit voltage error E0VCC 0: No error present 1: An error is present Setting condition Upper limit voltage error of E0VCC is detected Clearing condition A value of 1 is written to EVCC_ULMEC in AVSEGSECVMONCLR

Table 43.122 AVSEGSECVMONERR Register Contents (2/2)

Bit Position	Bit Name	Function
16	VCC_ULME	Upper limit voltage error VCC 0: No error present 1: An error is present. Setting condition Upper limit voltage error of VCC is detected. Clearing condition A value of 1 is written to VCC_ULMEC in AVSEGSECVMONCLR
15 to 4	Reserved	When read, the value after reset is returned.
3	AWOVDD_LLME	Lower limit voltage error AWOVDD 0: No error present 1: An error is present. Setting condition Lower limit voltage error of AWOVDD is detected. Clearing condition A value of 1 is written to AWOVDD_LLMEC in AVSEGSECVMONCLR
2	ISOVDD_LLME	Lower limit voltage error ISOVDD 0: No error present 1: An error is present. Setting condition Lower limit voltage error of ISOVDD is detected. Clearing condition A value of 1 is written to ISOVDD_LLMEC in AVSEGSECVMONCLR
1	EVCC_LLME	Lower limit voltage error E0VCC 0: No error present 1: An error is present. Setting condition Lower limit voltage error of E0VCC is detected. Clearing condition A value of 1 is written to EVCC_LLMEC in AVSEGSECVMONCLR
0	VCC_LLME	Lower limit voltage error VCC 0: No error present 1: An error is present. Setting condition Lower limit voltage error of VCC is detected. Clearing condition A value of 1 is written to VCC_LLMEC in AVSEGSECVMONCLR

(10) AVSEGSECVMONCLR – Secondary voltage monitor error clear register

AVSEGSECVMONCLR is an 32-bit write-only register that control error clearing in AVSEGSECVMONERR register. AVSEGSECVMONCLR is always read as 0.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <AVSEG_base> + 44_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	AWOVDD_ULMEC	ISOVDD_ULMEC	EVCC_ULMEC	VCC_ULMEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AWOVDD_LLMEC	ISOVDD_LLMEC	EVCC_LLMEC	VCC_LLMEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Table 43.123 AVSEGSECVMONCLR Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When writing, write the value after reset.
19	AWOVDD_ULMEC	Upper limit voltage error AWOVDD clear Writing 0: Not clear Writing 1: Clear
18	ISOVDD_ULMEC	Upper limit voltage error ISOVDD clear Writing 0: Not clear Writing 1: Clear
17	EVCC_ULMEC	Upper limit voltage error E0VCC clear Writing 0: Not clear Writing 1: Clear
16	VCC_ULMEC	Upper limit voltage error VCC clear Writing 0: Not clear Writing 1: Clear
15 to 4	Reserved	When writing, write the value after reset.
3	AWOVDD_LLMEC	Lower limit voltage error AWOVDD clear Writing 0: Not clear Writing 1: Clear
2	ISOVDD_LLMEC	Lower limit voltage error ISOVDD clear Writing 0: Not clear Writing 1: Clear
1	EVCC_LLMEC	Lower limit voltage error E0VCC clear Writing 0: Not clear Writing 1: Clear
0	VCC_LLMEC	Lower limit voltage error VCC clear Writing 0: Not clear Writing 1: Clear

43.7.4 Operation

43.7.4.1 Noise Count Method

The AVSEG noise count methods are shown below. Noise is filtered and reduced by counting the number of times the ADC boundary values are exceeded using the input error pulses.

CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

Example for the upper error pulse AVSEG for VCC:

Method 1:

AVSEGVCCCNTCR.AVSEGVCCERMCNT = 1_H to 3_H and
AVSEGVCCCNTCR.AVSEGVCCNRMCNT = 1_H.

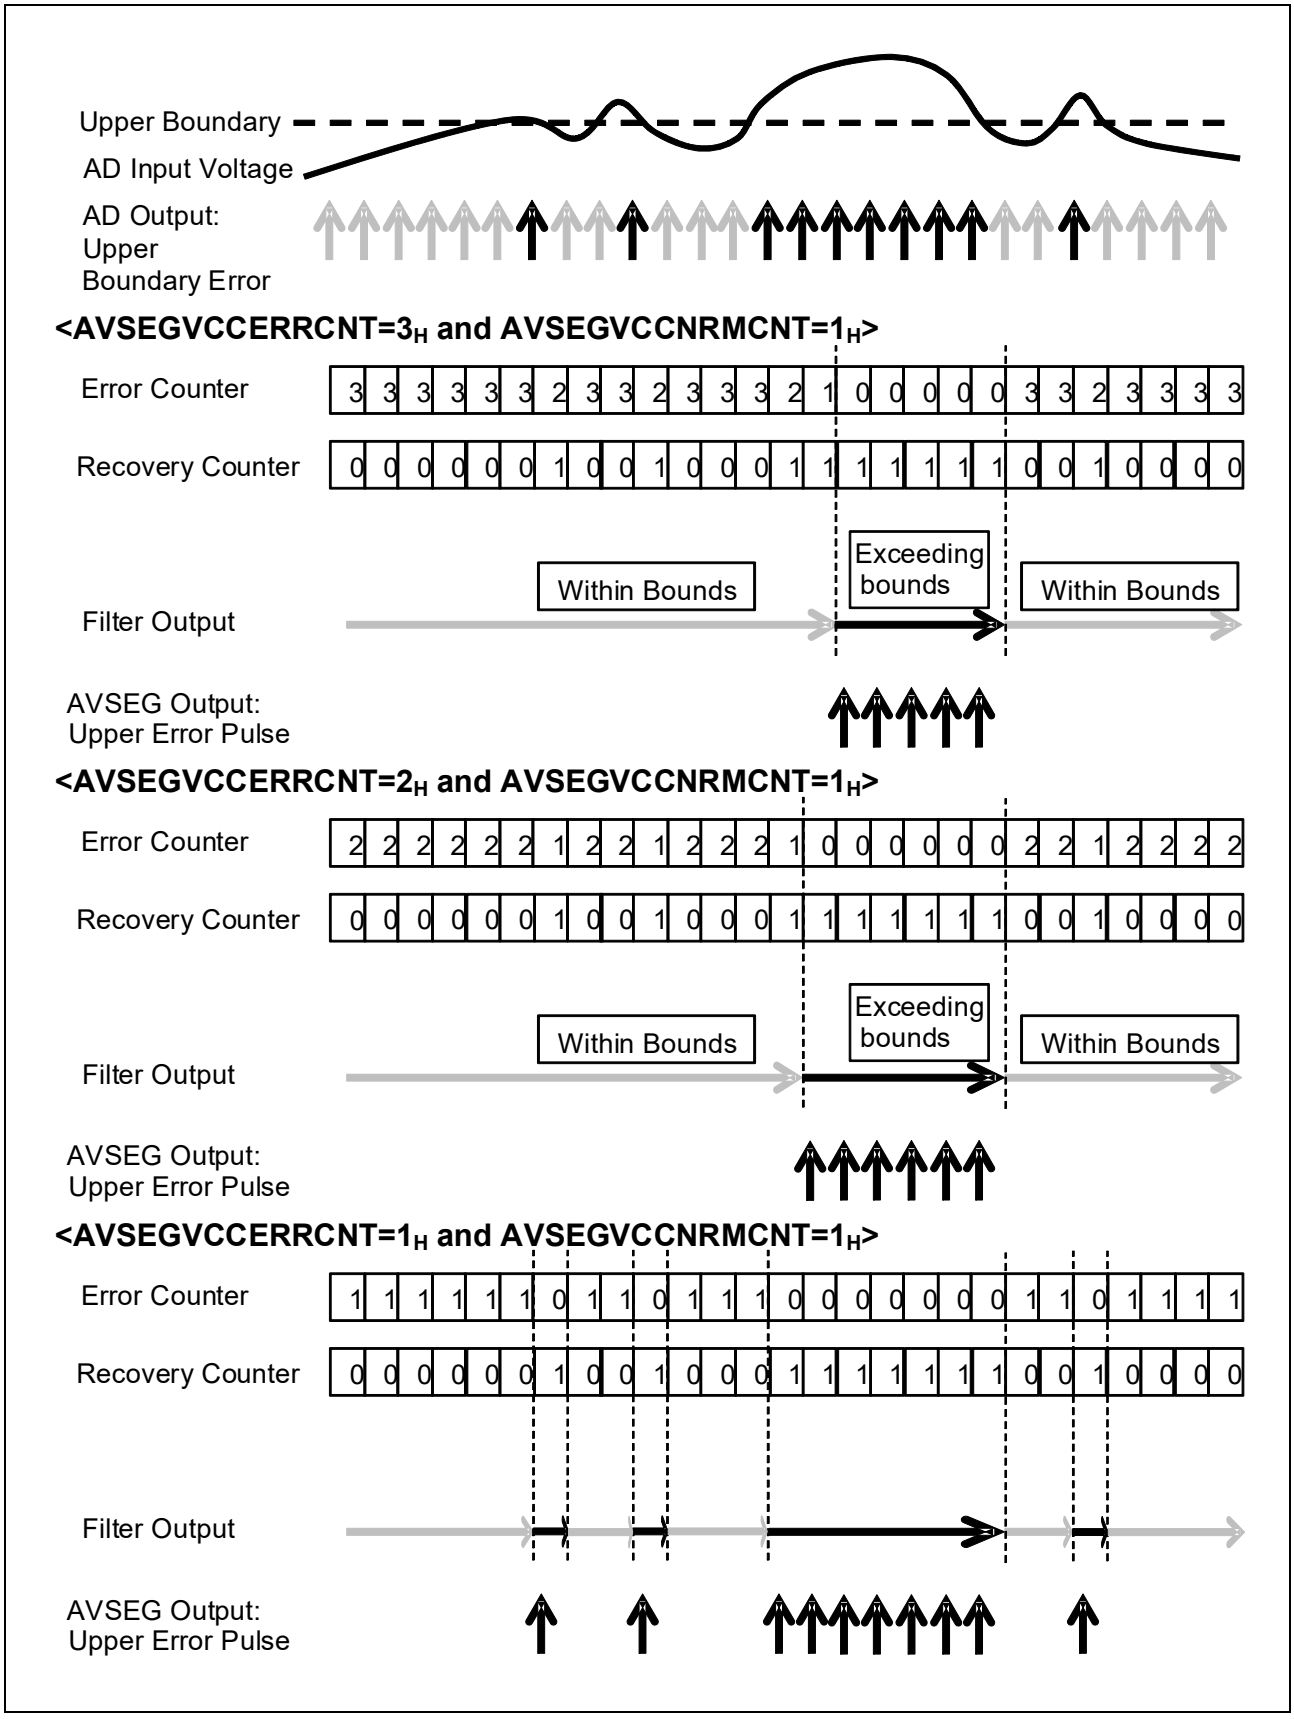

Figure 43.81 Noise Count (1)

Method 2:

AVSEGVCCCNTCR.AVSEGVCCERMCNT = 1_H to 3_H and
AVSEGVCCCNTCR.AVSEGVCCNRMCNT = 2_H.

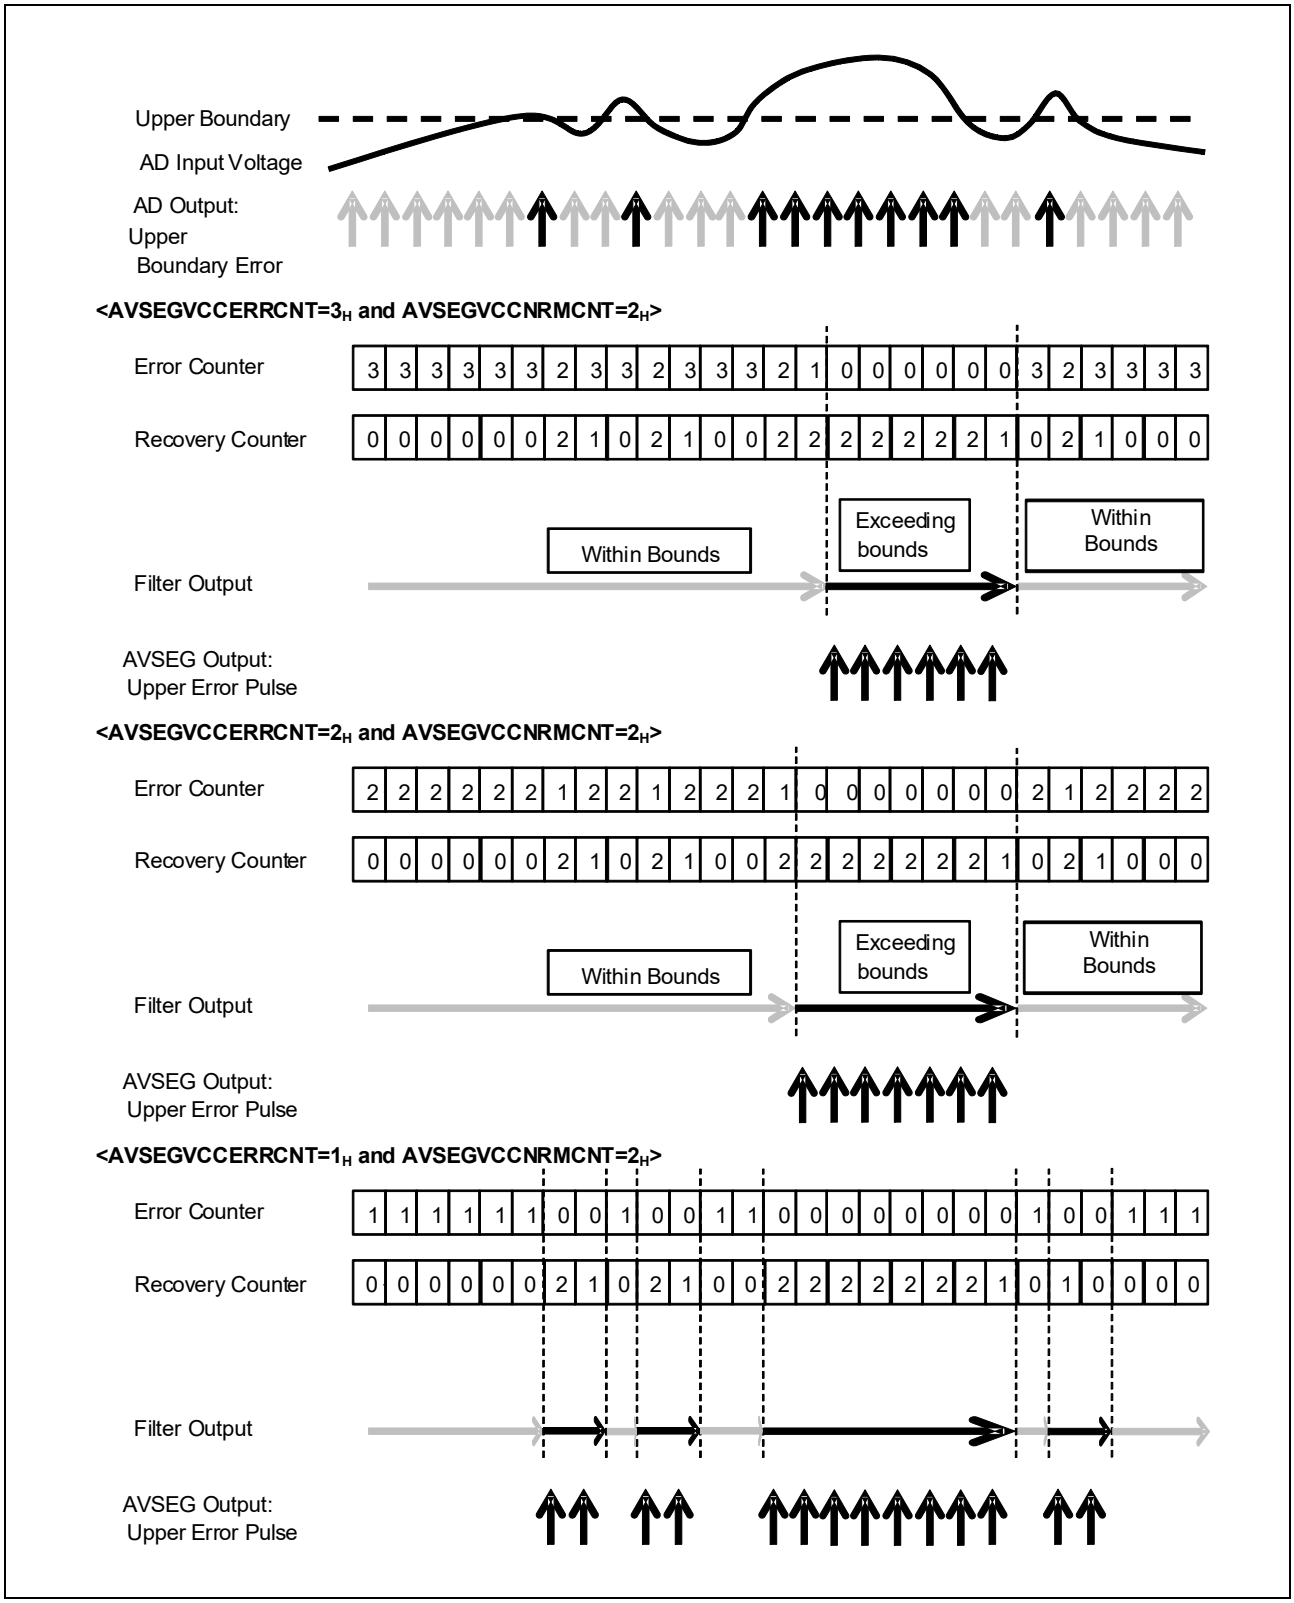

Figure 43.82 Noise Count (2)

Method 3:

AVSEGVCCCNTCR.AVSEGVCCERRCNT = 1_H to 3_H and
AVSEGVCCCNTCR.AVSEGVCCNRMCNT = 3_H.

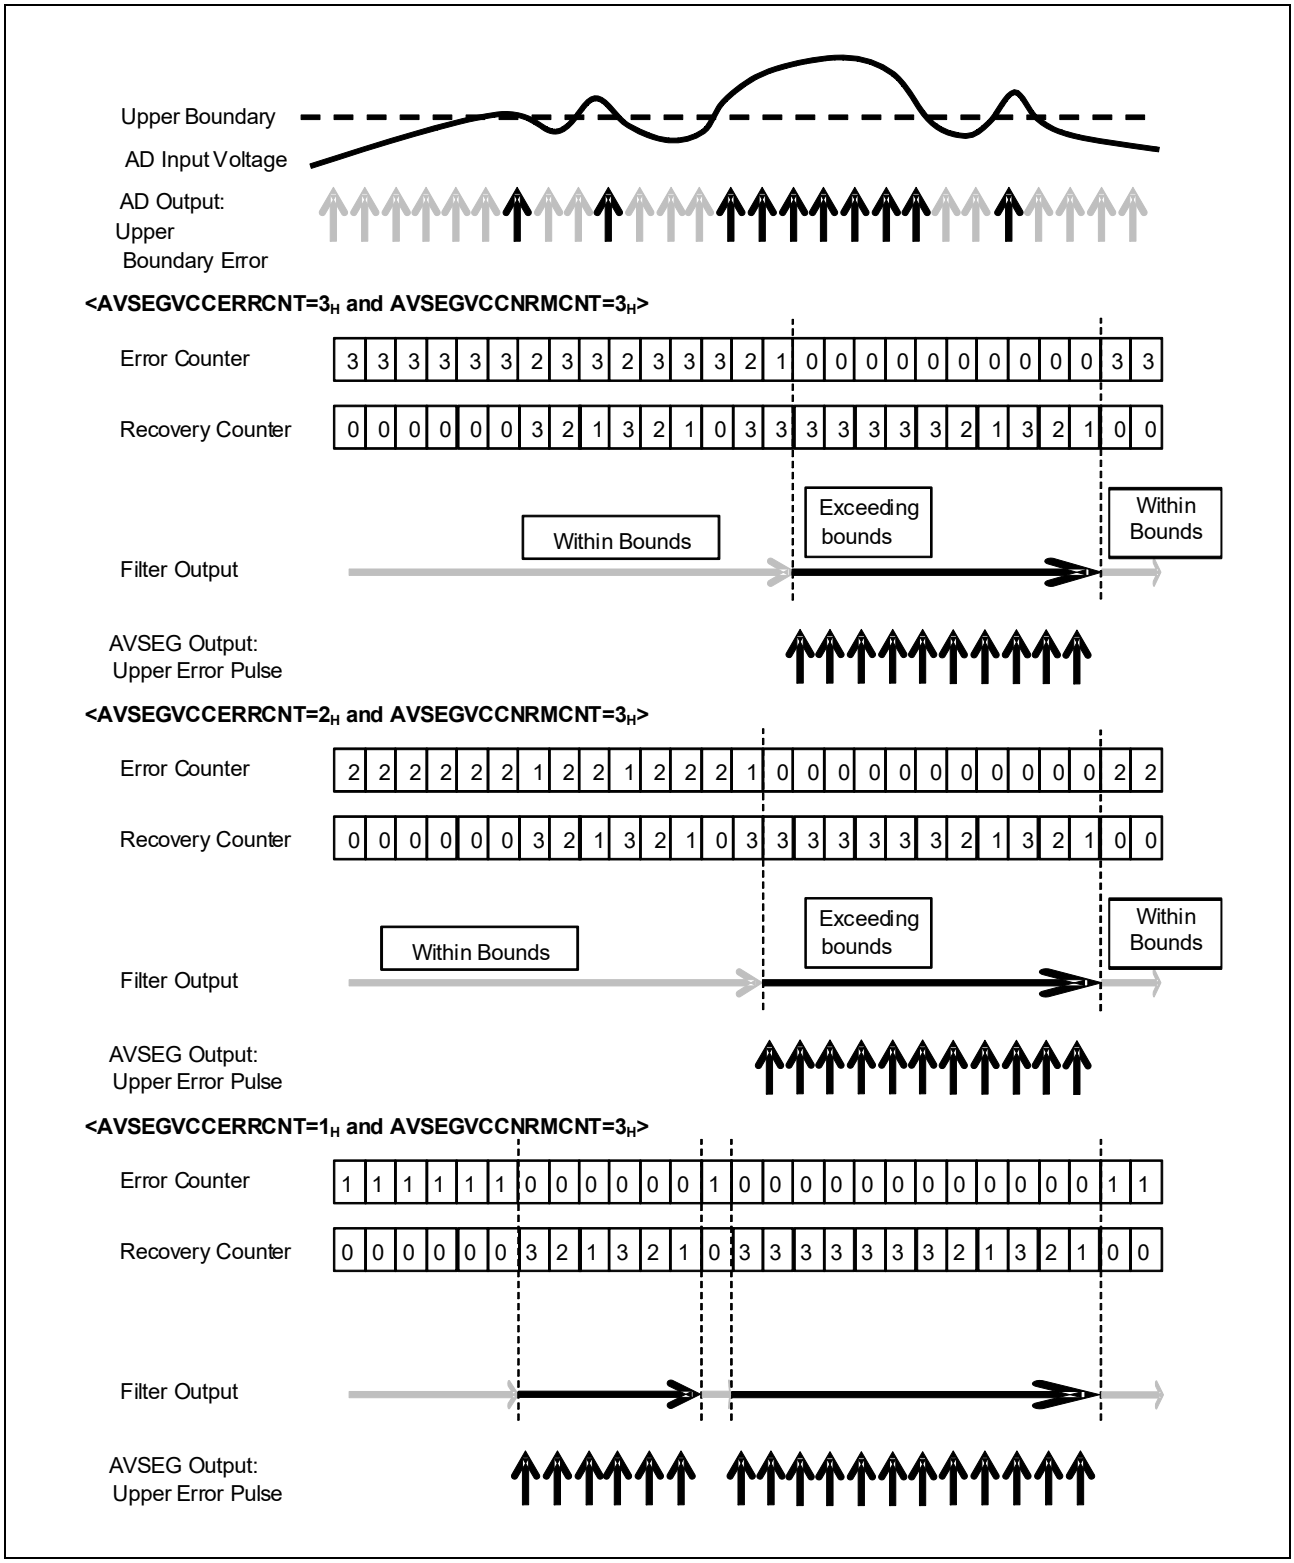

Figure 43.83 Noise Count (3)

43.7.4.2 Upper/Lower Error Pulse Output

The AVSEG upper/lower error pulse output signals are shown below. All output signals are generated by signals that have passed through the filter function to reduce noise.

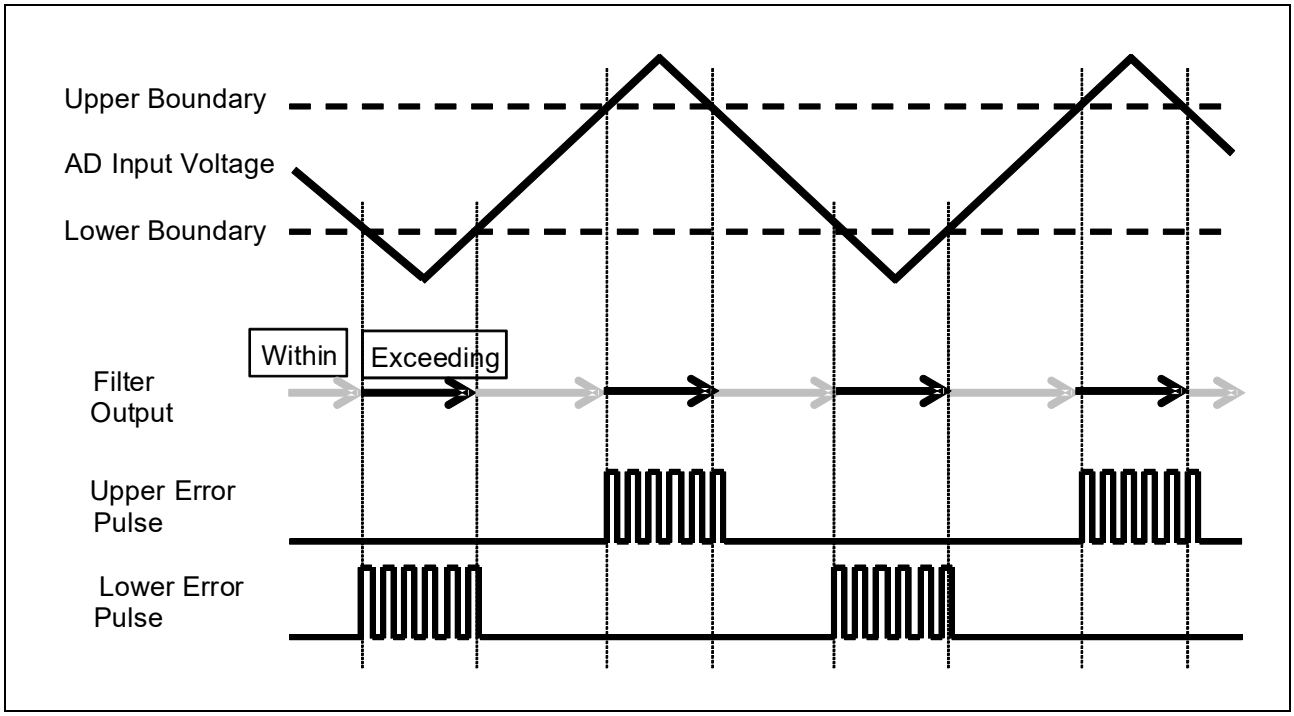

Figure 43.84 Upper/Lower Error Pulse Output

43.7.5 Use Method

(1) Startup Procedure Example

(a) ADC Settings (For details, refer to **Section 43, Analog to Digital Converter (ADCJ)**

Set the virtual channel registers and virtual channel upper/lower limit table registers so that comparisons are made between the limit registers and the input voltage during conversion.

(b) Interrupt setting

Refer to **Section 6, Interrupts**.

(c) Clear error status in AVSEGSECVMONERR by writing to AVSEGSECVMONCLR register.

(d) AVSEG Settings

Set the Input Channel Selector Register of respective voltage (AVSEGVCCCHSCR, AVSEGEVCCCHSCR, AVSEGISOVDDCHSCR and AVSEGAWOVDDCHSCR).

Set the Filter Counter Control Register of respective voltage (AVSEGVCCCNTCR, AVSEGEVCCCNTCR, AVSEGISOVDDCNTCR and AVSEGAWOVDDCNTCR).

(e) Begin A/D Conversion

Begin A/D conversion after setting up AVSEG. If the AVSEG Filter Counter Control Register is modified, the error counter and recovery counter will be set with the written values, and all outputs change will be masked.

(2) Stop Procedure Example

(a) End A/D Conversion

Stop the ADCJ0.

(b) AVSEG Setting

Set the filter counter enable bit, AVSEGVCCCNTCR. AVSEGVCCENB, AVSEGEVCCCNTCR. AVSEGEVCCENB, AVSEGISOVDDCNTCR. AVSEGISOVDDENB and AVSEGAWOVDDCNTCR. AVSEGAWOVDDENB to 0.

This will prevent any and all pulse signals from being output from AVSEG.

NOTE

The internal filter counters will be reset to the written values during the AVSEGVCCCNTCR, AVSEGEVCCCNTCR, AVSEGISOVDDCNTCR and AVSEGAWOVDDCNTCR write procedure.

(3) Usage Notes

(a) The input of both upper and lower error pulses into the same module at the same time is prohibited.

(b) Setting AVSEGVCCNRMCNT, AVSEGVCCERRCNT, AVSEGEVCCNRMCNT, AVSEGEVCCERRCNT, AVSEGISOVDDNRMCNT, AVSEGISOVDDERRCNT, AVSEGAWOVDDNRMCNT and AVSEGAWOVDDERRCNT to 0_H is prohibited.

Section 44 Functional Safety

44.1 Overview

This section describes the intended safety mechanisms provided to detect the MCU failures with a short detection time. Here, the failures include both the recoverable transient failures such as soft errors of a memory and the unrecoverable permanent failures.

This MCU was developed to meet the requirements for a Safety Element out of Context (SEooC) as described in the ISO26262. In a SEooC development, safety requirements of target device (component) are assumed from market requirements by component manufacturers, and then the device is developed according to these assumed requirements. As this application is targeted for chassis & safety and body applications, some special considerations are already included to minimize gaps with chassis & safety and body requirements, however this should not restrict use with other applications. If Renesas assumptions are not enough to achieve system safety requirements derived from safety goals, the system safety requirements need to be modified. Contact our sale office for details regarding the development process and safety organization.

The following lists the intended safety mechanisms provided by this product.

Note 1. The suitability of the safety mechanisms referenced in this chapter will finally be judged during the safety analysis and safety assessment of the MCU. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

ECC and EDC

Detect failures of memory and data transfer paths; correct failures.

Lockstep

Detects failures of the CPU and DTS with a short detection time.

Memory Protection

Detects erroneous access to the memory and peripheral circuits to protect the data in these elements against erroneous access.

BIST

Detects failures of the failure detection function itself.

Error Control Module (ECM)

Monitors various failure detection states in the MCU and defines the operation to be carried out when a failure occurs reaction.

Voltage Monitor

Monitors power supply voltage to detect over and under voltage.

Clock Monitor

Monitors the clock operation to detect abnormal operation.

Data CRC

Generates CRC to verify the data streams protected by CRC.

44.2 Reset Sources

Register reset conditions (defined in this section) are shown in **Table 44.1**.

Table 44.1 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
ECC and EDC	All registers	√	√	√	√	√	√*1	—
Lockstep (CPU)	See **Section 3, CPU System**.							
Lockstep (DTS)	DTS_COMP_CNTRL	√	√	√	√	√	—	—
Memory Protection	All registers	√	√	√	√	√	—	—
BIST	See **Section 44.6.2.3, Reset of Registers**.							
Error Control Module (ECM)	See **Section 45, Error Control Module (ECM)**.							
Voltage Monitor	See **Section 11, Power Supply Voltage Monitor**.							
Clock Monitor	See **Section 14, Clock Monitor (CLMA)**.							
Data CRC	See **Section 46, Data CRC Function K (KCRC)**.							

Note 1. ECC for peripheral RAM is initialized by Module Reset. For the target modules of Module Reset, see **Section 9, Reset Controller**. For details of ECC for peripheral RAM, see **Section 44.3.10, ECC for Peripheral RAM**.

44.3 ECC and EDC

44.3.1 Overview

44.3.1.1 ECC

This product incorporates ECC for the following memories. The ECC enables detection and correction of errors of the data retained in memory. The ECC also enables detection and correction of errors produced between the ECC encoder and memory; and memory and ECC decoder.

Table 44.2 ECC Overview

Applicable Memory	Applicable Data Width [bits]	Operation upon Error Detection				Failure Insertion
		Detection/ Correction	Notice to ECM	Error Status	Address Capture	
Code flash	256	SEC-DED	Possible*1	Possible*1	Possible*1	Possible
Data flash	32	SEC-DED	Possible	Possible	Possible	Possible
Local RAM (all CPU cores)	32	SEC-DED	Possible	Possible	Possible	Possible
Cluster RAM	32	SEC-DED	Possible	Possible	Possible	Possible
Instruction cache (data)	64	SED-DED	Possible	Possible	Possible	Possible
Instruction cache (tag)	32	SED-DED	Possible	Possible	Possible	Possible
RAM for DTS	32	SEC-DED	Possible	Possible	Possible	Possible
RAM for sDMAC (Descriptor)	32	SEC-DED	Possible	Possible	Possible	Possible
RAM for sDMAC (Data Transfer)	64	SEC-DED	Possible	Possible	Possible	Possible
Peripheral RAM (32 bits)	32	SEC-DED	Possible	Possible	Possible	Possible
Data transfer path (data)	32/128	SEC-DED	Possible	Possible	N/A	Possible
Data transfer path (address)	32	SED-DED	Possible	Possible	N/A	Possible

Note 1. When an error except ECC 1-bit error correction occurs in instruction fetch at the time of cache miss or cache invalid, ECM error sources may not be notified and error status / error address registers may not be updated.
For details, see **Section 3, CPU System**.

Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors*1 can only be detected.

SED-DED: 1-bit errors and 2-bit errors*1 can only be detected.

Note 1. All 0s and 1s of data bits and ECC bits are not a legal combination and detected as 2-bit errors.

Notice to ECM

A detected error can be reported to the ECM.

Error Status

The status of a detected error is retained.

Address Capture

The address of a detected error is retained.

Failure Insertion

An ECC error can be intentionally generated to enable software test of the ECC decoder operation.

44.3.1.2 Address Parity

This product incorporates address parity for the following types of memory. The address parity enables detection of errors during address decoding. It also enables detection of errors produced at addresses between the parity encoder and memory.

Table 44.3 Address Parity Overview

Applicable Memory	Parity Bit	Notice to ECM	Error Status	Address Capture	Failure Insertion
Code flash	1 bit	Possible*1	Possible*1	Possible*1	Possible

Note 1. When an error occurs in instruction fetch at the time of cache miss or cache invalid, ECM error sources may not be notified and error status / error address registers may not be updated.
For details, see **Section 3, CPU System**.

44.3.1.3 Address Feedback

This product incorporates an address feedback function for the following types of memory. The address feedback function enables detection of address errors inside memory module itself.

Table 44.4 Address Feedback Overview

Applicable Memory	Notice to ECM	Error Status	Address Capture	Failure Insertion
Local RAM (all CPU cores)	Possible	Possible	Possible	Possible
Cluster RAM	Possible	Possible	Possible	Possible
Instruction cache (data/tag)	Possible	Possible	Possible	Possible
RAM for DTS	Possible	Possible	Possible	Possible

44.3.2 Error Notifications

44.3.2.1 Error Notifications for Code Flash ECC and Address Parity

The error notifications of Code Flash ECC and Address Parity are listed in the following table.

Table 44.5 Error Notifications for Code Flash

Error Notification	Description	ECM Error Number	Error Response to bus master
Code Flash - Address parity error	Code Flash address parity error	80	√
Code Flash - Data ECC 2-bit error	Code Flash data ECC 2-bit error	81	√
Code Flash - Data ECC 1-bit error	Code Flash data ECC 1-bit error	82	√/— *1
Code Flash - ECC overflow error	Code Flash ECC error address buffer overflow error	83	—

Note 1. It depends on setting of ECC 1-bit error correction disable bit (SECDIS). When ECC 1-bit error correction is disabled (SECDIS=1), it causes Error Response. When ECC 1-bit error correction is enabled (SECDIS=0), it doesn't cause Error Response.

44.3.2.2 Error Notifications for Data Flash

The error notifications of Data Flash ECC are listed in the following table.

Table 44.6 Error Notifications for Data Flash

Error Notification	Description	ECM Error Number	Error Response to bus master
Data Flash - Data ECC 2-bit error	Data Flash data ECC 2-bit error	88	√
Data Flash - Data ECC 1-bit error	Data Flash data ECC 1-bit error	89	√/—*1
Data Flash - ECC overflow error	Data Flash ECC error address buffer overflow error	90	—

Note 1. It depends on setting of ECC 1-bit error correction disable bit (SECDIS). When ECC 1-bit error correction is disabled (SECDIS=1), it causes Error Response. When ECC 1-bit error correction is enabled (SECDIS=0), it doesn't cause Error Response.

44.3.2.3 Error Notifications for Local RAM ECC and Address Feedback

The error notifications of Local RAM ECC and Address Feedback are listed in the following table.

Table 44.7 Error Notifications for Local RAM (1/2)

Error Notification	Description	ECM Error Number	Error Response to bus master
Local RAM - Data ECC 2-bit error	LRAM data ECC 2-bit error (for read data loaded from the other PE's Local RAM speculatively)	96	√
Local RAM - Data ECC 1-bit error	LRAM data ECC 1-bit error (for read data loaded from the other PE's Local RAM speculatively)	97	√/—*1
Local RAM - ECC overflow error	LRAM data ECC error address buffer overflow error (for read data loaded from the other PE's Local RAM speculatively)	98	—
Local RAM (PE0) - Address feedback compare error - Data ECC 2-bit error	LRAM address feedback compare error LRAM data ECC 2-bit error	232	√
Local RAM (PE0) - Data ECC 1-bit error	LRAM data ECC 1-bit error	233	√/—*1
Local RAM (PE0) - ECC overflow error	LRAM ECC error address buffer overflow error	234	—
Local RAM (PE1) - Address feedback compare error - Data ECC 2-bit error	LRAM address feedback compare error LRAM data ECC 2-bit error	264	√
Local RAM (PE1) - Data ECC 1-bit error	LRAM data ECC 1-bit error	265	√/—*1
Local RAM (PE1) - ECC overflow error	LRAM ECC error address buffer overflow error	266	—

Table 44.7 Error Notifications for Local RAM (2/2)

Error Notification	Description	ECM Error Number	Error Response to bus master
Local RAM (PE2) - Address feedback compare error - Data ECC 2-bit error	LRAM address feedback compare error	296	√
	LRAM data ECC 2-bit error		
Local RAM (PE2) - Data ECC 1-bit error	LRAM data ECC 1-bit error	297	√/—*1
Local RAM (PE2) - ECC overflow error	LRAM ECC error address buffer overflow error	298	—
Local RAM (PE3) - Address feedback compare error - Data ECC 2-bit error	LRAM address feedback compare error	328	√
	LRAM data ECC 2-bit error		
Local RAM (PE3) - Data ECC 1-bit error	LRAM data ECC 1-bit error	329	√/— *1
Local RAM (PE3) - ECC overflow error	LRAM ECC error address buffer overflow error	330	—

Note 1. It depends on setting of ECC 1-bit error correction disable bit (SECDIS). When ECC 1-bit error correction is disabled (SECDIS=1), it causes Error Response. When ECC 1-bit error correction is enabled (SECDIS=0), it doesn't cause Error Response.

44.3.2.4 Error Notifications for Cluster RAM ECC and Address Feedback

The error notifications of Cluster RAM ECC and Address Feedback are listed in the following table.

Table 44.8 Error Notifications for Cluster RAM ECC and Address Feedback

Error Notification	Description	ECM Error Number	Error Response to bus master
Cluster RAM - Address feedback compare error - Data ECC 2-bit error	CRAM address feedback compare error	104	√
	CRAM data ECC 2-bit error		
Cluster RAM - Data ECC 1-bit error	CRAM data ECC 1-bit error	105	√/—*1
Cluster RAM - ECC overflow error	CRAM data ECC error address buffer overflow error	106	—

Note 1. It depends on setting of ECC 1-bit error correction disable bit (SECDIS). When ECC 1-bit error correction is disabled (SECDIS=1), it causes Error Response. When ECC 1-bit error correction is enabled (SECDIS=0), it doesn't cause Error Response.

44.3.2.5 Error Notifications for Instruction Cache EDC and Address Feedback

The error notifications of Instruction Cache EDC and Address Feedback are listed in the following table.

Table 44.9 Error Notifications for Instruction Cache

Error Notification	Description	ECM Error Number	Error Response to bus master
Instruction cache RAM (PE0) - Address feedback compare error - Data EDC error	Instruction cache RAM (tag) address feedback compare error	236	√/—*1
	Instruction cache RAM (data) address feedback compare error		
	Instruction cache RAM (tag) data EDC 2-bit error		
	Instruction cache RAM (tag) data EDC 1-bit error		
	Instruction cache RAM (data) data EDC 2-bit error		
	Instruction cache RAM (data) data EDC 1-bit error		
Instruction cache RAM (PE1) - Address feedback compare error - Data EDC error	Instruction cache RAM (tag) address feedback compare error	268	√/—*1
	Instruction cache RAM (data) address feedback compare error		
	Instruction cache RAM (tag) data EDC 2-bit error		
	Instruction cache RAM (tag) data EDC 1-bit error		
	Instruction cache RAM (data) data EDC 2-bit error		
	Instruction cache RAM (data) data EDC 1-bit error		
Instruction cache RAM (PE2) - Address feedback compare error - Data EDC error	Instruction cache RAM (tag) address feedback compare error	300	√/—*1
	Instruction cache RAM (data) address feedback compare error		
	Instruction cache RAM (tag) data EDC 2-bit error		
	Instruction cache RAM (tag) data EDC 1-bit error		
	Instruction cache RAM (data) data EDC 2-bit error		
	Instruction cache RAM (data) data EDC 1-bit error		
Instruction cache RAM (PE3) - Address feedback compare error - Data EDC error	Instruction cache RAM (tag) address feedback compare error	332	√/—*1
	Instruction cache RAM (data) address feedback compare error		
	Instruction cache RAM (tag) data EDC 2-bit error		
	Instruction cache RAM (tag) data EDC 1-bit error		
	Instruction cache RAM (data) data EDC 2-bit error		
	Instruction cache RAM (data) data EDC 1-bit error		

Note 1. It depends on setting of Instruction cache control (ICCTRL) and Instruction cache error (ICERR). For more details of these registers, refer to **Section 3, CPU System**.

44.3.2.6 Error Notifications for sDMAC/DTSRAM ECC and Address Feedback

The error notifications of sDMAC/DTSRAM ECC and Address Feedback are listed in the following table.

Table 44.10 Error Notifications for sDMAC/DTSRAM

Error Notification	Description	ECM Error Number	Error Response to bus master
DTSRAM - Address feedback compare error - Data ECC 2-bit error	DTSRAM address feedback compare error	112	√
	DTSRAM data ECC 2-bit error		
DTSRAM - Data ECC 1-bit error	DTSRAM data ECC 1-bit error	113	√/— *1
DTSRAM - ECC overflow error	DTSRAM ECC error address buffer overflow error	114	—
sDMAC0 RAM - Data ECC 2-bit error	sDMAC0 DPRAM data ECC 2-bit error sDMAC0 DATARAM data ECC 2-bit error	120	√
sDMAC0 RAM - Data ECC 1-bit error	sDMAC0 DPRAM data ECC 1-bit error sDMAC0 DATARAM data ECC 1-bit error	121	√/— *1
sDMAC1 RAM - Data ECC 2-bit error	sDMAC1 DPRAM data ECC 2-bit error sDMAC1 DATARAM data ECC 2-bit error	122	√
sDMAC1 RAM - Data ECC 1-bit error	sDMAC1 DPRAM data ECC 1-bit error sDMAC1 DATARAM data ECC 1-bit error	123	√/— *1
sDMACn RAM (n = 0, 1) - ECC overflow error	sDMAC0 DPRAM data ECC error address buffer overflow error	159	—
	sDMAC0 DATARAM data ECC error address buffer overflow error		
	sDMAC1 DPRAM data ECC error address buffer overflow error		
	sDMAC1 DATARAM data ECC error address buffer overflow error		

Note 1. It depends on setting of ECC 1-bit error correction disable bit (SECDIS). When ECC 1-bit error correction is disabled (SECDIS=1), it causes Error Response. When ECC 1-bit error correction is enabled (SECDIS=0), it doesn't cause Error Response.

44.3.2.7 Error Notifications for Peripheral RAM

The error notifications of Peripheral RAM are listed in the following table.

Table 44.11 Error Notifications for Peripheral RAM (1/4)

Error Notification	Description	ECM Error Number	Error Response to bus master
FlexRay RAM - Data ECC 2-bit error	FLXA0 MRAM data ECC 2-bit error	128	—
	FLXA0 TBFRAM A data ECC 2-bit error		
	FLXA0 TBFRAM B data ECC 2-bit error		
	FLXA1 MRAM data ECC 2-bit error		
	FLXA1 TBFRAM A data ECC 2-bit error		
	FLXA1 TBFRAM B data ECC 2-bit error		
FlexRay RAM - Data ECC 1-bit error	FLXA0 MRAM data ECC 1-bit error	129	—
	FLXA0 TBFRAM A data ECC 1-bit error		
	FLXA0 TBFRAM B data ECC 1-bit error		
	FLXA1 MRAM data ECC 1-bit error		
	FLXA1 TBFRAM A data ECC 1-bit error

	sDMAC1 DPRAM data ECC error address buffer overflow error		
	sDMAC1 DATARAM data ECC error address buffer overflow error		

44.3.2.8 Error Notifications for Data Transfer Path

The error notifications of Data Transfer Path are listed in the following table.

Table 44.12 Error Notifications for Data Transfer Path (1/2)

Error Notification	Description	ECM Error Number	Error Response to bus master
Data transfer path - Address EDC error	Data transfer path in Code Flash address EDC 2-bit error (CCIB, bridge from System Bus to Global FLASH Bus)	160	√/— *2
	Data transfer path in CRAM address EDC 2-bit error (Bridge from System Bus to CRAM Bus, CRAMC)		
	Data transfer path in LRAM address EDC 2-bit error (Bridge from System Bus to Inter-processor element Bus, VCIS I/F in PE)		
	Data transfer path in I-Bus address EDC 2-bit error (Slave modules on I-Bus)		
	Data transfer path in AXI2PVCI bridge address EDC 2-bit error (Bridge from System Bus to P-Bus)		
	Data transfer path in P-Bus address EDC 2-bit error (Slave modules on P-Bus)		
	Data transfer path in remap module address EDC 2-bit error (GCFU for Local FLASH Bus during remap, bridge from Global FLASH Bus to System Bus, GCFU for Global FLASH Bus during remap)		
	Data transfer path in H-Bus address EDC 2-bit error (Slave modules on H-Bus)		
	Data transfer path in Code Flash address EDC 1-bit error (CCIB, bridge from System Bus to Global FLASH Bus)		
	Data transfer path in CRAM address EDC 1-bit error (Bridge from System Bus to CRAM Bus, CRAMC)		
	Data transfer path in LRAM address EDC 1-bit error (Bridge from System Bus to Inter-processor element Bus, VCIS I/F in PE)		
	Data transfer path in I-Bus address EDC 1-bit error (Slave modules on I-Bus)		
	Data transfer path in AXI2PVCI bridge address EDC 1-bit error (Bridge from System Bus to P-Bus)		
	Data transfer path in P-Bus address EDC 1-bit error (Slave modules on P-Bus)		
	Data transfer path in remap module address EDC 1-bit error (GCFU for Local FLASH Bus during remap, bridge from Global FLASH Bus to System Bus, GCFU for Global FLASH Bus during remap)		
	Data transfer path in H-Bus address EDC 1-bit error (Slave modules on H-Bus)		

Table 44.12 Error Notifications for Data Transfer Path (2/2)

Error Notification	Description	ECM Error Number	Error Response to bus master
Data transfer path - data ECC 2-bit error	Data transfer path in CRAM data ECC 2-bit error (RMW-write in CRAMC, RMW-cdata in CRAMC)	161	√/—*2
	Data transfer path in DMAC/DTS data ECC 2-bit error (sDMAC masters, DTS master)		
	Data transfer path in LRAM data ECC 2-bit error (VCIS I/F in PE)		
	Data transfer path in I-Bus data ECC 2-bit error (slave modules on I-Bus)		
	Data transfer path in PE for read data from peripherals data ECC 2-bit error (VCIM I/F in PE)		
	Data transfer path in VCI2AXI bridge for write/read data data ECC 2-bit error (RMW-read in bridge from Inter-processor element Bus to System Bus, RMW-write bridge from Inter-processor element Bus to System Bus)		
	Data transfer path in P-Bus data ECC 2-bit error (Slave modules on P-Bus)		
	Data transfer path in remap module data ECC 2-bit error (Bridge from Global FLASH Bus to System Bus)		
	Data transfer path in H-Bus data ECC 2-bit error (Master/slave modules on H-Bus)		
Data transfer path - data ECC 1-bit error	Data transfer path in CRAM data ECC 1-bit error (RMW-write in CRAMC, RMW-cdata in CRAMC)	162	√/— *1, *2
	Data transfer path in DMAC/DTS data ECC 1-bit error (sDMAC masters, DTS master)		
	Data transfer path in LRAM data ECC 1-bit error (VCIS I/F in PE)		
	Data transfer path in I-Bus data ECC 1-bit error (Slave modules on I-Bus)		
	Data transfer path in PE for read data from peripherals data ECC 1-bit error (VCIM I/F in PE)		
	Data transfer path in VCI2AXI bridge for write/read data data ECC 1-bit error (RMW-read in bridge from Inter-processor element Bus to System Bus, RMW-write bridge from Inter-processor element Bus to System Bus)		
	Data transfer path in P-Bus data ECC 1-bit error (Slave modules on P-Bus)		
	Data transfer path in remap module data ECC 1-bit error (Bridge from Global FLASH Bus to System Bus)		
	Data transfer path in H-Bus data ECC 1-bit error (Master/slave modules on H-Bus)		

Note 1. It depends on setting of ECC 1-bit error correction disable bit (SECDIS). When ECC 1-bit error correction is disabled (SECDIS=1), it causes Error Response. When ECC 1-bit error correction is enabled (SECDIS=0), it doesn't cause Error Response.

Note 2. ECC modules on H-Bus don't make Error response.

44.3.3 Key Code Protection for ECC Control Registers

44.3.3.1 Overview

The product incorporates key code register to protect ECC control registers from unintended access.

44.3.3.2 List of Registers

Table 44.13 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCKCPROT (P-Bus Group 0)	ECC Control Key Code Protection register	ECCKCPROT	FFFB 2800$_H$	32	—	—

44.3.3.3 ECCKCPROT — ECC Control Key Code Protection Register

This register is used for protection against writing to the ECC control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FFFB 2800$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.14 ECCKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit*2 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing protected registers.
Write A5A5A501$_H$ to this register to enable writing protected registers.

Note 2. Unlocking this protection is one of necessary conditions to enable writing the protected registers. It is also necessary to unlock security protection driven by the ICUMHA when ICUMHA function is active. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

44.3.4 Code Flash ECC and Address Parity

44.3.4.1 Overview

The code flash ECC is summarized in the table below.

Table 44.15 Code Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled; 1-bit error detection and correction and 2-bit error detection are carried out.
Address parity	Address parity check can be either enabled or disabled. When enabled, Address parity is checked during address decoding. When disabled, no address parity check is carried out. In the initial state, this function is enabled.
Error notification	The occurrence of an ECC error or a parity error is reported to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. **Address Parity Error:** • Error notification can be either enabled or disabled upon detection of an address parity error. In the initial state, error notification is enabled upon detection of an address parity error. **Overflow Error:** • Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error. In the initial state, error notification is enabled upon detection of an address buffer overflow error. An ECC 2-bit error, an ECC 1-bit error, an address parity error, and an overflow error are handled as individual sources in ECM. An ECC 1-bit error signal is only issued to the ECM if the ECC 1-bit error address is not yet stored in the error address buffer.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error detection, and address parity error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address parity error is detected. The error status serves as the enable bit of the capture address. Address buffers are updated if the error status is cleared. Multi-stage address buffers are provided for an ECC 1-bit error. ECC 1-bit error: Four stages ECC 2-bit error, address parity error shared: One stage
Self-diagnosis	The ROM data and the ECC and address parity bits in Code Flash can be read directly. Self-diagnosis of ECC and address parity is possible by reading data from ECC test area.

44.3.4.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 44.16 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ECCCNT_CFP_PE0CL0_base>	FFC4 8000_H	P-Bus Group 0
<ECCCNT_CFP_PE1CL0_base>	FFC4 8080_H	P-Bus Group 0
<ECCCNT_CFP_PE2CL1_base>*1	FFC4 8100_H	P-Bus Group 0
<ECCCNT_CFP_PE3CL1_base>*1	FFC4 8180_H	P-Bus Group 0
<ECCCNT_CFCCL0_base>	FFC4 8800_H	P-Bus Group 0
<ECCCNT_CFCCL1_base>*1	FFC4 8880_H	P-Bus Group 0
<ECCCNT_CFS_base>	FFC4 $8A00_H$	P-Bus Group 0
<MECCCAP_CFL_base>	FFC5 2400_H	P-Bus Group 0

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.4.3 List of Registers

Table 44.17 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCCNT_CFP_PEnCL0 (n = 0, 1)	ECC control register	CFPECCCTL	<ECCCNT_CFP_PEnCL0_base> + 00_H	8, 16, 32	*1	ECCKCPROT
ECCCNT_CFP_PEnCL1 (n = 2, 3)*3	ECC control register	CFPECCCTL	<ECCCNT_CFP_PEnCL1_base> + 00_H	8, 16, 32	*2	ECCKCPROT
ECCCNT_CFCCL0	ECC control register	CFCECCCTL	<ECCCNT_CFCCL0_base> + 00_H	8, 16, 32	PBG00#3	ECCKCPROT
ECCCNT_CFCCL1*3	ECC control register	CFCECCCTL	<ECCCNT_CFCCL1_base> + 00_H	8, 16, 32	PBG00#4	ECCKCPROT
ECCCNT_CFS	ECC control register	CFSECCCTL	<ECCCNT_CFS_base> + 00_H	8, 16, 32	PBG00#2	ECCKCPROT
MECCCAP_CFL	Error notification control register	CF_ERRINT	<MECCCAP_CFL_base> + 00_H	8, 16, 32	PBG00#2	ECCKCPROT
	1-bit error status clear register	CF_SSTCLR	<MECCCAP_CFL_base> + 10_H	8, 16, 32	PBG00#2	—
	Fatal error status clear register	CF_DSTCLR	<MECCCAP_CFL_base> + 14_H	8, 16, 32	PBG00#2	—
	1-bit error overflow status clear register	CF_OVFCLR	<MECCCAP_CFL_base> + 18_H	8, 16, 32	PBG00#2	—
	1-bit error status register	CF_SERSTR	<MECCCAP_CFL_base> + 20_H	8, 16, 32	PBG00#2	—
	Fatal error status register	CF_DERSTR	<MECCCAP_CFL_base> + 24_H	8, 16, 32	PBG00#2	—
	1-bit error overflow status register	CF_OVFSTR	<MECCCAP_CFL_base> + 28_H	8, 16, 32	PBG00#2	—
	1-bit error location information register	CF_SERINF	<MECCCAP_CFL_base> + 30_H	32	PBG00#2	—

Table 44.17 List of Registers (2/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
MECCCAP_CFL	1st 1-bit error address register	CF_00SEADR	<MECCCAP_CFL_base> + 70_H	32	PBG00#2	—
	2nd 1-bit error address register	CF_01SEADR	<MECCCAP_CFL_base> + 74_H	32	PBG00#2	—
	3rd 1-bit error address register	CF_02SEADR	<MECCCAP_CFL_base> + 78_H	32	PBG00#2	—
	4th 1-bit error address register	CF_03SEADR	<MECCCAP_CFL_base> + $7C_H$	32	PBG00#2	—
	1st fatal error address register	CF_00DEADR	<MECCCAP_CFL_base> + $F0_H$	32	PBG00#2	—

Note 1. n=0: PBG01#0
n=1: PBG01#1

Note 2. n=2: PBG01#2
n=3: PBG01#3

Note 3. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Table 44.18 The relation between the module storing the error and the error source for Code Flash

Protection target	Function	Controlled by	Captured to	Applicable for
Data from CodeFlash at Code Flash I/F in PE0	Data ECC decode	ECCCNT_CFP_PE0CL0	MECCCAP_CFL	Instruction from CodeFlash area
				Load data from CodeFlash area
Data from CodeFlash at Code Flash I/F in PE1		ECCCNT_CFP_PE1CL0		Instruction from CodeFlash area
				Load data from CodeFlash area
Data from CodeFlash at Code Flash I/F in PE2*1		ECCCNT_CFP_PE2CL1		Instruction from CodeFlash area
				Load data from CodeFlash area
Data from CodeFlash at Code Flash I/F in PE3*1		ECCCNT_CFP_PE3CL1		Instruction from CodeFlash area
				Load data from CodeFlash area
Data from CodeFlash at CCIB (Cluster0)		ECCCNT_CFCCL0		Read data from CodeFlash area bank A/B in cluster 0
Data from CodeFlash at CCIB (Cluster1)*1		ECCCNT_CFCCL1		Read data from CodeFlash area bank C/D in cluster 1
Data from CodeFlash at SAXI2FAXI (bridge from System Bus to Global Flash Bus)		ECCCNT_CFS		Read data from CodeFlash area
Address to CodeFlash at CCIB (Cluster0)	Address parity check	ECCCNT_CFCCL0		Request address to CodeFlash area
Address to CodeFlash at CCIB (Cluster1)*1		ECCCNT_CFCCL1		Request address to CodeFlash area

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.4.4 CFPECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data from CodeFlash to PE.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CFP_PEnCL0_base> + 00_H (n = 0, 1)
<ECCCNT_CFP_PEnCL1_base> + 00_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEC DIS	ECC DIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 44.19 CFPECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	ECC 1-bit error correction disable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correction is enabled when 1-bit error is detected 1: Correction is disabled when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled.

44.3.4.5 CFCECCCTL — ECC Control Register

This register controls address parity error detection, ECC error detection/correction and 1-bit error correction for read data from CodeFlash.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CFCCL0_base> + 00_H
<ECCCNT_CFCCL1_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.20 CFCECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	BLANKMASKENABLE	Blank read error mask bit Enable/disable ECC error and address parity error detection when reading blank data from CodeFlash 0: Blank read errors are checked 1: Blank read errors are ignored
23 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	APEDIS	Address parity error disable bit Setting address parity error detection to enable/disable. 0: Address parity error detection is enabled 1: Address parity error detection is disabled
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.4.6 CFSECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data to SAXI2FAXI bridge.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CFS_base> + 00_H

Value after reset: $0000\ 0000_H$

Table 44.21 CFSECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.4.7 CF_ERRINT — Error Notification Control Register

This register controls whether error information is reported to the ECM when an address parity error, ECC error and/or overflow error has occurred.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 00_H

Value after reset: $0000\ 0087_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.22 CF_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	SEOVFIE	Controls error reports when overflow error occurs. 0: Overflow error report disabled 1: Overflow error report enabled
6 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	APEIE	Controls error reports when address parity error is detected. 0: Address parity error report disabled 1: Address parity error report enabled
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.4.8 CF_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in CF_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Table 44.23 CF_SSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When writing, write the value after reset.
3	SSTCLR03	Writing 1 to this bit clears SEDF03 in CF_SERSTR.
2	SSTCLR02	Writing 1 to this bit clears SEDF02 in CF_SERSTR.
1	SSTCLR01	Writing 1 to this bit clears SEDF01 in CF_SERSTR.
0	SSTCLR00	Writing 1 to this bit clears SEDF00 in CF_SERSTR.

44.3.4.9 CF_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in CF_DERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DST CLR00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.24 CF_DSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DSTCLR00	Writing 1 to this bit clears APEF00 and DEDF00 in CF_DERSTR.

44.3.4.10 CF_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in CF_OVFSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SERR OVF CLR1	SERR OVF CLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 44.25 CF_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in CF_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in CF_OVFSTR.

44.3.4.11 CF_SERSTR — 1-bit Error Status Register

This register indicates whether an ECC 1-bit error has occurred. The location and address of the error that is detected are stored in CF_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is “0”. If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in CF_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SEDF 03	SEDF 02	SEDF 01	SEDF 00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.26 CF_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	SEDF03	Indicates that an ECC 1-bit error was detected and error address is stored in CF_03SEADR register.
2	SEDF02	Indicates that an ECC 1-bit error was detected and error address is stored in CF_02SEADR register.
1	SEDF01	Indicates that an ECC 1-bit error was detected and error address is stored in CF_01SEADR register.
0	SEDF00	Indicates that an ECC 1-bit error was detected and error address is stored in CF_00SEADR register.

44.3.4.12 CF_DERSTR — Fatal Error Status Register

This register indicates whether an address parity error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in CF_00DEADR register when APEF00 and/or DEDF00 flags are set. The APEF00 and/or DEDF00 flag is set only when an address parity error and/or an ECC 2-bit error is detected while all the flags are “0”. Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in CF_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	APEF00	DEDF00	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.27 CF_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	APEF00	Indicates that an address parity error was detected.
1	DEDF00	Indicates that an ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.4.13 CF_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether an overflow of the address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address with errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in CF_OVFCLR register respectively.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CFL_base> + 28_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.28 CF_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that ECC 1-bit error s over working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error is detected when all ECC 1-bit error flags in CF_SERSTR are set.

44.3.4.14 CF_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in CF_SERSTR register were detected.

This register is updated whenever CF_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_CFL_base> + 30_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEDLINF16

Table 44.29 CF_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned.
16	SEDLINF16	Indicates that an ECC 1-bit error was detected in read data from CodeFlash to SAXI2FAXI.
15 to 8	Reserved	When read, the value after reset is returned.
7	SEDLINF07	Indicates that an ECC 1-bit error was detected in read data loaded from CodeFlash to PE3.*1
6	SEDLINF06	Indicates that an ECC 1-bit error was detected in read data fetched from CodeFlash to PE3.*1
5	SEDLINF05	Indicates that an ECC 1-bit error was detected in read data loaded from CodeFlash to PE2.*1
4	SEDLINF04	Indicates that an ECC 1-bit error was detected in read data fetched from CodeFlash to PE2.*1
3	SEDLINF03	Indicates that an ECC 1-bit error was detected in read data loaded from CodeFlash to PE1.
2	SEDLINF02	Indicates that an ECC 1-bit error was detected in read data fetched from CodeFlash to PE1.
1	SEDLINF01	Indicates that an ECC 1-bit error was detected in read data loaded from CodeFlash to PE0.
0	SEDLINF00	Indicates that an ECC 1-bit error was detected in read data fetched from CodeFlash to PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.4.15 CF_nSEADR — n-th 1-bit Error Address Register (n = 00 to 03)

This register is used to hold the address and the location of the error when the corresponding SEDFn flag is set.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_CFL_base> + n × 4_H + 70_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEDL[4:0]					—	SEADR0[25:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.30 CF_nSEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26	Reserved	When read, the value after reset is returned.
25 to 2	SEADR0[25:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each SEDL indicates.

Table 44.31 SEDL information

SEDL[4:0]	Indicated information
31 to 17	Reserved
16	Indicates an ECC 1-bit error is detected in loading data from CodeFlash by any master except PEs.
15 to 8	Reserved
7	Indicates an ECC 1-bit error is detected in loading data from CodeFlash by PE3*1 master.
6	Indicates an ECC 1-bit error is detected in fetching instructions from CodeFlash by PE3*1 master.
5	Indicates an ECC 1-bit error is detected in loading data from CodeFlash by PE2*1 master.
4	Indicates an ECC 1-bit error is detected in fetching instructions from CodeFlash by PE2*1 master.
3	Indicates an ECC 1-bit error is detected in loading data from CodeFlash by PE1 master.
2	Indicates an ECC 1-bit error is detected in fetching instructions from CodeFlash by PE1 master.
1	Indicates an ECC 1-bit error is detected in loading data from CodeFlash by PE0 master.
0	Indicates an ECC 1-bit error is detected in fetching instructions from CodeFlash by PE0 master.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.4.16 CF_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither APEF00 nor DEDF00 flag is set and an address parity error and/or ECC 2-bit error was detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_CFL_base> + $F0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.32 CF_00DEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26	Reserved	When read, the value after reset is returned.
25 to 2	DEADR0[25:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each DEDL indicates.

Table 44.33 DEDL Information

DEDL[4:0]	Indicated information
31 to 17	Reserved
16	Indicates a fatal error is detected in loading data from CodeFlash by any master except PEs.
15 to 8	Reserved
7	Indicates a fatal error is detected in loading data from CodeFlash by PE3*1 master.
6	Indicates a fatal error is detected in fetching instructions from CodeFlash by PE3*1 master.
5	Indicates a fatal error is detected in loading data from CodeFlash by PE2*1 master.
4	Indicates a fatal error is detected in fetching instructions from CodeFlash by PE2*1 master.
3	Indicates a fatal error is detected in loading data from CodeFlash by PE1 master.
2	Indicates a fatal error is detected in fetching instructions from CodeFlash by PE1 master.
1	Indicates a fatal error is detected in loading data from CodeFlash by PE0 master.
0	Indicates a fatal error is detected in fetching instructions from CodeFlash by PE0 master.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.4.17 Test Function

(1) Reading Code Flash

(a) Set ECCDIS bit in CFPECCCTL register to 1 to disable ECC error detection and correction.

(b) When ECCDIS=1, neither error detection nor correction proceeds when the code flash is read; the data output from the code flash is read unchanged.

How to exit this test mode:

(a) Set ECCDIS bit in CFPECCCTL register to 0 to enable ECC error detection and correction.

(2) Reading the ECC and address parity bits

(a) When the Blank check area of Code Flash is read, the ECC and address parity bits of corresponding address are read. The bit assign is as follows:

Table 44.34 Bit assign of read data when the Blank check area of Code Flash is read

Bit Position	Function
31 to 16	Always 0
15	Blank Flag
14 to 11	Always 0
10	Address parity bit
9 to 0	ECC bits for Code Flash 256bit data

(3) Self-diagnosis of ECC and address parity check function

Self-diagnosis of the ECC decoder and address parity checker for the access ports is possible by reading data from ECC test area.

For details about the ECC test area, refer to *RH850/U2Ax Safety Application Note*.

For the address location of the ECC test area, refer to **Section 4, Address Space**.

44.3.5 Data Flash ECC

44.3.5.1 Overview

The data flash ECC is summarized in the table below.

Table 44.35 Data Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out.
Error notification	Upon occurrence of an ECC error, it is notified to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. • Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. **Overflow Error:** • Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC error. In the initial state, error notification is enabled upon detection of an address buffer overflow error. An ECC 2-bit error, an ECC 1-bit error and an overflow error are handled as individual sources in ECM.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the capture address. If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured.
Self-diagnosis	The ROM data and the ECC bits in Data Flash can be read directly. Desired values can be written to the data and the ECC bits in Data Flash.

44.3.5.2 List of Registers

Table 44.36 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCDF (P-Bus Group 1)	Data Flash ECC control register	DFECCCTL	FFC6 2C00$_H$	16, 32	PBG10#2	DFKCPROT
	Data Flash error status register	DFERSTR	FFC6 2C04$_H$	32	PBG10#2	—
	Data Flash error status clear register	DFERSTC	FFC6 2C08$_H$	8, 16, 32	PBG10#2	—
	Data Flash error overflow status register	DFOVFSTR	FFC6 2C0C$_H$	32	PBG10#2	—
	Data Flash error overflow status clear register	DFOVFSTC	FFC6 2C10$_H$	8, 16, 32	PBG10#2	—
	Data Flash error notification control register	DFERRINT	FFC6 2C14$_H$	8, 16, 32	PBG10#2	DFKCPROT
	Data Flash 1st error address register	DFEADR	FFC6 2C18$_H$	32	PBG10#2	—
	Data flash test control register	DFTSTCTL	FFC6 2C1C$_H$	16, 32	PBG10#2	DFKCPROT
	Data Flash ECC key code protection register	DFKCPROT	FFC6 2C20$_H$	32	PBG10#2	—

Table 44.37 The relation between the module storing the error and the error source for Data Flash

Protection target	Function	Controlled by	Captured to	Applicable for
Data Flash	Data ECC decode	ECCDF	ECCDF	Read data from Data Flash area

44.3.5.3 DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and 1-bit error correction for read access.

DFECCCTL register is protected by DFKCPROT register.

Access: This register can be read or write in 32-bit or 16-bit units.

Address: FFC6 2C00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 44.38 DFECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correction is enabled when 1-bit error is detected. 1: Correction is disabled when 1-bit error is detected.
0	ECCDIS	ECC Disable Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled. 1: ECC error detection/correction is disabled.

44.3.5.4 DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

SEDF bit is set if an ECC 1-bit error is detected while ECC error detection/correction is enabled (ECCDIS = 0), and the DEDF bit is set if an ECC 2-bit error is detected.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC6 2C04$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF	SEDF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.39 DFERSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: An ECC 2-bit error is not generated. 1: An ECC 2-bit error is generated. Clearing condition: ERRCLR bit is set in Data Flash error status clear register. Setting condition: ECC 2-bit error is generated.
0	SEDF	ECC 1-bit error Monitor Flag 0: An ECC 1-bit error is not generated. 1: An ECC 1-bit error is generated. Clearing condition: ERRCLR bit is set in Data Flash error status clear register. Setting condition: ECC 1-bit error is generated with both SEDF and DEDF being 0.

44.3.5.5 DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the Data Flash error status register. DFERSTC is a write-only register and is always read as 0.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: FFC6 2C08$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERR CLR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.40 DFERSTC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

44.3.5.6 DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of Data Flash error overflow.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC6 2C0C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERR OVF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.41 DFOVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF	Error Overflow Flag ERROVF is set if the following occur: • An ECC 1-bit error occurs when DFERSTR.SEDF = 1 and access address is different from DFEADR. • An ECC 1-bit error occurs when DFERSTR.DEDF = 1 • An ECC 2-bit error occurs when DFERSTR.SEDF = 1 • An ECC 2-bit error occurs when DFERSTR.DEDF = 1 and access address is different from DFEADR. 0: Did not occur 1: Occurred Clearing condition: Set the ERROVFCLR bit in DFOVFSTC to 1.

44.3.5.7 DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the Data Flash error overflow flag.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: FFC6 2C10$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERR OVF CLR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.42 DFOVFSTC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	ERROVFCLR	Error Overflow Flag Clear 0: No effect (Setting the ERROVFCLR bit to 0 does not affect the flag in DFOVFSTR.) 1: The ERROVF flag in the DFOVFSTR register is cleared.

44.3.5.8 DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal to ECM upon detection of an ECC 2-bit error or an ECC 1-bit error.

DFERRINT register is protected by DFKCPROT register.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: FFC6 2C14$_H$

Value after reset: 0000 0007$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	EOVFIE	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 44.43 DFERRINT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	EOVFIE	ECC Error Address Overflow Notification Control Enables or disables generation of the error notification signal upon detection of an address buffer overflow error. 0: Error address overflow report disabled 1: Error address overflow report enabled
1	DEDIE	ECC 2-bit error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection/correction is enabled (ECCDIS = 0). 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-bit error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection/correction is enabled (ECCDIS = 0). 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

44.3.5.9 DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address if the following occur:

- An ECC 1-bit error occurs when DFERSTR.SEDF = 0 and DFERSTR.DEDF = 0
- An ECC 2-bit error occurs when DFERSTR.DEDF = 0

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC6 2C18$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DFEADR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DFEADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.44 DFEADR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20 to 2	DFEADR[20:2]	ECC Error Address DFEADR is a read-only field to monitor the address at which an ECC error has occurred. This register holds an internal address. Convert it to the actual address by adding the data flash base address described in **Section 4, Address Space**.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

44.3.5.10 DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for ECC testing.

The data of the ECC bit can be read after setting the ECC test mode (ECCTST = 1).

DFTSTCTL register is protected by DFKCPROT register.

Access: This register can be read or written in 32-bit or 16-bit units.

Address: FFC6 2C1C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC TST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.45 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test By setting ECC test mode bit to “1” (ECCTST = 1), CPU can read ECC bit.

44.3.5.11 DFKCPROT — Data Flash ECC Key Code Protection Register

DFKCPROT is used for access protection of other Data Flash ECC registers.

Protected registers:

DFECCCTL

DFERRINT

DFTSTCTL

Access: This register can be read or written in 32-bit units.

Address: FFC6 2C20$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.46 DFKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing protected registers.
Write A5A5A501$_H$ to this register to enable writing protected registers.

44.3.5.12 Test Function

Data in the ROM and the ECC bits can be read by setting the data flash test control register (DFTSTCTL).

(1) Reading the ROM data

(a) Set ECCDIS bit in the data flash ECC control register to 1 to disable ECC error detection and correction.

(b) When ECCDIS = 1, neither error detection nor correction proceeds when the data flash is read; the data output from the data flash is read unchanged.

How to exit this test mode:

(a) Set ECCDIS bit in the data flash ECC control register to 0 to enable ECC error detection and correction.

(2) Reading the ECC bits

(a) Set ECCDIS bit in the data flash ECC control register to 1 to disable ECC error detection and correction.

(b) Set ECCTST bit in the data flash test control register to 1 to set test mode.

(c) When the data flash is read, the 7 lower-order bits of read data are read as ECC data.

How to exit this test mode:

(a) Set ECCDIS bit in the data flash ECC control register to 0 to enable ECC error detection and correction.

(b) Set ECCTST bit in the data flash test control register to 0 to set normal mode.

(3) Self-diagnosis of ECC check function

Self-diagnosis of the ECC decoder is possible by writing incorrect data to the data flash memory beforehand (fault injection) and then reading this data. A 1- or 2-bit ECC error fault can be injected by generating correct ECC bits once and inverting only the appropriate bits. For details on programming of the data flash, refer to the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

44.3.6 Local RAM (CPUs) ECC and Address Feedback

44.3.6.1 Overview

Local RAM ECC of CPUs is summarized in the table below.

Table 44.47 Local RAM ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected: • ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out.
Address feedback	Address feedback check can be either enabled or disabled. When enabled, Address feedback error detection is carried out. When disabled, no error detection is carried out. In the initial state, this function is enabled.
Error notification	The occurrence of an ECC error or an address feedback error is reported to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. **Address Feedback Error:** • Error notification can be either enabled or disabled upon detection of an address feedback error. In the initial state, error notification is enabled upon detection of an address feedback error. **Overflow Error:** • Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error. In the initial state, error notification is enabled upon detection of an address buffer overflow error. The error notification signal for both an address feedback error and an ECC 2-bit error is handled as one source in ECM. An ECC 1-bit error and an overflow error are handled as individual sources in ECM. An ECC 1-bit error signal is only issued to the ECM, if the ECC 1-bit error address is not yet stored in the error address buffer.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error detection, and address feedback error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address feedback error is detected. The error status serves as the enable bit of the address that is captured. Address buffers are updated if the error status is cleared. Multi-stage address buffers are provided for an ECC 1-bit error. ECC 1-bit error: Eight stages (for each CPU) ECC 2-bit error and address feedback error: One stage (for each CPU)
Self-diagnosis	Desired values can be written to the RAM data and the ECC. The RAM data can be read directly and the ECC can be read via Read Buffer Register in ECC Test Mode. Moreover, the error injection to an address feedback checker is possible by setting AFINV.

ECC of Local RAM is provided for each 32 bits of data and each 32-bit data is called bank 0 to 3. The relationship between addresses and bank numbers are as follows.

Table 44.48 Relationship between addresses and bank numbers

4 lower-order bits of address (Hexadecimal Notation)	F_H to C_H	B_H to 8_H	7_H to 4_H	3_H to 0_H
Bank number	Bank 3	Bank 2	Bank 1	Bank 0

44.3.6.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.49 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ECCCNT_LR_PE0CL0_base>	FFC4 9800_H	P-Bus Group 0
<ECCCNT_LR_PE1CL0_base>	FFC4 9880_H	P-Bus Group 0
<ECCCNT_LR_PE2CL1_base>*1	FFC4 9900_H	P-Bus Group 0
<ECCCNT_LR_PE3CL1_base>*1	FFC4 9980_H	P-Bus Group 0
<MECCCAP_LR_PE0CL0_base>	FFC5 0000_H	P-Bus Group 0
<MECCCAP_LR_PE1CL0_base>	FFC5 0100_H	P-Bus Group 0
<MECCCAP_LR_PE2CL1_base>*1	FFC5 0200_H	P-Bus Group 0
<MECCCAP_LR_PE3CL1_base>*1	FFC5 0300_H	P-Bus Group 0
<MECCCAP_LRA_base>	FFC5 0800_H	P-Bus Group 0

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.6.3 List of Registers

Table 44.50 List of Registers (1/3)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCCNT_LR_PEnCL0 (n = 0, 1)	ECC control register	LRECCCTL	<ECCCNT_LR_PEnCL0_base> + 00_H	8, 16, 32	*1	ECCKCPROT
	ECC test control register	LRECCTSTCTL	<ECCCNT_LR_PEnCL0_base> + 10_H	8, 16, 32	*1	ECCKCPROT

	4th 1-bit error address register	LR1_03SEADR	<MECCCAP_LRA_base> + $7C_H$	32	PBG00#2	—
	5th 1-bit error address register	LR1_04SEADR	<MECCCAP_LRA_base> + 80_H	32	PBG00#2	—
	6th 1-bit error address register	LR1_05SEADR	<MECCCAP_LRA_base> + 84_H	32	PBG00#2	—
	7th 1-bit error address register	LR1_06SEADR	<MECCCAP_LRA_base> + 88_H	32	PBG00#2	—
	8th 1-bit error address register	LR1_07SEADR	<MECCCAP_LRA_base> + $8C_H$	32	PBG00#2	—
	1st fatal error address register	LR1_00DEADR	<MECCCAP_LRA_base> + $F0_H$	32	PBG00#2	—

Note 1. n=0: PBG01#0
n=1: PBG01#1

Note 2. n=2: PBG01#2
n=3: PBG01#3

Note 3. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Table 44.51 The relation between the module storing the error and the error source for Local RAM

Protection target	Function	Controlled by	Captured to	Applicable for
Data from LRAM at LRAM I/F in PE0	Data ECC decode	ECCCNT_LR_PE0CL0	MECCCAP_LR_PE0CL0	Read data from LRAM area of PE0 requested by PE0 master
			MECCCAP_LR_PE0CL0	Read data from LRAM area of PE0 requested by other than PEs
			MECCCAP_LR_PE0CL0	Read data from LRAM area of PE0 requested by other PEs in non-speculative access*1
			MECCCAP_LRA	Read data from LRAM area of PE0 requested by other PEs in speculative access*1
Data from LRAM at LRAM I/F in PE1	Data ECC decode	ECCCNT_LR_PE1CL0	MECCCAP_LR_PE1CL0	Read data from LRAM area of PE1 requested by PE1 master
			MECCCAP_LR_PE1CL0	Read data from LRAM area of PE1 requested by other than PEs
			MECCCAP_LR_PE1CL0	Read data from LRAM area of PE1 requested by other PEs in non-speculative access*1
			MECCCAP_LRA	Read data from LRAM area of PE1 requested by other PEs in speculative access*1
Data from LRAM at LRAM I/F in PE2*2	Data ECC decode	ECCCNT_LR_PE2CL1	MECCCAP_LR_PE2CL1	Read data from LRAM area of PE2 requested by PE2 master
			MECCCAP_LR_PE2CL1	Read data from LRAM area of PE2 requested by other than PEs
			MECCCAP_LR_PE2CL1	Read data from LRAM area of PE2 requested by other PEs in non-speculative access*1
			MECCCAP_LRA	Read data from LRAM area of PE2 requested by other PEs in speculative access*1
Data from LRAM at LRAM I/F in PE3*2	Data ECC decode	ECCCNT_LR_PE3CL1	MECCCAP_LR_PE3CL1	Read data from LRAM area of PE3 requested by PE3 master
			MECCCAP_LR_PE3CL1	Read data from LRAM area of PE3 requested by other than PEs
			MECCCAP_LR_PE3CL1	Read data from LRAM area of PE3 requested by other PEs in non-speculative access*1
			MECCCAP_LRA	Read data from LRAM area of PE3 requested by other PEs in speculative access*1
Address to LRAM at LRAM I/F in PE0	Address feedback check	ECCCNT_LR_PE0CL0	MECCCAP_LR_PE0CL0	Request address to LRAM area of PE0
Address to LRAM at LRAM I/F in PE1		ECCCNT_LR_PE1CL0	MECCCAP_LR_PE1CL0	Request address to LRAM area of PE1
Address to LRAM at LRAM I/F in PE2*2		ECCCNT_LR_PE2CL1	MECCCAP_LR_PE2CL1	Request address to LRAM area of PE2
Address to LRAM at LRAM I/F in PE3*2		ECCCNT_LR_PE3CL1	MECCCAP_LR_PE3CL1	Request address to LRAM area of PE3

Note 1. For details about speculative access, refer to **Section 3, CPU System**.

Note 2. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.6.4 LRECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data from Local RAM and address feedback error detection for request address to Local RAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_LR_PEnCL0_base> + 00_H (n = 0, 1)
<ECCCNT_LR_PEnCL1_base> + 00_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AFE DIS	—	SEC DIS	ECC DIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W

Table 44.52 LRECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEDIS	Address feedback error disable bit Sets address feedback error detection to enable/disable. 0: Address feedback error detection is enabled 1: Address feedback error detection is disabled
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.6.5 LRECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), either data field or ECC field of Local RAM can be written separately.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_LR_PEnCL0_base> + 10_H (n = 0, 1)
<ECCCNT_LR_PEnCL1_base> + 10_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC TST	DAT SEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 44.53 LRECCTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	Sets the write mode to Local RAM. 0: Normal mode 1: Test mode Either data field or ECC field can be written according to DATSEL setting in test mode.
0	DATSEL	Sets the field to write data when ECCTST = 1. 0: Data field only 1: ECC field only

44.3.6.6 LRAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from Local RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_LR_PEnCL0_base> + 20_H (n = 0, 1)
<ECCCNT_LR_PEnCL1_base> + 20_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	AFINV[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 44.54 LRAFINV Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 4	AFINV[20:4]	Specifies bit pattern to inject errors into feedback address.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.6.7 LRTDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Local RAM for self-diagnosis. ECC field in requested address can be stored this register while reading from Local RAM where ECCTST = 1.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_LR_PEnCL0_base> + 60_H (n = 0, 1)
<ECCCNT_LR_PEnCL1_base> + 60_H (n = 2, 3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	BFECC3[6:0]							—	BFECC2[6:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.55 LRTDATBFECCF Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 24	BFECC3[6:0]	ECC field read from the address that is requested in Local RAM bank 3
23	Reserved	When read, the value after reset is returned.
22 to 16	BFECC2[6:0]	ECC field read from the address that is requested in Local RAM bank 2
15	Reserved	When read, the value after reset is returned.
14 to 8	BFECC1[6:0]	ECC field read from the address that is requested in Local RAM bank 1
7	Reserved	When read, the value after reset is returned.
6 to 0	BFECC0[6:0]	ECC field read from the address that is requested in Local RAM bank 0

44.3.6.8 LR0_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address feedback error, ECC error and/or overflow error has occurred.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 00_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 00_H (n = 2, 3)

Value after reset: $0000\ 008B_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.56 LR0_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	SEOVFIE	Controls error reports when overflow error occurs. 0: Overflow error report disabled 1: Overflow error report enabled
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEIE	Controls error reports when address feedback error is detected. 0: Address feedback error report disabled 1: Address feedback error report enabled
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.6.9 LR0_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in LR0_SERSTR. This is a write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 10_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 10_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Table 44.57 LR0_SSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset
7	SSTCLR07	Writing 1 to this bit clears SEDF07 in LR0_SERSTR.
6	SSTCLR06	Writing 1 to this bit clears SEDF06 in LR0_SERSTR.
5	SSTCLR05	Writing 1 to this bit clears SEDF05 in LR0_SERSTR.
4	SSTCLR04	Writing 1 to this bit clears SEDF04 in LR0_SERSTR.
3	SSTCLR03	Writing 1 to this bit clears SEDF03 in LR0_SERSTR.
2	SSTCLR02	Writing 1 to this bit clears SEDF02 in LR0_SERSTR.
1	SSTCLR01	Writing 1 to this bit clears SEDF01 in LR0_SERSTR.
0	SSTCLR00	Writing 1 to this bit clears SEDF00 in LR0_SERSTR.

44.3.6.10 LR0_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in LR0_DERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 14_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 14_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Table 44.59 LR0_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in LR0_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in LR0_OVFSTR.

44.3.6.12 LR0_SERSTR — 1-bit Error Status Register

This register indicates whether an ECC 1-bit error has occurred. The location and address of the error that is detected are stored in LR0_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is “0”. If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in LR0_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 20_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 20_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.60 LR0_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	SEDF07	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_07SEADR register.
6	SEDF06	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_06SEADR register.
5	SEDF05	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_05SEADR register.
4	SEDF04	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_04SEADR register.
3	SEDF03	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_03SEADR register.
2	SEDF02	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_02SEADR register.
1	SEDF01	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_01SEADR register.
0	SEDF00	Indicates that an ECC 1-bit error was detected and error address is stored in LR0_00SEADR register.

44.3.6.13 LR0_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in LR0_00DEADR register when AFEF00 and/or DEDF00 flag are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are “0”. Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in LR0_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 24_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 24_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

	—	—	—	—	—	—	—	—	—	—	—	—	AFEF00	—	DEDF00	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.61 LR0_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	AFEF00	Indicates that an address feedback error was detected.
2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that an ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.6.14 LR0_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address, is detected when the address buffer is fully used. If the newly detected error has the same address with errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in LR0_OVFCLR register respectively.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 28_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 28_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.62 LR0_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than the working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error is detected when all ECC 1-bit error flags in LR0_SERSTR are set.

44.3.6.15 LR0_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in LR0_SERSTR register were detected.

This register is updated whenever LR0_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + 30_H (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + 30_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.63 LR0_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned.
4	SEDLINF04	Indicates that an ECC 1-bit error was detected in bank 3 of Local RAM.
3	SEDLINF03	Indicates that an ECC 1-bit error was detected in bank 2 of Local RAM.
2	SEDLINF02	Indicates that an ECC 1-bit error was detected in bank 1 of Local RAM.
1	SEDLINF01	Indicates that an ECC 1-bit error was detected in bank 0 of Local RAM.
0	SEDLINF00	Indicates that an ECC 1-bit error was detected in read data loaded from its own Local RAM speculatively.

44.3.6.16 LR0_nSEADR — n-th 1-bit Error Address Register (n = 00 to 07)

This register is used to hold the address and the location of the error when the corresponding SEDFn flag is set.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_LR_PEmCL0_base> + n × 4_H + 70_H (m = 0, 1)
<MECCCAP_LR_PEmCL1_base> + n × 4_H + 70_H (m = 2, 3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEDL[4:0]					—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.64 LR0_nSEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 16	Reserved	When read, the value after reset is returned.
15 to 2	SEADR0[15:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each SEDL indicates.

Table 44.65 SEDL information

SEDL[4:0]	Indicated information
31 to 5	Reserved
4	Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 3 of Local RAM.
3	Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 2 of Local RAM.
2	Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 1 of Local RAM.
1	Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 0 of Local RAM.
0	Indicates an ECC 1-bit error is detected in loading data from its own Local RAM.

44.3.6.17 LR0_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error was detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_LR_PEnCL0_base> + $F0_H$ (n = 0, 1)
<MECCCAP_LR_PEnCL1_base> + $F0_H$ (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.66 LR0_00DEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 16	Reserved	When read, the value after reset is returned.
15 to 2	DEADR0[15:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each DEDL indicates.

Table 44.67 DEDL Information

DEDL[4:0]	Indicated information
31 to 5	Reserved
4	Indicates a fatal error is detected in storing data to or fetching instructions from bank 3 of Local RAM.
3	Indicates a fatal error is detected in storing data to or fetching instructions from bank 2 of Local RAM.
2	Indicates a fatal error is detected in storing data to or fetching instructions from bank 1 of Local RAM.
1	Indicates a fatal error is detected in storing data to or fetching instructions from bank 0 of Local RAM.
0	Indicates a fatal error is detected in loading data from its own Local RAM.

44.3.6.18 LR1_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM when an ECC error and/or overflow error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 00_H

Value after reset: $0000\ 0083_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.68 LR1_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	SEOVFIE	Controls error reports when overflow error occurs. 0: Overflow error report disabled 1: Overflow error report enabled
6 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.6.19 LR1_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in LR1_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 10_H

Value after reset: $0000\ 0000_H$

Table 44.69 LR1_SSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7	SSTCLR07	Writing 1 to this bit clears SEDF07 in LR1_SERSTR.
6	SSTCLR06	Writing 1 to this bit clears SEDF06 in LR1_SERSTR.
5	SSTCLR05	Writing 1 to this bit clears SEDF05 in LR1_SERSTR.
4	SSTCLR04	Writing 1 to this bit clears SEDF04 in LR1_SERSTR.
3	SSTCLR03	Writing 1 to this bit clears SEDF03 in LR1_SERSTR.
2	SSTCLR02	Writing 1 to this bit clears SEDF02 in LR1_SERSTR.
1	SSTCLR01	Writing 1 to this bit clears SEDF01 in LR1_SERSTR.
0	SSTCLR00	Writing 1 to this bit clears SEDF00 in LR1_SERSTR.

44.3.6.20 LR1_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in LR1_DERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DST CLR00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.70 LR1_DSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DSTCLR00	Writing 1 to this bit clears DEDF00 in LR1_DERSTR.

44.3.6.21 LR1_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in LR1_OVFSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SERR OVF CLR1	SERR OVF CLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 44.71 LR1_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in LR1_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in LR1_OVFSTR.

44.3.6.22 LR1_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in LR1_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is “0”. If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in LR1_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.72 LR1_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	SEDF07	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_07SEADR register.
6	SEDF06	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_06SEADR register.
5	SEDF05	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_05SEADR register.
4	SEDF04	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_04SEADR register.
3	SEDF03	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_03SEADR register.
2	SEDF02	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_02SEADR register.
1	SEDF01	Indicates that an ECC 1-bit error was detected and error address is stored in LR1_01SEADR register.
0	SEDF00	Indicates that an ECC 1-bit error r was detected and error address is stored in LR1_00SEADR register.

44.3.6.23 LR1_DERSTR — Fatal Error Status Register

This register indicates whether ECC 2-bit error has occurred. The location and address of the error that is detected are stored in LR1_00DEADR register when DEDF00 flags are set. The DEDF00 flag is set only when an ECC 2-bit error is detected while the DEDF00 is “0”.

This register can be cleared by DSTCLR00 in LR1_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.73 LR1_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that an ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.6.24 LR1_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address, is detected when the address buffer is fully used. If the newly detected error has the same address with errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in LR1_OVFCLR register respectively.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_LRA_base> + 28_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SERR OVF1	SERR OVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.74 LR1_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than the working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error is detected when all ECC 1-bit error flags in LR1_SERSTR are set.

44.3.6.25 LR1_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in LR1_SERSTR register were detected.

This register is updated whenever LR1_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_LRA_base> + 30_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	SEDLINF03	SEDLINF02	SEDLINF01	SEDLINF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.75 LR1_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	SEDLINF03	Indicates that an ECC 1-bit error was detected in read data to PE3*1 loaded from the other PE's Local RAM speculatively.
2	SEDLINF02	Indicates that an ECC 1-bit error was detected in read data to PE2*1 loaded from the other PE's Local RAM speculatively.
1	SEDLINF01	Indicates that an ECC 1-bit error was detected in read data to PE1 loaded from the other PE's Local RAM speculatively.
0	SEDLINF00	Indicates that an ECC 1-bit error was detected in read data to PE0 loaded from the other PE's Local RAM speculatively.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.6.26 LR1_nSEADR — n-th 1-bit Error Address Register (n = 00 to 07)

This register is used to hold the address and the location when the corresponding SEDFn flag is set.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_LRA_base> + n × 4_H + 70_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEDL[4:0]					—	—	—	SEADR0[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SEADR0[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.76 LR1_nSEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 24	Reserved	When read, the value after reset is returned.
23 to 2	SEADR0[23:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each SEDL indicates.

Table 44.77 SEDL information

SEDL[4:0]	Indicated information
31 to 4	Reserved
3	Indicates an ECC 1-bit error is detected in loading data from the other PE's Local RAM by PE3*1 master.
2	Indicates an ECC 1-bit error is detected in loading data from the other PE's Local RAM by PE2*1 master.
1	Indicates an ECC 1-bit error is detected in loading data from the other PE's Local RAM by PE1 master.
0	Indicates an ECC 1-bit error is detected in loading data from the other PE's Local RAM by PE0 master.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.6.27 LR1_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when DEDF00 flag is not set and ECC 2-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_LRA_base> + $F0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEDL[4:0]					—	—	—	DEADR0[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEADR0[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.78 LR1_00DEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 24	Reserved	When read, the value after reset is returned.
23 to 2	DEADR0[23:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each DEDL indicates.

Table 44.79 DEDL Information

DEDL[4:0]	Indicated information
31 to 4	Reserved
3	Indicates a fatal error is detected in loading data from the other PE's Local RAM by PE3*1 master.
2	Indicates a fatal error is detected in loading data from the other PE's Local RAM by PE2*1 master.
1	Indicates a fatal error is detected in loading data from the other PE's Local RAM by PE1 master.
0	Indicates a fatal error is detected in loading data from the other PE's Local RAM by PE0 master.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.6.28 Test Function

Through appropriate register settings, desired values can be written as RAM data and to the ECC bits. Also, data in the RAM and the ECC can all be read.

(1) Writing RAM data

(a) Set ECCTST bit in the ECC Test Control Register to 1 to set test mode.

(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 0 to select RAM data for access when writing.

(c) When data is written to the Local RAM, only the RAM data can be modified without updating the ECC bits.

How to exit this test mode:

(a) Set ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

(2) Reading RAM data

(a) Set ECCDIS bit in the ECC Control Register to 1 to disable ECC error detection and correction.

(b) Read the Local RAM. Since neither error detection nor correction proceeds when the Local RAM is read, the RAM data is read unchanged.

How to exit this test mode:

(a) Set ECCDIS bit in the ECC Control Register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC bits

(a) Set ECCTST bit in the ECC Test Control Register to 1 to set test mode.

(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 1 to select the ECC bits for access when writing.

(c) When data is written to the Local RAM, only the ECC bits can be modified without updating the RAM data. At that time, bits[6:0] are written to the ECC bits.

How to exit this test mode:

(a) Set ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

(4) Reading the ECC bits

(a) Set ECCTST bit in the ECC Test Control Register to 1 to set test mode.

(b) When the Local RAM is read, the ECC bits are stored in the word corresponding to local RAM ECC read buffer register.

How to exit this test mode:

(a) Set ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

(5) Self-diagnosis of the ECC check function

Desired values can be written to the RAM data, ECC bits by the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the Local RAM in normal mode and checking the result of error correction or detection.

(6) Self-diagnosis of the address feedback check function

Self-diagnosis is enabled by following procedure below.

(a) Set the desired bit(s) of AFINV[20:4] in the Address Feedback Test Control Register to 1 to set test mode.

(b) When the Local RAM is read or written, address feedback error occurs because feedback address XOR-ed with AFINV can be input to address feedback checker.

How to exit this test mode:

(a) Set AFINV[20:4] bits in the Address Feedback Test Control Register all to 0 to disable test mode (normal mode).

44.3.7 Cluster RAM ECC and Address Feedback

44.3.7.1 Overview

The Cluster RAM ECC is summarized in the table below.

The ECC protection described below takes into consideration all possible Cluster RAM accesses from PE0, PE1, PE2*1, PE3*1, H-Bus, System Bus and read access for read-modify-write processing unit of 8-bit and 16-bit data.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Table 44.80 Cluster RAM ECC (1/2)

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out.
Address feedback	Address feedback check can be either enabled or disabled. When enabled, Address feedback error detection is carried out. When disabled, no error detection is carried out. In the initial state, this function is enabled.
Error notification	The occurrence of an ECC error or an address feedback error is reported to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. **Address Feedback Error:** • Error notification can be either enabled or disabled upon detection of an address feedback error. In the initial state, error notification is enabled upon detection of an address feedback error. **Overflow Error:** • Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error. In the initial state, error notification is enabled upon detection of an address buffer overflow error. The error notification signal for both an address feedback error and an ECC 2-bit error is handled as one source in ECM. An ECC 1-bit error and an overflow error are handled as individual sources in ECM. An ECC 1-bit error signal is only issued to the ECM if the ECC 1-bit error address is not yet stored in the error address buffer.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error detection, and address feedback error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.

Table 44.80 Cluster RAM ECC (2/2)

Item	Description
Address capture	The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address feedback error is detected. The error status serves as the enable bit of the address that is captured. Address buffers are updated if the error status is cleared. Multi-stage address buffers are provided for a 1-bit data error. • ECC 1-bit error: Eight stages • ECC 2-bit error and address feedback error shared: One stage
Self-diagnosis	Desired values can be written to the RAM data and the ECC bits. The RAM data can be read directly and the ECC can be read via Read Buffer Register in ECC Test Mode. Moreover, the error injection to an address feedback checker is possible by setting AFINV.

ECC of Cluster RAM is provided for each 32 bits of data and each 32-bit data is called bank 0 to 3. The relationship between addresses and bank numbers are as follows.

Table 44.81 Relationship between addresses and bank numbers

4 lower-order bits of address (Hexadecimal Notation)	F_H to C_H	B_H to 8_H	7_H to 4_H	3_H to 0_H
Bank number	Bank 3	Bank 2	Bank 1	Bank 0

44.3.7.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.82 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ECCCNT_CRCCL0_base>	FFC4 $9C00_H$	P-Bus Group 0
<ECCCNT_CRCCL1_base>*1	FFC4 $9C80_H$	P-Bus Group 0
<ECCCNT_CRCCL2_base>*2	FFC4 $9D00_H$	P-Bus Group 0
<ECCCNT_CRCCL3_base>	FFC4 $9D80_H$	P-Bus Group 0
<ECCCNT_CRA_base>	FFC4 $9E00_H$	P-Bus Group 0
<MECCCAP_CRAM_base>	FFC5 2000_H	P-Bus Group 0

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.7.3 List of Registers

Table 44.83 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCCNT_CRCCLn (n = 0-3) *2	Address feedback control register	CRCAFCTL	<ECCCNT_CRCCLn_base> + 00_H	8, 16, 32	*1	ECCKCPROT
	ECC test control register	CRCECCTSTCTL	<ECCCNT_CRCCLn_base> + 10_H	8, 16, 32	*1	ECCKCPROT
	Address feedback test control register	CRCAFINV	<ECCCNT_CRCCLn_base> + 20_H	8, 16, 32	*1	ECCKCPROT
	ECC read buffer register	CRCTDATBFECCF	<ECCCNT_CRCCLn_base> + 60_H	8, 16, 32	*1	—

Data at SAXI2MBI2 (bridge from System Bus to CRAM Bus)*3				Read data from CRAM2 area requested by other than PEs
Data at SAXI2MBI2 (bridge from System Bus to CRAM Bus)*3				Instruction from CRAM2 area
Data at SAXI2MBI3 (bridge from System Bus to CRAM Bus)				Read data from CRAM3 area requested by other than PEs
Data at SAXI2MBI3 (bridge from System Bus to CRAM Bus)				Instruction from CRAM3 area
Address to CRAM at CRAM controller 0	Address feedback check	ECCCNT_CRCCL0		Request address to Cluster RAM0 area
Address to CRAM at CRAM controller 1*2		ECCCNT_CRCCL1		Request address to Cluster RAM1 area
Address to CRAM at CRAM controller 2*3		ECCCNT_CRCCL2		Request address to Cluster RAM2 area
Address to CRAM at CRAM controller 3		ECCCNT_CRCCL3		Request address to Cluster RAM3 area

Note 1. Read-modify-write includes SET1, NOT1, CLR1, CAXI and write access less than 4 bytes. For example, 2-byte write access is included.

Note 2. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 3. This function is not implemented in RH850/U2A6.

44.3.7.4 CRCAFCTL — Address Feedback Control Register

This register controls address feedback error detection for the address that is requested to Cluster RAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CRCCLn_base> + 00_H (n = 0-3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.85 CRCAFCTL Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEDIS	Address feedback error disable bit Sets address feedback error detection to enable/disable. 0: Address feedback error detection is enabled 1: Address feedback error detection is disabled
2 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.7.5 CRCECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), either data field or ECC field of Cluster RAM can be written separately.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CRCCLn_base> + 10_H (n = 0-3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC TST	DAT SEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 44.86 CRCECCTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	Selects the write mode to Cluster RAM. 0: Normal mode 1: Test mode Either data field or ECC field can be written according to DATSEL setting in test mode.
0	DATSEL	Selects field to write data when ECCTST = 1. 0: Data field only 1: ECC field only

44.3.7.6 CRCAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from Cluster RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CRCCLn_base> + 20_H (n = 0-3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	AFINV[20:19]		AFINV [18]	AFINV [17]	AFINV [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 44.87 CRCAFINV Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 19	AFINV[20:19]*1	Specifies bit pattern to inject errors into feedback address.
18	AFINV[18]*2	Specifies bit pattern to inject errors into feedback address.
17	AFINV[17]*2	Specifies bit pattern to inject errors into feedback address.
16 to 4	AFINV[16:4]	Specifies bit pattern to inject errors into feedback address.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. AFINV[20:19] is implemented only in ECCCNT_CRCCL2. AFINV[20:19] is reserved bit and read only for ECCCNT_CRCCL0 and ECCCNT_CRCCL1 and ECCCNT_CRCCL3 in RH850/U2A-EVA, RH850/U2A16 and RH850/U2A8.
AFINV[20:19] is reserved bit in RH850/U2A6.

Note 2. AFINV[18] is implemented only in ECCCNT_CRCCL0 and ECCCNT_CRCCL1 and ECCCNT_CRCCL2, AFINV[18] is reserved bit and read only for ECCCNT_CRCCL3 in RH850/U2A-EVA and RH850/U2A16.
AFINV[18:17] is implemented only in ECCCNT_CRCCL0 and ECCCNT_CRCCL2, AFINV[18:17] is reserved bit and read only for ECCCNT_CRCCL3 in RH850/U2A8.
AFINV[18:17] is implemented only in ECCCNT_CRCCL0, AFINV[18:17] is reserved bit and read only for ECCCNT_CRCCL3 in RH850/U2A6.

44.3.7.7 CRCTDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Cluster RAM for self-diagnosis. ECC field in the address that is requested can be stored in this register while reading from Cluster RAM where ECCTST = 1.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CRCCLn_base> + 60_H (n = 0-3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	BFECC3[6:0]							—	BFECC2[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BFECC1[6:0]							—	BFECC0[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.88 CRCTDATBFECCF Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 24	BFECC3[6:0]	ECC field read from requested address in Cluster RAM bank 3
23	Reserved	When read, the value after reset is returned.
22 to 16	BFECC2[6:0]	ECC field read from requested address in Cluster RAM bank 2
15	Reserved	When read, the value after reset is returned.
14 to 8	BFECC1[6:0]	ECC field read from requested address in Cluster RAM bank 1
7	Reserved	When read, the value after reset is returned.
6 to 0	BFECC0[6:0]	ECC field read from requested address in Cluster RAM bank 0

44.3.7.8 CRAECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read from Cluster RAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_CRA_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.89 CRAECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.7.9 CR_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address feedback error, ECC error and/or overflow error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 00_H

Value after reset: $0000\ 008B_H$

Table 44.90 CR_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	SEOVFIE	Controls error reports when overflow error has occurred. 0: Overflow error report disabled 1: Overflow error report enabled
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEIE	Controls error reports when address feedback error is detected. 0: Address feedback error report disabled 1: Address feedback error report enabled
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.7.10 CR_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in CR_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.91 CR_SSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset
7	SSTCLR07	Writing 1 to this bit clears SEDF07 in CR_SERSTR.
6	SSTCLR06	Writing 1 to this bit clears SEDF06 in CR_SERSTR.
5	SSTCLR05	Writing 1 to this bit clears SEDF05 in CR_SERSTR.
4	SSTCLR04	Writing 1 to this bit clears SEDF04 in CR_SERSTR.
3	SSTCLR03	Writing 1 to this bit clears SEDF03 in CR_SERSTR.
2	SSTCLR02	Writing 1 to this bit clears SEDF02 in CR_SERSTR.
1	SSTCLR01	Writing 1 to this bit clears SEDF01 in CR_SERSTR.
0	SSTCLR00	Writing 1 to this bit clears SEDF00 in CR_SERSTR.

44.3.7.11 CR_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in CR_DERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.92 CR_DSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DSTCLR00	Writing 1 to this bit clears AFEF00 and DEDF00 in CR_DERSTR.

44.3.7.12 CR_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in CR_OVFSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SERR OVF CLR1	SERR OVF CLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 44.93 CR_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in CR_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in CR_OVFSTR.

44.3.7.13 CR_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in CR_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is “0”. If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in CR_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.94 CR_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	SEDF07	Indicates that an ECC 1-bit error was detected and error address is stored in CR_07SEADR register.
6	SEDF06	Indicates that an ECC 1-bit error was detected and error address is stored in CR_06SEADR register.
5	SEDF05	Indicates that an ECC 1-bit error was detected and error address is stored in CR_05SEADR register.
4	SEDF04	Indicates that an ECC 1-bit error was detected and error address is stored in CR_04SEADR register.
3	SEDF03	Indicates that an ECC 1-bit error was detected and error address is stored in CR_03SEADR register.
2	SEDF02	Indicates that an ECC 1-bit error was detected and error address is stored in CR_02SEADR register.
1	SEDF01	Indicates that an ECC 1-bit error was detected and error address is stored in CR_01SEADR register.
0	SEDF00	Indicates that an ECC 1-bit error was detected and error address is stored in CR_00SEADR register.

44.3.7.14 CR_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in CR_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are “0”. Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in CR_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AFEF00	—	DEDF00	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.95 CR_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	AFEF00	Indicates that an address feedback error was detected.
2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that an ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.7.15 CR_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in CR_OVFCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_CRAM_base> + 28_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SERR OVF1	SERR OVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.96 CR_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error is detected when all ECC 1-bit error flags in CR_SERSTR are set.

44.3.7.16 CR_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in CR_SERSTR register were detected.

This register is updated whenever CR_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_CRAM_base> + 30_H

Value after reset: $0000\ 0000_H$

Table 44.97 CR_SERINF Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned.
23	SEDLINF23	Indicates that an ECC 1-bit error was detected in upper address of Cluster RAM for cluster 3 during the RMW operation.
22	SEDLINF22	Indicates that an ECC 1-bit error was detected in lower address of Cluster RAM for cluster 3 during the RMW operation.
21	SEDLINF21	Indicates that an ECC 1-bit error was detected in upper address of Cluster RAM for cluster 2*2 during the RMW operation.
20	SEDLINF20	Indicates that an ECC 1-bit error was detected in lower address of Cluster RAM for cluster 2*2 during the RMW operation.
19	SEDLINF19	Indicates that an ECC 1-bit error was detected in upper address of Cluster RAM for cluster 1*1 during the RMW operation.
18	SEDLINF18	Indicates that an ECC 1-bit error was detected in lower address of Cluster RAM for cluster 1*1 during the RMW operation.
17	SEDLINF17	Indicates that an ECC 1-bit error was detected in upper address of Cluster RAM for cluster 0 during the RMW operation.
16	SEDLINF16	Indicates that an ECC 1-bit error was detected in lower address of Cluster RAM for cluster 0 during the RMW operation.
15	SEDLINF15	Indicates that an ECC 1-bit error was detected in the data read from upper address of Cluster RAM to SAXI2MBI for cluster 3.
14	SEDLINF14	Indicates that an ECC 1-bit error was detected in the data read from lower address of Cluster RAM to SAXI2MBI for cluster 3.
13	SEDLINF13	Indicates that an ECC 1-bit error was detected in the data read from upper address of Cluster RAM to SAXI2MBI for cluster 2*2.
12	SEDLINF12	Indicates that an ECC 1-bit error was detected in the data read from lower address of Cluster RAM to SAXI2MBI for cluster 2*2.
11	SEDLINF11	Indicates that an ECC 1-bit error was detected in the data read from upper address of Cluster RAM to SAXI2MBI for cluster 1*1.
10	SEDLINF10	Indicates that an ECC 1-bit error was detected in the data read from lower address of Cluster RAM to SAXI2MBI for cluster 1*1.

Table 44.97 CR_SERINF Register Contents (2/2)

Bit Position	Bit Name	Function
9	SEDLINF09	Indicates that an ECC 1-bit error was detected in the data read from upper address of Cluster RAM to SAXI2MBI for cluster 0.
8	SEDLINF08	Indicates that an ECC 1-bit error was detected in the data read from lower address of Cluster RAM to SAXI2MBI for cluster 0.
7 to 4	Reserved	When read, the value after reset is returned.
3	SEDLINF03	Indicates that an ECC 1-bit error was detected in the data read from Cluster RAM to PE3*1.
2	SEDLINF02	Indicates that an ECC 1-bit error was detected in the data read from Cluster RAM to PE2*1.
1	SEDLINF01	Indicates that an ECC 1-bit error was detected in the data read from Cluster RAM to PE1.
0	SEDLINF00	Indicates that an ECC 1-bit error was detected in the data read from Cluster RAM to PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.7.17 CR_nSEADR — n-th 1-bit Error Address Register (n = 00 to 07)

This register is used to hold the address and the location of the error when the corresponding SEDFn flag is set.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_CRAM_base> + n × 4_H + 70_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEDL[4:0]					—	—	—	SEADR0[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.98 CR_nSEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 24	Reserved	When read, the value after reset is returned.
23 to 2	SEADR0[23:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each SEDL indicates.

Table 44.99 SEDL information (1/2)

SEDL[4:0]	Indicated information
31 to 24	Reserved
23	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 3: Storing sub-word data by any master. CAXI operation by any PE master.
22	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 3: Storing sub-word data by any master. CAXI operation by any PE master.
21	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 2*2: Storing sub-word data by any master. CAXI operation by any PE master.

Table 44.99 SEDL information (2/2)

SEDL[4:0]	Indicated information
20	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 2*2: Storing sub-word data by any master. CAXI operation by any PE master.
19	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1*1: Storing sub-word data by any master. CAXI operation by any PE master.
18	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1*1: Storing sub-word data by any master. CAXI operation by any PE master.
17	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0: Storing sub-word data by any master. CAXI operation by any PE master.
16	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0: Storing sub-word data by any master. CAXI operation by any PE master.
15	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 3: Loading data by any master except PEs. Fetching instructions by any PE master.
14	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 3: Loading data by any master except PEs. Fetching instructions by any PE master.
13	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 2*2: Loading data by any master except PEs. Fetching instructions by any PE master.
12	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 2*2: Loading data by any master except PEs. Fetching instructions by any PE master.
11	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1*1: Loading data by any master except PEs. Fetching instructions by any PE master.
10	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1*1: Loading data by any master except PEs. Fetching instructions by any PE master.
9	Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0: Loading data by any master except PEs. Fetching instructions by any PE master.
8	Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0: Loading data by any master except PEs. Fetching instructions by any PE master.
7 to 4	Reserved
3	Indicates an ECC 1-bit error is detected in loading data from Cluster RAMs by PE3*1 master.
2	Indicates an ECC 1-bit error is detected in loading data from Cluster RAMs by PE2*1 master.
1	Indicates an ECC 1-bit error is detected in loading data from Cluster RAMs by PE1 master.
0	Indicates an ECC 1-bit error is detected in loading data from Cluster RAMs by PE0 master.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.
Note 2. This function is not implemented in RH850/U2A6.

44.3.7.18 CR_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error, and/or ECC 2-bit error was detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_CRAM_base> + $F0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEDL[4:0]					—	—	—	DEADR0[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEADR0[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.100 CR_00DEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 24	Reserved	When read, the value after reset is returned.
23 to 2	DEADR0[23:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Refer to the following table to confirm the detailed information which each DEDL indicates.

Table 44.101 DEDL Information (1/2)

DEDL[4:0]	Indicated information
31 to 24	Reserved
23	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 3: Storing sub-word data by any master. CAXI operation by any PE master.
22	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 3: Storing sub-word data by any master. CAXI operation by any PE master.
21	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 2*2: Storing sub-word data by any master. CAXI operation by any PE master.
20	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 2*2: Storing sub-word data by any master. CAXI operation by any PE master.

Table 44.101 DEDL Information (2/2)

DEDL[4:0]	Indicated information
19	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1*1: Storing sub-word data by any master. CAXI operation by any PE master.
18	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1*1: Storing sub-word data by any master. CAXI operation by any PE master.
17	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0: Storing sub-word data by any master. CAXI operation by any PE master.
16	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0: Storing sub-word data by any master. CAXI operation by any PE master.
15	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 3: Loading data by any master except PEs. Fetching instructions by any PE master.
14	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 3: Loading data by any master except PEs. Fetching instructions by any PE master.
13	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 2*2: Loading data by any master except PEs. Fetching instructions by any PE master.
12	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 2*2: Loading data by any master except PEs. Fetching instructions by any PE master.
11	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1*1: Loading data by any master except PEs. Fetching instructions by any PE master.
10	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1*1: Loading data by any master except PEs. Fetching instructions by any PE master.
9	Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0: Loading data by any master except PEs. Fetching instructions by any PE master.
8	Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0: Loading data by any master except PEs. Fetching instructions by any PE master.
7 to 4	Reserved
3	Indicates a fatal error is detected in loading data from Cluster RAMs by PE3*1 master.
2	Indicates a fatal error is detected in loading data from Cluster RAMs by PE2*1 master.
1	Indicates a fatal error is detected in loading data from Cluster RAMs by PE1 master.
0	Indicates a fatal error is detected in loading data from Cluster RAMs by PE0 master.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.7.19 Test Function

(1) Writing RAM data

(a) Set ECCTST bit in the ECC Test Control Register to 1 to set test mode.

(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 0 to select RAM data for access when writing.

(c) When data is written to the cluster RAM, the RAM data is modified without updating the ECC bits.

How to exit this test mode:

(a) Set ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

(2) Reading RAM data

(a) Set ECCDIS bit in the ECC Control Register to 1 to disable ECC error detection and correction.

(b) Read the Cluster RAM. Since neither error detection nor correction proceeds when the Cluster RAM is read, the RAM data is read unchanged.

How to exit this test mode:

(a) Set ECCDIS bit in the ECC Control Register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC bits

(a) Set ECCTST bit in the ECC Test Control Register to 1 to set test mode.

(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 1 to select the ECC bits for access when writing.

(c) When data is written to the Cluster RAM, the ECC bits are modified without updating the RAM data. At that time, bits[6:0] are respectively written to the ECC bits.

How to exit this test mode:

(a) Set ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

(4) Reading the ECC bits

(a) Set ECCTST bit in the ECC Test Control Register to 1 to set test mode.

(b) When the Cluster RAM is read, the ECC bits are stored in the word corresponding to cluster RAM ECC read buffer register.

How to exit this test mode:

(a) Set ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

(5) Self-diagnosis of the ECC check function

Desired values can be written to the RAM data, ECC bits by using the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the Cluster RAM in normal mode and checking the result of error correction or detection.

(6) Self-diagnosis of the address feedback check function

Self-diagnosis is enabled by following procedure below.

(a) Set the desired bit(s) of AFINV[20:4] in the Address Feedback Test Control Register to 1 to set test mode.

(b) When the Cluster RAM is read or written, address feedback error occurs because feedback address XOR-ed with AFINV can be input to address feedback checker.

How to exit this test mode:

(a) Set AFINV[20:4] bits in the Address Feedback Test Control Register all to 0 to disable test mode (normal mode).

Note: AFINV[20:19] is implemented only in ECCCNT_CRCCL2. AFINV[20:19] is reserved bit and read only for ECCCNT_CRCCL0 and ECCCNT_CRCCL1 and ECCCNT_CRCCL3.

Note: AFINV[18] is implemented only in ECCCNT_CRCCL0 and ECCCNT_CRCCL1 and ECCCNT_CRCCL2. AFINV[18] is reserved bit and read only for ECCCNT_CRCCL3

44.3.8 Instruction Cache EDC and Address Feedback

44.3.8.1 Overview

The instruction cache EDC is summarized in the table below.

Table 44.102 Instruction Cache EDC

Item	Description
ECC error detection	ECC error detection can be either enabled or disabled. When enabled, the following settings can be selected: • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, error detection is not carried out. In the initial state, the ECC function is enabled; 1-bit error detection, and 2-bit error detection are carried out.
Address feedback	Address feedback check can be either enabled or disabled. When enabled, Address feedback error detection is carried out. When disabled, no error detection is carried out. In the initial state, this function is enabled.
Error notification	The occurrence of an ECC error or an address feedback error is reported to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, notification of both an ECC 2-bit error and an ECC 1-bit error is disabled. **Address Feedback Error:** • Error notification can be either enabled or disabled upon detection of an address feedback error. In the initial state, error notification is disabled upon detection of an address feedback error. The error notification signal is output with an ECC 2-bit error and an ECC 1-bit error and an address feedback error handled as one source in ECM. An ECC error signal is only issued to the ECM if the ECC error address is not yet stored in the error address buffer.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error detection and address feedback error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error, an ECC 1-bit error or an address feedback error is detected. The error status serves as the enable bit of the captured address. If an ECC error occurs while no error status is set, the address at which the associated error occurred is captured.
Self-diagnosis	A cache instruction is used to write the desired values as RAM data and to the ECC bits. Similarly, data in the RAM and the ECC bits can be read directly. Since cache instructions go through the same encoding or decoding path as a normal cache fill or instruction fetch, errors can be both inserted and confirmed simply by using a cache instruction. Errors can also be injected into an address feedback checker by setting AFINV.

44.3.8.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 44.103 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ECCCNT_IT_PE0CL0_base>	FFC4 9000_H	P-Bus Group 0
<ECCCNT_IT_PE1CL0_base>	FFC4 9080_H	P-Bus Group 0
<ECCCNT_IT_PE2CL1_base>*1	FFC4 9100_H	P-Bus Group 0
<ECCCNT_IT_PE3CL1_base>*1	FFC4 9180_H	P-Bus Group 0
<ECCCNT_ID_PE0CL0_base>	FFC4 9400_H	P-Bus Group 0
<ECCCNT_ID_PE1CL0_base>	FFC4 9480_H	P-Bus Group 0
<ECCCNT_ID_PE2CL1_base>*1	FFC4 9500_H	P-Bus Group 0
<ECCCNT_ID_PE3CL1_base>*1	FFC4 9580_H	P-Bus Group 0
<MECCCAP_IT_PE0CL0_base>	FFC5 1000_H	P-Bus Group 0
<MECCCAP_IT_PE1CL0_base>	FFC5 1100_H	P-Bus Group 0
<MECCCAP_IT_PE2CL1_base>*1	FFC5 1200_H	P-Bus Group 0
<MECCCAP_IT_PE3CL1_base>*1	FFC5 1300_H	P-Bus Group 0
<MECCCAP_ID_PE0CL0_base>	FFC5 1800_H	P-Bus Group 0
<MECCCAP_ID_PE1CL0_base>	FFC5 1900_H	P-Bus Group 0
<MECCCAP_ID_PE2CL1_base>*1	FFC5 $1A00_H$	P-Bus Group 0
<MECCCAP_ID_PE3CL1_base>*1	FFC5 $1B00_H$	P-Bus Group 0

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.8.3 List of Registers

Table 44.104 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCCNT_IT_PEnCL0 (n = 0, 1)	ECC control register	ITECCCTL	<ECCCNT_IT_PEnCL0_base> + 00_H	8, 16, 32	*1	ECCKCPROT

Address to Cache data RAM at Instruction Cache I/F in PE3*1		ECCCNT_ID_PE3CL1	MECCCAP_ID_PE3CL1	Request address to Instruction cache data RAM of PE3

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.8.4 ITECCCTL — ECC Control Register

This register controls ECC error detection for data read from cache tag RAM and address feedback error detection for the address that is requested to cache tag RAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_IT_PEnCL0_base> + 00_H (n = 0, 1)
<ECCCNT_IT_PEnCL1_base> + 00_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.106 ITECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEDIS	Address feedback error disable bit Sets the address feedback error detection to enable/disable. 0: Address feedback error detection is enabled 1: Address feedback error detection is disabled
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCDIS	ECC disable bit Sets the ECC error detection to enable/disable. 0: ECC error detection is enabled 1: ECC error detection is disabled

44.3.8.5 ITAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from cache tag RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_IT_PEnCL0_base> + 20_H (n = 0, 1)
<ECCCNT_IT_PEnCL1_base> + 20_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 5	AFINV[12:5]	Specifies bit pattern to inject errors into feedback address.
4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.8.6 IDECCCTL — ECC Control Register

This register controls ECC error detection for data read from cache data RAM and address feedback error detection for the address that is requested to the cache data RAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_ID_PEnCL0_base> + 00_H (n = 0, 1)
<ECCCNT_ID_PEnCL1_base> + 00_H (n = 2, 3)

3	AFEDIS	Address feedback error disable bit Sets the address feedback error detection to enable/disable. 0: Address feedback error detection is enabled 1: Address feedback error detection is disabled
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCDIS	ECC disable bit Sets the ECC error detection to enable/disable. 0: ECC error detection is enabled 1: ECC error detection is disabled

44.3.8.7 IDAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from the cache data RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_ID_PEnCL0_base> + 20_H (n = 0, 1)
<ECCCNT_ID_PEnCL1_base> + 20_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Table 44.109 IDAFINV Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 3	AFINV[12:3]	Specifies bit pattern to inject errors into feedback address.
2 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.8.8 IT_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM when address feedback error and/or ECC error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 00_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 00_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.110 IT_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEIE	Controls error reports when address feedback error is detected. 0: Address feedback error report disabled 1: Address feedback error report enabled
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.8.9 IT_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in IT_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 10_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 10_H (n = 2, 3)

Table 44.113 IT_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in IT_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in IT_OVFSTR.

44.3.8.12 IT_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in IT_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is “0”.

This register can be cleared by SSTCLR00 in IT_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 20_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 20_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.114 IT_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDF00	Indicates that an ECC 1-bit error was detected.

44.3.8.13 IT_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in IT_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are “0”. Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in IT_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 24_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 24_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.115 IT_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	AFEF00	Indicates that an address feedback error was detected.
2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that an ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.8.14 IT_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in IT_OVFCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 28_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 28_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.116 IT_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set.

44.3.8.15 IT_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in IT_SERSTR register were detected.

This is up-to-date whenever IT_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 30_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 30_H (n = 2, 3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.117 IT_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	SEDLINF03	Indicates that an ECC 1-bit error was detected in way 3 of cache tag RAM.
2	SEDLINF02	Indicates that an ECC 1-bit error was detected in way 2 of cache tag RAM.
1	SEDLINF01	Indicates that an ECC 1-bit error was detected in way 1 of cache tag RAM.
0	SEDLINF00	Indicates that an ECC 1-bit error was detected in way 0 of cache tag RAM.

44.3.8.16 IT_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + 70_H (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + 70_H (n = 2, 3)

Value after reset: 0000 0000_H

Table 44.118 IT_00SEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 13	Reserved	When read, the value after reset is returned.
12 to 5	SEADR0[12:5]	Indicates at which address this error was detected.
4 to 0	Reserved	When read, the value after reset is returned.

Refer to the following table to confirm the detailed information which each SEDL indicates.

Table 44.119 SEDL information

SEDL[4:0]	Indicated information
31 to 4	Reserved
3	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 3 of cache tag RAM.
2	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 2 of cache tag RAM.
1	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 1 of cache tag RAM.
0	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 0 of cache tag RAM.

44.3.8.17 IT_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_IT_PEnCL0_base> + $F0_H$ (n = 0, 1)
<MECCCAP_IT_PEnCL1_base> + $F0_H$ (n = 2, 3)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.120 IT_00DEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 13	Reserved	When read, the value after reset is returned.
12 to 5	DEADR0[12:5]	Indicates at which address this error was detected.
4 to 0	Reserved	When read, the value after reset is returned.

Refer to the following table to confirm the detailed information which each DEDL indicates.

Table 44.121 DEDL Information

DEDL[4:0]	Indicated information
31 to 4	Reserved
3	Indicates a fatal error is detected in storing data to or loading data from way 3 of cache tag RAM.
2	Indicates a fatal error is detected in storing data to or loading data from way 2 of cache tag RAM.
1	Indicates a fatal error is detected in storing data to or loading data from way 1 of cache tag RAM.
0	Indicates a fatal error is detected in storing data to or loading data from way 0 of cache tag RAM.

44.3.8.18 ID_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM when address feedback error and/or ECC error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 00_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 00_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Table 44.122 ID_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEIE	Controls error reports when address feedback error is detected. 0: Address feedback error report disabled 1: Address feedback error report enabled
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.8.19 ID_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in ID_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 10_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 10_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Table 44.125 ID_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in ID_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in ID_OVFSTR.

44.3.8.22 ID_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in ID_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is “0”.

This register can be cleared by SSTCLR00 in ID_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 20_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 20_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.126 ID_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDF00	Indicates an ECC 1-bit error is detected.

44.3.8.23 ID_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in ID_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are “0”. Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in ID_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 24_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 24_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.127 ID_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	AFEF00	Indicates that address feedback error was detected.
2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that an ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.8.24 ID_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in ID_OVFCLR register respectively.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 28_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 28_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.128 ID_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set.

44.3.8.25 ID_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in ID_SERSTR register were detected.

This is up-to-date whenever ID_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 30_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 30_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.129 ID_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	SEDLINF03	Indicates that an ECC 1-bit error was detected in way 3 of the cache data RAM.
2	SEDLINF02	Indicates that an ECC 1-bit error was detected in way 2 of the cache data RAM.
1	SEDLINF01	Indicates that an ECC 1-bit error was detected in way 1 of the cache data RAM.
0	SEDLINF00	Indicates that an ECC 1-bit error was detected in way 0 of the cache data RAM.

44.3.8.26 ID_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + 70_H (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + 70_H (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEDL[4:0]					—	—	—	—	—	—	—	—	—	—	—

Table 44.130 ID_00SEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 13	Reserved	When read, the value after reset is returned.
12 to 3	SEADR0[12:3]	Indicates at which address this error was detected.
2 to 0	Reserved	When read, the value after reset is returned.

Refer to the following table to confirm the detailed information which each SEDL indicates.

Table 44.131 SEDL information

SEDL[4:0]	Indicated information
31 to 4	Reserved
3	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 3 of cache data RAM.
2	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 2 of cache data RAM.
1	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 1 of cache data RAM.
0	Indicates an ECC 1-bit error is detected in storing data to or loading data from way 0 of cache data RAM.

44.3.8.27 ID_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_ID_PEnCL0_base> + $F0_H$ (n = 0, 1)
<MECCCAP_ID_PEnCL1_base> + $F0_H$ (n = 2, 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEDL[4:0]					—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.132 ID_00DEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 13	Reserved	When read, the value after reset is returned.
12 to 3	DEADR0[12:3]	Indicates at which address this error was detected.
2 to 0	Reserved	When read, the value after reset is returned.

Refer to the following table to confirm the detailed information which each DEDL indicates.

Table 44.133 DEDL Information

DEDL[4:0]	Indicated information
31 to 4	Reserved
3	Indicates a fatal error is detected in storing data to or loading data from way 3 of cache data RAM.
2	Indicates a fatal error is detected in storing data to or loading data from way 2 of cache data RAM.
1	Indicates a fatal error is detected in storing data to or loading data from way 1 of cache data RAM.
0	Indicates a fatal error is detected in storing data to or loading data from way 0 of cache data RAM.

44.3.8.28 Test Function

A cache instruction is used to write the desired values as RAM data and to the ECC bits, and read data in the RAM and the ECC bits directly.

Since cache instructions go through the same encoding or decoding path as a normal cache fill or instruction fetch, errors can be both inserted and confirmed simply by using a cache instruction.

For details, refer to the *RH850G4MH User's Manual: Software*.

44.3.9 sDMAC/DTSRAM ECC and Address Feedback

44.3.9.1 Overview

sDMAC RAM ECC is summarized in the table below.

Table 44.134 sDMAC RAM ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected: • ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out.
Error notification	The occurrence of an ECC error is reported to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, notification of both a 2-bit error and a 1-bit error is enabled. **Overflow Error:** • Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error. In the initial state, error notification is enabled upon detection of an address buffer overflow error. An ECC 2-bit error, an ECC 1-bit error and an overflow error are handled as individual sources. An ECC 1-bit error signal is only issued to the ECM if the ECC 1-bit error address is not yet stored in the error address buffer.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the captured address. ECC 1-bit error: One stage ECC 2-bit error: One stage
Self-diagnosis	Desired values can be written to the RAM data and the ECC bits in sDMAC RAM in ECC Test Mode. The RAM data and the ECC bits in sDMAC RAM can be also read via Read Buffer Registers in this mode.

DTSRAM ECC is summarized in the table below.

Table 44.135 DTSRAM ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection, 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out.
Address feedback	Address feedback check can be either enabled or disabled. When enabled, Address feedback error detection is carried out. When disabled, no error detection is carried out. In the initial state, this function is enabled.
Error notification	The occurrence of an ECC error or an address feedback error is reported to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, notification of both a 2-bit error and a 1-bit error is enabled. **Address Feedback Error:** • Error notification can be either enabled or disabled upon detection of an address feedback error. In the initial state, error notification is enabled upon detection of an address feedback error. **Overflow Error:** • Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error. In the initial state, error notification is enabled upon detection of an address buffer overflow error. The error notification signal is output with an ECC 2-bit error and an address feedback error handled as one source, and an ECC 1-bit error and an overflow error are handled as individual sources. An ECC 1-bit error signal is only issued to the ECM, if the ECC 1-bit error address is not yet stored in the error address buffer.
Error status	A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error detection, and address feedback error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address feedback error is detected. The error status serves as the enable bit of the capture address. ECC 1-bit error: One stage ECC 2-bit error and address feedback error: One stage
Self-diagnosis	Desired values can be written to the RAM data and the ECC bits in DTSRAM in ECC Test Mode. The RAM data and the ECC bits in DTSRAM can be also read via Read Buffer Registers in this mode. Moreover, the error injection to an address feedback checker is possible by setting AFINV.

44.3.9.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offset from the base addresses.

Table 44.136 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ECCCNT_DTS_base>	FFC4 A000$_H$	P-Bus Group 0
<ECCCNT_DMDE0_base>	FFC4 A400$_H$	P-Bus Group 0
<ECCCNT_DMDA0_base>	FFC4 A480$_H$	P-Bus Group 0
<ECCCNT_DMDE1_base>	FFC4 A500$_H$	P-Bus Group 0
<ECCCNT_DMDA1_base>	FFC4 A580$_H$	P-Bus Group 0
<MECCCAP_DTS_base>	FFC5 2600$_H$	P-Bus Group 0
<MECCCAP_DMDE0_base>	FFC5 2800$_H$	P-Bus Group 0
<MECCCAP_DMDA0_base>	FFC5 2900$_H$	P-Bus Group 0
<MECCCAP_DMDE1_base>	FFC5 2A00$_H$	P-Bus Group 0
<MECCCAP_DMDA1_base>	FFC5 2B00$_H$	P-Bus Group 0

44.3.9.3 List of Registers

Table 44.137 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECCCNT_DTS	ECC control register	DRECCCTL	<ECCCNT_DTS_base> + 00$_H$	8, 16, 32	PBG00#2	ECCKCPROT

Note: The initial characters of DTS/sDMAC register symbols indicates the followings.
DR: DTSRAM
DE: Descriptor RAM of sDMAC
DA: Data RAM of sDMAC

Table 44.138 The relation between the module storing the error and the error source for sDMAC/DTSRAM

Protection target	Function	Controlled by	Captured to	Applicable for
Data from DTSRAM at DTS	Data ECC decode	ECCCNT_DTS	MECCCAP_DTS	Read data from DTSRAM
Address to DTSRAM at DTS	Address feedback check			Request address to DTSRAM
Data from Descriptor RAM at sDMAC0	Data ECC decode	ECCCNT_DMDE0	MECCCAP_DMDE0	Read data from Descriptor RAM of sDMAC0
Data from Descriptor RAM at sDMAC1		ECCCNT_DMDE1	MECCCAP_DMDE1	Read data from Descriptor RAM of sDMAC1
Data from Data RAM at sDMAC0		ECCCNT_DMDA0	MECCCAP_DMDA0	Read data from Data RAM of sDMAC0
Data from Data RAM at sDMAC1		ECCCNT_DMDA1	MECCCAP_DMDA1	Read data from Data RAM of sDMAC1

44.3.9.4 DRECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read from DTSRAM and address feedback error detection for the address that is requested to DTSRAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DTS_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.139 DRECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	AFEDIS	Address feedback error disable bit Sets the address feedback error detection to enable/disable. 0: Address feedback error detection is enabled 1: Address feedback error detection is disabled
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets the ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.9.5 DRECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be written to data field and ECC field of DTSRAM.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DTS_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.140 DRECCTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	Selects input data for DTSRAM. 0: Normal mode 1: Test mode The values of DRECCTSTDIN0 and DRECCTSTEIN registers are written to data and ECC fields of DTSRAM when writing in test mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.9.6 DRAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from DTSRAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DTS_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.141 DRAFINV Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 2	AFINV[11:2]	Specifies bit pattern to inject errors into feedback address.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.9.7 DRECCTSTDIN0 — Test Data Input Register

This register is used to inject errors into data field of DTSRAM for self-diagnosis. The values of DRECCTSTDIN0 and DRECCTSTEIN registers are written to the requested address when write operation to DTSRAM occurs in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DTS_base> + 30_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.142 DRECCTSTDIN0 Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Specify the test data for DTSRAM. The data is provided to data field of DTSRAM when ECCTST = 1.

44.3.9.8 DRECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of DTSRAM for self-diagnosis. The values of DRECCTSTDIN0 and DRECCTSTEIN registers are written to the requested address when write operation to DTSRAM occurs in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DTS_base> + 40_H

Value after reset: $0000\ 0000_H$

Table 44.150 DETDATBFDATAF0 Register Contents

Bit Position	Bit Name	Function
31 to 0	BFDATA[31:0]	Data field read from the requested address in Descriptor RAM

44.3.9.16 DETDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Descriptor RAM of sDMAC for self-diagnosis. ECC field in the address that is requested can be stored in this register while reading from Descriptor RAM where ECCTST = 1.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DMDEn_base> + 60_H (n = 0, 1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.151 DETDATBFECCF Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	BFECC0[6:0]	ECC field read from the address that is requested in Descriptor RAM

44.3.9.17 DAECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data from Data RAM of sDMAC.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DMDAn_base> + 00_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.152 DAECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), set the 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets the ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.9.18 DAECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be written to data field and ECC field for Data RAM of sDMAC.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DMDAn_base> + 10_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.153 DAECCTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	Selects input data for Data RAM of sDMAC. 0: Normal mode 1: Test mode The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to data and ECC field for Data RAM of sDMAC when buffering transfer data in test mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.9.19 DAECCTSTDIN0 — Test Lower Data Input Register

This register is used to inject errors into lower data field of Data RAM of sDMAC for self-diagnosis. The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to the requested address when write operation to Data RAM occurs in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DMDAn_base> + 30_H (n = 0, 1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.154 DAECCTSTDIN0 Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Specify test data for Data RAM of sDMAC. The data is provided to lower data field of Data RAM when ECCTST = 1.

44.3.9.20 DAECCTSTDIN1 — Test Upper Data Input Register

This register is used to inject errors into upper data field of Data RAM of sDMAC for self-diagnosis. The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to the requested address when write operation to Data RAM occurs in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DMDAn_base> + 34_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Table 44.155 DAECCTSTDIN1 Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Specify the test data for Data RAM of sDMAC. The data is provided to upper data field of Data RAM when ECCTST = 1.

44.3.9.21 DAECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of Data RAM of sDMAC for self-diagnosis. The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to the requested address when write operation to Data RAM occurs in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_DMDAn_base> + 40_H (n = 0, 1)

Value after reset: 0000 0000_H

7 to 0	ECC[7:0]	Specify the test data for Data RAM of sDMAC. The data is provided to ECC field of Data RAM when ECCTST = 1.

44.3.9.22 DATDATBFDATAF0 — Lower Data Read Buffer Register

This register is used to hold data field read from Data RAM of sDMAC for self-diagnosis. The data field in the requested address can be stored in this register while reading from Data RAM when ECCTST = 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ECCCNT_DMDAn_base> + 50_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

44.3.9.25 DR_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address feedback error, ECC error and/or overflow error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DTS_base> + 00_H

Value after reset: $0000\ 008B_H$

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 44.163 DR_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in DR_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in DR_OVFSTR.

44.3.9.29 DR_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in DR_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is “0”.

This register can be cleared by SSTCLR00 in DR_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DTS_base> + 20_H

Value after reset: $0000\ 0000_H$

Table 44.164 DR_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDF00	Indicates that ECC 1-bit error was detected.

44.3.9.30 DR_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in DR_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are “0”. Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in DR_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DTS_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.165 DR_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	AFEF00	Indicates that address feedback error was detected.
2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.9.31 DR_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flag can be cleared by SERROVFCLR0 and SERROVFCLR1 in DR_OVFCLR register respectively.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DTS_base> + 28_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.166 DR_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set.

44.3.9.32 DR_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in DR_SERSTR register were detected.

This register is updated whenever DR_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DTS_base> + 30_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.167 DR_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDLINF00	Indicates that ECC 1-bit error was detected in DTSRAM.

44.3.9.33 DR_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DTS_base> + 70_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 12	Reserved	When read, the value after reset is returned.
11 to 2	SEADR0[11:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Table 44.169 SEDL Information

SEDL[4:0]	Indicated information
31 to 1	These values are reserved
0	Indicates an ECC 1-bit error is detected in storing data to or loading data from DTSRAM.

44.3.9.34 DR_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DTS_base> + $F0_H$

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 12	Reserved	When read, the value after reset is returned.
11 to 2	DEADR0[11:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Table 44.171 DEDL Information

DEDL[4:0]	Indicated information
31 to 1	These values are reserved
0	Indicates a fatal error is detected in storing data to or loading data from DTSRAM.

44.3.9.35 DE_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when ECC error and/or overflow error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDEn_base> + 00_H (n = 0, 1)

Value after reset: $0000\ 0083_H$

Table 44.172 DE_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	SEOVFIE	Controls error reports when overflow error occurs. 0: Overflow error report disabled 1: Overflow error report enabled
6 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.9.36 DE_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in DE_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDEn_base> + 10_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.175 DE_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in DE_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in DE_OVFSTR.

44.3.9.39 DE_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in DE_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is “0”.

This register can be cleared by SSTCLR00 in DE_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDEn_base> + 20_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.176 DE_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDF00	Indicates that ECC 1-bit error was detected.

44.3.9.40 DE_DERSTR — Fatal Error Status Register

This register indicates whether ECC 2-bit error has occurred. The location and the address of the error that is detected are stored in DE_00DEADR register when DEDF00 flag is set. The DEDF00 flag is set only when an ECC 2-bit error is detected while the DEDF00 is “0”.

This register can be cleared by DSTCLR00 in DE_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDEn_base> + 24_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.9.41 DE_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in DE_OVFCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDEn_base> + 28_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Table 44.179 DE_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDLINF00	Indicates that ECC 1-bit error was detected in Descriptor RAM of sDMAC.

44.3.9.43 DE_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DMDEn_base> + 70_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.180 DE_00SEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 12	Reserved	When read, the value after reset is returned.
11 to 2	SEADR0[11:2]	Indicates at which address this error was detected.
1, 0	Reserved	When read, the value after reset is returned.

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

Table 44.181 SEDL Information

SEDL[4:0]	Indicated information
31 to 1	These values are reserved
0	Indicates an ECC 1-bit error is detected in storing data to or loading data from Descriptor RAM of sDMAC.

44.3.9.44 DE_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when DEDF00 flag is not set and an ECC 2-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DMDEn_base> + $F0_H$ (n = 0, 1)

Value after reset: $0000\ 0000_H$

Table 44.183 DEDL Information

DEDL[4:0]	Indicated information
31 to 1	These values are reserved
0	Indicates a fatal error is detected in storing data to or loading data from Descriptor RAM of sDMAC.

44.3.9.45 DA_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when ECC error and/or overflow error occurs.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 00_H (n = 0, 1)

Value after reset: $0000\ 0083_H$

Table 44.184 DA_ERRINT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	SEOVFIE	Controls error reports when overflow error occurs. 0: Overflow error report disabled 1: Overflow error report enabled
6 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when ECC 2-bit error is detected. 0: ECC 2-bit error report disabled 1: ECC 2-bit error report enabled
0	SEDIE	Controls error reports when ECC 1-bit error is detected. 0: ECC 1-bit error report disabled 1: ECC 1-bit error report enabled

44.3.9.46 DA_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in DA_SERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 10_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.185 DA_SSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR00	Writing 1 to this bit clears SEDF00 in DA_SERSTR.

44.3.9.47 DA_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in DA_DERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 14_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.186 DA_DSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DSTCLR00	Writing 1 to this bit clears DEDF00 in DA_DERSTR.

44.3.9.48 DA_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in DA_OVFSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 18_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 44.187 DA_OVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SERROVFCLR1	Writing 1 to this bit clears SERROVF1 in DA_OVFSTR.
0	SERROVFCLR0	Writing 1 to this bit clears SERROVF0 in DA_OVFSTR.

44.3.9.49 DA_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in DA_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is “0”.

This register can be cleared by SSTCLR00 in DA_SSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 20_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEDF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.188 DA_SERSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDF00	Indicates that ECC 1-bit error was detected.

44.3.9.50 DA_DERSTR — Fatal Error Status Register

This register indicates whether ECC 2-bit error has occurred. The location and address of the error that is detected are stored in DA_00DEADR register when DEDF00 flag is set. The DEDF00 flag is set only when an ECC 2-bit error is detected while the DEDF00 is “0”.

This register can be cleared by DSTCLR00 in DA_DSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 24_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.189 DA_DERSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF00	Indicates that ECC 2-bit error was detected.
0	Reserved	When read, the value after reset is returned.

44.3.9.51 DA_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.

SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flag can be cleared by SERROVFCLR0 and SERROVFCLR1 in DA_OVFCLR register respectively.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <MECCCAP_DMDAn_base> + 28_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SERR OVF1	SERR OVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.190 DA_OVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SERROVF1	Indicates that more ECC 1-bit errors than the working memory were detected simultaneously.
0	SERROVF0	Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set.

44.3.9.52 DA_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in DA_SERSTR register were detected.

This register is updated whenever DA_SERSTR register is updated.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DMDAn_base> + 30_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEDLINF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.191 DA_SERINF Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SEDLINF00	Indicates that ECC 1-bit error was detected in Data RAM of sDMAC.

44.3.9.53 DA_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DMDAn_base> + 70_H (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEDL[4:0]					—	—	—	—	—	—	—	—	—	—	—

Table 44.192 DA_00SEADR Register Contents

Bit Position	Bit Name	Function
31 to 27	SEDL[4:0]	Indicates where this error was detected.
26 to 11	Reserved	When read, the value after reset is returned.
10 to 3	SEADR0[10:3]	Indicates at which address this error was detected.
2 to 0	Reserved	When read, the value after reset is returned.

Table 44.193 SEDL Information

SEDL[4:0]	Indicated information
31 to 1	These values are reserved
0	Indicates an ECC 1-bit error is detected in storing data to or loading data from Data RAM of sDMAC.

44.3.9.54 DA_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when DEDF00 flag is not set and an ECC 2-bit error is detected.

This register can only be cleared by reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MECCCAP_DMDAn_base> + $F0_H$ (n = 0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 27	DEDL[4:0]	Indicates where this error was detected.
26 to 11	Reserved	When read, the value after reset is returned.
10 to 3	DEADR0[10:3]	Indicates at which address this error was detected.
2 to 0	Reserved	When read, the value after reset is returned.

Table 44.195 DEDL Information

DEDL[4:0]	Indicated information
31 to 1	These values are reserved
0	Indicates a fatal error is detected in storing data to or loading data from Data RAM of sDMAC.

44.3.9.55 Test Function

(1) DTSRAM ECC

The ECC of the DTSRAM can be tested by using the following procedure:

1. Make sure that the RAM address to be tested is not modified by any ongoing DTS transfer. It is recommended to disable DTS entirely.
2. Write data to any DTSRAM address.
3. Write 02_H to the DTSRAM ECC Test Control Register (DRECCTSTCTL). Enable ECC Test Mode and encode ECC from write data.
4. Read data from the same DTSRAM address.
5. Check Data and ECC field by using the Data Read Buffer Register (DRTDATBFDATAF0) and ECC Read Buffer Register (DRTDATBFECCF).
6. Restore DTSRAM data and ECC with 1-bit or 2-bit errors by using the ECC Test Data Input Register (DRECCTSTDIN0) or the ECC Test ECC Field Input Register (DRECCTSTEIN).
7. Write data to the same DTSRAM address.
8. Write 00_H to the DTSRAM ECC Test Control Register (DRECCTSTCTL). Then, Read data from the same DTSRAM address and check if ECC error occurs.

(2) sDMAC Descriptor RAM ECC

The ECC of the sDMAC Descriptor RAM can be tested by using the following procedure:

1. Make sure that the RAM address to be tested is not modified by any ongoing sDMAC transfer. It is recommended to disable sDMAC entirely.
2. Write data to any sDMAC Descriptor RAM address.
3. Write 02_H to the sDMAC Descriptor RAM ECC Test Control Register (DEECCTSTCTL). Enable ECC Test Mode and encode ECC from write data.
4. Read data from the same sDMAC Descriptor RAM address.
5. Check Data and ECC field by using the Data Read Buffer Register (DETDATBFDATAF0) and ECC Read Buffer Register (DETDATBFECCF).
6. Restore sDMAC Descriptor RAM data and ECC with 1-bit or 2-bit errors by using the ECC Test Data Input Register (DEECCTSTDIN0) or the ECC Test ECC Field Input Register (DEECCTSTEIN).
7. Write data to the same sDMAC Descriptor RAM address.
8. Write 00_H to the sDMAC Descriptor RAM ECC Test Control Register (DEECCTSTCTL). Then, Read data from the same sDMAC Descriptor RAM address and check if ECC error occurs.

(3) sDMAC Data RAM ECC

The ECC of the sDMAC Data RAM can be tested by using ECC calculation of ERRGEN. For details, see **Section 44.3.12.8, Usage of ERRGEN**.

44.3.10 ECC for Peripheral RAM

44.3.10.1 Overview

This is an ECC module for the RAM of the following peripheral modules:

RS-CANFD, FlexRay, Ethernet, GTM, MSPI and MMCA

Error Detection and Correction

Seven-bit ECC data is appended to the 32-bit RAM data.

This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.

Table 44.196 RS-CANFD, FlexRay, Ethernet, GTM, MSPI and MMCA RAM ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled; 2-bit error detection, and 1-bit error detection and correction are carried out.
Error notification	Upon occurrence of an ECC error, it is notified to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. **Overflow Error:** (only for RS-CANFD, FlexRay, GTM and MSPI and MMCA RAM ECC, except for Ethernet) • Error notification is issued upon detection of an address buffer overflow error for ECC error. An ECC 2-bit error and an ECC 1-bit error are handled as individual source in ECM. Overflow errors of each peripheral module (except Ethernet) are notified to ECM as one factor. An ECC error signal is only issued to the ECM, if the ECC error address is not yet stored in the error address buffer.
Error status	A status register is provided, which indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. A one-stage buffer is provided for 2-bit error and 1-bit error. The error status can be cleared using the clear register.
Address capture	The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the capture address. Address buffer is updated if the error status is cleared. One-stage address buffer is provided for an ECC 2-bit error and an ECC 1-bit error.
Self-diagnosis	• By setting the test mode, register values can be used as the data to be output to the RAM. When a peripheral module writes to the RAM, the E710TED.ECEDB[31:0] bit value can be written to the RAM data section, and the E710TRC.ECERDB[6:0] bit value can be written to the ECC redundant bit section. • By setting the test mode, the ECC redundant bit section can be latched when RAM data is read, and the value can be confirmed. • By setting the test mode, the ECC redundant bit (encoding circuit) and syndrome code (decoding circuit), which are generated from the input data, can be confirmed.

44.3.10.2 List of Registers

(1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 44.197 List of ECC modules

Peripheral Functions		ECC Module Names and Register Base Addresses	
		Module Name	Base Address <base_addr>
RS-CANFD0 (P-Bus Group 8)	Message buffer RAM (MB RAM)	E7RC01	FFF2 B000$_H$
	Acceptance filter list RAM (AFL0 RAM)	E7RC02	FFF2 B200$_H$
	Acceptance filter list RAM (AFL1 RAM)	E7RC03	FFF2 B400$_H$
RS-CANFD1 (P-Bus Group 3)	Message buffer RAM (MB RAM)	E7RC11	FFD2 2000$_H$
	Acceptance filter list RAM (AFL0 RAM)	E7RC12	FFD2 2040$_H$
	Acceptance filter list RAM (AFL1 RAM)	E7RC13	FFD2 2080$_H$
FlexRay0 (P-Bus Group 9)	Message RAM (MRAM)	E7FR00	FF05 0000$_H$
	Temporary buffer (TBF A)	E7FR01	FF05 0200$_H$
	Temporary buffer (TBF B)	E7FR02	FF05 0400$_H$
FlexRay1*3 (P-Bus Group 9)	Message RAM (MRAM)	E7FR10	FF05 0600$_H$
	Temporary buffer (TBF A)	E7FR11	FF05 0800$_H$
	Temporary buffer (TBF B)	E7FR12	FF05 0A00$_H$
GTM (P-Bus Group 6H)	MCS0_RAM0	E7GT00	FF70 2000$_H$
	MCS0_RAM1	E7GT01	FF70 2200$_H$
	MCS1_RAM0	E7GT10	FF70 2400$_H$
	MCS1_RAM1	E7GT11	FF70 2600$_H$
	MCS2_RAM0	E7GT20	FF70 2800$_H$
	MCS2_RAM1	E7GT21	FF70 2A00$_H$
	MCS3_RAM0	E7GT30	FF70 2C00$_H$
	MCS3_RAM1	E7GT31	FF70 2E00$_H$
MSPIn (n=0,2,4*4,6*1,8*1) (P-Bus Group 4) (n=1,3,5*4,7*1,9*2) (P-Bus Group 5)	MSPI0 RAM	E7MS00	FFC7 5700$_H$
	MSPI1 RAM	E7MS01	FFC7 C800$_H$
	MSPI2 RAM	E7MS02	FFC7 5800$_H$
	MSPI3 RAM	E7MS03	FFC7 CA00$_H$
	MSPI4 RAM*4	E7MS04*4	FFC7 5900$_H$
	MSPI5 RAM*4	E7MS05*4	FFC7 CC00$_H$
	MSPI6 RAM*1	E7MS06*1	FFC7 5A00$_H$
	MSPI7 RAM*1	E7MS07*1	FFC7 CE00$_H$
	MSPI8 RAM*1	E7MS08*1	FFC7 5B00$_H$
	MSPI9 RAM*2	E7MS09*2	FFC7 D000$_H$
MMCA*5 (P-Bus Group 3)	MMCA0 RAM A	E7MM00	FFD5 5200$_H$
	MMCA0 RAM B	E7MM01	FFD5 5300$_H$
ETNB0*6 (P-Bus Group 9)	Fast Ethernet TX RAM	E7ME00	FF0A 3000$_H$
	Fast Ethernet RX RAM	E7ME01	FF0A 3200$_H$
ETNB1*3 (P-Bus Group 9)	Gb Ethernet TX RAM	E7GE00	FF0A 5400$_H$
	Gb Ethernet RX RAM	E7GE01	FF0A 5600$_H$

Note 1. This function is not implemented in RH850/U2A16 (292 pins), RH850/U2A8 (292 pins) and RH850/U2A6.
Note 2. This function is not implemented in RH850/U2A16 (373/292 pins), RH850/U2A8 (373/292 pins) and RH850/U2A6.
Note 3. This function is not implemented in RH850/U2A6.
Note 4. This function is not implemented in RH850/U2A6 (144 pins).
Note 5. This function is not implemented in RH850/U2A6 (156/144 pins).
Note 6. This function is not implemented in RH850/U2A6 (156 pins).

(2) List of Registers

Table 44.198 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other

E710TED	ECEDB[31:24]	ECEDB[23:16]	ECEDB[15:8]	ECEDB[7:0]	$0C_H$
E710EAD	ECEAD[31:24]	ECEAD[23:16]	ECEAD[15:8]	ECEAD[7:0]	10_H

44.3.10.3 E710CTL — ECC Control Register

E710CTL controls the status and modes of the ECC modules.

E710CTL can be read and written to using the 16-bit or 8-bit manipulation instruction.

Access: This register can be read or written in 16-bit or 8-bit units.

Address: <base_addr> + 00_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA[1:0]		—	—	ECOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. This bit is always read as 0.

Table 44.201 E710CTL Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	EMCA[1:0]	Sets Access Control 1 and 0 to ECC Mode Select Bit These bits enable or disable writing to bit 7. The read value is always 0.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECOVFF	Error Overflow Detection Flag This flag is set when an error of any source other than the same error address occurs while the error flag (ECER2F or ECER1F) is set. One of the following clears this flag: • An internal or external reset • When ECC function is disabled (ECTHM = 1) • Writing 1 to ECER2C and ECER1C
10	ECER2C	2-Bit ECC Error Detection Flag Clear Clears the bit 2 (ECER2F) status flag. The read value is always 0, and writing 0 to ECER2C does not change the state. If writing 1 to ECER2C conflicts with the condition for setting bit 2, the former takes priority. Writing 1 to ECER2C while ECER2F is set clears ECER2F.
9	ECER1C	1-Bit ECC Error Detection Flag Clear Clears the bit 1 (ECER1F) status flag. The read value is always 0, and writing 0 to ECER1C does not change the internal state. If writing 1 to ECER1C conflicts with the condition for setting bit 1, the former takes priority. Writing 1 to ECER1C while ECER1F is set clears ECER1F.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTHM	ECC Function Disable Select Selects the ECC decoding operation. Write access to ECTHM is enabled when the value of bits 15 and 14 is 01_B. Therefore, only the 16-bit manipulation instruction is valid. Setting ECTHM to 1 disables error detection and bit correction. Here, if the data to be output to the peripheral module contains an error, the data is output without bit correction. Setting ECTHM to 1 has no effect on the encoder side. 0: Enable ECC detection and correction. 1: Disable ECC detection and correction.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-Bit ECC Error Correction Enable 0: Enable 1-bit error correction upon error detection. 1: Disable 1-bit error correction upon error detection.

Table 44.201 E710CTL Register Contents (2/2)

Bit Position	Bit Name	Function
4	EC2EDIC	2-Bit ECC Error Detection Notification Enable 0: When a 2-bit error is detected, the ECM is not notified of the error. 1: When a 2-bit error is detected, the ECM is notified of the error.
3	EC1EDIC	1-Bit ECC Error Detection Notification Enable 0: When a 1-bit error is detected, the ECM is not notified of the error. 1: When a 1-bit error is detected, the ECM is notified of the error.
2	ECER2F	2-Bit ECC Error Detection Flag Indicates that errors have been detected at two bits in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. This bit is a read only flag. 0: A 2-bit error has not occurred since this bit was cleared. 1: A 2-bit error has occurred. Clearing conditions (1) Reset is applied. (2) 1 is written to ECER2C. (3) ECC function is disabled (ECTHM = 1)
1	ECER1F	1-Bit ECC Error Detection And Correction Flag Indicates that an error has been detected at one bit in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. Setting this bit generates no interrupt signal. This bit is a read only flag. 0: A 1-bit error has not occurred. 1: A 1-bit error has occurred. Clearing conditions (1) Reset is applied. (2) 1 is written to ECER1C. (3) ECC function is disabled (ECTHM = 1)
0	ECEMF	ECC Error Message Flag Indicates that the current read data contains an error. ECEMF is updated every time RAM data is read. Since the RAM value after reset is undefined, if this bit is read before the RAM is initialized, this bit might be set, indicating an error. Therefore, the ECEMF value after reset is undefined. 0: The current RAM data contains no bit errors. 1: The current RAM data contains bit errors. Clearing conditions (1) ECC function is disabled (ECTHM = 1) (2) Decoding circuit input data contains no 1-bit errors. ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled.

44.3.10.4 E710TMC — ECC Test Mode Control Register

E710TMC is a 16-bit register used to switch the mode to test mode and control the mode.

E710TMC can be read and written to using the 16-bit or 8-bit manipulation instruction.

Access: This register can be read or written in 16-bit or 8-bit units.

Address: <base_addr> + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA[1:0]		—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. This bit is always read as 0.

Table 44.202 E710TMC Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	ETMA[1:0]	Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits enable or disable writing to bit 7. The read value is always 0.
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Control Enable ECTMCE enables or disables access to the test registers and test control bits. Write access to ETCMCE is enabled when the value of bits 15 and 14 is 10_B. 0: Disable access to the test registers and test control bits. 1: Enable access to the test registers and test control bits.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Control Enable ECTRRS enables the read status of RAM to be generated by reading the E710TED register, and also allows the RAM output data to be read out when the E710TRC:ECERDB[7:0] bits and the E710TED register are read. Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Disable generation of RAM read status for testing when E710TED is read. 1: Enable generation of RAM read status for testing when E710TED is read. When E710TRC:ECERDB[7:0] and E710TED are read, the values of the RAM output data pin are read out.
3	ECREOS	ECC Redundant Bit Output Data Select ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allow encoding result to be output as the ECC redundant bit output. 1: Allow the E710TRC:ECERDB[6:0] value to be output as the ECC redundant bit output.

Table 44.202 E710TMC Register Contents (2/2)

Bit Position	Bit Name	Function
2	ECENS	ECC Encoder Input Select ECENS selects either the data value from the peripheral module or the internal test register value (E710TED:ECEDB[31:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allow the RAM write data from the peripheral module to be input as the ECC encoder input data. 1: Allow the E710TED:ECEDB[31:0] value to be input as the ECC encoder input data.
1	ECDCS	ECC Decoder Input Select ECDCS selects either the lower 32-bit data value from the RAM or the internal test register value (E710TED:ECEDB[31:0]) as the lower 32-bit data of the input signal to be decoded. Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously). ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allow the lower 32-bit RAM output data to be input to the data area (32 lower-order bits) to the decoder. 1: Allow the E710TED:ECEDB[31:0] value to be input to the data area to the decoder.
0	ECREIS	ECC Redundant Bit Input Data Select ECREIS selects either the upper 7-bit data value from the RAM (redundant bit area) or the internal test register value (E710TRC:ECERDB[6:0]) as the upper 7-bit data of the input signal to be decoded. Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allow the upper 7-bit RAM output data to be input to the ECC redundant bit area to the decoder. 1: Allow the E710TRC:ECERDB[6:0] value to be input to the ECC redundant bit area to the decoder.

44.3.10.5 E710TED — ECC Encoder and Decoder Data Test Register

E710TED is a 32-bit data test register for ECC encoding and decoding.

When ECTMCE = 1, E710TED can be read and written to using the 32-bit manipulation instruction.

When ECTMCE = 0, E710TED is always read as 0.

In test mode, the E710TED value can be used as the data input to the encoding circuit and decoding circuit.

Access: This register can be read or written in 32-bit units.

Address: <base_addr> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEDB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

NOTE

Changing ECTMCE from 1 to 0 resets E710TED synchronously.

When E710TMC:ECENS = 1, the ECEDB value is input to the encoding circuit and supplied to the RAM.

When E710TMC:ECDCS = 1, the ECEDB value is input as bits 31 to 0 of the data input to the decoding circuit.

When E710TMC:ECTRRS = 1, reading ECEDB returns the RAM output data instead of the data written to ECEDB.

44.3.10.6 E710TRC — ECC Redundant Bit Data Control Test Register

E710TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECERDB) corresponding to the ECC redundant bit area. Each field can be accessed as the 8-bit register with the same name. For details of each field, refer to the descriptions of these four registers.

When ECTMCE = 0, E710TRC is always read as 0.

When ECTMCE = 1, E710TRC can be read using the 32-bit manipulation instruction.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <base_addr> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECSYND								ECHORD							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECECRD								ECERDB							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

NOTE

Changing ECTMCE from 1 to 0 resets E710TRC synchronously.

44.3.10.7 ECSYND — ECC Decoder Syndrome Data Register

ECSYND is a read-only register used to confirm the syndrome code generated by the decoding circuit in test mode (ECTMCE = 1).

Write access to ECSYND is ignored.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <base_addr> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

When read, ECSYND bits return the value of the syndrome code (SYND[6:0]) generated based on the data input to the decoding circuit.

ECSYND bits are not holding circuits; the register value changes as the input signal changes.

ECSYND is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 7 is reserved. When read, the value after reset is returned.

44.3.10.8 ECHORD — ECC 7-Bit Redundant Data Holding Test Register

ECHORD holds the 7-bit ECC redundant area (upper 7-bit RAM data) that cannot be confirmed by the peripheral module when the peripheral module accesses the RAM for reading in test mode (ECTMCE = 1).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <base_addr> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

ECHORD bits are loaded with the upper 7-bit RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode (ECTMCE = 1).

ECHORD bits are also loaded with the data on the input pins EC7TERI38 to EC7TERI32 at the next operating clock pulse when the ECEDB[15:0] register is read while E710TMC:ECTRRS = 1.

ECHORD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 7 is reserved. When read, the value after reset is returned.

44.3.10.9 ECECRD — ECC Encoder Test Register

ECECRD is a read-only register used to read the 7-bit redundant section generated by the encoding circuit in test mode (ECTMCE = 1).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <base_addr> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module. Here, the data that is read is the result of encoding (ECC[6:0]), not the output value.

ECECRD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 7 is reserved. When read, the value after reset is returned.

44.3.10.10 ECERDB — ECC Redundant Bit Input and Output Substitution Buffer Register

ECERDB is a buffer register for the data that substitutes for the input and output data for the 7-bit ECC redundant data area in test mode (ECTMCE = 1).

ECERDB can be read and written to in ECC test mode (ECTMCE = 1).

Access: This register can be read or written in 8-bit units.

Address: <base_addr> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When ECREOS = 1, ECERDB value, instead of the seven redundant bits generated by the encoding circuit, is output to the pin and supplied to the RAM.

When ECREIS = 1, ECERDB value, instead of the upper seven data bits to be input to the decoding circuit, is handled by the decoding circuit.

When ECTRRS = 1, reading ECERDB returns the signal value supplied to RAM instead of the data written to ECERDB.

Bit 7 is reserved. When read, the value after reset is returned. When writing, write the value after reset.

44.3.10.11 E710EAD — ECC Error Address Register

E710EAD is a read-only register used to hold the address at which an ECC error has occurred.

If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E710EAD as the address at which the ECC error occurred.

The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. The address can be calculated by adding the base address.

Only one address can be held in E710EAD.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <base_addr> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

NOTE

For the formula of the ECC error address calculation, refer to **Section 44.3.13, ECC error address calculation**.

44.3.10.12 Notification to ECM

Detection of errors in two bits can be set for this module and the ECM is notified of detected errors.

- 1-bit Error Notification

  While EC1EDIC is set to $1_{B,}$ when an error is detected in one bit from among bits 0 to 38 of data read from RAM, the ECM is notified of the 1-bit error. When ECER1F or ECER2F is already set, however, the ECM will not be notified of the error.

- 2-bit Error Notification

  While EC2EDIC is set to 1_B, when an error is detected in two bits from among bits 0 to 38 of data read from RAM, the ECM is notified of the 2-bit error. When ECER2F is already set, however, the ECM will not be notified of the error.

44.3.10.13 Test Function

(1) Writing RAM Data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in **(3)** below.

(2) Reading RAM Data

(a) Set ECTHM bit in E710CTL register to 1 to disable ECC error detection and correction.

(b) Read the peripheral RAM. Since neither error detection nor correction proceeds when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:

(a) Set ECTHM bit in E710CTL register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC Bits

(a) Set ECTMCE bit in E710TMC register to 1 to set ECC test mode.

(b) Write the value to be written to the ECC bits to E710TRC.ECERDB[6:0].

(c) Set ECREOS bit in E710TMC register to 1 to select writing of the value of E710TRC.ECERDB[6:0] bits to the ECC bits.

(d) When data is written to the peripheral RAM, the value in E710TRC.ECERDB[6:0] bits will be written to the ECC bits.

How to exit this test mode:

(a) Set ECTMCE bit in E710TMC register to 0 to set normal mode.

(4) Reading the ECC Bits

(a) Set ECTMCE bit in E710TMC register to 1 to set ECC test mode.

(b) When data in the peripheral RAM is read, the ECC bits are stored in E710TRC.ECHORD[6:0] bits.

How to exit this test mode:

(a) Set ECTMCE bit in E710TMC register to 0 to set normal mode.

44.3.11 Safety Mechanism on Data Transfer Path

44.3.11.1 Overview

This product provides the function which protects the transaction data and the address on each bus. The scope of this function covers Cluster RAM Bus, Local FLASH Bus, Global FLASH Bus, Inter-processor element Bus, Inter-cluster Bus, System Bus, Peripheral Bus and High speed Bus.

ECC protection on bus is summarized in the table below.

Table 44.203 ECC protection on Bus

Item	Description
Data ECC error detection and correction	ECC error detection and correction on data bus between master and slave can be either enabled or disabled. When enabled, either of the following settings can be selected: • ECC error detection and correction are carried out (2-bit error detection, 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out.
Address ECC error detection	ECC error detection on address bus between master and slave can be either enabled or disabled. In the initial state, 1-bit error detection and 2-bit error detection are carried out.
Error notification	The occurrence of a Data ECC error or an Address EDC error is reported to the Error Control Module. **Data ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit and ECC 1-bit error. **Address EDC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit and ECC 1-bit error. The error notification signal is output with an Address ECC 2-bit error, an Address ECC 1-bit error handled as one source, and a Data ECC 2-bit error and a Data ECC 1-bit error are handled as individual sources.
Error status	A status register is provided that indicates the status of Data ECC 2-bit error detection, Data ECC 1-bit error detection, Address ECC 2-bit error detection, and Address ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Self-diagnosis	ERRGEN is available for self-diagnosis of ECC decoder of data transfer path.

44.3.11.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 44.204 Register Base Addresses (1/3)

Base Address Name	Base Address	Bus Group
<ECCCNT_A_CCIB0CL0_base>	FFC4 $B000_H$	P-Bus Group 0

Address to VCI slave I/F in PE2*3		ECCCNT_SA_PE2CL1		Request address to PE2 area
Address to VCI slave I/F in PE3*3		ECCCNT_SA_PE3CL1		Request address to PE3 area
Address to AXI2VCI0 (bridge from System Bus to Inter-processor element Bus)		ECCCNT_A_X2VCL0		Request address to PE0/PE1 area and I-Bus area
Address to AXI2VCI1 (bridge from System Bus to Inter-processor element Bus)*3		ECCCNT_A_X2VCL1		Request address to PE2/PE3 area
Data at VCI slave I/F in PE0	Data ECC decode	ECCCNT_SD_PE0CL0		Write data to PE0 area
Data at VCI slave I/F in PE1		ECCCNT_SD_PE1CL0		Write data to PE1 area
Data at VCI slave I/F in PE2*3		ECCCNT_SD_PE2CL1		Write data to PE2 area
Data at VCI slave I/F in PE3*3		ECCCNT_SD_PE3CL1		Write data to PE3 area

Table 44.206 The relation between the module storing the error and the error source for Data Transfer Path (2/5)

Protection target	Function	Controlled by	Captured to	Applicable for
Address to CRAM at CRAM controller 0	Address EDC decode	ECCCNT_A_CRAM	BECCCAP_CRAM	Request address to Cluster RAM0 area
Address to CRAM at CRAM controller 1*3		ECCCNT_A_CRAM		Request address to Cluster RAM1 area
Address to CRAM at CRAM controller 2*4		ECCCNT_A_CRAM		Request address to Cluster RAM2 area
Address to CRAM at CRAM controller 3		ECCCNT_A_CRAM		Request address to Cluster RAM3 area
Address to SAXI2MBI0 (bridge from System Bus to CRAM Bus)		ECCCNT_A_SX2MB		Request address to CRAM0 area
Address to SAXI2MBI1 (bridge from System Bus to CRAM Bus)*3		ECCCNT_A_SX2MB		Request address to CRAM1 area
Address to SAXI2MBI2 (bridge from System Bus to CRAM Bus)*4		ECCCNT_A_SX2MB		Request address to CRAM2 area
Address to SAXI2MBI3 (bridge from System Bus to CRAM Bus)		ECCCNT_A_SX2MB		Request address to CRAM3 area
Data in read-modify-write at CRAM controller 0	Data ECC decode	ECCCNT_D_CRAM		Write data to CRAM0 area in read-modify-write*1
Data in read-modify-write at CRAM controller 1*3		ECCCNT_D_CRAM		Write data to CRAM1 area in read-modify-write*1
Data in read-modify-write at CRAM controller 2*4		ECCCNT_D_CRAM		Write data to CRAM2 area in read-modify-write*1
Data in read-modify-write at CRAM controller 3		ECCCNT_D_CRAM		Write data to CRAM3 area in read-modify-write*1
Data from DataRAM at sDMAC0	Data ECC decode	ECCCNT_D_DMDE0	BECCCAP_DMDT	Read data from write buffer of sDMAC0
Data from DataRAM at sDMAC1		ECCCNT_D_DMDE1		Read data from write buffer of sDMAC1
Data at DTS		ECCCNT_D_DTS		Read data from anywhere during DTS transfer
Data at sDMAC0		ECCCNT_D_DMA0		Read data from anywhere during sDMAC0 transfer
Data at sDMAC1		ECCCNT_D_DMA1		Read data from anywhere during sDMAC1 transfer

Table 44.206 The relation between the module storing the error and the error source for Data Transfer Path (3/5)

Protection target	Function	Controlled by	Captured to	Applicable for
Address to IPIR	Address EDC decode	ECCCNT_A_IPIR	BECCCAP_PERI	Request address to IPIR area
Address to BarrierSync		ECCCNT_A_BARR		Request address to BarrierSync area
Address to TPTM		ECCCNT_A_TPTM		Request address to TPTM area
Address to VCI2APB0 (bridge to P-Bus group 0)		ECCCNT_A_SG0		Request address to P-Bus Group 0 area
Address to AXI2PVCI (bridge from System Bus to P-Bus)		ECCCNT_A_SX2PV		Request address to P-Bus area
Data at VCI master I/F in PE0	Data ECC decode	ECCCNT_MD_PE0CL0		Read data via Inter-processor element Bus requested by PE0 master
Data at VCI master I/F in PE1		ECCCNT_MD_PE1CL0		Read data via Inter-processor element Bus requested by PE1 master
Data at VCI master I/F in PE2*3		ECCCNT_MD_PE2CL1		Read data via Inter-processor element Bus requested by PE2 master
Data at VCI master I/F in PE3*3		ECCCNT_MD_PE3CL1		Read data via Inter-processor element Bus requested by PE3 master
Data at VCI2AXI0 (bridge from inter-processor element Bus to System Bus)	Data ECC decode	ECCCNT_D_V2XWCL0		Write data to SAXI (System Bus)s area requested by PE0 and PE1 in specific instructions*2
Data at VCI2AXI0 (bridge from inter-processor element Bus to System Bus)		ECCCNT_D_V2XRCL0		Read data from SAXI (System Bus) area requested by PE0 and PE1 in specific instructions*2
Data at VCI2AXI1 (bridge from inter-processor element Bus to System Bus)*3		ECCCNT_D_V2XWCL1		Write data to SAXI (System Bus) area requested by PE2 and PE3 in specific instructions*2
Data at VCI2AXI1 (bridge from inter-processor element Bus to System Bus)*3		ECCCNT_D_V2XRCL1		Read data from SAXI (System Bus) area requested by PE2 and PE3 in specific instructions*2
Data to VCI2APB0 (bridge to P-Bus group 0)	Data ECC decode	ECCCNT_D_PV2APBW		Write data to P-Bus Group 0 area
Data to IPIR		ECCCNT_D_IPIR		Write data to IPIR area
Data to BarrierSync		ECCCNT_D_BARR		Write data to BarrierSync area
Data to TPTM		ECCCNT_D_TPTM		Write data to TPTM area

Table 44.206 The relation between the module storing the error and the error source for Data Transfer Path (4/5)

Protection target	Function	Controlled by	Captured to	Applicable for
Address to CodeFlash at FAXI2SAXI (bridge from Global Flash Bus to System Bus)*4	Address EDC decode	ECCCNT_A_FX2SX	BECCCAP_EMU	Request address to FAXI2SAXI bridge
Address to GCFU for Global Flash Bus		ECCCNT_A_GCFUF		Request address to remap module from System Bus
Data at FAXI2SAXI (bridge from Global Flash Bus to System Bus)*4	Data ECC decode	ECCCNT_D_EMU		Read data to FAXI2SAXI bridge
Address to CodeFlash at GCFU(PE0/inst) for Local Flash Bus	Address EDC decode	ECCCNT_A_GCFU0ICL0		Request address to remap module for instruction from PE0
Address to CodeFlash at GCFU(PE0/data) for Local Flash Bus		ECCCNT_A_GCFU0DCL0		Request address to remap module for data read from PE0
Address to CodeFlash at GCFU(PE1/inst) for Local Flash Bus		ECCCNT_A_GCFU1ICL0		Request address to remap module for instruction from PE1
Address to CodeFlash at GCFU(PE1/data) for Local Flash Bus		ECCCNT_A_GCFU1DCL0		Request address to remap module for data read from PE1
Address to CodeFlash at GCFU(PE2/inst) for Local Flash Bus*3		ECCCNT_A_GCFU2ICL1		Request address to remap module for instruction from PE2
Address to CodeFlash at GCFU(PE2/data) for Local Flash Bus*3		ECCCNT_A_GCFU2DCL1		Request address to remap module for data read from PE2
Address to CodeFlash at GCFU(PE3/inst) for Local Flash Bus*3		ECCCNT_A_GCFU3ICL1		Request address to remap module for instruction from PE3
Address to CodeFlash at GCFU(PE3/data) for Local Flash Bus*3		ECCCNT_A_GCFU3DCL1		Request address to remap module for data read from PE3
Address to VCI2APB1 (bridge to P-Bus group 1)	Address EDC decode	ECCCNT_A_V2A1	BECCCAP_V2A1	Request address to P-Bus Group 1 area
Address to VCI2APB2 (bridge to P-Bus group 2)		ECCCNT_A_V2A2	BECCCAP_V2A2	Request address to P-Bus Group 2 area

Address to VCI2APB6 (bridge to P-Bus group 6)		ECCCNT_A_V2A6	BECCCAP_V2A6	Request address to P-Bus Group 6 area
Address to VCI2APB7 (bridge to P-Bus group 7)		ECCCNT_A_V2A7	BECCCAP_V2A7	Request address to P-Bus Group 7 area
Address to VCI2APB8 (bridge to P-Bus group 8)		ECCCNT_A_V2A8	BECCCAP_V2A8	Request address to P-Bus Group 8 area
Address to VCI2APB9 (bridge to P-Bus group 9)		ECCCNT_A_V2A9	BECCCAP_V2A9	Request address to P-Bus Group 9 area

Table 44.206 The relation between the module storing the error and the error source for Data Transfer Path (5/5)

Protection target	Function	Controlled by	Captured to	Applicable for
Data to VCI2APB1 (bridge to P-Bus group 1)	Data ECC decode	ECCCNT_D_V2A1W	BECCCAP_V2A1	Write data to P-Bus Group 1
Data to VCI2APB2 (bridge to P-Bus group 2)		ECCCNT_D_V2A2W	BECCCAP_V2A2	Write data to P-Bus Group 2
Data to VCI2APB3 (bridge to P-Bus group 3)		ECCCNT_D_V2A3W	BECCCAP_V2A3	Write data to P-Bus Group 3
Data to VCI2APB4 (bridge to P-Bus group 4)		ECCCNT_D_V2A4W	BECCCAP_V2A4	Write data to P-Bus Group 4
Data to VCI2APB5 (bridge to P-Bus group 5)		ECCCNT_D_V2A5W	BECCCAP_V2A5	Write data to P-Bus Group 5
Data to VCI2APB6 (bridge to P-Bus group 6)		ECCCNT_D_V2A6W	BECCCAP_V2A6	Write data to P-Bus Group 6
Data to VCI2APB7 (bridge to P-Bus group 7)		ECCCNT_D_V2A7W	BECCCAP_V2A7	Write data to P-Bus Group 7
Data to VCI2APB8 (bridge to P-Bus group 8)		ECCCNT_D_V2A8W	BECCCAP_V2A8	Write data to P-Bus Group 8
Data to VCI2APB9 (bridge to P-Bus group 9)		ECCCNT_D_V2A9W	BECCCAP_V2A9	Write data to P-Bus Group 9
Address to RHSIF0*4	Address EDC decode	HB91SECC	HB91SECC	Address to RHSIF0
Write Data to RHSIF0*4	Data ECC decode			Write data to RHSIF0
Read data to RHSIF0*4	Data ECC decode	HB91MECC	HB91MECC	Read data requested by RHSIF0
Address to FlexRay0	Address EDC decode	HB92SECC	HB92SECC	Address to FlexRay0
Write Data to FlexRay0	Data ECC decode			Write data to FlexRay0
Read data to FlexRay0	Data ECC decode	HB92MECC	HB92MECC	Read data requested by FlexRay0
Address to FlexRay1*4	Address EDC decode	HB93SECC	HB93SECC	Address to FlexRay1
Write Data to FlexRay1*4	Data ECC decode			Write data to FlexRay1
Read data to FlexRay1*4	Data ECC decode	HB93MECC	HB93MECC	Read data requested by FlexRay1
Address to SFMA*5	Address EDC decode	HB96SECC	HB96SECC	Address to SFMA
Write Data to SFMA*5	Data ECC decode			Write data to SFMA
Read data to Ethernet*4	Data ECC decode	HB94MECC	HB94MECC	Read data requested by Gb Ethernet
Read data to Fast Ethernet*6	Data ECC decode	HB95MECC	HB95MECC	Read data requested by Fast Ethernet

Note 1. Read-modify-write includes SET1, NOT1, CLR1, CAXI and write access less than 4 bytes. For example, 2-byte write access is included.

Note 2. An access by specific instructions(CLR1, NOT1, SET1 and CAXI) is targeted.

Note 3. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 4. This function is not implemented in RH850/U2A6.

Note 5. This function is not implemented in RH850/U2A6 (156/144 pins).

Note 6. This function is not implemented in RH850/U2A6 (156 pins).

44.3.11.4 BUSAECCCTL — ECC Control Register

This register controls ECC error detection for requested address.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either ECCKCPROT or APECKCPROT, see **Table 44.205, List of Registers**. When KCE = 0, it cannot be written. It can be written only when KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address:
<ECCCNT_A_CCIBnCL0_base> + 00_H (n = 0, 1)
<ECCCNT_A_CCIBnCL1_base> + 00_H (n = 0, 1)
<ECCCNT_SA_PEnCL0_base> + 00_H (n = 0, 1)
<ECCCNT_SA_PEnCL1_base> + 00_H (n = 2, 3)
<ECCCNT_A_GCFUnICL0_base> + 00_H (n = 0, 1)
<ECCCNT_A_GCFUnICL1_base> + 00_H (n = 2, 3)
<ECCCNT_A_GCFUnDCL0_base> + 00_H (n = 0, 1)
<ECCCNT_A_GCFUnDCL1_base> + 00_H (n = 2, 3)
<ECCCNT_A_X2VCLn_base> + 00_H (n = 0, 1)
<ECCCNT_A_BARR_base> + 00_H
<ECCCNT_A_IPIR_base> + 00_H
<ECCCNT_A_TPTM_base> + 00_H
<ECCCNT_A_CRAM_base> + 00_H
<ECCCNT_A_SG0_base> + 00_H
<ECCCNT_A_SX2PV_base> + 00_H
<ECCCNT_A_SX2FX_base> + 00_H
<ECCCNT_A_FX2SX_base> + 00_H
<ECCCNT_A_GCFUF_base> + 00_H
<ECCCNT_A_SX2MB_base> + 00_H
<ECCCNT_A_V2An_base> + 00_H (n = 1-9)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.207 BUSAECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCDIS	Address ECC disable bit Sets ECC error detection to enable/disable. 0: ECC error detection is enabled 1: ECC error detection is disabled

44.3.11.5 BUSAECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be input to ECC decoder.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address:
<ECCCNT_A_CCIBnCL0_base> + 10_H (n = 0, 1)

6 to 0	ECC[6:0]	Specify test data for ECC decoder. The data is provided to ECC field of the ECC decoder when ECCTST = 1.

44.3.11.8 BUSDVCECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction.

This register is protected by Key Code Protection Register. For details whether this register is protected by either ECCKCPROT or APECKCPROT, see **Table 44.205, List of Registers**. When KCE = 0, it cannot be written. It can be written only when KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_D_V2XWCLn_base> + 00_H (n = 0, 1)
<ECCCNT_D_V2XRCLn_base> + 00_H (n = 0, 1)

Table 44.218 BUSDEMECCTSTEIN Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECC[6:0]	Specify the test data for ECC decoder. The data is provided to ECC field of the ECC decoder when ECCTST = 1.

44.3.11.16 BUSDDEECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for internal buffer of sDMAC.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_D_DMDEn_base> + 00_H (n =0, 1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.219 BUSDDEECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	Data ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	Data ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.11.17 BUSDDEECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be input to ECC decoder.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_D_DMDEn_base> + 10_H (n =0, 1)

Value after reset: $0000\ 0000_H$

Table 44.220 BUSDDEECCTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	Selects input data for the data ECC decoder. 0: Normal mode 1: Test mode The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN registers are provided to data and ECC fields of the ECC decoder in test mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.11.18 BUSDDEECCTSTDIN0 — Test Lower Data Input Register

This register is used to inject errors into lower data field of ECC decoder for self-diagnosis. The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <ECCCNT_D_DMDEn_base> + 30_H (n =0, 1)

Value after reset: $0000\ 0000_H$

Table 44.221 BUSDDEECCTSTDIN0 Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Specify the test data for the data ECC decoder. The data is provided to lower data field of the ECC decoder when ECCTST = 1.

44.3.11.19 BUSDDEECCTSTDIN1 — Test Upper Data Input Register

This register is used to inject errors into upper data field of ECC decoder for self-diagnosis. The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Table 44.224 BUSDECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	Data ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	Data ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.11.22 LR_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_LRAM_base> + 00_H

Value after reset: $0000\ 000F_H$

Table 44.229 LR_BUSDDSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When writing, write the value after reset.
3	DDSTCLR03*1	Writing 1 to this bit clears DDEDF03 in LR_BUSDDERSTR.
2	DDSTCLR02*1	Writing 1 to this bit clears DDEDF02 in LR_BUSDDERSTR.
1	DDSTCLR01	Writing 1 to this bit clears DDEDF01 in LR_BUSDDERSTR.
0	DDSTCLR00	Writing 1 to this bit clears DDEDF00 in LR_BUSDDERSTR.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.27 LR_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, flags of the detected errors are all set.

This register can be cleared by LR_BUSASSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_LRAM_base> + 50_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.230 LR_BUSASERSTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	ASEDF17*1	Indicates that an address ECC 1-bit error was detected in request address to AXI2VCI bridge in cluster 1.
16	ASEDF16	Indicates that an address ECC 1-bit error was detected in request address to AXI2VCI bridge in cluster 0.
15 to 4	Reserved	When read, the value after reset is returned.
3	ASEDF03*1	Indicates that an address ECC 1-bit error was detected in request address to PE3.
2	ASEDF02*1	Indicates that an address ECC 1-bit error was detected in request address to PE2.
1	ASEDF01	Indicates that an address ECC 1-bit error was detected in request address to PE1.
0	ASEDF00	Indicates that an address ECC 1-bit error was detected in request address to PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.28 LR_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by LR_BUSADSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_LRAM_base> + 60_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.231 LR_BUSADERSTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	ADEDF17*1	Indicates that an address ECC 2-bit error was detected in request address to AXI2VCI bridge in cluster 1.
16	ADEDF16	Indicates that an address ECC 2-bit error was detected in request address to AXI2VCI bridge in cluster 0.
15 to 4	Reserved	When read, the value after reset is returned.
3	ADEDF03*1	Indicates that an address ECC 2-bit error was detected in request address to PE3.
2	ADEDF02*1	Indicates that an address ECC 2-bit error was detected in request address to PE2.
1	ADEDF01	Indicates that an address ECC 2-bit error was detected in request address to PE1.
0	ADEDF00	Indicates that an address ECC 2-bit error was detected in request address to PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.29 LR_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by LR_BUSDSSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_LRAM_base> + 70_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.233 LR_BUSDDERSTR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	DDEDF03*1	Indicates that a data ECC 2-bit error has been detected in write data to PE3.
2	DDEDF02*1	Indicates that a data ECC 2-bit error has been detected in write data to PE2.
1	DDEDF01	Indicates that a data ECC 2-bit error has been detected in write data to PE1.
0	DDEDF00	Indicates that a data ECC 2-bit error has been detected in write data to PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.31 CR_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CRAM_base> + 00_H

Value after reset: $0000\ 000F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit Position	Bit Name	Function
31 to 15	Reserved	When writing, write the value after reset.
14	DDSTCLR14	Writing 1 to this bit clears DDEDF14 in CR_BUSDDERSTR.
13 to 11	Reserved	When writing, write the value after reset.
10	DDSTCLR10*2	Writing 1 to this bit clears DDEDF10 in CR_BUSDDERSTR.
9 to 7	Reserved	When writing, write the value after reset.
6	DDSTCLR06*1	Writing 1 to this bit clears DDEDF06 in CR_BUSDDERSTR.
5	DDSTCLR05*1	Writing 1 to this bit clears DDEDF05 in CR_BUSDDERSTR.
4	DDSTCLR04*1	Writing 1 to this bit clears DDEDF04 in CR_BUSDDERSTR.
3	Reserved	When writing, write the value after reset.
2	DDSTCLR02	Writing 1 to this bit clears DDEDF02 in CR_BUSDDERSTR.
1	DDSTCLR01	Writing 1 to this bit clears DDEDF01 in CR_BUSDDERSTR.
0	DDSTCLR00	Writing 1 to this bit clears DDEDF00 in CR_BUSDDERSTR.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.11.36 CR_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to Cluster RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by CR_BUSASSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CRAM_base> + 50_H

Value after reset: $0000\ 0000_H$

Table 44.239 CR_BUSASERSTR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned.
27	ASEDF27	Indicates that an address ECC 1-bit error was detected in request address to SAXI2MBI bridge for cluster 3.
26	ASEDF26*2	Indicates that an address ECC 1-bit error was detected in request address to SAXI2MBI bridge for cluster 2.
25	ASEDF25*1	Indicates that an address ECC 1-bit error was detected in request address to SAXI2MBI bridge for cluster 1.
24	ASEDF24	Indicates that an address ECC 1-bit error was detected in request address to SAXI2MBI bridge for cluster 0.
23 to 15	Reserved	When read, the value after reset is returned.
14	ASEDF14	Indicates that an address ECC 1-bit error was detected in request address to Cluster RAM in cluster 3 from outside.
13 to 11	Reserved	When read, the value after reset is returned.
10	ASEDF10*2	Indicates that an address ECC 1-bit error was detected in request address to Cluster RAM in cluster 2 from outside.
9 to 7	Reserved	When read, the value after reset is returned.
6	ASEDF06*1	Indicates that an address ECC 1-bit error was detected in request address to Cluster RAM in cluster 1 from outside.
5	ASEDF05*1	Indicates that an address ECC 1-bit error was detected in request address from PE3 to Cluster RAM in cluster 1.
4	ASEDF04*1	Indicates that an address ECC 1-bit error was detected in request address from PE2 to Cluster RAM in cluster 1.
3	Reserved	When read, the value after reset is returned.

Table 44.239 CR_BUSASERSTR Register Contents (2/2)

Bit Position	Bit Name	Function
2	ASEDF02	Indicates that an address ECC 1-bit error was detected in request address to Cluster RAM in cluster 0 from outside.
1	ASEDF01	Indicates that an address ECC 1-bit error was detected in request address from PE1 to Cluster RAM in cluster 0.
0	ASEDF00	Indicates that an address ECC 1-bit error was detected in request address from PE0 to Cluster RAM in cluster 0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.11.37 CR_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to Cluster RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by CR_BUSADSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CRAM_base> + 60_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.242 CR_BUSDDERSTR Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14	DDEDF14	Indicates that a data ECC 2-bit error was detected in write data to Cluster RAM in cluster 3 from outside.
13 to 11	Reserved	When read, the value after reset is returned.
10	DDEDF10*2	Indicates that a data ECC 2-bit error was detected in write data to Cluster RAM in cluster 2 from outside.
9 to 7	Reserved	When read, the value after reset is returned.
6	DDEDF06*1	Indicates that a data ECC 2-bit error was detected in write data to Cluster RAM in cluster 1 from outside.
5	DDEDF05*1	Indicates that a data ECC 2-bit error was detected in write data from PE3 to Cluster RAM in cluster 1.
4	DDEDF04*1	Indicates that a data ECC 2-bit error was detected in write data from PE2 to Cluster RAM in cluster 1.
3	Reserved	When read, the value after reset is returned.
2	DDEDF02	Indicates that a data ECC 2-bit error was detected in write data to Cluster RAM in cluster 0 from outside.
1	DDEDF01	Indicates that a data ECC 2-bit error was detected in write data from PE1 to Cluster RAM in cluster 0.
0	DDEDF00	Indicates that a data ECC 2-bit error was detected in write data from PE0 to Cluster RAM in cluster 0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.11.40 CF_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address ECC 2-bit error and address ECC 1-bit error are detected.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CFL_base> + 00_H

Value after reset: $0000\ 000C_H$

Table 44.243 CF_BUSERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ADEDIE	Controls error reports when address ECC 2-bit error is detected. 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled
2	ASEDIE	Controls error reports when address ECC 1-bit error is detected. 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.3.11.41 CF_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in CF_BUSASERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CFL_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ASSTCLR24	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.244 CF_BUSASSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When writing, write the value after reset.
24	ASSTCLR24	Writing 1 to this bit clears ASEDF24 in CF_BUSASERSTR.
23 to 6	Reserved	When writing, write the value after reset.
5	ASSTCLR05*1	Writing 1 to this bit clears ASEDF05 in CF_BUSASERSTR.
4	ASSTCLR04*1	Writing 1 to this bit clears ASEDF04 in CF_BUSASERSTR.
3, 2	Reserved	When writing, write the value after reset.
1	ASSTCLR01	Writing 1 to this bit clears ASEDF01 in CF_BUSASERSTR.
0	ASSTCLR00	Writing 1 to this bit clears ASEDF00 in CF_BUSASERSTR.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.42 CF_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in CF_BUSADERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CFL_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.245 CF_BUSADSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When writing, write the value after reset.
24	ADSTCLR24	Writing 1 to this bit clears ADEDF24 in CF_BUSADERSTR.
23 to 6	Reserved	When writing, write the value after reset.
5	ADSTCLR05*1	Writing 1 to this bit clears ADEDF05 in CF_BUSADERSTR.
4	ADSTCLR04*1	Writing 1 to this bit clears ADEDF04 in CF_BUSADERSTR.
3, 2	Reserved	When writing, write the value after reset.
1	ADSTCLR01	Writing 1 to this bit clears ADEDF01 in CF_BUSADERSTR.
0	ADSTCLR00	Writing 1 to this bit clears ADEDF00 in CF_BUSADERSTR.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.43 CF_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to CodeFlash. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected error are all set.

This register can be cleared by CF_BUSASSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_CFL_base> + 50_H

Value after reset: $0000\ 0000_H$

Table 44.248 PH_BUSERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ADEDIE	Controls error reports when address ECC 2-bit error was detected. 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled
2	ASEDIE	Controls error reports when address ECC 1-bit error was detected. 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled
1	DDEDIE	Controls error reports when data ECC 2-bit error was detected. 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	DSEDIE	Controls error reports when data ECC 1-bit error was detected. 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

44.3.11.46 PH_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in PH_BUSASERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_PERI_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.249 PH_BUSASSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When writing, write the value after reset.
25	ASSTCLR25	Writing 1 to this bit clears ASEDF25 in PH_BUSASERSTR.
24 to 21	Reserved	When writing, write the value after reset.
20	ASSTCLR20	Writing 1 to this bit clears ASEDF20 in PH_BUSASERSTR.
19	Reserved	When writing, write the value after reset.
18	ASSTCLR18	Writing 1 to this bit clears ASEDF18 in PH_BUSASERSTR.
17	ASSTCLR17	Writing 1 to this bit clears ASEDF17 in PH_BUSASERSTR.
16	ASSTCLR16	Writing 1 to this bit clears ASEDF16 in PH_BUSASERSTR.
15 to 0	Reserved	When writing, write the value after reset.

44.3.11.47 PH_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in PH_BUSADERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_PERI_base> + 20_H

Value after reset: $0000\ 0000_H$

Table 44.252 PH_BUSDDSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When writing, write the value after reset.
25	DDSTCLR25	Writing 1 to this bit clears DDEDF25 in PH_BUSDDERSTR.
24 to 19	Reserved	When writing, write the value after reset.
18	DDSTCLR18	Writing 1 to this bit clears DDEDF18 in PH_BUSDDERSTR.
17	DDSTCLR17	Writing 1 to this bit clears DDEDF17 in PH_BUSDDERSTR.
16	DDSTCLR16	Writing 1 to this bit clears DDEDF16 in PH_BUSDDERSTR.
15 to 12	Reserved	When writing, write the value after reset.
11	DDSTCLR11*1	Writing 1 to this bit clears DDEDF11 in PH_BUSDDERSTR.
10	DDSTCLR10*1	Writing 1 to this bit clears DDEDF10 in PH_BUSDDERSTR.
9	DDSTCLR09	Writing 1 to this bit clears DDEDF09 in PH_BUSDDERSTR.
8	DDSTCLR08	Writing 1 to this bit clears DDEDF08 in PH_BUSDDERSTR.
7 to 4	Reserved	When writing, write the value after reset.
3	DDSTCLR03*1	Writing 1 to this bit clears DDEDF03 in PH_BUSDDERSTR.
2	DDSTCLR02*1	Writing 1 to this bit clears DDEDF02 in PH_BUSDDERSTR.
1	DDSTCLR01	Writing 1 to this bit clears DDEDF01 in PH_BUSDDERSTR.
0	DDSTCLR00	Writing 1 to this bit clears DDEDF00 in PH_BUSDDERSTR.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.50 PH_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PH_BUSASSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_PERI_base> + 50_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	ASEDF25	—	—	—	—	ASEDF20	—	ASEDF18	ASEDF17	ASEDF16

Table 44.253 PH_BUSASERSTR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	ASEDF25	Indicates that an address ECC 1-bit error was detected in request address to VCI2APB bridge for P-Bus Group 0.
24 to 21	Reserved	When read, the value after reset is returned.
20	ASEDF20	Indicates that an address ECC 1-bit error was detected in request address to AXI2PVCI bridge.
19	Reserved	When read, the value after reset is returned.
18	ASEDF18	Indicates that an address ECC 1-bit error was detected in request address to IPIR.
17	ASEDF17	Indicates that an address ECC 1-bit error was detected in request address to BarrierSync.
16	ASEDF16	Indicates that an address ECC 1-bit error was detected in request address to TPTM.
15 to 0	Reserved	When read, the value after reset is returned.

44.3.11.51 PH_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PH_BUSADSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_PERI_base> + 60_H

Value after reset: $0000\ 0000_H$

Table 44.254 PH_BUSADERSTR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	ADEDF25	Indicates that an address ECC 2-bit error was detected in request address to VCI2APB bridge for P-Bus Group 0.
24 to 21	Reserved	When read, the value after reset is returned.
20	ADEDF20	Indicates that an address ECC 2-bit error was detected in request address to AXI2PVCI bridge.
19	Reserved	When read, the value after reset is returned.
18	ADEDF18	Indicates that an address ECC 2-bit error was detected in request address to IPIR.
17	ADEDF17	Indicates that an address ECC 2-bit error was detected in request address to BarrierSync.
16	ADEDF16	Indicates that an address ECC 2-bit error was detected in request address to TPTM.
15 to 0	Reserved	When read, the value after reset is returned.

44.3.11.52 PH_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PH_BUSDSSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_PERI_base> + 70_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.255 PH_BUSDSERSTR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	DSEDF25	Indicates that a data ECC 1-bit error was detected in write data to VCI2APB bridge for P-Bus Group 0.
24 to 19	Reserved	When read, the value after reset is returned.
18	DSEDF18	Indicates that a data ECC 1-bit error was detected in write data to IPIR.
17	DSEDF17	Indicates that a data ECC 1-bit error was detected in write data to BarrierSync.
16	DSEDF16	Indicates that a data ECC 1-bit error was detected in write data to TPTM.
15 to 12	Reserved	When read, the value after reset is returned.
11	DSEDF11*1	Indicates that a data ECC 1-bit error was detected in read data to VCI2AXI bridge in cluster 1.
10	DSEDF10*1	Indicates that a data ECC 1-bit error was detected in write data to VCI2AXI bridge in cluster 1.
9	DSEDF09	Indicates that a data ECC 1-bit error was detected in read data to VCI2AXI bridge in cluster 0.
8	DSEDF08	Indicates that a data ECC 1-bit error was detected in write data to VCI2AXI bridge in cluster 0.
7 to 4	Reserved	When read, the value after reset is returned.
3	DSEDF03*1	Indicates that a data ECC 1-bit error was detected in read data to PE3 from peripherals.
2	DSEDF02*1	Indicates that a data ECC 1-bit error was detected in read data to PE2 from peripherals.
1	DSEDF01	Indicates that a data ECC 1-bit error was detected in read data to PE1 from peripherals.
0	DSEDF00	Indicates that a data ECC 1-bit error was detected in read data to PE0 from peripherals.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.53 PH_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PH_BUSDDSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_PERI_base> + 80_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DDEDF25	—	—	—	—	—	—	DDEDF18	DDEDF17	DDEDF16

Table 44.256 PH_BUSDDERSTR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	DDEDF25	Indicates that a data ECC 2-bit error was detected in write data to VCI2APB bridge for P-Bus Group 0.
24 to 19	Reserved	When read, the value after reset is returned.
18	DDEDF18	Indicates that a data ECC 2-bit error was detected in write data to IPIR.
17	DDEDF17	Indicates that a data ECC 2-bit error was detected in write data to BarrierSync.
16	DDEDF16	Indicates that a data ECC 2-bit error was detected in write data to TPTM.
15 to 12	Reserved	When read, the value after reset is returned.
11	DDEDF11*1	Indicates that a data ECC 2-bit error was detected in read data to VCI2AXI bridge in cluster 1.
10	DDEDF10*1	Indicates that a data ECC 2-bit error was detected in write data to VCI2AXI bridge in cluster 1.
9	DDEDF09	Indicates that a data ECC 2-bit error was detected in read data to VCI2AXI bridge in cluster 0.
8	DDEDF08	Indicates that a data ECC 2-bit error was detected in write data to VCI2AXI bridge in cluster 0.
7 to 4	Reserved	When read, the value after reset is returned.
3	DDEDF03*1	Indicates that a data ECC 2-bit error was detected in read data to PE3 from peripherals.
2	DDEDF02*1	Indicates that a data ECC 2-bit error was detected in read data to PE2 from peripherals.
1	DDEDF01	Indicates that a data ECC 2-bit error was detected in read data to PE1 from peripherals.
0	DDEDF00	Indicates that a data ECC 2-bit error was detected in read data to PE0 from peripherals.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.3.11.54 DM_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when data ECC 2-bit error and data ECC 1-bit error are detected.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_DMDT_base> + 00_H

Value after reset: $0000\ 0003_H$

Table 44.257 DM_BUSERRINT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DDEDIE	Controls error reports when data ECC 2-bit error was detected. 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	DSEDIE	Controls error reports when data ECC 1-bit error was detected. 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

44.3.11.55 DM_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in DM_BUSDSERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_DMDT_base> + 30_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.259 DM_BUSDDSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When writing, write the value after reset.
8	DDSTCLR08	Writing 1 to this bit clears DDEDF08 in DM_BUSDDERSTR.
7 to 4	Reserved	When writing, write the value after reset.
3	DDSTCLR03	Writing 1 to this bit clears DDEDF03 in DM_BUSDDERSTR.
2	DDSTCLR02	Writing 1 to this bit clears DDEDF02 in DM_BUSDDERSTR.
1	DDSTCLR01	Writing 1 to this bit clears DDEDF01 in DM_BUSDDERSTR.
0	DDSTCLR00	Writing 1 to this bit clears DDEDF00 in DM_BUSDDERSTR.

44.3.11.57 DM_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to DMA/DTS. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by DM_BUSDSSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_DMDT_base> + 70_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.260 DM_BUSDSERSTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned.
8	DSEDF08	Indicates that a data ECC 1-bit error was detected in read data to DTS.
7 to 4	Reserved	When read, the value after reset is returned.
3	DSEDF03	Indicates that a data ECC 1-bit error was detected in internal buffer of sDMAC 1.
2	DSEDF02	Indicates that a data ECC 1-bit error was detected in read data to sDMAC 1.
1	DSEDF01	Indicates that a data ECC 1-bit error was detected in internal buffer of sDMAC 0.
0	DSEDF00	Indicates that a data ECC 1-bit error was detected in read data to sDMAC 0.

44.3.11.58 DM_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to DMA/DTS. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by DM_BUSDDSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_DMDT_base> + 80_H

Value after reset: $0000\ 0000_H$

Table 44.261 DM_BUSDDERSTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned.
8	DDEDF08	Indicates that a data ECC 2-bit error was detected in read data to DTS.
7 to 4	Reserved	When read, the value after reset is returned.
3	DDEDF03	Indicates that a data ECC 2-bit error was detected in internal buffer of sDMAC 1.
2	DDEDF02	Indicates that a data ECC 2-bit error was detected in read data to sDMAC 1.
1	DDEDF01	Indicates that a data ECC 2-bit error was detected in internal buffer of sDMAC 0.
0	DDEDF00	Indicates that a data ECC 2-bit error was detected in read data to sDMAC 0.

44.3.11.59 EM_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by ECCKCPROT register. When ECCKCPROT.KCE = 0, it cannot be written. It can be written only when ECCKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_EMU_base> + 00_H

Value after reset: $0000\ 000F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.267 EM_BUSASERSTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	ASEDF17*2	Indicates that an address ECC 1-bit error was detected in request address to FAXI2SAXI bridge.
16	ASEDF16	Indicates that an address ECC 1-bit error was detected in request address to the remap module from a SAXI master.
15 to 8	Reserved	When read, the value after reset is returned.
7	ASEDF07*1	Indicates that an address ECC 1-bit error was detected in request address to the remap module for data read from PE3.
6	ASEDF06*1	Indicates that an address ECC 1-bit error was detected in request address to the remap module for instruction fetch from PE3.
5	ASEDF05*1	Indicates that an address ECC 1-bit error was detected in request address to the remap module for data read from PE2.
4	ASEDF04*1	Indicates that an address ECC 1-bit error was detected in request address to the remap module for instruction fetch from PE2.
3	ASEDF03	Indicates that an address ECC 1-bit error was detected in request address to the remap module for data read from PE1.
2	ASEDF02	Indicates that an address ECC 1-bit error was detected in request address to the remap module for instruction fetch from PE1.
1	ASEDF01	Indicates that an address ECC 1-bit error was detected in request address to the remap module for data read from PE0.
0	ASEDF00	Indicates that an address ECC 1-bit error was detected in request address to the remap module for instruction fetch from PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.11.65 EM_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSADSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_EMU_base> + 60_H

Value after reset: 0000 0000_H

Table 44.268 EM_BUSADERSTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	ADEDF17*2	Indicates that an address ECC 2-bit error was detected in request address to FAXI2SAXI bridge.
16	ADEDF16	Indicates that an address ECC 2-bit error was detected in request address to the remap module from a SAXI master.
15 to 8	Reserved	When read, the value after reset is returned.
7	ADEDF07*1	Indicates that an address ECC 2-bit error was detected in request address to the remap module for data read from PE3.
6	ADEDF06*1	Indicates that an address ECC 2-bit error was detected in request address to remap module for instruction fetch from PE3.
5	ADEDF05*1	Indicates that an address ECC 2-bit error was detected in request address to remap module for data read from PE2.
4	ADEDF04*1	Indicates that an address ECC 2-bit error was detected in request address to remap module for instruction fetch from PE2.
3	ADEDF03	Indicates that an address ECC 2-bit error was detected in request address to the remap module for data read from PE1.
2	ADEDF02	Indicates that an address ECC 2-bit error was detected in request address to remap module for instruction fetch from PE1.
1	ADEDF01	Indicates that an address ECC 2-bit error was detected in request address to remap module for data read from PE0.
0	ADEDF00	Indicates that an address ECC 2-bit error was detected in request address to remap module for instruction fetch from PE0.

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6.

44.3.11.66 EM_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSDSSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_EMU_base> + 70_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DSEDF17	—

Table 44.269 EM_BUSDSERSTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	DSEDF17*1	Indicates that a data ECC 1-bit error was detected in read data to FAXI2SAXI bridge.
16 to 0	Reserved	When read, the value after reset is returned.

Note 1. This function is not implemented in RH850/U2A6.

44.3.11.67 EM_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSDDSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_EMU_base> + 80_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.270 EM_BUSDDERSTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	DDEDF17*1	Indicates that a data ECC 2-bit error was detected in read data to FAXI2SAXI bridge.
16 to 0	Reserved	When read, the value after reset is returned.

Note 1. This function is not implemented in RH850/U2A6.

44.3.11.68 APECKCPROT — Key Code Protection Register

This register is used for protection against writing to ECC control registers and Error notification control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <PBnECC_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]

	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.271 APECKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit*2 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

Note 2. Unlocking this protection is one of necessary conditions to enable writing the protected registers. It is also necessary to unlock security protection driven by the ICUMHA when ICUMHA function is active. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware.*
ECCCNT_A_V2An (n = 1, 2, 6, 9)
ECCCNT_D_V2AnW (n = 1, 2, 6, 9)
BECCCAP_V2An (n = 1, 2, 6, 9)

44.3.11.69 PHC_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by PBnECC.APECKCPROT register. When PBnECC.APECKCPROT.KCE = 0, it cannot be written. It can be written only when PBnECC.APECKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_V2An_base> + 00_H (n = 1-9)

Value after reset: 0000 $000F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.272 PHC_BUSERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ADEDIE	Controls error reports when address ECC 2-bit error is detected. 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled
2	ASEDIE	Controls error reports when address ECC 1-bit error is detected. 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled
1	DDEDIE	Controls error reports when data ECC 2-bit error is detected. 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	DSEDIE	Controls error reports when data ECC 1-bit error is detected. 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

44.3.11.70 PHC_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in PHC_BUSASERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_V2An_base> + 10_H (n = 1-9)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.276 PHC_BUSDDSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DDSTCLR00	Writing 1 to this bit clears DDEDF00 in PHC_BUSDDERSTR.

44.3.11.74 PHC_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PHC_BUSASSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <BECCCAP_V2An_base> + 50_H (n = 1-9)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.280 PHC_BUSDDERSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	DDEDF00	Indicates that a data ECC 2-bit error was detected in write data to VCI2APB bridge for P-Bus Group n.

44.3.11.78 HBECECCCTL — ECC Control Register

This register controls the ECC error detection/correction and 1-bit error correction.

This register is protected by HBnECC.HBECKCPROT register. When HBnECC.HBECKCPROT.KCE = 0, it cannot be written. It can be written only when HBnECC.HBECKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit or 16-bit units.

Address: <HBnECC_base> + 00_H (n=91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0008_H$

Table 44.281 HBECECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	AECCDIS	Address ECC disable bit (for H-Bus slave) Sets address ECC error detection to enable/disable. 0: Address ECC error detection is enabled 1: Address ECC error detection is disabled For H-Bus master, when writing, write the value after reset because this bit is reserved.
1	SECDIS	ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to enable/disable. 0: Correct when 1-bit error is detected 1: Do not correct when 1-bit error is detected
0	ECCDIS	ECC disable bit Sets ECC error detection/correction to enable/disable. 0: ECC error detection/correction is enabled 1: ECC error detection/correction is disabled

44.3.11.79 HBECERRINT — ECC Error Information Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error, address/data ECC 1-bit error are detected.

This register is protected by HBnECC.HBECKCPROT register. When HBnECC.HBECKCPROT.KCE = 0, it cannot be written. It can be written only when HBnECC.HBECKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <HBnECC_base> + 04_H(n=91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: 0000 0033_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.282 HBECERRINT Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	ADEDIE	Controls error reports when address ECC 2-bit error is detected (for H-Bus slave). 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled For H-Bus master, when writing, write the value after reset because this bit is reserved.
4	ASEDIE	Controls error reports when address ECC 1-bit error is detected (for H-Bus slave). 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled For H-Bus master, when writing, write the value after reset because this bit is reserved.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	Controls error reports when data ECC 2-bit error is detected. 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	SEDIE	Controls error reports when data ECC 1-bit error is detected. 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

44.3.11.80 HBECSTCLR — Error Status Clear Register

This register is used to clear error flag in HBEC1STERSTR. This is write only register and read value is always “0”.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <HBnECC_base> + 08_H (n = 91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 44.283 HBECSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Writing 1 to this bit clears AECDEDF0/AECSEDF0/DEDF0/SEDF0 in HBEC1STERSTR.

44.3.11.81 HBEC1STERSTR — Error Status Register

This register indicates whether error has occurred. When all error flags are “0” and a new error occurs, error status flag is set.

If address ECC 1-bit error or data ECC 1-bit error are set and the new error is address ECC 2-bit error or data ECC 2-bit error, the new error is set (does not clear the previous error flag).

If multiple causes of errors are detected, the errors that are detected are all set (e.g. if data ECC 2-bit error and address ECC 2-bit error are detected at the same access, DEDF0 and AECDEDF0 are both set.).

This register can be cleared by STCLR0 in HBECSTCLR register.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <HBnECC_base> + 10_H (n = 91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	AEC DEDF0	AEC SEDF0	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.284 HBEC1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	AECDEDF0	Indicates address ECC 2-bit error was detected (for H-Bus slave). This is set when address ECC 2-bit error is detected when AECDEDF0 and DEDF0 are all “0”. For H-Bus master, when read, the value after reset is returned because this bit is reserved.
6	AECSEDF0	Indicates address ECC 1-bit error was detected (for H-Bus slave). This is set when address ECC 1-bit error is detected when all error flags are “0”. For H-Bus master, when read, the value after reset is returned because this bit is reserved.
5 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	Indicates data ECC 2-bit error was detected. This is set when data ECC 2-bit error is detected when AECDEDF0 and DEDF0 are all “0”.
0	SEDF0	Indicates data ECC 1-bit error was detected. This is set when data ECC 1-bit error is detected when all error flags are “0”.

44.3.11.82 HBECTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After ECC test mode (ECCTST = 1) setting, arbitrary data value can be input to ECC decoder of H-Bus slave. For H-Bus master, keep the value after reset because this register is reserved.

This register is protected by the HBnECC.HBECKCPROT register. When HBnECC.HBECKCPROT.KCE = 0, it cannot be written. It can be written only when HBnECC.HBECKCPROT.KCE = 1.

When accessing any registers in the same H-Bus Group, ECCTST is cleared to 0.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <HBnECC_base> + 150_H(n = 91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R

Table 44.285 HBECTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	ECCTST	Selects input data for the address ECC decoder. 0:Normal mode 1:Test mode The values of HBECTSTDIN0 and HBECTSTEIN registers are provided to data and ECC field of the ECC decoder respectively when accessing any registers in the same H-Bus Group in test mode. This bit is always read as 0.
0	Reserved	When writing, write the value after reset.

44.3.11.83 HBECTSTDIN0 — Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of HBECTSTDIN0 and HBECTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the key-code protection HBnECC.HBECKCPROT register. When HBnECC.HBECKCPROT.KCE = 0, it cannot be written. It can be written only when HBnECC.HBECKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <HBnECC_base> + 154_H(n = 91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.286 HBECTSTDIN0 Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Specify the test data for the address ECC decoder. The data is provided to data field of the ECC decoder of H-Bus slave when accessing any registers in the same H-Bus Group when ECCTST = 1. For H-Bus master, keep the value after reset because this register is reserved.

NOTE

An actual access address for H-bus modules is determined according to the value of HBECTSTDIN0.

44.3.11.84 HBECTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of HBECTSTDIN0 and HBECTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by HBnECC.HBECKCPROT register. When HBnECC.HBECKCPROT.KCE = 0, it cannot be written. It can be written only when HBnECC.HBECKCPROT.KCE = 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <HBnECC_base> + 158_H (n = 91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.287 HBECTSTEIN Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECC[6:0]	Specify the test data for the address ECC decoder. The data is provided to ECC field of the ECC decoder of H-Bus slave when accessing any registers in the same H-Bus Group when ECCTST = 1. For H-Bus master, keep the value after reset because this register is reserved.

44.3.11.85 HBECKCPROT — Key Code Protection Register

This register is used for protection against writing to the HBnECC control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <HBnECC_base> + $15C_H$(n = 91M, 91S, 92M, 92S, 93M, 93S, 94M, 95M, 96S)

Value after reset: $0000\ 0000_H$

Table 44.288 HBECKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.3.11.86 Test Function

ECC on the write data, the read data and the address are checked by the each ECC decoder. Each ECC decoder has a self-diagnosis function that uses ERRGEN module.

For details, refer to **Section 44.3.12.8, Usage of ERRGEN**.

44.3.12 Error Injection for ECC Function

44.3.12.1 Overview

ERRGEN is a utility module for self-diagnosis tests of ECC decoders. ERRGEN can be used to generate a data pairs and ECC including errors in any bit. ERRGEN has the following features.

Table 44.289 Error Injection for ECC Function

Item	Description
ECC calculation	Provides the correct 7-bit and 8-bit ECC value of arbitrary data.
Error injection	Injects various errors into read data include ECC field. • Error injection is only into the 32-bit data and 7-bit ECC fields. • No function to inject errors into 64-bit data and 8-bit ECC fields directly but ECC calculation register is available.
Register set	A set of registers in odd and even words respectively used to inject errors to 64-bit bus consisting of 2 sets of 32-bit data and 7-bit ECC are implemented, and also a register for users to calculate 8-bit ECC field.

44.3.12.2 List of Registers

Table 44.290 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ERRGEN (P-Bus Group 0)	Error data register	EGDATORGn (n = 0, 1)	FFC5 8400_H + n × 04_H	8, 16, 32	PBG00#2	—
	7-bit ECC calculation register	EGECCCALn (n = 0, 1)	FFC5 8408_H + n × 04_H	8, 16, 32	PBG00#2	—
	ECC Data Error injection register	EGDATINVn (n = 0, 1)	FFC5 8410_H + n × 04_H	8, 16, 32	PBG00#2	—
	ECC Field Error injection register	EGECCINVn (n = 0, 1)	FFC5 8418_H + n × 04_H	8, 16, 32	PBG00#2	—
	8-bit ECC calculation register	EGECC8CAL	FFC5 8420_H	8, 16, 32	PBG00#2	—

44.3.12.3 EGDATORGn — Error Data Register

This register is used to set original data before the error injection and to obtain the modified data containing injected errors according to the settings of EGDATINVn and EGECCINVn. The read data is the value of this register XOR-ed with EGDATINVn and the read value of ECC is EGECCCALn XOR-ed with EGECCINVn when reading this register.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: FFC5 8400_H + n × 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	DATORG[31:0]	Write data before injecting errors and read data after errors are injected

44.3.12.4 EGECCCALn — 7-bit ECC Calculation Register

This register is used to obtain a 7-bit ECC value for the arbitrary value written to EGDATORGn. This ECC value is then injected into an ECC decoder on the address channel. ECC value calculated from EGDATORGn can be read when reading this register. The value of this register is updated simultaneously when EGDATORGn is updated.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: FFC5 8408_H + n × 04_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

6 to 0	ECCCAL[6:0]	Read ECC values calculated from EGDATORGn

44.3.12.5 EGDATINVn — ECC Data Error Injection Register

This register is used to inject errors into the read data signal when reading EGDATORGn. The read data signal is driven by EGDATORGn XOR-ed with this register.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: FFC5 8410_H + n × 04_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	DATINV[31:0]	Bit pattern to invert EGDATORGn value when reading EGDATORGn

44.3.12.6 EGECCINVn — ECC Field Error Injection Register

This register is used to inject errors into the ECC signal when reading EGDATORGn. The ECC signal is driven by EGECCCALn XOR-ed with this register.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: FFC5 8418_H + n × 04_H

Value after reset: 0000 0000_H

Table 44.294 EGECCINVn Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECCINV[6:0]	Bit pattern to invert ECC value of EGDATORGn when reading EGDATORGn

44.3.12.7 EGECC8CAL — 8-bit ECC Calculation Register

This register is used to obtain an ECC values for the arbitrary values written to EGDATORG0 and EGDATORG1. These ECC values are then injected into ECC decoders on Data RAM of sDMAC. ECC values calculated from {EGDATORG1, EGDATORG0} can be read when reading this register. The value of this register is updated simultaneously when either EGDATORG0 or EGDATORG1 is updated.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: FFC5 8420_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.295 EGECC8CAL Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7 to 0	ECC8CAL[7:0]	Read ECC values calculated from {EGDATORG1,EGDATORG0}

44.3.12.8 Usage of ERRGEN

(1) Error Injection into Read Data Channel

ERRGEN can be used to run self-diagnosis tests for ECC decoders of some bus masters on read data channel. Self-diagnosis tests for an ECC decoder on read data channel are made in the following way.

1. Write arbitrary data to EGDATORG0 and EGDATORG1.
2. Set any 1 or 2 bits among EGDATINV0, EGDATINV1, EGECCINV0 and EGECCINV1 to 1.
3. Read EGDATORG0 and EGDATORG1 at the same time in double word access from a target bus master.
4. Check ECC error notification asserted from the bus master.

(2) Error Injection into Write Data Channel

ERRGEN can be used to run self-diagnosis tests for ECC decoders of some bus slaves on write data channel. Self-diagnosis tests for an ECC decoder on write data channel are made in the following way.

1. Write arbitrary data to EGDATORG0 and EGDATORG1.
2. Set any 1 or 2 bits among EGDATINV0, EGDATINV1, EGECCINV0 and EGECCINV1 to 1.
3. Make DTS transfer data from EGDATORG0 and EGDATORG1 to a target bus slave in 64-bit mode.
4. Check ECC error notification asserted from the bus slave.

(3) Error Injection into Address Channel

This case uses a different feature of ERRGEN, which can calculate ECC value of data. It is necessary for users to know correct ECC value for any data to inject various errors into ECC decoders of bus slaves on address channel. Self-diagnosis tests for an ECC decoder on address channel are made in the following way.

1. Write arbitrary data to EGDATORGn.
2. Read EGECCCALn to obtain correct ECC value of the data.
3. Invert any 1 or 2 bits among the data and the ECC value.
4. Set the modified data and ECC value to related registers*1 of the Address EDC decoder and enable its test function.
5. Read data from a target bus slave including the ECC decoder.
6. Check ECC error notification asserted from the ECC decoder.

(4) Error Injection into Data RAM of sDMAC

ERRGEN can also calculate ECC value of 64-bit data. It is necessary for users to learn correct ECC value for any data to inject various errors into ECC decoders on Data RAM of sDMAC. Self-diagnosis tests for an ECC decoder on Data RAM of sDMAC are made in the following way.

1. Write arbitrary data to EGDATORG0 and EGDATORG1.
2. Read EGECC8CAL to obtain correct ECC value of the data.
3. Invert any 1 or 2 bits among the data and the ECC value.
4. Set the modified data and ECC value to related registers*2 of the sDMAC Data RAM ECC module and enable its test function.

5. Make sDMAC including the ECC decoder transfer data from anywhere to anywhere.
6. Check ECC error notification asserted from the ECC decoder.

Note 1. For details, refer to **Section 44.3.11, Safety Mechanism on Data Transfer Path**.
Note 2. For details, refer to **Section 44.3.9, sDMAC/DTSRAM ECC and Address Feedback**.

44.3.13 ECC error address calculation

The ECC error address register does not show the actual address where the error has occured.

The actual address where the error was detected needs to be calculated by the related formula described in **Table 44.296**.

Table 44.296 ECC error address calculation table (1/2)

ROM/RAM (or error capture reigster name)	ECC error address register	Formula for ECC error address calculation
Code Flash	CF_nSEADR (n = 00 to 03)	0000 0000_H + (SEADR0[25:2] << 4)
	CF_00DEADR	0000 0000_H + (DEADR0[25:2] << 4)

MSPI5 RAM [For U2A6(292/176/156 pins)]*4	E7MS05.E710EAD	FFCC 5000_H + (ECEAD[8:2] << 2)

Note 1. This function is not implemented in RH850/U2A8 and RH850/U2A6.

Note 2. To access to RS-CANFD RAM, RAM test mode must be enabled. For more detail of RAM test mode, refer to **Section 23, CANFD Interface (RS-CANFD)**.
For the RS-CANFD Message Buffer RAM, ECEAD indicates the address right-shifted by 2 bits rather than the actual address, so it is necessary for users to multiply it by 4 and add the base address of RS-CANFD MB RAM in test mode to get address at which the error was detected. For the page number setting of the

RS-CANFD Message Buffer RAM, it can be calculated by E710EAD[15:6] + 60_H.
For the RS-CANFD Acceptance Filter List RAM, ECEAD indicates the address right-shifted by 3 bits rather than the actual address, so it is necessary for users to multiply it by 8 and add the base address of the RS-CANFD Acceptance Filter List RAM in test mode to get address at which the error was detected. For the page number setting of the RS-CANFD Acceptance Filter List RAM, it can be calculated by 0000_H + E710EAD[11:5].
For details of the RAM test mode, refer to **Section 23, CANFD Interface (RS-CANFD)**.

Note 3. GTM ECC error address indication
ECEAD indicates the address right-shifted by 2 bits rather than the actual address, so it is necessary for users to multiply it by 4 and add the base address of corresponding GTM RAM to get address at which the error was detected. It means the error address in the 32-bit address space is
GTM MCS RAM0 (E7GT00, E7GT10, E7GT20, E7GT30): <the address of corresponding GTM RAM0> + (ECEAD[10:0] << 2),
GTM MCS RAM1 (E7GT01, E7GT11, E7GT21, E7GT31): <the base address of corresponding GTM RAM1> + (ECEAD[9:0] << 2).
For the base address and configuration of GTM RAM, refer to **Section 38, Generic Timer Module (GTM)**.

Note 4. MSPI ECC error address indication
In RH850/U2A-EVA, RH850/U2A16 and RH850/U2A8, ECEAD indicates the offset address that has to be added to the base address of the RAM to get the address at which the error was detected.
In RH850/U2A6, ECEAD indicates the address right-shifted by 2 bits rather than the actual address, so it is necessary for users to multiply it by 4 and add the base address of corresponding MSPIn RAM to get address at which the error was detected.
For the base address of MSPIn RAM, refer to **Section 19, Multichannel Serial Peripheral Interface (MSPI)**.

Note 5. The address for DTSnnnCM can be recognized from corresponding DTTCCnnn after calculation. For more detail, refer to **Section 8, DTS Controller**.

44.4 Hardware Redundancy

44.4.1 Overview

This product implements the CPU0/1/2/3 and DTS with the lockstep function to quickly detect failures without software interaction. The CPU0/1/2/3 and DTS execute the function using two different cores; that is, a master core and checker core, and constantly compare the execution results of the two cores. When the results do not match, an error is reported to the ECM. The comparison targets of CPU's bus outputs are own Local RAM, Cluster RAM, Inter-processor element Bus, Local FLASH Bus, and the tag RAM and the data RAM of Instruction cache. The lockstep function of the CPU1/2/3 can be disabled by the configuration of flash option byte 9. For details of the configuration, see **Section 51, Flash Memory**.

The lockstep function of the CPU0/1/2/3 and DTS features of failure insertion, through which errors can be intentionally triggered and thus self-diagnosis of the lockstep operation is possible. For details of CPU0/1/2/3's failure insertion, refer to **Section 3, CPU System**.

Following table shows redundant structure implemented in this product.

Table 44.297 Redundant Blocks

Block Name	Features	Comparator Error Injection
CPU0, CPU1, CPU2*1, CPU3*1	Dual lock step with 2-cycle delay	Yes
DTS	Dual lock step with 2-cycle delay	Yes
Bus bridge of sDMAC	Duplication and comparator	No
Cluster RAM Controller	Duplication and comparator	No
SAXI2FAXI bridge (from System Bus to Global FLASH Bus)	Duplication and comparator	No
SAXI2MBI bridge (from System Bus to CRAM Bus)	Duplication and comparator	No
VCI2APB bridge (from P-Bus to each P-Bus Group)	Duplication and comparator	No
VCI2AXI bridge (from Inter-processor element Bus to System Bus)	Duplication and comparator	No
AXI2VCI bridge (from System Bus to P-Bus)	Duplication and comparator	No
AXI2VCI bridge (from System Bus to Inter-processor element Bus)	Duplication and comparator	No
GCFU	Duplication and comparator	No
CCIB	Comparator of input and output signals	No

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.4.2 Error Notifications

The error notifications of this module are listed in the following table.

Table 44.298 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
DTS compare error	DTS redundant lock step compare error	36	—
BUS Bridge compare error of sDMAC	Duplication comparator error detected in sDMAC0	37	—
	Duplication comparator error detected in sDMAC1		
Bus Bridge compare error	Duplication comparator error detected in CRAM controller	38	—
	Duplication comparator error detected in SAXI2FAXI bridge (from System Bus to Global FLASH Bus)		
	Duplication comparator error detected in SAXI2MBI bridge (from System Bus to CRAM Bus)		
	Duplication comparator error detected in VCI2AXI bridge (from Inter-processor element Bus to System Bus)		
	Duplication comparator error detected in AXI2VCI bridge (from System Bus to P-Bus)		
	Duplication comparator error detected in AXI2VCI bridge (from System Bus to Inter-processor element Bus)		
	Duplication comparator error detected in VCI2APB bridge (from P-Bus to each P-Bus Group)		
	Duplication comparator error detected in GCFU block for SAXI masters		
	Duplication comparator error detected in GCFU block for instruction fetch or data access		
	Comparator error detected in CCIB block		
DCLS compare error (PE0)	Redundant lock step compare error	224	—
DCLS compare error (PE1)	Redundant lock step compare error	256	—
DCLS compare error (PE2)	Redundant lock step compare error	288	—
DCLS compare error (PE3)	Redundant lock step compare error	320	—

44.4.3 List of Registers

Table 44.299 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
DTS_COMPC	Error injection control register	DTS_COMP_CNTRL	FFC5 8200$_H$	32	PBG00#2	DTS_COMP_CNTRL

44.4.4 DTS_COMP_CNTRL — Error Injection Control Register

This register can control the output signals on the checker side of the DTS. A DTS comparison error can be generated by setting this register.

Writing to this register should be executed with PROT[31:30] = 01_B.

Access: This register can be read or written in 32-bit units.

Address: FFC5 8200_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT[31:30]		DTSCMPERR[29:16]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DTSCMPERR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.300 DTS_COMP_CNTRL Register Contents

Bit Position	Bit Name	Function
31, 30	PROT[31:30]	Protection Bit 01_B: Writing is enabled Other: Writing is disabled These bits are always read as 0.
29 to 0	DTSCMPERR[29:0]	A DMA comparison error can be generated by writing 111111_11111011_11111111_11111111 $_B$ to DTSCMPERR together with the PROT bit. Clear all these bits to 0 if there is no need to generate this error.

44.4.5 Usage Note

Reading a register with a value that is undefined after a reset without initializing the register may lead to a CPU comparison error. Accordingly, such registers must be initialized with the desired settings. Even if the branch instruction and the subsequent instruction is issued in parallel, the CPU comparison error might be occurred by undefined register after the reset. It should be applied as specified below until the register which refer by subsequent instruction is initialized in case of branching in the preceding instruction.

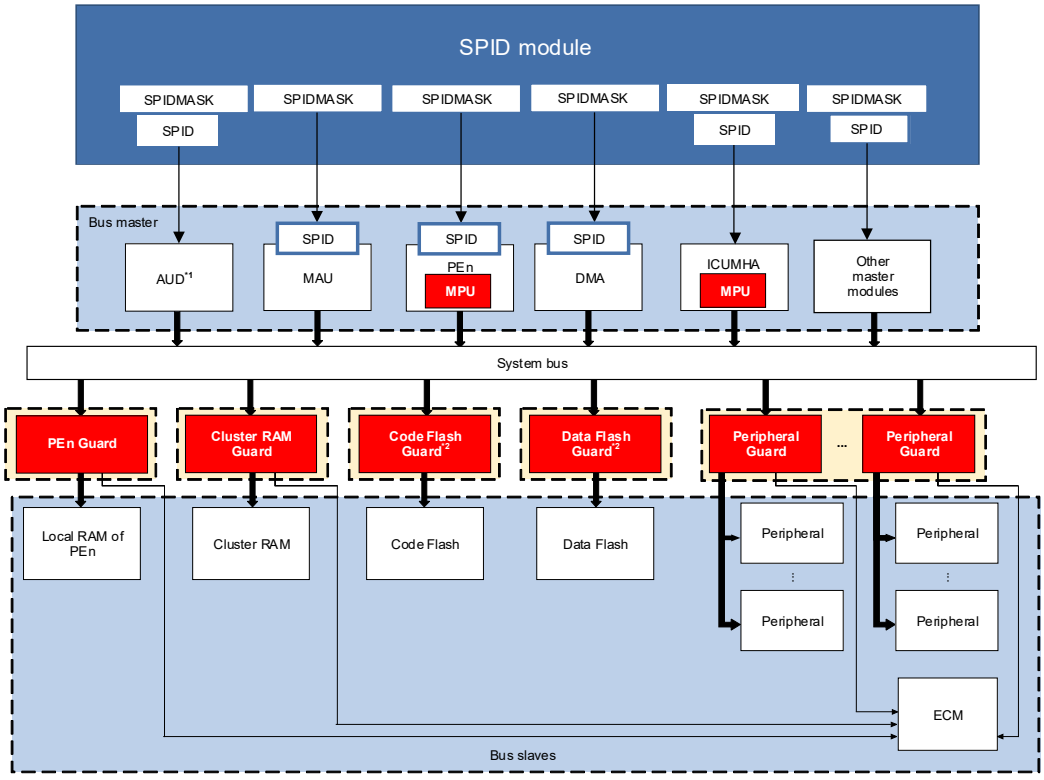
– Insert the SYNCI instruction or the RIE instruction following the branch instruction. (It has to be added by assembler language. When C language is used, it could be optimized.)

– Applicable branch instructions:
  - Bcond except BR
  - JARL, JMP

44.5 Memory Protection

44.5.1 Overview

This product incorporates the memory protection/guard functions to prevent erroneous access to data in the memory and control registers of the peripheral modules. **Figure 44.1** shows the overall memory protection architecture. Each programmable core (bus master) has a Memory Protection Unit (MPU) that defines the software access protection. In addition, each resource (bus slave) has a guard that controls the access by any bus master, including ones that do not have an MPU such as the DMA.



Note 1. AUD function is only supported in RH850/U2A-EVA.

Note 2. For details of Code Flash Guard and Data Flash Guard, See the *RH850/U2A-EVA Group Security User's Manual: Hardware.*

Figure 44.1 Memory Protection Architecture

- **MPU**

  All CPU cores and ICUMHA protect the memory against unintended access from the CPU cores and ICUMHA themselves. Requests to access addresses that are prohibited by the MPU are never issued by the CPU cores or ICUMHA. For details, see **Section 3, CPU System** and the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

- **Slave Guard**

  A specific memory is protected against unintended access from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

  – PEG

    Local RAM and INTC1 are protected against unintended access except from the CPU incorporating the Local RAM and INTC1 themselves. For example, access from CPU0 to Local RAM in CPU0 is not rejected by the PEG.
    For details, refer to **Section 44.5.4, PEG**.

  – CRG

    Cluster RAM is protected against unintended access.

  – Peripheral Guard

    The control registers in the peripheral circuits and memory are protected against unintended access.
    Peripheral Guard includes INTC2 Guard, DTS Guard, sDMAC Guard, IBG, HBG and PBG.
    For details, refer to **Section 44.5.6, INTC2 Guard** to **Section 44.5.11, HBG**.

For this purpose, each guard has following common guard attributes for memory protection.

In addition to access address, each bus access contains the following access attributes that identifies the bus master for error information capture.

Table 44.301 Common guard attributes for each slave guard

Priority	Guard Attribute	Contents
High	SEC*1	Any non-secure masters are prohibited to access to the target slave if the attribute is enabled.
	DBG	Any debug masters can access to the target slave if this attribute is enabled.
↓	UM	Any masters in user mode are prohibited to access to the target slave if this attribute is disabled.
	SPID[m]	Any masters whose SPIDs are equivalent to m can access to the target slave if this attribute is enabled.
	WG	Any masters can write to the target slave if this attribute is enabled.
Low	RG	Any masters can read from the target slave if this attribute is enabled.

Note 1. This attribute is available for only PBG6L1.

Table 44.302 Access attributes of each bus access

Access attribute	Function
UM	Indicates the operating mode of bus master when the all bus masters access to an address. 0: Supervisor mode 1: User mode When CPU or ICUMHA*1 accesses an address, this access attribute indicates the value set in system register of CPU core. When DTS or sDMAC or MAU*2 accesses an address, this access attribute indicates the value set in each dedicated register. When the ICUM_AES0*1 accesses an address, the value of this access attribute is always 1. When the other masters accesses an address, the value of this access attribute is always 0.
SEC	Indicates the access mode of the ICUMHA or ICUM_AES0 when ICUMHA or ICUM_AES0 accesses an address. 0: Non-secure 1: Secure When the other master accesses an address, the value of this access attribute is always 0.
DBG	Indicates the access mode of the debug modules when the debug module accesses an address. 0: Normal mode 1: Debug mode When the other master accesses an address, the value of this access attribute is always 0.
SPID	Indicates the system protection identifier SPID that is assigned by themselves when all bus masters access to an address. When CPU accesses an address, this access attribute indicates the value set in the system register of CPU core. When DTS or sDMAC or MAU accesses an address, this access attribute indicates the value set in each dedicated register. When the other master accesses an address, this access attribute indicates the value set in SPID module. See **Section 44.5.3, SPID** for details.
WRITE	Indicates the access type of bus master. 0: Read access 1: Write access

Note 1. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Note 2. MAU is one of the debug functions to read and write the memory and registers.

- **Default MPU and Guard Configuration**

  The MPU of each PE and the ICUMHA is disabled after reset.
  The PBG and HBG are enabled after reset and access to the protected area is limited by the initial settings of the configuration registers to protect against unintended access. For details, see the reset values of the configuration registers of PBG and HBG in each section.
  All other guards require a configuration setting first to define the protected address range or modules. Therefore, their regions are disabled by default. See the reset values of the registers in the related sections for more information.

44.5.2 Error Notifications

The error notifications of these modules are listed in the following table. MPU can generate exceptions. For details, see **Section 3, CPU System** and the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Table 44.303 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
CRAM Guard error	CRG error	168	√
I-Bus Guard error	IBG error	169	√
P-Bus Guard error	DTS guard error sDMAC guard error INTC2 guard error PBG error	170	√
H-Bus Guard error	HBG error	171	√
PE Guard error (PE0)	PEG error by access to PE0 slave	240	√
PE Guard error by PE0 read access (PE0)	PEG error detected in a read request from PE0 to the other LRAM	241	√
PE Guard error (PE1)	PEG error by access to PE1 slave	272	√
PE Guard error by PE1 read access (PE1)	PEG error detected in a read request from PE1 to the other LRAM	273	√
PE Guard error (PE2)	PEG error by access to PE2 slave	304	√
PE Guard error by PE2 read access (PE2)	PEG error detected in a read request from PE2 to the other LRAM	305	√
PE Guard error (PE3)	PEG error by access to PE3 slave	336	√
PE Guard error by PE3 read access (PE3)	PEG error detected in a read request from PE3 to the other LRAM	337	√

44.5.3 SPID

44.5.3.1 Overview

SPID (System Protection identifier) indicates an identifier of the software task. The value of SPID for CPU cores, DTS/sDMAC and MAU[*2] can be set individually in each configuration register. For the other masters, it can be set in SPID module.

SPID module supervises all SPIDs except for some bus masters which have own configuration register. These SPID registers present in SPID module are configurable by software. In addition, the SPID module also supervises SPIDs which all bus masters use through SPID mask registers.

SPID mask registers can be locked by SPID mask lock registers for security purposes. Once SPID mask lock register locks a SPID mask register, it can be cleared by Power Up Reset, System Reset1, System Reset2, Application Reset and DeepSTOP Reset.

Table 44.304 shows the initial values of SPID for each bus master.

Table 44.304 Initial Value and Register Location of SPID

Initial value of SPID[*4]	Bus master	Register location
0	CPU0	CPU0
1	CPU1	CPU1
2	CPU2[*3]	CPU2
3	CPU3[*3]	CPU3
4 to 16	Reserved	-
17	Gb Ether[*6]	SPID module
18	Reserved	-
19	RHSIF0[*6]	SPID module
20	Reserved	-
21	Reserved	-
22	FlexRay1[*6]	SPID module
23	FlexRay0	SPID module
24	Fast Ether[*7]	SPID module
25	ICUM_AES0	SPID module
26	ICUMHA	SPID module
27	sDMAC1	sDMAC1
28	sDMAC0	sDMAC0
29	DTS[*1]	DTS
30	AUD[*5]	SPID module
31	MAU	MAU

Note 1. Initial value of SPID for DTS is stored in DTSRAM. Therefore, it is undefined after reset and it becomes 0 after RAM initialization. Refer to **Section 9.5.6, RAM Initialization**.

Note 2. MAU is one of the debug functions to read and write the memory and registers.

Note 3. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 4. The initial value shown in this table is the same as the 'Bus master index n' in the register description in this section.

Note 5. AUD function is only supported in RH850/U2A-EVA.

Note 6. This function is not implemented in RH850/U2A6.

Note 7. This function is not implemented in RH850/U2A6 (156 pins).

Features of SPID:

- SPID of each bus master is configurable by software with high flexibility according to user's system.
- It is possible to assign one SPID to one bus master or assign one SPID to several bus masters.
- It is possible to limit SPID that each bus master uses by SPIDMASK register. Moreover this configuration can be locked.
- The lock function above prevents unauthorized use of SPID for security purpose.

Table 44.305 shows a case which eight SPIDs are allocated only to CPU0 and other SPIDs are allocated to each remained bus master. **Table 44.306** shows a case which some SPIDs are allocated to each CPU and some peripheral bus masters use one same SPID.

The system integrator should define the SPID assignment according to the system.

Table 44.305 Example of SPID setting (Several SPIDs are allocated only to CPU0)

SPID value	Bus master	Lock/Unlock
0	CPU0	Unlocked
1	CPU1	Locked
2	CPU2*1	Locked
3	CPU3*1	Locked
4 to 10	CPU0	Unlocked
11 to 16	Reserved	-
17	Gb Ether*3	Locked
18	Reserved	-
19	RHSIF0*3	Locked
20	Reserved	-
21	Reserved	-
22	FlexRay1*3	Locked
23	FlexRay0	Locked
24	Fast Ether*4	Locked
25	ICUM_AES0	Locked
26	ICUMHA	Locked
27	sDMAC1	Locked
28	sDMAC0	Locked
29	DTS	Locked
30	AUD*2	Locked
31	MAU	Locked

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.
Note 2. AUD function is only supported in RH850/U2A-EVA.
Note 3. This function is not implemented in RH850/U2A6.
Note 4. This function is not implemented in RH850/U2A6 (156 pins).

Table 44.306 Example of SPID setting (Several SPIDs are allocated to each CPU)

SPID value	Bus master	Lock/Unlock
0	CPU0	Unlocked
1	CPU1	Unlocked
2	CPU2*1	Unlocked
3	CPU3*1	Unlocked
4 to 12	CPU0	Unlocked
13 to 21	CPU1	Unlocked
22	CPU2*1	Unlocked
23	CPU3*1	Unlocked
24	RHSIF0*3/FlexRay0/FlexRay1*3/Gb Ether*3/Fast Ether*4	Locked
25	ICUM_AES0	Locked
26	ICUMHA	Locked
27	sDMAC1	Locked
28	sDMAC0	Locked
29	DTS	Locked
30	AUD*2	Locked
31	MAU	Locked

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.
Note 2. AUD function is only supported in RH850/U2A-EVA.
Note 3. This function is not implemented in RH850/U2A6.
Note 4. This function is not implemented in RH850/U2A6 (156 pins).

44.5.3.2 List of Registers

Table 44.307 List of SPID Registers (1/2)

Module Name	Register Name*1	Symbol	Address	Access Size	Access Protection	
					PBG	Other
SPIDCTL (P-Bus Group 9)	BusMaster 17 SPID Register	BM17SPID*4	FF0A 8044$_H$	8, 16, 32	PBG90#3	—
	BusMaster 19 SPID Register	BM19SPID*4	FF0A 804C$_H$	8, 16, 32	PBG90#3	—
	BusMaster 22 SPID Register	BM22SPID*4	FF0A 8058$_H$	8, 16, 32	PBG90#3	—
	BusMaster 23 SPID Register	BM23SPID	FF0A 805C$_H$	8, 16, 32	PBG90#3	—
	BusMaster 24 SPID Register	BM24SPID*5	FF0A 8060$_H$	8, 16, 32	PBG90#3	—
	BusMaster 25 SPID Register	BM25SPID	FF0A 8064$_H$	8, 16, 32	PBG90#3	—
	BusMaster 26 SPID Register	BM26SPID	FF0A 8068$_H$	8, 16, 32	PBG90#3	—
	BusMaster 30 SPID Register	BM30SPID*3	FF0A 8078$_H$	8, 16, 32	PBG90#3	—
	BusMaster 00 SPID mask Register	BM00SPIDMSK	FF0A 8100$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 01 SPID mask Register	BM01SPIDMSK	FF0A 8104$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 02 SPID mask Register	BM02SPIDMSK*2	FF0A 8108$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 03 SPID mask Register	BM03SPIDMSK*2	FF0A 810C$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 17 SPID mask Register	BM17SPIDMSK*4	FF0A 8144$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 19 SPID mask Register	BM19SPIDMSK*4	FF0A 814C$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 22 SPID mask Register	BM22SPIDMSK*4	FF0A 8158$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 23 SPID mask Register	BM23SPIDMSK	FF0A 815C$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 24 SPID mask Register	BM24SPIDMSK*5	FF0A 8160$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 25 SPID mask Register	BM25SPIDMSK	FF0A 8164$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 26 SPID mask Register	BM26SPIDMSK	FF0A 8168$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 27 SPID mask Register	BM27SPIDMSK	FF0A 816C$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 28 SPID mask Register	BM28SPIDMSK	FF0A 8170$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 29 SPID mask Register	BM29SPIDMSK	FF0A 8174$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 30 SPID mask Register	BM30SPIDMSK*3	FF0A 8178$_H$	8, 16, 32	PBG90#3	SPIDKCPROT
	BusMaster 31 SPID mask Register	BM31SPIDMSK	FF0A 817C$_H$	8, 16, 32	PBG90#3	SPIDKCPROT

Table 44.307 List of SPID Registers (2/2)

Module Name	Register Name*1	Symbol	Address	Access Size	Access Protection	
					PBG	Other
SPIDCTL (P-Bus Group 9)	BusMaster 00 SPID mask Lock Register	BM00SPIDMSKLOCK	FF0A 8200$_H$	8, 16, 32	PBG90#3	—
	BusMaster 01 SPID mask Lock Register	BM01SPIDMSKLOCK	FF0A 8204$_H$	8, 16, 32	PBG90#3	—
	BusMaster 02 SPID mask Lock Register	BM02SPIDMSKLOCK*2	FF0A 8208$_H$	8, 16, 32	PBG90#3	—
	BusMaster 03 SPID mask Lock Register	BM03SPIDMSKLOCK*2	FF0A 820C$_H$	8, 16, 32	PBG90#3	—
	BusMaster 17 SPID mask Lock Register	BM17SPIDMSKLOCK*4	FF0A 8244$_H$	8, 16, 32	PBG90#3	—
	BusMaster 19 SPID mask Lock Register	BM19SPIDMSKLOCK*4	FF0A 824C$_H$	8, 16, 32	PBG90#3	—
	BusMaster 22 SPID mask Lock Register	BM22SPIDMSKLOCK*4	FF0A 8258$_H$	8, 16, 32	PBG90#3	—
	BusMaster 23 SPID mask Lock Register	BM23SPIDMSKLOCK	FF0A 825C$_H$	8, 16, 32	PBG90#3	—
	BusMaster 24 SPID mask Lock Register	BM24SPIDMSKLOCK*5	FF0A 8260$_H$	8, 16, 32	PBG90#3	—
	BusMaster 25 SPID mask Lock Register	BM25SPIDMSKLOCK	FF0A 8264$_H$	8, 16, 32	PBG90#3	—
	BusMaster 26 SPID mask Lock Register	BM26SPIDMSKLOCK	FF0A 8268$_H$	8, 16, 32	PBG90#3	—
	BusMaster 27 SPID mask Lock Register	BM27SPIDMSKLOCK	FF0A 826C$_H$	8, 16, 32	PBG90#3	—
	BusMaster 28 SPID mask Lock Register	BM28SPIDMSKLOCK	FF0A 8270$_H$	8, 16, 32	PBG90#3	—
	BusMaster 29 SPID mask Lock Register	BM29SPIDMSKLOCK	FF0A 8274$_H$	8, 16, 32	PBG90#3	—
	BusMaster 30 SPID mask Lock Register	BM30SPIDMSKLOCK*3	FF0A 8278$_H$	8, 16, 32	PBG90#3	—
	BusMaster 31 SPID mask Lock Register	BM31SPIDMSKLOCK	FF0A 827C$_H$	8, 16, 32	PBG90#3	—
	SPID Key code Protection Register	SPIDKCPROT	FF0A 8300$_H$	32	PBG90#3	—

Note 1. For "Bus master index n" in register name of below sections, refer **Table 44.304**.

Note 2. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

Note 3. These registers are only implemented in RH850/U2A-EVA device because AUD (Advanced User Debugger) function is just supported by RH850/U2A-EVA.

Note 4. This function is not implemented in RH850/U2A6.

Note 5. This function is not implemented in RH850/U2A6 (156 pins).

44.5.3.3 BMnSPID — BusMaster n SPID Register

This register is used to set the SPID of each bus master.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: BM17SPID:FF0A 8044$_H$
BM19SPID:FF0A 804C$_H$
BM22SPID:FF0A 8058$_H$
BM23SPID:FF0A 805C$_H$
BM24SPID:FF0A 8060$_H$
BM25SPID:FF0A 8064$_H$
BM26SPID:FF0A 8068$_H$
BM30SPID:FF0A 8078$_H$

Value after reset: 0000 00XX$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SPID[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	(defined for each bus master)*1				
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W				

Table 44.308 BMnSPID Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	SPID[4:0]	SPID for each bus master.

Note 1. See **Section 44.5.3.1, Overview** for the initial value of each SPID.

44.5.3.4 BMnSPIDMSK — BusMaster n SPID Mask Register

This register is used to set the SPID that each bus-master can use.

This register is protected by key-code register.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: BM00SPIDMSK:FF0A 8100$_H$*1
BM01SPIDMSK:FF0A 8104$_H$*1
BM02SPIDMSK:FF0A 8108$_H$*1
BM03SPIDMSK:FF0A 810C$_H$*1
BM17SPIDMSK:FF0A 8144$_H$
BM19SPIDMSK:FF0A 814C$_H$
BM22SPIDMSK:FF0A 8158$_H$
BM23SPIDMSK:FF0A 815C$_H$
BM24SPIDMSK:FF0A 8160$_H$
BM25SPIDMSK:FF0A 8164$_H$
BM26SPIDMSK:FF0A 8168$_H$
BM27SPIDMSK:FF0A 816C$_H$
BM28SPIDMSK:FF0A 8170$_H$
BM29SPIDMSK:FF0A 8174$_H$
BM30SPIDMSK:FF0A 8178$_H$
BM31SPIDMSK:FF0A 817C$_H$

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPIDMSK[31:16]

Table 44.309 BMnSPIDMSK Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDMSK[31:0]	Set inhibition of SPID value which that each bus master can use. Each bit corresponds to a single SPID value. 0: The bus-master cannot use this SPID. Setting of this SPID is inhibited. 1: The bus-master can use this SPID. Setting of this SPID is not inhibited.

Note 1. The setting value of this register is reflected to SPIDLIST register in CPU.
For details, see **Section 3, CPU System**.

44.5.3.5 BMnSPIDMSKLOCK — BusMaster n SPID Mask Lock Register

This register is used to set write-mask to each BMnSPIDMSK.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: BM00SPIDMSKLOCK:FF0A 8200$_H$
BM01SPIDMSKLOCK:FF0A 8204$_H$
BM02SPIDMSKLOCK:FF0A 8208$_H$
BM03SPIDMSKLOCK:FF0A 820C$_H$
BM17SPIDMSKLOCK:FF0A 8244$_H$
BM19SPIDMSKLOCK:FF0A 824C$_H$
BM22SPIDMSKLOCK:FF0A 8258$_H$
BM23SPIDMSKLOCK:FF0A 825C$_H$
BM24SPIDMSKLOCK:FF0A 8260$_H$
BM25SPIDMSKLOCK:FF0A 8264$_H$
BM26SPIDMSKLOCK:FF0A 8268$_H$
BM27SPIDMSKLOCK:FF0A 826C$_H$
BM28SPIDMSKLOCK:FF0A 8270$_H$
BM29SPIDMSKLOCK:FF0A 8274$_H$
BM30SPIDMSKLOCK:FF0A 8278$_H$
BM31SPIDMSKLOCK:FF0A 827C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LOCK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.310 BMnSPIDMSKLOCK Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LOCK	Lock of register 0: Register (BMnSPIDMSK) can be re-written 1: Any further write to the register (BMnSPIDMSK) is ignored. LOCK can be cleared by Power On Reset, System Reset 1, System Reset 2, and Application Reset and DeepSTOP Reset.

44.5.3.6 SPIDKCPROT — SPID Key Code Protection Register

This register is used to set the key-code lock or unlock of BMnSPIDMSK.

Access: This register can be read or written in 32-bit units.

Address: FF0A 8300$_H$

Value after reset: 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE

Table 44.311 SPIDKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing protected registers.
Write A5A5A501$_H$ to this register to enable writing protected registers.

44.5.3.7 Usage

SPID is used for one of the identifiers of the memory protection/guard functions. SPID setting procedure is as follows.

1. Set the SPID key code protection register (SPIDKCPROT) to enable writing to SPID registers.
2. Set the SPID mask register (BMnSPIDMSK) to define the SPID values that the bus master can set according to system FFI.
3. Set the SPID mask lock register (BMnSPIDMSKLOCK) to prohibit changing the SPID mask register setting for security purposes.
4. Set the value allowed by the SPID mask register (BMnSPIDMSK) to the SPID register (BMnSPID) for the next time the bus master is accessed.
5. Set the SPID key code protection register (SPIDKCPROT) to disable writing to SPID registers.
6. Configure the memory protection/guard settings to prevent erroneous access identified by SPID and other Identifiers.

44.5.4 PEG

44.5.4.1 Overview

Each PE has a guard that controls the access to the Local RAM and INTC1 from other bus masters. Access by bus masters can be controlled via their bus context for eight regions through this PE Guard (PEG). Bus masters can only access the Local RAM area and INTC1 register area if permission is granted. PEG can prevent read*1 and write accesses against which the Local RAM area and INTC1 register area should be protected. If PEG detects illegal access, guard error is reported to ECM.

If the guard enable bit (GEN) of all PEGPROTm registers is disabled, all masters can access to both the Local RAM area and INTC1 registers.

If the guard enable bit (GEN) of either PEGPROTm registers is enabled, an access to Local RAM area and INTC1 registers is limited according to that setting.

In case of overlap within PEG channels, the access is granted to the bus masters if at least one guard permits the access.

Note 1. Including instruction fetch access.

44.5.4.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 44.312 Register Base Addresses

Base Address Name	Base Address	Bus Group
<GUARD_PE0CL0_base>	FFC6 $C000_H$	P-Bus Group 0
<GUARD_PE1CL0_base>	FFC6 $C100_H$	P-Bus Group 0
<GUARD_PE2CL1_base>*1	FFC6 $C200_H$	P-Bus Group 0
<GUARD_PE3CL1_base>*1	FFC6 $C300_H$	P-Bus Group 0
<PEGCAP_M_PE0CL0_base>	FFC6 $C800_H$	P-Bus Group 0
<PEGCAP_S_PE0CL0_base>	FFC6 $C820_H$	P-Bus Group 0
<PEGCAP_M_PE1CL0_base>	FFC6 $C840_H$	P-Bus Group 0
<PEGCAP_S_PE1CL0_base>	FFC6 $C860_H$	P-Bus Group 0
<PEGCAP_M_PE2CL1_base>*1	FFC6 $C880_H$	P-Bus Group 0
<PEGCAP_S_PE2CL1_base>*1	FFC6 $C8A0_H$	P-Bus Group 0
<PEGCAP_M_PE3CL1_base>*1	FFC6 $C8C0_H$	P-Bus Group 0
<PEGCAP_S_PE3CL1_base>*1	FFC6 $C8E0_H$	P-Bus Group 0

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.5.4.3 List of Registers

Table 44.313 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
GUARD_PEnCL0 (n = 0, 1)	Key code protection register	PEGKCPROT	<GUARD_PEnCL0_base> + 00_H	32	*1	—
	Channel protection control register	PEGPROTm (m = 0-7)	<GUARD_PEnCL0_base> + 40_H + m × 10_H	8, 16, 32	*1	PEGKCPROT
	Channel SPID setting register	PEGSPIDm (m = 0-7)	<GUARD_PEnCL0_base> + 44_H + m × 10_H	8, 16, 32	*1	PEGKCPROT
	Channel base address setting register	PEGBADm (m = 0-7)	<GUARD_PEnCL0_base> + 48_H + m × 10_H	32	*1	PEGKCPROT
	Channel valid bit setting register	PEGADVm (m = 0-7)	<GUARD_PEnCL0_base> + $4C_H$ + m × 10_H	32	*1	PEGKCPROT
GUARD_PEnCL1 (n = 2, 3)*2	Key code protection register	PEGKCPROT	<GUARD_PEnCL1_base> + 00_H	32	*1	—
	Channel protection control register	PEGPROTm (m = 0-7)	<GUARD_PEnCL1_base> + 40_H + m × 10_H	8, 16, 32	*1	PEGKCPROT
	Channel SPID setting register	PEGSPIDm (m = 0-7)	<GUARD_PEnCL1_base> + 44_H + m × 10_H	8, 16, 32	*1	PEGKCPROT
	Channel base address setting register	PEGBADm (m = 0-7)	<GUARD_PEnCL1_base> + 48_H + m × 10_H	32	*1	PEGKCPROT
	Channel valid bit setting register	PEGADVm (m = 0-7)	<GUARD_PEnCL1_base> + $4C_H$ + m × 10_H	32	*1	PEGKCPROT
PEGCAP_M_PEnCL0 (n = 0, 1)	Guard error overflow clear register	PEGOVFCLR	<PEGCAP_M_PEnCL0_base> + 00_H	8, 16, 32	*1	—
	Guard error overflow status register	PEGOVFSTAT	<PEGCAP_M_PEnCL0_base> + 04_H	8, 32	*1	—
	Guard error address register	PEGERRADDR	<PEGCAP_M_PEnCL0_base> + 08_H	32	*1	—
	Guard error access information register	PEGERRTYPE	<PEGCAP_M_PEnCL0_base> + $0C_H$	16, 32	*1	—
	Guard SPID error clear register	PEGSPIDERRCLR	<PEGCAP_M_PEnCL0_base> + 10_H	32	*1	—
	Guard SPID error status register	PEGSPIDERRSTAT	<PEGCAP_M_PEnCL0_base> + 14_H	32	*1	—
PEGCAP_S_PEnCL0 (n = 0, 1)	Guard error overflow clear register	PEGOVFCLR	<PEGCAP_S_PEnCL0_base> + 00_H	8, 16, 32	*1	—
	Guard error overflow status register	PEGOVFSTAT	<PEGCAP_S_PEnCL0_base> + 04_H	8, 32	*1	—

		PEGCAP_M_PE0CL0	Load request from PE0
		PEGCAP_M_PE1CL0	Load request from PE1
		PEGCAP_M_PE2CL1	Load request from PE2

Note 1. It is necessary to give read permission even when fetching instructions from its own LRAM.

Note 2. This function is not implemented in RH850/U2A8 (373/292 pins), RH850/U2A6.

44.5.4.4 PEGKCPROT — Key Code Protection Register

This register is used to unlock/lock key protection of the PE guard register.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_PEnCL0_base> + 00_H
<GUARD_PEnCL1_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 44.315 PEGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.4.5 PEGPROTm — Channel Protection Control Register

Specifies the PE resource access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_PEnCL0_base> + 40_H + m × 10_H
<GUARD_PEnCL1_base> + 40_H + m × 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.316 PEGPROTm Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, PEGSPIDm is used as a judgment condition. 1: During write, PEGSPIDm is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, PEGSPIDm is used as the judgment condition. 1: During read, PEGSPIDm is not used as a judgment condition.

44.5.4.6 PEGSPIDm — Channel SPID Setting Register

Specifies the PE resource access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_PEnCL0_base> + 44_H + m * 10_H
<GUARD_PEnCL1_base> + 44_H + m * 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.317 PEGSPIDm Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID PEGSPIDm is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting PEGSPIDm to 0101_B enables access to areas SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = x depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = x

44.5.4.7 PEGBADm — Channel Base Address Setting Register

This register is used to define area n when the setting of PEGPROTm and PEGSPIDm is valid. PEGBADm specifies base address of area n and PEGADVm specifies valid bits of PEGBADm.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_PEnCL0_base> + 48_H + m * 10_H
<GUARD_PEnCL1_base> + 48_H + m * 10_H

Value after reset: FC00 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	BAD[25:16]									
Value after reset	1	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	BAD[15:12]				—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.318 PEGBADm Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 12	BAD[25:12]	Base address
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

44.5.4.8 PEGADVm — Channel Valid Bit Setting Register

This register is used to define area n when the setting of PEGPROTm and PEGSPIDm is valid. PEGBADm specifies base address of area n and PEGADVm specifies valid bits of PEGBADm.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_PEnCL0_base> + $4C_H$ + m * 10_H
<GUARD_PEnCL1_base> + $4C_H$ + m * 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	ADV[25:16]									
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADV[15:12]				—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.319 PEGADVm Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 12	ADV[25:12]	Valid bits of PEGBADm When an ADV bit is 1, the address of each access will be compared with the corresponding BAD bit of PEGBADm. When all ADV bits are set to 1, 4K bytes (the minimum unit) are targeted for protection based on the address specified by PEGBADm. When all ADV bits are set to 0, the target of protection is the whole of the Local RAM and INTC1 register area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Example: When PEGBADm[25:12] is set to $1C00_H$ and PEGADVm[25:12] is set to $3FFE_H$, PE guard protection area n is FDC0 0000_H to FDC0 $0FFF_H$ and FDC0 1000_H to FDC0 $1FFF_H$.

Commentary: When PEGBADm[25:12] is set to $1C00_H$, the base address is FDC0 0000_H and the configurable range of bits is enclosed in [ ] shown below.

1111 11[01 1100 0000 0000] 0000 0000 0000

F D C 0 0 0 0 0

When PEGADVm[25:12] is $3FFE_H$, bits set to 0 in that range and the 12 lower-order bits are ignored, so we have

1111 11[01 1100 0000 000X] XXXX XXXX XXXX

which means that the 4K byte ranges (a total of 8K byte) from

F D C 0 0 0 0 0 to

F D C 0 0 F F F,

and

F D C 0 1 0 0 0 to

F D C 0 1 F F F

will be protected.

44.5.4.9 PEGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear PEGOVFSTAT register. PEGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. 0 is always returned when reading this register.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <PEGCAP_M_PEnCL0_base> + 00_H
<PEGCAP_S_PEnCL0_base> + 00_H
<PEGCAP_M_PEnCL1_base> + 00_H
<PEGCAP_S_PEnCL1_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R

Table 44.320 PEGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears PEGOVFSTAT.OVF bit by writing 1
0	Reserved	When writing, write the value after reset.

44.5.4.10 PEGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. The OVF bit is set when a guard error is reported again under the condition any bit of PEGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing PEGOVFCLR register. See **Section 44.5.4.9, PEGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <PEGCAP_M_PEnCL0_base> + 04_H
<PEGCAP_S_PEnCL0_base> + 04_H
<PEGCAP_M_PEnCL1_base> + 04_H
<PEGCAP_S_PEnCL1_base> + 04_H

Value after reset: $0000\ 0000_H$

Table 44.321 PEGOVFSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.4.11 PEGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when PEGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PEGCAP_M_PEnCL0_base> + 08_H
<PEGCAP_S_PEnCL0_base> + 08_H
<PEGCAP_M_PEnCL1_base> + 08_H
<PEGCAP_S_PEnCL1_base> + 08_H

Value after reset: $0000\ 0000_H$

Table 44.322 PEGERRADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	ADDR[31:0]	Access address to the target slave when a guard error has occurred

44.5.4.12 PEGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when PEGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit or 16-bit units.

Address: <PEGCAP_M_PEnCL0_base> + $0C_H$
<PEGCAP_S_PEnCL0_base> + $0C_H$
<PEGCAP_M_PEnCL1_base> + $0C_H$
<PEGCAP_S_PEnCL1_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Table 44.323 PEGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.4.13 PEGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear PEGSPIDERRSTAT register. PEGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <PEGCAP_M_PEnCL0_base> + 10_H
<PEGCAP_S_PEnCL0_base> + 10_H
<PEGCAP_M_PEnCL1_base> + 10_H

Table 44.324 PEGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear PEGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.4.14 PEGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to PEGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Note 1. Error depends on Master and slave.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PEGCAP_M_PEnCL0_base> + 14_H
<PEGCAP_S_PEnCL0_base> + 14_H
<PEGCAP_M_PEnCL1_base> + 14_H
<PEGCAP_S_PEnCL1_base> + 14_H

Value after reset: $0000\ 0000_H$

Table 44.325 PEGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.5 CRG

44.5.5.1 Overview

Cluster RAM guard (CRG) has two functions. One is function for Inter-VM Communication (IVC). For more detail of IVC see **Section 3, CPU System**. The other is function for protection of Cluster RAM as a memory guard. Bus masters can only access the Cluster RAM area if permission is granted. CRG can prevent read*1 and write accesses against which the Cluster RAM area should be protected. If CRG detects illegal access, guard error notification is signaled to ECM.

If the guard enable bit (GEN) of all CRGPROTm/CSGPROTm registers is disabled, all masters can access to the Cluster RAM area.

If the guard enable bit (GEN) of either CRGPROTm/CSGPROTm registers is enabled, an access to Cluster RAM area is limited according to that setting.

CRG as a memory guard consists of GUARD_CRAMCRGn and GUARD_CRAMCSGn. Access to the Cluster RAM can be controlled via the bus context for eight regions by GUARD_CRAMCRGn. Access to the Cluster RAM can be controlled via the bus context for four regions by GUARD_CRAMCSGn.

In case regions have an overlapping address range, the resulting access permission is different between the GUARD_CRAMCRGn and the GUARD_CRAMCSGn:

- In case of overlap within GUARD_CRAMCRGn, the access is granted to the bus masters if at least one guard permits the access.
- In case of overlap within GUARD_CRAMCSGn, the access is not granted to the bus masters if at least one guard prohibits the access.
- In case of overlap between GUARD_CRAMCRGn and GUARD_CRAMCSGn, the access permission depends on the GUARD_CRAMCSGn setting.

Note 1. Including instruction fetch access.

44.5.5.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.326 Register Base Addresses

Base Address Name	Base Address	Bus Group
<GUARD_CRAMCRG0_base>	FFC6 D000$_H$	P-Bus Group 0
<GUARD_CRAMCRG1_base>*1	FFC6 D200$_H$	P-Bus Group 0
<GUARD_CRAMCRG2_base>*2	FFC6 D400$_H$	P-Bus Group 0
<GUARD_CRAMCRG3_base>	FFC6 D600$_H$	P-Bus Group 0
<CRGCAP_PE0CL0_base>	FFC6 D800$_H$	P-Bus Group 0
<CRGCAP_PE1CL0_base>	FFC6 D820$_H$	P-Bus Group 0
<CRGCAP_PE2CL1_base>*1	FFC6 D840$_H$	P-Bus Group 0

Table 44.329 CRGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.5.5 CRGPROTm — Channel Protection Control Register

Specifies the Cluster RAM access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCRGn_base> + 10_H + m * 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.330 CRGPROTm Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	OW	Enables/disables Inter-VM communication function. For more detail see **Section 3, CPU System**.
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, CRGSPIDm is used as a judgment condition. 1: During write, CRGSPIDm is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, CRGSPIDm is used as the judgment condition. 1: During read, CRGSPIDm is not used as a judgment condition.

44.5.5.6 CRGSPIDm — Channel SPID Setting Register

Specifies the Cluster RAM access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCRGn_base> + 14_H + m * 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.331 CRGSPIDm Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID CRGSPIDm is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting CRGSPIDm to 0101_B enables access to areas with SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = x depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = x

44.5.5.7 CRGBADm — Channel Base Address Setting Register

This register is used to define area n when the setting of CRGPROTm and CRGSPIDm is valid. CRGBADm specifies base address of area n and CRGADVm specifies valid bits of CRGBADm.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCRGn_base> + 18_H + m * 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	BAD[20:19]		BAD[18]	BAD[17]	BAD[16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	*1	*1	*2	*2	R/W

Table 44.332 CRGBADm Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20, 19*1	BAD[20:19]	Base address
18*2	BAD[18]	Base address
17*2	BAD[17]	Base address
16 to 8	BAD[16:8]	Base address
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. BAD[20:19] is implemented for GUARD_CRAMCRG2. BAD[20:19] is reserved bit and read only for GUARD_CRAMCRG0 and GUARD_CRAMCRG1 and GUARD_CRAMCRG3 in RH850/U2A-EVA, RH850/U2A16 and RH850/U2A8.
BAD[20:19] is reserved bit in RH850/U2A6.

Note 2. BAD[18] is implemented only in GUARD_CRAMCRG0 and GUARD_CRAMCRG1 and GUARD_CRAMCRG2, BAD[18] is reserved bit and read only for GUARD_CRAMCRG3 in RH850/U2A-EVA and RH850/U2A16.
BAD[18:17] is implemented only in GUARD_CRAMCRG0 and GUARD_CRAMCRG2, BAD[18:17] is reserved bit and read only for GUARD_CRAMCRG3 in RH850/U2A8.
BAD[18:17] is implemented only in GUARD_CRAMCRG0, BAD[18:17] is reserved bit and read only for GUARD_CRAMCRG3 in RH850/U2A6.

44.5.5.8 CRGADVm — Channel Valid Bit Setting Register

This register is used to define area n when the setting of CRGPROTm and CRGSPIDm is valid. CRGBADm specifies base address of area n and CRGADVm specifies valid bits of CRGBADm.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCRGn_base> + $1C_H$ + m * 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADV[20:19]		ADV[18]	ADV[17]	ADV[16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	*1	*1	*2	*2	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADV[15:8]								—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 44.333 CRGADVm Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 19*1	ADV[20:19]	Valid bits of CRGBADm When an ADV bit is 1, the address of each access will be compared with the corresponding BAD bit of CRGBADm. When all ADV bits are set to 1, 256 bytes (the minimum unit) are targeted for protection based on the address specified by CRGBADm. When all ADV bits are set to 0, the target of protection is the whole of the Cluster RAM.
18*2	ADV[18]	Valid bits of CRGBADm
17*2	ADV[17]	Valid bits of CRGBADm
16 to 8	ADV[16:8]	Valid bits of CRGBADm
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. ADV[20:19] is implemented only in GUARD_CRAMCRG2. ADV[20:19] is reserved bit and read only for GUARD_CRAMCRG0 and GUARD_CRAMCRG1 and GUARD_CRAMCRG3 in RH850/U2A-EVA, RH850/U2A16 and RH850/U2A8.
ADV[20:19] is reserved bit in RH850/U2A6.

Note 2. ADV[18] is implemented only in GUARD_CRAMCRG0 and GUARD_CRAMCRG1 and GUARD_CRAMCRG2, ADV[18] is reserved bit and read only for GUARD_CRAMCRG3 in RH850/U2A-EVA and RH850/U2A16.
ADV[18:17] is implemented only in GUARD_CRAMCRG0 and GUARD_CRAMCRG2, ADV[18:17] is reserved bit and read only for GUARD_CRAMCRG3 in RH850/U2A8.
ADV[18:17] is implemented only in GUARD_CRAMCRG0, ADV[18:17] is reserved bit and read only for GUARD_CRAMCRG3 in RH850/U2A6.

This is example for cluster #0. For valid bit of each clusters, refer to Note1 and Note2 described in CRGBADm/CRGADVm Register Contents.

Example: When CRGBADm[18:8] is set to 000_H and CRGADVm[18:8] is set to $7EF_H$, Cluster RAM guard protection area n is FE00 0000_H to FE00 $00FF_H$ and FE00 1000_H to FE00 $10FF_H$.

Commentary: When CRGBADm[18:8] is set to 000_H, the base address is FE00 0000_H and the configurable range of bits is enclosed in [ ] shown below.

1111 1110 0000 0[000 0000 0000] 0000 0000

F E 0 0 0 0 0 0

When CRGADVm[18:8] is $7EF_H$, bits set to 0 in that range and the 8 lower-order bits are ignored, so we have

1111 1110 0000 0[000 000X 0000] XXXX XXXX

which means that the 256-byte ranges (a total of 512-byte) from

F E 0 0 0 0 0 0 to

F E 0 0 0 0 F F,

and

F E 0 0 1 0 0 0 to

F E 0 0 1 0 F F

will be protected.

44.5.5.9 CSGPROTm — Channel Protection Control Register

Specifies the access to be protected for Cluster RAM. Access prohibited by any of the identifiers is protected as unauthorized access. This register is used to specify the settings for those other than SPID.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCSGn_base> + 00_H + m * 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.334 CSGPROTm Register Contents

Bit Position	Bit Name	Function
31	LOCK	Register (CSGPROTm, CSGSPIDm, CSGBADm, CSGADVm) access lock function 0: CSGPROTm, CSGSPIDm, CSGBADm and CSGADVm register can be written. 1: CSGPROTm, CSGSPIDm, CSGBADm and CSGADVm register cannot be written. Write access to these registers is ignored. Lock function can only be cleared by reset.
30 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, CSGSPIDm is used as a judgment condition. 1: During write, CSGSPIDm is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, CSGSPIDm is used as the judgment condition. 1: During read, CSGSPIDm is not used as a judgment condition.

44.5.5.10 CSGSPIDm — Channel SPID Setting Register

Specifies the access to be protected for Cluster RAM. Access prohibited by any of the identifiers is protected as unauthorized access. This register is used to specify the SPID setting.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCSGn_base> + 04_H + m * 20_H

Value after reset: $0000\ 0000_H$

Table 44.336 CSGBADm Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20, 19*1	BAD[20:19]	Base address
18*2	BAD[18]	Base address
17*2	BAD[17]	Base address
16 to 8	BAD[16:8]	Base address
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. BAD[20:19] is implemented for GUARD_CRAMCSG2. BAD[20:19] is reserved bit and read only for GUARD_CRAMCSG0 and GUARD_CRAMCSG1 and GUARD_CRAMCSG3 in RH850/U2A-EVA, RH850/U2A16 and RH850/U2A8.
BAD[20:19] is reserved bit in RH850/U2A6.

Note 2. BAD[18] is implemented only in GUARD_CRAMCSG0 and GUARD_CRAMCSG1 and GUARD_CRAMCSG2, BAD[18] is reserved bit and read only for GUARD_CRAMCSG3 in RH850/U2A-EVA and RH850/U2A16.
BAD[18:17] is implemented only in GUARD_CRAMCSG0 and GUARD_CRAMCSG2, BAD[18:17] is reserved bit and read only for GUARD_CRAMCSG3 in RH850/U2A8.
BAD[18:17] is implemented only in GUARD_CRAMCSG0, BAD[18:17] is reserved bit and read only for GUARD_CRAMCSG3 in RH850/U2A6.

44.5.5.12 CSGADVm — Channel Valid Bit Setting Register

This register is used to define area n when the setting of CSGPROTm and CSGSPIDm is valid. CSGBADm specifies base address of area n and CSGADVm specifies valid bits of CSGBADm.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCSGn_base> + $0C_H$ + m * 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.337 CSGADVm Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 19*1	ADV[20:19]	Valid bits of CSGBADm When an ADV bit is 1, the address of each access will be compared with the corresponding BAD bit of CSGBADm. When all ADV bits are set to 1, 256 bytes (the minimum unit) are targeted for protection based on the address specified by CSGBADm. When all ADV bits are set to 0, the target of protection is the whole of the Cluster RAM.
18*2	ADV[18]	Valid bits of CSGBADm
17*2	ADV[17]	Valid bits of CSGBADm
16 to 8	ADV[16:8]	Valid bits of CSGBADm
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. ADV[20:19] is implemented only in GUARD_CRAMCSG2. ADV[20:19] is reserved bit and read only for GUARD_CRAMCSG0 and GUARD_CRAMCSG1 and GUARD_CRAMCSG3 in RH850/U2A-EVA, RH850/U2A16 and RH850/U2A8.
ADV[20:19] is reserved bit in RH850/U2A6.

Note 2. ADV[18] is implemented only in GUARD_CRAMCSG0 and GUARD_CRAMCSG1 and GUARD_CRAMCSG2, ADV[18] is reserved bit and read only for GUARD_CRAMCSG3 in RH850/U2A-EVA and RH850/U2A16.
ADV[18:17] is implemented only in GUARD_CRAMCSG0 and GUARD_CRAMCSG2, ADV[18:17] is reserved bit and read only for GUARD_CRAMCSG3 in RH850/U2A8.
ADV[18:17] is implemented only in GUARD_CRAMCSG0, ADV[18:17] is reserved bit and read only for GUARD_CRAMCSG3 in RH850/U2A6.

44.5.5.13 CRGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear CRGOVFSTAT register. CRGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <CRGCAP_PEnCL0_base> + 00_H
<CRGCAP_PEnCL1_base> + 00_H
<CRGCAP_CRAMHCLn_base> + 00_H
<CRGCAP_CRAMLCLn_base> + 00_H
<CRGCAP_SX2MBHCLn_base> + 00_H
<CRGCAP_SX2MBLCLn_base> + 00_H

Value after reset: $0000\ 0000_H$

1	CLRO	Clears CRGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.5.14 CRGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard errors overflow was occurred. OVF bit is set when a guard error is reported again under the condition any bit of CRGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to CRGOVFCLR register. See **Section 44.5.5.13, CRGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <CRGCAP_PEnCL0_base> + 04_H
<CRGCAP_PEnCL1_base> + 04_H
<CRGCAP_CRAMHCLn_base> + 04_H

Table 44.341 CRGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.5.17 CRGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the CRGSPIDERRSTAT register. The CRGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <CRGCAP_PEnCL0_base> + 10_H
<CRGCAP_PEnCL1_base> + 10_H
<CRGCAP_CRAMHCLn_base> + 10_H
<CRGCAP_CRAMLCLn_base> + 10_H

Table 44.342 CRGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear CRGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.5.18 CRGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the CRGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a Read-only register that can be read in 32-bit units.

Address: <CRGCAP_PEnCL0_base> + 14_H
<CRGCAP_PEnCL1_base> + 14_H
<CRGCAP_CRAMHCLn_base> + 14_H
<CRGCAP_CRAMLCLn_base> + 14_H

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.6 INTC2 Guard

44.5.6.1 Overview

INTC2 guard is one of the slave guards used to control the access to INTC2 registers. INTC2 guard can protect respectively the read and write access against INTC2 registers of each channel. If INTC2 guard detects illegal access, guard error notification is signaled to ECM.

44.5.6.2 List of Registers

Table 44.344 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
GUARD_INTC2 (P-Bus Group 0)	Guard error overflow clear register	INTC2GOVFCLR	FFC6 4000_H	8, 32	PBG00#0	—
	Guard error overflow status register	INTC2GOVFSTAT	FFC6 4004_H	8, 32	PBG00#0	—
	Guard error address register	INTC2GERRADDR	FFC6 4008_H	32	PBG00#0	—
	Guard error access information register	INTC2GERRTYPE	FFC6 $400C_H$	16, 32	PBG00#0	—
	Guard SPID error clear register	INTC2GSPIDERRCLR	FFC6 4010_H	32	PBG00#0	—
	Guard SPID error status register	INTC2GSPIDERRSTAT	FFC6 4014_H	32	PBG00#0	—
	Key code protection register	INTC2GKCPROT	FFC6 4018_H	32	PBG00#0	—
	SPID setting register	INTC2GMPIDm (m = 0-7)	FFC6 4040_H + m × 04_H	8, 32	PBG00#0	INTC2GKCPROT

Table 44.352 INTC2GKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing protected registers.
Write A5A5A501$_H$ to this register to enable writing protected registers.

44.5.6.10 INTC2GMPIDm — SPID Setting Register

INTC2GMPIDm are used to specify a set of SPIDs, which are referred by INTC2GPROT_n/GR/IMR registers. Access protection can be controlled by combination of INTC2GMPIDm registers and INTC2GPROT_n/GR/IMR register. For example, masters with SPID=1 or SPID=7 can access to global registers when setting INTC2GPROT_GR.MPID=00000101_B, INTC2GMPID0.SPID=01_H and INTC2GMPID2.SPID=07_H.

Access: This register can be read or written in 32-bit or 8-bit units.

Address: FFC6 4040_H + m * 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.354 INTC2GPROT_n/GR/IMR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	MPID[7:0]	R/W enable setting based on MPID MPID is a list of bits each representing one MPID value. Multiple MPID values are enabled simultaneously by setting multiple bits. For example, setting MPID to 0101_B enables access to areas MPID = 0 and MPID = 2. 0: Reading/writing the area with MPID = x depends on the RG and WG bit setting 1: Enables reading/writing the area with MPID = x
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, MPID is used as a judgment condition. 1: During write, MPID is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, MPID is used as the judgment condition. 1: During read, MPID is not used as a judgment condition.

44.5.7 DTS Guard

44.5.7.1 Overview

DTS guard is one of the slave guards used to control the access to the registers for DTS transfer. DTS guard can prevent read and write access to the DTS registers of each channel. If DTS guard detects illegal access, guard error notification is signaled to ECM.

44.5.7.2 List of Registers

Table 44.355 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
GUARD_DTS (P-Bus Group0)	Guard error overflow clear register	DTSGOVFCLR	FFC6 8000_H	8, 32	PBG00#0	—
	Guard error overflow status register	DTSGOVFSTAT	FFC6 8004_H	8, 32	PBG00#0	—
	Guard error address register	DTSGERRADDR	FFC6 8008_H	32	PBG00#0	—
	Guard error access information register	DTSGERRTYPE	FFC6 $800C_H$	16, 32	PBG00#0	—
	Guard SPID error clear register	DTSGSPIDERRCLR	FFC6 8010_H	32	PBG00#0	—
	Guard SPID error status register	DTSGSPIDERRSTAT	FFC6 8014_H	32	PBG00#0	—
	Key code protection register	DTSGKCPROT	FFC6 8018_H	32	PBG00#0	—
	SPID setting register	DTSGMPIDm (m = 0-7)	FFC6 8040_H + m × 04_H	8, 32	PBG00#0	DTSGKCPROT
	DTS protection control register	DTSGPROT_GR	FFC6 $80F0_H$	32	PBG00#0	DTSGKCPROT

44.5.7.3 DTSGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear DTSGOVFSTAT register. DTSGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit or 8-bit units.

Address: FFC6 8000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears DTSGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.7.4 DTSGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. OVF bit is set when a guard error is reported again under the condition any bit of DTSGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to the DTSGOVFCLR register. See **Section 44.5.7.3, DTSGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: FFC6 8004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.7.5 DTSGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when the DTSGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC6 8008_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.360 DTSGERRADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	ADDR[31:0]	Access address to the target slave when a guard error has occurred

44.5.7.6 DTSGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when the DTSGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit or 16-bit units.

Address: FFC6 800C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.361 DTSGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.7.7 DTSGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the DTSGSPIDERRSTAT register. The DTSGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFC6 8010_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.362 DTSGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear DTSGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.7.8 DTSGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the DTSGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC6 8014_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPIDERR[31:16]

Table 44.363 DTSGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.7.9 DTSGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/DTS protection control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FFC6 8018$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 44.364 DTSGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing protected registers.
Write A5A5A501$_H$ to this register to enable writing protected registers.

44.5.7.10 DTSGMPIDm — SPID Setting Register

DTSGMPIDm are used to specify a set of SPIDs, which are referred by DTSGPROT_nnn/GR registers. Access protection can be controlled by combination of DTSGMPIDm registers and DTSGPROT_nnn/GR register. For example, masters with SPID=1 or SPID=7 can access to global registers when setting DTSGPROT_GR.MPID=00000101_B, DTSGMPID0.SPID=01_H and DTSGMPID2.SPID=07_H.

Access: This register can be read or written in 32-bit or 8-bit units.

Address: FFC6 8040_H + m * 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R	R/W	R/W

Table 44.366 DTSGPROT_nnn/GR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	MPID[7:0]	R/W enable setting based on MPID MPID is a list of bits each representing one MPID value. Multiple MPID values are enabled simultaneously by setting multiple bits. For example, setting MPID to 0101_B enables access to areas with MPID = 0 and MPID = 2. 0: Reading/writing the area with MPID = x depends on the RG and WG bit setting 1: Enables reading/writing the area with MPID = x
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, MPID is used as a judgment condition. 1: During write, MPID is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, MPID is used as the judgment condition. 1: During read, MPID is not used as a judgment condition.

NOTE

Use DTS channels except channel 4 and channel 68 in case that it is necessary to handle the setting of the DTSGPROT_nnn register after a DTS channel nnn operation starts.

44.5.8 sDMAC Guard

44.5.8.1 Overview

sDMAC guard is one of the slave guards used to control the access to the registers for sDMAC transfer. sDMAC guard can prevent read and write access to the sDMAC registers of each channel. If sDMAC guard detects illegal access, guard error notification is signaled to ECM.

44.5.8.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.367 Register Base Addresses

Base Address Name	Base Address	Bus Group
<GUARD_DMAC0_base>	FFC6 9000_H	P-Bus Group 0
<GUARD_DMAC1_base>	FFC6 9400_H	P-Bus Group 0

44.5.8.3 List of Registers

Table 44.368 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
GUARD_DMACj (j = 0, 1)	Guard error overflow clear register	DMAGOVFCLR	<GUARD_DMACj_base> + 00_H	8, 16, 32	PBG00 #0	—
	Guard error overflow status register	DMAGOVFSTAT	<GUARD_DMACj_base> + 04_H	8, 32	PBG00 #0	—

sDMAC1 Descriptor RAM	DMAGPROT_DP (GUARD_DMAC1)		
sDMAC1 Channel registers	DMAGPROT_n (n = 000 to 015) (GUARD_DMAC1)		

44.5.8.4 DMAGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear DMAGOVFSTAT register. The DMAGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_DMACj_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.370 DMAGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears DMAGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.8.5 DMAGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. OVF bit is set when a guard error is reported again under the condition any bit of DMAGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to DMAGOVFCLR register. See **Section 44.5.8.4, DMAGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <GUARD_DMACj_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.8.6 DMAGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when the DMAGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_DMACj_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.372 DMAGERRADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	ADDR[31:0]	Access address to the target slave when a guard error has occurred

44.5.8.7 DMAGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when the DMAGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit or 16-bit units.

Address: <GUARD_DMACj_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Table 44.373 DMAGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.8.8 DMAGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the DMAGSPIDERRSTAT register. The DMAGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <GUARD_DMACj_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.374 DMAGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear DMAGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.8.9 DMAGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the DMAGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_DMACj_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPIDERR[31:16]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPIDERR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.375 DMAGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.8.10 DMAGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/DMA/DMA descriptor protection control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_DMACj_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.376 DMAGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.8.11 DMAGMPIDm — Guard SPID Setting Register

DMAGMPIDm are used to specify a set of SPIDs, which are referred by DMAGPROT_n/GR/DP registers. Access protection can be controlled by combination of DMAGMPIDm registers and DMAGPROT_n/GR/DP register. For example, masters with SPID = 1 or SPID = 7 can access to global registers when setting DMAGPROT_GR.MPID = 00000101_B, DMAGMPID0.SPID = 01_H and DMAGMPID2.SPID = 07_H.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_DMACj_base> + 40_H + m * 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.377 DMAGMPIDm Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	SPID[4:0]	SPID setting

44.5.8.12 DMAGPROT_n/GR/DP — Channel/DMA/DMA Descriptor Protection Control Register

Specifies the sDMAC slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: DMAGPROT_n: <GUARD_DMACj_base> + 100_H + n * 04_H
DMAGPROT_GR: <GUARD_DMACj_base> + $F0_H$
DMAGPROT_DP: <GUARD_DMACj_base> + $F4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	MPID[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	—	—	—	—	—	—	—	GEN	—	DBG	—	UM	—	—	WG	RG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R	R/W	R/W

Table 44.378 DMAGPROT_n/GR/DP Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	MPID[7:0]	R/W enable setting based on MPID MPID is a list of bits each representing one MPID value. Multiple MPID values are enabled simultaneously by setting multiple bits. For example, setting MPID to 0101_B enables access to areas with MPID = 0 and MPID = 2. 0: Reading/writing the area with MPID = x depends on the RG and WG bit setting 1: Enables reading/writing the area with MPID = x
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, MPID is used as a judgment condition. 1: During write, MPID is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, MPID is used as the judgment condition. 1: During read, MPID is not used as a judgment condition.

44.5.9 IBG

44.5.9.1 Overview

IPIR, BarrierSync and TPTM connect to Inter-cluster Bus (I-Bus). I-Bus Guard (IBG) is one of the slave guards used to control the access to these I-Bus modules. IBG can prevent read and write access to the registers of each module. If IBG detects illegal access, guard error notification is signaled to ECM.

44.5.9.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.379 Register Base Addresses

Base Address Name	Base Address	Bus Group
<GUARD_IPIR_base>	FFC6 A200$_H$	P-Bus Group 0
<GUARD_BARR_base>	FFC6 A000$_H$	P-Bus Group 0
<GUARD_TPTM_base>	FFC6 A600$_H$	P-Bus Group 0

44.5.9.3 List of Registers

Table 44.380 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
GUARD_IPIR	Guard error overflow clear register	IPIGOVFCLR	<GUARD_IPIR_base> + 00$_H$	8, 32	PBG00#0	—
	Guard error overflow status register	IPIGOVFSTAT	<GUARD_IPIR_base> + 04$_H$	8, 32	PBG00#0	—
	Guard error address register	IPIGERRADDR	<GUARD_IPIR_base> + 08$_H$	32	PBG00#0	—
	Guard error access information register	IPIGERRTYPE	<GUARD_IPIR_base> + 0C$_H$	16, 32	PBG00#0	—

	Channel protection control register	TPTGPROT0_n (n = 0 to 3, 8 to 9)*1	<GUARD_TPTM_base> + 80_H + n × 08_H	8, 16, 32	PBG00#0	TPTGKCPROT
	Channel SPID setting register	TPTGPROT1_n (n = 0 to 3, 8 to 9)*1	<GUARD_TPTM_base> + 84_H + n × 08_H	8, 16, 32	PBG00#0	TPTGKCPROT

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins) and RH850/U2A6 with index n = 2, 3.

Table 44.381 Relation between guard controllers and capture modules for protection targets

Protection target	Controlled by	Capture to	Applicable for
I-Bus Group0 registers (1) (IPIR)	IPIGPROT0_Rn (n = 0-3) (GUARD_IPIR)	GUARD_IPIR	Access request from all masters
I-Bus Group0 registers (2) (IPIR)	IPIGPROT0_Tn (n = 0-3) (GUARD_IPIR)		
I-Bus Group0 registers (3) (IPIR)	IPIGPROT0_4 (GUARD_IPIR)		
I-Bus Group1 registers (1) (BARR)	BRGPROT0_n (n = 0-15) (GUARD_BARR)	GUARD_BARR	
I-Bus Group1 registers (2) (BARR)	BRGPROT0_16 (GUARD_BARR)		
I-Bus Group2 registers (1) (TPTM)	TPTGPROT0_n (n = 0 to 3)*1 (GUARD_TPTM)	GUARD_TPTM	
I-Bus Group2 registers (2) (TPTM)	TPTGPROT0_8 (GUARD_TPTM)		
I-Bus Group2 registers (3) (TPTM)	TPTGPROT0_9 (GUARD_TPTM)		

Note 1. This function is not implemented in RH850/U2A8 (373/292 pins) and RH850/U2A6 with index n = 2, 3.

Table 44.382 Detail target register of protection target

Protection target	Detail target register
I-Bus Group0 registers (1) (IPIR)	IPInENS, IPInFLGS, IPInFCLRS[*1]
I-Bus Group0 registers (2) (IPIR)	IPInREQS, IPInRCLRS[*1]
I-Bus Group0 registers (3) (IPIR)	IPInENm, IPInFLGm, IPInFCLRm, IPInREQm, IPInRCLRm[*1]
I-Bus Group1 registers (1) (BARR)	BRnINIT, BRnEN, BRnCHKS, BRnSYNCS[*2]
I-Bus Group1 registers (2) (BARR)	BRnCHKm, BRnSYNCm[*2]
I-Bus Group2 registers (1) (TPTM)	TPTMnIRUN, TPTMnIRRUN, TPTMnISTP, TPTMnISTR, TPTMnIIEN, TPTMnIUSTR, TPTMnIDIV, TPTMnFRUN, TPTMnFRRUN, TPTMnFSTP, TPTMnFSTR, TPTMnFDIV, TPTMnICNT0, TPTMnILD0, TPTMnICNT1, TPTMnILD1, TPTMnFCNT, TPTMnURUN, TPTMnURRUN, TPTMnUSTP, TPTMnUSTR, TPTMnUIEN, TPTMnUDIV, TPTMmUTRG, TPTMnUCNT0, TPTMnUCNT1, TPTMnUCMP00, TPTMnUCMP01, TPTMnUCMP02, TPTMnUCMP03, TPTMnUCMP10, TPTMnUCMP11, TPTMnUCMP12, TPTMnUCMP13[*3 *4]
I-Bus Group2 registers (2) (TPTM)	TPTMG0URUN,TPTMG0URRUN, TPTMG0USTP
I-Bus Group2 registers (3) (TPTM)	TPTMG1URUN,TPTMG1URRUN, TPTMG1USTP

Note 1. n = 0 to 3: n is the IPIR channel number. m = 0 to 3: m is the CPU number. m = 2, 3 is not implemented in RH850/U2A8 (373/292 pins) and RH850/U2A6.

Note 2. n = 0 to 15: n is the Barrier-Synchronization channel number. m = 0 to 3: m is the CPU number. m = 2, 3 is not implemented in RH850/U2A8 (373/292 pins) and RH850/U2A6.

Note 3. n = 0 to 3: n is the CPU number. n = 2, 3 is not implemented in RH850/U2A8 (373/292 pins) and RH850/U2A6.

Note 4. TPTM Self region registers are protected according to TPTGPROT0_n setting.

44.5.9.4 IPIGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear IPIGOVFSTAT register. IPIGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit or 8-bit units.

Address: <GUARD_IPIR_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R

Table 44.383 IPIGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears IPIGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.9.5 IPIGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. OVF bit is set when a guard error overflow is reported again under the condition any bit of IPIGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to IPIGOVFCLR register. See **Section 44.5.9.4, IPIGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <GUARD_IPIR_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 44.384 IPIGOVFSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.9.6 IPIGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when the IPIGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_IPIR_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.386 IPIGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.9.8 IPIGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the IPIGSPIDERRSTAT register. The IPIGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <GUARD_IPIR_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 44.387 IPIGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear IPIGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.9.9 IPIGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the IPIGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_IPIR_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPIDERR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	SPIDERR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.388 IPIGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.9.10 IPIGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/common protection control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_IPIR_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.389 IPIGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.9.11 IPIGPROT0_Rn/Tn, IPIGPROT0_4 — Channel, Common Protection Control Register

Specifies the IPIR slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: IPIGPROT0_Rn: <GUARD_IPIR_base> + 80_H + n * 10_H
IPIGPROT0_Tn: <GUARD_IPIR_base> + 88_H + n * 10_H
IPIGPROT0_4: <GUARD_IPIR_base> + $C0_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.390 IPIGPROT0_Rn/Tn, IPIGPROT0_4 Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, IPIGPROT1_Rn/Tn, IPIGPROT1_4 is used as a judgment condition. 1: During write, IPIGPROT1_Rn/Tn, IPIGPROT1_4 is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, IPIGPROT1_Rn/Tn, IPIGPROT1_4 is used as the judgment condition. 1: During read, IPIGPROT1_Rn/Tn, IPIGPROT1_4 is not used as a judgment condition.

44.5.9.12 IPIGPROT1_Rn/Tn, IPIGPROT1_4 — Channel, Common SPID Setting Register

Specifies the IPIR slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: IPIGPROT1_Rn: <GUARD_IPIR_base> + 84_H + n * 10_H
IPIGPROT1_Tn: <GUARD_IPIR_base> + $8C_H$ + n * 10_H
IPIGPROT1_4: <GUARD_IPIR_base> + $C4_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPID[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 44.391 IPIGPROT1_Rn/Tn, IPIGPROT1_4 Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID IPIGPROT1_Rn/Tn/4 is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting IPIGPROT1_Rn/Tn/4 to 0101_B enables access to areas with SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = m depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = m

44.5.9.13 BRGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear BRGOVFSTAT register. BRGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit or 8-bit units.

Address: <GUARD_BARR_base> + 00_H

Value after reset: $0000\ 0000_H$

Table 44.392 BRGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears BRGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.9.14 BRGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. OVF bit is set when a guard error is reported again under the condition any bit of when SPIDERR bit of BRGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to BRGOVFCLR register. See **Section 44.5.9.13, BRGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <GUARD_BARR_base> + 04_H

Value after reset: $0000\ 0000_H$

Table 44.395 BRGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.9.17 BRGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the BRGSPIDERRSTAT register. The BRGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <GUARD_BARR_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.396 BRGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear BRGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.9.18 BRGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the BRGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_BARR_base> + 14_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.397 BRGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.9.19 BRGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/common protection control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_BARR_base> + 18_H

Value after reset: $0000\ 0000_H$

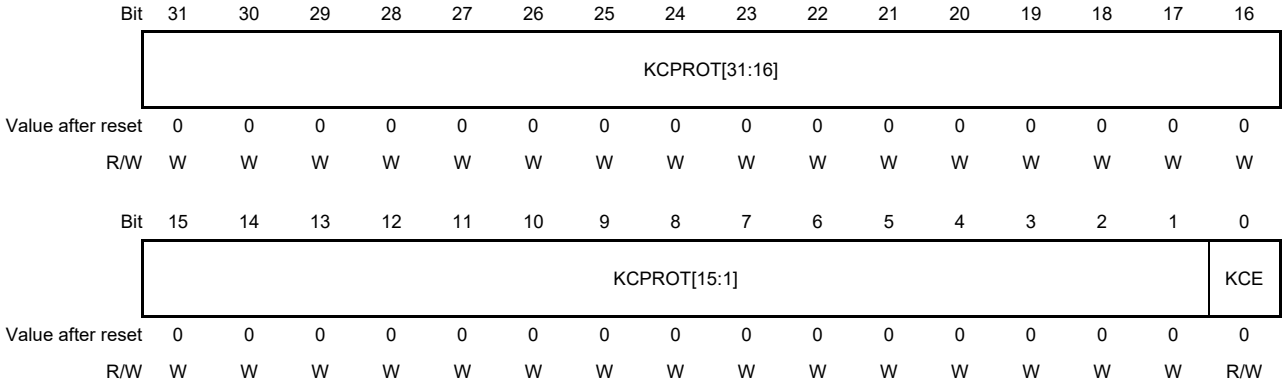

Table 44.398 BRGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.9.20 BRGPROT0_n/16 — Channel/Common Protection Control Register

Specifies the BarrierSync slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: BRGPROT0_n: <GUARD_BARR_base> + 80_H + n * 08_H
BRGPROT0_16: <GUARD_BARR_base> + 100_H

Value after reset: 0000 0000_H

Table 44.400 BRGPROT1_n Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID BRGPROT1_n/16 is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting BRGPROT1_n/16 to 0101_B enables access to areas with SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = m depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = m

44.5.9.22 TPTGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear TPTGOVFSTAT register. TPTGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit or 8-bit units.

Address: <GUARD_TPTM_base> + 00_H

Value after reset: $0000\ 0000_H$

Table 44.401 TPTGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears TPTGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.9.23 TPTGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. OVF bit is set when a guard error is notified again under condition any bit of TPTGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to TPTGOVFCLR register. See **Section 44.5.9.22, TPTGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <GUARD_TPTM_base> + 04_H

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.9.24 TPTGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when the TPTGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_TPTM_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]

Table 44.404 TPTGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.9.26 TPTGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the TPTGSPIDERRSTAT register. The TPTGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <GUARD_TPTM_base> + 10_H

Value after reset: $0000\ 0000_H$

Table 44.409 TPTGPROT1_n Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID TPTGPROT1_n is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting TPTGPROT1_n to 0101_B enables access to areas with SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = m depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = m

44.5.10 PBG

44.5.10.1 Overview

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected. Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers. For details of PORT categories for PBG see **Table 44.411**.

Note: Even if protected module or channel is not available by product variants, guard registers for that module are available (except PBG01#2,3).
For details of protection target modules by product variants, refer to corresponding each section.

Table 44.410 List of Peripheral Circuit Modules to be Protected (1/8)

PBG Group	PBG Channel Number	Module to be Protected
PBG00	0	P-Bus guard control and error register (PBG00, PBG01, PBGERRSLV00) INTC2 guard register, DTS guard register, sDMAC guard register, I-Bus guard register
	1	GCFU, CFU
	2	BOOTCTRL register, DTS_COMP_CNTRL register, ERRGEN, ECC/Address feedback/Address parity controller without suffix PE0, PE1, PE2, PE3 and Cluster0, Cluster1, Cluster2 and Cluster3
	3	ECC/Address feedback/Address parity controller for Cluster0 Cluster RAM guard for Cluster0 without suffix PE0, PE1, PE2 and PE3 CCIBH0
	4	ECC/Address feedback/Address parity controller for Cluster1 Cluster RAM guard for Cluster1 without suffix PE0, PE1, PE2 and PE3
	5	ECC/Address feedback/Address parity controller for Cluster2 Cluster RAM guard for Cluster2 without suffix PE0, PE1, PE2 and PE3
	6	ECC/Address feedback/Address parity controller for Cluster3 Cluster RAM guard for Cluster3 without suffix PE0, PE1, PE2 and PE3
PBG01	0	ECC/Address feedback controller for PE0 PEG register for PE0 CRG register with suffix PE0
	1	ECC/Address feedback controller for PE1 PEG register for PE1 CRG register with suffix PE1
	2*4	ECC/Address feedback controller for PE2 PEG register for PE2 CRG register with suffix PE2
	3*4	ECC/Address feedback controller for PE3 PEG register for PE3 CRG register with suffix PE3
PBG10	0	P-Bus guard control and error register (PBG10, PBGERRSLV10)
	1	ECC on Bus for P-Bus Group 1
	2	ECC controller for Data Flash

Table 44.410 List of Peripheral Circuit Modules to be Protected (2/8)

PBG Group	PBG Channel Number	Module to be Protected
PBG20	0	P-Bus guard control and error register (PBG20, PBG21, PBG22, PBGERRSLV20)
	1	ECC on Bus for P-Bus Group 2H/2L
	2	System Control – Category 1 Registers of the following modules: • Clock Controller • Power Supply Voltage Monitor And registers of the following modules that are NOT related to ICUMHA: • Reset Controller (including BIST skip control registers) • Standby Controller • Clock Monitor • Operating Mode Assumption of Use: a group which is assigned to the safety core.
	3	System Control – Category 2 Registers SWSRESA_ICUM and SWARESA_ICUM*1. Assumption of Use: a group which is assigned to the ICUMHA or the safety core.
	4	BIST
	5	TAUJ2
	6	TAUJ3
	7	LPS0
	8	FENC, FEINC (for PE0, PE1, PE2, PE3)
	9	ADCJ2
	10	RTCA0
	11	WDTBA
	12	Port configuration register – Category A Assumption of Use: a group which is configured at start-up
	13	Port configuration register – Category B Assumption of Use: a group which is configured at start-up
	14	Port configuration register – Category C Assumption of Use: a group which is configured at start-up
	15	JPort configuration register – Category C Assumption of Use: a group which is configured at start-up

Table 44.410 List of Peripheral Circuit Modules to be Protected (3/8)

PBG Group	PBG Channel Number	Module to be Protected
PBG21	0	Port configuration register – Category D Assumption of Use: a group which is configured at start-up
	1	JPort configuration register – Category D Assumption of Use: a group which is configured at start-up
	2	Port configuration register – Category E Assumption of Use: a group which is configured at start-up
	3	JPort configuration register – Category F Assumption of Use: a group which is configured at start-up
	4	Port configuration register for Port group 0 – Category F Assumption of Use: a group which is configured dynamically
	5	Port configuration register for Port group 1 – Category F Assumption of Use: a group which is configured dynamically
	6	Port configuration register for Port group 2 – Category F Assumption of Use: a group which is configured dynamically
	7	Port configuration register for Port group 3 – Category F Assumption of Use: a group which is configured dynamically
	8	Port configuration register for Port group 4 – Category F Assumption of Use: a group which is configured dynamically
	9	Port configuration register for Port group 5 – Category F Assumption of Use: a group which is configured dynamically
	10	Port configuration register for Port group 6 – Category F Assumption of Use: a group which is configured dynamically
	11	Port configuration register for Port group 8 – Category F Assumption of Use: a group which is configured dynamically
	12	Port configuration register for Port group 9 – Category F Assumption of Use: a group which is configured dynamically
	13	Port configuration register for Port group 10 – Category F Assumption of Use: a group which is configured dynamically
	14	Port configuration register for Port group 11 – Category F Assumption of Use: a group which is configured dynamically
	15	Port configuration register for Port group 12 – Category F Assumption of Use: a group which is configured dynamically

Table 44.410 List of Peripheral Circuit Modules to be Protected (4/8)

PBG Group	PBG Channel Number	Module to be Protected

	7	ETNB1 (Gb Ether)

Note 1. For more detail of these registers refer to the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Note 2. When ICUMHA is enable, PBG error is notified to ICUMHA. When ICUMHA is disable, PBG error is notified to ECM.

Note 3. This protected module is available only when ICUMHA is disable.

Note 4. The register of this channel is not available in RH850/U2A6.

Table 44.411 Relation between categories and target registers for PORT configuration registers

Category		Target register
Category A		PKCPROT, PWE, LVDSCTRLA, LVDSCTRLB
Category B		FCLACTLm_<name>, DNFACTL_<name>, DNFAEN_<name>, DNFAENH_<name>, DNFAENL_<name>*1
Category C		PCRn_m, APCRn_m, JPCRn_m
Category D		PIBCn, PBDCn, PIPCn, PUn,PDn, PODCn, PDSCn, PISn, PISAn, PUCCn, PODCEn, APIBCn, APBDCn, APODCn, APDSCn, APODCEn, JPIBC0, JPBDC0, JPU0, JPD0, JPODC0, JPDSC0, JPIS0, JPISA0, JPUCC0, JPODCE0
Category E		PSFCn, PSFTSn, PSFTSEn, APSFCn, APSFTSn, APSFTSEn
Category F	For Port Group	Pn, PSRn, PNOTn, PPRn, PMn, PMCn, PFCn, PFCEn, PMSRn, PMCSRn, PFCAEn, PINVn
	For APort Group	APn, APSRn, APNOTn, APPRn, APMn, APMSRn, APINVn
	For JTAG Port	JP0, JPSR0, JPNOT0, JPPR0, JPM0, JPMC0, JPFC0, JPFCE0, JPMSR0, JPMCSR0, JPINV0

Note 1. Except DNFA registers for TAUD2

44.5.10.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.412 Register Base Addresses

Base Address Name	Base Address	Bus Group
<PBG00_base>	FFC6 B080$_H$	P-Bus Group 0
<PBG01_base>	FFC6 B100$_H$	P-Bus Group 0
<PBGERRSLV00_base>	FFC6 B000$_H$	P-Bus Group 0
<PBG10_base>	FFC6 3000$_H$	P-Bus Group 1
<PBGERRSLV10_base>	FFC6 3100$_H$	P-Bus Group 1
<PBG20_base>	FFDE 0B00$_H$	P-Bus Group 2L
<PBG21_base>	FFDE 0C00$_H$	P-Bus Group 2L
<PBG22_base>	FFDE 0D00$_H$	P-Bus Group 2L

P-Bus Group 9 registers	PBG90	PBGERRSLV90	

44.5.10.4 PBGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear PBGOVFSTAT register. PBGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <PBGERRSLVn_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R

Table 44.415 PBGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset
1	CLRO	Clears PBGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.10.5 PBGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard error overflow was occurred. OVF bit is set when a guard error is notified again under the condition any bit of PBGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to PBGOVFCLR register. See **Section 44.5.10.4, PBGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit or 8-bit units.

Address: <PBGERRSLVn_base> + 04_H

Value after reset: $0000\ 0000_H$

Table 44.416 PBGOVFSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.10.6 PBGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when the PBGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PBGERRSLVn_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.417 PBGERRADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	ADDR[31:0]	Access address to the target slave when a guard error has occurred

44.5.10.7 PBGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when the PBGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit or 16-bit units.

Address: <PBGERRSLVn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.418 PBGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.10.8 PBGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the PBGSPIDERRSTAT register. The PBGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <PBGERRSLVn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.419 PBGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear PBGSPIDERRSTAT.SPIDERR bit by writing 1.

44.5.10.9 PBGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the PBGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PBGERRSLVn_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.420 PBGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.10.10 PBGKCPROT — Key Code Protection Register

This register is used for protection against writing to the P-Bus guard control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <PBGERRSLVn_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.421 PBGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.10.11 PBGPROT0_m — Channel Protection Control Register

Specifies the P-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

PBG01 PBGPROT0_2, PBGPROT0_3 are not available in RH850/U2A6.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <PBGn_base> + 00_H + m * 08_H

Value after reset: 00000141_H
PBG6L1 PBGPROT0_1, PBGPRTOT0_2: $0x000001C1_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	GEN	SEC	DBG	—	UM	—	—	WG	RG
Value after reset	0	0	0	0	0	0	0	1	*1	1	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W

Table 44.422 PBGPROT0_m Register Contents

Bit Position	Bit Name	Function
31	LOCK	Allows blocking any further change of PBGPROT0_m and PBGPROT1_m. 0: Register can be re-written 1: Any further write to PBGPROT0_m and PBGPROT1_m is ignored This bit can only be cleared by reset.
30 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting
7*2 *3	SEC	R/W disable setting for non-secure master 0: R/W disabled 1: R/W depends on other enable/disable settings
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, PBGPROT1_m is used as a judgment condition. 1: During write, PBGPROT1_m is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, PBGPROT1_m is used as the judgment condition. 1: During read, PBGPROT1_m is not used as a judgment condition.

Note 1. Initial value of this bit is 1 for only PBGPROT0_1 and PBGPROT0_2 for PBG6L1.

Note 2. When ICUMHA is enable, this bit is available only PBG6L1. For other PBG, this bit is not available regardless of ICUMHA enable/disable.

Note 3. When ICUMHA is disable, this bit for PBG6L1 is no function although it can be written and read.

44.5.10.12 PBGPROT1_m — Channel SPID Setting Register

Specifies the P-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID setting.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <PBGn_base> + 04_H + m * 08_H

Value after reset: See **Table 44.424**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPID[31:16]

	SPID[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.423 PBGPROT1_m Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID PBGPROT1_m is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting PBGPROT1_m to 0101_B enables access to areas with SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = x depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = x

Note 1. This depends on each channel. See **Table 44.424**.

Note 1. The register of this channel is not available in RH850/U2A6.

44.5.11 HBG

44.5.11.1 Overview

HBG can prevent read and write access against which a peripheral circuit on H-Bus should be protected. If HBG detects illegal access, guard error notification is signaled to ECM.

The following table lists the peripheral circuits to be protected and the corresponding HBG names.

Table 44.425 List of Peripheral Circuit Module to be Protected

HBG	Module to be Protected
HBG91	RHSIF0*1
HBG92	FLXA0
HBG93	FLXA1*1
HBG96	SFMA0*2

Note 1. This function is not implemented in RH850/U2A6.
Note 2. This function is not implemented in RH850/U2A6 (156/144 pins).

44.5.11.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 44.426 Register Base Addresses

Base Address Name	Base Address	Bus Group
<HBG91_base>*1	FF0D 0600$_H$	P-Bus Group 9
<HBGERRSLV91_base>*1	FF0D 1600$_H$	P-Bus Group 9
<HBG92_base>	FF0D 0000$_H$	P-Bus Group 9
<HBGERRSLV92_base>	FF0D 1000$_H$	P-Bus Group 9
<HBG93_base>*1	FF0D 0200$_H$	P-Bus Group 9
<HBGERRSLV93_base>*1	FF0D 1200$_H$	P-Bus Group 9
<HBG96_base>*2	FF0D 0400$_H$	P-Bus Group 9
<HBGERRSLV96_base>*2	FF0D 1400$_H$	P-Bus Group 9

Note 1. This function is not implemented in RH850/U2A6.
Note 2. This function is not implemented in RH850/U2A6 (156/144 pins).

44.5.11.3 List of Registers

Table 44.427 List of Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
HBGERRSLVn (n = 91, 92, 93, 96)*1	Guard error overflow clear register	HBGOVFCLR	<HBGERRSLVn_base> + 00_H	8, 16, 32	PBG90#0	—
	Guard error overflow status register	HBGOVFSTAT	<HBGERRSLVn_base> + 04_H	8, 16, 32	PBG90#0	—
	Guard error address register	HBGERRADDR	<HBGERRSLVn_base> + 08_H	32	PBG90#0	—
	Guard error access information register	HBGERRTYPE	<HBGERRSLVn_base> + $0C_H$	16, 32	PBG90#0	—
	Guard SPID error clear register	HBGSPIDERRCLR	<HBGERRSLVn_base> + 10_H	32	PBG90#0	—
	Guard SPID error status register	HBGSPIDERRSTAT	<HBGERRSLVn_base> + 14_H	32	PBG90#0	—
	Key code protection register	HBGKCPROT	<HBGERRSLVn_base> + 18_H	32	PBG90#0	—
HBGn (n = 91, 92,93, 96)*1	Channel protection control register	HBGPROT0	<HBGn_base> + 00_H	8, 16, 32	PBG90#0	HBGKCPROT
	Channel SPID setting register	HBGPROT1	<HBGn_base> + 04_H	8, 16, 32	PBG90#0	HBGKCPROT

Note 1. This function is not implemented in RH850/U2A6 with index n = 91, 93 and in RH850/U2A6 (156/144 pins) with index n = 96.

Table 44.428 Relation between guard controllers and capture modules for protection targets

Protection target	Controlled by	Capture to	Applicable for
H-Bus Group 0 registers (RHSIF0)*1	HBG91	HBGERRSLV91	Access request from all masters
H-Bus Group 1 registers (FLXA0)	HBG92	HBGERRSLV92	
H-Bus Group 2 registers (FLXA1)*1	HBG93	HBGERRSLV93	
H-Bus Group 3 registers (SFMA0)*2	HBG96	HBGERRSLV96	

Note 1. This function is not implemented in RH850/U2A6.

Note 2. This function is not implemented in RH850/U2A6 (156/144 pins).

44.5.11.4 HBGOVFCLR — Guard Error Overflow Clear Register

This register is used to clear HBGOVFSTAT register. HBGOVFSTAT.OVF bit is cleared immediately after writing 1 to this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <HBGERRSLVn_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R

Table 44.429 HBGOVFCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset
1	CLRO	Clears HBGOVFSTAT.OVF bit by writing 1.
0	Reserved	When writing, write the value after reset.

44.5.11.5 HBGOVFSTAT — Guard Error Overflow Status Register

This register is used to notify users whether guard errors have occurred. OVF bit is set when a guard error is reported again under the condition any bit of HBGSPIDERRSTAT register is already set. This register is not writable and is cleared when writing 1 to HBGOVFCLR register. See **Section 44.5.11.4, HBGOVFCLR — Guard Error Overflow Clear Register**.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <HBGERRSLVn_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.430 HBGOVFSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Overflow status flag
0	Reserved	When read, the value after reset is returned.

44.5.11.6 HBGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when the HBGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <HBGERRSLVn_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.431 HBGERRADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	ADDR[31:0]	Access address to the target slave when a guard error has occurred

44.5.11.7 HBGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when the HBGSPIDERRSTAT register is all 0.

Access: This register is a read-only register that can be read in 32-bit or 16-bit units.

Address: <HBGERRSLVn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.432 HBGERRTYPE Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	SEC	Access attribute of SEC to the target slave when a guard error has occurred
12	DBG	Access attribute of DBG to the target slave when a guard error has occurred
11	UM	Access attribute of UM to the target slave when a guard error has occurred
10 to 6	SPID[4:0]	Access attribute of SPID to the target slave when a guard error has occurred
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	Access type of read or write to the target slave when a guard error has occurred

44.5.11.8 HBGSPIDERRCLR — Guard SPID Error Clear Register

This register is used to clear the HBGSPIDERRSTAT register. The HBGSPIDERRSTAT.SPIDERR[x] bit is cleared immediately after writing 1 to the x-th bit in this register. Read data is always 0 when reading this register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <HBGERRSLVn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.433 HBGSPIDERRCLR Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDCLR[31:0]	Clear PBGSPIDERRSTAT.SPIDERR bit.

44.5.11.9 HBGSPIDERRSTAT — Guard SPID Error Status Register

This register is used for users to know whether guard errors were occurred or not. The SPIDERR[x] bit is set when a guard error caused by a master whose SPID is x is notified by an error detecting module. This register is not writable and is cleared when writing 1 to the HBGSPIDERRCLR register. Guard error is notified to ECM when SPIDERR[x] changes from 0 to 1.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <HBGERRSLVn_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPIDERR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPIDERR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.434 HBGSPIDERRSTAT Register Contents

Bit Position	Bit Name	Function
31 to 0	SPIDERR[31:0]	Guard error status flag based on SPID 0: No guard error. 1: Shows SPID that a guard error has occurred.

44.5.11.10 HBGKCPROT — Key Code Protection Register

This register is used for protection against writing to the H-Bus guard control registers due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: <HBGERRSLVn_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 44.435 HBGKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

44.5.11.11 HBGPROT0 — Channel Protection Control Register

Specifies the H-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <HBGn_base> + 00_H

Value after reset: $0000\ 0141_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GEN	—	DBG	—	UM	—	—	WG	RG
Value after reset	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R	R/W	R/W

Table 44.436 HBGPROT0 Register Contents (1/2)

Bit Position	Bit Name	Function
31	LOCK	Allows to block any further change of HBGPROT0 and HBGPROT1. 0: Register can be re-written 1: Any further write to HBGPROT0 and HBGPROT1 is ignored This bit can only be cleared by reset.
30 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting 0: Disables the guard setting 1: Enables the guard setting **CAUTION** When this bit is set to 1, HBG causes incorrect write accesses when: 1. Two consecutive*1 write access to same bus slave. 2. Second write*2 access is guarded by HBG. Following things are occurred. 1. First write access cannot complete. 2. Second access's write data is written to first access's address. 3. H-Bus cannot accept new read/write*3. Note 1. Consecutive: Two sequential write access one after another without empty bus cycle in between (within 2 bus cycle). Note 2. Read operation is not affected. Note 3. H-Bus cannot respond the bus access completion to the bus master. And H-Bus cannot accept new read/write request.
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master 0: Depends on other enable/disable settings 1: Enables R/W
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode 0: R/W disabled 1: R/W depends on other enable/disable settings

Table 44.436 HBGPROT0 Register Contents (2/2)

Bit Position	Bit Name	Function
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable 0: During write, HBGPROT1 is used as a judgment condition. 1: During write, HBGPROT1 is not used as a judgment condition.
0	RG	Read Global Enable 0: During read, HBGPROT1 is used as the judgment condition. 1: During read, HBGPROT1 is not used as a judgment condition.

44.5.11.12 HBGPROT1 — Channel SPID Setting Register

Specifies the H-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID setting.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <HBGn_base> + 04_H

Value after reset: $0000\ 000F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.437 HBGPROT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	R/W enable setting based on SPID HBGPROT1 is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. For example, setting HBGPROT1 to 0101_B enables access to areas with SPID = 0 and SPID = 2. 0: Reading/writing the area with SPID = m depends on the RG and WG bit setting 1: Enables reading/writing the area with SPID = m

44.6 BIST

44.6.1 Overview

This product incorporates Built-In-Self-Test (BIST) function to detect failures of the safety mechanism itself. The BIST consists of Logic BIST (LBIST) and Memory BIST (MBIST). LBIST is considered as the effective hardware safety mechanism to measure latent faults which can reduce software load for error injection tests.

Power-On BIST is executed for safety mechanism in both of ISO and AWO areas during the reset sequence of Power On Reset, System Reset 1 and System Reset 2 before the CPU starts operation (called FBIST0). In addition, by setting System Reset 2, BIST (FBIST0) can be performed during the reset sequence in accordance with the setting of the BSEQ0CTL register (hereafter called Shut-Down BIST).

Standby-Resume BIST is executed for safety mechanism in ISO area only during the reset sequence of DeepSTOP reset before the CPU starts operation. By entering DeepSTOP mode, BIST (FBIST1) can be performed during the reset sequence in accordance with the setting of the BSEQ1CTL register after DeepSTOP Reset is generated when MCU mode transits from DeepSTOP mode to RUN mode. Also when MCU mode transits from DeepSTOP mode to CyclicRUN mode, BIST (FBIST2) can be performed during the reset sequence in accordance with the setting of the BSEQ2CTL register after DeepSTOP Reset is generated.

BIST execution results can be identified by the BIST result register (BSEQ0ST). When running BIST, any of LBIST ONLY, MBIST ONLY or both can be selected either by using flash option byte 3 (at Power-On BIST using Power On Reset or System Reset 1, or at Shut-Down BIST using System Reset 2) or by using BSEQ0SEL register (at Shut-Down BIST using System Reset 2 or Standby-Resume BIST using DeepSTOP Reset).

44.6.2 Registers

44.6.2.1 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc. Write protected registers can be written by releasing the protection of RESKCPROT0. For details of RESKCPROT0, see **Section 9, Reset Controller**.

44.6.2.2 List of Registers

Table 44.438 List of Registers (1/3)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection

44.6.2.4 LBISTREF1 — Logic BIST Reference Value Register 1

This register indicates the reference value of the Logic BIST. This register is automatically updated by the reference value after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6000$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTREF1[19:16]

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	MBISTREF1[19:0]	Reference signature value (expected signature value)*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	000A A55A$_H$
BIST is not executed without any of MBIST scenario:	Reference signature value (expected signature value)
BIST is not executed with any of MBIST scenario:	Reference signature value (expected signature value)
BIST is executed without any of MBIST scenario:	Reference signature value (expected signature value)
BIST is executed with any of MBIST scenario:	Reference signature value (expected signature value)

44.6.2.7 MBISTREF2 — Memory BIST Reference Value Register 2

This register indicates the reference value of the Memory BIST. This register is automatically updated by the reference value after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 600C$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	MBISTREF2[19:0]	Reference signature value (expected signature value)*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	0005 5AA5$_H$
BIST is not executed without any of MBIST scenario:	Reference signature value (expected signature value)
BIST is not executed with any of MBIST scenario:	Reference signature value (expected signature value)
BIST is executed without any of MBIST scenario:	Reference signature value (expected signature value)
BIST is executed with any of MBIST scenario:	Reference signature value (expected signature value)

44.6.2.8 MBISTREF3 — Memory BIST Reference Value Register 3

This register indicates the reference value of the Memory BIST. This register is automatically updated by the reference value after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6010$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	MBISTREF3[19:0]	Reference signature value (expected signature value)*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	000A AA55$_H$
BIST is not executed without any of MBIST scenario:	Reference signature value (expected signature value)
BIST is not executed with any of MBIST scenario:	Reference signature value (expected signature value)
BIST is executed without any of MBIST scenario:	Reference signature value (expected signature value)
BIST is executed with any of MBIST scenario:	Reference signature value (expected signature value)

44.6.2.9 LBISTSIG1 — Logic BIST Signature Value Register 1

This register indicates the signature value of the Logic BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user compares the reference signature of LBISTREF1 against the resulting signature LBISTSIG1. The Logic BIST is passed if these are equal.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6014$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.445 LBISTSIG1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	LBISTSIG1[19:0]	Logic BIST1 result signature value*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	0005 A5A5$_H$
BIST is not executed without any of LBIST scenario:	0005 A5A5$_H$
BIST is not executed with any of LBIST scenario:	Inverted value of LBISTREF1 register
BIST is executed without any of LBIST scenario:	0005 A5A5$_H$
BIST is executed with any of LBIST scenario:	Logic BIST1 result signature value

44.6.2.10 LBISTSIG2 — Logic BIST Signature Value Register 2

This register indicates the signature value of the Logic BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user shall compare the reference signature of LBISTREF2 against the resulting signature LBISTSIG2. The Logic BIST is passed if these are equal.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6018$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.446 LBISTSIG2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	LBISTSIG2[19:0]	Logic BIST2 result signature value*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	000A 5A5A$_H$
BIST is not executed without any of LBIST scenario:	000A 5A5A$_H$
BIST is not executed with any of LBIST scenario:	Inverted value of LBISTREF2 register
BIST is executed without any of LBIST scenario:	000A 5A5A$_H$
BIST is executed with any of LBIST scenario 9 or 11 to 20:	000A 5A5A$_H$
BIST is executed with any of LBIST scenario 1 to 3, 5 to 7 or 10:	Logic BIST2 result signature value

44.6.2.11 MBISTSIG1 — Memory BIST Signature Value Register 1

This register indicates the signature value of the Memory BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user shall compare the reference signature of MBISTREF1 against the resulting signature MBISTSIG1. The Memory BIST is passed if these are equal.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 601C$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 44.447 MBISTSIG1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	MBISTSIG1[19:0]	Memory BIST1 result signature value*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	0005 5AA5$_H$
BIST is not executed without any of MBIST scenario:	0005 5AA5$_H$
BIST is not executed with any of MBIST scenario:	Inverted value of MBISTREF1 register
BIST is executed without any of MBIST scenario:	0005 5AA5$_H$
BIST is executed with any of MBIST scenario:	Memory BIST1 result signature value

44.6.2.12 MBISTSIG2 — Memory BIST Signature Value Register 2

This register indicates the signature value of the Memory BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user shall compare the reference signature of MBISTREF2 against the resulting signature MBISTSIG2. The Memory BIST is passed if these are equal.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6020$_H$

Value after reset: *1

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	MBISTSIG2[19:0]	Memory BIST2 result signature value*1

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	000A A55A$_H$
BIST is not executed without any of MBIST scenario:	000A A55A$_H$
BIST is not executed with any of MBIST scenario:	Inverted value of MBISTREF2 register
BIST is executed without any of MBIST scenario:	000A A55A$_H$
BIST is executed with either of MBIST scenario 3 or 4:	Inverted value of MBISTREF2 register
BIST is executed with either of MBIST scenario 1 or 2:	Memory BIST2 result signature value

44.6.2.13 MBISTSIG3 — Memory BIST Signature Value Register 3

This register indicates the signature value of the Memory BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user shall compare the reference signature of MBISTREF3 against the resulting signature MBISTSIG3. The Memory BIST is passed if these are equal.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6024$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

44.6.2.16 MBIST1FTAG2 — Memory BIST1 FTAG Signature Value Register 2

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6030$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

44.6.2.19 MBIST1FTAG5 — Memory BIST1 FTAG Signature Value Register 5

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 603C$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MBIST1FTAG5[31:16]

44.6.2.21 MBIST1FTAG7 — Memory BIST1 FTAG Signature Value Register 7

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6044$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

44.6.2.24 MBIST2FTAG2 — Memory BIST2 FTAG Signature Value Register 2

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 6050$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.487 BSEQ0STB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	BISTENDB	0: The BIST sequence finished within the time limit. 1: The BIST sequence did not finish within the time limit.
0	CMPERRB	0: BIST abnormal end 1: BIST normal end

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.

BIST is skipped:	0000 0002$_H$
BIST is not executed:	0000 0001$_H$
BIST is executed:	The inverted state of BIST sequencer for the BIST result

44.6.2.40 BISTST — BIST Result Register

This register indicates the result of the BIST. This register is automatically updated by the BIST result after BIST execution.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF9A 4408$_H$

Value after reset: *1*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MBIST3ST	MBIST2ST	MBIST1ST	LBIST2ST	LBIST1ST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	*2	*2	*2	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 44.488 BISTST Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned.
4	MBIST3ST	0: MBIST3 passed successfully 1: MBIST3 has detected an error
3	MBIST2ST	0: MBIST2 passed successfully 1: MBIST2 has detected an error
2	MBIST1ST	0: MBIST1 passed successfully 1: MBIST1 has detected an error
1	LBIST2ST	0: LBIST2 passed successfully 1: LBIST2 has detected an error
0	LBIST1ST	0: LBIST1 passed successfully 1: LBIST1 has detected an error

Note 1. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.
BIST is skipped:
LBIST1ST and LBIST2ST show "11_B"
BIST is not executed with any of LBIST scenario:
LBIST1ST and LBIST2ST show "11_B"
BIST is executed with any of LBIST scenario 9 or 11 to 20:
The BIST result is stored in LBIST1ST (LBIST2ST shows "1_B")
BIST is executed with any of LBIST scenario 1 to 3, 5 to 7 or 10:
The BIST result is stored in LBIST1ST and LBIST2ST

Note 2. The value depends on the BIST execution condition. For details about the BIST execution condition, see **Section 44.6.3.1, BIST Execution Condition**.
BIST is skipped:
MBIST1ST, MBIST2ST and MBIST3ST show "111_B"
BIST is not executed with any of MBIST scenario:
MBIST1ST, MBIST2ST and MBIST3ST show "111_B"
BIST is executed with any of MBIST scenario 3 or 4:
The BIST result is stored in MBIST1ST (MBIST2ST and MBIST3ST show "11_B")
BIST is executed with any of MBIST scenario 2:
The BIST result is stored in MBIST1ST and MBIST2ST (MBIST3ST shows "1_B")
BIST is executed with any of MBIST scenario 1:
The BIST result is stored in MBIST1ST, MBIST2ST and MBIST3ST

44.6.2.41 BSEQ0SEL — BIST Scenario Select Register

This register is used to select the execution scenario of BIST at the next System Reset 2 or DeepSTOP Reset occurrence.

Access: This register can be read or written in 32-bit units.

Address: FF9A 440C$_H$

Value after reset: 0000 0030$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PARAMSEL	—	—	—	—	—	—	—	—	—	HWTESTSET[1:0]		HWLBISTSEL[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.489 BSEQ0SEL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PARAMSEL	Selects BIST parameters (HWLBISTSEL[1:0], HWTESTSET[1:0]) of BIST which will be executed during next System Reset 2 or DeepSTOP Reset. 0: Parameters specified by Flash option byte.*1 (default) 1: Parameters specified by BSEQ0SEL registers.*2
14 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 4	HWTESTSET[1:0]	BIST selection 00_B: Prohibited 01_B: LBIST ONLY 10_B: MBIST ONLY 11_B: LBIST AND MBIST
3 to 0	HWLBISTSEL[3:0]	Refer to **Table 44.490** and **Table 44.491**.

Note 1. For details, see **Section 51, Flash Memory**.

Note 2. This bit has to be set to "1_B" when Standby Resume BIST will be executed at next DeepSTOP Reset.

Table 44.490 BIST scenario selection at the next System Reset 2

HWLBISTSEL	LBIST scenario	MBIST scenario*2	Run time*1		
			LBIST only	MBIST only	LBIST and MBIST
0000_B	1	1	5.1ms	6.5ms	11.3ms
0001_B	2	1	10.2ms	6.5ms	16.4ms
0010_B	3	1	15.3ms	6.5ms	21.5ms
Other	Reserved	—	—	—	—

Note 1. Run time is calculated by the typical frequency of the CLK_HSIOSC. For details, see **Section 55, Electrical Characteristics**.

Note 2. For details of RAM group mapping for each executed MBIST scenario, see **Section 44.6.2.14, MBIST1FTAG0 — Memory BIST1 FTAG signature value register 0** to **Section 44.6.2.25, MBIST3FTAG0 — Memory BIST3 FTAG signature value register 0**.

Table 44.491 BIST scenario selection at the next DeepSTOP Reset

HWLBISTSEL	LBIST scenario	MBIST scenario*2	Run time*1		
			LBIST only	MBIST only	LBIST and MBIST
0000_B	5	2	5.1ms	6.5ms	11.3ms
0001_B	6	2	10.2ms	6.5ms	16.4ms
0010_B	7	2	15.3ms	6.5ms	21.5ms
0011_B	Reserved	—	—	—	—
0100_B	9	3	2.04ms	3.5ms	5.24ms
0101_B	10	4	2.04ms	3.5ms	5.24ms
0110_B	11	3	2.04ms	3.5ms	5.24ms
0111_B	12	4	2.04ms	3.5ms	5.24ms
1000_B	13	3	2.04ms	3.5ms	5.24ms
1001_B	14	4	2.04ms	3.5ms	5.24ms
1010_B	15	3	2.04ms	3.5ms	5.24ms
1011_B	16	4	2.04ms	3.5ms	5.24ms
1100_B	17	3	2.04ms	3.5ms	5.24ms
1101_B	18	4	2.04ms	3.5ms	5.24ms
1110_B	19	3	2.04ms	3.5ms	5.24ms
1111_B	20	4	2.04ms	3.5ms	5.24ms

Note 1. Run time is calculated by the typical frequency of the CLK_HSIOSC. For details, see **Section 55, Electrical Characteristics**.

Note 2. For details of RAM group mapping for each executed MBIST scenario, see **Section 44.6.2.14, MBIST1FTAG0 — Memory BIST1 FTAG signature value register 0** to **Section 44.6.2.25, MBIST3FTAG0 — Memory BIST3 FTAG signature value register 0**.

Table 44.492 The relationship of executed scenario and target of ASIL level*1

Executed scenario	Target ASIL level
LBIST scenario 1	ASIL-B
LBIST scenario 2	ASIL-C
LBIST scenario 3	ASIL-D
LBIST scenario 5	ASIL-B
LBIST scenario 6	ASIL-C
LBIST scenario 7	ASIL-D
LBIST scenario 9 to LBIST scenario 12*2	ASIL-B
LBIST scenario 9 to LBIST scenario 16*2	ASIL-C
LBIST scenario 9 to LBIST scenario 20*2	ASIL-D

Note 1. ISO26262 compliance for LFM (Latent Fault Metric) by LBIST.

Note 2. All scenarios for target ASIL level must be executed and the result must be confirmed within the fault detection interval for latent fault.

44.6.2.42 BSEQ0CTL — BIST Skip Control Register for FBIST0

This register is used to control the BIST execution at the next System Reset 2 occurrence.

Access: This register can be read or written in 32-bit units.

Address: FF98 8400$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HWBISTSEL	HWBISTEXE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 44.493 BSEQ0CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	HWBISTSEL	Selects flash option byte value or register value for the BIST execution setting. 0: BIST is executed according to Flash Option Byte*1 value. 1: BIST is executed according to HWBISTEXE value.
0	HWBISTEXE	This bit selects if BIST is skipped or not at the next system reset 2 0: BIST is skipped at the next system reset 2 1: BIST is executed at the next system reset 2

Note 1. For details, see **Section 51, Flash Memory**

44.6.2.43 BSEQ1CTL — BIST Skip Control Register for FBIST1

This register is used to control the BIST execution at the next DeepSTOP Reset occurrence for FBIST1.

Access: This register can be read or written in 32-bit units.

Address: FF98 8404$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HWBISTEXE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.494 BSEQ1CTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	HWBISTEXE	This bit selects if BIST is skipped or not at the next DeepSTOP Reset 0: BIST is skipped at the next DeepSTOP Reset 1: BIST is executed at the next DeepSTOP Reset This bit is automatically set to 0 after FBIST1 has finished.

44.6.2.44 BSEQ2CTL — BIST Skip Control Register for FBIST2

This register is used to control the BIST execution at the next DeepSTOP Reset occurrence for FBIST2.

Access: This register can be read or written in 32-bit units.

Address: FF98 8408$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HWBISTEXE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 44.495 BSEQ2CTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	HWBISTEXE	This bit selects if BIST is skipped or not at the next DeepSTOP Reset 0: BIST is skipped at the next DeepSTOP Reset 1: BIST is executed at the next DeepSTOP Reset This bit is automatically set to 0 after FBIST2 has finished.

44.6.3 Functions

44.6.3.1 BIST Execution Condition

The BIST is executed during reset sequence of Power On Reset, System Reset 1, System Reset 2 and DeepSTOP Reset. The following tables explain the conditions of BIST execution.

Table 44.496 BIST Execution in Power On Reset, System Reset 1 for FBIST0

Conditions			
Reset Category	**$\overline{\text{TRST}}$ pin**	**HWBIST (Flash option*1)**	**BIST Execution during Reset Sequence**
Power On Reset System Reset 1	High	0	BIST is skipped. Reset is released without waiting for the selected BIST scenario time.
		1	BIST is not executed. Reset is released after the expiration of the selected BIST scenario time*1.
	Low	0	BIST is skipped. Reset is released without waiting for the selected BIST scenario time.
		1	BIST is executed with preset parameters*1. Reset is released after BIST is finished.

Note 1. For details, see **Section 51, Flash Memory**.

Table 44.497 BIST Execution in System Reset 2 for FBIST0

Reset Category	**$\overline{\text{TRST}}$ pin**	**BSEQ0CTL.HWBISTSEL**	**BIST Execution during Reset Sequence**
System Reset 2	High	0	HWBIST (Flash option*1) value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is not executed. Reset is released after the expiration of the selected BIST scenario time*1.
		1	BSEQ0CTL.HWBISTEXE value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is not executed. Reset is released after the expiration of the selected BIST scenario time.
	Low	0	HWBIST (Flash option*1) value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is executed with preset parameters*1. Reset is released after BIST is finished.
		1	BSEQ0CTL.HWBISTEXE value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is executed with preset parameters. Reset is released after BIST is finished.

Note 1. For details, see **Section 51, Flash Memory**.

Table 44.498 BIST Execution in DeepSTOP Reset for FBIST1

Reset Category	$\overline{\text{TRST}}$ pin	BIST Execution during Reset Sequence*1
DeepSTOP Reset	High	BSEQ1CTL.HWBISTEXE value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is not executed. Reset is released after the expiration of the selected BIST scenario time.
	Low	BSEQ1CTL.HWBISTEXE value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is executed with preset parameters. Reset is released after BIST is finished.

Note 1. MBIST3 related registers except MBISTREF3 register always show “BIST is skipped” because the RAM in AWO area is not target of Standby Resume BIST.

Table 44.499 BIST Execution in DeepSTOP Reset for FBIST2

Reset Category	$\overline{\text{TRST}}$ pin	BIST Execution during Reset Sequence*1
DeepSTOP Reset	High	BSEQ2CTL.HWBISTEXE value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is not executed. Reset is released after the expiration of the selected BIST scenario time.
	Low	BSEQ2CTL.HWBISTEXE value 0: BIST is skipped. Reset is released without waiting for the selected BIST scenario time. 1: BIST is executed with preset parameters. Reset is released after BIST is finished.

Note 1. MBIST3 related registers except MBISTREF3 register always show “BIST is skipped” because the RAM in AWO area is not target of Standby Resume BIST.

44.6.3.2 BIST Result Confirmation

After the BIST execution, read and compare the following register values to confirm whether the BIST execution completed normally without failure in case of executed both of LBIST and MBIST at Power On BIST.

- BSEQ0ST = $0000\ 0002_H$
- BSEQ0STB = $0000\ 0001_H$
- LBISTSIG1 = LBISTREF1
- LBISTSIG2 = LBISTREF2
- MBISTSIG1 = MBISTREF1
- MBISTSIG2 = MBISTREF2
- MBISTSIG3 = MBISTREF3
- BISTST = $0000\ 0000_H$

CAUTION

In RH850/U2A-EVA product, Logic BIST signature value register 1/2 and LBIST1/2ST bits of BIST Result Register do not show correct BIST result at Standby Resume BIST.

MBISTxECCy (x = 1 to 3, y = 0 to 7) registers are not supported in RH850/U2A-EVA product.

44.6.4 Operation

The target of LBIST and MBIST is difference between Power-On BIST and Standby-Resume BIST. When running BIST, any of LBIST ONLY, MBIST ONLY or both can be selected either by using flash option byte 3 (at Power-On BIST using Power On Reset or System Reset 1, or at Shut-Down BIST using System Reset 2) or by using BSEQ0SEL register (at Shut-Down BIST using System Reset 2 or Standby-Resume BIST using DeepSTOP Reset).

Table 44.500 BIST Scenario Select Condition

RESET	Source	BIST Scenario Select
Power On Reset	POC Reset	Flash option byte*1
System Reset 1	External Reset, Primary VMON Reset	Flash option byte*1
System Reset 2	Software System Reset, ECM Reset, WDTBA reset	Flash option byte*1 (BSEQ0SEL.PARAMSEL = 0) BSEQ0SEL register (BSEQ0SEL.PARAMSEL = 1)
DeepSTOP Reset	DeepSTOP Reset	BSEQ0SEL register (BSEQ0SEL.PARAMSEL = 1)

Note 1. For details, see **Section 51, Flash Memory**.

44.7 ECM

The ECM monitors various failure detection states in this microcontroller, and defines the operation to be carried out upon failure detection. For details of the ECM, see **Section 45, Error Control Module (ECM)**.

44.8 Voltage Monitor

The Voltage Monitor detects over and under voltage of the voltage domains, E0VCC, VCC, ISOVDD and AWOVDD. For details of the Voltage Monitor, see **Section 11, Power Supply Voltage Monitor**.

44.9 Clock Monitor

The Clock Monitor detects abnormal frequencies of internal clocks related to the safety of the device. For details of the Clock Monitor, see **Section 14, Clock Monitor (CLMA)**.

44.10 Data CRC Function

The Data CRC Function generates CRC to verify the data streams protected by CRC. For details of the Data CRC Function, see **Section 46, Data CRC Function K (KCRC)**.

Section 45 Error Control Module (ECM)

45.1 Features

45.1.1 Number of Units and Channels

This microcontroller has the following number of ECM unit.

Table 45.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1									
Name	ECM									

Table 45.2 Index

Index	RH850/U2A-EVA U2A16 mode (516 pins), RH850/U2A16 (516/373/292 pins)	RH850/U2A-EVA U2A8 mode (516 pins), RH850/U2A8 (373/292 pins), RH850/U2A6 (292/176/ 156/144 pins)	Meaning
i	i = 0 to 3	i = 0 to 1	Throughout this section, the core number is identified by the index “i”.
j	j = 0 to 10	j = 0 to 8	Throughout this section, the error number divided by 32 is identified by the index “j”.
k	k = 0 to 3	k = 0 to 1	Throughout this section, the external error input number is identified by the index “k”.
m	m = M, C		Throughout this section, the individual ECM Master and ECM Checker are identified by the index “m”.
n	n = 0 to 3	n = 0 to 1	Throughout this section, the Error trigger number is identified by the index “n”.

45.1.2 Register Base Addresses

ECM base addresses are listed in the following table.

ECM register addresses are given as offsets from the base addresses in general.

Table 45.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<ECMM_base>	FFD3 9000_H	P-Bus Group 3
<ECMC_base>	FFD3 $A000_H$	P-Bus Group 3
<ECM_base>	FFD3 8000_H	P-Bus Group 3

45.1.3 Clock Supply

Clock supply by and to ECM is listed in the following table.

Table 45.4 Clock Supply

Unit Name	Unit Clock Name	Clock Supply Name
ECM	PCLK	CLK_HSB
	cntclk*1	CLK_ECMCNT

Note 1. cntclk is used for delay timer and clear mask timer logics.

45.1.4 Interrupt Requests and Error Notifications

ECM interrupt requests are listed in the following table. The interrupt request signal is driven to the high level with a pulse width of one PCLK cycle when the error source status flag of an error source for which interrupt generation is enabled is set.

Table 45.5 Interrupt Requests

Interrupt symbol name	Unit Interrupt Signal	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
INTECMMI	INTECMMI	ECM maskable interrupt (EI level)	EIINT8	—	—
INTECMDCLSMI	INTECMDCLSMI *1	DCLS error interrupt (EI level)	EIINT9	—	—
FEINT	INTECMNMI	ECM maskable interrupt (FE level)	FEINT	—	—

Note 1. When DCLS function is disabled by Flash option byte setting, ECM does not generate DCLS error interrupt (EI level).

The error notifications of this module are listed in the following table.

Table 45.6 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
ECMmESET monitor	The status of ECMmESET.ECMmEST writing	2	—
ECMmESET0 monitor	The status of ECMmESET0.ECMmEST writing	3	—
ECMmESET1 monitor	The status of ECMmESET1.ECMmEST writing	4	—
ECMmESET2 monitor	The status of ECMmESET2.ECMmEST writing	5	—
ECMmESET3 monitor	The status of ECMmESET3.ECMmEST writing	6	—
Delay timer overflow for Error output	The status of the delay timer overflow for $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pins	11	—
ECM compare error	ECM redundant compare error	20	—
External Error Input 0	$\overline{\text{ERRORIN0}}$ through digital noise filter	184	—

45.1.5 Reset Sources

ECMM, ECMC and ECM reset sources are listed in the following table. ECMM, ECMC and ECM are initialized by these reset sources.

Table 45.7 Reset Sources (1/2)

Unit Name	Register Name	Reset condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
ECM Master Registers								
ECMM	ECM master error set trigger register	√	√	√	√	√	—	—
ECMM	ECM master error set trigger register n	√	√	√	√	√	—	—
ECMM	ECM master error clear trigger register	√	√	√	√	√	—	—
ECMM	ECM master error clear trigger register n	√	√	√	√	√	—	—
ECMM	ECM master error source status register j	√	—*1	—	—	√	—	—
ECM Checker Registers								
ECMC	ECM checker error set trigger register	√	√	√	√	√	—	—
ECMC	ECM checker error set trigger register n	√	√	√	√	√	—	—
ECMC	ECM checker error clear trigger register	√	√	√	√	√	—	—
ECMC	ECM checker error clear trigger register n	√	√	√	√	√	—	—
ECMC	ECM checker error source status register j	√	—*1	—	—	√	—	—
ECM Common Registers								
ECM	ECM error pulse configuration register	√	√	√	√	√	—	—
ECM	ECM interrupt type selection configuration register j	√	√	√	√	√	—	—
ECM	ECM interrupt notification configuration register i j	√	√	√	√	√	—	—
ECM	ECM internal reset configuration register j	√	√	√	√	√	—	—
ECM	ECM error mask register j	√	√	√	√	√	—	—
ECM	ECM error trigger n mask register j	√	√	√	√	√	—	—
ECM	ECM error source status clear register j	√	√	√	√	√	—	—
ECM	ECM key-code protection register	√	√	√	√	√	—	—
ECM	ECM pseudo error trigger register j	√	√	√	√	√	—	—
ECM	ECM delay timer control register	√	√	√	√	√	—	—

Table 45.7 Reset Sources (2/2)

Unit Name	Register Name	Reset condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
ECM	ECM delay timer register	√	√	√	√	√	—	—
ECM	ECM delay timer compare register	√	√	√	√	√	—	—
ECM	ECM delay timer configuration register j	√	√	√	√	√	—	—
ECM	ECM error output clear invalidation configuration register	√	√	√	—	√	—	—
ECM	ECM error trigger n clear invalidation configuration register	√	√	√	—	√	—	—
ECM	ECM pseudo error mask register	√	√	√	√	√	—	—

Note 1. When Primary VMON Reset occurred, the registers show undefined value.

45.1.6 External Input and Output Signals

External Input/output signals of ECM are listed below.

Table 45.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
$\overline{\text{ERROROUT\_M}}$	Error output master signal	$\overline{\text{ERROROUT\_M}}$
$\overline{\text{ERROROUT\_C}}$	Error output checker signal	$\overline{\text{ERROROUT\_C}}$
$\overline{\text{ERRORINk}}$	External error input signal k *1	$\overline{\text{ERRORINk}}$

Note 1. Digital noise filter must be configured before the function is used. For details of configuration, see **Section 2, Pin Functions**.

45.1.7 Internal Output Signals

Internal output signals of ECM are listed below.

Table 45.9 Internal Output Signals

Unit Signal Name	Description	Connected to
ERROROUTZ	Error trigger signal for Hi-Z control of PIC	PIC
ERROROUTnZ	Error trigger signal n for Port Safe State	Port
ECMRESZ	Internal reset generation signal	Reset Controller

45.2 Overview

45.2.1 Specification Overview

ECM (Error Control Module) collects error signals coming from different error sources and monitoring circuits. It also outputs error signals from the error pins ($\overline{\text{ERROROUT\_M}}$, $\overline{\text{ERROROUT\_C}}$) and generates interrupts and Error Control Module Reset signals. **Table 45.10** shows the specification overview of ECM.

Table 45.10 Specification Overview

Item	Description
Safety processing	ECM can handle the following processing in response to error signal inputs from individual modules. • Error flag set • Interrupt generation Either FE or EI level interrupt generation can be selected for individual errors. Notified CPU can be selected with one, multicast or broadcast for individual errors. If there is configuration that interrupt does not notify anywhere, it means interrupt generation is disable. • Internal reset generation System Reset 2 or Application Reset generation can be controlled (enabled/disabled) for individual errors. • Error pin output Pin output mask can be controlled (enabled/disabled) for individual errors. Output can be toggled in response to a timer input or made at a fixed level.
Error status	ECM incorporates error source status registers, which can be used to confirm the error status from the error flag. The error flags are only cleared by a Power On Reset, DeepSTOP Reset or writing to clear register. In case of System Reset 1, System Reset 2, Application Reset, Module Reset and JTAG Reset, the error flags are kept and the reset generation source can be confirmed by reading the status register after reset.
Debug, self-diagnosis	• Pseudo errors can be generated for debug and self-diagnosis. The operation during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the masking of the error pin output, interrupt, or Error Control Module Reset apply in the same way. • ECM incorporates a loop-back function of the error output pin ($\overline{\text{ERROROUT\_M}}$) that is used to diagnose the path to the error output pin. The status of the error output pin is reflected to an internal register and can be confirmed by reading the register.
Timeout function	ECM incorporates a function that generates an error output or Error Control Module Reset when the count value of the delay timer matches with the delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request.
Port safe state	Error triggers (ERROROUTnZ) connect to port safe state and ECM can control the state of general purpose I/O to a condition (Hi-Z) according to user configuration. For details of function, see **Section 2, Pin Functions**.
Register protection	A write-protection with a key code is implemented to protect registers from illegal write access. For details of function, see **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**.
Error output and Error triggers clear masking	ECM incorporates a function that can mask software clearance of Error output and Error triggers until the counter which is started from error occurrence reaches the value specified in the configuration registers. If another error occurs during time counting, then the time count is reset and restarted from 0.
Hi-Z control signal trigger into PIC	ECM triggers Hi-Z control signal into PIC. Hi-Z control signal (ERROROUTZ) is triggered at the same condition when ECM activates Error output pin. Regarding of enabling of Hi-Z control, see **Section 41, Peripheral Interconnect (PIC)**.
Others	ECM is duplexed. ECM incorporates the error output pin. Error output and Error triggers for Port Safe State from the ECM master and checker are constantly compared. If they do not match, an ECM compare error occurs.

45.2.2 Block Diagram

ECM is redundantly implemented using ECM Master and ECM Checker. See **Figure 45.1, Connection among ECM Master, ECM Checker and peripherals**, and **Figure 45.2, Structure of binding components**.

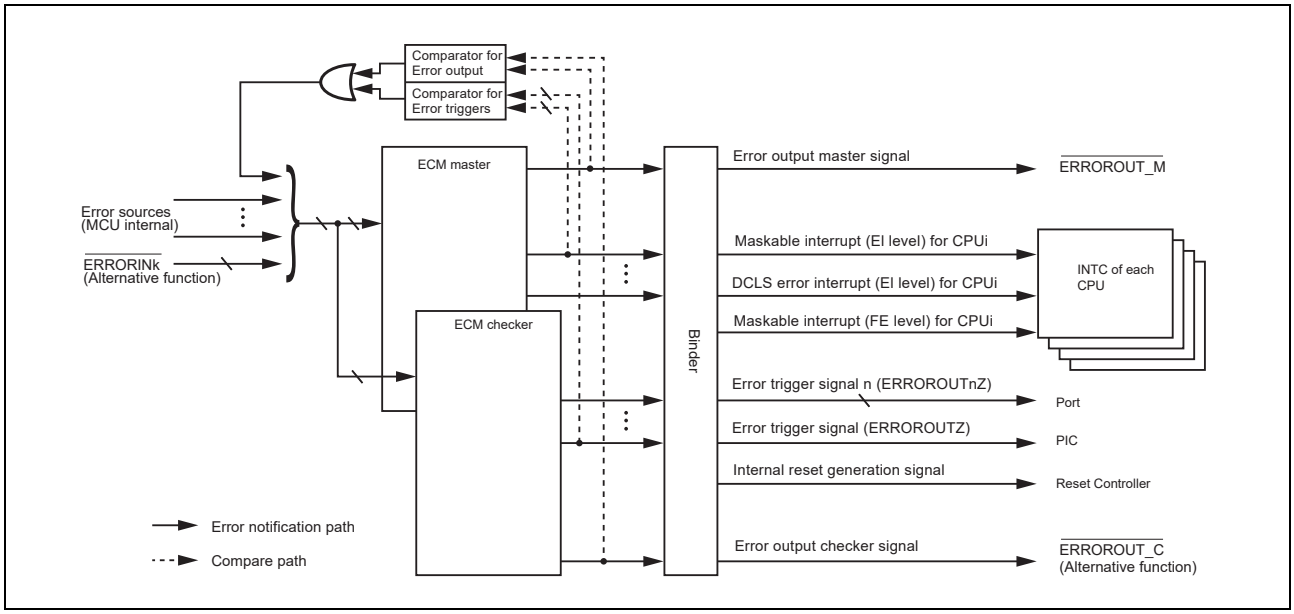

Figure 45.1 Connection among ECM Master, ECM Checker and peripherals

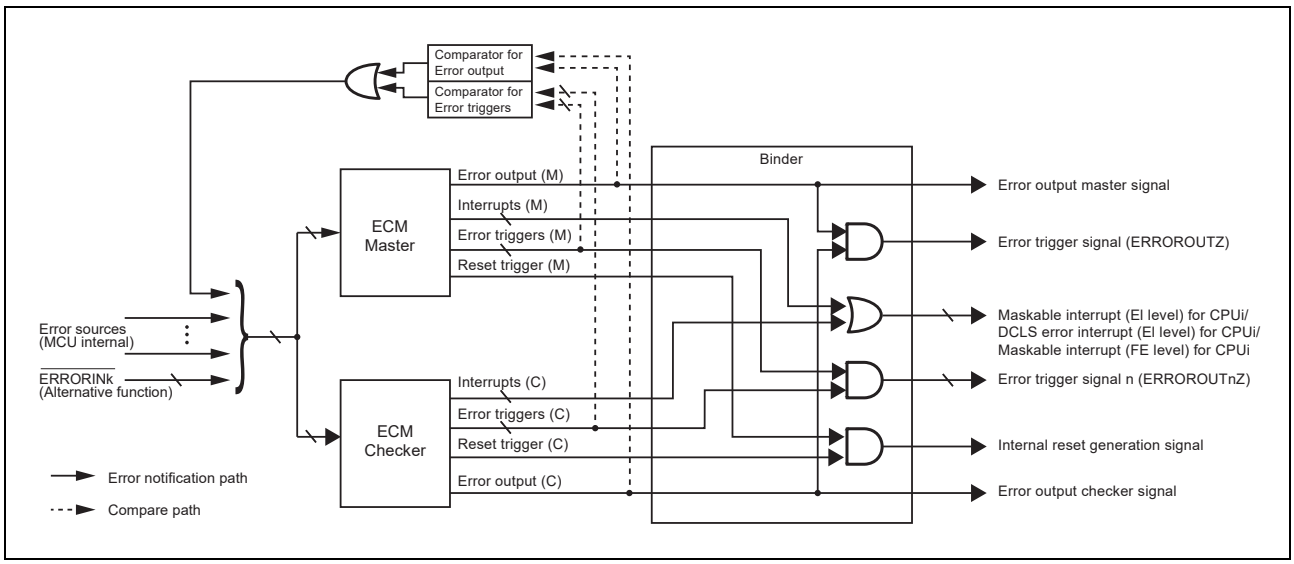

Figure 45.2 Structure of binding components

CAUTION

Pay attention to the difference in output voltage between the $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pins because different power supply systems are used for those pins.

$\overline{\text{ERROROUT\_M}}$ pin: E1VCC

$\overline{\text{ERROROUT\_C}}$ pin: GETH0RVCC for P3_8 [For U2AEVA, U2A16, U2A8 only]; E0VCC for P3_8 [For U2A6 (292 pins) only]; E0VCC for P4_13 and P5_3; E1VCC for P10_14

45.2.3 Error Input

Table 45.11 shows the error inputs to ECM.

"—": not covered
"√": covered
Gray hatching: its number is reserve bit.

Table 45.11 List of Error Inputs (1/22)

Note 1. Error trigger for Hi-Z control of PIC only is supported.

Note 2. Error trigger for Port Safe State only is supported.

Note 3. FACI reset transfer error/warning and BIST parameter transfer error have a possible to be flagged at the same time, when System Reset 1 occurs during reset sequence. Then FACI Reset Transfer Status registers and BIST result registers must be checked. For details of FACI Reset Transfer Status registers, see **Section 51, Flash Memory** and the detail of BIST result registers, see **Section 44, Functional Safety**. If FACI Reset Transfer Status registers have not detected any error information, FACI reset transfer error/warning can be recognized as pseudo error. If BIST has been confirmed to be correctly executed by checking of BIST result registers, BIST parameter transfer error can be recognized as pseudo error.

Note 4. The error input of CLMA3 may be detected in the initial state. For details, see **Section 14, Clock Monitor (CLMA)**.

Note 5. This module generates specific interrupts for Redundant lock step compare error when maskable interrupt (EI level) is selected. For details, see **45.2.12, DCLS Error Interrupt (EI Level) and EI Level Interrupt**.

Note 6. The internal reset generation is enabled in the initial state.

Note 7. ECM functions for an error handling can be used for debug purpose only. In other use cases, ECM functions must be disabled by related configuration registers.

Note 8. Before $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pins are cleared to high level, the error output of Data Access Error must be disabled by appropriate error output signal mask control bits which are described in **Section 45.3.11, ECMEMKj — ECM Error Mask Register j**.

45.2.4 Operations for Error Output

After reset release, the $\overline{\text{ERROROUT\_M}}$ pin outputs the low (error) level. Follow the procedure described in **Section 45.3.4, ECMmECLR — ECM Master/Checker Error Clear Trigger Register**, to clear the error before using ECM. As the $\overline{\text{ERROROUT\_C}}$ pin is multiplexed with a general-purpose port and other functions, select the $\overline{\text{ERROROUT\_C}}$ function before use. For settings, see **Section 2, Pin Functions**.

The error output can be configured for two different modes of operation, non-dynamic or dynamic.

The error output is in synchronization with the occurrence of error source conditions and the error level is output as the pin state regardless of the dynamic mode pulse cycle.

Error triggers connect to port safe state and ECM can control the state of general purpose I/O to safe state according to user configuration. For details of function, see **Section 2, Pin Functions**.

Table 45.12 Operation for Error Output

Error Status ECMmSSE	Operating Mode ECMEPCFG.ECMSL0 Bit	Error Output Operating Mode	Error Output Level*1	Error Trigger Level*1	Error Status
0	0	Non-dynamic	H	H	No error
	1	Dynamic	Toggles (according to timer input)	H	No error
1	0	Non-dynamic	L	L	Error
	1	Dynamic	L	L	Error

Note 1. The level of the error output ($\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$) can be masked by ECMEMKj registers and the level of the error trigger (ERROROUTnZ) can be masked by ECMETMKn_j registers.

45.2.5 $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ Behavior at Reset

Below table explains the behavior of the error output logic and the $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pins at reset. Also the level of the $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ signals during and after reset is explained.

Table 45.13 $\overline{\text{ERROROUT\_M}}$ Behavior at Reset

Category	Reset Condition						
	Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
$\overline{\text{ERROROUT\_M}}$ pin level during reset	Hi-Z	Hi-Z*1	Low level	Level according to error status before reset*2	Hi-Z	Level according to error status before reset	Level according to error status before reset
$\overline{\text{ERROROUT\_M}}$ pin level after reset	Low level	Low level	Low level	Level according to error status before reset*2	Low level	Level according to error status before reset	Level according to error status before reset

Note 1. In case of Debugger Disconnection Reset, $\overline{\text{ERROROUT\_M}}$ pin level during reset shows low level.

Note 2. The level of the $\overline{\text{ERROROUT\_M}}$ can be changed by clearing ECMEMKj registers at reset. To keep the level, it is necessary to clear the ECMMESSTRj bit which corresponds to ECMEMKj bit of setting which masked error output before reset.

Table 45.14 $\overline{\text{ERROROUT\_C}}$ Behavior at Reset

Category	Reset Condition						
	Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
$\overline{\text{ERROROUT\_C}}$ pin level during reset	Hi-Z	Hi-Z	Hi-Z	Hi-Z	Level according to error status before reset*1	Level according to error status before reset	Level according to error status before reset
$\overline{\text{ERROROUT\_C}}$ pin level after reset	Hi-Z	Hi-Z	Hi-Z	Hi-Z	Level according to error status before reset*1	Level according to error status before reset	Level according to error status before reset

Note 1. The pin level is kept with I/O hold state function. Port alternative function for $\overline{\text{ERROROUT\_C}}$ has to be reconfigured before releasing I/O hold state, if low level output needs to be kept.

45.2.5.1 Dynamic Mode Enable

1. Initialize the related timer OSTM0.
2. Set the error output to high level by setting ECMmECT bit in ECM master/checker error clear trigger register to 1.
3. Set ECMEPCFG.ECMSL0 bit to 1 for dynamic mode.
4. Start the timer OSTM0.

45.2.5.2 Dynamic Mode Disable

1. Set the error output to low level by setting ECMmEST bit in ECM master/checker error set trigger register to 1.
2. Stop the timer OSTM0.
3. Clear ECMSL0 bit in ECM error pulse configuration register to 0 to specify non-dynamic mode.

45.2.6 Loop-Back Function

ECM incorporates a loop-back function that is used to check the path to the error output pin ($\overline{\text{ERROROUT\_M}}$). The output level of the error output pin can be checked with ECMmSSE0_0 bit in ECM master/checker error source status register 0.

45.2.7 Pseudo Error Generation

ECM incorporates a function that can generate pseudo errors for test or debug purposes. The operation of the ECM during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for error masks, interrupt, internal reset, or delay timer apply in the same way.

45.2.8 Error Status

The error status is indicated by ECM master/checker error source status registers. The error status is only cleared by Power On reset, DeepSTOP reset or writing to ECMESSTCj. In case of reset except for Power On reset and DeepSTOP reset, the error status is kept and the error that triggered the reset can be confirmed by reading the ECM master/checker error source status registers after reset release.

45.2.9 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.

By releasing the protection of ECMKCPROT, it can be written. For details, see **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**.

45.2.10 Timeout Function for Interrupt Processing

The delay timer incorporated in ECM can be started simultaneously with the occurrence of an interrupt request. ECM incorporates a function that generates an error output or Error Control Module Reset when the count value of the delay timer matches with the value of the delay timer compare register because the delay timer was not stopped during the interrupt processing. The timer counting is not stopped when a break occurs.

The counting of the delay timer always starts from 0. Configure the duration until an Error Control Module Reset or error output is generated with the settings of the delay timer compare register.

In response to the occurrence of a new error source condition with the setting to start the delay timer while the delay timer is operating, the counter value of the delay timer which is currently operating is not reset. Instead, counting by the timer continues.

45.2.11 Masking of error clear trigger registers

The active error output/error triggers status must be cleared by software via the Error clear trigger registers (ECMMECLR/ECMMECLRn/ECMCECLR/ECMCECLRn). A minimum activation time of the error output is achieved by the Error output clear invalidation counter. This counter is (re)started each time a new error event is triggered at the ECM. It counts up from 00 0000_H to FF $FFFF_H$. Error output clear by software is not possible unless this counter reaches the compare value configured in ECMEOCCFG/ECMETCCFGn register. If Error output/trigger clear invalidation counter is still running, Error output/trigger clear is masked and Error output/trigger clear request by software is ignored.

45.2.12 DCLS Error Interrupt (EI Level) and EI Level Interrupt

This module can generate specific interrupts of DCLS error for each CPU. When DCLS error for a certain PE is occurred in the state of setting Maskable (EI level) interrupt by ECMISCFGj register and interrupt generation enabled by ECMINCFGi_j register, DCLS error interrupt is generated to the PE and EI level interrupt is generated to other PEs. The following figure shows the generation logic of DCLS error interrupt and EI level interrupt from ECM. For each CPUi, EI level interrupt of CPUi is generated by EI level interrupt from ECM master, ECM checker and other DCLS error interrupt except self's DCLS error interrupt being OR-ed.

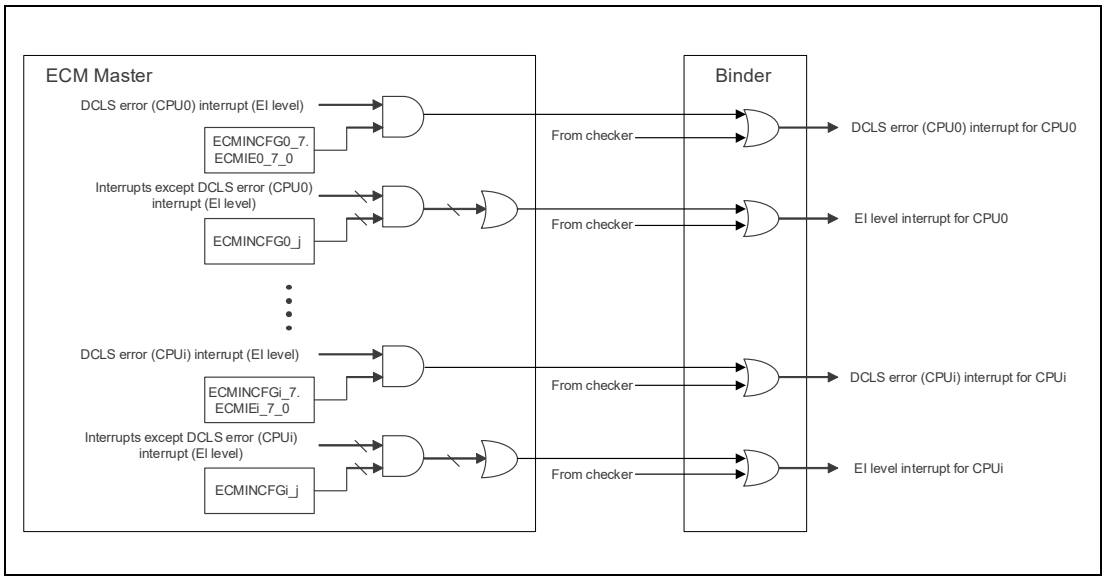

Figure 45.3 DCLS Error Interrupt (EI Level) and EI Level Interrupt

45.3 Register Specification

45.3.1 List of Registers

ECM consists of three address areas: ECM master, ECM checker, ECM common.

The following shows the register map of the ECM master and checker registers.

Table 45.15 Address List of ECM Master and Checker Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECM Master Registers <ECMM_base: FFD3 9000_H>						
ECMM	ECM master error set trigger register	ECMMESET	<ECMM_base> + 000_H	32	PBG30#12	ECMKCPROT
ECMM	ECM master error set trigger register n	ECMMESETn	<ECMM_base> + 008_H to 020_H	32	PBG30#12	ECMKCPROT
ECMM	ECM master error clear trigger register	ECMMECLR	<ECMM_base> + 004_H	32	PBG30#12	ECMKCPROT
ECMM	ECM master error clear trigger register n	ECMMECLRn	<ECMM_base> + $00C_H$ to 024_H	32	PBG30#12	ECMKCPROT
ECMM	ECM master error source status register j	ECMMESSTRj	<ECMM_base> + 048_H to 070_H	32	PBG30#12	—
ECM Checker Registers <ECMC_base: FFD3 $A000_H$>						
ECMC	ECM checker error set trigger register	ECMCESET	<ECMC_base> + 000_H	32	PBG30#12	ECMKCPROT
ECMC	ECM checker error set trigger register n	ECMCESETn	<ECMC_base> + 008_H to 020_H	32	PBG30#12	ECMKCPROT
ECMC	ECM checker error clear trigger register	ECMCECLR	<ECMC_base> + 004_H	32	PBG30#12	ECMKCPROT
ECMC	ECM checker error clear trigger register n	ECMCECLRn	<ECMC_base> + $00C_H$ to 024_H	32	PBG30#12	ECMKCPROT
ECMC	ECM checker error source status register j	ECMCESSTRj	<ECMC_base> + 048_H to 070_H	32	PBG30#12	—

The following shows the register map of the ECM common registers.

Table 45.16 Address List of ECM Common Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
ECM Common Registers <ECM_base: FFD3 8000_H>						
ECM	ECM error pulse configuration register	ECMEPCFG	<ECM_base> + 000_H	32	PBG30#12	ECMKCPROT
ECM	ECM interrupt type selection configuration register j	ECMISCFGj	<ECM_base> + 004_H to $02C_H$	32	PBG30#12	ECMKCPROT
ECM	ECM interrupt notification configuration register i_j	ECMINCFGi_j	<ECM_base> + 040_H to $011C_H$	32	PBG30#12	ECMKCPROT
ECM	ECM internal reset configuration register j	ECMIRCFGj	<ECM_base> + 220_H to 248_H	32	PBG30#12	ECMKCPROT
ECM	ECM error mask register j	ECMEMKj	<ECM_base> + $25C_H$ to 284_H	32	PBG30#12	ECMKCPROT
ECM	ECM error trigger n mask register j	ECMETMKn_j	<ECM_base> + 298_H to 374_H	32	PBG30#12	ECMKCPROT
ECM	ECM error source status clear trigger register j	ECMESSTCj	<ECM_base> + 478_H to $4A0_H$	32	PBG30#12	ECMKCPROT
ECM	ECM key code protection register	ECMKCPROT	<ECM_base> + $4B4_H$	32	PBG30#12	—
ECM	ECM pseudo error trigger register j	ECMPEj	<ECM_base> + $4B8_H$ to $4E0_H$	32	PBG30#12	ECMKCPROT
ECM	ECM delay timer control register	ECMDTMCTL	<ECM_base> + $4F4_H$	32	PBG30#12	ECMKCPROT
ECM	ECM delay timer register	ECMDTMR	<ECM_base> + $4F8_H$	32	PBG30#12	—
ECM	ECM delay timer compare register	ECMDTMCMP	<ECM_base> + $4FC_H$	32	PBG30#12	ECMKCPROT
ECM	ECM delay timer configuration register j	ECMDTMCFGj	<ECM_base> + 500_H to 528H	32	PBG30#12	ECMKCPROT
ECM	ECM error output clear invalidation configuration register	ECMEOCCFG	<ECM_base> + $71C_H$	32	PBG30#12	ECMKCPROT
ECM	ECM error trigger n clear invalidation configuration register	ECMETCCFGn	<ECM_base> + 720_H to $72C_H$	32	PBG30#12	ECMKCPROT
ECM	ECM pseudo error mask register	ECMPEM	<ECM_base> + 740_H	32	PBG30#12	—

The register areas of the ECM registers are common to the redundancy area to be implemented. Writes to the common register areas are conducted simultaneously. The common area for ECM master is read by reading access to the common area. The ECM master register and the ECM checker register represent the address areas which can be written separately.

CAUTION

The register bit related to reserved function and reserved error shown by "—" in Table 45.11, List of Error Inputs must not be configured and register access must follow "When reading, the value after reset is read. When writing, write the value after reset".

45.3.2 ECMmESET — ECM Master/Checker Error Set Trigger Register

The ECM master/checker error set trigger register is for setting the error signal from the error pin to the low level. When ECMmEST bit is set to 1, the error pin outputs the low level. The output cannot be masked. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register** for details of key code protection. This register is always read as $0000\ 0000_H$.

Access: This register is a write-only register that can be written in 32-bit units.

Address: ECMMESET: <ECMM_base> + 000_H
ECMCESET: <ECMC_base> + 000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECMmEST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 45.17 ECMmESET Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	ECMmEST	Error set trigger bit 0: Writing 0 is invalid 1: Sets the output level from the error pin to the active (low) level.

CAUTIONS

Setting the error output from the $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pins via ECMmESET register will set ECMmSSE0_20 bit of ECMmESSTR0 register (ECM compare error). Therefore, ECMmESET register has to be set following the sequence below.

1. Set MSKM bit and MSKC bit of ECMPEM register to “masked”.
2. Set ECMmEST bit in ECMmESET register.
3. Wait until $\overline{\text{ERROROUT\_M}}$ become low by checking that ECMmSSE0_0 bit of ECMmESSTR0 register is "0” and $\overline{\text{ERROROUT\_C}}$ become low by checking that PPR bit of the port register is "0”.
4. Set MSKM bit and MSKC bit of ECMPEM register to “not masked”.

45.3.3 ECMmESETn — ECM Master/Checker Error Set Trigger Register n

The ECM master/checker error set trigger register is for triggering the port safe state function. When ECMmEST bit is set to 1, the configured pins with port register enters the safe state. When error trigger is set, each port state will be changed to safe state according to user's setting. Regarding to port side setting, refer to **Section 2, Pin Functions**. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register** for details of key code protection. This register is always read as $0000\ 0000_H$.

Access: This register is a write-only register that can be written in 32-bit units.

Address: ECMMESETn: <ECMM_base> + n × 8_H + 008_H
ECMCESETn: <ECMC_base> + n × 8_H + 008_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECMmEST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 45.18 ECMmESETn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	ECMmEST	Error set trigger bit 0: Writing 0 is invalid 1: Triggers to enter the port safe state.

CAUTIONS

Setting the error trigger via ECMmESETn register will set ECMmSSE0_20 bit of ECMmESSTR0 register (ECM compare error). Therefore, ECMmESETn register has to be set following the sequence below.

1. Set MSKM bit and MSKC bit of ECMPEM register to "masked".
2. Set ECMmEST bit in ECMmESETn register.
3. Wait until pin level become expected value by checking that PPR bit of the port register is "0" or "1".
4. Set MSKM bit and MSKC bit of ECMPEM register to "not masked".

45.3.4 ECMmECLR — ECM Master/Checker Error Clear Trigger Register

The ECM master/checker error clear trigger register is for setting the error signal from the error pin to the high level (toggle). When the ECMmECT bit is set to 1, the error pin outputs the high level (toggle) as long as there are no other sources that set the error pin to the low level. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register** for details of key code protection. This register is always read as $0000\ 0000_H$.

Access: This register is a write-only register that can be written in 32-bit units.

Address: ECMMECLR: <ECMM_base> + 004_H
ECMCECLR: <ECMC_base> + 004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECMm ECT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 45.19 ECMmECLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	ECMmECT	Error clear trigger bit 0: Writing 0 is invalid 1: Sets the output level from the error pin to the inactive (high) level.

CAUTIONS

Clearing of the error output pin is only possible if all errors, not masked by ECMEMKj registers, are cleared beforehand.

Clearing the error output via ECMmECLR register will set ECMmSSE0_20 bit of ECMmESSTR0 register (ECM compare error). Therefore, ECMmECLR register has to be set following the sequence below.

1. Set MSKM bit and MSKC bit of ECMPEM register to “masked”.
2. Set ECMmECT bit in ECMmECLR register.
3. Wait until $\overline{\text{ERROROUT\_M}}$ become high by reading ECMmSSE0_0 bit of ECMmESSTR0 register 5 times and $\overline{\text{ERROROUT\_C}}$ become high by reading PPR bit of the port register 5 times. After that, check that ECMmSSE0_0 bit of ECMmESSTR0 register and PPR bit of the port register are “1”. If ECMmSSE0_0 bit of ECMmESSTR0 register and PPR bit of the port register are not “1”, a new error may have occurred.
4. Set MSKM bit and MSKC bit of ECMPEM register to “not masked”.

Note: This procedure is used when ECMEOCCFG register is not set. If the Error output invalidation counter is still running, the Error output clear function is masked and Error output clear requests are ignored. Error output clear function is executed, after the Error output invalidation counter has expired and the Error output clear register is written.

45.3.5 ECMmECLRn — ECM Master/Checker Error Clear Trigger Register n

The ECM master/checker error clear trigger register is for clearing the port safe state function. When ECMmECT bit is set to 1, the configured pins with port register release from port safe state as long as there are no other sources that set to enter the port safe state. For the configuration flow of port safe state mode setting, see **Section 2.6.5, Port Safe State Function Setting**. For the configuration flow of port safe state mode setting, see **Section 2, Pin Functions**. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register** for details of key code protection. This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: ECMMECLRn: <ECMM_base> + n × 8_H + $00C_H$
ECMCECLRn: <ECMC_base> + n × 8_H + $00C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECMmECT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 45.20 ECMmECLRn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	ECMmECT	Error clear trigger bit 0: Writing 0 is invalid 1: Releases from the port safe state.

CAUTIONS

Clearing of the error triggers is only possible if all errors, not masked by ECMETMKn_j registers, are cleared beforehand.

Clearing the error triggers via ECMmECLRn registers will set ECMmSSE0_20 bit of ECMmESSTR0 register (ECM compare error). Therefore, ECMmECLRn registers have to be set following the sequence below.

1. Set MSKM bit and MSKC bit of ECMPEM register to “masked”.
2. Set ECMmECT bit in ECMmECLRn register.
3. Wait until pin level become expected value by reading PPR bit of the port register. After that, check that PPR bit of the port register is "0" or "1". If PPR bit of the port register is not expected value, a new error may have occurred.
4. Set MSKM bit and MSKC bit of ECMPEM register to “not masked”.

Note: This procedure is used when ECMETCCFGn register is not set. If the Error trigger invalidation counter is still running, the Error trigger clear function is masked and Error trigger clear requests are ignored. Error trigger clear function is executed, after the Error trigger invalidation counter has expired and the Error trigger clear register is written.

45.3.6 ECMmESSTRj — ECM Master/Checker Error Source Status Register j

The ECM master/checker error source status register is read-only register.

This register represents the status of individual internal error sources, and is unrelated to the setting of the error mask.

ECMmSSEs are provided for the each status of individual internal error sources.

Access: This register is a read-only register that can be read in 32-bit units.

Address: ECMMESSTRj: <ECMM_base> + j × 4_H + 048_H
ECMCESSTRj: <ECMC_base> + j × 4_H + 048_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 45.21 ECMmESSTRj Register Contents*1

Bit Position	Bit Name	Function
31 to 0	ECMmSSEj_31 to ECMmSSEj_0	Error source status bit ECMmSSEj_31 to ECMmSSEj_0 correspond to error sources [j × 32 + 31] to [j × 32 + 0]. 0: Error not occurred 1: Error occurred

Note 1. ECMmESSTR0.ECMmSSE0_0 shows the status of the $\overline{\text{ERROROUT\_M}}$ pin.

45.3.7 ECMEPCFG — ECM Error Pulse Configuration Register

The ECM error pulse configuration register is a read/write register. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + $0000\ 0000_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 45.22 ECMEPCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECMSL0	Error pin operation configuration bit Error output operation setting for the error pin 0: Non-dynamic mode 1: Dynamic mode*1

Note 1. In Dynamic mode the timer output OSTM0 determines the output wave of the $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pin in case of no error.

CAUTION

After setting the dynamic mode, it is recommended not to change to non-dynamic mode again, because this can cause a glitch in the error output.

45.3.8 ECMISCFGj — ECM Interrupt type Selection Configuration Register j

The ECM interrupt type selection configuration register is used to select the generation type of INTECMMI and INTECMDCLSMI interrupts (EI level interrupt), or INTECMNMI interrupt (FE level interrupt). Writing to these registers are protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + j × 4_H + 004_H

Value after reset: $0000\ 0000_H$

ECMISCFG0 to ECMISCFG6

45.3.9 ECMINCFGi_j — ECM Interrupt Notification Configuration Register i j

The ECM interrupt notification configuration register is used to set the notification of interrupt. This register is prepared for each core and the interrupt generation enable/disable of each error can be configured. This register must be set after configure ECMISCFGj register, otherwise ECM will notify to each CPUs with different interrupt type in case of error is detected during ECM configuration for interrupt. Writing to these registers are protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + i × $3C_H$ + j × 4_H + 040_H

Value after reset: 0000 0000_H

45.3.11 ECMEMKj — ECM Error Mask Register j

The ECM error mask register is used to mask the individual error sources of the error pin output. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + j × 4_H + $25C_H$

Value after reset: 0000 0000_H

45.3.13 ECMESSTCj — ECM Error Source Status Clear Trigger Register j

The ECM error source status clear trigger register is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <ECM_base> + j × 4_H + 478_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 45.32 ECMESSTCj Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMCLSSEj_31 to ECMCLSSEj_0	ECM error status clear bit ECMCLSSEj_31 to ECMCLSSEj_0 correspond to ECMmSSEj_31 to ECMmSSEj_0. 0: Corresponding error status unchanged 1: Corresponding error status cleared

45.3.14 ECMKCPROT — ECM Key Code Protection Register

The ECM key code protection register is used for protection against writing operation to the configuration registers.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + $4B4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 45.33 ECMKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]	Enable or disable modification of the KCE bit. The written value is not retained. These bits are always read as 0.*1
0	KCE	Key Code Enable bit 0: Disable write access to protected registers 1: Enable write access to protected registers

Note 1. Write $A5A5A500_H$ to this register to disable writing protected registers.
Write $A5A5A501_H$ to this register to enable writing protected registers.

45.3.15 ECMPEj — ECM Pseudo Error Trigger Register j

The ECM pseudo error trigger register is write-only register. This register is used to generate a error for Software alarm 0 to 3 (Error number 192 to 195) and a pseudo error for test purpose. The ECM operation in response to the generation of a pseudo error is identical to that of a real error source. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <ECM_base> + j × 4_H + $4B8_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 45.34 ECMPEj Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMPEj_31 to ECMPEj_0	ECM pseudo error trigger bit ECMPEj_31 to ECMPEj_0 correspond to error sources [j × 32 + 31] to [j × 32 + 0]. 0: Pseudo error is not generated. 1: Pseudo error is generated.

45.3.16 ECMDTMCTL — ECM Delay Timer Control Register

The ECM delay timer control register is a read/write register. This register is used to control the delay timer. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + $4F4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DTMSTACNTCLK	—	—	DTMSTP	DTMSTA
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R/W

Table 45.35 ECMDTMCTL Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	DTMSTACNTCLK	Delay timer start confirmation status. 0: Delay timer does not start 1: Delay timer starts.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DTMSTP	Delay timer stop bit By writing “1” to this bit, delay timer is stopped (writing 0 is ignored). Simultaneously, DTMSTA bit will be 0. 0: Delay timer is completed or stop request is not in progress. 1: Stop request for delay timer is in progress.
0	DTMSTA	Delay timer start bit Specifies the operation of the delay timer at the occurrence of an error event. 0: Delay timer does not start 1: Delay timer starts

CAUTIONS

1. **ECMDTMCTL register can be accessed via P-Bus but delay timer runs with not P-Bus clock but dedicated counter clock.**
   Therefore, time lag exists between writing of ECMDTMCTL and enabling of delay timer.
   DTMSTACNTCLK can be used to confirm whether delay timer is enabled or not.
   Reconfirm that DTMSTA has been updated by checking DTMSTACNTCLK after writing to DTMSTA.
2. **ECMDTMCTL register can be written only when (DTMSTA, DTMSTACNTCLK) = (0, 0) or (1, 1).**
   Confirm the values of DTMSTA and DTMSTACNTCLK before writing to ECMDTMCTL.
3. **The delay timer needs 3 clocks of cntclk until it stops an overflow certainly. Consider to set the sufficient value to ECMDTMCMP[23:0].**

45.3.17 ECMDTMR — ECM Delay Timer Register

The ECM delay timer register is a read-only register. The ECM delay timer register is initialized by setting the DTMSTA bit of the ECM delay timer control register from 1 (timer in operation) to 0 (timer stopped).

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ECM_base> + $4F8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ECMDTMR[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.36 ECMDTMR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned.
23 to 0	ECMDTMR[23:0]	Delay timer counter value.

45.3.18 ECMDTMCMP — ECM Delay Timer Compare Register

The ECM delay timer compare register is a read/write register. ECMmESSTR0.ECMmSSE0_11 bit is set according to configuration of ECMDTMCFGj register when the value of this registers matches with the value of the ECM delay timer register.

Writing data to this register has to be conducted while the delay timer is stopped. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + $4FC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CMPW	ECMDTMCMP[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.37 ECMDTMCMP Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CMPW	Indicates whether a write to the counter clock region of ECMDTMCMP register setting is in progress 0: Not in progress 1: In progress. While the bit is set, further setting to ECMDTMCMP is prohibited.
23 to 0	ECMDTMCMP[23:0]	Delay timer compare value

CAUTIONS

1. **ECMDTMCMP register is set via P-bus, however actual delay timer exists in a different clock domain. When ECMDTMCMP is configured, the value is copied across clock domains to reflect to the delay timer, which takes a certain time. CMPW indicates whether reflecting the new ECMDTMCMP value across clock domains is in progress.**
2. **While CMPW is "1", further setting to ECMDTMCMP is ignored. Confirm CMPW = 0, before writing of ECMDTMCMP.**

45.3.19 ECMDTMCFGj — ECM Delay Timer Configuration Register j

The ECM delay timer configuration register is a read/write register. This register is used to set enable/disable of the delay timer start caused by either EI level interrupt or FE level interrupt configured to ECMINCFGi_j and ECMISCFGj registers in response to errors. When delay timer overflow occurs, delay timer overflow event (error factor #11) is raised according to this register configuration. Writing data to this register has to be conducted while the delay timer is stopped. Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + j × 4_H + 500_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECMDTMEj_31	ECMDTMEj_30	ECMDTMEj_29	ECMDTMEj_28	ECMDTMEj_27	ECMDTMEj_26	ECMDTMEj_25	ECMDTMEj_24	ECMDTMEj_23	ECMDTMEj_22	ECMDTMEj_21	ECMDTMEj_20	ECMDTMEj_19	ECMDTMEj_18	ECMDTMEj_17	ECMDTMEj_16

45.3.20 ECMEOCCFG — ECM Error Output Clear Invalidation Configuration Register

This register is a read/write register and can be written in 32-bit units.

After counter for Error Output clear invalidation exceed the value which is configured to this register, it is possible to clear non-safe status of error output by SW.

Configure to this register only if error output status is safe.

Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + $71C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 45.39 ECMEOCCFG Register Contents

Bit Position	Bit Name	Function
31	EOCIEN	Error Output Clear Invalidation Function Enabled 0: Disabled 1: Enabled
30 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CMPW	Indicates on execution of ECMEOUTCLRT[23:0] register setting to counter clock domain 0: Not in progress 1: In progress. While the bit is set, further setting to the ECMEOUTCLRT is prohibited.
23 to 0	ECMEOUTCLRT [23:0]	The number of clock cycles after which it is possible to clear error output by SW.

CAUTIONS

1. **ECMEOCCFG register is set via P-bus, however actual "output clear invalidation counter" exists in a different clock domain. When ECMEOCCFG is configured, the value is copied across clock domains to reflect to the counter, which takes a certain time. CMPW indicates whether the reflection across clock domains is in progress.**
2. **While CMPW is "1", writing of ECMEOUTCLRT[23:0] is ignored. Confirm CMPW = 0 before writing of ECMEOUTCLRT[23:0].**

45.3.21 ECMETCCFGn — ECM Error Trigger n Clear Invalidation Configuration Register

This register is a read/write register and can be written in 32-bit units.

After counter for Error trigger n clear invalidation exceed the value which is configured to this register, it is possible to clear non-safe status of error trigger by SW.

Configure to this register only if error trigger status is safe.

Writing to this register is protected by ECMKCPROT. Refer to **Section 45.3.14, ECMKCPROT — ECM Key Code Protection Register**, for details of key code protection.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + n × 4_H + 720_H

Value after reset: 0000 0000_H

23 to 0	ECMETRGCLRT [23:0]	The number of clock cycles after which it is possible to clear error trigger by SW.

CAUTIONS

1. **ECMETCCFGn register is set via P-bus, however actual "trigger clear invalidation counter" exists in a different clock domain. When ECMETCCFGn is configured, the value is copied across clock domains to reflect to the counter, which takes a certain time. CMPW indicates whether the reflection across clock domains is in progress.**
2. **While CMPW is "1", writing of ECMETRGCLRT[23:0] is ignored. Confirm CMPW = 0 before writing of ECMETRGCLRT[23:0].**

45.3.22 ECMPEM — ECM Pseudo Error Mask Register

This register can mask the pseudo error of "ECM compare error" to support self-diagnosis of the binding components for $\overline{\text{ERROROUT\_M}}$ and $\overline{\text{ERROROUT\_C}}$ pins and Error triggers.

Access: This register can be read or written in 32-bit units.

Address: <ECM_base> + 740_H

Value after reset: $0000\ 0000_H$

1	MSKM	0: Pseudo error of "ECM compare error" for ECM master is NOT masked. 1: Pseudo error of "ECM compare error" for ECM master is masked.
0	MSKC	0: Pseudo error of "ECM compare error" for ECM checker is NOT masked. 1: Pseudo error of "ECM compare error" for ECM checker is masked.

Section 46 Data CRC Function K (KCRC)

This section contains a generic description of the Data CRC Function K (KCRC). The first part of this section describes all RH850/U2A-EVA specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the KCRC.

46.1 Feature

46.1.1 Number of Units and Channels

This microcontroller has the following number of KCRC units.

Table 46.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)
Name	KCRCn									

Table 46.2 Index

Index	Description
n	Throughout this section, the individual KCRC units are identified by the index “n” (n = 0 to 7). For example, KCRCnCTL indicates the KCRCn control register.

46.1.2 Register Base Addresses

KCRCn base addresses are listed in the following table. KCRCn register addresses are given as offsets from the base addresses in general.

Table 46.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<KCRC0_base>	FFD3 4000_H	Peripheral Group 3
<KCRC1_base>	FFBF $F400_H$	Peripheral Group 5
<KCRC2_base>	FFD3 5000_H	Peripheral Group 3
<KCRC3_base>	FFBF $F700_H$	Peripheral Group 5
<KCRC4_base>	FFD3 6000_H	Peripheral Group 3
<KCRC5_base>	FFBF $FA00_H$	Peripheral Group 5
<KCRC6_base>	FFD3 7000_H	Peripheral Group 3
<KCRC7_base>	FFBF $FD00_H$	Peripheral Group 5

46.1.3 Clock Supply

Table 46.4 Clock Supply

Unit Name	Unit Clock Name	Clock Supply Name	Description
KCRCn	KCRC module clock	CLK_HSB	Operation clock
	Register access clock	CLK_HSB	Bus clock

For details of clock supply, see **Section 13, Clock Controller**.

46.1.4 Interrupt, DMA/DTS Requests and Error Notifications

This module has no interrupt and DMA/DTS requests.

This module has no error notifications.

46.1.5 Reset Sources

KCRCn reset sources are shown below. KCRCn is initialized by the following reset sources.

Table 46.5 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
KCRCn	All registers	√	√	√	√	√	—	—

For details of reset source, see **Section 9, Reset Controller**.

46.1.6 External Input/Output Signals

This module has no external input/output signals.

46.2 Overview

46.2.1 Functional Overview

The Data CRC Function K can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- Supported CRC polynomials (For details, refer to **Table 46.16, Setting Table**)
  - 64-bit CRC64ECMA
    $42F0E1EB\ A9EA3693_H$: $X^{64}+ X^{62}+ X^{57}+ X^{55}+ X^{54}+ X^{53}+ X^{52}+ X^{47}+ X^{46}+ X^{45}+ X^{40}+ X^{39}+ X^{38}+ X^{37}+ X^{35}+ X^{33}+ X^{32}+ X^{31}+ X^{29}+ X^{27}+ X^{24}+ X^{23}+ X^{22}+ X^{21}+ X^{19}+ X^{17}+ X^{13}+ X^{12}+ X^{10}+ X^{9}+ X^{7}+ X^{4}+ X+ 1$
  - 32-bit CRC32P4
    $F4ACFB13_H$: $X^{32}+ X^{31}+ X^{30}+ X^{29}+ X^{28}+ X^{26}+ X^{23}+ X^{21}+ X^{19}+ X^{18}+ X^{15}+ X^{14}+ X^{13}+ X^{12}+ X^{11}+ X^{9}+ X^{8}+ X^{4}+ X+ 1$
  - 32-bit Ethernet CRC
    $04C1\ 1DB7_H$: $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^{8} + X^{7} + X^{5} + X^{4} + X^{2} + X + 1$
  - 32-bit CRC32 Reversed Polynomial
    $EDB88320_H$: $X^{32}+ X^{31}+ X^{30}+ X^{29}+ X^{27}+ X^{26}+ X^{24}+ X^{23}+ X^{21}+ X^{20}+ X^{19}+ X^{15}+ X^{9}+ X^{8}+ X^{5}+ 1$
  - 32-bit CRC32C (Castagnoli)
    $1EDC\ 6F41_H$: $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^{9} + X^{8} + X^{6} + 1$
  - 16-bit CCITT CRC
    1021_H: $X^{16} + X^{12} + X^{5} + 1$
  - 16-bit Baicheva00
    $90D9_H$: $X^{16} + X^{15} + X^{12} + X^{7} + X^{6} + X^{4} + X^{3} + 1$
  - 15-bit CRC15CAN
    4599_H: $X^{15}+ X^{14}+ X^{10}+ X^{8}+ X^{7}+ X^{4}+ X^{3}+ 1$
  - 16-bit ARC
    8005_H: $X^{16}+ X^{15}+ X^{2}+ 1$
  - 8-bit SAE J1850 CRC
    $1D_H$: $X^{8} + X^{4} + X^{3} + X^{2} + 1$
  - 8-bit 0x2F CRC
    $2F_H$: $X^{8} + X^{5} + X^{3} + X^{2} + X + 1$
- Selectable input data size. (8/16/32-bit)
- Supported Reflection of Input data.
- Supported Reflection of Output data.
- Supported Reflection of Polynomial.
- Supported XOR Mask of output data.
- CRC generation to an arbitrary data block length by register.
- After initialization of the KCRC data register, every write access to the KCRC input register generates a new CRC according to the chosen polynomial and the result is stored in the KCRC data register.
- Supported AUTOSAR 4.3.0.

46.2.2 Block Diagram

The following figure shows the block diagram of the Data CRC Function K.

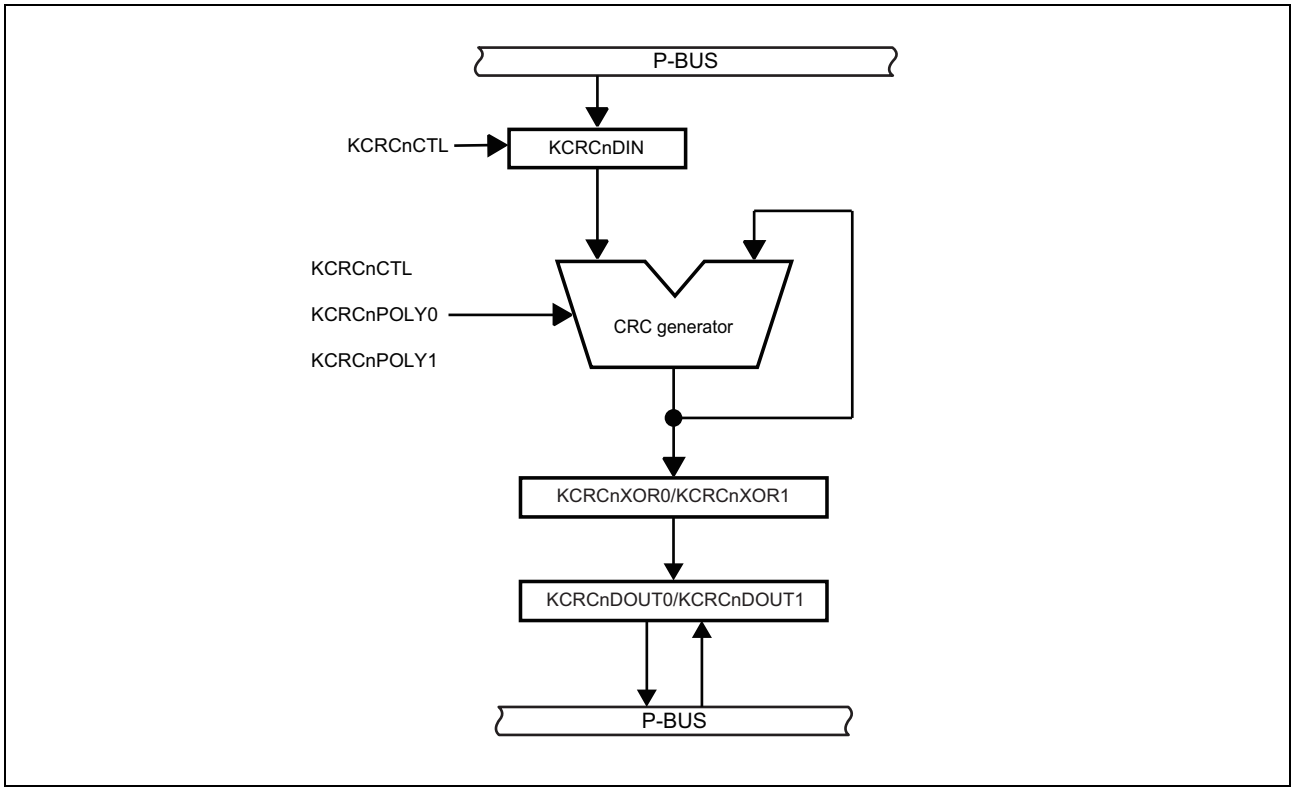

Figure 46.1 Block Diagram of Data CRC Function K

46.3 Registers

46.3.1 List of Registers

KCRC registers are listed in the table below.

For details about <KCRCn_base>, see **Section 46.1.2, Register Base Addresses**.

Table 46.6 List of Registers

Module Name	Register Name	Symbol	Address	Access Protection	
				PBG	Other
KCRCn	KCRCn data input register	KCRCnDIN	<KCRCn_base> + 00_H	*1	—
	KCRCn data output register (Lower)	KCRCnDOUT0	<KCRCn_base> + 80_H	*1	—
	KCRCn data output register (Upper)	KCRCnDOUT1	<KCRCn_base> + 84_H	*1	—
	KCRCn control register	KCRCnCTL	<KCRCn_base> + 90_H	*1	—
	KCRCn Polynomial register (Lower)	KCRCnPOLY0	<KCRCn_base> + $A0_H$	*1	—
	KCRCn Polynomial register (Upper)	KCRCnPOLY1	<KCRCn_base> + $A4_H$	*1	—
	KCRCn XOR mask register (Lower)	KCRCnXOR0	<KCRCn_base> + $B0_H$	*1	—
	KCRCn XOR mask register (Upper)	KCRCnXOR1	<KCRCn_base> + $B4_H$	*1	—

Note 1. n = 0: PBG30#13
n = 1: PBG52#2
n = 2: PBG30#14
n = 3: PBG52#3
n = 4: PBG30#15
n = 5: PBG52#4
n = 6: PBG31#0
n = 7: PBG52#5

46.3.2 KCRCnDIN — KCRCn Data Input Register

This register holds the input data for the CRC calculation. The effective bit width used for CRC calculation must be set by KCRCnCTL.DW[2:0].

When data is written to this register, the CRC code is generated. The CRC calculation is immediately started after the KCRCnDIN register is written. The KCRCnDOUT register must be initialized, with the initial value, before the first data of the data block is written to KCRCnDIN register.

Access: This register can be read or written in 32/16/8-bit units.

Address: <KCRCn_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DIN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DIN[15:0]

Table 46.7 KCRCnDIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DIN[31:0]	Input data for CRC calculation. The valid bits are controlled by KCRCnCTL.DW[2:0]: For 32 bits, effective bit width: DIN[31:0] For 16 bits, effective bit width: DIN[15:0] For 8 bits, effective bit width: DIN[7:0]

46.3.3 KCRCnDOUT0 — KCRCn data output register (Lower)

This register stores the result of the CRC code generated by the CRC polynomial selected by KCRCnPOLY0.POLY[31:0].

Access: This register can be read or written in 32-bit units.

Address: <KCRCn_base> + 80_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DOUT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOUT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 46.8 KCRCnDOUT0 Register Contents

Bit Position	Bit Name	Function
31 to 0	DOUT[31:0]	Result of the CRC code generation. The valid bits are controlled by KCRCnCTL.PSIZE[5:0]: For 32-bit effective bit width: DOUT[31:0] For 16-bit effective bit width: DOUT[15:0] For 15-bit effective bit width: DOUT[14:0] For 8-bit effective bit width: DOUT[7:0] When reading from this register, the value is XORed by hardware with the value specified in **Table 46.16, Setting Table** for the chosen polynomial. Therefore, for the CRC32 polynomial (as default setting), 0000 0000_H is read from this register even in the initial state.

CAUTION

The read value after reset is 0000 0000_H, since the CRC32 polynomial is selected as the CRC generating function after reset and the value is XORed onto FFFF $FFFF_H$ by hardware.

This register must be initialized with the start value before the first data of the data block is written to KCRCnDIN register.

46.3.4 KCRCnDOUT1 — KCRCn data output register (Upper)

This register stores the result of the CRC code generated by CRC polynomial selected by KCRCnPOLY1.POLY[63:32].

Access: This register can be read or written in 32-bit units.

Address: <KCRCn_base> + 84_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DOUT[63:49]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOUT[48:32]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 46.9 KCRCnDOUT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	DOUT[63:32]	Result of the CRC code generation (Upper side of 64 bits width). The valid bits are controlled by KCRCnCTL.PSIZE[5:0]. For 64-bit polynomial size, CRC result upper side from bit 64 to bit 32 will be stored in KCRCnDOUT1 register after CRC calculation. For other polynomial sizes, the value of this register will be undefined after CRC calculation.

CAUTION

The read value after reset is 0000 0000_H, since the CRC32 polynomial is selected as the CRC generating function after reset and the value is XORed onto FFFF $FFFF_H$ by hardware.

This register must be initialized with the start value before the first data of the data block is written to KCRCnDIN register.

46.3.5 KCRCnCTL — KCRCn Control register

This register provide CRC calculate settings. All settings shall use as the **Table 46.16, Setting Table**.

Access: This register can be read or written in 32-bit units.

Address: <KCRCn_base> + 90_H

Value after reset: $001F\ 0000_H$

Table 46.10 KCRCnCTL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	PSIZE[5:0]	Specifies the CRC polynomial size $0x07_H$: 8 bits $0x0E_H$: 15 bits $0x0F_H$: 16 bits $0x1F_H$: 32 bits $0x3F_H$: 64 bits Other: Setting prohibited For details of settings, see **Table 46.16**.
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	CMD0	Specifies the CRC calculate mode 0 (for output) 0: Mode N (N = Normal) 1: Mode R (R = Reflect) For details of settings, see **Table 46.16**.
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CMD1	Specifies the CRC calculate mode 1 (for input) 0: Mode N (N = Normal) 1: Mode R (R = Reflect) For details of settings, see **Table 46.16**.
4	CMD2	Specifies the CRC calculate mode 2 (for input/output and polynomials) 0: Mode M (M = The byte order of KCRCnDIN and KCRCnPOLY are MSB*1 first) 1: Mode L (L = The byte order of KCRCnDIN and KCRCnPOLY are LSB*2 first) Note 1. MSB = Most Significant Byte Note 2. LSB = Least Significant Byte For details of settings, see **Table 46.16**.

Table 46.10 KCRCnCTL Register Contents (2/2)

Bit Position	Bit Name	Function
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DW[2:0]	Specified the CRC input data size select These bits define valid data width of data input. 000: 32-bit fix mode 001: 16-bit fix mode 011: 8-bit fix mode Other: Setting prohibit

NOTE

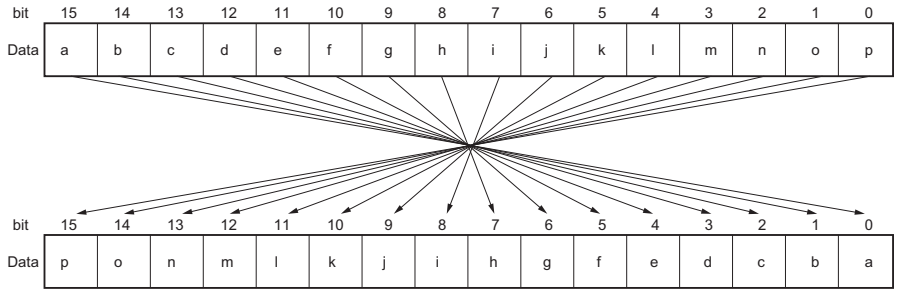
After changing the CRC calculate setting (KCRCnCTL), the KCRCnDOUT[0-1] registers must be initialized.

CAUTION

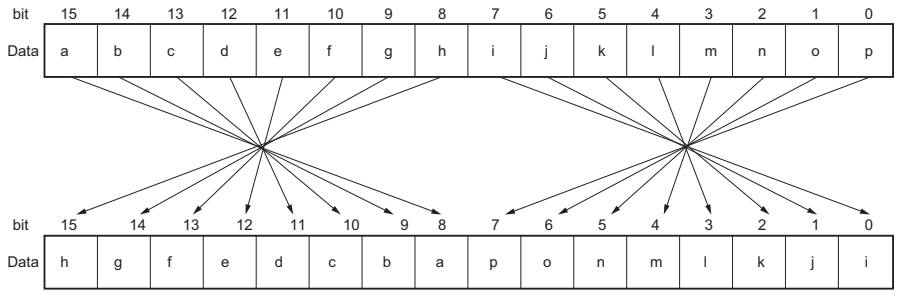
- **The CRC input bit width (KCRCnCTL.DW[2:0]) must be set according to the data block bit width. After the final CRC result is read from KCRCnDOUT[0-1] registers, the KCRCnDOUT[0-1] registers must be initialized with the initial value.**
- **Switching the CRC polynomial (KCRCnPOLY.POLY[0-1][31:0]) is also not allowed during processing of a data block.**

USAGE NOTES

- If CMD0 is setting 1 in PSIZE = 16-bit. Output data is reflected as show below.

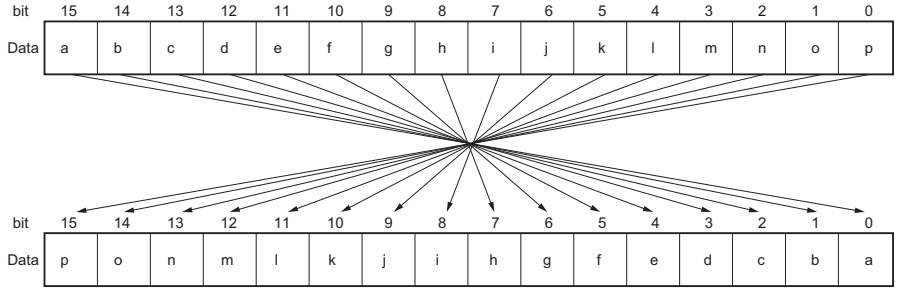


- If CMD1 is setting 1 in DW = 16-bit. Input data is reflected as show below.

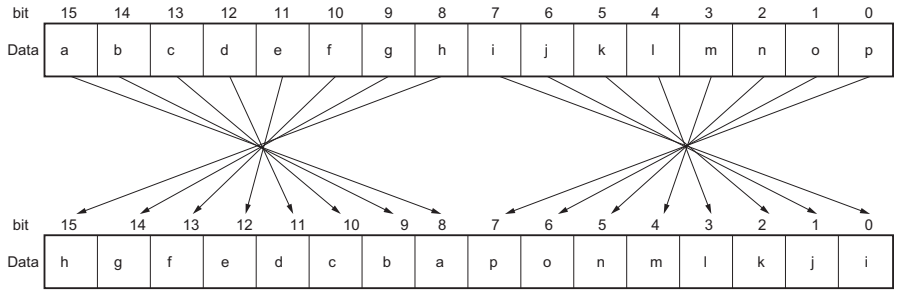


- If CMD2 is setting 1 in PSIZE = 16-bit and DW = 16-bit.

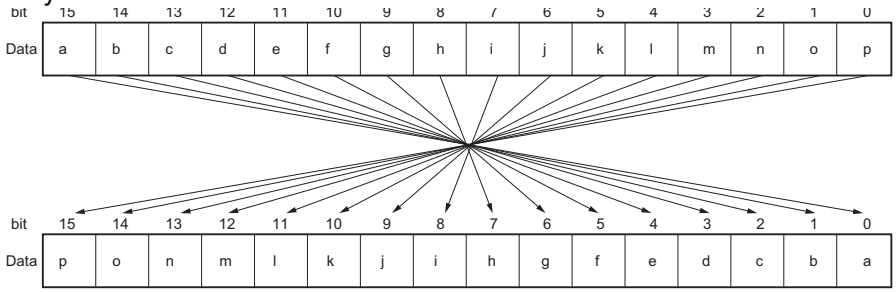
→ Output data is reflected as shown below.



→ Input data is reflected as shown below.



→ Polynomial is reflected as shown below.



46.3.6 KCRCnPOLY0 — KCRCn Polynomial register (Lower)

This register controls the CRC polynomial type for CRC calculation process.

Access: This register can be read or written in 32-bit units.

Address: <KCRCn_base> + $A0_H$

Value after reset: $04C1\ 1DB7_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.12 KCRCnPOLY1 Register Contents

Bit Position	Bit Name	Function
31 to 0	POLY[63:32]	Specifies the polynomial 64 bits type for CRC calculation. Setting must be able to set only **Table 46.16**.

46.3.8 KCRCnXOR0 — KCRCn XOR mask register (Lower)

This register stores the XOR value of the CRC code specified in the AUTOSAR standard for the chosen polynomial. This value will be XORed with initial value of KCRCnDOUT0 for CRC calculation process.

Access: This register can be read or written in 32-bit units.

Address: <KCRCn_base> + $B0_H$

Value after reset: $FFFF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CRC15CAN	00000000 00004599$_H$	No	No	00000000 00000000$_H$	00000000 00000000$_H$	000E0003$_H$	059E$_H$
CRC64ECMA	42F0E1EB A9EA3693$_H$	Yes	Yes	FFFFFFFF FFFFFFFF$_H$	FFFFFFFF FFFFFFFF$_H$	003F0123$_H$	995DC9BB DF1939FA$_H$

Note: KCRCnCTL.DW can change by user software.

Note 1. Check value can provide check sequence. See **Section 46.4, (1) Check** .
The Polynomial shall set to KCRCnPOLY0 and KCRCnPOLY1 registers.
The XOR shall set to KCRCnXOR0 and KCRCnXOR1 registers.
The Initial value shall set to KCRCnDOUT0 and KCRCnDOUT1 registers.

(1) Check

This field is a check value that can be used as a weak validator of implementations of the algorithm. The field contains the checksum obtained when the ASCII values '1' '2' '3' '4' '5' '6' '7' '8' '9' corresponding to values 31_H, 32_H, 33_H, 34_H, 35_H, 36_H, 37_H, 38_H, 39_H is fed through the specified algorithm.

(2) Data flow

The Data CRC Function K generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the Data CRC Function in 8-, 16-, 32-bit or 64-bit units. The CRC polynomial can either be selected for 64-bit CRC64ECMA, 32-bit Ethernet, 32-bit CRC32C, 16-bit CCITT, 16-bit Baicheva00, 8-bit SAE J1850 or 8-bit 0x2F, etc, .. polynomial CRC, the initial starting value must be set at the KCRCnDOUT0 and KCRCnDOUT1 registers before the first write access to the KCRC input register (KCRBnDIN) is performed.

After the last write access to the KCRCnDIN register is performed, the result can be read-out from the KCRCnDOUT0 and KCRCnDOUT1 registers after one clock period.

The flow chart below shows the CRC generating procedure.

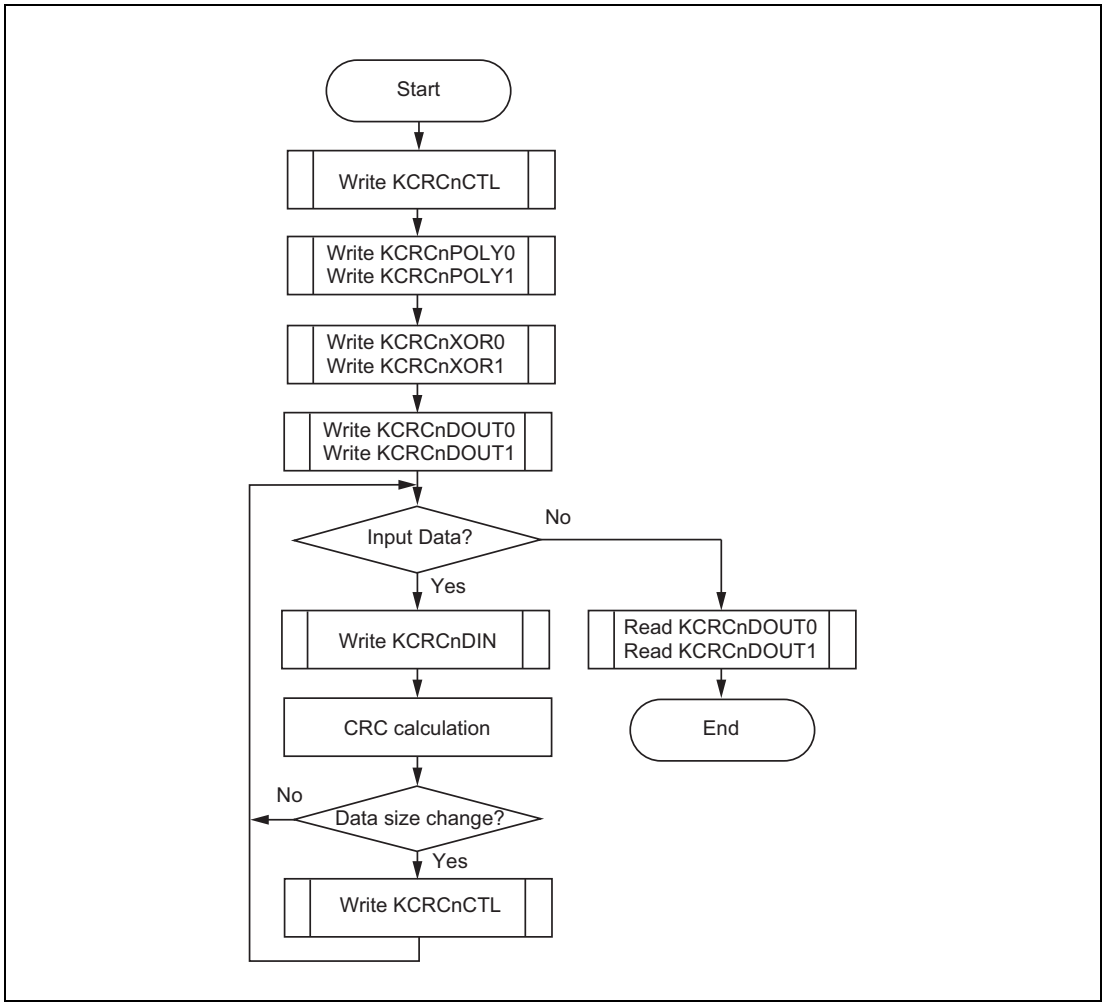

Figure 46.2 Data Flow

NOTES

- All settings shall be to set as **Table 46.16**
- The initial value that has to be written into KCRCnDOUT0 and KCRCnDOUT1 can be chosen by the user. To be compliant to the AUTOSAR standard the initial value has to be chosen according to the value specified for the chosen polynomial.
- When reading from register KCRCnDOUT0 and KCRCnDOUT1, the value is XORed by hardware with the value specified in the AUTOSAR standard for the chosen polynomial.
- Generation of CRC code and storage to KCRCnDOUT0 and KCRCnDOUT1 are done by hardware.
- All registers are accessible by CPU or by CPU-independent read/write access via DMA/DTS. Independent from access of the KCRCn via CPU or DMA/DTS the verification of the CRC signature (CRC-check result in KCRCnDOUT0 and KCRCnDOUT1) has to be performed by SW.

(3) Sample data generation sequence

(Example: Input data is as follows,

Data input1 = 34333231_H

Data input2 = 38373635_H

Data input3 = 39_H)

- Case: check sequence of CCITT 16

```
Write32 KCRCnCTL      = 000F0000H ;  // input data size 32-bit mode
Write32 KCRCnPOLY0    = 00001021H ;  // Polynomial setting
Write32 KCRCnPOLY1    = 00000000H ;  // Polynomial setting
Write32 KCRCnXOR0     = 00000000H ;  // xor mask setting
Write32 KCRCnXOR1     = 00000000H ;  // xor mask setting
Write32 KCRCnDOUT0    = 0000FFFFH ;  // initialize
Write32 KCRCnDOUT1    = 00000000H ;  // initialize
Write32 KCRCnDIN      = 34333231H ;  // Data input 1 (32-bit access )
Write32 KCRCnDIN      = 38373635H ;  // Data input 2 (32-bit access)
Write32 KCRCnCTL      = 000F0003H ;  // input data size change to 8-bit mode.
Write8  KCRCnDIN      = 39H ;        // Data input 3 (8-bit access) ONLY KCRCnCTL.DW is
                                       able to change.
Read32  KCRCnDOUT0;                  // Return check value (KCRCnCTL.DOUT0 show
                                       000029B1H)
```

Note: KCRCnCTL.DW[2:0] can change in processing for less than 4 bytes. Usually, KCRCnCTL.DW set to 4 byte mode for data transfer efficiency.

Section 47 Basic Hardware Protection (BHP)

To protect the code flash memory, data flash memory and Flash extra area, this product has several Flash protection functions.

The security function that is used by the ID authentication and setting of Flash Option Byte is described in this section. The ID code and the Flash Option Byte that is described in this section are mapped at Security Settings area and Block Protection Settings area.

In the initial state of the product at shipment, the ID code are set by all - 1. These ID should be set at the first programming to Flash Option Byte. For details of the programming to the flash memory, see **Section 51, Flash Memory**.

47.1 Features

47.1.1 Functional features

(1) Mode and connection entry protection

- System requires some password base authentication to enter other than Normal operation mode.
- Authentication ID and related option can be configured by Security settings area.
- The 256 bit SPID password authentication is needed to enter Serial programming mode.
- The 256 bit OCDID password authentication is needed when On-chip debug.
- The RHSIF ID authentication is needed to connect to RHSIF Link Partner [For U2A-EVA/ U2A16/U2A8 only].

(2) Flash Protection by ID authentication

- The system requires 256 bit Customer ID authentication for re-programming to User area by each block.
- The Customer ID authentication is needed to read the User/User boot area when debugger is connected.
- The system requires 256 bit Data Flash ID authentication for re-programming to Data area.
- The Data Flash ID authentication is needed to read the Data area when debugger is connected.

(3) Flash protection by OTP

- User area on code flash supports OTP (One Time Programmable) functionality for each block.
- Flash extra area protection by OTP
- Dedicated configuration area supports OTP functionality for each 4 Byte unit.

(4) ID code

- **Table 47.1** shows the ID code that can be set in this product.
  The system requires each ID authentication for programming and reading the ID.

Table 47.1 ID Code

ID Code	Function
OCD ID	Protection for debug connection
Serial Programmer ID	Protection to enter the serial programming mode
RHSIF ID	Protection for RHSIF Link Partner [For U2A-EVA/U2A16/U2A8 only]
Customer ID A, B, C	Protection for Code Flash and Flash extra area
Data Flash ID	Protection for Data Flash
C-TEST ID	Refer to the *RH850/U2A-EVA Group Security User's Manual: Hardware*. When this ID is not used, set all bits to 1.

- The setting and function that related each ID code can select the Flash Option Byte. The system requires each ID authentication to re-programming these Flash Option Byte.

(5) Flash protection by the security function of ICUMHA

- When security function settings by ICUMHA is enabled, programming/erase of the code flash area from masters other than the ICUMHA or Hardware property setting is prohibited. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

47.2 Security Functions in Serial Programming Mode

Two functions are provided as security functions in serial programming mode: ID authentication and prohibition of serial programmer connection.

1. Serial Programmer ID Authentication
   The ID codes are checked for authenticity to protect the code flash memory, data flash memory and Flash extra area. Programming, erasure, and reading of the code flash and data flash memory can proceed upon successful ID authentication.
2. Prohibition of Serial Programmer Connection
   All serial programmer commands is disabled by boot firmware.

47.3 Security Functions in Debug Interfaces

This product is capable of restricting connection of the debug interfaces to protect against unauthorized access via the debug interfaces. This feature has two security levels.

- Security level 1:
  Debug interface can be used. At this level, the on-chip debugging (OCD) function is protected by using OCD ID authentication. For OCD to be used, it must be unlocked by using OCD ID authentication.
- Security level 2:
  At this level, the debug interface cannot be used.
  These security levels can be changed by Flash Option Byte (JPDBGIF_EN) in Security Setting area of the flash memory.

When ICUMHA is enabled, The C&R authentication is added to security function.
For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware.*

47.3.1 Security Levels and State of Restricting the Connection of Debug Interfaces

Table 47.2 show each security level and the corresponding security states and **Figure 47.1** shows the conditions for transitions.

Table 47.2 Security Levels and State of Restricting Connection to the Debug Interfaces

State	Result of OCD ID Authentication	JPDBGIF_EN*1	Restriction on Debug Interface Connection
Security level 1	Unlocked	1_B	No restriction on access via the debug interfaces
	Locked	1_B	Restriction on access via the debug interfaces is in place.
Security level 2	—	0_B	Connection to the debug interfaces is prohibited.

Note 1. For details of the JPDBGIF_EN bits, see **Section 47.8.3, S_OPBT0 — OCD ID Related Option Byte.**

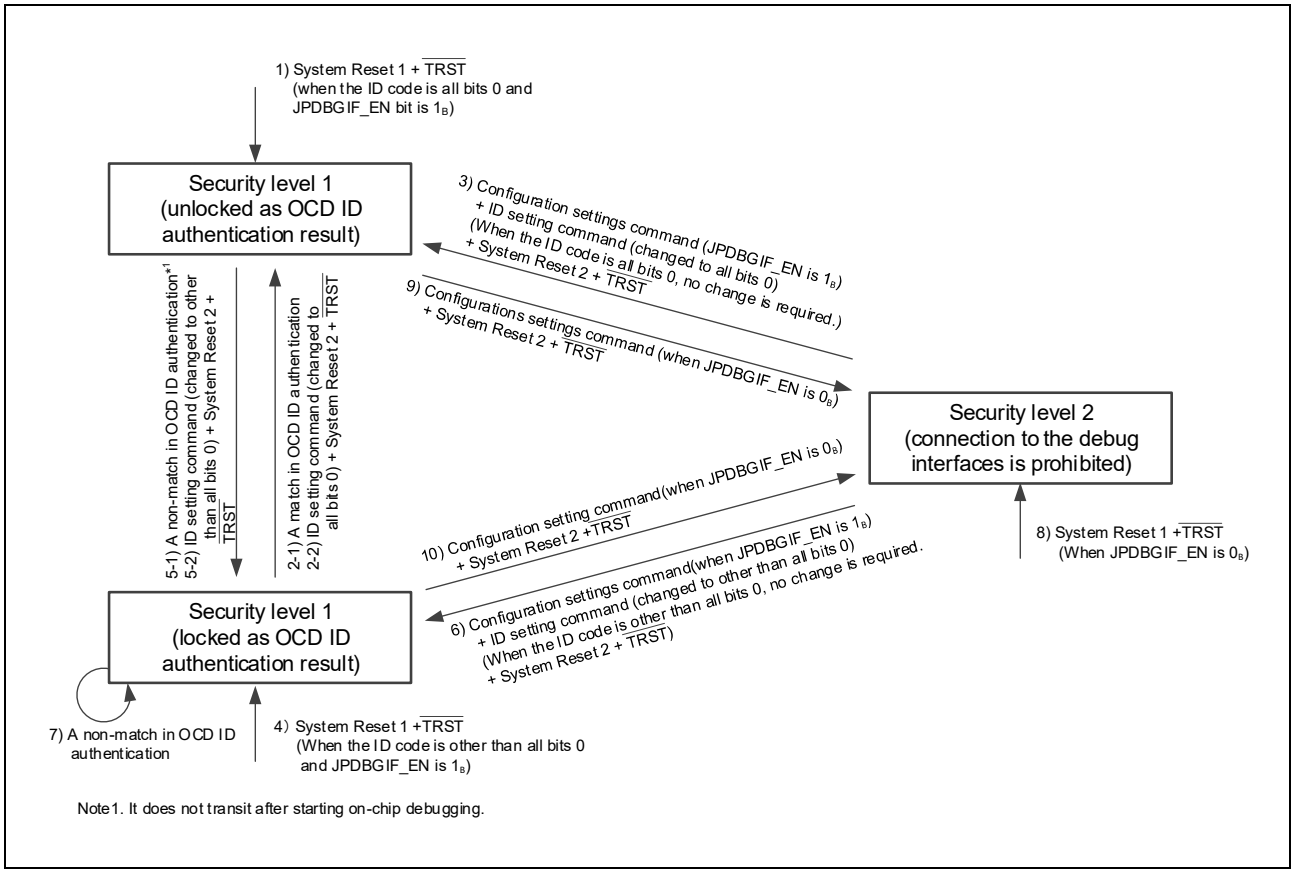

Figure 47.1 Transitions of Security Level

Conditions for transitions to each security level described in **Table 47.2**.

- Conditions for transitions to security level 1 (unlocked as OCD ID authentication result)

1. Startup in the state of security level 1 (unlocked as OCD ID authentication result)
   When System Reset 1 and a reset by $\overline{\text{TRST}}$ are applied while the ID code is all 0s and while the value of the JPDBGIF_EN is 1_B, startup proceeds with security level 1 (unlocked as OCD ID authentication result).
2. Transition from security level 1 (locked as OCD ID authentication result) to security level 1 (unlocked as OCD ID authentication result)

– Transition to security level 1 (unlocked as OCD ID authentication result) follows a match in OCD ID authentication.
– When System Reset 2 and a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “all bits 0”, startup proceeds at security level 1 (unlocked as OCD ID authentication result).

3. Transition from security level 2 to security level 1 (unlocked as OCD ID authentication result)
When System Reset 2 and a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “all bits 0” and the value of the JPDBGIF_EN to 1_B, startup proceeds at security level 1 (unlocked as OCD ID authentication result).

- Conditions for Transitions to Security Level 1 (locked as OCD ID Authentication result)

4. Startup in the state of security level 1 (locked as OCD ID authentication result)
When System Reset 1 and a reset by $\overline{\text{TRST}}$ is applied while the ID code is “other than all bits 0” and the value of the JPDBGIF_EN is 1_B, startup proceeds at security level 1 (locked OCD ID authentication result).
5. Transition from security level 1 (unlocked as OCD ID authentication result) to security level 1 (locked as OCD ID authentication result).

– A transition to security level 1 (locked as OCD ID authentication result) follows a non-match in OCD ID authentication. However, it does not transit after starting on-chip debugging.
– When System Reset 2 and a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “other than all bits 0”, startup proceeds at security level 1 (locked as OCD ID authentication result).

6. Transition from security level 2 to security level 1 (locked as OCD ID authentication result)
When System Reset 2 and a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “other than all bits 0” and the value of JPDBGIF_EN is 1_B, startup proceeds at security level 1 (locked as OCD ID authentication result).
7. Retaining security level 1 (locked as OCD ID authentication result)
In case of a non-match in OCD ID authentication, security level 1 (failure in OCD ID authentication) remains in place.

- Transition to security level 2

8. Startup at security level 2
When System Reset 1 and a reset by $\overline{\text{TRST}}$ is applied while the value of JPDBGIF_EN is 0_B, startup proceeds at security level 2.
9. Transition from security level 1 (unlocked as OCD ID authentication result) to security level 2
When System Reset 2 and a reset by $\overline{\text{TRST}}$ is applied after changing the value of the JPDBGIF_EN to 0_B, startup proceeds at security level 2.
10. Transition from security level 1 (locked as OCD ID authentication result) to security level 2
When System Reset 2 and a reset by $\overline{\text{TRST}}$ is applied after changing the value of the JPDBGIF_EN to 0_B, startup proceeds at security level 2.

47.4 Security Functions in Connection of RHSIF Link Partner [For U2A-EVA/U2A16/U2A8 only]

Two functions are provided as security functions unique to RHSIF ID authentication.

- RHSIF ID Authentication
  ID codes are checked for authenticity to protect RHSIF Link Partner connection.
  When ICUMHA is enabled, the C&R authentication is added to security function.
  For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.
- Access Window setting
  User can set the access area from Link Partner that is configured the access window register. The access window register can not set from Link Partner.
  The details of this function, see **Section 29, Renesas High-Speed Serial I/F (RHSIF)**.

47.5 Code Flash/Data Area Protection

Protection based on section password operates for non-secure area and doesn't affect the access from ICUMHA. The section password is stored in Security settings area for each of code flash and Data Area (Customer ID and Data Flash ID). User can unlock protection by inputting correct section password by software or external debugging tool.

Inputting target registers for software, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Customer ID and Data Flash ID, see **Section 47.8.11, CUSTOMERIDn — Customer ID A (n = 0 to 7), Section 47.8.14, CUSTOMERIDBn — Customer ID B (n = 0 to 7), Section 47.8.15, CUSTOMERIDCn — Customer ID C (n = 0 to 7),** and **Section 47.8.12, DATAFLASHIDn — Data Flash ID (n = 0 to 7)**.

The ID authentication for read access can be skipped by setting read protection flag in Security settings area for code flash and Data Area respectively (CFRPF and DFRPF).

Table 47.3 shows access protection to User Area or Extended Data Area by Customer ID. ID authentication to read access in Normal Operation mode/On-chip debug is done via debugger I/F. ID authentication for reading access in serial programming mode is not needed.

Table 47.4 shows access protection to Data Area by Data Flash ID. ID authentication to access is same as User Area/Extended Data Area. But the ID to authenticate becomes Data Flash ID.

Table 47.3 Access Protection to User Area/Extended Data Area from PEs by Customer ID

Mode	Operation	Access from PEs		Access Via PEs Debug Master	
		Read	Erase/Write	Read	Erase/Write
Normal Operation Mode /User Boot Mode	Self-programming	Don't care	Customer ID A/ B/C authentication by SW	N/A	N/A
	On-chip debug	Customer ID A authentication by debugger I/F	Customer ID A authentication by debugger I/F*1	Customer ID A authentication by debugger I/F	Customer ID A authentication by debugger I/F*1
			Customer ID B/C authentication by SW		Customer ID B/C authentication by SW
Serial programming mode	—	Don't care	Don't care	N/A	N/A

Note: Don't care: there are no access restriction, N/A: not applicable

Note 1. If target ID has not been authenticated by debugger I/F, the ID certification by SW is necessary.

Table 47.4 Access Protection to Data Area from PEs by Data Flash ID

Mode	Operation	Access from PEs		Access Via PEs Debug Master	
		Read	Erase/Write	Read	Erase/Write
Normal Operation Mode/User Boot Mode	Self-programming	Don't care	Data Flash ID authentication by SW	N/A	N/A
	On-chip debug	Data Flash ID authentication by debugger I/F	Data Flash ID authentication by debugger I/F*1	Data Flash ID authentication by debugger I/F	Data Flash ID authentication by debugger I/F*1
Serial programming mode	—	Don't care	Don't care	N/A	N/A

Note: Don't care: there are no access restriction, N/A: not applicable

Note 1. If target ID has not been authenticated by debugger I/F, the ID certification by SW is necessary.

47.5.1 Block Protection Function

If FACI command is issued to a block that was protected by ID, the flash sequencer enters "Command Lock" state.

- User Area/Extended Data Area Erase/Write Protection
  User Area/Extended Data Area can be protected from Erase/Write by Customer ID authentication. This function can be set by 4 bit per Block of code flash. **Figure 47.2** shows an example of Block Protection structure. Once set, the OTP setting cannot be released.
- Data Area Erase/Write Protection
  Data Area can be protected from Erase/Write by Data Flash ID authentication. This function can be set by DPROT. (see **Section 47.8.5, S_OPBT4 — Data Flash ID Related Option Byte**.)

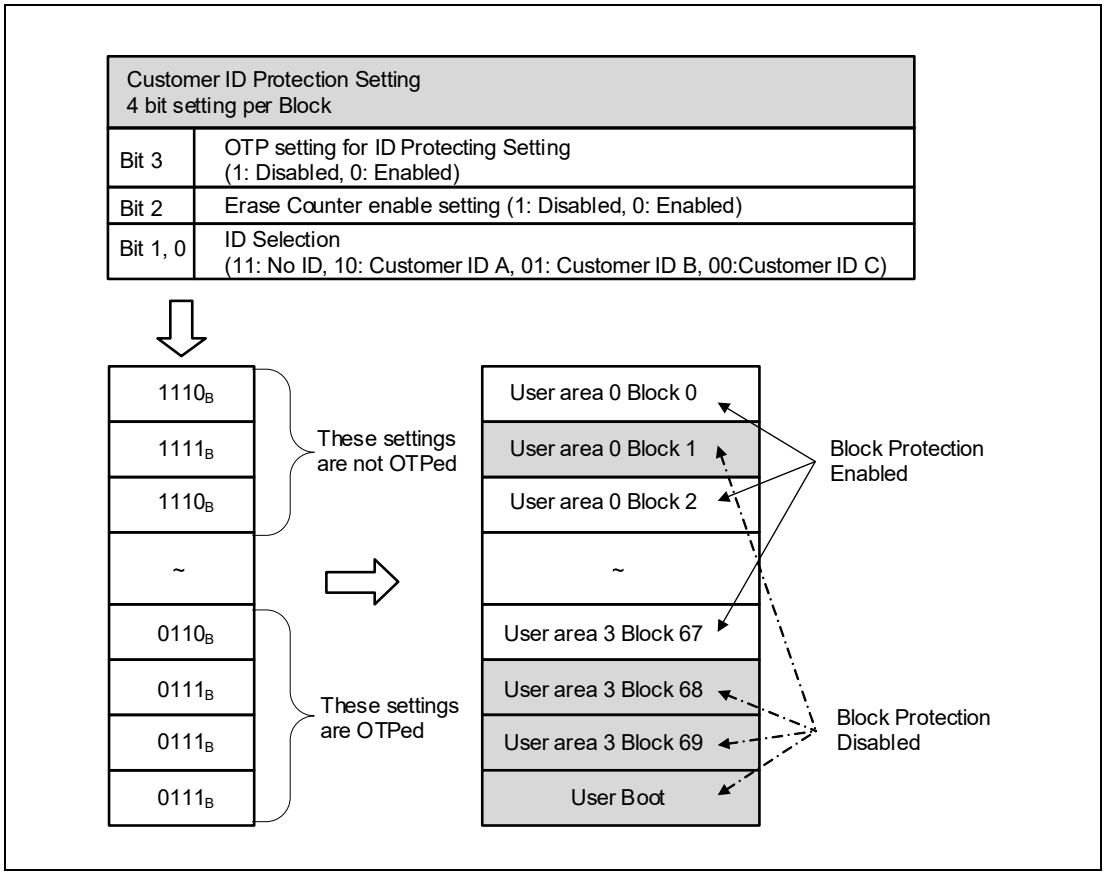

Figure 47.2 Block Protection Function Structure

47.5.2 OTP (One Time Programmable) Function

OTP can be individually set for each block of the user area and the user boot area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self programming is prohibited. Once set, the OTP setting cannot be released.

If a "Programming" or "Block Erasure" command is issued to a OTP protected block, flash sequencer enters "Command Lock" state.

For details of base address in the following table, see **Section 51.3.3, Mapping of Hardware Property Area in Data Flash Memory**.

Table 47.5, **Table 47.6**, and **Table 47.7** show Mapping of OTP setting for User Area, User Boot Area, and Extended Data Area.

Table 47.5 Mapping of OTP Setting (User Area m and User Boot Area m) (m[*1] = 0, 1) (k = f, b)

Address	Bit	Protection Area
<BPA0k_base>+ 0200_H+ 20_H x m	[0]	Block 0 of User Area m
	[1]	Block 1 of User Area m
	[2]	Block 2 of User Area m
	:	:
	[31]	Block 31 of User Area m
<BPA0k_base>+ 0204_H+ 20_H x m	[0]	Block 32 of User Area m
	[1]	Block 33 of User Area m
	:	:
	[31]	Block 63 of User Area m
<BPA0k_base>+ 0208_H+ 20_H x m	[0]	Block 64 of User Area m
	[1]	Block 65 of User Area m
	:	:
	[5]	Block 69 of User Area m
	[6]	Reserved
	:	:
	[31]	Reserved
<BPA0k_base>+ ($020C_H$ to 0218_H) + 20_H x m	[31:0]	Reserved[*2]
<BPA0k_base>+ $021C_H$+ 20_H x m	[0]	Reserved
	:	:
	[30]	Reserved
	[31]	User Boot Area m

Note 1. OTP setting area of m = 0 is shared with User Area 1, User Boot Area 1 when Double Map Mode.
OTP setting area of m = 1 is reserved when Double Map Mode.

Note 2. These reserved words need to be programmed when programming Block Protection Area for FPSYS0.

Table 47.6 Mapping of OTP Setting (Extended Data Area) (k = f, b)

Address	Bit	Protection Area
<BPA0k_base>+ $03E0_H$	[0]	Extended Data Area
	[1]	Reserved
	:	:
	[31]	Reserved
<BPA0k_base>+ $03E4_H$ to $03FC_H$	[31:0]	Reserved

Table 47.7 Mapping of OTP Setting (User Area m) (m[*1] = 2, 3) (k = f, b) [For U2A-EVA U2A16 mode/U2A16]

Address	Bit	Protection Area
<BPA1k_base>+ 0200_H+ 20_H x (m - 2)	[0]	Block 0 of User Area m
	[1]	Block 1 of User Area m
	[2]	Block 2 of User Area m
	:	:
	[31]	Block 31 of User Area m
<BPA1k_base>+ 0204_H+ 20_H x (m - 2)	[0]	Block 32 of User Area m
	[1]	Block 33 of User Area m
	:	:
	[31]	Block 63 of User Area m
<BPA1k_base>+ 0208_H+ 20_H x (m - 2)	[0]	Block 64 of User Area m
	[1]	Block 65 of User Area m
	:	:
	[5]	Block 69 of User Area m
	[6]	Reserved
	:	:
	[31]	Reserved
<BPA1k_base>+ ($020C_H$ to $021C_H$)+ 20_H x (m - 2)	[31:0]	Reserved[*2]

Note 1. OTP setting area of m = 2 is shared with User Area 3 when Double Map Mode.
OTP setting area of m = 3 is reserved when Double Map Mode.

Note 2. These reserved words need to be programmed when programming Block Protection Area for FPSYS1.

47.6 Hardware Property Area Protection

The access to Hardware Property Area (Configuration Setting, Security Setting, Block Protection, Switch, TAG Area) is protected by each protection ID. ID authentication for reading/writing access is done by SW. Customer ID A authentication by debugger I/F for read access can be skipped by setting read protection flag in Security Setting Area (CFRPF).

Table 47.8 shows access protection to Hardware Property Area (Configuration Setting, Security Setting, Block Protection, Switch, TAG Area). Protection ID of Configuration Setting Area, see **Section 47.7, Configuration Setting Area (Option Bytes, Reset Vector)**. Protection ID of Security Setting Area, see **Section 47.8, Security Setting Area**. Protection ID of Block Protection Area, see **Section 47.9, Block Protection Area for FPSYS0/FPSYS1**. Protection ID of Switch Area, see **Section 47.10, Switch Area**. Protection ID of TAG Area, see **Section 47.11, TAG Area**.

Table 47.8 Access Protection to Hardware Property Area (Configuration Setting, Security Setting, Block Protection, Switch, TAG Area) from PEs

Mode	Operation	Access from PEs		Access via PEs Debug Master	
		Read	Erase*2/Write	Read	Erase*2/Write
Normal Operation Mode / User Boot Mode	Self-programming	ID authentication by SW	ID authentication by SW	N/A	N/A
	On-chip debug	Customer ID A authentication by debugger I/F and ID authentication by SW*1	ID authentication by SW*1	Customer ID A authentication by debugger I/F and ID authentication by SW*1	ID authentication by SW*1
Serial programming mode	—	ID authentication by SW	ID authentication by SW	N/A	N/A

Note: N/A: not applicable

Note 1. If target ID has been authenticated by debugger I/F, the ID certification by SW is unnecessary.

Note 2. For Switch Area and TAG Area Only.

47.7 Configuration Setting Area (Option Bytes, Reset Vector)

Configuration Setting Area can be protected by the following functions.

(1) OTP
When OTP protection is effective, configuration setting which is protected by the OTP setting is not changed by "Property Programming" command (the data will be copied from valid area automatically regardless of the input programming data), and flash sequencer does not enter "Command Lock" state. Invalid area of Configuration setting area always can be erased by "Property Erasure" command regardless of the OTP setting.

(2) ID authentication
When ID authentication protection is effective, configuration setting which is protected by the ID authentication is not changed by "Property Programming" command (the data will be copied from valid area automatically regardless of the input programming data), and flash sequencer does not enter "Command Lock" state. Invalid area of Configuration setting area always can be erased by "Property Erasure" command regardless of ID authentication. Configuration Setting Area can be protected from programming by Customer ID A.
This protection doesn't affect the access from ICUMHA.

(3) Clear protection against "Property Programming" command
OTP setting bits cannot be changed from "0" to "1" by "Property Programming" command.

Table 47.9 shows Mapping of OTP setting for Configuration Setting Area.

For details of base address in the following table, see **Section 51.3.3, Mapping of Hardware Property Area in Data Flash Memory**.

Table 47.9 Mapping of OTP Setting (Configuration Setting Area) (k = f, b)

Address	Bit	Protection Area (32 bit)
<CSAk_base>+ 0200_H	[0]	<CSAb_base>+0300_H
	[1]	<CSAb_base>+0304_H
	[2]	<CSAb_base>+0308_H

	:	:
	[31]	<CSAb_base>+$03FC_H$
<CSAk_base>+ 0208_H	[0]	<CSAb_base>+0400_H
	[1]	<CSAb_base>+0404_H
	[2]	<CSAb_base>+0408_H
	:	:
	[31]	<CSAb_base>+$047C_H$

47.8 Security Setting Area

Security Setting Area consists of two areas (Area 0 and Area 1). Valid area is mapped in front side, Invalid area is mapped in back side. Valid area cannot be updated whereas Invalid area can be updated.

Area 0 is selected as valid area at the shipping from RENESAS.

Area 1 is selected as invalid area and erased at the shipping from RENESAS.

The flash memory has the area to store a data specified by the user for security settings. Changes in settings become effective after TAG Update and release from the reset state. OTP setting of Security Settings Area becomes effective without reset. Valid / Invalid area switching for read access also becomes effective without reset.

Security Setting Area can be protected by the following functions.

(1) OTP
When OTP protection is effective, Security setting which is protected by the OTP setting is not changed by "Property Programming" command (the data will be copied from valid area automatically regardless of the input programming data), and flash sequencer does not enter "Command Lock" state. Invalid area of Security setting area always can be erased by "Property Erasure" regardless of the OTP setting.

(2) ID authentication
When ID authentication protection is effective, Security setting which is protected by the ID authentication is not changed by "Property Programming" command (the data will be copied from valid area automatically regardless of the input programming data), and flash sequencer does not enter "Command Lock" state. Invalid area of Security setting area always can be erased by "Property Erasure" command regardless of ID authentication. Security setting area can be protected from programming by Customer ID A/B/C, OCD ID, Serial Programming ID, Data Flash ID, and RHSIF ID. See **Table 47.11** for details.
This protection doesn't affect the access from ICUMHA.

(3) Clear protection against "Property Programming" command
OTP setting bits cannot be changed from "0" to "1" by "Property Programming" command.

Table 47.10 shows Mapping of OTP setting for Security Setting Area.

For details of base address in the following table, see **Section 51.3.3, Mapping of Hardware Property Area in Data Flash Memory**.

Table 47.10 Mapping of OTP Setting (Security Setting Area) (k = f, b)

Reserved*9	<SSAk_base>+ (0740_H to $07FC_H$)	Erased	Can not Write	—	—

Note 1. This is the value of valid area at the shipping. Invalid area is erased at the shipping.

Note 2. For details of this function, see **Section 47.8, Security Setting Area**.

Note 3. When all bits of Protection ID are “1” or “0”, the ID authentication is no needed to program/read. And when this protection is effective, Config area is not change/modify by "Property Program" (copied data from valid area is programed), and flash sequencer does not enter "Command Lock" state. Config area always can erase by "Property Erase" regardless of ID authentication.

Note 4. When CFRPF is set (CFRPF bit is 0).

Note 5. For this reserved area, program FFFF $FFFF_H$ when programming Security Setting Area.
Note 6. When the all bits are “1”, the ID authentication is needed to connect a flash memory programmer.
Note 7. When On-chip debug and S_OPBT3.CFRPF is "0", the Customer ID A authentication is needed to read.
Note 8. This area will be updated automatically when programming Security Setting Area.
Note 9. This area cannot be programmed. When this area is read, it behaves as if it is erased.
Note 10. For details of this function, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.
Note 11. <SSAk_base> (k = f, b)
Note 12. For this reserved area, program the value of valid area at the shipping when programming Security Setting Area. The details of this function, see the *RH850/U2A-EVA Group Security User’s Manual: Hardware*.
Note 13. S_OPBT6 is reserved in U2A6. For this reserved area, program FFFE $FFFF_H$ when programming Security Setting Area.
RHSIFIDn is reserved in U2A6. For this reserved area, program FFFF $FFFF_H$ when programming Security Setting Area.

47.8.1 SSAVOFn — Valid Option Byte Flag n for Security Setting Area (n = 0,1,7 to 18,40)

This flag indicates that the related option bytes are programmed or not.
The relation between each SSAVOFn and option bytes are shown in **Table 47.11**.
This flag is referred by flash sequencer in order to check whether the related option bytes are programmed or not.
This flag will be updated automatically when programming Security Setting Area.
The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + 0000$_H$ + 04$_H$ x n

Value at the shipping: 5AA5 A55A$_H$ (valid area)
Erased (invalid area)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSAVOFn[31:16]															

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSAVOFn[15:0]															

Table 47.12 SSAVOFn Contents

Bit Position	Bit Name	Function
31 to 0	SSAVOFn [31:0]	Program completion flag. 5AA5 A55A$_H$: The related option bytes are programmed. Other than above: The related option bytes are not programmed.

47.8.2 SSAVOFCn — VOF Program completion flag n for Security Setting Area (n = 0,1,7 to 18,40)

This flag indicates that SSAVOFn is programmed or not.
The relation between each SSAVOFCn and option bytes are shown in **Table 47.11**.
This flag is prepared to check whether the related option bytes are programmed or not by user program.
This flag will be updated automatically when programming Security Setting Area.
The updated value will be 5AA5 $A55A_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Address: <SSAk_base> + 0100_H + 04_H x n

Value at the shipping: 5AA5 $A55A_H$ (valid area)
Erased (invalid area)

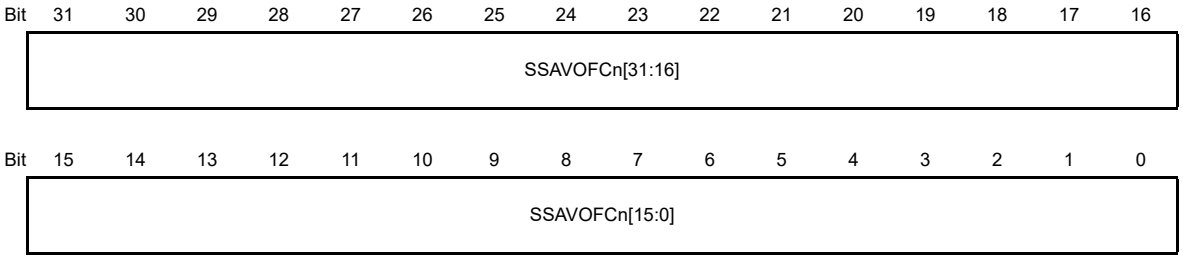

Table 47.13 SSAVOFCn Contents

Bit Position	Bit Name	Function
31 to 0	SSAVOFCn [31:0]	SSAVOFn Program completion flag. 5AA5 $A55A_H$: SSAVOFn is programmed. Other than above: SSAVOFn is not programmed.

47.8.3 S_OPBT0 — OCD ID Related Option Byte

OCD ID authentication is necessary to program these data.

When all bits of OCD ID are “1” or “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + 0300_H

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

Bit Position	Bit Name	Function
31	JPDBGIF_EN	Security level 2 setting 1: Unset security level 2 (can use debug interface) 0: Set security level 2 (can not use debug interface)
30	DRDY_EN	Switching of the DRDY use for Nexus 1: Use DRDY 0: Not use DRDY(Use as GPIO)
29 to 25	Reserved	Set the value of valid area at the shipping.
24	CPUBTMSK_EN	PE0 boot mask enable (when the $\overline{TRST}$ = H mode only) 0: PE0 boot mask disable 1: PE0 boot mask enable
23 to 1	Reserved	Set the value of valid area at the shipping.
0	OIDDIS	OCD ID Authentication Disable 0: ID authentication is disabled (Can not entry Debug mode) 1: ID authentication is enabled

47.8.4 S_OPBT3 — Customer ID A Related Option Byte

Customer ID A authentication is necessary to program these data.

When all bits of Customer ID A are “1” or “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + $030C_H$

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

31 to 17	Reserved	Set the value of valid area at the shipping.
16	DFRPF	Data Flash Read Protection Flag. Controlling section password authentication for Data Area read access at debug mode. 0: Data Flash ID authentication for read access is needed. 1: Data Flash ID authentication for read access is not needed.
15 to 1	Reserved	Set the value of valid area at the shipping.
0	DPROT	Data Flash Erase/Write protection Flag. Controlling section password authentication for Data Area Erase / Write access. 0: Data Flash ID authentication for Erase/Write access is needed. 1: Data Flash ID authentication for Erase/Write access is not needed.

47.8.6 S_OPBT5 — Serial Programmer ID Related Option Byte

Serial Programmer ID authentication is necessary to program these data.

When all bits of Serial Programmer ID are “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <SSAk_base> + 0314_H

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

0	SPD	Serial Programmer Disable 0: All serial programmer commands is disabled by boot firmware. 1: Serial programmer commands is enabled.

47.8.7 S_OPBT6 — RHSIF ID Related Option Byte [For U2A-EVA/U2A16/U2A8 only]

RHSIF ID authentication is necessary to program these data.

When all bits of RHSIF ID are “1” or “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <SSAk_base> + 0318_H

Value at the shipping: FFFE $FFFF_H$ (valid area)
Erased (invalid area)

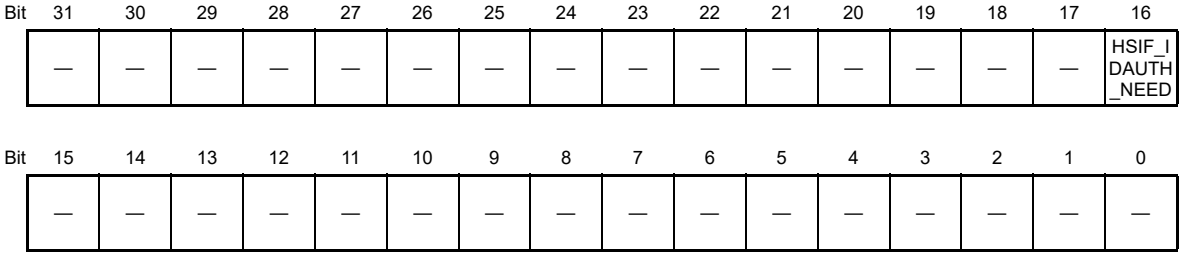

Table 47.18 S_OPBT6 Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	Set the value of valid area at the shipping.
16	HSIF_IDAUTH_NEED	RHSIF Link Partner Authentication Setting 0: RHSIF ID authentication for Link Partner access is not needed. 1: RHSIF ID authentication for Link Partner access is needed.
15 to 0	Reserved	Set the value of valid area at the shipping.

47.8.8 S_OPBT7 — Debugging and Calibration related Option Byte

OCD ID authentication and Customer ID A authentication (CFRPF bit of S_OPBT3 is 0) are necessary to program these data.

When all bits of Protection ID are “1”, the ID authentication are not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + $031C_H$

Value at the shipping: FDFF $FFFF_H$ (valid area)
Erased (invalid area)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AUDREN*1

Note 1. This bit is available in U2AEVA only. For U2A16/U2A8/U2A6, this bit is reserved.

Table 47.19 S_OPBT7 Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	Set the value of valid area at the shipping.
24	DDRSTDIS	[For U2A-EVA] Reserved. Set the value of valid area at the shipping. [For U2A16/U2A8/U2A6] Debugger Disconnection Reset Control Flag 0: Debugger Disconnection Reset is enabled. 1: Debugger Disconnection Reset is disabled.
23 to 17	Reserved	Set the value of valid area at the shipping.
16	OVERLAYEN	Overlay function enable/disable 0: Overlay function of CFU, GCFU is disabled. 1: Overlay function of CFU, GCFU can be enabled.
15 to 1	Reserved	Set the value of valid area at the shipping.
0	AUDREN	[For U2A-EVA Only] AUDR monitor enable 0: AUDR is disabled. 1: AUDR is enabled.

47.8.9 OCDIDn — OCD ID (n = 0 to 7)

OCD ID authentication is necessary to read / program these data.

When all bits of OCD ID are “1” or “0”, the ID authentication is not necessary to read / program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <SSAk_base> + 0320_H + 04_H x n

Value at the shipping: FFFF $FFFF_H$ (valid area)
Erased (invalid area)

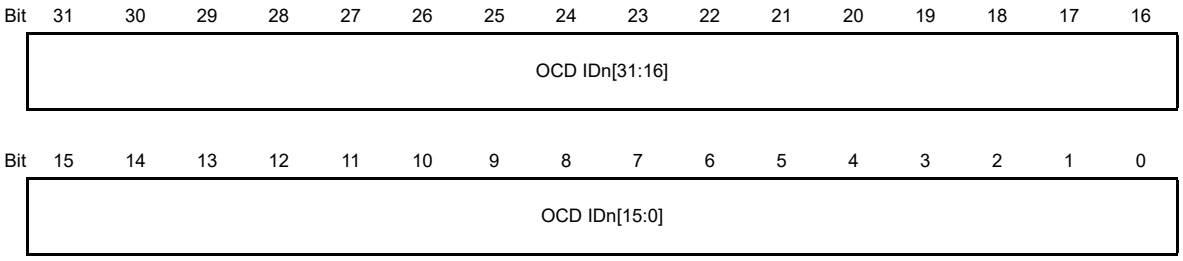

Table 47.20 OCDIDn Contents

Bit Position	Bit Name	Function
31 to 0	OCD ID	ID Code for On-chip debug connection authentication. Bit mapping table is as follows: OCD ID[31:0]: OCDID0[31:0] OCD ID[63:32]: OCDID1[31:0] … OCD ID[255:224]: OCDID7[31:0]

47.8.10 SPIDn — Serial Programmer ID (n = 0 to 7)

Serial Programmer ID authentication is needed for read/program these data.

When all bits of Serial Programmer ID are “0”, the ID authentication is not necessary to read/program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <SSAk_base> + 0340_H + 04_H x n

Value at the shipping: FFFF $FFFF_H$ (valid area)
Erased (invalid area)

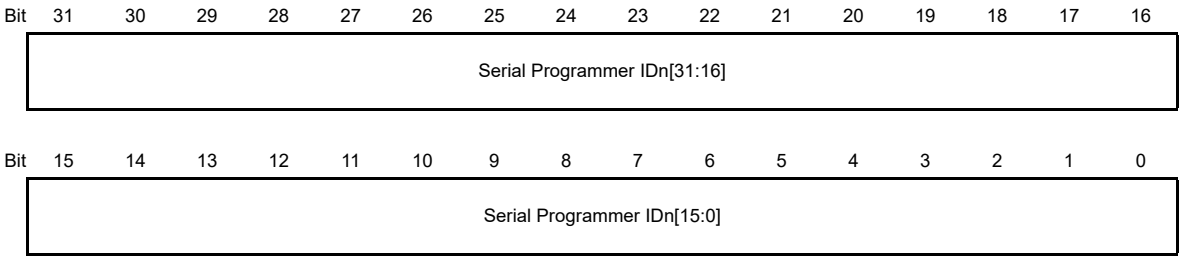

Table 47.21 SPIDn Contents

Bit Position	Bit Name	Function
31 to 0	Serial Programmer ID	ID Code for Serial Programmer authentication. Bit mapping table is as follows: Serial Programmer ID[31:0]: SPID0[31:0] Serial Programmer ID[63:32]: SPID1[31:0] … Serial Programmer ID[255:224]: SPID7[31:0]

47.8.11 CUSTOMERIDn — Customer ID A (n = 0 to 7)

Customer ID A authentication is needed for read / program these data.

When all bits of Customer ID A are “1” or “0”, the ID authentication is not necessary to read / program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + 0360_H + 04_H x n

Value at the shipping: FFFF $FFFF_H$ (valid area)
Erased (invalid area)

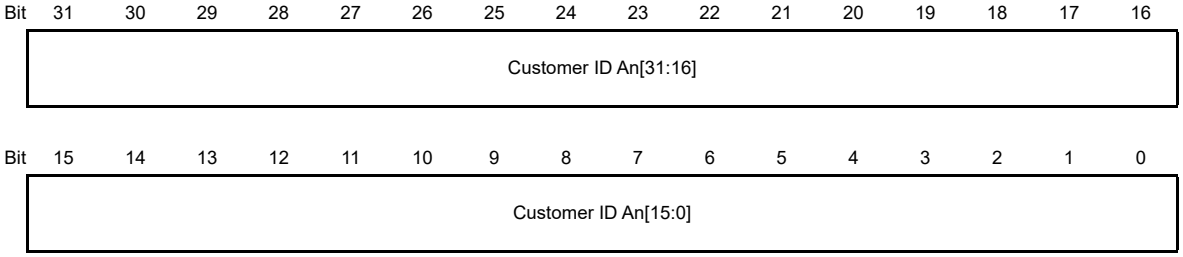

Table 47.22 CUSTOMERIDn Contents

Bit Position	Bit Name	Function
31 to 0	Customer ID A	ID Code for Code Flash Protection, Configuration setting and etc. Bit mapping table is as follows: Customer ID A[31:0]: CUSTOMERID0[31:0] Customer ID A[63:32]: CUSTOMERID1[31:0] … Customer ID A[255:224]: CUSTOMERID7[31:0]

47.8.12 DATAFLASHIDn — Data Flash ID (n = 0 to 7)

Data Flash ID authentication is needed for read / program these data.

When all bits of Data Flash ID are “1” or “0”, the ID authentication is not necessary to read / program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <SSAk_base> + 0380_H + 04_H x n

Value at the shipping: FFFF $FFFF_H$ (valid area)
Erased (invalid area)

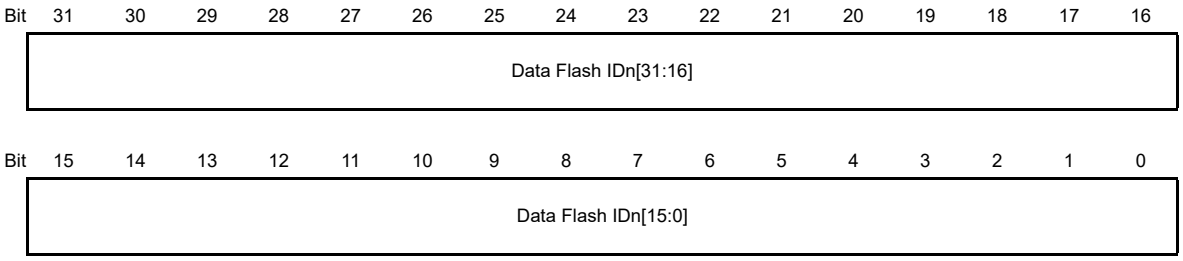

Table 47.23 DATAFLASHIDn Contents

Bit Position	Bit Name	Function
31 to 0	Data Flash ID	ID Code for Data Area Protection. Bit mapping table is as follows: Data Flash ID[31:0]: DATAFLASHID0[31:0] Data Flash ID[63:32]: DATAFLASHID1[31:0] … Data Flash ID[255:224]: DATAFLASHID7[31:0]

47.8.13 RHSIFIDn — RHSIF ID (n = 0 to 7) [For U2A-EVA/U2A16/U2A8 only]

RHSIF ID authentication is needed for read / program these data.

When all bits of RHSIF ID are “1” or “0”, the ID authentication is not necessary to read/program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <SSAk_base> + $03C0_H$ + 04_H x n

Value at the shipping: FFFF $FFFF_H$ (valid area)
Erased (invalid area)

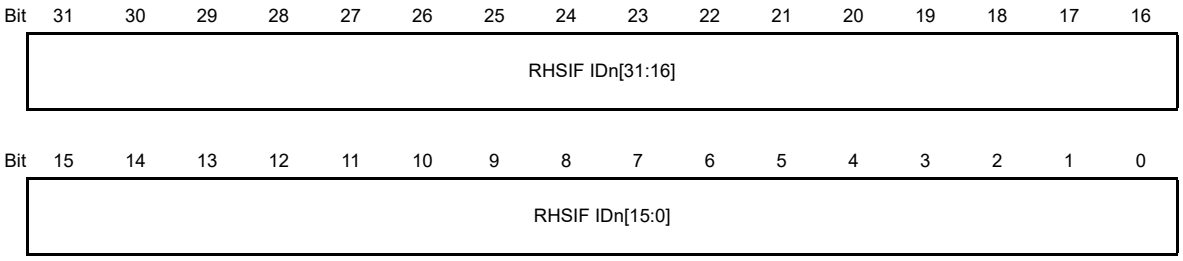

Table 47.24 RHSIFIDn Contents

Bit Position	Bit Name	Function
31 to 0	RHSIF ID	ID Code for RHSIF Link Partner connection authentication. Bit mapping table is as follows: RHSIF ID[31:0]: RHSIFID0[31:0] RHSIF ID[63:32]: RHSIFID1[31:0] … RHSIF ID[255:224]: RHSIFID7[31:0]

47.8.14 CUSTOMERIDBn — Customer ID B (n = 0 to 7)

Customer ID B authentication is needed for read/program these data.

When all bits of Customer ID B are “1” or “0”, the ID authentication is not necessary to read/program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + $03E0_H$ + 04_H x n

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

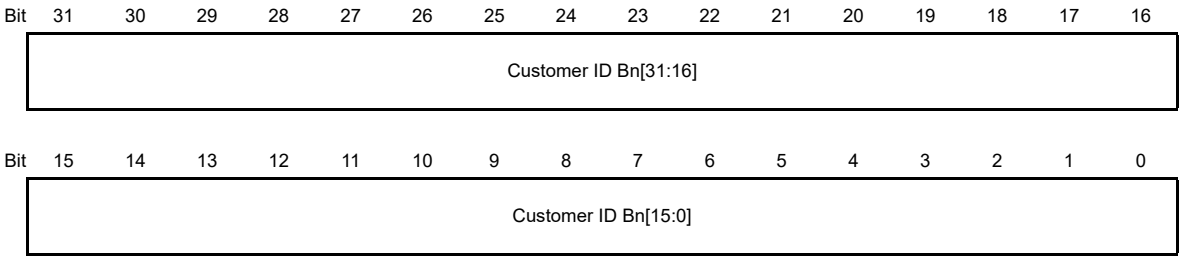

Table 47.25 CUSTOMERIDBn Contents

Bit Position	Bit Name	Function
31 to 0	Customer ID B	ID Code for Code Flash Protection, Bit mapping table is as follows: Customer ID B[31:0]: CUSTOMERIDB0[31:0] Customer ID B[63:32]: CUSTOMERIDB1[31:0] … Customer ID B[255:224]: CUSTOMERIDB7[31:0]

47.8.15 CUSTOMERIDCn — Customer ID C (n = 0 to 7)

Customer ID C authentication is needed for read/program these data.

When all bits of Customer ID C are “1” or “0”, the ID authentication is not necessary to read/program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SSAk_base> + 0400_H + 04_H x n

Value at the shipping: FFFF $FFFF_H$ (valid area)
Erased (invalid area)

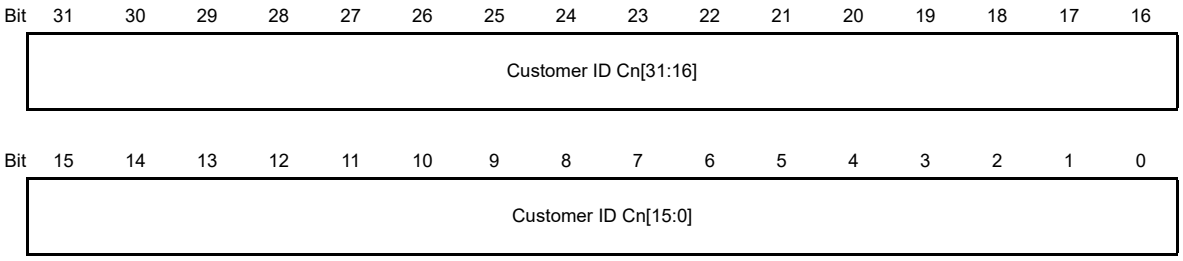

Table 47.26 CUSTOMERIDCn Contents

Bit Position	Bit Name	Function
31 to 0	Customer ID C	ID Code for Code Flash Protection Bit mapping table is as follows: Customer ID C[31:0]: CUSTOMERIDC0[31:0] Customer ID C[63:32]: CUSTOMERIDC1[31:0] … Customer ID C[255:224]: CUSTOMERIDC7[31:0]

47.9 Block Protection Area for FPSYS0/FPSYS1

Block Protection Area for each FPSYSn (n = 0,1) consists of two areas (Area 0 and Area 1). Valid area is mapped in front side, Invalid area is mapped in back side. Valid area cannot be updated whereas Invalid area can be updated.

Area 0 is selected as valid area at the shipping from RENESAS.

Area 1 is selected as invalid area and erased at the shipping from RENESAS.

The flash memory has the area to store a data specified by the user for Block Protection settings. Changes in settings become effective after TAG update without reset. Valid/Invalid area switching for read access also becomes effective without reset.

Do not issue reprogramming of user/data area or Extended data area without reset after changing the settings of Block Protection.

Block Protection Area can be protected by the following functions.

(1) ID authentication
When ID authentication protection is effective, Block protection which is protected by the ID authentication is not changed by "Property Programming" command (the data will be copied from valid area automatically regardless of the input programming data), and flash sequencer does not enter "Command Lock" state. Invalid area of Block protection area always can be erased by "Property Erasure" command regardless of ID authentication. Block protection area can be protected from programming by Customer ID A.
This protection doesn't affect the access from ICUMHA.

(2) Protection against "Property Programming" and "Property Erasure" command Block Protection Area for FPSYS1 cannot be erased/programmed while "TAG update/TAG erasure" command is being issued.

(3) Clear protection against "Property Programming" command
OTP setting bits cannot be changed from "0" to "1" by "Property Programming" command.

Table 47.27 and **Table 47.28** show Block Protection Area. For setting and reading these areas, see the *Renesas Flash Programmer Flash Programming Software User's Manual*, or the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Customer ID Protection & Erase Counter Setting for user area3*5	<BPA1k_base>+ (0440_H to $047C_H$)	All FFFF FFFF$_H$	Customer ID A	—	18 to 19
Reserved(need to be programmed)*6	<BPA1k_base>+ (0480_H to $05FC_H$)	All FFFF FFFF$_H$	Customer ID A	—	20 to 31
Reserved*8	<BPA1k_base>+ (0600_H to $07FC_H$)	Erased	Can not Write*8	—*8	—

Note 1. This is the value of valid area at the shipping. Invalid area is erased at the shipping.

Note 2. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary for programming the data.

Note 3. When On-chip debug and S_OPBT3.CFRPF is “0”, the Customer ID A authentication is needed to read.

Note 4. For details of this function, see **Section 47.5.2, OTP (One Time Programmable) Function**.

Note 5. For details of this function, see **Section 47.9.5, Block Protection/Erase Counter Enable setting for User Area, User Boot Area, Extended Data Area**.

Note 6. For this reserved area, program FFFF FFFF$_H$ when programming Block Protection Area for each FPSYS.

Note 7. This area will be updated automatically when programming Block Protection Area for each FPSYS.

Note 8. This area cannot be programmed. When this area is read, it behaves as if it is erased.

Note 9. For details of this function, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Note 10. <BPA0k_base> (k = f, b), <BPA1k_base> (k = f, b)

47.9.1 BPA0VOFn — Valid Option Byte Flag n for Block Protection Area for FPSYS0 (n = 0 to 7,15 to 31,39)

This flag indicates that the related option bytes are programmed or not.
The relation between each BPA0VOFn and option bytes are shown in **Table 47.27**.
This flag is referred by flash sequencer in order to check whether the related option bytes are programmed or not.
This flag will be updated automatically when programming Block Protection Area for FPSYS0.
The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Address: <BPA0k_base> + 0000$_H$ + 04$_H$ x n

Value at the shipping: 5AA5 A55A$_H$ (valid area)
Erased (invalid area)

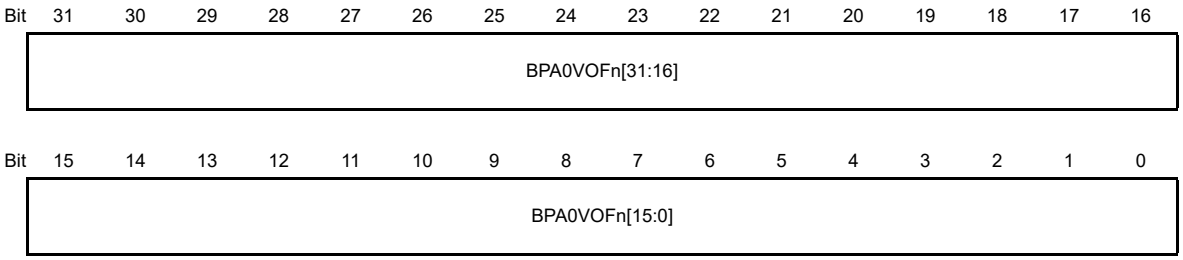

Table 47.29 BPA0VOFn Contents

Bit Position	Bit Name	Function
31 to 0	BPA0VOFn [31:0]	Program completion flag. 5AA5 A55A$_H$: The related option bytes are programmed. Other than above: The related option bytes are not programmed.

47.9.2 BPA0VOFCn — VOF Program completion flag n for Block Protection Setting Area for FPSYS0 (n = 0 to 7,15 to 31,39)

This flag indicates that BPA0VOFn is programmed or not.
The relation between each BPA0VOFCn and option bytes are shown in **Table 47.27**.
This flag is prepared to check whether the related option bytes are programmed or not by user program.
This flag will be updated automatically when programming Block Protection Area for FPSYS0.
The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <BPA0k_base> + 0100$_H$ + 04$_H$ x n

Value at the shipping: 5AA5 A55A$_H$ (valid area)
Erased (invalid area)

Table 47.30 BPA0VOFCn Contents

Bit Position	Bit Name	Function
31 to 0	BPA0VOFCn [31:0]	BPA0VOFn Program completion flag. 5AA5 A55A$_H$: BPA0VOFn is programmed. Other than above: BPA0VOFn is not programmed.

47.9.3 BPA1VOFn — Valid Option Byte Flag n for Block Protection Area for FPSYS1 (n = 0 to 7,16 to 31)

This flag indicates that BPA1VOFn is programmed or not.
The relation between each BPA1VOFn and option bytes are shown in **Table 47.28**.
This flag is referred by flash sequencer in order to check whether the related option bytes are programmed or not.
This flag will be updated automatically when programming Block Protection Area for FPSYS1.
The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Address: <BPA1k_base> + 0000$_H$ + 04$_H$ x n

Value at the shipping: 5AA5 A55A$_H$ (valid area)
Erased (invalid area)

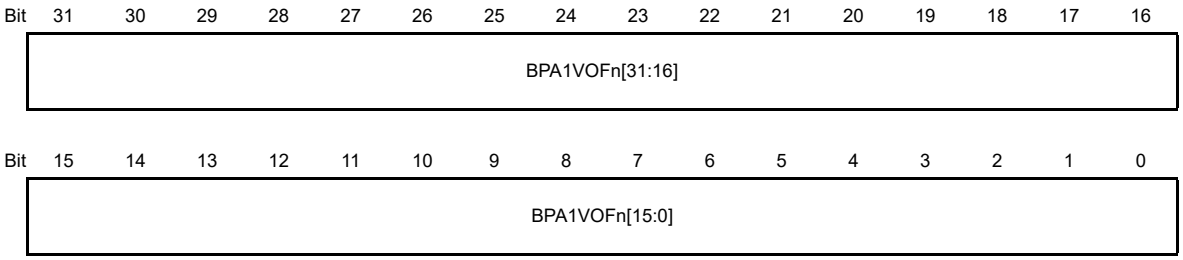

Table 47.31 BPA1VOFn Contents

Bit Position	Bit Name	Function
31 to 0	BPA1VOFn [31:0]	Program completion flag. 5AA5 A55A$_H$: The related option bytes are programmed. Other than above: The related option bytes are not programmed.

47.9.4 BPA1VOFCn — VOF Program completion flag n for Block Protection Area for FPSYS1 (n = 0 to 7,16 to 31)

This flag indicates that BPA1VOFn is programmed or not.
The relation between each BPA1VOFCn and option bytes are shown in **Table 47.28**.

This flag is prepared to check whether the related option bytes are programmed or not by user program.
This flag will be updated automatically when programming Block Protection Area for FPSYS1.
The updated value will be 5AA5 $A55A_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <BPA1k_base> + 0100_H + 04_H x n

Value at the shipping: 5AA5 $A55A_H$ (valid area)
Erased (invalid area)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

47.9.5 Block Protection/Erase Counter Enable setting for User Area, User Boot Area, Extended Data Area

For details of this function, see **Section 47.5, Code Flash/Data Area Protection** and **Section 51.15, Erase Counter Area**.

Non-secure Code flash can be protected from Programming/Erase by Customer ID A, B or C authentication which has a function called Block Protection. Erase Counter can be enabled/disabled for each erase block respectively. These functions can be set by 4 bits per Block of code flash.

Table 47.33 Customer ID and Erase Counter Setting 4 bit setting per block

Customer ID & Erase Counter Setting 4 bit setting per block	
Bit 3	OTP setting for ID Protection Setting*2
Bit 2	Erase Counter enable setting*1*2 0: Erase Counter of the block is enabled. 1: Erase Counter of the block is disabled.
Bit 1 to 0	ID selection 00_B: Customer ID C 01_B: Customer ID B 10_B: Customer ID A 11_B: No ID

Note 1. Erase counter is not supported for Extended Data Area.

Note 2. These bits are one time programmable (OTP) and user cannot return these bits to 1 once these bits are set to 0.

Table 47.34 Mapping of Block Protection/Erase Counter Enable Setting (User Area m and User Boot Area m) (m*1 = 0, 1) (k = f, b)

Address	**Bit**	**Protection Area**
<BPA0k_base>+ 0400_H+ 40_H x m	[3:0]	Block 0 of User Area m
	[7:4]	Block 1 of User Area m
	[11:8]	Block 2 of User Area m
	[15:12]	Block 3 of User Area m
	[19:16]	Block 4 of User Area m
	[23:20]	Block 5 of User Area m
	[27:24]	Block 6 of User Area m
	[31:28]	Block 7 of User Area m
:	:	:
<BPA0k_base>+ 0420_H+ 40_H x m	[3:0]	Block 64 of User Area m
	[7:4]	Block 65 of User Area m
	[11:8]	Block 66 of User Area m
	[15:12]	Block 67 of User Area m
	[19:16]	Block 68 of User Area m
	[23:20]	Block 69 of User Area m
	[31:24]	Reserved
<BPA0k_base>+ (0424_H to 0438_H) + 40_H x m	[31:0]	Reserved*2
<BPA0k_base>+ $043C_H$ + 40_H x m	[27:0]	Reserved
	[31:28]	User Boot Area m

Note 1. Block Protection/Erase Counter Enable setting area of m = 0 is shared with User Area 1, User Boot Area 1 when Double Map Mode. Block Protection/Erase Counter Enable setting area of m = 1 is reserved when Double Map Mode.

Note 2. These reserved words need to be programmed when programming Block Protection Area for FPSYS0.

Table 47.35 Mapping of Block Protection (Extended Data Area) (k = f, b)

Address	Bit	Protection Area
<BPA0k_base>+ $06E0_H$	[3:0]	Extended Data Area
	[31:4]	Reserved

Table 47.36 Mapping of Block Protection/Erase Counter Enable Setting (User Area m) (m[*1] = 2, 3) (k = f, b) [For U2A-EVA U2A16 mode/U2A16]

Address	Bit	Protection Area
<BPA1k_base>+ 0400_H+ 40_H x (m - 2)	[3:0]	Block 0 of User Area m
	[7:4]	Block 1 of User Area m
	[11:8]	Block 2 of User Area m
	[15:12]	Block 3 of User Area m
	[19:16]	Block 4 of User Area m
	[23:20]	Block 5 of User Area m
	[27:24]	Block 6 of User Area m
	[31:28]	Block 7 of User Area m
:	:	:
<BPA1k_base>+ 0420_H+ 40_H x (m - 2)	[3:0]	Block 64 of User Area m
	[7:4]	Block 65 of User Area m
	[11:8]	Block 66 of User Area m
	[15:12]	Block 67 of User Area m
	[19:16]	Block 68 of User Area m
	[23:20]	Block 69 of User Area m
	[31:24]	Reserved
<BPA1k_base>+ 0424_H to $043C_H$ + 40_H x (m - 2)	[31:0]	Reserved[*2]

Note 1. Block Protection/Erase Counter Enable setting area of m = 2 is shared with User Area 3 when Double Map Mode.
Block Protection/Erase Counter Enable setting area of m = 3 is reserved when Double Map Mode.

Note 2. These reserved words need to be programmed when programming Block Protection Area for FPSYS1.

47.10 Switch Area

Switch Area can be protected by the following functions.

(1) ID authentication
When Customer ID A authentication protection is effective, invalid area of Switch Area is not changed by "Switch Programming", "Switch Erasure" command, and flash sequencer enters "Command Lock" state.
This protection doesn't affect the access from ICUMHA.

47.11 TAG Area

TAG Area can be protected by the following functions.

(1) ID authentication
When Customer ID A authentication protection is effective, TAG Area is not changed by "TAG Update", "TAG Erasure" command, and flash sequencer enters "Command Lock" state.
This protection doesn't affect the access from ICUMHA.

47.12 Usage Note

(1) OTP setting for Double Map Mode
The setting for User Area 0 also affects User Area 1, the setting for User Area 2 also affects User Area 3, the setting for User Boot Area 0 also affects User Boot Area 1 in case of Double Map Mode.
Make sure that the contents of the block in both valid and invalid area is completely same before setting the OTP of the block. Otherwise, unintentional fallback may happen when switching the valid area and invalid area of User Area/User Boot Area.

(2) Counter measure for prohibiting unsuitable fallback
The settings of this product can be fallback by updating Switch/TAG area if the old settings still remain in the invalid area of Configuration setting/Security setting/Block protection area.
It means that the security function such as OTP/Block protection setting is also able to be fallback.
It is necessary to erase the old settings in invalid area or copy the new settings to invalid area after the old settings become unnecessary in order to prohibit unsuitable fallback.

(3) P6_15, P10_7, P10_8 can be used for security function
Do not enable pull-up resistor or output of P6_15 when the security function is used.
For details of the security function, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Section 48 Intelligent Cryptographic Unit/Master (ICUMHA)

The Intelligent Cryptographic Unit/Master (ICUMHA) is a hardware security module (HSM). ICUMHA can be activated by Option Byte setting.

This section describes about resources in which an accessibility is controlled by ICUMHA when ICUMHA is activated. For details of ICUMHA, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

48.1 Overview

48.1.1 Number of Units

This microcontroller has the following number of units.

Table 48.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1	1	1	1	1	1	1	1	1	1
Name	ICUMHAn (n = 0)									

48.1.2 Features

The Intelligent Cryptographic Unit/Master (ICUMHA) is a hardware security module (HSM).

The features of ICUMHA are described below.

- ICUMHA integrates an Intelligent Cryptographic Unit Processor (ICUP) that controls the ICUMHA sub-system and runs the user-defined security services.
- ICUMHA integrates an accelerator that supports a block cipher algorithm based on the AES (Advanced Encryption Standard, FIPS PUB 197).
- ICUMHA integrates several public key cryptographic algorithms like RSA, ECC.
- ICUMHA integrates an accelerator that supports HASH function based on SHA-1, SHA-224 and SHA-256 (Secure Hash Algorithm, FIPS-PUB 180).
- ICUMHA integrates a true random number generator.
- ICUMHA can be used as a slave peripheral to run security services upon request. Also the ICUMHA handles processing of other user-defined security services (for example, checking contents of memory for completeness and integrity) and operates as a master handling procedure to strengthen measures for security.
- ICUMHA has an exclusive read access and programming access to a specific area of non-volatile (flash) memory which contains confidential data (keys and certificates) and highly confidential code for operating security services.

48.2 ICUM_CMDREG

48.2.1 Registers

48.2.1.1 ICUM_ACTFLAG – ICUMHA Activating Flag Register

This register indicates active state of ICUMHA.

Access: This register can be read in 32-bit units.

Address: FF1F 0018$_H$

Value after reset: Specified by user

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ICUP R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
CPU (PE) R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICUMACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0/1*1	0/1*1
ICUP R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
CPU (PE) R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. This value is dependent on the value in the flash memory which is specified by the user.

Table 48.2 ICUM_ACTFLAG Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ICUMACT[1:0]	ICUMHA active status 00: ICUMHA is inactive 11: ICUMHA is active

48.3 Clock Monitor

For details of clock monitor for ICUMHA (CLMAS), see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

48.3.1 Interrupt Requests and Error Notifications

This module has no interrupt requests for CPU(PE).

The error notifications of this module are listed in the following table.

Table 48.3 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
Clock monitor error for CLK_HBUS	CLMAS over/under frequency error	53	—

48.4 Flash Memory

48.4.1 Programming Sequence while ICUMHA is Enabled

If the ICUMHA is enabled, arbitration between the ICUP and CPU(PE) by software is required to avoid flash access conflict. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

48.5 Operation

48.5.1 Enabling ICUMHA

CAUTION

When ICUMHA is enabled, default start mode (WDTBA) must be disabled.

Always select software trigger start mode by setting OPBT0.OPWDRUNA = 0.
For OPBT0, see Section 51.12.7, OPBT0 — Option Byte 0.

Section 49 Secure Watchdog Timer (SWDT)

About SWDT, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Section 50 Debugging and Calibration

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001™-2003 Class 1, a Nexus debug interface standard.

Production devices support Nexus Class 1 debug functionality. Emulation devices support Nexus Class 3 debug functionality.

CAUTION

The debug functions described in this section are supported by the microcontroller but whether these functions can actually be used depends on the debugger. For details on debugging, see the user's manual of the debugger.

50.1 Debug Interface

This microcontroller supports the following debug interfaces:

(1) Nexus JTAG Interface

(2) Low Pin Count Debug Interface (4-pin) (LPD4).

(3) In U2A-EVA emulation devices, a 4-lane Aurora trace port is provided.

(4) Trigger Input / Output pin ($\overline{\text{EVTI}}$/$\overline{\text{EVTO}}$)

On-chip debugging can be performed by using these debug interfaces.

Table 50.1 Debug Interface Modes

Serial programming mode*1	Normal operating mode/user boot mode*1	Debug ports		Option bytes*3		
2-wire UART/ CSI*4		$\overline{\text{TRST}}$	TDI (JP0_0)*2	DRDY_EN	JPDBGIF_EN	JP0 port usage
1	0	x	x	x	x	Serial programming *5
0	1	0	x	x	0	GPIO
0	1	0	x	x	1	GPIO*8
0	1	1	0	x	0	GPIO (security level 2 *6)*7
0	1	1	0	x	1	LPD4 *8
0	1	1	1	x	0	JTAG Boundary Scan(security level 2*6)
0	1	1	1	1	1	Nexus (with $\overline{\text{DRDY}}$) & JTAG Boundary Scan*8
0	1	1	1	0	1	Nexus (without $\overline{\text{DRDY}}$) & JTAG Boundary Scan*8

Note: x = don't care

Note 1. For details, see **Section 5, Operating Modes**.

Note 2. Latch output at rising edge of $\overline{\text{TRST}}$.

Note 3. For details, see **Section 47, Basic Hardware Protection (BHP)**.

Note 4. For details, see **Section 51, Flash Memory**.

Note 5. Boot firm changes the function of the terminal to 2-wire UART or CSI interface.

Note 6. For details, see **Section 47, Basic Hardware Protection (BHP)**.

Note 7. Operation at the time of reset assertion in the data output is not guaranteed. When use GPIO, $\overline{\text{TRST}}$ must be "0".

Note 8. The JP0 port register settings must be their initial value.

50.2 Run Control Functions

(1) Debug functions

These basic debug functions are implemented:

- Downloading a user-created program
- Reading and writing the memory and registers
- Running a user-created program starting at any address

(2) On-chip break functions

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for the data access address. Asynchronous Break function is supported.

The following break functions are supported:

- Relay break function: Each CPU can be configured to stop when another CPU hits a breakpoint.
- Individual break function: Each CPU can be configured to continue executing when another CPU hits a breakpoint.

CAUTION

Whether the individual break function can be used or not depends on the debugger.

(3) Software break function

Software breakpoints can be specified at any execution address.

(4) Forced break function

Execution of a user-created program can be interrupted forcibly by a debugger.

(5) Peripheral break control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

(6) Forced reset function

This device (microcontroller) can be forcibly reset by a debugger.

(7) Reset mask function

A reset factor (external reset, software reset, and ECM reset) can be masked.

(8) Event detection function

Events can be detected based on execution address, data access address, data value, data value range, and sequential execution.

(9) Trigger input interface

This microcontroller incorporates an event trigger input interface to acknowledge external events. It can acknowledge an external event in response to an input from the $\overline{\text{EVTI}}$ pin.

(10) Trigger output interface

An event trigger output interface is included in this microcontroller to notify an external debug device of event detection. Output from the $\overline{\text{EVTO}}$ pin reports detection of an event trigger to the outside. Debug trigger registers control trigger output to an external debug device via a request from the CPU. Up to eight debug trigger registers are supported. Each register supports 32 software triggers.

When $\overline{\text{TRST/LPDRST}}$ is low level, the system reset signal is output from $\overline{\text{EVTO}}$.

(11) Debug interrupt interface function

Execution of a user program can be forcibly suspended by asserting an input signal on the $\overline{\text{EVTI}}$ pin from the outside.

(12) Multi core debug function

The following multi-core debug functions are supported for each CPU: synchronization functions (including reset, execution, and break), synchronous setting, and simultaneous tracing for multiple cores.

50.3 Calibration Functions

This microcontroller includes emulation RAM as emulation memory for the on-chip flash memory.

(1) Real-time RAM monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

(2) Dynamic memory modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

(3) Emulation RAM (ERAM) [For U2A-EVA and U2A6 Only]

The Emulation RAM (CERAM and GERAM) is available in the Code Flash Emulation Function. The ROM data can be dynamically modified during execution of a user program via the Emulation RAM which has mapped to the Code Flash area.

(4) Calibration Function Unit (CFU) [For U2A-EVA and U2A6 Only]

The Calibration Function Unit (CFU) controls access to Cluster ERAM of Flash emulation memory.

(5) Global Calibration Function Unit (GCFU)

The Global Calibration Function Unit (GCFU) controls access to Global ERAM [For U2A-EVA only] and Cluster RAM of Flash emulation memory [For U2A16, U2A8].

50.4 Trace Control Functions

This microcontroller provides several trace functions including branch PC trace and data trace for each CPU, and DMA data trace.

(1) Trace RAM [For U2A-EVA and U2A6 Only]

This microcontroller has 64 KB of trace RAM [For U2A-EVA only], 32KB of trace RAM [For U2A6 only]. The trace information in the trace RAM is accessible via Nexus and LPD4 debug interfaces.

(2) Trace filter RAM [For U2A-EVA and U2A6 Only]

- Advanced data trace filtering allows selection of small 4 byte sections of data which can be individually enabled for data trace.
- Trace filter RAM does not have ECC.

(3) Software trace

This function enables the obtaining of user program execution histories, data changes, etc. The software trace information can be output to the trace RAM or via LPD4, Aurora debug interface.

(4) Trace over reset

Remaining trace data is output after a reset.

(5) Global timestamp information

The global timestamp information is the absolute time from (absolute time 0) when the trace buffer is cleared.

(6) The trace message format conforms to the Nexus standard

(7) Windowed instruction trace or data trace

50.5 Performance Measurement Function

This microcontroller provides a two-event interval time difference measurement function to measure the time difference between the points at which two events occur.

(1) Two-event interval time difference measurement function

- Provides a function to measure the time difference (maximum time, minimum time, accumulation time) between two events (measurement start event to measurement stop event).
- Provides a function to measure the number of measurements (the number of measurement stop events) for two-event intervals (measurement start event to measurement stop event).
- Provides a threshold value violation detection function for two-event intervals (measurement start event to measurement stop event).
- Measurement clock: Debugging clock or CPU clock
- Measurement counter: 32-bit counter × 4 channels
- Measurement items: Maximum value, minimum value, accumulation value, measurement count (measurement stop event count)
- Count conditions: Number of debugging clock cycles, measurement count (measurement stop event count); number of CPU clock cycles, instruction execution or other events.
- Measurement limitations: When the interval between the measurement start event and the measurement stop event (from measurement start to measurement stop) or between a measurement stop event and the next measurement start event (from measurement stop to measurement start) is short, it may not be possible to correctly detect the measurement start or measurement stop events due to synchronization processing (from the system clock to the debugging clock).
  Note that the required interval for detection depends on the system clock and the debugging clock frequencies.
- Measurement of the cache hit rate
- Measurement of the number of CPU cycles when a pipeline stall occurred

50.6 Debug Support Function

(1) Hot plug-in function

Debugging can be started in normal operating mode without external reset input.

NOTE

When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up process. About the INTDCUTDI interrupt, refer to Appendix file "**Interrupt_table.xlsx**".

(2) Security function

To prevent the contents of the flash memory from being read by an unauthorized person, a 256-bit ID code must be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code in the microcontroller, the flash memory cannot be accessed.

For details, see **Section 47, Basic Hardware Protection (BHP)**.

(3) Halt after reset

The debugger can control the start of CPU0 after internal reset release.

This must be set by using an option byte. For details, see **Section 47, Basic Hardware Protection (BHP)**.

(4) ICUMHA debug function

For details, see the separate document for security functions.

(5) GTM debug function

For details, see **Section 38, Generic Timer Module (GTM)**.

(6) Device ID function

Device ID (device identification) information can be acquired via the debug interface (Nexus).

(7) Reset output pin

The reset output pin ($\overline{\text{RESETOUT}}$) reflects the state of the internal reset condition.

For details, see **Section 2, Pin Functions**.

50.7 Peripheral Break Control

The peripheral break function generates a stop request for the peripheral modules as a break signal from each CPU if the user-created program is stopped, for instance upon a breakpoint hit.

During peripheral break, the peripheral modules operate as follows:

1. Modules that stop unconditionally regardless of the EPC.SVSTOP setting WDTBn (n = 0 to 3), SWDT0, and TPTMn (n = 0 to 3, Interval timer and Free-run timer)
2. Modules that stop when EPC.SVSTOP = 1 and EPC_SVSTOPn setting OSTMn (n = 0 to 9), ENCAn (n = 0, 1), GTM, ADCn (n = 0 to 2), PWM, RTCA, TSG3n (n = 0, 1), TAUJn (n = 0 to 3), TPBAn (n = 0 to 1), TAUDn (n = 0 to 2), TAPAn (n = 0 to 3), RLIN3n (n = 0 to 23), LTSC, TPTMn (n = 0 to 3, Up timer) and LPS modules
3. Module that stop when EPC_SVSTOP58 setting, but regardless of the EPC.SVSTOP setting WDTBA

50.8 Hot Plug-in in Each Mode

50.8.1 Run Mode

When Hot Plug-in has occurred in Run mode, it is necessary to maintain the current state.

50.8.2 STOP/DeepSTOP Mode

When Hot Plug-in has occurred in STOP/DeepSTOP mode, it is necessary to transfer in RUN mode.

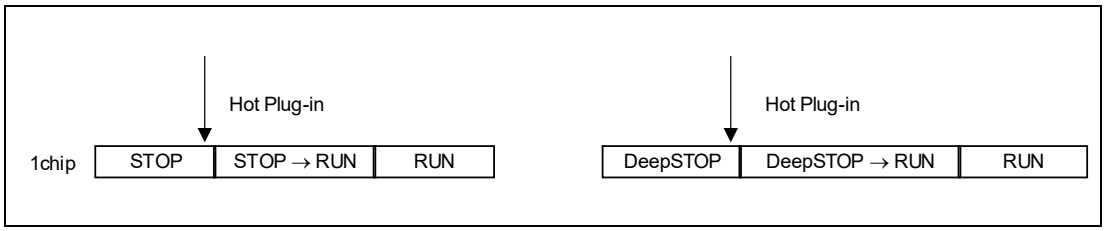

Figure 50.1 Hot Plug-in in STOP/DeepSTOP Mode

50.8.3 Cyclic RUN Mode

When Hot Plug-in has occurred in Cyclic Run mode, it is necessary to transfer in DeepSTOP mode and wakeup to RUN mode by the following reason.

All regulators in ISO are made operating state in OCD mode.

To do ID authentication, it's necessary to transmit the data of Flash extra.

Then, on the occurrence of interrupt of "DCUTDI Rising Edge Detection interrupt (INTDCUTDI)", it is necessary for a transfer order to be executed to DeepSTOP mode by user (software) if on-chip debugging is performed.

The sequence of the time when to enter to OCD mode in Cyclic RUN mode is mentioned below.

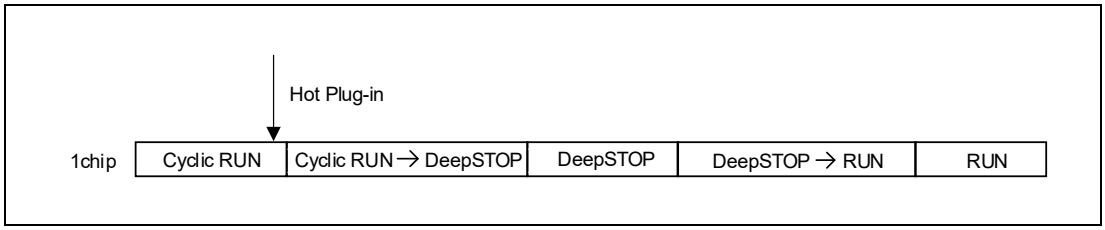

Figure 50.2 Hot Plug-in in Cyclic RUN Mode

50.8.4 Cyclic STOP Mode

When Hot Plug-in has occurred in Cyclic STOP mode, it is necessary to transfer in Cyclic RUN mode.

Then, on the occurrence of wakeup factor of INTDCUTDI, it is necessary for a transfer to be executed as the same case of Cyclic RUN mode.

The sequence of the time when to enter to OCD mode in Cyclic STOP mode is mentioned below.

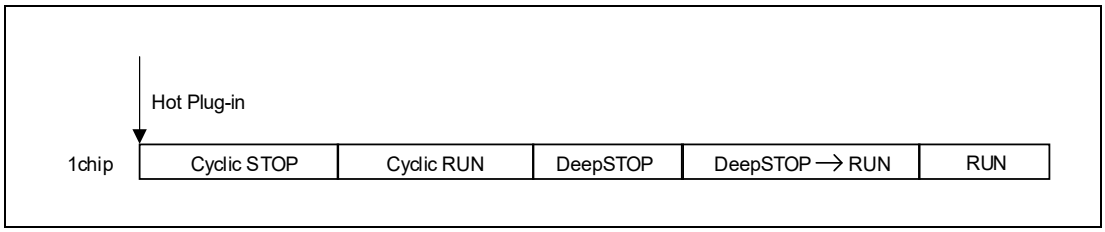

Figure 50.3 Hot Plug-in in Cyclic STOP Mode

50.9 Aurora Trace Interface

50.9.1 Overview

Aurora is lightweight link-layer protocol for communicating over high-speed serial lanes.

Nexus introduces this protocol in IEEE-ISTO 5001-2012 (Nexus standard).

This product supports a simplex TX-only interface. 4-lane is used.

Aurora for this product is fully compatible with Nexus standards and Xilinx's Aurora Protocol spec V2.2.

Table 50.2 shows the Aurora reference documents for this product.

Table 50.2 Reference Documents

Reference Document	Document Name	Reference
Aurora 8b / 10b protocol specification V2.2	aurora_8b10b_protocol_spec_sp002.pdf	http://www.xilinx.com/
The Nexus 5001 Forum™ Standard for a Global Embedded Processor Debug Interface V3.0.1	ieee_isto_5001_2012_301_Final.pdf	http://www.nexus5001.org.

50.10 Advanced User Debugger RAM Monitor (AUDR)

AUD (Advanced User Debugger) RAM monitor (AUDR) is implemented to help debug the user program. AUDR can read or write resources mapped memory space (ex the peripheral register or internal memory) during LSI operation. AUDR can't operate during System Reset.

50.11 Cautions on Using On-Chip Debugger

(1) Handling of devices used for debugging
Do not install a device that was used for debugging on a mass-produced product. This is because the flash memory will be rewritten during system debugging and thus the write / erase count of flash memory cannot be guaranteed.

(2) This product does not support hot plug out for power off (including removal of the connector) of the debug tool during debug mode. Do not turn off the power of the Nexus tool (including removal of the connector) in debug mode.

(3) When ending on-chip debugging, set the $\overline{\text{TRST}}$ pin and external reset pin to low level.

(4) When a debugger is used, the program written to the microcontroller before the OCD emulator is ready to communicate with the microcontroller is executed from the reset vector. To stop the operation of the program, release the $\overline{\text{TRST}}$ before $\overline{\text{RESET}}$.

50.12 Cautions on Using U2A-EVA to Emulate U2A8 Functions [For U2A8 Only]

Though U2A-EVA has U2A8 mode to emulate U2A8, there is a restriction as follows.

Hence, be cautious about the following difference in case of emulating U2A8 by using U2A-EVA.

- In case of accessing to below areas, the behavior of U2A8 is different from U2A-EVA.
  - Areas related to ETNB1 (ETNB1, E7GE00, E7GE01 and HB94MECC)
  - Areas related to MSPI6, MSPI7 and MSPI8 (MSPIn, E7MS0n and MSPInINTIF (n = 6 to 8))
  - Areas related to RLIN3n (n = 12 to 23)

In U2A8 mode of U2A-EVA, the error response is signaled, because these areas are prohibited to access.

(Hence, above functions can not be emulated on U2A8 mode of U2A-EVA.)

In U2A8, above functions including related functions are accessed without error response.

For details, see **Section 4, Address Space**.

50.13 Cautions on Using U2A-EVA to Emulate U2A6 Functions [For U2A6 Only]

U2A-EVA does not have U2A6 mode to emulate U2A6.

Hence, be cautious about the following differences in case of emulating U2A6 by using U2A-EVA.

- Memory size of Flash and RAM (for details, see **Section 1, Overview**)
- Number of IP units and channels (for details, see **Section 1, Overview**)
  ==> Unmapped area access error for unimplemented resources in U2A6 is not supported.

- MSPI RAM area of U2A6 is different from U2A-EVA.

  For details, see **Table 19.19, Areas of MSPI RAM**.

- Especially for RS-CANFD, below configurations of U2A6 are different from U2A-EVA.
  - Memory size of RAM
  - Number of TXMB, AFL entry and RXMB
  - Number of channels per unit

  For details, see **Section 23, CANFD Interface (RS-CANFD)**.

- In case of accessing to FA00 0000_H to FA01 $7FFF_H$, the behavior of U2A6 is different from U2A-EVA.
  In U2A-EVA, Instrumentation RAM is accessed without error response.
  In U2A6, the error response is signaled, because this area is prohibited to access.
  For details, see **Section 4, Address Space**.

Section 51 Flash Memory

This product incorporates Code Flash Memory and Data Flash Memory.

Product Name	Code Flash Memory		Data Flash Memory	
	User Area	User Boot Area	Data Area	Exclusively for ICUMHA
RH850/U2A-EVA (U2A16 mode)	16 Mbytes	2x 64 Kbytes	512 Kbytes	64 Kbytes
RH850/U2A-EVA (U2A8 mode)	8 Mbytes	2x 64 Kbytes	256 Kbytes	64 Kbytes
RH850/U2A16	16 Mbytes	2x 64 Kbytes	512 Kbytes	64 Kbytes
RH850/U2A8	8 Mbytes	2x 64 Kbytes	256 Kbytes	64 Kbytes
RH850/U2A6	6 Mbytes	2x 64 Kbytes	192 Kbytes	64 Kbytes

51.1 Features

51.1.1 Units

This product contains three Flash Programming Systems (FPSYS0, FPSYS1, FPSYS2).

Each FPSYS contains Flash Memory and flash sequencer.

Each flash sequencer contains Flash Application Command Interface (FACI).

51.1.2 Register Base Address

Register base addresses are listed in the following table.

Register addresses are given as offsets from the base addresses in general.

Table 51.1 Register Base Address

Base Address Name	Base Address	Bus Group
<CCIB0_base>	FFFB 0800_H	P-Bus Group 0
<SCDS_base>	FFCD 0000_H	P-Bus Group 6L
<FACI0_base>	FFA1 0000_H	P-Bus Group 6L
<FACI1_base>	FFA1 4000_H	P-Bus Group 6L
<FACI2_base>	FFA1 8000_H	P-Bus Group 6L

51.1.3 Clock Supply

Flash Programming System clock supply is shown in the following table.

Table 51.2 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
FACIn	Peripheral clock	CLK_LSB

51.1.4 Interrupt Requests and Error Notifications

Flash Programming System supports an interrupt to indicate completion of processing by the flash sequencer.

Table 51.3 Interrupt and DMA/DTS Requests

Unit Interrupt Name	Description	Interrupt Number	sDMA Trig-ger Number	DTS Trigger Number
INTFL0ENDNM	FPSYS0 Flash sequencer processing end interrupt	34	—	—
INTFL1ENDNM	FPSYS1 Flash sequencer processing end interrupt	36	—	—
INTFL2ENDNM	FPSYS2 Flash sequencer processing end interrupt	38	—	—
INTDMAFL0	DMA request (FPSYS0 DMA programming) interrupt	—	Group0-154	Group3-34
INTDMAFL1	DMA request (FPSYS1 DMA programming) interrupt	—	Group0-155	Group3-35
INTDMAFL2	DMA request (FPSYS2 DMA programming) interrupt	—	Group0-156	Group3-36

The error notifications related to Flash Memory are listed in the following table.

Table 51.4 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
Flash access error*1	FPSYS0 Flash access error.	32	—
	FPSYS1 Flash access error.		—
	FPSYS2 Flash access error.		—
FACI reset transfer error	FPSYS0 FACI reset transfer error.	33	—
	FPSYS1 FACI reset transfer error.		—
	FPSYS2 FACI reset transfer error.		—
FACI reset transfer warning	FPSYS0 FACI reset transfer warning.		—
	FPSYS1 FACI reset transfer warning.*2		—
BIST parameter transfer error	BIST parameter transfer error.	34	—
Code Flash read BGO error	See **Section 51.8.2, Background Operation**.	—	√
Data Flash read BGO error	See **Section 51.8.2, Background Operation**.	—	√

Note 1. See the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.
Note 2. For U2A-EVA and U2A16.

51.2 Overview

51.2.1 Functional Overview

This product incorporates 16 Mbytes (U2A8: 8 Mbytes, U2A6: 6 Mbytes) code flash allowing high-speed accesses, which enables each CPU to access this flash memory.

This memory can be reprogrammed while it is placed on an application system. This can shorten the system development period and significantly improve the serviceability after the system is delivered.

This product also has 576 Kbytes (U2A8: 320 Kbytes, U2A6: 256 Kbytes) data flash that is available for storing EEPROM data.

Code Flash

- Capacity: Up to 16 Mbytes of User Area and 2x 64 Kbytes of User Boot Area.
- Multi banked configuration.
- Program unit: 512 bytes
- Erase unit: 16 Kbytes for 8 blocks and 64 Kbytes for remaining blocks in each User Area
- OTP (One Time Programmable) is supported for each block.
- Address map swapping between banks is supported.

Data Flash

- Data Area:
  - Capacity: Up to 512 Kbytes (Two Data Areas: 256 Kbytes + 256 Kbytes) and 64K bytes for ICUMHA exclusively
  - Program unit: 4, 8, 16, 32, 64, 128 bytes
    DMA can initiate 4-byte program in multiple time without software overhead. (within one Data Area)
  - Erase unit: Nx 4 Kbytes (N = 1, 2, 3 …) (within one Data Area)

- Hardware Property Area:

  The settings of this product can be configured in Hardware Property Area in Data Flash Memory.

  Hardware Property Area consists of Configuration Setting Area, Extended Data Area, Security Setting Area, Block Protection Area, Switch Area, TAG Area and Erase Counter Area.

  - Configuration Setting Area: To store the System Configuration Parameters. (Flash Option Byte, Reset Vector, Software Configuration Option Byte, etc.)
  - Security Setting Area: To store the Security Parameters. (ID Codes, Security Setting flag, etc.)
  - Block Protection Area: To store the Code Flash Protection Settings. (OTP flag, etc.)
  - Switch Area and TAG Area: To update Configuration Setting Area, Security Setting Area and Block Protection Area in an atomic and robust way.
  - Erase Counter Area: To store the Erase Counter.
  - Extended Data Area To store any data to use by user software.
    Capacity: 2 Kbytes

Program unit: 4, 8, 16, 32, 64, 128 bytes
Erase unit: 2 Kbytes

Other Functions

- Programming method
  - Serial programming: Programming of flash memory by external flash memory programmer through serial interface.
  - Self-programming: Programming of flash memory by a user program written on Code Flash already.
- Support for security functions to protect against illicit tampering and illicit reading data in flash memory
- Support for protection functions to protect against erroneous programming/erasure into the flash memory
- ECC support for error detection and correction for both Code Flash and Data Flash
  - Reading erased Code Flash results in an ECC error.
  - Reading erased Data Flash results in an ECC error.
- Background Operation (BGO) support
  The readability of flash memory during programming/erasure within one FPSYS is as follows.
  - Code Flash read is possible during Data Flash programming/erasure
  - Code Flash read from other bank is possible during programming/erasure of a bank of Code Flash
  - Data Flash read from other Data Area is possible during programming/erasure of a Data Area of Data Flash
  - Data Flash read is possible during Code Flash programming/erasure
- Multi FPSYS Operation support
  - The Flash memories that are belonging to the different FPSYS can be programmed/erased simultaneously.
- Suspend/Resume support for both Code Flash and Data Flash (Data Area and Extended Data Area)
  - Programming / erasure operation can be suspended. Suspended operation can be resumed. It can be used for interruption processing received during self-programming.
- Blank Check Area for code flash memory

  This area is used for checking that User Area or User Boot Area is blank or not. Which area (User or User Boot) to specify is selected by BLCHKSELR register. It can be accessed by $0C000000_H$ address offset of User Area or 04000000_H address offset of User Boot Area.

- Non-overlay Area for code flash memory

  This area is mirror of User Area without remapping. It can be accessed by 04000000_H address offset of User Area. In case that remap setting is enabled by CFU or GCFU, the data of corresponding non-secure User Area in Code Flash Memory cannot be read from bus masters via non-secure User Area. On the other hand, the data in Code Flash Memory can be read via this area without being influenced by CFU/GCFU setting.

- Blank Check Area for data flash memory

  This area is used for checking that Data Area or Hardware Property Area is blank or not. It can be accessed by 00200000_H address offset of Data Area or Hardware Property Area.

- OTA (Over-the-Air) update support

  Code Flash programming / erasure is possible while executing the user program that is stored in the User Area.

  Two types of Code Flash Memory Mapping Mode are supported (Single Map Mode and Double Map Mode).

  For details, see **Section 51.3.1, Mapping of Code Flash Memory**.

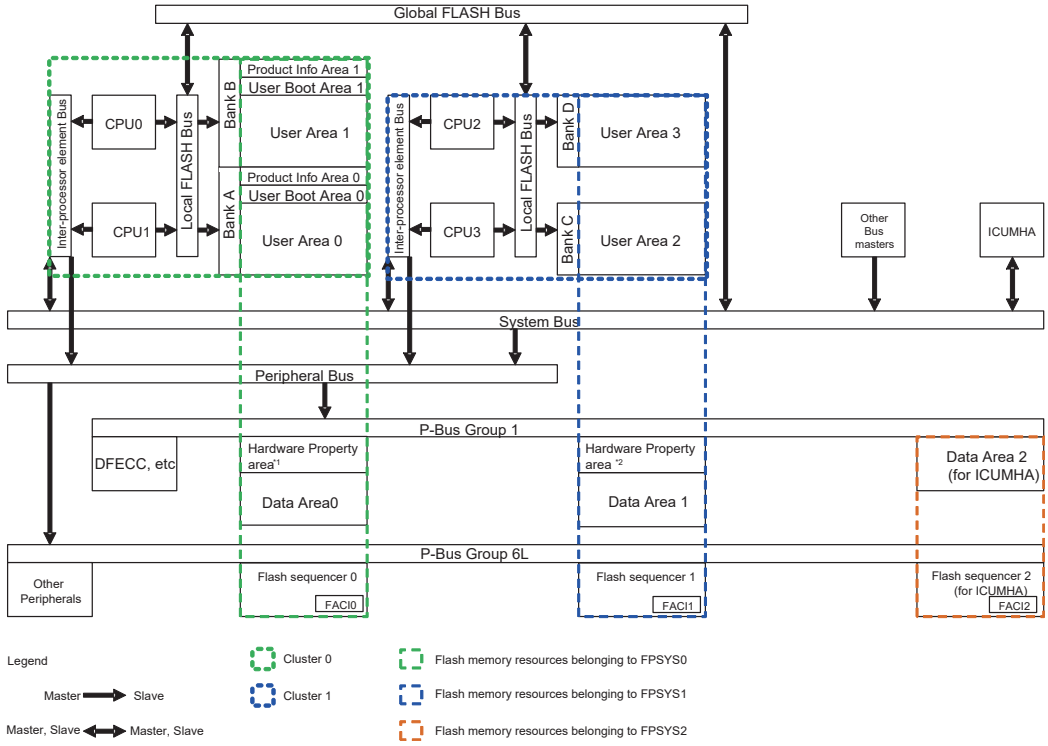
  Code Flash Memory Mapping Mode can be selected by Option Bytes setting.

  – Single Map Mode
  Hardware remapping of User Area read address is supported by GCFU (Overlay function).

  – Double Map Mode
  Hardware swapping of address map between Code Flash Memory Banks is supported.
  The Code Flash Memory Banks are mapped into two areas. One is valid area and the other is invalid area.
  The Banks in the valid area and invalid area can be swapped by Option Bytes setting.
  The user program can be executed from the banks in valid area while the banks of invalid area are being programmed / erased.

51.2.2 Block Diagram

Figure 51.1 shows block diagram of U2A-EVA/U2A16 Flash Programming System structure.



Note 1. Extended Data Area, Configuration Setting Area, Security Setting Area, Block Protection Area for FPSYS0, Switch Area, TAG Area

Note 2. Block Protection Area for FPSYS1.

51.3.1 Mapping of Code Flash Memory

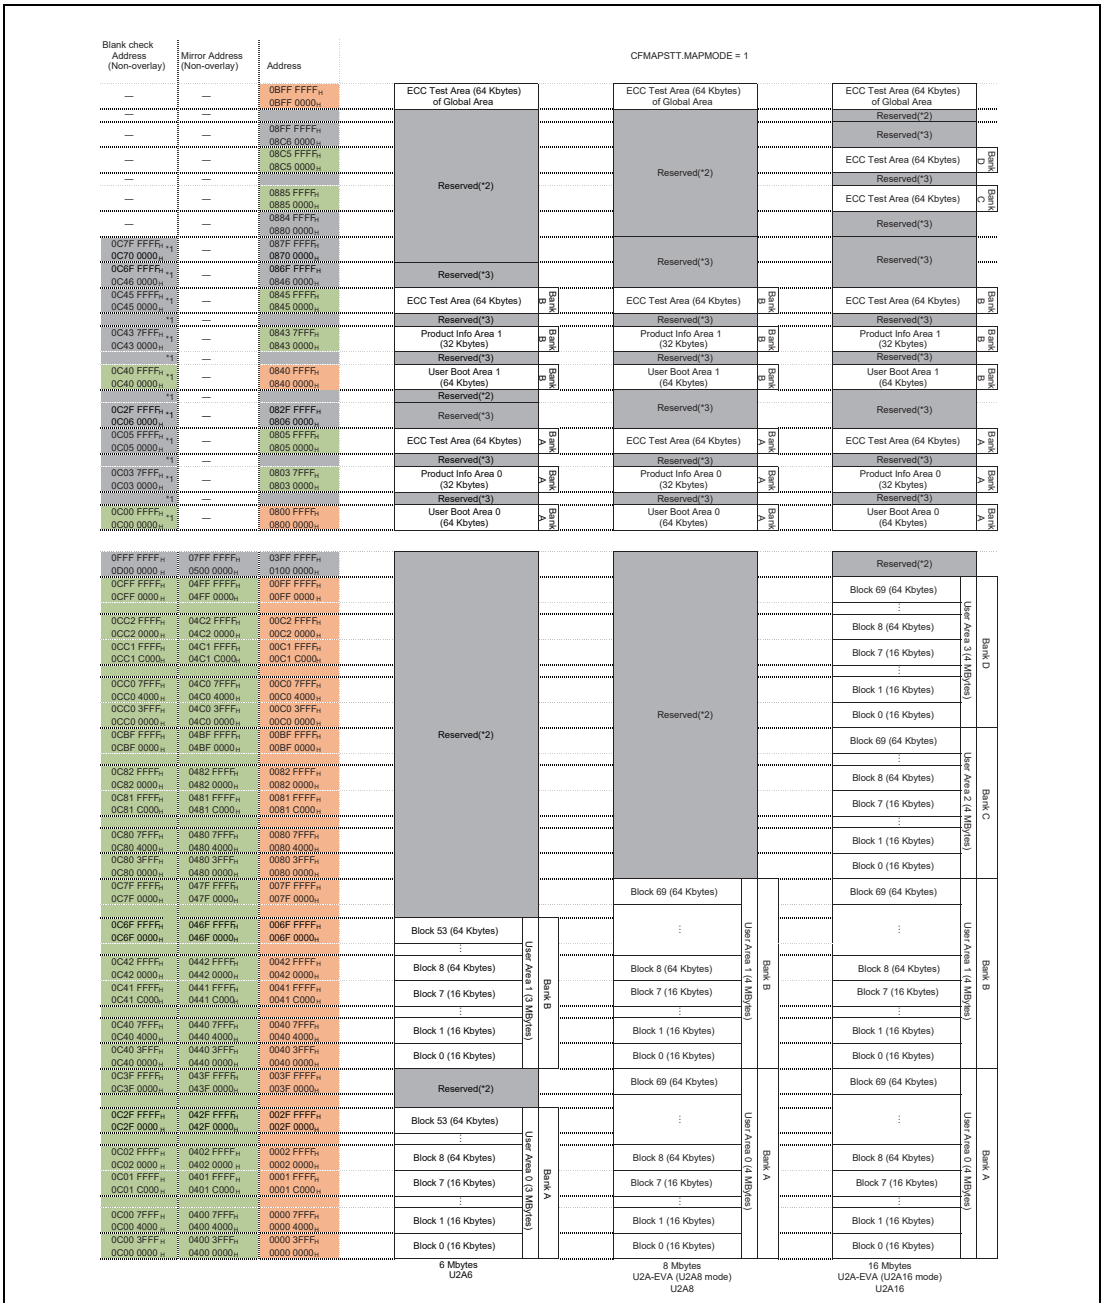
Figure 51.3 illustrates the mapping of the code flash memory for the 16-Mbyte (U2A-EVA (U2A16 mode), U2A16), 8-Mbyte (U2A-EVA (U2A8 mode), U2A8) and 6-Mbyte (U2A6) devices at the Single Map Mode.

Figure 51.4 and **Figure 51.5** illustrate the mapping of the code flash memory for the 16-Mbyte (U2A-EVA (U2A16 mode), U2A16) devices at the Double Map Mode.

Figure 51.6 illustrates the mapping of the code flash memory for the 8-Mbyte (U2A-EVA (U2A8 mode), U2A8) devices at the Double Map Mode.

Figure 51.7 illustrates the mapping of the code flash memory for the 6-Mbyte (U2A6) device at the Double Map Mode.

The User Area in the code flash memory of this product is divided into 16-Kbyte and 64-Kbyte blocks for each User Area, which can be erased individually. A single block of 64-Kbyte User Boot Area is also incorporated in Bank A and Bank B respectively. The User Area can be used to store the user program. The User Boot Area can be used to store a non-rewritable boot program during user program operation, such as a boot program for rewriting code flash memory through a selected user interface. The Product Info Area stores Product information (See **Section 51.11.1, Registers Related to Product Information**). This area is not rewritable. The BGO condition of Product Info Area is same as User Area /User Boot Area of same bank.



Note 1. When BLCHKSELR.BLNKSEL=1. For details, see **Section 51.11.2.1, BLCHKSELR — Blank Check Area Selection Register**.
Note 2. If this area is read, Error response occurs.
Note 3. If this area is read, Error response, ECC 2-bit error occur. Address parity error also occurs depending on the address.

Note: The following color coding is used in the map above.

Fetch and data access available
Data access available
Access prohibited

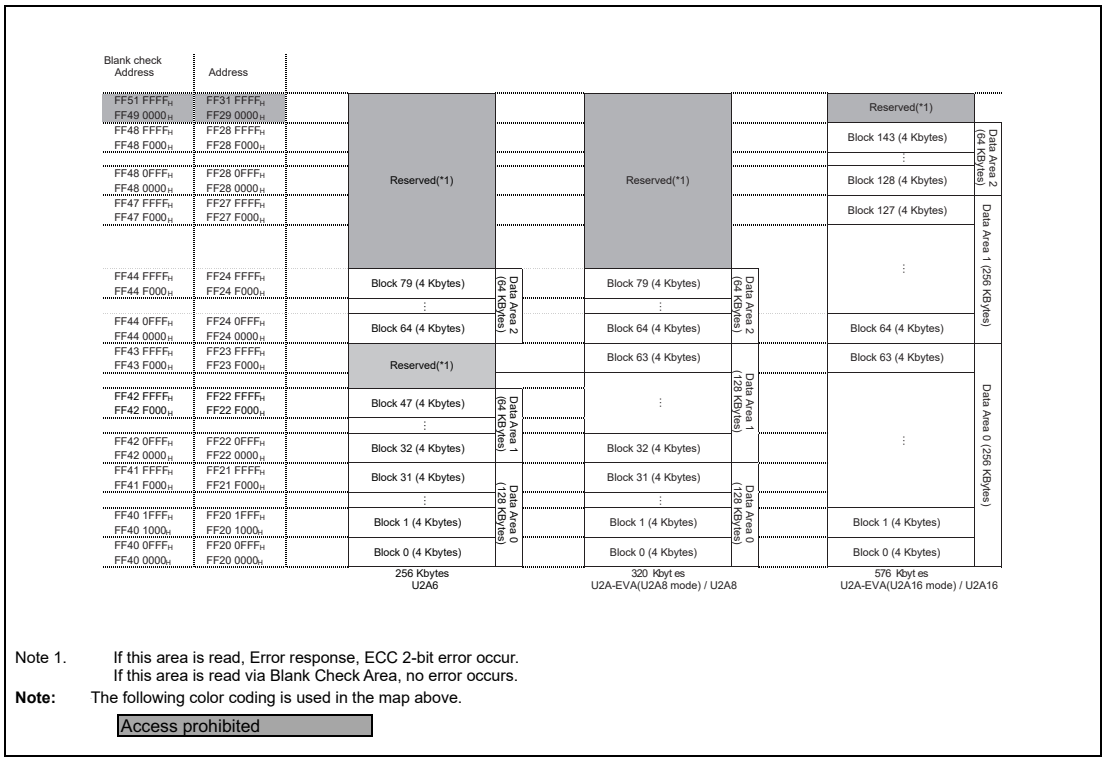
51.3.2 Mapping of Data Area in Data Flash Memory

The Data Area of the data flash memory in this product is divided into 4-Kbyte blocks, with each being a unit for erasure. **Figure 51.8** shows data flash memory map.



Note 1. If this area is read, Error response, ECC 2-bit error occur.
If this area is read via Blank Check Area, no error occurs.

Note: The following color coding is used in the map above.

Access prohibited

Figure 51.8 Mapping of Data Area

51.3.3 Mapping of Hardware Property Area in Data Flash Memory

Hardware Property Area of this product consists of seven areas (Extended Data Area, Configuration Setting Area, Security Setting Area, Block Protection Area, Switch Area, TAG Area and Erase Counter Area).

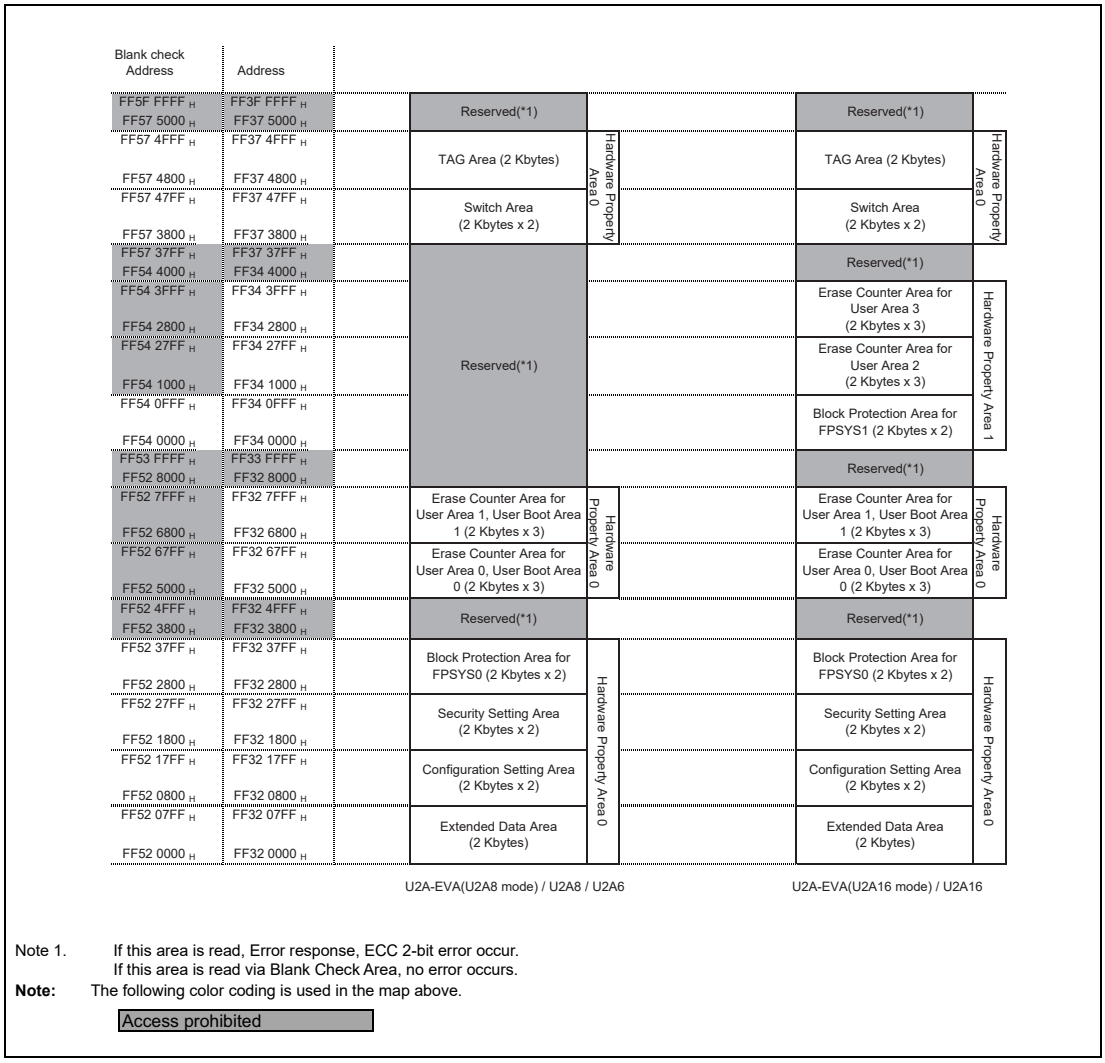
- For Security Setting Area, see **Section 47.8, Security Setting Area**.
- For Extended Data Area, see **Section 51.16, Extended Data Area**.
- For Configuration Setting Area, see **Section 51.12, Configuration Setting Area (Option Bytes, Reset Vector)**.
- For Block Protection Area, see **Section 47.9, Block Protection Area for FPSYS0/ FPSYS1**.
- For Switch Area, see **Section 51.13, Switch Area**.
- For TAG Area, see **Section 51.14, TAG Area**.
- For Erase Counter Area, see **Section 51.15, Erase Counter Area**.

Dedicated programming/erasure command is supported for Configuration Setting Area, Security Setting Area, Block Protection Area, Switch Area and TAG Area.

Configuration Setting Area and Security Setting Area can be set OTP (One Time Programming) by 4 bytes unit.

Extended Data Area can be set OTP (One Time Programming).

Table 51.8 shows Hardware Property Area memory map. This area is placed in the data flash memory. The condition of BGO, see **Table 51.27, Conditions under which Background Operation is Usable**.



Note 1. If this area is read, Error response, ECC 2-bit error occur.
If this area is read via Blank Check Area, no error occurs.

Note: The following color coding is used in the map above.

Access prohibited

Base Address Name <SWAk_base> (k = f, b)	Base Address	Bus Group
<SWAf_base>	FF37 3800_H (Switch Area 1)	P-Bus Group 1
<SWAb_base>	FF37 4000_H (Switch Area 0)	P-Bus Group 1

f … front side (valid). b… back side (invalid).

Table 51.20 shows Base address of TAG Area.

Table 51.20 Base address of TAG Area

Base Address Name	Base Address	Bus Group
<TAG_base>	FF37 4800_H	P-Bus Group 1

Table 51.21 shows Base address of Erase Counter Area.

Table 51.21 Base address of Erase Counter Area.

Base Address Name	Base Address	Bus Group
<EC0_base>	FF32 5000_H	P-Bus Group 1
<EC1_base>	FF32 6800_H	P-Bus Group 1
<EC2_base>	FF34 1000_H	P-Bus Group 1
<EC3_base>	FF34 2800_H	P-Bus Group 1

51.4 Operating Modes Associated with Flash Memory

Figure 51.10 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see **Section 5, Operating Modes**.

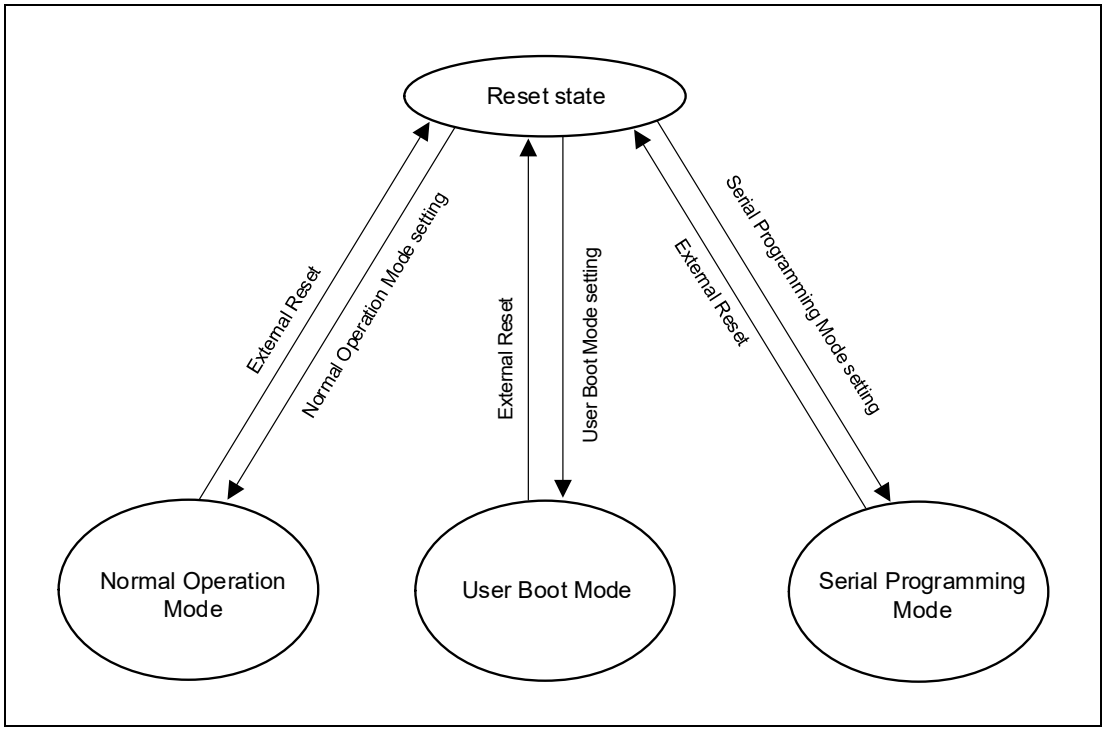

Figure 51.10 Mode Transition Associated with Flash Memory

Table 51.22 shows the flash memory area which is programmable and erasable in each mode and the boot program after reset release.

Table 51.22 Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release

Item	Normal Operation Mode	User Boot Mode	Serial Programming Mode
Programmable and erasable area	• User Area • Data Area • Hardware Property Area	• User Area • Data Area • Hardware Property Area	• User Area • User Boot Area • Data Area • Hardware Property Area
Boot program after reset release	Program in User Area (Changeable by using the variable reset vector)	Program in User Boot Area (CPU0) Program in User Area (Changeable by using the variable reset vector) (CPU1-3)	Boot Firmware program for serial programming

51.5 Programming Overview

The flash memory of this device can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions.

Table 51.23 gives an overview of the methods of programming and the corresponding operating modes.

Table 51.23 Methods of Programming

Method of Programming	Overview of Functionality	Operating Mode
Serial programming	A dedicated flash memory programmer allows on-board programming the flash memory after the device is mounted on the target system.	Serial Programming Mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	The user program that is written to code flash memory in advance by serial programming executing also allows updating the flash memory. When data flash memory is being programmed with self-programming, the BGO function enables instruction fetch and data read from code flash memory. Thus, data flash memory can be programmed by executing a program on code flash memory prepared for flash programming. When code flash memory bank is being programmed with self-programming, instruction fetch and data read from the bank are prohibited. This programming needs to be carried out by executing a program prepared for flash programming that has been transferred to the Cluster RAM or the Local RAM in advance or a program on a different bank.	Normal Operation Mode, User Boot Mode

When executing self-programming, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Table 51.24 lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by interface operation of flash memory or the user program enables self-programming.

Table 51.24 Basic Functions at a Glance

Function	Description in Overview	Level of Support (√: Supported,×: Not Supported)	
		Serial Programming	Self-Programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded.	√	√
Erasure	This is for erasing the contents of specified block of memory.	√	√
Programming	This is for writing to a specified address.	√	√
Reading	Data that have been written to the flash memory are read out.	√	√
Setting of Security Settings (Setting an ID Codes)	Security Settings (ID codes, Debugger connection prohibited setting, etc.) are set and the security is made effective. An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the On-chip debug, and etc. See **Section 47.8, Security Setting Area** for details.	√	√
Setting of Block Protection	A specified block of code flash memory is set for Customer ID Protection Setting and OTP (one-time programming). (OTP can only be set, that is, it is not possible to release a block's OTP setting). See **Section 47.9, Block Protection Area for FPSYS0/FPSYS1** for details.	√	√
Setting of Configuration Settings	Configuration Settings (Option bytes, Reset Vector, etc.) are set to change them from the initial values for this product.	√	√

For details on serial programming, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

For details on self-programming, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

The flash memory supports various security functions.

Setting of OTP and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, and prohibiting connection of a dedicated flash memory programmer are available for use as security functions.

Table 51.25 lists security functions that are supported by the flash memory. Security Settings is established in the Security Setting Area. For Security Settings, see **Section 47.8, Security Setting Area**.

Table 51.25 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the User Area and the User Boot Area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of code flash memory and data flash memory writing by self-programming.
Prohibition of connection of a dedicated flash memory programmer*1	The connection of a dedicated flash memory programmer for serial programming is prohibited.

Note 1. The “Prohibition of connection of a dedicated flash memory programmer” function can be used in conjunction with “ID authentication”.

The flash memory supports various protection functions. **Table 51.26** lists protection functions that are supported by the flash memory.

Table 51.26 Summary of Protection Functions

Function	Description
User boot protection	Programming or erasure of the User Boot Area by self-programming is prohibited. Programming or erasure of the User Boot Area by serial programming is available.
Variable reset vector	The protection settings include control of the reset vector. As shown in **Figure 51.11**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program. The areas that can be specified by using the reset vector are the User Area.
Code Flash Valid area protection	Code Flash Valid area protection is function for front side(valid) of User Area in Double Map Mode. The front side(valid) of User Area can be protected from programming, block erasure, and program/erasure resumption command. For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.
Flag protection for Switch Area and TAG Area	Switch Area cannot be changed when VAF in TAG Area is not correct. TAG Area cannot be changed when CVA/SVA/BVA0/BVA1 in Switch Area or VOFs in Configuration Setting Area/Security Setting Area/Block Protection Area are not correct. For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

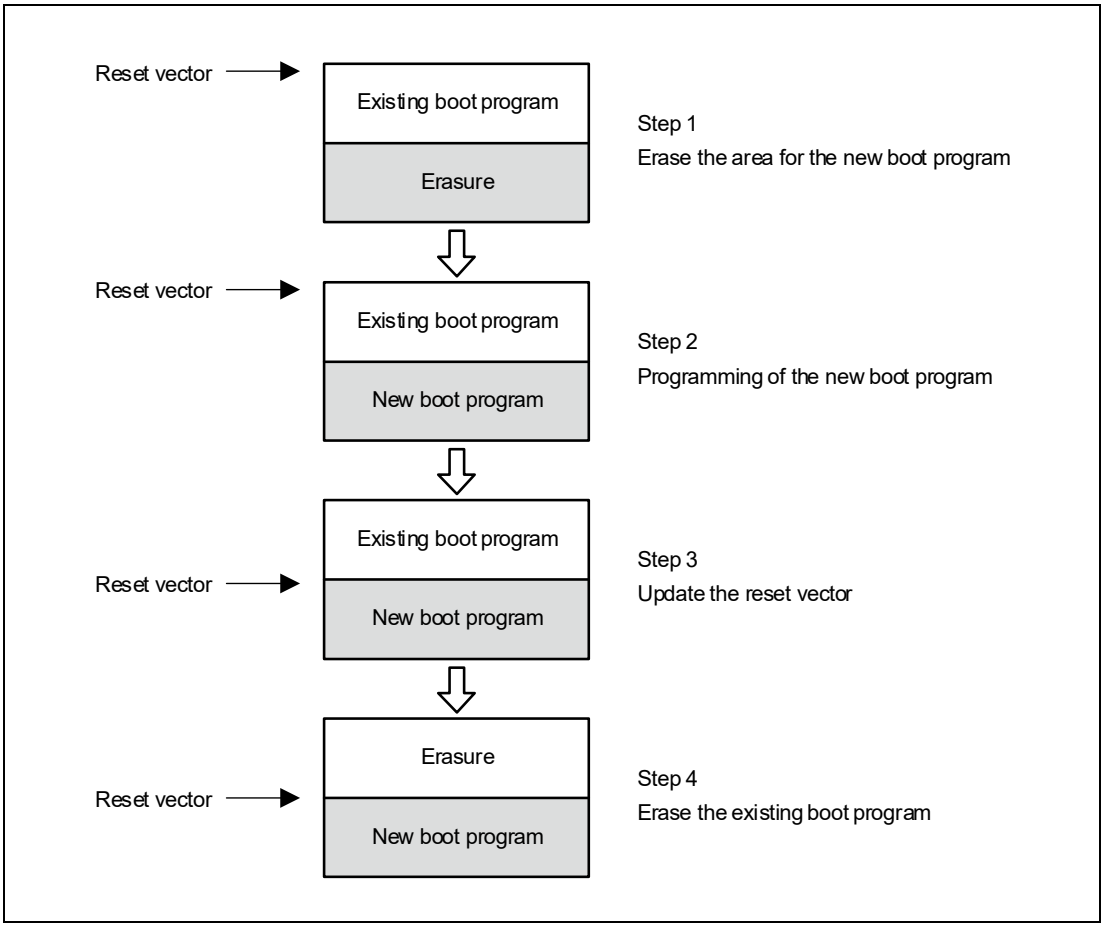

Figure 51.11 Utilizing the Variable Reset Vector Function to Update the Boot Program

51.6 Serial Programming

A dedicated flash memory programmer can be used to handle the flash memory in Serial Programming Mode.

Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the target microcontroller by the flash memory programmer to proceed.

NOTE

For details on Renesas Flash Programmer, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

51.7 Flash Programming Interface

51.7.1 Asynchronous Flash Programming Interface — 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR(JP0_0): Receive data input
- FPDT(JP0_1): Transmit data output

51.7.2 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

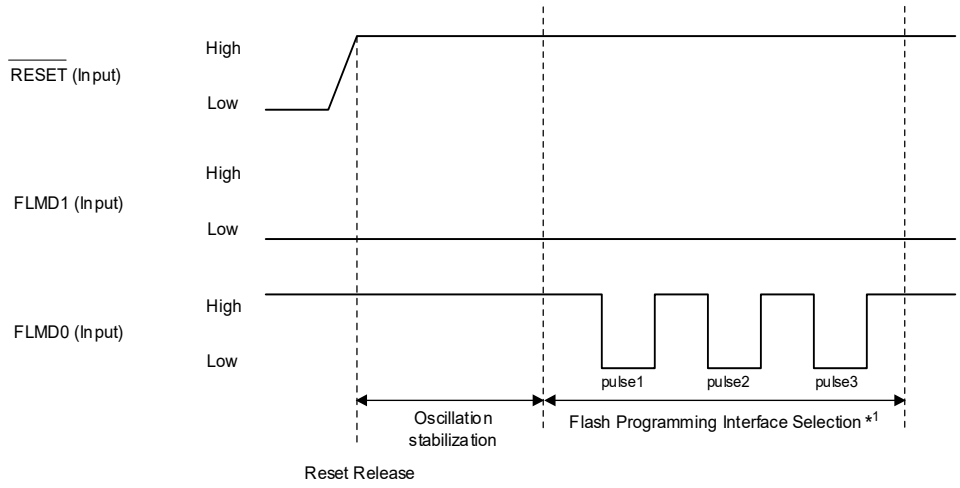
- FPDR(JP0_0): Receive data input
- FPDT(JP0_1): Transmit data output
- FPCK(JP0_2): Serial clock input

The flash memory programmer outputs the serial data clock FPCK, and the microcontroller operates as a slave.

51.7.3 Selection of Flash Programming Interface

In this product, Flash Programming Interface can be selected by pulse input to the FLMD0 pin (up to 3 pulses) after transition to the Serial Programming Mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

Figure 51.12 shows the relation between the number of pulses and Flash Programming Interface.



Note 1. The number of FLMD0 Pulses to be inserted depends on Flash Programming Interface as in the following table.

FLMD0 Pulse	Flash Programming Interface
0	CSI
3	2-wire UART
Other than above	Setting prohibited

Figure 51.12 Selection of Flash Programming Interface

For details of AC Characteristics, see the **Section 55, Electrical Characteristics**.

51.8 Self-Programming

51.8.1 Outline

This product supports programming of the flash memory by user program itself. The code flash and data flash memory can be programmed by using the commands of Flash Application Command Interface (FACI) for flash memory programming in user's applications. Therefore, update of the user program and programming of constant data fields can be possible.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to the Local RAM or the Cluster RAM in advance and executed to program the data flash memory.

When the code flash memory is programmed, the background operation facility makes it possible to execute a programming program form the code flash memory of a bank to program the code flash memory of the other bank. Furthermore, the programming program can be copied to the Local RAM or the Cluster RAM in advance and executed to program the code flash memory.

For comprehensive information on flash self-programming, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

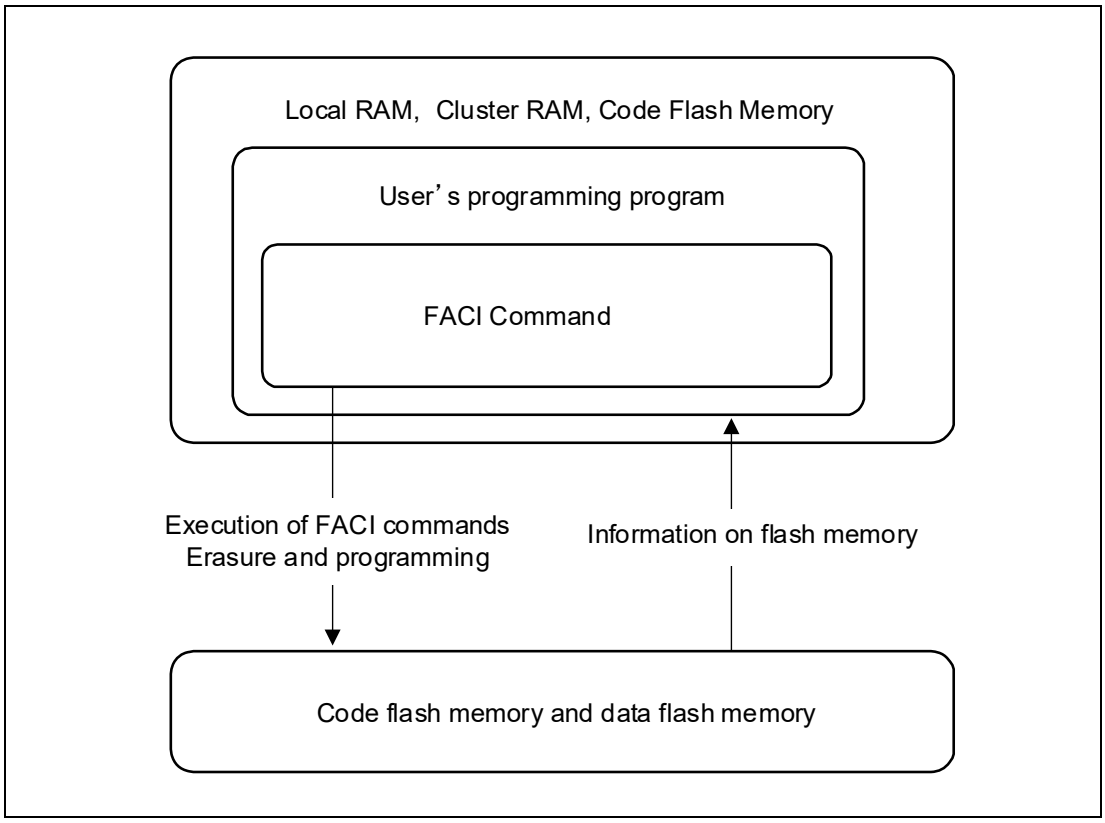


Figure 51.13 Concept of Self-Programming

51.8.2 Background Operation

Background operations can be used when the combination of the flash memory for programming/erasure and the flash memory for reading within one FPSYS is any of those listed below.

Error response occurs when the area could not be read due to the conditions under which Background Operation is not usable. On instruction fetch, SYSERR also occurs. On data flash read access, ECC 2-bit error also occurs.

Note that no error occurs when Blank Check Area for data flash memory could not be read due to the conditions under which Background Operation is not usable.

Table 51.27 Conditions under which Background Operation is Usable

			Code Flash				Data Flash			
			Bank N*1		Bank M*1		Data Area n*1		Hardware Property Area n*1	
			R	P/E	R	P/E	R	P/E	R	P/E
Code Flash	Bank N*1	R	—	—	Yes	Yes	Yes	Yes	Yes	Yes
		P/E	—	—	Yes	—	Yes	—	Yes*2	—
	Bank M*1	R	Yes	Yes	—	—	Yes	Yes	Yes	Yes
		P/E	Yes	—	—	—	Yes	—	Yes*2	—
Data Flash	Data Area n*1	R	Yes	Yes	Yes	Yes	—	—	Yes	Yes
		P/E	Yes	—	Yes	—	—	—	Yes	—
	Hardware Property Area n*1	R	Yes	Yes*2	Yes	Yes*2	Yes	Yes	—	—
		P/E	Yes	—	Yes	—	Yes	—	—	—

Note 1. Available Code Flash Bank/Data Area/Hardware Property Area is dependent on each FPSYS.
(N, M, n) = (A, B, 0) for FPSYS0.
(N, M, n) = (C, D, 1) for FPSYS1.
(N, M, n) = (N/A, N/A, 2) for FPSYS2. Hardware Property Area is not available for FPSYS2.

Note 2. Hardware Property Area is not readable while Code Flash block which is configured to enable Erase Counter is being erased.

Legend
R: Reading
P/E: Programming/Erasure

51.8.3 Multi FPSYS Operation

Multi operations can be used when the combination of the flash memory for programming/erasure and the flash memory for programming/erasure is any of those listed below.

Table 51.28 Conditions under which Multi Operation is Usable

		FPSYSn		FPSYSm (m != n)	
		R	P/E	R	P/E
FPSYSn	R	See **Section 51.8.2, Background Operation**		Yes	Yes
	P/E			Yes	Yes*1
FPSYSm (m != n)	R	Yes	Yes	See **Section 51.8.2, Background Operation**	
	P/E	Yes	Yes*1		

Note 1. Simultaneous Programming/Erasure of Hardware Property Area 0 and 1 is prohibited.
Simultaneous Programming/Erasure of multiple FPSYS should be operated so as not to deviate operational condition.

51.8.4 Switching of Hardware Property Area

Switch and TAG Area are used to switch Configuration Settings, Security Settings, and Block Protection data in an atomic and robust way.

To improve robustness against unintentional interruption during update of Hardware Property Area and make fallback procedure of Hardware Property Area easily, below functions are supported.

1. Configuration Setting Area, Security Setting Area, and Block Protection Area are duplicated. One is valid area, the other is invalid area.
2. Valid Area Flags which indicate valid area of the above duplicated area are stored in Switch and TAG Area.
3. The flags which indicate progress of programming / erasure of each data.

Figure 51.14 shows concept of Configuration Setting, Security Setting, Block Protection, Switch, and TAG Area structure. Note that U2A-EVA (U2A16 mode) and U2A16 have Block Protection Area for FPSYS0 and FPSYS1 respectively.

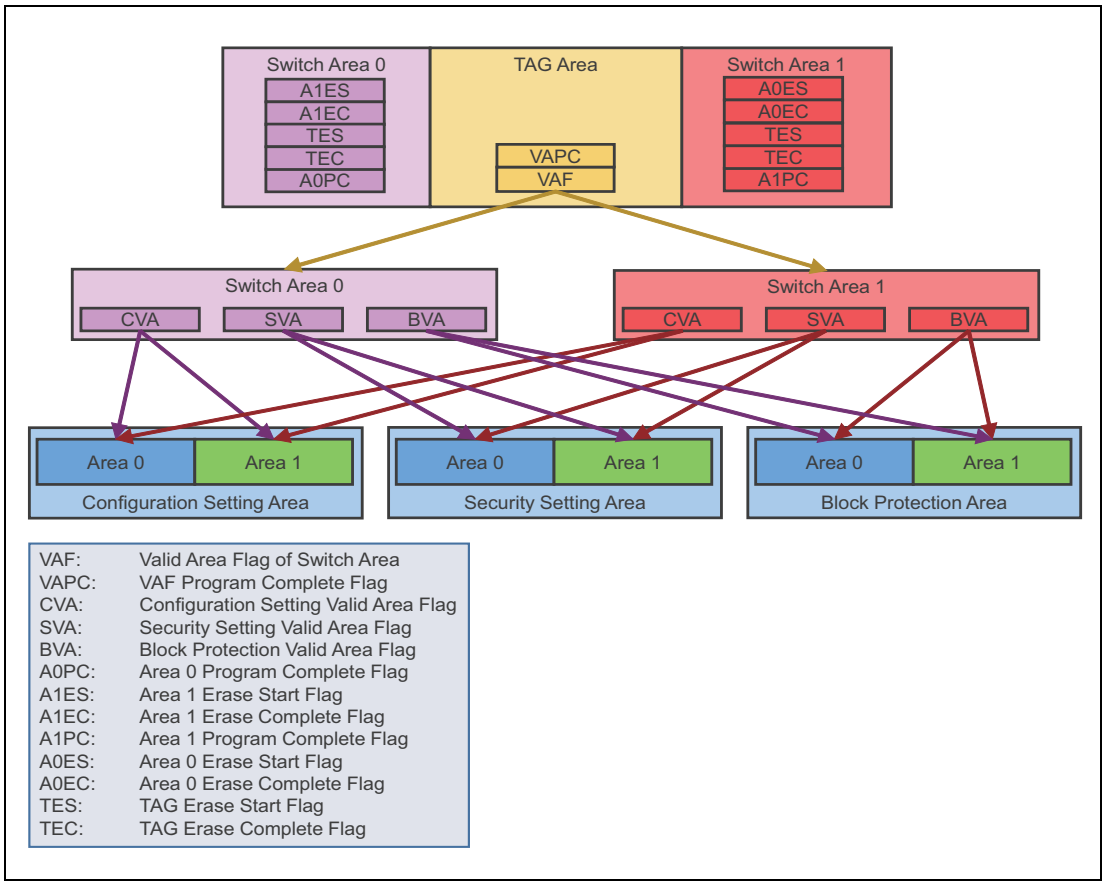

Figure 51.14 Concept of Configuration Setting, Security Setting, Block Protection, Switch, and TAG Area structure

Valid area of Switch Area is selected by VAF in TAG Area.

Valid area of Configuration Setting Area, Security Setting Area, and Block Protection Area are selected by CVA, SVA, BVA in valid area of Switch Area respectively.

The other flags are prepared to indicate progress of programming / erasure of each data in order to improve robustness against unintentional interruption during programming / erasure of each data (Note that the complete robustness is not guaranteed).

51.8.4.1 How to update and switch Configuration Setting Area, Security Setting Area, Block Protection Area

Update invalid area of Configuration Setting Area, Security Setting Area, or Block Protection Area beforehand if it is necessary. Then switch the valid area of those area.

VAPC in TAG Area may be undefined state if update of TAG Area is interrupted.

Unintentional fallback may be caused by FACI reset transfer if this state is left uncontrolled.

To avoid such unintentional fallback, run the flow of Recovering Switch Area Status.

For details, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

51.8.5 Example of User Program Update Procedure in the Field

The figure below is an example of user program update procedure in the field using hardware swapping in Double Map Mode.

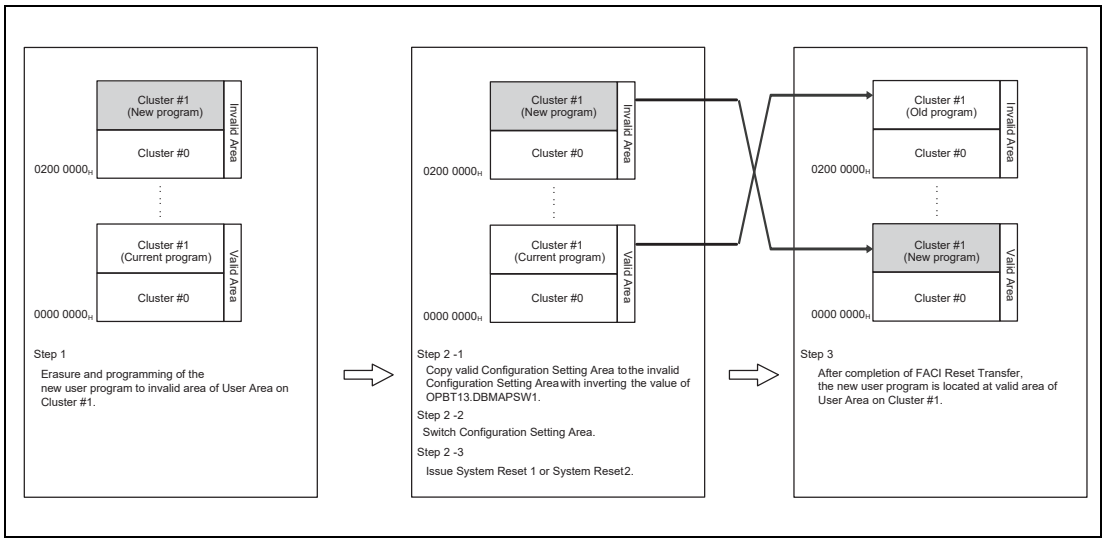

Figure 51.15 Example of User Program Update Procedure in the Field (In case of Update User Area on Cluster #1)

51.9 Reading Flash Memory

51.9.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in Normal Operation Mode and User Boot Mode. Data can simply be read out through access to addresses in the code flash memory.

Reading data bits from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) are all 1 and lead to the detection of an ECC 2-bit error and generation of the corresponding exception. That also lead to the detection of Address Parity Error depending on the address and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state. See **Section 44, Functional Safety** for the details of ECC and Address Parity.

51.9.2 Parallel Access to the Code Flash memory

The code flash memory is multi banked configuration. One bus master may access one bank and another bus master access other bank without a wait for arbitration of contention for the access path.

When multiple bus masters access the same bank, the accesses are arbitrated in round-robin fashion.

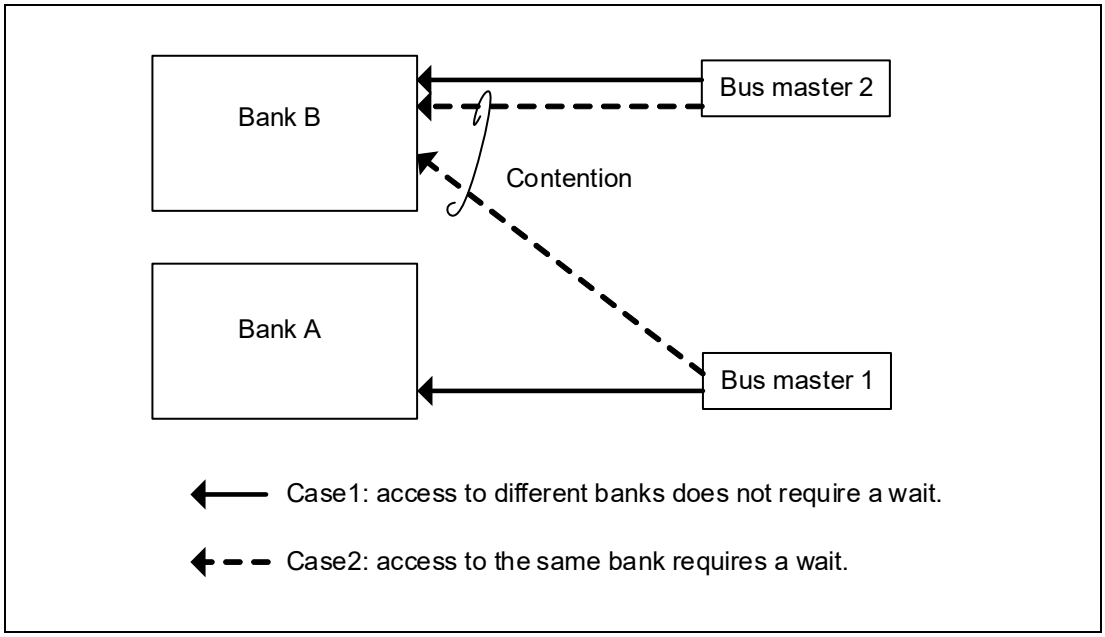

Figure 51.16 Operation in Access to Banks A and B (Example)

51.9.3 Reading Data Flash Memory

Reading data bits from an area of data flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) are all 1 and lead to the detection of an ECC 2-bit error. Use blank checking when you need to confirm that an area is in the non-programmed state. See **Section 44, Functional Safety** for the details of ECC.

51.10 Blank Checking Flash Memory

This product has Blank Check Area. This area is a mirror area of the flash memory and can read address parity and ECC field written in flash memory. In addition, blank flag is set if the read object address is blank.

51.10.1 Blank Check Area of Code Flash Memory

Table 51.29 Blank check address of code flash memory

Name	Address	Object Address	
		User Code Area*1	User Boot Area*1
Blank check address of code flash memory in Single Map Mode	0C00 0000_H + 20_H × n	0000 0000_H + 20_H × n to 0000 0000_H + 20_H × n + $1F_H$ n = 0,1,2,…,524287 for U2A-EVA (U2A16 mode) / U2A16 n = 0,1,2,…,262143 for U2A-EVA (U2A8 mode) / U2A8 n = 0,1,2,…,98303, 131072 + (0,1,2,…,98303) for U2A6	0800 0000_H + 20_H × n to 0800 0000_H + 20_H × n + $1F_H$ n = 0,1,2,…,2047 for Bank A n = 131072 + (0,1,2,…,2047) for Bank B
Blank check address of code flash memory in Double Map Mode	Valid area: 0C00 0000_H + 20_H × n Invalid area: 0E00 0000_H + 20_H × n	Valid area: 0000 0000_H + 20_H × n to 0000 0000_H + 20_H × n + $1F_H$ Invalid area: 0200 0000_H + 20_H × n to 0200 0000_H + 20_H × n + $1F_H$ n = 0,1,2,…,262143 for U2A-EVA (U2A16 mode) / U2A16 n = 0,1,2,…,131071 for U2A-EVA (U2A8 mode) / U2A8 n = 0,1,2,…,98303 for U2A6	Valid area: 0800 0000_H + 20_H × n to 0800 0000_H + 20_H × n + $1F_H$ Invalid area: 0A00 0000_H + 20_H × n to 0A00 0000_H + 20_H × n + $1F_H$ n = 0,1,2,…,2047

Note 1. For details of this function, see **Section 51.11.2.1, BLCHKSELR — Blank Check Area Selection Register**.

Table 51.30 Blank check of code flash memory Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, all ‘0’ is returned.
15	BF	Blank Flag. 0: the object address is not blank. 1: the object address is blank.
14 to 11	Reserved	When read, all ‘0’ is returned.
10	AP	Address parity bit Address[27] and [24:5] are used for generating an address parity, and generation type is even parity. If object address is blank, AP bit is “1”.
9 to 0	ECC[9:0]	ECC bits for Code Flash 256bit data. If object address is blank, all bit of ECC is “1”.

51.10.2 Blank Check Area of Data Flash Memory

Table 51.31 Blank check address of data flash memory

Name	Address	Object Address
Blank check address of Data Area	FF40 0000_H + 4_H × n	FF20 0000_H + 4_H × n to FF20 0000_H +4_H × n + 3_H n = 0,1,2,…,147455 for U2A-EVA (U2A16 mode) / U2A16 n = 0,1,2,…,81919 for U2A-EVA (U2A8 mode) / U2A8 n = 0,1,2,…,49151, 65536 + (0,1,2,…,16383) for U2A6
Blank check address of Extended Data Area	FF52 0000_H + 4_H × n	FF32 0000_H + 4_H × n to FF32 0000_H +4_H × n + 3_H n = 0,1,2,…,511
Blank check address of Configuration Setting Area	FF52 0800_H + 4_H × n	FF32 0800_H + 4_H × n to FF32 0800_H +4_H × n + 3_H n = 0,1,2,…,1023
Blank check address of Security Setting Area	FF52 1800_H + 4_H × n	FF32 1800_H + 4_H × n to FF32 1800_H +4_H × n + 3_H n = 0,1,2,…,1023
Blank check address of Block Protection Area for FPSYS0	FF52 2800_H + 4_H × n	FF32 2800_H + 4_H × n to FF32 2800_H +4_H × n + 3_H n = 0,1,2,…,1023
Blank check address of Block Protection Area for FPSYS1	FF54 0000_H + 4_H × n	FF34 0000_H + 4_H × n to FF34 0000_H +4_H × n + 3_H n = 0,1,2,…,1023 for U2A-EVA (U2A16 mode) / U2A16
Blank check address of Switch Area	FF57 3800_H + 4_H × n	FF37 3800_H + 4_H × n to FF37 3800_H +4_H × n + 3_H n = 0,1,2,…,1023
Blank check address of TAG Area	FF57 4800_H + 4_H × n	FF37 4800_H + 4_H × n to FF37 4800_H +4_H × n + 3_H n = 0,1,2,…,511

Table 51.32 Blank check of data flash memory Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, all ‘0’ is returned.
15	BF	Blank Flag. 0: the object address is not blank. 1: the object address is blank.
14 to 7	Reserved	When read, all ‘0’ is returned.
6 to 0	ECC[6:0]	ECC bits for Data Flash 32bit data. If object address is blank, all bit of ECC is “1”.

51.11 Description of Registers

51.11.1 Registers Related to Product Information

In Product Info Area in Code Flash Memory, Product information (Product Name, Product Number, Unique Chip ID) is stored.

Table 51.33 shows the list of registers related to product information. Other addresses in this area are reservations. Do not access them.

Table 51.33 List of Registers Related to Product Information

Register Name	Symbol	Address*1	Access Size
Product number / Product version storage register	PRDNUM	<PRDINFk_base> +0040_H	32
Product name storage register	PRDNAME1-3	<PRDINFk_base> +($00A0_H$ to $00A8_H$)	32
Unique Chip Identifier	UCID0-3	<PRDINFk_base> +(1000_H to $100C_H$)	32

Note 1. <PRDINFk_base> (k = f, b)

51.11.1.1 PRDNUM — Product Number/Product Version Storage Register

Access: This register can be read in 32-bit units.

Address: <PRDINFk_base> + 0040_H

Value after reset: See **Table 51.35**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	DID_RN[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0/1*1	0/1*1	0/1*1	0/1*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DID_PN[15:0]															
Value after reset	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. This value after reset is dependent on products. See **Table 51.35**.

Table 51.34 PRDNUM Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 16	DID_RN[3:0]	Revision Number These bits indicate the revision. The value is the same as SDID[31:28] (see **Section 53, Boundary Scan**).
15 to 0	DID_PN[15:0]	Product Number These bits indicate the product number. The value is the same as SDID[27:12] (see **Section 53, Boundary Scan**).

51.11.1.3 Unique Chip IDn — Unique Chip Identifier (n= 0 to 3)

Unique Chip ID is flash part of unique chip Identifier.

Access: This register can be read in 32-bit units.

Address: <PRDINFk_base> + 1000_H + 04_H x n (n = 0 to 3)

Value after reset: The value after reset is unique chip by chip.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Unique Chip IDn[31:16]

R/W	W*2	W*2	W*2	W*2	W*2	W*2	W*2	W*2	R	R	R	R	R	R	R	R/W*1

Note 1. Writing is enabled only when $A5_H$ is written to the KEY bit.

Note 2. Write only. When read, 0 is returned.

Table 51.41 BLCHKSELR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	KEY[7:0]	These bits control the modification of the BLNKSEL bits. $A5_H$: BLNKSEL can be written Other than above: BLNKSEL cannot be written, then retain previous value These bits must be specified simultaneously with BLNKSEL writing. These bits are write only. When read, 0 is returned.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BLNKSEL	Memory map selection bit of Blank Check Area for Code Flash. 0: Blank Check Area is mapped to User Area. 1: Blank Check Area is mapped to User Boot Area.

51.11.3 Registers Related to Code Flash Memory Mapping

Table 51.42 shows the list of registers related to Code Flash Memory Mapping.

Table 51.42 Registers Related to Code Flash Memory Mapping

Unit Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
SCDS	Code Flash Memory Mapping Mode Select Status	CFMAPSTT	<SCDS_base> + 0450_H	32	—	—
SCDS	Code Flash Memory Valid Area Switching Status	CFSWSTT	<SCDS_base> + 0454_H	32	—	—

CFMAPSTT	√	√	√	—	√	—	—
CFSWSTT	√	√	√	—	√	—	—

51.11.3.1 CFMAPSTT — Code Flash Memory Mapping Mode Status Register

CFMAPSTT indicates Code Flash Memory Mapping Mode.

Access: This register can be read in 32-bit units.

Address: <SCDS_base> + 0450_H

Value after reset: Specified by the user
The value after reset is the value of OPBT12 in valid area of Configuration Setting Area.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MAPMODE[1:0]	
Value after reset	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. This value is dependent on the value in the flash memory which is specified by the user

Table 51.44 CFMAPSTT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	MAPMODE[1:0]	Code Flash Memory Mapping Mode Select Status $0\ 0_B$: Double Map Mode. $0\ 1_B$: Single Map Mode. $1\ 0_B$: setting prohibited. $1\ 1_B$: setting prohibited.

51.11.3.2 CFSWSTT — Code Flash Memory Valid Area Switching Status Register

CFSWSTT indicates Code Flash Memory Valid Area by the cluster. The setting of this register is valid when Code Flash Memory Mapping Mode is Double Map Mode.

Access: This register can be read in 32-bit units.

Address: <SCDS_base> + 0454_H

Value after reset: Specified by the user
The value after reset is the value of OPBT13 in valid area of Configuration Setting Area.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBMAP SW1	DBMAP SW0
Value after reset	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1	0/1*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. This value is dependent on the value in the flash memory which is specified by the user

Table 51.45 CFSWSTT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DBMAPSW1	[For U2A-EVA/U2A16] Double Map Mode Switching of Cluster 1 0: Bank D is mapped in valid area. 1: Bank C is mapped in valid area. [For U2A8/U2A6] Set the value of valid area at the shipping.
0	DBMAPSW0	Double Map Mode Switching of Cluster 0 0: Bank B is mapped in valid area. 1: Bank A is mapped in valid area.

51.11.4 Registers Related to Hardware Property Area

Table 51.46 shows the list of registers related to Hardware Property Area.

Table 51.46 Registers Related to Hardware Property Area

Unit Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
FACI0	Switch Area Status Register	FSWASTAT_0	<FACI0_base> + $00A8_H$	8	PBG6L1#1	—
FACIn	FACI Reset Transfer Status n (n = 0,1)	FRTSTAT_n	<FACIn_base> + 0098_H	8	*1	—
FACIn	FACI Reset Transfer Warning Interrupt Enable n (n = 0,1)	FRTEINT_n	<FACIn_base> + $009C_H$	8	*1	—

Note 1. n = 0: PBG6L1#1
n = 1: PBG6L1#2

Table 51.47 Register Reset Conditions

Register	Reset Category						
	Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
FSWASTAT_0	√	√	√	—	√	—	—
FRTSTAT_n	√	√	√	—	√	—	—
FRTEINT_n	√	√	√	—	√	—	—

51.11.4.1 FSWASTAT_0 — Switch Area Status Register

FSWASTAT_0 indicates valid area and status of Switch Area.

For details of this register, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

51.11.4.2 FRTSTAT_n — FACI Reset Transfer Status Register (n = 0,1)

FRTSTAT_n indicates FACI reset transfer warning status of FPSYSn.

[For U2A8/U2A6] No warning from FPSYS1 because there is no Hardware Property Area in FPSYS1.

See **Section 51.17.1, FACI reset transfer** for details of FACI reset transfer.

Access: This register can be read in 8-bit units.

Address: <FACIn_base> + 0098_H (n = 0,1)

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTEDTCT	RTECRCT
Value after reset	0	0	0	0	0	0	0/1	0/1
R/W	R	R	R	R	R	R	R	R

Table 51.48 FRTSTAT_n Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	RTEDTCT	Indicates that ECC 2-bit error has been detected during FACI reset transfer. 0: No error has been detected. 1: An error has been detected. RTEDTCT bit will be updated when it is reset and FACI reset transfer is finished.
0	RTECRCT	Indicates that ECC 1-bit error has been corrected during FACI reset transfer. 0: No error has been corrected. 1: An error has been corrected. RTECRCT bit will be updated when it is reset and FACI reset transfer is finished.

51.11.4.3 FRTEINT_n — FACI Reset Transfer Warning Interrupt Enable Register (n = 0,1)

FRTEINT_n enables FPSYSn FACI reset transfer warning interrupt.

FPSYSn FACI reset transfer warning interrupt is notified to ECM.

[For U2A8/U2A6] No warning from FPSYS1 because there is no Hardware Property Area in FPSYS1.

See **Section 51.17.1, FACI reset transfer** for details of FACI reset transfer.

Access: This register can be read / written in 8-bit units.

Address: <FACIn_base> + $009C_H$ (n = 0,1)

Value after reset: 03_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTEDIE	RTECIE
Value after reset	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R/W	R/W

Table 51.49 FRTEINT_n Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTEDIE*1	Enables FPSYSn FACI reset transfer warning interrupt when ECC 2-bit error occurs during FACI reset transfer and RTEDTCT bit in each FRTSTAT_n register becomes 1. 0: Does not generate FPSYSn FACI reset transfer warning interrupt when RTEDTCT = 1. 1: Generates FPSYSn FACI reset transfer warning interrupt when RTEDTCT = 1.
0	RTECIE*1	Enables FPSYSn FACI reset transfer warning interrupt when ECC 1-bit error occurs during FACI reset transfer and RTECRCT bit in each FRTSTAT_n register becomes 1. 0: Does not generate FPSYSn FACI reset transfer warning interrupt when RTECRCT = 1. 1: Generates FPSYSn FACI reset transfer warning interrupt when RTECRCT = 1.

Note 1. It is necessary to clear RTEDIE and RTECIE before clearing the ECM error source status for FACI reset transfer warning interrupt because FRTSTAT_n register is updated only when it is reset and FACI reset transfer is finished.

51.12 Configuration Setting Area (Option Bytes, Reset Vector)

Configuration Setting Area consists of two areas (Area 0 and Area 1). Valid area is mapped in front side, Invalid area is mapped in back side. Valid area cannot be updated whereas Invalid area can be updated.

Area 0 is selected as valid area at the shipping from RENESAS.

Area 1 is selected as invalid area and erased at the shipping from RENESAS.

The flash memory has the area to store a data specified by the user for configuration settings. Changes in settings become effective after TAG Update and release from the reset state (see **Section 51.17, Reset Transfer**).

OTP Setting of Configuration Setting Area becomes effective without reset. Valid / Invalid area switching for read access also becomes effective without reset.

Table 51.50 shows Configuration Setting Area. For setting and reading this area, see the *Renesas Flash Programmer Flash Programming Software User's Manual*, or the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Table 51.50 Configuration Setting Area (1/2)

Option byte 13 (OPBT13)	<CSAk_base>+ $03D4_H$	FFFF FFFF$_H$	Customer ID A	—	14

Table 51.50 Configuration Setting Area (2/2)

Name	Address*9	State at the shipping*1	Write Protection ID*2	Read Protection ID*3	CSAVOF/ CSAVOFC Number
Option byte 14 (OPBT14)	<CSAk_base>+ $03D8_H$	$0000\ 0002_H$ (U2A-EVA) $0000\ 0192_H$ (U2A16/U2A8/ U2A6)	Customer ID A	—	14
Reserved (need to be programmed) *5	<CSAk_base>+ $03DC_H$	$FFFF\ FFFF_H$	Customer ID A	—	14
Option byte 16 (OPBT16)	<CSAk_base>+ $03E0_H$	$6FFF\ FFFF_H$	Customer ID A	—	15
Option byte 17 (OPBT17)	<CSAk_base>+ $03E4_H$	$FFFF\ FFFF_H$	Customer ID A	—	15
Option byte 18 (OPBT18)	<CSAk_base>+ $03E8_H$	$FFFF\ FFFF_H$	Customer ID A	—	15
Option byte 19 (OPBT19)	<CSAk_base>+ $03EC_H$	$FFFF\ FFFF_H$	Customer ID A	—	15
Option byte 20 (OPBT20)	<CSAk_base>+ $03F0_H$	$F088\ FF00_H$	Customer ID A	—	15
Option byte 21 (OPBT21)	<CSAk_base>+ $03F4_H$	$0000\ 00CC_H$	Customer ID A	—	15
Option byte 22 (OPBT22)	<CSAk_base>+ $03F8_H$	$C000\ C000_H$	Customer ID A	—	15
Option byte 23 (OPBT23)	<CSAk_base>+ $03FC_H$	$FFFF\ C000_H$	Customer ID A	—	15
Reserved (need to be programmed) *5	<CSAk_base>+ (0400_H to $047C_H$)	All $FFFF\ FFFF_H$	Customer ID A	—	16 to 19
Reserved*7	<CSAk_base>+ (0480_H to $07FC_H$)	Erased	Can not Write	—	—

Note 1. This is the value of valid area at the shipping. Invalid area is erased at the shipping.
Note 2. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary for programming the data.
Note 3. When On-chip debug and S_OPBT3.CFRPF is “0”, the Customer ID A authentication is needed to read.
Note 4. For details of this function, see **Section 47.7, Configuration Setting Area (Option Bytes, Reset Vector)**.
Note 5. For this reserved area, program $FFFF\ FFFF_H$ when programming Configuration Setting Area.
Note 6. This area will be updated automatically when programming Configuration Setting Area.
Note 7. This area cannot be programmed. When this area is read, it behaves as if it is erased.
Note 8. For details of this function, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.
Note 9. <CSAk_base> (k = f, b)

51.12.1 CSAVOFn — Valid Option Byte Flag n for Configuration Setting Area (n = 0, 8 to 19)

This flag indicates that the related option bytes are programmed or not.

The relation between each CSAVOFn and option bytes are shown in **Table 51.50**.

This flag is referred by flash sequencer in order to check whether the related option bytes are programmed or not. This flag will be updated automatically when programming Configuration Setting Area. The updated value will be 5AA5 $A55A_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Address: <CSAk_base> + 0000_H + 04_H x n

Value at the shipping: 5AA5 $A55A_H$ (valid area)
Erased (invalid area)

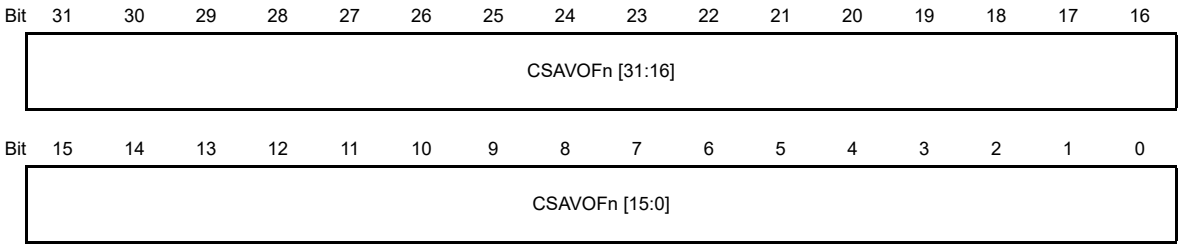

Table 51.51 CSAVOFn Contents

Bit Position	Bit Name	Function
31 to 0	CSAVOFn [31:0]	Program completion flag. 5AA5 $A55A_H$: The related option bytes are programmed. Other than above: The related option bytes are not programmed.

51.12.2 CSAVOFCn — VOF Program completion flag n for Configuration Setting Area (n = 0, 8 to 19)

This flag indicates that CSAVOFn is programmed or not.
The relation between each CSAVOFCn and option bytes are shown in **Table 51.50**.
This flag is prepared to check whether the related option bytes are programmed or not by user program.
This flag will be updated automatically when programming Configuration Setting Area. The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Address: <CSAk_base> + 0100$_H$ + 04$_H$ x n

Value at the shipping: 5AA5 A55A$_H$ (valid area)
Erased (invalid area)

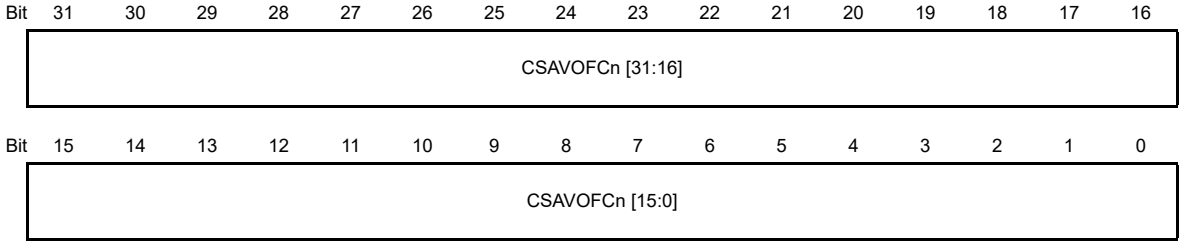

Table 51.52 CSAVOFCn Contents

Bit Position	Bit Name	Function
31 to 0	CSAVOFCn [31:0]	CSAVOFn Program completion flag. 5AA5 A55A$_H$: CSAVOFn is programmed. Other than above: CSAVOFn is not programmed.

51.12.3 Software Configuration Option Byte (n = 0 to 31)

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + 0300_H + 04_H x n (n = 0 to 31)

Value at the shipping: $0000\ 0000_H$ (valid area)
Erased (invalid area)

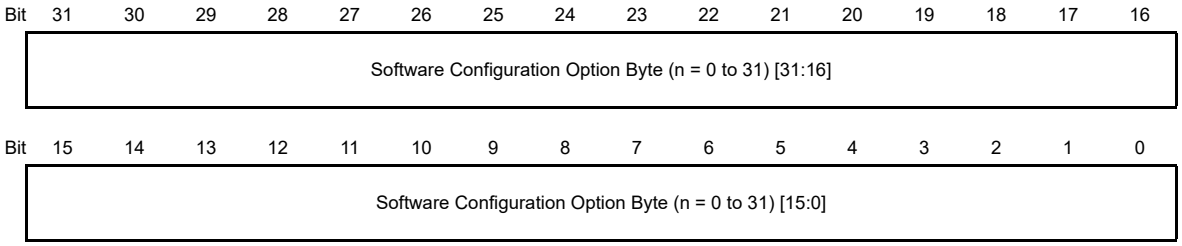

Table 51.53 Software Configuration Option Byte (n = 0 to 31) Contents

Bit Position	Bit Name	Function
31 to 0	—	Software Configuration Option Byte (n = 0 to 31) These data do not affect hardware behavior.

51.12.4 Reset Vector PE0

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Address: <CSAk_base> + 0380_H

Value at the shipping: $0000\ 0000_H$ (valid area)
Erased (invalid area)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	OPT_RBASE0[23:16]							

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OPT_RBASE0[15:9]							—	—	—	—	—	—	—	—	—

Table 51.54 Reset Vector PE0 Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	Set the value of valid area at the shipping.
23 to 9	OPT_RBASE0 [23:9]	These bits indicate the reset vector base address of PE0 in Normal Operation Mode.
8 to 0	Reserved	Set the value of valid area at the shipping.

51.12.5 Reset Vector PE1

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + 0384_H

Value at the shipping: $0000\ 0000_H$ (valid area)
Erased (invalid area)

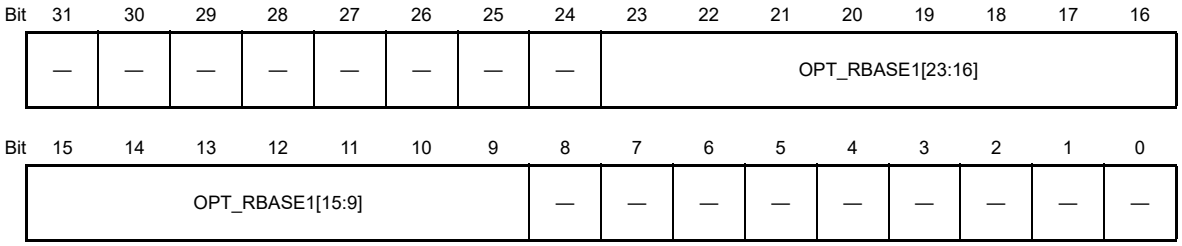

Table 51.55 Reset Vector PE1 Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	Set the value of valid area at the shipping.
23 to 9	OPT_RBASE1 [23:9]	These bits indicate the reset vector base address of PE1 in Normal Operation Mode and User Boot Mode.
8 to 0	Reserved	Set the value of valid area at the shipping.

51.12.6 Reset Vector PEn (n = 2, 3)

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + 0380_H + 04_H x n (n = 2, 3)

Value at the shipping: $0080\ 0000_H$ (valid area)
Erased (invalid area)

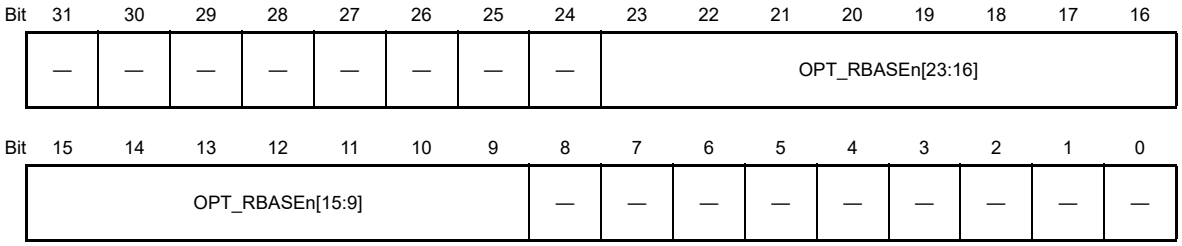

Table 51.56 Reset Vector PEn Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	Set the value of valid area at the shipping.
23 to 9	OPT_RBASEn[23:9]	[For U2A-EVA/U2A16] These bits indicate the reset vector base address of PEn (n=2,3) in Normal Operation Mode and User Boot Mode. [For U2A8/U2A6] Set the value of valid area at the shipping.
8 to 0	Reserved	Set the value of valid area at the shipping.

51.12.7 OPBT0 — Option Byte 0

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + $03A0_H$

Value at the shipping: 3FF3 0010_H (valid area)
Erased (invalid area)

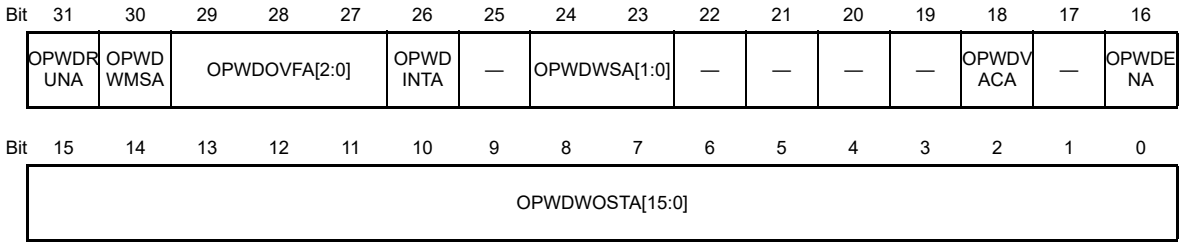

Table 51.57 OPBT0 Contents (1/2)

Bit Position	Bit Name	Function
31	OPWDRUNA	This bit sets the start mode of WDTBA. 0: WDTBA software trigger start mode 1: WDTBA default start mode
30	OPWDWMSA	This bit selects Window Open function mode of WDTBA 0: Window Size of Window Open function is set by WDTBAWS[1:0]. WDTBATIT outputs When the counter reaches 75% of the overflow setting defined by WDTBAMD.WDTBAOVF[2:0] 1: Window Size of Window Open function is set by WDTBAWOST WDTBATIT outputs When WDTBAWIS matches WDT counter.
29 to 27	OPWDOVFA[2:0]	These bits select the overflow interval time of WDTBA.

OPWDOVFA[2:0]	Overflow Interval Time
000_B	2^9 / WDTBTCKI
001_B	2^{10} / WDTBTCKI
010_B	2^{11} / WDTBTCKI
011_B	2^{12} / WDTBTCKI
100_B	2^{13} / WDTBTCKI
101_B	2^{14} / WDTBTCKI
110_B	2^{15} / WDTBTCKI
111_B	2^{16} / WDTBTCKI

26	OPWDINTA	This bit enables or disables a 75% interrupt request of WDTBA (WDTBATIT). 0: WDTBATIT disabled 1: WDTBATIT enabled
25	Reserved	Set the value of valid area at the shipping.
24, 23	OPWDWSA[1:0]	These bits select the window open period of WDTBA.

OPWDWSA[1:0]	Window Open Period
00_B	25%
01_B	50%
10_B	75%
11_B	100%

Table 51.57 OPBT0 Contents (2/2)

Bit Position	Bit Name	Function
22 to 19	Reserved	Set the value of valid area at the shipping.
18	OPWDVACA	This bit specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTBAWDTE (fixed) 1: WDTBAEVAC (variable)
17	Reserved	Set the value of valid area at the shipping.
16	OPWDENA	This bit enables/disables the WDTBA 0: WDTBA is disabled 1: WDTBA is enabled
15 to 0	OPWDWOSTA	These bits are Window Open Start register for setting the start timing of the window open.

For details of these data, see **Section 31, Window Watchdog Timer (WDTB)**.

51.12.8 OPBT1 — Option Byte 1

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + $03A4_H$

Value at the shipping: F0FB 0000_H (valid area)
Erased (invalid area)

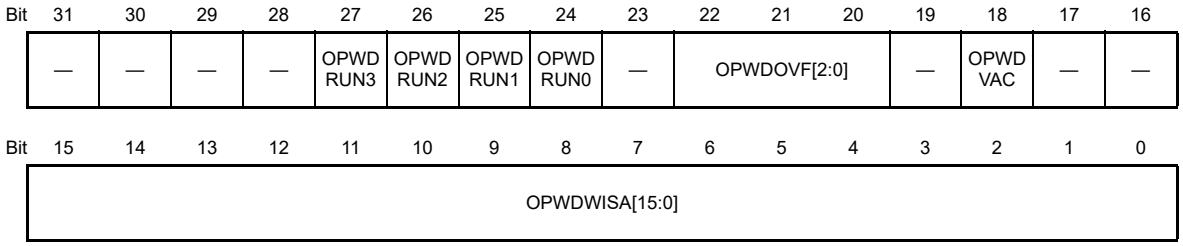

Table 51.58 OPBT1 Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	Set the value of valid area at the shipping.
27	OPWDRUN3	[For U2A-EVA/U2A16] This bit sets the start mode of WDTB3. 0: WDTB3 software trigger start mode 1: WDTB3 default start mode [For U2A8/U2A6] Arbitrary value can be specified.
26	OPWDRUN2	[For U2A-EVA/U2A16] This bit sets the start mode of WDTB2. 0: WDTB2 software trigger start mode 1: WDTB2 default start mode [For U2A8/U2A6] Arbitrary value can be specified.
25	OPWDRUN1	This bit sets the start mode of WDTB1. 0: WDTB1 software trigger start mode 1: WDTB1 default start mode
24	OPWDRUN0	This bit sets the start mode of WDTB0. 0: WDTB0 software trigger start mode 1: WDTB0 default start mode
23	Reserved	Set the value of valid area at the shipping.
22 to 20	OPWDOVF[2:0]	These bits select the overflow interval time of WDTBn (n = 0 to 3). OPWDOVF[2:0] / Overflow Interval Time 000_B / 2^9 / WDTBTCKI 001_B / 2^{10} / WDTBTCKI 010_B / 2^{11} / WDTBTCKI 011_B / 2^{12} / WDTBTCKI 100_B / 2^{13} / WDTBTCKI 101_B / 2^{14} / WDTBTCKI 110_B / 2^{15} / WDTBTCKI 111_B / 2^{16} / WDTBTCKI
19	Reserved	Set the value of valid area at the shipping.
18	OPWDVAC	This bit specifies the trigger register of WDTBn (n = 0 to 3) for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTBnWDTE (fixed) 1: WDTBnEVAC (variable)

Table 51.58 OPBT1 Contents (2/2)

Bit Position	Bit Name	Function
17, 16	Reserved	Set the value of valid area at the shipping.
15 to 0	OPWDWISA	These bits specify WDTBA Interrupt Output Timing Setting Register

For details of these data, see **Section 31, Window Watchdog Timer (WDTB)**.

51.12.9 OPBT2 — Option Byte 2

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

For details of this OPBT2, see the *RH850/U2A-EVA Group Security User’s Manual: Hardware*.

51.12.10 OPBT3 — Option Byte 3

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + $03AC_H$

Value at the shipping: F1FF $FEFE_H$ (valid area)
Erased (invalid area)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PE3_DISABLE	PE2_DISABLE	PE1_DISABLE	—	—	—	—	—	—	—	—	—

	HWBIST	—	—	—	TESTSET[1:0]		LBISTSEL[1:0]		—	—	—	—	—	—	STMSEL1	STMSEL0

Table 51.59 OPBT3 Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	Set the value of valid area at the shipping.
27	PE3_DISABLE	[For U2A-EVA/U2A16] PE3_DISABLE bit 0: PE3 enable 1: PE3 disable [For U2A8/U2A6] Arbitrary value can be specified.
26	PE2_DISABLE	[For U2A-EVA/U2A16] PE2_DISABLE bit 0: PE2 enable 1: PE2 disable [For U2A8/U2A6] Arbitrary value can be specified.
25	PE1_DISABLE	PE1_DISABLE bit 0: PE1 enable 1: PE1 disable
24 to 16	Reserved	Set the value of valid area at the shipping.
15	HWBIST	Power On BIST enable 0: BIST is skipped 1: BIST is executed
14 to 12	Reserved	Set the value of valid area at the shipping.
11, 10	TESTSET[1:0]	BIST selection 0 0_B: Prohibited 0 1_B: LBIST Only 1 0_B: MBIST Only 1 1_B: LBIST and MBIST For details, see **Section 44, Functional Safety**.
9, 8	LBISTSEL[1:0]	BIST scenario selection 0 0_B: LBIST scenario 1/MBIST scenario 1 0 1_B: LBIST scenario 2/MBIST scenario 1 1 0_B: LBIST scenario 3/MBIST scenario 1 1 1_B: Prohibited For details, see **Section 44, Functional Safety**.
7 to 2	Reserved	Set the value of valid area at the shipping.
1, 0	STMSEL1, STMSEL0	These bits select operating mode and startup area. When FLMD0 pin is 0, the operating mode and startup area are selected depending on the combination of the STMSEL1 and STMSEL0. For details, see **Section 5, Operating Modes**.

51.12.11 OPBT4 — Option Byte 4

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + $03B0_H$

Value at the shipping: 0C0C 0C0F$_H$ (valid area)

Table 51.60 OPBT4 Contents (1/2)

Bit Position	Bit Name	Function
31, 30	ISOVDDFLTW[1:0]	VMON configurations for ISOVDD Select the minimum filtering width of digital noise filter.
29, 28	ISOVDDCLKSEL [1:0]	VMON configurations for ISOVDD Select a clock of the digital noise filter.
27	ISOVDDFLTEN	VMON configurations for ISOVDD Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF.
26	Reserved	Set the value of valid area at the shipping.
25	ISOVDDHDE	VMON configurations for ISOVDD ISOVDD High voltage detection enable.
24	ISOVDDLDE	VMON configurations for ISOVDD ISOVDD Low voltage detection enable.
23, 22	VCCFLTW[1:0]	VMON configurations for VCC Select the minimum filtering width of digital noise filter.
21, 20	VCCCLKSEL[1:0]	VMON configurations for VCC Select a clock of the digital noise filter.
19	VCCFLTEN	VMON configurations for VCC Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF.
18	Reserved	Set the value of valid area at the shipping.
17	VCCHDE	VMON configurations for VCC VCC High voltage detection enable.
16	VCCLDE	VMON configurations for VCC VCC Low voltage detection enable.
15, 14	E0VCCFLTW[1:0]	VMON configurations for E0VCC Select the minimum filtering width of digital noise filter.
13, 12	E0VCCCLKSEL[1:0]	VMON configurations for E0VCC Select a clock of the digital noise filter.
11	E0VCCFLTEN	VMON configurations for E0VCC Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF.
10	Reserved	Set the value of valid area at the shipping.
9	E0VCCHDE	VMON configurations for E0VCC E0VCC High voltage detection enable.
8	E0VCCLDE	VMON configurations for E0VCC E0VCC Low voltage detection enable.

Table 51.60 OPBT4 Contents (2/2)

Bit Position	Bit Name	Function
7, 6	AWOVDDFLTW[1:0]	VMON configurations for AWOVDD Select the minimum filtering width of digital noise filter.
5, 4	AWOVDDCLKSEL [1:0]	VMON configurations for AWOVDD Select a clock of the digital noise filter.
3	AWOVDDFLTEN	VMON configurations for AWOVDD Enable output filter for VMONOUT and VMONF.
2	DSDETEN	VMON control during DeepSTOP
1, 0	Reserved	Set the value of valid area at the shipping.

For details of these data, see **Section 11, Power Supply Voltage Monitor**.

51.12.12 OPBT6 — Option Byte 6

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + $03B8_H$

Value at the shipping: FFFF $0FC3_H$ (valid area)
Erased (invalid area)

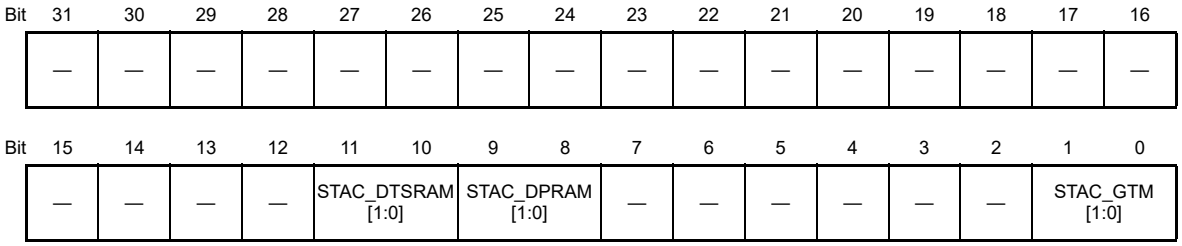

Table 51.61 OPBT6 Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	Set the value of valid area at the shipping.
11, 10	STAC_DTSRAM[1:0]	RAM Initialization Mode for DTSRAM. X 0_B: Disabled 0 1_B: Prohibited 1 1_B: Enabled
9, 8	STAC_DPRAM[1:0]	RAM Initialization Mode for DPRAM. X 0_B: Disabled 0 1_B: Prohibited 1 1_B: Enabled
7 to 2	Reserved	Set the value of valid area at the shipping.
1, 0	STAC_GTM[1:0]	RAM Initialization Mode for GTM. X 0_B: Disabled 0 1_B: Prohibited 1 1_B: Enabled

For details of these data, see **Section 9, Reset Controller**.

51.12.13 OPBT7 — Option Byte 7

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Address: <CSAk_base> + $03BC_H$

Value at the shipping: $FFFF\ FFFF_H$ (valid area)

Table 51.65 OPBT10 Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	Set the value of valid area at the shipping.
28	MOSC_EXCLKINPUT	Main OSC input clock select. 0: Direct clock input to X1 (EXCLK mode). Main OSC amplifier is disabled. 1: Normal crystal oscillation. Main OSC amplifier is enabled.
27	Reserved	Set the value of valid area at the shipping.
26 to 24	MOSC_FREQ[2:0]	Main OSC frequency selection bit 000_B: 16 MHz 001_B: 20 MHz 010_B: 24 MHz 011_B: 40 MHz $1xx_B$: setting prohibited (need to configure all bit)
23	Reserved	Set the value of valid area at the shipping.
22 to 20	MOSC_AMP_SEL_A [2:0]	Main OSC trimming configuration These bits control OSC drivability during oscillation destabilization.
19	Reserved	Set the value of valid area at the shipping.
18 to 16	MOSC_AMP_SEL_B [2:0]	Main OSC trimming configuration These bits control OSC drivability during oscillation stabilization.
15 to 12	MOSC_CAP_SEL [3:0]	Main OSC trimming configuration These bits control internal capacitance.
11	Reserved	Set the value of valid area at the shipping.
10 to 8	MOSC_RD_SEL_A [2:0]	Main OSC trimming configuration These bits control Damping resistor during oscillation destabilization.
7	Reserved	Set the value of valid area at the shipping.
6 to 4	MOSC_RD_SEL_B [2:0]	Main OSC trimming configuration These bits control Damping resistor during oscillation stabilization.
3, 2	Reserved	Set the value of valid area at the shipping.
1	MOSC_SHTSTBY_A	Main OSC trimming configuration This bit controls OSC drivability during oscillation destabilization. MOSC_SHTSTBY_A must be set to 1.
0	MOSC_SHTSTBY_B	Main OSC trimming configuration This bit controls OSC drivability during oscillation stabilization. MOSC_SHTSTBY_B must be set to 0.

For details of these data, see **Section 13, Clock Controller**.

51.12.17 OPBT11 — Option Byte 11

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03CC_H$

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

Table 51.68 OPBT13 Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	Set the value of valid area at the shipping.
1	DBMAPSW1	[For U2A-EVA/U2A16] Double Map Mode Switching of Cluster 1 0: Bank D is mapped in valid area. 1: Bank C is mapped in valid area. [For U2A8/U2A6] Set the value of valid area at the shipping.
0	DBMAPSW0	Double Map Mode Switching of Cluster 0 0: Bank B is mapped in valid area. 1: Bank A is mapped in valid area.

51.12.20 OPBT14 — Option Byte 14

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03D8_H$

Value at the shipping: 0000 0002_H (valid area) (U2A-EVA), 0000 0192_H (valid area) (U2A16/U2A8/U2A6)
Erased (invalid area)

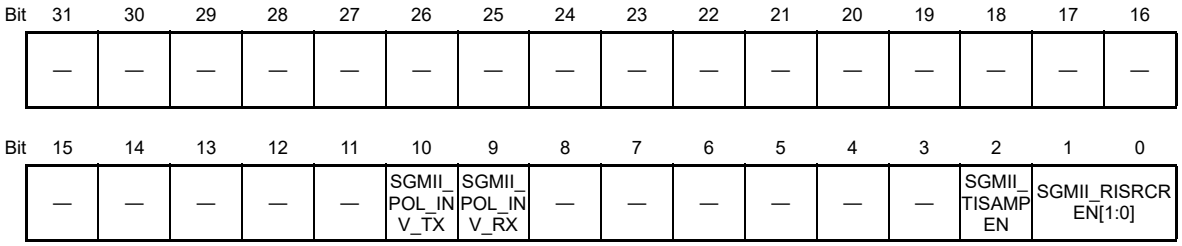

Table 51.69 OPBT14 Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	Set the value of valid area at the shipping.
10	SGMII_POL_INV_TX	SGMII transmitter polarity inversion 0: Polarity of TX_DATAP/TX_DATAN pin is not inverted. 1: Polarity of TX_DATAP/TX_DATAN pin is inverted. This bit is valid for U2A16/U2A8 only. For U2A-EVA, the polarity cannot be inverted. [For U2A-EVA/U2A6] Arbitrary value can be specified.
9	SGMII_POL_INV_RX	SGMII receiver polarity inversion 0: Polarity of RX_DATAP/RX_DATAN pin is not inverted. 1: Polarity of RX_DATAP/RX_DATAN pin is inverted. This bit is valid for U2A16/U2A8 only. For U2A-EVA, the polarity cannot be inverted. [For U2A-EVA/U2A6] Arbitrary value can be specified.
8 to 3	Reserved	[For U2A-EVA/U2A6] Arbitrary value can be specified. [For U2A16/U2A8] Set the value of valid area at the shipping.
2	SGMII_TISAMPEN	SGMII output amplitude control 0: 300mVpp (600mVppd) 1: 600mVpp (1200mVppd) This bit is valid for U2A-EVA only. For U2A16/U2A8, the amplitude is fixed to 300mVpp (600mVppd). [For U2A16/U2A8/U2A6] Arbitrary value can be specified.
1, 0	SGMII_RISRCREN [1:0]	SGMII receiver termination selectors $0\ 0_B$: Hi-Z $0\ 1_B$: Setting prohibited $1\ 0_B$: 50ohm + 50ohm between RIDP and RIDN (DC coupled) $1\ 1_B$: 50ohm to Vcm (AC coupled with IEEE802.3-2015 compliant capacitor) These bits are valid for U2A-EVA/U2A16/U2A8 only. [For U2A6] Arbitrary value can be specified.

51.12.21 OPBT16 — Option Byte 16

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03E0_H$

Value at the shipping: $6FFF\ FFFF_H$ (valid area)
Erased (invalid area)

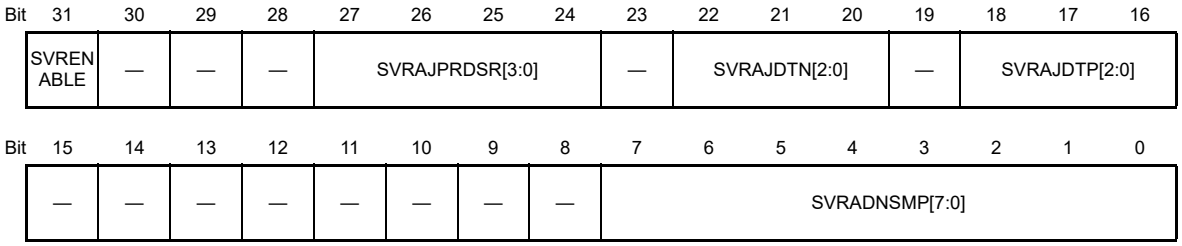

Table 51.70 OPBT16 Contents

Bit Position	Bit Name	Function
31	SVRENABLE	SVR Enable setting. 0: Disabled (default) 1: Enabled **CAUTION** Make sure that the all SVR parameters to be set to OPBT16-23 are correct before enabling SVR. Otherwise, the output voltage of Power MOSFET may be unintentional value.
30 to 28	Reserved	Set the value of valid area at the shipping.
27 to 24	SVRAJPRDSR[3:0]	SVR Adjusting slew rate (drive ability).
23	Reserved	Set the value of valid area at the shipping.
22 to 20	SVRAJDTN[2:0]	SVR Adjusting dead time of Lo-side:OFF->Hi-side:ON.
19	Reserved	Set the value of valid area at the shipping.
18 to 16	SVRAJDTP[2:0]	SVR Adjusting dead time of Hi-side:OFF->Lo-side:ON.
15 to 8	Reserved	Set the value of valid area at the shipping.
7 to 0	SVRADNSMP[7:0]	SVR ADC Sampling time.

For details of these data, see **Section 10, Power Supply Circuit**.

51.12.22 OPBT17 — Option Byte 17

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03E4_H$

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

Table 51.71 OPBT17 Contents

Bit Position	Bit Name	Function
31 to 24	SVRADTHRESHE[7:0]	SVR ADC conversion completion state setting.
23 to 16	SVRADTHRESH[7:0]	SVR ADC sampling start state setting.
15 to 8	SVRMAXDUTY[7:0]	SVR Maximum on-duty setting.
7, 6	Reserved	Set the value of valid area at the shipping.
5, 4	SVRMINSKIPDUTY[1:0]	SVR Skip minimum pulse setting.
3, 2	Reserved	Set the value of valid area at the shipping.
1, 0	SVRFSWMODE[1:0]	SVR Switching frequency setting.

For details of these data, see **Section 10, Power Supply Circuit**.

51.12.23 OPBT18 — Option Byte 18

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03E8_H$

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

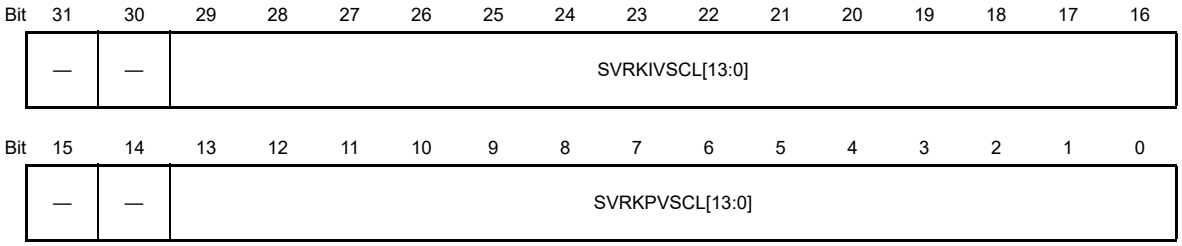

Table 51.72 OPBT18 Contents

Bit Position	Bit Name	Function
31, 30	Reserved	Set the value of valid area at the shipping.
29 to 16	SVRKIVSCL[13:0]	SVR Scaled KI value of VPID.
15, 14	Reserved	Set the value of valid area at the shipping.
13 to 0	SVRKPVSCL[13:0]	SVR Scaled KP value of VPID.

For details of these data, see **Section 10, Power Supply Circuit**.

51.12.24 OPBT19 — Option Byte 19

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03EC_H$

Value at the shipping: $FFFF\ FFFF_H$ (valid area)
Erased (invalid area)

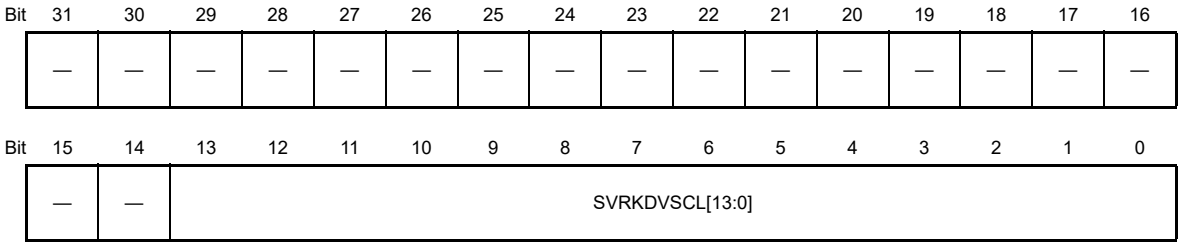

Table 51.73 OPBT19 Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	Set the value of valid area at the shipping.
13 to 0	SVRKDVSCL[13:0]	SVR Scaled KD value of VPID.

For details of these data, see **Section 10, Power Supply Circuit**.

51.12.25 OPBT20 — Option Byte 20

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03F0_H$

Value at the shipping: F088 $FF00_H$ (valid area)
Erased (invalid area)

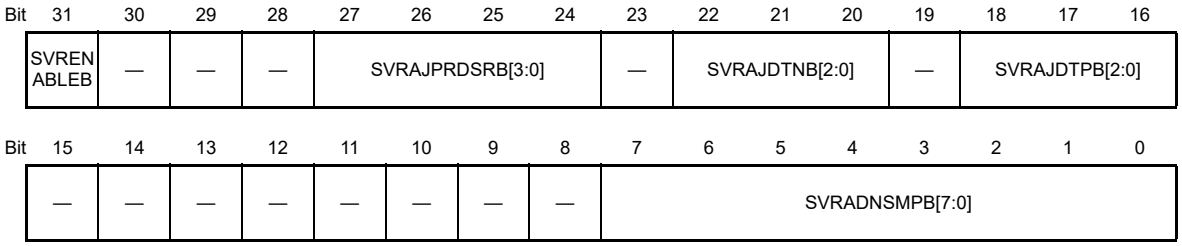

Table 51.74 OPBT20 Contents

Bit Position	Bit Name	Function
31	SVRENABLEB	Program inverted value of SVRENABLE.
30 to 28	Reserved	Set the value of valid area at the shipping.
27 to 24	SVRAJPRDSRB[3:0]	Program inverted value of SVRAJPRDSR[3:0].
23	Reserved	Set the value of valid area at the shipping.
22 to 20	SVRAJDTNB[2:0]	Program inverted value of SVRAJDTN[2:0].
19	Reserved	Set the value of valid area at the shipping.
18 to 16	SVRAJDTPB[2:0]	Program inverted value of SVRAJDTP[2:0].
15 to 8	Reserved	Set the value of valid area at the shipping.
7 to 0	SVRADNSMPB[7:0]	Program inverted value of SVRADNSMP[7:0].

For details of these data, see **Section 10, Power Supply Circuit**.

51.12.26 OPBT21 — Option Byte 21

Customer ID A authentication is necessary to program these data. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary to program these data.

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware*.

Address: <CSAk_base> + $03F4_H$

Value at the shipping: 0000 $00CC_H$ (valid area)

Bit Position	Bit Name	Function
31 to 14	Reserved	Set the value of valid area at the shipping.
13 to 0	SVRKDVSCLB[13:0]	Program inverted value of SVRKDVSCL[13:0].

For details of these data, see **Section 10, Power Supply Circuit**.

51.12.29 OTP (One Time Programmable) setting for Configuration Setting Area.

The details of this function, see **Section 47.7, Configuration Setting Area (Option Bytes, Reset Vector)**.

51.13 Switch Area

Switch Area consists of two areas (Area 0 and Area 1). Valid area is mapped in front side, Invalid area is mapped in back side. Valid area cannot be updated whereas Invalid area can be updated.

Area 0 is selected as valid area at the shipping from RENESAS.

Area 1 is selected as invalid area at the shipping from RENESAS.

Changes in settings become effective after TAG update without reset. Valid / Invalid area switching for read access also becomes effective without reset.

Table 51.78 and **Table 51.79** show Switch Area. For setting and reading these areas, see the *Renesas Flash Programmer Flash Programming Software User's Manual*, or the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Table 51.78 Switch Area in case of Area 0 is valid (FSWASTAT_0.SWVA = 0) (1/2)

Area	Name	Address	State at the Shipping*1	Write/Erase Protection ID*2	Read Protection ID*3
Area 0	A0PC (Area 0 Program Complete Flag)	<SWAf_base>+ 0000_H	5AA5 A55A$_H$	Can not Write	—

Area 0	BVA1 (Block protection setting Valid Area for FPSYS1)	<SWAb_base>+ $020C_H$	—	Customer ID A	—
Area 0	Reserved (need to be programmed)*4	<SWAb_base>+ (0210_H to $021C_H$)	—	Customer ID A	—
Area 0	Reserved*6	<SWAb_base>+ (0220_H to $07FC_H$)	—	Can not Write	—

Note 1. This is the value of valid area at the shipping. Invalid area is erased at the shipping.

Note 2. When all bits of Customer ID A are all “1” or all “0”, the ID authentication is not necessary for programming/erasure the data.

Note 3. When On-chip debug and S_OPBT3.CFRPF is “0”, the Customer ID A authentication is needed to read.

Note 4. For this reserved area, program FFFF $FFFF_H$ when programming invalid area of Switch Area.

Note 5. This area will be updated automatically when programming invalid area of Switch Area.

Note 6. This area cannot be programmed. When this area is read, it behaves as if it is erased.

51.13.1 AnPC — Area n Program Complete Flag (n = 0, 1)

This flag indicates that the Switch Area n is programmed or not.
This flag is prepared to check whether the Switch Area n is programmed or not by user program.
It is also referred by flash sequencer in order to check whether Switch Area Status is valid or dirty.

This flag will be updated automatically when programming Switch Area. The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: FSWASTAT_0.SWVA = 0 (Area 0 is valid)
A0PC : <SWAf_base> + 0000$_H$
A1PC : <SWAb_base> + 0000$_H$
FSWASTAT_0.SWVA = 1 (Area 1 is valid)
A1PC : <SWAf_base> + 0000$_H$
A0PC : <SWAb_base> + 0000$_H$

Value at the shipping: 5AA5 A55A$_H$ (valid area)
5AA5 A55A$_H$ (invalid area)

Bit Position	Bit Name	Function
31 to 0	AnPC[31:0]	Program completion flag. 5AA5 A55A$_H$: The Switch Area n is programmed. Other than above: The Switch Area n is not programmed.

51.13.2 AnES — Area n Erase Start Flag (n = 0, 1)

This flag indicates that the Erasure of the other Switch Area is started or not.
Note that Switch Area 0 contains A1ES. Whereas Switch Area 1 contains A0ES.

This flag is prepared to check whether the Switch Area Status is dirty or not by user program.

It is also referred by flash sequencer in order to check whether Switch Area Status is valid or dirty.

This flag will be updated automatically when Erasure of the other Switch Area is started. The updated value will be 5AA5 A55A$_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: FSWASTAT_0.SWVA = 0 (Area 0 is valid)

FSWASTAT_0.SWVA = 1 (Area 1 is valid)
A0ES : <SWAf_base> + 0004$_H$
A1ES : <SWAb_base> + 0004$_H$

Value at the shipping: Erased (valid area)
5AA5 A55A$_H$ (invalid area)

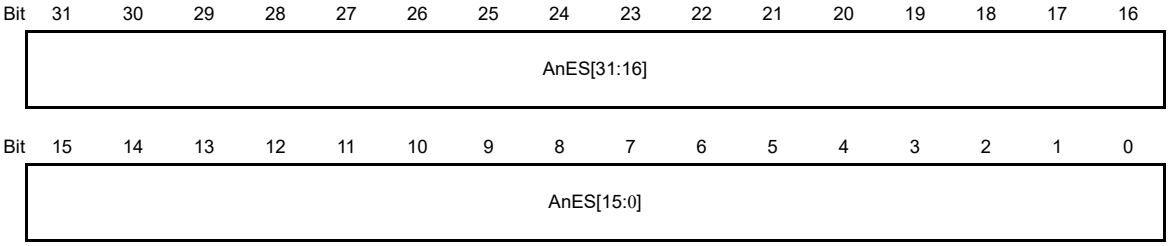

Table 51.81 AnES Contents

Bit Position	Bit Name	Function
31 to 0	AnES[31:0]	Erase Start flag of the other Switch Area. 5AA5 A55A$_H$: The erasure of the other Switch Area is started. Other than above: The erasure of the other Switch Area is not started.

51.13.3 AnEC — Area n Erase Complete Flag (n = 0, 1)

This flag indicates that the Erasure of the other Switch Area is completed or not.
Note that Switch Area 0 contains A1EC. Whereas Switch Area 1 contains A0EC.

This flag is prepared to check whether the Switch Area Status is dirty or not by user program.

It is also referred by flash sequencer in order to check whether Switch Area Status is valid or dirty.

This flag will be updated automatically when Erasure of the other Switch Area is completed. The updated value will be 5AA5 $A55A_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Valid Area of Security Setting Area is shown in FSWASTAT_0.SECVA. For details, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

51.13.8 BVAn — Block Protection for FPSYSn Valid Area Flag (n = 0, 1)

This flag indicates the Valid Area of Block Protection Area for FPSYSn.
For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <SWAf_base> + $0208_H + 04_H$ x n (valid area)
<SWAb_base> + 0208_H + 04_H x n (invalid area)

Value at the shipping: A55A $5AA5_H$ (valid area)
A55A $5AA5_H$ (invalid area)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BVAn[31:16]															

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAn[15:0]															

Table 51.87 BVAn Contents

Bit Position	Bit Name	Function
31 to 0	BVAn[31:0]	Block Protection for FPSYSn Valid Area Flag 5AA5 $A55A_H$: Block Protection Area 1 for FPSYSn is valid. A55A $5AA5_H$: Block Protection Area 0 for FPSYSn is valid. Other than above: Setting prohibited. Valid Area of Block Protection Area for FPSYSn are shown in FSWASTAT_0.BPVAn. For details, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

51.14 TAG Area

TAG Area is used to specify the valid area of Switch Area.

Changes in settings become effective after TAG Update without reset. Valid/Invalid area switching for read access also becomes effective without reset.

Table 51.88 shows TAG Area. For setting and reading this area, see the *Renesas Flash Programmer Flash Programming Software User's Manual*, or the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Table 51.88 TAG Area

Name	Address	State at the shipping*1	Write/Erase Protection ID*2	Read Protection ID*3
VAPC (VAF Program Complete Flag) *4	<TAG_base>+ 0000_H	5AA5 A55A$_H$	Can not Write	—
Reserved*5	<TAG_base>+ (0004_H to $01FC_H$)	Erased	Can not Write	—
VAF (Valid Area Flag)*4	<TAG_base>+ 0200_H	A55A 5AA5$_H$	Customer ID A	—
Reserved*5	<TAG_base>+ (0204_H to $07FC_H$)	Erased	Can not Write	—

Note 1. This is the value of valid area at the shipping.

Note 2. When all bits of Customer ID A are all "1" or all "0", the ID authentication is not necessary for programming/erasure the data.

Note 3. When On-chip debug and S_OPBT3.CFRPF is "0", the Customer ID A authentication is needed to read.

Note 4. This area will be updated automatically by TAG update command.

Note 5. This area cannot be programmed. When this area is read, it behaves as if it is erased.

51.14.1 VAPC — VAF Program Complete Flag

This flag indicates that the VAF is programmed or not.
This flag is prepared to check whether the Switch Area Status is dirty or not by user program.
It is also referred by flash sequencer in order to check whether Switch Area Status is valid or dirty.

This flag will be updated automatically when VAF is updated. The updated value will be 5AA5 $A55A_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.
Address: <TAG_base> + 0000_H
Value at the shipping: 5AA5 $A55A_H$

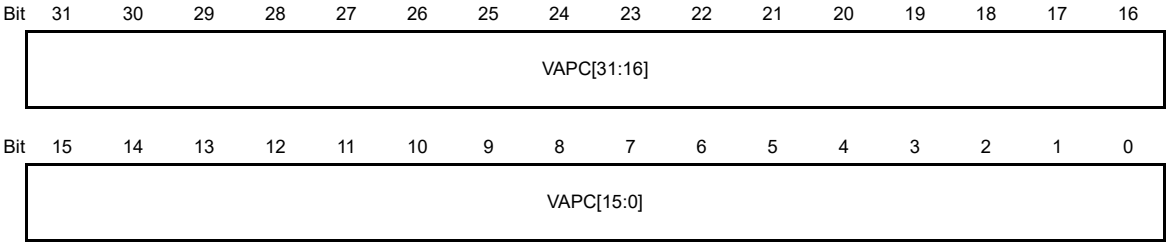

Table 51.89 VAPC Contents

Bit Position	Bit Name	Function
31 to 0	VAPC[31:0]	VAF Program completion flag. 5AA5 $A55A_H$: VAF is programmed. Other than above: VAF is not programmed.

51.14.2 VAF —Valid Area Flag of Switch Area

This flag indicates the Valid Area of Switch Area.

This flag will be updated automatically by TAG Update command. The updated value will be 5AA5 $A55A_H$ or A55A $5AA5_H$.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

Access: For setting these data, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

Address: <TAG_base> + 0200_H

Value at the shipping: A55A $5AA5_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VAF[31:16]															

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VAF[15:0]															

Table 51.90 VAF Contents

Bit Position	Bit Name	Function
31 to 0	VAF[31:0]	Valid Area Flag of Switch area 5AA5 A55AH: Switch Area 1 is valid. A55A 5AA5H: Switch Area 0 is valid. Other than above: Switch Area Status is Dirty. Valid Area of Switch Area is shown in FSWASTAT_0.SWVA. For details, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware.*

51.15 Erase Counter Area

Each block of User Area has 16-bit Erase Counter.

Maximum count of Erase Counter is $03E9_H$ (1001), and the counter value is not increased if an “Erase” command is issued when an Erase Counter is $03E9_H$.

Erase Counter Area for User Area 0 and User Boot Area 0 are located in FF32 5000_H to FF32 $67FF_H$.

Erase Counter Area for User Area 1 and User Boot Area 1 are located in FF32 6800_H to FF32 $7FFF_H$.

Erase Counter Area for User Area 2 is located in FF34 1000_H to FF34 $27FF_H$.

Erase Counter Area for User Area 3 is located in FF34 2800_H to FF34 $3FFF_H$.

When an “Erase” command is issued to User Area or User Boot Area, Erase Counter Area is updated first, after that code flash is erased.

Table 51.91 and **Table 51.92** show mapping of Erase Counter Area. Un_m indicates block number of User Area. For example, U0_1 indicates block 1 of User Area 0. U0_uba indicates User Boot Area 0. When Area 0/1 Valid Flag for Erase Counter equal to 5AA5 $A55A_H$, Area 1 is valid. When Area 0/1 Valid Flag for Erase Counter is other values, Area 0 is valid.

The offset of Area 0 and Area 1 are fixed (not flipped by Hardware). It is necessary to check the Area 0/1 Valid Flag for Erase Counter to judge the valid area.

For details of this function, see the *RH850/U2A-EVA Group Flash Memory User’s Manual: Hardware.*

Table 51.91 Erase Counter Area for User Area n and User Boot Area n (n = 0, 1)

Area	Address (User Mode)	bit 31 bit16	bit15 bit0	State at the shipping	Read Protection ID*1
	<ECn_base> + 0000_H	Area 0/1 Valid Flag for Erase Counter		FFFF $FFFF_H$	—
	<ECn_base> + 0004_H to $07FC_H$	Reserved		Undefined	—
Area 0	<ECn_base> + 0800_H	Counter for Un_1	Counter for Un_0	0000 0000_H	—
	<ECn_base> + 0804_H	Counter for Un_3	Counter for Un_2	0000 0000_H	—
	…	…	…	…	…
	<ECn_base> + 0888_H	Counter for Un_69	Counter for Un_68	0000 0000_H	—
	<ECn_base> + $088C_H$ to $FF8_H$	Reserved*2		Erased	—
	<ECn_base> + FFC_H	Counter for Un_uba	Reserved	0000 $FFFF_H$	—
Area 1	<ECn_base> + 1000_H to $17FC_H$	Same as <ECn_base> + 0800_H to FFC_H (Valid area is decided by Area 0/1 Valid Flag for Erase Counter)			

Table 51.92 Erase Counter Area for User Area n (n ≠ 0, 1)

Area	Address (User Mode)	bit 31 bit16	bit15 bit0	State at the shipping	Read Protection ID*1
	<ECn_base> + 0000_H	Area 0/1 Valid Flag for Erase Counter		FFFF $FFFF_H$	—
	<ECn_base> + 0004_H to $07FC_H$	Reserved		Undefined	—
Area 0	<ECn_base> + 0800_H	Counter for Un_1	Counter for Un_0	0000 0000_H	—
	<ECn_base> + 0804_H	Counter for Un_3	Counter for Un_2	0000 0000_H	—
	…	…	…	…	…
	<ECn_base> + 0888_H	Counter for Un_69	Counter for Un_68	0000 0000_H	—
	<ECn_base> + $088C_H$ to $FF8_H$	Reserved*2		Erased	—
	<ECn_base> + FFC_H	Reserved		FFFF $FFFF_H$	—
Area 1	<ECn_base> + 1000_H to $17FC_H$	Same as <ECn_base> + 0800_H to FFC_H (Valid area is decided by Area 0/1 Valid Flag for Erase Counter)			

Note 1. When On-chip debug and S_OPBT3.CFRPF is "0", the Customer ID A authentication is needed to read.

Note 2. When this area is read, it behaves as if it is erased.

51.16 Extended Data Area

Extended Data Area is used to store any data to use by user software.

This area is 1 block of the data flash. But, protection specifications are different.

Table 51.93 Extended Data Area

Name	Address	State at the shipping.*1	Write/Erase Protection ID*2	Read Protection ID*3
Extended Data Area	FF32 0000_H to FF32 $07FF_H$	Erased	Customer ID A/B/C	—

Note 1. This is the value at the shipping.

Note 2. The ID (Customer ID A or B or C) which protects the Extended Data Area can be selected by the setting of Block Protection.
For details, see **Section 47.9, Block Protection Area for FPSYS0/FPSYS1.**
When all bits of the ID are all “1” or all “0”, the ID authentication is no needed to set.

Note 3. When On-chip debug and S_OPBT3.CFRPF is “0”, the Customer ID A authentication is needed to read.

51.17 Reset Transfer

Reading the setting of this product (such as System Configuration Parameters) from Flash Memory is executed by Power On Reset, System Reset 1, System Reset 2 and DeepSTOP Reset automatically (so called “Reset Transfer”).

Reset Transfer consists of two parts, FACI reset transfer and BIST parameter transfer.

51.17.1 FACI reset transfer

System Configuration Parameters, Security Parameters, various flags in Hardware Property Area, etc are read by FACI reset transfer and stored to System Configuration Data Storage (SCDS).

If an ECC error is detected during FACI reset transfer, the ECC error is notified to ECM.

The ECC error is categorized into two types dependent on the severity.

One is FACI reset transfer error and the other is FACI reset transfer warning.

The microcontroller will be kept in reset state and will not start up if the FACI reset transfer error is detected in Normal Operation Mode or User Boot Mode.

The microcontroller will start up even if the FACI reset transfer warning is detected.

In this case, Switch Area Status which is indicated by the FSWASTAT_0.SWAS may be dirty or the data in invalid area of Block Protection Area for FPSYS1 may be undefined. It is necessary to recover the Switch Area Status to valid in the startup program by the user. It is necessary to recover the data in invalid area of Block Protection Area for FPSYS1 to defined data (completely programmed or erased) in the application program by the user.

For details, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

51.17.2 BIST parameter transfer

BIST parameters are read by BIST parameter transfer.

If an ECC error is detected during BIST parameter transfer, the ECC error is notified to ECM (BIST parameter transfer error). In this case, the result of BIST is not reliable. See **Section 44.6, BIST** for details. The microcontroller will start up even if the BIST parameter transfer error is detected.

51.18 GCFU

NOTE

The GCFU mentioning this section is same hardware resource as debug function “Global Calibration Function Unit(GCFU)”.

So when using GCFU, it should confirm the GCFU usage for debugging and should be considered avoid confliction of resources.

For details on debugging, see the user's manual of the debugger.

51.18.1 Features of GCFU

51.18.1.1 Number of Units and Channels

This product has only one GCFU unit.

Table 51.94 Number of Units

	RH850/U2A-EVA, U2A16, U2A8, U2A6
Number of Channels	1
Name	GCFU

51.18.1.2 Register Base Address

Table 51.95 Register Base Address

Base Address Name	Base Address	Bus Group
<GCFU_base>	FFFB 1400_H	P-Bus Group 0

51.18.1.3 Clock Supply

The clocks supplied to the GCFU are listed in the following table.

Table 51.96 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
GCFU	PCLK	CLK_HBUS

51.18.1.4 Interrupt Requests and Error Notifications

No interrupt requests, no error notifications.

51.18.1.5 Reset Sources

Table 51.97 Reset Sources

Unit Name	Register Name	Reset Category						
		Power Up Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
GCFU	All registers	√	√ *1	√ *1	√*1	√*1	—	—

Note 1. When debugging tools are used, initialization of the on-chip debug registers by system reset may be protected so that debugging can be performed at system reset assertion by debug setting. Protect debugging Registers (Reset mask function).
For details on debugging, see the user's manual of the debugger.

51.18.2 Overview

51.18.2.1 Functional Overview

The GCFU is a function unit to remap a code flash memory area to code flash memory area or other memory area.

- Number of memory mapping blocks

  Up to 32 memory mapping blocks are supported.

- Block size

  Remap size of each memory mapping block is configurable from 8 KB to 1024 KB.

- Target area

  Non-secure area of User Area can be set to a source address. An address of non-secure area of User Area or other memory area can be set to a destination address. For details of non-secure area or secure area, see the *RH850/U2A-EVA Group Security User's Manual: Hardware.*

- Mapping error detection

  This function can detect mapping error and prohibit mapping when the source address mapping or destination address mapping is not correct.

NOTE

- The address is remapped whether it is instruction fetch or data access.
- The accesses from all bus masters are address conversion target.
- Access latency is changed if address of the access is remapped.
  It is increased in the case of remapping to same cluster of Code Flash.
- The access from flash memory application command interface (FACI) for flash memory programming in user's applications is out of address remap target.
- [For U2A6] It is prohibited to set address of Cluster RAM to a destination address.

- Automatic cache clear

  Each time the mapping setting is updated, a cache clear is issued by GCFU automatically for instruction cache and data buffer to avoid unintended instruction or data use.

NOTE

- Automatic cache clear effects all CPU cores except ICUMHA.
  To avoid unintended instruction or data use for ICUMHA, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

51.18.3 Registers

This section lists function registers (data registers) which control operation of the GCFU.

51.18.3.1 List of Register

GCFU registers are given as offsets from the base address <GCFU_base>.

The GCFU has the registers listed in **Table 51.98**.

Table 51.98 List of Registers (1/3)

Unit Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
GCFU	Memory Mapping Enable Register	TM_ME	<GCFU_base> +0010$_H$	32	PBG0#1	—
GCFU	Memory Mapping Status Register	TM_MS	<GCFU_base> +0014$_H$	32	PBG0#1	—
GCFU	Memory Mapping Error Register	TM_ERR	<GCFU_base> +0024$_H$	32	PBG0#1	—
GCFU	Memory Mapping Size Configuration Register 0	TM_SZC0	<GCFU_base> +0030$_H$	32	PBG0#1	—

51.18.3.2 TM_ME — Memory Mapping Enable Register

The Memory Mapping Enable Register is used to control the address remap function by memory mapping setting.

NOTES

1. Cache clear request is executed by update of mapping enable bit (TMEn) (not including update to the same value (without changing value)) (n = 00 to 31).
2. The mapping setting of block n is disabled regardless of TMEn setting if TM_ERR.ERn is “1” (mapping error) (n = 00 to 31).
3. For details of updating register setting, see **Section 51.18.4.1, Register Setting Sequence**.

Access: This register can be read / written in 32-bit units.

Address: <GCFU_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 51.99 TM_ME Register Contents

Bit Position	Bit Name	Function
31 to 0	TME31 to TME00	Memory Mapping Block n Mapping Enable (n = 00 to 31) Requests mapping of memory mapping block n. (n = 00 to 31) 0: Disable mapping. 1: Enable mapping.

51.18.3.3 TM_MS — Memory Mapping Status Register

The Memory Mapping Status Register is used to indicate the mapping state of memory mapping blocks 00 to 31.

NOTES

1. Following TM_ME register update, be sure to wait until the read value of the TM_MS register becomes the same as the value set to the TM_ME register (until the mapping setting set to the TM_ME register is actually applied).
2. The mapping setting of block n is disabled regardless of the value shown in MESn bit if TM_ERR.ERn is “1” (mapping error) (n = 00 to 31).

Access: This register can be read in 32-bit units.

Address: <GCFU_base> + 0014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 51.100 TM_MS Register Contents

Bit Position	Bit Name	Function
31 to 0	MES31 to MES00	Memory Mapping Block n Enable Status (n = 00 to 31) Indicates the mapping state of memory mapping block n. (n = 00 to 31) 0: Mapping is disabled. 1: Mapping is enabled.

51.18.3.4 TM_ERR — Memory Mapping Error Register

The Memory Mapping Error Register is used to indicate the mapping error of TM_MSAn/TM_MDAn (n = 00 to 31).

TM_ERR register indicate the mapping error when the address in TM_MSAn (n = 00 to 31) registers or TM_MDAn (n = 00 to 31) registers are not correct. For details of mapping error condition, see **Section 51.18.4.2, Mapping Error Detection**.

GCFU forcibly disables mapping setting of the block that detects mapping error.

Access: This register can be read in 32-bit units.

Address: <GCFU_base> + 0024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 51.101 TM_ERR Register Contents

Bit Position	Bit Name	Function
31 to 0	ER31 to ER00	Memory Mapping Block n Error Status (n = 00 to 31) These bits indicate "1" when the address set in the TM_MSAn register / TM_MDAn register is a mapping error. 0: No mapping error. 1: Mapping error.

51.18.3.5 TM_SZCn — Memory Mapping Size Configuration Registers (n = 0 to 3)

The Memory Mapping Size Configuration Registers are used to set the mapping size of memory mapping blocks 00 to 31.

NOTES

1. Setting mapping sizes that exceed the implementation size is prohibited (the operation is not guaranteed).
2. Each entry (blocks 00 to 31) can be mapped only in mapping size alignment units.
3. Before updating the memory mapping size configuration bits MMSZn, be sure to set the corresponding mapping enable bit TMEn to 0 (mapping disabled) (n = 00 to 31).
4. For details of updating register setting, see **Section 51.18.4.1, Register Setting Sequence**.

Access: This register can be read / written in 32-bit units.

Address: <GCFU_base> + 0030_H + n × 4_H (n = 0 to 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MMSZ(8n+7)				MMSZ(8n+6)				MMSZ(8n+5)				MMSZ(8n+4)

Table 51.102 TM_SZCn Register Contents

Bit Position	Bit Name	Function
31 to 28	MMSZ (8n+7)	Memory Mapping Block 8n+7 Size Configuration (n = 0 to 3)
27 to 24	MMSZ (8n+6)	Memory Mapping Block 8n+6 Size Configuration (n = 0 to 3)
23 to 20	MMSZ (8n+5)	Memory Mapping Block 8n+5 Size Configuration (n = 0 to 3)
19 to 16	MMSZ (8n+4)	Memory Mapping Block 8n+4 Size Configuration (n = 0 to 3)
15 to 12	MMSZ (8n+3)	Memory Mapping Block 8n+3 Size Configuration (n = 0 to 3)
11 to 8	MMSZ (8n+2)	Memory Mapping Block 8n+2 Size Configuration (n = 0 to 3)
7 to 4	MMSZ (8n+1)	Memory Mapping Block 8n+1 Size Configuration (n = 0 to 3)
3 to 0	MMSZ (8n+0)	Memory Mapping Block 8n+0 Size Configuration (n = 0 to 3)

Set the mapping size of each memory mapping block.

Value	Block Size	Value	Block Size
0_H	Reserved (setting prohibited)	8_H	Reserved (setting prohibited)
1_H	1024 Kbytes	9_H	8 Kbytes
2_H	Reserved (setting prohibited)	A_H	16 Kbytes
3_H	Reserved (setting prohibited)	B_H	32 Kbytes
4_H	Reserved (setting prohibited)	C_H	64 Kbytes
5_H	Reserved (setting prohibited)	D_H	128 Kbytes
6_H	Reserved (setting prohibited)	E_H	256 Kbytes
7_H	Reserved (setting prohibited)	F_H	512 Kbytes

51.18.3.6 TM_MSAn — Memory Mapping Source Address Registers (n = 00 to 31)

Memory Mapping Source Address Registers 00 to 31 are used to set the addresses of User Area.

Any address in non-secure area of User Area (up to 32 areas) can be set. For details of the address range which can be set to this register, see **Section 51.18.4.2, Mapping Error Detection**.

The address specified with memory mapping source address register n (TM_MSAn) is remapped with the address specified with memory mapping destination address register n (TM_MDAn).

The address range to be mapped can be specified from 8 KB/block to 1024KB/block.

Up to 32 blocks can be specified.

NOTES

1. Before updating Memory Mapping Source Address Register n (TM_MSAn register), be sure to set the corresponding mapping enable bit TMEn to 0 (mapping disabled). (n = 00 to 31)
2. Do not overlap mapping setting (source area) of the mapping enabled blocks. The operation is not guaranteed if mapping setting of the mapping enabled blocks are overlapped.
3. For details of updating register setting, see **Section 51.18.4.1, Register Setting Sequence**.

Access: This register can be read / written in 32-bit units.

Address: <GCFU_base> + 0040_H + n × 4_H (n = 00 to 31)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MMSAn[31:16]

E_H	256 KB	MMSAn 25 to 18	MMSAn 31 to 26, 17 to 0
F_H	512 KB	MMSAn 25 to 19	MMSAn 31 to 26, 18 to 0

51.18.3.7 TM_MDAn — Memory Mapping Destination Address Registers (n = 00 to 31)

Memory Mapping Destination Address Registers 00 to 31 are used to set the addresses of memory area.

Any address in non-secure area of User Area (up to 32 areas) can be set. Address of other memory area also can be set.

For details of the address range which can be set to this register, see **Section 51.18.4.2, Mapping Error Detection**.

The address specified with memory mapping source address register n (TM_MSAn) is remapped with the address specified with memory mapping destination address register n (TM_MDAn). The address range to be mapped can be specified from 8 KB/block to 1024 KB/block. Up to 32 blocks can be specified.

NOTES

1. Before updating Memory Mapping Destination Address Register n (TM_MDAn register), be sure to set the corresponding mapping enable bit TMEn to 0 (mapping disabled). (n = 00 to 31)
2. For details of updating register setting, see **Section 51.18.4.1, Register Setting Sequence**.
3. [For U2A6] It is prohibited to set address of CRAM to TM_MDAn.

Access: This register can be read / written in 32-bit units.

Address: <GCFU_base> + $00C0_H$ + n × 4_H (n = 00 to 31)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MMDAn[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

51.18.4 Remap Function

51.18.4.1 Register Setting Sequence

The remap setting requires that the registers of GCFU be set in the appropriate sequence. During the sequence, do not access source area of the mapping block whose mapping will be changed by the sequence. It is necessary to prepare new data to memory area which will be destination of the remap in advance.

Table 51.107 Register Setting Sequence

(1)	**Mapping status checking**	
(1-1)	CPU core	Check the mapping setting of block n whose mapping is to be changed with mapping status bit MESn (if “0”, go to (3). if “1”, go to (2)). (n = 00 to 31).
(2)	**Mapping disable processing**	
(2-1)	CPU core	Set mapping enable bit TMEn of block n to “0” (mapping disabled). (n = 00 to 31).
(2-2)	GCFU *1	Request the code flash memory bus use right from GCFU upon updating of the mapping enable register (TM_ME register).
(2-3)	GCFU *1	Following acquisition of the bus use right, switch the memory mapping (to apply the setting of the mapping enable register (TM_ME register)).
(2-4)	GCFU *1	Following acquisition of the bus use right, output the cache clear request signal from GCFU to the Instruction cache and data buffer.
(2-5)	GCFU *1	Following the mapping switch/cache clear request signal output, GCFU releases the code flash memory bus use right.
(2-6) *2	CPU core	Check whether the mapping setting has been applied with mapping status bits MESn (if “0”, go to (3). if “1”, go to (2-6)). (n = 00 to 31).
(3)	**Remap address Setting**	
(3-1)	CPU core	Set mapping size configuration bits MMSZn of the block n. (n = 00 to 31).
(3-2)	CPU core	Set source address of User Area to TM_MSAn register of the block n. (n = 00 to 31).
(3-3)	CPU core	Set destination address of User Area to TM_MDAn register of the block n. (n = 00 to 31).
(3-4)	CPU core	Check error status bit ERn of block n (if “0”, go to (4). if “1”, confirm MMSZn, TM_MSAn, TM_MDAn setting and go to (3-1)). (n = 00 to 31).
(4)	**Mapping enable processing**	
(4-1)	CPU core	Set mapping enable bit TMEn of block n for which remap settings have been completed to “1” (mapping enabled).
(4-2)	GCFU *1	Request the code flash memory bus use right from GCFU upon updating of the mapping enable register (TM_ME register).
(4-3)	GCFU *1	Following acquisition of the bus use right, switch the memory mapping (to apply the setting of the mapping enable register (TM_ME register)).
(4-4)	GCFU *1	Following acquisition of the bus use right, output the cache clear request signal from GCFU to the Instruction cache and data buffer.
(4-5)	GCFU *1	Following the mapping switch/cache clear request signal output, the GCFU releases the code flash memory bus use right.
(4-6) *2	CPU core	Check whether the mapping setting has been applied with mapping status bits MESn (if “0”, go to (4-6). if “1”, end the sequence). (n = 00 to 31).

Note 1. This processing is performed by hardware.

Note 2. The processing for synchronization is also necessary. See **Section 3.9.1.2, When the Updated Results in the Control Registers and Memories are Reflected in the Instruction Fetch of a Subsequent Instruction:**.
Cache clear request of GCFU does not affect ICUMHA. To avoid unintended instruction or data use for ICUMHA, see the *RH850/U2A-EVA Group Security User’s Manual: Hardware*.

51.18.4.2 Mapping Error Detection

Mapping error is detected if the source address mapping or destination address mapping is not correct.

GCFU forcibly disables mapping setting of the block that detects mapping error.

Detail condition of Mapping Error Detection is shown in below.

Table 51.108 Mapping Error Detection

	region start address	region end address	Mapping Error Detection
TM_MSAn*2	0000 0000H	03FF FFFF$_H$	Secure area: Error is detected. Others: No Error is detected.
	0400 0000H	FFFF FFFF$_H$	Not available (Cannot set this region to TM_MSAn).
TM_MDAn*2	0000 0000H	03FF FFFF$_H$	Secure area: Error is detected. Others: No Error is detected.
	0400 0000H	FAFF FFFF$_H$	Error is detected.
	FB00 0000H	FBFF FFFF$_H$	No Error is detected.*1
	FC00 0000H	FDFF FFFF$_H$	Error is detected.
	FE00 0000H	FEFF FFFF$_H$	No Error is detected.*1
	FF00 0000H	FFFF FFFF$_H$	Error is detected.

Note 1. For details, see **Section 4, Address Space**.

Note 2. Valid Bits of Mapping Source Address and Mapping Destination Address are same between Mapping and Error Detection. See **Table 51.104, Mapping Size and Mapping Source Address bits** and **Table 51.106, Mapping Size and Mapping Destination Address bits** for details.

51.19 Usage Notes

(1) Reading areas where programming or erasure was interrupted
When programming or erasure of an area of flash memory is interrupted intentionally or unintentionally, the data stored in the area become undefined. To avoid undefined data that are read out becoming the source of faulty operation, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

(2) Prohibition of additional writing
Writing to a given area twice is not possible. If you want to update data in an area of flash memory after writing to the area has been completed, erase the area first.

(3) Resets during programming and erasure
In the case of an external reset during programming and erasure, wait for at least width of reset pulse more than the min value by an external reset once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

(4) Allocation of vectors for interrupts and other exceptions during programming and erasure
Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory. For how to change the address for vector fetching, see **Section 3, CPU System** and **Section 6, Interrupts**. For ICUMHA, see the *RH850/U2A-EVA Group Security User's Manual: Hardware.*

(5) Checking the areas where programming or erasure was interrupted
If programming or erasure is interrupted intentionally or unintentionally, the programming or erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming or erasure was interrupted, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to prove that the corresponding area is completely erased before using.

(6) Items prohibited during Flash sequencer processing
Do not perform the following operations while the Flash sequencer is processing (FSTATR_n.FRDY=0).
For details of FSTATR_n register, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.

- Have the operating voltage from the power supply go beyond the allowed range.
- Update the values of FHVE15FPn and FHVE3FPn for the FPSYSn of which Flash sequencer is processing.
  For details of these registers, see the *RH850/U2A-EVA Group Flash Memory User's Manual: Hardware*.
- Change the operating frequency of peripheral clock.
- Entering STOP mode / DeepSTOP mode.

(7) Securing coherency of instruction cache and data buffer
After the code flash memory is programmed or erased, a reset or instruction cache and data buffer clearing are required to secure coherency of the instruction cache and data buffer. For details of instruction cache and data buffer, see **Section 3, CPU System**. For ICUMHA, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

(8) Setting of OTP.
Set OTP after programing target data, because OTP setting becomes effective without reset.

(9) STOP mode and suspended programming / erasure
It is prohibited to enter STOP mode with suspended programming / erasure.

(10) Reprogramming of User Area or Data Area after Emulation Device mode change. [For U2A-EVA]
Do not issue reprogramming of User Area or Data Area without reset after changing the Emulation Device mode which affects the address mapping of User Area or Data Area.
EVA_PRD_EMU in OPBT9 will change the Emulation Device mode after the reset which causes the Reset Transfer. For details of the reset, see **Section 51.17, Reset Transfer**.
When changing each product setting in EVA_PRD_EMU, it is necessary to reprogram the entire area of Flash as well because each address map of Flash is also changed.

(11) Reprogramming of User Area after Code Flash Memory Mapping Mode change.
Do not issue reprogramming of User Area without reset after changing the Code Flash Memory Mapping Mode which affects the address mapping of User Area.
MAPMODE in OPBT12 will change Code Flash Memory Mapping Mode after the reset which causes the Reset Transfer. For details of the reset, see **Section 51.17, Reset Transfer**.

(12) Code Flash Memory Mapping Mode or Emulation Device mode change after once it is set.
If Code Flash Memory Mapping Mode or Emulation Device mode is changed by mis-operation, the area which is protected in old mode may be revealed in new mode unintentionally.
EVA_PRD_EMU in OPBT9 will change Emulation Device mode. [For U2A-EVA]
MAPMODE in OPBT12 will change Code Flash Memory Mapping Mode.
For product device, it is recommended to set OTP for MAPMODE in OPBT12 once the configuration of MAPMODE is set.

(13) U2A8 mode and Block Protection Area for FPSYS1 [For U2A-EVA]
Make sure that both valid and invalid area of Block Protection Area for FPSYS1 are programmed completely and the contents are the same before changing the device mode to U2A8 mode.
EVA_PRD_EMU in OPBT9 will change Emulation Device Mode.

(14) Two User Boot Area for OTA(Over-the-Air) update support function
Code Flash Memory Mapping Mode of Single Map Mode and Double Map Mode have two User Boot Area. These two User Boot Area are arranged in address space. One is located at Bank A and the other is at Bank B. In Double Map Mode, the stored data in two User Boot Area can be swapped with each other by setting of User Area on Cluster 0 (OPBT13.DBMAPSW0). It has no setting to swap only User Boot Area. Therefore, it is necessary to store same data on both sides of User Boot Area in advance when using User Boot Area in Double Map Mode.

Section 52 RAM

This section describes the RAM mounted on RH850/U2A-EVA Group.

52.1 List of On-Chip RAMs

Table 52.1 shows the list of On-Chip RAMs.

Table 52.1 List of On-Chip RAMs

		RH850/U2A-EVA	RH850/U2A16	RH850/U2A8	RH850/U2A6
Local RAM per CPU		64 KB	64 KB	64 KB	64 KB
Cluster0 RAM		512 KB	512 KB	512 KB	512 KB
Cluster1 RAM		512 KB	512 KB	No	No
Cluster2 RAM		2048 KB	2048 KB	1024 KB	No
Cluster3 RAM*1 (AWO, Retention RAM)		256 KB	256 KB	128 KB	128 KB
Cluster0 ERAM*2		1 MB	No	No	32 KB
Cluster1 ERAM *2		1 MB	No	No	No
Global ERAM (GERAM)*2		2 MB	No	No	No
Instrumentation RAM*2		96 KB	No	No	No
Instruction cache RAM (tag)		128 lines × 4/core	128 lines × 4/core	128 lines × 4/core	128 lines × 4/core
Instruction cache RAM (data)		4 KB × 4/core	4 KB × 4/core	4 KB × 4/core	4 KB × 4/core
DTSRAM		4 KB	4 KB	4 KB	4 KB
sDMAC RAM	sDMAC Descriptor RAM (DPRAM)	4 KB/module	4 KB/module	4 KB/module	4 KB/module
	sDMAC Data RAM (DATARAM)	2 KB/module	2 KB/module	2 KB/module	2 KB/module
FLXA RAM	FLXA Message RAM (MRAM)	8 KB/module	8 KB/module	8 KB/module	8 KB/module
	FLXA RTBFRAM (TBF A/B)	512 B × 2/module	512 B × 2/module	512 B × 2/module	512 B × 2/module
ETNB RAM	Transmit FIFO	16 KB × 1/module	16 KB × 1/module	16 KB × 1/module	16 KB × 1/module
	Receive FIFO	8 KB × 1/module	8 KB × 1/module	8 KB × 1/module	8 KB × 1/module
RS-CANFD RAM	RS-CANFD AFLRAM	1.5 KB × 2/channel	1.5 KB × 2/channel	1.5 KB × 2/channel	1 KB × 2/channel
	RS-CANFD MBRAM	24.2 KB/channel	24.2 KB/channel	24.2 KB/channel	7.5 KB/channel
GTM MCS RAM (0/1)		8 KB × 4 4 KB × 4	8 KB × 4 4 KB × 4	8 KB × 4 4 KB × 4	8 KB × 4 4 KB × 4
MSPI RAM		128 B/module	128 B/module	128 B/module	512 B/module
MMCA RAM		512 B × 2	512 B × 2	512 B × 2	512 B × 2

Note 1. All data is retained in STOP mode and DeepSTOP mode (without MBIST execution).

Note 2. All data is retained in STOP/DeepSTOP mode in debug mode.

52.2 Features

Access:

The CPUn*1, DMA and H-Bus Master can access the Local RAM (CPUn*1), the Cluster 0/1/2/3 RAM*2, the Cluster 0/1 ERAM, and the Global ERAM. The access latency from CPUn to the Local RAM for CPUn*1 is the same as the access to the Local RAM (self).

The access latency from CPU0 or CPU1 to Cluster0 RAM is faster than the access latency to Cluster1/2/3 RAM*2, because CPU0 and CPU1 are in Cluster0. The access latency from CPU2 or CPU3 to Cluster1 RAM*2 is faster than the access latency to Cluster0/2/3 RAM, because CPU2 and CPU3 are in Cluster1*2. Cluster 2 only contains Cluster2 RAM, Cluster 3 only contains Cluster3 RAM, no CPU included.

Note 1. RH850/U2A-EVA and RH850/U2A16: n = 0 to 3
RH850/U2A8 and RH850/U2A6: n = 0, 1

Note 2. Cluster 1 and Cluster 1 RAM are not implemented in RH850/U2A8.
Cluster 1, 2 and Cluster 1, 2 RAM are not implemented in RH850/U2A6.

RAM Retention:

In RH850/U2A-EVA Group, Cluster3 RAM are retained in Standby mode.

For details, see **Section 15, Standby Controller (STBC)**.

ECC:

The Local RAM(CPU0/CPU1/CPU2*3/CPU3*3) and Cluster RAM include the ECC.

The Local RAM(CPU0/CPU1/CPU2*3/CPU3*3) and Cluster RAM also include the address feedback function. For details, see **Section 44, Functional Safety**.

Note 3. CPU2 and CPU3 are not implemented in RH850/U2A8 and RH850/U2A6.

RAM Initialization:

To avoid long initialization phases by software, a hardware mechanism is implemented to initialize the following RAMs. This initialization includes correct setting of the related ECC bits.

- GTM MCS RAM
- MMCA RAM
- MSPI RAM
- DTSRAM
- sDMAC Descriptor RAM (DPRAM)

For details of RAM initialization function, see **Section 9.5.6, RAM Initialization**.

52.3 RAM Data Retention

When reset*1 and write to RAM*1 occur at the same time, undefined data will not be written, and the data before writing or the data after writing will be retained depending on the timing.

When reset*1 and read from RAM*1 occur at the same time, undefined data will not be written and the data will be retained.

Note 1. See **Table 52.2** for the target reset factor and RAM. Regarding detail information of reset, see **Section 9, Reset Controller**.

Table 52.2 RAM Data Retention by each Reset factor

No	Category	Source	Retention RAM (included in Cluster RAM)	Local RAM per CPU, Cluster RAM *1	Cluster ERAM, Global ERAM, Instrumentation RAM
1	Power On Reset	POC Reset	—	—	—
		Debugger Reset	√	√	√
2	System Reset 1	External Reset	√	√	√
		Primary VMON Reset	—	—	—
		Debugger Disconnection Reset	√	√	√
3	System Reset 2	Software System Reset	√	√	√
		ECM Reset (if RESC0 = 0)	√	√	√
		WDTBA Reset	√	√	√
4	Application Reset	Software Application Reset	√	√	√
		ECM Reset (if RESC0 = 1)	√	√	√
5	DeepSTOP Reset	DeepSTOP Reset	√	—	√
6	Module Reset	Software Module Reset	√	√	√
7	JTAG Reset	JTAG Reset (TRST)	√	√	√

Note 1. In case MBIST is executed, RAM data is not retained.

52.4 Usage Notes

When ECC error detection/correction is enabled for the Local RAM and Cluster RAM, initialize the RAM using a write instruction with the maximum bit length of its access size before using the RAM.

For the maximum bit length of the RAM access size, see the applicable data width in **Section 44, Functional Safety**.

If the RAM is accessed before its initialization, an ECC error may be detected. Also, if initialization with the maximum bit length is not performed (e.g. if a 32-bit RAM is initialized by an 8-bit or 16-bit access), an ECC error may be detected.

Section 53 Boundary Scan

This section contains a generic description of boundary scan.

This product has a JTAG interface and provides a boundary scan function.

53.1 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of this product conforms to IEEE Std 1149.1-2001.

53.2 Features

- Five control signals (TCK, TDI, TDO, TMS, and $\overline{\text{TRST}}$)
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has six instructions.

- BYPASS
  Test mode conforming to the IEEE 1149.1
- EXTEST
  Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD
  Test mode conforming to the IEEE 1149.1
- CLAMP
  Test mode conforming to the IEEE 1149.1
- HIGHZ
  Test mode conforming to the IEEE 1149.1
- IDCODE
  Test mode conforming to the IEEE 1149.1

Figure 53.1 shows a block diagram of the JTAG interface.

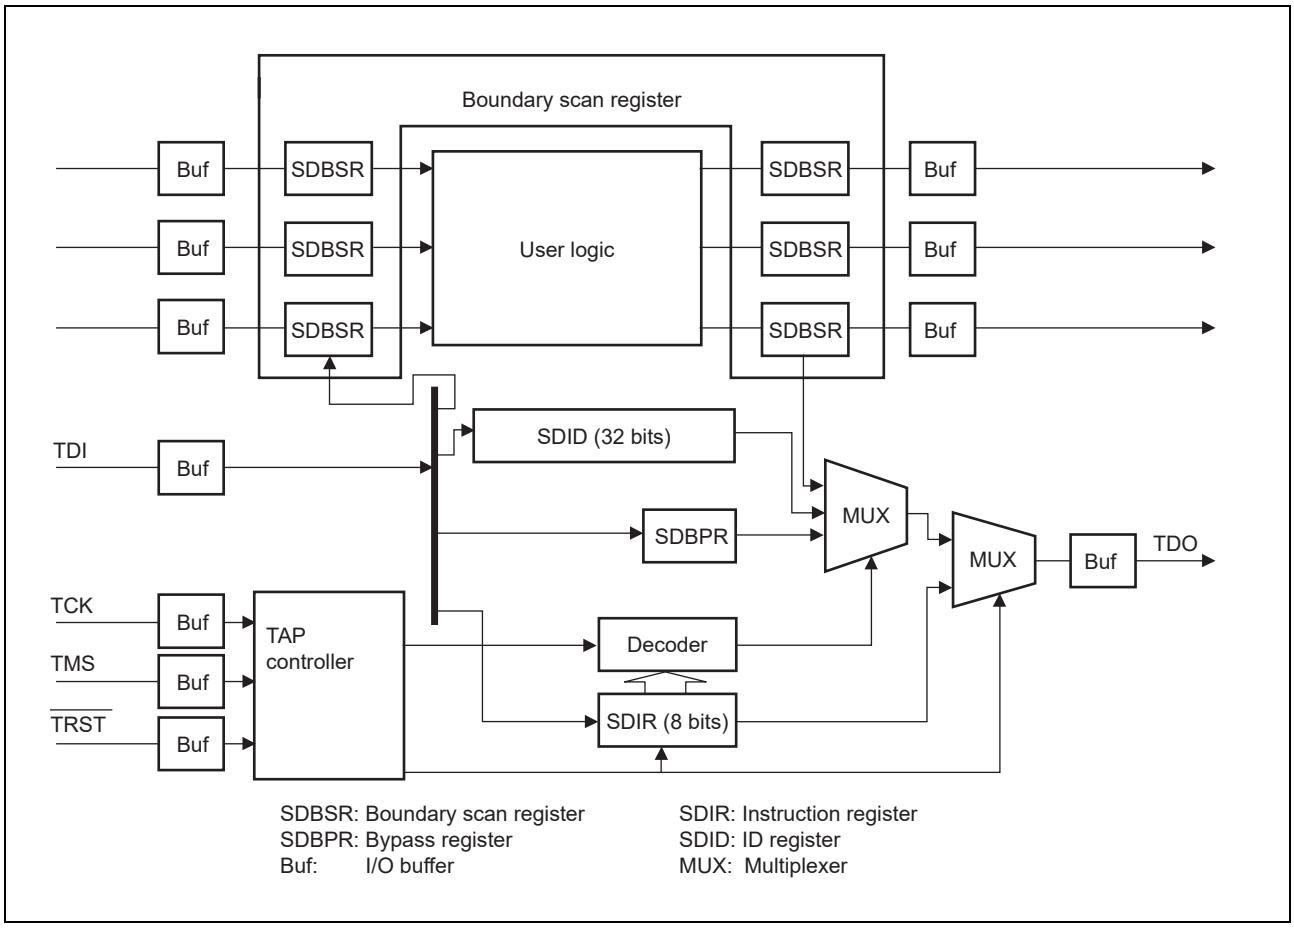

Figure 53.1 Block Diagram of JTAG Interface

53.3 External Input/Output Pins

There are five JTAG control signals: TCK, TDI, TMS, TDO, and $\overline{\text{TRST}}$.

Table 53.1 shows the pin configuration.

Table 53.1 Pin Configuration

Pin Name	Description
TCK	Serial data input/output clock pin Data is input to TDI and is output from TDO in synchronization with this clock signal.
TMS	Mode select input pin Changing the level of this signal in synchronization with TCK changes the state of the TAP controller. For the protocol, see **Figure 53.2, TAP Controller State Transition Diagram**.
$\overline{\text{TRST}}$	Reset input pin A low-level input of this signal resets the JTAG interface. This signal is accepted asynchronously with TCK.
TDI	Serial data input pin Data is input in synchronization with TCK and sent to the JTAG interface.
TDO	Serial data output pin Data to be read from the JTAG interface is output in synchronization with TCK.

53.4 Register Descriptions

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 53.2 Register Configuration

Register Name	Symbol	Access Size	Initial Value*1
Instruction register	SDIR	8	55_H
ID register	SDID	32	*2
Bypass register	SDBPR	1	Undefined
Boundary scan register	SDBSR	—	Undefined

Note 1. Registers are initialized when $\overline{\text{TRST}}$ pin is 0 or when TAP is in the Test-Logic-Reset state.

Note 2. The initial value differs depending on the device. Refer to **Table 53.3, List of ID Register (SDID) Value**.

Table 53.3 List of ID Register (SDID) Value

Products	MSPI restriction*1	SVR restriction *2	Product Name	ID Register Code			
				31 to 28	27 to 12	11 to 1	0

Note 1. Refer to **Section 19.8, MSPI restrictions**.

Note 2. Refer **Section 10.10, SVR restriction**.

Note: Bit[31:28]: Revision Number. These bits indicate the revision of the product.
Bit[27:12]: Product Number. These bits indicate the product number.
Bit[11:1]: Manufacture ID. These bits indicate the manufacturer number (manufacturer ID).
223_H: Renesas Electronics.

Instructions can be serially transferred from the serial data input pin (TDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which TDI and TDO are connected in BYPASS mode, CLAMP mode and HIGHZ mode. The boundary scan register (SDBSR) is connected to TDI and TDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID code register (SDID) is a 32-bit register, from which the ID code is output via TDO in IDCODE mode.

Table 53.4 shows the serial transfer types possible with the JTAG interface registers.

Table 53.4 Serial Transfer Types

Register	Serial Input	Serial Output
SDIR	Possible	Impossible*1
SDBPR	Possible	Possible
SDBSR	Possible	Possible
SDID	Impossible	Possible

Note 1. A fixed value is read out.

53.4.1 Instruction Register (SDIR)

SDIR is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a low-level input of $\overline{\text{TRST}}$ or in the TAP Test-Logic-Reset state. Operation is not guaranteed if a reserved instruction is set in this register.

Table 53.5 Boundary Scan Instructions

Instruction Code								Description
0	0	0	0	0	0	0	0	JTAG EXTEST
0	1	0	0	0	0	0	0	JTAG SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	JTAG IDCODE (initial value)
1	1	0	1	0	0	0	0	JTAG CLAMP
1	0	0	0	0	0	0	0	JTAG HIGHZ
1	1	1	1	1	1	1	1	JTAG BYPASS
Other than above								Reserved

53.4.2 ID Register (SDID)

SDID is a 32-bit register with a device specific ID.

SDID can be read from the JTAG interface when the IDCODE instruction is set, but cannot be accessed from the CPU.

For the read values, see **Table 53.2, Register Configuration**.

53.4.3 Bypass Register (SDBPR)

SDBPR is a 1-bit register to go through the boundary scan register. When SDIR is set to BYPASS mode, CLAMP mode or HIGHZ mode, SDBPR is connected between TDI and TDO. The initial value is undefined. SDBPR is not initialized by a power-on reset or by a low level input of $\overline{\text{TRST}}$.

53.4.4 Boundary Scan Register (SDBSR)

SDBSR is a shift register for controlling the external Input/Output pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected to the position between TDI and TDO. The initial value is undefined. SDBSR is not initialized by a power-on reset or a low-level input of $\overline{\text{TRST}}$.

53.5 Operation

53.5.1 TAP Controller

Table 53.2 shows the state transition of the TAP controller. Transition is triggered by the TMS value at the rising edge of TCK.

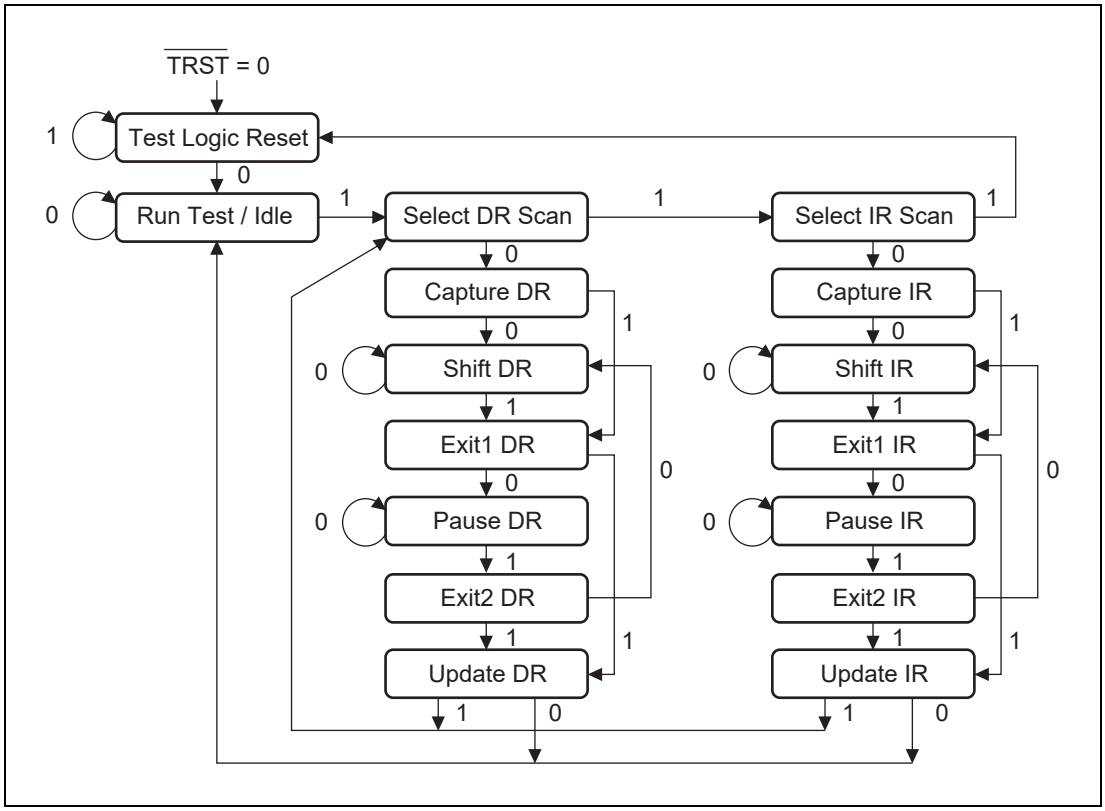

Figure 53.2 TAP Controller State Transition Diagram

NOTE

The TDI value is sampled at the rising edge of TCK and is shifted at the falling edge. TDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. A low-level input of $\overline{\text{TRST}}$ causes transition to Test-Logic-Reset state asynchronously with TCK.

53.5.2 Supported Instructions

53.5.2.1 BYPASS

The BYPASS instruction is a standard instruction indispensable to bypass register operation. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

53.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this device; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this device is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this device.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this device.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

53.5.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this device is mounted on the printed-circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the (N - 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

53.5.2.4 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by a low-level input of $\overline{\text{TRST}}$ or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

53.5.2.5 CLAMP instruction

When the CLAMP instruction is selected, the output pin outputs the boundary scan register value that has been previously set by the SAMPLE/PRELOAD instruction. While the CLAMP instruction is selected, the boundary scan register retains the previous state regardless of the TAP controller state. The bypass register is connected between TDI and TDO and operates in the same manner as when the BYPASS instruction is selected.

53.5.2.6 HIGHZ instruction

When the HIGHZ instruction is selected, all the output pins go to the high-impedance state. While the HIGHZ instruction is selected, the boundary scan register retains the previous state regardless of the TAP controller state. The bypass register is connected between TDI and TDO and operates in the same manner as when the BYPASS instruction is selected.

53.5.3 Pins Subject to Boundary Scan

All pins, excluding pins such as external clock input pins or power supply pins, are subject to boundary scan.

The pins which are not subjected to boundary scan are listed in **Table 53.6**.

For the supported terminals of the product, refer to Appendix "E02_01_List_of_Pin_Assignment.xlsx".

Table 53.6 Pins not Subject to Boundary Scan

Type	Pins
JTAG interface	JP0_0/TDI, JP0_1/TDO, JP0_2/TCK, JP0_3/TMS, $\overline{\text{TRST}}$
Mode pins	P6_13/FLMD1, P6_14/FLMD2, P5_3/MODE0
Power supply pins	SYSVCC, VCC, AWOVCL, VSS, VDD, E0VCC, E1VCC, E2VCC, SVRDRVCC, SVRDRVSS, LVDVCC, DVCC, DVDD, EMUVCC, EMUVDD, ERAMVDD, ERAMVCC, GETH0BVCC, GETH0RVCC, GETH0PVCC, GETH0VCL, SVRAVCC, SVRAVSS
Power supply pins (A/D converter)	A0VCC, A1VCC, A2VCC, A0VREFH, A1VREFH, A2VREFH, A0VSS, A1VSS, A2VSS
Clock signal	X1, X2
System pins	$\overline{\text{VMONOUT}}$, $\overline{\text{ERROROUT\_M}}$, PWRCTL, SVRNGATE, SVRPGATE
Debug pins	$\overline{\text{MSYN}}$, $\overline{\text{AURORES1}}$, $\overline{\text{AURORES2}}$, $\overline{\text{AURORESPD}}$, TODP0 to TODP3, TODN0 to TODN3, $\overline{\text{EVTI}}$, $\overline{\text{EVTO}}$, $\overline{\text{AUDRST}}$, AUDCK, $\overline{\text{AUDSYNC}}$, AUDATA0 to AUDATA3, CICREFP, CICREFN, $\overline{\text{ERAMRES2}}$, $\overline{\text{ERAMRESPD}}$
SGMII pins	RX_DATAN, RX_DATAP, TX_DATAN, TX_DATAP, RX_CLKN, RX_CLKP

The following signals are only sampled in boundary scan mode.

Table 53.7 Pins Subject to Boundary Scan (Sampling Only)

Function	Pin Name
Reset	$\overline{\text{RESET}}$
MODE	FLMD0

The following pins are shared by the analog buffer. Accordingly, boundary scan only applies to general I/O pins.

Table 53.8 Pins Subject to Boundary Scan (Only General I/O Pins)

Function	Pin Name
ADCJ0 input	P24_4 to P24_13, AP0_0 to AP0_15, AP1_0 to AP1_3
ADCJ1 input	P10_8 to P10_14, P17_0 to P17_6, AP2_0 to AP2_15, AP3_0 to AP3_3
ADCJ2 input	P6_0, P6_2 to P6_7, P6_9, P6_11, P6_12, AP4_0 to AP4_15, AP5_0 to AP5_3

NOTE

In boundary scan mode, the level of the following pins must be fixed:
FLMD1: High, FLMD2: High, MODE0: Low

53.6 Usage Notes

1. Once a instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert a instruction that has no effect on chip operation (such as BYPASS) between the instructions.
2. To start the system in boundary scan mode, de-assert $\overline{\text{TRST}}$ while $\overline{\text{RESET}}$ is high. Also be sure to set TMS to high before de-asserting $\overline{\text{TRST}}$ and ensure that TMS remains high for 600 ns + five TCK clock cycles after de-asserting $\overline{\text{TRST}}$.
3. For details of boundary scan timing constraint, see **Section 55, Electrical Characteristics**.
4. If serial transfer is performed exceeding the number of bits of the register connected between TDI and TDO, the data that is input from TDI is output from TDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert $\overline{\text{TRST}}$. In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via TDO at the falling edge of TCK.
7. To facilitate debugging, route $\overline{\text{TRST}}$ on the board in such a way that patterns can be easily cut.

Section 55 Electrical Characteristics

The specifications in this section are for devices operating under the conditions shown in **Section 55.2.1.1, Supply Voltage Characteristics**. Where a special condition is required for a given specification, the condition will be indicated. Furthermore, the specifications in this section are not guaranteed unless the conditions listed below are met.

55.1 Absolute Maximum Ratings

Conditions:

- VSS = SVRDRVSS = SVRAVSS = AnVSS
- Reference ground potential: VSS = 0 V.

Table 55.1 Absolute Maximum Ratings (1/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit

Note 1. JP0, P0, P1, P2, P3 (except P3_8 [For U2A-EVA, U2A16 and U2A8 Only]), P4, P5, P6, P8

Note 2. P9, P10, P11, P12, P18, P19, P20, 21, P22, P23

Note 3. P24

Note 4. $\overline{AUDRST}$, $\overline{AUDSYNC}$, AUDCK, AUDATA0-AUDATA3

Note 5. RHSIF: HSIF0_TXDP, HSIF0_TXDN, HSIF0_RXDP, HSIF0_RXDN
MSPI: MSPI0_SOP, MSPI0_SON, MSPI0_SIP, MSPI0_SIN, MSPI0_SCKP, MSPI0_SCKN

Note 6. RX_CLKN, RX_CLKP, RX_DATAN, RX_DATAP, TX_DATAN, TX_DATAP and REFCLK.

Note 7. Given specification includes injected currents.

Note 8. After mounting

Note 9. Do not exceed maximum 1.42 V.

Note 10. Voltage overshoot 5.8 V to 6.5 V is permissible, cumulative time is less than 2 h. Voltage overshoot 5.5 V to 5.8 V is permissible, cumulative time is less than 100 h.

Note 11. Voltage overshoot 1.205 V to 1.42 V is permissible, cumulative time is less than 2 h. Voltage overshoot 1.155 V to 1.205 V is permissible, cumulative time is less than 100 h.

Note 12. Voltage overshoot 3.9 V to 4.6 V is permissible, cumulative time is less than 2 h. Voltage overshoot 3.6 V to 3.9 V is permissible, cumulative time is less than 100 h.

Note 13. Input voltage must be kept within -0.8 V ≤ Vin ≤ 6.5 V. Power supply voltage must be kept within rated values. Injection current must be kept within rated values on all states include ramp-up/down, and power-on/off. Injection current effects power dissipation in the package for thermal characteristics.

CAUTION

- **Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.**
- **Input voltage, analog reference voltage and analog input voltage must not exceed 6.5 V.**
- **Even in case when input voltage does not meet the specified characteristics, it is accepted if the injected current characteristics specified in Section 55.2.7 are met.**

55.2 General & DC Characteristics

55.2.1 Operational Condition

55.2.1.1 Supply Voltage Characteristics

Conditions:

- Temperature range: Tj (min) to Tj (max)
- VSS = SVRDRVSS = SVRAVSS = AnVSS
- Reference ground potential: VSS = 0 V

Table 55.2 Supply Voltage Characteristics (1/2)*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System control supply voltage*6	V_{SYSVCC}	SVR unused*2	3.0		5.5	V
		SVR used*2	3.0		3.6	V
			4.5		5.5	V
Regulator supply voltage	V_{VCC}	SVR unused	3.0		5.5	V
		SVR used	3.0		3.6	V
			4.5		5.5	V

Aurora control core supply voltage	V_{EMUVDD}	Aurora used	1.04	1.09	1.14	V
		Aurora unused	1.025	1.09	1.155	V
ERAM IO supply voltage*7	$V_{ERAMVCC}$		3.0		3.6	V
ERAM core supply voltage*7	$V_{ERAMVDD}$	Aurora used	1.04	1.09	1.14	V
		Aurora unused	1.025	1.09	1.155	V

Table 55.2 Supply Voltage Characteristics (2/2)*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SGMII supply voltage*5	$V_{GETH0RVCC}$	SGMII used	3.14	3.3	3.46	V
		SGMII unused	3.0		5.5	V
	$V_{GETH0PVCC}$	SGMII used	3.14	3.3	3.46	V
		SGMII unused	3.0		5.5	V
	$V_{GETH0BVCC}$	SGMII used	3.14	3.3	3.46	V
		SGMII unused		*4		V

Note 1. Use this device with the following conditions.
[For U2A-EVA, U2A16 and U2A8 Only]
SVRDRVCC ≥ SYSVCC = VCC = SVRAVCC
A0VCC ≥ A0VREFH ≥ VCC
A0VCC ≥ A0VREFH ≥ E0VCC = LVDVCC
A1VCC ≥ A1VREFH
A2VCC ≥ A2VREFH
GETH0RVCC = GETH0PVCC = GETH0BVCC, when SGMII use.
[For U2A6 Only]
SVRDRVCC ≥ SYSVCC = VCC = SVRAVCC
A0VCC = A0VREFH ≥ VCC
A0VCC = A0VREFH ≥ E0VCC
A1VCC = A1VREFH
A2VCC = A2VREFH

Note 2. SYSVCC is monitored by POC, see **Section 55.2.13, Voltage Detector (POC, VLVI) Characteristics**.

Note 3. Maximum allowable noise for SVRDRVCC is 500mV peak to peak.

Note 4. Input 3.0V to 3.6V voltage or connect to VSS with 1 kΩ or more pull-down resistance.

Note 5. Maximum allowable noise for SGMII power is 50mV peak to peak.

Note 6. Maximum allowable noise for SYSVCC is 100mV peak to peak.When MainOSC is used as the clock source of SGMII, allowable noise for SYSVCC will be 50mV peak to peak.

Note 7. U2A6 has only ERAM core and its supply voltage is V_{VDD}.

CAUTION

During operations, supply the specified voltages to all power lines. When stopping operation, turn off all of the power supplies.

55.2.1.2 Main Oscillator Characteristics

Conditions:

- Supply voltage range: Refer to **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.3 Main Oscillator Characteristics (1/3)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
MainOSC frequency	f_{MOSC} *1,*2	Crystal/Ceramic		16 – 1%		40 + 1%	MHz

Table 55.3 Main Oscillator Characteristics (3/3)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
X1 clock Input high level pulse width	t_{EXH}	EXCLK mode	f_{EX} = 16 MHz	26			ns
			f_{EX} = 20 MHz	20			ns
			f_{EX} = 24 MHz	16			ns
			f_{EX} = 40 MHz	10			ns
X1 clock rise time	t_{EXR}	EXCLK mode	f_{EX} = 16 MHz			4	ns
			f_{EX} = 20 MHz			4	ns
			f_{EX} = 24 MHz			3	ns
			f_{EX} = 40 MHz			2.5	ns
X1 clock fall time	t_{EXF}	EXCLK mode	f_{EX} = 16 MHz			4	ns
			f_{EX} = 20 MHz			4	ns
			f_{EX} = 24 MHz			3	ns
			f_{EX} = 40 MHz			2.5	ns
X1 clock Input total jitter (Dj + 14 * rms Random jitter)	t_{CITJ}	The clock source of SGMII used @ 20MHz				73*6	ps peak to peak
X1 Input capacitance	C_{X1}	Main OSC. EXCLK mode, MOSC_CAP_SEL = 0010				10	pF

Note 1. To reach internal usable clocks only following 4 frequencies are supported: 16MHz, 20MHz, 24MHz and 40MHz. Tolerance of external quartz crystal is assumed as +/–1%.

Note 2. The StartUp is supported without external components under following conditions:
- See **Section 51.12.16, OPBT10 — Option Byte 10** for default values of drivability, damping resistance and internal capacitance.
- Specification covers a maximum external stray capacitance of up to 6pF to each pin X1 and X2.
- After StartUp drivability and capacitance will be configured by OPBT10
- A possible exceeding of the recommended maximum drive level for a crystal for all start-up phases has to be agreed with the crystal manufacturers separately.

Note 3. Ccapsel_x1 (Ccapsel_x1 including parasitic capacitance to ground at the X1 side), Ccapsel_x2 (Ccapsel_x2 including parasitic capacitance to ground at the X2 side).

Note 4. The capacitor tolerance is ±15%.

Note 5. The clock source of SGMII used. Ethernet grade crystal is mandatory. Example: CX3225GA(KYOCERA)

Note 6. 12 kHz to 20 MHz rms jitter = 3 ps.

CAUTION

Oscillation stabilization times differ according to matching with the resonator. Secure an oscillation stabilization time determined through evaluation of matching.

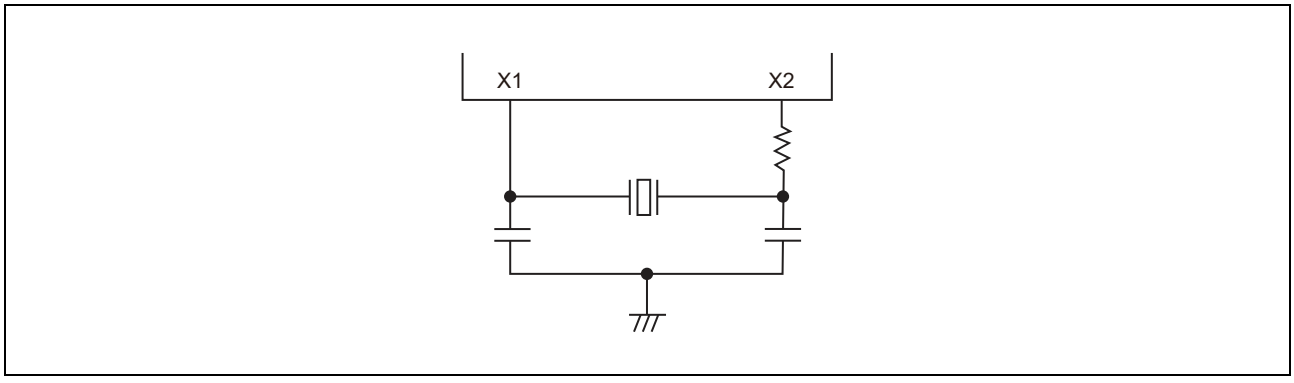

Figure 55.1 Oscillator Circuit Diagram (Crystal with External Components)

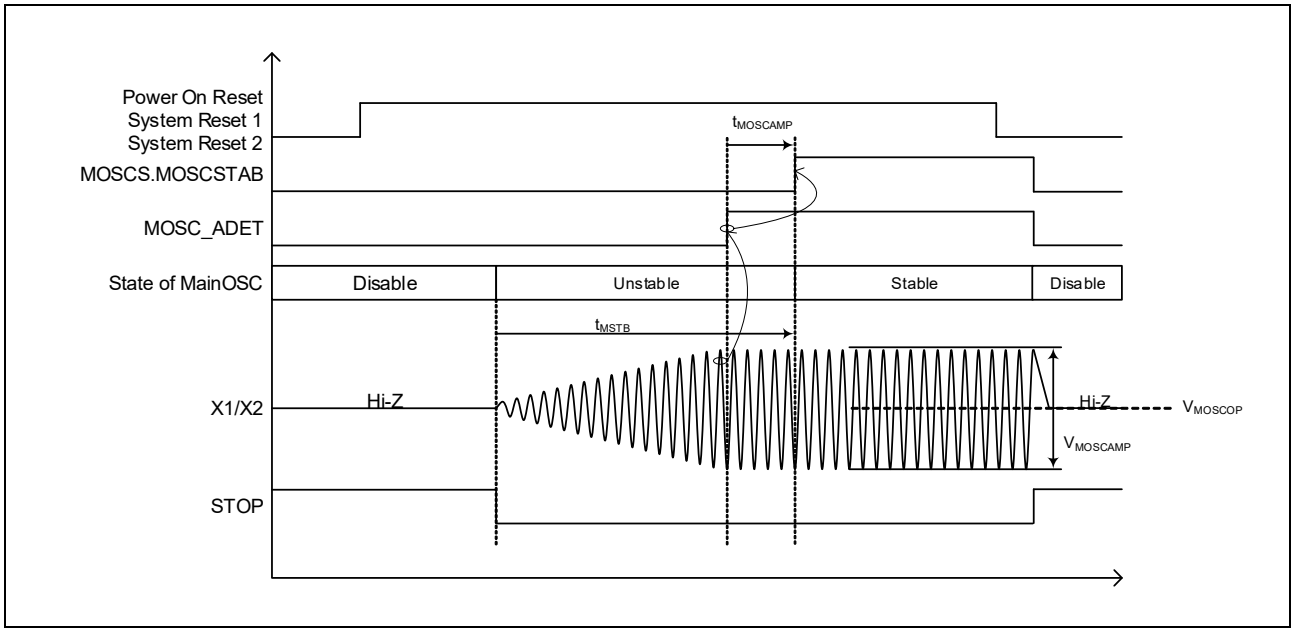

Figure 55.2 Main OSC Stabilization

55.2.1.3 Internal Oscillator Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.4 Internal Oscillator Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LS IntOSC frequency	f_{RL}		216	240	264	kHz
HS IntOSC frequency	f_{RH}		190	200	210	MHz
HV IntOSC frequency	f_{RHV}		8	16	24	MHz

55.2.1.4 PLL Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.5 PLL Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
PLL output long term jitter*1	t_{PLLLTJ}	Term = 1 µs	–500		500	ps
		Term = 10 µs	–1		1	ns
		Term = 20 µs	–2		2	ns
PLL lock time*2	t_{PLLLCT}				112	µs

Note 1. This characteristic is not tested in production.
Note 2. Lock time is time until being set “1” in PLLS.PLLCLKSTAB bit after PLLE.PLLENTRG bit is written “1”.

Table 55.6 RHSIF PLL Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
PLL lock time	$t_{RHPLLLCT}$				50	µs

55.2.1.5 Regulator Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.7 Regulator Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output voltage	V_{AWOVCL}	AWOVCL pin	1.025	1.09	1.155	V
	$V_{GETH0VCL}$	GETH0VCL pin	1.025	1.09	1.155	V
Capacitance	C_{AWOVCL}	AWOVCL pin*1	0.140	0.2	0.286	µF
	$C_{GETH0VCL}$	GETH0VCL pin	0.154	0.22	0.286	µF
Equivalent series resistance for load capacitance	R_{VRAWO}	for C_{AWOVCL}			40*2	mΩ
	$R_{VRGETH0}$	for $C_{GETH0VCL}$			40*2	mΩ
Inrush current during power-on	$I_{RUSYSVCC}$	SYSVCC*3			350*2*4	mA
	$I_{RUGETH0PVCC}$	GETH0PVCC			100*2	mA

Note 1. The capacitors has to be mounted with one of the following connections:
- Distribute evenly the total capacitance for the device to all AWOVCL pins.
- Concentrate the total capacitance for the device to one AWOVCL pin.
In this case, the capacitor has to be connected to F23(BGA516), A22(BGA373), A18(BGA292), 126(QFP176), A13(BGA156) and 103(QFP144).
And other AWOVCL pins which capacitor not connected has to be left open.

Note 2. This is reference value.

Note 3. When returning from DeepSTOP.

Note 4. The time of current flow is less than 2.5 µs.

Table 55.8 Switching Voltage Regulator Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output voltage	VDD		1.025	1.09	1.155	V
Switching frequency	f_{SVRSW}	FSWMODE[1:0] = 00_B	368	434	500	kHz
		FSWMODE[1:0] = 01_B	736	868	1000	kHz
SVR load transient response		Less than ΔI (max)	–33.5*1		33.5*1	mV
SVR efficiency		FSWMODE[1:0] = 00_B		80*1		%
		FSWMODE[1:0] = 01_B		70*1		%
Capacitance	$C_{SVRDRVCC}$	SVRDRVCC pin	9	14		µF
	$C_{SVRAVCC}$	SVRAVCC pin	0.7	1	1.3	µF
	C_{VDD0}	VDD pin. Close to LX		*2		µF
Equivalent series resistance for load capacitance	$R_{VRSVRDRVCC}$	for $C_{SVRDRVCC}$ (@0.1MHz to 5MHz)			10	mΩ
	$R_{VRSVRAVCC}$	for $C_{SVRAVCC}$ (@0.1MHz to 5MHz)			10	mΩ
	R_{VRVDD}	for C_{VDD0} (@0.1MHz to 5MHz)			10	mΩ
Inductance	LX	Close to external MOSFETs		*2		µH
DC resistance for inductance	R_{LX}	for LX			*2	mΩ
Inrush current during power-on	SVRDRVCC	include external circuit			4000*1	mA
Operating current variation*2*4*5	ΔI	I_{ISOVDD_R}, U2A16			440	mA/100 µs
		I_{ISOVDD_R}, U2A8			220	
		I_{ISOVDD_R}, U2A6			220	
Ramp-up time with soft start	t_{RUT}				3.6	ms

Note 1. This is reference value.
Note 2. Contact our sale office for the method of setting parameters.
Note 3. The total capacitance for the device has to be distributed around thermal ball.
Note 4. Operating current variation filtered by simple moving average of 20 µs window can be ignored.
Note 5. Operating current variation with smaller than 1 mA/µs slope is not necessary to be counted as "ΔI".

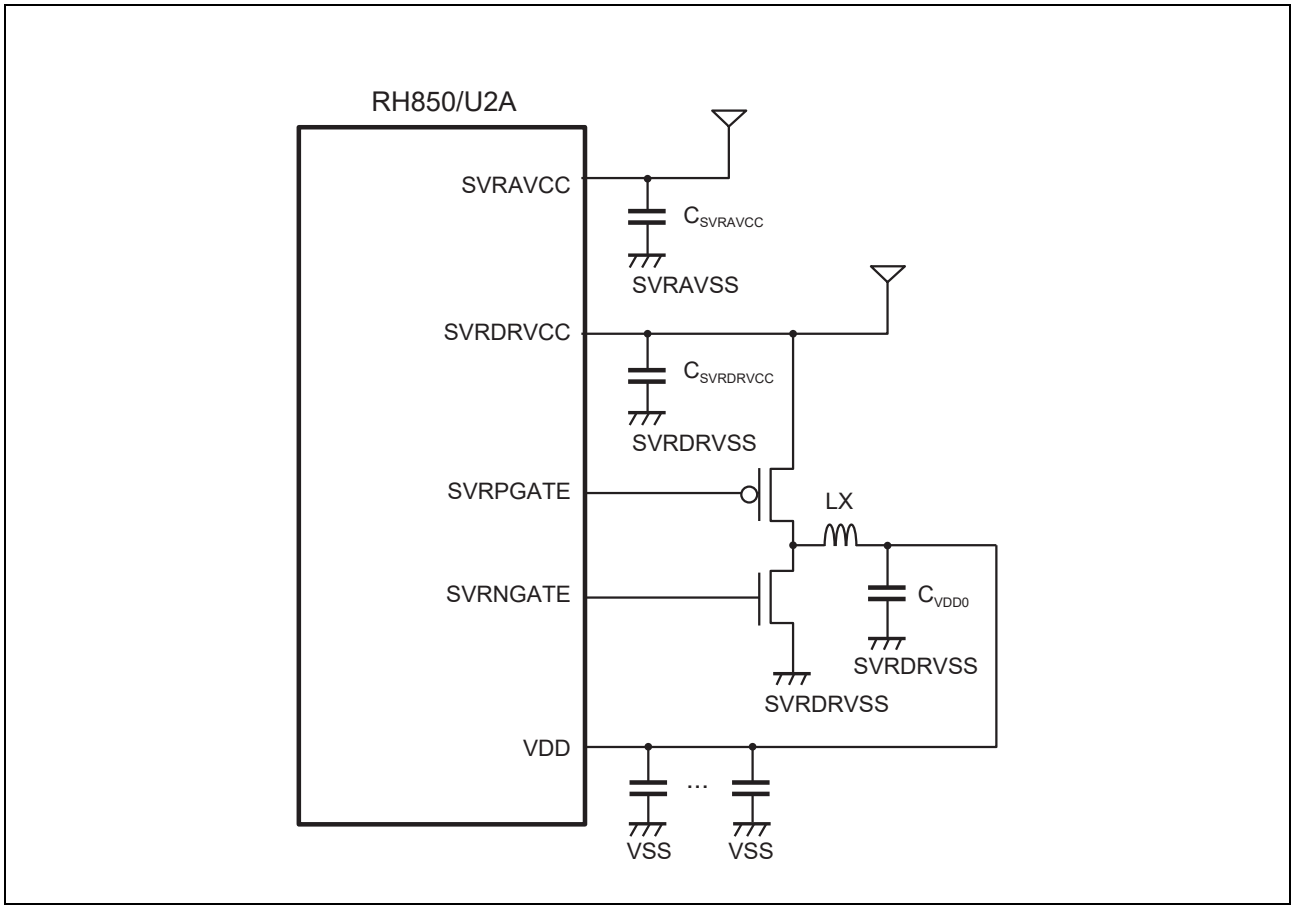

Figure 55.3 External Components of Switching Voltage Regulator

55.2.2 Input Voltage Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.9 Input Voltage Characteristics

Item	Symbol	Condition*1	MIN.	TYP.	MAX.	Unit
High level input voltage	V_{IH1}	SHMT1, IOVCC = 3.0 to 5.5 V	0.65 × IOVCC		IOVCC + 0.3	V
	V_{IH2}	SHMT2, IOVCC = 3.0 to 5.5 V	0.75 × IOVCC		IOVCC + 0.3	V
	V_{IH3}	SHMT4, IOVCC = 3.0 to 5.5 V	0.80 × IOVCC		IOVCC + 0.3	V
	V_{IH4}	TTL, IOVCC = 3.0 to 5.5 V	2.2		IOVCC + 0.3	V
Low level input voltage	V_{IL1}	SHMT1, IOVCC = 3.0 to 5.5 V	–0.3		0.35 × IOVCC	V
	V_{IL2}	SHMT2, IOVCC = 3.0 to 5.5 V	–0.3		0.25 × IOVCC	V
	V_{IL3}	SHMT4, IOVCC = 3.0 to 5.5 V	–0.3		0.50 × IOVCC	V
	V_{IL4}	TTL, IOVCC = 3.0 to 5.5 V	–0.3		0.8	V
Input hysteresis for Schmitt*3	V_{HS1}	SHMT1, IOVCC = 4.5 to 5.5 V	0.4			V
		SHMT1, IOVCC = 3.0 to 4.5 V	0.3			V
	V_{HS2}	SHMT2, IOVCC = 3.0 to 5.5 V	0.2 × IOVCC			V
	V_{HS3}	SHMT4, IOVCC = 3.0 to 5.5 V	0.1			V

Note 1. "IOVCC" means power supply voltage for I/O ports. See the appendix "*E02_01_List_of_Pin_Assignment.xlsx*" for the power supply of each pin.

Note 2. For X1 pin, see **Section 55.2.1.2, Main Oscillator Characteristics**.

Note 3. The configured drive strength of the output terminals in a power group might affect the hysteresis characteristics of the input terminals in the same power group. See Appendix file "*E02_01_List_of_Pin_Assignment.xlsx*" for the assignment of the power group.

55.2.3 Input Leakage Current

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.10 Input Leakage Current

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Input leakage current	I_{LIH1}	Vin = 0 to EnVCC • Pn_m (Except P2_0, P2_5, P2_10 to P2_15, P4_5 to P4_10, P22_0 and P22_4)	Tj ≤ 105°C			0.5	µA
			105°C < Tj ≤ 150°C			1.0	µA
			150°C < Tj			2.0	µA
	I_{LIH2}	Vin = 0 to EnVCC • P2_0, P2_5, P2_10 to P2_15, P4_5 to P4_10, P22_0 and P22_4	Tj ≤ 105°C			0.5	µA
			105°C < Tj			2.0	µA
	I_{LIH3}	Vin = 0 to AnVCC • APn_m	Tj ≤ 150°C			0.5	µA
			150°C < Tj			1.0	µA
	I_{LIL1}	Vin = 0 to EnVCC • Pn_m (Except P2_0, P2_5, P2_10 to P2_15, P4_5 to P4_10, P22_0 and P22_4)	Tj ≤ 105°C			–0.5	µA
			105°C < Tj ≤ 150°C			–1.0	µA
			150°C < Tj			–2.0	µA
	I_{LIL2}	Vin = 0 to EnVCC • P2_0, P2_5, P2_10 to P2_15, P4_5 to P4_10, P22_0 and P22_4	Tj ≤ 105°C			–0.5	µA
			105°C < Tj			–2.0	µA
	I_{LIL3}	Vin = 0 to AnVCC • APn_m	Tj ≤ 150°C			–0.5	µA
			150°C < Tj			–1.0	µA

55.2.4 Pull-up/Pull-down Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.11 Pull-up/Pull-down Characteristics

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Input pull-up current source	I_{PU1}		IOVCC*1 = 3.0 to 5.5V, Vin = 0V	30		350	µA
Input pull-down current source	I_{PD1}	Other than the below	IOVCC*1 = 3.0 to 5.5V, Vin = IOVCC*1	30		350	µA
	I_{PD2}	$\overline{\text{RESET}}$, $\overline{\text{AURORES1}}$, $\overline{\text{AURORES2}}$, $\overline{\text{AURORESPD}}$, $\overline{\text{ERAMRES2}}$, $\overline{\text{ERAMRESPD}}$	IOVCC*1 = 3.0 to 5.5V, Vin = IOVCC*1			110	µA

Note 1. "IOVCC" means power supply voltage for I/O ports. See the appendix "*E02_01_List_of_Pin_Assignment.xlsx*" for the power supply of each pin.

55.2.5 Output Voltage Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.12 Output Voltage Characteristics*1

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Output resistance	R_{O11}	Drive strength = 1	IOVCC – V_{OH} = 0.4 V, V_{OL} = 0.4 V	6		40	Ω
	R_{O12}	Drive strength = 2	IOVCC – V_{OH} = 0.4 V, V_{OL} = 0.4 V	11		72	Ω
	R_{O13}	Drive strength = 3	IOVCC – V_{OH} = 0.4 V, V_{OL} = 0.4 V	18		100	Ω
	R_{O14}	Drive strength = 4	IOVCC – V_{OH} = 0.4 V, V_{OL} = 0.4 V	32		200	Ω
	R_{O15}	Drive strength = 5	IOVCC – V_{OH} = 0.4 V, V_{OL} = 0.4 V	61		400	Ω
High level output voltage	V_{OH1}	Drive strength = 1 IOVCC = 3.0 to 5.5 V	I_{OH} = –4 mA / pin (4 output pins)*2	IOVCC–0.8			V
			I_{OH}= –2 mA / pin (4 output pins)*2	IOVCC–0.5			V
	V_{OH2}	Drive strength = 2 IOVCC = 3.0 to 3.6 V	I_{OH} = –4 mA / pin (8 output pins)*2	IOVCC–0.8			V
			I_{OH}= –2 mA / pin (8 output pins)*2	IOVCC–0.5			V
		Drive strength = 2 IOVCC = 3.6 to 5.5 V	I_{OH} = –4 mA / pin (2 output pins)*2	IOVCC–0.8			V
			I_{OH}= –2 mA / pin (2 output pins)*2	IOVCC–0.5			V
	V_{OH3}	Drive strength = 3 IOVCC = 3.0 to 5.5 V	I_{OH} = –4 mA / pin (8 output pins)*2	IOVCC–0.8			V
			I_{OH} = –2 mA / pin (8 output pins)*2	IOVCC–0.5			V
	V_{OH4}	Drive strength = 4 IOVCC = 3.0 to 5.5 V	I_{OH} = –2 mA / pin (16 output pins)*2	IOVCC–0.7			V
			I_{OH} = –1 mA / pin (16 output pins)*2	IOVCC–0.5			V
	V_{OH5}	Drive strength = 5 IOVCC = 3.0 to 5.5 V	I_{OH} = –1 mA / pin (16 output pins)*2	IOVCC–0.7			V
			I_{OH} = –500 µA / pin (16 output pins)*2	IOVCC–0.5			V
Low level output voltage	V_{OL1}	Drive strength = 1 IOVCC = 3.0 to 5.5 V	I_{OL} = 4 mA / pin (4 output pins)*2			0.8	V
			I_{OL} = 2 mA / pin (4 output pins)*2			0.5	V
	V_{OL2}	Drive strength = 2 IOVCC = 3.0 to 3.6 V	I_{OL} = 4 mA / pin (8 output pins)*2			0.8	V
			I_{OL} = 2 mA / pin (8 output pins)*2			0.5	V
		Drive strength = 2 IOVCC = 3.0 to 5.5 V	I_{OL} = 4 mA / pin (2 output pins)*2			0.8	V
			I_{OL} = 2 mA / pin (2 output pins)*2			0.5	V
	V_{OL3}	Drive strength = 3 IOVCC = 3.0 to 5.5 V	I_{OL} = 4 mA / pin (8 output pins)*2			0.7	V
			I_{OL} = 2 mA / pin (8 output pins)*2			0.5	V
	V_{OL4}	Drive strength = 4 IOVCC = 3.0 to 5.5 V	I_{OL} = 2 mA / pin (16 output pins)*2			0.7	V
			I_{OL} = 1 mA / pin (16 output pins)*2			0.5	V
	V_{OL5}	Drive strength = 5 IOVCC = 3.0 to 5.5 V	I_{OL} = 1 mA / pin (16 output pins)*2			0.7	V
			I_{OL} = 500 µA / pin (16 output pins)*2			0.5	V

Note 1. "IOVCC" means power supply voltage for I/O ports. See the appendix "*E02_01_List_of_Pin_Assignment.xlsx*" for the power supply of each pin.

Note 2. The number of pin indicates simultaneous ON in one power. The influence of the noise emission should be considered when switching the output level.

55.2.6 Output Current

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.13 Output Current Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High level output current	$\|I_{OH}\|$	per pin			8	mA
	$\Sigma\|I_{OH}\|$ EnVCC	Each EnVCC			60	mA
	$\Sigma\|I_{OH}\|$ AnVCC	Each AnVCC			16	mA
Low level output current	I_{OL}	per pin			8	mA
	ΣI_{OL} EnVCC	Each EnVCC			60	mA
	ΣI_{OL} AnVCC	Each AnVCC			16	mA

55.2.7 Injection Current Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.14 Injection Current Operating Conditions

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DC injection current (per pin)	I_{INJ_DIN}	Digital pin *1	–2		3	mA
	I_{INJ_AIN}	Analogue pin	–3		3	mA
DC injection current (each power supply)	I_{INJ_E0VCC}	E0VCC			50	mA
	I_{INJ_E1VCC}	E1VCC			50	mA
	I_{INJ_E2VCC}	E2VCC			30	mA
	I_{INJ_A0VCC}	A0VCC			20	mA
	I_{INJ_A1VCC}	A1VCC			20	mA
	I_{INJ_A2VCC}	A2VCC			20	mA
DC injection current (total)	I_{INJ_TOTAL}				80	mA

Note 1. Injection current to the logic pin multiplied with LVDS function is prohibited when LVDS function is used. When LVDS function is not used, Injection current to the logic pin multiplied with LVDS function causes at maximum additional 1 µA leakage current at the P/N combinational pin. For example, injection current to HSIF0_TXDP causes at maximum additional 1 µA leakage current at HSIF0_TXDN.

NOTE

- Injection current to P3_8 pin is prohibited when SGMII function is used.
- Input voltage must be kept within –0.8V ≤ Vin ≤ 6.0V, if injection current is kept within rated value.
- Power supply voltage must be kept within operating conditions.
- Injection current effects power dissipation in the package for thermal characteristics.

55.2.8 LVDS Characteristics

55.2.8.1 LVDS Driver Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.15 LVDS Driver Characteristics (based on IEEE 1596.3-1996)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output low-level voltage	V_{LVDSOL}		1000			mV
Output high-level voltage	V_{LVDSOH}				1400	mV
Output differential voltage	V_{LVDSOD}		150		250	mV
Offset voltage	V_{LVDSOS}		1.125	1.2	1.275	V
Output impedance	R_{LVDSOI}		40		300	Ω

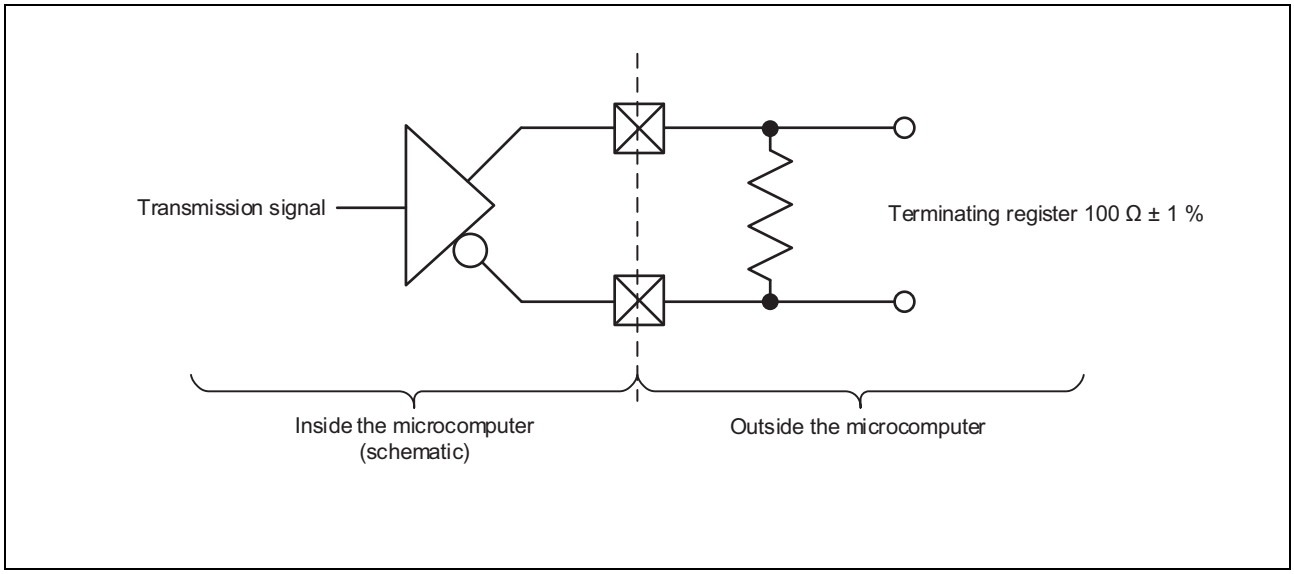

Figure 55.4 LVDS Driver Measurement Conditions

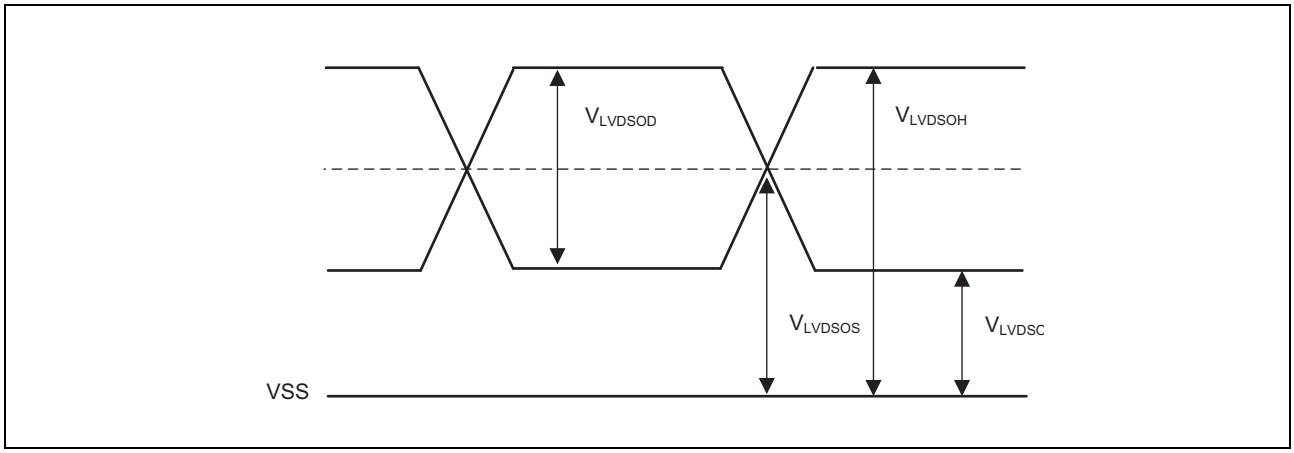

Figure 55.5 Meaning of LVDS Driver Symbols

55.2.8.2 LVDS Receiver Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.16 LVDS Receiver Characteristics (based on IEEE 1596.3-1996)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential Input threshold voltage	$V_{LVDSIDTH}$		–100		100	mV
Input voltage range	V_{LVDI}		0.825		1.575	V

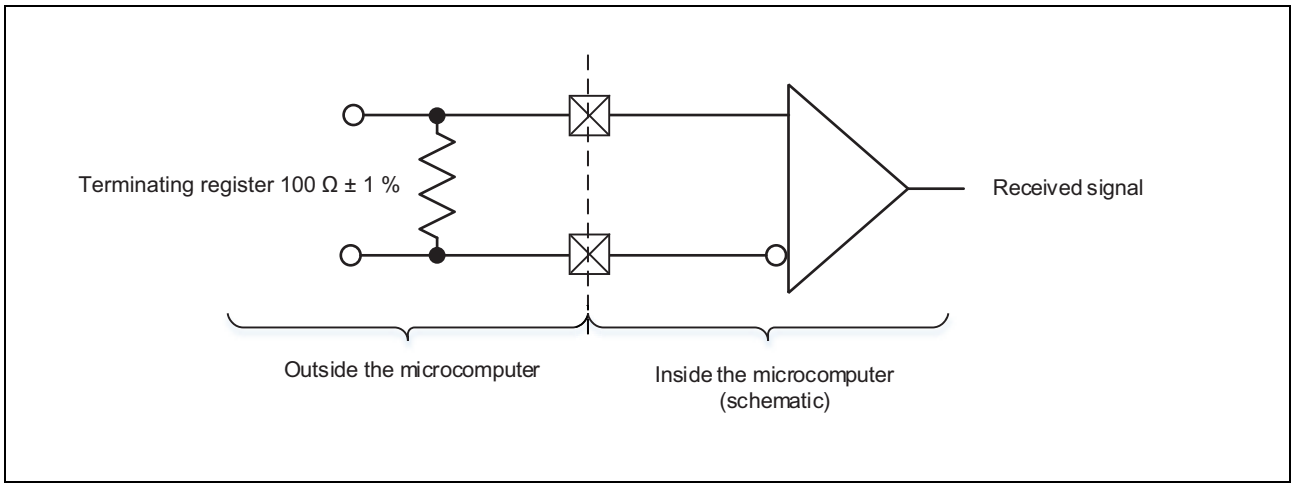

Figure 55.6 LVDS Receiver Measurement Conditions

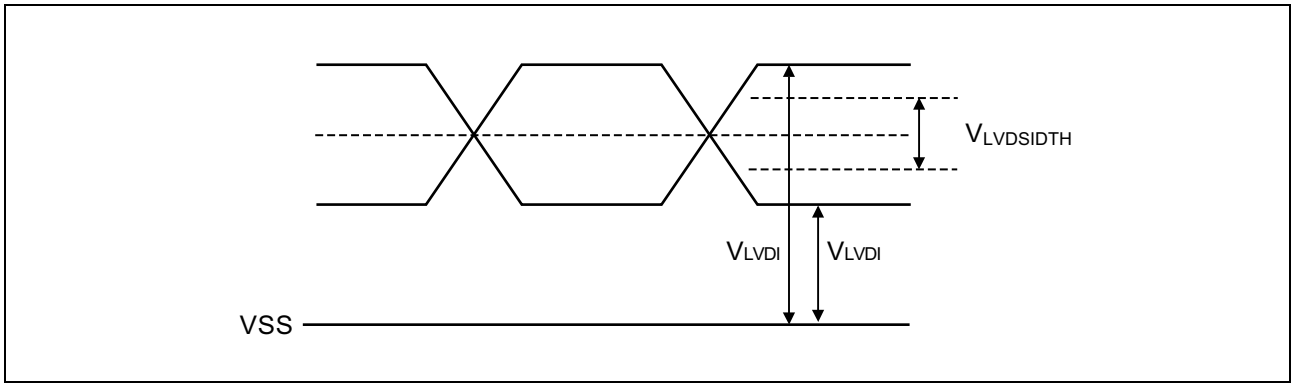

Figure 55.7 Meaning of LVDS Receiver Symbols

55.2.9 SGMII Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.17 SGMII REFCK Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High level input voltage	V_{IH}		2.0		GETH0RVCC + 0.3	V
Low level input voltage	V_{IL}		–0.3		0.8	V

Table 55.18 SGMII Tx Buffer Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output voltage high	V_{OH}				1525	mV
Output voltage low	V_{OL}		875			mV
Output Differential Voltage	$\|V_{OD}\|$		150		400	mV
Output Offset Voltage	V_{OS}		1075		1325	mV
Change in V_{OD} between “0” and “1”	$\Delta\|V_{OD}\|$				25	mV
Change in V_{OS} between “0” and “1”	ΔV_{OS}				25	mV
Output current on Short to GND	I_{sa}, I_{sb}				40	mA
Output current when a, b are shorted	I_{sab}				12	mA

Note 1. For details of the symbols, refer to the IEEE1596.3-1996 standard.
Note 2. All parameters measured at Rload = 100 Ω ±1 % load

Table 55.19 SGMII Rx Buffer Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input Voltage range a or b	V_I		675		1725	mV
Input differential threshold	V_{idth}		–50		50	mV
Receiver differential input impedance	R_{in}		80		120	Ω

Note 1. For details of the symbols, refer to the IEEE1596.3-1996 standard.

55.2.10 Aurora Interface Clock Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.20 Aurora Interface Clock Characteristics (CICREFP, CICREFN)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential input voltage	$V_{DIFFCIC}$ *1		200		1600	mV
External AC coupling capacitor	C_{ACC}		75	100	200	nF
Differential input resistance	$Z_{DIFFCIC}$		70	100	130	Ω

Note 1. Peak to peak differential input voltage.

Table 55.21 Aurora Interface Characteristics (TODP0-3/TODN0-3)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential output voltage	$V_{DIFFTOD}$ *1		800		1600	mV
Differential output resistance	$Z_{DIFFTOD}$		70		130	Ω

Note 1. Peak to peak differential input voltage.

55.2.11 IO Capacitances

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.22 IO Capacitances *1, *2

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	C_I	f = 1 MHz 0 V for non measurement pins			10	pF
Input/output capacitance	C_{IO}				10	pF
Output capacitance	C_O				10	pF

Note 1. This capacity is the capacity value per BGA_Ball (QFP_Pin) 1 terminal.

Note 2. For analog input pins (ADCJnIm and ADCJnImS), refer to **Section 55.4, A/D Converter Characteristics**.

55.2.12 Supply Current Characteristics

55.2.12.1 General Definition

Power consumption except for the current of I/O buffer (I_{EnVCC}) is specified below.

The parameter I_{EnVCC} depends on customer's application and thus need to be defined by customer in order to determine the total power dissipation of a device.

55.2.12.2 Power Supply Currents

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.23 Current consumption for RH850/U2A-EVA*2, *3

Item	Symbol	Power supply	CPU frequency	MIN.	TYP.*1	MAX.	Unit
RUN mode current	I_{SYSVCC_R}	SYSVCC	400 MHz		6	34	mA
			320 MHz		6	34	mA
			240 MHz		6	34	mA
	I_{VCC_R}	VCC*5	400 MHz		22	45	mA
			320 MHz		22	45	mA
			240 MHz		22	45	mA
	I_{ISOVDD_R}	ISOVDD	400 MHz		480	1870	mA
			320 MHz		405	1694	mA
			240 MHz		330	1518	mA
STOP mode current*6	I_{SYSVCC_S}	SYSVCC			3	20	mA
	I_{VCC_S}	VCC			0.005	1	mA
	I_{ISOVDD_S}	ISOVDD			385	1300	mA
DeepSTOP mode current*6	I_{SYSVCC_DS}	SYSVCC			0.52	12	mA
	I_{VCC_DS}	VCC			2	400	µA
	I_{ISOVDD_DS}	ISOVDD			14*4	900*4	mA
Cyclic RUN mode current*6	I_{SYSVCC_CR}	SYSVCC	100 MHz		4	32	mA
	I_{VCC_CR}	VCC	100 MHz		0.008	1.2	mA
	I_{ISOVDD_CR}	ISOVDD	100 MHz		405	1350	mA
Cyclic STOP mode current*6	I_{SYSVCC_CS}	SYSVCC			3	20	mA
	I_{VCC_CS}	VCC			0.005	1	mA
	I_{ISOVDD_CS}	ISOVDD			385	1300	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- SYSVCC = VCC = EnVCC = LVDVCC = AnVCC = AnVREFH = SVRDRVCC = SVRAVCC = 5.0 V
- GETH0PVCC = GETH0BVCC = GETH0RVCC = 3.3 V
- ISOVDD = 1.09 V

Note 2. The above value does not include the current of SVR converter.

Note 3. The above value does not include the current of I/O buffer.

Note 4. Indicated leak current will be applied if the power continues supplying to ISOVDD during DeepSTOP mode.

Note 5. Additional current (max.60 mA for Code Flash per unit, max.35 mA for Data Flash per unit) will be applied when data writing/erasing to Code or Data Flash is processing.

Note 6. MainOSC and all peripherals are stopped.

Table 55.24 Current consumption for RH850/U2A-EVA (specific power supply)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
EMUVCC	I_{EMUVCC}					20	mA
DVCC	I_{DVCC}					20	mA
ERAMVCC	$I_{ERAMVCC}$					5	mA
EMUVDD	I_{EMUVDD}					20	mA
DVDD	I_{DVDD}					350	mA
ERAMVDD	$I_{ERAMVDD}$					250	mA

Table 55.25 Current consumption for RH850/U2A16[*2, *3]

Item	Symbol	Power supply	CPU frequency	MIN.	TYP.[*1]	MAX.	Unit
RUN mode current	I_{SYSVCC_R}	SYSVCC	400 MHz		6	34	mA
			320 MHz		6	34	mA
			240 MHz		6	34	mA
	I_{VCC_R}	VCC[*5]	400 MHz		11	35	mA
			320 MHz		11	35	mA
			240 MHz		11	35	mA
	I_{ISOVDD_R}	ISOVDD	400 MHz		420	1650	mA
			320 MHz		355	1483	mA
			240 MHz		290	1316	mA
STOP mode current[*6]	I_{SYSVCC_S}	SYSVCC			3	20	mA
	I_{VCC_S}	VCC			0.005	1	mA
	I_{ISOVDD_S}	ISOVDD			335	1130	mA
DeepSTOP mode current[*6]	I_{SYSVCC_DS}	SYSVCC			0.52	12	mA
	I_{VCC_DS}	VCC			2	400	µA
	I_{ISOVDD_DS}	ISOVDD			12[*4]	730[*4]	mA
Cyclic RUN mode current[*6]	I_{SYSVCC_CR}	SYSVCC	100 MHz		4	32	mA
	I_{VCC_CR}	VCC	100 MHz		0.008	1.2	mA
	I_{ISOVDD_CR}	ISOVDD	100 MHz		350	1180	mA
Cyclic STOP mode current[*6]	I_{SYSVCC_CS}	SYSVCC			3	20	mA
	I_{VCC_CS}	VCC			0.005	1	mA
	I_{ISOVDD_CS}	ISOVDD			335	1130	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- SYSVCC = VCC = EnVCC = LVDVCC = AnVCC = AnVREFH = SVRDRVCC = SVRAVCC = 5.0 V
- GETH0PVCC = GETH0BVCC = GETH0RVCC = 3.3 V
- ISOVDD = 1.09 V

Note 2. The above value does not include the current of SVR converter.

Note 3. The above value does not include the current of I/O buffer.

Note 4. Indicated leak current will be applied if the power continues supplying to ISOVDD during DeepSTOP mode.

Note 5. Additional current (max.60 mA for Code Flash per unit, max.35 mA for Data Flash per unit) will be applied when data writing/erasing to Code or Data Flash is processing.

Note 6. MainOSC is stopped.

Table 55.26 Current consumption for RH850/U2A8[*2, *3]

Item	Symbol	Power supply	CPU frequency	MIN.	TYP.[*1]	MAX.	Unit
RUN mode current	I_{SYSVCC_R}	SYSVCC	400 MHz		6	30	mA
			320 MHz		6	30	mA
			240 MHz		6	30	mA
	I_{VCC_R}	VCC[*5]	400 MHz		9	28	mA
			320 MHz		9	28	mA
			240 MHz		9	28	mA
	I_{ISOVDD_R}	ISOVDD	400 MHz		245	870	mA
			320 MHz		210	780	mA
			240 MHz		175	690	mA
STOP mode current[*6]	I_{SYSVCC_S}	SYSVCC			3	16	mA
	I_{VCC_S}	VCC			0.005	0.6	mA
	I_{ISOVDD_S}	ISOVDD			170	580	mA
DeepSTOP mode current[*6]	I_{SYSVCC_DS}	SYSVCC			0.46	8	mA
	I_{VCC_DS}	VCC			2	320	µA
	I_{ISOVDD_DS}	ISOVDD			5[*4]	385[*4]	mA
Cyclic RUN mode current[*6]	I_{SYSVCC_CR}	SYSVCC	100 MHz		4	28	mA
	I_{VCC_CR}	VCC	100 MHz		0.008	0.8	mA
	I_{ISOVDD_CR}	ISOVDD	100 MHz		180	620	mA
Cyclic STOP mode current[*6]	I_{SYSVCC_CS}	SYSVCC			3	16	mA
	I_{VCC_CS}	VCC			0.005	0.6	mA
	I_{ISOVDD_CS}	ISOVDD			170	580	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- SYSVCC = VCC = EnVCC = LVDVCC = AnVCC = AnVREFH = SVRDRVCC = SVRAVCC = 5.0 V
- GETH0PVCC = GETH0BVCC = GETH0RVCC = 3.3 V
- ISOVDD = 1.09 V

Note 2. The above value does not include the current of SVR converter.

Note 3. The above value does not include the current of I/O buffer.

Note 4. Indicated leak current will be applied if the power continues supplying to ISOVDD during DeepSTOP mode.

Note 5. Additional current (max.60 mA for Code Flash per unit, max.35 mA for Data Flash per unit) will be applied when data writing/erasing to Code or Data Flash is processing.

Note 6. MainOSC is stopped.

Table 55.27 Current consumption for RH850/U2A6[*2, *3]

Item	Symbol	Power supply	CPU frequency	MIN.	TYP.[*1]	MAX.	Unit
RUN mode current	I_{SYSVCC_R}	SYSVCC	400 MHz		6	30	mA
			320 MHz		6	30	mA
			240 MHz		6	30	mA
	I_{VCC_R}	VCC[*5]	400 MHz		9	28	mA
			320 MHz		9	28	mA
			240 MHz		9	28	mA
	I_{ISOVDD_R}	ISOVDD	400 MHz		240	840	mA
			320 MHz		207	755	mA
			240 MHz		173	670	mA
STOP mode current[*6]	I_{SYSVCC_S}	SYSVCC			3	16	mA
	I_{VCC_S}	VCC			0.005	0.6	mA
	I_{ISOVDD_S}	ISOVDD			168	570	mA
DeepSTOP mode current[*6]	I_{SYSVCC_DS}	SYSVCC			0.46	8	mA
	I_{VCC_DS}	VCC			2	320	µA
	I_{ISOVDD_DS}	ISOVDD			4[*4]	375[*4]	mA
Cyclic RUN mode current[*6]	I_{SYSVCC_CR}	SYSVCC	100 MHz		4	28	mA
	I_{VCC_CR}	VCC	100 MHz		0.008	0.8	mA
	I_{ISOVDD_CR}	ISOVDD	100 MHz		178	610	mA
Cyclic STOP mode current[*6]	I_{SYSVCC_CS}	SYSVCC			3	16	mA
	I_{VCC_CS}	VCC			0.005	0.6	mA
	I_{ISOVDD_CS}	ISOVDD			168	570	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- SYSVCC = VCC = EnVCC = AnVCC = AnVREFH = SVRDRVCC = SVRAVCC = 5.0 V
- ISOVDD = 1.09 V

Note 2. The above value does not include the current of SVR converter.

Note 3. The above value does not include the current of I/O buffer.

Note 4. Indicated leak current will be applied if the power continues supplying to ISOVDD during DeepSTOP mode.

Note 5. Additional current (max.60 mA for Code Flash per unit, max.35 mA for Data Flash per unit) will be applied when data writing/erasing to Code or Data Flash is processing.

Note 6. MainOSC is stopped.

55.2.12.3 Power Supply Currents for specific features

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.28 Current consumption for specific features*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SVR converter	I_{SVR}	Current of SYSVCC			4	mA
	I_{SVRA}	Current of SVRAVCC			12	mA
LVDS for RHSIF/MSPI	I_{LVDS}	Current of LVDVCC			16	mA
Gigabit Ethernet	I_{GBETH}	Current of GETH0BVCC, GETH0RVCC and GETH0PVCC			90	mA
ADCJ0	I_{ADC0}*2	Current of A0VCC 4ch T&H function is used			5.7	mA
	$I_{ADC0REF}$*2	Current of A0VREFH			0.2	mA
ADCJ1	I_{ADC1}*2	Current of A1VCC 4ch T&H function is used			5.7	mA
	$I_{ADC1REF}$*2	Current of A1VREFH			0.2	mA
ADCJ2	I_{ADC2}*2	Current of A2VCC			2.9	mA
	$I_{ADC2REF}$*2	Current of A2VREFH			0.2	mA

Note 1. This table shows additional current when the specific function indicated above is used.

Note 2. For QFP package and BGA156 package, the current of AnVREFH (IADCnREF) is total of AnVREFH current (IADCnREF) and AnVCC current (IADCn).

55.2.13 Voltage Detector (POC, VLVI) Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.29 Voltage Detector (POC, VLVI) Characteristics*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Detection voltage (SYSVCC)	V_{POC}		2.5	2.63	2.75	V
	V_{VLVI}		1.9	2.0	2.1	V
Response time	t_{DPOC1}	Rise			1.2	ms
	t_{DPOC2}	Fall			10	µs
SYSVCC minimum pulse width	t_{WPOC}		0.2			ms
SYSVCC voltage ramp	t_{SYSVS}		0.002		550	ms/V

Note 1. POC monitors SYSVCC supply voltage.

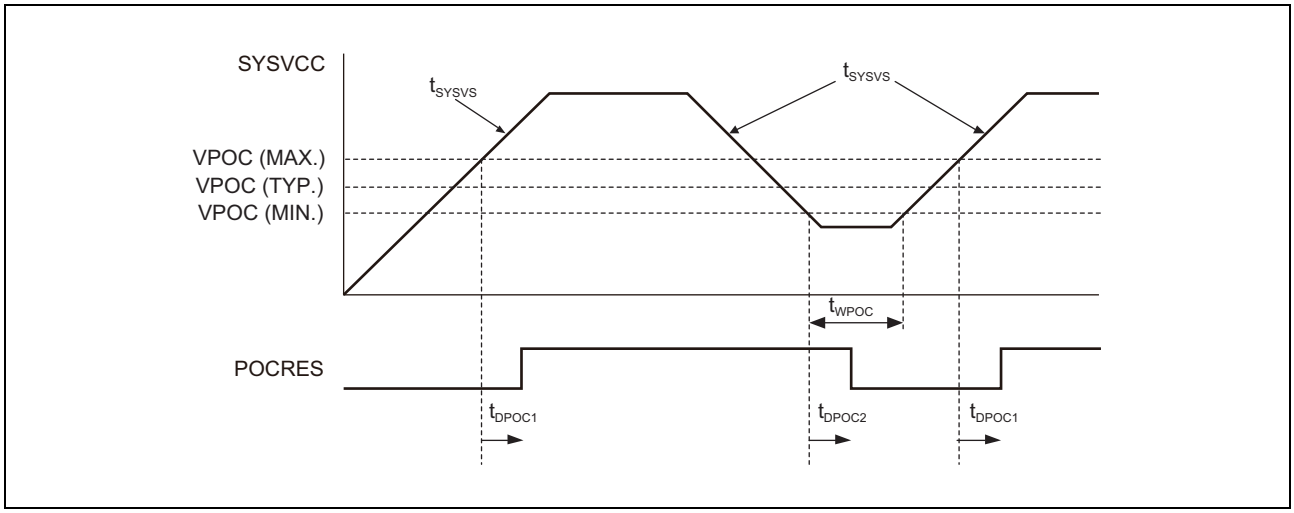

Figure 55.8 POC Characteristics

55.2.14 VMON Characteristics

Conditions:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.

Table 55.30 VMON Characteristics*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
VDD primary high detection level	V_{VDDMAH}	AWOVDD	1.155	1.17	1.205	V
	V_{VDDMIH}	ISOVDD	1.155	1.17	1.205	V
VDD primary low detection level	V_{VDDMAL}	AWOVDD	0.975	1.01	1.025	V
	V_{VDDMIL}	ISOVDD Enable assist by Delay Monitor (DMON)	0.985	1.01	1.025	V
VCC primary high detection level	V_{VCCMH}		5.5	5.64	5.8	V
VCC primary low detection level	V_{VCCML}		2.8	2.9	3	V
E0VCC primary high detection level	V_{EVCCMH}		5.5	5.64	5.8	V
E0VCC primary low detection level	V_{EVCCML}		2.8	2.9	3	V
$\overline{\text{VMONOUT}}$ delay time	t_{DVMON}				10+Filter time*1	µs
VMON minimum pulse width	t_{WVMON}		0.2			ms
Voltage ramp	t_{VS}		0.002		550	ms/V

Note 1. See **Section 11.3.6, Registers** for details specification of filter time.

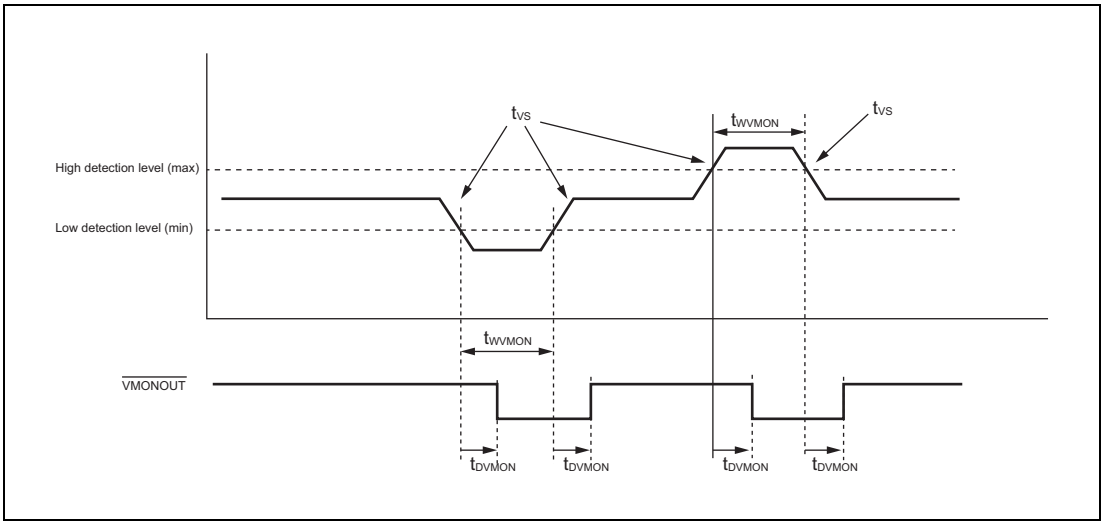

Figure 55.9 VMON Characteristics

55.3 AC Characteristics

55.3.1 AC Characteristic Measurement Condition

55.3.1.1 General Conditions

Below conditions are valid for all subsequent timing specifications if not noted otherwise:

- See **Section 55.2.1.1, Supply Voltage Characteristics**.
- Drive strength = 3
- CL = 30 pF
- All bits of PINVn/JPINV0 are set as 0.
- All bits of PODCn/JPODC0 are set as 0 except for specification on RIIC timing.

NOTE

Even though AC characteristics correspond to the nominal frequency, a main oscillator tolerance of up to 1000 ppm is considered with regard to timing characteristics for communication modules.

55.3.1.2 Input Measurement Points

If not stated otherwise, the below given AC timing specification is based on the measurements points as follows:

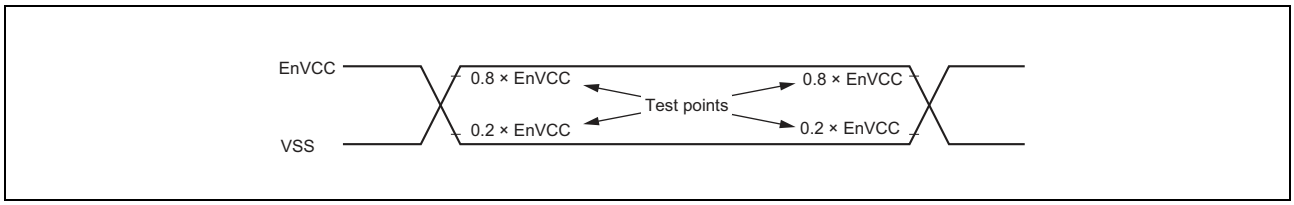

Figure 55.10 AC Input Measurement Points

55.3.1.3 Output Measurement Points

If not stated otherwise, the below given AC timing specification is based on the measurements points as follows:

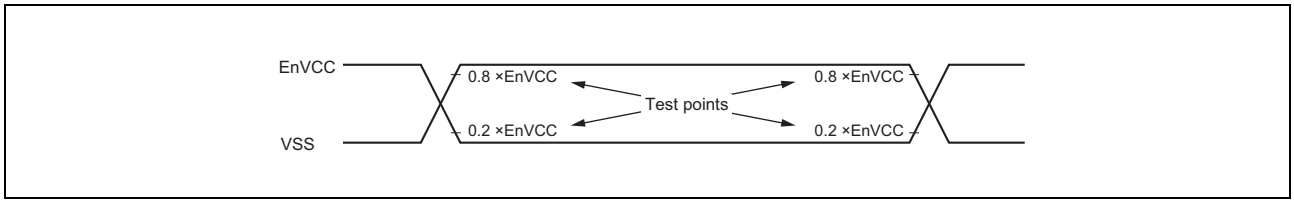

Figure 55.11 AC Output Measurement Points

55.3.1.4 Load conditions

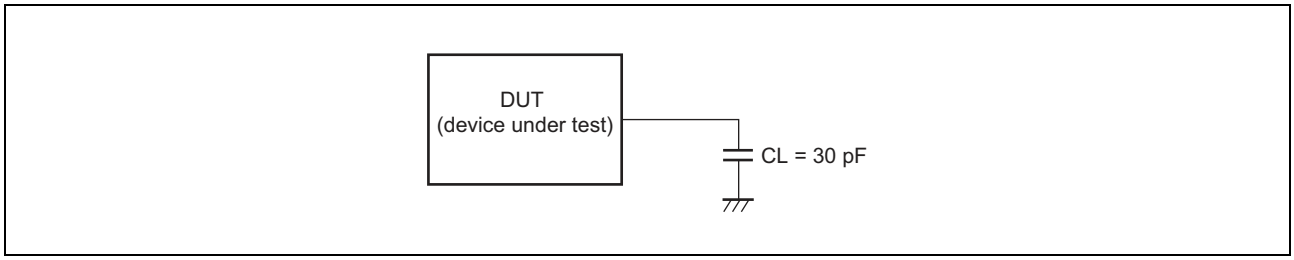

Figure 55.12 AC Load Conditions

55.3.2 Power On/Off Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.31 Power On/Off Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Reset hold time at power-on	t_{RESH1}*6	Power-up*1 SVR is used	1.3 + t_{RUT}			ms
		Power-up*1 SVR is not used	1.3			ms
Power hold time at reset assertion*5	t_{PWH}	Power-down*2 (ETNB1 (SGMII) used)	64			µs
		Power-down*2 (ETNB1 (SGMII) not used)	10.5			µs
Operation mode low level hold time at power-on	t_{MDL1}*6	SVR is used	0.1 + t_{RUT}			ms
		SVR is not used	0.1			ms
Operating mode setup time at power-on	t_{MDS1}		1			ms
Operating mode setup time at reset assert	t_{MDS2}		1			ms
Operating mode hold time at reset negate	t_{MDH1}		1			ms
Operating mode hold time at power-off	t_{MDH2}		0			µs
$\overline{\text{TRST}}$ setup time at reset	t_{TRMDS}		2			µs
$\overline{\text{TRST}}$ hold time at reset negate*4	t_{TRMDH}		30			ms
$\overline{\text{TRST}}$ hold time at power-on	t_{TRSTH1}*6	SVR is used	1.29 + t_{RUT}			ms
		SVR is not used	1.29			ms
$\overline{\text{TRST}}$ hold time at power-off	t_{TRSTH3}	Time since SYSVCC and VDD were power-off.			10	µs
Oscillator stabilization time	t_{OSC}				5.5	ms
PLL lock in time	t_{PLLL}	*3			1	ms
EMUVDD hold time at power-on	$t_{EMUVDDH1}$		0			ms
EMUVDD setup time at power-off	$t_{EMUVDDS1}$		0			ms

Note 1. t_{RESH1} is the reset time required for the supply of internal clock signals to become stable after power supplies are turned on. There are no restrictions on the rising order of each power supply.

Note 2. t_{PWH} is the time from assertion of the reset signal until any of the power voltages have dropped below the lower-limit voltages.
There are no restrictions on the falling order of each power supply.

Note 3. t_{PLLL} is the time required for PLL to lock in after MOSC oscillation has become stable.

Note 4. Access by the Nexus, LPD and BSCAN during t_{TRMDH} duration is prohibited (both of High and low condition of $\overline{\text{TRST}}$).

Note 5. The device can withstand up to 1000 uncontrolled power down cycles without impact on lifetime.
Uncontrolled means not according to power down timing requirements.

Note 6. Objection of power supplies for t_{RESH1}, t_{TRSTH1} and t_{MDL1} is changed by power configuration.
When SVR is used:All power supplies except for ISOVDD
When SVR is not used: All power supplies

CAUTION

The states of I/O pins are not reset during the noise cancellation interval of the reset signal following its assertion while power is being turned off. During that time, do not allow any input of mid-range potential to the pin or contention of output data.

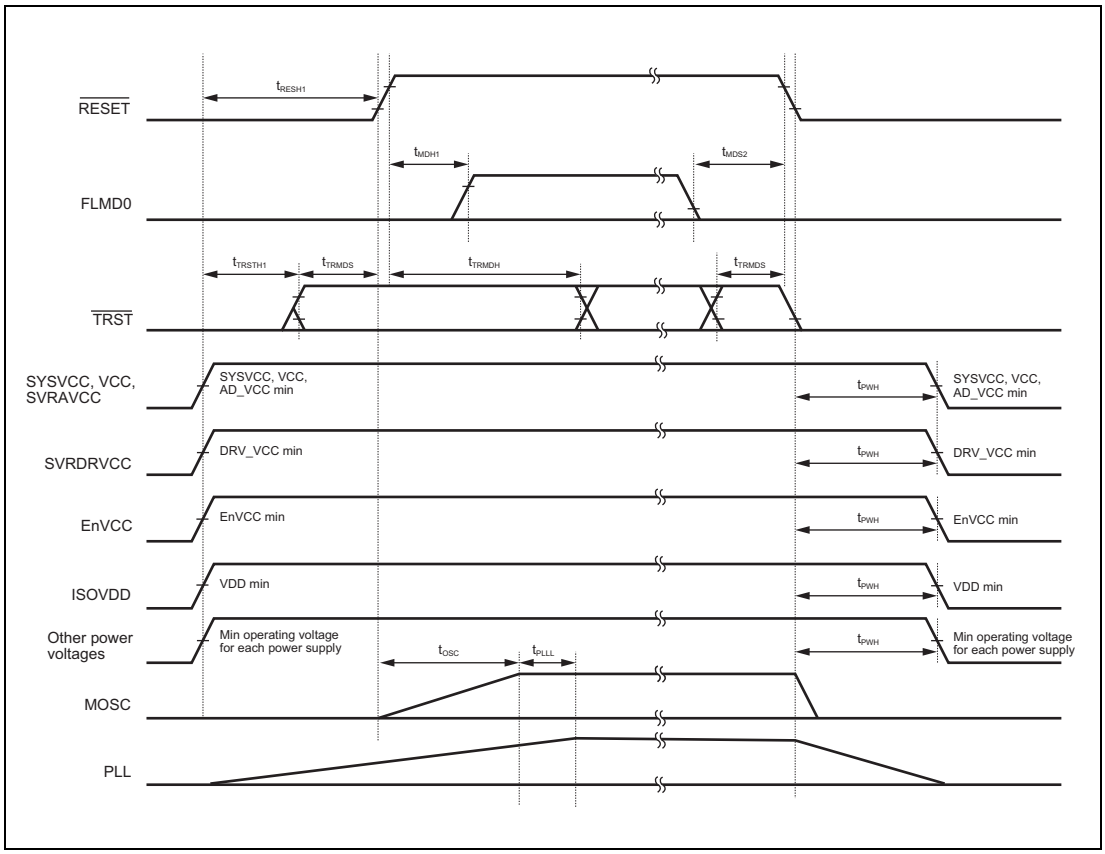

Figure 55.13 Power On/Off Timings (Normal operating mode and User boot mode 0)

NOTE

DVCC, DVDD, ERAMVCC, ERAMVDD and EMUVDD are not included in the other power voltages.

For power on/off timing about those power sources, see **Figure 55.18, EMUVCC, EMUVDD Power On / Off Timings** and **Section 55.3.30, Debug Resource (Aurora, ERAM) Specific Reset Timing**.

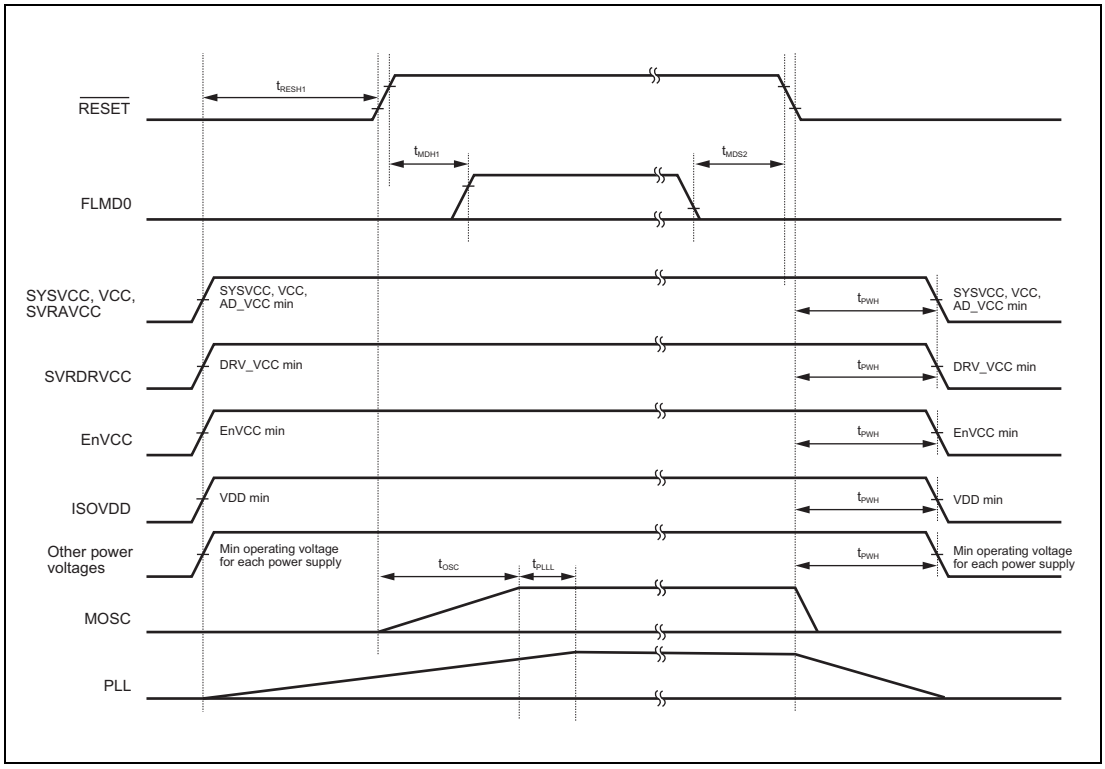

Figure 55.14 Power On/Off Timings (Serial programming mode 0)

NOTE

DVCC, DVDD, ERAMVCC, ERAMVDD and EMUVDD are not included in the other power voltages.

For power on/off timing about those power sources, see **Figure 55.18, EMUVCC, EMUVDD Power On / Off Timings** and **Section 55.3.30, Debug Resource (Aurora, ERAM) Specific Reset Timing**.

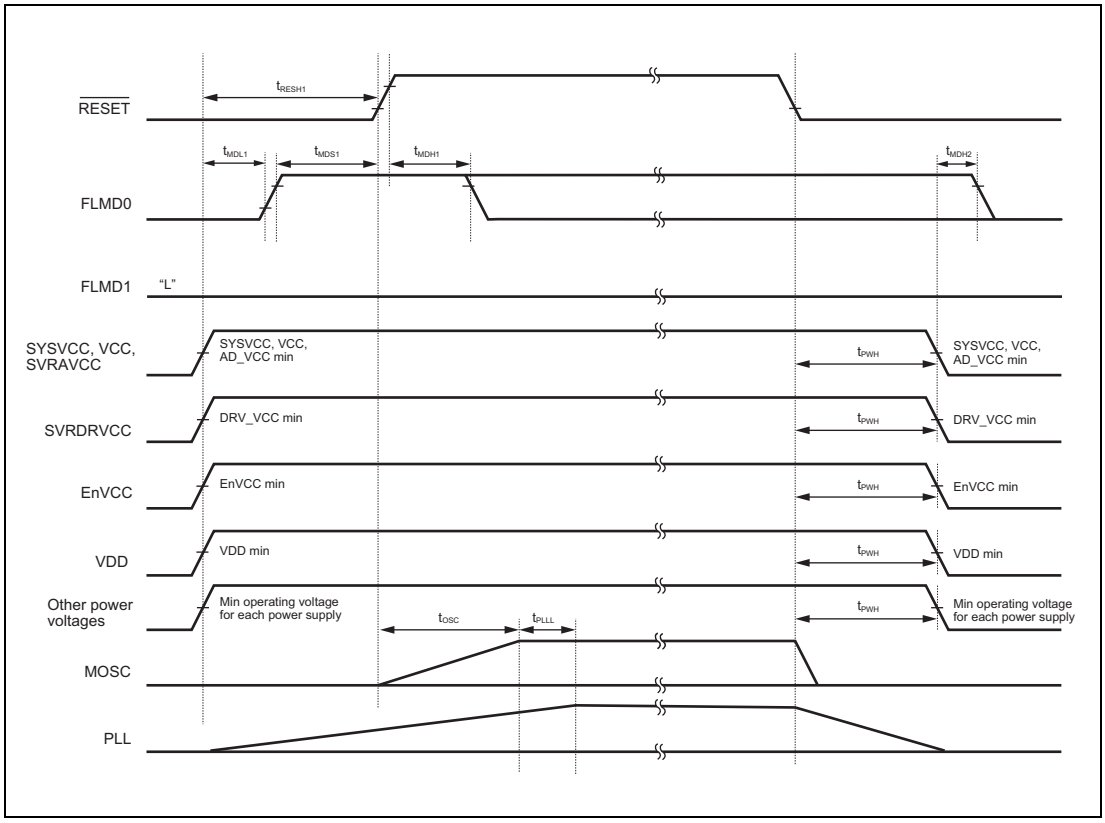

Figure 55.15 Power On/Off Timings (Serial programming mode 1)

NOTE

DVCC, DVDD, ERAMVCC, ERAMVDD and EMUVDD are not included in the other power voltages.

For power on/off timing about those power sources, see **Figure 55.18, EMUVCC, EMUVDD Power On / Off Timings** and **Section 55.3.30, Debug Resource (Aurora, ERAM) Specific Reset Timing**.

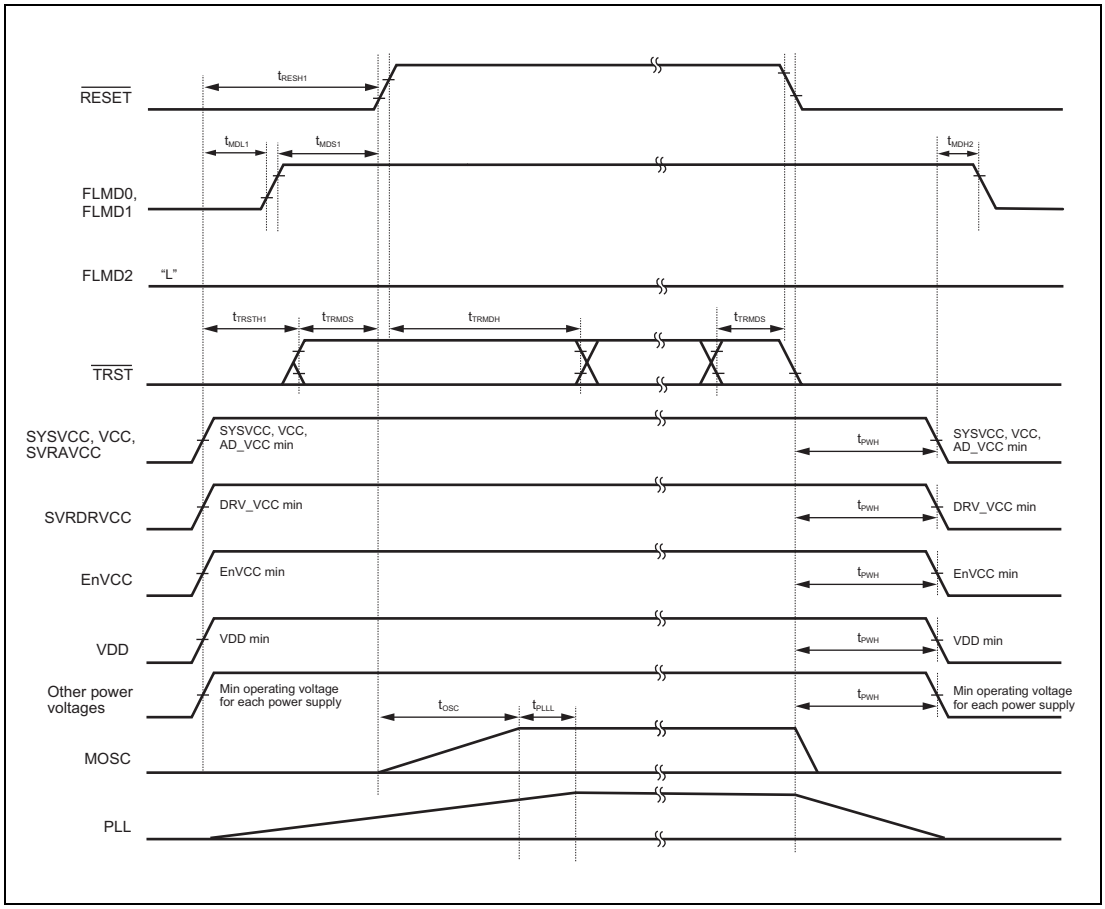

Figure 55.16 Power On/Off Timings (User boot mode 1)

NOTE

DVCC, DVDD, ERAMVCC, ERAMVDD and EMUVDD are not included in the other power voltages.

For power on/off timing about those power sources, see **Figure 55.18, EMUVCC, EMUVDD Power On / Off Timings** and **Section 55.3.30, Debug Resource (Aurora, ERAM) Specific Reset Timing**.

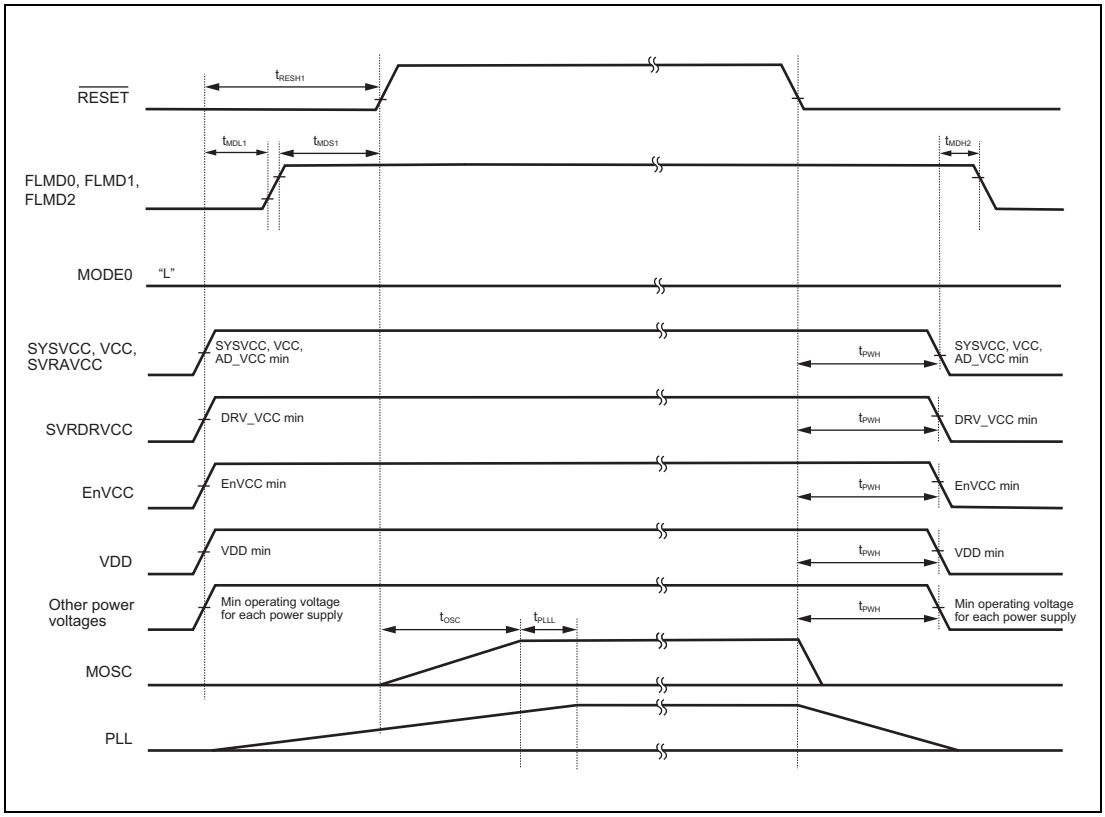

Figure 55.17 Power On/Off Timings (Boundary scan mode)

NOTE

DVCC, DVDD, ERAMVCC, ERAMVDD and EMUVDD are not included in the other power voltages.

For power on/off timing about those power sources, see **Figure 55.18, EMUVCC, EMUVDD Power On / Off Timings** and **Section 55.3.30, Debug Resource (Aurora, ERAM) Specific Reset Timing**.

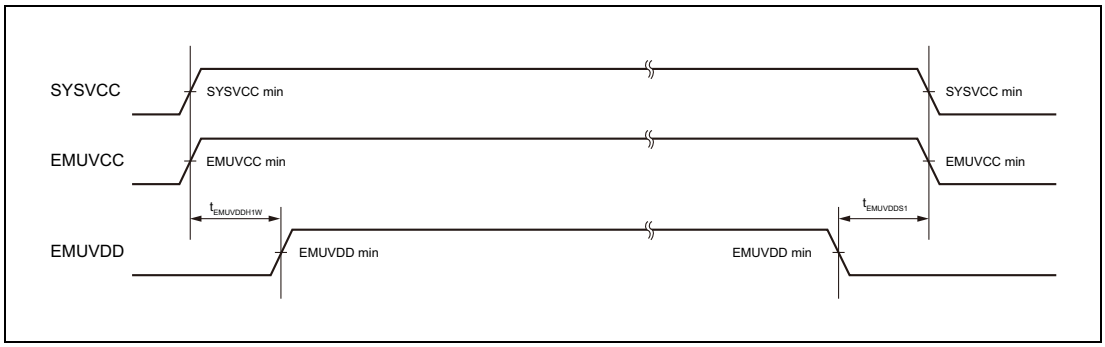

Figure 55.18 EMUVCC, EMUVDD Power On / Off Timings

55.3.2.1 Power Up Sequencing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**

Table 55.32 Power Up Sequencing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Runtime from release of $\overline{\text{RESET}}$ to start of instruction fetch					1.5 + t_{BIST}*1	ms

Note 1. t_{BIST} means BIST run time. Refer to **Table 44.490, BIST scenario selection at the next System Reset 2** on **Section 44.6.2.41, BSEQ0SEL — BIST Scenario Select Register** for details. Note that the given BIST run time is the typical value and the tolerance of the corresponding clock needs to be taken into account for the maximum value.

55.3.3 Standby Transition/Return Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**

Table 55.33 DeepSTOP Transition/Return Timing In case of VDD External Supply

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Wake-up trigger to PWRCTL delay time	$t_{DPWRCTL}$				100	µs
VDD hold time	t_{HDD}		0			µs
VDD power-on start time	t_{PDD}		0			µs

55.3.4 Clock Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.34 Clock Output Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Clock output period time	t_{CLKOUT}		41.6			ns
Clock output high level width	t_{WCOH}		t_{CLKOUT} / 2 – 10			ns
Clock output low level width	t_{WCOL}		t_{CLKOUT} / 2 – 10			ns

Note 1. There is a function to output the internal clock via EXTCLKnO pin.

NOTE

For base clock, refer to related **Section 13, Clock Controller**.

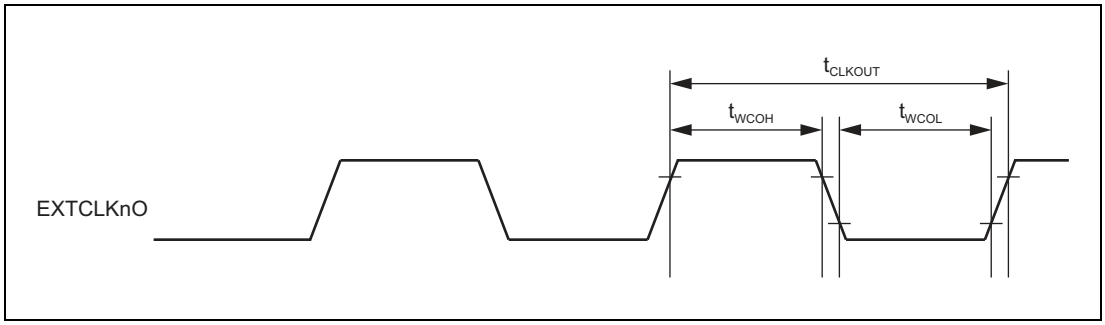

Figure 55.19 Clock Output Timing

55.3.5 Output Slew Rate

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.35 Output Slew Rate

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Output rise and fall time	t_{KRP11}/t_{KFP11}	Drive strength = 1 20% to 80%	CL = 100 pF			6.7	ns
	t_{KRP12}/t_{KFP12}	Drive strength = 2 20% to 80%	CL = 30 pF			4.0	ns
			CL = 50 pF			6.7	ns
			CL = 100 pF			13.4	ns
	t_{KRP13}/t_{KFP13}	Drive strength = 3 20% to 80%	CL = 30p F			6.7	ns
			CL = 50 pF			11.1	ns
			CL = 100 pF			21.0	ns
	t_{KRP14}/t_{KFP14}	Drive strength = 4 20% to 80%	CL = 30 pF			13.5	ns
			CL = 50 pF			22.5	ns
			CL = 100 pF			45.0	ns
	t_{KRP15}/t_{KFP15}	Drive strength = 5 20% to 80%	CL = 30 pF			27.0	ns
			CL = 50 pF			45.0	ns
			CL = 100 pF			90.0	ns

55.3.6 Control Signal Timing

55.3.6.1 $\overline{\text{RESET}}$ Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.36 $\overline{\text{RESET}}$ Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width	t_{WRSL}*1		800			µs
$\overline{\text{RESET}}$ pulse rejection width*2	t_{WRRJ}		400		2400	ns

Note 1. t_{WRSL} is the minimum required time to complete the reset state generated by an external reset signal. When an external reset signal is input that is shorter than this time, the reset state will continue even after the external reset release. This microcontroller is completely reset after completion of the reset state. An external reset request is accepted with a reset input width of more than the maximum time of t_{WRRJ}. When the reset pulse width is less than the minimum value of the reset noise rejection width, the reset request is not accepted. When the reset signal is input during DeepSTOP mode, the reset state will continue during the wait time set by PWRGD_CNT even when the external reset signal is released.

Note 2. Input pulses between min. and max. value result in an undefined signal condition (i.e. pulses might be filtered out or not). This characteristic is not tested in production.

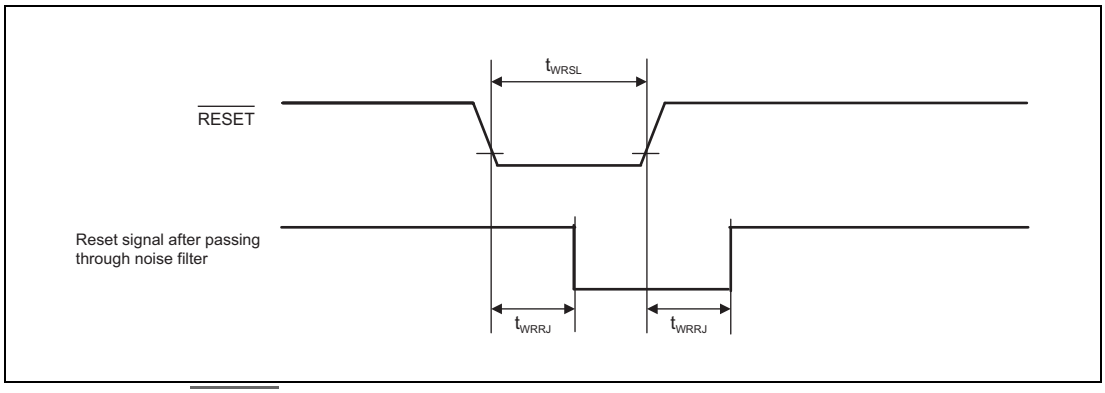

Figure 55.20 $\overline{\text{RESET}}$ Timing

55.3.6.2 Interrupt, Wake-up and Error Input Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.37 Interrupt Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high level width	t_{WNIH}	*3	600			ns
		*4	20			µs
NMI input low level width	t_{WNIL}	*3	600			ns
		*4	20			µs
NMI pulse rejection width*2	t_{WNIRJ}		100		600	ns
INTPn input high level width	t_{WITH}	*3	600			ns
		*4	20			µs
INTPn input low level width	t_{WITL}	*3	600			ns
		*4	20			µs
INTPn pulse rejection width*2	t_{WIRJ}		100		600	ns
RLIN3nRX wake-up input high level width	t_{WRLINH}		(S + 1) x 1/fs*1			ns
RLIN3nRX wake-up input low level width	t_{WRLINL}		(S + 1) x 1/fs*1			ns
RLIN3nRX wake-up pulse rejection width*2	$t_{WRLINRJ}$		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
CANnRX wake-up input high level width	t_{WCANH}		(S + 1) x 1/fs*1			ns
CANnRX wake-up input low level width	t_{WCANL}		(S + 1) x 1/fs*1			ns
CANnRX wake-up pulse rejection width*2	t_{WCANRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
FLXnRXDA wake-up input high level width	t_{WFLXH}		(S + 1) x 1/fs*1			ns
FLXnRXDA wake-up input low level width	t_{WFLXL}		(S + 1) x 1/fs*1			ns
FLXnRXDA wake-up pulse rejection width*2	t_{WFLXRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
$\overline{\text{ERRORINn}}$ wake-up input high level width	t_{WERRH}		(S + 1) x 1/fs*1			ns
$\overline{\text{ERRORINn}}$ wake-up input low level width	t_{WERRL}		(S + 1) x 1/fs*1			ns
$\overline{\text{ERRORINn}}$ wake-up pulse rejection width*2	t_{WERRRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns

Note 1. S: Number of sampling times
fs: The value given by following formula

$$fs = \frac{f_{DNFCK}}{PRS}$$

f_{DNFCK}: frequency of CLK_LSB
PRS: 1, 2, 4, 8, … , 128

Note 2. Input pulses between min. and max. value result in an undefined signal condition (i.e. pulses might be filtered out or not). This characteristic is not tested in production.

Note 3. Edge Detection or Level Detection (CLKA_LPS is operated by CLK_HSIOSC/20)

Note 4. Level Detection (CLKA_LPS is operated by CLK_LSIOSC)

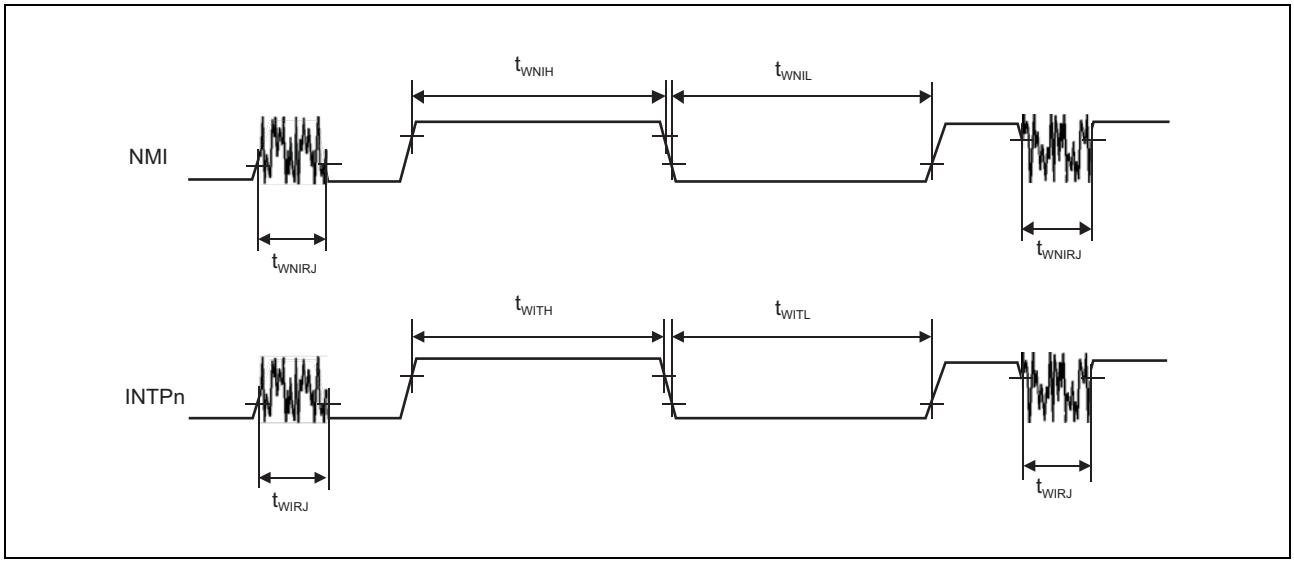

Figure 55.21 Interrupt, wake-up and error input timing

55.3.6.3 Mode Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.38 Mode Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0, FLMD1, FLMD2, MODE0 input high level width	t_{WMDH}		600			ns
FLMD0, FLMD1, FLMD2, MODE0 input low level width	t_{WMDL}		600			ns
FLMD0, FLMD1, FLMD2, MODE0 pulse rejection width*1	t_{WMDRJ}		100		600	ns

Note 1. Input pulses between min. and max. value result in an undefined signal condition (i.e. pulses might be filtered out or not). This characteristic is not tested in production.

NOTE

Switching of FLMD0 after rising edge of $\overline{\text{RESET}}$ is prohibited except for serial programming mode.

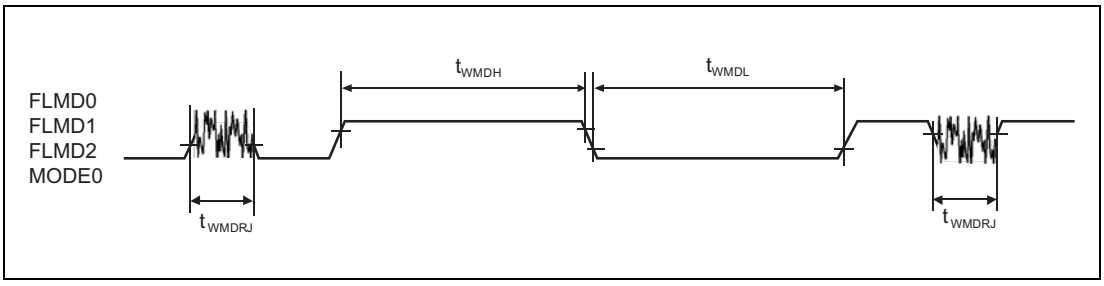

Figure 55.22 Mode Timing

55.3.6.4 ADTRG Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.39 ADCJnTRGm Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ADCJnTRGm input high level width	t_{WADH}		(S + 1) x 1/fs*1			ns
ADCJnTRGm input low level width	t_{WADL}		(S + 1) x 1/fs*1			ns
ADCJnTRGm pulse rejection width*2	t_{WADRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns

Note 1. S: Number of sampling times
fs: The value given by the following formula

$$fs = \frac{f_{DNFCK}}{PRS}$$

f_{DNFCK}: frequency of CLK_ADC, CLKA_ADC
PRS: 1, 2, 4, 8, … , 128

Note 2. Input pulses between min. and max. value result in an undefined signal condition (i.e. pulses might be filtered out or not). This characteristic is not tested in production.

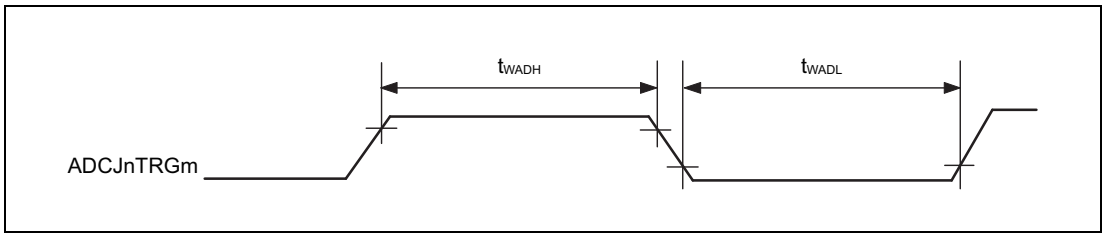

Figure 55.23 ADCJnTRGm Timing

55.3.6.5 Communication Signal Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.40 Control Signal

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SENTnRX input high level width	$t_{WSENTIH}$	Analog filter	600			ns
		Digital filter	(S + 1) x 1/fs*1			ns
SENTnRX input low level width	$t_{WSENTIL}$	Analog filter	600			ns
		Digital filter	(S + 1) x 1/fs*1			ns
SENTnRX pulse rejection width	$t_{WSENTIRJ}$	Analog filter	100		600	ns
		Digital filter	(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
PSI5nRX input high level width*2	$t_{WPSI5IH}$	Analog filter	600			ns
		Digital filter	(S + 1) x 1/fs*1			ns
PSI5nRX input low level width	$t_{WPSI5IL}$	Analog filter	600			ns
		Digital filter	(S + 1) x 1/fs*1			ns
PSI5nRX pulse rejection width*2	$t_{WPSI5IRJ}$	Analog filter	100		600	ns
		Digital filter	(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns

Note 1. S: Number of sampling times
fs: The value given by the following formula

$$fs = \frac{f_{DNFCK}}{PRS}$$

f_{DNFCK}: frequency of CLK_HSB
PRS: 1, 2, 4, 8, … , 128

Note 2. Input pulses between min. and max. value result in an undefined signal condition (i.e. pulses might be filtered out or not). This characteristic is not tested in production.

55.3.7 Low Power Sampler (DPIN input) Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Drive strength = 4 (SELDP2-0)

Table 55.41 Low Power Sampler Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time	t_{DSDDI}				150	ns

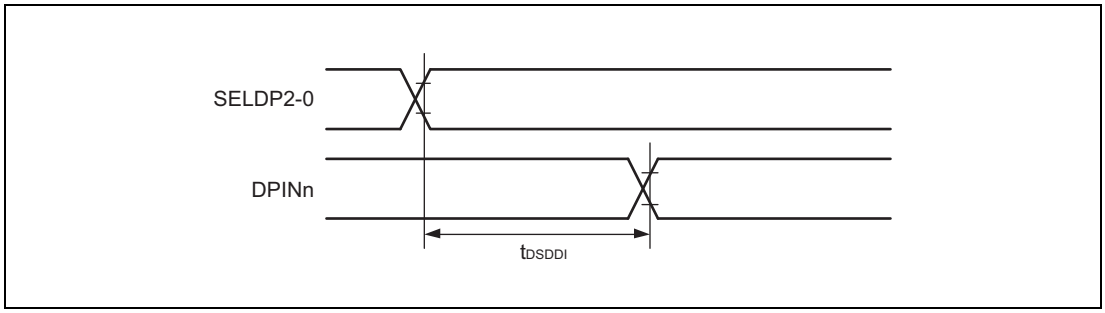

Figure 55.24 Low Power Sampler Timing

55.3.8 SFMA Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Drive strength = 2
- Buffer type = Sch1

Table 55.42 SFMA Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SFMA0CLK clock cycle	$t_{SFMAcyc}$		25			ns
SFMA0CLK high pulse width	t_{SFMAWH}		0.4 × $t_{SFMA0cyc}$		0.6 × $t_{SFMA0cyc}$	ns
SFMA0CLK low pulse width	t_{SFMAWL}		0.4 × $t_{SFMA0cyc}$		0.6 × $t_{SFMA0cyc}$	ns
Data input setup time	$t_{SFMADIS}$		9.0			ns
Data input hold time	t_{SFMDIH}		0.0			ns
SFMA0SSL setup time	t_{SFMASS}		1 × $t_{SFMA0cyc}$ – 12.5		8 × $t_{SFMA0cyc}$	ns
SFMA0SSL hold time	t_{SFMASH}		1.5 × $t_{SFMA0cyc}$		8.5 × $t_{SFMA0cyc}$ + 12.5	ns
Continuous transfer delay time	$t_{SFMACTD}$		1 × $t_{SFMA0cyc}$		8 × $t_{SFMA0cyc}$	ns
Data output delay time	$t_{SFMADOD}$				6.6	ns
Data output hold time	$t_{SFMADOH}$		–4.6			ns
Data output buffer on time	$t_{SFMADBON}$				6.6	ns

55.3.10.2 MSPI Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Buffer type = Sch1

Table 55.45 MSPI Timing (Master mode : Communication Speed 10MHz)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MSPI operation clock cycle	$T_{MSPInCLK}$		12.5			ns
MSPInSCK cycle*1*5	T_{SCKCYC}		100			ns
MSPInSCK Low/High width*1	T_{SCKWID}	CL = 30 pF Drive strength = 3	0.5 × T_{SCKCYC} – 9			ns
		CL = 50 pF Drive strength = 3	0.5 × T_{SCKCYC} – 12			ns
		CL = 100 pF Drive strength = 3	0.5 × T_{SCKCYC} – 23			ns
		CL = 30 pF Drive strength = 4	0.5 × T_{SCKCYC} – 15.5			ns
		CL = 50 pF Drive strength = 2	0.5 × T_{SCKCYC} – 10			ns
		CL = 100 pF Drive strength = 1*4	0.5 × T_{SCKCYC} – 10			ns
Chip select signal setup time*2*6	T_{MCSSU}	$T_{MSPInCLK}$ = 12.5 ns	MSPInSEUPm [11:0] x $T_{MSPInCLK}$ - 15			ns
Chip select signal hold time*3	T_{MCSHO}	$T_{MSPInCLK}$ = 12.5 ns	MSPInHOLDm [11:0] x $T_{MSPInCLK}$ - 5			ns
Receive data setup time (MSPInSAMP =0)	T_{MSISU1}		20			ns
Receive data setup time (MSPInSAMP =1)	T_{MSISU2}		20			ns
Receive data hold time (MSPInSAMP =0)	T_{MSIHO}		0			ns
Receive data hold time (MSPInSAMP =1)	T_{MSIHO}		0			ns
Transmit data delay time	T_{MSODL}				7	ns
Transmit data hold time	T_{MSOHL}		(T_{SCKCYC} / 2) – 5			ns

Note 1. This item is programmable, the value can be set by MSPInPRCSm[1:0] and MSPInCDIVm[4:0].
Note 2. This item is programmable, the value can be set by MSPInSEUPm[11:0] and it must be set to 002_H or above.
Note 3. This item is programmable, the value can be set by MSPInHOLDm.
Note 4. The selection of "Drive strength = 1" is available on P2_0 and P22_4 only.
Note 5. Use by “PCLK/2 ≥ MSPInSCK”.
Note 6. When using the MSPI at master mode with the setting MSPInCFGm1.MSPInCPHAm = 0, set the period from CS active to the first edge of SCK to 1/2 or more of the communication rate by MSPInSEUPm.

Table 55.46 MSPI Timing (Master mode : Communication Speed 20MHz)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MSPI operation clock cycle	$T_{MSPInCLK}$		12.5			ns
MSPInSCK cycle*1*4	T_{SCKCYC}		50			ns
MSPInSCK Low/High width*1	T_{SCKWID}	CL = 15pF@50Ω Drive strength = 3	0.5 × T_{SCKCYC} – 6			ns
Chip select signal setup time*2*5	T_{MCSSU}	$T_{MSPInCLK}$ = 12.5 ns	MSPInSEUPm [11:0] x $T_{MSPInCLK}$ – 15			ns
Chip select signal hold time*3	T_{MCSHO}	$T_{MSPInCLK}$ = 12.5 ns	MSPInHOLDm [11:0] x $T_{MSPInCLK}$ – 5			ns
Receive data setup time (MSPInSAMP = 1)	T_{MSISU2}		20			ns
Receive data hold time (MSPInSAMP = 1)	T_{MSIHO}		0			ns
Transmit data delay time	T_{MSODL}				7	ns
Transmit data hold time	T_{MSOHL}		(T_{SCKCYC}/2) – 5			ns

Note 1. This item is programmable, the value can be set by MSPInPRCSm[1:0] and MSPInCDIVm[4:0].
Note 2. This item is programmable, the value can be set by MSPInSEUPm[11:0] and it must be set to 002_H or above.
Note 3. This item is programmable, the value can be set by MSPInHOLDm.
Note 4. Use by “PCLK/2 ≥ MSPInSCK”.
Note 5. When using the MSPI at master mode with the setting MSPInCFGm1.MSPInCPHAm = 0, set the period from CS active to the first edge of SCK to 1/2 or more of the communication rate by MSPInSEUPm.

Table 55.47 MSPI Timing (Master mode : Communication Speed 40MHz)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MSPI operation clock cycle	$T_{MSPInCLK}$		12.5			ns
MSPInSCK cycle*1*4	T_{SCKCYC}		25			ns
MSPInSCK Low/High width*1	T_{SCKWID}	CL = 15pF@LVDS	0.5 × T_{SCKCYC} – 2.5			ns
Chip select signal setup time*2*5	T_{MCSSU}	$T_{MSPInCLK}$ = 12.5 ns	MSPInSEUPm [11:0] x $T_{MSPInCLK}$ – 15			ns
Chip select signal hold time*3	T_{MCSHO}	$T_{MSPInCLK}$ = 12.5 ns	MSPInHOLDm [11:0] x $T_{MSPInCLK}$ – 5			ns
Receive data setup time (MSPInSAMP = 1)	T_{MSISU2}		7			ns
Receive data hold time (MSPInSAMP = 1)	T_{MSIHO}		0			ns
Transmit data delay time	T_{MSODL}				5	ns
Transmit data hold time	T_{MSOHL}		(T_{SCKCYC}/2) – 5			ns

Note 1. This item is programmable, the value can be set by MSPInPRCSm[1:0] and MSPInCDIVm[4:0].
Note 2. This item is programmable, the value can be set by MSPInSEUPm[11:0] and it must be set to 002_H or above.
Note 3. This item is programmable, the value can be set by MSPInHOLDm.
Note 4. Use by “PCLK/2 ≥ MSPInSCK”.
Note 5. When using the MSPI at master mode with the setting MSPInCFGm1.MSPInCPHAm = 0, set the period from CS active to the first edge of SCK to 1/2 or more of the communication rate by MSPInSEUPm.

Table 55.48 MSPI Timing (Slave mode : Communication Speed 10MHz)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MSPI operation clock cycle	$T_{MSPInCLK}$		12.5			ns
MSPInSCK cycle	T_{SCKCYC}		100			ns
MSPInSCK Low/High width	T_{SCKWID}		$0.5 \times T_{SCKCYC} - 23$			ns
Chip select signal setup time (MSPInCSIE = 1)	T_{SCSSU}		15			ns

55.3.11 SCI3 Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Buffer type = Sch1

Table 55.51 SCI3 Timing (Master Mode, Asynchronous)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate	r_{SCI3AS}				10	Mbps

Table 55.52 SCI3 Timing (Master Mode, Synchronous)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output cycle time	$t_{SCI3Scyc}$		200			ns
Output clock pulse width	t_{SCI3SW}		0.4 × $t_{SCI3Scyc}$		0.6 × $t_{SCI3Scyc}$	ns
Transmit data delay time	$t_{SCI3TXD}$		–40		40	ns
Receive data setup time	$t_{SCI3RXS}$		4 × t_{PCLK}			ns
Receive data hold time	$t_{SCI3RXH}$		4 × t_{PCLK}			ns

Note: t_{PCLK} is the period of PCLK (CLK_HSB).

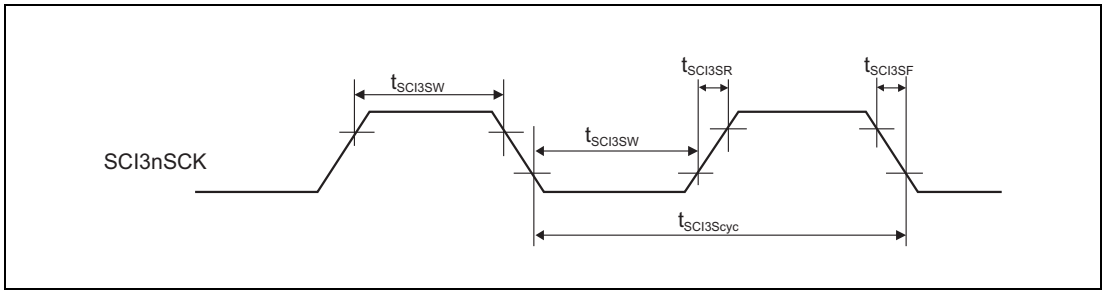

Figure 55.35 SCI Clock Input/Output Timing

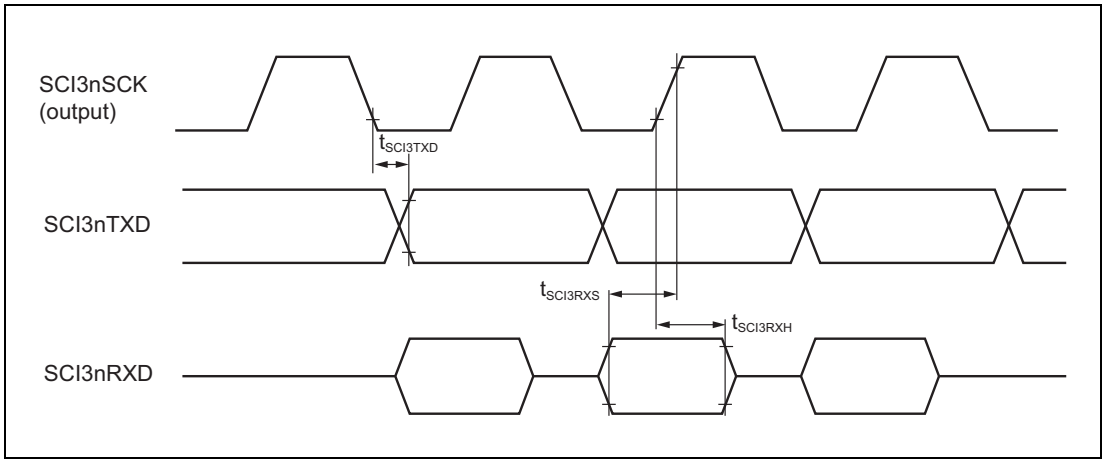

Figure 55.36 SCI3 Input/Output Timing, Clock Synchronous Mode (in Master Mode)

Table 55.53 SCI3 Timing (Slave Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input cycle time	$t_{SCI3Scyc}$		200			ns
Input clock pulse width	t_{SCI3SW}		0.4 × $t_{SCI3Scyc}$		0.6 × $t_{SCI3Scyc}$	ns
Transmit data delay time*1	$t_{SCI3TXD}$		2 × t_{PCLK}		50 + 4 × t_{PCLK}	ns
Input clock rising time	t_{SCI3SR}				20	ns
Input clock falling time	t_{SCI3SF}				20	ns
Receive data setup time	$t_{SCI3RXS}$		4 × t_{PCLK}			ns
Receive data hold time	$t_{SCI3RXH}$		4 × t_{PCLK}			ns

Note 1. This does not apply to transmission of Data 0 (the first bit) which is transferred not in continuous transfer mode. Transmission of Data 0 (the first bit) which is transferred not in continuous transfer mode starts when TDRE becomes 0.

Note: t_{PCLK} is the period of PCLK (CLK_HSB).

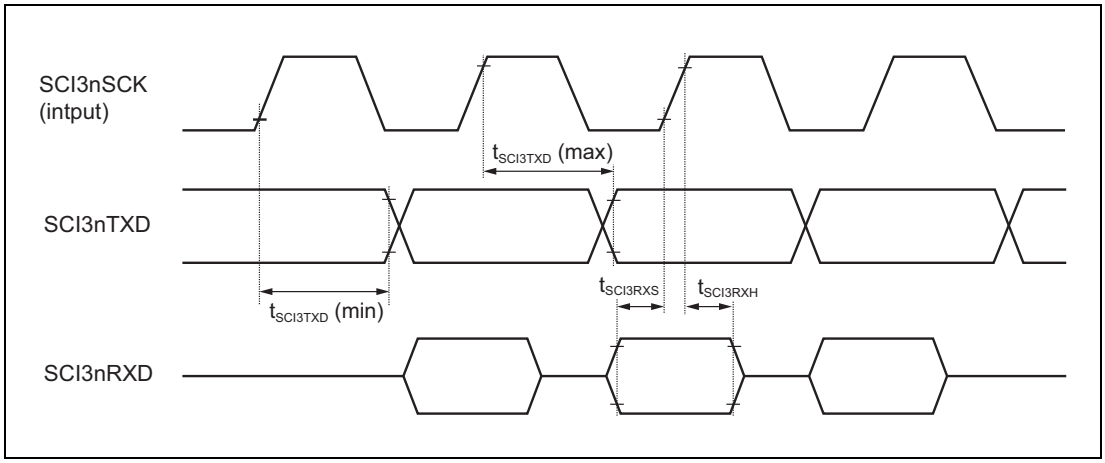

Figure 55.37 SCI3 Input/Output Timing, Clock Synchronous Mode (in Slave Mode)

55.3.12 RLIN3 Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Drive strength = 4
- Buffer type = Sch1

Table 55.54 RLIN3 Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate	r_{RLin}	LIN mode			20	kbps
	r_{RLine}	LIN extended baud rate*1			115.2	kbps
	r_{RLurt}	UART mode			8	Mbps

Note 1. The LIN extended baud rate is not part of the LIN standard specification.

55.3.13 RIIC Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Buffer type = Sch1

Table 55.55 RIIC Timing (Normal Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				100	kHz
Bus free time (between stop/start condition)	t_{BUF}		4.7			µs
Hold time[*1]	t_{HD}: STA		4.0			µs
RIICnSCL clock low level width	t_{LOW}		4.7			µs
RIICnSCL clock high level time	t_{HIGH}		4.0			µs
Setup time for start/restart condition	t_{SU}: STA		4.7			µs
Data hold time	t_{HD}: DAT	CBUS compatible master	5.0			µs
		I^2C mode	0[*2]		[*3]	µs
Data setup time	t_{SU}: DAT		250			ns
Stop condition setup time	t_{SU}: STO		4.0			µs

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 3. If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Table 55.56 RIIC Timing (Fast Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				400	kHz
Bus free time (between stop/start condition)	t_{BUF}		1.3			µs
Hold time[*1]	t_{HD}: STA		0.6			µs
RIICnSCL clock low level width	t_{LOW}		1.3			µs
RIICnSCL clock high level time	t_{HIGH}		0.6			µs
Setup time for start/restart condition	t_{SU}: STA		0.6			µs
Data hold time	t_{HD}: DAT	I^2C mode	0[*2]		[*5]	µs
Data setup time	t_{SU}: DAT		100[*3]			ns
Stop condition setup time	t_{SU}: STO		0.6			µs
Pulse width with spike suppressed by input filter	t_{SP}		0		[*4]	ns

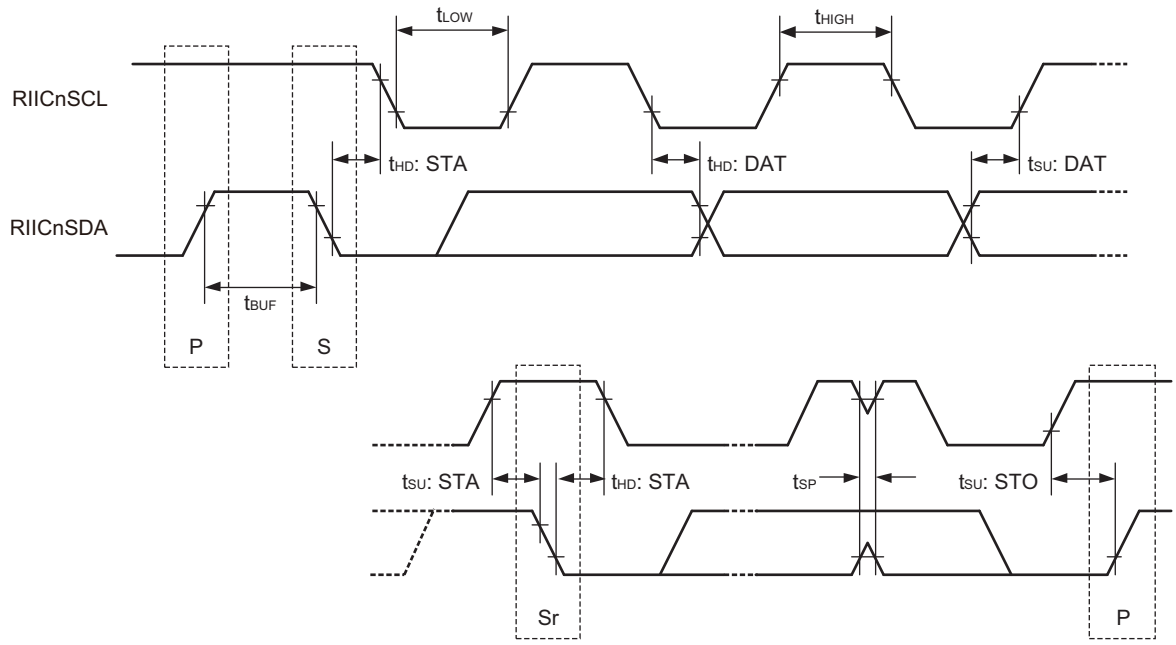
Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 3. The fast mode I^2C bus can be used in normal mode I^2C bus system. In this case, set the fast mode I^2C bus so that it meets the following conditions.
- If the system does not extend the RIICnSCL signal's low state hold time: t_{SU}: DAT ≥ 250 ns
- If the system extends the RIICnSCL signal's low state hold time:
Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line (1250 ns: Normal mode I^2C bus specification).

Note 4. The filtered width is specified by the frequency of IICΦ and the value of RIICnMR3.NF[1:0].

Note 5. If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.



Note
P: Stop condition S: Start condition Sr: Restart condition

Figure 55.38 RIIC Timing

55.3.14 RS-CANFD Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Buffer type = Sch1

Table 55.57 RS-CANFD Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate	r_{CN1}	Classical CAN mode			1	Mbps
	r_{CN2}	CAN FD mode (nominal bit rate)			1	Mbps
	r_{CN3}	CAN FD mode (data bit rate)			8	Mbps
Internal delay time	t_{DCIN}	$t_{INPUT} + t_{OUTPUT}$			50	ns

Note 1. For the configuration of the transfer speed, see **Section 23.5.1.3, Baud Rate**.

Required loop back delay time (from CXP1nTX to CXP1nRX)	t_{pwm_loop}				0.05 × Tbit	µs

Table 55.64 CXPI Timing (CXPI-PWM Mode, Slave node)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CXPI transfer rate	r_{CXPI}				20	kbps
CXPI cycle time	Tbit		50			µs
CXP1nTX output delay time (from CXP1nRX)	$t_{tx\_0\_pd}$		4 × t_{PCLK} *1		511 × t_{PCLK} + 4 × t_{PCLK} + 0.1 *1,*2	µs
Required loop back delay time (from CXP1nTX to CXP1nRX)	t_{pwm_loop}				0.05 × Tbit	µs

Note 1. t_{PCLK} is period of CLK_HSB

Note 2. "511 × t_{PCLK}" means maximum surge noise filter time. For details, see **Section 30.4.1.6, CXP1nFIL — CXPI Input Filter Setting Register**

Table 55.65 CXPI Timing (CXPI-NRZ Mode, Master or Slave node)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CXPI transfer rate	r_{CXPI}				20	kbps
CXPI cycle time	Tbit		50			µs
Required loop back delay time (from CXP1nTX to CXP1nRX)	t_{nrz_loop}		1 × Tbit		4 × Tbit	µs

55.3.19 Ethernet Timing

55.3.19.1 MII Characteristics

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- CL = 15 pF
- Buffer type = TTL

Table 55.66 Ethernet Timing – 10 Mbit/s MII Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ETNBnTXCLK width	t_{MTC}		400 – 100 ppm	400	400 + 100 ppm	ns
ETNBnTXCLK high width	t_{MTCH}	*1	140	200	260	ns
ETNBnTXCLK low width	t_{MTCL}	*1	140	200	260	ns
ETNBnTXD [3:0] delay time	t_{MTXD}		0		25	ns
ETNBnTXEN delay time	t_{MTXE}		0		25	ns
ETNBnRXCLK width	t_{MRC}		400 – 100 ppm	400	400 + 100 ppm	ns
ETNBnRXCLK high width	t_{MRCH}	*1	140	200	260	ns
ETNBnRXCLK low width	t_{MRCL}	*1	140	200	260	ns
ETNBnRXD [3:0] setup time	t_{MRXDS}		10			ns
ETNBnRXD [3:0] hold time	t_{MRXDH}		10			ns
ETNBnRXDV, ETNBnRXER setup time	t_{MRDES}		10			ns
ETNBnRXDV, ETNBnRXER hold time	t_{MRDEH}		10			ns
ETNBnWOL delay time	t_{MWOL}		1		30	ns

Note 1. The duty cycle of ETNBnTXCLK and ETNBnRXCLK shall be between 35 to 65% (IEEE802.3).

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Cload = 15 pF
- Drive strength = 2
- Buffer type = TTL

Table 55.67 Ethernet Timing – 100 Mbit/s MII Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ETNBnTXCLK width	t_{MTC}		40 – 100 ppm	40	40 + 100 ppm	ns
ETNBnTXCLK high width	t_{MTCH}	*1	14	20	26	ns
ETNBnTXCLK low width	t_{MTCL}	*1	14	20	26	ns
ETNBnTXD [3:0] delay time	t_{MTXD}		0		25	ns
ETNBnTXEN delay time	t_{MTXE}		0		25	ns
ETNBnRXCLK width	t_{MRC}		40 – 100 ppm	40	40 + 100 ppm	ns
ETNBnRXCLK high width	t_{MRCH}	*1	14	20	26	ns
ETNBnRXCLK low width	t_{MRCL}	*1	14	20	26	ns
ETNBnRXD [3:0] setup time	t_{MRXDS}		10			ns
ETNBnRXD [3:0] hold time	t_{MRXDH}		10			ns
ETNBnRXDV, ETNBnRXER setup time	t_{MRDES}		10			ns
ETNBnRXDV, ETNBnRXER hold time	t_{MRDEH}		10			ns
ETNBnWOL delay time	t_{MWOL}		1		30	ns

Note 1. The duty cycle of ETNBnTXCLK and ETNBnRXCLK shall be between 35 to 65% (IEEE802.3).

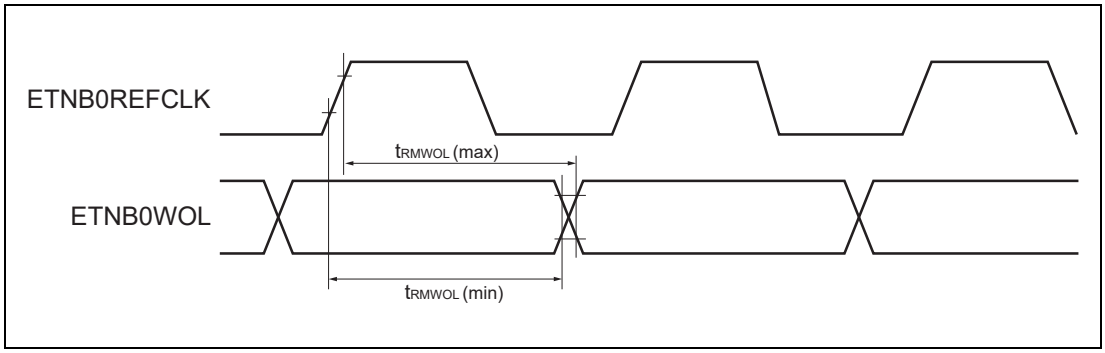

Figure 55.51 Ethernet Timing – RMII WOL

55.3.19.3 SGMII Characteristics

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.69 Ethernet Timing – SGMII REFCK Characteristics

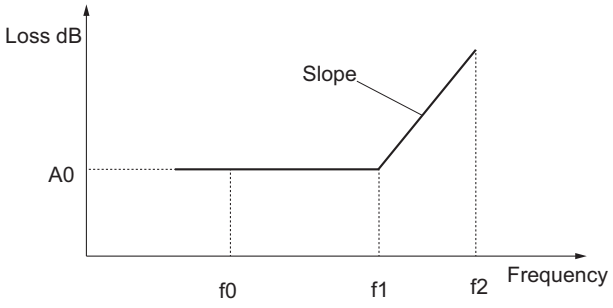
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Clock input frequency	t_{CIF}		40 – 100ppm		40 + 100 ppm	ns
Clock input duty cycle	t_{CIDC}		45		55	%
Clock input rising/falling time (20%-80%)	t_{CIRFT}				3	ns
Clock Input Total jitter (Dj+ 14* rms Random jitter)	t_{CITJ}				73*1	ps peak to peak

Note 1. 12 kHz to 20 MHz rms jittrer = 3 ps.

Table 55.70 Ethernet Timing – SGMII Tx buffer Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Signaling speed	t_{SS}		1.25 – 100 ppm		1.25 + 100 ppm	GBd
Total output jitter (Dj+14*rms random jitter)	t_{TOJ}				300	ps peak to peak
VOD rise/fall time (20% - 80%)	t_{VRFT}		60		250	ps
Differential output return loss (min)	DORL				*1	dB

Note 1. See the **Figure 55.52, Differential output return loss** for details of differential output return loss.



Parameter value		Unit
A0	-8	dB
f0	50	MHz
f1	0.625	GHz
f2	1.25	GHz
Slope	10	dB/dec

Figure 55.52 Differential output return loss

Table 55.71 Ethernet Timing – SGMII Rx buffer Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Signaling speed	t_{SS}		1.25 – 100 ppm		1.25 + 100 ppm	GBd
Total input jitter tolerance*2 (Dj+14*rms random jitter)	t_{TIJT}				400	ps peak to peak
setup/hold time*1, *3	t_{SHT}		120			ps

Note 1. Measured at 50% of the transition

Note 2. Only supported by RH850/U2A

Note 3. Only supported by RH850/U2A-EVA

Table 55.72 Ethernet Timing – Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SGMII power stabilization time	t_{SPST}				1.2	ms

55.3.19.4 Management Interface

Timing of management interface (ETNBnMDC and ETNBnMDIO) depends on software. It is necessary to adjust wait time according to AC specification of PHY.

55.3.20 PSI5 Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Drive strength = 4

Table 55.73 PSI5 Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bit time		125 kbps (Low speed)	7.6	8.0	8.4	µs
		189 kbps (High speed)	5.0	5.3	5.6	µs
		250 kbps (PAS compatibility)	3.8	4.0	4.2	µs
Gap time		125 kbps (Low speed)	8.4			µs
		189 kbps (High speed)	5.6			µs
		250 kbps (PAS compatibility)	2.0			µs

55.3.21 PSI5-S Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.74 PSI5-S Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
PSI5-S transfer rate	r_{PSI5S1}	PSI5-S mode			5.33	Mbps
	r_{PSI5S2}	UART mode			5.33	Mbps
Output clock cycle	$t_{PSIScyc}$	PSI5-S mode	37.5			ns
Output clock pulse width	$t_{PSISCKW}$	PSI5-S mode	0.3 x $t_{PSIScyc}$		0.5 x $t_{PSIScyc}$	ns

55.3.22 Timer Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.75 Timer Input Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TAUDnIm input high level width	t_{WTDIH}		(S + 1) x 1/fs*1			ns
TAUDnIm input low level width	t_{WTDIL}		(S + 1) x 1/fs*1			ns
TAUDnIm pulse rejection width*2	t_{WTDRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
TAUJnIm input high level width	t_{WTJIH}	Analog noise filter	600*3			ns
		Digital noise filter	(S + 1) x 1/fs*1			ns
TAUJnIm input low level width	t_{WTJIL}	Analog noise filter	600*3			ns
		Digital noise filter	(S + 1) x 1/fs*1			ns
TAUJnIm pulse rejection width*2	t_{WTJRJ}	Analog noise filter	100		600*3	ns
		Digital noise filter	(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
TAPAnESO input high level width*4	t_{WTPIH}	Analog noise filter	600			ns
		Digital noise filter	(S + 1) x 1/fs*1			ns
TAPAnESO input low level width*4	t_{WTPIL}	Analog noise filter	600			ns
		Digital noise filter	(S + 1) x 1/fs*1			ns
TAPAnESO pulse rejection width*2, *4	t_{WTPRJ}	Analog noise filter	100		600	ns
		Digital noise filter	(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
ENCAnTINm input high level width	t_{WENIH}		(S + 1) x 1/fs*1			ns
ENCAnTINm input low level width	t_{WENIL}		(S + 1) x 1/fs*1			ns
ENCAnTINm pulse rejection width*2	t_{WENRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns
TSG3nPTSIm/ENCAnEx, TSG3nCLKI high level width	t_{WTGIH}		(S + 1) x 1/fs*1			ns
TSG3nPTSIm/ENCAnEx, TSG3nCLKI low level width	t_{WTGIL}		(S + 1) x 1/fs*1			ns
TSG3nPTSIm/ENCAnEx, TSG3nCLKI pulse rejection width*2	t_{WTGRJ}		(S – 1) x 1/fs*1		(S + 1) x 1/fs*1	ns

Note 1. S: Number of sampling times
fs: The value given by the following formula

$$fs = \frac{f_{DNFCK}}{PRS}$$

f_{DNFCK}: frequency of CLKA_TAUJ (for TAUJ2 and TAUJ3), CLK_HSB (others)
PRS: 1, 2, 4, 8, … , 128

Note 2. Input pulse shorter than the given min. value will be filtered out. Input pulses between min. and max. value result in an undefined signal condition (i.e. pulses might be filtered or not.
This characteristic is not tested in production.

Note 3. When CLK_LSIOSC is selected by CLKA_TAUJ register, at least one clock period of CLK_LSIOSC (4.6 µs) is required for activation of input signal for that domain. Any input pulses with less than 4.6 µs width may be rejected.

Note 4. By-pass of filter is possible. For details, see **Section 2.7.2.10, ANF/DNF Type F1**.

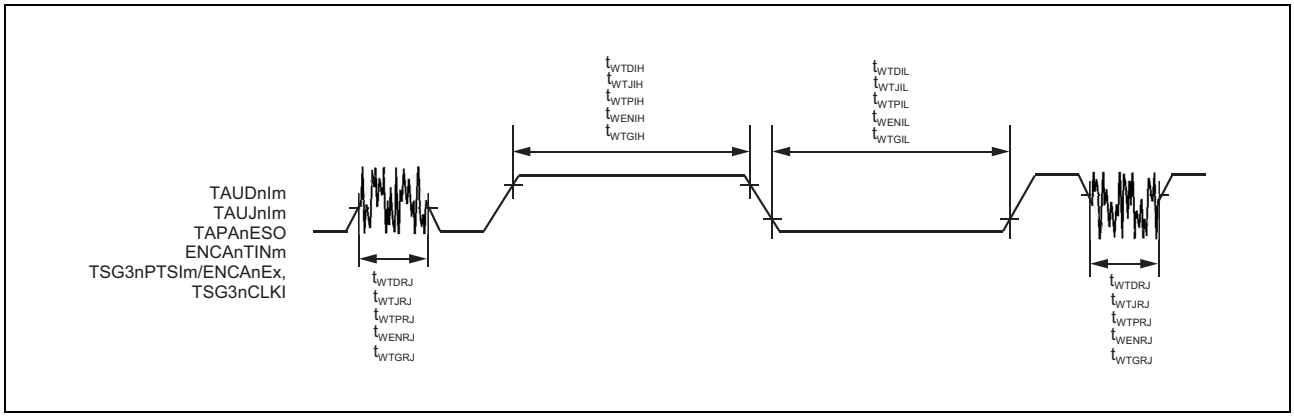


Figure 55.53 Timer Input Timing

55.3.23 GTM Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.76 GTM Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
GTM input high level width	t_{WGTIH}		4 × Tsamp*1			ns
GTM input low level width	t_{WGTIL}		4 × Tsamp*1			ns
GTM output cycle time	t_{CYGTO}		4 × Tsamp*1			ns
GTMECLKn output cycle	$t_{CYGTECLK}$		8 × Tsamp*1			ns
GTMECLKn output high level width	t_{WGTOH}		4 × Tsamp*1 – 10			ns
GTMECLKn output low level width	t_{WGTOL}		4 × Tsamp*1 – 10			ns

Note 1. Tsamp = $1/f_{CLK\_UHSB}$

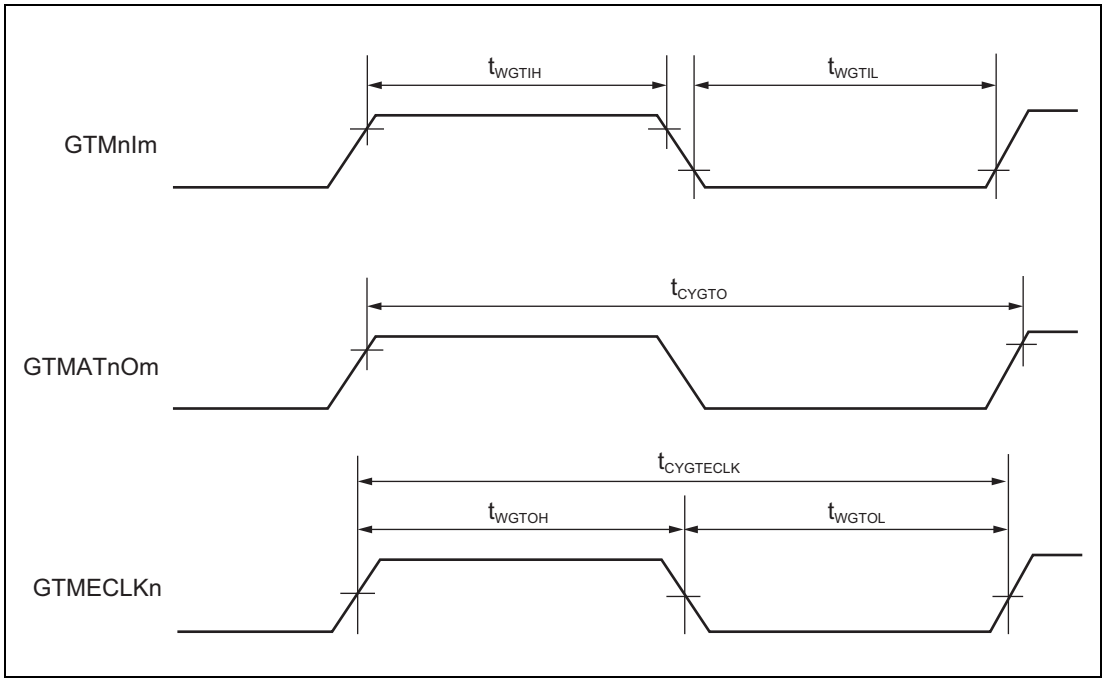

Figure 55.54 GTM Timing

55.3.24 Emergency shut-Off (ESO) Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.77 ESO Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
GTMATnOx Hi-z delay time	t_{DESO}				50	ns

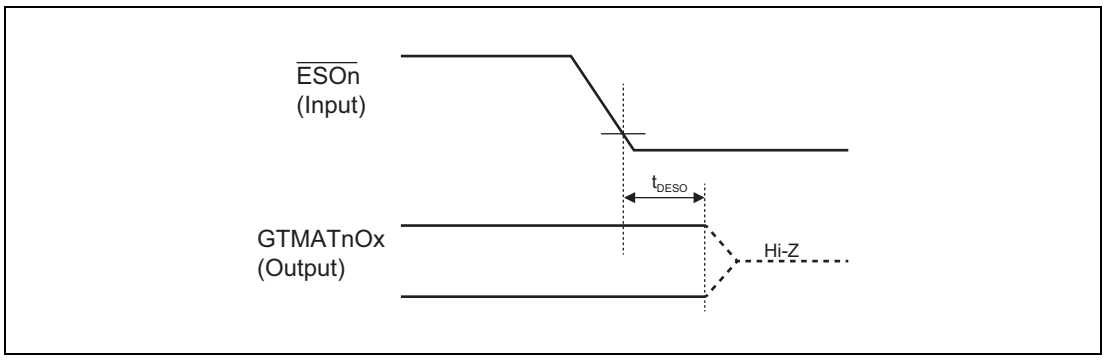

Figure 55.55 ESO Timing

55.3.25 Debug Reset Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.78 Debug Reset Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{TRST}}$ input low level width	t_{WTRL}		600			ns
$\overline{\text{TRST}}$ pulse rejection*1	t_{WTRRJ}		100		600	ns
$\overline{\text{AURORES1}}$, $\overline{\text{AURORES2}}$, $\overline{\text{AURORESPD}}$ input low level width	t_{WARSL}		600			ns
$\overline{\text{AURORES1}}$, $\overline{\text{AURORES2}}$, $\overline{\text{AURORESPD}}$ pulse rejection width*1	t_{WARRJ}		100		600	ns
$\overline{\text{ERAMRESPD}}$, $\overline{\text{ERAMRES2}}$ input low level width	t_{WERSL}		600			ns
$\overline{\text{ERAMRESPD}}$, $\overline{\text{ERAMRES2}}$ pulse rejection width*1	t_{WERRJ}		100		600	ns

Note 1. Input pulses shorter than the given min. value will be filtered out (resulting in no interrupt detected). Input pulses between min. and max. value result in an undefined interrupt signal condition (i.e. pulses might be filtered out or not).

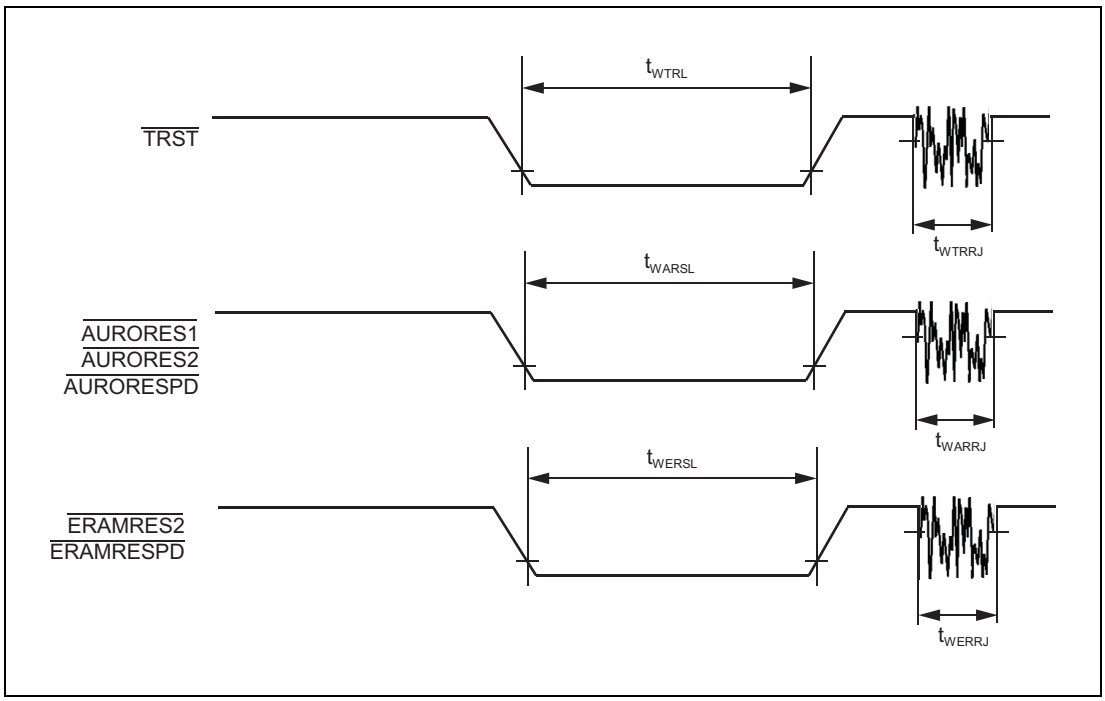

Figure 55.56 Debug Reset Timing

55.3.26 Nexus Interface Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Buffer type = TTL

Table 55.79 Nexus Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TCK Cycle width	t_{TCKW}		50			ns
TCK high level width	t_{TCKWH}		21			ns
TCK low level width	t_{TCKWL}		21			ns
TMS/TDI setup time	t_{TISU}		6			ns
TMS/TDI hold time	t_{TIH}		6			ns
TDO output delay time	t_{TDOD}				17	ns
$\overline{RDY}$ delay time	t_{RDYD}				17	ns
TCK/$\overline{TRST}$/TMS/TDI input rising time	t_{TIR}				4	ns
TCK/$\overline{TRST}$/TMS/TDI input falling time	t_{TIF}				4	ns

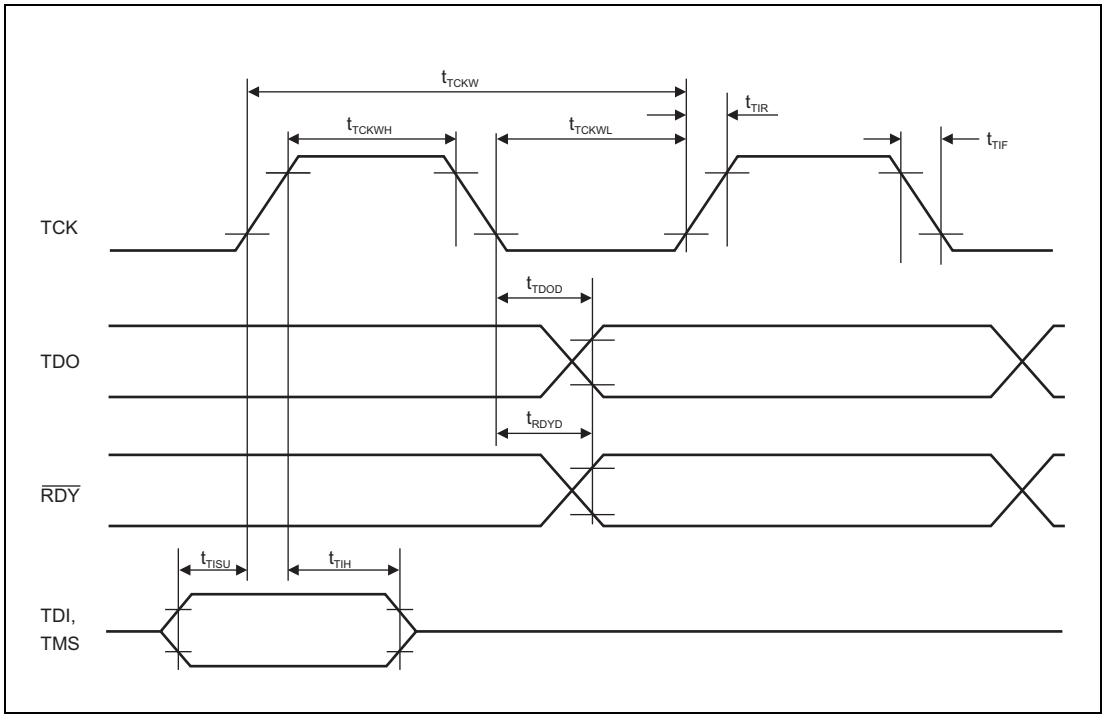

Figure 55.57 Nexus Interface Timing

55.3.27 LPD (4pin) Interface Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.80 LPD (4pin) Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LPDCLK cycle time	$t_{LPDCKCYC}$		25			ns
LPDCLK high/low level width	t_{LPDCKW}		4.5			ns
LPDCLK input rising/falling time	$t_{LPDCKRF}$				8	ns
LPDI setup time	t_{LPDSU}		3			ns
LPDI hold time	t_{LPDH}		3			ns
LPDCLKO cycle time	$t_{LPDCKOCYC}$		25			ns
LPDCLKO high/low level width	$t_{LPDCKOW}$		t_{LPDCKW} - 2			ns
LPDCLK to LPDCLKO delay time	$t_{LPDCKOD}$				44	ns
LPDO output delay	t_{LPDOD}		0		18	ns

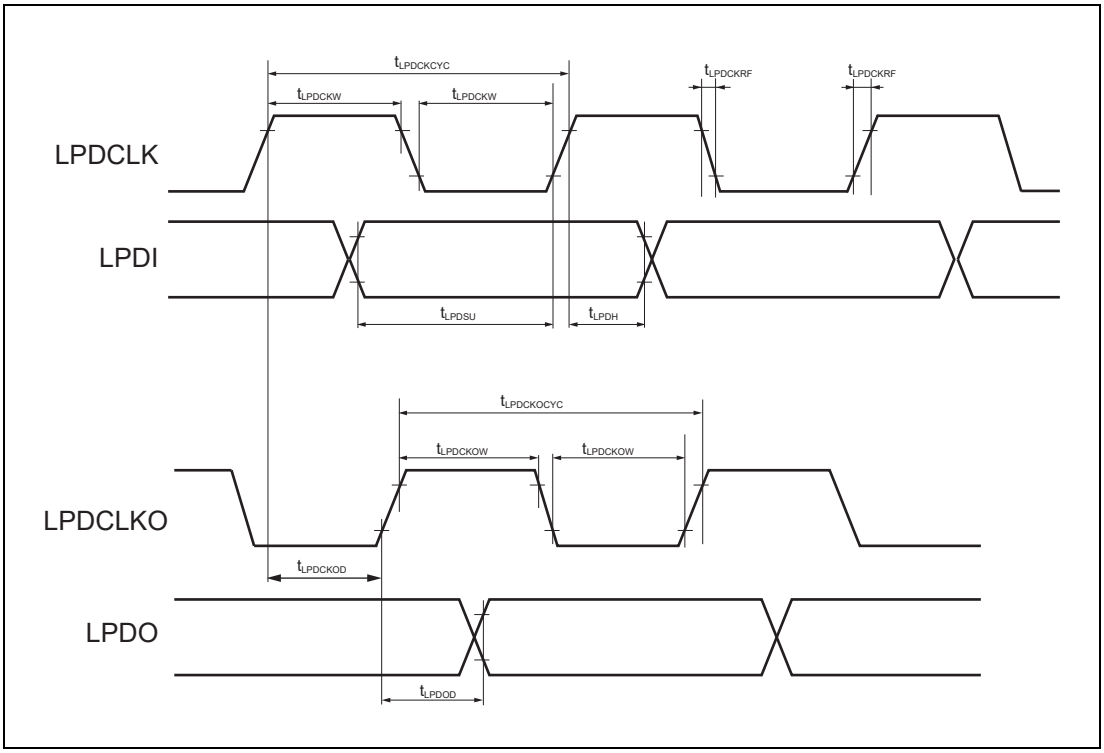

Figure 55.58 LPD (4pin) Interface Timing

55.3.28 AUDR Interface Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- CL = 10 pF
- Drive strength = 2
- Buffer type = SHMT1 ($\overline{\text{AUDRST}}$), TTL (Others)

Table 55.81 AUDR Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
AUDCK cycle time	$t_{AUCKcyc}$		20			ns
AUDCK high level width	t_{AUCKH}		0.4 x $t_{AUCKcyc}$			ns
AUDCK low level width	t_{AUCKL}		0.4 x $t_{AUCKcyc}$			ns
$\overline{\text{AUDRST}}$ setup time	t_{AURSTS}		12			ns
$\overline{\text{AUDRST}}$ pulse width	t_{AURSTW}		5 x $t_{AUCKcyc}$			ns
$\overline{\text{AUDSYNC}}$ setup time	t_{AUSYS}		10			ns
$\overline{\text{AUDSYNC}}$ hold time	t_{AUSYH}		5			ns
AUDATA input setup time	t_{AUDTS}		8			ns
AUDATA input hold time	t_{AUDTH}		5			ns
AUDATA output delay	t_{AUDTD}				$t_{AUCKcyc}$ – 3.4	ns

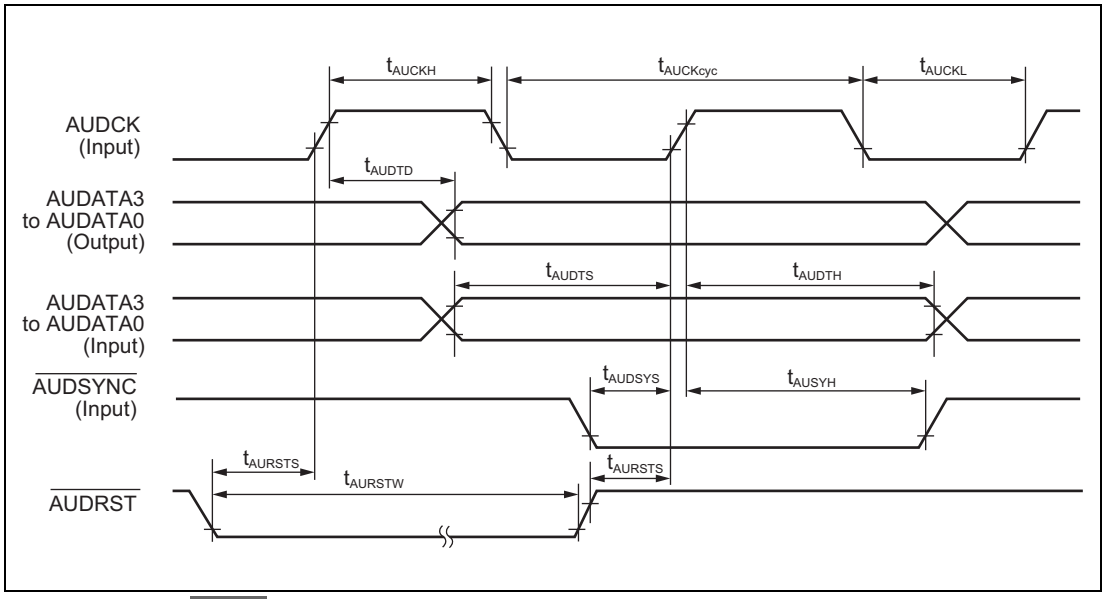

Figure 55.59 $\overline{\text{AUDR}}$ Interface Timing

55.3.29 Aurora Interface Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

55.3.29.1 Aurora Interface — 1.25 Gbps baud rate

Table 55.82 Aurora Interface Operating Condition – 1.25Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Rise/Fall Time	t_{AITRF}	*1	60			ps
Deterministic jitter	t_{AIDJ}				0.17	UI
Total jitter	t_{AITJ}				0.35	UI
Output skew	t_{AIOS}	*2			25	ps
Multiple output skew	t_{AIMOS}	*3			1000	ps
Unit interval	t_{AIUI}		800 - 100 ppm		800 +100 ppm	ps

Note 1. At driver output.
Note 2. Skew at transmitter output between the differential pair.
Note 3. Skew at transmitter output between lanes of a multi-lane channel.

55.3.29.2 Aurora Interface — 2.5 Gbps baud rate

Table 55.83 Aurora Interface Operating Condition – 2.5Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Rise/Fall Time	t_{AITRF}	*1	40			ps
Deterministic jitter	t_{AIDJ}				0.17	UI
Total jitter	t_{AITJ}				0.35	UI
Output skew	t_{AIOS}	*2			20	ps
Multiple output skew	t_{AIMOS}	*3			1000	ps
Unit interval	t_{AIUI}		400 - 100 ppm		400 + 100 ppm	ps

Note 1. At driver output.
Note 2. Skew at transmitter output between the differential pair.
Note 3. Skew at transmitter output between lanes of a multi-lane channel.

55.3.29.3 Aurora Interface — 3.125 Gbps baud rate

Table 55.84 Aurora Interface Operating Condition – 3.125Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Rise / Fall Time	t_{AITRF}	*1	30			ps
Deterministic jitter	t_{AIDJ}				0.17	UI
Total jitter	t_{AITJ}				0.35	UI
Output skew	t_{AIOS}	*2			15	ps
Multiple output skew	t_{AIMOS}	*3			1000	ps
Unit interval	t_{AIUI}		320 -100 ppm		320 + 100 ppm	ps

Note 1. At driver output.
Note 2. Skew at transmitter output between the differential pair.
Note 3. Skew at transmitter output between lanes of a multi-lane channel.

55.3.29.4 Aurora Interface — 5 Gbps baud rate

Table 55.85 Aurora Interface Operating Condition – 5Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Rise/Fall Time	t_{AITRF}	*1	30			ps
Deterministic jitter	t_{AIDJ}				0.25	UI
Total jitter	t_{AITJ}				0.35	UI
Output skew	t_{AIOS}	*2			15	ps
Multiple output skew	t_{AIMOS}	*3			1000	ps
Unit interval	t_{AIUI}		200 - 100 ppm		200 + 100 ppm	ps

Note 1. At driver output.
Note 2. Skew at transmitter output between the differential pair.
Note 3. Skew at transmitter output between lanes of a multi-lane channel.

55.3.29.5 Aurora Interface — 6.25 Gbps baud rate

Table 55.86 Aurora Interface Operating Condition – 6.25Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Rise / Fall Time	t_{AITRF}	*1	30			ps
Deterministic jitter	t_{AIDJ}				0.25	UI
Total jitter	t_{AITJ}				0.35	UI
Output skew	t_{AIOS}	*2			15	ps
Multiple output skew	t_{AIMOS}	*3			1000	ps
Unit interval	t_{AIUI}		160 - 100 ppm		160 +100 ppm	ps

Note 1. At driver output.
Note 2. Skew at transmitter output between the differential pair.
Note 3. Skew at transmitter output between lanes of a multi-lane channel.

55.3.29.6 Aurora Interface — Transmitter clock Timing

Table 55.87 Aurora Interface Transmitter clock timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Reference clock frequency	f_{AICLK}	1.25 Gbps baud rate		62.5		MHz
		2.5 Gbps baud rate		125		MHz
		3.125 Gbps baud rate		156.25		MHz
		5 Gbps baud rate		125		MHz
		6.25 Gbps baud rate		156.25		MHz
Reference clock rise time	t_{AICTR}			200	400	ps
Reference clock fall time	t_{AICTF}			200	400	ps
Reference clock duty cycle			45		55	%
Reference clock total jitter	t_{AICTJ}	*1			40*2	ps
Stability	$t_{AICSTAB}$				50	ppm

Note 1. Peak to peak.

Note 2. Phase noise of CICREF[P/N] should be below the line of **Figure 55.60**.

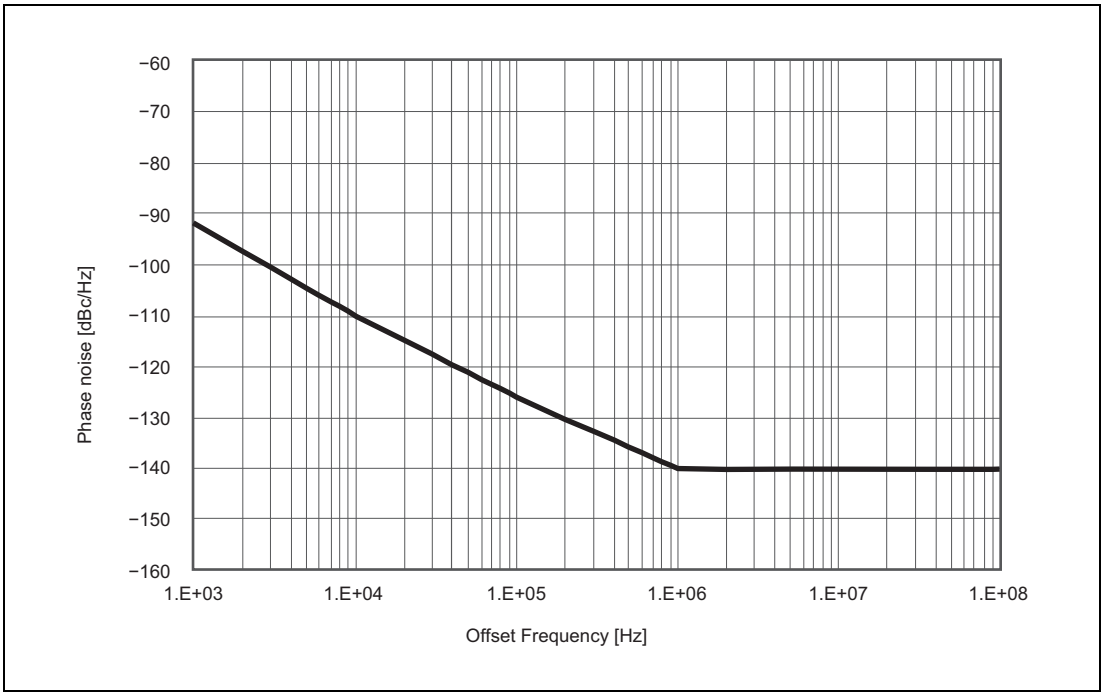

Figure 55.60 Phase noise of CICREF[P/N]

55.3.30 Debug Resource (Aurora, ERAM) Specific Reset Timing

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.

Table 55.88 Debug Resource (Aurora, ERAM) Specific Reset Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{AURORES2}}$ release timing delay	t_{DART2R}		0		400	ns
$\overline{\text{AURORES2}}$ inactive hold time	t_{HART2R}		2.4			µs
$\overline{\text{AURORES2}}$ setup time	t_{SART2P}		2.4			µs
$\overline{\text{ERAMRES2}}$ release timing delay	t_{DERT2R}		0		400	ns
$\overline{\text{ERAMRES2}}$ inactive hold time	t_{HERT2R}		2.4			µs
$\overline{\text{ERAMRES2}}$ assert setup time	t_{SERT2P}		2.4			µs
$\overline{\text{AURORES1}}$, $\overline{\text{AURORESPD}}$ release timing delay	$t_{DART2AVD}$		2.4			µs
$\overline{\text{AURORES1}}$, $\overline{\text{AURORESPD}}$ inactive hold time	$t_{SART2AVD}$		2.4			µs
$\overline{\text{ERAMRESPD}}$ release timing delay	$t_{DERT2EVD}$		2.4			µs
$\overline{\text{ERAMRESPD}}$ inactive hold time	$t_{SERT2EVD}$		2.4			µs

Secondary power supply voltage monitor absolute error*2		for E0VCC, VCC		–16		16	LSB
		for AWOVDD, ISOVDD		–10		10	LSB
Pull-up resistor for wiring break detection	R_{PU}	ADCJnIm pins	VIAN = AnVSS	10		34	kΩ
			VIAN = AnVCC/2	5		22	kΩ
			VIAN = AnVCC	3		16	kΩ
		ADCJnImS pins	VIAN = AnVSS	10		34	kΩ
			VIAN = EnVCC/2	5		22	kΩ
			VIAN = EnVCC	3		16	kΩ
Pull-down resistor for wiring break detection	R_{PD}	ADCJnIm pins	VIAN = AnVSS	1.5		10	kΩ
			VIAN = AnVCC/2	5		19	kΩ
			VIAN = AnVCC	10		34	kΩ
		ADCJnImS pins	VIAN = AnVSS	1.5		10	kΩ
			VIAN = EnVCC/2	5		19	kΩ
			VIAN = EnVCC	10		34	kΩ

Note 1. Quantization error is not included.

Note 2. Error of only voltage monitor.

Note 3. Include oscillation accuracy of HS IntOSC.

Note 4. For details of t_{SPL} and t_{SAR}, see **Section 43.4.24, Analog Input Sampling and Scan Group Processing Time**.

CAUTION

An analog input pin can also be used as a digital general-purpose input or output pin.

Changes in a digital input or output at the analog input pin during an AD conversion may reduce the precision of conversion.

The coupling noise from the changes in digital inputs or outputs of pins near the analog input pin during an AD conversion may also reduce the precision of conversion.

The power supply noise from the changes in digital outputs of pins of the same power supply as the analog input or the ADC that are performing AD conversion may also reduce the precision of conversion.

55.4.1 Sampling Errors in the External Circuit of the A/D Converter

Sampling error is error to which “Errors (Sampling error 1) which depend on input leakage current of analog pin” and “Errors (Sampling error 2) which depend on conversion cycles with charge sharing” were added.

$$Sampling\ error\ =\ Sampling\ error\ 1\ +\ Sampling\ error\ 2$$

The external circuits of the A/D pins which become the factor of sampling error (sampling error 1 and sampling error 2) are shown below.

(a) Errors (Sampling error 1) which depend on input leakage current of analog pin

The error depends on the input leakage current (ILeak) of analog pin and external resistance (Re), and occurs.

The error which depends on the input leakage current is given by the formula of the following.

$$Sampling\ error\ 1\ (LSB)\ =\ Re \times ILeak \times \frac{4096}{V_{avrefh}}$$

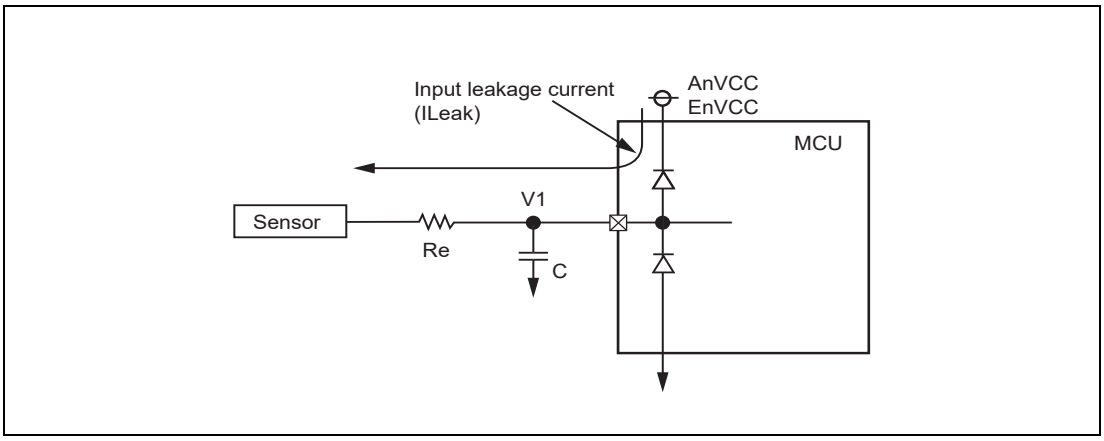

Figure 55.72 Errors (Sampling error 1) which Depend on Input Leakage Current of Analog Pin

(b) Errors (Sampling error 2) which depend on conversion cycles with charge sharing

A formula for errors in sampled values due to the external circuit of the A/D converter is given below. These errors will depend on the input circuit and conversion cycle. The formula given below for the errors is simplified for the calculation of sampling error based on internal stray capacitance, amplifier offset, resistance of the signal source, and conversion cycle. This formula can also be used to calculate the effects of the signal source resistance and conversion cycle on these errors.

The formula gives the error of analog input 2 as shown in the figure below when A/D conversion is performed in the order of analog input 1 then 2.

$$Sampling\ error\ 2\ (LSB) = \left[\left(\frac{|V2 - V1| \times CIN1}{Ce + CIN1} + \frac{|V_{vfaerr}| \times CIN2}{Ce + CIN2}\right) \times \frac{1}{1 - e^{(-T1)/(Re \times Ce)}} + \left(\frac{1}{T1} \times C1 \times V3 \times Re\right)\right] \times \frac{4096}{V_{avrefh}}$$

Table 55.95 Definition of the symbols for the Sampling Error Formula

Item	Symbol	Condition	Reference	Unit
Common capacitance of the final stage of channel multiplexer	CIN1	ADCJ0Im	1.5	pF
		ADCJ0ImS	5.2	pF
		ADCJ1Im	1.5	pF
		ADCJ1ImS	6.6	pF
		ADCJ2Im	1.5	pF
		ADCJ2ImS	5.2	pF
Common capacitance of the final stage of the amplifier and T&H control circuit	CIN2	ADCJ0Im, ADCJ0ImS	9.1	pF
		ADCJ1Im, ADCJ1ImS	9.1	pF
		ADCJ2Im, ADCJ2ImS	8.0	pF
External capacitor on analog input pin	Ce		Depends on customer's environment	µF
Signal source impedance	Re			kΩ
Conversions cycle of analog Input pins	T1			ms
AnVREFH voltage	Vavrefh			V
Potential difference between V1 and V2	V2-V1			V
Offset voltage of the amplifier and T&H control circuit	Vvfaerr		50	mV
Parasitic capacitance in the channel multiplexer	C1	ADCJnIm	2	pF
		ADCJnImS	4	
|AnVCC voltage / 2.5 - measured pin voltage (V2)|	V3		Depends on customer's environment	V

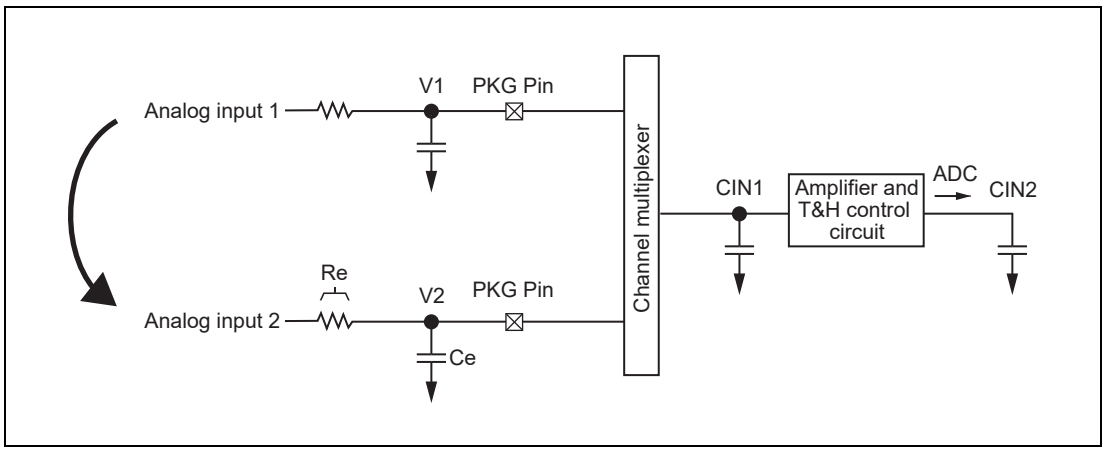

Figure 55.73 Schematic for Sampling Error 2 Formula

Values for conversion error calculated by using this formula do not include error (absolute error, etc.) specified in the A/D converter characteristics.

This formula is a desktop formula and is theoretical. When the signal source has an extremely high resistance or when the conversion cycle is too short, calculated and measured values may differ. Actual error depends on the external capacitor, external resistor, capacitance and resistance of board wiring, so evaluate and verify the error on the user board is no greater than the value produced by this formula (Condition of this formula is "Re < 1.5 MΩ and T1 ≥ 10 µs", or "1.5 MΩ ≤ Re ≤ 2 MΩ and T1 ≥ 512 µs").

55.5 Code Flash Characteristics

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Table 55.96 Code Flash Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{CLKFC} *1		8		40	MHz
Number of rewrites*2	CWRT	Data retention of 20 years*3	1000			times

Note 1. f_{CLKFC} is the frequency of CLK_LSB.

Note 2. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n”, the device can be erased “n” times for each block. For example, when a block of 64 KB is erased after 512 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 3. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Only the processing time of the hardware. The overhead required by the software is not included.

Table 55.97 Code Flash Programming Characteristics

Item	Symbol	Block size	Condition	8MHz ≤ f_{CLKFC} < 20 MHz			20MHz ≤ f_{CLKFC} < 40 MHz			f_{CLKFC} = 40 MHz			Unit
				MIN.	TYP.	MAX.	MIN.	TYP.	MAX.	MIN.	TYP.	MAX.	
Programming time		512 B	CWRT < 100 times		0.31	2.0		0.25	1.8		0.24	1.7	ms

55.6 Data Flash Characteristics

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Table 55.103 Data Flash Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{CLKFD} *1		8		40	MHz
Number of rewrites*2	DWRT	Data retention 20 years*3	125k			Times
		Data retention 3 years*3	250k			Times

Note 1. f_{CLKFD} is the frequency of CLK_LSB.

Note 2. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n”, the device can be erased “n” times for each block. For example, when a block of 4096 bytes is erased after 4 bytes of writing have been performed for different addresses 1024 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 3. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Conditions:

- See **Section 55.3.1, AC Characteristic Measurement Condition**.
- Only the processing time of the hardware. The overhead required by the software is not included.

Section 90 Long-Term System Counter (LTSC)

This section contains a generic description of the Long-Term System Counter (LTSC).
The first part in this section describes all RH850/U2A-EVA specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the LTSC.

90.1 Features LTSC for RH850/U2A-EVA

Long-Term System Counter (LTSC) is 64-bit counter that operates by long period. It enables the generation of a unique timestamp without overflow.

90.1.1 Number of Units and Channels

This microcontroller has the following number of LTSC units.

Table 90.1 Number of Units

Product Name	RH850/U2A-EVA (516 pins)	RH850/U2A16 (516 pins)	RH850/U2A16 (373 pins)	RH850/U2A16 (292 pins)	RH850/U2A8 (373 pins)	RH850/U2A8 (292 pins)	RH850/U2A6 (292 pins)	RH850/U2A6 (176 pins)	RH850/U2A6 (156 pins)	RH850/U2A6 (144 pins)
Number of Units	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)
Name	LTSCn									

LTSC is connected to PCLK. Neither compare nor interrupt functions.

Table 90.2 Index

Index	Description
n	Throughout this section, the individual LTSC units are identified by the index “n” (n = 0).

90.1.2 Register Base Address

LTSCn base addresses are listed in the following table.
LTSCn register addresses are given as offsets from the base addresses.

Table 90.3 Register Base Address

Base Address Name	Base Address	Bus Group
<LTSC0_base>	FFC7 8100_H	P-Bus Group 5

90.1.3 Clock Supply

Clock supply by and to LTSCn is listed in the following table.

Table 90.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
LTSCn	PCLK	CLK_HSB

For details of the clock, see **Section 13, Clock Controller**.

90.1.4 Interrupt Request and Error Notifications

LTSC does not support the interrupt request and error notifications.

90.1.5 Reset Sources

LTSCn reset sources are listed in the following table. LTSCn is initialized by these reset source.

Table 90.5 Reset Sources

Unit Name	Register Name	Reset condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
LTSCn	LTSCnRMSK	√	√	√	—	√	—	—
	Other Registers	√	√	√	√*1	√	—	—

Note 1. Reset for “Other Registers” is masked when LTSCnRM bit in LTSCnRMSK register is set to 1.

90.1.6 External Input/Output Pins

LTSC has no external pins

90.2 Overview

90.2.1 Functional overview

- 1×64-bit counter
- Free-run up counting
- Atomic read/write access to all registers
- No compare functions
- Clock sources: Peripheral Clock PCLK
- No interrupt functions
- No functions to start/stop multiple counter channels synchronously (Only 1channel)
- Anytime read access to counter registers
- Application reset (SW reset) can be masked. When masked, counter keeps running on reset occurrence and counter register will not be initialized.
- Stop control by Supervisor

90.2.2 Counter channels

Long-Term System Counter is composed of one 64-bit up-counter channel. This counter is not equipped with compare registers.

The counter register can be read at any time.

The CPU architecture supports 64-bit write access on the 32-bit peripheral bus. However, in case of individual 32-bit write accesses to 64-bit counter, the updated register value will be processed after write to the upper 32-bit register. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed to the lower 32 bits first, and then to the upper 32 bits.)

In case of reading the 64-bit counter value while the counter is running, the current 64-bit counter value will be captured first and read access will be performed on the captured value then. This is to avoid that the upper or lower 32-bit value changes between the two consecutive 32-bit read accesses.

90.2.3 Block Diagram

The following block diagram shows the main components of the Long-Term System Counter.

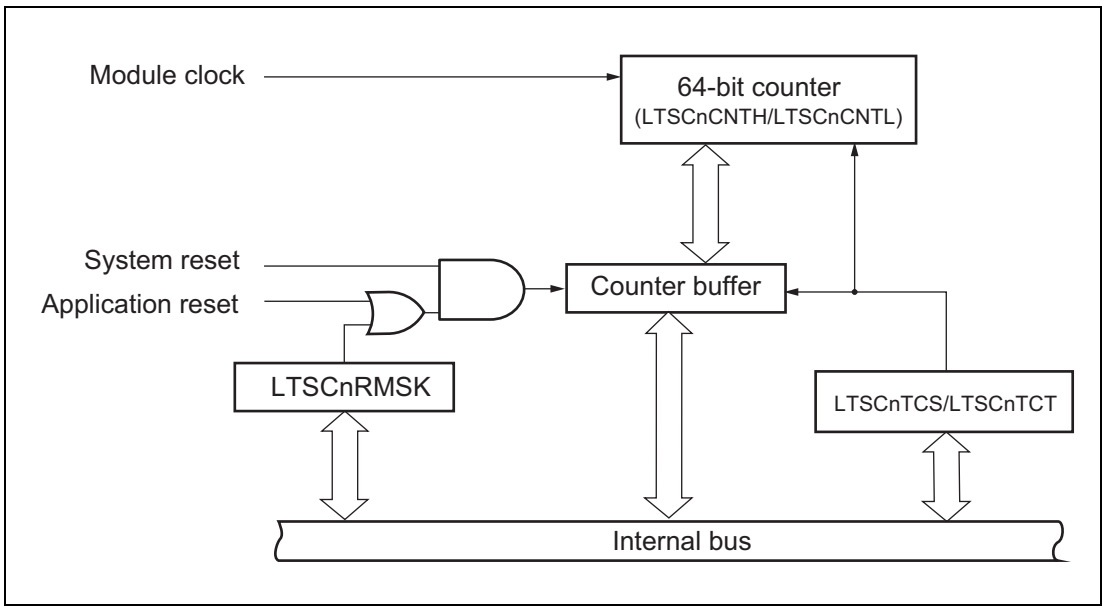

Figure 90.1 LTSC Block Diagram

90.3 Registers

This section contains a description of all registers of Long-Term System Counter.

90.3.1 List of Registers

LTSC registers are listed in the following table.

For details about <LTSCn_base>, see **Section 90.1.2, Register Base Address**.

Table 90.6 List of Registers

Module Name	Register Name	Symbol	Address	Access size	Access Protection	
					PBG	Other
LTSCn	LTSC Timer Counter Start Register	LTSCnTCS	<LTSCn_base>+0010$_H$	32/8	PBG50#6	—
	LTSC Timer Counter Stop Register	LTSCnTCT	<LTSCn_base>+0014$_H$	32/8	PBG50#6	—
	LTSC Timer Counter Status Register	LTSCnCSTR	<LTSCn_base>+0018$_H$	32/8	PBG50#6	—
	LTSC Timer SW Reset Mask Register	LTSCnRMSK	<LTSCn_base>+0034$_H$	32/8	PBG50#6	—
	LTSC Timer Counter Register L	LTSCnCNTL	<LTSCn_base>+0040$_H$	32	PBG50#6	—
	LTSC Timer Counter Register H	LTSCnCNTH	<LTSCn_base>+0044$_H$	32	PBG50#6	—

90.3.2 LTSCnTCS — LTSC timer counter start register

Access: This register is a write-only register that can be written in 32- or 8-bit units.

Address: <LTSCn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTSCnTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 90.7 LTSCnTCS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	LTSCnTS	This bit starts the counter channel. 0: No function 1: Starts the counter and sets LTSCnCSTR.LTSCnCST = 1. Setting this bit is ignored as long as LTSCnCSTR.LTSCnCST = 1.

NOTES

1. A reset from any source will initialize the bit unless the masking function has been selected in the LTSC SW reset mask register (LTSCnRMSK). If masking function is selected, the function related to register bits LTSCnTS is not affected by SW reset (Application Reset). Refer to **Section 90.4.4, Resets**.
2. LTSCnTCS is always read as $0000\ 0000_H$.

90.3.3 LTSCnTCT — LTSC timer counter stop register

Access: This register is a write-only register that can be written in 32- or 8-bit units.

Address: <LTSCn_base> + 0014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTSCnTT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 90.8 LTSCnTCT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	LTSCnTT	This bit stops the counter. 0: No function 1: Stops the counter and clears LTSCnCSTR.LTSCnCST bit. Setting this bit is ignored as long as LTSCnCSTR.LTSCnCST = 0.

NOTES

1. A reset from any source will initialize the bit unless the masking function has been selected in the LTSC SW reset mask register (LTSCnRMSK). If masking function is selected, the function related to register bits LTSCnTT is not affected by SW reset (Application Reset). Refer to **Section 90.4.4, Resets**.
2. LTSCnTCT is always read as $0000\ 0000_H$.

90.3.4 LTSCnCSTR — LTSC timer counter status register

Access: This register is a read-only register that can be read in 32- or 8-bit units.

Address: <LTSCn_base> + 0018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTSCn CST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 90.9 LTSCnCSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	LTSCnCST	This bit indicates whether the counter is enabled or disabled. 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to LTSCnTCS.LTSCnTS being set to 1. Setting LTSCnTCT.LTSCnTT to 1 re-sets this bit to 0.

NOTE

A reset from any source will initialize the bit unless the masking function has been selected in the LTSC SW reset mask register (LTSCnRMSK). If masking function is selected, the function related to register bits LTSCnCST is not affected by SW reset (Application Reset). Refer to **Section 90.4.4, Resets**.

90.3.5 LTSCnRMSK — LTSC timer SW reset mask register

Access: This register can be read or written in 32- or 8-bit units.

Address: <LTSCn_base> + 0034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTSCnRM
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 90.10 LTSCnRMSK Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LTSCnRM	This bit masks the SW reset (Application Reset). When SW reset is masked, it behaves as follows: • The counter continues counting up operation. SW reset occurrence has no impact on the counter operation and the counter value. • The count enable status will not be changed by SW reset; no stop trigger will be generated by occurrence of SW reset. All other LTSC registers will be reset independent whether masking was selected or not. 0: Reset mask disabled (LTSC responds to SW reset (Application Reset)) 1: Reset mask enabled (LTSC does not responds to SW reset (Application Reset))

NOTE

This register will be initialized by only System reset, while it will not be initialized by SW reset (Application Reset) even though LTSCnRM bit is set to 0. Refer to **Section 90.4.4, Resets**.

90.3.6 LTSCnCNTL — LTSC timer counter register low (lower 32-bit)

Access: This register can be read or written in 32-bit units.

Address: <LTSCn_base> + 0040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTSCnCNTL[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTSCnCNTL[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 90.11 LTSCnCNTL Register Contents

Bit Position	Bit Name	Function
31 to 0	LTSCnCNTL [31:0]	Lower 32-bit of 64-bit counter value

NOTES

1. A reset from any source will initialize the bits unless the masking function has been selected in the LTSC SW reset mask register (LTSCnRMSK) for this channel. If masking function is selected, the register contents will not be changed by SW reset (Application Reset). Refer to **Section 90.4.4, Resets**.
2. This register is part of a 64-bit register. The architecture supports 64-bit write access to the upper and lower register. However, in case of individual 32-bit write accesses the total 64-bit register value will become effective after the higher 32-bit value has been written to. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.).
3. Read access to counter registers is supported both while counter is running and stopped.
   In case of reading the 64-bit counter value while the counter is running, the current 64-bit counter value will be captured on read access to the lower 32-bit value. The captured upper 32-bit value can be read afterwards. This is to avoid that the upper or lower 32-bit value changes between the two consecutive 32-bit read accesses.
4. Write access is permitted only, while counter is stopped.

90.3.7 LTSCnCNTH — LTSC timer counter register high (upper 32-bit)

Access: This register can be read or written in 32-bit units.

Address: <LTSCn_base> + 0044_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTSCnCNTH[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTSCnCNTH[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 90.12 LTSCnCNTH Register Contents

Bit Position	Bit Name	Function
31 to 0	LTSCnCNTH [31:0]	Upper 32-bit of 64-bit counter value

NOTES

1. A reset from any source will initialize the bits unless the masking function has been selected in the LTSC SW reset mask register (LTSCnRMSK) for this channel. If masking function is selected, the register contents will not be changed by SW reset (Application Reset). Refer to **Section 90.4.4, Resets**.
2. This register is part of a 64-bit register. The architecture supports 64-bit write access to the upper and lower register. However, in case of individual 32-bit write accesses the total 64-bit register value will become effective after the higher 32-bit value has been written to. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.).
3. Read access to counter registers is supported both while counter is running and stopped.
   In case of reading the 64-bit counter value while the counter is running, the current 64-bit counter value will be captured on read access to the lower 32-bit value. The captured upper 32-bit value can be read afterwards. This is to avoid that the upper or lower 32-bit value changes between the two consecutive 32-bit read accesses.
4. Write access is permitted only, while counter is stopped.

90.4 Operation

LTSC is a 64-bit timer/counter that operates by PCLK based period. When the counter value reached to FFFFFFFF FFFFFFFF$_H$, it will change to 00000000 00000000$_H$ at the next cycle and it will continue to count. In case of writing to timer counter register low and high (LTSCnCNTL/H) while the counter is running, the value of these registers is not updated.

90.4.1 Start and Stop LTSC

The basic operation of start and stop for LTSC is shown as follows.

(1) Start the counter

LTSC counter starts from the current count value when LTSCnTCS.LTSCnTS bit is written to 1. When LTSCnTCS.LTSCnTS is written to 1 again while the counter is running, the counter operation is not affected.

(2) Stop the counter

LTSC counter stops when LTSCnTCT.LTSCnTT bit is written to 1. The counter value keeps the value when the counter stopped.

90.4.2 How to update the counter value

It is possible to start the counter from the unique value by setting timer counter register low and high in advance. The way to update the counter is shown as follows

1. Read LTSCnCSTR register to check the status of the counter. Write 1 to LTSCnTCT.LTSCnTT bit to stop the counter if the value of LTSCnCSTR.LTSCnCST bit is 1.
2. Write the update value to LTSCnCNTL and LTSCnCNTH register. Refer to "**Section 90.4.3, Access to register** " about the procedure of writing these registers.
3. Write 1 to LTSCnTCS.LTSCnTS to start the counter.

90.4.3 Access to register

The bit width of the counter register in LTSC is 64-bit. To those register, 64-bit access is supported and the 64-bit access will be divided into twice accesses of the 32-bit peripheral bus. In case of individual 32-bit write or read accesses to 64-bit counter registers of LTSC, the upper 32-bit register will be processed after the lower 32-bit register access. Writing access to a 64-bit register, the register value will be updated when the upper 32-bit register is processed while reading access to a 64-bit register, the value of the register at that moment will be read out.

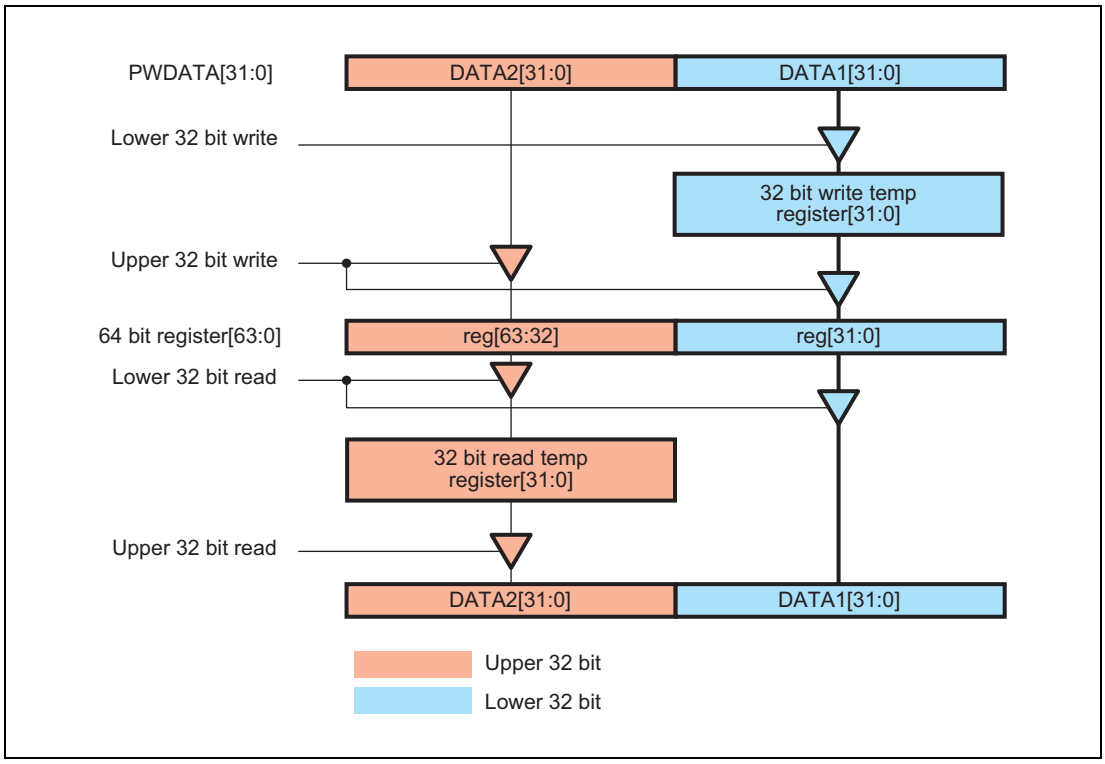

Figure 90.2 Timer counter register access sequence

90.4.4 Resets

There are Application reset and System reset for LTSC. To System reset, all of the LTSC registers will be initialized, to the Application reset, you can mask it or not. All the registers behave as shown in the below table upon the Application reset or System reset.

Table 90.13 Reset of LTSC registers

Registers or bits in LSTC		Application reset		System reset
		Masked (LTSCnRM =1)	UnMask (LTSCnRM =0)	
LTSCnTCS	LTSCnTS	KEPT	INIT	INIT
LTSCnTCT	LTSCnTT	KEPT	INIT	INIT
LTSCnCSTR	LTSCnCST	KEPT	INIT	INIT
LTSCnRMSK	LTSCnRM	KEPT	KEPT	INIT
LTSCnCNTL	LTSCnCNTL[31:0]	KEPT	INIT	INIT
LTSCnCNTH	LTSCnCNTH[31:0]	KEPT	INIT	INIT

Note: INIT: initialized
KEPT: values are kept
